艾滋病合并马尔尼菲篮状菌感染者肺部 CT 征象分析及诊断

鲁植艳、李逸攀、史延斌
武汉大学中南医院

目的：探讨艾滋病（AIDS）合并马尔尼菲篮状菌（TM）感染者胸部 CT 表现，以提高对该病的认识及诊断水平。

方法：回顾性分析武汉大学中南医院 2013 年 1 月 30 号至 2020 年 8 月 11 号期间，经过病原学确诊为“艾滋病合并马尔尼菲篮状菌感染”患者 32 例，在收集相关临床和影像学资料后，观察并总结该病患者的胸部 CT 征象。

结果：本组研究中，AIDS 合并 TM 患者出现斑片状磨玻璃密度影/实变影 15 例（46.9%），其中 3 例（9.4%）出现以肺门为中心，向外周扩散，对称性分布、大小不等的片状实变影；肺内实性结节 17 例（53.1%），其中 1 例出现空洞，结节样肿块 3 例（9.4%）；弥漫性粟粒样病变 3 例（9.4%）；胸腔积液 8 例（25%）；胸膜增厚 3 例（9.4%）。纵隔内淋巴结肿大 20 例（62.5%），最大短径范围为 13.6-20.4mm。7 例（21.9%）患者出现纵隔内淋巴结的明显增多，呈簇状聚集。

结论：AIDS 合并 TM 感染者肺内 CT 表现多样，部分患者出现粟粒样病变及以肺门为中心、向外周扩散的片状实变影，这两个征象具有一定特征性。同时关注其纵隔肿大淋巴结病变的规律也能对该病提供重要的诊断价值。

耐药肺结核影像学诊断专家共识解读

陆普选
深圳市慢性病防治中心、深圳市第三人民医院

结核病（TB）仍是全球重大传染病之一，发病率居高不下，而耐药肺结核（DR-TB）更是结核病防控中的世界三大挑战之一。对耐药肺结核的早期、快速、准确诊断对于选择适当和个性化治疗方案至关重要，也是减少疾病传播和降低病死率的重要手段。近年来耐药肺结核的影像学诊断研究发展迅速，但缺乏一致性认识。为此，中国研究型医院学会感染与炎症放射学专委会、中华医学会放射学分会传染病放射学组等牵头组织全国结核病临床及影像学相关专家，参考国际国内 DR-TB 的诊疗现状，结合我国临床实践及循证医学对指南及标准的方法学要求，经反复讨论形成耐药肺结核影像诊断专家共识。其内容主要包括 DR-TB 的临床诊断与分型、病原学及影像学检查（主要为 X 线、CT）的优选，CT 是诊断耐药肺结核的主要手段（证据级别：IV，推荐强度：强），建议常规平扫，必要时增强扫描；胸部 X 线检查可作为耐药肺结核的首选筛查方法（证据级别：III，推荐强度：强），也是疗效评估的常用手段（证据级别：IV，推荐强度：强）。DR-TB 的 DR 及 CT 影像表现中肺结节、实变和空洞发生率比药敏肺结核更高；空洞大小、空洞内径、数量、空洞分布、空洞类型和空洞壁的厚度等相关的影像征象是诊断 MDR-TB 最重要的依据之一；若同时出现空洞数量 ≥ 3 个、厚壁空洞及病变分布在 3 叶以上时，是诊断耐药结核的重要影像学依据（证据级别：IV，推荐强度：强）；单耐药肺结核（含利福平耐药肺结核）的影像表现、MDR-TB（含 PDR-TB）的影像学表现以及 XDR-TB/pre-XDR-TB 的影像学表现各有相似性，病灶的影像表现范围、空洞的程度等尚有一定差异。DR-TB 主要应与非结核分枝杆菌病、肺真菌病（肺曲霉病和肺隐球菌病）进行鉴别诊断。以期通过该专家共识提高 DR-TB 影像学改变的认识，作为及时检测可疑 DR-TB 患者的起点，并可以有效提高临床诊断效率，达到对耐药肺结核早期诊治的目的。

Using Artificial Intelligence for Chest Radiograph Interpretation: A Retrospective Multi-reader-multi-center (MRMC) Study of the Automatic Detection of Multiple Abnormalities and Generation of Diagnostic Report System

YUAN-MING FLEMING LURE¹, Lin Guo¹, Bin Zheng², Stefan Jaeger³, Maryellen Giger⁴, Li Xia¹, Hongjun Li⁵

1. Shenzhen Zhiying Medical Imaging

2. School of Electrical and Computer Engineering, University of Oklahoma

3. National Library of Medicine, National Institute of Health

4. Department of Radiology, University of Chicago

5. Department of Radiology, Beijing YouAn Hospital, Capital Medical University

We evaluate the performance of a novel AI-based system to assist radiologists in image interpretation and diagnostic report generation on PA/AP chest X-ray (CXR), and assess its potential clinical utility through a retrospective multi-reader-multi-center (MRMC) study in western China. The AI system (MOM-ClaSeg) for multiple disease detection and diagnostic report generation has been developed by applying augmented Mask R-CNN deep learning and Decision Fusion Networks. From May-1-2022 to Sept-30-2022, 33,439 PA/AP CXR from 15 hospitals were retrospectively collected as control group (G1) and experiment group (G2), respectively. A group of 11 radiologists were involved in this study: 6 junior radiologists (JrR) (5~10 yr-experience) generating initial diagnostic reports, 2 senior radiologists (SrR) (>15 yr-experience) reviewing initial reports from JrR with/without MOM-ClaSeg to generate final reports, and 3 consensus expert radiologists (ExR) (>25 yr-experience) to reconcile the potential difference between initial and final reports. Compared with standard CXR screening and diagnosing (G1) of JrR, the sensitivity of JrR for G2 with MOM-ClaSeg has increased significantly by 18.67% (from 70.76% to 89.43%, $P<0.001$), and the specificity has slightly decreased by 3.36% (from 99.49% to 96.13%, $P<0.001$). The overall reading time of G2 has decreased by 27.07% ($P<0.001$) across all CXR, with a particularly significant reduction of 66.48% ($P<0.001$) on abnormal CXR, indicating that the MOM-ClaSeg system has the potential for lung disease triaging. This study presents the first AI-based system to assist radiologists in image interpretation and diagnostic report generation, displaying a promising step toward improved diagnostic performance and productivity in future clinical practice.

Is contrast-enhanced MRI an alternative for contrast-enhanced CT? Appraisal of guidelines on intravenous gadolinium-based contrast media use in patients with kidney disease

Jingyu Zhong¹, Wenjie Lu¹, Liwei Chen¹, Silian Wang¹, Ying Zhu¹, Huan Zhang², Weiwei Yao¹

1. Tongren Hospital, Shanghai Jiao Tong University School of Medicine

2. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective: To appraise the quality of guidelines on intravenous gadolinium-based contrast medium (GBCM) use in patients with kidney disease, and to compare the recommendations.

Methods: English and Chinese guidelines published between January 2018 and June 2023 on intravenous GBCM use in patients with kidney disease were identified by searching four literature databases, eight guideline libraries, and ten homepages of radiological societies. The appraisal of

the guidelines was conducted according to Scientific, Transparent and Applicable Rankings (STAR) tool.

Results: Ten guidelines were included, with a median sum STAR score of 40.0 (range 34.0-61.5). The guidelines performed well in "Recommendations" domain (30/40, 75%), while poor in "Registry" (0/20, 0%) and "Protocol" domains (0/20, 0%). The consensus has been almost reached on the cutoff of the estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73m² for referring patients to discuss the risk-benefit balance of GBCM use. Macrocytic or liner ionic GBCM were recommended for patients with reduced eGFR by some of guidelines, especially the macrocytic GBCM. The risk of nephrogenic systemic fibrosis (NSF) from GBCM in patients with advanced kidney disease is thought to be very low. Further, the potential harms of delaying or withholding GBCM in patients with acute kidney injury or eGFR < 30 mL/min/1.73m² should be balanced against and may outweigh the risk of NSF. The contradictory recommendations were found on dialysis initiation or alteration based on GBCM use. The relation and timing between GBCM and iodinated contrast medium use were unclear.

Conclusion: The quality of guidelines on GBCM use in in patients with kidney disease is unsatisfied. The contradictory remains in managements after GBCM use. The recommendations for patients plan to undergo contrast-enhanced MRI as an alternative for contrast-enhanced CT were lacking.

儿童遗传代谢性疾病相关颅内钙化影像学特点

李欣

天津市第二人民医院

目的: 分析 36 例儿童遗传代谢性疾病相关颅内钙化影像学表现, 找出提示性特点, 缩小颅内钙化鉴别诊断范围方法: 婴儿颅内钙化原因, 假 TORCH 综合征。幼儿颅内钙化原因, Krabbe 病、Aicardi-Goutières 综合征、Cockayne 综合征、假 TORCH 综合征、HIV、T。学龄前儿童颅内钙化原因, Cockayne 综合征、Down 综合征、脉络丛、松果体。学龄期儿童颅内钙化原因, Kearns-Sayre 综合征、MELAS、僵联合。青春期儿童颅内钙化原因, 生殖细胞肿瘤、碳酸酐酶 II 缺乏症。

结果: 儿童遗传代谢性疾病相关颅内钙化包括, 线粒体病、假 TORCH 综合征、脑白质病、家族性特发性基底节钙化等。MELAS 典型影像学表现, 皮层受累为主, 常多发, 多位于颞、顶、枕叶, 分布与血管供血区不一致, 呈游走性及多变性。ASL 急性期病变呈高灌注, MRS NAA 峰 ↓、Lac 峰 ↑, CT 双侧基底节、丘脑钙化灶、随儿童年龄增加。T1WI 低信号、T2WI 及 FLAIR 高信号, 急性期 DWI 高信号。Kearns-Sayre 综合征典型表现, MRI 额、顶叶皮层下白质及小脑白质为主, 胼胝体压部与内囊后肢可受累, 后期累及深部核团, 双侧对称性; T1WI 低信号、T2WI 及 FLAIR 高信号; DWI 急性期呈高信号。CT 疾病晚期, 基底节区、丘脑等钙化。Cockayne 综合征典型影像学表现, 进行性脑萎缩, 大脑半球白质脱髓鞘。MRS 白质和灰质 NAA/Cr ↓, 白质 Cho/Cr ↓, Lac 峰 ↑。颅内钙化多见于早期出现症状的患儿, 双侧基底节钙化, 壳核最常见, 大脑半球深部皮层区、小脑齿状核钙化, 丘脑、白质、软脑膜钙化, MRIT1WI 稍高信号、SWI 低信号。

结论: 儿童期颅内钙化病因复杂, 见于多种神经系统疾病, 病因广泛, 年龄、钙化位置、合并神经影像学表现有助于疾病诊断, 颅内钙化的影像学表现、结合临床实验室、可提示潜在遗传学病变。

癫痫 MR 成像规范 (HARNESS-MRI) 及 MR 新技术应用进展

肖江喜
北京大学第一医院

在癫痫病学中, MRI 彻底革新了我们检测大脑病变的能力, 癫痫病学已从以前主流的电-临床研究转变为多学科的研究。尤其重要的是结构 MRI 对病灶的精准定位, 与良好的术后预后相关, 使得该技术已成为药物难治性癫痫临床诊疗的基石。但是, 常规头 MRI 扫描对脑内癫痫灶的检测能力较低, 而且不同单位扫描序列不一致。针对 MRI 检查的目标患者: 癫痫 MRI 检查方案的最低要求是什么? 如何评估 MRI 图像? 如何优化病灶的检出? 国际抗癫痫联盟诊断方法委员会 (ILAE) 委托 2013-2017 年神经影像专题工作组制定了一套建议, 组确定了一组以三维采集为核心、统一的癫痫结构神经成像序列—HARNESS-MRI 方案。由于这些序列在大多数 MR 扫描仪上都可用, 与临床环境和国家/地区无关, 因此 HARNESS-MRI 方案可推广使用。

目前对于 FCD 的诊断主要依赖于 MRI 检查, 但大约 40% 的 II 型 FCD 和 85% 的 I 型 FCD 在常规 MRI 上没有明确的阳性征象, 常导致漏诊。对于怀疑 FCD 但 MRI 上表现为阴性的患者, 临床常用脑磁图 (MEG)、脑电图 (EEG)、颅内脑电图 (IEEG) 进行定位并指导手术切除, 但这些方法难以精确定位 FCD 的边界, 可能会导致病灶切除不完全或过度切除, 从而导致癫痫复发或脑组织功能损伤。随着 MRI 硬件、软件及后处理技术发展, 极大提高了 MRI 阴性 FCD 的检出率 (综合诊断增益率为 31%), 对病灶准确定位、指导手术、降低术后癫痫发作具有重要的作用。

影像征象与临床病理 - 探讨如何正确地影像思维

叶滨滨
中山大学附属第一医院

在疾病的诊断中, 影像学检查也已成为日常医疗工作必不可少的重要手段。正确的思维方法和路线非常重要。疾病的影像思维过程包括两个部分: 影像检查的设计: 如何根据患者的临床症状和体征选择最适宜的检查方法以显示疾病的病理改变-怎么做? 影像的解读: 将影像所见尽可能准确地还原回病理-怎么看? 正确诊断的保证: 能真正掌握和熟练应用影像学检查技术及具有宽、厚的临床、病理学基础;

一、选择正确的检查方法是影像诊断和鉴别诊断的关键: 1、真正掌握各种影像检查方法的成像原理, 深刻认识其适应证、应用价值与限度; 常规检查作为首选, 特殊检查及功能成像作为补充; 2、在此基础上根据患者的临床症状和体征选择最适宜的检查方法以显示疾病的病理改变。二、借助功能影像及特殊的影像检查探求疾病的本质解读“异病同影”: 随着现代科技的发展, 医学影像学已由过去的大体、宏观观察转变为宏观加微观信息观察, 由过去单纯的解剖学形态观察转变为解剖形态加功能观察, 一些特殊检查方法的出现, 更有益于揭示疾病的本质, 进行定性诊断及鉴别诊断的。三、充分认识疾病发生、发展的影像学变化过程, 必要时需调整影像诊断思路: 许多疾病的发病初期, 影像学征象往往不能反映出其特征性病理改变, 给疾病的诊断和鉴别诊断带来一定的困难; 但其发展变化的过程, 对治疗的反映、转归等则会对诊断有大帮助, 因此, 随诊复查非常必要, 要根据影像的演变过程调整诊断思路, 以接近疾病的本质。四、充分认识影像征象形成的机制, 切忌单纯地“看图识字”: 我们接触到的影像学征象往往不是某一种病的特征征象, 很多疾病在发展到某一阶段常常会出现相同的征象。既: “异病同影”; 如何从错综复杂的现象中, 寻找疾病的特性, 揭示疾病的本质? 要求影像医生还必需充分认识疾病自身的病理基础、发病机制以及特定的临床表现等, 追根溯源, 探寻彼此间的差异。

人工智能技术在儿科影像的应用

何玲

重庆医科大学附属儿童医院

人工智能（Artificial Intelligence, AI）是研究用于模拟、延伸和扩展人的智能的一门新的技术科学。人工智能在医学领域中广泛应用，影像组学和深度学习就是人工智能在医学影像中的应用。

影像组学是从 CT、MRI 等影像学图像的感兴趣区中高通量的提取高维特征（如一阶直方图、二阶纹理以及经小波变换、高斯拉普拉斯算子等滤波转换的高阶特征），并通过机器学习方法从其中提取关键的信息，对病灶进行精准量化评估。深度学习是机器学习领域中一个新的研究方向，深度学习建立模拟人脑进行分析学习的神经网络，对影像中的可疑病灶进行评估。以影像组学和深度学习为基础的人工智能不仅可以对成人患者的疾病进行鉴别诊断、疗效评估和预后预测，在儿科影像临床中也发挥了重要的作用。

呼吸系统疾病是儿童最常见的疾病，而肺炎又是儿童最常见的呼吸系统疾病。人工智能可以对儿童肺炎的病原菌进行鉴别，也可以对肺实变患者是否发生坏死、肺炎后是否发生纤维化等结果做出预测。

人工智能在儿童实体瘤中的应用也非常广泛。影像组学可以对不同病理类型肿瘤进行鉴别诊断：儿童盆腔横纹肌肉瘤和卵黄囊瘤；儿童腹膜后神经母细胞瘤和节细胞神经母细胞瘤；儿童弥漫大 B 细胞性淋巴瘤与霍奇金淋巴瘤；儿童肾脏恶性肿瘤的鉴别诊断。影像组学也可以区别不同基因分型的肿瘤：影像组学特征结合机器学习有助于识别儿童神经母细胞瘤 MYCN 基因是否扩增。影像组学还可以在治疗前判断实体瘤的危险分层：影像组学模型可以较好的识别高危神经母细胞瘤。

基于深度学习的人工智能可以判别儿童胼胝体是否存在结构异常，以及异常的亚区所在，也可以对主动脉缩窄及弓发育不良的儿童患者提出诊断标准。

人工智能作为一种无创、精确的新方法有望在未来更多儿童疾病研究领域中发挥作用。

基于 CT 影像组学的机器学习模型在儿童社区获得性肺炎诊疗体系中的应用

徐树明

山西省儿童医院（山西省妇幼保健院）

摘要：目的：探讨 CT 影像组学机器学习模型构建对儿童社区获得性肺炎进行早期病原学预测、疗效监测、评估预后中的作用。

方法：提取 3000 例不同类型儿童社区获得性肺炎 CT 影像组学特征，构建影像组学标签，通过不同类型机器学习选取最优模型，再结合相关临床实验室检查构建融合模型，对肺炎进行早期病原学预测、疗效监测及预后评估。

结果（1）：从每位患儿的 CT 图像中共提取 386 个影像组学特征。通过 UFS 和 MI 筛选出 5 个较优特征。6 种机器学习模型均有较高的区分能力，其中 DT 模型的预测能力最好，在训练集中预测支原体肺炎、细菌性肺炎及病毒性肺炎的 AUC 分别为 0.918, 0.806 和 0.823，在验证集中分别为 0.816, 0.741 和 0.876。结果（2）在诺模图中，D-二聚体、CT 影像表现（斑片、大片、都有）、肝损害、坏死性肺炎、热程、应用激素时长为预测儿童重症肺炎的独立特征。训练组和内部验证验证组的 AUC 分别为 0.807 和 0.799，校准曲线显示 nomogram 预测值与实际观测值之间有良好的-致性。DCA 显示 nomogram 具有临床应用价值。

结论: CT 影像组学机器学习模型可全面提高儿童社区获得性肺炎的诊疗水平, 提高早期诊断准确率及治愈率, 最大可能减少并发症的发生, 减少家庭及社会的负担。

Differential diagnosis of cerebellopontine angle area neoplasms in children

Jing Chen
Tianjin Children's Hospital

Abstract

Objectives: To investigate the imaging features and differential diagnosis of cerebellopontine angle (CPA) neoplasms in children.

Methods: The area of the cerebellopontine angle is complex. The neoplasms of CPA area have various origins and pathological types. The spectrum of neoplasms in the CPA area in children is different from that in adults. The preoperative diagnosis is mainly based on CT and MRI imaging features.

Results: The neoplasms in the CPA area can be divided into extra-axial and intra axial masses. The lesions can originate from the nerves, meninge, and blood vessels in the CPA area, or from adjacent brain parenchyma. They can also originate from the lateral foramen area of the fourth ventricle or extend from the fourth ventricle to the cerebellopontine angle area. Based on the location of the lesions, the characteristics of conventional MRI sequence, enhancement type, are helpful to make the diagnosis of the lesions. The types of lesions involving the CPA area in children that require differential diagnosis, include embryonic tumors (such as medulloblastoma, AT/RT), ependymoma, and less common types include choroid plexus papilloma, meningioma, brainstem glioma, cranial nerve schwannoma, pilocytic astrocytoma, vascular lesions (aneurysm, cavernous hemangioma) and so on, which also need to be differentiated from tumor like diseases, such as dermoid cyst, epidermoid cyst, arachnoid cyst, etc.

Conclusions: The common spectrum of neoplasms in the CPA area in children is different from that in adults, and the pathological types are various. It is necessary to combine CT and MRI manifestations to define the imaging characteristics of these diseases, which is helpful for differential diagnosis.

小儿双侧基底节病变的影像诊断思路

严志汉
温州医科大学附属第二医院

主要从以下几方面进行讲解。

- 1.基底节区及丘脑的 MRI 解剖;
- 2.基底节区及丘脑的主要生理功能;
- 3.病因和诊断思路主要参照如下“Midnights”原则:

(1) M-metabolism, 如代谢性疾病 HIE、有机酸尿血症、Wilson 脑病、线粒体脑肌病 (Leigh 综合征、MELAS 综合征) 等。

(2) I-immunity/inflammation, 指免疫/炎性疾病, 如 NMO、抗 NMDAR 相关性脑炎、ADEM、PANDAS。

(3) D--degeneration, 指变性性疾病: 如 Fahr's 病、Huntington's 病、NBIA。

(4) N--neoplasm, 指肿瘤: 如 1 型神经纤维瘤、胶质瘤。

- (5) I--infection, 指感染, 如疱疹病毒感染、黄病毒感染、CJD。
- (6) G--gland, 内分泌疾病, 如甲状旁腺功能减退。
- (7) H--hereditary, 包括遗传性: M-有机酸尿、Wilson 脑病、线粒体脑肌病 (Leigh 综合征、MELAS 综合征);
- (8) Trauma, 指外伤, 小儿急性外伤性基底节梗死。或者 T--toxication 中毒, 如一氧化碳、美沙酮、抗癫痫药中毒。
- (9) S--stroke, 指卒中。

S-12

Fetal development: From Biometry to sulcus

夏薇、郭豫、邵剑波

华中科技大学同济医学院附属武汉儿童医院

MRI 单次激发快速自旋回波序列评价胎儿脑沟发育的可行性研究

目的 利用 MRI 单次激发快速自旋回波序列评价宫内胎儿的脑沟发育。**方法** 分析 203 例 22-38 孕周的正常胎儿的脑部 MRI 图像, 根据孕周分组, 评价胎儿半球间裂、外侧裂、顶枕沟、海马裂、胼胝体沟、距状裂、扣带沟、边缘沟、侧副沟、中央沟、额上沟、中央前沟、中央后沟、顶内沟、颞上沟、额下沟、颞下沟、枕颞沟、次级扣带沟、次级枕沟及岛沟的发育, 并计算各孕周组中脑沟的可见百分率。**结果** 建立了 22-38 孕周胎儿大脑所有初级脑沟和部分次级脑沟的可见百分率的时间表。超过 75% 的胎儿在 22 孕周时可见半球间裂、外侧裂、顶枕沟、海马裂、胼胝体沟和距状裂, 在 24 孕周可见扣带沟, 在 25 孕周可见边缘沟、侧副沟、中央沟、额上沟, 在 26 孕周可见中央前沟、中央后沟、顶内沟, 在 27 孕周可见颞上沟、额下沟, 在 31 孕周可见颞下沟、枕颞沟、次级扣带沟, 在 32 孕周可见次级枕沟, 在 34 孕周可见岛沟。**结论** MRI 单次激发快速自旋回波序列可以用于评价胎儿脑沟的发育, 为评价胎儿脑部发育提供了一个参考标准, 可用于评价正常胎儿脑沟发育和辅助诊断脑发育滞后。

imaging diagnosis of central nervous system involvement in leukemia

Disrupted spontaneous brain activity in obese children: a resting-state fMRI study

Kun Liu

The Second Affiliated Hospital and Yuying Children's Hospital of Wenzhou Medical University

Aims: To investigate spontaneous brain activity changes in obese children based on fractional amplitude of low-frequency fluctuation (fALFF) analysis.

Materials and Methods: Fifty-nine obese children and forty-eight age-, sex-matched healthy controls underwent resting-state functional MRI. The characteristics of fALFF were analyzed in obese children compared with the healthy controls. The correlations between fALFF and clinical data and intelligence quotient (IQ) were examined in the obese group.

Results: Compared with control subjects, obese children showed significantly increased fALFF values in the left insula, left superior temporal gyrus (STG), left middle frontal gyrus (MFG) and right middle cingulate gyrus ($p < 0.05$, corrected for multiple comparisons). In the obese group, fALFF values in the left insula were negatively correlated with visceral adipose tissue area and positively correlated with subcutaneous adipose tissue area and high-density lipoprotein, while

fALFF values in the right middle cingulate gyrus were positively correlated with alanine aminotransferase and aspartate aminotransferase ($p < 0.05$).

Conclusions: Childhood obesity is associated with disturbed spontaneous activity in brain regions associated with salience (insula and middle cingulate gyrus), self-control and inhibition (MFG), and verbal comprehension (STG). Regional neural activity is affected by lipids, liver function and abdominal adipose tissue area. Our results may contribute to the understanding of the mechanisms underlying childhood obesity and obesity-related cognitive impairment.

Detention of fetal cardiac anomaly using prenatal MRI

Suzhen Dong

Shanghai Children's Medical Center, School of Medicine, Shanghai Jiao Tong University

The objective of this presentation is to provide an overview of fetal cardiac MR imaging methods and their applications in congenital heart disease. This presentation will cover recent technical advances in fetal CMR, the modified anatomic segmental approach to image fetal congenital heart disease, imaging appearances of fetal normal cardiovascular structure and appearances of various structural congenital heart disease on fetal CMR. Multiple imaging examples of fetal congenital heart disease diagnosed by fetal cardiac MR will be presented. The entire fetus in 3 planes including the cardiovascular structures, brain, chest and abdomen via standard protocol, fetal cardiac structures were analyzed using a modified anatomic segmental approach of congenital heart disease (CHD).

S-15

胎儿畸胎瘤的 MRI 评价

刘鸿圣

广州市妇女儿童医疗中心

畸胎瘤 (teratoma) 是胎儿最常见的肿瘤, 约占胎儿肿瘤 50%, 起源于胚胎早期的全能干细胞。尾骨前方的亨森结是多能干细胞集中的部位, 故骶尾部畸胎瘤 (sacroccocygeal teratoma, SCT) 最为多见。发病率约为 1/35000~1/40000, 75% 发生在女胎。根据良恶性程度可分为成熟型和未成熟型, 90% 为良性、10% 为恶性, 但良性有恶变的潜能。SCT 胎儿可无其他结构畸形, 50% SCT 胎儿可伴发其他畸形, 如泌尿生殖系统畸形 (最常见)、心血管畸形。SCT 合并染色体异常率较正常人群无增加, 文献报道合并染色体异常的病例均合并有其他畸形。胎儿 MRI 可作为产前超声的有效补充, 提供更全面的信息。根据肿瘤的位置可分为四型: I 型: 完全位于体外, 骶前没有肿瘤; II 型: 体外和骨盆内均有肿瘤; III 型: 体外存在肿瘤, 体内部肿瘤蔓延至腹部; IV 型 (内生型): 完全位于体内, 体外没有肿瘤。从 I 型到 IV 型, 其外科手术方式由易到难, 恶性程度的可能性从小到大。I 型、囊性、肿瘤较小者预后良好, 出生后手术治疗成功率高。III 型、IV 型 SCT 因位置较隐匿, 出生后不易被发现, 可能因此而失去最佳的治疗时机。IV 型 SCT 最容易检出恶性成份。SCT 体外部分肿块越大的, 其恶性成份检出率越低。肿瘤直径大于 10cm 提示高风险, 但同时需要联合囊实性比例评估。胎儿 MRI 可准确评估肿瘤的成分: 囊性、实性、继发的瘤体坏死、囊性变、内部出血、钙化等。根据肿瘤的成分可分为: 囊性型 (囊性 > 90%)、囊性为主型 (囊性占 50%~90%)、实性为主型 (实性占 50%~90%)、实性型 (实性 > 90%)。实性成分比例是一个有意义的预后评估指标, 囊性成分比例越大, 提示良性可能性大; 实性成分比例越大, 提示恶性程度高。I、II、III 型的囊性 SCT 需与骶尾部脊膜膨出相鉴别: SCT 的骶尾部脊柱排列是完整的, 瘤

体与脊髓的硬膜囊界限清楚，瘤体与椎管不相连通；骶尾部的脊膜膨出通常与脊柱裂同时存在，通过骶骨局限性的骨质缺损与椎管相通，严重者胎儿颅内结构也会出现异常。胎儿 MRI 可为 SCT 胎儿的预后判断及后期的临床治疗提供依据。

Angiopep-2 靶向识别帕金森病脑内 α -突触核蛋白的 7T CEST-MRI 研究

关计添、赖凌峰、孙树宜、吴明敏、谢润夏、张晓磊、周腾、吴仁华

汕头大学医学院第二附属医院

目的：基于化学交换饱和转移成像技术 (CEST)，验证了一种多肽 (Angiopep-2) 靶向可视化 α -突触核蛋白的可行性。

方法：使用化学分析平台预测 Angiopep-2 结构，将 Angiopep-2 分别与 α -突触核蛋白、A β 蛋白分别对接，分析其结合能力。通过体外荧光结合实验验证并对比 Angiopep-2 分别与 α -突触核蛋白、A β 蛋白间亲和力。再使用 CEST 技术研究尾静脉注射 Angiopep-2 后 PD 大鼠 CEST 信号变化，通过免疫组化观察 α -突触核蛋白与 CEST 图像是否存在共定位。最后昆明小鼠尾静脉注射 Angiopep-2，取 7d 组及 30d 组做相关血液生化检验及 HE 染色，评估 Angiopep-2 活体毒性。

结果：分子对接结果表明 Angiopep-2 与 α -突触核蛋白的特点是结合能高，甚至高于与 A β 蛋白的结合能。体外荧光实验结果表明含有 A β 1-42 或 α -突触核蛋白聚集体的溶液中所存在的 FITC-Angiopep-2 的荧光强度随着 A β 1-42 或 α -突触核蛋白聚集体的浓度增加而增加，证明其与 α -突触核蛋白聚集体和 A β 1-42 存在亲和力。FITC-Angiopep-2 对 α -synuclein 的 Kd 值为 16.98 μ mol/L，而 FITC-Angiopep-2 对 A β 1-42 的 Kd 值为 18.63 μ mol/L。动物实验表明 PD 大鼠为出现明显认知功能障碍，注射 Angiopep-2 后，PD 大鼠脑内 CEST 效应明显增强 ($P < 0.001$)，且 CESTR 效应主要分布在右侧纹状体和前额叶皮层，与免疫组化结果相匹配。最后，毒性试验证实 Angiopep-2 具有良好生物相容性。

结论：Angiopep-2 可作为 PD 的 CEST 探针，未来将有望应用于临床，提高 PD 患者的早期临床诊断准确性，为患者争取更多治疗干预时间。

肿瘤磁共振精准成像

张兵波
同济大学

核磁共振成像 (MRI) 因具有非侵入性、无电离辐射、组织断层扫描等特点, 特别是结合探针的使用, 可进一步增强病灶显影, 使其在临床医学诊疗中具有非常重要的地位。但目前 1H-MRI 的成像灵敏度、病灶信噪比和特异性还较低; 另外 MRI 探针成像尺度局限性, 无法同时提供结构和分子功能信息。针对上述问题, 本次报告将从 MRI 原理出发, 讲解核磁共振探针催化加速氢质子弛豫过程, 并结合相关机制分享探针设计原则。在探针制备方面, 汇报本课题组近些年发展起来的蛋白生物模拟仿生合成新方法, 特别是在超小铁基 T1 型磁共振探针蛋白介导合成及其疾病组织增强显影方面的研究。另外, 课题组创制了系列病生理响应型磁共振探针, 实现从疾病的单一结构造影到与特征分子事件跨尺度融合可视化, 提供多维度疾病诊断信息。该系列研究在磁共振成像和成像引导治疗中具有重要意义。

Pyrrolizidine alkaloids-induced hepatic sinusoidal obstruction syndrome: the correlation between CT and MRI findings with liver function and the severity

Ping Lei¹, Xiaoqian Yang², Yuhu Song³, Xin Li¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. dMed Biopharmaceutical Co., Ltd.

3. Division of Gastroenterology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives: To conduct quantitative analysis of contrast-enhanced CT and contrast-enhanced MRI images in patients with pyrrolizidine alkaloids (PAs)-induced hepatic sinusoidal obstruction syndrome (HSOS), and compare the correlation between the CT-based and MRI-based quantitative parameters with the liver function tests and clinical severity of HSOS.

Methods: Thirty PAs-induced HSOS patients who underwent CECT and CE MRI were retrospectively enrolled in this study, basic information, clinical data, CT and MRI images were collected. The damaged volume ratio and changes in lesion-to-normal liver density ratio (ΔDR)/grayscale ratio (ΔGR) on CT and MRI were quantitative measured on portal venous phase images, and the severity of imaging findings (CT score/MRI score) were calculated based on the volume ratio and $\Delta DR/\Delta GR$ (CT score = damaged volume ratio $\times \Delta DR$, MRI score = damaged volume ratio $\times \Delta GR$). The correlation between CT-based or MRI-based quantitative parameters and clinical factors was analyzed.

Results: CT score was positively correlated with PT and INR, biomarkers of synthetic liver function. While MRI score was positively correlated with PT and INR, as well as liver function tests revealed as ALT and AST. CT score on CECT was positively correlated with model for end-stage liver disease (MELD) score, while volume ratio and MRI score on CE MRI were positively correlated with MELD score. ΔGR and MRI score of CE MRI were positively correlated with the severity grading of HSOS, however, such correlations were not observed in CT-based quantitative parameters.

Conclusion: Quantitative parameters of CE MRI were demonstrated to be more accurate than CECT in evaluating the clinical severity of patients with PAs-induced HSOS.

人工智能骨关节智能测量的研究和应用

龚向阳
浙江省人民医院

目的: 分析国内外人工智能骨关节测量的研究现状, 为该领域的研究和临床应用提供指导。

方法: 综述近五年国内外基于深度学习算法的人工智能骨关节测量的相关研究报告, 结合作者单位 2018 年以来的相关实践, 对骨关节智能测量的方法、应用场景、使用效果能进行归纳和总结。

结果: 1) 相关研究主要集中于中国、美国、韩国、德国等国家; 2) 涉及的解剖部位包括脊柱、髋关节、膝关节、手足、肩关节、下肢、头颅和软骨; 3) 涉及的领域主要在计算机、骨科和放射学; 4) 主要的技术手段包括兴趣区分割和关节点识别等。5) 作者单位近年来针对膝关节、髋关节、脊柱等解剖部位开展了相关研究。

结论: 人工智能骨关节测量可成为替代人工测量、实现大数据分析的有效工具。

TFCC 损伤的病理及影像学表现

白荣杰
首都医科大学附属北京积水潭医院

目的: 利用高分辨 3.0T MR 研究腕关节三角纤维软骨复合体(Triangular fibrocartilage, TFCC)正常解剖及损伤的分型及 MR 表现。

方法: 利用大体标本断层解剖图像及相应的 MR 图像, 详细介绍 TFCC 断层解剖结构及 MR 表现。研究 TFCC 正常断层解剖与影像表现的相关性。研究 TFCC 的损伤机制、病理特点与影像学表现的相关性。

结果: 高分辨 3.0T MR 可清晰显示 TFCC 正常解剖结构及损伤的 MR 表现, 为损伤的早期诊断奠定基础。TFCC 损伤的病理特点与影像学表现特点密切相关。TFCC 损伤分型的病理、MR 表现与损伤的功能变化具有明显的相关性。

结论: TFCC 损伤在临床上很常见, 高分辨 3.0T MR 可清晰显示 TFCC 正常解剖结构和损伤的影像学表现, 为损伤的早期诊断和治疗, 提供精准的解剖学和影像学依据。

2023《中国 Stanford B 型主动脉夹层影像诊断和介入治疗临床指南》解读

郑传胜
华中科技大学同济医学院附属协和医院

Stanford B 型主动脉夹层 (TBAD) 是一种急危重症心血管疾病, 及时有效的诊断及治疗极为重要。影像学在 TBAD 的诊疗中发挥着关键作用, 但目前我国缺乏 TBAD 影像诊断临床应用指南。介入治疗已成为 TBAD 的主要治疗方式, 但在不同分型、分期、分类中的治疗仍缺乏标准。为此, 中华

医学会放射学分会介入学组组织专家共同编写了 2023《中国 Stanford B 型主动脉夹层影像诊断和介入治疗临床指南》，内容包括概述、主动脉夹层的诊断、治疗、围手术期管理、术后常见并发症的预防及处理、随访管理等，旨在提高行业对 TBAD 的认识，促进我国 TBAD 的诊疗向更加专业、规范的方向发展。通过对本指南的内容进行详细解读，旨在帮助相关专业技术人员熟悉 TBAD 的最新研究进展，了解 TBAD 的新规范，从而更好的开展 TBAD 的影像诊断和介入治疗，造福患者。

医用胶在胃静脉曲张 BRTO 中应用

梁斌

华中科技大学同济医学院附属协和医院

球囊辅助逆行经静脉闭塞术（BRTO）是治疗孤立性胃静脉曲张的有效方法。该介入治疗技术经门脉高压自发性胃-体分流道(如胃-肾分流)，向胃底静脉曲张血管内注入硬化剂/栓塞剂，达到闭塞胃静脉曲张的目的。其中，硬化剂/栓塞剂在 BRTO 治疗中起至关重要的作用。本文就胃静脉曲张的概述、BRTO 技术中硬化剂/栓塞剂使用进展，以及医用胶的应用优势作一讲述。

从跟跑到并跑，浅谈 UKKA 指南中的中国技术

黄勇慧

中山大学附属第一医院

血透通路介入治疗是外周血管介入治疗的重要内容，但是长期未受到国人重视，尤其是放射专业的介入专业人士关注甚少。近年来一些相关学科开始开展这项工作，也获得了国际认可。UKKA 是英国肾病学会简称，UKKA 通路指南是与美国肾病学会的 KDOQI 齐名的国际指南文件。今年 UKKA 最新血透通路诊疗指南于 4 月 5 日发布，这份指南中收录了诸多中国介入同仁在中心静脉狭窄闭塞方面的最新技术和经验，其中包括中山大学附属第一医院本团队的宝贵经验。在引用文献频次上，中国仅次于美国成为国际相关经验技术数据最大的提供国家之一。作为被引作者之一，本稿荟萃了该指南中主要的中国技术，向大家展示我国在该领域最新进展。

TIPS 治疗门静脉阻塞所致门静脉高压症

胡继红

昆明医科大学第一附属医院

目的：分析 TIPS 治疗门静脉阻塞所致门静脉高压合并静脉曲张出血及顽固性腹水的安全性及价值。
方法：回顾性收集了我院 352 例经 TIPS 手术治疗的患者的信息，其中 56 例符合标准。门静脉海绵样变的病例达 22 例，门静脉血栓患者有 28 例，门静脉癌栓患者有 6 例，食道胃底静脉曲张出血的病例有 42 例，顽固性腹水患者有 14 例。
结果：TIPS 技术成功率 100%，出血及腹水控制率 100%，HE 发生 2 例。
结论：TIPS 治疗门静脉阻塞所致门静脉高压症所致并发症安全、有效。

CT-guided percutaneous radiofrequency ablation of hepatic malignancies adjacent to the heart

Hongtao Hu

The Affiliated Cancer Hospital of Zhengzhou University/ Henan Cancer Hospital

Objective: To explore the safety and effectiveness of CT-guided percutaneous radiofrequency ablation (RFA) in the treatment of hepatic malignancies adjacent to the heart. **Materials and methods:** From January 2019 to December 2020, 412 patients who underwent RFA for hepatic malignancies were retrospectively analyzed, of which 42 patients had lesions less than 5 mm from the border of the heart. During the follow-up period, the complete ablation rate within 1 month and 24 months and the treatment-related complications within 30 days were recorded, and the complete ablation rate of adjacent cardiac lesions and non-adjacent cardiac lesions was calculated. Univariate and multivariate Logistic regression analyzes were used to analyze the relevant prognostic factors affecting complete ablation. **Results:** A total of 42 patients had 61 lesions. The average tumor size of 42 adjacent cardiac lesions was 3.01 ± 1.04 cm, and the total diameter of intrahepatic lesions was 3.60 (2.98, 4.73) cm. During the 1-month follow-up, the complete ablation rates of lesions adjacent to the heart and non-adjacent to the heart were 85.7% (36/42) and 89.5% (17/19). The follow-up time ranged from 12 to 26 months, and 2 patients were lost to follow-up. The complete ablation rate of adjacent cardiac lesions was 82.5% (33/40), and the complete ablation rate of non-adjacent cardiac lesions was 88.2% (15/17). Univariate and multivariate Logistic regression analysis showed that liver metastases and not receiving preoperative TACE were independent risk factors affecting the rate of complete ablation ($P < 0.05$). No serious complications related to RFA occurred during the treatment, and the overall safety was controllable. **Conclusion:** CT-guided radiofrequency ablation of tumors adjacent to the heart is safe and effective.

(讲座) 内耳内淋巴积水磁共振影像评估

陈青华

首都医科大学附属北京同仁医院

内耳膜迷路内淋巴积水(endolymphatic hydrops,EH)于 1938 年由 Hallpike 和 Cairns 发现内淋巴积水,2007 年日本学者 Nakashima 等率先利用磁共振内耳钆造影的延迟成像方式在梅尼埃病患者中成功实现了膜迷路成像。其基本原理是利用迷路膜迷路生物屏障对不同物质的选择性运输的特性,使钆对比剂选择性地进入外淋巴腔隙,通过外淋巴腔隙间接显像反映内淋巴腔隙。内耳 MR 钆造影的检查方法:鼓膜穿刺或咽鼓管注射、静脉注射钆对比剂引入内耳,使用 3.0 T 磁共振设备和多通道颅脑或头颈联合线圈,多采用 3D-FLAIR 或 3D-REAL IR 等序列延迟扫描。内耳内淋巴积水 MR 影像评估方法包括定性、半定量、定量方法。对内淋巴积水的影像学评估,不同的评价方法各有利弊。

头颈部罗道病病例分享

杨智云

中山大学附属第一医院

头颈部罗道病变少见，表现多样，影像医生及临床意思认识不足。

本文收集了头颅、鼻窦、颈部等头颈五官部位的病理证实的罗道病病例，以临床影像病理对照的方式分享和展示。

目的是提高大家的认识。

罗道病临床表现为无痛性肿块为主，鼻腔鼻窦区的可以表现为鼻塞，头颅的常常为头痛等，症状无特异性。

影像表现：密度信号较为均匀，T2WI 信号往往较低。增强扫描显著强化。坏死囊变少见。

虽然为良性病变，但手术后容易复发。

鉴别诊断：其他肿瘤性病变。

S-29

双侧前庭疾病的临床与影像学认识的探讨

陈正光、王伟涛、李小圳、钟立群、闫占峰

北京中医药大学东直门医院

目的：探讨双侧前庭病(Bilateral Vestibulopathy, BVP)的定义、特点和临床表现。提出 BVP 在中枢神经功能上的影响和影像学所关联关系，探讨 BVP 在功能影像上逻辑关系。

定义和特点：双侧前庭病（BVP）是以头部运动时出现视震荡，行走时出现步态不稳，具有空间记忆和定向障碍为主要临床特征的前庭疾病。BVP 以单侧迷路或前庭神经的外周性损害造成的前庭功能丧失为特点。生物学上前庭功能存在涉及到外周性前庭和中枢性前庭的整合。中枢性前庭在功能解剖上存在着双侧前庭的 4 个交叉：前庭神经核水平，前庭神经核上方的脑桥水平，中脑水平，两个半球的前庭皮层区域之间的连接穿越胼胝体。

材料和方法：我们系列的文献复习，临床相关认知和焦虑量表，动物行为研究和实际患者的颅脑空间解剖（MRI-VBM）和 MRI 功能成像技术（DTI，静息态 fMRI）等研究和分析，探索 BVP 患者大脑局部体积和功能反射和连接的变化。

结论：（1）BVP 患者空间焦虑增加；（2）BVP 患者会影响到空间记忆和导航；

（3）BVP 会导致海马形态萎缩。（4）BVP 测量海马容积和空间能力是正相关的。

显然，部分或完全 BVP 患者都会导致脑解剖和功能的改变，特别是海马形态的改变表现为患者主观和客观行为缺陷。这些缺陷应该能直接反映医生在评估 BVP 患者日常生活时发现。

咽旁间隙肿瘤或瘤样病变诊断新观察

徐雷鸣

浙江大学医学院附属第二医院

目的:咽旁间隙肿瘤影像诊断的分析方法不易掌握，特别对大部分非头颈部专业和初入门的影像大夫，易发生误诊。如何解决这些问题，值得思考。方法：回顾我院咽旁间隙肿瘤或肿瘤样病变误诊病例，深入分析误诊的原因，寻找解决的方法。结果：误诊原因主要有：对咽旁间隙病变解剖定位

征象不熟悉；未能掌握咽旁间隙常见病变的病理影像特征；对特别难的患者，无最后穿刺取得病理诊断的方法。结论：熟悉咽旁间隙肿瘤定位诊断的思路，掌握常见咽旁间隙肿瘤病理影像特征。特别困难患者，需借助穿刺活检，获得病理诊断。

Quantitative and semi-quantitative diagnostic points for salivary gland tumors on MRI

Ling Zhu
shanghai ninth peoples hospital

Purpose: Magnetic resonance imaging (MRI) plays a crucial role in the diagnosis of salivary gland tumors. This study explores the diagnostic value of applying functional MRI techniques in addition to conventional imaging sequences.

Methods: Through a retrospective analysis of a large number of cases involving salivary gland tumors, we compare the diagnostic efficacy of conventional MRI techniques with the inclusion of functional imaging. We also analyze the diagnostic value of quantitative and semi-quantitative parameters in functional imaging.

Results: Combining functional MRI parameters, including DWI, DCE-MRI, and MRS, with conventional MRI imaging significantly improves the accuracy of tumor diagnosis, as well as the ability to directly diagnose certain tumors, such as pleomorphic adenomas and adenolymphomas.

Conclusion: Functional MRI imaging is a valuable tool for enhancing disease diagnosis and guiding surgical interventions. The quantitative and semi-quantitative techniques provided by MRI offer effective assurance in distinguishing between benign and malignant diagnoses.

MRI in Thyroid-Associated Ophthalmopathy: State of the Art

Xiaoquan Xu, Hao Hu, Feiyun Wu
The First Affiliated Hospital of Nanjing Medical University

Thyroid-Associated Ophthalmopathy is a common orbital disease, with a increase of mobility. It has a very negnative influence on the quality of life of the patients. Magnetic resonance imaging plays an important role on the management of the thyroid-associated ophthalmopathy. Accurate diagnosis and stage is the base for establishing the individual treatment approach for the patients with thyroid-associated ophthalmopathy.

Follow-up magnetic resonance imaging is very important for judge whether the treatment is effective or nor. In this lecture, we aimed to discuss the role of magnetic resonance imaging (including functional magnetic resonance imaging) in the diagnosis, stage, and follow-up of thyroid-associated ophthalmopathy.

S-33

基于真实世界事件的 NSCLC 疗效的影像学客观评估要点与主观评估差异分析

胡晓云、王洁、毛海霞、方向明
无锡市人民医院

目的：探讨基于真实世界事件的非小细胞型肺癌（NSCLC）影像学评估标准的应用要点及影像评阅结果差异的常见缘由。方法：浅析、比较肿瘤影像评估标准的发展演变过程，从 WHO 标准发展到 RECIST 和 RECIST 1.1 标准及其之间的区别。解读 RECIST 1.1 标准中的主要诊断术语解析及应用要点；NSCLC 多中心临床试验影像评估实际案例分析：28 家全球分布的多中心 890 例病例 4900 个访视点，独立影像中心采用 A、B 两组双盲独立阅片所有病例，每组由 2 名 5 年以上 RECIST 阅片经验的放射医师采用双盲一致性独立评估所有病例，评估结果不一致时由另一名同样资质的阅片人进行裁判阅片。最后，比较 2 组阅片人的结果差异，并归纳导致此差异的来源。结果：A 组、B 组 2 组的组内阅片一致率分别为 95.7%、97.2%（ $P<0.05$ ）；经裁判阅片后，两组间的评估结果一致性为 92.3%，符合 FDA 的评估要求。组内与组间的不一致性的主要原因有（占 80%）：靶病灶的选择，肺内靶病灶的测量时的窗宽位合理选择，肺癌靶病灶梭形机化以及访视期靶病灶测量时遵行患者临床真实世界事件规则；新病灶的确认；其次原因有（20%）：非靶病灶明确进展的确认；新增淋巴结病灶的判断；腹膜转移的忽略。结论：RECIST1.1 要点的精准掌握并结合患者临床真实世界事件是科学精准 NSCLC 疗效的基础，也是避免评估结果主观差异的主要手段。

S-34

建立以病人为中心的影像检查及质量管理与控制体系

鲜军舫
首都医科大学附属北京同仁医院

目的：影像学在疾病诊疗和保障人民健康方面发挥着越来越重要的作用，如何建立以病人为中心的影像检查及质量管理与控制体系进一步提升影像学的价值和促进影像学高质量发展是目前面临的巨大机遇和挑战。方法：从顶层设计影像检查适应性评价（适应证）和影像检查方法的选择、影像检查方案和参数的制定和选择到最后问题的总结与分析及持续改进方案是一个闭环过程。结果和结论：在这个过程中，要做到：既要坚持以人民健康为中心确实解决病人和临床关注的问题，又要优化流程提升两个效益；既要扩大影像学的应用范围，又要避免不必要的过度影像检查；既要严格按照规范实施检查和质控保证同质化，又要不断创新提升影像的价值，促进影像学高质量发展。

磁共振四维血流成像在肥厚型心肌病 左室流出道应用的可行性研究

徐晶、陈秀玉、陆敏杰、赵世华
中国医学科学院阜外医院

目的 探索磁共振四维血流成像 (4D-Flow MRI) 技术在左心室腔内应用的可行性。

方法 本研究为前瞻性、横断面研究, 纳入 2022 年 8 月至 2023 年 1 月于我院接受心脏 MRI 检查的肥厚型心肌病患者, 采用 3.0T MR 扫描仪进行 2D-Flow 及 4D-Flow 成像, 收集患者 1 周内进行的超声心动图检查结果。采用组内相关系数 (ICC)、变异系数 (COV) 及 Bland-Altman 分析比较 2D-Flow、4D-Flow 评估左室流出道峰值流速的可重复性及一致性, 并通过 Pearson 相关性分析探究二者与超声测量结果的关系。

结果 共纳入 21 例完成全部心脏 MR 及超声心动图检查的患者。2D-Flow 和 4D-Flow 观察者内/观察者间的 ICC 分别为 0.999/0.999 和 0.995/0.992, COV 分别为 0.408/0.429 和 1.815/2.334。4D-Flow 与超声的一致性较好, ICC 为 0.375 ($P=0.013$), 相关系数 r 值为 0.574 ($P=0.006$)。2D-Flow 与 4D-Flow 和超声间的一致性较差, 与 4D-Flow 间的 ICC 为 0.102 ($P=0.287$), r 值为 0.132 ($P=0.567$), 与超声间的 ICC 为 -0.038 ($P=0.617$), r 值为 -0.099 ($P=0.670$)。

结论 4D-Flow 技术能够可视化心腔内血流模式, 对左室流出道峰值流速的测量具有高度可重复性, 且与超声心动图的测量结果具有显著的一致性。

Cerebral blood flow changes and their genetic mechanisms in major depressive disorder: a combined neuroimaging and transcriptome study

Xuetian Sun, Weisheng Huang, Jie Wang, Ruoxuan Xu, Xiaohan Zhang, Jianhui Zhou, Jiajia Zhu, Yinfeng Qian
The First Affiliated Hospital of Anhui Medical University

Background: Extensive research has shown abnormal cerebral blood flow (CBF) in patients with major depressive disorder (MDD) that is a heritable disease. The objective of this study was to investigate the genetic mechanisms of CBF abnormalities in MDD.

Methods: To achieve a more thorough characterization of CBF changes in MDD, we performed a comprehensive neuroimaging meta-analysis of previous literature as well as examined group CBF differences in an independent sample of 133 MDD patients and 133 controls. In combination with the Allen Human Brain Atlas, transcriptome neuroimaging spatial association analyses were conducted to identify genes whose expression correlated with CBF changes in MDD, followed by a set of gene functional feature analyses.

Results: We found increased CBF in the reward circuitry and default-mode network and decreased CBF in the visual system in MDD patients. Moreover, these CBF changes were spatially associated with expression of 1532 genes, which were enriched for important molecular functions, biological processes, and cellular components of the cerebral cortex as well as several common mental disorders. Concurrently, these genes were specifically expressed in the brain tissue, in immune cells and neurons, and during nearly all developmental stages. Regarding behavioral relevance, these genes were associated with domains involving emotion and sensation. In addition, these genes could construct a protein-protein interaction network supported by 60 putative hub genes with functional significance.

Conclusions: Our findings suggest a cerebral perfusion redistribution in MDD, which may be a consequence of complex interactions of a wide range of genes with diverse functional features.

OR-0003

Comparison of DW-MRI and FDG PET/CT in preoperative assessment of specific-region metastases in advanced epithelial ovarian cancer: a correlation study with surgical results

Songqi Cai¹, Jianfeng Huang¹, Minrong Wu², Jingjing Lu¹, Xiaoliang Ma¹, Jianjun Zhou², Mengsu Zeng¹

1. Zhongshan Hospital, Fudan University

2. Zhongshan Hospital (Xiamen), Fudan University

Objectives: To compare the efficacy of DW-MRI and FDG PET/CT in detection of specific-region metastases in epithelial ovarian cancer (EOC).

Methods: This prospective study involved women with suspected stage III-IV EOC between October 2020 and July 2021. Prior to surgery, participants underwent both DW-MRI and FDG PET/CT. Data on clinical, pathological, surgical, and residual tumor were collected. The peritoneal cancer index (PCI) with additional points for involvement of specific regions were used. The key region metastases which independently predicted the feasibility of incomplete resection were identified. The agreement between imaging PCI and surgical PCI were calculated. The diagnostic performance of the two imaging modalities in specific regions were also compared.

Results: A total of 43 patients with stage III-IV EOC were enrolled in the study. Both DW-MRI and FDG PET/CT underestimated the imaging PCIs. DW-MRI performed significant better in detecting lesions of the diaphragmatic peritoneum ($p=0.017$) and omental lesions extending to the hepatic flexure or splenic flexure ($p=0.028$). The key regions associated with incomplete resection were small bowel mesentery lesions ($OR=4.645$; $p=0.010$) and omental lesions extending to the hepatic flexure or splenic flexure ($OR=4.202$; $p=0.019$). The area under receiver operating characteristic curves of DW-MRI and FDG PET/CT in above two key regions were 0.789, 0.967 and 0.663, 0.846 respectively.

Conclusions: Both DW-MRI and FDG PET/CT often underestimated the actual extent of peritoneal dissemination. DW-MRI showed a tendency for higher accuracy than FDG PET/CT in key regions that were more predicting incomplete resection.

OR-0004

IVIM 监测间充质肝细胞对肝部分切除后大鼠肝再生的疗效研究

王旭阳¹、谢双双²、沈文^{1,2}

1. 南开大学

2. 天津市第一中心医院放射科

目的: 探索体素内不相干运动 (IVIM) 成像监测间充质干细胞 (MSCs) 促进部分肝切除后肝再生的效果研究。

材料与方法: 将 70 只成年 SD 大鼠随机分为对照组和治疗组, 每组 35 只。所有大鼠均行 70% 肝大部切除术 (切除肝左外侧叶和肝中叶)。每组大鼠再根据时间点分为 7 个亚组 (术前、术后第 1、2、3、5、7、14 天), 每个组 5 只。培养间充质干细胞, 术中经门静脉移植到大鼠体内 (每鼠移植 2×10^6 个细胞), 对照组注射等量的 PBS 溶液。每组在对应时间点均进行肝脏 IVIM 成像, 随后处死取肝脏组织和静脉血, 测量肝功能化验指标和肝细胞 Ki-67 增殖指数。分析肝脏 IVIM 功能参数、病理指标和血液生化指标在组间和不同时间点间的差异。分析影像参数与病理和生化指标的关联性。

结果: 对照组与治疗组肝实质 D、D*、PF 值差异均有统计学意义 ($P < 0.05$)。两组大鼠肝实质 D 值在术后均先上升后下降, 术后第 2、7、14 天 D 值有明显差异 ($P < 0.05$)。两组大鼠肝实质 D*、

PF 值在术后均先下降后上升, 治疗组肝实质 D*、PF 值下降速度较对照组缓慢, D*值恢复速度较对照组缓慢, D*值在术后第 14 天没有恢复到基线水平 ($P<0.05$)。对照组与治疗组的 ALT 与 AST 值术后先上升后逐渐下降, 且治疗组术后 1 天的 ALT 与 AST 值较对照组明显减低 ($P<0.05$)。肝细胞 Ki-67 增殖指数与肝细胞大小均先上升后下降, 治疗组术后第 2 天肝细胞 Ki-67 增殖指数低于对照组, 第 3、5 天肝细胞 Ki-67 增殖指数高于对照组。治疗组肝细胞大小在术后 2~14 天均大于对照组, 治疗组肝实质 D、D*、PF 值与 AST 水平、肝细胞 Ki-67 指数和肝细胞大小具有相关性 ($|r|=0.35\sim0.71$; $P<0.05$)。

结论: 骨髓间充质干细胞治疗后会延长肝部分切除后肝脏增值期, IVIM 参数可以无创监测治疗后肝再生及肝功能恢复过程。

OR-0005

多参数 MRE 预测肝硬化患者的肝静脉压力梯度

鲁玥玥、马羽佳、石喻
中国医科大学附属盛京医院

目的: 评估磁共振弹性成像 (MRE) 在预测肝硬化患者肝静脉压力梯度 (HVPG) 中的价值。

方法: 前瞻性分析接受经颈静脉肝内门体静脉分流术 (TIPS) 治疗的肝硬化患者 48 例, 记录患者的天冬氨酸转氨酶与血小板比率指数 (APRI) 及纤维化-4 (FIB-4) 指数, 行 60HZ 的 MRE 检查并测得肝弹性值 (LS)、脾弹性值 (SS)。以 TIPS 术中所测 HVPG 为金标准, 定义 $\geq 10\text{mmHg}$ 为临床显著门静脉高压 (CSPH), $\geq 12\text{mmHg}$ 为严重门静脉高压 (SPH)。采用线性回归分析 HVPG 与 LS、SS 及可能影响因素的相关性, 得到 HVPG 预测值 (PV), 用受试者工作特征 (ROC) 曲线下面积 (AUC) 评价 MRE 在预测 CSPH、SPH 中的效能。

结果: 在多元线性回归中, SS 是 HVPG 的唯一独立影响因子 ($\beta=2.52$, $P=0.000$), 调整后 $R^2=0.69$, ($P=0.00$)。PV 对于诊断 CSPH 的 AUC 为 0.82 (95%CI: 0.68, 0.92, $P<0.0001$), FIB-4 AUC: 0.73 (95%CI: 0.58, 0.85, $P=0.01$), 高于 APRI AUC: 0.53 (95%CI: 0.38, 0.67, $P=0.80$ 未达统计意义)。PV 对诊断 SPH 的 AUC 为 0.90 (95%CI: 0.78, 0.97, $p<0.0001$), 高于 APRI AUC: 0.68 (95%CI: 0.53, 0.81, $P=0.04$), FIB-4 AUC: 0.64 (95%CI: 0.49, 0.78, $P=0.09$ 未达统计意义)。

结论: MRE 是一种简单有效的无创预测 HVPG 的方法。

基于 MRI 生境成像及影像组学预测高级别浆液性卵巢癌患者铂敏感性: 一项多中心研究

毕秋^{1,2}、强金伟¹、吴昆华²、李海明³

1. 复旦大学附属金山医院

2. 云南省第一人民医院

3. 复旦大学附属肿瘤医院

目的: 探讨 MRI 生境成像及影像组学预测 HGSOC 患者铂耐药的可行性, 并与传统影像组学和深度学习模型进行比较。

材料与方法: 回顾性搜集了 3 家医院的 HGSOC 患者的临床及 MRI 数据。采用基于队列的 K-means 算法对 T2WI、CE-T1WI 和 ADC 图进行生境聚类分析。根据 Calinski-Harabasz (CH) 评分决定聚类数。计算各生境容积、容积所占比例以及不同序列上的像素灰度均值。经特征提取及选择后, 分别构建传统影像组学模型、生境模型和深度学习模型对铂耐药和铂敏感患者进行识别。然后通过选

择以上三个模型中的最优模型和临床独立预测因子构建诺模图。使用 ROC 曲线及德龙检验评估比较各模型性能,采用净重分类指数 (NRI) 和综合判别指数 (IDI) 比较不同模型间的增益。

结果:本研究共纳入 394 例 (300 例铂敏感患者和 94 例铂耐药患者) 符合条件的 HGSOC 患者,其中训练组 307 例,外部验证组 87 例。根据 CH 评分, $K=3$ 时聚类效果最好,故将肿瘤聚类成 3 个生境,其中生境 1 (ADC 低、T2WI 低、CE-T1WI 高) 所占比例最高 (42.30%), 其次是生境 3 (ADC 低, T2WI 高, CE-T1WI 中等, 占 31.06%) 和生境 2 (ADC 高、T2WI 中等、CE-T1WI 中低, 占 26.70%)。铂耐药组不同序列的生境 2 容积和像素灰度均值显著高于铂敏感组 ($P<0.05$)。铂耐药组生境 3 的 ADC 值显著高于铂敏感组 ($P=0.021$)。与传统影像组学模型 ($AUC=0.640$) 和深度学习模型 ($AUC=0.603$) 相比, 生境模型的 AUC (0.710) 更高。采用生境标签和临床独立预测因子 (新辅助化疗) 构建的诺模图 AUC (0.721) 明显高于其他模型, NRI 和 IDI 均为阳性。

结论: 基于 MRI 的生境成像及其影像组学有潜力预测 HGSOC 患者铂耐药。结合了生境标签的诺模图对于评估 HGSOC 患者铂耐药具有最高的效能和净效益。

OR-0007

T2-weighted magnetic resonance imaging radiogenomic features for the prediction of neoadjuvant chemotherapy response in patients with osteosarcoma

Ping Yin, Nan Hong

Department of Radiology, Peking University People's Hospital

Objectives: This study aims to explore the role of T2-weighted magnetic resonance imaging (MRI) radiogenomic features in characterizing changes in patients with osteosarcoma (OS) and on neoadjuvant chemotherapy (NACT).

Material and Methods: Twenty-one patients with OS were examined retrospectively and divided into poor-response group ($n = 13$) and good-response group ($n = 8$). T2-weighted sequencing was performed at baseline. A total of 98 radiomic features and 31 gene expression profiles were analyzed for each patient. Age, sex, alkaline phosphatase, pathologic type, tumor size, and tumor location were also analyzed. Comparisons between the good- and poor-response groups were made using t-test, Mann-Whitney U test, or Fisher's exact test. The relationships between radiomic features and gene expression profiles was conducted using Spearman correlative analyses.

Results: Statistical differences in 19 radiomics features and glutathione-s-transferase 1 were found between the good- and poor-response groups ($P < 0.05$). No significant differences in clinical features were found ($P > 0.05$). The receiver operating characteristic curve showed that boxmean_ngtdm_Busyness, binomialblurimage_ngtdm_Busyness,

wavelet_ngtdm_wavelet_LLL_Busyness, and mean_ngtdm_Busyness had the best performance in predicting the NACT of patients with OS, with area under the curve of 0.788, sensitivity of 0.750, and specificity of 0.923. Correlation analysis showed that the HLA_I, CD274, GSTP1, and CCND3 were significantly correlated with one or more radiomics features ($P < 0.05$).

Conclusions: The T2-weighted MRI radiogenomic features can be used as biomarkers for the early response evaluation of NACT in OS. The radiomic features of patients with OS were associated with some chemotherapy-related genes.

OR-0008

In vivo Imaging Exploration: Irisin Prevents High-Fat Diet-Induced Metabolic Disorders via Brown Adipose Tissue Activation

Jingyue Dai, Xingui Peng
Zhongda Hospital, Medical School, Southeast University

Objective: This study sought to find whether an intervention with irisin, a small myokine, could restore interscapular brown adipose tissue (iBAT) function and improve systemic metabolism in the context of prolonged high-fat diet (HFD) feeding, and whether the irisin improves systemic metabolism through activation of iBAT.

Methods: Non-invasive magnetic resonance imaging (MRI) and position emission tomography (PET) with ^{18}F -fluoro-2-deoxy-D-glucose (^{18}F -FDG) were used to determine and follow the changes of systemic metabolism and lipid accumulation in liver and iBAT in HFD-induced obese mice during intervention with irisin for 2-week or 4-week. Additionally, an obese mouse model with the removal of iBAT was also constructed and scanned during a 4-week irisin intervention. Pathological and molecular biology analyses, including uncoupling protein 1 (UCP 1) protein expression level, were performed on tissue and blood samples.

Results: Prolonged HFD feeding in mice not only induced obesity but also impaired the thermogenic capacity of iBAT with a decline in overall metabolic activity. MRI showed that irisin intervention decreased lipid content in iBAT, coupled with increased UCP 1 protein expression and FDG uptake measured by PET. This restoration of iBAT activity was accompanied by an improvement in systemic metabolism. The beneficial effects of irisin appears to be dependent on the length of intervention time. When iBAT was removed, the positive effects of irisin on metabolism were partially suppressed, suggesting that irisin regulates metabolism through the restoration of the thermogenic function of iBAT.

Conclusion: HFD results in reduced thermogenic capacity of iBAT, while irisin intervention can effectively restore iBAT function, leading to improvement in overall glucose and lipid metabolism.

OR-0009

Multifrequency MR Elastography Based Tomoelastography: Additional New Imaging Tool for Postoperative Pancreatic Fistula Risk Stratification

Siya Shi, Yanji Luo, Liqin Wang, Jiaxin Yuan, Jinhui Yu, Tingting Wen, Shi-Ting Feng
The First Affiliated Hospital, Sun Yat-sen University

Background: Postoperative pancreatic fistula (POPF) is a prevalent and severe complication of pancreatico-enteric anastomosis but accurate preoperative prediction has been challenging. Pancreatic stiffness and fluidity quantified with tomoelastography (a multi-frequency MR elastography technique) may reflect pancreatic texture which was reported be strongly predictive of POPF.

Purpose: To investigate the predictive performance of pancreatic stiffness and fluidity and further to stratify the POPF risk.

Materials and Methods: This prospective study enrolled participants who underwent preoperative tomoelastography and pancreatico-enteric anastomosis between November 2021 and January 2023. Stiffness and fluidity were quantified using maps of shear-wave speed (c) and phase angle (ϕ) obtained from tomoelastography. The correlation between fibrosis, lipomatosis and MR

parameters was evaluated with Pearson correlation. The independent predictive clinical-radiological factors of POPF were determined using logistic regression analysis. The predictive performance was assessed with area under the receiver operating characteristic curve (AUC) analysis and compared using net reclassification improvement (NRI) and integrated discrimination improvement (IDI).

Results: Among 112 participants enrolled (56.5 ± 13.7 years, 53 males), 25 participants had POPF. There was a strong correlation between stiffness and fibrosis ($r=0.822$, 95% confidence interval [CI]: 0.752-0.875, $P<0.001$) while a moderate correlation between fat fraction and lipomatosis ($r=0.776$, 95%CI: 0.690-0.840, $P<0.001$). Stiffness (adjusted odds ratio [OR]: 0.00; 95% CI: 0.00-0.02; $P=0.002$), fluidity (adjusted OR: 0.00; 95%CI: 0.00-0.09; $P=0.014$) and fat fraction (adjusted OR: 1.13; 95%CI: 1.05-1.22; $P<0.001$) were independent predictive factors for POPF. The AUC of incorporating stiffness, fluidity and fat fraction in predicting POPF was 0.922 (95%CI: 0.856-0.964), which was higher than stiffness (0.838; NRI: 0.247, IDI: 0.183, both $P<0.05$), fluidity (0.763; NRI: 0.287, IDI: 0.331, both $P<0.05$), fat fraction (0.743; NRI: 0.344, IDI: 0.290, both $P<0.05$).

Conclusion: Pancreatic mechanical properties (stiffness and fluidity) quantified with tomoelastography can improve the predictive performance of conventional MRI in postoperative pancreatic fistula risk stratification.

OR-0010

Initial and Follow-up High-Resolution Vessel Wall MRI Study of Spontaneous Cervicocranial Artery Dissection

Xuehua Lin, Dairong Cao
The First Affiliated Hospital of Fujian Medical University

Objectives To explore the factors associated with ischemic stroke secondary to spontaneous cervicocranial artery dissection (sCCAD) and evaluate the initial imaging markers related to outcomes.

Methods Initial and follow-up high-resolution vessel wall MRI (VW-MRI) in consecutive patients with sCCAD were retrospectively analyzed. The associations of clinical and imaging factors and variants of the circle of Willis (COW) with ischemic stroke were evaluated using binary logistic regression analyses. The anatomical outcomes were categorized as complete, partial and no remodeling based on changes of vessel wall and lumen. Ordinal logistic regression analysis was used to assess associations between initial features and outcomes.

Results: A total of 115 dissected arteries (79 strokes, 36 non-strokes) were detected in 103 patients. Follow-up VW-MRI was available in 46 patients (44.7%, with 51 vessels), with a median interval of 8.5 months. Pseudoaneurysm (OR, 0.178; 95% CI, 0.039-0.810; $p = 0.026$) tended to rarely cause ischemic stroke, while intraluminal thrombus (OR, 5.558; 95% CI, 1.739-17.765; $p = 0.004$), incomplete COW (OR, 9.309; 95% CI, 2.122-40.840; $p = 0.003$), and partial complete COW (OR, 4.463; 95% CI, 1.211-16.453; $p = 0.025$) were independently associated with stroke occurrence. Furthermore, the presence of double lumen (OR, 5.749 95% CI, 1.358-24.361; $p = 0.018$) and occlusion (OR, 12.975; 95% CI, 3.022-55.645; $p = 0.001$) were associated with no remodeling of sCCAD.

Conclusions: Multiple initial factors were found to be related to stroke occurrence and anatomical outcomes of sCCAD. High-resolution VW-MRI may provide valuable insights into the pathophysiology and evolution of sCCAD.

Rectal Adenocarcinoma: Ex vivo 9.4T MRI - Correlation with Histopathologic Treatment Response to Neoadjuvant Chemoradiotherapy

Fu Shen¹, Yuan Yuan¹, Zhihui Li², Chengwei Shao¹, Yong Lu³

1. Changhai Hospital affiliated to Naval Military Medical University

2. Department of Radiology, Ruijin Hospital Luwan Branch, Shanghai Jiaotong University School of Medicine

3. Department of Radiology, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective: To determine the imaging detail and diagnostic information that can be obtained at 9.4T magnetic resonance imaging (MRI) of evaluating the treatment response to neoadjuvant chemoradiotherapy (nCRT) of rectal adenocarcinoma by ex vivo.

Methods: Fifteen cases with locally advanced rectal cancer (LARC) who underwent surgical resection after nCRT between September 2022 and February 2023 were included. Excised rectal adenocarcinoma specimens were fixed in a perfluoropolyether-filled test tube and scanned with a 3.0T and 9.4T MRI system ex vivo. The residual tumor depth and tumor regression grade (TRG) based on T2-weighted imaging (T2WI) were subjectively assessed and then compared with the pathological findings.

Results: The ex vivo 9.4T T2WI without fat suppression enabled clear differentiation between tumor tissue, fibrosis and normal rectal wall, which clearly corresponded to the pathologic tissues of the rectal specimens. The TRG could be accurately assessed on ex vivo 9.4T images in 13/15 specimens (86.7%), while in 11/15 specimens (73.3%) on ex vivo 3.0T images.

Conclusions: Ex vivo 9.4T MR imaging enables clear delineation of the rectal wall layers and demonstrated good performance for evaluating the TRG of LARC after nCRT, which allow radiologists to understand and then assess more accurately the treatment response to nCRT of rectal adenocarcinoma.

区域选择性动脉自旋标记 MRI 技术对颈动脉近闭塞患者内膜剥脱术后脑过度灌注的预测价值研究

范晓媛、来志超、刘暴、有慧、冯逢

中国医学科学院北京协和医院

目的: 探索在颈动脉近闭塞患者中, 区域选择性动脉自旋标记 (tASL) MRI 技术能否预测颈动脉内膜剥脱术 (CEA) 后脑过度灌注的发生。

方法: 2015 年 5 月至 2022 年 5 月, 连续纳入因颈动脉近闭塞接受 CEA 的患者, 在术前 2 周和术后 1 周内进行 MRI 检查。在 tASL 图像上, 视觉评估患侧颈内动脉 (ICA) 供血区面积 (正常、部分减小 [$<50\%$]、明显减小 [$>50\%$]), 对侧 ICA 和椎-基底动脉代偿情况 (无、部分代偿 [$<50\%$]、明显代偿 [$>50\%$]) 和术后患侧 ICA 灌注区域是否正常化 (图 1), 并定量患侧和健侧 ICA 供血区脑血流量 (ipCBF、conCBF)、患侧和健侧 ICA 供血体积比 (ripPV、rconPV) 和总灌注体积比 (rtPV)。脑过度灌注定义为与基线相比, 术后 CBF 增加超过 100%。

结果: 34 名患者 (平均年龄 64.8 ± 7.5 岁, 男性 79.4%) 中, 16 名 (47.1%) 患者发生过度灌注。Willis 环不完整 (43.8% vs 88.8%, $p=0.004$)、患侧 ICA 供血面积明显减小 (62.5% vs 16.7%, $p=0.013$)、对侧 ICA 无代偿 (43.8% vs 5.6%, $p=0.031$) 和术后 ICA 灌注区域正常化 (85.7% vs 43.8%, $p=0.045$) 与脑过度灌注的发生有关 (表 1); 联合三种术前半定量影像学标记物, 预测过度灌注的 AUC 为 0.929, 灵敏度 75.0%, 特异度 94.4% (图 2a)。在定量指标上, 过度灌注组术前 ipCBF (14.1 ± 6.2 ml/100g/min vs 17.8 ± 2.9 ml/100g/min, $p=0.041$) 和 conCBF 更低 (22.9 ± 8.6

ml/100g/min vs 27.9 ± 4.7 ml/100g/min, $p=0.049$), rtPV 更小 ($98.1\% \pm 13.6\%$ vs $108.7\% \pm 12.3\%$, $p=0.023$, 表 1); 联合三者预测过度灌注的 AUC 为 0.83, 灵敏度 81.25%, 特异度 83.33% (图 2b)。

结论: 在颈动脉近闭塞患者中, 术前进行 tASL 成像有助于识别 CEA 后脑过度灌注高风险的患者。

OR-0013

Reproducibility and normal value of liver and spleen stiffness measurement among healthy volunteers by multi-frequency magnetic resonance tomoelastography

Wen Lv, LiQin Wang, Lu Yu

Department of Radiology, The First Affiliated Hospital, Sun Yat-sen University

Background: Gastroesophageal varices, as a common complication of portal hypertension, constitute a major medical emergency with a high mortality rate. Early identification of gastroesophageal varices and timely intervention in high-risk cases makes positive influence in the prognosis for patients with portal hypertension. Consequently, there is a clinical need for non-invasive methods to predict the risk of gastroesophageal varices bleeding. Tomoelastography proves valuable in it. Currently, there is no research on the repeatability and influencing factors of measuring liver and spleen stiffness in tomoelastography in healthy volunteers. Therefore, our study focuses on investigating the measurement reproducibility and determining the normal value of liver and spleen stiffness in healthy volunteers, exploring the difference among healthy volunteers base on age, sex, BMI and the influence of steatosis in liver. **Methods:** Fifty-three healthy volunteers and thirty-two patients with steatosis were enrolled and underwent the examination at intervals of 2 ± 1 months to test the feasibility and repeatability of the hepatic and splenic tomoelastography. Two radiologists with 20-year (reader 1) and 4-year (reader 2) experience using hepatic and splenic MR imaging analyzed the images using ImageJ software. The stiffness of left robe of liver was compared to the right. The mean liver stiffness and spleen stiffness were compared based on the age, gender and BMI. And the mean liver stiffness in healthy volunteers was compared to the patients with steatosis.

Results: In the healthy volunteer group, the stiffness of the right robe of the liver and the left robe of the liver were 1.58 ± 0.09 m/s and 1.65 ± 0.11 m/s, respectively. The mean liver stiffness was 1.61 ± 0.08 m/s, and the spleen stiffness was 2.60 ± 0.25 m/s. The Bland–Altman analysis showed high intraobserver agreements and short-term reproducibility for both liver and spleen stiffness measurement. There were difference in hepatic stiffness between the right robe of the liver and the left lobe of the liver. ($P < 0.0001$) The frequencies of the mean liver stiffness and spleen stiffness did not differ by sex, age, or BMI. In the patients group, there were no difference in liver stiffness between patients with hepatic steatosis and healthy volunteers.

Conclusion: In conclusion, tomoealstography is a promising and reproducible method for measurement of liver and spleen stiffness. The mean liver stiffness in healthy volunteers was 1.61 ± 0.08 m/s, and the spleen stiffness was 2.60 ± 0.25 m/s. There were no significant difference in the frequencies of the liver and spleen stiffness among age, gender and body mass index groups. And we found no difference in liver stiffness between patients with hepatic steatosis and healthy volunteers.

OR-0014

脑动静脉畸形血管构筑特征、破裂状态与 4D flow MR 血流动力学参数相关性的初步研究

王玉婷¹、魏海宁²、程美雄¹、王益双¹、李睿²

1. 四川省医学科学院·四川省人民医院

2. 清华大学医学院

目的:脑动静脉畸形(AVM)的血流动力学特征很难通过形态学成像或外科分级来反映。本研究旨在研究脑 AVM 血管构筑特征和血流动力学之间的关系。

方法:前瞻性连续纳入 DSA 诊断脑 AVM 的患者,行 4Dflow MRI,体素为 1.0mm(3D 各向同性)。用 4D flow 计算三维速度场和血流量。计算瘤巢附近供血动脉的壁剪切力,搏动指数(PI),阻力指数(RI),瘤巢体积,病灶流入比(供血动脉总流量/瘤巢体积),流出比(引流静脉流量/瘤巢体积)。比较不同血管构筑特征、破裂状态的血流动力学组间差异。随访介入栓塞术后的血流变化。

结果:16 例患者中 13 例图像质量可获得血流动力学评估(男性 8 例,女性 5 例,年龄 19~61 岁),其中 AVM 破裂 4 例,未破裂 9 例。4 例介入术后再评估(随访 7~12 个月,中位数 11 个月)。破裂状态与 Spetzler-Martin 分级之间无显著相关性。多动脉供血与未破裂状态相关($p=0.001$),其余构筑特征(深静脉引流、瘤巢内动脉瘤、瘤巢紧密/松散)与破裂状态未见显著相关。Spetzler-Martin II 级患者的总流量(7.8~500.4 ml/min)与 III 级患者的总流量(7.8~920.4ml/min)有较大重叠。未破裂组与破裂组的总流量未见显著差异,但破裂组有更高的 PI ($p=0.02$)和 RI ($p=0.023$),更低的流出比($p=0.01$)。供血动脉单根最大流量、总流量与瘤巢体积高度相关($p=0.023, 0.001$)。PI 与供血动脉单根最大流量相关($p=0.031$)。流入比与动脉平均速度、最大流量及壁剪切力相关($p=0.004, 0.047, 0.001$)。随访的 4 例病例中,单根动脉最大流量均下降(幅度 20~91%),流速均下降(幅度 5~65%),总流量均下降(幅度 10~87%)。

结论:脑 AVM 即使具有相似的临床分级或血管构筑特征,其血流动力学也具有异质性,这可通过 4D flow 来量化。本初步研究中,AVM 在破裂病变中流量差异不明显,但 PI 及 RI 更高、流出比更低。供血动脉的高流量与瘤巢体积、PI、流入比正相关。介入栓塞后近 1 年显示了显著的病灶血流减量。

OR-0015

基于高分辨率磁共振血管壁成像研究 颈动脉斑块内出血与斑块分布象限的关系

曹鑫、唐烨、潘磊、冯喆

复旦大学附属华山医院

目的 通过 3D 高分辨率磁共振血管壁成像(VW-MRI)研究颈动脉斑块内出血(IPH)的发生与斑块分布象限的关系。

方法 招募 92 例急性期脑缺血或脑梗死的患者,通过超声检查发现至少一侧颈动脉有斑块。所有患者均行 VW-MRI 检查,序列包括 T1WI、T2WI、增强 T1WI、同步非增强血管造影和斑块内出血成像序列(SNAP)和 MRA。分别测量斑块和 IPH 体积,并计算两者体积百分比;将颈总动脉分叉部及颈内动脉起始部划分成 I-IV 四个象限;观察斑块强化情况。比较无 IPH 斑块组和出血斑块组的斑块象限分布差异。

结果 在纳入的 118 枚斑块中,有 IPH 的斑块共 28 枚(23.73%),IPH/斑块体积平均值 0.23 ± 0.16 ,斑块强化率 100%。同无 IPH 的斑块相比,出血斑块更多分布在第 I 象限(21.43% vs. 6.67%, $P < 0.05$),较少分布在第 III 象限(0.00 vs. 17.78%, $P < 0.05$),分布差异具有统计学意义。

结论 颈动脉斑块 IPH 的发生与其分布象限有关, 这或许与不同位置管壁所受壁切应力 (WSS) 不同有关, WSS 较大的斑块出血概率较高。此外, IPH 与斑块强化之间存在一定关联。进而提示斑块的分布象限可能一定程度影响其稳定性。

Development and validation of a model integrating radiomics and pathomics for predicting post-surgical prostate cancer biochemical recurrence

Chenhan Hu, Xiaomeng Qiao, Jie Bao, Ximing Wang
The first affiliated hospital of Soochow University

Objective: The goal of this study is to investigate the prediction performance of radiomics model and pathomics model for post-surgical BCR in PCa patients, and to develop and validate a combined model using macroscopic multiparametric magnetic resonance imaging (mpMRI) and microscopic whole-slide image (WSI).

Methods: We retrospectively recruited 363 eligible PCa participants who underwent pre-operative 3T MRI and received radical prostatectomy between January 2015 to March 2020 at the First Affiliated Hospital of Soochow University with a mean 36-month follow-up and then divided them into training (n=254) and test (n=109) sets at a ratio of 7:3. Both preoperative mpMRI and WSI of surgical specimens were collected and annotated for each patient. Quantitative image features were extracted from mpMRI and WSI and used to construct radiomics signature and pathomics signature powered by least absolute shrinkage and selection operator (LASSO) Cox regression. Independent clinical features were identified by univariate and multivariate Cox regression. The combined model incorporating two signatures and independent clinical factors were developed by a multivariate Cox proportional hazard model and compared against pre-operative CAPRA and post-operative CAPRA-S score for BCR prediction.

Results: Both radiomic and pathomics signatures presented significant prognostic prediction ability in training and test cohorts (C-index: 0.690–0.837). The radiomics-pathomics combined model showed a significant improvement for predicting BCR compared with CAPRA and CAPRA-S score in the training (C-index: 0.872 versus 0.602 and 0.587, all $p < 0.050$), and test cohorts (C-index: 0.871 versus 0.684 and 0.705, all $p < 0.050$). The combined model also significantly outperformed single-modality prediction models for the radiomics model and for pathomics model in both training (C-index: 0.872 versus 0.837 and 0.690, all $p < 0.050$) and test cohorts (C-index: 0.871 versus 0.742 and 0.730, all $p < 0.050$). Furthermore, the combined model successfully stratified PCa patients into two groups with distinguishable prognosis (log-rank $p < 0.0010$).

Conclusion: The magnetic and microscopic imaging features were able to predict BCR of PCa and may provide a novel tool to assist post-surgical individualized treatment by identifying who might benefit from addition therapy.

Eight weeks of bright light therapy increases myelin density in the posterior thalamic radiation in young adults with subthreshold depression: A inhomogeneous magnetization transfer MRI study

Guanmao Chen, Guixian Tang, Ying Wang
First Affiliated Hospital of Jinan University

Introduction: Subthreshold depression (SD) is a significant risk indicator of major depressive episodes. The inhomogeneous magnetization transfer (ihMT) technique has not been used to probe myelin abnormalities and its response to bright light therapy (BLT) in SD.

Methods: A total of 104 college students with SD and 91 age- and sex-matched healthy controls (HCs) were included. All participants underwent ihMT imaging, and pseudo-quantitative ihMT (qihMT), and ihMT ratio (ihMTR) were obtained. The qihMT and ihMTR values of 50 white matter (WM) fibers were compared between SD and HCs. Thirty-one SD participants underwent eight weeks of BLT, after which we observed the effect of treatment on WM fibers with abnormal qihMT and ihMTR values at baseline in SD. Also, the psychological variables were compared before and after BLT in SD.

Results: Compared to HCs, SD showed decreased qihMT values in the bilateral posterior thalamic radiation (PTR) (including optic radiation), right sagittal stratum (including inferior longitudinal fasciculus and inferior fronto-occipital fasciculus), and right uncinate fasciculus, and decreased ihMTR values in the left PTR (include optic radiation) at baseline (all, $p \leq 0.001$). After eight weeks of treatment, qihMT values of all the above fiber tracts increased by BLT in SD patients, with no significant differences than HCs, and qihMT values of the right PTR increased in SD compared to baseline ($p < 0.05$).

Conclusion: These findings suggest the macromolecular disruption of myelin in the PTR, sagittal stratum, and uncinate fasciculus in the early stages of depression. Furthermore, the myelin impairments in the PTR could be reversed by BLT, thus suggesting they might be used as the potential neural target for BLT in SD.

三维多频磁共振弹性成像评价肝细胞癌的预后

刘桂雪、严福华、李若坤
上海交通大学医学院附属瑞金医院

目的: 探讨通过三维多频磁共振弹性成像进行量化的生物力学特性是否可以预测肝切除术后肝细胞癌的无复发生存期。

方法: 本回顾性研究包括 105 例患者, 其中 75 例肝细胞癌作为训练组, 31 例肝细胞癌作为验证组。所有患者术前均行三维多频磁共振弹性成像和多参数磁共振检查。肿瘤和肝脏通过磁共振弹性成像进行量化的生物力学特性。剪切波速度(c)和损失角(ϕ)分别表示硬度和流动性。Cox 分析用于评估可能预测无复发生存期的变量, 并为可视化构建诺模图。

结果: 多因素 Cox 回归结果显示, 肝脏 c (HR:4.43; 95% CI:1.89, 10.41; $p=0.001$), MVI (HR:3.24; 95% CI: 1.35, 7.80; $p=0.009$), 肿瘤数目 (HR:2.77; 95% CI:1.14, 6.74; $p=0.025$)是复发的独立预测因素。无复发生存期诺模图的 C-index 为 0.82 (95%CI:0.70, 0.93), 具有良好的预测性能。

结论: 源自三维多频磁共振弹性成像的肝脏 c 是无复发生存期的生物标志物。

OR-0019

Prediction of EGFR Mutation Status in Non-small cell lung cancer Based on Chest MRI Radiomics

Bin Yang

Jinling Hospital, Medical School of Nanjing University

Objective: To establish and validate a predictive model based on magnetic resonance imaging (MRI) radiomics features combined with clinicopathological factors to predict the mutation status of EGFR in non-small cell lung cancer (NSCLC).

Patients and methods: A total of 91 NSCLC (72 in the training cohort and 19 in the validation cohort) were continuously included in this study. A total of 1708 radiomics features were extracted from MRI (T2w, CET1w) sequences. The variance threshold method combined with univariate selection method and least absolute shrinkage and selection operators (LASSO) regression were used to screen important radiomics features, calculate radiomics scores, and construct an radiomics model. The combination of radiomics scores (Rad-score) and independent predictive factors is based on multivariate logistic regression analysis to construct an radiomics nomogram to predict the mutation status of EGFR. The predictive performance and clinical practicality of the model were evaluated using area under curve (AUC), calibration curve, and clinical decision curve.

Result: A total of 30.8% (28/91) of EGFR mutant patients were identified. Thirteen important radiomics features were selected from 1708 radiomics features. The radiomics model can effectively classify EGFR mutant and wild-type, with AUCs of 0.846 and 0.808 for the training and validation cohorts, respectively. The radiomics nomogram has higher diagnostic efficiency, with AUCs of 0.880 and 0.859, respectively. The calibration curve shows that the model has good predictive performance, and the decision curve indicates that the radiomics nomogram has high clinical benefits.

Conclusion: The predictive model based on MRI radiomics has good diagnostic efficacy for EGFR mutation status in NSCLC, and can provide guidance for individualized targeted therapy.

基于动脉自旋标记联合 T1 mapping 的机器学习模型诊断阿尔茨海默病的应用研究

王笑男¹、王一达²、李盛勇²、李春媚¹、陈敏¹

1. 北京医院

2. 华东师范大学

目的: 本研究探索阿尔茨海默病 (Alzheimer's disease, AD) 和轻度认知障碍 (mild cognitive impairment, MCI) 患者脑血流量 (cerebral blood flow, CBF) 和纵向弛豫时间定量 (T1 mapping) 的变化, 为 AD 诊断提供依据。

方法: 纳入 34 名 AD 患者、24 名 MCI 患者和 38 名正常对照 (normal control, NC)。自动分割得到 24 个脑区的 CBF 及 T1 值。T 检验和 U 检验挑选出有显著性差异的特征, 递归特征消除和 Relief 进行数据降维, 支持向量机和逻辑回归构建诊断模型, 受试者工作特征 (receiver operating characteristic, ROC) 曲线和决策曲线分析 (Decision Curve Analysis, DCA) 评价模型诊断性能, 校准曲线评估模型预测概率和实际概率一致性, Hosmer-Lemeshow 检验评估模型的拟合优度。

结果: 筛选出左侧岛叶 T1 值, 左侧海马 T1 值, 右侧岛叶 T1 值, 左侧海马 CBF 值四个影像特征和一个临床特征 (年龄), 分别构建五种模型, 包括: 年龄、T1、ASL、T1+ASL 和 T1+ASL+临床。对于 AD 和 NC 的鉴别, T1+ASL+临床数据诊断效能最好 (AUC=0.931); 对于 MCI 组和 NC 的鉴别, ASL 模型、ASL+T1 模型、T1+ASL+临床模型、T1 模型 AUC 分别是 0.793、0.764、0.773、

0.709, 差异均没有统计学意义 ($P > 0.05$) ; 对于 AD 和 MCI 鉴别, 单纯 ASL 模型 $AUC=0.531$, 低于 T1 模型 ($AUC=0.724$) 和 ASL+T1 模型 ($AUC=0.727$) , 差异有统计学意义 ($P < 0.05$) , 而 ASL+T1+临床模型并未展现更高的诊断效能 ($AUC=0.674$) 。 T1+ASL 模型校准曲线显示实际概率与预测概率之间有良好的预测精度。

结论: ASL 技术联合 T1 mapping 技术比单纯 ASL 技术可以更好地鉴别 NC、MCI 和 AD, 尤其对于 MCI 和 AD 的鉴别。由此可见, ASL 技术联合 T1 mapping 技术可能作为 AD 诊断和精准诊断的有力工具。

Added-value of 3D amide proton transfer MRI in assessing prognostic factors of cervical cancer: a comparative study with multiple model diffusion-weighted imaging

Shujian Li

the First Affiliated Hospital of Zhengzhou University

Purpose: Amide proton transfer (APT) imaging has been gradually applied to cervical cancer, however, the relationships between 3D APT and multiple model diffusion-weighted imaging (DWI) have yet to be investigated. To evaluate the added value of 3D APT imaging to multiple model DWI for assessing prognostic factors of cervical cancer.

Methods: Eighty-eight patients with pathologically confirmed cervical cancer underwent APT imaging and DWI with 11 b-values (0 to 2000 s/mm²) on a 3T system (Ingenia CX, Philips Healthcare, Best, the Netherlands). APT imaging was conducted using an optimized 3D TSE pulse sequence combined with chemical shift-selective fat suppression for better robustness to field inhomogeneity and 3D volume coverage. The pre-saturation pulses consisted of 3 consecutive radiofrequency pulses of 500-ms duration with 500-ms interpulse delays and a time-average amplitude of 2 μ T. Six different image volumes at saturation frequencies (± 3.5 ppm, ± 3.42 ppm, ± 3.58 ppm, and -1560 ppm, relative to the water resonance frequency) were acquired for the Z-spectrum normalization and interpolation, and three acquisition were performed at $+3.5$ ppm with different echo time shifts to obtain a Dixon-type B0 field map to correct for B0 inhomogeneities in the Z-spectrum frequency domain. DWI was obtained in a single-shot echo-planar imaging (EPI) sequence with diffusion gradient b factors of 0, 10, 20, 50, 100, 200, 400, 800, 1,200, 1,600, and 2,000 s/mm². All data were transferred to a post-processing station (IntelliSpace Portal V10, Philips Healthcare, the Netherlands) for quantitative analysis. Mono-exponential, bi-exponential, and kurtosis models were fitted to calculate apparent diffusion coefficient (ADC), pure molecular diffusion (D), pseudo-diffusion (D*), perfusion fraction (f), mean diffusivity (MD), and mean kurtosis (MK). The APT SI was calculated as the asymmetry of the magnetization transfer rate (MTR_{asym}) at the frequency offset of $+3.5$ ppm. The mean, minimum, and maximum values of APT signal intensity (APT SI) and DWI-derived metrics were compared based on tumor stages, subtypes, grades, and lymphovascular space invasion (LVSI) status. Receiver operating characteristic (ROC) curves were generated to examine the ability of each metric to distinguish different prognostic factors when appropriate. Logistic regression analyses were used to identify independent factors and combination diagnosis.

Results: APT SI_{max}, APT SI_{min}, MK_{mean}, and MK_{max} showed significant differences between squamous cell carcinoma (SCC) and adenocarcinoma (AC) (all $P < 0.05$). APT SI_{mean}, APT SI_{max}, and MK_{max} were higher and ADC_{min}, D_{mean}, D_{min}, and MD_{min} were lower in the high-grade group than in low-grade group (all $P < 0.05$). For distinguishing LVSI, only MK_{mean} showed significant difference ($P < 0.05$). There was no significant difference between any metrics with regard to stages (all $P > 0.05$). APT SI_{max}, APT SI_{min}, and MK_{mean} were the independent predictors for tumor subtype, and APT SI_{max}, MD_{min} were the independent predictors for histological grade of cervical cancer. When APT SI_{min} and APT SI_{max} was combined with

MKmean and MKmax, the diagnostic performance was significantly improved for differentiating SCC and AC (AUC, 0.908). The combination of APT SImean, APT SI_{max}, ADC_{min}, MK_{max}, and MD_{min} demonstrated a higher diagnostic performance than each individual metric (all $P < 0.05$) for predicting tumor grade (AUC, 0.903).

Conclusion: 3D-APT imaging was comparable with multi-model DWI for cervical cancer typing and grading. Addition of APT to DWI may improve the ability to noninvasively predict poor prognostic factors of cervical cancer.

OR-0022

视野优化和约束无失真单次激发弥散加权成像 对肺部病变图像质量及定量分析准确性的研究

李婕、夏艺、范丽、徐美玲、林晓青、顾玲玲
中国人民解放军海军军医大学第二附属医院

目的: 与单次激发弥散加权成像 (SS) 对比, 探讨视野优化和约束无失真单次激发弥散加权成像 (FOCUS) 在肺部病变成像中的准确性。

材料与方法: 在 2022 年 11 月至 2023 年 5 月期间, 对 40 例肺部病变患者前瞻性的进行磁共振 FOCUS 及 SS 序列扫描。并对所有患者的两种磁共振扫描序列图像进行客观评价及主观评价。客观评价由两个测量者分别测量肺病变、肺实质和肌肉的感兴趣区并计算对比噪声比 (CNR)、病灶信噪比 (SNR) 和形变率 (DR)。图像主观评分是由两个具有 10 年胸部诊断经验的放射科医生依据 Likert Scale 评分法进行双盲评估。另有两名测量者测量病灶的 ADC 值, 其中一个测量者间隔一周再次测量。客观评价的组间及组内一致性由配对样本 t 检验和组内相关性 (ICC) 评估, 主观评价的观察者间一致性由 Kappa 系数检验, 不同序列间定量值的差异由 Wilcoxon 秩和检验评估, 并使用 ROC 曲线显示序列对鉴别良恶性的效能。

结果: 所有观察者在 ADC, SNR, DR 以及主观评分上的组内及组间一致性均较高 ($ICC > 0.6$), 而在 CNR 上则一致性较弱。对于客观评价中的 SNR, FOCUS 与 SS 之间的差异无显著性 ($P = 0.246$)。对于 CNR, FOCUS (4.41 ± 2.02) 高于 SS (3.03 ± 1.55), 差异有统计学意义 ($P < 0.001$)。在病灶显示上, FOCUS 的 DR 值 (0.57 ± 0.35) 显著小于 SS (0.68 ± 0.45), 差异有统计学意义 ($P < 0.001$)。两位观察者对 40 位患者 FOCUS 图像的评分均分 (4.01 ± 0.70) 高于 SS (3.85 ± 0.65), 差异具有统计学意义 ($P = 0.048$)。FOCUS 的 ADC 值与 SS DWI 相当, 无显著差异。对病变良恶性鉴别的 ROC 曲线上, FOCUS (AUC=0.778) 的 AUC 值高于 SS (AUC=0.748), 说明 FOCUS 在疾病鉴别上的能力。

结论: 与 SS 相比, FOCUS 对肺部病灶的偏移更小, 在临床的主观评分更高, 具有提供肺部病变良恶性诊断以及更多临床影像学信息的潜在价值。

OR-0023

Feasibility study on Pointwise encoding time reduction with radial acquisition (PETRA) magnetic resonance angiography (MRA) to assess intracranial artery at 7 Tesla

Xiangchuang Kong
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Introduction Pointwise encoding time reduction with radial acquisition magnetic resonance angiography (PETRA-MRA) is a non-contrast subtraction-based MRA technique for intracranial vasculature assessment. As an ultra-short TE technique, PETRA-MRA is inherently robust to

metallic susceptibility artifacts and has better performance than time-of-flight (TOF) MRA in follow-up imaging of stent-assisted coil embolization [1]. Furthermore, unlike TOF-MRA, PETRA-MRA is not subject to turbulent-flow-related dephasing artifacts and therefore has better performance in depicting saccular unruptured intracranial aneurysms (UIAs) [2]. Lastly, PETRA-MRA produces much lower acoustic noise. 7T MRI should further improve the performance of PETRA-MRA thanks to its higher SNR and in turn higher allowed spatial resolution. On the other hand, PETRA-MRA at 7T faces challenges such as SAR and limited B1 coverage in the labeling regions. To our knowledge, no previous PETRA-MRA study has been report at 7T for imaging intracranial artery, so in this study, we aim to demonstrate the feasibility and performance of PETRA-MRA at 7T in evaluating intracranial vasculatures.

Purpose To investigate the feasibility of PETRA-MRA and compare its performance to TOF on evaluating intracranial vasculatures at 7 Tesla.

Methods Under local QRB approval, 3D TOF and PETRA-MRA were performed on volunteers on a 7T MR scanner (Magnetom Terra, Siemens Healthcare, Erlangen, Germany) equipped with an 8Tx/32Rx head coil (Nova Medical, Wilmington MA, USA).

The 3D TOF was performed in an axial orientation with the following parameters: FOV = 200 × 148 mm², voxel size = 0.4 × 0.4 × 0.4 mm³, TR/TE = 17.00/3.57 ms, flip angle = 20°, GRAPPA acceleration factor of PE=3, bandwidth= 206Hz/Px, and acquisition time (TA) = 8 min 38 s.

For PETRA-MRA, the isotropic 3D acquisitions were performed with axial orientation and the following imaging parameters: FOV = 218 × 218mm², TR/TE = 5.72/0.07 ms, flip angle = 6°, imaging matrix = 544 × 544, voxel size = 0.4 × 0.4 × 0.4 mm³, bandwidth = 204 Hz/Px, and radial view number = 40,000. Two imaging datasets were acquired for PETRA MRA: TAG, a slice-selective saturation slice was placed at the skull base; Control, the same slice-selective saturation slice was placed on top of the head to achieve comparable MT effects on the imaging volume. The segmentation number of saturation pulse was set to 15 and the saturation slice thickness was set to 80mm to achieve desired black blood effects on the TAG images. The acquisition time for each TAG and CONTROL is 4 min 39s. We also acquired additional TAG and CONTROL pair with higher resolution (0.3×0.3×0.3 mm³) and the acquisition time is 6 min 37s each. The PETRA MRA images were obtained by subtracting the TAG image from the CONTROL image.

The MIP images of PETRA-MRA and TOF were reviewed by two MRI scientists. Visualization of Circle of Willis and lenticulostriate arteries were independently evaluated, focusing on artery blood signal homogeneities and sharpness depictions using a 4-point scale: 4, excellent; 3, good; 2, poor; 1, not assessable. For raw images before MIP, the contrast between arteries and background signal at MCA were calculated and compared between PETRA-MRA and TOF.

Results The contrast ratio between MCA and background tissue for PETRA MRA was significantly higher than TOF (12.66±1.45 vs 5.85±1.67, p< 0.001). The subjective image scores regarding artery blood signal homogeneities were higher in PETRA-MRA than in TOF, and sharpness were comparable between PETRA-MRA and TOF.

Discussion Sensitivity of PETRA-MRA in the detection of residual flow, turbulent flow and saturation effects is significantly superior to that of TOF-MRA because ultrashort-TE MRA is known to decrease the susceptibility artifacts and insensitive to slow blood flow. Our results indicate that at 7T, PETRA-MRA showed a higher blood to background contrast ratio compared to TOF. In addition, PETRA-MRA can cover the whole cerebral vasculature, while TOF is not able to image the top part of the brain due to placement of venous saturation band. Another advantage of PETRA-MRA is its greatly reduced acoustic noise compared to TOF, which is ideal for noise sensitive patients. One limitation of PETRA MRA is it's a subtraction-based method and thus sensitive to motion, but this could be further addressed by rigid (or no-rigid) 3D registration to reduce the motion induced discrepancy between TAG and CONTROL images.

Conclusions PETRA-MRA, with better visualization of cerebral arteries including lenticulostriate arteries, and higher contrast to background ratio than TOF, showed a promising performance in evaluating cerebral arteries in healthy volunteers, which may potentially benefit patient MRA exam at 7T.

Alterations of cerebral perfusion and corresponding brain functional networks in neuropsychiatric systemic lupus patient with cognitive impairment

Huiyang Liu, Hu Liu, Guoguang Fan
The First Affiliated Hospital of China Medical University

Objectives: Cognitive impairment (CI) frequently occurs in systemic lupus erythematosus (SLE) patients. Neuroinflammation processes, which interact with neurovascular changes in SLE, may disrupt local and global brain functions. However, the features of whole-brain, regional cerebral blood flow (CBF) and intrinsic functional connectivity (FC) in SLE have not been previously investigated.

Methods: In this study, we used the Montreal Cognitive Assessment (MoCA) to measure CI status in SLE patients, and conducted non-invasive arterial spin labeling (ASL) and seed-based FC analyses to detect the characteristics of local CBF and corresponding network alterations. The SLE patient group included 29 patients with normal cognition (SLE-NC) and 20 patients with cognitive impairment (SLE-CI), and the control group included 31 age and sex-matched healthy controls (HCs). Additionally, correlation analysis between these alterations and neuropsychological performances were further examined in patient groups.

Results: Compared with HCs, the SLE patients (both SLE-NC and SLE-CI) showed commonly decreased CBF in the bilateral orbitofrontal cortex, left insula, left temporal lobe, and increased CBF in the bilateral cerebellum posterior lobe (cerebellar area 8). In the patient subgroups comparison, SLE-NC patients had lower CBF than the SLE-CI group in the bilateral cerebellum_8. In the secondary analyses, increased FC in SLE-CI of the right supramarginal gyrus was observed when we set the right cerebellum_8 as the seed region. In the correlation analysis, CBF and FC values of the cerebellum were negatively correlated with MoCA scores and its component scores. Finally, orbitofrontal and right temporal CBF values negatively correlated with the SLE disease severity index (SLEDAI).

Conclusion: Our findings indicate that altered CBF and changed cerebello-cerebral networks are possible image biomarkers of cognitive impairment in SLE patients.

OR-0025

Quantitative assessment of tumor burden in multiple myeloma using MY-RADS from whole-body MRI: comparison with established prognostic biomarkers

Xing Xiong
The First Affiliated Hospital of Soochow University

Objectives To explore the value of MY-RADS from whole-body MRI in assessing tumor burden quantitatively in multiple myeloma (MM) with reference to established prognostic biomarkers.

Methods 108 consecutive newly diagnosed MM patients were enrolled from June 2019 to September 2022. Bone marrow (BM) infiltration patterns were determined by MRI presentation. The total burden score using MY-RADS, ADC, and fat fraction (FF) of representative background BM were measured. Spearman correlation analysis was used for correlating these parameters against plasma cell infiltration, and independent sample t-test was used to evaluate the differences between different ISS stages and free light-chain ratio groups.

Results The patients were divided into five infiltration patterns according to MY-RADS criteria. For diffuse and salt-and-pepper patterns, there were significant difference of ADC-L3 and FF-L3 between different ISS stages ($P < 0.001$, $P = 0.033$) and free light-chain ratio groups ($p < 0.001$, $p = 0.007$). They were also correlated with plasma cell infiltration ($P < 0.001$, $r = 0.650$; $P < 0.001$, $r =$

0.841). In contrast, the total burden score did not show difference between groups. For focal pattern, there was no significant difference of ADC and FF between groups. They didn't correlate with plasma cell infiltration as well. While, the total burden score showed difference ($P=0.006$, $P=0.005$) between groups and correlated well with plasma cell infiltration ($P=0.003$, $r=0.547$). For mixed pattern, ADC-L3, FF-L3 and the total burden score all showed statistical difference between groups and correlated well with plasma cell infiltration.

Conclusions The present study supports the applicability of MY-RADS as a surrogate biomarker when established prognostic biomarkers were not accessible conveniently.

脑小血管病患者白质损害介导脑龄增加对认知功能的影响

李元昊¹、朱文浩¹、杨时琪²、覃媛媛¹、田甜¹、张佳璇¹、张顺¹、朱文珍¹、刘城霞¹

1. 华中科技大学同济医学院附属同济医院

2. 湖北科技学院咸宁医学院生物医学工程与医学影像学院

目的: 脑小血管病 (cerebral small vessel disease, CSVD) 是血管性认知损害的重要病因。白质损害, 特别是脑白质高信号 (white matter hyperintensity, WMH) 是 CSVD 的典型影像学表现。PSMD (peak width of skeletonized mean diffusivity) 是一种新型白质微结构完整性标志物。神经影像衍生的脑龄是一种个性化评估大脑老化的生物标志物。本研究旨在探究 CSVD 患者脑龄与白质损害以及认知功能的关系。

方法: 纳入年龄性别匹配的 55 名 CSVD 患者和 42 名健康对照。认知评估包括简易智能精神状态量表 (MMSE), 听觉词语学习测验 (AVLT-short 和 AVLT-long) 和连线测试 (TMT-A 和 TMT-B)。基于预训练的神经网络模型以高分辨 T1 预测脑龄, 并通过回归排除实际年龄计算相对脑龄 (relative brain age, RBA)。我们还通过 T2 和 DTI 计算了 WMH 体积和 PSMD 以衡量白质损害。以性别、年龄和教育年限作为协变量, 通过 glm 探究 CSVD 患者和健康对照之间的 RBA 差异, 并进一步在 CSVD 组中将 RBA 与 WMH 体积、PSMD 以及认知功能进行偏相关分析和中介分析。

结果: CSVD 患者的 RBA 显著高于健康对照组 ($P<0.001$)。CSVD 患者 RBA 与 WMH 体积 ($P<0.001$) 以及 PSMD ($P=0.002$) 呈正相关。关于认知功能, CSVD 患者 RBA 与 MMSE ($P=0.006$), TMT-A ($P=0.003$) 和 TMT-B 评分 ($P<0.001$) 存在显著相关。基于以上相关性, 中介分析结果显示 WMH 体积 ($P=0.004$, 中介比例 55.1%) 和 PSMD ($P=0.004$, 中介比例 57.8%) 均是 RBA 影响 MMSE 评分路径中显著的中介因子。此外, PSMD 还介导了脑龄增加对 TMT-A ($P=0.025$, 中介比例 48.3%) 和 TMT-B ($P=0.018$, 中介比例 28.8%) 的影响。

结论: 在 CSVD 中脑龄增加和白质损害存在相关, 并部分通过白质损害来影响认知功能, 是监测 CSVD 认知障碍的潜在指标。

基于 11.7 T 磁共振成像系统 DWI 相关参数 评估肝纤维化的实验研究

路怡妹¹、王前锋²、汪登斌¹

1. 上海交通大学医学院附属新华医院

2. 复旦大学类脑智能科学与技术研究院

目的 探索 and 比较传统 DWI、IVIM 和 DKI 在胆管结扎 (BDL) 模型或四氯化碳 (CCl₄) 模型中无创性分期肝纤维化的性能

材料与方法 CCl₄ 模型中分别于第 2、4、7、10 周最后一次给药后 3-5 天内进行实验, BDL 模型中分别与术后第 8、15、24、40 天进行实验, 两种纤维化模型分别于各时间点随机从对照组中抽取 3 只大鼠和实验组共同进行 MRI 扫描, 扫描完成后对所有实验鼠解剖肝脏行病理学检查。天狼星红染色对肝纤维化进行半定量分析 (METAVIR 评分系统), HE 染色对肝脏坏死性炎症、脂肪变性进行评估, 普鲁士蓝染色用于铁沉积评分。采用盲法进行 MRI 参数测量及组织学分期, 最后根据组织学分期进行统计学分析各参数与纤维化各分期之间统计学差异及相关性和诊断效能。

结果 随着肝纤维化程度加重, ADC、D、f 和 MD 均降低, MK 值呈逐渐上升趋势。D* 在所有纤维化分期中均未见明显统计学差异。Spearman's 相关分析显示 MK 在所有纤维化模型中与纤维化分期呈强正相关 (rCCl₄ model=0.773, rBDL model=0.731, r Total cohort=0.757; 所有 P<.001)。

ADC、D 和 MD 值与肝纤维化分期呈中度负相关 (r=-0.421~-0.695, 所有 P<.011)。f 值在 CCl₄ 模型中与纤维化分期呈弱相关 (r=-0.383, P<.001), 而 BDL 模型中为中度相关 (r=0.532, P<.01)。所有扩散参数中 MK 和 MD 在两种纤维化模型中的一致性较好, f 在两种纤维化模型中的一致性稍差。ROC 曲线分析显示 MK 的诊断效能高于其它扩散参数 (AUC CCl₄ model=0.91, AUC BDL model=0.90, AUC Total cohort=0.91)。

结论 多个扩散参数与肝纤维化分期相关, 但在不同的纤维化模型中表现各异。其中 MK 是评估肝纤维化程度更有价值的成像生物标志物。f 在两种纤维化模型中的一致性较差。

基于相位敏感反转恢复技术的灰血序列 在检测瘢痕心肌中的临床应用

赵洁、孔祥闯、杨明、于群、雷子乔

华中科技大学同济医学院附属协和医院

目的: 比较相位敏感反转恢复灰血 LGE 与常规亮血 LGE 对瘢痕心肌的诊断差异。

方法: 前瞻性收集临床确诊为冠脉综合征的患者 41 例 (男 28 例, 女 13 例), 平均年龄 (55±9) 岁, 按照心脏磁共振 (CMR) 检查流程逐步扫描, 于静脉注射钆对比剂 (0.2mmol/kg) 后的 10-20 分钟内, 随机进行常规存活心肌磁化归零扫描 (亮血 LGE) 和左室血池磁化归零扫描 (灰血 LGE), 记录两种 LGE 开始扫描时的对比剂注射后的时间, 在 LGE 扫描前行 TI-scout 扫描以明确正常心肌和左室血池信号分别归零时的准确 TI 值。两位 CMR 技师分别在左心室血池、正常存活心肌和瘢痕心肌中绘制感兴趣区, 获取信号强度值, 以评估三种组织之间的相对对比度 (组织 A 与组织 B 的相对对比度定义为 A 与 B 的平均信号差值除以 B 的平均信号), 每种组织的信号强度定义为两位技师测值的平均值, 并评估两位技师所测得数据的一致性。两名 CMR 医师对亮血和灰血 LGE 图像进行独立评估, 采用美国心脏协会 16 段模型对左室短轴心肌分析有无 LGE, 采用 3 点 Likert 评分法评估 LGE 透壁程度: 0 分, 无 LGE; 1 分, LGE<50% 室壁厚度; 2 分, LGE>50% 室壁厚度, 以此测

量左室瘢痕负担,同时采用二元量表(自信/不自信)对每个 LGE 的确定性水平评级,并比较观察者间的一致性。

结果:与常规 LGE 相比,灰血 LGE 瘢痕心肌与左室血池之间的相对对比度显著增加($p<0.001$),血池与正常心肌之间的相对对比度也显著增加($p<0.001$),而瘢痕与正常心肌之间的相对对比度无显著差异。灰血 LGE 诊断阳性 LGE 多于亮血 LGE,诊断瘢痕心肌的可信度更高,差异具有显著性($p<0.05$),观察者间一致性良好(灰血 LGE 和亮血 LGE: ICC 均 >0.75)。

结论:与常规亮血 LGE 相比,灰血 LGE 检测出更多的瘢痕心肌,提高了对瘢痕心肌的检测能力,增加观察者的信心。此外,灰血 LGE 无需使用额外的磁化准备脉冲,因此无需进行广泛的优化、软件修改或额外的培训,即可在当前的 MR 系统上进行临床应用。

基于血管周围间隙扩散张量成像技术评价 发作性睡病患者的脑类淋巴系统改变

胡鹏鑫¹、邹宇¹、熊瑞芳¹、李承毅¹、朱涵婷¹、赵锡海²、唐小平¹

1. 南昌大学第二附属医院

2. 清华大学医学院生物医学影像研究中心

基于血管周围间隙扩散张量成像技术评价发作性睡病患者的脑类淋巴系统改变

目的:研究血管周围间隙扩散张量成像(DTI-ALPS)指数在评价 1 型发作性睡病(NT1)患者脑类淋巴系统的改变的作用。

方法:纳入 32 例经多导睡眠图(PSG)确诊的发作性睡病(NT1)患者和 28 例与之相匹配的健康对照者。所有被试者均行常规颅脑 MRI 和弥散张量成像扫描。利用 DSI-Studio 后处理软件分别在双侧大脑半球侧脑室体部水平的投射纤维区域、联合纤维区域勾画矩形感兴趣区(ROI),投射纤维区域、联合纤维区域的四个矩形 ROI 维持在一条直线上,测量每种纤维在 X、Y 和 Z 轴方向的扩散率,并根据公式分别计算 NT 组和正常健康对照组的 DTI-ALPS 指数,并分析其与其他变量的相关性。使用协方差分析方法评估 ALPS 指数的组间差异,根据数据的分布采用 Spearman 或 Pearson 相关分析法对 DTI-ALPS 指数与 PSG 结果进行相关性分析。

结果:NT1 组的 DTI-ALPS 指数低于正常健康对照组,并发现 NT 组的 DTI-ALPS 指数与 PSG 中的某些参数存在相关性,与 N1 期睡眠百分比呈负相关,N3 期睡眠占比呈正相关。

结论:发作型睡病患者的 DTI-ALPS 指数发生改变,提示患者发作型睡病患者存在胶质淋巴系统功能障碍,在探索发作性睡病的相关发病机制方面具有较好的应用前景,并需要进一步研究来确定脑类淋巴循环系统功能障碍是否与发作性睡病的病理生理学有关。

心脏移植术后患者与健康者的心脏磁共振多参数对比研究

赵洁、孔祥闯、杨明、于群、雷子乔、郑传胜

华中科技大学同济医学院附属协和医院

目的:比较心脏移植术后患者和健康志愿者的左室心功能各项参数的差异以及 T1 mapping、T2 mapping 和 ECV 等心肌标志物的区别。

材料和方法:连续纳入既往在本院行心脏移植手术并于 2021 年 1 月至 8 月在本院行常规临床复查且无不良临床症状及指标的患者为移植组,并招募既往无心脏相关病史的健康志愿者为对照组,分别行 CMR 检查,并于 CMR 检查当天查血常规获取 hct 值。采用 Siemens Skyra 3.0T 扫描仪进行左室短轴电影、T2 mapping、LGE 及增强前、后 T1 mapping 成像。主要测量的心功能包括:

LVEDV, LVESV、LVEF, LVM, 除 LVEF 外, 均经体表面积标准化得到各项指数: LVEDVi、LVESVi、LVMi。通过增强前、后 T1 和 htc 值自动计算心肌 ECV 图。参照美国心脏协会心肌 16 段分法, 手动测量心肌每个节段增强前 T1 值、增强后 T1 值、T2 值和 ECV 值。为了避免部分容积效应, 尽量避开心内膜和心外膜边界, 测量心肌中层。排除含有伪影的心肌节段, 包括呼吸和心脏运动伪影、偏共振伪影, 心肌周围的肝、肺、血池和脂肪组织导致的部分容积效应伪影。采用 SPSS 22.0 对上述所得数据进行统计分析。

结果: 移植组 45 例, 男 35 例, 女 10 例, 平均年龄 44.6 岁, 平均移植时间约 2.3 年; 对照组 30 例, 男 23 例, 女 7 例, 平均年龄 41.2 岁。移植组较对照组: 平均 LVEF ($P < 0.001$) 及 LVMi ($P < 0.05$) 增加, LVEDVi ($P < 0.001$) 及 LVESVi ($P < 0.001$) 显著降低。移植组的初始 T1、ECV 及 T2 值均明显增高(初始 T1: $P < 0.001$; ECV: $P < 0.05$; T2: $P < 0.001$), 而增强 T1 值减低 ($P < 0.05$)。心脏移植术后患者中约有 36% 出现心肌延迟强化, 并以非缺血表现为主。对 ECV 与 T2 值进行相关性分析显示两者呈明显正相关 ($r = 0.81$, $P < 0.001$)。

结论: 临床上无症状的心脏移植术后患者存在着左室心肌重构的情况: 心肌细胞外容积分数增加、心肌水肿, 并且这两者之间有一定关联, 有可能细胞外容积分数的增加部分来源于心肌水肿。

神经突方向离散和密度成像 (NODDI) 在颞叶癫痫伴海马硬化患者中的诊断价值

张晓楠、宋承汝、马可燃、毛鑫月、张勇、程敬亮
郑州大学第一附属医院

目的: 本研究旨在探讨神经突方向离散和密度成像 (NODDI) 在颞叶癫痫伴海马硬化 (TLE-HS) 患者中的诊断性能。**方法:** 招募 59 例 TLE-HS 患者及正常对照 (HC) 64 例, 使用单次激发自旋回波 EPI 序列采集 DWI 数据 (b 值为 0, 1000, 2000 s/mm^2)。使用开源 Amico 工具进行神经突方向离散和密度成像 (NODDI) 参数拟合, 然后获得 NODDI 参数图, NODDI 参数包括各向同性体积分数 (ISOVF)、细胞内体积分数 (ICVF) 和取向分散指数 (ODI), 选择双侧海马为感兴趣的分割区域 (ROIs)。然后计算海马 NODDI 各参数和 Flair 序列信号强度的平均值。采用单因素方差分析 (ANOVA) 或 Kruskal-Wallis 检测患侧、对侧和 HC 组之间的参数差异。然后, 采用 LSD 事后多重校正法的两样本 t 检验或 Mann-Whitney U 检验进行任意两组之间的成对比较。通过 ROC 分析确定每个参数的鉴别诊断效率。**结果:** 与对侧和 HC 相比, 患侧的 ICVF 和 ODI 显著降低, ISOVF 显著升高 (均 $P < 0.05$)。与 HC 组相比, 对侧的 ISOVF 较高 ($P < 0.05$)。Flair 信号强度在患侧和 HC 之间有显著性差异 ($P < 0.05$)。在患侧和 HC 之间, Flair 具有中等的诊断性能 (曲线下面积, $AUC = 0.660$), NODDI 模型的参数具有高的诊断性能 ($AUCs = 0.824 \sim 0.931$), 并且结合 ISOVF、ICVF、ODI 的 logistic 回归模型 (combined NODDI 模型) 具有最佳的性能 ($AUC = 0.970$)。在患侧和对侧之间, ISOVF、ICVF 和 ODI 均具有较高的诊断性能, AUC 范围为 0.723 至 0.908, 最佳组合 NODDI 模型的 AUC 为 0.962。在患侧和 HC 之间, ISOVF 具有中等诊断性能 ($AUC = 0.653$)。基于 Delong 检验, 与其他单一参数相比, 组合的 NODDI 模型在区分患侧和对侧海马以及 HC 方面实现了显著更高的诊断性能 (均 $p < 0.05$)。

结论: NODDI 在 TLE-HS 诊断方面可能优于常规 Flair 成像。

A modified diffusion-weighted MRI-based Suidan criteria from the radiologist's perspective: improved performance in determining the surgical resectability for advanced high grade serous ovarian cancer

Jing Lu, Haiming Li, Yajia Gu
Fudan University Shanghai Cancer Center

Objectives: To evaluate the value of the modified Suidan criteria on diffusion-weighted MRI (DW-MRI), which focused on the growth pattern of different parts of metastases for predicting gross residual disease (RD) at primary debulking surgery (PDS) in advanced high-grade serous ovarian cancer (HGSOC) patients.

Methods: A total of 184 patients with HGSOC who underwent pre-operative DW-MRI were enrolled from December 2018 to May 2023 at two centers in China. Samples were divided into study sample (n=100), internal (n=46) and external validation cohorts (n=38). Preoperative radiological assessments were reviewed by two radiologists, according to the original Suidan criteria and modified Suidan criteria. MRI morphological characteristics of the ovarian tumors were assessed. Transcriptomics analysis of primary tumor samples were performed. Univariable and multivariate statistical analyses were conducted.

Results: In the study sample, The intra- and inter-observer agreements were excellent with intra-class correlation coefficient of 0.980 and 0.959 in the original Suidan score, and 0.962 and 0.940 in the modified Suidan score, respectively. Original/modified Suidan criteria was independent factor for predicting the surgical resectability. The modified Suidan criteria displayed the best prediction value with an area under the curve of 0.867 in the study sample and 0.806, 0.913 in the internal and external validation respectively. With the modified Suidan criteria, the R0 rates for patients with predictive score 0-2, 3-4, 5-6, 7-10 and ≥ 11 were 90.3%, 66.7%, 53.3%, 11.8% and 0%, respectively. The original and modified Suidan criteria in the infiltrative HGSOCs were significantly higher than those in the mass-like ones. And molecular differences were identified between the two morphological subtypes.

Conclusions: Compared to the original Suidan criteria, the modified Suidan criteria exhibited improved accuracy in preoperatively predicting resectability for advanced HGSOC. Patients with predictive score 0-6 were suitable for PDS at our institution.

集成磁共振影像特征对三阴性乳腺癌的预测的研究

傅彦¹、易小平¹、王雪璿¹、Bihong T. Chen²

1. 中南大学湘雅医院

2. Department of Diagnostic Radiology, City of Hope National Medical Center

目的: 本研究旨在评估集成磁共振影像 (synthetic magnetic resonance imaging, SyMRI) 定量参数对三阴性乳腺癌 (TNBC) 的预测价值。

方法: 本研究前瞻性研究纳入了病理诊断为浸润性导管乳腺癌 (invasive ductal breast carcinoma, IDBC) 的患者, 并将其分为 TNBC 组和 Non-TNBC 组。术前乳腺 MRI 图像包括 SyMRI 和常规磁共振影像序列。SyMRI 的定量参数包括 T1 和 T2 弛豫时间、R1 ($1/T1$)、R2 ($1/T2$)、质子密度 (PD) 及其标准差 (SD)。我们对所有参与者的临床病理特征、常规 MRI 特征和定量综合参数进行了评估, 并进行了多变量逻辑回归分析以在术前确定 TNBC 的潜在独立成像预测因子。并使用受试者工作特征 (ROC) 曲线分析评估这些参数的性能。

结果: 该研究共包含 231 名病理学证实为 IDBC 的患者(TNBC 组, n=46; Non-TNBC 组, n=185)。与 Non-TNBC 组相比, TNBC 组显著具有更大的肿瘤大小 ($P=0.011$) 和更常见肿瘤内囊变或坏死 ($P<0.001$)。单变量分析结果表明 TNBC 组肿瘤具有比 Non-TNBC 组肿瘤显著更高的 T1 值 ($P=0.006$) 和 T2 值 ($P<0.001$)。TNBC 组肿瘤的 R1 值 ($P=0.003$) 和 R2 ($P<0.001$) 值显著低于 Non-TNBC 组。进一步多变量分析结果表明, T2 值和囊变或坏是 TNBC 的显著独立预测因子。结论: 综合影像学 T2 值和乳腺癌病人肿瘤囊变或坏死两者可作为术前鉴别 TNBC 和 Non-TNBC 的潜在影像学标志物。

MRI evaluation of serous borderline ovarian tumors and identification of risk factors predicting peritoneal implants

Shuhui Zhao¹, Haiming Li², Lei Bao¹, Jinwei Qiang³, Fenghua Ma⁴

1. Xinhua Hospital Shanghai Jiao Tong University School of Medicine

2. Department of Radiology, Fudan University Shanghai Cancer Center

3. Department of Radiology, Jinshan Hospital, Fudan University

4. Department of Radiology, Obstetrics & Gynecology Hospital, Fudan University

Objective: To evaluate magnetic resonance imaging features of serous borderline ovarian tumors and identify the risk factors that predict peritoneal implants.

Methods: This retrospective study included 130 consecutive patients with serous borderline ovarian tumors (median age, 37 years) who underwent preoperative magnetic resonance imaging examinations. Among the 130 patients, 52 had pathologically proven peritoneal implants and 78 had no pathologically proven peritoneal implants. Patients' clinical characteristics and the imaging features were involved in the logistic regression analysis for the identification of risk factors that predict peritoneal implants, including patients' age, CA-125 level, the anatomical site of the tumor, tumor size, growth pattern of papillary projection, ADC value, presence of hemorrhage, presence of detectable ipsilateral ovary, and ascites.

Results: Younger age (≤ 35 years) ($P=0.041$), elevated CA-125 (>227 U/ml) ($P=0.004$), bilateral involvement ($P=0.003$), exophytic papillary projection ($P=0.000$), and large amount of ascites ($P=0.000$) were significant risk factors associated with the development of peritoneal implants. A cutoff value of 4.0 cm in diameter of exophytic papillary projection significantly predicts the incidence of peritoneal implants, with an accuracy of 90.8%. Multivariable analysis further found that exophytic papillary projection with a height larger than 4.0 cm was an independent risk factor for peritoneal implants with an odds ratio of 25.6.

Conclusions: The exophytic growth pattern of papillary projection is a strong marker for the development of peritoneal implants in patients with serous borderline ovarian tumors. Exophytic papillary projection larger than 4.0 cm is an independent risk factor.

OR-0035

Prenatal magnetic resonance imaging features and postnatal outcomes of congenital hepatic hemangioma: an observational retrospective study

Cong Sun

Department of Radiology, Beijing Hospital, National Center of Gerontology, Institute of Geriatric Medicine, Chinese Academy of Medical Sciences, Beijing 100730, China

Objective: To explore the MRI features, growth patterns, and clinical outcomes of congenital hepatic hemangiomas (CHH).

Methods: Thirty-six pregnant women with a fetus prenatally diagnosed and postnatally confirmed CHH were included. According to the maximum diameter, CHHs were divided into small (< 1.5 cm), medium (1.5–5 cm), and large CHHs (> 5 cm). The volume of the CHH was measured at every follow-up. Based on different growth patterns, CHHs were divided into rapidly involuting congenital hemangiomas (RICH) and non-involuting congenital hemangiomas (NICH). Fisher's exact tests were performed to compare the MRI features among small, medium, and large CHHs. The repetitive measurement and analysis of variance were used to compare the volume of the CHH before and after birth.

Results : Thirty-three cases were confirmed by postnatal imaging and 3 were confirmed by biopsy. Small and medium CHH appeared homogeneous, but large CHH presented a more heterogeneous appearance ($p < 0.001$). Thirty-one (93.9%) cases were classified as RICH, and 2 (6.1%) were NICH. Among the RICH, 4 (12.9%) showed a tendency of initial proliferation followed by spontaneous regression. The CHH volume showed a downward trend with age and the fastest decline was at the age of 9 months ($p = 0.025$). There was only one case dead due to high-output cardiac failure, and the remaining 33 cases were asymptomatic.

Conclusions : The morphological features and growth patterns of the CHH were varied and the former were correlated with the lesion size. However, all patients showed a good prognosis if without complications at birth.

OR-0036

Astrocyte reactivity influences cerebral cortical atrophy in prodromal Alzheimer's disease

Qingze Zeng, Kaicheng Li, Xiao Luo, Xiaocao Liu, Luwei Hong, Jixuan Li, Minming Zhang
The Second Affiliated Hospital of Zhejiang University

Objective: Previous animal experiments have demonstrated that astrocyte reactivity is critical for triggering deposition of Alzheimer's disease (AD) pathology, which includes amyloid beta ($A\beta$) and tau phosphorylation. However, it remains unclear that whether astrocyte reactivity promotes the progression of mild cognitive impairment (MCI) patients (i.e., prodromal AD).

Methods: The flow chart of participants including was shown below (Fig. 1). Finally, we included 105 $A\beta+$ MCI patients (51 Ast- and 54 Ast+) and 28 $A\beta-$ normal controls with cerebrospinal fluid biomarkers (GFAP, $A\beta_{42}$ and p-tau₁₈₁) and structural MRI data. Structural MRI images were automatically segmented by CAT12 toolbox. By using a general linear model, we tested regional between-group differences for each of the ROIs concerning the Destrieux atlas, and the models were adjusted for age, gender, and years of education. Partial correlation analysis was performed for assessing the relationship between cortical thickness and cognitive function.

Results: The results of general linear models showed the differences of cortical thickness in bilateral angular gyrus, left insular gyrus, and right sulcus intermedius primus (Fig. 2). By post-hoc analyses, we found that MCI patients showed significant atrophy in the regions above compared to

controls (Fig. 3). Moreover, in the Ast+ MCI patients, the cortical thickness of left angular gyrus was thinner than other groups (Fig. 3), and it was associated with AD biomarkers and global cognitive function (Table. 1).

Conclusion: Our study showed that astrocyte reactivity could accelerate the atrophy of several regions which were reported to be vulnerable to AD pathology, suggesting astrocyte reactivity as an important upstream event related to cognitive decline.

脑小血管病相关认知障碍患者总负荷评分 与认知储备、认知功能的相关性研究

张晓倩、范晓媛、侯波、朱以诚、马超、有慧、李明利、冯逢
北京协和医院

目的：在 CSVD 相关认知障碍患者中，探究磁共振 CSVD 总负荷评分与整体及认知域认知功能的相关性，并探索测试认知储备与认知改变之间的关系是否因 CSVD 总负荷程度不同而改变。

方法：共入组 84 例 CSVD 相关认知障碍患者进行分析，均满足 MoCA 量表 <26 分。对患者进行 CSVD 总负荷、认知储备分数和神经心理学量表测试。磁共振 CSVD 总负荷评分包括 CMB、WMH、EPVS 和腔隙灶，总积分范围为 1-4 分。认知储备分数通过纳入文化程度、婚姻伴侣关系、职业成就、身高、每周体育活动时间进行分析，范围为 0-8 分。整体认知测评量表采用 MoCA 评分；各认知域的测评，包括定向力（MoCA 量表的定向力部分）、记忆（费城词语学习训练-12 词）、注意力/执行功能（数字广度测验、语音语义流畅性测验）、视空间结构功能（积木试验）及语言（波士顿命名测验）五个认知域的测评。认知域评分标化为 Z 分数。采用 Spearman 分析 CSVD 总负荷、认知储备分数与认知量表的相关性。选择多元线性回归模型来研究 CSVD 总负荷评分、认知储备与整体和认知域 Z 分数的关联。

结果：。校正人口学因素后，随 CSVD 总负荷评分升高，Z 注意力/执行 ($\beta = -0.197$)、Z 记忆 ($\beta = -0.218$) 及 Z 视空间 ($\beta = -0.220$) 认知域评分下降；随认知储备分数升高，MoCA 评分 ($\beta = 0.638$)、Z 注意力/执行 ($\beta = 0.194$)、Z 记忆 ($\beta = 0.150$) 及 Z 语言 ($\beta = 0.141$) 认知域评分升高 ($P < 0.05$)。将 CSVD 总负荷评分与认知储备分数的交互项代入回归方程，并没有发现交互项与各认知评分存在显著性关联 ($P > 0.05$)。

结论：在 CSVD 相关认知障碍患者中，CSVD 总负荷评分和认知储备是认知功能改变的独立影响因素。同时关注病理性血管性脑损伤和认知储备的概念，对于认识 CSVD 相关认知障碍的发病机制及延缓病程进展具有重要作用。

OR-0038

A Multiparameter Diagnostic Model Based on MRI Volumetric ADC Histogram and Clinical Variables Accurate Differentiate Thymic Epithelial Tumors from Thymic Lymphomas

Luna Wang

Shanghai Chest Hospital, Shanghai Jiao Tong University School of Medicine

Objectives: To evaluated the diagnostic value of multiparameter model based ADC histogram and clinical variables in differentiating TETs and thymic lymphomas.

Methods: The study retrospectively enrolled patients who were admitted to our hospital. ADC histogram data were derived from the whole tumor with ROIs drawn on all slices of DWI scans ($b = 0, 800 \text{ s/mm}^2$). Clinical characteristics and radiological features including ADC histogram metrics were assessed and compared between TETs and thymic lymphomas. Univariate and multivariate analyses were performed to identify the significant variables in two groups, these variables were then incorporated into a comprehensive diagnostic model. ROC curve analysis was carried out to evaluate diagnostic performance. A nomogram was developed to differentiate TETs and thymic lymphomas.

Results: A total of 130 patients were recruited for MRI before surgery or biopsy, including 93 TETs patients and 37 thymic lymphomas patients. At univariate analysis, the age of lymphoma is significantly lower than TETs (53.66 ± 12.99 years vs. 38.11 ± 13.51 years). A significant difference was observed in different symptoms. Elevated serum lactate dehydrogenase (LDH) level ($> 250\text{U/L}$) was more seen in thymic lymphomas. Radiologically, maximal diameter of TETs was significantly lower than thymic lymphomas, ADC histogram parameters, including 25thpercentile, 50thpercentile, 75thpercentile, 90thpercentil, 95thpercentile, ADCmax, ADCmean of thymic lymphomas patients were significantly lower than patients with TETs, while the skewness of patients with lymphomas were statistical higher than that of TETs (all $P < 0.05$). Comprehensive diagnostic model was established based on stepwise regression results which including age, LDH $>250\text{U/L}$ and skewness, the AUC was 0.914 (95%CI: 0.850-0.977). The internal bootstrap resampling and calibration plots demonstrated good consistence between the prediction and observation.

Conclusion: The comprehensive diagnostic model based on ADC histogram parameters and clinical characteristics had excellent value in the differential diagnosis of TETs and thymic lymphomas.

OR-0039

基于多模态磁共振的全流程端对端深度学习模型对经新辅助放化疗的局部进展期直肠癌患者的疗效及预后预测价值

刘宗霖、孙轶群、童彤

复旦大学附属肿瘤医院

目的: 治疗反应及预后预测是指导新辅助放化疗方案决策的关键。最近, 新型多模态、多任务深度学习模型被用于各种癌症的肿瘤分割、疗效预测及预后预测, 并取得了良好的性能。本研究旨在评估基于多模态磁共振的全流程端对端深度学习模型对经新辅助放化疗 (nCRT) 的局部进展期直肠癌 (LARC) 患者疗效及预后预测的临床价值。

材料和方法: 本研究回顾性纳入包括三个中心的共 416 例经 nCRT 治疗的直肠癌患者数据, 包括临床信息、基线多模态 MRI 影像 (T2、ADC、D、K) 以及随访生存期数据。其中, 中心一及中心二

的数据合并作为训练和内部验证集 (316 例), 中心三数据作为外部测试集 (100 例)。我们采用深度多任务联合生存模型, 同时进行肿瘤分割、疗效预测和预后预测。这些多任务相互协作, 有助于充分挖掘影像数据和临床数据的关键特征。考虑到多模态输入的情况, 我们引入了注意力机制, 以有效地捕捉模态内部和模态之间的有用信息, 以减少噪声对实验结果的影响。为了应对数据缺失问题, 我们采用了基于掩膜的图网络结构, 以充分利用数据并提高网络的适应性和鲁棒性。最后, 我们使用了不同的评估指标来衡量我们的结果。我们使用 DSC (Dice Similarity Coefficient) 用于评估分割结果; 对于疗效预测结果, 我们考虑了 AUC (Area Under the Curve)、召回率、精确度和准确性; 而对于预后预测结果, 我们使用了 C-index 和 AUC。此外, 我们还使用 Kaplan-Meier 方法来计算高风险和低风险患者的 PFS 率, 并与观察到的 PFS 概率进行比较。

结果: 在训练集、内部验证集及外部测试集中, 模型 DSC 分别为 0.845、0.792 及 0.778; 对于疗效预测结果, 模型 AUC 值在各数据集中分别为 0.982、0.858 及 0.887; 对于预后预测结果, 模型 C-index 分别为 0.822、0.742 及 0.722。

结论: 基于多模态影像的多任务深度学习模型在 LARC 患者中均具有较高的准确性和稳定性, 未来有望实现可实现全自动一站式预测, 为 LARC 患者个性化治疗的提供重要的参考信息。

基于健康志愿者的三种感知磁共振弹性成像系统的比较研究

王艺锴

上海交通大学医学院附属瑞金医院

背景: 不同的 MR 弹性成像 (MRE) 系统可能会产生不同的肝硬度测量值, 这使得在多中心研究中很难进行直接比较。

目的: 本研究的目的是评估三种不同的 MRE 系统测量的肝硬度的可重复性和偏差。

材料和方法: 从 2023 年 3 月到 2023 年 7 月招募 35 名健康志愿者, 对其进行了三种不同 MRE 设备的扫描。使用相位噪声比和位移噪声比来评估两台气动系统和一台电磁共振成像系统采集的波形图像。两名观察者为组织硬度进行评估。基于每位参与者的平均肝脏硬度对三个 MRE 系统的再现性和偏差进行了量化。使用组内相关系数 (ICC)、变异系数 (CV) 和 Bland-Altman 分析来评估观察者之间的重复性、电磁系统的重复性和系统之间的重复性。采用配对 t 检验来评估电磁系统的观察者间变异和描间变异。最后使用 Dunn 多重比较校正的 Friedman 检验来评估三个系统之间的差异。P 值小于 0.05 表明存在显著差异。

结果: 在三种不同的 MRE 设备上, 肝硬度值在两位观察者之间表现出很高的重复性 ($ICC > 0.8$), 并且没有显著差异 ($CV < 5\%$, P 值 > 0.20)。电磁式驱动的 MRE 在两次重复扫描之间同一志愿者的肝硬度重复性也很高 ($ICC > 0.91$), 且没有显著偏差 ($CV < 4\%$, P 值 > 0.5)。尽管三个 MRE 系统的刚度测量值存在显著差异 (P 值 < 0.01), 但观察到了良好的重复性 ($ICC = 0.78$), 偏差较小 (平均 $CV = 8.2\%$)。

结论: 不同 MRE 系统测量的肝脏绝对硬度值可能存在显著差异, 但三个 MRE 系统的测量结果一致, 具有可重复性且偏差较小。

影像组学在透明细胞型肝癌和普通型肝细胞癌鉴别诊断中的价值

刘斌¹、李宏军²

1. 民航总医院

2. 首都医科大学附属北京佑安医院

目的：通过比较逻辑回归模型、影像组学模型和组合模型的诊断效能评估影像组学在鉴别透明细胞型肝癌（primary clear cell carcinoma of the liver, PCCCL）和普通型肝细胞癌（common hepatocellular carcinoma, CHCC）中的临床价值。

方法：回顾性分析术前接受 CT 平扫和增强检查的 42 例 PCCCL 和 109 例 CHCC 患者，将患者按照 2:1 的比率随机分为训练集和验证集，利用训练集患者的临床影像特征建立逻辑回归模型。利用开源 python 平台在训练集患者的图像内获取影像组学表型特征，使用 Metlab 软件（2014 版）提取重复性较好的影像组学表型特征。使用决策树算法得到 4 个单序列影像组学标签，利用向前逐步回归得到最优影像组学融合模型并获取影像组学融合模型标签（Radscore），最后利用逻辑回归筛选出来的临床影像特征和融合影像组学标签构建组合模型。

结果：逻辑回归模型在训练集诊断 PCCCL 和 CHCC 的 AUC 值、敏感度、特异度和准确度分别为 0.797、0.808、0.662 和 0.700；在验证集的 AUC 值、敏感度、特异度和准确度分别为 0.647、0.625、0.600 和 0.608。影像组学融合模型在训练集的 AUC 值、敏感度、特异度和准确度分别为 0.878、1.000、0.703 和 0.780，在验证集的 AUC 值、敏感度、特异度和准确度分别为 0.812、0.688、0.857 和 0.804。组合模型在训练集的 AUC 值、敏感度、特异度和准确度分别为 0.940、1.000、0.757 和 0.820，在验证集的 AUC 值、敏感度、特异度和准确度分别为 0.868、0.688、0.886 和 0.824。

结论：Radscore 是鉴别 PCCCL 和 CHCC 的独立影响因子，三类模型比较结果表明基于临床影像特征和影像组学表型特征构建的组合模型诊断效能最高。

COVID-19 肺部病变短期吸收与否的临床和 CT 影像特征对比及 CT 随访研究

刘雪艳、吕圣秀、李春华、唐光孝

重庆市公共卫生医疗救治中心

目的：探讨 COVID-19 肺部病变短期未完全吸收者的临床和 CT 影像特征。

方法：回顾性收集 2020 年 1 月 24 日至 2020 年 3 月 15 日确诊的 COVID-19 患者的临床及影像学资料，并按照出院后第 4 周 CT 随访时肺部病变的吸收情况进行分组。出院后第 4 周随访时，肺病变未完全吸收者纳入 A 组，完全吸收者纳入 B 组。对两组患者的性别、年龄、流行病学史、临床症状、实验室检查结果、CT 表现等进行统计学分析。

结果 1) 分组及一般情况比较：82 例患者纳入研究，A 组 33 例，B 组 49 例。A 组与 B 组的平均年龄分别为 59.5 岁、40.5 岁，差异具有统计学意义。

A 组合并基础疾病者多于 B 组；其中合并高血压者 A 组多于 B 组。

2) 临床症状比较：两组均以咳嗽、发热为常见临床症状。

3) 实验室结果比较：

①入院时，A 组中性粒细胞绝对值、中性粒细胞百分比、ALT、AST、LDH 均高于 B 组；A 组淋巴细胞计数、淋巴细胞百分比、白蛋白、白球比、CD3 计数、CD4 计数、CD8 计数均低于 B 组。

②出院时，A 组白蛋白、CD3 细胞计数均低于 B 组。

4) CT 影像特征比较:

①入院时, A 组左肺上叶、右肺上叶和中叶受累的发生率和累及肺叶总数高于 B 组; A 组实变影、充气支气管征象、胸膜下线的发生率及 CT 积分高于 B 组。

②出院时, A 组左肺上叶和下叶、右肺上叶和下叶及中叶受累的发生率和累及肺叶总数均高于 B 组; A 组磨玻璃影、实变影、条索影、网状影、胸膜下线的发生率及 CT 积分高于 B 组。

③出院后第 4 周随访时, 肺部病变未完全吸收组以磨玻璃影、条索影、胸膜下线为主; 实变影、条索影、网状影、胸膜下线、累及肺叶总数和 CT 积分低于出院时。

结论: 与肺部病变完全吸收者相比, 未完全吸收者多为老年患者, 合并基础疾病者较多, 入院时炎症指标更高, 营养状态较差, 免疫力水平较低; 肺部病变累及范围更大, 实变影较多, CT 积分较高。出现胸膜下线多提示肺部病变不会在短期内完全吸收。

Vertebral and pelvic echinococcosis in northwestern China

Hui Guo

Xinjiang Medical University, Affiliated Hospital 1

Version:0.9 StartHTML:0000000105 EndHTML:0000004110 StartFragment:0000000141 EndFragment:0000004070 Purpose Echinococcosis remains a major economic and severe public health problem in endemic areas. Bone echinococcosis is rare, and the vertebra and pelvis are the most common sites of echinococcosis involving the skeletal. Because of the clinical severe symptoms and high recurrence rate, it brings excellent trouble to patients. Methods This study retrospectively analyzed the clinical manifestations, laboratory tests, radiological findings, and treatment of 44 patients with vertebral and pelvic echinococcosis during a period of 16 years (2005–2020). Results The mean age was 43 years (25 males, 19 females; 19–68 years). The most common symptom was pain, followed by numbness, weakness, activity limitation, and progressive paraparesis. Enzyme-linked immunosorbent assay test (ELISA) results were positive in 18 cases (75%). There are 24 cases of hydatid infection of the spine, 14 hydatid infection of the pelvis, and six hydatid infection of both vertebra and pelvis. The site of infection was 13 (29.5%) thoracic, five (11.4%) lumbar, four (9.1%) lumbosacral, seven (15.9%) sacral, 19 (43.2%) ilium, seven (15.9%) hip, six (13.6%) ischium, five (11.4%) pubis, and two (4.5%) femur, respectively. The imaging findings were cystic dilatancy, septal, and irregular bone destruction. MRI has a special value in showing the relationship between the surrounding tissues and organs of cystic bone echinococcosis. All patients were followed up for at least one year. The mean follow-up time was 3.6 years. Conclusions Even in epidemic areas, the incidence of bone echinococcosis is relatively rare. However, when encountering the vertebral and pelvic destruction, consider bone echinococcosis's possibility, especially for the herdsmen in endemic regions.

使用放射组学模型进行脑胶质瘤术前分级并与 3DASL 比较

王佳宁、殷小平、朱凤英、张宇、王天达

河北大学附属医院

目的: 构建应用机器学习的放射组学模型进行胶质瘤高/低级别的区分并与 3DASL 比较, 选取更优区分方法。材料与方法: 回顾性分析经病理证实的河北大学附属医院 105 例胶质瘤患者的 MRI T1WI 增强图像, 按照 8: 2 比例分为训练组和验证组, 测试组选取 BraTS 2020 中的 200 例患者, 进行图像分割、提取特征、筛选, 使用 MLP、SVM、RF 及 LR 构建模型并评估模型的预测性能。获取河北大学附属医院的 105 例患者的 3DASL 的平均相对 rCBFmax 值并用于评估高/低级别胶质

瘤的鉴别效能。结果：机器学习中，MLP 分类器模型区分高/低级别胶质瘤性能最好，MLP 的验证组和测试组曲线下面积分别与使用 rCBFmax 的曲线下面积比较结果为 0.968vs.0.815，0.981vs.0.815。与 3DASL 相比，机器学习 MLP 分类器模型区分高/低级别胶质瘤性能更好。结论：应用机器学习的放射组学模型及 3DASL 均对区分高/低级别脑胶质瘤有一定的价值，机器学习 MLP 模型的诊断效能更好。

Evaluating the diagnostic value of different field strengths MRI diffusion-weighted imaging in liver inflammation grading in chronic hepatitis B patients

Yuan Liu¹, Jinghui Dong¹, Hongwei Ren¹, Mengmeng Zhang¹, Shitong Liu³, Zeng Zheng¹, Huiyi Ye², Jianming Cai¹

1. Fifth medical centre of PLA general hospital

2. First medical centre of PLA general hospital

3. Chinese PLA Medical School

Purpose To explore the clinical value of diffusion-weighted imaging (DWI) derived from 3.0 T and 1.5 T MRI in assessing liver inflammation grades in chronic hepatitis B (CHB).

Methods The research was designed by the method of diagnostic test and self-matching. Since August 2019-July 2022, we prospectively recruited 140 consecutive patients with CHB who underwent both 1.5 T and 3.0 T DWI MRI ($b = 800s/mm^2$) at random order within 6 hours before liver biopsy, the interval between two scans was within 15 minutes, the protocol was respiratory-triggered DWI (RT-DWI). The apparent diffusion coefficient (ADC) values near the liver puncture site of the same patient were measured at both field strengths by using the delineation region of interest (ROI) method. With the pathological liver inflammation grade as the gold standard, the patients were divided into the case group ($N=70$, inflammation stage $\geq G2$) and the control group ($N=70$, inflammation stage $\leq G1$), ROC was used to predict the diagnostic power for liver inflammation stages $\geq G2$ of different strengths DWI MRI for the same CHB patient.

Results The area under curve (AUC) of 3.0 T DWI MRI in predicting liver inflammation stages $\geq G2$ was 0.913 in CHB patients, the sensitivity and specificity was 85.7 % and 80 %, the cutoff value of $ADC = 1.16 \times 10^{-3} mm^2/s$, meanwhile the AUC of 1.5 T DWI MRI in predicting liver inflammation stages $\geq G2$ was 0.880, the sensitivity and specificity was 78.6 % and 88.6 %, the cutoff value of $ADC = 1.19 \times 10^{-3} mm^2/s$.

Conclusion When using DWI to evaluate the liver inflammation stage non-invasively, if the measured ADC values of 3.0 T DWI MRI $\leq 1.16 \times 10^{-3} mm^2/s$ or the measured ADC values of 1.5 T DWI MRI $\leq 1.19 \times 10^{-3} mm^2/s$, the accuracy of predicting liver inflammation stage $\geq G2$ in CHB patients is high, and antiviral therapy should be actively performed.

OR-0046

CT 在鉴别异位 ACTH 综合征患者肺部神经内分泌肿瘤和肿瘤样肺部感染中的作用

宋兰、朱振宸、宋伟、金征宇

中国医学科学院北京协和医院

目的：肺神经内分泌肿瘤（NEN）是异位促肾上腺皮质激素综合征（EAS）最常见的病因，且 EAS 患者肺部感染的发生率较高。在某些情况下，EAS 患者感染的影像学表现可能会类似 NEN，并导致不必要的手术。然而，迄今为止，对 EAS 相关肺部影像学表现的研究，特别是对胸部 CT 影

像诊断价值的研究有限。本研究拟通过回顾性分析北京协和医院近 20 年来明确诊断因肺部 NEN 导致 EAS 或 EAS 伴类肿瘤样肺部感染的患者的临床及胸部 CT 影像学特征,以探索引起 EAS 的肺部 NEN 的典型临床及 CT 影像学特征,并筛选哪些特征可以帮助鉴别肺部 NEN 和类肿瘤样肺部感染。

方法:本回顾性研究共纳入 59 名明确诊断为 EAS 的患者(45 名肺部 NEN 患者和 14 名类肿瘤样肺部感染的患者),共 72 个肺部病变(45 个肺部 NEN 和 27 个类肿瘤样肺部感染病灶)。分别比较两组患者的临床表现、血液生化学指标、放射科医师定义的胸部 CT 影像学特征、生长抑素受体闪烁扫描(SRS)结果、18F-FDG PET/CT 结果、68Ga-DOTATE PET/CT 结果以及病理结果。

结果:肿瘤样感染组高敏 C 反应蛋白(hs-CRP, $P<0.001$)和咳痰发生率($P=0.04$)高于肺部 NEN 组,指氧饱和度($P=0.01$)低于肺 NEN 组。本研究中肺 NEN 均为孤立性原发性肿瘤,80% 为周围性肿瘤。与肿瘤样感染组相比,肺 NEN 组的血管贴边征和气道受累更为常见(P 均 <0.001)。肿瘤样感染组的多灶性($P=0.001$)和外周性($P<0.022$)病变、空洞($P<0.001$)、毛刺($P=0.01$)、胸膜牵拉凹陷($P<0.001$)、与肺静脉相连($P=0.023$)和伴有远端肺不张或炎性渗出征象($P=0.001$)更为常见。肺 NEN 组的 CT 增强幅度明显高于肿瘤样感染组($P<0.001$);受试者操作特征曲线(ROC)分析表明,在 ΔCT 值为 48.3 HU 时具有中度预测能力(敏感性=95.0%,特异性=54.1%)。

结论:胸部 CT 扫描有助于准确定位和表征 EAS 的肺部病变,从而能够帮助临床医师积极寻找导致 EAS 的靶病灶,并能更及时地对 EAS 进行鉴别诊断和有效的临床治疗。

AIDS 并发肺结核的临床影像表现分析

李春华、刘雪艳、吕圣秀、舒伟强
重庆市公共卫生医疗救治中心

目的 探讨艾滋病合并肺结核与正常免疫肺结核的临床影像表现,提高对艾滋病合并肺结核的认识。方法 回顾分析 2018 年 10 月~2020 年 9 月本院诊治的 142 例艾滋病合并肺结核(观察组)及 150 例非艾滋病患者肺结核(对照组)临床及胸部影像表现。结果 观察组在发热 93.7%、呼吸困难 36.6%、乏力 78.9%、纳差 79.6%、体质量下降 74.6%、头痛 18.3%、腹泻 14.8%、视物模糊 7.7%、尿路刺激征 7.7%,合并其他肺部感染 35.9%,合并肺外结核 29.6%,均多于对照组,两组比较差异有统计学意义($P<0.05$)。痰图片及痰培养阳性率 16.9%,PPD 试验阳性率 10.6%,对照组分别为 38%、78.7%,两组比较差异有统计学意义($P<0.05$)。观察组死亡率为 8.5%,对照组 2.7%,两组比较差异无统计学意义($P>0.05$)。影像表现:观察组以 II 型(14.8)、IV 型(44.4%)、V 型(29.6%)较多,病灶位于中下肺 62.0%,累及 3 叶以上 51.4%,均多于对照组($P<0.05$)。观察组肿大淋巴结增环形强化 35.7%(10/28),对照组环形强化 70.6%(12/17),两组比较差异有统计学意义($P<0.05$)。结论 艾滋病合并肺结核患者病情严重,临床表现不典型,容易合并多种机会性感染,影像表现复杂多样,当艾滋病患者出现全身多发症状,CT 表现为大片实变、空洞、粟粒结节、淋巴结肿大及胸腔积液时应考虑到艾滋病合并肺结核的可能。

OR-0048

造血干细胞移植后肺孢子菌肺炎 与巨细胞病毒肺炎的 CT 影像对比

程敏、陈皓、孙烨、洪楠
北京大学人民医院

目的 肺孢子菌肺炎（PJP）与巨细胞病毒肺炎（CMVP）是造血干细胞移植（HSCT）后的常见肺部并发症，临床特点相似，但治疗方式迥异，早期鉴别具有重要临床意义。胸部 CT 是 HSCT 患者肺部感染并发症的重要诊断手段，本文目的是比较 HSCT 后 PJP 与 CMVP 的影像学特点，为早期鉴别诊断提供依据。

方法 回顾性分析 HSCT 后 21 例 PJP 患者的胸部 CT 影像学资料。计算 CT 中病变的总严重程度评分（TSS），每个肺叶按病变累及范围评分，0 分：0%；1 分：1-25%；2 分：26-50%；3 分：51-75%；4 分：76-100%，全肺总分 0-20 分。再将主要病变分为实变、磨玻璃影、结节，分别计算三种病变的 TSS。此外选取 26 例 CMVP 患者作为对照组，对比其影像学特征。

结果 PJP 患者出现实变、磨玻璃影、结节者分别 11（52.4%）、17（81.0%）、8（38.1%）例，CMVP 患者出现实变、磨玻璃影、结节者分别 13（50.0%）、20（76.9%）、14（53.8%）例，两组间无明显统计学差异（ $P=0.871$ ， $P=0.737$ ， $P=0.282$ ）。磨玻璃影中弥漫分布者，PJP 组 7（41.2%）例，CMVP 组仅 1（5%）例，有明显差异（ $P=0.027$ ）。结节中表现为弥漫微结节者，PJP 组未出现，CMVP 有 5（19.2%）例，组间差异明显（ $P=0.034$ ）。PJP 组出现肺气肿者 4（19.0%）例，CMVP 组未出现，有统计学差异（ $P=0.020$ ）。PJP、CMVP 的平均 TSS 总分分别约 12.8 ± 6.2 、 11.3 ± 6.2 ，差异不明显（ $P=0.418$ ）。与 CMVP 组相比，PJP 组磨玻璃影评分较高（ 11.2 ± 7.6 ， 5.9 ± 5.2 ， $P=0.010$ ），结节评分较低（ 1.9 ± 4.4 ， 6.1 ± 7.9 ， $P=0.027$ ），实变评分无明显差异（ 2.1 ± 2.6 ， 2.3 ± 3.4 ， $P=0.814$ ）。

结论 HSCT 后 PJP 与 CMVP 的主要影像学表现均为实变、磨玻璃影、结节，但 PJP 的磨玻璃影分布更广泛，结节分布相对较少。PJP 中出现肺气肿，CMVP 中出现弥漫微结节，分别为特异性征象，有助于早期诊断。

基于双模态 MRI 的影像组学分析 在 HIV 相关神经认知障碍早期诊断中的研究

王伟¹、祁宇²、许凡¹、崔景景³、李宏军¹

1. 首都医科大学附属北京佑安医院

2. 南京市鼓楼医院

3. 联影智能医疗科技（北京）有限公司

背景 HIV 相关神经认知障碍综合征（HAND）损害患者认知功能，给家庭和社会带来沉重负担。cART 时代，HAND 中无症状神经认知损伤期（ANI）居主导地位，目前 HAND 诊断依赖神经认知量表，耗时长，亟需探寻客观精准的 ANI 期诊断替代指标。

目的 探讨基于双模态 MRI 的影像组学对 HAND 早期（ANI 期）的诊断价值。

方法 基于 Frascati 标准筛选入组 138 名无症状 HIV 感染者（PLWH），其中 68 人为无认知缺损组，70 人为 ANI 组，招募 70 名匹配的健康对照组；将三组受试者进行双模态 MRI（sMRI、DTI）扫描，并对 DTI 和 sMRI 数据进行 TBSS、皮层厚度的差异分析。针对 sMRI、DTI 计算出的差异脑区（右侧额内侧回、右侧额中回、左侧颞横回、胼胝体）及先验脑区（纹状体、丘脑）选取五组不同的感兴趣区（ROI）。ROI-1：右侧额内侧回、右侧额中回、左侧颞横回、纹状体、丘脑及胼胝

体, ROI-2: 纹状体+丘脑+胼胝体, ROI-3: 纹状体、胼胝体, ROI-4: 纹状体, ROI-5: 胼胝体。提取 ROI 的 sMRI 影像组学特征, 按照 7: 3 将三组受试者分为训练集和测试集, 基于 sMRI 提取的影像组学特征及临床特征, 利用 LR 和 SVM 分类器构建诊断模型并测试, 基于五组不同 ROI 区域影像组学特征模型的识别表现, 获取最优识别 PLWH 以及识别 PLWH 中 ANI 组的模型, 基于健康对照组与 PLWH 组、PLWH 中无认知缺损组与 ANI 组分别构建二分类模型 Model-A1, Model-A2, 基于健康对照组、无认知缺损组与 ANI 组构建三分类模型 Model-A3。

结果: Model-A2 在利用 ROI-4 (纹状体) 的影像组学特征构建模型时, 识别 PLWH 中的 ANI 期表现最优, 在测试集 AUC 为 0.80。Model-A1、Model-A3 均在利用 ROI-5 (胼胝体) 影像组学特征构建模型时表现最优, 在测试集中, Model-A1 的 AUC 为 0.87, Model-A3 的 AUC 为 0.76。

结论: 基于双模态 MRI 的影像组学模型对识别 HAND 早期 (ANI 期) 患者具有较高的准确性, 为 HAND-ANI 期的早期诊断提供了科学依据。

PET/CT 在感染与炎症中的临床应用

杨斌、傅洋
昆明市第一人民医院

正电子发射计算机断层显像 (positron emission tomography and computed tomography, PET/CT), 突破了常规医学影像的范畴, 提高了对全身疾病的诊断与鉴别诊断能力。在近二十多年的时间, PET/CT 已成为医学诊疗中强大的检查手段。然而, 因 PET/CT 在肿瘤, 特别是恶性肿瘤局部及全身评估中不可替代的作用, 难免让我们忽视了其在肿瘤以外的价值。实际上, 由于 PET/CT 的应用积累, 它在其他领域的作用越来越受到重视, 其中, PET/CT 在感染与炎症的应用最为广泛和重要, 但相关总结及阐述缺乏系统性。

本文聚焦于 PET/CT 在感染与炎症方面的临床应用, 涉及日常工作中常见的不同系统来源的感染和炎症, 同时也覆盖了对不明原因发热、结核、艾滋病、假体关节及血管移植物来源的特殊感染与炎症性疾病。同时探讨 PET/CT 检查对诊断胸部感染性疾病的优劣势及应用前景。相信本文能够为大家学习和掌握 PET/CT 在感染与炎症性疾病中的应用提供一定帮助。

OR-0051

Changes in White Matter and Neurophysiology in HIV Patients with Different Cognitive Functions after 1-2 years of Follow-up

Juming Ma, hongjun Li
Beijing YouAn Hospital, Capital Medical University

Background: HIV patients may have HIV-associated neurocognitive disorder (HAND), cognitive function decline and white matter microstructure changes, which can be observed by diffusion tensor imaging (DTI) and neuropsychological test. Patients with symptomatic neurocognitive impairment (ANI) and peoples living with HIV (PLWH) without cognitive impairments received special attention.

Methods: 26 male HIV-patients with ANI and 26 male peoples living with HIV (PLWH) after highly active antiretroviral therapy (HAART) were included in this study, including clinical information collection, DTI and neuropsychological test, which were divided into baseline period and follow-up period, with an interval of 1-2 years (an average of 1.66 years). DTI post-processing is based on track based spatial statistics (TBSS).

Results: There were differences in clinical and neuropsychological data between the two groups during the baseline and follow-up periods ($P<0.05$). There were differences in DTI parameters between the baseline and follow-up periods in both the ANI group and the PLWH group, and some brain regions with differences were correlated with neuropsychological results.

Conclusion: Regardless of the cognitive level, after HAART treatment, the cognitive level of HIV patients may still decline and slight white matter damage, and the patients with lower cognitive level may be more obvious.

OR-0052

不同 Child-Pugh 分级肝硬化患者 并发新冠病毒肺炎后胸部 CT 表现

邵国庆
徐州市中心医院

目的 探讨不同 Child-Pugh 分级肝硬化患者并发新冠肺炎后的胸部 CT 表现差异。**方法** 回顾性分析 2022 年 11 月-2023 年 3 月收治的 58 例并发新冠病毒肺炎的肝硬化患者胸部 CT 影像学资料, 根据 Child-Pugh 评分进行分级后将患者分为 A、B、C 三组, 总结其胸部 CT 特点, 比较三组患者间影像学表现差异。**结果** 依据 Child-Pugh 评分结果, A、B、C 三组患者分别为 12 例、23 例、23 例; B 组患者年龄高于 A、C 组 ($P<0.05$), 性别及肝硬化病因三组间无统计学差异 ($P>0.05$); 三组患者胸部 CT 共性表现为分布于胸膜下为主的斑片/片状磨玻璃影和/或实变影, 双肺多发 (98.3%); 三组患者胸部 CT 所示的病灶分布、肺叶受累、病灶密度、病灶特征、肺外伴随征象均无统计学差异 ($P>0.05$); C 组患者病灶的 CT 严重度评分较高, 与 A 组差异有统计学意义 ($P<0.05$)。结论 并发新冠肺炎的不同 Child-Pugh 分级肝硬化患者间胸部 CT 表现并无显著差异, 但 Child-Pugh 评分为 C 级的患者肺部炎症倾向表现为更大的受累范围。

HIV 患者无症状神经认知障碍 相关神经机制的多参数 MR 成像研究

韩帅¹、马举铭²、艾力希尔³、李宏军²
1. 山东大学齐鲁医院
2. 首都医科大学附属北京佑安医院
3. 北京航空航天大学

目的: 探索基于多参数 MR 的 HIV 患者无症状神经认知障碍 (ANI) 全脑功能和结构变化特征, 为 ANI 的早期诊断和神经机制的研究提供依据。

方法: 共招募 151 名 HIV 患者和 70 名健康人 (HCs) 进行神经认知测试、静息态功能磁共振、3D-T1 成像和弥散张量成像扫描。最终共纳入 44 名 ANI 患者和 47 名 HCs。1. 区域同质性 (ReHo) 用来评估全脑自发性神经元活动。2. 独立成分分析 (ICA) 评价全脑 13 个网络间功能连接 (FC) 的差异。3. 基于体素的形态学测量 (VBM) 和表面的形态学测量 (SBM) 对灰质体积和皮质厚度进行分析。4. 采用纤维束示踪空间统计分析 (TBSS) 探究白质纤维束各向异性分数 (FA)、平均弥散系数 (MD)、轴位弥散系数 (AD) 和垂直弥散系数 (RD) 变化。

结果: 1. ANI 组右侧舌回、左侧枕中回、双侧枕上回、右侧额中回、小脑蚓部 ReHo 降低, 左侧额中回和左侧脑岛 ReHo 增加; 左侧额中回与语言表现呈负相关; 左侧脑岛与病程呈正相关; 右侧舌回与抽象与执行功能呈正相关。2. ANI 组突显网络和外侧视觉网络、内侧视觉网络 FC 降低; 突显网络和内侧视觉网络 FC 降低与 CD4、CD4/CD8 比值呈负相关。3. ANI 组右侧小脑 Crus2 区、左侧额

下回三角部、右侧角回灰质体积降低,左、右侧楔前叶灰质体积增加,右侧海马旁回、左侧梭状回和颞下回皮层厚度增加。左侧楔前叶灰质体积与工作记忆呈负相关;右侧楔前叶灰质体积与 CD4、CD4/CD8 比值呈负相关;右侧海马旁回皮层厚度和 CD4/CD8 比值呈正相关。4. ANI 组双侧丘脑前辐射、双侧皮质脊髓束、双侧扣带回、双侧额枕下束、双侧上、下纵束、双侧钩状束、额钳、枕钳 FA 降低、RD 增加;ANI 组左侧丘脑前辐射、左侧扣带回、左侧额枕下束、左侧上纵束、左侧钩状束 MD 增加;FA 值和精细运动呈负相关;MD 值和精细运动、语言表现呈正相关;RD 值和精细运动呈正相关。

结论: 1.视觉网络改变可能是 ANI 最具代表性的特征。2.免疫指标和 ANI 脑结构功能改变密切相关。3.TBSS 方法可能对探测 ANI 较为敏感。4.ANI 主要累及患者的感知皮层系统,而联合皮层系统受累较轻。

OR-0054

HIV 感染伴无症状神经认知障碍的脑体积改变及肠道菌群特征

李瑞利¹、卢洁¹、李宏军²

1. 首都医科大学宣武医院

2. 首都医科大学附属北京佑安医院

目的 探讨 HIV 感染伴无症状神经认知障碍 (asymptomatic neurocognitive impairment, ANI) 的脑体积改变及肠道菌群特征。

方法 选取 52 例 HIV 感染者,经一系列神经认知量表评估,以 26 例伴无症状神经认知障碍的 HIV 感染者 (HIV-ANI) 为观察组,以 26 例认知功能正常的 HIV 感染者 (HIV with cognitive integrity, HIV-CI) 为对照组,此外招募 26 例年龄、性别、教育背景匹配的健康志愿者为健康对照组 (healthy control, HC)。对受试者进行 3D T1WI 的脑影像数据采集及 AccuBrain 自动分割和提取大脑结构的体积,并取受试者粪便样品进行 16SrRNA 基因测序技术分析,比较三组肠道菌群的组成及其丰度差异,采用 Pearson 相关性分析评估脑容量参数与肠道菌群特征的相关性。

结果 与 HIV-CI 和 HC 相比, HIV-ANI 患者双侧尾状核和侧脑室的相对体积存在显著差异,肠道菌群显著改变 (Adonis test, $P=0.02$), 主要表现 HIV-ANI 组患者在 Eubacterium、cCoproductus、Eisenbergiella、Aggregatibacter、Hungatella、RuminococcaceaeUCG_010、Pseudarthrobacter、Barnesiella、Ruminiclostridium 6、Alistipes 等属细菌的富集 ($P < 0.05$), 和 Desulfovibrio 属菌的减少 ($P < 0.05$)。HIV-ANI 患者双侧尾状核的相对体积与 Eubacterium 的细菌数呈正相关。

结论 HIV 感染可诱导肠道菌群结构失衡,而肠道菌群失调可能与 HIV 感染早期的神经认知功能障碍的发生及发展相关。

艾滋病合并原发性甲状腺淋巴瘤病例报道

李翔

昆明市第三人民医院

本文报道 1 例艾滋病合并原发性甲状腺弥漫大 B 细胞淋巴瘤影像表现及诊治过程。患者,女,67 岁,颈部包块伴呼吸困难 5 月余入院,患者 HIV 感染 7 年,既往有桥本氏甲状腺炎病史。超声提示甲状腺左叶边界清楚低回声巨大包块,大小 74mm×45mm,CT 提示甲状腺低密度肿块,增强扫描肿块无强化,肿块上极可见粗大血管穿行,正常甲状腺组织受压呈线状明显强化。经皮穿刺活检确诊弥漫性大 B 细胞淋巴瘤。行 R-CHPEP 方案化疗,化疗 5 天后,肿块明显缩小。弥漫性大 B 细胞

淋巴瘤被定义为艾滋病相关性肿瘤，桥本氏甲状腺炎也为原发性甲状腺淋巴瘤发生的危险因素，后者在影像表现上可分为实性结节型、多发结节型和弥漫型，经皮穿刺活检有助于诊断。

Analysis of Acute Adverse Reactions Caused by CT Contrast Medium: A Retrospective Study of 72556 Patients

Jun Chen, Haiyang Li, Tao Luo, Lujing Gao, Kexin Chen, Kang Li, Zhu Chen
The Second Xiangya Hospital of Central South University

Objective: To determine the correlation between age, sex and iodinated contrast medium (ICM) and acute adverse reactions (ARs) in patients who underwent contrast-enhanced CT examinations.

Methods: We retrospectively collected and analyzed the age, sex, type of ICM and severity of ARs in patients who underwent contrast-enhanced CT at our institution from August 1, 2020, to June 30, 2021. Univariate and multivariate logistic regression were performed to determine the independent risk factors for ARs.

Results: A total of 166 of 56752 patients experienced acute ARs (0.29%). The age (48 vs. 56, $p < 0.001$), sex (female vs. male=45% vs. 55%, $p < 0.001$) and Iohexol (0.41%, $p = 0.005$) were significantly different between the AR group and the non-AR group. Multivariate regression analysis revealed that younger age (OR=0.974, 95% CI: 0.965-0.983), female sex (OR=1.713, 95% CI: 1.255-2.340) and Iohexol (OR=1.590, 95% CI: 1.139-2.221) were independent risk factors for ARs. There were significant differences in AR incidence among different age groups and different ICM ($p < 0.001$). Adverse reaction occurred mostly in the 30-39 age group (0.61%) and mostly in the Iohexol group (0.41%). However, AR types and severity showed no significant relation with age, sex, and type of ICM.

Conclusion: ARs were associated with age, sex, and the type of contrast media. Younger and female patients who used Iohexol had a relatively higher risk of developing acute adverse reactions.

OR-0057

钆对比剂在小鼠体内不同组织沉积的研究

孔莹、张帅、徐凯
徐州医科大学附属医院

目的 研究钆对比剂在小鼠体内不同组织的沉积，评价钆沉积的潜在毒性作用。

方法 实验(一): 对小鼠注射不同类型 GBCAs，在不同时间点进行钆滞留检测、痛觉、组织学、血常规和血生化检测。将 240 只 ICR 小鼠随机分为 5 组 (n=48/组)，4 次/周、连续 5 周以 2.5 mmol Gd/kg 的剂量静脉注射 GBCAs (钆喷酸葡胺、钆特酸葡胺、钆双胺、钆布醇) 或生理盐水。分别在 0、6、10 周进行热痛觉检测、机械痛觉检测、血液学检测及病理检测；在第 4、6 和 10 周采用 ICP-MS 测小脑、神经、肝脏、肾脏、皮肤、骨骼中的钆浓度。实验(二): 由于在实验(一)中我们发现仅钆双胺组的数只小鼠出现尾部皮肤的溃烂。对小鼠 (48 只/组；共 5 组) 进行尾静脉注射不同类型的 GBCAs 或生理盐水，以 5 mmol Gd/kg 的浓度每周注射 5 次，共注射 5 周。观察小鼠尾部皮肤等状态变化，在相应的时间点进行钆滞留检测、痛觉测试、组织学、血常规和血生化分析。

结果 实验一: 1. 在第 6 周时，钆双胺组小鼠发现肾小球结构相对完整的基础上，肾小管上皮细胞出现明显的空泡状变化，第 10 周时此变化消失。2. 第 6 周时，线性 GBCAs 明显诱导了热痛觉过敏，再经过 4 周的恢复，钆双胺组仍然显著引起热痛觉过敏，而钆喷酸葡胺组恢复至基线水平。3. 线性 GBCAs 组在第 6 周 WBC 显著的升高，在第 10 周时恢复正常。实验二: 1. 钆双胺组在注射 4-

5 周期间出现了 6 只小鼠尾部的溃烂，溃烂部位可见鳞状上皮缺失伴坏死及炎性渗出，溃疡形成，病变部位外观及组织病理检查改变在 5 周内逐渐恢复。

结论 1. 线性 GBCAs 在组织中表现出更多的钆滞留，可引起白细胞一过性的升高，诱导小鼠的热痛觉过敏，其中钆喷酸葡胺组可恢复。3. 注射钆双胺可导致小鼠尾部注射部位的皮肤溃烂、肾小管上皮细胞的一过性空泡变化。

中国人民解放军陆军特色医学中心

目的：观察老年高血压患者冠脉 CTA 检查注射非离子碘对比剂血流动力学效应，为进一步解释指南中提出注射对比剂后可能引起高血压急症的生理反应是否与血流动力学变化有关提供依据。

方法：采用便利抽样法，选择老年非高血压与高血压冠脉 CTA 检查患者共 64 例，其中非高血压患者 32 例、高血压患者 32 例。持续无创测量从注射前 1 分钟到注射后 30 分钟内 6 个时间点的血流动力学数据，包括 SBP, DBP, MAP, HR, SVR, CO, SV。

结果：注射碘普罗胺后，组内比较：非高血压组：SBP：除 5 分钟外，其余各时间点测值和注射前有统计学差异；DBP：10、15、30 分钟测值和注射前测值有统计学差异。MAP：10、15、30 分钟测值和注射前测值有统计学差异。HR：注射过程中测值和注射前测值有统计学差异。CO：注射过程中、5、30 分钟测值和注射前测值有统计学差异。SVR：注射过程中、5、10、15 分钟测值和注射前测值有统计学差异。高血压组：SBP：注射过程中、5、30 分钟测值和注射前测值有统计学差异。HR：注射过程中、30 分钟测值和注射前测值有统计学差异。SV：注射过程中、5、10 分钟测值和注射前测值有统计学差异。CO：注射过程中、5 分钟测值和注射前测值有统计学差异。SVR：各时间点测值和注射前测值有统计学差异。除上述描述外，其余组内测值比较均无统计学差异。2 组所有指标的变化曲线趋势基本一致，除 SVR 呈短暂下降后再回升，30 分钟未恢复到基线水平之外，其余指标均呈短暂升高后再回落至基线水平的趋势。

结论：2 组患者注射非离子对比剂后血流动力学指标的变化曲线趋势基本一致，均在标准范围内波动，服药控制良好的高血压组较非高血压组引起更为明显的血流动力学变化。临床中应该重点关注血压控制不良患者注射对比剂后的血流动力学变化，防止高血压急症的发生。

双低剂量联合 KARL 3D 技术在肺动脉 CTA 中的应用

叶曼、刘昌盛、周桦、查云飞

武汉大学人民医院

目的：探讨低管电压和低对比剂总量联合双域迭代重建降噪算法（KARL 3D）技术在肺动脉 CT 血管造影中的临床应用价值。

方法：选取 60 例疑诊为肺动脉栓塞的患者作为研究对象，随机分成 A、B、C、D 四组，每组 15 例。使用联影 640 层螺旋 CT（uCT960+）应用 KARL 3D 技术，A 组管电压为 120 KV，常规造影剂总量（60-80 mL 碘佛醇）；B 组管电压为 100 KV，常规造影剂总量（60-80 mL 碘佛醇）；C 组管电压为 120 KV，低造影剂总量（20-30 mL 碘佛醇）；D 组管电压为 100 KV，低造影剂总量（20-30 mL 碘佛醇），对比四组的 CT 扫描结果：CT 值、有效辐射剂量、噪声值、信噪比、对比噪声比和图像质量评分，并进行统计学分析。

结果: B 组的 CT 值最高, C 组最低。B、D 组的有效辐射剂量比 A、C 组下降约 67.4 %, 差异有统计学意义($P < 0.05$); 噪声值方面, D 组最高, A 组最低, B 组高于 C 组, 各组间差异均有统计学意义($P < 0.001$); 信噪比、对比噪声比和图像质量评分方面, B 组最高, C 组最低, A 组高于 D 组, 各组间差异均有统计学意义($P < 0.05$)。

结论: 四组中扫描方案图像质量最高的是 B 组, 但考虑到辐射剂量危害和使用碘对比剂的肾毒性危害, 最理想的扫描方案为 D 组: 低管电压和低对比剂总量。D 组扫描方案联合 640 层螺旋 CT 的 KARL 3D 技术在进行肺动脉 CT 血管造影时, 虽然信噪比有所减低, 但成像效果相差无几仍能满足临床诊断需求, 且同时降低了辐射危害和碘对比剂的肾毒性危害, 且不良反应少, 具有临床推广的价值。对于患有严重心脏病的患者, 应使用较多的对比剂总量进行个性化扫描。

Biomaterialized Gadolinium-cerium metal-doped nanoparticles with High relaxation rate for enhanced MRI

yang zhao, Shifeng Cheng, jing peng
The Second Hospital of Tianjin Medical University

Background and purpose: Paramagnetic Gadolinium-based contrast agents (Gd-CAs) have been widely used in MRI examinations. However, emerging evidence has documented their long-term deposition in the body, leading to uncertain biosafety risks. Current challenges of existing Gd-CAs call for the development of high relaxivity CAs allowing minimal dose.

Method: In this study, a novel paramagnetic nanoparticle (CeGd@BSA) was synthesized by biomaterialization method. Subcutaneous tumor mouse models were established and intravenously injected with CeGd@BSA (15 mg/kg) or Magnevist (control group). Then dynamic MR imaging was performed at the scheduled time-points, with the contrast to noise ratio (CNR) of tumors monitored. Next, swine models were used and received MR angiography after intravenous injection at doses of 0.07 mg per kg body weight to validate its efficiency and biosafety in large animals. To investigate the retention of CeGd@BSA, brains of rats receiving 4 injections of either CeGd@BSA, Magnevist, or saline, were sampled to determine the Gd contents via inductively coupled plasma mass spectrometry (ICP-MS).

Result: The prepared NPs exhibited an ultra-high T1 relaxivity of above $80 \text{ mM}^{-1} \text{ s}^{-1}$, which was significantly higher than Magnevist. After intravenously injection, CeGd@BSA NPs demonstrated superior T1 enhancement effect and contrast-to-noise ratio in tumors than Magnevist. In swines, the 3D reconstructed images of MRA exposed an explicit depiction of whole-body vessels. Interestingly, the Gd dose in the CeGd@BSA group was a thousandth of the standard dose of Magnevist. After 4 doses of administration, magnevist caused gadolinium retention in the DCN, pons, and striatum. Whereas, no gadolinium retention was observed after CeGd@BSA injection.

Conclusion: In summary, this study proposes a promising MR CAs candidate for low-dose enhanced MRI with the advantages of ultra-high T1 relaxivity, high water solubility, and biocompatibility.

Conventional pituitary MRI radiomics feature improves diagnostic performance between growth hormone deficiency and idiopathic short stature

Kun Shu¹, Ke-Ren Wang¹, Rui-Fang Zhang², Yi Lu¹, Zhi-Han Yan¹

1. The Second Affiliated Hospital and Yuying Children's Hospital of Wenzhou Medical University

2. Children's Hospital, Zhejiang University School of Medicine

Background and Aims: In clinical practice, growth hormone deficiency (GHD) and idiopathic short stature (ISS) are characterized by short stature. Apart from invasive growth hormone stimulation tests, there is a lack of stable and reliable diagnostic tools. We plan to develop and validate a clinical-radiomics model based on clinical indicators and conventional pituitary magnetic resonance imaging (MRI) data to improve the noninvasive diagnosis of GHD.

Methods: In this cross-sectional study, a retrospective cohort (4-12 years) of 297 GHD children and 300 ISS children were included in the analysis. All participants underwent sagittal pituitary T1-weighted MRI scan and blood testing, and were divided into training and validation sets respectively (randomized in a ratio of 7 to 3). A total of 2264 radiomics features were extracted from the MRI images of the anterior pituitary gland and a radiomics model was subsequently constructed through the utilization of Least Absolute Shrinkage and Selection Operator (LASSO) regression analysis. The hematological biomarkers were selected to create a clinical diagnostic model and were included in the combined clinical-radiomics model. In addition, an external validation dataset with 100 children was employed in evaluating the stability of the constructed Integrated model. The area under the curve (AUC) and Delong test were used to assess the diagnostic performance of models.

Results: Seventeen radiomics features were selected for constructing radiomics model, while total protein, total cholesterol, and triglyceride were utilized for clinical model. The diagnostic performance of the combined model (AUC = 0.82) was found to be comparable to that of the radiomics model (AUC = 0.81, $p = 0.122$), with both models surpassing the clinical model (AUC = 0.58, $p < 0.0001$). Similar findings were observed in the internal validation cohort, with the combined model exhibiting an AUC of 0.80. Notably, in the external validation cohort, the combined model displayed the highest performance (AUC = 0.76) among all models (all $p < 0.05$).

Conclusion: Incorporating clinical indicators and conventional pituitary MRI data into a clinical-radiomics model improved the diagnostic performance of GHD.

OR-0062

Structural covariance network alterations associated with motor controlling in preterm and full-term children with periventricular leukomalacia

Jieqiong Lin, Hongwu Zeng
Shenzhen Children's Hospital

Objective To compare grey matter (GM) volumes and graph theory parameters of the motor covariance network between children with PVL and healthy controls, and between preterm and full-term patients.

Methods T1-weighted 3T brain MRI data were collected from 42 patients with PVL and 38 age- and gender-matched healthy children. According to gestational age, the patient group was stratified into the premature PVL group (pPVL, $n=27$) and the full-term PVL group (fPVL, $n=15$). Voxel-based morphometry (VBM) was employed to compare global structural volumes and regional grey matter

(GM) volumes between groups. For multiple comparison correction, family-Wise Error (FWE) and Monte Carlo z-field simulation were applied, setting $p < 0.05$ (2-tailed) as a threshold.

The quantification of structural connection strength between pairs of grey matter areas was conducted using structural covariance analysis. Connectivity strength among motor-related cortex-basal ganglia nuclei-cerebellum regions was compared with connectivity strength between 5,000 sets of randomly chosen regions. Graph theory was applied to analysis the motor covariance network. All participants underwent Gross motor function assessment (GMFM) and fine motor function assessment (FMFM).

Results Compared to the HC, GM volume loss of bilateral thalamic was observed in pPVL ($p < 0.001$), whereas only left thalamus in fPVL ($p < 0.001$). Structural covariance in both pPVL and fPVL groups was significantly weaker between thalamus and other chosen regions, including motor cortex and cerebellum, when compared with the HC group ($P < 0.001$). Conversely, both the pPVL and fPVL groups had significantly stronger structural covariance than the HC group in regions between the motor cortex and cerebellum ($P < 0.001$). The pPVL group performed abnormal global network parameters, whereas the fPVL group did not. Increased nodal local efficiency in basal ganglia nuclei was observed in both pPVL and fPVL group. In pPVL, several regions including left postcentral gyrus, bilateral superior parietal lobule were lost hubs, and left putamen was reconfigured hub. In fPVL, left postcentral gyrus and right superior parietal lobule were lost hubs. Right precentral gyrus and right paracentral lobule were reconfigured hub. Gross motor function scores were associated with thalamus volume in both pPVL and fPVL groups.

Conclusion These results elucidate altered structural covariance of the motor network in pPVL and fPVL, and basal ganglia nuclei, especially the thalamus, may play an important role in modulating motor control in early stages, indicating the potential association between motor performance and motor network alterations in the rehabilitation process.

Alterations of white-matter functional network in children with drug refractory temporal lobe epilepsy: A Graph-Theoretical Study

Yuxin Xie, Haifeng Ran, Qiane Yu, Tijiang Zhang
The Affiliated Hospital of Zunyi Medical University

Epilepsy is a brain disorder consisting of abnormal electrical discharges of neurons resulting in epileptic seizures that affects more than 10.5 millions children worldwide. A severe impairment of cognitive function characterizes drug refractory temporal lobe epilepsy (DRTLE) thus, the early diagnosis of DRTLE is very important. However, it is not clear whether there are white matter (WM) alterations in children with DRTLE. With confirming evidence that resting-state functional magnetic resonance imaging (rs-fMRI) of brain white matter (BWM) signals can effectively describe neuronal activity, this study investigated the interactions among BWM functional networks in DRTLE relative to healthy controls (HCs). Hence, this study was aimed to comprehensively analyze the topological properties of WM functional networks among children with DRTLE. We apply a region growing method to defined Node in WM functional networks, The correlation matrix for each participant was constructed by Pearson's correlation coefficient between averaged BOLD signals of paired nodes. Global and nodal topological properties were assessed based on the weighted WM functional networks. Independent samples t-test was used for comparisons of global topological properties and nodal topological properties between groups. The correlation between the altered WM functional network topological properties and neuropsychological tests were analyzed using spearman's correlation analysis ($p < 0.05$). As compared to the HCs group, the Network efficiency in DRTLE group was significantly decreased. Compared with the HC group, The DRTLE group showed significantly lower nodal clustering coefficient in 22 nodes, and higher nodal clustering coefficient in 1 node. The DRTLE group showed

significantly lower nodal local efficiency in 21 nodes. The DRTLE group correlated with duration, processing speed, working memory, and Full-scale Intelligence quotient(all $P < 0.05$). These findings may aid a new perspective for a deeper comprehension of the neuropathological mechanisms underlying this disease.

OR-0064

The associations of MRI-based proton density fat fraction of liver and vertebral marrow with common data acquired from physical examinations in children with obesity

Jinning Li¹, Xiance Zhao², Dengbin Wang¹

1. Xinhua Hospital, Shanghai Jiao Tong University School of Medicine

2. Clinical Science, Philips Healthcare

Objectives To investigate the associations of PDFFs in liver and vertebral marrow with common data in children with obesity.

Methods Thirty-five children with obesity (age range, 6-17 years; 9 female) underwent an axial mDixon-quant sequence. Regions of interests were respectively put on each of nine segments to calculate the mean PDFF. Vertebral fat quantifications were acquired by averaging three PDFFs measured from T10-T12. At the level of 5-cm above navel, abdominal circumference and area were also measured. Additionally, heights and weights of all children were recorded and BMIs were calculated. Spearman correlation analysis were performed. $P < 0.05$ was considered statistically significant.

Results The mean BMI of enrolled children was 27.00 ± 3.61 (22–39), and 80% of them had fatty liver. The mean PDFF of all children was $15.01 \pm 10.78\%$ in liver and $38.54 \pm 12.3\%$ in vertebral marrow. The mean abdominal circumference and area of children were 840.69 ± 66.80 mm and 50772 ± 8578.993 mm² respectively. PDFF of vertebral marrow showed moderate negative correlation with age, height, BMI and weight ($\rho = -0.545$ – -0.436 ; $P \leq 0.009$) and mild negative correlation with abdominal circumference and area ($\rho = -0.344$ – -0.334 , $P < 0.05$). However, liver fat had neither positive nor negative correlation with any of the parameters ($P > 0.05$), including PDFF of vertebral marrow ($P = 0.349$).

Conclusion PDFF of vertebral marrow negatively correlates with age, weight, height, BMI, and abdominal circumference and area in children with obesity.

Alterations of large-scale functional network connectivity in patients with infantile esotropia before and after surgery

Jianlin Guo, Yun Peng

Beijing Children's Hospital, Capital Medical University

Abstract Background: Growing evidences have indicated neurodevelopmental disorders in infantile esotropia (IE). However, few studies have analyzed the characteristics of large-scale functional networks of IE patients or their postoperative network-level alterations. **Methods:** Here, individuals with IE ($n = 32$) and healthy subjects ($n = 30$) accomplished the baseline clinical examinations and resting-state MRI scans. A total of 17 IE patients also under went corrective surgeries and completed the longitudinal clinical assessments and resting-state MRI scans. Linear mixed effects models were applied for cross-sectional and longitudinal network-level analyses. Correlation analysis was performed to assess the relationship between longitudinal functional connectivity (FC)

alterations and baseline clinical variables. Results: In cross-sectional analyses, network-level FC were apparently aberrant in IE patients compared to controls. In longitudinal analyses, intra- and internetwork connectivity were observed with significant alterations in postoperative IE patients compared to the preoperative counterparts. Longitudinal FC changes are negatively correlated to the age at surgery in IE. Conclusions: Obviously, altered network-level FC benefiting from the corrective surgery serves as the neurobiological substrate of the observed improvement of stereovision, visuomotor coordination, and emotional management in postoperative IE patients. Corrective surgery should be performed as early as possible to obtain more benefits for IE in brain function recovery.

OR-0066

Early recognition of necrotizing pneumonia in children based on non-contrast-enhanced computed tomography (CT) radiomics signatures

Xin Chen

Children's Hospital of Chongqing Medical University

Objective: Streptococcus pneumoniae and Mycoplasma pneumoniae pneumonia are two common pathogens of lung necrosis. The purpose of this study was to explore the ability of imaging omics to distinguish the two pathogens causing lung necrosis based on plain scan CT imaging features. **Materials and methods:** 86 cases of lung necrosis with early pulmonary consolidation were included according to the standard of sodium discharge. Imaging images and clinical features were collected. RadCloud was used to segment the lesions in CT scan manually, and 1207 radiomics features were extracted. In order to reduce redundancy, we use minimum absolute contraction and selection operator (LASSO) method for eigendimension reduction. The model based on imaging omics features and the composite model based on imaging and clinical features were established respectively, and the two models were compared. Random forest (RF), support vector machine (SVM) and logistic regression (LR) are three machine learning algorithms used to build machine learning models. To evaluate the recognition effect, area under the receiver operating characteristic curve (AUC), sensitivity, specificity and other indicators were used in the validation cohort.

Results: The minimum absolute contraction and selection operator (Lasso) method was used for feature dimension reduction, and eight imaging omics features with the best correlation coefficients with lung necrosis were identified. Three kinds of models were established: the model based on imaging omics, the model based on clinical features, and the composite model based on imaging features and clinical features. Random forest (RF), support vector machine (SVM) and logistic regression (LR) are three machine learning algorithms used to build the models. The values of AUC, F1-scores and RF in the composite model are 0.795 and 0.78 respectively in the training queue, and 0.774 and 0.81 respectively in the test queue.

Conclusion: The machine learning model RF based on the combined model of imaging and clinical features extracted from the area of interest at the early stage of pulmonary necrosis is helpful for the identification of two pathogens (Streptococcus pneumoniae pneumonia and Mycoplasma pneumoniae pneumonia).

经导管主动脉瓣置换术中循环崩溃的抢救与护理

杨清
陆军军医大学第一附属医院 (西南医院)

目的：探讨经导管主动脉瓣置换术中循环崩溃的抢救措施与护理要点。方法：回顾分析 2019 年 10 月-2023 年 5 月我院经导管主动脉瓣置换术中发生循环崩溃的病例资料，梳理术中紧急抢救措施及护理配合要点，进行根本原因分析，详细讨论可以优化的程序步骤。结果：我院行 TAVR 手术的 231 例患者中，术中循环崩溃 19 例 (8.23%)，包括心室颤动 ($n=6$, 31.58%)、主动脉破裂或夹层 ($n=4$, 21.05%)、瓣膜移位 ($n=3$, 15.79%)、急性左心室衰竭 ($n=2$, 10.52%)、心脏骤停 ($n=2$, 10.52%) 和心脏穿孔和心包填塞 ($n=2$, 10.52%)。快速判断，明确原因，及时采取有效的电除颤、静脉给药、心肺复苏、体外循环下中转开胸等一系列抢救措施。15 例抢救成功顺利完成手术，4 例抢救失败，其中 3 例自动离院，1 例抢救无效死亡。不同病因不同入路引起循环崩溃抢救措施及护理配合要点不同，故针对不同的循环崩溃原因总结相应的个性化、标准化的围术期急救护理要点，包括：组建循环崩溃急救团队，制定 TAVR 术中循环崩溃应急预案，清单管理法准备器械设备及用物，制定各类规范化抢救流程，组织培训考核、确保循环崩溃发生时能快速反应、各司其职、分工协作。结论：TAVR 术中循环崩溃事件发生率虽低，但抢救难度大、死亡率高。早期识别和制定标准化的抢救措施和个性化精准护理配合可以帮助快速应对 TAVR 术中循环崩溃。

新型机器人辅助穿刺系统在 CT 引导下肺穿刺活检术的应用研究及护理

张峥
上海市肺科医院

目的 探讨新型机器人辅助穿刺系统 RC120 在 CT 引导下肺穿刺活检术的应用效果及护理配合，以期新型机器人辅助穿刺系统的推广应用提供现实依据。

方法 2022 年 1-6 月，采用便利抽样法选择某院行机器人辅助穿刺的患者 29 例为观察组；同期同法选择采用传统经 CT 引导下人工操作穿刺的 29 例患者为对照组。比较两组穿刺患者的定位精度、护理满意度及并发症发生率。

结果 观察组患者定位精度为 5.0 (3.6-6.2) mm[中位数 (四分位数)]，优于对照组的 6.4 (4.0-8.4) mm[中位数 (四分位数)]，差异有统计学意义 ($z = -2.179$, $P = 0.034$)。观察组患者的满意度为 91.1 ± 1.6 分 (平均值 \pm 标准差)，明显高于对照组的 82.2 ± 1.7 (平均值 \pm 标准差) 分，差异有统计学意义 ($t = 21.047$, $P < 0.001$)。观察组中有 2 例患者发生并发症，并发症发生率为 6.9%；而对照组有 8 例患者发生并发症，并发症发生率为 27.6%；差异有统计学意义 ($\chi^2 = 4.350$, $P = 0.037$)。

结论 针对性护理能够减少辅助穿刺系统 RC120 在 CT 引导下进行肺穿刺引起的并发症发生风险，提高肺穿刺定位精度，提升患者护理满意度，值得推广。

基于视觉传达理论的视频宣教模式在输液港患者自我维护中的效果研究

吴燕燕
中国人民解放军海军军医大学第二附属医院

目的 探讨动画视频健康宣教模式对完全植入式静脉输液港患者自护能力提升的应用价值。

方法 本研究为一项单中心、前瞻性临床研究，共纳入 208 例接受完全植入式静脉输液港(Totally implantable venous access ports, TIVAPs)患者，其中 108 例为对照组（接受常规护理宣教），100 例为强化动画视频宣教组。比较两组患者的基本信息、TIVAPs 认知量表、并发症发生率及 TIVAPs 使用时长。

结果 两组患者人群均呈正态分布，无显著统计学差异 ($p > 0.05$)。在进行了强化视频宣教后，患者对于 TIVAPs 的认知度显著上升，表现为认知评分量表得分明显提高 ($71.77 + 19.22$ vs $59.8 + 15.41$, $p < 0.01$)，其自我护理能力得分也随之显著加强 ($78.83 + 2.23$ vs $73.92 + 5.15$, $p < 0.05$)。正因如此，视频宣教组的并发症总体发生率显著降低 (20.4% vs 12% , $p < 0.05$)。导管相关性感染均为两组最常见术后并发症，且两组发生率相似 (7.4% vs 6% , $p > 0.05$)。然而，对照组中，伤口愈合障碍和导管尖端血栓形成发生率分别为 5.6% 和 3.7% ，均显著高于视频宣教组 ($p < 0.05$)。由于对照组存在较高的 TIVAPs 并发症发生率，导致研究期间对照组 TIVAPs 使用时长显著短于视频宣教组 ($p < 0.05$)。

结论 围手术期强化动画视频宣教可显著提升使用者对于 TIVAPs 的认知程度和自我护理能力，从而显著降低 TIVAPs 并发症。提示强化视频宣教是一种有效的 TIVAPs 护理宣教方式。

优化护理流程在脑血管重症患者 颅脑“百秒”快速成像磁共振检查中的应用研究

庄丽娜、杜晓琳、宋清伟
大连医科大学附属第一医院

目的：探讨优化护理流程在脑血管重症患者颅脑“百秒”快速成像磁共振检查中的应用效果。

方法：2022 年 2 月至 2022 年 11 月神经内科重症患者 53 例为研究对象，随机分为对照组和干预组（对照组 26 例，干预组 27 例），均采用 3.0T MR（uMR Omega, 上海联影医疗）进行颅脑磁共振检查。对照组患者按照常规检查流程管理模式进行颅脑磁共振成像检查，扫描序列包括轴位 T2WI，T2-flair，T1WI，DWI，3D-TOF-MRA，各序列扫描时间分别为 124s、112s、136s、68s、183s。总扫描时间 623s。干预组患者按照流程优化管理模式进行颅脑“百秒”快速磁共振成像检查，扫描序列与常规颅脑磁共振检查相同，各序列扫描时间分别为 15s、18s、34s、44s、57s。总扫描时间 168s。检查完成后由护士记录磁共振检查全流程时间并完成家属护理满意度评分。由一名放射科诊断医生对两组图像进行图像质量评分。采用 Mann-Whitney U 检验比较两组磁共振检查全流程时间、磁共振图像质量和家属护理满意度评分， $P < 0.05$ 为差异具有统计学意义。

结果：干预组患者一次检查成功率高于对照组。差异具有统计学差异（ $P < 0.05$ ）。两组图像均符合诊断标准，两组图像质量主观评分差异无统计学差异（ $P > 0.05$ ）。干预组和对照组家属护理满意度评分差异具有统计学差异（ $P < 0.05$ ）。

结论：优化护理流程颅脑“百秒”快速磁共振成像能显著缩短脑血管重症患者磁共振检查时间，降低检查的风险，提高了检查成功率和家属护理满意度，保证了患者的安全，具有较高的临床价值。

CT 增强过敏史患者检查前禁食情况与不良反应的关系

李建洁、李雪*
中国人民解放军陆军特色医学中心

目的：最新指南明确提出不推荐常规 CT 增强检查前禁食。以往研究已经发现具有碘对比剂过敏史和其他过敏史患者是不良反应的独立危险因素。但取消禁食是否会与碘对比剂相关不良反应产生协同效应进一步增加不良反应发生风险，目前还不清楚。因此临床人员难以将指南运用至放射实践中。本研究旨在探寻具有碘对比剂过敏史和其他过敏史这类特殊患者饮食状态与不良反应和呕吐之间的关系，以期指南的丰富和完善提供依据。

方法：对 2014 年 1 月至 2020 年 12 月期间接受 CT 增强有过敏史的患者进行回顾性分析。进行 c_2 检验和单变量回归分析以探讨禁食与不良反应和呕吐之间的关系。

结果：27758 例有过敏史的患者（713 例碘对比剂过敏史和 27045 例其他过敏史；59.1 岁 \pm 13.7；14415 名男性）入组。未发生吸入性肺炎或死亡。有过敏史患者禁食组与非禁食组不良反应或呕吐总体发生率差异无统计学意义（ $P > 0.05$ ）。对于注射碘克沙醇 320 有碘对比剂过敏史患者，禁食组不良反应发生率高于非禁食组（44.44% vs 0%， $P = 0.021$ ）。对于其他过敏史的患者，禁食组严重不良反应的发生率高于非禁食组（0.06% vs 0.01%， $P = 0.046$ ）。腹部检查时禁食组不良反应发生率高于非禁食组（0.63% vs 0.24%， $P = 0.022$ ）。单变量回归分析显示未禁食不是不良反应发生的危险因素。

结论：取消禁食不会增加不良反应和呕吐并发症的总体风险。其他过敏史的患者，禁食与较高的严重不良反应发生率相关。对于一些特殊的患者亚组，禁食与较高的不良反应发生率相关。

一例脑出血合并肺栓塞病例分享

钟小宁、王玉娟、王小琳
重庆医科大学附属第二医院

本案例中，患者是一位自发性脑出血病人，治疗中并发了肺栓塞，目前公认的肺栓塞治疗为溶栓及抗凝，但抗凝溶栓治疗又会大大增加脑出血风险，处于两难境地，孰是孰非，何去何从？为了改善严重肺栓塞患者的临床结局，我院建立肺栓塞多学科快速反应团队，通过专家面对面会诊或实时线上会议等形式，为脑出血合并严重肺栓塞患者提供最佳的、个体化的诊疗方案。

在整个治疗过程中，护理团队通过详细全面的护理评估，梳理出护理难点有转运风险、术中体位管理、抗凝与出血的风险、右心衰与水化。通过制定详细的护理措施、专科流程，最终患者转危为安，顺利出院。

1 例碘克沙醇致罕见急性泛发性发疹性脓疱病

马秀秀^{1,2}、曾小红¹、何晓华¹、毕燕方¹
1. 南昌大学第一附属医院
2. 南昌大学护理学院

急性泛发性发疹性脓疱病(acute generalized exanthematous pustulosis, AGEP) 是一种罕见的迟发性超敏反应(non-immediate hypersensitivity reactions, NIHR)，发病率仅为 1~5 /1 000 000，于 1980 年由 Beylot 等报道并命名。临床上以红斑基础上发生的成片针尖大小、非毛囊性、无菌性脓疱及发热等全身症状为特征，多伴外周血白细胞增多及中性粒细胞增多，约 1/3 的患者可能伴有嗜酸性粒细胞增多，预后良好。内脏受累并不常见，低于 20%可发生，常累及器官为肝、肾、肺等，严重时可能导致死亡。据报道，AGEP 可由药物、感染或其他因素诱发（如汞、蜘蛛接触史等），约 90%的病例是由药物引起，但由碘对比剂所致极少报道，尤其是碘克沙醇。本案例为发生在本院的 35 岁女性行腹部多层螺旋 CT 增强扫描时使用碘克沙醇所致的罕见 AGEP，该患者在注射碘克沙醇后的 12 小时内出现瘙痒感，红疹从颈部、枕部、双臂短时间内蔓延至整个躯干部，并以红斑为基础出现密集或散在的白色针尖大小样脓疱，部分区域皮温稍高。同时该患者出现了发烧以及白细胞、中性粒细胞计数增高、血沉增快等典型特征。在即刻停止可疑致敏物碘克沙醇之后，基于患者不适表现进行对症治疗，其病情逐渐好转，部分区域脱屑、红斑变淡直至全身皮肤状况基本与患病前一致。即本案例报告了该患者 AGEP 的发生、发展、内在机制、治疗及转归。经过系统检索，国

内目前尚未发现碘克沙醇所致的 **AGEP** 案例，国外（仅英文）也仅有 4 例。鉴于该碘对比剂在放射科的广泛应用，放射科医生和转诊临床医生应该意识到这种潜在的并发症，对此类反应应有充分的认识，熟悉诊断及处理流程，以期更合理、规范地加以应对。

急诊手术--生命之舞

王京

华中科技大学同济医学院附属协和医院

各位老师大家好，我是来自武汉协和医院介入放射科的一名护士，我叫王京。今天我想给大家分享一个故事，这是我第一次急诊的故事。说起急诊，在座的各位老师肯定都经历过。急诊，对各位老师来说意味着什么呢？是打碎美梦，离开温暖被窝的无奈？还是临近下班又被通知有手术的失落？亦或是一直处于“待机”状态的惴惴不安？对我来说，有不安，在于不知何时会想起的电话铃声；有无奈，在于不得不放下手中的一切，马上赶到医院参与手术；但是更多的还是对生命的敬畏与珍视，我甘心付出所有，只为患者能够转危为安。

影像科护士共情疲劳现状及影响因素研究

伍冬梅、赵俐红

四川大学华西医院

目的：对影像科护士的共情疲劳现状进行调查，并分析其影响因素，为促进影像科护士心理健康、稳定护理队伍提供参考。

方法：于 2022 年 7 月便利选取 169 名来自四川省三级医院的影像科护士进行问卷星横断面问卷调查，调查工具包括一般资料调查表、领悟社会支持量表、中文版专业生活质量量表。采用 SPSS23.0 进行统计分析，主要统计学方法为描述性统计分析、单因素方差分析、相关性分析及多元线性回归分析。

结果：影像科护士共情疲劳三个维度得分为：共情满意（ 30.88 ± 8.43 ）分、职业倦怠（ 24.42 ± 5.74 ）分、继发性创伤应激（ 19.49 ± 4.21 ）分，89.9%的护士共情满意处于中低水平，61.5%的护士职业倦怠为中、高水平，26.6%的护士处于继发性创伤应激中等水平。多元线性回归分析显示，无工作场所暴力经历、工作满意度高、领悟社会支持高的护士共情满意水平高、职业倦怠水平低（ $P < 0.05$ ），无工作场所暴力经历的护士继发性创伤应激水平低（ $P < 0.05$ ）。

结论：影像科护士存在一定程度的共情疲劳，并且受工作场所暴力、工作满意度和领悟社会支持的影响。提示护理管理者应重视影像科护士共情疲劳管理，营造良好的工作环境，减少工作场所暴力，提供更多的支持，提升护士工作满意度，以减轻护士共情疲劳。

临床路径管理模式在成人 CTE 检查中的应用效果与评价

梁蝴蝶、王姝丽、邝楠楠、王晴文

山东省立医院

目的 探讨临床路径管理模式在成人 CTE 检查中的应用效果。

方法 采用便利抽样法，选取 2022 年 5 月-2023 年 4 月行 CTE 检查的 81 例成年患者为研究对象。

以 2022 年 10 月为节点,将 2022.5-2022.10 的 CTE 检查者作为对照组 (39 例),实施常规管理模式。将 2022.11-2023.4 的 CTE 检查者作为实验组 (42 例),实施临床路径管理模式。比较两组检查准备时长,肠道充盈评分及患者就诊满意度。

结果 对照组检查准备时长显著高于实验组,对照组肠腔充盈评分低于实验组评分,对照组肠道准备优良率显著低于实验组,对照组患者就诊满意度显著低于实验组。

结论 在 CTE 检查中实施临床路径管理模式具有良好的临床效果,能充分调动患者的主观能动性,提升患者就诊满意度,提升图像质量和技护工作效率,值得影像科推广应用。

6 例肝癌患者载药微球经导管动脉化疗 栓塞术后罕见并发症的护理

陈冬萍

华中科技大学同济医学院附属协和医院

目的:对 6 例载药微球经导管动脉化疗栓塞治疗肝癌术后发生的罕见并发症进行原因分析,总结护理经验。

方法:选取 2019 年 1 月至 2020 年 12 月行载药微球经导管动脉化疗栓塞术的 700 例肝癌患者中发生罕见并发症的 6 例进行分析,总结罕见并发症发生的原因及护理对策。

结果:本组 6 例患者中,2 例继发感染中 1 例好转出院,1 例死于感染性休克;2 例 DIC 中 1 例好转出院,1 例抢救无效死亡;1 例肠梗阻、1 例肿瘤破裂,均治疗好转出院。

结论:护理人员应结合患者既往史、血液检查指标及载药微球经导管动脉化疗栓塞术后常见的不良反应发生的规律,针对反复高热、尿色异常、穿刺点延迟瘀斑的出现、药物无法控制的腹痛及肠梗阻等异常情况,要与正常栓塞综合征相鉴别,做好潜在感染性休克、DIC、肠梗阻及肿瘤破裂等并发症发生的风险评估、应急处理准备及实施科学规范的健康宣教,可有效减少术后并发症的发生。

OR-0080

体外膜肺氧合支持下危重患者行 CT 血管造影检查的放射科管理

王晓弥

浙江大学医学院附属第二医院

目的:总结 8 例体外膜肺氧合支持下危重患者行 CTA 检查的放射科管理。

方法:放射科管理包括 1.组建由高年资护师、技师、医师组成的放射科检查团队。2.专人负责培训学习、制定科室应急预案、ECMO 患者行 CT 检查的模拟情景急演练(与监护室联合)。3.制定 ECMO 支持下危重患者行 CT 的检查流程。4.监护室转运团队同质化培训及要求。5.检查前快速病情评估。6.安全过床,固定导管位置,各人员各司其职。7.增强过程中护理监控,个性化设计 CTA 扫描模式。7.快速安全转运。8.急诊结构化报告。

结果:本院自 2020 年 7 月 3 日~2022 年 9 月 30 日共有 8 例患者进行 CTA 检查(1 例肺动脉造影,3 例肺动脉及支气管动脉造影,1 例胸痛 CTA,2 例 CT 全主动脉造影,1 例冠脉 CTA)。8 例患者均快速平稳顺利完成了检查,无生命体征大波动及碘对比剂过敏及外渗情况的发生,外出检查不良事件发生率为零,外出检查总耗时 15~25 分钟,病情好转出院 2 例,6 例自动出院。

结论:放射科管理有助于降低 ECMO 支持下危重患者院内转运不良事件的发生率。

The application of predictive nursing in magnetic resonance scan using the Hopkins Fall Score

Wanjiang Dai
Xuanwu Hospital Capital Medical University

Magnetic resonance imaging is considered a key reference for clinical treatment, with a large number of inpatients and outpatients visiting the magnetic resonance imaging room for examination every day. Patients have diverse symptoms and varying states. How to efficiently, orderly, and safely complete magnetic resonance scan under the current shortage of nurses and auxiliary personnel is an urgent problem for medical imaging departments to solve. According to the Hopkins Fall Scale, the patient's level of consciousness, mobility, vision, hearing, scanning coordination, and use of high-risk medications were assessed before the MRI examination to evaluate the cooperation level and scanning safety of hospitalized patients. Based on the evaluation results, the number of patients scheduled for MRI scanning per hour was determined, and corresponding numbers of nurses and support personnel were provided to assist patients with the examination.

The patient's cooperation level can be predicted based on the score, thereby avoiding the risk of transportation and the need for other protective measures. This will increase nursing and support personnel, safeguard patient safety, shorten patient waiting time, and guarantee that patients complete their examination in the safest manner and avoid cross-infection in the hospital within the shortest possible timeframe. Simultaneously, meticulous planning and quality control should be implemented for the examination process of patients, ensuring the accuracy of the examination results. In addition, attention should be paid to the mental state and psychological needs of patients, and necessary measures should be taken to alleviate patients' tension and anxiety, thereby enhancing their cooperation. Through rigorous and scientific management techniques, patients receive top-quality nursing care throughout the examination process, maximizing patient safety.

Analysis of the current situation of perioperative pain management and the influencing factors of self-efficacy of pain management of nurses in interventional department in China

Hao Zhang¹, Xue Li², Xiaochun Hu³
1. Henan Cancer Hospital
2. Daping Hospital, Army Medical University
3. Cancer Center of Sun Yat-sen University

Objective: The aim of this study was to critically evaluate the present status of perioperative pain management among nurses in interventional departments, as well as to delineate the factors influencing the self-efficacy of pain management. The objective was to furnish recommendations that may advance the standardized administration of perioperative pain.

Methods: In the month of October 2022, a bespoke questionnaire was utilized to examine the current pain management practices of 941 nurses in interventional departments across 24 provinces and municipalities directly governed by the Central Government in China. The investigation was conducted utilizing a convenient sampling technique, in conjunction with the

nursing working group platform of the Radiology Branch of the Chinese Medical Association.

Results: A significant majority (76.5%) of the nurses in the interventional departments had undergone training related to pain management; however, over one-third (37.6%) had not engaged in relevant training during the previous two years. Merely 4.9% of nurses expressed confidence that their knowledge in pain management was adequate to satisfy the requisites of clinical practice. The foremost three areas of pain management information desired by the nurses in the intervention department were pain psychology (79.6%), pharmacological pain treatment (78.1%), and non-pharmacological pain interventions (77.4%). A majority (57.6%) of the nurses failed to assess the patients' comprehension and perspectives of analgesia, elements contributing to pain exacerbation or alleviation, and the outcomes of analgesic measures. The cumulative score for the pain self-efficacy questionnaire among nurses in the intervention department was 63.95 ± 21.83 . Multiple linear regression analysis revealed that variables such as the acquisition of pain knowledge, the frequency of pain training in the past two years, the ratio of evaluation tools employed for assessment, the prevalent utilization of multi-dimensional evaluation instruments, and professional course studies in academia were determinants influencing pain management self-efficacy.

Conclusion: The state of perioperative pain management by nurses within China's interventional departments is unstandardized; the proficiency and capabilities of nurses in pain management are inadequate to fulfill clinical demands, and the provision of continued education in pain management is lacking. It is imperative for nursing administrators within the interventional department to devise accurate and targeted training schemes, congruent with the identified deficiencies among the nursing staff, thereby enhancing the ability to assess, prevent, and treat pain in the perioperative context. This, in turn, can lead to an augmented patient experience during interventional diagnostic and therapeutic procedures.

OR-0083

“防微杜渐，步步为营”——1 例主动脉夹层合并 心功能不全患者 CT 增强检查惊险记

兰芳、江小红、钟诚杨
中国人民解放军陆军特色医学中心

案例呈现：患者女性，68 岁，高血压史 20 余年，因胸痛 6 小时，外院就诊怀疑主动脉夹层，120 送入我院急救部，为进一步明确诊断，拟行头颈 CTA、胸腹 CT 增强检查，平车推入影像中心。T: 36.5°C, P:126 次/分, R: 26 次/分, BP:140/115mmHg, SPO2: 90%。无碘对比剂使用史、过敏史。患者胸腹平扫时发现有心包积液，初步判断可能存在夹层内破风险。与影像科和急诊科医生沟通后，决定先行头颈 CTA 检查。当注射 ICM 后患者立刻出现一过性意识障碍，但生命体征相对平稳，考虑与心包填塞有关。与临床医生沟通，影像科建议停止检查，快速安全转移至急诊科。

原因分析：（1）脉压差缩小：结合患者高血压病史，且有胸痛体征，怀疑存在心包积液，导致脉压差缩小。（2）心包积液：患者怀疑主动脉夹层，考虑是组织液经过假腔薄弱的血管壁渗透到心包腔，导致少量的心包积液。（3）平扫发现明显心包积液是否继续检查：立即与临床医生沟通，考虑风险/获益比，决定继续行头颈 CTA 检查。（4）注射碘 ICM 后一过性意识障碍：一方面考虑夹层类型的原因，该患者为 Standard A 型。另一方面考虑高压注射 ICM 进一步加重心脏负荷，引起了阿斯综合征。

思考与启示（护理方法）：（1）开启急救绿色通道，同时做好环境、医护、设备、急救四准备。（2）全程动态评估与护理：①检查前：患者到达后，护士立即开始评估，患者存在脉压差缩小、心功能不全等风险，属 ADR 高风险人群，告知风险并签慎用知情同意书，同时告知医生、技师检查风险，设置个性化扫描方案，全程动态监护。②检查中：搬运过程中注意保持平稳，设计个性化体位，检查过程中行动态观察。患者胸腹平扫后发现明显胸包积液，此时生命体征平稳，但脉压差

变小, 说明存在夹层破裂风险。立即沟通医生是否继续检查, 最终决定继续行 CTA 检查。注射 ICM 时严密观察, 患者发生一过性意识障碍, 护士即刻呼救并评估患者, 高度怀疑夹层随时破裂, 与临床沟通果断终止检查。②检查后: 再次评估患者感受/意识, 确认患者生命体征相对稳定, 快速安全转运。

OR-0084

虚拟护士在肝癌患者增强 CT 检查中的心理干预

崔馨元、郑淑梅、孙丽琴
哈尔滨医科大学附属第二医院

目的: 探讨增强 CT 检查前多媒体宣传及心理护理在肝细胞癌(HCC)患者中的应用价值。

方法: 选取 2020 年 7 月至 2023 年 4 月在我院接受增强 CT 检查的 HCC 患者 150 例, 随机分为研究组和对照组, 每组 75 例。在检查前等待期间, 研究组患者在独立安静的房间内, 观看与肝脏增强 CT 检查相关多媒体视频 30 分钟, 而对照组患者则进行常规呼吸训练等基础护理。采用焦虑自评量表 (SAS) 和抑郁自评量表 (SDS) 评估检查前后患者心理状况的变化, 记录 CT 增强检查后不良反应的发生情况。同时邀请 1 名放射科医师, 在不了解患者情况的前提下, 按照 I-IV 级对患者检查后图像质量进行评价。

结果: SAS 和 SDS 评分的克隆巴赫系数分别为 0.875 和 0.851, 可信度较好。在实施多媒体心理护理干预前, 对照组和研究组患者的 SAS 和 SDS 评分在检查前基本相同。但经多媒体心理护理干预后, 观察组患者 SAS 和 SDS 评分分别为 35.65 ± 6.67 和 38.21 ± 4.32 , 均显著低于对照组 (48.34 ± 3.33 和 46.91 ± 4.26), 差异均有统计学意义 ($p < 0.05$); 研究组不良反应发生率为 1.3%, 显著低于对照组的 4% ($P < 0.05$)。研究组的图像质量获评 I 级的数量高于对照组, 与对照组患者比例差异有统计学意义 ($p < 0.05$)。研究组中 II-IV 级图像质量患者比例低于对照组, 但差异无统计学意义 ($p > 0.05$)。

结论: 对接受增强 CT 检查的 HCC 患者, 在检查前进行多媒体宣传和心理护理, 可显著改善患者检查当时的紧张和焦虑情绪, 保证增强 CT 图像质量, 同时减少不良反应发生的可能性。

OR-0085

医学影像学线上、线下实习的探索与实践

马丽娅、罗彦、许楚瓯、沈亚琪、胡学梅
华中科技大学同济医学院附属同济医院

背景: 在 2020 年突发全球紧急情况下, 我院线上教学进行了放射科大课讲授及实习课讲授。本研究旨在比较线上与线下实习授课的效果, 并探索更适合放射科实习的模式。

方法: 选取 2019 年及 2020 年于我院进行实习的临床医学及临床医学 (中德班) 本科生进行匿名问卷调查。2019 年线下实习时主要从校内的评价系统中提取对课堂及老师评价相关信息, 2020 年线上实习时同时包括电子调查问卷、校内评价系统中提取。校内评价系统包括, 包括授课内容丰富程度、病例新颖程度、是否全面 (即包括中枢、胸、腹、骨肌等多个系统)、是否起到了对大课的补充及巩固作用; 电子调查问卷包括对放射科实习的整体打分、是否起到了补充作用、是否提高了对放射学的兴趣以及恢复线下实习的意愿、课堂的生动性、内容丰富度、内容难易程度、是否适合自己进行打分, 并统计授课老师的工作年限、性别、年龄及课堂回应情况。上述各项需要评分时, 均为 5 分制, 非常满意为 5 分, 非常不满意为 0 分, 依此类推。

结果: 在 2020 年线上实习授课中, 共三个临床医学专业, 分别有 7、4、26 名学生进行了评价, 三个专业相比, 学生对医学影像学整体较感兴趣 (三个专业评分均值为 4.6-5.0 分), 线下实习意愿

较为强烈 (4.8-5.0 分), 并认为对大课起到了补充作用 (4.7-4.8 分), 无明显统计学差异。而对于不同的影像专业部位授课, 共进行了 68 人、85 次授课, 在授课的生动性、丰富性、易理解性、是否适合本科生/本人, 均无明显统计学差异 ($P>0.05$), 但工作年限、性别、年龄、课堂回应应有统计学差异, 在进一步研究相关性分析中, 发现课堂回应与授课教师年限 ($r=0.10$, $P=0.06$)、年龄 ($r=0.21$, $P<0.01$) 呈正相关趋势, 而女性比男性打分更高 ($P<0.01$)。线上与线下的授课对比中, 实习带教的内容丰富性、病例吸引力、与大课授课内容的互补性在两组间大致相仿, 但线上实习授课系统更为全面, 线下实习带教局限于 1-2 个系统。

结论: 放射科线上实习效果与线下实习效果无显著差异, 短期内线上实习涉及知识更为全面, 但学生恢复线下实习意愿较为强烈。年龄更长、工作年限更长的女性教师可能有更好的课堂回应。

Naked eye 3D-AR teaching assistant system applied to undergraduate medical imaging education: a pilot study

Lina Ma, Jing Ren, Rui Peng, Jingji Xu, Qingling Yang, Aceng Li, Ye Han, Lei Yuan, Fan Shen, Danqing Yin, Minwen Zheng, Yayu Huang
Xijing Hospital, Air Force Medical University

Objective: Naked eye three-dimensional (3D) is an innovation that enables stereoscopic vision without external tools such as polarized glasses. This research aimed to explore the application value of the Augmented Reality (AR) teaching assistant system based on naked eye 3D in the undergraduate medical imaging education.

Methods: 52 students of grade 2019 clinical medicine major undergraduate as experimental group were taught through the naked eye 3D-AR Application (APP), which was independently developed. In contrast, 50 students of grade 2018 clinical medicine major undergraduate who adopted the traditional teaching method were the control group. According to Bloom's cognitive learning taxonomy, teaching effect of the two groups was evaluated by test score and students' satisfaction questionnaire, those were analyzed with t test and χ^2 test in SPSS Statistics software. **Results:** The theoretical examination (62.06 ± 3.06 vs 59.82 ± 3.38), practical testing (22.90 ± 2.35 vs 21.06 ± 2.65) and total score (84.96 ± 4.58 vs 80.88 ± 6.01) were statistically different between the experimental group and control group. The questionnaire showed by Likert scores (include enjoyment, satisfaction, participation, learning efficiency and understandable) of experimental group were significantly higher than those of control group. What's more, scores of the convenience of using the naked eye 3D-AR APP and the willingness to keep use the APP were really high in the experimental group.

Conclusions: The naked eye 3D-AR teaching assistance system is a new and efficient teaching model for medical imaging undergraduate teaching. Follow Bloom's cognitive learning taxonomy, compared with traditional teaching methods, it improved students' learning interest, increased teaching interaction, enhanced teaching effect, and has a good application prospect.

基于“三维融通 虚实结合”理念的医学影像技术本科生临床思维模式培养策略

张磊
吉林大学第一医院 放射科

目的: 探讨采用基于现实临床场景的情境案例库和基于真实病例的影像三维重建可视化案例库的实

习带教模式在影像技术检查操作及后处理重建, 综合临床思维培养中潜在的应用价值, 可拓展性, 并展望其建设推广的可能。

方法: 选取 2019 年至 2022 年在我院接受影像检查并确诊为常见疾病的患者, 经医学伦理委员会批准, 患者签署知情同意后, 利用三维重建技术将影像数据转化为三维模型, 并加入相关解剖结构和临床信息, 构建了包含 117 个案例的影像三维重建可视化案例库。同时, 根据疾病特点、检查项目操作要点等因素, 设计了 14 个基于实际临床场景的情境案例, 包括患者全流程诊治、设备操作、影像检查与诊断等内容, 形成了一个涵盖多场景和多层次的情境案例库。将 2019、2020 级影像技术专业本科生分为两组, 一组为案例库教学, 20-25 人, 除已有理论教学和实践教学外, 使用基于三维重建、3D 打印技术的可视化案例库进行解剖结构、临床疾病的教学和讨论, 并使用基于实际临床场景的情境案例进行模拟操作、后处理重建和临床思维训练; 另一组为常规教学, 使用传统课件和模型进行教学。两组分别由高年资技师进行临床带教工作辅助教学进行。在教学结束后, 对两组学生分别进行了解剖结构、临床疾病知识和操作技能考核, 并在临床生产实习轮转考核过程中对两组学生的教学满意度进行问卷调查。

结果: 案例库教学组的学生在解剖结构、临床疾病知识和操作技能考核中, 平均分分别为 92.3、90.5 和 88.7, 高于常规教学组的平均分 85.6、83.2 和 81.4, 差异均有统计学意义 ($P<0.05$)。案例库教学组的学生在教学满意度问卷中, 对教师授课水平、案例质量、教学方法、教学效果等方面的评价均高于常规教学组的评价, 差异均有统计学意义 ($P<0.05$)。

结论: 使用基于现实临床场景的情境案例库和基于真实病例的影像三维重建可视化案例库的实习带教模式, 在提高医学生解剖结构、临床疾病知识和操作技能水平, 增强医学影像专业学生对临床实践操作的兴趣和参与度方面, 具有明显优势。该教学模式也有利于创新拔尖人才的培养, 有助于培养具有新医科视野和临床思维模式的影像技术人才。

3D 打印断层影像模型在医学影像教学中的初步应用

陈钰、薛华丹、张大明、李雅彤、苏童、金征宇
中国医学科学院北京协和医院

目的: 建立 3D 打印断层影像模型, 并且应用于医学本科生医学影像学小组教学课堂, 评价模型在教学中的作用。

方法: 基于正常 CT 增强图像分别制作头、胸部、肝脏三维仿真模型, 并且将其分为多个切片的仿真模型。通过 3D 打印技术制作切片实物模型, 然后组装成三维模型, 并且将影像断层图像与切片实物模型进行对应, 即为 3D 打印断层影像模型。将 3D 打印影像断层模型应用于北京协和医院 2021 年度本科生医学影像学小组教学课堂。使用德尔菲法及层次分析法, 采用 1-5 分法评价模型在教学中的绩效期望以及社会影响, 共 13 二级个指标。比较老师及学生对模型评价的差异。

结果: 收集 5 位教师及 28 位学生对 3D 打印断层影像模型的问卷评价结果, 并进行分析。结果表明, 教师对模型的总体评价高于学生 (4.14 ± 0.55 v.s. 2.86 ± 1.05 , $P=0.003$)。老师和学生均认为模型可以帮助讲解和教授断层影像, 有助于将器官的断面结构转换为 CT/MR 图像中的器官断面, 并且对胸部及肝脏模型的教学使用体验比较满意, 教师和学生的评分比较无统计学差异 ($P>0.05$)。对于模型的总体绩效期望及社会影响, 教师的评价均高于学生 ($P<0.05$)。

结论: 3D 打印影像断层模型应用于医学影像学课堂教学, 对讲解和教授断层影像有一定辅助作用。教师对模型的评分普遍高于学生, 未来尚需对模型的结构进行优化, 以及进一步探索有利于学生使用的方式。

磁粒子成像和荧光分子成像双模态成像监测 具有强靶向保留效应的自体外泌体负载平台并 引导小鼠前列腺癌模型的光热/磁热治疗

刘松鹭、田雅琪、王良
首都医科大学附属北京友谊医院

目的：前列腺癌是最常见的男性癌症类型。早期诊断和治疗对于改善前列腺癌患者的预后至关重要。在最近的研究中，来自癌症患者的尿液外泌体已被广泛用于靶向递送。磁粒子成像是一种新兴的非侵入性成像方法，用于对分布在生物体中的超顺磁性氧化铁纳米粒子进行实时定量成像。由于信号只能在磁纳米粒子中检测到，因此它提供了极高的对比度和信噪比，无背景信号。荧光分子成像具有较高的灵敏度和空间分辨率，广泛应用于前列腺癌的 diagnosis 和治疗，但荧光分子成像存在深度限制，成像深度较低。如果将荧光分子成像和磁粒子成像结合起来，可以发挥两种成像的优势，获得高分辨率、高灵敏度的成像，为肿瘤的精准成像提供新的方向。它还提供了一种用于检测体内外泌体加载平台的准确成像方法。本研究旨在利用高灵敏度磁粒子成像和荧光分子成像来检测肿瘤部位外泌体负载平台的靶向递送，从而指导前列腺癌的光热和磁热联合治疗方案。

方法：从患者体内提取尿液外泌体，并负载磁纳米粒子和荧光染料。采用磁粒子成像和荧光成像进行双模态成像，动态监测外泌体负载平台在前列腺肿瘤部位的靶向和代谢。同时，使用外泌体负载平台对前列腺癌进行联合热治疗。

结果：利用磁粒子成像和荧光分子成像监测外泌体在前列腺肿瘤小鼠模型中的靶向滞留效应。外泌体负载平台在成像过程中也表现出强大的同源靶向能力(实验组:66.48%±3.85%;对照组:34.57%±7.55%, **P<0.01)，经体外成像和体外组织普鲁士蓝染色证实。同时，我们验证了光热治疗和磁热治疗前列腺癌模型可以达到更好的治疗效果。

结论：利用磁粒子成像和荧光分子成像双模态成像研究发现，外泌体负载平台对肿瘤部位具有更好的靶向滞留性，并且与肿瘤细胞有更好的结合，这表明内源性外泌体可以作为示踪剂并指导后续治疗。内源性外泌体结合多模态成像具有良好的临床转化潜力，未来可用于前列腺癌的靶向诊断和治疗。

响应型纳米探针联合定量磁共振成像技术 精准评价肺癌耐药的实验研究

沈爱军、王培军
上海市同济医院

目的：本研究拟通过构建 H₂O₂ 响应型纳米探针 Fe-MOFs@MnO₂，并与定量 T1-mapping MRI 技术联合应用，以期对 NSCLC 耐药的无创精准评价提供新方法。

方法：在乙醇溶液中，采用低温的合成方法制备 MIL-53 纳米颗粒，再在其表面可控氧化原位生长 MnO₂ 层，得到探针 Fe-MOF@MnO₂。对纳米探针的理化性质和体外水溶液 MRI 性能行相关表征。细胞和动物 MRI 实验，分别验证纳米探针 Fe-MOF@MnO₂ 联合 T1-mapping 定量 MRI 技术精准评价肺癌耐药的有效性和高效性。细胞和动物活体水平评价纳米探针的生物安全性。动物活体水平评价纳米探针的药代动力学特征。

结果：X 射线衍射、傅里叶红外光谱、紫外光谱、透射电镜等检测结果表明，成功合成纳米探针 Fe-MOF@MnO₂，且合成的纳米探针形貌均一，分散良好，水合动力学直径约 129±15 nm。体外水溶液试验结果提示，纳米探针 Fe-MOF@MnO₂ 能够灵敏响应 H₂O₂ 产生 MRI 信号，与 T1WI 技

术相比, T1-mapping 技术不仅可以提供定量数据, 且具有更高的检测灵敏度 (约为 T1WI 的 2.6 倍, $p < 0.01$)。细胞与动物 MRI 实验结果表明, 纳米探针 Fe-MOF@MnO₂ 行 MRI 能够有效诊断肺癌耐药, 且与 T1-mapping 技术联合应用具有更高的检测灵敏度和可重复性。Mn²⁺螯合实验和动物活体药代动力学实验结果表明, 纳米探针响应 H₂O₂ 后能够发生降解, 排除体外, 且能够同时螯合游离 Mn²⁺, 降低其可能的生物毒性。细胞和动物毒性实验结构也表明探针具有良好的生物安全性。结论: H₂O₂ 响应型纳米探针 Fe-MOFs@MnO₂ 与 T1-mapping 成像技术联合, 能够有效检测肿瘤微环境中 H₂O₂ 含量的变化, 为肺癌耐药提供无创、精准的评价方法。同时, T1-mapping 成像技术提供的定量数据可以保证检测结果的对比性和可重复性。

Dual-modality imaging-guided manganese-based nanotransformer for enhanced photothermal therapy combined immunotherapeutic strategy against triple-negative breast cancer

Xiuhong Guan^{1,2,4}, Yue Zhao^{1,4}, Zhiyong Wang³, Ruimeng Yang¹, Xinqing Jiang^{1,4}

1. Guangzhou First People's Hospital/The Sixth Affiliated Hospital of Guangzhou Medical University (Qingyuan People's Hospital)

2. The Sixth Affiliated Hospital of Guangzhou Medical University (Qingyuan People's Hospital)

3. Sun Yat-Sen University

4. Jinan University

PURPOSE: To treat refractory triple-negative breast cancer, we designed a functional nanotransformer, which could diagnose the tumor and confirm the time window of laser radiation via dual-modal imaging, and effectively suppress tumor growth and metastasis through gas-photothermal therapy combined STING-induced immunotherapeutic strategy.

METHODS: Preparation and characterization of MnCO based nanosystem (MnIR@NS) Firstly, the MnCO based nanosystem (MnIR@NS) was obtained through ultrasonic self-assembly towards Pluronic F127, MnCO and IR780 dyes into one system. Secondly, we characterized its particle size, morphology, near-infrared second region imaging, MRI, the photothermal effect, and CO release capability. Biocompatibility, phototherapy and macrophage polarization in vitro The uptake level of MnIR@NS at various time points in 4T1 cells was assessed by flow cytometry (FCM). The photothermal effect of MnIR@NS at the cellular level was proceeded by CCK-8 assay and propidium iodide (PI) and calcien-AM staining. The intracellular expression levels of characteristic proteins downstream of the STING pathway towards 4T1 cells with different treatments were measured by western blot. The ROS level towards 4T1 cells with different treatments was measured by DCF staining which was observed by laser confocal microscope and FCM. To investigate the ability of MnIR@NS to repolarize M2 macrophages to M1 phenotype, M1 (F4/80⁺IA/IE⁺) and M2 (F4/80⁺CD206⁺) in RAW264.7 cells with various treatment were estimated by flow cytometry. MRI-NIRF dual-modality imaging in vivo Breast cancer model was established via Balb/c mouse (female, 6 weeks old) injected 4T1 cells. When the tumor volume reached to 800 mm³ approximately, the tumor-bearing mice were randomly divided into three groups (PBS, free IR780 and MnIR@NS, n=3/group) and underwent NIRF II imaging. MR imaging in vivo of two groups mice (PBS group and MnIR@NS group, n=3/group) was performed on a 3.0 T MR system (Siemens, Germany). The T1-weighted images of tumors were obtained before injection and post injection (0 h, 2 h, 12 h, 24 h, 48 h). Parameters of T1-weighted imaging were as follow: FOV: 120 mm, TR/TE: 720/9.4 ms, slice thickness: 2 mm and slice spacing: 2 mm.

Anti-tumor Immunity synergistic therapy in vivo Firstly, the mice were classified as six groups randomly (n=5) as the tumors grew to approximately 100 mm³: ①health (no tumor), ②PBS, ③MnIR@NS, ④PBS+808 nm NIR, ⑤IR780+808 nm NIR, ⑥MnIR@NS+808 nm NIR. At 24 h post-

injection with PBS, IR780 and MnIR@NS, mice of group ④⑤⑥ were irradiated with 808 nm laser ($1.0 \text{ W} \cdot \text{cm}^{-2}$, 5 min). Secondly, dendritic cell (DCs) ($\text{CD45}^+\text{CD11c}^+\text{CD80}^+\text{CD86}^+$), cytotoxic T cells (CTLs) T cells ($\text{CD45}^+\text{CD3}^+\text{CD8}^+$), M1 ($\text{CD45}^+\text{F4/80}^+\text{IA/IE}^+$) and M2 ($\text{CD45}^+\text{F4/80}^+\text{CD206}^+$) macrophages in tumor of mice with different treatments at 7 days. In addition, the level of IFN- β , TNF- γ , IL-12 and IL-10 were measured by enzyme-linked immunosorbent assay. After undergoing different treatments, tumor volume and mouse body weight were measured every two days. And the tumors and vital organs were collected at 14th days and stained with hematoxylin-eosin, Ki67 and tunnel. All statistical analyses were performed using the software GraphPad Prism 8.0 (* $p < 0.05$, ** $p < 0.01$).

RESULTS AND DISCUSSIONS Firstly, MnIR@NS showed a diameter of $79.99 \pm 3.06 \text{ nm}$ and the TEM images further confirmed the core-shell spherical shape (Fig. 1A-C), which showed great potential for tumor accumulation through the EPR effect. Secondly, excellent cellular uptake capacity and photothermal effect in 4T1 cells was in Fig. 2A-C. Furthermore, remarkable NIR II and MRI imaging potential of MnIR@NS were showed in vitro (Fig. 1D&E) and in vivo (Fig. 3A-C). What's more, the excellent photothermal effect of MnIR@NS based laser irradiation were demonstrated in vitro (Fig 1F) and in vivo (Fig. 3D). STING pathway was activated (Fig. 2D) and the generation of ROS by MnIR@NS based laser irradiation were identified (Figs. 2E-G). Together, all of these activated immunotherapy because of MnIR@NS based phototherapy, and the antitumor immune cells (DCs, CD8^+ CLT cells and M1 macrophages) were upregulated along with the protumor immune cells (M2 macrophages) were downregulated (Fig. 2H-I & 4A-H). Meanwhile, The level of anti-tumor cytokines (IFN- β , TNF- γ , IL-12) was increased and promo-tumor cytokines (IL-10) were decreased (Fig. 4I-L). Finally, compared with the control groups, primary tumors and lung metastases in MnIR@NS+NIR group shrank significantly (Fig. 5A-J).

CONCLUSION We developed a multifunctional MnIR@NS nanocomposite, which could diagnose the tumor and confirm the time window of treatment via NIR II/MRI dual-modal imaging, and effectively suppress tumor growth through phototherapy, STING pathway and anti-tumor immunity. This MnCO-based nanosystem provided a promising strategy for cancer theranostic applications.

酸性肿瘤微环境激活的 MRI 纳米探针 用于抗 PD-L1 免疫治疗的调节和可视化

范凯、居胜红
东南大学附属中大医院

目的：细胞毒性 T 淋巴细胞 (CTL) 的缺乏和对免疫检查点阻断 (ICB) 治疗的有限反应是胰腺导管腺癌 (PDAC) 治疗的重大挑战。肿瘤 pH 的调节和可视化将是增强并监测 PDAC 中 ICB 治疗的有效方法。在这项研究中，我们报道了一种 MRI 引导 ICB 治疗 (MRGIT) 策略，以调节和可视化 anti-PD-L1 抗体治疗在 PDAC 肿瘤免疫抑制中的疗效。

方法：首先合成了能够调节和指示肿瘤 pH 的 pH 响应型纳米探针 (APPAM@U-104)。APPAM@U-104 对肿瘤的 pH 成像和缓解酸化在 Panc02 荷瘤小鼠中通过 MR-T1 和 T2 成像进行研究。同时研究了 T1-MR 增强到 T2-MR 增强的转换时间，以确定 anti-PD-L1 给药的最佳时间。用流式细胞术和免疫荧光染色法分析肿瘤 T 细胞活化情况。

结果：APPAM@U-104 治疗的小鼠肿瘤微环境 pH 从 6.5 增加到到了 7.2，同时伴随着从 T1 到 T2 的 MR 信号转换，随后在 T2“ON”时间给予 anti-PD-L1 治疗后显著抑制了肿瘤生长。免疫学检测显示，在 Panc02 荷瘤小鼠中 APPAM@U-104 与 anti-PD-L1 的组合导引引起了 T 细胞的活化和免疫抑制剂对肿瘤的杀伤效应的增强。

结论：我们开发了一种新的 MRGIT 策略来重塑酸性肿瘤微环境，并在 TME 的 pH 接近中性时指导 anti-PD-L1 的给药。通过分子成像关联抗肿瘤免疫反应，为胰腺癌的精准诊断和免疫治疗提供了新思路。

Biodegradable Silica Nanoparticles Incorporating Nanozyme for multimodal tumor imaging and therapy

Jue Wang¹, Liming Zhou², Yuanyuan Ma¹, Shenghong Ju¹

1. Zhongda Hospital, Southeast University

2. China Pharmaceutical University

Objectives: Nanotechnological systems are emerging as potent tools for the combination of biomedical imaging and cancer therapies. The exceptional safety and specificity of these nanomaterials enable on-site delivery of imaging probes and the conversion of less toxic substances into powerful cancer-fighting agents, driven by the unique characteristics of the tumor microenvironment (TME). However, the inherent antioxidant mechanisms and insufficient hydrogen peroxide (H_2O_2) within the cancer cells significantly hinder their effectiveness. Utilizing nanozymes to mediate glycolytic reactions, which act as a highly efficient catalyst for H_2O_2 production, could overcome these obstacles by providing additional H_2O_2 , thus enhancing the effect of reactive oxygen species (ROS)-oriented chemotherapy. In light of this, our aim is to create a nanotech-based system intended to boost the effectiveness of combined chemotherapy and sonodynamic cancer treatment, while simultaneously enabling effective imaging.

Methods: In this research, an innovative approach was formulated by incorporating glucose oxidase (GOx) into the core of biodegradable hybrid hollow silica nanoparticles (HSN), and subsequently encasing them within the metal-organic framework (MOF) known as HKUST-1, which contained a luminescent dye and sonosensitizer TCPP (referred to as GOx@HSN@HKUST-1-TCPP). The properties of this nanomaterial were examined using transmission electron microscopy, Zeta potential, X-ray diffraction, and dynamic light scattering. The cytotoxicity of the nanoparticles on cancer cells was assessed via the MTT assay. Furthermore, an on-site breast cancer model was established, and the biodistribution of the nanoparticles was tracked in real-time using near-infrared fluorescence imaging. The treatment effectiveness was evaluated by monitoring changes in tumor size and survival time analysis.

Results: Taking advantage of the enhanced permeability and retention (EPR) effect, the GOx@HSN@HKUST-1-TCPP effectively gathered at the tumor site post systemic administration. In the acidic tumor microenvironment (TME), the outer layer of pH-sensitive HKUST-1 rapidly broke down, accelerating the release of Cu^{2+} and TCPP. The Cu^{2+} ions reacted with the intracellular glutathione (GSH) to disrupt the reactive oxygen defense mechanisms, leading to their reduction to Cu^+ . Simultaneously, the interior GOx@HSN layer rapidly biodegraded, freeing GOx, which could be catalyzed to produce H_2O_2 and gluconic acid. The resulting H_2O_2 further interacted with the reduced Cu^+ to initiate a highly effective Fenton-like reaction, generating hydroxyl radicals ($\bullet OH$) for amplified chemodynamic therapy (CDT). Furthermore, the released TCPP served as both a luminescent dye and a sonosensitizer, aiding in effective sonodynamic therapy (SDT) and tumor imaging.

Conclusions: The GOx@HSN@HKUST-1-TCPP nanoparticles demonstrated a potent anticancer action, providing a reliable platform for both breast cancer imaging and treatment.

抗基质纳米平台靶向胰腺导管腺癌的成像与协同治疗研究

杨晓艳、余日胜
浙江大学医学院附属第二医院

研究目的: 胰腺导管腺癌 (PDAC) 中过度的细胞外基质 (ECM) 沉积严重阻碍了治疗药物的渗透, 并与不良预后相关。胶原蛋白是基质中含量最丰富的蛋白, 其形成了药物扩散的主要障碍。为克服 PDAC 药物渗透屏障, 构建了一种胶原酶功能化的仿生载药金纳米平台 (Col-M@AuNCs/Dox), 并联合 CT 成像监测, 实现 PDAC 精准主动联合治疗, 为 PDAC 治疗困境提供一种新策略。

方法: 设计构建了 Col-M@AuNCs/Dox 纳米平台, 集 ECM 降解、主动靶向、免疫逃逸、近红外光触发的药物释放、协同抗肿瘤治疗和 CT 成像于一体。通过提取 PDAC 肿瘤细胞膜, 包覆在负载阿霉素的金纳米笼上, 藕联胶原酶后得到该纳米平台, 并系统评估了该纳米平台的理化性质、体外和体内靶向性、肿瘤穿透性及体内外疗效。

结果: 该纳米平台可通过表面细胞膜的同源靶向作用高效靶向肿瘤, 在向肿瘤组织渗透的过程中, 致密的 ECM 逐渐被胶原酶降解, 进而能够深入渗透肿瘤实质, 最终在近红外照射下, 通过化疗、光热治疗和光动力治疗, 发挥强大的协同抗肿瘤作用, 同时该纳米平台的 X 射线衰减特性实现了 CT 成像指导下的治疗监测。

结论: 本研究提出了一种独特、简单而有效的策略来调控 PDAC 的 ECM 成分, 增强瘤内渗透和肿瘤杀伤作用, 并为治疗提供指导和监测, 为 PDAC 的治疗困境提供了有效的新途径。

RSNA-10837 CT radiomics features of body composition can predict postoperative early recurrence of hepatocellular carcinoma

Shuo Shi, Yuxuan Zhao, Gaorui Zhang, Dexin Yu
Qilu Hospital, Shandong University

Objectives To investigate the potential of computed tomography (CT) radiomics features extracted from body composition in predicting early recurrence (ER) of hepatocellular carcinoma (HCC) subsequent to surgical intervention.

Methods The retrospective study enrolled a total of 252 patients with HCC who underwent CT scans and curative resection from two independent institutions. In the training cohort of 178 patients from institution A, radiomics signatures extracted from visceral adipose tissue, subcutaneous adipose tissue, and skeletal muscle were applied to establish the radiomics score using least absolute shrinkage and selection operator regression. Using multivariable Cox regression analysis, two models were developed: one incorporating preoperative variables and the other incorporating both pre- and postoperative variables. Then the external validation of the two models was conducted at institution B with 74 patients.

Results The preoperative model incorporated tumor size, AFP, BMI, and radiomics score, while the postoperative model additionally integrated ES grade based on the aforementioned parameters. In both cohorts, both models demonstrated superior performance with time-dependent AUC exceeding 0.81 and concordance indices exceeding 0.72 which was significantly higher than traditional staging systems and corresponding clinical models ($P < 0.01$). Furthermore, the two models exhibited lower prediction errors (integrated Brier score < 0.19), well-calibrated calibration curves, and greater net benefits as determined by decision curve analysis. Importantly, the radiomics-based models facilitated risk stratification by accurately distinguishing high, intermediate, and low-risk groups for ER ($P < 0.01$).

Conclusion Statistical models integrated body composition-based radiomics can provide accurate and reliable predictions of postoperative ER for patients with HCC.

Manganese Ion-Bridged Nanodrug for MR/NIR-I/II Fluorescence Imaging and Synergistic Phototherapy of Breast Cancer

Defan Yao, Dengbin Wang
Xinhua Hospital, Shanghai Jiao Tong University School of Medicine

PURPOSE As an emerging anticancer approach, photodynamic therapy (PDT) produces cytotoxic reactive oxygen species (ROS) by exciting photosensitizers (PSs) under light triggers in the tumor site, which has the advantages of minimal invasiveness, fewer side-effects, and negligible drug resistance. However, the therapeutic efficacy of PDT is still stunted by several intrinsic obstacles, such as shallow depth of light penetration, tumor hypoxia and inevitable phototoxicity.

METHOD AND MATERIALS Herein, we successfully developed a carrier-free nanodrug, IR820-Mn/TH287, based on coordination-driven self-assembly of IR820/TH287 with Mn^{2+} via a "green" method.

RESULTS Photophysical properties of IR820-Mn/TH287 exhibited J-aggregates of IR820 monomer, such as absorption/emission beyond 900 nm, enhanced absorption coefficients, and photothermal performance. Molecular dynamics simulations further illustrated the interaction between Mn^{2+} and IR820 during the formation process of J-aggregates. Under laser irradiation, IR820-Mn could produce higher photothermal temperature and sufficient ROS to cause oxidative damage, and TH287 could improve cellular sensitivity to oxidative damage by suppressing the activity of MTH1 protein. Furthermore, the best time for laser irradiation would be achieved under the precise guidance of MR/NIR-I/NIR-II fluorescence imaging. Because of the synergistic effects from the above designs, IR820-Mn/TH287 could hold high-efficiency tumor elimination with negligible toxicity.

CONCLUSION Such Mn^{2+} -coordinated carrier-free nanodrug with multimodal imaging-guided phototherapy in NIR-II window could be an efficient and safe approach for breast cancer treatment.

SPIONs-enhanced Magnetic Particle Imaging Visualizes Intraplaque Macrophages for Detecting and Assessing Inflammation of Atherosclerotic Unstable Plaques

Ying Han¹, Wei Tong¹, Hui Hui², Yundai Chen¹, Jie Tian³

1. Department of Cardiology, the Sixth Medical Centre, Chinese PLA General Hospital

2. CAS Key Laboratory of Molecular Imaging, Institute of Automation, Chinese Academy of Sciences

3. Key Laboratory of Big Data-Based Precision Medicine (Beihang University), Ministry of Industry and Information Technology of China

Objective: Inflammation contributes to progression of atherosclerotic plaques, and reflects the disease activity and severity of atherosclerosis. However, detecting and evaluating inflammatory reaction of the unstable plaque by ¹⁸F-FDG-PET imaging may put human body in danger due to its radioactivity. Magnetic particle imaging (MPI) is an emerging, highly sensitive, radiation-free, and no-tissue-background tomographic technique that uses superparamagnetic iron oxide nanoparticles (SPIONs) as its contrast agent. Theoretically, SPIONs can be taken up by accumulated macrophages via surface scavenger at sites of inflammation. Therefore, We aimed to

investigate: 1) whether SPIONs-enhanced MPI could assess inflammation in unstable plaques by imaging macrophages; 2) compare the efficacy of four types of commercially available SPIONs in atherosclerotic inflammation imaging using MPI. **Methods:** We fed six-week-old male ApoE^{-/-} mice a high-fat diet and induced unstable plaques by cast placement over the left carotid artery. After twenty weeks, mice were divided in four groups (N=3-4) and intravenously administered with four types of SPIONs (Fe concentration, 8mg/kg), including Nanoeast (Nanjing Nanoeast Biotech Co., China), Vivotrax (Magnetic Insight Inc., USA), Synomag (Micromod Partikeltechnologie GmbH, Germany) and Ferumoxytol (AMAG pharmaceuticals, USA). MPI scanning was performed at Pre, 4h, 12h, 24h, 48h, and 72h post-injection. Signal-to-noise ratio (SNR) value of unstable plaques on MPI images was calculated. Plaque specimens were analyzed histologically. **Results:** For the ApoE^{-/-} mice injected with Nanoeast, the MPI SNR values of unstable plaques at multiple time points were 1.20 ± 0.12 (Pre), 7.11 ± 0.79 (4h), 9.86 ± 1.94 (12h), 12.20 ± 1.23 (24h), 6.70 ± 1.15 (48h), 6.01 ± 1.57 (72h). These revealed that MPI SNR values reached the peak at 24h after intravenous injection of Nanoeast. While the MPI SNR values reached the peak at 12h after intravenous injection of Synomag and Vivotrax, and were both significantly lower than the peak SNR values of the Nanoeast group (Synomag 6.91 ± 0.52 vs. Nanoeast 12.20 ± 1.23 , $P < 0.05$; Vivotrax 3.14 ± 0.36 vs. Nanoeast 12.20 ± 1.23 , $P < 0.05$). Of interest, the ferumoxytol group showed no significant differences in MPI SNR values between different time points. Histological analysis confirmed that more SPIONs accumulated in the unstable plaques of Nanoeast group than in those of the three other groups. **Conclusions:** The radiation-free MPI enabled macrophage detection in atherosclerotic plaques via imaging of SPIONs, which allows in vivo visualization of inflammation in atherosclerosis. Among the commercial MPI contrast agents, Nanoeast shows the highest MPI SNR values and may represent the most promising contrast agent in MPI imaging of atherosclerotic inflammation.

OR-0098

Association between PD-L1 expression in patients with cervical cancer and ADC values: comparison of different ROI-position methods at DWI

Kaihui Liu^{1,2}, Wei Yang²

1. Ningxia Medical University

2. General Hospital of Ningxia Medical University

Abstract: The expression status of programmed cell death ligand-1 (PD-L1) is crucial for immunotherapy of cervical cancer (CC). Diffusion-weighted imaging (DWI) and apparent diffusion coefficient (ADC) can provide the intrinsic characteristics of tumors. To assess the effects of different regions of interest (ROI) position methods for ADC measurements on the associations between ADC and PD-L1 expression and identify its independent relevant factors in CC.

Materials and Methods: The study was approved by our institutional review board. Between January 2021 and August 2022, 1015 eligible patients (range, 25–91 years old) with CC were enrolled. From January 2018 to June 2020, a training cohort (including 683 cases) was established through retrospective enrollment, while a validation cohort (including 332 cases) was constructed through prospective enrollment July 2020 to December 2022. ADC_{mean}, ADC_{ss} (at the largest level of tumor solid components), and ADC_{min} were measured using different ROI-position methods. Logistic regression analyses were performed to identify independent factors related to PD-L1 expression and establish combination models. The performance of combined models was evaluated by the receiver operating characteristic (ROC) analysis. The nomogram was created, and the calibration and discrimination performances were estimated.

Results: The ADC_{mean}, ADC_{ss}, and ADC_{min} were independently correlated with PD-L1 expression, among which the ADC_{min} demonstrated most excellent performance with AUC of 0.88 through the DeLong test (Z : 2.45-2.89, $P < 0.05$). FIGO staging, pathological grade, parametrial

invasion, lymph node status, and ADCmin were independently associated with PD-L1 expression. A combination model with the above parameters was constructed and yielded an AUC, sensitivity, and specificity of 0.91(0.88–0.93), 87.6%, and 85.5%, which is higher than the clinicopathological model (including FIGO staging, pathological grade, parametrial invasion, lymph node status, AUC: 0.83(0.79–0.85), 93.2%, 53.5%). A nomogram constructed based on the combination model was well validated in the validation cohort with C-index values of 0.90 and AUC of 0.90. The calibration with $P = 0.12$ Hosmer–Lemeshow test demonstrated good agreement, and the DCA verified the benefits of the nomogram.

Conclusion: The ADC values extracted from the DWI sequence were associated with PD-L1 expression, and ADCmin had excellent performance. The combination model could adequately discriminate while predicting PD-L1-positive in CC patients, thereby serving as a predominant tool for selecting eligible cases for immunotherapy.

Background: The diversity and complexity of impaired cortical neurons and circuits pose a significant challenge in stem cell therapy for ischemic cortical stroke(1). To enhance neuronal replacement and functional repair in cases of ischemic cortical stroke, we have generated new-generation forkhead box G1 (FOXP1)-positive neural precursor cells (NPCs), which can differentiate into various cortical neurons including upper- and deep-layer excitatory and inhibitory neurons, achieving early functional maturation simultaneously in vitro (Extended Fig.1). In this study, we systematically investigated the in vivo neuronal differentiation and functional integration of transplanted forebrain NPCs in stroke-damaged brains, focusing on synaptic regeneration and neural circuit reconnection of transplanted cells.

Methods: The synaptic vesicle glycoprotein 2A (SV2A) PET was employed for the first time to assess the overall modification in synaptic density in the infarct-adjacent area subsequent to transplantation of forebrain NPCs. Single-nucleus RNA sequencing (SnRNA-seq) and neurobiological analyses, including immunoelectron microscopy, electrophysiology, and virus tracing, were utilized to confirm efficient synaptic integration achieved by forebrain NPCs.

Results: In this study, 18F-SynVesT-1, a novel PET imaging probe targeting SV2A, was synthesized using trimethyltin precursors according to the reported method(2) (Fig. 1a). The radiosynthesis of 18F-SynVesT-1 proceeded with non-decay radiochemical yield ($9.74 \pm 4.55\%$; $n = 15$) and good radiochemical purity ($>99\%$, Fig. 1b,c). Furthermore, SV2A PET imaging results demonstrated a significant increase in 18F-SynVesT-1 accumulation in the NPC group compared to the vehicle control at 4 weeks post-transplantation. This suggests that there is an increased

occurrence of newly established synapses in the ipsilateral cortex adjacent to the infarct (the main transplantation location) (Fig. 1d,e). In snRNA-seq studies, the top expressed gene in transplanted human cells is associated with synapse organization, axonogenesis, and synapse assembly according to GO enrichment analysis (Fig. 1f). To confirm the direct integration of human grafts into rat brain circuits, we employed immunoelectron microscopy to identify synaptic connections between the grafts and host neurons. Results showed most forebrain NPC-derived cells displayed mature neuron ultrastructures 6 weeks post-transplantation, including mitochondrial-rich cytoplasm, rough endoplasmic reticulum, Golgi apparatus, and free ribosomes (Fig. 1g). Interestingly, we found most synaptic contacts (83%) were asymmetric with excitatory synapse structural characteristics, e.g., broad synaptic cleft, high postsynaptic density, and spherical synaptic vesicles (Fig. 1h-j). Whole-cell patch-clamp recordings were performed in acute brain slices at 7 and 11 weeks post-transplantation. Results showed that 93% of the 27 recorded forebrain NPC-derived cells fired action potentials upon depolarizing current injection (Fig. 1k). In addition, most recorded forebrain NPC-derived cells received postsynaptic currents, including spontaneous excitatory (sEPSCs, 78%) and inhibitory postsynaptic currents (sIPSCs, 4%) in 23 recorded forebrain NPC-derived neurons (Fig. 1l). These results demonstrate that transplanted forebrain NPC-derived neurons can establish effective functional synaptic connections with the host brain. Six weeks after transplantation, we injected a scAAV2/1-hSyn-Cre virus into the ipsilateral ventral thalamus of stroke model rats and AAV2/8-EF1 α -DIO-mCherry virus into the somatosensory-motor cortex where forebrain NPCs were transplanted. Four weeks after injection, the manifestation of mCherry signals was detected in forebrain NPC-derived neurons expressing GFP, which also exhibited positivity for HuNu (Figure 1m). This observation indicates that the forebrain NPC-derived neurons have successfully integrated into the thalamocortical projection circuit. Taken together, SV2A PET imaging, snRNA-seq and neurobiological analysis confirmed that the FOXG1+ NPC-derived cells achieved early functional maturation and efficient integration into the stroke-injured cortex.

Conclusions: The FOXG1 forebrain progenitor cells demonstrated proficient synaptic integration following transplantation into the stroke-injured brains. The non-invasive, in vivo 18F-SynVesT-1 PET imaging was successfully employed to evaluate changes in synapse count pre- and post-FOXG1 progenitor transplantation, which will play a pivotal role in clinical translational studies of NPCs therapy by enabling visual observation of synaptic regeneration and repair.

基于 J 差异编辑磁共振波谱的人体肝脏脂质组分测量

周煜凡¹、林丁乙¹、周嘉强²、徐义程³、陈峰⁴、王旻^{1,2}

1. 浙江大学生物医学工程与仪器科学学院

2. 浙江大学医学院附属邵逸夫医院内分泌科

3. 西门子医疗工程有限公司

4. 浙江大学医学院第一附属医院放射科

目的: 人体肝脏脂肪沉积与包括非酒精性脂肪肝炎在内的代谢类疾病相关, 并且脂肪成分相比于脂肪总量可能与肝脏脂肪变性的进程更加相关。肝活检是目前用于评价肝脂成分的“金标准”, 但其侵入性限制了其应用和研究范围, 而一般的磁共振波谱 (1H-MRS) 方法无法准确分离不饱和脂肪信号 (见图 1)。本研究旨在验证 J 差异编辑 (JDE) 波谱技术在人体肝脏脂质成分测量上的可行性。

方法:

设备/序列: 3 T 西门子临床磁共振/MEGA-PRESS 序列。

受试者: 16 例健康人, 15 例脂肪肝患者 (6 例轻度脂肪肝, 9 例中度脂肪肝), 8 例糖尿病伴随脂肪肝患者, 均禁食 8 小时以上。

测量方法: 在呼吸门控和屏气的条件下分别测量了右肝中段和下段的磁共振波谱, 用于比较不同方法下测量的稳定性。

脂肪成分分析: 测量不饱和脂肪质子信号, 计算脂肪成分的不饱和度 (UIs): 烯丙基 (allylic) / 亚甲基; 多不饱和度 (PUI): 二烯丙基 (diallylic) / 亚甲基。

数据分析: 用组内相关系数 (ICC) 分析不同测量方法的稳定性。分析不同测量方法下分析正常人与脂肪肝患者和糖尿病患者、脂肪肝患者和糖尿病患者之间的肝脏脂肪成分差异。

结果:

测量方法比较: 图 2a 展示了不同测量方法及获得的所有瞬态下的 JDE 波谱。图 2b 显示了在健康人、轻度和中度脂肪肝患者中不同测量方法的 ICC 值。呼吸门控+右肝下段的组合在所有组别中都表现出最好的稳定性。

脂质组成: 图 3a 展示了健康人和脂肪肝患者的 JDE 波谱。图 3b 显示, 健康人的 UIs 和 PUI 都显著高于脂肪肝患者和治疗前后的糖尿病患者。另外, 配对检验显示糖尿病患者治疗前后的 UIs 和 PUI 都存在显著差异。脂肪肝患者和糖尿病患者之间则没有表现出差异性。

结论: 本研究展示了 JDE 技术测量人体肝脏脂质成分的可行性。该方法获得的脂质组成与以往研究中人体肝脏活检的结果一致, 即脂肪肝患者更有可能以饱和脂质的形式储存肝脏脂肪。本研究提出的测量方法和有效性可为今后 JDE MRS 在人体肝脏上的进一步应用研究提供依据。

纳米技术引发细胞焦亡联合影像技术监测癌症治疗的研究进展

黄月琳¹、汪登斌²、姚德帆^{1,2}

1. 上海体育大学

2. 上海交通大学医学院附属新华医院放射科

[目的] 在医工交叉创新融合的发展下, 通过构建精准功能化的纳米材料来应对复杂的肿瘤微环境和特殊的肿瘤疾病, 深入探索新型多功能纳米材料在肿瘤成像和治疗中的应用价值。

[方法] 近年来, 研究证明细胞焦亡是在 gasdermin 蛋白介导下破坏细胞膜并释放内容物诱导细胞死亡, 对肿瘤免疫进行调控并产生强烈的炎症反应和显著的肿瘤消退。在智慧医疗的提倡下, 肿瘤免疫疗法结合纳米制剂在影像技术的监测下能有效的清除恶性肿瘤, 可作为肿瘤有效治疗的新策略。在现有的抗癌策略中, 光动力疗法可以利用激光照射由光敏剂合成的新型纳米材料来提高肿瘤靶向治疗效率; 光热疗法可以通过光能转换为热能直接杀死肿瘤细胞, 而良好的生物降解性和较强的光热转换性的光热材料是提高肿瘤有效治疗的关键因素; 在继光动力疗法后, 新型声动力治疗策略以塑造超声响应的声敏剂, 实现声致发光介导的抗癌效应。另外, 通过多功能纳米颗粒调控肿瘤内环境的氧化还原平衡实现纳米催化治疗, 肿瘤内发生氧化应激以提升活性氧水平实现细胞焦亡。对于单一的化疗药物治疗作用广泛, 纳米药物递送系统能精准递送到肿瘤部位, 增强渗透滞留效应并有效降低化疗药物的副作用。在肿瘤成像方面, 能谱 CT 在性能和后处理能力上具有卓越的材料区分优势。能谱 CT 成像后处理技术结合纳米材料成像对比剂可以实现监测与治疗并行。在肿瘤与正常组织难以区分的情况下, 能谱 CT 成像利用物质分离、能谱曲线、能量分析技术等影像处理技术带来更精准、定量的多参数成像信息。

[结果] 新型的多功能纳米材料不仅可以满足实时高时空分辨率成像的需求, 给肿瘤治疗提供可视化的影像引导作用。此外, 纳米材料还可以调节肿瘤微环境, 通过调节氧化还原平衡产生活性氧诱导细胞死亡达到治疗肿瘤的目的。

[结论] 肿瘤免疫疗法结合纳米制剂可以在影像技术的监测下有效的清除恶性肿瘤, 可作为肿瘤有效治疗的新策略。设计多功能纳米制剂结合现阶段的影像技术手段可以满足影像成像与肿瘤治疗的需求, 辅助多种模式治疗方法实现动态监测治疗疗效。

基于 18F-FDG PET/CT 瘤内瘤周影像组学对非小细胞肺癌病理亚型分类的预测价值

秦杰、葛昭、曾钰瀧、莫碧云、崇维霞
桂林医学院附属医院

目的：本研究旨在探究基于 18F-FDG PET/CT 的肺癌瘤内瘤周影像组学模型在非小细胞肺癌病理亚型分类中的作用。

方法：收集了 2019 年 5 月至 2023 年 1 月期间 141 例非小细胞肺癌患者的 PET/CT 扫描数据。

使用 Pyradiomics 模块从 PET/CT 图像中提取瘤内和瘤周的 CT 和 PET 影像组学特征。

建立了基于瘤内、瘤周 2mm 和瘤周 4mm 区域的逻辑回归模型。

结果：在 141 例患者中，70% 被随机选择为训练集，30% 为测试集。

使用逻辑回归模型，瘤周 2mm 联合模型的 AUC 值达到 0.964，是所有模型中表现最佳的，其次是瘤内联合模型 (AUC=0.937) 和瘤周 4mm 模型 (AUC=0.890)。

结论：基于 18F-FDG PET/CT 的瘤内瘤周影像组学模型对非小细胞肺癌的亚型分类具有高度的预测准确性，其中瘤周 2mm 模型表现最佳。这为非小细胞肺癌的诊断和治疗提供了新的视角和方法。未来，结合影像组学与其他先进技术，如基因组学和多模态数据融合，将为研究提供更多可能性。

自噬抑制剂增效锰促 STING 通路激活的免疫治疗用于防止 TNBC 术后复发转移

王红、高至亮、于德新
山东大学齐鲁医院

目的：高复发、转移率是导致 TNBC 患者死亡的最直接原因，T 细胞浸润不足及肿瘤免疫抑制微环境等临床现行干预手段无法使患者获益。 Mn^{2+} 作为人体必备微量元素可以介导干扰素基因 (STING) 通路的激活，有效促进 T 细胞的启动和招募，提高免疫治疗疗效。但其通路的激活易诱使肿瘤细胞产生保护性自噬，降低 STING 通路激活效果。因此协同激活 STING 通路并抑制保护性自噬可以显著降低 TNBC 术后复发和转移，并同步实现基于 Mn^{2+} MRI 成像的动态监测，从而改善患者预后。

材料与方法：我们构建了一种由水凝胶包载的纳米体系 (GOx-MPN/HCQ@Gel)。纳米颗粒进入肿瘤细胞后， Mn^{2+} 激活 STING 通路，HCQ 抑制保护性自噬解除对 STING 通路抑制，从而高效招募效应 T 细胞，发挥强效抗肿瘤治疗效果。同时， Mn^{2+} 在 GOx 参与下介导的类芬顿反应可以协同增强 STING 通路的激活，并通过 CDT 疗法增效肿瘤杀伤，最终实现多机制联合的免疫治疗。我们对纳米体系的理化性质、体内外成像能力、STING 通路及自噬相关蛋白表达和免疫治疗效果进行了评估。

结果：MR 扫描显示纳米体系具有锰浓度依赖性成像特点，材料及动物层面均可实现稳定成像能力。CCK-8 结果显示 GOx-MPN/HCQ@Gel 可以有效诱导 4T1 细胞凋亡。Western Blot 检测证实纳米体系处理的 4T1 细胞中 STING 通路相关蛋白表达明显增加，抑制性自噬蛋白表达显著降低。小动物术后模型在给予水凝胶治疗 15 天后，GOx-MPN/HCQ@Gel 治疗组肿瘤体积明显减小，且组织内见大片坏死；相关 CD4、CD8 以及记忆 T 细胞等免疫细胞的表达较其他组均显著增加；同步进行的 MRI 检查亦可观察到相同的现象。血液生化指标检测以及组织器官病理切片染色显示纳米体系生物安全性高。

结论：本研究成功构建 GOx-MPN/HCQ@Gel 纳米体系，显著增强 STING 通路激活并抑制保护性自噬，明显增强免疫治疗效果，有效降低 TNBC 术后复发和转移率。同时具备缓释和实时磁共振评

估能力, 实现药物肿瘤部位长时程蓄积及疗效动态监测评估; 并且具有良好的生物相容性及生物安全性。

OR-0104

基于磁共振 CEST 成像对脉冲电磁场治疗阿尔兹海默症小鼠的疗效评估与机理研究

刘思奇¹、程焱²、吴仁华¹

1. 汕头大学医学院第二附属医院

2. 山东大学第二医院

目的: 尝试利用磁共振 CEST 成像活体动态监测脉冲电磁场 (Pulse Electromagnetic Field, PEMF) 干预下阿尔兹海默症 (Alzheimer's disease, AD) 小鼠的抑制性神经递质 γ -氨基丁酸 (GABA) 的变化, 并通过比较与疾病组和空白组之间的差异以探索疗效和机制。

方法: 在这项研究中, 对 APP/PS1 转基因小鼠进行脉冲电磁场治疗, 持续 4 周。对 APP/PS1+PEMP 组、APP/PS1 组、WT 组于治疗期/假治疗期的前/后进行磁共振 CW-CEST 与 VDMP-CEST 成像, 揭示 PEMF 对海马及皮层 GABA 含量及微观结构的影响, 采用酶联免疫吸附实验 (ELISA) 检测脑组织中海马及皮层的 GABA 水平, 通过免疫组织化学 (IHC) 分析评估 A β 病理的参与, 通过尼氏染色 (Nissl staining) 检查神经元功能状态, 采用莫里斯水迷宫 (Morris water maze) 检验探讨 PEMF 对 AD 动物模型运动和认知障碍的影响。通过 MATLAB 软件进行 CEST 图像后处理并计算 CEST 比率 (CEST ratio, CESTR), 用 image J 软件分析免疫组化切片阳性 A β 斑块面积与尼氏染色阳性细胞计数, 用 SPSS、Graphpad Prism 软件统计绘图。

结果: 本研究探讨 PEMF 对 AD 小鼠模型中 GABA 能突触传递的影响。在体内和体内实验中, 我们证实 PEMF 可以使 APP/PS1+PEMP 组小鼠大脑的 GABA 含量增多、A β 沉积减少, 而 APP/PS1 组与 WT 组于假治疗期前后的 GABA 含量无明显差异、A β 沉积较多, 且 VDMP-CEST 较 CW-CEST 对 GABA 的成像效果更优。另外, PEMF 能够改善 APP/PS1+PEMP 组小鼠大脑神经元数目和形态, 减轻 APP/PS1+PEMP 组小鼠的认知障碍。这种神经保护机制可能涉及调节大脑的 GABA 能传递。

结论: GABA 是改善 AD 认知障碍的重要神经递质, VDMP-CEST 是脉冲电磁场治疗中 GABA 变化可视化的有效方法。

OR-0105

新型靶向 LAG-3 环肽 PET 分子探针 在肝细胞癌个体化免疫治疗的研究

全震、陈铨、孙博、郑传胜、李欣

华中科技大学同济医学院附属协和医院

目的: 淋巴细胞活化基因 3 (Lymphocyte-activation gene 3, LAG-3) 在肝癌患者 CD8⁺ 肿瘤浸润 T 淋巴细胞上广泛表达, 与肝癌预后不良密切相关, 有潜力成为评价肝癌治疗疗效的潜在生物标志物, 因此对 LAG-3 进行活体成像具有重要价值。在本研究中, 我们开发了一种基于环肽结构的靶向 LAG-3 的 PET 分子成像探针-⁶⁸Ga-NOTA-C25, 在体内评估小鼠肝癌 LAG-3 的表达。

方法: ⁶⁸Ga-NOTA-C25 是利用 ⁶⁸Ga 定点标记的方法制备获得。标记完成后, 计算标记率、放化纯度等进行表征及质控。构建 Hepa1-6 小鼠肝癌皮下移植瘤模型, 并随机分配为靶向组和阻断组 (n=3-4, 在探针前 60min 经鼠尾静脉注射未做标记的 C25 500 μ g)。随后经鼠尾静脉给两组小鼠注射 ⁶⁸Ga-NOTA-C25 (约 200 μ Ci), 分别在 30、60 和 120min 进行 micro-PET 扫描。比较两

组老鼠肝癌在各个时间点的摄取值和肿瘤与肌肉比 (tumor/muscle, T/M)。

结果: ^{68}Ga -NOTA-C25 的放射化学产率约 60%和纯度约 99%。 ^{68}Ga -NOTA-C25 在靶向组和阻断组 Hepa1-6 小鼠肝癌摄取值有显著差异。靶向组 Hepa1-6 小鼠肝癌摄取值在 30min 为 0.852 ± 0.272 %ID/g, T/M 约 20.52 ± 4.78 , 随后分子探针在 60min、120min 的摄取值、T/M 下降, 摄取值分别为 0.435 ± 0.124 %ID/g、 0.315 ± 0.075 %ID/g, T/M 分别为 8.45 ± 1.32 、 7.42 ± 1.56 。阻断组小鼠肿瘤的摄取值在 30、60 和 120min 分别 0.428 ± 0.144 %ID/g, 0.237 ± 0.125 %ID/g, 0.218 ± 0.115 %ID/g, T/M 分别为 5.32 ± 1.56 、 4.55 ± 1.22 、 4.23 ± 1.38 。

结论: ^{68}Ga -NOTA-C25 PET 成功在活体监测到小鼠肝癌的 LAG-3 表达, 有望成为监测肝癌免疫治疗的分子影像学工具。

Low-Power Magnetic Resonance-Guided Focused Ultrasound Tumor Ablation upon Controlled Accumulation of Magnetic Nanoparticles by Cascade-Activated DNA Cross-Linkers

Jingyi Wang, Zhongling Wang
Shanghai General Hospital

Magnetic resonance-guided focused ultrasound (MRgFUS) is a promising non-invasive surgical technique with spatial specificity and minimal off-target effects. Despite the expanding clinical applications, the major obstacles associated with MRgFUS still lie in low magnetic resonance imaging (MRI) sensitivity and safety issues. High ultrasound power is required to resist the energy attenuation during the delivery to the tumor site and may cause damage to the surrounding healthy tissues. Herein, a surface modification strategy is developed to simultaneously strengthen MRI and ultrasound ablation of MRgFUS by prolonging Fe_3O_4 nanoparticles' blood circulation and tumor environment-triggered accumulation and retention at the tumor site. Specifically, reactive oxygen species-labile methoxy polyethylene glycol and pH-responsive DNA cross-linkers are modified on the surface of Fe_3O_4 nanoparticles, which can transform nanoparticles into aggregations through the cascade responsive reactions at the tumor site. Notably, DNA is selected as the pH-responsive cross-linker because of its superior biocompatibility as well as the fast and sensitive response to the weak acidity of 6.5–6.8, corresponding to the extracellular pH of tumor tissues. Due to the significantly enhanced delivery and retention amount of Fe_3O_4 nanoparticles at the tumor site, the MRI sensitivity was enhanced by 1.7-fold. In addition, the ultrasound power was lowered by 35% to reach a sufficient thermal ablation effect. Overall, this investigation demonstrates a feasible resolution to promote the MRgFUS treatment by enhancing the therapeutic efficacy and reducing the side effects, which will be helpful to guide the clinical practice in the future.

The mechanism of myocardial injury in iron overload cardiomyopathy based on CMR and Cell Biology

Juxiang Hou, Lihong Zi, Xihan Fan, Wei Chen
The First Affiliated Hospital of Kunming Medical University

Objective: To investigate the effect of ferroptosis on the mechanism of myocardial injury in iron overload cardiomyopathy (IOC) by CMR in vivo and Cell Biology in vitro.

Methods: An IOC rat model was established by intraperitoneal injection of iron dextran to simulate human iron overload conditions and cardiomyocytes (H9C2) were cultured in different concentrations of iron overload medium (ferric citrate) for the IOC cell model. CMR was performed to evaluate cardiac function and iron deposition. Blood biochemistry was used to detect circulating iron overload. Prussian blue staining and Masson staining were used to detect iron and fibrosis deposition in myocardial tissue, respectively. The mitochondrial morphology was observed by Transmission Electron Microscopy (TEM). IOC cell model was constructed and ferroptosis-related markers including Malondialdehyde (MDA) and prostaglandin-endoperoxide synthase 2 (PTGS2) were detected to verify the underlying mechanism of myocardial injury in iron overload.

Results: T2 values of septum papillary muscle level in the IOC group (septum: 22.3 ± 2.6 ms Vs. 12.7 ± 3.3 ms, $P < 0.01$). There were no significant differences in LVEF between the IOC and control group ($P > 0.05$). However, GLS was significantly reduced in the IOC model group ($-21.9 \pm 1.3\%$ vs. $-18.8 \pm 2.1\%$, $P < 0.01$), but GRS and GCS were not significantly reduced ($P > 0.05$). LGE was negative in the IOC group. Blood biochemical results showed that serum iron, ferritin, and transferrin levels were significantly increased in IOC rats (all $P < 0.01$). Serum iron levels in the IOC group correlated with myocardial T2 values ($R^2 = 0.5051$, $P = 0.01$). Massive iron particles were deposited in the myocardial tissue by Prussian blue staining and there was no fibrosis in Masson-stained myocardium in the IOC group. CCK-8 results showed that cardiomyocyte viability decreased ferric citrate dose-dependently ($R^2 = 0.5483$, $P < 0.0001$). Markers of ferroptosis included MDA, which was dose-dependently increased with the concentration of iron citrate ($R^2 = 0.5451$, $P = 0.0005$), and PTGS2 was significantly upregulated in iron-treated cells and positively correlated with ferric citrate (FAC) concentration ($R^2 = 0.6939$, $P = 0.04$). Under TEM the mitochondrial degeneration and swelling, crest broke even disappeared, and local vacuolization of cardiomyocytes in the myocardium in IOC rats and cardiomyocytes were visible.

Conclusions: CMR, blood biochemistry, and pathology confirmed that intraperitoneal injection of iron dextran can construct a rat model of iron overload cardiomyopathy. Ferroptosis may be the potential mechanism of cardiac dysfunction in IOC rats.

OR-0108

Nanoparticle-Mediated Blockade of CXCL12/CXCR4 Signaling Enhances Glioblastoma Immunotherapy: Monitoring Early Responses with MRI-Radiomics

Ruili Wei¹, Shengsheng Lai², Xinhua Wei¹, Xinqing Jiang¹, Youyong Yuan³, Ruimeng Yang¹

1. Second Affiliated Hospital, School of Medicine, South China University of Technology

2. School of Medical Equipment, Guangdong Food and Drug Vocational College, Guangzhou 510520, PR China.

3. School of Biomedical Sciences and Engineering, South China University of Technology, Guangzhou International Campus, Guangzhou 511442, PR China.

The limited therapeutic efficacy of checkpoint blockade immunotherapy against glioblastoma (GBM) is closely related to the blood-brain barrier (BBB) and tumor immunosuppressive microenvironment, the latter being largely driven by tumor-associated myeloid cells (TAMCs). Targeting the C-X-C motif chemokine ligand-12/C-X-C motif chemokine receptor-4 (CXCL12/CXCR4) signal pathway orchestrates the recruitment of TAMCs and has emerged as a promising approach to alleviate immunosuppression. Herein, we developed an iRGD ligand-modified polymeric nanoplatform for co-delivery of the CXCR4 antagonist AMD3100 and the small-molecule immune checkpoint inhibitor BMS-1. The iRGD peptide facilitated superior BBB crossing and tumor targeting abilities, validated in both in vitro and in vivo models. In mice bearing orthotopic GL261-Luc tumor, co-administration of AMD3100 and BMS-1 significantly inhibited tumor proliferation without adverse effects. Notably, we observed a reprogramming of immunosuppression upon CXCL12/CXCR4 signal blockade, characterized by the reduction of TAMCs and CD4⁺CD25⁺Foxp3⁺ regulatory T cells (Treg cells), an increased proportion of CD3⁺CD8⁺ T lymphocytes, as well as the upregulation

of antitumor cytokines IFN- γ and TNF- α , and downregulation of protumor proteins TGF- β and IL-10. Remarkably, elevation of IFN- γ secreted from activated immune cells upregulated PD-L1 expression in tumor cells, highlighting the synergistic effect of BMS-1 in counteracting the PD-1/PD-L1 pathway. Additionally, our study unveiled the ability of MRI-radiomics to reveal early changes in the tumor immune microenvironment following immunotherapy, offering a powerful tool for monitoring treatment responses.

Intracranial gadolinium deposition after using gadolinium-based contrast agents in children: A systematic review and meta-analysis

Yiqi Ma¹, Li Bao^{1,2}, Weixia Chen¹, Jia Tan¹, Ziwei Wang¹, Su Lui¹, Min Wu¹

1. 四川大学华西医院

2. 四川大学华西第二医院

Background: Gadolinium-based contrast agents (GBCAs) have been widely used in contrast-enhanced magnetic resonance imaging (MRI) examinations, but the safety of GBCAs has always been a concern due to the toxic of free Gd³⁺. Currently, most research on intracranial gadolinium deposition has been conducted in adults, but the influence of GBCAs in children is still unknown. **Purpose:** To determine whether the use of GBCAs induces gadolinium deposition in the brains of children.

Methods: We searched PubMed、MEDLINE、Web of Science、Embase 和 Cochrane Central Register of Controlled Trials databases until April 2023. Studies on changes in T1-weighted MR images (T1WI) signal intensity in the globus pallidus (GP) and dentate nucleus (DN) in the brains of children after administration of GBCAs were included. Quality evaluation, heterogeneity analyses, meta-regression, subgroup analyses, sensitivity analyses and publication bias analyses were performed.

Results: Ten studies were finally included in the meta-analysis, including 459 pediatric patients with an age range of 0.1 to 18.1 years. In the linear GBCAs studies, the changes in T1-weighted imaging intensity in the GP and DN exhibited significant difference (effect size=1.55, 95% CI: 0.75 to 2.34; effect size=1.96, 95% CI: 1.01 to 2.91, respectively) and notable heterogeneity ($I^2=83.3\%$, $P<0.001$; $I^2=89.4\%$, $P<0.001$, respectively). In the macrocyclic GBCAs studies, after excluding interfering studies, no significant change existed in T1WI signal intensity in GP or DN (effect size=0.13, 95% CI: -0.08 to 0.35; effect size=-0.02, 95% CI: -0.21 to 0.16, respectively) and no heterogeneity existed ($I^2=0\%$, $P=0.884$; $I^2=0\%$, $P=0.959$, respectively).

Conclusion: Regarding linear contrast agents, a history of brain radiation therapy and the number of uses of GBCAs affected gadolinium deposition in the brains of children. Macrocyclic GBCAs had higher safety in children. These data lay the foundation for future prospective large-scale clinical trials in children.

OR-0110

用于乳腺癌早期诊断及精准手术 导航的靶向 FI/MRI 多模态分子探针的构建

张爱薇

徐州医科大学附属医院

目的: 乳腺癌作为最常见的恶性肿瘤之一, 是女性癌症相关死亡的第二大原因。通常在乳腺癌的早期就已经发生了转移, 因此, 乳腺癌的早期诊断和复发筛查是提高乳腺癌患者生活质量和生存率的决定因素。但乳腺癌的早期诊断和治疗目前仍面临以下三个重要的临床问题: 首先目前临床常见的影像检查方式对早期乳腺癌的敏感性较低, 严重影响了患者的预后; 其次, 转移与否决定了不同治疗方式的选择, 但是目前临床常见的检查方式对微转移灶并不敏感, 这是肿瘤复发的重要原因。再者, 外科医生手术时仅能靠主观观察去判断切除范围, 这导致术后手术切缘肿瘤阳性的比例较高, 严重影响了患者的预后。为有效解决上述 3 个临床问题, 实用荧光-磁共振双模态分子探针可以实现肿瘤的早期诊断和术中可视化手术导航, 对肿瘤的精准切除和改善预后有重要的临床价值。

方法: 本研究拟通过“一锅法”合成碳钆复合物 (GCNP), 为了能够靶向乳腺癌细胞, 在 GCNP 表面修饰了 CD44 抗体作为靶向配体。随后通过细胞毒性实验、溶血实验评估分子探针的急性毒性反应, 通过对小鼠心、肝、脾、肺、肾组织切片的 H&E 染色来评估分子探针的急慢性毒副作用小鼠多器官对分子探针的安全性、靶向性及成像功能进行检测。通过细胞电镜、细胞荧光、细胞及活体 MRI 评估分子探针成像效果及靶向性。

结果: TEM 显示该探针成球形, 大小约 35.38 ± 4.93 nm, 荧光量子产率约 62.17%。纵向弛豫率 (r_1) 明显高于 Gd-DTPA (8.58 (GCNPs)、2.08 (Gd-DTPA))。细胞荧光成像显示靶向细胞发出明显的蓝光、绿光和红光, 细胞磁共振显示随着分子探针量的增加信号增强明显。小鼠切片、荧光成像及 MRI 成像显示分子探针主要在肿瘤边界聚集, 逐渐向中心进展。

结论: 该研究构建的荧光-磁共振双模态分子探针为乳腺癌的精准手术、复发转移检测提供了重要的临床价值。

OR-0111

A CT-based radiomics approach to predict intra-tumoral tertiary lymphoid structures and recurrence of intrahepatic cholangiocarcinoma

Ying Xu, Feng Ye, Xinming Zhao

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose This study aims to predict the TLSs status and recurrence-free survival (RFS) of intrahepatic cholangiocarcinoma (ICC) patients using preoperative CT texture analysis.

Patients and methods A total of 116 ICC patients from two centers were included (training cohort = 86; external validation cohort = 30). The enhanced CT images were performed for radiomics model construction. The logistic regression analysis was applied to construct the clinical model. The combined model was based on clinical and radiomics models. Model performance was compared by ROC curves.

Results A total of 6 features were combined to establish a radiomics model, with an AUC of 0.82, 0.86 in the training and external validation cohorts, respectively. Arterial phase diffuse hyperenhancement and AJCC 8th stage were combined to construct a clinical model, with AUCs of 0.75, 0.71 in the training, external validation cohort. Patients of intra-tumoral TLSs-positive showed significantly better RFS than those of TLSs-negative ($p=0.014$). Patients of rad-score no

less than -0.76 (low-risk) group showed significantly better RFS than those of rad-score less than -0.76 (high-risk) group ($p < 0.001$). Patients of nomogram-score no less than -1.16 (low-risk) group showed significantly better RFS than those of nomogram-score less than -1.16 (high-risk) group ($p < 0.001$). And all the stratifications were confirmed in the external validation cohort.

Conclusions CT radiomics nomogram could serve as a preoperative biomarker of intra-tumoral TLSs status, better than independent radiomics or clinical models; pre-operative CT radiomics nomogram achieved accurate stratification for RFS of ICC patients, better than the post-operative pathologic TLSs status.

改变“廓清”在钆塞酸二钠增强 MRI 上的定义后 LI-RADS 对肝细胞癌 (HCC) 的诊断效能

吕蓉
天津市第三中心医院

目的 探讨将钆塞酸二钠增强 MRI (EOB-MRI) 上肝脏成像报告与数据系统 (LI-RADS) 中“廓清”定义扩大到移行期 (TP) 低信号或肝胆期 (HBP) 低信号后, LI-RADS 中 LR-5 (肯定 HCC 的分类) 对 HCC 的诊断效能。

方法 回顾性收集经病理证实且进行 EOB-MRI 检查的高 HCC 风险患者资料。根据不同的“廓清”定义, 提出了三种改进的 LI-RADS (mLI-RADS) 算法: a) PVP 或 TP 低信号; b) PVP 或 HBP 低信号; c) PVP 或 TP 或 HBP 低信号。计算 LI-RADS 中 LR-5 对 HCC 的诊断效能, 包括敏感度, 特异度、阳性预测值、阴性预测值、准确度和约登指数。采用 McNemar χ^2 检验比较 LI-RADS 与 mLI-RADS 的诊断效能的差异。

结果 共 379 例患者, 426 个经病理证实的肝脏病灶 (250 例 HCC, 88 例非 HCC 恶性病变和 88 例良性病变)。mLI-RADS a-c 的敏感度均高于 LI-RADS (80.0% vs. 74.4%, 80.8% vs. 74.4%, 80.8% vs. 74.4%, p 均 < 0.001)。mLI-RADS a-c 对 HCC 的特异度略低于 LI-RADS (86.9% vs. 88.6%, 85.8% vs. 88.6%, 85.8% vs. 88.6%), 但差异无统计学意义 (p 均 > 0.05)。三种 mLI-RADS 算法的准确度相同且均高于 LI-RADS (82.9% vs. 80.3%, p 均 < 0.05)。

结论 当在 EOB-MRI 图像上使用 LI-RADS 诊断 HCC 时, 将“廓清”定义不仅限于 PVP 低信号, 而是扩展到 TP 或 HBP 低信号时, 可获得更高的敏感度和准确度, 且特异度降低不显著。

Radiomics model based on contrast-enhanced CT texture features for pretreatment prediction of overall survival in esophageal neuroendocrine carcinoma

Wanling Mu, Yue Zhou, Jianbo Gao
THE FIRST AFFILIATED HOSPITAL OF ZHENGZHOU UNIVERSITY

Background Limited studies have observed the prognostic value of CT images for esophageal neuroendocrine carcinoma (NEC) due to rare incidence and low treatment experience in clinical. In this study, the pretreatment enhanced CT texture features and clinical characteristics were investigated to predict the overall survival of esophageal NEC.

Methods This retrospective study included 89 patients with esophageal NEC. The training and testing cohorts comprised 61 (70%) and 28 (30%) patients, respectively. A total of 402 radiomics features were extracted from the tumor region that segmented pretreatment venous

phase CT images. The least absolute shrinkage and selection operator (LASSO) Cox regression was applied to feature dimension reduction, feature selection, and radiomics signature construction. A radiomics nomogram was constructed based on the radiomics signature and clinical risk factors using a multivariable Cox proportional regression. The performance of the nomogram for the pretreatment prediction of overall survival (OS) was evaluated for discrimination and calibration.

Results Only the enhancement degree was an independent factor in clinical variable influenced OS. The radiomics signatures demonstrated good predictability for prognostic status discrimination. The radiomics nomogram integrating texture signatures was slightly superior to the nomogram derived from the combined model with a C-index of 0.844 (95%CI: 0.783-0.905) and 0.847 (95% CI: 0.782-0.912) in the training set, and 0.805 (95%CI: 0.707-0.903) and 0.745 (95% CI: 0.639-0.851) in the testing set, respectively.

Conclusion The radiomics nomogram based on pretreatment CT radiomics signature had better prognostic power and predictability of the overall survival in patients with esophageal NEC than the model using combined variables.

Feasibility of synthetic magnetic resonance imaging for deciding whether neoadjuvant chemoradiotherapy and predicting it's short-term efficacy in cervical cancer: Comparison with high resolution T2WI and DWI

Xiaorong Ou, Yigang Pei, Wenzheng Li, Hui Liu
Xiangya Hospital Central South University

Purpose To investigate the feasibility of a synthetic MRI sequence(MAGiC) for deciding whether neoadjuvant chemoradiotherapy(NCRT) and predicting it's short-term efficacy(STE) in cervical cancer(CC) patients,in comparison to high resolution T2-weightedimaging(hrT2WI) and diffusion weighted imaging(DWI).

Materials and Methods The study protocol was approved by the local Research Ethics Committee.Informed consent was obtained from all subjects. 244 patients suspected of CC were enrolled and undergone the pre-treatment MAGIC, hrT2WI and DWI(Table 1).For those CC patients underwent NCRT,hrT2WI were performed again at 2 months after NCRT for evaluating STE(devided into completed response(CR)and no-CR group).MAGiC can generate synthetic morphologic images(syT2WI)and quantitative synthetic images(synthetic T1, T2 and PD maps)(Fig1).For the syT2WI,the tumor staging was assessed and decided whether NCRT for CC patients (hrT2WI as the reference).For the quantitative synthetic images,T1,T2,PD value were measured by regions of interests (ROIs) (Fig 2) to analysis the predictive performance of STE after NCRT (apparent diffusion coefficient (ADC) as reference). In addition, the image quality of syT2WI and hrT2WI were assessed with 4-point scale for anatomical details display, distortion, artifacts and lesion conspicuity.

Results 44 out of 75 confirmed CC patients undergone NCRT were followed up at least two months (Fig3). For the image quality, syT2WI was no significant differences in comparison of hrT2WI (All $P > 0.05$;Table2, Fig2).For deciding whether NCRT,the acc,sen,and spec of sy-T2WI were 0.899,0.947and0.999 in CC patients (Table3). For the quantitative synthetic images, T2, T1 and ADC values had a significant statistical differences to identify CR from no-CR($P < 0.05$)but PD($P > 0.05$; Table 4). Furthermore,T2(AUC:0.825) and T1 value (AUC:0.795) had a similar predictive performance for the STE after NCRT compared with ADC (AUC: 0.789,all $P > 0.05$) (Table5, Fig4).However,T1 combined T2 could not improve the predictive performance for STE with comparison of ADC (AUC:0.818vs0.789) (Table5, Fig4).

Conclusions MAGiC can derive synthetic morphologic images and quantitative synthetic images in one acquisition,which is a promising technique and feasibility for deciding whether NCRT and predict the STE in CC patients.

OR-0116

Multiparametric magnetic resonance investigations on acute and long-term kidney injury

Bin Wang
,First Hospital of Shanxi Medical University

Abstract: Acute kidney injury (AKI) is a frequent complication of critical illness and carries a significant risk of short- and long-term mortality. The prediction of the progression of acute kidney injury to long-term injury has been difficult for renal disease treatment. Radiologists are keen for the early detection of transition from acute kidney injury (AKI) to long-term kidney injury, which would help in the preventive measures. The lack of established methods for early detection of long-

term kidney injury underscores the pressing needs of advanced imaging technology that reveals microscopic tissue alterations during the progression of AKI. Fueled by recent advances in data acquisition and post-processing methods of magnetic resonance imaging (MRI), multiparametric MRI is showing great potential as a diagnostic tool for many kidney diseases. Multiparametric MRI studies offer a precious opportunity for real-time non-invasive monitoring of pathological development and progression of AKI to long-term injury. It provides insight into renal vasculature and function (arterial spin labeling, intravoxel incoherent motion), tissue oxygenation (blood oxygen level-dependent), tissue injury and fibrosis (diffusion tensor imaging, diffusion kurtosis imaging, T1 and T2 mapping, quantitative susceptibility mapping). The multiparametric MRI approach is highly promising but the longitudinal investigation on the transition of acute kidney injury to irreversible long-term impairment is largely ignored. Further optimization and implementation of renal MR methods in clinical practice will enhance our comprehension of not only acute kidney injury but chronic kidney diseases. Novel imaging biomarkers for microscopic renal tissue alterations could be discovered and benefit the preventative interventions. This review explores recent MRI applications on acute and long-term kidney injury while addressing lingering challenges, with emphasis on the potential value of the development of multiparametric MRI for renal imaging on clinical systems.

光谱 CT 的细胞外容积及电子云密度在结肠癌浆膜受侵中的研究

王艺洁、赵卫、何波、李亚敏、杨亚英

昆明医科大学第一附属医院

目的：研究基于双层探测器光谱 CT(Dual-layer detector computed tomography, DLCT)的细胞外容积 (Extracellular volume, ECV) 及电子云密度 (Electron density, ED) 在鉴别结肠癌肠周脂肪间隙模糊时浆膜层受侵中的价值。方法：搜集经 DLCT 检查的结肠癌肠周脂肪间隙模糊患者 62 例，根据病检结果分为突破浆膜层组 18 例，未突破浆膜层组 44 例，对差异有统计学意义的参数绘制 ROC (Receiver operating characteristic, ROC) 曲线。结果：有淋巴结转移的结肠癌患者更易突破结肠癌浆膜层，差异具有统计学意义 ($P < 0.05$)；两组间性别、发病部位及分化程度差异无统计学意义。未突破浆膜层与突破浆膜层两组患者在动脉期、静脉期及延迟期图像中，突破浆膜层组标准化碘浓度 (Normalized iodine concentration, NIC)、ECV 及 ED 差均大于未突破浆膜层组，且差异具有统计学意义 (均 $P < 0.05$)。利用延迟期 ECV 预测结肠癌突破浆膜层的诊断价值最高，临界值为 3.685 时，AUC 为 0.948，灵敏度为 94.44%，特异度为 90.91%。利用 ED 差进行诊断时，静脉期具有较高的诊断价值，临界值为 4.300% 时，AUC 为 0.903，灵敏度为 77.22%，特异度为 72.22%；而利用 NIC 进行诊断时，动脉期具有较高的诊断价值，AUC 为 0.902，灵敏度为 88.33%，特异度为 90.91%。结论：基于双层探测器光谱 CT 的 ECV 及 ED 在鉴别结肠癌肠周脂肪间隙模糊患者浆膜层侵犯中具有较高的诊断价值。

多参数 MRI 在识别 HCC 瘤内自发性凝固性坏死的价值研究

左立平¹、侯明源^{1,2}、范金蕾¹、李芳轩¹、赵倩^{1,3}、于德新¹

1. 山东大学齐鲁医院

2. 威海市妇幼保健院

3. 济南医院影像中心

背景：肝细胞肝癌 (hepatocellular carcinoma, HCC) 瘤内自发性凝固性坏死 (spontaneous intratumoral coagulative, iCN) 是一种常见的坏死亚型，可能代表 HCC 高侵袭性形式，并与低存活

率相关。

目的：探讨多参数 MRI 在识别肝细胞肝癌内自发性凝固性坏死中的价值。

方法：回顾性选取 2015 年 1 月至 2019 年 2 月行多参数 MRI 检查并行手术治疗的 HCC 患者进行研究。使用单变量和多变量 logistic 回归分析以筛选与 iCN 相关的 MRI 影像学特征，并评估其敏感性与特异性。多变量 Cox 比例风险模型和 Kaplan-Meier 生存分析用于评估 iCN 在预测 HCC 早期复发中的价值。

结果：对 163 名 HCC 患者(中位年龄：56 岁；四分位数：49, 64 岁；139 名男性)进行了评估，其中 27 例(16.6%)为 iCNs。在多变量 logistic 分析中，动脉期不规则边缘样强化($P=0.029$)和门脉癌栓($P=0.041$)是 iCN 的独立预测因子。动脉期不规则边缘样强化识别 iCN 的敏感性为 92.6% (25/27)，特异性为 57.4%(78/136)。门脉癌栓识别 iCN 的敏感性为 70.4%(19/27)，特异性为 92.1% (116/136)。当同时存在动脉期不规则边缘样强化及门脉癌栓时，识别 iCN 的敏感性为 80.0%，特异性为 86.4%。在多变量 Cox 比例风险模型中，只有存在 iCNs 与早期肿瘤复发独立相关($HR=2.73$; 95% CI: 1.20~6.21; $P=0.017$)。Kaplan-Meier 生存分析也显示存在 iCN 与 HCC 肿瘤早期复发相关 ($P<0.01$)

结论：在多参数 MRI 中，结合动脉期不规则边缘样强化和门脉癌栓有助于识别肝细胞肝癌内自发性凝固性坏死。存在 iCN 与 HCC 术后早期复发显著相关。

肝细胞肝癌的自然生长模式：单中心回顾性研究

谢弘¹、周石¹、涂丽¹、雷平贵¹、李其¹、赵佩玲¹、杨帆²、龚池¹、姚元林¹

1. 贵州医科大学附属医院

2. 贵州医科大学

背景及研究目的：目前中国人群的肝细胞肝癌的发病和死亡人数均居于世界首位，然已发表的中英文文献中缺乏对中国人群肝癌自然病程及生长的研究的结果报道，本研究旨在量化中国区域内肝细胞肝癌患者肿瘤的自然生长速度与体积倍增时间，探索其自然生长特征及其相关影响因素，从而为中国区域内肝癌患者随诊及患者管理提供证据。

方法：回顾性观察我中心 2014 至 2021 年期间诊断 HCC 且未接受针对肝癌治疗患者，基于治疗前三维的患者 CT 及磁共振增强图像测量其肿瘤体积，计算肝癌肿瘤体积倍增时间及生长速度。采用描述性统计学方法进行描述，Kruskal-Wallis 检验，Fisher exact test 及 Univariable logistic regression 进行相关数据分析。

结果：研究最终共纳入肝癌患者 60 例，肿瘤中位体积倍增时间为 163.7 天。肿瘤倍增时间与肿瘤直径有关，直径增大，倍增时间延长；患者之间肿瘤的生长速度存在差异，肝癌直径越大，生长速度越慢。以 3 个月、9 个月分组，研究人群中肝癌快速生长组（体积倍增时间<3 个月）、中间组（3-9 个月）及惰性生长组（>9 个月）各占 1/3。

结论：本研究支持对中国大陆区域人群自然状态下采用间隔 6 个月的随诊，肝细胞肝癌生长与肿瘤直径相关，且人群中的肝癌肿瘤生长存在异质性。

Early tumor shrinkage and depth of response during treatment with immune checkpoint inhibitors as predictors of overall survival in patients with second-line or later therapy for advanced esophageal squamous cell carcinoma

Yue Zhou, Jianbo Gao

The first affiliated hospital of Zhengzhou university

Background: Evaluation of tumor heterogeneity through early tumor shrinkage (ETS) and depth of response (DoR) serves as an indicator of inherent variations in treatment sensitivity. We hypothesized that ETS and DoR have potential as imaging biomarkers for assessing the efficacy of immune checkpoint inhibitors (ICIs) in patients receiving second-line or later therapy for advanced esophageal squamous cell carcinoma (ESCC).

Materials and methods: We retrospectively analyzed 121 patients with a histological or cytological diagnosis of advanced or metastatic ESCC. Patients who had failed or were intolerant to previous first-line or second-line standard treatments and received immunotherapy at our institute were eligible for inclusion in this study. ETS and DoR were calculated according to the Response Evaluation Criteria in Solid Tumors (RECIST) methodology. Additionally, multivariate analyses were performed to identify the significant prognostic variables for overall survival (OS).

Results: The results of the analysis revealed significant associations between longer overall survival (OS) and higher ETS and DoR values, as well as patients without lymphatic metastasis or with disease control ($p < 0.05$). OS was significantly shorter in patients with ETS $< 10\%$, DoR $< 13\%$, and those with lymphatic metastasis or without disease control ($p < 0.05$). Lymphatic metastasis, disease control, ETS with a 10% cut-off value, and DoR with a 13% cut-off value were independent predictive factors correlated with OS in the univariate and multivariate analyses.

Conclusion: ETS and DoR values were significantly associated with the overall survival of patients treated with ICIs during second-line or later therapy for advanced ESCC.

Contrast-enhanced CT radiomics for preoperative prediction of stage in epithelial ovarian cancer: a multicenter studyYinping Leng¹, Ao Kan¹, Xiwen Wang¹, Xuan Xiao¹, Yu Wang², Lianggeng Gong¹

1. the Second Affiliated Hospital of Nanchang University

2. Clinical and Technical Support, Philips Healthcare

Background Preoperative prediction of stage in patients with epithelial ovarian cancer (EOC) is crucial for determining appropriate treatment strategy. This study aimed to explore the value of contrast-enhanced CT (CECT) radiomics in prognosticating the preoperative staging of EOC, and to validate the stability of the model through an independent external dataset.

Methods A total of 201 EOC patients from three centers, divided into a training cohort ($n=106$), internal ($n=46$) and external ($n=49$) validation cohorts. The least absolute shrinkage and selection operation (LASSO) regression algorithm was used for screening radiomics features. Five machine learning algorithms, namely logistic regression, support vector machine, random forest, light gradient boosting machine (LightGBM), and decision tree, were utilized in developing the radiomics model. The optimal performing algorithm was selected to establish the radiomics model, clinical

model, and the combined model. The diagnostic performances of the models were evaluated through receiver operating characteristic analysis, and the comparison of the area under curves (AUCs) were conducted using the Delong test.

Results Seven optimal radiomics features were retained by the LASSO algorithm. The five radiomics models demonstrate that the LightGBM model exhibits notable prediction efficiency and robustness, as evidenced by AUCs of 0.83 in the training cohort, 0.80 in the internal validation cohort, and 0.68 in the external validation cohort. The multivariate logistic regression analysis indicated that carcinoma antigen 125 and tumor location were identified as independent predictors for the staging of EOC. The combined model exhibited best diagnostic efficiency, with AUCs of 0.95 in the training cohort, 0.83 in the internal validation cohort, and 0.79 in the external validation cohort. The Delong test indicated that the combined model exhibited a significantly superior AUC value compared to the radiomics model ($P=0.04$) in the external validation cohort.

Conclusions The combined model integrating clinical characteristics and radiomics features shows potential as a non-invasive adjunctive diagnostic modality for preoperative evaluation of the staging status of EOC, thereby facilitating clinical decision-making and enhancing patient outcomes.

Survival time prediction of patients with high-grade serous ovarian cancer based on PET/CT-derived spatial heterogeneity metrics

Beibei Li¹, Dianning He², Zhaoyu Liu¹

1. Shengjing Hospital of China Medical University

2. College of Medicine and Biological Information Engineering, Northeastern University

Objectives: To determine whether models based on quantitative PET/CT-derived spatial heterogeneity metrics can accurately predict the progression-free survival (PFS) and overall survival (OS) of patients with high-grade serous ovarian cancer (HGSOC). The correlation between model risk scores and p53 and Ki-67 expression levels was also assessed.

Methods: Patients diagnosed with HGSOC were retrospectively enrolled at our two affiliated hospitals from January 1, 2010, to December 30, 2020. Quantitative spatial heterogeneity metrics were calculated based on conventional measurements and texture features of primary and metastatic lesions in PET/CT. Then the conventional models, heterogeneity models and integrative models were constructed to predict PFS and OS. Spearman's correlation coefficient (ρ) was used to evaluate the correlation between immunohistochemical scores of p53 and Ki-67 and model risk scores.

Results: 292 patients were included (median age: 54 ± 9.4 years). The integrated models showed best performance in predicting both PFS and OS. The C-indices of the verification sets of integrated PFS model and OS model were 0.891 (95% confidence interval [CI]: 0.860–0.921) and 0.905 (95% CI: 0.873–0.936), respectively. The integrated PFS model showed the strongest correlation with the expression levels of p53 ($\rho = 0.859$, $p < 0.001$) and Ki-67 ($\rho = 0.829$, $p < 0.001$).

Conclusion: The models based on PET/CT quantitative spatial heterogeneity metrics exhibited good performance for predicting the PFS and OS of patients with HGSOC. P53 and Ki-67 expression levels were strongly correlated with the risk scores of the integrated predictive models.

OR-0123

基于深度学习重建的膀胱 MRI 在 VI-RADS 评估肌层浸润诊断中的前瞻性应用

张馨心、王绎忱、陈雁、赵心明
中国医学科学院肿瘤医院

目的: 本研究目的为在前瞻性临床队列中探究 DLR 对膀胱 MRI 的影响, 包括检查时间、图像质量以及膀胱成像报告和数据系统 (vertical imaging reporting and data system, VI-RADS) 的诊断表现。

方法: 本前瞻性研究连续纳入 2022 年 8 月至 2023 年 2 月间经病理证实的膀胱尿路上皮癌患者。扫描标准横轴位和冠状位 T2WI (T2WIs) 以及标准横轴位 DWI (DWIs; 扫描时间为 5 分 57 秒) 后, 获取基于 DLR 的快速横轴位和冠状位 T2WI 序列 (T2WIDL) 以及横轴位 DWI (DWIDL; 扫描时间为 3 分 13 秒; 减少了 46%)。三名放射科医师独立进行 Likert 评分 (1-5 分, 5 分为最佳)、测量感兴趣区域信噪比和对比噪声比进行图像评估。此外, 还测量了 DWIs 和 DWIDL 中靶病灶的表观扩散系数 (apparent diffusion coefficient, ADC), 并进行了 VI-RADS 评分。对于标准序列和应用 DLR 的快速序列之间的数据比较, 根据数据是否为符合正态分布选择配对 T-检验和配对 Wilcoxon 符号秩检验。

结果: 本研究共纳入 70 名患者 (平均年龄 64 岁; 年龄范围 40-82 岁)。与横轴位和冠状位 T2WIs 和横轴位 DWIs 相比, 横轴位和冠状位 T2WIDL 以及横轴位 DWIDL 显示出显著更高的信噪比、对比噪声比以及提高的图像质量 (包括总体图像质量、图像清晰度和病变边缘锐利度)。DWIDL 和 DWIs 的 ADC 值未显示出显著性差异。在三名影像科医生中, 标准序列和应用 DLR 的快速序列在 VI-RADS 评估肌层浸润的受试者操作曲线下面积没有显著差异。

结论: 将 DLR 应用于膀胱 MRI 中的 T2WI 和 DWI 序列显著缩短了检查时间, 提高了图像质量, 并且不影响 VI-RADS 在评估膀胱癌肌层浸润的诊断性能。

OR-0124

Association between computed tomography-measured skeletal muscle quantity and quality characteristics and early diabetic kidney disease: a propensity score-matched study

Jinlei Fan, Liping Zuo, Fangxuan Li, Bowen Wang, Yueming An, Dexin Yu
Qilu hospital of Shandong University

Objective: To investigate the association between computed tomography (CT)-measured quantity and quality characteristics of skeletal muscle (SM) and early diabetic kidney disease (DKD) in patients with type 2 diabetes mellitus (T2DM).

Methods: This retrospective study included patients diagnosed with T2DM, with and without early DKD, between January 2019 and December 2021. To reduce potential bias, propensity score matching (PSM) was performed. The areas and CT attenuation values for SM, intermuscular, visceral, subcutaneous, and perirenal adipose tissue were measured. After PSM, logistic and multiple linear regression analyses were performed to analyse risk factors for early DKD. Receiver operating characteristic (ROC) curve was performed to evaluate the performance of CT body composition characteristics in detecting abnormal cystatin C level.

Results: A total of 267 patients were enrolled (mean age, 61.67 years \pm 10.87; 155 men) and divided into two groups: T2DM with early DKD (n=133); and T2DM without DKD (n=134). After PSM, 230

patients were matched (T2DM with early DKD [n=115]; and T2DM without DKD [n=115]), with no statistical differences in general characteristics between the two groups ($P>0.05$). In multivariate logistic regression analysis, high-density lipoprotein cholesterol (odds ratio [OR] 0.14; $P=0.002$), uric acid (OR 1.01; $P=0.006$), and SM attenuation value (OR 0.94; $P=0.003$) were independent risk factors for early DKD. Multiple linear regression analysis revealed significant correlations between SM attenuation value and cystatin C after adjustment for confounders ($\beta=-0.39$, $P=0.004$). The area under the ROC curve for detecting abnormal cystatin C level was 0.711 with SM attenuation value ($P<0.001$; cut-off value, 28.05 HU).

Conclusion: T2DM patients with lower SM attenuation values may exhibit a higher risk for early DKD than those with higher values, which provides a potential imaging biomarker for early DKD diagnosis.

钆塞酸二钠增强磁共振功能性肝脏影像学评分及影像征象与 ALBI 分级评估肝功能的对照研究

郭义万、郭婷婷、孙博、韩萍、李欣
华中科技大学同济医学院附属协和医院

目的 以白蛋白-胆红素 (ALBI) 分级作为肝功能评估标准, 通过分析慢性肝病患者钆塞酸二钠增强磁共振肝胆期图像, 探讨功能性肝脏影像学评分 (FLIS) 及其三个影像学征象在评估肝功能方面的应用价值。

方法 回顾性分析 2022 年 2 月至 2023 年 4 月于本院行钆塞酸二钠增强 MRI 检查的 170 例慢性肝病患者的临床及影像资料。根据实验室指标计算 ALBI 评分并将患者分为 ALBI1 级、2 级、3 级。两名放射科医生独立评估钆塞酸二钠增强 MRI 肝胆期图像并计算 FLIS 及其三个影像学征象 (肝实质增强、胆道对比剂排泄、门静脉征) 得分。采用 Spearman 检验评估 FLIS 及影像学征象与 ALBI 评分之间的相关性并用 K-W H 检验分析上述影像学参数在不同 ALBI 分级之间的组间差异。采用 ROC 曲线评价 FLIS 及影像学征象鉴别不同 ALBI 分级的诊断效能。采用组内相关系数评估不同审阅者之间评分的一致性。

结果 FLIS 及三个影像学征象得分与 ALBI 评分之间均有较高的相关性, 其中 FLIS 的相关系数最高, $r=-0.735$, $P<0.001$ 。K-W H 检验示仅 ALBI1 级和 ALBI2 级之间的胆道造影剂排泄得分差异无统计学意义 ($P=0.111>0.05$), 余影像学指标均有明显统计学差异。ROC 曲线分析示 FLIS 相较于其他三个影像学征象在鉴别不同 ALBI 分级时的诊断效能最高, AUC 值分别为 0.846 (ALBI1 级 vs ALBI2 级或 3 级)、0.952 (ALBI3 级 vs ALBI1 级或 2 级)。两位审阅者对 FLIS、肝实质增强、胆道对比剂排泄及门静脉征评估的一致性均较高, ICC 值分别为 0.951、0.847、0.930、0.945。

结论 FLIS 相较于其他三个影像学征象与 ALBI 评分之间具有更高的相关性且能较准确地鉴别不同 ALBI 分级。FLIS 有望作为一种简单无创的影像学指标评估慢性肝病患者的肝功能并对其临床管理具有一定指导价值。

Quantitative imaging techniques of Creeping fat: research progress and clinical value in Crohn's disease

Bowen Wang, Liping Zuo, Jinlei Fan, Qing Yang, Min He, Xiaowen Liu, Dexin Yu
Department of Radiology, Qilu Hospital of Shandong University, Jinan, Shandong, 250012, China

Creeping fat (CF) in Crohn's disease (CD) patients refers to the pathologically proliferating

mesenteric adipose tissue that wraps around the inflamed parts of the intestine. It is significantly associated with CD's etiology, progression, and prognosis of the disease. Non-invasive imaging techniques, such as CT, MRI and ultrasound, can help with the diagnosis, differentiation and grading assessment of CD by evaluating the extent of mesenteric adipose tissue growth. Moreover, these techniques assist in predicting patient responsiveness to anti-TNF, guiding treatment and determining prognosis. CF is identified when there is mesenteric adipose tissue growth detected on CT/MRI, causing separation or displacement of the surrounding bowel. Alternatively, it can be diagnosed when an inhomogeneous hypoechoic band greater than 5-6mm is seen around the thickened bowel wall on sonogram. Currently, a number of studies have used the mesenteric fat index (MFI) to indirectly assess the impact of CF on CD, defined as the visceral fat area divided by the subcutaneous fat area at the level of the 3rd lumbar vertebra. However, MFI primarily reflects the proportional change in visceral adipose tissue and does not accurately indicate the effect of CF on CD since it includes the peri-organ fat and retroperitoneal fat. Recently, the reliability of emerging quantitative imaging indices, such as the mesenteric creeping fat index (MCFI) and slope of the energy spectrum curve of CF (λ HU), has not yet been supported by large sample sizes and multicentre studies, despite their promising outcomes. Additionally, it is crucial to conduct further research to detect CD mesenteric alterations through novel technologies like radiomics and artificial intelligence.

基于 APTw 和 DCE-MRI 序列定量参数的列线图评估 子宫内膜癌 Her-2 基因表达的价值

马长军^{1,2}、田士峰^{1,2}、宋庆玲^{1,2}、陈丽华^{1,2}、王楠^{1,2}、宋清伟^{1,2}、林良杰³、孙鹏³、王家正³、刘爱连^{1,2}

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心

3. 飞利浦（中国）投资有限公司

目的 探讨基于多模态功能 MRI 技术的列线图可视化评估子宫内膜癌人表皮生长因子受体 2 表达的价值。

方法 本研究回顾性分析了 2019 年 8 月至 2023 年 8 月因怀疑子宫疾病在我院术前行盆腔 3.0T MRI 检查且术后病理证实为 EC 的患者，经纳排标准筛选后，最终有 66 例 EC 患者纳入最终的研究，其中 Her-2 阳性组 32 例，Her-2 阴性组 34 例。MRI 扫描序列包括常规序列、酰胺质子转移加权成像和动态增强磁共振序列。两组间的各定量参数值统计学差异检验通过两独立样本 t 检验或 Mann-Whitney U 检验来评估；通过 logistic 回归分析预测 EC Her-2 表达的独立预测因素纳入诊断模型，并构建列线图；采用受试者工作特征曲线评价有统计学差异的参数和诊断模型评估 EC Her-2 表达的价值；绘制校准曲线直观评价模型的预测准确性，采用 Hosmer-Lemeshow (H-L) 检验评价模型的拟合优度；采用 Delong 检验比较各曲线下面积间的差异性。

结果 APT 值和 Ve 值在 Her-2 阳性组和阴性组间的差异均有统计学意义 ($P < 0.05$)；经 logistic 回归分析发现 APT 值、Ktrans 值和深肌层侵犯值为预测 EC Her-2 表达基因状态的独立预测因子；基于独立预测因子构建的诊断模型在术前预测 EC Her-2 基因表达价值较高，经 H-L 检验分析显示，诊断模型校准曲线与理想模型校准曲线之间无统计学差异 ($P = 0.924$)；APT 值、Ve 值及诊断模型评估 EC Her-2 基因表达的 AUC 分别为 0.691、0.669 及 0.859；DeLong 检验结果显示诊断模型具有最好的诊断效能，较单一参数评估效能均得到了提升 ($P < 0.05$)。**结论** 基于 APTw 和 DCE-MRI 序列定量参数联合临床病理信息的列线图可更全面、更有效地评估 EC Her-2 基因的表达，具有一定的临床应用前景。

A Fully Automated Artificial Intelligence Model to Predict Extrapaneuric Perineural Invasion at CT in Pancreatic Ductal Adenocarcinoma

Jieyu Yu

Department of Radiology, Changhai Hospital, Naval Medical University

Background: Extrapaneuric perineural invasion (EPNI) is a significant risk factor for the prognosis of patients with pancreatic cancer, yet few reliable clinical indicators exist to assess its presence.

Purpose: To develop and validate an automated preoperative artificial intelligence (AI) algorithm model for prediction of EPNI in patients with pancreatic ductal adenocarcinoma (PDAC).

Materials and Methods: In this study, patients with surgically resected, pathologically confirmed PDAC underwent CT from March 2016 and December 2020. We developed a fully automated AI algorithm for the segmentation of tumors and vessels, which utilized the spatial relationships between tumors and peripheral vessels to predict EPNI. The performance of the model was determined on the basis of the discrimination. Kaplan-Meier curves, the log-rank test, or Cox regression were used for survival analysis.

Results: Overall, 709 patients (mean age, 63 years \pm 9 [SD]) were evaluated. All patients were split into training (n = 497) and validation (n = 212) sets. In the training set, the AI model showed the highest performance (area under the receiver operating characteristic curve [AUC], 0.87) in the prediction of EPNI, whereas the clinical model had AUC of 0.62. In the validation set, the AI model showed the highest performance (AUC, 0.88) in the prediction of EPNI, AI model-predicted positive EPNI was associated with worse survival (hazard ratio, 1.49; 95% CI: 1.05, 2.21; P = .03). Furthermore, when patients underwent subgroup analysis for survival based on different pathological indicators (T category, N category, LVSI, and differentiation), the model-predicted EPNI was a stable predictive factor.

Conclusion: The AI model can be an efficient tool for diagnosis of extrapancreatic perineural invasion at CT in patients with PDAC

The changes of gut microbiome and neuropsychological activity in patients with Crohn's disease: A prospective microbiota-gut-brain axis study

ruonan zhang¹, Xiaodi Shen¹, Yangdi Wang¹, Li Huang¹, Ren Mao², Ziping Li¹, Shi-ting Feng¹, Xuehua Li¹

1. Department of Radiology, The First Affiliated Hospital, Sun Yat-Sen University

2. Department of Gastroenterology, The First Affiliated Hospital, Sun Yat-Sen University

***Purpose:** Recent studies point to the microbiota-gut-brain axis dysfunction as a key player in the development of Crohn's disease (CD). There is an urgency to identify biological mechanisms underlying neuropsychological activity in patients with CD. This study aims to explore the relationship between neuropsychological changes and gut microbiome in CD. ***Methods and Materials:** 230 CD patients and 30 healthy controls (HCs) were prospectively recruited. Serum neurotransmitter levels of the total 260 participants and fecal microbiota determined by 16S rRNA of the 182 participants (CD patients, n=152; HCs, n=30) were tested. Among them, 80 patients and 30 HCs underwent brain functional and structural MRI (including T1-weighted structural images, BOLD and DTI) and state-trait anxiety inventory (STAI) questionnaire. Additionally, 230 CD patients also received MR Enterography and they were divided into mild (G1) and moderate-severe (G2) groups according to the cut-off value (<12 or \geq 12) of the MR Enterography Global Score.

***Results:** According to the MR Enterography Global Score, 230 CD patients were divided into G1 groups (n=108) and G2 groups (n=122). Comparing to G1, alpha diversity (an important indicator for judging the species richness of intestinal microbiota) in G2 was decreased and negatively associated with depressive scores (Shannon index; $R=-0.247$; $P<0.05$). In Lefse analysis of beta diversity of gut microbiome, the abundance of depression-related bacteria (genera Eggerthella, Coprococcus, Sellimonas, Lachnospirillum, Ruminoclostridium) in G2 was more abundant than that in G1 groups. The differential neurotransmitter metabolites between G1 and G2 included glutamine, histidine, tryptophan and gamma amino butyric acid (GABA) (all $P<0.05$). Aforesaid neurotransmitters concentrations were lower in G2 groups than that in G1, which are consistent with the hypothesis that low neurotransmitters concentration is associated with depression. CD patients in G2 had higher amplitude of low frequency fluctuations in thalamus, higher regional homogeneity in cerebellar, higher fractional anisotropy in seven fiber bundles (eg, body of corpus callosum, etc), but lower gray matter signal in orbitofrontal cortex than those of G1 and HCs (all $P<0.05$). ***Conclusions:** CD patients demonstrate abnormal neural and mental activity associated with intestinal dysbacteriosis and abnormal serous neurotransmitter. We present evidence that the microbiota-gut-brain axis plays a key role in the disease course of CD patients.

肝脏局灶实性病灶的 MRI 多动脉期强化特征变化的研究

蒋佳慧、杨大为、徐辉、杨正汉
首都医科大学附属北京友谊医院

目的: 探讨肝细胞癌高危人群肝局灶实性病变 MRI 多动脉期图像强化特征变化情况。

材料和方法: 回顾性收集了 2018 年 4 月至 2021 年 12 月在首都医科大学附属北京友谊医院行肝脏增强 MRI 检查的患者, 所有患者均行多动脉期扫描。根据纳入及排除标准, 最后共纳入来自 141 位患者的 238 个病灶。对所有患者的多动脉期 MRI 图像随机分布排序。四名副主任医师参与阅片, 在阅片过程中, 仅告知医师所读图像来源于肝癌高风险患者, 而不提供其他临床信息。两名副主任医师在多动脉期 MRI 图像上独立判读病灶有无动脉期高强化及动脉期高强化类型。另外两名副主任医师基于影像征象判断并记录采集的各个多动脉期图像的时相。当两名副主任医师意见不一致时, 由第三位主任医师进行仲裁并给出最后判读结果。

结果: 2.1% (5/238) 的病灶在多动脉期图像中出现了动脉期高强化类型的不一致, 且均从非边缘高强化到边缘高强化。87.8% (209/238) 的病灶在多动脉期图像中表现出一致的非边缘 APHE, 10.2% (24/238) 的病灶表现出一致的边缘 APHE。在基于影像征象判读时相后, 87.9% (124/141) 多动脉期图像均为动脉期, 12.1% (17/141) 多动脉期图像中包含门脉期。通过单因素分析得出, 多动脉期图像时相会影响病灶在多动脉期图像上强化特征的变化。在考虑时相结果排除门脉期后, 89.9% (214/238) 的病灶在多动脉期图像中表现为一致的非边缘 APHE, 10.1% (24/238) 的病灶表现出一致的边缘 APHE, 因此病灶在多动脉期图像上未出现动脉期高强化类型的不一致。

结论: 多动脉期图像时相是病灶在多动脉期上出现强化特征变化的影响因素。由于部分患者多动脉期序列扫描会采集到门脉期图像, 从而在相应图像上造成病变强化特征的变化。因此基于多动脉期图像判读病灶强化特征, 应先基于影像征象判断时相, 避免诊断错误。

Combination of clinical and spectral-CT parameters in evaluating the perineural invasion of node-negative gastric cancer

Tiezhu Ren, junlin Zhou
Lanzhou University Second Hospital

Objective: Node-negative gastric cancer with perineural invasion-positive has a significantly increased chance of staging migration, and the choice of treatment regimen should be equivalent to that of node-positive patients. The purpose of this study was to investigate the utility of combining clinical and spectral computed tomography (CT) parameters in the preoperative evaluation of perineural invasion (PNI) in node-negative gastric cancer (GC).

Methods and materials: We retrospectively analyzed 106 patients with GC. All cases were confirmed by pathology, underwent spectral-CT examination, and were divided into positive group (n=78) and negative group (n=28) depending on PNI occurrence. Clinical characteristics, including demographic information, serum tumour markers, and gastroscopic pathological information, were collected. The effective atomic number (Zeff), iodine concentration (IC), and water concentration were measured in the arterial (AP) and venous (VP) phases. Parameter differences between the two groups were compared, and diagnostic performance was evaluated.

Results: The PNI-positive group's histological grade, Borrmann type, Zeff, and IC were substantially greater than those of the negative group (AP-Zeff, 8.90 ± 0.21 vs 8.24 ± 0.18 ; VP-Zeff, 8.98 ± 0.16 vs 8.45 ± 0.15 ; AP-IC, 18.67 ± 7.19 vs 12.42 ± 5.51 ; VP-IC, 21.50 ± 4.04 vs 16.77 ± 4.16 , all $p < 0.05$). The evaluated efficiency of the combination of clinical and spectral-CT parameters was superior to that of individual parameters. The clinical parameters combined with Zeff and IC in AP and VP exhibited good evaluation efficacy (AUC=0.820, sensitivity=80.9%, specificity=75.4%).

Conclusions: Clinical and energy spectral-CT parameters exhibited considerable value in the preoperative evaluation of PNI in GC. The combination of clinical and spectral-CT parameters exhibited a favorable performance in predicting PNI in GC.

OR-0132

Predicting Tumor Perineural Invasion Status and Risk Stratification in Patients with Intrahepatic Mass-forming Cholangiocarcinoma Based on Preoperative MRI Features

Shuang Chen, Hongmei Zhang
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose This study focused on developing and validating the nomogram based on clinical and magnetic resonance imaging (MRI) features to preoperatively predict perineural invasion (PNI) in intrahepatic mass-forming cholangiocarcinoma (IMCC).

Methods We enrolled 158 consecutive patients diagnosed with IMCC underwent preoperative MRI and R0 resection. Clinical and histopathological findings were collected from medical records. Univariate and multivariate stepwise logistic regression analyses were applied to screen for independent factors of PNI. A nomogram was established, and the predictive performance was assessed by receiver operating characteristic (ROC) curves. Furthermore, the patients were classified into two risk groups for PNI. Correlations between PNI and the nomogram with disease-free survival (DFS) were explored by log-rank survival analysis.

Results Among 158 patients, PNI was present in 70 (44.3%). Survival analysis showed that PNI-

negative had significantly better DFS than PNI-positive (1-year DFS, 57.6% vs 38.6%, $P < 0.001$) in the total cohort. Multivariate logistic regression revealed that CA 19-9, tumor multiplicity, tumor location, and necrosis were independent predictors for PNI. The nomogram incorporating these indicators had significant predictive power in training (area under the curve [AUC]: 0.759) and validation (AUC: 0.751) cohorts. Low-risk group defined by nomogram had significantly better DFS than high-risk group in the training (1-year DFS 60.5% vs 28.9%, $P < 0.001$) and validation (1-year DFS 62.7% vs 26.3%, $P < 0.05$) cohorts.

Conclusion The nomogram can preoperatively predict PNI in patients with IMCC, which can also provide prognostic value and help filter patients into effective treatment strategies.

OR-0133

Preoperative CT-Based Radiomics and Deep Learning Model for Predicting Risk Stratification in Patients with Gastric Gastrointestinal Stromal Tumors

Ping Yang¹, JiaMei Wu², MengQi Liu¹, YiNeng Zheng¹, XiaoFang Zhao¹, Yun Mao¹

1. The First Affiliated Hospital of Chongqing Medical University

2. Chongqing Dongnan Hospital

Objective To establish and evaluate an artificial intelligence (AI) model based on CT morphological features, radiomics and deep learning features to predict the risk stratification of primary gastric Gastrointestinal stromal tumors (GISTs) preoperatively.

Methods The preoperative CT enhanced images of 193 gastric GISTs lesions were retrospectively analyzed. The data were randomly divided into training set (117), validation set (37), and test set (37) in a ratio of 6:2:2. Senior radiologists segmented three-dimensional images of the tumor area manually and extracted radiomic features and deep learning features based on ResNet50. Recursive feature elimination and multivariate logistic regression were used for feature selection and model construction. The arterial phase, venous phase and dual-phase AI models were built respectively and the morphological features were added to the dual-phase AI model to construct a combined model. Receiver operating characteristic (ROC) curves were used to evaluate the efficacy of each model. The clinical application value of the combined model was determined through the decision curve analysis (DCA) and the net reclassification index (NRI) of the combined model was analyzed.

Results The area under the curve (AUC) of the dual-phase AI model was 0.876, which was higher than that of the arterial phase model or venous phase model (0.813, 0.838, respectively). The combined model with morphological features had best predictive performance than the above models, with an AUC of 0.9408 (95% CI: 0.8871-0.9735) ($p = 0.012$, Delong test). DCA demonstrated that the combined model had good clinical application value, with an NRI of 0.575 (95% CI: 0.357-0.891).

Conclusion In this study, we established a combined model that incorporated dual-phase morphological characteristics, radiomics, and deep learning characteristics, which can be used to facilitate the individualized prediction of preoperative risk stratification of gastric GISTs.

Noninvasive Identification of Proliferative Hepatocellular Carcinoma Preoperatively Using Quantitative Measurements and 2021 LI-RADS Lexicon-Based Features on Dynamic Contrast Enhanced CT

Wanli Zhang^{1,2}, Jiamin Li^{1,2}, Ruimeng Yang^{1,2}, Xinqing Jiang^{1,2}

1. The Second Affiliated Hospital, School of Medicine, South China University of Technology

2. Guangzhou First People's Hospital

Objective To noninvasively identify proliferative hepatocellular carcinoma (HCC) preoperatively by employing quantitative measurements combined with the standard 2021 Liver Imaging Reporting and Data System (LI-RADS) lexicon-based qualitative features on dynamic contrast enhanced (DCE) computed tomography (CT).

Methods 163 patients (66 proliferative HCC, 97 non-proliferative HCC) who underwent preoperative DCE CT with surgically confirmed HCC, were retrospectively analyzed. Imaging qualitative features were evaluated according to 2021 LI-RADS lexicon and quantitative measurements were recorded. All CT findings and clinical factors were compared between proliferative HCCs and non-proliferative HCCs. Multivariable logistic regression was utilized to screen predictive factors for proliferative HCC, with four predictive models (clinical, CT quantitative-clinical, CT qualitative-clinical and combined model) were developed. ROC analysis and DeLong test were used to assess model performances. A nomogram was built for the most effective model and tested in a subgroup of patients with lesions < 5cm in size (n = 58, 19 proliferative HCC vs. 39 non-proliferative HCC).

Results Both the CT quantitative-clinical model and CT qualitative-clinical model demonstrated excellent performance in identifying proliferative HCC, with the AUCs of 0.806 (95% CI: 0.737-0.864) and 0.813 (95% CI: 0.744-0.870), respectively. The combined model, integrating multiple-scale features (AFP ≥ 200 ng/mL, two qualitative features including non-smooth tumor margin and rim arterial phase hyperenhancement, and two quantitative indicators including standardized tumor-to-aorta density ratio in portal venous phase $\leq (-0.13)$ and the proportion of persistent or increased enhancement after arterial phase $\geq 12.5\%$, significantly improved performance (AUC of 0.869 (95% CI: 0.808-0.917) ($p < 0.05$)). This combined model was particularly effectively in the subgroup analysis, with an AUC of 0.901 (95% CI: 0.826-0.977).

Conclusions The standard 2021 LI-RADS lexicon-based features, quantitative CT measurements and AFP ≥ 200 ng/mL can contribute to the identification of proliferative HCC in a noninvasive manner. The combined model, which integrates clinical, CT quantitative and qualitative features, holds significant promise for preoperative prediction of proliferative HCC.

PI-RADS v2.1 评分联合 PSAD 检测 PSA 灰区 临床显著性前列腺癌的双中心研究

张云^{1,2}、张琨¹、董喆^{1,2}、刘百川²、符永瑰¹、王海屹²、叶慧义²

1. 中国人民解放军总医院第六医学中心放射诊断科

2. 中国人民解放军总医院第一医学中心放射诊断科

目的 基于双中心数据, 探讨 PI-RADS v2.1 评分联合前列腺特异度抗原密度 (PSAD) 在前列腺特异度抗原灰区 (4-10ng/mL) 患者中对临床显著性前列腺癌 (csPCa) 的诊断价值。

材料与方法 回顾性分析 2017 年 1 月至 2021 年 12 月解放军总医院第一医学中心（中心一）和 2019 年 1 月至 2022 年 5 月解放军总医院第六医学中心（中心二）PSA 灰区疑似 PCa 患者的临床及影像资料，所有患者均接受了标准 mpMRI 扫描。由两名放射科医师根据 PI-RADS v2.1 评分对所有图像进行盲法评估。将中心一患者作为试验组，中心二患者作为测试组。在试验组应用单变量及多变量 Logistic 回归对 csPCa 和 non-csPCa 组间有统计学差异的参数进行分析，确定对 csPCa 的独立预测因素，并分析多参数组合对 csPCa 的诊断效能；并在测试组进行验证。

结果 最终纳入中心一 220 例，csPCa 患者 152 例；中心二 50 例，csPCa 患者 25 例。试验组 csPCa 和 non-csPCa 组间，年龄和 tPSA 无统计学差异；PV、PSAD、PI-RADS v2.1 评分有统计学差异；多变量 Logistic 回归显示 PI-RADS v2.1 评分和 PSAD 是 csPCa 的独立预测因素。PI-RADS v2.1+PSAD 预测灰区 csPCa 的 AUC 为 0.86，高于 PI-RADS v2.1 (0.82) 和 PSAD (0.78)，且差异具有统计学意义。测试组 PI-RADS v2.1+PSAD 预测 csPCa 的 Se、Sp、PPV、NPV 分别为 94.1%、84.0%、85.4%、87.5%。PI-RADS 4-5 分且 PSAD \geq 0.15 ng/ml² 时 csPCa 比例最高 (94%)。

结论 PI-RADS v2.1 评分与 PSAD 可作为 PSA 灰区 csPCa 的独立预测因素，两者联合应用对 csPCa 的诊断效能优于单独应用，有助于指导临床活检决策。

基于肝脏和病灶自动分割的 MRI 拓扑深度学习 技术预测肝细胞癌微血管侵犯

陈钊地、宋彬
四川大学华西医院

背景与目标 微血管侵犯(MVI)是导致肝细胞癌(HCC)患者预后不良的重要危险因素，传统的深度学习(DL)模型通常存在一些无法解释的因素，拓扑信息不仅为深度学习提供了可解释性，而且有可能进一步提高深度学习模型的预测性能。因此，我们的目的是建立并验证一种新的磁共振成像(MRI)拓扑深度学习模型，用于术前预测 MVI。

方法 本研究回顾性纳入了两家大型医疗中心 2015 年 1 月至 2022 年 12 月间行手术治疗且术前进行了 MRI 检查的 HCC 患者。采用弱监督和半监督学习方法实现肝脏和病灶的全自动分割。计算了肿瘤区域的持续同源性和拓扑(Topo)信息。采用深度学习网络构建了 Pure CNN、TopoCNN 和 TopoCNN+Clinic 模型预测 MVI，并进行外部验证。采用 gad - cam 算法生成显著性图。采用 Cox 回归分析筛选危险因素，使用 ROC 曲线下面积(AUC)评估模型的效能。采用 Kaplan-Meier 法和 log-rank 法进行生存分析。

结果 该研究共纳入 589 例 HCC 患者，TopoCNN 模型用于训练集、内部验证集和外部验证集的 AUC 分别为 0.903 (95% CI: 0.870 ~ 0.935)、0.890 (95% CI: 0.828 ~ 0.951)和 0.871 (95% CI: 0.817 ~ 0.925)。显著图可显示经病理证实的肿瘤周围 MVI 高危区域。Cox 回归分析显示，TopoCNN 模型的 MVI 预测概率是早期 RFS 的独立危险因素(HR=6.64; 95% CI: 4.38 ~ 10.07)和 OS (HR=13.33; 95% CI: 5.38-33.01)。对于 MVI 的高危和低危组，TopoCNN 模型预测的中位早期 PFS 分别为 444 天和 670 天，中位 OS 分别为 1517 天和 2595 天 (P <0.001)。

结论 基于全自动肝脏和病灶分割的 MRI 拓扑深度学习模型能够准确便捷地预测 MVI，该模型在 HCC 术后患者早期 RFS 和 OS 评估方面也显示出显著的分层能力，这可能为高危 HCC 患者的临床分层管理决策提供更多信息支持。

OR-0137

Optimizing Prostate Biopsy Decision-Making for Patients with PI-RADS ≥ 3 Lesions: Novel MRI-based Nomograms

Yanling Chen, Huanjun Wang, Yan Guo, Wenxin Cao
Department of Radiology, The First Affiliated Hospital, Sun Yat-Sen University

Objectives To construct and externally validate a novel nomogram based on Multiparametric MRI (mpMRI) and Synthetic MRI to predict the risk of PCa and avoid unnecessary biopsy in patients with PI-RADS ≥ 3 lesions.

Methods From January 2020 to December 2022, a total of 323 patients suspected of PCa and undergoing mpMRI, including synthetic MRI, prior to targeted biopsy were enrolled from two medical centres (cohort 1: 243; cohort 2:80). Univariable and multivariable logistic regression analyses were executed to identify independent risk factors for PCa. Internal validation was performed using 1000 bootstrap resamples. The nomogram's performance was assessed by the area under the receiver operating characteristic curve (AUC), calibration plots, and decision curve analysis (DCA). Data from cohort 2 were utilized for external validation. The nomogram's impact on biopsy decisions was assessed through calculation of the biopsy avoidance rate, unnecessary biopsies avoidance rate, as well as the rates of missed PCa diagnoses.

Results Four independent predictive factors of PCa were incorporated into the nomogram, including age, SyMRI-derived transverse relaxation time (T2), ADC values, and PI-RADS. High AUC values were observed in the training set (0.916, 95%CI:0.877-0.956) and external validation set (0.947, 95% CI: 0.900-0.994). Calibration curves and DCA curves confirmed its clinical practicability. With the assistance of the nomogram, 20.16% and 13.75% of biopsy could be avoided in the training and external validation cohorts. The PCa missed rates were 4.49% and 4.54%, respectively.

Conclusion The nomogram combining mpMRI and Synthetic MRI could efficiently predict the risk of PCa, and reduce the number of unnecessary biopsies in patients with PI-RADS ≥ 3 lesions.

OR-0138

基于深度学习成像重建低剂量 40keV 虚拟单能成像早期发现结直肠癌肝转移

李昇霖、周俊林
兰州大学第二医院

目的: 探讨低剂量 40keV-VMI 宝石光谱成像(GSI)和深度学习图像重建(DLIR)能否增强结直肠癌肝转移(CRLM)的早期发现和诊断。**方法:** 在 2022 年 3 月至 8 月前瞻性纳入 35 例经病理证实的结直肠癌进行腹部 CT 常规护理。对比增强 CT 采用 GSI 模式, 获得两幅门静脉期 CT 图像[标准剂量(SD) CT 剂量指数(CTDIvol) = 15.51 mGy, RD CTDIvol = 7.95 mGy]。通过滤波后投影(FBP)和迭代重建(ASIR-V 60%, AV60)对 SD 和 RD 图像进行重建。采用 RD 中等强度深度学习图像重建(DLIR-M)和 RD 高强度深度学习图像重建(DLIR-H)对 40keV-VMI 进行重建。客观评价肝脏及病变的信噪比(CNR)、对比噪声比(SNR)。主观评价整体图像质量、病变显著性、诊断置信度。**结果:** 35 例受试者均行两次门静脉期 CT 扫描。与 SD- GSI 扫描相比, RD- GSI 扫描的剂量-长度乘积降低了 49-53%(420.22 \pm 31.95)vs(817.58 \pm 60.56)。共发现 219 个病变, 其中良性 55 个, 转移 164 个, 平均大小为 7.37 \pm 4.14 mm。SD-FBP 检测到 207 个病灶, SD-AV60 检测到 201 个病灶, DLIR-M 和 DLIR-H 分别检测到 199 个和 190 个病灶。病变 ≤ 5 mm 时, SD-FBP 与 DLIR-M(P= 0.32)、SD-AV60 与 DLIR-M(P= 0.56)的检出率差异无统计学意义。DLIR-M 和 DLIR-H 40keV-VMI 图像的 CNR、SNR 和噪声优于 SD-FBP 图像(P < 0.01), 与 SD-AV60 图像差异无统计学意义(P > 0.05)。病变 ≤ 5 mm

时, 与 SD-FBP、SD-AV60、DLIR-M、DLIR-H 比较, 病变总体诊断敏感性差异有统计学意义 ($P<0.01$)。结论: RD-DLIR-M 40keV-VMI 可用于 CRC 患者的常规随访护理, 优化 CT 图像质量。同时维持小病变的检出率及诊断敏感性和特异性。

OR-0139

MRI 定量评估膀胱癌人表皮生长因子受体 2 (HER2) 表达

孔令敏、蔡迁、凌坚、李美琴、郭燕、王焕军
中山大学附属第一医院

目的: 探讨扩散加权成像(DWI)及集成 MRI 定量参数在评估膀胱癌人表皮生长因子受体 2 (HER2) 表达的应用价值。

方法: 前瞻性收集 2021 年 4 月至 2023 年 7 月就诊于中山大学附属第一医院并经手术病理证实的 76 例膀胱癌患者的临床及影像学资料。所有患者均在术前 2 周内接受了包括 DWI 和集成 MRI 的磁共振检查。测量病灶的纵向弛豫时间(T1), 横向弛豫时间(T2), 质子密度(PD)和表观扩散系数(ADC)值。采用独立样本 t 检验和 χ^2 检验比较不同 HER2 表达状态膀胱癌患者的临床、病理及定量参数差异。采用受试者工作特征曲线 (ROC) 的曲线下面积 (AUC) 评估各定量参数鉴别膀胱癌 HER2 表达状态的诊断效能。

结果: 90 例膀胱癌患者中 HER2 表达阳性 51 例, 阴性 25 例。HER2 阳性、阴性患者肿瘤 ADC 值 ($1.01 (0.93, 1.157) \times 10^{-3} \text{ mm}^2/\text{s}$ vs. $0.88 (0.83, 0.99) \times 10^{-3} \text{ mm}^2/\text{s}$)、T1 值 ($1532.65 \text{ msec} \pm 245.98$ vs. $1419.17 \text{ msec} \pm 165.98$) 及 T2 值 ($111.04 (102.14, 125.35) \text{ msec}$ vs. $97.46 (88.21, 109.67) \text{ msec}$) 差异均具有统计学差异 ($P = 0.001, 0.041, 0.003$)。多因素回归分析发现肿瘤病理级别及 ADC 值为独立预测因子 ($P < 0.05$), 构建联合模型。联合模型用于鉴别 HER2 表达状态的 AUC、灵敏度及特异度分别为 0.864、70.59%、96.00%。DeLong 检验提示 ADC 值、T2 值及 ADC 值+T2 值三者 AUC 无明显统计学差异 ($P > 0.05$)。

结论: ADC 值及集成 MRI 定量参数 T2 值可用于治疗前评估膀胱尿路上皮癌 HER2 表达状态, 有助于膀胱癌抗 HER2 靶向治疗计划的制定。

CT-based artificial intelligence for individual lymph node metastasis assessment in gastric cancer

Yun Qin¹, Di Dong^{2,3}, Weihang Zhang¹, Cong Li^{2,3}, Hanyu Jiang¹, Mustafa R. Bashir⁴, Ting Duan¹, Heng Xu¹, Zhenhua Hu^{2,3}, Bin Song^{1,5}, Jiankun Hu¹, Jie Tian^{2,3,6,7}

1. West China Hospital

2. School of Artificial Intelligence, University of Chinese Academy of Sciences

3. CAS Key Laboratory of Molecular Imaging, Institute of Automation, Chinese Academy of Sciences

4. Duke University Medical Center

5. Sanya People's Hospital

6. Beijing Advanced Innovation Center for Big Data-Based Precision Medicine, School of Medicine and Engineering, Beihang University

7. Engineering Research Center of Molecular and Neuro Imaging of Ministry of Education, School of Life Science and Technology, Xidian University

Background: Accurate preoperative lymph node (LN) metastasis assessment on a per-LN basis is imperative but challenging in gastric cancer (GC). Therefore, we aimed to develop an artificial intelligence (AI) model on preoperative CT images to predict individual LN metastasis and to investigate whether the model could be used to improve radiologist interpretation accuracies.

Methods: Consecutive GC patients of whom the resected LNs could be matched rigidly on preoperative CT images were retrieved from a prospectively-collected database spanning 5 years. An AI model, integrating handcraft radiomic and deep learning features, was generated based on both the LNs and corresponding primary tumors. In the testing dataset, LN metastasis was predicted by the AI model and also by three independent radiologists without and with the assistance of AI against histopathology. Diagnostic performances were characterized by area under the receiver operating characteristic curve (AUC), sensitivity, and specificity.

Results: A total of 1381 LNs (739 [53.5%] metastasis positive) in 666 patients (median age, 61 years; range, 29-86 years; 462 males) were included. In the testing dataset, the AUC of the AI model was 0.804 for predicting individual LN metastasis. Compared with radiologist consensus interpretation, the AI model demonstrated a higher specificity (70.6% vs. 48.5%, $p<0.001$) but a lower sensitivity (73.9% vs. 85.8%, $p<0.001$). The specificity of radiologist consensus interpretation with AI assistance improved over that without AI assistance (60.3% vs. 48.5%, $p<0.001$), whereas the sensitivities remained comparable (81.5% vs. 85.8%, $p=0.052$).

Conclusions: In GC patients, we developed a CT-based AI model with high accuracy for predicting the metastasis status of individual LNs. The AI model also showed promise in assisting radiologists to improve their diagnostic accuracies.

OR-0141

Differential value of amide proton transfer imaging combined with diffusion weighted imaging in prostate cancer and benign prostatic hyperplasia

Huijia Yin, Xuekun Li, Ruifang Yan, Dongming Han
The First Affiliated Hospital of Xinxiang Medical University

Objective: To explore the value of magnetic resonance amide proton transfer (APT) imaging combined with diffusion weighted imaging (DWI) in the differential diagnosis of prostate cancer (Pca) and benign prostatic hyperplasia (BPH). **Materials and Methods:** A retrospective analysis was conducted on the data of 52 patients with prostate cancer and 60 patients with prostate hyperplasia. The APT parameter values MTRasym and DWI parameter values ADC were measured in both groups, and two independent sample t-tests were used to compare and analyze the parameters between the two groups. Evaluate the efficacy of meaningful parameters and their combined diagnosis using the receiver operating characteristic (ROC) curve. Use Delong test to compare those two parameters and joint diagnostic efficacy. Analyze the correlation between two parameters using Pearson test. **Result:** The MTRasym value in the prostate cancer group $[(3.70 \pm 0.94)\%]$ was significantly higher than that in the prostate hyperplasia group $[(2.35 \pm 0.60)\%]$ ($P<0.05$); ADC value in prostate cancer group $[(0.93 \pm 0.15) \times 10^{-3}\text{mm}^2/\text{s}]$ significantly lower than that in the prostate hyperplasia group $[(1.32 \pm 0.22) \times 10^{-3}\text{mm}^2/\text{s}]$ ($P<0.05$). The areas under the ROC curve for identifying Pca and BPH using MTRasym value, ADC value, and their combination were 0.886, 0.914, and 0.966, respectively. There was no statistically significant difference in the diagnostic efficacy between the MTRasym value and the ADC value ($P>0.05$), and the combined diagnostic efficacy of the two was superior to the individual diagnostic efficacy of the MTRasym value and ADC value ($P<0.05$). The MTRasym value is negatively correlated with the ADC value ($r=-0.469$, $P<0.001$). **Conclusion:** APT and DWI have high efficacy in distinguishing between prostate cancer and benign prostatic hyperplasia, and the two parameters are negatively correlated. The combination of the two sequences has higher diagnostic efficacy.

双层探测器光谱 CT 定量参数联合常规 CT 特征列线图术前预测结直肠癌肿瘤沉积的价值

冯飞文、胡粟、胡春洪
苏州大学附属第一医院

目的: 探讨双层探测器光谱 CT 定量参数联合常规 CT 特征的列线图模型在术前预测结直肠癌肿瘤沉积 (TDs) 中的应用价值。

方法: 回顾性收集苏州大学附属第一医院 2022 年 1 月至 2023 年 3 月术前接受光谱 CT 腹部增强扫描且经病理确诊的 126 例结直肠癌患者, 根据病理结果将其分为 TDs 阳性组 (n = 38) 和 TDs 阴性组 (n = 88)。分别测量并计算病灶动脉期、静脉期 40-100Kev 光谱曲线斜率 (K40-100kev)、标准化有效原子序数 (NZ)、标准化碘浓度值 (NIC) 以及动-静脉期 NIC 差值; 同时评估其常规 CT 特征:cT 分期、cN 状态、静脉期强化是否均匀、瘤周脂肪浸润 (PFI)、肿瘤最大径以及肿瘤位置等。采用多因素 logistic 回归分析筛选出独立预测因素并构建基于光谱 CT 定量参数及常规 CT 特征的列线图模型, 利用 ROC 曲线评估各参数及模型的预测效能。采用 DeLong 检验比较各 AUC 间的差异, 利用校准曲线评估列线图的校准度。

结果: TDs 阳性组和阴性组间 cT 分期、cN 状态、静脉期强化是否均匀、PFI、NICv、NZv、Kv(40-100kev)、动-静脉期 NIC 差值之间差异均有统计学意义 (P<0.05), 以动-静脉期 NIC 差值的预测效能最高 (AUC、灵敏度、特异度分别为 0.802,80.7%、71.6%)。由静脉期强化不均匀、PFI、动-静脉期 NIC 差值构建的列线图模型的 AUC、灵敏度、特异度、准确度分别为 0.919、84.2%、86.5%、85.7%, 其诊断效能优于 cT 分期、cN、静脉期强化是否均匀、PFI、常规 CT 特征模型 (AUC 为 0.646-0.796) 及各光谱 CT 定量参数 (AUC 为 0.713-0.802), 差异均有统计学意义 (P<0.05)。

结论: 双层探测器光谱 CT 可用于术前预测结直肠癌 TDs, 以光谱 CT 定量参数联合常规 CT 特征的列线图模型诊断效能最佳。

The Value of Magnetic Resonance Elastography in Preoperatively Predicting Wnt/ β -catenin Pathway Activation and MVI Expression in Hepatocellular Carcinoma

huanhuan zhong¹, Huimin Lin¹, Yuchen Yang², Jiahao Zhou¹, Yikun Wang¹, Ruokun Li¹, Fuhua Yan¹

1. Department of Radiology, Ruijin Hospital, School of Medicine, Shanghai Jiao Tong University

2. Department of Hepatobiliary Surgery, Ruijin Hospital, School of Medicine, Shanghai Jiao Tong University

Purpose: To investigate the impact of preoperative magnetic resonance elastography (MRE) on predicting Wnt/ β -catenin pathway activation and MVI expression in hepatocellular carcinoma (HCC).

Methods and Materials: Between June 2020 and April 2024, 209 individuals with pathologically confirmed HCC underwent hepatectomy or liver transplantation and were recruited for preoperative MRE. Tumor morphologic hallmarks and the quantitative parameters of MRE were evaluated, and recurrence-free survival (RFS) was recorded after periodic surveillance tests. Multivariate logistic and COX regression identified independent clinicoradiologic predictors of MVI or Wnt/ β -catenin phenotype, and relapse or mortality, respectively. Predictive discrimination was quantified with the

area under the receiver operating characteristic curve (AUC), and $P < 0.05$ was considered as statistically significant.

Results: Totally, 59 patients suffered from MVI with the median RFS of 9.967 months (non-MVI > 37.967 months; Log-rank test, $P = 0.007$), while 105 patients were in a state of Wnt/ β -catenin pathway silencing (27.067 months; activated state > 37.967 months; $P < 0.001$). Multivariate COX regression analysis indicated that Wnt/ β -catenin pathway activation (HR 0.405, 95%CI 0.247-0.664, $P < 0.001$; AUC=0.834, 95%CI 0.777-0.890, $P < 0.001$) and MVI (HR 1.737, 95%CI 1.021-2.954, $P = 0.042$; AUC=0.718, 95%CI 0.641-0.796, $P < 0.001$) were independent predictors for postoperative recrudescence, together with carcinoembryonic antigen, aspartate aminotransferase, multiple lesions and enhancing capsule. Besides, an elevated tumor stiffness (c value: OR 1.582, 95%CI 1.034-2.420, $P = 0.034$), total bilirubin $> 24 \mu\text{mol/L}$ (OR 2.465, 95%CI 1.154-5.267, $P = 0.020$), smooth tumor margin (OR 2.226, 95%CI 1.157-4.283, $P = 0.017$), and mosaic architecture (OR 1.990, 95%CI 1.029-3.851, $P = 0.041$) were markedly prone to Wnt/ β -catenin expression, yielding an AUC of 0.711 (95%CI 0.641-0.782, $P < 0.001$). Nevertheless, the decreased tumor c value (OR 2.075, 95%CI 1.095-3.937, $P = 0.025$), alongside with non-smooth tumor edge (OR 8.246, 95%CI 3.048-22.307, $P < 0.001$), peritumoral enhancement (OR 2.677, 95%CI 1.081-6.630, $P = 0.033$), incomplete or absent capsule enhancement (OR 3.846, 95%CI 1.680-8.800, $P = 0.001$), and multiple lesions (OR 2.579, 95%CI 1.036-6.420, $P = 0.042$) were identified as independently correlated to MVI-positive HCC (AUC=0.880, 95%CI 0.827-0.933, $P < 0.001$).

Conclusion: The integration of tumor stiffness with morphologic traits could satisfactorily distinguish HCC patients with high risk of Wnt/ β -catenin activation and MVI, both of which facilitate stratifying patients' outcomes before surgery.

OR-0144

探究 T1 mapping 与体素内不相干运动 (IVIM) 参数评估慢性肾病的价值

张倩瑜、鞠烨、骆仁娜、王悦、张瀚月、刘爱连
大连医科大学附属第一医院

目的 探究 T1 mapping 与 IVIM 参数评估慢性肾病(CKD)患者肾功能的价值。

材料与方法 回顾性收集 3.0 T MRI 检查的慢性肾病共 26 例, 扫描序列包括 T1 mapping、IVIM 序列。根据 CKD 分期标准将其分为 A 组(轻度肾损害, $n=12$)和 B 组(中重度肾损害, $n=14$), 同时搜集 10 例健康志愿者作为对照组 (C 组)。使用 Functool、ISP 软件重建图像, IVIM 序列生成 Standard ADC 图、D-mono、D*-mono 和 f-mono 图, 在右肾最大横断面及其相邻上下两个层面的皮质、髓质区分别放置一个感兴趣 (ROI), 取三个层面均值进行统计分析。使用 Shapiro-Wilk 检验数据正态性, 使用 Kruskal Wallis 检验比较组间各参数的差异性; 应用二元 Logistic 回归和受试者工作特征 (ROC) 曲线分析各单一参数和联合参数的诊断效能。

结果 皮质 T1 ($P < 0.01$)、髓质 T1 ($P = 0.011$) 与皮质 D-mono ($P = 0.034$) 在三组间存在显著差异, 余定量参数无明显差异 ($P > 0.05$)。B 组皮质 T1 [1692.22(1644.16, 1736.29)ms] 显著高于 A 组 [1468.65(1426.88, 1546.88)ms] 和 C 组 [1477.72(1437.84, 1516.55)ms] ($P < 0.05$); A 组髓质 T1 [1703.43(1696.12, 1769.05)ms] 显著低于 B 组 [1816.35(1703.50, 1931.80)ms] 和 C 组 [1841.99(1715.06, 1898.62)ms] ($P < 0.05$)。C 组皮质 D-mono 值明显高于 B 组 ($P < 0.05$)。皮质 T1、髓质 T1 及二者联合鉴别 A 组和 B 组的 ROC 曲线下面积 (AUC) 分别为 0.869, 0.815, 0.875; 皮质 T1、皮质 D-mono 及二者联合鉴别 B 组和 C 组的 AUC 分别为 0.929, 0.186, 0.921; 髓质 T1 鉴别 A 组与 C 组的 AUC 为 0.8。

结论 T1 mapping 与 IVIM 参数值可无创性评估 CKD 肾功能损害程度, 有助于疾病的早期发现与诊断。

Application of DKI for the Evaluation of Renal Cold Ischemia-reperfusion Injury in Rat Model: A Preliminary Study

Yizhong Yuan¹, Yan Ren², Jipan Xu³, Lihua Chen², Wen Shen²

1. Tianjin Medical University General Hospital

2. Tianjin First Central Hospital

3. First Teaching Hospital of Tianjin University of Traditional Chinese Medicine

Purpose: To investigate the value of diffusion kurtosis imaging (DKI) in evaluating renal cold ischemia-reperfusion injury (CIRI) after different cold ischemia time (CIT) in rats.

Materials and Methods: Sixty-five Sprague-Dawley rats were randomly divided into 4 groups: 5 rats in control group, 20 rats in different CIT groups (CIT-1h, CIT-2h, CIT-4h) respectively. CIRI in-situ perfusion model of left kidney was established. Five rats in control group and each CIT group at 1 hour, 1 day, 2 days, and 5 days after reperfusion were randomly selected for DKI scans. DKI images were processed and analyzed to generate mean diffusivity (MD) and mean kurtosis (MK) parametric maps. Blood was collected from the inferior vena cava to obtain laboratory indicators, and the left kidney was removed for pathological examination 1 hour after scan.

Results: The cortical and medullary MD values in different CIT groups were significantly lower than control group 1 hour after reperfusion ($P < 0.01$), CIT-1h group and CIT-2h group recovered 1 day after reperfusion, and CIT-4h group recovered 5 days after reperfusion. The cortical MK values of CIT-1h group were lower than control group 1 hour and 1 day after reperfusion ($P < 0.01$), and gradually recovered 2 days after reperfusion. The cortical MK values of CIT-2h group and CIT-4h group 1 hour after reperfusion were higher than control group, and decreased 1 day and 2 days after reperfusion ($P < 0.05$), CIT-2h group recovered 5 days after reperfusion, and CIT-4h group were still lower than control group 5 days after reperfusion ($P < 0.05$). There were moderate negative correlations between medullary MD values and pathologic scores ($r = -0.517$, $P < 0.01$). Cortical MK values were negatively correlated with pathologic scores, serum CRE and BUN ($r = -0.512$, -0.433 , -0.492 , $P < 0.01$).

Conclusion: DKI can effectively and noninvasively evaluate the microstructural changes of renal CIRI.

基于时间依赖性磁共振弥散成像的细胞微结构研究鉴别前列腺癌与前列腺增生价值

李茜玮¹、陈丽华¹、孙鹏²、林良杰²、武志刚²、王楠¹、王家正²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦（中国）投资有限公司北京分公司

目的：本研究旨在利用时间依赖性磁共振弥散成像探究前列腺癌与前列腺增生的细胞微结构信息。

材料与方法：

所有患者均行振荡梯度自旋回波序列扫描，经过 IMPULSED 模型建模得定量参数值细胞平均直径（dmean）、细胞内体积分数（fin）、细胞密度（cellularity）、细胞外扩散系数（Dex）。采用数字病理图像测量 PCa 及 BPH 测量细胞等效直径(dhistology)，并采用 MONAI 软件计算细胞核体积分数 fin-histology 值。Pearson 检验用于评估 PCa 及 BPH 细胞的 dhistology 值与 dmean 值的相关性及 fin-histology 值与 fin 值的相关性。独立样本 t 检验或 Mann-Whitney 检验评估 PCa 及 BPH 组各定量参数的差异。受试者工作特征曲线用于评估各定量参数值的诊断效能。Spearman 检验用

于评估 ADC 值与各微结构定量参数的相关性。

结果: PCa 细胞的 dhistology 值与 dmean 值呈正相关 ($r=0.91$, $P=0.04$), BPH 细胞的 dhistology 值与 dmean 值不相关 ($r=0.49$, $P=0.33$)。PCa 及 BPH 细胞的 fin-histology 值与 fin 值呈正相关 ($r=0.63$, $P=0.04$)。dmean 值鉴别 PCa 与 BPH 差异无统计学意义 ($P=0.092$); PCa 组 fin 及 cellularity 值高于 BPH 组 ($P<0.05$)。PCa 组 Dex 值低于 BPH 组, ($P<0.05$)。fin 及 cellularity 与 ADC 值呈负相关 ($r=-0.803$ 、 -0.838 , P 均 <0.05), Dex 与 ADC 值呈正相关 ($r=0.701$, $P<0.05$)。

结论: 基于时间依赖性弥散磁共振成像的细胞微结构参数对于鉴别前列腺增生与前列腺癌具有很好的价值, 可以作为临床无创诊断前列腺癌的影像标志物。

MR 早期强化特征对局部进展期食管鳞癌新辅助化疗/化免治疗后肿瘤完全缓解的诊断价值

闫铎、史燕杰、杨欣、管真、李晓婷、王琳琳、戴亮、孙应实
北京大学肿瘤医院

目的: 探索食管增强 MR 早期强化特征对接受新辅助化疗 (NAC) 或 NAC 联合免疫检查点抑制剂 (ICI) 治疗的食管鳞癌患者治疗后肿瘤完全反应 (ypT0) 的术前诊断价值。

方法: 回顾性收集 198 例于 2020 年 12 月至 2022 年 6 月间接受 NAC 或 NAC+ICI 治疗患者术前食管 MR 图像。评估肿瘤早期强化 (ECE-MR) 和 T2WI 联合 DWI 特征诊断 ypT0 的准确性。采用组内相关系数 (ICC) 计算评估者间一致性, 采用受试者工作特征曲线分析 MR 特征诊断效能; 采用 DeLong 法比较不同 MR 方法对 ypT0 诊断的曲线下面积。对不同肿瘤分期的 ECE-MR 及 T2+DW-MR 的鉴别诊断效能进行亚组分析。根据多因素 Logistic 回归筛选与 ypT0 诊断独立相关的影像特征。采用卡方检验比较不同 MR 特征与病理特征间的相关性。

结果: 食管增强 MR 早期强化特征评估具有极佳的评估者间一致性, ICC 为 0.84。ECE-MR 对 ypT0 具有较好的诊断效能, AUC 为 0.85, 显著高于 T2+DW-MR ($AUC=0.69$, $p<0.001$)。T2+DW-MR 和 ECE-MR 的诊断效能随着肿瘤分期的上升而提高; 与 T2+DW-MR 相比, ECE-MR 可显著提高鉴别治疗后分期较早的肿瘤 (ypT1~2 肿瘤) 与 ypT0 的准确性 ($p=0.03$), 而对于 ypT3 肿瘤与 ypT0 的鉴别效能则与 T2+DW-MR 相当 ($p=0.18$)。病理分析显示 2~3 级肿瘤相关炎性细胞浸润 (TILN) 较 1 级 TILN 在 ECE-MR 误诊的 ypT0 肿瘤中更常见 ($p=0.049$); 2~3 级纤维化较 1 级纤维化在 T2+DW-MR 误诊的 ypT0 肿瘤中更常见 ($p=0.023$)。在基于 ECE-MR 和 T2+DW-MR 误诊的 ypT1~4 肿瘤中, TRG 1 较 TRG2~3 更常见、残存肿瘤细胞呈分散分布者更常见 ($p<0.001$)。结论: ECE-MR 对 ypT0 有良好的诊断效能, 特别是对于治疗后分期较早的肿瘤与 ypT0 的鉴别, 其诊断价值明显优于常规影像征象的评估。

OR-0148

ASL combined with T1 mapping quantitatively assess renal function in patients long term after kidney transplantation and correlate with pathology

Mo Zhu, Bin Jiang
the first affiliated hospital of Soochow University

Objective To investigate the value of ASL combined with T1 mapping for assessing renal function in patients long term after kidney transplantation and to validate these functional MRI measurements against kidney allograft biopsy findings to establish radiologic-histopathologic correlations.

Methods This prospective study included 63 long-term surviving renal allograft recipients undergoing ASL, T1 mapping. Twenty patients underwent biopsies. Patients were divided into 3 groups according to estimated glomerular filtration rate (eGFR): group 1, $eGFR \geq 60$ ml/min/1.73m²; group 2, $30 \leq eGFR < 60$ ml/min/1.73m²; group 3, $eGFR < 30$ ml/min/1.73m². Cortical T1, medullary T1, $\Delta T1$ from T1 mapping and renal blood flow (RBF) from ASL were calculated and compared. The receiver operating characteristic (ROC) curve and binary logistic regression analyses were performed to assess the diagnostic performances. Pearson correlation was used to analyze the correlation between MRI parameters and eGFR. Spearman correlation were used to analyze the correlation between MRI parameters and Banff renal allograft histopathology scores.

Results RBF was higher in group 1 (221.2 ± 52.1 ml/100g/min) than those in group 2 (172.0 ± 63.8 ml/100g/min, $P=0.009$) and group 3 (122.6 ± 46.5 ml/100g/min, $P<0.001$); group 2 had higher RBF than group 3 ($P=0.044$). Cortical T1 in group 1 (1284.5 ± 114.6 ms) was lower than those in group 2 (1384.3 ± 103.7 ms, $P=0.008$) and group 3 (1456.3 ± 106.3 ms, $P<0.001$). The $\Delta T1$ of group 1 (39.5 ± 10.0 ms) was larger than those in group 2 (24.9 ± 9.2 ms) and group 3 (23.9 ± 6.0 ms). RBF, cortical T1 and $\Delta T1$ were moderately correlated with eGFR ($r = 0.569, -0.573, 0.672$ respectively, all $P < 0.05$). Several MRI parameters were correlated with Banff pathological scores of renal allograft: RBF was negatively correlated with peritubular capillaryitis ($r=-0.485$), cortical T1 was positively correlated with interstitial inflammation ($r=0.459$) and tubulitis ($r=0.520$), $\Delta T1$ was negatively correlated with interstitial fibrosis ($r=-0.502$) and tubular atrophy ($r=-0.452$), all $P < 0.05$. The area under the curve for the discrimination of Group1 versus Group2 and Group1 versus Group3 were 0.740 and 0.923 by ASL, 0.873 and 0.926 by T1 mapping, 0.892 and 0.956 by multiparameter. The area under the curve for the discrimination of Group2 versus Group3 were 0.729 by ASL.

Conclusion RBF, cortical T1 and $\Delta T1$ can serve as new imaging biomarkers of renal function and histopathological microstructure.

肾动脉几何形状联合计算流体动力学 评价肾动脉动脉粥样硬化斑块特征

李笑天¹、王慧颖¹、赵玉娇²、张程³、赵雨蒙¹、秦佳明¹、陈丽华²、夏爽^{1,2}、沈文^{1,2}

1. 南开大学医学院

2. 天津市第一中心医院放射科

3. 天津医科大学

目的：动脉粥样硬化性肾动脉狭窄被认为是继发性高血压和其他并发症的主要原因。我们旨在探讨肾动脉几何形状与血流动力学的关系，以及它们在预测动脉粥样硬化肾动脉轻度狭窄斑块特征方面的表现。

材料和方法：回顾性分析纳入轻度狭窄的肾动脉粥样硬化斑块患者。于 CTA 图像评估肾动脉几何参数（曲率，弯曲度，分叉角），斑块特征（斑块面积，斑块体积，斑块负荷，动脉重塑率，狭窄和钙化程度）。使用有限元软件评估血流动力学参数，包括壁剪切应力（wall shear stress, WSS），振荡剪切指数（oscillatory shear index, OSI）和相对停留时间（relative residence time, RRT）。使用广义估计方程分析评估几何形状和血流动力学参数的预测性能。

结果：结果纳入 45 例患者的 76 块斑块。分布于上部斑块的 WSS 低于下部和腹侧（ $p=0.017$ 和 $p<0.001$ ），OSI 高于下部和腹侧（ $p=0.004$ ），RRT 高于下部和腹侧（ $p=0.001$ 和 $p=0.012$ ）。WSS 与斑块负荷（ $r=0.26$; $p=0.023$ ）以及曲率和斑块负荷（ $r=0.284$; $p=0.013$ ）之间存在弱正相关。WSS 与斑块负荷（OR 1.004; $p=0.004$ ）和狭窄程度（OR 1.005; $p=0.038$ ）相关，曲率与斑块负荷（OR 1.093; $p=0.045$ ）独立相关。

结论：肾动脉分叉处具有固定的血流动力学分布，WSS 和曲率与斑块负荷有关。

The LiverRisk Score: an accurate marker to predict liver fibrosis and diabetes-related death in the general population

Xiaochun Yin¹, Shanghao Liu², Huihui Chen³, Chuan Liu¹, Xiaolong Qi¹

1. Zhongda Hospital, School of Medicine, Southeast University, Nanjing, Jiangsu, China

2. The First School of Clinical Medicine, Lanzhou University, Lanzhou 730030, China

3. Department of Ultrasound, Zhongda Hospital, Medical School, Southeast University, Nanjing, China

Background and aims Non invasive and early assessment of liver fibrosis is of great significance and challenge. We evaluated the predictive performance of the LiverRisk Score for liver fibrosis and diabetes-related death in the general population.

Methods In a cross-sectional study using data from the National Health and Nutrition Examination Survey (NHANES) 2017-2020, we included adult subjects with transient elastography (TE) data for exploring the link between the LiverRisk Score and liver fibrosis. Data from NHANES from 1999-2018 was used to explore the value of the LiverRisk score in the prediction for metabolic-associated deaths through the use of Cox proportional hazard models. In addition, subgroup analyses were further performed. The prognostic value of the LiverRisk Score, FIB-4, APRI, AAR, GPR, FI and Forns was validated with the receiver operating characteristic (ROC) curve.

Results We included 3,770 participants in the cross-sectional cohort, 25,317 in the follow-up cohort. The LiverRisk score had the highest prognostic accuracy, with AUC of 0.78 (0.73-0.83) over 15 kPa compared to FIB-4 [0.69 (0.63-0.74)], APRI [0.67 (0.61-0.73)], AAR [0.52 (0.47-0.58)], GPR [0.72 (0.66-0.77)], FI-fibrosis index [0.68 (0.62-0.74)] and Forns score [0.71 (0.65-0.77)]. According to the selected cut-off values (6 and 15), we stratified patients into 3 groups with

significantly different risks: Low risk, Medium risk and High risk group. We found that the improved LiverRisk grading criteria can better and accurately predicted liver fibrosis. In addition, the score was effective in identifying individuals at risk of diabetes-related deaths. The hazard ratio for diabetes-related mortality in the high-risk group was 13.88 (95% CI 9.83–19.60), compared with the minimal risk group ($P < 0.001$).

Conclusion The LiverRisk Score is an accurate marker to predict liver fibrosis and diabetes-associated outcomes in the general population.

CT Characteristics of Invasive Intraductal Tubulopapillary Neoplasms versus Invasive Intraductal Papillary Mucinous Neoplasms of the Pancreas

Xu Fang, Yun Bian, Li Wang, Chengwei Shao, Jianping Lu
Changhai Hospital of Second Military Medical University

Objective: This study aimed to compare the CT characteristics of invasive intraductal tubulopapillary neoplasm (ITPN) and invasive main duct or mixed type intraductal papillary mucinous neoplasm (IPMN) of the pancreas.

Methods: Preoperative CT images of pathologically confirmed ITPN and IPMN were retrospectively reviewed. Fifteen patients (9 males and 6 females; age, 56.00 ± 8.09 years [mean \pm SD]) had invasive ITPN, and 53 patients (35 males and 18 females; mean age, 63.55 ± 7.92 years) had invasive main duct or mixed type IPMN. Two independent observers blinded to the pathological findings compared the CT characteristics of the two groups. The t test and chi-square tests were used to determine differences between the two groups. Risk factors associated with invasive ITPN were assessed by multivariate analyses, and apparent performance was assessed according to the ability to discriminate patients with the two conditions.

Results: The presence of an intraductal solid component, a 2-tone duct sign, a cork-of-wine-bottle sign, no change in caliber of upstream MPD, and growth into the duodenum were significantly associated with invasive ITPN ($P < 0.05$). Multivariate analysis revealed that a 2-tone duct sign and a cork-of-wine-bottle sign were independent predictors for invasive ITPN (odds ratios: 11.76 and 11.76), and the area under the curve values both were 0.81. The sensitivity, specificity, and accuracy of these two findings both were 73.33%, 88.68% and 85.92%, respectively.

Conclusion: Preoperative CT is helpful in differentiating invasive ITPN and invasive main duct or mixed type IPMN. These findings are important because the prognosis of invasive ITPN is better than that of invasive main duct or mixed type IPMN.

基于 BOLD-MRI 评估 CCL4 诱导肝硬化 大鼠肾脏动态变化及对肾损伤早期诊断的研究

秦佳明^{1,2}、谢双双¹、于永泉³、赵雨蒙^{1,2}、沈文¹

1. 天津市第一中心医院

2. 南开大学医学院

3. 威海市中心医院

目的: 探索 BOLD-MRI 监测 CCL4 诱导肝硬化大鼠肾脏氧合变化过程及对肾损伤的早期诊断价值。
材料方法: 运用 CCL4 皮下注射法建立慢性肝病模型。将 43 只 Sprague-Dawley 大鼠随机分为两组, 病理组 (N=36) 及连续扫描组 (N=7)。其中病理组根据时间点分为 6 个亚组 (n=6 只/组), 分别于基线、CCL4 注射后第 2 周、第 4 周、第 6 周、第 8 周、第 12 周进行肾脏 BOLD-MRI 扫描, 随后处死取静脉血进行肝肾功能检测、取肝肾组织进行组织学分析。连续扫描组在相同时间点进行连续肾脏 BOLD-MRI 扫描。测量所有大鼠肾脏皮质及外髓外带 BOLD-MRI 衍生的 T2* 值。采用单因素方差分析比较病理组各亚组间肾脏皮质及外髓外带 T2* 值、肝肾功能化验指标、肝肾组织病理学指标的差异。采用重复测量方差分析比较连续扫描组各时间点间肾脏 T2* 值的差异。采用 Pearson 或 Spearman 相关分析肾脏 T2* 值与肝肾功能生化指标、肝纤维化 Ishak 评分、肾损伤评分的相关性。

结果: 病理组各亚组和连续扫描组不同时间点的肾脏 T2* 值与基线的差异均具有统计学意义 ($P < 0.05$)。CCL4 注射后 2 周肾脏 T2* 值出现明显下降, 4 周回升后至 12 周急剧下降, 除第 4 周外, CCL4 注射后各组肾脏 T2* 值均明显低于基线 ($P < 0.05$)。而 CCL4 注射后各组 Scr 只在第 8 周相较基线明显升高 ($P < 0.05$)。病理组 CCL4 注射后各亚组间肝纤维化 Ishak 评分、肾损伤评分均明显高于基线组 ($P < 0.05$)。肾脏皮质带及外髓外带 T2* 值与肾损伤评分、肝脏纤维化 Ishak 评分均存在中-高度负相关 (r 值分别为 -0.554、-0.605、-0.698、-0.660)。

结论: BOLD-MRI 监测的 CCL4 诱导肝硬化大鼠肾脏变化早于 Scr, 且能准确评估肾脏损伤, 有望在 Scr 正常情况下尽早提示肾脏潜在的病理损伤。

15. North China University of Science and Technology Affiliated Hospital
16. Jincheng People's Hospital

Objective: In patients with compensated advanced chronic liver disease (cACLD), the invasive examination of esophagogastroduodenoscopy (EGD) is the gold standard for risk assessment of variceal bleeding. This is a prospective, multi-center study and have been registered on the clinical trials (NCT04546360). The aims of our study were to develop and validate a novel strategy based on two-dimensional shear wave elastography (2D-SWE) for screening of high risk varices (HRV) and avoiding unnecessary EGD in cACLD patients and to compare the performance of the strategy with existing screening models based on 2D-SWE.

Methods: A prospective multicenter study was conducted in patients with cACLD. We recruited 410 patients from 14 hospitals in China between October 2020 to September 2022 as a prospective training cohort to develop a novel strategy, and 90 patients from Croatia between January 2011 to December 2020 as a retrospective cohort to validate. All patients underwent liver stiffness measurement and spleen stiffness measurement by 2D-SWE and EGD. The new strategy has been compared with previous standards regarding the performance for spared EGD.

Results: 416 patients were included in the final analysis. Of them, 343 patients were included in the prospective training cohort and 73 patients in the retrospective validation cohort. In the training cohort, independent predictors of HRV were identified including spleen stiffness measurement, spleen diameter, and platelet count and fitted to develop the novel strategy, termed "SSP" strategy. The SSP strategy performed significantly better (all $P < 0.05$) than other assessed methods with receiver operating characteristic curve of 0.85 (95% confidence interval: 0.81–0.89) in the training. The spared EGD was best stratified by the cutoff value at 2.5, which could spare 122 (35.6%) EGD with a missed HRV rate of 4.1% (5/122). In the validation cohort, comparing with other models, SSP strategy improved the proportion of avoided EGD and lowered the rate of misclassified HRV.

Conclusion: The SSP strategy can be readily applied into clinical practice to accurately spared EGD in cACLD patients.

系膜内结节“血管植入征”是局部进展期直肠癌预后独立影响因素

孙瑞佳、卢巧媛、李晓婷、张晓燕、孙应实
北京大学肿瘤医院

背景: MR 图像显示局部进展期直肠癌的系膜内结节, 当观察到血管穿行于其中时, 定义这种征象为“血管植入征”, 本研究旨在基线和疗后 MRI 图像上识别血管植入征, 探讨其与预后的关系, 从而进一步筛选需要强化治疗的高风险病人。

方法: 回顾性连续纳入从 2015 年 1 月到 2018 年 6 月于本中心就诊的 261 位局部进展期直肠癌患者, 评价所有患者的 MR 特征, 包括: 影像 TN 分期、原发灶 mrEMVI (T-mrEMVI) 状态、mrMRF 状态以及是否存在血管植入征, 并比较这些特征与总生存 (OS)、无转移生存 (DFS) 和局部无复发生存 (LRFS) 的相关性。

结果: 单因素分析显示, 基线及疗后血管植入征与 OS (HR=7.24; $P<0.001$)、DFS (HR=6.72; $P<0.001$) 均显著相关。基线多因素生存回归结果显示, 对于 OS, T-mrEMVI (HR=3.78; $P=0.002$) 和血管植入征 (HR=4.49; $P=0.001$) 是其独立影响因素。对于 DFS 和 LRFS, 仅血管植入征 (HR=6.72; $P<0.001$; HR=5.03, $P=0.005$) 是其独立影响因素。疗后多因素生存回归结果显示, 对于 OS, T-ymrEMVI (HR=4.09; $P=0.001$) 和血管植入征 (HR=2.83; $P=0.02$) 是其独立影响因素。T-ymrEMVI (HR=2.76; $P=0.001$) 和血管植入征 (HR=3.73; $P<0.001$) 两者同样也是 DFS 的独立影响因素。

结论: 在同时接受新辅助治疗与根治性手术的局部进展期直肠癌患者中, 血管植入征这一影像指标是生存及疾病进展的独立危险因素, 可作为风险分层的依据, 从而帮助识别高风险患者并制定个体化的治疗策略。

Predicting human epidermal growth factor receptor 2 status of patients with gastric cancer by computed tomography and clinical features

Jifei Wang, Qingyu Lin, Zeyao Wang, Yuying Chen, Yin Li
The First Affiliated Hospital, Sun Yat-sen University

Objective: There have been no studies on predicting human epidermal growth factor receptor 2 (HER2) status in patients with resectable gastric cancer (GC) in the neoadjuvant and perioperative settings. We aimed to investigate the use of preoperative contrast-enhanced computed tomography (CECT) imaging features combined with clinical characteristics for predicting HER2 expression in GC.

Methods: We retrospectively enrolled 301 patients with GC who underwent curative resection and preoperative CECT. HER2 status was confirmed by postoperative immunohistochemical analysis with or without fluorescence in situ hybridization. A prediction model was developed using CECT imaging features and clinical characteristics that were independently associated with HER2 status in multivariate logistic regression analysis. Receiver operating characteristic curves were constructed; the performance of the prediction model was evaluated. The bootstrap method was used for internal validation.

Results: Three CECT imaging features and one serum tumour marker were independently associated with HER2 status in GC: enhancement ratio in the arterial phase (odds ratio [OR]=4.535; 95% confidence interval [CI]: 2.220–9.264), intratumoral necrosis (OR=2.64; 95% CI: 1.180–5.258), tumour margin (OR=3.773; 95% CI: 1.968–7.235), and cancer antigen 125 (CA125) level (OR=5.551; 95% CI: 1.361–22.651). A prediction model derived from these variables showed an

area under the receiver operating characteristic curve of 0.802 (95% CI: 0.740–0.864) for predicting HER2 status in GC. The established model was stable, and the parameters were accurately estimated.

Conclusions: The enhancement ratio in the arterial phase, intratumoral necrosis, tumour margin, and CA125 level were independently associated with HER2 status in GC. The prediction model derived from these factors can be used preoperatively to estimate HER2 status in GC and guide clinical treatment.

The Involvement of Mesorectal Fascia by Tumor Deposits and Extramural Venous Invasion Predicts Poor Overall Survival in Locally Advanced Rectal Cancer

Yaru Feng, Tong Tong
Fudan University Shanghai Cancer Center

Objective: In magnetic resonance imaging (MRI), mesorectal fascia (MRF) involvement serves as an adverse prognostic indicator for locally advanced rectal cancer (LARC). However, prognoses among MRF-positive (MRF+) patients vary. This study aims to further classify MRF involvement in MRF+ cases and investigate its prognostic implications.

Methods: We conducted a retrospective analysis of data from LARC patients who were evaluated MRF+ and underwent surgery after neoadjuvant chemoradiotherapy at Fudan University Shanghai Cancer Center between January 2012 and December 2019. Patients were categorized into four groups based on MRF involvement: MRF+ (Tumor) vs MRF+ (Non-tumor), MRF+ (Extramural venous invasion; EMVI) vs MRF+ (Non-EMVI), MRF+ (lymph node; LN) vs MRF+ (Non-LN), and MRF+ (Tumor deposits; TDs) vs MRF+ (Non-TDs). Survival curves were generated using the Kaplan-Meier (K-M) method, and differences in overall survival (OS) were assessed using the log-rank test. Prognostic factors were evaluated through multivariate Cox proportional hazards models.

Results: A total of 400 LARC patients with MRF+ status were included in the study. The occurrence of MRF+ (Tumor), MRF+ (TDs), and MRF+ (EMVI) was higher in patients aged ≥ 60 years compared to those aged < 60 years, and this difference was statistically significant ($p < 0.05$). In the K-M survival analysis, both MRF+ (TDs) and MRF+ (EMVI) cases were associated with significantly worse OS compared to MRF+(Non-TDs) and MRF+ (Non-EMVI) (p all < 0.05). Conversely, there were no significant differences in OS between MRF+ (Tumor) and MRF+ (LN) cases and MRF+ (Non-tumor) and MRF+ (Non-LN). In the multivariate COX regression analysis, MRF+ (TDs) demonstrated a significant association with OS (HR 1.744; 95% CI, 1.064–2.860, $P < 0.05$). Similarly, MRF+ (EMVI) displayed a significant correlation OS (HR 1.886; 95% CI, 1.076–3.306, $P < 0.05$). Conversely, there were no significant associations observed between MRF+ (Tumor) or MRF+ (LN) and OS.

Conclusion: MRF+ (TDs) and MRF+ (EMVI) independently indicated higher risks for adverse prognosis in MRF-positive LARC patients, providing valuable insights for treatment and follow-up strategies.

酰胺质子转移磁共振成像评估慢性肾病纤维化程度的价值霍宇婷^{1,2}、鞠烨¹、张倩瑜¹、张瀚月¹、胡庆晨¹、骆仁娜¹、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连医科大学中山学院

目的：本研究旨在探索酰胺质子转移磁共振成像 (APT-MRI) 序列与纤维化肾脏组织病理学指标之间的关联关系，通过病理指标和磁共振序列参数的映射关联，验证 APT 序列在评估 CKD 患者肾脏纤维化程度中的价值。

方法：通过回顾性队列研究数据，收集大连医科大学附属第一医院 2020 年 5 月至 2023 年 8 月接受肾脏功能磁共振检查的 CKD 患者。扫描序列包括 3.0 T 磁共振 APT 序列。功能磁共振参数值分别为皮髓质的 APT 值。所有患者在 MRI 检查后 3 天内，在超声引导下肾活检。肾活检方法采用国家肾脏疾病临床医学研究中心发明并推广的“B 超引导下斜角进针负压吸引一秒钟快速经皮肾活检法”。收集肾活检常规病理数据(球性硬化比例)以及肾脏病理诊断。球性硬化比例=硬化肾小球数量/切片上所有肾小球数量。根据肾小球球性硬化百分比进行分组，以小于 10%，10%-30%，30%-50% 和大于 50% 分为四组，分析对应的磁共振序列参数变化。采用 SPSS 27.0 统计学软件(IBM SPSS Statistics)进行统计分析。皮髓质 APT 值与肾纤维化病理指标的相关关系采用皮尔逊相关系数(Pearson's r)或斯皮尔曼相关系数(Spearman's Rho)。所有检验均为双侧检验， $P < 0.05$ 为差异有统计学意义， $P < 0.01$ 为差异有非常显著统计学意义。

结果：皮质 APT 值、髓质 APT 值与球性硬化百分比之间存在显著正相关性分别为： $Rho = 0.736$, $P < 0.01$; $Rho = 0.626$, $P < 0.01$ 。

结论：APT 序列对评估慢性肾病纤维化程度具有优势。本研究将 APT 序列与肾脏病理纤维化指标进行相关性分析，以明确其对肾脏纤维化的评估作用和 CKD 进展的预后判断能力。未来可以尝试用于患者远期预后判断和随访过程中肾脏慢性化病变进展的监测。

A Nomogram for Preoperative Prediction of Vessels Encapsulating Tumor Clusters (VETC) Pattern and Prognosis of Hepatocellular CarcinomaYinzhong Wang¹, miaomiao wang^{1,2}, liang cao¹, hongliang huang¹, shi cao³, xiaoxue tian⁴, junqiang Lei¹

1. Department of Radiology, The First Hospital of Lanzhou University

2. The First Clinical Medical College of Lanzhou University

3. Department of Pathology, The First Hospital of Lanzhou University

4. Department of nuclear medicine, Second Hospital of Lanzhou University

Background Vessels encapsulating tumor clusters (VETC) is a novel pattern of vascular metastasis that is significantly associated with poor prognosis after surgical resection in patients with hepatocellular carcinoma. Predicting VETC-positive HCC will help patients make clinical treatment decisions and individualized treatment.

Objective To establish a nomogram model to predict VETC patterns based on preoperative CT imaging features, and to evaluate prognostic factors associated with recurrence-free survival (RFS) of HCC.

Methods The study included HCC patients who underwent radical surgical resection between January 1, 2016 and August 31, 2022. CT imaging features were evaluated based on LR-RADS. Logistic regression analysis was used to identify independent variables related to the VETC pattern, and a nomogram model was constructed. Receiver operating characteristic curve (ROC) was plotted to evaluate the diagnostic performance of the CT features and nomogram model. COX

regression was used to determine the predictors associated with RFS after surgical resection in patients with HCC, and Kaplan-Meier method was used to plot the survival curve. P value <0.05 was considered statistically significant.

Results A total of 84 patients were included for CT analysis. All patients underwent radical surgical resection. Multivariate logistic regression showed that AST/ALT >1.07(odds ratio [OR], 4.91; 95% CI: 1.11, 21.68; P=0.036), intratumoral necrosis (OR, 4.99; 95% CI: 1.25, 19.99; P=0.023) and enhancing capsule (OR, 3.32; 95% CI: 1.27, 8.94; P=0.017) were independent predictors of VETC-positive HCC. By combining the above three predictors, a nomogram model showed the optimal diagnostic performance, with specificity, sensitivity and accuracy of 68.09%, 78.38% and 72.62%, respectively, and the highest AUC value of 0.767 (95%CI [0.662, 0.852]). In multivariate COX regression analysis, CK19 status (Hazard ratio [HR], 2.02; 95% CI: 1.06, 3.86; P=0.032), the number of tumors (HR, 3.31; 95% CI: 1.47, 7.45; P=0.004) and VETC pattern (HR, 2.52; 95% CI: 1.31, 4.86; P=0.006) were independent predictors of postoperative RFS in patients with hepatocellular carcinoma. The Kaplan-Meier curve showed shorter RFS and higher risk of recurrence for VETC-positive HCC, and the Log-Rank test found significant differences between the two groups.

Conclusion A nomogram model based on preoperative CT imaging features can be used to predict VETC pattern, and has prognostic significance for postoperative recurrence-free survival in patients with hepatocellular carcinoma.

OR-0159

基于多参数磁共振成像的膀胱影像报告 与数据系统对不同形态膀胱癌评估的应用价值

马元昊^{1,2}、刘海丽³、陈逸剑¹、白旭¹、徐鸿昊^{1,2}、宁雪怡^{1,2}、王海屹¹

1. 中国人民解放军总医院第一医学中心放射诊断科

2. 中国人民解放军医学院研究生院

3. 中国人民解放军总医院第四医学中心

目的：探讨基于多参数磁共振成像（mpMRI）的膀胱影像报告与数据系统（VI-RADS）对不同形态膀胱癌肌层侵犯评估的应用价值。

方法：回顾性连续入组 2019 年 1 月~2023 年 4 月间于解放军总医院第一医学中心行膀胱 MRI 检查及根治性膀胱切除术或经尿道膀胱肿瘤切除术（TURBT）的 97 例膀胱癌患者。VI-RADS 评分由一名放射科医生（7 年盆腔疾病影像诊断经验）在对病理信息不知情的前提下，首先将膀胱病变形态划分为腔内生长型，非腔内生长型（壁内生长型，内层增厚型），然后根据 T2WI、扩散加权成像和动态增强图像进行两次评估，时间间隔为 2 个月。以病理为金标准，利用受试者工作特征曲线计算 VI-RADS 评分诊断肌层浸润性膀胱癌的曲线下面积（AUC），采用 kappa 分析对 VI-RADS 评分的重测信度进行评估。

结果：73 例患者（平均年龄 63±12 岁，男性 59 例）影像表现为腔内生长型，24 例（平均年龄 64±10 岁，男性 21 例）为非腔内生长型（壁内生长型 7 例，内层增厚型 17 例）。使用 VI-RADS 评分系统评估腔内生长型膀胱癌肌层侵犯的 AUC 为 0.787（95%CI: 0.675~0.874），以≥3 分为截断值时诊断敏感性和特异性分别为 82.6%、68.0%；使用 VI-RADS 评分系统评估非腔内生长型膀胱癌肌层侵犯的 AUC 为 0.916（95%CI: 0.729~0.990），以≥3 分为截断值时诊断敏感性和特异性分别为 92.3%、81.8%。评估者对于腔内生长型膀胱癌前后评估结果重复性较好（加权 κ 值=0.670, 95%CI: 0.510 ~ 0.830）；评估者对于非腔内生长型膀胱癌前后评估结果重复性良好（加权 κ 值=0.826, 95%CI: 0.698 ~ 0.954）。

结论：VI-RADS 评分受膀胱癌形态的影响，VI-RADS 在非腔内生长型膀胱癌中评估其肌层侵犯情况诊断效能更高。

使用钆塞酸二钠增强 MRI 定量评估移植肝功能： 功能性 T1 mapping

陈根、胡学梅、胡道予、李震
华中科技大学同济医学院附属同济医院

目的：钆塞酸二钠增强 MRI 已显示出作为评估肝功能的宝贵工具的前景。它被认为是评估肝移植最有前途的成像技术之一，可以很好地检测移植后的并发症，并有机会评估肝损伤的严重程度。本研究的目的是探讨钆塞酸二钠增强 MRI 得出的功能性 T1 mapping 与肝移植功能之间的相关性，并评估这种方法是否有助于识别处于高危状态的受者。

方法：2021 年 1 月至 2022 年 9 月间，101 名肝移植受者接受了 3.0 T 的肝脏 MRI，包括 T1 mapping 和钆塞酸二钠增强 MRI。使用终末期肝病 (MELD) 模型定量评估肝功能。在注射钆塞酸二钠 (0.025 mmol/kg) 前和后 20 分钟，通过使用 T1 mapping 序列获得 T1 mapping 图。评估 MELD 模型与以下 MRI 参数之间的关系：肝脏的对比前和对比后 T1 值、减少率 ($\Delta T1\%$) 和胆管显示程度。使用受者工作特征曲线下面积与其他参数比较 $\Delta T1\%$ 对高危状态患者的诊断效能。

结果： $\Delta T1\%$ 与 MELD 模型呈负相关， r 为 -0.61 ($P < 0.001$)。在低风险或中风险状态的肝移植受者中，其 $\Delta T1\%$ 高于高风险状态的受者 ($P < 0.001$)。

结论： $\Delta T1\%$ 与 MELD 模型测量的肝移植功能呈负相关，并提供可接受的诊断性能，帮助识别处于高风险状态的受者。此外，钆塞酸二钠增强 MRI 可以在一次检查中实现动态成像和肝细胞特异性成像，从而为评估肝移植后并发症和肝损伤提供综合方法。因此，钆塞酸二钠增强 MRI 代表了一种“一站式”肝脏评估方法。

Radiomics Nomogram Model Based on Multi-phase Contrast-enhanced Magnetic Resonance Imaging for Predicting Early Recurrence in Hepatocellular Carcinoma After Curative Ablation

Wanrong Huang, lu jiang, yao zhang
The First Affiliated Hospital Of Fujian Medical University

Purpose: Predicting early recurrence (ER) after curative ablation for hepatocellular carcinoma (HCC) patients is critical for the decision of subsequent follow-up and treatment. We aimed to develop and validate a radiomics nomogram based on multi-phase contrast-enhanced magnetic resonance imaging (CE-MRI) to preoperatively predict early recurrence (ER) (≤ 2 years) of HCC after curative ablation.

Methods: We retrospectively enrolled 134 patients with HCC who underwent curative ablation. Patients were randomly divided into the training ($n = 94$) and validation ($n = 40$) cohorts. Preoperative multi-phase CE-MRI images were reviewed, and the 3D volumes of interest (VOIs) of the whole tumor were delineated on non-contrast T1-weighted imaging (T1), T2-weighted imaging (T2), arterial phase (AP), portal venous phase (PVP), delayed phase (DP), and hepatobiliary phase (HBP). One hundred and seven original radiomics features were extracted from each phase. Minimal redundancy maximal relevance and recursive feature elimination were applied to screen the optimal features subset and logistic regression was used to train corresponding radiomics models. Clinical characteristics and qualitative imaging features were identified by two independent radiologists and combined to establish a clinical-radiological model. A combined model comprising the best radiomics model and clinical-radiological risk factors was constructed based on

multivariable logistic regression analysis, which was ultimately presented as a radiomics nomogram model. Utilizing the receiver operating characteristic curve and its area under the curve (AUC) to evaluate the performance of each model.

Result: In total, six radiomic features and three clinical-radiological risk factors were identified and used for model construction, and they presented good performance in the discrimination of early recurrence alone with an AUC of 0.727 and 0.810, respectively. The combined radiomics nomogram model integrating the radiomics score with clinical-radiological risk factors showed the best predictive performance with AUCs as 0.888 and 0.964 in the training and testing cohort. A better net benefit was observed with the combined model compared with the other two models according to the decision curve analysis.

Conclusions: The combined radiomics nomogram model which combined radiomic features extracted from multi-phase CE-MRI images with clinical-radiological risk factors could non-invasively predict HCC early recurrence after curative ablation, which could provide support for individualized treatment planning.

OR-0162

Diagnostic value of synthetic magnetic resonance imaging in prostate disease patients with PSA levels in the gray area.

Wenxin Cao, Yanling Chen, Lingmin Kong, Zhihua Wen, Huanjun Wang, Yan Guo
The First Affiliated Hospital of Sun-yat Sen University

Purpose: To investigate the diagnostic performance of synthetic MRI in discriminating prostate diseases (including prostate cancer and non-cancerous lesions) in patients with prostate-specific antigen (PSA) levels in the gray area.

Materials & Methods: Patients with prostate-specific antigen (PSA) levels in the gray area (4 -10 ng/ml) who were suspected with prostate cancer were retrospectively collect from two medical centers between August 2020 and August 2022. All patients underwent the serum PSA test and magnetic resonance imaging (MRI) examination including synthetic MRI and diffusion-weighted imaging (DWI) before treatment, and transrectal ultrasound (TRUS)-guided biopsy or radical prostatectomy for pathology were subsequently performed. Patients were classified into prostate cancer and non-cancerous prostatic lesions according to pathology. Regions of interest (ROIs) and the values of quantitative parameters such as longitudinal relaxation time (T1), transverse relaxation time (T2), proton density (PD), and apparent diffusion coefficient (ADC), were separately drawn and measured by two independent radiologists based on relaxometry maps and ADC maps. Interobserver agreement was evaluated using the interclass correlation coefficient (ICC). Independent sample t-test or Mann-Whitney U test was used to assess the differences in quantitative parameter values between prostate cancer and non-cancerous lesions. Receiver operating characteristic curve (ROC) analysis was performed to evaluate the diagnostic performance of each parameter (T1, T2, PD, and ADC values), and their combination in discriminating the cancer and non-cancerous lesions groups. Differences of $P < 0.05$ were considered statistically significant.

Results: A total of 130 patients were enrolled in this study, and the mean age was 67 ± 9 years (Table 1). Interobserver agreement of all T1, T2, PD and ADC values was classified as good and above ($ICC = 0.60-1.00$). The means of all the T1, T2, PD, ADC values were significantly different between prostate cancer and non-cancerous lesions ($P < 0.05$, Figure 2), while the diagnostic performance of the ADC value outperformed the other parameters, with the AUC of $0.854(0.781-0.909)$. The combination of the T1, T2, PD and ADC, with the AUC of $0.853(0.781-0.909)$, showed a higher diagnostic performance than either T1, T2, or PD values (AUC values: 0.622, 0.721, 0.608, respectively) for differentiating prostate cancer and non-cancerous

lesions, while when compared to ADC value, there was no statistical significance ($P > 0.05$, Table 2).

Conclusions: The quantitative parameters including T1, T2, and PD derived from synthetic MRI can be applied to distinguish prostate cancer from non-cancerous lesions in patients with PSA levels in the gray area. While when ADC combined with those parameters, the diagnostic performance was not improved compared with ADC value alone.

Clinical relevance/ application: Prostate cancer (PCa) is a common malignancy of the male genitourinary system and the second leading cause of cancer death among males. Early detection and accurate diagnosis of prostate cancer have always been a clinical research focus. PSA test contributes to routine screening of prostate cancer. But its specificity is not high, additionally, it would be more difficult to accurately differentiate prostate cancer from benign prostatic hyperplasia, especially in patients with PSA levels of 4-10 ng/ml. Synthetic MRI is capable of quantifying the relaxation time of tissues, reflecting tissue biophysical characteristics, and providing more objective quantitative data. Combined with DWI, it may be possible to further improve the objective diagnostic performance of prostate diseases. Our results showed that the means of all the T1, T2, PD, ADC values were significantly different between prostate cancer and non-cancerous lesions. However, compared to ADC value alone, the combined diagnostic performance has not improved ($P > 0.05$, the difference was not statistically significant) when T1, T2, and PD values were combined with the ADC value. Our study suggested that synthetic MRI was helpful for distinguishing prostate cancer but did not improve the diagnostic performance of the ADC value when it came to making a diagnosis among clinically suspected prostate cancer patients with PSA levels in the gray area.

OR-0163

Preoperative Scoring Model for Identifying Proliferative Hepatocellular Carcinoma on Multiphase Liver MRI and Its Implication for Surgical Resection

Junhan Pan, Zhu Yanyan, Feng Chen

Department of Radiology, The First Affiliated Hospital, Zhejiang University School of Medicine

Objectives: To develop and validate a scoring model for preoperative identification of proliferative hepatocellular carcinomas (HCCs) using multiphase liver MRI, and to compare the early recurrence rates between patients with model-predicted proliferative and nonproliferative HCCs after surgical resection.

Materials and methods: Between September 2019 and August 2021, consecutive patients with surgically proven HCC who underwent preoperative multiphase liver MRI were retrospectively enrolled. The classification of HCCs into proliferative and nonproliferative classes was determined through histological analyses. Univariate and multivariate logistic regression analyses were conducted to identify predictors associated with the proliferative HCC. The significant predictors from the training cohort were used to establish a scoring model, which was then verified in a time-independent validation cohort using the area under the receiver operating characteristic curve (AUC). To assess the model's applicability in molecular classification, it was applied to a RNA sequencing dataset for discriminating proliferative HCCs (G1, G2, G3) from nonproliferative HCCs (G4, G5, G6). The early recurrence rates of HCC patients following surgical resection were evaluated by the Kaplan–Meier method with log-rank test.

Results: A total of 498 patients (391 men; median age, 59.1 years; IQR, 18–83 years) were divided into the training cohort ($n=332$), time-independent validation cohort ($n=144$), and RNA sequencing dataset ($n=22$). Logistic regression analyses showed that serum alpha-fetoprotein level >100 ng/mL (odds ratio [OR], 3.1; $P < 0.001$; 7 points), lobulated or infiltrative tumor margin (OR, 4.9; $P < 0.001$; 10 points), rim arterial phase hyperenhancement (OR, 3.6; $P = 0.002$; 8 points), marked diffusion weighted imaging (OR, 3.3; $P < 0.001$; 8 points), and tumor-to-liver arterial phase ratio ≤ 1.4 (OR, 3.1; $P < 0.001$; 7 points) were independent predictors for proliferative HCC. The scoring

model was constructed using these predictors, with cutoff values of >18 points. The AUC of the model was 0.83, 0.80, and 0.77 in the training cohort, time-independent validation cohort, and RNA sequencing dataset, respectively. Moreover, in the both training and validation cohorts, patients with model-predicted proliferative HCCs exhibited significantly higher postoperative early recurrence rates compared to those with model-predicted nonproliferative HCCs (all $P < 0.05$). Furthermore, patients with BCLC stage B-C and predicted nonproliferative HCCs exhibited similar early recurrence rates to those with BCLC stage 0-A and predicted proliferative HCCs in the both cohorts (all $P > 0.05$).

Conclusion: The developed scoring model, incorporating four MRI features and serum AFP level, showed promising potential for predicting proliferative HCCs and identifying suitable surgical candidates for patients with HCC.

OR-0164

Predictive Value of a Radiomics Nomogram Model Based on Contrast-Enhanced Computed Tomography for KIT Exon 9 Gene Mutation in Gastrointestinal Stromal Tumors

Yuze Wei

Department of Radiology, Liaoning Cancer Hospital & Institute, China Medical University, China.

Objectives: To establish and validate a radiomics nomogram model for preoperative prediction of KIT exon 9 mutation status in patients with gastrointestinal stromal tumors (GISTs). **Materials and methods:** Eighty-seven patients with pathologically confirmed GISTs were retrospectively enrolled in this study. Imaging and clinicopathological data were collected and randomly assigned to the training set ($n=60$) and test set ($n=27$) at a ratio of 7:3. Based on contrast-enhanced CT (CE-CT) arterial and venous phase images, the region of interest (ROI) of the tumors were manually drawn layer by layer, and the radiomics features were extracted. The intra-class correlation coefficient (ICC) was used to test the consistency between observers. Least absolute shrinkage and selection operator regression (LASSO) were used to further screen the features. The nomogram of integrated radiomics score (Rad-Score) and clinical risk factors (extra-gastric location and distant metastasis) was drawn on the basis of multivariate logistic regression. The area under the receiver operating characteristic (AUC) curve and decision curve analysis were used to evaluate the predictive efficiency of the nomogram, and the clinical benefits that the decision curve evaluation model may bring to patients. **Results:** The selected radiomics features (arterial phase and venous phase features) were significantly correlated with the KIT exon 9 mutation status of GISTs. The AUC, sensitivity, specificity, and accuracy in the radiomics model were 0.863, 85.7%, 80.4%, and 85.0% for the training group (95% confidence interval [CI]: 0.750-0.938), and 0.883, 88.9%, 83.3%, and 81.5% for the test group (95% CI: 0.701-0.974), respectively. The AUC, sensitivity, specificity, and accuracy in the nomogram model were 0.902 (95% confidence interval [CI]: 0.798-0.964), 85.7%, 86.9%, and 91.7% for the training group, and 0.907 (95% CI: 0.732-0.984), 77.8%, 94.4%, and 88.9% for the test group, respectively. The decision curve showed the clinical application value of the radiomic nomogram. **Conclusion:** The radiomics nomogram model based on CE-CT can effectively predict the KIT exon 9 mutation status of GISTs and may be used for selective gene analysis in the future, which is of great significance for the accurate treatment of GISTs.

OR-0165

与潜在基因表达模式相关的放射组学特征 预测肝细胞癌的预后和治疗反应

王丹丹

哈尔滨医科大学附属第二医院

目的: 确定肝细胞癌 (HCC) 的稳健预后和治疗效率预测生物标志物具有挑战性。本研究的目的是开发一种基于治疗前 CT 图像预测总生存期 (OS) 的放射组学方法, 并探索与放射组学相关的关键基因。

方法: 本研究回顾性纳入三个数据集中经病理或临床证实的 HCC 患者。使用接受经动脉化疗栓塞 (TACE) 治疗的研究所内部数据作为训练集, 构建放射组学特征, 通过最小绝对收缩和选择算子 COX (LASSO-COX) 回归算法来预测 OS。该模型在癌症基因组图谱 (TCGA) 的 41 名患者中进行了外部测试, 并提供了可用的 CT 图像。受试者工作特征曲线下面积 (AUC) 和对数秩检验用于基于高放射组学评分与低放射组学评分的生存分析。使用 TCGA 和 GEO 公共数据库的 RNA 测序数据进行基因表达分析。

结果: 共有 752 名患者分为放射组学队列 ($n = 267$)、TCGA 队列 ($n = 338$) 和 GEO 队列 ($n = 147$)。rad 评分将患者分为高风险组和低风险组, 训练组和外部测试组的生存率存在显著差异 ($P < 0.0001$ 和 $P = 0.0055$)。5 年 OS 的 AUC 分别为 0.730 和 0.695。鉴定出 7 个 OS 相关基因 (SPP1、GJA5、GJA4、INMT、PDZD4、ALDOA 和 MAFG), 除 MAFG 外, 所有这些基因都与 TACE 效率相关 (P 大于 0.05)。

结论: CT 影像组学特征可以有效预测 HCC 的预后和治疗反应, 并与肿瘤微环境异质性相关

钆塞酸二钠增强 MRI 简化序列 对肝细胞癌高危人群的诊断新策略

何旭¹、韩鼎盛¹、张嘉诚¹、许倩¹、时付坤¹、黄婷婷²、张岚 (通讯作者)³

1. 河南中医药大学

2. 河南中医药大学第一附属医院放射科

3. 河南中医药大学第一附属医院 MRI 科

目的 探讨对肝细胞癌 (HCC) 高危患者采用钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 简化序列 (AMRI) 形成新的诊断策略。

方法 回顾性分析 2020 年 1 月至 2023 年 6 月行 Gd-EOB-DTPA 动态增强 MRI 的 405 例慢性乙型或丙型肝炎和/或肝硬化患者的临床及影像学资料, 由两名诊断医师评阅 Gd-EOB-DTPA 动态增强 MRI 全序列: T1WI+T2WI+动态增强四期 (动脉早期、动脉晚期、门脉期和移行期)+扩散加权成像 (DWI)+肝胆期 (HBP), 及从全序列中提取组合的两组 AMRI 模拟全序列 MRI 对 HCC 的诊断: 平扫 (NC)-AMRI 组: T2WI+DWI; HBP-AMRI 组: T2WI+DWI+HBP。将病理和随访结果作为是否存在 HCC 的参考标准, 采用 Cochran's Q 检验评估并比较三组扫描方案对 HCC 的诊断效能, 并分析三组方案的扫描时间。

结果 纳入的 227 例患者中 (HCC 组患者 137 例, 非 HCC 组 90 例) 共检出 238 个病灶。全序列组、NC-AMRI 组和 HBP-AMRI 组的敏感度分别为 95.17%、82.76% 和 94.48%; 特异度为 96.77%、86.02% 和 91.39%; 准确度为 95.79%、84.03% 和 93.28%。三组扫描方案的敏感度 (Cochran's $Q = 34.111$, $P < 0.001$)、特异度 (Cochran's $Q = 12.500$, $P = 0.002$) 和准确度 (Cochran's $Q = 43.467$, $P < 0.001$) 差异均有统计学意义, 当进行两组间比较时, 全序列组和

HBP-AMRI 组的敏感度、特异度和准确度均无统计学意义, 三组中 NC-AMRI 组的敏感度、特异度和准确度最低。两组简化方案的扫描时间为 4~5 分钟均短于全序列扫描所需时间。三组扫描方案受试者操作特征曲线 (ROC) 下面积 (AUC) 分别为 0.960、0.844 和 0.929。

结论 两组简化序列方案有极大的潜力成为 Gd-EOB-DTPA 增强 MRI 全序列可供选择的替代方案作为 HCC 高危患者的诊断新策略, 其中由 T2WI+DWI+HBP 构成 HBP-AMRI 组是最佳的简化方案。

OR-0167

双能量 CT 来源的细胞外体积分数预测进展期胃癌新辅助免疫治疗的肿瘤退缩等级

陈勇、张欢

上海交通大学医学院附属瑞金医院

目的: 本研究旨在使用双能量 CT (DECT) 来源的细胞外体积分数 (ECV) 预测进展期胃癌 (AGC) 新辅助免疫治疗的肿瘤退缩分级 (TRG)。

方法: 回顾性纳入瑞金医院 2019 年 8 月至 2023 年 3 月在术前接受抗 PD-1 免疫治疗和 DECT 扫描的 88 名 AGC 患者。收集患者的临床数据和血清标志物参数。勾画三期增强 DECT 图像及对应碘图的原发灶感兴趣区, 测量肿瘤三期碘浓度 (ID) 和碘比率 (IR), 根据延迟期 IR 计算 ECV。采用 Ryan 标准评估患者的 TRG, 将所有患者分为病理学完全缓解 (pCR) 组和 non-pCR 组。采用五倍交叉验证单因素分析和 Spearman 相关性分析筛选变量; 随后采用权重 logisitc 回归模型预测患者的 pCR。测量 DECT 参数的观察者间一致性评价采用组内相关系数 (ICC)。

结果: 88 名患者中, 71.6% 为男性, 年龄中位数为 65.0 岁。免疫治疗的 pCR 率为 23.9%。Sintilimab 是最常用的抗 PD-1 免疫检查点抑制剂 (ICI) (42.0%)。两名观察者间具有较高一致性, 其 ICC 分别为 0.977 和 0.969。ECV、肿瘤面积和 IDAV (静脉期相对于动脉期的 ID 变化率) 纳入最终的交叉验证模型中。ECV 在所有模型中一致地表现为独立的预测因子 ($p < 0.05$, 平均 $OR = 0.911$ (95%CI, 0.798~0.994))。组合模型在训练集中的平均 AUC 为 0.780, 准确度、敏感性和特异性分别为 69.1%, 74.9% 和 67.1%。在验证集中, 相应的指标分别为 AUC 0.766, 准确度 71.5%, 敏感性 71.0% 和特异性 72.4%。

结论: DECT 来源的 ECV 具有预测 AGC 患者新辅助免疫治疗后 TRG 的潜在价值。

OR-0168

Feasibility study on the diagnosis of fatty liver with VNC in abdomen using second-generation dual-layer detector spectral CT

yong cheng, jiehao ding, chenghao cao, yu zhang
West China Hospital, Sichuan University

Objective To explore the feasibility of diagnosing fatty liver with second-generation dual-layer detector spectral CT virtual non-contrast images.

Methods Retrospective analysis of the imaging data of 148 patients who underwent abdominal enhanced CT at the second-generation dual-layer detector spectral CT in West China Hospital of Sichuan University from June 2022 to June 2023. The liver CT values of the left lobe, right anterior lobe, right posterior lobe and spleen of all patients were measured on the true non-contrast (TNC), arterial phase virtual non-contrast (A-VNC) images and venous phase VNC (V-VNC) images, and the difference (L-S) and ratio (L/S) between the liver CT values and the spleen CT values at the corresponding phase were calculated. Referring to the threshold value of TNC image for diagnosis

of fatty liver in previous studies, the patients were divided into two groups: fatty liver and non-fatty liver. Mann-Whitney U test was used to compare the difference of quantitative parameters between fatty liver group and non-fatty liver group. The efficacy of VNC in the diagnosis of fatty liver was evaluated by receiver operating characteristic (ROC) curve, and the difference between ROC curves was compared with DeLong's test. The intraclass correlation coefficient (ICC) were used to evaluate the consistency of data measurement.

Results The intra-group and inter-group consistency of all measured data is very good, the range of ICC values is (0.826~0.977) and (0.804~0.951) respectively ($P<0.05$). The CT value, (L-S) value and (L/S) value of TNC, A-VNC and V-VNC images in non-fatty liver group were higher than those in fatty liver group (all $P<0.05$). The area under the curve (AUC) of CT values of A-VNC and V-VNC for the diagnosis of fatty liver were 0.946, and there was no statistical difference ($P=0.684$). The AUC of A-VNC (L-S) and V-VNC (L-S) in the diagnosis of fatty liver were 1.00 and 0.961, respectively, and there was no statistical difference ($P=0.074$). The AUC of A-VNC (L/S) and V-VNC (L/S) in the diagnosis of fatty liver were 0.992 and 0.987, respectively, and there was no statistical difference ($P=0.606$).

Conclusion The CT values of liver and spleen in VNC images reconstructed by second-generation dual-layer detector spectral CT are lower than TNC, but it is still feasible to diagnose fatty liver based on VNC images.

基于 MR 影像组学实现前列腺癌患者 DDR 基因信号通路致病突变的预测——一项多中心回顾性研究

陈云天、叶蕾、曾浩、姚晋、宋彬
四川大学华西医院

背景: 早期识别携带有 DNA 损伤修复基因致病突变 (pDDRg) 的前列腺癌 (PCa) 患者具有重要的临床意义。因为此类肿瘤侵袭性较强, 但对 PARP 抑制剂的相关治疗敏感。然而由于基因检测费用昂贵, 因此 DDR 基因检测目前在真实世界中的应用推广受到了较大的限制。基于以上背景, 研究者计划基于 MRI 影像组学来无创评估 PCa 的患者携带 pDDRg 突变的风险, 从而减少不必要的基因检测患者。

方法 研究为回顾性研究, 共涉及 3 个中心。纳入标准为在前列腺活检前进行多参数 MRI 并后续进行 DDR 突变基因检测患者。其中四川大学华西医院的数据用于模型建模与内部验证, 上海复旦附属肿瘤医院和中山大学肿瘤防治中心的数据用于外部验证。模型的评估采用受试者工作特征曲线、校准曲线和决策曲线。

结果: 研究最终纳入了 225 名患者, 其中共有 48/225 (21.3%) 的患者通过基因检测确定为 pDDRg 突变阳性。通过一致性分析, LASSO 降维, 研究者最终从 T2WI ($n=7$) 和 ADC 序列 ($n=6$) 中提取了 13 个放射学特征来建立模型。T2WI+ADC 的综合诊断模型在内部验证数据集中的 AUC 为 0.824 (95% CI 0.677-0.923), 在外部验证数据集中为 0.836 (95% CI 0.738-0.908)。值得注意的是, 在“零漏诊”的截止值, 上述模型可在内部和外部验证数据集中减少约 25% 的不必要的基因检测。此外, 在亚组分析中, 该模型的诊断效能不受年龄、基线 PSA、Gleason 评分和转移状态等因素的影响。

结论: MRI 影像组学具有预测 PCa 患者是否合并 pDDRg 突变的潜能。但仍需要前瞻性研究来验证上述结论。

OR-0170

基于多参数 MRI 评估肝细胞癌伴 门静脉癌栓患者手术切除的预后研究

张琳、郑天颖、蒋涵羽、宋彬
四川大学华西医院

目的：基于术前多参数 MRI 构建肝细胞癌伴门静脉癌栓患者手术切除后的预后预测模型。

方法：回顾性纳入 2008 年 1 月至 2021 年 5 月于四川大学华西医院接受术前增强 MRI、手术切除治疗且有完整随访资料的成年肝细胞癌伴门静脉癌栓患者。MR 图像由两名放射科医师采用双盲法独立评阅。采用单因素和多因素 Cox 回归分析评价多参数 MRI、临床及实验室检查等特征对接受手术切除的肝细胞癌伴门静脉癌栓患者的预后价值，并构建了预测总生存期（overall survival, OS）的预后评分。

结果：本研究共纳入 94 名患者（84 名男性，平均年龄 50.1 岁）。多因素 Cox 回归分析结果显示，患者年龄[风险比(hazard ratio, HR), 0.978; $p=0.04$]、血清白蛋白 (HR, 0.948; $p=0.02$)、术前 MRI 显示的最大两个肿瘤的大小之和 (HR, 3.050; $p<0.001$) 以及肿瘤生长亚型 (HR, 1.928; $p=0.006$) 是患者 OS 的独立风险预测因素。基于上述特征构建了预后评分模型： $100 \times$ 最大两个肿瘤的大小之和 ($>13\text{ cm}$, 1; $\leq 13\text{ cm}$, 0) + $59 \times$ 肿瘤生长亚型 (融合多结节或浸润型, 1; 单结节或单结节伴结节外生长型, 0) - $5 \times$ 白蛋白 (g/L) - $2 \times$ 年龄 (岁) + 300。基于此模型，患者被分为高危组 (评分 >29.5 分) 和低危组 (评分 ≤ 29.5 分)。其中，高危组患者的 OS 明显短于低危组 (11.7 个月 vs. 25.0 个月, $p<0.001$)；门静脉癌栓程氏 I 型 (12.1 个月 vs. 25.9 个月, $p=0.002$) 及 II 型中高危组的 OS 均明显短于低危组 (11.7 个月 vs. 25.0 个月, $p=0.004$)。

结论：基于患者年龄、血清白蛋白、以及 MRI 显示的最大两个肿瘤的大小之和以及肿瘤生长亚型四项术前指标构建的预后评分模型能够对肝细胞癌伴门静脉癌栓患者进行准确的术前风险分层，且为现有门静脉癌栓分型系统的有力补充。本研究结果有助于识别有望从手术切除治疗中获益的肝细胞癌伴门静脉癌栓患者，辅助个体化治疗决策制定，延长患者生存期。

2 型糖尿病伴肾功能不全患者肾脏磁共振体素内 不相干运动及弥散峰度成像参数与糖尿病视网膜病变的相关性

周少鹏、王倩、翟雪、赵建、白旭、王海屹
中国人民解放军总医院第一医学中心

目的：探究 2 型糖尿病伴肾功能不全患者肾脏磁共振体素内不相干运动 (IVIM) 及弥散峰度成像 (DKI) 参数与糖尿病视网膜病变 (DR) 的相关性。

方法：2022 年 1 月至 2023 年 9 月前瞻性、连续性纳入在解放军总医院第一医学中心行磁共振扫描并接受肾脏穿刺活检的 2 型糖尿病伴肾功能不全患者 68 名，测得肾脏皮质、髓质 IVIM 及 DKI 参数：灌注分数 f 、扩散系数 D 、灌注系数 D^* 、表观扩散系数 ADC、平均扩散系数 MD 及弥散峰度系数 MK 值，根据有无 DR 将患者分为 DR 组和无 DR (NDR) 组。使用 Mann-Whitney U 检验或独立样本 t 检验比较两组间的 IVIM 及 DKI 参数、临床信息、糖尿病及肾功能相关生化指标，应用单因素及多因素 logistic 回归分析筛选 DR 的独立危险因素，并应用受试者工作特征 (ROC) 曲线分析其对 DR 的诊断效能。

结果：共 53 名 NDR 组患者 (53.81 ± 9.29 岁, 36 名男性, 17 名女性) 及 15 名 DR 组 (49.20 ± 10.23 岁, 13 名男性, 2 名女性) 患者纳入了本研究。相较于 NDR 组, DR 组患者具有较长的糖尿病病

程、较高的血肌酐, 以及较低的总胆固醇 (TC)、低密度脂蛋白 (LDL)、皮髓质 f 值及 ADC 值 (均 $P < 0.05$)。单因素 logistic 回归分析显示总胆固醇、低密度脂蛋白、皮质 ADC 值及髓质 ADC 值是影响 DR 发生的相对危险因素, 在调整了年龄、性别、糖尿病病程、体重指数 (BMI)、收缩压、舒张压、TC 及 LDL 等因素后, 肾皮质 ADC 值仍与 DR 相关 [OR (95%CI): 0.990(0.982,0.999), $P=0.026$]。受试者工作特征曲线分析显示, 肾皮质 ADC 值曲线下面积为 0.776, 肾皮质 ADC 值预测 DR 的截断值为 $1105 \times 10^{-6} \text{ mm}^2/\text{s}$ 时灵敏度及特异度最高, 分别为 77.4% 和 73.3%。亚组分析显示, 在 25 名病理证实为糖尿病肾病患者中, DR 患者的皮质 ADC 值仍显著低于无 DR 患者 ($Z=-2.23$, $P=0.026$)。

结论: 2 型糖尿病伴肾功能不全患者肾皮质 ADC 值与 DR 患病风险呈明显相关性, 肾皮质 ADC 值有助于诊断 DR 及筛查有 DR 风险的人群。

OR-0172

Radiomics analysis based on dual-energy CT hydroxyapatite (HAP)-fat decomposition technique for osteoporosis prediction

Jinling Wang, Linlin Guo, Kun Zhang

The First Hospital of Hunan University of Chinese Medicine

Purpose: To develop and validate a radiomics model based on the hydroxyapatite (HAP)-fat material decomposition (MD) images of dual-energy CT for osteoporosis prediction. **Materials and Methods:** 83 patients who underwent dual-energy CT included L1-L5 and quantitative computed tomography (QCT) were collected. With QCT as the reference standard, the patients were divided into two groups according to the guidelines introduced by the International Society for Clinical Densitometry (ISCD) and American College of Radiology (ACR), osteoporosis of the spine was defined as a BMD value $< 80 \text{ mg/cm}^3$, and non-osteoporosis (osteopenia and normal) was defined as a BMD value $\geq 80 \text{ mg/cm}^3$. Radiomic features were selected from HAP-fat MD images of dual-energy CT. A radiomics model was constructed from linear combinations of the selected features weighted by their coefficients. The ROC curve was performed to evaluate the performance of the radiomics model. **Results:** The radiomics model, which comprised 8 selected radiomics features (shape_Maximum2DDiameterColumn, shape_Maximum2DDiameterSlice, shape_Sphericity, firstorder_10Percentile, firstorder_90Percentile, firstorder_Skewness, glcm_LargeDependenceHighGrayLevelEmphasis, glcm_LargeDependenceLowGrayLevelEmphasis) based on HAP-fat MD images of dual-energy CT, showed excellent differential ability with AUC of 0.999 (95%CI, 0.987–1.000), sensitivity of 0.983, specificity of 1.000, negative prediction value of 0.960, positive prediction value of 1.000 in the cohort. The discrimination performance of the radiomics model to identify osteoporosis from non-osteoporosis (osteopenia and normal) showed high accuracy of 98.8% in the cohort. **Conclusions:** The radiomics model comprised 8 selected radiomics features had excellent ability to predict osteoporosis based on dual-energy CT HAP-fat MD images.

OR-0173

Radiomics Model based on MRI to Differentiate Spinal Multiple Myeloma from Metastases: A Two-center Study

Xiang Wang, Li Fan, Yi Xiao, Shiyuan Liu
Changzheng Hospital

Purpose: Spinal multiple myeloma and metastases are two common cancers with similar imaging characteristics, which need differential diagnosis from each other to guide appropriate precision diagnosis and treatment planning. The aim of this study is to establish radiomics models for effective differentiation between the two cancers.

Methods: This study enrolled a total of 263 patients from two medical centers, of whom 127 were diagnosed as spinal multiple myeloma, and 136 were spinal metastases. They were divided into internal training cohort ($n = 210$, Institution I) and external validation cohort ($n = 53$, Institution II). Contrast-enhanced T1-weighted imaging (CET1) and T2-weighted imaging (T2WI) sequences were collected and reviewed. After 1037 radiomics features extracted from both CET1 and T2WI images, Logistic Regression (LR), AdaBoost (AB), Support Vector Machines (SVM), Random Forest (RF), and multiple kernel learning support vector machine (MKL-SVM) were adapted to evaluate the generalization of them, respectively. We split the training data set into five equally-sized parts, each exhibiting the same class distribution, and then the five-fold cross-validation was used to tune hyper-parameters. The diagnostic efficiency among different radiomics models were compared by Accuracy (ACC), Sensitivity (SEN), Specificity (SPE), the area under the ROC curve (AUC), YI, Positive Predictive Value (PPV), Negative Predictive Value (NPV), and F1-score.

Result: The RF model outperformed all other models based on single-sequence. All models based on T2WI images performed better than those based on CET1. All models' efficiency was boosted by incorporating CET1 and T2WI sequences, and MKL-SVM achieved the best performance with an ACC, AUC, and F1-score of 0.86, 0.87, and 0.87, respectively.

Conclusions: The radiomics models constructed based on MRI achieved satisfactory diagnostic performance for the classification of spinal MM and metastases, and have broad application prospects for individualized diagnosis and treatment.

髌下脂肪垫脂肪含量可评估膝骨性关节炎严重程度 —— 一项基于磁共振 mDIXON—Quant 脂肪定量技术的研究

赵保根、张力
河北医科大学第一医院

目的: 本研究基于磁共振 mDIXON-Quant 技术, 定量测量髌下脂肪垫 (infrapatellar fat pad, IPFP) 脂肪含量与膝骨性关节炎 (knee osteoarthritis, KOA) 严重程度的相关性。**材料与方法:** 本研究招募 44 例 KOA 患者共计 70 例膝关节进行膝关节 MRI 检查及 mDIXON-Quant 序列扫描, 分别测量每例膝关节 IPFP 脂肪含量与 KOA 严重程度的相关性。基于膝关节全器官磁共振评分 (Whole-Organ Magnetic Resonance Imaging Score, WORMS) 评估 KOA 严重程度, WORMS 总得分越高, 反映结构损伤的严重程度越高。分析各膝 IPFP 脂肪含量与膝关节疼痛时间、膝关节 WORMS 所含 11 个特征区独立评分及总评分的相关性。**结果:** KOA 患者 IPFP 脂肪含量与膝关节 WORMS 总评分、滑膜炎/积液、关节软骨完整性、关节面下骨髓信号异常、关节面下骨囊肿、关节面下骨磨损、边缘骨赘、内外侧半月板完整性、前后交叉韧带完整性、关节内游离体、关节周围囊肿/滑囊炎 ($r = -0.989, -0.259, -0.884, -0.739, -0.544, -0.815, -0.862, -0.544, -0.243, -0.460, -0.285$, p 均 < 0.05) 均呈负相关性; 与疼痛时间、内外侧副韧带完整性 ($r = 0.028, r = 0.027$, p 均

≥ 0.05) 无显著相关性。结论: 磁共振 mDIXON-Quant 技术可以敏感、定量评估 KOA 患者 IPFP 脂肪含量, IPFP 脂肪含量改变与膝关节结构异常密切相关, 可以用于评估 KOA 的严重程度, 为膝骨性关节炎患者的早期干预和治疗提供重要的依据。

Deep Learning-Based Reconstruction Enhances Image Quality and Improves Diagnosis in MR Imaging of the Shoulder Joint

Zijun Liu¹, Baohong Wen¹, Ziyu Wang¹, Kaiyu Wang², Lizhi Xie², Yimeng Kang¹, Qiuying Tao¹,
Weijian Wang¹, Yong Zhang¹, Jingliang Cheng¹, Yan Zhang¹
1. The First Affiliated Hospital of Zhengzhou University
2. MR Research China, GE Healthcare, Beijing, China

Objectives: To compare the image quality of accelerated magnetic resonance imaging (MRI) sequences reconstructed using a deep-learning (DL) algorithm with conventional MRI for shoulder examinations. Additionally, we aimed to evaluate the effectiveness of DL MRI in accurately demonstrating the degree of subacromial (SbA) bursa and subcoracoid (SC) bursa thickening.

Methods: A total of forty-one patients who underwent 3-T MRI of the shoulder were included in this study. Both Conventional MRI and accelerated MRI sequences were acquired. The image quality and degree of artifacts were assessed using a 5-point Likert scale for both Conventional MRI and DL MRI. Additionally, the degree of SbA and SC thickening, as well as the relative signal-to-noise ratio (rSNR) and relative contrast-to-noise ratio (rCNR) of Conventional MRI, DL MRI, and accelerated MRI sequences reconstructed without using deep-learning (Non-DL) MRI and DL MRI, were analyzed using the Paired Wilcoxon test. Statistical significance was defined as $p < 0.05$.

Results: The use of accelerated sequences resulted in a remarkable 58% reduction in total scan time. Overall, DL MRI exhibited superior image quality scores and fewer artifacts compared to Conventional MRI. Specifically, DL MRI (3.92[2.83,5.82]mm) demonstrated significantly higher measurements of SC thickenings in the oblique sagittal FS PDWI sequence compared to Conventional MRI (3.74[2.92,5.96]mm) ($p=0.028$). Moreover, DL MRI exhibited higher detection of SbA thickenings in the oblique coronal FS PDWI sequence, with a notable trend towards significant differences. Furthermore, DL MRI exhibited better noise reduction in muscle tissue compared to bone when compared to Conventional MRI. Additionally, all DL MRI images exhibited significantly greater rSNRs and rCNRs compared to Non-DL MRI ($p<0.001$).

Conclusions: DL MRI enhances image quality and improves diagnostic capabilities, making it a promising alternative to Conventional MRI for shoulder imaging.

Investigation of the anatomic risk factors in acute anterior cruciate ligament rupture combined with ramp lesions of the medial meniscus by quantitative MRI

Ziyi Tang, Yuxi Luo, Haitao Yang
The First Affiliated Hospital of Chongqing Medical University

Objective To investigate the anatomic risk factors of knee in patients with acute non-contact anterior cruciate ligament (aACL) rupture coexisted with ramp lesions of medial meniscus.

Methods A total of 202 subjects were retrospectively assigned to the following 3 groups: (1) aACL rupture with ramp lesion group ($n=76$); (2) isolated ACL rupture group ($n=56$) and (3) a normal

control group (n=70). Several morphological parameters on MRI were manually measured and analyzed: the diameter of medial femoral condyle (MFC), the anterior-posterior length and depth of medial tibial plateau (MTP AP length and MTP depth), the lateral posterior tibial slope (LPTS) and medial posterior tibial slope (MPTS), the asymmetry of LPTS and MPTS (LMPTS), the lateral meniscal slope (LMS), and medial meniscal slope (MMS).

Results The incidence of ramp lesion in aACL ruptures was 17.4%. The MTP AP length ($p < 0.001$), MTP AP length/ MFC diameter ratio ($p < 0.001$), MTP depth ($p < 0.001$), LPTS ($p < 0.001$) and the asymmetry of LMPTS ($p < 0.001$) showed significant differences among the three groups. The MTP AP length was significantly longer (40.9 ± 3.7), the MTP AP length / MFC diameter ratio was larger (0.87 ± 0.06), the MTP depth was deeper (2.4 ± 0.9), the LPTS (6.42 ± 2.17) was steeper, with an increased the asymmetry of LMPTS (3.38 ± 2.07) in the group of aACL rupture with ramp lesions. The risk factors associated with the ramp lesions including a longer MTP AP length (OR 1.17, 95%CI 1.00-1.44, $p = 0.044$), deeper MTP depth (OR 1.91, 95%CI 1.22-3.00, $p = 0.005$) and larger MTP AP length/ MFC diameter ratio (OR 1.11, 95%CI 1.01-1.22, $p = 0.036$). The highest AUC was MTP AP length/ MFC diameter ratio (0.74; 95% CI, 0.66-0.82), with a sensitivity of 73% to predict the ramp lesions.

Conclusion Some occult anatomic characteristics especially the morphology of proximal medial tibia can be as risk factors for patients of aACL rupture with concurrent ramp lesions and produce potential impact on injury patterns.

OR-0177

基于 3.0T 化学位移编码 磁共振成像的髌髌关节骨髓脂肪酸成分分析

陈民^{1,2}、程传力³、成官迅²

1. 南方科技大学医院

2. 北京大学深圳医院

3. 中国科学院深圳先进技术研究院

目的: 应用化学位移编码磁共振成像分析、比较中轴型脊柱关节炎患者及对照组的髌髌关节骨髓脂肪酸成分, 探索中轴型脊柱关节炎定量评估的新的影像标志物。

方法: 前瞻性招募诊断为年龄在 18-45 岁之间的中轴型脊柱关节炎患者及年龄、性别、体质指数匹配的非脊柱关节炎对照组。所有参与者在同一台 3.0T 磁共振仪 (UMR780, 联影, 上海, 中国) 上进行多回波梯度回波的化学位移编码成像髌髌关节磁共振扫描, 并通过后处理分析髌髌关节骨髓脂肪酸成分, 包括多不饱和脂肪酸、单不饱和脂肪酸及饱和脂肪酸比例。在髌骨侧及髌骨侧分别手动勾画感兴趣区, 分析的区域包括存在脂肪沉积和不存在脂肪沉积的骨质。疾病组与对照组之间不同骨髓脂肪酸成分的比较采用 T 检验进行分析。

结果: 本研究共招募了 85 名参与者, 包括 48 名中轴型脊柱关节炎患者 (25 名男性, 23 名女性) 和 37 名非脊柱关节炎患者 (18 名男性, 19 名女性)。男性脊柱关节炎患者髌髌关节多种骨髓脂肪酸成分与对照组之间存在显著差异, 包括: 髌骨、髌骨脂肪沉积区域及髌骨无脂肪沉积区域单不饱和脂肪酸比例显著升高 (髌骨脂肪沉积区, +12%, $p < 0.001$, 髌骨脂肪沉积区, +9%, $p < 0.001$, 髌骨无脂肪沉积区, +10%, $p = 0.002$), 髌骨、髌骨脂肪沉积区域多不饱和脂肪酸比例显著降低 (髌骨脂肪沉积区, -10%, $p = 0.001$, 髌骨脂肪沉积区, -11%, $p < 0.001$), 以及髌骨无脂肪沉积区饱和脂肪酸比例显著降低 (-6%, $p = 0.001$)。在女性脊柱关节炎患者中, 仅仅髌骨脂肪沉积区域的饱和脂肪酸比例显著高于对照组 (+7%, $p = 0.036$)。

结论: 中轴型脊柱关节炎患者髌髌关节骨髓脂肪酸成分与对照组之间存在显著差异, 这种差异可以用化学位移编码磁共振成像扫描检测到。

OR-0178

Feasibility of artificial intelligence-supported assessment of dual-energy computed tomography for measuring bone mineral density: correlation with quantitative CT

Yali Li, Dan Jin, Ming N, Chenyu Jiang, Huishu Yuan
Peking University Third University

Purpose Artificial intelligence (AI) is considering the promising method in automating assessment of bone mineral density (BMD) in dual-energy computed tomography (DECT). The objective of this study was to evaluate the precision and agreement between BMD measurements performed in DECT-derived hydroxyapatite (HAP) concentration of the L1 vertebra to L3 vertebra and automated, AI-supported assessment of DECT-derived HAP concentration of the three vertebrae with European Spine Phantom (ESP) in comparison to quantitative CT (QCT).

Materials and Methods The image acquisitions were performed on Revolution CT (GE Healthcare, Waukesha, WI) at 120kV with tube rotation times of 0.8 seconds and modulated tube currents of 100 and 500mA, and fast tube voltage switching between high and low energy (140/80kVp) with tube rotation times of 0.5 seconds and modulated tube currents of 240 and 365mA using ESP (No. 145, Germany ORM company) on March 2023. The ESP was scanned for ten repeated times without repositioning. For QCT measurement, the QCT PRO workstation (Mindways QCT PRO workstation) can automatically generate analyze the ROIs and analyze the BMD values of the L1, L2, L3. For the measurement of DECT-derived HAP values, the circular region of interest (ROI) was set as the median plane of the vertebral body with an area of 468.78mm² avoiding cortical bone and its pedicle, and the HAP values of the L1, L2, and L3 were measured from the axial-view HAP (Water)-based material decomposition (MD) images on a dedicated Gemstone Spectral Imaging workstation (GE Workstation). For the measurement of the automated, AI-supported assessment of DECT-derived HAP concentration of the three vertebrae was performed by a new post-processing workflow for fully automatic and highly accurate BMD analysis based on AI technology, detailed analysis process as follows:

Firstly, Spine analysis, using spectral CT images as the original input, process detects, names, segments, and recognizes the orientation of the vertebral body within the image without the need for manual location positioning; Secondly, ROI extraction, the system automatically selects the most suitable three vertebrae for evaluation, recognizes their direction and central plane, segments their trabecular bone, and extracts the three-dimensional structure of the vertebrae for measuring bone density based on vertebral body segmentation; Thirdly, bone density calculation, using spectral CT technology combined with X-ray attenuation principles, the system automatically calculates the calcium-based substance concentration of voxels within the ROI as the current BMD values of the vertebral trabecular bone; Lastly, intelligent reporting, with reference to domestic and foreign databases and guidelines, the system generates personalized bone density reports and diagnosis and treatment recommendations for patients. The paired sample t test was used to determine the differences between the two measurements. The association and consistency of the two measurements were analyzed by Pearson correlation.

Results The volume CT dose index (CTDI_{vol}) derived from QCT were 5.53mGy in 100mA and 27.66mGy in 500mA, whilst DECT-derived HAP were 5.80mGy in 240mA and 9.25mGy in 365mA. Under different scanning conditions, the QCT-derived BMD values of the L1, L2, and L3 were 53.60±0.27, 106.25±0.11, 202.76±0.23mg/cm³, respectively. The DECT-derived HAP-Water values of the L1, L2, and L3 were 45.25±0.42, 89.2±0.86, 180.00±0.15mg/cm³ with the tube current of 240mA, whilst 39.46±0.51, 88.64±0.74, 170.1±0.38mg/cm³ with the tube current of 365mA. The DECT-derived HAP-Water values of the L1, L2, and L3 with AI were 44.2±0.87, 94.73±0.32, 173.22±0.71mg/cm³ with the tube current of 240mA, and 41.23±0.23, 92.03±0.74, 173.79±0.78mg/cm³ with the tube current of 365mA. There was a strong positive correlation between the two methods ($r=0.91$, $P<0.0001$).

Conclusion The automated, AI-supported assessment of DECT-derived HAP concentration of

the three vertebrae is feasible to measure the BMD values and potentially aid a help in opportunistic screening of osteoporosis in high-risk populations.

OR-0179

基于深度学习的肩关节 MR 冈上肌腱撕裂的全自动诊断方法

李杰
青岛大学附属医院

目的:以关节镜检查为参考标准,探讨应用深度学习检测方法检测肩关节 MRI 冈上肌腱撕裂的可行性。

材料和方法:在这项回顾性研究中,来自两个中心的 431 名参与者被用于建立和验证基于深度学习的冈上肌腱撕裂检测系统。提出的系统是通过使用 U-Net 网络来分割和隔离冈上肌腱,然后使用 Swin-transformer 网络来确定是否存在冈上肌腱撕裂。并对 Densnet101 和 Resnet50 作为分类器进行了对比评估。由 3 名放射科医师进行主观诊断,获得诊断结果。采用受试者工作特征曲线、曲线下面积、灵敏度、特异度和准确度评价系统和放射科医师的诊断性能。我们还将模型的性能与放射科医师的诊断结果进行了比较。

结果:本文提出的基于 U-net 和 Swin-transformer 网络的冈上肌腱撕裂检测系统的 AUC 为 0.986,准确率为 0.929,灵敏度为 0.918,特异度为 0.940,总体诊断准确率较高。提出的基于深度学习的肩关节 MR 冈上肌腱撕裂的全自动诊断方法和肌骨放射科专家之间的诊断效能无统计学差异。

结论:本文提出的冈上肌肌腱撕裂检测系统具有与经验丰富的临床放射科医师相当的诊断性能。

Inter-rater variability and repeatability in the assessment of the Tanner-Whitehouse classification of hand radiographs for the estimation of skeletal age

Jian Geng^{1,2}, Wenshaung Zhang¹, Yufeng Ge⁴, Ling Wang¹, Pengju Huang^{1,3}, Yandong Liu¹, Jia Shi⁵, Fengyun Zhou¹, KangKang Ma¹, Glen Blake⁶, Gang Xu⁷, Dong Yan¹, Xiaoguang Cheng¹

1. Department of Radiology, Beijing Jishuitan Hospital, Capital Medical University

2. Affiliated Hospital of Shaanxi University of Chinese Medicine

3. Department of Radiology, National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University

4. Department of Traumatology, Beijing Jishuitan Hospital, Capital Medical University

5. National Institute of Nutrition and Health, Chinese Center for Disease Control and Prevention

6. Osteoporosis Research Unit, King's College London

7. Department of Athletic Training, Beijing Sport University

Background The visual atlas is thought to be less objective and reliable than the Tanner-Whitehouse (T-W) classification when determining skeletal age (SA). However, because of how complicated and time-consuming it is to use, there are few studies evaluating the inter-rater variability and repeatability in the assessment of bone maturity using the T-W methods.

Objective To determine which bone growth classification had the lower consistence and accuracy hence needed deeper scrutiny when employing the T-W approaches.

Materials and Methods 24 radiologists were recruited to be trained in the T-W classification of skeletal development. The consistency and skill of the radiologists in determining bone developing status was then assessed using 20 pediatric hand radiographs as test radiographies. The results of the two tests performed by the remaining 20 radiologists were analyzed since 4 of them were excluded considering the poor concordance rate of their results in their 1st reading test. With the mean assessment of two senior experts as the reference standard, concordance rate, scoring, and standard deviation (SD) were calculated to evaluate accuracy and consistency.

Results The RUS system outperformed the C system in terms of scores. The repeatability analysis between 2 tests shows that the second rating test performed after two months of SAA practice was more consistent and accurate than the first. The capitate had the lowest average concordance rate and scoring (0.620, 31.95 points), as well as the lowest concordance rate for its D classification. Moreover, the G classification in 6/7 carpal bones had a concordance rate less than 0.6. The bones with higher SDs were likewise those with lower scores and consistency rates.

Conclusion The grade D of capitate showed the highest variation, and the use of T-W to determine SA was frequently inconsistent. A more comprehensive description with a focus on inaccuracy bones or ratings and a modification to the T-W3 approach would significantly advance SAA.

OR-0181

Quantitative multiparametric UTE-MRI sequences for early cartilage degeneration corresponding to biochemical components—an in vivo study

Xiaolian Su¹, Lidi Wan¹, Jieying Chen¹, Yitong Wang¹, Zonghui Liang², Guangyu Tang¹

1. Shanghai Tenth People's Hospital, School of Medicine, Tongji University, 301 Middle Yanchang Road, Shanghai 200092, China

2. Shanghai Jing'an District Central Hospital

Purpose To investigate the feasibility of UTE-MRI quantitative imaging in diagnosing early cartilage degeneration in vivo, compare the diagnostic efficacy of various sequences and explore their corresponding pathological and biochemical basis.

Materials and Methods Twenty volunteers with osteoarthritis (OA) for total knee arthroplasty (TKA) were recruited between June 2020 and August 2021. MRI scans (UTE-MT, UTE-AdiabT1p, UTE-T2* mapping, CubeQuant-T2 and CubeQuant-T1p) were performed one day before surgery. From each patient, 11 regions of interests (ROIs) were manually drawn to get MRI quantitative values, seven from the tibial plateau and four from the lateral femoral condyle. During TKA, cartilage samples were collected in strict accordance with the preset positions corresponding to MRI images. Then, the pathological and biochemical components of the corresponding ROI were obtained, including histological grading, glycosaminoglycan (GAG) content (constituting PG), collagen structural integrity and water content of the cartilage. The receiver operating characteristic (ROC) was conducted to evaluate the performance of three UTE-MRI quantitative imaging techniques.

Results Ninety-one regions of interest (ROIs) from 20 volunteers (7 males, age range: 68 to 78 years; 74±3 years; 13 females, age range: 57 to 79 years; 67±6 years) were assessed. UTE-MT ($r=-0.619$, $P<.001$), UTE-AdiabT1p ($r=0.568$, $P<.001$), and UTE-T2* ($r=-0.495$, $P<.001$) values demonstrated stronger correlations with histological grading compared to T2 ($r=0.287$, $P=.006$) and T1p values ($r=0.435$, $P<.001$). Among them, UTE-MTR exhibited the highest diagnostic performance when compared to UTE-AdiabT1p and UTE-T2* values (AUC=0.824, 0.796, 0.635; $P<.001$, $=.001$, $=.113$, respectively). Upon analyzing the correlation between each quantitative value and three main biochemical components of cartilage, UTE-MTR primarily related to collagen structural integrity ($r=0.536$, $P<.001$), UTE-AdiabT1p value mainly associated with PG content ($r=-0.652$, $P<.001$), while UTE-T2* value predominantly reflected water content ($r=-0.518$, $P<.001$).

Conclusion Quantitative UTE-MRI values exhibit superior diagnostic efficacy for detecting early cartilage degeneration in vivo, surpassing conventional T2 and T1p values. UTE-MTR demonstrates the highest effectiveness in diagnosing early cartilage degeneration. Specifically, UTE-MTR, UTE-AdiabT1p, and UTE-T2* values primarily reflect distinct aspects of cartilage degeneration, including collagen structure integrity, PG content, and water content, respectively.

基于影像及临床参数对脊髓型颈椎病预后评估的列线图模型构建

何来昌、曾献军、谭永明、余召强
南昌大学第一附属医院

目的：构建并验证影响脊髓型颈椎病预后的列线图模型

方法：收集 2016 年 9 月-2022 年 9 月期间在南昌大学第一附属医院诊治的 189 例脊髓型颈椎病 (CSM) 患者术前临床资料及影像数据 (术前 Cobb、椎间稳定性、椎间旋转不稳、最大脊髓受压程度、脊髓压迫类型及信号等)，基于术后 1 年 JOA 疗效评分，按照 3: 7 比例分为训练数据集与测试数据集。应用 LASSO-Cox 筛选对 CSM 患者临床预后的影响因素，应用 R 软件 (版本 R 3.6.3) 构建预测 CSM 患者临床预后的 nomogram 预测模型，用受试者工作特征 (receiver operating characteristic, ROC) 曲线、校准曲线来评估本研究构建的列线图预测模型的预测效能。决策曲线分析 (DCA) 用于评估临床适用性。

结果：多因素 Cox 回归模型结果提示性别、preCobb、椎间段不稳定、椎间旋转不稳、最大脊髓受压程度 (MSCC) 为 CSM 临床预后的独立影响因素。绘制 ROC 曲线、校准曲线，结果显示：ROC 曲线下面积为 0.918 (95% 置信区间为 0.674~0.835)，曲线斜率接近 1。决策曲线分析 (Decision curve analysis, DCA) 表明，当阈值概率在 5% 到 100% 之间时，nomogram 预测模型对预测脊髓型颈椎病患者预后具有较高的净收益。

结论：通过 LASSO-Cox 回归筛选出 CSM 临床预后预测的影像及临床参数，并在此基础上初步构建了 nomogram 模型，具有较好的预测效果。

基于骨骺弥散张量成像的模型可用于儿童身高的预测

李灵丽、杨炼、潘峰
华中科技大学同济医学院附属协和医院

目的：验证骨骺 DTI 指标作为身高增加速度 (从 MRI 检查开始的 1 年身高增益) 和总身高增益 (从 MRI 检查到生长停止的身高增益) 的预测因子，并将预测精度与基于骨龄的模型进行比较。

方法：本研究为基于 2021 年 1 月至 2023 年 7 月期间接受了膝关节 MRI 检查的健康儿童的前瞻性研究，受试儿童同时接受了股骨 DTI 检测 (b 值=0 和 600 秒/mm²；方向= 20)、骨龄 X 线检查、身高及体重检查。并在 1 年后随访复查。分析 DTI 束的体积和长度与身高的增加速度的相关性。采用多线性回归模型来评估 DTI 指标在预测这两个参数中的潜力。Bland-Altman 图用于比较基于骨骺 DTI 和基于骨龄的身高预测方法的均方根误差 (RMSE) 和偏差。

结果：65 名儿童 (平均年龄 11±3 岁，37 名男孩) 测量身高增加速度。在控制了年龄和性别后，DTI 束的体积与长度 ($r^2 = 0.49$) 和身高增加速度 ($r^2 = 0.46$) (P, 均为 0.001) 相关。DTI 束的长度是预测身高增加的最强预测因子。与基于骨龄的估算方法 (身高增加速度: $R^2=0.32$, RMSE=2.9cm) 相比，基于 DTI 束长度的估算模型，可以有效提高对身高增加速度 ($R^2 = 0.63$, RMSE=1.7cm) 的预测。

结论：在儿童中，使用弥散张量成像得到的束体积模型在预测身高速度和总身高增益方面可能比基于骨年龄的模型表现更好。

OR-0184

Prediction the early retear in the rotator cuff tear patients after arthroscopy based on preoperative indexes

Xinxin Liu¹, Xiaowen Ma¹, Jian Yang²

1. Xi'an Honghui Hospital

2. The First Affiliated Hospital of Xi'an Jiaotong University

Background: Retear after arthroscopic rotator cuff repair (ARCR) consistently challenges medical staff and patients. At present, the rate of retear after arthroscopic rotator cuff repair is 11-57.3%, and the rate of retear after arthroscopic repair of huge rotator cuff tear is even as high as 94%, and some patients even need a second operation, which has a great adverse impact on the postoperative functional recovery and life quality.

Purpose: The purpose of this study was to identify the risk factors that cause retear after ARCR and provide diagnostic basis for predicting tendon retear at an early stage.

Methods: The authors reviewed the records of 258 patients who, 3 months after primary rotator cuff repair had magnetic resonance imaging to assess repair integrity. The mean age at the time of surgery was 55.83 ± 7.72 years (range, 37-73 years), and 170 patients were women (65.6%). For morphologic assessment, the routine PD-FS images were used to classify the repair tendon integrity into five categories based on Sugaya classification. Sugaya classification type IV or V was regarded as healing failure. The factors affecting cuff integrity were analyzed through univariate and multivariate analyses. The cutoff values and ROC curve were received to obtain diagnosis efficiency of retear.

Results: The overall healing failure rate was 15.9%. The independent risk factors were age, pre VAS, costant score, internal rotation, tear retraction and width, infraspinatus tendon tear, supraspinatus muscle atrophy and fatty infiltration, tear form and operation method in the arthroscopic. The following independent risk factors were identified in the multivariate analysis: pre-operation costant score 42 ($P = 0.031$, $OR = 0.93$), and tear width 1.3cm in anteroposterior dimension ($P = 0.021$, $OR = 2.03$). The ROC of the combining diagnostic value was 0.727. The sensitivity and specificity were 69.57% and 75.74%, respectively ($P = 0.002$).

Conclusion: The preoperative costant score and tear width affected the tendon retearing after arthroscopic at an early stage. Explore the related factors affecting the rate of rotator cuff retear is prone to improve the understanding of retear meanwhile reduce the occurrence of retear after surgery.

OR-0185

Evaluation of the peripheral nerves of the knee using Double-Echo Steady-State MRI at 7 T

Pinzhen Chen, Wei Chen, Zhiming Zhen

Department of Radiology, The first affiliated hospital, Army Medical University

Purpose The peroneal nerve (PN), tibial nerve (TN), and saphenous nerve (SN) are the main peripheral nerves of the knee, which cannot be reliably visualized on 3T MRI. This study aims to evaluate the potential of the DESS sequences at 7T MR for assessing the detailed structures of the peripheral nerve in healthy and patient adults.

Methods Twenty-two healthy subjects and one patient underwent 7T MR scans (MAGNETOM Terra, Siemens Healthcare) with a 28-channel knee coil. Scanning protocol (Table 1) included axial Proton Weighted (PD) and two three-dimensional double-echo steady-state (3D-DESS) sequences with different resolutions: sagittal DESS-A images for 3D structural evaluation and axial DESS-B images with a high in-plane resolution for the nerve fascicles assessment. The quality of nerve images in different sequences was evaluated by two radiologists with a 3-grade scale. The signal-

to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of the nerves to surrounding fat tissue were measured.

Results The κ value of subjective scores for image quality was from 0.65 to 1. The subjective scores, SNR, and CNR of the three protocols were summarized in Table 2. DESS-A protocol provided superior delineation for the PN, while DESS-B protocol provided excellent image quality for depicting the TN and SN (Fig. 1 and Fig. 2).

The representative images of a patient with peripheral nerve damage caused by trauma are shown in Figure 3. The PD imaging showed markedly swollen TN and PN with enhanced signal and thickening of the nervous tracts and epineurium. Thickened tibial and peroneal individual nerve fascicles and muscular branches of the TN and the lateral sural cutaneous nerve were clearly observed on DESS-B images.

Conclusions The DESS sequences have the potential to provide precise assessments of the peripheral nerves of the knee and more valuable information for the diagnosis of peripheral nerve diseases.

基于倾向性得分匹配法分析椎旁肌退变 对腰椎椎间融合术后相邻节段病翻修术的预测价值

李丹丹、张维升
大连医科大学附属第一医院

目的：通过比较腰椎椎间融合术（PLIF）后行相邻节段病（ASD）翻修手术与未行 ASD 翻修术患者椎旁肌的退变情况，研究其对 PLIF 后 ASD 翻修手术的预测价值。

材料与方法：收集 2006 年 9 月至 2022 年 9 月在大连医科大学附属第一医院连续进行两次 PLIF，且符合纳入及排除标准的患者 40 例作为实验组；使用倾向性得分匹配法，选取同期仅接受过一次 PLIF 且与实验组年龄、性别、身体质量指数、手术节段数相匹配的患者 40 名作为对照组，使用两组术前腰椎 MRI 图像，分别测量多裂肌（MF）、竖脊肌（ES）、腰大肌（PS）和多裂肌及竖脊肌之和即椎旁肌群（PVM）的总横截面积（CSA）、有效横截面积（FCSA）、肌肉椎体指数 CSA-VI 和 FCSA-VI（ $\text{CSA-VI}=\text{CSA}\times 100/\text{同层椎体横截面积}$ ， $\text{FCSA-VI}=\text{FCSA}\times 100/\text{同层椎体横截面积}$ ），采用独立样本 t 检验比较两组差异，并绘制受试者工作特征曲线（ROC）曲线。

结果：在腰 3 下终板水平，病例组 MF、ES、PVM 的 FCSA 和 FCSA-VI 均较对照组小，差异有统计学意义（ $P<0.01$ ）；病例组和对照组 MF、ES、PVM 的 CSA、CSA-VI 相比较，差异均无统计学意义（ $P>0.05$ ）；病例组和对照组 PS 的 CSA、FCSA、CSA-VI、FCSA-VI 相比较，差异均无统计学意义（ $P>0.05$ ）。多裂肌 FCSA-VI 用于预测 PLIF 后相邻节段翻修术的最佳截断值为 41.82，曲线下面积为 0.874，敏感性为 62.07%，特异性 96.55%。

结论：PLIF 后 ASD 翻修术患者 MF、ES 的肌肉萎缩程度比不需要 ASD 翻修术患者程度重，多裂肌的 FCSA-VI 是 PLIF 后发生 ASD 翻修手术的预测因素。

OR-0187

Experimental Study on Thermal Field of Microwave Ablation in Homogenous Liquid Using Cyst-Mimicking Models

Bin Li, Xiaoguang Li
Beijing Hospital

Objective The aim of this study was to explore the thermal field characteristics of microwave ablation (MWA) in homogeneous liquid using cyst-mimicking models.

Methods A total of twelve bladders of New Zealand White rabbits were used to mimic cysts, divided into an MWA experimental group ($\phi = 5\text{ cm}$, 60 W) and a control group. The MWA antennas were introduced into the centers of the cyst-mimicking models. We measured the real-time temperatures during MWA and used an infrared thermal imaging device to dynamically monitor the thermal field distribution. The macroscopic and histological changes of the cyst-mimicking models were evaluated, and statistical analysis was conducted.

Results A total of ten cyst-mimicking models were performed MWA, with five temperature points in each case, and two cases without MWA in the control group. There was a positive correlation between the temperature gradient of cyst-mimicking model (wall and liquid) and MWA power. The temperature of the cystic left side wall was similar to the right side wall ($P > 0.05$), and below the average of the cystic top wall and fluid ($P > 0.05$), and obviously higher than the cystic bottom wall ($P < 0.05$), with all temperature values eventually balanced. The microwave thermal field was regionally distributed in the cyst-mimicking model, the region and range of the thermal field was associated with the ablation duration. The temperature of cystic side wall and liquid can reach the point of coagulative necrosis (70°C) with covered by microwave thermal field. Histopathology of control group showed normal bladder epithelial cells and intracellular structural integrity, the morphology of lamina propria and muscle cell integrity; experimental group revealed bladder wall epithelial cell degeneration and necrosis, and lamina propria and muscular layer of normal tissue structure were completely disappeared.

Conclusions Microwave thermal energy was transmitted in the liquid by thermal convection, and the distribution of the thermal field in the homogeneous liquid was regional and uniform. MWA is a promising treatment for cystic lesions.

ERAS 理念联合氢吗啡酮 PCA 在恶性肿瘤介入围手术期的应用研究

赵久甜
贵州医科大学附属肿瘤医院

目的 观察加速康复外科 (enhanced recovery after surgery, ERAS) 理念联合氢吗啡酮患者自控镇痛 (patient controlled analgesia, PCA) 在恶性肿瘤介入围手术期的有效性及安全性。方法 选取 2021 年 01 月—2022 年 01 月贵州医科大学附属肿瘤医院介入科恶性肿瘤行介入手术病人 60 例为研究对象, 随机分为观察组和对照组, 30 例/组, 对照组常规围手术期护理, 术前 8h 禁食、水。观察组 ERAS 理念联合氢吗啡酮 PCA 镇痛治疗, 成立 ERAS 护理小组。术前: 收集患者一般资料, 医生根据患者情况拟定手术方案; 护士做好术前宣教、营养评估, 术前 2h 可口服碳水化合物, 术前 1h 使用氢吗啡酮 PCA 镇痛治疗。配置方法为氢吗啡酮 $5\text{mg} + \text{生理盐水 } 115\text{ml}$, 背景量 2ml/h , PCA 单次剂量 4ml/次 , 锁时 15min 。给药前评估患者疼痛情况, 记录 NRS 评分。术中: 麻醉医师根据病人情况为其实施麻醉方案, 密切观察患者术中生命体征。术后: 定时监测患者生命体征, 术

后出现爆发性疼痛时, 根据病人情况遵医嘱予相应止痛治疗。记录 PCA 给药前, 栓塞即刻, 栓塞后 5min 及术后 2、6、12、24、48h 的 NRS 评分, 每日发生疼痛次数, 补救镇痛次数、患者满意度、不良反应情况和生活质量 BPI 评分。结果 术前两组患者临床特征比较, 差异均无统计学意义 (均 $P>0.05$)。观察组在栓塞及术后各时间点 NRS 评分均低于对照组, 每日发生疼痛的次数、补救镇痛次数均低于对照组, 患者满意度更高, 差异有统计学意义 ($P<0.05$)。患者无过度镇静、呼吸抑制等严重不良反应, 差异无统计学意义 ($P>0.05$)。生活质量 BPI 评分改善, 差异有统计学意义 ($P<0.05$)。结论 ERAS 理念联合氢吗啡酮 PCA 可有效缓解恶性肿瘤介入围手术期患者疼痛, 改善患者生活质量, 不良反应轻, 提高患者护理满意度, 可推广应用。

基于 NaXWO₃ 纳米晶体的微波消融 和化学动力学联合治疗三阴性乳腺癌

闫海丽、高龙、杜江锋、张辉
山西医科大学第一医院

目的: 本研究旨在探讨基于六方相 NaXWO₃ 纳米晶体的微波消融和肿瘤微环境响应性化学动力学对小鼠 4T1 三阴性乳腺癌移植瘤的联合治疗作用。

方法: 采用环保水热法, 以 WO₃ 前驱体和 Na₂SO₄ 为原料合成六方相 NaXWO₃ 纳米晶体, 并对其理化性质进行表征。细胞层次采用 CCK-8 实验和线粒体膜电位 JC-1 检测 NaXWO₃ 纳米晶体选择性杀伤肿瘤细胞的可行性和机制。活体层次构建 4T1 小鼠乳腺癌模型, 待肿瘤体积达到 50 mm³ 左右时进行随机分组治疗 (n=5)。治疗结束后, 正常饲养小鼠, 并且每隔一天监测各组小鼠的体重和肿瘤体积。观察结束后, 取小鼠肿瘤及重要脏器行组织病理学 H&E 染色以及细胞凋亡标志物 Tunel 的免疫组化分析。

结果: 通过环保水热法成功制备了 PVP 修饰的长度约为 100-150 nm, 直径约为 5 nm 的六方相 NaXWO₃ 纳米晶体。体外模拟液的 DCF 荧光光谱图和 TAOH 荧光光谱图显示, 以 W5+ 为优势价态的 NaXWO₃ 纳米晶体可分解 H₂O₂ 生成强氧化性的·OH, 且该催化性能随着底物浓度、反应时间以及反应温度的增加而逐渐增强。CCK-8 实验表明当 NaXWO₃ 纳米晶体浓度达到 400 μg mL⁻¹ 时, 4T1 细胞的活力下降到 67.8±2.6%, 而 HUVEC 细胞活力仍接近 100%。当加入外源性 H₂O₂ 和 NaXWO₃ 纳米晶体后, HUVEC 细胞活力明显下降 (77.2±5.7%)。JC-1 实验结果进一步揭示 NaXWO₃ 纳米晶体处理的 4T1 细胞线粒体膜电位发生去极化改变, 而 HUVEC 细胞的线粒体膜电位并无明显的改变。活体实验中, 与对照组相比, NaXWO₃ 纳米晶体+MWA 处理组呈现最好的肿瘤体积抑制效果以及最严重的肿瘤坏死和凋亡。

结论: 六方相 NaXWO₃ 纳米晶体通过在肿瘤部位同时产生加热效应和强氧化性的·OH 实现了外源性 MWA 和内源性化学动力学联合治疗小鼠 4T1 三阴性乳腺癌移植瘤。

Low-dose CT fluoroscopy-guided interventional minimally invasive robot

Xiaofeng He, Yueyong Xiao
Chinese PLA General Hospital

Object: This study aimed to assess the feasibility, safety, and accuracy of a low-dose CT fluoroscopy-guided remote-controlled robotic real-time puncture procedure.

Methods: The study involved two control groups: Group A, which underwent low-dose traditional

CT-guided manual puncture (blank control), and Group B, which underwent conditional control puncture. Additionally, an experimental group, Group C, underwent CT fluoroscopy-guided remote-controlled robotic real-time puncture. In a phantom experiment, various simulated targets were punctured, while in an animal experiment, attempts were made to puncture targets in different organs of four pigs. The number of needle adjustments, puncture time, total puncture operation time, and radiation dose were analyzed to evaluate the robot system.

Results: Successful punctures were achieved for each target, and no complications were observed. P-values were calculated for all parameters using SPSS 26.0 software and independent-samples t-test.

Conclusion: The low-dose CT fluoroscopy-guided puncture robot system is a safe, feasible, and equally accurate alternative to traditional manual puncture procedures.

脊髓 CT 血管造影对脊髓血管畸形的评价价值

曹旭阳、洪楠
北京大学人民医院

[摘要] 目的 观察 CT 血管成像 (CTA) 诊断脊髓血管畸形 (SCVM) 的价值。方法 回顾性分析 85 例经手术确诊 SCVM 患者 CTA 及数字减影血管造影 (DSA) 资料, 以术中所见及术后临床诊断为金标准, 计算 CTA 判断病变类型和范围的准确率, 以及 CTA 显示增粗供血动脉及瘘口位置与 DSA 的符合率。结果 85 例 SCVM 包括硬脊膜动静脉瘘 (SDAVF) 59 例、脊髓周围动静脉瘘 (SPAVF) 10 例、脊髓动静脉畸形 (SAVM) 12 例及海绵状血管瘤 (CM) 4 例。CTA 判断病变类型和范围的准确率分别为 85.88% (73/85) 和 92.94% (79/85)。除 4 例 CM CTA 及 DSA 结果均为阴性外, CTA 显示 81 例 SCVM 供血动脉及瘘口位置与 DSA 的符合率分别为 86.42% (70/81) 和 82.72% (67/81)。结论 脊髓 CTA 能较准确显示 CM 之外大部分 SCVM 病变范围、供血动脉及瘘口位置

Clinical analysis of esophageal artery chemoembolization combined with camrelizumab for advanced esophageal squamous carcinoma

Wenze Xu,xuhua duan,hao li,chao liang
The First Affiliated Hospital of Zhengzhou University

Purpose To evaluate the safety and feasibility of esophageal artery chemoembolization combined with camrelizumab for the treatment of patients with advanced esophageal squamous cell carcinoma (ESCC).

Methods The present study retrospectively analyzed the clinical efficacy and adverse effects of esophageal artery chemoembolization combined with camrelizumab (200 mg, q3w) for patients with advanced ESCC. The observation indexes were objective response rate (ORR), disease control rate (DCR), progression-free survival (PFS) time, overall survival (OS) time, and treatment-related adverse reactions. The changes of life assessment scale and esophageal cancer specific scale were assessed before and after treatment.

Results Twenty-three patients with advanced ESCC were successfully treated, with a follow-up time of 15.4 ± 5.7 months. The ORR and DCR reached 80.0% and 90.0% after receiving 15 cycles of camrelizumab. Median OS and PFS were 15.8 months (13.0,20.0) and 8.6 months (7.8,19.1). Emotional function improved significantly after six treatment cycles compared to pre-treatment

($P=0.018$). Social function and the overall status improved gradually, with significant changes after nine cycles ($P=0.012$, $P=0.023$). The esophagus-specific symptoms were all significantly relieved after nine treatment cycles compared to the pre-treatment period ($P=0.004$, 0.001 , and 0.005). All adverse reactions during treatment were all relieved by symptomatic treatment.

Conclusion Camrelizumab combined with esophageal artery chemoembolization is effective in the control of advanced ESCC and significantly improves PFS and OS with controllable adverse drug effects. This combination of treatments can improve the overall quality of patient lives.

介入光学成像实时引导及评估肝癌射频消融治疗

阚雪峰、郑传胜

华中科技大学同济医学院附属协和医院

目的：创建一种介入光学成像技术实时引导及评估肝癌射频消融治疗，实现肝癌的完全消融治疗。

材料与方法：本研究分 3 部分进行：（1）VX2 肝癌细胞在不同时间点吸收不同浓度的 ICG，优化光学显影剂吲哚菁绿(ICG)在体外行光学成像的剂量及浓度；（2）建立体外介入光学成像系统，并评估该系统在体外能否鉴别活的吸收 ICG 的 VX2 肝癌细胞与热消融后死亡的吸收 ICG 的 VX2 肝癌细胞；（3）创建兔 VX2 肝癌模型，验证介入光学成像系统可实时引导及评估兔 VX2 肝癌射频消融治疗。

结果：ICG 被 VX2 肝癌细胞吸收良好，在体外最佳吸收浓度为 $100 \mu\text{g/mL}$ ，最佳吸收时间点为 24 小时。吸收 ICG 的 VX2 肝癌细胞行热消融(80°C)治疗 10 分钟后，其光学信号强度显著降低，体外介入光学成像可清晰鉴别活的吸收 ICG 的 VX2 肝癌细胞与热消融后死亡的吸收 ICG 的 VX2 肝癌细胞。体内动物实验显示介入光学成像可在射频消融术中发现未消融的残存活性 VX2 肝癌细胞，并且可以清晰鉴别消融肿瘤边界病理三区（完全射频消融区、炎症反应带、残存活性肿瘤/正常肝脏组织）。

结论：介入光学实时成像可实时引导及评估肝癌射频消融治疗，实现肝癌完全消融治疗。

Immunomodulators enhance the effect of anti-PD-1 therapy on incomplete ablation of residual tumors.

Tao Sun, Bo Sun, Xuefeng Kan, Chuansheng Zheng
wuhan union hospital

Background and aims: Radiofrequency ablation (RFA) often results in incomplete ablation for medium-to-large and irregular tumors. To solve this clinical problem, we proposed a new treatment strategy of OK-432 in combination with an anti-programmed cell death protein 1 ($\alpha\text{PD-1}$) antibody for residual tumors after incomplete RFA (iRFA) of hepatocellular carcinoma (HCC).

Approach and results: The effect of OK-432 on immature dendritic cells (iDCs) was evaluated in vitro. A CCK-8 kit and ELISPOT were used to assess the killing effect of OK-432-induced CD8+ T cells in combination with an $\alpha\text{PD-1}$ antibody on Hepa1-6 cells. We found that OK-432 significantly increased the maturation level of DCs, and OK-432-induced CD8+ T cells in combination with $\alpha\text{PD-1}$ antibody significantly enhanced the function of CD8+ T cells. In the in vivo experiment, HCC model mice were treated with (1) pseudo iRFA + phosphate-buffered saline (PBS); (2) iRFA + PBS; (3) iRFA + OK-432; (4) iRFA + $\alpha\text{PD-1}$; or (5) iRFA + OK-432 + $\alpha\text{PD-1}$. We found that the combined therapy of OK-432 with $\alpha\text{PD-1}$ antibody significantly increased the infiltration and function of CD8+ T cells and significantly decreased the number of FoxP3+ regulatory T cells in residual tumors after iRFA of HCC. Moreover, the smallest tumor volumes and the longest survival were observed in the

triple combination treatment (iRFA+OK-432 + α PD-1 antibody) group compared with the other four groups.

Conclusions: The combined therapy of OK-432 with α PD-1 antibody induced a strong antitumor immune

response, which significantly inhibited the residual tumors after iRFA of HCC. This concept may provide a new treatment strategy to increase the curative efficacy of RFA for medium-to-large and irregular HCCs.

基于深度学习的 TBAD 真假腔智能分割重建研究

向东桥、郑传胜

华中科技大学同济医学院附属协和医院

目的: 本研究基于影像学先验知识, 旨在开发一种基于内膜注意力机制、能够整合夹层动脉上下层信息的深度学习方法实现 TBAD 真腔(true lumen, TL)和假腔(false lumen, FL)的智能分割重建。

方法: 从四个大型医院收集 TBAD 患者的术前 CTA 影像数据, 构建一个多中心数据集。该数据集含有与临床场景一致的假腔无血栓化和有血栓化的病例。基于 PyTorch 框架为 TBAD 分割开发一种特有的内膜注意力机制, 联合级联网络

结构和两步训练策略提出一种深度学习模型, 命名为 ADSeg。用单中心数据进行模型训练, 并在多中心数据集

上测试模型的分割性能和泛化能力, 用 Dice 系数 (dicecoefficient) 和平均边界距离 (boundary distance) 对分割结果进行评估。

结果: ADSeg 分割 TL、FL、动脉主干及 BR 的 Dice 系数分别为 91.1%、88.4%、93.2% 及 84.9%。

与经典的 U-Net 算法相比, ADSeg 分割 TL、FL 及 BR 的 Dice 系数分别提高了 6.4%、7.4% 及 2.4%; 边界距离分别降低了 0.36mm、0.38mm 及 0.10mm。与此前报道的最优方法相比, ADSeg 分割 TL 和 FL 的 Dice 系数分别提高了 4.1% (91.1% vs. 87.0%) 和 5.9% (88.4% vs. 82.5%); 边界距离分别降低了 0.21mm (1.47mm vs. 1.68mm) 和 0.64mm (2.10mm vs. 2.74mm)。

结论: 本研究提出了一种以内膜注意力机制和长距离 z 轴信息交互为特点, 同时利用了级联网络结构及两步训练策略的深度学习方法, 相比现有的主动脉夹层真假腔分割方法具有更高的分割准确性, 并在多中心测试集上表现出强大的泛化性。ADSeg 有望为 TBAD 精准智能诊断、个体化治疗方案制定、术后随访及预后预测等提供价值。

MRI-based Investigation of Dynamic changes in Viable Hepatocellular Carcinoma following Transarterial Chemoembolization

Weilang Wang, Yuan-Cheng Wang

Zhongda Hospital Affiliated of Southeast University Hospital

Objective To analyze the dynamic changes in MRI radiological features of viable tumors at different follow-up times after the initial Transcatheter arterial chemoembolization (TACE) treatment for hepatocellular carcinoma (HCC) to improve the understanding and diagnostic accuracy of viable tumors.

Methods The study analyzed a prospective, single-arm, multicenter clinical trial data set (NCT03113955) and another three centers of clinically diagnosed patients with intermediate-stage

HCC who received TACE as their first treatment. Viable tumors in two follow-up MRI were evaluated according to the Liver Imaging Reporting and Data System (LI-RADS). Radiological features were evaluated including signal characteristics of T1WI, T2WI, and DWI, the presence or absence of wash in and wash out, as well as the size, location, and shape characteristics of the viable tumors.

Results There were 157 HCCs in multicenter data set and 297 HCCs in another three centers met inclusion criteria. After exclusion, there were total 160 viable tumors on both follow-up MRI. Compared with the radiological features of the baseline, the T2WI hyperintensity ($P = .002$), wash out ($P < .001$) and the tumor short diameter ($P < .001$) of the first follow-up viable tumors significantly decreased. Compared with the radiological features of the first follow-up viable tumors, the DWI hyperintensity of the second follow-up viable tumors increased ($P = .009$), and the other features were similar. For the shape features of viable tumors, both follow-ups showed mostly regular shapes (66.9%, 60.6%). Another location feature, the first follow up viable tumor showed mostly internal location (51.3%), but the second follow up viable tumor showed mostly non-internal location (66.9%).

Conclusions The radiological features of viable tumors at early follow up post-TACE showed more variability compared to the baseline HCC, while those at second follow-up remained variable but less than the first follow up viable tumors.

肝动脉输注化疗联合分子靶向和免疫治疗 最佳治疗有效率的初步研究

李梅、王莉、秦浩、张凯、邢文阁、于海鹏
天津医科大学肿瘤医院

目的:本研究旨在探讨在不可切除的肝细胞癌(HCC)患者接受氟尿嘧啶、亚叶酸钙和奥沙利铂(FOLFOX)联合分子靶向和免疫治疗的肝动脉输注化疗(HAIC)时,使用改进的实体瘤反应评价标准(response Evaluation Criteria in Solid tumor),以最佳反应率(BRR)作为总生存期(OS)的替代指标的有效性。方法采用限制性三次样条(RCS)和最大选择的秩和统计方法确定BRR的最佳阈值。绘制高评分组和低评分组患者的生存曲线。然后,我们使用估计变化(CIE)方法过滤掉混杂因素,并使用处理加权逆概率(IPTW)来平衡两组之间的混杂因素,以评估结果的稳健性。结果本研究连续入组111例影像学资料完整的患者。在总体人群中,联合治疗方案的中位数频率为3次。计算出的最佳BRR截断值为-0.2。根据该值将77例患者分为低评分组,34例患者分为高评分组。高评分组和低评分组的OS差异有统计学意义(6个月 vs 11个月;术中;0.001)。采用绝对10%截断值,CIE方法筛选影响预后的混杂因素:转换手术成功、基线肿瘤大小、巴塞罗那临床肝癌(BCLC)分期、血清总胆红素水平、介入治疗次数、甲胎蛋白水平、下腔静脉肿瘤血栓存在、部分凝血酶激活时间。然后使用IPTW对混杂因素再次绘制生存曲线,发现低评分组的OS继续优于高评分组。最后分析BRR与基线因素的关系,下腔静脉肿瘤血栓、基线肿瘤大小与BRR有显著相关。结论BRR可作为不可切除HCC患者接受FOLFOX-HAIC联合分子靶向和免疫治疗的替代终点。因此,通过计算BRR,可以预测HCC患者联合治疗后的预后。下腔静脉肿瘤血栓和基线肿瘤大小与BRR密切相关。

OR-0198

Safety and Efficacy of CT-guided Preoperative Indocyanine Green Localized Simultaneous Video-Assisted Thoracoscopic Surgery of Multiple Pulmonary Nodules a Retrospective Study

Shenbo Zhang, Cao Jian, Wang Kefei, Wang Zhiwei, Jin Zhengyu
Peking Union Medical College Hospital

Objectives To evaluate the safety and efficacy of indocyanine green (ICG) in preoperative CT-guided localization of multiple pulmonary nodules.

Methods The patients who underwent CT-guided preoperative ICG localization followed by Video-Assisted Thoracoscopic Surgery (VATS) from June 2021 to March 2023 were included. The clinical, nodular, localization, and surgery characteristics were collected. Patients were divided into multiple nodules group and single nodules group. The patients in the multiple nodules group were divided into bilateral and unilateral subgroups according to the localization side.

Results A total of 374 patients (mean age, 54.8 ± 11.4 years, 96 men, 99 multiple nodules) with 511 nodules were evaluated. The success rate in the multiple nodules group reached 98.3%, which is equal to the single nodule group. The other outcomes between the single nodule group and multiple nodules group showed no significant difference except in the postoperative hospital stay [3(2-4) days vs. 3(3-4) days, $P = 0.022$]. Multivariate analysis indicated pulmonary hemorrhage during localization, surgery blood loss, postoperative complication, and not segmentectomy were significantly associated with longer postoperative hospital stay. For pneumothorax, advanced age is the only independent risk factor. The success rate unilateral group and nodule group was 97.8% and 99% respectively. Only a higher pneumothorax rate was observed in the unilateral group than in the bilateral group (38.3% vs. 20%).

Conclusion CT-guided preoperative ICG localization is a safe and effective method to localize multiple pulmonary nodules. ICG localization of both unilateral and bilateral MPNs has similar safety and efficacy, which could be applied in simultaneous VATS resection of MPNs.

直接淋巴管造影在原发性乳糜尿中的诊断价值

郝琪^{1,2}、洪楠¹、王仁贵^{2,3}

1. 北京大学第二临床医学院 (北京大学人民医院)

2. 北京大学第九临床医学院

3. 首都医科大学附属北京世纪坛医院

目的 探讨直接淋巴管造影 (DLG) 在诊断原发性乳糜尿中的应用价值。

方法 回顾性收集确诊为原发性乳糜尿的 37 例患者的临床及影像学资料, 所有患者均行直接淋巴管造影 (DLG), 采用美国 GE Innova 2000-IQ DSA 机行 DLG 检查。根据患者临床情况, 选取一侧足 (本组 1 例患者从腹股沟淋巴结注入) 注射碘油, 若患者合并下肢淋巴水肿, 则选择健侧足, 患者取仰卧位, 于一侧足第 1~3 趾根间皮内及皮下注射亚甲蓝与 2%利多卡因混合液 (1:1) 约 1~2ml, 在显微镜下足背中部局部以 1%利多卡因麻醉后, 做 0.5~1cm 皮肤横切口, 自皮下寻至一支蓝染浅淋巴管, 用淋巴管造影针穿刺进入淋巴管管腔, 以 6~8ml/h 的注射流率, 注入碘油总量约 7~15ml, 于 DSA 下间断动态观察碘油显影及反流情况, 直至显示胸导管末端入血情况, 观察时间约 1.5~4.0h 不等。DLG 统计指标包括: 泌尿系统及胸腹部异常淋巴管分布、反流及扩张情况。对于原发性乳糜尿患者 DLG 征象采用分类变量资料中的构成比进行统计描述。

结果 DLG 示同侧髂淋巴管迂曲、扩张 30 例 (81.1%); 对侧髂淋巴反流 17 例 (45.9%); 同侧

腰干迂曲扩张、反流 19 例 (51.4%)；对侧腰干反流 21 例 (56.8%)；同侧肾盂肾窦反流 17 例 (45.9%)；对侧肾盂肾窦反流 21 例 (56.8%)；胸导管回流受阻 32 例 37 例 (100.0%)；支气管纵隔干反流 7 例 (18.9%)，其中 1 例 (2.7%) 肺门反流，3 例 (8.1%) 肋间反流 (图 11%)；4 例 (10.8%) 会阴反流；1 例 (2.7%) 腹腔反流；颈干、锁骨下干反流 21 例 (56.8%)。

结论 DLG 能够动态直观显示淋巴回流及异常反流、准确评价淋巴管形态，对于原发性乳糜尿的诊断能够达到 81.8%。

临床应用 DLG 能够对原发性乳糜尿的诊断及术前评估提供重要影像学依据。

Transcatheter arterial embolization for hepatic hemangioma: effectiveness and its affecting factors

dan zhao¹, Lingli Xie², Liangrong Shi³, Joyman Makamure¹, Ziyi Liu¹, Lijie Zhang¹, Qing Li¹, Xin Zhang¹, Yazhuo Zhao³, Chuansheng Zheng¹, Bin Liang¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Department of Gastroenterology, General Hospital of the Yangtze River Shipping

3. Department of Radiology, Xiangya Hospital, Central South University

Purpose: To evaluate the effectiveness of Transcatheter arterial embolization (TAE) for the treatment of hepatic hemangioma (HH) and to analyze the factors affecting the TAE effectiveness.

Method: Institutional review board approvals were obtained for this study and written informed consent was waived. A retrospective analysis was conducted of consecutive HH patients who received TAE with bleomycin-Lipiodol emulsion and gelatin sponge particles at three institutions from January 2014 to January 2021. TAE effectiveness was defined as more than 50% reduction of tumor volume. The effectiveness, safety, and CT changes of hemangiomas after TAE were assessed. Factors affecting TAE efficacy were analyzed with logistic regression analysis.

Results: A total of 102 patients with 109 HHs were included. TAE effectiveness was achieved in 80.7% (88/109) of hemangiomas, which was characterized by significant reduction in tumor volume during the first year with Lipiodol retention. Atypical enhancement pattern ($p = .001$) and central arterioportal shunt (APS) ($p = .002$) were independent predictors of TAE ineffectiveness. Postembolization syndrome and transient increase in liver enzymes were common without severe complications and death.

Conclusion: TAE was safe and effective in shrinking hemangioma, with characteristic changes during follow-up CT. Lesion enhancement pattern and APS type were associated with TAE efficacy.

Efficacy of TACE Combined with Sirolimus in the Treatment of Kasabach-Merritt Phenomenon in Infants

Chuangao Yin
Anhui Children's Hospital

[Abstract] **Objective:** To observe the efficacy of TACE combined with sirolimus in the treatment of hemangioma combined with Kasabach-Merritt phenomenon. **Methods:** A total of 11 infants with Kasabach-Merritt phenomenon (KMP) who were treated at our hospital from January 2016 to September 2021 were chosen and treated with arteriosclerosis embolotherapy by using the emulsion and microsphere formed by bleomycin + ultra-fluid lipiodol + dexamethasone + contrast agent or bleomycin mixed microsphere as the embolizing agent. The patients took orally sirolimus after surgery. The clinical efficacy and examination indicators before and after treatment were

observed and compared. Results: The 11 infants underwent TACE treatment of arteriosclerosis embolotherapy for 21 times, among whom 10 were cured and 1 showed moderate response, without non-response case or death case. The platelet count rose to $236.0 (188.0, 275.0) \times 10^9/L$ after surgery from $10.0 (7.0, 18.0) \times 10^9/L$ before surgery, and the tumor size decreased to $7.0 (3.5, 17.0) \text{ cm}^3$ from $49.0 (43.0, 111.7) \text{ cm}^3$. The differences were statistically significant (Z values were -2.943 and -2.934 respectively, $P < 0.05$). Conclusion: TACE combined with sirolimus has significant efficacy on critical children with KMP.

Radiation Dose and Image quality evaluation of Virtual Monoenergetic Images from Spectral CT in CT guided percutaneous spine biopsy

Shuai Tian, Ning Lang, Huishu Yuan
Peking University Third Hospital

Purpose: to evaluate whether improved image quality by means of 74keV virtual monoenergetic images enables a radiation dose reduction compared to conventional images in CT guided percutaneous spine biopsy.

Methods: Thirty patients (male, female, age range, mean age) who underwent spectral CT-guided percutaneous spine biopsy were retrospectively analyzed from March to April 2021. Each patient received conventional 120kVp scanning and spectral scanning after the needle tip of the spine biopsy reached the target lesion area. All other scanning parameters were kept identical. The volume CT dose index was recorded. ROIs were placed in front of the spine biopsy needle tip on conventional images and copied to identical positions in 74keV virtual monoenergetic images. The contrast-to-noise ratio was calculated. Two radiologists blinded to the reconstruction technique evaluated image quality on a 5-point Likert-scale. Statistical assessment was performed using ANOVA and Wilcoxon test adjusted for multiple comparisons.

Results: The mean volume CT dose index of 120kVp group and 74keV group was 7.01 and 9.31 mGy, respectively. Irrespective of the volume CT dose index, noise was significantly lower in 74keV virtual monoenergetic images compared with conventional images (20.8 ± 8.4 vs. 19.1 ± 6.3 HU, $P < 0.001$). Overall, the contrast-to-noise ratio in 74keV virtual monoenergetic images was superior to that in conventional images irrespective of the volume CT dose index (0.76 ± 0.04 vs. 0.24 ± 0.03 , $P < 0.001$). Subjective analysis confirmed better image quality in 65- keV virtual monoenergetic images.

Conclusion: The 74keV virtual monoenergetic images from spectral CT unenabled a radiation dose reduction compared to conventional images in CT guided percutaneous spine biopsy, while it could improve the overall CT image quality.

Endovascular Treatment for Patients with Perforator Stroke Related to Middle Cerebral Artery Stenosis: Based on Multi-Mode Imaging

Ziyao Wang, Sen Wei, Yu Fu, Xuan Cui, Wentao Gong, Xiaojie Fu, Chao Liu, Sheng Guan
Department of Interventional Neuroradiology, First Affiliated Hospital of Zhengzhou University

Background: Although most neurologists believe that patients presenting with perforator stroke (PS) related to intracranial atherosclerotic stenosis (ICAS) are not suitable for endovascular treatment, the author finds that this is untrue and that some patients may be treated with endovascular therapies under the guidance of multi-mode imaging. This study aimed to investigate the outcomes of endovascular treatment for PS related to middle cerebral artery stenosis (MCAS).

Materials and methods: Patients who presented with PS related to MCAS and accepted endovascular treatment in our center between January 2015 and June 2022 were enrolled retrospectively. The clinical and surgical data of the patients were evaluated. The primary endpoint was procedure-related PS. We also focused on any stroke or death within 1 month, stroke or death in the territory of qualifying artery beyond 1 month through 1 year after procedure, and changes in postoperative visualization of perforator arteries in lesions.

Results: A total of 26 patients (mean age 57.7 years) were enrolled. The primary endpoint of procedure-related PS was in 1 patient (1/26, 3.8%), and no other patient had any stroke or death within 1 month. During follow-up, one patient experienced symptomatic in-stent restenosis (3.8%). DSA revealed that perforator arteries in lesions improved in 16 patients after the procedure (61.5%).

Conclusion: In this retrospective study, endovascular treatment for PS related to MCAS did not increase the incidence of procedure-related PS. Endovascular treatment may be safe and effective in such patients.

上海市第六人民医院

目的: 评估肝肾囊肿 CT 引导下聚桂醇硬化治疗效果。 **方法:** 对 114 例 (122 个) 肝肾囊肿 CT 引导下聚桂醇硬化治疗进行回顾性分析, 其中肾囊肿 79 例 (83 个), 肝囊肿 35 例 (39 个)。术前准备: ①增强检查排除肾囊肿是否与肾盂肾盏、肝囊肿是否与胆道系统相通; ②进行血常规、出凝血功能、肝肾功能和心电图检查; ③根据增强检查的囊肿部位来确定穿刺治疗体位: 肾囊肿采取俯卧位或者侧卧位、肝囊肿采取仰卧位或侧卧位; ④并且确定进针路径以及定位标记的放置。术中:

①采取平静呼吸模式; ②确定穿刺层面、路径及距离: 平扫后肾囊肿选择靠近尿里收集系统侧的最大层面作为进针层面, 肝囊肿选择肝区最大径层面作为进针层面; 肝囊肿避开周围大血管及胆道、肾囊肿避开肝脾和肠道、选择最短的进针路径, 针尖一般位于囊肿中心偏肾盂侧或肝区侧、确定穿刺距离; ③穿刺和抽液: 确定好穿刺层面、穿刺路径和距离后常规消毒、铺无菌洞巾, 然后 BADR 18G 同轴穿刺针进行穿刺、扫描确定进针路径和距离准确后, 进行抽液, 囊肿较大时、需要缓慢抽液、避免减压太快发生囊壁毛细血管破裂导致的囊内出血; ④冲洗: 扫描确认囊液抽净或基本抽净后, 用生理盐水 40-100mL 反复冲洗 1-2 次, 去除囊壁附着的蛋白及粘液; ⑤硬化: 再次抽净囊内液体后、向囊腔内注入 20-80mL 的聚桂醇泡沫硬化剂 (氧气和聚桂醇按照 1: 1 配比)。然

后拔针包扎穿刺点。结果：囊肿最大径约 4.3-14 cm；抽出囊液量为 100-1200mL，肝囊肿囊液为无色或淡绿色，肾囊肿为淡黄色或淡茶色。所有患者在经过聚桂醇泡沫硬化治疗后，临床症状均有明显的好转或消失。本组患者术后 1 月、3 月和半年复查随访的总体疗效指数（有效率）分别为：88.10%、90.72%、95.24%。整个抽吸硬化治疗过程顺利，患者均无硬化剂外渗和并发症发生。结论：肝肾囊肿 CT 引导下聚桂醇硬化治疗效果显著、且操作便捷简单，与外科手术相比对患者造成的创伤更小、费用更少、住院天数短，可以替代外科手术。

真实世界中肝动脉灌注化疗治疗 一线化疗失败的胰腺癌肝转移的疗效和安全性

朱坤忠¹、张跃伟²、汪樨琴²

1. 青海大学附属医院

2. 北京清华长庚医院

目的：本研究的目的是评价经肝动脉灌注化疗（HAIC）治疗一线化疗失败的胰腺癌肝转移的疗效、安全性及患者生存期。方法：回顾性分析 2021 年 11 月至 2022 年 12 月期间在北京清华长庚医院接受肝动脉内灌注奥沙利铂联合 5-FU 方案治疗的 16 例病人，该组病例特点均是一线化疗后进展的胰腺癌肝转移患者。采用 Kaplan-Meier 法分析患者肝内中位无进展生存期（mPFS）及中位总生存期（mOS）。结果：随访至 2023 年 7 月，中位随访时间 8.2 个月，16 例患者中 3 例存活，13 例死亡。客观缓解率（ORR）：43.75%，疾病控制率（DCR）：68.75%，mPFS：4.7 个月（95%CI：3.328~6.072），mOS：8.0 月（95%CI：6.824~9.176）。3 级不良反应：4 例，2 例为血红蛋白减少，1 例为总胆红素升高，1 例发生腹痛。结论：以奥沙利铂为基础的经肝动脉灌注化疗是治疗一线化疗后进展的胰腺癌肝转移安全有效的疗法。结论：以奥沙利铂为基础的肝动脉灌注化疗是治疗一线全身静脉化疗失败的胰腺癌肝转移安全有效的疗法，与化疗或化疗和靶向药物联合可以同时控制肝内外肿瘤进展。

肝硬化脾功能亢进大鼠模型的构建和部分脾动脉栓塞术治疗研究

田栳甫

昆明医科大学第一附属医院

目的 介绍一种肝硬化脾功能亢进（脾亢）大鼠动物模型的建立方法，并在此模型基础上进行部分脾动脉栓塞（PSE）治疗研究。方法 给予大鼠 40% CCl₄-橄榄油溶液皮下注射，造成中毒性肝硬化后继发门脉高压性脾功能亢进，再进行 PSE 治疗，观察大鼠外周血细胞变化，了解脾脏影像学变化以及组织病理学改变。结果 经 CCl₄-橄榄油溶液皮下注射数月后，血红细胞、血小板降低，脾脏组织被膜大范围增厚，结缔组织增生，脾脏组织学改变符合脾脏淤血肿大的改变。脾动脉栓塞后能引起脾脏广泛坏死，胞核碎裂溶解。结论 经四氯化碳皮下注射建立的肝硬化继发脾功能亢进大鼠模型，便于构建、运输及饲养，可以作为肝硬化脾亢外科或介入治疗的较理想模型，PSE 治疗是一种有效的干预措施。

逆向开通技术在肠系膜上动脉闭塞的应用策略

梁凯、马金辉、陈江波、逯党辉、翟水亭、李天晓
河南省人民医院

目的：探讨逆向开通技术在肠系膜上动脉闭塞患者中的应用体会。

方法：针对肠系膜上动脉完全闭塞的患者无法经原动脉开口行介入开通，采用经腹腔干动脉分支逆向开通技术反向开通闭塞的肠系膜上动脉，具体路径为经腹腔干动脉-分支-肠系膜上动脉主干-肠系膜上动脉开口闭塞；具体方式为：经股动脉及肱动脉入路，应用 4F 蛇管进入腹腔干动脉并建立轨道，经微导管进入腹腔干动脉与肠系膜上动脉沟通侧枝，反向应用微导丝经肠系膜上动脉远端逆向开通开口闭塞段，后采用 2mm, 3mm, 4mm 球囊依次扩张闭塞段；经肱动脉入路应用鹅颈抓捕器抓捕微导丝并建立轨道，应用 6mm 及更大球囊扩张闭塞段，并置入支架完全开通肠系膜上动脉闭塞段。

结果：应用逆向开通技术开通肠系膜上动脉闭塞患者三例，两例完全开通，效果明显；一例患者未开通，后应用自体大隐静脉行髂动脉-肠系膜上动脉转流后效果可。两例患者随访 3-10 月，未出现支架狭窄及闭塞，中期随访效果明显。

结论：由于肠系膜上动脉的特殊解剖结构，肠系膜上动脉完全闭塞经正规入路开通困难，临床中遇到类似患者可采用逆向开通技术进行肠系膜上动脉闭塞段的开通及介入治疗，效果明显，值得临床推广。

Development of a Sun Yat-sen sharp recanalization (SYSR) scoring system for thoracic venous occlusive disease in hemodialysis patients

Bin Chen, Yonghui Huabg, Run Lin, Haitao Dai, Keyu Tang, Jianyong Yang
the First Affiliated Hospital, Sun Yat-sen University

Object: There has been no reliable scoring system for sharp recanalization of thoracic central venous occlusive disease (TCVOD) in hemodialysis patients. We aim to establish a scoring system to guide therapy in hemodialysis patients with TCVOD.

Methods: Data from 122 TCVOD procedures were analyzed. Using sharp device for recanalization was set as an end point, instead of actual procedural success. The least absolute shrinkage and selection operator (LASSO) method was used to select independent predictors. The SYSR (Sun Yat-sen University Sharp Recanalization) score was determined by assigning 1 point for each independent predictor of this end point and summing all points accrued. This value was then used to develop a model stratifying all lesions into 3 recommend intensity for sharp recanalization: minor (SYSR score of 0), intermediate (score of 1), and highly recommended (score of ≥ 2). 10-fold cross-validation was used to test the robustness and accuracy of our model.

Results: The set end point was achieved in 25.4% (31/122) of lesions. Independent predictors included calcification and blunt stump. Minor, intermediate, and highly recommended groups, stratified by SYSR score, demonstrated recommend intensity of using sharp recanalization for TCVOD. The receiver operating characteristic (ROC) curve yielded an RUC of 0.84(95%CI, 0.755-0.925). In the 10-fold cross-validation, the AUC in the derivation group was 0.795 to 0.878, while in the validation group, the AUC was 0.717 to 0.885.

Conclusions: This model would predict the probability of using sharp recanalization very well and can be applied for thoracic central venous occlusive disease in hemodialysis patients.

Glubran2 组织胶在肝细胞癌外科切除术前 计划性门静脉栓塞术中的应用价值

王海瑞、温锋、畅智慧
中国医科大学附属盛京医院

目的 肝细胞癌 (HCC) 在我国高发, 致死率高, 外科手术是治疗可切除 HCC 的首选方法, 但存在术后剩余肝脏体积 (FLR) 过小、残余肝功能代偿不足等问题, 因此外科术前计划性应用门静脉栓塞术 (PVE), 促进残余肝脏组织增生肥大, 增加肝脏储备功能, 有效避免术后肝衰竭。但 PVE 的理想栓塞材料存在争议。本研究比较 Glubran2 组织胶和氰基丙烯酸异丁酯 (NBCA) 在 HCC 外科切除术前计划性 PVE 治疗中的有效性及安全性。

方法 回顾性分析 2020 年 1 月至 2023 年 6 月收治于我院 56 例进行 HCC 外科切除术前计划性 PVE 患者的临床资料, 根据主要栓塞材料不同, 将患者分为 Glubran2 组 26 例和 NBCA 组 30 例。比较两组 PVE 手术成功率、术中及术后并发症发生率、HCC 外科手术切除率、FLR 增加值 (PVE 术后-PVE 术前 FLR)、FLR 增生率 (PVE 术后-PVE 术前 FLR/PVE 术前 FLR)、FLR 增生速度 (FLR 增加值/PVE 后天数)、HCC 外科手术围术期的死亡率及术后 90 天内死亡率。

结果 Glubran2 组和 NBCA 组的 PVE 手术成功率、术中及术后并发症发生率、HCC 外科手术切除率均无显著统计学差异 ($P=0.632$ 、 0.565 、 0.662), Glubran2 组 PVE 术后 (27.63±9.32) 天 FLR 增加值 (236.87±62.95) ml, NBCA 组 PVE 术后 (26.31±8.73) 天 FLR 增加值 (158.97±71.63) ml ($P=0.032$)。Glubran2 组及 NBCA 组 FLR 增生率分别为 (56.96±13.28)%、(45.23±18.19)% ($P<0.039$), FLR 增生速度分别为 (10.91±6.39) ml/天、(6.79±6.85) ml/天 ($P=0.019$), Glubran2 组 1 例患者于 HCC 外科手术围术期内死亡, Glubran2 组及 NBCA 组各 1 例患者于术后 90 天内死亡 ($P=0.685$)。

结论 Glubran-2 组织胶应用于肝细胞癌外科切除术前的计划性门静脉栓塞术, 有效促进 FLR 增加, Glubran-2 和 NBCA 作为主要栓塞材料的门静脉栓塞术安全性相当。

TACE 联合靶向或免疫药物治疗 不可切除的肝内胆管细胞癌的临床疗效研究

宋子阳
中国科学院大学附属肿瘤医院 (浙江省肿瘤医院)

目的: 评估 TACE 联合靶向或免疫药物治疗不可切除肝内胆管细胞癌的临床有效性与安全性。

方法: 回顾性收集了 2016 年 2 月 1 日至 2022 年 7 月 7 日在浙江省肿瘤医院接受 TACE 联合靶向药物或免疫药物 (pd-1 或 pd-L1) 治疗不可切除的肝内胆管细胞癌 (ICC) 患者 42 例, 其中 8 例患者接受 TACE 联合靶向药物 (仑伐替尼、阿帕替尼或安罗替尼), 7 例接受 TACE 联合免疫药物 (信迪利单抗、替雷利珠单抗或特瑞普利单抗), 27 例接受 TACE 联合靶向药物和免疫药物。同时与同期在本院接受单纯 TACE 治疗的 36 例 ICC 患者进行疗效的比较。根据 mRECIST 标准进行疗效评估, 比较 TACE 联合靶向或免疫药物组和单纯 TACE 组的肿瘤客观缓解率 (ORR)、疾病控制率 (DCR)。Kaplan - Meier 法绘制生存曲线, 比较两组的中位无进展生存期 (mPFS)、中位总生存期 (mOS)、无进展生存期 (PFS)、总生存期 (OS)。多因素 Cox 回归模型分析相关预后因素。同时, 观察两组患者的不良事件 (AEs) 的差异。

结果: TACE 联合组的 PR 和 ORR 均显著高于单纯 TACE 组 (PR, 66.7% vs 41.7%, $P=0.027$; ORR, 71.4% vs 44.4%, $P=0.016$)。TACE 联合组与单纯 TACE 组的中位 PFS 分别为 7.4 个月 (95% CI: 4.8-10.0) 和 5.8 个月 (95% CI: 3.5-8.1), 具有统计学差异 ($P=0.028$)。TACE 联合组和单纯 TACE 组的中位 OS 分别为 17.3 (95% CI: 13.8-20.7) 个月和 19.3 (95% CI: 7.9-30.7) 个月。独立危险因素方面, 多因素分析提示胆红素 $>20 \mu\text{mol/L}$ 和多发肿瘤是 PFS 的独立危险因素, 而 CA199 和 ALT 高水平是 OS 的独立危险因素。副反应方面, 最常见的不良反应是腹痛、恶心和白蛋白减低等, 两组间无明显差别。

结论: 对于肝内胆管细胞癌 TACE 具有较好的疗效, 且 TACE 联合靶向或免疫治疗比单纯 TACE 具有更好的近期疗效, 并且不增加严重的不良反应发生率。

胸部 sDWI-CT 融合图像对肺结节的诊断价值研究

夏亮、张俊、梁志鹏
南京医科大学附属逸夫医院

目的: 通过对循环生成对抗网络 (CycleGAN) 进行迁移学习, 实现合成胸部磁共振伪弥散加权图像 (sDWI), 将胸部 sDWI 与胸部 CT 图像融合, 评估融合图像诊断良恶性肺结节的价值。方法: 数据集 1: 收集 4000 张头颅 DWI 图像、4000 张头颅 CT 图像。数据集 2: 收集 400 张胸部 DWI 图像、400 张胸部 CT 图像, 其中 400 张胸部 CT 图像含 120 个肺结节。首先, 将头颅 DWI 图像以及头颅 CT 图像输入 CycleGAN 进行训练, 由此得到的生成器 GCT-DWI 可以将头颅 CT 图像合成头颅 DWI 图像。其次, 将胸部 DWI 图像、胸部 CT 图像以及生成器 GCT-DWI 输入挖掘生成对抗网络 (mineGAN) 训练。mineGAN 可以将胸部 CT 合成胸部 sDWI 图像。然后将胸部 sDWI 图像与胸部 CT 进行基于傅立叶变换的图像融合并进行带通滤波。最后, 比较胸部真实 DWI 与 sDWI 图像之间像素值差异, 在两图像之间计算平均绝对误差 (MAE)、平均误差 (ME)、峰值信噪比 (PSNR) 和结构相似性 (SSIM) 以定量评估胸部 sDWI 质量, 结果用平均值 \pm 标准差表示。观察结节的信号特点, 采用 ROC 曲线评估胸部 sDWI-CT 融合图像诊断良恶性肺结节的效能。结果: 胸部 sDWI 图像与真实 DWI 图像 MAE 为 36.981 ± 0.989 , ME 为 16.882 ± 0.878 , PSNR 为 27.642 ± 3.4266 , SSIM 为 0.9527 ± 0.026 。恶性结节在 sDWI-CT 融合图像上大部分为低信号; 准确率为 0.932, 特异性为 0.974, 敏感性为 0.819, AUC 为 0.962。结论: mineGAN 可以实现对 CycleGAN 迁移学习, 胸部 sDWI 图像质量良好。胸部 sDWI-CT 融合图像对良恶性肺结节的诊断具有重要鉴别诊断价值。

基于对比增强 T1WI 和表观扩散系数直方图分析术前评估成人颅内室管膜瘤病理分级和瘤细胞增殖活性的价值

刘显旺^{1,2,3,4}、韩涛^{1,2,3,4}、刘宏^{1,2,3,4}、周俊林^{1,2,3,4}
1. 兰州大学第二医院
2. 兰州大学第二临床医学院
3. 甘肃省医学影像重点实验室
4. 医学影像人工智能甘肃省国际科技合作基地

目的: 探讨基于对比增强 T1WI (T1C) 和表观扩散系数 (ADC) 直方图分析术前评估成人颅内室管膜瘤病理分级和瘤细胞增殖活性的价值。

方法: 回顾性收集 2014 年 4 月--2023 年 7 月兰州大学第二医院 47 例经组织病理学证实的成人颅

内室管膜瘤患者。使用 FireVoxel 软件分别提取整个肿瘤 T1C 和 ADC 图像的直方图参数, 包括 minimum、maximum、mean、Perc.01、Perc.05、Perc.10、Perc.25、Perc.50、Perc.75、Perc.90、Perc.95、Perc.99、标准差 (SD)、方差、变异系数 (CV)、偏度、峰度和熵。采用独立样本 t 检验或 Mann-Whitney U 检验比较 2 级和 3 级成人颅内室管膜瘤各直方图参数间的差异。使用受试者工作特征曲线 (ROC) 和 Logistic 回归分析确定各参数的评估效能。Spearman 相关分析用于评估直方图参数与 Ki-67 增殖指数之间的关系。

结果: 与 2 级成人颅内室管膜瘤相比, 3 级成人颅内室管膜瘤 T1C 直方图参数中的 Perc.95、Perc.99、SD、方差、CV 和熵均显著升高 ($P<0.05$), ADC 直方图参数中的 minimum、mean、Perc.01、Perc.05、Perc.10、Perc.25、Perc.50 均显著降低, 而 CV 和熵均显著升高 ($P<0.05$)。在 T1C 和 ADC 直方图参数, 熵 (T1C) 和 Perc.10 (ADC) 分别具有较高的诊断性能, AUC 为 0.805 和 0.827, 结合熵 (T1C) 和 Perc.10 (ADC) 后, 诊断性能进一步提高, AUC 为 0.857。T1C 和 ADC 中重要的直方图参数均与 Ki-67 增殖指数之间存在显著相关性 ($P=0.001-0.044$)。

结论: 基于 T1C 和 ADC 的全肿瘤直方图分析是术前评估成人颅内室管膜瘤病理分级和瘤细胞增殖活性的有效手段, 可为临床治疗方案的选择提供参考依据。

5. Medical Imaging Center, Affiliated Hospital of Weifang Medical University, Weifang, 261041, China.

6. GE Healthcare, Precision Health Institution, Pudong new town, No1, Huatuo road, Shanghai 210000, China.

7. Department of Radiology, Zhejiang Provincial People's Hospital, Affiliated People's Hospital of Hangzhou Medical College, Hangzhou 310000, Zhejiang Province, China.

8. Department of Radiology, Deyang People's Hospital, Deyang 618000, Sichuan Province, China.

Purpose: Reliable prediction of volume doubling time (VDT) is essential for the personalized management of pulmonary ground glass nodules (GGNs). We aimed to determine the optimal VDT prediction method by comparing different machine learning methods only based on the baseline chest CT images.

Materials and methods: Seven classical machine learning methods were evaluated in terms of their stability and performance for VDT prediction. The VDT, calculated by the preoperative and baseline CT, was divided into two groups with a cut-off value of 400 days. A total of 90 GGNs from three hospitals constituted the training set, and 86 GGNs from the fourth hospital served as the external validation set. The training set was used for feature selection and model training, and the validation set was used to evaluate the predictive performance of the model independently.

Results: The eXtreme Gradient Boosting showed highest predictive performance (accuracy: 0.890 ± 0.128 , AUC: 0.896 ± 0.134), followed by Neural Network (accuracy: 0.865 ± 0.103 , AUC: 0.886 ± 0.097). While regarding stability, Neural Network showed highest robustness against data perturbation [relative standard deviations (%) of mean AUC: 10.9%]. Therefore, Neural Network was chosen as the final model, achieving high accuracy of 0.756 in the external validation set.

Conclusion: Neural Network is a promising machine learning method to predict VDT of GGNs, which would assist in the personalized follow-up and treatment strategies for GGNs reducing unnecessary follow up and radiation dose.

基于 ASPECTS 分区梗死核心定量的急性缺血性脑卒中长期预后的精准预测

魏来^{1,2}、张康微^{1,2}、席芊³、刘明⁴、徐华丽⁵、王培军^{1,2}

1. 同济大学附属同济医院, 医学影像科, 上海, 200065
2. 同济大学医学院医学影像人工智能研究所, 上海, 200065
3. 同济大学附属东方医院, 医学影像科, 上海, 200120
4. 上海交通大学医学院附属新华医院, 放射科, 上海, 200092
5. 上海中医药大学附属普陀医院, 放射科, 上海, 200062

目的: ASPECTS 评分是一种评价大脑中动脉区急性缺血性卒中 (Middle cerebral artery- Acute ischemic stroke, MCA-AIS) 的半定量工具, DWI-ASPECTS 检出敏感度及准确度高。本研究将基于 DWI 图像获取 ASPECTS 分区的 10 个梗死核心体积变量 (ASPECTS- VolDWI), 并将其与传统临床多维变量 (Multi-clinics) 联合建模, 以精准预测 MCA-AIS 的长期功能预后。

方法: 本研究是一项多中心的回顾性研究, 最终符合入组标准的 MCA-AIS 患者为 464 例; 使用 RealNow 软件获得基于 DWI 图像的 ASPECTS- VolDWI; 随访入住患者的 90d-mRS 评分作为长期功能预后分组标准 (预后良好: mRS \leq 2/预后不良: mRS $>$ 2); 使用 R (4.2.1 版) 进行统计分析。

结果: 基于 ASPECTS- VolDWI+Multi-clinics 相结合的逻辑回归模型取得最好的预测效能, AUC 为 0.878[0.847-0.909]、敏感度为 0.8075[0.744-0.861]、特异度 0.810[0.759 - 0.855]、准确率 0.809[0.769- 0.849]; Delong 检验显示 ASPECTS- VolDWI +Multi-clinics 联合建模的性能明显优于 ASPECTS- VolDWI ($p<0.001$) 与 Multi-clinics 模型 ($p<0.001$); 诺模图显示: 年龄、基线 NIHSS 评分、豆状核、尾状核及内囊后肢的梗死体积是最为重要的预测因子。

结论: 本研究提出了基于 ASPECTS 分区的梗死核心体积的精准定量, 这是 MCA-AIS 病情危重判定、治疗方案选择及预后精准预测的重要影像学定量指标; 在此基础上, 联合临床多维变量实现了 MCA-AIS 长期预后预测模型的构建及可视化。

基于靶向对抗学习构建的抗直肠伪影前列腺癌深度学习系统在真实临床情境下的应用

胡磊、刘再毅
广东省人民医院

目的: 本研究旨在开发一种基于 MRI 的, 能够抵抗直肠伪影的前列腺癌 (prostate cancer, PCa) 诊断模型。

材料与方法: 利用靶向对抗训练 (targeted adversarial training with proprietary adversarial samples, TPAS) 策略增强深度学习对抗直肠伪影的能力。使用包含 1500 个前列腺 MRI 的公共数据集 (Prostate Imaging: Cancer AI) 来训练模型和进行内部验证。回顾性纳入了三个医学中心的 2203 名前腺癌病变 MRI, 用于模型外部验证。并从上述患者中挑选了 1555 例没有伪影的病例, 加入类似直肠伪影的噪声来评估直肠伪影噪声对模型的干扰。通过接受者操作特征曲线下的面积 (AUC-ROC) 和精确率-召回率曲线下的面积 (AUC-PR) 来评估直肠伪影对这两种深度学习模型在患者和病变水平上的影响。

结果: 与对照模型相比, TPAS 模型在多中心验证数据集上在患者水平上的诊断性能提高了 6% (AUC-ROC: 0.87 vs. 0.81; $p<0.001$), 在病变水平上提高了 7% (AUC-PR: 0.84 vs. 0.77; $p=0.007$)。在面对直肠伪影干扰时, TPAS 模型的性能下降程度较对照模型更低 (Δ AUC-ROC: -17% vs. -19%; Δ AUC-PR: -18% vs. -21%)。在患有轻度 (AUC-ROC: 0.80 vs. 0.75; AUC-PR:

0.65 vs. 0.60)、中度 (AUC-ROC: 0.79 vs. 0.73; AUC-PR: 0.68 vs. 0.61) 和严重 (AUC-ROC: 0.75 vs. 0.57; AUC-PR: 0.69 vs. 0.59) 伪影的患者中, TPAS 模型表现优于对照模型。
结论: TPAS 模型可以减少 MRI 诊断 PCa 时的直肠伪影干扰, 从而在临床应用中提高其性能。

基于 MRI 影像组学特征预测高级别胶质瘤 C5AR1 基因表达水平及患者预后

吴子君、杨媛、查云飞
武汉大学人民医院

背景与目的:补体 C5a 受体 1(C5AR1)在与补体级联相关的固有免疫反应中起关键作用。最新研究表明, 它也在癌症进展中发挥作用。然而, C5AR1 在高级别胶质瘤(HGG)中的作用尚未见报道。我们通过影像组学方法预测 C5AR1 的表达, 评估其在 HGG 中的预后价值。

方法:本研究共收集 298 例 HGG 患者进行生物信息学分析, 其中 182 例患者具有 MRI 数据用于影像组学分析。我们采用 Kruskal-Wallis、Wilcoxon 符号秩和检验和 Spearman 相关分析探讨 C5AR1 表达与临床病理特征的关系。采用 Kaplan-Meier 和 Cox 回归分析 C5AR1 与预后的关系。通过 GO/KEGG 分析确定与 C5AR1 相关的关键信号通路。在影像组学分析中, 我们采用 mRMR 和 RFE 算法筛选影像组学特征。采用支持向量机(SVM)和 Logistic 回归构建预测模型。采用受试者工作特征(ROC)曲线、校准曲线和 DCA 评价模型的性能。

结果:C5AR1 基因在 HGG 患者中表达升高, 是 HGG 患者预后的独立因素(HR=3.984, 95% CI: 2.834~5.607)。GO/KEGG 分析显示 C5AR1 高表达富集了多条肿瘤相关通路。我们选择 2 个影像组学特征预测 HGG 患者 C5AR1 表达水平。在 SVM 模型中, 训练集 AUC 为 0.828, 测试集 AUC 为 0.808。在 Logistic 回归模型中, 训练集 AUC 为 0.824, 测试集 AUC 为 0.806。通过 SVM 模型计算的 rad-score 与 HGG 患者的总生存时间具有高度相关性($p<0.01$)。

结论:C5AR1 在高级别胶质瘤患者的进展和预后中起重要作用,提示 C5AR1 可能作为脑胶质瘤预后的生物标志物。基于机器学习和影像组学的模型能够无创、有效预测 HGG 患者 C5AR1 表达水平和预后。

Multimodal Classification Model for Gram-Positive and Gram-Negative Bacterial Pneumonia using Imaging and Clinical Features: Improving Antibiotic Treatment Decisions

Ru Wen¹, Xianchun Zeng², Jian Wang¹, Chen Liu¹

1. Southwest Hospital, Army Medical University (Third Military Medical University)

2. Guizhou Provincial People Hospital, Guiyang City, Guizhou Province

Purpose: This study aimed to develop and validate a classification model that combines imaging features and clinical characteristics to accurately identify patients with Gram-positive and Gram-negative bacterial pneumonia, assisting clinical physicians in empirical antibiotic treatment.

Materials and Methods: The study included patients with bacterial pneumonia who sought medical care at a tertiary hospital in China between 2010 and 2020. The patients were randomly divided into a training set and a validation set in an 8:2 ratio. The ResNet-18 model was used as the base model, and 512 features were extracted from the maximum lesion layer as deep features.

Spearman correlation and mutual information were employed for dimensionality reduction, and the XGBoost model was utilized to construct the imaging model. The GBM model served as the classifier for establishing the clinical model. A logistic regression algorithm was employed to construct an imaging-clinical fusion model based on the individual scores of the imaging model and the clinical model. The classification performance of the clinical model, imaging model, and fusion model was compared using the DeLong test.

Results: This study included data from 2423 patients with bacterial pneumonia. Among them, 563 cases were Gram-positive bacterial pneumonia, and 1860 cases were Gram-negative bacterial pneumonia. The imaging model and clinical model had AUCs of 0.719 and 0.827, respectively, in the test set. The fusion model achieved an AUC of 0.884 (95% CI: 0.868-0.898), sensitivity of 0.772, specificity of 0.822, and accuracy of 0.808 in the test set. The Delong test results demonstrated that the performance of the fusion model was slightly higher than that of the individual imaging or clinical models ($P < 0.05$). Nomogram results of the fusion model showed that clinical scores had the highest weight, and the fusion model exhibited good consistency between predicted probability and expected probability. Decision curve analysis (DCA) confirmed that the fusion model performed well in classifying bacterial pneumonia across most threshold probabilities.

Conclusion: In this study, we integrated multimodal data including imaging, laboratory tests, and clinical signs to classify gram-positive and gram-negative bacterial pneumonia. Our research demonstrates that the fusion of multiple modalities enhances the classification performance of the model.

Clinical Relevance Statement

The fusion model we have developed enables accurate classification of bacterial pneumonia in patients based on CT images, laboratory tests, and clinical signs. It holds significant clinical value in avoiding unnecessary antibiotic usage and provides timely information for guiding clinical decisions and improving patient prognosis.

基于多类别分割的肺间质性疾病 HRCT 影像征象的智能识别

程晓悦¹、郝优²、贺文¹、李华²、陈疆红¹、刘佳宝¹、曹佳鑫¹

1. 首都医科大学附属北京友谊医院

2. 中国科学院计算技术研究所

目的：使用基于多种注意力机制的 UNet 网络结构对 HRCT 上肺间质性疾病的多种影像征象进行多类别分割，来模拟临床影像医师对肺间质性疾病的 CT 诊断流程，初步探讨人工智能在 CT 肺间质性疾病中的应用。方法：回顾性分析由胸部影像专家进行人工标注的肺间质性疾病的胸部 HRCT 病例，将肺间质性疾病的 CT 征象分为 6 种：蜂窝、实变、磨玻璃、网格、肺气肿、非气肿样囊腔，标注病例共 48 例，标注的切片数量共 2908 张二维切片。首先利用阈值分割法将肺实质区域进行分割，将肺实质区域的图像裁剪出来，之后应用基于多种注意力机制的 UNet 网络结构，在裁剪后的区域上进行多类分割实验，应用五折交叉验证评估其分类准确率及召回率。结果：在所有标注的二维切片上进行训练，共 200 次迭代，利用阈值分割法将肺实质区域进行分割，在裁剪之后的区域上进行多类分割实验，应用五折交叉验证，准确率分别为 70.21%、63.47%、67.06%、65.89%、70.34%，平均准确率达 67.39%，召回率分别为 70.22%、78.19%、76.82%、76.30%、76.10%，平均召回率达 75.53%。结论：本研究利用人工智能的多类别分割方法，对 HRCT 上肺间质性疾病的多种影像征象进行识别，取得了较高的准确率及召回率，是实现肺间质性疾病 CT 影像人工智能辅助诊断的必要步骤，具有重要的应用价值。

Predicting Proliferative and Non-proliferative Hepatocellular Carcinoma Using EOB-MRI-based Deep Learning Model

Kan He,Huimao zhang
The first Hospital of Jilin University

***Purpose:** Hepatocellular carcinomas (HCCs) are heterogeneous tumors, and the prognosis varies depending on the subtype. Two broad molecular classes of HCC have been proposed: a proliferative and a nonproliferative class. We aim to develop the deep learning model to perform preoperative assessments of HCC subtypes using gadoxetic acid-enhanced magnetic resonance imaging (EOB-MRI). The findings will provide a better understanding of HCC subtype preoperative prediction .

***Methods and Materials:** This retrospective cohort study evaluated patients with surgically resected treatment-naïve single HCC (≤ 5 cm) who underwent hepatic resection from January 2017 through December 2022 and preoperative gadoxetate-enhanced MRI. We constructed two deep learning models : tumor segmentation and HCC subtype classification.

The former involves utilizing TransUNet solely with hepatobiliary phase (HBP) images for tumor segmentation, while the latter stage employs a wider array of MR sequences such as T2WI, T1-pre, Early arterial phase, Late arterial phase, Portal venous phase and HBP . After obtaining the tumor segmentation, the multi-phase images are then cropped based on the segmentation results with a bounding box of 80 x 80 in the transverse plane to extract pertinent information about the tumor and its surrounding environment.

The cropped images are resized to 224 x 224 for further processing. For the HCC subtype classification, we introduce an expanding-compressing layer that precedes the ResNet-34 extraction module to accommodate multiple input channels. The expanding-compressing layer increases the input's dimensionality before compressing the resulting feature maps to three channels. The extracted features are then fed into an LSTM module to capture spatial relationships across slices, followed by a classifier to obtain a final prediction.

***Results:** A total of 268 patients (mean age, 55 years ± 7 ; 217 men and 51 women) were evaluated. Eighty-eight of the 268 HCCs (32.8%) were proliferative class HCCs (34 macrotrabecular-massive HCCs, 52 CK19-positive HCCs and two sarcomatoid HCC). For deep learning segmentation model in HBP, an average Dice coefficient of 95.6% in liver, an average Dice coefficient of 81.1% in HCC tumor were achieved. For deep learning HCC subtype classification model, an average sensitivity of 81.5%, an average specificity of 67.5%, an average Accuracy of 72.4%, and an average AUC of 79.1% were achieved.

***Conclusions:** This preliminary deep learning study demonstrated feasibility for automatic classifying proliferative and non-proliferative HCC with Gd-EOB-DTPA MRI.

多区域影像组学在直肠癌表征和预后预测中的性能比较

朱影
温州医科大学附属第一医院放射科

目的: 影像组学可以揭示肿瘤的异质性。然而从感兴趣区中提取影像组学特征需要大量人工标注,这在全肿瘤 3D 标注中尤为明显。作为替代权衡, 2D 和矩形框标注可能是基于直肠癌影像组学研究中的首选。本研究通过三个预测任务 pT、pLNM、DFS, 综合比较在直肠癌 T2WI 上不同的人工标注方式 2D、3D、2D 矩形框 (2DBB)、3D 矩形框 (3DBB) 在直肠癌表征中的鉴别能力。

方法：回顾性纳入了 293 例直肠癌根治术后患者，按 7: 3 随机划分为训练集和测试集。分别从 2D、3D、2DBB、3DBB 提取影像组学特征。pT、pLNM 预测任务使用 Lasso-logistic 模型，DFS 预测任务使用 Lasso-Cox 模型。使用性能最好的标注方式放射评分与临床危险因素建立 nomograms 联合模型。

结果：在 pT 预测任务上，2D 和 3DBB 模型表现最好。测试集 2DpT(AUC=0.800)，3DpT(AUC=0.791)，2DBBpT(AUC=0.783)，3DBBpT(AUC=0.806)，NomopT(AUC=0.806)。在 pLNM 预测任务上，2D 和 3DBB 模型表现最好。测试集 2DpLNM(AUC=0.728)，3DpLNM(AUC=0.627)，2DBBpLNM(AUC=0.636)，3DBBpLNM(AUC=0.722)，NomopLNM(AUC=0.773)。在 DFS 预测任务上，3D 表现最好。测试集 2DDFS(AUC=0.788)，3DDFS(AUC=0.811)，2DBBDFS(AUC=0.791)，3DBBDFS(AUC=0.788)，NomoDFS(AUC=0.809)。

结论：研究发现，在这些预测任务中，基于 2D、3D 和矩形框标注方式性能和辨别能力相当，这表明劳动密集型 3D 标注影像分析没有显著改善预测性能。但 3D 方式仍然提供更全面的肿瘤信息，更适合需要提供更全面信息的预后预测任务。2D 方式排除其他因素如肿瘤边界和表观厚度的干扰，只提供肿瘤核心区域特征，更适合需要聚焦分析的诊断任务。此外，影像组学结合临床危险因素构建的 nomograms 使预测性能进一步提升，可以为临床决策提供依据。

人工智能非心电图门控 CT 冠状动脉钙化积分联合深度学习 MR 图像重建心肌延迟强化检出未识别心肌梗死

陆雪芳、闫玉辰、杨文兵、彭宙锋、龚威、查云飞
武汉大学人民医院

目的 本研究旨在探索人工智能(artificial intelligence, AI)非心电图门控 CT 冠状动脉钙化积分(coronary artery calcification score, CACS) (AI-CACS)联合深度学习(deep learning, DL)MR 图像重建心肌延迟强化(late gadolinium enhancement, LGE_{DL})检出未识别心肌梗死的临床价值。

方法 前瞻性纳入 2022 年 3 月-2023 年 8 月因常规体检于武汉大学人民医院行非门控胸部 CT 平扫体检者 (年龄≥45y) 1679 例，自动获取 AI-CACS 的 Agatston 评分，对可疑 UMI 患者行 LGE_{DL} 心脏短轴位扫描。使用阈值技术获得心肌强化面积百分比(P_{area})，评估各测量值的组内及组间一致性。以临床诊断 UMI 为金标准计算 CACS、LGE_{DL} 和原始 LGE(LGE_O)的诊断准确性。

结果 最终纳入评估的可疑 UMI 志愿者 66 人 (男 48 例(72.73%)，年龄 56.17±8.65 岁)。Total-Agaston 对 UMI 诊断的 AUC 值为 0.759 (p<0.001)，对 UMI 诊断的最佳界值为 109.69。LGE_{DL} 和 LGE_O 对 UMI 的诊断准确率为 98.47%，敏感度为 77.11%，特异度为 99.84%。对于 2-10 倍标准差法，心肌 P_{area DL} 均高于 P_{area O} (P 值均<0.001)；对于半峰全宽法，P_{area DL} 略高于 P_{area O}，差异无统计学意义(p=0.12)；不同阈值法 P_{area} 测量值组内及组间一致性好(ICC>0.700，P 均<0.001)。

结论 人工智能非心电图门控 CT 冠状动脉钙化积分联合深度学习 MR 图像重建心肌延迟强化序列可检出体检人群中未识别心肌梗死，AI-CACS 联合 LGE_{DL} 可增加对 UMI 的诊断信心，对 UMI 风险分层及随访建议提供重要参考。

图像引导放疗中基于深度学习和结构保真性的超稀疏 CBCT 重建算法的构建和临床性能评估

吴天雄^{1,2}、钟仁明^{1,2}、柏森^{1,2}、宋莹^{1,2}

1. 四川大学

2. 四川大学华西医院

目的：在图像引导放射治疗（IGRT）中，锥形束 CT(CBCT)为常用的图像验证系统，治疗前 CBCT 扫描可以纠正患者摆位误差，提高治疗精度，但是也会给正常组织带来额外剂量，并且降低临床效率。减少 CBCT 扫描帧数可以有效降低 CBCT 辐射剂量，但是会增加图像噪声、伪影等。本研究引入定位 CT 信息，构建结构保真的 CBCT 先验图像，基于生成对抗网络(GAN)建立超稀疏采样 CBCT 重建模型(USCRM)，利用极少采样数据对头颈部 CBCT 进行高质量快速重建，并评估临床性能。

方法：实验随机选取四川大学华西医院放射物理技术中心 633 例头颈部放射治疗患者的计划 CT，并通过 CT-CBCT 投影模拟生成对应降采样 1/8, 1/16, 1/32 和 1/64 的结构保真的模拟 CBCT，形成 CT-CBCT 结构保真图像对，随机分为训练集（538 例），验证集（48 例）和模型测试集（47 例）。另外随机选取行 IGRT CBCT 扫描的 9 例头颈部患者共 39 例 CBCT_{FDK} 分别采用 1/8, 1/16, 1/32 和 1/64 降采样数据重建出 CBCT_{USCRM} 进行临床测试。将重建结果分别与传统 FDK 算法（FDK），基于代数重建方法(SART)进行对比评估。由两名肿瘤医生对图像进行主观评价。通过峰值信噪比 (PSNR)、结构相似度(SSIM)和下颌骨 Dice 相似性系数(DSC)定量指标进行客观评价。在 Eclipse 计划系统中将 CBCT_{USCRM}、全数据 CBCT_{FDK} 分别与计划 CT 进行刚性配准比较摆位误差。

结果：两名肿瘤医生一致认为重建图像质量达到临床要求。与 CBCT_{FDK} 和 CBCT_{SART} 相比，CBCT_{USCRM} 的 PSNR 和 SSIM 最大分别提升了 25 dB、81%和 15dB、14%；全数据、1/8 和 1/16 CBCT_{USCRM} 的下颌骨 DSC 与全数据 CBCT_{FDK} 没有差异。配准结果显示模型测试和临床测试最大摆位误差分别为 0.30 mm, 0.15°和 1.27 mm, 0.73°。

结论：基于深度学习和结构保真性的低剂量 CBCT 重建算法，能够通过减少 CBCT 扫描帧数的方式，在大幅降低 CBCT 剂量的同时仍能保持高质量图像重建。

基于 MRI 影像组学术前预测胶质母细胞瘤肿瘤浸润性 CD8+ T 细胞表达的研究

薛彩强、周俊林

兰州大学第二医院

目的：探讨术前使用基于 MRI 影像组学模型评估胶质母细胞瘤（GBM）患者肿瘤浸润性 CD8+ T 细胞表达的价值，为预测 GBM 免疫治疗后的预后提供依据。

方法：对 150 例 GBM 患者进行回顾性分析，使用免疫组织化学 (IHC) 染色评估来自患者的肿瘤组织样本中肿瘤浸润性 CD8+ T 细胞表达进行量化，并根据总生存时间将患者划分为 CD8 高表达组和 CD8 低表达组。从 T1C 和 T2 图像序列中为每位患者提取了 1185 个影像组学特征。使用方差阈值、最小冗余最大相关性 (MRMR)、最小绝对值收缩和选择算法 (LASSO) 进行特征选择。采用 XGBoost 作为分类器，建立临床-影像预测模型、影像组学预测模型、联合模型，使用接收者操作特征 (ROC) 分析，以评估分类器的诊断准确性。

结果：联合模型预测性能最好，训练集中 AUC 达到了 0.99，准确度为 0.99，敏感度为 1.00，特异度为 0.97，在验证集 AUC 达到了 0.84，准确度为 0.80，敏感度为 0.90，特异度为 0.60。

结论: 磁共振影像组学在评估 GBM 患者肿瘤浸润性 CD8+ T 细胞表达具有可行性, 有助于术前预测 GBM 患者的预后。

基于深度学习的肿瘤分割和总代谢肿瘤体积预测 对弥漫性大 B 细胞淋巴瘤患者预后的研究

王雪^{1,3}、王玥^{4,5,6}、黄新韵⁷、温宁^{1,2,3}、许彭鹏^{4,5,6}、严福华¹、李彪⁷、赵维莅^{4,5,6}

1. 上海交通大学医学院附属瑞金医院放射科

2. 上海交通大学博渊未来技术学院

3. 上海交通大学医学院附属瑞金医院医学影像先进技术研究院

4. 上海交通大学医学院附属瑞金医院血液科

5. 医学基因组学国家重点实验室

6. 上海血液学研究所

7. 上海交通大学医学院附属瑞金医院核医学科

目的: 利用深度学习方法在全身 18F-FDG PET 扫描中自动分割弥漫大 B 细胞淋巴瘤 (DLBCL) 并验证分割模型的有效性, 利用该分割模型预测肿瘤总代谢体积 (pTMTV) 并验证其在预后中的价值。

方法: 本实验基于 AutoPET 公开数据集中 1014 例 PET/CT 图像 (其中 501 例含有精标注, 513 例为无肿瘤区域的健康对照) 进行模型预训练, 在来自瑞金医院的 160 例精标注 PET/CT 图像中进行 Fine-tune (其中训练集 127 例, 测试集 33 例)。基于 nnUNet 算法利用 PET 序列和 CT 序列建立双通道三维 U-Net 架构训练 DLBCL 病灶分割模型。用 Dice 相似系数 (DSC)、假阳性体积 (FP) 及假阴性体积 (FN) 评估分割模型性能。基于 DLBCL 的分割模型预测总代谢肿瘤体积 (pTMTV), 在 117 例一线治疗为 R-CHOP 的患者中, 用 Bland-Altman 检验及 Pearson 相关性分析与 Siemens syngo.via VB2.0 软件中病灶自动标记程序 Multi-foci Segmentation 测得 TMTV (gtTMTV) 进行校验, 用时间依赖 ROC 曲线求取截断值, 并进行生存及预后的分析。

结果: 基于 AutoPET 训练集进行预训练和瑞金训练集进行 Fine-tune 得到模型, 在测试集的平均 DSC、FP 和 FN 分别为 83.97、1.17 和 2.83。gtTMTV 和 pTMTV 的 Bland-Altman 分析同质性较佳, Pearson 相关性分析呈强相关 ($R^2 = 0.871$, $P < 0.001$), 时间依赖的 ROC 曲线将 pTMTV > 498.958 定义为高组, 且 pTMTV 升高被证明是 PFS 和 OS 的不良预后因素 (PFS: HR = 5.698, $P < 0.001$; OS: HR = 6.843, $P < 0.001$)。

结论: 利用 U-Net 模型可以准确地分割淋巴瘤病变, 并允许在 DLBCL 患者的 PET 扫描上全自动评估 TMTV。此外, pTMTV 是 DLBCL 患者生存的独立预后因素。

Energy Spectrum CT Volume Quantitative Based Radiomics Models Developed With Features of the Whole Liver and Liver Biopsy Area: Assessment of the Severity of Liver Fibrosis

Fukai Li^{1,2,3,4}, Hongyu Zhang^{1,2,3,4}, Yuan Xu^{1,2,3,4}, Yu Guo^{1,2,3,4}, Jianli Liu^{1,2,3,4}

1. Department of Radiology, Lanzhou University Second Hospital

2. Second Clinical School, Lanzhou University

3. Key Laboratory of Medical Imaging of Gansu Province

4. Gansu International Scientific and Technological Cooperation Base of Medical Imaging Artificial Intelligence

Objective: By extracting the quantitative volume features of the whole liver and liver biopsy area (right posterior lobe), a radiomics model based on energy spectral CT was constructed to compare the evaluation efficiency of the two models on the severity of liver fibrosis.

Methods: A retrospective analysis of 164 patients with liver fibrosis confirmed by pathology was performed. According to the Metavir scoring system, the patients were divided into non-advanced liver fibrosis group (F0-F2, n=78) and advanced liver fibrosis group (F3-F4, n=86). According to the ratio of 7 : 3, the patients were randomly divided into training set (n=115) and validation set (n=49). Based on the energy spectral CT images of portal vein whole liver (ROI_w) and liver tissue puncture area (ROI_b), the quantitative parameters of energy spectral CT volume and radiomics features were obtained. Valuable spectral CT parameters were obtained by univariate and binary logistic regression analysis. Radiomics features were screened by univariate analysis, Spearman correlation analysis and LASSO, and spectral radiomics models (ROI_w and ROI_b) were constructed by logistic regression (LR). ROC curve and calibration curve were used to evaluate and compare the diagnostic performance of the two models.

Results: A total of 8 optimal radiomics features were selected. In the training samples, the AUC of ROI_w and ROI_b radiomics models were 0.846, 0.887, the sensitivity were 0.821, 0.815, and the specificity were 0.826, 0.737, respectively. In the testing samples, the AUC of the ROI_w and ROI_b radiomics models were 0.817, 0.844, the sensitivity were 0.816, 0.723, and the specificity were 0.774, 0.852, respectively. There was no significant difference between the two radiomics models (P=0.716, DeLong test). The calibration curves of the two models showed good consistency.

Conclusion: Through the quantitative parameters of energy spectral CT volume in the whole liver and liver biopsy area, combined with radiomics features, the spectral radiomics model constructed has good performance in evaluating the severity of liver fibrosis, and the performance of the two models is comparable.

3. National Engineering Research Center of Personalized Diagnostic and Therapeutic Technology, Xiangya Hospital of Central South University

4. the First Affiliated Hospital of the University of South China

5. the Second Affiliated Hospital of the University of South China

6. Chenzhou No 1 People's Hospital

7. Johns Hopkins Medicine

8. the Warren Alpert Medical School, Brown University

Objectives To construct and evaluate structured report (SR) and deep learning (DL) models for earlier radiation-induced temporal lobe injury (RTLI) detection, and assess radiologists' performance without and with SR or DL assistance.

Materials and Methods MRI of 3842 nasopharyngeal carcinoma patients receiving radiotherapy from January 2010 to June 2021 from 4 hospitals were retrospectively retrieved, and initial MRI with RTLI-findings were selected for the development SR and DL model, respectively. Two experts reviewed these MRIs, and the results were recorded in a SR introducing a temporal lobe field. Then, a DL model based on EfficientNet using contrast-enhanced T1- and T2 weighted MRIs to detect RTLI was developed. Patients from one center was divided into training (n=380 with 234 non-RTLI and 146 RTLI) and validation set (n=96 with 59 non-RTLI and 37 RTLI), and those from other institutions were used as external test set (n=1567 with 1353 non-RTLI and 214 RTLI).

Results In the external test set, the miss rate of initial MRI with RTLI-findings in original reports (OR) was 46.3%, which decreased to 26.6%, 9.8%, and 7.5%, respectively, after the use of three diagnostic approaches (SR-assisted, DL, and DL-assisted radiologists). Compared to OR, the radiologists achieved a higher accuracy (95.5% vs. 93.7%, $P=0.017$) and sensitivity (73.4% vs. 53.7%, $P<0.001$) when using SR. Compared to SR, DL model achieved comparable accuracy (96.3% vs. 95.5%, $P=0.25$) to SR with significantly improved sensitivity (90.2% vs. 73.4%, $P<0.001$). Assisted by DL model, radiologists achieved the highest accuracy (97.8% vs. 96.3%, $P=0.002$) and specificity (98.6% vs. 97.3%, $P=0.006$).

Conclusion A structured report introducing a temporal lobe field and a deep learning model with high diagnostic sensitivity led to improved performance of radiologists in detecting initial radiation-induced temporal lobe injury lesions.

OR-0227

基于动、静脉双期增强 CT 的胰腺囊性病变术前良恶性诊断深度学习模型

邓文祎¹、丛福泽¹、谢飞扬¹、毛丽²、李秀丽²、金征宇¹、薛华丹¹

1. 中国医学科学院北京协和医院 北京协和医学院

2. 深睿医疗人工智能研究院

目的：胰腺囊性病变（pancreatic cystic lesions, PCL）检出率逐年升高，良、恶性病灶间影像特征重叠，手术并发症发生率高达 30%。指南指出，PCL 临床管理的关键点之一在于术前准确识别恶性病灶。因此，我们开发了一种深度学习模型进行 PCLs 的术前无创良恶性诊断，并与医生诊断结果比较。

方法：回顾性分析 2014 年 6 月至 2020 年 1 月在北京协和医院因 PCLs 行薄层增强 CT 扫描的 393 例病灶的影像资料，纳入标准包括：（1）病灶有明确的病理学良恶性诊断；（2）增强 CT 检查在术前一个月内进行；（3）增强 CT 图像质量佳；（4）患者术前未进行治疗。将病灶按检查时间顺序分为训练集（良性=150 例，恶性=102 例）、验证集（良性=39 例，恶性=25 例）及测试集（良性=42 例，恶性=35 例）。由两名影像科医生在不知道病灶病理结果的情况下独立进行门脉期胰腺轮廓及病灶轮廓勾画，由一名高年资影像科医生对勾画的轮廓进行修正，而后通过 deedsBCV 算法将动脉期图像配准到门脉期图像上。模型训练前首先进行数据预处理，将患者动、静脉双期图像重采样到间隔为 0.75mm、0.75mm、1mm，而后将图像随机裁剪为包含感兴趣区的 256×256×256 像素的图片，同时将病灶轮廓和胰腺轮廓分为两个通道，连同动、静脉序列共 4 个通道输入模型。在训练集上构建 resnext50 模型，以胰腺轮廓及病灶轮廓为感兴趣区进行 PCLs 术前良恶性诊断，并在验证集上进行超参数选择，最后在测试集上测试模型对 PCLs 的术前良恶性诊断效能，并与高年资及低年资医生比较。

结果：在测试集上，以 0.412 为截断值，resnext50 模型对 PCLs 诊断的 AUC、准确性、敏感性 & 特异性分别为 0.888、0.831、0.771 和 0.881。高年资医生的准确性、敏感性 & 特异性为 0.857、0.829 和 0.881，低年资医生为 0.727、0.657 和 0.786。

结论：这项研究初步表明，基于动、静脉双期增强 CT 上胰腺及病灶轮廓的 resnext50 模型能够实现优于低年资医生的 PCLs 术前良恶性诊断，帮助恶性患者及早进行干预，避免良性患者过度治疗。

General purpose Large Language model to Professional Large Language Model on Chinese Medical Image Reports: ChatGPT4 vs. Locally Finetuned Large Language Models

Junwen Liu^{1,3}, Zheyu Zhang², Jifeng Xiao³, Zhijia Jin¹, Xuekun Zhang¹, Yuanyuan Ma¹, Fuhua Yan^{1,3}, Ning Wen^{1,2,3}

1. Ruijin Hospital, Shanghai Jiaotong University School of Medicine

2. The Global Institute of Future Technology, Shanghai Jiaotong University, Shanghai, China

3. The SJTU-Ruijin-UIH Institute for Medical Imaging Technology, Ruijin Hospital Shanghai Jiaotong University School of Medicine, Shanghai, China

Background: Medical imaging description and diagnosis recommendation are two consecutive portions while writing an imaging report by professional radiologists. The latter represents not merely a summary, but an intricate medical correspondence and diagnosis derived from radiologists' expertise. Traditional Natural Language Processing (NLP) methods have struggled to yield satisfied performance in disclosing such implicit medical correspondence, due to their limited learning capabilities. The purpose of this work is to disclose such concealed medical

correspondence and generate high quality diagnosis recommendations based on image descriptions.

Method: 3714 abdominal CT are evenly collected in three groups. Each group was split into training, validation, and test datasets at a ratio of 9:1:1. Unlike conventional NLP tasks in text summarization and translation, special characters and numbers were not removed. All commas were replaced by semicolons to avoid grammatical issues with csv (comma separated values) files. Specific suffixes and prefixes were added to each image description to help a LLM learn the beginning and end of descriptions. The data was leveraged to conduct a full network wide fine-tune on a 4 V100-32GB GPU server.

Results: The evaluation, using ROUGE-L F1-scores to analyze relative sequence matches, yielded F1-scores of 0.664, 0.722, and 0.76 for the three test data groups, respectively. Notably, achieving F1-scores in the range of 0.6-0.7 is considered the upper limit of human capability in translation and summarization tasks. A specially designed metric (0-5) crafted by professional radiologists, resulted in scores of 4.31, 4.35, 4.7, surpassing corresponding outputs generated by chatGPT4 by 7.75%, 3.57%, 4.26% respectively.

Conclusion: Our model yields an average performance improvement of 5.19% compared to chatGPT4 in this specific task, which may further boost radiologists' work by providing standardized diagnosis recommendation template based on tens of years' departmental knowledge, and in turn save individual radiologists' time and improve the reports writing efficiency and quality.

基于影像组学和深度学习的肾癌 Leibovich 评分预测模型

李武超^{1,2}、张体江³、王荣品¹

1. 贵州省人民医院

2. 贵州大学

3. 遵义医科大学附属医院

前言：肾透明细胞癌是一种常见的泌尿系统恶性肿瘤，其预后与肿瘤的分期和分级密切相关。Leibovich 评分是一种基于五个与远处转移相关的特征（肿瘤分期、肿瘤大小、区域淋巴结状态、核分级和肿瘤坏死状态）的预后模型，用于评估局限性肾透明细胞癌患者肾切除术后的远期生存率。根据分值的总和，患者可以分为低风险（0-2 分）、中风险（3-5 分）和高风险（6 分及以上）。因此，本研究旨在基于影像组学、深度学习和临床模型探索最佳的肾透明细胞癌 Leibovich 评分的二分类模型。

方法：本研究共纳入贵州省人民医院 169 例，遵义医科大学附属医院 121 例，TCGA 公共数据集 94 例共 384 例局限性肾透明细胞癌患者，根据 Leibovich 评分将其分为低危组（0-2 分）和中高危组（3-11 分）。首先基于训练集从 CT 图像中提取了 293 个影像组学特征和 2048 个深度学习特征，并使用 LASSO 方法进行特征选择。通过多变量逻辑回归分析，将与肿瘤诊断相关的常规影像学特征与影像组学评分和深度学习评分组合构建融合模型。通过绘制 ROC 曲线来评估模型的鉴别能力。结果：结果显示，临床-影像组学模型和临床-深度学习模型在训练集、验证集 1 和验证集 2 上均表现出较高的 AUC 值，分别为 0.845、0.887、0.846 和 0.875、0.866、0.852，明显优于而单纯的临床模型、影像组学模型和深度学习模型。此外，将影像组学评分和深度学习评分相结合，也能得到一个较好的二分类模型，其 AUC 值为 0.875、0.881、0.859。最后，将临床模型、影像组学评分和深度学习评分全部纳入模型构建，得到的 AUC 值为 0.875、0.870、0.848。结果显示影像组学-深度学习模型略优于临床-影像组学-深度学习模型，考虑其不受临床模型主观因素的影响，因此具有更好的稳定性和可重复性。

结论：本研究表明，基于影像组学-深度学习的模型能够有效地预测肾透明细胞癌 Leibovich 评分的危险程度，并提高临床模型的鉴别能力。这些模型有望为肾透明细胞癌患者提供更精准的个体化治疗方案。

基于深度学习的肺腺癌脑转移 EGFR 基因分型预测和 GTV 自动勾画的多尺度、多任务模型

周子淳、仇清涛、尹勇
山东第一医科大学附属肿瘤医院

背景:准确预测表皮生长因子受体(EGFR)突变状态及肿瘤总体积(GTV)自动勾画是计算机辅助肺腺癌脑转移诊断的重要目标。然而,由于 MRI 中图像强度分布不均匀、边界模糊以及脑转移形状多变,这两项任务一直存在困难。现有的解决这些问题的方法主要依赖于单任务算法,忽略了这两个任务之间的相互依赖性。

方法:为了解决这些挑战,我们提出了一种多任务多尺度深度学习模型,能够同时实现 GTV 的自动勾画和 EGFR 突变状态的自动分类。具体而言,我们设计了一个由卷积自注意模块组成的多尺度自注意编码器,提取用于 GTV 分割解码器和 EGFR 基因分型分类器的共享空间和全局信息。然后,我们设计了一个由卷积模块和 Transformer 模块组成的 CNN-Transformer 混合分类器,将编码器所提取的全局信息和局部信息结合起来。在此基础上,利用多任务损失函数来解决任务的相关性和异质性问题,通过引入可学习权重来平衡两个任务的损失函数。

结果:188 例被诊断为肺腺癌脑转移的患者入组,用于训练模型和内部测试。实验结果表明,我们提出的模型取得了优异的性能,超越了单任务学习方法。我们提出的模型实现了平均 GTV 分割概率为 0.89,平均 EGFR 亚型准确率为 0.88。同时纳入了另外两家医院的 38 名肺腺癌脑转移患者作为外部验证数据集,取得了较好的测试结果。

结论:通过引入高效的特征提取模块、CNN-Transformer 混合分类器和多任务损失函数,多任务深度学习网络显著提高了 GTV 分割和 EGFR 基因分型任务的性能,可以同时实现高效的 EGFR 基因分型预测和 GTV 自动勾画。

14. 山西省肿瘤医院放射科

背景:为优化可切除性肺腺癌患者的预后分层,指导术后治疗决策,我们开发并验证了一个自动化

多模态影像-病理整合分析框架, 使用临床常规的胸部 CT 影像, 以及 H&E 染色的病理数字化全切片 (WSI) 图像, 对肺腺癌的肿瘤内异质性和肿瘤微环境进行了全面表征。

方法: 我们回顾性收集了来自四个中心的 1039 名 I-IIIa 期可切除性肺腺癌患者, 构成训练集 (N=303)、测试集 1 (N=197)、测试集 2 (N=228) 和特征测试集 (N=311)。我们从术前 CT 影像中提取 487 个来自肿瘤、瘤周 0-5、5-10、10-15、15-20mm 区域的影像组学特征, 并从手术病理 WSI 中提取 783 个来自肿瘤床、上皮、间质、癌细胞核的多尺度病理组学特征。我们用最佳多模态特征集构建了一个生存支持向量机模型, 称为影像-病理组学评分。我们评估了影像-病理组学评分对术后无病生存期 (DFS) 的预测性能, 并与影像组学评分、病理组学评分进行比较。

结果: 在调整临床病理危险因素后, 影像-病理组学评分提供了独立的预后信息 ($P<0.05$)。与影像组学评分、病理组学评分相比, 影像-病理组学评分对 DFS 的预测性能更好 (一致性指数, 训练集: 0.734、0.692、0.744, 测试集 1: 0.701、0.638、0.719, 测试集 2: 0.689、0.684、0.711)。将影像-病理组学评分与临床模型 (包括 TNM 分期、吸烟状况、血管侵犯) 整合后, 整合模型预测 DFS 的准确性进一步提高 (一致性指数, 训练集: 0.763、0.676, 测试集 1: 0.739、0.676; 测试集 2: 0.711、0.699, $P<0.001$)。在有复发高危风险因素的 IB 期肿瘤和 $>4\text{cm}$ 的 IIA 期肿瘤 (N=238) 中, 影像-病理组学评分与术后辅助化疗的 DFS 获益之间存在交互作用 ($P=0.032$)。影像-病理组学评分与多个预后/治疗相关的生物标志物有关联, 包括病变类型、分化程度、免疫表型和 EGFR 状态等。

结论: 多模态整合框架能有效利用 CT 影像和病理 WSI 的互补信息, 为全面表征肺腺癌提供了经济有效的选择。我们提出的影像-病理组学评分有稳健的预后预测能力, 能为术后治疗决策提供额外信息。

OR-0232

基于影像基因组学探索时空异质性在预测腔面型乳腺癌治疗敏感性中的作用: 一项多中心研究

孙诗昀、顾雅佳、尤超
复旦大学附属肿瘤医院

目的: 为了揭示时空异质性影像组学特征在预测腔面型乳腺癌治疗敏感性中的作用, 并挖掘东西方人群中稳定的预测特征, 探索其可解释性。

方法: 这项研究包括来自中国的发展队列 (FUSCC), 来自西方的验证队列 (DUKE、ISPY-1) 以及同时匹配影像和转录组数据的解释队列 (TCGA)。1) 我们提取了多尺度影像组学特征: 空间异质性特征 (瘤内亚区域、全瘤体、瘤周区域)、时序特征。在特征筛选过程中, 我们使用三种不同方法 (L1-based、RFE、tree-based) 选择最优特征, 并将基于不同机器学习方法中被重复筛选的特征组合成为第四类稳定特征。在模型建立过程中, 我们使用三种不同的分类器 (lasso, SVM, XGBoots) 与特征筛选方法进行交叉组合, 尝试寻找最佳模型。2) 我们在西方队列中进行了同样的特征筛选流程, 旨在寻找不同人群中依然具有稳定预测效能的特征。3) 最后, 我们在 TCGA 队列中使用生信分析解释特征背后的生物学意义。

结果: 在发展队列中, 稳定特征-XGBoots 的组合拥有最佳预测效能, 优于基于单一方法的模型 ($\text{AUC} = 0.82$ vs $0.66\sim0.73$), 结果在外部队列中得到验证 ($\text{AUC} = 0.75$ vs $0.61\sim0.72$)。此外, 我们发现 4 个影像组学特征是东西方人群共有的稳定特征。其中, 中等灌注亚区域中高灰度区域分布的比例、高灌注亚区域中相邻强度值出现的最大概率均与治疗有效呈负相关 ($r=-0.81, -0.75, P<0.05$)。低灌注亚区域和周围区域之间的对比度差异以及增强早期整个肿瘤的区域熵与治疗有效呈正相关 ($r=0.79, 0.83, P<0.05$)。来自亚区域的影像组学特征均富集到了细胞周期相关通路, 来自全瘤体的特征富集到了细胞坏死相关通路。

结论: 基于影像组学的时空异质性特征是在东西方人群中预测腔面型乳腺癌治疗反应的稳定影像生物标志物且与特征筛选方法无关。

OR-0233

基于基线水平不同乳腺影像学方法预测乳腺癌新辅助治疗疗效模型的建立及比较

周雅秋、路红
天津医科大学肿瘤医院

摘要:目的:评估基线水平 MRI、US、MG 三种影像学检查方法联合临床病理特征建立不同模型预测乳腺癌新辅助治疗病理完全缓解的价值。方法:回顾性分析 2016 年 1 月至 2020 年 12 月就诊于天津医科大学肿瘤医院并接受新辅助治疗的乳腺癌患者 397 例,共 411 侧病灶(其中 14 例是双乳癌)。按照检查时间分为训练集(312 侧)和验证集(99 侧)。对所纳入患者的临床资料及新辅助治疗前的乳腺 X 线摄影、超声、磁共振影像特征进行分析,采用 Mann-Whitney U 检验及 χ^2 检验进行单因素分析,再通过多因素 logistic 回归筛选预测因子,并按照不同检查方法分别构建预测模型。采用受试者操作特征曲线(ROC)及曲线下面积(AUC)比较不同模型预测 PCR 的效能;进一步用决策曲线(DCA)和校准曲线评估检查方法模型的净获益及校准能力。结果:临床模型训练集和验证集 AUC 值分别为 0.767、0.787;MRI、US、MG 对应的模型训练集和验证集的 AUC 值分别为 0.810、0.800、0.799 和 0.836、0.834、0.823;三者的联合模型的 AUC 值训练集和验证集分别为 0.842、0.793。在预测不同分子亚型乳腺癌的 PCR 中,US 模型在 luminal 型乳腺癌中的 AUC 值最高;MRI 模型预测三阴性乳腺癌 PCR 的效能明显优于 US 和 MG 模型;MG 模型的预测效能不同分子亚型中均较低,在 luminal 亚型中效能高于 HER2+和三阴性;MG+US+MRI 联合模型在 luminal 亚型中具有最高预测效能。结论:通过联合新辅助治疗前 MRI、US、MG 影像征象和临床特征建立的不同检查方法模型,均较单独临床模型提高了预测新辅助治疗病理完全缓解的效能,MRI 模型效能优于 US 和 MG 模型,MG+US+MRI 联合模型优于单一模型。在探究模型预测不同分子分型乳腺癌 PCR 中,luminal 亚型中,联合模型具有最佳的预测效能,略优于 US 模型;HER2+亚型中,联合模型具有最佳预测效能;三阴亚型中,MRI 模型具有最佳的预测效能。

OR-0234

CEM 量化特征联合形态学对不同分子分型乳腺癌的诊断价值

徐维敏、潘德润、文娟娟、汪思娜、曾辉、马梦伟、陈卫国
南方医科大学南方医院

目的:探讨对比增强乳腺 X 线摄影(contrast enhancement mammography, CEM)量化特征联合形态学对不同分子分型肿块型乳腺癌的诊断价值。
方法:回顾分析 2018 年 1 月-2022 年 12 月术前行 CEM 检查的肿块型原发乳腺癌。所有患者均行头尾(craniocaudal, CC)位(早期, T1)、内外斜(mediolateral oblique, MLO)位(晚期, T2)摄影,随后测量病灶与背景灰度值比值(the lesion to background grey value ratio, LBR)。并根据 LBR 在两个时相的变化量评估病灶动态强化特点。同时分析病灶 CEM 低能图及减影图形态学特征。最后以免疫组织化学结果为金标准,分析量化及形态学特征对不同分子分型乳腺癌的诊断价值。
结果:249 例患者全为女性,其中 Luminal A 型 56 例、Luminal B 型 149 例、HER2 过表达型 18 例及三阴性型 26 例。LBR、低能图肿块边缘、减影图肿块样强化边缘及肿块样强化内部特征在不同分子分型之间的差异具有统计学意义($P<0.05$)。LBR 在 Luminal A 型(LBR=0.9616)最低,而在 Luminal B 型(LBR=1.2971)最高。Luminal A 型及 Luminal B 型低能图肿块边缘多为毛刺(75.0% vs. 53.3%),而 HER2 过表达型及三阴性型肿块边缘多模糊(77.8% vs. 76.9%)。不同分子分型肿块样强化边缘均多为模糊。Luminal A 型肿块样强化内部多均匀,而其他类型均多不均匀。联合 LBR、低能图肿块边缘、肿块样强化边缘、肿块样强化内部特征诊断不同分子分型乳腺癌的 AUC 约 0.732,灵敏度、特异度及准确度分别为 71.6%、70.9%、72.5%。

结论: 综合 CEM (低能图+减影图) 形态学及 LBR 可一定程度鉴别不同分子分型肿块型乳腺癌。

OR-0235

Quantitative Apparent Diffusion Coefficient Metrics for MRI-only Suspicious Breast Lesions: Any Added Clinical Value?

Xue Li,Hong Wang, Jiayin Gao,Lei Jiang,Min Chen
Beijing Hospital

Background: Suspicious breast lesions (Breast Imaging Reporting and Data System, BI-RADS 4 or 5) detected only by magnetic resonance imaging (MRI) and invisible on other initial imaging modalities (MRI-only lesions) are usually small and poorly characterized in previous literature, thus making diagnosis and management difficult. This study aimed to investigate the clinical significance of quantitative apparent diffusion coefficient (ADC) metrics derived from conventional diffusion-weighted imaging (DWI) on evaluating MRI-only lesions.

Methods: A total of 90 suspicious MRI-only lesions were evaluated, including 51 malignant and 39 benign lesions. Morphological and kinetic characteristics of all lesions (termed BI-RADS parameters) were described according to the BI-RADS lexicon on dynamic contrast enhancing imaging. Minimum, maximum, and mean ADC values (ADCmin, ADCmax, ADCmean) were obtained by measuring the ADC map of DWI. ADC heterogeneity was then obtained by the following formula: $ADC_{heterogeneity} = (ADC_{max} - ADC_{min}) / ADC_{mean}$. Diagnostic performance of these parameters was assessed and compared using the receiver operating characteristic curve (ROC).

Results: Of the 90 MRI-only lesions, there were 45 masses and 45 non-mass lesions. Among BI-RADS parameters, only the two different kinetic patterns were significantly different between benign and malignant group ($P = 0.005$ and $P < 0.001$, respectively). The area under ROC (AUC) of combined significant ADC parameters (ADCmin, ADCmean, and ADCmax, all $P \leq 0.001$) was significantly higher than that of the two different kinetic patterns ($P = 0.006$ for both). For MRI-only masses, only ADCmean and ADCmax, among all BI-RADS and ADC parameters, had diagnostic value (combined AUC = 0.833). For non-mass lesions, size, distribution, ADCmin, and ADCmean were significantly different between benign and malignant group ($P = 0.004$, $P < 0.001$, $P = 0.001$, and $P < 0.001$, respectively). In addition, ADCmean had the highest diagnostic performance among all ADC parameters, regardless of mass or non-mass (AUC = 0.825 and 0.812, respectively). ADCheterogeneity showed no significant differences, no matter in mass or non-mass group ($P = 0.62$ and 0.43, respectively).

Conclusions: In differentiating MRI-only suspicious lesions, quantitative ADC metrics generally performed better than BI-RADS parameters, and ADCmean is still the best ADC parameter to distinguish MRI-only lesions.

OR-0236

Artificial intelligence model for diagnosis of breast lesions in contrast enhanced mammography: a multicenter study

Haicheng Zhang,Ning Mao,Haizhu Xie
Yantai Yuhuangding Hospital

Objective: Early diagnosis of breast cancer prior to metastasis allows for increased efficacy in treatment and consequently leads to notable enhancements in survival rates. Early diagnosis of in situ and invasive carcinoma can develop different surgical and treatment plans for patients. We

aimed to establish an artificial intelligence (AI)-based method for preoperative diagnosis of breast lesions from contrast enhanced mammography (CEM) as well as to explore its biological mechanism.

Method: This retrospective study includes 1297 eligible patients who underwent CEM examination and histologically confirmed breast lesions at Yantai Yuhuangding Hospital from June 2017 to June 2020, divided into construction set ($n=1101$), internal test set ($n=196$). Four central datasets from Fudan University Cancer Center from May 2018 to May 2019, Guangdong Maternal and Child Health Hospital from April 2021 to June 2021, Beijing Cancer Hospital from May 2018 to July 2019, and Guilin Municipal Hospital of Traditional Chinese Medicine from July 2021 to July 2022) were used as pooled external test set ($n=133$). The primary lesions of low-energy and recombined images on cranial-caudal view were delineated by radiologists. The AI model adopted RefineNet as a backbone network, and an attention sub-network, named convolutional block attention module (CBAM), was built upon the backbone for adaptive feature refinement. An XGBoost classifier was used to integrate the refined deep learning features with clinical characteristics to perform diagnosis of benign and malignant of breast lesions. We further retrained the AI model to distinguish in situ and invasive carcinoma among breast cancer candidates. RNA-sequencing data from 12 patients were used to explore the underlying biological basis of the AI prediction. The model's performance was evaluated by the receiver operating characteristic (ROC) curve and was compared with other deep learning (DL) models, traditional radiomics models, and radiologists (R1 and R2).

Results: The mean age was 51.54 ± 11.61 years (range, 17–85 years old) in the construction set, 52.62 ± 11.36 years (range, 17–80 years old) in the internal test set, and 51.23 ± 10.42 years (range, 23–83 years old) in the pooled external test set. In the internal test set, the AI model combining refined deep learning features and clinical characteristics (age, lesion diameter) achieved an AUC of 0.928 (95% CI: 0.891–0.965), higher than those of the RefineNet+CBAM model (AUC: 0.897, 95% CI: 0.848–0.946, $P = .15$), RefineNet model (AUC: 0.857, 95% CI: 0.798–0.917, $P = .02$), ResNet+CBAM model (AUC: 0.880, 95% CI: 0.827–0.934, $P = .04$), ResNet model (AUC: 0.833, 95% CI: 0.771–0.900, $P = .001$), and the best performing radiomics model (logistic regression AUC: 0.783, $P < 0.001$). In the pooled external test set, the AI model achieved an AUC of 0.932 better than the best performing DL model (RefineNet+CBAM AUC: 0.893, $P = 0.04$) and the best performing radiomics model (logistic regression AUC: 0.674, $P = 0.003$). In the internal test set and the pooled external test set, the AI model achieved the best performance with an accuracy of 0.872 and 0.857, sensitivity of 0.857 and 0.903, PPV of 0.978 and 0.912, NPV of 0.639 and 0.677. The accuracy, specificity, specificity, PPV, and NPV of R1 increased by 0.067, 0.048, 0.134, 0.04, and 0.148 in the pooled external test set, respectively. Meanwhile, the accuracy, sensitivity, specificity, PPV, and NPV of R2 increased from 0.842 to 0.902, 0.893 to 0.942, 0.667 to 0.767, 0.902 to 0.933, and 0.646 to 0.793 in the pooled external test set, respectively. For differentiation between in situ and invasive carcinoma, our AI model showed AUCs of 0.824 and 0.788 in the internal test set and pooled external test set; an accuracy of 78.4% and 75.7%; a sensitivity of 83.3% and 70.0%; and a specificity of 78.2% and 76.3%. In addition, we tested the performance of the AI model on the different lesion diameter subgroups in the test sets, and showed that the AUCs of the AI model were 0.811, 0.886, and 0.943 for lesion diameters of ≤ 1 cm, 1–2 cm, and ≥ 2 cm subgroups in the internal test set and 1.000, 0.920 and 0.938 in the pooled external test set. Further the biological basis exploration revealed that the significant differences between the low- and high- risk group, and discovered the differentially expressed genes related to breast cancer, such as FHL1, GPM6B, RELN, and CXCL10. KEGG analysis inferred that several pathways such as ECM–receptor interaction, focal adhesion, and human papillomavirus infection were significantly upregulated in high-risk patients. From the enriched pathways based on the GO analysis, we found that these pathways were mainly enriched in extracellular matrix organization and structure organization.

Conclusion: The AI model we proposed that integrated refined deep learning features and clinical characteristics can efficiently and non-invasively identify benign and malignant breast lesions from CEM, surpassing traditional radiomics models, clinical models, and radiologists. Moreover, the biological mechanism of AI model is explained. In addition, the AI model can also distinguish in situ carcinoma from invasive carcinoma.

Can An Artificial Intelligence System Help Radiologists Improve the Assessment Accuracy of Initial BI-RADS 3 and 4A cases in mammograms?

Xiaohui Lin¹, Rushan Ouyang², Lin Li¹, Tingting Liao¹, Yuting Yang¹, Jie Ma¹

1. shenzhen people's hospital

2. The Eighth Affiliated Hospital, Sun Yat-sen University

Purpose: To investigate whether a deep learning-based artificial intelligence (AI) system can assist radiologists to improve the assessment accuracy of initial BI-RADS (Breast imaging reporting and data system) 3 and 4A cases in mammograms.

Methods and Materials: We trained deep neural networks to detect lesions and predict the malignancy of the potential lesions on a large-scale mammogram data set. A total of 824 new patients (846 breasts) with BI-RADS 3 or 4A were included in this study. All these lesions had biopsy results and at least 2 years of follow-up, which were used as reference standard. The mammograms of MLO and CC views went through the AI system and the malignancy of the lesions were predicted. The higher risk score of the two views was selected to predict the malignancy of the lesion for the AI system. Six radiologists (Three junior radiologists <5y of experience, Three senior radiologists >5y of experience) split and retrospectively re-assessed the same cases without and with the assistance of the AI, respectively.

Results: The AUC of AI system (0.66) was higher than that of 3 junior radiologists (0.52, 0.40, 0.45) and lower than that of 3 senior radiologists (0.70, 0.73, 0.68). The AUC of all radiologists combined with AI model for category 3 and 4A lesions of BI-RADS was improved compared with radiologists diagnosis alone. The AUC of junior radiologists combined with AI system was significantly improved compared with that of diagnosis alone (AUC was increased to 0.74, 0.77, 0.77 respectively, Z value was 2.61, 3.42, 3.01, P values were all < 0.001), and the AUC of senior radiologists combined with AI system was not statistically significant compared with that of diagnosis alone (AUC was increased to 0.79, 0.78, 0.78, Z value was 0.23, 0.20, 0.41, P values were all > 0.05).

Conclusions: The deep learning-based AI system surpassed junior radiologists and significantly improved the performance of junior radiologists in the assessment of BI-RADS 3 and 4A lesions by reducing missed diagnosis and unnecessary biopsy.

Association between cumulative low-density lipoprotein cholesterol and brain white matter health: The META-KLS Study

Jing Sun¹, Ying Hui¹, Min Gao², Mingze Xu³, Qian Chen¹, Ning Wu⁴, Jing Li¹, Pengfei Zhao¹, Shuohua Chen⁵, Shouling Wu⁵, Zhenchang Wang¹, Han Lv¹

1. Beijing Friendship Hospital, Capital Medical University

2. Department of Radiology, JingXing County Hospital

3. Center for MRI Research, Academy for Advanced Interdisciplinary Studies, Peking University, China; College of Information Technology, Nanchang Vocational University

4. Department of Medical Imaging Technology, Yanjing Medical College, Capital Medical University

5. Department of Cardiology, Kailuan General Hospital

Background and Purpose: Limited information existed regarding the relationship between long-term exposure to low-density lipoprotein cholesterol (LDL-C) and brain white matter health. This study aimed to investigate the associations of cumulative LDL-C exposure with white matter microstructural integrity and white matter hyperintensity (WMH) burden.

Materials and Methods: This study included 1,114 community-dwelling participants aged 25-83 years based on KaiLuan Study. LDL-C level was assessed in interviews biennially from 2006 to 2018. Brain MRI were performed from December 2020 onward. We used generalized linear model to investigate the multivariate-adjusted associations of cumulative time-weighted average (TWA) LDL-C with global metrics of white matter microstructural integrity and WMH load.

Results: After full adjustments, per-SD rise in cumulative TWA LDL-C (in z-score, moderate high vs. low) was associated with increased fractional anisotropy (FA) ($\beta = 0.25$, 95% CI 0.10 to 0.40), decreased mean diffusivity (MD) ($\beta = -0.24$, 95% CI -0.37 to -0.10), axial diffusivity (AD) ($\beta = -0.18$, 95% CI -0.33 to -0.04), and radial diffusivity (RD) ($\beta = -0.24$, 95% CI -0.38 to -0.10). For age-specific analysis, these associations existed only for individuals in young adulthood and midlife. Disrupted white matter microstructural integrity were more susceptible to increased cumulative LDL-C in male participants. Besides, a higher burden of WMH was observed with high exposure for cumulative LDL-C for young adults only ($\beta = 0.16$, 95% CI 0.04 to 0.28).

Conclusion: Elevated cumulative LDL-C was associated with higher global FA and lower MD, AD, and RD, as well as higher burden of WMH. Our findings suggested that lipid lowering in youth and middle age may help maintain white matter microstructural integrity and reduce WMH burden.

Transcriptional substrates underlying functional connectivity profiles of subregions within the human sensorimotor cortex

Yuhao Shen^{1,2,3}, Cun Zhang^{1,2,3}, Jiajia Zhu^{1,2,3}, Yongqiang Yu^{1,2,3}

1. The First Affiliated Hospital of Anhui Medical University

2. Research Center of Clinical Medical Imaging, Anhui Province, Hefei 230032, China

3. Anhui Provincial Institute of Translational Medicine, Hefei 230032, China

Background: The human sensorimotor cortex has multiple subregions showing functional commonalities and differences, likely attributable to their connectivity profiles. However, the molecular substrates underlying such connectivity profiles are unclear.

Methods: Here, transcriptome-neuroimaging spatial correlation analyses were performed between transcriptomic data from the Allen Human Brain Atlas and resting-state functional connectivity (rsFC) of 24 fine-grained sensorimotor subregions from 793 healthy subjects.

Results: Results showed that rsFC of six sensorimotor subregions were associated with expression measures of six gene sets that were specifically expressed in brain tissue. These sensorimotor subregions could be classified into the polygenic- and oligogenic-modulated subregions, whose rsFC were related to gene sets diverging on their numbers (hundreds vs. dozens) and functional characteristics. First, the former were specifically expressed in multiple types of neurons and immune cells, yet the latter were not specifically expressed in any cortical cell types. Second, the former were preferentially expressed during the middle and late stages of cortical development, while the latter showed no preferential expression during any stages. Third, the former were prone to be enriched for general biological functions and pathways, but the latter for specialized biological functions and pathways. Fourth, the former were enriched for neuropsychiatric disorders, whereas this enrichment was absent for the latter. Finally, although the identified genes were commonly associated with sensorimotor behavioral processes, the polygenic-modulated subregions associated genes were additionally related to vision and dementia.

Conclusion: These findings may advance our understanding of the functional homogeneity and heterogeneity of the human sensorimotor cortex from the perspective of underlying genetic architecture.

运动成瘾的神经机制：基于多模态磁共振成像的脑影像学研究

张菲菲、张辉
山西医科大学第一医院

目的：虽然规律的体育运动有益于身心健康，但过度的不可控制的体育锻炼对一个人的身心健康是有害的，并且可能产生运动成瘾行为。越来越多的证据表明，成瘾本质上是动机问题，同时压力、焦虑、抑郁等负性情绪也是运动成瘾发生和发展的潜在危险因素。然而，人们对运动成瘾的神经基础以及动机、负性情绪等影响运动成瘾的潜在神经心理学机制知之甚少。

材料和方法：本研究在 88 名具有运动成瘾症状的被试，采用基于体素的形态学方法分析结构 MRI 和功能 MRI，通过计算被试的大脑灰质体积和功能活动来研究运动成瘾的潜在神经机制，以及灰质结构、功能和运动成瘾三者之间的关系；为了探索运动成瘾的神经心理学机制，我们采用中介分析方法研究社会心理因素、脑影像以及运动成瘾之间的关系，探索三者之间的作用机制。以上所有分析均采用多重比较校正后具有显著统计学差异的结果。

结果：在结构 MRI 和功能 MRI 研究中我们发现，运动成瘾与右侧眶额回、左侧前扣带回、左侧辅助运动区的灰质体积呈显著负相关，其中右侧眶额回的灰质体积在能力动机、负性情绪和运动成瘾的关系间起中介作用。并且中介分析还发现左侧辅助运动区的功能通过影响其结构来影响运动成瘾。基于种子点的功能连接分析发现，运动成瘾与额顶叶功能连接呈显著负相关，并且左侧前扣带回-右侧缘上回的功能连接在左侧前扣带回的灰质体积和运动成瘾的关系中起中介作用。以上结果在性别、年龄、体重指数、家庭社会经济情况、一般智力、大五人格和全脑体积（或头动参数）作为协变量进行回归后仍然显著，这表明研究结果具有特异性。

结论：上述的研究结果表明，负性情绪、锻炼动机是运动成瘾的潜在危险因素，MRI 研究提示，眶额回、前扣带回、岛叶、纹状体等奖赏系统相关脑区的结构和功能的改变与运动成瘾显著相关。总之，本研究为运动成瘾的潜在神经心理机制提供了证据，揭示了运动成瘾可能存在奖赏相关的执行控制功能减低。

Cerebral hemodynamic and metabolic abnormalities in neonatal hypocalcemia: findings from advanced MRI

Ying Qi

Department of Radiology, Shengjing Hospital of China Medical University

Background and Purpose: NHC is the most common metabolic disorder, and whether asymptomatic disease should be treated with calcium supplements remains controversial. We aimed to quantify their global CBF and CMRO2 using physiological MRI and elucidate the pathophysiologic vulnerabilities of NHC.

Materials and Methods: A total of 37 consecutive NHC patients were enrolled. They were further divided into subgroups with and without structural MRI abnormalities, denoted as NHC-a (n=24) and NHC-n (n=13). Nineteen healthy neonates were enrolled as a control group. Brain physiological parameters determined using PC MRI, TRUST MRI, and brain volume, were compared between NHC (their subgroups) and controls. Predictors for NHC-related brain injuries were identified using multivariate logistic regression analysis and expressed as OR with 95% CI.

Results: NHC showed significantly lower CBF and CMRO2 compared with controls. Furthermore, the NHC-a (vs. controls or NHC-n) had significantly lower CBF and CMRO2. There was no significant difference in CBF and CMRO2 between NHC-n subset and controls. CBF and CMRO2 were independently associated with NHC. The ORs were 0.80 (95% CI, 0.65–0.99) and 0.97 (95% CI, 0.89–1.05) for CBF and CMRO2, respectively.

Conclusion: NHC with structural damage may exhibit lower hemodynamics and cerebral metabolism. CBF may be useful in assessing the need for calcium supplementation in asymptomatic NHC to prevent brain injury.

**早发型与晚发型阿尔茨海默病一体化
18F-AV-1451 PET/MR 研究**

许欣茹、陈玖、张鑫、张冰

南京大学医学院附属鼓楼医院

目的: 本研究比较早发型和晚发型阿尔茨海默病人群中一体化 tau PET/MR 成像中 tau 蛋白沉积和灰质萎缩的影像学表现, 寻找早发型阿尔茨海默病诊断的潜在影像学生物标志物。

方法: 回顾性分析在中国人民解放军北部战区总医院接受 PET/MR 检查的 AD 患者, 根据发病年龄分成早发型 AD (发病年龄在 60 岁以下) 和晚发型 AD 组 (发病年龄在 60 岁以上), 同时收集患者的临床资料, 所有受试者均为 A β PET 阳性, 对 EOAD 和 LOAD 组进行基于感兴趣区和基于体素的分析, 相关性分析用于评估患者的发病年龄与感兴趣区的 tau PET SUVR 值和灰质体积值的相关性。

结果: 34 名受试者被纳入, 其中 EOAD 13 人, LOAD 21 人。性别 (P=0.078) 和受教育程度 (P=0.591) 没有显著的组间差异。EOAD 组的 MoCA 评分显著减低, 基于 ROI 的分析显示, 较 LOAD 组相比, EOAD 组灰质体积在双侧顶叶显著减低, 双侧颞叶、额叶轻度减低。基于体素的形态学分析显示, EOAD 较 LOAD 相比, 在顶上小叶、楔前叶的灰质萎缩更为明显, 在后扣带回、楔前叶、外侧颞叶、丘脑的 tau 沉积更为明显, 且发病年龄与脑内 18F-AV-1451 放射性摄取存在显著的负相关。

结论: 多模态 PET/MR 显示, EOAD 较 LOAD 的灰质萎缩和 tau 蛋白负荷更严重, PET/MR 神经影像有助于探究 EOAD 的病理特征。

复发缓解型多发性硬化不同类型病灶中 氧摄取分数的变化:一项横断面和纵向研究

谢彦、张妍、朱文珍

华中科技大学同济医学院附属同济医院

目的: 通过氧摄取分数(OEF)比较复发缓解型多发性硬化(RRMS)患者不同类型病灶的氧代谢水平, 并且纵向分析各病灶亚型 OEF 和磁化率随时间的变化规律。另外, 探索病灶平均 OEF 与临床残疾之间的关联。

方法: 本研究共纳入 46 例 RRMS 患者和 41 名健康对照。OEF 图和定量磁化率图 (QSM) 由 3D 多回波梯度回波序列重建获得。根据增强 T1WI, 白质病灶被分为强化病灶 (CEL) 和非强化病灶。根据 QSM, 非强化病灶被分为顺磁性边缘病灶 (PRL)、高信号病灶和非高信号病灶。采用 Kruskal-Wallis 检验比较不同类型病灶的 OEF 和磁化率的差异 Wilcoxon 符号秩检验被用于纵向比较各病变亚型的 OEF 和磁化率的改变。采用 Spearman 相关评估病灶平均 OEF 与 MS 患者扩展残疾状况量表 (EDSS) 的关联。

结果: PRL 具有最高的磁化率, 其次为高信号病灶。CEL 和非高信号病灶的磁化率与 MS 患者看似正常的白质和健康对照的白质相似。PRL 的 OEF 低于其他类型病灶; 高信号病灶的 OEF 低于非高信号病灶。纵向分析显示, 随着时间的推移, PRL 的磁化率增加($P=0.001$), OEF 降低($P<0.001$); 非高信号病灶的磁化率和 OEF 无明显变化($P=0.837$, $P=0.122$)。然而, 高信号病灶可随着时间的推移转换为 PRL 和非高信号病灶。转换为 PRL 的高信号病灶体积增大($P=0.011$), OEF 降低($P=0.028$); 转换为非高信号病灶的高信号病灶体积减小($P=0.006$), OEF 升高($P=0.013$), 磁化率降低($P=0.016$)。另外, 相关分析显示病变平均 OEF 与 EDSS 评分呈显著负相关($\text{Rho}=-0.546$, $P<0.001$)。

结论: 本研究揭示了不同类型 MS 病灶在组织损伤和氧代谢方面的差异。此外, OEF 可能是评估 MS 患者临床残疾程度的潜在影像学生物标志物。这有助于我们进一步了解 MS 病灶演变的病理机制。

OR-0244

Interpretable and Intuitive Machine Learning Approaches for Predicting Disability Progression in Relapsing- Remitting Multiple Sclerosis Based on Clinical and Grey Matter Atrophy Indicators

Zichun Yan, Zhuowei Shi, Qiyuan Zhu, Bing Lin, Yongmei Li
the Chongqing Medical University

Objective To investigate whether clinical and grey matter (GM) atrophy indicators can predict disability in relapsing-remitting multiple sclerosis (RRMS) and to enhance the interpretability and intuitiveness of a predictive machine learning model.

Methods One hundred forty-five and 50 RRMS patients with structural MRI and at least 1-year follow-up Expanded Disability Status Scale (EDSS) results were retrospectively enrolled and placed in the discovery and external test cohorts, respectively. Six clinical and radiomics feature-based machine learning classifiers were trained and tested to predict disability progression in the discovery cohort and validated in the external test set. Partial dependence plot (PDP) analysis and a Shiny web application were conducted.

Results In the discovery cohort, 98 patients had disability stability, and 47 patients were classified as having disability progression. In the external test set, 35 patients had disability stability, and 15 patients had disability progression. Models trained with both clinical and radiomics features (area under the curve (AUC), 0.725-0.950) outperformed those trained with clinical (AUC, 0.600-0.740) or radiomics features only (AUC, 0.615-0.945). Among clinical + radiomics feature models, the logistic regression (LR) classifier-based model performed best, with an AUC of 0.950. The radiomics feature-only models showed fair performance, with AUCs ranging from 0.617 to 0.753 in the external test set. PDP analysis showed that female patients and those with lower volume, surface area, and symbol digit modalities test (SDMT) scores; greater mean curvature and age; and no disease modifying therapy (DMT) had increased probabilities of disease progression. Finally, a Shiny web application (<https://lauralin1104.shinyapps.io/LRshiny/>) was developed to calculate the risk of disability progression.

Conclusions Interpretable and intuitive machine learning approaches based on clinical and GM atrophy indicators can help physicians predict disability progression in RRMS patients for clinical decision-making and patient management.

基于核磁共振成像的影像组学用于评估成人和青少年弥漫性中线胶质瘤，伴 H3 K27 改变患者的预后

涂佳琪¹、朱凤平²、胡斌¹、刘建鹏¹、熊佑³、李郁欣¹

1. 复旦大学附属华山医院放射科

2. 复旦大学附属华山医院神经外科

3. 复旦大学附属华山医院病理科

目的：评估基于核磁共振成像的影像组学模型预测成人和青少年弥漫性中线胶质瘤，伴 H3 K27 改变患者总生存期的能力。

材料与方法：回顾性分析 2016 年 8 月至 2020 年 11 月期间在我院诊断为的 89 例弥漫性中线胶质瘤，伴 H3 K27 改变的患者，并按 7:3 的比例随机分为训练集和测试集。在构建预测模型前，从 T1 增强和 T2FLAIR 图像中提取肿瘤内和瘤周水肿区域的影像组学特征并进行筛选。通过单变量 Cox 回归分析筛选出与总生存期相关的临床特征，包括人口统计学信息、MRI 传统特征、治疗策略和病理结果。临床模型、放射组学模型和混合模型是通过多变量 Cox 回归分析和 10 倍交叉验证建立的，风险评分分别在训练集中计算，然后在测试集中验证。最终比较各模型间的随时间变化的平均 AUC 值和 C 指数，并对模型进行比较。此外，还利用 Kaplan-Meier 曲线对患者的总生存期进行分层。

结果：纳入的患者年龄在 12 至 70 岁之间，中位总生存期为 387 天，范围从 22 天到 1621 天不等。在构建放射组学模型时，共使用了来自 T1 增强的五个影像组学特征和来自 T2 FLAIR 的四个影像组学特征。对于临床特征，只有年龄、脑室下区是否受累和术后治疗方式等三个临床因素与 OS 相关。在测试集中，组合模型的 C 指数 (0.696) 和随时间变化的平均 AUC 值 (ad-AUC, 0.719) 最高。放射组学模型 (ad-AUC 差值为 0.081, $p < 0.001$) 和组合模型 (ad-AUC 差值为 0.105, $p = 0.002$) 在预测 OS 方面均优于临床模型。放射组学模型 ($p = 0.024$) 和组合模型 ($p = 0.011$) 能够对患者进行分层，识别高风险患者群体。

结论：基于磁共振成像的放射组学模型可以有效预测弥漫性中线胶质瘤，伴 H3 K27 改变的成人患者和青少年患者的总生存率，并能为临床因素提供额外的预测价值。

化学交换饱和转移频率重要性分析预测弥漫性胶质瘤 H3K27M 突变状态的价值

赵本琦¹、郑卓肇¹、陈一兵²、宋小磊³

1. 清华大学附属北京清华长庚医院

2. 西北农林科技大学

3. 清华大学

目的 探讨化学交换饱和转移(CEST)频率重要性分析和传统酰胺质子转移成像(APTw)分析预测弥漫性胶质瘤 H3K27M 突变状态的价值。

方法 回顾性分析 28 例经病理确诊的弥漫性胶质瘤患者的临床与 MRI 资料。所有患者均行头颅磁共振 CEST 扫描。根据组蛋白 H3 突变状态分为 H3K27M 突变组和 H3K27M 野生组两组。采用 CEST 频率重要性分析方法获得区分肿瘤与正常脑组织间的 3.5ppm 处酰胺质子和-3.5ppm 处脂肪族质子频率重要性值。将肿瘤与正常脑组织 APTw 值相减后分别得到 Δ APT_w 的 10th 分位数、90th 分位数和平均值。采用 Mann-Whitney U 检验统计分析两组间 CEST 各参数差异。采用受试者操作特征(ROC)曲线评估各个参数的预测能力。

结果 28 例脑胶质瘤患者中, 突变组 7 例, 男 5 例、女 2 例, 年龄(28.1±10.9)岁; 野生组 21 例, 男 13 例、女 8 例, 年龄(53.0±14.5)岁, 年龄具有统计学差异($P<0.001$)。传统 Δ APT_w 的 10th 分位数、平均值、酰胺质子和脂肪族质子频率重要性值在两组间均具有统计学差异($P<0.05$)。弥漫性胶质瘤伴有 H3K27M 突变组的酰胺质子频率重要性值显著高于野生组(1.47±0.19 vs 0.55±0.40, $P<0.001$)。酰胺质子频率重要性值预测弥漫性胶质瘤 H3K27M 突变的 ROC 曲线下面积最大, AUC 为 1.00($p<0.001$)。酰胺质子频率重要性阈值为 1.30 时预测弥漫性胶质瘤 H3K27M 突变的灵敏度为 1.00, 特异度为 1.00。

结论 基于 CEST 的酰胺质子频率重要性值能有效预测弥漫性胶质瘤 H3K27M 的突变状态。

基于功率谱斜率分析方法对酒精使用障碍患者体素水平的全脑静息态 fMRI 研究

阮霞、陈军

武汉大学人民医院放射科

目的 早期的神经影像学研究表明, 酒精使用障碍 (AUD) 患者的大脑异常活动与频率有关。然而, 目前尚缺乏直接捕捉多频段振幅的综合方法。本研究采用了一种新的度量指标-功率谱斜率 (PSS), 来探讨 AUD 患者全脑体素水平上的改变。

方法 本研究中共纳入 33 名 AUD 患者和 29 名年龄、性别、受教育年限、利手等相匹配的健康对照组 (HC 组)。两组均接受颅脑 3.0T MRI 检查, 获得常规像、静息态功能像和高分辨率 T1WI 结构像数据。使用 REST 软件对图像进行预处理, 预处理后的图像通过快速傅里叶变换产生每个体素时间序列的功率谱。在拟合之前, 将每个体素信号的功率除以所选频率范围(从 0.01 Hz 到 0.25 Hz)的平均幅度, 以标准化功率范围。计算并比较两组患者功率谱斜率的线性系数和幂律系数。使用受试者工作特征 (ROC) 曲线来检验 PSS 分析区分 AUD 和 HC 的能力。Spearman 相关性分析用于评估网络节点变化与临床参数密歇根酒精筛查量表 (MAST) 和酒精成瘾量表 (ADS) 的相关性。

结果 AUD 组和 HC 组的大部分大脑皮层都显示出负 PSS 值, 尤其是在视觉区域, 其斜率也比全脑平均值更陡峭, 而白质是发现 PSS 正值最多的区域。AUD 患者左侧中央前回的 PSS 两个指标均比对照组高。特定脑区的 PSS 差异显示出良好的曲线下面积 (AUC) (0.836-0.844), 以及良好的

敏感性 (83.3%-86.7%) 和特异性 (73.1%-76.9%)。MAST 或 ADS 评分与特定脑区的 PSS 值无明显相关性。

结论 作为一种新的分析方法, PSS 能在体素水平上很好地检测出 AUD 患者大脑中的局部异常活动, 可能成为未来 fMRI 研究中一种新的补充方法。

OR-0248

基于海马 MRI 和 PET 纹理分析的阿尔茨海默病早期诊断研究

陈志庚、毕晟、崔碧霄、杨宏伟、齐志刚、闫少珍、卢洁
首都医科大学宣武医院

目的: 海马萎缩和葡萄糖代谢减低是诊断阿尔茨海默病 (Alzheimer's disease, AD) 的重要影像标志物。纹理分析是基于机器学习的图像分析方法, 通过图像各像素信号及分布等信息, 获取肉眼无法识别的局部纹理改变。然而, 海马多模态纹理特征对 AD 早期诊断的效能仍不清楚。本研究旨在探讨基于 3D T1WI 和 ^{18}F -FDG PET 的海马纹理特征对 AD 和遗忘型轻度认知障碍 (amnesic mild cognitive impairment, aMCI) 的诊断价值。

材料和方法: 本研究纳入 55 例 AD 患者, 60 例 aMCI 患者和 55 例健康对照 (health control, HC)。受试者经一体化 PET/MR 扫描得到 3D T1WI 和 ^{18}F -FDG PET 图像。以海马为感兴趣区提取 3D T1WI 和 ^{18}F -FDG PET 纹理特征, 包括原始特征及高阶特征, 即 LoG (Laplacian of Gaussian)、局部二值模式及小波特征。采用方差选择法、相关系数法和多因素回归分析筛选特征, 以五折交叉验证逻辑回归算法建立 3D T1WI、 ^{18}F -FDG PET 和组合模型并评估效能。通过 SHAP (shapley additive explanation) 分析特征的分类贡献度。

结果: AD 和 HC、aMCI 和 HC 分类中, ^{18}F -FDG PET 模型 (AUC: 0.941、0.951) 优于 3D T1WI 模型 (AUC: 0.801、0.833), 组合模型优于单模态模型, AUC 达 0.996、0.967。AD 和 HC 分类特征中, 6 个小波特征 (60.0%), 3 个 LoG 特征 (30.0%), 1 个原始特征 (10.0%)。aMCI 和 HC 分类特征中, 3 个小波特征 (37.5%), 2 个 LoG 特征 (25.0%), 2 个局部二值模式特征 (25.0%), 1 个原始特征 (12.5%)。其中以小波特征的占比最高, ^{18}F -FDG PET 特征贡献度最高。

结论: 基于 3D T1WI 和 ^{18}F -FDG PET 的多模态海马纹理分析有助于诊断 AD 和 aMCI, 其中 ^{18}F -FDG PET 优于 3D T1WI。纹理特征中小波特征具有重要价值, 有潜力成为 AD 早期诊断生物标志物。

OR-0249

Visualizing the habenula using 3T high-resolution MP2RAGE and QSM

Bingyang Bian, Lei Zhang, Lin Hou
First Hospital of Jilin University

PURPOSE: Habenula (Hb) is a key node in regulating emotion-related behavior (Figure 1). Accurate visualization and reliable quantitative analysis of Hb are vital in psychiatric disorders. In order to obtain high-contrast habenula images and allow them to be compatible with clinical applications, this study compared 3.0T magnetization-prepared 2 rapid acquisition gradient echoes (MP2RAGE) and quantitative susceptibility mapping (QSM) with magnetization-prepared rapid gradient echo (MPRAGE) for Hb segmentation performance.

MATERIALS AND METHODS: Ten healthy volunteers were scanned twice with 3.0T MPRAGE and MP2RAGE, and once with QSM. Image quality and visibility of Hb anatomical features were analyzed by three radiologists using a 5-point scale. Contrast assessments of Hb and thalamus

were also performed. The reproducibility of the Hb volume from MPRAGE and MP2RAGE was evaluated using manual segmentation and the Multiple Automatically Generated Template brain segmentation algorithm (MAGeTbrain, Figure 2). T1 values and susceptibility were measured in whole Hb and Hb geometrical subregion using MP2RAGE-T1 mapping and QSM.

RESULTS: 3.0T MP2RAGE and QSM demonstrated clear boundaries and anatomical features of the Hb compared to MPRAGE, with a higher subjective scores, signal-to-noise and contrast-to-noise ratio (all $P < 0.05$, Figure 3 and Figure 4). Additionally, 3.0T MP2RAGE provided reliable Hb manual and MAGeTbrain segmentation volume estimates with greater reproducibility (Figure 5). T1 mapping derived from MP2RAGE was highly reliable, and susceptibility contrast was highly non-uniform within the Hb (Figure 6 and Figure 7).

CONCLUSION: We identified an optimized sequence combination (3.0T MP2RAGE combined with QSM) that may be useful for enhancing Hb visualization and more reliable quantitative data.

OR-0250

Altered brain iron depositions of SCA3: from pre-symptomatic to symptomatic stage

Haishan Qiu, Jing Zhao, Jiale Wu, Chao Jiang, Manshi Hu, Chao Wu, Jianping Chu
Sun Yat-sen University, the First Affiliated Hospital

Purpose:

To comprehensively investigate brain iron deposition alterations of SCA3 at different clinical stages in the precentral gyrus and brain nuclei, and their correlations with clinical symptoms and damaged fiber bundles.

Methods:

We prospectively investigated QSM of SCA3 [19 pre-symptomatic (5 females, $29.1 \pm 8.2y$) and 41 symptomatic (28 females, $39.5 \pm 10.4y$)] and 37 matched healthy controls (HCs) recruited from 2018.05 to 2021.01. Group susceptibility was cross-sectionally compared, and their associations between altered brain iron deposition with clinical symptoms and fractional anisotropy of the bilateral corticospinal tracts and cerebellar peduncles were explored.

Results:

Compared to HCs, except for the bilateral precentral gyrus, putamen, and thalamus, increased susceptibility in all the brain nuclei was observed in pre-symptomatic SCA3. Most of the supratentorial and the right dentate nuclei had significantly increased susceptibility in symptomatic than the pre-symptomatic stage and was partially correlated with disease duration and damaged cerebellar peduncles. The left substantia nigra (SN) demonstrated the highest diagnostic efficacy in identifying pre- and symptomatic SCA3. Notably, the susceptibility of red nuclei most significantly contributed to the parkinsonian symptom.

Conclusion:

Brain iron depositions abnormality is an early event of the SCA3's occurrence and development. The left SN might be a critical site for the disease starts and development, and it could be a promising imaging biomarker for disease diagnosis and surveillance.

OR-0251

Use of biomarkers from contrast-enhanced magnetic resonance imaging radiomics to predict chemotherapeutic response in primary central nervous system lymphoma

Xiaochen Wang, Sihui Wang, Xuening Zhao, Lingxu Chen, Mengyuan Yuan, Shengjun Sun
Beijing Tiantan Hospital, Capital Medical University

Objectives To evaluate the utility of contrast-enhanced magnetic resonance imaging (CE-MRI) radiomics features to predict responses when treating primary central nervous system lymphoma (PCNSL) and establish a prediction model in patients with PCNSL who are treated with high-dose methotrexate (HD-MTX)-based chemotherapy.

Methods A total of 131 patients with PCNSL (101 in the training set and 30 in the testing set) who had had contrast-enhanced MRI scans were retrospectively analyzed. Pyradiomics was used to extract radiomics features, and the clinical variables of the patients were collected. Support Vector Machine (SVM) and Logistic Regression (LR) was used to establish the prediction model. The prediction performance of radiomics model, clinical model, and combined model was independently assessed and compared using Receiver Operating Characteristic (ROC) curves.

Results In total, 1598 features were extracted, and six of these were selected by T test and recursive feature elimination (RFE). In the test set, the area under the ROC curve was 0.868 (0.683, 0.967) for the combined prediction model, 0.857 (0.681, 0.957) for the radiomics model, 0.618 (0.413, 0.797) for the clinical prediction model. The combination of the radiomics signature with IL-2R had the highest predictive power, and the radiomics prediction model was also yield higher accuracy (80.0%).

Conclusions Our combined prediction model, including both radiomics signatures extracted from CE-MRI and serum IL-2R, may represent an effective way of stratifying patients with PCNSL before chemotherapy, and may thus help clinicians make better treatment decisions.

The deeper, The better? Efficacy of deep transcranial magnetic stimulation in spinocerebellar ataxia type 3

Peiling Ou, Linfeng Shi, Jian Wang, chen liu
Department of Radiology, Southwest Hospital, Army Medical University (Third Military Medical University),
Chongqing 400038, China

【Objective】 This study aims to investigate the efficacy of deep transcranial magnetic stimulation (dTMS) in improving motor symptoms in patients with spinocerebellar ataxia type 3 (SCA3). **【Methods】** Thirteen SCA3 patients underwent 20 sessions of dTMS targeting the primary motor cortex (M1) and cerebellum respectively, which delivering for 5 consecutive days per week for 4 weeks (a total of 1200 pulses per session). Clinical outcomes included the Scale for the Assessment and Rating of Ataxia (SARA) and the International Cooperative Ataxia Rating Scale (ICARS). Outcome assessments were performed at baseline and on the last day of dTMS intervention. Statistical analysis were performed using SPSS software. **【Results】** Our findings suggest that patients receiving dTMS exhibited improvement in ataxia, with a 2.0-point decrease in SARA scores (95% confidence interval (CI)-2.43 to -1.54, $p < 0.001$) and a 3.8-point decrease in ICARS scores (95% CI-4.91 to -2.65, $p < 0.001$) compared to baseline data. Moreover, this study reports no severe adverse events from dTMS therapy. **【Conclusions】** This study reveals that dTMS can be a safe and effective intervention for the alleviation of ataxia in SCA3 and highlights its efficacy as a more enhanced rehabilitative approach compared to traditional TMS for SCA3 therapy.

Pericarotid fat density is associated with severity of cerebral small vessel disease

Shuo Zhao, Yunliang Guo, Hui Gu, Congshan Ji, Xianshun Yuan, Yuanyuan Li, Jing Zhang, Ximing Wang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

Purpose: To determine the association between neuroimaging characteristics of cerebral small vessel disease (CSVD) and pericarotid fat density obtained by computed tomography angiography (CTA).

Materials and Methods: A total of 272 CSVD patients who underwent both carotid CTA and cranial magnetic resonance imaging (MRI) from Jan 2020 to Jan 2022 were recruited. Perivascular fat attenuation index (FAI) surrounding extracranial internal carotid artery (ICA) and neuroimaging markers of CSVD were evaluated. FAI surrounding extracranial ICA was quantified semi-automatically via a dedicated software. Neuroimaging markers of CSVD included lacunes, white matter hyperintensities (WMH), microbleeds (CMB), enlarged perivascular space (EPVS) and CSVD total score. The Correlations between pericarotid FAI and neuroimaging markers of CSVD were assessed using binary logistic regression (for lacunes, WMH and CMB) or ordinal logistic regression (for EPVS and CSVD total score). The receiver operating characteristic curve (ROC) analysis was used to evaluate the predictive role of FAI in CSVD patients between acute ischemia stroke (AIS) and non-AIS groups.

Results: Pericarotid FAI was significantly associated with the occurrence of lacunes and CMB, as well as WMH grades before and after controlling for confounding indicators (all $P < 0.05$). An increased pericarotid FAI was independently associated with a higher CSVD total score after adjusting for confounding indicators (mean FAI: $P < 0.001$; max FAI: $P < 0.001$). No difference was observed in FAI among different grades of EPVS after adjusting for clinical parameters. Altogether, 100 patients (36.8%) suffered from AIS, and patients with AIS had a significantly higher FAI value than those without AIS (mean FAI: $P = 0.045$; max FAI: $P = 0.007$). Compared with non-AIS group, FAI exhibited relatively higher diagnostic value for detecting larger CSVD total score in AIS group (AIS vs non-AIS: AUC = 0.769 vs 0.699 (mean FAI); AUC = 0.798 vs 0.747 (max FAI)).

Conclusions: Pericarotid FAI obtained from carotid CTA, a surrogate marker characterizing perivascular adipose tissue inflammation, is an adverse indicator related to severity of CSVD and incidence of AIS. These findings might assist in risk stratification and individual prevention of CSVD patients.

OR-0254

MRI histogram analysis of telomerase reverse transcriptase promoter mutation status in IDH-wildtype glioblastoma

Bin Zhang, Junlin Zhou
Lanzhou University Second Hospital

Purpose: To investigate the predictive value of preoperative magnetic resonance imaging (MRI) histogram analysis for evaluating telomerase reverse transcriptase promoter (pTERT) mutation status in IDH-wildtype glioblastoma (GBM).

Methods: The clinical and imaging data of 181 patients with IDH-wildtype GBM at our hospital between November 2018 and April 2023 were retrospectively assessed. We used the molecular sequencing results to classify the data sets into pTERT mutations (C228T and C250T) and pTERT-wildtype groups. Preoperative T1-weighted contrast-enhanced (T1C) histogram parameters of

patients with IDH-wildtype GBM were extracted using FireVoxel software. The T1C histogram parameters were compared between groups and correlated with conventional MRI features. Receiver operating characteristic (ROC) curve was used to assess histogram parameter performance.

Results: Patient age and percentage of necrotic area showed statistically significant differences between the pTERT mutation and pTERT-wildtype groups ($p < 0.05$). Among the T1C histogram features, the maximum, standard deviation, variance, coefficient of variation (CV), skewness, 5th, 10th, 25th, 95th and 99th percentiles were statistically significantly different between groups (all $p < 0.05$). When the CV was 3.19, the sensitivity, specificity and accuracy (80.30%, 72.90% and 77.90%, respectively) for predicting the pTERT mutation status reached their maximum values, with an area under the curve (AUC) of 0.775(0.702–0.848). Moreover, CV was positively correlated with the percentage of necrotic area (correlation coefficient: 0.825; $p < 0.05$). There were no significant differences in the T1C histogram parameters between the C228T and C250T groups (all $p > 0.05$).

Conclusion: T1C histogram parameters can be used as non-invasive quantitative parameters to assist in the preoperative clinical prediction of pTERT mutation status in IDH-wildtype GBM.

OR-0255

ASPECTS-based net water uptake outperforms target mismatch for outcome prediction in patients with acute ischemic stroke and late therapeutic window

Shanshan Lu, Rongrong Wu, Yuezhou Cao, Haibin Shi, Feiyun Wu
The first affiliated hospital of Nanjing Medical University

Purpose: To compare the prognostic value of net water uptake (NWU) and target mismatch (TM) on CT perfusion (CTP) in acute ischemic stroke (AIS) patients with late-time window. **Materials and Methods:** One hundred and nine consecutive AIS patients with anterior-circulation large vessel occlusion presenting within 6–24 hours from onset/last seen well were enrolled. Automated Alberta Stroke Program Early CT Score-based NWU (ASPECTS-NWU) was calculated from admission CT. The correlation between ASPECTS-NWU and CTP parameters was assessed. Predictors for favorable outcome (modified Rankin Scale score ≤ 2) at 90 days was assessed using logistic regression analysis. The ability of outcome prediction between ASPECTS-NWU and TM (an ischemic core < 70 ml, a mismatch ratio ≥ 1.8 , and an absolute difference ≥ 15 ml) was compared using receiver-operating-characteristic (ROC) curve.

Results: A higher level of ASPECTS-NWU was associated with a larger ischemic core ($r = 0.66$, $P < 0.001$) and a larger hypoperfusion volume ($r = 0.38$, $P < 0.001$). ASPECTS-NWU performed better than TM for outcome stratification (area under the curve [AUC, 0.738 versus 0.583, $P = 0.004$]) and was the only independent neuroimaging marker associated with favorable outcomes compared with CTP parameters (odds ratio, 0.73; 95% confidence interval [CI] 0.62–0.87, $P < 0.001$). An outcome prediction model including ASPECTS-NWU and clinical variables (National Institutes of Health Stroke Scale scores and age) yielded an AUC of 0.828 (95% CI 0.744–0.893; sensitivity 65.4%; specificity 87.7%).

Conclusion: ASPECTS-NWU performed better than TM for outcome prediction in AIS patients with late-time window and might be an alternative imaging biomarker to CTP for patient selection.

OR-0256

Performance evaluation of deep learning image reconstruction algorithm in low-dose whole brain CT perfusion examination of acute ischemic stroke: a feasibility study

Limin Lei, Yuhao Zhou, Hui Wang, Zhihao Wang, Songwei Yue
The First Affiliated Hospital of Zhengzhou University

Purpose: To investigate the impact of deep learning image reconstruction (DLIR) algorithm on image quality and diagnostic parameters in low-dose whole brain CT perfusion.

Methods: We prospectively enrolled acute ischemic stroke (AIS) patients admitted within 24 hours of onset and underwent non-contrast CT and CTP examinations. Patients were randomly divided into two groups, and the scanning conditions of the two groups were the same except the tube current of CTP scanning. CTP scanning: 80kV, 150mA (conventional dose group (CD))/ 100 mA (low dose group (LD)). According to our previous research, we reconstructed images in the CD group with adaptive statistical iterative reconstruction-Veo 80% algorithm (ASIR-V80%), which is Group A, and we reconstructed CTP images in the LD group with ASIR-V80% (Group B), DLIR algorithms at medium (DLIR-M, Group C), and high levels (DLIR-H, Group D). The clinical features of the two groups including gender, age, height, weight, time of onset, NIHSS score at admission and underlying diseases were recorded and compared. Meanwhile, the subjective and objective image quality, perfusion parameters (including CBF, CBV, MTT, Tmax and TTP), diagnostic performance and radiation dose of the four groups of reconstructed images were compared.

Results: The mean effective radiation dose was 5.71 mSv and 3.80 mSv for the CD and LD protocols, respectively, with a statistically significant difference found between them ($P < 0.001$). There was no statistically significant difference in clinical baseline characteristics between CD and LD group. Compared to Groups B and C, the SD values decreased while SNR increased in Groups A and D ($P < 0.05$) for both gray matter (GM) and white matter (WM) regions. The overall objective image quality ranked from high to low: Group D = Group A > Group B > Group C, and the result of subjective scoring was the same. Perfusion parameters showed no significant difference between Groups A and D. In GM, the CBV value of Group B was lower than that of Group A ($P = 0.017$), while in WM, both Groups B and C had significantly higher CBF values and lower MTT values than Group A ($P < 0.05$). There was no statistical difference in absolute value between the maximum diameter of cerebral infarction and the standard reexamination measurement ($P > 0.05$).

Conclusions: Low-dose CTP combined with DLIR-H can improve image quality, facilitating over 30% radiation dose reductions without influencing CTP diagnosis parameters, including CBF and MTT, which can be applied in clinical practice.

OR-0257

胆碱能基底前脑系统在帕金森病姿势不稳/步态障碍及注意力障碍中的机制研究

吴晨青、郭昊婷、周诚、管晓军、张宝荣、徐晓俊、张敏鸣
浙江大学医学院附属第二医院

背景 帕金森病 (PD) 姿势不稳/步态障碍 (PIGD) 和认知功能损伤的病理生理机制尚不清楚, 而姿势步态控制以及认知功能均与胆碱能基底前脑系统 (cBF) 密切相关。

方法 本研究招募了 84 名 PD 患者和 82 名正常对照组 (NC), 参与者均接受了多模态磁共振扫描、运动和认知评估。扩散张量成像 (DTI) 用于检测 cBF 系统的结构异常, 通过 FreeSurfer 自动分割

cBF 核团, 并使用概率性纤维追踪其投射纤维束。为反映细胞丢失及细胞外自由水积聚, 我们量化了自由水分分数 (FWf), 并提取了 cBF 核团及其纤维束的 FWf 以及皮层胆碱能投射密度进行统计分析。

结果 PD 患者 cBF 核团的 FWf 明显高于 NC (P -value<0.001), 纤维束 FWf 也明显高于 NC (P -value =0.021), 且在枕叶 (P -value <0.001)、顶叶 (P -value<0.001) 和前额叶 (P -value =0.005) 的胆碱能皮层投射明显降低。在患者中, cBF 核团 FWf 升高与 PIGD 评分 ($r=0.306$, P -value=0.006) 以及连线测试 A (TMT-A) 时间增加显著相关 ($r=0.303$, P -value=0.007)。注意力 (TMT-A 时长) 部分中介了 cBF 核团 FWf 和 PIGD 评分之间的关系 (间接效应: $a*b=0.071$, 总效应: $c=0.256$, P -value=0.006)。

结论 我们的发现表明, PD 患者存在 cBF 系统整体退化, 涉及 cBF 核团、纤维束和皮层投射, 在认知与运动之间的互动中发挥重要作用。

动脉通过伪影能更简单识别颅内动脉粥样硬化狭窄患者短暂性脑缺血发作和卒中

李玲、严雪娇、汤敏、张晶、文玉、雷晓燕、张小玲
陕西省人民医院

目的:比较高分辨率磁共振成像(HRMRI)和动脉自旋标记(ASL)成像对鉴别颅内动脉粥样硬化性狭窄患者短暂性脑缺血发作(TIA)和脑卒中的能力, 并建立动脉粥样硬化患者缺血性脑卒中的预测模型。
方法:回顾性分析 2020 年 10 月至 2021 年 12 月期间接受 HRMRI 和 ASL 成像的症状性动脉粥样硬化患者, 根据 DWI 检查有无梗死将其分为卒中组及 TIA 组, 所有患者均使用带有 32 通道头部线圈的 3.0 T 磁共振扫描仪(Ingenia CX, Philips Healthcare)进行成像。评估 HRMRI 图像上大脑中动脉最窄部位的血管腔和斑块特征, 并评估标记后延迟时间(PLDs) 分别为 1.5 和 2.5 s 时动脉通过伪影(ATAs)存在与否。采用多因素 logistic 回归分析, 结合临床因素、斑块差异特征和不同 PLD ATAs 的存在, 受试者工作特征(ROC)曲线用来评价不同模型的诊断效果。 $P<0.05$ 认为有统计学差异。

结果:共有 85 名参与者最终纳入研究, TIA 组 47 名患者, 卒中组 38 名。与 TIA 组相比, 卒中组高血压、高脂血症发生率、斑块负担、狭窄程度、增强比例、正性重构患病率、斑块内出血、1.5s ATAs 和 2.5s ATAs 存在的发生率明显更高 (p 均<0.005)。我们将斑块差异特征和 2-PLD ATAs 的存在与临床因素相结合, 建立了模型 1(临床危险因素+斑块特征)、模型 2(临床危险因素+ 2-PLD ATAs 存在)、和模型 3(临床危险因素+斑块特征+存在 2-PLD ATAs 存在)。模型 3 的诊断准确率高于模型 1 和模型 2 ($p<0.005$)。模型 1 和模型 2 的 AUC 差异无统计学意义($Z=0.612$, $p=0.541$)。模型 3 的敏感性、特异性、阳性预测值、阴性预测值和准确率分别为 92.11%、95.74%、94.59%、93.75%和 94.12%。

结论:ASL 在预测脑卒中方面比 HRMRI 提供了更简单的成像评估。此外, 斑块特征与血流动力学差异在鉴别卒中与 TIA 患者也是有效区分的生物学标记物。结合这些特征, 建立的预测模型具有良好的预测性能。

半剂量增强 T2FLAIR 肿瘤强化程度与血管渗透性的相关性研究

金腾、汪晶

华中科技大学同济医学院附属协和医院

目的：探讨脑转移瘤在 1/2-dose CE-T2 FLAIR 的强化程度与动态增强磁共振扫描血管渗透性参数的相关性。

方法：前瞻性纳入来我院就诊的 39 例脑转移瘤患者。所有患者于治疗前行平扫 T1WI、平扫 T2 FLAIR、DCE-MRI、1/2-dose CE-T2 FLAIR、1/2-dose CE-T1WI 以及 routine-dose CE-BRAVO 序列。测量所有转移灶的 DCE 定量参数值：Ktrans、Kep、Ve，以及转移灶在 1/2-dose CE-T2 FLAIR 中的 CR 值和 PI 值。病灶分组：（1）A 组，病灶在 1/2-dose CE-T2 FLAIR 的强化程度高于 routine-dose CE-BRAVO；B 组，两者强化程度相当；C 组，前者小于后者。（2）所有转移灶按直径及强化方式分为三组：a 组：直径<5mm 的病灶；b 组：直径≥5mm 的环形强化灶；c 组：直径≥5mm 的实性强化灶。（I）采用 Spearman 法分析所有病灶 Ktrans 值、Kep 值、Ve 值与 CR 值和 PI 值的相关性。（II）分别比较 Ktrans 值、Kep 值、Ve 值、CR 值与 PI 值在 ABC 三组之间的统计学差异。（III）比较 Ktrans 值在 abc 三组之间的统计学差异。

结果：（I）相关性分析：病灶 Ktrans 值与 CR 值、PI 值均呈中度负相关，相关系数 r 分别为-0.551 和-0.511。病灶 Kep 值与 CR 值呈高度负相关，相关系数 r=-0.708。（II）组间比较：A 组、B 组、C 组的 Ktrans 值、Kep 值三组间差异均有统计学意义（P<0.001）。ABC 三组的 CR 值与 PI 值均有统计学意义（P<0.001）；（III）abc 三组的 Ktrans 值差异有统计学意义，a 组与 b 组的 Ktrans 值均低于 c 组；ABC 组在 1/2-dose CE-T2 FLAIR 上 CR 值于 PI 值均有统计学意义（P<0.001）。

结论：脑转移瘤在 1/2-dose CE-T2 FLAIR 的强化程度与血管渗透性参数（Ktrans 和 Kep）呈显著负相关，转移瘤组织血管渗透性是 CE-T2 FLAIR 与 CE-T1WI 强化程度存在差异的重要原因。

基于深度学习的急性缺血性脑卒中多任务病灶分割及其对卒中预后预测的应用研究

崔莹、汤天宇、居胜红

东南大学附属中大医院

目的：急性缺血性脑卒中（AIS）梗塞灶体积和脑白质高信号（WMH）与临床预后密切相关，但临床缺乏对这两种病灶的精准定位、定量评估。本研究旨在建立一种基于深度学习自动分割梗塞病灶和 WMH 的影像模型，以期对 AIS 预后进行准确预测。

方法：回顾性分析 2008 年至 2022 年多中心数据(训练和验证数据集来自中大医院的训，独立测试数据集来自一项多中心脑卒中研究)，纳入的脑卒中患者均于发病 72 小时内获得 MRI 图像。采用多任务卷积神经网络(CNN)深度学习模型对 DWI 和 FLAIR 图像进行梗塞灶和 WMH 负荷的自动分割，并提取体积大小、位置等影像学特征。以 7 天和 90 天 mRS 评分为结局，建立包含影像和临床特征融合的预测模型，分别在内部(中大医院)和外部(多中心注册)数据集上检测模型性能，计算曲线下面积(AUC)。

结果：内部数据集包括 1179 名 AIS 患者，外部测试数据集包括 83 名患者。分割方法具有稳健性，其中梗塞病灶分割 Dice 得分为 0.90±0.03(训练集)和 0.90±0.02(测试集)，WMH 分割 Dice 评分在训练集和测试集中分别为 0.89±0.01 和 0.86±0.01。影像-临床融合模型在预测 7 天 mRS 得分方面的表现显著优于其他模型，在训练、验证和测试数据集上分别达到 0.82 (95% CI: 0.78-0.86)、0.80 (95% CI: 0.73-0.86)和 0.80 (95% CI: 0.70-0.90)。该模型在预测 90 天 mRS 得分表现出了最佳性能。

结论：本研究开发的影像分割方法稳健、适于临床转化，基于该方法建立的影像-临床特征融合模型在预测短期和长期 AIS 预后方面均表现最佳，为临床 AIS 的快速判别、预后预测提供了有力的手段。

OR-0261

白血病脑出血患者非对比增强 CT 标志物及短期预后模型的研究

施露、洪楠
北京大学人民医院

目的：使用非对比增强 CT（NCCT）标志物描述白血病患者脑出血病灶，并探讨语义特征在白血病患者脑出血早期死亡影像组学预后模型中的价值。

方法：回顾性分析 2007 至 2023 年间在北京大学人民医院由 CT 诊断为脑出血的 135 例白血病患者 CT 图像及临床资料，由 2 名专业放射医师评估脑出血灶语义特征并勾画 2D ROI 区。共收集了 67 个 CT 图像特征，由包含 4 种 CT 标志物（低密度征、混合密度征、岛征及边缘不规则征）的 11 种语义特征及基于影像组学方法提取的 56 种几何特征组成。将患者按短期预后分为两组，比较患者的基线资料，确定语义特征是否与不良预后相关。随后将数据分为训练集和测试集。在训练集中，采用单因素 logistics 方法、最小绝对收缩和选择算子(LASSO)和十则交叉验证进行临床实验室数据和 CT 图像特征筛选，分别得到当前特征集合的最优特征集，使用随机森林算法进一步构建临床模型和影像组学模型。最后对模型进行评估。

结果：(1)低密度征、岛征及边缘不规则征在白血病患者中的发生率（65.93%，46.67%，83.70 %）高于已有研究中自发性脑出血患者（31.2-44%，16.3%，46%），其中低密度征及岛征与其他研究中口服抗凝药患者发生率（52.6%，>50%）接近。(2)白血病患者脑出血病灶好发部位为幕上皮质下，40.74%表现为多发性病灶。(3)影像组学模型由 7 个特征构成，形状特征贡献度高于语义特征。(5)临床模型和影像组学模型的 AUC 值没有统计学差异（Delong test $p>0.05$ ）。影像学模型的校准曲线、DCA 曲线略优于临床模型。

结论：1. NCCT 标志物在白血病人人群中表现不同于其他脑出血人群。我们对白血病人 NCCT 标志物的研究填补了标志物通常只在自发性和口服抗凝药患者人群中研究的空白。2.影像组学模型表明，在白血病患者中，基于 2D ROI 的形状特征对短期预后模型的贡献度高于语义特征。3.基于 NCCT 图像特征构建的影像组学模型在预测白血病脑出血患者 7 天死亡风险方面略优于临床模型。

OR-0262

应用神经突方向离散度和密度成像量化肌萎缩侧索硬化症中丘脑及其连接性的微结构损伤

曹运彬、陈华俊
福建医科大学附属协和医院

目的：应用神经突方向离散度和密度成像（neurite orientation dispersion and density imaging, NODDI）评估肌萎缩侧索硬化症（amyotrophic lateral sclerosis, ALS）丘脑和丘脑-皮质连接的微观结构损伤。

方法：本项研究包括 47 名健康对照者和 43 名 ALS 患者，收集他们的结构和弥散加权磁共振数据。采用最先进的平行传输纤维束成像（parallel transport tractography），在个体空间识别丘脑-皮层

纤维束。然后,根据丘脑与事先定义的皮层(即前额叶/运动/感觉/颞叶/后顶叶/枕叶)区域的连接模式,将丘脑划分为六个亚区。在丘脑亚区、皮质亚区以及丘脑-皮质纤维束中,对以下 NODDI 指标做了组间比较:神经突方向离散度(orientation dispersion index, ODI)、神经突密度(neurite density index, NDI)和各向同性体积分数(isotropic volume fraction, ISO)。并且,利用这些指标作接收者操作特征曲线(receiver operating characteristic curve, ROC)分析和斯皮尔曼相关性(Spearman correlation)分析。

结果:在 ALS 患者中,与左侧运动皮层及其他运动外(如躯体感觉和枕叶)皮层连接的丘脑亚区 ODI 下降,ISO 上升(经 Bonferroni 校正, $P < 0.05$)。双侧丘脑-运动和丘脑-体感纤维束以及右侧丘脑-后顶叶和丘脑-枕叶纤维束的 NDI 下降(经 Bonferroni 校正, $P < 0.05$)。双侧丘脑-运动纤维束($P = 0.017$ 和 0.009)和左侧丘脑-体感纤维束($P = 0.029$)的 NDI 降低与疾病严重程度相关。在丘脑-皮质纤维束中,与传统的弥散张量成像指标相比,NDI 在组间比较中产生的效应量更高,ROC 曲线下的面积更大($P < 0.05$)。

结论:丘脑和丘脑-皮质连接的微结构损伤是 ALS 的特征。NODDI 提高了对 ALS 丘脑-皮质连接损伤的检测。

The association among individual gray matter volume of frontal-limbic circuitry, fatigue susceptibility, and comorbid neuropsychiatric symptoms following COVID-19

Xuan Niu, Wenrui Bao, Zhaoyao Luo, Tao Lu, Ming Zhang

Department of Medical Imaging, the First Affiliated Hospital of Xi'an Jiaotong University, Xi'an 710061, China

Background: Fatigue is one of the most common and debilitating symptoms of COVID-19 infection and is often associated with comorbid sleep disturbance and psychological distress. This study aimed to identify structural brain markers of post-COVID fatigue and to further investigate the association between individual grey matter volume, fatigue susceptibility and comorbid neuropsychiatric symptoms.

Methods: Individuals who had experienced mild COV+ infection underwent neuropsychological testing ($n=335$) and MRI scans ($n=271$) within one month. Of these individuals, 191 (70.5%) were followed up three months after the infection. Additionally, 67 healthy controls underwent the same protocol during enrolment.

Results: The analysis of the whole brain revealed that there was no difference in grey matter volume during the acute phase between the study groups. In the COV+ group, however, fatigue severity was linked only to the volume of the right dorsal anterior cingulate cortex (dACC) and dorsolateral prefrontal cortex (DLPFC), which are both part of the frontal-limbic system. Furthermore, it should be noted that fatigue acted as a mediator in the associations observed between the volume of identified brain regions and COVID-related sleep, post-traumatic stress disorder (PTSD), and anxiety. It is important to highlight that the initial structural differences in the dorsolateral prefrontal cortex (DLPFC) observed during the early stage of recovery can predict fatigue symptoms three months after COVID-19 infection. This was confirmed through stepwise linear regression analysis.

Conclusion: Our findings offer novel evidence for the neuroanatomical basis of fatigue susceptibility and highlight fatigue as an important link from GMV in frontal-limbic regions to comorbid neuropsychiatric symptoms in early recovery from infection. This could facilitate public health interventions by enabling early detection of individuals at risk of developing post-COVID fatigue and targeting treatments to reduce the disease's long-term detrimental effects further.

应用人工智能压缩感知技术加速慢性缺血性脑血管病患者全脑 3D 酰胺质子转移成像

夏超¹、曾嘉欣^{2,3}、刘至钦^{2,3}、卫霞^{2,3}、李梓瑜^{2,3}、孙源^{2,3}、李星^{2,3}、肖安琪⁴、刘翼⁴、艾凯⁵、胡娜^{2,3}、吕粟^{2,3}

1. 四川大学

2. 四川大学华西医院放射科功能与分子影像四川省重点实验室、华西磁共振研究中心

3. 中国医学科学院精神放射影像创新单元

4. 四川大学华西医院神经外科

5. 飞利浦 (中国) 投资有限公司

目的：慢性缺血性脑血管病患者在未发生明确脑梗死的情况下，需要行全脑 3D 酰胺质子转移成像 (APT) 才能明确全脑的酸碱代谢情况，但目前全脑 3D APT 扫描时间长，不利于临床应用及转化。本研究旨在探究基于人工智能的压缩感知 (CS-AI) 技术对全脑 3D APT 质效的影响。

材料与方法：前瞻性纳入 2022 年 4 月-2023 年 4 月于四川大学华西医院就诊的慢性缺血性脑血管病患者 11 例。采集患者头部平扫 MRI、常规 3D-APT、CS-AI 3D-APT 及 CT 灌注 (CTP) 图像。扫描时，记录每例患者常规 3D-APT 和 CS-AI 3D-APT 的实际扫描时间。根据患者 CTP 图像上脑灌注的情况，分别在常规 3D-APT 和 CS-AI 3D-APT 图像上的脑灌注降低区和对侧正常表现脑白质区 (NAWM) 勾画感兴趣区 (ROIs)，测量其 APT 加权 (APT_w) 值，并计算图像信噪比 (SNR)、对比噪声比 (CNR) 及图像质量主观评分。使用配对 t 检验对比两种成像技术在 SNR、CNR 及扫描时间的差异，采用配对秩和检验评估图像质量主观评分间有无统计学差异。

结果：对于对侧 NAWM 而言，常规 3D-APT 和 CS-AI 3D-APT 图像的 SNR (4.53 ± 2.17 vs 4.30 ± 1.98 , $P=0.71$) 与 CNR (2.67 ± 2.23 vs 2.86 ± 1.49 , $P=0.82$) 均未表现出明显差异。对于灌注降低的脑组织而言，常规 3D-APT 和 CS-AI 3D-APT 图像的 SNR (3.29 ± 1.84 vs 4.21 ± 1.91 , $P=0.26$) 与 CNR (2.58 ± 2.38 vs 2.76 ± 1.20 , $P=0.81$) 同样未表现出明显差异。此外，两种 APT 图像的图像质量主观评分一致 ($3.5[3-4]$ vs $4[3-4]$, $P=0.71$)，但 CS-AI 3D-APT 的扫描时间比常规 3D-APT 明显更短 (896 ± 20 秒 vs 538 ± 13 秒, $P<0.001$)，扫描时间可节省约 6 分钟 (40%)。

结论：与常规 3D APT 相比，CS-AI 3D-APT 获得的慢性缺血性脑血管病患者头部图像质量相当，并能有效缩短扫描时间，提示其可能具有较好的临床应用前景。

Similar Transmembrane Water Exchange Rate but Different Transmembrane Pathway Patterns in Glioblastoma and Lung Cancer Brain Metastases

Bao Wang¹, Yingchao Liu², Ruiliang Bai³

1. Qilu Hospital of Shandong University

2. Shandong Provincial Hospital Affiliated to Shandong First Medical University

3. Zhejiang University

Objectives: Water exchange rate and water transmembrane pathway are two important parts in the water homeostasis of tumor cells. This study aimed to explore the difference of water exchange rate and water transmembrane pathway in glioblastoma (GBM) and lung cancer brain metastases (LCBM) in vivo.

Materials and methods: From August 2018 to April 2021, forty patients who were diagnosed with GBM and forty-four patients with solitary LCBM were enrolled in this retrospective study. Water exchange rate (k_{io}) were evaluated by shutter-speed dynamic contrast enhanced MRI. Expression of aquaporin-4 (AQP4) and Na⁺-K⁺ ATPase were explored by immunohistochemical scores (from

0 to 6). Besides, Gene expression differences between AQP4 and Na⁺-K⁺ transporting ATPase interacting 1 (NKAIN1) in GBM and lung cancer were explored using Gene Expression Omnibus DataSets. Differences of kio and differences of AQP4 and Na⁺-K⁺ ATPase (or NKAIN1) expression between GBM and solitary LCBM were tested.

Results: kio was not significantly different between solitary LCBM and GBM (median [interquartile range]: 1.0s-1 [0.3,1.8] vs 0.9s-1 [0.3,2.9], $p=0.673$). AQP4 has a significantly higher immunohistochemical scores than Na⁺-K⁺ ATPase in GBM (5 [4,5] vs 3 [2,3], $p<0.001$), and a significantly opposite expressions in LCBM (3 [2,3] vs 5 [4,5], $p<0.001$). AQP4 gene has a significantly higher expression than NKAIN1 in GBM (3365 ± 2860 vs 257 ± 196 , $p<0.001$), while a significantly lower expression in lung cancer (4.05 ± 0.21 vs 5.75 ± 0.41 , $p<0.001$).

Conclusions: Both GBM and LCBM have a similar tumor-averaged water exchange rate. AQP4 may contribute more to water homeostasis than Na⁺-K⁺ ATPase in GBM and the same role of Na⁺-K⁺ ATPase in LCBM.

人类穹窿的寿命轨迹：超高分辨率弥散 MRI 研究

胡强、高磊、徐海波
武汉大学中南医院

背景和目的：穹窿是边缘系统的一部分并且构成 Papez 环路，参与记忆的形成与保留。尽管穹窿的功能如此重要，但有关其毕生轨迹及其与记忆的耦合严重缺乏研究。本研究应用世界首台 5T 高分辨弥散磁共振成像，旨在（1）研究穹窿结构连接与多领域认知参数的关联，以及（2）刻画穹窿老化的毕生轨迹。

材料与方法：总共招募 250 例 18-85 岁健康成人参与本研究，采集高分辨 MRI 及行为表型数据。使用高分辨弥散磁共振成像，跟踪穹窿结构连接及白质完整性，使用年龄段平均来计算群体水平穹窿连接模版，使用曲线拟合计算毕生轨迹，使用多元回归计算穹窿连接与多维度认知及行为参数的关联。

结果：（1）穹窿纤维束连接长度与整体认知及语义记忆相关，但与执行功能不相关；（2）穹窿连接呈现明显的年龄相关的非线性减低，特别是左侧比右侧减低更为明显。

结论：我们的数据提供了有关穹窿高分辨的结构连接模式及毕生演变模式，以及如何与高级认知（特别是记忆）的耦合，为理解穹窿结构连接的毕生轨迹及老化相关退变疾病提供了重要的观点。

The Multi-faceted Imaging Presentation of Cerebral Amyloid- β -Related Angiitis

Jinhao Lv, Xin Lou
Chinese PLA General Hospital

Objectives: Amyloid- β -related angiitis (ABRA) is a rare form of vasculitis. Early recognition is crucial for appropriate treatment and outcome improvement. We aimed to review a case with pathological confirmed ABRA and summarized its imaging characteristics by referring to literature. Methods: A 61-year-old female suffered from intermittent headache, nausea, and vomiting for 1 month and mental disorder for 1 week. Serial MRI scans and PET-CT from were acquired. Repeated CSF examination were also performed. Pathology were obtained at day 98 from symptom onset.

Result: The patient received steroid pulse therapy, antibiotic therapy, and anti-tuberculosis treatment, but the symptom did not show improvement. The serial MRI scans showed ischemic lesions, hemorrhagic lesions and meningeal enhancement with dynamic changes and progression. PET-CT at day 78 demonstrated palpable bilateral cortex F18 FDG uptake decrease. Repeated CSF examination demonstrated intracranial hypertension and protein elevation with normal cell count, normal glucose and chloride. Finally, ABRA was confirmed by pathology.

Discussion: Neuroimaging is crucial for ABRA's early diagnosis. In the absence of infection, ABRA should be heeded if a multi-faceted imaging appearance, including diffuse cortical hemorrhage, brain ischemia and meningeal enhancement, presented in elderly patients.

Quantitative pharmacokinetic parameter K^{trans} map assists in regional segmentation of nasopharyngeal carcinoma in dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI)

Zhou Liu, Shangpo Yang, Yingying Chen, Liyan Zou, Qian Yang, Honghong Luo, Dehong Luo
Cancer Hospital Chinese Academy of Medical Sciences, Shenzhen Hospital

Purpose: Accurate segmentation of nasopharyngeal carcinoma (NPC) lesion areas from dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) facilitates subsequent diagnostic and prognostic workups. Traditionally, anatomical DCE-MRI-based NPC segmentation using deep learning has achieved fair results but still needs further improvement. Hence, we investigate the incremental benefit of incorporating pharmacokinetic parameter maps into anatomical DCE-MR image segmentation tasks by taking advantage of the hemodynamic contrast between NPC and surrounding tissue.

Methods and Materials: In this paper, a pharmacokinetic parameter K^{trans} map of NPC is used as prior information and combined with anatomical DCE-MRI data to improve the performance of segmentation models. A novel model, multi-input branch residual U-Net (MBRU-Net), which extracts features from both anatomical DCE-MR images and K^{trans} maps and fuses them to improve the segmentation performance, is introduced. The effectiveness of the multibranch network is validated by comparing MBRU-Net with deep residual U-Net (ResU-Net) with DCE-MRI + K^{trans} data. Additionally, different models (U-Net, segmentation network (SegNet), recurrent residual U-Net (R2U-Net), and ResU-Net) are trained with DCE-MRI and DCE-MRI + K^{trans} data separately and compared to validate the effectiveness of multimodal data using the Dice coefficient (Dice).

Results: Our proposed MBRU-Net achieves the best Dice in this study ($67.39 \pm 15.79\%$), higher than ResU-Net's Dice (65.57 ± 17.52) based on DCE-MRI and K^{trans} data. U-Net, SegNet, R2U-Net, and ResU-Net achieve better results in terms of segmenting tumor regions with DCE-MRI + K^{trans} data than those of the corresponding models with DCE-MRI data alone, where U-Net has the best performance (DCE-MRI + K^{trans} : DCE-MRI = $66.31 \pm 17.80\%$: $61.10 \pm 24.14\%$).

Conclusions: It is beneficial to add a pharmacokinetic parametric (K^{trans}) map as prior information to the conventional anatomical MRI-based segmentation task, and multibranch network structures perform better than single-branch network structures in terms of NPC segmentation.

Causal associations of genetically determined tinnitus with neuroimaging traits: evidence from a Mendelian Randomization study

Jing Sun¹, Xinghao Wang¹, Jia Li¹, Tingting Zhang¹, Qian Chen¹, Wenjuan Liu¹, Linkun Cai², Pengfei Zhao¹, Zhenghan Yang¹, Junhua Pan³, Zhenchang Wang¹, Lv Han¹

1. Beijing Friendship Hospital, Capital Medical University

2. School of Biological Science and Medical Engineering, Beihang University

3. Beijing Chest Hospital, Capital Medical University & Beijing Tuberculosis and Thoracic Tumor Research Institute

Objective: Potential reverse causality and unmeasured confounding factors were common biases in most neuroimaging studies on tinnitus and central correlates. The causal association of tinnitus with neuroimaging features also remained unclear. The aim of this study was to investigate the causal relationship of tinnitus with alterations of neuroanatomical features using Mendelian randomization (MR).

Methods: Summary-level data from a genome-wide association study (GWAS) of tinnitus were derived from the UK Biobank ($n = 117,882$). GWAS summary statistics for four global-brain tissue and fourteen sub-brain grey matter volumetric traits were also obtained ($n = \text{up to } 33,224$). A bidirectional MR analysis was conducted to explore the causal relationship between tinnitus and neuroanatomical features at global-brain and sub-brain level.

Results: Genetic susceptibility to tinnitus was causally associated with increased white matter volume ($OR = 2.36$, 95% CI 1.03–5.39, $p = 0.04$) and total brain volume ($OR = 2.39$, 95% CI 1.05–5.46, $p = 0.04$) but inversely associated with cerebrospinal fluid volume ($OR = 0.36$, 95% CI 0.16–0.83, $p = 0.02$). Genetically determined smaller grey matter volume in the Left Heschl's Gyrus, Right Insular Cortex and larger grey matter volume in the posterior division of the Left Parahippocampal Gyrus may predict an increased risk for tinnitus ($OR = 0.98$, 95% CI 0.96–1.00, $p = 0.02$; $OR = 0.99$, 95% CI 0.98–1.00, $p = 0.02$; $OR = 1.01$, 95% CI 1.00–1.03, $p = 0.03$).

Conclusions: Volume alteration in several sub-regions in the grey matter was the cause of tinnitus. Reversely, genetic susceptibility to tinnitus was causally associated with increased white matter volume and total brain volume. Our findings provide bidirectional evidence for further elucidating the underlying pathophysiological mechanisms of tinnitus-related neuroanatomical abnormalities at the genetic level.

OR-0270

Altered dynamic brain activity and functional connectivity in thyroid-associated ophthalmopathy

Wenhao Jiang¹, Jun Liu¹, Jiang Zhou¹, Qian Wu¹, Xiong-Ying Pu¹, Huan-Huan Chen², Xiao-Quan Xu¹, Hao Hu¹, Fei-Yun Wu¹

1. The First Affiliated Hospital of Nanjing Medical University (Jiangsu Province Hospital)

2. 南京医科大学第一附属医院 (江苏省人民医院) 内分泌科

Background and Purpose: Although previous neuroimaging evidence has confirmed the brain functional disturbances in thyroid-associated ophthalmopathy (TAO), the dynamic characteristics of brain activity and functional connectivity (FC) in TAO were rarely concerned. The present study aims to investigate the alterations of temporal variability of brain activity and FC in TAO using resting-state functional magnetic resonance imaging (rs-fMRI).

Methods: Forty-seven TAO patients and 30 age-, gender-, education-, and handedness-matched healthy controls (HCs) were enrolled and underwent rs-fMRI scanning. The dynamic amplitude of low-frequency fluctuation (dALFF) was firstly calculated using a sliding window approach to characterize the temporal variability of brain activity. Based on the dALFF results, seed-based

dynamic functional connectivity (dFC) analysis was performed to identify the temporal variability of efficient communication between brain regions in TAO. Additionally, correlations between dALFF and dFC and the clinical indicators were analyzed.

Results: Compared with HCs, TAO patients displayed decreased dALFF in the left superior occipital gyrus (SOG) and cuneus (CUN), while showing increased dALFF in the left triangular part of inferior frontal gyrus (IFGtriang), insula (INS), orbital part of inferior frontal gyrus (ORBinf), superior temporal gyrus (STG) and temporal pole of superior temporal gyrus (TPOsup). Furthermore, TAO patients exhibited decreased dFC between the left STG and the right middle occipital gyrus (MOG), as well as decreased dFC between the left TPOsup and the right calcarine fissure and surrounding cortex (CAL) and MOG. Correlation analyses showed that the altered dALFF in the left SOG/CUN was positively related to visual acuity ($r = 0.409$, $P = 0.004$), as well as the score of QoL for visual functioning ($r = 0.375$, $P = 0.009$).

Conclusion: TAO patients developed abnormal temporal variability of brain activity in areas related to vision, emotion and cognition, as well as reduced temporal variability of FC associated with vision deficits. These findings provided additional insights into the neurobiological mechanisms of TAO.

多维度弥散磁共振成像在鼻咽癌中的应用： 一项探索性的横断面研究

陈影影¹、刘周¹、邹丽艳¹、罗虹虹¹、钱龙²、罗德红¹

1. 中国医学科学院肿瘤医院深圳医院

2. GE 健康医疗

目的：评价多维度弥散 MRI (multidimensional diffusion MRI, Mdd-MRI) 在评估鼻咽癌 (nasopharyngeal carcinoma, NPC) 微观扩散特点的潜能，旨在探讨其在诊断和鉴别鼻咽癌病理亚型和 TNM 分期以及 EB 病毒 (EBV) 感染状态的应用价值。

方法与材料：本研究纳入了 66 例经组织学证实的 NPC 患者。使用多个 b 值进行 Mdd-MRI 数据采集，将原始数据转换并计算获得 4 个微观扩散指标，既：各向异性平均峰度 (MKa)、各向同性平均峰度 (MKi)、总平均峰度 (MKt) 和微观分数各向异性 (μ FA)。为了与宏观扩散特性进行比较，通过常规的扩散加权成像序列获得了表观扩散系数 (ADC)。使用独立样本 t 检验比较 NPC 组织和正常鼻咽组织之间的上述所有弥散参数的差异，同时比较这些参数在不同组织病理学类型、TNM 分期和 EBV 感染状态之间的差异。最好，将有差异的弥散参数与和 TNM 分期进行 Spearman 相关性分析。 $P < 0.05$ (双尾) 表示有显著性差异。

结果：肿瘤组织 ADC 值与正常鼻咽组织 ADC 值比较有显著性差异 ($P = 6.023e-11$)。微观弥散参数和 ADC 在不同原发肿瘤 T 分期 (T1-T4) 之间存在显著差异，且与 T 分期呈显著相关 (μ FA: $\rho = 0.52$, $P = 0.0001$; MKa: $\rho = 0.38$, $P = 0.002$; MKi: $\rho = 0.27$, $P = 0.03$; MKt: $\rho = 0.32$, $P = 0.009$ 和 ADC: $\rho = 0.36$, $P = 0.003$)。所有弥散参数在 N 分期、M 分期和 EB 病毒感染状态直接无显著组间差异 (均 $P > 0.05$)。

结论：微观弥散参数与 T 分期的关系反映了 Mdd-MRI 是有助于评价鼻咽癌组织的微观弥散特点。但是，在诊断 NPC、区分肿瘤病理亚型、N 期和 M 期以及预测 EBV 感染状态等方面的价值有限。

3D-pCASL 与 DWI 在鉴别 T1 期鼻咽癌及 淋巴组织增生的对照研究

莫志英、周文娟
广西梧州市人民医院

目的 对比三维准连续动脉自旋标记 (3D-pCASL) 与扩散加权成像 (DWI) 技术各定量参数在鉴别诊断 T1 期鼻咽癌 (NPC_{T1}) 及淋巴组织增生(LH)的应用价值。**方法** 选取经病理确诊及临床分期为 NPC_{T1} 的患者 12 例, 经病理确诊为 LH 的患者 35 例。所有患者均在治疗前接受鼻咽部 3D-pCASL 及 DWI 序列扫描, 测量所有患者病灶的血流量平均值 (BF_{mean})、最小值 (BF_{min})、最大值 (BF_{max}) , 并测量病灶与同侧翼外肌血流量比值的相对平均值 (RBF_{mean})、相对最小值 (RBF_{min}) 及相对最大值 (RBF_{max}) , 同时测量所有患者病灶表观扩散系数平均值 ADC_{mean}、最小值 ADC_{min}、最大值 ADC_{max}。分析 NPC_{T1} 组与 LH 组间各参数有无显著差异; 绘制受试者工作特征(ROC)曲线并计算曲线下面积(AUC), 以评价各参数的诊断效能。**结果** 相较于 LH 组, NPC_{T1} 组的 BF_{max}、RBF_{mean}、RBF_{min}、RBF_{max} 值更高, 差异有统计学意义 (P<0.05); 而 ADC_{mean}、ADC_{min}、ADC_{max} 值则无统计学差异 (P>0.05)。应用 BF_{max}、RBF_{mean}、RBF_{min} 及 RBF_{max} 值鉴别诊断的 AUC 分别为 0.807、0.729、0.779、0.874。**结论** 3D-pCASL 技术能够无创性反映 T1 期鼻咽癌与淋巴组织增生的血流灌注差异, 可作为一种鉴别 NPC_{T1} 和 LH 的有效方法, 其中 RBF_{max} 诊断效能最佳; 而 ADC 值难以区分 NPC_{T1} 和 LH 之间在水分子扩散方面的差别, 对鉴别诊断价值有限。

OR-0273

磁共振 T2-mapping 序列与纹理分析技术对 鉴别嗜酸性鼻窦炎伴鼻息肉价值的研究

王宇辰、鲜军舫
首都医科大学附属北京同仁医院

目的: 评估纹理分析及 T2 Mapping 序列对嗜酸性鼻窦炎伴鼻息肉 (eosCRSwNP) 和非嗜酸性鼻窦炎伴鼻息肉 (non-eosCRSwNP) 的诊断价值。

材料与方法: 研究纳入了 56 名接受鼻内镜手术的 CRSwNP 患者, 其中 eosCRSwNP 患者 36 名, non-eosCRSwNP 患者 20 名。所有患者术前进行包括 T1WI、T2WI 和 T2 Mapping 序列在内的 MRI 扫描。测量病灶至鼻孔前缘及鼻道底壁的距离作为 ROI 的术中定位标志。将 T2 Mapping 值和病理切片中不同细胞计数做相关性分析并计算 AUC。分别构建基于 T1WI 和 T2WI 纹理特征的模型。三个模型进行 Delong 检验比较不同模型间 AUC 差异。

结果: EosCRSwNP 患者病理组织中嗜酸性粒细胞多于 non-eosCRSwNP 患者, 而淋巴细胞少于 non-eosCRSwNP 患者, 病理组织 II 度水肿人数多于 non-eosCRSwNP 患者 (P 均<0.05)。eosCRSwNP 组 T2 Mapping 值显著高于 non-eosCRSwNP 组。患者 T2 Mapping 值与嗜酸性粒细胞计数呈正相关, 与淋巴细胞计数呈负相关。基于 T2 Mapping 的诊断模型 AUC 为 0.776, 区分 eosCRSwNP 和 non-eosCRSwNP 的 T2 值阈值为 168.2 ms, 敏感度为 0.899, 特异度为 0.600。T1WI 纹理特征 LR 模型 AUC 为 0.733, T2WI 纹理特征 LR 模型 AUC 为 0.747。基于 T2 Mapping 值、T1WI 和 T2WI 纹理特征的模型诊断性能无统计学差异 (P>0.05)。

结论: T2 Mapping 序列能够定量测量 CRSwNP 病灶的 T2 值, 其能够潜在的反应病灶内嗜酸性粒细胞的数量, 基于 T2 Mapping 序列的诊断模型对 CRSwNP 具有较高的诊断效能, 与常规序列纹理特征模型诊断效能相当, 但其简便、经济、直观的优势更有利于临床应用。

OR-0274

Immune-Related Visual Dysfunction in Thyroid Eye Disease: a Combined Orbital and Brain Neuroimaging Study

Haiyang Zhang¹, Yuting Liu¹, Mengda Jiang², Xiaofeng Tao², Jipeng Li¹, Yinwei Li¹, Jing Sun¹, Xuefei Song¹, Huifang Zhou¹, Xianqun Fan¹

1. Shanghai Ninth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine
2. Department of Radiology, Shanghai Ninth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

Objectives: To investigate the pathological interplay between immunity and the visual processing system (VPS) in thyroid eye disease (TED).

Methods: A total of 24 active patients (AP), 26 inactive patients (IP) of TED, and 27 healthy controls (HCs) were enrolled. Orbital magnetic resonance imaging (MRI) and resting-state functional MRI (rs-fMRI) were conducted for each participant. Multiple MRI parameters of the intraorbital optic nerve (ON) were assessed. The amplitude of low-frequency fluctuations (ALFF) and regional homogeneity (ReHo) were calculated. Correlation analyses were carried out on the above parameters and clinical characteristics.

Results: Visual functioning scores differentiated between the AP and IP groups. The ON subarachnoid space and ON sheath diameter were significantly higher in AP than in IP. Six vision-related brain regions were identified in TED patients compared with HCs, including right calcarine (CAL.R), right cuneus (CUN.R), left postcentral gyrus (PoCG.L), right middle temporal gyrus (MTG.R), left superior frontal gyrus (SFG.L), and left caudate (CAU.L). The brain activity of MTG.R, SFG.L, and CAU.L differentiated between the AP and IP groups. The correlation analysis revealed a close association among the vision-related brain regions, MRI parameters of ON, and clinical characteristics in AP and IP, respectively.

Conclusions: Combined orbital and brain neuroimaging revealed abnormalities of the VPS in TED, which had a close correlation with immune statuses. Vision-related brain regions in TED might be possibly altered by peripheral immunity via a direct or indirect approach.

Development and validation of benign and malignant thyroid nodule risk stratification system based on MRI morphological features

Tingting Zheng, Bin Song
Fudan University Minhang Hospital

Objects: This study aimed to develop and validate MRI predictive models, comparing with ultrasound thyroid nodule image reporting and data system (TI-RADS) for preoperative diagnosis of thyroid nodules.

Methods: We retrospectively analysed 825 postoperatively pathologically confirmed thyroid nodules (508 benign and 317 malignant). After removing nodules with specific MRI features, 594 nodules were divided into training set (n = 397) and validation set (n = 197). Predictors and corresponding regression β coefficients were obtained from univariate and multivariate analyses based on the clinical and MRI morphological features within the training group. Utilizing the minimum B regression coefficient the integer multiples of it from other predictors, the risk score is determined. The risk score was then combined with MRI specificity features to

develop an MRI-based risk stratification system (RSS). The sensitivity, specificity, accuracy, positive predictive value (PPV), negative predictive value (NPV), area under the receiver operative characteristic curve (AUC) and net reclassification index (NRI) of the MRI-based RSS were calculated and compared with TI-RADS.

Results: Multivariate logistic regression revealed age (OR = 1.96, P = 0.101, B = 0.672), high signal intensity on T2WI (OR = 3.92, P = 0.003, B = 1.367), restricted diffusion (OR = 39.54, P < 0.001, B = 3.677), reversed halo sign in delay phase (OR = 19.26, P < 0.001, B = 2.958), cystic degeneration (OR = 4.44, P = 0.03, B = 1.490) and wash-out pattern (OR=3.04, P=0.009, B=1.112) were risk factors for malignant nodules, each assigned a risk scores of 2, 4, 11, 9, 4 and 3, respectively. The optimal cutoff value for the risk score was 12. The MRI-based RSS exhibited accuracy, sensitivity, specificity, PPV, NPV and AUC of 94.4%, 96.0%, 93.4%, 89.9%, 96.5% and 0.947, respectively. Notably, this performance surpassed that of TI-RADSs and the difference was statistically significant (DeLong test, P < 0.05). The MRI-based RSS demonstrated improved accuracy (NRI > 0) compared to TI-RADSs.

Conclusions: Our MRI-based diagnostic model for distinguishing between benign and malignant thyroid nodules demonstrated strong diagnostic performance, thereby enhancing the accuracy of TI-RADS.

高分辨率 CT 多平面重组及曲面重组对外伤性听力损伤、面瘫的诊断价值

杨静

西安市中心医院

目的 探讨高分辨率 CT (HRCT) 听骨多平面重组 (MPR)、听骨链及面神经管曲面重组 (CPR) 在外伤性听骨链、面神经管损伤诊断中的应用价值。方法 对 139 例颞骨骨折后出现听力下降和/或面瘫的患者进行 HRCT 轴位扫描, 在 Philips EBW 工作站, 行听骨 MPR、听骨链、面神经管 CPR, 观察听骨链、面神经管损伤的位置、类型及邻近结构的累及情况。结果 139 例颞骨外伤后患者中, 听骨链损伤 80 耳 (80/139,57.55%), 面神经管骨折 40 耳 (40/139,28.78%), 听骨链损伤合并面神经管骨折 19 耳 (19/139,13.67%)。其中锤砧关节脱位 49 耳 (49/99,49.49%), 砧镫关节脱位 27 耳 (27/99,27.27%), 锤砧关节并砧镫关节脱位 21 耳 (21/99, 21.21%), 锤骨颈骨折 1 耳 (1/99,1.01%), 砧骨短突骨折 1 耳 (1/99, 1.01%); 面神经管迷路段骨折 6 耳 (6/59, 10.17%), 面神经管膝状神经窝骨折 19 耳 (19/59,32.20%), 面神经管鼓室段骨折 17 耳 (17/59,28.81%), 面神经管膝状神经窝并鼓室段骨折 11 耳 (11/59,18.64%), 面神经管迷路段、膝状神经窝、鼓室段并乳突段骨折 6 耳 (6/59,10.17%)。结论 HRCT 扫描结合 MPR、CPR 重组技术可清晰显示听骨、面神经管损伤情况, 为临床明确外伤后听力下降、面瘫患者的病因提供可靠的影像学参考依据。

Dark-blood computed tomography angiography combined with deep learning reconstruction for carotid artery wall imaging in Takayasu arteritis patients

Tong Su¹, Zhe Zhang¹, Yu Chen¹, Min Xu², Jian Wang², Zhengyu Jin¹

1. Peking Union Medical College Hospital

2. Canon Medical systems, China

Objectives To evaluate the image quality of a newly developed dark-blood CTA imaging combined with deep learning reconstruction (DLR) for visualizing the carotid artery wall in Takayasu arteritis (TAK) patients, compared to delayed-phase CTA images with hybrid iterative reconstruction (HIR).
Materials & Methods

This prospective study continuously recruited fifty-three TAK patients (mean age: 33.8 ± 10.2 years; 49 females) who underwent head-neck CTA scans. Arterial and delayed phase images were reconstructed using HIR and DLR. The subtraction images of arterial phase from delayed phase were then added to the original delayed phase with a denoising filter to generate the final dark-blood images. Qualitative scores and quantitative parameters were computed and compared among three groups of images: Delayed-HIR, Dark-blood-HIR, Dark-blood-DLR. The vessel wall thickness of common carotid artery was measured and the inter-rater variability was evaluated.

Results When compared with Delayed-HIR, Dark-blood-HIR images demonstrated higher qualitative scores in terms of vascular wall display ability and diagnostic confidence index (all $p < 0.001$). These qualitative scores of Dark-blood-HIR can be further improved with DLR in terms of overall image noise, vascular wall display ability, and diagnostic confidence index (all $p < 0.001$).

In quantitative analysis, the CNRs between the vessel wall and lumen of Dark-blood-HIR images for bilateral carotid arteries and brachiocephalic trunk were significantly higher compared to those of Delayed-HIR (all $p < 0.05$). The CNRs of Dark-blood-DLR images were further increased for all the neck arteries than those of Dark-blood-HIR (all $p < 0.001$). The highest intraclass correlation coefficient (ICC) value between two raters for wall thickness measurements was obtained on Dark-blood-DLR image (ICC, 0.958; 95% CI: 0.927, 0.976).

Conclusion

Compared to Delayed-HIR CTA, dark-blood method combined with DLR improved CTA image quality and enhanced visualization of carotid artery wall in TAK patients.

合成 MRI 技术联合直方图分析在预测局部晚期鼻咽癌患者放化疗早期治疗反应中的价值

杨凡、魏浩然、余小多、张红梅、林蒙

中国医学科学院肿瘤医院

目的: 早期监测鼻咽癌治疗反应对于调整临床治疗方案以及生存预测非常重要。本研究旨在探究合成 MRI (SyMRI) 联合直方图分析在预测鼻咽癌放疗后肿瘤残存中的价值。

方法: 此项前瞻性研究连续性的纳入了 42 例局部晚期的鼻咽癌患者, 所有患者均进行了标准治疗 (同步放化疗联合或不联合诱导化疗) 及规律随访。根据实体肿瘤反应评估标准, 两位放射科医生在治疗完成后 12 周进行评估。此研究一共有 16 和 26 例患者被分为残留组和非残留组。两名放射科医生分别在 SyT2WI 上勾画原发肿瘤的体积, 除外坏死和出血, 并提取直方图参数 (第 90 百分位数 (90th)、平均值 (Mean)、熵 (Entropy) 和平均绝对偏差 (MAD))。根据情况采用独立样

本 t、曼-惠特尼 U 或卡方检验。此外,使用多变量逻辑回归构建模型 (SyMRI 单模型、临床 (Clinic) 单模型、SyMRI+Clinic 模型和 TNM 分期模型)。最后构建列线图并绘制校准曲线 (n=1000)。Delong 检验用于比较模型性能。

结果:从 T1 图、T2 图和 PD 图得出的直方图参数均显示出极好的组间一致性 (ICC 均 ≥ 0.965)。在单变量分析中,非残留组 T2_90th、T2_Mean、PD_90th、PD_Mean 和 PD_Entropy 均高于残留组 (P 值均 ≤ 0.020)。经过多变量逻辑回归分析,纳入 PD_Mean 和 PD_Entropy 构建 SyMRI 单模型 (AUC: 0.834),纳入两个临床因素 (EBV DNA 水平和年龄) 构建 Clinic 单模型 (AUC: 0.745)。组合模型共纳入 PD_Mean、PD_Entropy、EBV DNA 水平和年龄,其 AUC 为 0.894。与 Clinic 单模型相比,组合模型的性能明显更高 (P=0.041),而与 SyMRI 单模型相比无明显差异 (P=0.165)。此外,组合模型比 TNM 模型显示出更高的预测性能 (AUC: 0.666, P=0.026)。

结论:治疗前的 SyMRI 参数为鼻咽癌的早期治疗反应评估提供了一种无创方法。SyMRI 和临床因素的组合模型可为个体治疗方案制定和预后预测提供参考价值。

OR-0279

18F-FDG PET/MR 在口腔癌中分期及复发检测中的临床应用

王芳晓、许远帆、潘建虎
杭州全景医学影像诊断中心

目的:探讨 18F-FDG PET/MR 在评价口腔癌分期及复发检测中的临床应用价值。

方法:回顾性分析接受 18F-FDG PET/MR 检查的 31 名口腔癌患者的资料,由 2 名核医学科医师对 PET/MR 图像进行诊断评价。采用 Kappa 一致性检验评价口腔癌 PET/MR 分期和病理金标准的诊断一致性;采用诊断试验评价指标评估 PET/MR 对复发检测的应用价值。

结果:18F-FDG PET/MR 术前临床分期与金标准的诊断一致性较高 (Kappa 值=0.897)。PET/MR 检测复发的灵敏度为 100%,特异性为 94.3%,准确率为 95.4%,阳性预测值为 88%,阴性预测值为 100%。

结论:18F-FDG PET/MR 对口腔癌分期及复发检测具有较高的应用价值,有望成为一种准确、无创评估口腔癌患者病情的影像学检查方法。

Use of diffusion kurtosis imaging and dynamic contrast-enhanced MRI for differentiating parotid gland tumors

Zijun Liu¹, Baohong Wen¹, Zanzia Zhang¹, Feifei Qu², Yanglei Wu³, Robert Grimm⁴, Yong Zhang¹, Jingliang Cheng¹, Yan Zhang¹

1. The First Affiliated Hospital of Zhengzhou University
2. MR Collaboration, Siemens Healthineer Ltd., Shanghai, China
3. MR Collaboration, Siemens Healthineer Ltd., Beijing, China
4. MR Application Predevelopment, Siemens Healthcare GmbH, Erlangen, Germany

Objectives:

To evaluate the diagnostic performance of combined diffusion kurtosis imaging (DKI) and dynamic contrast-enhanced MRI (DCE-MRI) for differentiating parotid gland tumors (PGTs).

Methods:

One hundred forty-two patients with PGTs verified by histopathology were enrolled. The patients were divided into four groups: malignant tumors (MTs), pleomorphic adenomas (PAs), Warthin tumors (WTs), and basal cell adenomas (BCAs). All MRI examinations were conducted using a 3T MRI scanner with a 20-channel head and neck coil. Quantitative parameters of DCE-MRI and DKI and their relative values were determined. Using the Kruskal-Wallis H test, post hoc test with Bonferroni correction, one-way analysis of variance (ANOVA) and post hoc test with LSD method, and the ROC curve for statistical analysis. Statistical significance was set at $p < 0.05$.

Results:

Only the combination of DKI and DCE-MRI parameters could reliably distinguish BCAs from other PGTs. PAs demonstrated the lowest K^{trans} value (0.09, [0.06-0.20] min^{-1}), relative K^{trans} (rK^{trans}) (-0.24, [-0.64, 1.00]), K_{ep} value (0.32, [0.22-0.53] min^{-1}), relative K_{ep} (rK_{ep}) (-0.71, [-0.81, -0.56]) and iAUC value (0.15, [0.09-0.26] $\text{mmol}\cdot\text{s}/\text{kg}$) compared with WTs, BCAs, and MTs (all $p < 0.05$). The D values of WTs and MTs were significantly lower than those of BCAs ($1.71 \pm 0.29 \times 10^{-3} \text{mm}^2/\text{s}$) (all $p < 0.001$). In addition, MTs had lower K_{ep} (0.71, [0.52-1.28] min^{-1}) value and lower K^{trans} (0.17 [0.10, 0.31] min^{-1}) value than WTs (all $p < 0.05$). The ROC curve demonstrated that the combination of the rK_{ep} and rK^{trans} values (AUC, 0.906), D value (AUC, 0.841), and K_{ep} value (AUC, 0.815) could provide higher diagnostic efficacy for stepwise identification of PAs, BCAs, and WTs.

Conclusions:

DKI and DCE-MRI can be used to differentiate PGTs quantitatively and can complement each other. Evaluation of the relative values of quantitative parameters is helpful to improve the ability of differential diagnosis.

安罗替尼联合放疗治疗伴瘤周水肿的 有症状脑转移瘤患者的回顾性队列研究

黄诗琪、李晓霞、王雪真、陈金梅、洪金省
福建医科大学附属第一医院

目的 回顾性分析放疗期间有无联用安罗替尼治疗伴瘤周水肿的有症状脑转移瘤患者在放疗前后瘤周水肿和肿瘤体积的变化情况, 探讨安罗替尼在减轻瘤周水肿和控制肿瘤方面的疗效。

方法 回顾性收集 2018 年 11 月至 2022 年 6 月于福建医科大学附属第一医院放疗科就诊的所有脑转移瘤患者的相关资料。对放疗前后检查的颅脑 MR 资料, 于 T1 增强序列勾画每例患者的脑转移瘤的肿瘤体积, 于 FLAIR 加权序列勾画瘤周水肿体积, 于 T1 平扫序列勾画颅顶至第二颈椎上缘的颅骨内缘体积为全脑体积。主要观察指标: 肿瘤体积退缩率、水肿指数、水肿体积退缩率、病变体积退缩率及病变体积脑占比。组间差异性分析采用卡方检验以及 wilcoxon 秩和检验。采用多因素 logistic 回归分析放疗期间影响瘤周水肿及肿瘤体积的相关因素。

结果 共纳入 60 例脑转移瘤患者, 其中放疗联合安罗替尼组 14 例, 单纯放疗组 46 例; 男性 43 例, 女性 17 例。两组患者中位肿瘤体积退缩率分别为 75.8% 和 60.2%, 二者差异有统计学意义 ($P=0.043$)。两组患者中位水肿指数差值分别为 0.13 ± 0.22 和 0.02 ± 0.19 , 二者差异有统计学意义 ($P=0.043$)。两组患者的中位水肿体积退缩率分别为 88.0% 和 48.0%, 两组差异有统计学意义 ($P=0.003$)。两组患者的放疗前后中位病变体积脑占比差值分别为 9.18% 和 1.57%, 二者差异有统计学意义 ($P<0.001$)。两组患者的中位病变体积退缩率分别为 79.8% 和 50.5%, 两组间差异有统计学意义 ($P=0.003$)。多因素 logistics 回归分析显示放疗期间联用安罗替尼是放疗后瘤周水肿体积退缩率 ($OR=0.104$)、病变体积退缩率 ($OR=0.220$)、病变体积脑占比变化率 ($OR=0.030$) 的保护因素。

结论 安罗替尼联合放疗治疗有合并瘤周水肿的症状脑转移瘤患者, 可在放疗后早期快速缩小瘤周水肿和肿瘤体积。

OR-0282

An investigation of gray matter morphology and white matter integrity abnormalities in dysthyroid optic neuropathy using tract-based spatial statistics and surface-based morphometry study

Mengsha Zou¹, Hongzhang Zhu¹, Dide Wu², Cui Yan¹, Shubin Hong², Zhiyun Yang¹

1. Department of Radiology, The First Affiliated Hospital of Sun Yat-sen University

2. Department of Endocrinology, The First Affiliated Hospital of Sun Yat-sen University

Purpose: To explore changes in the morphological and microstructural of grey and white matter beyond the eye and the visual pathways in DON patients.

Methods: We acquired magnetic resonance imaging from 42 DON patients and 42 well-matched healthy controls. Cortical thickness, cortical volume and area were measured using the surface-based morphometry (SBM) approach. We also evaluated DTI-metrics (fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD) and radial diffusivity (RD)) derived from diffusion spectrum imaging data using tract-based spatial statistics (TBSS). Correlations between alterations in brain structure and clinical symptoms were analyzed in all patients.

Results: Compared with controls, DON patients exhibited decrease cortical volume in precuneus and occipital pole. DON patients exhibited decrease cortical area in precuneus and precentral gyrus. DON exhibited widespread decreased FA value (Genu of corpus callosum, body of corpus callosum, anterior corona radiata superior corona radiata, posterior corona radiata and superior longitudinal fasciculus). MD, AD and RD showed no significant difference between DON patients and HC. In patient group, the FA value in the body of corpus callosum was positively correlated with visual acuity ($r = 0.446$, $P = 0.015$).

Conclusion: DON patients demonstrated reduced cortical volume and area structural alteration of precuneus, and cortical volume change in occipital pole. Microstructural alterations in brain white matter. Combined multimodal neuroimaging methods may provide a more comprehensive understanding of DON's pathological mechanism.

OR-0283

Clinical and imaging analysis of nerve sheath myxoma

Qiaoying Zhang, Hongsheng Liu, Jiping Dong
Xi'an Central Hospital

Objective: To improve the understanding of nerve sheath myxoma (NSM) and the accuracy of preoperative diagnosis by reviewing this case and literature.

Methods: A case of NSM of facial nerve confirmed by surgery and pathology in our hospital was collected, and 117 cases of NSM reported in the literature from 1996 to 2022 in China were collected, and their clinical and imaging characteristics were summarized.

Results: 1. After screening, there were a total of 89 reliable cases, including 40 males and 49 females. 2. The onset age ranged from 9 months to 75 years old, and the average onset age was 39.32 ± 14.22 years old. 3. There were 34 cases with clear onset site, among which 13 cases occurred in the limbs; 6 cases in the trunk; 6 cases in other parts. 4. 87 cases were single lesions, 2 cases were multiple. 5. Most of them are painless masses, which may increase gradually. 6. All patients underwent surgical resection, and the follow-up period ranged from 6 months to 5 years. No recurrence was found. 7. The maximum diameter of the tumor was 2.53 ± 2.23 cm, and the median was 1.2 cm.

Conclusion: The age of onset of the disease is wide, and the peak incidence is between 30 and 48 years old. There are slightly more women than men. The extremities are the most common sites of

disease, especially the fingers. The domestic and foreign literatures have not reported NSM occurring in the facial nerve, and this case is the first case. Most are solitary lesions. Tumors are generally small, grow slowly, and have a longer course of disease. Often a painless lump. On imaging, the lesions presented as soft tissue masses, with slightly hypointensity on T1WI and slightly hyperintensity on T2WI and DWI. The lesions showed obvious ring enhancement and delayed phase enhancement, and the contrast agent tended to fill in. When the tumor occurs in the facial nerve, there may be bone destruction of the facial nerve canal. The effect of surgical resection is good, and the overall recurrence rate is low.

OR-0284

Dixon MRI based quantitative parameters of extraocular muscles, intraorbital fat and lacrimal glands for staging thyroid-associated ophthalmopathy

Xiongying Pu, Lu Chen, Qian Wu, Hao Hu, Xiaoquan Xu, Feiyun Wu
Jiangsu province hospital

Purpose: To investigate the value of Dixon magnetic resonance imaging (MRI) based quantitative parameters of extraocular muscles (EOMs), intraorbital fat (IF) and lacrimal glands (LGs) in staging the patients with thyroid-associated ophthalmopathy (TAO).

Methods: Two hundreds of patients with TAO (211 active and 189 inactive eyes) who underwent Dixon MRI for pre-treatment evaluation were retrospectively enrolled, and divided into training cohort (169 active and 151 inactive eyes) and validation cohort (42 active and 38 inactive eyes). Maximum, mean, and minimum values of signal intensity ratios (SIRs), fat fraction (FF) and water fraction (WF) of EOMs, IF and LGs were measured and compared between active and inactive group in training cohort. Binary logistic regression analysis, receiver operating characteristic curves analyses and Delong test were used in further statistical analyses as appropriate.

Results: Active TAOs showed significantly higher EOM-SIRmax, EOM-SIRmean, EOM-SIRmin, IF-SIRmax, IF-SIRmean, LG-SIRmax, LG-SIRmean, EOM-WFmean, EOM-WFmin, IF-WFmax, IF-WFmean and LG-WFmean, and lower EOM-FFmax, EOM-FFmean, IF-FFmean, IF-FFmin and LG-FFmean than inactive TAOs (all $P < 0.05$). EOM-SIRmean, LG-SIRmean and LG-FFmean were found to be independently associated with active TAO (all $P < 0.05$). Combination of EOM-SIRmean, LG-SIRmean and LG-FFmean showed better performance than EOM-SIRmean alone in staging TAO in both training (AUC, 0.820 vs 0.793; $P = 0.016$) and validation (AUC, 0.751 vs 0.733, $P = 0.341$) cohort.

Conclusion: Dixon MRI based parameters of EOMs, LGs and IF are all useful for differentiating active from inactive TAOs. Integration of multiple parameters can further improve the staging performance.

OR-0285

Abnormal regional spontaneous neural activity and functional connectivity in thyroid-associated ophthalmopathy patients with different activity: a resting-state fMRI study

Mengda Jiang

上海交通大学医学附属第九人民医院

Purpose: We aimed to evaluate the spontaneous neuronal activity and functional connectivity pattern variations using resting-state functional magnetic resonance imaging (rs-fMRI) measures, such as amplitude of low-frequency fluctuation (ALFF), fractional amplitude of low-frequency fluctuation (fALFF), and functional connectivity (FC), in patients with thyroid-associated ophthalmopathy (TAO).

Method: A total of 24 active TAO patients, 26 inactive TAO patients, and 27 matched healthy controls (HCs) were included. First, ALFF and fALFF were used to detect local neural activity changes, the MRI data were analyzed, and regions with group differences were taken as seeds. Second, FC analysis was performed to explore the altered connection between seeds and other brain regions. A correlation analysis was performed to assess the relationship between functional brain activity and clinical indices and neuropsychiatric behaviors.

Results: Compared to HCs, both active and inactive TAO patients exhibited significantly lower ALFF values in the right calcarine (Calcarine_R) and left postcentral gyrus (Postcentral_L). Active TAO patients also showed significantly higher ALFF values in the left caudate nucleus (Caudate_L) and increased fALFF values in the superior lobe of the right cerebellum (Cerebelum_Crus1_R). Moreover, both active and inactive TAO patients demonstrated decreased FC within the left postcentral gyrus (Postcentral_L) compared to HCs. Additionally, active TAO patients exhibited lower FC compared to inactive TAO patients. The ALFF values in the Calcarine_R of active TAO patients positively correlated with disease duration ($r = 0.5892$, $P = 0.0049$) and the Hamilton Anxiety Rating Scale (HARS) ($r = 0.5377$, $P = 0.0119$). Furthermore, the ALFF value in the Calcarine_R of inactive TAO patients negatively correlated with visual functioning ($r = -0.5449$, $P = 0.0072$), while the ALFF values in the Caudate_L of active TAO patients positively correlated with visual functioning ($r = 0.6496$, $P = 0.0014$).

Conclusions: We found that the Caudate_L and Cerebelum_Crus1_R related to motor control and coordination in active TAO patients exhibit significant compensatory mechanisms; whereas, the Calcarine_R and Postcentral_L related to visual and somatosensory cortices show varying degrees of impairment. Our findings complement the functional neural mechanism of TAO.

OR-0286

Apparent diffusion coefficient histogram analysis of adenoid cystic carcinoma: correlation with histopathology and the prediction of survival

Weiqing Tang

Shanghai 9th People's Hospital

Introduction

Adenoid cystic carcinoma (ACC) is a rare malignancy that mainly rises from major and minor salivary glands, which was described as “one of the most biologically destructive and unpredictable tumors of the head and neck”, for having a distinct natural history characterized by slow-growing

but high frequency of local recurrence, perineural spread, and development of distant metastasis^{1, 2}.

The current study aimed to analyze the DWI histogram to construct a diagnosed model for distinguishing different subtypes of ACC. The usefulness of this model in predicting the survival of ACC was also assessed.

Method

MRI data of our institution were retrospectively reviewed. Inclusion criteria were (1) Primary ACC located in the head and neck region; (2) diagnosis of cases was confirmed by surgical pathology and pathological subtype were diagnosed; (3) all cases underwent the MR examinations within 2 weeks before surgery. And exclusion criteria were (1) patients who had received any treatment (biopsy, neoadjuvant chemotherapy, or prior radiotherapy) before the MR exam; (2) those who had other head and neck tumors previously or recurrent disease; (3) poor image quality because of artifacts.

In most ACCs, all three patterns coexist and are interleaved in such a manner that diagnosis depends on the pathologist's subjective interpretation. According to the definition, low-grade ACC consists of Perzin grade I (predominantly tubular, no solid) and II (predominantly cribriform, <30% solid). High-grade ACC thus consists of Perzin grade III (>30% solid component). Specimens were subdivided into low- and high-grade ACC for analysis.

All MR images were obtained from 3T MR scanners (Ingenia, Philips Medical Systems; MAGNETOM Vida, Siemens) with a 16-channel head and neck coil. Pre-enhancement MR sequences included axial T1WI, axial and coronal T2WI, and diffusion weighted imaging (DWI). DWI images were obtained by using a spin-echo echo-planar imaging sequence with b values of 0 and 800 sec/mm². Axial and coronal post-enhancement T1WI were obtained after administration of gadopentetate dimeglumine at a dose of 0.1 mmol/kg of body weight at an injection rate of 2 ml/s. The corresponding ADC map of were constructed by a monoexponentially fitting model with the b values of 0 and 800 sec/mm².

The preprocess and the feature extraction were implemented by PyRadiomics 3.0.1 and followed the Image biomarker standardization initiative (IBSI). All cases were resampled into an inner resolution of 0.56mmx0.56mm by a fit-to-original-grid approach and the ROI was re-segmented part by a 3-sigma approach. Considering the sequence is not quantitative, we normalized the sequence for each case respectively by Z-score. For the histogram analysis of ADC maps, we used the Ostu threshold algorithm to estimate the cut-off value for splitting the high- and low-ADC sub-regions. The 10%, 50%, 90%, the mean value of ADC values of each region were estimated. Then we used these features to develop the machine learning model to estimate the prediction of the ACC subtypes. Cox regression with multivariable analysis were used to construct the survival signature.

Result

The final study population was comprised of 107 cases (41 men, 66 women; mean age, 52.4 ± 13.5 years). The gender and the T stage were found significant differences between low- and high-grade groups with the $\chi^2=4.757$ ($P=0.029$) and $\chi^2=7.713$ ($P=0.007$), respectively. The median OS time was 27 months for all patients (range, 5–78 days). During the follow-up period, 27 patients (25.2%) had experienced a confirmed death.

The ADC values of all cases were distributed in a nearly normal fashion and the cut-off value was 1.3×10^{-3} mm²/s (figure 1). Based on the ROC analyses, the ADC_10th percentile and ADC_50th percentile values achieved higher diagnostic efficacy with an AUC of 0.821 and 0.804, a sensitivity of 94.4% and 83.3%, and specificity of 61.7% and 68.5%, for differentiating the low-grade group from a high-grade group at the cutoff value of 0.92×10^{-3} mm²/s and 1.10×10^{-3} mm²/s, respectively.

Cox proportional hazards model found that radiomic signature and tumor stage were significant predictors in ACC patients (radiomic signature: HR: 3.13, 95% CI:1.95–5.24, $P < 0.001$; stage: HR: 3.25, 95% CI: 1.01–2.35, $P = 0.042$).

Discussion

In this study, the results revealed significant differences in several radiomics features of DWI that could be used to predict the histological subgroup of ACC. The combination of radiomics parameters of DWI significantly improved the differentiating ability of subtypes than radiomics

parameters of DWI alone, which could potentially be used in clinical practice regarding the ACC evaluation before treatment. A diagnostic model was found useful not only in the diagnosis of the histopathological subgroup of ACC but also in the prediction of survival rate.

Conclusion

Histogram analysis of ADC values may be helpful for differentiating the subtypes of ACC, leading to improved targeted treatment and reduced morbidity.

OR-0287

不同颅内压状态下乙状窦源性耳鸣患者的临床特征分析

陈澜月、马晓博、周梦迪、曲晓霞、刘兆会
首都医科大学附属北京同仁医院

目的 探讨高颅内压和正常颅内压状态下乙状窦源性耳鸣患者临床特征的差异。**方法** 收集 2019 年 10 月~2022 年 1 月就诊于首都医科大学附属北京同仁医院的乙状窦源性耳鸣患者。所有患者行一站式颞骨双期增强 CT (DPCT) 以及颅脑 MRV 检查。基于 DPCT 进行乙状窦源性耳鸣病因评价, 最终入选乙状窦源性耳鸣患者 66 例 (乙状窦沟骨板缺损 55 例, 乙状窦憩室 11 例)。基于颅脑 MRV 使用横窦狭窄指数 (ITSS) 方法进行颅内压评价, 对横窦进行分类 (0~4 量表值), 即 0 表示横窦无狭窄; 1 表示狭窄<33%; 2 表示狭窄 33~66%; 3 表示狭窄>66%; 4 表示发育不全或未发育。ITSS=左侧横窦狭窄程度的量表值×右侧横窦狭窄程度的量表值。当 ITSS≥4 时, 则认定为存在颅内高压; 当 ITSS<4 时, 则认定为颅内压正常。最终将患者分为高颅内压组 41 例, 正常颅内压组 25 例。回顾性分析两组患者的人口学资料、临床指标、耳鸣特征及血生化检查的差异。**结果** 高颅内压组和正常颅内压组身体质量指数 (BMI) 分别是 24.98 kg/m² (22.87 kg/m², 28.46 kg/m²) 和 24.01 kg/m² (20.34 kg/m², 25.03 kg/m²), 耳鸣障碍评估量表 (THI) 评分分别是 (45.59±23.47) 分和 (33.84±20.13) 分。高颅内压组的 BMI 和 THI 评分均明显高于正常颅内压组 (P 分别是 0.042 和 0.047)。两组间年龄、性别、左右利手、耳鸣侧别、平均动脉压 (MAP)、耳鸣持续时间、耳鸣频率、耳鸣响度及血生化指标均无显著性差异。**结论** 本研究发现高颅内压和正常颅内压的乙状窦源性耳鸣患者临床特征存在差异, 具体表现为高颅内压的耳鸣患者 BMI 和 THI 评分明显升高。深入了对乙状窦源性耳鸣的认知, 为临床医生针对不同特征的乙状窦源性耳鸣患者制定个性化治疗方案提供参考依据。

OR-0288

Whole-brain morphological network alterations in patients with H3K27M-altered diffuse midline glioma

Di Chen^{1,2}, Simin Zhang^{1,2}, Qiyong Gong^{1,2}, Qiang Yue^{1,2}

1. West China Hospital, Sichuan University

2. Huaxi Glioma Center, West China Hospital of Sichuan University, Chengdu, China

Objectives: H3K27M-altered diffuse midline glioma (DMG-A) is a malignant glioma that mostly affects children and adolescents, with a median survival of 11 months, the prognosis remains dismal. While previous research tended to focus on the tumor mass itself, often overlooking the structural and functional alternations in the entire brain induced by this entity. Actually, recent studies demonstrate that glioma is a whole-brain disease, as tumor cells spread far beyond the macroscopically visible lesion and form networks throughout the whole brain. However, little is known about the alterations in the morphological networks of the whole brain in patients with DMG-A. Thus, in the current study, we aimed to perform a comparative analysis of the topological properties of cortical thickness morphological networks in DMG patients with and without H3K27M alterations to elucidate their effects on whole brain.

Methods: High-resolution 3D T1 structural images were acquired from 70 DMG-A patients, 84 wild-type diffuse midline glioma (DMG-W) patients and 86 age- and sex-matched healthy controls (HC). Cortical thickness was extracted from 68 brain regions to construct the whole-brain structural covariance networks by calculating the Pearson correlation coefficients. The topological properties of these networks were analyzed by using graph theory. Network-based statistic (NBS) was employed to determine the connected subnetwork. Finally, the differences in nodal properties and network metrics between groups were compared using a non-parametric test. **Results:** Compared with HC, patients with DMG-A had smaller nodal efficiency in the lingual gyrus, insula, pericalcarine, parahippocampal gyrus and transversetemporal gyrus. Additionally, patients with DMG-W had smaller nodal degree and nodal efficiency in the insula, transverse temporal gyrus and visual cortex (i.e., lingual gyrus, pericalcarine, cuneus gyrus and lateraloccipital gyrus). NBS analysis revealed decreased morphological connections in the default mode network, sensorimotor network, salience network, auditory network and visual network, in both DMG-A and DMG-W group. Moreover, when compared DMG-A with DMG-W, DMG-A showed further decreased morphological connections in the whole brain network.

Conclusions: The decrease in nodal properties and connections in the whole-brain network of both DMG-A and DMG-W suggests a significant disruption of the topological organization of their structural covariance network (SCN). Furthermore, the connections of the whole-brain morphological network were further decreased in mutant patients compared to the wild type, indicating that the presence of H3K27M mutations may be associated with more aggressive whole-brain network damage. These findings provide new insights into the whole-brain tumor burden induced by DMG and may potentially aid in the tailoring and monitoring of DMG therapy.

多参数定量磁共振技术评估甲状腺相关眼病活动性

唐宇轩¹、高鹏¹、张维升¹、邢倩²

1. 大连医科大学放射科附属第一医院放射科
2. 大连医科大学放射科附属第一医院内分泌科

【目的】研究旨在联合应用 Dixon 成像、T2 mapping 成像及扩散张量成像 (DTI) 在评价甲状腺眼病 (TAO) 患者眼眶内部的微结构变化并评估疾病活动性方面的能力

【方法】招募 30 例 TAO 患者及 15 例健康志愿者 (HC)，患者及健康志愿者在飞利浦 3.0T (使用 32 通道头线圈) 上接受 MRI 扫描，协议包括：轴位 T2WI、轴位 Dixon-T2WI、冠状位 T2WI、冠状位 Dixon-quant、冠状位 T2 mapping、冠状位 DTI。部分需行进静脉激素治疗的患者在治疗前行 MRI 检查。患者图像及数据在飞利浦工作站上进行后处理。同时由资深眼科医师与内分泌医师给患者行 CAS 评分，依据评分将患者分为活动组 (CAS>3) 和非活动组 (CAS≤2)。对患者及志愿者共 90 只眼睛进行图像分析及数据测量，测量结构包括眼肌、眼眶、泪腺及视神经，在冠状位 Dixon 和 T2 mapping 图像上完整勾画眼肌、泪腺及眼眶的轮廓，在冠状位 DTI 图像上完整勾画眼肌与视神经的轮廓。最终比较活动性患者、非活动患者及健康志愿者在定量数据上的差异，并评估活动期的诊断效率。

【结果】与对照组相比，TAO 眼外肌和泪腺的脂肪分数与水值显著升高 ($p<0.001$)；眼眶组织的脂肪分数与水值差异无统计学意义。活动性与非活动性患者间无明显差异。视神经的 FA 值与 ADC 值患者与对照组间相比显著升高。患者组内差异无统计学意义。眼肌 ADC 值在患者组内及对照组间差异有统计学意义，FA 只在对照组间差异有统计学意义。活动性患者与非活动性患者眼肌、眼眶、泪腺 T2 值差异均有统计学意义。影像数据与临床指标 (甲功五项) 联合的模型诊断效能最优 (AUC=0.945)。

【结论】Dixon、DTI、T2 mapping 辅助诊断 TAO 效果良好。T2 mapping 可以评估患者眼眶重塑情况，效能优于 Dixon 与 DTI。MRI 多参数定量与 CAS 评分有相关性，联合使用从多角度评估 TAO 的活动性，与临床指标结合的模型诊断效能更优。

基于深度学习模型实现在颈椎 MR 图像上对脊髓及椎管的自动测量

马超、曹凯、杨家诚、冯小晨、林丽娜、陆建平、邵成伟
中国人民解放军海军军医大学第一附属医院

目的：脊髓型颈椎病无症状或轻症患者应避免进行性脊髓损伤，早期诊断及治疗尤为重要。基于颈椎 MR 的脊髓及椎管测量可以量化诊断依据，有助于及时诊断。然而，测量严重依赖工具且耗时耗力，临床实际应用较少。因此，本研究拟探讨基于深度学习自动化测量颈椎 MR 脊髓和椎管的可行性。**方法：**回顾性连续收集 2021 年 1 月至 2021 年 12 月，在上海长海医院健康管理中心的 614 例被检者的颈椎 MR 平扫图像。其中，横断位 T2WI 图像 1194 张，矢状位 T2WI 图像 558 张。由一位低年资放射科主治医师（6 年）在每例被检者的矢状位 T2WI 图像和横断位 T2WI 图像上，使用 labelme 软件对脊髓和椎管进行手工分割，并测量计算脊髓最大受压程度、椎管最大狭窄程度、横截面积及压缩比。由一名放射科主任医师（25 年）对其标注及测量结果进行复核修改作为金标准。将所有图像按照 8: 1: 1 比例随机分为训练集 (n=487)、调优集 (n=61)、测试集 (n=61)，采用训练集数据训练 Swin Transformer 分割模型和关键点检测模型。由另一名高年资放射科主治医师（10 年）在测试集的矢状位 T2WI 图像和横断位 T2WI 图像上对脊髓和椎管进行手工分割，并测量计算作为人工组结果。在测试集中采用 Dice 相似系数 (DSC)、交并比 (IoU) 评价模型的分割效能，使用同类相关系数 (ICC) 方法比较模型组、人工组与金标准测量结果的一致性。**结果：**在测试集中 Swin Transformer 模型分割脊髓（横断位、矢状位）的 DSC 值 (%) 和 IoU 值 (%) 分别为 93.88%、94.48% 和 88.46%、89.53%，分割椎管（矢状位）的 DSC 值 (%) 和 IoU 值 (%) 分别为 86.21%、75.76%。在测试集中模型组与金标准的组间 ICC 值为 0.861，人工组与金标准的组间 ICC 值为 0.773，两者差异具有统计学意义 ($p < 0.001$)。**结论：**深度学习 Swin Transformer 模型对颈椎 MR 平扫图像自动化分割脊髓及椎管具有较高的准确性，模型测量结果与金标准测量一致性良好，为脊髓型颈椎病早期诊断量化依据的临床应用奠定了基础。

3D 酰胺质子转移成像 APT MRI 预测基线鼻咽癌的肿瘤(T) 分期

钱李娟¹、喻杰¹、刘园¹、陈慢慢¹、孙鹏²、黄晶¹、李欣¹、杨帆¹

1. 华中科技大学同济医学院附属协和医院

2. 飞利浦医疗科技有限公司

目的：

基线鼻咽癌分期对临床诊断及放化疗有重要意义。我们旨在研究 3D APTw MRI 在预测鼻咽癌分级方面的潜在价值，与弥散加权成像 (DWI) 和 EBV DNA 相比，并确定 APTw MRI 多参数与鼻咽癌 (NPC) 分期之间的关联。

方法：

从 2022 年 6 月至 2023 年 2 月，所有经病理学分析确认为未经治疗、病变大于 1 厘米且 MRI 质量良好的鼻咽癌患者作为研究对象。所有参与者在术前进行了 3D APTw 成像扫描，使用 3.0 T 扫描仪，并进行了扩散加权成像 (DWI)。两位资深放射科医生根据 5 分 Likert 量表评估 APTw 图像的质量。然后对感兴趣区域 (ROI) 进行了复审和批准。从每个 ROI 中获取了平均 APT 值 (APTmean)、90th 百分位数 (APT90)、10th 百分位数 (APT10)、峰度、偏度和 ADC 值。

我们的研究使用相同的实验室方法在同一机构对所有患者进行了 EB 病毒 DNA 的测量。使用曼-惠特尼 U 检验生成接受者操作特征曲线来评估这些定量参数的诊断性能。

结果

76 名鼻咽癌患者 (平均年龄 49 岁 \pm 19[标准差]; 61 名男性, 15 名女性) 根据 AJCC/UICC TNM 第八版对患者进行了分期。56 例为高分期鼻咽癌, 20 例为低分期鼻咽癌。高分期鼻咽癌 (T3 和 T4) 的 APTmean 明显高于低分期鼻咽癌 (3.76 vs 2.83, $p=0.01$)。APT90、Skewness 和 Kurtosis 在高分期和低分期之间存在显著差异 (5.37 vs 4.37, $p=0.04$; 0.23 vs -0.02, $p=0.04$; 3.24 vs 2.69, $p=0.006$)。与 EBV DNA 相比, APTw 在区分低分期和高分期鼻咽癌方面的受试者工作特征曲线下面积 (AUC) 为 0.812 (0.694–0.931)。受试者间一致性: ICC 为 0.944 (0.938 < ICC < 0.95)。鼻咽癌高分期和低分期的 ADC 值没有显著差异 (0.70 vs 0.75)。

结论

联合 3D APT w 成像和 EBV DNA 有潜力改善鼻咽癌的组织学鉴别, 能更客观量化更准确区分低分级和高分级的鼻咽癌。

深度学习图像重建算法在来自全脑 CT 灌注的 脑 CTA 图像中的应用价值研究

雷丽敏、周宇涵、马金平、曹伟萌、岳松伟
郑州大学第一附属医院

目的: 通过与常规扫描的 CT 血管造影 (CTA) 相比较, 评估深度学习图像重建 (DLIR) 算法在由 CT 灌注 (CTP) 动脉峰值期重建的 CTA 图像中的应用价值。

方法: 前瞻性纳入 39 例由 LVO 引起的 AIS 患者, 所有患者在症状出现后 24 小时内接受了头颅 CT 平扫、CTP 和 CTA 检查。使用 FBP、ASIR-V40%、ASIR-V80% 和三种不同强度水平的 DLIR (DLIR-L, M, H) 算法重建层厚为 0.625mm 的 CTP 动脉峰值期图像, 并将其与 ASIR-V80% 重建的常规 CTA 图像进行比较。在健侧轴位图像上, 于颈内动脉 (ICA) 虹吸部、大脑中动脉 M1 段 (MCA-M1) 和颞肌上绘制 ROI, 测量并比较对应的 CT 值、图像噪声值 (SD 值)、信噪比 (SNR) 和对比噪声比 (CNR)。主观评价包括图像噪声、血管边缘锐利度、小血管显示和整体图像质量。采用六分评分法对七组 CTA 图像的侧支循环进行评分。

结果: 七组 CTA 图像于 ICA 虹吸部、MCA-M1 和颞肌的 CT 值均无统计学差异 ($P>0.05$)。DLIR-M、DLIR-H 与常规 CTA 图像的 SD、SNR 和 CNR 相当 ($P>0.05$)。与常规 CTA 组相比, ASIR-V80% 组的 SD 值稍高, SNR 稍低 ($P<0.05$), 但 ASIR-V80%、DLIR-M 和 DLIR-H 三组之间无统计学差异 ($P>0.05$)。DLIR-M 和 DLIR-H 组图像的主观评分仅在小血管显示方面低于常规 CTA 组 ($P<0.05$)。ASIR-V80% 组的图像噪声和整体图像质量低于 DLIR-M 和 DLIR-H 组 ($P<0.05$), 三组的血管边缘锐利度和小血管显示无显著差异。每位患者六组重建 CTA 图像的侧支循环评分均与常规 CTA 图像一致。

结论: DLIR-H 和 DLIR-M 重建的 CTP 动脉峰值期图像的客观和主观图像质量与常规 CTA 图像相当, 优于 FBP 和 ASIR-V 算法。从 CTP 数据中重建 CTA 图像不仅可以避免多次扫描以减少辐射暴露和造影剂剂量, 且缩短了急性脑梗死患者的检查时间。

基于超声图像的甲状腺结节可解释性机器学习诊断系统构建与验证

张璐、金哲、张斌、张水兴
暨南大学附属第一医院

目的: 目前用于甲状腺结节风险分层的系统存在特异性低和活检率高的问题。最近, 机器学习模型被用于甲状腺结节超声辅助诊断, 但诊断过程缺乏可解释性。因此, 本研究旨在开发一个可解释的甲状腺结节机器学习在线诊断及管理系统。

方法: 本项回顾性研究纳入了经 FNAB 或手术病理确诊的 3965 个甲状腺结节, 其中 3098 个来自中心 1 的甲状腺结节被随机划分至训练集 ($n = 2168$) 和内部验证集 ($n = 930$)。867 个来自中心 2 的甲状腺结节被作为独立的外部验证集。从电子病历收集患者临床及实验室检查数据, 包括年龄、性别、甲状腺基础疾病及甲状腺激素水平。超声图像由两名具有 10 年以上经验的超声医生, 依据 ACR-TIRADS 指南对结节的成分、回声、形态、边缘和局灶性强回声共五个超声特征进行评估, 并测量结节的最大直径。使用随机森林 (RF)、支持向量机 (SVM) 和极端梯度提升 (XGBoost) 构建了基于超声特征和超声+临床特征的机器学习模型。并利用 SHAP 算法解析最优模型的诊断过程, 为机器学习模型提供全局及个体水平的可解释性。

结果: 在外部验证集中, 基于超声特征构建的 RF 模型 (命名为 Thy-Wise) 诊断效能最优。与 ACR-TIRADS 相比, Thy-Wise 在保持相近敏感性的同时, 取得了更高的 AUC (0.892 vs. 0.853, $P < 0.01$)、准确性 (82.8% vs. 73.4%) 和特异性 (79.7% vs. 66.9%), 并大幅降低了非必要 FNAB 率 (14.8% vs. 48.3%)。在超声特征的基础上加入临床特征, 所有机器学习模型的诊断效能及指导 FNAB 的可靠性均未提高。SHAP 特征重要性排序图显示边缘和局灶性强回声是 Thy-Wise 诊断过程中最重要的两个特征, SHAP 模型预测力图能直观可视化结节各个特征的取值对于模型诊断结果的影响方向及程度。

结论: Thy-Wise 模型能有效提高甲状腺结节超声诊断的准确性及推荐 FNAB 的可靠性, 基于 SHAP 的机器学习模型解释, 使临床医生能够更好地理解诊断背后的推理过程, 有助于模型的临床转化。

磁共振 T2mapping 技术对不同程度颞下颌关节功能紊乱综合征关节盘及周围韧带的定量研究

韦晓玉、王鹏、和仕珍、李建波
云南大学附属医院

目的旨在探讨 T2 mapping 在颞下颌关节功能紊乱综合征 (temporomandibular joint disorder, TMD) 关节盘及周围韧带早期改变中的应用, 以期阐明 TMD 关节盘损伤与周围韧带损伤的相互作用机制, 更好的揭示早期损伤的改变。

材料与方法前瞻性纳入 2023 年 3 月至 2023 年 9 月在云南大学附属医院口腔外科诊断为 TMD 患者, 且符合纳入及排除标准病例组 125 名、对照组 50 名。所试对象均行颞颌常规序列及 T2 Mapping 序列扫描。扫描后利用工作站处理后获得关节盘及周围韧带显示最佳层面伪彩图, 由我科两位影像医师采取双盲法对所试对象 MRI 图像进行分析评定, 按前移程度分 (正常上位、轻微前移、轻度前移、中度前移、重度前移); 按损伤程度分 (可复、不可复、骨关节病、骨关节合并可复、骨关节合并不可复)。分别在开、闭口位伪彩图上勾画关节盘及周围韧带 ROI, 获取 T2 值。采用独立样本 t 检验分别验证病例组与对照组关节盘及关节周围韧带 T2 值的差异; 多组间比较采用

单因素方差分析, 组间两两比较采用 Bonferroni 检验方法, 分别对闭口位及开口位不同移位/损伤程度与对照组 T2 值的差异进行比较, $P < 0.05$, 视为差异有统计学意义。

结果病例组与对照组关节盘及周围韧带 T2 值差异具有统计学意义, 均 $P < 0.05$; TMD 患者关节盘损伤常合并关节周围韧带损伤, 闭口位、开口位病例组与对照组关节周围韧带 T2 值差异具有统计学意义 (关节盘轻度前移、中度前移 T2 值均 $>$ 关节盘正常上位 T2 值); TMD 患者关节盘不同程度损伤关节周围韧带与对照组 T2 值差异具有统计学意义; 相同组别 TMD 患者不同取点平均 T2 值两两比较差异具有统计学意义; 颞后附着、下颌后附着 T2 值变化与双板区 T2 变化具有相关性。

结论颞颌关节紊乱综合征的患者常伴有关节盘周围韧带的损伤, T2 Mapping 技术可以通过观察关节盘及关节周围韧带 T2 值的变化, 定量的评估关节损伤的情况。

(2D BLADE) Turbo Gradient- and Spin-Echo in the evaluation of the sinonasal occupying lesions: A comprehensive comparison of image quality in (2D navigator) Readout-Segmented Echo-Planar imaging

Yue Geng, Yan Sha, Zuohua Tang
Eye and ENT Hospital, Fudan University

Objective: Diffusion-weighted imaging (DWI), as a non-invasive way to analyze the structures of biological tissues at a microscopic level, can be used as an effective method to evaluate sinonasal lesions. However, DWI in the sinonasal region is challenging because of its proximity to bone and skin, and the presence of a large air-bone-soft tissue interface in this region is prone to severe magnetization artifacts. The objective of this study was to investigate the feasibility of a two-dimensional (2D) turbo gradient- and spin-echo (TGSE) diffusion-weighted (DW) pulse sequence with non-Cartesian BLADE trajectory in the evaluation of sinonasal lesions, and to qualitatively and quantitatively compare the image qualities of TGSE BLADE with readout-segmented echo-planar imaging using parallel imaging and 2D navigator (RESOLVE).

Methods: A total of 48 patients with sinonasal occupying lesions were included in this prospective intra-individual study. In all patients, axial DW imaging, with prototype TGSE BLADE and commercially available RESOLVE with comparable imaging parameters, was performed at 3.0-T scanner (MAGNETOM Prisma, Siemens Healthcare, Erlangen, Germany). Two independent observers assessed the different sequences by qualitative imaging parameters (overall image quality, lesion conspicuity, distortion) and quantitative imaging parameters (geometric distortion ratio [GDR], signal-to-noise ratio [SNR], contrast). Furthermore, the apparent diffusion coefficient (ADC) values of the lesion and pons in the two sequences were compared. By visual evaluation, the overall image quality was classified from 1 (nondiagnostic image quality with severe artifacts) to 5 (excellent image quality with high-level anatomic details). Likewise, lesion conspicuity was classified on the basis of the lesion boundary and internal structure from 1 (unable to evaluate) to 5 (clearly visible). The geometric distortion of the overall image and lesion was classified from 0 (no distortion) to 4 (severe distortion). GDR was assessed by comparing the lengths of the head and lesion on the corresponding b0 images and the undistorted T2-weighted images. To compare the SNR, contrast and ADC values between two different sequences of DW images, circular regions of interest (ROIs) were drawn manually on the lesion, pons and background.

Results: A comparison of qualitative scores revealed that TGSE BLADE exhibited higher image quality ($P < 0.001$), lesion conspicuity ($P < 0.001$) and less geometric distortion ($P < 0.001$) than were observed for RESOLVE. Quantitative evaluations revealed that TGSE BLADE exhibited higher contrast ($P < 0.001$) and lower GDR ($P < 0.001$) than were found for RESOLVE, and SNR ($P < 0.001$) was lower than RESOLVE. The image ADC values of TGSE BLADE was lower than that of RESOLVE ($P < 0.05$). It was also found that the skull base, mastoid and orbits were better

displayed on TGSE BLADE with reduced susceptibility artifacts, distortion and blurring comparing to RESOLVE.

Conclusions: Compared with RESOLVE, TGSE BLADE significantly improved the image quality in evaluation of sinonasal occupying lesions by reducing the susceptibility artifacts, distortion and blurring. However, TGSE BLADE also has the disadvantage: the whole image intensity is slightly low, so that the anatomical details of the air-bone interface are not shown well, and this shortcoming should be improved in the future. TGSE BLADE DWI is still a promising imaging sequence in clinical MR exams for evaluation of sinonasal lesions.

Utility of machine learning for identifying stapes fixation on ultra-high-resolution CT

Ruowei Tang, Ning Xu, Pengfei Zhao, Zhengyu Zhang, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Purpose: Imaging diagnosis of stapes fixation (SF) is challenging owing to a lack of definite evidence. We developed a comprehensive machine learning (ML) model to identify SF on ultra-high-resolution CT.

Materials and methods: We retrospectively enrolled 109 participants (143 ears) and divided them into the training set (115 ears) and test set (28 ears). Stapes mobility (SF or non-SF) was determined by surgical inspection. In the ML analysis, rectangular regions of interest were placed on consecutive axial slices in the training set. Radiomic features were extracted and fed into the training sessions. The test set was analyzed using 7 ML models (support vector machine, k nearest neighbor, decision tree, random forest, extra trees, eXtreme Gradient Boosting, and Light Gradient Boosting Machine) and by 2 dedicated neuroradiologists. Diagnostic performance (sensitivity, specificity and accuracy, with surgical findings as the reference) was compared between the radiologists and the optimal ML model by using the McNemar test.

Results: The mean age of the participants was 42.3 ± 17.5 years. The Light Gradient Boosting Machine (LightGBM) model showed the highest sensitivity (0.83), specificity (0.81), accuracy (0.82) and area under the curve (0.88) for detecting SF among the 7 ML models. The neuroradiologists achieved good sensitivities (0.75 and 0.67), moderate-to-good specificities (0.63 and 0.56) and good accuracies (0.68 and 0.61). This model showed no statistical differences with the neuroradiologists (P values 0.289–1.000).

Conclusions: Compared to the neuroradiologists, the LightGBM model achieved competitive diagnostic performance in identifying SF, and has the potential to be a supportive tool in clinical practice.

OR-0297

Assessment of lateral cervical lymph node metastasis in thyroid carcinoma by using the standard deviation of attenuation values on virtual monoenergetic images in dual-layer spectral detector computed tomography-a prospective study with external validation

Sheng Li
中山大学肿瘤医院

Purpose: To investigate the clinical value on standard deviation values of virtual monoenergetic images and other spectral parameters derived from the dual-layer spectral detector computed tomography (DLCT) in the diagnosis of the lateral cervical lymph node (LN) metastasis of thyroid carcinoma.

Methods and materials: A total of 194 consecutive patients with 266 lymph nodes, were involved in this prospective study. 193 LNs were used as training group, 43 LNs in 30 patients were used as internal validation group, and 30 LNs as external validation group. All the patients received unenhanced and dual-phase contrast-enhanced scanning in DLCT. Monoenergetic images at 40keV and 70keV (MoneE40 and MoneE70) in unenhanced, arterial, and venous phases (UP, AP and VP, respectively) were reconstructed. CT attenuation values and the corresponding standard deviation (SD, regarding image noise) of non-metastatic and metastatic lymph nodes on three phases MoneE images were recorded. Slope of the spectral Hounsfield unit curve, iodine concentration, normalized iodine concentration and effective atomic number on three phases were also measured and analyzed. Receiver Operating Characteristic (ROC) curves were utilized to analyze the effectiveness of multiple parameters in different phases of non-metastatic and metastatic LNs. Delong test was used to compare the area under curves (AUC) for different parameters. ICC value was analyzed for measurement repeatability.

Results: The quantitative parameters in both MoneE40 and MoneE70 images in both AP and VP in the metastatic group were all significantly higher than those in the group (all $P < 0.001$), but no significant difference in UP between the two groups (both $P > 0.05$). ICC value were more than 0.8 for the training group. The SD values in both MoneE40 and MoneE70 images in all three phases in the metastatic group were all significantly higher than the values in the non-metastatic group (all $P < 0.001$). The AUC of SD values in MoneE40 and MoneE70 images in AP, VP were 0.978, 0.939, 0.981 and 0.924, respectively, and had no significant difference between each two ROC curves (all $p > 0.05$). The AUC of venous SD in MoneE40 images in internal and external validation groups were 0.978 and 0.962, respectively.

Conclusion: The SD value in arterial or venous phases MonoE40 images has the potential to differentiate non-metastatic from metastatic lateral cervical LNs in patients with thyroid carcinoma.

OR-0298

基于双能量 CT 瘤内及瘤周血管异质性预测喉鳞状细胞癌患者诱导化疗后早期疗效

沈卓¹、李文菲²、夏爽¹

1. 天津市第一中心医院

2. 河北省秦皇岛市第一医院

目的: 基于双能量 CT (DECT) 表征喉鳞状细胞癌瘤内及瘤周血管增殖异质性, 并观察其不同 T 分期、不同位置喉癌的分布情况, 进而预测诱导化疗后的治疗反应。

方法: 回顾性收集 2018 年 7 月至 2021 年 12 月期间于天津市第一中心医院接受诱导化疗治疗的 104 例喉鳞状细胞癌患者。由 2 名分别具有 3 年及 10 年头颈部影像诊断经验的医生对患者 DECT 图像进行分析, 根据 RECIST 标准将患者分为缓解组和抵抗组, 使用诱导化疗前动、静脉期图像及碘图图像对瘤内及瘤周血管空间异质性进行评估, 通过观察动脉期图像肿瘤内部是否存在迂曲血管定义有无瘤内动脉, 通过分析肿瘤静脉期图像评估病灶瘤周强化连续性来定义假包膜的完整性。采用盲法对基线及诱导化疗后的图像进行判读, 并间隔四周后进行第二次评估, 行观察者内和观察者间的一致性分析。采用卡方检验及 Fisher 确切概率法观察患者肿瘤血管空间异质性与不同 T 分期、位置是否存在相关性, 多因素 Logistic 回归分析血管异质性是否与喉癌患者诱导化疗早期治疗反应独立相关。

结果: 瘤内动脉与假包膜征象在不同位置、不同 T 分期喉癌的分布存在异质性。瘤内动脉征象在 T 分期分布中存在显著差异, 在晚期 (T3-T4) 喉癌中的出现频率明显高于 T2 期, 在 T3 与 T4 期肿瘤中无显著差异; 假包膜连续性与不同位置的喉癌密切相关, 累及声门上型的肿瘤假包膜完整性较好。一致性分析发现瘤内动脉征象的观察者间一致性好于假包膜 (瘤内动脉, ICC>0.81, 一致性良好; 假包膜特征, ICC>0.71, 一致性中等)。进一步进行 Logistic 回归分析表明瘤内动脉、假包膜完整是诱导化疗后早期出现良好治疗反应的独立预测因子, 结果表明诱导化疗后缓解型喉癌动脉期图像上常可以观察到瘤内动脉, 而静脉期碘图更常出现完整假包膜。

结论: 首次基于 DECT 图像提出的瘤内动脉、假包膜两种征象与喉鳞状细胞癌 T 分期、位置显著相关, 并有助于预测诱导化疗后早期疗效。

OR-0299

Hemodynamic assessments of unilateral pulsatile tinnitus with jugular bulb wall dehiscence using 4D Flow MRI

Chihang Dai, Pengfei Zhao, Zhenchang Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Objectives:

To investigate the hemodynamics of patients suffering from pulsatile tinnitus (PT) with jugular bulb wall dehiscence (JBWD) and compare them with those of patients with sigmoid sinus wall dehiscence (SSWD) and with volunteers.

Methods:

Eleven female unilateral PT patients with JBWD (JBWD group, 11sides), 22 age- and side-matched female patients with SSWD (SSWD group, 11sides), and 22 age-matched female volunteers (volunteer group, 36 sides) were enrolled. All participants underwent four-dimensional flow magnetic resonance imaging (4D Flow MRI). Maximum voxel velocity (V_{v-max}), maximum velocity (V_{max}), average velocity (V_{avg}), and average blood flow rate (Q) were measured in the transverse sinuses (TS), sigmoid sinuses (SS), and jugular bulb (JB). The vortex flow pattern was also

assessed. Fisher's exact test and Bonferroni correction were used for count data, the $p < 0.017$ was considered as statistically significant. Shapiro-Wilk test, one-way ANOVA, Kruskal-Wallis H test, paired-samples t-test and Wilcoxon matched-pairs signed-rank test were used for continuous variables depending on the distribution and variance of the data. The $p < 0.05$ and corrected $p < 0.05$ was considered as statistically significant.

Results

The area and Q of TS and JB on the symptomatic side were higher than those on the contralateral side in the JBWD group (all $p < 0.05$). The area was larger and velocities were lower in the JBWD group at the TS than the SSWD group (all corrected $p < 0.05$), and velocities were higher at the distal TS and SS than the volunteer group (all corrected $p < 0.05$). At the JB, the JBWD group also had higher Vv-max than the volunteer group (corrected $p < 0.05$). The occurrence rate of vortex at JB in the JBWD group was higher than both the JBWD and the volunteer groups ($p = 0.002 < 0.017$ and $p = 0.009 < 0.017$, respectively).

Conclusions

The blood flow of the intracranial venous sinus was different between the JBWD group and the SSWD group. The indicators that can differentiate include Vv-max, Vmax, Vavg, vortex, and TS cross-sectional area.

OR-0300

基于双能 CT 的列线图预测甲状腺乳头状癌大容量 中央区淋巴结转移的价值

张佳燕^{1,2}、唐苗月^{1,2}

1. 重庆市人民医院

2. 西南医科大学

目的：基于双能 CT 定量参数构建列线图，探讨其预测大容量中央区淋巴结转移（hv-CLNM）的价值。

方法：回顾性分析 213 例经手术病理证实的甲状腺乳头状癌患者，根据颈部中央区淋巴结清扫术病理结果，将患者分为 hv-CLNM 组（74 例）和非 hv-CLNM 组（139 例）。常规的临床及影像征象包括性别、年龄、大小、病灶数量、病灶位置、纵横比及 BRAF 基因，双能 CT 定量参数由两名经验丰富的放射科医生测量并计算，包括动脉期及静脉期的碘浓度（IC）、标准化碘浓度（NIC）以及能谱曲线斜率（ λ_{HU} ），采用组内相关系数评估测量者组内及组间一致性。将两组之间具有统计学差异的变量纳入多因素 Logistic 回归分析，以筛选出甲状腺乳头状癌 hv-CLNM 的独立预测因素，比较各预测因素以及组合模型的预测效能，构建可视化列线图模型。校准曲线用于评估列线图的拟合度，决策曲线用于评估列线图的临床获益。

结果：多因素 Logistic 回归分析显示，病灶大小（OR=2.601，95%CI: 1.284~5.268）、动脉期 NIC（OR=6.423，95%CI: 1.863-22.146）、动脉期 λ_{HU} （OR=0.097，95%CI: 0.011-0.826）以及静脉期 NIC（OR=3.907，95%CI: 1.717-8.889）是甲状腺乳头状癌 hv-CLNM 的独立预测因素，P 均 <0.05 。组合模型预测效能高于各独立预测因素。校准曲线、决策曲线显示列线图预测结果与实际结果具有良好的一致性，且其临床获益较高。

结论：基于病灶大小、动脉期 NIC、动脉期 λ_{HU} 以及静脉期 NIC 构建的组合模型可有效预测甲状腺乳头状癌 hv-CLNM，并在一定程度上指导临床制定个性化治疗方案。

OR-0301

基于血栓放射组学预测颅内粥样硬化性闭塞的研究

曹若瑶^{1,2}、陈涓¹、陈敏^{1,2}

1. 北京医院

2. 北京协和医学院研究生院

背景与目的: 颅内动脉硬化性闭塞 (ICAS-O) 是急性缺血性卒中 (AIS) 中常见的病因, 适用于机械取栓术的患者。一方面, 一线支架取栓术可能优于接触吸引术。另一方面, 通常需要进行补救治疗, 例如动脉内或静脉内应用替罗非班, 以及经腔内血管成形术和/或支架植入。增强 ICAS-O 的早期识别可能有助于决策制定。我们旨在探索术前基于血栓的放射组学模型对 ICAS-O 的预测价值。

方法: 共有 119 名来自两个中心的 AIS 患者被分类为培训和验证组。使用计算机断层扫描血管造影法对血栓进行分割, 然后自动计算 2153 个与血栓相关的放射组学特征。执行特征相关性分析, 与相关系数低于 0.9 的任何特征进行消除。在特征相关性分析后, 选择 L1 基础方法进行特征选择。C 越小, 保留的特征越少。为了基于本研究中包含的数据构建一个有效、稳健的模型, 我们将数据集划分为 70% 的训练集和 30% 的验证集。我们使用名为 Gradient Boosting 的机器学习模型。通过接收者操作特性曲线下的面积 (AUC) 来评估模型的性能。

结果: 由 CT 图像中的 20 个相关特征组成的放射组学标志达到了良好的校准 (所有 Hosmer-Lemeshow $p > 0.05$)。在训练集中, 模型的 AUC 为 0.999, 而在验证子集中的性能略有下降, 其 AUC 为 0.808。此外, 决策曲线分析验证了放射组学标志在两个外部队列中的临床效用。

结论: 对于前循环 AIS 患者, 基于血栓的放射组学作为检测 ICAS-O 的非侵入性工具展现出了前景。然而, 还需要进行额外的研究来验证其有效性。此项研究为我们提供了基于血栓放射组学预测颅内动脉硬化性闭塞的新视角, 其强大的预测能力使我们能够在治疗前对患者的病情进行更精确的评估, 从而制定更为合理和针对性的治疗方案。此外, 该研究还突显了机器学习在医学图像分析中的巨大潜力, 为未来的研究提供了有力的参考。希望在未来的研究中, 我们可以进一步拓展这一方法的应用范围, 为更多的患者带来实际的诊疗帮助。

24 周窄带声治疗前后特发性耳鸣患者脑沟深度的变化研究

魏璇、王振常

首都医科大学附属北京友谊医院

目的: 脑沟深度是基于表面分析方法的大脑皮层的定量测量指标之一, 本研究旨在探索特发性耳鸣患者接受 24 周窄带声音治疗前后大脑皮层脑沟深度的变化。

方法: 33 名特发性耳鸣患者在基线期 (未治疗期) 和 24 周的声音治疗接受了磁共振成像扫描。26 名年龄和性别匹配的健康对照组 (HC) 也在 24 周的间隔前后接受了两次扫描。所有参与者在 3.0T 的 MRI 扫描仪中采集了的高分辨率的三维结构像。使用 DPABISurf 工具箱对结构图像数据进行了预处理。耳鸣障碍量表 (THI) 评分被用来评估治疗前后耳鸣的严重程度。统计分析中使用了混合因素方差分析 (ANOVA) 和 Pearson 相关分析, 在事后分析中使用了 Student-Newman-Keuls 检验。

结果: 与 HC 组相比, 耳鸣组在基线期时, 左侧颞中回皮层 (medial temporal cortex, MTC) 和右侧躯体感觉运动皮层 (somatosensory and motor cortex, SMC) 的脑沟深度明显减低; 经过 24 周的窄带声音治疗后, 耳鸣组的左侧 MTC 和右侧 SMC 脑沟深度明显增加; 耳鸣患者组在治疗后与 HC 组之间的脑沟深度没有显著差异。

结论: 脑沟深度的重塑是声音治疗有效的影像学指标, 有统计学差异的脑区可能为有效治疗耳鸣提供有意义的神经影像学靶点。

3.0T 磁共振高清结合功能成像对青少年颞下颌关节盘复位手术前后的应用价值

盛爱珠、张景峰、陈斌、夏建笔、干放
宁波市第二医院

目的: 3.0T 磁共振(MRI)观察未经治疗的单侧颞下颌关节盘前移位患者的关节盘长度、盘-髁距离、髁突骨质及关节腔积液的变化,探讨其临床价值。

方法: 回顾性分析我院 2022 年 1 月份-2023 年 8 月份, 13-18 岁患者 386 例颞下颌关节盘前移位患者治疗前的 MRI 图像,分为可复性关节盘前移位组 261 例和不可复性关节盘前移位组 125 例,均采用 3.0T 磁共振,型号 Prisma ,64 通道头颈联合线圈。先扫描双侧颞下颌关节闭口横断位 T2WI-TSE-FS、闭口斜矢状位 PDWI-TSE-FS、闭口斜冠状位 PDWI-TSE-FS, 再让患者开口在双侧的上下磨牙之间放入口腔专用咬合器, 行双侧颞下颌关节张口斜矢状位 PDWI-TSE-FS 扫描。扫描参数: T2WI, TR 4300ms, TE 56ms; PDWI, TR 2500 ms, TE15 ms; 层厚 3mm, 层距 3 mm; 激励次数 3; 矩阵 364x512; 视野 14 cmx14 cm。

结果: 不可复组关节盘长度短于可复组 ($t = 4.001, P < 0.05$),不可复组盘髁距离长于可复组 ($t = -5.36, P < 0.05$)。可复组患侧关节盘长度短于健侧 ($t = 2.745, P < 0.05$);患侧盘髁距离长于健侧 ($t = -9.19, P < 0.05$);不可复组患侧关节盘长度短于健侧 ($t = -4.176, P < 0.05$);患侧盘髁距离长于健侧 ($t = 9.542, P < 0.05$)。不可复组更易发生髁突骨质改变 ($t = 37.354, P < 0.05$);2 组关节腔积液发生率比较差异无统计学意义 ($t = 0.038, P > 0.05$)。

结论: 两组均有关节盘长度缩短,盘髁距离增加; TMD (颞下颌关节紊乱) 患者应早期发现、早期诊断、早期采取干预措施,预防颞下颌关节骨关节病的发生;MRI 可清晰显示关节盘形态、髁突骨质改变及关节腔积液,为临床提供颞下颌关节紊乱不同时期的影像表现,对临床诊断与治疗提供可靠的影像信息。

OR-0304

Comparison of evaluation of locally advanced thyroid cancer R0/R1 resectability based on radiological CT scoring model and radiomics models: a two-center study

Xinyi Gao², Yajia Gu¹
1. Shanghai Cancer Center, Fudan University
2. Zhejiang Cancer Hospital

Objectives

For patients with locally advanced thyroid cancer, R0/R1 resection demonstrated superior survival compared with R2 resection. Evaluating disease extent pre-operatively is critical for guiding optimal treatment and may help predict prognosis. However, there is no clear consensus on pre-operative assessment of R0/R1 resectability in locally advanced thyroid cancer. We aim to establish and validate a convenient model based on radiological CT to evaluate the resectability of locally advanced thyroid cancer and compare with classic radiomics approaches.

Methods

This two-center retrospective study included 95 locally advanced thyroid cancer patients from Shanghai Cancer Center Fudan University as training cohort and 31 patients from Zhejiang Cancer Hospital as independent validation cohort, who were categorized into the resectable and unresectable groups. Three radiologists scored the CT scans of each patient by evaluating the extension to recurrent laryngeal nerve (RLN), trachea, oesophagus, artery, vein, soft tissue. A 12-score radiological model were developed. Radiomics models were built based on Random Forest (RF), K-Nearest Neighbor (KNN), Logistic Regression (LR), Support Vector Machine (SVM). Receiver-operating characteristic (ROC) analysis was used to evaluate the performance of the models.

Results

In the training cohort, compromised RLN ($P<0.001$), trachea ($P=0.001$), oesophagus ($P=0.002$), artery ($P<0.001$), vein ($P=0.005$), and soft tissue ($P<0.001$) were predictors for unresectability. External validation of the radiological model reached an AUC of 0.875. The AUCs of the radiomics models based on RF, KNN, LR and SVM were 0.782, 0.810, 0.738 and 0.799 accordingly.

Conclusions

By evaluating the extension to RLN, trachea, esophagus, artery, vein, and soft tissue, we built a convenient model based on radiological CT scoring to evaluate the resectability of locally advanced thyroid cancer. Radiomics approaches including RF, KNN, LR and SVM were not inferior to the radiological CT scoring model.

OR-0305

Integrating Machining Learning and Multimodal Neuroimaging to Predict the Prognosis of Sudden Sensorineural Hearing Loss

Yan Zou, Hui Ma, Ping Han

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: About 1/3 patients with SSNHL have poor prognosis even after standard treatment. In this study, we aimed to establish prognostic biomarkers in SSNHL at the individual level and generate a predictive model of the prognosis of postoperative SSNHL with multimodal features derived from brain network properties and clinical features.

Methods and Materials:

- (1) Follow-up of the hearing outcome of patients with SSNHL 3 months later. According to prognosis, patients were divided into recovery group ($n=86$) and non-recovery group ($n=64$).
- (2) Support vector machine model, Logistic regression model, and Decision Tree model were separately used for outcome prediction after features selection based on GMV, diffusional metrics (FA, MD, AD, RD, LDH), and functional parameters (amplitude of low frequency fluctuation (ALFF), fractional ALFF (fALFF), regional homogeneity (ReHo)).
- (3) Besides, the predictive capabilities of models were evaluated by the area under ROC curve (AUC).

Results:

- (1) AUC of training set and testing set were 0.807 and 0.752 respectively in SVM model with GMV of right supramarginal gyrus, left cingulate gyrus, right cingulate gyrus, left striatum, right striatum and left cuneus were selected.
- (2) Based on diffusional metrics, AUC of training set and testing set were 0.762 and 0.775 respectively in LR model. After feature selection, five diffusional features remained which were LDH of right superior fronto-occipital fasciculus, LDH of body of corpus callosum, AD of right superior corona radiata, MD of left superior fronto-occipital fasciculus, and MD of left tapetum.
- (3) AUC of training set and testing set were 0.764 and 0.737 respectively in Decision Tree model with 6 functional parameters were selected which were ALFF of left olfactory cortex, right rolandic operculum, left caudate nucleus, left rolandic operculum, right temporal pole superior temporal gyrus and left inferior frontal gyrus, opercular part.

Conclusions: Combination of machine learning and multimodal MRI, our study provides validated evidence of 17 biomarkers for predicting the hearing outcome of unilateral SSNHL, which will be helpful in clinic application.

OR-0306

Extracellular volume fraction as a potential predictor to differentiate lung cancer from benign lung lesions with dual-layer detector spectral CT

Xinang Jiang, Qianyun Ma, Shiyuan Liu, Li Fan
Changzheng Hospital, Navy Medical University

Objective: To evaluate the feasibility of extracellular volume fraction (ECV) derived from a dual-layer detector CT to differentiate lung cancer (LC) from benign lung lesions (BLLs).

Methods: Retrospectively, 128 patients with pathologically confirmed LC (n = 86) or BLLs (n = 42) were included. Conventional CT characteristics (including lesion size, shape, boundary, vascular convergence sign, lobulation, spiculation, pleural indentation and enlarged lymph node) and spectral CT parameters (including effective atomic number, electron density, extracellular volume fraction, iodine concentration, normalized iodine concentration, arterial enhancement fraction) were assessed. All patients' hematocrits were measured to correct contrast volume distributions in blood while calculating ECV. Chi-square test, Mann-Whitney U test, or a two-sample t-test were used to compare various types of variables. After performing a logistic regression analysis, conventional CT signs models (Model A), DLCT parameters models (Model B), combined diagnostic models (Model C), and ECV diagnostic models (Model D) were developed. The diagnostic effectiveness of each model was examined using the receiver operating characteristic (ROC) curve. The AUC of each model was compared using the Delong test.

Results: Certain conventional CT features (such as lesion size, lobulation, spiculation, pleural indentation, and enlarged lymph nodes) differed significantly between the two groups (all $P < 0.05$). Statistical differences were found in the following DLCT parameters (all $P < 0.05$): effective atomic number (Zeff) (nonenhancement), electron density (ED) (nonenhancement), extracellular volume fraction (ECV), iodine concentration (IC), normalized iodine concentration (NIC). Models A, B, C, and D had AUCs of 0.801, 0.805, 0.925, and 0.754, respectively. The AUC of Model D (ECV) showed no significant difference from that of Model A and B (Delong Test, $P > 0.05$).

Conclusion: The ECV derived from DLCT was feasible to differentiate LC from BLLs, broadening the scope of ECV in clinical research.

布鲁氏菌性脊柱炎影像诊断专家共识

郭辉、刘文亚
新疆医科大学第四附属医院

布鲁氏菌性脊柱炎是一种全球性的人畜共患的严重危害健康的感染疾病, 已成为危害公众健康的公共卫生问题。影像学监测对布鲁氏菌性脊柱炎的早期诊断、术前评价及疗效随访等方面发挥着不可替代的作用。当前影像学检查在布鲁氏菌性脊柱炎中缺乏诊断共识, 致使布鲁氏菌性脊柱炎的临床诊断与治疗随访过程中缺乏规范性, 为此由李宏军教授牵头联合全国多家医院著名专家, 运用循证医学方法, 查找与学习国内外最新与最佳的研究证据, 针对布鲁氏菌性脊柱炎影像学诊断原则、诊断依据、诊断标准及鉴别诊断来构建其共识, 为临床医师在布鲁氏菌性脊柱炎影像学诊断中提供可靠的诊断依据。

心脏磁共振扫描简介及伪影控制策略

李燕¹、雷颖¹、郝晓勇²、李璇²

1. 山西医科大学第一医院

2. 山西省心血管病医院

心脏磁共振检查可获得心脏的解剖, 功能, 灌注, 代谢及冠脉分布等综合信息。其无创、无辐射, 其多参数成像赋予其集结构、功能与组织学等“一站式”成像能力。CMR 新技术则能够揭示疾病的早期病理生理变化, 将在疾病的早期诊断、预后判断和危险分层中发挥重要指导作用。因此, 本次汇报将介绍心脏磁共振扫描简介及伪影控制策略, 以期提高心脏磁共振扫描水平, 发挥更大作用。

影像云在放射诊断质控工作中的应用价值

姚侃敏

上海交通大学医学院附属瑞金医院

医学影像学发展迅猛, 包括放射诊断、影像技术、介入放射等多门亚专业学科已经成为临床诊断、指导治疗、检测预后的重要辅助手段, 放射科医疗质量与质控管理也越来越受到影像和临床医生的高度重视。本着保障医疗安全及提高医疗影像质量的宗旨, 上海市放射诊断质控中心(以下称质控中心)于 2000 成立, 经过两届质控中心 10 多年的努力, 形成了上海放射诊断质控体系, 完成了上海放射诊断质控标准的修订等工作。然而质控中心对于各医院质控管理、培训、督查、数据填报等工作仍然停留在 10 多年前现场督查, 纸张记录, 人工统计结果, 集中大课培训等老方法, 对质控工作的效率, 质控结果的及时反馈和质控效果持续改进都是一种制约。2016 年公布的《医疗质量管理办法》的第三十九条对全国和地区的医疗质量管理部门的信息化建设有了明确指示。因此, 大数据时代来临的大背景下, 利用云技术, 建立一套全市统一的放射诊断质控云平台, 用信息化的手段优化质控中心工作, 实现质控数字化、质控平台化、质控智能化、数据标准化, 是打破放射诊断质控发展的关键举措。

吉林省医学影像质控中心关于网络共享平台建立完善前影像检查结果互认开展的道路探索

张祯铭¹、张瑛妮¹、柳林¹、程凯亮¹、吕忠文¹、张美玲²

1. 吉林大学中日联谊医院

2. 辽源市中心医院

目的: 搭建影像网络互认共享平台前期需要一定人力、财力和时间。吉林省影像科质控中心通过摸底调研和试点, 探索网络共享平台建立完善前影像检查结果互认开展的方式和经验

方法: 2022 年国家卫生健康委发布《医疗机构检查检验结果互认管理办法》的文件后, 吉林省医学影像科质控中心组织建立“省级质控中心—市区级质控中心—委员所在医疗机构—申请影像检查结果互认医疗机构”的微信联络群, 积极进行以“实现影像检查结果互认”为目标的摸底调研; 由头颈、

心胸、腹盆、骨肌专家组进行标准制定,通过云影像平台、网络传输、DICOM 数据刻录进行交互抽样考核,并记录纸质版评分表。

结果: 1.通过微信联络群、质控中心小程序上报结果并进行统计,包括 1) 吉林省医疗机构等级、数量、地区分布和占比,通过地区医疗机构数量和分布重新划分考核小组; 2) 医疗机构 CT、MR、DR 扫描仪器数量、厂家和地区分布排名,决定 DICOM 数据标注“JLHR”,同时互认项目在报告单上体现“吉林省 HR”; 3) 医疗机构具备云影像平台、DICOM 拷贝功能的数量和地区分布及排名; 4) 2022 年全省 102 项检查项目检查量统计、地区分布及排名,以及检查量排名靠前的检查项目类别。综合结果组织专家组发布了《关于印发九项吉林省医学影像互认质控标准和三项操作原则(2023 年版)的通知》,通过交互抽样考核通过第一批次三级试点单位 20 余家,医联体单位 2 家,民营医院 3 家。

结论: 在网络共享平台建立不完善的过程中, 1) 首先应通过已有的网站、微信群等方式尽可能的进行人员、设备、检查量的基础调研, 2) 同期组织人员制定质控标准, 3) 先试点质控中心委员单位抽样、交互考核,再逐级向三级医院、医联体医院、优质民营医院进行覆盖; 4) 统一三级医院影像 DICOM 检查结果会诊模式, 5) 号召二级医院医疗机构完善光盘刻录; 6) 酌情推进云影像平台。从而阶段性实现群众二次检查、重复花费、看病时间长的问题。

持续质量改进优化泌尿系 MSCT 图像质量的应用研究

夏传江、刘衡

中国人民解放军陆军特色医学中心

目的 采用持续质量改进方法,优化泌尿系 MSCT 图像质量。

方法 由科室技师长、高年资诊断医生及质控小组成员,根据相关指南及专家共识并结合科室情况,制定泌尿系 MSCT 扫描规范、图像后处理规范及图像质量控制评价标准。图像质控总分设置为 100 分,主要指标包括: 1、检查前准备环节(闭气配合、膀胱充盈、异物伪影、体位摆放、定位准确), 2、扫描环节(扫描范围,皮质期相,实质期相、排泄期相), 3、后处理环节(重建视野、重建范围、特殊重建、VR、CPR),各个指标设定相应分数;由质控负责人参照规范,并根据相关质控指标情况进行扣分;将总得分为 85 分以上的图像定义为优质,低于 85 分且高于 70 分的图像定义为合格,70 分以下定义为不合格。从 2021 年 6 月开始,由质控负责人每月抽取陆军特色医学中心放射科 50 例泌尿系 MSCT 图像进行质控,由技师长审核后,将质控结果与当月绩效挂钩;并每月召开质控分析会,质控人员通报当月质控情况,并运用 PDCA 管理工具,如鱼骨图、柏拉图等,分析较差图像的主要原因,制定预期改善目标,及下月重点质控指标。回顾性分析 2021 年 6 月至 2022 年 12 月每月的图像质控结果,统计图像优质率、合格率、不合格率,以及各项指标每月间的差异。

结果 图像优质率由 2021 年 6 月的 35%上升至 2022 年 12 月的 78%,差异具有统计学意义($P<0.05$)。图像合格率有 2021 年 6 月的 48%,降低至 2022 年 12 月的 17%,差异具有统计学意义($P<0.05$)。图像不合格率由 2021 年 6 月的 15%,降低至 2022 年 12 月的 5%,差异具有统计学意义($P<0.05$)。图像各项指标扣分情况每月均有下降。

结论 通过 PDCA 管理的持续质量改进方法,可以显著提高泌尿系 MSCT 图像优质率,降低不合格率;图像各项评价指标均有不同程度的提升,有效的改善了泌尿系 MSCT 的整体图像质量,为临床提供更优质精准的诊断。

基于深度学习构建颅脑 CT 图像质量智能量化评价体系的可行性研究

张鑫盛^{1,2}、郑介志³、陈述³、熊芳舒³、梅博哲²、龚向阳²

1. 浙江中医药大学

2. 浙江省人民医院

3. 上海联影智能医疗科技有限公司

目的

构建颅脑 CT 图像质量量化评价指标体系和基于深度学习的智能量化评价系统，实现快速、精准的颅脑 CT 图像质量自动化评价。

方法

通过文献回顾和专家论证，构建由图像质量维度、质量标准和量化指标组成的颅脑 CT 图像质量量化评价指标体系。由 5 名高年资放射科医生针对 315 份颅脑 CT 图像的质量维度和整体图像质量进行主观评分。利用基于 ResNet-50 的深度学习模型和线性回归分析构建图像质量智能量化评价系统。评价步骤包括：（1）利用基于 ResNet-50 的深度学习模型自动测量量化指标参数；（2）采用线性回归分析评估量化指标参数与质量维度评分之间的关系以及质量维度评分与整体图像质量评分之间的关系。采用组内相关系数（ICC）、Pearson 相关系数（r）和平均绝对差异（MAD）评估深度学习模型测量量化指标参数的准确性。采用配对样本 t 检验、Bland-Altman 图和 95% 一致性区间评估图像质量智能量化评价系统的性能。

结果

构建了由 7 个质量维度（摆位、布局、清晰度、对比度、噪声、异物、伪影）、11 条质量标准和 15 个量化指标组成的颅脑 CT 图像质量量化评价指标体系。深度学习模型测量量化指标参数的准确性较高（ICC = 0.71 ~ 1.00，r = 0.62 ~ 1.00，MAD = 0 ~ 56.85）。15 个量化指标参数与质量维度评分之间均有显著相关性（P 均 < 0.0001），7 个质量维度评分与整体图像质量评分之间均有显著相关性（P 均 < 0.0001）。图像质量智能量化评价系统预测评分与放射科医生评分之间无明显统计学差异（P > 0.05），Bland-Altman 分析结果显示两者差值在 95% 一致性区间内未呈现大小趋势的变化。

结论

构建了颅脑 CT 图像质量量化评价指标体系，具有系统性、全面性、客观性。构建了基于深度学习的颅脑 CT 图像质量智能量化评价系统，该系统在量化指标参数测量和图像质量评分方面具有较高的准确性，为大数据图像质量评价提供了可靠的自动化图像质量评价工具。

数字化 X 线标准化摄影操作视频在影像同质化中的应用

文雨婷

四川大学华西医院

目的 医学影像技术作为诊疗环节中的重要环节，致力于为临床提供及时、精准、有效的影像数据。针对不同类型疾病的检查需求，现已有上千项影像学检查医嘱。由于不同地区放射技术从业人员临床经验的差距，对于疾病诊断的掌握以及图像质量的把控标准均不统一，常常导致不同地区或不同医疗机构的检查结果不能互认。为了实现影像资料同质化，跨机构影像检查结果互认，拟制定标准化检查流程视频，建立摄影规范以及图像质控标准。

方法 从数字化 X 线摄影着手，按大纲整理-脚本撰写-视频拍摄-校正审核-成品推广应用的流程进行视频制作。大纲参考人民卫生出版社出版的《中华医学影像技术学》系列丛书并覆盖临床使用的常

规及特殊摄影位置，每期视频内容包括该摄影位置检查前准备、体位设计、摄影参数设计、图像质控、图像后处理以及临床应用等方面的操作规范。

结果 经过专家团队两年的制作，已完成头面部、胸腹部、躯干部、四肢骨关节、全长拼接摄影、乳腺摄影和检查注意事项共计 43 期规范化视频。

结论 视频过审后已通过各类平台推广应用，推进国内大型综合医院、医联体、基层医院建立统一的技术标准；同时应用于本科教学、毕业后教育、青年技师交流学习，助力专业技术人员提高及成长。

如何提高胎儿磁共振检查的成功率及图像质量

陈晓惠、徐海波
武汉大学中南医院

背景与目的：胎儿磁共振检查是当超声检查发现胎儿异常，不能明确诊断胎儿疾病的进一步针对性检查，可以为临床医生提供更精确的产前诊断，是减小患儿出生缺陷的有效措施。由于胎儿磁共振检查无电离辐射、组织分辨率高、准确率高，近几年胎儿磁共振检查发展非常快，不仅开展胎儿磁共振检查的医院增多、胎儿磁共振检查的范围也不断扩大，从原来单纯的只开展胎盘、胎头检查，到目前扩展到胎儿全身各系统检查。目前缺少特别熟悉胎儿疾病的放射科医生，胎儿疾病的诊断更依赖扫描的图像质量，但胎儿磁共振检查成像时间较长、受胎动影响较大，如何提高胎儿磁共振检查的成功率以及保证图像质量是影像科技师工作的一个难点。文章从多个方面进行分析总结归纳经验，旨在提高胎儿磁共振检查的成功率以及图像质量。

方法：从胎儿磁共振检查的安全性、检查过程中的注意事项、检查过程中的难点、扫描方案及参数优化、图像质量控制以及社会人文关怀等方面进行分析总结，归纳提高胎儿磁共振检查成功率以及图像质量的经验。

结果：检查前对孕妇进行呼吸运动训练，检查过程中，遵循一个原则“尽量让孕妇舒服”；对于参数的设置原则：在保证能诊断疾病的前提下尽量缩短扫描时间，这些方法可以提高胎儿磁共振检查的成功率以及图像质量。

结论：在进行胎儿磁共振检查前，给孕妇多一些人文关怀，在保证能诊断疾病的前提下尽量缩短扫描时间，这会极大的降低孕妇的心理压力，胎动也可能会随之减少，从而推动检查的顺利进行，提高胎儿磁共振检查的成功率。

PO-0001

Functional Abnormalities of Cerebellum in Vascular Mild Cognitive Impairment

Zhao Ruan, Haibo Xu

Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan, 430071, China

Synopsis: The potential prevalence of vascular cognitive impairment (VCI) is high; early diagnosis and treatment is essential for disease prognosis. In this study, compared to healthy controls (HCs), there were differences of functional connectivity (FC) between the cerebellum and cerebral regions of VCI patients, mainly involving default mode network (DMN), sensorimotor network (SMN) and frontoparietal network (FPN). Furthermore, FC between multiple sub-regions in the cerebellum reduced in patients with VCI compared to HCs. These findings may expand our understanding of the neural mechanisms of VCI in the perspective of neurovascular coupling.

Objective: Recent neuroimaging studies have extensively described the atlas partitioning of the cerebellar cortex and its functional mappings related to cognitive function in cortical and subcortical brain regions. However, mappings of alterations in vascular cognitive impairment remains largely unexplored. This study aimed to perform functional FC analysis using high-resolution dissection mapping of the cerebellum, including the intra-cerebellar FC and cerebellar-cerebral FC, to investigate the potential associations between abnormal cerebellar connectivity and changes in cognitive function.

Materials and Methods: MRI data were collected on a 3.0T MR scanner (Signa 750w, GE Healthcare, USA). 72 VCI patients, including 38 small vessel mild cognitive impairment (SVMCI) and 34 post-stroke mild cognitive impairment (PSMCI), and 43 demographically matched HCs were included in this study. Changes of FC between sub-regions in the cerebellum and from each cerebellar sub-region to the cerebral seed points in VCI patients were calculated, and the association of these changes with cognitive function was examined.

Results: Compared with HCs, we found that VMCI patients had 11 cerebellar subregions showing significant differences (mainly decreases) in FC with brain regions in the default-mode network (DMN), sensory-motor network (SMN), and frontoparietal network (FPN). In the intracerebellar FC analysis, 47 (8%) cerebellar connections had significant intergroup differences, mainly a reduced magnitude of FC in VMCI patients. In the correlation analysis, higher Montreal Cognitive Assessment (MoCA) scores were correlated with stronger intracerebellar FC (left crus II–right lobule VI, left crus II–right lobule VIIb) and cerebellar-cerebral FC (right lobule X–left precuneus, vermal lobule IX–right inferior parietal lobule) in both the SVMCI and PSMCI groups.

Discussion and conclusion: Our results were consistent with recent studies of changes in cerebellum structure and function as VCI progresses. The finding of prominent intra-cerebellar and cerebellar-cerebral FC abnormalities in VCI patients adds to the evidence for a possible role of the cerebellum in cognitive processes. Patterns in FC changes in VCI patients and their correlations with neuropsychological measures may be a pathophysiological foundation for cognitive impairment, which provides new information to explore the involvement of the cerebellum in VCI that may aid the early diagnosis of VCI.

PO-0002

Altered Neurovascular Coupling in Patients with Vascular Cognitive Impairment: A Combined ASL-fMRI Analysis

Zhao Ruan¹, Haibo Xu²

1.

Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan, 430071, China;

2. 武汉大学中南医院

Abstract

Background and Objective:

This study aims to examine the role of neurovascular coupling (NVC) in vascular cognitive impairment (VCI) by investigating the relationship between white matter lesion (WML) burden, NVC, and cognitive deficits. Additionally, we aim to explore the potential of NVC as a tool for understanding the neural mechanisms underlying VCI.

Methods:

This study included thirty-eight small vessel disease cognitive impairment (SVCI) patients, 34 post-stroke cognitive impairment (PSCI) patients, and 43 healthy controls (HC). Comprehensive assessments, including neuroimaging and neuropsychological testing, were conducted to evaluate cognitive function. WML burden was measured and correlated with NVC coefficients to examine the relationship between white matter pathology and NVC. Mediation analysis was employed to explore the link relationship between NVC, WML burden, and cognitive function.

Results:

The present study showed that NVC was significantly reduced in the SVCI and PSCI groups compared with HCs at both whole-brain and brain region level. The analysis revealed notable findings regarding NVC in relation to WML burden and cognitive function in VCI patients. Specifically, reduced NVC coefficients were observed within higher order brain systems responsible for cognitive control and emotion regulation. Mediation analysis demonstrated that NVC played a mediating role in the relationship between WML burden and cognitive impairment.

Conclusions:

This study reveals the mediating role of NVC in the relationship between WML burden and cognitive function in VCI patients. The results demonstrate the potential of the NVC as an accurate measure of cognitive impairment and its ability to identify specific neural circuits affected by WML burden.

PO-0003

Dynamic Contrast-enhanced MRI Distributed Parameter Model in Identifying IDH Mutation and 1p/19q Codeletion in Patients With Glioma

Kai Zhao, Xiaoyue Ma, Jingliang Cheng

Department of Magnetic Resonance Imaging, the First Affiliated Hospital of Zhengzhou University, Zhengzhou 450052, China

Introduction

Gliomas are the most common primary brain tumors in adults. The isocitrate dehydrogenase (IDH) genotype and 1p/19q codeletion status are two essential molecular markers that divide glioma into three groups: IDH wild-type, IDH mutant with 1p/19q non-codeletion, and IDH mutant with 1p/19q codeletion. The current available method for assessment of IDH and 1p/19q status is surgical biopsy along with subsequent genomic and proteomic analysis. The procedure has inherent

sampling error due to the tumor heterogeneity, inevitably resulting in erroneous determination. Furthermore, it is invasive, time consuming, and expensive. Dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) can assess blood-brain barrier (BBB) disruption and neovascularization in gliomas. These features reflect the variations in growth microenvironment and metabolic characteristics among different pathological subtypes of glioma to some extent. Previous research has demonstrated that DCE-MRI, employing the widely used Extended Tofts-Kety (exTofts) model, can predict the isocitrate dehydrogenase (IDH) genotype in gliomas. However, the utility of DCE-MRI in predicting the chromosome 1p/19q co-deletion status remains unexplored. This study aims to evaluate the potential of DCE-MRI, utilizing the distributed parameter (DP) model, in predicting the IDH genotype and chromosome 1p/19q co-deletion status in adult diffuse gliomas.

Materials and Methods

48 patients diagnosed with gliomas between April 2021 and April 2023 were retrospectively collected. All image processing was performed using a commercially available software (Mlalytics, FITPU Healthcare, Singapore), the median values of following kinetic parameters were yielded: transfer constant, K_{trans} (min^{-1}), fractional volume of extravascular extracellular space, V_e (mL/100 mL), plasma fractional volume, V_p (mL/100 mL) in exTofts, and blood flow, F (mL/min/100 mL), permeability-surface area product, PS (mL/min/100 mL), V_e and V_p in DP. Tumor region of interest (ROI) including tumor core was manually delineated. The differences of the parameters and mean age were compared between IDH-mutant and IDH-wildtype groups using independent t-test or Mann-Whitney U test according to the results of test for normality and homoscedasticity. The receiver operating characteristic (ROC) curves were utilized for assessing the performance of kinetic parameters. The same statistical tests were applied to examine the differences in parameters between IDH-mutant gliomas with and without 1p/19q co-deletion.

Results

V_e in extofts has the best performance in predicting IDH genotype ($AUC = 0.83$). F in DP has the best performance in predicting IDH genotype ($AUC = 0.79$). No parameter in extofts model shows significant difference between IDH-mutant gliomas with and without 1p/19q co-deletion.

Conclusion

Dynamic contrast-enhanced MRI distributed parameter Model is better in predicting the chromosome 1p/19q co-deletion status in adult diffuse gliomas.

PO-0004

Altered Dynamic Functional Connectivity of Insular Subdivisions in cigarette smokers

An Xie^{1,3}, Yunkai Sun², Haobo Chao^{1,3}, Ling Li², Yanhui Liao², Peng Liu^{1,3}

1. Department of Radiology, The People's Hospital of Hunan Province (The First Affiliated Hospital of Hunan Normal University)

2. Department of Psychiatry, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University

3. Center for Mind & Brain Sciences, Hunan Normal University

Background: Insular subdivisions show distinct patterns of resting state functional connectivity with specific brain regions, each with different functional significance in chronic cigarette smokers. The goal of this study is to explore the altered dynamic functional connectivity (dFC) of distinct insular subdivisions in smokers. **Methods:** Resting-state BOLD data of 31 smokers and 27 sex- and age-matched non-smokers were collected. Three bilateral insular regions of interest (dorsal, ventral, and posterior) served as seeds for analyses. Sliding windows method was used to acquire the dFC metrics of different insular seeds. Support vector machine based on abnormal insular dFC was applied to classify smokers from non-smokers. **Results:** We found that smokers showed decreased dFC variance between the left ventral anterior insula with the right superior parietal cortex and left inferior parietal cortex, as well as increased dFC variance the right ventral anterior insula with the right middle cingulum cortex relative to non-smokers. Altered dFC variance of the right dorsal insula

and the right middle temporal gyrus in smokers was also found. Correlation analysis found the higher dFC between the right dorsal insula and the right middle temporal gyrus was associated with more smoker using years. The altered insular subdivision dFC can classify smokers from non-smokers with the accuracy of 89.66%, sensitivity of 96.30% and specificity of 83.87%. Conclusions: Our findings highlighted the abnormal patterns of fluctuating connectivity of insular subdivision circuits in smokers and suggested that these abnormalities may be potential biomarkers classifying smokers.

PO-0005

Altered insular functional activity in individual following electronic cigarettes

An Xie^{1,3}, Yunkai Sun², Yehong Fang², Haobo Chen^{1,3}, Ling Li², Yanhui Liao², Peng Liu^{1,3}

1. Department of Radiology, The People's Hospital of Hunan Province (The First Affiliated Hospital of Hunan Normal University)

2. Department of Psychiatry, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University

3. Center for Mind & Brain Sciences, Hunan Normal University

Background: Smoking continues to be a burden to economies and healthcare systems across the world. One proposed solution to the problem has been e-cigarettes (e-cigs), however little is known about their potential health impacts. The study aimed to explore the impact of e-cigs on brain. **Methods:** We acquired the resting-state functional magnetic resonance imaging data from 93 chronic e-cigs users and 103 age- and sex- matched health controls (HC). Intrinsic oscillation was analyzed via regional homogeneity (ReHo) method at voxel-wise. The functional connectivity (FC) between the NAcc, VTA and insula was calculated at ROI-wise. The support vector machining classification model based on significant functional activity was used to identify e-cigs users from HCs. **Results:** Compared with HCs, chronic e-cigs users showed increased ReHo in the right rolandic operculum ($p < 0.05$, FDR corrected) and the right insula ($p < 0.05$, FDR corrected). At ROI-wise level, the significant group difference between e-cigs users and HCs in FC between NAcc, VTA and insula were found ($p < 0.05$, FDR corrected). Correlation analysis found a significant negative correlation between ReHo in the left NAcc and years of e-cigs ($r = -0.273$, $p = 0.008$, FDR corrected). Support vector machine based on all significant results can differentiate chronic e-cigs users from HCs with accuracy of 73.47%, AUC of 0.781, sensitivity of 67.74% and specificity of 78.64%. **Conclusions:** Dysregulated spontaneous activity and FC of addiction-related regions were found in chronic e-cigs users. It is suggested that e-cigs may have a negative health impact on brain and pose a risk of addiction.

PO-0006

Progression of hippocampal subfield atrophy and asymmetry in Alzheimer's Disease

Jingjing Xu, Sijia Tan, Jiaqi Wen, Minming Zhang, Xiaojun Xu

The Second Affiliated Hospital of Zhejiang University, School of Medicine

Background and purpose: Alzheimer's Disease (AD) affect hippocampus during progression, but currently there is no detail understanding of hippocampal regional vulnerability during disease. Determining the sequence in which hippocampal subfield become abnormal and its association with memory can provide important insights into AD progression.

Methods: In this study, we included 207 subjects: 86 mild cognitive impairment (MCI), 53 AD and 68 healthy controls from the Alzheimer's Disease Neuroimaging Initiative (ADNI). Participants underwent structural MRI scans to calculate the volume ratio and asymmetry index of hippocampal

subfields. Memory was scored using composite measures. We employed an event-based model to determine the sequence of occurrence of hippocampal subfield abnormal in MCI and AD cohorts. We assigned each patient to a specific event-based model stage, based on the number of their abnormal subfields. We used a combination of two-year follow-up MRI scans to demonstrate the longitudinal consistency and utility of the event-based model's staging system.

Results: In both MCI and AD groups, the event-based model estimated that the earliest atrophy occurs in hippocampal fissure, then spreading to other subregions and finally the subiculum. The sequence of asymmetry index (AI) increase beginning in the molecular and granule cell layers of the dentate gyrus (GC-ML-DG), cornus ammonis (CA) 4, the molecular layer (ML) in both MCI and AD. Longitudinal analysis performed using two years of follow-up data from baseline confirms efficacy of the model, as majority of the subjects move to later stages or remain stable with time. In addition, both subfield abnormal and event-based model stage were significantly correlated with patients' memory scores ($p < 0.05$).

Conclusion: We used a data-driven method to provide new insight into Alzheimer's disease hippocampal progression. The present model could aid to understanding of the disease stages, as well as track memory decline.

PO-0007

Alteration in Resting-state Effective Connectivity within the Papez Circuit in Presbycusis

Yuchen Chen

Nanjing First Hospital, Nanjing Medical University

Background and purpose: Previous studies have suggested that the injuries to Papez circuit are linked with cognitive dysfunction in presbycusis. The aim of this study was to investigate abnormal alterations in resting-state effective connectivity within the Papez circuit and their association with cognitive decline in presbycusis patients.

Methods: Sixty-one presbycusis patients and 52 healthy controls (HCs) were included. The spectral dynamic causal modeling (spDCM) approach was used for resting-state effective connectivity analysis within the Papez circuit. The hippocampus (HPC), mamillary body (MB), anterior thalamic nuclei (ATN), anterior cingulate cortex (ACC), posterior cingulate cortex (PCC), entorhinal cortex (ERC), subiculum (Sub) and parahippocampal gyrus (PHG) were selected as the regions of interest. The fully connected model difference in effective connectivity between the two groups was assessed, and the correlation between effective connectivity alteration and cognitive scale was analyzed.

Results: We found that presbycusis patients demonstrated decreased effective connectivity from MB, PCC, and Sub to ACC relative to HCs, while higher effective connectivity strength was shown from HPC to MB, from ATN to PHG, and from PHG to Sub. The effective connectivity from PHG to Sub was significantly negatively correlated with Complex Figure Test (CFT)-delay score ($\rho = -0.259$, $p = 0.044$).

Conclusion: The results support and reinforce the role of abnormal effective connectivity within the Papez circuit in the pathophysiology of presbycusis-related cognitive impairment and reveal its potential as a novel imaging marker.

PO-0008

Changes of resting-state MRI in patients with sleep problems after COVID-19 infection

Haobo Chen¹, ling li², yi liu², peng liu¹, an xie¹, yanhui liao²

1. First Affiliated Hospital Hunan Normal University

2. Department of Psychiatry, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University, Hangzhou, Zhejiang, P. R. China

Corona Virus Disease 2019 (COVID-19) infection is widespread, and many people have problems such as easy fatigue and sleep disturbance after COVID-19 infection. However, the changes in brain function associated with the development of sleep problems after COVID-19 infection remain unclear. To investigate the changes in brain function in the population with sleep problems after COVID-19. In current study, 32 patients who developed sleep problems after neocoronary were collected, as well as 22 gender- and education-year-matched controls, and all subjects were scaled to exclude emotional problems. As shown by resting-state magnetic resonance imaging the final results revealed that compared to the control group, the Low-frequency fluctuation (ALFF) values of the right putamen, part of the frontal lobe, extra-nuclear and the Lentiform Nucleus were significantly higher in the sleep problem group compared to the control group, while the ALFF values of the right inferior temporal gyrus. The ALFF values of the right inferior temporal gyrus were lower than those of the control group, and the functional connectivity of the putamen with the right postcentral gyrus, right parietal lobe, and right precentral gyrus was found to be reduced. This explains to some extent the changes in sleep-related brain areas in people with sleep problems after COVID-19. The COVID-19 infection can cause changes in sleep-related brain areas.

PO-0009

Comparison of Ruptured Intracranial Aneurysms Identification Using Different Machine Learning Algorithms and Radiomics

Beisheng Yang, Wenjie Li, Zhiming Zhou

the Second Affiliated Hospital of Chongqing Medical University

Introduction: Different machine learning algorithms have different characteristics and applicable scenarios. Machine learning based on patients with intracranial aneurysm would benefit from the accurate prediction of aneurysm rupture, especially with objective features. Radiomics have been commonly applied in the prediction of intracranial aneurysm rupture. Given on the diversity of machine learning algorithms, a comprehensive evaluation of the current diversity features and machine learning algorithms would contribute to this topic. This study aims to predict ruptured intracranial aneurysms by radiomics models based on different machine learning algorithms and determine the best optimal radiomics model through the comparison. Determine whether there exist differences among the efficacy of diverse machine learning models and evaluate which machine learning algorithm is relatively more suitable for the identification of the rupture-prone aneurysms.

Methods: A total of 576 patients with intracranial aneurysm (192 ruptured ones, and 384 matched unruptured ones intracranial aneurysms) from two institutions centers were included, and were randomly divided into a training cohort and a validation cohort in a ratio of 7:3. Among which 403 patients were randomly chosen as the training cohort. Of the 109 radiomics features extracted from computed tomography angiography images, seven radiomics features stood out after independent sample t-test and elastic network regression analysis of total 109

extracted features from computed tomography angiography images. Then radiomics features and 12 commonly used machine learning algorithms including the decision-making tree, support vector machine, logistic regression, Gaussian Naive Bayes, k-nearest neighbor, Random forest, extreme gradient boosting, Bagging Classifier, Adaboost, Gradient boosting, Light Gradient Boosting Machine and Catboost, were applied to construct prediction models for predicting ruptured intracranial aneurysm. The predictive performance of all models was compared. Comparisons were conducted among them.

Results: In the validation cohort, the area under curve (AUC) values of models based on Adaboost, Gradient boosting, and Catboost for predicting ruptured intracranial aneurysm were 0.889, 0.883 and 0.864, respectively, with no significant difference among them. Of note, the performance of these models was, but significantly superior to that of the other nine models. The AUCs of Adaboost model in cross-validation were within the range of 0.842 to 0.918.

Conclusion: Radiomics models based on the boosting algorithms can be used to predict ruptured intracranial aneurysms. Under the same data condition, the prediction efficacy differed among machine learning algorithms, among which the boosting algorithms, especially the Adaboost algorithm, might be superior.

PO-0010

Predictive Value of Whole-brain CTP Combined with ABCD3 Score for Short-Term Stroke after TIA

Ting Chen, Shushu Liu, Wei Wu, Dajing Guo
The Second Affiliated Hospital of Chongqing Medical University

Objective:

To investigate the predictive value of combining Whole Brain CT Perfusion (WB-CTP) combined with the ABCD3 score in patients with transient ischemic attack (TIA).

Methods:

A total of 336 TIA patients with TIA underwent WB-CTP and ABCD3 score assessment within 48 hours of admission. Spearman correlation test was performed to analyze the relationship between the degree of vascular stenosis, relative perfusion values, and ABCD3 score. Logistic regression analysis was used to identify independent risk factors for secondary cerebral infarction. Receiver operating characteristic (ROC) curves were generated to evaluate the predictive value of relative cerebral blood flow (rCBF), degree of vascular stenosis, ABCD3 score, and the WB-CTP-ABCD3 combined model for secondary cerebral infarction after TIA.

Results:

Among the 336 TIA patients, 143 showed abnormal perfusion areas and 146 had responsible vessel stenosis. The degree of vascular stenosis, relative time-to-maximum (rTmax), and relative mean transit time (rMTT) were positively correlated with the ABCD3 score, while rCBF and relative cerebral blood volume (rCBV) were negatively correlated with the ABCD3 score. ROC curve analysis identified a cutoff value of 0.8205 for rCBF, with a sensitivity of 84.10% and specificity of 58.10% for distinguishing the cerebral infarction group from the non-cerebral infarction group. Furthermore, $rCBF \leq 0.8205$, degree of vascular stenosis, and ABCD3 score > 6 were identified as independent risk factors for secondary cerebral infarction in TIA patients within 90 days in TIA patients. The AUC of the WB-CTP-ABCD3 combined model for predicting secondary cerebral infarction within 90 days was 0.836.

Conclusion:

The combined model of WB-CTP-ABCD3 shows promise as a valuable method for predicting secondary cerebral infarction within 90 days following TIA.

PO-0011

Clinicopathological and radiological characteristics of false-positive and false-negative results in T2-FLAIR mismatch sign of IDH-mutated gliomas

Yuying Zang, Fei Zheng, Limei Feng, Xuzhu Chen

Department of Radiology, Beijing Tiantan Hospital, Capital Medical University, Beijing, China

Abstract

Purpose:

To explore the clinicopathological and radiological characteristics associated with false-positive and false-negative results in the identification of isocitrate dehydrogenase (IDH) mutations in gliomas using the T2-fluid-attenuated inversion recovery (FLAIR) mismatch sign.

Methods:

In 1515 patients with cerebral gliomas, tumor location, restricted diffusion using diffusion-weighted imaging, and the T2-FLAIR mismatch sign were retrospectively analyzed using preoperative magnetic resonance imaging. Moreover, both the false-positive and false-negative results of the T2-FLAIR mismatch sign were obtained. Univariate and multivariate logistic analyses were performed to evaluate the risk factors associated with false-positive and false-negative results.

Results:

The overall false-positive rate was 3.5% (53/1515), and its independent risk factors were the patient's age (adjusted odds ratio [OR], 0.977; 95% confidence interval [CI], 0.957, 0.997; $p = 0.027$) and non-restricted diffusion (adjusted OR, 1.968; 95% CI, 1.060, 3.652; $p = 0.032$). The overall false-negative rate was 39.7% (602/1515); its independent risk factors were the patient's age (adjusted OR, 1.022; 95% CI, 1.005, 1.038; $p = 0.008$), 1p/19q co-deletion (adjusted OR, 3.334; 95% CI, 1.913, 5.810; $p < 0.001$), and telomerase reverse transcriptase promoter mutation (adjusted OR, 2.004; 95% CI, 1.181, 3.402; $p = 0.010$). For the mismatch sign in idiopathic IDH, the area under the receiver operating characteristic curve (AUC) was 0.602. The combined AUC for the T2-FLAIR mismatch sign and risk factors was 0.871.

Conclusions:

Clinicopathological and radiological characteristics can lead to the misinterpretation of IDH status in gliomas based on the T2-FLAIR mismatch sign. However, this can be avoided if careful attention is paid.

PO-0012

Altered brain structure and function after EC-T chemotherapy in patients with breast cancer: a longitudinal MRI study

Peng Li^{1,2}, Huawen Zhang¹, Tonghui Liu¹, Guoqiang Li¹, Wei Feng¹, Hengyang Wei¹, Xueyuan Wang¹, Rui Chen¹, Long Ning¹, Wanwan Zhao¹, Ming Zhang²

1. No.215 Hospital Of Shaanxi Nuclear Geology

2. First Affiliated Hospital of Xi'an Jiaotong University

Objective:

The heterogeneity of the chemotherapy regimens can undermine the identification of cognitive impairment and underlying neural mechanisms in patients with breast cancer (BC). The EC-T chemotherapy regimen (epirubicin, cyclophosphamide, and docetaxel) is a standard approach for adjuvant treatment for BC patients. We aim to investigate the detrimental effects of the EC-T chemotherapy regimen on alteration in cognition, brain structure, and function in BC patients.

Methods:

By using individual high-resolution T1-weighted structural sequence and resting-state functional magnetic resonance imaging, 20 BC patients and 26 matched healthy controls were scanned before the EC-T chemotherapy at baseline (T1). All BC patients were also scanned after whole EC-T chemotherapy (T2). Gray matter volume (VBM) were used to assess changes in brain structure between-group differences. Amplitude of low-frequency fluctuation (ALFF) and regional homogeneity (ReHo) methods were used to evaluate the spontaneous brain activity between-group differences. A battery of neuropsychological tests was performed twice (T1 and T2) to assess an individual's cognitive function.

Results:

Compared with the T1, the BC patients at T2 exhibited a significantly poorer performance in attention, memory and executive function ($p < 0.05$). The volume of gray matter decreased at T2 compared with the T1 in breast cancer patients, mainly located in the left inferior frontal gyrus ($p < 0.001$, uncorrected), which was positively correlated with the score of the digit span test (backward) ($r = 0.519$, $p = 0.019$). Compared with the BC patients at T1, significantly lower ALFF values at T2 were showed mainly located in right posterior cingulate gyrus, and left precuneus, and increased ALFF values were showed in the left medial frontal gyrus ($p < 0.01$, Bonferroni corrected). Significantly lower ReHo values mainly located in left anterior cingulate gyrus, left medial cingulate gyrus, left piniform putamen, and right medial temporal gyrus in BC patients at T2 compared with T1 ($p < 0.01$, Bonferroni corrected). The lower ALFF values in right posterior cingulate gyrus were positively correlated with the short-term recall score of auditory verbal learning test ($r = 0.480$, $p = 0.032$) and the color trail test-A scores ($r = -0.488$, $p = 0.029$). The lower ReHo values in left anterior cingulate gyrus were positively correlated with the short-term recall scores ($r = 0.514$, $p = 0.014$) and immediate recall scores ($r = 0.480$, $p = 0.032$) of auditory verbal learning test.

Conclusion:

Our results suggest that structural and functional abnormalities in vulnerable brain regions exposed to the EC-T regimen may provide neuroimaging evidence to identify cognitive impairment induced by specific chemotherapy regimen.

PO-0013

Altered Functional Connectivity within the Brain Fear Circuit in Parkinson's Disease with Anxiety: A Seed-Based Functional Connectivity Study

Kaidong Chen

The Affiliated Wuxi People's Hospital of Nanjing Medical University

Objectives: Aimed to investigate whether there are abnormal changes in the functional connectivity (FC) between the amygdala with other brain areas, in Parkinson's disease (PD) patients with anxiety.

Methods: Participants were enrolled prospectively, and the Hamilton Anxiety Rating (HAMA) Scale was used to quantify anxiety disorder. Rest-state functional MRI (rs-fMRI) was applied to analyze the amygdala FC patterns among anxious PD patients, non-anxious PD patients, and healthy controls.

Results: Thirty-three PD patients were recruited, 13 with anxiety, 20 without anxiety, and 19 non-anxious healthy controls. In anxious PD patients, FC between the amygdala with the hippocampus, putamen, intraparietal sulcus, and precuneus showed abnormal alterations compared with non-anxious PD patients and healthy controls. In particular, FC between the amygdala and hippocampus negatively correlated with the HAMA score ($r = -0.459$, $p = 0.007$).

Conclusion: Our results support the role of the fear circuit in emotional regulation in PD with anxiety. Also, the abnormal FC patterns of the amygdala could preliminarily explain the neural mechanisms of anxiety in PD.

PO-0014

Ectopic invasive ACTH-secreting pituitary adenoma mimicking chordoma: a case report and literature review

Yan Li, Jian-Guo Zhu, Qing-Quan Li, Xiao-Jing Zhu, Ji-Hong Tian
the 2nd Affiliated Hospital of NJMU

Abstract

Background Ectopic pituitary adenoma (EPA) is defined as a special type of pituitary adenoma that originates outside of the sellar region, is extra- or intra-cranially located, and without connection to normal pituitary tissue. EPA is extremely rare, with most cases presented as case reports or small case series. Due to nonspecific symptoms and laboratory indicators, the preoperative diagnosis, treatment and management for EPA remain challenging.

Case presentation Here, we report the imaging phenotype and pathological findings of a case of invasive EPA in a 47-year-old woman. A preoperative non-contrast CT scan revealed a 5.8×3.6×3.7 cm soft tissue mass located in the sphenoid sinus and clivus. MRI showed an ill-defined solid mass with heterogeneous signals on T1-weighted and T2-weighted images. The mass displayed infiltrative growth pattern, destroying bone of the skull base, invading adjacent muscles and encasing vessels. The patient underwent partial tumor resection via transsphenoidal endoscopic surgery. Pathological examination led to diagnosis of ectopic ACTH-secreting pituitary adenoma. Post-surgery, the patient received external beam radiotherapy.

Conclusion EPA with invasive growth pattern has rarely been reported. The imaging phenotype displays its relationship to the pituitary tissue and surrounding structures. Immunohistochemical examination acts as a crucial role in differentiating EPA from other skull base tumors. This case report adds to the literature on EPA by summarizing its characteristics alongside a review of the literature.

PO-0015

Structural degeneration and functional reorganization of visual cortex and visual subcortex in dysthyroid optic neuropathy

Hongyu Wu, Jing Zhang
Tongji Hospital of Huazhong University of Science and Technology

Purpose: Dysthyroid-optic-neuropathy (DON) is the most severe complication of thyroid-associated-ophthalmopathy (TAO), which may lead to irreversible vision loss if treated untimely. This study aimed to investigate structural and functional alterations of visual-cortex (VC) and visual-subcortex (VS) in DON.

Methods: DON patients, TAO without DON patients and healthy controls (HC) were retrospectively selected from our hospital database. Clinical assessments included clinical activity scores (CAS), visual acuity (VA). Structural alterations included VC (primary, second, third and fourth VC) and VS (lateral-geniculate-nucleus, LGN) gray matter volume (GMV) through structural MRI. Functional alterations were analysed included functional-connectivity (FC) and dynamic functional connectivity (dFC strength, dFCS; dFC variability) based on VC and VS through rs-fMRI. Correlation analyses were used to assess the relationships between MRI alterations and clinical assessments.

Results: 30 DON patients, 40 TAO patients and 21 HC were enrolled in our study. DON showed reductions in GMV of VC and VS than TAO and HCs. Compared with TAO, DON showed decreased FC between left-primary VC to left-Temporal-Pole-Sup, increased dFCS between r-LGN

to r-BA19, l-BA37, l-precuneus. Compared with HC, DON showed decreased FC between r-primary VC to r-BA6 and l-BA38, decreased dFCS between l-third VC to l-BA7 and r-BA11. In DON, GMV of r-LGN, l-second, l-third, l-fourth VC exhibited correlations with VA ($r=0.43$; $r=0.38$; $r=0.38$; $r=0.50$, respectively). In addition, dFCS between r-LGN to l-BA37 was associated with CAS ($r=0.37$) and GMV of r-LGN ($r=0.37$). dFCS between r-third VC to r-BA11 positively correlated with GMV of r-third VC ($r=0.41$).

Conclusion: This study indicates the potential of structural and functional abnormalities at MRI within visual-cortex and subcortex as predictive indicators of DON and contributes to our comprehension of the degeneration of posterior visual pathway in DON.

PO-0016

Non-alcoholic fatty liver disease is associated with brain function disruption in type 2 diabetes patients without cognitive impairment

Xin Li,bing zhang

Department of Radiology, Nanjing Drum Tower Hospital Clinical College of Nanjing Medical University

Context: Type 2 diabetes (T2D) is frequently accompanied by non-alcoholic fatty liver disease (NAFLD), both of which are associated with cognitive impairment. However, whether and how NAFLD worsens brain damage in patients with T2D remains unclear.

Objective: This study aimed to investigate the neural statics and dynamics intrinsic activity of intra-/inter- network topology in T2D with NAFLD (T2NAFLD) and without NAFLD (T2noNAFLD), and assess the relationship with metabolism.

Methods: Fifty-six T2NAFLD patients, 78 T2noNAFLD patients, and 55 healthy controls (HC) were included. Participants had normal cognition and underwent functional MRI scan, clinical measurements and global cognition assessment. Independent component analysis was used to study frequency spectrum parameters, static functional network connectivity and temporal properties of dynamic functional network connectivity ($p < 0.05$, false discovery rate corrected). Statistical analysis included one-way analysis of covariance with post hoc analysis, partial correlation, and canonical correlation analysis.

Results: Our findings showed that: 1) T2NAFLD patients are more disordered in blood glucose and lipid metabolism, more severe insulin resistance and more obese than T2noNAFLD; 2) patients with T2D exhibit disruptive brain function, as evidenced by alteration in the intra-/inter-network topology, even in the absence of clinically measurable cognitive impairment; 3) T2NAFLD patients have a significantly greater reduction in frequency spectrum parameters of the cognitive executive network and visual network than T2noNAFLD; 4) altered brain function in patients with T2D is associated with post-prandial glucose, high-density lipoprotein cholesterol, waist-hip ratio and body mass index.

Conclusion: This study may provide novel insights into neuroimaging correlates for underlie pathophysiologic processes that brain damage in T2NAFLD. Given this, controlling blood glucose and lipid levels and body weight may reduce the risk of cognitive impairment in these patients.

PO-0017

Dimensional subtyping of first-episode drug-naïve major depressive disorder: A multisite resting-state fMRI study

Biao Zhang

The First Affiliated Hospital of Anhui Medical University

Background: Major depressive disorder (MDD) is a heterogeneous syndrome, and understanding its neural mechanisms is crucial for the advancement of personalized medicine. However, conventional subtyping studies often categorize MDD patients into single subgroup, neglecting the continuous interindividual variations. This implies a pressing need for a dimensional approach.

Methods: 230 first-episode drug-naïve MDD patients and 395 healthy controls undergoing resting-state functional magnetic resonance imaging (rs-fMRI) scans obtained from 5 sites via the Rest-meta-MDD project. A Bayesian model harmonizes categorical and dimensional perspectives of heterogeneity and was utilized to estimate latent factors based on the resting-state functional connectivity (RSFC) of MDD. Demographic and clinical variables were compared across these identified factors.

Results: We identified three latent factors with distinct but partially overlapping whole-brain hypo- and hyper-RSFC patterns. Most participants co-expressed multiple latent factors to varying degrees rather than a single factor. All factors shared abnormal RSFC involving the default mode network and frontoparietal network, but the directionality (hypo- or hyper-RSFC) partially differed across factors. All factors had comparable demographic and clinical variables.

Conclusions: These findings shed light on the interindividual variability in MDD and could form the basis for developing novel therapeutic approaches that capitalize on the heterogeneity of MDD.

PO-0018

Altered brain structure in patients with right hemifacial spasm: A multimodal brain structure study

Qingyang Yu

Changzheng Hospital, Navy Military Medical University

Objective: The anatomical alterations in the brain generated by hemifacial spasm (HFS) continue to be a source of contention. We evaluated changes in the brain microstructure associated with HFS and observed their relevance to clinical features.

Methods: 3.0T MRI was adopted to capture T1-weighted structural imaging and diffusion tensor imaging data from 36 HFS patients and 36 healthy controls. We employed voxel-based morphometry (VBM) and tract-based spatial statistics (TBSS) to identify gray matter volume (GMV) and disruptions in the white matter (WM). The severity of the spasm was determined via the Cohn grading system.

Results: A substantial decrease in GMV in the left Thalamus but an increase in GMV in the right Cerebellum IV-V in the HFS group, as analyzed by the VBM. Fractional anisotropy (FA) in the HFS group's left superior longitudinal fasciculus (SLF) has suffered from a substantial increase. Changes of GMV in left thalamus and FA in left SLF were correlated with disease duration and Cohn grading.

Conclusions: We identified altered regions of GMV in HFS patients characterized by decreased thalamic volume and increased cerebellar compensatory volume. Furthermore, it is concluded that the FA in the left SLF may be a critical neuronal marker for HFS.

PO-0019

Structure Alterations in left-sided trigeminal neuralgia: A voxel-based morphometry and diffusion tensor imaging study

Qingyang Yu

Department of Radiology, Changzheng Hospital, Navy Military Medical University

Background: The purpose of this study was to investigate the changes of brain structure in patients with primary trigeminal neuralgia (TN), and to further explore the relationship between these changes and the clinical manifestations of TN patients.

Methods: T1-weighted structural imaging and diffusion tensor imaging data were collected from 32 TN patients and 32 healthy controls using 3.0T MRI. Gray matter volume (GMV) and white matter destruction (WM) were identified using voxel-based morphometry (VBM) and tract-based spatial statistics. The correlations between structural metrics and visual analogue scale (VAS) and disease duration were analyzed.

Results: A substantial decrease in GMV in the right thalamus in the TN group, as analyzed by the VBM. Fractional anisotropy (FA) and radial diffusivity (RD) in the genu and body of corpus callosum (CC), anterior corona radiata (CR), and superior CR have suffered from a substantial increase and decrease, relatively. The changes of FA and RD in some of these altered brain regions were correlated with disease duration and VAS.

Conclusions: We found that the altered area of GMV in left TN patients was characterized by decreased thalamic volume. In addition, the FA and RD values of CC and CR have important value in evaluating the pain degree of TN patients.

PO-0020

The hierarchical organization of the precuneus captured by functional gradients

Ping Jiang^{1,2,3}, Shun Cui^{1,2,3}, Jiajia Zhu^{1,2,3}, Yongqiang Yu^{1,2,3}

1. The First Affiliated Hospital of Anhui Medical University

2. Research Center of Clinical Medical Imaging

3. Anhui Provincial Institute of Translational Medicine

Background: The precuneus shows considerable heterogeneity in multiple dimensions including anatomy, function, and involvement in brain disorders. Leveraging the state-of-the-art functional gradient approach, we aimed to investigate the hierarchical organization of the precuneus, which may hold promise for a unified understanding of precuneus heterogeneity. **Methods:** Resting-state functional MRI data from 793 healthy individuals were used to discover and validate functional gradients of the precuneus, which were calculated based on the voxel-wise precuneus-to-cerebrum functional connectivity patterns. Then, we performed a series of further analyses to explore the relationships of the precuneus functional gradients with cortical morphology, intrinsic geometry, canonical functional networks, and behavioral domains. **Results:** We found that the precuneus principal and secondary gradients showed dorsoanterior-ventral and ventroposterior-dorsal organizations, respectively. Concurrently, the principal gradient was associated with cortical morphology, and both the principal and secondary gradients showed geometric distance dependence. Importantly, precuneus functional subdivisions corresponding to canonical functional networks (behavioral domains) were distributed along both gradients in a hierarchical manner, i.e., from the sensorimotor network (somatic movement and sensation) at one extreme to the default mode network (abstract cognitive functions) at the other extreme for the

principal gradient and from the visual network (vision) at one end to the dorsal attention network (top-down control of attention) at the other end for the secondary gradient. Conclusion: These findings suggest that the precuneus functional gradients may not only provide mechanistic insights into the multifaceted nature of precuneus heterogeneity, but also have the potential to generate new hypotheses about neural mechanisms of neuropsychiatric disorders.

PO-0021

Decoupling of Gray and White Matter Functional Networks in Cognitive Impairment Induced by Occupational Aluminum Exposure: a case control study

Feifei Zhang, Hui Zhang
First Hospital of Shanxi Medical University

Background Aluminum (Al) is a low toxic and accumulative harmful substance that has neurotoxicity and a negative impact on human cognitive function. The goal of the present study was to investigate the neuro mechanisms of cognition impairment caused by occupational Al exposure.

Methods Resting-state functional magnetic resonance imaging was performed on 54 workers who were exposed to Al for more than 10 years. The level of Al was collected, and cognition was assessed by the Montreal Cognitive Assessment (MoCA). Then, the K-means clustering algorithm was used to identify functional gray matter (GM) and white matter (WM) networks. Two-sample t tests were performed between the cognition impairment group and control group to determine which differences in functional connectivity (FC) were significant.

Results Al was negatively correlated with the MoCA score. Participants with cognitive impairment showed decreased FC between the middle cingulum network (WM1) and anterior cingulum network (WM2) and between the executive control network (WM6) and limbic network (WM10). It is worth noting that decreased FCs were found between the executive control network (GM5) and WM1, WM4, WM6, and WM10. In addition, the FC of GM5-GM4 and WM1-WM2 was negatively correlated with TMT-A scores.

Conclusion The long-term accumulation of Al has a detrimental effect on cognition, and this damage is mainly related to the disconnection in executive control and limbic networks.

PO-0022

Evaluation of the Default Mode Network using Nonnegative Matrix Factorization in Patients with Cognitive Impairment Induced by Occupational Aluminum Exposure

Feifei Zhang, Hui Zhang
First Hospital of Shanxi Medical University

Aluminum (Al) is an important environmental pathogenic factor for neurodegenerative diseases, especially mild cognitive impairment (MCI). To evaluate the gray matter volume of structural covariance network alterations in patients with Al-induced MCI. Male subjects who had been exposed to Al for more than ten years were included in the present study. The plasma Al concentration, Montreal Cognitive Assessment (MoCA) score and verbal memory assessed by the Rey auditory verbal learning test (AVLT) score were collected from each participant. Nonnegative matrix factorization was used to identify the structural covariance network. The neural structural basis for patients with Al-induced MCI was investigated using correlation analysis and group

comparison. Plasma A β concentration was inversely related to MoCA scores, particularly AVLT scores. In patients with A β -induced MCI, the gray matter volume of the default mode network (DMN) was considerably lower than that in controls. Positive correlations were discovered between the DMN and MoCA scores, as well as between the DMN and AVLT scores. Together, long-term occupational A β exposure has a negative impact on cognition, primarily by affecting delayed recognition. The reduced gray matter volume of the DMN may be the neural mechanism of A β -induced MCI.

PO-0023

The Role of the Orbitofrontal Cortex in Exercise Addiction and Exercise Motivation: A Brain Imaging Study Based on Multimodal Magnetic Resonance Imaging

Feifei Zhang, Hui Zhang
First Hospital of Shanxi Medical University

Background Excessive exercise may also lead to exercise addiction (EXA), which is harmful to people's physical and mental health. Behavioral and neuroimaging studies have demonstrated that addictive disorders are essentially motivational problems. However, little is known about the neuropsychological mechanism of EXA and the effects of motivation on EXA.

Methods We investigated 130 regularly exercised participants with EXA symptoms to explore the neurobiological basis of EXA and its association with motivation. The correlation between EXA and gray matter volume (GMV) was evaluated by whole-brain regression analysis based on voxel-based morphometry. Then, regional brain function was extracted and the relationship between brain structure-function-EXA was analyzed. Finally, mediation analysis was performed to further detect the relationship between the brain, motivation, and EXA.

Results Whole-brain correlation analyses showed that the GMV of the right orbitofrontal cortex (OFC) was negatively correlated with EXA. The function of the right OFC played an indirect role in EXA and affected EXA via the GMV of the OFC. Importantly, the GMV of the right OFC played a mediating role in the relationship between ability motivation and EXA. These results remain significant even when adjusting for sex, age, body mass index, family socioeconomic status, general intelligence, total intracranial volume, and head motion.

Limitation The results should be interpreted carefully because only the people with EXA symptoms were included.

Conclusion This study provided evidence for the underlying neuropsychological mechanism of the important role of the right OFC in EXA and revealed that there may be a decrease in executive control function in EXA.

PO-0024

Abnormal alterations of cerebral blood flow and functional connectivity in Neuromyelitis Optica Spectrum Disorders

Juan Chen, Ting You, Hui Dai
Affiliated Hospital of Zunyi Medical University

Objective Studies have demonstrated that patients with Neuromyelitis Optica Spectrum Disorders (NMOSD) has abnormal brain function. Our study focused on elucidating the alterations of Cerebral Blood Flow (CBF) and Functional Connectivity (FC) in NMOSD patients who were negative in routine MRI scan.

Methods In this study, 24 patients with NMOSD and 25 demographically matched healthy controls (HCs) were studied for CBF and FC using a seed-based whole-brain FC analysis. Arterial Spin Labelling (ASL) were used to determine differential CBF regions in patients with NMOSD. A seed-based whole-brain FC analysis was performed for regions with significant CBF changes.

Results The results showed that the cerebral blood flow of bilateral occipital cortex was the most significant in NMOSD patients. Compared with HCs, CBF of bilateral calcarine fissure (CAL), right supplementary motor area (SMA) and right superior temporal gyrus (STG) were decreased in NMOSD patients, while the right middle temporal gyrus (MTG) were increased. We observed that the FC between the bilateral CAL and Olfactory (OLF) and that between the right SMA and left superior frontal gyrus (SFG), the right STG and cuneus (CUN) were increased in patients with NMOSD. While that between the right SMA and right postcentral gyrus (PoCG), the right STG and inferior parietal lobule (IPL) were decreased. We found a correlation between CBF of bilateral calcarine fissure and EDSS score in NMOSD patients.

Conclusions These findings suggested that CBF and FC were altered simultaneously in patients with NMOSD, which may provide additional information and insight regarding the pathophysiology of NMOSD from neuronal and vascular integration perspectives.

PO-0025

Altered static and dynamic functional network connectivity in individuals with subthreshold depression: a large-scale resting-state fMRI study

Dan Liao, chunhong liu

(Beijing Hospital of Traditional Chinese Medicine, Capital Medical University, Beijing 100010, China)

Dynamic functional network connectivity (dFNC) is an expansion of static FNC (sFNC) that measures connectivity variation among brain networks. This study aims to investigate the changes of sFNC and dFNC strengths as well as temporal properties in individuals with subthreshold depression (StD). Forty-two individuals with subthreshold depression and 38 healthy controls were included in this study. Data-driven independent component analysis (GICA) was used to determine the target resting-state networks. Sliding window and k-means clustering analysis were used to obtain dFNC patterns and temporal properties for each subject. We compared sFNC and dFNC differences between the StD and HCs groups. Relationships between changes of FNC strength, temporal properties, and neurophysiological scores were evaluated by Spearman's correlation analysis. Regarding the analysis of sFNC, StD individuals showed altered FNC among four functional domains, mainly involving in executive control network (ECN), default mode network (DMN), sensorimotor network (SMN) and dorsal attentional network (DAN). For the dFNC analysis, 4 recurring FNC patterns were identified. When compared to HCs, StD had increased mean dwell time and fraction time in a weak connected state (state 4), which is associated with self-focused thinking status. In addition, StD demonstrated decreased dFNC strength between DMN-DAN in state 2. The sFNC strength (DMN-ECN) and temporal properties were correlated with HAMD-17 scores in StD individuals. Our study provides new evidence on aberrant time-varying brain activity and large-scale network interaction disruptions in StD individuals, which may provide novel insight to better understand the underlying neuropathological mechanisms.

PO-0026

The reduction of vitamin D in females with major depressive disorder is associated with worse cognition mediated by abnormal brain functional connectivity

Wenming Zhao

The First Affiliated Hospital of Anhui Medical University

Low vitamin D is linked to major depressive disorder (MDD) through affecting the brain. Gender difference is apparent in MDD and vitamin D level. We aimed to examine the association between gender, vitamin D, clinical presentations, and brain functional connectivity in a large cohort of MDD patients and comparison subjects. Resting-state functional MRI data from 122 patients and 119 controls were collected to perform a combined analysis of functional connectivity density (FCD) and seed-based functional connectivity (FC). Peripheral venous blood samples were obtained to measure serum concentration of vitamin D (SCVD). Clinical presentations (symptoms profiles and cognition) were also assessed. We found an interaction of group and gender on SCVD in which MDD patients demonstrated lower SCVD than controls in females rather than males. Concurrently, lower SCVD was associated with worse cognitive performance (prospective memory and sustained attention). Compared with controls, female MDD patients showed reduced FCD and FC of the left middle frontal gyrus, which were related to lower SCVD. Importantly, these FCD and FC changes mediated the relationship between lower SCVD and cognitive dysfunction. Our findings suggest that functional connectivity abnormalities may serve as neural substrates underlying the associations between low vitamin D and cognitive impairments in female MDD patients, providing unique insight into treatment and prevention of MDD and its related cognitive dysfunction from the perspective of regulating circulating vitamin D.

PO-0027

Brain function mediates the association between low vitamin D and neurocognitive status in female patients with major depressive disorder

Wenming Zhao

The First Affiliated Hospital of Anhui Medical University

Background: Vitamin D is engaged in various neural processes, with low vitamin D linked to depression and cognitive dysfunction. There are gender differences in depression and vitamin D level. However, the relationship between depression, gender, vitamin D, cognition, and brain function has yet to be determined.

Methods: One hundred and twenty-two patients with major depressive disorder (MDD) and 119 healthy controls underwent resting-state functional MRI and fractional amplitude of low-frequency fluctuations (fALFF) was calculated to assess brain function. Serum concentration of vitamin D (SCVD) and cognition (i.e. prospective memory and sustained attention) were also measured.

Results: We found a significant group-by-gender interaction effect on SCVD whereby MDD patients showed a reduction in SCVD relative to controls in females but not males. Concurrently, there was a female-specific association of SCVD with cognition and MDD-related fALFF alterations in widespread brain regions. Remarkably, MDD- and SCVD-related fALFF changes mediated the relation between SCVD and cognition in females.

Conclusion: Apart from providing insights into the neural mechanisms by which low vitamin D contributes to cognitive impairment in MDD in a gender-dependent manner, these findings might have clinical implications for assignment of female patients with MDD and cognitive dysfunction to

adjuvant vitamin D supplementation therapy, which may ultimately advance a precision approach to personalized antidepressant choice.

PO-0028

The protective effect of vitamin D supplementation on the brain of patients with major depressive disorder: A randomized controlled trial

Wenming Zhao

The First Affiliated Hospital of Anhui Medical University

Background: Growing evidence points to the pivotal role of vitamin D in the pathophysiology and treatment of major depressive disorder (MDD). However, there is a paucity of longitudinal research investigating the effects of vitamin D supplementation on the brain of MDD patients.

Methods: We conducted a double-blind randomized controlled trial in 46 MDD patients, who were randomly allocated into either VD (antidepressant medication + vitamin D supplementation) or NVD (antidepressant medication + placebos) groups. Data of diffusion tensor imaging, resting-state functional MRI, serum vitamin D concentration, and clinical symptoms were obtained at baseline and after an average of 7 months of intervention.

Results: Both VD and NVD groups showed significant improvement in depression and anxiety symptoms, but with no significant differences between the two groups. However, a greater increase in serum vitamin D concentration was found to associate with greater improvement in depression and anxiety symptoms in VD group. More importantly, neuroimaging data demonstrated disrupted white matter integrity of right inferior fronto-occipital fasciculus along with decreased functional connectivity between right frontoparietal and medial visual networks after intervention in NVD group, but no changes in VD group.

Conclusions: These findings suggest that vitamin D supplementation as adjunctive therapy to antidepressants may not only contribute to improvement in clinical symptoms, but also help to preserve brain structural and functional connectivity in MDD patients.

PO-0029

Spin-Singlet Targeted Glutamate Proton Magnetic Resonance Radiofrequency Pulse Sequence Development and Preliminary Application

Junlong Wang, Yan Ren, Hanqiu Liu
Huashan Hospital, Fudan University

Background Proton Magnetic Resonance Spectroscopy ($^1\text{H-MRS}$) can non-invasively measure the concentration of specific compounds in the selected voxel region of living tissue and thus infer the metabolic state of the corresponding brain region. Timely and accurate quantitative analysis of amino acids in vivo can aid in the early diagnosis of central nervous system diseases. The spectral signals of glutamate (Glu) and glutamine (Gln) obviously overlap in the curves obtained by $^1\text{H-MRS}$, which makes it very difficult to separate Glu signals. Therefore, it is very important to selectively isolate the signal of Glu in vivo to study the metabolic process of Glu in normal people and to determine its role in the progression of glioma.

Objective To verify the feasibility of applying targeted Glu sequence to different concentrations of Glu aqueous solution and clinical practice.

Methods 1) Using a 3.0T clinical MRI scanner, Glu-targeted ^1H -MRS pulse sequences were developed and tested to selectively detect Glu signals. The tests were performed in Glu aqueous phantom at different concentrations, and a conventional single voxel spectroscopy (SVS) PRESS sequence was scanned simultaneously to determine the reliability of the Glu signal isolated in the aqueous phantom. 2) The SVS PRESS sequence and the Glu-targeted ^1H -MRS pulse sequence were applied to healthy controls and glioma patients respectively, to determine the reliability of the Glu-targeted ^1H -MRS pulse sequence in clinical applications. The Glu spectral lines obtained from the above SVS PRESS sequence measurements were qualitatively compared with the Glu spectral lines fitted by the LCModel software.

Results The developed pulse sequence of Glu-targeted ^1H -MRS was applied to Glu aqueous phantom at different concentrations, different parts of healthy human brain and glioma patients, and the signals of Glu were selectively detected and isolated. The chemical shifts, peaks and waveforms of the obtained spectral lines all converged with the Glu spectral lines fitted by LCModel.

Conclusion The newly developed Glu-targeted ^1H -MRS pulse sequence can detect the Glu signal in the water model solution at different concentrations. It can be applied to the selective Glu-targeted detection of normal human brain and glioma patients.

PO-0030

Quantitative Study of Clinical Application of Spin-Singlet Targeted Glutamate Proton Magnetic Resonance Radiofrequency Pulse Sequence

Junlong Wang, Yan Ren, Hanqiu Liu
Huashan Hospital, Fudan University

Background Conventional single voxel spectroscopy (SVS) proton magnetic resonance spectroscopy (^1H -MRS) is a non-invasive method for measuring cellular metabolism in tissues and organs. ^1H -MRS imaging combined with LCModel analysis software can be used to non-invasively detect changes in brain metabolites and quantitatively analyze the concentration of these metabolites. By continuously optimizing the scanning and post-processing techniques, we can also quantify metabolites with similar molecular structure and spectral characteristics, such as acetylaspartic acid (NAA), Glu/Gln, etc. However, there are many other post-processing analytical methods that can change the accuracy of ^1H -MRS metabolite quantification, and it is not clear to what extent the differences in analytical methods used to quantify ^1H -MRS data affect the quantitative results.

Objective The brain tissue and glioma of normal volunteers (Healthy controls, HCs) were detected by conventional voxel MRS, ^1H -MRS Glu targeted pulse sequence and LCModel, MATLAB and other post-processing software. The method of in vivo quantitative detection of Glu, quantitative detection of Glu in different lobes of normal brain and quantitative detection of Glu in glioma were investigated. To explore the feasibility of Glu quantification detected based on Glu-targeted ^1H -MRS pulse sequence as a biomarker for Glu metabolic imaging in human brain in vivo.

Methods From June 2022 to January 2023, 10 glioma patients (over 18 years old) were enrolled as the patient group and 28 healthy volunteers were recruited as the volunteer group. All subjects were scanned by SIEMENS 3.0T MRI (Prisma) system, including 3D-MRI axial scan, single voxel ^1H -MRS (PRESS) scan, and Glu-targeted ^1H -MRS scan. In normal subjects, frontal lobe, occipital lobe and basal ganglia were selected as voxel regions of interest (VOI). In the patient group, the VOI was located in the solid part of tumor. The spectral lines obtained by conventional voxel MRS detection were post-processed and semi-quantitatively determined by LCModel (SVS-LCModel method), and the spectral lines obtained by targeted Glu sequence were manually measured and semi-quantitatively determined by MATLAB (SSO-MATLAB method). The reliability of the two

quantitative detection methods was evaluated by Bland-Altman (B-A) method and coefficient of variation (CV) analysis, respectively. Pearson product-moment correlation coefficient (R) was used to calculate the correlation between Glu and total creatine (tCr) quantified by different detection methods, i.e. creatine (Cr) + creatine phosphate (Pcr). The quantitative values of Glu in the tumor area detected by two methods were compared with those in the normal frontal lobe area by two-sample t-test.

Results The quantitative results of SVS-LCModel in frontal lobe, occipital lobe and basal ganglia of volunteers were (1.275 ± 0.0987 ; 1.227 ± 0.1696 ; 1.040 ± 0.1335), the quantitative results of SSO-MATLAB were (0.690 ± 0.0742 ; 0.529 ± 0.1304 , 0.552 ± 0.1990), and the quantitative results of SVS-LCModel and SSO-MATLAB in the glioma area were (3.407 ± 0.6149) and (0.644 ± 0.3002), respectively. The semi-quantitative Glu values of the two methods in the frontal lobe, occipital lobe and basal ganglia region and glioma group were in good agreement with each other, among which the frontal lobe and occipital lobe had the best consistency. CV analysis also showed that the variation of frontal lobe and occipital lobe was the lowest, among which SVS-LCModel (frontal lobe: 7.74%, occipital lobe: 13.82%) was better than SSO-MATLAB (frontal lobe: 10.75%, occipital lobe: 24.65%). The results of correlation analysis of the two methods showed that there was a good correlation between frontal lobe and occipital lobe, but there was no correlation between basal ganglia and tumor area, and SVS-LCModel showed that the content of Glu in glioma area was significantly higher than that in normal frontal lobe (SVS-LCModel), and there was no significant difference in Glu content between glioma area and frontal lobe by SSO-MATLAB method.

Conclusion The quantitative detection of Glu of SSO-MATLAB in frontal lobe and occipital lobe of normal subjects has a better correlation with SVS-LCModel, and the reliability of semi-quantitative detection of Glu is better, but the reliability of quantitative detection of Glu in basal ganglia and glioma is not ideal, so it still needs to be improved.

PO-0031

Diffusion heterogeneity and vascular perfusion in tumor and peritumoral areas for prediction of overall survival in patients with high-grade glioma

Jun Qiu

Department of Radiology, The First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China, Hefei, Anhui, China.

Objective: To evaluation of diffusion heterogeneity and vascular perfusion in tumor and peritumoral areas for prognostic prediction in high-grade glioma (HGG, WHO III/IV grade).

Methods: Forty patients with HGG underwent diffusion kurtosis imaging (DKI), intravoxel incoherent motion (IVIM), and arterial spin labeling (ASL) MRI before operation. After normalization, the parameters were divided into diffusion heterogeneity parameters (rD, rMD, rMK, rKr, rKa) and vascular perfusion parameters (rD*, rF, rCBF). Univariate and multivariate Cox regression analyses were used to evaluate associations between overall survival (OS) and the above parameters, clinical factors, and IDH1 status. The Mann-Whitney test was used to evaluate differences in the parameters between different IDH1 states.

Results: In the univariate Cox regression analysis, OS was significantly associated with tumor resection range, IDH1 status, tumor heterogeneity parameters (rD, rMD, rMK, rKr, rKa), and rCBF in tumor area (all $p < 0.05$). In addition, rD and rCBF measured in the peritumoral region were also predictors of poor OS (both $p < 0.01$). Multivariate Cox regression analysis indicated that rMK in the tumor area and rCBF in the peritumoral area (hazard ratio = 7.900 and 5.466, respectively, for each 0.1 increase in the normalized value) were independent predictors of OS.

Conclusion: The rMK of tumor area and rCBF of peritumoral area had independent predictive value for OS in patients with HGG.

Advances in knowledge: This study explored useful imaging biomarkers from the diffusion heterogeneity and vascular perfusion of tumor and peritumoral areas in HGG, which is useful to help clinician to make precise therapeutic plans, and predict the prognostic for glioma patients.

PO-0032

Histogram models of dynamic contrast-enhanced MR imaging in predicting progression of enhancing non-measurable disease after chemoradiotherapy in high-grade glioma

Haimei Cao¹, Zhousan Huang¹, Ruowei Qiu¹, Zhiyong Li², Kan Deng³, Jay J Pillai⁴, Guanglong Huang², Yikai Xu¹, Yuankui Wu¹

1. Nanfang Hospital, Southern Medical University

2. Department of Neurosurgery, Nanfang Hospital, Southern Medical University, Guangzhou, China

3. Philips Healthcare, Guangzhou, China

4. Division of Neuroradiology, Russell H. Morgan Department of Radiology and Radiological Science, Johns Hopkins University School of Medicine, Baltimore, MD, United States

Objectives

To investigate the potential of histogram models based on volume transfer constant (K^{trans}) between the plasma and extravascular extracellular space and extravascular volume (V_e) in predicting the progression of enhancing non-measurable disease (NMD) persisting after chemoradiotherapy following gross total resection in high-grade glioma (HGG) patients.

Methods

Dynamic contrast-enhanced MR images of patients who underwent temozolomide-based chemoradiation after gross total resection from January 2016 to May 2022 were analyzed retrospectively. The histogram features of K^{trans} and V_e of enhancing NMD were extracted and compared between the progression and non-progression groups. Histogram features with significant differences were included in binary logistic regression to construct histogram models of K^{trans} and V_e to predict progression in 2-3 months. Receiver operating characteristic curves were used to evaluate the prediction performance of different models (K^{trans} , V_e , and $K^{trans} + V_e$).

Results

A total of 97 HGG patients (mean age \pm standard deviation, 47.1 years \pm 12.1; 73 men) were enrolled, including 55 in the progression group and 42 in the non-progression group. The histogram model of K^{trans} (10th percentile + 90th percentile + skewness) showed an area under the curve (AUC) of 0.900 in predicting progression. The model of V_e (10th percentile + minimum + skewness) had an AUC of 0.879. Combining K^{trans} and V_e , the model (V_e _10th percentile + V_e _skewness + K^{trans} _ root-mean-squared) had an AUC of 0.927.

Conclusions

The histogram models based on K^{trans} and V_e can predict the progression of enhancing NMDs in HGG following chemoradiotherapy 2-3 months in advance.

PO-0033

Construction of Common Harmonic Waves on Major Depressive Disorder-A New Approach for Brain Network Analyses

Kai Xu¹, Haoxuan Lu², Li Ke¹

1. Department of Radiology, Strategic Support Force Medical Center

2. Department of Radiology, PLA General Hospital

Objective Mounting evidence shows that neurological diseases can be understood as a disconnection syndrome where the large-scale brain network is progressively disrupted by neuropathological processes. Our proposed harmonic-based network analysis approach provides a new methodology to analyze these neuropathological changes in the progression of major depressive disorder (MDD).

Methods 55 patients with MDD and 46 normal controls (NC) were selected as subjects for the study. All participants underwent scanning with a 3.0T ultra-high-field MR scanner to obtain three-dimensional high-resolution T1-weighted image data. Nine morphological features (the number of vertices, gray matter volume, Gaussian curvature, fold index and et al) were constructed using the Freesurfer 5.3.0 tool to create brain networks. Common harmonic waves were obtained through the eigenvalue decomposition of the Laplacian matrix. Finally, Fisher's J score (the ratio of between-class mean to within-class variance) was calculated for harmonic energy between MDD subjects and healthy controls, comparing whether there were significant differences in harmonic energy of morphological features between MDD and NC in each harmonic wave.

Results There was no significant difference in total harmonic energy of the nine morphological features between the MDD and NC group. However, specific harmonic energy differed from the NC group, including 1) the number of vertices: harmonic wave 2, 6, 15, 44, and 57; 2) surface area: harmonic wave 2, 6, 16, and 57; 3) gray matter volume: harmonic wave 2, 12, 13, 15, and 57; 4) mean cortical thickness: harmonic wave 2, 19, 35, 36, and 44; 5) standard deviation of cortical thickness: harmonic wave 8, 21, and 42; 6) mean curvature: harmonic wave 26 and 57; 7) Gaussian curvature: harmonic wave 34, 40, 54, and 57; 8) fold index: harmonic wave 5, 16, and 21; 9) curvature index: harmonic wave 25, 32, 33, and 37. These data all showed significant difference ($P < 0.05$).

Conclusion These results confirm abnormal harmonic waves associated with the brain morphological network in MDD patients. It may related to the underlying mechanism of the brain network and provide a new insight for the following research.

PO-0034

Predicting IDH1 Expression using Computational Modeling of Interstitial Fluid Pressure in Glioblastoma

Jianan Zhou, Chuanshuai Tian, Zhengyang Zhu, Bing Zhang, Xin Zhang

Department of Radiology, The Affiliated Drum Tower Hospital of Nanjing University Medical School

Synopsis The immunohistochemistry features of glioblastoma have important influence on its occurrence and prognosis. Understanding the noninvasive detection of interstitial fluid pressure (IFP) and velocity (IFV) based on dynamic contrast enhanced (DCE)-MRI to explore the correlation between IFP and IFV with immunohistochemical markers of glioblastoma. The investigation demonstrates that IFP indicators have significant correlation with isocitrate dehydrogenase 1 (IDH1) expression and Ki-67 level of glioblastoma, and could help diagnose IDH1-mutation patients.

Summary of main findings

Computational modeling of IFP and IFV based on DCE-MRI has significant correlation with IDH mutation status and Ki-67 level of glioblastoma.

Introduction

Glioblastoma is the most common primary malignant tumor of central nervous system¹, which is characterized by extensive invasion, strong invasion and angiogenesis. Conventional MRI sequences could only reflect the anatomical information, morphological characteristics and enhancement mode of the tumor. Recently, computational models were established to simulate interstitial fluid pressure (IFP) and velocity (IFV) based on dynamic contrast enhanced (DCE)-MRI². Previous clinical studies have shown that the increase of IFP is closely related to the occurrence and prognosis of tumors³. At present, the gold standard for measuring IFP is wick-in-needle (WIN) method, but it is invasive⁴⁻⁶. The purpose of this study is to explore correlation of computational modeling of IFP and IFV based on DCE-MRI with immunohistochemistry markers (IDH1 expression and Ki-67 level) in glioblastoma, and explore the diagnosis performance for distinguishing IDH1-mutation patients.

Materials and Methods

Patients data between 2020 and 2021 meeting the following criteria were reviewed: (1) Pathologically confirmed glioblastoma; (2) Underwent DCE-MRI examination before surgery in a 3.0T MR scanner (uMR770, United Imaging Healthcare); (3) IDH1 expression and Ki-67 level were evaluated by immunohistochemistry of tumor samples after surgery. IDH1 expression (0: wild; 1/2/3: mutation +/++/+++) and Ki-67 level (0 ~ 100%) were evaluated by immunohistochemistry of tumor samples after surgery.

DCE-MRI based on transverse T1-weighted spoiled gradient-echo sequence were performed before, during and after the injection of contrast agent (CA) (gadodiamide injection, 0.2mL/kg, 3.5mL/s). 100 time-points were acquired during 4min 10s (temporal resolution 2.5s).

The permeability parameters were calculated from extended Tofts model (ETM)⁷.

$$C_t(t) = K_{trans} \int_0^t \exp(-k_{ep}(t-\tau)) C_p(\tau) d\tau + v_p C_p(t)$$

where K_{trans} is the volume transfer constant, v_p is the volume of extravascular extracellular space, k_{ep} is the transport rate constant of CA from the extravascular extracellular space, and $C_p(t)$ is the plasma CA concentration with time. Volume-of-interests were delineated manually including the whole tumor on late DCE images. The partial differential equation of IFP and IFV was formulated from the continuity equation and solved in MATLAB.

$$-KH \nabla^2 p_i = K_{trans} / \langle K_{trans} \rangle [L_p S/V (p_{eff} - p_i)] - L_p L_{SL}/V (p_i - p_L)$$

Where p_i is the pressure in interstitial space, p_{eff} is the effective pressure in vascular after considering tumor osmotic pressure, L_p is the hydraulic conductivity of the vessel wall; S/V is the surface to volume ratio of the capillary wall. The lymphatic clearance term $L_p L_{SL}/V$ is assumed to be zero in the brain. All modeling parameters were decided according to foreknowledge from previous studies^{2,8}.

Spearman's correlation was used to assess the relationship between IFP and IFV indicators (mean, standard deviation (SD), kurtosis, skewness) and immunohistochemistry markers. Mann-Whitney U test was used to compare the IFP indicators between IDH1-wild group and IDH1-mutation group. The receiver operating curve (ROC) curve analysis was performed to assess the diagnostic performance of IFP indicators in distinguishing IDH1-mutation patients from IDH1-wild. Significance criteria was $P < 0.05$ for all statistic results.

Results Fifty-two patients were included (mean age 56.9 ± 9.8 , 28 females). IFP and IFV mappings were obtained for each patient (an example in Figure 1). The IDH1 expression was significantly correlated with IFPmean ($P=0.019$, $r=-0.342$), IFPSD ($P=0.026$, $r=0.324$), IFPkurtosis ($P=0.04$, $r=-0.300$), and IFPskewness ($P=0.05$, $r=0.288$). Ki-67 level was correlated with IFPSD ($P=0.047$, $r=0.280$). No significance was found in other statistic results.

Compared to IDH1-wild group, IDH1-mutation group showed significantly lower IFPmean (1282 Pa vs 1215 Pa, $P=0.020$) and IFPkurtosis (3.944 vs 3.292, $P=0.030$), and significantly higher IFPSD (241 Pa vs 275 Pa, $P=0.024$) and IFPskewness (-1.199 vs -0.986, $P=0.045$). IFPmean had best diagnosis performance (AUC=0.713) among IFP indicators (Figure 2).

Discussion

This study found that computational modeled IFP were associated with the expression of IDH1 in glioblastoma. Previous studies have shown that DCE perfusion parameters such as Ktrans and Ve reflect vascular permeability and can be used to predict IDH mutation status of glioma⁹. IFP is closely associated with tumor permeability, and could be affected by the microvascular properties within the tumor. Compared with IDH mutant, IDH wild-type glioma has faster tumor cell proliferation, richer neovascularization and higher permeability. Ki-67 reflects the proliferation of tumor cells and can be used to distinguish low-grade glioma from high-grade glioma. Previous study reported that Ki-67 in high-grade glioma is higher than that in low-grade glioma¹⁰⁻¹¹. Therefore, IFP indicators have potential significance in predicting the molecular classification, tumor recurrence and prognosis of glioma.

Conclusion

IFP indicators calculated from DCE-MRI have significant correlation with the IDH mutation status and Ki-67 level, and hold potential to predict IDH1 mutant and IDH1 wild type of glioma.

Alterations of cortical and subcortical structures in mild cognitive impairment

Junxia Wang, Bing Zhang
Nanjing Drum Tower Hospital

Purpose: Grey matter changes are thought to be closely related to cognitive decline in mild cognitive impairment (MCI) patients but no consensus has yet emerged. The study aimed to explore the alterations of cortical and subcortical structures in MCI patients, and to investigate the association with cognitive assessment.

Methods: A total 24 MCI individuals and 22 normal controls (NCs) were included. Voxel-based morphometry (VBM) analysis and vertex-based shape analysis were used to analyze the volume and shape of subcortical nuclei, respectively. We also used surface-based morphometry (SBM) analysis through the Computational Anatomy Toolbox (CAT12) to compare cortical morphological changes between MCI and NCs. Relationships between abnormal changes of cortical and subcortical structures and cognitive assessment were investigated with spearman correlation analysis. Classification via support vector machine (SVM) was performed to evaluate whether MRI features could differentiate the MCI group with NCs accurately.

Results: Compared with NCs, MCI patients showed significant atrophy in the volume of left thalamus ($p = 0.011$), left hippocampus ($p = 0.006$), left amygdala ($p = 0.031$), right pallidum ($p = 0.009$) and right hippocampus ($p = 0.008$). Meanwhile, vertex-wise shape analysis showed inward deformation in the left amygdala in MCI group compared with NC ($p < 0.05$, FWE corrected). The SBM analysis revealed that MCI group exhibited significantly shallower sulci depth in the left hemisphere, predominantly in the fusiform, isthmus cingulate and superior frontal regions, and increased cortical gyrification index (GI) in the right frontal gyrus. Correlation analysis showed the positive correlation between adjusted right hippocampus volume and episodic memory, while negative correlation between the altered GI and memory performance in MCI group. The SVM result showed that sulci depth and gyrification index derived from SBM outperformed subcortical imaging features in MCI identification. Particularly, when combining the cortical and subcortical morphological metrics, SVM reached the best performance with an accuracy of 89% to classify the MCI from NC.

Conclusion: The study indicates that obvious grey matter structural changes occur in MCI patients. These morphological alterations may be the basis of the brain functional differences underlying MCI and could be helpful for the early identification and clinical diagnosis of MCI. These findings contribute to our understanding of the neural mechanisms underlying memory impairment in MCI.

PO-0036

Amygdala subnuclei volume predicts anxiety reactivity related to the COVID-19 pandemic

Junxia Wang, Bing Zhang
Nanjing Drum Tower Hospital

Objective: The COVID-19 pandemic has seriously affected the mental health of the public and exacerbated psychological anxiety. The purpose of this study was to analyze the changes in anxiety status of individuals before and after COVID-19 pandemic, as well as the relationship between the baseline (before COVID-19 pandemic) structural and functional connectivity of brain regions associated with emotional processing and the changes in anxiety status of individuals before and after COVID-19 pandemic.

Methods: The State Trait Anxiety Inventory (STAI) was collected from 40 healthy young adults during the pandemic using a longitudinal follow-up study, and brain imaging data and baseline (daily) anxiety scores were obtained prior to the pandemic. The relationship between baseline amygdala subregion volume, cortical thickness (insula, anterior cingulate gyrus), amygdala-ventromedial prefrontal functional connectivity and anxiety scores and change rates before and after the pandemic were analyzed using a generalized linear mixed model.

Results: The STAI-S score of individuals during the COVID-19 pandemic increased significantly compared with that before the pandemic ($t=2.58$, $p=0.014$). The larger volume of the left central nucleus ($F=6.197$, $p=0.018$) and medial nucleus ($F=6.753$, $p=0.014$) of the amygdala at baseline, the smaller the change rate of state anxiety before and after the pandemic, and the sub-correlation was more obvious in young women.

Conclusions: These findings suggest that amygdala subregion volume is useful in predicting changes in individual anxiety levels caused by major stressful events, such as the current global health crisis. This helps us understand the neurobiological basis of anxiety susceptibility and may provide information for the development of targeted psychological and clinical interventions.

PO-0037

Systematically disrupted functional gradient of the cortical connectome in lifelong premature ejaculation

Jiaming Lu, Xin Zhang, Fei Zhou, Liangpeng Wei, Bing Zhang
The Affiliated Drum Tower Hospital of Nanjing University Medical School

Premature ejaculation (PE) is a major component of male sexual dysfunction. However, the finer topological relationships in terms of continuous spatial arrangement between these systems are still ambiguous. Connectome gradients provide the topological representations of human macroscale hierarchy in an abstract low-dimensional space by embedding the functional connectome into a set of axes. 28 right-handed PE patients (Age: 28.61 ± 4.48) and 17 normal control (Age: 26.519 ± 4.61) were included. Each participant had no neuropsychiatric disorder. Resting-state functional Magnetic Resonance Imaging (rs-fMRI) data and intravaginal ejaculatory latency time (IELT) scores were acquired from each participant. Considering the computing efficiency, ROI based gradient analysis was conducted using Schaefer 400 atlas. Group average cortical functional connectome matrices were constructed by computing the Pearson's correlation of vertices time series, resulting in a functional connectivity matrix (400×400) for each group. We then thresholded the matrix to retain the top 10% connections per row, in line with a series of previous studies. The gradient mapping process used the BrainSpace Toolbox (<http://github.com/MICA-MNI/BrainSpace>). We found the extended principal gradient revealed the excessive functional segregation between the default model network and somatosensory & auditory network in PE patients (Kolmogorov-Smirnov test, K-S stat = 0.11, $p = 0.015$). Furthermore, the connectivity profile of regions with abnormal principal gradients verified the disrupted functional hierarchy revealed by gradients. Moreover, altered gradient in the default model network and somatosensory & auditory network were significantly correlated with the intravaginal ejaculatory latency time ($p < 0.001$). Together, our findings provided a novel view of functional system hierarchy alterations, which facilitated a continuous spatial arrangement of macroscale networks, to increase our understanding of the functional connectome hierarchy in premature ejaculation.

PO-0038

Connectome-based Prediction of Global Cognition in Patients with Type 2 Diabetes

Wen Zhang, Bing Zhang

Drum Tower Hospital, The Affiliated Hospital of Nanjing University Medical School

Purpose

Patients with type 2 diabetes (T2D) have a high prevalence of cognitive decline, yet to date, there is no simple and quick method to measure cognitive performance. In this study, we performed brain connectome-based predictive modeling (CPM) to pursue “neural fingerprints” of global cognitive performance in T2D.

Materials and Methods

CPM with leave-one-out cross-validation was carried out to probe important functional networks that were predictive of global cognitive performance within the training set of 315 T2D patients. This model generalized to both 197 novel T2D patients in testing set 1 and 105 Alzheimer's Disease Neuroimaging Initiative (ADNI) participants in testing set 2. Furthermore, identified networks were applied to a subset of 58 subjects who completed a 12-16 week follow-up with different types of antidiabetic drug interventions. We also compared whether network strengths identified by the CPM model were significantly different between T2D with mild cognitive impairment (MCI) and without MCI. Age, sex, years of education, and body mass index were controlled as covariates.

Results

CPM predicted global cognition as indicated by a significant correlation between predicted and actual MoCA values ($r=0.501$, $P_{\text{perm}}=0.0002$, $\text{MAE}=1.544$). The connectivity edge predictive of global cognition was identified within and between networks implicated in sensorimotor, attention and visual perception. The identified model in training set was generalized to predict global cognition in independent testing set 1 ($r=0.508$, $P_{\text{perm}}=0.0002$, $\text{MAE}=2.014$) and testing set 2 ($r=0.311$, $P_{\text{perm}}=0.014$, $\text{MAE}=4.478$), suggesting the replicability of CPM approach. In addition, positive network strengths were significantly different between T2D with MCI and without MCI ($P<0.01$). The areas under the curves of the predicted values of the CPM model for diagnosing MCI were training set ($\text{AUC}=0.974$), testing set 1 ($\text{AUC}=0.752$), and testing set 2 ($\text{AUC}=0.776$). In the treatment sample, the change value of the positive network strength of the subjects with improved cognition was significantly higher than those without cognitive improvement.

Conclusion

These findings point to the feasibility of using the whole-brain functional connectome to predict global cognitive performance in T2D and provide evidence that individual differences in large-scale neural networks contribute to the diagnosis of cognitive impairment and cognitive improvement after treatment.

PO-0039

A clinical-radiomics machine learning framework tailored to predict clinical outcomes in patients with acute ischemic stroke

Xiaoling Wu¹, Xiao Zhang^{1,2}, Liting Chen¹, Fei Wang¹, Xiaoyun Liang², Bin Zhang¹, Shuixing Zhang¹

1. The First Affiliated Hospital of Jinan University

2. Neusoft Research of Intelligent Healthcare Technology, Co. Ltd., Artificial Intelligence and Clinical Innovation Research

Purpose: To develop and validate a machine learning model that enables prediction of clinical outcomes in patients with acute ischemic stroke (AIS) using radiomics features and clinical information.

Materials and Methods: We retrospectively analyzed data from 148 patients with AIS (training cohort, n=105; validation cohort, n=43) who underwent MRI examinations. According to the modified Rankin Scale (mRS) at 90-day after hospital discharge, the patients were stratified into good (mRS ≤ 2) and poor (mRS > 2) prognosis. A total of 1130 radiomics features were extracted from diffusion-weighted imaging, apparent diffusion coefficient, and cerebral blood flow images, respectively. Pearson correlation coefficient analysis and recursive feature elimination algorithm were applied to identify the optimal subset of features. Six machine learning classifiers with five-fold cross validation were compared to construct the single-layer radiomics signature. Logistic regression algorithm were leveraged to build the clinical model, radiomics model, and combined model. The discrimination, calibration, clinical usefulness of the integrated model were evaluated by the area under the curve (AUC), calibration curve, and decision curve analysis (DCA).

Results: The combined model integrating the fusion radiomics signature and clinical variables (location of vessel occlusion and diabetes) demonstrated better performance (AUC, 0.946; 95%CI: 0.924-0.967) than the clinical model (AUC, 0.570; 95%CI: 0.513-0.628; p<0.001) and fusion radiomics model (AUC, 0.919; 95%CI: 0.889-0.949; p=0.002). DCA indicated good clinical usefulness of the integrated model.

Conclusion: The clinical-radiomics model incorporating clinical variables and radiomics features performed well in predicting clinical outcomes of AIS patients, which can be used to guide personalized treatment.

PO-0040

Evaluating magnetic resonance imaging characteristics and risk factors for hemifacial spasm

Bo Li^{1,2}, Chun Luo¹, Yabin Jin¹, Ying Yi¹, Dongliang Cheng¹, Guofu Wang¹, Xuguang Zhong¹, Hai Zhao¹, Mingyong Gao¹

1. The First People's Hospital of Foshan

2. Sun Yat-Sen University

Objectives: The specific neurovascular compression (NVC) event responsible for the symptomatic manifestation of hemifacial spasm (HFS) remains difficult to assess accurately using MRI. We aim to evaluate the MRI characteristics of HFS and identify their risk factors for its development.

Methods: We retrospectively included 186 patients with HFS. The facial nerve was divided into attached segment, root detachment point, proximal cisternal segment and distal cisternal segment. NVC was categorized as contact or deformity. The presence, severity, and offending vessel type of NVC in each portion, and the orientation of the offending vessel around the facial nerve, were recorded. Conditional logistic regression analyses were performed to identify the risk factors associated with HFS occurrence.

Results: The attached segment, root detachment point, and proximal cisternal segment of the symptomatic nerve were more likely to conflict than those on the asymptomatic side (all $P < 0.05$). Both contact and deformity in the root detachment point (odds ratio = 19.98 and 37.22, respectively, $P < 0.05$) or attached segment (odds ratio = 4.99 and 252.52, respectively, $P < 0.05$) were risk factors for HFS. Deformity in the proximal cisternal segment was a risk factor for HFS (odds ratio = 256.58, $P < 0.05$), whereas contact was not ($P = 0.23$). Involvement of the anterior inferior cerebellar artery ($P < 0.05$) was a risk factor; the posterior inferior cerebellar and vertebral arteries was not.

Conclusions: This study demonstrates that location and severity of NVC are strongly associated with HFS occurrence. Different portions of the facial nerve respond differently to NVC. This study also indicates that each offending vessel has its own preferred conflict orientation. Our findings may improve the efficacy of MRI in the diagnosis of HFS.

PO-0041

Vasari-based features nomogram to predict the tumor-infiltrating CD8+ T cell levels in glioblastoma

Caiqiang Xue, junlin zhou
Lanzhou University Second Hospital

Background: Tumor-infiltrating CD8+ T cells play a key role in glioblastoma development, malignant progression, and recurrence. To establish nomograms based on the Visually AcceSable Rembrandt Images (VASARI) features of multiparametric magnetic resonance imaging (MRI) to determine the expression levels of tumor-infiltrating CD8+ T cells in patients with glioblastoma.

Materials and methods: Pathological and imaging data of 140 patients with glioblastoma confirmed by surgery and pathology were retrospectively analyzed. The levels of tumor-infiltrating CD8+ T cells in tumor tissue samples obtained from patients were quantified using immunohistochemical staining. Patients were divided into high and low CD8 expression groups. The MRI images of patients with glioblastoma were analyzed by two radiologists using the VASARI scoring system.

Results: A total of 25 MRI-based VASARI imaging features were evaluated by two neuroradiologists. The features with the greatest predictive power for CD8 expression levels were, cystic (OR, 3.063; 95% CI: 1.387, 6.766; $P = 0.006$), hemorrhage (OR, 2.980; 95% CI: 1.172, 7.575; $P = 0.022$), and ependymal extension (OR, 0.257; 95% CI: 0.114 0.581; $P = 0.001$). A logistic regression model based on these three features showed better sample predictive performance (AUC = 0.745; 95% CI: 0.665, 0.825; Sensitivity = 0.527; Specificity = 0.857).

Conclusions: The VASARI feature-based nomogram model can shows promise to predict the level of infiltrative CD8 expression in GB tumors noninvasively for earlier tissue diagnosis and more aggressive treatment.

PO-0042

AI-Based Automated Quantification of Arterial Stenosis in Head and Neck CT Angiography: A Comparison with Manual Measurements from Digital Subtraction Angiography and CT Angiography

Xinyue Huan, Kunhua Li, Dajing Guo

Department of Radiology, the Second Affiliated Hospital of Chongqing Medical University, Chongqing, China

Purpose:

To evaluate the performance of artificial intelligence (AI) algorithm for automated quantification of arterial stenosis (AS) in head and neck CT angiography (CTA) using an independent bi-center dataset, with digital subtraction angiography (DSA) as the gold standard, and to compare it with manual measurements on CTA.

Materials and Methods:

Patients who received head and neck CTA and DSA between January 2019 and December 2021 were included in this retrospective analysis. The stenosis quantification was automatically evaluated by CerebralDoc based on CTA images. The quantitative performance of CerebralDoc per-lesion was evaluated across 0-100%, <50%, ≥50% and ≥70% thresholds. Sensitivity analysis including linear and logistic regression, and subgroup analysis was performed to identify influencing factors.

Result:

287 patients were analyzed. The intraclass correlation coefficients (ICCs) between CerebralDoc and DSA for ≥50% and ≥70% stenosis were excellent (0.955, 0.922, respectively), for 0-100% stenosis was good (ICC: 0.735), and for <50% stenosis was poor (0.056). For ≥50% and ≥70% stenosis of CerebralDoc and CTA manual measurements compared with DSA, ICCs were close (0.955 vs 0.994, $P < 0.001$; 0.922 vs 0.982, $P < 0.001$), and differences were small (0.258% vs 0.362%, $P < 0.05$; 0.369% vs 0.199%, $P < 0.05$). The sensitivity analysis revealed that specific locations (V1, V2, V3, V4) and slender vessel may be the primary influencing factors, with differences ranging from 15.551% to 44.238%.

Conclusion:

CerebralDoc exhibits excellent performance in automatically quantifying AS of ≥50% and ≥70% in head and neck CTA. However, further research is needed to improve its performance for <50% stenosis and to address the large or remarkable differences observed in specific locations and slender vessels.

PO-0043

Dynamic functional connectivity patterns associated with asymptomatic carotid stenosis

Chi Zhang¹, Yu-Ting Li², Zhu-Hong Chen², Wen Wang²

1. Department of Medical Technology, Shaanxi University of Chinese Medicine

2. Department of Radiology, Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu Hospital, Fourth Military Medical University

Background: Carotid artery stenosis without transient ischemic attack or stroke is considered as “asymptomatic”. However, there is increasing evidence that these asymptomatic carotid stenosis (ACS) patients had cognitive impairment in tests of executive function, psychomotor speed, and memory. Previous studies on ACS were mostly based on static analysis. In reality, individuals engage in different mental states that cannot be experimentally controlled. Recent studies have shown that resting-state FC can vary considerably in different temporal scales. Time-varying

characteristics may represent spontaneous change of the potential network, so it may reveal neural mechanisms that cannot be discovered only by static resting-state FC. Dynamic functional network connectivity (dFNC) captures temporal variations of functional connectivity during magnetic resonance imaging (MRI) acquisition and its alterations have been associated with specific cognitive states, psychiatric conditions and neurological disorders, such as Alzheimer's disease and Parkinson's disease. Therefore, dFNC may be a suitable method to detect cognitive changes in ACS. This study assesses the relationships between dFNC and cognitive impairment with ACS.

Methods: To investigate the dFNC, 40 ACS patients with cognitive impairment were recruited from Tangdu Hospital and 40 healthy controls (HC) were matched to ACS patients regarding age, gender and education. All participants gave their written informed consent. Firstly, the image was preprocessed. After excluding the subjects whose head movements were greater than 3 degrees, the remaining 72 participants were used for subsequent analysis. Then, dFNC analysis was carried out, which was composed of three steps (Figure 1): (i) Group independent component analysis (GICA) was applied with spatial reference to resolve whole-brain resting-state fMRI data into 37 independent components (ICs) and then 18 ICs were selected; (ii) A sliding-window approach with graphical LASSO was used to compute dFNC among ICs (iii) k-means clustering method on the dFNC was used to confirm different brain states and the temporal properties.

Results: Eighteen ICs were broadly categorized based on anatomy and prior knowledge of their function into the following sub-categories: auditory network (AN), ventral attention network (DAN), default-mode network (DMN), control executive network (CEN), and visual network (VSN). Subsequently, five dFNC brain states were identified to characterize and compare dynamic functional connectivity patterns. The top 10 connections in which HC was stronger (Figure 2B) or weaker (Figure 2C) than ACS were displayed, respectively. Three of them showed weak connections (States 2, 3, and 4) and the other showed strong connections (States 1 and 5). The dFNC temporal features (Fractional rate, FR; Mean dwell time, MDT; Number of transitions, NT) between HC and ACS were shown in Figure 3. Significantly higher FR in State 3 (Figure 3A, $P < 0.001$, false discovery rate [FDR] < 0.05) and State 4 (Figure 3A, $P = 0.037$, FDR < 0.05), but lower in State 5 (Figure 3A, $P < 0.001$, FDR < 0.05) were observed in ACS group compared with HC group. Significantly higher MDT in State 3 (Figure 3B, $P = 0.008$, FDR < 0.05), but lower in State 5 (Figure 3B, $P < 0.001$, FDR < 0.05) were observed in ACS group compared with HC group.

Conclusions: This study revealed more common but less specific dFNC alterations in ACS patients, which indicated their decreased information processing and communication ability and may help us to understand their abnormal cognitive functions clinically. Further studies on dFNC changes could help to better understand the progressive dysfunction of networks between ACS cognitive states.

PO-0044

Individualized Prediction of Mild Cognitive Impairment Progression Based on Morphological and Network Features of Gray Matter

Rong Zeng¹, li lai², chuanming li⁴, beisheng yang³, dajing guo³

1. The Third Affiliated Hospital of Chongqing Medical University

2. Chongqing Western Hospital

3. the Second Affiliated Hospital of Chongqing Medical University

4. Chongqing Emergency Medical Center

Purpose: To develop radiomics models and a multipredictor nomogram for predicting the time to progression (TTP) from mild cognitive impairment (MCI) to Alzheimer's disease (AD).

Materials and methods: We included 162 MCI patients from the Alzheimer's Disease Neuroimaging Initiative (ADNI) database in this study. Morphological and network features of gray matter from magnetic resonance imaging (MRI) scans were individually extracted to develop and

validate radiomics models and to create a multipredictor nomogram to predict MCI progression. The performance of each model was assessed by the concordance index (C-index).

Results: The C-indexes of the morphology-network and morphology-network-clinical models were 0.928 (95% confidence interval [CI]: 0.898-0.958) and 0.951 (0.928-0.974) in the training cohort and 0.844 (0.756-0.932) and 0.880 (0.817-0.943) in the validation cohort, respectively. A multipredictor nomogram with 3 predictors, which had high accuracy for individual progression prediction with a C-index of 0.951 (0.928-0.974), was established.

Conclusion: The prediction of individual progression from MCI to AD could be accurately conducted using the radiomics model of the morphology-network-clinical and multipredictor nomogram.

PO-0045

COVID-19 is associated with changes in brain function and structure: a multimodal meta-analysis of neuroimaging studies.

Zixuan Guo, Ying Wang
Jinan University First Affiliated Hospital Medical Imaging Center

The actual role of coronavirus disease 2019 (COVID-19) in brain damage has been increasingly reported, necessitating a meta-analysis to collate and summarize the inconsistent findings from functional imaging and voxel-based morphometry (VBM) studies. A comprehensive voxel-wise meta-analysis of the whole brain was conducted to identify alterations in functional activity and gray matter volume (GMV) between COVID-19 patients and healthy controls (HCs) by using Seed-based d Mapping software. We included 14 functional imaging studies (449 patients with COVID-19, 498 HCs) and 9 VBM studies (449 patients with COVID-19, 388 HCs) in the analysis. Overall, patients with COVID-19 exhibited decreased functional activity in the right superior temporal gyrus (STG) (extending to the right middle and inferior temporal gyrus, and insula), left insula, right orbitofrontal cortex (OFC) (extending to the right olfactory cortex), and left cerebellum compared to HCs. For VBM, patients with COVID-19 relative to HCs showed decreased GMV in the bilateral anterior cingulate cortex/ medial prefrontal cortex (extending to the bilateral OFC), and left cerebellum, and increased GMV in the bilateral amygdala (extending to the bilateral hippocampus and STG, and right striatum). Moreover, overlapping analysis revealed that patients with COVID-19 exhibited both decreased functional activity and increased GMV in the right STG. The multimodal meta-analysis suggests that brain changes of function and structure in the temporal lobe, OFC and cerebellum, and functional or structural alterations in the insula and the limbic system in COVID-19. These findings contribute to a better understanding of the pathophysiology of brain alterations in COVID-19.

PO-0046

Systematic Review and Meta-analysis: Multimodal Functional and Anatomical Neural Alterations in Autism Spectrum Disorder

Zixuan Guo, Ying Wang
Jinan University First Affiliated Hospital Medical Imaging Center

[Objective] This meta-analysis aimed to explore the most robust findings across numerous existing resting-state functional imaging and voxel-based morphometry (VBM) studies on the functional and structural brain alterations in patients with autism spectrum disorder (ASD). [Methods] A whole-brain voxel-wise meta-analysis was conducted to compare the differences in the intrinsic functional activity and gray matter volume (GMV) between patients with ASD and typically developing individuals (TDs) using Seed-based d Mapping software. [Results] A total of 23 functional imaging studies (786 ASD, 710 TDs) and 52 VBM studies (1728 ASD, 1747 TDs) were included. Compared with TDs, patients with ASD displayed resting-state functional decreases in the left insula (extending to left superior temporal gyrus [STG]), bilateral anterior cingulate cortex/medial prefrontal cortex (ACC/mPFC), left angular gyrus and right inferior temporal gyrus, as well as increases in the right supplementary motor area and precuneus. For VBM meta-analysis, patients with ASD displayed decreased GMV in the ACC/mPFC and left cerebellum, and increased GMV in the left middle temporal gyrus (extending to the left insula and STG), bilateral olfactory cortex, and right precentral gyrus. Further, patients with ASD displayed decreased resting-state functional activity and increased GMV in the left insula after overlapping the functional and structural differences. [Conclusion] The present multimodal meta-analysis demonstrated that ASD exhibited similar alterations in both function and structure of the insula and ACC/mPFC, and functional or structural alterations in the default mode network (DMN), primary motor and sensory regions. These findings contribute to further understanding of the pathophysiology of ASD.

PO-0047

The visual and attention network integration of migraine without aura patients in interictal period

Zhuhong Chen, Guan Yang, Wen Wang
Air Force Medical University, Tangdu Hospital

Objective

This study aimed to investigate the brain functional and topological alterations in interictal period of migraine without aura (MoA) patients.

Methods

Totally, 52 MoA patients and 41 age- and gender- matched health controls (HC) were included to explore the functional networks connectivity (FNC) using independent components (ICs) approach. Furthermore, the large-scale networks properties, dynamic functional networks connectivity (dFNC) and topological metrics, were conducted based on sliding-window approach. Finally, we assessed the relationships between clinical characteristics and abnormal dFNC changes among ICs using Pearson's correlation analysis.

Results

The FNC was consistently activated between dorsal attention network (DAN) and visual network (VN), salience network (SN) and frontoparietal network (FPN) during static stating of MoA patients. Negative connectivity was showed between default mode network (DMN) and auditory network (Aud), DMN and FPN. Four reoccurring clustered states were robustly constructed to compare dFNC patterns. We identified that MoA patients spent more time in a sparsely connected state

(State 4), and less time in densely connected state (State 2). Increased FNC between superior parietal lobule (SPL) and lingual gyrus (LG) was positively associated with MoCA scores. The dynamic FNC between superior occipital gyrus (SOG) and posterior central gyrus (PostCG) was positively correlated with headache intensity, and negatively associated with headache duration was explored between SPL and inferior parietal lobule (IPL). In state 4, higher local transfer information efficiency was indicated in MoA than HC.

Conclusions

Our study provided the evidence that brain networks integration of DAN and VN might play a part in interictal period, and allowed developing the underlying neuroimaging mechanism for MoA patients.

PO-0048

Analysis of magnetic susceptibility of thalamus in ischemic stroke using quantitative susceptibility mapping and fMRI

Xiaoshi Li, Lei Wang, Xin Li, Yifan Qian, Wei Niu, Yue Qin
Xi'an Daxing Hospital

Introduction

Dyskinesia is a common symptom that occurs after stroke. Despite the fact that most strokes do not occur in areas of the brain associated with move zone. The aim of this study is to investigate the post-stroke QSM changes in the three pairs of motor nuclei in the thalamus, and to reveal the effect of stroke on iron deposition in the ipsilateral thalamus and motor function

Methods

36 patients with stroke in the left hemisphere and 24 age-, sex- and education-matched healthy controls underwent QSM (In all patients, the lesions were not located in the thalamus).

The scanning parameters:

1) Gradient-echo EPI

TR 720 ms, TE 33.1 ms, flip angle 52 deg, FOV 208x180 mm (RO x PE), Matrix 104x90 (ROx PE), Slice thickness 2.0 mm; 72 slices; 2.0 mm isotropic voxels, Multiband factor 8, Echo spacing 0.58 ms, BW 2290 Hz/Px, Acquisition Time 14:33(min:sec)

2) OSM

TR=50ms, TE1/ATE/TE8=3.5ms/6ms/45ms, slice thickness=2

flip angle=15°, FOV=240mmx240mm, matrix size=256x256, bandwidth=240 Hz/Px, and slices=64, Acquisition Time 6:34(min:sec)

QSM image analysis:

The IronsmithQSM was used to generate the QSM graph (Valentinou Zachariou, University of Kentucky). IronsmithQSM is a comprehensive, fully automated pipeline for creating and processing Quantitative Susceptibility Maps (QSM), extracting QSM based iron concentrations from subcortical and cortical brain regions and evaluating the quality of QSM data using SNR measures and assessment of outlier regions on phase images.

Clinical variables of history of hypertension, diabetes, hyperlipidemia, smoking, degree of education and drinking in all patients were evaluated. The magnetic susceptibility of thalamus move nucleus (Ventral anterior, Ventral lateral and Ventral posterolateral nucleus) was assessed. Susceptibility was compared between the patients and controls. Patients and controls also performed self-controls. The t-test was used to compare the difference of QSM values between the two groups of subjects.

Results

In healthy controls, QSM values in right VA nuclei were significantly lower than those of the left ($P=0.0221$). In patients, the difference between the left and right VA nuclei disappeared ($P=0.121$). No such alterations were found in either VL or VPL nuclei in other healthy controls

and patients. We compared all bilateral thalamic motor nuclei in healthy controls with those in patients, except for the findings in the VA nuclei, nothing else was altered.

Conclusion

After a stroke in the left cerebral parenchyma, the susceptibility value of the left thalamus changes. QSM can detect weak changes in susceptibility value at the nucleus level, which may be used as a predictor of motor function in stroke rehabilitation.

PO-0049

Differentiation between cerebral alveolar echinococcosis and brain metastases with radiomics combined machine learning approach

Yasen Yimiti^{1,2}, Paierhati Yasheng², Abuduresuli Yuersun¹, Wenxiao Jia², Yunling Wang², Mayidili Nijati¹

1. The First People's Hospital of Kashi Prefecture

2. The First Affiliated Hospital of Xinjiang Medical University

Abstract

Background: Cerebral alveolar echinococcosis (CAE) and brain metastases (BM) are similar in locations and imaging appearance. While, CAE is usually treated with chemotherapy and surgical treatment, BM is often treated with radiotherapy and targeted primary malignancy treatment. Accurate diagnosis is critical due to the vastly different treatment approaches for these conditions. **Purpose:** This study aims to investigate the effectiveness of radiomics and machine learning approaches on magnetic resonance imaging (MRI) in distinguishing CAE and BM. **Methods:** We have retrospectively analyzed MRI images of 130 patients (30 CAE, 100 BM, training set =91, testing set=39) who confirmed CAE or BM in Xinjiang medical university's first affiliated hospital from January 2014 to December 2022. Three dimensional tumors were segmented by radiologists from contrast-enhanced T1WI images on open resources software 3D Slicer. Features were extracted on Pyradiomics, further feature reduction was carried out using univariate analysis, correlation analysis, and least absolute shrinkage and selection operator (LASSO). Finally, we built five machine learning models, support vector machine, logistic regression, linear discrimination analysis, KNeighbors classifier, and Gaussian NB and evaluated their performance via several metrics including sensitivity (recall), specificity, positive predictive value (precision), negative predictive value, accuracy and the area under the curve (AUC). **Results:** The area under curve (AUC) of SVC, LR, LDA, KNN, and NB algorithms in training (testing) sets are 0.99 (0.94), 1.00 (0.87), 0.98 (0.92), 0.97 (0.97), and 0.98 (0.93) respectively. Nested cross-validation demonstrated the robustness and generalizability of the models. Additionally, the calibration plot and decision curve analysis demonstrated the practical usefulness of these models in clinical practice, with lower bias toward different subgroups during decision-making. **Conclusion:** The combination of radiomics and machine learning approach on contrast enhanced T1WI images could well distinguish CAE and BM. This approach holds promise in assisting doctors with accurate diagnosis and clinical decision-making

PO-0050

MRI-Based Machine Learning Fusion Models to Distinguish Encephalitis and Gliomas in Atypical Cases

Fei Zheng, Nan Hong
Peking University People's Hospital

Objectives: This paper aims to compare the performance of the classical machine learning (CML) model and the deep learning (DL) model, and assess the effectiveness of utilizing fusion radiomics from both CML and DL in distinguishing encephalitis from glioma in atypical cases.

Methods: We analysed the axial FLAIR images of preoperative MRI in 116 patients pathologically confirmed as gliomas and clinically diagnosed with encephalitis. The 3 CML models (Logistic Regression, LR; Support Vector Machine, SVM; and Multi-Layer Perceptron, MLP), 3 DL models (DenseNet 121, ResNet 50, and ResNet 18) and a deep learning radiomics (DLR) models were established, respectively. The area under the receiver operating curve (AUC) and sensitivity, specificity, accuracy, negative predictive value (NPV) and positive predictive value (PPV) were calculated for the training and validation sets. In addition, a deep learning radiomics nomogram (DLRN) and a web calculator were designed as a tool to aid clinical decision-making.

Results: The best DL model (ResNet50) consistently outperformed the best CML model (LR). While the DLR model had the best predictive performance, with AUC, sensitivity, specificity, accuracy, NPV and PPV of 0.879, 0.929, 0.800, 0.875, 0.867 and 0.889 in the validation sets, respectively. Calibration curve of DLR model show good agreement between prediction and observation and the decision curve analysis (DCA) indicated that the DLR model had a higher overall net benefit than the other two models (ResNet50 and LR). Meanwhile, the DLRN and web calculator can provide dynamic assessments.

Conclusion: Machine learning (ML) models have the potential to non-invasively differentiate between encephalitis and glioma in atypical cases. Furthermore, combining DL and CML techniques could enhance the performance of the ML models.

Comparison of three coordinate based meta-analysis methods in functional magnetic resonance imaging

Mengting Li¹, Mengqi Zhao¹, Jiawei Sun², Qianqian Wang¹, Su Hu¹, Jianjie Wen¹, Linlin Zhan³, Xize Jia¹, Jun Ren¹

1. Zhejiang Normal University

2. Karolinska Institutet

3. Heilongjiang University

Background: Studies obtained abundant findings with the maturity of functional magnetic resonance imaging (fMRI) technology. Meta-analysis has been widely applied as an effective tool for aggregating results from different studies. The image-based meta-analysis (IBMA) uses a complete statistical parameter map. In contrast, the coordinate based meta-analysis (CBMA) uses coordinates (x, y, z) after multiple comparison corrections reported in the article. At present, three CBMA methods are widely used: activation likelihood estimation (ALE), multi-level kernel density analysis (MKDA) and anisotropic effect size signed differential mapping (AES-SDM). This study intends to compare the three CBMA approaches with the IBMA method and explore the impact of liberal or strict thresholds on CBMA methods.

Methods: The resting state functional magnetic resonance imaging (rs-fMRI) data of 1725 subjects was obtained from Consortium for Reliability and Reproducibility (CoRR) dataset. The functional connectivity (FC) difference was compared between genders. The IBMA was applied based on the uncorrected whole brain T-maps and the three CBMA methods were conducted based on the

coordinates obtained from the corrected T-maps with different thresholds ($p < 0.05$, $p < 0.05$, $p < 0.005$, $p < 0.001$). The results of different CBMA were compared with IBMA result separately.

Results: AES-SDM showed better control over the false positive and false negative rates. And AES-SDM method is least affected by the thresholds. It can stably detect the consistent brain areas of brain functional connectivity differences between genders under eight thresholds, while MKDA and ALE can detect the consistent brain areas only under relatively liberal thresholds.

Conclusions: The IBMA could generate results preferred over CBMA. For the CBMA, a liberal threshold increases the false positive rate, but too strict a threshold is difficult to detect results and to miss the meaningful brain regions.

4. Jiamusi University

5. China University of Petroleum (East China)

6. Shanghai International Studies University

Objective: Autism spectrum disorder (ASD), a set of heterogeneous biological and neurodevelopment conditions related to brain development that begin in early childhood, impacts how an individual perceives and socializes with others, leading to restricted, repetitive behaviors/interests, language regression, and other kinds of autism-specific language profiles that further affect social interaction. Suffering from the autism symptoms listed above, patients with ASD may come to the attention of healthcare providers and speech-language pathologists. Therefore, language-related brain research may deepen the understanding of the neural mechanism and the effective interventions of ASD. Wernicke's area, a traditional and classical brain region linked to language processing, impacts dysfunctions of language abilities hugely since it is the receptive language center and responsible for interactive verbal communication. In pursuit of a comprehensive understanding of the pathological mechanisms underpinning ASD from the perspective of language, the present study executed a mega-analysis.

Method: This analysis utilized the Autism Brain Image Data Exchange (ABIDE) dataset, encompassing data from 443 typically developing individuals (TD) and 362 patients with ASD. The primary objective was to identify frequency-specific alterations in functional connectivity (FC) using Wernicke's area as the seed region.

Results: The results found that in the conventional frequency band (0.01-0.08 Hz), ASD patients demonstrated increased FC in the right thalamus compared with TD, and the slow-5 frequency band (0.01-0.027 Hz) presented increased FC in the left cerebellum Crus II and right lenticular nucleus, pallidum.

Conclusion: The findings of the present research might provide new insight into the potential neural mechanisms of language impairments in ASD and might enlighten treatments that facilitate ASD patients' social and community engagement.

PO-0053

Tract based spatial statistics analysis of T2DM patients

Weiwei Wang, Yanwei Miao, Jianlin Wu
The first affiliated hospital of Dalian medical university

Objective:

TBSS technology was used to analyze the changes in the microstructure of white matter in T2DM patients, so as to explore the possible pathological changes and their rules in the white matter of T2DM patients, to analyze the possible clinical influence indicators of DTI parameters, to reveal the relevance of DTI parameters and cognitive scores, to provide imaging evidence and biological markers for in-depth interpretation and understanding of T2DM patients with brain microstructure change and neuropathologic mechanism.

Subjects and Methods:

A total of 72 volunteers were prospectively collected and divided into T2DM group and control group according to grouping criteria. There were 45 patients in T2DM group and 27 healthy controls. The clinical data and laboratory indicators of the subjects were recorded within one week before or after MRI scanning, including: age, gender, height (Ht), weight (Wt), hip circumference (HC), waist circumference (WC), waist hip ratio (WHR), waist height ratio (WHtR), Body mass index (BMI), blood pressure, education level (converted into education years), occupation, drinking history, smoking history, duration, fasting plasma glucose (FG), glycated hemoglobin (HbA1c), fasting Insulin (INS), low density lipoprotein (LDL), high density lipoprotein (HDL), total cholesterol (TChol), triglycerides (TG), and Homocysteic Acid (Hcy). HOMA - IR was used to calculate the insulin resistance index (IRI) according to FG and INS. The Mini - Mental State Examination (MMSE) and The Montreal Cognitive Assessment (MoCA) were used to assess the Cognitive status of all subjects. The California Verbal Learning Test (CVLT) and the Symbol Digit Modalities test (SDMT) were used to evaluate the two cognitive fields of memory and execution which were easily damaged in the early stage in T2DM. Philips Ingenia CX 3.0 T MR was used for MRI data acquisition of all subjects, including axial FFE T1 sequence, axial FFE T2 sequence, axial TSE Flair sequence, sagittal 3D T1 TFE sequence and axial DTI sequence (64 directions). In Linux OS (Oracle VM VirtualBox) environment, FSL software is applied to analyze FA, MD, I1 and I23 based on white matter skeleton. The general linear model was adopted, with age, gender and years of education as covariables, and the permutation test was used to carry out statistical analysis for each parameter between the two groups, and threshold free cluster enhancement (TFCE) correction method was used. $P < 0.05$ was considered as a significant difference.

Results:

Compared with HC group, FA values of bilateral anterior, posterior, superior part of corona radiata, and body of corpus callosum in the T2DM group were reduced ($P < 0.05$, TFCE corrected). MD values of several regions were increased ($P < 0.05$, TFCE corrected), mainly included bilateral superior fronto-occipital fasciculus, inferior fronto-occipital fasciculus, superior longitudinal fasciculus, left inferior longitudinal fasciculus, anterior, posterior and superior part of bilateral corona radiata, genu, body and splenium part of corpus callosum, right cingulum, anterior and posterior limb of left internal capsule, retrolenticular part of left internal capsule, left external capsule, posterior part of left thalamic radiation, anterior part of right thalamic radiation, bilateral corticospinal tract and left Fornix/Stria-terminalis ($P < 0.05$, TFCE corrected). I23 values of several regions were increased ($P < 0.05$, TFCE corrected), mainly included bilateral superior fronto-occipital fasciculus, inferior fronto-occipital fasciculus, superior longitudinal fasciculus, left inferior longitudinal fasciculus, anterior, posterior and superior part of bilateral corona radiata, genu, body and splenium part of corpus callosum, right cingulum, anterior limb of left internal capsule, retrolenticular part of left internal capsule, left external capsule, left tapetum, posterior part of bilateral thalamic radiation, and bilateral corticospinal tract. I1 values of T2DM group and control group showed no difference ($P > 0.05$, TFCE corrected). FA value was negatively correlated with HbA1c ($r = -0.255$, $P = 0.030$); MD value was positively correlated with age ($r = 0.245$, $P = 0.038$), HbA1c ($r = 0.391$, $P = 0.001$),

FG ($r = 0.358$, $P = 0.002$), WHtR ($r = 0.285$, $P = 0.015$), negatively correlated with CVLT correct number of free recall ($r = -0.304$, $P = 0.010$) and MoCA visuospatial score ($r = -0.244$, $P = 0.039$); I23 value was positively correlated with age ($r = 0.249$, $P = 0.035$), HbA1c ($r = 0.340$, $P = 0.004$), IRI ($r = 0.254$, $P = 0.033$), FG ($r = 0.338$, $P = 0.004$), WHR ($r = 0.356$, $P = 0.002$), and WHtR ($r = 0.393$, $P = 0.001$), negatively correlated with CVLT correct number of free recall ($r = -0.372$, $P = 0.001$), MMSE calculation and attention score ($r = -0.417$, $P = 0.000$), MMSE writing score ($r = -0.273$, $P = 0.020$).

Conclusion:

The integrity of white matter was damaged in T2DM patients, mainly involved corpus callosum, bilateral corona radiata, bilateral superior fronto-occipital fasciculus, inferior fronto-occipital fasciculus, superior longitudinal fasciculus, inferior longitudinal fasciculus, thalamic radiation and bilateral corticospinal tract. It mainly manifested as myelin sheath damage. DTI can detect the changes of white matter microstructure before abnormalities appear in conventional images and white matter atrophy, which is of great clinical significance for the early diagnosis of white matter microstructure impairment of T2DM.

PO-0054

Disrupted structural brain networks and structural-functional decoupling in first-episode drug-naïve adolescent major depressive disorder

Baolin Wu^{1,2}, Zhiyun Jia³, Qiyong Gong^{1,2,4}

1. West China Hospital of Sichuan University

2. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences, Chengdu 610041, China

3. Department of Nuclear Medicine, West China Hospital of Sichuan University, Chengdu 610041, China

4. Department of Radiology, West China Xiamen Hospital of Sichuan University, Xiamen 361000, China

Purpose: Major depressive disorder (MDD) tends to emerge during adolescence, but the neurobiology of adolescent MDD is still poorly understood. This study aimed to explore the topological organization of white matter structural networks and the relationship between structural and functional connectivity in adolescent MDD. **Methods:** Structural and functional magnetic resonance imaging data were acquired from 94 first-episode drug-naïve adolescent MDD patients and 78 healthy adolescents. Whole-brain structural and functional networks were constructed for each subject. Then, the topological organization of structural networks and the coupling strength between structural and functional connectivity were analyzed. **Results:** Compared to controls, adolescent MDD patients showed disrupted small-world, rich-club, and modular organizations. Adolescent MDD patients had decreased nodal centralities in the medial part of bilateral superior frontal gyrus, bilateral hippocampus, right superior occipital gyrus, right angular gyrus, bilateral precuneus, left caudate nucleus, bilateral putamen, right superior temporal gyrus, and right temporal pole part of superior temporal gyrus. In addition, adolescent MDD patients had a decrease in the coupling strength between structural and functional connectivity. **Conclusions:** Our findings suggest widespread disruption of structural brain networks and structural-functional decoupling in adolescent MDD, potentially leading to reduced network communication capacity.

PO-0055

Altered single-subject gray matter structural networks in first-episode drug-naïve adolescent major depressive disorder

Baolin Wu^{1,2}, Zhiyun Jia³, Qiyong Gong^{1,2,4}

1. West China Hospital of Sichuan University

2. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences, Chengdu 610041, China

3. Department of Nuclear Medicine, West China Hospital of Sichuan University, Chengdu 610041, China

4. Department of Radiology, West China Xiamen Hospital of Sichuan University, Xiamen 361000, China

Purpose: Although previous studies have demonstrated both structural and functional abnormalities in adolescent major depressive disorder (MDD) patients, how the topological organization of brain networks is affected is still unclear. Thus, this study aimed to investigate the gray matter (GM) structural topology in adolescents with MDD. **Methods:** Structural magnetic resonance imaging data were acquired from 100 first-episode drug-naïve adolescent MDD patients and 80 healthy controls (HCs). Whole-brain GM structural network was constructed for each subject, and a graph theory analysis was used to calculate the topological metrics of GM networks. **Results:** Adolescent MDD patients showed significantly lower cluster coefficient ($p = 0.008$) and local efficiency ($p = 0.033$) compared to HCs. Compared to controls, adolescent MDD patients showed higher nodal centralities in the bilateral cuneus, left lingual gyrus, and right middle occipital gyrus and lower nodal centralities in the bilateral dorsolateral superior frontal gyrus, bilateral middle frontal gyrus, right anterior cingulate and paracingulate gyri, bilateral hippocampus, bilateral amygdala, bilateral caudate nucleus, and bilateral thalamus (all $p < 0.05$, false discovery rate corrected). Nodal centralities of the hippocampus were negatively associated with symptom severity and illness duration. **Conclusions:** Our findings suggest disrupted topological organization of GM structural networks in adolescent MDD patients. Impaired local segregation and abnormal nodal centralities in the prefrontal-subcortical-limbic areas and visual cortex regions may play important roles in the neurobiology of adolescent-onset MDD.

PO-0056

Aberrant resting-state functional connectivity of the amygdala in non-alcoholic fatty liver disease with mild cognitive impairment

Yihan Jin^{1,2}, Kuanghui Xu^{1,2}, Ruoyu Tang², Xiaofei Chen^{1,2}, Jie Li^{1,2}

1. The Affiliated Hospital of Hangzhou Normal University

2. Hangzhou Normal University

Background: The amygdala (AMG) is a vital subcortical center that has been implicated in a variety of emotional/cognitive functions ranging from emotion generation, identification of emotional stimuli, and emotion regulation. Mild cognitive impairment (MCI) is commonly seen in patients with nonalcoholic fatty liver disease (NAFLD), but the neural mechanism is yet to be elucidated. This study used resting-state fMRI (RS-fMRI) to investigate the aberrant functional connectivity (FC) of the AMG in patients with MCI_NAFLD.

Methods: A total of 74 NAFLD patients and 62 demographic-matched healthy controls (HC) were enrolled. According to the Montreal Cognitive Assessment (MoCA) score, the patients were divided into two groups: 43 patients with MCI_NAFLD and 31 patients with nonMCI_NAFLD. All participants underwent a 3.0T RS-fMRI scan and psychological scale assessment, and the liver fat content and blood biochemical index were measured in the patients. After preprocessing RS-fMRI data, the AMG was taken as the region of interest (ROI) to perform whole-brain seed-based FC in the three

groups. One-way analysis of covariance (ANCOVA) and post-hoc t-tests were analyzed to compare FC values among the three groups. Correlation analyses were performed to evaluate the relationship between differing FC in NAFLD and clinical variables.

Results: Compared with the nonMCI_NAFLD group, the MCI_NAFLD group had increased FC between the right AMG and the right superior frontal gyrus (SFG), while reduced FC between the left AMG and the left SFG. In patients with NAFLD, the right AMG-related FC in the right SFG was correlated with the MoCA score and liver-controlled attenuation parameter (CAP), and the left AMG-related FC in the left SFG was positively correlated with MoCA scores. Compared with the HC group, both NAFLD groups had enhanced right AMG-related FC in the right insular and left AMG-related FC in the bilateral putamen/insula and left postcentral gyrus. In addition, patients with MCI_NAFLD patients also had increased left AMG-related FC in the midbrain and those without MCI had increased left AMG-related FC in the left middle temporal gyrus.

Conclusion: Dysregulated FC in regions involved in the frontal-limbic-mesencephalic loop plays an important role in the development of early cognitive dysfunction in patients with NAFLD, and the accumulation of visceral fat may exacerbate the degree of loop dysfunction.

PO-0057

Altered metabolites in the periaqueductal gray in COVID-19 patients with headache: a longitudinal MRS study

Ping Jin, feng Cui, Zhang Luping

Hangzhou TCM Hospital Affiliated to Zhejiang Chinese Medical University

Background: Headache is one of the most common symptoms of acute COVID-19 infection. However, its mechanisms remain obscure and there lack a study investigate the periaqueductal gray (PAG) in the COVID-19 headache.

Methods: Fifteen participants experience headache during the acute phase of COVID-19 were recruited. All subjects underwent twice proton magnetic resonance spectroscopy (1H-MRS) examinations focusing on the PAG before and after them were infected. Metabolite changes were investigated between pre- and post-infection groups.

Results: The combined glutamine and glutamate/total creatine ratio (Glx/tCr) was increased in the PAG after infection. The total choline/total creatine ratio (tCho/tCr) in the pre-infection group was negatively correlated with the days of headache during the acute phase of COVID-19.

Conclusion: The present study indicates that PAG play an important role in COVID-19 headache, thereby support the involvement of trigeminovascular system activation in the pathophysiology of COVID-19 headache.

PO-0058

Peak time delay in the ischemic core may predict poor functional outcome in acute ischemic stroke

Liping Lin, li jiang, jing zhao

Department of Radiology, First Affiliated Hospital, Sun Yat-sen University

Background: Numerous clinical and radiological metrics have been suggested for predicting functional outcomes of acute ischemic stroke (AIS) patients with ambiguous results. The best metric to comprehensively evaluating the predictive prognosis value of CTP-derived imaging parameters in AIS is uncertain.

Purpose: To investigate the value of CTP source images, CTP, and CTP-derived time-density curve's (TDC's) parameters in determining clinical outcomes of AIS patients.

Methods: This retrospective study evaluated AIS patients with anterior circulation occlusion within 24 h from July 2017 to May 2022. We assessed the arterial (Menon et al.) and venous (cortical vein opacification) collaterals and recorded the CTP parameters. CTP-derived TDC's parameters were automatically generated and calculated after outlining the largest ischemic core area, accompanied penumbra and their contralateral healthy hemisphere. The relevant clinical information was collected. Final ischemic volume (FIV) and infarct growth volume (IGV) were determined at follow-up images. Univariate, multivariable regression analysis and receiver operating characteristic curves were further analyzed.

Results: 175 patients were included (median age, 66 years, interquartile range, 56-77 years; 111 men). Eighty-four patients had favorable outcomes (90-day mRS:0-2). Among all parameters, the peak time delay in the ischemic core demonstrated the highest diagnostic value (AUC: 0.74, 95%CI: 0.67, 0.80). A shorter peak time delay in the ischemic core and lower baseline NIHSS were independent predictors of favorable outcomes with high diagnostic values (AUC: 0.89, 95%CI: 0.84, 0.94). Besides, the peak density ratio in the ischemic core was an independent predictor of FIV ($\beta = 18.12$, $P < 0.001$) and IGV ($\beta = 15.47$, $P < 0.001$).

Conclusions: The peak time delay of the ischemic core is a promising imaging marker for functional outcomes prediction in AIS patients. The peak density ratio of the ischemic core is an essential factor in determining tissue fate.

PO-0059

Neuroimaging characteristics and long-term prognosis of myxoma-related intracranial diseases

Xiang Yao¹, Ke Ren², E Chen¹

1. Zhongshan Hospital of Xia Men University

2. Xiang'an Hospital of Xia Men University

Purpose Myxoma-related intracranial diseases were rarely documented in history. The main purpose of our study is to provide a more comprehensive and detailed understanding of the pathogenesis, imaging features, surgical procedures and pathology of such patients through long-term follow-up.

Methods From March 2012 to July 2022, baseline information that included neuroimaging and neuropathology data from 12 cardiac myxoma patients with neurological symptoms were retrospectively analysed, and the treatment options were discussed. Nine patients underwent long-term postoperative follow-up.

Results Twelve cardiac myxoma patients with neurological symptoms were identified, and among them, 10 patients were postoperative patients who had undergone excision of cardiac myxoma, 5 patients had received craniotomy, and the others had received conservative treatment. Positive neuroimaging findings were found in all patients, including cerebral infarction (12/12, 100%), multiple intracranial aneurysms (8/12, 67%), and extravascular metastasis (6/12, 50%). After a long-term average follow-up of 27 months, an increased number of metastatic lesions or an enlargement of the intracranial aneurysms was found in 4 patients.

Conclusions Neuroimaging findings of myxoma-related intracranial lesions were diversified and usually presented as multiple cerebral infarction, aneurysm formation, focal intracranial haemorrhage and space-occupying lesions. Progress is over a long period of time after primary tumour resection. It is necessary for patients to be regularly examined within 2 years after cardiac myxoma resection using MRI+CTA/MRA/DSA in order to be ruled out. Stable and effective chemotherapy drugs are urgently needed.

PO-0060

The Detrimental Impact of Cerebral Small Vessel Disease on the Integrity of the Cholinergic System in Patients with Mild Cognitive Impairment

Tiantian Qiu¹, Hui Hong², Fei Xie¹, Shouping Dai¹, Minming Zhang²

1. Linyi people's hospital

2. Department of Radiology, The Second Affiliated Hospital of Zhejiang University School of Medicine

Background: Cerebral small vessel disease (SVD) elevates the risk of mild cognitive impairment (MCI) progressing to Alzheimer's disease (AD), while cognitive decline frequently linked to cholinergic deficits. However, the influence of SVD on cholinergic system integrity during AD progression remains inadequately elucidated. This study seeks to examine the associations relationships between SVD, cholinergic deficits, and cognitive impairments in MCI patients through cross-sectional and longitudinal analyses.

Methods: We included 40 cognitively unimpaired (CU) subjects, 29 MCI patients without SVD, and 23 MCI patients with SVD. All participants underwent 4-year follow-ups, including cognition assessments and MRI scans. We measured nucleus basalis of Meynert (NBM) volume using T1-weighted images, and tracked cholinergic white matter (WM) pathways using diffusion tensor imaging. We employed mean diffusivity (MD) as a metric to assess the integrity of WM pathways. In the cross-sectional analysis, we compared cholinergic markers among three groups and examined associations between SVD burden, cholinergic markers, and cognitive performance using linear regression models. In the longitudinal analysis, we used linear mixed models to assess changes in cholinergic markers over time among the groups.

Results: After controlling for age, sex, education, and total intracranial volume, both MCI groups showed decreased NBM volume compared to the CU subjects, however, there was no significant difference between the two MCI groups. Furthermore, increased MD was observed in both medial and lateral pathways in MCI patients with SVD when compared to those without SVD and CU subjects. Longitudinally, there was no significant difference in NBM volume changes among the three groups over 4 years of follow-up. However, MCI patients with SVD showed a faster increase of MD in both medial and lateral pathways compared to CU subjects. Additionally, MCI patients without SVD also showed a faster increase in medial pathway MD compared to CU subjects. Correlation analyses demonstrated that cholinergic pathway integrity was associated with SVD burden and cognitive impairments across MCI patients.

Conclusions: Our work underscored the clinical significance of preserving cholinergic system integrity as a potential therapeutic avenue in mitigating cognitive decline in individuals with MCI and SVD.

PO-0061

High-resolution MR vessel wall imaging combined with ideal cardiovascular health for evaluating the occurrence of ischemic stroke

Wenqiao Zheng

First Hospital of Shanxi Medical University

Objective: To explore the relationship between high-resolution MR vessel wall imaging (HR-VWI) based plaque characteristics combined with ideal cardiovascular health (CVH) metrics and ischemic stroke attributed to middle cerebral artery (MCA) plaque.

Methods: Retrospective analyzed of 119 participants, 83 patients with high signal in the area of the MCA on diffusion-weighted imaging (DWI) were included in the symptomatic group, and the other 36 patients without high signal were included in the asymptomatic group. Plaque characteristics including degree of stenosis, enhancement ratio, intraplaque hemorrhage (IPH), and remodeling were measured and compared between groups. The CVH score and other clinical data were obtained. The association between these factors and ischemic stroke was investigated by univariate and multivariate analysis.

Results: Patients in symptomatic group showed significantly higher degree of stenosis (symptomatic vs. asymptomatic: 72.46% (54.01%, 87.69%) vs. 16.7% (28.61%, 61.81%), $p < 0.001$), plaque burden (symptomatic vs. asymptomatic: 0.81 (0.71, 0.91) vs. 0.73 (0.68, 0.81), $p = 0.001$), and enhancement ratio (symptomatic vs. asymptomatic: 0.94 ± 0.56 vs. 0.71 ± 0.40 , $p = 0.005$) than asymptomatic group. The prevalence of IPH in symptomatic group was significantly higher than asymptomatic group (symptomatic vs. asymptomatic: 41.0% vs. 5.6%, $p < 0.001$). Meanwhile, CVH score in asymptomatic group was significantly higher than that in symptomatic group ($p < 0.001$). Multivariate logistic regression analysis showed that degree of stenosis (OR = 1.066; 95% CI, 1.023–1.111), IPH (OR = 7.254; 95% CI, 1.167–45.029), and total CVH score (OR = 0.445; 95% CI, 0.298–0.665) were the independent characteristics associated with occurrence of ischemic stroke. ROC curve showed that the AUC values of degree of stenosis, IPH, and CVH score were 0.798, 0.677, and 0.859 respectively. The combined model achieved an AUC of 0.926.

Conclusion: The degree of stenosis and IPH of MCA identified on HR-VWI, as well as CVH score, were independently associated with ischemic stroke. Plaque characteristics combined with CVH may identify high-risk plaque and provide new insight for preventive treatment of ischemic stroke.

PO-0062

Energy spectral CT assessment of the anti-angiogenic effect of carbon ions on rat C6 gliomas

Yufeng Li, Jianli Liu
Lanzhou University Second Hospital

Purpose: Exploring the value of energy-spectral CT in evaluating the role of carbon ion irradiation (CIR) in inhibiting angiogenesis of rat C6 gliomas.

Methods and Materials: Establishing 78 rat C6 glioma models. Before CIR, all rats were subjected to energy-spectral CT-enhanced scans and 6 rats were randomly selected as molecular pathology controls, the rest were randomly divided into three groups using different doses of carbon ions irradiation (0 Gy, 1 Gy and 2 Gy). Energy-spectral CT-enhanced scans on day 7, 14 and 21 after CIR to obtain the best single-energy CT value (CT_{70 keV}), iodine concentration (IC) and slope of the energy-spectral curve ($K_{(40-70 \text{ keV})}$) in the solid tumour area and to measure the tumour volume. Then, three rats were randomly selected for HE and immunohistochemical staining for HIF-1 α , VEGF, CD34, α -SMA at each time point in each group; three rats were randomly selected on day 7 and 14 after CIR to collect tumour tissues for the detection of vascular-associated protein expression by WB method.

Results: The tumour volume in the three groups still increased at 7 days after CIR, gradually decreased at 14 days in the 1 Gy and 2 Gy groups, and decreased significantly at 21 days in the 2 Gy group.

Compared with the 0 Gy group, the tumour blood perfusion was reduced in the 2 Gy group at 7 days after CIR, and CT_{70 KeV}, IC and $K_{(40-70 \text{ KeV})}$ decreased; at 14 days, CT_{70 KeV}, IC and $K_{(40-70 \text{ KeV})}$ decreased significantly in the 1 Gy and 2 Gy groups. There was a good correlation between the percentage of HIF-1 α , VEGF, CD34 and α -SMA positive cells and each quantitative parameter of the energy spectrum CT in each groups. The expression of vascular-related proteins in the 2 Gy group was gradually downregulated after CIR.

Conclusions: Quantitative parameters of energy spectral CT, including CT 70 KeV, IC and K (40-70 KeV), can be used as a non-invasive dynamic monitoring tool to respond to the inhibitory effect of carbon ions on angiogenesis in rat C6 gliomas.

PO-0063

Mild cognitive impairment in non-alcoholic fatty liver disease is associated with abnormal resting-state functional connectivity between the default mode network and regions within the reward system

Kuanghui Xu^{1,2}, Yihan Jin^{1,2}, Ruoyu Tang², Xiaofei Chen¹, Jie Li¹

1. the Affiliated Hospital of Hangzhou Normal University

2. the Hangzhou Normal University

Background: Mild cognitive impairment (MCI) is commonly seen in patients with nonalcoholic fatty liver disease (NAFLD), but the neural mechanisms have not been elucidated. In this study, we used resting-state fMRI (RS-fMRI) to investigate the characteristics of spontaneous neural activity in NAFLD patients with MCI.

Methods: A total of 74 NAFLD patients and 62 demographic-matched healthy controls (HC) were enrolled. According to the Montreal Cognitive Assessment (MoCA) score, the patients were divided into two groups: 43 patients with MCI_NAFLD and 31 patients with nonMCI_NAFLD. All participants underwent 3.0T RS-fMRI scan and neurocognitive psychological assessment, and patients underwent liver MRI proton density fat fraction (PDFF) and blood biochemical indexes measurement. DPABI software was used to process the RS-fMRI data and obtain the whole brain amplitude of low-frequency fluctuations (ALFF) map. One-way analysis of covariance and post-hoc tests were used to compare the differences in ALFF maps among the three groups. The abnormal regions were selected as the regions of interest (ROI) to compare the differences in whole-brain seed-based functional connectivity (FC) between the two patient groups, and the correlation between abnormal FC values and clinical variables was analyzed.

Results: Compared with nonMCI_NAFLD patients, MCI_NAFLD patients had reduced ALFF values in the right cerebellum and right cuneus, and increased ALFF values in the left posterior cingulate gyrus (PCC), and the ALFF values in these different regions were significantly correlated with MoCA scores. Compared with nonMCI_NAFLD patients, MCI_NAFLD patients had enhanced FC between the left PCC and the left lingual gyrus, left parahippocampal gyrus, left medial orbitofrontal gyrus, left middle frontal gyrus, left postcentral gyrus and right postcentral gyrus, and reduced FC between the left PCC and the left insula and right supplementary motor area. Among them, the FC values between the left PCC and the regions related to the reward system were correlated with cognitive function, emotional symptoms, PDFF values and insulin function in NAFLD patients. In particular, the ALFF values of the PCC completely mediated the correlation between the FC values between the PCC and the orbitofrontal cortex and MoCA scores.

Conclusions: The development of cognitive impairment in patients with NAFLD may be closely related to the dysfunction of the default mode network and dopamine pathway, in which visceral fat accumulation and insulin dysfunction also play a crucial role.

PO-0064

A preliminary study on the application of AI to improve the efficacy of cerebral aneurysm detection by resident physicians with different years of training

Tianhui Zhang,Zhifeng HUANG,Zheng ZHONG,Xi LONG,Weixiong FAN
People's Hospital of Meizhou

Objective:To explore the value of applying artificial intelligence to improve the efficacy of aneurysm detection by junior and senior resident-trained physicians. **Methods:** The data of 48 patients who underwent head and neck CTA examination in our hospital from December 2021 to February 2022 were retrospectively selected. The CTA was read by junior and senior resident-trained physicians using the independent method and AI-assisted method, and the diagnostic results and reading time were recorded. Paired chi-square test was used to compare the difference in the detection rate of aneurysm between independent method and AI-assisted method, and paired t-test was used to compare the difference in the reading time between the independent method and AI-assisted method. **Results:** The detection rate of aneurysm by junior resident-trained physician using AI-assisted method was 95.35% , which was significantly higher than the detection rate using independent method of 79.07% ($P < 0.05$). The detection rate of aneurysm by senior resident-trained physicians using AI-assisted method was 93.02%, which was slightly higher than the detection rate using independent method of 83.72%, but the difference was not statistically significant ($P > 0.05$). The time of reading head and neck CTA by AI-assisted method were significantly shorter than that by independent method, and the difference was statistically significant ($P < 0.001$). **Conclusion:** The application of AI by junior and senior resident-trained physicians can help improve the detection rate of cerebral aneurysm and shorten the reading time, and the application by junior resident-trained physicians is more effective.

PO-0065

Computed tomography imaging predictors of early neurologic deterioration and long-term functional outcomes in symptomatic acute ischemic stroke treated with thrombolysis

Xueyang Wang
Yancheng Traditional Chinese Medicine Hospital Affiliated to Nanjing University of Chinese Medicine

Background: The aim of this study was to identify the clinical, laboratory, and radiological factors linked to early neurologic deterioration (END) and long-term functional outcomes in patients who have received thrombolysis treatment for symptomatic acute anterior circulation ischemic stroke. **Methods:** This study was conducted at the Stroke Center of Yancheng Third People's Hospital. From a comprehensive database comprising consecutive patients diagnosed with cerebrovascular ischemia, we retrospectively included patients with symptomatic anterior circulation large vessel stenosis or occlusion stroke who underwent intravenous thrombolytic therapy and multiparametric computed tomography (CT) scan, including noncontrast CT, CT angiography, and CT perfusion, before thrombolysis. Symptom severity was assessed at admission and 72 hours after using the National Institutes of Health Stroke Scale (NIHSS). The outcomes evaluated included the incidence of END following thrombolysis and the patient's 90-day postprocedure functional status as measured by the Modified Rankin Scale (mRS; with a score of 0–2 denoting a favorable outcome). We employed a binary logistic regression model to discern the clinical predictors of functional independence. A P value < 0.05 was considered statistically significant.

Results: There was a substantial correlation between the occurrence of END and unfavorable scores on the mRS at 90 days ($P<0.01$). The significant CT parameter predictors for END and an unfavorable 90-day mRS score were lower regional leptomeningeal collateral (rLMC) score ($P<0.01$), larger volume of perfusion lesion ($P<0.01$), infarct core ($P<0.01$), and ischemic penumbra ($P<0.05$). As shown by area under the receiver operator characteristic curves (AUCs) for predicting the long-term functional outcomes, the optimal thresholds of the rLMC score, perfusion lesion, infarct core, and ischemic penumbra were 17.5 (AUC =0.751; $P=0.01$), 90 mL (AUC =0.736; $P=0.01$), 14.5 mL (AUC =0.716; $P=0.01$), and 57.0 mL (AUC =0.712; $P=0.01$), respectively.

Conclusions: In patients with symptomatic acute anterior circulation ischemic stroke treated with thrombolysis, CT imaging parameters, including rLMC, perfusion lesions, infarct core, and ischemic penumbra, hold independent prognostic value for the development of END and long-term functional outcomes.

PO-0066

MR imaging characteristics of ‘diffuse hemispheric gliomas, H3 G34-mutant’ and possible differentiation from ‘glioblastomas, IDH-wildtype’ in adolescents and young adults

Hanbing Shao, Xiaorui Su, Qiang Yue
West China Hospital of Sichuan University

Purpose: We aimed to report the clinicopathologic and neuroradiological features of diffuse hemispheric gliomas, H3 G34-mutant (DHGs-G34m), compare these characteristics to those of IDH-wildtype glioblastomas (GBMs-IDH-WT) in adolescents and young adults, and try to investigate the capacity of quantitative MRI variables in differentiating them.

Methods: Twenty-three patients with DHG-G34m and thirty GBMs-IDH-WT were recruited in this retrospective study. All patients underwent preoperative MRI. Clinical, radiological, and molecular data of DHGs-G34m were reviewed, and neuroimaging features were compared to those of GBMs-IDH-WT. Visually Accessible Rembrandt Images (VASARI) features were extracted based on preoperative MRI. The Kruskal-Wallis test was performed, and a logistic regression model was constructed to evaluate the differentiation diagnostic performance between DHG-G34m and GBM-IDH-WT. Subsequently, an open-source software named FeAture Explorer was performed to generate the machine learning pipeline and select important radiomics features that had been extracted with the PyRadiomics. Some metrics including sensitivity, specificity, and area under the curve (AUC) were used to evaluate the performance.

Results: The mean age of G34-mutant patients was 23.7 years, younger than GBM-IDH-WT patients (mean age, 30.9 years). The majority of G34-mutant cases were in the frontal, parietal, and temporal lobes, and demonstrated no or only a faint contrast enhancement, while 83% of GBMs-IDH-WT were seen in the frontal lobe and showed marked contrast enhancement. The radiomics features model (AUC=0.925) had better discriminatory performance between DHG-G34m and GBM-IDH-WT than the VASARI feature analysis (AUC=0.843).

Conclusions: DHGs-G34m occur most frequently in the frontal, parietal, and temporal lobes, and are associated with distinct radiological characteristics compared to GBMs-IDH-WT in adolescents and young adults. Successful identification can be achieved using either VASARI features or radiomics signature, which may provide assistance in clinical settings.

PO-0067

Impaired glymphatic system in pre-cirrhotic NAFLD patients: A pilot MRI study based on DTI-ALPS

Kun Shu¹,Jia-Wen Song¹,Xiao-Yan Huang¹,Xin-Jian Ye¹,Shi-Han Cui¹,Yong-Jin Zhou¹,Peng Wu²,Lu Han²,Zhi-Han Yan¹,Kun Liu¹

1. The Second Affiliated Hospital and Yuying Children's Hospital of Wenzhou Medical University

2. Philips Healthcare, Shanghai, China;

Background: Dysfunction of the glymphatic system (GS) has been associated with cognitive impairment. However, whether there are alterations in the GS of patients with non-alcoholic fatty liver disease (NAFLD) remains unclear. Therefore, this study aims to investigate alterations in GS function in patients with NAFLD and explore the relationship between these alterations and cognition.

Methods: Forty-three patients with pre-cirrhotic NAFLD (diagnosed by liver biopsy) and twenty-three age-, sex-, and education-matched controls underwent diffusion tensor imaging (DTI) examination and cognitive measurements. The DTI analysis along the perivascular space (DTI-ALPS) index, calculated from the DTI data, assessed differences in GS function between the two groups. Linear regression analysis examined the relationship between the ALPS index and Z-transformed cognitive scores. Spearman/Pearson correlation analysis was conducted for assessing the relationship of the ALPS index with clinical indicators.

Results: After adjusted for age, sex, and BMI, NAFLD patients exhibited significantly lower ALPS index and higher diffusivity of projection fibers in the direction of the y-axis than controls (both $p < 0.001$). In the NAFLD group, the ALPS index was significantly correlated with the Mini-Mental State Examination (MMSE) score (beta (95% CI) = 2.123 (0.156, 4.091), $p = 0.035$) and the clock drawing score (CDT) (beta (95% CI) = 4.233 (0.073, 8.393), $p = 0.046$) after adjusting for age, sex, body mass index, and education level. In addition, a significantly positive correlation between the ALPS index and VAT ($r = 0.353$, $p = 0.020$) after adjusting for age, sex, and BMI in NAFLD patients.

Conclusions: Patients with NAFLD exhibit glymphatic dysfunction prior to developing cirrhosis. Changes in the GS may affect cognitive performance in NAFLD. These findings contribute to understanding the mechanisms underlying cognitive impairment in NAFLD patients.

PO-0068

Difference of hierarchy and topology in individual gray matter network between MCI patients who converted to AD and who did not convert within 3 years

Baiwan Zhou,Yueqi Zhao,Xiaoja Wu

The Second Affiliated Hospital of Chongqing Medical University

Objective: The aim of our study was to explore the difference of individual gray matter (GM) network in mild cognitive impairment patients who converted (MCI-C) and who did not convert (MCI-NC) to Alzheimer's disease (AD) within 3 years at baseline.

Materials and Methods: 461 patients with MCI were collected from the Alzheimer's Disease Neuroimaging Initiative (ADNI), with 180 MCI-C patients and 281 MCI-NC patients. For each subject, individual GM network was constructed by using Kullback-Leibler divergence method based on 3D-T1 imaging. Then, gradient analysis and topological analysis were performed based on the individual GM network, and partial correlations was used to evaluate relationships between network properties and cognitive function as well as apolipoprotein E (APOE) $\epsilon 4$ alleles. Finally, a support vector machine (SVM) model was constructed to discriminate MCI-C group from MCI-NC group at baseline based on individual GM connectome.

Results: In gradient analysis, distribution of gradient scores of principal gradient in MCI-C group was more compressed than that in MCI-NC group, and gradient scores of left lingual gyrus, right

fusiform gyrus and left middle temporal gyrus increased in MCI-C group, compared with MCI-NC group ($p < 0.05$, FDR corrected). In topological analysis, significant differences of nodal efficiency in four nodes were also detected between the two groups. Muchmore, the gradient scores or nodal efficiency of above regions were found to be significant related with scores of neuropsychological tests, and gradient scores of left middle temporal gyrus were found to be positively related with the number of APOE $\epsilon 4$ alleles ($r = 0.192$, $p = 0.002$). Finally, by using SVM model, we obtained a balanced accuracy of 79.4% in the classification of MCI-C and MCI-NC patients ($p < 0.001$).

Conclusion: Hierarchy of whole-brain GM network in MCI-C group was more compressed than that in MCI-NC group, which may be related with the more serious cognitive impairment in MCI-C group. Muchmore, the gradient scores of left middle temporal gyrus were both related with the cognitive function and APOE $\epsilon 4$ alleles, which may be a potential biomarker to distinguish MCI-C and MCI-NC at baseline.

PO-0069

Baseline white matter dynamic functional connectivity reveals dysconnectivity and predicts the early treatment response in first-episode schizophrenia

Xusha Wu, Yibin Xi, Hong Yin
Xi'an People's Hospital (Xi'an Fourth Hospital)

Objective

Schizophrenia (SZ) is associated with abnormal dynamic functional structure, which may affect the efficacy of early treatment. This experiment aimed to determine the prognostic predictive value of white matter dynamic functional connectivity (FC) of patients after early antipsychotic treatment.

Materials and Methods

Thirty-six patients with SZ, and 44 health control (HC) were included. This research has been approved by an ethical committee. Based on resting-state fMRI, sliding-window methods were used to analyze the patients' dynamic FC changes of white matter and the relationship with antipsychotic drugs efficacy, namely, to explore their predictive ability for early treatment response.

Results

Dynamic analysis showed that SZ patients had a relatively infrequent but strongly connected state I, and a more frequent but weaker state II. The overall incidence of these two states varied widely, with state II (71.09%) more frequent than state I (28.91%). Dynamic FC weakened was dominant in white matter brain regions such as the genu of the corpus callosum and the right corticospinal tract; dynamic FC was mainly weakened such as left anterior limb of internal capsule and right cingulum. The temporal properties of dynamic FC (window ratio, mean dwell time, number of transitions) were not significantly different between groups and were not significantly related to response status.

Conclusion

There are characteristic changes of dynamic FC in SZ patients, and the temporal characteristics may be not potentially related to the early treatment effect of SZ. Further research on the dynamic changes of white matter FC holds promise to understand the pathophysiological mechanism of SZ.

PO-0070

Application of 3D vessel wall high-resolution MR(3D VW-MR) imaging in Primary Angiitis of the Central Nervous System

Hongwei Zhou
The First Hospital of Jilin University

Purpose Vasculitis usually reveals a smooth, homogeneous, concentric arterial wall thickening and enhancement in three-dimensional vessel wall magnetic resonance imaging (3D VW-MRI). We compared 3D VW-MRI and MRA and provide diagnostic information on PACNS.

Material and Methods Seventeen patients diagnosed with PACNS were recruited from March 2020 to March 2022 in the first hospital of JLU. 3DVW-MRI and MRA were performed on all patients. 3D T1 VISTA protocol was performed on a 3.0T Ingenia MR Scanner. Three cases with particular imaging characteristics on 3D VW-MRI were explored, providing hints on the application of 3D VW-MRI in PACNS.

Results There were 12 cases (70.6%) combined with white matter involvement, 6 cases (35.3%) combined with the meningeal involvement, 2 case (11.8%) complicated with basal ganglia involvement and 2 cases (11.8%) complicated with spinal cord involvement. Cortical atrophy was identified in 6 cases (17.6%). There were 12 cases (70.6%) with the enhancement of the lesions and meningeal. The 3D Vessel Wall MR imaging showed uniform thickness in all patients (100%) with contrast enhancement of the vessel wall of the vasculitis artery. Imaging findings could be seen. The brain pathology in 3 cases, manifested as brain edema, partial necrosis or brain tissue loose, blood vessel wall thickening and perivascular lymphocytes.

Conclusion 3D-VW-MRI is now an optimal approach. Firstly, it provides a visualization of vessel wall and the lumen especially after the contrast agents. Second, the thickness is 1mm, MPR and CPR are helpful for demonstrating the specific vasculopathy and the whole-brain vasculature. 3D-VW-MRI showed uniform thickness of the involved vessel. Furthermore, according to the enhancement intensity after contrast, the c of PACNS could be evaluated. In conclusion, 3D-VW-MRI provides a more comprehensive information for detecting and diagnosing PACNS.

PO-0071

Prediction of CDKN2A/B homozygous deletion status in IDH-mutant astrocytoma by radiomics nomogram strategy

Linling Wang
The First Affiliated Hospital of Chongqing Medical University

Background :To construct an MRI-based radiomic nomogram to predict the CDKN2A/B homozygous deletion status in patients with IDH-mutant astrocytoma.

Methods :A total of 200 IDH-mutant astrocytoma (103 CDKN2A/B homozygous deletion and 97 CDKN2A/B non-homozygous deletion) were enrolled in the training cohort (n = 140) and the test cohort (n = 60) for the prediction of CDKN2A/B homozygous deletion. Total 1946 features were extracted from tumor edema and tumor parenchyma, respectively. A total of 3,992 features were obtained from T2 FLAIR (T2 fluid attenuation reversal) and T1WI + C (contrast T1WI). The Student's t-test and the Least Absolute Selection and Shrinkage Operator (LASSO) model were used to select a radiomics signature, and finally a radiomics nomogram was constructed using the age, gender information and the above features.

Results :Student's t-test concluded that the overall tumor radiomics constructed with tumor edema radiomics and tumor parenchyma radiomics has the best performance (AUC: training cohort = 0.951, test cohort = 0.779). CDKN2A/B homozygous deletion in IDH mutant astrocytoma was predicted by radiomics nomogram (C index: training cohort = 0.899, test cohort = 0.805). The clinical usefulness of the nomogram in predicting CDKN2A/B homozygous astrocytoma was further confirmed by decision curve analysis.

Conclusions :The nomogram, which combines age, gender, and radiomics features, offers a clinically useful approach to predict the status of CDKN2A/B homozygous deletion in IDH mutant astrocytoma, and facilitated MRI-based clinical decision-making in IDH mutant astrocytoma.

PO-0072

Study on brain function changes in patients with neurological depression based on resting state functional magnetic resonance imaging(rs-fMRI)

Jiang Wu

The first hospital of Jilin University

Purpose To construct functional brain network using rs-fMRI and to compare the relationship between rs-fMRI changes and clinical scales in evaluating the depression. To provide imaging evidence for the diagnosis and pathogenesis of depression.

Material and Methods

24 patients with depression and 16 healthy controls (HC) were included. Initially, participants underwent medical history inquiries and were assessed using HAMA, 24 HAMD, PHQ-9, and GAD-7 scales. Subsequently, rs-fMRI data were collected, and brain functional networks were constructed based on fALFF, ReHo, and FC data, which help determine abnormalities in brain regions and functional connectivity. Image were processed on DPARSFA in Matlab (R2018b). General data were analyzed using SPSS 24.0. A two-sample T-test for group comparisons. For fALFF, ReHo, and FC data, one-sample T-tests were performed using dpadi software (Matlab R2018b) and SPM12, followed by a two-sample T-test between groups. We applied significance level of $P < 0.01$.

Results

Significant differences were found in HAMD, HAMA, PHQ-9, and GAD-7 scores between the two groups ($P < 0.05$). About 83% of patients primarily take physical symptoms as the primary complaint, including sleep disorders, dizziness, headaches, and memory loss, while 17% reported emotional symptoms firstly. In rs-fMRI images, the patient group had higher fALFF values in the left superior frontal gyrus, right cerebellum 6 area, and gyrus lingualis. The ReHo value was higher in the patient group in the right posterior central gyrus, right superior occipital lobe, and right angular convolution. Additionally, the patient group showed increased FC values in the right posterior central gyrus, right gyrus temporalis medius, left fusiform gyrus, left inferior temporal gyrus, and medial prefrontal cortex.

Conclusion

By comparing the value changes of fALFF, ReHo, and FC, we figure out that there are a significant number of differences in rs-fMRI between the groups.

PO-0073

The application of High-Resolution Vessel Wall MRI(HR-VW-MRI) in determining the stability of intracranial MCA and BA plaques

Hongwei Zhou
The First Hospital of Jilin University

Purpose

To study HR-VW-MRI imaging characteristics of intracranial MCA and BA plaques, and discriminate the stability of early intracranial MCA and BA plaques. To improve the detection rate of symptomatic intracranial artery plaques

Material and Methods

87 patients with acute ischemic stroke who visited the department of neurology of 1st Hospital of JLU from March 2017 to March 2019 were collected in the study. All the patients were performed with the HR-VW-MRI protocol. All of the VW-MRI examinations were performed on a 3 T Siemens Trio MR scanner. The remodelling ratio, eccentricity index and plaque range of MCA and BA plaques were compared using MRI-PlaqueViewTM. SPSS 19.0 statistical software was used for statistical analysis of the data. For quantitative data, t-test (for normally distributed data) or Mann-Whitney U test was used, and a chi-square test was used for qualitative data. $P < 0.05$ was considered statistically significant.

Results

87 patients with 116 plaques were included in this study. There were 80 plaques located in the MCA and 36 plaques found in the BA. Among MCA plaques, 22 were symptomatic, 7 were indeterminate, and 51 were asymptomatic. Among BA plaques, 13 were symptomatic, 14 were uncertain, and 9 were asymptomatic. Among all plaques, the eccentricity index of symptomatic plaques was 0.612 ± 0.618 , while that of asymptomatic plaques was 0.490 ± 0.619 ($p = 0.0005$). The plaque range in the symptomatic plaques was 125.9 ± 20.40 , while that of uncertain and asymptomatic plaques was 143.4 ± 23.62 ($p < 0.001$). That meant the symptomatic plaques had much higher eccentricity index and much much smaller plaque range.

Conclusion:

In this study, the characteristics of MCA and BA plaques in the early and middle stages included in the group were manifested as the symptomatic plaques prone to stroke with higher eccentricity index and smaller plaque range.

PO-0074

Structural and functional abnormalities of the insula subregions in patients with bulimia nervosa

Weihua Li, Peng Zhang, Zhenchang Wang
Beijing friendship hospital affiliated to capital Medical University

Abstract

Background: Bulimia nervosa (BN) is a complex and serious eating disorder with a clinically chronic course and recurrent episodes, which has been shown to be closely related to the brain dysfunction. The insula has also been commonly identified as an abnormal brain region in previous eating disorders related studies.

Methods: Structural magnetic resonance imaging (MRI) and resting-state functional MRI images were acquired from 54 BN patients and 56 healthy controls (HCs). Neuroimaging analysis methods including voxel-based morphometry (VBM), amplitude of low-frequency fluctuation (ALFF), slow-5

ALFF, fractional ALFF (fALFF), slow-5 fALFF, and functional connectivity (FC) were applied to investigate multimodal neuroimaging abnormalities of the insula between the BN patients and HCs. Partial correlation was then used to examine the relationships between neuroimaging findings and clinical features.

Results: Compared with the HCs, the BN patients exhibited decreased GMV of in the right dorsal anterior insula (dAI) and bilateral ventral anterior insula (vAI). BN patients showed significantly decreased slow-5 ALFF of bilateral dAI and left posterior insula (PI) and slow-5 fALFF of bilateral dAI, bilateral posterior insula (PI) and left vAI. Taking the insula subregions including the left dAI, the left PI, the left vAI, the right dAI, the right PI, the right vAI as regions of interest (ROIs), FC differences of the ROIs were observed in several brain regions between the two groups, which involves multiple functional areas including cognitive control, affect and body imaging processing. Furthermore, the decreased FC between the bilateral vAI and anterior cingulate gyrus and paracingulate gyri (ACG) and/or median cingulate and paracingulate gyri (DCG) were significantly correlated with the severity and abnormal eating behavior of BN.

Conclusions: Findings from our investigation suggest that the structural and/or functional abnormalities of the insula subregions are correlated with BN clinical features, which have implications for understanding neurobiological mechanisms underlying BN.

PO-0075

Association of the Glymphatic System with Motor Symptoms in Parkinson's Disease

Jinhuan Deng^{1,2}, Fan Lin¹

1. The Second People's Hospital of Shenzhen
2. The First Affiliated Hospital of Shenzhen University

Background and objectives: Parkinson's disease (PD) is the second most common neurodegenerative disease, characterized by the aggregation of misfolded α -synuclein (α -syn) as its main pathological feature. Recent studies have shown that dysfunction of the glymphatic system, which serves as the cerebrospinal fluid transport system responsible for the metabolism of waste products in the brain leads to the accumulation of the associated proteins. Growing evidence links glymphatic dysfunction to PD, yet its imaging in motor symptoms remains unclear. This study aim to validate glymphatic system's connection to motor symptoms in PD patients in "OFF" (baseline) and "ON" (post-levodopa) states.

Methods: Retrospective study of 86 PD patients with 3.0-T MRI scans (July 2019-March 2021), assessing DTI-ALPS index (an index for diffusivity along the perivascular space) and perivascular spaces (PVSS). We analyzed the association between these metrics and UPDRSIII (the third part of the Unified Parkinson's Disease Rating Scale) scores using linear regression. Furthermore, the relationships with age, Hoehn&Yahr(H&Y) stage, Mini-mental State Examination (MMSE) scores were explored.

Results: Pre-levodopa, the UPDRSIII score was negatively correlated with the DTI-ALPS index ($p < .05$) and positively correlated with the PVSSs of the bilateral basal ganglia region (BG-PVSSs) ($p < .001$). When age was introduced as a covariate in the linear regression analysis, BG-PVSSs maintained a significant relationship with the "OFF" UPDRSIII scores ($p < .001$). Post-levodopa, the UPDRSIII scores were negatively correlated with the DTI-ALPS index ($p < .001$) and positively correlated with BG-PVSSs ($p < .001$). After introducing age as a covariate, the "ON" UPDRSIII scores maintained a significant negative linear relationship with the DTI-ALPS index ($p < .01$) and a positive linear correlation with BG-PVSSs ($p < .01$). Among the association between non-motor clinical parameters and DTI-ALPS Index and PVSSs, age correlated with DTI-ALPS index negatively ($p < .01$), with BG-PVSSs positively ($p < .001$). H&Y stage correlated with DTI-ALPS index ($p < .05$) and BG-PVSSs ($p < .05$) similarly. MMSE scores correlated with DTI-ALPS index positively ($p < .05$).

Conclusions: Study affirm a correlation between glymphatic dysfunction and motor symptoms in Parkinson's patients. Specifically, as the glymphatic impairment intensifies, the motor symptoms become more pronounced. Both the DTI-ALPS index and PVSs emerge as potential imaging biomarkers for the glymphatic system in PD.

PO-0076

Altered Voxel-Wise Degree Centrality of Brain Network in Chronic Rhinosinusitis Patients: A Resting-State Functional Magnetic Resonance Imaging Study

Simin Lin¹, Miaomiao Nie², Bingshan Wang², Hengyu Zhao¹

1. Xiamen Cardiovascular Hospital, Xiamen University

2. Zhongshan Hospital of Xiamen University

Objective: Chronic rhinosinusitis (CRS) is a chronic inflammatory disorder of the paranasal sinus and nose. CRS patients have an increased risk of emotional and cognitive disorders. Although neuroimaging research has revealed alterations in the brains of CRS patients, the underlying causes of malfunction remain unclear. Here, we aim to explore the abnormal pathophysiological mechanisms in CRS patients using the voxel-wise degree centrality (DC) approach.

Methods: In this study, 26 CRS patients and 38 age- and sex-matched healthy controls (HCs) were enrolled for resting-state functional magnetic resonance imaging (rs-fMRI) scanning. The DC value was calculated using rs-fMRI data and correlated with clinical symptoms as well as with anxiety and depression scores in the CRS group. Moreover, a receiver operating characteristic (ROC) curve was used to classify the data.

Results: Compared with HCs, CRS patients indicated decreased DC values in the right precuneus and increased DC values in the left inferior temporal gyrus (ITG). In addition, a positive correlation between the DC values in the left inferior temporal gyrus and disease duration was observed. The results of the ROC curves indicated that the DC values of the right precuneus and the left ITG have the potential to be diagnostic imaging biomarkers for CRS.

Conclusions: Altered DC values in the precuneus and in the ITG in CRS patients may be involved in the pathophysiological mechanisms of brain dysfunction in those patients.

PO-0077

Research on radiomics in distinguishing anti myelin oligodendrocyte glycoprotein immunoglobulin G-associated disorder from aquaporin 4-immunoglobulin G-positive neuromyelitis optica spectrum disorder

Ningning Wang¹, wei Chen², Yongjie Yao³, Yuxin Li⁴, Xinjuan Jin¹, Xiaodi Jin¹, Xueling Liu⁴, Anning Li¹

1. Qilu Hospital of Shandong

2. Shandong First Medical University and Shandong Academy of Medical Sciences

3. Richao City Hospital of TCM

4. Huashan Hospital, Fudan University

Objective

To develop and validate an individual radiomics nomogram for differential diagnosis of myelin oligodendrocyte glycoprotein immunoglobulin G-associated disorder (MOGAD) and aquaporin 4-immunoglobulin G-positive neuromyelitis optica spectrum disorder (AQP4+NMOSD). To provide a viable predictive model for early, rapid and accurate differential diagnosis of these two diseases.

Methods

21 patients with MOGAD and 63 patients with AQP4+NMOSD from the Qilu Hospital of Shandong University were retrospectively collected and enrolled as the primary cohort. 10 patients with MOGAD and 34 patients with AQP4+NMOSD from Huashan Hospital, Fudan University were enrolled as the external validation cohort. Radiomic features were extracted from the cervical spinal cord and brainstem lesions from the sagittal T2WI images. Then, filtering features by reducing dimensionality. Based on the selected features, the random forest (RF) model was constructed and the random forest radiomics score was calculated for each sample. The Rad score was then combined with the clinical characteristics to construct a logistic regression analysis model nomogram to differentiate MOGAD from AQP4+NMOSD. Calibration curves were plotted and the agreement between predicted and actual results was evaluated using the Brier test.

Results

The clinical and routine imaging features showed that the age, cervical lesions counts of the two patient groups had statistical significance ($P < 0.05$). The clinical features like the bladder, bowel dysfunction and lesions in the pons, midbrain had no statistically significant difference in the validation cohorts ($P > 0.05$). On the contrary, there was statistical significance in the primary cohorts ($P < 0.05$). AQP4+NMOSD patients showed a predominance of females in both the primary and validation cohorts, and the ratio of males to females in MOGAD patients was relatively similar. 11 radiomic features were extracted from an initial set of 1218 radiomic features, mainly reflecting lesion heterogeneity. Combining with clinical manifestations, age and lesion distribution, these features were used to construct a nomogram to discriminate MOGAD from AQP4+NMOSD. The area under the ROC curve (AUC) were 0.915 and 0.837 for the primary and validation cohorts respectively. The model exhibited good calibration (Brier Score 0.083 and 0.108 in the primary and validation cohorts, respectively).

Conclusions

Validated nomograms that include the radiomic features of brainstem and cervical cord lesions, age, and lesion distribution are useful in distinguishing MOGAD from AQP4 + NMOSD.

PO-0078

A Comparative Study: ASL and DSC Perfusion Imaging in Distinguishing Glioma Recurrence from Radiation-Induced Brain Injury using Machine Learning

Yanhua Li

The first medical center of chinese people's liberation army(PLA) general hospital

Abstract

Objective: This study aimed to evaluate the diagnostic efficacy of radiomics features extracted from dynamic susceptibility contrast (DSC) enhanced imaging and arterial spin labeling (ASL) in differentiating between radiation-induced brain injury (RIBI) and tumor recurrence (TR) in patients with diffuse gliomas.

Materials and Methods: A total of 131 patients with histopathologically confirmed diffuse gliomas, presenting with enhancing lesions after standard treatment, were included in this study for model development. Lesion segmentation was manually performed by two raters using ITK-SNAP on T1-weighted imaging (T1WI), T2-weighted imaging (T2WI), contrast-enhanced T1-weighted imaging (CE-T1WI), cerebral blood flow maps (CBF) from ASL, and relative cerebral blood flow maps (RCBF) from DSC. A total of 1130 radiomics features were extracted from the segmented areas of each imaging sequence. The intraclass correlation coefficient (ICC) assessed segmentation consistency between the two raters. Feature selection was conducted via t-tests, and an elastic net regression (ENR) algorithm combined with recursive feature elimination with cross-validation (RFECV) was used to identify the most optimal feature subset. Five machine learning classifiers were employed to establish radiomics models. Diagnostic performance was assessed using the

area under the curve (AUC) for single-parameter (CBF vs. RCBF), conventional (T1WI+T2WI+CE-T1WI), and multiparameter (conventional+CBF vs. conventional+RCBF) MRI radiomics models. The most optimal models were further validated in an independent validation set (N=37).

Results: Six features from CBF, five from RCBF, one from T1WI, one from T2WI, and six from CE-T1WI were identified as the most significant features. The K-nearest neighbor (KNN) classifier was selected as the optimal classifier. Both single-parameter MRI models, CBF (AUC 0.962) and RCBF (AUC 0.946), demonstrated satisfactory diagnostic performance, surpassing that of conventional MRI radiomics models (AUC 0.844). The incorporation of perfusion-derived features into conventional MRI models (conventional+CBF vs. conventional+RCBF, AUC 0.960 vs. AUC 0.971) resulted in improved diagnostic accuracy.

Conclusion: The integration of perfusion-derived features into conventional MRI radiomics models significantly enhanced diagnostic accuracy. ASL and DSC perfusion-weighted imaging exhibited strong consistency in distinguishing between RIBI and TR. Radiomics features derived from single perfusion parameters (CBF vs. RCBF), as well as when combined with conventional MRI (conventional+CBF vs. conventional+RCBF), demonstrated comparable diagnostic performance in distinguishing glioma recurrence from radiation-induced brain injury ($z=0.765$, $p=0.4441$; $z=0.756$, $p=0.4499$).

PO-0079

The prognostic value and biological significance of MRI CE-T1-based radiomics models in CNS5-identified GBM

Xiaoxia Li^{1,2}, Shiqi Huang^{1,2}, Mingwei Zhang^{1,2,3}, Xuezhen Wang^{1,2}, Yang Yang⁴, Shan Li^{1,2}, Qiuyuan Yue⁵, Qichun Wei⁴, Jinsheng Hong^{1,2,3}

1. First Affiliated Hospital of Fujian Medical University

2. National Regional Medical Center, Binhai Campus of the First Affiliated Hospital, Fujian Medical University

3. Key Laboratory of Radiation Biology of Fujian Higher Education Institutions, The First Affiliated Hospital, Fujian Medical University

4. The Second Affiliated Hospital, Zhejiang University School of Medicine

5. Fujian Cancer Hospital & Fujian Medical University Cancer Hospital

Objectives: Following the publication of the 2021 WHO Classification of CNS Tumors (CNS5), prognostic markers of patients with glioblastoma (GBM) (CNS5) need to be further explored. Radiomics is a non-invasive and reproducible method for the prognostic assessment of multiple solid tumors. The aims of the study were to explore the prognostic value and biological significance of MRI T1 - weighted enhancement (CE-T1) - based radiomics in GBM (CNS5).

Methods: The MRI CE-T1 tumor region was segmented, and radiomics features were extracted. The consistency analysis, univariate Cox regression and two machine learning algorithms were used for feature reduction. The radiomics prognostic model was established to calculate the radiomics score (RS) and independently external validated using bicenter radiotherapy cohorts. The enrichment analyses of the differential genes between RS-high and -low groups were implemented for biological significance exploration.

Results: A six-features radiomics prognostic model were built. High RS (HR=3.718, 95%CI: 2.222–6.220, $P<0.001$) was an independent risk factor for overall survival (OS) which was externally validated by two cohorts. RS was significantly correlated with DNA repair ($P=0.009$) and glycolysis ($P=0.001$) pathway enrichment scores. RS was associated with γ δT cell infiltration and the expression of LAG3.

Conclusion: The MRI CE-T1 based radiomics models can predict GBM (CNS5) prognosis noninvasively, which is relevant to DNA repair, and may guide the screening of radiosensitive populations.

PO-0080

Disrupted long-range connections is related to cognitive performance in patients with cerebral small vessel disease

Tong Lu¹, Zan Wang², ChunQiang Lu¹, Shenghong Ju¹

1. Zhongda Hospital, School of Medicine, Southeast University

2. Department of Neurology, Beijing Tiantan Hospital, Capital Medical University, Beijing, China

Purpose: We aimed to investigate whether the white matter hyperintensities (WMHs)-related disruptions in hub connectivity patterns are associated with connection distance and whether these disconnections mediate the relationship between WMHs and cognitive dysfunction in cerebral small vessel disease (SVD) patients with cardiometabolic risk factors.

Methods: We constructed comprehensive neuropsychological assessments and resting-state fMRI scans for 36 SVD patients with moderate to severe WMHs (Fazekas score ≥ 3) and 34 healthy controls. The voxel-based graph theory approach-functional connectivity strength (FCS) was employed to systematically investigate intrinsic functional connectivity patterns of whole-brain networks. Multiple linear regression and mediation analyses were applied to investigate the differences in global and nodal topological disruptions of brain functional network between groups. Partial correlation analysis was used to identify the relationship between functional connectivity and cognitive performances in the SVD group.

Results: The SVD patients performed significantly worse than the healthy controls in episodic memory ($p = 0.009$) and information processing speed ($p = 0.003$). We further observed that WMHs selectively targeted highly connected hub regions, mainly involving the medial and lateral prefrontal cortex, inferior parietal lobule, and insula. Furthermore, this impairment was contingent on connection distance, with the most prominent disruptions appearing in the long-range connections (e.g., 100 - 150 mm). Finally, these disruptions of hub connectivity (e.g., the long-range FCS in the left dorsolateral prefrontal cortex) positively correlated with the cognitive performance in SVD patients.

Conclusion: Our results emphasize that the disrupted long-range connections in WMHs is related to the cognitive performance in patients with SVD. This study advances our current understanding of the relationships between WMHs, abnormal connectivity patterns and cognitive impairment in SVD.

PO-0081

Longitudinal associations of cerebrospinal fluid α -synuclein with subcortical volumes differed between Parkinson's disease motor subtypes

Lubin Gou

The Second Affiliated Hospital of Chongqing Medical University

Background Heterogeneous brain atrophy and progression were found in Parkinson's disease (PD) motor subtypes. However, the relationship between these discrepancies and the longitudinal change of cerebrospinal fluid (CSF) α -synuclein is not very clear.

Objectives The current study mainly aimed to evaluate longitudinal changes of CSF α -synuclein, subcortical volumes, and motor and cognitive progression, as well as their relationships between PD motor subtypes.

Methods One hundred and twenty-two PD patients, including 87 tremor dominant PD (TD-PD) patients and 35 non-tremor dominant PD (nTD-PD) patients, completed clinical assessments, including motor and cognitive function, magnetic resonance imaging (MRI) scans and lumbar

punctures for CSF α -synuclein for a maximum total of three longitudinal annual visits (including baseline). A series of linear mixed-effects models were used to examine longitudinal changes in CSF α -synuclein, subcortical volume, and clinical progression between PD motor subtypes, as well as the correlation among CSF α -synuclein, subcortical volume, and clinical progression in TD-PD group and nTD-PD group separately.

ResultsThe CSF α -synuclein longitudinal concentration was significantly reduced in nTD-PD patients. Lower CSF α -synuclein at baseline was associated with faster right globus pallidus atrophy in nTD-PD patients and right thalamus enlargement in TD-PD patients longitudinally. Lower baseline CSF α -synuclein was correlated with faster cognitive deterioration in nTD-PD patients.

ConclusionsThe present study indicates that the consequences of α -synuclein aggregation on subcortical volume and cognitive function were distinct between nTD-PD and TD-PD groups. It provides us new insight to explore the pathophysiological processes and precisely pathogenesis targeted treatments between PD motor subtypes.

PO-0082

CT-based radiomics for differentiating intracranial contrast extravasation from intraparenchymal haemorrhage after mechanical thrombectomy

Xiao 珺 Chen

Jinhua Municipal Central Hospital

Objective

To develop a nonenhanced CT-based radiomic signature for the differentiation of iodinated contrast extravasation from intraparenchymal haemorrhage (IPH) following mechanical thrombectomy.

Methods

Patients diagnosed with acute ischaemic stroke who underwent mechanical thrombectomy in 4 institutions from December 2017 to June 2020 were included in this retrospective study. The study population was divided into a training cohort and a validation cohort. The nonenhanced CT images taken after mechanical thrombectomy were used to extract radiomic features. The maximum relevance minimum redundancy (mRMR) algorithm was used to eliminate confounding variables. Afterwards, least absolute shrinkage and selection operator (LASSO) logistic regression was used to generate the radiomic signature. The diagnostic performance of the radiomic signature was evaluated by the area under the curve (AUC), accuracy, specificity, sensitivity, positive predictive value (PPV), and negative predictive value (NPV).

Results

A total of 166 intraparenchymal areas of hyperattenuation from 101 patients were used. The areas of hyperattenuation were randomly allocated to the training and validation cohorts at a ratio of 7:3. The AUC of the radiomic signature was 0.848 (95% confidence interval (CI) 0.780–0.917) in the training cohort and 0.826 (95% CI 0.705–0.948) in the validation cohort. The accuracy of the radiomic signature was 77.6%, with a sensitivity of 76.7%, a specificity of 78.9%, a PPV of 85.2%, and a NPV of 68.2% in the validation cohort.

Conclusions

The radiomic signature constructed based on initial post-operative nonenhanced CT after mechanical thrombectomy can effectively differentiate IPH from iodinated contrast extravasation.

PO-0083

Association of glymphatic system dysfunction with sleep disorders in Parkinson's disease

Yuting Li, Shenghong Ju
Department of Radiology, Zhongda Hospital, Medical School of Southeast University

Purpose: Abnormal accumulation of α -synuclein (α -syn) is a key pathological progress in Parkinson's disease (PD), which may relate to dysfunction of glymphatic system. Sleep disorder may lead to the aggregation of α -syn in PD, however the underlying mechanism has not been well investigated. This study aims to investigate glymphatic system and its relationship with sleep disorder and α -syn in PD by diffusion tensor image analysis along the perivascular space (DTI-ALPS).

Methods: This study included 126 untreated PD and 43 HCs from Parkinson's Progression Markers Initiative database. Sleep disorder was assessed by ESS and RBDSQ questionnaires. All subjects underwent MRI examination, including T1-weighted imaging (T1WI) and diffusion tensor imaging (DTI).

All DTI images used to create a population-specific DTI template by DTI-TK, and were normalized to the created template. Four spherical ROIs with radius = 5 mm were placed on bilateral projection and association fibers. DTI-ALPS metrics were then calculated: $DTI-ALPS = \frac{\text{mean}(D_{xxproj}, D_{xxassoc})}{\text{mean}(D_{yyproj}, D_{zzassoc})}$. Pearson correlation analysis was performed among DTI-ALPS, α -syn and sleep scales.

Results: According to ESS and RBDSQ tests, PD patients were divided into two groups: 50 with sleep disorders (male:34; mean age=63.4) and 76 without sleep disorders (male:46; mean age=60.9). No significant differences were found in gender, age and educated years among all groups.

The α -syn levels showed significant difference among PD with and without sleep disorders and HC (1655 vs. 1840 vs. 2170, $P < 0.001$). DTI-ALPS also showed significant differences (1.58 vs. 1.62 vs. 1.72, $P = 0.003$). DTI-ALPS was significantly correlated with α -syn in patients with sleep disorders ($P = 0.031$), but not in those without sleep disorders ($P = 0.227$) and HC ($P = 0.205$).

Conclusions: Sleep disorders can impair glymphatic system functions of PD patients, leading to accumulation of α -syn and disease progression. DTI-ALPS could be a potential imaging marker to predict disease progression in PD.

PO-0084

Periventricular gradient of normal-appearing white matter and its transcriptional signatures in normal aging and multiple neurological diseases

Zhizheng Zhuo¹, Decai Tian¹, Yunyun Duan¹, Runzhi Li¹, Yutong Bai¹, Yulu Shi¹, Xiaolu Xu¹, Siyao Xu¹, Shan Lv¹, Guanmei Cao¹, Geli Hu², Jun Xu¹, Jianguo Zhang¹, Fudong Shi¹, Chard Declan³, Barkhof Frederik⁴, Haller Sven⁵, Xinghu Zhang¹, Yaou Liu¹

1. Beijing Tiantan Hospital, Capital Medical University

2. Philips Healthcare

3. University College London

4. VU University Medical Center

5. University Hospitals of Geneva and Faculty of Medicine of the University of Geneva

Purpose

Recently, a periventricular gradient in normal-appearing WM (NAWM) microstructural integrity abnormalities that decreases with distance from the ventricular cerebrospinal fluid (CSF), has been identified in multiple sclerosis (MS, a classic chronic inflammatory demyelinating disease). The potential drivers of this phenomenon include external (e.g., a CSF soluble factor, leucocytes entering CSF through damaged blood-brain barrier, and ependymal processes) and intra-parenchymal pathophysiological mechanisms (e.g., susceptibility to hypoxia of axons and oligodendrocytes in periventricular venous watershed regions, tract-mediated effects of periventricular lesions, and microglial activation). Neurodegenerative (e.g., Alzheimer's disease [AD] and Parkinson's disease [PD]), cerebral small vessel (CSVD), and neuroinflammatory diseases (e.g., MS), are distinct diseases, but share several underlying pathological mechanisms and abnormal gene expression. These may result in shared microstructural integrity abnormalities. To date, periventricular gradients in NAWM abnormalities have only been reported in MS, but chronic inflammation such as that which in part underlies this in MS, has also been observed in other neurological diseases including AD, PD and CSVD.

In this study, given the potential for shared inflammatory mechanisms in MS, AD, PD, CSVD and normal aging, we hypothesized that the periventricular gradient of NAWM would be a common WM signature. To test this hypothesis, neurite orientation dispersion and density imaging (NODDI) was used to look for a periventricular gradient across multiple neurological diseases. To understand how this relate to focal damage and markers of neurodegeneration, associations with brain MRI measures (WMH, WM and grey matter [GM] volumes) were assessed. To assess clinical relevance, associations with cognitive scores were also investigated. With a view to further understanding the underlying mechanism of the periventricular gradient in NAWM, gene expression in normal aging and multiple neurological diseases was also explored.

Methods

This retrospective study collected clinical (age, sex, education, disease duration and cognitive tests) and MRI (FLAIR, T1WI and multi-shell high angular resolution diffusion imaging) data from 395 healthy controls (HCs), 335 patients with AD, 295 patients with PD, 161 patients with CSVD, and 221 patients with MS were initially collected. Additionally, the data of 642 healthy people (aged 18–88 years) from a public database provided by Cam-CAN were included. An additional independent prospectively designed replication cohort including 109 patients with AD, 88 with PD, 70 with CSVD, and 99 with MS was conducted to validate the findings.

Segmentations of the WMH, WM, GM, and CSF were performed. Multi-shell high angular resolution diffusion images were preprocessed using FMRIB Software Library. NODDI model fitting was performed using Accelerated Microstructure Imaging via Convex Optimization. Diffusion metrics including the neurite density index (NDI), orientation dispersion index (ODI), and free water fraction (isotropic volume fraction) mapping were obtained. In this study, NDI and ODI, which were sensitive to microstructural alterations in WM, were used. NAWM was segmented into concentric periventricular rings. Ten rings were adopted corresponding to a distance of 3 mm to 33 mm from the ventricle. The raw NODDI metrics in NAWM were extracted and averaged within each

concentric ring. HCs (from Tiantan hospital and public database) were split into three groups (younger [age ≤ 45 years], middle-aged [45 years < age ≤ 60 years], and older [age > 60 years]). For each NAWM ring, the normalized diffusion metric (z-score = [mean value of diffusion metrics - mean value of diffusion metrics in younger HC]/[standard derivation of diffusion metric in younger HC]) of the middle-aged and older HCs and patients was calculated and used to represent the alteration of diffusion metric compared to that in the younger HC group. Gene expression data were processed with a toolbox for working with the AHBA microarray expression data using the concentric rings calculated by the populational-level WM and ventricle mask in the MNI space.

linear mixed models (LMMs) were used to evaluate the relationship between normalized diffusion metrics and distance from the ventricle for NAWM, respectively. The normalized diffusion metric in each ring was treated as the dependent variable and the following variables were used as independent variables including fixed effect for age, sex, group and ring distance, interaction of group and ring distance, and random effects for ring distance in each individual and ring distance in each protocol (assessments of using protocols as covariates in LMM to minimize the potential impact of protocols on NODDI metrics).

The association of aging and the individual periventricular gradient was assessed through linear regression with age as independent variable, adjusting for sex, scanner-specific protocols, and whole brain NAWM normalized diffusion metric. Clinical relevance with brain degeneration and cognitive decline was assessed using linear regression, adjusting for age, sex, scanner-specific protocols, and whole brain NAWM normalized diffusion metric. For WMH volume, log-transformed was first applied. For WMV and GMV, total intracranial volume was adjusted by taking it as an additional covariate in the LMM.

Partial least square (PLS) regression was used to determine the relationship between the periventricular gradient of HC and neurological diseases and transcriptional features for all the 15329 genes. The first component of PLS (PLS1) was the linear combination of gene expression values that was most strongly correlated with the normalized diffusion metrics in the rings. The set of genes with an absolute value of Z-score > 5 and FDR adjusted p of 1%, either negative, PLS1-, or positive, PLS1+ was defined as the gradient associated gene list. The previous reported neurological disease associated GWAS genes from the DiseGeNET in Metascape was used. The overlapping genes of PLS1- and PLS1+ gene list and neurological disease-associated genes were identified. Whether the PLS1- or PLS1+ gene list shared enrichment pathways (Gene Ontology biological process, Kyoto Encyclopedia of Genes and Genomes and Hallmark Gene Sets), as well as immunologic signatures with polygenic risk for normal aging and neurological diseases, was tested using Metascape analysis. A multi-gene-list meta-analysis was performed to facilitate the understanding of pathways and immunologic signatures that are shared between, or selectively ascribed to, specific gene lists. Data from five different single-cell studies using postmortem cortical samples of human postnatal participants were used to obtain gene sets from each cell type. The gene set of each cell type was overlapped with the PLS1- and PLS1+ gene list to assign gradient-related genes obtained by PLS analysis to cell types.

Results Periventricular normalized NDI gradients were observed in the middle-aged HC, older HC, AD, PD, CSVD, and MS groups. The older HC group had a steeper gradient than the middle-aged HC group. The AD group had a steeper gradient than the middle-aged HC and PD groups. The CSVD group had a steeper gradient than the middle-aged HC, older HC, AD, PD and MS groups. The MS group had a steeper gradient than the middle-aged HC and PD groups. Periventricular normalized ODI gradients were observed in older HC, AD, PD, CSVD and MS groups. The AD group had a steeper gradient than the older HC, CSVD and MS groups. The PD group had a steeper gradient than the older HC, CSVD and MS groups. The CSVD group had a steeper gradient than the older HC group. The MS group had a steeper gradient than the older HC group.

The periventricular normalized NDI gradient was positively associated with age in the older HC, AD, PD and CSVD groups. The periventricular normalized ODI gradient was positively associated with age in the older HC, CSVD and MS groups. The periventricular normalized NDI gradient was positively associated with log-transformed WMH volume in the older HC, AD, PD, CSVD and MS groups; negatively associated with WMV in the middle-aged HC, older HC, CSVD and MS groups; and negatively associated with GMV in the AD, PD, CSVD and MS groups. The periventricular normalized ODI gradient was positively associated with log-transformed WMH volume in the older

HC group and negatively in MS group; positively associated with WMV in the middle-aged HC, older HC, AD, CSVD and MS groups; and negatively associated with GMV in the older HC and CSVD groups, while positively in MS group. The periventricular normalized NDI gradient was negatively associated with the Mini-Mental State Examination (MMSE) in the older HC and AD groups, and with the Montreal Cognitive Assessment (MOCA) in the AD group. The periventricular normalized ODI gradient was negatively associated with the MMSE in the older HC and CSVD groups, with the MOCA in the older HC and CSVD groups.

The normalized NDI-associated genes were identified according to the contribution of gene expression to the PLS first component (PLS1), which explained the 82.71%, 86.11%, 87.54%, 86.00%, and 90.08% variance ($p(\text{permutation}=5000) = 0.0188, 0.0072, 0.0032, 0.0046, 0.0016$) of the normalized NDI within the rings in the HC, AD, PD, CSVD, and MS groups, respectively. Finally, 119 NDI-PLS1- and 155 NDI-PLS1+ genes for the HC group, 239 NDI-PLS1- and 266 NDI-PLS1+ genes for the AD group, 252 NDI-PLS1- and 241 NDI-PLS1+ genes for the PD group, 256 NDI-PLS1- and 249 NDI-PLS1+ genes for the CSVD group, and 251 NDI-PLS1- and 244 NDI-PLS1+ genes for the MS group were identified.

The NDI-PLS1- genes were enriched in the AD and MS GWAS genes, and the NDI-PLS1+ genes were enriched in the AD and PD GWAS genes. Both the NDI-PLS1- and NDI-PLS1+ genes shared Gene Ontology and Kyoto Encyclopedia of Genes and Genomes pathways and Hallmark Gene Sets. The NDI-PLS1- genes involved common Gene Ontology biological processes (e.g., “response to oxygen levels”, “blood vessel morphogenesis”, “regulation of monocyte chemotaxis”, “positive regulation of cytokine production” and “response to interferon-beta”) and hallmark genes (e.g., “HALLMARK IL2 STAT5 SIGNALING”, “HALLMARK INTERFERON GAMMA RESPONSE”, “HALLMARK XENOBIOTIC METABOLISM” and “HALLMARK ADIPOGENESIS”). The NDI-PLS1+ genes involved common Gene Ontology biological processes (e.g., “regulation of ion transport”, “modulation of chemical synaptic transmission,” “regulation of signaling receptor activity”, “regulation of neuron projection development” and “negative regulation of neuron death”) and the Kyoto Encyclopedia of Genes and Genomes pathways (e.g., “synaptic vesicle cycle” and “neuroactive ligand-receptor interaction”). Both the NDI-PLS1- and NDI-PLS1+ genes were enriched in the up- or down-regulations of macrophage, T-cell, and B-cell. We observed that a majority of NDI-PLS1- genes were enriched in endothelial cells, while NDI-PLS1+ genes were enriched in neurons (including both excitatory neurons and inhibitory neurons). Replication of the periventricular gradient and its associated transcriptional signatures in normal aging and neurological diseases were obtained.

Conclusion

A periventricular gradient was observed in diffusion MRI measures with normal aging and in people with vascular and neurodegenerative neurological diseases. This raises the possibility of a shared mechanism, plausibly explained by a CSF-mediated factor affecting endothelial, synaptic, and immunologic functions.

PO-0085

A common brain network links aging and vulnerability to neurodegenerative diseases

Yuna Li, Zhizheng Zhuo, Yaou Liu
Beijing Tiantan Hospital, Capital Medical University

Background: Aging is also a primary risk factors for neurodegenerative diseases, but the neurobiological bases of the association between aging and neurodegenerative diseases at brain network level remain poorly understood.

Methods: We first constructed individual-level morphometric similarity networks in a large-scale, adult human lifespan populations ($n=3126$, aged 20-90 years old). Then we used independent component analysis (ICA) to split individual brain MSN into a set of network components, and model network component loading across the human lifespan to defining heterogeneous trajectories of age-related subnetwork. We further used spatial correlation to explore whether these age-related subnetworks can explain common or distinct network disruptions of various neurodegenerative disorders, including mild cognitive impairment (MCI, $n=70$), Alzheimer disease (AD, $n=335$), Parkinson disease (PD, $n=295$), cerebral small vessel disease (SVD, $n=161$) and multiple sclerosis (MS, $n=161$). The loading of each age-related network components was obtained on each neurodegenerative disorder by using spatial regression, and further correlated with the Mini-Mental State Examination (MMSE) score in each patient group. Finally, a comprehensive multimodal analysis combined with Neuromaps (<https://github.com/netneurolab/neuromaps>) was conducted to further uncover the multiscale biological drivers of each age-related subnetworks.

Result: The load of IC2 (age-related subnetwork2, dorsal attention network [DAN] integrate with sensorimotor network [SMN], while frontoparietal network [FPN] segregate with SMN) showed a negatively quadratic relationship with age (adjusted $R^2 = 0.16$, $p < 0.001$). The load of IC3 (age-related subnetwork3, DAN integrate with SMN, while the network segregation was less obvious) showed a negatively quadratic relationship with age (adjusted $R^2 = 0.12$, $p < 0.001$). The IC5 (age-related subnetwork5, default module network [DMN] integrate with DAN, while DAN segregate with SMN) showed a significant quadratic increase with increasing age (adjusted $R^2 = 0.16$, $p < 0.001$). The age-related subnetwork 5 was demonstrated heightened vulnerability to etiologically distinct clinical neurodegenerative disease, including MCI, AD, PD, SVD and MS ($r=0.36, 0.32, 0.58, 0.25$ and 0.32 , respectively, all $p < 0.001$). A comprehensive multimodal analysis combined with Neuromaps further uncover the distinct biological factors, such as regional T1/T2 ratio, gradient of functional connectivity, multiple neurotransmitters, glucose metabolism and cerebral blood flow, that driven the regional co-various pattern of age-related heterogeneous subnetworks.

Conclusion: We observed significant network organization of the human brain MSN across the lifespan, and highlight the age-related network vulnerability linked with the of neurodegeneration disorder at network level. Our finding provides an important understanding of the effect and risk of age on neurodegeneration disorder from a whole network perspective.

The Influence of Perivascular Spaces in the Basal Ganglia on Function Brain Activity in Parkinson's Disease

Xinhui Wang^{1,2}, Kaiyue Ding⁷, Yihang Zhou⁶, Yan Bai², Wei Wei², Yu Shen², Zhiping Guo^{4,5}, Meiyun Wang^{2,3}

1. Zhengzhou University People's Hospital

2. Department of Medical Imaging, Henan Provincial People's Hospital

3. Biomedical Research Institute, Henan Academy of Sciences

4. Health Management Center of Henan Province, People's Hospital of Zhengzhou University

5. FuWai Central China Cardiovascular Hospital, Zhengzhou, China

6. Department of Medical Imaging, Xinxiang Medical University People's Hospital

7. Department of Medical Imaging, Henan University People's Hospital

Objective

To investigate the association between enlarged perivascular spaces (EPVS) in the basal ganglia (BG) and function brain activity in Parkinson's disease (PD).

Methods

We recruited 46 patients with PD (mean age 61.76 ± 7.95 years, 15 female) who underwent brain magnetic resonance imaging (MRI), Movement Disorder Society Unified Parkinson's Disease Rating Scale (MDS-UPDRS) and Mini-Mental State Examination (MMSE). The number of BG-EPVS was counted on axial T2-weighted images. Then, patients were divided into 2 groups: a PD group with a low number (0–10) of EPVS (PD-EPVS–; $n = 26$) and a PD group with a high number (>10) of EPVS (PD-EPVS+; $n = 20$). The amplitude of low-frequency fluctuations (ALFF) acquired from resting-state functional MRI was used to analyze regional brain activity between PD-EPVS+ and PD-EPVS– groups. Spearson correlation analyses were conducted on the relationship between abnormal ALFF values and MDS-UPDRS-III and MMSE.

Results

In the PD-EPVS+ group, we found decreased ALFF in the Frontal_Sup_Medial_L and Cingulum_Mid_R. Which remained after Gaussian Random Field (GRF) correction at two-tailed voxel $p < 0.001$ and a clustering level of $p < 0.05$, was considered to be significant. There was a positive correlation between ALFF values in the Frontal_Sup_Medial_L and the MMSE score ($r=0.433$, $p<0.01$). However, abnormal brain areas did not correlate and the MDS-UPDRS-III.

Conclusion

BG-EPVS in PD patients may be associated with changes in brain neuron activity. This further explains that BG-EPVS may be a useful imaging marker for predicting cognitive decline in PD.

PO-0087

Imaging transcriptomics of brain functional alterations in multiple sclerosis and neuromyelitis optical spectrum disorder

Yuna Li, Jun Sun, Yaou Liu

Beijing Tiantan Hospital, Capital Medical University

Background: The underlying transcriptomic signatures driving brain functional alterations in multiple sclerosis (MS) and neuromyelitis optical spectrum disorder (NMOSD) still unclear.

Methods: Regional fractional amplitude of low-frequency fluctuation (fALFF) values were obtained and compared between 209 MS patients, 90 AQP4+ NMOSD patients, 49 AQP4– NMOSD patients and 228 healthy controls from a discovery cohort. We used partial least squares (PLS) regression to identify the gene transcriptomic signatures associated with disease-related fALFF alterations. The biological process and cell type specific signature of the identified PLS genes were explored

by enrichment analysis. The correlation between PLS genes and clinical variables was explored. A prospective independent cohort was used to validate the brain fALFF alterations and the repeatability of identified genes.

Results: MS, AQP4+ NMOSD and AQP4- NMOSD showed decreased fALFF in cognition-related regions and deep grey matter, while NMOSD (both AQP4+ and AQP4-) additionally demonstrated lower fALFF in the visual region. The overlapping PLS1- genes (negatively correlated with decreased fALFF) were enriched in response to regulation of the immune response in all diseases, and the PLS1- genes were specifically enriched in the epigenetics profile in MS, membrane disruption and cell adhesion in AQP4+ NMOSD, and leukocyte activation in AQP4- NMOSD. For the cell type transcriptional signature, microglia and astrocytes accounted for the decreased fALFF. The fALFF-associated PLS1- genes directly correlated with EDSS of MS and disease duration across disorders.

Conclusion: We revealed the functional activity alterations and their underlying shared and specific gene transcriptional signatures in MS, AQP4+ NMOSD, and AQP4- NMOSD.

Dynamic Changes in Automatic Generated Quantitative Biomarkers and Correlation with Pathology type of Alzheimer's Disease – A Longitudinal Study

Xiang FAN^{1,2}, Yuan CAI², Wanting LIU², Lin SHI², Vincent Mok²

1. 北京大学深圳医院

2. 香港中文大学

INTRODUCTION

Alzheimer's disease resemblance atrophy index (AD-RAI) is an MRI-based machine learning-derived composite index reflecting the multi-region atrophy severity of AD. We investigated the association between the serial change in AD-RAI and other conventional MRI biomarkers (i.e., hippocampal volume (HV), hippocampal fraction (HF), brain parenchymal volume (BPV), and fraction (BPF)) among cognitive unimpaired (CU) and mild cognitive impairment (MCI) subjects with and without A+T+ (i.e., A β + and Tau+).

METHODS

We selected subjects from ADNI and included those aged 55 to 90 years, diagnosed with CU and MCI at baseline, and matched T1W scans and CSF during 4-year follow-up. A total of 168 subjects, including 108 non-converters and 60 converters, were recruited in total. The following data were extracted for further analysis: AD-RAI, HV, HF, BPV and BPF. We used a linear mixed-effects model (LMM) in SPSS 26.0 to explore the serial changes of the imaging biomarkers and pathology-type interaction effects over time.

RESULTS

In either converters or non-converters, AD-RAI with A+T+ increased significantly faster than non-A+T+ over time ($P < 0.05$), while HV and HF with A+T+ decreased significantly faster than non-A+T+ over time ($P < 0.05$, respectively). BPF with A+T+ decreased significantly faster than non-A+T+ over time only in converters ($P = 0.041$) but not in non-converters ($P = 0.186$). BPV with A+T+ did not show any significant change than that with non-A+T+ in both converters ($P = 0.594$) and non-converters ($P = 0.647$).

CONCLUSIONS

AD-RAI of subjects with A+T+ increased significantly faster than non-A+T+ over time while HV and HF of subjects with A+T+ decreased significantly faster than non-A+T+ over time. AD-RAI, HV, and HF outperform whole-brain biomarkers in reflecting the changes with progressive AD pathology.

PO-0089

Application of SMS-RESOLVE DWI technology combined with artificial intelligence diagnostic system in acute cerebral infarction

Yan Huang, Wenqiang Xia, Le Lin, Yuan Zhang, Qiqing Liao
Hechi first people's Hospital

Objective: To evaluate the image quality and diagnostic efficacy of MR simultaneous multi-layer acquisition (SMS) high-definition diffusion imaging (RESOLVE) technology combined with artificial intelligence diagnostic system for acute cerebral infarction imaging.

Method: 104 patients with acute cerebral infarction were collected using the MAGNETOM Vida 3.0T MRI and a 20 channel head and neck combined phased array coil. Each patient was scanned with three diffusion sequences: conventional diffusion weighted imaging (DWI), RESOLVE DWI, and SMS-RESOLVE DWI. The patient is in a supine position, with the head in the first position, and the positioning center is aligned with the center of the eyebrow line and the center of the coil. Scanning range: Axial scanning from the skull base to the top of the skull. Two highly experienced radiologists used a double-blind method to assess acute cerebral infarction DWI ($b=1000\text{s/mm}^2$). Use the Likert scale subjective evaluation of the display of lesions by images includes the sharpness of anatomical structures, degree of image deformation, degree of magnetic sensitivity artifacts, and overall image quality. Two weeks later, scored again and observed the consistency of the scores. The research group was scored by the artificial intelligence diagnosis system. Finally, compare the observer rating with the artificial intelligence rating. The evaluation criteria are as follows: 1. poor image definition, i.e. great image distortion or motion artifact; 2 points refers to poor image definition, that is, distortion or motion artifacts are relatively serious; 3: medium image definition, i.e. medium distortion or motion artifact; 4 points: good image clarity, that is, slight distortion or motion artifacts; 5 points for excellent image clarity, i.e. no distortion or artifact. Objectively measure the signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR), signal-to-noise efficiency (SNRefficiency), minimum apparent diffusion coefficient (ADCmin), maximum apparent diffusion coefficient (ADCmax), and average apparent diffusion coefficient (ADCmean) of three types of DWI sequence images. Compare the subjective and objective evaluation differences of three DWI sequence images.

Results: In subjective evaluation, there was no significant difference between the diagnostic coincidence rates of the two observers and there was a strong consistency (Kappa value ≥ 0.75). Regardless of observer rating or artificial intelligence rating, the subjective image quality of SMS-RESOLVE DWI is superior to that of conventional DWI in all aspects and there is a statistical difference ($P < 0.05$). The subjective image quality of SMS-RESOLVE DWI and RESOLVE DWI is equivalent and there is no significant statistical difference ($P > 0.05$). In objective evaluation, for SNR and CNR, SMS-RESOLVE DWI was higher than conventional DWI and showed significant statistical differences. In artificial intelligence diagnostic system, there was no significant statistical difference between SMS-RESOLVE DWI and RESOLVE DWI ($P > 0.05$); There are significant statistical differences in SNRefficiency among the three technologies, with SMS-RESOLVE DWI having the highest SNRefficiency, RESOLVE DWI taking the second place, and conventional DWI having the lowest SNRefficiency. There was no significant difference in the ADCmin, ADCmax, and ADCmean of the three DWI sequences ($P > 0.05$). The image quality of SMS-RESOLVE DWI is better than that of conventional DWI. And the subjective image quality is equivalent to that of RESOLVE DWI under the condition of high SNRefficiency.

Conclusion: Acute cerebral infarction is a common disease with a high disability and mortality rate in China. Magnetic resonance DWI technology has a high diagnostic accuracy, but conventional DWI technology uses SS-EPI, which can cause magnetic sensitive artifacts, image blurring, deformation, and affect diagnostic efficiency. The RESOLVE DWI technology adopts a multiple excitation and segmented readout acquisition method, which can reduce image deformation and blurring caused by magnetic sensitivity, and display clear acute cerebral infarction lesions in the temporal lobe and near the skull base. SMS-RESOLVE DWI technology, on the basis of

RESOLVE DWI technology, uses multi-layer simultaneous acquisition technology, which can shorten the examination time without reducing image quality, improve the detection rate of subtle cerebral infarction lesions, and thus improve the diagnostic efficiency of AI. It is worth promoting in acute cerebral infarction imaging.

PO-0090

Application of perfusion weighted imaging technology combined with artificial intelligence diagnostic system in acute ischemic stroke

Yan Huang, Le Lin, Wenqiang Xia, Qiqing Liao, Yuan Zhang
Hechi First People's Hospital

Objective: To explore the image quality and diagnostic efficacy of perfusion weighted imaging technology combined with artificial intelligence diagnostic systems for acute ischemic stroke imaging.

Method: 104 patients with acute ischemic stroke were collected using the UNITED uMR780 3.0T MRI and a 24 channel head and neck combined phased array coil. The common scanning sequences include three-dimensional T1WI sequence scanning, T2 * WI sequence scanning, conventional diffusion weighted imaging (DWI) scanning, fluid attenuation inversion recovery sequence (FLAIR) scanning, and head and neck vascular imaging (MRA). 52 patients who underwent additional scanning that arterial blood proton spin labeling imaging (ASL) sequence scanning were selected as the observation group; 52 cases of dynamic magnetic sensitive contrast-enhanced perfusion imaging sequence (DSC) with conventional contrast agent injection were used as the control group. The images obtained from both groups were uploaded to the Fast-Stroke AI diagnostic system for analysis. Two senior radiologists used the double-blind method to subjectively score the pseudo color images processed by the two groups of sequence AI using the Likert scale, and observed whether the two groups of pseudo color images met the diagnostic requirements, and whether there were differences in image clarity, image distortion, and artifacts between the two groups. Two weeks later, scored again and observed the consistency of the scores. The evaluation criteria are as follows: 1. poor image definition, i.e. great image distortion or motion artifact; 2 points refers to poor image definition, that is, distortion or motion artifacts are relatively serious; 3: medium image definition, i.e. medium distortion or motion artifact; 4 points: good image clarity, that is, slight distortion or motion artifacts; 5 points for excellent image clarity, i.e. no distortion or artifact. Objective evaluation involves conducting inter group tests based on two sets of cerebral blood flow (CBF) parameters calculated by AI. SPSS statistical software was used to statistically analyze the data. The measurement data were expressed as mean \pm standard deviation, and t-test was used for comparison between groups; Kappa consistency test was performed on the subjective score results of two diagnostic physicians (kappa > 0.75 indicates good consistency, 0.4-0.75 indicates general consistency, and < 0.4 indicates poor consistency), with $P < 0.05$ as the difference with statistical significance.

Result: In subjective evaluation, the difference in scores between the two observers was not significant and there was strong to strong consistency (Kappa value ≥ 0.75). The subjective image quality of pseudo color images in ASL and DSC is equivalent and there is no significant statistical difference ($P > 0.05$). There was no significant statistical difference between the two groups of CBF parameters ($P > 0.05$).

Conclusion: Acute ischemic stroke is a common disease with high disability rate and case fatality rate rate in China at present. PWI technology has high diagnostic accuracy and can judge the existence of penumbra. The advantage of ASL sequence is not using contrast agents, but the early maturity of this technology is not high, and there is still a gap between it and DSC sequence comparison. Currently, ASL technology is developing rapidly, and AI diagnostic systems have good

diagnostic performance for both ASL and DSC sequences. The combination of the two is worth promoting in acute cerebral infarction imaging.

PO-0091

Structural and functional connectivity alteration patterns in different subregions of the cingulate gyrus in type 2 diabetes

Dongsheng Zhang¹, Yang Huang¹, shasha Liu¹, jie Gao¹, weirui Liu¹, wanting Liu¹, Kai Ai², Xiaoyan Lei¹, Xiaoling Zhang¹

1. Shaanxi Provincial People's Hospital

2. Philips Healthcare

Objective: We aimed to explore the characteristic changes in the cortical thickness and functional connectivity (FC) patterns of different subregions of the cingulate gyrus in type 2 diabetes mellitus (T2DM) patients without mild cognitive impairment to reveal both structural and functional aspects of the role of the cingulate gyrus in the early cognitive impairment in T2DM.

Materials and methods: Fifty-six patients with T2DM and 60 healthy controls (HCs) underwent a neuropsychological assessment and sagittal 3-dimensional T1-weighted and resting-state functional MRI. The differences in cingulate cortex thickness were compared between patients with T2DM and HCs. We defined nine subregions of the cingulate gyrus as regions of interest (ROIs) to examine the differences in FC between the ROIs and the whole brain in two groups. Correlation analysis was performed to examine the relationship between cortex thickness and FC and the patients' clinical/cognitive variables.

Results: The cortical thickness of the cingulate gyrus was not significantly different between T2DM patients and HCs. However, the T2DM patients showed significantly decreased FC between the pACC and the bilateral hippocampus, but had significantly increased FC between the pACC and bilateral lateral prefrontal cortex (LPFC) and left precentral gyrus. In addition, the T2DM group showed significantly lower FC between the RSC and right cerebellar Crus I. Moreover, the FC between the pACC and the left hippocampus was negatively correlated with the FC between the pACC and left lateral prefrontal cortex (LPFC) ($r = -0.306$, $P = 0.022$).

Conclusions: The pACC and the RSC show dysfunctional connectivity in multiple brain regions before the appearance of structural abnormalities in T2DM patients without MCI. Notably, our findings suggest that the abnormal FC of the pACC with the bilateral hippocampus and LPFC may involve a neural compensatory mechanism for memory function, which providing valuable information and new directions for possible interventions for the cognitive impairment associated with T2DM.

PO-0092

Intracranial granulomatous inflammation caused by cryptococcal infection: a case report and literature review

Xinru Deng, Xinlan Xiao

The Second Affiliated Hospital Of Nanchang University

Purpose: Intracranial cryptococcal granuloma is a rare manifestation of central nervous system infection and familiarity with its imaging manifestations is crucial given its lethality and tendency to be missed or misinterpreted on imaging. Previous studies have shown that cryptococcal infections leading to cryptococcal meningitis are common, while cryptococcal granuloma has been reported less frequently. This article reports a case of intracranial granulomatous inflammation due to

Cryptococcus infection in an immunocompetent adult at our institution along with a literature review describing salient clinical and imaging characteristics.

Method: We report a case of intracranial granulomatous inflammation due to cryptococcus infection in an immunocompetent adult at our institution, emphasizing the features of imaging diagnosis of cryptococcal granulomas and reviewing the relevant case reports and literature review.

Result: Cryptococcal granuloma with peripheral edema and leptomeningeal enhancement is a more characteristic manifestation of cryptococcal granulomatous inflammation, which commonly occurs in the basal ganglia and parietal ventricles.

Conclusion: In conclusion, the possibility of cryptococcal infection should be considered in patients presenting with central nervous system-related symptoms such as headache, fever, and unexplained intracranial infections, especially in those with impaired immune system function. MRI is crucial to carefully analyze imaging signs to avoid missed diagnosis of cryptococcal granulomas, which is a rare sign, and timely cryptococcal-specific testing will help diagnose the cause of disease at an early stage and improve patient prognosis.

PO-0093

The White Matter Integrity and Functional Connection Changes of Fornix (cres)/Stria Terminalis in Individuals with Mild Cognitive Impairment Induced by Occupational Aluminum Expose

Yangyang Li¹, Feifei Zhang², Yan Tan²

1. Shanxi Medical University

2. First Hospital of Shanxi Medical University

Aims: Long-term aluminum (Al) exposure increases the risk of mild cognitive impairment (MCI). The aim of present study was to investigate the neural mechanisms of Al-induced MCI.

Methods: Individuals with occupational Al exposure > 10 years were enrolled and divided into two groups: MCI (Al-MCI) and healthy controls (Al-HC). Plasma Al concentrations and Montreal Cognitive Assessment (MoCA) score were collected for all participants. And diffusion tensor imaging (DTI) and resting-state functional magnetic resonance imaging (rs-fMRI) were used to examine changes of white matter (WM) and functional connectivity (FC).

Results: There was a negative correlation between MoCA score and plasma Al concentration. Compared with the Al-HC, fractional anisotropy (FA) value for the right fornix (cres)/stria terminalis (FX/ST) was higher in the Al-MCI. Furthermore, MCI participants exhibited decrease FC between the right FX/ST and right temporal pole, and also between the right sagittal stratum (SS) and anterior cingulate and paracingulate gyri (ACG) and inferior frontal gyrus, orbital part (ORB_inf). An open-loop pathway was formed by these WM and cortical areas.

Conclusions: Long-term Al exposure affects WM integrity and FC in the right FX/ST, which are associated with cognitive. These alterations may serve as potential neuroimaging marker for early diagnosis of MCI.

PO-0094

Local-to-remote brain function alterations in patients with thyroid-associated ophthalmopathy: a resting-state fMRI study

Cui Yan, Mengsha Zou, Dide Wu, Yingqian Chen, Yanglei Cheng, Yufen Li, Shubin Hong, Zhiyun Yang, Hongzhang Zhu

The First Affiliated Hospital of Sun Yet-sen University

Objectives: To explore the brain activity alterations in both local and remote brain functional interactions in patients with thyroid-associated ophthalmopathy (TAO) using the method combining regional homogeneity (ReHo) and functional connectivity (FC) analysis.

Methods: We recruited 44 patients with TAO and 23 age- and sex-matched healthy controls. Resting-state functional magnetic resonance imaging (rs-fMRI) data were collected. The ReHo values of the whole brain voxels were first calculated and compared them between the two groups. The brain regions with different ReHo values were defined as regions of interest (ROI). The FC analysis was secondly conducted between ROIs and the whole brain. The correlations among ReHo, FC values and clinical parameters were analyzed.

Results: Compared with healthy controls, patients with TAO showed increased ReHo values in the left posterior cingulate gyrus (PCG) and decreased ReHo values in the right orbital part of the inferior frontal gyrus (ORBinf) and the right middle temporal gyrus (MTG). The ROI-based FC analysis showed significantly increased FC values between the left PCG and the left precuneus and between the left PCG and the right PCG. The ReHo values in the right MTG were positively correlated with the Hamilton Anxiety Rating Scale (HARS, $r = 0.45$, $p = 0.034$).

Conclusion: Patients with TAO exhibit significant brain dysfunction in local and remote brain functional connectivity in brain regions mainly related to cognitive function, suggesting a possible neuroimaging marker of neuropsychological disorder in TAO.

PO-0095

Correlation of bBrain iron deposition correlates withand freezing of gait in Pparkinson's disease: a cross-sectional study

Ying Yan¹, Zheng Wang¹, Wei Wei², Lingfei Guo³, Zhenchang Wang¹, Xuan Wei¹

1. Department of Radiology, Beijing Friendship Hospital, Capital Medical University

2. Division of Science and Technology, Beijing Friendship Hospital, Capital Medical University, Beijing

3. Department of Radiology, Shandong Provincial Hospital Affiliated to Shandong First Medical University

Background: Quantitative susceptibility mapping (QSM) is a novel imaging method for detecting iron content in the brain. The study aimed determine whether the iron deposition in the brains of people with Parkinson disease (PD) is correlated with freezing of gait (FOG).

Methods: We retrospectively collected the data of 24 patients with PD from the Movement Disorders Program and 36 healthy controls (HCs) from January 2021 to December 2021. Clinical assessments included mental intelligence scales, Parkinson rating scales, motor-related scales, and clinical gait assessments. All exercise scales and gait assessments were performed in the "ON" and "OFF" states. Magnetic resonance imaging (MRI) data were collected using 3-dimensional fast low-angle shot sequences. We chose the bilateral red nucleus, substantia nigra, thalamus, putamen, caudate nucleus, and globus pallidus as regions of interest for QSM analysis.

Results: The iron deposition in the substantia nigra of the PD group was significantly higher than that of the HC group ($P < 0.01$). In the PD group, the iron deposition in the substantia nigra of patients

with FOG was significantly higher than that in patients without FOG ($P=0.04$). The iron deposition in the substantia nigra was positively correlated with the New Freezing of Gait Questionnaire ($P=0.03$). The scores for depression and anxiety of the PD group were significantly higher than those of the HC group, while the Berg balance scale score was significantly lower ($P<0.01$).

Conclusions: The iron deposition in the substantia nigra of patients with PD is increased compared with that of controls and is associated with FOG. QSM can be used to detect brain iron deposition in patients with PD, which would help to explore the mechanism of abnormal neurobiological activity in FOG.

PO-0096

Cerebellar morphometric evaluation of motor subtypes of distinguishes between Parkinson's disease motor subtypes

Nengjin Zhu, Jing Zhao, Haishan Qiu, Wenting Zeng, Wenwen Zhou, Jianping Chu
the Department of Radiology, First Affiliated Hospital of Sun Yat-sen University, Guangzhou, China

Background and Purpose:

Morphometric MRI of Parkinson's disease (PD) with motor subtypes has demonstrated typical patterns of atrophy or volume loss in the supratentorial areas, but cerebellar morphometric alterations are still unknown. The present study aimed to assess cerebellar morphometric alterations between PD motor subtypes using voxel-based morphometry (VBM).

Materials and Methods:

Forty-nine PD patients (male:61.2%, mean age:60.04) and forty healthy controls (HCs) (male:55.0%, mean age:62.93) were prospectively recruited. All PD patients' movement disorders were evaluated by senior neurologists and were allocated to the tremor-dominant (TD) group ($n=17$) and postural instability and gait disorder-dominant (PIGD) group ($n=XX$). Twenty and thirty-two HCs with matched age and sex were assigned to TD and PIGD groups, respectively. A spatially unbiased atlas template of the cerebellum and brainstem (SUIT) based VBM was used to identify the cerebellar morphometric alterations among the above groups (TD vs HCs, PIGD vs HCs, and TD vs PIGD). The relationship between cerebellar morphometric alterations and clinical motor features was further analysed. All comparisons were set up applying $P < 0.001$ and an extent threshold (K) > 20 voxels.

Results:

Compared with HCs, TD subtype patients showed significantly decreased grey matter volume in the left lobules VIII. And patients with the PIGD subtype showed significantly decreased grey matter volume in bilateral lobule VIII. On the other side, in comparison with HCs, both PD motor subtypes with significantly increased grey matter volume of vermis IV and V; besides, the TD subtype showed significantly increased grey matter volume in the right lobule VI. However, there was no significant difference in the cerebellum in these two motor subtypes of PD patients. Further, irrespective of PD motor subtypes, a positive correlation was found in the right lobule Crus I and clinical features (H&Y stage).

Conclusion

Our findings highlight the involution of cerebellar morphometric alterations in the pathogenesis and heterogeneity of PD motor subtypes, which broaden the understanding of PD.

PO-0097

The Trends of Hippocampal Stratum Radiatum, Lacunosum, and Molecular Changes in the Alzheimer's Disease Continuum

Ke Wang², Kaicheng Li¹, Qingze Zeng¹, Chun Fang², Xiao Luo¹

1. 浙江大学医学院附属第二医院

2. 浙江省衢州市第二人民医院

Background:

Alzheimer's disease (AD) is the most common cause of neurodegenerative dementia, characterized by progressive memory and cognitive decline. Accumulation of neurofibrillary tangles (NFTs) within the medial temporal lobe, particularly in the hippocampus, is one of the early pathological hallmarks of AD. Hippocampal volume measurement from MRI is an established biomarker for AD, despite its lack of specificity and lower sensitivity compared to amyloid positron emission tomography (PET) or cerebrospinal fluid biomarkers. Given the widespread use of MRI, assessing hippocampal volume has clinical significance for early screening of AD patients. However, its sensitivity in detecting preclinical AD patients is limited, necessitating a more sensitive MRI-derived biomarker.

Method:

The hippocampus is a complex structure with specialized subregions interconnected with distinct histological features. Subregional volumetric quantification has shown higher sensitivity in capturing subtle atrophy patterns compared to whole hippocampal volume. Autopsy studies in AD reveal that amyloid and tau pathology initiates in the entorhinal cortex (ERC) and peri-olfactory cortex, followed by the CA1 subfield, radiatum, lacunosum, and molecular (SRLM), and eventually spreads to broader cortical regions. SRLM, containing dendrites and axon bundles parallel to the CA surface and mixed with the molecular layer of the dentate gyrus (DG), serves as a critical pathway with glutamatergic inputs from CA3 and ERC, as well as numerous GABA interneurons regulating hippocampal network dynamics. Thus, SRLM involvement in the connections between CA1, CA3/ERC, and between the hippocampus and broader cortical areas makes it a potential preclinical AD biomarker.

This study utilized 3T T1 and T2 MRI images. Whole hippocampal volume was quantified using Freesurfer software from T1 images, and a semi-quantitative scoring system assessed hippocampal volume. T2 images were employed to evaluate the integrity of the Stratum Radiatum, Lacunosum, and Molecular (SRLM). A validated rating scale assessed the clarity of the hypo-intense line representing SRLM.

Results:

The study sample was constructed within a biological AD framework based on amyloid PET, including 178 amyloid-negative (A-) healthy elderly controls, 91 amyloid-positive (A+) cognitively healthy elderly, 90 A+ mild cognitive impairment patients, and 14 A+ AD patients. No significant age differences were observed among groups. The primary findings showed significant differences in SRLM, hippocampal volume visual scores, and hippocampal volume across the four groups. Post hoc comparisons revealed that only SRLM could distinguish between NC A- and NC A+ ($p < 0.05$, corrected), while SRLM, hippocampal volume visual scores, and hippocampal volume could differentiate between NC A- and MCI A+ and NC A- and AD A+. Correlation analyses across all subjects demonstrated significant associations between SRLM, hippocampal volume visual scores, hippocampal volume, and MMSE scores, CDR total scores, and amyloid SUVR ($p < 0.001$), with SRLM showing the strongest correlation with amyloid SUVR ($r = -0.38$).

Conclusion:

This study suggests that SRLM may serve as an effective biological marker for AD, aiding in the early screening of preclinical AD patients. Its sensitivity and correlation with amyloid deposition make it a promising candidate for further research in the field of AD biomarker development.

PO-0098

Aberrant brain structural–functional connectivity coupling associated with cognitive dysfunction in different cerebral small vessel disease burden

Xinyue Zhang,Lingfei Guo,Changhu Liang,Na Wang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

BACKGROUND: Emerging evidence suggests that cerebral small vessel disease (CSVD) pathology changes brain structural connectivity and functional connectivity (FC) networks. Despite network-level SC and FC are closely coupled in healthy population, how SC-FC coupling and functional network changes correlated with neurocognitive outcomes in patients with different CSVD burdens remains largely unknown.

METHODS: Using multimodal MRI, we reconstruct whole-brain SC and FC networks for 54 patients with severe CSVD burden (CSVD-s), 106 patients with mild CSVD burden (CSVD-m) and 79 healthy controls. We then investigated the aberrant SC-FC coupling and functional network topology in CSVD and their correlations with cognitive dysfunction.

RESULTS: We found that compared with controls, CSVD-s patients exhibited significantly decreased whole-brain SC-FC coupling, and reduced modular SC-FC coupling, nodal efficiency of the bilateral amygdala and heschl gyrus within the auditory/motor and limbic/subcortical modules. Notably, for CSVD-s patients, whole-brain SC–FC coupling was positively correlated with MoCA and SDMT[h1] scores, and limbic/subcortical modular SC–FC coupling was negatively correlated with SCWT score, while global/local efficiency was positively correlated with AVLT score. For CSVD-m group, whole-brain and auditory/motor modular SC–FC couplings were positively correlated with SCWT and TMT scores, while global/local efficiency was positively correlated with AVLT and SDMT scores.

CONCLUSION: Our findings demonstrated that decreased whole-brain and module-dependent SC-FC couplings associated with reduced functional efficiency might underlie more severe burden and worse cognitive decline in CSVD patients. SC-FC coupling might provide a more sensitive neuroimaging biomarker of CSVD burden as well as new insights into the pathophysiologic mechanisms of the clinical development of CSVD.

PO-0099

Prognostic value of the baseline magnetic resonance score in patients with acute posterior circulation ischaemic stroke after mechanical thrombectomy

Shanshan Huang,Bofeng Bai,Yannan Wang,Cong Ning,Yongbin Li
Xi'an NO.1 Hospital

AIM:To investigate the prognostic value of the composite posterior circulation ASPECTS-Collaterals(pcASCO) score, which combines Diffusion-Weighted Imaging(DWI)- posterior circulation Acute Stroke Prognosis Early CT Score (pcASPECTS) and the Magnetic Resonance Angiography(MRA)-collateral circulation score, at baseline among patients with acute posterior circulation ischaemic stroke after mechanical thrombectomy.

MATERIALS&METHODS:Patients with acute posterior circulation ischaemic stroke who underwent mechanical thrombectomy were retrospectively analysed. The DWI-pcASPECTS and MRA-collateral circulation score before treatment and the modified Rankin Scale(mRS) at 90 days after treatment were used as the endpoints. An mRS≤2 was defined as a good prognosis, and an mRS≥3

was defined as a poor prognosis. Multivariate logistic regression was used to analyse independent predictors of functional outcome 90 days after mechanical thrombectomy.

RESULTS: Mechanical thrombectomy was performed in 57 patients; 38 patients had a good prognosis, 19 patients had a poor prognosis and 33 patients were successfully recanalized. Univariate logistic regression found that National Institute of Health Stroke Scale (NIHSS) score (OR: 1.18, $p < 0.001$), pcASPECTS (OR: 1.91, $p = 0.028$) and pcASCO score (OR: 0.51, $p = 0.001$) were factors of good functional outcome. Receiver operating characteristic curve (ROC curve) analysis showed that the diagnostic efficiency of the NIHSS and pcASCO was better (AUC= 0.88, 0.83, $p < 0.05$) than that of the pcASPECTS (AUC=0.65). The prediction model was established by age, NIHSS and pcASCO, and the diagnostic efficiency of the prediction model was better (AUC=0.94).

CONCLUSIONS: The composite MR-pcASCO score can be used as an important predictor of the prognosis of patients with acute posterior circulation ischaemic stroke after mechanical thrombectomy.

PO-0100

The visual pathway: a valuable biomarker of disease duration and cognitive function in amyotrophic lateral sclerosis

Yali Zhao, Yuan Yang, Jing Zhang

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives: To investigate the relationship between visual pathway and disease duration and cognitive function in patients with amyotrophic lateral sclerosis (ALS).

Methods: 31 ALS patients and 20 healthy controls were enrolled. Patients were categorized into the ALS-early and ALS-late groups according to disease duration. Edinburgh Cognitive and Behavioral ALS Screen (ECAS) was performed for all patients. Retinal nerve fiber layer (RNFL) thickness via optical coherence tomography (OCT), and fractional anisotropy (FA) and mean diffusivity (MD) of the optic nerve (ON), optic tract (OT), and optic radiation (OR) via diffusion tensor imaging (DTI) were compared between three groups. Associations between OCT or DTI parameters and clinical parameters were assessed by correlation analysis for patients.

Results: RNFL thickness was increased in ALS-early ($106.95 \pm 10.52 \mu\text{m}$, $P = 0.008$) but not in ALS-late ($102.67 \pm 11.70 \mu\text{m}$, $P = 0.510$) compared to controls ($98.23 \pm 14.41 \mu\text{m}$). FA and MD of ON were similar between three groups. OT-FA was decreased in both ALS-early (0.4784 ± 0.0508 , $P < 0.001$) and ALS-late (0.4785 ± 0.0572 , $P < 0.001$) compared to controls (0.5304 ± 0.0496). OR-MD was higher in ALS-late than controls ($0.9672[0.9417-1.0735]$ vs. $0.9241[0.8777-0.9810]$, $P = 0.027$). Executive domain of ECAS was negatively correlated with ON-FA ($r = -0.326$, $P = 0.010$) and positively correlated with ON-MD ($r = 0.353$, $P = 0.005$), OT-FA ($r = 0.269$, $P = 0.034$), and OR-FA ($r = 0.291$, $P = 0.022$).

Conclusions: Changes in the anterior and posterior visual pathway occurred in an earlier and later disease stage, respectively. DTI parameters of individual segments of the visual pathway were correlated with cognitive parameters, suggesting the mechanism of trans-synaptic degeneration in the cognitive dysfunction in ALS.

PO-0101

Temporal and topological properties of dynamic networks reflect disability in patients with neuromyelitis optica spectrum disorders

Yao Wang, Fuqing Zhou
The First Affiliated Hospital of Nanchang University

Background: Approximately 36% of patients with neuromyelitis optica spectrum disorders (NMOSD) suffered from severe visual and motor disability (blindness or light perception or unable to walk) with abnormalities of functional networks. However, it remains unclear how functional networks are related to clinical disability in patients with NMOSD. Therefore, our study aims to explore the static strength, time-varying and topological properties of large-scale functional networks and their association with disability in patients with NMOSD.

Methods: A total of 30 NMOSD patients (37.70 ± 11.99 years) and 45 healthy controls (HCs, 41.84 ± 11.23 years) were recruited. All subjects underwent functional MRI and disability assessments. We constructed resting-state functional networks for subjects and evaluated between-group differences in the static strength and network temporal and topological properties of networks using analysis of variance. We also assessed their association with disability severity with Spearman's correlation coefficients. A receiver operating characteristic (ROC) curve was also generated to investigate the efficacy of abnormal measures in diagnosing NMOSD.

Results: Compared to HCs, NMOSD patients showed significant alterations in dynamic networks rather than static networks. Three dynamic states were defined, and State 1 was characterized by overall hypoconnectivity within and between networks. NMOSD patients showed increased fractional times ($P < 0.001$) and dwell times in State 1 ($P < 0.001$) with fewer transitions ($P = 0.028$) than HCs, and increased fractional times ($r = 0.400$, $P = 0.029$), higher dwell times ($r = 0.461$, $P = 0.031$) and fewer transitions ($r = -0.383$, $P = 0.049$) were related to more severe disability. ROC curve analysis indicated that the increased fractional and dwell times in State 1 could significantly distinguish NMOSD patients from HCs (area under the curve: 0.991, 0.996). Moreover, NMOSD patients exhibited altered small-worldness, decreased degree centrality and reduced clustering coefficients for hub nodes in dynamic networks ($P < 0.05$, false discovery rate corrected). Decreased clustering coefficients for the bilateral precuneus ($r = -0.387$, $P = 0.046$) and thalamus ($r = 0.406$, $P = 0.036$) were related to clinical disability in NMOSD patients.

Conclusion: Increased fractional time, higher dwell times with fewer transitions in the hypoconnectivity state in dynamic networks were associated with increased disability in NMOSD patients.

PO-0102

The disruption of network hierarchy patterns in bulimia nervosa revealing the brain information integration disorder

Yiling Wang, Peng Zhang, Zhenchang Wang
Beijing Friendship Hospital

Background:

Previous studies have demonstrated abnormalities in several specific networks of bulimia nervosa (BN), but whether and how the network hierarchy changes in BN remain unknown. This study aims to investigate the BN network hierarchy pattern alteration and its clinical relevance.

Method:

Connectome gradient analyses were applied to depict the network hierarchy pattern of BN patients ($n = 59$) and healthy controls (HCs, $n = 39$). Then we evaluated the network- and voxel-level gradient alterations of BN by comparing the gradient values in each network and each voxel between BN and HC groups. The association between the altered gradient values and clinical variables was explored.

Result:

Compared to the HCs, BN patients exhibited reduced gradient values in the dorsal attention network and increased gradient values in the subcortical network in the principal gradient, and had decreased gradient values in the ventral attention network and increased gradient values in the limbic network in the secondary gradient. Regionally, the regions with altered principal or secondary gradient values in BN patients were mainly located in the transmodal networks. In BN group, the gradient values of right inferior frontal gyrus in the principal gradient were negatively associated with external eating behavior.

Conclusion:

This study revealed the disordered network hierarchy patterns of BN, which suggested a disturbance of brain information integration from attention network and subcortical network to transmodal network in BN patients. These findings may provide insight into the neurobiological underpinnings for BN.

PO-0103

Glymphatic system impairment in dysthyroid optic neuropathy: relation with cerebrospinal fluid circulation in the optic nerve and visual function

Yali Zhao, Jing Zhang

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To investigate the relationship between glymphatic system function in the brain and ocular cerebrospinal fluid circulation in patients with dysthyroid optic neuropathy (DON), and the correlation between glymphatic function and visual dysfunction.

Materials and Methods: The study included 35 patients with DON (age, 51.71 ± 9.56 years; 20 man), 32 TAO patients without DON (age, 47.41 ± 8.75 years; 15 man) and 30 healthy controls (HCs) (age, 48.87 ± 9.95 years; 16 man). The ALPS index is calculated by dividing the diffusion of water molecules along the perivascular space by the diffusion of free water molecules on DTI. The parameters of the optic nerve and its intrathecal cerebrospinal fluid circulation were also evaluated in all subjects. The relationship between the ALPS index and the parameters of cerebrospinal fluid circulation in the visual pathway and visual function was evaluated by correlation analysis.

Results: Both DON and thyroid-associated ophthalmopathy (TAO) without DON patients showed an overall lower diffusion along perivascular space (DTI-ALPS) index versus healthy controls and DON group was lower than TAO group (1.334 ± 0.168 vs 1.472 ± 0.157 vs 1.584 ± 0.217 , $P < 0.001$). In patients, lower diffusion along perivascular space index was associated with more enlarged optic nerve subarachnoid space ($r = -0.513, P < 0.001$), more swollen optic nerve ($r = -0.318, P = 0.009$) and more severe visual field defect ($r = 0.303, P = 0.023$).

Conclusion: The glymphatic system is impaired in TAO, especially in TAO with DON. Impaired glymphatic function was associated with measures of both swollen optic nerve and enlarged optic nerve subarachnoid space and reflects a more severe visual dysfunction. Glymphatic impairment may be a pathological mechanism underpinning TAO and DON. The dynamic interplay with other pathological substrates of the disease deserves further investigation.

PO-0104

The Impact of Magnetic Resonance-Guided Focused Ultrasound Thalamotomy on Gray and White Matter in Essential Tremor: A Neuroimaging Study

Haoxuan Lu, Xin Lou

Department of Radiology, First Medical Center of the Chinese PLA General Hospital

Objective: Magnetic resonance-guided focused ultrasound thalamotomy of the ventral intermediate nucleus (VIM-MRgFUS) is a minimally invasive neuromodulation technique for drug-refractory essential tremor (ET). This study aims to investigate the changes in brain gray matter volume and white matter integrity in ET patients after VIM-MRgFUS.

Methods: Thirty-five ET patients who underwent unilateral VIM-MRgFUS were included in this prospective study. Images were obtained before and at 1 day, 1 week, 1 month, 3 months, and 6 months after surgery. Gray matter volumes and white matter integrity were analyzed using longitudinal segmentation, voxel-level paired t-tests, and ROI-based DTI analysis. The tremor symptoms were assessed preoperatively and at 1 month and 6 months postoperatively using the Clinical Rating Scale for Tremor.

Results: Thirty-two patients completed the 6-month follow-up. Voxel-level paired t-tests revealed that gray matter volume in the left fusiform gyrus, left temporal transverse gyrus, and left thalamus decreased significantly at 6 months postoperatively (voxel level $P < 0.001$, cluster-level $P_{FWE} < 0.05$). Reduction in the left thalamus volume was correlated with the tremor improvement ($P < 0.05$). ROI-based DTI analysis showed that the fractional anisotropy (FA) of genu of corpus callosum (GCC), left posterior limb of the internal capsule (LPIC), left and right superior cerebellar peduncle decreased, while the mean diffusivity, lateral diffusivity and axial diffusion of multiple brain regions increased after treatment ($P < 0.05$). Among them, the white matter integrity indexes of the GCC and LPIC all changed significantly, and were correlated with the tremor scale score change rate ($P < 0.05$).

Conclusion: VIM-MRgFUS affects the gray matter volume in the thalamus and audiovisual-related brain regions and the white matter integrity of remote areas. The reduction in the left thalamus volume can be used as a neuroimaging index to assess clinical outcomes.

PO-0105

Feasibility of MUSE DTI in the differentiation of spinal cord injury severity in cervical spondylotic myelopathy

Haoyue Shao, Xiangyu Tang

Tongji Hospital Affiliated to Tongji Medical College of Huazhong University of Science and Technology

Objective: This study aimed to investigate the clinical diagnosis value of a novel protocol of MUSE-DTI in patients with cervical spondylotic myelopathy (CSM).

Methods: From August 2021 to March 2022, a total of 60 subjects (22-71 years) were enrolled, including 51 CSM patients and 9 healthy subjects. A 3.0T MR scanner (Sina Architect, GE Healthcare) performed the MUSE-DTI sequence on each subject. The cervical canal stenosis of subjects was classified from grade 0 to grade III according to the method of an MRI grading system. MD, FA, AD, and RD maps were generated by post-processing MUSE-DTI data on the GE workstation (ADW4.5, Functool 9.4.04b). Regions of interest (ROIs) were manually drawn at the C2 vertebral body level and C2/3-C6/7 intervertebral disc levels by covering the whole spinal cord. The clinical severity of myelopathy of subjects was assessed by the clinical Japanese Orthopedic Association scale (JOA).

Results: MUSE-DTI can acquire a high-resolution diffusion image compared to traditional DTI. FA values at MCL showed a decreasing trend from grade 0 to grade III, while the MD, AD, and RD values at MCL showed an overall increasing trend. Significant differences in MD, AD, and RD values were found between adjacent groups among grades I -III ($p<0.05$). At the C2 level, the AD values in CSM patients (grade I-III) were significantly lower than healthy controls (grade 0) ($P=0.019$). The clinical JOA score has a significant correlation with the MD ($P<0.001$), FA ($P=0.016$), AD ($P<0.001$), and RD ($P=0.001$) values at MCL.

Conclusion: MUSE-DTI displayed a better image quality compared to traditional DTI. MUSE-DTI parameters displayed a grade dependent trend. All the MUSE-DTI parameters at MCL were correlated with clinical JOA score. The AD values at C2 level can reflect the secondary damage of distal spinal cord. Therefore, MUSE-DTI could be a reliable biomarker for clinical auxiliary diagnosis of spinal cord injury severity in cervical spondylotic myelopathy.

PO-0106

Altered intersubject functional variability of brain white-matter in major depressive disorder and its association with gene expression profiles

Qun Gai, Tongpeng Chu, Ning Mao, Haizhu Xie
Yantai Yuhuangding Hospital affiliated to Qingdao University

Background: Major depressive disorder (MDD) is a heterogeneous disorder with remarkable intersubject variability in clinical presentations and neurobiological substrates. Although the altered intersubject variability in functional connectivity (IVFC) within gray-matter has been reported in MDD, the alterations to IVFC within white-matter (WM-IVFC) and the molecular mechanisms associated with these changes remain unknown.

Methods: Based on the resting-state functional MRI data of discovery [(145 MDD patients and 119 healthy controls (HCs)] and validation cohorts (54 MDD patients, and 78 HCs), we compared the WM-IVFC between the two groups. We further assessed the meta-analytic cognitive functions related to the alterations. The altered regional WM-IVFC was used to classify MDD patients and predict clinical symptoms in patients. In combination with the Allen Human Brain Atlas, transcriptome-neuroimaging association analyses were further conducted to investigate gene expression profiles associated with WM-IVFC alterations in MDD, followed by a set of gene functional characteristic analyses.

Results: We found extensive WM-IVFC alterations in MDD compared to HCs, which were associated with multiple behavioral domains, including visual and sensorimotor processes, as well as higher-order functions. For clinical applications, the altered regional WM-IVFC could not only effectively distinguish MDD patients from HCs with an area under curve ranging from 0.889 to 0.901 across three classifiers, but also significantly predict depression severity ($r = 0.575$, $p = 0.002$) and suicide risk ($r = 0.384$, $p = 0.040$) in patients. Furthermore, MDD-related WM-IVFC changes spatially correlated with the expression of 1004 genes, which were enriched for synapse, neuronal system, and ion channel, and predominantly expressed in excitatory and inhibitory neurons. Our results obtained good reproducibility in the validation cohort.

Conclusion: These findings revealed intersubject functional variability changes of brain WM in MDD and its linkage with gene expression profiles, providing potential implications for understanding the high clinical heterogeneity of MDD.

PO-0107

Value of Alberta Stroke Program Early CT Score on venous-phase CT in predicting the final infarct core and clinical outcome of the patients with acute ischemic stroke after endovascular thrombectomy

Zixin Yin, Guangchen Shen, Wenjing Ni, Gao Ma, Yue Chu, Shanshan Lu, Xiaoquan Xu, Feiyun Wu
The First Affiliated Hospital of Nanjing Medical University (Jiangsu Province Hospital)

Objectives: To assess the value of Alberta Stroke Program Early CT Score (ASPECTS) on non-contrast CT (NCCT), arterial-phase CT (APCT) or venous-phase CT (VPCT) in predicting the final infarct core (IC) on follow-up diffusion weighted imaging (DWI) and the clinical outcome of the patients with acute ischemic stroke (AIS) after endovascular thrombectomy (EVT).

Methods: A total of 120 patients with AIS who underwent EVT in our center were retrospectively enrolled. Correlations between NCCT-ASPECTS, APCT-ASPECTS, VPCT-ASPECTS and follow-up DWI-ASPECTS were analyzed using Spearman rank correlation coefficient. Mean differences and limit of agreement (LoA) between NCCT-ASPECTS, APCT-ASPECTS or VPCT-ASPECTS and follow-up DWI-ASPECTS were assessed using Bland-Altman plots and intra-class correlation coefficient (ICC). Multivariate logistic regression and receiver operating characteristic curve analyses were used to identify the independent predictors, and evaluate their performances in predicting the clinical outcome.

Results: VPCT-ASPECTS was significantly related to follow up DWI-ASPECTS ($r = 0.846$, $ICC = 0.837$). The mean difference between VPCT-ASPECTS and follow-up DWI-ASPECTS was 0.0 (LoA, -2.1 to 2.1). Enrolled in the stepwise logistic regression model, NIHSS scores at admission (NIHSSpre) (odds ratio [OR], 1.162; 95% CI, 1.063-1.270; $P = 0.001$) and VPCT-ASPECTS (OR, 0.728; 95% CI, 0.535-0.991; $P = 0.044$) were the independent predictors of clinical outcome. The combined model integrating NIHSSpre and VPCT-ASPECTS showed an excellent performance in predicting clinical outcome (AUC, 0.807; sensitivity, 75.0%; specificity, 72.3%).

Conclusions: VPCT-ASPECTS might be a promising imaging biomarker to predict the final IC and the clinical outcomes of the patients with AIS after EVT.

PO-0108

The value of 3D T2-weighted TSE sequences in the differential diagnosis for spinal arteriovenous fistula and acute transverse myelitis

Feng Ouyang, Xianjun Zeng, Qin Wu
First Affiliated Hospital of Nanchang University

OBJECTIVE: Spinal arteriovenous fistulas (SAVF) was often neglected and misdiagnosed as acute transverse myelitis (ATM) due to its insidious onset and non-specific clinical symptoms. This study aims to investigate the differential diagnostic value of high-resolution T2-weighted volumetric sequence (3D sampling perfection with application-optimized contrasts using different flip-angle evolutions [SPACE]) in patients with SAVF and ATM.

METHODS: Retrospectively analyzed the clinical and radiological findings of 32 SAVF patients and 32 ATM patients treated at our institutions from May 2018 to January 2023. They all underwent conventional spinal MRI and T2-SPACE examination, compared their performance in identifying lesions, to estimate the value of T2 SPACE sequence in the diagnosis of SAVF and ATM patients.

RESULTS: The clue of cauda equina area change (CEAC) in conventional MRI and T2-SPACE sequences is specific for the diagnosis of SAVF. The diagnostic model composed of perimedullary flow voids (PFV) and CEAC has good diagnostic performance (AUCMRI = 0.95; AUCSPACE = 0.935). Compared with conventional MRI, the T2-SPACE sequence has a higher detection rate, sensitivity, and negative predictive value for PFV and CEAC in SAVF patients, but lower specificity and positive predictive value. In T2 SPACE images, there are significant differences in the distribution range and quadrant, maximum diameter of the PFV vessels between SAVF and ATM patients. In addition, T2-SPACE sequence can determine the site of fistula in most SAVF patients preferably, and the inter-rater agreement was good in the assessment of the fistula.

CONCLUSION: The CEAC is a new and useful clue for the diagnosis of thoracolumbar SAVF. And T2-SPACE sequence can more intuitively observe the lesions of SAVF, has good differential diagnostic value for SAVF and ATM patients.

PO-0109

Changes in the corticospinal tract after acute and chronic attacks based on diffusion tensor imaging

Qingguo Ren, Xiangshui Meng
Qilu Hospital of Shandong University (Qing'dao)

Background: To investigate the changes in the corticospinal tract (CST) after respective attacks of intracerebral hemorrhage (ICH) and amyotrophic lateral sclerosis (ALS) using diffusion tensor imaging (DTI).

Material and methods: We prospectively enrolled patients with different stages of ICH and those with ALS, who visited our neurological department between January 2019 and December 2020, in addition to healthy adults, who were recruited from the community. All participants underwent examination with a series of brain magnetic resonance imaging protocols, including routine sequencing, three-dimensional T1, and DTI of the whole brain. The mean fractional anisotropy (FA) of the ipsilesional and contralesional sides, calculated using the atlas and tract-based spatial statistics (TBSS), was used independently for the analysis.

Results: This study enrolled 49 patients with corona radiata and/or basal ganglia hemorrhage, 46 age and sex-matched patients with ALS, and 41 healthy controls. The CST FA value of the ipsilesional side was lower in patients with ICH compared to those with ALS and the controls ($P < 0.05$). The CST FA value of the contralesional side was lower in patients with ICH than that in the controls ($P < 0.05$), but no statistically significant difference was observed between the ICH and ALS groups ($P > 0.05$). The CST, cingulum hippocampus, uncinate fasciculus of the contralesional side, and cingulate gyrus of the ipsilesional side recovered gradually at different periods during the course of ICH, while the FA value of the cingulum hippocampus of the ipsilesional side decreased gradually over time.

Conclusion: Injury to the CST on the ipsilesional side was more severe in ICH than that in ALS, but on the contralesional side similar changes were observed between ICH and ALS based on FA.

PO-0110

Classification of Major Depressive Disorder Based On Integrated Temporal and Spatial Variability Features of Dynamic Brain Network

Qun Gai, Tongpeng Chu, Ning Mao, Haizhu Xie
Yantai Yuhuangding Hospital affiliated to Qingdao University

Background: The dynamics of brain network has been a focus in the study of depression in recent years. However, most previous studies focused on single temporal dimension, while ignoring spatial dimensional information. The present study aimed to integrate temporal and spatial variability features of dynamic brain network for distinguishing patients with major depressive disorder (MDD) from healthy controls (HCs).

Methods: This multicenter study included a discovery cohort (119 MDD and 106 HCs) and a cross-site validation cohort (126 MDD and 124 HCs). The model integrating temporal and spatial variability features with separate feature selection method (MSFS) was proposed for MDD classification. The performance of the model was compared with the models using single temporal variability features (MTVF), single spatial variability features (MSVF), and integrated temporal and spatial variability features with the method of hybrid feature selection (MHFS). In addition, a linear regression model for assessing MDD symptom severity was established based on the integrated features.

Results: The optimal classification model, i.e., MSFS, achieved an accuracy of 0.933 and AUC of 0.946 in the discovery cohort, as well as the accuracy of 0.834 and AUC of 0.834 in the validation cohort. Moreover, the features with high discriminative power to distinguish MDD from HCs involved multiple widely concerned functional networks, particularly the visual and cognitive control networks. Additionally, we found that altered temporal and spatial variability could predict the severity of depression ($r = 0.640$, $p = 2.169 \times 10^{-6}$) and anxiety ($r = 0.616$, $p = 0.001$) in MDD.

Conclusion: Conclusion: Our study suggests that integrating temporal and spatial variability features can discriminate MDD from HCs with a high classification performance and that altered spatiotemporal dynamics may explain underlying neurobiological mechanism of MDD.

PO-0111

Automated Anterior Visual Pathway Segmentation in Magnetic Resonance Image by a Novel Convolutional Neural Network

Yongliang Han¹, haixiang Wang², Qi Luo¹, Yiqiu Wei¹, Yuhui Xu¹, Qiyuan Zhu¹, Shaoguo Cui², Yongmei Li¹

1. The first affiliated hospital of Chongqing Medical University

2. Chongqing Normal University

Background A wide variety of benign and malignant conditions may affect the anterior visual pathway (AVP) resulting in optic neuropathy. Accurate and robust segmentation of AVP has the capacity to play an important role in the differential diagnosis and severity assessment of these diseases.

Purpose To develop a reliable automated segmentation method for the anterior visual pathway by using a novel convolutional neural network.

Materials and Methods Adult patients with non-specific neurological symptoms who underwent 3.0T MRI were retrospectively included in this study from our hospital (inclusion period: January to September 2022). The anterior visual pathway was outlined as a reference for deep-learning segmentation training, optimization, and testing data. To address the limitation of traditional

convolutional networks in capturing global representations, we proposed a lightweight volumetric convolutional network called large and small network (LS-Net). The Dice similarity coefficient (DSC), Jaccard similarity index (Jac), precision, average symmetric surface distance (ASSD) and Hausdorff distance (HD) were used to evaluate the segmentation performance of U-Net model.

Results 161 adults (mean age, 44.99 years \pm 12.42 [SD]; 73 male) were included. In our dataset, the average DSC of LS-Net was higher than those of 3D UX-Net, Swin UNETR, and classic 3D U-Net (0.3%, 1.16%, and 3.31%, respectively). Our model has a parameter quantity of 54.71M, which is higher than that of TansBTS (32.99M) and 3D VNet (45.60M); however, the DSCs are higher (10.8% and 14.85%, respectively). This shows that LS-Net has good segmentation performance and a lower parameter quantity. We also observed that segmentation of the left and right optic nerves was relatively easy, and the chiasma and optic tracts were difficult because of their small volumes and complex surrounding anatomical structures.

Conclusion In this study we provide a novel lightweight volumetric convolutional network which having a small number of parameters, improving the accuracy of AVP segmentation than classic convolutional neural networks. This pipeline can be further used for lesion localization, differential diagnosis, and severity assessment of AVP related diseases.

PO-0112

Delineation of Target Volume for Radiotherapy of High-Grade Gliomas through Registration of Preoperative MR on Postoperative MR Images

Lichao Ma¹, Yujia Zhou², Qichao Zhang³, Liuji Guo¹, Haimei Cao¹, Hao Zhang¹, Qianjin Feng², Yuankui Wu¹

1. Nanfang Hospital, Southern Medical University

2. Department of Guangdong Provincial Key Laboratory of Medical Image Processing, Guangdong Province Engineering Laboratory for Medical Imaging and Diagnostic Technology, School of Biomedical Engineering, Southern Medical University, Guangzhou, P.R. China

3. Department of DongGuan Tungwah Hospital, DongGuan

Background: Accurate delineation of gross tumor volume (GTV) in high-grade glioma (HGG) radiotherapy is challenging. We proposed a novel nonlinear registration method for registering preoperative MR images onto postoperative MR images.

Methods: The preoperative and postoperative MR images of 96 HGG patients were included in this retrospective study. Three commonly used registration methods and our proposed method were used to register preoperative MR images on postoperative MR images. Target registration error and Dice score were calculated to select the optimal registration method. Three radiation oncologists outlined the GTV on the registered (with optimal registration method only) and unregistered images, respectively. The concordance index (CI) and coefficient of variance (COV) were calculated. The number of cases and number of slices of GTV including surgical complication lesions were calculated.

Results: Among these four registration approaches, our proposed method had the lowest target registration error (2.22 ± 0.47 mm) ($P < 0.01$) and the highest Dice score (69.89 ± 5.47 %) ($P < 0.05$). The COV for the registered images (12.03 ± 6.11 %) was smaller than that on the unregistered images (17.07 ± 15.54 %) ($P < 0.05$); the CI on the registered images (66.69 ± 8.64 %) was larger than that on the unregistered images (59.70 ± 13.81 %) ($P < 0.05$). The GTV delineated on registered images included less surgical complication lesions ($P < 0.05$).

Conclusions: Our proposed nonlinear registration method could improve the interobserver consistency and accuracy of GTV delineation for radiotherapy in HGG.

PO-0113

Expression of p53 Combined with Ki-67 in IDH-wildtype Glioblastomas: Prediction by Apparent Diffusion Coefficient Values

Bin Zhang, Junlin Zhou
Lanzhou University Second Hospital

Background: The presence of p53 mutations combined with high Ki-67 expression can predict poor prognosis and overall survival in IDH-wildtype glioblastoma patients. Here, we used magnetic resonance imaging (MRI) features and apparent diffusion coefficient (ADC) values to predict the expression of p53 and Ki-67 in IDH-wildtype glioblastomas to inform clinical treatment.

Methods: We retrospectively collected clinical and imaging data for 103 IDH-wildtype glioblastoma patients in our hospital between June 2021 and February 2023. The datasets were divided into four groups: p53(+)/Ki-67(+), p53(+)/Ki-67(-), p53(-)/Ki-67(+), and p53(-)/Ki-67(-) according to mutant status of p53 and expression level of Ki-67. Six MRI morphological features and four ADC values for the tumor parenchyma were analyzed.

Results: Of the 103 patients, 21 had p53(-)/Ki-67(-), 12 had p53(+)/Ki-67(-), 28 had p53(-)/Ki-67(+), and 42 had p53(+)/Ki-67(+). Tumor location showed statistically significant differences among the 4 groups ($P < 0.05$). ADC parameters were negatively correlated with p53 and Ki-67 expression status and could distinguish the co-expression of p53 and Ki-67 ($P < 0.05$). In distinguishing between the p53(+)/Ki-67(+) and p53(-)/Ki-67(-) groups, when ADC_{min} was $0.85 \times 10^{-3} \text{ mm}^2/\text{s}$, the sensitivity, specificity and accuracy reached their maximum values of 61.90%, 92.90% and 82.54%, respectively.

Conclusion: The expression of p53 and Ki-67 in IDH-wildtype glioblastoma can be evaluated by ADC values. ADC values can be used as a non-invasive quantitative parameter to assist in the clinical diagnosis of IDH-wildtype glioblastoma molecular states.

PO-0114

Diagnostic value of adenohipophyseal magnetic resonance imaging features in girls with precocious puberty

Dong Liu, wenzhen zhu
Tongji Hospital, Tongji Medical College, Huazhong University of Science & Technology

Background and Purpose

This study aimed to evaluate the diagnostic value of adenohipophyseal MRI features for precocious puberty (PP) in girls and also to establish a non-invasive diagnostic approach for easy implement in clinics.

Materials and Methods

A total of 126 girls (37, 57 and 32 girls clinically diagnosed as patients with central PP [CPP] and incomplete PP [IPP], and controls) were enrolled in this study. Data in the three groups were collected and analyzed using analysis of variance. Pearson correlation and stepwise multivariate linear regression analysis were used to examine the association and build prediction models. ROC analysis was used to evaluate the diagnostic efficacy.

Results

The values of adenohipophysis volume (aPV), adenohipophysis height (aPH), and signal-intensity-ratio (SIR), body height (Height), body weight (Weight) and seven laboratory testing characteristics were correlated closely with the activation status of the Hypothalamic-pituitary-

gonad axis in the different groups (all $P < 0.05$). Model 1 including aPV, Weight, and aPH and Model 2 including SIR, aPV, and Height were built to obtain predicted luteinizing hormone (LH) ($R^2 = 0.271$) and LH/FSH ($R^2 = 0.311$). ROC analysis showed the predicted LH, predicted LH/FSH, and aPV was the top three best predictors in distinguishing CPP group from controls (AUC=0.969, 0.949, and 0.938) while predicted LH/FSH was the best predictor in distinguishing CPP group from IPP and control group (AUC=0.829 and 0.828).

Conclusion

The main adenohypophyseal MRI features and the prediction models increase diagnosis efficiency for PP and offer a non-invasive and credible diagnostic method.

PO-0115

Predictive value of ADC histogram in preoperative peritumoral 2cm edema zone for spatial recurrence pattern of IDH wild-type glioblastoma

Linlan Zeng, Hanwei Wang, Shunan Wang
Daping Hospital Army Medical University

[Abstract] Objective To evaluate the predictive value of preoperative apparent diffusion coefficient (ADC) histogram analysis of the 2cm peritumoral edema zone for spatial recurrence pattern of IDH wild-type glioblastoma (GB). **Methods** Retrospective analysis was performed on 50 patients with IDH wild-type GB treated with standard protocol and diagnosed by pathology and confirmed as tumor recurrence by regular follow-up MRI in our hospital from January 2012 to December 2021. The postoperative spatial recurrence patterns were divided into local recurrence group ($n=28$) and non-local recurrence group ($n=22$) according to whether the distance between the recurrence foci and the operative cavity was more than 2cm. The ADC images corresponding to the maximum level of tumor MRI enhanced axial planes was selected, Mazda software was used to outline the region of interest along the edge of the 2cm range of peritumoral edema for histogram analysis. The histogram parameters of the two groups with different spatial recurrence patterns were statistically analyzed, and the area under the curve (AUC) was obtained by receiver operating characteristic curve to evaluate the diagnostic efficacy. **Results** Among the 50 recurrent GB patients, progression-free survival (PFS) and overall survival (OS) in local recurrence group were both longer than those in the non-local recurrence group (median PFS: 6.6 vs 4.6 months; median OS: 15.4 vs 12.4 months), and the differences were statistically significant (PFS: log-rank $\chi^2=4.325$, $P=0.038$; OS: log-rank $\chi^2=4.022$, $P=0.045$). Variance, Kurtosis and Perc.90% of the 9 feature parameters extracted from ADC histogram were statistically significant differences between the two groups ($P < 0.05$). Specifically, Variance had the best diagnostic efficiency, with AUC of 0.804, a sensitivity of 75.00%, and a specificity of 81.82%. Among the four logistic regression models constructed based on the statistically significant parameters, the model constructed with the combination of variance, kurtosis and perc.90% had the best diagnostic efficiency, with AUC of 0.878, diagnostic sensitivity of 78.57%, and specificity of 86.36%, respectively. **Conclusions** The preoperative ADC histogram of 2cm peritumoral edema zone can be used as an imaging marker to predict the different spatial patterns of postoperative recurrence in IDH wild-type GB.

PO-0116

Synergistic effects of cerebral small vessel disease and deep gray matter iron deposition on cognitive impairment in hypertension

Yu Su, Lixia Wang, Wenjun Wu, Chungao Li, Youzhi Wang, Tingting Liu

Huazhong University of Science and Technology Tongji Medical College First Clinical College: Wuhan Union Hospital

Purpose : Cerebral small vessel disease (CSVD) and deep gray matters (DGMs) iron deposition often occur together in hypertensive patients, and CSVD was thought to be related to cognitive impairment. However, whether CSVD and iron deposition synergistically deleteriously impact cognition in hypertension remains unclear. We aimed to investigate the associations between CSVD, iron deposition, and cognitive impairment and whether iron deposition may mediate the association between CSVD and cognitive impairment.

Materials and Methods: A total of 69 hypertensive patients and 31 healthy volunteers with age, gender, and education years matched were included. All subjects underwent a strategically acquired gradient echo (STAGE) protocol. The multi-echo data were used to reconstruct quantitative susceptibility mapping (QSM), and susceptibilities were used to describe iron content from both global and regional perspectives. Global region (RI) susceptibilities of DGMs were measured, and age-related thresholds were used to determine high-iron content region (RII) susceptibilities. The CSVD was evaluated by visual assessment scales including white matter hyperintensity (WMH), cerebral microbleed, recent small subcortical infarct/lacune of presumed vascular origin, perivascular space, and brain atrophy. Based on the Montreal Cognitive Assessment (MOCA) scores, all subjects were divided into three groups: hypertension with cognitive impairment (HTN-CI, n=38), hypertension without cognitive impairment (HTN-NCI, n=31), and healthy controls (HCs, n=31). The effects of CSVD, iron deposition, and cognitive impairment were evaluated using a multivariate linear regression model with a significance level of 0.05. Finally, the mediation model was used to investigate the role of iron deposition on the relationship between CSVD and cognitive impairment.

Results: The susceptibilities showed significant differences in bilateral caudate nucleus (CN), thalamus (TH), and putamen (PU) among the three groups for RI or RII analysis (all $p < 0.05$), and bilateral CN's susceptibilities in HTN-CI were significantly higher than HTN-NCI ($p < 0.05$). The susceptibilities of DGMs were positively correlated with WMH scores, and the susceptibilities of left CN and red nucleus (RN) were positively correlated with the iron burden of microbleeds (all $p < 0.05$). The results of multivariate linear regression analysis showed that paraventricular WMH, cerebral microbleed, and susceptibilities of left PU were the influencing factors of total MOCA scores; cerebral microbleed were negatively associated with visuospatial-executive and language scores; and iron burden of microbleed, susceptibilities of left CN and PU were negatively associated with delayed memory scores (all $p < 0.05$). The susceptibilities of left PU accounted for 19.41% and 17.40% of mediating effects on the relationships of paraventricular WMH and cerebral microbleed with total MoCA scores, respectively.

Conclusion : CSVD and iron deposition had a synergistic deleteriously effect on cognitive impairment in hypertensive patients, and iron deposition of DGMs may partly mediate the effects of CSVD on cognitive impairment.

PO-0117

Case evidence of functional connectivity-guided repetitive transcranial magnetic stimulation for refractory irritable bowel syndrome

Jie Li¹, Xiaofei Chen¹, Kuanghui Xu¹, Yihan Jin¹, Ruoyu Tang², Yufeng Zang²

1. Department of Radiology, the Affiliated Hospital of Hangzhou Normal University, Hangzhou

2. Hangzhou Normal University, Hangzhou

Background: Transcranial magnetic stimulation (TMS) on the dorsolateral prefrontal cortex (DLPFC) can effectively regulate brain-intestinal interaction, but its efficacy and mechanism in irritable bowel syndrome (IBS) remains unknown. Recently, functional connectivity (FC) of the pregenual anterior cingulate gyrus (pgACC) has been proposed to be used for individualized localization of DLPFC targets and as a predictor of TMS efficacy. We investigated the effects of pgACC-DLPFC FC-guided TMS on gastrointestinal and emotional symptoms, and brain function in patients with refractory IBS.

Methods: Four patients with refractory IBS who had not improved with conventional therapy were given 20 TMS sessions over a month. Based on the baseline resting-state fMRI data, the site of the DLPFC that displayed stronger negative FC with the pgACC was selected as the individualized TMS target. Patients underwent three clinical assessments and MRI scans (RS-fMRI and MRS) at baseline, during and after treatment. Rectal manometry was performed before and after treatment. **Results:** The pain, gastrointestinal symptoms and negative emotions of IBS patients were gradually relieved. There was also a marked improvement in visceral sensitivity. RS-fMRI showed that the amplitude of low-frequency fluctuation (ALFF), fractional ALFF (fALFF), and regional homogeneity (ReHo) values of pgACC decreased, the ALFF and fALFF values of left DLPFC increased, and the FC value of pgACC-DLPFC increased. In addition, MRS showed a gradual increase in NAA/Cr and a decrease in Cho/Cr in pgACC and left DLPFC.

Conclusion: pgACC-DLPFC FC-guided rTMS is effective in improving gastrointestinal and emotional symptoms in patients with refractory IBS. In addition, it may regulate local neuronal spontaneous activity and metabolism, and promote connectivity between frontal and limbic regions.

PO-0118

Neuropsychological Insights into Exercise Addiction: The Role of Brain Structure and Self-Efficacy in Middle-Older Individuals

Yingbo Shao, Feifei Zhang, Hui Zhang
First Hospital of Shanxi Medical University

Purpose: Exercise addiction (EXA) is a behavioral problem involving excessive exercise that can lead to structural brain changes and health problems. Concurrently, self-efficacy denotes an individual's capacity for exerting control their own conduct, and it may serve as a pivotal factor in molding an individual's exercise patterns. Hence, the objectives of this study encompass the investigation of atypical gray matter volume (GMV) among exercise addicts in the middle-older demographic, and to analyze the relationship between self-efficacy and physiological modifications alongside EXA.

Method: Structural magnetic resonance images and behavioral assessments were administered to the designated study population. Voxel-based morphological analysis was carried out using SPM12 software, and mediation analysis was employed to explore the potential neuropsychological mechanism of self-efficacy in relation to EXA.

Result: 133 patients with symptoms of EXA (male = 43, age 52.8611.78 years) were recruited. EXA were positively correlated with the GMV of right inferior temporal (ITG.R) and right hippocampus (HIP.R), and negatively correlated with the left Rolandic operculum (ROL.L). Self-efficacy has the potential to indirectly impact EXA by influencing the GMV of ITG.R, and it can also serve as a mediating variable in mediating the influence of the GMV of ITG.R on EXA.

Conclusion: This study elucidates the predictive significance of alterations in brain structure concerning EXA among middle-older adults, alongside the neurophysiological mechanism associated with self-efficacy in this context. This offers a robust scientific foundation for comprehending the intricacies of EXA and formulating intervention strategies aimed at enhancing the well-being of middle-older individuals.

PO-0119

Abnormal white matter along fibers by automated fiber quantification in patients undergoing hemodialysis

Huijuan Chen¹, Jie Qiu², Xiaoling Xu¹, Yihao Guo¹, Lili Fu¹, Qingqing Fu¹, Yanglei Wu³, Yonghui Qi⁴, Feng Chen¹

1. Department of Radiology, Hainan General Hospital

2. Department of Ultrasound, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University)

3. MR Collaboration, Siemens Healthineers Ltd.

4. Blood Purification Center, Hainan General Hospital

Background: Abnormal white matter has been reported in patients with end-stage renal disease (ESRD). However, few studies have investigated the relationship between specific damage segments and cognition in ESRD. This study aimed to delineate white matter alterations in ESRD and its relationship with cognition.

Methods: A total of 36 patients undergoing hemodialysis and 25 healthy controls underwent diffusion tensor imaging (DTI) and a series of neuropsychiatric tests. Automated fiber quantification was used to extract distinct DTI indices, and the relationship between the specific segment of the white matter and clinical properties was investigated. Furthermore, a support vector machine was applied to differentiate patients with ESRD from healthy controls.

Results: Fractional anisotropy values decreased in multiple fiber bundles, including bilateral thalamic radiata, cingulum cingulate, inferior fronto-occipital fasciculus (IFOF), uncinate, Callosum_Forceps_Major/Callosum_Forceps_Minor (CFMaj/CFMin), and left uncinate from the tract level in patients with ESRD. Specific damaged segments were detected in 8 fiber bundles, including bilateral thalamic radiation, cingulum cingulate, IFOF, CFMin, and left corticospinal tract. Few alterations in these fiber bundles were correlated with cognition impairment and hemoglobin levels. The tract profiles of the left thalamic radiata and left cingulum cingulate could be used to differentiate hemodialysis patients from healthy controls, with an accuracy of 76.9% and 67.6%, respectively.

Conclusions: This study revealed white matter damage in hemodialysis patients. This damage occurred in specific segments of the tract, especially in the left thalamic radiata and left cingulum cingulate, which might become a new biomarker for patients with ESRD and cognition impairment.

PO-0120

Altered whole-brain resting-state functional connectivity and brain network topology in typhoon-related post-traumatic stress disorder

Huijuan Chen¹, Jun Ke^{2,3}, Jie Qiu⁴, Qiang Xu², Yuan Zhong², Guangming Lu², Yanglei Wu⁵, Rongfeng Qi², Feng Chen¹

1. Department of Radiology, Hainan General Hospital

2. Department of Medical Imaging, Jinling Hospital, Medical School of Nanjing University

3. Department of Radiology, The First Affiliated Hospital of Soochow University

4. Department of Ultrasound, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University)

5. MR Collaboration, Siemens Healthineers Ltd.

Background: Altered resting-state functional connectivity has been found in patients with post-traumatic stress disorder (PTSD). However, the alteration of resting-state functional connectivity at whole-brain level in typhoon-traumatized individuals with PTSD remains largely unknown.

Objectives: To investigate changes in whole brain resting-state functional connectivity and brain network topology in typhoon-traumatized subjects with and without PTSD.

Design: Cross-sectional.

Methods: Twenty-seven patients with typhoon-related PTSD, 33 trauma-exposed controls (TEC), and 30 healthy controls (HC) underwent resting-state functional MRI scanning. The whole brain resting-state functional connectivity network was constructed based on the automated anatomical labeling atlas. The graph theory method was used to analyze the topological properties of the large-scale resting-state functional connectivity network. Whole-brain resting-state functional connectivity and the topological network property were compared by analyzing the variance.

Results: There was no significant difference in the area under the curve of γ , λ , σ , global efficiency, and local efficiency among the three groups. The PTSD group showed increased dorsal cingulate cortex (dACC) resting-state functional connectivity with the postcentral gyrus (PoCG) and paracentral lobe and increased nodal betweenness centrality in the precuneus relative to both control groups. Compared with the PTSD and HC groups, the TEC group showed increased resting-state functional connectivity between the hippocampus and PoCG and increased connectivity strength in the putamen. In addition, compared with the HC group, both the PTSD and TEC groups showed increased connectivity strength and nodal efficiency in the insula.

Conclusion: Aberrant resting-state functional connectivity and topology were found in all trauma-exposed individuals. These findings broaden our knowledge of the neuropathological mechanisms of PTSD.

PO-0121

Automated estimation of quantitative lesion water uptake as a prognostic biomarker for patients with ischemic stroke and large vessel occlusion

Shanshan Lu, Yuezhou Cao, Rongrong Wu, Feiyun Wu
The first affiliated hospital of Nanjing Medical University

Background and purpose: Net water uptake (NWU) is qualified as an imaging marker of brain edema. We aimed to investigate the ability of NWU as a predictor for the 90-day functional outcome in patients with acute ischemic stroke (AIS) and large vessel occlusion (LVO).

Materials and Methods: A total of 295 consecutive patients were retrospectively enrolled. Automated Alberta Stroke Program Early CT Score-based NWU (ASPECTS-NWU) was calculated on the admission CT. The relationship between ASPECTS-NWU and 90-day neurological outcome was assessed. The independent predictors of favorable outcome (modified Rankin Scale score \leq

2) were assessed using multivariate logistic regression analysis and ROC curves, and stratified by ASPECTS.

Results: Favorable 90-day outcomes were observed in 156 (52.9%) patients. ASPECTS-NWU (OR, 0.79; 95% CI, 0.70–0.90), National Institutes of Health Stroke Scale (NIHSS) scores (OR, 0.91; 95% CI, 0.87–0.96), age (OR, 0.96; 95% CI, 0.94–0.99), and vessel recanalization (OR, 7.78; 95% CI, 3.96–15.29) were independently associated with favorable outcomes at 90 days (all $p < 0.01$). A lower ASPECTS-NWU independently predicted a good prognosis, even in the subgroup of patients with low ASPECTS (≤ 5) ($p < 0.05$). An outcome prediction model based on these variables yielded an area under the ROC curve of 0.856 (95% CI, 0.814–0.899; sensitivity, 76.3%; specificity, 81.3%).

Conclusion: ASPECTS-NWU could independently predict 90-day neurological outcomes in patients with AIS and LVO. Integrating ASPECTS-NWU with clinical models could improve the efficiency of outcome stratification.

PO-0122

APOE4 aggravates self-propagating pattern of tau in brain

Panlong Li, Meiyun Wang
Henan Provincial People's Hospital

Background: The Apolipoprotein E type 4 allele (APOE4) is the strongest genetic risk factor for Alzheimer's disease (AD), which is associated with the intracellular neurofibrillary tangles consisting of abnormally phosphorylated tau protein. However, it is still unclear how tau spreads between regions and the effect of APOE4 on the propagating pattern. Purpose: The aim of this study is to evaluate the effect of APOE4 on tau propagation in brains of individuals with AD.

Methods: A total of 456 subjects including 226 health controls (HC), 166 mild cognitive impairment (MCI), and 64 AD from the Alzheimer's Disease Neuroimaging Initiative (ADNI) were included in this study. Regional standard uptake value ratios (SUVRs) were calculated from the preprocessed 18F-AV1451 PET images. An individual-level network analysis method was applied to the SUVRs matrix to evaluate the tau propagating between brain regions. The propagating pattern was verified by group differences analysis and longitudinal data analysis. The effect of APOE4 was evaluated by compare the group differences between APOE4 carriers and not carriers in the three groups. **Results:** Group differences in HC, MCI, and AD showed that the tau network characteristics including connectivity, nodal efficiency, and global efficiency show a decreasing trend for NC, MCI, and AD. The longitudinal results verified the tau network pattern. Further, the APOE4 carriers had decreased connectivity, nodal efficiency, and global efficiency compared to the not carriers in MCI and AD. **Conclusions:** The accumulation of tau was regional independent which suggested that the tau accumulation in each brain regions was self-propagating once tau aggregates had formed in discrete brain areas. The APOE4 could aggravate the self-propagating pattern.

PO-0123

Increased T2 value may suggest the normal-appearing corticospinal tract degeneration following stroke with multiple overlapping-echo detachment quantitative magnetic resonance technology

Yue Zhang¹, Xiao Wang¹, Zongye Li¹, Fei Wu¹, Ming Ye², Congbo Cai², Jianfeng Bao¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. Xiamen University

Background: Stroke patients commonly face challenges during clinical MRI examinations due to unconsciousness and involuntary movements. The study aims to address these challenges with a self-developed anti-motion, ultrafast, multiple overlapping-echo detachment (MOLED) quantitative magnetic resonance technology. Furthermore, with this technique, we seek to quantitatively detect potential damage of the corticospinal tract (CST) distal to the lesion following stroke, whose integrity is crucial for controlling random movements of the body and limbs.

Methods: A total of 79 patients with ischemic cerebral infarction underwent multimodal MRI, including MOLED. The MOLED technique's accuracy, reliability, and anti-motion were validated on phantoms and five healthy volunteers. Subsequently, we assessed motor dysfunction severity, ischaemic lesion volume, the T₂ values of CST, and the T₂ ratio (rT₂) between the ipsilesional and contralesional of the CST in patients. Motor dysfunction severity was assessed using the upper and lower limb motor function scores from the National Institutes of Health Stroke Scale (NIHSS).

Results: MOLED showed high accuracy ($P < 0.001$) and excellent repeatability, with a mean coefficient of variation of 1.11%, and accessed reliable quantitative results even under head movement: Mean_{diff}=0.28%, SD_{diff}=1.34%. Moreover, the T₂ value of the CST on the ipsilesional was significantly higher than the contralesional ($P < 0.001$), and a positive correlation was observed between rT₂ and the severity of motor dysfunction ($r_s = 0.575$, $P < 0.001$). Furthermore, rT₂ was able to predict post-stroke motor impairment, with the area under the curve (AUC) was 0.883.

Conclusions: The MOLED technique shows significant advantages for imaging in patients with involuntary movements. Additionally, the T₂ mapping detected alterations in the integrity of the CST, aiding in monitoring stroke-induced motor impairment.

PO-0124

High-resolution vessel wall imaging study of the correlation between intracranial atherosclerotic plaque remodelling patterns and diabetes mellitus

Yongqian Mo¹, Hanwen Zhang², Fan Lin²

1. ddd

2. 深圳市第二人民医院 (深圳大学第一附属医院)

Objective: To investigate the factors of intracranial atherosclerotic remodelling patterns and the relationship between intracranial atherosclerotic remodelling and diabetes mellitus using high-resolution vessel wall imaging (HR-VWI).

Methods: Ninety-four patients diagnosed with middle cerebral artery or basilar artery atherosclerosis were enrolled. Their basic clinical data were collected, and HR-VWI was performed. The vascular area at the plaque (VA MLN) and normal reference vessel (VA reference) were delineated and measured on image postprocessing software, and the reconstruction index (RI) was calculated. According to the value of the reconstruction index, the patients were divided into a

positive reconstruction group (PR group), intermediate remodelling group (IR group), negative reconstruction group (NR group), or positive reconstruction group (PR group) and nonpositive reconstruction group (N-PR group).

Results: There were statistically significant differences in the prevalence of diabetes and serum cholesterol levels among the PR group, IR group and NR group ($P < 0.05$). The prevalence of diabetes in the PR group was higher than that in the IR and NR groups, and the serum cholesterol level in the PR group was also higher than that in the IR and NR groups. There were significant differences in the prevalence of diabetes, triglycerides and cholesterol between the PR group and the N-PR group ($P < 0.05$). There were more diabetes patients in the PR group than in the N-PR group, and serum triglyceride and cholesterol levels were higher in the PR group than in the N-PR group. Logistic regression analysis showed that diabetes mellitus was an independent influencing factor in plaque-positive reconstruction.

Conclusion: HR-VWI can clearly show the morphology and signal characteristics of intracranial vascular walls and plaques. Intracranial atherosclerotic plaques in diabetic patients are more likely to show positive remodelling, suggesting poor plaque stability and a greater risk of stroke, and the results of this study provide a basis for ischaemic stroke prevention.

PO-0125

The axes among tobacco/alcohol, inflammation, and neuroimaging: a preliminary exploratory analysis

Longtao Yang, Chuxin Huang, Yanyao Du, Wenhan Yang, Fei Tang, Jun Liu
中南大学湘雅二医院放射科

Background: Tobacco and alcohol use are the most common addictive behaviors worldwide. Distinct modal metrics can reflect alterations in various aspects of addicts' brain characteristics via neuropsychiatric imaging. Nevertheless, the axes among inflammation, neural features, and nicotine/alcohol abuse are still unclear in humans.

Methods: In this study, genome-wide association studies of brain imaging-derived phenotypes including GMV, FA, and MD, substance use phenotypes, as well as inflammatory factors were analyzed by mendelian randomization method. Thus, we employed several MR techniques, such as weighted model, inverse variance weighting (IVW), MR-PRESSO, MR-Egger regression, and weighted median to investigate causal relationships among neuroimaging, addiction, and inflammatory phenotypes. Finally, mediation analyses were conducted.

Result: We revealed "cigarette per day—SDF-1A—cortical thickness of right cuneal cortex" and "IL-18—MD of left medial lemniscus—cigarette per day" pathways. In addition, after Bonferroni correction, there were forward relationships between age of initiation and default network SC [β : 0.0032, 95%CI (0.0016, 0.0048) PIVW = 0.0001], between cerebral global FC and smoking cessation [β : 25.4385, 95%CI (11.2399, 39.6371), PIVW=0.0004], as well as between MD of left medial lemniscus and cigarette per day [β : -0.0505, 95%CI (-0.0717, -0.0292), PIVW=3.1635 $\times 10^{-6}$], which will help the discovery of diagnostic or predictive makers and potential therapeutic targets.

Conclusion: Neuroimaging can reflect cognitive alterations and behavioral aberrance to some extent, and inflammation might take an important role in pathological processes as well as addiction initiation, which will help the discovery of diagnostic or predictive makers and potential therapeutic targets in addiction.

PO-0126

MRI radiomics for predicting intracranial progression in non-small cell lung cancer patients with brain metastases treated with epidermal growth factor receptor-tyrosine kinase inhibitors

Jiao Qu, Su Lui

Department of Radiology, West China Hospital, Sichuan University

Objective To identify clinical and MRI radiomics predictors specialized for intracranial progression (IP) after first-line epidermal growth factor receptor (EGFR)-tyrosine kinase inhibitor (TKI) treatment in non-small cell lung cancer (NSCLC) patients with brain metastases (BMs).

Methods Seventy EGFR-mutated NSCLC patients with a total of 212 BMs who received first-line EGFR-TKI therapy were enrolled. Radiomic features were extracted from the BM regions on the pretreatment contrast-enhanced T1-weighted images, and the radscore of each BM was established based on the selected features. Furthermore, the radscore_mean derived from the average radscore of all included BMs in each patient was calculated. Univariate and multivariate logistic regression analyses were performed to identify potential predictors of IP. Prediction models based on different predictors and their combinations were constructed, and nomogram based on the optimal prediction model was evaluated.

Results Thirty-three (47.1%) patients developed IP, and the remaining 37 (52.9%) patients were intracranial progression-free. EGFR-19del mutation (OR 0.19, 95% CI 0.05–0.69), third-generation TKI treatment (OR 0.33, 95% CI 0.16–0.67) and radscore_mean (OR 5.71, 95% CI 1.65–19.68) were found to be independent predictive factors. Models based on these 3 predictors alone and in combination (combined model) achieved AUCs of 0.64, 0.64, 0.74, and 0.86 and 0.64, 0.64, 0.75, and 0.84 in the training and validation sets, respectively, and the combined model demonstrated optimal performance for predicting IP.

Conclusion The model integrating EGFR-19del mutation, third-generation TKI treatment and radscore_mean had good predictive value for IP after EGFR-TKI treatment in NSCLC patients with BM.

PO-0127

Structural and functional MRI markers for cognitive impairment in neuromyelitis optica spectrum disorders

Xiaolu Xu¹, Xinli Wang², Xiran Liu³, Yunyun Duan¹, Zhizheng Zhuo¹, Ningnannan Zhang⁴, Fenglian Zheng¹, Decai Tian³, Xinghu Zhang³, Sven Hallar⁵, Chunshui Yu⁴, Frederik Barkhof⁶, Fudong Shi³, Yaou Liu¹

1. Beijing Tiantan Hospital

2. Department of Neurology, Tianjin Medical University General Hospital, Tianjin, China

3. Department of Neurology, Beijing Tiantan Hospital, Capital Medical University, Beijing, China

4. Department of Radiology, Tianjin Medical University General Hospital, Tianjin, China

5. Department of Imaging and Medical Informatics, University Hospitals of Geneva and Faculty of Medicine of the University of Geneva, Geneva, Switzerland

6. Queen Square Institute of Neurology and Center for Medical Image Computing, University College London, UK

Purpose

To identify the imaging markers of cognitive impairment (CI) in NMOSD using multimodal MRI.

Materials and Methods

101 NMOSD patients and 43 age- and gender-matched healthy controls (HC) were prospectively recruited between January 2015 and May 2019. All patients underwent comprehensive

neuropsychological assessments and multimodal MRI including T2/FLAIR, 3D-T1, diffusion images and resting-state functional MRI. Structural MRI measures including white matter (WM) lesion volume, WM integrity (fractional anisotropy, FA), gray matter volume (GMV), and functional MRI measure (amplitude of low-frequency fluctuation, ALFF) were compared between CI and cognitive preserved (CP) groups. Receiver operating characteristic curve and binary logistic regression model were performed to determine the power of clinical and MRI measures for predicting CI status.

Results

Thirty-four patients (33.7%) were classified as CI. Both CI and CP patients showed decreased FA, GMV, and functional abnormalities compared to HC. Compared to CP patients, the CI patients showed decreased FA in the anterior corpus callosum, decreased GMV in bilateral thalamus, parahippocampal gyrus, gyrus rectus and right middle temporal gyrus. While CP patients showed increased ALFF in bilateral inferior parietal lobule (IPL) and left superior parietal lobule, CI patients had decreased ALFF in the right IPL, compared to HC. A combination of structural and functional MRI measures alongside with education level and age exhibited fair to excellent discriminative power ($AUC > 0.8$) for the discrimination between CI and CP. Binary logistic regression analysis predicted CI including GMV in right middle temporal gyrus ($\beta = 11.92$, $P = 0.014$) and ALFF in right IPL ($\beta = -12.56$, $P = 0.002$).

Conclusion

CI developed as the structural damage in deep GM, frontal and temporal lobes progressed and functional adaption failed. GMV in right middle temporal gyrus and ALFF in right IPL are promising imaging markers for predicting CI in NMOSD.

PO-0128

Visualization of the clearance mechanism on glial lymphatic pathway under different amyloid protein load via 9. 4T MR

Xinyu Jiang, Yunyan Su, Chunhong Hu

Department of Radiology, The First Affiliated Hospital of Soochow University

Abstract

Purpose: In the research framework proposed by the National Institute on Aging and Alzheimer's Association in 2018, $A\beta$ was considered as a biomarker to determine whether a person belongs to Alzheimer's disease (AD) continuum. And the clearance of amyloid protein β and τ deposited in the brain can be achieved through the glial system. The glial system, also known as aquaporin 4 (AQP4), can promote the exchange of cerebrospinal fluid (CSF) and interstitial fluid (ISF), which can clear amyloid β and τ protein from brain of AD patients. That is to say, the glial system represents an exciting new target for AD.

Methods: After injecting Gd-DTPA into the cerebellomedullary cistern of APP/PS1 mice aged 2, 4, 6, and 8 months, the first dynamic enhanced MRI (DCE) image was collected at 9.4T at 30 minutes, and then collected at every 15 minutes until 150 minutes after injection. Immunofluorescence was used to verify the expression of AQP4.

Result: In APP/PS1 mice model, 4-6 months old is the preclinical stage of AD. In this model, we observed the change process of CSF-ISF exchange rate from enhancement to damage, and AQP4 from polarization to depolarization. Interestingly, during the 4-6-month-old stage, the deposition rate of amyloid protein is the slowest, corresponding to the strongest exchange rate of CSF-ISF at 6 months old. Excitingly, we found for the first time in the APP/PS1 mice model that the damage to the ophthalmic lymphatic system occurs earlier than that of the cerebral lymphatic system. Subsequently, we used the new AQP4 inhibitor TGN-020 to demonstrate significantly impaired glial lymph CSF-ISF exchange.

Conclusion: The amount of amyloid protein deposition in APP / PS1 mice at 4-6 months of age may better activate this clearance pathway. For the first time, we found that the eye lymphatic system was damaged earlier than the brain lymphatic system in the APP / PS1 mice, and AQP4 plays an important role in the lymphatic clearance system. Therefore, it is speculated that this system can be used as a target for understanding and treating AD.

PO-0129

The relationship between rest tremor and fiber organization in Parkinson's disease and Essential tremor

Xiaojie Duanmu, Xiaojun Guan, Xiaojun Xu
The Second Affiliated Hospital, Zhejiang University School of Medicine

Background:

Rest tremor is a common movement disorder that can appear in many diseases, such as Parkinson's disease (PD), and essential tremor (ET). It is worth noting that, rest tremor is usually associated with slower progression in PD, whereas it is often associated with more severe progression in ET. However, the underlying white matter organization of rest tremor behind PD and ET remains unclear.

Methods:

This study included 57 ET (40 without rest tremor (ETWR), 17 with rest tremor (ETRT)) patients, 68 PD patients (34 without rest tremor (PDWR), 34 with rest tremor (PDRT)), and 62 normal controls (NC). We used fixel-based analysis (FBA) to evaluate the structural changes of white matter (WM) fiber in rest tremor in these different diseases.

Results:

The fiber-bundle cross-section (FC) of right non-decussating dentato-rubro-thalamic tract (nd-DRTT) and many other fibers outside the DRT pathway in ETWR were significantly higher than that in NC (false discovery rate (FDR) corrected: $P_{\text{left CGH}} = 0.016$, $P_{\text{left IFO}} = 0.024$, $P_{\text{left ILF}} = 0.016$, $P_{\text{left UNC}} = 0.024$, $P_{\text{right CGC}} = 0.016$, $P_{\text{right IFO}} = 0.024$, $P_{\text{right ILF}} = 0.024$, $P_{\text{right nd-DRTT}} = 0.027$). The fiber density and cross-section of left nigro-pallidal (SN-GP) in PDWR is significantly lower than that of NC (FDR corrected: $P = 0.048$), while the FC of bilateral SN-GP in PDRT is significantly lower than that of NC (FDR corrected: $P_{\text{left SN-GP}} < 0.001$, $P_{\text{right SN-GP}} < 0.001$). No significant difference in tract-of-interest fixel metrics between NC vs ETRT, PDWR vs PDRT, and ETWR vs ETRT.

Conclusion:

ET patients with single action tremor showed over-activation of fiber organization, but that is not the case in the patients with rest tremor, which may suggest the invisible damage of structural compensation when rest tremor appears. Except for the SN-GP that is degenerated in both PD, PD patients with rest tremor will not have worse fiber organization, that may indicate the benign behavior of rest tremor in PD. These findings provide new insight of differential influences of rest tremor on brain fiber architecture in ET and PD.

PO-0130

Association of abnormal segment in uncinate fasciculus with cognitive deficit in first-episode, treatment-naïve young adults with major depressive disorder

Meiting Ban,Xueling Zhu,Jincheng He,Yuegui Cao
Xiangya Hospital, Central South University

Background: Cumulative evidence has consistently shown that white matter (WM) disruption is associated with cognitive decline in geriatric depression. However, studies investigating the association between these disturbances and cognitive deficit in untreated young adults with major depressive disorder (MDD) are sparse.

Method: Diffusion tensor images were performed on 60 first-episode, treatment-naïve young adult patients with MDD and 54 matched healthy controls (HCs). Automated fiber quantification was applied to calculate the tract profiles of fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD), and radial diffusivity (RD) to evaluate the WM microstructural organization. Pearson correlation analysis was performed to find the associations between the diffusion properties and cognitive performance.

Results: Compared with HCs, patients with MDD exhibited predominantly different diffusion properties in bilateral uncinate fasciculus (UF), corticospinal tracts (CSTs), left superior longitudinal fasciculus (SLF), anterior thalamic radiation (ATR). The FA of right UF was positively correlated with working memory. The MD of left UF was negatively correlated with working memory and positively correlated with the symptom severity. Additionally, a positive correlation between the MD of left CST and psychomotor speed was observed.

Conclusions: Our findings provided evidence of alterations in specific segments of brain WM tracts in first-episode, treatment-naïve young adults with MDD, which were associated with cognitive deficit.

PO-0131

Influence of different scanning conditions of CTP combined with deep learning image reconstruction algorithms on image quality and perfusion parameters

Limin Lei,Yuhan Zhou,Jinping Ma,Zhihao Wang,Weimeng Cao,Songwei Yue
The First Affiliated Hospital of Zhengzhou University

Purpose: To evaluate the performance of deep learning image reconstruction (DLIR) algorithm in conjunction with lower tube current or lower tube voltage in whole brain CT perfusion (CTP) examination under reduced radiation dose.

Methods: 45 patients (age 60.04 ± 13.46 years, Group1) in this study underwent CTP examination at 80 kV and 150mA; 47 patients (age 62.85 ± 13.47 years, Group2) underwent CTP examination at 80 kV and 100mA; and 20 patients (age 59.21 ± 12.64 years, Group3) with CTP at 70 kV and 150mA. CTP datasets were reconstructed using FBP, ASIR-V40%, ASIR-V80%, and DLIR at medium and high levels (DLIR-M, H) for Group1(Group A-F) and ASIR-V80% and DLIR-H for Groups 2(Group G-H) and 3(Group I-J). Objective parameters such as CT values, image noise, signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR) of frontal, temporal, and parietal lobes were compared. Two radiologists subjectively evaluated perfusion pseudo-color images (CBF, CBV, Tmax, MTT, and TTP) according to Abels' scoring system. Additionally, corresponding perfusion parameters were measured and compared.

Results: The radiation doses of the three CTP scanning protocols in Groups 1, 2, and 3 were 5.70mSv, 3.81mSv, and 3.83 mSv, respectively. Within Group 1, as the reconstruction strength of ASIR-V and DLIR increased, image noise decreased, SNR and CNR increased. The trend in gray matter(GM) and white matter(WM) was consistent, but the improvement in WM was more significant. Group F had the highest SNR and CNR. Groups F, E, and C generated higher subjective scores. Different reconstruction algorithms did not affect the five perfusion parameters. Within Groups 2 and 3, the DLIR-H images showed lower SD values than ASIR-V80%, with higher SNR and CNR in WM ($P<0.05$ for Group G vs. H, Group I vs. J); there was no significant difference in GM; the subjective scores of DLIR-H images were higher than those of ASIR-V80% ($P<0.05$ for Group G vs. H, Group I vs. J). The objective and subjective image quality of DLIR-H images in Groups 2 and 3 were comparable to those of the ASIR-V80% group in Group 1 ($P>0.05$ for Group C vs. H vs. J). Groups G, I, and J showed significant differences in perfusion parameters compared to other groups, especially in decreased MTT and increased CBF values in the white matter region. The changes in Groups I and J were more significant among these three groups.

Conclusions: Low tube current scanning with the DLIR-H algorithm improves image quality without compromising perfusion parameter accuracy, but reducing tube voltage to 70kV lowers accuracy, especially for MTT and CBF. A larger sample size is needed for further study.

PO-0132

Value of whole-lesion histogram analysis of ADC and ASL in predicting the response to chemotherapy and prognosis of PCNSL

Nan Zhang

Department of Radiology, The First Medical Center, Chinese PLA General Hospital, Beijing, China

Objective: To predict the response to methotrexate (MTX) chemotherapy and overall survival (OS) in primary central nervous system lymphoma (PCNSL) patient by the histogram parameters based on apparent diffusion coefficient (ADC) and arterial spin labelin (ASL)

Method: Thirty-six PCNSL patients treated with combined MTX-based chemotherapy regimens were retrospectively involved in this study. The patients were divided into response group and no-response group. The differences in Histogram parameters, including maximum, minimum, mean and the 5th, 10th, 25th, 50th, 75th 90th, and 95th percentiles of ADC and CBF images were analyzed between the two groups. The univariate and multivariate logistic regressions were performed to identify the independent predictors for MTX chemosensitivity. The predictive performance was assessed by the receiver operating characteristic (ROC). The Kaplan-Meier analysis and Cox regression were used to analyse the OS.

Results: The proportion of patients with age >60 and multiple lesions in no-response group was significantly higher than response group ($p<0.05$). ADCmax, ADCmean, ADC5-50 percentiles, CBFmax, CBFmean and CBF5-95 percentiles in response group were significantly higher than non-R patients (all $p<0.05$). Number of lesions (NL), ADCmax and CBF95 were independent predictive factors of chemotherapy response (all $p<0.05$) with the area under the ROC curve (AUC) of 0.741, 0.788 and 0.856 respectively. The combine model of ADCmax+CBF95+NL showed the best predictive performance with AUC of 0.963. The patients with CBF95 <57.98 ($\chi^2=4.460$, $p=0.035$) and multiple lesions ($\chi^2=6.396$, $p=0.011$) have significantly shorter OS. Multivariate Cox regression showed multiple lesions (HR, 3.796; 95%CI, 1.024-14.073; $p=0.046$) was an independent risk factor for poor OS.

Conclusion: ADC and CBF values are promising predictive factors of chemotherapy response and outcome in PCNSL patients .

PO-0133

Increased brain iron deposition in medication-overuse headache with quantitative susceptibility mapping

Xin Li^{1,2}, Zhiye Chen^{1,2}

1. Hainan Hospital of PLA General Hospital

2. The Second School of Clinical Medicine, Southern Medical University

Objective: To utilize quantitative susceptibility mapping (QSM), a pilot voxel-based technique, to estimate the iron accumulation level over the whole brain and reveal the possible neuromechanism of medication-overuse headache (MOH).

Methods: Thirty-seven MOH patients and 27 normal controls were enrolled in the study, and received both a multi-echo gradient echo MR sequence and a brain high resolution structural imaging. A voxel-based analysis was performed to detect the brain regions with altered iron deposition, and the quantitative susceptibility mapping value of the positive brain regions was extracted. The correlation analysis was calculated between the susceptibility value and the clinical variables.

Results: The brain regions with increased susceptibility value were located in bilateral substantia nigra (SN) (MNI coordinate: 8, -18, -14; -6, -16, -14) compared with NC (P value < 0.001), while the altered iron deposition had no significant correlation with clinical variables (P value > 0.05). The area under curve (AUC) of left SN was 0.734 and the cut-off value was set as 0.077 with sensitivity 72.97% and specificity 70.37%. Right SN presented an AUC of 0.699 and cut-off value was 0.084 with sensitivity 72.97% and specificity 62.96%.

Conclusion: The increased iron deposition could be observed on bilateral SN in MOH, which might provide a novel insight on the dysfunction mechanism of the mesocorticolimbic dopamine system in MOH, but needed further investigated. QSM technique could be considered as a non-invasive quantitative and effective tool to detect the brain iron deposition level in migraine neuroimaging.

PO-0134

Altered static and dynamic intrinsic brain activity in unilateral sudden sensorineural hearing loss

Jing Li, Xin Li

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Introduction: Sudden sensorineural hearing loss (SSHL) is a critical otologic emergency characterized by a rapid decline of at least 30 dB across three consecutive frequencies in the pure-tone audiogram within a 72-hour period. This audiological condition has been associated with alterations in brain cortical and subcortical structures, as well as changes in brain functional activities involving multiple networks. However, the extent of cerebral intrinsic brain activity disruption in SSHL remains poorly understood. The aimed of this study is to investigate intrinsic brain activity alterations in SSHL using static and dynamic fractional amplitude of low-frequency fluctuation (fALFF) analysis. **Methods:** Resting-state functional magnetic resonance imaging (fMRI) data were acquired from a cohort of SSHL patients (unilateral, $n = 102$) and healthy controls ($n = 73$). Static and dynamic fALFF methods were employed to analyze the acquired fMRI data, enabling a comprehensive examination of intrinsic brain activity changes in SSHL. **Results:** Our analysis revealed significant differences in static fALFF patterns between SSHL patients and healthy controls. SSHL patients exhibited decreased fALFF in the left fusiform gyrus, left precentral gyrus, and right inferior frontal gyrus, alongside increased fALFF in the left inferior frontal gyrus, left superior frontal gyrus, and right middle temporal gyrus. Additionally, dynamic fALFF analysis demonstrated elevated fALFF in the right superior frontal gyrus and right middle frontal gyrus among SSHL patients. Intriguingly, we observed a positive correlation between static fALFF in the left fusiform gyrus and the duration of hearing loss, shedding light on potential temporal dynamics

associated with intrinsic brain activity changes. Discussion: The observed disruptions in intrinsic brain activity and temporal dynamics among SSHL patients provide valuable insights into the functional reorganization and potential compensatory mechanisms linked to hearing loss. These findings underscore the importance of understanding the underlying neural alterations in SSHL, which could pave the way for the development of targeted interventions and rehabilitation strategies aimed at optimizing SSHL management.

PO-0135

Multilayer network analysis reveals instability of brain dynamics in untreated first-episode schizophrenia

Ziyang Gao^{1,2,3}, Yuan Xiao^{1,2,3}, Fei Zhu^{1,2,3}, Bo Tao^{1,2,3}, Wei Yu^{1,2,3}, Su Luj^{1,2,3}

1. Department of Radiology, and Functional and Molecular Imaging key Laboratory of Sichuan Province, West China Hospital of Sichuan University

2. Huaxi MR Research Center (HMRRC), West China Hospital of Sichuan University

3. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences

Aims: Although aberrant static functional brain network activity has been reported in schizophrenia, as have effects of antipsychotic exposure on static brain network function, little is known about how the dynamics of neural function are altered in first-episode schizophrenia and are modulated by antipsychotic treatment. This study aims to investigate the dynamic reconfiguration of the brain connectome in schizophrenia patients and the effects of one year of antipsychotic treatment on neural dynamics.

Method: We recruited 122 first-episode drug-naïve schizophrenia patients and 128 healthy controls (HCs) to obtain the baseline resting-state functional magnetic resonance imaging data, and 44 patients were rescanned after one-year of antipsychotic treatment. To characterize the dynamic topological configuration of the brain connectome, we applied multilayer network analysis to calculate the network switching rates between brain states. We compared switching rates of patients and HCs at baseline, and tested for changes after one-year of treatment.

Study Results: We detected significantly increased network switching rates in schizophrenia patients compared with HCs at baseline. This effect was observed mainly in the sensorimotor (SMN) and dorsal attention networks (DAN), and in temporal and parietal regions at the nodal level. Switching rates were reduced after one-year of antipsychotic treatment at the global level and in DAN. Switching rates at baseline at the global level and in the inferior parietal lobule were correlated with the treatment-related reduction of negative symptoms.

Conclusions: These findings suggest that instability of functional network activity plays an important role in the pathophysiology of acute psychosis in early-stage schizophrenia. The normalization of network stability after antipsychotic medication suggests that this effect may represent a systems-level mechanism for their therapeutic efficacy.

PO-0136

Static and Dynamic Functional Connectome Alterations in Drug-naïve Patients with Early Parkinson's Disease

Wenliang Fan, Xiangchuang Kong, Ziqiao Lei, Fan Yang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose:

This study aimed to investigate static and dynamic functional connectivity changes in early stage drug-naïve Parkinson's disease (PD) patients compared to healthy control (HC) subjects.

Methods and Materials:

A case-control study of 65 PD patients and 80 HC participants were collected. All participants were underwent rs-fMRI and a series of questionnaires such as UPDRS-III, MMSE, MOCA, HAMA and HAMD to assess the severity of disease and the status of psychiatry. Then, the mean time series of 90 cortical or subcortical regions based on anatomical automatic labeling (AAL) atlas was extracted. The static functional connectome (SFC) was constructed by Pearson's correlation. The intra- and internetwork architecture of SFC were analysed at integrity level, network level and edge level by nine well-defined functionally brain networks. The dynamic functional connectome (DFC) was defined by clustering the BOLD phase-locking patterns obtained using leading eigenvector dynamics analysis (LEiDA) and characterized from a dynamic perspective by the occupancy, lifetime, and transition profiles of DFC patterns. The score of UPDRS-III, MMSE, MOCA, HAMA and HAMD reflecting the motor and non-motor symptoms of PD were collected for further regression analysis with SFC and DFC parameters.

Results:

For SFC analysis, reduced degree of functional connectivity were mainly observed in the visual (VSN), somatomotor (SMN), limbic (LBN), and deep gray matter networks (DGN) at integrity level in PD patients. Intra-network analysis indicated decreased functional connectivity in DGN, SMN, LBN, and ventral attention networks (VAN). Inter-network analysis indicated reduced functional connectivity in nine pairs of resting-state networks. At the edge level, the LBN was the center of abnormal functional connectivity ($p < 0.05$, FDR corrected). For DFC analysis, LEiDA results showed that PD group displayed a shorter lifetime ($p < 0.05$, FDR corrected) and lower probability ($P < 0.05$, FDR corrected) than the HC group in a characteristic of DFC mainly involving the DGN and SMN. For regression analysis of SFC parameters, MOCA score was associated with the intra-network functional connectivity strength (FC) of the DGN, and inter-network FC of the DGN-VAN. HAMA and HAMD scores were associated with the FC of the SMN and DGN, and either the LBN or VAN, respectively. For regression analysis of DFC parameters, the lower probability in the PD group was found to be negatively correlated with the HAMA and MOCA in a partial correlation analysis with years of education as a covariate.

Conclusions:

This study demonstrated the variation of whole brain static and dynamic functional connectome in drug-naïve patients with early PD compared with age-matched HC main focus on SMN, DGN, LBN and VSN, which may be relevant to the motor and non-motor symptoms in early PD. Meanwhile, the results reveal the changes of convergent and divergent intranetwork and internetwork connectivity patterns of drug-naïve patients with early PD from SFC analysis. What is more, a holistic understanding of brain function can only be gleaned if the temporal dynamics of FC is included.

PO-0137

CDCA2 is a prognostic biomarker of glioma patients and correlates with immune cell infiltration in the tumor microenvironment

Yiqi Ma¹, Zijun Wu², Yunfei Zha², BeiBei Liu¹, Su Lui¹, Min Wu¹

1. 四川大学华西医院

2. 武汉大学人民医院

Background: Cell division cycle associated 2 (CDCA2) is crucial for cell cycle and cell proliferation, which is highly expressed in gliomas. However, the underlying mechanisms of the role of CDCA2 in gliomas remain unclear. This study assessed its predictive value and molecular function in gliomas with The Cancer Genome Atlas data. **Methods:** Kruskal-Wallis, Wilcoxon signed-rank test and logistic regression were used to analyze the association between CDCA2 expression and clinicopathological characteristics. The link between CDCA2 and prognosis was investigated using Kaplan-Meier and Cox regression analyses. We created a nomogram based on multivariate data from the Cox model to estimate effect of CDCA2 on prognosis. To reveal the signaling cascades linked to CDCA2, gene set enrichment analysis (GSEA) was performed. The CDCA2 expression of gliomas in Tissue microarrays was analyzed using immunohistochemistry. Furthermore, cell proliferation assays, flow cytometric analyses, and colony forming assays were performed to validate molecular function of CDCA2. **Results:** A substantial link was observed between CDCA2 gene expression and WHO grade, 1p/19q codeletion, IDH status, histological type, age, and primary treatment results. In univariate analyses, CDCA2 expression was associated with shorter overall survival [hazard ratio: 5.48; 95% CI: 4.05–7.42; and $P < 0.001$]. According to multivariate analyses, CDCA2 expression was associated with poor overall survival [hazard ratio: 2.098; 95% CI: 1.367–3.221; and $P < 0.001$]. GSEA results showed a number of cancer-associated pathways were differentially enriched in the group with high CDCA2 expression. The nomogram demonstrated effective prediction ability in glioma patients. Experimental results verified that CDCA2 knockdown inhibited glioma cell growth, colony formation and the cell cycle G1/S phase transition. **Conclusion:** CDCA2 may be a significant predictive factor in gliomas, since it affects cancer progression and prognosis.

PO-0138

Neuroimaging Insights: Structural Changes and Classification in Ménière's Disease

Wenliang Fan, Ziqiao Lei, Fan Yang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives: This study aimed to comprehensively investigate the neuroanatomical alterations associated with Ménière's disease (MD) using Voxel-Based Morphometry (VBM) and Surface-Based Morphometry (SBM) techniques. The primary objective was to explore nuanced changes in gray matter volume, cortical thickness, fractal dimension, gyrification index, and sulcal depth in MD patients compared to healthy controls (HC). Additionally, we sought to develop a machine learning classification model utilizing these neuroimaging features to effectively discriminate between MD patients and HC.

Design: A total of 55 patients diagnosed with unilateral MD and 70 HC were enrolled in this study. VBM and SBM were employed to analyze neuroimaging data and identify structural differences between the two groups. The selected neuroimaging features were used to build a machine learning classification model for distinguishing MD patients from HC.

Results: Our analysis revealed significant reductions in gray matter volume in MD patients, particularly in frontal and cingulate gyri. Distinctive patterns of alterations in cortical thickness were observed in brain regions associated with emotional processing and sensory integration. Notably, the machine learning classification model achieved an impressive accuracy of 84% in distinguishing MD patients from HC. The model's precision and recall for MD and HC demonstrated robust performance, resulting in balanced F1-scores. Receiver Operating Characteristic (ROC) curve analysis further confirmed the discriminative power of the model, supported by an Area Under the Curve (AUC) value of 0.92.

Conclusions: This comprehensive investigation sheds light on the intricate neuroanatomical alterations in MD. The observed gray matter volume reductions and distinct cortical thickness patterns emphasize the disease's impact on neural structure. The high accuracy of our machine learning classification model underscores its diagnostic potential, providing a promising avenue for identifying MD patients. These findings contribute to our understanding of MD's neural underpinnings and offer insights for further research exploring the functional implications of structural changes.

PO-0139

Inter-scanner Reproducibility of Volumetric Quantitative Susceptibility Mapping about Cerebral Subcortical Gray Nuclei at 3.0T MR

Zhiye Chen, Mengqi Liu
Chinese PLA General Hospital

Background: Quantitative susceptibility mapping (QSM) technique was a new quantitative magnetic technique to evaluate the cerebral iron deposition in clinical practice. Therefore, it would become important for the reproducibility of the susceptibility value at different MR scanner before the wide clinical application. The current study was aimed to investigate the reproducibility of the susceptibility of the subcortical gray nuclei at two different 3.0T MR scanner.

Methods: Cerebral magnitude and phase images of 21 normal subjects were acquired from a 3D multi-echo enhanced gradient recalled echo sequence at two different 3.0T MR scanner, and then the magnetic susceptibility images were generated by STI software. The brain structural images were obtained from a 3D T1 gradient echo sequence, which was used to coregistered with magnitude images and generated the normalized parameters, and then generated the normalized susceptibility images. The subcortical gray nuclei template was applied to extract the volumetric susceptibility value of the target nuclei. The intraclass correlation (ICC) and Bland-Altman method were used to evaluate the reproducibility.

Results: ICC value (95%CI) of the caudate, putamen and GP were 0.847(0.660~0.935), 0.848(0.663~0.935) and 0.838(0.643~0.931), respectively. The ICC value of the thalamus was 0.474(0.064~0.747). Ninety-five point two percent (20/21) of the difference points of the susceptibility located between the 95% LA for the caudate at the two different 3.0T MR scanner, while the less than 95% of the difference points of the susceptibility value located between the 95% LA for the putamen, globus pallidus and thalamus.

Conclusions: The current study identified that the caudate had the stable reproducibility of the volumetric susceptibility value, and the other basal ganglion nuclei should be cautious for the quantitative evaluation of the magnetic susceptibility value at different 3.0T MR scanner.

PO-0140

The altered perfusion changes of locus coeruleus in the patients with chronic migraine: a pilot 3D-PCASL study

jianmei xiong¹, Zhiye Chen², Mengqi Liu²

1. Department of Neurology, Hainan Hospital of PLA General Hospital

2. Department of Radiology, Hainan Hospital of PLA General Hospital

Background: The locus coeruleus (LC) played important role in the integration and regulation of pain. Numerous study demonstrated that acute nociceptive pain could activate LC producing spinal cord-mediated endogenous analgesia. However, roles of LC in chronic pain were difficult to define due to temporal dynamics of neuroplasticity. The current study was aimed to investigate the alteration of morphology and perfusion of LC in chronic migraineur (CM) using MR three-dimensional pseudo-continuous arterial spin labeling (3D PCASL) imaging, aiming to explore its correlation with migraine features.

Methods: Thirteen CM patients and 15 age and sex-matched normal controls (NC) were enrolled and undertook 3D PCASL and brain structural imaging. The cerebral blood flow (CBF) images were co-registered with the brain structural images, and the volume and CBF value of LC were extracted from the raw brain structural images and co-registered CBF images using an individual LC mask, which was obtained from the LC template under transformation by the inverse deformation field generated from the segmentation of the brain structural images. The independent sample t test and receiver operating characteristic (ROC) curve was used to investigate the altered volume and perfusion of the LC in CM patients.

Results: No statistical differences were found for the total volume of bilateral LC between CM patients and NC ($P > 0.05$). Compared with NC, CM patients presented with significant lower CBF value (43.91 ± 6.21 ml/100mg.min) compared with that of the NC groups (51.27 ± 10.11 ml/100mg.min) in the right LC ($P = 0.031$). Correlation analysis found a negative correlation between the CBF value of both sides of LC with duration of the disease (years). ROC analysis identified that the area under the curve was 0.749 (95% CI 0.563-0.935) with cut-off value 49.67 ml/100mg.min with sensitivity 53% and specificity 92%.

Conclusion: Hypoperfusion was observed in both sides of LC in CM. As the disease duration (DD) increased, the LC blood flow decreased progressively. These findings support the use of LC perfusion as a potential early diagnostic imaging biomarker for CM.

PO-0141

Structural characteristics of the thalamic nuclei in drug-naïve first-episode schizophrenia

Wei Yu, Bo Tao, Yuan Xiao, Ziyang Gao, Fei Zhu, Su Lui
West China Hospital of Sichuan University

Objectives To explore the structural characteristics of thalamic nuclei and their changes after one-year antipsychotic treatments in a large cohort of antipsychotic-naïve patients with first-episode schizophrenia (FES).

Methods At baseline, 219 patients with FES and 199 healthy controls (HCs) were enrolled in this study. Each participant underwent MRI examination via a 3.0T scanner with an 8-channel head coil (General Electric, Signa). Among the patients, 58 received one-year antipsychotic treatments. Volumes of 25 thalamic nuclei for each brain hemisphere were extracted using Freesurfer. Baseline group differences (FES vs HCs) in thalamus volumes were tested by multivariate analysis of covariance. A paired T-test was performed to identify the volume changes between the baseline and the one-year follow-up in patients. The statistical significance threshold was set at $p < 0.05$, with Bonferroni correction for multiple comparisons. We also

examined associations of nuclei volumes with Positive and Negative Syndrome Scale (PANSS) scores and Global Assessment of Functioning (GAF) scores in patients at baseline.

Results At baseline, the FES group showed smaller volumes in bilateral laterodorsal and lateral posterior nuclei, the right pulvinar anterior nuclei, and the left pulvinar inferior nuclei. Additionally, the right ventral anterior magnocellular nuclei showed larger volume compared to HCs. Furthermore, the volume of the left pulvinar inferior nuclei was negatively correlated with PANSS negative scores and positively correlated with GAF scores. After one-year treatments, a smaller volume was observed in the right lateral geniculate and limitans nuclei.

Conclusions Our findings demonstrated structural alterations of thalamic nuclei in FES at the early stage of the illness, mainly involving the lateral and pulvinar subregions. It was challenging to determine whether short-term antipsychotic treatments disadvantage thalamus substructures in schizophrenia or not.

PO-0142

Hypoperfusion of periaqueductal gray as an imaging biomarker in chronic migraine beyond diagnosis: a 3D pseudo-continuous arterial spin labeling MR imaging

Pan Huang, Zhiye Chen

Department of Radiology, Hainan Hospital of PLA General Hospital

Background: The periaqueductal gray (PAG) is at the center of a powerful descending antinociceptive neuronal network, and is a key node in the descending pain regulatory system of pain. However, less is known about the altered perfusion of PAG in chronic migraine (CM).

Objective: To measure the perfusion of periaqueductal gray matter, an important structure in pain modulation, in chronic migraine with a contrast agent-free and quantitative approach.

Methods: Three-dimensional pseudo-continuous arterial spin labeling (3D-PCASL) and brain structure imaging were performed in 13 patients with chronic migraine and 15 normal subjects. The inverse deformation field generated by brain structure image segmentation was applied to the midbrain PAG template to generate individualized PAG. Then the perfusion value of the periaqueductal gray area of the midbrain was extracted based on the individual PAG mask.

Results: Perfusion of PAG in CM patients (47.98 ± 8.38 ml/100mg·min) was significantly lower than that of the control group (59.87 ± 14.24 ml/100mg·min). Receiver operating characteristic curve analysis (ROC) showed that the area under the curve was 0.77(0.60, 0.94)(95%CI), and the cut-off value for the diagnosis of CM was 54.83ml/100mg·min with a sensitivity 84.60% and a specificity 60%.

Conclusions: Imaging evidence of the impaired pain conduction pathway in CM may be related with the decreased perfusion in the PAG, which could be considered as an imaging biomarker for the evaluation of the diagnosis and therapy.

PO-0143

Reduced functional connectivity induced by longitudinal alterations of structure and perfusion may be associated with cognitive impairment in patients on maintenance hemodialysis

Wenbo Yang, Hao Wang, Lijun Song

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Aims: Hemodialysis (HD) leads to cognitive impairment; however, the pathophysiology of maintenance HD remains unclear. This study aimed to investigate the longitudinal alterations in gray matter volume (GMV) and cerebral blood flow (CBF) in patients on follow-up HD compared with baseline HD, examine the alterations in functional connectivity (FC) by defining co-changed brain regions as seed points, and investigate the correlation between the co-changed brain regions and neuropsychological test scores.

Methods: Twenty-seven patients with HD and 30 healthy controls were enrolled in this study. All participants underwent high-resolution T1-weighted imaging, arterial spin labeling, and functional MR imaging to measure GMV, CBF, and FC. The patients on HD were assessed at baseline and 3 years subsequently.

Results: The right and left medial superior frontal gyrus (SFGmed.L) exhibited significantly lower GMV and CBF in patients on follow-up HD compared with patients on baseline HD and lower FC between the SFGmed.L and left middle temporal gyrus (MTG.L). Decreased FC between the SFGmed.L and MTG.L was positively correlated with neuropsychological test scores in the follow-up HD group.

Conclusion: Reduced GMV and CBF may result in decreased FC between the SFGmed.L and MTG.L, which may be associated with cognitive impairment in patients on maintenance HD.

PO-0144

Associations between glymphatic function and A β , tau with cognition in Alzheimer's disease

Yihao Guo¹, Tao Liu², Weiyuan Huang¹, Feng Chen¹

1. Hainan general hospital

2. Department of Geriatric Center, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University)

Objectives: The glymphatic system is related to β -amyloid (A β) and tau protein clearance from the brain in Alzheimer's disease (AD). This study aimed to investigate the associations between glymphatic function levels and abnormal A β , tau deposition in CSF and plasma, and neuropsychological function across the preclinical and clinical spectrum of AD.

Methods: Participants from the Alzheimer's Disease Neuroimaging Initiative (ADNI) cohort (n = 180) and our cohort (n = 127) underwent brain diffusion tensor imaging (DTI) examination and neuropsychological evaluation. According to their clinical diagnosis, the subjects of ADNI cohort were grouped into the following groups: cognitively normal (CN, n = 35), subjective memory concern (SMC, n = 28), mild cognitive impairment (MCI, n = 82), and AD dementia (n = 35), and the subjects of our cohort were grouped into the following group: CN (n = 25), SMC (n = 51), MCI (n = 32), and AD dementia (n = 19). The glymphatic activity was calculated by diffusion tensor image analysis along the perivascular space (ALPS). CSF A β 42 and pTau levels and plasma pTau level were measured in the ADNI cohort, and plasma A β 42 and pTau levels were measured in our cohort. ANOVA test was applied to investigate group difference in CSF and plasma biomarkers. The associations between the ALPS index and AD biomarkers with cognition were analyzed.

Results: In both cohorts, the ALPS index showed significant differences among the groups, and there was a positive correlation between the MMSE score and the ALPS index in the bilateral brain. The CSF A β 42 level was significantly associated with the ALPS index in ADNI cohort. The plasma A β 42 level was significantly associated with the ALPS index in our cohort. Furthermore, there was a significant association between the plasma pTau level and ALPS index in bilateral brain for both cohorts.

Conclusion: The ALPS index reflecting glymphatic activity has potential to be an effective AD biomarker.

PO-0145

Association of inflammatory cytokines with magnetic resonance imaging features of the brain in patients with depression

Li Zhou, Shengdan Liu, Qian Li, Li Wang, Yurong Zheng, Minglin Yu, Xiaofei Lu, Wei Lei, Guangxiang Chen
The Affiliated Hospital of Southwest Medical University

Objective: To explore the relationship between inflammatory cytokines and cerebral magnetic resonance imaging (MRI) features in patients with depression.

Methods: Sixty depressed patients and sixty healthy controls (HCs) were included. Three-dimensional T1-weighted imaging and resting-state functional MRI were collected. Inflammatory cytokines in peripheral blood were measured. Correlation analyses were used to explore the relationships between inflammatory cytokines and imaging features in depressed patients. Seed-based functional connectivity (FC) analysis was performed. A receiver operating characteristic curve was drawn to evaluate the diagnostic performance of imaging features for diagnosing depressed patients.

Results: Interleukin-1 was positively correlated with gray matter volume (GMV) in the left putamen and negatively correlated with regional homogeneity (ReHo) and degree centrality (DC) in the left anterior cingulate cortex. Interleukin-6 was positively correlated with GMV in the right superior parietal lobule and ReHo in the left pallidum and putamen. Interferon- α was negatively correlated with DC in the left postcentral gyrus. The ReHo in the left pallidum in depressed patients was lower than that in HCs. The FCs based on the left pallidum as the seed in depressed patients were significantly reduced. The imaging features of the left pallidum have good performance (area under the curve: 0.891) for distinguishing depressed patients.

Conclusion: Inflammatory cytokines are associated with cerebral imaging features in patients with depression; abnormal imaging features of the left pallidum may be a potential neuroimaging biomarker of depression.

PO-0146

Characteristics of functional asymmetry and its association with age and sex in antipsychotic-naïve first-episode schizophrenia.

Bo Tao, Wei Yu, Yuan Xiao, Ziyang Gao, Fei Zhu, Su Lui
Department of Radiology, West China Hospital, Sichuan University, Chengdu, Sichuan, China

Objective

To explore characteristics of functional asymmetry and its association with age and sex in a large sample of antipsychotic-naïve first-episode schizophrenia patients (AN-FES).

Methods

Two hundred and five AN-FES and 168 healthy controls (HCs) were recruited in this study. Functional imaging data was obtained for all participants using a 3.0 T MRI scanner (GE, Signa EXCITE). After data preprocessing and construction of within-hemispheric functional networks, we used Gretna to evaluate topological characteristics of these functional networks, and then asymmetry scores for each network metric were calculated. One-way analysis of covariance was used to test between-group differences in asymmetry score of each network metric. Linear and non-linear regression analyses were used to estimate the effects of age and sex on hemispheric

network properties with statistically significant group differences, by fitting linear and quadratic models.

Results

Four brain regions, including the supramarginal gyrus (SMG), medial superior frontal gyrus (MSF), medial orbitofrontal cortex (MOF), and middle cingulum, exhibited significantly reduced asymmetry scores for both nodal efficiency and degree in AN-FES compared to HCs. Regression analysis showed that the asymmetry of nodal efficiency and degree in the MOF and MSF fit a quadratic model over aging in AN-FES. In a subsequent sex-specific analysis, we found that the asymmetry of nodal efficiency and degree in the MSF followed a quadratic model over aging only in male patients. Similarly, a quadratic trajectory of hemispheric asymmetry of nodal degree in the MOF over aging was also observed in male patients.

Conclusion

The findings demonstrated significantly asymmetric abnormalities of local information transmission in the frontal-parietal regions in schizophrenia in the absence of antipsychotics, especially among male patients.

PO-0147

Detection of microstructural abnormalities of gray matter in migraineurs without aura using Mean Apparent Propagator (MAP) MRI

Xiaoyun Su, Jing Wang, Qing Zhu, Chuansheng Zheng
union hospital, tongji medical college, Huazhong University of science and technology

OBJECTS

The mean apparent propagator (MAP) MRI is an advanced diffusion model proposed recently for brain microstructure imaging. In this study, the MAP-MRI model was applied in diagnosis of migraineurs patient without aura.

METHODS

Totally 25 MWoAs were recruited based on the International Classification of Headache Disorders 3rd edition criteria and were scanned during an interictal period. 25 age- and gender-matched healthy controls (HCs) were enrolled. All subjects underwent Magnetization Prepared Rapid Gradient Echo (MP2RAGE) and diffusion spectrum imaging (DSI) sequences on a 3T MR scanner. The DSI parameters were as follows: TR/TE= 5200/111 ms, FOV = 220×220 mm², slice thickness = 2 mm, voxel size = 2×2×2 mm³, GAPPA = 2, slice accelerated factor= 2, Δ/δ = 55.2/32.2 ms, q-space Cartesian grid sampling scheme is used with two b=0 and 98 diffusion images with different diffusion gradient directions and bmax= 3000 s/mm². The MAP-MRI parameters included the return-to-the-origin probability (RTOP), return-to-the-plane probability (RTAP), return-to-the-axis probability (RTPP), Q-space inverse variance (QIV), mean squared displacement (MSD). Paired-sample t-test was used to compare the difference between the patients with migraine and controls. P < 0.05 was considered statistically significant.

RESULTS

We included 25 MWoA and 25 controls (27 years±10.1; range, 17-49 years; 23 female; 2 men). Figure 1 and figure 2 shows the parameter maps of one healthy subject and migraineurs without aura, respectively. The RTOP, RTAP and RTPP in the bilateral superior frontal gyrus were significantly higher in the MWoAs than HCs (P< .05). MWoAs exhibited decreased RTPP in the left amygdala, hippocampus and bilateral olfactory cortex (P< .05). We also found lower the RTOP, RTAP and RTPP in the bilateral temporal pole and left heschi gyrus in the MWoAs (P< .05). The RTOP, RTAP in the bilateral anterior cingulate and paracingulate gyri were significant higher in the MWoAs than HCs, while the MSD in the right these regions were lower than HCs (P< .05). The

RTOP in the right para-hippocampal gyrus were significant higher in the MWOAs than HCs, while the MSD in the bilateral these regions were lower than HCs ($P < .05$).

CONCLUSION

MAP-MRI can reveal microstructural changes in multiple brain regions between patients with migraine and healthy controls. These findings further suggest involvement of the gray matter in the pathology of migraine without aura.

PO-0148

Morphometric dissimilarity between cortical and subcortical areas underlies cognitive impairment in first-episode, treatment-naïve patients with major depressive disorder

Xinyue Hu, Lianqing Zhang, Zilin Zhou, Yidan Wang, qiyong Gong, Xiaoqi Huang
West China Hospital, Sichuan University

Background: Major depressive disorder (MDD) often involves morphological alterations within the cortical-limbic system. Furthermore, the incoherent aging of cortical and subcortical regions underlies emerging cognitive function impairments in patients with MDD. However, these deviations remain largely unexplored to date. **Methods:** We adopted 8 cortical morphological features and 5 subcortical morphometric features to construct cortical-subcortical morphometric similarity network (MSN) with each morphometric feature being normalized from 133 first-episode, treatment-naïve patients with MDD and 130 age-, sex-, education level- and handedness-matched healthy controls (HCs). The cortical-subcortical MSN was constructed based on the Desikan and Aseg atlas (95 nodes), with each edge in the MSN representing the Pearson correlation between the morphometric profiles from each pair of nodes. Cognitive performance was assessed across three domains: attentional control, executive function, and cognitive flexibility. We utilized the Louvain community detection approach to generate an individual-level module arrangement. Moreover, we compared the edges within and between modules in patients with depression and HCs. A mixed linear model was employed to analyze the correlations between the abnormal edges and cognitive functions as well as depressive symptoms. **Results:** Based on the MSNs, each brain was clustered into seven modules with distinct cytoarchitecture and evolutionary relevance. Compared to the HCs, patients with MDD showed higher prefrontal-subcortical module dissimilarity (FDR corrected $p < 0.05$). The prefrontal-subcortical module dissimilarity was significantly positively related to executive function (FDR corrected $p < 0.05$). **Conclusion:** These results highlight prefrontal-subcortical morphometric dissimilarity as a potential biomarker for cognitive function impairment in patients with MDD and provide insights into brain aging.

PO-0149

Genotype-specific brain structural damage in Hereditary Spastic Paraplegia subtypes

Yuqing Tu, Ying Liu, Fan Zhang, Mengcheng Li, Shuping Fan, Jiaqi Wen
The First Affiliated Hospital of Fujian Medical University

Objective: This study aimed to identify and compare the brain gray matter (GM) and white matter (WM) damage patterns in two subtypes of HSP (SPG4 and SPG5), and to investigate how cortical gene expression contributes to brain damage patterns in different subtypes of HSP patients, and

to explore the causal relationship between patterns of GM atrophy and WM microstructural damage in SPG4 and SPG5.

Methods: Forty-two patients with HSP (21 SPG4 and 21 SPG5 patients) and 42 sex- and age-match healthy controls underwent clinical and neuroimaging evaluations. The alterations of GM and WM pattern were compared between groups by applying Source-based morphometry (SBM) approach to GM images from 3D T1-weighted MRI and fractional anisotropy (FA) maps from diffusion tensor imaging. Spearman rank correlation was used to explore the spatial associations between gene expression maps for HSP associated genes (obtained from the Allen Human Brain Atlas) and cortical GM atrophy patterns in HSP subtypes. Mediation analysis was conducted to investigate the interplay between patterns of GM atrophy and WM microstructural damage. Correlations between clinical and WM or GM damage patterns were evaluated.

Results: Compared to controls, SPG4 and SPG5 patients showed similar and extensive WM microstructural damage, but different GM atrophy patterns. Cortical GM atrophy patterns in SPG4 and SPG5 were spatial correlation with corresponding gene expression maps (Spearman's ρ $r=0.297$, $p=0.008$; $r=0.396$, $p<0.001$, respectively). Mediation analysis indicated that GM atrophy patterns in HSP patients were mediated by WM microstructural damage. The patterns of WM microstructural damage were significant correlated with disease severity in HSP patients.

Conclusions: GM atrophy patterns were distinct between SPG4 and SPG5. GM atrophy in HSP subtypes were not only secondary to WM microstructural damage but also associated with disease related gene expression levels in cortical regions.

PO-0150

Aberrant structural-functional network coupling is associated with cognitive decline in patients with non-dialysis-dependent stage 5 chronic kidney disease

Lijun Song, WenBo Yang, Hao Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Objective: This study aimed to investigate the brain network topology and functional-structural coupling characteristics in patients with non-dialysis-dependent stage 5 chronic kidney disease and the correlation between network changes and cognitive scores.

Methods: We prospectively performed diffusion tensor and resting-state functional magnetic resonance imaging on 40 patients with non-dialysis-dependent stage 5 chronic kidney disease and 47 healthy controls. Graph theory analysis of functional and structural connectivity was performed. Small-world properties and network efficiency properties were calculated, including characteristic path length, clustering coefficient, normalized clustering coefficient, normalized characteristic path length, small-worldness, global efficiency, and local efficiency. The SC-FC coupling characteristics and the association between Montreal Cognitive Assessment scores and graph-theoretical features were analyzed.

Results: For structural connectivity, the small-worldness ($P=0.009$), clustering coefficient ($P=0.018$), global efficiency ($P<0.001$), and local efficiency ($P=0.014$) were significantly lower in patients with non-dialysis-dependent stage 5 chronic kidney disease than in healthy controls, while characteristic path length ($P<0.001$) and normalized characteristic path lengths ($P<0.001$) were significantly higher in the patients than in healthy controls. For functional connectivity, the small-worldness ($P=0.008$), normalized clustering coefficient ($P=0.009$), global efficiency ($P=0.043$), and local efficiency ($P<0.001$) were lower in patients with non-dialysis-dependent stage 5 chronic kidney disease than in healthy controls; however, the characteristic path length ($P=0.021$) was higher in the patients than in healthy controls. Structural connectivity–functional connectivity coupling ($P<0.001$) was greater in patients with non-dialysis-dependent stage 5 chronic kidney disease than in healthy controls. The structural (clustering coefficient, local efficiency, global efficiency) and functional network parameters (small-worldness, normalized clustering coefficient, global efficiency)

of the patients with non-dialysis-dependent stage 5 chronic kidney disease were positively correlated with Montreal Cognitive Assessment scores; however, the characteristic path length of both structural and functional networks was negatively correlated with Montreal Cognitive Assessment scores.

Conclusions: All patients with non-dialysis-dependent stage 5 chronic kidney disease included in the study exhibited changes in their structural and functional brain network topology closely related to mild cognitive impairment. Structural connectivity–functional connectivity coupling was elevated in the patients compared with that in the controls. This may provide vital information for understanding and revealing the underlying mechanisms of cognitive impairment in patients with non-dialysis-dependent stage 5 chronic kidney disease.

PO-0151

Preliminary exploration of lumbosacral plexus DTI and further analysis of clinical characterization in anti-neurofascin 155 antibody-positive patients - a case series

Yan Deng, Weiwei Wang, Yang Yang, Hanqiu Liu
Huashan Hospital, Fudan University

Purpose : This study aimed to enhance the understanding of characteristics of the anti-neurofascin 155 antibody-positive neuropathy. The goal were also to be the first to investigate whether lumbosacral plexus nerve Diffusion Tensor Imaging (DTI) can reflect the pathological changes of this nodopathy disease and to potentially differentiate anti-NF155 seropositive patients from Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) patients. **Methods:** Data was retrospectively collected from 6 anti-NF155 seropositive patients and 14 CIDP patients who were hospitalised at our institution between January 2017 and December 2021. All patients underwent lumbosacral plexus DTI examinations to obtain Apparent Diffusion Coefficient (ADC) and Fractional Anisotropy (FA) values of the bilateral nerve roots (L3-S1). Differences were then analysed between the two groups. Detailed profiles were also collected for all 6 anti-NF155 seropositive patients. **Results**

DTI analysis revealed that CIDP patients had higher FA values (0.26 ± 0.046) and lower ADC values (1.59 ± 0.260), while anti-NF155 seropositive patients had lower lumbosacral plexus FA values (0.18 ± 0.020) and higher ADC values (2.02 ± 0.270). There were statistically significant variations in both FA ($p=0.001$) and ADC ($p<0.001$). Both the average protein concentration in cerebrospinal fluid (3661.83 ± 1333.675) mg/L and the average cross-sectional area of the bilateral lumbosacral plexus nerves (75.42 ± 20.673) mm² were significantly greater than average in anti-NF155 seropositive patients. **Conclusion:** Patients positive for anti-NF155 antibodies can be differentiated from those with CIDP using DTI. This distinction is marked by noticeably lower FA values and higher ADC values, which likely signify major pathophysiological differences between the two disorders. Patients with NF155 antibodies display distinct clinical and imaging characteristics that aid in the early identification of the disease.

PO-0152

Dynamic Individual-specific Functional Connectivity Changes in Disorder of Consciousness Patients

Linglong Chen¹, Bo Rao², Haibo Xu²
1. the First Affiliated Hospital of Nanchang University
2. Wuhan University Zhongnan Hospital

Previous studies have identified abnormalities in large scale functional brain networks in disorder of consciousness (DoC), yet most of them were based on static functional connectivity. Until now, most studies of DoC have relied on applying group-level atlases when assessing individual-level functional data, may dilute important brain-behavior associations. We suggested that a dependence of brain dynamics on the state of consciousness based on individual functional network, which may serve as biomarkers of disease. Twenty-six DoC patients (thirteen minimally conscious state (MCS) and thirteen vegetable state (VS)) and 26 age and gender matched healthy controls were included in this study. An individual template was obtained using iterative parcellation approach and estimated using support vector regression. Then, resting-state functional MRI and a sliding-window approach, k-means clustering algorithm, graph theory analysis were used to study the dynamic functional connectivity. Finally, we used also support vector machines to analyze the efficiency of dFNC states in classifying MCS and VS patients. Here we reported the robust performance of individual network template to predict the CRS-R scores. Dynamic analysis suggested two distinct connectivity states across the entire group while DoC spent much more time in the state of more randomly organized interictal and inefficient network. There were significant differences in the temporal dynamic properties between the MCS, VS patients and the HCs. The number of transitions is positively correlated with the CRS-R scores of all DoC patients ($r=0.508$, $p=0.008$). There were also significant differences in graph properties between the three groups. DoC showed an large-scale disconnection pattern of DMN-centered. The difference between MCS and VS existed in diminished crossmodal connectivity rather than disorder of a single network, providing evidence for a global disconnection hypothesis. Our result stresses the necessity of examining global, top-down and cross-modal disconnection representing arousal, not only those associated with awareness.

PO-0153

Prognostic value of perivascular space and small-vessel disease neuroimaging measures in idiopathic normal pressure hydrocephalus

Wenjie He, Jun xia
Shenzhen No.2 People Hospital

Background Enlarged perivascular spaces (EPVS) and small-vessel disease (SVD) are overrepresented among patients with idiopathic normal pressure hydrocephalus (iNPH), but their neuroimaging markers in prognostic implications remains unclear. To explore the value of EPVS and SVD neuroimaging markers in predicting the postoperative prognosis for iNPH.

Methods This retrospective study included consecutive 66 patients with iNPH who underwent shunting surgery. Preoperative neuroimaging markers were evaluated with the EPVS count markers, white matter hyperintensities (WMH), total SVD score, modified total SVD score (mSVD), and Brain Atrophy and Lesion Index (BALI). We determined the predictive value of these neuroimaging markers at follow-up 1 and 2 years postoperatively using Mann-Whitney U test, receiver operating characteristic (ROC), and binary logistic regression models.

Results There were no significant differences in preoperative EPVS count markers, WMH volume, or total SVD score between the improved and non-improved groups at follow-up 1 and 2 years postoperatively. However, at 2 years of follow-up, the improvement and non-improvement groups differed significantly in BALI and mSVD in primary and secondary outcomes; the AUC values for ROC curves were 0.708 (95%CI: 0.546–0.840 $P=0.009$) for mSVD, 0.807 (95%CI: 0.654–0.913 $P<0.001$) for BALI scales; for mSVD score and BALI scales, the odds ratios after adjustments were both significant ($P=0.008$ and $P=0.045$, respectively).

Conclusions Proposed EPVS count markers have limited ability in predicting the prognosis of patients with iNPH after shunting. The prognostic role of BALI and mSVD in iNPH could be considered as biomarkers of long-term prognosis in patients of iNPH at follow-up 2 years postoperatively.

PO-0154

Mesenchymal stem cells with p38 mitogen-activated protein kinase interference ameliorate mouse ischemic stroke

Yingying Bai

Department of Radiology, Zhongda Hospital, Medical School, Southeast University

Abstract

Objective: Mesenchymal stem cells (MSCs) have been widely used in the treatment of ischemic stroke. However, factors such as high glucose, oxidative stress, and aging can lead to the reduced function of donor MSCs. The p38 mitogen-activated protein kinase (MAPK) signaling pathway is associated with various functions, such as cell proliferation, apoptosis, senescence, differentiation, and paracrine secretion. This study examined the hypothesis that the downregulation of p38 MAPK expression in MSCs improves the prognosis of mice with ischemic stroke.

Methods: Lentiviral vector-mediated short hairpin RNA (shRNA) was constructed to downregulate the expression level of p38 MAPK in mouse bone marrow-derived MSCs. The growth cycle, apoptosis and senescence of MSCs after infection were examined. A mouse model of ischemic stroke was constructed. After MSC transplantation, the recovery of neurological function in the mice was evaluated.

Results: Lentivirus-mediated shRNA significantly downregulated the mRNA and protein expression levels of p38 MAPK. The senescence of MSCs in the p38 MAPK downregulation group was significantly reduced, but the growth cycle and apoptosis did not significantly change. Compared with the control group, the infarct volume was reduced, and the neurological function and the axonal remodeling were improved in mice with ischemic stroke after transplantation of MSCs with downregulated p38 MAPK. Immunohistochemistry confirmed that in the p38 MAPK downregulation group, apoptotic cells were reduced, and the number of neuronal precursors and the formation of white matter myelin were increased.

Conclusions: Downregulation of p38 MAPK expression in MSCs improves the therapeutic effect in mice with ischemic stroke, an effect that may be related to a reduction in MSC senescence. This method is expected to improve the efficacy of MSCs in patients, especially in patients with underlying diseases such as diabetes, thus providing a basis for clinical individualized treatment for cerebral infarction.

PO-0155

Brain network hierarchy reorganization and neurotransmitter associations in deficit and non-deficit schizophrenia

Chengmin Yang, Li Yao, Su Lui
West China hospital of Sichuan university

Background: Schizophrenia is a neurodevelopmental disorder with heterogenous, and deficit schizophrenia (DS) is a clinical subgroup with primary and enduring negative symptoms and impaired social function and emotional processing. Identifying potential biological difference of DS from non-deficit schizophrenia (NDS) may be a pressing need for treatment targets and mechanisms. Here, we investigated the brain functional hierarchy alteration by gradient-based approach in patients with DS and NDS respectively and their underlying molecular architecture.

Methods: 44 DS and 55 NDS patients, as well as 60 matched healthy control (HC) were included in this study. Gradient metrics were calculated using BrainSpace toolbox. Correlational analyses were subsequently conducted between gradient measures and symptom severity. Then we analyzed the spatial correlation between DS/NDS gradient distribution and density maps of 10 neurotransmitter derived by JuSpace toolbox to link the neuroimaging to underlying neurotransmitter information.

Results: Both DS and NDS patients exhibited compressed gradient patterns comparing to HC, with more severe disorganization in DS patients, suggesting reduced network differentiation. Correlational analyses further revealed contributed network of ventral attention network (VAN) was associated with depression symptom in DS patients, whereas the visual network (VIS) was related to total, general and paranoid scores in NDS patients. Moreover, spatial correlation of neurotransmitter analysis revealed that the gradient distribution of DS was primarily related with serotonergic system while those of NDS patients were predominantly associated with the dopamine system.

Conclusion: The current study offers converging evidence supporting the divergent of cortical hierarchy disorganization patterns in patients with DS and NDS, and further spatially relating possibly to the neurochemical metabolic differences. These findings are consistent with the hypothesis that DS is a separate subtype differ from NDS from neurodevelopmental perspective.

PO-0156

Increased functional synchronization between gray and white matter in posttraumatic stress disorder

lei li¹, bin guo^{2,3}, jinping lin³, qiyong gong^{1,2,3}

1. West China Hospital of Sichuan University

2. the Xiamen Key Laboratory of Psychoradiology and Neuromodulation

3. West China Xiamen Hospital of Sichuan University

Background: Posttraumatic-stress disorder (PTSD) has been hypothesized to be a brain disorder involving alteration in white matter (WM) fiber tracts, leading to insufficient communication between WM and cortex. While previous studies have mainly examined the structural properties of WM in PTSD patients using magnetic resonance imaging (MRI) or diffusion tensor imaging, functional synchronization between gray matter (GM) and WM remained seldom investigated.

Methods: A total of 58 medication-naïve PTSD patients and 68 trauma-exposed controls without PTSD underwent resting-state functional MRI (rs-fMRI) and high-resolution T1-weighted imaging. The functional connectivity (FC) in 82 Brodmann areas within GM and 48 WM bundles, as well as between GM and WM were compared between these two groups. The correlations between

function in WM tracts with that in GM regions reflected the GM-WM functional synchrony. Furthermore, the associations between the identified abnormalities and symptom severity were also explored in PTSD group.

Results: Significantly increased GM-WM functional correlations were observed in PTSD group, primarily involving FC between the left posterior corona radiata, left thalamic radiation, left sagittal stratum, with several GM regions in the frontal and temporal lobes. Additionally, increased functional synchrony was observed between the right tapetum and temporal cortex, as well as between the right retrolenticular part of the internal capsule and temporal cortex, when compared with controls ($p < 0.05$, FDR corrected).

Conclusions: The increase in GM-WM functional synchrony in PTSD patients provides novel evidence of hyper-connectivity within the brain's system in this disorder. Specifically, the findings suggested greater involvement of the white matter (WM) in the left hemisphere in PTSD.

PO-0157

Multi-parametric radiomics of conventional T1 weighted and susceptibility-weighted imaging for differential diagnosis of idiopathic Parkinson's disease and multiple system atrophy

Shuting Bo, Guoguang Fan
the first hospital of China Medical University

Objectives

This study aims to investigate the potential of radiomics with multiple parameters from conventional T1 weighted imaging (T1WI) and susceptibility weighted imaging (SWI) in distinguishing between idiopathic Parkinson's disease (IPD) and multiple system atrophy (MSA).

Methods

A total of 201 participants, including 57 patients with IPD, 74 with MSA, and 70 healthy control (HCs) individuals, underwent T1WI and SWI scans. From the 12 subcortical nuclei (e.g. red nucleus, substantia nigra, subthalamic nucleus, putamen, globus pallidus, and caudate nucleus), 2640 radiomic features were extracted from both scan types. Three classification models—logistic regression (LR), support vector machine (SVM), and light gradient boosting machine (LGBM)—were used to distinguish between MSA and IPD, and among MSA, IPD, and HC groups based on T1WI features, SWI features, and a combination of both. Five-fold cross-validation was used to evaluate the performance of the models with metrics such as sensitivity, specificity, accuracy, and area under the receiver operating curve (AUC). During each fold, the ANOVA and least absolute shrinkage and selection operator (LASSO) methods were used to identify the most relevant subset of features for the model training process.

Results

The LGBM model trained by the features combination of T1WI and SWI exhibited the most outstanding differential performance in both the three-class classification task and the binary classification task, with an accuracy of 0.814 and 0.854, and an AUC of 0.904 and 0.881. The texture-based differences (GLCM) of the SN and the shape-based differences of the GP were highly effective in discriminating between the three classes and two classes, respectively.

Conclusions

Radiomic features combining T1WI and SWI can achieve a satisfactory differential diagnosis for PD, MSA, and HC groups, as well as for PD and MSA groups, thus providing a useful tool for clinical decision-making based on routine MRI sequences.

PO-0158

Mismatched signs in Glioma Grading by Contrast-Enhanced MRI and 3D-ASL Perfusion Imaging

Guangwen Zhang, Yan Feng, Jinsong Zhang
Xijing Hospital

Purpose

To evaluate the performance of three-dimensional arterial spin labeling (3D-ASL) perfusion and contrast-enhanced MRI (CE-MRI) in glioma grading and attempt to explain the mismatched signs in 3D-ASL and CE-MRI.

Method

Forty-two cases, who had undergone 3D-ASL and CE-MRI pre-operations between 2015 and 2017, with pathologically confirmed glioma were enrolled. Sensitivity, specificity, positive and negative predictive value and diagnostic accuracy of 3D-ASL and CE-MRI were calculated respectively in grading gliomas. The mismatched cases between ASL and CE-MRI or imaging and pathology were analyzed further.

Results

The sensitivity, specificity, positive and negative predictive value and accuracy of 3D-ASL were similar to CE-MRI in differentiating low-grade from high-grade gliomas (0.89, 0.71, 0.86, 0.77, 0.79 for 3D-ASL; 0.82, 0.71, 0.85, 0.67, 0.81 for CE-MRI, respectively). Sensitivity, specificity, positive and negative predictive value and accuracy of combination of CE-MRI and 3D-ASL (0.95, 0.81, 0.91, 0.90, 0.83, respectively) were better than those of any single modality in distinguishing low-grade from high-grade gliomas, however there were no significant differences ($P>0.05$). There were 14 mismatched cases (about 1/3) including mismatched presentation between two imaging methods (11 cases) and mismatches between imaging and pathological grading (3 cases). The causes of mismatches between 3D-ASL, CE-MRI and pathology might be the different imaging mechanisms, degree of angiogenesis, dynamic development of glioma and the technique drawbacks of ASL.

Conclusions

Using a combination of ASL and CE-MRI could enhance the confidence of radiologists in glioma grading, however, they should be cautious and provide reasonable explanations for the mismatched signs between multimodality imaging.

PO-0159

Functional Alterations Associated with Tremor Help Identify Parkinson's Disease and Multiple System Atrophy: A Resting-State fMRI Study

Xiaolu Li, guoguang Fan
Department of Radiology, the first hospital of China medical University

Objective: This study aims to investigate functional connectome alterations in patients with tremor due to Multiple System Atrophy (MSA) and Parkinson's Disease (PD), and to develop a differential diagnosis model based on these alterations for the classification of MSA and PD.

Methods: Resting-state fMRI data were collected from 55 MSA patients, 62 PD patients, both with tremors and 52 healthy controls (HCs). Percent amplitude of fluctuation (PerAF), seed-based functional connectivity (FC), and effective connectivity (EC) analyses were used to examine functional abnormalities in the brain. Support Vector Machine (SVM) was employed to construct the differential diagnosis model based on the identified functional alterations. Additionally, Spearman correlation analysis was performed to explore the relationship between functional abnormalities and tremors.

Results: Both MSA and PD patients with tremors showed similar activity changes in the bilateral Orbital part of the superior frontal[1] gyrus (ORBsup), CerebelumVIII (CRBL8), right rectus (REC), left CerebelumIV-V (CRBL45.L), and FC based on the seeds of PUT.L, CRBL8.R, and REC.R. These changes were more pronounced in MSA patients. However, MSA patients exhibited increased putamen activity and effective connectivity from the caudate (CAU) to the putamen, whereas PD patients showed decreased activity and effective connectivity in these regions. The SVM classification model demonstrated good performance, with the putamen being the most influential factor for classification. Furthermore, the functional alterations were correlated with tremors in both diseases.

Conclusion: The CTC circuits and BGN are involved in tremor disorders among MSA and PD patients. The activation of the putamen, involvement of the caudate, and pronounced changes in the CTC circuits in MSA patients may serve as important neurobiological markers, offering potential implications for prognosis and precise classification of MSA and PD patients.

PO-0160

Assessment of Glx and GABA levels in the Global Developmental Disability Children: A MRS Study

Zhuohang Liu¹, Dan Li¹, Liangjie Lin², Ling Shan¹

1. the First Hospital of Jilin University

2. Philips Healthcare

This study aims to explore the correlation between brain neuro metabolites and clinical symptom scales in GDD and GDD+ASD. 11 children with GDD and 12 GDD +ASD children took MR scans, and completed the GABA and Glx spectroscopic acquisition. Results indicated that there is a significant difference in DQ language levels between GDD and GDD+ASD, and the GABA/Cr levels were significantly decreased in GDD+ASD compared with GDD. A positive correlation was observed between Glx/Cr and ADOS stereotype among all participants, and a clear link was observed between Glx/Cr and the sensory symptoms of ASD at both behavioral and perceptual levels.

PO-0161

Structural and functional alterations of motor-thalamus in different motor subtype of Parkinson's disease: An individual study

Shuting Bo, Guoguang Fan

the first hospital of China Medical University

Objective

This study aimed to investigate the structural and functional alterations occurring within bilateral premotor thalamus (mPMtha) in motor subtypes of Parkinson's disease (PD).

Methods

Sixty-one individuals with instability and gait difficulty (PIGD) subtype, sixty individuals with tremor-dominant (TD) subtype and sixty-six healthy controls (HCs) participated in the study. All participants underwent resting-state functional magnetic resonance imaging (rs-fMRI) and 3D T1-weighted (3DT1) scans. Functional connectivity (FC) analysis and Voxel-based morphometry (VBM) analysis were performed to evaluate the function and volume of mPMtha. Additionally, correlations between motor performance and FC values, volumes were examined separately. Support vector machine

(SVM) model based on FC values and thalamic volumes was conducted to assist in the clinical diagnosis of PD motor subtype.

Results

Compared with HCs and PIGD, TD subtype showed increased FC between the bilateral mPMth and left middle occipital gyrus (MOG), left inferior parietal lobule (IPL). While PIGD subtype demonstrated decreased FC between right mPMth and precentral gyrus (PreCG), supramarginal, IPL and superior parietal lobule (SPL). FC of bilateral mPMth with the identified regions were significantly correlated with motor performance scores in PD patients. The SVM classification based on FC values demonstrated a high level of efficiency (AUC=0.874). The volumes of the bilateral mPMth were indifferent among three groups.

Conclusion

We noted distinct FC alterations of mPMth in TD and PIGD subtypes, and these changes were correlated with motor performance. Furthermore, the machine learning based on statistically significant FC might be served as an alternative approach for automatically classifying PD motor subtypes individually.

PO-0162

Molecular Mechanisms Underlying Human Spatial Cognitive Ability Revealed with Neurotransmitter and Transcriptomic Mapping

Jia Yang¹, Kexuan Chen², Junyu Zhang¹, Yingzi Ma¹, Jiaojian Wang¹

1. State Key Laboratory of Primate Biomedical Research, Institute of Primate Translational Medicine, Kunming University of Science and Technology

2. Medical School, Kunming University of Science and Technology

Spatial cognitive ability is closely associated with perception, spatial processing, and general intelligence. Mental rotation is an intrinsic dynamic and one of the most core spatial cognitive abilities. Although the brain underpinnings of mental rotation have been reported, the cellular and molecular mechanisms remain unexplored. Here, we used magnetic resonance imaging (MRI), a whole-brain spatial distribution atlas of 19 neurotransmitter receptors, transcriptomic data from Allen Human Brain Atlas, and mental rotation performances of 356 healthy individuals to identify the genetic/molecular foundation of mental rotation. We found significant associations of mental rotation performance with gray matter volume (GMV) and fractional amplitude of low-frequency fluctuations (fALFF) in primary visual cortex, fusiform gyrus, primary sensory-motor cortex, and default mode network. GMV and fALFF in these brain areas also exhibited significant sex differences. Importantly, we conducted analyses to correlate the spatial patterns of GMV or fALFF with mental rotation and the spatial distribution patterns of neurotransmitter receptors and transcriptomic data, identifying the related genes and neurotransmitter receptors associated with mental rotation. These identified genes are localized on the X chromosome and are mainly involved in trans-synaptic signaling, transmembrane transport, and hormone response. Our findings provide initial evidence for the neural and molecular mechanisms underlying spatial cognitive ability.

PO-0163

Functional Network Modularity Differences between Drug-Responsive and Drug-Nonresponsive Schizophrenia Patients

Chen Wang

Xijing Hospital, Air Force Military Medical University

Purpose: To explore the differences in baseline functional network module levels between drug-responsive and non-responsive schizophrenia patients (SZs) using functional magnetic resonance imaging (fMRI) combined with graph theory analysis.

Methods: Thirty-six first-episode schizophrenia patients and 36 matched healthy controls (HCs) were recruited. According to the drug treatment response after two weeks, the SZs were divided into non-responders and responders. The Positive and Negative Syndrome Scale (PANSS) was used to assess the severity of schizophrenia symptoms. The resting-state fMRI data of SZs and HCs were collected. The cerebral cortex was divided into seven modules based on the Yeo functional network. Graph theory analysis was used to calculate the modular topological properties of each functional network, and group comparisons were performed using one-way analysis of variance (ANOVA).

Results: Significant differences were found in the default module (DMN), somatomotor module (SMN), visual module (VIS), and subcortical module (SUB) between the HCs, drug-responsive SZs, and drug-nonresponsive SZs. The VIS, SMN and SUB had significantly lower intra-modular connectivity in the responder SZs compared to the non-responder group. The SUB-VIS inter-modular connectivity was significantly higher in the responder group, while the SUB-LIM, SUB-DMN, SUB-SMN, and SMN-DMN intermodular connectivities were significantly lower compared to the non-responder SZs. The SUB and SMN were significantly lower in the HCs compared to both the responder and non-responder SZs. The SMN-DMN and SUB-SMN inter-modular connectivities were significantly lower in the HCs compared to the non-responder SZs.

Conclusion: The topological properties of functional network modules at baseline may serve as imaging biomarkers for early prediction of treatment response in schizophrenia patients treated with antipsychotics.

PO-0164

Investigating the shared genetic architecture between chronic pain and cognition

Yanjing Chen, Wei Zhao, Sijie Yi, Jun Liu

Department of Radiology, Second Xiangya Hospital, Central South University

Abstract:

Background: It has been widely found that there is a correlation between chronic pain and functional changes. However, the underlying mechanisms are still unclear. The purpose of this study is to investigate whether there is an influence of genetic pleiotropy or an inherent causal relationship between them.

Method: We utilized GWAS data to investigate the genetic architecture of two traits: chronic multi-site pain and eight cognitive functional traits, including intelligence, memory, and reaction time etc. LDSC was employed to assess the genetic correlations between each pair of traits. SNP and gene analyses were carried out to examine pleiotropic genetic loci associated with the traits. Additionally, TWAS analysis was performed to investigate expression of the genes and the LCV model was employed to explore the potential causal relationship between the traits. Furthermore, enrichment

analysis was conducted to examine the tissue and cellular basis for the co-occurrence of these two conditions.

Results:We discovered a significant negative genetic correlation between chronic pain and most cognitive functions, particularly intelligence ($rg = -0.11$, $P = 7.77E-64$). Cross-phenotype analysis identified 150 pleiotropic loci, including 83 newly discovered ones and 20 loci with pleiotropic effects at the same genomic position as identified by COLOC. The LCV analysis indicated no causal relationship between chronic pain and cognitive functions. Combining the genetic analysis information, we found that the pleiotropic genes of multiple traits were enriched in brain tissues, predominantly in the prefrontal cortex.

Conclusions:Our findings enhance the understanding of the complex interplay between cognitive function and chronic pain from a genetic perspective, highlighting the importance of considering these genetic loci in future research and clinical decision-making. Furthermore, it emphasizes the significance of addressing chronic pain management approaches in managing cognitive decline.

PO-0165

Higher Baseline Subcortical Net Water Uptake in Computed Tomography Predicts Malignant Middle Cerebral Artery Infarction in Patients with Acute Ischemic Stroke

Jia Wang

Northern Jiangsu People's Hospital

Objective: Net water uptake (NWU) based on the Alberta Stroke Program Early Computed Tomography Score (ASPECTS) was recognized as a reliable indicator of brain edema. The objective of this study was to assess the predictive performance of ASPECTS-NWUs from different ASPECT regions in relation to the development of malignant middle cerebral artery (MCA) infarction.

Methods: Patients with acute ischemic stroke (AIS) of the MCA territory were retrospectively enrolled between January 2019 and July 2022. Patients were divided into two groups according to the follow-up CT after 24 to 48 hours: malignant and non-malignant infarction. NWUs were measured on diverse ASPECT regions on admission non-contrast CT, namely affected-ASPECTS-NWU (af-ASPECTS-NWU), subcortical-ASPECTS-NWU (sc-ASPECTS-NWU) and cortical-ASPECTS-NWU (c-ASPECTS-NWU). Baseline characteristics were collected for univariate analyses and multivariate regression analyses to explore the independent risk factors for malignant infarction. Receiver operating characteristic (ROC) curves were plotted and compared.

Results: 153 patients were included in the final analysis. Malignant MCA infarction was achieved in 42 (27.45%) patients and non-malignant was 111 (72.55%). Compared with the non-malignant group, higher baseline NIHSS score, af-ASPECTS-NWU, c-ASPECTS-NWU, sc-ASPECTS-NWU, and lower ASPECTS were noted in malignant infarction group (all $P < 0.001$). Multivariate logistic regression showed that only baseline sc-ASPECTS-NWU ($>3.6\%$) was a positive factor for malignant MCA infarction. The ROC analysis indicated the highest predictive value of sc-ASPECTS-NWU for indicating malignant infarction with the AUC 0.906.

Conclusion: Higher baseline sc-ASPECTS-NWU was a quantitative predictor for malignant MCA infarction in patients with AIS, which could be helpful for treatment decision.

PO-0166

Exploring cognitive loop decoupling in Nondialysis Patients with CKD based on multimodal MRI cross-modal coupling

Lijun Song, Wenbo Yang, Hao Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Objective: The aim of this study was to explore differences in neurovascular coupling in undialyzed chronic kidney disease (CKD) patients based on resting-state functional magnetic resonance imaging, three-dimensional pseudo-continuous arterial spin labeling, and quantitative magnetization rate mapping.

Methods: We prospectively performed resting-state functional magnetic resonance imaging, 3D pseudo-continuous arterial spin labeling and quantitative magnetization rate mapping in 43 patients with stage 1–4 CKD (CKD 1–4) and 69 nondialysis patients with stage 5 CKD (CKD 5ND) and 44 healthy controls (HCs) recruited. Voxel-based overall and regional Bold signal analysis [(amplitude of low-frequency fluctuation, ALFF), (regional homogeneity, ReHo)], cerebral blood flow (CBF) analysis, susceptibility value, and neurovascular coupling (CBF-ALFF, CBF-ReHo, susceptibility value - ALFF, and susceptibility value- ReHo) were analyzed. In addition, correlations between neuroimaging indices and Montreal Cognitive Assessment scores and clinical laboratory findings were analyzed.

Results: ALFF and ReHo in CKD5 ND and CKD1-4 patients were mainly dominated by a decrease in the default mode network region compared to HC; CBF in the right chiasmatic nucleus was increased and CBF in the middle temporal gyrus was decreased in CKD5 ND and CKD1-4 patients compared to HC; CBF in the left hippocampus and the left supraoccipital gyrus were elevated in CKD5 ND patients compared to those with the CKD1-4 group; sensitivity values were higher in the bilateral caudate nucleus, bilateral thalamus, and bilateral shell nuclei and lower in the bilateral hippocampus in both the CKD5 ND and CKD1-4 groups ($P < 0.05$, cluster-level FDR-corrected). At the whole-brain level, both the CKD1-4 and CKD5 ND groups demonstrated lower CBF-ALFF coupling coefficients, CBF-ReHo coupling coefficients and sensitivity compared with the HC -ALFF coupling coefficient. At the roi level, CKD5 ND patients showed lower CBF-ALFF coupling coefficients and CBF-ReHo coupling coefficients in the hippocampus and basal ganglia regions. In addition the above neuroimaging indices were significantly correlated with clinical presentation and Montreal cognitive score.

Conclusion: Neurovascular coupling is abnormal in non-dialyzed patients with chronic kidney disease, and these changes are associated with cognitive impairment in which susceptibility value - ALFF may serve as a biomarker for the early assessment of cognitive impairment in patients with chronic kidney disease, which may help to better understand the pathogenesis of cognitive impairment in chronic kidney disease.

PO-0167

Discriminating white matter degeneration patterns of cognitive impairment in Parkinson's disease and multiple system atrophy

Huize Pang,Guoguang Fan
the first affiliated hospital of china medical university

Objectives: The white matter (WM) degenerations have significant impact on cognitive performance. Whether their functioning is affected in a similar or distinct way by Parkinson's disease (PD) and multiple system atrophy (MSA) is not clear.

Methods: A total of 116 participants (37 patients with PD with mild cognitive impairment (PD-MCI), 37 patients with mild cognitive impairment (MSA-MCI), and 42 healthy controls (HC)) were enrolled and underwent diffusion tensor imaging and a battery of cognitive assessment. Three types of WM fibers, including association fibers, projection fibers, and thalamic fibers, were reconstructed using probabilistic fiber tracking method. Regression analyses were conducted between microstructural diffusion metrics and multiple cognitive domains. Support vector machine and Shapley Addictive exPlanations (SHAP) analyses identified the WM predictors of MCI.

Results: PD-MCI and MSA-MCI patients exhibited similar white matter disconnection pattern involving the thalamic radiations (anterior and superior thalamic radiation) and association fibers (forceps minor, uncinate fasciculus) compared to HC, though the WM deterioration was more severe in MSA-MCI group. Moreover, MSA-MCI patients manifested distinct WM impairment ranging to projection fibers (middle cerebellar peduncle, corticospinal tract), and cingulum bundle. Furthermore, the FA and MD value of the right anterior thalamic radiation showed significant correlation with global efficiency (FA: $B=0.69$, $P<0.001$, $VIF=1.31$; MD: $B=-0.53$, $P=0.02$, $VIF=2.50$). Diffusion metrics of impaired WM were significantly associated with cognitive subdomains. The MCI was predicted by WM signatures between PD-MCI and MSA-MCI (accuracy = 0.73; $P<0.01$). The most valuable predictor was the MD value of anterior thalamic radiation.

Conclusions: The MSA-MCI patients showed similar, yet more severe, as well as distinct WM deterioration pattern compared to the PD-MCI group, with affection of frontal-thalamic, cerebral-cerebellar, and frontal-limbic communications and to be associated with the cognitive domains. Our results may extend our knowledge of the neurobiological basis of cognitive impairment in Parkinsonian disorders.

PO-0168

MRI morphological differences comparing diffuse midline glioma - H3K27 mutation and near midline low grade glioma

Xiao-Dan Huang¹,Hua-Zhen Deng²,Hong-Bo Zhang^{3,6},Han-Wen Zhang^{2,6},Xiao-Lei Liu²,Jiu-Ping Liang¹,Li-Lian Tan⁴,Biao Huang^{5,6},Fan Lin²

1. Shenzhen Songgang People's Hospital

2. Department of Radiology, the First Affiliated Hospital of Shenzhen University, Health Science Center, Shenzhen Second People's Hospital

3. Department of Radiology, The Seventh Affiliated Hospital, Sun Yat-sen University

4. Department of Radiology, the Second Affiliated Hospital of Guangzhou Medical University

5. Department of Radiology, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences

6. The Second School of Clinical Medicine, Southern Medical University, Guangzhou, China

Background: In 2016, WHO identified a new molecular subtype, diffuse midline glioma with H3K27m mutation, which corresponds to grade IV. This study sought to examine the differences between diffuse midline gliomas and low-grade gliomas in MR imaging.

METHODS: Retrospective analysis of MRI images from 20 patients with midline low-grade line gliomas and 39 individuals with diffuse midline glioma-H3K27 mutation. The size, number and imaging characteristics of the tumors, including peritumoral edema, DWI and enhancement, lesion cystic necrosis, intratumoral hemorrhage, and T2WI mismatch sign were observed. T-test and chi-square test were used to describe the differences between them.

RESULTS: An independent sample t-test revealed that patients with DMG had younger mean ages than those with LGG ($P < 0.001$). The chi-square test revealed ($P < 0.001$) that the tumor size of DMG was much less than that of LGG. DWI and DMG enhancement were both significantly higher ($P < 0.001$). Additionally, Peritumoral edema showed statistical significance for DMG and LGG ($P < 0.05$).

CONCLUSION: Compared to low-grade gliomas in the midline region, diffuse midline gliomas with H3K27 mutation have specific MRI presentation and clinical features that can aid in identification and differential diagnosis.

PO-0169

MRI-based radiomics models for prediction of telomerase reverse transcriptase promoter mutation status in IDH-wildtype histological lower-grade astrocytoma

Xiefeng Yang

The first affiliate hospital of fujian medical university

Objective

Telomerase reverse transcriptase promoter (pTERT) status is crucial for prognosis prediction and individual management in patients with IDH wildtype (IDH-wt) histological lower-grade astrocytoma (LGA). The purpose of this study was to construct MRI-based radiomic models for prediction of pTERT status in IDH-wt LGA.

Methods

This retrospective study included 86 adult IDH-wt LGA patients with known TERT promoter mutation status (23 mutants, 63 wildtypes). Multiparameter MRI including T1WI, T1CE, T2WI, and FLAIR was performed on all patients. One hundred seven first-order, shape, and texture features were extracted from each sequence. Radiomics signatures models based on MRI were established with promising diagnostic performances. The prediction performance of different models was assessed by receiver operating characteristic curve analysis.

Results

In the test dataset, the accuracy of single sequence and multiparameter models were 0.731 (T1WI), 0.808 (T1CE), 0.731 (T2WI), 0.769 (FLAIR), and 0.923 (multiparameter model), respectively. Among all radiomics models, the multiparameter MRI-based model had the best predictive ability, with the area under the curve of 0.942 (0.918-0.967) in the training group and 0.925 (0.812-1.000) in the test group.

Conclusion

MRI-based radiomics signatures could be useful for predicting pTERT mutation status in IDH-wt LGA. A combination of multimodal MRI may improve the diagnostic performance.

PO-0170

MRI-based Radiomics Signatures for Predicting Ki-67, CD105, and VEGF Expression of IDH-mutant Astrocytoma

Xiefeng Yang

The first affiliate hospital of fujian medical university

Background: Immunohistochemical biomarkers are important for the clinical diagnosis and prognosis predicting of gliomas. The aim of this study was to evaluate the usefulness of radiomics models extracted from conventional MRI for predicting Ki-67, CD105 and VEGF expression status of IDH-mutant astrocytoma.

Methods: 83 pathologically confirmed IDH-mutant astrocytoma patients with known Ki-67, CD105 and VEGF status were retrospective reviewed. A total of 428 radiomics features was extracted from multiparameter MRI. Then, dimensionality reduction methods and classifiers were used to develop radiomic models for predicting the biomarkers of IDH-mutant astrocytoma. The diagnostic performance of radiomic models was evaluated using receiver operating characteristic curve (ROC) with area under the curve (AUC).

Results: For the radiomics model of Ki-67, AUC, accuracy, sensitivities, and specificities were 0.913, 0.897, 0.867, and 0.907 for training group, and 0.833, 0.880, 0.833, and 0.895 for test group, respectively. For the radiomics model of CD105, AUC, accuracy, sensitivities, and specificities were 0.870, 0.800, 0.900, and 0.745 for training group, and 0.820, 0.833, 0.875, and 0.813 for test group, respectively. For the radiomics model of VEGF, AUC, accuracy, sensitivities, and specificities were 0.916, 0.845, 0.840, and 0.849 for training group, and 0.721, 0.720, 0.818, and 0.643 for test group, respectively.

Conclusions: The radiomics features extracted from multiparameter MRI can predict Ki-67, CD105, and VEGF status. The radiomics models may serve as non-invasive methods for predicting Ki-67, CD105, and VEGF expression in IDH-mutant astrocytoma.

PO-0171

Plaque distribution in multi-cerebrovascular beds associates with acute cerebral infarction: A magnetic resonance imaging study

Chenyang Zhao^{1,2}, Jin Li³, Huiyu Qiao², Dan Zhou¹, XiHai Zhao²

1. the Affiliated BenQ Hospital of Nanjing Medical University,

2. Center For Biomedical Imaging Research, Department of Biomedical Engineering, School of Medicine, Tsinghua University, Beijing 100084, China

3. Department of Radiology, Beijing Chaoyang Hospital, Capital Medical University, Beijing, China.

Objective:

This study aimed to investigate the association between coexisting intracranial and extracranial carotid artery atherosclerotic plaque characteristics among different carotid segments and acute cerebral infarction (ACI) using 3D MRI.

Materials and Methods:

Patients with recently occurred cerebrovascular accident in anterior circulation (< 2 weeks) and presence of atherosclerotic plaque in at least one side of the carotid artery underwent multi-contrast MR vessel wall imaging and 3D time-of flight CMR angiography. The atherosclerotic plaques in intracranial artery and extracranial carotid segment were recorded. Coexisting characteristics of these plaques among different carotid segments was compared between patients with and without ACI and its association with ACI was determined.

Results:

121 patients (mean age: 62.0 ± 11.8 years; 89 males) were recruited. 100(82.6%) had acute cerebral infarction. The presence of coexisting cerebrovascular atherosclerosis (atherosclerotic plaques in carotid bulb segment of carotid artery) was found to be significantly associated with ACI patients compared to those without ACI (HR = 4.06, 95% CI, 1.50-11.02; $P = 0.006$, respectively). After adjusting for baseline confounding factors, this association remained statistically significant (HR = 3.27, 95% CI 1.15-9.33, $P = 0.027$, respectively). No significant association was found between intracranial stenosis coexistent with atherosclerotic plaque in other segments of carotid artery and vascular events (all $P > 0.05$).

Conclusion:

The co-existing cerebrovascular atherosclerotic disease with atherosclerotic plaque in the segment of carotid bulb is independently associated with ACI.

PO-0172

CBV Index could be a reliable predictor of the prognosis for acute ischemic stroke patients after EVT.

Wenjing Ni, Guangchen Shen, Zixin Yin, Gao Ma, Yue Chu, Shanshan Lu, Xiaoquan Xu, Feiyun Wu
The First Affiliated Hospital with Nanjing Medical University (Jiangsu Province Hospital)

Objectives: To assess the prognostic value of CBV index in patients with acute ischemic stroke (AIS) receiving computed tomography perfusion (CTP) beyond the time window after endovascular thrombectomy (EVT).

Methods: A retrospective enrollment was conducted on 137 patients at our center who received EVT for AIS of the anterior circulation beyond the time window. Parameters included clinical disease history, National Institutes of Health Stroke Scale (NIHSS), Modified Rankin Scale (MRS) score, ODT (onset-to-close time), DPT (door to puncture time), occluded vessel site, and core infarct volume. Multivariate logistic regression analysis was utilized to investigate acute ischemic stroke of the anterior circulation factors that impact the prognosis of EVT in patients. ROC curves were employed to analyze the predictive value of the combination of age, National Institutes of Health Stroke Scale (NIHSS) score on admission, recanalization, and CBV index on the prognosis in patients with anterior circulation AIS after EVT.

Results: The good prognosis group consisted of 60 patients, while the poor prognosis group consisted of 77 patients. Six parameters showed significant differences: age (63.6 ± 13.1 vs. 73.61 ± 10.3 , $p < 0.001$), NIHSSpre (10.5 ± 5.5 vs. 18.5 ± 7.5 , $p < 0.001$), ischemic core volume (7.1 ± 12.2 vs. 33.4 ± 51.3 , $p < 0.001$), CBV index (0.8 ± 0.3 vs. 0.7 ± 0.2 , $p < 0.001$), successful recanalization (95.0% vs. 79.2%, $p = 0.008$), and gender (71.7% vs. 51.9%, $p = 0.019$). Multivariate Logistic regression analysis showed that age (odds ratio [OR], 0.947; 95% CI, 0.908-0.987; $P = 0.011$), NIHSSpre (OR, 0.844; 95% CI, 0.780-0.910; $P = 0.001$), successful recanalization (OR, 6.466; 95% CI, 1.365-30.630; $P = 0.019$), and CBV index (OR, 30.348; 95% CI, 1.380-667.490; $P = 0.030$) were found to be independently associated with functional outcome in patients with AIS after EVT. The combined model of age, recanalization, NIHSSpre, and CBV index showed excellent predictive ability for clinical prognosis (AUC, 0.878; sensitivity, 83.3%; specificity, 81.8%), outperforming the model without CBV index (AUC, 0.861).

Conclusions: The CBV index improves the accuracy of prognostication after EVT in patients with anterior circulation AIS.

PO-0173

Evaluation of Kidney-Brain Axis and Ferroptosis Mechanism based on Multimodal Magnetic Resonance Imaging

Ziyang Yu
Xiamen University

Aims: Acute kidney injury (AKI) has been associated with a variety of neurological problems, while the neurobiological mechanism remains unclear. In the present study, we utilized resting-state functional magnetic resonance imaging (rs-fMRI) and Diffusion Tensor Imaging to detect brain injury at an early stage and investigated the impact of microglia on the neuropathological mechanism of AKI.

Methods: Multi-modal MRI data were collected from AKI rats and the control group with a 9.4-Tesla scanner at 24, 48, and 72 h post administration of contrast medium or saline. The amplitude of low-frequency fluctuations (ALFF), Functional connectivity and Probabilistic fiber track were then compared across the groups at each time course. Additionally, flow cytometry, SMART-seq2 and pAAV-CAMKII-HChR2-mCherry-WFRE were employed to evaluate microglia. Furthermore, pathological staining and Western blot were used to analyze the samples.

Results: MRI results revealed that AKI led to a decreased ALFF in the hippocampus, particularly in the 48 h and 72 h groups. The connection between CA1 and prefrontal cortex decreased after AKI. Additionally, western blot suggested that AKI-induced the neuronal Ferroptosis at 48 h and 72 h. Flow cytometry and confocal microscopy images demonstrated that AKI activated the aggregation of microglia into neurons at 24 h, with a strong upregulation of M1 polarization at 48 h and peaking at 72 h, accompanying with the release of proinflammatory cytokines.

Conclusions: Our study demonstrated that microglia aggregation and inflammatory factor upregulation are significant mechanisms of AKI-induced neuronal Ferroptosis. We used multimodal MRI to detect the alterations in hippocampal function, which may provide a noninvasive method for the early detection of brain injury after AKI.

PO-0174

MEGA-PRESS Detects the Changes of Metabolite in Parkinson's Disease with Depression

Xinzi Liu¹, Baolin Chen², Yixiang Mo³, Jinyue Xue¹, Yongzhou Xu⁴, Zhibo Wen¹

1. Department of Radiology, Zhujiang Hospital, Southern Medical

2. Department of Neurology, Zhujiang Hospital, Southern Medical University

3. Department of Functional Neurosurgery, Zhujiang Hospital, Southern Medical University

4. Philips Healthcare, Guangzhou, China

Purpose

To explore the changes of λ -aminobutyric acid (GABA), glutamate and glutamate (Glx) in depression in Parkinson's disease (DPD) using MEGA-PRESS, in order to provide new ideas for the potential pathogenesis and treatment of DPD.

Materials and Methods

Fifty-four primary PD patients and twenty-three healthy controls (HC) were included in this study. According to the Hamilton Depression Scale (HAMD), PD patients were classified into DPD (n=13) and non-depressed Parkinson's disease (NDPD) (n=45). All subjects underwent 3.0T head magnetic resonance scanning, including 3D T1WI and MEGA-PRESS sequence. 3D T1WI was used to obtain high-resolution three-dimensional brain structure images, and which was used to locate the volume of interest (VOI). The MEGA-PRESS sequence was performed in 18.48ml voxels

in the left thalamus and medial frontal cortex (MFC) respectively. All the data were processed using Gannet 3.1 to quantify GABA+ , Glx and Creatine (Cr) levels. Statistical analysis was performed to compare the concentration of metabolites such as GABA+ and the demographics in the three groups.

Results

The level of GABA+/Water was significantly lower in MFC of PD patients compared with HC ($p=.015$). GABA+/Water and GABA+/Cr of MFC levels were significantly lower in NDPD than that of DPD and HC ($p=.003$, $p=.015$), while there was no statistical difference between the DPD and HC. And there was no significant difference of metabolites level in the left thalamic among all groups ($p > .05$). However, MFC Glx levels were inversely correlated with depression severity in DPD ($r = -.696$, $p = .017$).

Conclusion

This study demonstrates decreased GABA+ in MFC in patients with primary Parkinson's disease. And DPD has higher GABA+ level in MFC than NDPD, while the concentration between DPD and HC has no difference. So that we conclude that MFC GABA plays a beneficial rather than a detrimental role in DPD, and that GABA may improve depressive symptom.

PO-0175

Combination of Hematoma and Perihematoma Tissue Radiomics Analysis on Baseline CT Scans Predicts Early Clinical Outcome of Conservatively Treated Spontaneous Cerebral Hemorrhage

Xuelin Song¹, Hao Zhang², Yang Dong¹, Shiyun Lou³, Endong Zhao¹, Yuxuan Han¹, Chao Yang³

1. the Second Hospital of Dalian Medical University

2. Fudan University Shanghai Cancer Center

3. the First Affiliated Hospital of Dalian Medical University

Objective:

To explore whether radiomic features of hematoma and perihematoma tissue can improve the accuracy of short-term clinical outcome prediction in patients with conservatively treated spontaneous cerebral hemorrhage.

Methods:

A total of 166 patients with a clinical and imaging diagnosis of spontaneous cerebral hemorrhage were included in this retrospective analysis. These patients were treated conservatively during their hospitalization. Patients were randomized into a training group (N=132) and a validation group (N=34) with a ratio of 8:2. Clinical outcome at 90 days after clinical treatment was assessed by the modified Rankin Scale (mRS), and was categorized as good outcome ($mRS \leq 2$) and poor outcome ($mRS > 2$). Radiomic features of hematoma and perihematoma tissues of 5mm, 10mm, 15mm were extracted from non-contrast computed cranial tomography (NCCT) images, respectively, and were downscaled by LASSO regression to construct a random forest model to predict the early clinical outcome of patients with cerebral hemorrhage under conservative treatment. The predictive performance of the radiomic features in different regions was assessed by subject working characteristic curves. Clinical factors were analyzed by single and multifactor logistic regression . Results: In the validation group, the mean area under the ROC curve (AUC) of the hematoma was 0.83, the AUC of the hematoma periphery in the 5mm, 10mm, 15mm was 0.79, 0.82, 0.77, respectively, and the AUC of the combined model of hematoma+perihematoma 10-mm was 0.79. The AUC of the hematoma model was significantly higher than that of the combined hematoma+perihematoma 10-mm model. The clinical-radiomics nomogram consisting of five independent predictors of hematoma volume, time from onset to first CT, breakthrough into the ventricle, gender, and AST/ALT on admission and Rad-score of the hematoma model were used

to assess 90-day outcome in patients with conservatively treated spontaneous cerebral hemorrhage.

Conclusions:

Radiomics analyses based on hematoma and perihematoma tissue in patients with conservatively treated spontaneous cerebral hemorrhage showed that a combined model of hematoma and perihematoma tissue did not necessarily provide a more accurate assessment of early clinical outcome in patients with conservatively treated spontaneous cerebral hemorrhage. Hematoma in patients with conservatively treated spontaneous cerebral hemorrhage remains the predominant therapeutic target.

PO-0176

Modular Edge Analysis Reveals Chemotherapy Caused Brain Network Changes for Lung Cancer Patients

Jia You

Department of Radiology, Nanjing First Hospital, Nanjing Medical University, Nanjing, China

Purpose: Lung cancer patients after chemotherapy may have disconnected or weakened function connections within brain networks. The purpose of this study was to investigate the abnormality of brain functional network in lung cancer patients after chemotherapy by modular edge analysis.

Methods: Resting-state functional magnetic resonance imaging (Rs-fMRI) scans were performed in 40 post-chemotherapy and 40 non-chemotherapy patients and 40 healthy controls (HCs). All groups were age- and sex-matched. Then, modular edge analysis was used to assess changes in brain functional networks.

Results: In intra-modular connections, compared with the controls, the post-chemotherapy patients showed decreased connection strength in the occipital lobe module ($p < 0.05$). And compared with the non-chemotherapy group, the post-chemotherapy patients showed decreased connection strength in the subcortical module ($p < 0.05$). In inter-modular connections, compared with the controls, the post-chemotherapy patients showed decreased connection strength in the frontal-temporal lobe modules ($p < 0.05$). And compared with the non-chemotherapy group, the post-chemotherapy patients showed decreased connection strength in the subcortical-temporal lobe modules ($p < 0.05$).

Conclusions: These results suggest that chemotherapy can disrupt connections in the brain functional networks. To our knowledge, this is the first study to use modular edge analysis to report changes in brain functional brain networks associated with chemotherapy. Modular edge analysis may play an important role in predicting the clinical outcome for lung cancer patients after chemotherapy.

PO-0177

Topological characteristics changes in chronic tinnitus: A Resting-State Functional Magnetic Resonance Imaging Study

Jia Xie^{1,2}, Meiyun Wang^{3,4}

1. Zhengzhou University People's Hospital

2. Zhengzhou University Academy of Medical Sciences

3. Department of Medical Imaging, Henan Provincial People's Hospital

4. Biomedical Research Institute, Henan Academy of Sciences

Purpose: In this study, resting state functional magnetic resonance imaging (rs-fMRI) was used to explore the topological characteristics of brain connectivity in chronic tinnitus from the global and node level using the method of graph theory.

Method: We recruited 16 patients with chronic tinnitus and 16 healthy controls matched by age, and sex. All subjects underwent functional and structural MRI scanning, pure tone audiometry (PTA) and neuropsychological assessment. The AAL brain atlas was used to divide the cerebral cortex into 90 regions of interest (ROI) and further construct the correlation matrix to analyze the global properties and node properties. Global network properties included global efficiency (Eg), local efficiency (Eloc), clustering coefficient (Cp), characteristic path length (Lp) and small worldness. Nodal network properties included degree centrality (DC), betweenness centrality (BC), nodal efficiency (NLe), and nodal clustering coefficient (NCp).

Results: Global level analysis showed that Eg decreased and Cp, Lp increased in chronic tinnitus compared with HC. Small world property analysis showed that lambda increases and sigma decreases. Nodal level analysis showed that DC was decreased in right hippocampus, bilateral putamen and right pallidum in tinnitus patients compared with HC, and increased in the left inferior temporal gyrus, left precuneus, bilateral inferior occipital gyrus, and left middle occipital gyrus. The NCp was increased in the right cuneus. NE was decreased in the right orbit part of inferior frontal gyrus, right heschl gyrus, right insula, right hippocampus, bilaterally putamen and bilaterally pallidum in chronic tinnitus compared with HC, and increased in the right inferior occipital gyrus and left inferior temporal gyrus.

Conclusion: The topological properties of chronic tinnitus are altered suggesting that tinnitus patients have reduced brain network efficiency and changes in auditory, limbic and default mode networks. This study provides clues to the pathogenesis of tinnitus and tinnitus related diseases (eg: depression and anxiety).

PO-0178

Atlas-based analysis of diffusion imaging may predict efficacy of constraint-induced movement therapy with different training modes for motor function recovery in stroke rats

Xinxin Zhao¹, Ce Li², Yulong Bai², Yan Zhou¹, Jianrong Xu¹

1. Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai

2. Huashan Hospital, School of Medicine, Fudan University, Shanghai

Background: Constraint-Induced Movement therapy (CIMT) is a method of behavior-based neurorehabilitation that has demonstrated efficacy for chronic stroke. Atlas-based analysis (ABA), a method of whole brain white matter analysis based on an anatomical atlas, may be helpful in

evaluating obscure lesions in brain injury of stroke rats. The aim of this study was to predict efficacy of CIMT for motor function recovery in stroke rats using ABA diffusion methods.

Methods: Twenty-four male Sprague-Dawley (SD) rats were divided into two groups according to the brain injury with unilateral or bilateral CIMT rehabilitation training as follows: moderate group (unilateral/bilateral n=6/6), severe group (unilateral/bilateral n=6/6). Catwalk and diffusion MRI scans were conducted on the groups of rats at baseline, and at 7, 14 and 28 days after surgery, combining micro-PET to observe the metabolic levels of ^{18}F -FDG in various brain regions. Regions of interest (ROIs) analyses were conducted on 29 regions, independent anatomically, on the basis of the DTI atlas of the P72 rat brain. Statistical analyses of fractional anisotropy (FA) and mean diffusivity (MD) values were performed with a two-sample t test.

Results: Compared to baseline, FA and MD were decreased in the moderate group in the corpus callosum, fornix, right cerebral peduncle and the peripheral regions. Bilateral limb training can enhance the metabolic level of the nucleus accumbens in rats with severe cerebral ischemia in early stage.

Conclusions: Unilateral limb training can significantly enhance the interactive inhibitory effect of bilateral cortical sensory and motor areas in moderate group. Whereas bilateral training was more helpful in enhancing the interactive inhibitory effect of various brain regions in rats with severe cerebral ischemia. Atlas-based analysis of diffusion imaging may predict efficacy of multiple CIMT modes for motor function recovery in stroke rats with varying degrees of brain injury.

PO-0179

Prediction of meningiomas' critical molecular phenotype using the transverse relaxation time

Zongye Li¹, Yue Zhang¹, Xiao Wang², Congbo Cai³, Yong Zhang², Jianfeng Bao², Jingliang Cheng²

1. the First Affiliated Hospital of Zhengzhou University

2. 郑州大学第一附属医院

3. 厦门大学

Purpose

Progesterone receptor (PR) is crucial to meningiomas as it is not only associated with the pathogenesis, but also indicates the aggressiveness and prognosis. T2 mapping has shown great promise in the explanation of pathological microstructure and tissue composition. In this study, we investigated the association of T2 and apparent diffusion coefficient (ADC) with PR expression.

Material and Methods

We enrolled 63 meningiomas patients totally (57.34 ± 9.60 years, 44 women). An experienced pathologist identified positive PR expression in 50 out of 63 meningiomas. All the MRI examinations were performed on a 3.0 T Prisma scanner. Whole-brain T2 maps were acquired within 32 s in a single scan using a novel single-shot ultrafast T2 mapping technique. Axial T2-dark-fluid imaging, diffusion-weighted imaging, and contrast-enhanced T1-weighted imaging were also performed for all patients. Two blind neuroradiologists manually delineated whole-tumor regions of interest on T2 maps using 3D Slicer (version 4.10.2, www.slicer.org), with their consensus as the final result. Necrosis, large vessels and calcification were excluded. Using a free application FeAture Explorer (FAE; <https://github.com/salan668/FAE>), we extracted the following histogram parameters: mean, median, maximum, minimum, ten percentiles (P10), 90 percentiles (P90), interquartile range (IQR), range, entropy, skewness, kurtosis, uniformity, and variance. Parameters were compared using independent t-test or Mann-Whitney U test. Multivariate logistic regression and receiver operating characteristic (ROC) analysis were performed to evaluate their diagnostic efficiency. The significance level of p value is 0.05.

Results

Compared to PR-negative meningiomas, there were significantly higher IQR, mean, median, maximum, P10, P90, range and entropy of T2 ($p = 0.001-0.049$) in PR-positive meningiomas, along with higher ADC kurtosis ($p = 0.022$). T2 IQR had the highest area under the ROC curve ($\text{AUC} =$

0.742) among all the T2 parameters and ADC kurtosis showed an AUC of 0.605. Notably, the combination of T2 and ADC exhibited the best diagnostic performance (AUC = 0.818).

Conclusion

This study suggested that T2 and ADC histogram parameters could be used to predict PR expression in meningiomas. Compared to ADC value, T2 may provide more detailed information about the tumor composition and microstructure of meningiomas. The multivariate logistic regression model combining T2 and ADC exhibited the best diagnostic performance.

PO-0180

Whole-Tumor Histogram Analysis of Synthetic MRI Predicts isocitrate dehydrogenase mutation status in gliomas

Xin Ge^{1,2}, Jing Zhang²

1. Lanzhou MU

2. Lanzhou University Second Hospital

Introduction: To investigate the potential value of whole-tumor histogram metrics derived from synthetic MRI in predicting isocitrate dehydrogenase (IDH) mutation status of gliomas.

Materials and methods: In this prospective study, 80 glioma patients were enrolled from September 2019 to June 2022. All patients underwent pre- and post-contrast synthetic MRI examination within 2 weeks before surgery. Immunohistochemistry staining or gene sequencing were used to assess IDH mutation status in tumor tissue samples. Whole-tumor histogram metrics, including T1, T2, proton density (PD), etc., were extracted from the quantitative maps, while radiological features were assessed by synthetic contrast-weighted maps. Basic clinical features of the patients were also evaluated. Differences in clinical, radiological, and histogram metrics between IDH-mutant type (IDH-M) and IDH-wild type (IDH-W) groups were analyzed using Student's t test, Mann-Whitney U test, Chi-square test or Fisher test. Variables with statistical significance in univariate analysis were included in multivariate logistic regression analysis to develop the combined model. Receiver operating characteristic and area under the curve (AUC) were used to assess the diagnostic performance of metrics and models.

Results: The histopathologic analysis revealed that of the 80 cases, 41 were classified as IDH-M gliomas and 39 as IDH-W gliomas. Compared to IDH-W gliomas, IDH-M gliomas showed significantly lower T1 (10th, mean, and median) and cPD (10th, 90th, mean, median, and maximum) values as well as higher cT1 (10th, mean, median, and minimum) values (all $P < 0.05$). The combined model (T1-10th + cT1-10th + age) was developed by integrating the independent influencing factors of IDH-M gliomas using the multivariate logistic regression. The diagnostic performance of this model (AUC = 0.872) was superior to the clinic-radiological model, which was constructed using age and enhancement degree (AUC = 0.822, $P = 0.035$).

Conclusion: The combined model constructed using histogram metrics derived from synthetic MRI could be a valuable preoperative tool to predict IDH mutation status in gliomas, and subsequently, could assist in the decision-making process of pretreatment.

PO-0181

Association between white matter hyperintensities and altered cerebral blood flow in maintenance hemodialysis patients: a longitudinal study

Hao Wang, Mingan Li, Wenbo Yang, Lijun Song, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objectives: To explore changes in cerebral blood flow (CBF) and white matter in hemodialysis patients.

Methods: Thirty-three hemodialysis patients who underwent two brain MRI at an interval of three years and 33 age- and sex-matched healthy controls (HC) underwent structural and arterial spin-labeling MRI examinations. Intergroup differences in CBF in the gray matter, white matter, and whole matter, and regional white matter hyperintensities (WMH) were analyzed. Based on the changes in CBF between the baseline and follow-up groups, the hemodialysis patients were divided into two subgroups: an increased CBF group and a decreased CBF group. Differences in CBF and WMH between the subgroups and HC were analyzed.

Results: Patients undergoing hemodialysis exhibited increased cerebral watershed (CW) WMH, deep WMH, and periventricular WMH ($P < 0.01$). The CBF of patients with decreased CBF was higher than that of HC at baseline ($P < 0.025$) and lower than that of HC at follow-up ($P < 0.025$). Compared with the increased CBF group, obvious development of deep WMH was found in the decreased CBF group for the gray matter, white matter, and whole matter ($P < 0.025$).

Conclusions: WMH in hemodialysis patients were distributed in the deep white matter, periventricular white matter and CW, and progressed with the extension of hemodialysis duration. CBF in hemodialysis patients could manifest as both increased and decreased, and WMH in patients with decreased CBF developed severely with prolongation of hemodialysis duration.

PO-0182

Accurate staging of Cerebral Venous Sinus Thrombosis using T1 SPACE: clinical experience

Yanan Ren
The first affiliated hospital of Zhengzhou University

Synopsis:

This study aims to explore magnetic resonance High-resolution Variable Flip Angle Turbo-Spin-Echo(T1 SPACE) technique for accurate staging of Cerebral Venous Sinus Thrombus(CVT). CVT patients confirmed by Computed Tomographic (CT) were randomly divided into three groups according to the time from the onset of symptoms to T1 SPACE. Signal to Noise Ratio(SNR) and Contrast to Noise Ratio(CNR) between thrombus and gray tissues/white tissues were calculated on every thrombus segments and difference between different groups were analyzed. Results indicate that T1 SPACE has the potential to be a promising tool for accurate diagnosis and staging of CVT.

Introduction:

Cerebral Venous Sinus Thrombosis (CVT) is a rare, life-threatening central nervous system disease that affects young individuals frequently¹. Effective treatment of CVT requires accurate evaluation of thrombus distribution and stage. However, for the non-specificity clinical manifestation and variety imaging features at different stages, accurate staging of CVT is currently a major clinical challenge². Several imaging techniques, such as Computed Tomographic venography (CTV), could detect CVT effectively but it cannot be used for CVT staging but also has the limitation to

severe renal insufficiency for the use of iodine-based contrast medium. As the clinically approved CVT diagnosis standard, PC-MRV exhibits thrombus as filling defect, but it lacks of the ability to stage CVT³. High-resolution T1 SPACE imaging has demonstrated a super approach that can early detect CVT with a high diagnostic accuracy for it permits direct visualization of thrombus⁴. In this study, we sought to use T1 SPACE technique for accurate staging of CVT.

Method:

This study was approved by the Institutional Review Board. 44 consecutive CVT patients (33±15 years old, 28 males, 16 females), confirmed by Computed Tomography (CT), were enrolled. MRI data were collected on a MAGNETOM Prisma 3T MR scanner (Siemens Healthcare, Erlangen, Germany) with a 64-channel head coil, including routine head scan, PC-MRV, and high-resolution T1 SPACE. The routine head scan included Fast Low Angle Shot sequence (FLASH) and T2-weighted Turbo Spin Echo (TSE) sequence. Detailed parameters of PC-MRV and the high-resolution T1 SPACE were shown in table 1.

CVT patients were divided into 3 groups based on the duration of clinical onset: acute stage (group1, ≤3 days), subacute stage (group2, between 4 days and 15 days), chronic stage (group3, between 16 days and 30 days)⁵. Cerebral venous sinus images obtained from all patients were reviewed separately for 10 venous segments as follows: superior sagittal sinus, inferior sagittal sinus, right transverse sinus, right sigmoid sinus, left transverse sinus, left sigmoid sinus, straight sinus, confluence of sinuses, deep venous, and cortical veins.

Thrombus signals were measured by averaging three independent and equally distributed regions of interest (ROIs) on thrombus segment. Two kinds of CNRs were calculated between thrombus and brain tissues (mean of 4 ROIs), including thrombus to gray matter and thrombus to white matter. In addition, SNR was calculated between thrombus and background noise drawn out from four symmetrically distributed corners of T1 SPACE images.

Statistical tests were used to assess CNRs and SNR among two different stages. Data distribution was evaluated for normality with Kolmogorov-Smirnov test and homogeneity of variance was evaluated with Levene test. One-way analysis of variance (ANOVA) was used to assess differences among different stages and Least significant difference (LSD)-t test was used for multiple pairwise comparisons.

Results:

65 thrombi segments were confirmed by CT in total. In the end, there were 7 thrombi in group 1, 36 thrombi in group 2, and 22 thrombi in group 3. A detailed overview of the quantitative results of T1 SPACE was summarized in Table 2. SNR and CNR values were all significantly different between two adjacent stages for group1 and group2 (SNR:87±18 vs.173±45; CNR: thrombus to gray matter: 1.13±0.34vs.2.12±0.53; thrombus to white matter:0.84±0.17vs.1.62±0.39; both $p<0.000$), for group2 and group3 (SNR:173±45vs.140±40, $p=0.006$; CNR: thrombus to gray matter:2.12±0.53vs.1.75±0.52, $p=0.009$; thrombus to white matter:1.62±0.39vs.1.36±0.39; $p=0.013$), respectively.

Discussion:

Figure 1. shows that, signals of CVT on conventional MR T1-, T2- weighted images change mutably, so it is hard to stage thrombus. PC-MRV would be filling defect when venous sinus is thromboembolic or blood stasis, which may lead to misdiagnosis of venous sinus atresia/hypoplasia or stenosis⁶. For the selective visualization of CVT, T1 SPACE exhibits acute thrombus as isointense, subacute thrombus as hyperintense and chronic thrombus as hyperintense/ isointense compared with brain tissues while venous lumen signals are hypointense. So T1 SPACE is more direct and convenient to stage CVT. Furtherly, our findings show that the signals of CVT change is first up in about 3-5 days, stable in about 20 days and fall to isointense or venous revascularization finally. This is because that the T1 was shortened when erythrocyte lysis—oxidation of iron turned to paramagnetic Fe³⁺, and then were prolonged with organization of the thrombus and recanalization⁷.

Conclusion:

Our findings show that T1 SPACE technique provides a novel staging criteria of CVT, and can be a promising first-line staging tool.

PO-0183

Regional changes of neuromelanin and iron in the substantia nigra of early Parkinson's disease

Yufan Chen¹, Tao Gong¹, Changyuan Xu², Mengyuan Zhuo³, Yang Zhao², Yubo Liu¹, Guangbin Wang^{1,2}

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. Shandong First Medical University

3. Shandong University

Objective: To investigate the changes of neuromelanin and iron in the substantia nigra subregion of early Parkinson's disease.

Methods: In this prospective study, 3D ME-MTC-NM sequence was performed in 30 patients with early PD and age-sex matched 70 healthy volunteers. Manual outlining and arithmetic methods were used to obtain neuromelanin accumulation, iron deposition and overlap regions. Using analysis of covariance, age was used as a covariate to compare the differences in volume, contrast ratio (CR) and/or susceptibility of the three sub-regions in early PD and healthy controls, and the receiver operating characteristic (ROC) curve was used to evaluate the diagnostic efficacy and the area under curve (AUC) was compared to determine the measurement index with optimal diagnostic efficacy.

Results: The volume ($P=0.023$) and CR ($P<0.001$) of neuromelanin accumulation regions in early PD patients were significantly lower than healthy controls (HC); the susceptibility in iron deposition regions was higher than that HC ($P=0.023$). The volume and CR of overlap regions were significantly lower in early PD patients than HC ($155.881\pm47.039\text{ mm}^3$, $176.671\pm37.367\text{ mm}^3$, $P=0.047$; 0.063 ± 0.034 , 0.133 ± 0.040 , $P<0.001$), while susceptibility was higher than HC (0.100 ± 0.020 , 0.091 ± 0.017 , $P=0.029$). The volume ($P=0.042$), CR ($P<0.001$) of neuromelanin accumulation regions and CR ($P<0.001$) of overlap regions could diagnosed early PD from HC, with AUCs of 0.650, 0.898, and 0.920, respectively. Of these, AUC for the CR in the overlap regions was significantly higher than the CR in the neuromelanin accumulation regions (0.920, 0.898, $P=0.018$).

Conclusion: The volume and CR of the overlap regions were reduced and the susceptibility was increased. In addition, the CR of the overlap region showed higher diagnostic efficacy in the diagnosis of early PD, suggesting that the reduced CR of the overlap regions may be a sign of early nigrostriatal degeneration in PD.

PO-0184

Based on CT plain scan, using 3D-Slicer to measure the effect of bleeding volume on the prognosis of posterior inferior cerebral aneurysm rupture

Guoping Zhang, Changlei Lü, Mingqing Kou, Yan Zhang, Minggang Huang, Xiaoli Chen

Shaanxi provincial people's hospital

Objective : To investigate the effect of 3D-Slicer based on CT scan on the prognosis of ruptured posterior inferior cerebral aneurysm.

Methods : A retrospective analysis of 18 patients with posterior inferior cerebral aneurysms admitted to our hospital from January 2018 to september 2023, excluding 6 cases of unruptured, untreated and followed up, and finally included 12 cases treated by surgical clipping or embolization. According to the modified Rankin score, they were divided into a good prognosis group and a poor prognosis group. According to the GCS score, they were divided into mild coma, moderate coma, and poisoning coma. The patient's gender, age, and aneurysm site were recorded. The

amount of subarachnoid hemorrhage, ventricular hemorrhage, and total bleeding were calculated, and their relationship with prognosis was analyzed.

Results : 7 cases had good prognosis and 5 cases had poor prognosis. There were 5 cases of mild coma, 2 cases of moderate coma and 5 cases of poisoning coma. Surgical clipping was performed in 10 cases and embolization in 2 cases. There was no significant difference in gender, age, admission GCS grade, subarachnoid hemorrhage, surgical method and prognosis. There were significant differences between the amount of intraventricular hematoma, the total amount of bleeding and the prognosis.

Conclusion : The amount of bleeding from posterior inferior cerebral aneurysm rupture has an effect on the prognosis. The amount of intraventricular hematoma and the total amount of bleeding in the poor prognosis group are higher than those in the good prognosis group.

PO-0185

Aberrant functional and causal connectivity of the amygdala in herpes zoster and postherpetic neuralgia patients

Xiaofeng Jiang,jian jiang
The First Affiliated Hospital of Nanchang University

Background: Resting-state functional magnetic resonance imaging (rs-fMRI) and Granger causality analysis (GCA) were used to observe the characteristics of amygdala and whole-brain effect connections in patients with herpes zoster (HZ) and postherpetic neuralgia (PHN) and to determine their relationship with clinical features.

Method: Rs-fMRI scans were performed on 50 HZ; 50 PHN; and 50 age-, sex- and education-year-

matched healthy controls (HCs). Bilateral amygdala subregions were used as seeds for functional connectivity (FC). GCA was used to analyze the effective connection of brain regions that were significantly different among groups. Then the correlation between FC, and GCA values and clinical indices was investigated.

Results: PHN had impaired FC between the amygdala subregion with the putamen, cortex, anterior cingulate cortex (ACC) to HCs and reduced FC of medial amygdala (MeA) with the parieto-occipital lobe and motor cortex to HZ;

HZ had reduced FC of the lateral amygdala (LA) with the insula to HCs. GCA values from the bilateral LA to the bilateral ACC, left MeA to the bilateral ACC and left putamen, and right ACC to the bilateral MeA were reduced in PHN patients compared to

HCs. Compared with HCs, the GCA values from the left MeA to the left ACC and right putamen were reduced in HZ. The GCA values from the amygdala subregion to the ACC were positively correlated with HAMA or HAMD scores in PHN.

Conclusion: PHN showed reduced FC between the amygdala subregions and cortico-putamen and decreased effective connectivity from the amygdala subregion to the ACC and putamen.

PO-0186

Altered small-world, functional brain networks in patients with lower back pain

Jian Jiang, yanwei miao
The First Affiliated Hospital of Dalian Medical University

The purpose of this study is to investigate the functional network changes that occur in patients with lower back pain (LBP), and the link between LBP and the small-world properties of functional networks within the brain. Functional MRI (fMRI) was performed on 41 individuals with LBP and 57 age and gender-matched normal controls during the resting state. The severity of the pain in the individuals with LBP ranged from 5 to 8 on a 0–10 scale (0-no pain). Network-based statistics were performed to investigate the differences between the brain networks of individuals with LBP and the normal controls. Several small-world parameters of brain networks were calculated. These criteria reflect the overall network efficiency. The brain networks in the individuals with LBP due to herniation of a lumbar disc demonstrated a significantly longer characteristic path length as well as a lower clustering coefficient, global efficiency, and local efficiency compared to those in control subjects. We found that LBP patients tended to have unstable and inefficient brain networks when compared with healthy controls. In addition, LBP individuals showed significantly decreased functional connectivity in the anterior cingulate cortex, middle cingulate cortex, post cingulate cortex, inferior frontal gyrus, middle temporal gyrus, occipital gyrus, postcentral gyrus, precentral gyrus, supplementary motor area, thalamus, fusiform, caudate, and cerebellum. We believe that these regions may be involved in the pathophysiology of lower back pain.

PO-0187

Metaverse in Neuropsychiatric Imaging Research of Substance Use Disorders: A Promising Frontier

Lijie Zhang, Longtao Yang, Jun Liu
The Second Xiangya Hospital of Central South University

Aims: Substance use disorders (SUDs) are global public health problems that require urgent attention. The metaverse medical paradigm is expected to open up novel ideas for inhibiting relapse to substances. We summarized the relevant researches in recent years, aiming to provide a reference for exploring more effective addiction treatment and personalized biomarkers in the future.

Methods: We conducted a review by searching electronic databases PubMed, Embase, and Google scholar for papers published until June 2023.

Results: We screened 387 abstracts and analyzed 48 articles, dividing them into two categories, the first category is used for neuroimaging studies based on metaverse cue exposure, and the second category is used to evaluate the efficacy of combining metaverse with withdrawal treatment.

Discussion: Metaverse technology presents a promising approach for providing effective education and psychological training without causing harm to patients and is a powerful and potential tool for evaluating and treating SUDs.

PO-0188

Impaired interhemispheric synchrony in Parkinson's disease patients with progressive cognitive impairment

Xinhui Wang, Naying He, Fuhua Yan, Yu Liu, Youmin Zhang
The Department of Radiology, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective: To elucidate functional interhemispheric coordination in Parkinson's disease (PD) with progressive cognitive impairment (pPD).

Methods: Forty-two PD with stable cognitive performance (sPD) patients, 26 pPD patients, and 19 healthy controls (HCs) were recruited. All subjects underwent T1-weighted and resting-state functional magnetic resonance imaging scanning. Voxel-mirrored Homotopic Connectivity (VMHC) value was applied to represent the synchrony of homotopic connections between hemispheres. The receiver operating characteristic curve analyses were performed, and area under the curve (AUC) was calculated.

Results: The pPD group showed decreased VMHC value in the superior temporal gyrus and inferior parietal lobule compared with sPD group. The pPD group showed a lower VMHC value in the postcentral gyrus. In addition, the VMHC value of these two regions also showed a positive correlation with cognitive function. the AUC of VMHC value of the superior temporal gyrus and inferior parietal lobule were 0.84 and 0.83, respectively.

Conclusion: The destruction of homotopic connectivity is related to cognitive impairment, and the VMHC value in superior temporal gyrus and inferior parietal lobule could be a potential neuroimaging feature discerning pPD patient.

PO-0189

Noninvasive Detection of Brain Glioma Temperature using Magnetic Resonance Spectroscopy: A Preliminary Study

Yahong Tan
Chinese people PLA general medical school

Abstract

Purpose Cerebral gliomas are the second most common type of primary central nervous system (CNS) tumor. However, many potential parameters of glioma still need to explore using MR. The aim of our study is to compare the temperature difference between the glioma tissue and normal tissue based on voxel using Magnetic Resonance Spectroscopy (MRS) thermometry.

Materials and Methods In this case-control study conducted between September 2022 and August 2023, and 22 glioma patients and 26 age- and sex-matched healthy controls were included. A total of 291 voxels were acquired and categorized into three groups based on voxels location, 138 normal voxels from healthy control (Group1), among glioma participants, 88 normal voxels from contralateral hemisphere of the lesion (Group2) and 65 voxels from lesion area (Group3), respectively. Conventional magnetic resonance imaging (MRI), including the pre-contrast T1-Weighted Image (T1WI), T2-Weighted Image (T2WI), Diffusion Weighted Imaging (DWI), T2-Fluid-Attenuated Inversion Recovery (T2-FLAIR), post contrast T1WI and MRS were performed in all participants. MRS data was analyzed by LCModel to estimate voxels temperature. All participants with glioma enrolled in this research received surgery operation, and the final diagnosis of participants with glioma was confirmed by histopathology. Statistical analysis was performed using R in Rstudio, $P < 0.05$ was considered to be statistically significant.

Results The mean age in years of Group1, Group2 and Group3 is 45.52 ± 13.19 , 45.49 ± 13.32 , and 46.13 ± 13.33 , respectively. The Kruskal-Wallis test demonstrated significant differences in the temperature between the three groups ($P < 0.001$). The Wilcoxon rank-sum test further showed that

the temperature of the glioma voxel was significantly lower compared to normal voxels in glioma patients ($P < 0.001$) and in healthy controls ($P < 0.001$), while the temperature of normal voxels between glioma participants and healthy controls did not show statistical difference.

Conclusion This study demonstrated abnormal temperature variations in glioma patients compared to normal brain tissue, offering potential insights for the diagnosis and clinical management of glioma patients.

PO-0190

Alteration of Static and Dynamic Intrinsic Brain Activity Induced by Short-term Spinal Cord Stimulation in Postherpetic Neuralgia Patients

chunxiao bu

the First Affiliated Hospital of Zhengzhou University

Introduction: Short-term spinal cord stimulation (stSCS) is an effective treatment for postherpetic neuralgia (PHN). However, how exactly stSCS affects time-dynamic intrinsic brain activity in PHN patients is not clear. The purpose of this study was to examine the static and dynamic variability of neural activity in PHN patients after stSCS. **Methods:** In this study, 10 patients with PHN underwent resting-state functional magnetic resonance imaging (rs-fMRI) at baseline and after SCS. The amplitude of low-frequency fluctuations (ALFF) and dynamic ALFF (dALFF) were used to investigate the static and dynamic variability of neural activity in PHN patients after stSCS. We additionally examined the associations between clinical parameters and functional changes in the brain. **Results:** There was a significant increase in dALFF in the left precuneus and right superior parietal gyrus, and a decrease in dALFF in the left inferior temporal gyrus, right rectus gyrus, left superior temporal gyrus, orbital part of right medial frontal gyrus, and orbital part of left superior frontal gyrus. There was significantly increased ALFF in the right inferior temporal gyrus, and decreased ALFF in the right lingual gyrus, left superior parietal gyrus, right superior parietal gyrus, and left precuneus. Furthermore, Pittsburgh sleep quality index scores were positively associated with dALFF changes in the left superior temporal gyrus and orbital part of left superior frontal gyrus. Hospital anxiety and depression scale scores and continuous pain scores exhibited significant negative correlation with dALFF changes in the right superior parietal gyrus. **Conclusion:** This study indicated that stSCS is able to cause dALFF changes in PHN patients, thus stSCS might alter brain functions to relieve pain, sleep, and mood symptoms. The findings provide new insights into the mechanisms of stSCS efficacy in the treatment of patients with PHN.

PO-0191

Gray matter morphological abnormalities are constrained by normal structural covariance network in OCD

Baohong Wen, Yinhan Xu, Keke Fang, Qiuying Tao, Zijun Liu, Wenqing Shi, Yong Zhang, Jingliang Cheng, Shaoqiang Han

the First Affiliated Hospital of Zhengzhou University

Purpose: A growing body of evidences reveal that abnormal gray matter morphology is constrained by normal brain network architecture in neurodegenerative and psychiatric disorders. However, whether this finding holds true in obsessive-compulsive disorder (OCD) remains unknown. In the current study, we aimed to investigate the association between gray matter morphological abnormalities and normal structural covariance network architecture in OCD. **Methods:** First, gray matter morphological abnormalities were obtained between 98 medicine-naïve and first-episode

patients with OCD and 130 healthy controls (HCs). Then, putative disease epicenters whose structural connectome profiles in HCs most resembled the morphological differences pattern were identified using a backward stepwise regression analysis. **Results:** A set of brain regions were identified as putative disease epicenters whose structural connectome architecture significantly explained 59.94% variance of morphological abnormalities. These disease epicenters comprised brain regions implicated in high-order cognitive functions and sensory/motor processing. Other brain regions with stronger structural connections to disease epicenters exhibited greater vulnerability to disease.

Conclusion: These results suggest that gray matter abnormalities are constrained by structural connectome and provide new insights into the possible pathological progression in OCD.

PO-0192

Cerebral blood flow changes and their genetic mechanisms in COVID-19: a combined neuroimaging and transcriptome study

Yao Wang, Fuqing Zhou
Nanchang University

Objectives: Extensive studies have shown Coronavirus Disease 2019 (COVID-19) is a disease strongly associated with genetics, and neuroimaging studies have found that COVID-19 patients have reduced cerebral blood flow (CBF), but the relationship between CBF changes and gene expression remains unclear. Therefore, our study aims to explore the genetic mechanisms of CBF abnormalities in COVID-19.

Methods: From January to April 2023, this study prospectively collected 51 COVID-19 patients and 30 healthy controls (HCs). All subjects underwent arterial spin labeling (ASL) perfusion imaging, and the between-groups CBF changes were obtained by using a two-sample T test. In combination with the Allen Human Brain Atlas (<http://www.brain-map.org>), transcriptome-neuroimaging spatial association analyses were conducted to identify genes whose expression correlated with CBF changes in COVID-19 after strict multiple comparison and spatial autocorrelation corrections. These genes were analyzed on the COVID-19 Disease Portal (<http://geneontology.org/covid-19.html>) for a series of functional annotations.

Results: Compared to HCs, COVID-19 patients showed decreased CBF in the left superior temporal gyrus, middle frontal gyrus, inferior frontal gyrus and supplementary motor area (GRF corrected, voxel-level at $P < 0.001$, cluster-level at $P < 0.01$). Moreover, these CBF changes were spatially associated with the expression of 2918 genes. Further analysis of enrichment suggested that these COVID-19-related gene were highly associated with coronavirus infection and enriched in COVID-19-related important molecular functions (electron transfer activity, RNA binding and protein binding), biological processes (regulation of cell cycle, cellular process, and cytoplasmic translation) and cellular components. Meanwhile, these COVID-19-related genes are specifically expressed in brain tissue and neuronal cells of the adult cerebral cortex.

Conclusion: Our findings suggest a cerebral perfusion reduce in COVID-19 patients, which may be a consequence of complex interactions of a wide range of COVID-19-related genes.

PO-0193

Correlation between changes of brain ALFF and cognitive impairment in patients with neuropsychiatric lupus

Yue Ma, Sha Ni, Xueying Ma, Pengfei Qiao
Affiliated Hospital of Inner Mongolia Medical University

objective: To explore the relationship between brain function changes and clinical serological indicators and behavioral cognitive assessment in NPSLE patients, and to understand the pathogenesis of NPSLE from the perspective of imaging. **Methods:** The resting-state functional imaging data, clinical serological and behavioral cognitive assessment scores of 55 NPSLE patients and 32 HC patients were prospectively collected. The ALFF obtained from the analysis and processing were correlated with the serological data and behavioral cognitive assessment scores to find out the relationship between these data. **Results:** The average age of the NPSLE group was older than that of the HC group, and there were significant differences in education level, AVLT-H and TMT scores between the two groups. The NPSLE group showed increased brain activity in the insula, precentral gyrus and superior temporal gyrus, and decreased brain activity in the superior parietal gyrus. The ALFF of the insula was positively correlated with Anti- β 2gp1 antibody, and negatively correlated with Anti-nucleosome antibody and AVL-RC. The ALFF of the precentral gyrus was negatively correlated with AVL-I, AVL-SR and AVL-LR. The ALFF of the superior temporal gyrus is negatively correlated with AVL-RC. The ALFF of the left superior parietal gyrus was positively correlated with CRP. The ALFF of the right superior parietal gyrus was positively correlated with SLEDAI and negatively correlated with AVL-I. **Conclusion:** NPSLE patients show different brain activity changes in different brain regions, and the abnormal brain regions are correlated with some lupus antibodies, inflammatory factors and cognitive assessment, suggesting that the correlation between the three may provide insights into the pathogenesis of NPSLE.

PO-0194

Glioblastoma phenotypes based on MR imaging radiomic features had diversity recurrence patterns

Hong Guo
Daping Hospital, Army Medical University

Objective: The recurrence or progression of glioblastoma (GBM) after treatment is inevitable. We sought to explore non-invasive radiomic characterization of MR could assist in reflection diverse patterns of GBM progression.

Methods: Three recurrence patterns (Rps), including local, diffusion and distant recurrence (83, 18, 11 cases, respectively), were categorized according to the spatial location and signal characteristics of recurrent lesions in conventional MRI images in 112 patients. Quantitative image features capturing the shape, texture, edge sharpness, wavelet features from the whole tumor (WT) were extracted. All the image features were analysed by consensus clustering with 10,000 iterations to classify GBM phenotypes. Median progression-free survival (PFS) and overall survival (OS) of Rps and radiomic-based phenotypes were estimated using Kaplan-Meier method. When comparing clinical features, including sex, age, boundary, non-enhancement region and enhancement-pattern (rim-like, irregular and solid enhancement) differences among phenotypes, we performed the Kruskal-Wallis test for continuous variables and the Fisher's exact test for categorical variables. Finally, regression analysis was used to obtain significant clinical parameters for each phenotype group.

Results: The median PFS (4.8 M, 8.9 M, 5.7 M, $P = 0.05$) and OS (12.3M, 21.0M, 12.5M, $P = 0.52$) of local, diffusion and distant recurrence. Three distinct radiomic-based phenotype, including phenotype 1-3 (each phenotype contained patients 58, 48, 6 cases respectively), emerged in our cohort. The median PFS (5.5M, 8.4M, 8.6M, $P = 0.05$) and OS (10.4M, 19.4 M, 10.0 M, $P = 0.016$) of phenotype 1- 3. We found that phenotype 1, 2 mainly includes local recurrence and diffusion recurrence, while distant recurrence was distributed in all three phenotype ($P = 0.03$). Univariate regression analysis showed sex, non-enhancement region and enhancement pattern had statistical significance for each phenotype. However, the non-enhancement region had significance in multiparameter regression analysis.

Conclusions: Phenotype based on non-invasive radiomic characterization of MR hold different recurrence or progression pattern after treatment.

PO-0195

Choroid Plexus Volume Change-A Candidate for a New Radiological Marker of PD

Chenghao Cao
West China Hospital Sichuan University

Objects: This study aims to investigate the choroid plexus (CP) volume alterations in the early and advanced stage of Parkinson's disease (PD) patients

Methods: We enrolled 54 PD patients (PD-early stage, 33; PD-advanced stage, 21) and 48 healthy controls (HC). Freesurfer software was used for CP reconstruction and volumetric calculation on three-dimensional T1-weighted images data. Furthermore, we analysed the correlation between CP volume and gray matter volume, ventricular system and clinical variables

Results: Compared with HC, significant increased bilateral CP volume was observed in PD-early stage patients. In PD patients, the volume of bilateral choroid plexus was positively correlated with bilateral lateral ventricle, third ventricle, forth ventricle, and CSF. In addition, a significant negative correlation was found between the left choroid plexus volume and left amygdale volume. We also observed significant negative correlation between right CP volume and HAMD scores in PD patients

Conclusions: CP plays an important role in the pathogenesis of PD and can be regarded as a biomarker indicating PD in the early stage

PO-0196

Subdivisional Iron Deposition and “Swallow Tail Sign” of Substantia Nigra in Relapsing Remitting Multiple Sclerosis Patients with Different Disease Duration by Quantitative Susceptibility Mapping

Chun Zeng, Yong-mei Li, Fei-yue Yin
the First Affiliated Hospital of Chongqing Medical University

Objective To study the iron accumulation in SN subdivisions and the “swallow tail sign” in MS patients. Materials and methods Fifty-three RRMS patients (18 with DDs ≤ 5 years [Group Les], 17 with DDs 5-10 years [Group Mid], and 18 with DDs > 10 years [Group Mor]) and 37 controls (Group Con) underwent QSM. Each SN was divided into rostral anterior- and posterior-SN, caudal anterior- and posterior-SN. QSM values were measured in the anterior- and posterior-SN. “Swallow tail signs” of the SN were observed. Results The QSM values of the rostral pSNs were higher in

the Group Les than the Group Con ($P < 0.001$). The QSM values of the rostral pSN in the Group Mid were higher than the Group Con ($P < 0.05$). The QSM values of the rostral aSN in the Group Mid was higher than the Group Con ($P < 0.01$). The QSM values of the rostral aSN and pSN in the Group Mor were higher than the Group Con ($P < 0.05$). At the level of the caudal SN, the QSM values in the Group Mid were higher than the Group Con and the Group Les ($P < 0.05$). There were positive correlations between "swallow tail sign" scores and QSM values of the caudal pSN in the Group Mid and Group Mor ($P < 0.05$).

Conclusion This preliminary study providing objective evidence of the iron-related progression of SN subregions in RRMS patients with different DDs, and abnormal "swallow tail sign" may provide an additional imaging maker for MS patients.

PO-0197

Comparison of 7T TOF-MRA and 3T TOF-MRA in Assessment of Moyamoya Disease

Qi Duan, Jinhao Lyu, Runze Li, Chenxi Li, Xin Lou
Chinese PLA General Hospital

BACKGROUND Moyamoya disease (MMD) is a chronic cerebrovascular disease with progressive steno-occlusion of the internal carotid arteries and compensatory "puff of smoke" collateral network, which is a leading cause of stroke in pediatric and young patients. Digital subtraction angiography (DSA) is considered the gold standard for diagnosing and assessing MMD but invasively. Time-of-flight MRA (TOF-MRA) is widely accepted as a noninvasive diagnostic modality for evaluating MMD. 7T TOF-MRA enables the visualization of the smaller distal intracranial vessels, even the "puff of smoke" collateral network in MMD. We aim to compare 7T TOF-MRA and 3T images for MMD diagnosis.

METHODS 7T TOF-MRA and 3T TOF-MRA data from each patient were collected. 7T TOF-MRA acquisition by a 7T whole-body MR scanner (MAGNETOM Terra, Siemens Healthcare, Erlangen, Germany) equipped with an 8-channel transmitting and 32-channel receiving head coil. 3T TOF-MRA acquisition by a 3T whole-body MR scanner (Discovery MR750; General Electric, Milwaukee, WI, USA) with a 32/8-channel phased-array head coil. Image quality was rated from 0 to 5 (poor to good). Visualization of vascular disease was rated from 0 to 3 (poor to good). Grading the Houkin's grading system of each symptomatic hemisphere by using 7T TOF-MRA and 3T TOF-MRA. Grading the Suzuki staging system of each symptomatic hemisphere by using DSA.

RESULTS Seven MMD patients with 13 symptomatic hemispheres were enrolled (mean age, 40.42 years \pm 6.29, 4 men). The Image quality score of 7T TOF-MRA was better than 3T (4.86 ± 0.38 vs 4.71 ± 0.49). 7T TOF-MRA visualizes the small vascular excellent compared to 3T (3 vs 2.43 ± 0.53). The value 0.745 (95%CI, 0.579-0.911) of Kappa was good for Houkin's grading system assessment between 7T TOF-MRA and 3T. The results of Spearman's correlation showed that the correlation of the Suzuki staging system on DSA was strong with both Houkin's grading system grading on 7T TOF-MRA ($r_s=0.775$, $p=0.002$) and 3T ($r_s=0.695$, $p=0.008$).

CONCLUSION 7T TOF-MRA enables the visualization of the small vessel clearly for MMD patients in a noninvasive way better than 3T.

PO-0198

Predictive Value of Integrated PET/MR Indicators for Early Detection of Ischemic Brain Changes Following CAS Stenting

Senhao Zhang, Shaozhen Yan, Jie Lu
Xuanwu hospital Capital medical university

Background and Objective: Carotid Artery Stenting (CAS) is an established treatment for carotid artery stenosis. New ischemic brain lesions on diffusion-weighted Images (DWI) appearing perioperatively are one of the common postoperative imaging manifestations, which may be related to the preoperative morphology of the vessel, plaque characteristics, and inflammatory uptake. Therefore, early identification and prediction of new ischemic brain lesions on DWI that may occur within the perioperative period (within 3 days) after CAS stenting are crucial for predicting high-risk patients for recurrent ischemic stroke.

Methods: In this retrospective study, 50 patients who underwent CAS were included. All participants received integrated carotid PET/MR examination before surgery and routine brain MR examination after treatment. Experienced clinicians determined the responsible carotid artery based on symptoms and record reviews. Lumen and outer wall boundaries were segmented on hrVWI, as well as atherosclerotic components, and complicated carotid artery plaques (AHA-lesion type VI) were defined by multi-sequence contrast enhancement. The standardized uptake value and the tissue-to-background ratio quantified the ^{18}F -NaF uptake, and the validated symptomatic carotid atheroma inflammation lumen-stenosis (SCAIL) score included stenosis severity and inflammation measured by PET. Welch, χ^2 , Wilcoxon, or Fisher tests were used to assess statistical significance. The primary outcome was new ischemic brain lesions on DWI, and a multivariate model was established to evaluate the relationship between imaging biomarkers and new infarction changes. **Results:** A total of 50 participants were included in the study (mean age, 65.2 years \pm 6.85 [SD]; 45 were male, 20 of whom had symptomatic carotid stenosis). Of these 50 participants, 33 (66%) exhibited new ischemic brain changes. The new ischemic brain lesions on DWI were located in (26%, 13/50) and/or beyond (38%, 19/50) the territory of the treated artery. In the adjusted model, higher SUV max (>2.86), thin fibrous cap, complicated carotid artery plaques was an independent predictor of new ischemic brain lesions, with an odds ratio (OR) of 9.1 (95% CI: 1.1, 77.8), 5.53 [1.08, 28.18], 7.06 [1.39, 35.87]. Further analysis revealed that the constructed predictive model had an area under the ROC curve (AUC) value of 0.79 for new ischemic brain lesions on DWI.

Conclusion: Integrated carotid PET/MR-related indicators can effectively predict the risk of new ischemic brain lesions on DWI during the perioperative period after CAS stenting, providing important references for early identification of high-risk patients for recurrent ischemic stroke after surgery. Further large-scale randomized controlled studies are necessary to validate the clinical application value of these indicators.

PO-0199

Resolving heterogeneity in depression using individualized structural covariance network analysis

Ya Tian, Shaoqiang Han, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objective: we aimed to identify individualized structural covariance aberrance with the help of individualized differential structural covariance network analysis (IDSCN).

Methods: T1-weighted anatomical images of 195 first-episode untreated patients with depression and matched healthy controls (HCs, $n = 78$) were acquired. We obtained IDSCN for each patient and identified subtypes of depression based on shared differential edges.

Results: patients with depression demonstrated tremendous heterogeneity in the distribution of differential structural covariance edges. Despite this heterogeneity, altered edges within subcortical-cerebellum network were often shared by most of patients. Two robust neuroanatomical subtypes were identified. Specifically, patients in subtype 1 often shared decreased motor network related edges. Patients in subtype 2 often shared decreased subcortical-cerebellum network related edges. Functional annotation further revealed that differential edges in subtype 2 were mainly implicated in reward/motivation related functional terms.

Conclusions: In conclusion, we investigate individualized differential structural covariance and identify that decreased edges within subcortical-cerebellum network are often shared by patients with depression. The identified two subtypes provide new insights into taxonomy and facilitate potential clues to precision diagnosis and treatment of depression.

PO-0200

Resolving heterogeneity in obsessive compulsive disorder through individualized differential structural covariance network analysis

Ya Tian, Shaoqiang Han, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objective: The high heterogeneity of obsessive compulsive disorder (OCD) denies attempts of traditional case-control studies to derive neuroimaging biomarkers indicative of precision diagnosis and treatment. To handle the heterogeneity, we uncovered subject-level altered structural covariance by adopting individualized differential structural covariance network (IDSCN) analysis.

Methods: The IDSCN measures how structural covariance edges in a patient deviated from those in matched healthy controls (HCs) yielding subject-level differential edges. One hundred patients with OCD and 106 HCs were recruited and whose T1-weighted anatomical images were acquired. We obtained individualized differential edges then clustered patients into subtypes based on these edges.

Results: Patients presented tremendously low overlapped altered edges while frequently shared altered edges within subcortical-cerebellum network. Two robust neuroanatomical subtypes were identified. Subtype 1 presented distributed altered edges while subtype 2 presented decreased edges between default mode network and motor network compared with HCs. Altered edges in subtype 1 predicted the total Yale–Brown Obsessive Compulsive Scale score while that in subtype 2 could not.

Conclusions: We depict individualized structural covariance aberrance and identify that altered connections within

subcortical-cerebellum network are shared by most patient with OCD. These two subtypes provide new insights into taxonomy and facilitate potential clues to precision diagnosis and treatment of OCD.

PO-0201

Prediction of meningioma subtypes using a novel single-shot ultrafast T2 mapping pulse sequence

Zongye Li¹, Xiao Wang¹, Yong Zhang¹, Congbo Cai², Shuhui Cai², Zhong Chen¹, Jianfeng Bao¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. School of Electronic Science and Engineering · Xiamen University

This study aims to explore the efficacy of ultrafast T2 mapping using Multiple Overlapping-Echo Detachment Imaging (MOLED) in predicting histological subtypes and Ki-67 index of WHO grade 1 meningiomas. Involving 75 patients, the study compared two different Region-of-Interest (ROI) placements for diagnostic efficiency. Results indicated that T2 histogram parameters could effectively differentiate meningothelial meningiomas from other subtypes in both ROIs ($P = 0.036$ - 0.001 for ROI1 and $P = 0.027$ - 0.001 for ROI2). T2 variance was especially effective, achieving the highest Area Under the Curve (AUC) for both ROIs. Importantly, no significant difference in diagnostic performance between the two ROI placements was found ($P = 0.875$). While the Ki-67 index, a marker for cell proliferation, didn't vary significantly among subtypes, it did show significant correlation with specific T2 histogram parameters. The study validates MOLED's clinical potential in preoperative tumor evaluation.

PO-0202

Mapping of iron deposition gradients in the nigrostriatal system in normal aging and Parkinson's disease

Jiaqi Wen, Xiaojun Xu

The Second Affiliated Hospital of Zhejiang University School

Objective Degeneration of the nigrostriatal dopaminergic system is the main cause of Parkinson's disease (PD). In this study, the spatial changes (i.e., gradients) of iron deposition in substantia nigra (SN) and striatum were mapped to understand the basal ganglia degeneration in normal aging and PD.

Methods A total of 100 healthy young people, 171 normal elderly and 231 PD patients were enrolled in this study. The brain iron content of all subjects was measured by quantitative susceptibility mapping (QSM). An automatic procedure generate QSM functions along the main axis of a subcortical structure at the individual subject level was used to identify and quantify spatial gradients of iron deposition in individual human brains in vivo.

Results During normal aging, iron deposition along the three main axes of the striatum (caudate and putamen) was significant in almost all segments ($p < 0.05$), except for the most medial caudate nucleus (segment 1 of medial-lateral axis); Iron deposition along the three main axes of the SN was more significant in the anterior, posterior, medial, lateral, and dorsal segments ($p < 0.05$).

In PD patients, SN iron deposition was mainly concentrated in the central parts ($p < 0.05$) compared with normal elderly, and putamen iron deposition was found only in the most dorsal part (segment 7 of the ventral-dorsal axis). In addition, the iron content of the anterior, medial, ventral, and dorsal caudate nucleus was higher in normal elderly than in PD patients ($p < 0.05$).

Conclusion The preliminary results of our study reveal the spatial gradient of iron deposition in the nigrostriatal system in normal aging and PD in vivo, providing more subtle and profound insights into the pathological changes of subcortical nuclei during neurodegeneration.

PO-0203

Artificial Intelligence Imaging for Predicting High-Risk Molecular Markers of Gliomas

Qian Liang, hui zhang
First Hospital of Shanxi Medical University

Glioma is the most common primary malignant tumor of the central nervous system. The fifth edition of the World Health Organization Classification of Tumors of the Central Nervous System (WHO CNS5) published in 2021 incorporated high-risk molecular markers of gliomas, which can enhance the grade of gliomas and affect glioma patients' survival and prognosis. It is of great significance for the diagnosis and prognosis of gliomas to noninvasively predict glioma high-risk molecular markers. The current gold standard for determining the molecular type is genetic testing after biopsy, which is invasive and time-consuming. Magnetic resonance Imaging (MRI) is a noninvasive tool that can provide both structural and functional information about gliomas, but it is difficult to comprehensively reflect the high heterogeneity of gliomas. Artificial intelligence (AI) imaging can mine plentiful information and extract valid information from large quantities of medical images for quantitative analysis, providing important molecular information. Herein, we present an overview of AI imaging for predicting high-risk molecular markers of gliomas and discuss the challenges and future perspectives.

PO-0204

Impact of white matter hyperintensity location on outcome in acute ischemic stroke patients: a lesion-symptom mapping study

Yuling Peng, Xiaoya Chen, Yongmei Li, Tianyou Luo
the First Affiliated Hospital of Chongqing Medical University

Background To investigate the association between white matter hyperintensity (WMH) location and outcomes in patients with their first-ever acute ischemic stroke using lesion-symptom mapping.

Methods Patients with first acute ischemic stroke from September 2021 to September 2022 were recruited. Demographic, clinical, and neuroimaging data were collected at baseline, and modified Rankin Scale (mRS) scores were assessed at 90 days after stroke to evaluate functional outcomes. The association between the location of WMH and clinical outcomes was assessed at the voxel level using voxel-based lesion symptom mapping and further, at the region of interest level employing ordered logistic regression.

Results A total of 137 patients with first-ever acute ischemic stroke were included (mean age, 66 years \pm 13 [SD]; 91 male [66.4%]). Median admission National Institutes of Health Stroke Scale was 3 [IQR, 1-5]. Median total WMH volume was 10.17 cm³ [IQR, 5.36–21.36 cm³]. WMH were associated with poor mRS at 90 days. Specifically, WMH damage in Anterior limb of internal capsule (R), Anterior corona radiata (R), Superior corona radiata (L), Posterior thalamic radiation (L), External capsule (L), Superior fronto-occipital fasciculus (L), Inferior fronto-occipital fasciculus (R), Inferior fronto-occipital fasciculus (L) were implicated in poor mRS.

Conclusion

WMH topography provides valuable anatomical insights into post-stroke prognosis, with specific regions strategically impacting functional outcomes.

PO-0205

Diffusion along the perivascular space as a potential biomarker for glioma grading and IDH1 mutation status prediction

Hongquan Zhu, Wenzhen Zhu

Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: The diffusion tensor image analysis along the perivascular space (DTI-ALPS) may potentially reflect lymphatic dysfunction in glioma patients. The study aimed to explore the correlation of DTI-ALPS with glioma grade and isocitrate dehydrogenase 1 (IDH1) genotype, and to compare ALPS-index with other diffusion metrics.

Methods: In this study, 81 glioma patients and 31 healthy controls underwent diffusion MRI examination. The ALPS-index, fractional anisotropy (FA), mean diffusivity (MD) and mean kurtosis (MK) were calculated. Comparisons were made between the bilateral hemispheres and between patients and controls. Differences in grade and IDH1 status were compared after age adjustment. Then diagnostic performance of each metric was assessed by receiver operating characteristic (ROC) analysis.

Results: In glioma patients, the ALPS-index ipsilateral to glioma was significantly lower than the contralateral ALPS-index (1.417 ± 0.177 vs. 1.478 ± 0.165 , $P=0.002$), and the bilateral ALPS-index values in patients were significantly decreased compared with those in healthy controls. The ALPS-index was significantly higher in lower-grade gliomas (LrGGs) than that in glioblastomas (GBMs) (1.495 ± 0.151 vs. 1.320 ± 0.159 , $P<0.001$), and was significantly lower in IDH1 wild-type LrGGs than those in IDH1 mutant LrGGs (1.400 ± 0.185 vs. 1.530 ± 0.123 , $P=0.036$). FA, MD and MK also showed significant differences between LrGGs and GBMs, and between IDH1 mutant LrGGs and wild-type LrGGs ($P<0.05$). Furthermore, adding ALPS-index to FA, MD or MK improved the discrimination abilities compared to metric alone. ALPS-index combining MD had the highest area under the curve (AUC) of 0.854 in glioma grading, and had the highest AUC of 0.861 in IDH1 mutation prediction.

Conclusions: The reduced ALPS-index might reflect the tumor-caused lymphatic system impairment and ALPS-index could play a complementary role to conventional diffusion metrics in glioma grading and IDH1 genotyping.

PO-0206

Investigation of grey matter abnormalities in patients with idiopathic generalized epilepsy: A neurite orientation dispersion and density imaging study

Feng Cui, Yi Lu, Yun Zhu, Heyi Gu, Bingbing Ling, Wen Zhao, Yizhen Zeng, Ting Zhou, Wanlin Jiang
The First Affiliated Hospital of Kunming Medical University

Purpose: Generalized abnormal brain discharges had been considered to be a main clinical features of patients with idiopathic generalized epilepsy (IGE) and may be associated with potential grey matter (GM) alternations. So we used the neurite orientation dispersion and density imaging (NODDI) model to determine the evidence of GM abnormalities in IGE patients.

Materials and methods: 19 IGE patients and 19 Health controls (HCs) were recruited in this study, clinical indicators and multi-shell diffusion images were collected for each participant. NODDI enabled to obtain parameters including neural density index (NDI), orientation dispersion index (ODI), and fractional anisotropy (FA) from diffusion images. Atlas-based analysis was used to

determine the diffusion abnormalities from each specific grey matter label and evaluate the correlations between GM alternations and clinical indicators. Finally, a robust machine learning model classified and ranked all GM features.

Results: IGE patients exhibited extensive reductions of NDI and ODI in GM. The decrease of NDI mainly concentrated in the prefrontal lobe, and the decrease of ODI almost accumulated in all the lobe. FA was only decreased in few GM. Moreover, the decreases of NDI and ODI in the GM especially the left orbitofrontal lobe were negatively correlated with the duration of IGE and the Quality of life in epilepsy-31 (QOLIE-31) scores. Machine learning indicated that the ODI in left margin superior gyrus may be a vital GM feature for IGE.

Conclusions: GM abnormalities, especially the decrease of neurite density and dispersion, are one of the characteristics of IGE and may reveal the neurophysiological mechanism of abnormal discharge in IGE patients.

PO-0207

Static changes in intrinsic brain activity in first-episode patients with obsessive-compulsive disorder

Qiuying Tao, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objective: Obsessive-compulsive disorder (OCD) is one of the top ten disabling diseases in the world and the fourth most common emotional disorder in clinical practice, with an annual prevalence rate of 1.1% -1.8% and a lifetime prevalence rate of about 1% -3%. However, the awareness rate of OCD among the general public (22.5%) and the treatment rate of OCD patients (34%) in China both are low. The most important reason is that the mechanism of OCD occurrence and development is not yet clear, this seriously hinders clinical diagnosis and treatment. Existing research has shown that drug use can affect changes in brain structure and function in patients with OCD. Our aim is to investigate the changes in brain neuronal functional activity during resting state in first-episode patients with OCD.

Method: 103 first-episode patients with OCD (49 females, average age 23.1 years) and 106 normal controls matched in age, gender, and education years (53 females, average age 23.1 years) were included. The resting-state functional magnetic imaging (rs-fMRI) scan was performed on a 3.0 Tesla MR scanner (Discovery MR750, General Electric, Milwaukee, WI, USA). All subjects were asked to close their eyes but to stay awake during the scan, without thinking about anything in particular. The rs-fMRI data were preprocessed by the Data Processing Assistant for Resting-State fMRI Analysis Toolkit (DPARSF), including deleting the first five volumes, removing head movements, spatial standardization, trending, time bandpass filtering, linear regression, spatial smoothing, and calculating frame level displacement at time points. Using a dual sample t-test, analyze whether there are statistically significant brain regions in the amplitude of low frequency fluctuation (ALFF) between the patient group and the control group.

Result: Compared with the control group, patients with OCD showed significant differences in left anterior cerebellar lobe (Number of voxels = 147, Peak MNI coordinate = 0, -48, -9, $t = -4.686$, $p < 0.001$), left medial frontal gyrus (Number of voxels = 59, Peak MNI coordinate = -12, -33, 63, $t = -4.705$, $p < 0.001$), left central posterior gyrus (Number of voxels = 44, Peak MNI coordinate = -42, -2, 57, $t = -4.633$, $p < 0.001$), right lingual gyrus (Number of voxels = 39, Peak MNI coordinate = 24, -57, -6, $t = -4.261$, $p < 0.001$) and right occipital lobe (Number of voxels = 33, Peak MNI coordinate = 30, -87, -9, $t = -4.259$, $p < 0.001$), which had reduced ALFF value, and no brain regions with elevated ALFF values were found.

Conclusion: First-episode patients with OCD exhibit spontaneous changes in neuronal activity in their brain regions during resting state, which may provide objective basis for further exploration of the pathogenesis and development of OCD.

PO-0208

The moderation effect of COVID-19 infection on the association between hyperarousal-related neural substrates and anxiety during the 1st wave of COVID-19 in China

Tao Lu

The First Affiliated Hospital of Xi'an Jiaotong University

Objective—PTSD is characterised by three core clusters of posttraumatic symptoms, together with disturbances in emotion regulation. One of its core symptoms, hyperarousal, which appears to be a physiological overreaction to the trauma, may represent an individual genetic susceptibility phenotype that can vary between individuals, rather than an acquired deficit. The present study examined the relationship between hyperarousal-related brain structural differences and anxiety disorders that are highly comorbid with PTSD, with hyperarousal as a mediator of this relationship. This study also examined the participants' COVID-19 infection status as a moderating factor in the mediated model.

Method—The total sample of 310 participants underwent neuropsychological measures and MRI scans, including Individuals with mild SARS-COV2 infection (COV+) (n=245) during the acute infectious phase (<28 days) and 65 healthy controls (COV-). Data analysis was performed using the SPSS PROCESS macro.

Results—Results show that GMV of the ventral anterior cingulate cortex (VACC) is negatively associated with hyperarousal. Furthermore, hyperarousal fully mediated the relationship between GMV in the VACC and anxiety symptoms. In the moderated mediation model, an individual's infection status significantly moderates the indirect effect of GMV in the VACC on anxiety by strengthening the mediating effect of hyperarousal on anxiety, which has no significant effect on uninfected individuals.

Conclusion—Our results suggest that the hyperarousal factor of PTSD acts as an important link from GMV in the VACC to anxiety disorders. This may provide novel insights into the neuroanatomical basis of hyperarousal vulnerability and contribute to the early identification of individuals at high risk of developing anxiety in a stressful environment similar to the COVID-19 pandemic.

PO-0209

Improved Brain Structural Health Related to Body Weight and Waist-to-hip Ratio Loss Especially among Overweight and Obese adults

Jing Sun¹, Shouling Wu², Zhenchang Wang¹, Han Lv¹

1. Beijing Friendship Hospital, Capital Medical University

2. Department of Cardiology, Kailuan General Hospital

Objective: This study aimed to examine the associations of long-term variability in general and central adiposity with neuroimaging metrics that approximate brain structural health.

Materials and Methods: This prospective cohort study recruited 1,114 participants aged 25-83 years from the META-KLS study, a subset of brain MRI acquisition within the Kailuan study. BMI and WHR variability during 12-year follow-up were calculated as the average slope incorporating all 7 biennial measurements respectively. We applied generalized linear models to investigate the associations of BMI and WHR variability with MRI markers of brain tissue volumes, white matter microstructural integrity, white matter hyperintensity, and cerebral small vessel diseases. **Results:**

Progressive weight gain during follow-up was associated with decreased global FA (beta = -0.19, 95% CI -0.35 to -0.02) and increased MD (beta = 0.16, 95% CI 0.01 to 0.31) and RD (beta = 0.18, 95% CI 0.03 to 0.33). Weight loss was also associated with a lower burden of PWMH (beta = -0.24, 95% CI -0.47 to -0.02) and a lower risk of moderate-to-severe BG-EPVS (odds ratio (OR) = 0.41, 95% CI 0.21 to 0.83). Among overweight populations, weight loss was linked with decreased volumes of WMH (beta = -0.47, 95% CI -0.79 to -0.15), PWMH (beta = -0.57, 95% CI -0.88 to -0.26), and DWMH (beta = -0.36, 95% CI -0.69 to -0.03), as well as lower risk of CSVD (OR = 0.22, 95% CI 0.08 to 0.62) and imaging markers of lacune (OR = 0.12, 95% CI 0.01 to 0.91) and moderate-to-severe BG-EPVS (OR = 0.24, 95% CI 0.09 to 0.61). Additionally, we observed that in adults classified as central obesity, WHR loss was positively associated with an increase in gray matter volume (beta = 0.50, 95% CI 0.11 to 0.89), hippocampus (beta = 0.62, 95% CI 0.15 to 1.09), and parahippocampal gyrus volume (beta = 0.85, 95% CI 0.34 to 1.37).

Conclusion: Progressive weight gain was associated with impaired white matter integrity. Weight and WHR loss were suggestively associated with improved general brain structural health. This present study contributes to a better understanding of the integrated relationship between variations in general and central adiposity and brain structural sub-health, especially in the early-stage prevention of adiposity causes of Alzheimer's disease, dementia, and stroke.

PO-0210

Disastrous Cerebral and Ocular Complications after Cosmetic Facial Filler Injections

Yuyun Xu, Fanfan Zhao
Zhejiang Provincial People's Hospital

Purpose: To investigate the clinical and radiological features of severe cerebral and ocular complications caused by cosmetic facial filler injections.

Methods: Patients with cerebral or ophthalmic complications from facial augmentation with filler injections from January 2017 to August 2023 were retrospectively obtained. The clinical, computed tomography (CT), magnetic resonance imaging (MRI), and digital subtraction angiography (DSA) findings were described and analysed.

Results: The patients with facial cosmetic filler injections were composed of twelve women with a mean age of 38.5 years (range, 22–61 years). Injected materials included hyaluronic acid (n = 10) and autologous fat (n = 2), and injection sites were the nose region (n = 5), glabellar (n = 3), cheek (n = 3), and preorbital (n = 1), respectively. The affected arteries included the central (n = 6) or branch (n = 2) retinal artery, ophthalmic artery (n = 4), and supraorbital artery (n = 1). Multifocal cerebral infarction was found in 5 patients (41.7%), with multiple haemorrhagic transformations in one patient and subarachnoid haemorrhage in another. Plain head CT scans revealed no abnormalities. CTA showed right ophthalmic artery occlusion (OAO) in three patients (25.0%). DSA showed complete or partial OAO in two patients (16.7%) and one patient had an occlusion of the left middle cerebral artery (MCA) with an embolism.

Conclusion: Radiological examinations are crucial to demonstrating severe complications, and brain MRI is especially strongly suggested in patients with cosmetic filler-induced vision loss to identify asymptomatic cerebral infarctions. Extreme caution and care should be taken during facial injections by plastic surgeons.

PO-0211

The prevalence of abnormal brain morphology in neurological disorders

Li Chai¹, Yin shan Wang², Zhi zheng Zhuo¹, Xi nian Zuo², Ya ou Liu¹

1. Beijing Tiantan Hospital Affiliated to Capital Medical University

2. Beijing Normal University

Objective To quantify and depict specific global and regional brain involvement rates across various neurological diseases, including inflammatory demyelinating diseases, autoimmune diseases affecting the central nervous system (CNS), neurodegenerative diseases, and cerebrovascular disease.

Method Based on brain charts, we investigated multiple neurological diseases, including inflammatory demyelinating diseases (MS, NMOSD, and MOGAD), autoimmune diseases affecting the central nervous system (NPSLE), neurodegenerative diseases (MCI, AD, PD), and cerebrovascular disease (cSVD) about normative structural brain changes across the lifespan to examine the prevalence of global and regional MRI phenotypes. Extreme negative deviations of MRI phenotypes were defined by centile scores < 2.5%. Correlations between centile scores of neurological diseases and cognition scores (MMSE and MoCA) were analyzed.

Results The highest proportion of extreme negative deviations of regional MRI phenotype was the entorhinal cortex in AD, MCI and MS (37.5%, 12.9% and 12.0%, respectively), the precentral gyrus in PD (12.4%), the lateral occipital gyrus in NMOSD (8.7%), the parahippocampal gyrus in MOGAD (18.5%), precuneus in NPSLE (11.8%) and inferior parietal gyrus in cSVD (6.0%). Among disorders in each global MRI phenotype, the highest proportion of extreme negative deviations of GMV and meanCT was seen in AD patients (18.0% and 27.9%, respectively). The highest proportion of extreme negative deviations of sGMV and WMV was seen in MS patients (26.3% and 12.2%, respectively). The highest proportion of extreme negative deviations of TCV and SA was seen in MOGAD (11.8%) and NPSLE patients (11.8%), respectively. A greater number of extreme negative deviations were associated with worse cognitive function in multiple neurological disorders.

Conclusions Based on brain charts, multiple neurological disorders showed the distinct prevalence of structure alterations, spatial patterns and heterogeneity characteristics. Individualized normative maps of brain charts provide an important clinical tool for screening, preclinical/prodromal prognosis and monitoring.

PO-0212

The effect of LRRK2 mutations on the cholinergic system in manifest and premanifest stages of Parkinson's disease: a cross-sectional free-water imaging study

Chao Wang

Department of Radiology, the Second Affiliated Hospital, Zhejiang University School of Medicine

Background: Markers of neuroinflammation exhibit elevated levels in some patients with LRRK2 Parkinson's disease (PD) compared with patients with idiopathic PD, suggesting possible differences in disease pathogenesis. An acetylcholinesterase PET study has suggested enhanced cholinergic activity and preserved cholinergic innervation in LRRK2 mutation carriers. Free-water imaging can predict and monitor dopamine system degeneration in patients with PD, and can also enhance the sensitivity of conventional diffusion tensor imaging (DTI) metrics for indexing neurodegeneration. We postulated that individuals with LRRK2 mutations might show abnormalities of free-water content in the cholinergic system using free-water imaging, even before the diagnosis of PD.

Methods: Between June, 2010, and May, 2023, we recruited participants from the Parkinson's Progression Markers Initiative (PPMI) study from 33 participating sites worldwide. LRRK2 carrier status was confirmed by genetic sequencing. We evaluated the effect of LRRK2 mutations on the cholinergic system (i.e. cholinergic basal forebrain and pedunculo pontine nucleus) in manifest and premanifest stages of PD using the free-water imaging. We compared free-water values between groups using ANCOVA, with adjustment for age based on the results of linear regression analysis. Then, the discriminative power of the free-water content was evaluated by receiver operating characteristic curve (ROC) analysis. In addition, partial correlation analyses were performed adjusting for age to determine the relationship between free-water content and clinical characteristics in PD patients.

Results: We recruited 27 patients with LRRK2 PD, 33 LRRK2 mutation carriers without PD, 281 patients with idiopathic PD, and 98 healthy controls. We noted significant between-group differences in free-water content in Ch4 ($p=0.003$). LRRK2 mutation carriers without PD had decreased free-water content in the Ch4 compared with healthy controls ($p=0.036$), and idiopathic PD patients ($p=0.001$); LRRK2 PD patients showed decreased tendency of free-water content in the Ch4 compared with idiopathic PD patients ($p=0.074$). Free-water content was associated inversely with age in all participants and healthy controls only. Furthermore, ROC analysis showed that free-water content in the Ch4 identified asymptomatic LRRK2 mutation carriers with a high specificity (84.7%). In addition, partial correlation analyses showed negative correlations between free-water content in the Ch4 and olfaction score in idiopathic PD patients ($p=0.013$, $r=-0.15$) and in pooled PD patients ($p=0.017$, $r=-0.137$).

Conclusion: LRRK2 mutation is associated with decreased free-water content in the Ch4 (also referred to as nucleus basalis of Meynert, nbM), which might suggest early and sustained attempts to compensate for LRRK2-related dysfunction. As an objective non-invasive and non-radiative neuroimaging technique, free-water imaging has the potential to be applied as an alternative imaging technique to PET to identify asymptomatic LRRK2 mutation carriers. In addition, increased free-water content in the nbM is associated with worse olfaction in PD patients.

Funding: This work was supported by National Natural Science Foundation of China (Grant No. 82302135).

PO-0213

Cerebellar functional network topology and alterations in motor circuit connectivity in spinocerebellar ataxia type 3

Bing Liu^{1,2}, Aocai Yang², Linwei Zhang², Jixin Luan², Kuan Lv², Pianpian Hu², Guolin Ma²

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. China-Japan Friendship Hospital

Objective To investigate the functional topological characteristics of cerebellar network connectivity and the role of functional connectivity (FC) in cerebellar-brain stem-thalamo-basal ganglia-cortical motor circuit in SCA3.

Materials and Methods Resting-state functional magnetic resonance imaging (rs-fMRI) from 17 SCA3 patients and 17 healthy controls (HCs) were analyzed using graph-theoretical approach for cerebellar functional network topology. Seed-based FC analyses at both voxel and region-of-interest levels were done for the cerebellar-brain stem-thalamo-basal ganglia-cortical motor circuit. Significant functional modifications of cerebellar network and motor circuit were correlated with disease duration, CAG repeats, and clinical scores.

Results SCA3 patients exhibited small-world organization, hierarchy manners and modular structures in cerebellar functional network, without significant topological changes. Modularity showed increased inter-modular connectivity between frontoparietal network and dorsal somatomotor network, and decreased intra-modular connectivity in cerebellar default mode network and the data-driven module2 in SCA3. Seed-based analyses for motor circuit demonstrated losses of dentate FC with left frontal cortex, pallidum FC with right thalamus, caudate

FC with left thalamus, red nucleus (RN) FC with bilateral thalamus. Within the motor circuit network, FC between thalamus and pallidum as well as thalamus and RN were lower. Further analysis showed significant correlations between aberrant FC alterations and CAG repeats, disease duration, and clinical scores.

Conclusion Our findings indicate a relatively preserved cerebellar functional topological architectures in SCA3, with specific modular alterations of cerebellar network and FC changes in key regions of motor circuit correlated to clinical variables, deepening the understanding of the cerebellar role in SCA3.

PO-0214

Changes in brain susceptibility in Wilson's disease patients: A quantitative susceptibility mapping study

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To reveal changes in the susceptibility of the caudate nucleus (CN), putamen (Put), and globus pallidus (GP) in patients with neurological and hepatic Wilson's disease (WD) by quantitative susceptibility mapping (QSM).

***Methods and Materials:** We retrospectively analyzed brain MRI images of 33 patients diagnosed with Wilson's disease (WD) and 20 age-matched controls. All subjects underwent brain T1-weighted, T2-weighted, and QSM images using a 1.5T MRI scanner. The QSM maps were calculated using STISuite toolbox. The quantitative susceptibility of the CN, Put, and GP was analyzed using region-of-interest analysis on QSM maps. The differences among the neurological WD patients, hepatic patients, and controls were compared.

***Results:** Susceptibility values were significantly higher in all examined structures (CN, Put, GP) in patients with neurological WD compared to controls (all $P < 0.05$) and hepatic WD patients (all $P < 0.05$). No statistically significant differences were found in susceptibility values between patients with hepatic WD and controls (all $P > 0.05$).

***Conclusions:** The QSM technique is a valuable tool for detecting changes in susceptibility in the brain of WD patients, indicating abnormal metal deposition. Notably, our findings suggest that neurological WD patients exhibit more severe susceptibility changes than hepatic WD patients. Therefore, QSM can be utilized as a complementary method to detect brain injury in WD patients.

PO-0215

Histogram analysis of MR perfusion imaging for glioma genotyping

Dandan Song

The First Hospital of China Medical University

Objectives To compare the diagnostic performance of histogram features of dynamic contrast enhanced (DCE) MRI and dynamic susceptibility contrast (DSC) MRI in predicting IDH, TERT, MGMT and 1p/19q genotyping and to explore their association with Ki-67 and microvascular density (MVD).

Methods Forty-four patients with brain glioma were enrolled prospectively from December 2020 to August 2022, which include 22 IDH mutant - 22 IDH wild type, 29 TERT mutant - 15 TERT wild type, 28 MGMT methylated - 16 MGMT unmethylated, 16 1p19q codeletion - 28 1p19q non codeletion. The volume transfer constant (K_{trans}), wash-out constant (k_{ep}), extravascular extracellular volume fraction (V_e), plasma volume fraction (V_p), area under the curve (AUC),

maximum concentration of contrast agent (Maxconc), maximum slope of the time signal curve (Maxslope) were calculated from DCE. Histogram features of whole tumor were extracted. The mean, maximum and minimum of relative cerebral volume (rCBV) of DSC were calculated. Immunohistochemical staining of Ki-67 and microvascular density (MVD) was performed. Comparisons between groups were performed according to different genotypes status. Spearman rank correlation was used to analyze correlation between histogram features and Ki-67, MVD.

Results A total of 44 participants (25 males, 19 females; mean age, 53.3 ± 14.5) with grade 2 ($n = 9$), grade 3 ($n = 14$), and grade 4 ($n = 21$) gliomas were included. The kep-skewness, rCBV-max, Ktrans-median and Ve-kurtosis, AUC-energy provided optimal differential diagnostic efficiency for IDH, TERT, MGMT and 1p19q, respectively (AUC=0.808, 0.725, 0.830, 0.862). The Ve - 5th and Ve - 90th have significant and positive correlation with Ki-67 and MVD ($p < 0.001$, $r = 0.699$, 0.738).

Conclusion Histogram features based on DCE-MRI and DSC-MRI can serve as imaging markers to predict glioma genotyping.

PO-0216

3-dimensional MR neurography shows unclear distal brachial plexus in amyotrophic lateral sclerosis (ALS): a case-control study

Shanshan Wang, Xiao Man, Yufan Chen, Guangbin Wang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

Objective: To assess whether the display of unclear distal brachial plexus is different between amyotrophic lateral sclerosis (ALS) patients and healthy controls (HCs) and between ALS patients and chronic inflammatory demyelinating polyneuropathy (CIDP) patients.

Methods: 22 ALS patients, 15 CIDP patients and 19 HCs were evaluated on 3D MR neurography using a four-point grading scale by two neuroradiologists. Kruskal-Wallis test was used to assess the differences in nerve scored values. The differences in cross-sectional area (CSA) of brachial plexus nerve roots were assessed. The correlation between nerve scored values and ALSFRS-R (the revised ALS Functional Rating Scale) values, ALSFRS-UL values (upper limb score of ALSFRS-R) and duration of symptom of ALS patients was assessed.

Results: Interobserver agreement was excellent. There were statistically significant differences in nerve scored values between ALS patients and HCs ($P < 0.001$) and between ALS patients and CIDP patients ($P < 0.001$). The CSA of nerve roots was significantly larger in CIDP than in ALS and in HCs ($p < 0.001$). No difference was found between ALS patients and HCs. No clear correlation exists between the nerve scored values and ALSFRS-R values, ALSFRS-UL values and duration of symptom in ALS patients.

Conclusions: 3D MR neurography showed more unclear distal brachial plexus in ALS than in HCs and in CIDP, which reflect the pathophysiological changes of ALS. However, further prospective study is needed to ascertain whether the unclear distal nerve observed in 3D MR neurography can be helpful in diagnosing ALS and is associated with disease course and severity.

PO-0217

Neuromelanin magnetic resonance imaging of substantia nigra and locus coeruleus in Parkinson's disease with freezing of gait

Shangpei Wang

The Second Hospital of Anhui Medical University

Background: The downregulation of monoamines, especially dopamine in substantia nigra (SN) and norepinephrine in locus coeruleus (LC), may be responsible for freezing of gait (FOG) pathological basis in Parkinson's disease (PD).

Methods: Thirty-two Parkinson's disease patients with freezing of gait (PD-FOG), 32 Parkinson's disease patients without freezing of gait (PD-NFOG) and 32 healthy controls (HC) underwent neuromelanin magnetic resonance imaging (NM-MRI). The volume, surface area and contrast to noise ratio (CNR) of SN and LC were measured and compared. The correlation analyses were conducted between the measurements of SN and LC with clinical symptoms. We plotted the receiver operating characteristic (ROC) curve and determined the sensitivity and specificity of the CNR of SN and LC for discriminating the PD-FOG from the PD-NFOG.

Results: Both PD-FOG and PD-NFOG showed decreased volume, surface area and CNR of SN compared with HC. The PD-FOG exhibited decreased volume and surface area of LC compared with both PD-NFOG and HC groups, and decreased CNR of LC compared with HC group. The volume, surface area and CNR of SN were negatively correlated with the Unified Parkinson's Disease Rating Scale part III scores. The illness durations in PD patients were negatively correlated with the volume, surface area of SN, while not the CNR. And the volume and surface area of LC were negatively correlated with new freezing of gait questionnaire scores. ROC analyses indicated that the area under the curve (AUC) was 0.865 and 0.713 in the CNR of SN and LC, respectively, in PD versus HC, whereas it was 0.494 and 0.637 respectively, in PD-FOG versus PD-NFOG. Among these, for discriminating the PD from the HC, the sensitivity and specificity in the CNR of the SN was 90.6 and 71.9%, respectively, when the cut-off value was set at 2.101; the sensitivity and specificity in the CNR of the LC was 90.6 and 50.0%, respectively, when the cut-off value for CNR was set at 1.411.

Conclusion: The dopaminergic changes in the SN were found across both PD-FOG and PD-NFOG, whilst LC noradrenergic neuron reduction was more evident in PD-FOG.

PO-0218

Clinical and radiological differentiation between Trousseau syndrome and cardiogenic embolism

Lin Li, Tong Li, Cuicui Li, Rui Qin, Ximing Wang
Shandong Provincial Hospital

Objective: This study aimed to discuss the differentiation of clinical and radiographic characteristics between Trousseau syndrome and cardiogenic embolism, with acute multiple cerebral infarction as the main manifestation.

Methods: We retrospectively analyzed 69 patients with Trousseau syndrome and 105 patients with cardiogenic embolism who were treated at Shandong Provincial Hospital between August 2018 and October 2022. Patient clinical baseline data, laboratory tests, imaging, and other related data were collected for analysis.

Results: Between the two groups, diabetes, hemoglobin, triglyceride, low-density lipoprotein, C-reactive protein, creatinine, uric acid, D-dimer, and fibrin degradation products were significantly different ($P < 0.05$). In addition, multifactorial logistic regression analysis suggested D-dimer and

triglyceride as independent risk factors for Trousseau syndrome. The predominantly malignant cancer in the Trousseau syndrome group was digestive system cancer. Regarding the radiographic characteristics, the infarctions in the Trousseau syndrome group were widely distributed in multiple arterial supply areas. More importantly, bilateral anterior + posterior circulation was also an independent risk factor for Trousseau syndrome. However, in the cardiogenic embolism group, the infarctions were mostly located in a concentrated distribution of a single arterial supply area.

Conclusions: Trousseau syndrome and cardiogenic embolism are significantly different in many ways. When unexplained multiple cerebral infarctions occur in the cancer-prone age group, and there are abnormalities in lipids and D-dimer levels as well as infarction foci involving multiple arterial blood supply areas, it suggests a high probability of Trousseau syndrome.

PO-0219

Spinal cord change patterns in normal aging population and multiple neurological diseases

Xiaoqin Zhu, Yaou Liu, Yunyun Duan

Department of Radiology, Beijing Tiantan Hospital, Capital Medical University, Beijing, China

OBJECTIVE To investigate the clinical relevance of spinal cord changes in the normal population and multiple neurological disorders including multiple sclerosis (MS), neuromyelitis optica spectrum disorders (NMOSD), Alzheimer's disease (AD), Parkinson disease (PD), and cerebral small vessel disease (CSVD).

METHOD The mean upper cervical cord area (MUCCA) and compression ratio (CR= anteroposterior diameter/transverse diameter) were obtained on 3D T1-weighted images using Spinal Cord Toolbox (SCT) and compared between disease groups and HC. The correlation of MUCCA with brain gray matter region and clinical variables was analyzed.

RESULTS The MUCCA was smaller in older (>60 years) than middle-aged HC (45~60 years), while there was no significant difference between middle-aged and young HC (≤45 years). MUCCA of patients in all disease groups except AD was smaller than age- and sex-matched HC. CR increased in group MS, decreased in group PD, and did not change significantly in group AQP4+NMOSD, AD, and CSVD. Among atrophied gray matter regions in comparison with HC, the strongest correlations with MUCCA were observed for atrophy of thalamus in MS, AQP4+NMOSD and AD, pallidum in PD, and accumbens in CSVD. MUCCA was associated with worse scores on the Mini-Mental State Examination (MMSE) and Expanded Disability Status Scale (EDSS) in MS, and MMSE, Montreal Cognitive Assessment (MOCA) in NMOSD, and MMSE in AD.

CONCLUSIONS Spinal cord atrophy is a common feature of normal aging and accelerates in neuroinflammatory, neurodegenerative, and vascular diseases. The morphology of spinal cord atrophy varies significantly in different diseases. MUCCA could serve as a generic inflammatory MRI marker in a wide range of neurodegenerative diseases.

PO-0220

Primary Ewing's sarcoma Peripheral Primitive Neuroectodermal Tumor of the lateral ventricle: a case report and literature review

Zhibo Zhang¹, yongbin Li¹, yitong Bian²

1. The First Affiliated Hospital of Northwest University (Xi'an First Hospital)

2. The First Affiliated Hospital of Xi'an Jiaotong University

Background Ewing sarcoma (ES) and peripheral primitive neuroectodermal tumors (pPNETs) are extremely rare neoplasms, which is most frequently arises from skeletal bone. Central nervous system (CNS) involvement by Ewing sarcoma (ES) is rare, with an incidence of about 1 per 100 patients and to-date few case reports have been published in lateral ventricle.

Case Description We report a rare case of Lateral Ventricular PNET and highlight its neuroimaging features, outcome and literature review. The details are described below. A 40-year-old male was admitted to the hospital with headache, dizziness over half month, which aggravated in the last 3 days. MRI showed a 7.0×3.3×3.3cm Oval cyst solid mixed signal mass density lateral ventricle with mild peritumoral edema. The mass was successfully removed under neuro-navigation and electrophysiological monitoring. The entire mass was removed, and postoperative pathology indicated an ES pPNET diagnosis, with an EWSR1 gene rearrangement. Subsequently, the patient underwent disciplinary radiotherapy.

Conclusion The diagnosis of primary lateral ventricular ES/pPNETs depends on the comprehensive consideration of histological examination, immunohistochemical analysis, and genetic detection. The diagnosis of it by radiographical examination is often difficult because of its similarity to other brain tumors.

PO-0221

Assessment of acid-base metabolism in chronic ischemic brain tissue by amide proton transfer weighted imaging

Hongxia Li^{1,2,3}, Chao Xia^{1,2,3}, Jiaxin Zeng^{1,2,3}, Zhiqin Liu^{1,2,3}, Xia Wei^{1,2,3}, Yuan Sun^{1,2,3}, Xing Li^{1,2,3}, Ziyu Li^{1,2,3}, Yue Li⁴, Anqi Xiao⁴, Yi Liu⁴, Kai Ai⁵, Na Hu^{1,2,3}, Su Lui^{1,2,3}

1. West China Hospital, Sichuan University

2. Huaxi MR Research Center (HMRRC), Functional and Molecular Imaging Key Laboratory of Sichuan Province, Department of Radiology, West China Hospital, Sichuan University

3. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences

4. Department of Neurosurgery, West China Hospital, Sichuan University

5. Philips Healthcare

Objective: Application of magnetic resonance amide proton transfer weighted (APTw) imaging to explore the changes of acid and base metabolism in brain tissue of chronic ischemic cerebrovascular disease (CICVD) patients.

Methods: From January 2021 to July 2022, thirty-nine patients with CICVD in West China Hospital of Sichuan University were retrospectively included. All of these patients received computed tomography perfusion (CTP) imaging and APTw imaging. The APTw values were measured according to the site of impaired perfusion as shown by the CTP. Normal-appearing white matter (NAWM) in the ipsilateral cerebral hemisphere, contralateral cerebral hemisphere, and ipsilateral cerebellar hemisphere whose perfusion was normal were selected as references. The APTw signals of cerebral tissue with perfusion impaired were compared with NAWM APTw signals of cerebellum and cerebellum.

Results: The average APTw value of cerebral perfusion-impaired tissue was 0.40 ± 0.19 , and the minimum APTw value was 0.16 ± 0.27 . The average and minimum APTw values of cerebral tissue with perfusion impaired were significantly lower than those of ipsilateral cerebral hemisphere NAWM ($P < 0.001$), contralateral cerebral hemisphere NAWM ($P < 0.001$), and ipsilateral cerebellar hemisphere NAWM ($P < 0.001$). And the mean and minimum APTw values of NAWM in the cerebellar hemispheres on the same side of cerebral perfusion impaired tissue were significantly higher than those in the cerebellar hemispheres ($P < 0.001$).

Conclusions: APTw values reflect the pH level of acid-base metabolism in brain tissue. And this imaging technique can effectively detect the changes of brain microenvironment caused by impaired cerebral hemodynamics in patients with chronic ischemia.

PO-0222

Time-variant and Tissue-Level Collaterals Predict Perioperative Neurological Recovery and Clinical Outcomes of Patients with Endovascular Thrombectomy

Song Liu¹, Tao Ren¹, Song Jin¹, Luotong Wang², Shuai Zhang², Chao Tian¹

1. Tianjin Huanhu Hospital

2. CT Imaging Research Center, GE Healthcare China

Purpose: Comprehensive collateral status assessment can provide deeper insights into the ischemic mechanism in patients with acute ischemic stroke (AIS). To investigate whether time-variant and tissue-level collateral characteristics can help to predict perioperative neurological recovery and clinical outcomes of patients with endovascular thrombectomy (EVT).

Materials and Methods: In this retrospective study, AIS patients with anterior large-vessel occlusion who underwent multiphase CT angiography (mCTA) and CT Perfusion (CTP) on admission and treated with EVT between May 2020 to Dec 2022 were enrolled. Time-variant collateral score was defined as the collateral score on color-coded summation maps (CSCC) of mCTA. Hypoperfusion intensity ratio (HIR) was derived from CTP. Multivariable logistic regression analysis was used to assess the association between CSCC, HIR and 90-day mRS. Mixed effect model was established to estimate the fixed effect of the time and collateral stratification on perioperative NIHSS.

Results: A total of 128 patients underwent EVT (97 men [75.78%]; median age, 64 years [interquartile range, 57-69 years]) were included. CSCC (OR, 0.502 [95% CI, 0.270-0.890]; $P = .02$) and HIR (OR, 50.601 [95% CI, 5.075-616.948]; $P = .001$) were independently associated with 90-day mRS. The area under the ROC curve of combined model was 0.828 (95% CI: 0.757, 0.898; $P < .001$). Mixed effect models revealed significant group \times time interaction effects ($P < .01$ at all time points) in HIR stratification, and it was the better indicator in determination of perioperative neurological recovery than CSCC stratification (akaike information criterion: HIR = 4600 vs CSCC = 4649).

Conclusion: CSCC and HIR could provide time-variant and tissue-level characteristics of collateral status to predict clinical outcomes of patients with EVT, and HIR stratification could provide more prominent information to predict the trend of perioperative neurological recovery.

PO-0223

Temporal region associated functional and effective connectivity relate to psychotic symptoms in drug-naïve first-episode adolescent-onset schizophrenia

Hongwei Li^{1,2}, wenjing zhang², lihua zhao¹, hongchao yao¹, su lv²

1. Department of Radiology, the Third Hospital of Mianyang/Sichuan Mental Health Center, Mianyang, China.

2. Department of Radiology, and Functional and Molecular Imaging Key Laboratory of Sichuan Province, West China Hospital of Sichuan University, Chengdu, China.

Objective: The objective of present study was to investigate the functional brain substrates of psychotic symptoms in patients with adolescent-onset schizophrenia (AOS).

Methods: Twenty-one patients with AOS and 20 healthy controls (HCs) were recruited and scanned with resting-state functional magnetic resonance imaging (rs-fMRI). They were matched in sex, age, and education level. Regional homogeneity (ReHo) was used to investigate the alteration in local connectivity between the diagnostic groups. Regions with significant ReHo changes in AOS patients was selected as “seeds” for further functional connectivity (FC) and Granger causality analysis (GCA), and the obtained functional brain measures were then related to psychotic symptoms in patients with AOS.

Results: Compared with HCs, the AOS group showed significantly increased ReHo in the right middle temporal gyrus (MTG), which was positively correlated with Positive and Negative Syndrome Scale-positive scores (PANSS-P) and Psychotic Rating Scales (PSYRATS) scores. With this seed, FC analysis further indicated that the AOS patients had significantly lower connectivity with the bilateral postcentral gyrus (PCG) but significantly higher connectivity with the right precuneus than healthy participants. The reduced FC between right MTG and bilateral PCG exhibited a significant positive correlation with PSYRATS scores. The GCA indicated a negative feedback effect from the seed area (the right MTG) to the left middle frontal gyrus (MFG), and also a negative feedback effect from right MFG to the seed area in AOS patients, but such effects did not significantly differ from HCs.

Conclusion: The right MTG showed abnormal local connectivity, and functional connectivity/effective connectivity with regions within default mode network that were correlated to the hallucination and delusion ratings, representing a pivotal substrate for psychotic symptoms in AOS.

PO-0224

Application of spinal subtraction and bone background fusion CTA in the accurate diagnosis and evaluation of spinal vascular malformations

Xuehan Hu¹, Zhidong Yuan¹, Kaiyin Liang¹, Min Chen², Zhen Zhang¹, Guanxun Cheng¹

1. Peking University Shenzhen Hospital

2. Southern University of Science and Technology Hospital

Background: Accurate pre-treatment diagnosis and assessment of spinal vascular malformations (SVMs) using spinal CTA are crucial for patient prognosis. But the post-processing reconstruction may struggle to fully visualize the lesions due to the complexity inherent in spinal anatomy.

Objective: To explore the application value of the spinal bone background fusion CTA (SBBFF-CTA) technique in precisely visualizing and localizing SVMs lesions.

Methods: In this retrospective study, patients (from Nov 2017 to Nov 2022) presenting symptoms similar to SVMs, were divided into diseased group (Group A) and non-diseased group (Group B). All patients underwent spinal CTA using Siemens dual-source CT. The MPR, routine bone

subtraction (RBS-CTA), and SBBFF-CTA images were obtained through Snygo.via and ADW4.6 post-processing reconstruction workstation. Multiple observers researched the following three aspects: (a) preliminary screening capability by MPR-CTA; (b) the accuracy and stability of the SBBFF-CTA technique; (c) diagnostic evaluation by three types of images. The diagnostic performance used receiver operating characteristics analysis, while reader or image differences used the Wilcoxon signed-rank test or the Kruskal-Wallis rank sum test.

Results: Sixty-three patients (Group A/B: 22/27 patients, mean age \pm SD, 44.0 years \pm 14.3/44.6 years \pm 15.2, 13/16 men) were evaluated. Junior doctors showed lower diagnostic accuracy/sensitivity using MPR-CTA (85.7%/77.3%) compared to senior doctors (93.9%/90.9% and 98%/95.5%). Short-term trained juniors achieved SBBFF-CTA image accuracy similar to experienced doctors ($P > 0.05$). In terms of visualization and localization of SVMs lesions (nidus/fistula, feeding artery, and drainage vein), both MPR and SBBFF-CTA outperformed RBS-CTA ($P = 0.000$). Compared to MPR, using SBBFF-CTA allowed less-experienced doctors to achieve superior diagnostic capabilities (comparable to experienced radiologists) more rapidly ($P < 0.05$).

Conclusion: The SBBFF-CTA technique exhibits excellent reproducibility and enables accurate pre-treatment diagnosis and assessment of SVMs with higher diagnostic efficiency, particularly for junior radiologists.

PO-0225

A chain multiple mediation model analysis reveals the distinct relationship among inflammation, white matter and recognition in individuals at different levels of risk for developing BD

Wenjin Zou, Xiaoyue Li, Kangguang Lin
Affiliated Brain Hospital of Guangzhou Medical University

Objective: This study aims to investigate potential differences in plasma interleukin-6 (IL-6) levels, white matter microstructural (WM) alterations, and cognition between bipolar disorder (BD) offspring of parents with and without subthreshold mood symptoms. Additionally, we explore the inflammation-WM-cognition relationship to identify any distinctive patterns.

Methods: A total of seventy-six bipolar offspring were enrolled and divided into two groups based on the presence or absence of subthreshold mood symptoms: asymptomatic offspring (AO) ($n=41$) and symptomatic offspring (SO) ($n=35$). The groups were matched for age, sex, and education. DTI data were collected using a Philips Achieva 3T MR scanner, plasma IL-6 levels were measured using ELISA, and cognition was assessed using the MATRICS Consensus Cognitive Battery (MCCB) tool. To further understand the relationship between inflammatory factors, WM alterations, and cognition in AO and SO groups, a mediation chain model was employed. In the model, the group (AO=0, SO=1) served as the independent variable, BACS symbol coding scores as the dependent variable, IL-6 levels and FA values of forceps major as mediator 1 and mediator 2, respectively.

Results: The SO group exhibited higher IL-6 levels ($t=2.80$, $P=0.07$), lower BACS symbol coding scores ($t=-2.27$, $P=0.03$), and decreased FA values of forceps major (FM) ($t=-2.75$, $P=0.008$) compared to the AO group. In the mediation chain model, after adjusting for age and sex, the regression equation effect was significant ($R^2=0.34$, $F=12.51$, $P<0.01$). Bootstrapping analysis with 5000 iterations showed a direct effect from the group to the symbol coding scores of BACS as -5.6359 [-11.0182 to -0.2536]. Relative to the AO group, the indirect effects were found to be -0.003 [-0.1355 to 0.1512] from the IL-6 mediator to the symbol coding scores of BACS, -0.1844 [-0.4191 to -0.0284] from the IL-6 level to the FA value of FM, and -0.0597 [-0.1508 to -0.0082] for the mediated effect of IL-6 and FA values of FM mediators to the symbol coding scores of BACS, and the total indirect effect was -0.2443 [-0.4954 to -0.437].

Conclusion: In individuals with genetic risk for BD, inflammation and WM microstructure may jointly mediate the impact on cognition, regardless of symptomatic risk. These findings suggest distinct pathological characteristics at different levels of risk for developing BD.

PO-0226

Altered static and dynamic functional connectivity strength in adolescents with first-episode major depressive disorder and previous suicide attempts

Objective A growing body of evidence showed that corticostriatolimbic system dysfunctions were linked to suicide behaviors in individuals with major depressive disorder (MDD). However, the neurobiological mechanism that makes depressed youths more vulnerable to suicide is poorly understood. Therefore, this study aimed to investigate the functional connectivity pattern in depressed adolescents with prior suicide attempts.

Methods A total of 115 depressed adolescents with and without prior suicide attempts (SA) and 35 age-, education-, and gender-matched healthy controls underwent resting-state functional imaging (R-fMRI) scans. The dynamic FCS (dFCS) variability and static FCS (sFCS) metrics were measured.

Results We found that the dFCS variability of the major depressive disorder with suicide attempts (MDD-SA) group was higher than that of the major depressive disorder without suicide attempts (MDD-NSA) group in the right caudate nucleus/pallidum, right anterior cingulate gyrus and left medial superior frontal gyrus, and the MDD-SA group showed higher sFCS values in the bilateral cuneus. dFCS variability of the left medial superior frontal gyrus and right anterior cingulate gyrus was significantly correlated with the SI intensity rating scores. Combining the altered dFCS and sFCS metrics could improve the classification performance for discriminating MDD-SA from MDD-NSA (area under the curve: 0.780).

Conclusion Our findings suggest that abnormal connectivity patterns in multiple brain regions involving cognition and emotion control, and self-referential processing are associated with the increasing risk of vulnerability to a suicide attempt in depressed adolescents. Furthermore, FCS could serve as a sensitive biomarker for revealing the neurobiological mechanisms underlying suicidal vulnerability.

PO-0227

Monitoring Bevacizumab-Induced Tumor Vascular Normalization by Intravoxel Incoherent Motion Diffusion-Weighted MRI

Huan Li, Bo Li, Haibo Xu

Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan University, Wuhan, 430071, P.R.China

Purpose: To serial monitor the vascular normalization time window of tumor antiangiogenesis treatment through intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) and histopathological methods. **Study Type:** Exploratory animal study. **Population:** Sixty rat C6 glioma

models were randomly and equally divided into the control groups ($N = 30$) and bevacizumab treatment groups ($N = 30$). Twenty-five for magnetic resonance imaging (MRI) and five for electron micro_x0002_scope testing in each group. Field Strength/Sequence: T1-weighted imaging (T1WI), T2WI with a fast spin echo sequence and IVIM-DWI with a spin_x0002_echo echo-planar imaging sequence at 3 T. Assessment: IVIM-DWI quantitative parameters (f , D , D^* , and fD^*) were obtained on days 0, 2, 4, 6, and 8 after bevacizumab treatment. After MRI, the microvessel density (MVD), pericyte coverage, and hypoxia-inducible factor-1 α (HIF-1 α) were assessed. Electron microscope observation was performed at each time point. Statistical Tests: One-way analysis of variance and Student's t-tests were used to compare differences within and between groups. Spearman's correlation coefficient (r) assess the correlation between IVIM and pathological parameters. The intra_x0002_group correlation coefficient was determined to assess the repeatability of each IVIM parameter. Results: The IVIM-DWI perfusion parameters (f and fD^*) of the treated group were higher than the control group on days 2 and 4. Compared to the control group, MVD decreased on days 2 and pericyte coverage increased on days 4 in the treatment group. Electron microscopy showed that the tight junctions of the treatment group were prolonged on days 2–4. In the control group, f had the highest correlation with MVD ($r = 0.689$). In the treated group, f had a good correla_x0002_ tion with pericyte coverage ($r = 0.557$), HIF-1 α had a moderately positive correlation with f ($r = 0.480$) and fD^* ($r = 0.447$). Data Conclusion: The vascular normalization time window of bevacizumab treatment of glioma was days 2–4 after antiangiogenesis treatment, which could be monitored noninvasively by IVIM-DWI.

PO-0228

The effect of short-term antidepressant treatment on the functional connectivity strength in depressed adolescents with previous suicide attempts

Xiaofang Cheng¹, Jianshan Chen¹, Xiaofei Zhang¹, Ting Wang², Jiaqi Sun¹, Yeyu Xiao³, Amei Chen², Taifeng Lin¹, Xinhua Wei², Liping Cao¹

1. Guangzhou Huiai hospital

2. the Second Affiliated Hospital, School of Medicine, South China University of Technology

3. Guangzhou Integrated Traditional Chinese and Western Medicine, Guangzhou

Objective Several studies have reported that antidepressants may increase or reduce the suicide risk in depressed adolescents, but no neuroimaging studies have been performed to investigate the underlying mechanism. The primary goal of the study was to investigate the effect of short-term antidepressant treatment on the functional connectome in depressed adolescents with previous suicide attempts.

Methods we collected resting-state fMRI (R-fMRI) data and clinical scales from 22 depressed adolescents with prior suicide attempts (MDD-SA) and 15 depressed adolescents without prior suicide attempts (MDD-NSA) at baseline and 4-week follow-up. The static and dynamic FCS metrics were measured separately.

Results The results suggested that short-term treatment with selective serotonin reuptake inhibitors (SSRIs) could reduce suicide ideation (SI) and depressive symptoms, and this effect was more prominent in the MDD-SA group. This changing pattern was consistent with that observed in imaging indices, that was, the alteration in sFCS values in the MDD-SA group before and after treatment involved a wider range of brain regions than that in the MDD-NSA group. In addition, the alterations of dFCS variability of the MDD-SA group and MDD-NSA group showed opposite patterns in the left middle temporal gyrus, left middle occipital gyrus, and left posterior central gyrus before and after treatment.

Conclusion The results suggested that short-term treatment with SSRIs could reduce SI and depressive symptoms. The intervention mechanisms of antidepressant therapy were different for depressed adolescents with and without suicidal behaviors. From the standpoint of fMRI, this work offers preliminary evidence for the protective effect of antidepressants on suicide risk in depressed youths.

PO-0229

Regional blood flow by 3D pseudo-continuous Arterial Spin Labeling as a predictor of headache and acute mountain sickness at high altitude in men and women

Hao Zhang, Jie Feng, Wenjia Liu, Lin Ma
The First Medical Center of Chinese PLA General Hospital

Aim To investigate the difference of sea-level cerebral blood flow in men and women with high altitude headache (HAH) or not and with acute mountain sickness (AMS) or not after acute exposure to high altitude by 3D pseudo-continuous arterial spin labeling, and to select the best postlabeling delay (PLD) time for prediction in each group with or without HAH or AMS.

Methods A total of 49 volunteers recruited reached high altitude at 3658m by air after scanning of head magnetic resonance imaging (MRI) by ASL with three PLDs at sea level. The volunteers were divided into 4 groups due to their symptoms of HAH and AMS (Lake-Louise Score \geq 3) recorded at high altitude. Cerebral blood flow (CBF) of region of interests (ROIs) including bilateral cortex of frontal-parietal-temporal-insula (FPTI) lobe, cingulate, caudate nucleus head (CNH), putamen, occipital lobe, and cerebellar hemisphere was chosen for statistical analysis. The CBF ratio of left to right of the same anatomical part was recorded as rCBF. T-test or nonparametric test was used to determine the relation of CBF or rCBF and HAH or AMS. By univariable analysis, the significant variable was chosen as a predictor. And receiver of operator characteristic (ROC) curve was applied for diagnostic performance assessment of each difference-significant variable.

Results In men, sea-level CBF of HAH group were higher than non-HAH group in bilateral FPTI cortex, right cingulate, bilateral occipital cortex, bilateral cerebellar hemisphere ($p<0.05$); and rCBF of FPTI in HAH group were lower than non-HAH group (0.95 vs 1.03, $p<0.05$) (PLD with 2525ms); sea-level CBF of AMS group were higher than non-AMS group in bilateral FPTI cortex, bilateral cingulate, bilateral putamen, bilateral occipital cortex, bilateral cerebellar hemispheres ($p<0.05$). In women, sea-level rCBF of HAH group was higher than non-HAH group in the cerebellar hemisphere (1.02 vs 0.97, $p<0.05$); sea-level rCBF of AMS group was lower than non-AMS group in cingulate ($p<0.05$). CBF of right cerebellar hemisphere and right occipital lobe (PLD=2525ms) predicted best the HAH and AMS in men, respectively (AUC=0.892, $p<0.05$; AUC=0.871, $p<0.05$). RCBF of cerebellar hemisphere (PLD=1525ms) and cingulate (PLD=2025ms) was the best to predict HAH and AMS in women, respectively (AUC=0.808, $p<0.05$; AUC=0.753, $p<0.05$).

Conclusion Sea-level regional CBF differences between groups with high altitude headache or AMS and groups without high altitude headache or AMS could be distinguished by ASL with three PLDs. And the significance of different PLDs varies in AMS and HAH in men and women.

PO-0230

Automatic Segmentation of Choroid Plexus Based on Gaussian Mixture Model in First-Episode Drug-Naïve Schizophrenia

Jiaxin Zeng, Wenjing Zhang, Su Lv
West China Hospital, Sichuan University

Purpose: Inflammation dysfunction has been recognized as the pathophysiology of schizophrenia. Recent interest in choroid plexus has been stimulated by increased understanding of interactions between inflammation and schizophrenia. It remains unclear whether choroid plexus alteration is involved in schizophrenia, especially in first-episode patients before drug initiation.

Methods: Seventy-six first-episode drug-naïve schizophrenia patients and sixty-four matched healthy controls were enrolled in this study. Patients were assessed using the Positive and Negative Syndrome Scale and Global Assessment of Functioning. High-resolution T1-weighted images were acquired from all participants. Masks including voxels of cerebral spinal fluid, ventricular wall, and choroid plexus were extracted and then the Gaussian Mixture Model was used to segment the choroid plexus based on the intensity difference of the neighboring tissues. General linear model was used to compare choroid plexus volume between groups, with age and total intracranial volume as covariates. Partial correlation analysis was used to explore the relationship between choroid plexus volume and clinical symptoms, and between choroid plexus with brain measures including grey matter, white matter and lateral ventricular volumes, controlling for age and total intracranial volume. The significant level was set as $p < 0.05$.

Results: First-episode drug-naïve schizophrenia showed significantly larger choroid plexus volume compared with healthy controls ($p = 0.034$, $F = 4.58$). The choroid plexus volume was positively correlated with white matter volume ($p = 0.017$, $r = 0.28$) and lateral ventricular volume ($p < 0.01$, $r = 0.49$). No significant correlation was found between choroid plexus volume and clinical measures. **Conclusion:** Our findings revealed choroid plexus volume enlargement at first-episode state before drug initiation and its potential correlation with white matter and ventricular alterations, which may enhance our understanding of the illness biology of schizophrenia.

PO-0231

Baseline alterations and Acute Effects of Escitalopram on Amygdala Functional Connectivity in Youth at High-Risk for Bipolar Disorder

Lu Lu¹, Jeffrey Strawn², John Sweeney^{1,2}, Qiyong Gong¹, Manpreet Singh³, Melissa DelBello²

1. Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

2. University of Cincinnati

3. Stanford University

Aims: Youth with a family history of bipolar disorder (BD), especially those who present with depression and/or anxiety symptoms, are at high-risk for developing BD and disrupted functional connectivity (FC) within the prefrontal-amygdala emotional network. Antidepressants are commonly used to treat depression and anxiety in youth. However, the neural effects of antidepressant exposure in these high-risk youth remain unknown.

Methods: We conducted a two-site, double-blind, placebo-controlled trial of escitalopram in youth (12-17 years old) with depression and/or anxiety disorder and with a first-degree relative with BD. At baseline, 121 youth with at least one first degree relative with BD-I and current moderate or severe depression and/or anxiety disorders, and 55 healthy controls (HC) without any first or second-degree relative with a mood or psychotic disorder were recruited. High-risk youths were

then randomized to receive psychotherapy plus escitalopram ($n=77$) or psychotherapy plus placebo ($n=44$) for up to 16 weeks.

A 3-Tesla scanner with an 8-channel phased-array head coil was used at each site to acquire resting-state functional images and anatomical images with the same parameters at baseline for high-risk youth and controls, and at 4-weeks after treatment initiation in high-risk youth. Two 5-minute functional runs used $TR = 2000$ msec and slice thickness = 3 mm. Image analysis was performed using SPM, CONN, and MATLAB. Preprocessing steps included discarding the initial 10 volumes, slice-timing, realignment, structural segmentation and normalization, functional normalization, outlier detection, and smoothing. Denoising was then performed, which applied linear regression of confounders, band-pass filtering, and linear detrending to remove unwanted motion, physiological, and other artificial effects from the BOLD signal. Next, the FC map between amygdala and voxels of the whole brain was generated for each youth, which was then taken to two second-level statistical analyses. The first was two-sample t-tests of amygdala-based FC with age, sex and site as covariates using thresholds $p < 0.001$ at voxel-level and $p < 0.05$ at cluster-level with False discovery rate (FDR) correction. The second was treatment (escitalopram or placebo)-by-time (baseline or week 4) interaction using a full-factorial analysis with age, sex, and site as covariates, and thresholds of $p < 0.005$ at the voxel-level and FDR-corrected $p < 0.05$ at the cluster-level. Connectivity values were extracted from clusters with significant treatment-by-time interactions, and post-hoc analyses were performed to calculate FC changes from baseline to week 4 in escitalopram and placebo groups separately.

Results: One hundred and six high-risk youth and 46 age- and sex-matched HC with usable data were included in the baseline analyses. High-risk youth had decreased left amygdala connectivity with left ventral prefrontal cortex (VLPFC) which extended to insula and superior temporal cortex (peak coordinate: $x=-46$, $y=16$, $z=-16$; cluster size=122; $t=4.78$; FDR-corrected $p=0.036$), and decreased right amygdala connectivity with bilateral dorsal anterior cingulate cortex (dACC, peak coordinate: $x=-4$, $y=26$, $z=14$; cluster size=217; $t=5.48$; FDR-corrected $p=0.002$) and right dorsolateral prefrontal cortex (DLPFC, peak coordinate: $x=22$, $y=52$, $z=14$; cluster size=129; $t=4.45$; FDR-corrected $p=0.014$) comparing to healthy controls.

Eighty-four high-risk youth with usable baseline and week 4 data were included, 50 of them received escitalopram and the other 34 received placebo. Significant treatment-by-time interactions were found between right amygdala and bilateral supplementary motor cortex (peak coordinate: $x=-2$, $y=-26$, $z=62$; cluster size=264; $F=20.18$; FDR-corrected $p=0.011$), left lateral occipital cortex including left fusiform gyrus (peak coordinate: $x=-44$, $y=-78$, $z=10$; cluster size=424; $F=16.97$; FDR-corrected $p=0.001$), and right occipital fusiform gyrus (peak coordinate: $x=32$, $y=-64$, $z=-6$; cluster size=197; $F=15.72$; FDR-corrected $p=0.032$). Post-hoc analyses showed these amygdala FCs significantly decreased in youth treated with escitalopram relative to youth who received placebo.

Conclusions: We found that depressed and/or anxious youth at high-risk for bipolar disorder had decreased amygdala connectivity in regions having important roles in emotion perception and regulation relative to healthy individuals. These findings suggest that brain functional connectivity within and between emotion processing and regulation networks are disrupted in youth at high-risk for bipolar disorder, indicating that these alterations may serve as potential targets for early intervention in this population. Additionally, we identified that amygdala connectivity with sensory and motor cortices decreased significantly in high-risk youth after four weeks of treatment with escitalopram and psychotherapy relative to those receiving four-weeks of placebo and psychotherapy. Further analyses will examine whether the significant effects of escitalopram on the interface among emotional, visual and motor networks are associated with subsequent behavioral and mood changes resulting from antidepressant treatment in this population.

PO-0232

Predicting Prognosis and Severe Complications for Acute Ischemic Stroke Using Clinical-CT Fusion Feature-Based Ensemble Machine Learning

Weixiong Zeng, Gengqiang Qin, Weiguo Chen
Southern Medical University Nanfang Hospital

Purpose

To establish predictive models using clinical and quantitative imaging features for predicting the risk of futile recanalization (FR), malignant cerebral edema (MCE), and cerebral hernia (CH) in patients with acute ischemic stroke (AIS).

Methods

This prospective study included 110 patients who underwent mechanical thrombectomy (MT) and for whom successful recanalization was achieved. FR was defined as a 90-day modified Rankin Scale score >2 . Non-contrast CT and clinical information were used to construct five machine learning (ML) models fused into a logistic regression algorithm using the stacking method (LR-Stacking) to predict each classification task. The quantitative imaging features include the assessment results and radiomics information of lesions. Shapley Additive Explanation method was added to display crucial factors. Prediction performances for different ML algorithms were compared using area under the receiver operating characteristic curve (AUC) and decision curve analysis (DCA).

Results

A total of 61 patients (55.5%) experienced FR, 34 patients (30.9%) experienced MCE, and 22 patients (20.0%) experienced CH. In the prediction tasks of FR, MCE, and CH, the AUC of the LR-Stacking model based on clinical and image fusion features were 0.938, 0.889, and 0.986, respectively. Considering the results of the Delong test and DCA analysis, the performance and overall benefit of the LR-Stacking model based on clinical and image fusion features are higher than that of the LR-Stacking model based on clinical features. The results of SHAP analysis showed that the hypodensity volume and its proportion in the responsible blood supply area were the most significant risk factors affecting the poor prognosis of patients and had a strong predictive effect on FR, MCE, and CH.

Conclusion

The integrated machine learning model, LR-Stacking, constructed in this study, demonstrated excellent classification performance in predicting the risk of FR, MCE, and CH in AIS patients who underwent successful MT. Quantitative imaging features extracted from the first CT image within 24 hours postoperatively played a significant role in prognosis and prediction of severe complications in this AIS patient population. The hypodensity volume and its proportion in the responsible blood supply area were particularly significant in all three predictive tasks, while the hyperdensity volume provided substantial assistance to the model's predictions. The radiomics score showed statistically significant differences among different groups and were particularly helpful in predicting the risk of CH.

Based on readily available clinical and Non-contrast CT information, the integrated ML models developed in this study exhibited good predictive ability for prognosis and severe complications. We utilized SHAP technology to show the features' importance of the ensemble model, which enabled us to promptly determine the individual risk factors for adverse outcomes and improve the prognosis in patients with AIS.

PO-0233

Alterations of Diffusion Kurtosis Imaging Measures in Gait-related White Matter in Parkinson's Disease

Xuan Wei,Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objectives: Gait impairment is closely related to the quality of life of Parkinson's disease (PD) patients and can be used as one of the indicators to monitor the progression of this disease. However, the mechanism of gait impairment in PD is still unclear. Our study aimed to explore the alterations in brain microstructure in patients with PD and in healthy controls (HC) using diffusion kurtosis imaging (DKI) to identify correlation of gait impairment in the ON and OFF state of patients with PD respectively.

Methods: Twenty-four PD patients and 29 HC were included. We acquired magnetic resonance imaging (MRI) scans, and DKI images were processed. Preprocessing of diffusion-weighted data was performed with Mrtrix3 software, using a directional distribution function to track participants' main nerve fiber bundles. Quantitative gait and clinical scales were used to assess the status of medication ON and OFF in patients with Parkinson's disease. The DKI measures and clinical scales were assessed by calculating Pearson or Spearman's rank correlations. Correlations between DKI indicators and gait parameters were also analyzed by Pearson or Spearman's rank correlations.

Results: The Beck Depression Inventory (BDI) and Beck Anxiety Inventory (BAI) scores of the PD group were significantly higher than those of HC. Compared with the HC group, the PD group had significantly lower Berg Balance Scale (BBS) scores and higher Timed-Up and Go (TUG) values. In the PD group, the ON status reduced the TUG time and the scores of the International Parkinson and Movement Disorder Society Unified Parkinson's Disease Rating Scale (MDS-UPDRS) part-III and MDS-UPDRS total scores. The velocity and step length of HC were higher than those of PD patients. No statistical difference in gait parameters in the status of ON and OFF in PD patients. The axial kurtosis (AK), mean kurtosis (MK), and radial kurtosis (RK) of the specific fibers was significantly higher in PD patients than HC. Six significant fibers are corticospinal tract, superior longitudinal fasciculus, cingulum, anterior thalamic radiation, forceps minor, and forceps major. The MK value was negatively correlated with the TUG scores in the ON and OFF state of PD patients. Within the patient group, lower AK, MK, and RK, whether in the status of ON or OFF, were associated with better motor performance, i.e. higher velocity, cadence, and stride length, and lower stride time.

Conclusions: Our findings highlight the role of microstructural neuroimaging alterations in PD patients' gait impairment and specific clinical features.

PO-0234

Unlocking the Link: How Hippocampal Glutathione-Glutamate Coupling Predicts Cognitive Impairment in Multiple Sclerosis Patients

Fei Gao,Fuyan Li,Fuxin Ren
Shandong Provincial Hospital Affiliated to Shandong First Medical University

Cognitive impairment is a common symptom of multiple sclerosis and profoundly impacts quality of life. Glutathione (GSH) and glutamate (Glu) are tightly linked in the brain, participating in cognitive function. However, GSH-Glu couplings in cognitive brain regions and their relationship with cognitive impairment in relapsing-remitting multiple sclerosis (RRMS) have remained unclear. 41

RRMS patients and 43 healthy controls (HCs) underwent magnetic resonance spectroscopy to measure GSH and Glu levels in the posterior cingulate cortex, medial prefrontal cortex, and left hippocampus. Neuropsychological tests were used to evaluate the cognitive function. The Glu/GSH ratio was used to indicate the coupling between GSH and Glu and was tested as a predictor of cognitive performance. The results show that RRMS patients exhibited reduced hippocampal GSH and Glu levels, which were found to be significant predictors of worse verbal and visuospatial memory, respectively. Moreover, GSH levels were dissociated from Glu levels in the left hippocampus of RRMS patients. The hippocampal Glu/GSH ratio is significantly correlated with processing speed and has a greater predictive effect. Here we show the hippocampal Glu/GSH ratio could serve as an imaging marker sensitive to cognitive impairment in RRMS, providing novel evidence for the prompt implementation of preventive and treatment interventions.

PO-0235

Topological properties of brain functional network in Vertically transmitted HIV positive adolescents

Xiao Yu

Zhongnan Hospital of Wuhan University

Purpose: To explore the topological properties of brain functional networks in vertical HIV-infected (HIV+) and HIV-exposed uninfected (HEU) adolescents.

Methods: Based on the graph theoretical analysis, resting-state functional MRI (rs-fMRI) was used to construct brain network connectivity in 15 HIV+ children (mean age, 13.87 years) and 35 HEU children (mean age, 13.06 years). We calculated the global and local measures and analyzed differences between two groups. Finally, betweenness was used to calculate the threshold and select the hubs of brain functional networks.

Results: The brain functional networks of two groups showed a typical small-world architecture. For the global properties, only clustering coefficient displayed significant difference between groups under a few sparsity. While the local properties showed significant difference between groups in multiple brain regions. Compared with HEU, some regions showed higher centrality in HIV+ children and more regions represented increased segregation of brain network. The HIV+ group detected 8 global hubs and 5 in the HEU group.

Conclusion: The brain functional networks of HIV + and HEU children showed typical small-worldness and increased segregation. We believe that the higher centrality of some nodes related to advanced cognition may guarantee the normal learning activities of HIV+ children. In the future, more attention needs to be paid into the long-term results of neurodevelopmental and cognitive abnormalities. It is necessary to conduct further longitudinal research and analysis.

PO-0236

Gender Specific Re-considered of default mode network (DMN) in insomnia disorder patients: evidence from resting state fMRI

Enfeng Wang,Dapeng Shi,Yongli Li,Meiyun Wang
Henan Province People's Hospital

Insomnia disorder is known as trouble sleeping, in which there is predominant complaint of dissatisfaction with sleep quantity or quality, whether there is gender difference of DMN in different genders or not is unclear. **Method:** we recruited 30 insomnia disorder patients and 30 healthy subjects analyzed resting state fMRI. **Results:** There were significantly differences of DMN between

male and female in healthy control and insomnia group. Whether there are differences of brains function which affected by insomnia disorder in male and female groups or not is unclear. So, we separately analyze the difference between healthy control and insomnia disorder group in different gender. In male group, compared with healthy control, the FC between the left superior frontal gyrus and PCC increased in insomnia group, the FC between the left lobule VI of cerebellar hemisphere, right midbrain/bilateral thalamus and PCC decreased in insomnia group. And in female group, compared with healthy control group, the FC between the left middle frontal gyrus and PCC increased in insomnia group, the FC between the left middle temporal gyrus and PCC decreased in insomnia group. Conclusion: There were differences of DMN in healthy control group and insomnia disorder group, and insomnia disorder affects different brain regions of DMN in different gender, in male group, patients pay more attention to the self-awareness and coordination with the sensory system. The FC of lobules VI of cerebellar hemisphere and PCC decrease may one of cognitive and emotions dysfunction of insomnia disorder patients. While in female group, the FC between left middle frontal gyrus and PCC increase may one of Pathologic Physiology of working memory of insomnia disorder patients, The FC between left middle frontal gyrus and PCC increased means female patients pay more attention to the uncertainty things, this may one of reimbursement mechanism of female insomnia disorder patients physically exhausted. It would be better when we analyze insomnia disorder brain functions.

PO-0237

Classifying major depressive disorder and post-traumatic stress disorder via static and dynamic functional networks with machine learning

Jing Jiang^{1,2}, Lei Li¹, Jinping Lin¹, Baolin Wu¹, Qiyong Gong¹

1. West China Hospital of Sichuan University

2. Chengdu Third People's Hospital, Southwest Jiao Tong University

Objective: Major depressive disorder (MDD) and post-traumatic stress disorder (PTSD) are common stress-related mental disorders with similar and distinct epidemiological and clinical features. The present study aimed to investigate the potential of static and dynamic functional networks for classification of MDD and PTSD based on resting-state functional MRI.

Materials and Methods: We recruited 56 patients with first-episode MDD, 48 PTSD patients, and 80 healthy controls (HC). First, the intrinsic connectivity networks were identified using group-level independent component analysis. Static functional network connectivity (FNC) were based on the entire scan time. Different FNC states were obtained using the sliding time window method and k-means clustering analysis. We extracted these static and dynamic FNC with significant differences among the three groups (NBS, FWER corrected, $p < 0.05$) as features. A linear kernel support vector machine (SVM) classifier was adopted, and the leave-one-out cross-validation strategy was used to evaluate the performance of the classifier.

Results: We identified 48 meaningful independent components, and 4 FNC states. Significant differences were found in static functional networks, and FNC in State 2 and State 4. The classifier based on State 2 showed the best performance for all classification settings (MDD vs. HC, PTSD vs. HC, and PTSD vs. MDD), with the accuracies of 82.05% (sensitivity=93.75%, specificity=73.91%), 88.14% (sensitivity=76.92%, specificity=91.3%) and 77.78% (sensitivity=84.62%, specificity=78.13%) respectively. The consensus features were involved in multiple functional networks, with the top 10 edge features with the highest weights mostly associated with cognitive-control, sensorimotor, default mode, and visual networks.

Conclusion: This study demonstrated that FNC features have good diagnostic potential for MDD and PTSD, providing a basis for the potential use of FNC features as objective clinical diagnostic criteria.

PO-0238

Reduced Diffusion Tensor Image Analysis Along the Perivascular Space (DTI-ALPS) Index in Neuromyelitis Optica Spectrum Disorder (NMOSD) Patients with Seropositive for AQP4-Antibody

Xiaoya Chen, Yongliang Han, Yuling Peng, Qiao Zheng, Tianyou Luo, Yongmei Li
The First Affiliated Hospital of Chongqing Medical University

Objective: To investigate potential differences in activity of the glymphatic system between patients with Neuromyelitis Optica Spectrum Disorders (NMOSD) who are seropositive and seronegative for AQP4 antibody (NMOSD-AQP4+ and NMOSD-AQP4-) by measurement of the Diffusion Tensor Image Analysis Along the Perivascular Space (DTI-ALPS) index.

Methods: Thirty-nine patients with NMOSD, of whom 28 were NMOSD-AQP4+ and 11 were NMOSD-AQP4-, and 25 Healthy Controls (HC) were recruited for this study. The DTI-ALPS index was calculated from Diffusion Tensor Imaging (DTI) data and compared between groups. Potential correlations between DTI-ALPS index between clinical and MRI variables were also investigated.

Results: Compared to HC (Left: 1.69 ± 0.15 , Right: 1.58 ± 0.20), a significant bilateral reduction was observed in the DTI-ALPS index in NMOSD-AQP4+ patient group (Left: 1.48 ± 0.18 , Right: 1.41 ± 0.15) ($p < 0.05$, false discovery rate, FDR corrected), but not in NMOSD-AQP4- patient group (Left: 1.56 ± 0.16 , Right: 1.50 ± 0.13) ($p > 0.05$, FDR corrected). In NMOSD-AQP4+ group, the value of the DTI-ALPS index measured for the right side was negatively correlated with the total volume of lesions measured on T2-weighted images ($r = -0.626$), Pittsburgh sleep quality index ($r = -0.536$) and volume of right lateral ventricle ($r = -0.524$), and positively correlated with the volumes of left ventral diencephalon ($r = 0.565$), thalamus ($r = 0.582$) and accumbens ($r = 0.577$), and the value of the DTI-ALPS index measured for the left side was negatively correlated with the volumes of the third ventricle ($r = -0.611$) and choroid plexus ($r = -0.58$).

Conclusion: The significant reduction in DTI-ALPS index may indicate the impaired glymphatic function in NMOSD patients with seropositive for AQP4-antibody and may be related to brain morphology and affect sleep quality.

PO-0239

VR with eye-tracking to empower MRI in diagnosing of mild cognitive impairment

Xiang FAN, Zhuonan Wei, Keyan Yu, Chenwang Yin, Lele Chen, Guanxun Cheng
北京大学深圳医院

Objectives: Alzheimer's disease (AD) is the common cause of dementia. AD progresses irreversibly and needs to be found in the early stage. MRI is the common examination assisting AD clinical diagnosis and hippocampal volume (HV) is a well-recognized AD biomarker in NIA-AA diagnostic criteria. However, HV is not sensitive enough in the early stage of AD. We aim to find effective virtual reality (VR) with eye-tracking biomarkers to empower HV in diagnosing early-stage AD, which includes mild cognitive impairment (MCI) and mild AD.

Methods:

Sixty early AD patients and 50 healthy controls were recruited and underwent neuropsychological assessment and MRI examinations. The VR with eye-tracking is a 5-mins computerized evaluation, which is used to evaluate multiple cognitive domains including attention, abstraction, calculation, executive function, memory and delayed recall memory in corresponding patterns. The automated structure tool and SPSS 26.0 was used in the analysis of the hippocampal variables and VR scores. We investigated the area under curve (AUC) of VR variables, HV, and hippocampal fraction (HF) and the conjoined models using a VR score (total VR score or an optimal domains VR score, respectively) and a hippocampal metric (HV or HF, respectively) based on the logistic regression.

Results:

The mean and standard deviation of MMSE in early AD is 27.2 ± 2.0 , which illustrates that patients belong to the early stage of the disease. The AUC of HV and HF was only 0.562 and 0.563, respectively, while the conjoined use of VR_Calculation and HV performed best (AUC = 0.725).

Conclusions:

VR with eye-tracking can empower hippocampal metrics in diagnosing MCI in early AD.

PO-0240

Cerebral Blood volume measurement at tumor microvasculature derived from local image variance of susceptibility weighted imaging in glioblastoma: correlation with IDH mutation status

Hao Wu

Department of Radiology, Research Institute of Surgery, Daping Hospital, Army Medical University, Chongqing, China

Purpose

This prospective study was aim to assess the clinical practice of rCBV value at tumor-microvasculature derived from local image variance (LIV) of susceptibility-weighted imaging (SW) for IDH genotype prediction in glioblastoma (GBM).

Methods and materials

Preoperative MRI examinations of 78 GBM patients with known IDH genotype were recruited. rCBV derived from DSC-MRI was computed and normalized against the contralateral unaffected white matter value. rCBV and SWI images were coregistered to MNI space. SWI-LIV were calculated according to the Steiner translation theorem. The LIV regions were then extracted as RO for rCBV measurement, The hot-spot ROI-based rCBV analysis was also conducted for confrontation. The discriminating potential for assessing IDH mutation status prediction was assessed by ROC curves.

Results

ROC analysis revealed that the rCBVs in SW-LIV regions had great ability to predict IDH genotype with a sensitivity of 82.05% and a specificity of 97.06% (AUC=0.955). The SWI-LIV based rCBV analysis has a superior diagnostic performance for IDH genotype prediction compared to hot-spot ROI method (difference between areas=0.077, Z-score= 1.697, p=.09)

Conclusion

Our study proven that rCBVs in SW-LIV regions has high prediction capabilities for IDH mutation status in GBM patients. As SWI hypointensity is high correlated with tumor microvasculature, SWI-LIV based ROI method is reliable to evaluate the hemodynamic change compared to hot-spot based method.

Limitations

The main imitation was lacking the micarovascular-related biopsy data or pathologic sampling to confirm the rCBV change in SWI-LIV regions.

PO-0241

The potential value of pseudo-continuous arterial spin labeling in reflecting cognitive performance for older adults with MRI-negative epilepsy

Xuyang Yin, Jun Zhang
Huashan Hospital, Fudan University

Objective: We aimed to investigate the potential value of cerebral blood flow (CBF) measured by pseudo-continuous arterial spin labeling (PCASL) in indicating cognitive performance for older adults with MRI-negative epilepsy.

Methods: Older adults with MRI-negative epilepsy were recruited and administered a battery of neuropsychological tests, followed by the high-resolution T1 and ASL scan. Whole-brain voxel-based perfusion pattern of epilepsy with cognitive impairment was identified, and correlations between ROI-based CBF and domain-specific cognitive performance were conducted. Receiver operating characteristic curve was analyzed to examine the diagnostic value of ROI-based CBF in epilepsy with cognitive impairment.

Results: Eighty older adults with MRI-negative epilepsy (32 with cognitive impairment and 48 with normal cognition) were enrolled. Participants with cognitive impairment performed worse in MMSE score ($P = 0.015$), memory ($P = 0.009$), attention ($P = 0.007$), and executive function ($P = 0.003$). They exhibited decreased CBF in the bilateral middle frontal gyrus, bilateral superior frontal gyrus, bilateral precentral gyrus, left precuneus and right postcentral gyrus ($P < 0.05$, AlphaSim corrected, cluster-level). There were positive associations between mean CBF of the bilateral middle frontal gyrus and superior frontal gyrus and memory ($r = 0.202$, $P = 0.043$ for left and $r = 0.202$, $P = 0.043$ for right), and executive function ($r = 0.265$, $P = 0.032$ for left and $r = 0.263$, $P = 0.033$ for right). Mean CBF of the left precuneus was also positively correlated with executive function ($r = 0.262$, $P = 0.034$). The area under curve of the left middle frontal gyrus and superior frontal gyrus, right middle frontal gyrus and superior frontal gyrus, left precuneus and right postcentral gyrus in diagnosing epilepsy with cognitive impairment were 0.840, 0.805, 0.746, 0.703, respectively.

Conclusion: CBF measured by PCASL may be a useful indicator for cognitive performance in older adults with MRI-negative epilepsy.

PO-0242

Mixed brain perfusion pattern and its association with epilepsy duration: The application of arterial spin labeling in older people with epilepsy

Xuyang Yin, Jun Zhang
Huashan Hospital, Fudan University

Purpose: We aimed to identify the brain perfusion pattern of older people with epilepsy by pseudo-continuous arterial spin labeling (PCASL), and find the association between cerebral blood flow (CBF) and duration of epilepsy.

Methods: A total of 80 older people with epilepsy and 40 healthy controls were recruited and administrated the high-resolution T1 and ASL magnetic resonance imaging (MRI) scan. We compared the perfusion differences between two groups on whole-brain voxel-based level, and conducted linear regression between ROI-based CBF and duration of epilepsy.

Results: Compared to healthy controls, older people with epilepsy exhibited decreased CBF in the bilateral middle temporal gyrus and inferior temporal gyrus, and increased CBF in the left supplementary motor area, right fusiform gyrus and left anterior cingulate and paracingulate gyri ($P < 0.05$, cluster-level, AlphaSim corrected). After adjustment for age of onset, gender, education, seizure frequency and number of anti-seizure medication types, we found lower CBF in areas of hypoperfusion significantly correlated with longer duration of epilepsy.

Conclusions: There was a mixed brain perfusion pattern in older people with epilepsy in relation to the epilepsy duration, suggesting the potential effectiveness of applying ASL in clinical practice of early diagnosis and evaluation of seizure activity and severity for epilepsy.

PO-0243

Exploring the Feasibility of Ultrafast, Single-Scan Quantitative Magnetic Resonance Imaging for Huntington's Disease Patients

Fei Wu¹, Xiao Wang¹, Yong Zhang¹, Congbo Cai², Shuhui Cai², Zhong Chen², Liangjie Ling³, Jianfeng Bao¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. Department of Electronic Science, Fujian Provincial Key 3 Laboratory of Plasma and Magnetic Resonance, Xiamen University, Xiamen 361005, China

3. 飞利浦医疗公司

In this study, we tackle the challenge of acquiring clear Magnetic Resonance Imaging (MRI) scans from patients with Huntington's Disease, who often exhibit involuntary head movements. We employs a novel, ultrafast Multiple Overlapping Echo Separation (MOLED) pulse sequence to obtain high-quality images. The study involves both healthy volunteers and Huntington's patients, utilizing a 3 Tesla Philips Ingenia Elition imager and a complex readout scheme to isolate different types of overlapping echo signals in k-space. Preliminary results indicate that the MOLED-based fast quantitative scans successfully yield high-quality T2-mapping images, offering promise for more accurate diagnostics and future region-of-interest delineations in Huntington's patients.

PO-0244

Diffusion Tensor Imaging Analysis Along the Perivascular Space Index uncovers relationships of glymphatic dysfunction and cognitive progression in de novo Parkinson's disease

Xiaofei Huang
Guangzhou First People's Hospital

Background: The glymphatic system is involved in the clearance of misfolded α -synuclein. In recent years, research on glymphatic system dysfunction in patients with Parkinson's disease (PD) has received much attention. However, the relationship between glymphatic system dysfunction and cognitive progression in PD is unclear.

Objectives: To investigate the correlation between glymphatic system function and cognitive progression in PD patients using along the perivascular space index based on diffusion tensor imaging (DTI-ALPS).

Methods: Data were collected from the Parkinson's Disease Progression Markers Initiative (PPMI) cohort of newly diagnosed, unmedicated, cognitively normal at baseline and followed for 5 years in patients with PD. PD patients were divided into PD-MCI nonconverters and PD-MCI converters according to whether they developed mild cognitive impairment (MCI) within 5 years. DTI data were post-processed to obtain the DTI-ALPS index. The DTI-ALPS index of PD-MCI nonconverters and PD-MCI converters were compared, and correlation analyses were performed between the DTI-ALPS index and clinical scales and cerebrospinal fluid metrics, and one-way and multifactorial logistic regressions were used to explore the effects of baseline glymphatic system function on cognitive progression.

Results: A total of 90 PD patients were included (57 PD-MCI nonconverters, 33 PD-MCI converters.) The DTI-ALPS index was lower in the PD-MCI converters than in the PD-MCI non-converters (1.280 ± 0.207 vs. 1.380 ± 0.219 ; $P = 0.029$). In PD-MCI nonconverters, DTI-ALPS index was negatively correlated with MoCA score ($r = -0.402$, $P = 0.002$). Baseline DTI-ALPS index was an independent predictor of cognitive progression in PD (OR, 0.094, $P=0.049$).

Conclusion: This study found that PD patients with slower cognitive progression may have compensatory enhancement of glymphatic system function. In addition, the DTI-ALPS index may be an independent predictor of cognitive progression in PD.

PO-0245

Value of diffusion kurtosis imaging in the hierarchical diagnosis of glioma

Xiang Li,Hui Zhang
First Hospital of Shanxi Medical University

Purpose

To investigate the value of diffusion kurtosis imaging in the hierarchical diagnosis of glioma.

Materials and Methods

The clinical and imaging data of 65 patients with glioma confirmed by pathology from 2018 to 2020 were retrospectively analyzed, including 29 patients with grade 2, 20 patients with grade 3, and 16 patients with grade 4. Patients underwent routine MRI and DKI scanning before surgery, measuring tumoral solid portion, peritumoral edema, and normal appearing white matter DKI parameter value, including fractional anisotropy (FA), mean diffusivity (MD), mean kurtosis (MK), axial kurtosis (Ka),

radial kurtosis (Kr). The DKI parameters correction was made (tumor or edema parameters values divided by normal appearing white matter value) to obtain the rFA (ratio of FA), rMD (ratio of MD), rMK (ratio of MK), rKa (ratio of Ka), rKr (ratio of Kr) value. Analysis of variance (ANOVA) or Mann-Whitney U test was applied to compare the differences in the corrected DKI parameters of gliomas of different histological grades, and the diagnostic value of each parameter value for the pathological grading of gliomas was analyzed by plotting the receiver operating characteristic (ROC) curve.

Results

Comparison of rMD and rKa in the tumor parenchyma area of gliomas with different pathological grades showed no statistically significant difference ($P > 0.05$). rMK and rKr of those with pathological grade 4 were significantly higher than those with grades 2 and 3 and the difference was statistically significant ($P < 0.05$), but the difference between rMK and rKr of grades 2 and 3 was not statistically significant ($P > 0.05$). The parameter values of rFA of grade 4 were higher than those of grades 2 and 3, but the difference was statistically significant only between grade 4 and grade 3 ($P < 0.05$). The differences in rMK and rKr between different grades of peritumoral edema area were statistically significant ($P < 0.05$), and the differences in the rest of the parameters were not statistically significant ($P > 0.05$). The results of the analysis of ROC curves showed that the tumor parenchyma area rMK, rKr, rFA and the peritumoral edema area rMK and rKr all had a higher diagnostic value of the pathologic grade 4 gliomas ($P < 0.05$), and the area under the ROC curve was 0.796 [95% confidence interval (CI): 0.660-0.932], 0.745 (95% CI: 0.592-0.897), 0.704 (95% CI: 0.575-0.833), and 0.755 (95% CI: 0.618-0.892), respectively, 0.694 (95% CI: 0.555 to 0.833).

Conclusions

DKI can noninvasively evaluate glioma grade. rMK, rKr and rFA values have high diagnostic value for grade 4 glioma, among which rMK has the highest diagnostic efficiency.

PO-0246

精神障碍神经影像国家自然科学基金青年项目申请书“解密”

崔龙彪
空军军医大学

摘要:

目的: 国家自然科学基金是广大科技工作者获取科研经费的主要渠道, 本书收录了本磁共振成像科研团队中精神分裂症、抑郁症、木僵三个精神疾病方向负责人所撰写的国家自然科学基金青年项目申请书原文, 对申请书的撰写要点, 注意事项和技巧进行了生动而详尽的阐述, 对申请书的专家评审过程中的经验教训进行了深度的自我剖析与总结反思, 力求在青年项目申请过程中, 能够对初出茅庐的青年科技工作者、对申请书撰写评审有疑问者提供实用性的参考和借鉴, 帮助他们少走弯路, 提高申请书的写作水平和基金申请的成功率。

方法: 作者于 2018 年、2022 年先后获批国家自然科学基金青年项目 (基于影像组学策略的精神分裂症脑标记物及预后预测的 fMRI 研究) 与面上项目 (精神分裂症认知损害的大尺度机制及神经导航 rTMS 调控研究), 结合个人经验, 联合其他 5 位青年科技人员, 主编本书, 并获曹丰教授、印弘教授、李涛教授、林铮教授、刘军教授题跋。

结果: 《影像医学中的精神障碍: 国家自然科学基金青年项目申请书“解密”》于 2022 年出版, 销量 940 本, 捐赠图书馆及同行 160 本。

结论: 近年来, 国家自然科学基金委显著加强了对优秀青年人才的培养和支持, 对青年科学基金支持的力度逐年加大。本书由具有多年青年基金申请经验的几位科技工作者撰写而成, 主要围绕着影像医学中的精神疾病, 分为六章, 涉及《国家自然科学基金项目指南》节录、影像医学中的精神疾病项目申请经验、申请书原文及其审议意见与反思。结合他们在撰写, 审议过程中的宝贵经历“现

身说法”，不仅展示了他们的国家自然科学基金青年项目申请书原文，还对申请书的撰写要点，注意事项和技巧进行了生动而详尽的阐述。

PO-0247

非痴呆型血管性认知障碍患者海马表观弥散系数平均值研究

谈炎欢

常熟市中医院（常熟市新区医院）

【摘要】 目的 探讨非痴呆型血管性认知障碍（VCIND）患者两侧海马表观弥散系数平均值（ADCmean）与认知功能的关系。方法 对 43 例 VCIND 患者（VCIND 组）和 43 例条件匹配的志愿者（NC 组）行常规头颅 MRI 检查，测量两侧海马体积，以两侧海马作为感兴趣区（ROI），检测其 ADCmean 值并进行分析，将 VCIND 组和 NC 组的 ADCmean 值与 MoCA 评分进行相关分析。所有实验对象均为右利手。结果 1.VCIND 组和 NC 组两组组内和组间海马体积比较无明显差异（ $P>0.05$ ）。2.VCIND 组两侧海马 ADCmean 值均较 NC 组增高，差异有统计学意义（ $t=5.36$ ， $P<0.05$ ； $t=4.84$ ， $P<0.05$ ）。3.VCIND 组和 NC 组左侧海马 ADCmean 值均高于对侧，差异有统计学意义（ $t=6.16$ ， $P<0.05$ ； $t=5.29$ ， $P<0.05$ ）。4.VCIND 组两侧海马 ADCmean 值均与 MoCA 评分具有明显相关性（ $rs=-0.84$ ， $P<0.05$ ； $rs=-0.74$ ， $P<0.05$ ）。结论 在海马发生形态学改变之前，ADCmean 值可以从分子影像学角度准确、快速地反映 VCIND 患者海马水分子的扩散能力，ADCmean 值的升高提示海马存在微观结构的损伤，一定程度上可以反映 VCIND 患者认知功能的改变，可能是该病早期诊断的可靠的分子影像学依据。

PO-0248

非痴呆型血管性认知障碍患者海马氢质子磁共振波谱研究

谈炎欢

常熟市中医院（常熟市新区医院）

【摘要】 目的 应用氢质子磁共振波谱（Proton Magnetic Resonance Spectroscopy, $^1\text{H-MRS}$ ）技术，分析非痴呆型血管性认知障碍（Vascular Cognitive Impairment no Dementia, VCIND）患者两侧海马区物质代谢变化，及其与蒙特利尔认知功能（Montreal Cognitive Assessment, MoCA）评分的相关性。方法 对 22 名 VCIND 患者（VCIND 组）和 22 名条件匹配的志愿者（NC 组）行常规头颅 MRI 和 $^1\text{H-MRS}$ 检查，测量两侧海马体积，以两侧海马作为感兴趣区，检测其 N-乙酰天门冬氨酸（NAA）、胆碱复合物（Cho）、肌酸复合物（Cr）的相对浓度并进行分析。将 VCIND 组的 NAA/Cr、Cho/Cr 值与 MoCA 评分进行相关分析。所有实验对象均为右利手。结果 1.VCIND 组和 NC 组两组组内和组间海马体积比较无明显差异（ $P>0.05$ ）。2.VCIND 组两侧海马 NAA/Cr 值均较 NC 组显著降低，差异有统计学意义（ $P<0.05$ ）。两组间两侧海马 Cho/Cr 值比较无显著性差异（ $P>0.05$ ）；3.VCIND 组左侧海马 NAA/Cr 值低于对侧，差异有统计学意义（ $P<0.05$ ），NC 组两侧海马 NAA/Cr 值比较差异不明显（ $P>0.05$ ）。VCIND 组和 NC 组组内两侧海马 Cho/Cr 值比较均无明显差异（ $P>0.05$ ）；4.VCIND 组两侧海马 NAA/Cr 值均与 MoCA 评分具有明显相关性（ $P<0.05$ ），两侧海马 Cho/Cr 值与 MoCA 评分无明显相关性（ $P>0.05$ ）。结论 1.海马 $^1\text{H-MRS}$ 代谢物浓度的变化可在海马发生形态学改变之前，提示海马神经元损伤的存在；2. $^1\text{H-MRS}$ NAA/Cr 可以在一定程度上反映患者的认知功能改变，有助于本病的早期诊断、早期治疗。

PO-0249

多模态影像技术在脑泡状棘球蚴病中的诊断价值

王媛
郑州大学第一附属医院

目的: 脑泡状棘球蚴病其囊内包虫幼虫可随脑脊液流动而移动, 对其诊断主要依赖于对脑脊液的动态检测。因此, 对脑实质多模态影像技术进行研究分析, 可以更好指导临床对泡状棘球蚴囊性病变的诊断与治疗。

方法: 选择 16 例泡状棘球蚴病患者, 所有病例均行 CT 平扫、增强, MRI 平扫、增强扫描。

结果: 16 例泡状棘球蚴病患者中, CT 平扫和增强检查均未见异常, 而 MRI 增强后病灶明显强化。

结论: 泡状棘球蚴病是一种包虫寄生于中枢神经系统引起的具有典型临床表现的慢性寄生虫疾病, 诊断时需要结合临床病史和脑脊液检查。MRI 可做为首选检查方法, 根据不同分期患者, 选用不同的 MRI 检查方案, 以提高其诊断正确率。

PO-0250

基于 CCTA 影像标记物和影像组学预测脑白质高信号的进展: 探索心脏和大脑之间的潜在相关性

侯婕¹、晋慧²、龚向阳³
1. 锦州医科大学
2. 蚌埠医学院
3. 浙江省人民医院

目的: 比较两种 CCTA 影像标记物(CT 血流储备分数 CT-FFR、冠状动脉周围脂肪衰减指数 pFAI)和影像组学标签预测脑白质高信号(WMH)进展效能。结合 CT-FFR、pFAI 和影像组学标签开发诺莫图用于预测 WMH 进展。**方法:** 收集浙江省人民医院 2019 年 1 月至 2022 年 5 月行冠脉 CCTA 和头颅 MRI 的 146 例冠心病患者资料, 随访第二次 MRI 有 63 名 WMH 进展患者, 将 146 名患者分为训练集(n=116)和内部验证集(n=30), 纳入杭州市中医院 80 名患者作为外部验证集。使用半自动软件从 CCTA 图像中计算 CT-FFR 和 pFAI 同时分割冠状动脉周围脂肪组织(PCAT)和全心肌(Myocardium)并提取影像组学特征, 筛选出最佳特征后利用不同机器学习算法对影像组学标签进行模型构建。分析临床因素、CT-FFR、pFAI 和两组标签确定 WMH 进展独立预测因素构建诺莫图。**结果:** 不同机器学习算法比较得出 XGBoost 算法中 PCAT 标签展现出较高预测 WMH 进展效能, 在训练集、内部验证集、外部验证集 PCAT 和 Myocardium 标签的 AUC 分别为 0.862、0.760、0.731 和 0.738、0.708、0.711, 同时对两种影像标记物比较发现 pFAI 比 CT-FFR 具有更高预测效能, 在训练集、内部验证集、外部验证集 pFAI 和 CT-FFR 的 AUC 分别为 0.799、0.787、0.762 和 0.625、0.726、0.682, 最终, 结合 CT-FFR、pFAI 和影像组学标签的诺莫图显示出最高预测效能, 在训练集、内部验证集、外部验证集的 AUC 分别为 0.918、0.846、0.893。**结论:** 对两种影像标记物和影像组学标签比较发现, pFAI 比 CT-FFR、PCAT 标签比 Myocardium 标签预测 WMH 进展效能更好。结合 pFAI、CT-FFR 和影像组学标签的诺莫图是一种识别 WMH 进展潜在工具。

PO-0251

基底节区对称性低密度病变的发病机理与 CT 诊断相关性

邹灿

玉林市四人民医院

【目的】探讨基底节区对称性低密度病变的发病机理，探讨其与 CT 诊断的相关性，为临床医生提供更好的诊断及治疗方案。

【方法】选取 2020 年至 2022 年在我院治疗的基底节区对称性低密度病变患者，共计 50 例。采用 CT 螺旋扫描对病变进行影像学分析，结合临床资料结果进行综合分析。

【结果】50 例患者中，男性 27 例，女性 23 例。年龄分布在 40 岁至 70 岁之间，平均年龄为 56 岁。CT 表现为基底节区对称性低密度影像，病变范围多为对称性，部分患者伴有轻度半侧性脑萎缩。病变多为脑动脉硬化所致的缺血性病变。与对照组比较，患者基础疾病中高血压、糖尿病、高脂血症、吸烟等因素的发生率明显较高。

【结论】基底节区对称性低密度病变的发病机理与脑动脉硬化有关，高血压、糖尿病、高脂血症、吸烟等因素是其发病的主要危险因素。CT 诊断可对基底节区对称性低密度病变进行准确的影像学诊断，为临床医生提供更好的诊断和治疗方案。

PO-0252

Mahalanobis 距离测量法：量化脑卒中患者白质变化与预测预后的新方法

苏厚铭、李元昊、朱文珍

华中科技大学同济医学院附属同济医院

目的：脑卒中是一种异质性疾病，其临床表现与影像特征在个体之间存在差异，这给基于病例对照法的神经影像研究带来了挑战。标准化建模是一种衡量个体偏离正态模式程度的新兴方法，有望为此提供解决方案。本研究旨在组水平和个体水平上评估脑卒中引起的白质微结构异常，寻找可用于预后预测的特异性生物标志物。

方法：我们招募了 46 名缺血性脑卒中患者和 46 名性别与年龄匹配的健康对照者。卒中发作 7 天内进行扩散加权成像和临床评估。首先，使用自动纤维量化技术对 20 条主要纤维束的 100 个节点进行弥散参数的表征。随后，将每位患者与 46 名健康对照者建立的标准化模式对 7 条具有组间差异的纤维束进行 Mahalanobis 距离测量，并提取 Mahalanobis 距离偏差负荷 (Mahalanobis distance-based deviation loads, MaDDLs) 和多参数融合的 MaDDL_{multi}。最后，进行相关性分析和 logistic 回归分析，评估 MaDDLs 与功能评分之间的关系。

结果：我们观察到左侧皮质脊髓束、双侧额枕下束、左侧下纵束、双侧丘脑辐射和右侧钩束的白质微结构完整性受损。MaDDLs 与初始功能障碍之间的相关系数在 0.521 至 0.618 之间，其中最高的是 MaDDL_{multi}。此外，与单变量 MaDDLs 相比，MaDDL_{multi} 在预后预测方面展现出更好的性能 (AUC = 0.875, 敏感度 = 0.867, 特异度 = 0.839)。值得注意的是，与左侧皮质脊髓束 MaDDL 相比，MaDDL_{multi} 预测效果更佳 (综合判别改善指数 = 9.62%, P = 0.005)。

结论：MaDDL_{multi} 在评估功能障碍和预测预后方面潜力可观，对于个性化临床决策和卒中康复具有重大意义。更重要的是，我们提出的方法在分析异质性神经疾病方面具有广阔的应用前景。

PO-0253

初诊 GBA 相关帕金森病的神经递质变化特点

任静茹、刘卫国
南京医科大学附属脑科医院

目的: 目前 GBA 相关帕金森病 (GBA-related Parkinson's disease, GBA-PD) 的神经递质缺陷及其与认知障碍的关系尚不清楚。深入理解 GBA-PD 神经递质损伤, 尤其是在初诊未服药阶段, 有利于制定具有针对性的治疗方案。因此, 本研究旨在探索 GBA-PD 和特发性帕金森病 (idiopathic Parkinson's disease, iPD) 的神经递质紊乱模式及其与认知表现的相关性。

材料与方法: 本研究共招募 189 例初诊 PD 患者进行 GBA 基因测序。在 17 例 GBA-PD、100 例 iPD 和 32 例年龄和性别匹配的健康对照组 (healthy controls, HCs) 中, 采用基于体素的形态学 (voxel-based morphometry, VBM) 分析技术探索脑灰质体积 (gray matter volume, GMV) 的变化特点。使用涵盖各种神经递质图谱的 JuSpace 工具箱, 研究 GBA-PD 和 iPD 患者 (相对于 HCs) 的局部 GM 萎缩区域是否与特定神经递质的空间分布相关。

结果: 与 HCs 相比, GBA-PD 患者的右侧颞中回 (middle temporal gyrus, MTG) 存在显著的 GM 萎缩。右侧 MTG 体积与初诊 PD 患者的执行功能呈正相关。GBA-PD 和 iPD 的 GM 萎缩与血清素能的高分布、多巴胺能和乙酰胆碱能的低分布存在显著的空间相关性 ($p < 0.05$, FDR 校正)。认知领域的执行功能和语言也与血清素能、多巴胺能和乙酰胆碱能回路的 GMV 共定位强度相关。

结论: GBA-PD 和 iPD 患者的 GM 萎缩与多种神经递质显著相关, 包括血清素能、多巴胺能和乙酰胆碱能, 并且与执行功能和语言能力显著相关。这些发现可能为 GBA-PD 和 iPD 的病理生理过程和相关认知特征提供新的见解, 促进潜在的治疗靶点以改善 PD 管理。

PO-0254

II~III级颅内孤立性纤维瘤的 MRI 表征与病理特征分析

冉云彩、王潇、张勇、程敬亮
郑州大学第一附属医院

目的 探讨基于 MRI 表征分析术前预测颅内孤立性纤维性肿瘤 (intracranial solitary fibrous tumor, ISFT) 病理分级的价值及其病理特征。

材料与方法 回顾性分析本院 55 例经过手术病理证实的 ISFT 患者 (27 例 II 级、28 例 III 级) 的临床、MRI 影像征象及病理资料, 比较 II 级与 III 级 ISFT 患者 MRI 表征及病理特征差异。两组间计量资料的比较采用独立样本 t 检验或 Mann-Whitney U 检验, 分类资料的比较采用 Pearson 卡方或 Fisher 精确检验。通过 logistic 回归分析对差异有统计学意义的 MRI 表征进行变量筛选构建综合模型, 并绘制受试者工作特征 (ROC) 曲线并计算曲线下面积 (AUC) 评价各参数及综合模型对 II 级与 III 级 SFT 鉴别诊断的价值。

结果 II 级与 III 级 ISFT 患者平均发病年龄相当, II 级与 III 级患者中男性患病率均较女性稍高, 组间差异分析发现 II 级与 III 级患者中 T2F lair 信号特征、DWI 信号特征、ADCmax、ADCmin、ADCmean、肿瘤分布位置、颅骨侵犯情况存在显著差异 (P 均 < 0.05); 通过二元 logistic 回归分析将 T2F lair 信号特征及 ADCmin 值纳入回归方程显示模型准确率为 90.9%, 同时 ROC 曲线显示 T2F lair 信号特征的 AUC 为 0.703 (0.558, 0.848)、ADCmin 值的 AUC 为 0.805。ISFT 患者免疫组化 STAT6 阳性率达 96%, 免疫组化 Ki-67 的表达在 II 级 10% (5%, 15%) 与 III 级 15% (10%, 20%) ISFT 患者中差异有统计学意义 ($P < 0.05$)。

结论 基于 MRI 表征分析获得的 T2F lair 信号特征及 ADCmin 值对 IⅡ级与Ⅲ级 ISFT 术前鉴别诊断具有较高价值, 有助于提高本病的影像分级诊断率, 且Ⅲ级 ISFT 患者免疫组化 Ki-67 的表达高于 IⅡ级。

PO-0255

全肿瘤表观扩散系数直方图分析鉴别微囊型脑膜瘤和颅内孤立性纤维性肿瘤的价值

刘显旺^{1,2,3}、韩涛^{1,2,3}、周俊林^{1,2,3}

1. 兰州大学第二医院

2. 甘肃省医学影像重点实验室

3. 医学影像人工智能甘肃省国际科技合作基地

目的: 探讨全肿瘤表观扩散系数 (apparent diffusion coefficient, ADC) 直方图分析术前鉴别微囊型脑膜瘤 (microcystic meningioma, McM) 和颅内孤立性纤维性肿瘤 (solitary fibrous tumor, SFT) 的价值。

材料与方法: 回顾性分析兰州大学第二医院经手术病理证实的 18 例 McM 和 23 例 SFT 患者的术前 MRI 资料。记录每名患者的 MRI 语义特征 (包括位置、分叶征、坏死/囊变、瘤周水肿、瘤脑界面、邻近骨质变化、血管流空信号、增强模式和肿瘤直径)。同时使用 MaZda 软件在轴位 ADC 图像上进行全肿瘤勾画并进行直方图分析, 获得 Mean、Variance、Skewness、Kurtosis、Perc.01、Perc.10、Perc.50、Perc.90 和 Perc.99 等 9 个直方图参数。分类变量采用 χ^2 检验比较, 计量资料采用独立样本 t 检验或 Mann-Whitney U 检验比较。绘制受试者工作特征曲线分析各直方图参数的鉴别诊断效能。

结果: McM 和 SFT 组间 MRI 语义特征均无统计学差异 ($P > 0.05$)。SFT 直方图参数中的 Mean、Perc.01、Perc.10、Perc.50、Perc.90 和 Perc.99 均明显低于 McM 组, 且各参数间差异均具有统计学差异 ($P < 0.05$); 而两组间 Variance、Skewness、Kurtosis 的差异均无统计学意义 ($P > 0.05$)。ROC 分析结果显示 Perc.01 是鉴别 McM 和 SFT 的最佳参数, 相应的曲线下面积为 0.861, 敏感性、特异性和准确性分别为 78.26%、88.89% 和 82.93%。

结论: McM 和 SFT 组间 MRI 语义特征存在交叉重叠。ADC 直方图分析有助于术前区分 McM 和 SFT, 其中 Perc.01 的鉴别性能最佳。

PO-0256

人工智能技术评估脊髓小脑共济失调 3 型患者脑萎缩的应用价值

陈思丹¹、吴交交²、曹伯裕¹、李雨钢¹、胡宙瑶¹、花蕊²、石峰²、王小川¹、戚乐¹

1. 杭州师范大学附属医院

2. 上海联影智能医疗科技有限公司

目的: 基于人工智能 (artificial intelligence, AI) 技术评价脊髓小脑共济失调 3 型 (spinocerebellar ataxia type 3, SCA3) 患者脑萎缩程度, 探究其与疾病严重程度的相关性。方法: 收集 2019 年 9 月至 2022 年 4 月 SCA3 患者实验组 (SCA3 组) 23 例和健康对照组 (healthy control, HC 组) 24 例的临床资料和影像数据。使用国际合作共济失调严重程度评分量表 (international cooperative ataxia rating scale, ICARS) 评估 SCA3 患者共济失调严重程度。采用 AI 技术处理实验组和对照组的 3D-T1WI 磁共振影像数据, 分割及测量脑组织的体积及其体积百分比。统计分析 SCA3 患者脑组织结构改变与共济失调严重程度的相关性。结果: 两组间性别、年龄比较无统计学差异 ($P > 0.05$)。与

HC 组比较, SCA3 组额叶、颞叶、顶叶、枕叶、边缘叶、右侧大脑白质、皮层下灰质、小脑及脑干体积及体积百分比显著下降(多重假设检验校正后 $\text{adjusted } P < 0.01$)。SCA3 组的 ICARS 评分与患者的年龄呈正相关($r = 0.571$, $P = 0.004$), 与左侧小脑白质、小脑蚓部、延髓的体积及小脑白质、小脑蚓部、脑桥、延髓的体积百分比均存在负相关($P < 0.05$)。结论: SCA3 患者幕上以及幕下脑组织均存在萎缩, 其中苍白球萎缩最为显著, 提示其可以作为 SCA3 的影像标志物之一。

PO-0257

临床 5.0 T 超高场 MRI 磁敏感加权成像评估脑静脉及深髓静脉的价值

刘畅
安徽省立医院

目的:探讨 5.0 T 超高场 MR 磁敏感加权成像(SWI) 技术评估健康人群脑静脉及深髓静脉的价值。

方法:收集本院 2023 年 3 月至 5 月招募的健康成年人 50 名, 采用完全随机设计将其分为 3.0 T MR 组和 5.0 T MR 组, 每组 25 名。对所有受检者进行磁敏感加权成像 (SWI), 采用主观 Likert5 分量表评分对图像质量进行评估, 采用 3 分量表法对脑深髓静脉显示质量 [大脑大静脉 (VofG) 及其 3 段、大脑内静脉 (ICV) 及其 3 段、透明隔前静脉 (ASV) 及其 3 段、流入透明隔前静脉的深髓静脉 (DV of ASV)、流入尾状核横静脉的深髓静脉 (DV of TCV)、流入侧脑室内侧静脉的深髓静脉 (DV of TLV)] 进行评估。2 组间定量指标的比较采用独立样本 t 检验和 Mann-Whitney U 检验。

结果:50 名受检者中男 27 名、女 23 名。5.0 T MR 组图像的 SNR 值和 CNR 值高于 3.0 T MR 组, 差异有统计学意义 (t 分别为 23.62、21.45, $P < 0.001$), 但 5.0 T MR 组、3.0 T MR 组图像质量主观评分差异无统计学意义 [分别为 5.0 (5.0, 5.0)、5.0 (4.0, 5.0) 分, $Z = -1.46$, $P = 0.113$]。对脑深髓静脉的评估上, 3.0 T MR 组与 5.0 T MR 组 SWI 在 VofG 和 ICV 的显示均较好, 评分差异无统计学意义 ($P > 0.05$), 而在 ASV 的显示上 5.0 T MR 组图像均明显优于 3.0 T MR 组图像 ($P < 0.05$)。在 DV of ASV、DV of TCV、DV of TLV 的评估中发现 5.0 T MR 组对深髓静脉的显示均显著高于 3.0 T MR 组图像 ($P < 0.001$)。

结论:5.0 T 超高场强 MR SWI 技术扫描对脑静脉及深髓静脉显示优良, 这为构建脑髓质静脉网络提供了可能, 可用于脑静脉疾病的诊断和鉴别诊断。

PO-0258

基于白质结构及衍生的网络属性预测 MCI 进展为 AD 的机器学习研究

彭珈璇
锦州医科大学
浙江省人民医院

目的:本研究旨在利用 DTI 技术识别可能导致 MCI 进展的纤维束损伤和白质网络改变, 其次, 在此基础上联合机器学习及临床特征构建综合模型用于预测 MCI 患者中可能进展为 AD 的高风险人群。

方法:从 ADNI 中纳入 173 例 MCI 患者, 其中 45 例在 4 年的随访中进展为 AD。每名患者使用 DTI 技术提取相关纤维束属性特征, 此外, 基于白质纤维束构建脑网络提取网络属性特征。使用 mRMR、Lasso 等降维方式对纤维束特征及网络特征进行降维构建白质标志物。将降维后的重要特征与有差异的临床特征进行相关性分析, 同时利用机器学习 (SVM、Bayes、Tree、

RandomForest 和 KNN) 方法结合多模态临床数据构建综合模型。使用十折交叉验证及 ROC 曲线评估模型性能。

结果: 基于多因素逻辑回归筛选出 CDRS 评分及 ADAS 评分、白质标志物作为独立预测因子构建综合模型, 综合模型在训练队列中的 AUC、敏感性和特异性分别为 0.938, 0.937 和 0.91。在测试队列中的 AUC、敏感性和特异性分别为 0.905, 0.923 和 0.872。Delong 检测显示综合模型相比 CDR 评分、ADAS 评分有统计学差异($p < 0.05$), 而与白质标志物评分之间无统计学差异($p = 0.341$)。此外, 右侧中央前回介数中心性与 CDR、ADAS 评分呈负相关($r = -0.203, -0.27, P = 0.025, 0.003$), 右侧颞下回的 PageRank 与 ADAS 呈负相关($r = -0.241; P = 0.008$)。右侧海马扣带回的 MD 值与 MMSE 评分呈负相关($r = -0.233, P = 0.001$)。左侧钩束的 FA 值与 MMSE 评分呈正相关($r = 0.246, P = 0.007$)。结论: 本研究结果表明, 新型的白质特征组合联合临床量表评分构建的预测模型可以识别可能进展为 AD 的高风险人群, 结合 SVM 可以使模型准确率大大提高, 这有助于 AD 的早期诊断。

PO-0259

乳腺癌术前化疗过程中脑静息态功能活动与类淋巴功能改变及相关性分析

王艾博、陈磊、尹晓宇、刘颖、叶兆祥
天津市肿瘤医院 (天津医科大学肿瘤医院)

目的: 探究女性乳腺癌患者术前新辅助化疗后脑功能和类淋巴功能变化及其之间的相关性情况。

方法: 40 名健康女性被试(healthy participate, HP) 及 80 名女性乳腺癌患者被纳入本次研究, 80 名乳腺癌患者均进行术前新辅助化疗。应用 MMSE 和 DSST 评分评价被试认知水平, 应用 FACT-CogPCI 评分评估乳腺癌患者化疗前后认知功能的变化。应用 rsfMRI 获取反映被试大脑功能活动的 ALFF 及 fALFF 指标。应用 DTI 获取反映脑类淋巴功能的血管周围间隙指数(along perivascular space, ALPS)。分析乳腺癌患者化疗前后 ALFF、fALFF 及 ALPS 变化及相关性, 分析各指标与认知评分之间的相关性。

结果: 相比 HP 及化疗前, 乳腺癌患者化疗后 MMSE 及 DSST 评分减低, FACT-CogPCI 评分增高。相比 HP, 乳腺癌患者化疗前, 右侧小脑、左侧丘脑的中间脑核及双侧顶叶中回等脑区团块 ALFF 值减低。化疗后, 左侧颞极中部、左侧丘脑腹外侧核及右侧顶后中回团块 ALFF 值相比 HP 组减低。而乳腺癌患者化疗前(BS) 右侧舌状回、左侧镰切沟和右侧前额顶叶团块以及化疗后的右侧纺锤状回、左侧舌状回团块 fALFF 值相比 HP 组增高($pFDR-C < 0.001$)。化疗后, 乳腺癌患者双侧颞叶、枕叶及顶叶多个脑区的 ALFF 值与 PCI 评分呈正相关($pFDR-C < 0.001$)。化疗后 ALPS 指数相比 HP 增高(1.42 ± 0.29 vs $1.56 \pm 0.24, p = 0.011$), 同时 ALPS 指数与 FACT-CogPCI 评分呈正相关($r = 0.241, p = 0.04$)。与此同时化疗后左侧舌状回 ALFF 值与 ALPS 指数呈正相关($r = 0.69, p < 0.001$)。结论: 我们的研究结果提示, 大脑功能活动和类淋巴引流均参与化疗后认知功能改变的过程, 同时两者在这个过程中存在相互关联。

PO-0260

青年及青少年抑郁症患者自杀相关的大脑白质结构和网络异常

张华为¹、李慧茹²

1. 四川大学华西医院

2. 昆明医学院第一附属医院

目的：重度抑郁症患者的自杀风险明显高于普通人群和其他精神障碍人群。自杀行为和意念通常始于青春期/成年早期，此时不仅是身体、智力发生变化的关键发展阶段，也是与大脑功能和结构重组相关的认知和情感变化的过渡时期，因此阐明青春期/成年早期自杀行为的神经基础可能有助于自杀的早期识别和预防。本研究拟通过磁共振成像技术，从连接大脑各脑区的白质纤维微结构的异常和大脑白质结构的网络拓扑属性的改变来研究有自杀倾向的青年、青少年抑郁症患者的神经影像学改变，探究抑郁症患者自杀的神经影像学机制。

方法：本研究一共纳入了年龄和性别相匹配的 33 名健康对照 (HC)、33 名无自杀倾向的抑郁患者 (DS-) 和 33 名有自杀倾向的抑郁患者 (DS+)，年龄范围 15-25 岁。采用自动纤维量化 (AFQ) 的方法分析了三组被试的弥散成像数据，追踪了被试大脑的 20 条纤维，评估了各纤维 100 个节段的各向分数异性 (FA)、平均弥散率 (MD)、径向弥散率 (RD) 和轴向弥散率 (AD)。将基于弥散成像数据得到的大脑 FA 值构建大脑的白质结构网络，利用基于图论的方法分析脑网络的全局和节点拓扑属性。

结果：AFQ 分析发现三组之间有差异的纤维束包括小脑体、双侧额枕下束、左丘脑前辐射和左弓状束。基于图论的大脑白质结构网络的全局和节点拓扑属性分析发现，与 HC 组相比，DS+组的 λ 显著增高，与 HC 组相比，DS-组和 DS+组的 Cp 值均明显降低；节点拓扑属性的异常表现为 DS+组和 DS-组的右侧丘脑节点效率显著低于 HC 组。

结论：本研究表明，青年及青少年抑郁症患者的自杀行为不仅与大脑白质的结构异常有关，还涉及到复杂的结构网络，前额叶-边缘系统可能在抑郁症患者的自杀行为中有重要意义，这为未来抑郁症自杀行为可能的治疗靶点提供了新的证据，未来的研究可能需要使用更大的样本量和更复杂的网络分析。

PO-0261

Sy-MRI 联合 3D-ASL 成像技术在恶性胶质瘤中
预测 IDH 基因突变的应用研究马文富¹、吕瑞瑞²、孙萌¹、金一萱¹、郑佳瑞¹、王晓东²

1. 宁夏医科大学

2. 宁夏医科大学总医院

目的 探索集成 MRI(Synthetic MRI, Sy-MRI)联合三维动脉自旋标记 (three dimension-arterial spin labeling, 3D-ASL) 成像技术在恶性胶质瘤中预测异柠檬酸脱氢酶(isocitrate dehydrogenase, IDH) 基因突变的应用价值。

材料与方法 本研究共纳入具有完整病理及免疫组化的胶质瘤患者 60 例，术前均行 Sy-MRI 及 3D-ASL 扫描，将病例分为 IDH 突变型和 IDH 野生型。对 Sy-MRI 的各参数图与 3D-ASL 的相对脑血流量(relative cerebral blood volume, rCBF)图进行配准，测量肿瘤实体部分在上述参数图的信号。采用独立样本 t 检验比较 IDH 突变型和 IDH 野生型组间不同参数的差异，采用单因素逻辑回归分析 Sy-MRI 参数及 rCBF 在 IDH 突变中的预测价值，采用受试者工作特征(receiver operation characteristic, ROC)曲线评估各参数及其联合对 IDH 突变的诊断效能。结果均以双侧 $P < 0.05$ 为差异有统计学意义。

结果 IDH 突变型和野生型组在增强前 T1、增强后 T1、 $\Delta T1$ 、 $\Delta T2$ 及 rCBF 间差异有统计学意义(p 均 <0.05)；在增强前 T2 和增强后 T2 间差异无统计学意义(p 均 >0.05)。单因素逻辑回归分析显示增强前 T1、增强后 T1、 $\Delta T1$ 、 $\Delta T2$ 及 rCBF 对 IDH1 突变状态有较高的预测价值(p 均 <0.05)，而增强前 T2 和增强后 T2 无统计学上的预测价值(p 均 >0.05)。rCBF、 $\Delta T1$ 、 $\Delta T2$ 值独立诊断 IDH1 突变状态的 AUC 值分别为 0.801、0.749、0.770。上述三参数联合模型诊断 IDH 突变的 AUC 为 0.920。

结论 Sy-MRI 的定量弛豫成像和 3D-ASL 成像技术可作为术前无创预测 IDH 突变状态的新影像学指标。

PO-0262

糖尿病前期及 2 型糖尿病皮层萎缩与认知功能的相关性研究

李欣、张冰

南京大学医学院附属鼓楼医院

目的 本研究旨在探讨糖尿病前期和 2 型糖尿病患者大脑皮层的改变模式及其与认知功能的关系，以期探寻血糖代谢异常早期的影像标志物。

方法 本研究纳入 96 名 2 型糖尿病 (T2DM)、30 名糖尿病前期 (PDM) 以及 48 名正常对照 (NC)，对被试进行了认知功能测试、临床生化检查及高分辨率 3D-T1WI 磁共振扫描。使用 CAT12 软件进行基于体素的形态学分析和基于表面的形态学分析得到全脑灰质体积和皮层厚度、局部回指数等皮层结构参数，并比较 3 组间的差异，结果均使用 $P < 0.05$ 的阈值和 FWE 校正进行多重比较校正。进一步提取组间具有差异的参数，与生化指标及认知量表得分进行相关分析。

结果 与 NC 相比，PDM 右侧眶部额下回及左侧中央后回灰质体积减小 ($P < 0.05$, FWE 校正)，T2DM 患者出现更多灰质萎缩，特别是右侧颞上回、右侧眶部额下回、右侧颞中回及左侧中央后回，右侧前额叶皮层厚度减小 ($P < 0.05$, FWE 校正)。在血糖代谢异常被试中全脑灰质体积与胰岛素抵抗指数 ($r = -0.227$, $P = 0.012$) 及连线测试 A 得分 ($r = -0.250$, $P = 0.001$) 呈负相关，与数字广度-倒背得分呈正相关 ($r = 0.267$, $P = 0.003$)；皮层厚度与糖化血红蛋白 ($r = -0.181$, $P = 0.040$) 及餐后 2h 血糖 ($r = -0.272$, $P = 0.020$) 呈负相关，与餐后 2h 胰岛素 ($r = 0.236$, $P = 0.010$) 及胰岛 β 细胞功能指数 ($r = 0.207$, $P = 0.022$) 呈正相关。

结论 本研究发现糖尿病前期已存在脑区灰质萎缩，T2DM 患者出现更多的灰质萎缩，且与注意和工作记忆功能相关，因此皮层萎缩有可能是糖尿病相关脑损伤早期的影像标志物。这提示处于糖尿病前期的被试也应该严格控制血糖，早期干预有利于预防认知损害及改善预后。

PO-0263

人工智能在基于 CT 灌注原始图像重组头颅 CT 血管成像的应用

欧阳颖

广东省人民医院

目的 探讨利用人工智能软件从 CTP 原始图像中重组的 CTA 的临床应用价值。资料与方法 收集临床疑似缺血性脑血管病患者 60 例，所有患者均进行头颅 CT 平扫、CTA 与 CTP 检查，将 CT 灌注原始图像导入数坤脑灌注智能分析系统获得重组 CTA (即 CTPA)。以常规 CTA 扫描结果为参照，CTA 与 CTPA 组各分析 540 个节段血管，采用 Kappa 检验比较两者图像质量以及脑动脉狭窄显示的一致性。结果 图像质量主观评价发现 CTPA 图像显示脑动脉强化程度、脑动脉细节显示能力、图像噪声及静脉污染等与 CTA 相似。血管狭窄程度分析得出 CTA 和 CTPA 对脑内动脉显示具有很好的一致性，Kw 值均大于 0.75。共 540 个节段血管中，仅 15 个节段的血管存在 CTPA 与 CTA 显

示不一致的结果, 其中仅 2 个节段为低估血管狭窄程度, 余 13 个节段血管均为高估血管狭窄程度。结论 利用 AI 软件, 能方便、快捷地迅速从 CTP 灌注原始图像中重组出颅内动脉图像, 所得 CTPA 与常规 CTA 比较, 有较好的一致性, 能准确显示动脉狭窄和闭塞。

PO-0264

基于人工智能 CT 评估前循环大血管闭塞性急性缺血性脑卒中血管内治疗预后的影响因素

唐小平¹、陆丽芳¹、涂江龙¹、龚良庚¹、赵锡海²

1. 南昌大学第二附属医院医学影像中心

2. 清华大学医学院生物医学影像研究中心

目的: 探讨基于人工智能多模态 CT 评估前循环大血管闭塞性急性缺血性脑卒中(AIS-LVO)血管内治疗(EVT)预后的影响因素, 并构建预后预测模型, 旨在改善患者临床预后提供理论依据。

方法: 回顾性收集我院 114 例接受 EVT 的前循环 AIS-LVO 患者。收集患者的一般临床资料。治疗前所有患者均行颅脑 CT 平扫(NCCT)、颅脑 CT 血管成像(CTA)、脑 CT 灌注成像(CTP)检查。根据术后 3 个月改良 Rankin 量表(mRS)评分将患者分为预后良好组和预后不良组。采用单因素分析及多因素 Logistic 回归分析筛选前循环 AIS-LVO 患者 EVT 后预后的独立预测因素, 并构建基于临床因素、影像因素、临床联合影像因素的预后预测模型, 应用 ROC 曲线评估各模型的预测效能。

结果: 多因素 Logistic 回归分析显示, 回归临床模型显示年龄, 入院时 NIHSS 评分是预测卒中预后的独立预测因素, 该模型预测卒中预后的 AUC 为 0.899, 敏感度 72.9%, 特异度 90.9%。回归影像模型显示梗死核心体积, 侧支血管 Miteff 评分是预测卒中预后的独立预测因素, 该模型预测卒中预后的 AUC 为 0.914, 敏感度 81.3%, 特异度 89.4%。回归临床联合影像模型显示年龄, 入院时 NIHSS 评分, 梗死核心体积, 侧支血管 Miteff 评分是预测卒中预后的独立预测因素, 该模型预测卒中预后的 AUC 达 0.953, 敏感度 87.5%, 特异度 93.9%。DeLong 检验发现, 与临床联合影像模型相比, 临床模型($Z=-2.422$, $P=0.015$)、影像模型($Z=2.196$, $P=0.028$)预测能力较低, 差异有统计学意义。

结论: 年龄、入院时 NIHSS 评分、梗死核心体积及侧支血管 Miteff 评分是前循环 AIS-LVO 患者 EVT 后预后不良的独立预测因素。临床联合影像的预测模型能有效提高前循环 AIS-LVO 患者 EVT 术后预后预测效能。

PO-0265

大脑功能同伦的遗传机制: 一项基于转录组学和静息态功能磁共振的研究

赵晗、余永强、朱佳佳
安徽医科大学第一附属医院

目的: 大脑半球间的沟通与协调主要由胼胝体调节, 对感觉运动等低级神经功能和语言注意等高级认知功能过程都至关重要。大脑功能同伦, 作为半球间沟通与协调的代表, 指大脑半球间几何结构对称的区域自发活动的高度同步性和功能共激活, 是大脑固有功能结构的基本特征之一。尽管大脑功能同伦极其重要, 但我们对其遗传机制仍知之甚少。本研究的目的是通过结合神经影像学 and 转录组数据来研究大脑功能同伦的遗传机制。

材料与方法: 采用来自 1 个发现数据集和 2 个独立的验证数据集的静息态功能磁共振数据计算镜像同伦连接(voxel-mirrored homotopic connectivity, VMHC)。这种方法量化了一侧半球的每个体素与另一侧半球的镜像体素之间的静息态功能连接, 用于表征大脑功能的同伦性。同时, 采用新开发的

标准化处理流程对艾伦人类大脑图谱的基因表达数据进行处理,得到标准化大脑基因表达数据。随后,对基因表达数据及 VMHC 进行转录组-神经影像学空间相关性分析,从而鉴定 VMHC 相关基因。最后,对 VMHC 相关基因进行全面的特征分析,包括功能注释、特异性表达分析、行为相关性分析及蛋白质-蛋白质网络分析。

结果:我们发现 1001 个基因的表达量在空间上与 VMHC 显著相关。功能富集分析表明,这些与 VMHC 相关的基因显著富集在与蛋白激酶活性、离子通道调节、突触功能等相关的生物功能以及许多神经精神疾病。同时,组织及细胞特异性表达分析表明,这些基因在大脑组织及多种类型的神经元和免疫细胞中都有特异性表达;时间特异性分析表明,这些基因几乎在大脑所有发育时期都特异性发挥作用。此外,VMHC 相关基因与多个行为域相关,包括视觉、执行力和注意力。最后,这些基因可以构建一个由 36 个具有重要功能的中枢基因支持的蛋白-蛋白相互作用网络。

结论:我们的研究表明,大脑半球间的交流和协调涉及复杂的多基因相互作用,具有丰富的功能特征。

PO-0266

垂体脓肿的诊断与鉴别诊断

周宇堃

山西医科大学第一医院

目的:垂体脓肿是一种罕见的鞍内感染性病变,发病率极低,多为病例报道,临床表现与其他垂体占位相比无特异性,多为头痛及相关的垂体功能紊乱。磁共振成像是诊断垂体脓肿必不可少的检查方法。通过本次的资料报告及相关的文献学习可以帮助影像科医生更好的了解疾病,提高诊断的准确性。

方法:回顾了垂体脓肿患者的临床资料(包括内分泌检查、外周血表现、脑脊液检查)、影像资料,并进行了相关疾病的文献复习。

结果:DWI 明显高信号,增强扫描呈囊壁厚薄均匀一致的明显强化,同时出现垂体柄增粗及明显强化对垂体脓肿具有提示性意义。需与垂体瘤囊变、颅咽管瘤、Rathke's 囊肿相鉴别。

结论:磁共振平扫结合增强扫描可以较为准确的诊断垂体脓肿,熟悉疾病的发病部位、发病机制、实验室检查、特征性影像表现及鉴别诊断,有助于提高影像科医师诊断的准确性。

PO-0267

椎管内节细胞神经瘤的 MRI 表现及文献复习

吴晓峰、张辉、王效春

山西医科大学第一医院磁共振影像科

目的:探讨椎管内节细胞神经瘤的临床表现及 MRI 特点,提高术前诊断该病的准确率。

方法:分析经本院手术病理证实的椎管内节细胞神经瘤的临床表现、影像特点,并结合文献复习,总结其诊断要点。

结果:椎管内节细胞神经瘤以颈段好发,沿椎间孔生长,与神经鞘瘤难鉴别。病灶 MRI 平扫 T1WI 呈等或稍低信号,T2WI 呈高信号,信号均匀或不均匀,增强扫描病灶强化或强化不明显。

结论:椎管内节细胞神经瘤有一定 MRI 特征性表现,进行准确诊断及鉴别诊断有重要意义。

PO-0268

抑郁症患者的功能及形态学脑网络构建与分析

徐凯¹、陆皓璇²、李科¹

1. 中国人民解放军战略支援部队特色医学中心

2. 中国人民解放军总医院

目的 对抑郁症(major depressive disorder, MDD)患者的功能及形态学脑网络进行构建并分析。**方法** 选取 55 例抑郁症(MDD)患者和 46 例正常对照(normal controls,NC)被试作为研究对象。所有受试在 3.0T 超高场 MR 仪进行扫描,获取全脑三维高分辨结构磁共振(structural MRI,sMRI)及静息态功能磁共振(resting-state dynamic functional MRI, rs-fMRI)图像数据,通过 DPARSF 工具箱构建脑功能网络,通过 Freesurfer 工具构建脑形态学网络。**结果** MDD 组全局功能脑网络特征与正常对照无显著差异,但局部形态学及功能脑网络特征区别于 NC 组,组间差异主要包括 1)形态学脑网络特征:左脑区颞横皮质区域灰质体积(gray volume, GrayVol)和表面积(surface area, SurfArea)显著大于健康对照($P<0.05$); 2)功能脑网络特征:默认模式网络(default mode network,DMN)中多个节点的功能连接(functional connectivity, FC)异常增加;其中,左脑区颞叶皮质与默认网络内其他节点及背侧注意网络(dorsal attention network, DAN)之间的功能连接(functional connectivity,FC)显著增强,局部拓扑指标中左脑区颞横皮质介数中心性增强($P<0.05$)。**结论** MDD 患者功能及形态学脑网络较正常对照存在差异,左脑区颞横皮质区域差异显著,可能其发病机制相关联。

PO-0269

对左背外侧前额叶皮层行 rTMS 治疗来改善尼古丁依赖: 一项静息态功能连接的纵向研究

汪涛、李瑞阳、张建军

浙江医院

目的 评估对左背外侧前额叶皮层(LDLPFC)进行重复经颅磁刺激(rTMS)是否可以减少吸烟欲望并提高戒烟率,利用静息态脑网络方法来探究尼古丁依赖吸烟者 rTMS 治疗前后尼古丁相关成瘾环路感兴趣区的功能连接变化,深度挖掘其神经生物学机制。

方法 纳入 17 例寻求治疗的尼古丁依赖吸烟者(>每天 10 支烟),所有被试均进行吸烟严重度指数、尼古丁依赖评估量表(FTND)、明尼苏达烟草戒断症状量表(MNWS)、吸烟渴求简短问卷(sTCQ)等量表测试。参与者在两周内完成 10 次 mri 精准引导的 rTMS 治疗(采用定位帽定位,10Hz/100%,连续刺激时间 5s,间隔 20s,总时间 15min,总刺激数 1500 次),在治疗前、后分别采集静息态 BOLD 数据,以双侧伏隔核为种子点对全脑进行纵向功能连接分析。

结果 接受 rTMS 治疗的尼古丁依赖吸烟者在 2 周的疗程后尼古丁依赖程度显著降低($P<0.001$),烟草戒断症状改善($P<0.05$),吸烟渴望度显著减低($P<0.001$)。功能连接分析发现 rTMS 治疗后右侧伏隔核至右侧梭状回、楔叶、舌回、枕中回、枕下回及颞下回等脑区连接强度增加($P<0.05$, GRF 校正)。

结论 MRI 引导下对 LDLPFC 进行持续至少两周的 rTMS 治疗可显著减少尼古丁的依赖程度及改善烟草戒断症状,提高了戒烟的可能性。治疗前后右侧伏隔核功能连接的改变可能其有效戒烟的神经生物学机制之一。

PO-0270

CTA 联合 CTP 成像参数和血清生物学 对卒中复发事件的预测价值

何仕丽、卢洪艳、吴蓉、贺雨欣、张高峰
遵义医科大学第二附属医院

摘要：目的 探讨 CTP 联合 CTA 检查中影像参数和血清生物学指标在 3 个月和 1 年时预测卒中后复发事件的预后价值。方法 回顾性纳入 136 名神经内科首次诊断脑梗死的患者，患者接受了头颈 CTA+CTP 一站式检查和血清生物标志物检测，并对卒中复发事件的发生进行了三个月和一年的随访。复发事件被定义为缺血性中风、视网膜梗死、脑内出血、蛛网膜下腔出血及死亡。结果 在三个月和一年的随访中，卒中复发事件的发生率分别为 23.3%（32 例）和 36.7%（50 例）。半暗带体积（OR=1.010，P=0.029）、出院时 mRS 评分（OR=1.388，P=0.008）是三个月随访时卒中复发事件的独立危险因素；脂蛋白 a（OR=1.002，P=0.044）、血管狭窄程度（OR=1.489，P=0.029）、出院时 mRS 评分（OR=1.282，P=0.038）是一年卒中复发事件的独立危险因素。结论 在首次发生卒中的患者中，半暗带体积、出院时 mRS 评分和脂蛋白 a、血管狭窄程度及出院时 mRS 评分是 3 个月和 1 年随访卒中后复发事件有力的预测因素。

PO-0271

血管选择性动脉自旋标记对成人颅内侧支循环的研究

李晨、周智鹏
桂林医学院附属医院

目的：探讨 t-ASL 灌注成像评估成人大脑侧支循环的情况，并研究 t-ASL 灌注成像技术的临床应用价值。

方法：收集 50 名正常志愿者及临床上诊断为脑卒中的 18 名患者的影像数据，所有志愿者及脑卒中患者均进行 t-ASL 灌注成像、3D-ASL 脑灌注成像检查，所有脑卒中患者均进行 DSA 检查。经两位医师对于 t-ASL 灌注成像评估健康成人志愿者颅内侧支循环的一致性分析以及 t-ASL 灌注成像与 MRA 对于侧支循环一致性分析采用 Kappa 系数检验；t-ASL 灌注成像与 3D-ASL 脑灌注成像诊断健康成人颅内解剖变异的差异性分析则采用 χ^2 检验对比。分析脑卒中患者 DSA 与 t-ASL 对侧支循环形成评估的一致性，采用 Kappa 系数检验；对比 3.0T t-ASL 灌注成像与 3D-ASL 脑灌注成像对于脑卒中患者颅内侧支循环评估的准确度、敏感度、特异度，采用 χ^2 检验对比。P<0.05 表示差异有统计学意义。

结果：运用 t-ASL 灌注成像对健康志愿者颅内侧支循环分析：1.两位医师之间对于 t-ASL 的评估一致性良好（Kappa 值：0.876）；2. t-ASL 与 MRA 对正常成年人颅内侧支循环形成的评估一致性良好（Kappa 值：0.786）；3.t-ASL 灌注成像与 3D-ASL 灌注成像在评估正常志愿者灌注方面差异具有统计学意义（P<0.01）。

运用 t-ASL 灌注成像对脑卒中患者颅内侧支循环分析：1.DSA 与 t-ASL 对侧支循环形成的评估一致性较好（Kappa 值：0.679）；2.t-ASL 灌注成像在评估脑卒中患者侧支循环及灌注方面准确度、灵敏度高于 3D-ASL 灌注成像（P<0.05）。

结论：1.t-ASL 灌注成像能够评估单支血管灌注情况，为评估正常成人脑灌注方面提供更多信息。2.t-ASL 灌注成像评估脑卒中患者侧支循环优于 3D-ASL 脑灌注成像技术。

PO-0272

体素内不相干运动成像 (IVIM) 监测脑胶质瘤复发和治疗后反应的初步探讨

王斌
山西医科大学第一医院

目的: 探讨磁共振体素内不相干运动成像 (intravoxel incoherent motion, IVIM) 在监测脑胶质瘤复发和治疗后反应中的应用价值。材料和方法: 26 例脑胶质瘤患者 (15 例脑胶质瘤复发, 11 例治疗后反应) 在同步放化疗结束 2 月内行头部常规 MRI 扫描、增强扫描及多 b 值弥散加权扫描, 通过 IVIM 软件的双指数模型, 对图像后处理得到 standard ADC、slow ADC (D)、fast ADC (D*)、fraction of fast ADC (f) 的伪彩图, 分别测量病例异常强化区 standard ADC 值、D 值、D*值、f 值。采用两样本 t 检验比较两组各参数值是否存在差异, 受试者工作特性曲线 (ROC) 评估各参数值在脑胶质瘤复发和治疗后反应鉴别诊断的效能。结果: 复发组的强化病灶 standard ADC 值、D 值低于治疗后反应组, 差异有统计学意义 ($P < 0.05$)。ROC 曲线分析, 当 standard ADC 值、D 值曲线下面积分别为 0.703、0.788 时, 其阈值分别为 1.166、0.631, 敏感性分别为 54.5%、81.8%, 特异性分别为 86.7%、73.3%; 复发组的强化病灶 D*值、f 值均高于治疗后反应组, 差异有统计学意义 ($P < 0.05$)。ROC 曲线分析, 当 D*值、f 值曲线下面积分别为 0.752、0.758 时, 诊断阈值分别为 2.642、0.693, 敏感性分别为 66.7%、81.8%, 特异性分别为 81.8%、66.7%。结论: IVIM 可以监测脑胶质瘤复发和治疗后反应, 为脑胶质瘤患者在临床的进一步治疗提供影像依据。

PO-0273

磁共振 DTI 技术在内囊走行纤维束分析研究

姜洪新
故城县医院

大脑的解剖结构与功能非常复杂。尤其投射纤维的走行与链接一直是脑科学关注的核心问题, 也是临床神经病学的定位和定性的基础。弥散张量成像 (diffusion tensor imaging, DTI) 是唯一可显示活体脑白质纤维束的无创性成像技术, 能够立体、直观的显示纤维束的走行变化。本研究采用 DTI 观察内囊纤维束的组成及毗邻关系。从而为了解内囊区域病变导致相应的临床症状打下了基础。对脑功能精准定位和制定精准康复计划有重要的指导意义, 尤其在功能神经外科领域有着广泛的应用前景。

PO-0274

通过自动纤维定量的无监督机器学习探索多发性硬化症的亚型

梁学恒^{1,2}、李咏梅¹
1. 重庆医科大学附属第一医院
2. 重庆医科大学附属巴南医院

目标: 本研究的主要目标是通过应用无监督机器学习技术, 对多发性硬化症 (MS) 的扩散张量成像 (DTI) 数据中的 WM 纤维束进行亚型分类。通过在这些 WM 纤维束中识别有意义的模式, 研究旨在揭示 MS 人群中隐藏的亚型。这些亚型可以为我们了解疾病的异质性及其对认知和残疾结果的影响提供洞察。

材料与方法: 本研究利用自动化纤维量化 (AFQ) 方法从一组 MS 患者的 DTI 数据中提取了 18 个 WM 纤维束。AFQ 自动分割 WM 纤维束并量化其特征, 包括分数异性 (FA)、平均弥散性 (MD)、轴向弥散性 (AD) 和径向弥散性 (RD)。应用无监督机器学习技术, 包括聚类分析, 对提取的特征进行分析, 以在 MS 人群中识别出不同的亚型。将临床数据, 包括认知评估和残疾评分, 与 DTI 指标结合起来, 以了解已识别亚型的影响。

结果: 分析揭示了 MS 人群中存在三种不同的亚型。这些亚型在临床特征和 DTI 指标方面存在显著差异。值得注意的是, 亚型之间 FA、MD、AD 和 RD 值的变化表明了 WM 完整性和微结构损伤的潜在差异。亚型 3 表现出最快的残疾进展和认知衰退, 而亚型 2 的进展速度较慢。亚型 1 介于两者之间, 显示出适度的残疾轨迹。

讨论: 在 MS 人群中识别出不同的亚型对于理解疾病异质性和个体化患者护理具有重要意义。亚型之间的 WM 完整性和微结构损伤差异的观察突显了这些参数作为预测疾病结果的生物标志物的潜力。亚型 3 中的较快残疾进展和认知衰退强调了早期识别和为这组患者量身定制干预措施的临床意义。

结论: 本研究证明了将无监督机器学习应用于 WM 纤维束数据进行 MS 患者亚型分类的可行性。已识别出的亚型在认知功能、残疾进展和 DTI 指标方面存在显著差异。这些发现为 MS 中的个体化治疗策略和预后预测铺平了道路。该研究强调了 WM 异常作为有价值的生物标志物, 用于指导临床决策并改善患者预后。

PO-0275

基于隐马尔科夫模型研究主观认知下降 人群脑动态活动特征及与空间导航的关联

陈钱、张冰
南京鼓楼医院

目的: 主观认知下降 (subjective cognitive decline, SCD) 与临床前阿尔茨海默病 (Alzheimer's disease, AD) 风险增加有关。以往神经影像学研究多采用脑静态分析, 然而人脑本质是一个动态的系统。空间导航障碍是临床前 AD 的一个被忽视的认知标志物, SCD 人群的脑动态活动特征及与空间导航的关联尚不清楚。

方法: 80 名 SCD 受试者和 77 名正常对照 (normal control, NC) 被招募并接受了认知量表评估、空间导航测试、脑磁共振成像扫描。采用隐马尔科夫模型, 推断出 12 种不同的脑活动状态。计算每位受试者在各个状态下的分数占比 (fractional occupancy, FO) 和平均停留时间 (mean dwell time, MDT), 以及状态之间的转移概率 (transition probability, TP)。比较 SCD 与 NC 组三种脑动态活动指标的组间差异, 并与空间导航距离误差进行相关性分析。最后, 评估脑动态活动特征和空间导航距离误差对 SCD 与 NC 的分类效能。

结果: 与 NC 组相比, SCD 组在状态 8 和状态 12 的 FO 显著升高 ($p < 0.05$, 错误发现率校正), 这两种状态在腹侧默认模式网络、后侧突显网络、视觉空间网络均表现出较低的激活程度。SCD 组在状态 7 的 FO 显著降低 ($p < 0.05$, 错误发现率校正), 状态 7 中全脑网络表现为高度激活状态。SCD 组从状态 1 到状态 7 的 TP, 以及从状态 7 到状态 10 的 TP 显著降低。结合脑动态活动特征和空间导航距离误差对 SCD 与 NC 进行分类, 曲线下面积为 0.854。

结论: SCD 人群脑动态活动显著改变, 表现为腹侧默认模式网络、后侧突显网络、视觉空间网络活动程度降低, 以及无法灵活地上调或下调脑功能活动, 这可能与空间导航功能减退相关。结合脑动态活动特征和空间导航行为学有助于临床前 AD 高风险人群的早期诊断。

PO-0276

去除环形强化 GBM 坏死相关炎症的影响区域是否可提高 MRI 定量研究中与感染性病变的鉴别能力?

康晓伟、李艳、席一斌
西安市人民医院 (西安市第四医院)

目的: 利用动态对比增强 (DCE) 和 DWI 分析去除 GBM 坏死相关炎症的影响区域是否可提高与感染性病变的鉴别诊断效能。**方法:** 回顾性分析本院临床或病理证实、且呈环形强化的 GBM 和颅内感染性病变。术前 2 周接受 3.0T MRI 平扫、T1W 增强、DWI 和 DCE 扫描。采用双盲的方式分别在 ADC 和 DCE 图像的病灶最大层面手动勾画 GBM 的整体环形强化区、厚壁毛玻璃样强化区、薄壁显著强化区和感染性病变的环壁作为感兴趣区。GBM 的厚壁毛玻璃样强化、薄壁显著强化和感染性病变的强化环壁分别定义为组 1、组 2、组 3。对具有组间统计学差异的参数进一步绘制 ROC 曲线, 根据约登指数得到最佳截断值、敏感度、特异度和准确度, 采用综合判别改善指数 IDI (Integrated Discrimination Index, IDI) 对联合诊断方法的改善情况进行评价。上述过程均采用 SPSS25.0 软件、R 软件 (version 4.0.2) 加载 pROC 软件包和 PredictABEL 软件包, $P < 0.05$ 表示结果具有统计学差异。**结果:** 三组强化环壁的 Ktrans、AUC、MAXslope 和 ADC 具有显著统计学差异 ($P < 0.05$); Vp、Kep、TTP、Ve 无显著统计学差异 ($P > 0.05$)。两两比较, 结果提示组 2 为 GBM 坏死相关炎症的影响区域。去除组 2 区域后, 勾画感染性病变的整体 ROI、分别勾画 GBM 整体强化环壁、厚壁毛玻璃样强化区作 ROI。前者定量 DCE 的 ROC 曲线下面积、灵敏度和特异度分别为 0.917, 1.000 和 0.900; ADC 联合对定量 DCE 的诊断效能无显著加权作用。只勾画 GBM 厚壁毛玻璃样强化区, ADC 联合定量 DCE 鉴别诊断效能最佳, ROC 曲线下面积达 0.967。**结论:** 去除环形强化 GBM 坏死相关炎症的影响区域可提高 MRI 定量研究中与感染性病变的鉴别能力。

PO-0277

基于纤维束自动定量法对遗忘型认知障碍患者脑白质纤维完整性改变的研究

李卫萍、张冰
南京鼓楼医院

目的 采用纤维束自动定量法 (AFQ) 对遗忘型认知障碍患者 (aMCI) 的脑白质纤维束部分各向异性值 (FA) 及平均扩散率 (MD) 进行分析, 以研究其脑内白质纤维束逐点破坏的特点。**方法** 选取 2018 年 1 月-2019 年 3 月南京大学医学院附属鼓楼医院神经内科记忆门诊就诊的 20 例 aMCI 患者、22 例 naMCI 患者和年龄、性别、受教育程度匹配的 23 例正常认知对照组 (NC), 所有被试均进行 3.0T 磁共振扩散张量成像及高分辨 T1 加权成像扫描, 采用 AFQ 对全脑 20 根纤维束的 100 个节点进行 FA 及 MD 值定量分析。**结果** 与 naMCI 相比, aMCI 组右侧皮质脊髓束中间节段 (节点 33-60) 的 FA 值明显减低 ($t = -4.023, p < 0.000$, FWE 校正), 左侧扣带束海马部分的中间节段 (节点 41-61) MD 值明显增高 ($t = 2.408, p = 0.037$, FWE 校正)。与正常对照组相比, aMCI 患者左侧下纵束偏后部 (节点 24-46) ($t = -2.919, p = 0.006$, FWE 校正) 及左侧扣带束海马的中间节段 (节点 38-71) ($t = -3.878, p = 0.002$, FWE 校正) MD 值明显增高。**结论** 本研究首次对 aMCI 患者脑内 20 条纤维束进行 100 个节点定量分析, 提示了 aMCI 患者部分纤维束的特定节点会出现一定损伤; 此外, 不同的白质纤维束破坏模式各异; 较之前的其它类似研究明显改进了定量分析方法, 对进一步理解 aMCI 患者脑白质纤维束破坏模式具有重要价值。

PO-0278

2 型糖尿病患者认知障碍相关的脑自发活动 和功能网络动力学改变

傅琳清、张雯、张冰
南京鼓楼医院

目的 探讨 2 型糖尿病 (T2D) 患者动态功能连接 (DFC) 改变及脑自发活动的动态特征及其与认知能力和生化特征的相关性。

方法 本研究包括 45 名健康对照 (HC) 和 102 名 T2D 患者, 将 T2D 患者根据有无轻度认知障碍 (MCI) 分为 T2-NC 组 (n=62) 和 T2-MCI 组 (n=40)。基于独立成分分析 (ICA) 设定 39 个独立成分, 划分为 7 个脑网络。基于滑动窗口法和 k-means 聚类, 分析组间动态功能连接的变化, 并比较特征参数。此外, 采用动态低频振幅 (dALFF) 和动态局部一致性 (dReHo) 评估局部神经活动动力学。同时评估了神经影像学指标与认知能力和生化特征之间的相关性, 采用受试者工作特征 (ROC) 曲线评价了脑动力学改变对 MCI 的诊断效能。

结果 最终得到 4 个功能连接状态: 局部强连接状态 (状态 1)、广泛的相互连接状态 (状态 2)、弱连接状态 (状态 3) 及强连接状态 (状态 4)。T2D 患者在状态 2 的平均停留时间增加 ($p = 0.048$), 在状态 4 的平均停留时间减少 ($p = 0.041$), 在状态 4 的分数窗口减少 ($p = 0.013$), 并且状态 2 和状态 4 之间的转换次数减少 ($p = 0.045$)。当统计效能为 0.8 时, 每组 88 个样本即可观察到 T2-NC 组和 T2-MCI 组之间有显著差异。与 HC 和 T2-NC 相比, T2-MCI 显示右侧岛叶的 dALFF 增加, 左侧距状裂周围皮层的 dReHo 增加。ROC 曲线显示, 综合所有有意义的指标 (包括 dALFF 及 dReHo 的变异系数、状态 2 的平均停留时间、状态 4 的平均停留时间、状态 4 的分数窗口和状态 2 至状态 4 的转换次数) 的曲线下面积 (AUC) 为 0.796 (95% CI = 0.711-0.881)。

结论 与 2 型糖尿病功能损害相关的 DFC 差异和自发脑活动的动态特征可能是预测临床进展、评估认知损的潜在生物标志物。

PO-0279

影像基因组学在胶质母细胞瘤免疫浸润特征评估 及预后预测中的应用研究

刘东明¹、陈玖¹、刘宏毅²、章文斌²、张鑫¹、张冰¹

1. 南京鼓楼医院

2. 南京脑科医院

目的:

肿瘤微环境和免疫细胞浸润 (ICI) 在胶质母细胞瘤 (GBM) 的发生、发展中扮演重要角色。本研究旨在通过转录组数据分析建立与 GBM 预后有关的 ICI 生物标志物, 探讨 ICI 特征与 GBM 肿瘤生物学特征之间的关系, 并基于影像基因组学分析构建影像-免疫特征预测及综合预后模型。

方法:

从三个数据库 (GEO, TCGA, CGGA) 中纳入共计 774 例 GBM 患者的基因表达和生存数据, 并划分为发现集 (TCGA+GEO, $n = 400$) 和独立验证集 (CGGA, $n = 374$)。在发现集中, 基于 CIBERSORT 和 ESTIMATE 工具包识别出 GBM 肿瘤 ICI 模式, 使用无监督聚类分析及主成分分析方法计算 GBM 患者个性化的 ICI 风险评分, 并将该评分在独立验证集 (CGGA) 中进行外部验证。基于 Pyradiomics 从肿瘤内和肿瘤周总共提取 5915 个放射组学特征。使用基于交叉验证的递归

消除来选择关键特征, 并使用支持向量机训练从影像到 ICI 特征的预测模型。使用成像和生存数据在独立数据集 ($n = 149$) 中检查已确定的放射基因组模型的预后价值。

结果:

结果表明, 较高的 ICI 风险评分通常预示患者较差的预后 (多变量风险比 MHR: 发现组=0.48, 验证组=0.63) 以及相对较高的免疫检查点相关基因的表达水平。而结合了 11 个放射组学特征的影像基因组学模型可以很好地区分具有不同 ICI 评分的肿瘤 (十折交叉验证 $AUC = 0.96$, 准确度 = 94%)。此外, 在外部独立影像验证队列 (NBH, $n=149$) 中, 该模型可以通过 GBM 患者的影像信息对患者进行无创预后分层。

结论:

基于转录组数据构建的 ICI 风险评分可以表征 GBM 免疫相关生物学过程, 能够作为一种有效的 GBM 患者预后生物标志物。而这种转录组水平的 ICI 特征可以通过影像基因组学分析进行无创评估, 构建出的模型在外部不同数据集中表现出良好预测能力。

PO-0280

单侧颞叶低级别胶质瘤患者健侧海马及其亚区结构的可塑性研究

刘东明¹、陈玖¹、章文斌²、刘宏毅²、张鑫¹、张冰¹

1. 南京鼓楼医院

2. 南京脑科医院

目的: 面对神经系统慢性损伤, 大脑可以表现出结构或功能水平的代偿模式。本研究基于慢性低级别胶质瘤患者的结构 MRI 数据, 探讨单侧颞叶低级别胶质瘤患者的健侧海马及其亚区的结构可塑性。

方法: 本研究共纳入 55 例患有单侧颞叶累及海马的低级别胶质瘤患者, 收集术前 3DT1 加权 MRI 图像。最终纳入左侧颞叶累及海马的胶质瘤(HipL)患者共 27 例, 右侧(HipR)28 例。此外还纳入 30 名年龄和性别相匹配的健康被试 (HC)。采用基于体素的形态学测量法(VBM)来量化患者健侧海马区域和三个对照脑区(额上回、尾状核和枕上回)的灰质密度差异。基于虚拟脑分割 (VBG) 技术对肿瘤病灶进行虚拟填充修复, 并使用 FreeSurfer 软件对修复后的结构图像进行健侧海马及亚区水平的分割, 并与 HC 进行统计分析, 计算海马及其亚区水平的体积差异。

结果: 与 HC 相比, HipL 和 HipR 组患者在对侧海马和海马旁回均表现出明显更大的灰质密度 (FWE corrected $p < 0.05$), 而在三个对照区域没有发现明显的改变。海马亚区体积分析显示, 与对照组相比, 患者组在海马亚区水平表现为特定亚区体积的增大, 包括 CA1 头、CA3 头、海马杏仁核过渡区(HATA)和海马伞。值得注意的是, 在 Bonferroni 多重比较校正 (19 次) 后, 患者对侧的 HATA 和海马伞亚区仍然保持统计显著性。

结论: 累及单侧海马区域的低级别胶质瘤浸润可以引起对侧海马灰质体积的显著增加。而 HATA 和海马伞在上述损伤引起的结构重塑过程中表现出良好的可塑性潜能。

PO-0281

人工智能重建在颅内 3D T1WI 成像中的应用价值

王茂雪、陈楚玥、张冰
南京鼓楼医院

目的：在压缩感知 (Compressed Sensing-Sensitivity Encoding, CS-SENSE) 采集技术的基础上，探索人工智能重建方式 (Artificial Intelligence, AI) 在 3D T1WI 图像 (T1 weighted imaging, T1WI) 中的应用。

方法：前瞻性收集 2021 年 5 月至 2022 年 10 月在南京鼓楼医院进行头颅磁共振检查的 52 例患者。每例患者均采集压缩感知因子为 3 和 6 的 3D T1WI (CS3、CS6)，同时进行人工智能重建，生成 AI3 及 AI6 图像。在四组图像中勾画感兴趣区，计算图像的信噪比 (signal to noise ratio, SNR) 及对比噪声比 (contrast to noise ratio, CNR)。从灰白质对比、深部核团轮廓、舌肌肉噪声、视神经清晰度四个方面对不同序列图像进行定性评估。对图像的 SNR 及 CNR 差异采用单因素重复测量方差分析，采用 Friedman 检验比较定性分析结果差异。

结果：在相同 CS 因子下，AI 重建图像 SNR、CNR 明显优于的常规 CS 重建图像 (SNR、CNR: AI3, 21.10 ± 1.09 , 12.77 ± 0.71 vs CS3, 17.51 ± 0.82 , 10.79 ± 0.52 , $PSNR < 0.001$, $PCNR \dots$; AI6, 20.61 ± 1.10 , 12.44 ± 0.75 vs CS6: 12.33 ± 0.47 , 7.34 ± 0.31 , $PSNR < 0.001$, $PCNR \dots$)。图像定性分析中，AI 重建图像的评分明显高于常规重建图像 (AI3: 2.95 ± 0.21 vs CS3: 2.93 ± 0.25 , $P < 0.001$; AI6: 2.94 ± 0.23 vs CS6: 1.85 ± 0.41 , $P < 0.001$)。

结论：与 CS3 相比，AI6 在保证图像分辨率的基础上，同时可以减少 48.78% 的采集时间。

PO-0282

基于螺旋成像技术的 TOF-MRA 在颅内小血管成像中的应用

王茂雪、于雨洁、张冰
南京鼓楼医院

目的：以常规 TOF-MRA (压缩感知因子 4: MRA CS4) 为参考，探索基于螺旋成像技术的 MR 血管成像 (MRAspiral) 在颅内小血管成像中的可行性。

方法：2021 年 5 月 29 日至 2022 年 6 月 11 日，在 3.0T MR 系统 (Ingenia CX, Philips Healthcare, Best, Netherlands) 中前瞻性收集 49 例怀疑脑血管病变患者。MRACS4 和 MRAspiral (τ 分别为 4、6、8、12，其中 τ 为螺旋成像的采集窗口) 为采集序列。在大脑中动脉 (ACA)、大脑中动脉 (MCA)、大脑后动脉 (PCA) 的近段和远段绘制感兴趣区域。以胼胝体为背景计算对比度 (contrast ratio, CR) 值。图像质量和诊断的可行性定性分析由两名经验丰富的放射科医生分别进行。各 MRA 序列均采用单因素重复测量方差分析比较 CR 值的差异，Friedman 检验比较定性分析的结果。

结果：在远段分支，MRA τ 6 的 PCA (2.61 ± 1.09) 远段 CR 值低于 MRACS4 (3.16 ± 1.62) ($P = 0.014$)。其余 MRAspiral 图像的 CR 值 (MRA τ 4: 2.73 ± 1.45 , MRA τ 8: 2.78 ± 1.28 , MRA τ 12: 2.64 ± 1.43) 与 MRACS4 的无显著性差异 ($P > 0.05$)。在远段血管显示方面，MRA τ 4 (4.78 ± 0.41)、MRA τ 6 (4.77 ± 0.42) 及 MRA τ 8 (4.55 ± 0.52) 明显优于 MRACS4 的远段血管 ($P < 0.005$)。在颅内近段血管显影方面，MRACS4 显示优于 MRAspiral ($P > 0.005$)。

结论：与 MRACS4 相比，MRA τ 4、MRA τ 6 及 MRA τ 8 能明显改善远段颅内血管的显影，MRA τ 8 (2min7s) 同时可以减少 44.30% 的采集时间。

PO-0283

基于自动纤维量化分析方法识别遗忘型/ 非遗忘型轻度认知障碍：一项多中心研究

魏良鹏、张冰
南京鼓楼医院

目的：本研究旨在检测早期脑白质微结构的异常，来分别识别遗忘型（aMCI）和非遗忘型轻度认知障碍（naMCI）。

方法：本文从两个中心招募受试者，分别是南京大学医学院附属鼓楼医院（正常 NC 组 19 人，aMCI 组 23 人，naMCI 组 17 人）和南京市脑科医院（正常组 68 人，aMCI 组 66 人，naMCI 组 9 人）。我们首先通过自动纤维量化分析方法（AFQ）追踪大脑主要纤维束，将每条纤维束等分为 100 份，同时逐点比较三组的扩散参数。其次计算这些微观结构变化并利用支持向量机分别识别 aMCI 或 naMCI 患者。

结果：本研究发现三组受试者白质存在精细的点差异，且与认知障碍程度具有相关性。aMCI 和 naMCI 患者左上纵束的异常扩散特性在两个中心都出现，以此为分类特征在两个中心分别建立分类模型，并用另一个中心进行外部验证，经过比较发现鼓楼医院中心的数据建立的模型分类效果更佳（5 折内部验证中区别 aMCI 和 NC 组准确率=80.83%，灵敏度=75%，AUC=0.90；区别 naMCI 和 NC 组准确率=85.71%，灵敏度=83.33%，AUC=0.93）。跨中心的外部验证也获得类似较好的分类结果（区别 aMCI 和 NC 组准确率=71.64%，灵敏度=89.39%，AUC=0.87；区别 naMCI 和 NC 组准确率=67.52%，灵敏度=88.89%，AUC=0.91）。

结论：上述结果提示 AFQ 方法检测到的左上纵束白质微结构的病变具有普遍性，本项研究以此作为特征建立的分类系统能够实现跨中心的识别 aMCI 或 naMCI，在相关疾病的精准诊断和干预方面具有临床潜力。

PO-0284

利用 EEG 和 fMRI 从单模态到多模态研究阿尔茨海默病

李菁、张冰
南京大学医学院附属鼓楼医院

目的：阿尔茨海默病（AD）的早期诊断和分期在临床实践中至关重要。脑电（EEG）和功能磁共振成像（fMRI）提取的一些客观参数被广泛应用于 AD 的诊断。本文重点综述了从单模态到多模态研究 AD 连续体的不同技术，包括 EEG 和 fMRI，以及 EEG-fMRI，并讨论主要研究结果和未来可能的发展方向。

方法：我们对 PubMed、EMBASE 和 Web of Science 数据库中所有合格的原创英文研究文章进行了全面的文献检索，检索截止日期为 2022 年 5 月 31 日。

结果：单模态 EEG 和 fMRI 在 AD 连续体的研究中应用较为广泛，双模态 EEG-fMRI 的异步/同步采集逐渐展示出早期诊断的优势， α 节律与丘脑 BOLD 信号相关性的逐步降低可能贯穿于从年轻人到老年人到认知障碍的整个过渡过程；EEG 微状态与 BOLD 信号的相关性是否可作为 AD 病程转换的标志物还有待进一步研究。多模态 TMS-EEG-fMRI 一体化方法使精确和直接监测大脑振荡状态和信号在皮质-皮质下网络传播之间的因果依赖成为可能。MRI-PET-EEG 可在相同的心理和生理条件下，同时记录结构、功能、病理、代谢和电生理数据。

结论：同步 EEG-fMRI 采集在 AD 的早期诊断中展现出显著优势，但仍有一些不足需克服。早期识别脑功能损害，筛选 AD 高危人群，甚至定位神经退行部位，将是 EEG-fMRI 在老年人和认知障碍患者中的主要临床应用。即使 EEG-fMRI 具有较高的时空分辨率，也无法通过 EEG-fMRI 对静息态

分析或特定任务的分子过程进行表征。因此,未来综合分析脑网络、脑微观状态以及信息处理的动态过程,可以更好地理解疾病转化过程。

PO-0285

原发性早泄患者静息态 fMRI 脑网络研究: 基于表面皮层的度中心度

周飞、陆加明、张冰、倪玲
南京鼓楼医院

目的:应用基于表面皮层的度中心度指标探讨早泄患者静息态脑功能网络属性的改变特点,并分析该特点与早泄患者临床症状的相关性。

方法:纳入符合入组标准的原发性早泄患者(患者组, n=36)及性别、年龄、受教育程度相匹配的正常对照组(对照组, n=22)。所有纳入研究的对象进行全脑静息态功能磁共振扫描,使用基于 MATLAB 软件的 dpabissurf 工具包对 fMRI 数据进行处理,进行基于表面皮层的度中心度(degree centrality,DC)分析,t 检验比较两组间 DC 值差异的脑区,并把差异脑区的 DC 值与临床症状进行相关分析。

结果:与对照组相比,患者组左侧楔前叶(MNI: x, y, z=-40,-71,-33)的 DC 值显著降低;右侧辅助运动区(SMA 区)(MNI: x, y, z=12,-8,46)的 DC 值显著升高,此外,IELT 和 CIPE 值与左侧楔前叶 DC 值呈正相关,与右侧 SMA 区 DC 值负相关。

结论:原发性早泄患者存在关键脑网络节点与相关脑区连接的异常并与临床症状密切相关,为神经介入治疗提供潜在的治疗靶点。

PO-0286

基于 APTw 成像感兴趣勾画的探讨构建脑胶质瘤分级的 临床诊断预测模型

叶梅萍、陈思璇、张鑫、张冰
南京大学医学院附属鼓楼医院

目的 探讨 APTw 图像感兴趣区的勾画对脑胶质瘤分级及鉴别诊断的意义,以及基于 APTw 成像构建预测脑胶质瘤分级的临床诊断预测模型。**方法** 回顾性分析 2019 年 7 月至 2023 年 5 月于南京大学医学院附属鼓楼医院行 MRI 检查及手术治疗的脑肿瘤患者 100 例。100 例患者中低级别胶质瘤 21 例,高级别胶质瘤 36 例,淋巴瘤 10 例,转移瘤 12 例,脑膜瘤 21 例。采取 3 种 ROI 勾画方式(勾画整个病灶、强化最显著区域、强化不明显或较弱区域)提取 APTw 信号强度的平均值和或最大值。采用卡方或独立样本 t 检验分析低级别与高级别胶质瘤、高级别胶质瘤与其他非胶质瘤类脑肿瘤之间性别、年龄及 APTw 信号强度的差异。选取高低级别胶质瘤组间有统计学差异的参数构建预测胶质瘤分级的二元 Logistic 诊断预测模型,并对模型进行评估及内部验证。**结果** 低级别与高级别胶质瘤组的年龄、性别、全肿瘤 APTw_max、全肿瘤 APTw_mean、强化最显著区 APTw_mean、强化不明显或较弱 APTw_mean 组间差异具有统计学意义(均 $P < 0.05$),构建的 Logistic 回归方程 $P = \exp(x) / (1 + \exp(x))$, $x = -4.318 - 0.087 \times \text{年龄} + 0.997 \times \text{全肿瘤 APTw_mean}$ 。该模型 Brier 得分为 0.137, AUC 为 0.881,截点值为 0.629,灵敏度为 0.833,特异度为 0.857,准确度为 0.819, Kappa 值为 0.622。高级别胶质瘤组和转移瘤组或淋巴瘤组组间比较差异无统计学意义;高级别胶质瘤组与脑膜瘤组的性别、全肿瘤 APTw_max、全肿瘤 APTw_mean 组间差异具有统计学意义(均 $p < 0.05$)。**结论** APT 成像对胶质瘤分级及鉴别诊断具有一定的价值;临床工作中更建议勾画

整个病灶提取 APTw 的平均信号强度；年龄及全肿瘤 APTw_mean 是预测脑胶质瘤分级的独立风险因素。

PO-0287

认知障碍血液标志物与痴呆影像学标志物的相关性研究

魏良鹏、张冰
南京鼓楼医院

目的：通过对认知障碍血液标志物的浓度检测及分类，探索与脑小血管病影像标志物之间的关系。
方法：收集 2020 年 9 月-2021 年 12 月期间以可疑认知障碍就诊于南京大学医学院附属鼓楼医院神经内科及老年科的患者，最后纳入同时进行了血液标志物检测及头颅 MRI 扫描的患者 358 例，男性 204 例，女性 154 例，平均年龄 72.61 ± 13.68 岁。记录 A β 42、pTau181 的检测浓度并进行分类，同时由影像医师记录脑白质高信号等级（Fazekas 分级）和内侧颞叶萎缩评定（MTA）量表，对影像指标判断结果用卡方检验比较组间差异。P<0.05 有显著统计学意义。
结果：A β 和 pTau181 同时阳性的患者内侧颞叶萎缩得分和脑白质损伤比 A β 和 pTau181 同时阴性患者显著增多。另外，男性的血液标志物与 MTA 评分相关性更高，女性的血液标志物即使都是阳性 MTA 评分也没有显著增加。男性和女性白质损伤评分均与血液标志物有关。男性血液中 A β 和 pTau181 浓度具有更高的一致性。
结论：认知障碍血液标志物（A β 42、p-Tau181）的浓度与痴呆影像学标志物之间存在相关性，且男性的相关性更高。

PO-0288

轻度认知障碍伴腔隙性脑梗死患者的脑自发活动异常 --静息态功能 MRI 研究

倪玲、张冰
南京鼓楼医院

目的：腔隙性脑梗死（LI）与认知能力下降和痴呆风险增加密切相关。轻度认知障碍（MCI）患者伴或不伴 LI 的自发性大脑活动模式是否存在不同仍不清楚。本研究旨在利用静息态功能磁共振成像（rs-fMRI）比较伴或不伴 LI 的 MCI 患者的自发性大脑活动模式。
方法：总共纳入 48 例 MCI 患者，包括 22 例伴 LI [MCI-LI] 和 26 例不伴 LI [MCI-no LI]，以及 28 例正常对照。所有被试行 rs-fMRI 检查，分析局部一致性（ReHo）和低频能量振幅（ALFF）指标，并行三组间组间比较；与神经心理学量表作相关分析。
结果：与 NC 组相比，MCI-LI 患者的楔前叶/楔叶及岛叶的 ReHo 降低，楔前叶/楔叶及额叶的 ALFF 降低；而颞叶的 ALFF 和 ReHo 值增高。MCI-no LI 组双侧海马和海马旁回的 ReHo 和 ALFF 值升高，额叶以及颞叶的 ALFF 和 ReHo 值降低。与 MCI-no LI 相比，MCI-LI 组存在额叶 ALFF 降低；楔前叶/楔叶及岛叶的 ReHo 降低；而颞叶的 ALFF 和 ReHo 值增高（ $p < 0.05$ ，AlphaSim 校正）。在 MCI-LI 患者中，内侧额叶的 ALFF 均值与 MoCA 评分存在相关性（ $r = 0.432$ ， $p = 0.045$ ）（Bonferroni 校正后具有临界意义）。
讨论：MCI-LI 中的脑自发活动模式与 MCI-no LI 不同。MCI-no LI 中存在的代偿机制在 MCI-LI 患者中可能会由于血管损伤而被破坏。

PO-0289

41 例脑干节细胞胶质瘤的影像特征分析

谭淑睿¹、吕兴隆¹、段云云²

1. 赤峰市医院

2. 首都医科大学北京天坛医院放射科

目的 分析脑干节细胞胶质瘤的临床、影像及病理特征。**方法** 回顾性分析 2011 年~2021 年首都医科大学附属北京天坛医院 (38 例) 和赤峰市医院 (3 例) 共 41 例脑干节细胞胶质瘤的临床表现, 观察病变术前常规 MRI、CT 影像资料, 结合病理结果, 总结脑干节细胞胶质瘤的影像特点。**结果** 将病变按形态学分为囊实性、实性两类, 其中囊实性病例 24 例, 其中 2 例大囊伴附壁结节, 实性病例 17 例。增强扫描 29 例病变呈明显强化, 强化方式实性部分呈结节样、团块样、斑片状及环形强化, 囊性部分无强化, 或部分囊壁呈环形强化。本组病例中有 24 例病变实性部分靠近脑表面侧强化, 横轴位观察时呈特征性的“波浪状”或“新月形”表现。位于延髓病变 13 例, 矢状位呈特征性的“笔尖样”强化。CT 病变主要表现为等密度、稍低密度或低密度影, 1 例可见点条状的钙化。**结论** 儿童及青少年, 脑干的实性病变伴囊变, 瘤周水肿不明显, 增强扫描病变实性部分多明显强化, 并可见沿脑表面强化等特征性表现时, 诊断及鉴别诊断应考虑节细胞胶质瘤。

PO-0290

终末期肾病患者的体素镜像同伦连接改变及其与患者认知功能之间的关系

顾正章、卢海涛、王欣、邢伟

常州市第一人民医院

目的 运用静息态功能磁共振 (rs-fMRI) 的体素镜像同伦连接 (VMHC) 方法探讨终末期肾病患者双侧大脑半球间静息态功能连通性变化及其与认知功能之间的关系。**方法** 纳入 35 例终末期肾病患者 (患者组) 及 25 例年龄、性别和受教育年限相匹配的健康志愿者 (对照组), 2 组受试者均于磁共振检查前 1 小时内完成蒙特利尔认知量表 (MoCA) 评估认知功能。采用 DPABI 软件的 Statistical Analysis 模块对两组标准化的 VMHC 参数图进行统计分析, 比较两组之间 VMHC 值差异的脑区, 并分析终末期肾病患者组 VMHC 值与 MoCA 总评分及亚项评分的相关性。**结果** 终末期肾病患者组 MoCA 量表总评分及注意、延迟回忆亚项评分显著低于对照组 ($P < 0.05$)。与对照组比较, 终末期肾病患者组双侧脑岛、中央后回、顶上回、顶下缘角回、缘上回、颞上回、颞极: 颞上回 VMHC 值显著减低 (GRF 校正, 体素水平 $P < 0.001$, 簇水平 $P < 0.05$), 未见 VMHC 值增高脑区。终末期肾病患者组双侧缘上回平均 VMHC 值与 MoCA 量表总评分呈正相关关系 ($r = 0.408$, $P = 0.015$), 双侧颞上回平均 VMHC 值与 MoCA 量表中延迟回忆亚项评分呈正相关关系 ($r = 0.526$, $P = 0.001$)。**结论** 本研究结果显示终末期肾病患者组与对照组相比, 其双侧脑岛、中央后回、顶上回、顶下缘角回、缘上回、颞上回、颞极: 颞上回 VMHC 值显著减低, 且与 MoCA 评分相关, 表明终末期肾病患者上述脑区双侧半球间功能协同性减弱, 可能是终末期肾病患者发生认知功能障碍的潜在因素之一。此研究结果也证实终末期肾病患者双侧大脑半球间存在镜像功能连接异常并与其认知功能障碍相关, 大脑半球的 VMHC 值或许可以成为早期诊断终末期肾病患者知功能障碍的指标之一。

PO-0291

基于体素内不相干运动成像的直方图分析鉴别高、低级别脑胶质瘤的价值

卢海涛

常州市第一人民医院

目的：探讨基于体素内不相干运动成像 (IVIM) 的直方图分析术前鉴别脑高、低级别胶质瘤的临床价值。**方法：**回顾性分析 67 例经手术病理证实的脑弥漫性生长胶质瘤，其中高级别组 48 例，低级别组 19 例。分别比较高、低级别组胶质瘤灌注分数 (f)、假弥散系数 (D*)、真实弥散系数 (D) 及表观弥散系数 (ADC) 值的直方图特征差异，对满足正态分布及方差齐性的特征采用独立样本 t 检验进行分析，对不满足正态分布或方差不齐的特征采用 Mann-Whitney 秩和检验进行分析，然后绘制受试者工作特征 (ROC) 曲线评价 IVIM 多参数值的直方图特征鉴别高、低级别脑胶质瘤的效能。**结果：**高级别胶质瘤的 f 最大值、平均值、中位值、第 90 百分位数、第 75 百分位数及标准差显著大于低级别胶质瘤 (均 $P < 0.001$)。高级别胶质瘤的 D 最小值、第 10 百分位数及第 25 百分位数显著小于低级别胶质瘤 (P 值分别为 <0.001 、 <0.001 、 0.006)；标准差、不均匀度显著大于低级别胶质瘤 (P 值分别为 0.002 、 <0.001)。高级别胶质瘤的 ADC 第 10 百分位数显著小于低级别胶质瘤 ($P = 0.002$)；标准差、不均匀度显著大于低级别胶质瘤 (P 值分别为 0.001 、 <0.001)。ROC 曲线示 f 值的第 90 百分位数鉴别高、低级别胶质瘤的 ROC 曲线下面积最大 (0.900)，D 值的标准差对鉴别诊断的特异度最高 (94.7%)，ADC 值的不均匀度灵敏度最高 (95.8%)。**结论：**基于 IVIM 的直方图分析有助于脑胶质瘤术前分级，对临床治疗、预后评估具有一定的价值。

PO-0292

首发未治疗成年重性抑郁障碍患者大尺度静息态脑网络研究

卢海涛

常州市第一人民医院

目的 探讨基于独立成分分析 (ICA) 法的大尺度脑网络研究对首发未治疗成人重性抑郁障碍 (MDD) 患者静息态脑网络 (RSNs) 内及网络间功能连接变化的价值。**方法** 招募 MDD 患者 23 例及健康志愿者 30 例，行静息态脑功能成像 (rs-fMRI) 检查。采用 ICA 法对 rs-fMRI 数据进行分析。采用 SPM-12、Gift 软件比较 MDD 组与 HC 组 RSNs 内及网络间功能连接强度的差异，采用 IBM SPSS statistic 25.0 进行 Pearson 相关分析评价 MDD 组 RSNs 内及网络间功能连接强度与 HAMD 17 评分的相关性。**结果** 与 HC 组相比，MDD 组内侧前额叶皮质 (mPFC) (MNI: x, y, z = -6, 54, 25) 内在功能连接强度显著增强；左侧角回 (AG) (MNI: x, y, z = -48, -66, 21)、左侧楔前叶 (PCu) (MNI: x, y, z = -6, -63, 33)、左侧背外侧前额叶皮质 (dlPFC) (MNI: x, y, z = -36, 12, 51) 及右侧前脑岛 (AI) (MNI: x, y, z = 36, 21, 0) 内在功能连接强度均显著减弱；MDD 组后默认网络 (pDMN) 与前默认网络 (aDMN) 间功能连接强度较 HC 组显著减弱 ($t = 2.206, P = 0.032$)，pDMN 与左额顶网络 (IFPN) 间功能连接强度较 HC 组显著增强 ($t = 2.318, P = 0.025$)。MDD 组 mPFC 内在功能连接强度、pDMN-IFPN 间功能连接强度与 HAMD-17 评分均呈正相关 ($r = 0.524, P = 0.010$; $r = 0.441, P = 0.035$)。**结论** 基于 ICA 法的大尺度脑网络研究能够发现首发未治疗成人 MDD 患者 RSNs 内及网络间功能连接异常，有望为临床 MDD 的诊治提供客观的影像学标记。

PO-0293

表观弥散系数的直方图特征与弥漫性胶质瘤组织学分级、Ki-67 增殖指数的对照研究

卢海涛
常州市第一人民医院

目的：探讨表观弥散系数（ADC）的直方图特征鉴别弥漫性胶质瘤高、低级别的价值，并评价其与 Ki-67 增殖指数的相关性。方法：回顾性分析 67 例经术后病理证实的弥漫性胶质瘤（其中高级别组 48 例，低级别组 19 例）的影像学及病理学资料。比较高、低级别组弥漫性胶质瘤 ADC 值的多个直方图特征差异，对满足正态分布及方差齐性的特征采用独立样本 t 检验进行分析，对不满足正态分布或方差不齐的特征采用 Mann-Whitney 秩和检验，然后绘制 ROC 曲线以评价其 ADC 值直方图特征鉴别高、低级别胶质瘤的效能。采用 Pearson 相关分析评价 ADC 值的直方图特征与 Ki-67 增殖指数的相关性。结果：高级别胶质瘤的 ADC 最大值、标准差及不均匀度均显著大于低级别胶质瘤（P 值分别为 0.025、0.001、0.000）。高级别胶质瘤的 ADC 值第 10 百分位数、第 25 百分位数显著小于低级别胶质瘤（P 值分别为 0.002、0.029）。ROC 曲线示 ADC 值的不均匀度鉴别高、低级别胶质瘤的 ROC 曲线下面积最大（0.815），同时对鉴别诊断的灵敏度最高（95.8%），最大值、第 10 百分位数的特异度最高（均为 68.4%）。Pearson 相关性分析示 ADC 值的第 10 百分位数与 Ki-67 增殖指数呈负相关（ $r=-0.415$ ， $P=0.002$ ），不均匀度与 Ki-67 增殖指数呈正相关（ $r=0.343$ ， $P=0.008$ ）。结论：表观弥散系数的直方图特征有助于预测弥漫性胶质瘤的组织学分级、Ki-67 增殖指数，对胶质瘤临床治疗方案的选取具有一定的价值。

PO-0294

顺磁性边缘病灶对复发缓解型多发性硬化患者皮层厚度和灰白质对比度的影响

谢彦、朱文珍
华中科技大学同济医学院附属同济医院

目的：在复发性多发性硬化（MS）中，顺磁性边缘病灶（PRL）被认为是疾病进展的一种影像学标志物。本研究旨在探讨此类病变对复发缓解型 MS（RRMS）患者皮层厚度及灰白质信号强度比（GWR）的影响。

方法：本研究共纳入 82 名 RRMS 患者（40 名伴有至少 1 个 PRL，42 名不伴有 PRL）和 43 名健康对照（HC）。定量磁化率图（QSM）由 3D 多回波梯度回波序列重建获得。根据 QSM 上是否存在有顺磁性环围绕的慢性病灶，将 RRMS 患者分为 PRL 组和无 PRL 组。使用 FreeSurfer 软件处理图像，获得每个被试重建的皮层表面。GWR 由皮层表面将每个顶点的灰质信号强度（近灰白质交界的 35% 皮层厚度处采样）除以白质信号强度（灰白质交界下方 1mm 恒定距离处采样）获得。基于顶点-顶点的一般线性模型分析，比较 PRL 组、无 PRL 组和 HC 组的皮质厚度和 GWR 的差异。采用偏相关分析评估临床特征与 MRI 参数之间的关系。

结果：与 HC 相比，PRL 组的 RRMS 患者存在多个区域的皮质显著性变薄，以及更广泛区域的 GWR 增加。这两类区域既有重叠的部分，也有相互独立的部分。然而，在无 PRL 的 RRMS 患者中，只有少数区域出现显著的皮质厚度变化，没有区域表现出 GWR 的显著性改变。在与无 PRL 组的比较中，PRL 组患者的一些区域表现出了皮质厚度的变薄以及 GWR 的升高。相关性分析发现，在有 PRL 的 RRMS 中，仅 PRL 体积与平均皮层厚度呈显著负相关（ $r=-0.323$ ， $P=0.048$ ），PRL 体积和病灶总体积与平均 GWR 呈正相关（ $r=0.347$ ， $P=0.033$ ； $r=0.431$ ， $P=0.007$ ）。

结论: PRL 的存在可能为 RRMS 提供一个分型标准, 有助于早期判断患者的脑损伤程度和指导个体化治疗。GWR 可能是 MS 进展过程中病理改变的影像学生物标志物, 有助于进一步了解 PRL 存在下的脑损伤机制。

PO-0295

气味刺激下主观认知下降患者嗅觉神经环路的功能连接改变

朱雅静、陆加明、张冰、张鑫
南京鼓楼医院

目的: 嗅觉障碍是阿尔茨海默病的早期特征。本研究目的是探讨特定气味刺激下的功能磁共振成像中主观认知下降患者嗅觉神经环路的功能连接改变。

材料与方法: 本研究共纳入 56 例正常对照和 57 例主观认知下降患者。所有受试者都接受了认知量表、嗅觉行为学评估和嗅觉任务功能磁共振成像。采用广义心理生理相互作用 (Generalized psychophysiological interaction, gPPI) 方法分析两组被试嗅觉神经环路功能连接的差异。

结果: 在特定气味刺激的嗅觉任务下, 主观认知下降患者双侧初级嗅觉皮层 (Primary olfactory cortex, POC) 与右海马之间的功能连接显著降低 (GRF 校正, 体素 $p < 0.01$, 聚类 $p < 0.05$); 而右侧海马与右侧额叶的功能连接显著增强 (GRF 校正, 体素 $p < 0.01$, 聚类 $p < 0.05$)。双侧 POC 与右侧海马的功能连接与记忆认知阈值呈显著正相关 ($r = 0.269$, $p = 0.043$)。

结论: 尽管主观认知下降患者的嗅觉行为学处于正常水平, 但嗅觉神经环路 (POC-海马-额叶) 的功能连接已经发生改变, 这可能是识别阿尔茨海默病早期风险人群的影像学标志物。

PO-0296

基于能谱多期 CTA 技术探讨其对颅内动脉瘤术后影像评估的临床价值

黄纯自
重庆医科大学附属第三医院

目的: 应用能谱多期 CTA 检查, 探索颅内动脉瘤术后患者的 CTA 最优图像方案, 以实现同时评估责任血管通畅情况及侧枝循环开放情况。

方法: 收集自 2022 年 7 月—2023 年 7 月 40 例重庆医科大学附属第三医院颅内动脉瘤术后接受能谱 CT 头颈部 CTA 及侧枝循环分析的受检者 CT 影像图。记录患者的姓名、性别、年龄、发病部位、持续时间、各项实验室指标及入院以来的影像资料。排除: ①因患者制动不佳或有其他伪影干扰使得图像质量较差, 无法达到诊断标准的影像数据; ②CT 影像数据无法与 GE Fast Stroke 软件兼容;

③因为采集时相不佳, 无法准确按照多期 CTA 时相的 CT 影像数据。利用 GE aw 4.7 工作站重建出 VR、MIP、MPR 图, 再在 40-140 KeV 能量区间内, 间隔 10 个 KeV 能级重建图像, 并分别利用 GE Fast Stroke 软件重建生成 ColorViz 图, 两位高年资放射医师对 40-140 KeV 的 ColorViz 图进行主观评分, 其中 40 KeV 和 ≥ 100 KeV 图像质量较差被排除使用, 在 50-90 KeV 区间, 每间隔 5 KeV 重建 9 个能级的单能量图像, 分别对图像的噪声值(SD)、信噪比(SNR)、伪影指数(AI) 做客观统计学评价。

结果: 进行组间 SNR 比较, 其中 65 KeV 与 70 KeV、75 KeV 与 80 KeV 单能量能级比较, 差异有统计学意义 ($P < 0.05$), 其余组间比较差异无统计学意义; 在 60-65 KeV 区间, AI 指数较低、图像质量客观评价得分最高, 提示该范围单能量能级 ColorViz 图像对弹簧圈栓塞术后血管显示较佳, 能更准确评估颅内动脉瘤术后患者的责任血管通畅情况及侧枝循环开放情况。

结论: 在 60-65 KeV 单能量区间, 能谱多期 CTA 检查能更准确评估颅内动脉瘤术后患者责任血管通畅情况及侧枝循环开放情况。

PO-0297

不同阶段血脑屏障通透性参数预测动脉瘤性蛛网膜下腔出血后迟发性脑缺血和预后

张超、周运锋

皖南医学院第一附属医院

目的 探讨动脉瘤性蛛网膜下腔出血 (aSAH) 后 24 h 内和迟发性脑缺血 (DCI) 时间窗 (DCITW) 内的血脑屏障通透性参数 Ktrans 对 DCI 和术后 3 个月预后的预测价值。

方法 对本院前瞻性 aSAH 数据库进行回顾性分析, 共纳入 128 例 aSAH 患者。根据是否发生 DCI 将患者分为 DCI 组和非 DCI 组, 根据术后 3 个月改良 Rankin 量表将患者分为预后良好组 (改良 Rankin 评分 0-2 分) 和预后不良组 (改良 Rankin 评分 3-6 分)。分别比较入院时 Ktrans 和 DCITW 内 Ktrans (DCITW Ktrans) 在 DCI 组和非 DCI 组间以及预后良好组和预后不良组间的差异。同时, 分析 Ktrans 从入院到 DCITW 内的动态变化。在单因素分析的基础上, 采用多因素 Logistic 回归分析进行自变量筛选, 确定 DCI 发生和 3 个月预后不良的独立危险因素。

结果 DCI 组患者入院时 Ktrans (0.58 ± 0.18 vs 0.47 ± 0.12 , $P=0.002$) 和 DCITW 内 Ktrans (0.54 ± 0.19 vs 0.41 ± 0.14 , $P<0.001$) 均显著高于非 DCI 组。预后良好组入院时 Ktrans 和 DCITW Ktrans 也高于预后不良组, 但在入院时的差异无统计学意义 (0.53 ± 0.18 vs 0.49 ± 0.14 , $P=0.198$)。非 DCI 组和预后良好组的 Ktrans 从入院到 DCITW 内均显著降低。多因素 Logistic 回归分析显示入院 Ktrans ($OR=1.75$, 95%CI: 1.25-2.44, $P=0.001$) 是 DCI 发生的独立危险因素, 而 DCITW Ktrans ($OR=1.73$, 95%CI: 1.24-2.43, $P=0.001$) 是 3 个月预后不良的独立危险因素。

结论 入院时 Ktrans 升高与 DCI 的发生相关, 但与 3 个月预后无关; 而从入院到 DCITW 内评估 Ktrans 的动态变化可以预测患者术后 3 个月预后。

PO-0298

蛛网膜下腔出血早期脑水肿评分与临床预后的关系: 基于血脑屏障通透性参数的评估

张超、周运锋

皖南医学院第一附属医院

目的 探讨蛛网膜下腔出血早期脑水肿评分 (SEBES) 与血脑屏障通透性参数 Ktrans 之间的相关性, 及其对迟发性脑缺血 (DCI) 和术后 3 个月预后的预测价值。

方法 对本院前瞻性动脉瘤性蛛网膜下腔出血 (aSAH) 数据库进行回顾性分析, 共纳入 129 例 aSAH 患者。根据是否发生 DCI 将患者分为 DCI 组和非 DCI 组, 根据术后 3 个月改良 Rankin 量表将患者分为预后良好组 (mRS 0-2) 和预后不良组 (mRS 3-6)。同时, 分析 SEBES 和 Ktrans 从入院到 DCI 时间窗内的变化 (分别表示为 $\Delta SEBES$ 和 $\Delta Ktrans$)。采用 Spearman 相关系数和线性回归分析 SEBES 和 Ktrans 之间的相关性。此外, 采用多因素 Logistic 回归分析确定 DCI 和 3 个月预后的独立危险因素。

结果 SEBES 和 Ktrans 在入院时 ($\rho=0.64$, $P<0.001$) 和 DCI 时间窗内 ($\rho=0.65$, $P<0.001$) 均呈中度相关, 而 $\Delta SEBES$ 和 $\Delta Ktrans$ 呈强相关 ($\rho=0.70$, $P<0.001$)。线性回归分析显示 SEBES 每增加 1 分, 入院时 Ktrans 增加 0.080 ml/100ml/min (95%CI: 0.061, 0.100, $P<0.001$), DCI 时

间窗内 K_{trans} 增加 0.079 ml/100ml/min (95%CI: 0.064, 0.094, $P<0.001$)。总体上, SEBES 和 K_{trans} 从入院到 DCI 时间窗内均显著降低。多因素 Logistic 回归分析显示入院时和 DCITW 时间窗内 SEBES 分别是 DCI (OR, 1.92; 95%CI: 1.08, 3.43; $P=0.028$) 和预后不良 (OR, 3.87; 95%CI: 2.14, 6.99; $P<0.001$) 的独立危险因素。

结论: aSAH 后脑水肿严重程度与 BBB 破坏程度具有显著相关性。入院时和 DCI 时间窗内的 SEBES 分别为 DCI 和 3 个月预后的独立危险因素。

PO-0299

遗忘型轻度认知障碍患者海马亚区体积改变及与认知表现的相关性

冯琪、丁忠祥
杭州市第一人民医院

背景: 神经影像学研究表明, 遗忘型轻度认知障碍 (aMCI) 人群海马和海马亚区体积发生变化。然而, 用于区分 aMCI 和正常对照 (NC) 的海马亚区体积模型研究相对较少, 海马体积与整体认知评分之间的关系尚不清楚。

方法: 为此, 我们采集了 50 名 aMCI 患者和 44 名 NC 的高分辨 3D T1 MRI 序列。首先, 采用单变量一般线性模型分析海马亚区的体积差异。然后, 采用四种降维方法和四种机器学习方法的组合基于海马亚区体积区分 aMCI 和 NC。最后, 分析海马亚区相对体积与认知测试变量 (MMSE 和 MoCA) 的相关性。

结果: 两组海马尾、下托、CA1、前下托、分子层、GC-ML-DG、CA3、CA4、海马伞体积差异有统计学意义, 尤以左侧海马体积差异显著。左右海马机器学习分类器的最高曲线下面积 (AUC) 值分别为 0.678 和 0.701。左侧下托、左分子层、右侧下托、右 CA1、右分子层、右 GC-ML-DG、右 CA4 体积与 MoCA 评分呈正相关。

结论: 海马亚区体积可能是 aMCI 的一个预测指标。结果表明, 海马亚区体积在整体认知表现中起敏感作用。

PO-0300

特鲁索综合征相关脑梗死的影像学特征及危险因素分析

李雨薇¹、蒋牧良²
1. 南宁市第一人民医院
2. 广西医科大学第一附属医院

目的: 探讨特鲁索综合征相关脑梗死患者的影像学特征、临床特点及相关危险因素, 提高对该疾病的认识, 为临床早期干预提供客观依据。

方法: 回顾性收集 2012 年 1 月至 2022 年 12 月的急性和/或亚急性期脑梗死的病例, 包括 41 例诊断为特鲁索综合征相关脑梗死的恶性肿瘤患者 (特鲁索综合征组) 和 62 例发病前后均无恶性肿瘤病史的大动脉粥样硬化型脑梗死患者 (对照组) 的影像学、临床及实验室检查等相关资料, 并进行统计分析。筛选特鲁索综合征相关脑梗死发生的独立危险因素。以 $P<0.05$ 为差异有统计学意义。

结果: 特鲁索综合征组患者的原发恶性肿瘤类型以肺癌最多, 病理类型以腺癌最多, 且多存在转移。特鲁索综合征组的脑梗死灶多分布在双侧前循环加后循环区域 ($P<0.05$); 且以同时累及脑叶皮层及皮层下为主 ($P<0.05$)。特鲁索综合征组患者的脑梗死传统危险因素的发生率低于对照组。特鲁索综合征组更易合并其他血栓栓塞事件发生 ($P<0.05$)。其 D-二聚体定量及 C 反应蛋白值高于, 红细胞计数、血红蛋白及血小板计数值低于对照组 ($P\leq 0.001$)。多因素 Logistic 回归分析显

示外周血 D-二聚体定量 (OR=1.001, P=0.004) 水平升高、C 反应蛋白 (OR=1.024, P=0.024) 水平升高、血小板计数 (OR=0.988, P=0.031) 降低是特鲁索综合征相关脑梗死发生的独立危险因素。

结论: 特鲁索综合征的原发恶性肿瘤类型以肺癌高发, 其中腺癌最常见。患者发病时恶性肿瘤多处于活跃状态或已发展至晚期, 且易合并其他血栓栓塞事件发生。特鲁索综合征相关脑梗死的影像学特征, 表现为多发、播散性、斑点、斑片状病灶, 易同时累及大脑半球脑叶皮层及皮层下, 其次是小脑区域, 病变累及两个以上血管区域最多见, “三流域征”具有特异性诊断价值。外周血 D-二聚体定量水平升高, C 反应蛋白水平升高及血小板计数降低是特鲁索综合征相关脑梗死发生的独立危险因素。

PO-0301

基于 FLAIR 血管高信号征构建急性缺血脑卒中 临床结局预测模型的研究

祁丹、王晓慧、张瑜、方玮玮
延安大学附属医院

目的: 基于 FVH 征象构建影像模型、临床模型、临床联合影像等三个预测模型, 寻找最佳预测模型来评估急性缺血脑卒中临床预后的情况。**方法:** 收集入院行一般治疗的急性前循环缺血性脑卒中患者 106 例。通过多因素逐步 Logistic 回归确定急性缺血性卒中预后不良发生的独立影响因素, 构建临床、影像、临床联合影像的预测模型, 应用 ROC 曲线评估临床、影像、临床联合影像模型的预测效能。**结果:** 多因素 Logistic 回归结果显示, 在临床因素中入院时 NIHSS 评分 (OR=0.573; 95% CI: 0.464~0.706; P<0.001) 为卒中预后不良的独立预测因子; 临床预测预后的模型 AUC 为 0.738 (95% CI: 0.644~0.831), 敏感度和特异度分别为 46.6%、91.7%。在影像因素中 DWI-ASPECTS 评分 (OR=6.098; 95% CI: 2.860~13.00; P<0.001)、FVH 评分 (OR=2.191; 95% CI: 1.199~4.003; P<0.001) 为卒中预后不良的独立预测因子; 影像预测预后模型的 AUC 为 0.856 (95% CI: 0.884~0.958), 敏感度和特异度分别为 75.9%、83.3%。在临床联合影像因素中入院时 NIHSS 评分 (OR=0.524, 95% CI: 0.371~0.741, P=0.001)、DWI-ASPECTS 评分 (OR=6.627, 95% CI: 2.097~20.947, P=0.001) 及 FVH 评分 (OR=3.018, 95% CI: 1.537~5.924, P=0.001) 均是急性缺血性卒中患者预后不良的独立预测因子; 临床联合影像的预测预后模型的 AUC 为 0.885 (95% CI: 0.823~0.946), 敏感度为 82.8%、特异度为 81.3%。**结论:** 临床联合影像的预测模型相较于临床模型或影像模型对于一般治疗的急性缺血性卒中患者有更好的预测效能。

PO-0302

能谱 CT 容积定量分析对急性脑梗死介入术后碘对比剂渗出和脑出血转化鉴别应用价值

洪玉芹、余娜
重庆医科大学附属第三医院

目的 本研究旨在通过能谱 CT 容积定量分析来对急性脑梗死介入术后颅内出现的异常高密度影进行鉴别分析, 探讨容积定量分析对此类异常影像的鉴别诊断作用。

方法 回顾性分析重庆医科大学附属第三医院 2021 年 5 月—2022 年 5 月收治的 26 例急性脑梗死介入术后即刻行能谱 CT 平扫出现颅内异常高密度影的急性脑梗死患者图像。以术后 24 h 常规 CT 复查结果为标准, 将 26 例颅内异常高密度影分为对比剂渗出组 (渗出组, 14 例) 和脑出血转化组

(出血组, 12 例)。利容积定量分析(利用容积再现从病灶体积分析)分别测量两组颅内异常高密度影及其周围正常脑白质的 CT 值、有效原子序数(effective atomic number, Eff-Z)、水(碘)浓度、碘(水)浓度, 血液(水)浓度, 并计算这些指标的相对值。组间比较采用 t 检验或秩和检验, 并对有统计学意义的指标行受试者工作特征(receiver operating characteristic, ROC)曲线分析。

结果 两组颅内异常高密度影容积 CT 比较, 差异无统计学意义($P=0.235$), 渗出组水(碘)浓度、血液(水)浓度小于出血组, Eff-Z、碘(水)浓度大于出血组($P<0.05$); 两组颅内异常高密度影周围正常脑组织的各 CT 指标无统计学差异($P>0.05$); 两组容积 CT 对比值无统计学差异($P>0.05$), 渗出组水(碘)浓度、血液(水)浓度对比值小于出血组, Eff-Z、碘(水)浓度对比值大于出血组($P<0.05$)。水(碘)浓度、碘(水)浓度、血液(水)浓度、Eff-Z 及各指标相对值对两组异常高密度影鉴别诊断的曲线下面积分别为 0.79、0.94、0.96、0.81、0.96、0.97。

结论 能谱 CT 容积定量分析能够对急性脑梗死介入术后颅内高密度影进行有效鉴别。

PO-0303

MRI 一阶特征在脑泡型包虫和脑转移瘤鉴别诊断中的研究

阿布都热苏力·吐尔孙¹、排尔哈提·牙生²、亚森·依米提^{1,2}、贾文霄²、王云玲²、马依迪丽·尼加提¹

1. 喀什地区第一人民医院

2. 新疆医科大学第一附属医院

【摘要】目的: 探究基于 MRI T1WI 增强序列的一阶特征在脑泡型包虫(Cerebral alveolar echinococcosis, CAE)和脑转移瘤(Brain Metastases, BM)鉴别诊断中的价值, 以提高两种疾病的鉴别诊断能力, 为临床提供术前准确、可靠的诊断依据。材料与方法: 回顾性分析新疆医科大学第一附属医院 2014 年至 2022 年在新疆医科大学第一附属医院神经外科经过手术并病理活检确诊为 CAE 和 BM 患者共 130 例, 其中 CAE 30 例, BM 100 例。首先分析两组疾病一般临床资料, 然后利用开源软件 3D Slicer 软件术前 T1WI 增强扫描(T1-CE)轴位图像勾画出病灶的感兴趣体积 VOI(volume of interest), 利用 Python 提取病灶第 10 百分位数, 第 90 百分位数, 中位数, 熵, 四分位数间距, 峰度, 最大值等 18 个一阶特征, 比较 CAE 与 BM 两种疾病的一阶特征参数并进行统计学分析, 观察比较各参数对疾病鉴别诊断的效能; 结果: CAE 与 BM 一般临床资料显示, CAE 与 BM 年龄及 BMI 无明显统计学差异, 本次研究结果显示 CAE 男性更多见($p<0.001$)。18 个一阶特征过滤高相关特征, 发现第 90 百分位数、熵、峰度、最小值、极差、均匀性、方差等 7 个特征有统计学差异, $p<0.05$, 七个特征联合分析诊断效能最佳, AUC 为 0.732, 敏感度为 79.5%、特异度为 61.1%、准确度为 72.3%; 逻辑回归分析, 熵 OR 值为 0.10, 95%置信区间为 0.01, 0.83, $p<0.05$ 。结论: 常规影像表现非常类似的 CAE 和 BM, 临床病史结合一阶特征可以明显提高鉴别诊断, 为临床提供重要的诊断依据。

PO-0304

成人型神经元核内包涵体病的 MRI 特征 (附 7 例报告及文献复习)

曹伯裕、戚乐

杭州师范大学附属医院

目的 分析 7 例成人型神经元核内包涵体病(NIID)患者的 MRI 特征并文献复习。方法 回顾性分析杭州师范大学附属医院 2018 年 6 月-2023 年 6 月经皮肤活检确诊的 7 例成人型 NIID 的临床、病理及

影像资料,并综述多篇文献报道的 NIID 的影像特点。结果 7 例成人型 NIID 患者临床症状不一,主要表现为认知障碍、排尿障碍、肢体无力、发作性意识障碍;头颅 MRI 检查显示 6 例 (6/7) 扩散加权成像 (DWI) 可见皮质、髓质交界区高信号, 1 例 (1/7) 双侧基底节区出现斑片状 T2WI 高信号, 1 例 (1/7) 胼胝体侧体区出现液体衰减反转恢复序列 (T2 Flair) 高信号。成人型结论 NIID 病患者的临床表现多样, 中枢和周围神经系统均可受累, 头颅 MRI 具有特征性皮髓交界区典型“绸带征”, 结合皮肤活检发现细胞核内嗜酸性包涵体可以提示 NIID 的诊断。

PO-0305

缺血性卒中脑类淋巴系统功能受损与运动功能障碍的相关性研究

王磊、李馨、李笑石、钱一帆、牛微、秦越
西安大兴医院

目的: 本研究采用血管周围间隙扩散张量成像分析 (diffusion tensor image analysis along the perivascular space, DTI-ALPS) 的方法, 评估运动功能障碍的缺血性卒中 (Ischaemic Stroke, IS) 患者恢复期脑类淋巴系统的活性, 并探讨其与运动功能评分、皮质脊髓束完整性之间的关系。方法: 招募 20 例我院 2021 年 1 月至 2022 年 11 月卒中中心收治的缺血性卒中患者和健康成人各 20 例。卒中组均为左侧大脑半球皮质下单发病灶。记录所有参与者的人口学数据和临床量表资料。所有参与者行颅脑 MRI 扫描, 序列包括: 扩散谱成像和 T2 加权成像。计算侧脑室水平 DTI-ALPS 指数、皮质脊髓束 (corticospinal tract, CST) 各向异性分数 (fractional anisotropy, FA) 及轴向扩散系数 (axial diffusivity, AD) 并比较两组间各指标差异。分析卒中组 DTI-ALPS 指数与 Fugl-Meyer 评分、皮质脊髓束完整性之间的相关性。结果: 卒中组患侧 DTI-ALPS 指数明显低于对照组同侧 ($t=-3.88$, $P<0.001$); 卒中组患侧 DTI-ALPS 指数与运动功能评分 ($\rho=0.52$, $P=0.019$)、运动功能评分分级 ($\rho=0.50$, $P=0.024$) 和感觉评分 ($\rho=0.45$, $P=0.048$) 均呈正相关关系, 且与健侧皮 CST 的 FA ($R=-0.60$, $P=0.009$)、DA ($R=-0.67$, $P=0.002$) 呈负相关关系。结论: 缺血性卒中患者脑类淋巴系统受损。DTI-ALPS 可能成为缺血性卒中患者运动功能障碍的潜在 MR 生物标志物, 同时对缺血性卒中病理生理机制的研究提出了新的思路。

PO-0306

基于人工智能的多参数 MRI 无创鉴别脑转移瘤、脑胶质母细胞瘤和颅内原发中枢神经系统淋巴瘤

李俊杰、刘亚欧、卓芝政、段云云、武明豪、曲丽莹、郭敏、杜小舟、程丹
首都医科大学附属北京天坛医院

研究背景: 临床工作中准确鉴别脑转移瘤 (Brain metastases, BM), 脑胶质母细胞瘤 (Glioblastoma, GBM)、颅内原发中枢神经系统淋巴瘤 (Primary central nervous system lymphoma, PCNSL) 和十分重要。然而, 多数人工智能 (Artificial intelligence, AI) 方法研究仅纳入两种肿瘤进行鉴别, 缺乏 AI 方法同时鉴别三种肿瘤的研究。

研究目的: 基于 AI 方法应用多参数 MRI 准确鉴别 BM、GBM 和 PCNSL。

研究方法: 本研究纳入了首都医科大学附属北京天坛医院 BM ($n=375$)、GBM ($n=391$) 和 PCNSL ($n=361$) 术前多参数 MRI 图像, 包括 T1w, T2w, FLAIR, ADC 和增强 T1。按照 7: 3 随机划分为训练集 ($n=788$) 和测试集 ($n=339$)。基于多参数 MRI 开发了一个全自动鉴别模型, 该模型包括肿瘤分割模型和肿瘤鉴别模型。把模型鉴别结果和低年资、高年资神经放射医生结果分别进行比较。然后, 低年资神经放射医生根据模型结果进行再次判读。

研究结果：该模型鉴别 BM、GBM 和 PCNSL 的准确度为 0.73，AUC 分别为 0.82、0.88、0.88，和高年资神经放射医生结果相似（准确度为 0.74，AUC 分别为 0.87、0.90、0.90），高于低年资神经放射医生（准确度为 0.6，AUC 分别为 0.6、0.73、0.71），低年资神经放射医生借助模型再次判读后结果提高（准确度为 0.70，AUC 分别为 0.71、0.81、0.77）。

结论：该模型基于多参数 MRI 无创鉴别 BM、GBM 和 PCNSL，鉴别结果和高年资神经放射医生相似，高于低年资神经放射医生，但可提高低年资神经放射医生的诊断水平。

PO-0307

DCE-MRI 定量和定性参数对脑胶质瘤 CDKN2A/B 纯合缺失的预测

杨惠泉、朱正阳、张鑫、张冰
南京大学医学院附属鼓楼医院

目的：细胞周期蛋白依赖性激酶抑制剂 2A/B（CDKN2A/B）纯合缺失是脑胶质瘤重要的预后因素，影响治疗策略的制定。本研究旨在探讨常规 MRI 图像参数结合动态对比增强磁共振（DCE-MRI）定量和定性参数是否可以预测脑胶质瘤中 CDKN2A/B 纯合缺失状态。方法：回顾性收集 2020 年 1 月至 2023 年 6 月南京鼓楼医院 77 例脑胶质瘤患者（平均年龄 \pm 标准差， 51.9 ± 17.4 岁；男性 43 名，女性 34 名；48 例无 CDKN2A/B 纯合缺失，29 例 CDKN2A/B 纯合缺失）的术前 MRI 数据，获得常规 MRI 特征、表观扩散系数（ADC）和 DCE-MRI 定性参数时间-强度曲线（TIC）类型、定量参数 Ktrans、kep、ve、vp 和 iAUC。分析两组患者各参数之间差异的显著性，纳入所有参数进行单因素 Logistic 回归，取有显著意义的参数建立多因素回归模型以预测 CDKN2A/B 纯合缺失状态，使用受试者工作特征曲线下面积（AUC）评估预测模型的判别性能。结果：两组之间年龄、病灶数量、囊变程度、强化程度、ADC、TIC 类型、Ktrans、ve、vp 和 iAUC 的差异具有统计学意义。在对所有胶质瘤患者的多变量分析中，年龄（比值比[OR]=1.098， $p=0.005$ ）和 Ktrans（OR=1.030， $p=0.01$ ）是 CDKN2A/B 纯合缺失的独立预测因素。相应模型的 AUC、准确性、敏感性和特异性分别为 0.90、81.8%、69.0%和 89.6%。结论：年龄和 Ktrans 可能是预测脑胶质瘤 CDKN2A/B 纯合缺失的有效参数，这为脑胶质瘤患者精确诊断和个体化治疗提供依据。

PO-0308

多模态影像融合技术在脑出血患者中的应用

郝桥、申博兴、秦江彦
延安大学附属医院心脑血管病医院放射科

目的：脑出血具有发病急，死亡率和发病率是相对较高的特征。目前神经外科对于需要钻孔引流术的患者应用较多的是无框架立体定向机器人引导的血肿穿刺引流术，但该手术术前需要刻盘及手术费用较高，而利用多模态影像融合技术也可以完成血肿的精准穿刺引流。本研究主要目的是探讨多模态影像融合技术在脑出血患者中精准穿刺引流术的临床可行性及准确性。

方法：纳入我院 2023 年 1 月至 2023 年 8 月神经外科接受血肿穿刺引流术治疗的脑出血患者 100 例，术前均行 CT 平扫，然后利用西门子后处理软件 Syngo.via 软件的区域增长及颅骨分离的方式，重建出三维立体的血肿的虚拟现实模型，通过与神经外科医师沟通，确立穿刺点，在 VR 图像上通过冠状缝和矢状缝确定穿刺点，将穿刺点平移至 MPR 图像血肿中心层面，测量矢状位血肿中心层面穿刺点至血肿中心的距离，该距离为虚拟穿刺道，然后测量虚拟穿刺道和听眦线的夹角，术中外科医师可依据颅脑体表投影，确定穿刺点，穿刺角度为①平行于矢状面②虚拟穿刺道和听眦线的夹

角, 穿刺的深度为穿刺点至血肿中心的距离, 术后依据复查颅脑平扫 CT 以及联影 AI 软件, 判断引流的效率, 进而探讨多模态影像融合技术在脑出血患者中精准穿刺引流术的临床可行性及准确性。结果: 在 100 例脑出血的患者中, 利用西门子后处理软件 Sygo.via 基于区域增长及颅骨分离完成虚拟现实模型图像融合的时间 <5 分钟, 平均 3 分钟, 通过虚拟现实模型图像制定的手术方式, 可准确的将引流管尖端置于血肿中心的层面, 术后血肿的引流效率 (基于 AI) 在术后第二天可达 50%, 术后第三天可达 75%。

结论: 利用西门子后处理软件 Sygo.via 基于区域增长及颅骨分离完成虚拟现实模型所制定的血肿穿刺引流术, 可准确的将引流管尖端置于血肿中心层面, 血肿引流效率高。利用该技术不仅降低了患者的经济成本及社会医学的经济压力, 还实现了精准治疗, 改善了患者的预后。

PO-0309

2 型糖尿病患者皮层形态特征的 MRI 结构研究

王微微、苗延巍、伍建林
大连医科大学附属第一医院

研究目的: 旨在应用 SBM 技术分析 T2DM 患者皮层特征, 以多参数、多维度反映 T2DM 患者皮层结构改变

材料方法: 收集 T2DM 患者 45 名, 健康对照 28 名。记录被试的年龄、性别、身高、体重、臀围、腰围、血压、教育水平、饮酒史、吸烟史、病程、空腹血糖、糖化血红蛋白、空腹胰岛素、高、低密度脂蛋白、总胆固醇、甘油三酯、同型半胱氨酸。使用 Philips Ingenia CX 3.0T MR 采集 3D T1 结构序列。应用 SPM 12 软件分析被试间皮层厚度、分形维 (FD)、回化指数 (GI) 及脑沟深度 (SD) 差异。使用简明精神状态量表、蒙特利尔认知评估量表、加利福尼亚词语学习测验、符号数字模式测验评估被试认知状态。采用 Pearson 相关分析分析具有显著性差异脑区皮层指标与人口学资料、化验指标及认知评分的相关性。 $P<0.05$ 视为差异有统计学意义

研究结果: T2DM 组被试左侧额中回下部等脑区的皮层厚度明显小于对照组 ($P<0.05$, FWE), 其中部分脑区皮层厚度与 HbA1c 及 FG 呈负相关 ($P<0.05$); 左侧额中回下部皮层厚度与 HDL 呈正相关 ($r=0.235$, $P=0.046$); 左侧额中回下部等脑区皮层厚度与记忆力、执行功能及注意力评分呈正相关 ($P<0.05$)。T2DM 组被试右侧额上回等脑区 FD 明显小于对照组 ($P<0.05$, FWE correction); 左侧眶额回外部 FD 大于对照组 ($P<0.05$, FWE); 右侧岛回等脑区 GI 明显小于对照组 ($P<0.05$, FWE)。组间 SD 差异未见明显统计学意义 ($P>0.05$)。大部脑区的 FD、GI 与糖化血红蛋白及空腹血糖呈负相关 ($P<0.05$); 部分脑区 FD、GI 与认知评分具有相关性

研究结论: T2DM 患者皮层厚度减低, 与糖化血红蛋白、空腹血糖升高、执行能力、记忆力等认知域认知评分相关。T2DM 患者部分脑区 FD、GI 降低, 主要累及额颞叶; 机体代谢水平影响皮层结构。

PO-0310

血管周围间隙扩散张量成像指数在评估帕金森病患者脑类淋巴系统功能中的价值

陈阿梅
华南理工大学附属第二医院

目的: 探讨血管周围间隙扩散张量成像 (DTI-ALPS) 指数在评价帕金森病 (PD) 患者脑类淋巴系统功能中的价值。

方法:自帕金森病进展标记物研究项目(PPMI)基线数据库中选取诊断为 PD 的 153 例患者及 59 例健康志愿者(HC 组)纳入本研究,212 例被试的临床资料(包括多种认知和运动测试量表评分和脑脊液检查资料)和 MRI 资料完整.脑脊液生物标记物包括 A β 4 2、aGsyn、tGtau、pGtau、tG tau/A β 4 2 和 pGtau/A β 4 2.所有 MR 图像在 Siemens 3.0T 磁共振仪上完成采集.利用 FSL 及 ImageGJ 软件在每例被试的各向异性分数(FA)图上,分别在左侧大脑半球侧脑室体部水平的投射纤维区域、联合纤维区域及皮层下纤维区域勾画直径 5.0mm 的球形感兴趣区,测量每种纤维在 X、Y 和 Z 轴方向的扩散率,并根据公式计算 DTI-ALPS 指数.比较 PD 组与 HC 组之间 ALPS 指数值的差异,并分析 PD 患者 ALPS 指数与临床指标及脑脊液生物标记物之间的相关性.

结果:与 HC 组比较,PD 组 DTI G ALPS 指数值显著减低($Z=3.769, P<0.001$).PD 组 ALPS 指数与年龄呈负相关($r=-0.256, P=0.001$);在控制年龄、性别及受教育年限三个因素后,PD 组 ALPS 指数与 MDS-URDRS III 评分呈负相关($r=-0.245, P=0.002$),与脑脊液 pGtau 浓度呈负相关($r=-0.357, P<0.001$).

结论:DTI-APLS 指数可用于评估 PD 患者类淋巴系统功能受损情况,在探索 PD 相关发病机制方面具有较好的应用前景.

PO-0311

MRI 银杏叶征象对脊膜瘤与椎管内神经源性肿瘤的鉴别诊断价值

赵本琦、郑卓肇

清华大学附属北京清华长庚医院

目的 研究 MRI 银杏叶征象在脊膜瘤与椎管内神经源性肿瘤鉴别诊断中的应用价值,并初步探讨银杏叶征出现的机制。

方法 回顾性分析经病理诊断的 285 例椎管内神经源性肿瘤与 102 例脊膜瘤患者的临床资料。依据病理结果分为神经源性肿瘤与脊膜瘤两组。所有患者均接受脊柱增强 MRI 检查。在轴位增强 T1WI 图像上,对比分析两组间银杏叶征像出现情况,并计算银杏叶征像对两种疾病的鉴别诊断性能(敏感度、特异度、阳性预测值、阴性预测值)。对患者的手术录像进行回顾,分析银杏叶征出现的解剖学机制。

结果 神经源性肿瘤与脊膜瘤银杏叶征出现率分别为 0% ($n=0$) 与 12.7% ($n=13$), 差异有明显统计学意义 ($p<0.001$)。银杏叶征对脊膜瘤诊断的敏感度为 12.7%, 特异度为 100%, 阳性预测值为 100%, 阴性预测值为 76.2%。13 例出现银杏叶征的脊膜瘤中, 8 例 (61.5%) 位于颈段椎管, 5 例 (38.5%) 位于下胸段椎管, 0 例 (0%) 出现在上胸段、腰段椎管; 8 例位于脊髓左侧, 5 例位于脊髓右侧, 左右侧比例为 1.6:1。回顾手术录像发现, 银杏叶征出现的机制为脊膜瘤包裹齿状韧带所致, 齿状韧带存在于颈段、胸段脊髓左右两侧的蛛网膜下腔, 腰段未观察到。颈段、下胸段齿状韧带游离缘较上胸段的长, 可能为此处脊膜瘤容易出现银杏叶征的解剖学机制。

结论 MRI 银杏叶征像对脊膜瘤与椎管内神经源性肿瘤的鉴别诊断具有较高的鉴别诊断性能, 特异性出现在颈段、下胸段的脊膜瘤。本研究结果有待进一步验证。

PO-0312

基于结构性 MRI 的形态学测量区分脊髓小脑共济失调及多系统萎缩的诊断价值

曾文婷^{1,2}、宋亭¹、胡曼诗²、丘海珊²、初建平²、赵静²

1. 广州医科大学附属第三医院

2. 中山大学附属第一医院

目的: 脊髓小脑共济失调 (SCAs) 和多系统萎缩 (MSA) 临床表现相似, 但疾病转归与预后显著不同, 早期准确区分两者尤为重要。前期研究表明 SCAs 和 MSA 均存在小脑和脑干的不同程度萎缩, 本研究拟探讨基于结构性 MRI 的形态学测量对两者的鉴别诊断价值。

方法: 收集于中山大学附属第一医院经基因诊断确诊的 SCAs 患者 86 例 (症状组 SCAs: 64, 症状前 SCAs: 22)、临床诊断为 MSA 47 例 (probable MSA)、健康对照 35 例 (HC), 采集 MRI 结构相及临床资料。SCAs 和 MSA 患者根据病程分为两组: <3 年和 3-7 年。三名具不同临床经验的观察者分别测量平枕骨大孔及 3-5 颈椎椎体上缘的脊髓前后径 (SC₀₋₃)、脑桥基底部 (a) 及被盖部前后径 (b) 和小脑上、中、下脚宽度, 其中一位观察者 2 个月后行重复测量, 计算观察者内及观察者间可重复性, 采用 t 检验、秩和检验、ROC 曲线及随机森林方法评估上述指标对同一病程阶段的 SCAs 与 MSA 的鉴别诊断价值。

结果: 指标具较高可重复性。病程 <3 年: SCAs 的 SC₀₋₃ 及 b 显著小于 MSA 和 HC ($P < 0.05$), 且相比 MSA, 症状前 SCAs 的 SC 和 SC₁ 已显著萎缩。ROC 示 SC 诊断价值最高 (AUC=0.90, 灵敏度: 78%, 特异度: 83%, cut-off 值: 8.0mm)。基于上述指标的随机森林模型表现出更高的诊断价值 (AUC=0.97), 其中 SC 贡献最大。进一步分析病程 3-7 年的 SCAs 与 MSA, SCAs 的 SC₀₋₃ 及 b 亦小于 MSA 和 HC ($P < 0.05$), ROC 示 SC₁ 诊断价值最高 (AUC=0.90, 灵敏度: 87%, 特异度: 87%, cut-off 值: 7.4mm)。随机森林进一步提升模型诊断价值 (AUC:0.95), 其中 SC₃ 的贡献最大。

结论: 结构性 MRI 的形态学测量可重复性好、不依赖于测量者临床经验, 可用于鉴别诊断 SCAs 与 MSA 且具有较高诊断价值。

PO-0313

表观扩散系数直方图分析在预测脑膜瘤复发风险中的价值

韩涛、刘显旺、周俊林
兰州大学第二医院

目的 拟探讨融合常规 MRI 特征及表观扩散系数直方图参数的模型对脑膜瘤复发风险的预测价值。

材料与方法 回顾性收集我院 2017 年 1 月-2020 年 6 月期间经手术和病理证实的 72 例脑膜瘤患者, 根据是否在 2022 年 6 月之前复发分为复发组和未复发组。使用 MaZda 软件在肿瘤最大层面勾画感兴趣区并自动生成直方图参数, 基于直方图参数和常规 MRI 特征建立预测脑膜瘤复发的 Logistic 回归模型列线图, 通过校准曲线和决策曲线评估模型的预测效能, 绘制受试者特征工作曲线(receiver operating characteristic, ROC)评价其对脑膜瘤复发的诊断效能。

结果 肿瘤最大直径、坏死、增强均匀度、年龄、辛普森分级、肿瘤形状和 ADC 第一百百分位数 (ADCp1) 在两组间差异具有统计学意义 ($P < 0.05$), 其中后四项是复发的独立危险因素。结合这四个危险因素构建的模型预测效果最好, 其曲线下面积、准确性、灵敏度、特异性、阳性预测值和阴性预测值分别为 0.965 (0.892-0.994)、90.3%、92.6%、88.9%、83.3% 和 95.2%。校准曲线显示, 模型预测的复发概率与实际复发概率之间具有良好的一致性。决策曲线表明该模型具有良好的临床可用性。

结论 基于常规 MRI 特征及表观扩散系数直方图参数的模型能够直观可靠地预测脑膜瘤复发, 为临床治疗方案的选择和个体化治疗提供了指导依据。

PO-0314

表观扩散系数直方图分析术前鉴别纤维型脑膜瘤 与非纤维型脑膜瘤

韩涛、刘显旺、周俊林
兰州大学第二医院

目的 探讨表观扩散系数 (apparent diffusion coefficient, ADC) 直方图分析在术前鉴别纤维型脑膜瘤与非纤维型脑膜瘤的价值。

方法 本研究回顾性分析 220 例经组织病理学确诊的 FM (fibroblastic meningiomas) 和 nFM (non-fibroblastic meningiomas) 患者的组织病理学及影像学资料。在轴位 ADC 图像上沿病灶边缘勾画整个肿瘤, 获得以下直方图参数 (均值、方差、偏度、峰度以及第 1、第 10、第 50、第 90 和第 99 百分位数)。采用单因素和多因素 logistic 回归分析确定鉴别 FM 和 nFM 的危险因素, 并采用受试者工作特征 (ROC) 曲线评估其术前鉴别 FM 和 nFM 的诊断效果。

结果 FM 组的均值、方差、第 50、第 90 和第 99 百分位数均低于 nFM 组 ($P < 0.05$), 肿瘤位置和性别差异有统计学意义 ($P < 0.05$)。多因素 logistic 回归分析结果显示, 第 99 百分位数 ($P < 0.001$) 和肿瘤位置 ($P = 0.007$) 是鉴别 FM 和 nFM 最有价值的参数, 将二者融合的诊断效能最佳, 其 AUC 值为 0.817 (95% CI, 0.759-0.866), 敏感性、特异性、准确性、阳性预测值和阴性预测值分别为 66.4%、83.6%、75.0%、80.2%和 71.3%。

结论 ADC 直方图分析可能有助于术前无创鉴别 nFM 和 FM, 第 99 百分位数融合肿瘤位置的诊断效果最好。

PO-0315

基于 MRI 弥散加权成像的影像组学特征预测急性缺血性脑卒中的短期预后

于泳
南京中医药大学附属盐城中医院

目的: 基于急性缺血性脑卒中 (acute ischemic stroke, AIS) 弥散加权成像的影像组学特征, 构建 AIS 短期预后的预测模型。

方法: 回顾性分析 219 例 AIS 患者的 MRI 图像。采用 ITK-SNAP 软件分割 DWI 上高信号梗死区, 并应用 pyradiomics 进行影像组学特征提取和降维, 利用 SVM 分类器构建预后预测模型。

结果: 共筛选出 15 个系数非零的特征, 包括 2 个一阶特征, 4 个形状特征和 9 个纹理特征, ROC 曲线显示预测模型在训练集上的 AUC 为 0.897, 准确度为 0.840; 在测试集上的 AUC 为 0.835, 准确度为 0.795。

结论: 基于 MRI 的影像组学预测模型能够有效地评估 AIS 患者的短期预后, 可为临床决策提供有力支持。

PO-0316

经典三叉神经痛患者单次触痛后脑功能变化

葛秀红、王罗羽、潘磊、叶海琪、朱小芬、丁忠祥
杭州市第一人民医院

目的: 本研究拟通过研究经典型三叉神经痛(CTN)患者单次疼痛后多时间点局部一致性(ReHo)的时间变异性及频率(经典频段, 慢 2-慢 5 频段)两个维度的变化, 以明确 CTN 患者单次触痛后脑功能变化。

方法: 本研究最终共纳入 48 名 CTN 患者, 通过模拟患者日常生活中无害性动作触发疼痛。所有被试均行三次 rs-fMRI 扫描(包括触发疼痛前、触发疼痛后 5 秒内、触发疼痛后 30 分钟进行)。三次测量的差异通过重复测量的 ANOVA 进行分析。

结果: 与触发疼痛前比较, 经典频段中, 左侧距状裂、右侧枕中回的 sReHo 值逐渐升高; 双侧额中回、左侧楔前叶的 sReHo 值逐渐降低; 左侧角回、左侧中央后回的 sReHo 值在触痛后 5s 降低, 在触痛后 30min 升高; 右侧眶部及三角部额下回的 sReHo 值在触痛后 5s 升高, 在触痛后 30min 降低。慢 2 频段的左侧枕上回及慢 3 频段的左侧顶上小叶与经典频段发生改变的脑区不同, 慢 5 频段的脑区虽然涵盖在经典频段, 其中左侧楔前叶的变化趋势与其不一致。其余各频段发生变化的脑区均涵盖在经典频段中, 且相同的脑区变化趋势一致。与触发疼痛前比较, 脑干、左侧丘脑和右侧壳核的 dReHo 值在触痛后 5s 降低, 在触痛后 30min 升高, 右侧前扣带回的 dReHo 值在触发疼痛后逐渐升高。

结论: 1). CTN 患者经典频段多发脑区 sReHo 值发生改变; 2). 慢 2-慢 5 频段 sReHo 值发生变化的脑区与经典频段即有一定的差异又有重叠, 除慢 5 频段的左侧楔前叶, 余相同脑区的变化趋势一致; 3). dReHo 值和 sReHo 值发生变化的脑区不尽相同, 可对 sReHo 提供有益的补充。

PO-0317

增强型动脉自旋标记成像在帕金森病脑灌注损伤中的应用研究

王雪^{1,2}、伍雅婷^{1,2}、陆瑶¹、张洪英¹、尚松安¹、吴晶涛¹

1. 江苏省苏北人民医院影像科

2. 大连医科大学研究生院

目的: 探讨增强型动脉自旋标记技术(eASL)对细化帕金森病(PD)患者脑血流灌注损伤的研究价值以及其多参数灌注特征在疾病诊断中的分类效能。

方法: 通过 eASL 和常规 ASL 获取 PD 患者及健康对照(HC)的灌注数据, 并对纳入受试者进行临床资料采集。使用基于 MATLAB 平台的 SPM12 软件包进行脑血流量(CBF)及动脉通过时间(ATT)的数据解析, 获得灌注参数(eASL: 校正 CBF、ATT; 常规 ASL: 未校正 CBF), 采用双样本 T 检验比较灌注参数的组间差异, 并应用 Spearman 相关分析差异脑区灌注参数值与临床评分的相关性。进一步基于灌注特征向量构建机器学习模型, 以评估各分类模型对 PD 的诊断效能。

结果: eASL 与常规 ASL 的获取的 CBF 均能构建出 PD 相关脑代谢网络模式。与未校正 CBF 相比, 校正 CBF 更为精准地探及运动相关责任脑区的灌注损伤, 表现为 PD 患者右侧丘脑、双侧中央前回、左侧中央后回等脑区的灌注增高。同时 PD 组左侧额中回的 ATT 值缩短。PD 组左侧壳核、左侧中央前回及左侧中央后回校正 CBF 值、左侧壳核未校正 CBF 值与运动功能评分呈显著正相关($p=0.487$, $P=0.003$; $p=0.582$, $P<0.001$; $p=0.398$, $P=0.020$; $p=0.471$, $P=0.005$), 右侧角回校正 CBF 值、左侧额中回 ATT 值与认知功能评分呈正相关($p=0.403$, $P=0.018$; $p=0.465$, $P=0.006$)。校正 CBF 特征向量对 PD 的诊断表现出较高的分类效价(AUC 0.85), eASL 灌注特征向量的多参数联合模型进一步提升了分类效能(AUC 0.87)。

结论: eASL 技术能够细化地呈现 PD 患者灌注损伤的责任脑区, 同时补充性提供 ATT 的异常改变, 有助于较为系统地理解 PD 患者脑代谢损伤的内在机制; 且多灌注参数的结合较好地实现了分类效能的提升, 为推进 PD 的临床诊断提供一定的研究依据。

PO-0318

基于 DTI 的衍生扩散参数预测轻度认知功能障碍疾病进展: 一种列线图的构建及验证

舒震宇

浙江省人民医院

目的: 构建并验证一个结合扩散张量成像 (DTI) 的衍生参数和临床相关特征的列线图, 用于预测轻度认知障碍 (MCI) 患者向阿尔茨海默病 (AD) 的进展。

方法: 对 121 例 MCI 患者的 MRI 和临床资料进行回顾性分析, 其中 32 例在 4 年的随访期内进展为 AD。这些 MCI 患者按照 7:3 的比例被分为训练组和测试组。从训练集中的 MCI 患者中提取 DTI 衍生参数, 并降维以构建影像生物标志物。然后, 结合 MCI 疾病进展的独立预测因子, 构建联合模型并生成列线图。最后, 基于测试集的数据, 使用受试者操作特征的曲线下面积 (AUC) 和决策曲线分析 (DCA) 曲线来评估列线图的诊断和临床疗效。

结果: 训练集和测试集中影像生物标志物的 AUC 分别为 0.81 和 0.84, 敏感性分别为 0.87 和 0.78, 特异性分别为 0.71 和 0.81。多元逻辑回归显示影像生物标志物、临床痴呆评分量表和阿尔茨海默病评估量表被选为独立的预测因素构建列线图。训练集和测试集中列线图的 AUC 分别为 0.89 和 0.91, 敏感性分别为 0.78 和 0.89, 特异性分别为 0.90 和 0.88。DCA 曲线表明, 列线图是预测 MCI 向 AD 进展的最有价值的模型, 它具有更多的净效益。

结论: 白质纤维束的变化可作为 MCI 疾病进展的影像学预测标志, 结合白质 DTI 衍生参数和相关临床特征构建列线图对 MCI 疾病发展具有重要的预测价值。

PO-0319

缺血半暗带定位和预测急性缺血性卒中进展

冯天保

延安大学附属医院

目的在敏感性加权成像 (SWI) 上检测急性脑卒中患者的非对称性突出静脉 (APV) 可能预示脑灌注受损。目的: 探讨急性脑卒中患者 APVs 在识别缺血半暗带和预测卒中进展中的作用。方法 20 例在症状发作 24 h 内出现大脑中动脉缺血性梗死的患者, 按照包括弥散加权成像 (DWI) 的标准 MR 卒中方案成像序列进行 SWI。在初始 MRI 研究后至少 5 天获得随访 (FUP) FLAIR 图像。使用 Alberta 卒中程序早期 CT 评分 (ASPECTS) 分别确定初始 DWI、SWI 和 FUP 图像上的初始梗死面积、APV 范围和最终梗死面积。结果 10 例 DWI-SWI 不匹配患者中有 6 例发生 IG, 无 DWI-SWI 不匹配者发生 IG。阳性 DWI/SWI 错配与 IG 显著相关 ($2 = 8.57$, $p = 0.0138$, Cramer V = 0.65)。在 SWI ASPECTS 和 IGS 之间发现显著的负相关 ($rs = -0.702$, $p = 0.001$)。DWI-SWI 不匹配评分与 IGS 高度相关。($rs = 0.788$, $p = 0.000$)。结论 DWI-SWI 不匹配是缺血半暗带的一个指标, 如果不治疗, 是梗死扩展的预测因子。

PO-0320

MR 定量磁敏感图磁化率及纹理分析在评估帕金森病轻度认知功能障碍中的价值

赵义^{1,2}、瞿航¹、潘钰¹、刘姜冰²、李郑¹、王苇¹、胡春洪²

1. 扬州大学附属医院

2. 苏州大学附属第一医院

目的: 探讨基于脑 QSM 的磁化率及纹理分析评估 PD-MCI 的价值。方法: 纳入原发性 PD 患者 32 例 (PD 组), 分为 PD-MCI 组 16 例和 PD-NC 组 16 例, 招募 28 名健康志愿者为 HC 组。1. 比较 PD-MCI 组、PD-NC 组和 HC 组之间基于体素分析和基于 ROI 分析的 QSM 值的差异。2. 比较三组之间基于 ROI 分析的方差、峰度和偏度等纹理特征的差异。3. 采用 ROC 曲线分析 QSM 值、方差、峰度和偏度对 PD-MCI 的诊断效能。4. 分析 PD 组各 ROI 的 QSM 值与 MoCA-B 评分、UPDRS-III 评分之间的相关性。结果: 1. PD-MCI 组、PD-NC 组、HC 组之间基于体素的全脑 QSM 分析显示: 三组之间左侧海马旁回、黑质、红核等部位 QSM 值存在显著统计学差异。三组间基于 ROI 的 QSM 值分析显示: 黑质、红核、海马旁回、楔叶等部位 QSM 值 PD-MCI 组显著高于 HC 组; 海马的 QSM 值 PD-MCI 组显著高于 PD-NC 组和 HC 组; 眶额皮层、丘脑、壳核的 QSM 值 PD-MCI 组显著高于 PD-NC 组。2. 基于 ROI 的纹理分析显示: 三组之间的方差、峰度、偏度在黑质、内嗅皮层、丘脑、壳核、楔前叶、楔叶、尾状核头、眶额皮层等部位存在差异。3. 组间有差异的 ROI 中海马对鉴别 PD-MCI 和 PD-NC 具有最高的诊断效能。其中海马部位磁化率值联合纹理特征的 AUC 为 0.828 (P=0.002)。4. 相关分析显示: PD 组 QSM 值与 MoCA-B 评分呈负相关的 ROI 为黑质、红核、壳核、苍白球、海马和丘脑; PD 组 QSM 值与 UPDRS-III 评分呈正相关的 ROI 为壳核和杏仁核。结论: 1. 基于 QSM 的纹理分析能够定量评估 PD 大脑铁分布的特征。2. 海马部位联合磁化率值和纹理分析的指标对 PD-MCI 具有最优的诊断效能。3. 记忆、情绪等认知相关脑区的过量铁沉积可能是 PD-MCI 的神经病理机制。

PO-0321

多期 CT 血管造影对急性缺血性脑卒中血管内治疗短期预后的价值

张远、宋彬

复旦大学附属闵行医院

目的

分析急性缺血性脑卒中 (acute ischemic stroke, AIS) 患者的影像学特征和临床基线资料, 探讨 CT 血管造影对血管内治疗短期预后的价值。

方法

回顾性分析 2019 年 6 月至 2022 年 3 月复旦大学附属闵行医院接受血管内治疗的 AIS 患者 183 例。患者通过使用改良 Rankin 量表 (modified Rankin Scale, mRS), 分为预后良好 (mRS 0-2) 和预后不良 (mRS 3-6)。基于改良 Tan 评分系统评估多期 CTA 侧支循环状态。利用临床基线和影像学特征构建多变量逐步向前 logistic 回归模型。模型的性能通过曲线下面积 (area under curve, AUC) 评价。模型间 AUC 差异的统计重要性通过 DeLong 检验进行评估。

结果

183 例 EVT 患者中发病 90 天预后良好组 94 例, 预后不良组 89 例。逐步 Logistic 回归分析显示入院 NIHSS 评分和动脉晚期侧支循环是 AIS 患者短期预后的独立预测因素。动脉晚期侧支循环良好对 AIS 短期预后具有较高的特异性 (91.5%)。受试者工作特征曲线分析显示动脉晚期侧支循环良好

和入院美国国立卫生研究院卒中量表(National Institute of Health Stroke Scale, NIHSS)评分预测 AIS 患者血管内治疗短期预后良好的 AUC 分别 0.72 (0.65-0.79) 和 0.75 (0.68-0.81)。相比之下, 使用联合模型(AUC=0.79)时, AUC 显著高于单独预测因子。(Delong 检验, 均 $p < 0.05$)。

结论
动脉晚期侧支循环良好和入院 NIHSS 评分是 AIS 患者血管内治疗短期预后良好的独立预测因素。联合预测模型具有良好的诊断效能, 为临床治疗方案选择提供参考。

PO-0322

临床影像组学模型在预测急性缺血性脑卒中血管内治疗短期预后中的价值

张远、宋彬
复旦大学附属闵行医院

目的

探讨基于 CT 血管造影的影像组学特征预测急性缺血性脑卒中 (Acute Ischemic Stroke, AIS) 患者血管内治疗短期预后的价值。

方法

对 2019 年 6 月至 2022 年 3 月在复旦大学附属闵行医院连续接受血管内治疗的 159 例 AIS 患者进行回顾性分析。患者以 7:3 比例随机分为训练队列和验证队列。通过使用改良 Rankin 量表 (modified Rankin Scale, mRS), 对患者的功能恢复进行评估, 分为良好的预后 (mRS 0-2) 和不良的预后 (mRS 3-6)。由一名专门从事神经影像评估的团队成员使用开源的 ITK-Snap 分割软件(3.8.0 版本)手动勾画三维感兴趣区。采用 R 软件(4.2.0 版本)统计分析。通过采用最小的相关性和冗余度, 以及最小的绝对收缩有效地选择影像组学特征。通过多变量 Logistic 逐步回归法建立包含影像组学特征和临床参数的联合预测模型, 模型的可视化通过列线图实现。采用曲线下面积和拟合优度检验评价列线图的性能和稳定性。决策曲线分析估算临床有用性和净效益。

结果

最终筛选出 19 个系数非零的影像组学特征并构建影像组学分数模型, 训练队列和验证队列的曲线下面积分别为 0.79 (0.70-0.87) 和 0.70 (0.54-0.85)。联合影像组学分数和临床特征 (年龄、入院 NIHSS 评分、糖尿病、出院他汀) 构建的影像组学列线图模型在训练队列和验证队列的曲线下面积分别为 0.85 (0.77-0.92) 和 0.76 (0.62-0.91)。校准度在训练队列和验证队列分别为 $p = 0.35$ 和 $p = 0.18$ 。决策曲线分析显示良好的临床适用性。

结论

临床影像组学联合模型对预测 AIS 患者血管内治疗短期预后具有良好的诊断效能, 可为临床决策提供参考依据。

PO-0323

基于脑 MR 定量磁敏感图对帕金森病轻度认知功能障碍铁沉积协变网络特征的研究

赵义^{1,2}、瞿航¹、潘钰¹、刘姜冰¹、李郑¹、王苇¹、胡春洪²

1. 扬州大学附属医院
2. 苏州大学附属第一医院

目的: 基于 QSM 构建铁沉积协变网络, 探索 PD-MCI 脑铁沉积的协变网络模式重构特征。

方法:1. 纳入原发性 PD 患者 71 例 (PD 组), 将其分为 PD-MCI 组 37 例和 PD-NC 组 34 例, 比较 PD-MCI 组、PD-NC 组之间人口统计学和一般资料的差异。2. 采集所有被试的头颅 MRI 数据, 进行 QSM 图像重建, 构建铁沉积协变网络, 分析协变网络的连边、全局拓扑属性和节点拓扑属性。3. 比较 PD-MCI 组和 PD-NC 组之间的铁沉积协变网络连边的差异。4. 比较 PD-MCI 组和 PD-NC 组之间铁沉积协变网络的全局和节点拓扑属性的差异。

结果:1. 本研究 PD-MCI 组、PD-NC 组之间年龄、性别及病程、H-Y 分级、UPDRS-III“关”期评分等差异无统计学意义 ($P>0.05$)。两组间 MoCA 评分存在统计学差异 ($P<0.001$)。2. 铁沉积协变网络连边分析显示: PD-MCI 组在右侧苍白球-右侧小脑齿状核、右侧苍白球-左侧壳核以及左侧海马-左侧黑质的铁沉积协变相关系数值显著高于 PD-NC 组 (均 $P<0.05$)。3. 铁沉积协变网络全局拓扑属性分析显示: PD-MCI 组和 PD-NC 组间的全局网络属性无显著差异。当稀疏度为 0.047 和 0.048 时, PD-MCI 组的聚类系数显著高于 PD-NC 组 ($P<0.05$)。4. 铁沉积协变网络节点拓扑属性分析显示: PD-MCI 组在左侧黑质、左侧内嗅皮层、左侧楔前叶和左侧壳核的节点介数显著低于 PD-NC 组 (均 $P<0.05$); PD-MCI 组在左侧齿状核的节点度显著低于 PD-NC 组 ($P<0.05$); PD-MCI 组在右侧眶额皮层的节点效率显著高于 PD-NC 组 ($P<0.05$)。

结论:

1. PD-MCI 患者的铁沉积协变网络拓扑属性发生了次优的重组, 更加偏向于规则化网络。
2. 基于 QSM 协变网络异常拓扑属性的改变可能是 PD-MCI 在大尺度铁代谢网络水平的神经病理机制。

PO-0324

一种新颖的用于预测颅内动脉瘤破裂的临床-影像组学评分诺莫图

周治明、李文洁、吴小佳
重庆医科大学附属第二医院

目的:本研究旨在通过验证不同模型的预测能力, 寻找更实用、更有效的预测颅内动脉瘤破裂的方法。

方法:回顾性分析 576 例 IA 患者的临床和影像学资料, 其中破裂的 IA 192 例, 未破裂的 IA 384 例。通过 t 检验和 Elastic-Net 回归选择从计算机断层血管造影(CTA)图像中提取的放射组学特征。放射组学评分(radscore)采用最优特征。通过多元回归选择炎症生物标志物。然后建立 radscore 模型、炎症模型、临床模型和临床-radscore 模型(C-R 模型)4 个模型。采用受试者工作特征曲线(ROC)评价各模型、各阶段及 ELAPSS 的性能。C-R 图显示了预测 IA 破裂风险的模型。

结果:5 个炎症特征、2 个放射学特征和 7 个放射组学特征与 IA 破裂有显著相关性。训练组 radscore、炎症模型、临床模型和 C-R 模型的 roc 下面积分别为 0.814、0.935、0.970 和 0.975, 验证组为 0.805、0.927、0.952 和 0.962。

结论:炎症模型对 IA 破裂风险的预测效果特别好, 结合放射学和放射组学特征进一步提高了其预测能力, 其中 C-R 模型的预测效果最好。C-R 图是一种比 phase 和 ELAPSS 更稳定和有效的工具, 用于单独预测 IA 患者的破裂风险。

PO-0325

基于静息态 fMRI 对帕金森病不同运动亚型患者脑网络节点功能连接属性改变的研究

王敏、王建伟、刘俊、贾永锋、王杰
江苏省人民医院 (南京医科大学第一附属医院)

目的: 研究不同运动亚型帕金森病患者静息态功能磁共振的脑网络节点功能连接属性的变化特点及意义。

方法: 采集 77 例 PD 患者和 29 例健康对照者 (HC) 的静息态功能磁共振数据, PD 组根据统一帕金森病评定量表 (UPDRS) 相关评分分为震颤型 (TD) 43 例和姿势不稳/步态障碍型 (PIGD) 34 例。采用度中心度 (DC) 分析方法对所得数据进行分析, 观察不同亚型帕金森患者的脑网络节点功能连接属性变化, 通过协方差分析 (ANCOVA) 和 Post-Hoc t 检验进行组间比较。

结果: 与 HC 相比, TD-PD 患者双侧丘脑、双侧尾状核 DC 值升高; 双侧梭状回、双侧海马、双侧海马旁回、左侧眶额回、左侧额上回、左侧岛叶、左侧壳核、右侧颞下回、右侧额上回 DC 值减低; PIGD-PD 与 HC 相比, 右侧顶上/下小叶、左侧丘脑 DC 值升高; 左侧中央前/后回、左侧旁中央小叶、左侧枕中回、左侧缘上回、双侧辅助运动区、双侧扣带回 DC 值减低; TD-PD 与 PIGD-PD 相比, 双侧楔状叶、左侧楔前叶、双侧距状裂及其周围皮层、双侧辅助运动区、左侧中央前回、左侧旁中央小叶 DC 值升高; 左侧眶额回、左侧额中回、左侧背外侧额上回 DC 值减低。Pearson 相关分析发现, TD 评分与左侧壳核、左侧梭状回、左侧海马、左侧海马旁回 DC 值负相关, 未见明显正相关脑区。PIGD 评分与左侧辅助运动区、左侧颞中回 DC 值呈负相关, 未见明显正相关脑区。

结论: 两种亚型 PD 患者均存在默认网络相关脑区节点的 DC 减低, 不同亚型 PD 患者静息网络节点功能连接属性有着特异性的改变, TD-PD 患者的网络节点功能连接属性改变主要表现在基底节、丘脑等神经环路相关脑区, 而 PIGD-PD 患者则主要体现运动网络、视觉加工网络等相关脑区。静息态功能磁共振基于体素的度中心度功能连接分析方法为探索不同运动亚型 PD 患者的潜在发病机制提供了一种新的研究方法。

PO-0326

探讨脊膜瘤的少见及不典型 MRI 表现

赵本琦、郑卓肇
清华大学附属北京清华长庚医院

目的 探讨脊膜瘤的少见及不典型 MRI 表现。

方法 回顾性分析 102 例经病理确诊的脊膜瘤患者的首诊 MRI 资料。所有患者均行脊柱 MRI 平扫及增强检查。由 2 名资深放射医师对 MRI 资料进行评价, 包括肿瘤数目、大小、部位、生长方式、形态、信号及强化特点等。重点观察肿瘤是否存在跨椎间孔生长、多节段纵行生长、弥漫塑形性生长、银杏叶征等少见及不典型影像表现。将脊膜瘤典型 MRI 表现定义为发生于髓外硬膜下, 与硬脊膜关系密切的局限性占位, 增强扫描呈均匀明显强化伴或不伴脊膜尾征。

结果 102 例脊膜瘤中 94 例 (92.2%) 典型, 8 例 (7.8%) 不典型, 13 例 (12.7%) 出现少见银杏叶征象。8 例不典型脊膜瘤术前初步诊断时均误诊。不典型 MRI 表现主要为脊膜瘤生长方式不典型: 跨椎间孔生长呈哑铃状 4 例, 术前误诊为神经源性肿瘤; 多节段纵行生长 3 例, 术前误诊为脊髓胶质源性肿瘤; 弥漫塑形性生长 1 例, 术前误诊为淋巴瘤。出现少见银杏叶征象的 13 例脊膜瘤中, 8 例 (61.5%) 位于颈段椎管, 5 例 (38.5%) 位于下胸段椎管; 8 例位于脊髓左侧, 5 例位于脊髓右侧, 左右侧比例为 1.6:1。8 例生长方式不典型脊膜瘤中, 5 例 (62.5%) 出现特征性银杏叶征。

结论 不典型生长方式的脊膜瘤易被误诊, 注重脊膜瘤少见的特征性银杏叶征象, 有助于正确诊断。

PO-0327

基于体素内不相干运动扩散加权成像的影像组学列线图 预测脑胶质瘤 ATRX 基因状态

林雪瑶、董海波、王超超、郑金晶、刘梦茹、李明、徐洪彬
宁波市医疗中心李惠利医院

目的 构建基于体素内不相干运动扩散加权成像 (IVIM-DWI) 的影像组学列线图预测脑胶质瘤 α -地中海贫血/智力低下 x 连锁 (ATRX) 基因的状态。**资料与方法** 回顾性分析 2017 年 1 月至 2023 年 5 月 85 例手术病理证实的脑胶质瘤患者的常规 MR 和 IVIM-DWI 资料, 其中, 男 46 例, 女 39 例, 年龄 18~87 (55 \pm 15) 岁, ATRX 基因野生型 36 例, 基因突变型 49 例。以 7: 3 比例划分为训练集 (N=61) 和测试集 (N=24), 使用 3d-slicer 软件勾画胶质瘤的 ROI, 分别勾画的肿瘤实质区 (rCET)、水肿区 (rE) 及坏死区 (rNec), 投影到 D、D* 及 f 序列, 每个 ROI 中提取出 1037 个特征, 每个患者共计 3111 个特征。采用最小冗余最大相关性 (mRMR) 算法、最小绝对收缩和选择算法 (LASSO) 对提取的特征进行筛选, 建立 Logistic 回归影像组学模型, 纳入年龄计算 Radscore, 构建临床-影像组学组合模型, 生成 Nomogram 图, 分别建立 D、D*、f 参数 3 个模型。采用受试者工作特征 (ROC) 和决策曲线分析 (DCA) 评价 3 个模型的预测效果。**结果** D 参数模型在训练集的 AUC 值为 0.97 (CI: 0.93-1.00), 验证集为 0.91 (CI: 0.79-1.00), 高于 D* 参数模型 (0.90、0.82) 和 f 参数 (0.89、0.91), 差异有统计学意义。**结论** 基于 IVIM-DWI 的影像组学列线图能有效预测胶质瘤 ATRX 基因状态, 以 D 参数效能最高。

PO-0328

帕金森病执行控制网络对运动调节作用的动态功能连接研究

伍雅婷^{1,2}、王雪^{1,2}、陆瑶^{1,3}、李琰^{1,2}、尚松安¹、张洪英¹

1. 苏北人民医院影像科
2. 大连医科大学研究生院
3. 扬州大学

目的: 探讨帕金森病 (PD) 执行控制网络与运动相关脑网络间动态功能连接 (dFNC) 性的变化及其临床意义。**资料与方法:** 采集 50 例 PD 患者和 50 例健康对照静息态功能磁共振成像数据, 经独立成分分析法 (ICA) 提取执行控制网络、感觉运动网络、小脑网络和基底神经节网络, 基于滑动窗口相关法, 采用 k-means 聚类法识别可重复出现的瞬时功能连接模式, 评估各独立组分间的动态功能连接性变化, 然后计算 PD 患者 dFNC 时间特性与临床评分之间的关系。**结果:** 经动态分析得到 5 种重复出现的功能连接状态, 其中状态 2 和状态 3 发生率较高、停留时间更长, 呈现较为紧密的连接状态, 状态 1 的发生率较低、停留时间更短, 呈现较稀疏的连接状态。PD 患者和健康对照的执行控制网络与感觉运动网络、小脑网络和基底神经节网络间表现出 dFNC 强度的差异。此外, 状态 3 的 dFNC 时间特性与临床运动评分呈负相关。**结论:** PD 患者执行控制网络与运动相关脑网络间功能连接的变化及其时间变异性, 不仅证实了大脑网络连接模式的时变性和小脑参与 PD 的运动过程, 还说明高级别控制系统功能缺陷与 PD 运动症状的产生有关, 有助于进一步理解 PD 运动障碍发生的潜在机制。

PO-0329

16 例小脑胶质母细胞瘤影像及临床分析

赵小二、邓克学

中国科学技术大学附属第一医院 (安徽省立医院) 南区

【摘要】 目的 探讨少见部位小脑胶质母细胞瘤的临床及影像特征, 为其临床诊治提供参考。方法 回顾性分析本院 2016 年 5 月至 2023 年 5 月间经手术及病理证实的 16 例小脑胶质母细胞瘤患者资料, 男性 10 例, 女性 6 例, 年龄 36~79 (69±11) 岁, IDH 突变型 1 例, IDH 野生型 7 例, NOS 型 8 例。分析患者临床及影像特征、治疗和术后情况等。结果 临床主要表现为头痛、头晕、共济失调伴或不伴呕吐, 临床病程较短 (1 周~6 月)。16 例肿瘤位于小脑表面 6 例, 余位于小脑深部; 单发病灶 12 例, 其中 8 例位于右侧小脑半球, 3 例位于左侧小脑半球, 1 例位于小脑蚓部; 多发病灶 4 例位于双侧小脑半球。肿瘤最长径 24~46 (35.7±6.6) mm。CT 表现为 9 例稍低密度, 5 例伴出血呈混杂密度, 1 例位于小脑表面呈脑膜瘤稍高密度。MR 表现为肿瘤实性部分 T1WI 呈等或低信号, T2WI 呈等或稍高信号, 病变与瘤周水肿分界不清, 16 例均有不同程度囊变坏死, 5 例伴出血, 增强 4 例呈团块状强化, 12 例不均匀花环状强化, 9 例伴小脑纤维束播散, 2 例伴软脑膜转移。12 例瘤周轻度水肿, 5 例瘤周中度以上水肿。5 例患者术后联合放化疗, 6 月后多模态 MRI 随访, 4 例无复发, 1 例术后 1 年边缘少许复发。结论 发生于小脑的胶质母细胞瘤少见, 但肿瘤的不均质性, 花环状强化, 瘤界不清, 瘤周水肿较转移瘤轻, 多发病灶和沿小脑纤维束播散等特征, 可对其作出预期影像学诊断。手术切除加同步放化疗是目前主要的治疗方法。

PO-0330

多发性硬化症患者深层灰质核团的多模态研究及其临床相关性: 一项多变量模式分析研究

殷菲悦

重庆医科大学附属第一医院放射科

背景: 多发性硬化症 (MS) 患者的深部灰质 (DGM) 核受累, 并与临床症状密切相关。我们采用机器学习方法进一步探索多发性硬化症患者深部灰质核的微结构改变。

方法: 115 名多发性硬化症患者和 71 名健康对照组 (HC) 患者接受了脑磁共振成像检查。测量了各向异性分数 (FA)、平均扩散率 (MD)、定量易感值 (QSV) 以及尾状核 (CN)、普特门 (PT)、苍白球 (GP) 和丘脑 (TH) 的体积。基于机器学习算法的多变量模式分析被用于研究受损最严重的区域。局部相关分析用于研究 MRI 定量指标与临床神经评分之间的相关性。

结果: RRMS 组的 CN、PT、GP 和 TH 体积均低于 HC 组 (P 均 <0.001)。RRMS 组 CN、PT 和 GP 的 QSV 均高于 HC 组 (P 均 <0.05), TH 的 QSV 低于 HC 组 ($P < 0.001$)。RRMS 患者 CN 的 FA 低于 HC ($P < 0.001$), CN 的 MD ($P = 0.007$) 和 PT ($P = 0.020$) 高于 HC。基于 FA 的分类模型的曲线下面积为 0.83, 而基于 MD 和 QSV 的分类模型的曲线下面积分别为 0.93 和 0.81。蒙特利尔认知评估评分与 DGM 的体积相关, 扩展残疾状况量表评分与 GP 和 PT 的 MD 相关。

结论: 多发性硬化症患者 DGM 受累, 其中 CN 受累最严重。多发性硬化症患者 DGM 的萎缩主要影响认知功能, DGM 的微结构损伤主要与临床残疾相关。

PO-0331

急性轻度创伤性脑损伤的神经血管耦合异常研究

严家豪^{1,2}、黄文静^{1,2}、张静^{1,2}

1. 兰州大学第二医院

2. 兰州大学第二临床医学院

目的 探究急性轻度创伤性脑损伤 (mTBI) 患者神经元活动与相应脑血流量变化的关系。

材料和方法 纳入 32 例 mTBI 患者和 37 例匹配良好的健康对照患者。扫描 T1 结构成像、静息态功能成像和动脉自旋标记灌注成像。使用 DPABI_5.0 (<http://rfmri.org/dpabi>) 和 SPM_12 (<https://www.fil.ion.ucl.ac.uk/spm/software/spm12>) 工具包对数据进行预处理; 一方面, 将计算得到的低频波动幅度 (ALFF)、比率低频波动幅度 (fALFF)、脑血流量 (CBF) 值进行双样本 t 检验; 另一方面, ALFF、fALFF 值分别和 CBF 值进行相关性分析, 得到的 ALFF-CBF、fALFF-CBF 相关性系数再进行双样本 t 检验; 最后将五个影像学指标中有组间差异的脑区与神经心理症状得分进行相关性分析。上述分析均采用错误发生率 (FDR) 对结果进行多重比较校正。

结果 与 HC 组相比, mTBI 组的 ALFF 值在右侧梭状回明显升高 ($P < 0.05$), fALFF 值在右侧直回和舌回明显升高 ($P < 0.05$)。mTBI 组 ALFF-CBF 值在左侧额下回与数字跨度向前试验呈正相关 ($r = 0.056$, $P < 0.05$), 在右侧角回和左侧颞横回与数字跨度向前试验呈负相关 ($r = -0.046$, $P < 0.05$); fALFF-CBF 值在右侧枕颞外侧回与数字跨度向后试验呈负相关 ($r = -0.041$, $P < 0.05$), 在右侧上边缘回与数字跨度向后试验和 MoCA 总分呈负相关 ($r = -0.053$, $P < 0.05$)。对于 CBF 值, 二者无统计学意义 ($P > 0.05$)。

结论 两组患者的数字跨度向前、向后试验评分和 MoCA 评分普遍高于对照组。这表明, 患者受伤后的语言、信息处理和记忆能力有所下降。同样, 这也反映在大脑的异常区域, 如控制感觉、情绪、记忆的颞横回、额下回和枕颞外侧回, 以及控制语言功能的角回和边缘上回。未来, 神经心理学评估和神经血管生物标志物可以结合起来监测治疗效果和认知障碍的进展。

PO-0332

QSM 联合 NODDI 研究帕金森患者脑铁沉积及微观结构变化特点

丁爽、蒋爽、阿卜杜热合曼·阿卜力米提

新疆医科大学第一附属医院

目的: 采用定量磁敏感图及神经突方向离散度与密度成像探讨 PD 患者脑内铁沉积量与微结构随疾病进展的演变规律及其两者之间的关系。方法: 研究对象为 41 例 PD 患者 (PD 组) 并根据 Hoehn-Yahr 分级分为早期 PD 组 (PD-1) 和中晚期 PD 组 (PD-2) 以及 23 名健康对照组 (HC 组)。所有受试者进行 QSM 及 NODDI 序列扫描获得感兴趣区定量磁敏感值及 NODDI 相关参数值。采用单因素方差分析比较三组铁沉积量差异, 采用 Spearman 相关系数分析 QSM 与 NODDI 各参数间的相关性。结果: 与对照组相比, 多个核团存在不同程度的 Vic 值、Viso 值、ODI 值的降低及铁沉积量的异常升高。早期 PD 组中, 黑质及红核的 ODI 值、苍白球的 ODI 值及 Viso 值与对应核团的定量磁敏感值之间存在相关性 ($r = -0.532$, $P = 0.016$; $r = 0.514$, $P = 0.020$; $r = -0.516$, $P = 0.020$, $r = -0.479$, $P = 0.033$); 而中晚期 PD 组中, 壳核的 Vic 值、苍白球的 Vic 值及 ODI 值与对应核团的定量磁敏感值之间存在相关性 ($r = 0.610$, $P = 0.003$; $r = 0.575$, $P = 0.006$; $r = 0.508$, $P = 0.019$)。结论: 随着 PD 的病程进展, PD 患者脑内存在铁沉积量异常及微观结构改变, 且两者之间具有一定的相关性。

PO-0333

基于动脉自旋标记技术探讨原发性痛经患者脑血流量的研究

樊丽华、张聪、马萧童、魏伟、郑运松
陕西中医药大学附属医院

目的 采用基于体素的形态学方法 (voxel-based morphometry, VBM) 及动脉自旋标记 (ASL) 技术, 探讨原发性痛经(primary dysmenorrhea, PDM)患者的脑血流量变化, 及其与临床量表评分进行相关性分析。方法 前瞻性纳入 31 例 PDM 患者和 32 例健康对照者, 在月经期第 1-3 天进行高分辨率 T1 结构像及全脑 ASL 扫描, 并采用疼痛视觉模拟量表 (VAS)、COX 痛经症状量表 (CMSS)、焦虑自评量表 (SAS)、抑郁自评量表 (SDS) 进行临床症状评估。采用 VBM 方法, 基于 Matlab 平台的 SPM8 软件的双样本 t 检验分析两组间脑血流量 (CBF) 有显著差异的脑区, 再采用 Pearson 相关性分析, 观察脑血流量差异脑区的 CBF 值与 VAS、CMSS、SAS、SDS 量表评分之间的相关性。结果 PDM 组与健康组在年龄、VAS、CMSS、SAS、SDS 量表评分的差异均有统计学意义 ($P<0.05$)。与健康对照组相比, PDM 组脑血流量增高的脑区主要包括左侧岛盖部额下回、左侧三角部额下回, 脑血流量减低的脑区包括右侧眶部额上回、右侧眶部额中回 ($P<0.001$, 团块水平 FDR 校正, $k\geq 60$)。相关性分析结果显示左侧三角部额下回 CBF 值与 VAS、CMSS 量表评分存在正相关。结论 基于 ASL 技术及 VBM 方法能够评估原发性痛经患者的脑血流灌注水平, 这些脑血流量改变的脑区主要位于痛觉传导通路, 为原发性痛经患者的诊治提供有价值的信息。

PO-0334

MR 总负荷评分联合 AI 脑分割对脑小血管病变相关的
认知障碍研究

梁佳欣^{1,2}、常卓然¹、李延静²
1. 延安市人民医院
2. 延安大学

目的: 基于 MR 总负荷评分联合 AI 脑分割对脑小血管病变 (cerebral small-vessel disease, CSVD) 相关的认知障碍研究, 旨在将脑萎缩也纳入 CSVD 负荷中, 为 CSVD 患者的认知障碍提供更全面、有价值的预测模型。

方法: 收集延安市人民医院 2022 年 3 月-2023 年 8 月的 179 例 CSVD 患者, 根据蒙特利量表 (MOCA-B) 将患者分为有无认知障碍两组。根据《中国脑小血管病诊治专家共识 2021》标准进行 CSVD 总负荷评分, 利用人工智能脑分割对脑体积进行定量分析, 采用卡方检验、独立样本 t 检验或 Mann-Whitney U 检验比较两组间的临床及影像指标差异。采用二元 Logistic 回归分析得出与认知有关的独立危险因素。建立对于 CSVD 患者认知障碍的影像预测模型。

结果: 两组之间年龄、教育年限、有无高血压、既往中风史、中心粒细胞计数、腔隙灶 (LAC)、微出血灶 (CMB)、白质高信号 (WHM)、CSVD 总负荷评分及脑脊液相对体积有显著差异 ($p<0.05$), 其中教育年限、CSVD 总负荷评分与脑脊液相对体积是有无认知障碍的独立危险因素 ($p<0.05$)。CSVD 与脑脊液联合的影像预测模型较单个影像模型效能更好, ROC 曲线面积 (area under the curve, AUC) $AUC=0.844$ (95%CI:0.772~0.875), 临界值 0.72, 敏感性 0.667, 特异性 0.887, 具有较高的预测价值。

结论: 相较于单个负荷而言, CSVD 总负荷评分联合脑体积定量分析对于 CSVD 患者认知障碍的评估更全面, 更有预测价值。

PO-0335

基于 MRI 影像组学和机器学习的急性前循环非腔隙性梗死预后预测的研究

周翔、魏来、张康微、孟瑾茜、王培军
上海市同济医院

目的急性前循环非腔隙性梗死 (AACNLI) 预后预测对该疾病的临床精准治疗意义重大。本研究旨在研发 AACNLI 预后预测模型, 探究导致预后不良的危险因素, 以提高该疾病疗效和整体预后。

材料与方法回顾性采集 372 例 AACNLI 住院患者的临床、影像、随访数据, 预后二分类参照 90d 改良 Rankin 量表。使用标注工具在 DWI 上分割缺血性脑卒中灶, 获得掩模 DWI、ADC、ADC620, 从 DWI、ADC、T2-FLAIR 抑脂图像中提取掩模的影像组学特征, 使用 12 种特征降维算法进行影像组学特征选择, 分别基于临床+传统影像变量和临床+传统影像+影像组学变量构建 9 种机器学习模型, 计算特征降维-机器学习算法组合的 AUC, 评价预后预测模型效能并验证。

结果在训练集和测试集 247 例 AACNLI 患者中, 预后良好 132 例, 预后不良 115 例, 两组在性别、年龄、吸烟史、冠脉硬化史、房颤史、心衰史、高脂血症史、卒中相关性肺炎 (SAP)、收缩压、TOAST 分型、OCSP 分型、入院 NIHSS、入院 GCS、发病 7d 内 NIHSSmax、CRP、D 二聚体、血糖、BNP、血栓负荷评分、DWI-ASPECTS 指标存在统计学显著差异。训练集中临床+传统影像+影像组学变量的特征降维与分类算法组合, 最小绝对收缩和选择算子-随机森林 (RF) 算法组合在三种掩模的 AUC 分别为 0.98、0.99、0.98, AUC 排序秩次总和最小, 表现最好。在三种掩模的 RF 模型中, 7d 内 NIHSSmax、卒中相关性肺炎、入院 GCS 位列预后预测模型特征值的前三位。

结论基于临床+传统影像+影像组学特征的 RF 模型能准确预测 AACNLI 发病 90 天预后, 7d 内 NIHSSmax、SAP、入院 GCS 是预后预测模型最重要的三个特征。基于掩模 ADC620 的 RF 模型 AACNLI 预后预测效能最好, 有助于筛选出预后不良的高风险患者, 明确预后不良的危险因素, 为临床精准治疗提供重要依据。

PO-0336

DWI 联合 3D-ASL 技术评估胶质瘤 IDH-1 突变状态

韩蕾、董燕、马鸣岳、裴彩侠、张巧莹、刘晓岚、郭小平
西安市中心医院

目的: 本研究旨在探讨扩散加权成像 (Diffusion Weighted Imaging, DWI) 联合三维动脉自旋标记 (3D Arterial Spin Labeling, 3D-ASL) 技术在评估脑胶质瘤异柠檬酸脱氢酶-1 (Isocitrate Dehydrogenase 1, IDH-1) 突变状态的应用价值。

方法: 回顾性分析我院手术病理证实的 36 例脑胶质瘤患者的临床及影像学资料, 其中 IDH-1 突变型 16 例, IDH-1 野生型 20 例。所有患者均行常规磁共振平扫、增强序列、DWI 及 3D-ASL 检查。测量并分析平均表观扩散系数 (Mean Apparent Diffusion Coefficient, ADCmean) 和平均脑血流量 (Mean Cerebral Blood Flow, CBFmean), 数据标准化后使用相对平均表观扩散系数 (Ratio of ADC, rADC) 和相对平均脑血流量 (Ratio of CBF, rCBF) 比值进行统计分析。

结果: ①IDH-1 野生型胶质瘤 rADC 值 (1.12 ± 0.17) 显著低于突变型胶质瘤 rADC 值 (1.25 ± 0.16), 差异具有统计学意义 ($t=2.456$, $P<0.05$); ②IDH-1 野生型胶质瘤 rCBF 值 (2.29 ± 0.16) 显著高于突变型胶质瘤 rCBF 值 (2.03 ± 0.21), 差异具有统计学意义 ($t=-4.003$, $P<0.05$)。

结论: DWI 联合 3D-ASL 技术可作为一种评估脑胶质瘤 IDH-1 突变状态的新方法。

PO-0337

斜坡颅咽管瘤 1 例

刘芮杉、王露、廖娟、李宏伟、卓丽华
绵阳市第三人民医院

颅咽管瘤是一种生长缓慢的良性肿瘤，一般起源于鞍上，累及鞍下的占少数。从病理假说来看，有学者认为颅咽管起源于口腔外胚层，在胚胎发育早期外胚层向上凹陷形成 Rathke 囊，并随着蝶骨以及蝶鞍的发育在胚胎发育时期退化消失，所以颅咽管瘤可以发生在这一路径上的任何位置。有学者认为鞍下颅咽管瘤常涉及的区域包括鼻咽、鼻腔以及蝶窦、筛窦、上颌窦，而发生于斜坡的颅咽管瘤十分少见，目前国内报道中斜坡颅咽管瘤仅 5 例，但局限在斜坡的病例报告之前并未发现。因此我们在此报告了一例仅累及斜坡的颅咽管瘤，并对它其展开鉴别诊断。

PO-0338

无先兆偏头痛患者自发脑活动动态中异常的一致性： 多变量模式分析研究

陈义磊、陈慧、康英杰、杨玉婵、龚志刚、黄炎文、王辉、詹松华、谭文莉
上海中医药大学附属曙光医院

目的：静态和动态自发脑活动的变化已广泛应用于探索无先兆偏头痛（MwoA）患者脑功能改变。然而，MwoA 患者自发脑活动动态中一致性的变化仍然大部分未知，本研究旨在确定基于一致性指数进行 MwoA 严重程度的诊断和预测的可能性。材料和方法：第一组包括 32 名 MwoA 患者和 33 名匹配的健康对照组（HCs），验证组包括 36 名 MwoA 患者和 32 名 HCAs，进行了静息态 fMRI 扫描。计算了这些动态指标的体积级和体素级一致性，并基于支持向量机进行了多体素模式分析（MVPA），从 MVPA 结果中得到的脑区用于进一步的关联向量回归分析。结果：与 HCAs 相比，MwoA 患者的整个灰质体积级一致性较低，体积级一致性的平均值与偏头痛发作频率呈负相关。MVPA 结果显示，最具鉴别性的脑区为右侧丘脑、右侧小脑 Crus II、左侧岛叶、左侧前中央回、右侧楔状回和左侧枕上沟回。此外，体素级一致性的变化可以预测偏头痛发作频率。讨论：我们的结果表明，在脑区自发脑活动动态中的一致性变化可能是识别 MwoA 患者的重要特征，并具有预测个体严重程度良好潜力的。

PO-0339

慢性腰背痛中小脑到运动皮质的有效连接改变： 一项基于多变量模式分析和频谱动态因果建模的研究

陈义磊、陈慧、康英杰、龚志刚、黄炎文、王辉、詹松华、谭文莉
上海中医药大学附属曙光医院

本研究使用基于静态和动态低频振幅分数（fALFF）分析的多体素模式分析（MVPA）和频谱动态因果建模（spDCM），探索慢性腰背痛（cLBP）中疼痛知觉的中枢处理机制。第一组包括 32 名 cLBP 患者和 29 名匹配的健康对照组（HCs），验证组包括 24 名 cLBP 患者和 22 名 HCAs，均进行了静息态 fMRI 扫描。将静态和动态 fALFF 的改变作为分类特征，区分 cLBP 患者和 HCAs。从 MVPA 结果中得到的脑区用于进一步的 spDCM 分析。我们发现，最具区别性的脑区，即有助于分类的脑区，包括右侧辅助运动区（SMA.R）、左侧副中央小叶（PCL.L）和双侧小脑 Crus II。随后，spDCM 结果显示，与 HCAs 相比，cLBP 患者的双侧小脑 Crus II 对 PCL.L 的兴奋性定向影响减弱，而从兴奋性定向影响转变为抑制性定向影响，且有效连接强度在中国式 Oswestry 腰椎功能障碍指

数问卷 (C-SFODI) 得分上呈现部分中介效应。我们的研究表明, 小脑及其与运动皮质之间减弱或抑制性的连接可能是 cLBP 疼痛知觉的潜在中枢处理机制, 并部分介导了功能障碍程度。

PO-0340

基于弥散张量成像的首发未治疗抑郁症患者 脑白质网络的初步研究

周宏伟
吉林大学第一医院

目的: 基于弥散张量成像 (DTI) 技术和图论探讨首发未治疗抑郁症患者大脑白质网络全局和局部拓扑属性的改变, 从脑白质网络的角度来寻找首发未治疗抑郁症的影像学标志, 进而深入探讨抑郁症发病的神经病理学机制。

方法: 本研究纳入了 2022 年 01 月至 2023 年 04 月在吉林大学第一医院心理卫生科及神经内科确诊为抑郁症的门诊患者 30 例, 均为首发未治疗。选正常受试者 21 例。所有患者的诊断均符合 DSM-V 抑郁诊断标准。入组患者的 HAMD-17 评分均大于等于 14 分。采用 PHILIPS 3.0T MRI 对受试者行 T1 像和 DTI 的图像采集。对 DTI 数据进行预处理; 以 AAL 将大脑分为 90 个脑区, 基于 PANDA, 使用确定性纤维追踪算法构建大脑白质网络; 最后使用基于 MATLAB 2013b 的 Gretna 对脑白质网络的拓扑属性指标进行计算。使用 Shapiro-Wilk 法检验两组一般临床资料和拓扑属性指标的正态性。首先用 SPSS 25.0 对全局、局部属性指标进行两组组间差异比较, 当 $P < 0.05$ 时, 认为差异有统计学意义。对于节点属性指标, 为了控制假阳性率, 进行 FDR 多重比较校正。

结果 (1) 两组受试者的脑白质网络均存在小世界属性, 抑郁症组的聚类系数 ($P = 0.007$) 和网络局部效率 ($P = 0.008$) 减低。(2) 首发未治疗抑郁症患者在右侧眶部额下回 ($P = 0.011$)、左侧枕中回 ($P = 0.002$) 节点聚类系数减低; 右侧眶部额下回 ($P = 0.012$) 节点局部效率减低。

结论: (1) 与健康对照组相比, 首发未治疗抑郁症患者的脑网络的全局和局部拓扑属性部分发生了改变, 提示首发未治疗抑郁症患者的局部脑网络出现了异常改变, 而全局网络有所保留。(2) 首发未治疗抑郁症患者右侧眶部额下回的节点聚类系数、节点局部效率和左侧枕中回的节点聚类系数有异常, 提示该脑区与抑郁症的发生有关。

PO-0341

分辨率磁共振血管壁成像在原发性中枢神经系统 血管炎中的诊断价值

周宏伟
吉林大学第一医院

目的: 通过分析原发性中枢神经系统血管炎 (PACNS) 在高分辨率磁共振血管壁成像 HR-VWI) 中的影像学特点, 并与 MRA 进行比较, 探索 HR-VWI 在 PACNS 中的诊断价值。

方法: 我们分析了 2018 年 1 月至 2022 年 12 月就诊于吉大一院神经内科的 PACNS 患者 18 例。所有患者均行 3.0T 磁共振 T1WI、T2WI、MRA 及 HR-VWI (平扫+增强) 检查。所有的检查结果由两位经验丰富的神经放射科医师和神经科医师进行判读及分析。数据均采用 SPSS21.0 进行统计学分析。计数资料用百分比表示, 两组间比较采用卡方检验。设定 $P < 0.05$ 表示有统计学意义。

结果: 18 例患者共 162 条大中血管, 包括双侧大脑前、中、后动脉、双侧椎动脉、基底动脉。HR-VWI (平扫+增强) 显示共 47 条大、中血管 (29.0%) 受累, 其中前循环 24 条 (14.8%), 后循环 23 条 (14.2%), 表现为受累血管管壁均匀、向心性增厚伴强化。而 MRA 只显示出 23 条

(14.2%)大、中血管受累,其中前循环 16 条(9.9%),后循环 7 条(4.3%),表现为相应血管管腔不同程度狭窄。MRA 阳性的 23 条血管在 HR-VWI 中也均为阳性。HR-VWI 的阳性检出率高于 MRA,差异具有统计学意义($P<0.05$)。

结论:HR-VWI 可以直接显示血管壁及管腔的情况,对 PACNS 的诊断具有重要价值,主要表现为受累血管管壁弥漫、均匀、向心性增厚伴强化。相比于传统的血管成像方法,如 MRA 等,HR-VWI 对异常血管的检出率更高,可以为 PACNS 的检测和诊断提供更全面的信息。因此,当临床怀疑 PACNS 时,应及时进行 HR-VWI 检查。

PO-0342

基于 VBM 及静息态 fMRI 对首发未治疗 抑郁症患者脑功能磁共振研究

周宏伟
吉林大学第一医院

目的:运用基于体素的形态学分析方法(VBM)探究首发未治疗抑郁症患者的脑灰质体积变化,并以差异脑区作为种子点,分析全脑与其功能连接状态,探讨抑郁症脑灰质结构改变与脑功能连接之间的联系。

方法:抑郁症患者组病例选取 2020 年 8 月至 2022 年 10 月期间吉大一院神经内科门诊及心理卫生门诊的病患 30 例,均为首发未治疗。对照组选取健康者 22 例。患者符合 DSM-V 诊断标准,同时 HAMD ≥ 7 分。使用 PHILIPS 3.0T MRI 对受试者行 T1WI 及静息态脑功能磁共振成像(Rs-fMRI),行 VBM 分析,探究患者组灰质体积变化,对处理后的数据采取 AlphaSim 校正,当 $P<0.05$, cluster size >45 时认为差异有统计学意义,从而得到患者组内脑灰质体积发生变化的脑区。以上述脑区为种子点,采用 Rs-fMRI 方法,探究种子点与全脑的功能连接状态,对处理后的数据采取 FWE 校正,当 $P<0.05$, cluster size >201 时认为差异有统计学意义,从而显示抑郁症患者脑内功能连接值增强或减弱的相关脑区。

结果:(1)VBM 表明首发未治疗的抑郁症患者组灰质体积减小的脑区为:左侧颞中回、右侧岛叶、左侧枕上回、右侧背外侧额上回。(2)以右侧岛叶为种子点,发现首发未治疗的患者组脑内存在与该种子点功能连接增强的脑区为:内侧额上回和楔前叶。其他种子点未发现链接增强或减弱的脑区。

结论:(1)首发未治疗的抑郁病人灰质体积减小的脑区主要涉及额颞枕叶及岛叶,表明抑郁症的发生与多个脑区相关。(2)Rs-fMRI 发现患者组中功能连接状态发生改变脑区均属默认网络的重要组成部分,表明了默认网络对抑郁症有着重要作用。(3)脑灰质体积改变的脑区同时存在脑功能连接异常,表明脑结构与脑功能的异常在抑郁症的发生中相互作用。

PO-0343

基于 4D Flow MRI 成像技术的颅内静脉系统 血流动力学状态的初步研究

周宏伟
吉林大学第一医院

目的：通过四维血流磁共振成像技术（4D Flow MRI）研究正常颅内静脉系统与伴随颅内压升高时静脉窦血栓（CVST）和特发性颅内高压（IIH）患者的血流动力学特征。

方法：纳入 2022 年 10 月至 2023 年 2 月吉大一院神经内科收治的高颅内压 CVST 和 IIH 患者 17 人（9 名 CVST+8 名 IIH 患者），纳入健康志愿者 14 人。均行 MRV 及 3D T1 VISTA 检查。因部分难以捕获血流信号，共 13 人（7 名 CVST+6 名 IIH 患者）4D Flow MRI 有效。用 SPSS 22.0，设定 $P<0.05$ 时有统计学意义。

结果：1、4D Flow MRI 显示健康者颅内静脉为层流。血流速度沿上矢状窦逐渐增加，且右侧血流参数值高于左侧。2、CVST 患者通过 4D Flow MRI 可以观察到血流复杂紊乱。血流动力学参数随脑脊液压力变化，呈负相关但无线性关系，较正常人低。CVST 患者血管再通后可见层流血流，且血流参数较复查前明显增加。3、IIH 患者的 4D Flow MRI 显示狭窄处的峰值速度及最大压力梯度大于上游，可见高速红色流线。狭窄下游的血流参数值较高可见射流样血流，狭窄附近可见同心圆样紊乱涡流。IIH 患者组参数均高于对照组，且跨狭窄处的峰值速度、最大压力梯度在两组间存在统计学差异（ $p<0.05$ ）。尽管上述指标与脑脊液压力无线性关系，但呈负相关。

结论：1、正常颅内静脉系统血流模式为层流，且右侧血管的参数值高于左侧，证明了存在优势引流。3、CVST 患者血流模式复杂，血流动力学参数低于正常人，且与颅内压负相关，血管再通后近似恢复正常。4、IIH 患者狭窄处及狭窄下游可见射流样血流，狭窄附近可见涡流。存在病理性压力梯度的 IIH 患者，跨狭窄处峰值速度、最大压力梯度数值均高于正常人，且与颅内压呈负相关。

PO-0344

磁共振多延迟动脉自旋标记技术对椎- 基底动脉扩张延长症患者脑血流灌注分析

于洪伟、谢晟
中日友好医院

目的：比较椎-基底动脉扩张延长症（VBD）患者和健康志愿者脑血流灌注的差异；分析颅外颈内动脉、椎动脉血流速度是否会引起颅内血动力学变化；预测 VBD 患者后循环缺血性卒中发生的风险因素。

方法：本研究于 2021 年 1 月至 2022 年 1 月纳入中日友好医院放射科 32 名 VBD 患者。所有患者由 MRA 诊断为椎-基底动脉迂曲或扩张。同时招募 32 名健康志愿者作为对照组。所有受试者均行多延迟动脉自旋标记（multi-delay-ASL）技术扫描及颅外颈内动脉、椎动脉多普勒超声检查。应用 CereFlow 软件对数据进行后处理，获得平均脑血流量（mCBF）、动脉脑血容量（aCBV）和动脉到达时间（ATT）等脑灌注参数。采用独立样本 t 检验比较两组之间前循环（额叶、顶叶和脑岛）和后循环（枕叶、小脑）的差异。使用 t 检验比较两组之间颅外颈内动脉、椎动脉的收缩期峰值速度（PSV）、舒张末期速度（EDV）、平均收缩期峰值速度（mPSV）和平均舒张末期速度（mEDV）。应用多元线性回归分析两组中影响 mCBF 的危险因素。采用受试者特征曲线（ROC）预测 VBD 患者后循环缺血卒中发生可能性。

结果：病例组前、后循环的 mCBF 及 aCBV 均低于对照组；除双侧岛叶外 ATT 显著长于对照组（ $P<0.05$ ）。除椎动脉 mEDV 外颅外颈内动脉、椎动脉的血流速度在对照组和病例组之间存在显

著差异 ($P<0.05$)。在 VBD 患者中,椎动脉的 mPSV、mEDV 分别与枕叶和小脑的 mCBF 具有显著相关性 ($P<0.05$)。而在前循环中颈内动脉 EDV、颈内动脉 PSV 以及岛叶 ATT 分别与额叶、顶叶和岛叶 mCBF 具有相关性。在 VBD 患者中双侧枕叶及小脑 ATT 是预测后循环缺血性卒中的因素。

结论: VBD 导致前、后循环区域灌注不足,双侧枕叶及小脑 ATT 延长可预测后循环缺血性卒中发生。颅外血流可能会影响 VBD 患者后循环的颅内血流动力学状态。

PO-0345

磁共振波谱成像在急性颈内动脉闭塞模型大鼠中的应用

叶浩翔¹、刘思齐²、伍志华¹、刘志锋¹

1. 广州医科大学附属第四医院(广州市增城区人民医院)

2. 中山大学附属孙逸仙纪念医院

目的

探讨磁共振波谱(magnetic resonance spectroscopy, MRS)成像在急性颈内动脉闭塞模型大鼠中早期诊断的可行性。

方法

将 15 只大鼠随机分为假手术组 (SHAM=5)、缺血 2 小时模型组 (CI2H=5) 与缺血 12 小时模型组 (CI12H=5), 模型组采用急性颈内动脉闭塞法建立大鼠缺血模型, 模型制备成功后分别于 2 小时、12 小时进行扩散加权成像与 MRS 扫描。测量三组大鼠的表观弥散系数、N-乙酰天门冬氨酸, 肌酸, 胆碱, 乳酸, 肌醇、脂质, 谷氨酰胺、谷氨酸、 γ -氨基丁酸组合, 并对三组大鼠大脑石蜡标本进行胞质紧密黏连蛋白 1 抗体、神经元特异性烯醇化酶、S-100 β 蛋白、细胞色素 C, 免疫组化检测, 并将有意义参数与 ZO-1、NSE、S-100 β 蛋白、CytC 进行 Spearman 相关性分析。

结果

CI12H 组 NAA 明显低于 SHAM 组与 CI2H 组 ($P<0.05$), SHAM 组 NAA 与 CI2H 无差异, 三组大鼠的 NAA 与 NSE 呈负相关 ($r=-0.800, P<0.001$); CI12H 组 Cho 明显高于 SHAM 组与 CI2H 组 ($P<0.05$), SHAM 组 Cho 与 CI2H 无差异, 三组大鼠 Cho 与 S-100 β 呈正相关 ($r=0.822, P<0.001$); SHAM 组 Lip 明显低于 CI2H 组 ($P<0.05$), 与 CI12H 组无差异, 三组大鼠 Lip 与 ZO-1 呈负相关 ($r=-0.768, P<0.001$); SHAM 组 Lac 明显低于 CI2H 组与 CI12H 组 ($P<0.05$), 三组大鼠 Lac 与 CytC 呈正相关 ($r=0.801, P<0.001$); CI12H 组右侧脑 ADC 值低于 SHAM 组 ($P<0.05$)、与 CI2H 组无差异。

结论

大鼠在 AICAO 发病 2 小时已出现 Lac、Lip 的异常变化, 早于 NAA、Cho、ADC 值的改变, RMS 扫描能早期发现 AICAO 大鼠大脑的物质改变, 能早于 DWI 发现急性缺血性脑卒中的发生, 对未来研究 DWI 阴性的 AICAO 提供新的无创性检测方法。

PO-0346

椎管内黏液乳头型室管膜瘤的 MRI 征象分析

刘春华、毛怡、杨倩、肖钦

陆军军医大学大坪医院

目的: 探讨椎管内黏液乳头型室管膜瘤的 MRI 征象, 提高本病术前影像诊断水平。方法: 回顾性分析本院经手术病理证实且影像资料及手术记录完整的 15 例黏液乳头型室管膜瘤的临床资料及影像表现。结果: 15 例黏液乳头型室管膜瘤均为单发病灶, 8 例位于腰 2 椎体附近, 15 例肿瘤呈中心性纵向生长, 平均长径为 (5.14 ± 2.92) cm, 13 例表现为规则的长椭圆形, 1 例表现为短椭圆形, 1

例形态不规则,对椎管后方骨质压迫、吸收呈“扇贝样”改变,但未累及椎间孔。12 例肿瘤与脊髓圆锥或马尾终丝分界不清,3 例对脊髓圆锥或马尾终丝推移。T1WI 平扫 14 例呈等信号(参照脊髓灰质),1 例呈低信号。T2WI 平扫 14 例为高信号,1 例为完全低信号,14 例肿瘤内部或边缘可见点状、条状及斑片状低信号,有 8 例肿瘤头端或尾端表现为“帽征”,且全部为马尾终丝区的肿瘤。5 例肿瘤内部可见囊变,2 例尾端囊变。T1WI 增强 15 例肿瘤实体均明显强化,10 例肿瘤表现为“蜂窝状”强化,1 例肿瘤 T2WI 显示为完全低信号,增强后环形强化。结论:椎管内黏液乳头型室管膜瘤在 MRI 上具有一定的特征性,结合临床资料,能提高术前诊断的准确性。

PO-0347

基于多组学因素的颅内动脉瘤破裂风险深度学习 预测模型的建立与验证:多中心队列研究

米热扎提·吐尔洪、杨新健
首都医科大学附属北京天坛医院

摘要:颅内未破裂动脉瘤是一种较为常见,并且严重危及生命的疾病。随着影像学检查技术的进步以及全民健康意识的提高,越来越多的无症状颅内未破裂动脉瘤在破裂前被发现。颅内未破裂动脉瘤的早期管理依赖于尽早识别其中破裂风险或生长风险较高的不稳定动脉瘤,并对其进行及时手术治疗是颅内未破裂动脉瘤诊治过程中关键步骤。近年兴起的人工智能领域中的机器学习算法的应用已经有效的解决以上困难,但仍存在预测效能不足及外部验证缺乏。此外,人工智能领域的影像组学属于一个新开发的新兴分支,在神经系统及循环系统疾病中已被证实预测预后方面有重要作用。除此之外,深度学习算法技术在最近的研究中也被证实对比于传统统计学方法和机器学习算法来说,有着更准确的预测能力及数据处理能力。

方法:纳入 2014 年 1 月至 2018 年 12 月在中国两家医院经数字减影血管造影证实的颅内动脉瘤患者 1740 例(共 1809 个动脉瘤)。我们将数据集(医院 1)随机分为训练(80%)和内部验证(20%)。外部验证使用从医院 2 收集的独立数据进行。通过 logistic 回归基于临床、动脉瘤形态学和影像组学参数建立预测模型。此外,还建立了基于组合的多维度参数的深度学习模型预测颅内未破裂动脉瘤的破裂风险,并与其他模型进行了比较。

结果:逻辑回归模型 A(临床)、B(形态学)、C(影像组学)的 AUC 分别为 0.678、0.708、0.738(P 均<0.05)。组合多维度特征模型 D(临床和形态学)、E(临床和影像组学)、F(临床、形态学和影像组学)的 AUC 分别为 0.771、0.839、0.849。深度模型(AUC=0.929)优于机器学习(AUC=0.878)和逻辑回顾模型(AUC=0.849)。此外,深度模型在外部验证数据集(AUC 分别为 0.876 vs 0.842 vs 0.823)中也表现出良好的性能。

结论:影像组学参数在预测动脉瘤破裂风险中发挥重要作用。在整合临床、动脉瘤形态学和影像组学参数的多维度颅内未破裂动脉瘤破裂风险预测模型中,深度学习算法优于传统统计学方法。因此,它可以作为临床决策的有用工具,并实现颅内未破裂动脉瘤的有效管理。

PO-0348

复合双流注射法注射方案在头颈 CTA 检查中的应用价值

吕鑫一、陈力
重庆市江津区第二人民医院

目的:通过对碘对比剂复合双流注射方法在头颈 CTA 检查中的应用研究与常规头颈 CTA 检查技术对比,寻找到对比剂用量少且效果更优的检查方法。

方法: 1.设备与扫描参数: 128 层螺旋 CT, 矩阵 512×512, FOV 200mm。2.扫描范围: 包括主动脉弓至头顶。3.患者选择: 选取 2 月—8 月来我院进行头颈 CTA 检查的患者 100 例, 随机分为实验组与对照组, 每组 50 例。实验组采用复合双流注射方法, 对照组采用常规注射方法。4.对比剂注入方法: 选择患者右肘正中静脉建立静脉通道, 采用双筒高压注射器, 对比剂选用碘克沙醇 (320mgI/ml)。实验组采用药: 水=2.5:7.5, 以 4.5ml/s 的速率注射 20ml, 之后以 4.5ml/s 的速率注射纯对比剂 25ml, 之后药: 水=7:3 以 4.5ml/s 的速率注射 20ml, 最后以 5.0ml/s 的速率注射生理盐水 40ml; 对照组使用常规注射方法, 先注射 60ml 对比剂, 随后 40ml 生理盐水。使用团注追踪法, 实验组触发阈值为 80HU, 对照组触发阈值为 120HU, 两组检测层面均选择主动脉弓层面主动脉弓中下段作为感兴趣区 (ROI)。5.评价方法与标准: 由两位高年资医师采用双盲法对血管图像进行评价并打分。颅内动脉 CT 值不低于 200HU 为 1 分, 颈内动脉 CT 值大于 250HU 为 1 分, 颅内静脉及颈内静脉 CT 值低于 150HU 为 1 分, 上腔静脉伪影及右锁骨下静脉伪影消除或残留少许 (<右锁骨下静脉 1/3) 对血管质量不产生影响者为 1 分。

PO-0349

基于 DTI-ALPS 指数评价 AICI 患者的脑胶质淋巴系统功能

韦敏

徐州医科大学附属医院

目的: 利用沿血管周围间隙扩散张量成像(DTI-ALPS)评估急性缺血性脑梗死(AICI)患者的脑胶质淋巴系统(GS)功能变化。方法: 回顾性搜集徐州医科大学附属医院 2021 年 9 月至 2023 年 6 月诊断为 AICI 的 33 例患者和 33 例健康对照组(HCs)的临床及影像学资料, 采集所有被试者的 DTI 参数, 以计算 DTI-ALPS 指数, 用于评价 AICI 患者脑胶质淋巴系统的变化。结果: AICI 患者病灶侧大脑半球 DTI-ALPS 指数显著低于健侧($P<0.01$, $t = -3.11$), 也显著低于健康对照组($P<0.01$, $t = -5.20$), AICI 病灶的体积、病灶至测量层面的距离与病灶侧大脑半球 DTI-ALPS 指数均无显著相关性($P=0.38$; $P=0.24$)。结论: 利用 DTI-ALPS 指数能够评估 AICI 患者脑胶质淋巴系统功能变化, 且 AICI 患者脑胶质淋巴系统功能的损害在病灶同侧大脑半球。

PO-0350

DTI 鉴别腰神经损伤及疗效评估

张波¹、陈思²

1. 连云港市第一人民医院

2. 南京医科大学康达学院

摘要: 目的: 探讨 DTI 在腰椎间盘突出症腰神经损伤状况的疗效评估。方法: 收集本院接收的将行手术治疗的腰椎间盘突出症导致腰神经损伤的患者 10 例, 健康人 4 例, 行核磁共振 DTI 扫描及图像后处理, 进行神经纤维束成像。分析患者 VAS 评分与腰椎间盘突出症导致受压侧水肿神经根 DTI 数值的相关性。并用 SPSS26.0 进行数据对比分析。结果: 水肿或脱髓鞘的神经根平均 DTI 参数值与对应同一层面健侧及健康人相应腰神经根平均 FA 值分别为 (0.348±0.046)、(0.211±0.040)、(0.204±0.051); ADC 值分别为 (1.652±0.030) 10⁻³mm²/s、(2.300±0.058) 10⁻³mm²/s、(2.256±0.031) 10⁻³mm²/s; RD 值分别为 (1.349±0.029) 10⁻³mm²/s、(2.017±0.045) 10⁻³mm²/s、(1.948±0.078) 10⁻³mm²/s; AD 值分别为 (2.266±0.045) 10⁻³mm²/s、(2.729±0.054) 10⁻³mm²/s、(2.744±0.033) 10⁻³mm²/s; 分别行成组 t 检验, 得出差异具有统计学意义 ($t=4.61$ 、 4.36 、 5.12 、 6.40 , $P<0.05$)。将其进一步进行两两比较, 健康对照组和病变组患者同侧对应的腰神经的平均 DTI 参数值存在差异 ($P<0.05$), 病变组 FA 值显著高于健康对照组, ADC 值、RD 值、AD 值显著低于健康对照组; 病变组健侧与患侧对应的腰神经的平均 DTI 参数值存在显著差异

($P<0.05$)，与上组类似；健康者神经根平均 DTI 参数值与腰神经受损或受压者健侧神经根的平均 DTI 参数值比较差异无统计学意义，($P>0.05$)，且病变组因腰椎间盘突出导致腰腿痛的 VAS 评分也与 DTI 数值呈规律相关性。结论：DTI 参数值能够有效评估腰椎间盘突出症导致的腰神经损伤程度及受压情况，有助于临床诊断。

PO-0351

双侧岛叶较低的灰质体积介导了超重肥胖对精神分裂症患者不良的精神效应

吴慧¹、戴国朝³、穆叶色尔·艾则孜³、唐娟³、邹科³、吴玉华³、吴小立²

1. 武汉大学人民医院
2. 中山大学附属第三医院
3. 喀什地区第一人民医院

背景：精神分裂症 (SZ) 和超重/肥胖患者均显示出类似的脑结构改变。由于合并超重肥胖常会恶化 SZ 患者的精神疾病预后，本研究旨在探讨超重/肥胖对 SZ 患者脑灰质体积 (gray matter volume, GMV) 的影响。

方法：本研究共纳入 250 名受试者，并将其分为四个亚组：合并超重/肥胖的 SZ 患者 (n=69, SZ-OWB)；体重正常的 SZ 患者 (n=74, SZ-NW)；合并超重/肥胖的健康对照 (n=54, HC-OWB)；体重正常的健康对照 (n=53, HC-NW)。所有受试者均接受高分辨率 T1 加权序列扫描，并应用阳性和阴性症状量表 (Positive and Negative Syndrome Scale, PANSS) 和蒙特利尔认知评估量表 (Montreal Cognitive Assessment, MoCA) 进行临床症状和认知功能评估。采用全脑基于体素的形态学分析方法检测受试者 GMV，并采用 2x2 的全因素方差分析以确定 SZ 疾病 (SZ vs. HC) 和超重肥胖 (NW vs. OWB) 的主效应及其交互作用。此外，采用相关性分析和中介效应模型分析差异脑区与 SZ 患者的精神病性症状和认知功能的关系。

结果：SZ 疾病主要效应位于右侧海马、双侧岛叶、直回、中部扣带回和丘脑 (SZ < HC)；而超重肥胖主要效应位于右侧杏仁核、左侧海马、双侧岛叶、左侧舌回和右侧颞上回 (OWB < NW)。本研究未发现显著的 SZ 疾病x超重肥胖的交互效应，但 SZ 疾病和超重肥胖均与双侧岛叶的 GMV 降低有关。进一步中介分析表明 BMI 通过双侧岛叶 GMV 减少间接加重 SZ 患者的阴性症状。

结论：本研究结果提示超重肥胖与 SZ 患者较低的 GMV 相关，并可能增加患者不利疾病进程的风险。

PO-0352

帕金森病冻结步态患者超直接通路功能连接与运动功能的关系

黎玉婷¹、魏新华²

1. 东莞人民医院红楼院区
2. 广州市第一人民医院

目的

帕金森病 (PD) 患者中黑质纹状体多巴胺的耗竭影响许多广泛分布的神经回路，因此脑网络异常是 PD 神经病理学的一个组成部分。有学者提出丘脑底核的爆发放电完全依赖于运动皮层的输入，导致错误的重复输入信息从皮质-丘脑下核传到苍白球-丘脑-皮质环路，从而导致 PD 的运动症状。本研究探讨原发性帕金森病冻结步态 (FOG) 患者超直接通路功能连接改变 (FC) 及其与运动功能之间的关系。

方法

本研究对 25 名伴冻结步态 (PD-FOG) 的 PD 患者、35 名无冻结步态 (PD-nFOG) 的 PD 患者和 30 名健康对照者 (HC) 进行静息态功能磁共振 (Rs-fMRI) 检查。定义双侧 5 个感兴趣区 (ROI) 作为超直接通路种子点, 包括双侧初级运动皮层 (PreCG)、辅助运动区 (SMA)、丘脑底核 (STN)、苍白球内侧部 (Gpi) 及丘脑 (Tha)。利用 REST 软件计算基于体素水平 ROI 与全脑之间的 FC。采用 Bonferroni 多重比较校正进行单因素方差分析 (ANOVA), 以确定各组 (PD-FOG、PD-nFOG 和 HC) 之间 FC 的差异。采用 GRF 进行事后分析, 设置统计学意义的体素水平为 $P < 0.05/3$, 聚类水平为 $P < 0.05$, 聚类大小为 18 个体素。最后, 评估差异脑区 FC 与 PD 运动神经量表的关系。

结果

我们发现, 与 HC 相比, PD 患者超直接通路与双侧大脑半球部分脑区之间 FC 减低, 主要包括额上回、中央前后回、枕中回、顶上小叶、壳核、扣带旁回、缘上回、楔前叶、角回、颞上回及颞中回等, 其中, 左侧 Gpi 与左侧扣带旁回 FC 减低与 UPDRS-I 及 PDQ-39 评分负相关。另外, 与 PD-nFOG 相比, PD-FOG 患者超直接通路与局部脑区的 FC 增高, 包括右侧小脑后叶及枕中回, 其中, 左侧 Tha 与右侧枕中回的 FC 增高与右侧肢体 UPDRS-III 评分正相关。

结论

与 HC 相比, PD 患者超直接通路与双侧大脑半球部分脑区的 FC 减低, 并与运动功能减弱相关。与 PD-nFOG 相比, PD-FOG 患者超直接通路与局部脑区的 FC 增高, 并与右侧肢体运动功能减弱相关。本研究为超直接通路功能连接网络在伴冻结步态的帕金森病患者中运动能力减弱的作用提供新的见解。

PO-0353

阿尔茨海默病认知域特异性功能损害的网络连接标志物

栾颖

东南大学附属中大医院

背景: 认知域特异性功能障碍的异质性是阿尔茨海默病 (AD) 临床诊断的主要挑战。本研究验证了以下假设: tau 蛋白异常沉积区域的功能网络决定了区域 tau-PET 对特定认知领域的影响。本研究旨在确定区域 tau-PET 积累的静息态功能连接模式, 从而得到功能网络连接加权的认知域特异性 tau-PET 预测因子。

方法: 我们纳入了来自 ADNI 的 218 名淀粉样蛋白阳性老年人。我们将 tau-PET SUVR 升高的区域投影到健康的人类功能连接组 (Human Connectome Project, HCP) 模版上, 并应用偏最小二乘分析来识别与情景记忆、执行功能或语言表现相关的连接模式。所得到的网络功能连接对区域 tau-PET SUVR 进行加权, 我们将这些连接加权 tau-PET 标记物的预测效能与整体和内嗅皮层 tau-PET 值对不同域认知功能的预测效能进行比较。

结果: 偏最小二乘回归得到了特定认知领域损伤相关的 tau 沉积的不同连接模式。利用认知域特异性网络连接对 tau 蛋白沉积脑区 tau PET 值进行加权对相应认知域功能进行预测, 其预测效能显著优于用全脑 tau-PET SUVR 值及内嗅皮层 tau-PET SUVR 值的预测效能。

结论: 网络连接加权 tau-PET 是一种具有潜力的新型生物标志物, 在预测特定领域的认知障碍方面, 其性能优于标准 tau-PET 指标。

PO-0354

注意缺陷多动障碍男童 SNAP-25 基因 MnlI 多态性与静息态脑功能和工作记忆的相关性研究

方佃刚、杨斌让、梁国华、曾洪武
深圳市儿童医院

目的：研究注意缺陷多动障碍男童 SNAP-25 基因 MnlI 多态性与静息态脑功能和工作记忆的相关性，探讨 SNAP-25 基因 MnlI 多态性对 ADHD 儿童工作记忆的影响机制。

方法：采集 36 例 SNAP-25 基因 MnlI 多态性 TT 纯合子基因型 ADHD 男童（简称 TT 组）和 20 例 G 等位基因型 ADHD 男童（简称 TG 组）静息态脑功能数据，采用局部一致性方法进行数据分析，选择双侧大脑半球的背外侧额上回、内侧额上回、后扣带回、前扣带回、楔前叶、额中回作为感兴趣区，计算每个被试感兴趣区的 ReHo 峰值。采用 N-back 任务评估两组男童的工作记忆，包括 0-back、1-back 和 2-back 四组任务的正确率。对 TT 和 TG 两组内所有被试每个感兴趣区的 ReHo 峰值与 N-back 正确率进行 Spearman 秩相关分析。当 $P < 0.05$ 差异有统计学意义。

结果：（1）TT 组：0-back 正确率与左背外侧额上回 ReHo 峰值呈低度负相关（ $r = -0.382, P = 0.021$ ），1-back 正确率与右背外侧额上回 ReHo 峰值呈低度正相关（ $r = 0.359, P = 0.031$ ）；2-back 正确率与右背外侧额上回 ReHo 峰值呈低度正相关（ $r = 0.344, P = 0.04$ ）。（2）TG 组：0-back 正确率、1-back 正确率、2-back 正确率与所有感兴趣区的 ReHo 峰值均无相关性（ $P > 0.05$ ）。结论：SNAP-25 基因 MnlI 多态性对 ADHD 男童工作记忆具有不同的遗传效应，fMRI 可从神经网络角度解释其差异的脑功能基础。

PO-0355

酒精使用障碍患者自发脑活动的频率特异性改变

阮霞、陈军
武汉大学人民医院放射科

目的 酒精使用障碍（AUD）是世界上最普遍的精神疾病之一，与公共卫生、社会、犯罪和心理健康等问题密切相关。早期的神经影像学研究表明，AUD 对大脑的结构和功能都有影响。然而，这些改变是否与不同的频段相关尚不清楚。本研究的目的是探讨 AUD 患者静息状态下自发脑活动的频率特异性改变，并评估这些改变与临床数据之间的相关性。

方法 纳入 33 名 AUD 患者和 29 名年龄、性别、受教育年限、利手等相匹配的健康对照组（HC 组）行常规磁共振成像、静息态功能磁共振成像和高分辨率 T_1WI 结构像扫描。计算六个频段（常规频段，0.01-0.08 Hz；slow-2, 0.198-0.25 Hz；slow-3, 0.073-0.198 Hz；slow-4, 0.027-0.073 Hz；slow-5, 0.01-0.027 Hz；and slow-6, 0-0.01 Hz）的低频振幅（ALFF）值，采用独立样本 t 检验比较两组间的差异。使用受试者工作特征（ROC）曲线来检验 ALFF 分析区分 AUD 和 HC 的能力，并将 ALFF 在多频段的参数值与临床参数密歇根酒精筛查量表（MAST）和酒精成瘾量表（ADS）评分进行相关性分析。

结果 共在四个频段中观察到 ALFF 值减少，且 ALFF 值减少的区域主要位于右侧额上回和额中回。slow-2 频段和 slow-6 频段的 ALFF 值没有明显差异。这些特定脑区的 ALFF 差异显示出良好的曲线下面积（AUC）（0.829-0.873），以及良好的敏感性（61.5%-100.0%）和特异性（63.3%-96.7%）。MAST 或 ADS 评分与这些特定脑区的 ALFF 值无明显相关性。

结论 AUD 患者大脑自发活动的改变具有频率特异性，对 AUD 患者自发脑活动的研究应考虑频段的影响。这一初步探索可为了解 AUD 的病理生理机制提供客观的影像学依据。

PO-0356

癫痫停药后复发患者的灰质形态网络异常

李秀丽、谭戈、雷都、秦坤、龚启勇
四川大学华西医院

目的

70%的新诊断癫痫患者在抗癫痫药物 (ASM) 治疗下可以获得缓解,但考虑到副作用和经济负担,获得长期癫痫缓解的患者将尝试减药治疗,或者完全停药。然而,约 49%的患者在停药后会出现癫痫复发。目前,对于 ASM 停药后癫痫复发的确切机制还不清楚。因此,本研究旨在探索停药后癫痫缓解与复发患者之间灰质网络的特征,以及这些网络特征与癫痫复发之间的关系。

方法

本研究纳入停药无癫痫发作的患者 24 例,复发的患者 22 例以及 46 例对照者。我们使用 DARTEL 软件对 3DT1 图像进行预处理,得到平滑和调制的灰质图像;随后,采用灰质容积的统计相似性来构建灰质斜变网络。然后,我们使用 GRETNA 工具箱来计算大脑灰质结构网络的全局 (小世界参数和网络效率参数) 及节点 (节点度和节点效率) 拓扑属性,采用 ANOVA 分析方法对 3 组间网络拓扑属性的进行比较;最后,将存在差异的网络属性与临床特征进行相关分析。

结果

(1) 在全局属性层面,与对照组相比,无复发组的局部效率减低,而复发组不仅全局和局部效率减低,其特征路径长度也增加。(2) 在节点属性层面,两患者组的节点中心性均有降低,复发组的受累节点较多,并且复发组右侧苍白球的节点中心性低于无复发组。复发组在右侧苍白球和左侧颞中回间的连接强度减低。(3) 相关分析显示,左侧后扣带回的节点中心性改变与癫痫患者的发病年龄呈正相关,并且在复发患者更加明显。

结论

在停用抗癫痫药物时,患者呈现出较弱的小世界化网络可能会具有更高的癫痫复发风险,而这种在全局水平上的异常模式可能是由节点的去中心化和涉及皮层和皮质下网络的节点间连接下降所致。更高度度的节点去中心化可能是由于活跃期和疾病持续时间的延长以及为控制癫痫而药物用量增加所致,但确切的机制有待进一步探讨。在停用抗癫痫药物后无癫痫复发者可能归因于这部分患者脑网络结构的恢复。

PO-0357

酒精使用障碍患者全脑功能连接及度中心性功能成像研究

阮霞、陈军
武汉大学人民医院放射科

目的 酒精使用障碍 (AUD) 患者由于长期、过量饮酒导致大脑的结构和功能发生变化, AUD 已经成为不可忽视的社会与医学问题。然而,人们对酒精成瘾神经影像学机制的了解仍然有限。本研究旨在利用体素水平二值化度中心性 (DC)、加权 DC 和功能连接 (FC) 方法探讨 AUD 患者的大脑网络活动,从而研究酒精成瘾的神经影像学机制。

方法 本研究中共纳入 33 名 AUD 患者和 29 名年龄、性别、受教育年限、利手等相匹配的健康对照组 (HC 组)。使用二值化和加权 DC 方法与基于种子点的 FC 方法相结合来评估 AUD 的异常内在功能枢纽特征。Spearman 相关性分析用于评估功能连接变化与临床参数密歇根酒精筛查量表 (MAST) 和酒精成瘾量表 (ADS) 的相关性。

结果 AUD 组和 HC 组的二值化和加权 DC 的空间分布图大致相似。与 HC 组相比, AUD 组的左侧中央前回和左侧顶下缘角回的二值化和加权 DC 均有所减少。并且基于左侧中央前回和左侧顶下缘角回作为种子的二次功能连接分析显示, AUD 组的右侧颞下回、右侧颞中回、左侧背外侧额上回、

双侧顶下缘角回、左侧楔前叶、左侧舌回、右侧小脑_crus1/颞下回/枕下回和右侧顶上回的 FC 发生了变化。相关性分析显示, 右侧颞中回-右侧中央前回的 FC 与 MAST 评分呈负相关, 右侧顶下缘角回-左侧顶下缘角回的 FC 与 ADS 评分呈正相关。

结论 酒精使用障碍与多个脑区的局部异常活动有关。二值化 DC、加权 DC 和 FC 分析可能是检测 AUD 患者大脑活动的重要指标。在 AUD 患者中也观察到了 FC 的组间差异, 这些差异与症状的严重程度有关。这种耐人寻味的关联可能是一种未确定的机制, 也可能是结构和功能连接之间的一种补偿机制。这些发现将为未来的 AUD 研究提供一个新的方向。

PO-0358

基于动脉自旋标记技术探究左旋多巴治疗背景下帕金森病特异性运动灌注模式的预后预测价值

郑茜诗、闻家琪、端木筱洁、谭斯珈、袁伟晋、周诚、曾庆泽、郭昊婷、吴晨青、张敏鸣、管晓军、徐晓俊
浙江大学医学院附属第二医院

目的本研究旨在通过动脉自旋标记 (ASL) 技术确定 PD 相关运动灌注模式, 并评估其对 PD 患者运动症状的左旋多巴反应性的预测作用。

材料与方法本研究共纳入 2 个独立的试验集与验证集, 试验集中有 179 名 PD 与 62 名年龄和性别匹配的正常对照 (NC); 验证集中有 36 名 PD 与 19 名 NC。试验集中的 72 名 PD 患者均进行了左旋多巴治疗并具有治疗前后的纵向临床运动数据 (随访时间 33.26 ± 20.20 个月)。基于 ASL 技术, 我们采用基于体素的比例子剖面模型-主成分分析 (SSM-PCA), 在基线时 OFF 状态下分别在两组间比较了 PD 和 NC 的临床变量以及 PD 相关灌注模式表达, 应用 Pearson 相关和分层多元线性回归分析最终确定了 PD 特异性运动灌注模式。此外, 我们通过该灌注模式中位值将 PD 患者分为高、低表达组, 将左旋多巴反应性定义为运动症状的改善程度, 改善程度低于 30% 定义为结局事件, 进行了多变量 Cox 回归和 Kaplan-Meier 生存分析, 以此来探究基线时 PD 患者特异性运动灌注模式能否预测随访期间的左旋多巴反应性。

结果基于 SSM-PCA 分析得到的主成分 1 (PC1) 最终被确定为 PD 特异性运动灌注模式, 其在 PD 组中的表达在试验集与验证集中均高于 NC (试验集 $P=0.017$, 验证集 $P=0.024$)。在试验集中基线时 PC1 的表达与 UPDRS III ($P=0.006$) 及其子症状 (中轴症状: $P<0.001$; 强直症状: $P=0.003$; 运动迟缓: $P=0.05$; 姿势症状: $P<0.001$) 相关, 而与震颤症状无关 ($P>0.411$)。

生存分析中发现 PC1 高表达组是中轴症状的不良预后因子, 基线时 PC1 表达越高, 伴中轴症状的 PD 患者随访时的左旋多巴反应性越差 ($P=0.046$), 且随着随访时间增加, 高低表达组的中轴症状改善程度趋于一致。而基线时 PC1 表达与随访过程中 UPDRS III、震颤、强直、运动迟缓和姿势症状改善均无相关性。

结论基于 ASL 技术的 PD 特异性运动灌注模式在基线时 OFF 状态下的表达模式能够预测 PD 患者随访早期中轴症状的左旋多巴反应性。该运动灌注模式可作为一种客观评价 PD 患者预后的候选生物标志物。

PO-0359

集成磁共振成像技术在多发性硬化患者脊髓病灶 检出中的应用价值

聂吉林
中南大学湘雅医院

目的：评价集成磁共振成像技术在多发性硬化患者脊髓病灶检出中的应用价值。方法：采集我院 35 例 MS 患者颈段脊髓的磁共振数据，分别扫描 SagT1WI、SagT2WI 序列及 Sag MAGIC（集成磁共振）序列。MAGIC 序列采集到的图像通过软件处理得到 10 组不同对比图，包括 T1WI、T2WI、PDWI、T1FLAIR、T2FLAIR、STIR、PSIR（相位敏感翻转恢复成像）、PSIR Vessel（PSIR 亮血成像）、DIR GM（双翻转灰质成像）、DIR WM（双翻转白质成像）。比较常规组与 MAGIC 组病灶检出率的差异。结果：常规 SagT1WI、SagT2WI 组共检出病灶 67 处，集成磁共振分解得到的 10 组对比图中，T1WI 组 62 处、T2WI 组 65 处、PDWI 组检出 89 处，T1FLAIR 组 66 处、T2FLAIR 组 68 处、STIR 组 76 处、PSIR 组 81 处、PSIR Vessel 组 91 处、DIR GM 组 89 处、DIR WM 组 63 处。PDWI 组、PSIR 组、PSIR Vessel 组、DIR GM 组与常规组检出率差别有统计学意义。其中 5 例患者常规组为阴性，集成磁共振组检出病灶。结论：集成磁共振成像技术能分解为多种权重对比图像，各权重图像联合诊断可有效提升 MS 患者脊髓病灶的检出率，有利于临床的诊疗。

PO-0360

血管源性脑白质高信号患者临床特征和 认知相关的纤维束成像研究

匡钦梅¹、黄木华²、周福庆²
1. 江西省肿瘤医院
2. 南昌大学第一附属医院

目的：血管源性脑白质高信号（white matter hyperintensity, WMH）是脑小血管病最常见的神经影像学表现，与全脑白质微结构完整性的破坏有关。在 WMH 患者中，常可见高血压、高龄、肥胖、认知功能下降等多种临床特征。然而，这些临床特征是否与大脑中断的白质纤维束连接相关联，还需要进一步的研究。因此，本研究基于全脑水平探索了与 WMH 相关的白质纤维束通路，目的是确定与 WMH 临床特征相关的最具代表性的神经通路。

方法：本研究共纳入 WMH 组患者 16 例，健康对照组 20 例。首先对所有被试进行临床及一般资料采集，包括总体认知评估如蒙特利尔认知评估，与 WMH 高度相关的临床因子如高血压评分、体重指数等，接着对所有被试使用相同的 MR 扫描方案采集弥散数据。对采集获得的数据通过 DSI studio 软件首先进行连接分析，得到患者组全脑连接受损的白质通路，由于大多数评分彼此高度相关，接着使用主成分分析以分离解释总体评分变异的主成分，并最后测定与每个主要成分相关的白质束特定通路。

结果：1、WMH 组与对照组在认知评分存在显著差异（双样本 t 检验， $P < 0.001$ ）；2、在主成分分析中，高血压评分、认知评分和体重指数可以解释 87.196% 的评分方差；3、胼胝体前压部、下纵束、胼胝体前部及小脑中脚与高血压评分显著相关（ $FDR = 0.04$ ）。胼胝体前压部、左侧丘脑顶束、下纵束及左侧小脑与 MoCA 评分显著相关（ $FDR = 0.01$ ）。胼胝体前压部、额枕下束、扣带束、穹窿/伞部与 BMI 显著相关（ $FDR < 0.01$ ）。

结论：研究结果表明 WMH 患者涉及全脑白质纤维束连接改变，高血压评分、认知评分和体重指数是 WMH 患者的重要临床特征，高血压程度和较高的体重指数与 WMH 患者的白质纤维束局部失连接相关，同时可能有助于我们理解 WMH 相关的认知障碍。

PO-0361

基于 fMRI 动态低频振幅应用于帕金森病辅助诊断研究

赵厚亮

徐州医科大学附属医院

目的：利用帕金森病 (PD) 患者和健康对照 (HCs) 全脑动态低频振幅 (dALFF)，实现对 PD 与 HCs 的分类，进一步探索 dALFF 与 PD 病程的关系。**方法：**24 名 PD 患者和 24 名 HCs 接受 3.0T BOLD-fMRI 检查。使用 DPARSF 软件对原始数据处理，并计算出 dALFF。将 dALFF 载入 PRoNTo 软件包对 PD 及 HCs 进行分类计算，采用分类精度、ROC 及 AUC 对分类结果进行评价。利用偏相关分析观察感兴趣脑区 dALFF 与病程的相关性。**结果：**全脑 dALFF 对 PD 与 HCs 的分类精度达 93.75% ($p = 0.0002$, 置换检验 5000 次)，分类权重最主要的脑区为双侧楔前叶、双侧小脑半球。其中，左侧楔前叶 dALFF 变异系数与病程呈正相关 ($p = 0.001$, $r = 0.645$)。**结论：**利用 dALFF 能够较为理想的区分 PD 和 HCs，为临床辅助诊断 PD 提供影像学参考。左侧楔前叶自发脑活动的动态变异程度反映 PD 患者疾病的进程。

PO-0362

基于多模态 MRI 的多任务学习用于脑胶质瘤分割和 IDH 基因分型预测余璇¹、吴亚平¹、白岩¹、魏焕焕¹、王梅云^{1,2}

1. 河南省人民医院

2. 河南省科学院

目的：尽管脑胶质瘤多模式标准化治疗已在临床实践中得到广泛应用，但不同基因表型的 HGG 标准化治疗效果差异很大。异柠檬酸脱氢酶 (IDH) 是脑胶质瘤基因分型的重要分子指标，对脑胶质瘤的个体化治疗和临床预后判断具有重要意义。脑胶质瘤的预后依赖于 IDH 的突变状态，准确预测 IDH 突变对于指导治疗和评估预后至关重要。本研究目标是提出一种完全自动化的多任务学习方法，结合卷积神经网络 (CNN)，从术前磁共振成像 (MR) 中进行肿瘤自动分割并预测脑胶质瘤的 IDH 状态。

方法：本研究回顾了 225 例来自河南省人民医院与 500 例来自癌症成像档案的脑胶质瘤术前 MR 图像，基于 T1、T1 增强、T2、液体衰减反转恢复图像和扩散加权成像序列，开发一个全自动模型，该模型包括用于肿瘤分割的 CNN 和用于 IDH 状态预测的基于 CNN 的分类器，结合肿瘤分割任务和 IDH 基因分型任务的相关性，提取两个任务间的共享全局特征表示，研究同时提出一种多任务损失函数，自适应分配两个任务的权重，优化模型训练。

结果：多任务学习网络取得了良好的性能，超越了单任务学习网络和其他先进的多任务学习模型，该模型通过五折交叉验证在分割任务中得到了 89.34% 的 Dice 系数结果，在 IDH 预测任务中得到了 90.65% 的 AUC 结果，敏感性和特异性分别为 92.07%、89.23%。

结论：本研究提出的全自动多任务学习模型展示了作为一种在不同数据集中高度可重复和可推广的工具用于非侵入性分割脑胶质瘤和预测 IDH 状态的潜力，研究发现该模型对 IDH 突变病例具有更好的敏感性。

PO-0363

基于 STAGE 序列探究帕金森病患者脑深部核团微结构的改变

赵婧含、苗延巍
大连医科大学附属第一医院

目的

探究帕金森病(PD)患者的 T1、质子密度和 T2*值的变化,分析 T1、质子密度和 T2*值的变化是否能反映帕金森病 的发生,探讨其是否有助于帕金森病的预防和诊断。

材料与方法

前瞻性收集 41 例帕金森病患者和 38 例健康志愿者。MRI 检查采用 CX Signa HDXT 3.0T 型磁共振扫描仪,颅脑 MRI 分期扫描。经后处理后获得 T1、质子密度和 T2*图。

这些核团包括尾状核(CN)、壳核(PUT)、苍白球(GP)、丘脑(THU)、红核(RN)、黑核(SN)和齿状核(DN)。代表这些结构的感兴趣区域(ROI)由两名研究人员使用 SPIN(Signal Processing in NMR, SpinTech, Inc., Bingham Farm, MI, United States)在 T1、质子密度和 T2*图上手动追踪。所有平均值均由该软件自动测量。所有数据均采用 SPSS20.0 软件进行统计分析,并对各组数据进行正态分布检验。符合正态分布的用均值±标准差表示,不符合正态分布的用中位数(上、下四分位数)表示。采用独立样本 t 检验或 Mann-Whitney U 检验(不符合正态分布)比较 PD 组与对照组双侧大脑半球 T1、质子密度和 T2*的平均值,并用独立样本 t 检验或 Mann-Whitney U 检验检验左右侧的差异。P 值<0.05 被认为具有统计学意义。

结果

PD 组 CN、GP、RN 的 T1 值和 CN、PUT、THU、RN 的质子密度值显著低于对照组,而 DN 的 T1 值高于对照组。(P<0.05)(表 4-5)。

同时,与对照组相比,SN 的 T2*值显著降低,THU 明显升高。(P<0.05)(表 6)。

HC 组右侧 THU、DN 的 T1 值和右侧 DN 的质子密度值均显著低于左侧。PD 组患侧与健侧的 T1 质子密度和 T2*值无明显差异。(P<0.05)(表 1-3)。

结论

T1 和质子密度图在检测脑深部核团微结构变化方面具有潜在的应用前景和应用价值。T1、质子密度和 T2*值的变化可能反映了脑深部核团的结构变化。

PO-0364

基于聚类探究特发性震颤临床异质性的脑结构与功能磁共振基础

袁伟晋、闻家琪、端木筱洁、谭斯珈、郑茜诗、周诚、曾庆泽、郭昊婷、郭涛、吴晨青、曹正业、张敏鸣、管晓军、徐晓俊

浙江大学医学院附属第二医院

背景:特发性震颤(ET)是临床上最常见的运动障碍性疾病之一。其典型表现是以持续 3 年以上的孤立性上肢动作性震颤为特征,伴或不伴有其他部位的震颤等。目前越来越多的证据表明 ET 也常常合并有精神、睡眠、认知、自主神经功能障碍等非运动症状。关于 ET 的临床表型在不同的个体之间具有很大的可变性,提示 ET 具有显著的临床异质性,不同的 ET 临床亚型可能反映了不同的神经生物学基础。

目的:本研究旨在基于 ET 的运动及非运动临床特征,利用数据驱动聚类分析的方法揭示 ET 临床异质性,并结合 DTI 及静息态功能 MRI 数据探讨其背后的神经生物学基础。

方法:本研究纳入了 103 名 ET 患者,基于运动症状(头面声震颤、双上肢震颤、双下肢震颤)和非运动症状(认知、抑郁、焦虑、夜间睡眠、日间嗜睡、自主神经功能),利用 K-means 方法对 103 名 ET 患者进行聚类分析,并结合人口统计学来定义 ET 的不同临床亚型。后续以 AAL_116 模板利用 DTI 数据构建脑结构网络以及利用 3T 静息态功能 MRI 数据探究 ET 不同亚型背后的脑结构与功能基础,并与临床症状进行相关性分析。

结果: K-means 聚类分析定义了两种 ET 亚型: 66 名 ET 患者被分类为“ET 未合并非运动症状”亚型, 37 名 ET 患者被分类为“ET 合并非运动症状”亚型。加权结构网络中全局集聚系数、特征路径长度、全局效率以及局部效率未发现显著差异; 3T 静息态功能磁共振分析提示: 两组 ET 亚型在右侧基底节区 (Peak MNI:12,12,0) 脑局部功能一致性 (ReHo) 指标具有显著统计学差异。与“ET 未合并非运动症状”亚型相比, “ET 合并非运动症状”亚型 ReHo 值显著降低, 并且与非运动症状综合评分 (NCO) 及临床症状全局综合评分 (GCO) 均呈负相关。

结论: 本研究基于 ET 运动和非运动症状, 利用数据驱动探索性地发现了其两种临床亚型及背后潜在的脑结构与功能改变, 这对未来更好地理解 ET 临床异质性背后的神经生物学基础提供了影像学依据。

PO-0365

单纯椎管内硬膜外海绵状血管瘤的 MRI 表现特点分析

邢新博、王鑫坤、习伟、李天然
中国人民解放军总医院第四医学中心

目的: 归纳总结单纯椎管内硬膜外海绵状血管瘤的 MRI 表现特点, 以提高术前诊断的准确率。方法: 回顾性分析 7 例经手术及病理证实的单纯椎管内硬膜外海绵状血管瘤的临床及 MRI 资料。结果: 7 例椎管内单纯椎管内硬膜外海绵状血管瘤, 位于胸段 4 例、腰椎段 3 例。肿瘤出现区域分别为脊髓或硬膜囊背侧(n=4)、外侧(n=1)、背侧和外侧 (n=2), 均累计相应节段椎间孔, 分为双侧椎间孔扩大 (n=3) 和单侧椎间孔扩大 (n=4), 所有病灶对临近骨质未侵犯。在所有 7 例患者中, 海绵状血管瘤大部分呈分叶状, 其中 3 例呈“T”型征, 病灶在 T1WI 图像上呈等信号, 在 T2WI 图像上呈高信号, 增强后呈较均匀性明显强化, 内部可见线条状低强化区域。结论: 单纯硬膜外海绵状血管瘤在 MRI 表现有着较为典型的征象: 分叶状轮廓 (大部分病变呈“T”型征), 占据椎管后部或椎间孔等区域, 椎间孔受累较普遍, 脊髓或硬膜囊受压或包绕、半包绕; 病灶于 T1WI 呈等信号, 于 T2WI 序列呈高信号, 增强后病灶大部分呈明显均匀强化, 内部见线条状低强化区。MRI 对单纯硬脊膜外海绵状血管瘤的检出和诊断具有重要作用。

PO-0366

慢性单侧大脑中动脉重度狭窄-闭塞患者脑灌注与脑小血管病总负荷的相关性

邢新博^{1,2}、吕晋浩¹、王雪扬¹、段祺¹、姜昕¹
1. 中国人民解放军总医院第一医学中心
2. 中国人民解放军总医院第四医学中心

目的 探讨症状性慢性单侧大脑中动脉重度狭窄-闭塞患者脑灌注状态与脑小血管病总负荷的相关性。方法 回顾性搜集 2015 年至 2018 年就诊于解放军总医院第一医学中心的 100 例症状性单侧大脑中动脉重度狭窄-闭塞 (狭窄程度 $\geq 70\%$) 患者 (女性 32 例 (32%)), 所有患者接受了多模态 MRI 检查。按照颅内供血动脉供血区在 ASL 上对 MCA 区域脑血流量进行定量测量, 比较 MCA 供血区域患侧与健侧脑血流量差异, 并与不同的脑小血管病总负荷评分进行比较; 根据相对脑血流量的差异, 分析不同灌注程度与其脑小血管病总负荷之间差异。结果 在单侧大脑中动脉狭窄患者中, 患侧的 MCA 供血区的脑血流量明显低于健侧 (患侧 $47.01 \pm 13.95 \text{ ml}/(100\text{g}\cdot\text{min})$, 健侧 $52.62 \pm 10.95 \text{ ml}/(100\text{g}\cdot\text{min})$, $t = -5.101$, $p = 0.000$); 将脑小血管病总负荷分为两组 (0-2 分为轻中度组, 3-4 分为重度组), 两组之间的 MCA 供血区域患侧脑血流量存在显著统计学差异 (轻中度组 $48.68 \pm 14.19 \text{ ml}/(100\text{g}\cdot\text{min})$, 重度组 $42.49 \pm 12.43 \text{ ml}/(100\text{g}\cdot\text{min})$, $t = 1.998$, $p = 0.048$); 将大脑中动脉供血区

域按相对脑血流量系数分为低灌注、等和高灌注两组, CSVD 两组之间 MCA 区域灌注状态存在差异并有统计学意义 ($\chi^2=5.163$, $P=0.023$); 多变量回归分析显示, CSVD 中重度组与患侧 MCA 脑低灌注状态相关 ((adjusted odds ratio) [aOR], 0.338 (95% CI, 0.122-0.936)), 而在各影像标志物中较重的 PWMH 评分与患侧 MCA 脑低灌注状态相关 (aOR, 0.148 (95% CI, 0.024-0.596))。结论 在症状性慢性单侧大脑中动脉重度狭窄-闭塞的患者中, 患侧脑血流量的减低受到脑小血管病的影响, 随着脑小血管病总负荷评分越高, 患侧 MCA 脑血流量相应有所下降。

PO-0367

大脑中动脉狭窄与脑小血管病影像标志物的相关性研究

邢新博^{1,2}、王雪扬¹、吕晋浩¹、段祺¹、姜昕¹

1. 中国人民解放军总医院第一医学中心

2. 中国人民解放军总医院第四医学中心

目的 探讨单侧大脑中动脉 (MCA) 狭窄程度与脑小血管病 (CSVD) 总负荷及其影像标志物之间的相关性。方法 回顾性分析 2015 年至 2019 年就诊于解放军总医院第一医学中心并接受了多模态 MRI 检查的慢性单侧大脑中动脉狭窄患者。根据 MCA 狭窄程度将患者分为重度狭窄-闭塞 (狭窄程度 $\geq 70\%$) 和轻中度狭窄 (狭窄程度 $< 70\%$) 两组, 比较两组间 CSVD 总负荷评分以及 CSVD 影像标志物之间的差异。结果 共纳入患者 261 例, 其中轻中度狭窄有 159 例, 男性 117 (73.6%) 例, 平均年龄 58.5 ± 12.5 岁; 重度狭窄-闭塞患者 102 例, 男性 70 例 (68.6%), 平均年龄 55.2 ± 11.9 岁。轻中度狭窄患者 CSVD 总负荷评分为 1 (0, 2), 重度狭窄-闭塞 CSVD 总负荷评分为 1 (1, 3), 两者之间比较后存在统计学差异 ($P=0.043$); 两组各影像标志物评分后相比较, 半卵圆中心血管周围间隙 ($P<0.001$)、腔隙 ($P=0.001$) 在两组之间存在统计学差异; 二元 logistics 回归分析显示, CSVD 总负荷评分 ($OR=1.3$, 95%CI 1.047–1.613, $P=0.017$)、半卵圆中心血管周围间隙评分 ($OR=2.099$, 95%CI 1.54–2.86, $P<0.001$) 和腔隙 ($OR=2.609$, 95%CI 1.294–5.261, $P=0.007$) 与重度狭窄-闭塞相关。结论 大脑中动脉狭窄程度与 CSVD 总负荷相关, 重度狭窄-闭塞的患者可能会有较高 CSVD 总负荷、更多的半卵圆中心血管周围间隙和腔梗。

PO-0368

四脑室区常见占位性病变的影像诊断

王景宇

吉林大学第一医院

室管膜瘤 (WHO II-III 级) 儿童多见, 5 岁前及 30 岁左右是两个发病高峰。部位: 儿童好发生于第四脑室, 成人好发生于侧脑室三角区常成不规则分叶状, 多靠近下髓帆 (四脑室下 $1/2$), 常突破脑室前后壁浸润脑干及小脑蚓部, 也可经侧孔/中央孔向桥小脑角区、小脑延髓池方向生长, 具有见缝就钻、塑型生长的特点, 常伴有梗阻性脑积水。肿瘤内钙化、囊变、出血多见。影像: 长 T1、长 T2 信号, 弥散多无受限; 增强扫描实性部分明显强化, 有时会有脑脊液环绕肿块的征象, 可有脑水肿。

脉络丛乳头状瘤 (WHO I 级) 起源于脉络丛上皮, 少见的良性肿瘤, 生长缓慢, 儿童好发于侧脑室三角区, 成人好发生于四脑室桑葚状或菜花状。影像: 等及长 T1、等及稍长 T2 信号; DWI 多扩散不受限或稍受限, 增强明显强化。脉络丛乳头状瘤很少侵犯脑组织, 一般不引起脑水肿, 但常引起脑积水。脑脊液生成和吸收紊乱 (交通性脑积水), 主要为肿瘤大小与脑积水程度不成比例, 较小肿瘤往往引起较重的脑积水。肿瘤直接导致脑脊液循环通路阻塞 (梗阻性脑积水)。

髓母细胞瘤 (WHO IV 级) 高度恶性, 好发于儿童, 男性多见。90% 以上的儿童患者肿瘤位于小脑蚓部及四脑室顶, 向前呈填充四脑室改变 (成人多位于小脑半球), 呈类圆形或类椭圆形, 以实性

成分为主（肿瘤细胞密集、核浆比高）。肿瘤内钙化、囊变、出血少见。影像：信号多较均匀，呈长 T1、等及稍长 T2 信号，DWI 呈高信号，ADC 信号减低，增强扫描呈不均匀轻至中度强化肿瘤的上方或前方可见脑脊液残留，有瘤周水肿，四脑室及脑干易受压变形移位，引起幕上梗阻性脑积水。易经脑脊液广泛种植转移（脑膜异常增厚强化或小结节状强化）。

胆脂瘤（表皮样囊肿）非真性肿瘤性病变。好发于桥小脑角区、四脑室、鞍上。沿临近脑沟、裂、池钻缝样生长，包绕神经和血管。影像：长 T1、长 T2 信号，DWI 呈不均匀明显高信号，ADC 值低于脑脊液、高于脑白质，无脑组织水肿，增强扫描无明显强化。肿瘤的上方或前方可见脑脊液残留，有瘤周水肿，四脑室及脑干易受压变形移位，引起幕上梗阻性脑积水

PO-0369

肝豆状核变性患者的静息态脑功能磁共振研究

关依霖、龚佳英
中山大学附属第六医院

目的：研究肝豆状核变性患者在脑功能活动方面的差异，探索静息态脑功能局部内在活动差异脑区与临床化验指标血清铜、铜蓝蛋白及 24h 尿铜的相关性。

方法：纳入 2021 年 1 月至 2022 年 12 月经神经内科收治的 44 例 WD 患者，和 32 例健康对照组。所有研究对象均进行了静息态功能磁共振成像（rs-fMRI）和三维结构相（T1-3D）采集。计算每个对象的低频振幅（ALFF）、低频振幅比值（fALFF）及局部一致性（ReHo），评估各脑区的功能活动的差异。检验患者的血清铜、铜蓝蛋白及 24h 尿铜水平。使用 Spearman 相关分析对差异脑区与临床化验指标进行相关性分析。

结果：WD 组在小脑后叶、右侧丘脑、左侧岛叶、右侧岛叶、右侧尾状核、右侧楔前叶、右侧辅助运动区 ALFF 值高于对照组（ $t=6.9561$ 、 4.5234 、 4.837 、 4.915 、 4.9927 、 5.801 、 4.1159 ， $p<0.05$ ），右侧眶部额中回及右侧背外侧额上回 ALFF 值低于对照组（ $t=-5.3877$ 、 -4.8392 ， $P<0.05$ ）。左侧楔前叶及右侧中央前回的 fALFF 值低于对照组（ $t=-5.2992$ 、 -4.2872 ， $p<0.05$ ）。右侧楔前叶 ReHo 值高于对照组（ $t=6.8114$ ， $p<0.05$ ），左侧梭状回、右侧枕中回、左侧中央后回及右侧中央后回 ReHo 值低于对照组（ $t=-4.4128$ 、 -4.8129 、 -5.9576 、 -5.5242 ， $p<0.05$ ）。右侧辅助运动区 ALFF 值与血清铜呈负相关（ $r=-0.313$ ， $p=0.036$ ），左侧楔前叶 fALFF 值与 24h 尿铜呈正相关（ $r=-0.312$ ， $p=0.037$ ），与铜蓝蛋白呈负相关（ $r=-0.398$ ， $P=0.007$ ），右侧中央后回 ReHo 值与铜蓝蛋白呈负相关（ $r=-0.297$ ， $P=0.048$ ），右侧枕中回 ReHo 值与血清铜呈负相关（ $r=-0.297$ ， $P=0.048$ ）。

结论：WD 患者多个脑区存在静息态内部功能活动水平的升高和降低，其中右侧辅助运动区、左侧楔前叶内在自发活动水平的改变及右侧中央后回、右侧枕中回的局部神经元活动一致性降低与血清铜、24h 尿铜及铜蓝蛋白等临床化验指标存在相关性。

PO-0370

影像标志物频率：脑出血后血肿扩大的新预测指标

宋磊、郭婷婷、邱晓明
黄石市中心医院

背景：血肿扩大 (Hematoma expansion, HE) 是脑出血 (Intracerebral hemorrhage, ICH) 患者致残的重要原因。本研究旨在确定影像标志物频率 (Frequency of imaging markers, FIM) 对 HE 的影响并评估其性能。

方法：2018 年 1 月至 2022 年 8 月期间，六个中心连续纳入了发病后 6 小时内的幕上 ICH 患者。我们将 FIM 定义为影像标志物数量与发病至初始成像时间之比。我们进行了多变量分析以确定 FIM 与 HE 之间的关系。受试者工作特征曲线用于确定可预测 HE 的 FIM 最佳阈值。此外，还计算了 FIM 的灵敏度、特异度、阳性和阴性预测值 (Positive and negative predictive values, PPV 和 NPV) 以及曲线下面积 (Area under the curve, AUC)。

结果：共有 1488 名 ICH 患者符合纳入条件，其中 418 人发生了 HE。多变量分析显示，年龄 (odds ratio [OR] = 0.98, 95% confidence interval [CI]: 0.97-0.99)、男性 (OR = 1.73, 95% CI: 1.28-2.35)、格拉斯哥昏迷量表评分 (OR = 0.87, 95% CI: 0.83-0.92)、脑室内出血 (OR = 0.42, 95% CI: 0.28-0.62) 和 FIM (OR = 7.82, 95% CI: 5.86-10.42) 是 HE 的独立预测因素。FIM 水平的最佳临界点为 0.63，其预测 HE 的灵敏度、特异度、PPV、NPV 和 AUC 值分别为 0.69、0.89、0.71、0.88 和 0.83。

结论：FIM 是预测 HE 的重要指标。它是治疗 HE 和改善 ICH 患者管理的一个强大且易于操作的工具。

PO-0371

环境因素对人脑白质纤维各向异性分数的影响

谢颖滢、刘嘉玮、于春水
天津医科大学总医院

目的：

作为弥散张量成像数据最常用的指标之一，各向异性分数 (fractional anisotropy, FA) 测量了脑内水分子在任何单一方向上的流动性，反映了白质的微观结构完整性，能刻画髓鞘形成、纤维密度和一致性等方面。白质 FA 值的减低常常与一些疾病密切相关。许多环境因素可以影响人脑形态结构，然而，环境因素是否影响人脑白质 FA 值及其具体的影响模式仍然未知。

方法：

基于 32535 名被试的环境数据，通过确定性因子分析，共构建了 7 个外环境因子，包括多重剥夺指数、地形、交通、绿地和海岸的可及性、街道网络可及性、空气污染、住宅噪声污染。在此基础上，还进一步纳入了 6 个个体环境因子，包括家庭总收入、户外活动时间、手机使用时长、烟草的暴露量、饮酒频率和饮食评分。在脑影像层面，共纳入了 32535 名被试的 48 条白质纤维的 FA 数据。我们将数据分为发现集 (22575 人) 和验证集 (9960 人)，并在发现集数据和验证集数据中单独分析，评估了每个环境因素与 FA 之间的相关性。将在发现集中显著的关联并在验证集中通过验证的结果定义为可靠的结果。将常见的混杂因素置为协变量，包括年龄、性别、中心。

结果：

在发现集中，共得到环境因素与 FA 之间存在 20 对显著相关，并全部在验证集中通过验证。分别是多重剥夺指数与双侧小脑上脚、双侧大脑脚及右侧内侧丘系的 FA 值呈显著负相关；家庭总收入与双侧小脑上脚、双侧大脑脚、双侧内侧丘系、双侧外囊及右侧上纵束的 FA 值呈显著正相关；饮酒

频率与双侧小脑上脚、双侧内侧丘系及右侧皮质脊髓束的 FA 值呈显著负相关；户外活动时间与左侧小脑上脚的 FA 值呈显著负相关。

结论:

研究结果表明, 环境对白质 FA 值可以造成显著的影响, 尤其体现在小脑上脚、大脑脚及内侧丘系。剥夺指数的增加、饮酒频率的增加及户外活动时长的增加会导致对应纤维 FA 值的下降, 家庭收入的增加则有利于白质的完整性。这些影响可以进一步影响人脑健康, 并可能与部分疾病的发生发展有关。这些发现有助于阐明环境对人类大脑的影响, 并为更好的生活方式、环境优化提供指导。

PO-0372

发育过程中脑类淋巴组织间液分区引流的形式及其机制研究

王睿¹、韩鸿宾²

1. 广东省人民医院

2. 北京大学第三医院

目的: 应用磁示踪法探究大鼠发育过程中脑深部类淋巴组织间液 (interstitial fluid, ISF) 引流及脑细胞外间隙 (Extracellular space, ECS) 结构的变化规律, 证实脑深部分区引流的结构基础及影响因素, 阐明发育过程中分区稳态的建立过程并初步探索其对脑功能发育的重要意义。

方法: 本研究运用磁示踪技术及 DECS-mapping 技术解析了 10-80 天发育不同阶段雄性 SPF 级 SD 大鼠的脑 ECS 结构及 ISF 功能变化及脑深部分区稳态建立过程, 之后应用荧光分子探针和光学成像技术验证。应用免疫组化、荧光及光学成像、电镜, 以及活体 DTI 成像等技术探究该分区屏障的结构基础。进一步应用 Morris 水迷宫、三厢交互、肢体放置、斜板实验及抓力实验等行为学检测方法, 探究分区屏障建立前后认知、社交等脑功能发育的情况。

结果: 在大鼠出生后 40 天脑内 ISF 引流途径发生明显改变。在 10-30 天的鼠脑尾状核区 ISF 向皮层和丘脑双向引流, 在 40 天时, 向丘脑区的引流停止, 向皮层区的引流依然保持, 这种引流与成年大鼠 ISF 引流一致。尾状核 ECS 的容积占比在 30 天时与成年一致, 通过光镜和电镜证实, 致密髓鞘纤维束是构成引流屏障的结构基础。在分区屏障建立后, 大鼠认知、社交、运动功能发育完善, 与成年大鼠相比无统计学差异。

结论: 本研究明确了脑 ISF 分区引流形成的时间, 阐明了活体状态下不同发育阶段脑深部 ECS 结构及其内 ISF 引流特征。证实了髓鞘发育成熟, 鼠脑分区稳态建立, 此时鼠脑的认知、社交、运动及感觉功能均发育完善, 提示分区稳态建立是脑功能发育的重要结构基础。

PO-0373

基于度中心度和格兰杰因果分析对慢性下腰痛患者的脑网络有效连接变化研究

陈慧、孔令军、喻益峰、李云龙、詹松华、谭文莉

上海中医药大学附属曙光医院

【目的】 采用度中心度 (DC) 和格兰杰因果分析 (GCA) 方法研究慢性下腰痛 (CLBP) 患者脑功能网络有效连接变化。【方法】 纳入 21 名 CLBP 患者及 21 名年龄、性别、受教育程度相匹配的健康被试, 行静息态功能磁共振扫描, 选取组间 DC 值有统计差异的脑区为种子点进行全脑体素 GCA 分析, 计算有统计学差异的脑网络参数值, 分析各网络参数值与视觉模拟评分 (VAS)、Oswestry 功能障碍指数 (ODI) 相关性。【结果】 CLBP 组与对照组比较, VAS 及 ODI 评分差异有统计学意义 ($p < 0.05$); DC 组间分析结果显示, 与对照组比较, CLBP 组右侧辅助运动区 DC 值降低 (GRF 校正, 体素水平 $p < 0.01$, 团块水平 $p < 0.05$, 双侧); GCA 组间分析结果显示,

CLBP 组右侧辅助运动区到全脑连接效应增强的脑区为左侧前扣带回, CLBP 组全脑到右侧辅助运动区连接效应减弱的脑区为右侧眶额皮层、左侧眶额皮层、左侧内侧额上回、左侧中扣带回、左侧颞中回 (GRF 校正, 体素水平 $p < 0.01$, 团块水平 $p < 0.05$, 双侧); 相关分析显示, 右侧右侧辅助运动区到左侧前扣带回的有效连接与 VAS、ODI 评分呈正相关, 余网络参数值与 VAS、ODI 评分呈负相关 ($p < 0.05$)。【结论】DC 反映了节点在整个大脑网络中的重要性, CLBP 患者右侧感觉运动区的 DC 值较健康组显著降低, 即这一脑区与其他脑区功能连接数量减低, 反映了 CLBP 患者存在运动执行及控制能力的损害。GCA 计算不同脑区网络之间的有效功能连接, CLBP 患者在涉及认知控制网络、疼痛网络、默认网络、突显网络等多个重要脑区间出现有效功能连接异常改变, 主要表现为左侧大脑半球为主的负性情绪/情感、疼痛调节网络的信息通路连接增强和认知控制网络信息通路连接减弱。且随着病情加重, 患者的负性情绪进一步加重, 认知控制能力进一步减退。这些结果为我们研究治疗 CLBP 的神经生理机制奠定了基础。

PO-0374

基于多参数 MRI 的机器学习检测原发性中枢神经系统淋巴瘤 BCL-6 过表达状态

王明霄、刘国莉、张楠、李艳华
中国人民解放军总医院第一医学中心

目的: 利用多参数磁共振机器学习技术检测原发性中枢神经系统淋巴瘤的 BCL-6 过表达状态

方法: 回顾性分析 2013 年 1 月至 2023 年 7 月在解放军总医院第一医学中心病理诊断为原发性中枢神经系统淋巴瘤 (Primary central nervous system lymphoma, PCNSL) 患者, 共纳入患者 65 例, 病灶 101 个。根据免疫组化信息, 将患者分为 BCL-6 过表达组 ($n_{\text{患者}}=40$, $n_{\text{病灶}}=72$) 与 BCL-6 非过表达组 ($n_{\text{患者}}=25$, $n_{\text{病灶}}=39$)。应用 ITK-SNAP 4.0 对术前 T2、T2Flair 及 ADC 图像进行感兴趣区勾画及特征的提取。通过 Python 代码调取 Pyradiomics 进行影像组学特征筛选, 每个序列提取 904 个特征。利用 t 检验与组内相关系数 (intraclass correlation coefficient, ICC) 筛选特征, 采用最小绝对收缩和选择算子对特征进行过滤。所有病例以 8: 2 随机分为训练组与测试组, 使用逻辑回归 (Logistic regression, LR)、支持向量机 (Support vector machine, SVM) 朴素贝叶斯 (Naive Bayes, NB)、近邻算法 (K-nearest Neighbor, KNN) 和多层感知器 (Multilayer Perceptron, MLP) 5 种分类器学习算法进行机器学习, 利用 AUC 值来评估影像序列联合分类器的检测性能, 获得最佳分类器。

结果: 基于影像组学的 30 个模型均可以不同程度的识别 BCL-6 过表达状态, 不同序列和分类器的组合可提高模型性能。多参数序列 (T2WI+T2Flair+ADC) 联合 SVM 机器学习的 AUC 最大, 在训练集与验证集检测 BCL-6 过表达分别为 0.945 (95%置信区间: 0.883-1.000) 及 0.865 (95%置信区间: 0.703-1.000), 准确率分别为 92.6%和 81.0%, 灵敏度分别为 98%和 92.7%, 特异度分别为 83.9%和 87.5%, 为最优机器学习模型。

结论: 多序列 MRI 图像的影像组学模型可无创检测 BCL-6 的过表达状态。

PO-0375

基于影像组学的多模态 MRI 成像技术在 脑胶质瘤基因分型中的应用

刘晓虎
成都市第五人民医院

目的: 探讨基于影像组学的多模态 MRI 成像技术在脑胶质瘤术前基因分型中的应用价值, 进而指导临床手术方案的制定以及对肿瘤患者预后疗效的评估。

方法: 收集我院 2021.10-2023.7 经手术病理证实的胶质瘤的患者 34 例, 所有患者均为新发肿瘤病例, 且术前未进行过放疗、化疗等治疗, 并根据最终病理结果将胶质瘤患者分为 IDH 基因突变阳性组 14 例和 IDH 基因突变阴性组 20 例; 所有患者均采集了多模态 MRI 序列 (T1WI、T2WI、T2-FLAIR 及 DWI、CE-T1WI), 使用 3D-Slicer 提取两组病人多模态磁共振各序列中的肿瘤病灶特征, 并用 Lasso 软件进行降维处理, 对降维后的特征再进行 logistic 多元回归相关性分析, 从而筛选出具有诊断价值且与胶质瘤 IDH 基因突变显著相关的影像组学特征, 最后运用受试者工作特征 (ROC) 曲线对特征参数的诊断效能进行分析。

结果: 在所有获得的影像组学特征中, CE-T1WI 序列提取特征中的 Gray Level Non-Uniformity Normalized (灰度非均匀归一化) 与胶质瘤 IDH 基因突变相关性最显著, 对胶质瘤的基因分型诊断效能最高, 其 ROC 的曲线下面积 (AUC) 为 0.898。

结论: 在多模态磁共振成像技术的基础上结合影像组学技术, 能够筛选出与胶质瘤的基因分型显著相关的影像组学特征, 其中 CE-T1WI 序列上筛选出的 Gray Level Non-Uniformity Normalized (灰度非均匀归一化) 参数对胶质瘤基因分型的诊断效能最高。

PO-0376

3D-ASL 联合 SWI 对急性缺血性脑卒中的长期预后评估价值

吕鸿泽、陈文
十堰市太和医院 (湖北医药学院附属医院)

目的: 对于急性脑梗死患者同时联合应用 ASL 和 SWI 成像技术, 对比分析其影像学表现, 探讨其能否为缺血性脑卒中诊断和预后评估提供新的见解, 最终提高对缺血性脑卒中患者的预后预测的准确性。**方法:** 纳入临床发病至接受 MRI 检查间隔 72h 内的急性脑梗死患者共 60 例, 所有患者采用 GE3.0T 磁共振成像系统行常规 MRI 序列 (T1WI、T2WI、DWI、FLAIR)、MRA、SWI 和 3D-ASL 检查。通过后处理得到 3D-ASL 伪彩图, 根据梗死核心区周围 3D-ASL 伪彩图上是否出现蛇形条状高信号, 将患者分为动脉传输伪影 (Arterial transit artifact, ATA) 阳性组和 ATA 阴性组; 通过 SWI 图观察梗死灶周围静脉显示情况, 将患者分为周围静脉增粗组和周围静脉正常组, 利用统计学分别计算与梗死面积、入院当日临床 NIHSS 评分及患者预后的相关性。3 个月后 mRS 评分为 0-2 分定义为预后良好, mRS 为 >2 分定义为预后较差。**结果:** 共 30 名患者预后情况较好 (mRS 评分 0-2 分), 30 名患者预后较差 (mRS 评分 >2 分)。出现 ATA 的患者共 19 名, 在预后较好的患者中出现 ATA 的患者为 15 名, ATA 阳性与预后较好有统计学意义 ($p < 0.05$), ATA 阳性与梗死灶面积及入院 NIHSS 评分无统计学意义 ($p > 0.05$)。未出现梗死周围静脉明显增粗的患者共 36 名, 预后较好的患者未出现周围静脉增粗的患者共 28 名, 未出现周围静脉增粗与预后较好有统计学意义 ($p < 0.05$), 与梗死灶面积及入院 NIHSS 评分无统计学意义 ($p > 0.05$)。同时有 ATA 阳性和梗死周围未出现周围静脉增粗的患者预后好于单独出现 ATA 阳性或单独出现梗死周围未出现周围静脉增粗的患者, 差异具有统计学意义 ($p < 0.05$)。**结论:** ASL 通过梗死核心周围区域血液灌注提示的信息, 能够真实客观呈现出血液动力学信息, SWI 能够显示梗死灶周围异常静脉, ASL 和

SWI 的联合,可以更好地评估侧支循环代偿建立状态以及缺血半暗带,对于了解急性脑卒中患者病情现状及长期预后评估提供客观依据,便于制定更加准确的治疗方案。

PO-0377

终末期肾病血液透析患者认知波动与静息态 MRI 脑损伤的相关性研究

谢青^{1,2}、敬丽²、伍建林²

1. 中山大学附属第五医院

2. 大连大学附属中山医院

目的: 基于 rs-fMRI 的局部一致性 (ReHo) 方法探讨静息状态下终末期肾病 (end-stage renal disease, ESRD) 维持性血液透析 (maintenance hemodialysis, MHD) 患者透析后 1 小时、24 小时脑自发性活动变化及其与认知功能的相关性。方法: 对 21 例 MHD 患者透析后 1h、24h 和 21 例年龄、性别相匹配的健康志愿者 (HC) 采集 fMRI, 并对透析后 1h 及 HC 组行 MoCA 总体认知及多项专项认知功能测评、对透析后 24h 行 TMT_A、DST 专项认知功能测评, 并采集 MHD 患者透析后 1h 内生生化指标。采用 DPARSF 软件包计算 MHD 及 HC 组全脑 ReHo 统计图。采用独立样本 t 检验比较 MHD 与 HC 组的全脑 ReHo 值, 采用配对 t 检验比较 MHD 患者透析后 1h、24h 的全脑 ReHo 值, 提取 MHD 组具有显著差异脑区的 ReHo 值, 并与认知功能测试评分、生化指标行 Pearson 相关性分析, 以 $P < 0.05$ 为差异具有统计学意义。结果: MHD 患者透析后 1h、24h TMT_A 评分差异具有显著统计学意义 ($P < 0.001$)。与 HC 组比较, MHD 患者透析后 1h 左侧枕中回、右侧颞下回的 ReHo 值减低, 透析后 24h 右侧颞上回的 ReHo 值明显减低, 差异均具有显著统计学意义 ($P < 0.001$)。与 MHD 患者透析后 1h 比较, MHD 患者透析后 24h 右侧颞中回 ReHo 值升高, 差异具有统计学意义 ($P < 0.05$)。结论: ESRD 维持性血液透析患者在一个透析间期的不同时间段存在自发性脑活动的改变, 并伴认知功能的波动; 血液透析及透析后的继发反应可能是引起这些改变的主要因素。

PO-0378

深髓静脉评分与白质高信号负荷相关性研究

蓝海源、雷新军、汪庆春

丽水市中医医院

目的: 探讨深部髓静脉 (DMV) 评分与白质高强度负荷 (WMH) 的相关性。

方法: 回顾性分析本院 130 例患者的临床及影像学资料, 分别在磁敏感图像上 (SWI) 和 FLAIR 图像上对 DMV 和基底节区高信号 Fazekas 评分 (PWMH)、深部脑白质高信号 Fazekas 评分 (DWMH) 进行评分, 应用 ITK-SNAP 软件对 WMH 进行体积测量, 分析 DMV 与 WMH Fazekas 评分和 WMH 体积的关系。

结果: 本研究共纳入 130 例患者, 平均年龄 60 ± 11 岁, 女性 61 例 (46.9%), 高血压 71 例 (54.6%), DMV 评分中位为 4 (1, 7), 平均 WMH 体积为 12.34 ± 12.54 ml。WMH 体积、PWMH 和 DWMH Fazekas 评分与年龄、DMVcore 相关 ($P < 0.05$), 高血压与 PWMH 和 DWMH Fazekas 评分相关 ($P < 0.05$), 但是与 WMH 体积无关 ($P > 0.05$)。多变量分析后, DMV 评分和年龄与 WMH 体积、PWMH 和 DWMH Fazekas 评分独立相关 ($P < 0.05$)。

结论: DMV 评分与 WMH 负担相关。

PO-0379

ADC 直方图分析和 ADC 直接测量法对 IDH1 突变型胶质瘤中 ATRX 基因突变的预测价值

丁玉洁

华中科技大学同济医学院附属同济医院

目的：应用表观弥散系数（ADC）直方图分析和 ADC 直接测量法预测成人异柠檬酸脱氢酶 1（IDH1）突变型胶质瘤中 α -地中海贫血/精神发育迟滞综合征 X 染色体相关蛋白（ATRX）基因突变的情况，并比较两种方法的诊断效能。

方法：本研究共纳入 71 例病理证实为弥漫性胶质瘤且 IDH1 基因分型为突变型的成人患者。他们均在我院行术前脑磁共振检查，获得 T1WI、T2WI、FLAIR 以及弥散加权成像（DWI）影像学数据。根据 ATRX 基因突变情况，30 例 IDH1 突变型胶质瘤患者被分为 ATRX 基因突变（IDH+/ATRX-）组，41 例被分为 ATRX 基因未突变（IDH+/ATRX+）组。参考 T2WI 和 FLAIR，在 ADC 图像上逐层勾画肿瘤实体成分的感兴趣区（ROI）来提取胶质瘤的全容积直方图参数。另外，将三个圆形 ROI 放置在 ADC 图肿瘤实体成分中视觉感知最低的部分，统计最小 ADC 值和平均 ADC 值。用受试者工作特征（ROC）曲线分析和曲线下面积（AUC）评价两种方法的诊断效能。

结果：IDH+/ATRX-组的 ADC 直方图参数中能量 ADC_{Energy} 、熵 $ADC_{Entropy}$ 、最大值 ADC_{Max} 、第十百分位数 ADC_{10th} 、第九十分位数 ADC_{90th} 、最大值 ADC_{Max} 、均值 ADC_{Mean} 、中值 ADC_{Median} 、四分位距 $ADC_{Interquartile\ Range}$ 、极差 ADC_{Range} 、平均绝对离差 ADC_{MAD} 、均方根 ADC_{RMS} 、方差 $ADC_{Variance}$ 以及直接测量法中的最小 ADC 值和平均 ADC 值均高于 IDH+/ATRX+组，差异具有统计学意义（ $P<0.05$ ）。ADC 直方图参数（ ADC_{90th} 、 ADC_{Energy} ）与直接测量法获得的平均 ADC 值相结合的 Logistic 回归模型对 IDH+/ATRX+和 IDH+/ATRX-的鉴别诊断效能最高（ $AUC=0.963$ ），灵敏度为 0.867，特异度为 0.976。

结论：ADC 直方图分析和 ADC 直接测量法对 IDH1 突变型胶质瘤中 ATRX 基因突变情况的预测具有潜在价值，两者结合的诊断效能更佳，有助于临床制定个性化诊疗方案。

PO-0380

颈内动脉迂曲与脑小血管病影像标志的关系研究

张丽娟、刘筱霜、龚贝贝、罗天友、吕发金、方维东

重庆医科大学附属第一医院

目的：探讨颈内动脉迂曲与脑小血管病（cerebral small vessel disease, CSVD）影像标志及认知功能改变的相关性。

方法：前瞻性分析行头颈 MRA 检查发现颈内动脉迂曲指数（internal carotid tortuosity index, ICTI） ≥ 20 的 58 例 ICA 迂曲组患者，纳入同一时期 ICTI <20 且年龄、性别和受教育年限匹配的 59 例患者作为对照组。对所有受试者进行临床资料收集、认知功能评价及头颅 MRI 图像评价。对 CSVD 影像标志包括脑白质高信号（WMH）、扩大血管周围间隙（EPVS）及腔隙灶进行视觉评分，对 WMH 体积进行定量计算。比较 ICA 迂曲组与对照组间 WMH 体积、WMH 评分、EPVS 评分、腔隙灶及认知功能评分的差异。对 ICTI 与 WMH 体积、WMH 评分、EPVS 评分及 MoCA 量表评分进行相关性分析。依据 WMH 及 EPVS 严重程度不同，将 WMH 及 EPVS 分为 I 级、II 级。采用多因素 logistic 回归分析 II 级 WMH 和 II 级 EPVS 的独立危险因素。

结果：ICA 迂曲组侧脑室旁 WMH 体积（ $P=0.011$ ）及 WMH 总体积（ $P=0.011$ ）大于对照组，深部白质 WMH 体积在两组间无统计学差异（ $P=0.055$ ）。ICA 迂曲组 WMH 评分总分高于对照组（ $P=0.005$ ）。ICA 迂曲组基底节区 EPVS 评分（ $P=0.005$ ）及 EPVS 总分（ $P=0.008$ ）高于对照

组, 脑白质区 EPVS 评分在两组间无统计学差异 ($P=0.096$)。ICA 迂曲组 MoCA 量表评分低于对照组 ($P<0.001$), MMSE 量表评分在两组间无统计学差异 ($P=0.144$)。ICTI 与 WMH 体积 ($P=0.0035$)、WMH 评分 ($P<0.0001$) 及 EPVS 评分 ($P=0.0025$) 均呈正相关, ICTI 与 MoCA 量表评分呈负相关 ($P<0.0001$)。ICTI ($OR=2.068$, $P<0.001$; $OR=2.139$, $P<0.001$) 是 II 级 WMH 的独立危险因素。ICTI ($OR=1.806$, $P=0.002$) 是 II 级 EPVS 的独立危险因素。

结论: 颈内动脉迂曲度增加与脑白质高信号和扩大血管周围间隙的增多以及认知功能下降有关。

PO-0381

与认知功能障碍相关的脑小血管病患者异常神经血管耦合随访研究

胡颖、孙雅文、汪耀、张一铭、周滢
上海交通大学医学院附属仁济医院

目的: 利用多模态磁共振成像技术, 研究与认知功能障碍相关的脑小血管病 (CSVD) 患者在 1-2 年的神经血管耦合 (NVC) 变化, 以纵向方式对 CSVD 患者发病机制进行表征, 为今后疾病的预防及治疗提供新思路。

方法: 分析在上海交通大学医学院附属仁济医院就诊的脑小血管病患者 42 例, 其中轻度认知障碍患者 (MCI) 22 例, 无认知障碍者 (NCI) 20 例。对所有受试者进行基线期和 1-2 年随访期共两次的神经心理学量表评估及静息态功能磁共振成像、三维伪连续性脉冲动脉自旋标记磁共振扫描。最终获得基线期和随访期的局部一致性 (ReHo) 及脑血流量 (CBF) 指标。通过 CBF-ReHo 相关系数评估全脑灰质、九个子网络模块以及局域脑区的神经血管耦合的变化。最后, 采用偏相关分析评估 NVC 改变与认知功能改变之间的关系, 控制性别、年龄和教育年限。

结果: 在 1-2 年随访期间, MCI 组腹侧注意力网络 (VEN) 和皮层下核团的神经血管耦合值显著降低, 默认模式网络 (DMN) 的神经血管耦合值异常升高。此外, NCI 患者颞上回、颞中回亚区的神经血管耦合值在随访期间显著降低, 且左侧颞上回亚区 NVC 的改变与整体认知表现的改变呈正相关。

结论: MCI 患者皮层下核团、VEN、DMN 的 NVC 仍处于随时间推移的进行性损伤过程中。MCI 患者的模块化 NVC 随着认知障碍的病程进展, 而相应的 NCI 变化不明显。此外, CSVD 患者 NVC 的改善可能有利于认知功能的改善。NVC 模式可被认为是监测 CSVD 中脑代谢、血流和神经环路变化等复杂病理的特异性和敏感性工具。CSVD 特定模块和局部 NVC 功能障碍与认知障碍的发展相关。结合 BOLD 和 ASL 方法, 对 CSVD 高危患者进行 NVC 特征分析可能有助于靶向药物和神经治疗的开发。

PO-0382

基于 NEPA 表观扩散系数值对高级别胶质瘤与孤立性脑转移瘤的鉴别价值

范军坤、哈传传、马芳芳、王小雷、徐东亮、赵露露
太和县人民医院

摘要: 目的 探讨基于瘤周非强化区域 (NEPA) 表观扩散系数值对高级别胶质瘤与孤立性脑转移瘤的鉴别价值。方法 选取我院 2019 年 1 月至 2023 年 9 月期间收治的 48 例高级别胶质瘤及孤立性脑转移瘤患者资料进行回顾性分析, 分为胶质瘤组 (19 例) 和转移瘤组 (29 例), 所有患者治疗前均行 MRI 常规平扫、DWI 及增强检查。使用逻辑回归算法生成 meanADC_minADC 值联合参

数, 比较胶质瘤组与转移瘤组 meanADC 值、minADC 值及 meanADC_minADC 值组间差异, 通过受试者工作特征 (ROC) 曲线评价 meanADC 值、minADC 值及 meanADC_minADC 值对高级别胶质瘤与孤立性脑转移瘤的鉴别诊断价值, 采用 Delong 检验比较三种 ROC 曲线的诊断效能, 使用 Pearson 相关分析检验胶质瘤组与转移瘤组不同 ADC 值参数与瘤周距离的相关性。结果 胶质瘤组的 meanADC 值、minADC 值及 meanADC_minADC 值均小于转移瘤组 ($P<0.05$); meanADC 值、minADC 值及 meanADC_minADC 值鉴别高级别胶质瘤与孤立性脑转移瘤的 AUC 分别为 0.938、0.967 和 0.971, 当阈值取 $1.505\times 10^{-3}\text{mm}^2/\text{s}$ 、 $1.385\times 10^{-3}\text{mm}^2/\text{s}$ 和 0.568 时, 对应灵敏度和特异度分别为 96.6%和 84.2%、93.1%和 89.5%、89.7%和 94.7%, 三种 ROC 曲线的诊断效能无显著差异 ($P>0.05$); 胶质瘤组的 meanADC 值、minADC 值与瘤周距离呈正相关 ($r=0.336, P<0.05; r=0.476, P<0.01$), 转移瘤组的 ADC 值参数与瘤周距离不存在相关性 ($P<0.05$)。结论 瘤周非强化区域 meanADC 值、minADC 值及 meanADC_minADC 值在鉴别高级别胶质瘤与孤立性脑转移瘤中均表现出较好的诊断效能, 可为临床医生选择最佳治疗方案提供量化参考价值。

PO-0383

影像新型评分预测血管内再通成功的后循环卒中的预后

白博锋^{1,2}、王立学²、黄珊珊¹、李永斌¹、郑卓肇²

1. 西安市第一医院

2. 北京清华长庚医院

摘要: 目的 探讨神经影像新评分在成功再通后急性椎基底动脉闭塞(VBAO)患者中的预后价值。方法 连续收集接受血管内治疗(EVT)并成功再通(改良的脑梗塞溶栓治疗(mTICI) 2b-3)的 VBAO 患者, 进行回顾性分析。基于基线 DWI 序列, 使用新型后循环评分(Novel-PC score)、急性卒中预后早期 CT 评分(pc-ASPECTS) 和脑干评分(BSS)分别评估后循环梗死情况。将 90 天改良 Rankin 量表评分(mRS)≤2 定义为良好结果。通过受试者工作特征(ROC)曲线分析来评估三种评分的预测价值。结果 共 83 例患者符合条件。功能独立组 (MRS≤2)与不良组之间 N-PCS 评分(中位数 [四分位数范围], 2[1-2]比 4[2-5]; $P<0.001$)有统计学意义。多因素 Logistic 回归分析显示, 年龄 (OR, 1.078; 95%CI, 1.02-1.14; $P=0.006$)、基线美国国立卫生研究院卒中评分 (NIHSS) (OR, 1.12; 95%CI, 1.04-1.20; $P=0.004$)和 Novel-PC score (OR, 2.65; 95%CI, 1.20-5.87; $P=0.016$)是预后良好的独立预后因素。结论 神经影像新评分可预测血管再通成功的 VBAO 患者预后。

PO-0384

基于 MEGA-PRESS 脉冲序列的白质高信号与执行功能相关性研究: 前扣带回皮层中 GABA 水平的中介作用

符晓娜¹、孙鹏²、张新利¹、秦倩¹、陆珏¹、朱冬勇¹、汪晶¹

1. 华中科技大学同济医学院附属协和医院放射科

2. 飞利浦(中国)投资有限公司北京分公司

目的

白质高信号(WMH)与认知功能领域, 特别是执行功能息息相关。大量研究表明颅脑灰质和白质具有密切关系, 皮层改变是导致 WMH 患者认知能力下降的中介因素。因此, 颅脑皮层对于 WMH 患者认知能力具有关键作用。 γ -氨基丁酸(GABA)作为中枢神经系统中重要的氨基酸神经递质,

对中枢神经系统的稳定至关重要。本研究旨在探讨 WMH 患者前扣带回皮层 (ACC)、后扣带回皮层 (PCC) 中的 GABA 水平,并探索其是否在 WMH 体积与执行功能间起到中介作用。

方法

本研究最终前瞻性纳入 87 名 WMH 患者,包括 46 名轻度和 41 名中-重度 WMH 患者。所有参与者均接受了神经心理学评估,并进行基于 MEGA-PRESS 序列的磁共振波谱扫描。对比了轻度、中-重度 WMH 患者两组间 ACC 和 PCC 内 GABA+/Cr、Glx/Cr 水平、全脑 WMH 体积以及执行认知领域的差异。采用偏相关分析探索 WMH 参与者中代谢物水平、全脑 WMH 体积和执行认知域的相关性。中介分析旨在进一步研究皮层内的 GABA 水平是否在 WMH 患者全脑 WMH 体积与执行功能间发挥中介作用。

结果

与轻度 WMH 患者相比,中-重度 WMH 患者的平均年龄较大 ($p=0.013$),执行功能差 ($p=0.004$),且中-重度 WMH 患者 ACC 中的 GABA+/Cr 低 ($p=0.034$)。在所有 WMH 患者中,全脑 WMH 体积与 ACC 中 GABA+/Cr 水平 ($r=-0.286$, $p=0.008$) 和执行功能 ($r=-0.397$, $p<0.001$) 呈负相关。两个感兴趣区域的 GABA+/Cr 与执行功能 (ACC, $r=0.342$, $p=0.001$; PCC, $r=0.241$, $p=0.027$) 存在显著正相关。此外,中介分析表明在 WMH 患者中,ACC 中的 GABA+/Cr 水平介导了全脑 WMH 体积与执行能力间的相关性 (间接效应 ab : effect= -0.020 , BootSE= 0.010 , 95% CI: -0.042 , -0.004)。

结论

ACC 中的 GABA+/Cr 水平在 WMH 患者执行功能中起关键作用,其可能成为 WMH 患者执行功能衰退发生和发展的保护因素或潜在靶点。

PO-0385

双能量 CT 对急性缺血性脑卒中血管内治疗术后梗死进展评估的价值

顾越、赵义、刘振生、瞿航、王苇
扬州大学附属医院

目的 探讨双能量 CT (DECT) 在急性缺血性卒中(AIS)血管内治疗术后早期梗死进展评估中的临床应用价值,从而更好的指导临床后续治疗方案的选择和预后判断。

方法 连续收集 50 名 AIS 并接受血管内治疗的患者,于术后立即行 DECT 扫描,经后处理获得混合能量图(MIX),虚拟平扫图(VNC)及脑水肿图 (X-Map),经综合分析诊断,以术后 24~48h 随访 CT 平扫或磁共振 DWI 序列上急性梗死区域为标准进行对照,测量并计算 MIX、VNC 及 X-Map 序列上早期梗死区的平均组织密度及脑梗死对侧差异(CID),并采用 ROC 分析,计算最大约登指数用于截断分析各序列对早期梗死进展发现的敏感性、特异性;两名医师独立评估各序列与随访 CT 或 MRI DWI 序列 Aspect 评分一致性以及各序列主观梗死视觉对比度、图像噪声评分。

结果 与 MIX 和 VNC 相比, X-Map 图具有最低的平均梗死区密度 (X-Map: 21.95 ± 6.73 HU; VNC: 25.00 ± 3.90 HU; MIX: 30.83 ± 6.86 HU)、最高的 CID(X-Map: 13.21 ± 5.92 HU; VNC: 7.09 ± 3.24 HU; MIX: 3.05 ± 5.78 HU)和主观梗死视觉对比,但其图像噪声也最严重; X-Map 序列具有最高的梗死检出率 (AUC= 0.96 ; $p<0.01$), 敏感度为 93%和特异度为 88%,截断值 <30.5 Hu; 与随访 CT 或 MRI DWI 序列对照,两名医师对 VNC 上急性梗死区域 ASPECT 评分的 ICC 较 X-Map 和 MIX 更高 (0.88 vs 0.70 vs 0.20 ; 0.86 vs 0.72 vs 0.14)。

结论 利用双能量的 VNC 及 X-Map 序列可以较常规 CT 图像更好的评估急性缺血性卒中血管内治疗术后早期梗死的进展。

PO-0386

癫痫患者中胼胝体形态的改变

顾晓瑜、江林
遵义医科大学第三附属医院

目的：探讨癫痫患者中胼胝体的形态是否发生变化。

方法

参与者：45 例癫痫患者和 49 例人口统计学及合并症匹配的健康对照组。

MRI 场强/序列：3.0 T MR 扫描仪获取 3D T1-weighted

数据获取：计算正中矢状面胼胝体面积、周长、圆整度、长度及 Witelson 与 Hampel 方案各个亚分区的面积(Witelson 等人将胼胝体分为 7 个亚区，即 W1 = 嘴部，W2 = 膝部，W3 = 嘴体部，W4 = 前中体部，W5 = 后中体部，W6 = 峡部，W7 = 压部；Hampel 等人将 CC 划分为 5 个亚区，包括 H1 = 膝部，H2 = 前中体部，H3 = 后中体部，H4 = 峡部，H5 = 压部)。

统计检验：独立的两样本 T 检验、卡方检验、Mann-Whitney U 检验。p 值 < 0.05 认为有统计学意义。

结果：与对照组相比，癫痫患者胼胝体面积、圆整度、W1、W4、W5、W7、H1、H2、H3、H5 减少具有统计学意义，其中以 W4、H2 的差异最为显著；胼胝体周长、长度、W2、W3、W6、H4 的差异无统计学意义。

结论：相比于健康对照组，癫痫中胼胝体 W4、H2 面积的减少具有统计学意义。先前的文献提出胼胝体的完整性和大小与神经和精神疾病有关，如帕金森病、癫痫和精神分裂症，但目前的研究较少聚焦于癫痫中胼胝体的改变。在我们的初步研究中发现癫痫患者的胼胝体形态改变具有统计学意义，即胼胝体形态的改变也可能同样发生在癫痫病人中。未来的研究可以增加样本量以验证该结论并拓展研究，如癫痫患者中胼胝体的连接是否发生改变。

PO-0387

基于磁共振结构成像评价血管性认知障碍及其中医证型的相关性研究

杨玉婵、张颖颖、徐春阳、谭文莉、詹松华
上海中医药大学附属曙光医院

目的 分析基于体素形态学(Voxel Based Morphometry, VBM)指标与临床资料、中医证型之间的相关性，探究 VCI 患者的脑结构影像学特征及其规律。

方法 收集 2021 年 1 月-2022 年 12 月间我院诊断为 VCI 患者 217 例(男：111 例，女：106 例)。采用蒙特利尔认知量表对其认知障碍程度分级。根据中医辨证标准的证候分型主要分为瘀血阻络证、肾精亏虚证、肝肾阴虚证和痰浊阻窍证。分析认知障碍程度分级的脑结构影像学特点，并将结构影像学差异脑区与临床指标做相关性。进一步分析不同中医证候类型 VCI 患者的临床与结构影像特点。

结果 ①根据 MoCA 量表评分，将 217 患者分为轻、中、重三组。轻度组和中度组各 73 人，重度组 71 人。3 组颅脑总体积(TIV)、灰质总体积(GMV)差异均具有统计学意义($P < 0.05$)。3 组进行 TIV、GMV 的事后分析，并进行两两的对比，轻度组与重度组间 TIV、GMV 有显著性差异($P < 0.001$)；轻度组和中度组，以及中度组和重度组之间的 TIV 和 GMV 均无显著差异($P > 0.05$)。

②GMV 在轻度组与重度组差异脑区分布特点, 重度组为右颞下回、右颞中回, 右额中回、右额下回, 右海马、右补充运动区、左中央旁小叶脑灰质体积与轻度组相比明显缩小 ($P<0.001$)。将所有差异脑区的灰质体积与 MoCA 量表评分进行偏相关分析。患者脑灰质总体积、右海马区灰质体积、右额中回灰质体积、右补充运动区灰质体积与 MoCA 量表得分呈正相关 (P 值均匀 $P<0.001$)。

③中医证候分型无争议的患者包括瘀血阻络证、肾精亏虚证、肝肾阴虚证和痰浊阻窍证各 40 人。四种证候类型的 MoCA 评分之间差异有统计学意义 ($P<0.05$)。事后分析显示瘀血阻络证和肾精亏虚证、肝肾阴虚证、痰浊阻窍证之间的评分均有显著差异 ($P<0.05$)，而其余三种证候之间的 MoCA 评分差异没有统计学意义 ($P>0.05$)。

结论 ①右侧海马区、右侧额中回、右侧补充运动区在患者认知功能下降的过程中扮演潜在的神经标志物角色。

②不同证候类型的患者在实质性神经结构出现损害之前, 认知功能障碍已经出现差异。瘀血阻络证与轻度 VCI 的特点较为吻合。

PO-0388

静息态 fMRI 网络效率在 OSAHS 脑类淋巴系统与认知功能关联中的介导作用：一项 DTI-ALPS 研究

熊真亮、柏铭先、曾宪春
贵州省人民医院

目的：阻塞性睡眠呼吸暂停低通气综合征 (OSAHS) 是一种睡眠呼吸紊乱的疾病, 主要病因在于上呼吸道的部分或完全塌陷, 导致夜间睡眠期间出现间歇性低氧血症和再氧合现象。沿脑血管周围空间扩散张量图像分析 (DTI-ALPS) 能间接反映脑类淋巴系统功能受损情况。本研究旨在探索 OSAHS 中脑类淋巴系统功能的改变以及其对脑网络连通性的潜在影响。

方法：本研究共纳入了 20 名 OSAHS 患者和年龄、性别匹配的 18 名健康对照组 (HC)。所有被试均行 GE 3.0T 磁共振 DTI 和静息态 fMRI 检查, 并从 DTI 数据中计算 DTI-ALPS 指数, 从静息态 fMRI 数据计算脑网络属性指标。然后, 评估 OSAHS 患者和健康对照者之间 DTI-ALPS 指数和脑网络属性的差异, 并进行 DTI-ALPS 指数与临床特征之间的相关性分析。此外, 还探讨了脑网络效率在 OSAHS 患者脑类淋巴系统与认知功能关联中的介导作用。

结果：OSAHS 患者的 DTI-ALPS 指数显著低于正常对照 HC 组 (1.27828 vs. 1.49997, $p = 0.00024$)。线性回归分析表明, DTI-ALPS 指数独立影响认知功能 ($\beta = 0.396$, $p < 0.05$)。相关性分析结果显示, DTI-ALPS 指数与呼吸暂停低通气指数 (AHI) 呈负相关 ($r = -0.392$, $p = 0.041$), 与 MoCA 和 MMSE 量表评分正相关 ($p < 0.05$)。同时, 脑网络的全局效率 (Efficiency Global, Eg) 与 OSAHS 患者的 DTI-ALPS 指数正相关 ($r = 0.348$, $p = 0.039$)。此外, 中介效应分析显示, 全局效率 Eg 在脑类淋巴系统障碍对认知功能损害的影响中起到了部分中介作用 (间接效应为 7.03, 95%置信区间 3.98–10.76)。

结论：在 OSAHS 患者中, DTI-ALPS 指数降低, 表明 OSAHS 患者的脑类淋巴系统功能受损。脑类淋巴系统功能障碍可能通过干扰脑网络功能连接来影响 OSAHS 患者的认知功能, 同时也可能是 OSAHS 患者的潜在病理机制之一。DTI-ALPS 指数有望成为 OSAHS 的新兴影像标志物。

PO-0389

MRI 体素内非相干运动(IVIM)评价磁靶向引导骨髓间充质干细胞(BMSCs)治疗新生大鼠 HIBD 微血管密度(MVD)变化

孙闯

大连医科大学附属第二医院

Objective: This study aims to use IVIM to evaluate brain neovascularization in a rat HIBD model after BMSCs treatment. **Methods:** BMSCs were labeled with SPIO-PLL. SD rats were divided into five groups: sham operation group, HIBD group, SPIO-PLL labeled BMSCs group injected into the lateral ventricle, SPIO-PLL labeled BMSCs group injected into the rat tail vein, and magnetic guided BMSCs group injected into the lateral ventricle with SPIO-PLL labeled BMSCs group. MR IVIM was performed on rats in each group. **Results:** HIBD resulted in decreased perfusion fraction of IVIM, and BMSCs treatment could partially reverse the HIBD-induced decrease in perfusion fraction. HIBD resulted in a marked increase in MVD.

Conclusions: BMSCs can effectively enhance brain perfusion within one week after HIBD, which may prevent hypoxia-induced hyper-neovascularization.

PO-0390

基于 CT 灌注特征评估急性缺血性脑卒中患者静脉溶栓后出血转化的价值研究

杨冠华¹、刘燕²、陈勇³

1. 宁夏医科大学总医院 (第一临床医学院)

2. 宁夏医科大学附属石嘴山市第一人民医院放射科

3. 宁夏医科大学总医院放射介入科

【摘要】 目的 探讨基于 CT 灌注特征评估急性缺血性脑卒中患者静脉溶栓后出血转化的价值。方法 回顾性分析 60 例静脉溶栓治疗的 AIS 患者临床及 CT 灌注特征, 根据随访结果分为出血转化组 (HT) 和无出血转化组 (non-HT)。对比 2 组患者临床资料和 CT 灌注参数, 脑血流量 (CBF)、脑血容量 (CBV)、对比剂平均通过时间 (MTT)、对比剂达峰时间 (TTP)、最大平均通过时间 (TMax) 和表面渗透性 (PS) 及其相对值的差异, 分析其与出血转化的相关性。结果 本组 60 例患者中, 发生出血转化 30 例, 未发生出血转化 30 例, 两组在性别、年龄、高血压、糖尿病、高胆固醇血症、发病至入院时间、梗塞部位供血区方面差异无统计学意义 ($P>0.05$)。出血组患者 PS、rPS 值较未出血组患者高, rCBV 较未出血组患者低, 差异有统计学意义 ($P<0.05$)。两组患者 CBF、rCBF、CBV、MTT、rMTT、TMax、rTMax、TTP、rTTP 差异无统计学意义 ($P>0.05$)。PS 与出血具有相关性 (相关系数 $r=0.360$, $P<0.05$), rPS 与出血具有显著相关性 (相关系数 $r=0.865$, $P<0.001$)。rCBV 与出血具有显著相关性 (相关系数 $r=-0.566$, $P<0.001$)。结论 头颅 CT 灌注成像中 PS 值可间接反映缺血性脑卒中患者脑梗死灶血脑屏障通透性, 评估静脉溶栓后出血转化风险具有一定价值。

PO-0391

双能量 CT 评估颈动脉支架最佳单能级研究

田家齐、赵辉林

上海交通大学医学院附属仁济医院

目的 探讨双能量 CT (DECT) 观察颈动脉支架成形术 (CAS) 后支架内管腔的最佳单能级水平。

方法 回顾性分析 2018 年 1 月至 2022 年 12 月于上海交通大学医学院附属仁济医院在 DECT 上行颈部 CTA 检查的 40 例 CAS 术后随访患者的资料, 共 51 枚支架。重建常规 CT 图像和 40~190 keV (间隔 10 keV) 的 16 组虚拟单能量图像 (VMI+)。对各组图像质量进行客观和主观评估, 客观指标包括信噪比 (SNR)、对比噪声比 (CNR)、噪声 (N)。主观评估采用 5 级评分法。采用 Spearman 相关分析探索 SNR、CNR 与能级水平的相关性。组间分析采用 Kruskal-Wallis H 秩和检验, 组内两两比较采用 Dunn-Bonforoni 检验。采用 Friedman 检验比较各组图像质量主观评价的差异。结果 常规 CT 图像与 40~190 keV VMI+图像的 SNR、CNR 总体比较差异均有统计学意义 ($P<0.001$)。40~190 keV VMI+能级水平与 SNR、CNR 呈负相关 (SNR: $r=-0.763$, $P<0.001$; CNR: $r=-0.696$, $P<0.001$)。40 keV VMI+图像的 SNR 和 CNR 均优于常规组和 60~190 keV VMI+组 (P 均 <0.05)。40~50 keV VMI+的 SNR 和 CNR 优于常规组 (P 均 <0.001)。在噪声值比较中, 各组图像之间差异均具有统计学意义 ($P<0.001$), 40 keV VMI+的噪声与常规 CT 及各能级间有统计学差异 (P 均 <0.001), 40~50 keV VMI+的噪声高于常规组 (P 均 <0.05)。在主观评分比较中, 各组图像间差异具有统计学意义 ($P<0.001$)。40 keV VMI+评分高于 80~190 keV VMI+组 (P 均 <0.001), 常规组与 40~70 keV VMI+间无显著差异 (P 均 >0.05)。结论 双能量 CT 40 keV 单能级图像是观察 CAS 术后支架内管腔的最佳单能级水平。

PO-0392

肿瘤栖息弥散加权异质性量化预测胶质瘤预后的临床研究

李文菲¹、韩芳²、夏爽³

1. 秦皇岛市第一医院

2. 大连大学附属中山医院

3. 天津市第一中心医院

目的: 利用数据驱动聚类技术从 DWI 序列中识别出具有相似特征的灌注亚区, 并评估基于这些亚区的弥散异质性与胶质瘤患者预后的关系。

方法: 回顾性收集两家医院的 108 名胶质瘤患者接受了术前 MRI 检查, 分别被纳入研究队列和验证队列。我们采用 k 值为 2 ~ 32 的 k -means 聚类算法来识别一组具有相似灌注特征的体素。为了选择最优的聚类数量 (栖息地), 通过 100 次重复, 使用每个 k 值的平均 Calinski-Harabasz 分数和 Silhouette 系数对聚类结果进行评估。根据获得的栖息地的放射组学特征构建栖息地风险评分 (habitat risk score, HRS)。建立了 HRS, 临床, 联合栖息地和两种传统放射组学风险模型来预测患者无进展生存。使用每个风险评分的中位数截断值将患者分为低风险组和高风险组。

结果: 根据 Calinski-Harabasz 评分和 Silhouette 系数确定最优聚类数为 3 个。在栖息地 1 表现为弥散显著受限, 栖息地 2 表现出轻度受限, 而栖息地 3 表现出无明显受限。在复发的患者子区域中, 栖息地 1 最占优势(45%), 其次是栖息地 2(35%)和栖息地 3(20%)。根据该阈值将患者分为高危组 ($HRS \geq 1.6$) 和低危组 ($HRS < 1.6$), 低危组预后较好。较高的分级 ($p < 0.001$)、IDH 野生型 ($p < 0.001$) 与高风险相关。在验证队列中, 栖息地风险模型在不同风险模型中表现最好。

结论: 弥散异质性的分区量化是预测胶质瘤预后的有效方法, 不同分区与胶质瘤生物学行为密切相关, 栖息地的可视化可能有助于胶质瘤患者个性化决策。

PO-0393

基于影像组学整合模型预测帕金森病从正常认知到轻度认知功能下降

简永劼¹、彭珈璇²

1. 四川护理职业学院附属医院 (四川省第三人民医院)

2. 锦州医科大学

目的: 本研究的目的是建立和验证一个影像组学整合模型与全脑磁共振成像 (MRI), 以预测帕金森无症候患者 (PD-NC) 可能进展为轻度认知障碍 (PD-MCI) 的高风险人群。

方法: 从 PPMI 数据库中分析了 183 例 PD-NC 患者, PPMI 数据库是一个多中心合作的 PD 开源数据库, 其中 50 例在 60 个月的随访期中进展为 PD-MCI 而归为进展组, 剩余 133 例归为非进展组。受试者被分为训练集 (n=129) 和测试集 (n=54)。对于每个患者, 基线 T1WI MRI 图像被自动分割为白质 (WM)、灰质 (GM) 和脑脊液 (CSF), 并从训练组中提取其影像学特征, 在降维之后使用逻辑回归建立影像组学特征。影像组学特征与 symptom1: Initial symptom (at diagnosis)-Resting Tremor 和蒙特利尔 (MoCA) 认知评估量表相结合, 用于构建联合模型。采用受试者工作特征 (ROC) 曲线和试验组数据分别评价模型的诊断准确性和可靠性。此外, 基于从 PD-NC 进展到 PD-MCI 的时间来评估该模型的临床预后功效。

结果: 逐步 Logistic 回归分析显示 symptom1、MoCA 量表和影像组学特征是 PD-NC 进展为 PD-MCI 的独立预测因子。根据其建成联合模型 ROC 曲线显示, 该模型在训练集和测试集的准确度分别为 0.82 和 0.79, 特异性值分别为 0.766 和 0.846, 灵敏度分别为 0.743 和 0.733。依据联合模型在训练组、测试组和全队列组中分类的低风险组和高风险组中的 MCI 进展人群数目均有统计学差异 ($P < 0.05$)。

结论: 基于全脑影像组学的整合模型能够准确识别和预测 PD-NC 患者中可能进展为 PD-MCI 的高危人群, 这可能为临床的筛查提供一种有效的工具。

PO-0394

脑白质疏松影响急性缺血性脑卒中病灶演变与临床结局

周佳莹、居胜红

东南大学附属中大医院

研究目的: 探索脑小血管病 (CSVD) 对梗死病灶体积的影响, 并分析 CSVD、梗死体积及临床结局的关系。

研究方法: 回顾性大血管闭塞性急性缺血性脑卒中患者, 入院后立即行 CTP、CTA 检查, 5-7 天后行 MRI 检查。利用 CTP 获得基线梗死核心体积, 利用 CTA 评估侧支循环状态, 利用 MRI 评估 CSVD。基于 MRI 获得最终梗死体积, 并将梗死进展体积 (最终梗死体积减去基线梗死核心体积) 与基线梗死核心体积的比值大于 20% 定义为显著进展。随访 3 个月后的 mRS 评分, mRS ≤ 2 为预后良好。

研究结果: 研究纳入 362 (年龄: 71, [IQR]: 60-80) 例患者, 169 (46.7%) 例预后良好, 278 (76.8%) 例病灶显著进展

脑白质疏松与基线梗死核心体积 ($P=0.021$)、最终梗死体积 ($P<0.001$) 及梗死病灶进展体积 ($P<0.001$) 显著相关。脑白质疏松可以通过基线梗死核心体积间接影响病灶进展, 中介作用比例较小 (11.2%, $P<0.001$); 脑白质疏松可以通过梗死病灶进展体积间接影响最终梗死体积, 中介作用为 97.3% ($P<0.001$)。严重脑白质疏松 (OR 2.50, 95%CI 1.37- 4.68, $P=0.002$) 是病灶显著进展的独立危险因素。联合脑白质疏松总负担与临床资料构建梗死病灶显著进展预测模型 ($AUC=75.16\%$), 模型预测准确性显著高于无脑白质疏松的预测模型 ($AUC=71.13\%$)

($P=0.048$)。脑白质疏松可以通过最终梗死体积间接影响临床结局,中介作用为 51.0% ($P=0.04$)。

结论:重度脑白质疏松可以通过促进病灶进展间接扩大病灶范围,并进一步影响临床功能恢复。在预测病灶显著进展时,脑白质疏松可以显著提高预测准确性。

PO-0395

基于体素的形态学测量的非酒精性脂肪性肝病患者脑结构改变及其与认知功能的相关性分析

吴立强、靳轶涵、许框慧、唐若瑜、施军平、李洁、陈晓飞
杭州师范大学附属医院

目的:采用基于体素的形态学测量方法(VBM)检测非酒精性脂肪性肝病(NAFLD)患者脑灰质体积(GMV)的异常,并探讨其与认知功能之间的相关性。方法:对 74 例 NAFLD 患者和 62 例相匹配的健康被试(HC)行 3D-T1WI 结构像扫描、多维度认知量表(蒙特利尔认知评估[MoCA]、数字广度测试[DST]、连线测试[TMT])和医院焦虑抑郁情绪测量表(HAD)的评估。其中,NAFLD 患者均接受基于肝脏 MRI 扫描的质子密度脂肪分数(MRI-PDFF)和血液指标(包括空腹血糖,胰岛素抵抗、肝酶以及血脂水平)的测定。运用 DPABI 软件对结构像数据进行预处理后,采用 VBM 方法分析两组间 GMV 差异的脑区。对 NAFLD 组中差异脑区的 GMV 值与认知心理量表评分、MRI-PDFF 及血生化指标进行偏相关分析。结果:NAFLD 患者存在工作记忆、注意力、执行等认知功能的下降、伴有轻度焦虑抑郁症状以及肝功能、血糖和胰岛素功能的受损。与 HC 相比,NAFLD 患者存在双侧海马旁回/梭状回、双侧海马/苍白球、左侧颞中回、左侧中央后回、右侧辅助运动区及右侧小脑半球的 GMV 减低(GRF 校正,体素水平 $P<0.001$,团块水平 $P<0.05$)。未发现 NAFLD 患者存在 GMV 增高的脑区。在 NAFLD 组中,右侧梭状回的 GMV 值与腰臀比呈负相关,左侧海马旁回/梭状回的 GMV 值与 DST 得分呈正相关,双侧海马旁回/苍白球的 GMV 值与肝酶水平、甘油三酯水平呈负相关。结论:NAFLD 患者存在多个脑区灰质体积的萎缩。特别地,内侧颞叶的萎缩与 NAFLD 的认知功能障碍有关,并受患者肝功能损伤、血脂代谢紊乱的影响。

PO-0396

CSVD 相关认知障碍患者结构和功能网络的模块化分析

毛海霞、方向明
无锡市人民医院

目的 分析脑小血管病(CSVD)相关认知障碍患者的功能网络模块的连接改变和相应的结构基础。方法 收集我院门诊/住院 CSVD 病例,将 CSVD 病例分为认知正常组(CSVD-CN)和认知障碍组(CSVD-CI),又同期纳入了性别、年龄和教育程度相匹配的健康对照组(HC),利用 dpabi 软件将静息态功能磁共振进行预处理,利用 gretna 构建功能网络并进行标准化(fisher Z 转化),再 linux 系统利用 fs1 对弥散加权图像进行预处理,利用 PANDA 软件做概率性纤维追踪并构建结构网络,然后利用 gretna 软件对结构和功能连接进行模块化分析,模块化图谱参照 Brainnetome Atlas246 图谱,将大脑分为 7 大功能模块(视觉网络 VN、感觉运动网络 SMN、背侧注意网络 DAN、腹侧注意网络 VAN、边缘网络 LN、额顶网络 FPN、默认模式网络 DMN),比较三组的 7 大网络模块的结构的模块间和模块内连接改变差异,并与神经心理学量表做相关,得到 CSVD 相关认知障碍患者的功能网络模块连接改变,并找到其相应的结构基础。

结果 功能网络模块分析:CSVD-CN 组与 HC 组的功能模块分析无统计学差异;相对于 HC 组,CSVD-CI 组的 VN-FPN、DAN-LN 和 FPN-DMN 模块间的连接减低,SMN 和 VAN 模块内连接减

低,与认知功能相关;相对于 CSVD-CN 组,CSVD-CI 组 VN-FPN 的模块内连接增加,VAN 的模块内连接减低,与认知功能相关。

结构网络模块分析:相对于 HC 组,CSVD-CN 组在 VAN-FPN、VN-DMN 间的连接减少,VAN-FPN 模块间连接减少与患者的记忆功能成正相关,VN-DMN 模块间连接减少与视空间功能成正相关。相对于 HC 组,CSVD-CI 组在 DAN-LN 的模块间的连接增加,SMN、VAN 和 DMN 的模块内连接增加,与认知功能相关。相对于 CSVD-CN 组,CSVD-CI 组在 DAN-DMN 的模块间的连接增加,VN、VAN、FPN 和 DMN 的模块内连接增加,与认知功能相关。

结论 CSVD 相关认知障碍患者的功能网络的模块化连接改变有相应的结构基础,但并非完全一一对应。

PO-0397

男性亚急性期缺血性卒中患者脑类淋巴系统活性研究

李馨、秦越、王磊、李笑石、钱一帆、牛微
西安大兴医院

目的:本研究采用血管周围间隙扩散张量成像分析(diffusion tensor image analysis along the perivascular space, DTI-ALPS)的方法,评估运动功能障碍的缺血性卒中患者亚急性期脑类淋巴系统的活性,并探讨其与运动功能评分、皮质脊髓束完整性之间的关系。方法:招募 17 例我院 2021 年 1 月至 2022 年 11 月卒中中心收治的男性亚急性期缺血性卒中患者(卒中组,平均年龄 59.21 ± 9.92 岁)和 11 例男性健康成人(对照组,平均年龄 55.9 ± 7.21 岁)。卒中组均为左侧大脑半球皮质下发病灶。记录所有参与者的流行病学数据和临床量表资料,包括年龄、发病时间、Fugl-Meyer 评分等。所有参与者行颅脑 MRI 扫描,序列包括:DSI 和 T2 FLAIR 成像。计算侧脑室水平 DTI-ALPS 指数、同一层面皮质脊髓束(corticospinal tract, CST)各向异性分数(fractional anisotropy, FA)及轴向扩散系数(axial diffusivity, AD)。采用独立样本 t 检验比较两组间各指标差异。卒中组 DTI-ALPS 指数与 Fugl-Meyer 评分、CST 完整性间关系采用 Spearman 相关性分析。结果:男性卒中组患侧 DTI-ALPS 指数明显低于对照组同侧($P=0.001$)。男性卒中组患侧 DTI-ALPS 指数与运动功能评分($\rho=0.52$, $P=0.031$)、运动功能评分分级($\rho=0.53$, $P=0.028$)均呈正相关关系,且与健侧 CST 的 FA($R=-0.55$, $P=0.023$)、AD($R=-0.6$, $P=0.012$)呈负相关关系。结论:男性亚急性期缺血性卒中患者脑类淋巴系统功能受损,这些发现有助于进一步了解男性缺血性卒中的病理生理机制,并为缺血性卒中的替代治疗提供新的靶点。

PO-0398

夜班相关睡眠剥夺医生静息态 fMRI 局部一致性研究

李馨、王磊、秦越、钱一帆、李笑石、牛微
西安大兴医院

目的 应用静息态功能磁共振成像(resting state functional magnetic imaging, rs-fMRI)分析夜班相关睡眠剥夺医生大脑局部一致性变化的特征。

资料与方法 所有参与者均使用西门子 3.0 T (Prisma) 磁共振扫描仪及 64 通道头颈联合线圈进行扫描。所有参与者均配有泡沫垫和耳塞,以尽量减少扫描过程中的头部运动和噪音。静息态扫描期间要求所有参与者保持头部不动,睁开双眼,不想任何事情。Rs-fMRI 采用回波平面成像序列,共 600 个时间点,扫描参数:TR = 1000 ms, TE = 38 ms, 翻转角 = 52° , 视野(field of view, FOV) = 208×208 mm, 层厚 = 2 mm, 层数 = 72, 采集时间 = 610 s; 三维高分辨率 T1 结构像扫描参数如下:TR = 1540 ms, TE = 2.99 ms, 翻转角 = 9° , FOV = 224×224 mm, 层厚 = 1 mm, 层数

= 176, 采集时间 = 189 s。基于 Matlab R2021b 平台, 采用 DPABI V6.1 软件进行数据预处理并计算 ReHo。采用 DPABI 内置统计工具进行配对样本 t 检验, 分析夜班相关睡眠剥夺前后 ReHo 变化的脑区, 经 FDR 校正后 $P < 0.05$ 认为差异有统计学意义。

结果 夜班相关睡眠剥夺下 rs-fMRI 提示双侧小脑半球、右侧颞中回、距状回、左侧顶下小叶、楔前叶、中央前回等脑区局部一致性明显减弱; 双侧舌回、扣带回等脑区局部一致性明显增强。

讨论 静息态下夜班相关睡眠剥夺医生的大脑局部一致性存在特征性变化, 涉及认知和记忆相关的多个脑区, 可能为今后促进医生夜班相关睡眠剥夺后恢复的影像学靶点。

PO-0399

多序列深度学习合成头部 T1 增强图像

吴亚平^{1,2}、王梅云^{1,2}

1. 河南省人民医院

2. 河南省科学院

目的:

多序列成像是磁共振成像的优势, 通过不同序列能够从不同方面反应病变的信息。对脑胶质瘤诊断时常增加扫描钆造影剂增强 T1 序列, 以便更好的进行级别诊断。在日常工作中, 患者初期可能由于特殊原因无法扫描 T1 序列, 例如过敏或者肾功能不全, 这种情况下, 如果能够基于合成增强后的序列将有助于诊断。直接通过增强前 T1 合成增强后 T1 效果不好, 我们相信, 利用多个序列信息将能更好的生成增强后的序列。

材料与方法:

本研究以无监督网络 DCLGAN 网络为基础网络。以 T1、T2 和 Flair 作为三个通道输入, T1 增强序列作为输出。基于对比学习和双重学习设置, 包含两个生成器和两个鉴别器。为了充分利用多序列 MRI 中的信息, 对生成器网络进行了改进: 1) 将注意力机制引入 ResNet 生成器, 通过对通道和空间重新调整并分配权重的方式使网络能够注意更细微的特征。2) 生成器的残差块采用空洞卷积, 在不增加参数量的情况下扩大感受野。基于 Patchwise 对比学习的图像生成, 采用噪声对比估计框架来最大化输入和输出的相应块之间的互信息。训练数据包括 402 例来自河南省人民医院脑胶质瘤磁共振数据, 预留 40 例作为测试集。选择有肿瘤的层面进行训练。对测试集结果, 由影像科医生采用 5 分制评价合成图像与实际增强图像的一致性, 采用 PSNR、SSIM、RMSE 评价客观一致性。

结果:

放射科医生对各个测试图像的一致性评分为 2.54 ± 0.51 , 还有待提高。客观结果 SNR 为 21.99, SSIM 为 0.87, RMSE 为 0.36。代表性结果如附件图 1 所示。

结论:

研究深度学习采用 T1、T2 和 Flair 图像, 可以合成钆增强 T1 图像, 能够为诊断提供辅助信息。本研究方法能为由于身体原因无法采集增强图像患者, 或者体检提示异常的患者提供合成的增强图像。

PO-0400

基于图论的方法研究不同病程耳鸣患者小世界功能网络拓扑属性的重组

韩舒婷、李勇刚

苏州大学附属第一医院

目的：耳鸣是一种复杂且涉及多因素的疾病，既往研究表明耳鸣的发生和发展不仅局限于听觉系统，还涉及到负责认知、注意等相关的脑区。耳鸣可根据病程分为新发耳鸣以及持续性耳鸣，我们的研究目的是研究耳鸣脑随着病程的延长，脑网络拓扑属性的改变。

材料与方法：我们采集了新发耳鸣组（ROT 组：30 例）、持续性耳鸣组（PT 组：30 例）及健康对照组（HC 组：30 例）rs-fMRI 数据以及临床数据，采用图论的方法研究三组被试脑功能网络拓扑属性的差异。首先利用 GRETNA 工具箱，使用 AAL 图谱将大脑划分为 90 个区域，并定义为大脑网络中的 90 个节点。然后提取每个节点的平均时间序列，并计算两个节点之间的皮尔逊相关系数。将这些相关系数连接矩阵定义为网络的边。稀疏度为 0.05-0.18，阈值区间为 0.01。最后对于每个稀疏度的大脑网络，我们计算了全局和节点网络指标、功能网络不同的模块的模块内及模块间连接，并进行三组之间比较，另外将以上指标与耳鸣临床数据进行相关性分析。

结果：我们的主要研究结果如下：（1）ROT 组相较于 PT 组在功能脑网络全局属性中，主要表现为特征路径长度的增大、聚类系数、小世界属性、网络局部效率的减低。（2）关于节点属性的指标，ROT 组及 PT 患者组较 HC 组左侧眶部额中回的度中心性减低。ROT 左侧中央后回的度中心性较 PT 以及 HC 组升高。其余几个节点，包括双侧嗅皮质、左侧尾状核、右侧豆状壳核的节点属性表现为度中心性的减低、以及节点效率及节点的局部效率减低。（3）功能脑网络的全局效率与耳鸣的频率相关，以及一些重要节点（包括双侧嗅皮质、左侧眶部额中回等）的部分节点属性与耳鸣的 VAS 评分、耳鸣导致的睡眠干扰、情绪等有相关关系。（4）改变的模块内和模块间连接主要发生在前额叶以及皮层下模块。

讨论：本研究结果表明耳鸣慢性化过程中存在脑功能网络的拓扑属性的变化，包括是新发耳鸣患者网络局部互连性及全局信息沟通能力的下降，一些重要节点功能的异常，包括左侧眶部额上回、左侧尾状核、双侧嗅皮质等。我们推测，耳鸣在新发耳鸣阶段会有全脑及部分节点连接属性的一些降低，而随着耳鸣病程的进展，大脑会逐步恢复或适应这些功能的重组。

PO-0401

2 型糖尿病患者脑功能连接梯度与认知功能相关性的研究

冉海峰、陈贵琴、何玉伦、谢雨辛、余前娥、张体江
遵义医科大学附属医院

目的

2 型糖尿病（T2DM）是我国糖尿病患者数最多的类型，由于长期暴露于高血糖和其他危险因素中，T2DM 患者可能在早期阶段就出现不同程度大脑功能和结构改变。但 T2DM 患者脑网络系统的空间分布及其之间的拓扑关系仍不清楚。本研究旨在利用梯度连接的方法，研究 T2DM 患者宏观网络功能层级结构变化及其与认知功能的关系。

方法

纳入 T2DM 患者 24 例及年龄、性别、受教育程度相匹配的健康对照 21 例，对 T2DM 患者进行 MMSE、MoCA 测试。所有被试均行静息态功能磁共振成像(rs-fMRI)扫描，采用非线性降维扩散图嵌入算法在 T2DM 患者和健康对照体素和网络水平上构建功能连接梯度，使用独立样本 T 检验比较两组受试者梯度值组间差异。提取有组间差异脑区和脑网络的梯度值与 T2DM 患者认知功能评分、病程、血糖浓度等临床变量进行偏相关分析（以年龄、性别、受教育程度作为协变量）。

结果

与对照组相比，T2DM 患者在不同体素和网络水平上的功能连接梯度改变。T2DM 患者第一梯度左、右侧中央沟盖、舌回、楔前叶及左侧楔叶的梯度值显著增高，左侧直回、右内侧额上回、角回、辅助运动区、额中回的梯度值显著降低(GRF 校正, $P < 0.05$)。第二梯度左侧中央前回、右侧中央旁小叶、中央前回的梯度值降低 (GRF 校正, $P < 0.05$)。T2DM 患者第一梯度视觉网络、感觉运动网络 (SMN)、背侧注意网络、腹侧注意网络(VAN)梯度值明显增加，在额顶网络(FPN)、默认网络的梯度值明显降低；第二梯度 SMN 的梯度值减低， FPN 的梯度值增高(FDR 校正, $P < 0.05$)。相

关分析发现,第一梯度左侧中央沟盖的梯度值变化与 MMSE 评分呈负相关($P=0.028$, $r=-0.479$),楔前叶/扣带回皮质的梯度值变化与病程呈负相关($P=0.027$, $r=-0.481$),VAN 的梯度值变化与 MMSE、MoCA 评分呈负相关($P=0.026$, 0.049 , $r=-0.484$, -0.435)。

结论

T2DM 患者的功能连接梯度存在改变并与认知功能和病程有关,增加了我们对 T2DM 患者宏观功能层级结构及病理生理学的理解,为 T2DM 患者脑功能改变提供客观影像依据。

PO-0402

质子磁共振波谱定量评估不同亚型的皮质发育畸形伴癫痫的代谢异质性

蒲华霞¹、王莉萍¹、刘文钰²、谭乔月¹、万欣月³、王维娜⁴、苏筱芮¹、张思敏¹、月强^{1,5,6}、龚启勇^{1,6,7}

1. 四川大学华西医院放射科磁共振研究中心
2. 四川大学华西医院神经内科
3. 复旦大学华山医院放射科
4. 浙江大学医学院第一附属医院放射科
5. 四川大学华西医院放射科
6. 四川大学华西医院功能与分子成像四川省重点实验室
7. 四川大学华西厦门医院放射科

目的:本研究旨在利用氢质子磁共振波谱(proton magnetic resonance spectroscopy, $^1\text{H-MRS}$)研究皮质发育畸形(malformations of cortical development, MCDs)的不同亚型可能存在神经代谢异常及代谢异质性。

方法:从 2018 年 8 月至 2021 年 11 月,在我院癫痫中心招募了 29 例 MCDs 伴癫痫的患者,其中 10 例患有灰质异位,10 例患有局灶性皮质发育不良,9 例患有多小脑回畸形,以及 25 例年龄和性别匹配的健康志愿者(对照组)。利用单体素 $^1\text{H-MRS}$ 点分辨波谱序列进行扫描,并采用 LCModel 软件进行后处理,获取 MCDs 患者的病灶区域和正常对侧区域(normal-appearing contralateral side, NACS)以及对照组的额叶区域代谢物的绝对浓度。然后分别对比 MCDs 患者组或各亚型的病灶侧和 NACS 侧与对照组额叶区域之间的各代谢物浓度的差异。

结果:MCDs 病灶区域相比 NACS 侧和对照组,氮乙酰天门冬氨酸浓度显著较低而肌醇浓度显著较高($P=0.002\sim 0.007$);MCDs 病灶相比对照组,胆碱和肌酸浓度显著较高($P=0.001\sim 0.016$)。此外,MCDs 组 NACS 的胆碱浓度高于对照组($P=0.015$)。在灰质异位的病灶区域,唯一的代谢改变是氮乙酰天门冬氨酸浓度降低(与对照组相比, $P=0.001$)。在局灶性皮质发育不良的病灶区域,代谢物浓度异常多于其他两种亚型,特别是与对照组或 NACS 相比,显示氮乙酰天门冬氨酸浓度降低而肌醇浓度增加($P=0.012\sim 0.042$)。在多小脑回畸形的病灶区域,肌酸(与对照组或 NACS 相比, $P=0.017\sim 0.021$)和谷氨酸/谷氨酰胺复合物(与 NACS 相比, $P=0.043$)浓度升高,而氮乙酰天门冬氨酸浓度正常。相关分析显示,MCDs 病变区域的肌酸浓度与癫痫发作频率呈正相关($r=0.411$, $P=0.027$)。

结论:基于 $^1\text{H-MRS}$,我们的研究结果表明 MCDs 的不同亚型之间存在不同的代谢特征,这可能与每个 MCDs 亚型病灶区域不同的细胞结构特性和功能有关。

PO-0403

癫痫伴偏头痛患者存在异常的脑代谢物改变

王莉萍^{1,2}、蒲华霞^{1,2}、苏筱芮^{1,2}、张思敏^{1,2}、月强^{1,2}、龚启勇^{1,2}

1. 四川大学华西磁共振研究中心

2. 四川大学华西医院放射科

目的：癫痫和偏头痛虽为两种独立的异质性疾病，但他们常常共同发生在同一患者中，两者在临床特征、发病诱因以及治疗方式等诸多方面存在一定的重叠和关联，表明两者之间的发病机制可能是相似的，因而容易共病，而共病会使疾病的诊断及治疗复杂化，影响患者的生活质量和预后，因此有必要研究癫痫共病偏头痛的发病机制，为临床预防及诊疗提供参考依据。本研究应用质子磁共振波谱探讨癫痫共病偏头痛患者在双侧背外侧前额叶的代谢变化，以期能从神经生化的角度理解两者的共病机制。

方法：2021 年 8 月至 2022 年 11 月，由华西医院癫痫中心的专业神经病学家诊断并连续纳入 24 例癫痫伴偏头痛患者、20 例癫痫不伴偏头痛患者以及 20 例年龄、性别及教育程度匹配的健康对照者进行研究，使用磁化制备快速梯度回波序列(MPRAGE)获得所有被试的高分辨率 T1 矢状位加权图像，再基于 T1 矢状位图重建出 T1 冠状位及轴位图，并在这三维视图上将感兴趣区定位在被试的双侧背外侧前额叶区域，再运用单体素点分辨光谱序列(PRESS)获得双侧背外侧前额叶的磁共振波谱数据，采用 LCModel 软件和 ANTs 高级归一化工具分别量化代谢物浓度和对代谢物浓度进行脑脊液校正。数据分析均采用 SPSS26.0 统计软件， $P<0.05$ 具有统计学意义。

结果：健康对照组和癫痫伴偏头痛组分别出现双侧背外侧前额叶的 NAA 和 Cho 水平的不对称，并都为左侧高于右侧；与对照组相比，在左侧背外侧前额叶中，癫痫伴偏头痛组和癫痫不伴偏头痛组均出现 NAA 水平的显著下降，且癫痫伴偏头痛组 NAA 浓度下降更多；在右侧背外侧前额叶中，癫痫伴偏头痛组较对照组 INS 显著减少；相关性分析显示，在癫痫伴偏头痛组中，右侧背外侧前额叶的 NAA 水平和双侧背外侧前额叶的 Cho 水平均与其偏头痛频率呈负相关。

结论：癫痫伴偏头痛患者在双侧背外侧前额叶中存在更多的代谢异常，表明其神经元及神经胶质细胞损伤、丢失更严重。这些发现从神经生物化学的角度揭示了癫痫与偏头痛共病的机制，并证实了双侧背外侧前额叶是可以反映癫痫与偏头痛共病患者脑代谢异常的重要脑区。

PO-0404

烟雾病患者联合血运重建术后脑网络中心度改变的静息态功能磁共振研究

王媛媛、李健、曾献军

南昌大学第一附属医院

目的：

烟雾病 (moyamoya disease, MMD) 是一种病因不明的慢性血管性疾病，联合血运重建术 (combined revascularization surgery, CRS) 是目前普遍有效的治疗方式，可以改善烟雾病患者的脑血流和预后，然而 CRS 治疗与烟雾病患者脑网络变化之间的关系尚不清楚。本研究旨在探索 MMD 患者经过 CRS 治疗后脑网络的变化，并分析其与临床指标的关系。

方法：

本研究纳入南昌大学第一附属医院神经外科确诊的 MMD 患者 43 例，其中 23 例经过 CRS 治疗 (CRS 组)，20 例未经过 CRS 治疗 (non-CRS 组)，同时纳入 20 例健康对照者 (healthy controls, HCs) (HC 组)。所有被试均行静息态功能磁共振成像 (functional magnetic resonance imaging, fMRI) 扫描，此外，所有的 MMD 患者均进行了相关的临床检查。采用基于体素水平的度

中心度 (degree centrality, DC) 方法来评估全脑网络连接特征, 采用 ANOVA 方差分析比较三组间脑网络的差异, 并提取 MMD 患者差异脑区的 DC 值, 与各项临床指标进行相关性分析。

结果:

CRS 组与非 CRS 组烟雾病患者在默认模式网络(DMN)、中央执行网络(CEN)、显著性网络(SN)和双侧小脑的分布存在显著性差异。此外, 与非 CRS 组相比, CRS 组双侧小脑后叶的 DC 值升高。

(多重比较使用 GRF 校正, 簇水平 $p < 0.05$, 体素水平 $p < 0.005$)。相关性分析发现这些差异脑区的 DC 值与 MMSE、MoCA 和 AS 得分有显著的相关性。($p < 0.05$)

结论:

与未接受 CRS 治疗相比, 接受 CRS 治疗的 MMD 患者脑网络的损害会明显减轻, 且 CRS 治疗可以有效逆转 MMD 引起的双侧小脑后叶的功能网络损害, MMD 患者脑网络中心度的改变可为 CRS 治疗评估提供潜在的神经影像生物标志物。

PO-0405

中重度斑秃患者脑结构和功能磁共振成像初步研究

段莹星、王冬翠、廖伟华

中南大学湘雅医院

背景:斑秃是一种由遗传和环境因素引起的自身免疫性疾病。目前尚无针对斑秃患者脑结构的研究。磁共振成像(MRI)技术可用于探讨斑秃患者脑结构的变化, 为了解斑秃的病理生理机制及其与社会心理因素的关系提供依据。

目的:利用磁共振成像技术(3DT1、BOLD)研究斑秃对中枢神经系统的影响, 探讨斑秃患者脑结构(全脑体积、灰质体积、白质体积、皮质厚度)以及脑功能的变化, 并分析这些结构变化与精神障碍(焦虑、抑郁、睡眠障碍)的关系。

方法:招募 2021 年 12 月至 2022 年 9 月来我科就诊的中重度斑秃患者 54 例, 健康对照 65 例。采用 HAMD、HAMA、PSQI 量表评估被试心理健康状况, 并对被试进行 3.0T-MRI 扫描。采用 t 检验比较斑秃患者组与健康对照组皮质厚度以及 ALFF 和 ReHo 的差异, 采用相关分析分析不同皮质厚度区域与 HAMA、HAMD、PSQI 评分的关系。

结果:1) 与健康对照组相比, 斑秃组患者 PSQI、HAMA、HAMD 评分均显著升高($P < 0.05$)。

2) 斑秃组右侧中央后回皮质厚度较薄($P < 0.01$), 右侧眶回和左侧颞上沟皮质厚度较厚($P < 0.001$)。

两组患者的全脑体积、灰质体积和白质体积均无显著差异。

3) 右侧眶回皮质厚度与 PSQI 评分呈正相关($r = 0.297$, $P = 0.029$), 右侧中央后回皮质厚度与 HAMA 评分呈正相关($r = 0.300$, $P = 0.029$), 左侧颞上沟皮质厚度与 HAMD 评分呈负相关($r = -0.302$, $P = 0.028$)。

4) ALFF 和 ReHo 结果: 斑秃患者双侧小脑均明显高于正常组 ($P < 0.001$)。

结论:本研究首次揭示中重度斑秃患者脑结构功能异常变化, 并可能与患者的焦虑、抑郁水平及睡眠质量受损有关。

PO-0406

基于血管周围间隙张量分析探究正常人脑双侧半球类淋巴系统与肠道短链脂肪酸之间的关系

汪旭洋、许珊、杨东、伍建林
大连大学附属中山医院

目的:通过血管周围间隙扩散张量 (DTI-ALPS) 指数探究正常人大脑双侧半球类淋巴系统功能与肠道短链脂肪酸之间的关系。

方法:招募 29 名健康志愿者纳入本研究, 采集所有被试的扩散磁共振图像, 通过 FSL 及 itk-snap 软件在双侧大脑半球侧脑室体部水平投射纤维及联合纤维上勾画 5.0mm 圆形感兴趣区, 测量感兴趣区内两种纤维在 X、Y、Z 轴方向上的扩散率, 并通过计算获得双侧大脑半球 DTI-ALPS 指数; 同时收集所有被试的粪便样本行短链脂肪酸检测, 对左右侧半球 ALPS 指数及相关纤维扩散率行配对样本 T 检验, 并将双侧半球 DTI-ALPS 指数、纤维扩散率与短链脂肪酸含量行 spearman 偏相关分析, $P<0.05$ 被认为具有统计学意义。

结果:左侧联合纤维在 Y 轴上的扩散率高于右侧联合纤维 ($P<0.05$)。右侧大脑 ALPS 指数与丙酸成正相关 ($r=0.44$, $P=0.022$)。右侧联合纤维 X 轴上的扩散率与丙酸成正相关 ($r=0.388$, $P=0.045$)。右侧投射纤维 y 轴上的扩散率与乙酸成正相关 ($r=0.569$, $P=0.002$)。与异丁酸及异戊酸成负相关 ($r=-0.458$, $P=0.016$; $r=-0.487$, $P=0.01$)。左侧联合纤维在 X 轴上的扩散率与丁酸成负相关 ($r=-0.39$, $P=0.045$)。

结论:健康中老年人淋巴系统功能及相关联合、投射纤维区域的扩散率与肠道短链脂肪酸之间存在联系。

PO-0407

基于顶点的形态学分析对帕金森病伴抑郁患者皮质下结构的形态改变及相关性研究

屈明睿、高冰冰、蒋玉涵、李媛、张煜堃、宋清伟、苗延巍
大连医科大学附属第一医院

目的:探讨皮质下灰质核团的形状在帕金森病 (PD) 伴抑郁患者中的改变特征及其与抑郁症状严重程度和临床资料的相关性。

材料与方法:本研究共招募了 40 名 PD 伴抑郁 (PDD) 患者, 26 名 PD 不伴抑郁 (PDND) 患者和 33 名健康对照组 (HC)。所有受试者行 3.0T MRI 头部扫描。使用 FMRIB 软件库的 FIRST 工具包进行基于顶点的形态学分析。将 15 个皮层下核团 (双侧伏隔核、尾状核、苍白球、丘脑、杏仁核、壳核和脑干) 进行自动分割。使用一般线性模型, 将年龄、性别及教育年限作为协变量, 利用 FSL 中的“Randomise”指令进行置换检验 (5000 次置换), 采用无阈值簇群增强方法对结果进行校正。提取具有显著差异区域的平均形变位移值用于后续偏相关分析, $P<0.05$ 表示有统计学意义。

结果:表 1 总结了人口统计学信息和临床数据。与 HC 组相比, PDD 组出现多个皮质下核团萎缩, 包括双侧海马 (左侧 $P=0.016$, 右侧 $P=0.043$)、双侧壳核 (左侧 $P<0.001$, 右侧 $P=0.001$)、双侧尾状核 (左侧 $P=0.019$, 右侧 $P=0.002$)、左侧伏隔核 ($P=0.013$)、右侧苍白球 ($P=0.002$)、右侧丘脑 ($P=0.028$)、右侧杏仁核 ($P=0.017$)。同时在双侧丘脑 (左侧 $P=0.024$, 右侧 $P=0.001$)、左侧壳核 ($P=0.01$)、右侧杏仁核 ($P=0.007$) 中发现局部膨胀区域。PDND 组与 HC 相比, 右侧壳核 ($P=0.015$)、右侧丘脑 ($P=0.016$) 局部萎缩, 同时在右侧丘脑 ($P=0.039$) 和右侧杏仁核 ($P=0.038$) 中存在小的膨胀区域。最后与 PDND 组相比, PDD 组中双侧丘脑 (左侧

$P=0.023$, 右侧 $P=0.04$) 存在广泛萎缩区域 (表 2-3, 图 1-2)。左侧伏隔核形状改变与汉密尔顿抑郁量表 (HAMD) 评分呈负相关 ($r=-0.377$, $P=0.021$), 右侧尾状核形状改变与病程呈负相关 ($r=-0.538$, $P=0.001$) (图 3)。

结论: 总之, PDD 患者出现多个皮质下核团表面形态萎缩, 同时也发现了部分核团存在局部膨胀区域。这些发现可能有助于进一步理解 PD 患者抑郁症状的潜在神经机制。

PO-0408

深度学习图像重建算法在急性缺血性脑卒中低剂量全脑 CT 灌注检查中的应用价值

雷丽敏、郭晓旭、周宇涵、王芝浩、岳松伟
郑州大学第一附属医院

目的: 探讨深度学习图像重建 (DLIR) 算法对急性缺血性脑卒中 (AIS) 患者低剂量全脑 CT 灌注检查中图像质量和诊断参数的影响。

方法: 前瞻性纳入发病后 24 小时内接受头颅 CT 平扫和脑 CTP 检查的 AIS 患者, 所有患者随机分为两组, 两组除 CTP 扫描管电流不同外其余扫描条件均相同。CTP 扫描: 管电压 80kV, 管电流 150mA (常规剂量组 (CD)) / 100 mA (低剂量组 (LD))。根据之前研究, 采用 80% 自适应统计迭代算法 (ASIR-V80%) 重建 CD 组 CTP 图像并命名为 A 组, 采用 ASIR-V80%、DLIR-M 和 DLIR-H 算法重建 LD 组图像并分别命名为 B-D 组。记录并比较两组患者包括性别、年龄、身高、体重、发病时间、入院时 NIHSS 评分和潜在疾病等在内的临床特征, 同时对四组重建图像的主客观图像质量、灌注参数 (包括 CBF、CBV、MTT、Tmax 和 TTP)、诊断性能和辐射剂量进行比较。

结果: 共纳入 94 名患者, CD 组 47 名, LD 组 48 名。CD 和 LD 方案的平均有效辐射剂量分别为 5.71 mSv 和 3.80 mSv, 存在统计学显著差异 ($P<0.001$)。在不同条件下扫描的两组患者的临床基线特征没有统计学显著差异 ($P>0.05$)。与 B 组和 C 组相比, A 组和 D 组的灰质 (GM) 和白质 (WM) 区域的 SD 值均降低, SNR 增加 ($P<0.05$)。总体客观质量从高到低依次为: D 组=A 组>B 组>C 组, 主观评分的结果与之相同。A 组和 D 组之间的所有灌注参数均无统计学差异。在 GM 区域, B 组的 CBV 值低于 A 组 ($P=0.017$), 而在 WM 区域, B 组和 C 组的 CBF 值高于 A 组, MTT 值低于 A 组 ($P<0.05$)。脑梗死最大直径测量值与标准复查测量值之间差值的绝对值也无统计学差异 ($P>0.05$)。

结论: 低管电流 CTP 扫描结合 DLIR-H 算法可以在不影响灌注参数 (包括 CBF 和 MTT) 的前提下提高图像质量, 减少 30% 的辐射剂量, 可将此算法常规应用于脑 CTP 检查中。

PO-0409

深度学习图像重建算法结合低管电流或低管电压扫描在脑灌注检查中的应用价值

雷丽敏、周宇涵、曹伟萌、王芝浩、王慧、岳松伟
郑州大学第一附属医院

目的: 评估深度学习图像重建 (DLIR) 算法结合较低管电流或低管电压在全脑 CT 灌注 (CTP) 检查降低辐射剂量中的应用价值。

方法: 除 CTP 外其他扫描条件均相同, CTP 检查: 组 1: 80 kV, 150mA, 共 45 例患者 (60.04 ± 13.46 岁); 组 2: 80 kV, 100mA, 共 47 例 (62.85 ± 13.47 岁); 组 3: 70 kV, 150mA, 共 22 例 (59.21 ± 12.64 岁)。组 1 采用滤波反投影算法 (FBP)、自适应迭代算法 (ASIR-V40%/80%)、

DLIR-L/M/H 重建 CTP 数据 (A-F 组); 组 2 (G-H 组) 和组 3 (I-J 组) 用 ASIR-V80%和 DLIR-H 重建。比较健侧额、颞和顶叶灰质(GM)和白质(WM)的 CT 值、噪声值 (SD)、SNR 和 CNR 等客观参数。两名放射医师根据 Abels's 评分对灌注参数(CBF、CBV、Tmax、MTT 和 TTP)行主观评估。测量并比较相应的灌注参数值。

结果:

三种 CTP 扫描的辐射剂量分别为 5.70、3.81 和 3.83 mSv。组 1 中, 随 ASIR-V 和 DLIR 重建强度增加, SD 减小, SNR 和 CNR 升高。GM 和 WM 的变化趋势一致, 但 WM 的图像改善更显著。F 组的 SNR 和 CNR 最高。F、E 和 C 组的主观评分较高。五种灌注参数值不受算法影响。

组 2 和组 3 中, DLIR-H 组的 SD 值均低于 ASIR-V80%组, WM 区域 DLIR-H 组的 SNR 和 CNR 高于 ASIR-V80%组(组 G vs. 组 H, 组 I vs. 组 J, $P<0.05$), 在 GM 中无显著差异; DLIR-H 组的主观评分高于 ASIR-V80 %组(组 G vs. 组 H, 组 I vs. 组 J, $P<0.05$)。

组 2 和组 3 中 DLIR-H 组的客观和主观质量与组 1 的 ASIR-V80%组相当(组 C vs. 组 H vs. 组 J, $P>0.05$)。与其他组相比, G 组、I 组和 J 组的灌注参数值有显著差异, 尤其是 WM 区域的 MTT 减少和 CBF 增加, 其中 I 和 J 组的变化更显著。

结论: 低管电流 CTP 扫描结合 DLIR-H 算法可在不改变灌注参数值的前提下提高图像质量, 但将管电压降低到 70kV 会降低灌注参数准确性, 尤其是 MTT 和 CBF。

PO-0410

银屑病病患者合并认知损害的大脑活性改变: 一项前瞻性队列的横断面分析

易小平、王雪璿、Bihong T. Chen
中南大学湘雅医院

目的: 我们前期研究发现银屑病患者常合并认知损害, 然而, 在认知能力下降的银屑病患者中, 其内在大脑活性和认知功能方面的关联尚不清楚。本研究旨在评估银屑病患者大脑活性的改变及其与认知损害的关系。

方法: 本研究共纳入 222 名年龄在 18-70 岁的银屑病患者和 144 名年龄和性别匹配的健康对照 (HC)。所有受试者均接受了大脑静息状态功能性磁共振成像 (rs-fMRI) 和神经心理学测量。通过低频波动幅度 (ALFF) 和基于种子的功能连接 (FC) 来分析 rs fMRI 数据的内在大脑活动。进行了大脑活性与认知评估结果之间的相关性分析。

结果: 与 HCs 相比, 银屑病患者在连线测试、数字广度测试和 Stroop 测试 (SCWT) 中的认知表现较差 ($P<0.05$), 银屑病患者左额上回、左额中上回和右楔前回的 ALFF 降低; 以及左中央旁小叶的 ALFF 增强 ($P_{FWE}<0.05$)。四个大脑区域的 ALFF 改变与认知评估结果之间也存在显著相关性 ($P<0.05$)。此外, 银屑病患者四个 ALFF 改变的大脑区域 (种子) 与左前额叶回、左前扣带回、左顶叶上小叶、右楔前回、左顶叶下小叶、右角回和双侧颞下回等默认模式网络 (DMN) 区域 ($P_{FWE}<0.05$)。

结论: 研究结果表明, 银屑病患者表现出 ALFF 改变和 DMN-前额叶回路内关键大脑区域的超连通性。银屑病患者这些自发脑活动改变可能与认知缺陷的病理生理机制有关。

PO-0411

基于 MRI 全脑定量分析对中、老年 2 型糖尿病合并高血压、高血脂脑结构的研究

方玮玮、贺程成、祁丹、李锦红、李延静
延安大学附属医院

目的 基于深度学习算法定量分析 T2DM 患者合并高血压、高血脂的脑结构变化,探讨年龄与合并高血压/高血脂或合并症之间对脑萎缩的影响。为患者的个性化治疗提供影像学依据,降低该类患者的脑结构损伤,提高患者的生活质量。

方法 回顾性收集 2021 年 11 月-2023 年 6 月于延安大学附属医院心脑血管病院诊断的 T2DM 患者 (259 例) 的临床及影像学资料。根据年龄将受试者分为 41-60 岁和 61-80 岁两组,再根据血压及血脂将被试者分为五个亚组,即单纯 T2DM 组、T2DM + 高血脂组、T2DM + 高血压组、T2DM + 高血脂 + 高血压组,使用 U-AI (上海联影医疗科技有限公司,人工智能全脑定量分析软件技术) 计算不同组别 (全脑、双侧灰质、双侧白质、双侧脑脊液、双侧杏仁体、双侧尾状核、双侧壳核、双侧苍白球及双侧丘脑) 等脑结构容积的基础数据,定量分析 T2DM 与其并发症之间相互作用对人类大脑皮层下灰质核团体积差异。

结果 各亚组间年龄、性别差异无统计学意义 ($P > 0.05$),与单纯 T2DM 组相比,41-60 年龄组之间全脑灰质 (左/右)、尾状核 (左/右) 体积有所减小 ($P < 0.05$)。61-80 年龄组之间全脑体积 (左/右)、全脑灰质 (左/右)、尾状核 (左/右)、海马 (左/右)、丘脑 (左/右) 体积有所减小 ($P < 0.05$)。

结论 糖尿病合并高血压、高血脂是全脑灰质的影响因素,全脑定量体积参数可定量反映 T2DM 患者脑结构的损害,为 T2DM 患者早期脑结构损害个性化治疗提供影像学依据。

PO-0412

基于 TRACULA 技术对焦虑障碍患者的脑白质研究

周焕¹、梁楷利¹、李海龙¹、曹凌霄¹、王一丹¹、柴双纬¹、刘诗雨²、邱昌建²、黄晓琦¹

1. 四川大学华西医院 华西磁共振研究中心

2. 四川大学华西医院 心理卫生中心

目的

焦虑障碍是一类以过度担心,运动性不安为主要表现的精神疾病,主要表现在胼胝体、上纵束等白质纤维的异常。现有白质纤维束追踪技术依赖已有图谱获取 ROI,存在个体图像配准不准确的局限性。新兴的基于解剖结构的纤维追踪 (Tracts Constrained by Underlying Anatomy, TRACULA) 技术充分考虑了个体纤维束周围的解剖分割信息,追踪效果受纤维连接和纤维交叉的影响较小,完整重建白质纤维束的敏感性和可靠性均已得到验证。本研究首次采用 TRACULA 技术探究焦虑障碍患者白质结构完整性的改变,及其与临床症状的相关性。

方法

纳入性别和年龄相匹配的 32 名焦虑障碍患者 (包括广泛性焦虑障碍和惊恐障碍) 和 20 名健康对照 (HCs),采集 3D-T1 结构像和 DTI 图像,并采用 GAD-7、HAMA-14、HAMD-17 评估被试的临床症状。采用 TRACULA 技术提取全脑 42 条白质纤维的部分各向异性分数 (FA)、平均扩散率 (MD)、径向扩散率 (RD) 和轴向扩散系数 (AD) 的加权平均值。采用协方差分析对每条纤维束的弥散指标进行组间比较,并将焦虑障碍组的弥散指标与临床量表评分进行偏相关分析,统计学阈值设置为 $p < 0.05$ (FDR 校正)。

结果

与 HC 相比, 焦虑障碍组的胼胝体体部中央区 FA 降低, RD、MD 升高; 前运动区 AD、MD 升高; 颞叶区 MD 升高; 右侧背侧扣带束的 FA 降低; 双侧背侧扣带束的 RD、MD 升高; 右侧上纵束 I 的 RD、MD 升高; 右侧上纵束 III 的 AD 升高。相关分析结果未通过 FDR 校正。

结论

本研究采用 TRACULA 技术发现了焦虑障碍患者胼胝体、上纵束等白质纤维异常改变, 实现了纤维精细的亚区定位。胼胝体体部亚区微结构改变提示患者左右额叶后部和顶叶半球间的信息交流可能存在障碍; 上纵束 I、III 白质微结构改变提示患者额上回与顶上小叶, 额下回与顶叶下部间的运动、记忆和情感功能受损。

PO-0413

基于 MRI 的放射组学、深度学习评分和临床病理影像参数预测 垂体瘤复发的 nomogram 模型研究

谭永明、曾献军、杨洪安、胡博
南昌大学第一附属医院

目的 本研究拟联合多序列 MRI 的放射组学评分、深度学习评分和临床-病理学的相关危险因素, 构建预测垂体腺瘤术后复发的模型。**方法** 回顾性分析了 2012 年 6 月至 2017 年 6 月 128 例确诊为垂体腺瘤患者的术前头颅 MRI 资料和临床病理资料。根据复发情况、随访到目前为止 (5-10 年), 分为垂体腺瘤复发组 (58 例) 和垂体腺瘤未复发组 (70 例)。使用 3D-slicer 软件对患者术前冠状位 T2WI、矢状位 T1WI 和对比增强 T1WI (CE-T1WI) 图像进行手动分割描绘肿瘤并提取放射组学和深度学习 (基于 ImageNet 数据集的预训练模型-微调方法, 详细见正文方法部分) 特征。降维分析后筛选出 6 个与复发相关放射组学特征、2 个深度学习特征。然后, 应用线性的 linear SVM、rbf-SVM、KNN、LR、RF 和 XGBoost 算法对筛选出的特征建立预测模型。根据受试者工作特性 (ROC) 曲线下的面积, 我们选择模型性能最佳、表现最优的线性支持向量机计算每个患者的复发概率并予以评分来构建 Radiomics score (R-score)、deep learning score (DL-score)。最后, 将 R-score、DL-score 和经过单变量和多变量分析筛选出的临床病理学及影像学的独立危险因素相结合, 建立 R-score 模型、DL-score 模型、临床病理模型、影像学模型单一模型及联合模型。采用受试者工作特性 (ROC) 曲线评估、校准曲线和决策曲线分析, 评价其临床应用价值。结果 Ki-67 和肿瘤最大直径是垂体腺瘤复发的独立预测因子。建立的六个机器学习模型性能中模型性能最佳的是 linear SVM。在最后建立的多元逻辑回归模型中, 联合 nomogram 模型则在训练集 (AUC=0.907, 95%CI: 0.843-0.972) 和测试集 (AUC=0.883, 95%CI: 0.769-0.998) 中表现出更好的预测性能。决策曲线也显示 nomogram 具有良好的临床应用价值。**结论** 联合 nomogram 模型在垂体腺瘤术后复发预测具有良好性能, 可能有助于预测个体化预后, 帮助临床进行个性化术前治疗决策和提前规划术后辅助治疗

PO-0414

磁共振 3D-T1 高分辨序列在矢状窦旁脑膜瘤术前 诊断中的应用价值

高安康、张勇、程敬亮
郑州大学第一附属医院

目的: 本研究比较 PCMRV 与基于延迟增强 3D-T1MPRAGE (CE-3D T1MPRAGE) 的动态实景渲染 (Cinematic Volume Rendering Technique, cVRT) 成像结果, 探讨基于 CE-3D T1MPRAGE 的

cVRT 成像矢状窦旁脑膜瘤(parasagittal meningioma, PSM)术前评估中的应用价值。材料和方法: 基于延迟 CE-3D T1MPRAGE 对大脑静脉系统及 PSM 进行 cVRT 可视化处理。评估 PSM 引流静脉及侧支循环形成情况, 计算术前 Sindou 分类准确率。结果: 共纳入研究 108 例 (男/女=32/75), 年龄范围 30-72 岁 (50 ± 10 岁)。经手术证实: Sindou 分类 I 型 53 例, II 型 4 例, III 型 5 例, IV 型 9 例, V 型 16 例, VI 型 21 例; WHO I 级 83 例, II 级 24 例, III 级 1 例。cVRT 图像矢状窦旁脑膜瘤 Sindou 分类诊断正确率达 89.81%, PCMRV 显示了矢状窦闭塞或者不同程度的狭窄, 难以实现对窦壁的观察及 Sindou 分类。Ki-67LI、SSTR2 阳性率 (99.07%, 107/108) 和 PR 阳性率 (96.29%, 104/108) 在 Sindou 6 分类中两两级别之间差异无统计学差异。cVRT 图像在 PSM 瘤周静脉的可视率 (106/108, 98.14%) 较 PCMRV (80/108, 74.07%) 高, 差异有统计学意义 (McNemar's 检验, $P < 0.001$); 浅静脉吻合侧支的可视率, 于 cVRT (99/108, 91.67%) 与 PCMRV (85/108, 78.70%) 相比差异有统计学意义 (McNemar's 检验, $P = 0.02$); 深静脉侧支的 cVRT 可视率 (59/108, 54.362%) 较 PCMRV (92/108, 85.18%) 明显降低, 差异存在统计学差异 (McNemar's 检验, $P < 0.001$)。结论: 基于增强延迟 3D T1MPRAG 的 cVRT 图像可将不同的组织进行颜色标记, 达到更直观、逼真的效果, 能够实现较为准确的 PSM Sindou 分类及浅静脉侧支、吻合支的显示, 为手术提供更准确的参考。

PO-0415

应用腰骶神经根 DTI 检测 II 型糖尿病周围神经病

陈嵩、谢晟、徐妍妍、邓瑞芬、李照青、汪伟、焦劲松
中日友好医院

目的: 应用 DTI 技术对 II 型糖尿病周围神经病 (DPN) 患者的腰骶神经根进行成像, 分析腰骶神经根 DTI 参数的变化, 并将 DTI 参数与临床资料和神经电生理结果进行相关性分析, 综合评价腰骶神经根 DTI 对 DPN 诊断的价值。

方法: 应用 3.0T MRI 设备对 32 例 II 型糖尿病 DPN 患者和 28 例 II 型糖尿病非 DPN 患者的 L4、L5 和 S1 神经根进行 DTI 成像。对 DTI 数据进行神经追踪, 生成神经根的纤维束成像伪彩图, 得到神经根的分数各向异性 (FA) 和表观扩散系数 (ADC) 值, 并在两组之间进行比较。使用 ROC 曲线分析腰骶神经根 DTI 参数的诊断效能。使用 Pearson 相关性分析 DTI 参数与临床资料和神经电生理之间的关系。 $P < 0.05$ 认为具有统计学差异。

结果: DPN 患者的 L4~S1 神经根 DTI 参数与糖尿病非 DPN 患者相比有统计学差异 ($p < 0.01$), 即 FA 值降低, ADC 值升高。在检测糖尿病患者有无 DPN 方面, L5 神经根的 FA 值表现出了最高的诊断效能 ($AUC = 0.774$, 敏感度=75.9%, 特异度=70.8%)。在诸多临床资料中, DTI 参数与空腹胰岛素水平的相关性最强, FA 值与空腹胰岛素水平呈正相关 ($r = 0.485$, $p = 0.001$), ADC 值与空腹胰岛素水平呈负相关 ($r = -0.460$, $p = 0.002$), 此外, FA 和空腹血糖 ($r = -0.282$, $p = 0.030$) 以及 ADC 和糖化血红蛋白 ($r = 0.283$, $p = 0.028$) 之间也表现出了弱相关性。在神经电生理结果中, FA 和 ADC 值均和电生理结果有相关性 (所有 $p < 0.05$), 其中 FA 和神经传导速度的相关性最强 ($r = 0.512$, $p < 0.001$)。

结论: DTI 可以对糖尿病周围神经病患者的神经根病变进行定量的评价。DTI 不仅可以检测出糖尿病患者是否发生了周围神经损伤, 还可以对周围神经损伤的程度进行定量描述, 并有潜力评价 DPN 治疗后神经改变。

PO-0416

成人散发型神经元核内包涵体病的多模态影像学研究

朱瑞、曲俊宇、武泳升、许归华、王大伟
山东大学齐鲁医院

目的

本研究拟基于体素分析的方法,应用扩散峰度成像技术对神经元核内包涵体病患者脑灰质及白质微观结构的改变及与认知功能障碍的关系做进一步研究,并基于独立成分分析探究成人散发型神经元核内包涵体病患者脑功能连接的改变,希望为此疾病的神经病理学机制及早期诊疗提供新的影像学视角。

方法

回顾性纳入 2019.5-2023.3 月间在山东大学齐鲁医院神经内科确诊为神经元核内包涵体病(neuronal intranuclear inclusion disease, NIID)的 11 例患者和同期年龄、性别、受教育程度匹配的健康对照 20 人,收集神经心理学结果及颅脑 DKI 和 rs-fMRI 数据。获得平均扩散峰度(mean kurtosis, MK)、平行扩散峰度(axial kurtosis, AK)、垂直扩散峰度(radial kurtosis, RK)、峰度各向异性(kurtosis anisotropy, KA)灰质参数及各向异性分数(fractional anisotropy, FA)和平均扩散率(mean diffusivity, MD)白质参数,对受试者临床资料、DKI 参数值进行统计学分析,分析 NIID 患者与健康对照差异有统计学意义脑区的 DKI 值与神经心理学评分的相关性。然后基于独立成分分析探究 NIID 患者脑网络功能连接的变化。

结果

与健康对照相比,NIID 患者脑灰质区丘脑的 MK、RK 值降低,右侧海马的 RK、KA 值降低;前扣带回、岛叶、楔前叶的 AK 值降低,舌回的 KA 值减低;脑白质区额叶、顶叶及部分颞叶区白质 FA 降低,MD 广泛升高,未累及枕叶部分(FWE 校正, $p < 0.05$)。NIID 患者右侧脑灰质海马区 KA 值与 MoCA 评分呈正相关($r = 0.650$, $P = 0.030$),其他感兴趣区 DKI 值与神经心理学结果无明显相关性。此外,NIID 患者较健康对照相比多个脑网络的网络内及网络间功能连接减弱。

结论

NIID 患者表现出多个脑区微观结构的改变,白质比灰质改变更广泛,并且存在多个脑网络的功能连接减低,这些变化可能有助于 NIID 的病理生理学的解释,并作为监测 NIID 严重程度和进展的潜在指标,对早期诊断有一定的临床价值。

PO-0417

DTI 联合 T2 mapping 多参数 MRI 成像定量
分析正中神经对腕管综合征的诊断价值

王悠之、王莉霞、吴文骏、苏宇
华中科技大学同济医学院附属协和医院

目的:探讨弥散张量成像(DTI)衍生参数联合 T2 定量成像(T2 mapping)的 T2 值对腕管综合征(CTS)患者诊断价值。

方法:前瞻性收集了 33 例经神经电生理检查确诊的腕管综合征确诊患者及 32 例健康对照组,所有受试者均行常规磁共振扫描、DTI 及 T2 mapping 扫描后,测量正中神经在豌豆骨层面、钩状骨层面两个层面的截面积(长径 \times 短径, CSA)、扁平率(短径/长径, MNFR)、DTI 衍生参数包括部分各向异性分数(FA)、表观扩散系数(ADC)、轴向弥散系数(AD)及径向弥散系数(RD)与 T2 值。采用独立样本 t 检验比较两组各参数值差异。建立多参数检测模型的 Logistic 回归方程并采用受试者工作特征(ROC)曲线评价各指标单独及联合检测对 CTS 的诊断价值。

结果: 在单因素分析中 CTS 组和健康对照组在两个层面的截面积、FA 值、ADC 值、RD 值、T2 值差异均有统计学差异 (P 均 <0.05), 其中 FA 值降低, ADC 值、AD 值、RD 值、T2 值及 CSA 均高于对照组。然后进行多变量逐步 Logistic 回归分析中, FA (OR, <0.001 ; 95%CI, <0.001 -0.226)、AD (OR, 4.148; 95%CI, 2.491-6.908)、T2 (OR, 1.321; 95%CI, 1.048-1.664)、CSA (OR, 1.543; 95%CI, 1.052-2.263) 值可作为独立诊断因子 (P 均 <0.05), 均为豌豆骨层面。用于诊断 CTS 的豌豆骨层面 FA 值、AD 值、T2 值、CSA 及联合参数的 AUC 值分别为 0.737、0.701、0.747、0.761、0.922, 联合参数诊断 CTS 的敏感度、特异度分别为 75.8%、69.5%。

结论: 腕掌部正中神经的 DTI 及 T2 mapping 各指标联合参数能明显提高 CTS 的诊断价值, MRI 定量参数在无创检测 CTS 方面具有较高的应用价值

PO-0418

基于 MRI 影像组学驱动的神经网络模型的 胶质瘤术前分级预测研究

秦燕、毛弈韬
中南大学湘雅医院

研究背景及目的: 脑胶质瘤是成人最常见的原发性中枢神经系统恶性肿瘤。具有复发率高、致残率高、生存率低的特点, 是全球难治性肿瘤之一, 严重影响到人类的生命健康。胶质瘤术前精准病理分级对患者治疗方案的确定和预后评估至关重要。既往研究主要聚焦在胶质瘤的二分类(即高级别与低级别胶质瘤)。据我们所知, 目前尚未有基于磁共振成像(MRI)影像组学的人工神经网络(ANN)模型对胶质瘤术前四分类(即 I、II、III 和 IV 级)的研究。

材料和方法: 本研究共纳入 272 例病理确诊脑胶质瘤患者。基于患者手术前的对比增强 T1 加权图像提取影像组学特征, 再根据其 与胶质瘤病理分级的相关性进行特征筛选。将它们按 3:1 的比例分配到训练组和验证组, 最后建立了一个用于术前脑胶质瘤病理分级(四分类)的人工神经网络模型。我们采用诊断混淆矩阵来直观地展示模型的诊断性能。

结果: 在提取的 530 个影像组学特征中, 选择纳入前 19 个特征后人工神经网络预测模型的诊断性能趋于稳定。此时, 训练集和测试集的平均总体诊断准确率分别为 91.28% 和 87.04%, 相应的变异系数(CV)为 0.0190 和 0.0272。训练集对 I、II、III 和 IV 级脑胶质瘤的诊断准确率分别为 91.9%、89.9%、92.1% 和 90.7%, 验证集的诊断准确率分别为 88.7%、87.1%、86.5% 和 86.9%。

结论: 基于 MRI 影像组学特征的人工神经网络模型为术前精准预测胶质瘤分级(四分类)提供了一种无创方法, 具有良好的准确性和稳定性。

多模态 CT 水摄取率对急性缺血性卒中发病时间的预测

史孟容¹、袁若涵²、李延静¹
1. 延安大学附属医院
2. 咸阳市中心医院

目的 分析不同发病时间组急性缺血性卒中患者临床基线数据及水摄取率的差异, 并探讨水摄取率(NWU)与发病时间的相关性, 旨在通过水摄取率预测急性缺血性卒中患者的发病时间。

方法 回顾性收集延安大学附属医院 2020 年 3 月至 2022 年 12 月入院的急性前循环缺血性卒中患者 206 例。根据发病至成像时间(4.5 小时、6 小时)进行不同分组, 采用独立样本 t 检验及 Mann-Whitney U 检验比较一般资料及水摄取率的差异; 使用 Pearson 或 Spearman 相关性分析水摄取率与发病时间的相关性。均以 $P < 0.05$ 时, 认为差异有统计学意义。

结果 本研究差异性分析显示,在纳入的 206 例患者中 79 人 (38.3%) 发病至成像时间在 4.5 小时内,127 人 (61.7%) 发病至成像时间在 4.5 小时后;105 人 (50.9%) 发病至成像时间在 6 小时内,101 人 (49.1%) 发病至成像时间在 6 小时后。不同分组之间性别、年龄、BMI、高血压、糖尿病、高脂血症、房颤、收缩压、舒张压、入院 NIHSS 评分、吸烟史及饮酒史差异无统计学意义 ($P>0.05$)。发病 4.5 小时内比发病 4.5 小时后的摄水率更低;发病 6 小时内比发病 6 小时后的摄水率更低。不同组别的差异均有统计学意义 ($P<0.05$)。相关性分析显示,水摄取率与发病时间呈中度正相关 ($r=0.674$, $P<0.01$)。

结论 急性缺血性卒中患者的发病时间对水摄取率有影响,并且两者呈中度正相关。因此,根据水摄取率可预测急性缺血性卒中患者的发病时间,这为急性缺血性卒中初诊患者的危险分层及诊疗提供了重要作用。

PO-0420

脊髓小脑共济失调 3 型脑白质结构运动网络改变的研究

黄自强、陈新元、陈群林
福建医科大学附属第一医院

目的:探讨脊髓小脑共济失调 3 型在临床前期和共济失调期的脑白质结构运动网络变化,及其与疾病严重程度之间的关系。

材料与方法:纳入 20 例临床前期患者,20 例共济失调期患者与 20 例年龄和性别匹配的健康对照组 (HC)。使用 SARA 和 ICARS 量表评估疾病严重程度。受试者在 3.0T 磁共振上接受扩散磁共振成像扫描,并使用概率性纤维追踪构建脑白质结构运动网络。使用图论和基于网络的统计 (NBS) 在全局、边和节点水平对运动网络进行分析。此外,评估网络拓扑属性和病程、疾病严重程度之间的相关性。

结果:与 HC 组相比,临床前期患者的运动网络的同配性增加。与 HC 组比较,共济失调期患者的运动网络的同配性增加,但全局效率、全局强度和传递性降低。与临床前期患者相比,共济失调期患者的全局效率和全局强度都有明显的下降。与 HC 组比较,NBS 分析发现临床前期患者运动网络中结构连接被破坏的子网络,包括 11 个节点的 12 条边。相对于临床前期患者,发现共济失调期患者运动网络连接脑区之间的结构连接降低的子网路,涉及 22 个边和 16 个节点。相对于 HC 组,NBS 分析共济失调期患者运动网络中结构连接减低的子网络包括 38 个节点和 242 个边。与 HC 相比,临床前期患者的运动网络中存在 5 个脑区的节点强度明显降低,包括左侧壳核、右侧腹侧间脑、左侧小脑 I_IV 区、双侧小脑 V 区。与临床前期或 HC 相比,在共济失调期患者观察到运动网络内 44 个脑区的节点强度明显降低,主要包括双侧中央前回、基底节、丘脑和小脑部分区域。此外在共济失调期患者中观察到运动网络的传递性与 SARA 和 ICARS 评分之间存在负相关。

结论:脊髓小脑共济失调 3 型的脑白质结构运动网络的变化早于共济失调症状的出现,并随着疾病从临床前期进展到共济失调期,运动网络受累范围增大。脑白质结构运动网络的全局拓扑属性有望成为反映疾病进展的客观生物标志物。本文研究为 SCA3 的疾病病理生理变化提供新的见解。

PO-0421

帕金森病患者日间过度嗜睡静息态脑功能局部一致性改变研究

刘俊
江苏省人民医院 (南京医科大学第一附属医院)

目的 探讨帕金森病伴日间过度嗜睡 (PD-EDS) 患者静息状态下脑功能局部一致性 (ReHo) 的改变。方法 收集 56 例 PD 患者以及年龄、性别、教育程度相匹配的 25 例健康对照者 (HC) 的静息

态功能磁共振 (rs-fMRI) 数据, 根据 Epworth 嗜睡量表评分 (ESS) 将 PD 患者分为 PD 伴日间过度嗜睡 (PD-EDS) 27 例及 PD 不伴日间过度嗜睡 (PD-nonEDS) 29 例。采用基于 MATLAB 的 DPABI 软件进行处理数据处理, 通过协方差分析 (ANCOVA) 和 Post-Hoc t 检验比较 ReHo 的组间差异, 并采用 Pearson 相关分析计算差异脑区 ReHo 值与 ESS 评分的相关性。结果 PD-EDS、PD-nonEDS 及 HC 组的 ReHo 值有显著性差异, 组间 Post-Hoc t 检验显示, 与 HC 组比较, PD-EDS 组的左侧颞上回、左侧苍白球、左侧尾状核 ReHo 值减低, 右侧角回、右侧额上回 ReHo 值升高 ($p < 0.05$, FDR 校正); 与 PD-nonEDS 组比较, PD-EDS 组的左侧颞上回 ReHo 值减低, 左侧丘脑、左侧枕中回 ReHo 值升高 ($p < 0.05$, FDR 校正)。Pearson 相关分析结果显示左侧颞上回的 ReHo 值与 ESS 评分呈负相关, 相关系数为 -0.45, $p < 0.05$ 。结论 PD-EDS 患者脑内 ReHo 异常的脑区包括了基底节区及背侧注意网络相关脑区, 提示 EDS 的发生可能与这些脑区功能活动局部一致性异常有关, 有助于进一步探知 PD 伴发 EDS 的神经病理机制。

PO-0422

首发精神分裂症患者小脑有效连接改变及其治疗后的长期变化

卫霞、罗春燕、赵倩楠、夏超、李梓瑜、刘至钦、张文静、龚启勇、吕粟
四川大学华西医院

背景: 小脑功能连接障碍在精神分裂症病理中起关键作用。然而, 小脑有效连接中断的细节尚不清楚。

方法: 本研究纳入 180 例首发未用药精神分裂症患者(其中 54 例在治疗一年后被重新评估)和 166 例健康对照。对所有被试的静息态功能磁共振进行格兰杰因果分析, 其中, 小脑的 9 个功能系统(感觉运动系统、听觉系统、视觉系统、默认模式系统、扣带-岛盖系统、额-顶系统、注意力系统、语言系统、多模式系统)被定义为种子点。基线时观察到的有效连接改变($q < 0.05$, FDR 校正)在随访时被进一步评估, 并与精神症状改变进行相关分析。

结果: 在首发未用药精神分裂症患者中, 我们发现从小脑到大脑的信息投射增加(即从小脑注意和扣带-岛盖系统到双侧角回, 从小脑扣带-岛盖系统到右侧额下回)。相比之下, 从大脑到小脑(即从右侧颞下回、左侧颞中回、左侧壳核和右侧角回到小脑语言系统)和小脑内(即从小脑扣带-岛盖系统到右侧小脑 Crus II)的信息投射减少。在随访一年时, 只有部分从大脑到小脑的信息投射得以恢复, 其中从左颞中回到小脑语言系统的信息投射的恢复程度与一般精神病理症状的改变呈正相关($r = 0.3$, $p = 0.04$, $n = 47$)。

结论: 本研究发现表明, 在精神分裂症急性期, 从大脑到小脑的信息投射减少可能是一种与症状和药物有关的状态依赖性改变, 而来自小脑的信息投射增加可能反映了一种持续的病理特征。

PO-0423

急性脑梗死患者脑铁沉积的定量磁敏感图初步研究

朱涵婷¹、赵锡海²、唐小平¹

1. 南昌大学第二附属医院

2. 清华大学医学院生物医学影像研究中心

目的 采用磁共振定量磁敏感图(quantitative susceptibility mapping, QSM)测量急性脑梗死患者梗死核心、缺血半暗带、大脑深部灰质核团的铁含量。

材料与方法 纳入 90 例急性脑梗死患者, 采用 GE 3.0 T MR 进行 QSM 和常规 MRI 检查。将原始图像进行处理后得到 QSM 图像, 分别测量梗死核心、缺血半暗带和对侧正常脑组织的磁敏感值, 病侧和对侧尾状核、壳核、苍白球及丘脑的磁敏感值, 采用配对样本 t 检验比较两侧脑组织及灰质核团间磁敏感值的差异。再根据血管病变的部位, 将纳入患者分为大脑中动脉梗死组、颈内动脉梗死组、大

脑前动脉梗死组、大脑后动脉梗死组、椎基底动脉梗死组,采用单因素方差分析比较五组患者梗死核心、缺血半暗带及病侧灰质核团间磁敏感值的差异。

结果 90 例受试者梗死核心、缺血半暗带磁敏感值较对侧差异有统计学意义($P<0.05$),病侧尾状核、壳核和苍白球磁敏感值较对侧差异有统计学意义($P<0.05$),丘脑两侧磁敏感值差异无统计学意义($P>0.05$)。上述五组各组间差异均无统计学意义(P 值均 >0.05)。

结论 应用 QSM 技术发现急性脑梗死患者梗死核心、缺血半暗带较对侧正常脑组织增高,病侧灰质核团铁含量较对侧增高,进一步加深对急性缺血性脑卒中病理生理过程的认识,从而为临床治疗和改善缺血性脑卒中预后提供指导。

PO-0424

两条并行的 MOp-CP-SNr 环路单向调节 PD 运动障碍的机制研究

姚梅、张鑫、陈玖、张冰
南京鼓楼医院

帕金森病 (PD) 是一种多发的神经退行性疾病,以运动功能障碍为主要症状。继发性神经环路异常是导致 PD 症状发展的重要原因,但其中的环路机制尚不清楚。研究表明学习、巩固新习得的运动技能以及运动的准备、规划和执行等不同阶段的发生均依赖运动皮层和纹状体的可塑性。先前的研究采用光遗传技术特定调控了帕金森疾病模型小鼠的运动皮层至 CP 投射环路,发现小鼠的运动能力得到改善,表明该环路对于运动相关的神经退行性疾病具有重要作用。我们前期的工作发现初级运动皮层 (MOp) 前外侧区和中间内侧区中端脑内投射神经元投射至尾壳核 (CP) 的轴突纤维分别位于背侧和腹侧区域,但这两条不同投射环路对于运动功能的调控是否存在差异尚不清楚。本研究采用病毒示踪、光遗传、化学遗传学与磁共振成像等前沿技术,证实了这两条并行的 MOp-CP 环路在运动中发挥不同的单向调节作用。黑质网状部 (SNr) 是 MOp→CP 神经元的主要投射区域之一,当损伤 MOp-CP 环路时,CP 投射环路活动不同程度增加,其中 CP→SNr 环路最为显著。本文进一步明确了 SNr 是 MOp→CP 神经元在运动中发挥作用的关键下游核团,揭示 MOp-CP-SNr 环路可能是介导 PD 发生的关键环路。本研究深入阐明了 PD 运动功能障碍的神经环路机制,为临床治疗 PD 提供环路连接基础和精准定位参考。

PO-0425

毛细胞型星形细胞瘤影像学表现及病理特征分析

唐兴
空军军医大学西京医院

目的 本研究旨在探讨毛细胞星形细胞瘤的影像学、病理学特征,进一步提高该疾病的诊断和鉴别能力,并探讨其预后。方法 回顾性分析 29 例病理证实的毛细胞星形细胞瘤患者的临床、影像及病理资料并总结其特征。结果 29 例病灶可分为实性型、囊实型、完全囊性型。实性成分在 CT 中呈等密度,在 MRI 中 T1WI 稍低信号, T2WI 稍高信号, FLAIR 稍高信号,囊性部分在 CT 中呈低密度,在 MRI 中 T1WI 低信号, T2WI 高信号, FLAIR 大部分为稍高、高信号。瘤周水肿表现幕上 $>$ 鞍区 $>$ 小脑。增强扫描实性部分明显强化,其内小囊变坏死不强化,大囊壁可强化或不强化。组织学上由致密区 (主要是肿瘤细胞及细胞间的 Rosenthal 纤维构成) 和疏松区 (星形细胞及多极细胞的退变产生的囊液) 组成,常见 Rosenthal 纤维和嗜酸性颗粒小体。免疫组化染色显示, GFAP (22/26)、Olig-2 (26/26)、S-100 (26/26) 呈阳性表达, Ki-67 增殖指数低 (绝大数为 1%-15%)。结论 毛细胞星形细胞瘤在幕上 (好发鞍区) 及幕下具有一定的特征,成人幕上多见,儿

童和青少年幕下多见。影像学不易与其它低级别胶质瘤鉴别,可以结合 DWI 和 FLAIR 以及组织细胞学特点,可确诊该病。该病预后良好,如完整切除,则无须放化疗,只需要定期复查即可。

PO-0426

有氧运动对阈下抑郁人群静息态脑功能动态特征的影响

黄丽娜

常熟市第二人民医院

目的:探讨基于脑功能动态分析差异脑区和阈下抑郁人群有氧运动干预效果的潜在关联性。

方法:纳入 44 例阈下抑郁受试者(阈下抑郁组)和 34 例健康受试者(对照组),两组均进行 8 周中等强度的有氧运动干预,并于干预前后采集静息态功能磁共振图像。采用滑动窗技术进行动态 fALFF (dynamic fALFF, dfALFF) 和动态功能连接 (dynamic functional connectivity, dFC) 分析。通过 Spearman 相关性分析考察阈下抑郁组有氧运动干预前后差异脑区 dfALFF 和 dFC 值与心理量表评分之间的相关性。

结果:基线期,与健康对照组相比,阈下抑郁组两侧舌回、左侧枕下回和左侧颞中回的 dfALFF 值显著降低;后扣带回和右侧枕下回、右侧缘上回的 dFC 显著增强,后扣带回和右侧后扣带回、左侧中央旁小叶的 dFC 显著减弱。8 周有氧运动干预后,与健康对照组相比,阈下抑郁组左侧颞上回、右侧颞中回、左侧丘脑和右侧背外侧额上回的 dfALFF 值显著增高;后扣带回和右侧舌回、左侧额中回和左侧颞上回的 dFC 值显著增强,后扣带回和右侧颞中回、右侧中间扣带回的 dFC 值显著减弱。阈下抑郁组有氧运动干预后,右侧颞下回、左侧内侧额上回、左侧楔前叶和两侧壳核的 dfALFF 值较基线期显著增高;后扣带回和左侧内侧额上回、左侧楔前叶的 dFC 值较基线期显著增强,后扣带回和左侧梭状回和左侧颞中回的 dFC 较基线期显著减弱。健康对照组有氧运动干预后,右侧颞上回的 dfALFF 值较基线期显著增高,右侧舌回、左侧枕下回的 dfALFF 值较基线期显著降低;后扣带回和两侧距状回、右侧额下回三角部及左侧楔前叶的 dFC 值显著增强,后扣带回和右侧内侧额上回和右侧额中回的 dFC 值显著减弱。阈下抑郁组在基线期左侧舌回的 dfALFF 值和 PHQ-9 和 SAS 评分均呈正相关 ($r=0.300$, $P=0.048$; $r=0.368$, $P=0.014$); 有氧运动干预后右侧颞下回的 dfALFF 值与 SAS 评分呈正相关 ($r=0.317$, $P=0.036$)。

结论:静息态脑功能的动态特征分析有助于阐明阈下抑郁人群有氧运动干预前后脑功能的瞬时动态特性,且敏感性更高。

PO-0427

CSVD 相关认知障碍患者默认网络格兰杰因果连接分析

毛海霞、方向明

无锡市人民医院

目的 探讨 CSVD 患者的默认网络的格兰杰因果连接改变与认知障碍的相关性

方法 搜集 CSVD 患者 119 例,其中 CSVD 认知正常者 (CSVD-CN) 62 例,CSVD 认知障碍 57 例,性别、年龄、教育程度相匹配的健康对照组 109 例,利用 dpabi 软件对静息态功能磁共振进行预处理,选取 DMN 的 4 个主要节点作为感兴趣区 (ROI),提取 4 个 ROI 的时间序列信号,构建一个 4 个节点之间的完全连接的 GCA 模型 (共 12 个连接)。然后利用基于残差的 GCA 分析方法计算每个脑区间的 GCA 关系,再利用 gretna 做组间比较。

结果 CSVD-CN 组相对于 HC 组, LIPC 到 PCC 的信息流动减少, mPFC 到 RIPC 和 PCC 到 RIPC 的信息流动增加; CSVD-CN 与 CSVD-CI 的组间 GCA 模型比较无统计学差异; CSVD-CI 组相对于 HC 组, LIPC 到 PCC 信息流动减少,且与认知相关。

结论 CSVD 患者 DMN 的信息流动的改变与认知障碍相关。

PO-0428

一体化 PET/MR 评估心衰患者左室心肌应变与脑结构改变的相关性研究

郑冲、崔亚东、卢洁
首都医科大学宣武医院

目的 心衰患者多合并脑损伤，合并脑损伤患者预后不良，但机制尚不清楚。本研究应用一体化 PET/MR 探究心衰患者左室结构功能损伤、脑结构改变的影像学特征及其关系。

方法 纳入左室心肌梗死导致心衰患者 51 例，及年龄、性别与患者组相匹配的健康志愿者 37 例。患者组先行 $^{13}\text{N-NH}_3\text{-H}_2\text{O}$ 心肌灌注显像和 ^{18}F -脱氧葡萄糖 (FDG) 心脏 PET/MR 检查，随后立即行脑 MR 检查，对照组仅行脑 MR 检查。记录两组临床基本信息及蒙特利尔认知评估 (MoCA) 评分。应用后处理工作站对心脏 PET 和 MR 图像进行分析，计算心功能参数、心肌应变参数包括整体径向应变 (GRS)、整体周向应变 (GCS) 和整体纵向应变 (GLS)。采用 17 段-5 分法判断心肌存活和心肌梗死，并计算心肌存活范围及心肌梗死范围。采用标准化脑分析软件 SPM12、CAT12 对脑 3D T1WI 数据分析，得到皮层厚度、沟深、皮质复杂度等脑结构参数，并比较两组脑结构参数差异。应用 Spearman 相关性分析评估脑结构改变、心脏影像学参数及 MoCA 之间的相关性 (校正临床基线资料及血管危险因素)。

结果 两组临床基本信息未见统计学差异，心衰组 MoCA 评分显著低于对照组 (22.7 ± 3.9 vs. 26.3 ± 1.8 , $P=0.001$)。与对照组相比，心衰组患者双侧海马旁回、颞上回、颞中回、额上回、额中回等脑区皮层厚度减低 (均 FDR 校正; 体素水平 $P<0.001$, 团块水平 $P<0.05$)。两组沟深及皮质复杂度未见统计学差异。以上减低脑区的皮层厚度与 MoCA 评分 (相关系数范围为 $0.49\sim 0.52$, P 均 <0.05) 及心肌应变参数 GCS (相关系数范围为 $-0.32 \sim -0.53$, P 均 <0.05) 呈显著相关, 与心功能参数、GRS、GCS 及梗死心肌、存活心肌范围等指标未见相关性 (P 均 >0.05)。

结论 心衰患者大脑皮层厚度减低, 且与认知功能及左室心肌应变减低存在相关性, 为心衰患者合并脑损伤提供影像学依据。

PO-0429

首发精神分裂症言语性幻听患者的小脑-丘脑-皮层功能和有效连接异常

魏亚蕊、薛康康、韩少强、汪卫建、张勇、宋学勤、程敬亮
郑州大学第一附属医院

众所周知, 精神分裂症言语性幻听 (AVHs) 的患者丘脑功能受损。在精神分裂症 AVHs 患者中发现丘脑的过滤功能异常。然而, 在研究 AVHs 患者丘脑连接障碍时, 通常采用的是整体结构方法, 而哪个丘脑核是 AVHs 的关键结构仍不清楚。在此, 我们研究了初次发作精神分裂症 (FES) 且未经药物治疗的 AVHs 患者丘脑核团的基于体素的静息态功能连接 (rsFC)。此外, 该研究还应用动态因果模型计算效应连接, 并估计解释异常 rsFC 的因果关系。与无 AVHs 的 FES 患者 (NAVH) 和正常对照组相比, AVHs 患者双侧丘脑内侧枕核 (PuM) 与小脑之间的 rsFC 显著较弱。此外, 与正常对照组相比, AVH 组和 NAVH 组的双侧 PuM 核与大脑皮层之间的 rsFC 显著较强, 而右侧内侧膝状体核与大脑皮层之间的 rsFC 较弱。与 NAVH 组和正常对照组相比, 动态因果模型显示

AVH 组从左侧 PuM 核到右侧额下回的效应连接显著更强。这些研究结果表明, AVH 的丘脑关键结构是 PuM 核, 并提供了小脑-丘脑-皮层回路与 AVH 相关的直接证据。

PO-0430

基于 HR-VWI 评估的颅内动脉粥样硬化斑块稳定性与 2 型糖尿病患者血糖波动的相关性研究

李天天、钱呈群、朱丽、王天乐
南通市第一人民医院

目的 探讨基于高分辨率磁共振血管壁成像 (HR-VWI) 评估的颅内动脉粥样硬化斑块稳定性与 2 型糖尿病 (T2DM) 患者血糖波动的相关性。**材料和方法** 回顾性纳入 2020 年 7 月至 2023 年 7 月间就诊于南通市第一人民医院的急性缺血性卒中 (AIS)/短暂性脑缺血 (TIA) 合并 T2DM 患者 203 例, 所有患者均在发病后 1 周内行颅内 HR-VWI 检查。收集患者临床资料[年龄、性别、血压、糖化血红蛋白 (HbA1c)、1,5-脱水葡萄糖醇 (1,5-AG) 等]。使用 HR-VWI 图像观察了双侧大脑前动脉 A1-2 段、大脑中动脉 M1-2 段、大脑后动脉 P1-P2 段、椎动脉 V4 段、基底动脉, 评估颅内动脉最狭窄处斑块特征 (斑块厚度、T1WI 高信号、强化程度、管腔狭窄率等)。根据血清 1, 5-AG 水平的二分位数将其分为血糖波动较大组 ($\leq 30.7 \mu\text{mol/L}$, 102 例) 和血糖波动较小组 ($> 30.7 \mu\text{mol/L}$, 101 例), 比较两组斑块特征差异。并根据颅内动脉最狭窄处斑块是否伴有 T1WI 高信号, 将患者分成 T1WI 高信号组 (88 例) 和非 T1WI 高信号组 (115 例)。采用二元 logistic 回归分析 T1WI 高信号的独立预测因子。结果 203 例患者中, 男 123 例、女 80 例, 年龄 29~85 岁, 1,5-AG 范围 3.0~207.5 $\mu\text{mol/L}$, 中位数 30.7 (13.8, 51.2) $\mu\text{mol/L}$, HbA1c 范围 5.37~14.05%, 中位数 7.9 (6.9, 9) %。血糖波动较大组的斑块 T1WI 高信号发生率高于血糖波动较小组 ($\chi^2=25.375$, $P<0.001$)。血糖波动较大组的斑块强化程度高于血糖波动较小组 ($\chi^2=6.757$, $P=0.009$)。血糖波动较大组的管腔狭窄率高于血糖波动较小组 ($Z=-2.118$, $P=0.034$)。二元 Logistic 回归分析显示, 1,5-AG (OR=0.971, $P=0.001$)、糖化血红蛋白 (OR=1.305, $P=0.01$) 是斑块 T1WI 高信号的独立风险因素。结论: 1, 5-AG、HbA1c 水平是 T2DM 患者颅内动脉粥样硬化斑块 T1WI 高信号的独立预测因子, 早期监测可能有助于发现高危斑块。

PO-0431

脑小血管病 NODDI 网络属性参数与认知功能相关性研究

朱默¹、王宁²
1. 苏州大学附属第一医院
2. 江苏省常熟市第二人民医院

目的: 探讨脑小血管病的结构脑网络属性参数与认知功能相关性, 评估结构脑网络属性参数和 MMSE、MoCa 量表评分的相关性。

材料与方法: 本研究于 2021 年 4 月至 2022 年 11 月期间纳入 58 例脑小血管病患者, 其中 29 例为 CSVD 无认知功能障碍患者, 29 例为 CSVD 认知功能障碍患者。所有患者均测试 MMSE 和 MoCa 量表及进行磁共振常规序列、高分辨率 TIWI 和 NODDI 序列扫描。基于虚拟机内 mrtrix 的环境下进行 NODDI 数据预处理及构建结构脑网络。在 GRETNA 中计算脑网络拓扑参数 (全局参数和局部参数)。运用图论方法分析两组患者间的脑网络拓扑参数差异。基于网络的统计分析方法 (Network based statistical analysis, NBS) 分析脑网络结构连接改变。基于 spearman 分析结构脑网络拓扑参数与 MMSE 和 MoCa 量表的相关性。

结果: (1) CSVD 患者均表现出小世界属性。两组患者的 Sigma、Lambda 及 Gamma 均具有统计学差异。(2) CSVD 认知功能障碍患者的 Eloc 和 Cp 参数值与 MMSE 评分具有正相关。(3) Sigma、Lambda、Gamma 和 Lp 参数值与 MoCa 评分具有负相关, Eg 和 Eloc 参数值与 MoCa 评分具有正相关。

结论: 小世界属性的改变提示 CSVD 患者可能损伤了结构脑网络的完整性, 以及是患者认知功能损害的机制之一。Sigma、Lambda、Gamma 参数在 CSVD 认知功能障碍疾病中可作为临床辅助诊断的定量生理指标。

PO-0432

高分辨率 MRI 联合动脉自旋标记可以区分颅内狭窄的短暂性脑缺血发作和脑卒中

李玲、严雪娇、汤敏、文玉、张小玲
陕西省人民医院

目的: 本研究采用高分辨率磁共振成像 (HRMRI) 和动脉自旋标记 (ASL) 成像研究缺血性卒中和 TIA 患者大脑中动脉斑块特征和血流动力学的差异, 并建立缺血性卒中的预测模型。

方法: 回顾性收集 2020 年 10 月至 2021 年 12 月症状性动脉粥样硬化患者。所有患者均使用带有 32 通道头部线圈的 3.0 T 磁共振扫描仪 (Ingenia CX, Philips Healthcare) 进行成像。根据 DWI 上大脑中动脉区是否发生脑梗死分为 TIA 组和卒中组。在 HRMRI 图像上评估大脑中动脉最狭窄部位的血管腔和斑块特征, 并在 PLD 为 1.5s, 2.5s 时 ASL 图像上评估动脉通过伪影 (ATA) 存在与否。采用 Logistic 回归分析评估 TIA 组与卒中组的不同特征, 受试者工作特征 (ROC) 曲线评价不同模型的诊断效果, z 检验比较各模型的曲线下面积 (AUC)。采用 SPSS (version 26) 或 R (version 4.0.4) 进行统计分析。若 $p < 0.05$, 则认为差异显著。

结果: 共有 85 名参与者最终纳入研究, TIA 组 47 名患者, 卒中组 38 名。与 TIA 组相比, 卒中组高血压、高脂血症患者明显更多 (p 均 < 0.005)。卒中组斑块负担、狭窄程度、增强比例、正性重构患病率、斑块内出血、1.5s ATA 和 2.5s ATA 存在的发生率明显高于 TIA 组 (p 均 < 0.001)。多变量回归分析显示, 校正临床混杂因素后, 在区分缺血性卒中与 TIA 患者时, 正性重构、增强比和 2.5s-ATA 存在联合诊断的准确率高于上述单一特征。联合诊断的 AUC 显著高于正重构 ($Z=4.089$, $p < 0.001$)、增强比 ($Z=3.278$, $p < 0.001$) 和 2.5s-ATA 存在 ($Z=3.482$, $p < 0.001$)。3 个特征组合的敏感性为 89.47%, 特异性为 91.49%, 阳性预测值为 89.47%, 阴性预测值为 91.49%, 准确率为 90.59%。结论: 管腔正性重构、增强比和 2.5s-ATA 存在与缺血性卒中的相关性更强。此外, 我们还建立了 TIA 患者随后发生不可逆卒中的预测模型。本研究为 TIA 患者的早期风险分层和早期临床干预提供了科学依据。

PO-0433

利用 DCE- MRI 纹理分析鉴别诊断生长激素缺乏症和特发性矮小患者

田诗云、高冰冰、苗延巍
大连医科大学附属第一医院

Purpose: To investigate the value of k_{ep} and k^{trans} maps in pituitary gland using DCE-MRI based on texture analysis in differentiating IGHD from ISS.

Method: 152 patients with clinical growth retardation, including 120 patients with clinical growth retardation, proved IGHD and 32 ISS patients. The features based on k_{ep} and k^{trans} were generated using OK software. ROC curves were used to evaluate the efficiency of texture features.

Results: Based on the texture analysis of K_{ep} maps, six features were significantly decreased, one feature was increased in IGHD group compared to ISS (all $P < 0.05$). The levels of growth hormone showed negative correlation with K^{trans} ($r = -0.306$, $P = 0.002$) in IGHD group.

Conclusions: Texture analysis of DCE-MRI in differentiating IGHD from ISS is feasible and noninvasive.

PO-0434

自闭症谱系障碍患者异常局部脑区功能和结构的改变

岳希鹏¹、魏巍¹、白岩¹、罗致¹、张梦瑶¹、郑谨翌¹、孙璇¹、王梅云^{1,2}

1. 河南省人民医院

2. 河南省科学院生物医学研究所

目的：自闭症谱系障碍(ASD)常导致患者生活、交流困难。其发病机制仍不清楚。磁共振成像技术包括静息态功能磁共振(rs-fMRI)和3D-T1结构磁共振被广泛应用于揭示ASD患者局部脑区功能和结构改变。但之前关于ASD患者局部脑区研究多采用单一结构磁共振或rs-fMRI分析方法，很少将结构磁共振和rs-fMRI结合探索异常脑区及异常脑区功能和结构之间关系。本研究采用rs-fMRI结合3D-T1结构磁共振分析方法探索ASD患者局部脑区异常功能和结构改变。此外，提取异常脑区功能和结构指标，分析异常脑区结构和功能之间关系。以期深入理解ASD患者脑结构功能神经机制改变。

方法：招募50名ASD患者和30名年龄、性别匹配健康者。被试行头颅rs-fMRI和3D-T1结构磁共振扫描，使用自闭症诊断观察量表(ADOS)对ASD患者评估。rs-fMRI数据采用局部一致性(ReHo)和低频波动振幅(ALFF)算法及双样本t检验对比两组局部脑功能差异，3D-T1磁共振数据采用基于体素形态学分析(VBM)及两样本t检验比较两组局部脑灰质体积差异。采用Spearman's相关分析探索ASD患者异常脑区ReHo、ALFF、灰质体积与ADOS相关性。异常脑区功能指标和结构指标之间相关性。

结果：相比健康被试，ASD组ALFF值在丘脑显著降低，在左颞下回显著升高。ASD组ReHo值在左舌回、丘脑显著降低，在右额上回、左额中回显著升高。ASD组灰质体积在楔前叶显著增高。ASD患者异常右额上回、丘脑和左额中回ReHo与ADOS评分显著负相关($r = -0.186$, $p = 0.036$; $r = -0.19$, $p = 0.49$; $r = -0.211$, $p = 0.017$)。右额上回ReHo和灰质体积显著负相关($r = -0.183$, $p = 0.037$)，丘脑ALFF与灰质体积显著负相关($r = -0.204$, $p = 0.02$)。

结论：ASD患者局部脑区存在异常功能和结构改变，异常脑区改变与患者临床症状相关。部分异常脑区内部功能和结构存在显著负相关性，提示脑结构在一定范围内对异常脑功能可能具有限制性调节作用。这对于深入理解ASD患者的神经机制改变有着重要意义。

PO-0435

帕金森病患者黑质神经黑色素脱失与功能网络连接和运动障碍有关

阎肃、朱文珍

华中科技大学同济医学院附属同济医院

目的: 黑质致密部内的神经黑色素反映了多巴胺色素神经元的丢失, 并在一定程度上反映了帕金森病 (Parkinson disease, PD) 中黑质-纹状体和纹状体-皮层通路的功能障碍。本研究旨在探究神经黑色素减少所表现出的黑质变性与大规模功能脑网络之间的相互作用及其对帕金森病运动障碍的影响。

方法: 纳入 2021 年 7 月至 2022 年 8 月在华中科技大学同济医学院附属同济医院神经内科住院的 68 名 PD 患者, 同时在社区招募 32 名年龄和性别匹配的健康志愿者。通过神经黑色素敏感成像序列计算黑质内侧、中间和外侧亚区的对比噪声比来衡量黑质的完整性。通过静息态功能磁共振成像序列基于独立成分分析获得静息态功能网络间连接。最后我们对帕金森病患者的黑质变性、功能网络破坏和运动障碍进行了相关和中介分析。

结果: 与健康对照相比, 我们观察到 PD 患者黑质内的神经黑色素含量减少, 且网络间功能连接异常, 主要涉及基底节、感觉运动和额顶网络。相关分析显示神经黑色素含量的减少与背侧感觉运动网络与内侧视觉网络之间的连接以及背侧感觉运动网络与基底节网络之间的连接呈负相关。中介分析表明, 在黑质神经黑色素含量减少对帕金森病运动症状严重程度的影响中 36.0% 是由基底节网络和背侧感觉运动网络之间连接强度的增加所介导的 (中介效应 = -1.358, 95% 置信区间为 -2.997 ~ -0.147, $P < 0.05$)。

结论: 我们的证据表明黑质内神经黑色素减少可能通过影响运动相关网络之间的功能连接来调控运动损害的严重程度, 从网络退变角度增加了对帕金森病运动障碍机制的了解, 并为监测帕金森病进展和筛选神经调控适应征提供了潜在的影像学指标。

PO-0436

合并海马硬化的内侧颞叶癫痫中症状、结构和脑网络之间的关系

王昭杰^{1,2}、张志强^{1,2}

1. 南京大学医学院附属金陵医院

2. 中国人民解放军东部战区总医院

目的: 探究合并海马硬化的内侧颞叶癫痫患者 (HS-mTLE) 脑灰质体积 (GMV) 的组间及个体差异, 通过研究 HS-mTLE 解剖学上灰质区域异质性是否能在功能上与共同的脑网络耦合, 从而为 HS-mTLE 提供结构病变与脑网络间的映射 (lesion-network mapping, LNM) 关系。

方法: 连续纳入 HS-mTLE 患者共 212 例 (排除合并其他结构性病变), 纳入年龄性别匹配的健康对照组共 565 例, 收集所有被试的临床资料及影像学资料 (包括常规序列、3D-T1WI 序列、BOLD 序列等)。收集所有癫痫患者的发作症状, 包括发作时意识程度、复杂部分性发作情况、先兆情况等。用 CAT12 软件对所有被试的 3D-T1WI 图像进行自动分割, 得到对应灰质。根据 HS 偏侧分为左、右两组, 用 SPM12 软件分别将两组患者与对照组进行 GMV 差异比较, 并将患者与对照组进行逐一 GMV 差异对比。将两组间 GMV 差异区域相加后与 HOA 脑功能模板相交, 制作为 GMV 差异脑区掩膜 (Mask)。用 DPARSF 软件将所有被试的 3D-T1WI 及 BOLD 图像配准于标准空间, 用 GREYNA 软件计算基于 Mask 的脑功能指标并比较结构差异脑区间的功能指标差异。将癫痫患者发作症状进行聚类分析, 将 GMV 差异脑区的脑功能指标与癫痫发作症状进行相关性分析。最后用另一中心数据 (患者组 65 例, 对照组 40 例) 进行重复性验证。

结果: 在组水平 GMV 对比中, HS-mTLE 患者的 GM 萎缩主要集中同侧额叶、内外侧颞叶、双侧丘脑及小脑 (FDR 校正, $P < 0.05$)。在个体水平上, 被试的 GMV 差异脑区并不完全重叠, 且部分与组水平差值结果不完全重叠。基于 GMV 差异脑区的网络指标提示在同一聚类症状中可敛入同一脑网络内。

结论: HS-mTLE 患者的结构与功能偏差不仅局限于颞叶, 还可导致其他脑叶的结构及脑网络指标异常。HS-mTLE 个体间 GMV 具有区域异质性是普遍特征, 但是结构差异不能完全解释其症状相关的病理生理机制。造成同类症状的差异脑区常位于同一脑功能网络中, 这为理解 HS-mTLE 症状的病理生理机制提供了新的视角。

PO-0437

脑梗死神经通路假性正常脑区的 MR-DKI 与病理学对照研究

郭岳霖¹、陈思兰²、李伟佳³、郑文斌³

1. 深圳市中西医结合医院

2. 揭阳市人民医院

3. 汕头大学医学院第二附属医院

目的: 探讨皮质脊髓束通路脑梗死继发超早期华勒氏变性的磁共振扩散峰度成像 (DKI) 表现及其病理学基础。

方法: 收集常规 MRI 确认皮质脊髓束通路存在非急性期脑梗死的患者 56 例为临床病变组 (A1 组); 另收集常规 MRI 无阳性发现 24 例为临床对照组 (B1 组), 均行常规 MRI 及 DKI 扫描。避开常规 MRI 可见的梗死灶, 在病变侧下行纤维束通路的代表层面 (脑桥、内囊后肢前部、放射冠及皮层下) 测量 DKI 的 MK、Ka、Kr 值。通过光化学法建立 SD 大鼠大脑运动皮层缺血性损伤模型组 (A2 组, $n=20$) 以及 Sham 组 (B2 组, $n=5$), A2 组分别于第 1-4 周的时间点行 DKI 扫描并取脑做常规 HE、髓鞘 LFB、免疫荧光染色等病理学检查。

结果: A1 组脑桥的假性正常脑区 MK、Ka、Kr 值均较 B1 组不同程度升高, 且 MK 和 Kr 值具有显著性统计学意义 ($P < 0.05$); 内囊后肢前部的假性正常脑区仅 Ka 值较 B1 组升高具差异有统计学意义 ($P < 0.05$); 放射冠的假性正常脑区仅 MK 值较 B1 组升高具有显著性统计学意义 ($P < 0.05$); 皮层下的假性正常脑区与 B1 组相比, Ka 值降低和 MK、Kr 值升高, 且均具有显著性统计学意义 ($P < 0.05$), Ka 与 MK、Kr 值反转。A2 组常规 MRI 序列及病理 HE 染色均可发现运动皮层及皮层下稳定梗死灶; 病变侧放射冠、内囊、脑桥于第 2-4 周 MK 值较对侧镜像区升高具有显著性统计学意义 ($P < 0.05$), 髓鞘 LFB、免疫荧光染色均提示不同程度神经纤维髓鞘脱失; 而 A2 第 1 周组及 B2 组各 ROI 的 MK 值及病理学指标均未见统计学差异 ($P > 0.05$)。

结论: 脑梗死累及的神经通路存在假性正常脑区, 提示超早期华勒氏变性, DKI 可有效评估其微观变化并与病理学结果一致; 本研究为脑梗死的疗效评估及预后判断提供一种全新的精准的影像学手段。

PO-0438

原发性中枢神经系统淋巴瘤多模态 MRI 不典型表现及其病理学基础的探讨

张隐笛、张伟

湖南省脑科医院 (湖南省第二人民医院)

【摘要】目的：原发性中枢神经系统淋巴瘤 (Primary central nervous system lymphomas, PCNSLs) 的不典型影像表现常导致诊断延误，不同免疫功能下原发性中枢神经系统淋巴瘤影像表现不一，本文旨在探讨免疫功能正常人群 PCNSLs 不典型 MRI 表现及相关病理学基础。方法：回顾性分析 2017 年 8 月至 2022 年 8 月在我院经组织病理学诊断的原发性中枢神经系统淋巴瘤患者，所有患者均在我院进行了治疗前的核磁共振检查，实验室检查显示无免疫功能缺陷，排除复发性中枢神经系统淋巴瘤及继发性淋巴瘤。由两位医师分别对核磁共振影像图像进行判读。结果：31 例 CNSLs 中 19 例符合入选标准，男性 11 例，女性 8 例，年龄为(63±9)岁。所有病例均经组织学病理诊断为 B 细胞淋巴瘤，15 例为弥漫性大 B 细胞淋巴瘤。病灶单发 7 例，病灶两个 4 例，病灶 3 个及以上 8 例。不典型发病部位包括侧脑室、脑干、小脑半球，不典型影像表现包括病灶信号不均匀，合并出血及坏死；增强无强化，多发片状、线状强化；呈高灌注；无明显弥散受限。结论：中枢神经系统淋巴瘤表现不典型时容易误诊，多发病灶中更容易出现不典型表现，采用多模态 MRI 尤其是结合病变 ADC 值及 MRS 有利于疾病诊断。

PO-0439

脑小血管病患者豆纹动脉影像学特征与认知功能障碍的相关性研究

张煜堃、苗延巍

大连医科大学附属第一医院

目的：脑小血管病(CSVD)是血管性认知障碍(VCI)的最常见原因。豆纹动脉的可视化对于理解微血管病变的机制至关重要。本研究探讨在散发性 CSVD 患者中豆纹动脉 (LSAs)影像学特征与认知功能的关系。

方法：前瞻性招募 47 例 CSVD 患者，其中男 26 例、女 21 例，年龄 60~85 岁，依据蒙特利尔认知评估量表 (MoCA) 评分结果和教育年限，分为非 VCI 组 (12 例)、VCI 组 (35 例)，另选取同期健康老年人群作为对照组 (28 例)。三组被试均进行磁共振检查，包括常规序列和高分辨率血管壁序列(VWI)以及神经心理学测试评估，包括简易精神状态量表(MMSE)、汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMD)和 MoCA。利用常规序列评估每位被试是否存在腔隙、脑白质高信号、微出血和周围血管间隙扩大，并利用 VWI 序列测量 LSA 数量、总长度和平均曲折度。计量资料组间比较采用 t 检验，计数资料组间比较采用 χ^2 检验，多因素 logistic 回归分析 CSVD 患者出现认知功能障碍的危险因素，Pearson 或 Spearman 相关性分析豆纹动脉影像学特征与认知功能障碍的关系。

结果：VCI 组的 MMSE、MoCA、LSA 数量和 LSA 平均长度较非 VCI 组和 HC 组显著减低 (均 $P < 0.05$)；VCI 组的 HAMA 和 HAMD 明显高于非 VCI 组和 HC 组 (均 $P < 0.05$)；VCI 组的腔隙和脑白质高信号均显著多于非 VCI 组 (均 $P < 0.05$) (表 1)。LSA 数量的减少是 CSVD 患者出现 VCI 的独立危险因素 (OR = 0.51 95%CI = 0.27-0.97 $P = 0.039$; 表 2)。CSVD 患者中 LSA 数量和 LSA 总长度与 MMSE ($r = 0.36, 0.25$, 均 $P < 0.05$) 和 MoCA 评分 ($r = 0.44, 0.42$, 均 $P < 0.05$) 呈正相关 (表 3)。

结论: LSAs 与 CSVD 患者的整体认知功能障碍相关, LSA 数量是 CSVD 出现 VCI 的独立危险因素。

PO-0440

衰老过程中大脑结构网络拓扑属性的变化模式及 APOE 基因多态性对其影响的研究

郑丽娟

东南大学附属中大医院

目的: 采用基于图论分析 (graph-based analysis) 方法研究衰老过程中全脑结构网络拓扑属性的变化, 并探索 APOE 基因在其中的作用。

材料与方法: 共纳入 599 例健康志愿者 (年龄范围 20-80 岁), 成了神经心理学量表, 多模态 MR 成像数据以及 APOE 基因型数据, 最终 436 例被试被分成 APOE 4-组 ($n = 374$) 和 APOE 4+组 ($n = 62$)。采用基于图论的复杂脑网络分析方法分析两组被试脑白质结构网络拓扑属性, 计算与量表评分之间相关性。

结果: 数字符号试验 (digit symbol test, DST) 与年龄呈负相关; 数字连接试验 (Number Connecting Test, NCT)、字色干扰测验 (Stroop Color Word Test): Stroop I、II 和 III 均与年龄正相关。APOE 4-组标准化聚类系数 (normalized clustering coefficient, γ) 和小世界属性 (small-world properties, σ) 均与年龄呈负相关; APOE 4+组标准化特征路径长度 (normalized characteristic path length, λ) 与年龄呈正相关。在 45-80 岁年龄段, APOE 4+组 λ 值显著高于 APOE 4-组。APOE 4+组度中心性 (degree centrality, D_c) 与年龄负相关的节点位于右侧缘上回, APOE 4+组节点效率 (nodal efficiency, N_e) 与年龄负相关的节点位于右侧后扣带回 (P 值均 < 0.0006 , 通过 Bonferroni 校正)。 λ 与 NCT 呈正相关, 右侧后扣带回 N_e 值与 DST 呈正相关, 与 NCT、Stroop I 和 Stroop II 呈负相关。

结论: APOE $\epsilon 4$ 携带者与非携带者全脑结构网络拓扑属性随年龄改变模式不同。APOE $\epsilon 4$ 携带者标准化特征路径长度随年龄增长而升高, 右侧后扣带回节点效率随年龄增长而下降, 与注意/执行功能和反应能力下降相关。这表明 APOE $\epsilon 4$ 等位基因对大脑老化有影响, 有可能加速大脑老化过程, 并且与注意/执行功能和反应能力相关。

PO-0441

基于 97ms 单体素 PRESS MRS 的胶质瘤相关性癫痫患者的肿瘤区代谢研究

肖瑶、聂壮、赵洁、周敏、杨帆、雷子乔

Wuhan Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

目的: 胶质瘤相关性癫痫在神经胶质瘤患者中呈高发状态, 然而其发作的相关机制复杂且不明确, 特别是与其相关的代谢物异常变化的研究还较少。本研究旨在通过使用回波时间 $TE = 97\text{ ms}$ 的单体素点分辨磁共振波谱 (PRESS MRS) 技术, 对脑胶质瘤区各代谢物进行定量分析, 从而帮助深化理解神经胶质瘤与其相关性癫痫的发病机制, 进而探寻潜在的可作为预测神经胶质瘤术前癫痫发作的脑代谢标记物。

方法: 本研究前瞻、序贯纳入于协和医院就诊的胶质瘤患者, 使用 PRESS 序列 ($TE = 97\text{ ms}$) 采集肿瘤区域的代谢物波谱。制作在 $TE = 97\text{ ms}$ 时, 包含多种脑代谢物的拟合基组, 并纳入到

LCModel 后处理软件中；最后通过使用该拟合基组，在 LCModel 中对采集到的 PRESS 波谱进行对应的代谢物的拟合定量。在本研究中，包括 2-羟基戊二酸 (2HG)、胱硫醚 (CTH)、 γ -氨基丁酸 (GABA)、总 N-乙酰基-L-天冬氨酸 (tNAA)、谷氨酸 (Glu)、肌酸 (Cr)、磷酸肌酸 (PCr) 等代谢物被准确定量。同时考虑到胶质瘤患者的临床和病理差异，本研究将患者的临床和病理信息进行了分类，最后将各类组别中的代谢物数据与癫痫发作的发生率进行了统计分析。

结果：在 114 例成人幕上神经胶质瘤患者中，31 名患者发生术前癫痫。术前癫痫发作与年龄小于 40 岁 ($P<0.001$)，肿瘤位于额部 ($P=0.038$) 及发生异柠檬酸脱氢酶 (IDH) 突变 ($P<0.001$) 显著相关。术前发生癫痫的患者瘤中 2HG 浓度显著高于没有发生癫痫的患者 (1.79 ± 1.02 Mm vs 0.54 ± 0.42 mM, $P=0.042$)。CTH、Cr 和 PCr 与术前癫痫的发生有明显相关性 ($P=0.015$)，而 Glu 和 tNAA 与术前癫痫的发作无明显相关。

结论：2HG、胱硫醚、肌酸、磷酸肌酸等代谢物的定量可能成为神经胶质瘤术前癫痫发作的生物标志。

PO-0442

探索听力损伤的轻度认知障碍患者脑皮层纵向变化模式

洪璐威、罗骁、曾庆泽、李凯程、刘小草、李季璇
浙江大学

研究背景：阿尔茨海默病 (AD) 是最常见的痴呆症类型，其临床表现为渐进的、不可逆的认知功能减退。年龄相关性听力损伤 (ARHL) 是 AD 可控的风险因素，若在早期进行听力矫正可达到早期预防 AD 或延缓 AD 进展的效果。同时轻度认知障碍 (MCI) 是正常老龄转向 AD 的前驱阶段。因此在 MCI 时期的早期干预、诊断可以有效延缓 AD 病程进展。然而，ARHL 虽然会增加患上 AD 的风险，但是并非所有患者都会进展为 AD，很大一部分患者的认知水平长期处于认知正常或 MCI 阶段。因此区分出认知稳定/进展的 ARHL 至关重要。MRI 具有可重复和非侵入的特点，已广泛应用于神经退行性疾病的早期诊断和预后评估。此外，以往研究通常笼统地将 HL 和 ARHL 混为一谈。但 HL 病因很多，而 ARHL 最常见的表现是双侧对称性感觉神经性 HL，以高频段损伤为主。因此，我们有必要对 ARHL 进行更严格的筛选，以消除其他类型 HL 的影响。在本研究中，我们通过严格定义 ARHL 的方式，根据临床诊断将 ARHL 人群分为稳定型和进展型，结合 MRI 探索 ARHL 的 MCI 患者大脑结构纵向变化模式。

研究方法：本研究纳入认知稳定型 (sMCI) 且听力健康 (HC) 的受试者 51 名，认知稳定型 ARHL 患者 20 名，认知进展型 (pMCI) ARHL 患者 21 名。所有受试者均有 3 个时间点的头颅结构像 MRI 数据，每次扫描间隔约 1 年。我们采用 Freesurfer 对大脑皮层进行分割。然后，我们采用重复测量方差分析探索三组人群大脑皮层的纵向变化模式。最后，我们采用 ROC 分析探索相关皮层是否能预测 ARHL 人群的认知变化情况。

研究结果：(1) 重复测量方差分析结果显示，pMCI+ARHL 组左侧内嗅皮层、左侧颞中回及双侧颞上回的皮层萎缩速度快于 sMCI+HC 组，pMCI+ARHL 组左侧海马旁回及左侧颞中回的皮层萎缩速度快于 sMCI+ARHL 组，sMCI+ARHL 组左侧颞横回、右侧颞上回及右侧颞中回的萎缩速度快于 sMCI+HC 组。(2) ROC 分析表明，与单个脑区相比，上述脑区的联合检测能更好预测 ARHL 人群认知进展情况。

结论：在 ARHL 人群中，认知进展的受试者和认知稳定的受试者的皮层萎缩模式不同。

PO-0443

低血糖脑病 MRI 影像学表现

柳佳、汪晶

华中科技大学同济医学院附属协和医院

目的：探讨低血糖脑病的 MRI 影像学表现及相关诊断价值。

方法：收集华中科技大学同济医学院附属协和医院 2023 年收治的 1 例 30 岁经临床诊疗证实为低血糖脑病的女性患者的临床资料进行回顾性分析，其临床主要表现为突发昏迷，意识不清 6 天，患者有 1 型糖尿病病史，发病时测血糖为 2.5mmol/L，患者进行了血液、尿液的常规检查，并进行性了自身免疫性抗体检测，同时行 MRI 平扫+增强、MRA、MRV、DWI 及 MRS 扫描。分析其 MRI 影像学表现及相关诊断价值。

结果：患者 MRI 检查发现右侧半卵圆中心-放射冠、双侧海马及胼胝体压部条片状长 T1、高 T2-Flair 信号影，DWI 示病灶弥散受限表现，增强扫描未见明显强化，MRA 及 MRV 未见明显异常，MRS 将感兴趣区置于双侧海马区，海马区 NAA 峰减低，Cho 峰稍高。经治疗后患者症状好转出院。

结论：低血糖的临床表现没有特异性，可从行为改变、乏力、精神错乱到癫痫和意识丧失，即功能性大脑衰竭。其影像学表现提示低血糖脑病常常累及大脑皮质、基底节区、海马、胼胝体和双侧内囊等区域。T2 及 Flair 序列主要表现为病变区的高信号，这可能与脑部水肿和炎症有关；DWI 序列可能显示出病变区的高信号，这可能是由于低血糖引起的脑细胞水肿和炎症反应导致的；部分患者 MRI 增强可强化，这可能是由于低血糖引起的脑血管紊乱导致的。主要鉴别诊断包括缺血缺氧性脑病、克雅氏病、中暑、其他毒物代谢引起的病变如肝性脑病。需要注意的是，MRI 特征并非低血糖脑病的特异性表现，因为其他脑部疾病也可能表现相似的影像学特征。确诊低血糖脑病还需要结合临床症状、血糖水平和其他实验室检查结果进行综合评估。

PO-0444

3D APT 成像联合 IVIM MRI 对胶质瘤分级以及 IDH 突变状态的术前预测

高萍、许秀安

哈尔滨医科大学附属第四医院

目的：使用 3D APT（酰胺质子转移）成像技术与 IVIM（体素内不相干运动）成像技术对脑胶质瘤进行分级以及 IDH（异柠檬酸脱氢酶）突变状态的术前预测，有助于指导临床为病人提供更合适的治疗方案，改善患者预后。

方法：术前对脑胶质瘤患者行 APT 成像技术、IVIM 成像技术及常规的 MRI 成像技术。应用 3D Slicer 软件和 MITK diffusion 软件获取脑胶质瘤的 APT 和 IVIM 直方图参数，提取两种成像参数中的最大值，最小值，平均值，中位数，第 10 百分位以及第 90 百分位。采集术后脑胶质瘤患者的病理结果，评估脑胶质瘤 WHO 分级和 IDH 突变状态。应用统计学方法分析 APT 和 IVIM 成像的直方图参数与胶质瘤的分级和 IDH 突变状态的相关性，并比较两种先进的成像技术的诊断效能。

结果：APT 参数在级别越高的胶质瘤中数值越大，IDH 野生型胶质瘤的 APT 参数大于 IDH 突变型胶质瘤的 APT 参数。IVIM 的三个参数可用于对胶质瘤的分级和 IDH 突变状态的预测。将 APT 参数与 IVIM 参数联合起来对胶质瘤的分级和 IDH 突变状态的评估时，诊断效能更高。

结论：APT 和 IVIM 是在细胞和分子水平上评估脑胶质瘤的两种有前途的分子功能成像技术，可以在术前无创地为患者提供更精确的诊断信息，这些重要的补充信息在预测胶质瘤分级和 IDH 突变状态方面很大的应用价值。

PO-0445

OGSE 联合 CEST 分析预测脑胶质瘤 IDH 突变张新利¹、符晓娜¹、陆珏¹、秦倩¹、王璇²、张肖肖³、汪晶¹

1. 华中科技大学同济医学院附属协和医院放射科

2. 华中科技大学同济医学院附属协和医院神经外科

3. 飞利浦（中国）投资有限公司中国分公司

目的

IDH (Isocitrate dehydrogenase) 基因分型对脑胶质瘤患者管理和预后具有重要价值, 先进的磁共振技术如振荡梯度自旋回波序列 (OGSE)、化学交换饱和转移 (CEST) 能够提供与肿瘤微结构、代谢改变相关的信息, 本研究旨在探究 OGSE 和 CEST 在术前脑预测胶质瘤 IDH 基因分型的潜能。

方法

前瞻性收集 2023 年 2 月至 2023 年 8 月 157 例疑诊脑肿瘤患者的常规 MRI (T1WI、T2-FLAIR、T1w-enhanced)、OGSE 及 CEST 图像, 经后处理由 OGSE 得到的参数包括: 细胞直径 (d)、细胞外水分子扩散系数 (Dex)、细胞内水分子体积分数 (Vin), 细胞密度 (Cellularity)、ADC0Hz、ADC17Hz、ADC33Hz、 Δ ADC1, Δ ADC2。由 CEST 得到的参数包括: 酰胺质子 (Amide)、ph、MTRrex_amide、amide/amine 等。采用独立样本 t 检验、Logistic 回归分析及 ROC 曲线评估 OGSE 和 CEST 的诊断效能。

结果

最终纳入 57 名病理证实为脑胶质瘤的患者 (IDH 突变型 16 例、IDH 野生型 41 例)。d、vin、cellularity、ADC0Hz、ADC17Hz、 Δ ADC1、 Δ ADC2、amide、ph、amide/amine、MTRrex_amide 在 IDH 突变组和野生组均具有显著差异 ($P < 0.01$)。其中, d、MTRrex_amide 分别获得 OGSE 和 CEST 的最佳诊断性能 (d: AUC=0.892, 敏感度 0.756, 特异度 0.938、MTRrex_amide: AUC=0.954, 敏感度 0.821, 特异度 0.999)。联合 MTRrex_amide、ph、amide、 Δ ADC1、 Δ ADC2、vin、cellularity 的多参数 Logistic 回归模型进一步提升了诊断效能 (AUC=0.992, 敏感度 0.974, 特异度 0.999)。

结论

本研究表明 OGSE 和 CEST 在鉴别 IDH 野生型和 IDH 突变型脑胶质瘤中具有很好的诊断价值, 两者联合使用能够进一步提高诊断效能。

PO-0446

脑小血管病中神经液体交互动力学改变的研究刘城霞¹、李元昊¹、朱文浩¹、杨时琪²、覃媛媛¹、田甜¹、张佳璇¹、张顺¹、朱文珍¹

1. 华中科技大学同济医学院附属同济医院

2. 湖北科技学院咸宁医学院生物医学工程与医学影像学院

目的: 神经液体 (neurofluids) 对维持神经元及胶质细胞的稳定代谢微环境具有重要作用, 它包括血液、淋巴液、脑脊液等。本研究目的为探索脑小血管病 (cerebral small vessel disease, CSVD) 中潜在的神经液体交互动力学改变。

方法: 本研究连续纳入 41 例 CSVD 病例及 34 例正常对照, 两组受试者年龄、性别及教育年限均匹配。脑血流 (cerebral blood flow, CBF) 动力学采用伪连续动脉自旋标记 (pCASL) 成像评估。脑淋巴液动力学采用基于弥散张量成像的 diffusion tensor image analysis along the perivascular space (DTI-ALPS) 技术评估。脑室系统的脑脊液 (cerebrospinal fluid, CSF) 容积采用基于 3D BRAVO 的自动化软件评估。使用多元线性回归及交互分析来评估 CSVD 组与对照组之间的神经液体参数改变。使用线性回归分析评估年龄、性别、神经液体参数对脑白质高信号 (white matter

hyperintensities, WMHs) 容积的影响。使用偏相关分析评估神经液体参数与认知功能之间的相关性。

结果: 在 CSVD 组中, DTI-ALPS 指数与灰质区标准化 CBF 之间($P < 0.001$)、DTI-ALPS 指数与白质区标准化 CBF 之间($P = 0.002$)、脑室系统 CSF 容积与 DTI-ALPS 指数之间($P < 0.001$)、脑室系统 CSF 容积与灰质区标准化 CBF 之间($P = 0.025$)、脑室系统 CSF 容积与灰质区标准化 CBF 之间($P = 0.008$)的交互相关性与对照组显著不同。灰质区标准化 CBF 值与 WMHs 体积显著相关($P = 0.001$), 而协变量 DTI-ALPS 指数与脑室系统 CSF 容积则被排除 ($P > 0.05$)。经过 FDR 校正, 标准化 CBF、DTI-ALPS 指数、脑室系统 CSF 容积均与认知功能显著相关。

结论: 脑小血管病病人的神经液体交互动力学较正常老年人显著改变。明确神经液体动力学改变对阐明脑小血管病病理生理机制具有重要意义。

PO-0447

双能量 CT-脑卒中血栓鉴别应用

黄山

青海红十字医院

AIS(急性缺血性脑卒中)是长期残疾和死亡的主要原因, 在过去十年中发病率不断上升。在所有中风中, 87%是缺血性中风, 10%是出血性中风(脑出血), 而 3%是蛛网膜下腔出血性(SAH)中风。根据最新的 AIS 患者早期管理指南, 标准治疗包括, 药物静脉溶栓和机械取栓。在开始任何治疗前, 应行 CT 平扫以排除颅内出血。而后行 CTP 和 CTA 或磁共振血管造影(MRA)与扩散加权磁共振成像(DWI)有助于确定缺血半暗带和相应的责任血管, 帮助选择血管内治疗与机械取栓的候选时机。

PO-0448

常见脑肿瘤的酰胺质子转移成像研究进展

高萍、许秀安

哈尔滨医科大学附属第四医院

酰胺质子转移加权 (APT) 成像是一种特殊的化学交换饱和转移 (CEST) MRI 成像技术, 它是通过检测组织中内源性、低浓度移动蛋白和多肽中的酰胺质子与水中氢质子的交换速率从而在分子水平反映出细胞中蛋白质含量及酸碱度的变化。APT 成像已被应用于各类肿瘤性疾病 (如脑肿瘤、乳腺癌、膀胱癌和前列腺癌等) 及非肿瘤性疾病 (如中风、颅内感染、帕金森病等) 的临床研究及诊断中。随着对疾病更深入地研究发现 APT 成像可以在一定程度上弥补传统 MRI 在分子水平对疾病预测的不足。神经肿瘤学的最新进展已经将焦点从组织病理学分级转向了分子特征分析, 分子特征已被纳入世界卫生组织分类中。这就要求神经放射科医生不仅需要判断肿瘤的病理分级, 还需要做出一定分子特征的诊断及鉴别。APT 成像技术作为一种新兴的分子成像技术, 在评估常见脑肿瘤方面提供了较传统影像学检查更精确的信息, 有望实现对疾病分子水平的预测, 进而指导临床选择更合适的治疗和手术方案, 更精准地判断预后。另外, APT 成像技术无需使用对比剂, 避免了增强检查带来的肾功能不全, 以及频繁的增强检查带来的对比剂在脑内的沉积的风险。然而, APT 成像还存在一些技术上的问题和挑战, 需要进一步开发新的 APT MRI 脉冲序列、数据采集协议和数据处理方法, 实现高信噪比、全脑覆盖和较短的采集时间等。相信随着相关研究的不断深入, APT 成像将会更广泛地应用于临床脑肿瘤及其他疾病的诊断及鉴别诊断, 并在指导临床治疗方面发挥更重要的作用。

PO-0449

CT 后处理技术对脑静脉畸形的诊断价值

李鸿涛、陈伟
中南大学湘雅医院

李鸿涛 陈伟 黎格 万黎妮 唐雨虹 钟林辉

研究目的：随着医疗设备的快速发展,CT 对神经系统疾病的诊断及复查起到了重要的作用,随 CT 在临床上的广泛运用静脉畸形的检出率明显增加,但有关 CT 血管成像在 CVM 诊断中的应用,特别是 CT 后处理技术的有效运用的文献报道极少。本文旨在通过不同的 CT 后处理技术使医生对脑静脉畸形的诊断更加具有信心。静脉畸形 (CVM) 是无动脉成分的血管畸形,由一簇脑内静脉汇聚到一个粗大的静脉,静脉缺乏平滑肌和弹力纤维,再扩张的血管之间有正常脑组织,占脑血管畸形的 3%。其特征性表现为多条静脉汇入一条扩张的静脉系统,流入浅、深静脉系统。影像学表现为典型的“水母头”样外观,以额顶叶多见。最近研究发现,CVM 发病率随年龄的增加而增加,静脉结构的改变和引流模式的变化有助于 CVM 的形成。因无特异性临床表现,CVM 多为偶然发现。而由 CVM 导致的静脉血栓形成可引起致命性静脉性梗塞,导致脑实质、脑室出血。而本文就探索 CT 血管造影的三种后处理技术对脑静脉畸形 (CVM) 的诊断价值做了研究。

材料与方法：在本单位回顾性选取 40 例患者,其中 20 例 CVM 阳性患者及 20 例 CVM 阴性患者,并对每例患者进行匿名,并分别对图像做容积再现 (VR)、全体积最大密度投影 (MIP) 及层块 MIP 处理,使用函数重新进行随机编号。最后组织 2 名放射科诊断医师分别三种后处理进行诊断,当出现分歧时由两位放射科诊断医师商量讨论重新进行评价,最终的诊断结果使用受试者操作特征 (ROC) 曲线评价各后处理技术对 CVM 的诊断能力。

结果：共对 40 例患者进行评估,其中 20 例患者被确诊为 CVM。VR、MIP、层块 MIP 后处理技术诊断 CVM 的灵敏度分别是 25%、30%、75%,特异度均为 100%。ROC 曲线显示曲线下面积分别为 0.625、0.650、0.875。层块 MIP 对静脉畸形的显示率明显高于 VR 及 MIP ($P<0.05$)。

结论：通过 2 名放射科医师的商量讨论后的诊断结果及 ROC 曲线分析 CT 后处理技术层块 MIP 诊断 CVM 是准确且敏感的方法,并且层块 MIP 较 VR 及 MIP 能发现更多 CVM 的特异征象。

PO-0450

净水摄取率联合双能量 CT 碘图预测急性前循环缺血性卒中患者 血管内治疗后预后的价值

宁聪、黄珊珊、白博锋、王燕楠、雷威、席小依、方孔、李永斌
西安市第一医院

目的：本研究探讨净水摄取率联合双能量 CT 碘图预测急性前循环缺血性卒中患者血管内治疗后预后的价值。

方法：对 67 例接受血管内治疗的急性前循环缺血性卒中患者进行回顾性分析。根据术后双能量 CT 检查结果,将患者分为：无高密度组 ($n=26$)、有高密度组,将有高密度组分为造影剂外渗组 ($n=23$) 和造影剂外渗+出血组 ($n=18$)。根据 90 天 mRS,将患者分为预后良好组 ($n=37$, mRS 0-2) 与预后不良组 ($n=30$, mRS 3-6)。测量碘浓度、净水摄取率,比较组间的一般临床资料与影像资料。

结果：经过 Bonferroni 多重比较,造影剂外渗+出血组与无高密度组净水摄取率存在统计差异 ($P=0.009$)。造影剂外渗组与造影剂外渗+出血组碘浓度存在统计差异 ($z=3.389, P<0.001$)。预后良好组与预后不良组净水摄取率 ($z=2.837, P=0.005$) 及血管内治疗后出现高密度

($z=5.477, P=0.019$) 存在统计差异。其中, 血管内治疗后出现高密度的患者中预后良好组与预后不良组碘浓度存在统计差异 ($z=2.616, P=0.009$)。经过多因素 logistic 回归分析, 净水摄取率是预测急性前循环缺血性卒中患者血管内治疗后预后的独立预测因素。以不良预后为因变量构建 ROC 曲线, 净水摄取率的 AUC 为 0.703, 截断值为 3.35%, 敏感性 63%, 特异性 73%。

结论: 净水摄取率是预测急性前循环缺血性卒中患者血管内治疗后预后的独立预测因素。血管内治疗后脑内出现高密度是预后不良的预测因素。

PO-0451

基于深度学习网络识别并定量评估原发性脑出血 早期血肿周围水肿扩张

蔡予、孙海洋、李惠明、居胜红
东南大学附属中大医院

目的: 开发一套集成专家智能的深度学习网络, 实现原发性脑出血 (Intracerebral hemorrhage, ICH) 的血肿、血肿周围水肿 (Perihematomal edema, PHE), 以及脑脊液 (Cerebral spinal fluid, CSF) 的精准识别, 评估早期血肿周围水肿扩张的危险因素。

方法: 回顾性收集了 506 例原发性脑出血患者的临床和影像学资料, 患者在发病 6 小时内进行了首次 NCCT 检查, 并在 48 小时内进行内随访。我们开发了一套集成专家智能的深度学习网络, 实现了对血肿, PHE, CSF 的全自动定量分析。我们计算了病灶侧脑脊液体积占全脑脑脊液体积比值 (CSF ratio), 并分析与早期 PHE 扩张(随访 48 小时内水肿体积增大大于 7ml)相关的影像及临床因素。

结果: 在 506 例 ICH 患者中有早期 PHE 扩大的是 192 例 (37.9%)。早期 PHE 扩大组和无早期 PHE 扩大组的年龄存在明显统计学差异 (63.5 vs 67 岁, $P=0.014$), 且早期 PHE 扩大组 mRS 评分明显高于非早期 PHE 扩大组 (4 vs 2, $P<0.001$)。早期 PHE 扩大组血肿体积 (35.64 vs 21.33 ml, $P<0.001$)、基线 PHE 体积 (15.98 vs 10.17 ml, $P<0.001$) 明显大于无早期 PHE 扩大组; 基线水平 CSF ratio 在早期 PHE 扩大组明显低于无早期 PHE 扩大组 (25.5 vs 27.54%, $P<0.001$)。经多因素逻辑回归分析, 筛选出早期 PHE 扩大相关的独立危险因素包括: 基线水平血肿体积 (OR 1.013; 95%CI, 1.007–1.019; $P<0.001$)、基线水平 PHE 体积 (OR 0.985; 95%CI, 0.974–0.997; $P<0.001$) 以及 CSF ratio (OR 0.985; 95%CI, 0.974–0.997; $P<0.01$)。

结论: 集成专家智能的深度学习网络能够精准分割、定量分析自发性脑出血血肿、血肿周围水肿以及脑脊液的体积, 筛选并评估出与自发性脑出血患者早期 PHE 扩大相关的独立危险因素。

PO-0452

基于 CT 的影像组学模型预测中小型血肿的血肿扩张的研究

李惠明、蔡予、汤天宇、居胜红
东南大学附属中大医院

目的

基于血肿内部和周围影像组学特征以及临床数据构建预测血肿扩大(hematoma expansion, HE)的最优模型, 并比较其预测性能。

材料和方法

回顾性收集 406 例中小型脑出血患者的临床和影像学资料, 均在发病 6h 内接受首次 NCCT, 并在首次 NCCT 后 48h 内接受 CT 随访。我们以 7:3 的比例将数据随机分为训练集和测试集。从血肿内

和血肿周围区域提取影像组学特征。采用单因素和多因素 logistic 回归分析筛选临床和影像学因素。然后在训练集中使用 FAE 构建影像组学(单一或联合)模型、影像组学-影像模型和联合模型。采用受试者工作特征曲线和 Delong 检验评估不同区域的影像组学特征的预测效能。

结果

在训练中,血肿内和血肿周围特征的预测性能相当,受试者工作特征曲线下面积[AUC]分别为 0.613 和 0.645 ($p>0.05$)。通过纳入血肿内和血肿周围特征,在测试集中实现了 0.620 的 AUC。回归分析筛选出 5 个危险因素,包括 2 个影像学特征和 3 个临床特征。使用影像组学特征联合影像组学特征构建的影像组学-影像组学(RR)模型在测试集中的曲线下面积(AUC)为 0.744。结合 2 个临床预测因子和 RR 后,影像-影像组学-临床(RR-cl)模型鉴别早期 HE 的 AUC 为 0.768。RR-CL 模型的预测性能优于 RR 模型,而影像组学特征与临床-影像特征相结合的列线图预测性能最佳。Delong 检验表明,结合影像学因素(血肿体积和混合征)可以提高基于影像组学特征的诊断效能($p<0.05$)。而临床因素(发病至扫描时间、NEUT 和 PT 是最重要的影响因素)使得 RR-CL 在诊断效能上与 RR 模型相当。

结论

基于多变量、临床和影像学特征的 NCCT 模型可提高早期 HE 的鉴别能力。联合模型是识别有早期 HE 风险的 ICH 患者的最佳推荐模型。模型中 NEUT 可能提示血肿周围早期炎症反应。

PO-0453

多 PLD 3D-ASL 结合 DWI 在西宁地区急性期脑梗死患者对脑血流量评估方面的应用

王润强、张海莲、吕金柱、孟庆宁、赵元艳、杨金凤
青海省第五人民医院

摘要:目的:探究评估 3D-ASL MRI 在西宁地区急性脑梗死患者中采用不同的多个标记后延迟时间对脑血流测量值的影响。方法:选择中老年急性脑梗塞患者 60 例(男 36 例,女 24 例);年龄 41~89 岁,平均 67 岁,ASL 采用三个标记后延迟时间(1525ms、2025ms、2525ms)在患病侧和相对侧的正常区域测量 CBF, DWI 序列采用 $b=1000s/mm^2$,并在患病侧和相对侧的正常区域测量 ADC。各组之间的每个脑区的 ADC 值及 CBF 值的比较使用独立的样本 t 检验。结果:比较 60 例受试者 ADC 值,患病侧 ADC 值平均值为 $(0.48\pm0.086)\times10^{-3}mm^2/s$,相对侧正常区域 ADC 值平均值为 $(0.97\pm0.172)\times10^{-3}mm^2/s$,患病侧 ADC 值均低于对侧正常区域 ADC 值,差异具有统计学意义($P<0.05$)。3D-ASL 使用不同 PLD 测量的患病侧 CBF 值与相对侧正常区域的 CBF 值进行比较, CBF 值在不同 PLD 的 3D-ASL 测量的患病侧低于相对侧正常区域的 CBF 值, $P<0.05$,差异具有统计意义。3D-ASL 使用不同 PLD 测量的患病侧 CBF 值相互比较, CBF 值在 PLD=1525ms 的更小,并且小于 CBF (PLD=2025ms), $P>0.05$,差异无统计意义,也小于 PLD=2525ms 的 CBF, $P<0.05$,差异具有统计意义, CBF (PLD=2025ms) 小于 PLD=2525ms 的值, $P>0.05$,差异无统计意义。3D-ASL 使用不同 PLD 测量的相对正常区域的 CBF 值相互比较, CBF (PLD=1525ms) 的测得值小于 PLD=2025ms 的 CBF, $P>0.05$,差异无统计学意义,并且小于 PLD=2525ms 测得的 CBF, $P<0.05$,差异具有统计意义, PLD=2025ms 的 CBF 小于 PLD=2525ms 的 CBF, $P>0.05$,差异无统计意义。结论: MRI 的 3D-ASL 在西宁地区急性脑梗死患者中使用不同的多个标记后延迟时间对脑血流测量评估中有一定影响, 3D-ASL 选取 PLD 为 2.0s、2.5s 时评估较为准确。

PO-0454

全身免疫炎症指数在成人高级别脑胶质瘤根治术后 预后评估的价值研究

蒋玉婷

湖南省脑科医院 (湖南省第二人民医院)

全身免疫炎症指数 (SII) 是一种基于外周血血小板、淋巴细胞和中性粒细胞计数的新型生物标志物, 已有研究显示, SII 与多种肿瘤的预后不良相关。然而, SII 在接受根治性手术的高级别脑胶质瘤成人患者中的预后价值尚不清楚。因此, 本研究的目的是评估 SII 在接受根治性手术的高级别脑胶质瘤成人患者预后中的应用价值。

PO-0455

比较弥漫中线胶质瘤-H3K27 突变和近中线低级别 胶质瘤的 MRI 形态学差异

黄晓丹¹、邓华珍²、张洪博⁵、张瀚文²、刘晓蕾²、谭理连⁴、黄彪³、林帆²

1. 深圳市松岗人民医院

2. 深圳市第二人民医院

3. 广东省人民医院 (广东省医学科学院)

4. 广州医科大学附属第二医院

5. 中山大学附属第七医院

目的: 弥漫性中线胶质瘤-伴 H3K27m 突变被 2016 年 WHO 定义为一种新的分子亚型, 对应于 IV 级。本研究旨在探究弥漫中线胶质瘤与低级别胶质瘤之间 MR 成像的差异。

方法: 回顾性分析 39 例弥漫中线的胶质瘤-h3k27 改变和 20 例中线低级别胶质瘤患者的 MRI 图像。观察肿瘤的大小、数量及影像表现, 包括瘤周水肿、DWI 及增强等特征, 病变囊变坏死、瘤内出血、T2WI 错配征。采用 T 检验和卡方检验来描述两者间的差异。

结果: 独立样本 T 检验结果显示 DMG 患者的平均年龄要比 LGG 的要年轻 ($P < 0.001$)。卡方检验结果显示, DMG 的肿瘤大小相对要小于 LGG ($P < 0.001$)。DMG 的 DWI 和增强程度相对较高 ($P < 0.001$)。而 DMG 与 LGG 在 Peritumoral edema 有统计学意义 ($P < 0.05$)。

结论: 与中线区低级别胶质瘤相比, H3K27 改变的弥漫性中线胶质瘤的 MRI 表现和临床特点具有一定的特点, 有助于提高诊断和鉴别诊断水平。

PO-0456

基于体素内不相干运动成像的脑白质高信号微结构改变和严重程度 及认知功能减退相关性研究

林惠花^{1,2}、戴晓敏¹、苏家威¹、杨昇升^{1,2}、郑永宏^{1,2}、马明平^{1,2}、俞顺^{1,2}

1. 福建省立医院

2. 福建医科大学省立临床医学院

目的: 脑白质高信号 (WMH) 是一种常见与年龄和血管危险因素相关疾病, 与认知功能相关, 但目前对这种效应机制了解相对较少。利用体素内不相干运动成像 (IVIM) 技术, 探讨 WMH 区微循环及微结构改变并分析其定量参数与 WMH 严重程度及其与认知功能的相关性。

方法: 本研究共纳入 49 名 WMH 患者和 31 名健康对照组接受常规磁共振及 IVIM 检查, 以深部脑白质高信号 (DWMH), 侧脑室周围白质高信号 (PWMH) 和灶周正常脑白质 (NAWM) 为感兴趣区获得 IVIM 双指数模型参数: 实质扩散率 (D)、血管内扩散率 (D*) 和灌注分数 (f)。根据 Fazekas 评分, WMH 严重程度分为轻度或重度。WMH 组和对照组之间 IVIM 参数 (D, D*, f) 比较采用独立样本 t 检验或 Mann-Whitney U 检验。Kruskal-Wallis 检验或单因素方差分析用于比较 WMH 组不同感兴趣区 (DWMH、PWMH、NAWM) 的 IVIM 参数。WMH 轻重两组间 D、D*、f 值比较采用 Wilcoxon 秩和检验或独立样本 t 检验。所有参与者均接受了简易智能状态检查量表 (MMSE) 和蒙特利尔认知评估量表 (MoCA) 的评估。采用多元线性回归分析确定与认知功能相关的独立因素。

结果: 在不同感兴趣区 (DWMH、PWMH、NAWM), WMH 组 D 值显著高于对照组 (p 值均 <0.05)。WMH 患者组的不同感兴趣区 (DWMH、PWMH、NAWM) IVIM 参数 (D, D*, f) 差异显著, 具有统计学意义 (p 值均 <0.001)。WMH 重度组 DWMH 和 PWMH 区 D 值均高于轻度组, 差异具有统计学意义 (p > 0.05)。多元线性回归分析结果显示 DWMH 和 PWMH 中的 D 值影响认知功能 (p 值均 <0.05)。

结论: IVIM 双指数模型参数 D 值可作为 WMH 严重程度及认知功能障碍的定量生物标志物。

PO-0457

基于图论的复杂脑网络分析在急性期 mTBI 后躯体症状的研究

王思思^{1,3}、张秋娟¹、毛翠平¹、杨花娟¹、张晓静²

1. 西安交通大学第二附属医院

2. 西安市精神卫生中心

3. 中国中医科学院望京医院(中国中医科学院骨伤科研究所)

目的: 基于图论的方法探讨轻度创伤性脑损伤 (mild traumatic brain injury, mTBI) 患者急性期的复杂脑网络变化及其与脑震荡后躯体症状之间的相关性。

方法: 前瞻性收集 43 例急性期 mTBI 患者及与其年龄、性别和教育程度相匹配的健康对照者 30 例, 对所有研究对象行神经心理学问卷测评、颅脑 MRI 常规检查、磁敏感加权成像 (Susceptibility Weighted Imaging, SWI) 及静息态功能磁共振成像, 分析两组间静息态脑网络全局属性及节点属性的差异, 及其与 Rivermead 脑震荡后症状问卷 (Rivermead Post-concussion Symptoms Questionnaire, RPQ) 得分之间的相关性。

结果:

图论的全局属性: 急性期 mTBI 患者和健康对照组的脑功能网络均具有小世界属性。两组间小世界属性 (P=0.635)、全局效率 (P=0.456) 与局部效率 (P=0.582) 及层级性 (P=0.406) 差异均无显著统计学差异。

图论的节点属性: 与健康对照组相比, 急性期 mTBI 组节点效率增加的脑区位于右侧眶部额上回、左侧额中回、右侧额中回、左侧岛盖部额下回、左侧三角部额下回、左侧顶上回、右侧顶下缘角回; 节点效率减低的脑区有右侧舌回 (P < 0.05)。左侧额中回与 RPQ 评分具有显著正相关 (P=0.041)。与健康对照组相比, 急性期 mTBI 组度中心性增加的脑区位于右侧眶部额上回、左侧额中回、右侧额中回、左侧三角部额下回、左侧顶上回、右侧顶下缘角回; 度中心性减低的脑区位于右侧楔叶、右侧舌回 (P < 0.05)。右侧额中回与 RPQ 评分呈显著正相关 (P=0.019)。

结论: 急性期 mTBI 组与健康对照组的全局属性均无显著统计学差异, 且两组的大脑网络均表现出经济的小世界属性。急性期 mTBI 患者涉及多个脑区节点属性的改变, 且与脑震荡后的相关躯体症状有关。

PO-0458

快眼动睡眠行为障碍对帕金森病脑白质微结构改变的纵向研究

谭斯珈、管晓军、徐晓俊
浙江大学医学院附属第二医院

目的

快速眼动睡眠行为障碍 (RBD) 的存在可能是区分不同帕金森病 (PD) 亚型的特定临床表现, 但 RBD 对全脑特别是脑白质微结构的病理生理改变仍有待阐明。本研究旨在探讨 RBD 症状在 PD 疾病对脑白质微结构随时间改变的影响。

材料和方法

本研究前瞻性纳入 83 例 PD 患者, 所有患者进行了全面的临床评估以及弥散张量成像扫描, 平均随访时间为 2 年。在随访期间, 患者被分为(1) PD 合并 RBD (PD-RBD, n=43), (2) PD 不伴 RBD (PD-nonRBD, n=40)。我们应用基于纤维束的空间统计方法 (TBSS) 提取白质纤维束的扩散张量度量, 包括各向异性分数 (FA)、平均扩散率 (MD)、轴向扩散率 (AD) 和径向扩散率 (RD)。首先, 我们采用线性混合效应模型 (LME) 探究 PD-RBD 和 PD-nonRBD 患者的白质纤维结构随着随访时间的变化。然后, 我们探究了 PD-RBD 和 PD-nonRBD 两组与随访时间对白质纤维扩散张量变化的交互作用。最后, 我们研究了 PD-RBD 组白质微结构的变化与临床评估数据变化的关系。

结果

基线的临床评估数据与脑白质微结构在 PD-RBD 和 PD-nonRBD 组间没有显著差异。纵向随访分析发现, 在 PD-RBD 组, 其弥散参数 FA 在多个白质区域下降, 除了这些区域以外, MD 和 RD 在其他更广泛的白质区域升高, 而在 PD-nonRBD 组, AD 在多个白质区域上升, 只有在少数白质区域 FA 下降以及 RD 上升。交互分析进一步揭示, 与 PD-nonRBD 组相比, PD-RBD 组在多个白质区域 FA 下降更快。最后, 我们发现在 PD-RBD 组中下降的 FA 区域与随访中运动症状的进展相关。

结论

RBD 的存在提示在帕金森病脑内白质纤维束退变范围更广以及在一些区域退变速度更快, 并且这些区域与运动症状的进展相关, 我们的研究结果进一步加深了 RBD 对 PD 病理生理机制影响的理解。

PO-0459

帕金森病冻结步态患者静息脑功能活动及功能连接改变的研究

王敏、王建伟、刘俊、张克忠、王杰
江苏省人民医院 (南京医科大学第一附属医院)

目的: 观察帕金森病冻结步态患者静息状态下脑功能活动和功能连接的变化特点, 并探索冻结步态产生的神经病理机制。

方法: 采集 30 例 PD 患者和 16 例健康对照者 (HC) 的静息态功能磁共振数据, 根据冻结步态量表评分 (FOGQ) 将 PD 组分为 PD 伴冻结步态患者 (FOG(+)) 14 例和 PD 不伴冻结步态患者 (FOG(-)) 16 例。采用局部一致性 (ReHo) 分析方法对所得数据进行分析, 观察伴有和不伴有冻结步态 PD 患者的脑功能活动变化; 同时选择脚桥核 (PPN) 为种子点, 采用种子相关分析得到全脑中与脚桥核功能连接改变的区域。通过协方差分析 (ANCOVA) 和 Post-Hoc t 检验进行组间比较。

结果: 与 HC 相比, FOG(+)PD 的左侧颞下回、右侧舌回、双侧梭状回、右侧枕下回、右侧矩状裂及其周围皮层及右侧小脑 ReHo 减弱; 右侧额中回、右侧三角部额下回、右侧岛盖部额下回、右侧背外侧额上回、右侧中央前回及右侧辅助运动区 ReHo 增强; 与 FOG(-)PD 相比, FOG(+)PD 的右

侧中央前回、右侧额中回、右侧额下回及右侧辅助运动区 ReHo 增强, 未发现 ReHo 减弱的区域。在功能连接方面, 与正常对照组及帕金森病不伴冻结步态组相比, 帕金森病伴冻结步态组与 PPN 功能连接异常的脑区主要分布在皮质-脑桥核-小脑通路 (包括双侧小脑和脑桥) 以及视觉相关颞叶皮层 (包括右侧颞中回和右侧颞下回)。

结论: 帕金森病冻结步态患者存在异常的脑功能活动和功能连接, FOG (+) PD 患者脑内局部一致性异常的脑区包括了小脑、额叶以及视觉网路相关皮层; 同时通过观察双侧 PPN 与全脑的功能连接, 发现 PD FOG (+) 患者存在异常的 PPN 功能连接网络, 主要影响皮质-脑桥核-小脑通路和参与视觉信息处理相关皮层, 提示了 FOG 的产生可能涉及的潜在神经功能异常和损伤机制, 有助于我们进一步探知 FOG 的神经病理机制。

PO-0460

基于多体素质子磁共振波谱的重度抑郁症前扣带回皮质代谢异质性研究

贺锦程
中南大学湘雅医院

目的: 先前研究发现, 重度抑郁障碍 (major depressive disorder, MDD) 患者 ACC 区域功能存在异质性, 然而 MDD 患者 ACC 区域代谢是否存在异质性还鲜有研究。本研究旨在探讨 MDD 患者 ACC 区域代谢异质性及相关影响因素。

方法: 研究招募了 59 名首发未服药的 MDD 患者和 50 名健康对照作为研究被试, 在西门子 prisma 3.0 T 机器上行多体素 1H-MRS 扫描, 体素放置在 ACC 中。将 ACC 分为两个亚区: 前膝下扣带回皮质 (pACC) 和前中扣带回皮质 (aMCC)。用单因素方差分析和重复测量方差分析分析被试间和被试内代谢物浓度的变化, 并进一步计算 MDD 组神经代谢物浓度与人口学、临床特征之间的关系。

结果: 与正常对照组比较, MDD 患者 ACC 谷氨酸 (GLU) ($MDD=2.02\pm0.42$, $HC=1.88\pm0.42$, $p=0.006$)、肌醇 (MI) ($MDD=1.51\pm0.20$, $HC=1.42\pm0.15$, $p=0.003$) 含量均升高。在 MDD 组和正常对照组均测得 aMCC 的 GLU ($MDD: 26\%\pm9\%$, $HC: 17\%\pm18\%$, $p<0.001$) 和谷氨酰胺 (GLN) ($MDD: 22\%\pm4\%$, $HC: 16\%\pm4\%$, $p<0.001$) 低于 pACC, 而 aMCC 的 N-乙酰天冬氨酸 (NAA) 高于 pACC ($MDD: 22\%\pm6\%$, $HC: 21\%\pm7\%$, $p<0.001$)。与正常对照组相比, MDD 患者的 GLU 和 GLN 浓度梯度更显著。相关分析发现, MDD 组 aMCC 的 MI 与发病年龄呈正相关 ($r=0.41$, $p=0.002$)。

结论: 本研究发现, 与正常对照组相比, MDD 组 pACC 和 aMCC 的神经代谢物浓度的分布和梯度变化存在异常, 这表明 MDD 患者 ACC 区域存在代谢异质性。

PO-0461

基于 MRI 纹理分析评估穿支动脉性脑梗死发生临床症状进展的初步研究

于文静、曹志坚
浙江中医药大学附属第一医院 (浙江省中医院)

目的 探讨基于 MRI 纹理分析在穿支动脉性脑梗死患者发生临床症状进展中的预测价值。

方法 根据纳入与排除标准, 回顾性连续收集 2015 年 10 月至 2022 年 6 月浙江中医药大学附属第一医院以及 2018 年 2 月至 2022 年 4 月浙江大学附属杭州市第一人民医院收治的穿支动脉性脑梗死患

者的临床资料和 MRI 影像资料。并根据进展性脑梗死的定义将患者分为进展组 (PCI) 和非进展组 (NPCI)。使用 ITK-SNAP 软件在常规头颅 MRI 序列上对脑梗死病灶进行勾画, 并且将勾画完成的感兴趣区导入 GE Analysis Kit(AK)软件进行纹理特征的提取。对筛选出的纹理特征数据进行多因素 logistic 回归分析得到预测概率值, 并以此概率值进行建模, 最后, 通过绘制受试者工作特征曲线 (ROC) 下面积 (AUC) 来评估不同 MRI 序列所建立模型的预测效能。

结果 共纳入 184 例穿支动脉性脑梗死患者, 其中进展性脑梗死组 68 例、非进展性脑梗死组 116 例。在常规 T2WI、DWI、ADC 序列上提取的纹理特征包括: 灰度共生矩阵 (GLCM)、灰度游程矩阵 (GLRLM)、灰度相依矩阵 (GLDM)、灰度大小区域矩阵 (GLSZM) 以及峰度。其中在 T2WI 序列中预测模型的 AUC 值 0.759, 敏感性为 76.47%, 特异性为 68.10%; 在 DWI 序列中预测模型的 AUC 值为 0.706, 敏感性为 79.41%, 特异性为 58.62%; 在 ADC 序列中, 预测模型的 AUC 值为 0.699, 敏感性为 58.82%, 特异性为 75.86%, 在 T2WI、DWI、ADC 三组图像纹理特征联合建立的预测模型 AUC 值最高, 其值为 0.835, 敏感性为 82.35%, 特异性为 70.69%。

结论 基于 MRI 的纹理分析在预测穿支动脉性脑梗死发生临床症状进展方面具有一定的价值, 其中, 三组纹理特征联合建立的预测模型具有最高的预测效能, 该结果为判断穿支动脉性脑梗死患者是否会发生临床症状进展提供新方向, 且对制定个体化治疗方案具有一定的指导作用。

PO-0462

吸烟者内侧前额叶皮层 NAAG 水平与 尼古丁依赖评分的相关性研究

许珂、张勇、程敬亮、汪卫建
郑州大学第一附属医院

背景和目的: 长期吸烟会导致心血管和呼吸系统疾病, 以及认知和神经损伤。研究表明, 尼古丁成瘾会引起大脑结构和功能的改变, 但关于吸烟者神经代谢变化的研究却很少。先进的 J-edited 1H 磁共振波谱技术(MEGA-PRESS)能够可靠地测定脑代谢物的局部浓度, 包括谷氨酸和 n-乙酰天冬氨酸(NAAG)的兴奋性神经递质和脑内抑制性神经递质 γ -氨基丁酸(GABA)。内侧前额叶皮层(mPFC)在认知行为、人格表达和社会行为中起着至关重要的作用。本研究旨在探讨尼古丁成瘾(NA)患者前额叶皮层脑神经递质的变化, 这可能有助于了解尼古丁成瘾的潜在代谢机制。方法: 选取 18 例 NA 患者和 22 例年龄和性别匹配的对照组纳入分析。编辑后的波谱在 MATLAB 软件上使用 Gannet 工具进行后处理和定量分析。参考肌酸信号定量测定 GABA、Glx 和 NAAG 水平。采用两独立样本 t 检验分析两组患者 NAAG、GABA、Glx 水平的差异。最后, 采用 Spearman 标准分析 GABA、Glx 和 NAAG 水平与临床特征评估量表(包括每日吸烟量、吸烟年龄、FTND 评分、RRSQ 评分和 BIS-11 评分)的相关性。结果: NA 组与 HC 组间 GABA、Glx、NAAG 水平差异无统计学意义。NA 组 mPFC NAAG 水平与尼古丁依赖法格斯特伦测验(Fagerstrom Test for Nicotine Dependence, FTND)评分有显著相关性。结论: J-edited 1H-MRS 实现了重叠代谢物信号的分离, 使我们能够直接准确地检测到特定脑区分离的代谢物信号。NAAG 是人类神经系统中第三常见的神经递质, 既往研究表明尼古丁成瘾者内侧前额叶的功能和结构发生改变。在本项研究中, 我们观察到 NA 患者内侧前额叶 NAAG 水平与尼古丁依赖显著相关。这说明 NAAG 的代谢在尼古丁依赖患者发病过程中发生了改变, NAAG 水平的改变可能是尼古丁依赖者成瘾行为形成的重要因素。

PO-0463

帕金森病前驱期伴随快速眼动睡眠行为障碍自由水成像变化的研究

丁凯玥¹、申雨^{2,3}、魏巍^{2,3}、王鑫惠^{2,3}、白岩^{2,3}、周一航²、王梅云^{2,3,4}

1. 河南大学人民医院医学影像科

2. 河南省人民医院医学影像科

3. 郑州大学人民医院

4. 河南省科学院生物医学研究所

目的: 特发性睡眠障碍 (idiopathic REM sleep behavior disorder, iRBD) 是帕金森 (Parkinson Disease, PD) 前驱症状的标志之一, 是突触蛋白病的前驱阶段, 帕金森前驱阶段的非特异性症状使疾病在早期阶段诊断受限。本实验利用自由水成像 (Free Water Imaging, FWI) 技术构建的双张量模型来评估帕金森前驱期伴特发性睡眠障碍患者在黑质致密部及内侧苍白球自由水体积分数的改变, 以探究帕金森前驱期的神经影像标志物, 为帕金森疾病早期诊断治疗提供依据。

方法: 本研究的影像和临床数据来自于 Parkinson's Progression Markers Initiative 数据库 (PPMI www.ppmi-info.org/data)。收集年龄、性别匹配的 19 例 iRBD 患者和 28 例帕金森患者, 25 例健康对照 (Healthy Control, HC) 的弥散张量磁共振图像。利用 single-shell 算法处理 DTI 数据, 获得了 FWI 数据。并测量其双侧黑质致密部、红核、内外侧苍白球的 FW 值。使用 ANOVA 比较三组 (PD 组, iRBD 组, HC 组) FW 差异, 并进行事后检验, $p < 0.05$ 时表示具有统计学差异。

结果: PD 组、iRBD 组、HC 组三组间在左内侧苍白球 (ANOVA $p < 0.001$) 及左侧黑质致密部 (ANOVA $p < 0.001$) 均有显著性差异。其中在左内侧苍白球 PD 组 FW 显著大于 HC 组 ($p < 0.001$), 并大于 iRBD 组 ($p = 0.036$), 且 iRBD 组 FW 显著大于 HC 组 ($p = 0.007$); 在左侧黑质致密部, PD 组 FW 显著大于 HC 组 ($p < 0.001$), 并大于 iRBD 组 ($p < 0.001$), 且 iRBD 组 FW 显著大于 HC 组 ($p = 0.003$)。

结论: 内侧苍白球和黑质致密部中的自由水成像在帕金森病的前驱阶段与临床表现相关, 内侧苍白球及黑质致密部微观结构在早期神经退行性阶段已改变, 本研究有助于了解突触核蛋白病的早期和进行性病理变化。研究结果表明, 内侧苍白球黑质致密部的自由水成像有可能成为突触核蛋白病早期诊断、进展和神经影像有效标志物。

PO-0464

基于人工智能的 ASPECTS 评分各区域梗死对急性大血管闭塞取栓术后患者预后的影像

邹宇¹、胡鹏鑫¹、熊瑞芳¹、朱涵婷¹、李承毅¹、唐小平¹、赵锡海²

1. 南昌大学第二附属医院影像中心

2. 清华大学医学院生物医学影像研究中心

目的: 探讨基于人工智能的 ASPECTS 评分 10 个区域的梗死占比与急性大血管闭塞机械取栓术后患者预后的关系。方法 收集我院 2021 年 1 月至 2023 年 6 月单侧急性大血管闭塞患者, 所有患者行血管内治疗前均进行头颅 CTP、头颅 CT 平扫检查。随访 90 天, 根据 mRS 评分将其分为预后良好组 ($mRS \leq 2$) 及预后不良组 ($mRS \geq 3$), 分析基于人工智能 ASPECTS 评分的 10 个区域各自梗死区占比与患者预后的关系。结果 纳入 78 例患者 (平均年龄 62.5 岁; 70.5% 为男性), 其中 53 例预后良好 ($mRS \leq 2$), 25 例预后不良 ($mRS \geq 3$)。Mann-Whitney U 检验显示两组之间的豆状核、尾状核、M6 区域梗死有统计学意义 ($P < 0.05$)。多因素 logistic 回归分析证实豆状核 ($OR = 1.02$; 95%CI 1.00~1.05; $P = 0.014$) 和 M6 区域 ($OR = 1.06$; 95%CI 1.02~1.10; $P = 0.004$) 梗死与预后

不良的可能性增加相关。结论 各 ASPECTS 评分区域对急性大血管闭塞机械取栓术后患者预后的影响不同, 在确定是否行机械取栓术前, 应考虑梗死部位。

PO-0465

自由水成像揭示帕金森病脑白质微观变化

申雨^{1,2}、白岩^{1,2}、吴亚平^{1,2}、魏巍^{1,2}、王鑫慧^{1,2}、丁凯玥¹、王梅云^{1,2,3}

1. 河南省人民医院

2. 郑州大学人民医院

3. 河南省科学院生物医学研究所

目的: 本研究使用弥散张量成像 (Diffusion Tensor Imaging, DTI) 技术, 应用单壳层 (Single-shell) 弥散模型生成自由水成像 (Free Water Imaging, FWI), 深入研究帕金森病 (Parkinson's Disease, PD) 患者全脑白质纤维在神经炎症、轴突髓鞘及萎缩性神经变性上的微观结构改变。本研究结合了 FWI 技术生成的自由水体积分数 (Free Water, FW), 定量评估脑白质结构的定向性与完整性。利用 FWI 构建的双张量模型评估帕金森病白质纤维束的神经炎性变化, 有助于进一步研究和了解帕金森病患者真正的结构功能改变, 对该疾病的早期诊断、治疗和预后评估具有决定性意义。

方法: 本研究所采集数据均来自 Siemens 3.0T Prisma 磁共振, 共采集 60 例 PD 患者, 以及年龄性别匹配的健康对照 (Healthy Controls, HC) 共 31 例的 DTI 数据。通过 single-shell 算法处理 DTI 数据, 获得了 FWI 数据, 使用对称图像标准化算法对所有 FWI 数据进行标准化。选取全脑 49 条纤维束作为感兴趣区域 (Region of interesting, ROI), 并比较 PD 患者与正常人的 FWI 值, $p < 0.05$ 时表示具有统计学差异。

结果: 研究表明 PD 患者在胼胝体膝部 ($p=0.001$)、双侧脊髓皮质束 (右侧 $p=0.046$, 左侧 $p=0.001$)、右侧内囊后肢 ($p=0.032$)、左侧外囊 ($p=0.009$) 以及双侧前放射冠 (右侧 $p=0.022$, 左侧 $p=0.012$)、双侧上放射冠 (右侧 $p=0.004$, 左侧 $p=0.002$)、双侧后放射冠 (右侧 $p=0.022$, 左侧 $p=0.006$)、双侧上纵束 (双侧 $p=0.001$)、右侧上额枕束 ($p=0.044$) 的 FW 值均显著高于 HC 组。

结论: 本研究结果强调了 FWI 在深入研究帕金森病患者脑白质微观结构方面的潜力, PD 中 FWI 的成像显示白质纤维束的神经退行性病变和神经炎性的相关性, 并为该疾病的病因、早期诊断、治疗和预后评估提供了重要线索。

PO-0466

非认知损害复发缓解型多发性硬化患者默认模式网络子系统的 MRI 研究

贺凡入、朴思蓉、周磊、张包静子、全超、李海庆、李郁欣

复旦大学附属华山医院

目的 探讨非认知损害复发缓解型多发性硬化 (RRMS) 患者默认模式网络 (DMN) 的子系统灰质体积、子系统内部及之间功能连接的变化情况。**方法** 该研究为前瞻性研究。收集 2020 年 4 月至 2021 年 1 月在复旦大学附属华山医院诊治的 37 例非认知损害 RRMS 患者 (RRMS 组), 并同期纳入的 43 名健康志愿者 (HC 组)。RRMS 组患者均接受临床认知功能量表评分。所有受检者均接受大脑结构三维 T1WI 和静息态功能 MRI。DMN 被划分为核心 (CORE)、背内侧前额叶 (DMPFC)、内侧颞叶 (MTL) 三个子系统。通过空间标准化生成的灰质体积图提取三个子系统的灰质体积; 根据 Yeo's 17 网络定义 DMN 的 24 个兴趣区 (ROI) 并计算其功能连接值, 从而获取子系统内部和子系统间的功能连接平均值。采用独立样本 t 检验比较 RRMS 组和 HC 组的灰质体积

和功能连接的差异,采用 Spearman 偏相关分析子系统灰质体积与功能连接,以及子系统灰质体积和功能连接与临床相关量表评分的相关性。结果 与 HC 组相比,RRMS 组 DMN 三个子系统的灰质体积均显著降低 ($P<0.05$),而三个子系统内部及其之间的功能连接差异均无统计学意义 ($P>0.05$)。基于 ROI 水平,与 HC 相比,RRMS 组患者 DMN 子系统内 FC 值显著减低的脑区主要集中在 DMPFC 左背内侧前额叶皮层、DMPFC 右外侧颞叶皮层和 MTL 左内侧颞叶皮层 ($P<0.01$)。HC 组的 DMPFC 灰质体积与 DMPFC 内部功能连接呈正相关($r=0.326$, $P=0.040$);RRMS 组 CORE 灰质体积与 CORE 和 DMPFC 之间的功能连接呈正相关 ($r=0.363$, $P=0.038$),CORE 内部功能连接与记忆与执行筛查量表评分呈正相关 ($r=0.430$, $P=0.036$)。结论 非认知损害的 RRMS 患者 DMN 三个子系统均出现灰质萎缩,子系统 DMPFC 的结构与功能的无相关性,子系统 CORE 的功能连接可反映记忆执行状态,DMPFC 和 CORE 可能是非认知损害的 RRMS 患者神经变性和脑功能改变的重要脑区。

PO-0467

单侧颈内动脉或大脑中动脉严重狭窄或闭塞时大面积脑梗死脑预测新指标-ASPECTS 与 CS 评分

陈婧姝

中国人民解放军北部战区总医院

目的 ASPECTS 评分已在 CTA 影像学检查方法中得到了广泛的应用,CS 评分系统在预测是否发生脑梗死方面灵敏性和特异性都很高(尤其是 MCA 供血区域的梗死)。目前对 ASPECTS 与 CTA-CS 来评估脑侧支循环的报道相对较少,本研究探讨 ASPECTS 与 CT 血管造影侧支评分(CTA-CS)系统联合评估对大面积脑梗死的临床预测。方法 回顾性分析 CTA 确诊为单侧颈内动脉或大脑中动脉重度狭窄或闭塞的脑梗死患者。采用受试者工作特征曲线(ROC)检验 ASPECTS 评分、CTA-CS 评分、ASPECTS 与 CTA-CS 评分对大面积脑梗死的预测能力。结果 单因素分析显示 ASPECTS 与 CTA-CS 评分两组间差异存在统计学意义 ($P<0.05$)。ROC 曲线检验结果显示,ASPECTS 评分、CTA-CS 评分、ASPECTS 与 CTA-CS 评分的 AUC 分别为 0.916 ($95\%CI=0.838\sim0.993$, $P<0.0001$)、0.910 ($95\%CI=0.823\sim0.997$, $P<0.0001$)、0.922 ($95\%CI=0.839\sim1.000$, $P<0.0001$),ASPECTS 与 CTA-CS 评分对大面积脑梗死预测价值优于 ASPECTS 或 CTA-CS,并确定最佳预测临界值为 20.5 分。结论 三种评估方法对预测大面积脑梗死都有一定的价值,但是 ASPECTS 与 CS 评估方法较其余两个价值更大,既 ASPECTS 与 CS 评估方法对判断发生大面积脑梗死的正确率更高。ASPECTS 与 CTA-CS 评分体系可预测侧支循环状态,提高单侧颈内动脉或大脑中动脉严重狭窄或闭塞时对大面积脑梗死的预测价值。

PO-0468

ASL 在静脉勃起功能障碍 (VED) MR 检查中的应用研究

朱志鹏、张炜

华中科技大学同济医学院附属协和医院

目的探讨动脉自旋标记 (arterial spin labeling,ASL) 序列在静脉勃起功能障碍 (venous erectile dysfunction ,VED) 患者应用价值。

方法回顾性分析 2020 年 6 月至 12 月在我院行颅脑 fMRI 检查的 75 名临床确诊为 VED 患者和 80 名健康志愿者的影像资料,进行 sag-3DT1,DTI,BOLD,ASL 序列扫描,基于之前对 VED 病人的研究 (与健康志愿者相比,VED 患者在大脑左侧中央后回和中央前回的皮质体积显著减少,右侧颞中回

的皮质体积显著增加。在大脑广泛区域观察到轴向扩散率 (AD)、径向扩散率 (RD) 和平均扩散系数增加), 对 VED 病人脑改变区域进行 ASL 研究。

结果在 VED 病人皮质体积减少区域脑血流量 (regional cerebral blood flow, CBF) 相应减少, 皮质体积增加区域 CBF 相应增加, 扩散增加区域 CBF 相应增加。VED 病人与健康志愿者 CBF 改变区域比较具有统计学差异。

在 VED 患者中观察到皮质体积和白质 (WM) 纤维结构变化, 其血流量 CBF 也发生改变, 并显示与临床症状和功能障碍持续时间显著相关。基于之前机器学习分析显示, 某些大脑区域的各种 CBF 改变, 可被视为 VED 患者和健康对照对象之间的可靠区分特征。

结论 ASL 可以有效评估 VED 病人大脑相应区域皮质体积改变的血管灌注情况, 为 VED 病人大脑研究提供了更多影像学信息, 同时能更好更精确的服务于临床。

PO-0469

定量磁敏感成像联合自由水成像在早期多系统萎缩与帕金森病鉴别中的价值

徐长媛、陈昱帆、赵阳、卓梦圆、巩涛、郑潇涵、李宇欣、王光彬

山东第一医科大学附属省立医院 (山东省立医院)

目的: 探究定量磁敏感成像(QSM)联合自由水成像在早期多系统萎缩 (MSA) 与早期帕金森病 (PD) 灰质核团中的诊断价值。

方法: 研究对象为山东省立医院近四年确诊的 23 例早期 MSA 患者 (H-Y<2) 和 40 例早期 PD 患者 (H-Y<2)。纳入了 33 例相匹配的健康志愿者 (HC)。分别行 3DT1、QSM 及 DTI 序列扫描, 并手动勾画壳核 (PT) 及齿状核 (DN) 等感兴趣区, 比较三者平均磁化率及扩散系数。

结果: QSM 结果显示, 早期 MSA (PT: 0.13 ± 0.03 ; DN: 0.15 ± 0.04) 患者的 PT 及 DN 的磁化率值高于 HC (PT: 0.08 ± 0.03 $P < 0.001$; DN: 0.11 ± 0.03 $P = 0.024$) 和早期 PD (PT: 0.08 ± 0.03 $P < 0.001$; DN: 0.11 ± 0.03 $P = 0.006$)。自由水成像结果表明, 早期 PD 患者 (FWE-FA: 0.17 ± 0.02 FW: 0.13 ± 0.05) PT 的 FWE-FA、FW 的值要高于 HC (FWE-FA: 0.16 ± 0.01 $P = 0.008$; FW: 0.09 ± 0.01 $P = 0.006$); DN (0.11 ± 0.03) 只有 FW 的值高于 HC (0.09 ± 0.03 $P = 0.014$)。早期 MSA 患者 PT (FWE-FA: 0.19 ± 0.02 FW: 0.16 ± 0.07 $P < 0.001$) 的 FWE-FA、FW 的值均高于 HC (FWE-FA: 0.15 ± 0.01 $P < 0.001$; FW: 0.09 ± 0.01 $P < 0.001$); 早期 MSA 患者的 DN 的 FWE-FA 值高于 HC (0.32 ± 0.03 $P < 0.001$)。最后, 将早期 PD 与早期 MSA 进行比较, 发现早期 MSA 患者 (0.38 ± 0.04) DN 的 FWE-FA 值高于早期 PD (0.32 ± 0.05 $P < 0.001$)。ROC 曲线显示, DN 可以作为一个较好的标志物区分早期 PD 与 MSA, 且两种序列联合的诊断效能要大于单独任何一个序列 ($P < 0.001$; AUC=0.843)。

结论: 首先, 结果表明, 齿状核可能是早期 MSA 的易损靶点。另外, QSM 与自由水成像是良好的互补工具, 两者联合可以更好了解铁沉积及神经损伤在两种疾病之间复杂病理生理贡献。

PO-0470

帕金森病患者的脑白质微结构改变

陈晨、程敬亮、张春艳
郑州大学第一附属医院

目的：采用扩散张量成像 (DTI) 基于纤维束追踪空间统计分析 (TBSS) 观察帕金森病 (PD) 患者脑白质结构的变化，探索 DTI 多参数变化与 PD 患者综合评分量表 (UPDRS) 评分升高具有显著相关的脑区。材料与方法：160 例 PD 患者及 99 例正常对照组行 DTI 检查，采用 TBSS 技术分析两组受试者脑白质纤维 DTI 的各相关参数，包括各向异性分数 (FA)、平均扩散系数 (MD)、轴向扩散系数 (AD)、平行扩散系数 (RD)，比较两组各 DTI 参数的差异，分析 PD 组有差异脑区的 FA、MD、AD、RD 值与临床 UPDRS 评分的相关性。结果：与对照组相比，PD 组多个脑白质区 FA 值降低，MD、AD、RD 值升高 ($P<0.05$)。PD 组较对照组有差异脑区的 FA 值、AD 值、RD 值与 UPDRS 评分均有相关关系 ($P<0.05$)；MD 值与 UPDRS 评分没有相关性。FA 值降低和 MD、RD 值升高并与 UPDRS 评分具有显著相关的脑区为胼胝体、左侧内囊前肢、左侧外囊，左侧上额枕束 ($P<0.05$)。结论：PD 患者存在脑白质结构的改变，可能是髓鞘脱失或轴突完整性受到破坏。

PO-0471

乳腺癌患者化疗早期的皮层表面形态学改变和癌症相关疲劳变化的关系：基于表面形态测量方法

周燕飞、伏晓、李海、杨立状
中国科学院合肥肿瘤医院

目的 研究乳腺癌患者化疗早期的皮层表面形态早期改变及其与癌症相关疲劳 (cancer-related fatigue, CRF) 的关系。材料与方法 选取 25 例首诊乳腺癌患者，分别在手术后化疗前 (T1)、化疗期间 (T2) 进行神经心理学测试和颅脑 3D-T1 加权数据采集。采用基于表面的形态学方法 (surface-based morphometry, SBM) 测量皮层表面形态结构在化疗期间的早期改变，并与 CRF 的纵向变化进行相关性分析。结果 与化疗前相比，乳腺癌患者在化疗早期的 CRF、抑郁、焦虑测量评分变化具有统计学意义 ($P<0.05$)。化疗期间乳腺癌患者皮层表面形态的多个参数值较化疗前发生了早期改变，差异有统计学意义 ($P<0.05$)，参数值减少的脑区包括：顶叶 (双侧楔前叶、右侧缘上回、右侧中央后回)、枕叶 (双侧楔叶、左侧距状皮层) 的皮层厚度减少，顶叶 (双侧顶下小叶、右侧缘上回、右侧顶上小叶及中央后回)、颞叶 (双侧梭状回及颞下回、右侧颞上回)、枕叶 (双侧枕外侧回、右侧楔叶、右侧距状皮层) 的沟深减少，左侧枕叶 (枕外侧回)、右侧额叶 (额上回、前中额叶及额下回)、右侧顶叶 (缘上回及顶下小叶) 的分形维数减少；参数值增大的脑区有：左侧枕叶 (枕外侧回及楔叶)、右侧顶叶 (缘上回、顶上小叶及顶下小叶)、右侧颞叶 (颞中回、颞下回及颞上回后部) 的皮层褶皱指数增大。与化疗前相比，化疗早期右前中额叶分形维数的改变与 CRF 的纵向变化呈负相关 ($r = -0.628, P = 0.001$)。结论 乳腺癌患者的皮层表面形态在化疗期间即可发生早期改变，并与 CRF 的变化相关。

PO-0472

基于合成磁共振成像技术对帕金森病患者 临床亚型分型的价值研究

李洁琼、韩倩倩、杜恩辅
十堰市太和医院（湖北医药学院附属医院）

目的

应用合成磁共振技术分析帕金森病（PD）患者在不同核团弛豫值上的改变，并探讨其与临床症状之间的相关性，辅助 PD 早期诊断及病情监测。

方法

应用合成磁共振序列对 50 例 PD 患者及 30 例健康对照组（HC）进行扫描，并根据主要症状将 PD 患者分为强直少动组（n=20）及震颤组（n=26），使用 MAGIC 软化勾画感兴趣区得到双侧尾状核、壳核、苍白球、丘脑枕核、红核、黑质的 T1、T2 及质子密度（PrD）值，比较 PD 组与 HC 组以及强直少动组与震颤组之间的差异。

结果

PD 组与 HC 组相比，尾状核头 T2 值减低（ $P<0.01$ ），PrD 值减低（ $P<0.01$ ）；尾状核体 T1 值增高（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）；壳核 T1 值增高（ $P<0.01$ ），T2 值减低（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）；苍白球 T1 值增高（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）；丘脑枕核 T1 值增高（ $P<0.01$ ），T2 值增高（ $P<0.01$ ）；红核 T1 值增高（ $P<0.05$ ），T2 值减低（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）；黑质 T2 值减低（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）。PD 患者强直少动组与震颤组相比，尾状核头 T1 值增高（ $P<0.01$ ），T2 值增高（ $P<0.05$ ），PrD 值增高（ $P<0.01$ ）；壳核 T1 值增高（ $P<0.01$ ），T2 值增高（ $P<0.05$ ），PrD 值增高（ $P<0.05$ ）；丘脑枕核 T1 值增高（ $P<0.01$ ），PrD 值增高（ $P<0.01$ ）；黑质 PrD 值减低（ $P<0.05$ ）。

结论

通过合成磁共振成像技术观察到 PD 患者与健康人之间以及不同临床症状的 PD 患者之间均存在不同核团弛豫值的差异，因此合成磁共振成像技术对 PD 的早期诊断以及病情分析具有一定的提示意义。

PO-0473

NODDI 预测脑胶质瘤 IDH-1 基因状态效能分析

赵淑琴、丁爽
新疆医科大学第一附属医院

目的：研究神经突方向离散度与密度成像（neurite orientation dispersion and density imaging, NODDI）预测脑胶质瘤异柠檬酸脱氢酶（isocitrate dehydrogenase, IDH-1）基因状态的效能。方法：收集新疆医科大学第一附属医院 45 例胶质瘤患者作为研究对象，其中男 20 例，女 30 例，所有受试者均在术前行常规 MRI 及 NODDI 扫描，得到的 NODDI 原始数据传入到西门子后理工作台进行相应的后处理，将处理后的图像导入相应的后处理软件，有经验的放射科医师勾画肿瘤实质相邻最大的三个层面作为 ROI，取得各个参数（ICVF、ODI、ISO）的均值。用独立样本 t 检验或 Mann-Whitney 秩和检验分别比较高、低级别组和不同 IDH-1 状态各扩散参数值的差异。进一步对有统计学意义差异的参数进行 Logistic 回归分析，评价其鉴别脑胶质瘤 IDH-1 基因突变状态的诊断效能，并获得受试者工作特征（ROC）曲线。结果：本研究最终纳入 45 例患者作为研究对象，其中野生型 31 例（68.89%），突变型 14 例（31.11%）。多因素 Logistic 回归分析显示 ICVF（OR=0.978、95%CI=0.957-0.999、 $P<0.001$ ）、肿瘤分级（OR=0.252、95%CI=0.083-0.796、 $P=0.015$ ）是 IDH-1 基因分析的独立影响因素。肿瘤分级曲线下面积 AUC=0.910，95%CI=0.813-1.000，ICVF

的曲线下面积 $AUC=0.871$, $95\%CI=0.759-0.983$ 。NODDI 参数中 ICVF 具有最佳的诊断效能。结论:胶质瘤肿瘤分级、NODDI 成像参数值有助于脑胶质瘤的 IDH 基因分型判断, 其中 ICVF 的敏感性 & 特异性均较高且曲线下面积较大。

PO-0474

臂丛 MRN 在诊断脱髓鞘合并轴索损伤 CIDP 中的应用

邓燕、王卫卫、杨杨、刘含秋
复旦大学附属华山医院

目的: 探讨臂丛磁共振神经成像在诊断脱髓鞘合并轴索损伤的慢性炎性脱髓性多发性神经根神经病 (CIDP) 中的应用价值。

方法: 收集我院 2016-2021 年确诊的 CIDP 患者 29 例, 根据神经电生理检查分为脱髓鞘组及脱髓鞘合并轴索损伤组。在臂丛磁共振神经成像 (MRN) 图像上测量所有患者臂丛神经根 (C5-C8) 最大直径以及神经-肌肉 T2WI 信号强度比, 收集所有患者的临床资料, 做组间差异性分析和组内相关性分析, 并绘制 ROC 曲线。

结果: 脱髓鞘合并轴索损伤组 CIDP 臂丛神经根最大直径大于脱髓鞘组, C5 ($P=0.011$)、C6 ($P=0.046$)、C8 ($P=0.001$) 具有统计学差异, ROC 分析结果显示, C8 神经根的最大直径具有较好的诊断效能 ($AUC=0.851$, 相应的阈值为 $4.36mm$)。脱髓鞘合并轴索损伤组 CIDP 患者 C6 ($r=0.634$, $P=0.02$)、C7 ($r=0.605$, $P=0.029$) 神经根最大直径与脑脊液蛋白水平呈中度正相关, C7 ($r=-0.567$, $P=0.043$) 神经根最大直径以及 C8 ($r=-0.598$, $P=0.031$) 神经根的神经-肌肉 T2WI 信号强度比与发病年龄呈中度负相关。

结论: 臂丛 MRN 有助于识别脱髓鞘合并轴索损伤的 CIDP 病人, C8 神经根的最大直径可能具有较好的诊断效能。

PO-0475

基于深度学习与影像组学诊断原发性三叉神经痛的应用研究

潘磊¹、王雪纯²、葛秀红¹、叶海琪¹、朱小芬¹、王海滨¹、石峰²、丁忠祥¹

1. 浙江大学医学院附属杭州市第一人民医院

2. 上海联影智能医疗科技有限公司

目的 本研究拟使用深度学习的方法对三叉神经进行定位、分析, 并用影像组学的方法鉴别 CTN 患者与健康人群。方法 招募了 165 名 CTN 患者以及性别、年龄与之相匹配的健康对照 175 名。所有被试都完成了磁共振扫描。使用 VB-Net 对所有被试双侧三叉神经脑池段进行定位、分割, 然后用影像组学的方法进行特征提取、降维、特征选择、模型构建和模型评估。结果 对 CTN 患者和健康对照进行分析, 发现 12 个权重较大的纹理特征, 且两组之间的 Rad_score 有显著统计学差异 ($p < 0.05$)。讨论 影像组学与临床诊断 CTN 具有结论一致性, 而影像组学更为客观、敏感, 是临床诊断 CTN 以及评估 CTN 患者三叉神经改变的一种可靠的神经生物学指标。

PO-0476

未破裂颅内动脉瘤血管内介入栓塞术患者疾病 不确定感的潜在类别分析

刘永贵
郑州大学第一附属医院

摘要 目的 了解未破裂颅内动脉瘤血管内介入栓塞术患者疾病不确定感的潜在类别，并探讨不同潜在类别患者疾病不确定感之间的特征差异。方法 便利选取 2021 年 4 月-2023 年 4 月于郑州大学第一附属医院住院的 188 例行颅内动脉瘤血管内介入栓塞患者为研究对象，采用一般资料调查表和疾病不确定感量表对其进行调查。采用潜在类别分析将患者疾病不确定感进行分类，多元 logistic 回归分析探讨各影响因素对其不同分型的影响。结果 未破裂颅内动脉瘤血管内介入栓塞术患者疾病不确定感得分为（81.9±11.51）分，未破裂颅内动脉瘤血管内介入栓塞术患者疾病不确定感可分为高不确定感组（43.6%）、中等不确定感组（36.2%）、低不确定感组（20.2%）。性别、文化程度、动脉瘤数量是未破裂颅内动脉瘤血管内介入栓塞术患者疾病不确定感的影响因素（均 $P < 0.05$ ）。结论 未破裂颅内动脉瘤血管内介入栓塞术患者疾病不确定感可分 3 个潜在类别，医务人员应针对不同特征人群实施精准干预，以降低患者的疾病不确定感，从而提高治疗依从性和患者整体健康水平。

PO-0477

慢性主观性耳鸣患者的多层脑功能网络研究

冯源、徐晓敏、李彪、殷信道、陈宇辰
南京市第一医院

目的 本研究拟利用多层网络技术对于慢性主观性耳鸣患者的静息态磁共振数据进行处理分析，以寻找具有一定动态特征的相关节点参数。**方法** 本研究选取 28 例慢性主观性耳鸣患者作为耳鸣组以及与之相匹配的 39 例健康志愿者作为对照组。在对所有受试者完善相关耳科以及神经精神科测试后，进行磁共振数据采集，并对数据进行预处理、动态功能连接分析、多层模块化与网络转换率分析。最后将磁共振数据结果与相关临床资料进行统计分析比较。结果 耳鸣组与对照组间整体模块化系数 Q 无显著差异（ $P > 0.05$ ）。而与对照组相比，耳鸣组在双侧前扣带回（ $P < 0.001$ ）以及右侧海马区（ $P < 0.01$ ）的网络转换率显著减低。耳鸣组右侧海马区的网络转换率与耳鸣病程时间呈负相关（ $r = 0.576$ ， $P = 0.003$ ）。结论 利用多层分析方法发现，慢性主观性耳鸣患者前扣带回与海马区对于信号的调节能力改变，可能影响了内部心理加工、记忆情绪等过程，而海马区的变化可能与病程的长短相关。

PO-0478

黎、汉族缺血性脑卒中患者 AS 分布差异及其危险因素分析

黄丹妮
海口市人民医院

目的：探讨黎、汉族缺血性脑卒中患者脑血管颅内、外段粥样斑块（AS）的分布差异以及其相关危险因素。

方法：对我院就诊的 1352 例黎、汉族患者，根据 MRI 检查结果分为缺血性脑卒中及非缺血性脑卒中，在根据 CTA 检查结果分为颅内段 AS 组、颅外段 AS 组、颅内外同时 AS 组及正常组，随后收

集患者病史资料（包括年龄、性别、吸烟史、饮酒史、高血压病、糖尿病、生化指标如 TC、TG、HDL-C、LDL-C 等）进行统计学分析。

结果：黎族缺血性脑卒中患者的单纯颅外动脉 AS 检出率明显高于汉族缺血性脑卒中患者， $P<0.01$ 。经 Logistic 回归分析显示，黎族单纯颅外动脉 AS 的危险因素有饮酒（OR=8.80）、高血压（OR=6.80）和年龄（OR=0.76）；汉族单纯颅外动脉 AS 的危险因素有年龄（OR=0.9）、高血压（OR=5.66）、糖尿病（OR=5.4）。黎族缺血性脑卒中单纯颅外动脉 AS 组的糖尿病患者比例明显低于汉族缺血性脑卒中单纯颅外动脉 AS 组，而有饮酒史患者比例明显高于汉族缺血性脑卒中单纯颅外动脉 AS 组， $P<0.05$ 。

结论：脑血管颅外段 AS 所致黎族缺血性脑卒中患者明显高于汉族人群，并且其危险因素与饮酒史有重要关系。

PO-0479

临床-语义-放射组学列线图模型预测自发性脑出血早期血肿扩大：包含脑室出血的修订版本的探讨

夏晓娜、孟祥水
山东大学齐鲁医院（青岛）

背景及目的：早期血肿扩大（hematoma expansion, HE）已被确定是脑出血不良预后的独立预测因子。目前 HE 的相关研究大多基于传统的定义，即只关注脑实质内血肿体积的变化，但既往相关临床研究均未改善脑出血患者的预后。包含脑室内血肿扩张的修订版本血肿扩张（revised hematoma expansion, RHE）定义近期被提出并用于筛选具有早期血肿扩大风险的患者。目前 RHE 的影像组学相关模型预测能力仍不清楚。本研究旨在开发和验证一种基于非强化 CT 的临床-语义-放射组学列线图模型，以识别入院时有 RHE 的幕上自发性脑出血（sICH）患者。

方法：本次双中心回顾性研究中，回顾了 467 例脑出血患者的数据（训练集=299；测试集=77；外部验证队列=91）。基于逻辑回归机器学习方法构建放射组学模型、临床-语义模型和组合模型。采用最小绝对收缩和选择算子（LASSO）进行 5 倍交叉验证。此外，还构建了经典的 BRAIN 评分系统来预测 RHE。采用 ROC 曲线和决策曲线分析（DCA）评价模型的预测性能。

结果：放射组学特征加入临床-语义模型显著提高了 RHE 的预测性能，临床-语义-放射组学列线图模型在训练集（AUC=0.94），测试集（AUC=0.84）及外部验证集（AUC=0.83）中的表现均明显高于单纯的放射组学模型及临床-语义模型，且具有统计学差异（均 $P<0.05$ ）。传统 BRAIN 评分系统的预测效能显著低于其他 3 个模型（训练集 AUC=0.71， $P<0.05$ ）。

结论：临床-语义-放射组学列线图模型能够有效准确地预测早期 RHE，明显优于传统 BRAIN 评分系统，有助于临床更加精准的选择早期血肿扩张的治疗队列。

PO-0480

CSVD 相关认知障碍默认网络的结构网络属性分析

毛海霞、方向明
无锡市人民医院

目的 探索脑小血管病（CSVD）相关认知障碍默认网络障碍的结构基础

方法 搜集我院就诊 CSVD 患者 77 例，其中 CSVD 伴认知障碍（CSVD-CI）34 例，CSVD 认知正常（CSVD-CN）33 例，同期收集性别、年龄和教育程度匹配健康对照组 66 例，每个被试均进行常规头颅平扫，3d-T1 和弥散加权像（ $b=0,1500,3000$ ）扫描，在 Linux 系统利用 fsl 对弥散加权成像进行预处理，然后利用 DiffusionKit 软件的 HARDI 的 CSD 方法进行体素内建模，再进行纤维束追踪，

然后利用 **Briannetome Atlas** 图谱进行 2 步配准后构建 **DMN** 结构网络, 最后利用 **gretna** 软件对 **DMN** 结构网络进行网络属性分析。

结果 相对于健康对照组: **CSVD-NCI** 组的左眶回_2 的节点介数降低; 右眶回_6 的节点效率降低 ($p < 0.05$, **FDR** 校正); 两组的小世界属性、全脑的全局和局部效率、度值、节点的局部效率和最短路径无统计学差异 ($p > 0.05$)。相对于健康对照组: **CSVD-CI** 组的全脑的全局效率和局部效率降低; **CSVD-CI** 组的左眶回_1、右眶回_2、右眶回_6、左扣带回_7 的节点度值下降; **CSVD-CI** 组的左眶回_1、左颞上回_6、左扣带回_7 的节点效率下降; **CSVD-CI** 组的左扣带回_7 的节点局部效率降低 ($p < 0.05$, **FDR** 校正)。两组的节点介数、最短路径和小世界属性无统计学差异 ($p > 0.05$)。在 **CSVD** 组中, 伴认知障碍组 (**CSVD-CI**) 的全脑的局部效率较无认知障碍患者的降低 ($p < 0.05$) , 两组的全脑的全局和局部效率、节点介数和度值、节点效率和节点的局部效率、最短路径、小世界属性无统计学差异 ($p > 0.05$)。

结论 **CSVD** 患者默认网络的内部结构改变与认知障碍相关。

PO-0481

随机生存森林模型在成人弥漫性胶质瘤预后分析中的应用

苏筱芮¹、刘玉锴²、李爽¹、邵晗冰¹、月强¹

1. 四川大学华西医院

2. 四川大学华西临床医学院

目的: 应用随机生存森林模型探索临床和影像组学特征对成人弥漫性脑胶质瘤 (ADG) 的预后风险评估的价值。

方法: 回顾性收集公开数据库 **TCIA** 具有配对术前 **MRI** 检查和预后资料的被试。基于开源工具自动分割胶质瘤, 随后利用 **Pyradiomics** 软件包进行影像组学特征的提取。整合被试的年龄、术前 **KPS** 评分及分子突变等资料为临床资料, **MRI** 组学特征为组学资料。**RSF** 通过 **Python** 工具包 **PySurvival** 实现 (8:2=训练集: 测试集), 使用 **Python** 代码进行网格搜索寻找模型的超参数以获得最适合的 **RSF** 模型, 使用 **C-index** 和综合 **brier** 分数 (**IBS**) 进行评估。基于每个被试的预后危险分数 **Risk score** 和最重要的特征, 再使用 **R** 语言中的 **survminer** 包得到最佳阈值划分为预后相关的高低风险组。

结果: 70 名 **ADG** 纳入本研究, 其中 **WHO2/3/4** 级分别为 22/23/35 名, 女/男=30/40 名; 平均年龄为 46.31 岁; 中位总生存期为 19.22 个月; 术前 **KPS** 评分平均为 81.95 分。

临床模型 model1 超参数为: **num_trees**=21,**max_depth**=2,**min_node**=2 ; **C-index**=0.833[95%CI,0.827-0.840],**IBS**=0.126[95%CI,0.124-0.128]。

组学模型 model2 超参数为: **num_trees**=42,**max_depth**=7,**min_node**=3 ; **C-index**=0.786[95%CI,0.779-0.794],**IBS**=0.147[95%CI,0.145-0.149]。

综合模型 model3 超参数为: **num_trees**=22,**max_depth**=5,**min_node**=2 ; **C-index**=0.820[95%CI,0.814-0.827],**IBS**=0.140[95%CI,0.137-0.142]。三个模型划分的高低风险组的预后均有显著组间差异。

结论: **RSF** 模型能对 **ADG** 的预后风险进行较好预测, 临床资料和临床资料整合临床组学资料的模型预测效果均优于单独的组学特征模型。该结果需进一步在大样本研究中验证。

PO-0482

精神分裂症不同皮层下结构亚型的表观遗传学异常模式研究

赵倩楠^{1,2}、罗春燕^{1,2}、卫霞^{1,2}、吕粟^{1,2}

1. 四川大学华西医院, 放射科

2. 四川大学华西医院, 临床磁共振研究中心

目的: 认知功能障碍是精神分裂症的突出表现, 与患者预后密切相关, 具有显著异质性。我们近期一项研究提示基底节、丘脑等皮层下核团的解剖结构特征有助于识别认知损害不同的病程中后期精神分裂症患者, 即此类患者可根据皮层下结构体积异常模式差异被分为 2 种不同认知损害的亚型。此外, 精神分裂症是一种多基因遗传病, 既往研究提示罹患该障碍个体伴有中枢和外周的 DNA 甲基化异常, 且与认知损害有关。因此, 本文的目的是探索精神分裂症不同皮层下结构亚型患者是否存在 DNA 甲基化异常模式差异及其是否受疾病阶段的影响。

方法: 纳入行颅脑磁共振结构像扫描的两组队列: (1) 病程中后期精神分裂症患者 52 例和健康对照 51 例, 以及 (2) 首发精神分裂症患者 37 例和健康对照 51 例。根据前期研究所采用的无监督与有监督相结合机器学习算法, 对两组患者分别进行基于皮层下结构体积的亚型划分, 在每个队列中评估不同患者亚型及健康对照之间的认知功能差异。对上述受试者的外周血进行 DNA 甲基化测定, 比较不同亚型与健康对照组之间的 DNA 甲基化差异, 对前 5000 个显著差异位点进行基于生物学过程的富集分析。

结果: 与前期发现类似, 本研究的两组患者均分为 2 个亚型: 亚型 1 以皮层下结构受损为特征, 亚型 2 则表现为基底节体积增大(病程中后期)或未见显著改变(疾病早期); 疾病中后期 2 个亚型患者伴有显著认知功能差异, 而疾病早期患者则无显著亚型间认知功能差异。不同亚型患者的表观遗传学异常模式各异: 对于疾病中后期患者来说, 亚型 1 与健康对照之间存在 133204 个显著 DNA 甲基化差异位点, 主要涉及神经系统发育、解剖结构形成等通路, 而亚型 2 与健康对照间仅有 34 个显著差异位点; 在疾病早期患者中, 亚型 1 与健康对照之间有 424 个显著的 DNA 甲基化差异位点, 而亚型 2 与健康对照之间存在 17031 个显著的差异位点, 后者涉及突触后结构调节等通路。

结论: 精神分裂症不同皮层下结构亚型患者的 DNA 甲基化异常模式存在差异, 且此种差异具有动态性、受到了疾病阶段的影响。

PO-0483

基于 3D 高分辨率磁共振成像的机器学习对颅内犯罪斑块的准确识别

马越、佟丹

吉林大学第一医院

背景: 识别颅内犯罪斑块、明确斑块特征对于预防和治疗卒中具有重要意义。

目的: 基于机器学习的三维(3D)高分辨率磁共振成像(HRMRI)开发高风险斑块模型。

方法: 纳入了 52 例有症状性颅内动脉狭窄并完成 HRMRI 检查的患者。在这些患者中, 有 25 个和 27 个斑块被分别确定为症状性和无症状性斑块。通过使用 T1 加权图像(T1WI)和对比增强 T1WI(CE-T1WI)的影像组学特征, 以临床和影像医生诊断为标准, 根据绘制的 ROI, 提取高维影像组学特征, 将影像组学标签带入到逻辑回归模型, 构建具有线性支持向量分类(线性 SVC)的高危斑块影像组学模型。

结果: 从每个 HRMRI 图像斑块区域提取 11 个 RFs 构建影像组学模型。影像组学的预测模型在交叉验证集和测试集上的 ROC 曲线, AUC 分别是 0.972; 0.905。模型 DCA 曲线下面积(0.267), 说明模型有较好的决策性能。

结论: 基于 3D HRMRI 的放射组学模型能准确区分症状性和无症状性颅内动脉斑块。

PO-0484

单侧颞叶癫痫伴海马硬化患者双侧类淋巴功能障碍及其与病程的关系

王冬翠、谢芳芳、周椿尧、周高峰

中南大学湘雅医院

目的：采用沿血管周围间隙的弥散张量成像分析 (DTI-ALPS) 技术评估单侧颞叶癫痫 (TLE) 合并海马硬化 (HS) 患者双侧半球类淋巴系统的功能变化。

方法：回顾性选取湘雅医院神经外科 61 例单侧 TLE-HS 患者和 53 例健康对照 (HCs)。利用同一台西门子 Prisma 3T MR 设备进行 DTI 数据采集，并计算 DTI-ALPS 指数。然后通过组间比较和相关分析分别评估 TLE-HS 患者和 HC 之间 DTI-ALPS 指数的差异以及 TLE-HS 患者的 DTI-ALPS 指数与癫痫临床特征 (包括年龄、发病年龄、癫痫发作持续时间和神经心理学评分等) 之间的关系。

结果：与 HCs 的双侧平均值相比，TLE-HS 患者的患侧和对侧 DTI-ALPS 指数均显著降低 (HCs 双侧均值: 1.49 ± 0.116 , TLE-HS 患侧: 1.41 ± 0.172 , $p = 0.006$; TLE-HS 对侧: 1.42 ± 0.158 , $p = 0.015$)。此外，TLE-HS 患者的患侧 DTI-ALPS 指数与病程呈显著负相关 ($r = -0.352$, $p = 0.005$)。

意义：本研究表明，TLE-HS 患者存在着类淋巴系统功能障碍，提示类淋巴系统作为 TLE-HS 新的治疗靶点的广阔前景。此外，患侧 DTI-ALPS 指数与疾病持续时间呈显著负相关，进一步提示了早期有效干预措施的重要性。

PO-0485

原发性帕金森病和多系统萎缩帕金森型患者小脑改变的磁共振成像研究

杨华光¹、刘薇音²、李亮¹、文之¹、罗晓光³、杨文兵¹

1. 武汉大学人民医院 (湖北省人民医院)

2. GE 医疗

3. 深圳市人民医院

背景：小脑病变会导致运动和非运动功能障碍，可能是多系统萎缩帕金森型 (MSA-P) 和特发性帕金森病 (IPD) 患者的重要鉴别诊断依据。本研究旨在探索 MSA-P 和 PD 患者在全小脑和小脑各亚区体积方面的差异，并进一步探索小脑亚区萎缩对临床运动和非运动症状解释偏倚的贡献。

方法：本研究总共纳入 35 名 MSA-P 患者、50 名 PD 患者和 53 名健康志愿者，所有被试进行临床运动和非运动症状的评估和结构性磁共振扫描。使用小脑特异性的“空间无偏倚小脑模板 (SUIT)”的方法探索小脑体积的改变。进一步使用分层多元线性回归分析，以评估小脑全脑、前叶、后叶和各亚区小脑萎缩与临床运动/非运动症状损伤之间相关性。

结果：SUIT 分析显示，与健康对照组 (HC) 相比，PD 和 MSA-P 患者均显示出较低的小脑体积，但在 MSA-P 患者中，小脑萎缩更为严重。回归分析显示，小脑容量改变参与了两种患者运动和认知症状。在 MSA-P 患者中，较低的小脑前叶体积预测了较差的运动表现 (主要是共济失调和步态冻结)，而较低的小脑后叶体积预测了较差的认知表现 (主要是视觉空间和执行功能)。小脑 Crus I 叶和小脑 Lobules VI 的灰质体积的减少可作为是 MSA-P 和 PD 鉴别诊断独立的影像学标志物。

结论：特定小脑叶的萎缩解释了 MSA-P 和 PD 患者运动和认知功能障碍症状的差异，且可能作为二者鉴别诊断的重要生物标志物。对小脑的进一步研究为 MSA-P 和 PD 的临床功能障碍的病理生理机制方面提供了更多的见解。

PO-0486

大脑外观正常烟雾病患者皮层下核团形态及灌注分析

李自军、王玉婷、罗明芳、席瑜、王益双
四川省医学科学院·四川省人民医院

目的：利用 FSL 及 Freesurfer 分析大脑外观正常烟雾病患者皮层下核团的形态（形状、体积）与正常人的差异及其与灌注的关系。

方法：前瞻性收集 10 例进行 3D_mprage 及 DSC 扫描的大脑外观正常烟雾病患者作为病例组，在公共数据库(SALD)中选择 20 例年龄、性别相匹配的被试作为对照组。通过 Freesurfer 的 recon-all 计算两组皮层下核团（尾状核、苍白球、壳核、丘脑、杏仁核、海马）的体积及颅内体积，使用 FSL 内的 FIRST 进行双侧核团的形状（Shape）分析，Shape 分析中使用了 FSL 的 Glm 统计模型，年龄、性别及颅内体积作为协变量，采用置换检验（TFCE）进行团块水平的校正，迭代次数为 5000 次。通过独立样本 T 检验分析两组被试的基底核体积与颅内体积的比值的差异。使用 FSL 的 applywarp 函数对 DSC 的 CBF 参数图进行 MNI 标准空间配准，通过 aparc 脑模板提取相应核团的 CBF 值，并用小脑进行标准化，标准化后参数记为 nCBF，皮尔逊相关用于分析体积有统计学意义的核团的 nCBF 与体积相关性。

结果：烟雾病组双侧尾状核、双侧苍白球、双侧壳核体积相对对照组增大（ $p<0.05$ ）有统计学意义，双侧丘脑、双侧杏仁核及海马体积平均值大于对照组，但 $p>0.05$ ，皮下核团的 Shape 分析发现双侧尾状核大约 80% 的边缘、双侧苍白球约 70% 边缘、双侧壳核约 50% 的边缘呈膨胀改变，双侧丘脑前缘及内侧缘约 30% 的边缘呈膨胀改变，右侧杏仁核及左侧海马约 30% 边缘呈膨胀改变，左侧杏仁核及右侧海马约 20% 的边缘为萎缩改变。双侧尾状核体积与 nCBF 存在正相关（ $p<0.05$ ），双侧苍白球及壳核的体积与 nCBF 亦存在正相关（ $p<0.05$ ），双侧丘脑、杏仁核及海马体积与 nCBF 的相关性无统计学意义。

结论：烟雾病组基底（中央核团）核团（尾状核、苍白球、壳核、丘脑）相对正常人可能存在膨胀（Shape 分析发现）、增大（体积分析发现）的改变，中央基底核团的膨胀及增大与发现的灌注增高相吻合，而外周核团（杏仁核、海马）未发现膨胀、增大及与灌注存在相关性，因此，基底核区核团的膨胀、增大可能与灌注增高有关。

PO-0487

肌萎缩侧索硬化症不同皮层起源皮质脊髓束纤维分枝受损：
神经突方向离散度和密度成像研究

林佳辉、陈华俊
福建医科大学附属协和医院

目的：利用神经突方向离散度和密度成像（neurite orientation dispersion and density imaging, NODDI）研究肌萎缩侧索硬化症（amyotrophic lateral sclerosis, ALS）中不同皮层起源的皮质脊髓束（corticospinal tract, CST）纤维分枝的微观结构损害情况。

方法：使用 39 例 ALS 患者和 50 例对照组的扩散加权成像数据来估计 NODDI 和扩散张量成像（diffusion tensor imaging, DTI）模型。构建起源于初级运动区（primary motor area, M1）、前运动皮层、初级感觉区和辅助运动区（supplementary motor area, SMA）的 CST 纤维分枝的精细图谱。计算 NODDI 指标（神经突密度指数[neurite density index, NDI]和方向离散度指数[orientation dispersion index, ODI]）和 DTI 指标（各向异性分数[fractional anisotropy, FA]和平均/轴向/径向扩散率[mean/axial/radial diffusivity, MD/AD/RD]）。

结果: ALS 患者的 CST 纤维分枝 (尤其是起源于 M1 的纤维分枝) 微观结构完整性损害 (表现为 NDI、ODI 和 FA 降低以及 MD、AD 和 RD 升高), 这与疾病严重程度相关。与其他扩散指标相比, NDI 具有最大的效应量, 并且其反映 CST 纤维分枝受损的程度最大。Logistic 回归分析发现, 与其他纤维分枝和 CST 整体相比, NDI 在起源于 M1 的 CST 纤维分枝中具有最高的诊断效能。

结论: CST 纤维分枝 (尤其是来源于 M1 的纤维分枝) 微观结构受损是 ALS 的主要特征。NODDI 和 CST 纤维分枝分析结合可以提高 ALS 的诊断效能。

PO-0488

脑小血管病患者中白质自由水的升高速率与白质纤维退变相关: 一项纵向研究

林妙、王淑玥、张睿婷、洪慧、章瑶、谢林芸、崔磊、刘凌云、黄沛钰
浙江大学医学院附属第二医院

目的 脑小血管病(CSVD)是导致认知下降及痴呆的最重要的血管因素。近期, 自由水(FW)作为 CSVD 的新兴影像标志物而受到广泛关注, 越来越多的研究表明了白质自由水(WM FW)与认知能力及疾病严重程度的相关性。然而 WM FW 在 CSVD 患者中升高的病理生理机制尚未明了。因此, 在本研究中, 我们旨在通过对 CSVD 患者的数据进行纵向分析, 探索 WM FW 与 CSVD 主要病理机制(白质纤维退变和组织低灌注)之间的关系。

方法 本研究回顾性纳入了 80 名 CSVD 患者, 所有受试者均进行了两次及以上的多模态 MRI 扫描。我们采用表观纤维密度(AFD)代表纤维退变的程度, 采用脑血流量(CBF)代表组织灌注情况。将所有时间点均表现为白质高信号(WMH)的白质区域定义为稳定的 WMH(sWMH), 所有时间点均非 WMH 的白质区域定义为稳定的表现正常白质(sNAWM)。我们采用相关分析和线性混合效应模型, 来探索在白质区域及其分区(sWMH、sNAWM)内 FW 的纵向改变情况, 以及 AFD/CBF 和 FW 之间的关系。

结果 在 WM、sWMH、sNAWM 中, FW 随时间持续增加(all $p < 0.001$)。与 sNAWM 相比, sWMH 的 FW 增加更快(0.018 vs 0.005, $p < 0.001$)。在 WM、sWMH、sNAWM 中, FW 与 AFD 均呈负相关($r = -0.68$; $r = -0.58$; $r = -0.65$; all $p < 0.001$), FW 与 CBF 均呈负相关($r = -0.39$, $p < 0.001$; $r = -0.28$, $p = 0.02$; $r = -0.30$, $p = 0.01$), 基线 AFD 均能够预测 FW 的纵向改变($SE = -0.04$, $p = 0.01$; $SE = -0.05$, $p = 0.04$; $SE = -0.04$, $p = 0.04$), 而基线 CBF 均不能预测 FW 的纵向改变。

结论 在脑小血管病人群中, 白质自由水随时间持续性升高, 白质纤维退变会加速其升高, 而白质区域低灌注则与其无关。

PO-0489

心源性栓塞型急性缺血性卒中 4D-CTA 影像特征

伍佳静^{1,2}、刘嘉杨²、王静杰²、李咏梅²、李靖²、谷思润²、姚芸卓²

1. 中国人民解放军陆军第九五八医院

2. 重庆医科大学附属第一医院

背景: 急性缺血性卒中中心源性栓塞的识别对血管内治疗和抗凝治疗的决策具有重要意义。我们旨在探讨心源性栓塞型急性缺血性卒中四维计算机体层血管成像(4D-CTA)影像特点, 并评估这些特征是否可以协助卒中病因分类。

方法: 回顾性分析了 2020 年 7 月至 2022 年 2 月在重庆医科大学第一附属医院入院的 294 例急性缺血性卒中患者的影像学资料。筛选出大脑中动脉 M1/M2 段闭塞, 伴/不伴颅内段颈内动脉闭塞的患者 110 例, 用于计算血栓负荷评分和侧支循环评分, 其中血栓近段和远端清晰的 88 例患者被用于

测量血栓长度。采用时间最大密度投影 (timeMIP) 和最大密度投影 (MIP) 后处理图像评估血栓特征。利用 Mann-Whitney U 检验比较心源性栓塞组和非心源性栓塞患者的各项血栓特征。采用二元逻辑回归评估血栓影像特征与心源性栓塞分型的关系。受试者特征工作曲线被用于检验血栓特征识别心源性栓塞分型的诊断效能。

结果:年龄、脑血管疾病高危因素、导致心源性栓塞的高危/中危因素、血栓长度、血栓负荷评分和侧支循环评分在心源性栓塞组和非心源性栓塞组之间有显著差异 ($P<0.05$)。二元逻辑回归结果显示, 心源性栓塞分型与 MIP-血栓长度显著相关[优势比 (OR), 1.15; 95%置信区间 (CI): 1.02-1.29; $p<0.05$], tMIP 血栓长度(OR, 1.18; 95% CI: 1.02-1.36; $p<0.05$), tMIP-血栓负荷评分(OR, 3.96; 95% CI: 1.08-14.58; $p<0.05$)。MIP 血栓长度识别心源性栓塞分型 ROC 曲线下面积为 0.75 (95% CI: 0.65-0.84, $P<0.05$), 截断值为 >7.4 mm。tMIP 血栓长度识别心源性栓塞 ROC 曲线下面积为 0.72 (95% CI: 0.61-0.81, $P<0.05$), 截断值为 >5.4 mm。

结论:MIP 图像一定程度上高估了血栓长度和负荷。在血栓特征中, 血栓长度可以作为识别心源性栓塞型急性缺血性卒中的影像学标志。

PO-0490

慢性脑桥梗死患者脑灰质体积及结构协变网络的异常改变

魏莹、张勇、程敬亮
郑州大学第一附属医院

前瞻性纳入 2014 年 10 月至 2021 年 6 月我院收治的首发单侧慢性期 PI 患者作为病例组, 同时纳入年龄、性别及受教育年限相匹配的健康受试者作为正常对照组。收集受试者高分辨率三维 T1 结构 MRI 图像及行为学评分。采用基于体素的形态学分析和双样本 t 检验探索组间 GMV 的差异。以 GMV 差异脑区作为种子点, 构建 SCN 探索 PI 患者结构协变模式的异常。采用 Spearman 秩相关分析差异脑区 GMV 与行为学评分的相关性。共纳入 60 例 PI 患者, 其中左侧 PI 33 例, 右侧 PI 27 例, 同时纳入 34 例健康对照者。与正常对照组比较, 左侧 PI 组双侧小脑后叶 GMV 显著缩小, 右侧 PI 组左侧小脑前后叶及右侧小脑后叶 GMV 均显著缩小 (高斯随机场校正, 体素水平 $P<0.001$, 簇水平 $P<0.05$, 簇体素 >20), 且左侧小脑前后叶及右侧小脑后叶 GMV 值与患者运动功能评分存在显著相关性 ($P<0.05$)。此外, 与正常对照组相比, 右侧 PI 组存在更广泛的协变脑区且协变脑区间结构连接数量显著增多 (簇类错误校正, $P<0.05$, 簇体素 >20)。

PO-0491

3.0T 高分辨率磁共振管壁成像显示豆纹动脉的研究

陈忠萍、佟丹
吉林大学第一医院

目的: 豆纹动脉的形态特征被认为与年龄、高血压、脑卒中和认知障碍密切相关。高分辨率磁共振管壁成像是无创管壁成像技术, 通常用于血管可视化。传统的 3.0T 高分辨率磁共振管壁成像技术, 由于扫描时间长、分辨率有限难以实现豆纹动脉的可视化。本研究探讨基于压缩感知加速技术的 3.0T 高分辨率磁共振管壁成像技术应用于豆纹动脉显示的成像效果和可行性。

材料与方法: 本研究经吉林大学第一医院伦理委员会批准, 并获得所有受试者的书面知情同意。患者在 3T 西门子 MR 扫描仪上进行检查。该方案由 3D 高分辨率 TOF MRA 和 3D SPACE 序列组成。采用冠状面最大强度投影(MIP)或最小强度投影(MinIP)重建 TOF MRA 和 3D SPACE 图像, 层厚为 20mm。由两名经验丰富的放射科医生统计豆纹动脉的数量及长度, 在冠状面 MIP 或 MinIP 测量豆纹动脉的最大长度

结果:

4 名患者纳入本研究, 豆纹动脉数量 4-8 支, 豆纹动脉最大长度 37.7-58.0mm。本研究的结果证明了基于压缩感知加速技术的 3.0T 高分辨率磁共振管壁成像技术应用于豆纹动脉显示的可行性和临床可应用性。

结论: 基于压缩感知加速技术的 3.0T 高分辨率磁共振管壁成像技术能够有效、准确的显示豆纹动脉, 极大的缩短扫描时间, 有利于临床应用及推广。

PO-0492

精神分裂症与阿尔茨海默病之间的共同遗传结构初步研究

周宇婧、苗延巍
大连医科大学附属第一医院

目的: 精神分裂症 (SCZ) 和阿尔茨海默病 (AD) 均属于遗传度较高的神经精神疾病, 其发病机制是由大量的遗传变异、各种各样的环境暴露共同作用的结果。流行病学研究发现二者之间经常存在症状重叠, 比如认知功能障碍是 SCZ 患者的核心特征, AD 患者晚期亦会出现精神类症状。然而, 关于两者共享的分子遗传机制尚不清楚。

方法: 本研究基于可公开获取的 130644 例 SCZ 和 455258 例 AD 患者的欧洲人全基因组关联研究 (GWAS) 统计数据, 利用条件性错误发现率 (condFDR) 来检测出更多的 SCZ、AD 显著相关的遗传位点, 利用联合条件性错误发现率 (conjFDR) 方法找到具体的 SCZ、AD 疾病共享位点。

结果: 我们观察到 SCZ 与 AD 间存在显著的遗传相关性 ($r=0.097$, $P=0.026$)。使用 condFDR 方法 ($P<0.01$), 发现 268 个与 SCZ 显著相关的 SNPs, 其中 78 个是新发现的仅与 SCZ 相关的 SNPs; 发现 125 个与 AD 显著相关的 SNPs, 其中 55 个是新发现的仅与 AD 相关的 SNPs。此外, 采用 conjFDR 方法 ($P<0.05$) 检测到 16 个 SCZ 与 AD 的共享位点; 其中 8 个 SNPs 具有一致的遗传风险效应方向。上述等位基因效应方向出现明显的混合模式, 表明两者疾病的遗传风险存在多效性。

结论: 本研究揭示了 SCZ 与 AD 之间共享的遗传风险位点, 有助于进一步理解这两种疾病的分子生物学基础, 为我们更好地理解这两种疾病临床症状及影像学表现的重叠提供新思路。

PO-0493

基于增强 T1WI 的直方图分析在区分侵袭性垂体瘤和非侵袭性垂体瘤的鉴别诊断价值

王琳坤^{1,2}、王炜²、白岩^{1,2}、王梅云^{2,3}
1. 河南大学人民医院医学影像科
2. 河南省人民医院医学影像科
3. 河南省科学院生物医学研究所

目的: 根据垂体瘤 knosp 分级, 探讨基于对比增强 T1WI (contrast-enhanced T1 weighted imaging, CE-T1WI) 直方图分析区分侵袭性垂体瘤和非侵袭性垂体瘤的价值。

材料和方法: 回顾性分析 2021 年 1 月至 2023 年 9 月就诊于河南省人民医院, 经组织病理学验证的 40 例非侵袭性垂体瘤 (0、I、II 级) 及 28 例侵袭性垂体瘤 (III、IV 级) 资料。采用 3D slicer 软件对肿瘤最佳层面勾画感兴趣区 (region of interest, ROI), 行灰度直方图分析, 提取 8 个直方图参数, 包括 Perc.10%、Perc.90%、峰度、平均值、中位数、最大值、最小值、方差。两组间计量资料的比较采用独立样本 t 检验或 Mann-Whitney U 检验。绘制受试者工作特征 (receiver operating characteristic curve, ROC) 曲线, 并计算曲线下面积 (area under the curve, AUC) 评估相关参数对于侵袭性垂体瘤和非侵袭性垂体瘤的诊断效能。

结果: 侵袭性垂体瘤和非侵袭性垂体瘤两组肿瘤, 在 CE-T1WI 直方图参数中, Perc.10%、Perc.90%、平均值、中位数、最大值、最小值、方差有统计学意义, P 值分别为 0.007、0.034、0.012、0.014、0.021、0.019、0.004。其 ROC 曲线下面积、敏感度、特异性分别为 0.693 (0.893、0.500)、0.652 (0.821、0.450)、0.680 (0.929、0.425)、0.676 (0.929、0.425)、0.665 (0.679、0.675)、0.668 (0.786、0.525)、0.704 (0.536、0.850)。

结论: 基于 CE-T1WI 直方图对侵袭性垂体瘤和非侵袭性垂体瘤的区分存在很大的价值, 在一定程度上有助于对患者制定最佳治疗方案, 提高诊断的准确率以及预后效果。

PO-0494

基于系统性红斑狼疮的脑结构-功能耦合的磁共振研究

李一凡、夏建国
泰州市人民医院

目的 探讨 SLE 患者脑灰质体积及功能连接的变化。方法 前瞻性纳入 65 例 SLE (35 例 NPSLE, 30 例 non-NPSLE) 患者为病例组, 同期纳入 31 例健康人作为对照组, 行功能磁共振检查, 并完成简易精神状态量表(MMSE)、蒙特利尔认知评估量表 (MoCA)、医院焦虑抑郁量表(HADS-A、HADS-D)、运动和认知功能疲劳量表(FSMC-M、FSMC-C)及实验室检查(C3、C4、IgA、IgM、IgG)。运用基于体素的形态学测量(voxel-based morphometry, VBM)方法对脑灰质体积进行分析, 并选择 NPSLE 与 non-NPSLE 灰质体积差异脑区为感兴趣区(region of interest, ROI)进行全脑功能连接的分析。分析 SLE 差异脑区灰质值及 FC 值与神经心理学量表及临床指标的相关性, 并探索他们的诊断效能。结果 与 HC 比, NPSLE 患者左侧眶部额下回、右侧回直肌、右侧颞横回、左侧眶内额上回、右侧眶内额上回体积减小 (FDR 校正后 $P < 0.05$); 与 HC 比, non-NPSLE 患者左侧眶部额下回、左侧眶内额上回、右侧眶内额上回、右侧颞横回灰质体积减小 (FDR 校正后 $P < 0.05$); 与 non-NPSLE 患者比, NPSLE 患者左侧眶部额下回、右侧回直肌、右侧颞横回体积减小 (FDR 校正后 $P < 0.05$)。功能连接分析显示, NPSLE 患者右侧颞横回与双侧中央后回功能连接减低 (FWE 校正后 $P < 0.05$)。右侧眶内额上回灰质值与 FSMC-C 负相关 ($r = -0.401, p = 0.023$); 右侧眶内额上回灰质值与 FSMC-M 负相关 ($r = -0.374, p = 0.035$); 右侧颞横回-左侧中央后回 FC 值与病程负相关 ($r = -0.390, p = 0.027$)。SLE 差异脑区灰质值及功能连接值具有较高的诊断效能。结论 SLE 患者多个脑区灰质体积减小, 同时与部分脑区功能连接减低, 这可能是其认知及情绪障碍的神经病理基础之一, 具有一定的临床意义。

PO-0495

视神经脊髓炎前视路扩散张量成像研究

杨曦玥、张颖、周红雨、吕粟
四川大学华西医院

目的: 使用基于 fixel 的分析 (FBA) 评估视神经脊髓炎谱系疾病 (NMOSD) 的视神经至外侧膝状体的前视路损伤特点, 并探究 NMOSD 视神经炎急性发作期扩散张量成像能否预测患者视力预后。方法: 研究纳入了视神经炎发作 ≥ 6 个月的稳定期 NMOSD 患者 (NMOSD-ON), 同时纳入性别、年龄匹配的健康对照和无视神经炎发作史的 NMOSD 对照组 (NMOSD-NON 组)。后依据稳定期结果, 继续招募视神经炎发作急性期的 NMOSD 确诊患者 (NMOSD-AON 组)。最终纳入 NMOSD-ON 组 20 例, NMOSD-NON 组 19 例, 健康对照组 20 例, NMOSD-AON 组 20 例。分别将视神经、视束均分为 10 段, 每段从前至后分别编号 1-10, 视交叉单独为 1 段, 使用 FBA 分析每段的 FD 值、FC 值和 FDC 值。使用一般线性模型比较各组之间前视路各子段的 FBA 测量值, 校正

年龄和性别。使用偏相关分析评估 FBA 测量值和 OCT 检查结果及临床参数的相关性。使用 Spearman 相关性分析探究视神经炎急性发作期 FBA 参数与基线数据及 6 个月视力的关系。结果：与健康对照组相比，NMOSD-ON 组视束的第 4-8 子段 FD 值、FDC 值显著降低 ($P < 0.05$)，视神经各子段 FD、FC、FDC 值均较健康对照低，但无统计性差异。NMOSD-NON 组与健康对照组相比，FBA 测量值未见显著差异。相关性分析显示 NMOSD 患者视交叉和视束的平均 FD 值、视神经的 FC 值、视交叉的 FDC 值和平均 GCIPL 厚度呈正相关。视交叉的 FD 值和平均 RNFL 厚度存在相关性。NMOSD-AON 组急性期视束的 FD、FC 和 FDC 值与恢复期视力显著相关。结论：NMOSD 前视路损伤主要位于视束后部，FD 值减低提示纤维密度的减低。FBA 参数与 OCT 检查结果可建立相关性，提示 FBA 分析可作为潜在的前视路损伤评估标记物。视束的急性期 FBA 参数可能对患者 6 个月视力预后提示作用。

PO-0496

NMOSD 患者扣带皮层神经递质紊乱的磁共振波谱研究

赵敏、任福欣、李晓、胡鑫、刘雨茜、王晶、高飞
山东第一医科大学附属省立医院

目的 视神经脊髓炎谱系障碍 (NMOSD) 在东亚人群中的发病率高达 3.5/10 万人。约 29-67% 的 NMOSD 患者存在认知障碍。并且 NMOSD 同时存在大脑结构、功能的重构。但是其神经化学基础尚不清楚。本研究将对 NMOSD 认知相关脑区的递质含量进行检测，并探索其与认知损害的关系。方法 我们应用短回波点分辨波谱 (PRESS) 和编辑波谱序列 (HERMES)，分别检测了 35 例 NMOSD 患者和 41 名健康对照组 (HC) 的前扣带皮层 (ACC)、后扣带皮层 (PCC) 和枕叶皮层 (OC) 中的 GABA、GLU、GSH 含量，并进一步对各脑区的兴奋抑制平衡 (E/I) 进行定量分析。此外，评估了所有受试者的认知功能和情绪状态。我们进一步通过独立样本 t 检验探索 NMOSD 组与 HC 组三个脑区递质含量的差异，通过偏相关分析探索 NMOSD 组三个脑区递质含量与认知指标的关系。结果 与 HC 组相比，NMOSD 的一般认知水平 (MoCA)、连线测试 A、B (TMT-A、TMT-B) 的成绩较差 ($p < 0.05$)，而焦虑得分增加 ($p = 0.015$)。神经递质方面，NMOSD 的 ACC 和 PCC 存在 GABA 水平降低 ($p < 0.01$)，Glu 水平升高 ($p = 0.017$)，GSH 水平升高 ($p = 0.002$)。NMOSD ACC 和 PCC 的 E/I 比值升高 ($p = 0.002$)。并且，NMOSD PCC 的 GABA 含量与焦虑呈负相关 ($r = -0.499$, $p = 0.006$)，E/I 比值与焦虑呈正相关 ($r = 0.434$, $p = 0.027$)。PCC 的 GSH 水平与 TMT_A 呈负相关 ($r = -0.442$, $p = 0.027$)。结论 我们发现 NMOSD 患者 ACC、PCC 脑区存在 GABA 含量降低，GLU、GSH 含量升高和 E/I 失衡，提示其脑内存在 GABA 能系统、GLU 能系统的紊乱。而 PCC 的 E/I 值与 NMOSD 的焦虑显著相关，提示 E/I 失衡可能是 NMOSD 患者情绪障碍的潜在代谢因素。NMOSD 患者 PCC 的 GSH 与认知显著相关，提示 PCC 的 GSH 含量可以用作预测 NMOSD 患者认知功能下降的预测因子，而抑制 NMOSD 患者的氧化应激水平可以保护其认知功能。

PO-0497

磁共振脊髓 CE-MRA 成像技术在硬脊膜动静脉瘘诊断中的应用价值

刘书林、廖伟华、苏逸航
中南大学湘雅医院

目的：评估 MRI 脊髓 CE-MRA 成像技术在硬脊膜动静脉瘘中的诊断效能。

方法：回顾性收集在湘雅医院 2021 年 1 月 1 日至 2023 年 7 月 31 日期间进行了脊髓常规 MRI 及 CE-MRA 检查的病例 74 个，并均在 MRI 检查后 90 天内进行了 DSA 或手术。CE-MRA 包括高空间分辨率（2 期）及高时间分辨率（17 期）扫描。

结果：74 个病例中硬脊膜血管畸形 49 例，无血管畸形 25 例；常规 T2WI 共有 6 例假阴性、3 例假阳性病例；CE-MRA 共有 13 例假阳性、无假阴性病例。CE-MRA 诊断脊髓血管畸形的敏感性、特异性分别为 100%、48%，常规 T2WI 诊断硬脊膜血管畸形的敏感性、特异性分别为 87.8%、88%。所有血管畸形在 CE-MRA 上均得到正确诊断及定位，供血动脉在 CE-MRA 上均得到清晰显示，并且能够连续获得动脉期及静脉期图像，以及脊髓血管性疾病的静脉引流模式。

结论：MRI 脊髓 CE-MRA 技术是一种针对硬脊膜血管畸形可靠的检查方法，具有较高的敏感性，能清晰显示供血动脉，为 DSA 或手术的术前诊断和定位提供可靠的影像学依据。

PO-0498

基于新分型的帕金森病脑白质微结构改变及相关病理机制研究

袁晓荣¹、侯中煜¹、于乔文²、刘艳艳¹、高洁²、陈金鸽²、刘玉嘉²

1. 山东第一医科大学附属省立医院

2. 山东第一医科大学附属省立医院

背景：帕金森的临床表现和预后具有明显的异质性，新分型是对人口统计学，遗传信息，运动症状和非运动症状进行聚类分析后，总结出的综合的全面的分类标准。但目前尚未有研究阐明 PD 新分型中不同亚型所表现出的不同临床症状的发病机制。因此本研究的目的是探索帕金森不同亚型脑白质微观结构的差异。

方法：本研究的横向数据涉及 PPMI 数据库中初诊时的帕金森患者：68 例轻度运动为主型，18 例弥漫恶化型，以及 45 例健康对照组，纵向数据涉及 PPMI 数据库中基线帕金森数据对应的随访 1 年后的 50 例轻度运动为主型，13 例弥漫恶化型，40 例健康对照组。Tract-based spatial statistics (TBSS) 用于对基线时和随访后的 DTI 参数值进行组间比较，年龄，性别，家族史，教育水平作为协变量矫正。对所有参与者的临床状况评估采用同一套运动及非运动症状量表。

结果：在运动症状，快动眼睡眠，自主神经功能症状，视觉空间觉，执行能力，思维流畅性，识别分歧能力此类领域中，弥漫恶化型与另外两组相比有显著的功能障碍。TBSS 分析显示，弥漫恶化型帕金森患者的径向扩散系数 AD 存在异常，这些部位涉及右侧皮质脊髓束，右侧额枕下束，右侧胼胝体压部；弥漫恶化型的轴向扩散系数 RD 存在广泛脑白质异常，并与语言流畅性和执行功能相关。随访 1 年后各亚型间 DTI 参数的变化无显著差异。

结论：开展基线时的 DTI 研究有助于在帕金森初诊时早期识别弥漫恶化亚型，本研究发现的白质纤维束异常有助于深入理解弥漫恶化型帕金森患者的发病机制。需要有更长时间的随访数据支持探究帕金森病各亚型间的进展差异。

PO-0499

基于静息态 fMRI 研究主观认知下降患者动态低频振幅与空间导航障碍的相关性

陈夫涛、张冰、陈钱、龙聪、朱雅静
南京大学医学院附属鼓楼医院

目的 比较主观认知下降患者 (subjective cognitive decline, SCD) 与健康对照组 (normal control, NC) 动态自发性脑活动差异, 以及与认知量表、空间导航能力 (spatial navigation, SN) 的相关性, 以探究 SCD 患者空间导航障碍的发生机制。

方法 招募接受静息状态功能性磁共振成像 (resting-state functional magnetic resonance imaging, rs-fMRI) 的 SCD 患者 (n=72), 以及年龄、性别和教育程度匹配的 NC (n=67)。采用滑动时间窗口方法分割 rs-fMRI 时间序列, 采用独立样本 t 检验比较两组间动态低频振幅 (dynamic amplitude of low frequency fluctuation, dALFF) 差异。利用计算机空间导航障碍测试系统对两组人群进行空间导航能力测验。采用 Pearson 相关分析探讨 SCD 组 dALFF 值的变化与认知表现、空间导航能力的相关性。

结果 与 NC 组相比, SCD 组在 SN 测试中表现更差, 在右侧楔前叶、左侧楔叶 dfALL 变异性减低 ($t=3.41, 3.12, P<0.05$, FDR 校正), 在右侧枕中回、右侧角回 dfALL 变异性升高 ($t=4.51, 3.36, P<0.05$, FDR 校正)。SCD 组右侧楔前叶 dALFF 时间变异性与自我空间导航 ($r=-0.341, P=0.025$)、延迟空间导航 ($r=-0.286, P=0.035$) 及记忆功能 ($r=-0.332, P=0.009$) 呈负相关, 左侧枕中回 dALFF 时间变异性与语言功能 ($r=0.339, P=0.015$)、视空间功能 ($r=0.343, P=0.008$) 呈正相关。

结论 右侧楔前叶、左侧枕中回 dALFF 时间变异性异常改变可能是 SCD 患者出现认知障碍、空间导航障碍的神经生物学基础, 这可能是早期识别 SCD 患者潜在的影像标志物。

PO-0500

mTBI-DSANet:使用多层功能连接网络诊断轻度创伤性脑外伤的深度自我注意模型

彭松、李娜
中南大学湘雅三医院

目的: 通过构建深度学习模型 mTBI- DSANet , 探索其对轻度创伤性脑外伤 (mTBI) 诊断的效能。

方法: 1、被试: 69 名 mTBI 患者和 60 名健康被试。mTBI 被试纳入标准包含:(1)格拉斯哥昏迷量表;(2)意识丧失的最大时间;(3)头颅常规 CT 未见明显颅内血肿;(4)损伤持续时间小于 3 天;(5)无多发骨折等其他严重身体损伤;(6)右利手。排除标准有:(1)头部外伤史;(2)颅内血肿或脑挫伤;(4)吸毒、酗酒或吸烟;(5)精神障碍;(6)磁共振检查禁忌症;(7)怀孕或计划怀孕。选取与 mTBI 被试相匹配的健康被试作为正常对照。2、数据采集及处理: 使用配备 15 通道头部线圈的飞利浦 3.0T 磁共振扫描仪, 使用 SPM12、REST1.8 在 MATLAB2013a 上完成数据预处理。3、计算低阶功能连接网络 (LoFCN), 高阶功能连接网络 (tHoFCN), 关联高阶功能连接网络 (aHoFCN), 构建 mTBI-DSANet。4、比较 mTBI-DSANet 与现有的机器学习模型对于不同 FCN 组合在准确度、灵敏度、特异性、精密度和 F 评分的表现。

结果: 1、使用 mTBI-DSANet 对不同的 FCN 组合评价, LoFCN+ aHoFCN 组合在准确度、灵敏度、特异性、精密度和 f 评分方面表现最佳; 2、基于 LoFCN+ aHoFCN 组合, mTBI-DSANet 与其他机

器学习模型在准确性、灵敏度、特异性、精度、f 评分几个指标比较, 效能更优异; 3、k-fold 交叉验证方案验证了 mTBI-DSANet 的稳健性。

结论: mTBI- dsanet 框架基于自注意机制, 可以捕获多级神经网络的特征, 用于 mTBI 诊断。实验结果表明:1、tHoFCN 和 aHoFCN 有利于 mTBI 的诊断;2、LoFCN 与 tHoFCN 或 aHoFCN 的组合, 特别是 LoFCN+ aHoFCN 的组合, 可以大大提高 mTBI 的诊断性能;3、LoFCN+ aHoFCN 组合的 mTBI-DSANet 在 10 倍交叉验证中准确率为 0.834, 灵敏度为 0.833, 特异性为 0.840, 精密度为 0.858,F-score 为 0.834, 显著优于其他同类机器学习模型。

PO-0501

双层探测器光谱 CT 对于减少脑动脉瘤术后患者 CTA 金属伪影干扰的研究

孔令煜、朱智明
中南大学湘雅医院

光谱 CT 技术可以达到“同源、同时、同向”的要求, 为准确地能量解析提供保障, 可以达到去除线束硬化伪影的最佳效果。脑动脉瘤病人术后复查 CTA 评估血管管腔及术区并发症时,常受到金属夹及弹簧圈伪影的干扰, 金属伪影使得病人血管管腔狭窄被高估, 并降低术区脑组织的影像质量, 给临床医师带来很大困扰, 因此选择一种新的方法减少这种伪影是临床工作中亟待解决的问题。目的: 探讨是否双层探测器光谱 CT 对于减少脑动脉瘤术后患者 CTA 金属伪影干扰。方法: 收集中南大学湘雅医院 8 月在飞利浦 IQon 双层探测器光谱 CT 进行脑部 CTA 扫描的动脉瘤术后患者 20 例, 基于重建 CT 数据获得常规混合能量图(PI)、加入 O-MAR 的 PI(MAR 图)、70~200 keV VMI 及其与 O-MAR 融合图(VMI-MAR 图);计算低密度和高密度伪影指数(AI)及脑组织噪声值(SD),并针对伪影严重程度及植入物周围组织清晰度进行主观评分;比较不同图像 AI、SD 和主观评分差异, 评估 VMI 联合 O-MAR 去除金属伪影的价值。结果 VMI 及 VMI-MAR 图中, 多数 AI 及 SD 随能级升高而下降, 且能级越高越趋于平稳; VMI 中, 部分 AI 及 SD 随能级升高而先降低后升高; AI 和 SD 均于 190 keV VMI-MAR 图中最低, VMI-MAR 图主观评分最高。结论 双层探测器光谱 CT VMI 联合 O-MAR 有助于去除脑动脉瘤术后患者 CTA 金属伪影干扰。

PO-0502

基于高分辨率 DWI 的垂体腺瘤诊断应用研究

赵楠、陈泽澄、杨斯闵、戴春来、郭春杰
吉林大学第一医院

目的: 本研究在包含 T1 (T1WI) 加权成像、T2 (T2WI) 加权成像及普通 T1 (CE-T1WI) 对比增强成像的临床常规成像的基础上应用了同时多层激发分段读出 (SMS-RESOLVE) 弥散加权成像 (DWI) 的新技术, 从主、客观评价的角度探讨新技术的可行性, 并对其扫描结果进行定量分析及药代动力学分析, 以进一步探讨其在垂体腺瘤诊断中的应用价值。

方法: 本研究最终纳入 11 例垂体腺瘤患者进行相关研究。对纳入研究的所有患者均使用 Siemens Vida 3T 磁共振设备行常规序列 T1WI、T2WI、CE-T1WI 和 SMS-RESOLVE DWI 新序列的扫描, 并收集临床数据及影像学数据进行分析。

对 SMS-RESOLVE DWI 在垂体腺瘤影像学诊断中的应用进行研究: 将主观评价结果与临床常规使用的 CE-T1WI 序列进行统计学分析对比, 同时记录并分析其客观评价结果。对 SMS-RESOLVEDWI 序列图像上正常垂体组织与垂体腺瘤的相对信号强度 rDWI 进行统计学分析。利用

前述影像学参数定量分析结果中有统计学差异者绘制 ROC 曲线, 并记录相关结果以评估其诊断效能。对数据进行统计分析处理: 记录其曲线下面积、敏感度、特异度、约登指数及最佳截断值以评估其诊断效能。

结果: 对 SMS-RESOLVE DWI 序列的扫描结果进行分析: CE-T1WI 与 SMS-RESOLVE DWI 组间的主观评价评分均无统计学差异($P>0.05$)。2 位阅片者在该序列冠状位图像上对病灶直径的测量结果均具有一致性($P<0.01$)。在高 b 值($b=1000s/mm^2$)SMS-RESOLVE DWI 上, 在垂体腺瘤与正常垂体组织、不同类型的垂体腺瘤以及区分泌乳素瘤与无功能垂体腺瘤的差异性评价中, $P<0.01$, 表明 SMS-RESOLVE DWI 序列其对于区分正常垂体组织和垂体腺瘤及区分不同类型的垂体腺瘤均具备一定的诊断效能。

结论: 高 b 值 SMS-RESOLVE DWI 可以有效区分正常垂体组织与垂体腺瘤, 并在区分不同类型的垂体腺瘤中具备一定的诊断效能, 有望成为无需注射造影剂的垂体腺瘤影像学检查方法。

PO-0503

颅脑动脉曲折率与脑小血管病总体负担评分的相关性研究

江虹^{1,2}、赵新湘²

1. 昆明市儿童医院

2. 昆明医科大学第二附属医院

目的: 探讨颈内动脉、基底动脉曲折率与脑小血管病(CSVD)神经影像和总体负担评分的相关性。

方法: 纳入 2020 年 0 至 2022 年两周内行头颈 CTA、头颅 MRI 检查并符合《中国脑小血管病诊治专家共识 2021》的 CSVD 患者 (总体负担评分 1-4 分), 纳入 0 分患者作为对照。收集所有研究对象的临床基线资料。将 CTA 图像导入后处理工作站, 测量左右颈内动脉, 基底动脉长度及最短距离, 计算曲折率 (TI)。采用两独立样本 t 检验和卡方检验比较对照组和病例组的基线资料, 并对有差异的指标行多因素 logistics 回归分析。将四项神经影像标志物包括腔梗 (LIs)、脑微出血 (CMBs)、脑白质高信号 (WMH)、血管周围间隙扩大 (EPVS) 分为 0、1 分组, 分析两组间血管曲折率差异和相关性。按总体负担评分将病例组分为低、高分组, 分析两组间血管曲折率差异和相关性。结果: 最终纳入 103 例受试者, 对照组 30 例, CSVD 病例组 73 例 (低分组 42 例, 高分组 31 例)。1. 对照组与病例组之间的临床基线资料比较: 相较于对照组, 病例组高龄、有高血压及饮酒史的病例占比更高, 甘油三酯 (TG)、低密度脂蛋白胆固醇 (LDL-c) 更高, 基底动脉、左右颈内动脉长度、左颈内动脉曲折率 (LICA TI)、右颈内动脉曲折率 (RICA TI) 值更大 ($P<0.05$)。2. CSVD 各神经影像评分与血管迂曲的相关性: Lis 评分 1 分的患者, L/RICA TI 更高, CMBs 评分 1 分的患者, LICA TI 更高, WMH 评分 1 分的患者, L/RICA TI 更高, EPVS 评分 1 分的患者, 患者 L/RICA TI 更高, 上述 $P<0.05$ 。(5) 各项神经影像标志物相关性分析中, Lis 与 LICA TI 的 rs 为 0.42, EPVS 与 LICA TI 的 rs 值为 0.41, 余指标 rs 介于 0.3~0.4 之间。3. CSVD 总体负担评分与血管迂曲的相关性: L/RICA TI 与 CSVD 总体负担评分呈正相关, rs 值分别为 0.51, 0.46。结论: 年龄、高血压、饮酒史是 CSVD 的危险因素。颅脑动脉曲折率越高, 四项神经影像严重程度越高; ICA TI 与 CSVD 总体负担评分存在正相关。

PO-0504

低强度聚焦超声对于化疗相关认知障碍大鼠模型的神经调控研究

韩小伟^{1,2}、朱希松¹、张冰²

1. 浙江大学附属衢州医院; 温州医科大学附属衢州医院

2. 南京鼓楼医院

[目的] 观察低强度聚焦超声对于化疗相关认知障碍大鼠模型的治疗效果并探索其神经调控机制。[材料和方法] 采用顺铂构建认知障碍大鼠模型, 基于对海马关键脑区进行亚区分割, 结合认知行为学及组织病理学检测用于评价顺铂化疗后的疗效情况; 筛选神经影像标志物用于分析其与生物学行为指标的相关性, 并基于网络动力学角度探索 LIFUS 神经调控机制, 基于分子生物学角度探索 LIFUS 治疗相关神经生物学机制。[结果] 水迷宫实验与新颖物体识别实验在 LIFUS 治疗组具有统计学差异。模型组在治疗前、后比较, 左侧 CA2、CA3, 双侧边缘内嗅皮层的 MD 值具有组间统计学差异; LIFUS 组在治疗前、后比较, 左侧 DG、双侧 PAS 的 MD 值具有组间统计学差异; 右侧 PAS 的 AD 值具有组间统计学差异; 右侧 CA2、双侧 DG、双侧 PAS 及左侧 MEC 具有组间统计学差异。模型组、假治疗组及 LIFUS 治疗组大鼠脑海马区树突棘密度显著降低; LIFUS 组大鼠脑海马区树突棘密度明显提高。模型组、假治疗组大鼠脑海马区出现髓鞘丢失增多, 银染颜色减淡。LIFUS 组大鼠海马区出现髓鞘丢失减少, 银染颜色加深。模型组、假治疗组大鼠脑海马区凋亡细胞数显著增多, LIFUS 组大鼠海马区凋亡细胞数显著减少。左侧 DG、左侧 PAS、右侧 PAS 的 MD 指标, 右侧 PAS 的 AD 指标, 左侧 DG、左侧 MEC 及右侧 DG 和 PAS 的 RD 指标, 均与潜伏期呈正相关; 右侧 CA2 的 RD 指标与新颖物体识别指数呈正相关。LIFUS 治疗组大鼠在部分脑区出现磁共振功能影像的平均可控性与模态可控性改变。CA2 亚区 GFAP 阳性数量在对照组与模型组间具有统计学差异, 阳性细胞面积在对照组与模型组间具有统计学差异; NeuN 阳性细胞相对值在模型组与对照组及模型组与治疗组间有统计学差异, 阳性细胞面积在对照组与模型组间具有统计学差异。[结论] 顺铂化疗大鼠模型出现认知障碍且 LIFUS 可以在一定程度上改善化疗大鼠的认知。LIFUS 组在治疗前、后的神经影像指标变化与生物学行为改变具有相关性。LIFUS 治疗效果的生物学机制主要体现在可以逆转化疗大鼠模型海马神经元与神经纤维损伤, 改善化疗大鼠模型海马组织细胞凋亡情况。

PO-0505

扩散谱成像评价伴轻度认知障碍的 2 型糖尿病患者
脑白质微结构变化唐小平¹、陈新悦¹、龚良庚¹、赵锡海²

1. 南昌大学第二附属医院医学影像中心

2. 清华大学医学院生物医学影像研究中心

目的: 通过磁共振扩散谱成像 (DSI) 评价 2 型糖尿病 (T2DM) 患者脑白质微结构变化及其与轻度认知功能障碍 (MCI) 的关系。

方法: 收集性别及教育相匹配 T2DM 伴 MCI 患者 (n=21)、T2DM 不伴 MCI 患者 (n=18) 及健康志愿者 (n=20), 进行认知评分、血生化检查和 DSI 扫描。运用 MoCA 量表和 MMSE 量表对各组进行认知评分, 应用 DSI Studio 软件处理 DSI 数据获得 GFA、QA、MD 值。所有数据采用 SPSS 26.0 软件分析, $P < 0.05$ 差异有统计学意义。

结果: T2DM 伴 MCI 组左侧钩束、双侧海马、左侧上纵束、右侧皮质脊髓束 GFA 值, 双侧钩束、双侧上纵束 QA 值低于对照组, 右侧钩束、双侧上纵束、双侧海马、双侧皮质脊髓束 MD 值高于对照组 ($P < 0.05$)。T2DM 不伴 MCI 组右侧皮质脊髓束 GFA 值、双侧皮质脊髓束的 QA 值低于对照组, 右侧皮质脊髓束 MD 值高于对照组 ($P < 0.05$)。T2DM 伴 MCI 组右侧钩束、双侧海马、左侧上纵束 GFA 值, 双侧海马、双侧皮质脊髓束 QA 值低于 T2DM 不伴 MCI 组, 右侧钩束、右侧海马、

右侧上纵束 MD 值高于 T2DM 不伴 MCI 组($P<0.05$)。左侧海马和右侧海马 GFA 值 AUC 分别为 0.854 和 0.878, 敏感性 & 特异性分别为 76.2%、85.7%; 77.8%、90.5%。左侧海马和右侧海马 QA 值的 AUC 分别为 0.733、0.743, 敏感性 & 特异性分别为 71.4%、66.7%; 71.4%、66.7%。左侧海马和右侧海马 MD 值的 AUC 分别是 0.706 和 0.664, 敏感性 & 特异性分别为 57.1%、83.3%; 90.5%、38.9%。

结论: T2DM 伴 MCI 患者脑白质纤维束完整性破坏, 海马 GFA 值具有较高的诊断效能, 是评估 T2DM 认知功能障碍较敏感的神经影像学标记物。

PO-0506

探索新冠病毒感染后急性期疲劳易感风险人群 先天大脑结构差异基础

包文睿、牛璇、罗诏耀、芦韬、张明
西安交通大学第一附属医院

背景: 疲劳是新型冠状病毒感染后最常见的症状之一, 通常合并有睡眠和心理障碍。本研究旨在确定新冠感染后疲劳的大脑影像标志物, 并进一步探讨个体大脑灰质体积、疲劳易感性和合并神经精神症状之间的关系。

方法: 轻型新冠感染患者 (COV+) 在 1 个月内接受了神经心理学测评 (335 人) 和大脑磁共振成像扫描 (271 人), 其中 191 人 (70.5%) 在感染后 3 个月接受了随访。67 名未感染新冠的健康被试在新冠患者入组阶段完成了相同的行为学评估与磁共振扫描方案。

结果: 全脑分析显示, 急性期新冠感染患者与未感染被试之间在大脑灰质体积 (grey matter volume, GMV) 没有差异。并且在新冠感染组, 患者的疲劳严重程度与右侧背侧前扣带回皮层 (dorsal anterior cingulate cortex, dACC) 和背外侧前额叶皮层 (dorsolateral prefrontal cortex, DLPFC) 的体积相关, 而这两个皮层主要涉及额叶-边缘系统。此外, 疲劳在 dACC 和 DLPFC 与新冠感染后睡眠障碍、创伤后应激障碍 (PTSD) 和焦虑症状之间的关系中起到了中介作用。最后, 逐步线性回归进一步表明, 新冠感染恢复早期的 DLPFC 结构差异可以预测新冠感染 3 个月后的疲劳症状。

结论: 我们的研究结果不仅为疲劳易感性的神经解剖学基础提供了新的证据, 更强调疲劳是大脑额叶-边缘系统的灰质体积与感染后早期合并有神经精神症状之间的重要联系。这可能有助于将来公共卫生干预措施的实施, 即早期识别新冠感染后疲劳易感与持续性人群, 并有针对性地进行疲劳干预, 以进一步减少长新冠的不良影响。

PO-0507

两种常春藤征的评分预测烟雾病患者的脑血流储备受损

柳计强¹、吴冰²、杨春华¹

1. 新乡医学院第三附属医院

2. 中国人民解放军总医院第七医学中心

背景与目的: 脑血流储备 (CVR) 的受损程度是烟雾病患者是否需要手术干预的重要指标, 但是目前测量 CVR 的方法临床普适性较低。本研究尝试通过常规磁共振 (T1 增强和 T2-FLAIR 图像) 的两种常春藤征改良 ASPECTS 评分来预测烟雾病患者的 CVR 的受损程度。

材料和方法: 回顾性分析 14 例烟雾病患者的影像学数据, 每例患者在手术前均完成了常规的磁共振检查和 XeCT 的 CVR 测量。两种常春藤征由三名放射科医师进行改良 ASPECTS 评分。计算每例患者的 T1WI 增强和 T2-FLAIR 常春藤征的最大评分和加和评分。使用 XeCT 测量 CVR 作为金标

准。使用 ICC 方法计算三名医师评分之间一致性。采用方差分析的方法比较各组之间的差异。采用 ROC 曲线计算常春藤征的最大评分和加和评分预测大脑半球内的 CVR 的效能, CVR 的阈值分别使用 -20%、-15%、-10%、-5%、0%、5%、10%、15%、20%。

结果: 三名医师在 T1Z 增强和 T2-FLAIR 常春藤征评分之间一致性均较好 (T1 增强: ICC=0.778, $P < 0.001$; T2-FLAIR: ICC=0.814, $P < 0.001$)。T1WI 增强常春藤加和评分为 9 时预测 CVR 小于 10% 效能最高 (AUC=1.000); FLAIR 常春藤加和评分为 3 时预测 CVR 小于 -10% 效能最高。

结论: T1WI 增强和 T2-FLAIR 常春藤评分均可以预测 CVR 的受损程度, T1WI 增强的常春藤较 T2-FLAIR 出现早, T2-FLAIR 常春藤征评分大于 3, 提示 CVR 已有明显失代偿。

PO-0508

扩散加权成像及灌注成像评估原发性中枢神经系统淋巴瘤短期化疗效果的研究

刘国莉、张君、张楠

中国人民解放军总医院第一医学中心

研究目的: 使用治疗前 PCNSL 患者的扩散加权 (Diffusion-Weighted Imaging, DWI) 及动脉自旋标记技术 (Arterial Spin Labeling, ASL) 图像预测短期化疗效果。

研究材料及方法: 从 PACS 系统中收集 2013 年 11 月至 2022 年 6 月的 PCNSL 患者并随访其治疗情况。通过手工测量最小 ADC 值 (minimum Apparent Diffusion Coefficient, ADCmin)、对侧正常白质区 ADC 值 (ADC of Normal White Matter, ADCn)、计算 ADCmin/ADCn 比值 (ADCmin to ADCn Ratio, rADC)、最小脑血流 (minimum Cerebral Blood Flow, CBFmin)、对侧正常白质区 CBF 值 (CBF of Normal White Matter, CBFn)、计算 CBFmin/CBFn 比值 (CBFmin to CBFn Ratio, rCBF); 同时手动分割 ADC 及 ASL 图上肿瘤区域并使用 Python 提取影像组学特征。使用 T 检验过滤特征, 弹性网络结合递归消除法筛选特征。最后使用的 6 种机器学习算法进行建模, 5 折检验进行内部验证。

研究结果: 在我们的队列研究中, MSKCC 分级 ($p = 0.005$)、病灶数目 ($p < 0.001$)、病灶的坏死/囊变 ($p = 0.013$) 与治疗有效性相关; rCBF 可以有效地区分 MTX 治疗后的缓解者和无反应者 (AUC=0.70±0.07)。在影像组学模型中, ADC+ASL 组中模型效能最好的是逻辑回归模型 (AUCmean=0.95±0.08)。加入其他特征后 (MSKCC 分级、病灶数目及瘤病灶的坏死/囊变), 整体而言复合模型效能优于单纯使用影像特征的模型; 在 rCBF+其他特征模型中最佳模型为邻近算法模型 (AUCmean=0.87±0.08); 在影像组学+其他特征中, 在 ADC+ASL+其他特征组中朴素贝叶斯算法 (AUCmean=0.97±0.04)。

研究结论: DWI 及 ASL 成像可作为化疗前预测疗效的有效手段, 为临床治疗方案的选择提供更多的参考信息。

PO-0509

一例神经元核内包涵体病个案分享

李润泽、吕晋浩、姜昕

中国人民解放军总医院第一医学中心放射诊断科

目的: 神经元核内包涵体病 (NIID) 是一种罕见的神经退行性疾病, 临床表现高度可变, 常伴多系统受累, 可出现运动障碍、自主神经功能障碍、周围神经病变和认知障碍等症状。本研究分享一例 NIID 个案。

方法：一名 62 岁女性患者，因行走不稳 2 年伴记忆力下降 2 月余入院。行走时稍前倾，步幅稍窄，四肢协调感稍差，入院蒙特利尔认知评估量表 (montreal cognitive assessment, MoCA) 13 分 (中度认知障碍)。患者感染新冠后感症状加重，并出现记忆力下降，以近事遗忘为主，出现食欲下降、味觉改变并反复呕吐。患者入院完成颅脑 MRI 检查和实验室检查。

结果：MRI 示双侧额顶叶、侧脑室旁白质大片状稍长 T1 稍长 T2 信号，DWI 示双侧额顶叶皮髓质交界区 (额叶为著) 对称飘带样高信号，ADC 呈等高信号，边缘较清，增强扫描脑实质及脑膜未见明确异常，SWI 及 MRS 未见明确异常考虑 NIID。基因检测示 NOTCH2NLG-GGC 重复片段次数 115 (>65 个异常重复扩增提示 NIID)，考虑 NIID。左小腿皮肤组织病理示表皮及汗腺细胞核内偶见嗜酸性包涵体倾向 NIID。根据临床病史、影像检查和实验室检查结果，该患者诊断为 NIID。

结论：我们分享了一例 NIID 个案，该患者出现了运动障碍、自主神经功能障碍及认知障碍等症状，影像学可见标志性飘带征。对于临床中出现类似症状的患者，需要考虑 NIID 的可能。

PO-0510

中缝背核在甲基苯丙胺成瘾中的发挥的作用

张明玉

宁波市医疗中心李惠利医院

中缝背核 (DRN) 位于中脑导水管周围灰质的腹侧是脑内最大的五羟色胺能核，同时还包含多巴胺能、谷氨酸能和 γ -氨基丁酸能神经元，投射到大脑的广泛区域。动物研究发现 DRN 参与奖赏处理及多种物质成瘾的神经机制。但其在甲基苯丙胺 (methamphetamine, MA) 成瘾中的作用和机制仍在很大程度上尚不清楚。此外，之前的研究是在动物水平上进行的，因此中缝背核在人类物质成瘾中的作用也没有明确。对 MA 成瘾患者 (MA 成瘾组, $n=46$) 及健康对照者 (健康对照组, $n=46$) 的静息态功能磁共振成像数据进行分析，将中缝背核选定为感兴趣区域 (region of interest, ROI) 构建了基于种子点的脑功能连接网络 (functional connectivity, FC)，比较两组之间的 FC 差异。研究发现 DRN 与包括枕叶视觉皮层在内的多个脑区的功能连接异常增强。MA 诱导的 DRN 与视觉皮层等多个脑区的异常功能连接可能与 DRN 参与的成瘾机制有关。

PO-0511

急性大脑中动脉闭塞取栓术后恶性脑水肿发生的影像学及临床、实验室预测因素分析

李辉、卞胜景、崔晓萍、刘镇业

中国人民解放军联勤保障部队第 900 医院

目的 探讨急性大脑中动脉闭塞性脑梗死患者介入取栓治疗术后发生恶性脑水肿的影像学及临床、实验室预测因素。

方法 本研究回顾性分析 2019 年 3 月-2022 年 2 月于我院确诊为急性大脑中动脉闭塞性脑梗死且通过介入取栓术后成功再通的 203 名患者，分析其影像、临床与实验室资料，探讨介入取栓术后恶性脑水肿的预测因素。根据脑梗死介入取栓术后是否发生恶性脑水肿分为恶性脑水肿组 (54 例) 与非恶性脑水肿组 (149 例)。影像学分析采用量化评价，采用 ASPECTS 评分、取栓后 PHCT 评分和 ASITN/SIR 侧支系统评分。多因素 Logistic 回归分析，探讨影响脑梗死介入取栓治疗后恶性脑水肿发生的危险因素，通过 ROC 曲线，评价影像量化评分联合临床、实验室指标对恶性脑水肿早期预测的最佳模型。

结果 (1) 恶性脑水肿组 NIHSS 评分、FBG、Hcy、血小板、D-二聚体、NT-proBNP 水平、ASITN/SIR 侧支系统评分、PHCT 评分高于非恶性脑水肿组 ($P<0.05$)，ASPECTS 评分低于非恶性脑水肿组 ($P<0.05$)，差异均有统计学意义。

(2) 多因素 Logistic 回归分析显示 NIHSS 评分、FBG、D-二聚体、NT-proBNP、ASPECTS 评分、ASITN/SIR 侧支系统评分、PHCT 评分与脑梗死介入取栓术后恶性脑水肿发生密切相关，属于独立危险因素。

(3) ROC 曲线显示 ASPECTS 评分、PHCT 评分、D-二聚体、NT-proBNP 预测效能较高，术前 ASPECTS 评分、D-二聚体、NT-proBNP 联合术后 PHCT 评分预测急性大动脉闭塞性脑梗死介入取栓术后恶性脑水肿的发生的预测效能明显高于各项指标单独预测及术前指标联合预测。

结论 (1) ASPECTS 评分、ASITN/SIR 侧支系统评分、PHCT 评分、NIHSS 评分、FBG、D-二聚体、NT-proBNP 均属于危险因素，与脑梗死介入取栓术后恶性脑水肿发生具有紧密相关性；

(2) 术后 PHCT 评分和术前 ASPECTS 评分、D-二聚体、NT-proBNP 四者联合对预后具有更高的预测价值。

PO-0512

“披头散发征”--神经梅毒树胶样肿型

张卓铖¹、赵艺蕾²

1. 浙江大学附属第一医院嵊州分院

2. 浙江大学附属第一医院

目的：神经梅毒被称为“万能模仿者”，临床与影像表现多样，其中树胶样肿型更是因其罕见鲜有报道，诊断较为困难，本研究提出了一种神经梅毒树胶样肿型的影像征象“披头散发征”（即 MR 增强图像上病灶病缘呈散乱的线样改变，边界模糊，多位于病灶单侧，呈偏心性，也可广泛分布于病灶表面，形似披散的头发），以提高其影像诊断准确率。

方法：对我院经临床确诊的 5 例神经梅毒树胶样肿型的影像资料及中、外文献报道的含有效 MR 资料的约 43 例个案进行回顾性分析。

结果：存在“披头散发征”表现的比例在我院临床确诊病例约为 80% (4/5)，在文献报道的个案中占比约为 37%-58% (16-25/43)。

结论：“披头散发征”可以为神经梅毒树胶样肿型的诊断起到重要的提示作用，为临床治疗提供指导，降低误诊率。

PO-0513

3D-ASL 联合 DKI 在鉴别脑胶质瘤复发和假性进展中的应用价值

梁倩^{1,2}、张辉¹

1. 山西医科大学第一医院

2. 山西医科大学医学影像学院

目的：探讨三维动脉自旋标记(three dimensional-arterial spin labeling, 3D-ASL)及扩散峰度成像(diffusion kurtosis imaging, DKI)单独和联合应用在鉴别脑胶质瘤复发和假性进展中的诊断价值。

方法：收集 2019 年 1 月-2022 年 3 月在山西医科大学第一医院进行手术切除后行同步放化疗并出现新的或增多的强化病灶的 42 例脑胶质瘤患者进行回顾性分析，所有患者在复查时均行 MRI 平扫及增强、3D-ASL、DKI 检查，根据二次手术病理结果或随访结果分为肿瘤复发组 (26 例) 和假性进展组 (16 例)，分析 3D-ASL 和 DKI 的相关参数(rCBF、rFA、rKA、rKR、rMK、rMD)，对有统计学意义的参数绘制受试者工作特征(receiver operating characteristic,ROC)曲线，对比单独应用

和联合应用的曲线下面积(area under curve, AUC)、敏感度及特异度, 评估 3D-ASL 及 DKI 单独和联合应用在鉴别脑胶质瘤复发和假性进展中的诊断价值。

结果: 在增强病灶中, 复发组的 rCBF、rKA、rKR、rMK 高于假性进展组, rMD 低于假性进展组, 差异具有统计学意义, rCBF、rKA、rKR、rMK、rMD 的 AUC 分别为 0.909、0.702、0.700、0.885、0.697, rCBF 和 rMK 表现出良好的诊断性能。多元 logistics 回归显示 rMK 联合 rCBF 的诊断性能最好, 优于任一参数, AUC 为 0.942, 敏感度为 92.3%, 特异度为 87.5%; 在瘤周水肿中, 复发组的 rCBF 和 rMK 高于假性进展组, 差异具有统计学意义, rCBF 和 rMK 的 AUC 分别为 0.696、0.640。

结论: 3D-ASL 和 DKI 联合诊断的性能优于单一成像技术, 能够更好地鉴别脑胶质瘤复发和假性进展, 并为临床决策的实施提供指导意义。

PO-0514

单侧颞叶癫痫患者的拓扑结构改变

马可燃、张晓楠、宋承汝、毛鑫月
郑州大学第一附属医院

目的:探讨单侧颞叶癫痫伴海马硬化的拓扑结构异常变化。

方法:选取 38 例颞叶癫痫 (TLE) 患者和 19 例年龄、性别匹配的健康对照 (HC), 进行静息状态功能磁共振成像(fMRI)检查。基于 fMRI 数据构建被试全脑功能网络。比较左、右侧 TLE 和 HC 患者的功能网络拓扑特征。

结果:与 HC 相比, 左侧 TLE 患者的聚类系数、整体效率和局部效率(Eloc)降低, 右侧 TLE 患者的 Eloc 降低。左侧 TLE 患者的 6 个与基底神经节(BG)网络或默认模式网络(DMN)相关的区域以及右侧 TLE 患者的 3 个与奖励/情绪网络或腹侧注意网络相关的区域的节点中心性发生了变化。右侧 TLE 患者在 DMN 相关的 4 个区域表现出较高的整合性(缩短的节点最短路径长度), 而在右侧颞中回表现出较低的分离性(降低的节点局部效率和节点聚类系数)。左侧 TLE 与右侧 TLE 比较, 整体参数无显著差异, 但左侧海马旁回和左侧苍白球的节中心性降低。

结论:全脑功能网络拓扑特性在 TLE 中被破坏。左侧 TLE 网络效率较低;右侧 TLE 在全局效率上保持不变, 但在容错性上中断。左侧 TLE 致痫灶外基底神经节网络中拓扑中心性异常的节点未在右侧 TLE 中发现。右侧 TLE 在 DMN 区域有一些最短路径长度减少的节点作为补偿。这些发现为侧化 TLE 提供了新见解。

PO-0515

基于 TBSS 对抑郁症患者白质结构改变的弥散张量成像研究

杨春、苗延巍
大连医科大学附属第一医院

目的:抑郁症是一种常见的精神疾病, 近年来, 精神放射学允许对神经精神病患者的大脑进行无创性的研究。弥散张量成像(DTI)是一种基于磁共振成像的神经成像方法, 可以推断体内脑结构连接的特性。运用纤维束追踪的空间统计学技术(TBSS)探讨抑郁症患者(DD)患者的脑白质微观结构的损害。

方法:前瞻性获取 50 例 DD 患者和 50 例健康对照(HC)的 DTI 图像。采用 TBSS 来评估两组间白质(WM)异常的体素差异, 部分各向异性 (FA)、平均弥散率 (MD)、径向扩散系数 (RD) 及轴向扩散系数 (AD) 进行组间比较。在进行 TBSS 处理之前, 先对 DTI 数据采用脑功能磁共振 (FMRIB) 软件库(FSL)进行预处理。使用 FSL 中的 TBSS 进行提速统计分析, 将所有 FA 地图在空间上对齐到 1mm × 1mm × 1mm FMRIB58 FA 标准空间, 对 FA 图进行平均以创建平均 FA 图像, 然后对其

进行骨架化以生成平均 FA 骨架。然后将所有受试者的对齐 FA 图投影到该骨架上。然后将相同的平均 FA 骨架应用于 MD, AD 和 RD 图像进行统计分析。所有 DD 组患者再扫描之前做了 HAMA 量表和 MoCA 量表, 并且进行了生化指标的采集: 包括促肾上腺皮质激素、皮质醇和生长激素。分析了 DTI 各参数与生化指标及抑郁评分量表之间的关系。

结果: 与 HC 组相比, DD 组的 FA 值显著降低, 主要发生在上纵束、下纵束、额枕下束及大钳。此外, DD 患者可观察到广泛且对称的深部 WM 损伤, 并伴有 AD 值、RD 值、MD 值升高。偏关性分析显示, FA 值与 HAMA 评分量表中的精神性焦虑和认知障碍呈现显著负相关($r=-0.293, p=0.049$; $r=-0.327, p=0.027$), MD 值与认知障碍呈现显著正相关($r=0.327, p=0.027$), AD 值与 MoCA 评分呈显著正相关($r=0.313, p=0.034$), 与 MoCA 量表中的视空间与执行能力呈显著正相关($r=0.329, p=0.025$)。

结论: 本研究结果表明, TBSS 技术作为可信度较高的最新扩散张量成像研究方法, 可以发现抑郁症患者脑白质微结构的损伤, 并且这种损伤与精神性焦虑、认知障碍、MoCA 评分水平相关。

PO-0516

基于多参数 MR 的遗传性痉挛性截瘫 5 型脊髓微结构变化纵向随访研究

林晨琳、张帆、范淑萍、李猛城、付莹、刘颖
福建医科大学附属第一医院

目的 遗传性痉挛性截瘫型 5 (SPG5) 是一组少见的以下肢进行性痉挛性截瘫为特点的神经系统退行性病变, 现已有临床研究使用多种降胆固醇药物治疗 SPG5, 因此寻找可用于评估该病的预后及监测疗效的影像标记物具有重要临床意义。前期磁共振研究提示 SPG5 患者脊髓萎缩及微结构损伤, 但其随疾病进展的变化情况尚不清楚。本研究基于多参数磁共振观察 SPG5 患者一年随访的脊髓微结构变化, 评估 SPG5 患者临床及脊髓影像的纵向改变, 探寻 SPG5 患者随访的影像标记物。

材料与方法 采集 SPG5 患者基线与一年随访的颈胸段脊髓结构像、DTI、T1 mapping 及 SPRS。通过 Spinal Cord Toolbox 软件提取 C1-T9 椎体节段脊髓截面积、左右径、前后径及 C2-T5 椎体节段脊髓白质 (WM)、后索 (DC) 及双侧皮质脊髓束 (CST) 这四个区域各向异性分数 (FA)、平均扩散程度 (MD)、轴向扩散程度 (AD)、径向扩散程度 (RD) 值及 T1 值, 分别通过配对样本 t 检验及 Wilcoxon 秩和检验比较 SPG5 患者基线与一年随访 SPRS 评分、脊髓截面积、左右径、前后径、脊髓 DTI 参数 (FA、MD、RD、AD 值) 及 T1 值的差异。

结果 11 名 SPG5 患者 (中位年龄 29 岁, 3 名女性, 8 名男性) 完成一年的影像及临床随访, 患者 SPRS 随访一年后与基线之间差异无统计学意义 ($P=1.000$)。SPG5 患者的颈胸段脊髓结构, 包括脊髓截面积、前后径、左右径随访前后无统计学差异; SPG5 患者基线与一年随访的 C2-T5 椎体节段脊髓白质、后索及双侧皮质脊髓束这四个区域的 FA、MD、AD、RD 及 T1 值差异均无统计学意义, 但是分析随访前后的具体数值, 发现颈段 C2-C7 脊髓 DTI 数据的变化具有一定趋势, 而胸段脊髓这些数据的变化趋势不明显。C2-C6 椎体水平脊髓 FA 值均较一年前减低, RD 值较前增高; 而 MD 值、AD 值及 T1 值无论在颈段还是胸段脊髓, 变化趋势均不明显。

结论 多参数脊髓磁共振随访为 SPG5 进展缓慢提供了影像学证据, FA 及 RD 值可能可作为 SPG5 患者随访的潜在影像标记物。

PO-0517

首发未经药物治疗的强迫症患者内在脑活动的静态变化

陶秋影、张勇、程敬亮
郑州大学第一附属医院

目的：强迫症是临床中第四常见的情感障碍类精神疾病，然而我国普通民众对强迫症的知晓率低（22.5%）、患者就诊率低（34%），最重要的原因是强迫症的发生发展机制尚不明确，这严重阻碍了临床上的诊断和治疗。现有的研究已经证明药物的使用会影响强迫症患者脑的结构和功能的改变。我们旨在探究首发未经治疗的强迫症患者静息状态下脑神经元功能活动的改变。

方法：纳入首发未经治疗的强迫症患者 103 例（女性 49 例，平均年龄 23.1 岁）以及年龄、性别、受教育年限相匹配的正常对照组 106 例（女性 53 例，平均年龄 23.1 岁）。使用 3.0 T（GE Discovery MR750, General Electric, Milwaukee, WI, USA）磁共振机器，在患者静息状态下扫描获得功能磁共振脑影像，由静息态 fMRI 数据处理助手分析工具包（DPARSF）进行预处理，包括删除前五卷、去除头动、空间标准化、趋势化处理、时间带通滤波、线性回归、空间平滑、计算时间点的帧级位移等，采用双样本 t 检验，分析患者组与对照组的低频振幅（amplitude of low-frequency fluctuation, ALFF）是否存在有统计学差异的脑区。

结果：与对照组相比，强迫症患者在左侧小脑前叶（体素值=147，峰值坐标=0, -48, -9, $t = -4.6861$, $p < 0.001$ ）、左额内侧回（体素值=59，峰值坐标=-12, -33, 63, $t = -4.7051$, $p < 0.001$ ）、左侧中央后回（体素值=44，峰值坐标=-42, -2, 57, $t = -4.6327$, $p < 0.001$ ）、右舌回（体素值=39，峰值坐标=24, -57, -6, $t = -4.261$, $p < 0.001$ ）和右枕叶（体素值=33，峰值坐标=30, -87, -9, $t = -4.2578$, $p < 0.001$ ）等脑区的 ALFF 值降低，未发现存在 ALFF 值升高的脑区。

结论：首发未经治疗的强迫症患者静息状态下存在脑区的自发脑神经元活动的改变，这可能为进一步探究强迫症的发生发展机制提供了客观依据

PO-0518

多延迟动脉自旋标记技术在慢性血管狭窄/闭塞患者中脑灌注评估中的应用价值

李璐璐
江苏省苏北人民医院

目的 采用单延迟时间三维准连续式动脉自旋标记及多延迟动脉自旋标记对单侧前循环动脉慢性闭塞或严重狭窄的患者进行全脑灌注成像，评价多延迟 ASL 对单侧前循环动脉闭塞后脑灌注评估的应用价值。

方法 前瞻性收集于我院神经内科收治的经颅脑磁共振血管成像、头颈 CT 血管成像诊断为单侧前循环动脉严重狭窄/闭塞（ $\geq 70\%$ ）并且未进行溶栓及血管内治疗的患者 34 例，其中男 23 例，女 11 例，年龄 33~81 岁，平均 60.1 ± 2.4 岁，所有受试者均行常规平扫、3DpCASL 及 MDASL，并人工手动绘制感兴趣区测量脑灌注参数，包括 CBF_{2020ms}、cCBF、ATT、rATT 及 aCBV。利用配对 t 检验比较两者 CBF_{2020ms} 及 cCBF 差异，独立样本 t 检验比较患者狭窄侧 ATT 及对侧 rATT 差异，采用 Kappa 一致性检验判断两位观察者对异常区域灌注判断结果一致性。

结果 34 例患者中，10 例单、多延迟 ASL 灌注结果一致（显示低灌注 8 例，低灌注伴局部高信号表现 2 例），24 例灌注结果不完全一致（3 例单延迟显示正常灌注，3 例多延迟显示低灌注，21 例单

延迟显示低灌注伴局部高信号,多延迟显示低灌注)。两位观察者间具有较好的一致性(Kappa 系数=0.788,显著性 $P<0.001$)。在显示低灌注方面,多延迟 ASL(94.1%)比单延迟 ASL(23.5%)更具优势。多延迟 ASL 示动脉狭窄侧 ATT 值高于对侧 rATT 值 ($1625.1\pm213.5\text{ms}$ vs. $1207.1\pm235.85\text{ms}$, $P<0.0001$),差异具有统计学意义。在 21 例单延迟显示低灌注伴局部高信号、多延迟表现为低灌注中,狭窄侧 $\text{CBF}_{2020\text{ms}}$ 值显著高于 cCBF ($38.9\pm11.7\text{ml}/100\text{g}/\text{min}$ vs. $21.0\pm6.6\text{ml}/100\text{g}/\text{min}$, $P<0.00001$)。结论 多延迟动脉自旋标记获得多参数 cCBF 及 ATT 联合 aCBV 可以更敏感准确地评估单侧前循环动脉慢性闭塞或严重狭窄导致的脑组织灌注的变化,能够更加精准地指导临床诊治。

PO-0519

基于非增强 CT 的影像组学识别动脉致密征阴性急性单侧前循环大血管闭塞的研究

周怡

扬州大学附属医院(扬州市第一人民医院)

【摘要】目的 探究基于非增强 CT (NCCT) 的影像组学识别动脉致密征 (HAS) 阴性的急性单侧前循环大血管闭塞 (LVO) 的价值。方法 回顾性收集经血管成像 (MRA/CTA/DSA) 检查证实的急性单侧前循环 LVO 且表现为 HAS 阴性的患者 80 例,共 160 根血管;以每例患侧 LVO 段及正常侧对应节段血管作为感兴趣区,共提取 108 个影像组学特征。使用最小绝对收缩和选择算子 (LASSO) 筛选关键特征,采用 5 折交叉验证法构建预测 LVO 的影像组学模型。通过受试者工作特征曲线下面积 (AUC) 评价预测性能,并使用 Delong 检验进行各模型受试者工作特征曲线 (ROC) 间的比较;最后通过临床决策曲线 (DCA) 分析评估影像组学模型的应用价值。结果 最终筛选出 6 个关键特征构建支持向量机 (SVM)、光梯度提升机 (LightGBM)、梯度提升 (GradientBoosting) 及自适应提升算法 (AdaBoost) 4 种影像组学模型。SVM 模型的 AUC 为 0.688 (95% CI 0.4971~0.8779),精确度为 0.688;LightGBM 模型的 AUC 为 0.787 (95% CI 0.6196~0.9546),精确度为 0.781;GradientBoosting 模型的 AUC 为 0.654 (95% CI 0.4567~0.8519),精确度为 0.688;AdaBoost 模型的 AUC 为 0.707 (95% CI 0.5147~0.8993),精确度为 0.750。DeLong 检验显示 LightGBM 与 GradientBoosting 间的 AUC 存在显著统计学差异 ($P=0.0398$),余模型间表现无明显统计学差异 ($P>0.05$)。DCA 分析显示 LightGBM 模型表现较好。结论 基于 NCCT 的影像组学对于识别 HAS 阴性的急性单侧前循环 LVO 具有较好的诊断效能。

PO-0520

神经精神狼疮患者脑局部自发神经元活动的静息态功能磁共振成像研究

李一凡、夏建国

泰州市人民医院

目的 探讨神经精神狼疮患者脑功能改变及其与认知功能和情绪的相关性。方法 纳入 2020 年 6 月至 2022 年 9 月南京医科大学附属泰州人民医院收治的 46 例系统性红斑狼疮患者,根据是否具有神经精神症状分为神经精神狼疮组 (NPSLE 组,26 例) 和非神经精神性狼疮组 (非 NPSLE 组,20 例),采用 rs-fMRI 计算平均局部一致性 (mReHo) 和平均分数低频振幅 (mfALFF),简易智能状态检查量表 (MMSE) 评价整体认知功能,运动和认知功能疲劳量表 (FSMC) 评价运动和认知

疲劳, 医院焦虑抑郁量表 (HADS) 评价焦虑和抑郁情绪; Pearson 相关分析和偏相关分析探讨神经精神狼疮患者各脑区 mReHo 值和 mALFF 值与神经心理学测验评分的相关性。结果 NPSLE 组患者 MMSE 评分 ($Z=-3.934$, $P=0.000$) 低于非 NPSLE 组, FSMC-运动 ($t=2.016$, $P=0.050$) 和认知 ($t=2.055$, $P=0.046$)、HADS-焦虑 ($Z=-2.424$, $P=0.015$) 和抑郁 ($Z=-2.731$, $P=0.006$) 评分高于非 NPSLE 组。与非 NPSLE 组相比, NPSLE 组患者右侧背外侧额上回、右侧枕中回、右侧中央后回、右侧顶下缘角回、右侧颞下回 mReHo 值降低, 右侧枕中回、右侧中央后回 mfALFF 降低 (FDR 校正; 体素水平 $P<0.001$, 团块水平 $P<0.05$)。相关分析显示, 神经精神狼疮患者右侧中央后回 mReHo 值 ($r=-0.483$, $P=0.017$) 和 mfALFF 值 ($r=-0.504$, $P=0.012$) 与 HADS-抑郁评分呈负相关; 右侧顶下缘角回 mReHo 值与 FSMC-运动 ($r=-0.475$, $P=0.019$) 和认知 ($r=-0.414$, $P=0.044$) 评分呈负相关; 右侧颞下回 mReHo 值与 FSMC-认知评分呈负相关 ($r=-0.427$, $P=0.037$)。结论 神经精神狼疮患者存在多脑区局部神经元活动异常, 且神经功能与神经心理学测验评分密切相关。

PO-0521

基于三重脑网络与小脑-大脑环路的网络内与网络间功能连接分析在多系统萎缩轻度认知功能障碍中的研究

李英美

中国医科大学附属第一医院

目的: 基于三重脑网络, 探究多系统萎缩 (MSA) 患者轻度认知功能障碍 (MCI) 的脑网络作用模式。方法: 纳入伴轻度认知功能障碍的 MSA 患者 (MSA-MCI) 70 例、认知功能正常的 MSA 患者 (MCI-NC) 66 例及健康对照组 (HC) 63 例。对三组被试行静息态功能磁共振扫描, 并进行神经心理学量表评估, 包括对整体认知功能的评分以及对执行、视空间、注意力、记忆力、语言功能五个认知域的细化评估。基于三重脑网络模型以及小脑-大脑环路在 MSA-MCI 中的作用, 应用独立成分分析方法提取三组被试内在连接网络, 包括左中央执行网络 (LCEN)、右中央执行网络 (RCEN)、前默认网络 (aDMN)、后上默认网络 (spDMN)、后下默认网络 (ipDMN)、突显网络 (SN) 以及小脑网络 (CN)。基于各内在连接网络对三组网络网络内与网络间相互作用改变进行功能连接 (FC) 分析与组间比较; 在各内在连接网络选取核心脑区, 基于感兴趣脑区 (ROI) 进行 ROI 间的 FC 分析与组间比较。将异常的网络内 FC、网络间 FC 与 ROI 间 FC 与整体认知功能及各认知域得分进行相关性分析。结果: 与 MSA-NC 组相比, MSA-MCI 组在 RCEN、ipDMN、spDMN 与 CN 存在网络内 FC 改变; 与 MSA-NC 组相比, MSA-MCI 组在 LCEN 与 aDMN、CN 与 RCEN 及 SN 与 RCEN 间存在相互作用减弱; LCEN 与 ipDMN 间相互作用增强; 与 MSA-NC 组相比, MSA-MCI 组在左侧额中回与右侧岛叶、右侧角回与左内侧额上回、右侧角回与右侧岛叶、右小脑 CrusI 与左侧楔前叶存在 FC 减低, 左侧小脑 VI 区与左内侧额上回 FC 增强。相关性分析结果显示, 网络内 FC 与 MSA 患者的整体认知功能、执行功能及注意力评分相关; 网络间 FC 与整体认知功能及注意力评分相关; ROI 间 FC 与整体认知功能及注意力评分相关。结论: MSA-MCI 存在三重脑网络网络内与网络间相互作用的异常, 以及 CN 对 CEN 及 ipDMN 调控作用的损伤, CN 与 aDMN 间存在代偿作用。其中 CEN 在 MSA-MCI 认知功能相关的脑网络作用模式中占据核心位置。

PO-0522

胶质母细胞瘤 IDH 野生型伴 TERT 启动子突变的 MRI 表现

范锐

陆军军医大学第一附属医院 (西南医院)

目的 探讨胶质母细胞瘤 IDH 野生型伴 TERT 启动子突变的 MRI 影像学特征。

方法 回顾性分析 30 例手术及病理、免疫组织化学、分子基因检测证实 TERT 启动子突变的胶质母细胞瘤 IDH 野生型患者临床表现及影像学资料, 对肿瘤部位、形态及在 MRI 各序列中的信号及强化方式等影像学特点进行分析总结。

结果 患者 30 例, 其中男 16 例, 女 14 例; 皆为成人, 年龄范围在 31~70 岁。30 例胶质母细胞瘤 IDH 野生型伴 TERT 启动子突变患者中 7 例为 TERT 启动子区域 C250T 突变, 23 例为 TERT 启动子区域 C228T 突变。12 例位于颞叶, 6 例位于额叶, 3 例位于顶叶, 1 例位于枕叶; 8 例累及两个及多个脑叶。30 例患者肿瘤形态不规则, 边界不清晰, 其中 5 例病灶内出血, 27 例肿瘤内可见囊变、坏死, 22 例中、重度瘤周水肿。30 例患者皆行 DWI 检查, 20 例患者行磁共振波谱成像 (MRS), 28 例肿瘤增强扫描后可见明显不均匀环状、斑片状强化。

结论 胶质母细胞瘤 IDH 野生型伴 TERT 启动子突变具有特定的影像学特征, 肿瘤好发于额颞叶, 易坏死、囊变, 中心坏死明显, 部分肿瘤可见出血, 增强扫描呈明显不均匀环状、斑片状强化。瘤周水肿明显, 弥散明显受限, ADC 呈低信号。磁共振波谱成像 Cho/NAA 比值常大于 3, 并出现明显的乳酸峰或脂质峰。这些影像学特征为临床诊断提供重要信息, 可为临床治疗方法制定及疾病预后提供帮助。

PO-0523

基于 MRI 镜像翻转图像构建影像组学模型鉴别高级别胶质瘤和单发性脑转移瘤

陈鹏¹、周艳艳²、郑屹峰¹

1. 湖州市中心医院

2. 湖州学院附属南太湖医院

目的: 探讨基于 MRI 镜像翻转图像的影像组学模型鉴别高级别胶质瘤 (high-grade gliomas, HGG) 和单发性脑转移瘤 (solitary brain metastasis, SBM) 的价值。材料与方法: 回顾性分析经病理证实或临床随访诊断为 HGG 和 SBM 患者 124 例, 其中 HGG 52 例, SBM 72 例, 通过完全随机方法按 7: 3 分为训练组 (86 例) 和验证组 (38 例)。搜集所有患者的 MRI 图像信息, 选取 T1WI 增强图像作为原始基准序列并手动勾画全瘤体感兴趣区域 (area of interest, ROI), 通过 MATLAB 软件对 T1WI 增强图像进行空间标准化以使得颅脑左右轮廓对称, 并规定中线为对称轴将 ROI 进行镜像翻转, 从而获得肿瘤侧 ROI₁ 和镜像侧正常脑实质 ROI₂, 并放射组学特征提取, 将两组特征代数相减获得新的特征集并命名为 D₁, 将肿瘤提取的特征集命名为 D₂。使用 Z-Score 标准化分别对 D₁ 和 D₂ 进行统一量度, 皮尔森相关系数进行数据降维、递归特征消除和逻辑回归进行特征筛选和影像组学模型构建。通过受试者工作特征曲线 (receiver operating characteristic, ROC) 的曲线下面积 (area under the curve, AUC) 和准确度 (accuracy, ACC) 评价模型效能。结果: 分别从 D₁ 和 D₂ 数据集中筛选 13 个和 8 个放射组学特征用于影像组学模型构建, 基于 D₁ 数据集构建的模型 M₁ 在训练组中效能与基于 D₂ 构建的模型 M₂ 效能相仿 (AUC: 0.941 vs. 0.937, ACC: 0.895 vs. 0.895), 但是验证组 M₁ 模型优于 M₂ 模型 (AUC: 0.935 vs. 0.878, ACC: 0.895 vs. 0.878), 并且 M₁ 模型整体稳定性优于 M₂。通过 MRI 镜像翻转技术可以将肿瘤区域和对侧正常区域进行对比, 其构建的模型整体效能优于基于肿瘤构建的模型。结论: 基于 MRI 镜像翻转图像的影像组学模

型能够很好的 HGG 和 SBM, 并且通过特征的不同间接反映了肿瘤分化的差异性, 从而能够很好的解释肿瘤的异质性, 能够为临床术前诊断和治疗方案选择提供一定参考价值。

PO-0524

睡眠相关过度运动性癫痫的局部大脑皮层厚度变薄和异常皮质折叠

蒲华霞¹、吴欣桐²、王莉萍¹、谭乔月¹、万欣月³、王维娜⁴、苏筱芮¹、张思敏¹、月强^{1,5,6}、龚启勇^{1,6,7}

1. 四川大学华西医院放射科磁共振研究中心
2. 四川大学华西医院神经内科
3. 复旦大学华山医院放射科
4. 浙江大学医学院第一附属医院放射科
5. 四川大学华西医院放射科
6. 四川大学华西医院功能与分子成像四川省重点实验室
7. 四川大学华西厦门医院放射科

目的:睡眠相关过度运动性癫痫 (sleep-related hypermotor epilepsy, SHE) 是一种特殊类型的局灶性癫痫, 其神经生物学因素如皮质表面结构改变尚不清楚。本研究试图基于结构磁共振成像 (magnetic resonance imaging, MRI), 采用基于表面的形态学分析 (Surface-Based Morphometry, SBM) 方法研究 SHE 患者的神经形态学异常及其与临床特征的关系。

方法:前瞻性招募 69 例 SHE 患者和 69 例健康志愿者 (对照组), 并使用三维磁化准备快速梯度回波 (Magnetization Prepared Rapid Gradient Echo, MPRAGE) 序列进行脑结构 T1 加权像采集。使用计算机解剖分析工具箱 (computational anatomy toolbox, CAT12) 对脑结构 MRI 图像进行处理, 重建出大脑的表面形态, 并提取大脑皮层指标 (皮层厚度、皮层局部脑回指数、局部分形维数和脑沟深度)。采用双样本独立样本 t 检验进行组间比较统计分析, 采用错误发现率 (Family Wise Error, FWE) 进行多重比较校正, 以 $P < 0.05$ 认为具有统计学意义, 获得显著差异脑区。将显著差异脑区的脑皮层指标值与 SHE 病程和癫痫发作频率行 Pearson 或 Spearman 相关性分析 ($P < 0.05$)。

结果:与健康对照组相比, SHE 患者的左侧顶下小叶、右侧顶上小叶、双侧枕叶外侧、左侧梭状回和左侧舌回皮层厚度显著变薄 ($P = 0.00001 \sim 0.00004$), 以及 SHE 患者的右侧中央前回和右侧中央后回脑沟深度显著降低 ($P \leq 0.00001$)。然而, 皮层局部脑回指数、局部分形维数在 SHE 组和对照组之间比较无明显统计学差异 ($P > 0.05$)。相关分析显示, 左侧顶下小叶的皮质厚度改变与 SHE 病程呈负相关 ($r = -0.325$, $P = 0.006$)。

结论:我们的研究揭示了 SHE 患者存在区域性皮层厚度变薄和皮质折叠异常, 并可能与过度运动症状发作的临床特征有关。这些皮层形态变化可能为理解 SHE 的癫痫网络紊乱和潜在的神经病理机制提供一定研究基础。

PO-0525

强迫症患者的白质微观结构异常和灰质体积改变: 基于坐标的荟萃分析

陶秋影、张勇、程敬亮
郑州大学第一附属医院

目的: 利用坐标相关数据进行综合荟萃分析, 探讨强迫症 (obsessive-compulsive disorder, OCD) 患者的白质 (white matter, WM) 微结构和灰质体积 (gray matter volume, GMV) 的异常。

方法: 我们回顾了 46 篇经同行审批的发表在 PubMed, Web of Science, Scopus 等数据库上的关于强迫症患者的脑结构改变的文章, 包含 1348 例强迫症患者和 1318 例性别、年龄、教育程度等相匹配的对照志愿者。我们使用基于弥散张量成像的 23 篇研究比较强迫症患者和健康对照组之间 WM 分数各向异性 (fractional anisotropy, FA) 的差异, 并进一步探究了基于纤维束示踪的空间统计分析 (tract-based spatial statistics, TBSS) 和基于体素分析 (voxel-based analysis, VBA) 两种方法的结果是否存在差异。此外, 我们还利用基于体素的形态测量学 (voxel-based morphometry, VBM) 方法的 21 篇研究来探索强迫症 GMV 的变化, 并比较成人和青少年之间的不同。

结果: 在汇总荟萃分析中, WM 研究结果显示, 与对照组相比, 强迫症患者右豆状核 (壳核) 的 FA 较高, 胼胝体、左脑岛、右小脑 (半球小叶)、右直回和左顶下回的 FA 较低; 然而, 在亚组分析中, 胼胝体在的 TBSS 和 VBA 亚组中 FA 值均降低, 但左侧额下回 (眶部) 的 FA 值下降仅存在于 TBSS 亚组中。此外, 我们发现强迫症患者的 GMV 在左纹状体和左中央前回显著增加, 在右额下回三角部、右颞上回和右海马显著降低; 与青少年相比, 成年患者左豆状核壳核的 GMV 增加。

结论: 荟萃分析显示强迫症患者存在 WM 微结构异常和 GMV 改变, 这些变化可能与该疾病的病理生理机制有密切的关系。

PO-0526

磁共振扩散峰度成像鉴别影像表现不典型的胶质瘤与脑炎

赵锴、马潇越、程敬亮
郑州大学第一附属医院磁共振科

目的 评估 MR 扩散峰度成像 (diffusion kurtosis imaging, DKI) 在鉴别影像表现不典型的胶质瘤与脑炎中的价值。

材料与方法 回顾性分析 68 例患有影像表现不典型的胶质瘤或脑炎患者的影像学资料, 所有患者在术前或保守治疗前均行 MRI 常规序列及多 b 值扩散加权成像 (Diffusion-weighted imaging, DWI) 序列扫描。用 NeuDiLab 软件处理 DWI 图像, 获得平均峰度 (mean kurtosis, MK)、平均扩散系数 (mean diffusivity, MD) 以及各向异性分数 (fractional anisotropy, FA) 参数图及 $b=0$ s/mm² 的扩散图像 (B0)。用 ITK-SNAP 软件在 B0 图像上手动勾画肿瘤的感兴趣容积 (volume of interest, VOI), 将其配准到其他参数图上。用 FAE 软件提取各参数图的平均值。根据病理检查或脑脊液检查结果将患者分为胶质瘤组和脑炎组。采用卡方检验、独立样本 t 检验及 Mann-Whitney U 检验比较两组患者的一般资料、常规 MRI 表现及 DWI 参数的差异。计算 Cohen's d 值评估 DWI 各参数的效应量。绘制受试者工作特征 (receiver operating characteristic, ROC) 曲线, 计算曲线下面积 (area under the curve, AUC)、灵敏度、特异度和准确率, 并用 Delong 检验比较各参数的鉴别诊断效能。

结果 共 61 例患者被纳入研究, 包括 39 例 WHO II 级胶质瘤患者、22 例脑炎病变患者。MK 鉴别脑炎组和胶质瘤组的 AUC 为 0.859, 当阈值取 0.598 时, 其敏感度为 87.2%, 特异度为 77.3%。DKI 模型的诊断表现优于 DTI。

结论 DKI 有助于鉴别诊断影像表现不典型的胶质瘤与脑炎。

PO-0527

运动锻炼对海马亚区体积作用的结构磁共振研究

敖亚雯、李玉爽、赵益林、查云飞
武汉大学人民医院

目的：运动锻炼被认为是很有前景且低成本的预防策略来促进脑健康，其中缓解人类海马衰退是运动锻炼的相关益处之一。海马是大脑中重要的多功能脑区，由高度特异神经细胞群体组成的非同质结构，具有不同的锥体神经元密度、突触结构和不同的皮质区域连接模式。因此解析运动锻炼对人类海马的精确亚区解剖结构影响，有助于理解运动如何调控大脑结构的可塑性。

方法：招募年龄 30-60 岁，至少持续 2 年以上的规律运动跑步史，平均每周跑量 30 km 以上，每周需要训练 4-5 次，至少参与 2 次及其以上全程马拉松比赛的业余马拉松跑者 73 名（男性 42 名、女性 31 例）。同时招募健康久坐对照组 52 名（男性 30 名、女性 22 例），利手、性别、年龄、教育程度与业余马拉松组相匹配。在 GE 3.0T 750W 磁共振仪上进行 T1WI 结构像数据采集。基于 FreeSurfer 6.0 版本软件自动分割 T1WI 解剖图像，计算整个左右海马的体积和左右 12 个亚区体积，分别为 CA1、CA2-3、CA4、海马伞、DG、海马-杏仁核过渡区、海马尾、分子层、旁下托、前下托、海马下托、海马裂。

结果：通过 FreeSurfer 6.0 软件处理我们将海马整体分割成如下亚区：分别为 CA1、CA2-3、CA4、海马伞、DG、海马-杏仁核过渡区、海马尾、分子层、旁下托、前下托、海马下托、海马裂（图 1）。基于海马亚区体积分析，我们发现业余马拉松跑者组左侧总海马 ($p < 0.001$, $\eta^2 = 0.115$)、左侧 CA1 ($p < 0.001$, $\eta^2 = 0.107$)、左侧 CA2-3 ($p = 0.002$, $\eta^2 = 0.080$)、左侧 CA4 ($p < 0.001$, $\eta^2 = 0.116$)、左侧 DG ($p < 0.001$, $\eta^2 = 0.124$) 及左侧分子层 ($p < 0.001$, $\eta^2 = 0.108$) 亚区体积明显大于健康久坐对照组，余海马亚区没有呈现出明显的差异（图 2）。

结论：我们发现业余马拉松跑者组的左海马亚区体积更大，提示运动锻炼引起的大脑结构可塑性改变具有不对称性。运动锻炼干预有助于预防与年龄相关的海马退化和保持大脑健康，成为主动健康的重要技术手段。

PO-0528

自身免疫性胶质纤维酸性蛋白星形胶质细胞病的临床表现和影像学特征

柯高潭、赵旭
华中科技大学同济医学院附属同济医院

目的：分析自身免疫性胶质纤维酸性蛋白星形胶质细胞病(GFAP-A)的临床和影像学特征，提高对该疾病的认识。

方法：我们回顾性地纳入了自 2017 年以来我院所有脑脊液中 GFAP 抗体检测呈阳性的患者，收集相关临床资料和影像学数据，分析具有特点的临床表现和影像学特征。

结果：CSF 中 GFAP-IgG 检测呈阳性的患者 36 例。发病的中位年龄为 41.5 岁，82.4%为男性。61.8%有发热，47.1%有头痛，14.7%存在神经自身抗体，2.9%合并肿瘤。最常见的表现是脑膜脑脊髓炎（38.3%），其次是脑膜脑炎（35.3%）。41.2%有运动障碍，以震颤最常见（29.4%），其他临床表现包括视物模糊（14.7%）和周围神经系统受累（11.8%）。76.5%CSF 有核细胞数升（淋巴细胞升高为主），79.4%CSF 蛋白升高，50%低钠血症。MRI 常表现为幕上软脑膜强化（45.5%）、脊膜强化（54.5%）；侧脑室周围放射线样强化为特征性表现（42.4%），可出现基

底节区 (45.5%) 及丘脑病变 (27.3%)。脊髓炎以长节段 (55.6%) 及横贯性病变 (51.9%) 最常见, 多位于胸段 (25.9%), 22.2% 累及脊髓全长, 病灶边界模糊呈斑点状强化。

结论: CSF GFAP-IgG 检测对疾病诊断具有重要意义; GFAP-A 临床具有异质性, 常合并低钠血症, 头颅、脊髓、视神经 MRI 有一定特点, 可辅助诊断; 糖皮质激素治疗效果良好。

PO-0529

合成 MRI 联合基于多重灵敏度编码 DWI 鉴别胶质瘤复发和治疗相关改变的应用研究

吕瑞瑞、马文富、金一萱、王晓东
宁夏医科大学总医院

目的: 探讨合成 MRI (synthetic MRI) 定量参数联合基于多重灵敏度编码 DWI (MUSE-DWI) 鉴别胶质瘤复发和治疗相关改变的应用价值。

材料与方法: 本研究于 2020 年 9 月-2022 年 11 月期间, 依据纳排标准收集我院胶质瘤全切除术行完整放化疗, 定期 MRI 随访出现新发强化灶患者 45 例。所有患者均行 MUSE-DWI、synthetic MRI 及 T1FLAIR+C 序列。入组病例根据修订版脑胶质瘤治疗反应评估标准 (mRANO) 分为复发组 (26 例) 和治疗相关改变组 (19 例)。采用 GE ADW4.7 工作站衍生的 ADC 图和 MAGiC 软件获取的 synthetic MRI 定量图, 两名神经影像诊断医师以双盲法参照 T1WI+C 图于 ADC 图、synthetic MRI 定量图勾画 ROI 测量强化区 ADC 值及增强前、后 T1 值 (T₁-pre、T₁-post)、T2 值 (T₂-pre、T₂-post)。采用独立样本 t 检验或 Mann-Whitney U 检验比较 synthetic MRI 定量参数和 ADC 值的组间差异, 采用二元 logistic 回归及受试者工作特征 (ROC) 曲线评估单参数及其联合的诊断效能。

结果 1. Synthetic MRI 参数及 ADC 值组间比较: 复发组 T₁-pre 高于治疗相关改变组 (P<0.05), T₁-post 和 ADC 值低于治疗相关改变组 (P<0.05), 两组间 T₂-pre、T₂-post 无统计学差异 (P>0.05)。2. 单参数分析时, ADC 值诊断效能最高 (AUC=0.878), 其次是 T₁-post、T₁-pre, AUC 分别为 0.783、0.745。T₁-pre、T₁-post 联合时, 诊断效能较单参数提高 (AUC=0.850), 多参数联合模型 (T₁-pre+T₁-post+ADC) 诊断效能最高 (AUC=0.901)。

结论: 本研究利用 synthetic MRI 提供组织特征信息的定量参数的优势, MUSE-DWI 技术减少几何失真提供高分辨率图像的优势, 两种技术构建弛豫定量参数联合 ADC 值的多参数模型, 能有效鉴别胶质瘤复发和治疗相关改变, 为临床诊疗提供影像学依据。

PO-0530

基于脑体积的影像组学模型在磁共振阴性癫痫分类中的应用研究

罕迦尔别克·库锐、徐蕊、常一凡、段静静、丁爽、贾文霄、王云玲
新疆医科大学第一附属医院

目的: 磁共振阴性癫痫患者因难以定位致痫灶, 常难以获得手术治疗, 因此本研究拟使用脑体积参数构建影像组学分类模型, 以了解其在磁共振阴性癫痫分类任务中的价值。

方法: 回顾性收集 2020-2022 年就诊于我院的癫痫患者及健康人 T1MPRAGE 图像, 分别纳入患者组和对照组, 使用 Freesurfer 软件的 recon-all 工具进行基于 Desikan-Killiany 和 Destrieux 图谱自动全脑体积分割, 将分割得到的结果用于影像组学模型的训练和验证, 模型训练结果使用 ROC 曲线的曲线下面积、敏感度、特异度表示。

结果: 共获得了双侧大脑半球 128 个脑区体积, 使用递归特征消除法 (RFE) 来选择特征并使用随机森林法进行模型训练后, 确定了基于 11 个特征的模型, 其中年龄、双侧杏仁核以及估计的全脑

体积是该模型贡献度前四位的特征参数, 该模型在验证集上获得了最高的 AUC。AUC 和准确率分别可以达到 0.756 和 0.718。

结论: 使用脑体积构建的影像组学模型可以用于磁共振阴性癫痫的分类任务, 能够为进一步寻找致痫灶位置提供优质证据。

PO-0531

急性缺血性脑卒中侧支循环建立的神经影像学评估

顾腾辉、钱伟军、李立
开封市中心医院

在急性缺血性脑卒中中, 侧支循环是维持处于风险脑组织血流量的关键, 并且能延长治疗时间窗、增加血管再通率及降低出血转归。目前已经证实, 良好的侧支循环与更小梗死体积、更好的长期预后明显相关。因而早期对侧支循环进行准确而完整地评估有着重要意义。随着现代影像技术的发展, 为评估急性脑梗死侧支循环的建立提供了重要手段, 文中就急性脑梗死侧支循环建立的影像学检查技术和方法作一综述, 旨在为合理的选择影像学检查方法提供依据。

PO-0532

脊髓小脑共济失调 3 型患者的脉络丛增大与基因及其临床表现的相关性研究

甄志铭¹、华艳秋¹、黄永华¹、左真涛²、刘晨¹
1. 中国人民解放军陆军军医大学第一附属医院 (西南医院)
2. 中国科学院生物物理所

目的: 探讨脊髓小脑共济失调 3 型患者的脉络丛 (CP) 结构与基因及其临床表现的相关性。

方法: 本研究为前瞻性对照研究, 共招募了 66 名基因确诊 SCA3 患者和 50 名人口统计学匹配的健康对照 (HCs) 进行 MRI 扫描, 所有 SCA3 患者进行了 Scale for the Assessment and Rating of Ataxia (SARA)、International Cooperative Ataxia Rating Scale (ICARS) 评估; Freesurfer 对脑区进行分割。所有的统计分析使用 SPSS 软件 26.0 版本 (IBM) 进行。用协方差分析比较 CP 体积差异; 对 SCA3 确诊患者进行基因 (CAG)、量表及脑区体积之间的偏相关分析。中介分析探索 CAG 到 SARA 之间的因果关系; 采用 ROC 曲线分析 SCA3 两组差异性脑结构体积对 Pre-SCA3、Sym-SCA3 分类的预测价值。

结果: 41 例健康志愿者 (41.73 ± 12.62) 和根据 SARA 量表分为的 Pre-CA3 组 12 人 (36.58 ± 14.50)、Sym-SCA3 组 44 人 (42.48 ± 12.45) 纳入研究。HC 组、Pre-CA3 组、Sym-SCA3 组的 CP 体积依次增大。HC 组、Sym-SCA3 组之间的 CP 体积存在显著性差异 ($P < 0.05$); CP 体积与脑干、前中扣带皮层、中央扣带皮层呈现负相关 ($P < 0.05$)。CP 体积与脑脊液, 侧脑室, 三脑室和四脑室呈现正相关 ($P < 0.05$)。CP 和临床变量部分: CP 体积与 CAG、SARA、ICARS 正相关 ($P < 0.05$)。在基因影响 SARA 路径中, CP 可作为中介变量脑干的调节变量。

结论: 本研究首次探索了 SCA3 CP 体积较正常人的扩大且其与基因及运动功能表现存在相关性。CP 在 SCA3 运动脑区的退行性改变中发挥了中介调节作用, 并在区分 sym-SCA3、pre-SCA3 中具有良好表现。研究为脑营养和免疫在 SCA3 的疾病进展机制以及其它退行性疾病研究提供了一个新的视角。

PO-0533

Rs-fMRI 评价 tDCS 改善脑梗死后图命名功能的功能连接研究

宋彦澄
沧州市中心医院

目的 采用静息态功能磁共振成像(rs-fMRI)技术对不同时期脑梗死后失语患者经颅直流电刺激(tDCS)治疗前、后语言相关脑区激活变化进行研究,从影像学的角度探讨图命名功能的损伤及恢复机制。

方法 选取 28 例脑梗死后失语患者,其中急性期(AP)16 例,恢复期(RP)12 例,采用 tDCS 刺激患者语言相关脑区,分别于治疗前、后行 rs-fMRI 检查及失语量表评分,观察患者相关脑区功能连接(FC)的变化。

结果 梗死后失语患者双侧大脑半球存在多个脑区与 Wernick 区 FC 减低,优势半球更为明显。经过 tDCS 治疗后,AP 组和 RP 组患者双侧额颞叶 FC 显著升高,且 AP 组患者双侧颞枕叶 FC 较治疗前升高。RP 组治疗前 FC 升高的左侧颞叶在治疗后 FC 减低。

结论 功能磁共振技术可对 tDCS 治疗前后脑梗死失语患者图命名能力的脑网络改变进行精准、无创的评估。急性期患者早期 tDCS 干预可能对视觉通路的功能代偿起到更加积极的作用。非优势半球的语言功能相关脑区激活可能只是一种短期内神经功能代偿机制。

PO-0534

基于甲基化信息的精分分裂症免疫相关亚型

罗春燕、皮雪楠、龚启勇、谢丹、吕粟
四川大学华西医院

背景: 表观遗传学变化是精神分裂症临床异质性的可能分子来源。既往的研究在精神分裂症患者中发现一个与炎症或免疫失调相关的亚型。但是,这个亚型是否稳定存在于首发未治疗的精神分裂症(FES)患者以及接受过长期疾病治疗的精神分裂症(LTS)患者中,目前仍不清楚。

方法: 本研究使用 Illumina 850k 芯片对 FES 和 LTS 患者及其相应健康对照的血液样本进行表观基因组全谱分析。采用非负矩阵因子分解(NMF)和 k 均值聚类分析方法对精神分裂症患者的甲基化信息进行异质性分析,并检验两个队列的分型结果的一致性。

结果: 本研究在 FES 被试中确定了一种亚型患者(47.5%),这个亚型在与免疫细胞活性相关基因位点具有广泛甲基化水平改变,并且其中性粒细胞比例显著增高。此外,FES 队列的聚类结果在 LTS 队列中得到了验证,两个队列的表观遗传学和临床特征高度一致。

结论: 本研究在 FES 和 LTS 两个队列中,证实精神分裂症患者的具有一个免疫相关亚型,并且具有高度的一致性。其特征表现为与免疫功能相关的基因甲基化谱的广泛改变以及较严重的临床症状。这一发现表明针对精神分裂症患者亚群的免疫治疗策略具有较好的前景。

PO-0535

多模态 CT 水摄取率预测急性缺血性脑卒中发病时间的价值

雷格格¹、袁若涵²、李延静¹

1. 延安大学附属医院

2. 咸阳市中心医院

目的: 应用多模态 CT 分析不同发病时间缺血性脑卒中患者一般资料及水摄取率 (Net water uptake, NWU) 的差异, 并分析 NWU 在识别不同发病时间的诊断效能。

方法: 回顾性采集延安大学附属医院 2020 年 3 月至 2022 年 12 月入院的急性前循环缺血性脑卒中患者 206 例。根据患者发病时间 (4.5h、6h) 进行分组, 采用独立样本 t 检验、Mann-Whitney U 检验或者卡方检验分析两组指标之间有无显著差异。再做绘制患者 NWU 在不同分组 (4.5h、6h) 的工作特征曲线 (Receiver operating characteristic curve, ROC), 分析 NWU 识别不同发病时间的诊断效能及最佳临界值, 并比较曲线下面积 (Area under the curve, AUC)、灵敏度、特异度。

结果: 分析显示, 两组患者年龄、性别、BMI、高血压病、冠心病、房颤、糖尿病、吸烟、饮酒及基线 NIHSS 评分差呈无统计学意义 (均 $P>0.05$), 发病时间在 4.5 小时以内患者的 NWU 低于发病时间在 4.5 小时后患者的 NWU, 不同组别的差异均有统计学意义 (均 $P<0.05$)。NWU 识别症状出现 4.5 小时内患者的 AUC 为 0.861 (95% 可信区间: 0.811-0.911, $P<0.001$), 截断值为 15.95%, 敏感度为 76.4%, 特异性为 86.1%。NWU 识别症状出现 6 小时内患者的 AUC 为 0.825 (95% 可信区间: 0.768-0.882, $P<0.001$), 截断值为 17.55%, 敏感度为 72.3%, 特异性为 83.8%。

结论: 急性缺血性脑卒中患者的发病时间可以通过水摄取率判断, 通过 ROC 曲线, 发现 NWU 对不同发病时间的卒中患者具有较高的识别能力。NWU 可以很好预测急性缺血性脑卒中患者的发病时间, 为急性缺血性脑卒中初诊卒中患者的分层及治疗提供重要价值。

PO-0536

孤独症谱系障碍动态功能连接的应用及研究进展

伍光榕、杨伟

遵义医科大学第三附属医院

目的: 自闭症谱系障碍 (ASD) 是一种异质性神经发育障碍, 核心症状表述为社交、互动障碍和受限、重复行为。近几十年来, 全球儿童和青少年 ASD 的患病率已攀升至 0.7 - 1.5 %。该病对患者及其家庭及社会带来巨大负担。本文旨在提供一个全面的描述 DFC 在 ASD 中应用的方法, 并指出我们认为最有希望的未来发展方向以及 DFC 在 ASD 应用分析的优点和不足之处。

方法: 本文主要通过对 Web of science、PubMed、中国知网以及万方数据库等检索相关文献, 以“孤独症谱系障碍”、“孤独症”、“自闭症”、“磁共振”、“动态功能连接”、“功能连接”、“autism spectrum disorder”、“dynamic functional connectivity”等作为关键词对文献进行检索、筛选、归纳、整理。

结果: 动态功能连接 (DFC) 被认为是揭示 ASD 患者中特定功能改变更有效且更可靠的方法。最近许多关于 ASD 患者的动态功能连接相关研究成果, 主要有 ASD 患者的后扣带回 (PCC) 和中颞极之间的 DFC 高于典型对照; ASD 患者内侧额上回和颞极的 DFC 增加; ASD 患者的注意网络 (AN) 和默认模式网络 (DMN) 之间的 DFC 显著高于 TC; 与正常对照组相比, ASDs 患者在右侧背外侧前额叶 (DLPFC) 与左侧梭状回/舌回之间、DLPFC 与颞上回之间、右侧额眼区 (FEF) 与左侧额中回之间、FEF 与右侧角回之间、左侧顶内沟与右侧颞中回之间的 DFC 显著增加。此外, 观察到 DFC 变化与症状严重程度之间的显著关系。

结论: DFC 可以准确捕捉 FC 随时间的波动, 揭示不同 FC 状态之间的转换, 从而反映出 ASD 发作的产生和传播的潜在机制, 以及与认知、行为障碍的关系, 可以在 ASD 中发挥预测、诊断和治疗作用。

PO-0537

胶质母细胞瘤 2021 版 WHO 分类变化与影像诊断进展

吕建勋、姚薇薇、罗振东、周丽莎、程琳、沈新平
香港大学深圳医院

目的: 通过对 2021 版 WHO CNS 分类变化的了解, 结合影像学表现, 探讨胶质母细胞瘤的影像学诊断进展, 为临床医生提供更准确的诊疗依据。

方法: 归纳总结 2021 版 WHOCNS 分类在胶质母细胞瘤的变化; 回顾性分析 2016 年 1 月-2022 年 12 月 44 例经病理证实胶质母细胞瘤的影像表现, 总结其常见与关键征象; 并对近期相关影像研究文献分析。

结果: 2021 版 WHO CNS 分类引入更多分子学特征与信息, 强调整合诊断和分层报告的重要性, 新定义了多种肿瘤类型和相关亚型, 纳入更多新的诊断技术; 胶质母细胞瘤取消了“胶质母细胞瘤, IDH 突变型”的命名, 其诊断应符合成人患者、弥漫性星形细胞瘤以及仅限于 IDH-野生型, 同时须符合以下表现之一: 坏死、微血管增生、7 号染色体扩增和 10 号染色体缺失、TERT 启动子的突变、EGFR 基因扩增。

44 例患者均行 MRI 检查, 包括男 29 例、女 15 例, 年龄 20-77 岁, 平均年龄约 55.6 岁。43 例均位于幕上(额颞叶 35/43, 顶枕叶 6/43, 中线 2/43), 1 例位于脑室系统沿脑室壁蔓延生长, 与淋巴瘤表现类似致术前误诊; 肿瘤异质性导致内部坏死、出血常见, 不规则厚壁环形强化及灶内拉网状/絮片状强化是较具特征性征象, 实性成分高灌注提示微血管丰富、增生, 同时高灌注是区别胶质母细胞瘤术后复发与假性进展或放射性脑坏死的重要征象依据之一; 肿瘤区域 Cho/NAA 比值通常>2.5; 另外肿瘤跨中线生长亦是肿瘤较具特征的生长方式。

最新研究表明, MGMT 启动子甲基化对于胶质母细胞瘤的治疗选择与预后相关, 具有 MGMT 启动子甲基化预示烷化剂化疗有效并且能改善预后; 有学者通过波谱成像 MRS、影像组学等技术手段术前提示胶质母细胞瘤是否具有 MGMT 启动子甲基化从而为临床提供新的诊断依据, 具有较大的临床应用意义。

结论: 胶质母细胞瘤 2021 版 WHO CNS 分类的变化, 为我们更准确地诊断和治疗胶质母细胞瘤提供了重要的指导意义, 影像学尤其是 MRI 在胶质母细胞瘤的诊断中具有重要地位, 而功能成像及影像组学在分子水平、基因层面为临床提供了预测手段。

PO-0538

自闭症和多动症共病的儿童及青少年脑灰质不对称性改变

李翠翠
Shandong Provincial Hospital

背景: 尽管自闭症(ASD)和多动症(ADHD)共病 (ASD + ADHD)率很高, 但其潜在的神经生物学基础仍不清楚。脑结构的偏侧化改变已分别在 ASD 和 ADHD 中得到证实, 使结构偏侧化成为表征 ASD + ADHD 神经生物学特征的候选指标。目的: 本研究的目的是评估及比较 ASD + ADHD、ASD 无 ADHD (ASD-only)患者和正常对照(TDc)的灰质(GM)体积偏侧化改变。方法: 本研究纳入了 111 例 ASD 和 211 例 TDc 的高分辨率 T1 加权数据。ASD 组包括 48 例 ASD + ADHD 和 63 例 ASD-only。我们还评估了脑-行为关系以及年龄对 GM 偏侧化的影响。结果: 我们发现, 与 TDc 相比, ASD + ADHD 和 ASD-only 患者既存在共同的灰质体积偏侧化改变, 也各自具有特异性的脑改变。这一发

现表明, ASD+ADHD 既不是 ASD 的内表型, 也不是 ASD 的附加改变, 而是一种完全不同的神经功能疾病。此外, 与 ASD-only 相比, ASD + ADHD 在负责执行功能和心理理论的前额叶区域表现出灰质体积偏侧化改变。此外, 内侧额叶/内侧眶额回的不对称指数与 ASD + ADHD 患者的社会反应量表评分呈负相关。我们还发现年龄对 GM 偏侧化有显著影响。结论: 本研究可能为 ASD + ADHD 的神经生物学基础提供脑结构上的见解。

PO-0539

联合弥散加权成像的临床多模态磁共振成像组学模型 在术前预测脑膜瘤脑侵犯的价值

刘斯辉¹、郑晖¹、张毅超²、王宗猛¹、林霖^{1,2}

1. 福建医科大学附属协和医院

2. 福建医科大学医学影像学院

背景: 脑侵犯是诊断 WHO 2 级脑膜瘤的一个独立诊断标准, 术前预测脑膜瘤的脑侵犯对治疗决策至关重要。先前研究报道基于结构磁共振成像的影像组学模型可以用于脑膜瘤脑侵犯的评估, 但功能成像影像组学模型用于脑膜瘤脑侵犯的研究仍未见报道。在此, 我们联合弥散加权成像、结构磁共振成像的组学特征和临床信息构建多种预测模型, 用于术前评估脑膜瘤的脑侵犯情况。

方法: 回顾性收集 2013 年至 2022 年间 723 例经病理确诊的脑膜瘤患者进行研究。从结构磁共振成像 (T2-FLAIR、T1WI、对比增强 T1WI)、弥散加权成像 (DWI) 和表观弥散系数 (ADC) 中提取脑瘤界面区的放射学特征。采用随机森林、主成分分析筛选组学特征。运用支持向量机、线性判别分析和逻辑回归分别构建结构 MRI 模型 (Ms)、弥散 MRI 模型 (Md)、临床模型 (Mc)、结构-弥散 MRI 模型 (Ms-d)、结构 MRI-临床模型 (Ms-c)、弥散 MRI-临床模型 (Md-c)、结构-弥散 MR-临床模型 (Ms-d-c)。使用受试者操作特征曲线分析评估了各模型的性能。利用 Bootstrap 法 (1000 个样本) 估算 95% 的置信区间。运用综合判别改进 (IDI) 指数比较不同模型的诊断效能。

结果: 结构-弥散 MR-临床模型共纳入结构磁共振成像的 15 个放射组学特征、DWI 的 9 个放射组学特征以及瘤周水肿体积。在所有模型中, 结构-弥散 MRI-临床模型在预测脑侵犯方面表现最佳, 其训练集 AUC 为 0.945 (95% CI: 0.922 至 0.968), 测试集 AUC 为 0.935, (95% CI: 0.892 至 0.979), 加入 DWI 组学特征可显著提高模型在预测脑膜瘤的效能 (IDI = 9.14%; $p < 0.001$)。

结论: 联合弥散加权成像的临床多模态磁共振成像组学模型可以用于术前评估脑膜瘤的脑侵犯, DWI 组学特征在预测肿瘤脑侵犯方面具有重要价值。

PO-0540

首发未用药青少年精神分裂症基于双侧楔前叶的功能 及有效连接的网络异常

李宏伟、卓丽华、姚洪超

绵阳市第三人民医院·四川省精神卫生中心

目的: 应用基于兴趣区相关性的方法探索青少年首发精神分裂症患者静息状态下双侧楔前叶功能及有效连接的异常改变。**方法:** 纳入符合 DSM-5 中精神分裂症诊断标准的首发未用药青少年精神分裂症患者 21 例以及具有年龄、教育程度、性别相匹配 21 例健康对照组。对被试者的临床症状评估

采用精神症状评定量表 (PSYRAT) 和 PANSS。所有被试者均进行静息态功能磁共振成像扫描, 以双侧楔叶为种子点进行功能及有效连接分析, 计算其与全脑的功能连接图, 并分析功能连接强度与临床症状的相关性。结果: 在功能连接方面, 患者组双侧楔前叶与左侧额中回的功能连接明显高于健康对照组 ($P<0.001$, FWE 校正, 簇水平 $P<0.05$); 在有效连接方面, 与健康对照组比较, 患者组表现出从种子区到左侧额中回的有效连接减弱。相关分析结果显示, 患者组从双侧楔前叶到左侧额中回有效连接减低与 PANSS 总评分呈正相关($r=0.45$, $P<0.041$)。结论: 首发青少年精神分裂症患者静息态下双侧楔前叶功能连接及有效连接网络模式存在异常, 其中双侧楔前叶与左侧额中回的有效连接减弱与患者精神症状相关。

PO-0541

急性一氧化碳中毒患者自发脑活动的动态变化

韩文轩¹、王生海²、陈海海²、张振显²、孙天泽¹、李海宁¹

1. 西安交通大学第一附属医院

2. 延安市人民医院

目的 一氧化碳中毒(carbon monoxide, CO)是全球最常见的中毒之一, 可导致多器官功能受损, 以中枢神经系统为主。既往有很多研究应用 rs-fMRI 技术分析 CO 中毒患者大脑活动的静态特征, 脑活动在时间维度上的动态变化特征关注较少。本研究的目的是探讨 CO 中毒患者大脑自发活动的动态变化情况, 并进一步探究这些变化是否与临床症状相关。

方法 本研究共招募了 26 名 CO 中毒患者以及 25 名健康志愿者, 对所有研究对象进行了 rs-fMRI 扫描, 采用 MMSE、MoCA-B 评估受试者的认知功能。基于 DPABI V4.3 的 TDA 工具箱, 采用滑动时间窗的方法计算所有参与者的动态局部一致性(dynamic regional homogeneity, dReHo)。采用双样本 t 检验对 dReHo 指标的组间差异进行比较, 同时利用高斯随机场(gaussian random field, GRF)方法进行多重比较校正(voxel $p<0.001$, cluster $p<0.05$)。随后, 本研究进一步分析了 CO 中毒患者异常脑区的 dReHo 值是否与认知状态存在相关性, 统计显著性水平设定为 $p<0.05$ 。

结果 与健康对照组相比, CO 中毒患者左侧颞下回和左侧额上回的 dReHo 值显著增加, 并且左侧颞下回的 dReHo 值与 MMSE 和 MoCA-B 评分呈显著负相关($r=-0.505$, $p=0.009$; $r=-0.483$, $p=0.012$)。此外, CO 中毒患者右侧丘脑、右侧海马旁回和右侧额上回的 dReHo 值与健康对照组相比明显减低。

结论 本研究探究了 CO 中毒患者大脑自发活动的动态特征, 发现 CO 中毒患者存在脑自发活动动态指标的异常, 并且异常的 dReHo 值与 MMSE 和 MoCA-B 评分呈负相关, 表明与患者的认知功能损害有一定相关性, 可能有助于进一步探究 CO 中毒的病理生理机制及预测患者预后的标记物。

PO-0542

帕金森病伴冻结步态的脑网络层次结构紊乱

阮秀杭、魏新华

广州市第一人民医院

引言: 人脑网络是一个层次结构的组织。在帕金森病伴步态冻结(PD-FOG)中, 网络层次是否以及如何被破坏尚不清楚。此外, 患有 FOG 的 PD 患者的脑网络层次变化与临床量表之间的关系尚不清楚。本研究的目的是探讨 PD-FOG 网络层次的变化及其临床意义。

方法: 本研究通过连接组梯度分析 31 例 PD-FOG、50 例 PD-NFOG 和 38 例健康对照(HC)的脑网络层次结构。通过比较 PD-FOG 组、PD-NFOG 组和 HC 组各网络梯度值的不同来评估网络层次的变化。我们进一步研究了网络梯度值与临床量表之间的动态变化关系。

结果: 在第二个梯度上, PD-FOG 组显著性/腹侧注意网络-A (SalVentAttnA)网络梯度显著低于 PD-NFOG 组, 而两个 PD 亚组的默认模式网络-C 梯度均显著低于 HC 组。在第三个梯度中, PD-FOG 组的躯体运动网络-A 梯度明显低于 PD-NFOG 组。此外, 降低的 SalVentAttnA 网络梯度值与 PD-FOG 患者更严重的步态、跌倒风险和冻结步态相关。

结论: PD-FOG 脑网络层次结构紊乱, 这种紊乱与冻结步态的严重程度有关。本研究为 FOG 的神经机制提供了新的证据。

PO-0543

基于 NCCT 影像组学在预测前循环缺血性脑卒中静脉溶栓后出血转化中的价值

季丹丹

南通市第一人民医院

目的 探讨 NCCT 影像组学联合临床危险因素预测前循环 AIS 患者 rt-PA 静脉溶栓后有无 HT 的价值
方法 回顾性分析 2018.10 至 2022.7 我院神经内科就诊并接受 rt-PA 静脉溶栓治疗的前循环 AIS 患者。将符合纳入和排除标准的患者随机分为训练集和验证集。训练集中, 将患者临床基线资料、发病至溶栓时间及入院时 NIHSS 评分采用卡方检验、Fisher 确切概率法、秩和检验及二分类 Logistic 逐步回归分析, 得出临床独立危险因素并建立临床模型。NCCT 图像上进行梗死区的勾画及影像组学特征的提取, 使用 ICCs、mRMR 以及 LASSO 对提取的影像组学特征进行降维筛选, 建立影像组学模型。最后将影像组学模型与临床模型结合建立联合预测模型, 并采用列线图的形式呈现。通过校正曲线和决策曲线分析对模型的校准度及临床实用价值进行评价。

结果 最终手机患者共计 298 例, 按照 6.5: 3.5 的比例随机分为训练集 (n=197) 和验证集 (n=101), 训练集与验证集之间临床因素均无统计学差异 (P 均>0.05)。临床模型包括患者是否伴有高血压、房颤以及入院时 NIHSS 评分, 模型在训练集、验证集中的 AUC 值分别为 0.733 (95%CI, 0.639-0.828)、0.679 (95%CI, 0.546-0.813)。保留 7 个特征构建影像组学模型, 模型在训练集和验证集中的 AUC 值分别为 0.728 (95%CI, 0.628-0.829)、0.680 (95%CI, 0.532-0.827)。将临床模型与 NCCT 影像组学模型联合获得联合预测模型, 训练集和验证集中的 AUC 值分别为 0.815 (95%CI, 0.736-0.895)、0.799 (95%CI, 0.683-0.915)。Delong 检验显示联合模型的诊断效能高于临床模型及影像组学模型, 校正曲线表明联合模型的预测结果与实际情况一致性较高。DCA 显示在大部分阈值 (0.17-1.0) 范围内, 联合预测模型净收益较高。

结论 NCCT 影像组学模型联合临床危险因素构建的联合模型对预测前循环 AIS 患者 rt-PA 静脉溶栓后有无 HT 有较高的诊断效能, 对临床治疗决策有一定的参考价值

PO-0544

Application of spinal subtraction and bone background fusion CTA in the accurate diagnosis and evaluation of spinal vascular malformations

扈雪晗¹、袁知东¹、梁凯茵¹、陈民²、张珍¹、成官迅¹

1. 北京大学深圳医院

2. 南方科技大学医院

Background: Accurate pre-treatment diagnosis and assessment of spinal vascular malformations (SVMs) using spinal CTA are crucial for patient prognosis. But the post-processing reconstruction may struggle to fully visualize the lesions due to the complexity inherent in spinal anatomy.

Objective: To explore the application value of the spinal bone background fusion CTA (SBBFF-CTA) technique in precisely visualizing and localizing SVMs lesions.

Methods: In this retrospective study, patients (from Nov 2017 to Nov 2022) presenting symptoms similar to SVMs, were divided into diseased group (Group A) and non-diseased group (Group B). All patients underwent spinal CTA using Siemens dual-source CT. The MPR, routine bone subtraction (RBS-CTA), and SBBFF-CTA images were obtained through Snygo.via and ADW4.6 post-processing reconstruction workstation. Multiple observers researched the following three aspects: (a) preliminary

screening capability by MPR-CTA; (b) the accuracy and stability of the SBBFF-CTA technique; (c) diagnostic evaluation by three types of images. The diagnostic performance used receiver operating characteristics analysis, while reader or image differences used the Wilcoxon signed-rank test or the Kruskal-Wallis rank sum test.

Results: Sixty-three patients (Group A/B: 22/27 patients, mean age \pm SD, 44.0 years \pm 14.3/44.6 years \pm 15.2, 13/16 men) were evaluated. Junior doctors showed lower diagnostic accuracy/sensitivity using MPR-CTA (85.7%/77.3%) compared to senior doctors (93.9%/90.9% and 98%/95.5%). Short-term trained juniors achieved SBBFF-CTA image accuracy similar to experienced doctors ($P > 0.05$). In terms of visualization and localization of SVMs lesions (nidus/fistula, feeding artery, and drainage vein), both MPR and SBBFF-CTA outperformed RBS-CTA ($P = 0.000$). Compared to MPR, using SBBFF-CTA allowed less-experienced doctors to achieve superior diagnostic capabilities (comparable to experienced radiologists) more rapidly ($P < 0.05$).

Conclusion: The SBBFF-CTA technique exhibits excellent reproducibility and enables accurate pre-treatment diagnosis and assessment of SVMs with higher diagnostic efficiency, particularly for junior radiologists.

PO-0545

卒中后认知障碍背外侧前额叶微结构对自发性脑活动的高度限制性

饶波

武汉大学中南医院

背景: 结构解耦指数量化了脑区的结构-功能依赖程度, 提供了一种新的认知信号大脑组织特征, 然而卒中后认知障碍认知信号损伤模式仍不清楚。因此, 我们探索卒中后认知障碍患者认知信号与行为相关的空间分布神经影像学病理机制。

方法: 我们采集了 27 卒中后认知障碍患者和 27 名性别、年龄相匹配的健康对照静息态功能性磁共振和弥散张量成像数据。弥散数据构建的结构连接组在图频域中分解为谐波, 并将功能信号(每个时间点的 fMRI)投影到结构谐波所跨越的空间中。然后功能信号滤波为低和高的结构图频率, 分别得到解耦和耦合的信号分量, 其比值即为结构解耦指数。此外, 使用简易智力状态检查量表和蒙特利尔认知评估量表评估认知功能。统计学分析采用双样本 T 检验和相关性分析。

结果: 与健康对照对比, 经 Bonferroni 多重比较校正后 ($p < 0.0001$), 卒中后认知障碍患者双侧的背外侧前额叶 (包括左侧 8BL、9p, 右侧 i6-8, 双侧 s6-8)、左侧运动辅助区 (6ma), 双侧颞中回 (V3CD)、左侧运动前区 (PEF、55b) 和顶上小叶 (7PC) 解耦指数明显减低; 进一步相关性分析表明, 右侧背外侧前额叶 (i6-8: $r = -0.52$, $p = 0.005$; s6-8: $r = -0.43$, $p = 0.025$) 与简易智力状态检查量表评分明显负相关。

结论: 卒中后认知障碍患者认知信号损伤不仅累及运动、听觉等低阶功能区域, 而且影响背外侧前额叶、顶上小叶等高阶功能区域, 表现为耦合增加和神经活动受下方结构高度限制。右侧背外侧前额叶神经活动受限可能是卒中后认知障碍认知损伤神经影像学病理基础, 进一步证实了右侧背外侧叶作为卒中后认知障碍神经调控靶区的神经机制, 可能为今后精准神经调控提供了更精细的解剖靶点。

PO-0546

WHO2-3 级胶质瘤恶性转化的临床及 MRI 特征分析

蒋健、张学凌、张鹏、白亮彩、周俊林
兰州大学第二医院

目的 分析发生恶性转化的 WHO 2~3 级胶质瘤患者的临床、病理、MRI 表现,探讨预测胶质瘤发生恶性转化的临床及 MRI 特征。**方法** 回顾性分析 24 例发生恶性转化的 WHO 2~3 级胶质瘤患者的临床资料,包括患者的临床病史、MRI 表现、组织病理结果、分子病理特征,并与同期的 14 例未发生恶性转化的 WHO 2~3 级胶质瘤患者的上述资料进行比较。**结果** 恶性转化组患者首次诊断时平均年龄 39.0 ± 11.0 岁,男:女比例约为 1.67:1。首次诊断时病程 3~730 天,中位时间 20 天。无进展生存时间 (MPFS) 6~99 月,中位时间 37 月;WHO 2 级肿瘤与 WHO 3 级肿瘤比例约为 1.7:1。复发未转化组患者首次诊断时平均年龄 36.9 ± 10.9 岁;男:女比例约为 1.8:1。首次诊断时病程 0.17~2555 天,中位时间 30 天。MPFS 5~87 月,中位时间 33 月;WHO 2 级肿瘤与 WHO 3 级肿瘤比例约为 0.27:1。临床表现为头痛、恶心、呕吐等颅高压症状及癫痫等神经功能缺损表现。恶性转化组与复发未转化组肿瘤 WHO 分级、分型有显著统计学差异 ($P < 0.05$),两组间年龄、性别、肿瘤部位、数目、肿瘤异质性、强化程度、瘤周水肿程度、临床症状、首次诊断时病程、MPFS 均无显著统计学差异 ($P > 0.05$)。**结论** 胶质瘤的 WHO 分级、分型与恶性转化相关,组织学诊断为 WHO 2~3 级的星形细胞瘤可能因其为 IDH1/2 野生型,更容易发生恶性转化。尽管可用于预判胶质瘤恶性转化的有价值参数较少,但密切关注患者临床及影像特征仍是提示肿瘤恶性程度、预判恶性进展的重要方法,在胶质瘤的病理诊断中更多体现分子特征,能对预判恶性转化提供重要参考。

PO-0547

脑膜瘤术后复发并存高级别胶质瘤一例

朱成悦、张慕琳、王静、莫茵
昆明医科大学第一附属医院

摘要:目的 探讨颅内相邻部位脑膜瘤合并高级别胶质瘤相关发病机制以及总结相关影像学表现。**方法** 回顾性分析 1 例经病理学诊断为相邻部位脑膜瘤合并胶质瘤患者的临床及影像资料,并进行相关的文献复习。**结果** 患者术前 MRI 示左侧额顶叶异常信号灶,与相邻部位不规则增厚硬脑膜关系密切。手术切除肿瘤,术后病理学诊断为合体细胞型脑膜瘤 (WHO I 级) 合并高级别胶质瘤 (WHO IV 级)。**结论** 颅内相邻部位脑膜瘤合并高级别胶质瘤十分罕见,其两者发病机制尚不清楚,两者同时或相继发生目前多以统计学上的巧合来解释。影像学对该疾病定位、定性及临床手术评估具有一定的诊断价值,但病理及活检仍是该疾病诊断的“金标准”。因此临床在术前可根据相关影像学特征了解肿瘤良恶性、生长位置及邻近关系,来选择合理的手术方式,从而尽可能减少患者手术创伤。

PO-0548

基于 DTI 探讨终末期肾病继发性甲旁亢患者认知及脑白质损伤

单艳棋

安徽医科大学第二附属医院

目的 探讨 ESRD 伴 SHPT 患者认知及脑白质微观结构损伤 **方法** 25 名 ESRD 合并 SHPT 患者 (SHPT 组) 及 25 名 ESRD 不伴甲旁亢患者 (ESRD 组) 行磁共振 DTI 检查、进行 MMSE 认知量表评估, 收集相关临床血清学指标, 比较两组间 MMSE 总评分、血清学指标、各向异性分数 (FA)、平均扩散率 (MD)、轴向扩散率 (AD) 和径向扩散 (RD) 的差异, 分析 SHPT 组 MMSE 总评分、血清学指标与差异性脑区 DTI 参数的相关性。 **结果** 与 ESRD 组相比, SHPT 组 MMSE 总评分明显减低, 血清钙水平略升高, 维生素 D 水平明显减低。SHPT 组多个脑区 FA 值及 AD 值减低, 包括大脑半球、小脑及脑干, 且大脑半球异常脑区以右侧分布为主, 部分脑区 RD 值升高, 且 SHPT 组血清钙水平、磷酸盐水平及肌酐水平与部分脑区 FA 值及 AD 值减低呈正相关, 血清磷酸盐水平与部分脑区 RD 值升高相关, 认知水平与血清 iPTH 水平呈负相关 (P 均 <0.05); 其他指标未见明显统计学差异 (P 均 >0.05)。 **结论** 本研究显示 ESRD 合并 SHPT 患者的脑白质微观结构及认知功能均出现损伤, 且脑白质微结构损伤范围广泛, 以轴突损伤为主, 具有右侧大脑半球偏侧性, 且与患者血清钙、磷酸盐、肌酐水平相关。

PO-0549

眼球运动障碍诊断定位与影像检查方法研究进展

田勤

河南省人民医院

本文是通过文献分析法, 针对眼运动神经病变引起的眼球运动障碍的病因、定位诊断和影像检查成像方法进行综述, 对临床工作中眼运动神经病变引起的眼球运动障碍诊断定位和有效影像检查方法提供有益参考。眼球运动障碍是临床常见的疾病表现, 除眼外肌本身病变导致的情况外, 眼运动神经, 包括动眼神经、滑车神经及外展神经病变原因导致的眼球运动障碍更为高发。眼运动神经异常依据解剖定位可以分为脑干眼运动神经核区病变, 例如脑干梗塞、出血、肿瘤性病变、炎性脱髓鞘性病变、外伤等, 临床表现除眼球运动障碍外会经常伴随肢体运动障碍等。定位在眼运动神经脑池段情况, 常常会累及不只一条颅神经, 常见的病变有颅内感染累及颅神经脑池段, 恶性肿瘤脑膜转移时累及颅神经, 再者是颅神经本身起源的神经源性肿瘤、外伤引起的颅神经脑池段牵拉等。定位在海绵窦区、眶上裂区的眼运动神经病变, 常见病变包括颈动脉动脉瘤、颈动脉夹层、颈动脉-海绵状瘘、海绵状窦血栓形成、梗死、感染、肿瘤(内在或外在)、Tolosa-Hunt 综合征和眼麻痹性偏头痛。定位在眶内段眼运动神经损伤的情况, 常见病变有感染/炎症, Tolosa-Hunt 综合征, 肉芽肿性, 肿瘤性(外源性或内源性)和外伤性, 骨折累及眶上裂。其中区分病变在海绵窦区、眶上裂区和眶尖区的鉴别点在于视神经是否受累, 三叉神经第二支是否受累。从眼球运动障碍的临床表现和伴随症状得出眼运动神经病变定位, 再针对性应用 CT 和 MR 检查显示出病变情况, 其中 CT 检查针对外伤时累及眶骨时或被检查者对 MRI 有禁忌时比较有优势, 不同病变部位 MRI 检查选择成像方位不同, 其中两个序列对于显示眼运动神经病变比较重要, 压脂 T2 序列和 3D 薄层 T1 对比增强序列, 一个是可以在高信号脑脊液衬托下显示颅神经, 另一个是在颅神经病变时显示异常强化。从而更好的显示出颅神经病变。

PO-0550

超高分辨磁共振 T2WI：面神经炎可视化诊断新技术

成涛
成都市第二人民医院

目的 探讨磁共振超高分辨 T2 成像对面神经炎的诊断价值。方法 对 50 例面神经炎患者行磁共振超高分辨 T2 成像。通过后处理工作站行 MIP 及 CPR 重建后观察面神经的炎症情况。测量患侧及健侧的平均信号强度。结果 50 例面神经炎患者中,有 43 例能在磁共振图像上观察到面神经炎症,鼓室段 15 例,乳突段 23 例,腮腺段 32 例,鼓室-乳突段均受累 10 例,乳突-腮腺段均受累 7 例,鼓室-乳突-腮腺段均受累 3 例。结论 磁共振超高分辨 T2 成像有助于清楚显示面神经炎及病变累及情况。

PO-0551

基于术前 MRI 影像组学对 IDH 野生型胶质母细胞瘤患者总生存期的预测

李欢、王首超、肖峰、徐海波
武汉大学中南医院

目的本研究旨在开发一种适用于异柠檬酸脱氢酶 (IDH) 野生型胶质母细胞瘤 (GBM) 患者进行术前预后预测的影像组学模型,并为不同患者的临床决策提供个性化帮助。

方法根据 2021 年世界卫生组织中枢神经肿瘤的分类,从武汉大学中南医院以及癌症基因组图谱 (TCGA)/癌症影像档案 (TCIA) 公共数据库中获 142 名 IDH 野生型 GBM 患者的临床及影像资料,随机分为训练组和验证组,其中训练组中有 100 名患者,验证组中有 42 名患者。首先,采用单变量 Cox 回归分析筛选出与其总生存期相关的具有意义的临床特征。然后在 T1 加权增强图像 (CE-T1WI)、T2 加权图像 (T2WI) 和 T2 加权液体衰减反转恢复 (T2-FLAIR) 核磁共振成像图像上,勾画肿瘤最大范围 (包括肿瘤区域及肿瘤周围水肿区域) 作为感兴趣区 (ROI)。从 ROI 中提取影像组学特征。随后,进行特征选择和影像组学特征的构建。通过整合影像组学特征和选定的临床因素,以建立组合模型。用 Kaplan-Meier 分析验证模型的判别能力,用 C 指数 (C-index) 评价预测的一致性。最后,生成影像组学特征+临床特征诺模图进行个性化预后分析,然后使用校准曲线进行验证。

结果临床特征分析筛选出 4 个危险因素。ICC、斯皮尔曼相关分析、单变量 Cox 和 LASSO-Cox 分析相结合,选择出了 8 个影像组学特征,构成了影像组学标签。影像组学模型和组合模型均能将患者分为低风险和高风险两组,结果具有显著差异 (训练组和测试组分别为 $P<0.001$ 和 $P<0.05$),并获得了良好的预测一致性 ($C\text{-index}=0.74\text{-}0.86$)。此外评估模型预测和实际观测之间的差异,在一年生存率和两年生存率方面,校准图显示了良好的一致性。

结论对于最新分类为 IDH 野生型 GBM 患者,影像组学是一种独立的术前无创预测预后工具。结合影像组学特征和临床因素构建的组合诺模图,可以预测 IDH 野生型 GBM 患者的预后情况。

PO-0552

不同饮食依从性 2 型糖尿病患者抑制控制的神经电生理活动特点

刘娜、王文

中国人民解放军空军军医大学第二附属医院

目的：抑制控制作为饮食行为调节的重要因素，越来越受到业界关注。但研究主要聚焦于健康人群、饮食失调人群、超重或肥胖患者以及限制性饮食人群等，较少涉及像糖尿病这类需要长期严格执行饮食管理的慢性病患者群体。因此，本研究旨在探讨不同饮食依从性 2 型糖尿病患者抑制控制的神经电生理活动特点，为揭示不同饮食依从性糖尿病患者的抑制控制差异提供客观指标，从而揭示抑制控制对饮食依从性影响的神经机制。方法：采用 2（组别：饮食依从性高、低组） \times 2（刺激：高、低热量食物图片）混合研究设计。采用 2 型糖尿病患者饮食行为依从性测评量表测量患者的饮食依从性；采用高、低热量食物图片改编的 Go/No go 任务测量食物相关抑制控制能力；采用 32 导脑电记录系统记录脑电信号，电极参照国际标准 10-20 系统放置。选择 CPz 为在线参考电极，GND 为地线，所有电极电阻均保持在 5K Ω 以下，采样率为 1000Hz。以 61 例住院 2 型糖尿病患者为研究对象。纳入标准：①病程 \geq 6 个月；②年龄 \geq 18 周岁；③初中及以上文化程度；④手指能做按键反应；⑤MoCA 量表得分 \geq 25 分；⑥知情同意并自愿参与本研究。排除标准：①既往有脑血管疾病史或其它中枢神经损伤的疾病及病史；②孕妇或伴有严重基础疾病等特殊人群；③伴有严重并发症者；④实验中途退出者。采用独立样本 t 检验、卡方检验、重复测量方差分析以及混合设计方差分析等统计学方法进行统计分析。结果：高饮食依从性组患者比低饮食依从性组在额叶脑区和中央脑区诱发更大的 P2 差异波幅（ $p=0.019, 0.011$ ）；高饮食依从性组患者比低饮食依从性组诱发更大的 P3 差异波幅（ $p=0.015$ ）。结论：饮食依从性高的 2 型糖尿病患者诱发更大的 P2 和 P3 脑电波，说明患者对食物的注意偏向和反应抑制能力更强。这提示，抑制控制对饮食依从性具有影响作用，通过抑制控制干预有望改善患者的饮食依从性，这具有重要的临床应用价值。

PO-0553

阿尔兹海默症和帕金森病轻度认知障碍功能脑网络连通性改变的异同：一项基于独立成分分析的研究

王矩洲、范国光

中国医科大学附属第一医院

背景：阿尔茨海默病（AD）和帕金森病（PD）是两种常见的神经退行性疾病，它们在导致认知功能障碍方面具有一定的异质性，可能涉及到不同的病理生理机制。轻度认知障碍（MCI）是正常衰老和痴呆症之间的中间阶段，也是临床疾病干预的关键时间窗口。本研究旨在探讨 AD-MCI 和 PD-MCI 两种疾病在轻度认知功能障碍阶段的脑网络改变。

方法：我们招募了 33 名 AD-MCI 患者、55 名 PD-MCI 患者和 34 名健康志愿者（HC），并对他们进行了静息态磁共振成像和神经心理评估。我们采用独立成分分析（ICA）方法来研究认知相关网络的变化特征。通过单因素方差分析比较了三组受试者在网络内和网络间功能连接方面的差异，以探索不同疾病导致的认知功能障碍在网络水平上的功能连接变化。

结果：网络间功能连接分析显示（FDR 校正， $P<0.05$ ），AD-MCI 和 PD-MCI 患者与 HC 相比，表现出网络间功能连接的增加和减少。具体而言，AD-MCI 患者的网络间功能连接减少主要出现在默认模式网络（DMN）内部以及 DMN 网络与执行网络（ECN）之间。PD-MCI 患者的网络间功能连接减少主要位于凸显网络（SN）和 DMN 网络之间。此外，AD-MCI 患者表现出 SN 网络与语言网络（LN）之间的功能连接增强，而 PD-MCI 患者的网络连接增强主要出现在显性网络内部。值得注意

的是，PD-MCI 患者与 AD-MCI 患者之间的 SN 网络以及 SN 网络与左侧执行控制网络（LECN）之间的功能连接存在显著差异。在网络内功能连接分析方面，AD-MCI 患者和 PD-MCI 患者在多个认知相关网络内的多个脑区的活动存在统计学上的差异（FDR 校正， $P < 0.05$ ）。

结论：AD-MCI 患者的脑网络变化主要集中在 DMN 网络，而 PD-MCI 患者的变化主要集中在 SN 网络。这些研究结果为更深入地理解这两种疾病在早期认知功能障碍阶段的病理生理机制提供了重要的神经网络基础。这些发现有望为未来的诊断和治疗策略提供更多的见解。

PO-0554

磁共振广义 T2-FLAIR 错配征象在诊断星形细胞瘤（IDH 突变型）及预测分子状态中的临床价值

冯岩、张劲松、张广文、郝勇飞、李婉清
空军军医大学西京医院

目的 探讨广义 T2-FLAIR 错配征象能否作为星形细胞瘤（IDH 突变型不伴 1p/19q 共缺失）的 MRI 影像标志物，以提高对该类型胶质瘤的术前诊断水平及预测分子状态。

方法 回顾性分析 158 例经病理证实且有完整术前常规 MRI 影像（T1、T2、FLAIR 序列）的星形细胞瘤（IDH 突变不伴 1p/19q 共缺失）的完整术前常规 MRI 影像资料，由 2 名中枢神经影像医师独立依据伦勃朗视觉感受图像（visually accessible Rembrandt images, VASARI）特征集的标准进行影像学特征的定量分析。运用 Kappa 检验评价 2 名医生对影像学特征评分结果的一致性。总结并扩展狭义 T2-FLAIR 错配征为广义错配征。运用 Logistic 回归分析及受试者工作特征（receiver operating characteristic, ROC）曲线分析评价广义 T2-FLAIR 错配特征对于星形细胞瘤（IDH 突变不伴 1p/19q 共缺失）的诊断效能。

结果 扩展定义的广义 T2-FLAIR 错配征包含三种类型，即完全 T2-FLAIR 错配，部分 T2-FLAIR 错配，FLAIR 高信号环伴环内不匹配。2 名中枢神经影像医师 VASARI 特征评分的一致性较好（Kappa 值：0.737~0.960）。将狭义 T2-FLAIR 错配征扩展为广义错配征，并作为星形细胞瘤（IDH 突变不伴 1p/19q 共缺失）诊断标准时，相对于狭义错配征，诊断敏感度提高了 50%，特异性没有受到明显影响。广义 T2-FLAIR 不匹配征对于星形细胞瘤（IDH 突变不伴 1p/19q 共缺失）的诊断具有统计学意义（ $P < 0.05$ ），可以作为独立预测危险因素，诊断效能较高，ROC 曲线下面积（area under curve, AUC）为 0.840。

结论 广义 T2-FLAIR 错配征可以作为星形细胞瘤敏感性、特异性较高的 MRI 成像标志物，并可以术前非侵入性的预测星形细胞瘤的 IDH 突变不伴 1p/19q 共缺失的分子状态。

PO-0555

常规磁共振 T2 微囊聚集区及囊变间隔/囊壁 T2-FLAIR 不匹配征象在诊断星形细胞瘤（IDH 突变型）及预测分子状态中的临床价值

冯岩、张劲松、张广文、郝勇飞、李婉清
空军军医大学西京医院

目的 探讨 T2 微囊聚集区及囊变间隔/囊壁 T2-FLAIR 不匹配征象能否作为星形细胞瘤（IDH 突变型不伴 1p/19q 共缺失）的 MRI 影像标志物，以提高对该类型胶质瘤的术前诊断水平及预测分子状态。

方法 回顾性分析 158 例经病理证实且有完整术前常规 MRI 影像 (T1、T2、FLAIR 序列) 的星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的完整术前常规 MRI 影像资料, 由 2 名中枢神经影像医师独立依据伦勃朗视觉感受图像 (visually accessible Rembrandt images, VASARI) 特征集的标准进行影像学特征的定量分析。运用 Kappa 检验评价 2 名医生对影像学特征评分结果的一致性。运用 Logistic 回归分析及受试者工作特征 (receiver operating characteristic, ROC) 曲线分析评价 T2 微囊聚集区及囊变间隔/囊壁 T2-FLAIR 不匹配征象对于星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的诊断效能。

结果 2 名中枢神经影像医师 VASARI 特征评分的一致性较好 (Kappa 值: 0.737~0.960)。T2 微囊聚集区及囊变间隔/囊壁 T2-FLAIR 不匹配征象对于星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的诊断具有统计学意义 ($P<0.05$), 可以做为独立预测危险因素, 诊断效能较高, ROC 曲线下面积 (area under curve, AUC) 为 0.779。

结论 T2 微囊聚集区及囊变间隔/囊壁 T2-FLAIR 不匹配征象可以作为星形细胞瘤的成像标志物, 并可以术前非侵入性的预测星形细胞瘤的 IDH 突变不伴 1p/19q 共缺失的分子状态。

PO-0556

经胼胝体结构连接的毕生轨迹研究: 一项 5T 超高场高分辨多模态磁共振脑成像研究

陈晓惠、刘希童、高磊、徐海波
武汉大学中南医院

背景与目的: 胼胝体是连接左右半球的最大白质纤维束, 不同区域包含不同的纤维密度及髓鞘水平, 反映不同的特化功能, 并提供半球间的整合和信息传输, 参与利手、语言、运动等功能。越来越多的研究指出, 胼胝体形态学可能是预测神经退行性病变的重要指标, 但不同胼胝体区域是如何连接左右半球, 以及胼胝体的毕生轨迹演变, 依然不太清楚。本研究利用世界首台 5T 超高场 MRI 磁共振采集 18-90 岁健康成人高分辨、多模态脑成像数据, 以及行为、认知评分数据和临床数据。旨在 (1) 理解群体水平胼胝体不同分区如何连接半球皮层区域; (2) 刻画经胼胝体结构连接的毕生发展轨迹。

材料方法: 总共招募 250 例 18-90 岁健康成人参与本研究, 采集高分辨多模态 5T MRI 脑成像数据及行为、认知评分数据和临床数据。所有受试者在 MRI 扫描七天内参加了认知测试, 主要涉及整体认知包括 MMSE 及 MoCA, 注意力与执行功能包括数字符号转换测试, 记忆包括雷氏语音记忆的即时回忆和延迟回忆。此外, 所有受试者在 MRI 扫描当天还填写了在线问卷, 主要包括睡眠、精力、水和酒精饮用等信息。根据 W 和 H 分区, 以及 100 个等份分区, 跟踪正中矢状位胼胝体亚区的结构连接及纤维束定量。使用年龄段平均计算群体水平经胼胝体结构连接, 使用曲线拟合计算经正中矢状位胼胝体亚区连接的毕生轨迹。

结果: 经正中矢状位胼胝体呈现明显的区域性结构连接变异, 前后部分密集连接额顶网络, 中间躯干部分连接体感运动皮层。在毕生轨迹分析中, 这些连接呈现明显的非线性下降, 特别是以 58-63 岁为拐点。

结论: 我们的数据提供了有关胼胝体高分辨结构连接的皮层连接模式及毕生轨迹演变模式, 为理解半球间整合的毕生轨迹及老化相关退变疾病提供了重要的观点。

PO-0557

裕固族双语大脑灰质结构动态变化的 VBM 研究

胡万均、张静
兰州大学第二医院

【摘要】目的：利用体素的形态学分析 (voxel-based morphometry, VBM) 方法分析裕固族双语与汉族非双语大脑灰质结构变化，探讨裕固族双语认知及大脑灰质体积差异的动态变化机制。

材料与方法：本研究收集了 29 名熟练使用裕固族语-汉语及性别、年龄、受教育程度相匹配的 25 名汉族非双语的健康成年人行磁共振 3D-T1WI 序列扫描并行 VBM 全脑灰质体积分析，利用双样本 T 检验比较两组的灰质体积差异，并与 MoCA 量表行认知相关性分析，最后利用 VBM 灰质体积差异脑区行中介分析揭示裕固族双语大脑灰质体积的动态变化机制。

结果：基于 VBM 分析显示，裕固族语-汉双语组右侧顶下小叶、双侧颞中回、左侧背侧丘脑及右侧直回灰质体积明显高于汉族非双语组，组间差异有统计学意义 (FWE 校正, $P < 0.05$)；右侧颞中回灰质体积与 MoCA 量表评分呈正相关。中介分析揭示左侧丘脑及右侧直回主要介导双侧颞中回灰质体积增加，且双侧颞中回都受左侧丘脑的间接或直接介导。

结论：裕固族双语与汉族非双语大脑灰质体积存在明显差异，第二语言的习得会导致大脑皮层灰质微观结构的改变，且裕固族双语大脑灰质体积差异存在相关动态变化机制。

PO-0558

右侧扣带回与帕金森病患者步态和认知功能障碍的相关性研究

魏璇、王振常
首都医科大学附属北京友谊医院

目的：本研究旨在通过高角度分辨率扩散成像(HARDI)评估帕金森病(PD)患者扣带回纤维束的变化，并探讨平均各向异性(FA)值与心理行为学指标及步态指标的相关性。

方法：24 例 PD 患者和 29 例健康志愿者(HC)纳入本研究。对于每个参与者，在 3.0TMRI 扫描仪上用采集 HARDI 序列及 MPAGE 高分辨 3D 结构像。利用 Mtrix3 软件进行扩散加权数据预处理，利用方向分布函数追踪 PD 患者的主要神经纤维束，并进行了自动化纤维定量分析。采用 20 英尺长的计算机化 Zeno 步道步态评估毯进行客观的步态评估，量化步速、步幅、步幅时间和步频，以自我选择步速(SSP)和快步速(FP)进行评估。定量记录 PD 患者服用左旋多巴类药物开期 (ON) 和关期 (OFF) 状态下的步态和临床指标。比较 PD 组与 HC 组的临床指标特点、步态特点及白质纤维束特点，分析 FA 值与心理行为学指标及步态指标的相关性。

结果：右侧扣带回的 34-58 段纤维束的 FA 值与简易精神状态检查(MMSE)、Berg 平衡量表(BBS)-OFF 期、BBS-ON 期的得分呈正相关；与 MDS-UPDRS-III-ON 期得分呈负相关。在步态指标的分析中，在 ON 和 OFF 两期，FA 值与步频和节奏域的速度、步频和步幅时间均显著相关($P < 0.05$)。

结论：使用 HARDI 数据可以获得详细而准确的右侧后扣带回节段性纤维，可以为 PD 的治疗提供了重要而具体的神经影像学信息与临床心理行为学评估方法。HARDI 结合神经认知和步态评估可能是诊断帕金森病步态和认知障碍的有价值的神经影像学及生物学标志物。

PO-0559

顺磁性环能够鉴别多发性硬化与伴有皮层下梗死和白质脑病的常染色体显性遗传性脑动脉病吗？

张妍、谢彦、朱文珍

华中科技大学同济医学院附属同济医院

目的：

研究显示顺磁性环病灶（PRL）在高达 50% 以上的多发性硬化（MS）患者中存在，代表含有嗜铁小胶质细胞的慢性活动期 MS 病灶，在除 Susac 以外的脑病中罕见，被认为是诊断 MS 的有利的特异性指标。伴有皮层下死和白质脑病的常染色体显性遗传性脑动脉病（CADASIL）常显示累及脑皮层下、侧脑室周围和脑干的点片状弥漫状脑白质 T2 高信号，是 MS 的一个强大的鉴别诊断。本研究的目的是探讨顺磁性环征象是否能提高 MS 与 CADASIL 的鉴别诊断效能。

材料方法：

回顾性分析 2018-2023 年我院符合 2017 年 McDonald 标准的 MS 患者和基因确诊的 CADASIL 患者的临床和影像资料，需含有至少一次磁敏感加权成像(SWI)检查。MRI 采集利用 3T 扫描仪，序列包括常规平扫（矢状位 T1WI，轴位 T1WI、T2WI 和 FLAIR）及 SWI。对常规平扫上显示出的颅内病灶，在 SWI 的相位图上评估是否为 PRL，并对颅内出血、微出血灶进行评估。PRL 被定义为相位图上有低信号边缘和等/稍高信号中心的病灶。

结果：

24 例 CADASIL（51.87 岁 \pm 10.37，15 位女性）、46 例 MS（33.61 岁 \pm 4.71，32 位女性）患者纳入研究。19 例（79.1%）CADASIL 患者检测到 PRL，18 例（75%）检测到微出血灶且其中 12 例（66.7%）微出血灶数目大于 10 个，5 例（20.8%）检测到陈旧出血灶。16 例（34.8%）MS 患者检测到 PRL，没有 MS 患者检测到出血或微出血灶。CADASIL 患者的 PRL 在平扫上表现为 T1 低信号、T2 高信号、FLAIR 外高内低的“腔隙”改变；而 MS 的 PRL 在平扫上表现为 T1 低信号、T2 高信号、FLAIR 高信号的“斑块”改变。

结论：

在 CADASIL 这种多发白质受累的疾病中，也有较高比例的 PRL 存在，PRL 存在与否并不能有利地鉴别出 CADASIL 与 MS。

PO-0560

脑卒中机械取栓后颅内高密度征的双能 CT 应用

陆钰

南通市第一人民医院

目的 探讨双能 CT 技术在急性缺血性脑卒中（AIS）机械取栓术后颅内高密度征中的应用价值。方法 前瞻性连续收集成功机械取栓术后出现颅内高密度征患者 61 例，于术后 1h 内行双能 CT 头颅平扫获得碘叠加图像（IOM）、虚拟平扫图像（VNC），于术后 24h~48h 行常规头颅 CT 平扫随访，将其结果作为诊断标准。分析双能 CT 鉴别颅内高密度征为颅内出血的敏感性、特异性、符合率、阳性预测值和阴性预测值。测量双能 CT 融合图像（MIX）高密度区平均 CT 值，评估 CT 值对出血转化的预测能力。结果 61 例颅内高密度患者中男性 32 例，女性 29 例，平均年龄（62.93 \pm 8.47）岁。其中诊断碘剂合并出血 28 例，在随访中均被证实，其中 13 例血肿范围明显扩大，碘剂外渗 33 例，其中 9 例随诊中发现高密度持续存在，6 例出现出血转化。双能 CT 诊断早期颅内出血的敏感

性 75.7%、特异性 100%、阳性预测值 100%、阴性预测值 72.7%，符合率 85.2%。出血性转化患者较无出血性转化患者 CT 显著增高 (124.13 ± 58.32) HU vs (78.32 ± 29.92) HU; $p=0.002$)。当 CT 值 >104 HU，高度提示患者存在出血转化风险，其 AUC 0.840，敏感性 77.3%，特异性 86.0%，95%CI 0.612-0.928。结论 双能 CT 可早期鉴诊脑卒中机械取栓后高密度出血，并可一定程度预测其出血转化风险。

PO-0561

MOG 抗体阳性脑炎 3 例病例分析

李琬瑶、苗延巍
大连医科大学附属第一医院

目的：对抗髓鞘少突胶质细胞糖蛋白 IgG 抗体 (MOG-IgG) 相关疾病 (MOGAD) 病例进行分析，探讨其影像特点。

方法：收集 2021 年 1 月至 2022 年 1 月在大连医科大学第一附属医院住院的 3 例 MOGAD 患者的临床资料及影像学资料并分析。

结果：病例 1，患者男，33 岁，以癫痫、认知障碍和睡眠障碍为主要症状，无肿瘤病史。脑部 MRI 显示 (图 1) 双侧额叶和扣带回区域皮质肿胀，T2 加权图像 (T2WI) 和液体衰减反转恢复 (FLAIR) 呈高信号，弥散加权成像 (DWI) 呈稍高信号。双侧额叶软脑膜强化。在磁共振波谱 (MRS) 上，这些病变显示 N-乙酰天冬氨酸 (NAA) 峰略有下降，胆碱化合物 (Cho) 和肌酸 (Cr) 峰增加 (Cho/Cr: 1.38; Cho/NAA: 1.17; NAA/Cr: 1.17)。灌注成像示双侧额叶和扣带回血流量减少。血清 MOG 抗体阳性，脑脊液和血清抗 IgLON5 抗体阳性。病例 2：患者男，14 岁，以癫痫、意识不清为主要症状。脑部 MRI 未见明显异常。血清 MOG 抗体阳性。病例 3：患者女，16 岁，头痛伴抽搐为主要症状。脑部 MRI (图 2) 显示右侧大脑半球额顶颞叶皮层及大脑镰旁皮层肿胀，T2WI 和 FLAIR 呈高信号病变，DWI 呈稍高信号，增强扫描未见明显强化。血清 MOG 抗体阳性。

结论：MOGAD 影像学表现多种多样。当脑部 MRI 显示多处疑似炎症性疾病的皮层病变时，也需要提示两种抗体共存。

PO-0562

无症状颈动脉狭窄认知下降的 MRI 神经影像研究

高磊
武汉大学

随着人均寿命的延长和老龄化社会的加剧，血管性痴呆日渐成为一个主要的临床挑战和公卫防控重点。其中构成血管性痴呆风险的一个重要因素是颈动脉狭窄。过去半个世纪，血管内介入和药物强化治疗已经大大降低无症状颈动脉狭窄年卒中风险，但与此同时，这类患者相关的认知损害风险大大增加，成为新的临床终点事件。即便临床上无症状的颈动脉狭窄也伴随着特定认知领域的损害，因此理解认知损害的神经基础成为重要的临床任务。国际学界开始指出，需要根据认知损害和老化重新定义无症状颈动脉狭窄，主要难题是如何识别高风险群体，以及理解认知损害的神经基础。

在过去五六年，我们使用 MRI 神经影像手段，围绕一个核心问题——无症状颈动脉狭窄认知损害的神经基础展开研究，分别从形态结构、功能、血流动力学、多模态病损灶定位等展开研究。特别是在国家自然科学基金青年项目的支持下，以及国内首批 5T 超高场 MRI 的投入使用，投稿人和团队开展了深入的研究，新近发表了多篇相关的论文。主要包括 (1) 单侧重度无症状颈动脉狭窄如何影响脑形态结构，包括皮层形态学、半球结构不对称性、个体化皮层脑网络、胼胝体的形态学和连接及海

马完整性等; (2) 功能成像研究, 主要关注如何影响人脑大尺度脑网络功能架构、半球功能整合与特化、皮层-皮层下交互、血流动力学架构等的刻画等; (3) 多模态成像指标及脑网络连接组的构建, 包括多模态脑网络图论指标的汇聚、脑白质高信号与微出血负荷定量等。这些研究为理解重度无症状颈动脉狭窄这一临床上“无症状”但是已经呈现特定认知领域损害提供了神经影像基础, 为这类患者的脑损害全貌提供多角度的脑影像信息。

PO-0563

高 b 值下双指数、峰度、分数阶微积分和伽马分布扩散模型在表征脑胶质瘤异质性上的诊断价值评价研究

孙文博、徐聃、周杰、徐海波
武汉大学中南医院

目的: 目前只有少数研究比较高 b 值下不同扩散模型在脑胶质瘤上的诊断表现[1], 而分数阶微积分和伽马分布模型尚未得到很好的研究和比较。对于胶质瘤而言, 异柠檬酸脱氢酶 1 (IDH-1) 基因的突变发挥了重要作用, 并是重要的预后指标[2]。本研究拟比较高 b 值下的双指数、峰度、分数阶微积分和伽马分布扩散模型在表征胶质瘤异质性的表现, 包括胶质瘤分级, 预测异柠檬酸脱氢酶-1 (IDH-1) 突变状态。

材料和方法: 前瞻性纳入病理证实的胶质瘤患者 52 例。在联影 790 3.0T 磁共振上, 使用不同的扩散模型 (双指数、峰度、分数阶微积分和 gamma 分布扩散模型) 分析具有 12 个 b 值 (0-3000 s/mm²) 的单次扩散回波平面成像扫描数据。使用接受者操作特征 (ROC) 分析评估和比较每个单独的扩散参数及其组合在胶质瘤分级和预测 IDH-1 突变状态中的表现。

结果: 在胶质瘤分级中, 每个扩散参数的最大曲线下面积 (AUC) 范围为 0.834 至 0.901, 峰度模型参数平均峰度 MK 显示最高的 AUC (0.901)。用于预测 IDH-1 突变状态的各个参数的 AUC 范围从 0.825 到 0.849, 其中 MK 和伽马分布参数 mode 均显示最高的 AUC (0.849)。对于扩散参数的组合, FROC 参数 D、 β 和 μ 的组合在胶质瘤分级 (0.901) 和预测 IDH-1 突变状态 (0.882) 中显示出最高的 AUC。

讨论: 研究发现峰度和 FROC 模型似乎更倾向于对胶质瘤进行分级和预测 IDH-1 突变状态, 这可能是由于具有连续扩散系数的分区 DWI 模型可能比双指数模型更强大。

PO-0564

扩散-弛豫谱成像用于脑胶质瘤分级研究

孙文博、徐聃、周杰、徐海波
武汉大学中南医院

目的: 开发用于术前预测的非侵入性影像工具仍然是必要的。扩散-弛豫谱成像 (Diffusion-Relaxation Correlation Spectrum Imaging, DR-CSI) 已经被用于前列腺[1]和胎盘的诊断[2], 本研究通过使用扩散-弛豫谱成像, 对胶质瘤进行分级和评估, 并与伽马分布扩散模型[3]进行比较。

材料和方法: 前瞻性纳入病理证实的胶质瘤患者 45 例, 其中低级别 14 例, 高级别 31 例。在联影 790 3.0T 磁共振上进行扫描具有多个 b 值 (0-3000 秒/mm²) 的 3.0 T 单次扩散回波平面成像, 并使用 4 种不同的回波时间分别采集。将 DR-CSI 计算得到的联合 T2-ADC 谱分数 (fa、fb、fc) 分

别在肿瘤核心和肿瘤周围区域量化,与伽马分布扩散模型衍生的谱分数(f1、f2、f3)进行比较,以分别对胶质瘤进行分级。同时计算了一维扩散谱和 T2 谱。使用接受者操作特征(ROC)分析评估和比较每个谱参数及其组合在胶质瘤分级的表现。

结果:高级别胶质瘤的 fa_core、fd1_core、fd3_core、ft1_core、f1_core、fa_peri 和 f3_peri 显着高于低级别胶质瘤,而高级别胶质瘤的 fb_core、fc_core、fd2_core、f2_core 和 fb_peri 显着低于高级别胶质瘤低级别胶质瘤($P<0.05$)。ROC 分析显示,在肿瘤核心区域,fa_core 在胶质瘤分级中的曲线下面积最高(0.979),而在瘤周区域,fb_peri 的 AUC 最高(0.756)。

讨论:扩散-弛豫谱成像相比于传统扩散模型,可以提高胶质瘤分级准确性。

PO-0565

记忆主诉人群在新冠感染及“脑雾”后的丘脑结构特征分析

余可妍^{1,2}、樊响¹、韦卓男¹、尹晨旺¹、华子萱¹、文戈²、成官迅¹

1. 北京大学深圳医院, 医学影像科

2. 南方医科大学南方医院, 影像诊断科

目的:大量证据表明新冠病毒感染后“脑雾”会对患者生活造成持续影响,而感染后丘脑的改变在不同研究中结果存在争议,本研究目的为探索新冠感染及出现脑雾症状后丘脑结构的变化。

方法:对北京大学深圳医院具有记忆主诉的受试者进行 MRI 及神经心理学量表检查(MMSE 及 MoCA)。根据新冠感染情况及症状分为脑雾组(BF 组)、新冠感染后非脑雾组(nBF 组)及无新冠阳性征象组(对照组)。脑雾定义为新冠感染后新出现集中注意力困难、记忆力下降、解决问题能力下降等症状,持续超过 3 个月,或原有上述症状,持续超过 3 个月且较感染前明显加重。共纳入 74 人(62%为女性),中位年龄 62(58, 67)岁,其中 BF 组 13 人, nBF 组 49 人,对照组 12 人。基于脑医生结构分析软件和 SPSS24.0 进行组间差异性分析及事后检验。比较三组间丘脑结构、MMSE 及 MoCA 评分的差异。

结果:BF 组及 nBF 组双侧丘脑体积均大于对照组:BF 组左侧丘脑体积为 $5.188\pm0.596\text{cm}^3$ ($P=0.004$)、nBF 组为 $5.123\pm0.414\text{cm}^3$ ($P=0.001$),对照组为 $4.572\pm0.480\text{cm}^3$; BF 组右侧丘脑体积为 $5.568\pm0.586\text{cm}^3$ ($P=0.001$), nBF 组为 $5.378\pm0.421\text{cm}^3$ ($P=0.001$),对照组为 $4.820\pm0.541\text{cm}^3$ 。nBF 组、BF 组与对照组之间 MMSE (26.458 ± 6.277 、 26.923 ± 3.067 、 25.167 ± 4.218 , $P=0.124$)、MoCA (23.979 ± 4.164 、 23.385 ± 4.052 、 22.333 ± 5.087 , $P=0.558$) 评分无统计学差异,各组间年龄($P=.710$)、性别($P=0.774$)构成无统计学差异。nBF 组感染-成像间隔为 153(122, 201)天, BF 组感染-成像间隔为 153(122, 201)天, 163(128, 210)天,两组间差异无统计学意义($z=-0.763$, $P=0.446$)。

结论:与对照组相比,新冠病毒感染超过 3 个月时存在双侧丘脑体积较大的情况。且未发现脑雾症状和该变化有关。这与部分先前研究结果一致,具体病理生理机制及未来转归仍需进一步探索。

PO-0566

异常共激活模式动态特征与帕金森病脑加速老化有关

阎肃、朱文珍

华中科技大学同济医学院附属同济医院

目的：老龄化已被公认为是神经退化的最强风险因素，而帕金森病（Parkinson's disease, PD）往往会加速大脑衰老的轨迹。本研究旨在探索 PD 对大脑结构老化和大规模功能网络时间动态的影响。

方法：纳入 2021 年 7 月至 2022 年 8 月在华中科技大学同济医学院附属同济医院神经内科住院的 62 名 PD 患者，同时在社区招募 32 名年龄和性别匹配的健康志愿者。首先通过预先训练的以 T1 加权结构影像数据作为输入的 U-Net 模型来计算全局和局部脑龄差值来评估大脑老化程度。然后利用聚类算法确定了整个大脑的六种共激活模式（Coactivation pattern, CAP），以捕捉 PD 患者和健康对照的神经网络活动。共激活模式的动态特征包括每一个 CAP 所占的时间分数、持续性、出现次数和转换概率。我们通过一般线性模型评估了脑龄差值和 CAP 指标的组间差异。最后，对组间局部脑龄差值图和 CAP 图进行了空间相关性分析，以揭示 PD 功能改变可能的解剖学基础。

结果：与健康对照（-3.73 岁）相比，PD 患者（+1.93 岁）的全局脑龄差明显升高，大部分脑区的局部脑龄差也显著升高，其中以额叶、颞叶、岛回、中央前回和壳核的偏离度最高。相关分析显示全局脑龄差与 PD 的症状严重程度和病程相关。此外，我们还研究了与 PD 相关的 CAP 指标异常。具体来说，PD 患者在以默认模式网络和额顶网络激活为特征的 CAP 以及以感觉运动网络和显著网络激活为特征的 CAP 中停留时间较少，在这些 CAP 和其他 CAP 之间转换的频率也较低。空间相关性分析表明，局部脑龄加速的模式与以感觉运动网络和显著网络激活为特征的 CAP 具有显著的空间相似性。

结论：这些结果揭示了大脑结构加速老化与大脑网络动态异常之间的关系，可为神经退行性疾病所涉及的神经理病理学机制提供新的见解，并为改变疾病进展提供新的治疗靶点。

PO-0567

扩散加权成像联合扩散峰度成像在脑胶质瘤 IDH 基因分型的预测研究

李祥、张辉

山西医科大学第一医院

目的通过扩散加权成像（diffusion-weighted imaging, DWI）联合扩散峰度成像（diffusion kurtosis imaging, DKI）预测脑胶质瘤异柠檬酸脱氢酶(isocitrate dehydrogenase, IDH)基因状态。

材料与方法回顾性分析 2018-2020 年经病理证实的 60 例脑胶质瘤患者的临床、影像资料，其中 IDH 突变型 30 例，IDH 野生型 30 例。患者术前均行常规 MRI、DWI 及 DKI 扫描，测量肿瘤实质区和同层面正常脑白质区的 DWI 参数表观扩散系数（ADC）以及 DKI 参数扩散各项异性分数（FA）、平均扩散系数（MD）、平均扩散峰度（MK）、轴向扩散峰度（Ka）、径向扩散峰度（Kr），将肿瘤实质区测量值除以对侧正常脑白质区测量数值，获得校正后参数，得到相对 ADC 值（rADC）和相对扩散各项异性分数(rFA)、相对平均扩散系数（rMD）、相对平均扩散峰度(rMK)、相对轴向扩散峰度（rKa）、相对径向扩散峰度(rKr)值。应用两独立样本 t 检验比较 IDH 突变型和 IDH 野生型组间校正后 DWI 及 DKI 参数差异，绘制受试者工作特征（receiver operating characteristic, ROC）曲线分析各参数值的诊断价值。

结果 IDH 野生型肿瘤实质区 rMK、rKa、rKr 值均高于 IDH 突变型，但仅 rMK 值两者之间差异有统计学意义($P<0.05$)，rADC 值和 rMD 值低于 IDH 突变型，两者之间差异有统计学意义($P<0.05$)，rFA 值两者之间差异没有统计学意义($P>0.05$)。ROC 曲线分析结果显示，rADC 和 rMD 对 IDH 基因状

态具有预测价值, ROC 曲线下面积分别为 0.64 和 0.69, rADC 联合 rMD 值预测 IDH 基因状态的曲线下面积为 0.70。

结论 rADC 和 rMD 值有助于判断 IDH 基因状态, rADC 联合 rMD 值可提高诊断效能。

PO-0568

2 型糖尿病患者丘脑亚区体积的改变

梁高、谢明国
成都中医药大学附属医院

目的 探索 2 型糖尿病患者丘脑亚区体积改变。

方法 收集 2 型糖尿病患者 (22 例) 与之相匹配的健康受试者 (24 例)。采用美国 Discovery MR 750 3.0 T 磁共振扫描仪 (32 通道头部线圈) 采集每位受试者高分辨-T1WI, 采用 Freesurfer 将单侧丘脑分割成 25 个亚区。比较组间临床资料 (年龄、性别) 的差异, 采用 MANCOVA 分析比较组间丘脑亚区体积的差异, 以年龄、性别、颅脑总体积为协变量。采用偏相关分析评估糖尿病组丘脑亚区体积与临床资料 (血糖水平、病程) 的相关性。

结果 2 型糖尿病组、健康对照组间年龄及性别无显著性差异。相比健康对照组, 糖尿病组双侧丘脑内侧膝状核和左侧中央外侧核体积缩小 (P 均 <0.05 , FDR 校正), 双侧腹内侧核体积较健康对照组增大 ($P < 0.05$, FDR 校正)。双侧丘脑内侧膝状核、左侧中央外侧核及双侧腹内侧核体积与血糖水平及糖尿病病程无相关性。

结论 2 型糖尿病患者丘脑亚区体积改变主要位于双侧内侧膝状核、腹内侧核及左侧中央外侧核。

Persistent Proatlantal Intersegmental Artery(PPIA): Are Consideration Based On MSCTA

Qin Xiao
Daping Hospital, Army Medical Center, Military Medical University

Abstract

Background: Persistent proatlantal intersegmental artery(PPIA) is a rare permanent carotid-basilar anastomosis. MSCTA has become the primary non-invasive imaging technique for evaluation of cephalic and cervical vascular anatomy.

Purpose: To investigate the MSCTA imaging characteristics of PPIA and its clinical values, so then to provide a new classification method based on posterior circulation blood supply.

Material and Methods: The imaging and clinical data of 11 patients with PPIA diagnosed by MSCTA through combined head and neck scanning were analyzed retrospectively.

Results: The incidence of PPIA was 0.01%. Used classification according to the starting position of PPIA, type I of PPIA were 2 cases (18.2%), type II of PPIA were 9 cases (81.8%). Classification

according to blood supply of posterior circulation, type 1 of PPIA were 4 cases (36.4%), type 2 of PPIA were 4 cases (36.4%), type 3 of PPIA were 1 case (9.1%), type 4 of PPIA were 2 cases (18.2%). Among the 11 PPIA patients, ipsilateral vertebral artery absence were 11 cases, contralateral vertebral artery dysplasia were 3 cases and absence was 1 case, persistent artery dysplasia were 2 cases, and basilar artery dysplasia were 2 cases. In addition, there were 2 patients with aneurysm, 1 patient with cerebral infarction, and 1 patient with PAVF.

Conclusion: The new classification method of PPIA is more conducive to the evaluation of the posterior circulation blood supply. In addition, using MSCTA to diagnose PPIA can reduce the missed diagnosis of other cephalic and cervical vascular diseases, and provide a more comprehensive imaging evaluation for interventional and surgical operations.

PO-0571

Non-Contrast CT Radiomics and Machine Learning for Outcomes Prediction of Patients with Acute Ischemic Stroke Receiving Conventional Treatment

Limin Zhang¹, Wei Zhang¹, Jing Wu², Ruize Yu³, Ruoyu Xu¹, Jiawen Yang⁴, Qianrui Fan³, Dawei Wang³

1. The Second Affiliated Hospital of Chongqing Medical University

2. Department of Radiology, The 958th Hospital, Southwest Hospital, Army Medical University

3. Institute of Research, Infervision Medical Technology Co., Ltd, 25F Building E, Yuanyang International Center, Chaoyang District, Beijing

4. Department of Radiology, Taizhou Hospital of Zhejiang Province affiliated to Wenzhou Medical University, Taizhou, Zhejiang

Purpose: Accurate prediction of outcomes for patients with acute ischemic stroke (AIS) is crucial for clinical decision-making. In this study, we developed prediction models based on non-contrast computed tomography (NCCT) radiomics and clinical features to predict the modified Rankin Scale (mRS) six months after hospital discharge.

Method: A two-center retrospective cohort of 240 AIS patients receiving conventional treatment was included. Radiomics features of the infarct area were extracted from baseline NCCT scans. We applied Kruskal-Wallis (KW) test and recursive feature elimination (RFE) to select features for developing clinical, radiomics, and fusion models (with clinical data and radiomics features), using support vector machine (SVM) algorithm. The prediction performance of the models was assessed by accuracy, sensitivity, specificity, F1 score, and receiver operating characteristic (ROC) curve. Shapley Additive exPlanations (SHAP) was applied to analyze the interpretability and predictor importance of the model.

Results: A total of 1454 texture features were extracted from the NCCT images. In the test cohort, the ROC analysis showed that the radiomics model and the fusion model showed AUCs of 0.705 and 0.857, which outperformed the clinical model (0.643), with the fusion model exhibiting the best performance. Additionally, the accuracy and sensitivity of the fusion model were also the best among the models (84.8% and 93.8%, respectively).

Conclusions: The model based on NCCT radiomics and machine learning has high predictive efficiency for the prognosis of AIS patients receiving conventional treatment, which can be used to assist early personalized clinical therapy.

PO-0572

Multimodal quantitative magnetic resonance imaging of the thalamus in tinnitus patients with different outcomes after sound therapy

Qian Chen, Zhenchang Wang

Beijing Friendship Hospital, Capital Medical University, Beijing, China

Aims: This study systematically investigated structural and functional alterations in the thalamus and its subregions using multimodal magnetic resonance imaging (MRI) and examined its clinical relevance in tinnitus patients with different outcomes after sound therapy (narrowband noise). **Methods:** In total, 60 patients with persistent tinnitus and 57 healthy controls (HCs) were recruited. Based on treatment efficacy, 28 patients were categorized into the effective group and 32 into the ineffective group. Five MRI measurements of the thalamus and its seven subregions, including gray matter volume, fractional anisotropy, fractional amplitude of low-frequency fluctuation, and functional connectivity (FC), were obtained for each participant and compared between the groups. **Results:** Patients in both the groups exhibited widespread functional and diffusion abnormalities in the whole thalamus and several subregions, with more obvious changes observed in the effective group. All tinnitus patients had abnormal FC compared with the HCs; FC differences between the two patient groups were only observed in the striatal network, auditory-related cortex, and the core area of the limbic system. We combined the multimodal quantitative thalamic alterations and used it as an imaging indicator to evaluate prognosis before sound therapy and achieved a sensitivity of 71.9% and a specificity of 85.7%. **Conclusion:** Similar patterns of thalamic alterations were identified in tinnitus patients with different outcomes, with more obvious changes observed in the effective group. Our findings support the tinnitus generation hypothesis of frontostriatal gating system dysfunction. A combination of multimodal quantitative thalamic properties may be used as indicators to predict tinnitus prognosis before sound therapy.

PO-0573

Study on CT Value of Lingual Thyroid

Yongshun Han

Shanghai Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai, China

Abstract Objective: The objective of the study was to identify the typical imaging features (CT values) of lingual thyroid to facilitate the diagnosis.

Methods: This was a retrospective single-institutional study, with 11 lingual thyroid cases, 28 patients with other lesions at the base of the tongue (control group) and 28 normal orthotopic thyroid controls (normal controls). Nonenhanced and contrast-enhanced CT values were measured.

Results: The mean nonenhanced and contrast-enhanced CT values (\pm SEM) in lingual thyroid were significantly ($P=0.000$) higher than those in control group. All except for two ectopic thyroids (proved to be 1 nodular goiter and 1 Hashimoto's thyroiditis) had attenuation greater than 60HU on nonenhanced CT and 100HU on contrast-enhanced CT. There was no statistical significance between lingual thyroid and normal controls in nonenhanced CT values ($P=0.051$). The mean contrast-enhanced CT values in lingual thyroid were significantly ($P=0.029$) lower than those in normal controls.

Conclusions: In most cases, lingual thyroid can be distinguished from other lesions at the base of the tongue for its characteristic high CT values, although its CT appearance can be affected when pathological cases occur. Lingual thyroid had a lower CT value than normal orthotopic thyroid on contrast-enhanced CT. It may be related to the high proportion of subclinical hypothyroidism in lingual thyroid.

PO-0574

Analysis of clinical and imaging features of carotid web patients with ischemic cerebrovascular disease

Na Fan, Yi Liang, Weiwei Yang, Jingxiong Tao, Wenhui Fan
General Hospital of Yangtze River Shipping & Wuhan Brain Hospital

Abstract To investigate the clinical and imaging features of carotid web(Caw) patients with asymptomatic,transient ischaemic attack (TIA) ,ipsilateral acute ischemic stroke (AIS) .**Methods** Patients diagnosed with carotid webs by CT angiography (CTA),which were retrospectively selected and divided into three groups(asymptomatic Caw group, TIA Caw group and ipsilateral AIS Caw group), according to the occurrence of acute ischemic change.**Results** A total of 76 Caw patients were diagnosed, including 26 asymptomatic Caw, 22 TIA Caw , 19 AIS Caw and 9 other cerebrovascular disease. There were 59 males and 17 females. There was a statistical significance in hypertension, smoking and high-density lipoprotein levels (asymptomatic Caw vs TIA , asymptomatic Caw vs AIS , $P < 0.05$). There was a statistical significance in diabetes (TIA vs asymptomatic Caw, TIA vs AIS , $P < 0.05$). In the comparison of three groups of carotid webs image features including axial length, oblique sagittal length, angle and stenosis, only stenosis had statistical significance (asymptomatic Caw vs AIS , $P < 0.05$). Age, sex, systolic blood pressure, diastolic blood pressure, total cholesterol level, triglyceride level, low density lipoprotein level, carotid webs (axial length, oblique sagittal length, angle) had no statistical significance ($P > 0.05$). **Conclusion** Carotid web is more common in males. Carotid web patients with associated risk factors such as hypertension, diabetes, smoking and high-density lipoprotein levels may be more liable to the occurrence of TIA and AIS .Carotid stenosis caused by carotid webs,which is also closely related to AIS.

PO-0575

Correlation of traditional Chinese medicine syndrome differentiation with CT imaging characteristic of nasopharyngeal carcinoma

Jian Xiang, Xiaona Zhou, Kun Zhang
The First Hospital of Hunan University of Chinese Medicine

Purpose:

To investigate the relationship between TCM syndrome differentiation and CT imaging characterization for the integration of Chinese and modern medical approaches in the treatment of NPC.

Materials and Methods:

A total of 49 patients with pathologically confirmed NPC were enrolled in this study. Prior to treatment, TCM syndrome typing, computed tomography (CT) imaging were performed on all patients. All patients were classified into 4 types (the lung heat congestion type, the liver stagnation and phlegm coagulation type, the blood static blocking collaterals type, the deficiency both qin and blood type) according to TCM syndrome differentiation standard. The correlation between TCM syndrome types and the CT imaging was assessed by Chi-square.

Results:

The liver stagnation and phlegm coagulation type (LSPC) accounted for the highest proportion at 42.9% (21/49), followed by the lung heat congestion type (LHC) with 26.5% (13/49), the deficiency both qin and blood type (DBQB) with 18.4% (9/49) and the blood static blocking collaterals type

(BSBC) with 12.2 % (6/49). CT imaging demonstrated a higher incidence of cervical lymph node metastases and otitis media in the LSPC and the QBQB patients [cervical lymph node metastases: 2/13 (15.4% for LHC) vs. 16/21 (76.2 for LSPC) vs. 3/6 (50% for BSBC) vs. 6/9 (66.7% for QBQB), $P<0.05$; otitis media: 2/13 (15.4% for LHC) vs. 12/21 (57.1% for LSPC) vs. 2/6 (33.3% for BSBC) vs. 7/9 (77.8% for QBQB), $P<0.05$], while the QBQB patients were more prone to skull base invasion [1/13 (7.7% for LHC) vs. 3/21 (14.3% for LSPC) vs. 2/4(50% for BSBC) vs. 8/9 (88.9% for QBQB), $P<0.05$]. TCM syndrome types showed no statistical difference in the unilateral or bilateral location of tumor, the invasion of parapharyngeal space and peripheral muscle invasion (all $P>0.05$).

Conclusions:

CT imaging demonstrated a higher incidence of cervical lymph node metastases and otitis media in the LSPC type and the DBQB type, while the DBQB were more prone to skull base invasion.

PO-0576

Feasibility of the mDIXON method for estimation the parotid gland fat fraction in Sjögren's syndrome

Quanshu Ji^{1,2}, Changwei Ding¹, Xiaoxue Fan¹, gaozhengbo Zhang¹

1. Shengjing Hospital of China Medical University

2. Affiliated Zhongshan Hospital of Dalian University

Objectives: SS characterized by irreversible varying degrees of fat deposition, the objective of this study is to explore the feasibility of estimating fat fraction (FF) in parotid glands with Sjogren's syndrome using the mDIXON method.

Methods: Conventional MRI and mDIXON-Quant were performed on 62 parotid glands (case group) in 31 SS patients and 62 parotid glands (control group) in 31 healthy volunteers with age and mean body mass index matching. The FF values of the two groups were compared, and the changes of FF values with different degrees of fat deposition were analyzed.

Results: The FF value of parotid gland in the case group was significantly higher than that in the control group (35.7 ± 15.7 , 28.3 ± 16.1 , respectively, $P=0.008$). The FF value in the case group increased gradually from no significant fat deposition in the early stage (32.1 ± 4.8) to significant fat substitution (73.0 ± 4.9).

Conclusions: The FF values obtained by the mDIXON method are a new method that can quantitatively assess the extent of SS parotid gland lesions.

PO-0577

Prediction the risk of local recurrence in nasopharyngeal carcinoma patients based on multiparametric MRI

Lijun Wei

Liaoning Cancer Hospital

Abstract

Objective: This study aims to predict the occurrence of local tumor recurrence from the magnetic resonance imaging (MRI) results of routine follow-up treatment with nasopharyngeal carcinoma (NPC).

Methods: This study retrospectively analyzed the clinical and Magnetic resonance imaging(MRI) data of 39 locally recurring nasopharyngeal carcinoma(NPC) patients and 96 non-recurring NPC patients. A predictive score model using the Logistic regression analysis was designed to minimize the possible independent risk factors in the model. In addition, the receiver operator characteristic (ROC) curve was used to test the accuracy of the prediction model.

Results: Compared to the Tx stage and T0 stage, T3-T4 stage increased the recurrence risk of NPC patients (OR=5.793, 95%CI 1.111, 30.202). Compared with individuals without nasopharyngeal cavity(NC) lesions, NC lesions increased NPC recurrence risk (OR=10.393, 95%CI 3.376, 31.999) .

Conclusion: T-stage and NC lesions are key risk factors for local recurrence in NPC patients. The predictive scoring model based on T staging and NC lesions has a good diagnostic power for predicting local recurrence of nasopharyngeal carcinoma, and can provide clinicians with individualized recurrence prediction probability.

PO-0578

Feasibility of 8 mL iodinated contrast media in cerebral computed tomographic angiography with a dual-layer spectral detector

Yinping Leng¹, Ying Liu¹, Shuhao Li¹, Xiwen Wang¹, Yu Wang², Lianggeng Gong¹

1. the Second Affiliated Hospital of Nanchang University

2. Clinical and Technical Support, Philips Healthcare

Objectives The purpose was to evaluate the feasibility of using extremely low contrast media volume and injection rate in cerebral computed tomography angiography on dual-layer spectral detector computed tomography.

Methods In this prospective study, forty patients were randomly enrolled to be group A (8 mL contrast media with 1 mL/s flow rate), then matched the same number of cases to group B (40 mL contrast media with 4 mL/s flow rate). The virtual monoenergetic images at 40-70 keV (virtual monoenergetic image 40-virtual monoenergetic image 70) with 10 keV interval in group A and polychromatic conventional images in two groups were reconstructed. computed tomography attenuation, image noise, contrast-to-noise ratio and signal-to-noise ratio were evaluated in the internal carotid artery and middle cerebral artery. Subjective image quality was assessed on a five-point scale.

Results In group A, the mean subjective image quality score, computed tomography attenuation and contrast-to-noise ratio of internal carotid artery, and middle cerebral artery were the highest on virtual monoenergetic image 40. The mean noise on virtual monoenergetic image 40-70 were all lower than polychromatic conventional images in group A (all $P < 0.05$). The average subjective image quality score, computed tomography value of internal carotid artery, middle cerebral artery, and cerebral parenchyma on virtual monoenergetic image 40 in group A were similar to those on polychromatic conventional images in group B ($P > 0.05$). The mean signal-to-noise ratio and contrast-to-noise ratio of internal carotid artery, and middle cerebral artery on virtual monoenergetic image 40 in group A were significantly higher than those on polychromatic conventional images in group B.

Conclusions Cerebral computed tomography angiography on virtual monoenergetic image 40 with 8 mL contrast media and 1 mL/s injection rate could provide diagnostic image quality.

PO-0579

Dual-Energy CT-based intratumoral and peritumoral radiomics can preoperatively predict initial recurrence risk in papillary thyroid cancer

Yan Zhou, Yong-Kang Xu, Xiao-Quan Xu, Fei-Yun Wu

The First Affiliated Hospital of Nanjing Medical University (Jiangsu province Hospital)

Background: Accurate evaluation of initial recurrence risk in papillary thyroid carcinoma (PTC) is of deep clinician concern. Intratumoral and peritumoral radiomics on dual-energy CT (DECT) provides an effective approach to investigate the vascular heterogeneity of target tumors at multiple scales. **Objective:** To explore the value of intratumoral and peritumoral radiomics on DECT for preoperatively predicting initial recurrence risk in PTC.

Materials and Methods: Total 236 PTC patients (training set, 165; validation set, 71) from July 2020 to June 2021 were retrospectively enrolled. Semiautomatic tumor segmentation was performed in the intratumoral and the peritumoral region with 2.5 mm outer and inner distance to the tumor boundary on unenhanced, arterial, and venous phase mixed images and iodine maps. Three corresponding rad-scores were built (rad-score [VOI^{whole}], rad-score [VOI^{outer layer}], and rad-score [VOI^{inner layer}]), respectively. Multivariate logistic regression was used to establish three radiomics models (radiomics model 1-3) incorporating the three rad-scores with other risk factors, and compared with the clinical model alone. A radiomics model that achieved the optimal performance was presented as a nomogram. Nomogram performance was assessed by predictive performance, calibration, and clinical utility.

Results: Rad-score (VOI^{outer layer}) and rad-score (VOI^{inner layer}) both significantly outperformed rad-score (VOI^{whole}) (training set, $P=0.036$, $P=0.001$; validation set, $P=0.044$, $P=0.011$). Three radiomics models all significantly surpassed the clinical model. Radiomics model 2 and 3 based on peritumoral rad-scores significantly preceded radiomics model 1 based on intratumoral rad-score (training set, $P=0.039$, $P<0.001$; validation set, $P=0.037$, $P=0.034$). A radiomics nomogram incorporating tumor size, tumor site, and rad-score (VOI^{inner layer}) was constructed with the optimal performance (training set, AUC=0.877; validation set, AUC=0.876). Good calibration, clinical utility, and performance stability of the nomogram was confirmed.

Conclusion: DECT-based radiomics analysis, especially performed in the peritumoral region, is useful for preoperative prediction of initial recurrence risk in PTC.

PO-0580

Value of arterial spin label technique on 3.0 T MR scanner in evaluating blood flow of thyroid glands in healthy adults

Wenming Deng¹, Jiahui Xiao¹, Qian Yang¹, Dehong Luo^{1,2}

1. National Cancer Center, National Clinical Research Center for Cancer, Cancer Hospital & Shenzhen Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

2. National Cancer Center, National Clinical Research Center for Cancer, Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objective To investigate the feasibility and reproducibility of using three-dimensional arterial spin labeling (3D-ASL) technique to evaluate the thyroid blood flow (TBF) of healthy adults and compare the difference in TBF between subjects with different gender and age. **Methods** In this prospective study, 100 healthy adult subjects were enrolled from November 2018 to June 2019 in Chinese Academy of Medical Sciences Cancer Hospital, Shenzhen Hospital. All of subjects received thyroid 3D-ASL MRI scanning, but several subjects were excluded for analysis for reason including intolerance to examination ($n=1$), overt artefacts ($n=11$), abnormality detected in thyroid gland

during conventional structure MRI ($n=15$), resulting in 73 subjects included. Two attending radiologists independently evaluated the quality of ASL images and measured the TBF in upper, middle and lower poles of each lobe in thyroid gland bilaterally. Cohen's kappa was used to test the agreement in image quality between 2 radiologists, while intraclass correlation (ICC) analysis was implemented to evaluate the consistency in TBF measurements. Univariate variance analysis was used to compare the TBF in upper, middle and lower pole of thyroid gland unilaterally, and student t-test was performed to test the difference in TBF between two lobes, or in the same lobe but between different gender or age groups. Results For image quality, 2 radiologists have good agreement ($\text{kappa}=0.753$, $P<0.001$). In terms of TBF, consistency was moderate in the lower pole of left lobe between 2 radiologists ($\text{ICC}=0.648$, $P<0.001$), but good in the remaining parts of thyroid gland (all $\text{ICC}>0.75$, $P<0.001$). Unilaterally, TBF in the middle pole was significantly higher than those in the upper or lower pole ($P<0.001$), but no significant difference was found between the upper and lower pole ($P>0.05$). Regardless of upper, middle or lower pole, TBF in the right lobe was higher than the counterpart in the left lobe ($t=6.182$, 6.294 , 4.896 respectively, $P<0.001$). Between male subjects ($n=31$) and female subjects ($n=42$), no significant difference was found in the corresponding upper, middle or lower pole of thyroid lobe unilaterally ($P>0.05$). As for age group, TBF in the middle pole of thyroid gland was higher in the middle age group (45—59 years old, $n=12$) than that in the young adult group (18—44 years old, $n=61$) ($t=3.868$, $P=0.003$ for the left lobe, and $t=2.647$, $P=0.022$ for the right lobe), but no significant difference was found in the upper or lower pole of the unilateral thyroid lobe ($P>0.05$). Conclusion ASL can accurately measure blood flow perfusion in the thyroid gland with good reproducibility.

PO-0581

The Role of Multidetector CT Angiography in the assessment of disease activity in Takayasu's Arteritis

Yu Lan, Yang Hou
China medical university

Objective To explore the clinical application value of computed tomography angiography (CTA) in evaluating the disease activity of Takayasu arteritis (TA).

Methods Sixty-one consecutive patients with TA from January 2010 to December 2021 were included in this study. Demographic and clinical characteristics, acute-phase reactants (APRs) and CTA indicator parameters were recorded. The value of CTA in identifying disease activity was evaluated, using Erythrocyte Sedimentation Rate (ESR) as a reference. A disease activity evaluation model was constructed to compare the benefits of the new model with ESR and Kerr scores by evaluating the consistency index (C-index), the net reclassification index (NRI) and the integrated discriminant index (IDI).

Results In total, 29 (47.54%) cases showed active disease. The C-index of ESR to indicate disease activity was 0.778 (95% CI: 0.635, 0.874). The new activity assessment model combining ESR, maximal wall thickness and perivascular fat density (PFD) showed significant improvement in C-index over the ESR method (0.902 vs 0.778, $P<0.01$; NRI 0.948, $P<0.01$; and IDI 0.204, $P<0.01$). In addition, the new model demonstrated a significant superiority over the Kerr score in terms of the C-index (0.902 vs 0.771, $P<0.05$), NRI (1.142, 95% CI: 0.730, 1.556, $P<0.01$) and IDI (0.300, 95% CI: 0.187, 0.423, $P<0.01$).

Conclusions A novel CTA-based method that involves combining ESR with maximal wall thickness and PFD demonstrated superiority in identifying active TA compared with conventional methods.

PO-0582

Increased brain iron in patients with thyroid-associated ophthalmopathy: a whole-brain analysis

Jiang Zhou, Hao Hu, Xiao-Quan Xu, Fei-Yun Wu
The First Affiliated Hospital of Nanjing Medical University

Objectives: To investigate the whole-brain iron deposition alternations in patients with thyroid-associated ophthalmopathy (TAO) using quantitative susceptibility mapping (QSM).

Methods: Forty-eight patients with TAO and 33 healthy controls (HCs) were enrolled. All participants underwent brain magnetic resonance imaging scans and clinical scale assessments. QSM values were calculated and compared between TAO and HCs groups using a voxel-based analysis. A support vector machine (SVM) analysis was performed to evaluate the performance of QSM values in differentiating patients with TAO from HCs.

Results: Compared with HCs, patients with TAO showed significantly increased QSM values in the bilateral caudate nucleus (CN), left thalamus (TH), left cuneus, left precuneus, right insula and right middle frontal gyrus. In TAO group, QSM values in left TH were positively correlated with Hamilton Depression Rating Scale (HDRS) scores ($r = 0.414$, $p = 0.005$). The QSM values in right CN were negatively correlated with Montreal Cognitive Assessment (MoCA) scores ($r = -0.342$, $p = 0.021$). Besides that, a nearly negative correlation was found between QSM values in left CN and MoCA scores ($r = -0.286$, $p = 0.057$). The SVM model showed a good performance in distinguishing patients with TAO from the HCs (area under the curve, 0.958; average accuracy, 90.1%).

Conclusions: Patients with TAO had significantly increased iron deposition in brain regions corresponding to known visual, emotional and cognitive deficits. QSM values could serve as potential neuroimaging markers of TAO.

PO-0583

Differential diagnosis of MRI Multi-sequence Imaging Technology in NAION and DON

Jinyi Ma, yongbin li
Department of Medical Imaging

Aims: To evaluate the value of magnetic resonance imaging (MRI) multi-sequence imaging technology in the differential diagnosis of acute non-arteritic anterior ischaemic optic neuropathy (NAION) and demyelinating optic neuritis (DON).

Methods: All patients underwent MRI orbital scanning, diffusion-weighted imaging (DWI), T1-weighted imaging (T1WI)-enhanced imaging, and enhanced examination. The clinical and MRI imaging features of the two groups were analysed by two doctors.

Results: The area under the curve of the diagnostic model with the single-index 'central bright spot sign' added to the age and sex basic model was the largest (92.93%). The diagnostic model with the central bright spot sign was statistically different from the basic model of age and sex.

Conclusion: The central bright spot sign on T2-weighted imaging-fluid attenuated inversion recovery can distinguish acute NAION from DON. The diagnostic model which combined age, sex, and central bright spot sign had the best diagnostic efficacy for differential diagnosis of NAION and DON in the acute stage.

PO-0584

Effect of different body position design on X-ray Grating Artifacts in Thyroid-Enhanced CT

Li Zhan, Yang Deng
Army Special Military Medical University

[Abstract] Objective Objective To improve the artifacts of thyroid enhanced ct by changing the position design. Methods An indwelling needle was placed in the right elbow vein and divided into conventional group A (bilateral arm sagging), group B (left arm lift), C (right arm lift) and D (bilateral arm lift). The four groups were rated subjectively by two high-year physicians, and the ratings of the four groups were compared using the chi-square test. The CT and SD values of the upper neck cartilage of plain scan, artery and vein; the CT and SD values of the thyroid and the CT and SD values of the neck and the C T and S D values of the common carotid artery and the total carotid artery. The four groups were compared using ANOVA and multiple comparisons. Results Subjective evaluation: 2.97 in upper neck group A, 2.23 in group B, 2.37 in group C and 1.77 in group D. Group A in each period, improved B and C and improved D except B and C; 0.93 points in lower neck A, 1.97 in B, 1.8 in C and 1.83 in D. Routine group A of each stage image was inferior to each improvement group, with a statistically significant difference and no significant difference between each improvement group. Objective evaluation: the signal to noise ratio of sternocleidomastoid muscle in the upper neck was significantly larger than the improvement group, no significant difference between improvement groups B and C but greater than the improvement group D; There was no statistical difference between the groups in the lower neck artery period, and the contrast signal to noise ratio of the thyroid and fat gaps in the conventional groups was significantly smaller than that of the improvement groups; the subclavian vein, subclavian artery and common carotid artery. Conclusion The image quality of thyroid enhanced CT, with single arm holding as the best position.

PO-0585

Radiographic analysis of desmoplastic fibroma of the jaw bones

Xiaoyan Wang
Department of Radiology, Shanghai Ninth People's Hospital, Shanghai Jiaotong University School of Medicine

Objective: To analyze the clinical manifestations and radiographic features of desmoplastic fibroma (DF) in order to achieve better understanding of this disease.

Methods: The clinical and imaging findings of 17 patients with DF were retrospectively analyzed. 16 patients with enhanced CT, 1 patient with plain CT, 27 patients with enhanced MR.

Results: Among the 17 patients, 11 were male and 6 were female. Patient age ranged from 4 years old to 64 years old with a mean of 20.27 years old. The main clinical manifestations were painless mandibular mass and difficult to open mouth. All cases were in the mandibles, mainly located in the corner of the mandibles. The image is dissolved expansion and partial compression and erosive bone destruction, with soft tissue mass, central or eccentric growth. All cases had "tree root-like" bony ridges. The imaging presentations were divided into 3 types: expansile destruction (n=6), osteolytic destruction (n=6), and parosteal destruction (n=5). Lesions showed moderate/marked enhancement after contrast-enhanced scanning. All cases have no calcification and periosteal reaction. MR showed isointense or hypointense on T1 weighted images, hypointense on T2 weighted images. The mean ADC value was $1.2 \times 10^{-3} \text{mm}^2/\text{s}$. The TIC type of 3 cases was type I, and 2 cases with type II.

Conclusions: DF is aggressive and easy to relapse, so it is important to recognize DF radiology features. CT, MR and functional examination can reflect the tissue composition of the lesion, and provide an important basis for the correct preoperative diagnosis.

PO-0586

Preoperative Prediction of Pathologic Response to Neoadjuvant Immunotherapy in Resectable Locally Advanced Head and Neck Squamous Cell Carcinoma Using Multiparametric MRI

Jiayue Han, Yuxi Tao, Lianmei Luo, Yaqin Zhang
The Fifth Affiliated Hospital of Sun Yat-Sen University

Rationale and Objectives Reliable preoperative prediction of pathologic response to Neoadjuvant immunotherapy of patients with head and neck squamous cell carcinoma (HNSCC) could guide clinical selection and the patients could also be spared from ineffective and unnecessary toxicity.

The aim of this study was to evaluate the value of quantitative changes in MR imaging after neoadjuvant immunotherapy in predicting pathologic response in resectable locally advanced HNSCC patients.

Materials and Methods

Fifteen patients with resectable locally advanced HNSCC who were recruited in the prospective phase Ib clinical trial were included in the current retrospective analysis. In this current analysis, patients have underwent contrast-enhanced MRI and diffusion-weighted MRI scanning before neoadjuvant immunotherapy and radical resection of the tumor respectively. Response to neoadjuvant immunotherapy was based on histopathological evaluation of the resected specimen. The volume of the primary tumour and the value of the apparent diffusion coefficient (ADC) was measured. Fisher's exact test and the Mann-Whitney U-test were used to compare the two groups of treatment response (good response and poor response).

The area under the receiver operating characteristic curve

(ROC) was used to calculate the capacity of relative changes in ADC value and tumor volume to discriminate between different pathologic response groups.

Results
Good response was found in 33.3% of all patients. Relative changes in primary tumour volume ($\Delta V_{\text{primary}}$ $p=0.001$) and in DW-MRI parameters ($\Delta \text{ADC}_{\text{primary}}$ $p=0.03$) after neoadjuvant immunotherapy were significantly different between the groups of good response and poor response. When the relative changes in tumor volume were used to predict treatment response, the area under the curve (AUC) was 0.98, with 100% sensitivity and 90% specificity. Change in ADC value achieved an AUC of 0.89 with a sensitivity of 100% and a specificity of 71% for the prediction of treatment response.

Conclusion
Changes in tumour volume and ADC value after neoadjuvant immunotherapy can help identify patients with good response to neoadjuvant immunotherapy in HNSCC.

PO-0587

The prevalence of malleus-tympanum synostosis on ultra-high-resolution CT: A preliminary study

Ning Xu, Pengfei Zhao, Xiaoshuai Li, Heyu Ding, Han Lv, Ruowei Tang, Chihang Dai, Xiaoyu Qiu, Zhengyu Zhang, Hongxia Yin, Zhenghan Yang, Guopeng Wang, Jing Xie, Qian Wu, Shusheng Gong, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Purpose To determine the prevalence of malleus-tympanum synostosis (MTS) in different individuals via 0.1 mm ultra -high-resolution CT (U-HRCT).

Methods This retrospective study evaluated U-HRCT scans with 0.1 mm thickness of 1587 ears from 1122 subjects from October 2020 to March 2022. MTS was detected in subjects with normal ears, subjects with different types of hearing loss (HL), and subjects with various causes of conductive HL. The prevalence of MTS was calculated and statistically compared between subjects with normal ears and with different types of HL, as well as between subjects with various causes of conductive HL. The correlation between MTS and age or gender was calculated using the Mann–Whitney U test.

Results The prevalence of MTS was 2.8% (16/577), 3.4% (12/352), 7.2% (27/374), and 13.7% (39/284) in subjects with normal, mixed HL, sensorineural HL, and conductive HL ears, respectively. MTS was more common in subjects with HL than in subjects with normal ears ($p < 0.001$), and significant differences were shown between mixed and sensorineural HL groups ($p = 0.023$), between mixed and conductive HL groups ($p = 0.001$), and between sensorineural and conductive HL groups ($p = 0.006$). The prevalence of MTS was 83.9% (52/62), 34.8% (23/66), 12.6% (61/483), 7.5% (8/107), and 6.9% (7/102) in subjects with conductive HL with tympanosclerosis, definite middle ear malformations, otitis media, otosclerosis, and middle ear cholesteatoma, respectively. Besides, MTS was found in 18.8% (6/32) of subjects with unexplained conductive HL, 3 of whom were confirmed as having malleus fixation by surgery. No correlation was shown between MTS and age ($p = 0.41$) or gender ($p = 0.70$) in subjects with normal ears.

Conclusion MTS is a new sign that can be clearly visualized on an ultra-high-resolution CT with 0.1 mm thickness. The prevalence of MTS was 2.8% and 7.7% in subjects with normal ears and with HL, respectively. It may be asymptomatic, or may be associated with conductive HL.

PO-0588

Quantitative evaluation of diffusion-weighted MRI for differentiating benign and malignant thyroid nodules larger than 4 cm

Tingting Zheng, Xiaoli Xie, Bin Song
Fudan University Minhang Hospital

Purpose: We aimed to diagnose the benign or malignant of thyroid nodules larger than 4 cm by quantitative analysis of diffusion-weighted imaging (DWI).

Methods: 82 thyroid nodules were investigated retrospectively and divided them into benign ($n = 62$) and malignant groups ($n = 20$). Quantitative features like DWI and apparent diffusion coefficient (ADC) signal intensity standard deviation (DWI_{SD} and ADC_{SD}), DWI and ADC signal intensity ratio (DWI_{SIR} and ADC_{SIR}), mean ADC and minimum ADC value (ADC_{mean} and ADC_{min}) and ADC value standard deviation (ADC_{VSD}) were calculated. Univariate and multivariate logistic regression were conducted to identify independent predictors, and develop a prediction model. We performed receiver operating characteristic (ROC) analysis to determine the optimal threshold of risk factors, and constructed combined threshold models. Diagnostic performance including area under the ROC curve (AUC), accuracy, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), unnecessary biopsy rate of all models were calculated and compared with the American College of Radiology Thyroid Imaging Reporting and Data System (ACR-TIRADS) result.

Results: Two independent predictors of malignant nodules were identified by multivariate analysis: $DWISIR$ ($P = 0.007$) and ADC_{min} ($P < 0.001$). The AUCs for prediction model, combined threshold of $DWISIR$ and ADC_{min} , combined threshold of $DWISIR$ and ADC_{SIR} and ACR-TIRADS were 0.946 (0.896-0.996), 0.875 (0.759-0.991), 0.777 (0.648-0.907) and 0.722 (0.588-0.857). The combined threshold of $DWISIR$ and ADC_{min} had the lowest unnecessary biopsy rate of 0%, compared with 56.3% for ACR-TIRADS.

Conclusion: Quantitative DWI demonstrated favorable malignant thyroid nodule diagnostic efficacy. Combined thresholds of $DWISIR$ and ADC_{min} greatly reduced the unnecessary biopsy rate.

PO-0589

Thyroid Imaging Reporting and Data System with MRI Morphological Features for Thyroid Nodules: Diagnostic Performance and Unnecessary Biopsy Rate

Tingting Zheng, Yuan Zhang, Bin Song, Yan Lei
Fudan University Minhang Hospital

Objects To assess MRI-based morphological features in improving the American College of Radiology Thyroid Imaging Reporting and Data System (ACR-TIRADS) for categorizing thyroid nodules.

Methods A retrospective analysis was performed on 728 thyroid nodules (453 benign and 275 malignant) that postoperative pathology confirmed. Univariate and multivariate logistic regression analyses were used to find independent predictors of MRI morphological features in benign and malignant thyroid nodules. The improved method involved increasing the ACR-TIRADS level by one when there are independent predictors of MRI-based morphological features, whether individually or in combination, and conversely decreasing it by one. The study compared the performance of conventional ACR-TIRADS and different improved versions.

Results Restricted diffusion and reversed halo sign were identified as independent risk factors for malignancy in thyroid nodules (OR=45.1, 95% CI=23.2-87.5, $P<0.001$; OR=38.0, 95% CI=20.4-70.7, $P<0.001$). The areas under the receiver operating characteristic curves (AUCs) for both the conventional and four improved ACR-TIRADSs were 0.887 (95% CI: 0.862-0.911), 0.945 (95% CI: 0.928-0.963), 0.947 (95% CI: 0.929-0.965), 0.945 (95% CI: 0.928-0.963) and 0.951 (95% CI: 0.934-0.967), respectively. The unnecessary biopsy rates for the conventional and four improved ACR-TIRADSs were 62.8%, 30.0%, 27.1%, 26.8% and 29.1%, respectively, while the malignant missed diagnosis rates were 1.1%, 2.5%, 2.9%, 4.4% and 1.2%.

Conclusions MRI morphological features with ACR-TIRADS has improved diagnostic performance and reduce unnecessary biopsy rate while maintaining a low malignant missed diagnosis rate.

PO-0590

Application Value of Radiomics Approach in predicting Chromosomal Arms 1p/19q in Low-Grade Gliomas

Wei Wei, Lihua Fan, Nan Yu, Yunsong Zheng, Yong Yu
Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: This study is to evaluate the value of radiomics in predicting the 1p/19q status of LGG based on T2-weighted MR images.

Methods: All study patients (n=82) from the Cancer Genome Atlas (TCGA) data portal who had pre-operative MRI images and biopsy proven 1p/19q status consisting either no deletion or co-deletion were included. We manually segment the tumors in 3D mode layer by layer on T2-weighted images, and extract 396 radiomics features including Histogram, Gray Level Co-occurrence Matrix (GLCM), Grey Level Size Zone Matrix (GLSZM), Run Length Matrix (RLM), Form Factor and Haralick. We divided the non-deleted and co-deleted patients into two independent cohorts as training cohort and validation cohort in a ratio of 7:3. The least absolute shrinkage and selection operator (LASSO) logistic regression model was used for further feature screening and 7 features with non-zero coefficients in the logistic regression model were selected in the training cohort. A formula was generated using a linear combination of selected features that were weighted by their respective LASSO coefficients. A radiomics score was calculated for each patient by the

formula to reflect the 1p/19q status. The performance of the radiomics signature was evaluated using the area under curve (AUC) of receiver operating characteristic curve. We performed decision curve analysis (DCA) within training and validation cohorts to assess the clinical usefulness of the signature.

Result: This study included 34 non-deleted and 48 co-deleted LGG. 7 features with non-zero coefficients were chosen from 396 candidate features to build a radiomics model that significantly correlated with the 1p/19q status. The model showed good calibration and discrimination in the training cohort, with an AUC of 0.754 (95% CI: 0.623-0.884), sensitivity of 79% and specificity of 74%. In the validation cohort, the AUC was 0.757 (95% CI: 0.547-0.967) with sensitivity of 80% and specificity of 71%. DCA for the radiomics label in the training cohort showed that using the radiomics label to predict 1p/19q status added more benefit than treating either all or no patients if the threshold probability was between 0.14 and 0.90.

Conclusion: The radiomics label can be used as a noninvasive method to predict the 1p/19q status of LGG for clinical decision of optimal therapy options.

PO-0591

Evolution of radiation-induced temporal lobe injury after intensity-modulated radiation therapy in nasopharyngeal carcinoma: a large cohort retrospective study

jing hou
the Hunan Cancer Hospital

Background: Previous studies have demonstrated conflicting findings regarding the initial magnetic resonance imaging (MRI) signs of radiotherapy-induced temporal lobe injury (RTLTI) and the evolution of different RTLTI patterns.

Purpose: To evaluate the initial MRI findings and evolution of RTLTI in patients with nasopharyngeal carcinoma.

Materials and Methods: Data of patients with RTLTI were retrospectively collected from two hospitals between January 2011 and December 2021. The injured lobes were categorized into three patterns based on initial MRI findings: isolated white matter lesions (WMLs), isolated contrast-enhanced lesions (CELs), and a combination of WMLs and CELs. The latency period, appearance, and temporal changes in WMLs and CELs were evaluated.

Results: A total of 913 patients with RTLTI with 1092 injured lobes were included in this study, constituting 640 men and 273 women, with a mean age of 43 ± 12.7 years. The numbers of isolated WMLs, isolated CELs, and combined WMLs and CELs identified at the first MRI detection were 7(0.6%), 172(15.8%), and 913(83.6%), respectively. The evolution of bilateral RTLTI was different in the same patient, and that of unilateral RTLTI combined with WMLs and CELs also occurred asynchronously. The time intervals from the initial MRI detection of isolated WMLs, isolated CELs, combined WMLs, and CELs to the last negative MRI scan were 8.6, 8.9 and 11.0 months, respectively. A significant difference was observed in the time intervals between the three patterns ($H = 14.287$, $P = 0.001$). Age and the time interval between the first RTLTI detection and the previous negative MRI examination were independent factors influencing the initial MRI signs of RTLTI.

Conclusion: WMLs and CELs can manifest as the earliest and sole MRI abnormalities in patients with RTLTI. Shorter intervals between MRI examinations may reveal more information about the natural history of RTLTI.

PO-0592

Age-related changes in computed tomography density of thyroid gland in children: a single-centre retrospective study in Northern China

Xiaoli Yi
Capital Institute of Pediatrics

Objective: The thyroid gland normally presents as a hyperdense organ on non-contrast computed tomography (CT) in adults. The correlation between thyroid gland CT density and its functional status has been studied; however, little is known regarding its density in children with normal thyroid functions. We aimed to assess the correlation between thyroid gland CT density and age in children with normal thyroid functions.

Methods: We enrolled 74 patients who had normal thyroid functions within 1 month before or after undergoing neck or cervical spine CT for trauma, neck masses, congenital diseases, and airway stenosis. Their CT images were retrospectively analyzed by two independent radiologists. Based on age, patients were divided into four groups: infant, preschool-aged, school-aged, and adolescence groups.

Results: Patients with thyroid gland hypodensity in the infant group (70%, 14/20) were significantly more numerous than those in preschool-aged (25%, 4/16), school-aged (20%, 5/25), and adolescence (15.4%, 2/13) groups ($P = 0.007$, 0.001 , and 0.002 , respectively, Fisher's exact test). The mean CT density of the thyroid gland was also lower in the infant group compared to the densities in other age groups. There was a weak positive correlation between thyroid CT density and age ($r = 0.264$, $P = 0.023$, linear regression analysis).

Conclusions: Thyroid CT density is related to age in children. The thyroid gland normally has a low density on non-contrast CT in most infants with normal thyroid function.

PO-0593

Diagnostic Value of Cochlear Nerve Characteristics for Occupational Noise Induced Hearing Loss

Nan Wang, Lei Liu, Lei Zhang, Lan Liu, Ying Liu, Jun Shi
Tianjin Occupational Diseases Precaution and Therapeutic Hospital

Objective: To explore the diagnostic value of cochlear nerve characteristics in the diagnosis of occupational noise-induced hearing loss (NIHL).

Methods: This prospectively observational study included patients with NIHL, patients with noise exposure, and healthy volunteers at Tianjin Occupational Diseases Prevention and Treatment Hospital between January 2021 and September 2022. Multi-planar reconstruction of bilateral cochlear nerves was performed to extract the cochlear nerves characteristics, including the long diameter, short diameter, average diameter, length-to-diameter ratio, cross-sectional area, and perimeter of the cochlear nerves at three different planes, and the diagnostic value for NIHL were evaluated by area under the receiver operating characteristic curve (AUC).

Results: The NIHL ($n=27$, 24 males, aged 47.9 ± 6.2 years), noise-exposed ($n=41$, 34 males, aged 46.9 ± 6.7 years), and healthy control ($n=27$, 23 males, aged 48.0 ± 6.1 years) groups were included. In bottom plane, the short diameter (0.55 ± 0.15 vs. 0.75 ± 0.16 mm), long diameter (0.83 ± 0.18 vs. 1.07 ± 0.23 mm), average diameter (0.69 ± 0.15 vs. 0.91 ± 0.18 mm), area (0.39 ± 0.15 vs. 0.72 ± 0.21 mm²), and perimeter (2.33 ± 0.48 vs. 3.08 ± 0.58 mm) of the NIHL group were significantly lower than those of the noise-exposed group (all $P < 0.05$). The area of bottom plane showed best diagnostic value, with AUC of 0.921 (95% CI: 0.855-0.987).

Conclusion: Cochlear nerve characteristics might be helpful in the diagnosis of NIHL, and the area of bottom plane showed best diagnostic value.

PO-0594

The changes of iron load in specific brain areas lead to neurodegenerative disease of the central nervous system

Xinghao Wang, Qian Chen, Jing Sun, Jia Li, Yawen Liu, Han Lv, Zhenghan Yang, Zhenchang Wang
Department of Radiology, Beijing Friendship Hospital, Capital Medical

Background: Central nervous system degenerative diseases refer to a group of diseases caused by chronic progressive degenerative degeneration of central nervous tissues, including Parkinson's disease (PD), Alzheimer's disease (AD), Huntington disease (HD), amyotrophic lateral sclerosis (ALS), multiple sclerosis (MS), etc. At present, the causes of these diseases have not been clearly studied, which brings great pain and burden to patients and their families, and challenges to social health burden.

Aim: Mendelian randomization (MR) was used to reveal the causal effect of iron load (SWI display) in some brain regions on degenerative diseases of the central nervous system.

Methods: Our brain imaging data were from a genome-wide association study based on 39691 head multimodal imaging samples in UK Biobank. Our aim was to explore Susceptibility weighted imaging (SWI), which represents the iron load of tissues and its impact on degenerative diseases of the central nervous system. We selected brain regions with genetic significance and stability for analysis, which are mainly distributed in basal ganglia, thalamus and limbic system. For AD, we selected 63926 samples from Alzheimer's Disease Genetics Consortium (ADGC), European Alzheimer's Disease Initiative (EADI) and other institutions. For PD, the data was from the International Parkinson's Disease Genomics Consortium, while the data for ALS was from a genome-wide association study based on 84694 people. For MS, the data was from 115803 gene data of the International Multiple Sclerosis Genetics Consortium. For Pick disease, data from 3024 multicenter researchers were studied in 2010. For Vascular dementia, more than 200000 European population cohorts were selected and divided into four subtypes. Finally, the inverse variance weighting was used as the main estimate, while MR Pleiotropy RESidual Sum and Outlier, MR Egger and weighted median were used to detect heterogeneity and pleiotropy.

Results: Through 399 screening of permutations and combinations, a total of nine positive results were presented to us. However, the iron load in these brain areas has a positive or negative or unrelated relationship with the occurrence of neurodegenerative diseases. For AD and PD, the increase of iron load in some brain regions is the cause of lesions. Right pallidum was significant for AD, and right caudate, left caudate and right accumbens were significant for PD. However, for MS and vascular dementia, the reduction of iron load was statistically significant. The right and left chambers are meaningful to MS, the left hippocampus plus right hippocampus is meaningful to Vascular dimensionia (Mixed), and the left thalamus and left accumbens plus right accumbens are meaningful to Vascular dimensionia (Subcortical).

Conclusion: Iron load changes lead to many neurogenic diseases, rather than diseases leading to iron load changes, which is both causal and reveals the relationship between time sequence. The increase or decrease of iron load in different brain regions has a causal effect on the occurrence of different degenerative diseases of the central nervous system, which is crucial for the understanding of the pathogenesis and exploration of treatment of this kind of disease.

PO-0595

Changes in apparent diffusion coefficient values of the parotid gland before and after treatment in patients with primary Sjögren's syndrome

Manting Tian, Changwei Ding, Xiaowen Jiang
Shengjing Hospital of China Medical University

Objectives: To investigate the changes in the apparent diffusion coefficient (ADC) values of the parotid gland before and after treatment in patients with primary Sjögren's syndrome (pSS), to correlate these changes with laboratory indicators, and to evaluate the utility of ADC values when combined with laboratory indicators for assessing changes in the inflammatory activity of the parotid parenchyma in patients with pSS.

Methods: Twenty-three patients with pSS underwent routine magnetic resonance imaging and diffusion-weighted imaging of the parotid glands before and after treatment. The ADC values were measured for the parotid parenchyma and spinal cord on the same slice, and the ratio (ADCR) was calculated. We analyzed the change rate of ADCR ($\Delta\text{ADCR}/\text{ADCR}$ before treatment) to determine its efficacy in evaluating changes in inflammatory activity. Logistic regression analysis was used to combine the change rate of ADCR with that of Laboratory indicators with significant changed.

Results: After treatment, we observed an increase in ADCR values (from 1.022 ± 0.098 to 1.131 ± 0.097) and a decrease in the rheumatoid factor (RF) (from 44 to 33). When the cutoff value for the change rate of ADCR was set at 0.059, the area under the curve (AUC) was 0.822, with a sensitivity of 80% and specificity of 88.9% for assessing changes in inflammatory activity.

Conclusion: ADC values can be a marker for evaluating changes in pathological status of parotid gland in patients with pSS before and after treatment, and the combination of ADCR and RF change rates may improve the accuracy of assessing changes in inflammatory activity.

PO-0596

Structural and functional brain changes after glucocorticoid therapy in thyroid-associated ophthalmopathy

Qian Wu, Zhou Jiang, Wen Hao Jiang, Xiong Ying Pu, Xiao Quan Xu, Hao Hu, Fei Yun Wu
The First Affiliated Hospital of Nanjing Medical University

Purpose: To investigate the brain structural and functional alterations in patients with thyroid-associated ophthalmopathy (TAO) before and after glucocorticoids therapy, using voxel-based morphometry (VBM) as well as resting-state functional magnetic resonance imaging (fMRI) with amplitude of low-frequency fluctuation (ALFF) and regional homogeneity (ReHo).

Methods: Between 2019 and 2022, 32 patients with TAO and 23 healthy controls were recruited to undergo pre-therapy MRI scans in. Intravenous glucocorticoid therapy was administered to all patients. Twenty-six of the patients were available for rescanned MRI three months after the end of therapy. The VBM, ALFF and ReHo methods were used to evaluate the brain structural and functional differences.

Results: Before therapy, TAO patients showed significantly decreased gray matter volume in left orbital part of superior frontal gyrus (ORBsup) and medial superior frontal gyrus (SFGmed) than healthy controls. Patients had higher ALFF values in bilateral gyrus rectus and olfactory cortex as well as lower values in bilateral cuneus. Besides, the patients showed decreased ReHo values in bilateral lingual gyrus. After therapy, increased gray matter volume in left anterior cingulate

gyrus and SFGmed, increased ALFF values in bilateral cuneus and superior occipital gyrus, as well as increased ReHo values in bilateral SFGmed were found in TAO patients compared to the pre-therapy cohort. Compared to controls, decreased gray matter volume in left ORBsup was observed in post-therapy TAO patients.

Conclusion: Our results indicated that TAO might cause functional and structural deficits in the visual and emotional regions of the brain, with recovery in the former and partial restoration in the latter after effective glucocorticoid therapy. These findings may lead to a deeper understanding of the pathophysiological mechanism behind TAO.

PO-0597

Time-dependent diffusion magnetic resonance imaging for the characterization of parotid gland tumors: a pilot study

Di Geng¹, Xiance Zhao², Yishi Wang³, Xiaoquan Xu¹, Feiyun Wu¹

1. The First Affiliated Hospital of Nanjing Medical University

2. Philips Healthcare, Shanghai, China

3. Philips Healthcare, Beijing, China

Abstract

Objective To investigate the utility of quantitative parameters derived from time-dependent diffusion magnetic resonance imaging (td-dMRI) in the characterization of parotid gland tumors.

Materials and Method Thirty-nine patients with parotid gland tumors were prospectively enrolled, including 24 patients with polymorphic adenomas (PAs), 8 patients with Warthin's tumors (WTs) and 7 patients with malignant tumors (MTs). td-dMRI was scanned in the pre-surgery MRI evaluation. Intracellular volume fraction (Vin), mean cell size (d), extracellular diffusion coefficient (Dex) and cellularity were obtained based on Imaging Microstructural Parameters Using Limited Spectrally Edited Diffusion model, and compared among three groups. One-way ANOVA, Kruskal-Wallis test and receiver operating characteristic (ROC) curves analyses were performed in statistical analysis as appropriate.

Results Significant differences were found on all Td-dMRI- derived parameters among PAs, WTs and MTs (all $p < 0.05$). Vin was the sole parameter that showed significant differences in all subgroup comparisons (PAs vs. WTs, < 0.001 ; PAs vs. MTs, $p = 0.031$; WTs vs. MTs, $p = 0.047$). When employing Vin of 0.267, 0.231, and 0.260 as the threshold value, respectively, optimal performances could be obtained for differentiating PAs from WTs (area under the ROC curve [AUC], 0.932; sensitivity, 0.917; specificity, 0.875), differentiating PAs from MTs (AUC, 0.744; sensitivity, 0.833; specificity, 0.714), and differentiating WTs from MTs (AUC, 0.750; sensitivity, 0.875; specificity, 0.714).

Conclusions The microstructural parameters derived from td-dMRI, especially Vin, might be promising imaging biomarker for characterizing parotid gland tumors.

PO-0598

Impact of Hashimoto's thyroiditis on the dual-energy CT quantitative parameters and its performances in diagnosing metastatic cervical lymph nodes in patients with papillary thyroid cancer

Di Geng¹, Yan Zhou¹, Ting Shang^{1,2}, Guo-Yi Su¹, Shu-shen Lin³, Yan Si¹, Xiao-Quan Xu¹, Fei-Yun Wu¹

1. The First Affiliated Hospital of Nanjing Medical University

2. Affiliated Hospital of Integrated Traditional Chinese and Western Medicine of Nanjing University of Chinese Medicine

3. Siemens Healthineers Ltd, Shanghai, China

Background: To evaluate the impact of Hashimoto's thyroiditis (HT) on dual-energy CT (DECT) quantitative parameters of cervical lymph nodes (LNs) and their performances in preoperatively diagnosing metastatic cervical LNs in patients with papillary thyroid cancer (PTC).

Methods: A total of 480 LNs from 233 PTC patients were classified into four groups (HT+/LN+, HT+/LN-, HT-/LN+ and HT-/LN- group). DECT quantitative parameters including iodine concentration (IC), normalized IC (NIC), effective atomic number (Zeff) and slope of the spectral curve (λ HU) in arterial phase (AP) and venous phase (VP) were compared. Receiver operating characteristics (ROCs) curves were performed to evaluate DECT parameters' diagnostic performance in differentiating metastatic from non-metastatic LNs in HT- and HT+ groups.

Results: Compared to HT-/LN+ group, HT+/LN+ group exhibited lower values of DECT parameters (all $p < 0.05$). Conversely, compared to HT-/LN- group, HT+/LN- group showed higher values of DECT parameters (all $p < 0.05$). In HT+ group, if using a AP-IC of 1.850 mg/mL as the threshold value, optimal diagnostic performance (AUC, 0.757; sensitivity, 69.4%; specificity, 71.0%) could be obtained. The optimal threshold value of AP-IC in HT- group was 2.050 mg/mL. By contrast, in HT- group, AP-NIC demonstrated the highest AUC of 0.988, when employing a optimal threshold of 0.243. The optimal threshold value of AP-NIC was 0.188 in HT+ group.

Conclusion: HT affected DECT quantitative parameters of LNs and subsequent the diagnostic threshold. When using DECT to diagnose metastatic LNs in patients with PTC, whether HT was coexistent should be clarified considering the different diagnostic threshold.

PO-0599

Predicting Response to Immunotherapy in Head and Neck Cancers via a CT-based Radiomics Model

Qifan Ma, Jiliang Ren, Rui Wang, Ying Yuan, Xiaofeng Tao

Shanghai Ninth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

Objective: To investigate whether radiomics models derived from pretreatment CT could help to predict response to immunotherapy in head and neck cancer (HNC).

Methods: Retrospectively, a total of 40 patients with measurable HNC were included. The patients were divided into responder and non-responder groups according to the comparison of pre-treatment and post-treatment CT findings. Radiomics features were extracted from pre-treatment CT, and significant features were selected to construct differentiating models using machine learning methods. The area under the curve (AUC), sensitivity and specificity were calculated to quantify the predictive efficacy.

Results: The feature of 'Minor Axis Length' showed the best predictive efficiency, with an AUC of 0.726. A total of 7 features were selected to build models upon machine learning methods. By

comparing different machine learning based models, the neural network model achieved the best predictive ability, with an AUC of 0.864, a sensitivity of 82.5%, and a specificity of 82.5%.

Conclusion: The pretreatment CT-based radiomics model showed good performance in predicting response to immunotherapy in HNC. Pretreatment CT-based radiomics model might provide an alternative approach for the selection of patients who benefit from immunotherapy.

PO-0600

Diagnosis of Major Depressive Disorder Based on individualized brain function and structural connectivity

Yuting Guo¹, Tongpeng Chu², Ning Mao²

1. BINZHOU MEDICAL UNIVERSITY

2. YANTAI YUHUANGDING HOSPITAL

Objective:

Major depressive disorder (MDD) exhibited substantial inter-individual variations in both neuroanatomy and neurophysiology. Nonetheless, the majority of previous neuroimaging studies have relied on the application of population-based brain templates, neglecting the distinctive brain network characteristics present in individuals. As compared to a single modality, multimodal imaging better investigate the interrelationships between brain networks in patients with depression. In this study, we aimed to determine whether the combination of both helps to improve classification performance by extracting individualized functional connectivity features and structural connectivity features. Going further, an in-depth understanding of MDD-related pathophysiological mechanisms underlying MDD is imperative to facilitate the diagnosis and treatment of depression.

Methods:

This study prospectively recruited 142 MDD patients and 127 well-matched healthy controls. First, by leveraging data analysis methods to extract subject-individualized functional and structural connectivity features. Then, we performed a fusion of the extracted individualized features, and further used support vector machines for classification and diagnosis to discriminate individuals with MDD from HCs. Finally, we also utilized features after fusion to establish a linear regression model to predict the severity of symptoms in patients with MDD. This study provided insight into understanding the pathophysiological mechanisms underlying MDD and provided potential quantitative neuroimaging biomarkers for MDD diagnosis.

Results:

Through feature fusion, independent components and mixing coefficients of each modality were generated. Based on the normality of the mixing coefficients, a two-sample t-test was conducted for each independent component (IC) to identify components that differentiate between groups. We discovered a joint group discriminant independent component with significant differences in both modalities. At the same time, we also found the components that only show significant group differences in a single mode. In rs-fMRI, there were two independent components with group differences. Also, we found components that showed significant group differences only in a single modality. The multi-modal fusion analysis of structural and functional magnetic resonance imaging processed extracted features of brain regions containing differences between groups. These fusion features significantly improved the classification efficiency, achieving high precision in cross-group differentiation.

Conclusion:

In summary, our study showed that individualized functional and structural connectivity-based characterization significantly improves the ability to discriminate depression. In this prospective study, we integrated multimodal neuroimaging data into the machine learning method. We identified complementary information between SC and FC that informs possible neural linkages. Combining DTI and rs-fMRI data, we investigated the neuropathological features of MDD patients from the perspective of functional-structural connectome coalescence. This article not only leveraged the

advantages of each imaging modality through multimodal data fusion but also explored the inter-relationships between brain networks in MDD patients, providing more supplementary information and comprehensive understanding of MDD diseases.

PO-0601

Synthetic MRI for early prediction of treatment response to chemoradiotherapy in advanced nasopharyngeal carcinoma: combination with clinicopathological characteristics

Peng Wang
Affiliated Hospital of Jiangnan University

Objectives: To explore the feasibility of synthetic MRI (syMRI) and its combination with clinicopathological characteristics for early prediction of treatment response to chemoradiotherapy (CRT) in advanced nasopharyngeal carcinoma (ANPC).

Materials: ANPC patients treated with CRT from September 2020 to June 2022 were retrospectively enrolled and categorized into response group (RG, n=95) and no-response group (NRG, n=32) based on RECIST 1.1. The quantitative parameters from pretreatment syMRI (T1, T2, PD) were compared between RG and NRG. The independent predictive factors were applied to create a multi-parameter model by logistic regression analysis. Internal validation data set was performed to verify the prediction model. The syMRI-derived parameters and clinicopathological characteristics were correlated with treatment response by spearman correlation.

Results: T1, T2 and PD values in NRG were significantly lower when compared with RG (all $P < 0.05$). Logistic regression analysis showed each of T1, T2, PD, EBV-DNA, clinical stage, and Ki-67 had significant relationships with CRT response (all $P < 0.05$). The corresponding multi-parameter model incorporating these six variables provided excellent prediction performance, with AUC, sensitivity, specificity, and accuracy of 0.947, 90.48%, 90.91%, and 90.80%. Moreover, by combining all syMRI and clinicopathological variables, a separate multi-parameter model was generated, indicating a further improved prediction performance, with AUC, sensitivity, specificity, and accuracy of 0.972, 95.24%, 90.91%, and 92.00%. The internal validated data set also demonstrated excellent prediction performance. In addition, negative correlation of T1, PD values, and positive correlation of EBV-DNA, ENE, clinical stage, Ki-67 were revealed with treatment response (all $P < 0.05$).

Conclusions: syMRI may be used for early prediction of CRT response in ANCP. The multi-parameter model by incorporating the syMRI and clinicopathological characteristics factors could serve as a novel tool in early prediction of CRT response.

PO-0602

Study on the lateral pterygoid muscle status after artificial temporomandibular joint replacement

Qi Sun

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

Abstract. The purpose of this study was to explore the status of the lateral pterygoid muscle (LPM) after detachment in artificial temporomandibular joint replacement (TJR) surgery. Patient clinical and computed tomography imaging data were collected before and after unilateral artificial TJR with LPM detachment. The volume of the LPM on the operated and unoperated sides was measured before and after surgery (at 1, 3, 6, 12 months) using ProPlan CMF 3.0 software. The volumes of the LPM on both sides, the patient's mandibular movements, quality of life (QoL), and pain and diet scores (visual analogue scales) were evaluated and compared at the different follow-up stages. Ten patients were included in the study. After surgery, the volume of the operated LPM was significantly reduced to 60.78% at 3 months ($P = 0.007$), and gradually stabilized to 51.58% at 6 months ($P = 0.025$) and 54.68% at 1 year postoperative ($P = 0.002$). There were no significant LPM volume changes on the unoperated side ($P = 0.67$). Lateral movement of the operated joint was significantly reduced ($P = 0.021$) and correlated with the LPM volume change after surgical detachment ($P = 0.042$). The LPM shrank after detachment in the artificial TJR surgery and the muscle detachment affected the movement of the replaced joint.

PO-0603

The value of spiral CT in evaluating primary maxillofacial ameloblastomas

Tao Tian

Department of Radiology, The Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, P.R.C

Objective: To explore the value of 64-slice spiral CT in evaluating primary maxillofacial ameloblastomas. **Methods:** 112 patients who suffered from primary maxillofacial ameloblastomas confirmed by pathology were performed with spiral CT preoperatively. The pathological classification included 70 solid/multicystic, 35 unicystic, 6 desmoplastic and 1 extraosseous/peripheral tumors. The post-processing of CT images included multiplanar reformation (MPR) and volume rendering (VR). Meanwhile, CT values were measured in the region of interest (ROI) in these tumors to analyze the features of the contrast enhancement of the tumors. **Results:** The spiral CT features of primary maxillofacial ameloblastomas were multilocular and cystic-solid mostly. There were contrast enhancements in cystic wall, septa and solid regions. And the enhancement of cystic wall could be mural nodular. The degrees of enhancement of 85% tumors were more than 50%. The edges were clear and company with linear scleroses mostly. The expansile changes of the bones, the thinning or destruction and interruption of the adjacent bone cortexes were found in the lesions commonly. Most tumors led to the changes of the adjacent tooth. **Conclusions:** The features of primary maxillofacial ameloblastomas could be shown clearly with spiral CT, which can provide more information for guiding clinical treatment.

PO-0604

Percutaneous core needle biopsy of deep suprahyoid head and neck lesions with CT-guided: study of diagnostic performance and factors associated with diagnostic failure.

Weiying Tang
Shanghai 9th People's Hospital

Object: The purpose of this study was to evaluate diagnostic accuracy and factors associated with diagnostic failure of core needle biopsy (CNB) with CT-guided in deep suprahyoid head and neck lesions.

Materials and methods: The records of 204 patients underwent CT-guided CNB were retrospective reviewed. CT-guided CNB was conducted for pathological diagnosis with the use of 18-G coaxial biopsy needles. Diagnostic accuracy for the diagnosis of lesions were calculated by comparing the biopsy results with the operative specimen or based on treatment response and clinical follow-up more than 6 months. Factors associated with biopsy failure was identified by chi-square test logistics regression of procedure characteristics and lesion features.

Result: All 204 specimens were considered adequate for diagnosis. No immediate or delayed procedural complications were encountered. Sensitivity, specificity and accuracy were 89.2% (141/158), 97.8% (45/46) and 91.2% (186/204), respectively. Lesions with poorly margins or pre-procedural diagnostic imaging were the potential factor for diagnostic failure.

Conclusion: CNB with CT-guidance is an effective procedure for tissue diagnosis of patient with primary deep suprahyoid head and neck and skull base lesions.

PO-0605

CT and MRI features of sinonasal teratocarcinoma: a preliminary analysis of 12 cases

Yifan Wang¹, Linying Guo Guo¹, Yanping Ji¹, Sihui Yu², Yan Sha¹
1. Fudan University Eye Ear Nose and Throat Hospital
2. Shanghai Ninth People's Hospital, Shanghai Jiaotong University, School of Medicine

Purpose: The study aimed to investigate imaging features of the sinonasal teratocarcinoma (SNTCS) on computed tomography (CT) and magnetic resonance imaging (MRI).

Methods: Twelve cases with histopathologically confirmed SNTCS were retrospectively reviewed. All patients underwent CT and MRI scans. Imaging features, such as tumor morphology, margin, range, internal structure, bony change, signal intensity, enhancement changes, and lymph node characteristics on CT and MRI, were evaluated. Apparent diffusion coefficient (ADC) values were also measured.

Results: Seven cases were located in the nasal cavity and ethmoid sinus region, and five cases were in the nasal cavity. All tumors were irregular in morphology and had ill-defined boundaries with no obvious calcification or ossification. On CT imaging, all cases showed obvious bone resorption destruction. On MRI, all cases demonstrated heterogeneous enhancement. Tortuous small vessels within tumor were detected in 8 lesions. The mean ADC for SNTCS was approximately 800 mm²/s.

Conclusion: CT and MRI can provide important clues for the preoperative diagnosis of sinonasal teratocarcinoma.

PO-0606

Brain white matter variation in patients with obstructive sleep apnea-hypopnea syndrome with diffusional kurtosis imaging

Yaoyao Zhai¹, Xiaoxia Liu²

1. General Hospital of Northern Theater Command

2. Shengjing Hospital of China Medical University

Objective To explore the changes of brain white matter of the patients with obstructive sleep apnea-hypopnea syndrome (OSAHS) with magnetic resonance diffusional kurtosis imaging (DKI). **Methods** 38 patients with OSAHS were examined by polysomnogram (PSG) from November 2017 to June 2021, and 32 non-OSAHS controls matched in gender and age. All the subjects were scanned by DKI. To find different encephalic regions through comparing kurtosis fractional anisotropy (KFA) values of all encephalic regions between the two groups, and to analysis the relationship between the KFA values of the different encephalic regions in OSAHS patients and the apnea-hypopnea index (AHI) and lowest saturation oxygen (LSO2) in PSG. **Results** The KFA values of white matter fiber tracts in corpus callosum, bilateral corona radiata, cingulate gyrus, right superior cerebellar peduncle and inferior cerebellar peduncle of OSAHS group were obviously lower than control group ($P < 0.05$). The Pearson correlation between AHI and the KFA values of corpus callosum, left posterior corona radiata, right anterior corona radiata, cingulate gyrus, right superior cerebellar peduncle, right inferior cerebellar peduncle in OSAHS group were all negative ($r = -0.476, -0.495, -0.486, -0.583, -0.346, -0.330$, $P < 0.05$), and the Pearson correlation between LSO2 and the KFA values of corpus callosum, left posterior corona radiata, right anterior corona radiata, cingulate gyrus, right superior cerebellar peduncle, right inferior cerebellar peduncle in OSAHS group were all positive ($r = 0.458, 0.521, 0.505, 0.476, 0.353, 0.381$, $P < 0.05$). After controlling for age and body mass index (BMI), the partial correlation between AHI and the KFA values of corpus callosum, left posterior corona radiata, right anterior corona radiata, cingulate gyrus in OSAHS group were also negative ($r = -0.344, -0.380, -0.406, -0.537$, $P < 0.05$), and the partial correlation between LSO2 and the KFA values of corpus callosum, left posterior corona radiata, right anterior corona radiata, cingulate gyrus, right superior cerebellar peduncle in OSAHS group were also positive ($r = 0.366, 0.406, 0.446, 0.404, 0.342$, $P < 0.05$). **Conclusions** Recurrent apnea and hypoxemia at night of OSAHS patients can cause damage to white matter fibers in parts of encephalic regions.

PO-0607

Comparison the Diffusion Metrics of Single-shell and Two-shell Neurite Orientation Dispersion and Density Imaging in Human Brain

Yuanqing Liu
soochow university

Purpose

To quantitatively compare the diffusion metrics from single-shell and two-shell protocols of neurite orientation dispersion and density imaging (NODDI) in normal human brain and infarcted brain tissues.

Material and Methods

NODDI data of brain were obtained in 18 ischemic stroke patients and 12 healthy volunteers. Each subject underwent two-shell multi-directional diffusion MRI sequence scans to obtain single-

shell protocols (Shellb1000 and Shellb2000) and two-shell protocol (Shellb1000+2000). Based on these data, the corresponding parametric maps of neural protrusion density (NDI), orientation dispersion (ODI), and each homogeneous water molecule (FISO) were obtained. For healthy volunteers, white matter templates (JHU-DTI atlas) and gray matter templates (AAL116 atlas) were selected. For ischemic stroke patients, two-dimensional region of interest (2d-ROIs) of the infarcted brain region was obtained by ITK-snap software. Linear regression, interclass correlation coefficient (ICC) and Bland–Altman plots were used to calculate coefficients of determination (R^2) and best fit lines, and to compare each diffusion metric (NDI, ODI and FISO) of ROIs from the three protocols (Shellb1000, Shellb2000, and Shellb1000+2000) in patients group and healthy controls.

Results

The R^2 values were 0.95 (Shellb1000 versus Shellb1000+b2000) and 0.99 (Shellb2000 versus Shellb1000+b2000), while the slopes of best fit lines were 0.97 (Shellb1000 versus Shellb1000+b2000) and 1.03 (Shellb2000 versus Shellb1000+b2000) for ODI values, based on the white matter JHU-DTI atlas. ICC analysis of single-shell and two-shell ODI showed “excellent” for the JHU-DTI atlas (ICC =0.983), the AAL116 atlas (ICC =0.909) and the infarction regions (ICC =0.950). From a Bland–Altman analysis of brain atlas and even infarcted region, the mean differences of the metrics of ODI for the three protocols were all found to be less than 0.05.

Conclusion

In conclusion, the ODI values from single-shell and two-shell protocols of NODDI were with a good consistency, suggesting that protocol Shellb1000 may estimate the ODI values as well as two-shell protocol Shellb1000+b2000. This has potential clinical value for reducing the scan time in patients with poor conditions and for analyzing ODIs from single-shell diffusion data in retrospective studies.

PO-0608

Evaluation of MR imaging findings in differentiating Granular Cell Tumor from Solitary Fibrous Tumor in the orbit

Hanyu Xiao, Yan Sha

Eye, Ear, Nose and Throat Hospital of Fudan University

Purpose: Orbital GCT, a rare tumor, used to be misdiagnosed as orbital SFT preoperatively but varied in prognosis and treatment. Thus, we aim to explore the MR imaging findings in distinguishing these two diseases.

Materials and Methods: Magnetic resonance imaging including T1-weighted, T2-weighted, contrast-enhanced MR imaging and diffuse weighted imaging was performed in 10 patients with GCT and 19 patients with SFT in the orbit confirmed by pathology. Two radiologists assessed the location, size, shape, margin, signal intensity, homogeneity, enhancement degree, enhancement pattern and the average ADC value of the tumors.

Results: For conventional MRI, location, signal intensity on T2WI, enhancement pattern and ADC values were significantly different between orbital GCTs and SFTs ($p < 0.05$).

Conclusion: Hypointense on T2WI, homogeneous enhancement pattern and lower ADC values played a crucial role in differentiating orbital GCTs from SFTs. These characteristics at some extent reflect the nature of tumors and help differential diagnosis when diseases mimic each other.

PO-0609

Assessment of a Deep Learning Image Reconstruction Algorithm's Effectiveness on CT Angiography Generated from Whole-Brain CT Perfusion

Yuhan Zhou, Limin Lei, Zhihao Wang, Weimeng Cao, Songwei Yue
The First Affiliated Hospital of Zhengzhou University

Objective To compare the image quality and diagnostic accuracy of CT angiography (CTA) images reconstructed from CT perfusion (CTP) arterial peak phase using deep learning image reconstruction (DLIR) algorithm with adaptive statistical iterative reconstruction-Veo (ASIR-V) and filtered back projection (FBP) in patients with acute ischemic stroke (AIS) due to anterior circulation large vessel occlusion (LVO).

Methods This prospective study involved 39 patients with AIS caused by LVO who underwent non-contrast CT, CTP, and CTA examination within 24 hours of symptom onset. CTP arterial peak phase images with a thickness of 0.625mm were reconstructed using FBP, ASIR-V40%, ASIR-V80%, and DLIR with three levels (low, medium, and high) and compared to conventional CTA images reconstructed with ASIR-V80%. ROIs were drawn on the internal carotid artery (ICA) siphon, M1 segment of the middle cerebral artery (MCA-M1), and temporalis in contralateral axial images. CT values, image noise, SNR, and CNR were measured and compared. Subjective evaluation included image noise, edge sharpness of vascular lumen, display of small blood vessels, and overall image quality. Collateral circulation of seven CTA image groups was scored using Bijoy K M et al six-point scoring system.

Results CT values of the ICA siphons, MCA-M1, and temporalis showed no statistical significance among all seven CTA image groups. Noise, SNR, and CNR were comparable among DLIR-M, DLIR-H, and conventional CTA images. While noise in ASIR-V80% was slightly higher and SNR lower than conventional CTA images ($P < 0.05$), no statistical difference was found among ASIR-V80%, DLIR-M, and DLIR-H ($P > 0.05$). FBP had the highest noise and lowest SNR and CNR. The images of DLIR-M and DLIR-H were slightly worse than those of conventional CTA images only in the display of small blood vessels ($P < 0.05$). ASIR-V80% CTA images showed slightly inferior image noise and overall image quality compared to DLIR-M and DLIR-H ($P < 0.05$), with no significant difference in edge sharpness or small blood vessel visibility. Collateral circulation scores of the six reconstructed CTA images for each patient were consistent with conventional CTA images.

Conclusions The objective and subjective image quality of CTP arterial peak phase images reconstructed by DLIR-H and DLIR-M were equivalent to conventional CTA images, and superior to FBP and ASIR-V algorithms. Intracranial CTA images reconstructed from CTP reduced the dosage of contrast agent and radiation dose. The CTP arterial peak phase images reconstructed by DLIR may be helpful to detect small responsible blood vessels. Reconstructing CTA images from CTP data not only reduces radiation exposure and contrast agent dose by avoiding multiple scans but also shortens the examination time for patients with acute cerebral infarction.

PO-0610

Color duplex ultrasonography characteristics and clinical factors associated with recanalization in patients with unilateral extracranial vertebral artery dissection

Yanhong Yan, Ziwei Lu, Bai Zhang, Yafang Ding, Qi Fang, Chunhong Hu, Pinjing Hui
The First Affiliated Hospital of Soochow University

Background and purpose Aimed to determine the predictive value of color duplex ultrasonography (CDU) features for recanalization rate of VAD, we systematically investigated the predictors and time course for complete recanalization in patients with unilateral extracranial VAD in the context of medical treatment.

Methods A total of 113 consecutive patients with a confirmed diagnosis of unilateral extracranial VAD by HRMRI were investigated retrospectively. To explore the dynamic development of dissection, CDU follow-ups were performed at 1, 3, 6, and 12 months. According to the results of CDU examination at 12 months, patients were recruited and divided into the complete recanalization and non-complete recanalization groups. At 12 months, a favorable functional outcome was defined as modified Rankin Scale score ≤ 2 . On CDU, the initial lesion location, as well as a variety of signs of dissection such as the presence of an intimal flap, double lumen, intramural hematoma, and other quantitative parameters of each dissected segment were reviewed, respectively. Multiple logistic regression was used to explore the association between clinical, initial imaging features of extracranial VAD and complete recanalization at 12 months.

Results Among 109 patients who matched the inclusion criteria, 91 (83.5%) achieved a favorable outcome at 12 months. The estimated rate of complete recanalization of extracranial VAD was 4.6% (5/109) at one month, 35.8% (39/109) at 3 months, 67.0% (73/109) at 6 months, and 71.6% (78/109) at 12 months. Overall, there were 78 patients in the complete recanalization group and the remaining 31 patients without complete resolution of arterial abnormalities. In multivariate analyses, intramural hematoma and lumen occlusion on CDU remained associated with complete resolution of VAD. After adjusting for age, gender, hypertension, LDL-C, hs-CRP, High Monocyte, clinical presentations, PC-ASPECT, and Initial NIHSS, lumen occlusion were still an independent risk factor for complete recanalization, with odds ratios of 15.63 (95% CI, 3.56-68.59, $P < 0.001$), whereas intramural hematoma substantially increased the likelihood of complete recanalization, with odds ratios of 0.03 (95% CI, 0.01-0.19, $P < 0.001$).

Conclusions CDU has proven to be a reliable tool for diagnosis and follow-up of extracranial VAD. Our results suggest that recanalization of unilateral extracranial VAD occurs primarily within the first 6 months. Initial occlusion reduce the likelihood of complete recanalization, whereas intramural hematoma increases it.

PO-0611

Relationship of Neutrophil-to-Lymphocyte Ratio with Carotid Plaque Vulnerability in Patients—an exploratory research based on Histopathology

Xinyi Cai, Yanhong Yan, Yafang Ding, Pinjing Hui
Department of Stroke Center, The First Affiliated Hospital of Soochow University, 188 Shizi Street, Suzhou, Jiangsu Province, China

Background and objective: Vulnerable plaques of carotid atherosclerosis had been proved to be significantly related to ischemic stroke events. This study aimed to explore the correlation between

inflammation related indicators and vulnerable plaques and to search for indicators that can predict carotid plaque instability.

Methods: Patients with ischemic stroke or transient ischemic attack (TIA) were analyzed as the study group from January 2019 and December 2020. All patients were confirmed by carotid doppler ultrasonography (CDU) and other imaging examinations that there were atherosclerotic plaques in the responsible vessels leading to vascular stenosis. Simultaneously we collected patients who underwent carotid endarterectomy (CEA) as the neurosurgery control group (CEA group) and health examination patients as the healthy control group. All patients were categorized into stable and vulnerable plaque groups based on the characteristics of plaque assessed by CDU. Application of Logistic Regression to Analyze the Correlation between inflammatory related indicators such as NLR (neutrophil-to-lymphocyte ratio), and vulnerable plaques. HE staining was used to analyze the characteristics of plaques in the neurosurgery group.

Results: In study group, age (1.123;1.14-1.33), BMI (1.51;1.10-2.09), systolic blood pressure (1.07;1.02-1.12), HDL-C (0.06;0.01-0.58), and NLR (1.048;0.95-1.15) were independent risk factors for the formation of carotid plaque. While NLR was independent risk factors for carotid plaque vulnerability (2.40; 1.47-3.92). The ultrasonic and pathological characteristics of carotid plaques in CEA group had strong consistency. We found that inflammatory cells were more inclined to gather around the ruptured fiber cap of vulnerable carotid plaques.

Conclusions: Inflammation runed through the whole process of the formation and development of carotid atherosclerotic plaques, especially in the process of plaque vulnerability. NLR was expected to effectively predict vulnerable carotid plaque for patients and is easier to obtain in clinical.

PO-0612

Integration of optical and optoacoustic scanning system for depicting residual nasopharyngeal carcinoma and guiding surgery

Wenhui Huang,Zicong He,Shuixing Zhang
The First Affiliated Hospital of Jinan University

Detecting residual nasopharyngeal carcinoma (rNPC) can be difficult because of the coexistence of occult tumors and post-chemoradiation changes, which poses a challenge for both radiologists and surgeons using current imaging methods. Currently, molecular imaging that precisely targets and visualizes particular biomarkers in tumors may exceed the specificity and sensitivity of traditional imaging techniques, providing the potential to distinguish tumors from non-neoplastic lesions. Here, we synthesized a HER2/SR-BI-targeted tracer to efficiently position NPC and guide surgery in living mice. This bispecific tracer contained two parts: IRDye 800 CW, as an imaging reagent for both optical and optoacoustic imaging, and a fusion peptide (FY-35) as the targeting reagent. Both in vitro and in vivo tests demonstrated that the tracer had higher accumulation and longer retention (up to 48 h) in tumors than a single-targeted probe, and realized sensitive detection of tumors with a minimum size of 3.9 mm. By visualizing the vascular network via a customised handheld optoacoustic scan, our intraoperative fluorescence molecular imaging system provides accurate guidance for intraoperative tumor resection. Integrating the advantages of both optical and optoacoustic scanning in intraoperative image-guided system, this method holds promise for depicting rNPC and guiding salvage surgery.

PO-0613

Can we find the potential biomarkers of vulnerable carotid plaque in patients with type 2 diabetes? An exploratory research based on predictive models

Yusen Liu, Xinyi Cai, Yanhong Yan, Pinjing Hui
The First Affiliated Hospital Of Soochow University

Background and Objective: Type 2 diabetes mellitus (T2DM) caused by insulin resistance (IR) results in elevated blood glucose levels, whose harmful effects in vivo environment including the damage to the intima of vessels and the formation of atherosclerotic plaques, particularly vulnerable plaques, which results in stenosis or even occlusion of blood vessels. The triglyceride-glucose index (TyG index) is a simple proxy for IR, how it may predict vulnerable carotid plaques in T2DM patients warrants further investigation. In light of this, the study aims to establish a predictive model to search for biomarkers of T2DM patients.

Methods: 333 patients diagnosed with T2DM were assessed the carotid plaque by multimodality imaging and then divided into 3 groups (no plaque, stable or vulnerable plaque) by the vulnerability and into 4 groups by TyG quartiles. Logistic regression models were constructed. In principal component analysis, lipid variables were reconstituted and calculated with TyG to form a new variable named TyG-C. The AUC was calculated and the cut-off value was analyzed.

Results: 1. The OR of the TyG index quartile for vulnerable plaques group increased with stratification, but lost statistical significance after controlling for covariates; 2. TyG, HDL-C and LDL-C interacted positively and negatively, respectively, and the reconstituted variables TyG-C calculated as $TyG-C = (0.397 \times LDL-C) + (-0.745 \times HDL-C) + (0.787 \times TyG \text{ index})$, was statistically significant risk factors in vulnerable plaque group; 3. ROC showed that the AUC of TyG-C in the vulnerable plaque was the largest. When the TyG-C is greater than 7.51, T2DM patients are more likely to suffer from carotid plaque, and when the TyG-C is greater than 7.82, the carotid plaques in T2DM patients are more likely to be vulnerable.

Conclusion: This study produced the model for predicting vulnerable carotid plaque in T2DM patients and demonstrated that TyG-C in peripheral blood as a marker for assessing carotid plaque vulnerability, that was more accurate than the TyG index in T2DM patients.

PO-0614

Is Arterial Spin Labeling necessarily low perfusion for cavernous hemangioma? A case of hyperperfusion cavernous hemangioma.

Dan Luo
Department of Radiology, the Second affiliated hospital of Nanchang university

Introduction: Differentiating between extracerebral cavernous malformation and meningiomas in the cavernous sinus area poses a challenge due to the influence of skull base bone and gas. It is crucial to distinguish between these conditions before surgery as their treatment differs. **Methods:** Non-contrast head CT, pre and postcontrast brain MRI, ASL with PLDs of 1.5s and 2.5s were used. Image analysis and data processing were performed using the GE AW4.6 workstation's Functool software, and the CBF map was automatically generated by ASL. **Conclusions:** Cavernous sinus venous malformations are characterized by increased capillary masses without direct arterial supply, resulting in low perfusion. On the other hand, meningiomas receive arterial blood supply and often exhibit high perfusion. ASL can be useful in distinguishing between these tumor types. In our specific case of cavernous sinus venous malformation, ASL

imaging revealed hyperperfusion, which is different from the conventional acute manifestation of ASL in cavernous vessels. This finding should be considered. Discussion: Hyperperfusion on ASL can occur when cavernous sinus venous malformation is associated with arteriovenous fistula malformation.

PO-0615

Application of double low-dose head and neck CT angiography using 60keV monoenergetic based on detector-derived spectral CT

Lichen Ren, Yiran Wang, Yang Liu, Yonggao Zhang
The First Affiliated Hospital of Zhengzhou University

Purpose

To explore the value of 60keV monoenergetic imaging combined with double low-dose protocol in head and neck CT angiography by using detector-derived spectral CT.

Methods

A total of 60 patients who underwent head and neck angiography with spectral CT scanner were prospectively enrolled and randomly divided into control group ($n = 30$) and study group ($n = 30$). The control group used 120 kVp tube voltage and conducted a personalized full contrast dose protocol ($25 \times \text{bodyweight} \times 10 \div \text{Iodine concentration}$) with the flow rate of contrast dose / 10. The study group used 100kVp low tube voltage and low contrast dose protocol ($18 \times \text{bodyweight} \times 10 \div \text{Iodine concentration}$), with the flow rate of contrast dose/7. Moreover, the study group reconstructed 60keV monoenergetic images by the raw data. The contrast agent dosage, radiation dose, subjective and objective image quality were compared between the two groups.

Results

Compared with the control group, contrast dose in the study group was reduced by about 23.2%, and the effective radiation dose was reduced by about 30.8%. The SNR of common carotid artery, C1 segment of internal carotid artery, C4 segment of internal carotid artery, V3 segment of vertebral artery, and basilar artery in the study group were higher than those in the control group (all $p < 0.05$). There was no significant difference in CNR and subjective images quality evaluation between the two groups.

Conclusion

Detector-based spectral CT achieves 60keV monoenergetic images in clinical routine, which allows to reduce the amount of contrast agent and radiation dose by 23% and 30% under routine head and neck CTA examinations, and there is no compromise in image quality.

PO-0616

The value of detector-derived spectral CT parameters in identifying high-risk plaques in carotid atherosclerotic plaques

Yang Liu, Lichen Ren, Yonggao Zhang
The First Affiliated Hospital of Zhengzhou University

Purpose

To explore the value of detector-derived spectral CT parameters combined with double low-dose protocol in identifying high-risk plaques in carotid atherosclerotic plaques

Methods

A total of 60 patients who underwent head and neck angiography with spectral CT scanner were prospectively enrolled. They were used 100 kVp low tube voltage and conducted a personalized low contrast dose protocol ($18 \times \text{bodyweight} \times 10 \div \text{Iodine concentration}$) with the flow rate of contrast dose /7. ROIs were placed on Low attenuation plaque [lipid-rich necrotic core (LRNC), intraplaque hemorrhage (IPH)], and calcified plaque on CTA images. For each ROI, attenuation was recorded for polyenergetic images; total thickness of plaque; attenuation spectrum curve slope; Iodine concentration; and Z-effective value was recorded. DLCTA parameters were compared among plaque components.

Results

106 plaques were analyzed. All parameters (CTPI, total thickness of plaque; attenuation spectrum slope; Iodine concentration; Z-effective value) showed significant differences between vulnerable plaques and the other components (all $p < .005$). ROC curve analysis showed that attenuation spectrum slope had the highest Area Under Curve (AUC) in identifying vulnerable plaques among the all parameter CT images.

Conclusion

DLCTA showed strong performance in differentiating vulnerable plaques from other components. Slope of energy spectrum curve of spectral CT can be used to identify vulnerable plaques before operation, which has high diagnostic efficacy and can provide reference for the treatment and prognosis of patients. And the amount of contrast agent and radiation dose were reduced under routine head and neck CTA examinations

PO-0617

Gender differences in lateral pterygoid muscle in patients with anterior disk displacement

Shuo Wang¹, Chen Yu¹, Guo Wei¹, Dejun She¹, Yunyang Liao², Zhen Xing¹, Nan Huang¹, Hongjie Huang¹, Dairong Cao¹

1. 1Department of Radiology, The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

2. 2Department of Oral and Maxillofacial Surgery, The First Affiliated Hospital of Fujian Medical University, Fuzhou, China

Objective: To use quantitative MRI to assess gender differences in lateral pterygoid muscle (LPM) characteristics in patients with anterior disk displacement (ADD).

Methods: Lateral pterygoid muscle of 51 patients diagnosed with temporomandibular joint disorders (TMD) who underwent T1-weighted Dixon and T1-mapping

sequences

were retrospectively analyzed. There were 34 female patients (10 with bilateral normal position disk [NP]; 24 with bilateral ADD) and 17 male patients (eight with bilateral NP; nine with bilateral ADD) among them. After controlling for age, differences in fat fraction, T1 value, volume and histogram features related to gender and disk status were tested with 2-way

ANCOVA or Quade ANCOVA with Bonferroni correction.

Results: Volume of LPM in NP was significantly smaller than that of ADD ($p < 0.001$).

Fat fraction of LPM in females with NP was significantly higher than males with NP ($p < 0.05$). Females with ADD showed a significantly higher T1 value ($p < 0.05$), and higher intramuscular heterogeneity than males with ADD.

Conclusions: Lateral pterygoid muscle in female TMD patients presented more fatty infiltration in the NP stage and might present more fibrosis in the ADD stage compared with males. Together, this leads to more serious intramuscular heterogeneity during the pathogenesis of ADD in females.

PO-0618

Nodular fasciitis in the head and neck: CT imaging findings

Shaoying Wang

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

Purpose: The purpose of this study was to describe the CT imaging findings of nodular fasciitis occurring in the head and neck region.

Methods: We retrospectively reviewed CT images of nodular fasciitis with pathologic correlation in 23 cases (11 men and 12 women; age range, 11-82 years) collected between August 2003 and October 2015 from our pathologic database. All of the CT images were retrospectively evaluated with respect to the location, size, relationship to fascia, enhancement, and enhancement pattern by 2 experienced radiologists.

Results: All patients presented with a palpable mass in the head and neck that was noticed 13 months earlier: 22 in the face and the remaining one in the occipital scalp. All lesions appeared as a discrete mass on imaging, ranging from 0.6 cm to 3.2 cm in diameter (mean, 1.55 cm). 15 masses were located in the subcutaneous tissue adjacent to fascia; 8 were at the subcutaneous/muscular border; however, all were in contact with fascia and 22 lesions showed a fascial tail on CT. 23 lesions, all of which appeared benign. 19 lesions were solid, and 4 lesions were partly or completely cystic in appearance. 13 lesions were well defined, whereas 10 lesions were ill defined. 14 of 15 lesions showed moderate to marked diffuse enhancement, whereas the remaining lesion demonstrated. Four cystic lesions showed peripheral, nodular, or rimlike enhancement.

Conclusion: Although rare, nodular fasciitis occurs as a discrete solid or cystic mass in the head and neck, depending on the predominant stromal components. When one sees a head and neck mass with a superficial location with fascial tail and moderate to marked enhancement on CT , nodular fasciitis should be included in the differential diagnosis, especially in patients with a recently developed, rapidly growing mass and a history of recent trauma.

PO-0619

Synthetic MRI plus FSE-PROPELLER DWI for differentiating malignant from benign head and neck tumors: A preliminary study

Baohong Wen, Jiangliang Cheng, Yong Zhang, Zanzia Zhang, Zijun Liu
the First Affiliated Hospital of Zhengzhou University

Background: Preoperative classification of head and neck (HN) tumors remains challenging, especially distinguishing early cancerogenic masses from benign lesions. Synthetic MRI offers a new way for quantitative analysis of tumors. The present study investigated the application of synthetic MRI and stimulus and fast spin echo diffusion-weighted imaging with periodically rotated overlapping parallel lines with enhanced reconstruction (FSE-PROPELLER DWI) to differentiate malignant from benign HN tumors.

Materials and Methods: Forty-eight patients with pathologically confirmed HN tumors were retrospectively recruited between August 2022 and October 2022. The patients were divided into malignant ($n = 28$) and benign ($n = 20$) groups. All patients were scanned using synthetic MRI and FSE-PROPELLER DWI. T1, T2, and proton density (PD) values were acquired on the synthetic MRI and ADC values on the FSE-PROPELLER DWI.

Results: Benign tumors showed higher ADC, T1, and T2 values compared to malignant tumors (all $P < 0.05$), while no differences were seen for PD values. ROC analysis showed that T2+ADC had optimal diagnostic performance vs. T1, T2, and PD alone in differentiating malignant from benign lesions (all $P < 0.05$); yet, the difference in AUC between ADC and T2+ADC or T2 did not reach statistical significance.

Conclusion: Synthetic MRI and FSE-PROPELLER DWI can quantitatively differentiate malignant from benign HN tumors. T2 value is comparable to ADC value, and T2+DC values could improve diagnostic efficacy.

PO-0620

Multimodal Ultrasound Imaging Diagnosis of Carotid Body Tumor: A Single Center Exploratory Study based on Histopathology

Yue Feng, Bai Zhang, Yanhong Yan, Yabo Huang, Zhong Wang, Pinjing Hui
The First Affiliated Hospital of Soochow University

Background and Objective : Though carotid body tumors (CBTs) are rare which are typically asymptomatic, with a low rate of biochemical functionality. The risk of surgery is high when the tumor is high. Therefore, early diagnosis and accurate assessment of Shamblin typing are particularly important. The purpose of this study is to evaluate carotid body tumors and the Shamblin type using multimodal ultrasound imaging and to compare it with postoperative histopathology.

Methods: We reviewed data of 21 CBT resection patients in our hospital from March 2015 to August 2023 and 12 cases met the inclusion criteria with complete data. We compared blood biochemical indexes of them with the normal and then performed Shamblin classification by ultrasound (US) and compared the consistency with magnetic resonance imaging (MRI) used Kappa value, and tested difference through Paired t-test between the carotid bifurcations differences on both sides of the patients in Shamblin group II and III by ultrasound, observed the blood supply of the tumor. Finally, ultimately validated by digital

subtraction angiography (DSA) and hematoxylin-eosin (HE) staining results of surgically obtained tumor tissue.

Results: Blood biochemical indicators of two groups had no significant difference. The consistency of US and MRI diagnostic classification, $Kappa=0.860$, $P<0.001$. US and MRI had good consistency in the assessment and classification. There was statistical significance in the bilateral carotid bifurcation difference between the Shamblin group II and Shamblin group III, $P=0.0027$. Color Doppler Imaging showed abundant blood flow signals and nutrient vessels in the tumor, which was confirmed by DSA and HE stains results.

Conclusion: CBTs are hard to diagnose by blood biochemical modalities, and US can accurately diagnose Shamblin type which match MRI results through the characteristics of abundant blood flow and increased bilateral carotid bifurcation differences, it was verified by pathology. Multimodal ultrasound imaging detection can play the role of preoperative evaluation and management of CBTs.

PO-0621

Development and Validation of Radiomics Models of Pretreatment MRI-determined Metastatic Lymph Nodes for Prognostic Prediction in Nasopharyngeal Carcinoma: Evaluation with Three Regions of Interest Delineation

Xiaoyi Wang

Department of Radiology, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University), Haikou, China,

Abstract

PURPOSE: Accurate prediction of nasopharyngeal carcinoma (NPC) prognosis is important for treatment. This study aimed to evaluate the performance of radiomics pretreatment using magnetic resonance imaging (MRI)-determined metastatic lymph nodes models to predict NPC prognosis with three delineation methods.

METHODS: Newly diagnosed patients with non-metastatic NPC with available MRI data were enrolled in this retrospective study. Radiomics features were extracted from all lymph nodes (ALN), largest lymph node (LLN), and largest slice of the largest lymph node (LSLN) to generate three radiomics signatures. The radiomics signatures, clinical model, and radiomics-clinic merged models were developed in training cohort for predicting overall survival (OS). Harrell's concordance index (C-index) was used to evaluate the model's discrimination. Bootstrap repeat sampling with 1000 iterations and the paired t-test were used to calculate the P values.

RESULTS: Between January 2010 and November 2012, 376 and 188 patients were retrospectively analyzed in the training and internal validation cohort; 165 eligible patients were analyzed as a temporal validation cohort after November 2012. The LSLN signature demonstrated better accuracy for OS prediction (C-index [95% confidence interval]: 0.762[0.760–0.763]) than the ALN (0.737 [0.736–0.739]) and LLN (0.705 [0.703–0.706]) signatures. The LSLN nomogram combining clinical factors demonstrated better performance than the other merged models (all $p<0.05$).

CONCLUSION: The LSLN signature with clinical factors predicted OS with high accuracy and robustness using pretreatment MR-determined metastatic lymph nodes, providing a new tool for treatment planning in NPC.

PO-0622

Grading and Prognostic Value of Paranasal Sinus Invasion in Nasopharyngeal Carcinoma: Proposed Modification in Current T Classification

Xiaoyi Wang

Department of Radiology, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University), Haikou, China,

Purpose: Our study aimed to evaluate the prognostic value of paranasal sinus involvement (PSI) in NPC and to explore its suitable position in the current AJCC staging system.

Methods: Pretreatment MRI of 1317 patients with NPC treated with intensity-modulated radiotherapy (IMRT) between January 1, 2010, and January 31, 2013, were reviewed retrospectively. Survival was compared between patients with PSI-slight (sinus bone wall erosion only) and PSI-severe (tumor penetration into sinus cavity). Multivariable analysis was performed to identify the independent predictors of survival.

Results: The study included 1317 patients (median age 46 years; range, 11-78 years; 964 men, 353 women). PSI-slight was present in 15.2% (200/1317) patients and PSI-severe in 20.0% (263/1317) patients. Overall survival (OS), distant metastasis-free survival (DMFS), locoregional recurrence-free survival (LRFS), and progression-free survival (PFS) were significantly lower in patients with PSI-severe (all $P < .05$). In multivariable analysis, PSI-severe was an independent negative prognostic factor for OS, DMFS, LRFS, and PFS ($P < 0.05$ for all). The 96 AJCC T3 category patients with PSI-severe were reclassified as T4 category. The revised T staging had significantly better predictive value (higher C-index) than that the AJCC system for survival (OS, 0.661 vs. 0.652, $P < 0.001$; DMFS, 0.655 vs. 0.650, $P = 0.02$).

Conclusion: PSI-severe is an independent negative prognostic factor in nasopharyngeal carcinoma, which is recommended to be classified as T4 category in the 8th AJCC staging system for NPC.

Part II: Study about the Prognostic value of Structured Report based on Pre-treatment MRI of Nasopharyngeal carcinoma

Purpose: To establish a prognostic model of nasopharyngeal carcinoma (NPC) based on the pre-treatment MRI structured report and to verify its effectiveness.

Methods: This study was approved by the institutional review board, with waiver of the need for informed consent. 792 consecutive non-metastatic NPC patients treated with intensity-modulated radiotherapy (IMRT) were enrolled, retrospectively. Clinical data and the MRI features from structured reporting system of the cohort were collected. Patients were randomly assigned to training ($N=528$) and internal validation ($N=264$) cohorts at a 2:1 ratio via computer software-generated random numbers. Cox proportional hazards regression method, least absolute shrinkage and selection operator (LASSO) method regression model and stepwise regression analysis were performed for building prognostic models based on structured report. Univariable and multivariable Cox proportional hazards regression method were used for independent prognostic factors selection of clinical data and TNM staging system. The endpoints of our study were OS, DMFS, LRFS and PFS. We built nomograms integrating MRI features of structured report with clinical features, and nomograms integrating features of TNM staging system with clinical features. The predictive accuracy of our nomogram models were determined by concordance index (C-index), and were compared with the nomogram models combining clinical features with tumor-node-metastasis (TNM) staging system. The results were validated using bootstrap resampling and a test cohort study of 264 patients.

Results: Nomograms of OS, DMFS and PFS were constructed based on the MR features of the structured report combined with clinical features, nomogram of LRFS was constructed based on the MR features of the structured report alone. The nomograms based on structured report's features exhibited a good prediction performance. The C-index for training cohort and test cohort

of the nomograms that constructed by structured reports' feactures are OS: 0.771 (95% CI:0.710-0.831) and 0.751 (95% CI: 0.671-0.832), DMFS:0.746 (95% CI:0.644-0.848) and 0.712 (95% CI:0.650-0.774), LRFS:0.730 (95% CI:0.666-0.794) and 0.654 (95% CI:0.539-0.768), PFS:0.698 (95% CI:0.651-0.745) and 0.694 (95% CI:0.620-0.768) , respectively. The C-index for training cohort and test cohort of the nomograms that constructed by TNM staging system and clinical feactures are OS: 0.756 (95% CI: 0.683-0.830) and 0.718 (95% CI: 0.656-0.779) 、DMFS: 0.754 (95% CI: 0.673-0.8835) and 0.668 (95% CI: 0.599-0.737) 、LRFS: 0.621 (95% CI: 0.545-0.697) and 0.531 (95% CI: 0.410-0.652) (nomogram of LFRS was conctructed by T+N categories) 、PFS: 0.671 (95% CI: 0.602-0.742) and 0.625 (95% CI: 0.571-0.680) , respectively. The C-index for training cohort and test cohort of the nomograms that constructed by TNM staging system are OS: 0.720 (95% CI: 0.633-0.787) and 0.689 (95% CI: 0.622-0.756) 、DMFS: 0.727 (95% CI: 0.644-0.810) and 0.652 (95% CI: 0.582-0.722) 、LRFS: 0.611 (95% CI: 0.538-0.685) and 0.524 (95% CI: 0.406-0.642) (nomogram of LFRS was conctructed by T category) 、PFS: 0.668 (95% CI: 0.598-0.737) and 0.617 (95% CI: 0.563-0.671) , respectively. The performance of the nomograms we built that based on structured report were better than the prognostic models based on TNM staging system combined with clinical features or not. Significant differences were observed between the predictive models based on the structure report, and TNM staging system combined with clinical features (P-values were OS: 0.009; DMFS: 0.02; LRFS: 0.02; PFS: 0.003, respectively); the performance of the nomograms constructed by structured report were better than the nomograms constructed by TNM staging system as well (OS: 0.001; DMFS: 0.002; LRFS: 0.02; PFS: 0.002, respectively) . The nomograms based on structured report's features outperformed TNM staging system in predicting prognosis of NPC patients.

Conclusions: The prognostic model baseds on the pre-treatment MRI structured report features showed a satisfactory prediction performance. The use of pre-treatment MRI structured report system in clinical diagnosis may aid individualized treatment strategies of NPC patients and improve the survival rate.

PO-0623

Study about the Prognostic value of Structured Report based on Pre-treatment MRI of Nasopharyngeal carcinoma

Xiaoyi Wang

Department of Radiology, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University), Haikou, China,

Purpose: To establish a prognostic model of nasopharyngeal carcinoma (NPC) based on the pre-treatment MRI structured report and to verify its effectiveness.

Methods: This study was approved by the institutional review board , with waiver of the need for informed consent. 792 consecutive non-metastatic NPC patients treated with intensity-modulated radiotherapy (IMRT) were enrolled , retrospectively. Clinical data and the MRI features from structured reporting system of the cohort were collected. Patients were randomly assigned to training (N=528) and internal validation (N =264) cohorts at a 2:1 ratio via computer software-generated random numbers. Cox proportional hazards regression method, least absolute shrinkage and selection operator (LASSO) method regression model and stepwise regression analysis were performed for building prognostic models based on structured report. Univariable and multivariable Cox proportional hazards regression method were used for independent prognostic factors selection of clinical data and TNM staging system. The endpoints of our study were OS, DMFS, LRFS and PFS. We built nomograms integrating MRI features of structured report with clinical features, and nomograms intergrting features of TNM staging system with clinical features. The predictive accuracy of our nomogram models were determined by

concordance index (C-index), and were compared with the nomogram models combining clinical features with tumor-node-metastasis (TNM) staging system. The results were validated using bootstrap resampling and a test cohort study of 264 patients.

Results: Nomograms of OS, DMFS and PFS were constructed based on the MR features of the structured report combined with clinical features, nomogram of LRFS was constructed based on the MR features of the structured report alone. The nomograms based on structured report's features exhibited a good prediction performance. The C-index for training cohort and test cohort of the nomograms that constructed by structured reports' features are OS: 0.771 (95% CI: 0.710-0.831) and 0.751 (95% CI: 0.671-0.832), DMFS: 0.746 (95% CI: 0.644-0.848) and 0.712 (95% CI: 0.650-0.774), LRFS: 0.730 (95% CI: 0.666-0.794) and 0.654 (95% CI: 0.539-0.768), PFS: 0.698 (95% CI: 0.651-0.745) and 0.694 (95% CI: 0.620-0.768), respectively. The C-index for training cohort and test cohort of the nomograms that constructed by TNM staging system and clinical features are OS: 0.756 (95% CI: 0.683-0.830) and 0.718 (95% CI: 0.656-0.779), DMFS: 0.754 (95% CI: 0.673-0.8835) and 0.668 (95% CI: 0.599-0.737), LRFS: 0.621 (95% CI: 0.545-0.697) and 0.531 (95% CI: 0.410-0.652) (nomogram of LRFS was constructed by T+N categories), PFS: 0.671 (95% CI: 0.602-0.742) and 0.625 (95% CI: 0.571-0.680), respectively. The C-index for training cohort and test cohort of the nomograms that constructed by TNM staging system are OS: 0.720 (95% CI: 0.633-0.787) and 0.689 (95% CI: 0.622-0.756), DMFS: 0.727 (95% CI: 0.644-0.810) and 0.652 (95% CI: 0.582-0.722), LRFS: 0.611 (95% CI: 0.538-0.685) and 0.524 (95% CI: 0.406-0.642) (nomogram of LRFS was constructed by T category), PFS: 0.668 (95% CI: 0.598-0.737) and 0.617 (95% CI: 0.563-0.671), respectively. The performance of the nomograms we built that based on structured report were better than the prognostic models based on TNM staging system combined with clinical features or not. Significant differences were observed between the predictive models based on the structure report, and TNM staging system combined with clinical features (P-values were OS: 0.009; DMFS: 0.02; LRFS: 0.02; PFS: 0.003, respectively); the performance of the nomograms constructed by structured report were better than the nomograms constructed by TNM staging system as well (OS: 0.001; DMFS: 0.002; LRFS: 0.02; PFS: 0.002, respectively). The nomograms based on structured report's features outperformed TNM staging system in predicting prognosis of NPC patients.

Conclusions: The prognostic model baseds on the pre-treatment MRI structured report features showed a satisfactory prediction performance. The use of pre-treatment MRI structured report system in clinical diagnosis may aid individualized treatment strategies of NPC patients and improve the survival rate.

PO-0624

Preliminary study of dual-energy CT parameters combined with inflammatory indicators to predict cervical lymph node metastasis in papillary thyroid cancer

Longyu Wei
Anhui Provincial Cancer Hospital

Abstract

Purpose: Patients with papillary thyroid cancer (PTC) who develop cervical lymph node metastasis (CLNM) usually exhibit a poor prognosis. The purpose of this study was to screen for predictors of CLNM in PTC and to construct a predictive model to guide the surgical approach in patients with PTC.

Method: Preoperative energy-spectral CT images of 114 patients with pathologically confirmed PTC between July 2019 and April 2023 were retrospectively analyzed, and all patients were randomly divided into a training and validation group in a 2:1 ratio, and then the training and

validation groups were further divided into lymph node metastasis and non-metastasis groups. The dual-energy CT parameters (IC, NIC, λ HU) of the venous stage cancer foci were measured and calculated, and the clinical data of the patients were also collected and analyzed. The independent influencing factors for predicting CLNM were determined by univariate and multivariate logistic regression analysis, and the prediction models were constructed. The clinical benefits of the model were evaluated using decision curves, calibration curves, and ROC curves.

Results: The mean values of IC, NIC, and λ HU in the metastatic group were 33.18 ± 6.89 , 0.71 ± 0.14 , and 3.82 ± 0.84 , respectively. And the mean values of IC, NIC, and λ HU in the non-metastatic group were 31.20 ± 7.43 , 0.66 ± 0.13 , and 3.60 ± 0.87 , respectively. The statistical results show that NIC, dNLR, PNI, gender, and tumor diameter were independent predictors of CLNM in PTC, and the AUC of nomogram was 0.898 (95% CI: 0.829-0.966), and the calibration curve and decision curve showed that the prediction model had good predictive effect and clinical benefit, respectively.

Conclusion: The nomogram constructed based on dual-energy CT parameters (NIC), inflammatory prognostic indicators (dNLR, PNI), gender and tumor diameter has high clinical value in predicting CLNM in PTC patients, and can provide a reference for the selection of surgical modalities in PTC patients.

PO-0625

Associations between pericarotid fat density and image-based risk characteristics of carotid plaque

Miao Yu

The Affiliated Hospital of Xuzhou Medical University

Objectives: In this study, we aimed to evaluate the associations between pericarotid fat density (PFD) and various risk characteristics of carotid plaque.

Methods: We retrospectively evaluated consecutive patients who were subjected to both high-resolution MRI and carotid artery CT angiography CTA at our institution between January 2016 and April 2021. The section of the carotid artery with the most severe lumen stenosis was selected from each patient for analysis. Two separated regions of interest (ROI) (each with an area of 2.5 mm² and located at least 1 mm from the outer margin of the carotid artery wall) were defined in the perivascular fat tissue. The mean value of PFD (mean HU) was measured on the plaque side and the same axial non-plaque side. Then, the bilateral difference (D-value HU) was calculated (plaque side mean HU minus non-plaque side mean HU). According to carotid plaque risk characteristics (American Heart Association VI type [AHA VI], intraplaque hemorrhage [IPH], thinning and/or rupture of the fibrous cap [TRFC], lipid-rich necrotic core [LRNC], and calcification [CA]), the associations between PFD and five different risk characteristic subgroups were analyzed. The Student's t-test, Mann-Whitney U test, and Chi-square test were used to compare differences between different risk subgroups. Receiver operating characteristic (ROC) curve analysis was used to evaluate the predictive efficacy of PFD for carotid plaque risk characteristics. $P < 0.05$ was considered statistically significant.

Results: A total of 71 eligible patients (mean age 61.25 ± 10.35 years, 57 male) were examined in this study. For the plaque side and the non-plaque side, the mean PFD values were -36.25 ± 20.65 HU and -66.87 ± 15.00 HU, respectively. In the non-AHA VI and AHA VI subgroups, the values for the mean HU of the plaque side were -49.50 ± 20.53 and -33.55 ± 19.78 , respectively ($P = 0.014$). The D-value HU was higher for the AHA VI group compared to the non-AHA VI group (33.61 ± 16.72 vs. 15.91 ± 14.52 , respectively; $P = 0.001$). Compared to the non-IPH subgroup, the IPH subgroup had a higher mean HU value for the plaque side (-47.68 ± 18.26 vs. -29.63 ± 19.16 , respectively; $P < 0.001$) and a higher D-value HU (17.80 ± 13.27 vs. 38.03 ± 15.46 , respectively; $P < 0.001$). Compared to the low risk non-TRFC subgroup, the TRFC subgroup had a higher D-value HU (24.51 ± 16.16 vs. 33.55 ± 17.65 , respectively; $P = 0.042$). The D-value of PFD was found to be a significant predictor of both AHA VI classification (AUC: 0.79; SE: 64.41%; SP: 83.33%; $P = 0.0001$) and IPH (AUC: 0.83; SE: 88.89%; SP: 65.38%; $P < 0.0001$).

PO-0626

The multi-slice CT features and preliminary analysis of plemorphic adenoma and low-grade malignant plemorphic adenoma of parotid

Lingling Cai

Shanghai Ninth People's Hospital, Shanghai JiaoTong Universital School of Medicine

Purpose: To investigate the CT findings and imaging diagnosis of parotid plemorphic adenoma (PA) and low-grade malignant PA. **Methods:**CT scanning features in 45 cases (48 lesions) of parotid PA patients confirmed by surgery and pathology were retrospectively analyzed. All of these lesions were diagnosed as benign tumors through multislice CT before the operation.**Results:**33 benign lesions and 15 low-grade malignant PA. Tumor location, tumor size(average maximum diameter: Benign group $2.10 \pm 0.79\text{cm}$, Low-grade malignant group $2.64 \pm 1.45\text{cm}$), integrity of the tumor envelope and strengthening degree in assessment gradation of the tumors was not helpful. Lesions of the fuzzy boundaries (benign group 3/33, low grade group 10/15), irregular shape (benign group 8/33, low grade group 9/15), uneven density (benign group 11/33, lowgrade group 13/15) and angioid enhancement at the margin of capsule (benign group 6/33, low grade group 10/15) are statistically significant differences ($P < 0.05$).**Conclusion:** CT examination is helpful for the diagnosis of parotid plemorphic adenoma and judging its benign or malignancy, instructing clinical treatment and estimateing prognosis.

PO-0627

Radiological evaluation of the tympanic segment of the chorda tympani nerve visualization by ultra-high resolution CT

Ruowei Tang,Ning Xu,Pengfei Zhao,Zhengyu Zhang,Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objective

The aim of this study was to identify the course and anatomic variants of the tympanic segment of the chorda tympani nerve (CTN) on ultra-high resolution CT (U-HRCT).

Methods

Fifty-five healthy participants (28 males and 27 females, mean age 32 years) with 104 ears were prospectively included. The tympanic segment was divided into four portions: the periannular, postero-malleus (PM), malleus and antero-malleus (AM). The length of the periannular portion was measured and the tympanic segment was categorized into three types based on the entry point and trajectory of the periannular portion. Four points of interest (the beginning and ending of the PM and AM portions) were chosen to carry out the distance measurement in relation to the tip of the malleus manubrium.

Results

The tympanic tract of the CTN was identified in all cases. The length of the periannular portion was measured $2.6 \pm 1.16\text{ mm}$. The attached type of the tympanic segment was the most frequent type (86.5%). Overall, the PM portion ascended in a medial-anterior direction and the AM portion descended in an antero-medial course through the tympanic cavity. The start of the PM and AM portions on the right side located at a more lateral location. The end of the PM portion and the start of the AM portion of male was posterior to those of female.

Conclusions

U-HRCT allows detailed identification of the tympanic segment of the CTN. Novel segmental classification of the tympanic segment on CT is proposed herein to provide detailed description of the nerve tract and its anatomic variants. Preoperative evaluation of the tympanic segment provides insight into safe nerve management in terms of reducing the risk of iatrogenic injury.

PO-0628

Malleus in the tympanic cavity: spatial location in normal middle ears based on ultra-high-resolution computed tomography

Ruowei Tang, Ning Xu, Pengfei Zhao, Zhengyu Zhang, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Purpose:

To establish the spatial location of the malleus in normal ears using ultra-high-resolution computed tomography.

Methods:

Imaging data of 117 patients (117 normal ears) from September 2020 to July 2021 were reviewed. The spatial location of the malleus was quantified by the distances between the malleus and anatomic landmarks on the tympanic cavity walls. Confounding factors (middle cranial fossa depth and mastoid pneumatization degree) were measured. Distances were compared in terms of age (18–29, 30–44, 45–59, 60–74, and ≥ 75 years), laterality, and sex.

Results:

The largest and smallest distances between the malleus and tympanic cavity walls were head-facial nerve (2.03 ± 0.36 mm) and anterior process-anterolateral wall (0.38 ± 0.12 mm) distances. The head-superior wall distance in 2 ears and head-anterior wall distance in 4 ears measured 0, presenting as strip-like high attenuation connecting the malleus and the tympanic cavity walls. The middle cranial fossa depth was 4.01 ± 1.98 mm. Among the 97 ears with full coverage, 2, 20, 19, and 56 ears showed hypopneumatization, moderate pneumatization, good pneumatization, and hyperpneumatization of the mastoid, respectively. No age- or sex-related differences were found, but the handle-medial wall distance was greater on the right (2.04 ± 0.45 mm) than on the left (1.84 ± 0.54 mm, $P = 0.039$).

Conclusion:

The spatial location of the malleus in normal ears provided a basis for identifying subtle changes in the spaces surrounding the malleus for diagnosing middle ear diseases and understanding the underlying pathology.

PO-0629

A Novel Imaging Scoring Method for Identifying Facial Canal Dehiscence: An Ultra-High-Resolution CT Study

Ruowei Tang, Ning Xu, Pengfei Zhao, Zhengyu Zhang, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objectives: Facial canal dehiscence (FCD), typically found in the tympanic segment, is a risk factor for facial nerve injury. An imaging scoring method was proposed to identify FCD based on ultra-high-resolution CT.

Methods: Forty patients (21 females and 19 males, mean age 44.3 ± 17.4 years), whose tympanic facial canal (FC) was examined during otological surgery, were divided into the FCD group ($n = 29$) and the control group ($n = 11$) based on surgical findings. Imaging appearance of tympanic FC was scored 0-3: 0 = no evident bony covering, 1 = discontinuous bony covering with linear deficiency, 2 = discontinuous bony covering with dotted deficiency, and 3 = continuous bony covering. Both lateral and inferior walls were assigned a score as L_{FCD} and I_{FCD} , respectively. An FCD score was calculated as $L_{FCD} + I_{FCD}$. The diagnostic value of FCD score was tested using ROC curve.

Results: The inter-observer agreement was moderate for the lateral wall (Cohen's κ coefficient 0.416, 95% CI 0.193–0.639), and good for the inferior wall (Cohen's κ coefficient 0.702, 95% CI 0.516–0.888). In the FCD group, the most common appearance for both walls was discontinuous bony covering with linear deficiency ($L_{FCD} = 1$, 22/29, 75.9%; $I_{FCD} = 1$, 15/29, 51.7%). An FCD score less than 4 was associated with 82% sensitivity and 93% specificity for predicting FCD with an AUC of 0.928).

Conclusions: Using the proposed scoring method, FCD score <4 could identify FCD of the tympanic segment with high concordance with surgical findings.

PO-0630

Correlation Between Condylar Structure and Temporomandibular Articular Disc Injury in Adolescents

Huaizhi Ge, Guanghui Bai
the Second Affiliated Hospital of Wenzhou Medical University

Rationale and Objectives: To explore the relationship between condylar structure and temporomandibular joint disc injury in adolescents by statistical methods.

Methods: A total of 94 temporomandibular joints were studied in 47 patients who underwent MRI examination of TMJ in our hospital. For them, a 3.0T MRI scan was performed with conventional sequences, as well as 3D-CUBE T2 and T2-mapping sequences. Maximum left-right and antero-posterior diameters of condyles were measured by multi-plane recombination (MPR) on 3D-CUBE T2 sequence images, whose product and quotient were also calculated. Qualitative and quantitative indicators were included for evaluation of articular disc injury. By reading the films of conventional sequences comprehensively, articular disc displacement was qualitatively classified into non-displacement (ND) group, reducible displacement (RD) group and non-reducible displacement (NRD) group. The T2 value of the articular disc was measured on the T2-mapping sequence as a quantitative indicator. Four parameters of condylar structure and 2 indicators of articular disc injury were analyzed by statistical method.

Results: There were statistically significant differences in three structural parameters of the condyle (left-right and antero-posterior diameters and their products) among the ND, RD and NRD groups ($P < 0.001$), and the corresponding mean values were ranked in descending order: $ND > RD > NRD$. The left-right and antero-posterior diameters and their products were slightly positively correlated with the T2 values of the articular disc ($r = 0.262$, $r = 0.317$, $r = 0.386$, $P < 0.05$).

Conclusion: The left-right diameter, antero-posterior diameter and product of the condyle decreased with aggravation of TMJ disc injury, they can be used as the indirect imaging features of temporomandibular disorder.

PO-0631

Value of MRI histogram parameters in differentiating benign from malignant submandibular gland tumors

Qingbo Song

Shanghai Xinhua Hospital affiliated to Shanghai Jiao Tong University School of Medicine

Background: Presurgical differentiation of benign and malignant submandibular gland (SMG) tumors is particularly important for surgical strategy.

Purpose: To explore the value of magnetic resonance imaging (MRI) histogram parameter from T2-weighted imaging (T2WI) and apparent diffusion coefficient (ADC) maps to differentiate between benign and malignant SMG tumors.

Material and Methods: MR images of 57 patients with pathologically confirmed SMG tumors (42 benign, 15 malignant) were analyzed retrospectively. Conventional MRI and diffusion-weighted imaging were undertaken before treatment. Histogram parameters of whole tumors derived from axial T2WI and ADC maps were evaluated and compared between benign and malignant groups, including mean, median, 10th percentile, 90th percentile, inhomogeneity, skewness, and kurtosis. A multivariable logistic regression model was employed and analysis of receiver operating characteristic (ROC) curves was undertaken.

Results: Multivariate logistic regression analysis showed that T2WIInhomogeneity and ADC90 were independent risk factors for discriminating between benign and malignant SMG tumors. The malignant group presented significantly higher T2WIInhomogeneity ($p = 0.012$) and lower ADC90 ($p = 0.001$) compared with those in the benign group. T2WIInhomogeneity, ADC90 and combined model achieved AUCs of 0.718, 0.799 and 0.911, with sensitivities of 86.67%, 66.67% and 86.67% and specificities of 54.76%, 92.86% and 85.71%, respectively.

Conclusions: T2WIInhomogeneity and ADC90 are valuable for the differential diagnosis of benign and malignant SMG tumors, and both of them had good interobserver repeatability.

PO-0632

Prognostic prediction in patients with primary DLBCL of the CNS using MRI-based radiomics

Jianpeng Liu¹, Jiaqi Tu¹, Bin Hu¹, Sirong Piao⁴, Yucheng Lu¹, Tianling Ding³, Chao Li³, Fengping Zhu², Yuxin Li¹

1. Huashan Hospital of Fudan University

2. Department of Neurosurgery, Huashan Hospital, Fudan University

3. Department of Clinical Neuroscience, University of Cambridge

4. Department of Radiology, Peking Union Medical College Hospital

Background.

Primary central nervous system (CNS) lymphoma is a rare form of extra-nodal non-Hodgkin lymphoma with poor prognosis. The objective of this study was to examine the potential of MRI-based radiomic signature as an adjunctive tool to the traditional clinical prognostic factors for predicting the prognosis of patients with Primary diffuse large B-cell lymphoma of the central nervous system (PCNS-DLBCL).

Methods.

The radiomics model was developed based on a retrospective analysis of 169 PCNS-DLBCL patients who underwent pretreatment MRI exams, and 4227 radiomics features were obtained from

enhanced T1-weighted (CE-T1WI), fluid attenuation inversion recovery (FLAIR), and apparent diffusion coefficient (ADC) MRI sequences. Imaging features were selected using a LASSO (least absolute shrinkage and selection operator) logistic regression model with 10-fold cross-validation to construct a radiomic signature for predicting progression-free survival (PFS) and overall survival (OS). Cox proportional hazards models were constructed for clinical, radiomics, and combined clinical and radiomics models. To ensure the dependability and stability of these models, an internal cohort comprising of 72 individuals and an external cohort consisting of 32 individuals were employed to validate their performance. Notably, the effectiveness of these models was assessed via clinical decision curves and the consistency index (CI).

Results.

The development of PFS and OS prediction models established the selection of 17 significant radiomic features. Radiomics score was an independent predictor of better outcome for both PFS (hazard ratio: 2.588(2.053-3.263), $P < 0.001$) and OS (hazard ratio: 2.612(2.056-3.319), $P < 0.001$) on multivariate analysis. The C-index of the combined clinical and radiomics model was higher performance in the training (PFS, $C = 0.741$ [95% CI: 0.697-0.786]; OS, $C = 0.793$ [95% CI: 0.752-0.835]), internal validation (PFS, $C = 0.652$ [95% CI: 0.571-0.733]; OS, $C = 0.730$ [95% CI: 0.655-0.806]), and external validation cohorts (PFS, $C = 0.785$ [95% CI: 0.638-0.933]; OS, $C = 0.775$ [95% CI: 0.640-0.910]) than any single clinical or radiomics model for OS and PFS. The decision curve analysis (DCA) results revealed that the combined model provided the highest net benefit across a wider range of appropriate threshold probabilities for predicting PFS and overall survival OS.

Conclusion.

Incorporating clinical and conventional MRI prognostic variables into a multi-sequence MR-based radiomics model can effectively enhance the predictability of PCNS-DLBCL prognosis. The combined clinical and radiomics model displayed superior performance as compared to NCCN-IPI and Conventional imaging models and maintained its robustness across different centers. These findings provide a promising approach for prognostic evaluation and treatment planning for PCNS-DLBCL patients.

PO-0633

Reduced Local Segregation of Single-Subject Gray Matter Networks in Unilateral Sudden Sensorineural Hearing Loss

Yan Zou, Hui Ma, Wenliang Fan, Ping Han

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To explore topological abnormalities of single-subject gray matter networks in patients with unilateral sudden sensorineural hearing loss (SSNHL) in the acute phase.

Materials and Methods:

(1) One hundred and fifty-eight patients with unilateral SSNHL and 136 age-, gender-, and education-matched healthy controls (HCs) were recruited to undergo pure tone audiometry (PTA) and 3D-T1 examination. (2) Individual morphological brain networks were constructed with using interregional similarity in the distribution of regional gray matter volume (GMV) in terms of the Kullback-Leibler divergence measure after preprocessing by voxel-based morphometry (VBM).

(3) Both the global (standardized clustering coefficient, standardized characteristic path length, small-worldness, clustering coefficient, characteristic path length, and global efficiency, local efficiency) and nodal network metrics (nodal centrality and hubs) were calculated by graph theory analysis.

(4) Independent-samples t test was performed to identify group differences in topological properties.

Results:

(1) The gray matter network in both unilateral SSNHL and HC were typically organized as small-world networks. At the global level, SSNHL patients displayed decreased standardized clustering coefficient, clustering coefficient and local efficiency ($P < 0.05$) compared with HCs.

(2) At the nodal level, SSNHL exhibited altered nodal centrality in left superior frontal gyrus, parahippocampal gyrus, caudate nucleus, superior occipital gyrus and right lenticular nucleus ($P < 0.05$). Altered hubs located in right superior temporal gyrus, inferior frontal gyrus and left olfactory cortex.

Conclusions: The reduced segregation of network indicates individual gray matter networks in unilateral SSNHL shifted toward randomization. And the altered nodal centrality involving auditory network and non-auditory networks of patients with unilateral SSNHL were found in the acute phase.

PO-0634

Accuracy of transverse sinus stenosis score predicting intracranial hypertension in patients with unilateral pulsatile tinnitus as the initial symptom

Chihang Dai, Pengfei Zhao, Zhenchang Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Purpose: To assess the accuracy of the transverse sinus stenosis (TSS) score for detecting intracranial hypertension (ICH) or idiopathic intracranial hypertension (IIH) in patients exhibiting initial symptoms of unilateral pulsatile tinnitus (PT).

Methods: Data from patients with unilateral PT who received CT venography and lumbar puncture between January 2020 and May 2023 was examined. Two observers evaluated six methods, including three previously published and three adapted, with inter-observer agreement assessed. The TSS score of each method was compared between patients with and without ICH and between patients with and without IIH.

Results: The mean cerebrospinal fluid (CSF) pressure in patients with unilateral PT is $234.49 \pm 54.69 \text{ mmHg}$, with 73.0% above 200 mmHg and 44.4% above 250 mmHg . The method utilizing the cross-sectional area at the transverse sinus 2cm from the torcular as a reference and the product of bilateral TSS score as the score reference had the highest inter-observer agreement ($\kappa = 0.821$). There was no statistical difference in TSS score between patients with and without ICH or IIH using the abovementioned six methods.

Conclusions: A quantitative method utilizing area, product, and reference location at the transverse sinus 2cm from the torcular yields the most reliable TSS score. However, these scores do not effectively screen for ICH or IIH in patients with PT.

PO-0635

Morphological remodeling of the repaired sigmoid sinus bone wall in patients with pulsatile tinnitus following successful surgical reconstruction: an ultra-high resolution CT study

Chihang Dai, Pengfei Zhao, Zhenchang Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Purpose: To evaluate morphological changes in the repaired sigmoid sinus bone wall following successful surgical reconstruction in patients with pulsatile tinnitus (PT) using ultra-high-resolution CT (U-HRCT).

Methods: Data were retrospectively analyzed from eight female patients with PT who presented with sigmoid sinus anomalies on pre-operative CT angiography and underwent sigmoid sinus wall reconstruction primarily with autologous bone powder and had no recurrence. Isotropic 0.1mm U-HRCT scans were conducted within three days and then again more than six months post-surgery. We compared the patients with regards to the integrity, relative density, extent and shape of the repaired wall and its fusion with residual bone.

Results: Of the ten PT patients, one (10%) achieved complete fusion of the repaired wall with the residual bone, eight (80%) experienced partial fusion, and one (10%) exhibited complete separation. Four patients (40%) showed sigmoid sinus wall dehiscence on the second U-HRCT. The presence of a gap between the repaired wall and residual bone in the initial U-HRCT was associated with poor fusion between the repaired wall and residual bone in the subsequent U-HRCT scan ($\chi^2=16.296$, $p<0.001$, $\phi=0.903$). The repaired wall shrank from the periphery to the center, and the density increased in all patients ($p<0.001$). The repaired wall compressed into the sigmoid sinus retracts over time, reshaping into a naturally curved sigmoid sinus sulcus.

Conclusion: Morphological remodeling is a typical characteristic of the repaired sigmoid sinus wall in PT patients. Short-term incomplete repair may imply poor fusion over the medium to long term, but this is not correlated with recurrence.

PO-0636

An MRI-based radiomics nomogram for predicting cervical esophagus invasion in hypopharyngeal squamous cell carcinoma

Meng Qi

Shanghai EENT hospital, Fudan university

Background Accurate detection of cervical esophagus invasion (CEI) in HPSCC is challenging but crucial. We aimed to investigate the value of magnetic resonance imaging (MRI)-based radiomics for predicting CEI in patients with HPSCC.

Methods This retrospective study included 151 HPSCC patients with or without CEI, which were randomly assigned into a training ($n = 101$) or validation ($n = 50$) cohort. A total of 750 radiomics features were extracted from T2-weighted imaging (T2WI) and contrast-enhanced T1-weighted imaging (ceT1WI), respectively. A radiomics signature was constructed using the least absolute shrinkage and selection operator method. Multivariable logistic regression analyses were adopted to establish a clinical model and a radiomics nomogram. Two experienced radiologists jointly evaluated the CEI status based on morphological findings. Areas under the curve (AUCs) of the models and readers were compared using the DeLong method. The performance of the nomogram was also assessed by its calibration and clinical usefulness.

Results The radiomics signature, consisting of five T2WI and six ceT1WI radiomics features, was significantly associated with CEI in both cohorts (all $p < 0.001$). The radiomics nomogram combining the radiomics signature and clinical T stage achieved significantly higher predictive value than the clinical model and pooled readers in the training (AUC 0.923 vs. 0.723 and 0.621, all $p < 0.001$) and validation (AUC 0.888 vs. 0.754 and 0.647, all $p < 0.05$) cohorts. The radiomics nomogram showed favorable calibration in both cohorts and provided better net benefit than the clinical model.

Conclusions The MRI-based radiomics nomogram is a promising method for predicting CEI in HPSCC.

PO-0637

Carcinoma ex pleomorphic adenoma of major salivary glands: CT and MR imaging findings

Can Wang

Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine Shanghai

Objectives: To describe the CT and MR imaging characteristics of primary carcinoma ex pleomorphic adenoma (Ca-ex-PA) in major salivary glands and present more information for recognizing this malignancy.

Methods: 210 patients with primary Ca-ex-PA in major salivary glands (167 in the parotid gland, 36 in the submandibular gland, 7 in the sublingual gland) underwent CT and MR imaging (plain and contrast-enhanced scans) prior to surgical management and histopathologic examination. The CT and MR imaging findings of this condition were retrospectively reviewed and correlated with their pathological types: noninvasive carcinoma (type I, 37 cases), minimally invasive carcinoma (type II, 18 cases), and widely invasive carcinoma (type III, 155 cases). The binary Logistic regression analysis was used to analyze the independent influencing factors of morphology and boundary for differentiating between type I/II and type III of CA-ex-PA, and the sensitivity, specificity and positive predictive value were calculated. Differences in ADC values between type I/II and type III of Ca-ex-PA were calculated by independent sample t-tests.

Results: On CT and MR imaging, there were 190/210 cases (90.4%) identified as lobular, 201/210 cases (95.7%) with enhancement, and 171/210 cases (81.4%) with inhomogeneous after contrast administration. Calcification within the mass was shown in 76 of 192 cases (39.6%) on plain CT examination. Of 55 neoplasms with type I and II, 38 (69.1%) were presented as round or oval and 42 (76.4%) as well-defined margins. Of 155 neoplasms with type III, 101 (65.1%) were presented as irregular form and 108 (69.7%) as uneven margins or with partial uneven margins. The mean ADC value of CA-ex-PA (22 cases) in major salivary glands was about $0.93 \times 10^{-3} \text{mm}^2/\text{s}$, and there was no significant difference in mean ADC value between type I/II and type III of this neoplasm. Cervical lymph node metastasis and distant metastasis were found in 66 patients (31.4%, type III) and 32 patients (15.2%, type I in 1; type II in 1; and type III in 30), respectively.

Conclusions: Most Ca-ex-PA is characterized by an irregular, lobular, and inhomogeneous enhanced neoplasm with uneven margin or partial uneven margin on CT and MR imaging, which is frequently corresponding with type III. And a round or

oval mass with well-defined margin usually correlates with type I and II. Morphology and boundary are important basis for distinguishing type I/II and type III tumors. Calcification within the neoplasm shown on CT may be regarded as a specific sign for indicating this malignancy. Low ADC value is an important manifestation of this neoplasm. Ca-ex-PA with type III is more likely to have cervical lymph node metastasis and distant metastasis.

PO-0638

Preliminary study of arterial spin labeling technique to assess blood perfusion of thyroid parenchyma and mass lesions

Yuyun Xu, Yanan Xiao, Qiaowei Song
Zhejiang Provincial People's Hospital

Objective: To investigate the feasibility of arterial spin labeling (ASL) technology to evaluate thyroid parenchyma and mass blood supply in routine clinical practice by comparing with enhanced thyroid CT examination.

Methods: The data of patients with thyroid mass lesions who underwent thyroid enhanced CT scan and thyroid MR examination including ASL technique in our hospital between August 2022 and September 2023 were retrospectively collected. ASL image quality was independently scored by two radiologists. Thyroid blood flow (TBF) for thyroid mass and normal thyroid parenchyma were measured. CT values for normal thyroid and thyroid mass were measured on plain, arterial phase, and venous phase CT. The agreement of image quality scores of the two radiologists was analyzed by Kappa test. The consistency of TBF in thyroid parenchymal and mass lesions was analyzed by intra-group correlation coefficient (ICC). The correlation between enhanced CT value and TBF value in normal thyroid and thyroid mass was evaluated by Pearson correlation.

Results: A total of 69 patients with thyroid mass underwent both enhanced thyroid CT and thyroid ASL MR perfusion, and the final surgical pathology was confirmed. Among them, 1 patient was excluded due to esophageal cancer invasion of thyroid, 3 cases had lesions below 5mm, 1 case had diffuse thyroid tumor and 3 cases were excluded without adequate ASL label, and a total of 57 cases were enrolled with 60 thyroid masses. The image quality scores of the two radiologists were consistent well ($\kappa=0.706$, $P<0.001$). ICC between two physicians in measuring TBF of thyroid parenchymal and thyroid mass lesion was 0.832, 0.666 ($P<0.001$), respectively. The correlation between TBF and CT enhancement value of thyroid parenchyma was fair ($r=0.340$, $p=0.007$), while the correlation between TBF and enhanced CT value of thyroid mass lesion was substantial ($r=0.767$, $P<0.001$).

Conclusion: Thyroid ASL technology can non-invasively quantify the blood perfusion of normal thyroid and thyroid mass lesions with good reproducibility, which may be more capable than thyroid-enhanced CT in reflecting the real blood flow perfusion of thyroid parenchyma and masses.

PO-0639

Relationship between the ultra-high-resolution computed tomography score of oval window region involvement and audiometry in otosclerosis

Heyu Ding, Pengfei Zhao, Wei Wei, Ning Xu, Ruowei Tang, Yan Huang, Zhengyu Zhang, Hongxia Yin, Han Lv, Xiaoyu Qiu, Chihang Dai, Chen Yang, Zhenghan Yang, Zhenchang Wang
Beijing Friendship Hospital

Objective To assess the relationship between the ultra-high-resolution computed tomography (U-HRCT) score of oval window region (OWR) involvement and audiometry in otosclerosis.

Materials and Methods This retrospective, single-center, cross-sectional study enrolled patients with clinically suspected otosclerosis who underwent U-HRCT examination. The analysis included 71 ears from 50 patients (13 men, 37 women; mean age, 38.0 [34.0-49.8] years). The ears were divided into the conductive hearing loss group (group A, 20 ears) and mixed hearing loss group (group B, 51 ears). The CT scores of bone involvement around the oval

window (0, none; 1, <25%; 2, 25%-50%; 3, 50%-75%; 4, >75%) and stapes footplate involvement (0, none; 1, <50%; 2, >50%) were evaluated and summed to obtain the CT score of OWR involvement. The Mann-Whitney U test was used to compare the difference in the distribution of the CT score of OWR involvement between groups A and B. Spearman's rank correlation analysis was performed to evaluate the association between the CT score of OWR involvement and the mean air conduction (AC), bone conduction (BC) and air-bone gap (ABG). After establishing the dummy variable, further univariate linear regression analysis was performed to investigate the degree to which the CT score of OWR involvement could predict the audiometry result with the highest correlation coefficient.

Results The CT score of OWR involvement in group B was significantly higher than that in group A ($p=0.014$). The correlation coefficients between the CT score of OWR involvement and the mean AC, BC, and ABG threshold were 0.74 ($p<0.001$), 0.52 ($p<0.001$), and 0.48 ($p<0.001$), respectively. Dummy variables were set by designating the CT score of 3 points as reference because it had the highest frequency distribution in the sample. Univariate linear regression analysis showed that the CT score of OWR involvement was correlated with the AC and yielded the following equation: $Y_{AC} = 56.307 - 21.307X_{\text{Score}=1} - 8.307X_{\text{Score}=2} + 5.221X_{\text{Score}=4} + 11.888X_{\text{Score}=5} + 18.381X_{\text{Score}=6}$ ($R=0.776$, $R^2=0.602$, $p<0.001$)

Conclusions U-HRCT possesses the ability to clearly depict the footplate of the stapes and annulus ligament. The U-HRCT-derived OWR involvement score of otosclerosis could reflect the type and degree of hearing loss.

PO-0640

The Impact of Submandibular Glands Protection on xerostomia by Diffusion-Weighted Imaging in Nasopharyngeal Carcinoma Patients

Dawei Zhao

Department of Radiology, Affiliated Hospital of Logistic University of the Chinese People's Armed Police Force (PAP), Tianjin, China

Purpose: To determine the impact of sparing submandibular glands (SMGs) on alleviating xerostomia and the functional dynamics of the irradiated parotid glands (PGs) and sublingual glands (SLGs) by diffusion-weighted imaging.

Methods: 97 participants underwent 9 rounds of DWI scans before IC (pre-IC), pre-radiation (pre-RT), the midpoint of radiation (mid-RT), the end of radiation (post-RT), 1, 3, 6, 9, 12 (12m-RT) months following radiation. Apparent diffusion coefficient of SMGs (ADCSMG), PGs (ADCPG), and SLGs (ADCSLG), xerostomia questionnaire scores (XQ), and saliva flow rate measures under unstimulated (uSFR) and stimulated condition (sSFR) were documented.

Results: ADCPG, ADCSMG, ADCSLG, and XQ showed a rapid increase with a top at 3m-RT followed by regression, whereas uSFR and sSFR had the reverse trend. The change rate of ADC correlated with the dose to PGs, SMGs, and SLGs, as well as uSFR, sSFR, and XQ scores ($p<0.05$ for all, except for uSFR with ADCPG ($p=0.063$)). Main group for ADCPG, uSFR, and sSFR were significant (p values were 0.028, 0.000, 0.000 respectively); ADCPG in SMG sparing group was lower while uSFR, and sSFR were higher than those in the SMG-unsparing group. Simple group for ADCSMG, ADCSLG (all $p<0.05$ from mid-RT to 12m-RT), and XQ (all $p<0.001$ at mid-, 6m-, 9m-, and 12m-RT) were significant; ADCSMG, ADCSLG, and XQ were lower in the SMG-sparing group. **Conclusions:** SMG protection has a great impact on the functional retention of PGs and SLGs, resulting in alleviating xerostomia and improving quality of life.

PO-0641

Retrolaminar migration as a complication of intraocular silicone oil injection detected on unenhanced head CT.

Fanfan Zhao¹, Xiangyang Gong^{1,2}

1. Center for Rehabilitation Medicine, Department of Radiology, Zhejiang Provincial People's Hospital (Affiliated People's Hospital), Hangzhou Medical College.
2. Institute of Artificial Intelligence and Remote Imaging, Hangzhou Medical College.

AIM: To investigate the clinical and radiologic features of retrolaminar migration silicone oil (SiO) and observe the dynamic position of ventricular oil accumulation in supine and prone head computed tomography (CT).

METHODS: For this retrospective study, twenty-nine patients who had a history of SiO injection treatment and underwent unenhanced head CT were included from January 2019 to October 2022. It was divided into cases of migration-positive and negative groups. Clinical history and CT features were compared using Whitney U and Fisher's exact tests. The dynamic position of SiO was observed within the ventricular system in supine and prone. CT images were visually assessed for SiO migration along the retrolaminar involving pathways for vision (optic nerve, chiasm, and tract) and ventricular system. All values for variables were expressed as mean \pm standard deviation.

RESULTS: Intraocular SiO migration was found in 5 of the 29 patients (17.24%), with SiO at the optic nerve head (n=1), optic nerve (n=4), optic chiasm (n=1), optic tract (n=1), and within lateral ventricles (n=1). The time interval between SiO injection and CT examination of migration-positive cases was significantly higher than that of migration-negative patients (22.8 ± 16.5 vs 13.1 ± 2.6 months, $P < 0.001$). The hyperdense lesion located in the frontal horns of the right lateral ventricle migrated to the fourth ventricle when changing the position from supine to prone.

CONCLUSION: The clinician and radiologist should be aware of migration routes. The supine combined with prone examination is the first-choice method to confirm the presence of SiO in the ventricular system.

PO-0642

Study in intracranial hemodynamic assessment based on four dimensional flow MRI (4D flow MRI) for unruptured aneurysm

Jiyun Zhang¹, Ying Shi²

1. First People Hospital of Kunming
2. First Affiliated Hospital of Kunming Medical University

Objective: This study aims to investigate the feasibility and clinical significance of employing four-dimensional flow magnetic resonance imaging (4D flow MRI) for assessing blood flow in unruptured intracranial aneurysms.

Methods: A retrospective analysis was conducted on 10 unruptured intracranial aneurysms (involving 10 patients) located at the anterior communicating artery, confirmed by digital subtraction angiography (DSA) performed at our Stroke Center from March 2021 to April 2023. Original data for these 10 aneurysms, including the cross-sectional area of the feeding artery, aneurysm neck diameter, and aneurysm size, were obtained. Computational fluid dynamics (CFD) was used to calculate hemodynamic parameters, including through-plane velocity, maximum through-plane velocity, average velocity, maximum velocity, and average and maximum instantaneous blood flow rates. Subsequently, all 10 patients with aneurysms underwent magnetic resonance vascular imaging and 4D flow MRI processing. This resulted in velocity vector fields, streamlines, shear rates, wall shear stress, oscillatory shear index, and three-dimensional blood flow pathlines for the 10 aneurysm cases. The average blood flow velocity at the aneurysm neck was extracted, and the normalized root mean square error (NRMSE) and linear correlation coefficient (R²) were calculated between the two methods. Finally, velocity distribution maps at the maximum cross-sectional area of the aneurysms were compared.

Results: Comparative analysis between 4D Flow MRI and CFD revealed similar flow patterns within the feeding artery and within the aneurysm sac. The average flow velocity at the aneurysm neck exhibited good agreement. The mean normalized root mean square error (NRMSE) for the average flow velocity at the neck of the 10 aneurysms was 0.08452, with a mean R2 value of 0.90132. This demonstrated a consistent distribution of high-velocity regions.

Conclusion: There is a strong concordance between the measurements obtained from 4D Flow MRI and the computational results from CFD. 4D Flow MRI offers a comprehensive assessment of hemodynamics and is a non-invasive examination, providing more precise data. This enhances the accuracy in assessing the risk of aneurysm rupture and prognosis.

PO-0643

Preoperative differentiated imaging of vagal nerve and sympathetic cervical schwannomas based on Diagnosis Score and vascular displacement nomogram

shiyu xiang

Fudan University Shanghai Cancer Center

Objective The purpose of this study was to propose and validate a Diagnosis Score and vascular displacement nomogram for the preoperative differentiation of VNCS from SCCS in the neck by CT and MR.

Methods 46 patients with VNCS and 64 patients with SCCS were analyzed retrospectively. Patients were divided into a training set ($n = 77$) and validation set ($n = 33$). The tumors were evaluated with their location, size, laterality and relationship to the vessels. The variables that had clinical significance in the final multivariate logistic regression model were built into Diagnosis Score and nomogram. The efficiency of the Diagnosis Score were evaluated and validated on the training and validation datasets.

Result No significant difference was observed for patient age, sex and tumor location, size, laterality between the two groups. In the upper neck, ICA/ECA and ICA/IJV splaying were significantly associated with SCCS ($p=0.000$) and VNCS ($p=0.000$), respectively. Five features were used to establish the Diagnosis Score. The threshold value of diagnosis score is 0.235. The imaging nomogram combined imaging features showed favorable preference value for differentiating VNCS from SCCS in the upper neck, with AUCs of 0.953 and 0.939 for the training set and validation set, respectively.

Conclusion ICA and IJV splaying frequently predicts VNCS. Medial and anterior ICA displacement is more likely to be VNCS. The Diagnosis Score and vessels displacement nomogram showed favorable predictive efficacy for differentiating VNCS from SCCS in the neck.

PO-0644

Prediction of glioma IDH status and VEGF expression levels using auto-machine learning with whole brain morphologic features combined with multiregional radiomics

Simin Zhang, Qiang Yue, Qiyong Gong

Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

Background: Glioma is a systemic disease that can induce micro and macro alternations of the whole brain. Isocitrate dehydrogenase (IDH) and vascular endothelial growth factor (VEGF) is proven prognostic marker and antiangiogenic therapy in glioma. We aimed to preoperatively predict IDH status and VEGF expression levels in glioma by applying Pycaret, an automated machine learning (autoML) approach combined with whole brain morphologic features and multiregional radiomics using MRI.

Materials and Methods: This retrospective study recruited 80 glioma patients with IDH wildtype (IDHwt) and high VEGF expression levels, 102 patients with IDH mutation (IDHmut) and low VEGF expression levels. Firstly, U-net network was applied to automatically segment glioma subregion and whole tumor. Next, the virtual brain grafting combined with Freesurfer was used to enable successful brain parcellation and compute whole brain morphologic features including cortical thickness, LGI and subcortical volume in individual glioma patients. Radiomics features were extracted from four glioma regions, including whole tumor, enhanced tumor, necrosis and edema region based on gadolinium-enhanced 3D T1-weighted images (Gd-3DT1WI). Pycaret was used to construct the optimal machine learning pipeline for predicting IDH mutation and VEGF expression level. Finally, the performance of models based on each feature set were compared to identify the best model with its top-performing features.

Results: Among the radiomics models, the whole tumor model achieved the best performance (accuracy 0.79, AUC 0.86), while, the combination of whole brain morphologic features had a superior predictive performance (accuracy 0.82, AUC 0.88). The features contributed most in predicting model including the right caudate volume, left middle temporal cortical thickness, first-order statistics (root mean squared, 90th Percentile), shape (major axis length, surface/volume ratio) and gray level cooccurrence matrix (GLCM).

Conclusions: Pycaret based on whole brain morphologic features combined with glioma radiomics yielded the highest accuracy in predicting IDH mutation and VEGF expression levels, indicating that morphologic abnormalities induced by glioma were associated with tumor biology.

PO-0645

Quantitative analysis of orbital soft tissue for the detection of Dysthyroid Optic Neuropathy in patients with Thyroid-Associated Ophthalmopathy, based on 3D Cube FSE-flex.

Weiqiang Liang, Jing Zhang

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China.

Objective: To evaluate the ability of volume and water fraction (WF) of orbital soft tissue for predicting dysthyroid optic neuropathy (DON).

Methods: This retrospective study included 60 patients with TAO (27 with DON, 33 without DON) who underwent 3D Cube FSE-flex MRI. Volume and water fraction of extraocular muscles (EOM), orbital fat, eyeball, optic nerve, and lacrimal gland were compared between patients with and without DON. A logistic regression analysis was conducted to determine the risk factors associated

with DON. In addition, we performed receiver operating characteristic curve (ROC) analysis and correlation analysis between magnetic resonance imaging (MRI) parameters and ophthalmic features.

Results: We investigated 116 orbits (53 and 63 with and without DON, respectively). Extraocular muscle volume (EOMV), water fraction of extraocular muscles (EOM-WF), and water fraction of orbital fat (OF-WF) were significantly higher in the DON group than in the TAO group. A larger EOMV (OR = 1.555) and greater OF-WF (OR = 1.190) were associated with a higher risk of DON. A model that combined EOMV and OF-WF was efficient in predicting DON in TAO patients (AUC=0.843; sensitivity = 0.698, specificity = 0.810). EOMV was positively correlated with clinical activity scores ($p < 0.001$, $r = 0.468$).

Conclusions: Edema of the orbital fat and enlargement of the EOM are significant risk factors for the development of DON. The combination of EOMV and OF-WF can be used as a valid radiological marker to identify DON.

PO-0646

Four-Dimensional Flow Magnetic Resonance Imaging (4D Flow MRI) Technique in the Study of Hemodynamics of Intracranial Cerebral Arteriovenous Malformations

Ji Yun Zhang¹, Ying Shi²

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Objective: To explore the feasibility and clinical value of applying Four-Dimensional Flow Magnetic Resonance Imaging (4D Flow MRI) technology in the assessment of blood flow in intracranial cerebral arteriovenous malformations (AVMs)."

Methods: A retrospective analysis was conducted on 14 patients with clinically significant unilateral intracranial arteriovenous malformations (AVMs) confirmed by digital subtraction angiography (DSA) at our Stroke Center from January 2022 to July 2023. Data on vascular characteristics of the 14 lesions and the contralateral normal vessels were obtained, including the size of the AVM nidus, cross-sectional area of feeding arteries, diameter of draining veins, and the presence of collateral circulation. Computational fluid dynamics (CFD) was employed to calculate hemodynamic parameters (such as the lesion site's plane velocity-to-maximum plane velocity ratio, average velocity, maximum velocity, and average and maximum instantaneous blood flow rates).

All 14 patients with 14 AVM lesions and their contralateral normal vessels underwent repeat magnetic resonance vascular imaging and 4D Flow MRI processing. This yielded velocity vector fields, streamlines, shear rates, wall shear stress, oscillatory shear index, and three-dimensional blood flow pathlines within the diseased vessels. Blood flow velocities at the lesion site were extracted, and the normalized root mean square error (NRMSE) and linear correlation coefficient (R2) were calculated to assess the agreement between the two measurements. Finally, differences in the velocity distribution maps of feeding arteries and contralateral normal vessels were compared, with a focus on exploring the hemodynamic factors related to AVM hemorrhage."

Results: Comparative analysis between 4D Flow MRI and CFD revealed similar flow patterns within the lesion site. Higher shear rates and wall shear stress in the feeding arteries of the lesions were associated with a greater propensity for AVM hemorrhage.

Conclusion: There is a strong concordance between the measurements obtained through 4D Flow MRI and the calculations from CFD. 4D Flow MRI can comprehensively assess the hemodynamics of intracranial AVMs, offering non-invasive examination and providing more precise data to guide clinical surgical approaches. It holds significant clinical utility.

PO-0647

Predictive Factors and the Development of a Clinical Scale for Futile Recanalization Following Endovascular Therapy in Patients with Large Anterior Vessel Occlusion

Ruoyao Cao, Juan Chen, Min Chen
Beijing Hospital

Purpose

Cerebrovascular accidents or strokes remain a leading cause of morbidity and mortality worldwide. Among patients presenting with acute ischemic stroke (AIS) due to large vessel occlusion, endovascular therapy (EVT) offers a promising therapeutic strategy. Yet, there exists a subset where EVT might not result in functional independence despite recanalization - a phenomenon termed as 'futile recanalization'. Recognizing this challenge, our study ventured to investigate potential predictors of this undesirable outcome and subsequently formulate a streamlined prediction scale to guide clinicians in decision-making.

Patients and Methods

A detailed retrospective assessment of 145 AIS patients suffering from anterior circulation large vessel occlusion was undertaken. These patients had been subjected to EVT at our center spanning a period from March 2016 to December 2021. Our definition of 'futile recanalization' encompassed those patients who, despite undergoing EVT within the recommended therapeutic window, failed to achieve functional independence at the 90-day mark, as gauged by the modified Thrombolysis in Cerebral Infarction score (mTICI) benchmarks of 2b or 3.

Results

To enhance the utility and ease of clinical application, quantitative parameters were transformed into binary categories, hinged on optimal cutoff values deduced from ROC analysis. Multivariable logistic regression pinpointed several significant predictors: NIHSS score, D-Dimer levels, Platelet (PLT) count, B-type Natriuretic Peptide (BNP), and the mismatch ratio as evidenced on CT perfusion scans. All these were found to be independent predictors of futile recanalization (all with $p < 0.05$). From this, a concise 5-item scale was established. The efficacy of this scale was noteworthy, reflected by AUC values of 0.916 (95% CI 0.861–0.954) and 0.846 (95% CI 0.779–0.899) for the training and validation groups, in that order.

Conclusion

The devised scale emerges as a promising tool in the pre-EVT evaluation phase. It can potentially delineate AIS patients more likely to gain from the intervention, enhancing therapeutic precision. However, it's crucial to underscore that for its universal clinical acceptance, a broader validation incorporating a larger patient sample becomes imperative. Such refined predictive measures can pave the way for reducing the occurrence of futile recanalizations, thereby optimizing patient outcomes and channeling the clinical benefits of EVT towards those most likely to benefit.

PO-0648

Nomograms Based on Multiparametric MRI Radiomics Integrated with Clinical-Radiological Features for Predicting the Response to Induction Chemotherapy in Nasopharyngeal Carcinoma

Zhuo Wang¹, Jing Zhang²

1. The Second Clinical College of Lanzhou University

2. Department of Magnetic Resonance, the Second Hospital of Lanzhou University

Objective: To establish nomograms integrating multiparametric MRI radiomics with clinical-radiological features to identify the responders and nonresponders to induction chemotherapy (ICT) in nasopharyngeal carcinoma (NPC).

Methods: We retrospectively analyzed the clinical and MRI data of 168 NPC patients between December 2015 and April 2022. We used 3D-Slicer to segment the regions of interest (ROIs) and the "Pyradiomic" package to extract radiomics features. We applied the least absolute shrinkage and selection operator regression to select radiomics features. We developed clinical-only, radiomics-only, and the combined clinical-radiomics nomograms using logistic regression analysis. The receiver operating characteristic curves, DeLong test, calibration, and decision curves were used to assess the discriminative performance of the models.

Results: A total of 14 optimal features were finally selected to develop a radiomic signature, with an AUC of 0.891 (95% CI, 0.825–0.946) in the training cohort and 0.837 (95% CI, 0.723–0.932) in the validation cohort. The nomogram based on the Rad-Score and clinical-radiological factors for evaluating tumor response to ICT yielded an AUC of 0.926 (95% CI, 0.875–0.965) and 0.901 (95% CI, 0.815–0.979) in the two cohorts, respectively. Decision curves demonstrated that the combined clinical-radiomics nomograms were clinically useful.

Conclusion: Nomograms integrating multiparametric MRI-based radiomics and clinical-radiological features could non-invasively discriminate ICT responders from non-responders in NPC patients.

PO-0649

Nomogram based on multiparameter MRI radiomics Integrated with Clinical Features for Predicting the Response to Induction Chemotherapy in Nasopharyngeal Carcinoma

Zhuo Wang¹, Jing Zhang²

1. The Second Clinical College of Lanzhou University

2. Department of Magnetic Resonance, the Second Hospital of Lanzhou University

Purpose To investigate the performance of nomogram based on multiparametric MRI combined with clinical factors for predicting the response to induction chemotherapy in locoregionally advanced nasopharyngeal carcinoma (LA-NPC). **Materials and Methods** The clinical and imaging data of 184 patients with LA-NPC from July 2014 to April 2022 were retrospectively analyzed. All patients were randomly stratified into training (n=110) and testing (n=74) cohorts at 3:2 ratios. We used 3D-Slicer to segment the regions of interest and "Pyradiomic" package to extract features. Multivariate logistic regression analysis were applied to identify predictive clinical factors. Least absolute shrinkage and selection operator (LASSO) was performed to select features.

We developed clinical-only, radiomics-only, and the combined clinical-radiomics nomograms using logistic regression analysis. The receiver operating characteristic curves, DeLong test, calibration, and decision curves were used to assess the discriminative performance of three models.

Results T stage (OR=0.335, P=0.001), enhanced degree of the foci (OR=5.177, P=0.003) were identified as the independent predictors for ICT response. A total of 15 radiomics features were selected to develop a radiomic signature. The ROC curves showed that nomogram model yielded the best predictive performance compared with clinical or radiomics models (AUC for training group: 0.922 vs. 0.748, 0.851; for testing group: 0.918 vs. 0.782, 0.843), and there were statistically significant differences of the AUC values between combined model and the other two models (DeLong test, $P < 0.05$). DCA displayed that the level of net clinical benefit of the nomogram was higher than that of the single clinical or radiomics model. **Conclusion**

Nomograms integrating multiparametric MRI-based radiomics and clinical-radiological features could non-invasively discriminate ICT responders from non-responders and provide a basis for personalized treatment of LA-NPC patients.

PO-0650

Hemodynamic changes in transverse-sigmoid sinus junction following effective surgical reconstruction for unilateral pulsatile tinnitus with sigmoid sinus wall anomalies: a 4D flow MRI analysis

Xiaoyu Chou, Rong Zeng, Pengfei Zhao, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objective: To compare the hemodynamic changes in the transverse-sigmoid sinus junction (TSSJ) before and after surgical reconstruction in patients with unilateral pulsatile tinnitus (PT) associated with sigmoid sinus wall anomalies (SSWAs) using 4D flow MRI.

Methods: The data of patients who complained of unilateral pulse-synchronous PT, were confirmed to have ipsilateral SSWAs by preoperative CT, and underwent sigmoid sinus wall reconstruction were retrospectively analyzed. Nineteen patients who underwent pre- and postoperative 4D flow MRI, had PT eliminated or significantly alleviated after at least 6 months of follow-up were recruited, including 6 patients with sigmoid sinus wall dehiscence and 13 with diverticulum. Quantitative and qualitative hemodynamic data, including bilateral velocity and net flow upstream and downstream of the TSSJ as well as vortexes in the TSSJ, were obtained and compared before and after surgery.

Results: Significant differences were observed only in the ipsilateral upstream average velocity (V_{avg}) and contralateral downstream maximum velocity (V_{max}) before and after treatment ($p=0.01$, $p'=0.01$). No significant changes were noted in other quantitative indicators. Among the 19 cases, 17 exhibited vortexes on the surgical side before surgery, of which 9 cases displayed vortex disappearance and 8 cases showed a reduction in vortex intensity postsurgery. Vortexes were observed in all 13 cases with diverticulum before surgery but disappeared after surgical intervention. The high-speed jet remained unchanged in 16 cases of TSS before and after treatment.

Conclusions: Sigmoid sinus wall reconstruction seems to lack a significant hemodynamic impact on the TSSJ. This observation implies a relative safety associated with the procedure, while the persistent risk of recurrence is attributable to abnormal hemodynamic impact on the reconstructed bony wall.

PO-0651

Exploring the hemodynamic mechanisms of symptomatic changes in venous pulsatile tinnitus during follow-up

Ke Lv^{1,2}, Huiying Wang^{1,2}, Chao Chai², Kaixu Xu³, Shuang Xia^{1,2}

1. Nankai University

2. Tianjin First Central Hospital

3. Otolaryngology Department of Tianjin First Central Hospital

Objective: The aim of this study is to clarify the change of symptom severity over time in VPT patients and to explore predictive factors for tinnitus severity changes in non-surgical VPT patients.

Method: This study included 59 unilateral VPT patients and 51 healthy volunteers. 4D Flow MRI was used to evaluate the hemodynamic status of the transverse and sigmoid sinuses, and temporal bone HRCT was used to evaluate the size of sigmoid sinus wall dehiscence (SSWD). Baseline, 1-month and 6-month Tinnitus handicap inventory follow-up. Analyze the impact of baseline hemodynamic characteristics and the size of SSWD on the severity of symptoms in patients during follow-up and its predictive significance.

Result: Compared to healthy volunteers, VPT patients had higher peak velocity ($P < 0.001$), wall shear stress ($P < 0.001$), and energy loss ($P < 0.001$). During the follow-up period, most VPT patients experienced worsening symptoms in 1 month ($P = 0.001$) and 6 month ($P < 0.001$). The stepwise linear regression model shows that the baseline peak velocity can be used as independent risk factor for the severity of tinnitus in both 1-month follow-up ($\beta = 0.545$, $P < 0.001$) and 6-month follow-up ($\beta = 0.699$, $P < 0.001$). Logistic model displays SSWD ($\beta = 0.179$, $P = 0.018$) and peak velocity ($\beta = 0.030$, $P = 0.040$) can be used as an independent predictor of symptom exacerbation in VPT patients.

Conclusion: Most non-surgical intervention VPT patients have poor prognosis. Higher peak velocity and SSWD can predict the worsening of tinnitus symptoms in VPT patients after 6 months. The use of 4D Flow MRI technology to explore the predictive factors of dynamic changes in tinnitus symptoms in VPT patients provides a powerful reference for clinical treatment decision-making.

PO-0652

Free-breathing 3D Stack-of-Stars GRE (StarVIBE) for Detection of Extranodal Extension in Head and Neck Cancer: An Image Quality and Diagnostic Performance Study

Jiangming Qu, Tong Su, Boju Pan, Tao Zhang, Xingming Chen, Xiaoli Zhu, Zhentan Xu, Tianjiao Wang, Yu Chen, Zhuhua Zhang, Zhengyu Jin

Peking Union Medical College Hospital, Chinese Academy of Medical Sciences

Background: This study aims to evaluate the image quality of cervical lymph nodes and the diagnostic performance of detecting extranodal extension (ENE) using free-breathing 3D Stack-of-Stars GRE (StarVIBE), characterized by the reduction of motion artifacts.

Methods: Eighty consecutive patients underwent StarVIBE before neck dissection at an academic center. Conventional Dixon-VIBE was available in 28 patients in the cohort for image quality comparison. A total of 73 suspicious metastatic lymph nodes from 40 patients were found based on morphology and enhancement pattern on StarVIBE. Sensitivity (SN), specificity (SP), and odds ratios were calculated for each MR feature from StarVIBE to predict pathologic ENE.

Results: StarVIBE exhibited significantly superior image quality, signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR) for enlarged lymph nodes compared to Dixon-VIBE. The MR findings of "invading adjacent planes" (SN, 0.54; SP, 1.00) and "matted nodes" (SN, 0.72; SP, 0.89)

emerged as notable observations. The highest diagnostic performance was attained by combining these two features (SN, 0.93; SP, 0.89).

Conclusions: This study confirms that StarVIBE offers superior image quality compared to Dixon-VIBE, and it can accurately diagnose ENE by utilizing a composite MR criterion.

PO-0653

Exploration of MRI T2 Mapping Image Application in Articular Disc Displacement of the Temporomandibular Joint in Adolescents

Xian Zhang, guang hui bai, zhoujing zhao

The Second Affiliated Hospital and Yuying Children's Hospital of Wenzhou Medical University

A total of 45 and 63 patients, who had articular disc displacement with and without reduction, respectively, were assigned to the experimental groups, and 57 participants with normal articular discs of the temporomandibular joint were considered as the control group. All participants in the three groups underwent MRI. T2 mapping was performed in the oblique sagittal plane. The regions of interest (ROIs) for the T2 relaxation time maps of the disc were selected manually. The performance of morphological and structural changes and quantitative parameters in MRI T2 mapping image artifacts were statistically compared.

Results: In the control group, the mean T2 value was 39.284 ± 5.634 ms, in the group of disc displacement with reduction, the mean T2 value was 33.634 ± 4.235 ms, and in the group of disc displacement without reduction, the mean T2 value was 30.982 ± 3.205 ms. The T2 mapping values of the experimental groups, together with different morphological structures, were significantly lower than were those of the control group.

Conclusion: MRI T2 mapping enables a more accurate evaluation of TMD severity. Sequentially, it helps provide a more reliable medical imaging basis for classifying diagnosis and evaluation in clinical practice.

PO-0654

Application of deep learning in temporomandibular joint imaging and diagnosis of temporomandibular joint disc displacement

Baohong Wen, Zijun Liu, Jin Sun, Yong Zhang, Jingliang Cheng

The First Affiliated Hospital of Zhengzhou University

Introduction Irrecoverable articular disc displacement is a common clinical disease with a high incidence, resulting in clinical symptoms such as restricted opening and mandibular joint pain on the affected side. Severe cases can cause facial deflection, which is one of the culprits of facial deflection. Conservative treatment was the main method for retractable anterior disk displacement. Severe irretrievable disc displacement will require surgery. Clinically, temporomandibular joint (TMJ) anterior disk displacement is the most common, which is usually divided into reversible anterior disk displacement and irreversible anterior disk displacement.

MRI is considered to be the gold standard for evaluating the dish-condylar relationship and soft tissue changes in the TMJ. T1-weighted imaging (T1WI), T2-weighted imaging (T2WI) and proton density-weighted imaging (PDWI) based on fast spin echo sequences are commonly used for diagnosis. PDWI showed the articular disc clearly, and T2WI was use to observe the articular effusion and condylar bone marrow structure. Images in both the mouth-opening and -closing

positions need to be collected. The traditional MR scan takes about 5 minutes, during which patients suffer from pain and discomfort and physiologically induced swallowing in the mouth-open position usually causes motion artifacts.

Deep learning(DL) technology overturns the traditional image filtering and fourier transform by directly transform raw K-space data to denoised MR images [2]. It can remove noise more cleanly without loss of low-frequency details of signal, and improve the signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of images. Meanwhile, the scanning time is shortened to avoid motion artifacts. In this study, we tried to use DL to accelerate the scan of TMJ disk on the premise of ensuring image quality, so as to improve patient experience and facilitate diagnosis.

MethodsExperiments were performed on a 3T GE MRI scanner (SIGNATM Premier, GE Healthcare, Waukesha, WI) with the conventional and deep Learning reconstruction protocol (DL Recon) , the parameters are shown in Table 1. Twelve patients (a total of 16 joints) aged 13–71 years were recruited. Three basic sequences, oblique sagittal (OSag) T1-weighted imaging (T1WI) and proton density-weighted imaging (PDWI) with closed mouth, oblique coronal (OCor) T2-weighted imaging (T2WI) with closed mouth, and OSag PDWI with opened mouth, were selected in combination for testing. In the OSag PDWI with closed mouth, three regions of interest (ROIs), the condyle, the disc , and external wing muscle were analyzed. The signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR) of the articular disc, condyle, and external wing muscles were calculated and analyzed using independent sample t-tests and one-way analysis of variance. Two senior radiologists scored the images subjectively.

ResultsAs shown in Table 1, in the conventional scanning protocol, the scanning time is 5 min 2 sec, while in the DL protocol, the total time is 2 min 52 sec. The SNR and CNR of all sequences in DL protocol are higher than those of the corresponding conventional ones. In Table 2, the SNR and CNR of articular disk, condyle, and external wing muscle in the DL protocol are also higher than those in the conventional protocol, even though the time has been shortened in DL. In particular, DL image of the articular disc was four times SNR than the conventional images while condyle was improved 4 times than conventional images in OSAG PDWI with mouth-closing. Moreover, the image displays an better Edge sharpness and improved the Partial Volume Effects by DL Recon (Figure 1). The DL images showed clear images in both reversible and irreversible anterior disk displacement (Figure 2), in which the Edge sharpness, fluid brightness, and contrast resolution were very helpful for diagnosis.

Discussion & ConclusionDL Recon is based on a deep convolution residual encoder network trained from a database of more than 10,000 images to reconstruct high-resolution and high-SNR images. The DL Recon network is embedded into a new reconstruction path running in parallel with the regular reconstruction to generate two sets of image series simultaneously from a set of original MR Data.

In this work, TMJ imaging based on DL Recon can well display all structures including articular disc, condyle, and external wing muscle. It is very helpful to diagnose the disease in this area. In the diagnosis of temporomandibular joint disc displacement, better image quality can be guaranteed while accelerate the scan. This is beneficial for improving the patient experience and for diagnosing with less-experience clinicians.

PO-0655

Magnetic resonance radiomics analysis for differentiating parotid neoplasms: A two-center study

Jin Sun, Baohong Wen, Zhanxia Zhang, Zijun Liu, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objectives Preoperative differentiation parotid benign tumors (BT) and malignant tumors (MT), and pleomorphic adenomas (PA) and Warthin tumors (WT) is critical to treatment decisions. The purpose of this study was to develop and validate a fused model obtained by screened radiomics scores, clinical and magnetic resonance (MR) images features for the preoperative differentiation of BT from MT, and PA from WT.

Methods A total of 200 patients (160 in training set and 40 in testing set) with BT =133 (PA, n =87; WT, n = 46) and MT= 67 were enrolled. Radiomics features were extracted from fat-saturated contrast enhanced T1-weighted image (fs-CE-T1WI). A radiomics model and a radiomics score (Rad-score) were constructed and calculated. A clinical model was built based on demographics and MR image features. A fused model combining the Rad-score, demographics and MR image features was constructed using multivariate logistic regression analysis. The diagnostic performance of the three models using ROC curves on the training and testing sets.

Results Radiomics signature consists of 10 key features from MR image was used to distinguish BT and MT. The fused model incorporating the radiomics model and clinical model had an AUC value of 0.87 (0.82-0.90) in the training set and 0.78 (0.73-0.83) in the testing set. 10 key features from MR images were used to build the radiomics signature in the identification of PA and WT. The fused model incorporating the radiomics model and clinical model had an AUC value of 0.97 (0.95-0.99) in the training set and 0.85 (0.89-0.92) in the testing set. Decision curve analysis showed that the two fused models outperformed the radiomics models in terms of clinical usefulness.

Conclusions The fused model obtained by screened Rad-score, clinical and MR image features performed well for differentiating BT from MT, and may aid in the clinical decision-making process.

PO-0656

Explore the Value of Quantitative MRI Parameters of lacrimal gland in predicting Treatment Response to Intravenous Glucocorticoid Therapy for Thyroid-Associated Ophthalmopathy

Yu Chen
Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective

To investigate the value of morphological parameters, histogram parameters obtained from T2 Mapping and FS T2 Mapping in predicting the therapeutic effect of IVGC in patients with moderate to severe active TAO.

Materials and methods

A total of 72 patients diagnosed with active, moderate-to-severe TAO, including 39 patients in the responsive group and 33 patients in the unresponsive group, were enrolled. Baseline clinical characteristics, morphological parameter (i.e., lacrimal gland herniation) and histogram parameters derived from T2 mapping with FS or without FS of lacrimal gland were compared between the two groups. The histogram parameters obtained from conventional T2 mapping and FS T2 mapping of

the extraocular muscles were also used to build predictive models. Independent predictors of treatment response to IVGC were identified using multivariable analysis. Receiver operating characteristic (ROC) curve analysis was performed to evaluate the predictive performance of the prediction models.

Results

Multivariate analysis showed that gender, smoking, course of disease, LGH, the first percentile of LG FS T2 relaxation time, and kurtosis of FS T2 relaxation time in extraocular muscles were independent predictors of therapy. The predictive model combining lacrimal gland parameters, extraocular muscle parameters and clinical indicators was significantly better than the prediction model constructed using only extraocular muscle parameters and clinical indicators. The combined model, had an optimized area under the ROC curve of 0.821, 84.6% sensitivity, and 71.2% specificity, which were significantly superior to the model without LG parameters($p = 0.027$).

Conclusion

Lacrimal gland parameters complement models that use only extraocular muscle parameters and baseline clinical indicators.

PO-0657

Assessment of low-dose paranasal sinus CT imaging using a new deep learning image reconstruction technique in children compared to adaptive statistical iterative reconstruction V (ASiR-V)

Yang Li, xiu feng song
Qingdao Women and Children's hospital

Purpose: To compare the effects of deep learning image reconstruction (DLIR) and adaptive statistical iterative reconstruction V (ASiR-V) on image quality in low-dose computed tomography (CT) of paranasal sinuses in children. **Methods:** Low-dose CT scans of the paranasal sinuses in 25 pediatric patients were retrospectively evaluated. The raw data were reconstructed with three levels of DLIR (high, H; medium, M; and low, L), filtered back projection (FBP), and ASiR-V (30% and 50%). Image noise was measured in both soft tissue and bone windows, and the signal-to-noise ratios (SNRs) and contrast-to-noise ratios (CNRs) of the images were calculated. Subjective image quality at the ethmoid sinus and nasal cavity levels of the six groups of reconstructed images was assessed by two doctors using a five-point Likert scale in a double-blind manner. **Results:** The patients' mean dose-length product and effective dose were 36.65 ± 2.44 mGy·cm and 0.17 ± 0.03 mSv, respectively. (1) Objective evaluation: 1. Soft tissue window: The difference among groups in each parameter was significant ($P < 0.05$). Pairwise comparisons showed that the H group's parameters were significantly better ($P < 0.05$) than those of the 50% post-ASiR-V group. 2. Bone window: No significant between-group differences were found in the noise of the petrous portion of the temporal bone or its SNR or in the noise of the pterygoid processes of the sphenoids or their SNRs ($P > 0.05$). Significant differences were observed in the background noise and CNR ($P < 0.05$). As the DLIR intensity increased, image noise decreased and the CNR improved. The H group exhibited the best image quality. (2) Subjective evaluation: Scores for images of the ethmoid sinuses were not significantly different among groups ($P > 0.05$). Scores for images of the nasal cavity were significantly different among groups ($P < 0.05$) and were ranked in descending order as follows: H, M, L, 50% post-ASiR-V, 30% post-ASiR-V, and FBP. **Conclusion:** DLIR was superior to FBP and post-ASiR-V in low-dose CT scans of pediatric paranasal sinuses. At high intensity (H), DLIR provided the best reconstruction effects.

PO-0658

The effects of transverse sinus stenosis and trans-stenotic pressure gradient on the hemodynamics at the transverse-sigmoid sinus junction

Xiaoyu Chou, Pengfei Zhao, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Objective To explore the effects of transverse sinus stenosis (TSS) and trans-stenotic pressure gradient (TPG) on the hemodynamics at the transverse - sigmoid sinus junction (TSSJ).

Methods Computed tomography venography of one patient with pulsatile tinnitus (PT) was used to construct a personalized venous sinus model. Different levels of TSS (0/25/ 50/ 75%) and TPG (2/ 5/ 8/ 11/ 14/ 17/ 20 mmHg) were used to constructed for steady-state computational fluid dynamics (CFD) simulation in a group of finite element models. The distributions of the wall pressure, maximum wall pressure (Pmax) and blood flow pattern (velocity vector or velocity streamline) were calculated to evaluate the hemodynamic changes.

Results The Pmax1 was located in the upper and lateral part of the TSSJ, regardless of different levels of TSS or/and TPG. As TSS level increased, the wall pressure at TSSJ decreased linearly as $y = 896.808 - 540.395 \times \text{TSS}$ ($R^2 = 0.994$, $p = 0.003$); the blood flow velocity increased; the medial blood flow pattern tended to be disordered. As TPG level increased, the wall pressure at TSSJ increased linearly as $y = -35.704 + 100.603 \times \text{TPG}$ ($R^2 = 0.998$, $p = 0.000$); the high pressure range expanded; the blood flow velocity increased; when the TPG exceeded 11 mmHg, the medial blood flow pattern was smooth.

Conclusion The Pmax location of TSSJ may not change with the levels of TSS and/or TPG, which may increase linearly with decreased TSS and/or increased TPG. The blood flow velocity may increase with increased TSS and/or TPG.

PO-0659

Predicting treatment response to multitarget tyrosine kinase inhibitors neoadjuvant chemotherapy in locally advanced thyroid cancer using noninvasive radiomics biomarkers: integration of five clinical trials

Xinyi Gao¹, Yajia Gu²
1. Zhejiang Cancer Hospital
2. Shanghai Cancer Center

Abstract

Purpose

Multitarget tyrosine kinase inhibitor demonstrated antitumor activity in radioiodine-refractory differentiated thyroid cancer and medullary thyroid cancer. We aimed to develop and validate noninvasive model based on radiomics to predict the efficacy of multitarget tyrosine kinase inhibitors before neoadjuvant therapy in patients with locally advanced thyroid cancer.

Materials and methods

This two-center study consisted of 58 prospective patients with locally advanced thyroid cancer who received multitarget tyrosine kinase inhibitors in the neoadjuvant setting from 5 phase II clinical Trials. Pre-contrast CT and standard post-contrast CT machine learning classifiers and integration classifiers were designed as three separate classifiers. In each classifier, dataset was randomly split into training and independent testing group on a 7:3 ratio, accordingly subjected to a 10-fold cross validation. After normalization, best feature subsets were selected by Pearson correlation coefficient (PCC) and recursive feature elimination (RFE), whereupon a radiomics classifier was

built with random forest. The discriminating performance was assessed with the area under receiver-operating characteristic curve (AUC).

Results

The AUC of pre-contrast CT classifier was 0.782. The AUC of standard post-contrast CT classifier was 0.766. The AUC of the integration model was 0.851.

Conclusion:

Integration of pre- and standard post-contrast CT machine learning classifier could help to predict the efficacy of multitarget tyrosine kinase inhibitors before neoadjuvant therapy in patients with locally advanced thyroid cancer.

PO-0660

基于 DWI 及 ADC 的影像组学模型对 甲状腺结节良恶性的预测价值

杨倩¹、徐海军²、何品¹、罗虹虹¹、邓文明¹、刘周¹、罗德红^{1,2}

1. 中国医学科学院肿瘤医院深圳医院

2. 中国医学科学院肿瘤医院

目的：探究基于 DWI 和 ADC 图像的影像组学特征鉴别甲状腺结节良恶性的价值。

材料与方法：回顾性分析我院经病理证实且行 DWI 检查的 140 名甲状腺结节患者(共 148 个甲状腺结节，良性 50 个，恶性 98 个)的临床和影像资料。对 DWI 和 ADC 图像进行感兴趣区勾画及组学特征提取，采用 t 检验、最小绝对收缩和选择算子(LASSO)算法和相关性分析进行特征筛选，使用 K 最近邻 (KNN)、支持向量机 (SVM)、随机森林 (RF) 和逻辑回归 (LR) 四个分类器建模，包括 DWI 模型、ADC 模型和联合模型，并对模型进行验证。应用受试者操作特征 (ROC) 曲线的曲线下面积 (AUC) 评价影像组学模型预测甲状腺结节良恶性的效能。

结果：经过特征筛选，10 个 DWI 特征和 18 个 ADC 特征被用于构建模型。在基于同一分类器构建的不同模型之间比较，除了基于 RF 分类器的联合模型 (AUC=0.809) 仅次于 ADC 模型 (AUC=0.825) 外，基于 KNN、SVM 和 LR 三个分类器的联合模型表现都要优于单独的 DWI 模型和 ADC 模型。在独立验证集中，LR 联合模型表现出了最佳的模型预测效能 (AUC=0.885)，优于其他 3 种分类器构建的联合模型 (SVM: AUC=0.867; KNN: AUC=0.846; RF: AUC=0.809)。

结论：基于 DWI 和 ADC 图像影像组学模型有助于鉴别甲状腺结节良恶性。

PO-0661

中枢神经细胞瘤 fMRI 表现及 ADCmin 与 Ki-67 相关性分析

肖钦

中国人民解放军陆军特色医学中心

目的：通过中枢神经细胞瘤 (central neurocytoma, CNC) 的常规及功能磁共振特征，提高影像诊断准确率，并对 ADC 值与 Ki-67 进行相关性分析，确定 ADCmin 值与 CNC 增殖活性的关系。方法：回顾性分析 13 例经手术病理证实中枢神经细胞瘤患者磁共振和病理资料，并通过分析 ADC 值与 Ki-67 表达相关性，确定 ADCmin 值与 CNC 增殖活性的关系。结果：12 例典型 CNC 位于透明隔孟氏孔区，WHO II 级，1 例非典型 CNC 主体位于右侧侧脑室后角，颅内及脊髓多发播散，WHO III 级。CNC 形态不规则，均呈分叶状 (13/13)，以宽基底附着透明隔 (11/13)；并发脑积水 (10/13)。肿瘤内显示血管流空信号 (9/13)，囊变 (13/13)。DWI 均为高信号 (12/12)，ADCmin (0.708±0.221×10⁻³mm²/s)；SWI 均出现低信号 (10/10)；PWI 均呈高灌注 (10/10)，增强扫描轻度强化 (6/13)、中度强化 (7/13)。10 例行 MRS 检查显示 Cho 峰升高，NAA 峰降

低, Cho/NAA (7.1 ± 3.9) 及 Cho/Cr (4.4 ± 1.6) 比值均增高, Gly/MI 峰升高 (8/10)。ADCmin 与 Ki-67 表达具有相关性, $P<0.05$, 相关系数 R^2 为 0.618。结论: 中枢神经细胞瘤为富血供肿瘤, 其位置及影像表现具有一定特征, ADCmin 值与 CNC 增值活性呈正相关, 对 CNC 术前诊断及评估提供一定帮助。

PO-0662

耳蜗管长度与耳蜗大小的相关性分析

胡文、王冬、侯欣、薛琴、郝跃文
西安市儿童医院

目的

利用 HRCT 多平面重建耳蜗标准方位图像并测量耳蜗的相关径线,以探讨耳蜗管长度与耳蜗相关径线间的关系,为植入电极的选择提供参考。

方法

收集本院 1-7 岁行颞部 CT 肉眼诊断内耳骨性结构正常的 SNHL 患儿 50 例 (100 耳)。利用多平面重建技术(MPR)得到耳蜗标准方位图像,测量耳蜗相关径线,由两名医师 A 和 B 分别测量后取均值所得,包括耳蜗底转长径 (BL)、耳蜗底转宽径 (BW)、耳蜗高度 (CH)、底转的宽度 (RW),曲面重建 (CPR) 测量耳蜗管长度 (CL)。采用 SPSS 21 统计软件分析影响蜗管长度的相关径线,并与传统计算的蜗管长度比较。

结果

(1)两个医生对所测量的信度指数 ICC 均大于 0.75。

(2)耳蜗底转长径 (BL)、耳蜗底转宽径 (BW) 以及耳蜗高度 (CH) 与耳蜗管长度 (CDL) 之间存在显著的正相关关系 (P 值分别为 0.001、0.002 和 0.008); (3)传统计算的耳蜗管长度 (CL) 与测量的耳蜗管长度比较之间有明显的差异 ($P<0.05$)。

结论

儿童耳蜗的个性化标准化径线测量可靠性良好,耳蜗底转长径 (BL)、耳蜗底转宽径 (BW) 和耳蜗高度 (CH) 均与蜗管长度 (CDL) 正相关,而蜗管长度的测量对于电极植入的选择有重要意义。

PO-0663

Revolution CT 70kV 低管电压联合等渗碘对比剂在头颈心 “一站式”CT 血管成像中的应用价值

邓建涛、刘盼、马婷、严高武、范小萍、李勇
遂宁市中心医院

目的 探讨正常体质量指数的中老年患者采用 Revolution CT 70kVp 低管电压联合等渗碘对比剂 (碘克沙醇 320mgI/mL) 在头颈心“一站式”CT 血管成像中的应用价值。方法 连续收集 50 例接受头颈心“一站式”CT 血管成像的患者并按随机数字表法分为 2 组。A 组管电压 70kVp, 碘克沙醇 320mgI/mL; B 组管电压 100kVp, 碘美普尔 400mgI/mL, 对比剂剂量均按 0.7mL/kg 计算。比较 2 组患者图像质量的客观评价和主观评分指标、辐射剂量和摄碘量。结果 A 组冠状动脉主干及分支血管 (升主动脉根部、右冠状动脉、左冠状动脉及回旋支)、头颈部动脉 (颈总动脉、颈内动脉及大脑中动脉 M1 段) 的平均 CT 值和 SD 值均高于 B 组, 差异具有统计学意义 ($P<0.05$); 但 A 组图像的 SNR 及 CNR 与 B 组比较, 差异无统计学意义 ($P>0.05$)。A、B 两组冠状动脉 CTA 和头颈部 CTA 的图像质量均无统计学差异 ($P<0.05$); 2 名医师对冠状动脉和头颈部血管图像质量的主观评分一致性好 (分别为 0.839、0.719 和 0.762、0.749)。与 B 组相比, A 组冠状动脉 CTA 的有效辐射剂量

ED 显著降低约 68.68%，头颈部 CTA 的 ED 显著降低约 65.75%，患者摄碘量显著降低约 21.23% (P 均 <0.001)。结论 采用 Revolution CT 70kVp 低管电压联合等渗碘对比剂在中老年患者头颈心“一站式”CT 血管成像中具有较好的应用价值，能显著降低辐射剂量和摄碘量。

PO-0664

全肿瘤表观扩散系数直方图在腮腺分泌性癌与腺泡细胞癌中的鉴别价值

程景风、唐作华

复旦大学附属眼耳鼻喉科医院

目的：探讨全肿瘤表观扩散系数 (ADC) 直方图在鉴别腮腺分泌性癌 (SC) 与腺泡细胞癌 (AciCC) 中的应用价值。方法：回顾性分析 6 例 SC 和 14 例 AciCC 的 MRI 资料。两名放射科医生采用 Firevoxel 软件，在 DWI 图像上沿着病灶的边缘逐层勾画感兴趣区 (ROI)，包括囊变、坏死区域，ROI 略微小于病灶的大小以减少部分容积效应的影响，组内相关系数用于检测两位医师之间的测量可重现性，同时将两名医师测量结果的平均值用于统计学检测。比较两组肿瘤 ADC 直方图参数的差异，绘制受试者操作特征 (ROC) 曲线分析具有显著差异的参数以明确鉴别 SC 和 AciCC 的最佳 ADC 直方图参数。结果：ADC 直方图各参数的组内相关系数为 0.942-0.999。两组肿瘤 ADC 的平均值、最大值、第 5、25、50、75、95 百分位数值、偏度的差异具有统计学意义 (P <0.05)，其中偏度在鉴别 SC 和 AciCC 中的特异度最高、达 92.86%，曲线下面积 (AUC) 0.774，敏感度 66.67%，准确度 85.00%；第 95 百分位数值值的 AUC 最大，AUC 为 0.917，敏感度为 100.00%，特异度 78.57%，准确度 85.00%。结论：全肿瘤 ADC 直方图能够有效地鉴别腮腺 SC 和 AciCC，并以第 95 百分位数值值的鉴别诊断效能最高。

PO-0665

基于脑 CT 灌注评估头颈部动脉狭窄

许云、王培军

上海市同济医院

目的：应用 320 排 CT 一站式 CTA-CTP 动态容积灌注成像技术，探讨头颈部动脉狭窄的脑血流动力学改变，分析头颈部动脉狭窄程度与脑灌注成像表现的关系。

方法：163 例经颈动脉 CTA 或 CE-MRA 及头颅 CTA 诊断为单侧颈动脉系统狭窄的患者纳入本研究中。所有患者均行脑 CTP 检查。经灌注后处理软件，分别得到相对脑血流量 (rCBV) 图、达峰时间 (TTP) 图、相对脑血流量 (rCBF) 图、平均通过时间 (MTT) 图及灌注参数值。根据头颈部动脉狭窄程度将头颈部动脉分为轻、中及重度狭窄组，对各组灌注表现进行定性和定量研究，分析各灌注参数中的敏感性指标；分析单侧头颈部动脉狭窄程度与灌注参数的相关性。

结果：80 例颈内动脉狭窄患者纳入本研究，年龄 44-90 岁。其中轻度组 25 例，男 15 例，女 10 例。中度组 41 例，男 28 例，女 13 例。重度组 14 例，男 8 例，女 6 例。83 例大脑中动脉狭窄患者纳入本研究，年龄 44-90 岁。轻度组 46 例，男 30 例，女 16 例。中度组 12 例，男 5 例，女 7 例。重度组 25 例，男 10 例，女 15 例。组间年龄、性别及患有高血压、糖尿病患者比例差异均无统计学意义 (P >0.05)。各组间灌注参数图的定性、定量诊断显示，共 21 例颈内动脉狭窄和 33 例大脑中动脉出现灌注异常，颈内动脉狭窄患者患、健侧 TTP 差异有统计学意义 (P <0.05)，大脑中动脉狭窄患者患、健侧 rCBV、MTT、TTP 差异有统计学意义 (P <0.05)，颈内动脉狭窄程度与患、健侧 rCBV 增加率、rCBF 增加率、MTT 增加率无相关性 (P >0.05)，与患、健侧 TTP 增加率有相关

性 ($P<0.05$)。而大脑中动脉狭窄程度还与患、健侧 rCBV 增加率、MTT 增加率有相关性 ($P<0.05$)。

结论:CTP 是评价颈动脉系统狭窄后脑组织血流动力学改变的敏感方法, 其中 TTP 是评价脑灌注异常的最敏感指标, 与动脉狭窄程度呈正相关。

PO-0666

头颈部动脉粥样硬化斑块周围血流动力学改变的研究

许云、王培军
上海市同济医院

目的: 血流动力学因素在动脉粥样硬化斑块的形成和发展中起到重要作用。计算流体力学(CFD)可以显示和分析动脉狭窄处血液动力学状态, 近年来常被应用于血管疾病中。本研究拟应用计算机数值模拟技术, 对特定的头颈部动脉粥样硬化斑块进行血流动力学研究, 观察头颈部动脉粥样硬化斑块周围血流动力学分布, 探讨颅内动脉粥样硬化患者斑块周围血流动力学改变与脑组织灌注的关系。方法: 17 例经头颈动脉 CTA 诊断为颈内动脉中重度狭窄及 10 例经颈动脉 MRA 及头 CTA+CTP 诊断为大脑中动脉中度狭窄的患者纳入本研究中, 所有血管均行 CFD 后处理, 得出壁面切应力 (WSS)、血流速度、管壁压力 (pressure)、血流储备分数 (FFRCFD) 等参数值, 其中大脑中动脉狭窄患者均行 CTP 检查。经灌注后处理软件, 分别得到 CTP 的 rCBV 图、TTP 图、rCBF 图、MTT 图及灌注参数值。

(1) 分析 CFD 结果, 比较颈内动脉中重度狭窄组与 WSS、血流速度、pressure、FFRCFD 等值之间的关系;

(2) 分析大脑中动脉狭窄处与正常血管的血流动力学变化情况, 分析大脑中动脉中度狭窄患者脑灌注异常与 CFD 各参数的相关性。

结果: (1) 对于 17 例颈内动脉狭窄患者进行 CFD 模拟血流动力学, 发现颈内动脉狭窄程度与 WSS、血流速度、FFRCFD 差异有统计学意义 ($P<0.05$)。

(2) 10 例大脑中动脉狭窄患者较对侧正常血管, WSS、血流速度、pressure 差异均有统计学意义 ($P<0.05$)。10 例患者中 CTP 阳性组 (6 例) 较阴性组 (4 例), WSS、血流速度、pressure、FFRCFD 均较大, 其中 WSS 差异具有统计学意义 ($P<0.05$)。

结论: 头颈部动脉粥样硬化狭窄伴有明显的血流动力学改变, 血流壁面切应力的增加可能是引起颅内动脉粥样硬化斑块破裂的危险因素。

PO-0667

先天内耳畸形的 CT 和 MRI 诊断及其临床价值

刘杰
襄阳市中心医院

目的 探讨先天内耳畸形的 CT 和 MRI 表现及其临床价值。方法 回顾性分析我院 2014 年 6 月至 2022 年 10 月收治的 34 例 (55 耳) 先天性内耳畸形的 CT 和 MRI 图像。结果 依据 2017 年 Sennaroglu 对内耳畸形的分类标准, 本次病例中 Michel 畸形 2 例 (2 耳), 初始听泡 1 例 (2 耳)、耳蜗未发育 2 例 (3 耳), 共同腔型 6 例 (10 耳), 耳蜗发育不全 4 例 (6 耳), 囊状耳蜗-前庭畸形 (IP-1) 3 例 (3 耳), Mondini 畸形 (IP-2) 7 例 (14 耳), X 连锁耳聋 (IP-3) 2 例 (4 耳), 前庭导水管扩大 9 例 (16 耳), 前庭畸形 4 例 (6 耳), 半规管畸形 6 例 (7 耳), 蜗神经发育不良 4 例 (8 耳), 蜗神经缺如 3 例 (5 耳)。结论 高分辨率 CT 和 MRI 检查都能诊断先天性内耳畸形, 但 MRI 能够判断听神经的发育及内耳膜迷路的异常程度。

PO-0668

合成 MRI 成像和酰胺质子转移成像在鼻腔鼻窦良恶性病变鉴别中的临床应用

向颖

西安交通大学第二附属医院

目的：基于鼻腔鼻窦组织来源复杂，一些良性的鼻腔鼻窦病变也可与恶性病变的影像表现相似。因此单从形态学表现上难以鉴别。基于此，本研究利用合成 MRI 成像和 APT 成像获取一系列定量参数，探究其在鼻腔鼻窦良恶性病变鉴别的诊断效能。

方法：回顾性分析 2022.3 月至 2023.5 月在西安交通大学第二附属医院就诊并经病理证实的 40 例鼻腔鼻窦病变患者的临床及影像学资料。所有患者均接受合成 MRI 和 APT 成像检查，手动勾画感兴趣区，使用 PyRadiomics 软件提取病变定量参数：T1、T2、PD 以及 MTRasym (3.5 ppm) 的直方图参数。采用独立样本 t 检验及 Mann-Whitney U 检验评估良恶性组间各参数之间的差异。利用受试者工作特性曲线法分析有统计学意义的各参数的鉴别诊断效能。应用组内相关系数分析数据测量的可重复性。

结果：恶性组病变 T1-mean, T1-10th, T2-mean, T2-10th, PD-mean, PD-10th, PD-90th 均明显低于良性组 ($P < 0.05$)；MTRasym-mean (8.02 ± 4.75) vs (4.28 ± 2.45) % 高于良性组 ($P < 0.05$)。良恶性组间各参数的偏度和峰度差异均无统计学意义 ($P > 0.05$)。ROC 曲线分析示：T2-10th + MTRasym-10th 具有最高的 AUC 值，具有较高的诊断效能。结论：基于 T1、T2、PD 以及 MTRasym (3.5 ppm) 的多参数组合预测模型可以更有效的鉴别鼻腔鼻窦良恶性病变。

PO-0669

MRI 影像组学鉴别眼眶海绵状血管瘤及神经鞘瘤的价值

任继亮

上海交通大学医学院附属第九人民医院

目的：探讨 MRI 影像组学在眼眶海绵状血管瘤和神经鞘瘤鉴别诊断中的价值。

材料与方法：回顾性纳入来自 2 家医院的 300 例患者。来自医院 1 的所有患者被随机分为训练队列 ($n=139$) 和验证队列 ($n=69$)，来自医院 2 的患者被纳入外部测试队列 ($n=92$)。从 T2WI 和增强 T1WI 图像中分别提取 750 个特征。采用最小绝对收缩和选择算子 logistic 回归构建影像组学标签。采用逐步 logistic 回归分析确定独立预测因素。使用准确性评估影像组学模型的性能，并基于 McNemar's 检验与 2 名放射科医师的诊断表现进行比较。

结果：联合 T2WI 与增强 T1WI 的影像组学标签区分两种肿瘤表现最佳，在训练组、验证组和测试组的准确性分别为 95.7%、92.8% 和 90.2%，其 AUC 值分别为 0.97、0.98 和 0.96。在 3 个队列中，两名医师的阅片表现类似或稍低于影像组学标签，分类准确为 87.0% ~ 90.2%。在影像组学标签的辅助下，两名医师在所有队列中的准确性均提高，尽管仅在训练组中放射科医师 1 观察到显著性差异 ($P=0.039$)。

结论：T2WI 和增强 T1WI 的联合影像组学标签可以辅助医生鉴别眼眶海绵状血管瘤和神经鞘瘤。

PO-0670

常规 MRI 影像组学评估口腔舌癌肿瘤浸润淋巴细胞水平的应用价值

任继亮

上海交通大学医学院附属第九人民医院

目的：探索基于机器学习的常规 MRI 影像组学分析用于预测口腔舌癌肿瘤浸润淋巴细胞（TIL）水平的可行性。

材料和方法：回顾性分析 2015 年 7 月至 2022 年 7 月期间就诊于上海九院，经病理证实的 68 例口腔舌癌患者的 MRI 及病理资料。通过术后标本 HE 染色来评估肿瘤基质淋巴细胞的比例，基于中位值（60%）将患者分为高 TILs 组（30 例）和低 TILs 组（38 例）。分别基于 T2WI 及增强 T1WI 图像手动勾画全瘤 ROI。使用 Pyradiomics 软件从每个序列中提取 750 个影像组学特征。通过观察者间一致性分析、共线性分析及基于最大相关最小冗余算法（mRMR）特征选择进行数据降维。两序列单独及联合分别筛选出 6 个最佳特征。使用随机森林、逻辑回归、支持向量机、朴素贝叶斯分类器来构建 TILs 水平的预测模型。采用 10-折交叉验证来评估模型的预测表现。

结果：基于单一序列特征构建模型预测口腔舌癌 TIL 水平，增强 T1WI 优于 T2WI，最大曲线下面积（AUC）分别为 0.820 和 0.754。两序列联合筛选的最佳特征包含 1 个 T2WI 和 5 个增强 T1WI 特征，所有特征均具有显著的组间差异（ p 值均 <0.05 ）。基于这些特征，采用逻辑回归分类器构建模型效果最佳，AUC 值为 0.846，准确性为 80.9%。

结论：常规 MRI 影像组学结合机器学习可为口腔舌癌 TILs 水平的术前评估提供一种可行的工具。

PO-0671

大数据人工智能时代头颈部影像学的优化与提升（专题讲座）

鲜军舫

首都医科大学附属北京同仁医院

目的：头颈部影像学在头颈部疾病诊疗和筛查方面发挥着非常重要的作用，尤其是功能磁共振和能谱 CT 等新技术的应用更进一步提升了其应用价值，但检查序列越来越多、检查和后处理及分析时间越来越长，如何在大数据人工智能时代优化与提升头颈部影像学是具有较大挑战性的新课题。方法：在坚持以人民健康为中心、坚持以病人为中心的指导原则下，探索通过大数据和人工智能方法来实现。结果和结论：1、优化影像检查流程和序列；2、减少检查等候时间和扫描时间及后处理时间；3、提升影像诊断、治疗前后评估与预测能力；4、提升头颈部影像学卫生经济学价值，促进头颈部影像学高质量发展。

PO-0672

Mikulicz 病的临床及 MRI 特征分析

王国蓉、曲晓霞、鲜军舫

首都医科大学附属北京同仁医院

目的：本研究回顾性分析 Mikulicz 病（MD）的临床、MRI 及病理特征，探讨 MRI 对该病的诊断价值。

材料和方法：回顾性分析我院 2020 年 1 月至 2022 年 12 月经病理诊断证实的 34 例 MD 患者，分析其临床资料、MRI 影像表现及病理特征，包括症状、受累部位、MRI 信号强度、强化方式、累及范围、免疫组化指标等。

结果：（1）临床资料：入组患者中，男 6 例，女 28 例，平均年龄（49.8±10.7）岁。临床表现多为眼睑肿胀，部分患者伴有眼睛干涩、眼眶疼痛、眼红等。（2）病变位置：25 例表现为双侧泪腺发病，9 例单侧发病，其中 6 例累及左侧泪腺，3 例累及右侧泪腺。34 例患者中，14 例病变累及眼睑，5 例累及眼外肌，2 例分别累及眼球及颌面部软组织。（3）眼眶 MRI 平扫检查影像学特征：34 例患者中，MRI 均表现为泪腺弥漫性增大，所有患者的受累泪腺组织均表现为 T1WI 等信号，27 例表现为 T2WI 等信号，5 例 T2WI 高信号，2 例 T2WI 略低信号。DWI 呈等/高信号，ADC 值为 $0.88 \times 10^{-3} \text{ mm}^2/\text{s}$ 。（4）眼眶 MRI 增强检查影像学特征：3 例患者增强扫描后受累组织呈不均匀强化；25 例患者病变部位呈轻-中度强化，9 例呈明显强化。其中，8 例接受眼眶动态增强扫描，6 例患者的时间-信号强度曲线表现为速升流出型，2 例表现为速升平台型。（5）MD 治疗与随访：所有患者均接受了眶内病损切除术+术后糖皮质激素治疗法，随访至 2023 年 3 月有 2 例患者复发。

（6）MD 病理学检查特征：免疫组化结果显示，34 例患者均表现为 CD20（+）、CD3（+）、CD21（+）、CD38（+）、CD138（+）。

结论：Mikulicz 病 MRI 表现多样，以双侧泪腺受累常见，呈 T1WI 等信号、T2WI 等信号，伴轻中度均匀强化，易与淋巴瘤混淆，MRI 可准确显示病变累及的范围，为临床诊断提供一定的指导意义。

CT 与 MRI 在中枢神经系统神经母细胞瘤诊断中的价值及影像特征分析

刘巍 刘军委

遵义市汇川区人民医院 影像科 贵州遵义 563000

遵义医科大学附属医院 影像科 贵州遵义 563000

摘要：目的 针对电子计算机断层扫描（CT）及磁共振成像（MRI）在中枢神经系统神经母细胞瘤诊断中的价值，并对其影像学特点进行分析。方法 回顾性选取遵义医科大学附属医院在 2018 年 1 月至 2022 年 12 月期间所收治的疑似中枢神经系统神经母细胞瘤患者 60 例，所有患者行 CT、MRI 检查及病理组织活检。比较病理组织活检检查与 CT 检查、MRI 检查方式的检出结果；比较 CT 检查、MRI 检查的诊断效能；并进行相关影像学特征的分析。结果 60 例疑似中枢神经系统神经母细胞瘤患者经病理组织活检检查后，确诊为阳性 47 例，阴性 3 例。CT 检查诊断为阳性 35 例，阴性 25 例，其中仅有 33 例确诊为中枢神经系统神经母细胞瘤患者；MRI 检查诊断为阳性 48 例，阴性 12 例，其中仅有 47 例确诊为中枢神经系统神经母细胞瘤患者；MRI 检查下的灵敏度、准确度均高于 CT 检查，差异存在明显统计学意义（ $P < 0.05$ ）；但两种检查方式的特异度相比，差异无明显统计学意义（ $P > 0.05$ ）。结论 临床上应用 CT、MRI 均可有效检出中枢神经系统神经母细胞瘤患者的阳性情况，但其中 MRI 具有更高的灵敏度、准确度，临床上可根据患者自身情况选择相应的检查方式应用于患者的辅助检查，便于后续治疗。

基于 3D real IR 序列评估梅尼埃病内淋巴积水与听力损失关系

黄炎、赵鹏飞、王振常
首都医科大学附属北京友谊医院

目的：探究梅尼埃病（Meniere's disease, MD）内淋巴积水与听力损失特征的关系。方法：回顾性分析 2019 年 4 月至 2022 年 5 月就诊于首都医科大学附属北京友谊医院并确诊为梅尼埃病的 35 例患者（40 耳）。所有患者均行三维真实重建反转恢复（three-dimensional real inversion recovery, 3D real IR）序列的内耳磁共振成像（magnetic resonance imaging, MRI）钆造影检查以及纯音测听检查，参照 2011 年 Gurkov 等提出的判定标准评估有无内淋巴积水、类型及程度。根据纯音测听结果得出平均听阈、临床分期以及中频和高频听阈。比较不同类型内淋巴积水间平均听阈以及临床分期差异，分析不同程度内淋巴积水与平均听阈以及临床分期的相关性，进一步分析耳蜗底转、中转积水程度与高频、中频听力损失的相关性。结果：前庭和耳蜗混合积水的平均听阈和临床分期高于单纯耳蜗或单纯前庭积水（ P 均 <0.05 ），单纯耳蜗或单纯前庭积水与未积水的平均听阈和临床分期均无统计学差异（ P 均 >0.05 ）。前庭积水分级与平均听阈、临床分期以及低频、中频、高频听阈值均无明显相关性（ P 均 >0.05 ）。耳蜗积水分级与平均听阈、临床分期均呈正相关（ r 值分别为 0.470 和 0.438， P 均 <0.01 ），与低频、中频听阈值也呈正相关（ r 值分别为 0.640 和 0.454， P 均 <0.01 ），与高频听阈无明显相关（ $P>0.05$ ）。耳蜗底转积水分级与高频听阈无显著相关（ $P>0.05$ ），中转积水分级与中频听阈正相关（ $r=0.454$ ， $P=0.003$ ）。结论：基于 3D real IR 序列的内淋巴积水类型和部位可用于提示 MD 患者听力损失的程度。

PO-0675

磁共振成像测量脑血管反应性的系统评价

李霞
重庆医科大学附属永川医院

脑血管反应性(CVR)磁共振成像(MRI)探测脑血流动力学变化对血管舒张刺激的反应。CVR 与血管健康密切相关，因此是研究脑卒中、小血管疾病和痴呆等脑血管疾病的关键参数。MRI 可以在体内测量 CVR，但文献中提出了几种不同的方法，不同的脉冲序列，硬件要求，刺激和图像处理技术。我们系统地回顾了截至 2020 年 6 月使用 MRI 测量 CVR 的出版物，确定了 235 篇相关论文。我们总结了采集方法、实验参数、使用的硬件和 CVR 量化方法、调查的临床人群以及相应的 CVR 总结措施。CVR 在许多疾病如狭窄闭塞性疾病、痴呆和小血管疾病中都有研究，患者的 CVR 通常低于健康对照组。血氧水平依赖(BOLD)采集与固定激励 CO₂ 气体或末潮汐 CO₂ 强迫刺激是最常用的方法。以尾潮 CO₂ 为回归量对 MRI 信号进行一般线性建模是计算 CVR 最常用的方法。我们对 CVR 测量方法和应用的调查将帮助研究人员确定良好的实践，并为未来共识建议的发展提供客观信息。

PO-0676

中耳相关解剖结构的影像定量测量在耳硬化诊断中的价值 HRCT 定量测量与耳硬化症手术相关解剖结构的研究

项蕾
南京鼓楼医院

【摘要】目的 探讨在中耳相关解剖结构的影像定量测量在耳硬化症诊断中的应用价值。方法 回顾性分析 42 例耳硬化症患者和 42 名正常对照者的颞骨 HRCT 图像，多平面重建并通过标准化处理后测量并评估前庭窗及圆窗各径长，比较两者间的差异，同时绘制 ROC 曲线评估各径长对耳硬化症的诊断效能。结果 耳硬化症患者冠状位前庭窗宽、外口径及横断位圆窗宽深低于对照组 ($P < 0.05$)，其 AUC 值 (曲线下面积) 分别为 0.906 ($P < 0.001$)、0.910 ($P < 0.001$) 及 0.641 ($P < 0.001$)。结论 前庭窗及圆窗的影像定量数据对耳硬化症的诊断具有重要应用价值。

PO-0677

多层螺旋 CT 后处理重建技术对耳硬化症的术前诊断应用价值及对术后听力的评估

公婷¹、杨军乐²、郭小平¹、马鸣岳¹、董燕¹
1. 西安市中心医院
2. 西安市第三医院

目的:

探讨多层螺旋 CT 重建技术对于耳硬化症的术前预测、影像分型、病灶范围及镫骨底板厚度与听力障碍关系、镫骨小窗技术术后短期与中期的听力效果关系。

方法:

选取 2017 年 1 月~2022 年 6 月在我院就诊并且于外院行耳内镜下行人工镫骨植入术的耳硬化症患者 72 例 (138 耳)，所有患者均行多层螺旋 CT 检查，结合患者术前临床资料及术中资料，进行多平面重建 (MPR)、曲面重建 (CPR) 图像分析，观察病变的影像学表现及其特征，测量镫骨底板厚度，总结多层螺旋 CT 重建技术对耳硬化症的术前诊断价值及术后听力改善情况以及比较病灶范围大小、镫骨底板厚度与听力测试图是否一致。

结果:

72 例 (138 耳) 患者，均无流脓史及中耳、内耳先天发育畸形；双侧患病 66 例 (132 耳)，单侧 6 例 (6 耳，其中左耳 5 例，右耳 1 例)；多层螺旋 CT 重建技术显示混合型 14 耳，蜗型 4 型，窗型 120 耳，重建图像病灶范围大小与听力测试图无相关性，镫骨底板厚度与听力障碍程度有线性相关性；镫骨小窗技术并非百分之百改善听力：5 例 (6.94%) 患者术后听力改善不明显 (术前气导均值 51 ± 11 dB，术后两个月气导均值 47 ± 9 dB，术后半年气导均值 53 ± 14 dB)；4 例 (5.56%) 患者术后听力未好转，随着时间推移听力逐渐加重 (术前气导均值 51 ± 7 dB，术后两个月气导均值 54 ± 18 ，术后半年气导均值 68 ± 13 dB)，63 例 (87.5%) 患者术后听力有所改善，随着时间的推移听力逐渐好转 (术前气导均值 62 ± 12 dB，术后两个月气导均值 52 ± 10 dB，术后半年气导均值 36 ± 9 dB)。

结论:

多层螺旋 CT MPR、CPR 重建技术能够清晰显示耳硬化症病变范围，直接测量镫骨底板厚度来间接评估听力障碍，提高术前诊断阳性率，降低术前漏诊率；镫骨小窗技术对大多数患者的听力有不同程度的改善的趋势。

PO-0678

Logistic 回归联合 ROC 曲线对不同病理亚型 Castleman 病的彩色多普勒超声表现的初步研究

张火根、游宇光
赣南医学院第一附属医院

目的：采用 Logistic 回归联合 ROC 曲线分析不同病理亚型 Castleman 病 (CD) 之间的彩色多普勒超声特点，提高超声诊断率。

方法：回顾性分析 2018 年 1 月至 2022 年 12 月于我院确诊的 21 例 CD 患者【分为 17 例透明细胞亚型 (HV 型)、4 例浆细胞亚型 (PC 型) 两组】的性别、年龄、发病部位等临床表现，收集病灶的是否有淋巴结形态、内部高回声分隔特点、是否有大血管穿入等彩色多普勒超声表现，运用单因素分析得到有明显统计学意义的指标，建立 Logistic 回归模型联合 ROC 曲线分析不同病理亚型 CD 的彩超特点。

结果：①两组患者的性别、厚径 (HV 型 $2.16 \pm 1.18\text{cm}$ 、PC 型 $1.13 \pm 0.22\text{cm}$)、内部高回声分隔、是否有大血管穿入具有明显差异 ($P < 0.05$)；②将上述有统计学意义的 4 个指标作为自变量纳入 Logistic 回归分析，以病理亚型为因变量，根据协变量 P 值删除是否有大血管穿入 ($P = 0.434$) 这一变量后，对余下的三个自变量赋值进行 Logistic 回归分析，多因素回归分析显示女性、厚径、内部高回声分隔三者的 Odd Ratio(OR)值分别为 0.071、14.0、0.044，可得出回归方程： $\text{Logit}(P) = -1.447 - 2.639 * \text{性别} (1=\text{男}; 2=\text{女}) + 2.639 * \text{厚径赋值} (>1.4\text{cm}=1; <1.4\text{cm}=2) - 3.114 * \text{是否内部高回声分隔} (1=\text{否}; 2=\text{是})$ ；③绘制性别、厚度赋值、内部高回声分隔及多参数回归模型的 ROC 曲线，四条 ROC 曲线的 AUC 分别为 0.787、0.787、0.816、0.926，通过 ROC 曲线形态与 AUC 证实多参数回归模型鉴别不同亚型 CD 的彩超表现具有较高的临床价值。

结论：基于性别、厚度、内部高回声分隔三者的回归方程有助于不同病理亚型 CD 之间的彩超特征鉴别，当 CD 患者为女性，彩超显示病灶厚径较大、内部见高回声分隔时应考虑为透明细胞亚型可能。

PO-0679

内淋巴积水与外淋巴强化征象联合对梅尼埃病的鉴别诊断价值

王佳红、廖小君、庄羽翔、邓晓娟
重庆医科大学附属第三医院

目的 探讨经静脉内耳延迟增强 MRI 检查评估内淋巴积水 (EH) 和外淋巴强化 (PE) 征象对梅尼埃病 (MD) 与眩晕相关其他内耳疾病的鉴别诊断价值。方法 回顾性分析 55 例眩晕患者的内耳延迟增强三维快速液体衰减反转恢复序列 (3D-CUBE-FLAIR) 图像，评估有无 EH 及积水程度分级，对 PE 征象进行视觉及定量评估。结果 MD 组 19 例，共 20 只患耳，75.00% (15/20) 显示 EH，50.00% (10/20) 显示 PE，45.00% (9/20) 同时显示 EH 及 PE 征象。眩晕相关其他内耳疾病组即非 MD 组 36 例，共 45 只患耳，20.00% (9/45) 显示 EH，55.56% (25/45) 显示 PE，13.33% (6/45) 同时显示 EH 及 PE 征象。出现单纯 EH 征象两组差异有统计学意义 ($P < 0.001$)，出现单纯 PE 征象两组差异无统计学意义 ($P = 0.678$)，同时出现 EH 和 PE 征象两组差异有统计学意义 ($P = 0.005$)。单纯 EH 征象诊断 MD 的敏感度、特异度、阳性预测值及阴性预测值分别为 75.00%、80.00%、62.50%、87.80%，单纯 PE 征象的各项值分别为 50.00%、44.44%、28.57%、66.67%，联合 EH 和 PE 征象的各项值分别为 45.00%、86.67%、60.00%、78.00%。结论 联合 EH 和 PE 征象能提高经静脉内耳延迟增强 MRI 检查对 MD 诊断的准确性，有助于鉴别 MD 与眩晕相关其他内耳疾病。

PO-0680

能谱 CT 最佳单能量伪彩图联合 MPR 在臂丛神经显像中的初探

周鹭

重庆医科大学附属第三医院

目的：探讨能谱 CT 最佳单能量图像联合多平面重组在臂丛神经显像中的价值。

方法：收集 2019-2020 年就诊于重庆医科大学附属第三医院因上肢感觉或运动功能异常行头颈部能谱 CT 检查的患者 31 例图像，测量包括 45、50、55、60、65Kev 值的单能量图像以及混合能量的图像，在冠状位上邻近上下 3 个层面勾画 ROI，计算臂丛神经、斜方肌的 CT 平均值，通过公式 $CNR = (CT \text{ 值肌肉} - CT \text{ 值神经根} / SD \text{ 肌肉})$ 的绝对值，分别计算各单能量下的最佳对比噪声比，再通过最佳单能量曲线分析，找到具有最佳 CNR 时的 Kev 值，再将具有最佳 Kev 值的单能量图像与混合能量图像进行统计学分析，并对图像质量进行主观评分。

结果：与混合能量图像相比，最佳单能量图像联合 MPR 重组技术在臂丛神经的图像质量有所提高，能更好地显示臂丛神经的走行以及与周围肌肉组织的关系。

结论：能谱 CT 的最佳单能量结合 MPR 及伪彩图对臂丛神经的显示具有一定的应用价值。

PO-0681

**八通道颈动脉表面线圈与十六通道头颈相控阵线圈
在颈部磁共振中的应用比较**

冉启胜

中国人民解放军陆军特色医学中心

目的：探讨八通道颈动脉表面线圈与十六通道头颈相控阵线圈在 3T 磁共振颈部成像的临床应用比较。方法：回顾性分析 2022 年 7 月至 2023 年 4 月我科飞利浦 ingenia CX 3T 磁共振设备扫描完成的患者 657 例，其中 432 患者采用飞利浦 16 通道头颈线圈检查分为 A 组（对照组），其中 225 例患者采用 8 通道颈动脉线圈分为 B 组（实验组）。分别测量并比较甲状腺、胸锁乳突肌、咽后壁、皮下脂肪的 SNR 及 CNR，由两名经验丰富的影像学诊断医师评价影像质量。结果：SNR 显示的甲状腺、胸锁乳突肌、皮下脂肪实验组均高于对照组具有明显的统计学差异 $P < 0.05$ ，咽后壁实验组低于对照组具有统计学意义 $P < 0.05$ ；CNR 显示的甲状腺、胸锁乳突肌、皮下脂肪实验组均高于对照组具有明显的统计学差异 $P < 0.05$ ，咽后壁实验组低于对照组具有统计学意义 $P < 0.05$ 。主观评价实验组影像质量评分高于对照组。结论：八通道颈动脉表面线圈与十六通道头颈相控阵线圈在 3T 磁共振颈部扫描时，对于鼻咽部以下颈部显示时八通道颈动脉表面线圈优于十六通道头颈部相控阵线圈，可以优先选择。

PO-0682

应用屏气配合指令在头颈 CTA 检查中的应用价值

杜科

中国人民解放军陆军特色医学中心

目的 探讨应用屏气配合指令对于头颈部 CTA 检查的临床使用价值。方法 分析我院 2020 年 7 月到 12 月间采用 Philips 256 层螺旋 CT (Brilliance i CT) 行头颈部 CTA 扫描的 1740 例病人,所有患者均采用示踪法进行扫描,监测平面均在扫描的起始层面,触发阈值为 100HU。其中 836 名触发阈值后直接扫描的患者标记为 A 组,904 名触发阈值后设置屏气配合指令进行扫描的患者标记为 B 组。

所有患者的图像由两名主管技师进行观察,并记录图像是否存在吞咽运动伪影、血管搏动伪影。分别计算 A、B 两组吞咽运动伪影、血管搏动伪影的发生率。结果 B 组吞咽运动伪影及血管搏动伪影的发生率明显低于 A 组,差异有统计学意义。结论 在头颈部 CTA 检查中应用屏气指令能明显减少图像吞咽运动伪影及血管搏动伪影的发生,减少因为这两种伪影造成的重复扫描,获得更多的优质图像,具有临床应用价值。

PO-0683

基于双源 CT 70KeV 图像影像组学评估结甲背景下微小乳头状癌的诊断价值

任志鹏、罗潇、何永胜、杨宏楷、潘书雅、武轩辕
马鞍山市人民医院

目的 探讨基于双源 CT 单能量 70KeV 图像影像组学模型评估结甲背景下微小乳头状癌的诊断价值。

方法 回顾性收集马鞍山市人民医院术前经双源 CT 评估、经手术病理证实的 85 例患者(共 97 处病灶,其中 55 处结节性甲状腺伴微小乳头状癌和 42 处单纯性结节性甲状腺肿)的临床和影像学资料。用 Syngo.via 生成平扫、动脉期及静脉期 70KeV 图像,导入深睿医疗多模态科研平台,勾画甲状腺病灶感兴趣区,共提取 6459 个影像组学特征。利用 F-检验筛选组学特征。利用 logistic 回归建立基于组学特征的诊断模型。应用受试者操作特性(ROC)曲线评估模型预测结节性甲状腺肿伴发微小乳头状癌的效能。

结果 基于多因素 logistic 回归,将特征降维后的最佳 14 个放射组学特征建立放射组学模型。在训练集和验证集的 AUC 值分别为 0.875、0.795。

结论 基于双源 CT 检查单能量 70KeV 图像影像组学对评估结甲背景下微小乳头状癌具有良好的诊断效能。

PO-0684

探究 AI 底层数据重建算法与传统迭代重建算法对超低剂量头颈 CTA 扫描图像质量的影响

朱鹏、耿纪刚、李笑石、杨万里、杨雅迪、秦越
西安大兴医院

目的 探究不同比例的 AI 底层数据重建算法对超低剂量头颈 CTA 扫描图像质量的影响。

方法 收集 2023 年 3 月至 2023 年 7 月西安大兴医院进行头颈 CTA 扫描患者 60 例。随机分为两组各 30 例,两组均使用相同的扫描条件,采用 70kV, 150mAs 进行扫描,迭代重建低剂量组记为 A 组,为组 B,经 AI 算法 ClearInfinity 重建的图像记为 B 组。由两名高年资医师对 A 组与 B 组图像采用 5 分法进行主观评价打分,出现意见不统一时,引入第三名医生进行判断。由其他两名高年资诊断医师对患者头颈血管的狭窄程度进行诊断,分为正常,轻度,中度及重度狭窄。将所有图像导入 AI 诊断软件中进行血管识别(左右椎动脉及颈内动脉,大脑中动脉,大脑前后动脉)及血管狭窄程度诊断。将诊断结果与 AI 诊断结果进行对比。

结果 A 组主观评分均值为 4.18 ± 0.52 ,与 B 组评分均值 4.61 ± 0.51 呈现出显著差异($P < 0.05$)。两组血管经 AI 软件进行血管识别的准确度均为 100%。A 组经 AI 软件诊断狭窄程度与医师诊断结果相比,准确率为 50%,10.50%的狭窄程度被低估,39.52%的狭窄程度被高估。B 组准确率为 55.72%,9.20%的狭窄程度被低估,33.10%的狭窄程度被高估。卡方检验结果显示,A 组诊断狭窄效能较 B 组低,有显著差异($p < 0.05$)。

结论与迭代算法相比 AI 算法 ClearInfinity 可以更好的提高图像质量, 超低剂量头颈 CTA 无论是配合迭代算法还是 AI 算法, 均会对 AI 诊断软件的诊断准确度产生影响, 但 AI 算法诊断效能更理想, 可以替代迭代重建算法。

PO-0685

基于 CT 血管造影的血管周围脂肪衰减指数是识别颈内动脉粥样硬化罪魁祸首斑块炎症的生物标志物

田子玉¹、左立平¹、侯明源¹、秦珊珊¹、陈治宇¹、唐喆²、李广²、张凯¹、于德新¹

1. 山东大学齐鲁医院

2. 中国深圳科亚医疗有限公司

背景: 基于 CT 血管造影 (CTA) 分析的血管周围脂肪衰减指数 (FAI) 可动态反应冠状动脉粥样硬化斑块炎症的变化, 因此可用于识别罪魁祸首斑块。然而, 它尚未应用于颈内动脉 (ICA) 中。本研究旨在评估 FAI 在测量斑块炎症和识别颈内动脉粥样硬化罪魁祸首斑块中的价值。

研究方法: 我们回顾性分析了 2019 年 1 月至 2022 年 3 月期间在我院接受颈部 CTA 检查的颈内动脉粥样硬化患者。根据临床诊断结果分为罪魁祸首斑块组和非罪魁祸首斑块组。我们比较了罪魁祸首斑块组和非罪魁祸首斑块组的斑块类型、斑块体积、斑块负荷和基线数据, 以及最大狭窄处、非狭窄处和整个 ICA 的 FAI。逻辑回归用于评估 ICA 中罪魁祸首斑块的成像标记。使用接收者操作特征曲线 (ROC) 确定 FAI 对双侧 ICA 动脉粥样硬化狭窄患者的罪魁祸首斑块分类的诊断准确性。

结果: 罪魁祸首斑块组 (平均年龄为 64.78 岁 \pm 8.17 岁; 84 名男性) 和非罪魁祸首斑块组 (平均年龄为 66.72 岁 \pm 7.51 岁; 80 名男性) 分别是 101 人和 94 人。在非罪魁祸首斑块组中, 最大狭窄部位和整根血管周围的 FAI 均低于罪魁祸首斑块组 ($P < 0.05$)。在双侧颅外 ICA 狭窄患者中, 动脉粥样硬化性狭窄程度联合最大狭窄处 FAI 的 ROC 分析在预测罪魁祸首斑块方面表现优秀 ($AUC = 0.863$, $P < 0.001$)。

结论: FAI 的无创测量可用于评估和识别 ICA 罪魁祸首斑块的局部炎症, 有助于监测动脉粥样硬化斑块的炎症进展。此外, 最大狭窄部位的 FAI 与狭窄程度联合可以无创预测 ICA 的罪魁祸首斑块, 为风险分层提供了一种新的监测方法, 帮助识别卒中风险患者并指导有针对性的治疗。

PO-0686

海绵状血管瘤的动脉自选回波 (ASL) 一定是低灌注吗?

罗丹

南昌大学第二附属医院

目的: 由于颅底骨质和气体的影响, 海绵窦区的海绵状血管瘤和脑膜瘤难以鉴别。由于两者治疗方法不同, 所以利用影像学方法对两者进行鉴别将有助于术前准备以及术式选择。

方法: 该患者使用头颅 CT 平扫、头颅 MRI 平扫加增强以及动脉自旋回波 (ASL) 序列。图像分析和数据处理使用 GE AW4.6 工作站的 Functool 软件进行, 并通过 ASL 自动生成 CBF 图像。

结果: 海绵状血管瘤多是由增加的毛细血管团构成, 没有直接的供血动脉, 因此 ASL 常表现为低灌注。而脑膜瘤有明确的供血动脉, 因此常表现为高灌注。ASL 有利于两者的鉴别。此例患者常规影像学表现更倾向于海绵状血管瘤, 但是由于颅底结构复杂且 ASL 表现为高灌注, 最后影像诊断考虑为脑膜瘤。术后病理证实为海绵状血管瘤。

讨论: 当海绵状血管瘤合并动静脉瘘时, ASL 常表现为高灌注, 因此本例患者可能是由于合并动静脉瘘。由于海绵状血管瘤常合并相关的血管畸形, 所以我们要提高对高灌注海绵状血管瘤的认识。

PO-0687

双层探测器光谱 CT 多参数分析对甲状腺乳头状癌初始复发风险的预测价值

周燕¹、许晓泉¹、许泳康¹、耿頔¹、陈杏彪²、盛志洪¹、斯岩¹、沈美萍¹、苏国义¹、吴飞云¹

1. 江苏省人民医院 (南京医科大学第一附属医院)

2. 飞利浦临床科研部

目的 探讨双层探测器光谱 CT (DLCT) 多参数分析对甲状腺乳头状癌 (PTC) 初始复发风险的预测价值。**方法** 回顾性分析经手术病理证实的 102 例 PTC 患者的临床和影像资料 (低危 75 例; 中高危 27 例)。纳入分析的临床信息包括年龄、性别、身体质量指数 (BMI)、是否合并结节性甲状腺肿、是否合并桥本氏甲状腺炎及术前甲状腺功能。形态学特征包括病灶的大小、位置、形状、纵横比、与包膜接触程度、钙化和囊变。测量动静脉期病灶 DLCT 定量参数包括碘浓度 (IC)、标准化碘浓度 (NIC)、有效原子序数 ($Z_{\text{eff-c}}$)、标准化有效原子序数 ($NZ_{\text{eff-c}}$)、电子云密度 (ED)、40-200keV 单能图像 CT 值和能谱曲线斜率 (λ_{HU})。分别采用卡方检验、t 检验或 U 检验比较低危和中高危患者组在计数及计量资料间的差异。利用二元 logistic 回归分别构建基于临床和形态学特征的临床模型、DLCT 定量参数模型及两者联合模型, 并采用受试者工作特性 (ROC) 曲线评估预测效能。**结果** 低危和中高危患者在性别、病灶大小 (轴位长径)、病灶大小 (轴位短径) 及病灶钙化特征的差异具有统计学意义 ($P=0.022$; $P=0.001$; $P=0.002$; $P=0.024$)。中高危患者病灶的动脉期 IC、动脉期 $Z_{\text{eff-c}}$ 、动脉期 λ_{HU} 、动脉期 $\text{CT}_{40\text{keV}}$ 、静脉期 NIC、静脉期 $NZ_{\text{eff-c}}$ 均显著低于低危患者 ($P=0.013$; $P=0.017$; $P=0.016$; $P=0.015$; $P=0.002$; $P=0.002$)。联合模型预测效能最佳 (曲线下面积为 0.857), 且显著优于临床模型 (曲线下面积为 0.720, $P=0.004$) 及 DLCT 定量参数模型 (曲线下面积为 0.774, $P=0.046$)。**结论** 基于病灶的 DLCT 多参数分析能有效预测 PTC 患者的初始复发风险, 且联合临床和病灶形态学特征能进一步提高预测准确性。

PO-0688

CT 影像特征机器学习预测模型对甲状腺乳头状癌的预测价值

朱翰林¹、冯波¹、魏培英²、韩志江^{*2}

1. 杭州市第九人民医院

2. 杭州市第一人民医院 (浙江大学医学院附属杭州市第一人民医院)

目的: 建立甲状腺乳头状癌 (papillary thyroid carcinoma, PTC) CT 影像特征 3 种机器学习预测模型, 运用 SHAP (shapley additive explanations) 值分析最佳模型中各 CT 特征在模型中的贡献度。

方法: 回顾分析经病理证实的 426 例 440 枚 PTC 的 CT 影像特征, 并与 467 例 528 枚结节性甲状腺肿 (nodular goiter, NG) 对比, 评估咬饼征、增强后范围缩小/模糊、微钙化和形态不规则 4 个 CT 特征在 2 者中的分布。将 PTC 和 NG 的 CT 影像资料以 8:2 的比例随机分为训练和测试集, 采用极端梯度提升 (XGBoost)、随机森林 (RF) 和支持向量机 (SVM) 构建 3 个机器学习模型。通过受试者工作特征曲线下面积 (area under the curve, AUC)、准确率、F1 评分等, 筛选出最佳模型。使用 SHAP 值解释最佳模型中各 CT 特征对模型贡献度。

结果: 440 枚 PTC 和 528 枚 NG 的 CT 特征中, 咬饼征、增强后范围缩小/模糊、微钙化和形态不规则分别为 326 枚和 30 枚、363 枚和 106 枚、158 枚和 53 枚、354 枚和 52 枚 (P 值均 <0.001)。XGBoost、RF 和 SVM 构建的机器学习模型在训练集上的 AUC、准确度、F1 评分范围分别为 0.884~0.925、0.867~0.871、0.844~0.854, 在测试集上为 0.869~0.923、0.845~0.871、

0.803~0.845, 其中 XGBoost 模型在测试集上诊断效能最高。4 个 CT 特征中, 形态不规则的绝对 SHAP 值最高, 对诊断 PTC 为正向贡献。结论: XGBoost 机器学习模型诊断 PTC 的效能最高; CT 特征中, 形态不规则对诊断 PTC 贡献度最高且为正向贡献。

PO-0689

合成 MRI 对腮腺肿瘤性病变的鉴别诊断价值

张赞霞、程敬亮、文宝红
郑州大学第一附属医院

目的: 探讨基于合成 MRI 技术生成的弛豫参数在鉴别腮腺常见肿瘤的应用价值。方法: 回顾性收集 2022 年 05 月至 2023 年 01 月在我院经病理确诊为腮腺肿瘤的 59 例患者纳入本研究。所有受试者均于治疗前行常规 MRI 和合成 MRI 序列, 并测量肿瘤全域 T1、T2 和 PD 值。比较各定量弛豫参数在腮腺多形性腺瘤、Warthin 瘤和恶性肿瘤间的差别。各弛豫参数的诊断效能和比较使用受试者工作特征曲线 (Receiver operating characteristic ROC) 和 DeLong 检验。结果: 腮腺多形性腺瘤的 T2 值大于腮腺恶性肿瘤 ($P < 0.05$), 腮腺多形性腺瘤和恶性肿瘤的 T1 值、T2 值和 PD 值均大于 Warthin 瘤 (P 均 < 0.05)。T2 值鉴别腮腺多形性腺瘤和恶性肿瘤的曲线下面积 (The area under the ROC curve, AUC) 为 0.794; T1 值鉴别腮腺 Warthin 瘤和恶性肿瘤的 AUC (0.939) 高于 T2 值 (0.873, $P=0.341$) 和 PD 值 (0.927, $P=0.891$); T2 值鉴别腮腺多形性腺瘤和 Warthin 瘤的 AUC (0.968) 高于 T1 值 (0.931, $P=0.360$) 和 PD 值 (0.876, $P=0.120$)。结论: 基于合成 MRI 技术的定量弛豫参数有助于鉴别腮腺多形性腺瘤、Warthin 瘤和恶性肿瘤。

PO-0690

动态 X 线摄技术在寰枢椎脱位症的应用研究

王强、王猛
吉林大学白求恩第一医院

目的: 研究动态 X 摄影技术, 在寰枢椎脱位症诊断应用的初步探讨。

方法: 收集 2019 年 1 月-2022 年 10 月, 因外伤引起的颈部向一侧倾斜头部转向受限且行动尚可的患者 50 例, 年龄 35-65 岁, 男女无差异。采用柯尼卡 Aero C80 动态数字摄影系统采集图像, 患者保持站立, 去除照射部位异物, 生殖器及腺体防护, 采用张口低头、抬头及后仰站位。SID200cm, 根据体厚: 管电压: 75-85KV, 管电流: 150-200mA, 采集时间: 3-6s, 附加滤过: 0.5Al+0.1Cu (mm), 训练张口位移动节律后拍摄动态图像 8fps/s。术前采集 2 次完整完整张口低头、抬头及后仰位时间的图像, 通过 KINOSIS 工作站进行评估。

结果: 50 例患者寰枢椎半脱位 43 例, 确诊 43 例, 显示寰枢椎半脱位、脱位及寰齿间距增宽程度 ($>3\text{mm}$)。假性脱位 6 例, 寰枢椎移位程度及寰齿间距无明显变化; 1 例因配合度等个体差异诊断不明确。统计结果具有统计学意义 ($P < 0.05$)。

结论: 动态 DR 数字成像机通过动态采集图像, 经后处理重建分析, 可得到更多位置及动力位连续的动态影像, 可更准确判断寰枢椎脱位症位移程度及寰枢关节间隙 (寰齿间距) 动态变化, 与传统 DR 张口位、侧位相比, 可减少技师摆位对后期成像的主观判断影响, 提高了图像准确性, 可逐帧观察每个细节体位图像, 为临床诊疗提供更好的影像数据支撑。

PO-0691

双能 CT 定量参数对甲状腺微小乳头状癌 cN0 淋巴结转移的特征分析

余加懿
重庆市人民医院

目的：部分术前淋巴结阴性(cN0)的甲状腺微小乳头状癌(PTMC)患者可发现颈淋巴结转移，其危险因素尚不清楚。本研究旨在探讨 cN0 PTMC 患者发生颈部淋巴结转移的临床及双能 CT 影像及定量分析危险因素，有助于筛查 cN0 PTMC 患者中发生颈部淋巴结转移的高风险人群，以进行预防性颈部淋巴结清扫术。

方法：本研究回顾性研究纳入 2020 年 4 月至 2023 年 5 月在我院接受手术的病理诊断为 cN0 PTMC 的患者。根据是否存在颈部淋巴结转移对患者进行分组。对比两组淋巴结临床、影像特征及双能 CT 定量参数的差异。单变量及多变量分析与颈部淋巴结转移相关的临床、影像特征及双能 CT 定量参数危险因素，通过 logistic 回归分析建立风险预测模型，并采用受试者工作特征曲线(ROC)评价其预测能力。

结果：最终纳入 433 例患者，其中 173 例(40%)为颈部淋巴结转移阳性，男性 82 人，女性 351 人。多变量分析显示，男性、年龄 ≤ 45 岁、靠近背膜、不规则边界是颈部淋巴结转移的临床和影像独立危险因素，双能 C T 定量参数中，转移淋巴结动脉期和静脉期 NIC、Zeff-c、 λ HU 是独立危险因素。由以上风险因素组成的风险预测模型中，动脉期 NIC 联合临床及影像特征的诊断效能最显著，AUC 为 0.788，敏感性为 69.6%，特异性为 74.4%。

结论：在 cN0 PTMC 淋巴结转移诊断中，可在双能 CT 影像学特征分析基础上联合定量参数分析，可有效提升对发生颈部淋巴结转移的高风险人群的检出效果，有助于确定是否需要预防性颈部淋巴结清扫术。

PO-0692

腮腺木村病的 MRI 影像 ADC 值和动态增强特征分析

任雨寒¹、戴晓庆²、朱凌²、王涛¹

1. 西安交通大学口腔医院

2. 上海交通大学医学院附属第九人民医院

目的 分析总结腮腺木村病的 MRI 影像特征，并探讨表观扩散系数 (apparent diffusion coefficient, ADC) 值及动态增强特征在木村病诊断中的作用，提高诊断准确性。方法 回顾性分析 15 例经病理验证为腮腺木村病患者的临床资料及 MRI 影像，观察病灶的位置及信号特征，测量 ADC 值及动态增强曲线。结果 15 例患者中男性 12 例，女性 3 例，年龄 14~73 岁，其中 12 例实验室检查有嗜酸性粒细胞增多。根据病灶形态可分为边界清晰的结节状病变和边界不清的弥漫病变，同一患者可同时存在结节状病变和弥漫病变。15 例病灶中 2 例以结节病灶为主，7 例以弥漫病灶为主，6 例介于二者之间；7 例仅累及单侧，8 例同时累及双侧；12 例伴有单侧或双侧颈部淋巴结肿大，3 例颈部淋巴结肿大不明显。弥漫病灶可同时累及颊部、耳后皮下组织，与肌肉组织相比，弥漫病灶 T1WI 呈等或稍高信号，T2 压脂呈高信号，DWI 弥散受限，ADC 值为 $(1.15 \pm 0.28) \times 10^{-3} \text{mm}^2/\text{s}$ ，增强扫描弥漫病灶内可见多发留空小血管影，动态增强曲线多为 I 型（缓慢上升型）。结节病灶多位于腮腺，与肌肉组织相比，结节病灶 T1WI 呈等信号，T2 压脂呈高信号，DWI 明显弥散受限，结节病灶的 T2 及 DWI 信号均高于弥漫病灶，ADC 值为 $(0.65 \pm 0.11) \times 10^{-3} \text{mm}^2/\text{s}$ ，增强扫描结节病灶均呈均匀强化，动态增强曲线多为 II 型（平台型）。颈部肿大淋巴结信号特征及强化特点与腮腺结节病灶类似。结论 木村病可累及腮腺及皮下，同一患者中往往同时存在弥漫病灶

和结节病灶两种形态，二者 ADC 值及动态增强曲线不同，是木村病较为特征的影像学表现，结合嗜酸性粒细胞增高的实验室检查结果，可以提高木村病诊断的准确性。

PO-0693

超高分辨力 CT (U-HRCT) 与高分辨力 CT (HRCT) 诊断窗型耳硬化症敏感性的对比研究

徐宁、赵鹏飞、丁贺宇、汤若薇、李小帅、张征宇、吕晗、代驰航、仇晓妤、王国鹏、刘玉和、龚树生、杨正汉、王振常

首都医科大学附属北京友谊医院

目的：比较超高分辨力 CT (U-HRCT) 与高分辨力 CT (HRCT) 诊断单纯窗型耳硬化症的敏感性。方法：回顾性纳入 2015 年 8 月至 2022 年 7 月由我院耳鼻喉科疑诊耳硬化症，行术前 CT 检查排除其他病因，手术证实镫骨固定的患者 85 例/耳，其中仅行 U-HRCT (0.1mm 层厚)、HRCT (0.67mm 层厚) 检查者分别为 20 耳、45 耳，同时行两种检查者 20 耳。由不了解临床及手术情况的普通影像医生、头颈影像医生分别评估 CT 诊断报告上对窗型耳硬化症的检出情况，分别比较两组医生、两类仪器对窗型耳硬化症诊断敏感性的差异。

结果：头颈影像医师基于 U-HRCT、HRCT 敏感性分别为 100% (40/40)、89.2% (58/65)，差异有统计学意义 ($p=0.042$)。常规影像医师基于 U-HRCT、HRCT 诊断耳硬化症的敏感性分别为 87.5% (34/40)、41.5% (27/65)，差异有统计学意义 ($p=0.000$)；基于 HRCT，常规影像医师诊断耳硬化症的敏感性显著低于头颈影像医师 ($p=0.000$)，常规影像医师基于 U-HRCT 与头颈影像医师基于 HRCT 诊断耳硬化症的敏感性无显著差异 ($p=0.026$)；在同时行上述两种检查的患者中，UHRCT 显示病变范围小于 1mm 者共 5 例，头颈方向医师基于 HRCT 诊断此类病变的敏感性为 40% (2/5)，低于头颈方向医师基于 HRCT 对 1mm 以上病变的诊断能力 (14/15)。

结论：U-HRCT 可提升窗型耳硬化的诊断敏感性和报告同质性，有潜成为临床疑诊耳硬化症的筛查手段。

PO-0694

基于动态对比增强磁共振成像的纹理特征预测鼻咽癌 放化疗疗效的价值

王楠、王丽君

大连医科大学附属第一医院

目的：本研究拟探讨基于 DCE-MRI 的纹理特征预测鼻咽癌原发灶放化疗疗效的价值。

方法：回顾性分析治疗前行鼻咽/颈部 DCE-MRI 检查且病理证实的 49 例鼻咽癌患者，根据治疗 6 个月后随访的 MR 和/或病理，将患者按疗效分为两组：预后差组（残留或复发）和预后好组（无残留和复发）。对 DCE-MRI 图像进行重建，获得渗透性参数图，并导入 3D Slicer 软件，由两名影像诊断医师逐层勾画感兴趣区域，对分割后的图像进行纹理特征提取（图 1、2）。

结果：

- 1、两名观察者测量的 DCE-MRI 功能图纹理特征参数具有一致性 (ICC 值均 >0.75) (见表 1)。
- 2、纹理特征在评估预后差组与预后好组 NPC 中的比较：预后好组 MinimumKtrans 信号强度、JointAverageKep 大于预后差组，而 AutocorrelationKtrans、JointAverageKtrans、SumAverageKtrans、AutocorrelationKep、SumAverageKep 值均小于预后差组，差异有统计学意义 (P 均 <0.05)，(见表 2)。而 Ve 信号强度图的纹理参数无差异性。

3、纹理特征评估 NPC 疗效效果的诊断效能: Ktrans 及 Kep 信号强度图纹理参数鉴别 NPC 疗效的 ROC 分析 (见表 3)。以 Kep 信号强度的 Autocorrelation、JointAverage、SumAverage 的 3.9974、1.9994、3.9987 为阈值预测 NPC 疗效的曲线下面积最大, 为 0.684, 敏感度为 81.48%, 特异度为 59.09% (见图 3)。

结论:

- 1、基于 DCE-MRI 的纹理特征对疗前预测鼻咽癌放化疗疗效有潜在价值。
- 2、DCE-MRI 的纹理特征中的 Autocorrelationkep、JointAveragekep、SumAveragekep 在评估预后差组与预后好组 NPC 具有更高的鉴别诊断效能。

PO-0695

计算机断层扫描对嗅窝深度的 Keros 分类

陈靓

徐州医科大学附属医院

目的: 根据 Keros 分类, 使用计算机断层扫描 (CT) 对嗅窝深度进行评估, 并探讨不同性别及左右侧嗅窝深度的差异。方法: 对 2022 年 6 月至 2023 年 1 月接受了副鼻窦 CT 平扫的 551 例患者进行了回顾性研究, 由两名放射科医生使用 PACS 软件进行评估。结果: 在研究人群中, 男性 342 人 (62.1%), 女性 209 人 (37.9%)。研究人群右侧平均深度为 4.9 mm, 左侧为 5.2 mm。左右两侧差异有统计学意义 (P 值 < 0.05)。在右侧 Keros 分型中, I 型 166 例 (30.1%), II 型 368 例 (66.8%), III 型 17 例 (3.1%); 左侧 Keros 分类中, 131 例 (23.8%) 为 I 型, 392 例 (71.1%) 为 II 型, 28 例 (5.1%) 为 III 型。男性右侧 Keros 分类 I 型 93 例 (27.2%), II 型 239 例 (69.9%), III 型 10 例 (2.9%); 女性右侧 I 型 73 例 (34.9%), II 型 114 例 (54.5%), III 型 22 例 (10.5%)。男性患者左侧 Keros 分类 I 型 83 例 (24.3%), II 型 216 例 (63.2%), III 型 43 例 (12.6%), 女性左侧 I 型 48 例 (22.9%), II 型 136 例 (65.1%), III 型 46 例 (22.0%)。Keros 分类嗅窝深度的总体平均值: I 型为 3.3mm, II 型为 5.6 mm, III 型为 8.6 mm; 左侧 I 型为 3.1 mm, II 型为 5.6 mm, III 型为 8.5 mm; 右侧分别为 3.2mm、5.5mm、8.8mm。男性受试者中, 在女性受试者中。此外, Keros 分类与性别、右侧 (p 值 = 0.002) 和左侧 (p 值 = .001) 变量之间存在显著差异。结论: 我们的研究表明, Keros II 型是最常见的, 其次是 I 型, 然后是 III 型。男性、女性两侧都是 II 型最多见, 男性 II 型右侧多于左侧, 女性 I 型右侧多于左侧, III 型男性、女性均左侧多于右侧。

PO-0696

泪腺 IgG4 相关性病变与炎性假瘤及淋巴瘤的动态增强核磁共振图像定量参数对比分析

李靖²、杨本涛¹

1. 首都医科大学附属北京同仁医院

2. 长沙市第四医院 首都医科大学附属北京同仁医院

目的 探讨动态增强 MRI (Dynamic contrast-enhanced magnetic resonance imaging, DCE-MRI) 定量参数应用于泪腺 IgG4 相关性病变 (Immune globulin G4-related lacrimal disease, IgG4-RLD) 预判及其与淋巴瘤和炎性假瘤鉴别的价值。方法 收集 2010 年 9 月至 2021 年 12 月期间经病理证实 IgG4-RLD、淋巴瘤以及炎性假瘤患者资料; 其中, 以 IgG4-RLD 为研究对象, 淋巴瘤和炎性假瘤为对照组。采用方差分析、LSD 检验、秩和检验比较三组结果 (Ktrans、Kep、Ve) 差异以及采用 ROC 曲线分析上述结果对于预判 IgG4-RLD 效能, $p < 0.05$ 认为有统计学意义。结果 1、IgG4-RLD 和淋巴瘤、炎性假瘤在 Ve 有统计学差异 ($p < 0.05$); 2、预判 IgG4-RLD 效能: (1) Ktrans:

AUC=0.545, $p=0.5924$; (2) Kep: AUC=0.54, $p=0.6351$; (3) Ve: AUC=0.545, $p=0.5816$; (4) 三参数联合 AUC=0.62, $p=0.1381$ 。结论 Ve 有助于 IgG4-RLD 和淋巴瘤、炎性假瘤的鉴别; 上述任一 DCE-MRI 定量参数预判 IgG4-RLD 效能较低, 而三参数 (Ktrans、Kep、Ve) 联合预判 IgG4-RLD 效能较高。

PO-0697

三维 T2 加权快速梯度回波神经成像判断腮腺内面神经与肿瘤解剖关系的价值

王艺华、王丽君、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 评价三维 T2 加权快速梯度回波成像 (three-dimensional T2-weighted imaging fast field echo imaging, T2WI-3D-FFE) 在显示腮腺内面神经 (intraparotid facial nerve, IFN) 和定位肿瘤方面的实用性。

方法: 回顾性纳入了 79 名接受 3D-T2WI-FFE 检查患者的磁共振数据。3D-T2WI-FFE 图像由两名放射科医生独立通过曲线平面重建进行处理。IFN 显示的图像质量以 0-3 分的进行评分。根据直接和两种间接方法[面神经线 (FNL) 和下颌后静脉线 (RMVL)]将肿瘤位置分类为深叶或浅叶。手术定位被认为是最终标准。计算每种方法定位腮腺病变的诊断准确度、敏感度和特异度, 并使用 McNemar 检验进行比较。

结果: 在重建的 3D-T2WI-FFE 图像上, IFN 的主干、颞面干和颈面干显示率分别为 100%、65.8% 和 58.2%。直接法定位深叶病变的诊断准确率、敏感性、特异性、阳性预测值和阴性预测值分别为 96.2%、88.9%、91.7%、80%、98.6%。3D-T2WI-FFE 序列的敏感度及特异度显著优于 FNL ($p < 0.05$), 敏感度优于 RMVL ($p = 0.015$)。肿瘤与 IFN 主干之间的关系在 93.67% 的图像中被正确预测。

结论: 3D-T2WI-FFE 可术前提供腮腺内面神经与相邻结构的详细形态学信息。

PO-0698

CTA 源图像上颈动脉周围脂肪定量与斑块 MRI 易损特征的相关性研究

徐含波
徐州医科大学附属医院

【摘要】目的 研究 CTA 源图像颈动脉周围脂肪密度与颈动脉斑块易损特征的相关性。方法 回顾性分析 2016 年 8 月至 2021 年 5 月在徐州医科大学附属医院连续行颈动脉高分辨率 MRI 和颈动脉 CT 血管造影检查的患者。选择颈动脉斑块最大的层面测量, 在颈动脉周围脂肪组织、颈部皮下脂肪组织中分别放置两个感兴趣区域 (ROI) 测量平均颈动脉周围脂肪密度 (PFD) 和颈部皮下脂肪密度 (CSFD), 在同层面使用同种方法测量对侧 (斑块或非斑块侧) 的平均 PFD、CSFD。根据颈动脉斑块的易损特征 (斑块内出血 [IPH]、纤维帽变薄和/或破裂 [TRFC]、富含脂质坏死核心 [LRNC]), 分析 PFD、CSFD 及 PFD/CSFD 与三个不同风险特征亚组之间的相关性。使用 Student t 检验、Mann-Whitney U 检验和卡方检验来比较不同风险亚组之间的差异。 $P < 0.05$ 认为差异具有统计学意义。结果 本研究共纳入 79 例患者, 患者平均年龄 61.2 ± 10.1 岁。与非 LRNC 亚组相比, LRNC 亚组斑块侧 PFD /CSFD 较低 ($P=0.010$)。与非 TRFC 亚组相比, TRFC 亚组斑块侧 PFD 较高 ($P=0.002$), TRFC 亚组斑块侧 PFD /CSFD 较低 ($P=0.004$)。与非 IPH 亚组相比, IPH 亚

组斑块侧 PFD 较高 ($P<0.001$)，IPH 亚组斑块侧 CSFD 较高 ($P=0.013$)，IPH 亚组斑块侧 PFD/CSFD 较低 ($P<0.001$)。PFD、CSFD 与 IPH ($P=0.004$ 、 $P=0.016$) 显著相关。结论 PFD、CSFD 及 PFD/CSFD 与颈动脉斑块易损特征具有相关性，其中 PFD、CSFD 与 IPH 显著相关，因此，PFD、CSFD 有可能被用作斑块不稳定性的影像标志物。

PO-0699

探究脑白质高信号与年龄的因果关联： 一项来自孟德尔随机化的证据

王星皓、杨文博、孙婧、陈乾、李佳、黄炎、吕晗、杨正汉、王振常
首都医科大学附属北京友谊医院

目的:探究脑白质高信号与年龄之间的因果关联，探索脑白质高信号体积与年龄之间的回归关系。

方法: 我们的大脑成像数据来自一项全基因组关联研究，该研究基于英国生物银行的 39691 个头部多模式成像样本，这其中就包括我们所需要的脑影像学特征即脑白质高信号体积。我们的目的是探索脑白质高信号体积与年龄之间的因果与回归关系。而关于年龄的全基因组关联研究 (Genome-Wide Association Studies, GWAS) 数据则来源于基于 11856 的欧洲人群，有关年龄的单核苷酸多态性 (Single Nucleotide Polymorphism) 为 9851867 个。我们应用双向孟德尔随机化研究方法来分析二者的因果关联。并采用主效应回归法建立脑白质高信号体积与年龄之间的回归关系。同时，对于孟德尔随机化的结果我们进行水平多效性与异质性分析，来保证结果的稳定与可靠。

结果: 在双向的孟德尔随机化分析中，脑白质高信号与年龄之间存在因果关联 (IVW, $\beta=0.151$, $P<0.05$)，而且大于 35 岁后二者呈现正向相关 (相关系数 >1)。孟德尔随机化的结果进行水平多效性与异质性分析均表示结果稳定可靠 ($P>0.05$)。

结论:脑白质高信号体积与年龄高度相关，且存在回归关系，应注意白质的高信号体积与人体衰老密切相关，且在一定年龄范围存在较强的回归关系。

PO-0700

探索多参数脑 MRI 表型与年龄之间的因果关系： 来自孟德尔随机化的证据

王星皓、陈乾、杨文博、孙婧、李佳、吕晗、杨正汉、王振常
首都医科大学附属北京友谊医院

目的: 探讨脑影像学改变与年龄之间的因果关系。

方法: 我们使用双样本孟德尔随机化 (MR) 方法。首先，我们基于英国生物库和年龄 GWAS 数据获得了脑成像表型 GWAS 数据。然后，我们筛选并协调了两个数据库基因以获得工具变量，并使用逆方差加权模型 (IVW) 来确定大脑成像表型与年龄之间的因果关系。我们分析的脑成像表型数据主要来自 T1, T2, DTI 和 SWI 序列，并计算了每个大脑区域的相关参数。最后，我们对 MR 结果进行了异质性和水平多效性验证。

结果: 年龄可导致白质高信号体积增加 (IVW, $\beta=0.151$)。对于弥散图像，小脑下脚 ($L1\beta=-0.128$, $OD\beta=0.173$)，脑脚 ($L1\beta=-0.136$)，额枕上束 ($ISOVF\beta=0.163$) 和边缘系统内的纤维 (扣带回海马，内囊前肢，穹窿嵴终末) 显示出不同程度的损伤和变化。同时，延髓外侧沟、眶内侧沟 (嗅沟) 的表面积以及额叶和颞叶部分区域的皮质厚度也减少 (IVW, $p<0.05$)。

结论: 从因果关系的角度来看，随着年龄的增长，衰老会导致大脑脚和小脑脚之间的白质完整性和连通性以及皮质边缘系统受损。同时，额叶和颞叶经常经历多次萎缩，改变皮质形态。

PO-0701

脊髓型颈椎病 C2/3 颈髓神经元退行性改变与脑灰质体积萎缩相关性研究

匡翠立、查云飞
武汉大学人民医院

目的：脊髓型颈椎病（Cervical spondylitis myelopathy—CSM）是常见的非创伤性脊髓损伤疾病。除颈髓局部受压外，脊髓型颈椎病还可能导致受压点上段 C2/3 颈髓神经元和脑灰质神经退行性改变。以往针对 CSM 颈髓神经元退行性改变与脑皮质神经元丢失的研究通常都是单独进行探讨。少有研究关注颈髓受压点以上 C2/3 颈髓神经元退化与脑灰质体积（Gray matter volume—GMV）萎缩间的关系。探索 C2/3 神经元退行性改变与脑 GMV 萎缩间的关系有助于寻找脊髓型颈椎病远端神经退行性改变机制的初步线索。

方法：40 例 CSM 患者和 28 例健康对照的两套图像被采集：（1）3D MERGE T2*WI，用于评估颈髓灰白质萎缩；（2）3D BRAVO T1WI，用于计算脑 GMV。使用脊髓工具箱软件计算 C2/3 颈髓形态学测量指标（颈髓横截面面积[CSA]，灰质面积[GMA]，白质面积[WMA]），并进行双样本 T 检验组比较。采用基于体素的形态测量学方法分析两组的脑 GMV。随后计算 CSM 组 C2/3 颈髓形态学测量指标与脑 GMV 改变之间的 Pearson 相关系数。

结果：与对照组相比，CSM 组 C2/3 CSA 和 WMA 显著降低。CSM 组右侧扣带中回 GMV 显著升高，右侧中央后回和左侧补充运动区 GMV 显著降低。CSM 组左侧补充运动区和右侧扣带中回 GMV 与 C2/3 CSA 和 WMA 呈正相关。

结论：相比对照组，CSM 组 C2/3 CSA 和 WMA 显著减少，与以往报道 CSM 随着时间进展颈髓受压点以上 C2/3 神经元缓慢且持续的退行性改变相一致。在疾病发展过程中，神经元退行性改变过程影响传入传出运动感觉通路，导致运动与感觉障碍。从左侧补充运动区到脊髓减少的皮质脊髓投射被认为在 CSM 远端神经元发生退行性改变过程中起到关键作用。C2/3 CSA 和 WMA 萎缩与左侧补充运动区 GMV 丢失之间的正相关表明颈髓上段和脑皮质神经退行性改变表现出一致的变化模式。CSM 组减少的 C2/3 WMA 与升高的右侧扣带中回 GMV 呈显著相关性可能是由于颈髓上段和脑皮质神经元自适应可塑性机制来抑制脊髓受压所导致的临床损伤。

PO-0702

基于 CT 宽探测器系统采用高清体积重建提高颅底图像质量

谢清明、朱亚男、冉纯杰、屈先凤、梁煜坤、雷发清、周和平
安康市中心医院

目的：在 16cm 宽探测器 256 排 CT 系统中采用高清体积重建算法(VHD)评价颅底图像质量。

材料和方法：前瞻性纳入 40 名成人（第 1 组）在 16cm 宽探测器 256 排螺旋 CT 扫描仪上进行头部 CT 平扫。测量延髓、小脑、脑干、基底节区和半卵圆中心（用作背景）的 CT 值及其标准差（SD），计算信噪比（SNR）和伪影指数（AI）： $AI = \sqrt{SD2ROI} - SD2（半卵圆中心）$ 。将这些值与第 2 组中 40 名成人（在 64 排 VCT 上进行头部 CT 平扫）的值进行比较。所有受试者均采用 120 kVp 和 1.0 秒旋转时间进行扫描，并调整管电流使两个系统具有相近的 CT 剂量指数(CTDI)。结果：两组受试者年龄、枕骨结节厚度、前后径、横径差异无统计学意义。与 64 排 CT 相比，256 排 CT 的图像噪声（HU）在延髓区降低了 27%（ 4.39 ± 0.68 vs. 6.00 ± 1.10 ），在小脑区降低了 24%（ 4.48 ± 0.51 vs. 5.86 ± 0.57 ），脑干区 33%（ 4.14 ± 0.51 vs. 6.17 ± 0.74 ），基底节区 39%（ 3.84 ± 0.58 vs. 6.30 ± 1.19 ），半卵圆中心区 28%（ 3.16 ± 0.37 vs. 4.36 ± 0.42 ），这四个区域的信噪比分别提高了 43%、42%、76%和 65%。此外，256 排 CT 的伪影指数显著降低，延髓降低 25%（ 2.95 ± 0.95 vs. 3.95 ± 0.95 ）。

vs. 3.93 ± 1.61), 小脑降低 20% (3.05 ± 0.93 vs. 3.83 ± 0.88), 脑干降低 40% (2.54 ± 0.92 vs. 4.26 ± 1.14), 基底节区降低 54% (2.00 ± 1.14 vs. 4.33 ± 1.83)。

结论: 与相似辐射剂量下, 与 64 排 CT 系统相比, 在 256 排宽探测器 CT 采用 VHD 重建算法能显著改善颅底图像的噪声和伪影。

临床相关性: 在与 64 排 CT 保持相似的剂量情况下, 在具有 VHD 的宽探测器 CT 上可以获得更好的颅底图像, 以克服锥束和散射等物理挑战。

PO-0703

新冠感染后嗅觉障碍患者的内嗅皮层灰质体积异常

栾继昕、周小林、杨晔愚、刘剑锋、马国林
中日友好医院

目的: 新冠病毒感染后出现嗅觉障碍已成为一种常见的临床表现, 但其发病机制仍不清楚。灰质体积是评估脑结构和功能的常用指标之一。本研究旨在探索新冠感染后嗅觉障碍患者与健康对照的脑灰质体积差异, 并使用机器学习算法对其进行分类, 以便深入了解新冠感染后嗅觉障碍的大脑病理生理机制。

方法: 收集新冠感染后嗅觉障碍患者 36 例, 健康对照 36 例。均行 T&T 嗅觉测试 (包括察觉阈和辨别阈值)、嗅觉主观评分 (VAS 评分)、以及 Zung 焦虑自评量表 (self-rating anxiety scale, SAS) 和 Zung 抑郁自评量表 (self-rating depression scale, SDS)。并且行高分辨 T1 磁共振扫描。使用 Freesurfer 进行预处理, 基于 DK 脑模板得到嗅觉障碍患者和健康对照的 34 个脑区灰质体积, 然后进行差异分析得到差异脑区, 对差异脑区结果进行多重比较校正。使用差异脑区体积和 T&T 评分、VAS 评分、SAS、SDS 评分等临床量表进行相关分析。基于差异脑区体积, 使用机器学习算法对嗅觉障碍患者和健康对照进行分类, 利用曲线下面积 (AUC) 评估其准确性。

结果: 患者和健康对照在性别、年龄、受教育程度没有差别。新冠感染后嗅觉障碍患者内嗅皮层的灰质体积变小, 与健康对照存在差别 ($P = 0.02$, Bonferroni 校正)。将其与临床量表进行相关分析, 发现内嗅皮层体积与 T&T 评分 (察觉阈) 呈正相关 (Spearman $r = 0.33$, $P = 0.048$), 说明患者的嗅觉察觉能力越低, 内嗅皮层的体积越大。使用机器学习算法对嗅觉障碍患者和健康对照进行分类, 结果表明使用 K 最近邻算法在测试集得到了最佳的 AUC 值, 为 0.819。

结论: 本研究发现新冠感染后嗅觉障碍患者与健康对照在内嗅皮层灰质体积方面存在差异, 这可能是大脑通过内嗅皮层代偿作用的体现。

PO-0704

高分辨率 CT 联合 MRI 对内耳畸形的诊断及评价

孙鹏峰、郭小平、马鸣岳、刘红生、董燕、董季平
西安市中心医院

目的 探讨高分辨率 CT (HRCT) 联合 MRI 对内耳畸形的诊断价值。方法 回顾性分析 82 例内耳畸形患者的 HRCT 及 MRI 资料, 行内耳结构、面神经管的 HRCT MPR、CPR 重建及内听道 MRI 斜矢状位重建, 对内耳畸形进行归类, 并评估面神经管及蜗神经发育情况; 采用连续性校正卡方检验比较内耳畸形与蜗神经发育的关系。结果 内耳畸形共 142 耳, 67 耳行 MRI 检查。2 耳 Michel 畸形, 3 耳耳蜗未发育, 4 耳共同腔畸形, 5 耳耳蜗发育不良, 4 耳不完全分隔 I 型 (IP-I), 61 耳不完全分隔 II 型 (IP-II), 6 耳不完全分隔 III 型 (IP-III), 28 耳前庭、半规管畸形, 26 耳前庭导水管扩大, 3 耳内听道畸形。19.72% (28/142) 有面神经管异常。38.81% (26/67) 蜗神经发育不良

(CND)；重度内耳畸形 CND 明显高于轻度内耳畸形 ($P=0.000$)。结论 HRCT 联合 MRI 可以准确诊断内耳畸形，并能有效评估面神经管及蜗神经发育情况。

PO-0705

18F-FDG PETMRI 对鼻咽癌骨转移的评估价值

许远帆、梁江涛、潘建虎
杭州全景医学影像诊断中心

目的：本研究旨在评估氟脱氧葡萄糖 (18F) 正电子发射断层扫描/磁共振成像 (18F-FDG PET/MRI) 在检测鼻咽癌骨转移中的作用。

方法：2018 年 5 月至 2022 年 5 月，58 名经组织学证实的 NPC 患者接受了 18F-FDG PET/MRI 和 99mTc-MDP 全身骨显像进行肿瘤分期。除头部外，骨骼系统分为四组：脊柱、骨盆、胸部和四肢。

结果：58 例患者中有 9 例 (15.5%) 证实有骨转移。在基于患者的分析中，PET/MRI 和骨显像之间没有统计学差异 ($P=0.125$)。一名进行超级扫描的患者被证实有广泛和弥漫性骨转移，并被排除在基于病变的分析之外。在 57 名患者中，所有 48 个转移灶在 PET/MRI 中均呈阳性，其中只有 24 个转移病灶在骨显像中呈阳性 (脊柱：8 个，胸部：0 个，骨盆：11 个，四肢：5 个)。在基于病变的分析中，观察到 PET/MRI 比骨显像更敏感 (灵敏度 100.0%对 50.0%； $P<0.001$)。

结论：与 99mTc-MDP 全身骨显像相比，18F-FDG PET/MRI 在鼻咽癌分期中对骨转移的病灶检出更敏感。

PO-0706

增强 CT 值对桥本甲状腺炎合并甲状腺乳头状癌中央区淋巴结转移的诊断价值

丁萍^{1,2}、章彤^{1,3}、田敏^{1,3}、韩志江³

1. 浙江中医药大学第四临床学院

2. 桐庐县第一人民医院放射科

3. 浙江大学附属杭州市第一人民医院放射科

目的 探讨增强 CT 值对桥本甲状腺炎 (Hashimoto's thyroiditis, HT) 背景下甲状腺乳头状癌 (papillary thyroid cancer, PTC) 中央区淋巴结转移 (central lymph nodes metastasis, CLNM) 的诊断价值。方法 回顾分析经手术及病理证实的 209 例 PTC 患者的中央区淋巴结，将其分为 HT 组与 non-HT 组，其中 HT 组淋巴结 77 枚 (52 枚阴性和 25 枚阳性) 和 non-HT 组淋巴结 132 枚 (74 枚阴性和 58 枚阳性)。在增强 CT 图像上测量淋巴结 CT 值，通过受试者工作特异度曲线分析增强 CT 值在两组中的最佳阈值及相应敏感度、特异度。结果 两组阳性淋巴结增强 CT 值分别为 (103.2 ± 21.1) Hu 和 (101.9 ± 25.4) Hu ($t=0.232$, $P>0.05$)，两组阴性淋巴结增强 CT 值分别为 (72.0 ± 15.8) Hu 和 (68.5 ± 10.9) Hu ($t=-1.377$, $P>0.05$)。HT 组与 non-HT 组增强 CT 值的曲线下面积分别为 0.882 和 0.918，最佳阈值分别为 78.8 Hu 和 74.7 Hu，相应诊断两组 CLNM 的敏感度分别为 92.0% 和 91.4%，特异度分别为 67.3% 和 77.0%。结论 增强 CT 值对 HT 组和 non-HT 组 CLNM 均具有较高的诊断效能，且两者诊断效能相近，为早期临床制定个性化治疗方案提供理论依据。

PO-0707

基于 DECT 的放射组学预测状甲状腺癌 BRAF V600E 突变

易荣琦
重庆两江新区中医院

Introduction: This study developed and validated a dual-energy computed tomography (DECT)-based radiomics model for the preoperative prediction of papillary thyroid carcinoma BRAF V600E mutation.

(英文摘要字符过多无法放在此处, 请见摘要附件, 字符 1999)

PO-0708

基于 MRI 的后循环血管形态学因素与单侧突发感音神经性耳聋发生及预后的相关性研究

王焱钧、居胜红
东南大学附属中大医院

目的: 评估基于 MRI 的后循环血管形态学因素与单侧 SSNHL 发生及预后的相关性。

方法: 收集我院 2019 年 4 月至 2021 年 11 月诊断为单侧 SSNHL 并入院治疗的患者的内耳 MRI 3D-T2WI 及增强 3D-T1WI 图像, 分析后循环血管及其形态学特征, 包括: 椎动脉 (vertebral artery, VA) 优势、偏曲的方向, 基底动脉 (basilar artery, BA) 偏曲的方向, 小脑前下动脉 (anterior inferior cerebellar artery, AICA) 优势和血管环的类型; 横窦-乙状窦 (transverse-sigmoid sinus, TS-SS) 和岩下窦 (inferior petrosal sinus, IPS) 优势。并收集患者的一般特征、听力学检查和出院前患者听力恢复情况。

结果: 共有 96 名单侧 SSNHL 患者纳入研究。大多数患者两侧 VA、AICA、TS-SS 及 IPS 不对称 (>85.0%), 多数患者存在 VA 和 BA 偏曲 (>70%)。AICA 血管袢分型中, 左、右耳 Kazawa IA 和 IIA 型、Chavda I 型占多数 (>75%)。随着 VA、BA 偏曲的方向由同侧向对侧改变, 同侧 SSNHL 比例显著增加 ($P<0.05$), 随着 AICA 优势由同侧向对侧改变, 对侧 SSNHL 比例显著增加 ($P=0.005$)。预后相关性方面, 随着患侧 VA 从细到粗的变化, 单侧 SSNHL 疗效的改变呈线性趋势 ($P=0.007$), 且为正相关 (Spearman 相关系数为 0.270), 随着 IPS 由细到粗的改变, 从有效到无效的改变呈线性趋势 ($P=0.026$), 且呈负相关 (Spearman 相关系数为-0.227)。

结论: 患耳椎基底动脉对侧偏曲、同侧 AICA 发育纤细与 SSNHL 发生存在一定相关性, 患耳同侧 VA 优势及同侧 IPS 发育不良多提示预后不良。本研究进一步强调了在 SSNHL 临床诊疗过程中后循环动静脉形态学评估的重要性。

PO-0709

基于“少阳疏泻”探讨针刺风池（阳陵泉） 穴位对前庭性偏头痛毒损脑络机制的多模态影像学研究

陈正光、王伟涛、李小圳、钟立群
北京中医药大学东直门医院

前庭性偏头痛 (vestibular migraine, VM) 是一种反复发作逐渐加重头晕/眩晕、偏头痛相关的常见疾病, 人群总患病率约 2.7%, 其中 21.4% 有家族性 VM 病史。本团队前期研究发现 SLC1A3 基因编码的胶质细胞转运体 EAAT1 代谢异常, 可导致大脑中谷氨酸 (Glu) 过度积累造成兴奋毒性, 导致皮层扩散抑制 (CSD) 和前庭神经-丘脑-皮层通路障碍而诱发 VM。同时, 我们的前期研究发现

后循环血流动力学异常头晕/眩晕患者 fMRI 改变涉及前庭通路及相关脑区灰质体积，针刺少阳经风池穴位，可多节点的调节前庭、视觉和运动相关脑区功能活动，并调整双侧大脑半球前庭和视觉中枢相关脑区局部活动和信息整合；ASL 及 IVIM 序列提示针刺风池治疗头晕/眩晕具有调节微循环灌注效应。据此，本项目初步研究结果提示，针刺风池穴位能通过“少阳疏泻”作用，改善前庭相关脑区的微循环，调节兴奋毒性 Glu 的释放和清除过程，对以“头晕/眩晕、偏头痛”为主要证候的前庭性偏头痛有治疗作用的科学假说，采用静息态 fMRI 技术观察 VM 发现患者脑功能活动变化和灰质体积改变的特点，以探讨患者头晕/眩晕、头痛的微结构基础与中枢病理机制；同时运用 ASL 和 IVIM 成像，发现了 VM 发病的微循环基础，观察针刺风池的干预发现对 ASL 和 IVIM 成像所萃取的脑微循环的改变均有影响，即可能是针刺治疗 VM 的微循环效应；同样采用 DTI 和 MRS 成像技术，观测到 VM 患者的神经传导和谷氨酸代谢状态，以探讨针刺风池穴治疗 VM 毒损脑络的微观基础。通过系列研究，从“少阳疏泻”和“毒损脑络”角度阐明针刺对 VM 的治疗作用，为针刺的神经保护作用提供科学依据。

PO-0710

鼻腔及鼻窦骨化性纤维瘤多模态影像学诊断价值

张武、侯文博、龙垒垒
张家口市第四医院

【摘要】 目的：分析鼻腔及鼻窦骨化性纤维瘤多模态影像学特征，以提高诊断的准确性。方法：对经病理证实的 27 例鼻腔及鼻窦骨化性纤维瘤患者的临床资料进行回顾性分析，比较其 CT 和 MRI 的形态学及功能学影像学特征。所有病例均行 CT 平扫及 MRI 平扫与增强，其中 17 例行 MRI 动态增强扫描。结果：27 例中病变中心位于右侧筛窦 17 例，双侧筛窦及鼻腔 7 例，左侧额窦 3 例。所有病变均呈膨胀性生长，17 例形态不规则呈分叶状，10 例形态规则呈类圆形；病变边界均清晰，周围结构不同程度受压。CT 表现：病灶表现为类圆形或不规则高密度肿块影，周边出现完整或不完整骨性包壳，其内密度不均匀，含有不同程度钙化，肿块呈膨胀性生长，周围组织受压变形但分界清楚。MRI 表现：27 例中有 20 例肿瘤实性部分于 T1WI 呈等信号，7 例呈低信号；于 T2WI 上 20 例呈低信号，7 例呈高信号。27 例中 20 例信号不均匀，于 T2WI 上夹杂片状高信号影；20 例继发囊变，于 T1WI 上呈低信号，T2WI 呈高信号。增强后肿块实性部分轻中度强化，囊性部分无强化，囊壁及间隔明显强化。多模态影像学诊断阳性率例数多于单行 CT 平扫或 MRI 平扫（ $P < 0.05$ ）。结论：多模态影像学不仅可准确显示鼻腔及鼻窦骨化性纤维瘤的发病部位、大小、形态、内部结构及邻近组织结构的侵及范围，还可以反应肿瘤内部功能学特征，可明显提高诊断准确率。

PO-0711

合成 MRI 技术成像质量评估：在鼻咽癌中的初步研究

杨凡、魏浩然、余小多、张红梅、林蒙
中国医学科学院肿瘤医院

目的：合成 MRI 技术（SyMRI）在一次扫描中可生成多个对比加权图像，包括 T1 加权成像（T1WI）和 T2 加权成像（T2WI）。在脑部和直肠癌中的研究发现 SyMRI 图像（包括 T1WI、T2WI 和 FLAIR）可满足基本临床需求。因此，本研究旨在比较鼻咽癌患者常规与合成 T1WI 和 T2WI 的成像质量。

方法：此项前瞻性研究共纳入 59 名经鼻咽镜确诊的鼻咽癌患者。SyMRI 在造影剂注射前进行。

患者图像质量由两名放射科医生（分别有 21 年和 3 年的肿瘤诊断经验）评估。患者及图像顺序随机。采用 Likert 5 分量表对以下 4 个因素进行评估：1) 病变边缘锐利度（1=不锐利；2=稍锐利；3=中等锐利；4=很锐利；5=非常锐利）；2) 病变显示度（1=难以发现；2=几乎识别不了；3=可识

别; 4=容易发现, 对比度良好; 5=对比度极佳); 3)运动伪影 (1=严重, 难以诊断; 2=稍严重, 可诊断; 3=中等; 4=轻微; 5=无伪影); 4)整体图像质量 (由上述三个因素相加, 1=不可接受; 2=较差; 3=中等; 4=好; 5=极佳)。至于整体图像质量, 评分 ≥ 3 则被认为临床可接受。

采用 Wilcoxon 符号秩检验比较常规与合成 T1WI 和 T2WI 的图像质量评分。两位放射科医生评分间一致性用 Kappa 值评估 (0.21-0.40, 一般; 0.41-0.60, 中等; 0.61-0.80, 良好; 0.81-1.00, 优秀)。

结果: 常规与合成图像质量评分的观察者间一致性为良好或优秀 (Kappa: 0.637-0.919)。常规 T2WI/FS 和合成 T2WI 在病变边缘锐利度、病变显示度、运动伪影和整体图像质量方面的差异没有统计学意义 (P: 0.074-0.835)。然而, 常规 T1WI 图像质量高于合成 T1WI (P 值均 ≤ 0.007)。在整体图像评分方面, 所有合成 T1WI 和 T2WI 图像评分均 ≥ 3 分, 这表明 SyMRI 图像在临床实践中是可接受的。值得注意的是, SyMRI 的 T2WI 带有脂肪模块, 在进行常规 T2WI/FS 与合成 T2WI 比较时, 需要考虑脂肪抑制的影响。

结论: 合成 T1WI 和 T2WI 图像可用于鼻咽部的临床评估, 具有良好的应用前景。

PO-0712

胆脂瘤型中耳炎 HRCT 诊断价值

张宏、郭小平、马鸣岳、张巧莹、高明
西安市中心医院

利用颞骨薄层 HRCT 多平面重组 (MPR) 及曲面重组 (CPR) 技术评价胆脂瘤型中耳炎患者听骨链 (OC) 破坏情况。方法 将 34 例 40 耳手术病理证实为胆脂瘤型中耳炎患者 CT 轴位、MPR 及 CPR 图像对听骨链破坏的显示情况并与术中对照, 评价各方法的灵敏性与特异性。结果 MPR 重建对锤骨破坏敏感性 & 特异性均为 100%, MPR 重建及 CPR 重组对砧骨破坏敏感性分别为 97.1% 及 91.2%, 特异性均为 100%, MPR 重建及 CPR 重组对镫骨破坏敏感性 & 特异性均为 88.9% 及 84.2%, MPR 重建对锤砧关节骨破坏显示敏感性 & 特异性均为 100%, CPR 重组对砧镫关节骨质破坏敏感性 & 特异性均为 100%。结论 HRCT MPR 及 CPR 技术可以评估胆脂瘤型中耳炎患者听骨链破坏情况, 为外科手术的可行性提供可靠的影像学参考数据。

PO-0713

3.0T MRI 联合低浓度对比剂 CE-MRA 和灌注成像在急性缺血性脑卒中的应用价值

姜海龙
南京市第一医院

目的 探讨在 3T MRI 联合低浓度对比剂增强磁共振血管成像 (CE-MRA) 和动态磁敏感灌注成像 (DSC-PWI) 在急性缺血性脑卒中的应用价值。方法 收集南京市第一医院 2017 年 10 月-2018 年 3 月急性脑卒中患者 30 例, 所有患者均接受低浓度对比剂 CE-MRA 和 DSC-PWI 成像, 并于 24 小时内接受数字减影血管造影 (DSA) 检查。CE-MRA 和 DSC-PWI 均使用半剂量对比剂浓度 (0.05mmol/kg)。通过与 DSA 对照, 评估 CE-MRA 对血管狭窄诊断的准确性。CE-MRA 诊断血管狭窄及 DSC-PWI 诊断不匹配区的观察者间一致性检验使用 Kappa 分析。结果 CE-MRA 对头颈动脉低级别 (<50%) 及高级别 (>50%) 狭窄诊断的敏感性、特异性、阳性预测值、阴性预测值分别为 82.4%、100%、100%、93.8% 及 100%、82.4%、93.8%、100%。CE-MRA 诊断动脉狭窄及

DSC-PWI 诊断不匹配区观察者之间一致性均好 (分别为 $\kappa=0.87$ 、 $\kappa=0.86$)。结论 3T MRI 联合低浓度对比剂 CE-MRA 和 DSC-PWI 是一种可行的急性缺血性脑卒中 MRI 扫描方案

PO-0714

双期增强 CT 对桥本甲状腺炎合并微小乳头状癌 中央组淋巴结转移的预测价值

张潇涵¹、章彤²、田敏²、魏培英³、韩志江³

1. 浙江中医药大学研究生院
2. 浙江中医药大学第四临床学院
3. 浙江大学附属杭州市第一人民医院

【摘要】目的 探讨双期增强 CT 对合并桥本甲状腺炎 (Hashimoto's thyroiditis, HT) 的微小乳头状癌 (Papillary thyroid microcarcinoma, PTMC) 中央组淋巴结转移 (Central lymph node metastasis, CLNM) 的预测价值。**方法** 回顾性分析经手术及病理证实的 74 例 108 枚合并 HT 的 PTMC 中央组淋巴结影像资料, 每个中央组取强化最明显淋巴结作为研究对象, 其中阳性 29 枚, 阴性 79 枚。分别测量淋巴结动脉期和静脉期 CT 值, 通过受试者工作特征度曲线 (Receiver operating characteristic, ROC) 获得淋巴结动脉期、静脉期 CT 值的最佳阈值及相应的敏感度、特异度来评估二者的诊断效能。**结果** 29 枚阳性淋巴结和 79 枚阴性淋巴结动脉期 CT 值分别为 ($78.6 \pm 24.8 \text{Hu}$) 和 ($58.7 \pm 16.8 \text{Hu}$) ($t = -4.756$, $P < 0.05$), 静脉期 CT 值分别为 ($79.1 \pm 17.2 \text{Hu}$) 和 ($67.0 \pm 14.9 \text{Hu}$) ($t = -3.349$, $P < 0.05$)。动脉期和静脉期 CT 值在预测 CLNM 的 AUC 值分别为 0.728 和 0.715, 当最佳阈值分别为 55.4Hu 和 76.4Hu 时, 敏感度分别为 89.7% 和 69.0%, 特异度分别为 46.8% 和 74.7%。二者联合预测 CLNM 的 AUC 值为 0.742, 敏感度和特异度分别为 72.0% 和 71.0%。动脉期和静脉期 ICC 分别为 0.926 和 0.892。结论 双期增强 CT 值可一定程度上预测 HT 合并 PTMC CLNM 情况, 动脉期 CT 值敏感度高于静脉期, 而静脉期 CT 值特异度高于动脉期, 二者联合可进一步提高预测 CLNM 的诊断效能。

PO-0715

SHAP 值在 XGBoost MRI 模型中鉴别腮腺恶性肿瘤 与 Warthin 瘤的价值

张潇涵¹、朱翰林²、韩志江³

1. 杭州师范大学附属萧山医院
2. 杭州市第九人民医院
3. 浙江大学附属杭州市第一人民医院

【摘要】目的 探讨 SHAP 值在 XGBoost MRI 模型中鉴别腮腺恶性肿瘤 (Malignant Tumor, MT) 与 Warthin 瘤 (Warthin Tumor, WT) 的价值。**方法** 回顾分析经手术病理证实的 22 例 22 枚 MT 和 38 例 51 枚 WT 的 MRI 资料, 分析瘤体形态、强化方式和位置, 以及 T1WI、T2WI、FS-T1WI、FS-T2WI 影像征象, 经单因素分析筛选有统计学意义的征象, 纳入极端梯度提升 (Extreme Gradient Boosting, XGBoost) 模型, 使用受试者工作特征曲线下面积 (Area under the curve, AUC)、敏感度、特异度评价模型诊断效能。再通过 SHAP (SHapley Additive exPlanations) 值进行模型分析, 明确各 MRI 征象在模型中的权重。**结果** 22 枚 MT 和 51 枚 WT 中, 渐进性强化 ($P < 0.05$)、形态不规则 ($X^2=20.707$, $P < 0.05$)、非尾叶 ($X^2=8.911$, $P < 0.05$)、T2WI 高信号 ($X^2=7.581$, $P < 0.05$)、FS-T1WI 等低信号 ($P < 0.05$)、FS-T2WI 高信号 ($X^2=9.016$, $P < 0.05$) 对鉴别 2 者有统计学意义, 且均更常见于 MT 中。将 6 项单因素纳入 XGBoost 模型分析得出

AUC 为 0.847, 敏感度为 77.3%, 特异度为 92.2%; 6 种 MRI 征象绝对平均 SHAP 值为 0.20~0.99, 其中形态不规则权重最大。**结论** 腮腺 MT 与 WT 的 MRI 征象 XGBoost 模型对 2 者的鉴别诊断有重要意义, SHAP 值可对模型中各征象的权重进行量化分析, 明确不同征象的诊断效能。

PO-0716

探究深度学习图像重建和金属伪影减少算法在颌面部 CT 中减少金属植入物伪影价值的研究

杨功鑫

上海交通大学医学院附属第九人民医院

目的: 本研究旨在将深度学习图像重建 (DLIR) 和金属伪影减少 (MAR) 算法相结合, 探究其在不同扫描条件下对带有金属植入物的 CT 图像质量的影响。

方法: 使用设计用于图像质量评估的猪颌面部模型, 在三个剂量水平 (CTDIvol: 20/10/5mGy) 下获取数据。原始数据使用滤波背投影 (FBP)、Veo 自适应统计迭代重建 (AV50) 和 DLIR (TrueFidelity™) 进行重建, DLIR 分为低、中和高三个水平。在不同组织 (近/远脂肪、近/远肌肉、近/远骨) 中选择感兴趣区域 (ROI), 包括有和没有金属植入物和伪影的层面。计算信噪比 (SNR)、对比度噪声比 (CNR) 和金属伪影指数 (MAI), 并由两名有经验的放射科医生在 5 分制 Likert 量表上评估主观图像质量。

结果: (1) 在相同的扫描条件下, 五种算法在不同组织的 Hounsfield 单位 (HU) 值之间没有显著差异。然而, DLIR-L、DLIR-M 和 DLIR-H 的标准差小于 FBP 和 AV50 ($P<0.05$)。 (2) 与 FBP 和 AV50 相比, DLIR 显示出更好的噪声减少效果 ($P<0.05$)。在三种组织中, SNR 的顺序为 DLIR、FBP 和 AV50 呈递减趋势。CNR 在脂肪和肌肉中的顺序为 DLIR、AV50 和 FBP, 骨骼除外。FBP 在近、远脂肪中的 MAI 最高。 (3) 两名观察者在所有三种组织类型中评价具有 MAR 的重建算法具有比没有 MAR 的算法更低的伪影分数 ($P<0.01$, 骨骼的远影和光晕除外, $P=1.0$)。随着 DLIR 水平的增加, 伪影减少的程度更好 ($P<0.05$), 两名观察者一致认为与 FBP 和 AV50 相比, DLIR 在伪影减少方面表现更好。主观图像质量的顺序为 DLIR、AV50 和 FBP ($P<0.01$)。

结论: DLIR 和 MAR 算法的结合可以提高图像质量并显著减少金属伪影, 具有更高的临床应用价值。

PO-0717

不同大小单灶甲状腺乳头状癌中央组淋巴结转移临床风险因素预测研究

章彤¹、田敏¹、舒艳艳²、魏培英¹、韩志江¹

1. 杭州市第一人民医院

2. 萧山区第一人民医院

目的 探讨影响单灶甲状腺乳头状癌 (papillary thyroid carcinoma, PTC) 中央组淋巴结转移 (central lymph node metastases, CLNM) 的临床风险因素, 评价年龄在不同性别及桥本氏甲状腺炎 (Hashimoto's thyroiditis, HT) 合并状态下对 CLNM 的预测价值。**方法** 回顾分析 4115 例单灶 PTC 患者的临床资料, 依据肿瘤大小分甲状腺微小乳头状癌 (papillary thyroid microcarcinoma, PTMC) (≤ 10.0 mm) 和 PTC (> 10.0 mm), 通过多因素分析确定影响 CLNM 的独立预测因素, 并均分为男性组、女性组、HT 组、non-HT 组 4 个亚组, 经受试者工作特异度曲线下面积 (area under the curve, AUC) 寻找各亚组中发生 CLNM 的最佳年龄阈值及诊断效能。**结果** PTMC 和 PTC 发生 CLNM 比例分别为 27.2% (937/3451) 和 58.9% (391/664)

($c_2=256.565$, $P < 0.050$)。肿瘤较大 ($OR=1.230$)、男性 ($OR=2.085$)、年龄较大 ($OR=0.960$)、HT ($OR=0.697$) 均与 PTMC 发生 CLNM 的独立相关, PTC 中仅男性 ($OR=1.460$)、年龄较大 ($OR=0.963$) 与 CLNM 独立相关。亚组分析显示 PTC 中男性、HT、non-HT 亚组年龄预测 CLNM 的 AUC 均高于 PTMC, 分别为 $0.642 \sim 0.689$ 和 $0.635 \sim 0.659$; 女性、HT、non-HT 亚组在 PTC 中的年龄阈值均低于 PTMC, 分别为 $38.5 \sim 39.5$ 岁和 $41.5 \sim 42.5$ 岁。结论 PTMC 组中, 男性、肿瘤较大是 CLNM 的危险因素, 年龄较大和 HT 是保护因素, PTC 组中, 男性和年龄较大分别是 CLNM 的危险和保护因素; 在不同性别及 HT 合并状态下, PTMC 和 PTC 患者发生 CLNM 年龄存在一定差异, 正确认识这些差异, 对提供个性化临床治疗具有重要意义。

PO-0718

临床和双能 CT 特征对甲状腺乳头状癌侧颈区淋巴结转移的预测价值

许泳康、周燕、耿頔、尚婷、斯岩、许晓泉、吴飞云
南京医科大学第一附属医院 (江苏省人民医院)

目的: 探讨临床和双能 CT 特征对甲状腺乳头状癌 (PTC) 侧颈区淋巴结转移 (LLNM) 的预测价值。方法: 回顾性分析术前双能 CT 检查、经病理证实的 263 例 PTC 患者的临床和影像资料。纳入分析的临床和 CT 图像特征包括年龄、性别、甲状腺功能指标、病灶位置、病灶大小、病灶是否合并钙化及囊变。测量平扫和动静脉期双能 CT 定量参数, 包括碘浓度 (IC)、有效原子序数 (Zeff-c)、标准化碘浓度 (NIC)、标准化有效原子序数 (NZeff-c)、双能指数 (DEI) 和能谱曲线斜率 (λHU)。比较 LLNM 组和非 LLNM 组间临床和双能 CT 特征差异。应用受试者工作特性 (ROC) 曲线评估临床特征、双能 CT 特征和两者联合模型的效能, 并计算曲线下面积 (AUC)、灵敏度和特异度。结果: 男性、甲状腺球蛋白异常、甲状腺球蛋白抗体异常、病灶位于上极、病灶最大短轴径 $>10mm$ 、病灶合并钙化的 PTC 患者更容易出现 LLNM (p 均 < 0.05)。LLNM 组动静脉期 IC、NIC 和 DEI 均显著高于非 LLNM 组 (p 均 < 0.05)。联合模型预测效能最高 (AUC 为 0.773; 灵敏度 84.1%; 特异度 65.3%), 其次是双能 CT 特征模型 (AUC 为 0.745; 灵敏度 79.9%; 特异度 67.4%), 两者均优于临床特征模型 (AUC 为 0.642; 灵敏度 62.6%; 特异度 65.3%; p 均 < 0.05)。结论: 相较于临床特征, 双能 CT 特征对 PTC 患者侧颈区淋巴结转移具有更高的预测价值, 两者联合可进一步提高预测效能。

PO-0719

基于个体化脑功能和结构连接对抑郁症诊断的研究

过雨亭¹、初同朋²、毛宁²

1. 滨州医学院
2. 烟台毓璜顶医院

目的: 抑郁症 (MDD) 患者在神经解剖学和功能上存在着显著的个体差异。但以往大多数神经影像学研究依赖于应用群体水平的大脑模板, 而忽略了个体中存在的大脑网络特征, 个体之间的大脑连接也存在很大差异。相比较单一模态, 利用多模态神经成像特征可以更好来研究抑郁症患者大脑网络之间的相互关系。本研究旨在通过提取个性化的功能连接特征和结构连接特征, 确定两者的结合是否有助于提高分类性能。深入了解 MDD 相关病理生理机制, 以辅助抑郁症的诊断与治疗。

方法: 本研究招募了 142 名重度抑郁症患者和 127 名匹配良好的健康对照者。我们利用数据分析方法提取受试者个体化的功能连接和结构连接特征。将提取的个体化特征进行特征融合, 再进一步使

用支持向量机进行诊断。此外,我们对群体判别 IC 的混合系数与临床数据(包括 HAMD 和 MoCA)进行相关分析,还利用融合后的特征建立线性回归模型,预测 MDD 患者症状严重程度。

结果:通过对每个组分的混合系数进行双样本 t 检验,我们发现一种联合组判别独立成分(IC3),其在两个模态中都存在显著差异。DTI 中存在一个独立成分具有群体鉴别性,即 IC7,同时 rs-fMRI 中有两个独立成分具有组区别性,分别为 FNC-IC10 和 FNC-IC12。融合后的特征使区分患者和对照者的效率显著提高,实现了跨群体区分的高精度。

结论:本研究表明,相比于原始大脑连接,基于个体化的连接组特征可以显著提升诊断抑郁症的能力。本文通过多模态数据融合不仅利用了每种成像方式的优势,而且还探究了 MDD 患者大脑网络之间的相互关系,提供了更多的补充信息,为 MDD 疾病提供更全面的理解。

PO-0720

能谱 CT 单能量技术优化头颈部 CTA 图像质量的研究

雷雨欣、任占丽、赵文勇、韩冬、申利、彭荟
陕西中医药大学附属医院

目的 探讨宝石能谱 CT 单能量技术对头颈部 CTA 图像质量优化的临床价值。

方法 选取本院拟行头颈联合 CTA 患者 28 例,采用能谱扫描,其中体重指数(BMI) $\leq 23\text{kg/m}^2$ 用 GSI-51 协议, BMI $> 23\text{kg/m}^2$ 用 GSI-1 协议。扫描完成后,分别重建 60keV、65keV、70keV、75keV、80keV 共 5 组单能量图像,将图像传入 AW4.6 工作站,进行 MPR、VR、CPR 重建。由两名有经验的医师对两组图像质量进行 4 分制主观评分,应用 Kappa 检验比较观察者间评分的一致性;测量主动脉弓、双侧颈总动脉、双侧颈内动脉、双侧大脑中动脉、胸锁乳突肌、脑实质的 CT 值,及双侧颈总动脉、双侧颈内动脉、胸锁乳突肌、脑实质的 SD 值,双侧对称性动脉求其 CT 值、SD 均值,计算出颈部血管的信噪比(SNR)、对比噪声比(CNR)。采用单因素方差分析比较 5 组图像的 CNR、SNR、主观评分,组间对比采用 LSD 检验。

结果 两位医师对两组图像评价结果的一致性较好(Kappa 值均 > 0.800)。获得最佳 CNR 的最佳单能量水平为 60-65keV。5 组图像的 SNR、CNR 及主观评分,差异有统计学意义(p 均 < 0.05),60keV 组和 65keV 组的 SNR、CNR 及主观评分最高,SNR 分别为颈总动脉(66.42 ± 18.84 、 68.04 ± 13.67)、颈内动脉(42.42 ± 13.08 、 43.10 ± 12.98)、大脑中动脉(45.51 ± 12.47 、 45.52 ± 11.47);CNR 分别为颈总动脉(77.22 ± 24.10 、 75.92 ± 24.04)、颈内动脉(77.31 ± 25.47 、 76.03 ± 25.04)、大脑中动脉(39.97 ± 11.99 、 39.45 ± 11.05);主观评分分别为 3.64 ± 0.49 、 3.61 ± 0.50 ,且二者之间无统计学差异(p 均 > 0.05)。

结论 单能量图像约在 60-65keV 可以获得最佳 CNR 的头颈 CTA 图像,宝石能谱 CT 能够提高头颈 CTA 图像质量。

PO-0721

CT 多参数测量预测甲状腺相关眼病视神经病变: 种简单快速的识别方法

姜梦达
上海交通大学医学附属第九人民医院

背景:甲状腺眼病视神经病变(DON)可致盲致畸,临床诊断需要多种检查且易和其他疾病混淆,延误病情,亟需快速且可及性高的判断方法。

目的:通过测量甲状腺眼病(TED)患者的眼外肌影像学参数,分析眼外肌影像学参数与疾病严重程度进展的关系,为临床诊断评估 DON 患者建立预测模型。

方法: 回顾性研究了 59 眼 DON 和 107 眼中重度 TED 患者的眼外肌影像学测量参数。采用 ITK-SNAP 对患者的眼眶 CT 图像进行三维重建, 基线垂直于硬腭, 在冠状位 CT 的眶下裂入口平面进行四条直肌和上斜肌长短径、面积及与视神经距离测量。将眼外肌测量参数与疾病严重程度进行相关性分析, 并以此建立 DON 诊断预测模型。

结果: 经差异性分析可知, 中重度 TED 患者和 DON 患者的性别($P<0.001$)、年龄($P<0.001$)、总面积($P=0.001$)、内直肌截面积($P<0.001$)、内直肌截面长径($P<0.001$)、内直肌厚度($P<0.001$)、内直肌截面积/眼眶截面积($P<0.001$)、外直肌-视神经距离($P=0.003$)、上直肌截面积($P<0.001$)、上直肌宽度($P<0.001$)等指标有显著差异。男性、较厚的上直肌和上直肌距离视神经较近是 DON 的重要危险因素, 联合诊断 DON 的二元 Logistic 回归的 ROC 曲线下面积 AUC 值为 0.870, 灵敏度为 78.95%, 特异度为 84.76%, 准确度为 80.86%。

结论: 在眶下裂后出现的冠状面 CT 中, 具有较厚的上直肌、上直肌距离视神经较近的男性 TED 患者具有较高风险进展为 DON, 本研究中采用的单层测量方法及预测模型可作为一种简单可靠的方法辅助临床快速判断患者进展为 DON 的可能性, 及早进行进一步的视觉相关检查以及干预治疗, 防止患者出现不可逆的视功能损害。

PO-0722

内耳畸形和耳蜗神经缺陷对极重度感音神经性听力 损失儿童听觉语言网络发育的影响

姜梦达

上海交通大学医学附属第九人民医院

重度先天性感音神经性听力损失(SNHL)阻碍儿童语言发育。人工耳蜗植入和听觉脑干植入可以提供部分听觉, 但语言发展的结果可能会有所不同, 特别是对于内耳畸形和/或耳蜗神经缺陷(IEM&CND)的患者。目前通过临床影像学的目视检查来评估外周听觉结构, 但这种方法对于手术规划和预后判断存在不足。中枢听觉通路由于其精细的皮质下结构, 在体内进行检查也具有挑战性。以往利用功能磁共振对声音的反应定位皮质下听核的尝试并不适用于重度听力损失患者, 因为在这些患者中无法检测到听觉脑干反应, 因此无法在功能磁共振中捕捉到相应的血氧信号。在这项研究中, 我们开发了一种利用结构和扩散 MRI 来定位听觉通路的新方法。我们使用基于 FIXEL-BASED ANALYSIS 的方法来研究外周结构正常的 SNHL 儿童和 6 岁以下 IEM&CND 儿童的听觉语言网络结构发展。我们的研究表明, 语言通路比中枢听觉通路对周围听觉状况更敏感, 这突出了早期干预对深度 SNHL 儿童及时提供语音输入的重要性。此外, 我们还提出了从耳蜗到听觉-语言网络的全面术前评估, 具有良好的临床应用前景。

PO-0723

基于融合多参数 DECT 的亚区生境技术预测 晚期喉癌无进展生存期的临床研究

李文菲¹、夏爽²

1. 秦皇岛市第一医院

2. 天津市第一中心医院

目的: 基于 DEC 多参数进行代谢亚区划分的方法(生境分析) 对晚期喉癌患者进行无进展生存期预测

资料和方法: 回顾性收集于 2018 年至 2021 年间在南开大学附属一中心医院进行手术治疗且经病理证实为喉癌的患者共计 118 例。患者在治疗前进行 DECT 检查。采用随机分组的方式(7:3)将

118 例患者分为训练组和验证组。利用 3D-slicer 图像勾画肿瘤全域,得到肿瘤感兴趣区域 (ROI) 后,利用无监督聚类 k-means 算法将肿瘤分为不同亚区。提取不同亚区域的影像组学特征。进行特征降维,用来筛选出有意义的特征,进而预测患者 PFS。对不同亚区的单位碘浓度进行比较。

结果:训练组与验证组之间临床特征基线并无显著的统计学差异 ($p>0.05$)。与从整个肿瘤中提取纹理特征构建的影像组学模型相比,运用生境分析法生成不同亚区纹理特征所构建的模型能够更好地预测喉癌患者的 PFS (训练组 AUC 分别为 0.85 和 0.78)。不同聚类亚区碘浓度分布特征存在显著差异。

结论:我们开发了基于 DECT 不同亚区的生境影像组学模型,它可以对晚期喉癌患者的无进展生存期分层,不同亚区的血管异质性有助于患者生存分层分析。

PO-0724

结节性甲状腺肿的中医证候要素与 CT 平扫特征及灌注参数的相关性研究

冀春亮

北京中医药大学东直门医院

目的:探讨双源 CT 平扫及灌注成像在结节性甲状腺肿中医辨证分型中的应用价值。方法:搜集结节性甲状腺肿患者 92 例,依据中医证型进行分组,总结不同证型结节性甲状腺肿的 CT 平扫特征,分析灌注成像参数。纳入健康志愿者 25 例作为正常组,比较结节性甲状腺肿与正常组,以及各中医证型结节性甲状腺肿的血流量、血容量、表面通透性 (PS)、平均通过时间 (MTT)。结果:92 例中,气滞组 31 例,痰凝组 25 例,血瘀组 16 例,阴虚组 20 例。气滞组多为单发结节,边界清楚;痰凝组多为多发结节,边界一般欠清楚,常有多发钙化灶;血瘀组多边界清楚,病变组织内常有点状钙化;阴虚组多发性结节多见。血瘀组的血流量、血容量与正常组比较,差异均有统计学意义 (均 $P<0.05$);气滞组的 PS 与正常组比较,差异有统计学意义 ($P<0.05$);MTT 组间比较,差异均无统计学意义 (均 $P>0.05$)。结论:双源 CT 平扫及灌注成像可为结节性甲状腺肿的中医辨证分型提供可参考的客观指标。

PO-0725

基于常规影像联合弥散加权成像影像组学 在鼻腔鼻窦良恶性病变鉴别中的应用

苏国义、吴飞云

南京医科大学第一附属医院 (江苏省人民医院)

目的:探讨基于常规影像联合弥散加权成像 (diffusion weighted imaging, DWI) 影像组学特征鉴别鼻腔鼻窦良恶性病变的能力。

材料与方法:我院经病理证实的 105 例鼻腔鼻窦恶性病变患者和 95 例鼻腔鼻窦良性病变患者被纳入本研究,并随机分为训练组和验证组 (7:3)。基于常规影像及 DWI 进行影像组学特征提取并降维,建立影像组学诊断模型并计算影像组学评分。采用受试者工作特征 (Receiver operating characteristic, ROC) 曲线评估影像组学评分的诊断效能。对包含 60 名患者的炎症组进行内部验证。结果:基于轴位 T2WI、增强 T1WI 及 ADC 图像,共提取 4065 个组学特征并筛选出 18 个特征用于影像组学模型建立,其中包含 11 个小波特征。组学模型在训练组及验证组均显示较高的诊断效能, AUC 分别为 0.929 和 0.893。

结论: 基于常规 MR 联合 DWI 影像组学特征可以作为一种无创的、客观定量的方法术前鉴别鼻腔鼻窦良恶性病变。

PO-0726

基于影像学无创性评价高颅压准确性的对比分析

陈澜月、马晓博、周梦迪、曲晓霞、刘航志、刘兆会
首都医科大学附属北京同仁医院

目的 对比无创性评价颅内压的不同影像学方法, 探讨优势与不足。**方法** 收集 2019 年 10 月~2022 年 1 月就诊于首都医科大学附属北京同仁医院的颅高压患者 15 例, 均为女性, 平均年龄 (38.47±9.20) 岁。所有患者行腰椎脑脊液穿刺测量颅内压, 并完成颅脑 CTV、颅脑 MRV 以及包括斜冠状面视神经脂肪抑制 FSE T2WI MR 的颅脑 MRI 检查。基于横窦狭窄指数 (ITSS)、颅脑形态学特征 (包括后巩膜扁平、部分空蝶鞍、联合狭窄评分 CSS<4) 定性评价颅内压增高与否。基于视神经周围蛛网膜下腔宽度 (OSASW) 定性和定量评估颅内压增高与否。ITSS 方法通过颅脑 MRV 观察硬脑膜窦, 对横窦进行分类 (0~4 量表值), 即 0 表示横窦无狭窄; 1 表示狭窄<33%; 2 表示狭窄 33~66%; 3 表示狭窄>66%; 4 表示发育不全或未发育; ITSS=左侧横窦狭窄程度的量表值×右侧横窦狭窄程度的量表值。当 ITSS≥4 时, 认定为存在颅高压; 当 ITSS<4 时, 认定为颅内压正常。基于 OSASW 定量计算公式为: 颅内压 (mmHg) =16.95×OSASW + 0.39×BMI + 0.14MAP-20.9。**结果** 基于 ITSS 方法和颅脑形态学特征定性诊断颅内压增高的准确率分别为 100% 和 93.3%。基于 OSASW 定性诊断颅内压增高的准确率为 86.7%, 定量计算颅内压值为 210.83±28.04mmH₂O, 与腰椎穿刺测量颅内压值 (222.33±31.67mmH₂O) 之间无显著性差异 (t=1.053, P=0.301), 但与腰椎穿刺测量颅内压值相比, 基于 OSASW 测量的颅内压值平均降低 11.5±3.63mmH₂O。**结论** ITSS 是诊断颅内压增高准确性最高的无创性影像学方法, 可定性诊断颅内压有无增高, 然后再应用 OSASW 测量颅内压, 在此数值基础上增加 11.5±3.63mmH₂O 可作为定量评价颅内压的参考值。

PO-0727

3D 高分辨磁共振黑血管壁成像用于评估颈动脉闭塞应用研究

潘春树、杜小峰、陈国平、李爱静、张景峰
宁波市第二医院

背景和目的: 颈动脉闭塞是引起缺血性脑卒中的一个重要原因。传统管腔成像技术 (如 CTA、MRA、DSA) 仅可评估闭塞近端血管特征, 无法评估闭塞段及远端血管结构特征。通过使用高分辨磁共振黑血管壁成像评估颈动脉闭塞, 分析图像特征, 以更好地为临床治疗提供信息。

方法: 选取我院 2021 年 1 月-2023 年 4 月 DSA 下行颈动脉造影确诊为颈动脉闭塞患者 32 例并收集整理患者病史资料。所有患者均在 3.0T MR 下行颈动脉 T1-SPACE 序列平扫及增强扫描。通过管壁成像图像评估闭塞起始端位置及信号特定、闭塞段长度范围和闭塞段信号特征、闭塞段血管壁增厚及强化特征。

结果: 32 例颈动脉闭塞患者中, 有症状患者 23 例, 占比约 71.9%, 无症状患者 9 例, 占比约 28.1%; 闭塞段起始端位于颈总动脉 1 例, 颈内动脉 C1 段 27 例, C2 段 2 例, C5 段 1 例, C6 段 2 例。闭塞近端斑块内高信号 4 例, 混杂信号 28 例。闭塞段管腔高信号 12 例, 稍低信号 13 例, 流空信号 7 例, 管腔塌陷 19 例, 管壁增厚 30 例, 管壁明显强化 28 例。管壁成像显示闭塞段长度范围与 DSA 一致的 5 例, 占比约 21.9%, 而 27 例患者管壁成像显示闭塞长度明显小于 DSA 结果。

结论: 高分辨磁共振黑血管壁成像可用于精准显示颈动脉闭塞长度及闭塞段信号特征, 为临床进一步手术治疗提供了准确的参考依据。

PO-0728

基于 Dixon MRI 的全眼眶多参数评估甲状腺眼病活动性

张海扬¹、夏多金²、王慧¹、姜梦达³、唐言³、孙静¹、李寅炜¹、宋雪霏¹、周慧芳¹

1. 上海交通大学医学院附属第九人民医院眼科

2. 上海理工大学健康科学与工程学院

3. 上海交通大学医学院附属第九人民医院放射科

目的: 磁共振成像 (MRI) 常被用来评估甲状腺眼病 (TED) 活动性。TED 累及眶内多个结构的病理改变, 而以往的研究主要集中在眼外肌或其他单一结构。本研究旨在探讨基于 Dixon MRI 全眼眶多参数对 TED 疾病活动性的诊断价值。

方法: 回顾性纳入 49 例 TED 的患者, 根据临床活动性评分 (CAS) 和 MRI 综合评价将其分为活动期 27 例, 静止期 22 例。所有患者均行 Dixon MRI 轴位和冠状位 MRI 检查。测量眼外肌、眶内脂肪、泪腺的水分数、脂肪分数, 以及眶内脂肪厚度及泪腺突出度。对眶内每个结构的影像参数采用单因素 logistic 回归分析, 将 $P < 0.05$ 的参数分三个组织单独以及联合纳入多因素 logistic 回归模型。采用受试者工作特征 (ROC) 曲线评价单个结构和多个结构联合的模型对于评估 TED 活动性的效能。

结果: 单因素 logistic 回归分析显示, 上直肌水分分数 ($P = 0.018$)、内直肌脂肪分数 ($P = 0.029$)、眶内脂肪水分分数 ($P = 0.004$)、泪腺突出度 ($P = 0.012$) 差异有统计学意义 ($P < 0.05$)。多因素 logistic 回归分析得出眼外肌、眶内脂肪、泪腺的曲线下面积 (AUC) 值分别为 0.774、0.771 和 0.729。将眶内三个结构的 4 个影像参数联合建模, 最终 AUC 为 0.909 (95%CI: 0.828 ~ 0.990; 敏感性, 85.2%; 特异性, 90.9%)。

结论: Dixon MRI 能较好地评估眼眶多个结构, 联合眼外肌、眶内脂肪、泪腺影像学参数可显著提高 TED 疾病活动性评估的诊断价值, 有助于临床医师做出合理的决策。

PO-0729

IQon 光谱 CT 碘密度图影像组学对甲状腺乳头状癌颈部淋巴结转移的诊断价值

刘波涛¹、乔英²

1. 山西医科大学

2. 山西医科大学第一医院

目的 探讨基于 IQon 光谱 CT 碘密度图的影像组学对甲状腺乳头状癌 (PTC) 颈部淋巴结转移的诊断价值。**方法** 回顾性分析 116 例 PTC 患者的 347 枚淋巴结 (205 枚非转移和 142 枚转移淋巴结), 按照 7 : 3 的比例分为训练集和验证集。在碘密度图上手动勾画淋巴结并提取其影像组学特征, 通过最小绝对收缩和选择算子 (LASSO) 回归方法进行组学特征选择和影像组学标签建立。采用 logistic 回归建立基于淋巴结 CT 图像特征 (模型 1)、组学特征 (模型 2) 和两者联合 (模型 3) 的诊断模型。将模型 3 用列线图直观表示, 采用 ROC 曲线及曲线下面积 (AUC) 评估 3 个模型诊断效能。**结果** 模型 1 由淋巴结短径、强化程度、钙化和囊变 4 个特征构成。LASSO 回归共筛选出 9 个组学特征并建立了影像组学标签 (模型 2)。模型 3 由淋巴结的强化程度、钙化、囊变和影像组学标签构成。在训练集和验证集, 模型 3 均具有最优的诊断效能 (AUC 为 0.94、0.91)。**结论** 基于 IQon 光谱 CT 碘密度图的组学分析对 PTC 颈部淋巴结转移具有较好的诊断效能。

PO-0730

多模态磁共振成像评估不同程度 TMD 患者翼外肌信号异常的价值

梁兰兰、王鹏、刘永倩、李建波
云南大学附属医院

目的 通过多模态磁共振（常规 MRI、T1WI-Dixon、T2 mapping）评估不同程度颞下颌关节紊乱病（temporomandibular disorders, TMD）患者翼外肌信号改变，评价 TMD 患者翼外肌脂肪浸润和水肿程度与 TMD 损伤程度的相关性，探讨 T1WI-Dixon 及 T2 mapping 技术在 TMD 患者周围肌肉评估的应用价值。

方法 前瞻性纳入我院初诊 TMD 患者 95 例共 190 个颞下颌关节及正常对照组 25 例共 50 个颞下颌关节，使用 3.0T MRI 对颞下颌关节进行常规序列、T2 mapping 及 T1WI-Dixon 序列扫描。将纳入的颞下颌关节按关节盘位置分组：健康对照组、正常位病例组、可复性前移位病例组和不可复前移位病例组。由两位观察者采用独立盲法在功能序列测量翼外肌 T2 值和脂肪分数（fat fraction, FF）。采用组内相关系数评估两名观察者测量结果的一致性。采用单因素方差分析方法分析各组翼外肌的 T2 值、FF 值之间的差异，用 LSD-t 方法比较每两组之间的差异， $P<0.05$ 为差异有统计学意义。采用斯皮尔曼相关检验评价 T2 值、FF 值与程度分级之间的相关性。

结果 两名观察者获得良好的一致性（ $ICC>0.75$ ）。健康对照组、正常位病例组、可复性前移位病例组和不可复前移位病例组翼外肌的 T2 值依次升高〔（ 35.69 ± 3.06 ）ms、（ 37.97 ± 2.16 ）ms、（ 39.30 ± 2.27 ）ms、（ 40.63 ± 4.71 ）ms; $F=56.378, P<0.001$ 〕，组间两两比较差异有统计学意义（ $P<0.05$ ）；FF 值依次升高（ 9.47 ± 1.51 、 11.15 ± 1.99 、 12.26 ± 2.57 、 16.09 ± 3.47 ; $F=22.50, P<0.001$ ），组间两两比较差异有统计学意义（ $P<0.05$ ）。FF 值、T2 值与 TMD 程度分级的相关性较好，相关系数分别是 $rs(FF)=0.656$ 、 $rs(T2)=0.285$ ，均有统计学意义（ $P<0.05$ ）。

结论 T2 mapping 及 Dixon 成像技术可定量和无创地评估肌肉脂肪浸润和水肿程度，在评价不同程度 TMD 患者翼外肌损伤中具有很好的应用价值。

PO-0731

外中耳畸形伴咽鼓管全程扩大畸形的 CT 表现

刘俊华、张放、沙炎
复旦大学附属眼耳鼻喉科医院放射科

目的：研究外中耳畸形伴咽鼓管全程扩大畸形患者的 CT 特征。**材料与方法：**回顾性分析 19 例（20 耳）外中耳畸形伴咽鼓管全程扩张畸形患者的临床、CT 资料，与 50 例外中耳畸形、咽鼓管无扩大患者对比；测量扩大咽鼓管骨性段横径、长度、咽鼓管总长度、软骨段与骨性段夹角、软骨段与水平面夹角，并与正常耳对比。**结果：**①根据扩张咽鼓管与鼓室关系分为相通组、不通组，二组均显示男性好发、左侧好发，半面短小畸形发生率高。②CT 表现为咽鼓管呈长管状含气管腔，11 耳（55%，相通组 4 耳，不通组 7 耳）咽鼓管在颅底区分叉，上部骨管向前上延申至蝶骨体，下部向下延续为咽鼓管软骨段，沟通鼻咽腔，6 耳伴蝶骨体乳突样气房。③中耳畸形较对照组更严重，尤其不通组；相通组中耳炎发生率低于对照组，不通组 4 例曾患扩张咽鼓管炎症。④与正常耳对比，咽鼓管扩大畸形患者骨性段较长，而总长度较短，不通组尤甚；骨性段与软骨段角度缩小、软骨段与水平面角度增大。**结论：**外中耳畸形伴咽鼓管全程扩大畸形罕见，男性好发、左侧好发，患侧半

面短小畸形发生率高, 中耳畸形较普通外中耳畸形更严重, 尤其不通组。相通组中耳炎发生率明显低于普通外中耳畸形, 不通组可能伴扩张咽鼓管炎症, 体位引流可辅助治疗。

PO-0732

乙状窦源性耳鸣伴正常颅压患者的脑脊液改变

王锡文、陈澜月、马晓博、曲晓霞、周梦迪、刘兆会
首都医科大学附属北京同仁医院

目的: 探讨乙状窦源性耳鸣伴正常颅压患者的脑脊液流量、流速及体积的改变。**方法:** 入选 2019 年 10 月~2022 年 1 月就诊于首都医科大学附属北京同仁医院的乙状窦源性耳鸣伴正常颅压患者 25 例, 年龄、性别相匹配的正常健康志愿者 35 例。基于 Q-FLOW 序列分析两组在脑脊液流量、流速方面的差异。基于 sT1W_3D 序列分析两组在脑脊液体积方面的差异。**结果:** 乙状窦源性耳鸣伴正常颅压患者和正常健康志愿者相比, 平均速度、峰值速度明显减低 (P 分别是 0.039 和 0.003), 平均流量增高 ($P=0.000$)。两组的返流分数和脑脊液体积均无显著性差异。**结论:** 乙状窦源性耳鸣伴正常颅压患者和正常健康志愿者在脑脊液流量、流速方面存在差异, 具体表现为乙状窦源性耳鸣患者平均速度、峰值速度明显减低, 脑脊液体积无显著性差异。

基于快速自旋回波 TSE-DWI 序列对急性大脑后循环缺血性脑卒中的诊断价值研究

屈欣然¹、史振杰²

1. 唐都医院

2. 西安市人民医院 (西安市第四医院)

目的: 分别对临床拟诊为急性大脑后循环缺血性脑卒中患者进行单次激发平面回波 (single short echo planar imaging, ss-EPI) DWI 序列和快速自旋回波 (turbo spin echo, TSE) DWI 序列扫描, 比较两种序列的图像质量、诊断准确性和对病变区域脑组织的表观弥散系数 (apparent diffusion coefficient, ADC) 测量的影响。**方法:** 选取 42 例符合中国中华医学会制定的缺血性脑卒中诊治指南标准的患者, 自发病 72 小时以来, 接受头部 MRI 平扫+MRA 扫描后, 行单次激发平面回波 (EPI-DWI) 序列, 由两位中级以上高年资诊断医师诊断结果为大脑后循环区域部分脑组织可疑弥散受限, 或未发现明显病灶但有相应受损神经定位与临床症状者, 进一步行快速自旋回波 (TSE-DWI) 序列扫描。对比两种序列的扫描图像质量, 分别测量比较可疑病变区域脑组织的 ADC 值, 并取得两组图像的有效检出率, 然后将所得的结果进行配对样本 Wilcoxon 符号秩检验, 分析比较二者之间 ADC 值的统计学差异。**结果:** 通过对比在随访中证实了的梗塞病例, 发现常规 EPI-DWI 组中, 部分患者由于颅底骨伪影严重, 图像磁敏感伪影较大、显示欠清, 从而增加了诊断难度和准确度, 其中准确诊断病灶 34 例, 常规 DWI 序列的有效检出率为 80.9%; 同理, TSE-DWI 组中准确诊断 39 例, 有效检出率为 92.8%, 明显大于 EPI-DWI 组。TSE-DWI 序列的梗塞区域脑实质 ADC 值 $[(0.423 \pm 0.043) \times 10^{-3} \text{mm}^2/\text{s}]$ 低于 EPI-DWI 序列 $[(0.595 \pm 0.051) \times 10^{-3} \text{mm}^2/\text{s}]$, 差异有统计学意义 ($P < 0.005$)。**结论:** TSE-DWI 序列较常规 DWI 序列可以科学有效地减少颅底骨伪影的影响, 提高图像清晰度, 增加诊断信心和准确率, 进而帮助临床医生坚定治疗方案的抉择。

PO-0734

腮腺黏液表皮样癌 MRI 表现

杨玉斌¹、郑颖彦²、余德君²、陈潭辉²

1. 永安市立医院

2. 福建医科大学附属第一医院

目的 分析腮腺黏液表皮样癌 (MEC) 的常规 MRI 和 DWI 表现。**方法** 回顾性分析 42 个经病理证实的腮腺 MEC 的术前 MRI 资料, 评估肿瘤的位置、形态、边界、大小、均质程度、信号特征、ADC 值、强化方式、包膜及与周边结构的关系。**结果** 41 例 MEC 患者中 40 例为单侧单发肿瘤, 1 例患者为单侧双发肿瘤, 21 个病灶位于腮腺浅叶, 21 个跨深浅叶。病灶最长径为 $2.5\text{cm} \pm 1.0\text{cm}$, 其中 28 个肿瘤形态不规则, 28 个边界不清, 3 个病灶存在包膜。病灶多表现为等 T1 长 T2 信号, 7 个病灶中 T2 明显高信号区出现分隔状、环状极低信号; ADC 值约 $1.05 \pm 0.17 \times 10^{-3} \text{mm}^2/\text{s}$; 增强后呈中度-明显强化。14 例病灶侵犯周围结构, 3 例发生淋巴结转移。**结论** 腮腺 MEC 的 MRI 表现具有一定的特征性, 有助于准确判断肿瘤的范围及侵犯的结构, 为临床手术方式的选择提供有用的信息。

PO-0735

基于规范建模方法研究梅杰综合征和面瘫患者脑区灰质体积差异

栾继昕¹、王银山²、高鹏²、杨鼻偲¹、左西年²、马国林¹

1. 中日友好医院放射诊断科

2. 北京师范大学认知神经科学与学习国家重点实验室

目的: 本研究旨在探究梅杰综合征 (MS)、面瘫 (FP) 和健康对照组 (HC) 之间不同脑区的灰质体积差异, 以揭示梅杰综合征和面瘫的神经机制。

方法: 本研究招募了来自中日友好医院神经外科的 53 名 FP 患者、31 名 MS 患者以及 102 名 HC。对于 MS 患者, 使用 Burke-Fahn-Marsden 肌张力障碍评定量表(运动部分)(BFMDRS-M)和眼睑痉挛残疾指数 (BSDI) 评估严重程度。对于 FP 患者, 使用多伦多面部分级系统量表 (TFGS) 评估面部功能。通过 3.0T 磁共振成像获取高分辨率结构图像, 并使用 mri_qc 工具包生成数据质量报告。皮质厚度分析使用 Freesurfer 6.0 处理结构图像, 计算 Desikan-Killiany 图谱的 34 个脑区体积。规范建模基于国际上数十个研究共同研发的脑图表 (Brainchart), 估计了来自中日友好医院的每个被试的差异百分位数。使用四种机器学习分类算法 (随机森林、支持向量机、极限梯度提升和最近邻) 对 FP-CN, MS-CN 和 FP-MS 进行分类建模。

结果: 本研究重新匹配了 FP、MS 和 HC, 使其在年龄和性别上保持一致: FP 组 (年龄: 43.6 岁) 和对应的 HC 组 (年龄: 41.2 岁), 以及 MS 组 (年龄: 58.3 岁) 和对应的 HC 组 (年龄: 52.1 岁)。在 FP 和 MS 患者比较中, 灰质体积在前扣带回尾部 ($P=0.032$)、前扣带回头部 ($P=0.002$) 和枕外侧 ($P=0.028$) 存在差异 (Bonferroni 校正)。在 FP 患者中, 前扣带回尾部与连带运动评分呈显著相关关系 ($r=-0.30$, $P=0.036$), 在 MS 患者, 前扣带回尾部与 BMDRS-嘴部分 ($r=-0.40$, $P=0.014$)、BMDRS-口下颌部分 ($r=-0.37$, $P=0.036$) 和 BMDRS 总分 ($r=-0.33$, $P=0.047$) 呈显著相关关系。规范建模研究发现, 低于 2.5% 的 MS 和 FP 患者中, 前扣带回尾部、颞上沟和枕外侧显示出异常。此外, 使用差异脑区特征进行机器学习分类, 结果表明 AUC 均达到了 0.8 以上。**结论:** 本研究揭示了面瘫、梅杰综合征和健康人之间的脑区体积差异, 前扣带回尾部被证明是重要的脑区。

PO-0736

基于能谱 CT 碘图的影像组学诊断甲状腺乳头状癌 颈部淋巴结转移的价值

金丹
苏州大学附属第二医院

目的：探讨基于能谱 CT 碘图的影像组学特征对甲状腺乳头状癌患者颈部转移性淋巴结的诊断价值。
方法：收集术前两周行颈部能谱 CT 检查的甲状腺乳头状癌患者，共纳入 117 枚转移性和 176 枚非转移性淋巴结，按照 3:1 的比例随机分为训练集和验证集。从静脉期碘图中提取并筛选淋巴结的影像组学特征。采用 Logistic 回归分别建立影像组学模型、CT 图像特征模型及联合模型，并绘制列线图将联合模型可视化。各模型的诊断效能、校准能力及临床实用性分别通过 ROC 曲线、校准曲线及决策曲线分析评估。结果：联合模型在训练集和验证集中均表现出最佳的诊断效能，其次是影像组学模型，且两者显著优于 CT 图像特征模型 ($P<0.05$)。所有模型均显示出良好的校准能力，决策曲线分析表明列线图的临床实用性优于其余两种模型。结论：能谱 CT 的影像组学特征在诊断甲状腺乳头状癌淋巴结转移方面表现出良好的性能，联合 CT 形态学特征后诊断效能进一步提高，可作为辅助临床决策的有用工具。

PO-0737

梅尼埃病患者前庭及耳蜗内淋巴积水程度 与临床分期之间的相关性研究

于金玉、侯博、巩武贤、巩若箴
山东第一医科大学附属省立医院

目的 探讨梅尼埃病患者前庭及耳蜗内淋巴积水程度与临床分期之间的相关性。
方法 选取 161 例梅尼埃病患者共 172 耳，对所有患者均行内耳钆造影 MRI 及纯音听阈检查，依据患耳纯音听阈检查结果进行临床分期，并将前庭及耳蜗内淋巴积水程度与临床分期进行相关性分析。
结果 本实验 161 例患者（共 172 耳）的前庭与耳蜗内淋巴积水部位所致听力损失程度之间存在显著差异；前庭与耳蜗不同积水程度与梅尼埃患者临床分期之间均存在正相关性 ($P<0.05$)。
结论 梅尼埃病患者前庭及耳蜗内淋巴积水部位和积水程度与患者临床分期之间存在相关性，依靠内耳磁共振钆造影检查评估的前庭及耳蜗内淋巴积水部位及积水程度变化可以为患者临床分期提供帮助。

PO-0738

小唾液腺癌在多形性腺瘤中的影像学表现

朱文静
上海交通大学医学院附属第九人民医院

目的：描述小唾液腺癌在多形性腺瘤中的 CT 和 MRI 影像学特征，并分析各种特征与病理分型的相关性。
方法：收集 43 例经手术病理证实的小唾液腺癌在多形性腺瘤中，其中 39 例术前行增强 CT 检查，1 例行平扫 CT 检查，4 例行增强 MRI 检查，2 例同时行增强 CT 和 MRI 检查。回顾性分析 CT 和 MRI 表现，并将其与病理分型相关联：非侵袭性癌（I 型，11 例）、微侵袭性癌（II 型，5 例）和侵袭性癌（III 型，27 例）。通过 t 检验计算 I/II 型和 III 型之间肿瘤最大径的差异。采用卡方检验分析 I/II 型和 III 型之间肿瘤形态、边界、内部结构、骨质侵犯和颈部淋巴结转移等情况与病理分型的相关性。
结果：43 例小唾液腺癌在多形性腺瘤中，18 例位于腭部，11 例位于颊部，5 例位于咽旁间隙，5 例位于上颌骨，2 例位于上颌窦，1 例位于舌根，1 例位于下颌骨。83.7%（36/43）的肿瘤边缘呈

分叶状；81.4% (35/43) 内部出现囊变或坏死，呈现不均匀强化；37.2% (16/43) 可见钙化灶；25.6% (11/43) 出现邻近骨质压迫性吸收。75% (12/16) 的 I/II 型肿瘤形态规则（圆形或卵圆形），77.8% (21/27) 的 III 型肿瘤形态不规则。93.8% (15/16) 的 I/II 型肿瘤边界清楚，66.7% (18/27) 的 III 型肿瘤边界模糊。59.3% (16/27) 的 III 型肿瘤出现溶骨性骨质吸收。通过 t 检验分析，I/II 型肿瘤平均最大径小于 III 型， $P < 0.05$ 。通过卡方检验显示肿瘤的形态、边界、溶骨性骨质吸收这三种影像特征与病理分型相关， $P \leq 0.001$ 。4 例 III 型肿瘤侵犯颅内。颈部淋巴结转移共 5 例（1 例 I 型，4 例 III 型）。肺转移 1 例（II 型）。

结论：大部分小唾液腺癌在多样性腺瘤中的 CT 和 MRI 表现以分叶状，不均匀强化为特征。I/II 型肿瘤多呈圆形或卵圆形、边界清楚；III 型肿瘤多数形态不规则、边界模糊且更易出现溶骨性骨质破坏；形态、边界和溶骨是区分 I/II 型和 III 型肿瘤的重要依据。肿瘤内钙化可视为癌在多样性腺瘤中的特异性征象。

PO-0739

抑郁症区域结构-功能连接耦合及其与基因表达谱的关联分析

初同朋¹、毛宁¹、宋西成¹、马恒¹、盖群¹、李庆贺¹、过雨亭¹、车凯莉¹、张海程¹、赵峰²、谢海柱¹

1. 烟台毓璜顶医院

2. 山东工商学院

背景：结构-功能连接 (Structural-Functional connectivity, SC-FC) 耦合最近已被用于描述抑郁症结构拓扑特性的功能动力学，然而，SC-FC 耦合在人脑内具有明确的层次结构。当前的研究忽略了 SC-FC 耦合的区域变异性和其背后的生物学机制，早期精准诊断仍然是临床工作中的难题。

材料与方法：采集 135 名健康对照和 163 名抑郁症患者 DTI 和 rs-fMRI。使用 Spearman 等级相关构造每个区域的网络间和网络内 SC-FC 耦合；提取差异区域 SC-FC 耦合作为特征，基于 SVM 构建机器学习预测模型；采用偏最小二乘法回归算法进行跨样本基因空间相关分析，并对相关基因进行功能富集分析。

结果：抑郁症患者表现出眶部额下回、补充运动区、枕中回、中央旁小叶、豆状壳核、豆状苍白球和颞上回的 SC-FC 耦合减弱，顶上回和顶下缘角回的 SC-FC 耦合增强。基于差异区域 SC-FC 耦合实现了较好的分类性能 (AUC=0.9)。发现 42 个过表达和 157 个低表达基因构成了抑郁症患者区域 SC-FC 耦合相关基因列表。GO 生物学过程包括 RNA 聚合酶 II 启动子转录的正、负调控，细胞内信号转导，蛋白磷酸化，凋亡过程。

结论：基于区域的 SC-FC 耦合可作为抑郁症早期诊断新的生物学标志物，神经影像学和转录组学之间存在一定的相关性，富集分析进一步解释了与抑郁症相关的生物学途径。

PO-0740

多灶性甲状腺乳头状癌高容量淋巴结转移临床风险因素研究

胡春锋¹、章彤¹、魏培英²、曹慧君¹、韩志江²

1. 浙江中医药大学第四临床医学院

2. 杭州市第一人民医院放射科

目的 探讨年龄、性别和桥本甲状腺炎 (Hashimoto's thyroiditis, HT) 对多灶性甲状腺乳头状癌 (multifocality Papillary thyroid carcinoma, m-PTC) 高容量淋巴结转移 (high-volume lymph node metastases, HVM) 的预测价值。方法 回顾性分析 566 例多灶性甲状腺微小乳头状癌 (multifocality Papillary thyroid microcarcinoma, m-PTMC; $d \leq 10\text{mm}$) 及 381 例 m-PTC ($d > 10\text{mm}$) 的临床病理资料, 通过单因素及多因素分析不同年龄、性别、HT、瘤体数目和大小下的 HVM 情况。结果 566 例 m-PTMC 和 381 例 m-PTC 中, 发生 HVM 的比例分别为 4.6% (26/566) 和 21.5% (82/381) ($\chi^2=64.588$, $P<0.05$)。单因素分析显示, m-PTMC 和 m-PTC 组中, 男性和女性发生 HVM 的比例分别为 15.3% (11/72) 和 3.0% (15/494) ($\chi^2=21.487$, $P<0.05$)、33.2% (35/106) 和 17.1% (47/275) ($\chi^2=11.492$, $P<0.05$)。HVM 阳性及阴性组的中位年龄分别为 41.0 岁和 47.5 岁 ($Z=-2.128$, $P<0.05$)、37.5 岁和 48.0 岁 ($Z=-4.987$, $P<0.05$)。瘤体最大径中位值分别为 7.0mm 和 6.0mm ($Z=-2.558$, $P<0.05$)、17.5mm 和 15.0mm ($Z=-2.871$, $P<0.05$)。最大径和年龄预测 m-PTMC 和 m-PTC 组 HVM 的阈值分别为 8.8mm 和 19.5mm、38.5 岁和 44.5 岁。多因素分析显示, 瘤体最大径较大、男性和年龄较轻均为 m-PTMC 和 m-PTC 发生 HVM 的独立风险因素, 优势比 (OR) 分别 3.027 和 2.378、5.398 和 1.909、3.889 和 3.136。结论 m-PTC 组发生 HVM 比例高于 m-PTMC 组; 最大径较大、男性和年龄较轻均是 m-PTMC 和 m-PTC 发生 HVM 的独立风险因素, 但最大径及年龄阈值存在一定差异。

PO-0741

高分辨率磁共振血管壁成像技术在诊断
头颈动脉夹层中的应用价值

尹安雨

深圳市龙华区人民医院

目的 分析高分辨率磁共振 (high-resolution magnetic resonance imaging, HR-MRI) 成像用于评价头颈动脉夹层的可重复性, 探讨高分辨率血管壁成像技术在诊断头颈动脉夹层中的应用价值。方法 回顾性分析 2019 年 7 月—2023 年 4 月间于龙华区人民医院就诊的确诊头颈动脉夹层病人 28 例, 使用飞利浦 Ingenia 3.0T 磁共振扫描仪和 16 通道头部线圈。检查包括常规头颅 MRI, 3D-时间飞跃法磁共振血管造影 (time of flight magnetic resonance angiography, 3D-TOF MRA) 及 HR-VWI, 扫描序列包括 T1WI、T2WI、FLAIR、弥散加权成像 (diffusion-weighted imaging, DWI) 和 3D-VISTA T1WI。由 2 名放射科医生对 CTA 和 HRMRI 影像进行双盲分析, 评价内容包括发病部位、有无内膜片、双腔征、壁内血肿、血肿累及范围、管腔有无狭窄或闭塞等。计算 CTA 和 HR-VWI 在血管节段水平诊断夹层的准确性。结果 28 例病人中共诊断 31 支血管存在夹层 (3 名病人为双侧), 其中累及颈内动脉 10 支、椎动脉 20 支、大脑中动脉 1 支。CTA 正确诊断 10 支血管存在夹层 (10/31, 敏感度 32.3%), 其中 3 个血管节段见双腔征。HRMRI 正确诊断 30 支血管存在夹层 (30/31, 敏感度 96.8%), 其中 21 支血管见壁内血肿, 16 支血管见双腔征, 12 支可见强化内膜瓣; 20 支见管腔狭窄或闭塞。观察者内与观察者间对斑块强化等级评价一致性高 ($Kappa > 0.75$)。结论 高分辨率血管壁成像评价头颈动脉夹层的可重复性好, 可显示头颈动脉夹层的管壁特征, 可作为动脉夹层诊断和随访的一线检查技术。

PO-0742

双期增强 CT 对甲状腺乳头状癌淋巴结转移的诊断价值： 强化值、比值和差值的对照研究

魏培英、韩志江、邵畅
杭州市第一人民医院

摘要：探讨淋巴结平扫和双期增强（动脉期和静脉期）CT 值、淋巴结双期增强 CT 值与肌肉和淋巴结平扫 CT 值的比值与差值、淋巴结动脉期 CT 值/静脉期 CT 值比值对甲状腺乳头状癌（Papillary Thyroid Carcinoma, PTC）淋巴结转移的诊断效能。

方法：回顾分析 84 例 143 枚 PTC 转移阳性与 132 例 172 枚转移阴性淋巴结的 CT 平扫、动脉期和静脉期影像资料，所有淋巴结均经手术病理证实。测量淋巴结和同侧胸锁乳突肌平扫、动脉期和静脉期 CT 值，计算淋巴结双期增强 CT 值与胸锁乳突肌 CT 值、淋巴结平扫 CT 值的比值与差值，以及淋巴结动脉期 CT 值/静脉期 CT 值比值，通过操作者执行曲线（ROC），寻找鉴别 PTC 淋巴结转移的最佳 CT 值阈值和相应的诊断效能。

结果：143 枚阳性淋巴结和 172 枚阴性淋巴结平扫 CT 值、动脉期 CT 值和静脉期 CT 值分别为 46.8 ± 8.9 和 42.6 ± 6.0 ($P < 0.001$)、 111.9 ± 33.3 和 66.1 ($56.8, 76.9$) ($P < 0.001$)、 99.07 ± 23.3 和 75.5 ± 14.0 ($P < 0.001$)，其中动脉期 CT 值对淋巴结转移具有最高的诊断效能，AUC、敏感度和特异度分别为 0.877、0.901 和 0.769。淋巴结动脉期 CT 值与胸锁乳突肌 CT 值、平扫淋巴结 CT 值的比值和差值对淋巴结转移诊断的 AUC、敏感度和特异度范围分别为 (0.838~0.88)、(0.907~0.959) 和 (0.692~0.755)，静脉期分别为 (0.719~0.817)、(0.773~0.860) 和 (0.50~0.568)，淋巴结动脉期 CT 值/静脉期 CT 值分别为 0.751、0.837 和 0.494。

结论：在双期增强 CT 对 PTC 颈部淋巴结转移的鉴别诊断中，动脉期具有更高的诊断效能，但鉴于特异度较低，需要结合临床和其他影像学征象综合判断。

PO-0743

两种体素内非相干运动弥散加权成像在鼻咽癌中的对比研究： 自旋回波技术和平面回波技术

刘园、钱李娟、李欣
华中科技大学同济医学院附属协和医院

目的：体素内非相干运动弥散加权（Intravoxel incoherent motion diffusion-weighted, IVIM）磁共振成像相关灌注参数在头颈部肿瘤的表征和预测中有极大潜力。以往鼻咽癌患者的 IVIM 成像选用平面回波技术 EPI，磁敏感伪影影响极大。本研究通过评估 IVIM 两种成像技术-自旋回波 TSE 和 EPI 在鼻咽癌区域的定性和定量指标，比较两者之间的优劣性。

方法：30 例鼻咽癌患者接受了治疗前分期 MRI 检查（16 通道头颈部线圈，Ingenia 3.0T），序列包含 TSE-IVIM 和 EPI-IVIM。对 IVIM 图像四个解剖结构进行主观和客观的评估，包括鼻咽病变区域、鼻甲、第三颈段脊髓和颞极。主观评价指标（磁敏感伪影、几何畸变、病变显著性和整体图像质量的五点量表）施行相关样本的 Wilcoxon 符号秩检验。定量指标，包括 SNR、CNR、ADC 和 IVIM 衍生参数 (D , f , D^*) 施行配对 t 检验。Bland-Altman 和变异系数 (CV) 用于分析 ADC 和 IVIM 衍生参数之间的可重复性和稳定性。

结果：TSE-IVIM 在鼻咽病变区域、鼻甲和颞极的主观评价指标上明显优于 EPI-IVIM (p 值均小于 0.001)，而在脊髓方面无显著差异。TSE-IVIM 脊髓和颞极的客观评价指标 (SNR 和 CNR) 显著低于 EPI-IVIM，而在鼻咽病变区域和鼻甲无显著性差异。TSE-IVIM 的 f 值在鼻咽病变中显著低于 EPI-IVIM，脊髓 TSE-IVIM 的 ADC 和 D^* 值显著高于 EPI-IVIM。Bland-Altman 分析显示两成像技术

在鼻咽病变区域和鼻甲的一致性 (LoAs) 范围很广。EPI-IVIM 的 ADC 及 IVIM 相关参数 CV 值较大, 值变化范围较 TSE-IVIM 大。

结论: TSE-IVIM 在鼻咽病变区域和鼻甲区表现出更好的图像质量和更稳定的定量参数, 在图像主观评分和信噪比不显著降低的情况下, 可见的磁敏伪影和图像畸形显著减少。由于在鼻咽区域两个序列之间的 f 值和 CV 不同, 并存在较宽 LOAs, 我们建议在鼻咽病变患者的 IVIM 评估中使用 TSE 技术。

PO-0744

颈部血管超声与高分辨率磁共振成像评估 单侧颅外段椎动脉夹层的一致性研究

颜燕红、惠晶晶、陆紫微、张白、丁亚芳、王润川、胡春洪、方琪
苏州大学附属第一医院

目的 探讨颈部血管超声 (CDU) 与高分辨率磁共振成像 (HRMRI) 评估单侧颅外段椎动脉夹层 (VAD) 的一致性。

方法 1. 回顾性连续纳入 2017 年 1 月至 2023 年 3 月在苏州大学附属第一医院卒中中心就诊, 因突发颈部或后枕部疼痛、有颈部外伤或按摩史、头痛伴随出现神经功能障碍等临床疑似颈部动脉夹层的患者 493 例, 入院经一站式计算机断层扫描 (CT) 排除 33 例, CDU 及 DSA 排除 328 例, 最终纳入临床高度怀疑为单侧 VAD 的患者 132 例, 同期行 CDU 与三维 HRMRI 检查 (间隔 ≤ 48 h), 并以三维 HRMRI 检查结果作为参考标准, 采用 Kappa 一致性检验分析 CDU 评估单侧颅外段 VAD 的敏感度、特异度及准确性。2. 通过 CDU 与 HRMRI 分别观察并记录颅外段 VAD 夹层病变部位及影像征象等, 采用北美症状性颈动脉内膜切除试验 (NASCET) 方法计算血管狭窄程度, 并将二者检查结果进行 Kappa 一致性分析。

结果

1. 一致性分析: 132 例患者中, 124 例经 HRMRI 确诊为单侧颅外段 VAD 者, 中位年龄为 38 (33, 48) 岁, 其中男性 57 例 (46.0%)。CDU 评估单侧颅外段 VAD 的阳性率为 93.2% (123/132), HRMRI 的阳性率为 93.9% (124/132), 二者一致性很强, Kappa 为 0.87 ($P < 0.001$); 以 HRMRI 为参考标准, CDU 检查颅外段 VAD 的敏感度为 99.2%, 特异度为 87.5%, 准确率为 86.7%。2. CDU 与 HRMRI 影像征象: VAD 最常见的发病部位为椎动脉的椎间段; 两者评估双腔征、腔内血栓、夹层动脉瘤、管腔不规则、病变部位及血管狭窄程度均一致性很强, Kappa 值分别 1.00、0.80、0.85、0.88、0.94、0.89 (均 $P < 0.001$); 两者评估壁内血肿一致性较强, Kappa 值为 0.79 ($P < 0.001$), 且 HRMRI 观察强化壁内血肿为 17.7%; 两者评估内膜撕裂征一致性中等, Kappa 值为 0.58 ($P < 0.001$)。

结论

CDU 能够有效地评估颅外段 VAD 的不同影像征象, 为早期诊治及定期随访提供可靠的影像学依据。

PO-0745

磁共振纹理分析在头颈部良恶性肿瘤中的鉴别诊断价值

王雪、陈志晔
中国人民解放军总医院海南医院放射科

目的 评估磁共振纹理特征分析在头颈部良恶性肿瘤鉴别诊断中的价值。方法 纳入解放军总医院海南医院 30 例头颈部良性肿瘤及 30 例头颈部恶性肿瘤患者, 对术前磁共振 T2WI 图像进行灰度共生矩阵纹理分析 (纹理参数包括角二阶矩、对比度自相关、逆差距及熵), 选取病变实性部位采用感

兴趣法进行测量。统计方法采用独立样本 t 检验、Mann-Whitney U 检验、二元 Logistic regression 分析及受试者工作特征曲线 (receiver operating characteristic curve, ROC) 分析。结果 恶性组对比度 (18.839 ± 12.291) 显著低于良性 (40.007 ± 32.238) ($T = 3.36$, $P = 0.002$), 而恶性组自相关及逆差距 [$0.017(0.006, 0.091)$] 及 0.292 ± 0.101 显著高于良性组 [$0.008(0.001, 0.132)$] 及 0.222 ± 0.096] ($Z = 2.706$, $P = 0.007$; $T = 2.752$, $P = 0.008$)。两组之间角二阶矩及熵无显著差异 ($Z = 1.587$, $P = 0.113$ 及 $T = 1.376$, $P = 0.176$)。对比度、自相关及逆差距的 ROC 曲线下面积分别为 0.722、0.703 及 0.711, 其二元 Logistic regression 方程为 $Y = -0.05076 * \text{Contrast} + 31.3318 * \text{Correlation} + 5.4226 * \text{IDM} + 0.5444$ (截断值为 0.5), 判断为良性肿瘤的正确率为 50.00%, 判断为良性肿瘤的正确率为 73.33%, 总正确率为 61.67%, 其阳性预测值的 ROC 曲线下面积为 0.758。结论 磁共振 T2WI 纹理特征参数对比度、自相关及逆差距可以用来鉴别头颈部良恶性肿瘤。

PO-0746

血管超声及高分辨率磁共振成像评估颈动脉粥样硬化斑块易损性的可行性研究

张莲莲¹、惠晶晶²、颜燕红²

1. 盐城市第一人民医院

2. 苏州大学附属第一医院

目的 探讨颈部血管超声 (CDU) 与高分辨率磁共振成像 (HRMRI) 评估颈动脉粥样硬化斑块 (AP) 性质的可行性。方法 回顾性连续纳入 2017 年 8 月至 2020 年 12 月于苏州大学附属第一医院卒中中心因急性缺血性卒中或短暂性脑缺血发作等就诊患者 85 例, 运用 CDU 及 HRMRI 评估颈部血管狭窄与否、狭窄程度及责任血管的粥样斑块性质。CDU 根据 AP 形态、回声、纤维帽完整与否、有无溃疡等评估斑块性质。HRMRI 参照 AHA 修正后动脉粥样硬化斑块 MRI 分型标准评估斑块性质。以 HRMRI 评估结果作为无创“金标准”, 将患者分稳定斑块组和易损斑块组。采用卡方检验、t 检验和 Mann-Whitney U 检验分别分析两组患者的临床及影像学资料。绘制 CDU 评估 AP 易损性的受试者工作特征 (ROC) 曲线, 得出曲线下面积、敏感度、特异度、约登指数。并用 Cohen's Kappa 值计算 CDU 和 HRMRI 评估 AP 易损性的一致性。结果 1、CDU 评估易损斑块占 54.1% (46/85), 根据 ROC 曲线得出 CDU 评估颈动脉易损斑块的 AUC 值为 0.921, 敏感度为 89.8%, 特异度为 94.4%, 约登指数为 0.842。2、计算 Cohen's Kappa 值得出 CDU 与 HRMRI 评估 AP 性质的一致性最强 (Kappa 值=0.833, $p < 0.05$) 3、CDU 与 HRMRI 评估颈动脉易损斑块有关特征: 脂质坏死核/斑块内出血、钙化、溃疡型斑块、血栓形成、纤维帽状态 (不完整/破裂/薄) Kappa 值分别为 0.905、0.875、0.839、0.822、0.719。结论 CDU 及 HRMRI 均为评估 AP 易损性的有效方法, 必要时可联合运用, 能够更加准确为治疗方案的选择提供更充分的依据。

PO-0747

基于碘图的光谱 CT 多模态参数成像在甲状腺乳头状癌中的诊断价值

刘静菀、樊文萍

中国人民解放军总医院海南医院

目的 评估光谱 CT 定量增强成像在甲状腺乳头状癌 (papillary thyroid carcinoma, PTC) 中的诊断价值。方法 回顾性分析 59 例行颈部光谱 CT 增强的患者能谱基数据 (spectrum base image, SBI), 采用 Multiphase 软件生成动脉增强分数 (arterial enhancement fraction, AEF) 图和细胞外容积 (extracellular volume fraction, ECV) 图, 并测量病灶和正常甲状腺组织的 AEF 及 ECV

值。统计学采用曼-惠特尼 U 检验 (Mann-Whitney U test) 进行组间比较, 采用受试者工作特征 (receiver operating characteristic, ROC) 曲线对 AEF 及 ECV 的诊断效能进行评估, 并对曲线下面积 (area under the curve, AUC) 进行 Z 检验。结果 甲状腺乳头状癌病变的 AEF[42.30(15.40,100.00)] 及 ECV 值 (37.52±9.50) 显著低于正常甲状腺组织的 AEF[51.30(21,100.00)]及 ECV 值[52.80(33.60,84.50)] (UAEF = 1311.00, PAEF = 0.02; UECV = 394.50, PECV < 0.0001)。AEF、ECV 及 AEF 联合 ECV 诊断 PTC 的 AUC 分别为 0.623、0.887 及 0.907, 约登指数分别为 0.271、0.661 及 0.678。AEF 及 ECV 联合诊断 PTC 的模型为 $Y = -0.033 \times \text{AEF} - 0.185 \times \text{ECV} + 10.084$ ($Y > 0.697$ 诊断 PTC)。结论: 光谱 CT 定量参数 AEF 联合 ECV 对 PTC 的诊断具有较高价值, 可以作为诊断 PTC 的影像学标志物。

PO-0748

增强 CT 和 MRI 在鉴别鼻腔鼻窦鳞状细胞癌与淋巴瘤的应用探究

陈海静、杨亚英、赵卫、胡继红、何波、李青青
昆明医科大学第一附属医院

目的 探讨鼻腔鼻窦鳞状细胞癌 (SCC) 和淋巴瘤 (NHL) 在增强 CT 和 MRI 的影像特征, 分析不同影像特征在鼻腔鼻窦 SCC 与 NHL 中的鉴别效能。方法 回顾性分析 2016 年 9 月至 2023 年 6 月在昆明医科大学第一附属医院行鼻窦增强 CT 和 (或) 鼻窦增强 MRI 检查并经手术及病理检查证实的 35 例 SCC 与 36 例 NHL 患者影像学及临床资料, 观察分析肿瘤起源部位、肿瘤最大直径、CT 密度、MRI 信号强度、增强强化程度、肿瘤内部坏死、临近骨质破坏、对周围组织的侵犯、扫描范围内是否有颈部淋巴结转移等影像表现特征, 采用受试者操作特征 (ROC) 曲线及曲线下面积 (AUC) 分析不同影像学特征在鼻腔鼻窦 SCC 和 NHL 的鉴别诊断效能。结果 鼻腔鼻窦 SCC 与 NHL 的肿瘤起源部位、CT 及 MRI 强化方式、肿瘤内部坏死、周围骨质破坏以及颈部淋巴结转移 5 个影像学特征组间差异具有统计学意义 ($P < 0.05$), AUC 分别为 0.681、0.629、0.570、0.903、0.885、0.600; 肿瘤内部坏死、周围骨质破坏的 AUC 较大 (AUC 均 > 0.7), 鉴别诊断效能较高。将肿瘤内部坏死、周围骨质破坏两者联合, 联合影像表现的 AUC 为 0.948, 具有较高的鉴别诊断准确度, 鉴别鼻腔鼻窦 SCC 和 NHL 的敏感度和特异度分别为 88.2%、92.3%。结论 肿瘤起源部位、CT 及 MRI 强化方式、肿瘤内部坏死、骨质破坏以及颈部淋巴结转移有助于鼻腔鼻窦 SCC 与 NHL 的鉴别, 尤其是出现肿瘤内部多发坏死、周围骨质吸收破坏时, 应优先考虑鼻腔鼻窦 SCC 的可能。增强 CT 和 MRI 有助于鼻腔鼻窦 SCC 与 NHL 的鉴别, 联合使用有助于提高鉴别诊断效能。

PO-0749

IVIM-DKI 定量参数诊断口腔癌颈部淋巴结转移可行性的初步研究

谢城锋、袁瑛、李思毅、陶晓峰
上海交通大学医学院附属第九人民医院

【摘要】目的 探讨体素内不相干运动-扩散峰度成像 (intravoxel incoherent motion-diffusion kurtosis imaging, IVIM-DKI) 定量参数诊断口腔癌 (oral cavity cancer, OCC) 颈部淋巴结转移的可行性和价值。方法 本研究回顾性收集 2023 年 2 月至 2023 年 8 月期间临床、磁共振成像 (magnetic resonance imaging, MRI) 资料完整且术后经病理证实的 29 例口腔癌患者, 共计纳入转移淋巴结 15 枚, 非转移淋巴结 31 枚。测量和记录相应淋巴结的 IVIM-DKI 定量参数, 包括真扩散系数 D、伪扩散系数 D*、灌注分数 f、平均扩散率 MD、平均扩散峰度 MK。采用 Mann-Whitney U 检验比较口腔癌颈部淋巴结转移组与非转移组间定量参数的差异, 通过受试者工作特征

(receiver operating characteristic, ROC) 曲线评价 IVIM-DKI 各参数鉴别转移淋巴结和非转移淋巴结的诊断效能, 通过逐步逻辑回归筛选出独立预测因子。结果 转移淋巴结组与非转移淋巴结组 D 值、f 值、MD 值具有统计学差异 ($P < 0.05$), 转移淋巴结组与非转移淋巴结组 D*值、MK 值无统计学差异。D 值、f 值、MD 值在 ROC 曲线中曲线下面积 (area under the curve) AUC 分别为 0.754、0.824、0.714, 分别以 $0.88 \times 10^{-3} \text{mm}^2/\text{s}$ 、27.77%、 $1.52 \times 10^{-3} \text{mm}^2/\text{s}$ 为阈值, 诊断淋巴结转移的敏感度分别为 66.67%、86.67%、40.00%, 特异度分别为 77.42%, 70.97%, 93.55%。结论 IVIM-DKI 定量参数 D 值、f 值、MD 值对颈部淋巴结转移具有良好的诊断效能, 其中 f 值是鉴别转移和非转移淋巴结的独立预测因子。

PO-0750

基于 CTA 影像组学的机器学习模型评估 出血性颈动脉斑块的研究

薛晨、杨欢、王翠艳
山东第一医科大学附属省立医院

目的: 出血性颈动脉斑块/斑块内出血 (IPH) 与缺血性脑卒中的发生关系最为密切, 是症状性颈动脉狭窄患者脑卒中发生及复发的独立危险因素。本研究的目的是以组织学为金标准, 比较基于 CTA 影像组学的机器学习方法与高分辨 MRI 成像在识别出血性颈动脉斑块中的能力。

方法: 本研究从 2021 年 9 月至 2023 年 6 月, 收集接受颈动脉 CTA 检查并计划进行颈动脉内膜切除术的患者 (患者术前均进行 CTA 及 HR-MRI 检查), 大部分患者患有短暂性脑缺血发作 (TIA) 或缺血性卒中; 术后得到病理切片, 切片用石蜡包埋, 并获取其免疫组化标本, 得到其组织学横断面; 根据组织学特点将切片分为出血性和非出血性两种。通过观察斑块的整体形态特征, 并结合已知位置和距离, 匹配所有颈动脉 CTA 横断面。进行影像组学分析, 建模; 比较组学与常规方法对斑块内出血的预测。

结果: 本实验共纳入了 77 名患者, 共分析了 109 个横断面。患者的中位年龄为 63.5 岁, 男性患者有 49 名, 占比 65%。有 50% 的患者有脑血管相关临床症状, 其中卒中占比 33%, 短暂性脑缺血发作占比 17%。本研究使用 mRMR 和 LASSO 两种特征选择方法来选择特征。首先进行 mRMR 去除冗余和不相关特征, 保留 30 个特征。然后进行 LASSO, 进而达到特征选择的目的, 选择优化后的特征子集构建最终模型。在特征数量确定后, 选择最具预测性的特征子集, 并计算相应的系数, 本研究共保留了 30 个特征参数。Radscore 是通过对所选特征的系数加权求和来计算的, 并将实验组及对照组的得分在训练集和验证集上进行比较, 说明机器学习模型在识别 IPH 和非 IPH 组别中是有差异的。训练集及验证集的 AUC 值分别为 0.86 和 0.80, 表明颈动脉 CTA 图像影像组学参数的机器学习分析能够有效识别颈动脉出血性斑块。

结论: 本研究构建基于颈动脉 CTA 影像组学的机器学习模型, 有助于提高卒中预测和识别靶向治疗的高危人群。

PO-0751

T2WI 信号值与最小表观弥散系数 (ADC) 对腮腺良恶性肿瘤的鉴别诊断价值

黄钰纯、张玉忠、颀林宁
深圳市龙华区人民医院

目的 评估 T2WI 信号及最小表观弥散系数 (ADC) 对腮腺肿瘤性病变的鉴别价值。

方法 回顾性分析 2018 年 8 月-2023 年 4 月手术病理证实的腮腺肿瘤性病变 82 例（多形性腺瘤 52 例，腺淋巴瘤 17 例，恶性肿瘤性病变 11 例）影像资料，以同层面腮腺、皮下脂肪及脊髓为基准，测量每例最大病灶与腮腺、脊髓及皮下脂肪的 T2WI 信号比值（SIRp,SIRc,SIRf），测量病灶最小 ADC，比较多形性腺瘤、腺淋巴瘤及恶性肿瘤组间 SIRp,SIRc,SIRf 及最小 ADC 的区别，通过 ROC 曲线比较各参数鉴别诊断效能。

结果 纳入 82 例患者，男 46 例，女 36 例，平均年龄（40.1±12.1）岁，其中多形性腺瘤 52 例，腺淋巴瘤 17 例，恶性肿瘤性病变 11 例（黏液表皮样癌 7 例，转移性鳞状细胞癌 2 例，腺样囊性癌 1 例，基底细胞癌 1 例）。腺淋巴瘤组男性患者显著多于女性患者（ $P<0.001$ ），腺淋巴瘤组年龄显著大于多形性腺瘤组及恶性肿瘤性病变组（ $P<0.001$ ， $P=0.014$ ）。多形性腺瘤组 SIRp,SIRc,SIRf 及 ADC 均显著高于腺淋巴瘤组及恶性肿瘤性病变组（ $P<0.001$ ， $P<0.001$ ），腺淋巴瘤组 SIRf 低于恶性肿瘤性病变组（ $P<0.05$ ）。SIRp,SIRc,SIRf 及 ADC 鉴别诊断多形性腺瘤与腺淋巴瘤 AUC 分别为 0.876、0.887、0.946、0.969；SIRp,SIRc,SIRf 及 ADC 鉴别诊断多形性腺瘤与恶性肿瘤 AUC 分别为 0.886、0.828、0.796、0.926；SIRp,SIRc,SIRf 及 ADC 鉴别诊断腺淋巴瘤与恶性肿瘤 AUC 分别为 0.532、0.655、0.799、0.650。

结论

SIRp,SIRc,SIRf 及 ADC 对多形性腺瘤与腺淋巴瘤、多形性腺瘤与恶性肿瘤性病变均具有较好的鉴别诊断效能，SIRf 有助于腺淋巴瘤与恶性肿瘤性病变的鉴别诊断。

PO-0752

原发性帕金森症患者视频透视吞咽造影检查与进食评估问卷调查工具评分—10（EAT-10）相关性探究

王彦玲

中国医学科学院北京协和医院

目的：视频透视吞咽造影检查（VFSS）在原发性帕金森症患者中误吸程度评分、吞咽困难评分与临床进食评估问卷调查工具评分—10（EAT-10）的相关性探究。

方法：回顾性分析我院 2019 年 4 月-2022 年 6 月临床诊断为 PD，共纳入 44 例，男 29 例，女 15 例，平均年龄（65.64±14.89）岁。所有患者均完成（VFSS）并 EAT-10 评估，比较吞咽困难及误吸程度评分与 EAT-10 各项评分及总分 Pearson 相关系数及显著性，以 $P<0.05$ 具有统计学差异。

结果：44 名患者 VFSS 误吸评分、吞咽困难评分分别为（1.14±1.34）、（1.41±0.54），误吸评分、吞咽困难评分间高度相关（Pearson=0.839， $P<0.001$ ）。VFSS 误吸评分与 EAT-10 中因吞咽问题使体重减轻、影响就餐、吞咽药片费力、吞咽时感到紧张、该 4 项总分、EAT-10 总分具有显著正相关，Pearson 相关系数及显著性分别为（0.409,0.006）、（0.367,0.014）、（0.320,0.034）、（0.309,0.041）、（0.395,0.008）（0.326,0.031）；VFSS 误吸评分与 EAT-10 中其他项吞咽液体费力、吞咽固体费力、吞咽有疼痛、影响进食时快感、吞咽时有异物感、吃东西会咳嗽无显著相关性。吞咽困难评分与 EAT-10 中因吞咽问题使体重减轻、吞咽时感到紧张、该 2 项总分、EAT-10 总分具有显著正相关性，Pearson 相关系数及显著性分别为（0.389,0.009）、（0.312,0.040）、（0.395,0.008）、（0.302,0.047），与 EAT-10 总分其他项不具有显著相关性。

结论：VFSS 误吸评分与 PD 患者的体重减轻、影响就餐、吞咽药片费力、吞咽时感到紧张、4 项总分相关性较高，是评估误吸程度的重要指标。吞咽困难评分与体重减轻、吞咽时感到紧张、该 2 项总分相关性较高，是评估 PD 患者吞咽困难的有效指标。综上所述，VFSS 检查中误吸评分、吞咽困难评分可较好反应 PD 患者的吞咽障碍问题，可发现 EAT-10 评分未发现的渗漏、误吸，二者结合检查对临床具有重要意义。

PO-0753

低血糖脑病的 MRI 影像学表现

柳佳、汪晶

华中科技大学同济医学院附属协和医院

目的：探讨低血糖脑病的 MRI 影像学表现及相关诊断价值。

方法：收集华中科技大学同济医学院附属协和医院 2023 年收治的 1 例 30 岁经临床诊疗证实为低血糖脑病的女性患者的临床资料进行回顾性分析，其临床主要表现为突发昏迷，意识不清 6 天，患者有 1 型糖尿病病史，发病时测血糖为 2.5mmol/L，患者进行了血液、尿液的常规检查，并进行性了自身免疫性抗体检测，同时行 MRI 平扫+增强、MRA、MRV、DWI 及 MRS 扫描。分析其 MRI 影像学表现及相关诊断价值。

结果：患者 MRI 检查发现右侧半卵圆中心-放射冠、双侧海马及胼胝体压部条片状长 T1、高 T2-Flair 信号影，DWI 示病灶弥散受限表现，增强扫描未见明显强化，MRA 及 MRV 未见明显异常，MRS 将感兴趣区置于双侧海马区，海马区 NAA 峰减低，Cho 峰稍高。经治疗后患者症状好转出院。

结论：低血糖的临床表现没有特异性，可从行为改变、乏力、精神错乱到癫痫和意识丧失，即功能性大脑衰竭。其影像学表现提示低血糖脑病常常累及大脑皮质、基底节区、海马、胼胝体和双侧内囊等区域。T2 及 Flair 序列主要表现为病变区的高信号，这可能与脑部水肿和炎症有关；DWI 序列可能显示出病变区的高信号，这可能是由于低血糖引起的脑细胞水肿和炎症反应导致的；部分患者 MRI 增强可强化，这可能是由于低血糖引起的脑血管紊乱导致的。主要鉴别诊断包括缺血缺氧性脑病、克雅氏病、中暑、其他毒物代谢引起的病变如肝性脑病。需要注意的是，MRI 特征并非低血糖脑病的特异性表现，因为其他脑部疾病也可能表现相似的影像学特征。确诊低血糖脑病还需要结合临床症状、血糖水平和其他实验室检查结果进行综合评估。

PO-0754

T1 mapping 和 RESOLVE-DWI 鉴别诊断腮腺肿瘤的价值

文宝红、程敬亮、张勇、张赞霞

郑州大学第一附属医院

目的 比较 MR 纵向弛豫时间成像 (T1 mapping) 及扩散加权成像 (DWI) 在腮腺良恶性肿瘤鉴别诊断中的价值。方法 回顾性分析 116 例治疗前接受常规 MRI、DWI 和 T1 mapping 检查并经病理证实的腮腺肿瘤患者，其中 81 例为良性肿瘤 (53 例多形性腺瘤、16 例腺淋巴瘤、12 例其它肿瘤)，35 例为恶性肿瘤，分别于增强前及注入对比剂 6 分钟后采集 T1 mapping 图像，测量肿瘤增强前 T1 值 (T1pre)、增强后 T1 值 (T1post) 及表观扩散系数 (ADC) 值，计算增强前后 T1 差异 ($\Delta T1$)、T1 值变化率，比较 $\Delta T1$ 、T1 值变化率及 ADC 值组间差异，并绘制受试者工作特征 (ROC) 曲线。结果 腮腺良性肿瘤的 $\Delta T1$ 、T1 值变化率及 ADC 值均高于恶性肿瘤，差异有统计学意义 (P 均 < 0.05)， $\Delta T1$ 、T1 值变化率及 ADC 值鉴别腮腺良、恶性肿瘤的 AUC 分别为 0.646、0.646 和 0.802。多形性腺瘤、腺淋巴瘤与恶性肿瘤两两比较显示 $\Delta T1$ 、T1 值变化率及 ADC 值差异均有统计学意义 (P 均 < 0.01)。 $\Delta T1$ 、T1 值变化率及 ADC 值鉴别多形性腺瘤与腺淋巴瘤的 AUC 分别为 0.940、0.912 和 0.981， $\Delta T1$ 、T1 值变化率及 ADC 值鉴别多形性腺瘤与恶性肿瘤的 AUC 分别为 0.765、0.761 和 0.892， $\Delta T1$ 、T1 值变化率及 ADC 值鉴别腺淋巴瘤与恶性肿瘤的 ROC 曲线下面积分别为 0.875、0.804 和 0.534，ADC 值鉴别诊断腺淋巴瘤与恶性肿瘤的效能低于 $\Delta T1$ ，差异有统计学意义 ($P < 0.01$)，其余组间差异无统计学意义。结论 T1 mapping 和 DWI 对鉴别诊断腮腺肿瘤均具有一定价值，在腺淋巴瘤和恶性肿瘤的鉴别上，T1 mapping 优于 DWI。

PO-0755

第三代双源 CT 能谱纯化技术在泪道造影中的应用

许卉、杨明

华中科技大学同济医学院附属协和医院

摘要：目的探讨第三代双源 CT 能谱纯化技术在泪道造影中的可行性。方法前瞻性选取 50 例行 CT 泪道造影扫描的患者，用随机数字表法分为低剂量组和能谱纯化组，每组 25 例，2 组的管电压和管电流分别为 100 kVp、80 mAs（低剂量组）和 Sn100 kVp、300 mAs（能谱纯化组）。测量 2 组患者图像的玻璃体、眶脂体和皮肤外空气 CT 值、噪声，记录设备显示的辐射剂量数值，并计算对比噪声比（CNR）和有效剂量品质因子（FOM）。组间各部位的 CT 值、噪声、CNR、FOM 和辐射剂量的差异用独立样本 t 检验进行比较，组间图像质量主观评分差异用非参数 Wilcoxon 符号秩和检验比较。结果组间图像质量主观评分、玻璃体噪声、空气 CT 值、空气噪声、玻璃体 - 空气 CNR 差异均无统计学意义（P 值均 > 0.05）。组间玻璃体 CT 值（29.47 HU ± 4.58 HU vs 23.81 HU ± 5.04 HU, P = 0.027）、眶脂体 CT 值（-107.00 HU ± 12.95 HU vs -97.05 HU ± 9.21 HU, P = 0.024）、眶脂体噪声（13.61 ± 3.30 vs 15.97 ± 2.78, P = 0.014）、玻璃体 - 眶脂体 CNR（10.01 ± 2.31 vs 8.51 ± 2.09, P = 0.015）、玻璃体 - 空气 FOM（19703.75 ± 6579.46 vs 43613.89 ± 18014.61, P < 0.01）、玻璃体 - 眶脂体 FOM（334.44 ± 157.37 vs 622.89 ± 321.20, P < 0.01）及辐射剂量的差异均有统计学意义。结论第三代双源 CT 能谱纯化技术在 CT 泪道造影可获得满意的图像质量，同时大幅降低了辐射剂量。

PO-0756

T2 mapping 及分段读出 DWI 鉴别诊断腮腺肿瘤的价值

文宝红、程敬亮、张勇、张赞霞、刘姿均

郑州大学第一附属医院

目的 探讨 T2 mapping 及分段读出 DWI（RESOLVE-DWI）在腮腺肿瘤鉴别诊断中的价值。**方法** 回顾性分析 2018 年 6 月至 2021 年 7 月经病理证实的 166 例腮腺肿瘤患者治疗前的 T2 mapping 及 RESOLVE-DWI 资料，其中多形性腺瘤 76 例，Warthin 瘤 29 例，基底细胞腺瘤 11 例，恶性肿瘤 50 例。测量肿瘤的 T2 值、ADC 值并比较组间差异，运用受试者工作特征（ROC）曲线评价 T2 值、ADC 值及二者联合（T2+ADC）鉴别诊断腮腺肿瘤的价值，并计算相应的曲线下面积（AUC）。结果 多形性腺瘤、Warthin 瘤、基底细胞腺瘤与恶性肿瘤之间 T2 值、ADC 值差异有统计学意义（P 均 < 0.01），两两比较，Warthin 瘤与恶性肿瘤的 T2 值及基底细胞腺瘤与恶性肿瘤的 T2 值、ADC 值之间的差异无统计学意义（均 P > 0.05），其余各组间 T2 值、ADC 值差异均有统计学意义（均 P < 0.05）。T2 值、ADC 值、T2+ADC 鉴别腮腺多形性腺瘤与 Warthin 瘤、多形性腺瘤与基底细胞腺瘤、多形性腺瘤与恶性肿瘤、Warthin 瘤与基底细胞腺瘤、Warthin 瘤与恶性肿瘤的 AUC 分别为 0.893、0.999 和 0.999，0.691、0.728 和 0.725，0.839、0.867 和 0.885，0.865、0.966 和 0.959，0.631、0.695 和 0.693。ADC 值和 T2+ADC 鉴别多形性腺瘤与 Warthin 瘤的诊断效能显著高于 T2 值（均 P < 0.05），其余各组间差异均无统计学意义（均 P > 0.05）。结论 T2 mapping 可以定量鉴别诊断腮腺肿瘤，T2 值与 ADC 值的诊断效能基本相当。

PO-0757

单侧颅外段颈内动脉夹层患者卒中事件的预测因素:一项单中心探索性研究

徐心纯^{1,2}、张莲莲²、颜燕红²、丁亚芳²、惠晶晶²

1. 苏州大学附属张家港医院

2. 苏州大学附属第一医院

Objective:

This study aimed to compare the diagnostic value of carotid Doppler ultrasound (CDU) and high-resolution magnetic resonance imaging (HRMRI) and investigate the correlation between imaging features and stroke in EICAD.

Methods:

Patients with suspected EICAD were admitted. The imaging features of EICAD were reviewed and compared between CDU and HRMRI. Then patients were grouped into stroke and non-stroke groups. Multivariate regression models were used to determine the association between imaging features of EICAD with stroke.

Results:

A total of 153 patients were included. Excellent agreement was found between CDU and HRMRI. In multivariable logistic regression analysis, the presence of IMH and intraluminal thrombus on CDU had a significantly increased risk of stroke.

Conclusion:

CDU may be the preferred choice for patients with a high suspicion of EICAD.

PO-0758

S-MAR: 一种能有效评估动脉瘤介入术后载瘤动脉的血管情况的去金属伪影技术

郑晗沛、汪晶、杨明

华中科技大学同济医学院附属协和医院

目的:临床检查中, 动脉瘤介入术后的弹簧圈金属伪影对于载瘤动脉的血管评估存在很大的干扰。S-MAR 是一种结合了金属伪影去除(MAR)、光谱 CT 和减影算法的新技术手段, 用来消除金属伪影的影响, 并在既往的研究中证实具有良好的去金属伪影的视觉效果。本研究基于 DSA 的参照下, 从量化的角度评估 S-MAR 技术对于载瘤动脉血管的显示, 并比较其与 DSA 的一致性。

方法:回顾性分析 128 例颅内动脉瘤血管内栓塞治疗后行双层探测光谱 CT 的患者。术中发现线圈 143 例, 支架 25 例, 98 例动脉粥样硬化。重建常规 CT 图像(CI)、VMI(范围:40- 200 KeV)和虚拟非增强图像(VNC)。然后将这些图像使用 O-MAR 技术处理后得到 CI_{MAR}、VMI_{MAR}和 VNC_{MAR}图像, 由 VNC_{MAR} 和 VMI_{MAR} 之间的相减得到 S-MAR。由后处理站自动计算载瘤血管直径(VD)、狭窄率(RS)和评估残余动脉瘤内造影增强(RICE)。线圈伪影评分(CA 评分)作为定性图像分析, 由两名放射科医生分别确定。采用配对样本 t 检验分析 S-MAR 和 DSA 对于载瘤动脉管腔评估的差异。P 值 <0.001 表示有统计学意义。

结果: S-MAR 与原始图像、多能级图像及单纯使用 MAR 技术的图像相比, 表现出明显更好的去除金属的效果(基于 CA 评分的对比, P<0.001)。原始图像对于载瘤动脉的血管直径、血管狭窄率存在很大的误差, 影响判断是否存在残余动脉瘤的评估, S-MAR 在对于载瘤动脉的血管直径、血管狭窄率的评估方面与 DSA 的结果相比具有很高的一致性(k=0.89)。

结论: S-MAR 能够有效去除动脉瘤介入术后弹簧圈金属伪影的干扰, 并能有效评估血管情况, 与 DSA 具有很高的一致性。

PO-0759

人工耳蜗植入术前后影像学评价及其价值

马辉

华中科技大学同济医学院附属协和医院

目的

研究人工耳蜗植入术前影像学评估和术后电极影像学评价的方法及其临床应用价值。

材料与方法

搜集临床拟做人工耳蜗植入的患者 43 例, 表现为双侧不同程度感音神经性聋。所有患者术前行 MSCT 和 MRI 检查。对感兴趣耳做 MIP 重建。垂直于内耳道长轴做 MPR 重建, 得到听神经轴位图像。分析其影像表现, MSCT 着重分析中耳乳突、颈静脉球、乙状窦、面神经管和内耳结构, MRI 着重分析听神经。其中 23 例进行了人工耳蜗植入, 术后所有患者 7~10 天均行 MSCT 检查及 VRT 重建, 12 例患者术后同时做了 X 线平片检查, 采用经眶位和耳蜗位拍片。

结果

43 例术前患者中内耳形态正常 20 例, 内耳病变 23 例, 其中内耳畸形 20 例 (39 耳), 骨化性迷路炎 3 例 3 耳。20 例内耳正常者均做了人工耳蜗植入手术, 双侧颈静脉球高位选程度较轻的一侧耳手术, 单侧颈静脉球高位选对侧耳手术, 乙状窦前置选择对侧耳手术。23 例内耳病变患者中 3 例进行了人工耳蜗植入手术, 1 例为 IP-I 畸形, 2 例为单纯前庭导水管扩大。

术后 MSCT 横断面图像上电极表现为点状高密度影, VRT 图像清晰显示了电极与耳蜗之间精确的空间立体关系。术后 X 线平片上每对电极可分辨, 但不能显示电极与耳蜗的精确空间位置关系。7 例显示电极数目与手术记录一致, 5 例所示电极数目较手术记录少。

结论

人工耳蜗植入术前 MSCT 和 MRI 检查非常重要, MSCT 在显示中耳乳突、颈静脉球高位、乙状窦位置、面神经管位置、立体显示内耳方面优于 MRI, 而 MRI 在显示听神经正常与否有重要价值。二者结合, 可指导手术适应症和电极类型的选择、预测术中可能出现的困难和术后可能出现的并发症。MSCT 结合 VRT 清晰、直观、准确的显示电极在耳蜗内的形态和位置, 能准确显示大部分病例植入电极数目, 是人工耳蜗植入术后观察电极直观准确的方法。X 线平片费用少、放射剂量低, 仅能粗略估计电极在耳蜗内的位置。

PO-0760

个案报道: 鼻咽部错构瘤 1 例

刘蕊、王鹏

云南大学附属医院 (云南省第二人民医院、云南省眼科医院)

目的 探讨 1 例鼻咽部错构瘤的临床及 CT 影像特征, 以提高对本病的认识及诊断。

方法 回顾性分析 1 例经病理证实的鼻咽部错构瘤病人, 分析其临床表现, 病理基础及影像表现。

结果 患者以“咽部肿物”收入院; 患者于半年前体检时发现咽部有一肿物, 时有咽干、咽痒、咽部异物感, 无咽痛、发热, 无吞咽困难及进食呛咳, 无鼻部出血回缩涕中带血。入院查体: 电子鼻咽镜下见左侧鼻咽侧壁肿物。颈部 CT 平扫及增强扫描示: 口咽、喉咽左侧壁纵行圆柱状混杂密度灶, 病灶以脂肪密度为主, 其内可见条状软组织密度影, 大小约 1.1×0.9×8cm, 向上达左侧侧隐窝, 向下与延续至食道胸 1 椎体下缘水平, 增强扫描病灶中心软组织成分轻度强化, 病灶向口咽及鼻咽腔凸出, 与周围结构分界清楚; 全麻下行鼻内镜下左侧鼻咽部肿物切除术+后鼻孔成形术, 术中见: 咽部肿物来源于左侧鼻咽部咽鼓管咽口外侧壁, 向下延伸至口咽、喉咽, 达食道; 术后病理回报: 肿瘤由纤维、横纹肌、脂肪组成, 表被覆鳞状上皮, 考虑为错构瘤 (鼻咽部)。

结论 鼻咽部错构瘤为罕见良性增生性病变,临床多以体检发现,当病灶较大时可出现咽干、咽痒、咽部异物感等临床表现。**CT** 影像特征提示病灶为良性病变, **CT** 值多样, 含有脂肪、软组织等多种成分, 增强后其内软组织成分强化而脂肪不强化, 病灶密度及强化方式与病理组织成分密切相关。

PO-0761

双层 探测器 CT 在淋巴瘤患者中评估淋巴结的诊断价值

谭正武、汪晶

华中科技大学同济医学院附属协和医院

目的: 本研究旨在评估双层探测器 **CT** (DLCT) 在淋巴瘤患者中淋巴结 (LN) 阳性识别方面的诊断性能。

方法与材料: 回顾性纳入了 78 例经组织学证实的淋巴瘤患者, 获得 1165 个 LN, 这些患者在治疗前均接受了 DLCT 和 18F-FDG PET/CT 检查。根据 18F-FDG PET/CT 结果作为参考标准, 病例被分为 LN 阴性组和 LN 阳性组。然后按 7:3 的比例将 LN 随机分为训练组 (809 例) 和验证组 (356 例)。对分类变量或定量参数采用 Chi-square 检验、t 检验或 Mann-Whitney U 检验, 比较 LN 阴性组和 LN 阳性组患者的临床特征和定量参数, 包括能谱参数: 曲线斜率 (λ HU)、动脉期 (AP) 和静脉期 (VP) 图像上的碘浓度 (IC)。在训练组通过 10 倍交叉验证进行多变量逻辑回归分析, 建立最有效的预测模型。曲线下面积 (AUC) 用于评估预测模型的诊断价值, AUC 的差异通过 DeLong 检验分析。此外, 预测模型还在验证组中进行了验证。使用类内相关系数 (ICC) 对 LN 进行了重复性分析。

结果: 在训练组中, 与其他参数相比, 长径 (LD) 作为独立因素在区分 LN 阳性和 LN 阴性方面的 AUC 最高 ($p=0.006$ 至 $p<0.001$), 而 LD 和 λ HU-AP 共同作用的预测模型的 AUC 显著进一步升高 (AUC 为 0.816, $p<0.001$)。而验证组中预测模型的 AUC 为 0.786。所有参数的重复性都很好到非常好 ($ICC>0.75$)。

结论: DLCT 的形态学和功能参数的结合可能是检测淋巴瘤 LN 阳性的潜在成像生物标记物。

PO-0762

基于 CT 多期三维纹理分析在腮腺良恶性肿瘤鉴别诊断中的价值

肖丹¹、王丽君²

1. 中国人民解放军联勤保障部队第 967 医院

2. 大连医科大学附属第一医院

目的: 探讨 CT 多期图像三维纹理特征对腮腺良恶性肿瘤鉴别的应用价值。方法: 回顾性收集了 158 例腮腺肿瘤患者, 其中良性肿瘤 107 例, 恶性肿瘤 51 例。将病例按 7:3 的比例随机分为试验组和训练组。采用 uAI Research Portal V1.1 (Shanghai United Imaging Intelligence, Co., Ltd.) 纹理分析软件对 CT 多期图像上整个肿瘤的感兴趣区域 (ROI) 进行纹理分析, 并通过软件自带的组学特征提取方法, 结合最大最小归一化、L1 范数规范化预处理, 构建 AdaBoost、二次判别分析、K 近邻和随机森林模型。根据特征曲线 (ROC) 下面积 (AUC)、敏感度、特异性和准确率对病灶进行分析, 评价其疗效。结果: 鉴别腮腺肿瘤良恶性纹理特征组学分析;在 AdaBoost 模型中, 有意义的是 AUC, 动脉期、静脉期及平扫的 AUC (95% CI) 分别是 0.702, 0.608 和 0.659;在二次判别分析模型中, 有意义的是灵敏度, 动脉期、静脉期及平扫的灵敏度分别为 0.809, 0.756 和 0.665;在随机森林模型中, 有意义的是特异度, 动脉期、静脉期及平扫的特异性分别为 0.95, 0.95 和 0.927;在 K 近邻模型中, 有意义的是准确率, 动脉期、静脉期及平扫的准确率分别为 0.72, 0.715 和 0.712。综上所述, K 近邻模型的各项指标综合比较结果相对较好。结论: 基于 CT 多期三维纹理分析技术对腮腺良恶性肿瘤鉴别有一定价值, 且动脉期优于平扫期和静脉期。

PO-0763

CT 减影图像影像组学模型在鉴别腮腺多形性腺瘤和腺淋巴瘤的价值

陈鹏¹、郑屹峰¹、程鹏宇¹、刘奇峰²

1. 湖州市中心医院

2. 皖南医学院第一附属医院

目的：探讨基于 CT 图像灰度相减和放射组学特征相减构建影像组学模型鉴别腮腺多形性腺瘤（pleomorphic adenoma, PA）和腺淋巴瘤（adenolymphoma, AL）的价值。材料与方法：回顾性分析经组织学病理证实为 PA 和 AL 患者各 55 例，并使用完全随机方法按 7:3 比例分为训练组（76 例）和验证组（34 例）。将 CT 平扫和动脉期图像进行配准，达到解剖点匹配后使用基于 Python 的减影算法将平扫与动脉期图像进行灰度相减得到减影图像，手动勾画平扫、动脉期和减影图像三组图像的全瘤体并生成感兴趣区域（area of interest, ROI）从而提取三组放射组学特征，其中将减影图像所提取特征集命名为数据集 D1，将动脉期特征和平扫特征代数相减得到新的特征集命名为数据集 D2。使用 Z-Score 标准化分别对 D1 和 D2 进行统一量度，皮尔森相关系数进行数据降维、多因素方差分析和支持向量机进行特征筛选和构建影像组学模型。通过受试者工作特征曲线（receiver operating characteristic, ROC）的曲线下面积（area under the curve, AUC）和准确度（accuracy, ACC）评价模型效能。结果：分别从 D1 和 D2 数据集中筛选 14 个和 10 个放射组学特征用于影像组学模型构建，通过图像灰度相减所构建的模型 M1 的效能优于通过特征相减所构建的模型 M2，M1 训练组效能与 M2 相仿（AUC: 0.941 vs.0.925, ACC: 0.910 vs.0.895），但是验证组 M1 优于 M2（AUC: 0.938 vs.0.882, ACC: 0.912 vs.0.853），并且 M1 模型整体稳定性优于 M2。结论：基于 CT 减影图像构建影像组学模型鉴别 PA 和 AL 方面优于平扫和动脉期的特征相减，模型的稳定性也更加，通过减影可以突出特征差异性，从而更好的寻找肿瘤差异和异质性，能够为临床术前诊断和治疗方案选择提供一定参考价值。

PO-0764

基于不同感兴趣区勾画方法的 T2 mapping 眼外肌定量测量在 Graves 眼病分期中的应用价值

杨丽彬、戴晓敏、苏家威、杨晟升、郑永宏、马明平、俞顺

福建省立医院

目的：探讨基于不同感兴趣区勾画方法的 T2 mapping 眼外肌定量测量在 Graves 眼病(Graves' ophthalmopathy, GO)分期中的价值。

方法：连续纳入 56 例 GO 患者，根据患者的临床活动度评分分为活动性 GO 或非活动性 GO。采用两种不同感兴趣区勾画方法在冠状位 T2 mapping 上测量眼外肌的 T2 弛豫时间(T2 relaxation time, T2RT)，分别获得 T2RT-mean 和 T2RT-max 值。采用独立样本 t 检验、Spearman 相关分析、受试者工作特征(receiver operating characteristic, ROC)曲线分析、多重 ROC 比较和组内相关系数进行统计学分析。

结果：活动性 GO 的 T2RT - mean 和 T2RT - max 值均显著高于非活动性 GO ($P < 0.001$)。T2RT-mean 和 T2RT-max 值与临床活动度评分 ($r_s = 0.73, 0.69, P < 0.001$)呈正相关。ROC 结果显示分别以眼外肌 T2RT-mean 值 ≥ 83.40 ms, T2RT ≥ 111.85 ms 判断 GO 处于活动期的诊断效能最优（曲线下面积分别为 0.822、0.827，灵敏度分别为 92.2 %、67.2 %，特异度分别为 58.3 %、

83.3 %)。T2RT-mean 与 T2RT-max 的曲线下面积差异无统计学意义($P = 0.751$)。测量 T2RT-mean 和 T2RT-max 值的观察者间一致性分别为优秀和良好, 组内相关系数分别为 0.954 和 0.882。结论: 眼外肌的 T2RT-mean 和 T2RT-max 值可用于 GO 的活动性评估。从观察者间一致性及诊断性能两者综合考虑, T2RT-mean 值在 GO 分期中具有较高的应用价值。

PO-0765

Multi-vane 技术用于腮腺肿瘤弥散加权成像的图像质量评价

徐振潭、苏童、陈钰、金征宇、王沅
中国医学科学院北京协和医院

目的评价 Multi-vane 技术和 Splice 技术在腮腺磁共振弥散加权成像的图像质量

方法收集 54 例腮腺肿瘤患者磁共振影像学资料, 行腮腺 MR 扫描, 使用飞利浦 IngeniaCX3.0TMRI 扫描, 采用头颈线圈, 扫描范围包括腮腺和颌下腺

四个序列的详细采集参数如下:

DWI-BS: 50 层, 总采集时间= 5:42 分钟

TSE SPLICE MV: 50 层, 总采集时间= 3:35 分钟

TSE SPLICE: 50 层, 总采集时间= 5:12 分钟

TSE: 50 层, 总采集时间= 3:46 分钟

以 T2 加权成像作为参考, 在高 b 值的 T2WI、DWI-BS、TSE SPLICE、TSE SPLICE MV、TSE 图像上, 选取病变最大截面沿边缘勾画病变面积, 变形程度定义为肿瘤最大截面在 DWI 上的面积变化百分率。同时分别测定 ROI 的面积和 SD 值, 并记录标准差。此外, 测定图像对比度进行视觉评估, 基于 4 分制的 Likert 量表 (1-差, 4-优秀)。内容包括: 组织解剖学细节, 图像边缘锐利度和解剖结构变形。4 分: 优秀的图像质量, 解剖结构清晰, 没有噪声或结构变形; 3 分: 较好的图像质量, 解剖结构清晰, 有少许噪声或结构变形; 2 分: 可接受的图像质量, 解剖结构尚可分辨, 有较多的噪声或结构变形; 1 分: 图像质量差, 没有诊断价值。

同时分别测定四个序列的病变信号值、ADC 值, 并记录其标准差。此外, 测定四个序列的图像信噪比, SNR 定义为病变信号值与其标准差的比值。

使用 SPSS 进行统计分析。数据描述采用平均值±标准差表示。数据分析使用 t 检验, P 值≤0.05 认为具有统计学差异。

结果 TSE SPLICE MV 序列在腮腺磁共振成像的图像变形程度小, 与 DWI-BS 序列相比, 两种序列在图像变形程度上具有显著差异 ($p<0.05$)。

主要结果数据, 使用 Multi-vane 技术同 DWI-BS 相比有不同程度的优化

- 1、同 DWI-BS 相比病变变形程度明显变小
- 2、ADC 值无差异
- 3、TSE SPLICE MV 序列图像质量好, 对比度高

结论 TSE SPLICE MV 图像质量最好, 速度慢。Multi-vane 结合 SPLICE 扫描技术可更好的评估腮腺肿瘤。

PO-0766

两类罕见颈内动脉发育异常 3 例报道

裴彩侠、董季平、鄢小平
西安市中心医院

目的: 分析颈内动脉侧移位与迷走颈内动脉的影像特点及二者的鉴别要点

方法: 运用颞骨 HRCT、颈部 CTA 及 MRA 评估颈内动脉发育异常类型

结果: 本文发现 3 例颈内动脉发育异常病例, 病例 1 为迷走颈内动脉患者, 病例 2、3 为颈内动脉侧移位患者, 均在我院行 CT 及 MR 相关检查。病例 1 为 42 岁男性, 因漏诊于术中注射利多卡因过程中出现癫痫大发作, 终止手术后追问病史, 患者具有搏动性耳鸣, 与脉搏节律一致, 耳镜见右鼓膜紧张部前下穿孔, 其内有黄豆大小淡红色肿物, 表面光滑有搏动。重阅 CT 图像显示: 右侧颈内动脉管走行迂曲, 外侧部分与鼓室间骨性间隔缺损, 中鼓室肿块与颈动脉管内软组织密度相连, 且右侧下鼓室小管扩大, 随后行 MRA 显示右侧颈内动脉走行迂曲, 其膝部向后外侧移位呈直角, 表现为特征性的反 7 字形, 结合 CT 及 MRA 诊断为迷走颈内动脉。病例 2 为 56 岁男性, 左耳搏动性耳鸣两年, 近一年加重, 外院 CT 及 MRI 检查疑为鼓室球瘤, 耳镜检查显示左耳鼓膜完整呈蓝紫色, 鼓膜周边明显搏动。颞骨 HRCT 显示左侧中耳腔及乳突蜂房内可见软组织密度影, 病变组织包绕听小骨; 左侧颈内动脉膝部与鼓室间骨性间隔缺损, 颈内动脉向外侧移位超过耳蜗低转中点垂直线, 突入鼓室。CTA 显示左侧颈内动脉较对侧增粗, 其膝部较对侧向外侧移位。临床行耳内镜下鼓膜切开探查并置管, 耳屏取软骨膜铺于裸露的骨性外耳道。病例 3 为 36 岁女性, 右侧搏动性耳鸣, 行颞骨 HRCT、颈动脉 CTA 及 MRA 示: 双侧颈内动脉岩骨内段向外侧移位, 其膝部均超过耳蜗底转裸露于鼓室腔, 以右侧为著。左侧颈内动脉全段纤细, 左侧下鼓室小管增宽, 左侧下鼓室动脉显影不良。影像诊断双侧颈内动脉侧移位并左侧颈内动脉发育不良。

结论: 颞骨 HRCT、颈动脉 CTA、MRA 检查, 对诊断颈内动脉发育异常及评估其类型, 阐明搏动性耳鸣的病因具有重要价值。

PO-0767

基于多模态影像组学联合机器学习模型在预测甲状腺乳头状癌颈部淋巴结转移中的价值

郭建峰、沈天赐、宋鑫洋、杜梦颖、纪旭东、杨峰
襄阳市第一人民医院

【摘要】目的 构建基于超声、CT 影像组学联合机器学习模型, 评估其预测甲状腺乳头状癌 (PTC) 颈部淋巴结转移 (CLNM) 中的价值。方法 回顾性分析 198 例经手术病理证实 PTC 患者, 其中 CLNM 组 97 例, 无 CLNM 组 101 例, 所有患者术前均接受甲状腺超声和 CT 扫描, 按照 7: 3 的比例随机分为训练集和测试集。采用单因素和多因素回归分析 PTC 患者发生 CLNM 的临床独立风险因素, 构建临床风险模型。基于超声和 CT 图像提取并筛选最优影像组学特征, 分别使用逻辑回归 (LR)、支持向量机 (SVM)、随机森林 (RF)、极度随机树 (ET)、K 邻近算法 (KNN)、监督学习集成模型 (Light GBM)、Gradient Boosting、AdaBoost、XGBoost、前馈神经网络多层感知器 (MLP) 等 8 个机器学习模型构建 PTC 患者 CLNM 影像组学预测模型。绘制受试者工作特征曲线 (ROC) 评估模型效能, 筛选出最优影像组学模型与临床风险模型构建诺模图模型 (Nomogram), 应用决策曲线分析 (DCA) 对比不同模型的临床获益。结果 SVM 模型在 8 种机器学习模型中表现最优。临床模型、SVM 模型及诺模图模型在训练集中的 AUC 分别为 0.770, 0.951, 0.960, 测试集中的 AUC 分别为 0.747, 0.857, 0.890。DCA 显示 SVM 模型和 nomogram 模型具有较高的临床净收益。结论 基于多模态影像组学联合机器学习模型可以更准确的区分 PTC 患者是否发生 CLNM 具有一定的临床应用价值

PO-0768

T2 mapping 不同测量方法在甲状腺相关眼病活动性评估中的应用

信雨晴、潘富强、王亚磊、张杨
阜阳市人民医院

目的: T2mapping 在甲状腺相关眼病 (TAO) 活动性评估及不同测量方法的诊断效能。

方法: 回顾性分析 22 例 TAO 患者共 43 个眼眶的临床及影像信息 (一个眼眶因图像伪影较重被排除), 根据 TAO 活动性评分 (CAS) 对每侧眼病活动情况分别评分, ≥ 3 分为活动组。对所有眼眶行 3.0T MR 冠状位 T2mapping 扫描, 并使用 3 种方法分别测量 T2 值: 1, T2hot: 信号最高的单只眼肌内勾画较小 ROI 测量最高 T2 值; 2, T2mean: 信号最高的单只眼肌的整个截面 T2 均值; 3, T2sum/4: 单侧眼眶四条眼肌肌腹层面 T2 值的平均数。采用曼-惠特尼 U 检验、斯皮尔曼相关分析及 ROC 曲线分析 3 种方法测量结果对 TAO 活动性的诊断效能。由另一名医师对图像进行重复测量, 应用组内相关系数对两次测量结果进行一致性检验。

结果: T2hot、T2mean 和 T2sum/4 与 CAS 均呈中等程度正相关, T2mean 与 CAS 相关性最强 ($r=0.66$), 活动组 T2hot、T2mean 和 T2sum/4 均大于非活动组, 差异有统计学意义。ROC 曲线显示 T2hot、T2mean 和 T2sum/4 对 TAO 活动性均有一定的诊断效能, T2mean 诊断效能最佳, $AUC=0.868$, 截断值 94.25ms 时判断活动性敏感度为 75%, 特异度为 89.5%。观察者间一致性评价结果显示 T2sum/4 一致性最好 ($ICC=0.958$), T2hot 则较差 ($ICC=0.754$)。

结论: T2mapping 序列的三种测量方法得出的 T2 值均可用于 TAO 的活动性评估。T2mean 在仅有单只眼肌受累时即可被监测到, 而 T2sum/4 在炎症早期并不敏感, T2RThot 与 CAS 的相关性及最差, 提示小 ROI 的 T2hot 不能很好的反映炎症的整体状态。综上 T2mean 与 CAS 的相关性最强、诊断效能最高、观察者间一致性较好, 是 T2mapping 定量测量评估 TAO 活动性的最佳指标。

PO-0769

颈动脉周围脂肪密度与急性缺血性脑卒中事件的相关性研究

余苗
徐州医科大学附属医院

目的 分析颈动脉周围脂肪密度与急性脑梗塞事件的相关性。方法 回顾性分析于我院同时进行颈动脉 CTA、颅脑 MRI 检查的患者临床及影像资料。由两名放射科医生, 分别在 PACS 上测量颈动脉 CTA 斑

块侧、对侧血管周围脂肪密度 (Pericarotid fat density, PFD)。选择颈动脉斑块最大层面, 分别计算斑块侧、非斑块 PFD、PFD 差值 [$\Delta PFD (HU) = \text{斑块侧 PFD} - \text{非斑块侧 PFD}$]。将患者分为急性脑梗塞组、非急性脑梗塞组; 轻中度狭窄组 (10%-69%)、重度狭窄组 (70%-100%)。急性脑梗塞患者又分为梗塞同侧、梗塞对侧亚组。分别比较临床实验室指标、PFD 的组间差异。采用 SPSS 19.0 进行数据处理。计数资料采用 χ^2 检验; 计量资料两组间比较采用 t 检验或 Mann-Whitney U 检验; 使用配对样本 T 检验比较急性脑梗塞的梗塞同侧及梗塞对侧的 PFD。P<0.05 认为差异具有统计学意义。结果 本研究共纳入 71 例患者, 患者平均年龄 61.3 ± 10.4 岁。急性脑梗塞组患者颈动脉 PFD 差值 (ΔPFD) 高于非急性脑梗塞组, 分别为 34.2 HU、25.5HU, 差异具有统计学意义 (P=0.039)。急性脑梗塞患者梗塞同侧颈动脉 PFD (-32.6 ± 20.5 HU) 高于梗塞对侧颈动脉 PFD (-66.8 ± 16.1 HU), 差异具有统计学意义 (P<0.001)。重度狭窄患者的 PFD 差值 (ΔPFD) 高于轻中度狭窄患者, 差异具有统计学意义 (P=0.013)。结论 颈动脉 PFD 的量化分析与急性脑梗塞事件相关, PFD 可能与斑块的易损性相关, 可以作为血管周围炎症的替代标志物。

PO-0770

刀锋技术快速梯度自旋回波扩散加权成像在鼻腔鼻窦病变评估中的应用:与分段读出平面回波扩散加权成像图像质量的综合比较

耿悦、沙炎、唐作华
复旦大学附属眼耳鼻喉科医院

目的: 探讨刀锋技术快速梯度自旋回波扩散加权成像 (TGSE BLADE DWI) 在鼻腔鼻窦占位性病变评估中的可行性, 并定性和定量比较 TGSE BLADE DWI 与分段读出平面回波扩散加权成像 (RESOLVE DWI) 的图像质量。

方法: 本研究前瞻性纳入 48 例鼻腔鼻窦占位性病变患者, 所有患者均在 3.0T MR 扫描仪上使用具有相似成像参数的 TGSE BLADE DWI 和 RESOLVE DWI 进行横断位扩散加权成像。两名放射科医师通过定性成像参数(整体图像质量、病变显著性、畸变)和定量成像参数(几何畸变比[GDR]、信噪比[SNR]、对比度)评估两种序列的图像质量。同时比较两组序列中病变和脑桥的表观扩散系数值(ADC)。

结果: 定性评分比较显示 TGSE BLADE DWI 比 RESOLVE DWI 具有更高的整体图像质量($P<0.001$)、病变显著性($P<0.001$)和更少的几何畸变($P<0.001$)。定量评价显示 TGSE BLADE DWI 比 RESOLVE DWI 具有更高的图像对比度($P<0.001$)和更低的 GDR($P<0.001$), 但 TGSE BLADE DWI 的 SNR 低于 RESOLVE DWI($P<0.001$)。病变和脑桥的 ADC 值在 TGSE BLADE DWI 图像中低于 RESOLVE DWI($P<0.05$)。

结论: 与 RESOLVE DWI 相比, TGSE BLADE DWI 能够有效降低图像磁敏感伪影和几何畸变, 更准确地显示正常解剖结构和病变组织, 改善鼻腔鼻窦区域扩散加权成像图像的质量。

PO-0771

基于 CTA 成像探究急性脑梗死患者形成颈动脉高危斑块的危险因素

李港、张祥林、吕晓虹
锦州医科大学附属第一医院

目的: 本研究以计算机断层血管造影 (CTA) 成像技术为基础, 探究急性脑梗死患者形成颈动脉高危斑块的危险因素, 为临床诊疗及预防提供有力的依据。

方法: 选择回顾性分析我院 2022 年 01 月-2023 年 01 月收治的急性脑梗死患者 156 例, 进行颈部动脉 CTA 检查, 对 CTA 图像进行评估, 根据其是否存在高危斑块分为高危斑块组及稳定斑块组, 收集两组患者临床资料及生化资料, 并采用单因素及多因素 Logistic 回归分析, 探究急性脑梗死患者颈动脉高危斑块形成的相关危险因素。

结果: 在 200 例急性脑梗死患者中, 高危斑块患者 101 例, 稳定斑块患者 99 例。根据 t 检验、U 检验、卡方检验结果显示, 两组之间的 HDL-C、高尿酸血症、糖尿病、高水平同型半胱氨酸、吸烟史、既往心梗史的差异具有统计学意义 ($P<0.05$), 其余因素的差异不具有统计学意义。再根据单因素及多因素 Logistic 回归模型结果显示, 高尿酸血症、糖尿病、高水平同型半胱氨酸、吸烟史、既往心梗史是急性脑梗死患者颈动脉高危斑块形成的独立危险因素 ($OR>1$, $P<0.05$), 而性别及 HDL-C 不是颈动脉高危斑块形成的独立危险因素。

结论: 1、高尿酸血症、糖尿病、高水平同型半胱氨酸、吸烟史、既往心梗史是急性脑梗死患者颈动脉高危斑块形成的独立危险因素。

2、CTA 能够有效识别颈动脉高危斑块特征, 能够对颈动脉高危斑块性质进行较好的评估。

基于超高分辨力 CT 的镫骨环韧带及镫骨肌腱影像解剖初步研究

汤若薇、徐宁、张征宇、赵鹏飞、王振常
首都医科大学附属北京友谊医院

目的：基于超高分辨力 CT (U-HRCT) 分析正常镫骨环韧带 (AL) 及镫骨肌腱 (ST) 影像解剖。
方法：回顾性分析 2020 年 9 月至 2021 年 8 月首都医科大学附属北京友谊医院 258 例 304 耳正常耳的 U-HRCT 资料，观察镫骨底板形态、AL 显示率、ST 附着点及与镫骨长轴夹角。采用卡方检验或独立样本 t 检验比较不同年龄及性别以上指标的差异。
结果：镫骨底板边缘形态分为尖角状、结节状及平直状。前端最常见形态为尖角状 (52.3%，159/304)；后端、上缘及下缘最常见者为平直状，分别占 50.0% (152/304)、91.8% (279/304)、98.0% (298/304)。AL 下缘显示率为 100.0% (304/304)，前端和上缘显示率均为 99.3% (304/304)，后端显示率较低 (81.9%，249/304)。81.9% (304/304) 的 ST 末端附着于镫骨头-颈。附于镫骨后弓的 ST 与镫骨长轴夹角 $[(92.9 \pm 9.1)^\circ]$ 大于附于镫骨头-颈者 $[(89.3 \pm 10.3)^\circ]$ ， $t = -2.378$ ， $P = 0.018$ 。后端 AL 显示率在女性 (87.5%，126/144) 高于男性 (78.1%，89/114)， $\chi^2 = 4.074$ ， $P = 0.044$ 。
结论：U-HRCT 能够清晰显示正常耳镫骨底板、AL 及 ST。正常镫骨底板边缘形态、AL、ST 影像所见具有规律性，为该区隐匿性病变的精准诊断提供参照。

PO-0773

基于超高分辨力 CT 的砧镫关节影像解剖初步研究

汤若薇、徐宁、张征宇、赵鹏飞、王振常
首都医科大学附属北京友谊医院

目的：基于超高分辨力 CT (U-HRCT) 分析正常砧镫关节 (ISJ) 影像解剖。
方法：回顾性分析 2020 年 9 月至 2021 年 8 月行超高分辨力 CT (U-HRCT 检查) 的耳鼻喉科患者 258 例，正常耳共计 304 侧。于 U-HRCT 图像设置 ISJ 标准观察层面，描述其解剖特征，并比较不同年龄及性别的 ISJ 解剖形态差异。
结果：88.2% (268/304) 砧镫关节清晰可见，11.8% (36/304) 模糊可见；47.7% (145/304) 砧镫关节表现为低密度，40.8% (124/304) 为部分骨性密度，11.5% (35/304) 为骨性密度。 ≤ 30 岁及 > 30 岁中 ISJ 解剖特征未见显著差异 (均 $P > 0.05$)。男性镫骨头-豆状突外侧距离、豆状突长径数值均大于女性，分别为 $[0.93 (0.81, 1.02)]$ mm 比 $[0.87 (0.74, 0.96)]$ mm， $Z = -2.870$ ， $P = 0.004$ 、 $[0.66 (0.55, 0.77)]$ mm 比 $[0.59 (0.51, 0.69)]$ mm， $Z = -2.825$ ， $P = 0.005$ ，关节间隙宽度 (即二者差值) 则未见显著差异。砧骨豆状突-镫骨头夹角在男性 $[129.8 (119.8, 148.9)^\circ]$ 显著大于女性 $[137.9 (126.3, 155.6)^\circ]$ ， $Z = -2.942$ ， $P = 0.003$ 。
结论：U-HRCT 可清晰显示正常 ISJ，后者影像解剖学为 ISJ 病变的影像诊断及术前评估提供基础。

PO-0774

MRI 对儿童眼眶的规范化评估及其临床意义

王志炜
空军军医大学西京医院

目的：利用磁共振成像（MRI）评估各年龄组儿童正常眼眶结构的标准数值，为儿童眼部外伤性、感染性、内分泌性以及肿瘤性疾病的影像学诊断奠定基础。方法 回顾性收集行眼眶 MRI 增强扫描且表现正常的儿童患者 130 例，其中男 67 例，女 63 例，并根据年龄分为四组：第 1 组：1-24 个月；第 2 组：25-48 个月；第 3 组：49-120 个月；第 4 组：121-216 个月；分别测量角膜、巩膜到颞间线（IZL）、眶间线的距离，以及视神经、各组眼外肌的直径。结果 各年龄组儿童角膜、巩膜到颞间线（IZL）、眶间线的距离以及视神经、眼外肌直径的差异具有统计学意义，其中角膜到颞间线（IZL）、眶间线的距离整体随年龄增大而增大，巩膜到颞间线（IZL）、眶间线的距离整体随年龄减小而减小，视神经、眼外肌直径大小整体随年龄增大而增大。结论：根据年龄将儿童患者分组，确定不同分组儿童眼眶 MRI 中眼球相对于 IZL 以及眶缘连线的位置、眼外肌及视神经正常直径范围，这种标准数值量表可以作为评估儿童患者眼眶 MRI 的指南，从而为儿童眼眶疾病的影像诊断奠定基础。

PO-0775

甲状腺乳头状癌高容量淋巴结转移临床风险因素研究： 单发与多发乳头状癌对比分析

曹慧君、韩志江
杭州市第一人民医院（浙江大学医学院附属杭州市第一人民医院）

目的：探讨性别、年龄及桥本氏甲状腺炎对最大径 $> 10.0\text{mm}$ 的单发甲状腺乳头状癌（papillary thyroid carcinoma, PTC）和多发 PTC 患者高容量淋巴结转移（high-volume central lymph node metastases, HVM）的预测价值。

方法：回顾性分析 680 例单发 PTC 和 373 例多发 PTC 的临床和病理资料，依据性别和 HT 合并状态将 2 组均进一步分为 HT、non-HT、女性和男性亚组，通过受试者工作特异度曲线下面积（area under the curve, AUC），寻找年龄在各亚组中预测 HVM 的最佳阈值及相应的诊断效能。

结果：680 例单发 PTC 和 373 例多发 PTC 中，发生 HVM 的比例分别为 8.8%（60/680）和 14.2%（53/373）（ $P < 0.05$ ）。单因素分析显示，单发 PTC 组中男性和女性发生 HVM 的比例分别为 13.0%（25/192）和 7.2%（35/488）（ $Z = 5.859$, $P < 0.05$ ），多发 PTC 组分别为 24.5%（25/102）和 10.3%（28/271）（ $Z = 12.220$, $P < 0.05$ ）；单发 PTC 组瘤体中位直径分别为 15.0mm 和 18.0mm（ $Z = -2.702$, $P < 0.05$ ），多发 PTC 组分别为 23.0mm 和 27.0mm（ $Z = -1.482$, $P = 0.139$ ）。多因素分析显示，男性、瘤体大小和年龄 ≤ 36.5 岁是 PTC 发生 HVM 的独立风险因素，优势比（odds ratios, OR）分别为 1.859、1.017 和 2.839。亚组分析显示，单发和多发 PTC 组中 non-HT 亚组预测 HVM 的年龄阈值和 AUC 分别为 36.5 岁和 32.5 岁、0.647 和 0.709，女性亚组分别为 32.5 岁和 43.0 岁、0.680 和 0.670。

结论：多发 PTC 组发生 HVM 比例高于单发 PTC 组，男性、瘤体大小和年龄 ≤ 36.5 岁是发生 HVM 的独立风险因素，且在不同性别及合并 HT 状态下，年龄预测单发 PTC 组和多发 PTC 组 HVM 的阈值和效能存在一定差异。

PO-0776

基于 T2WI 的纹理分析和磁敏感加权成像 鉴别诊断腮腺常见良性肿瘤

王艺华、王丽君、宋清伟、刘爱连
大连医科大学附属第一医院

目的评估基于 T2WI 的纹理分析及磁敏感加权成像 (SWI) 鉴别多形性腺瘤 (PA) 和 Warthin 瘤 (WT) 的作用。方法和材料回顾纳入 37 名在 3.0T MRI 接受 T2WI 和 SWI 检查扫描的患者 (21 名 PA 和 16 名 WT) (Ingenia CX, Philips Healthcare, the Netherlands)。两名放射科医生回顾性评估了其 MRI 序列。在 3D Slicer 软件上使用 T2 加权脂肪抑制图像进行纹理分析 (TA)，并在 SWI 最小强度投影图像上 (SWI-MinP) 中评估肿瘤内磁敏感信号强度 (ITSS)。TA 的 ROI 被绘制为尽可能完全覆盖每个层面上的病变，不包括坏死和血管。计算直方图参数，包括平均值、中位数值、熵、偏度、峰度、最大值、最小值和第 10、90 个百分位数。通过组内相关系数 (ICC) 评估观察者间的可靠性 (如 $ICC > 0.75$ ，则一致性良好)。两名观察者的平均值用于后续分析。使用独立样本 t 检验或 Mann-Whitney U 检验来比较 PA 和 WT 之间直方图参数和 ITSS 的差异。根据受试者工作特征曲线 (ROC) 分析诊断效能。采用 Logistic 法结合 ITSS 计算 TA 参数的对应曲线下面积 (AUC)。结果两个观察者之间的观察者间可靠性良好。WT 的平均值、熵显著低于 PA，偏度和峰度值显著高于 PA ($p < 0.05$)。PA 和 WT 的 ITSS 等级差异具有统计学意义 ($p < 0.05$)。均值、熵、偏度、峰度和 ITSS 的 AUC 分别为 0.779、0.726、0.754、0.687 和 0.718。熵和 ITSS 的联合 AUC 可以提高诊断性能，这与 ITSS 鉴别能力相比有统计学差异 ($p = 0.04$)。结论均值、熵、偏度、峰度和 ITSS 可以识别 PA 和 WT。四个直方图参数和 ITSS 的组合可以提高诊断效能。

PO-0777

定量磁共振成像在评估甲状腺相关眼病的疾病活动和 严重程度中的应用价值

沈彬、郭铤
北京医院

目的：甲状腺相关眼病 (TAO) 的准确分期，对于治疗选择至关重要。临床上目前以临床活动评分 (CAS) 来确定疾病活动性，传统 MRI 在分期上的作用有限。我们采用定量成像方法，意图对 TAO 进行更加精准的分期。

方法：回顾性选取了 40 例 TAO 患者，专科医师评价其 CAS 评分。影像方面，对患者进行了常规 MRI、脂肪分数 (IDEAL-IQ 序列)、T1 ρ 和 T2mapping 扫描。在 T1FLAIR 序列中测量了眶内脂肪 (OF) 的体积，在 IDEAL-IQ 序列测量了上直肌 (SR)、下直肌 (IR)、内直肌 (MR)、外直肌 (LR) 和上斜肌 (SO) 以及 OF 的脂肪分数，并测量了 SR、IR、MR、LR 及 SO 的体积。在 T1 ρ 序列及 T2 mapping 序列测量各眼外肌的 T1 ρ 值及 T2 弛豫时间。使用独立样本 t 检验和 Spearman 相关性分析进行统计分析。

结果：活动组 (CAS ≥ 3) 和非活动组 (CAS < 3) TAO 患者之间眶内脂肪体积没有显著差异 ($p = 0.816$)，眶内脂肪体积与 CAS 评分无相关性 ($p = 0.2$)。各眼外肌的脂肪分数在活动组和非活动组中均有显著差异 (所有 $p < 0.05$)，OF 的脂肪含量在活动组中降低，但统计学未表现出显著性。IR 的 T2 弛豫时间在活动组中较高 ($p = 0.03$)。各眼外肌脂肪分数随着 CAS 评分提高而降低 (所有 $p < 0.05$)，OF 脂肪分数随 CAS 评分提高而降低 ($p = 0.03$)。SR、IR、LR 的体积随 CAS 评分增加而增大 (所有 $p < 0.05$)。IR、MR 和外直肌 (LR) 的 T1 ρ 随着 CAS 提高而增加，MR 和 LR 的 T2 弛豫时间随着 CAS 提高而增加 (所有 $p < 0.05$)。

结论: 眶内脂肪体积可能无法区分 TAO 的活动性和严重程度。眼外肌的定量磁共振成像 (MRI) 参数, 包括脂肪分数 (反应眼外肌脂肪化程度) 及 T1 ρ (反应纤维化程度), 可以提供准确的参数来描述 TAO 的活动性和严重程度, 从而帮助选择适当的治疗方案。眼眶脂肪在活动的病人中可能因炎症浸润等因素导致脂肪含量减低或水肿程度增加, 这或许可以解释一部分眼部症状产生的原因。需要更多的案例参与到分析中, 并进行长期随访以评估定量 MRI 在预测 TAO 进展和预后方面的作用。

PO-0778

经颞浅动脉-大脑中动脉搭桥术前后烟雾病患者的脑血流 4D flow 分析

罗明芳、李自军、席瑜、王玉婷
四川省医学科学院·四川省人民医院

目的: 使用 4D flow 磁共振成像技术对经颞浅动脉-大脑中动脉搭桥术前后的烟雾病患者进行脑血流分析, 为重建术后评估提供新思路。**方法:** 前瞻性招募 13 例经 DSA 确诊为烟雾病或烟雾综合症的患者 (24-60 岁)。所有患者均在手术前行常规头颅磁共振扫描与 4D flow 磁共振扫描。使用 QFlow 4D 软件获取颈内动脉、大脑前动脉、大脑中动脉、大脑后动脉、基底动脉以及桥血管的血流量与峰值速度。将狭窄闭塞严重侧作为患侧, 比较同患侧各支血管脑血流量的差异、手术前后各时间点总脑血流量的变化、比较桥血管颅内段与颅外段血流量是否具有差异。流量及峰值流速测量值采用 Wilcoxon 符号秩和检验进行比较。**结果:** 术后对侧颈内动脉血流量较术前明显下降 (术后 96.97 ± 69.87 ml/min, 术前 124.65 ± 70.72 ml/min) 且差异具有统计学意义 $P=0.017$ 。其他血管血流量值无明显变化。桥血管颅外段与颅内段血流量值分别为 80.78 ± 58.30 、 108.80 ± 78.97 ml/min, 差异具有统计学意义 ($P=0.028$)。术前术后脑总血流量分别为 417.83 ± 202.17 、 484.17 ± 161.73 ml/min, 术后呈现明显增高趋势, 统计学无差异。患侧大脑后动脉峰值速度术前术后分别为 69.77 ± 18.07 、 55.46 ± 7.36 cm/s, 呈现降低趋势, 差异具有统计学意义 ($P<0.05$)。术后对侧颈内动脉血流量在总脑血流量中的占比由原来 42.16% 变为 32.12%, 术后基底动脉血流量在总脑血流量中的占比由原来 49.64% 变为 43.65%, 术后桥血管血流量在总脑血流量中的占比为 15.29%。**结论:** 4D flow MRI 提供了一种全面、无创的方法评价血流动力学。经颞浅动脉-大脑中动脉搭桥术后桥血管可以部分补偿较严重侧闭塞或狭窄的颈内动脉血流量的损失, 同时减轻相对健侧颈内动脉与基底动脉的代偿行为。这些血流参数值可能有助于改善患者术后评估方式。

PO-0779

高分辨 CT 结合 MRI 对颅底软骨肉瘤的诊断价值分析

李彩霞、刘红生
西安市中心医院

目的: 探讨高分辨 CT (HRCT) 结合 MRI 对高分化颅底软骨肉瘤的诊断价值。**方法:** 回顾性分析经病理证实的 10 例颅底软骨肉瘤患者的 HRCT、MRI 图像, MRI 序列包括常规 T1WI、T2WI、弥散加权成像、动态增强磁共振成像 (DCE-MRI)。HRCT 用于观察瘤内特征性骨质钙化及周围骨质破坏情况, 并通过面神经管曲面重建 (CPR) 图像直观地观察面神经管受累情况。MRI 常规扫描主要观察病灶的位置、形态、大小、信号特征、累及范围及与周围软组织的关系; 弥散加权成像测量病灶的表观弥散系数, DCE-MRI 成像测量病灶增强的时间-信号曲线 (TIC) 类型。**结果:** HRCT 显示 10 例均出现虫蚀样骨质破坏区, 10 例病灶内均出现钙化, 钙化表现为斑点状、不规则斑片状; 面神经管 CPR 图像直观显示 6 例病灶累及面神经管鼓室段、乳突段。MRI 图像上

所有肿瘤形态不规则,与周围组织分界清晰,T1WI 呈不均匀等或等低信号,T2WI 呈不均匀高信号,平均大小约 3.9cm×3.0cm×3.9cm,增强扫描呈中度或明显不均匀强化。10 例中,7 例病灶主体位于颈静脉孔区、2 例病灶主体位于颞骨乳突部、1 例病灶主体位于颞下窝区。肿瘤累及周围主要结构包括颈静脉孔区 (n=8)、颞骨乳突部 (n=7)、面神经管鼓室段及乳突段 (n=6)、舌下神经管 (n=5)、中耳 (n=4)、桥小脑角区 (n=3)、咽旁间隙 (n=2)、颈动脉间隙 (n=1)、内听道 (n=1)、下颌骨 (n=1);其中 2 例患者出现患侧舌肌萎缩、1 例患者出现患侧颈阔肌及胸锁乳突肌萎缩。10 例病灶弥散加权成像显示弥散不受限,表观弥散系数平均值为 $2.35 \times 10^{-3} \text{mm}^2/\text{s}$ 。10 例病灶 DCE-MRI 的 TIC 均呈持续上升型 (I 型)。

结论:颅底高分化软骨肉瘤的 HRCT 和 MRI 影像学表现具有明显的特征,此外 HRCT 面神经管 CPR 可直观地显示面神经管受累情况,因此 HRCT 结合 MRI 检查对于术前诊断及治疗具有重要的参考价值。

PO-0780

临床-常规影像特征和 MRI 影像组学模型对 腮腺良恶性肿瘤的预测研究

麦文锋
暨南大学

目的

本研究旨在构建腮腺良恶性肿瘤的术前无创预测模型,以解决传统影像学表现重叠混淆、穿刺活检结果不理想和活检导致肿瘤复发的问题。主要研究目标如下:(1)综合临床因素、常规影像学 and 磁共振成像影像组学,建立高准确度的腮腺良恶性肿瘤预测模型;(2)采用非刚性图像配准和 T1 加权图像定义感兴趣区,并运用新兴的最小冗余最大相关算法进行特征筛选,以目标提升模型的准确性和应用范围。

方法

本研究利用 2015 年至 2023 年暨南大学附属第一医院首诊的 92 例腮腺肿瘤患者数据,结合单变量、多变量分析和机器学习,构建了一个基于磁共振成像和临床因素的高准确度预测模型。图像配准和勾画使用 ITK-GREEDY 和 ITK-SNAP,通过 Python 进行图像预处理和特征提取。采用组内相关系数、Mann-Whitney U 检验以及最小绝对值收缩和选择算子和最大相关最小冗余算法进行特征降维和筛选。数据集经随机分组和四折交叉验证划分,模型则基于支持向量机和逻辑回归构建,性能评估以验证集为标准。

结果

本研究采用了三种不同的预测模型对腮腺肿瘤进行评估。基于临床与常规影像学因素的模型识别出位置、周围组织浸润和淋巴结异常为独立危险因素,其受试者工作特征曲线下面积 (AUC) 为 0.81,准确率为 0.89。影像组学联合支持向量机-最大相关最小冗余 (SVM-mRMR) 模型的 AUC 值为 0.91,准确率为 0.85,但显示欠拟合现象。联合临床与影像组学因素的综合模型进一步优化了预测性能,其 AUC 为 0.92,准确率为 0.90。总体而言,综合模型在诊断恶性肿瘤方面具有较高的准确性。

结论

本研究成功地构建了一个基于磁共振成像、临床因素和影像组学的腮腺肿瘤预测模型。该模型在验证组中的诊断性能显著,肿瘤内外特征均具有重要的诊断价值,为提高腮腺良恶性肿瘤的诊断准确性提供了科学依据。

PO-0781

基于双能 CT-形态学列线图鉴别 Bethesda III、IV 类甲状腺结节良恶性的价值

任小芳
重庆市人民医院

目的 探讨联合双层光谱检测器 CT (dual-layer spectral detector CT, SDCT) 定量参数与形态学特征鉴别 Bethesda III、IV 类甲状腺结节良恶性的价值。

方法

回顾性收集 2021 年 8 月至 2023 年 5 月重庆市人民医院具有术后病理结果的 75 例 Bethesda III、IV 类甲状腺结节患者的 SDCT 图像, 其中良性组 28 例, 恶性组 47 例。SDCT 定量参数包括动脉期和静脉期标准化碘浓度 ($NIC=IC_{\text{甲状腺结节}}/IC_{\text{颈动脉}}$)、能谱曲线斜率衰减 (λHU)、标准化有效原子序数 ($NZ_{\text{eff}}=Z_{\text{eff 甲状腺结节}}/Z_{\text{eff 颈动脉}}$)。形态学特征包括微钙化、增强后模糊、形态不规则、甲状腺包膜不连续。通过单因素分析比较良性和恶性组 SDCT 定量参数和形态学特征。采用多因素回归分析确定 Bethesda III、IV 类甲状腺恶性结节的独立危险因素, 并利用 logistic 回归构建形态学特征模型和 SDCT 定量参数-形态学特征联合模型。通过 Delong 检验比较不同模型的诊断效能。基于诊断效能最优的模型构建列线图。运用受试者工作特征曲线、校准曲线和决策曲线评估模型诊断效能。

结果

多因素二元 logistic 回归分析结果显示动脉期 NIC、增强后模糊是 Bethesda III、IV 类甲状腺恶性结节的独立危险因素 (P 均 <0.05)。基于此构建的列线图诊断效能优于增强后模糊 ($AUC: 0.798$ vs 0.658 , $P<0.05$)。敏感度为 87.2%, 特异度为 57.1%。校准曲线显示列线图实际和预测概率之间具有较好的一致性。决策曲线分析表明, 列线图模型较形态学模型的临床获益高。

结论

基于双能 CT-形态学列线图可以有效鉴别 Bethesda III、IV 类甲状腺结节良恶性。

PO-0782

探讨智能快速磁共振重建技术在头颅检查中的应用

吴瑜、曾宪春
贵州省人民医院

目的 探讨智能快速磁共振重建技术在头颅检查中的应用价值。**方法** 收集疑颅脑病变行头颅 MR 平扫患者 50 例, 将扫描后常规图像 (常规组) 行智能快速磁共振重建后获智能快速重建组图像, 分别对两组图像进行评估, 包括客观评分: 感兴趣区的平均信号强度、SD、SNR 及 CNR, 以及主观评分和图像的诊断效能等。**结果** 与常规图像组相比, 智能快速重建组图像颅内感兴趣区的 SD、SNR、CNR 均存在统计学差异 ($t=8.14$, $p<0.05$; $t=7.73$, $p<0.05$; $t=8.05$, $p<0.05$), 智能快速重建组图像的 SD 降低 28.24%, SNR 提高 42.71%, CNR 提高 49.11%; 而两组图像感兴趣区的平均信号强度无统计学意义 ($t=1.21$, $p>0.05$); 常规扫描组及智能快速重建组在主观评分上具有统计学差异 ($Z=5.09$, $p<0.05$), 智能快速重建组主观评分更高; 此外, 两组图像对病变检出率无统计学差异 ($p>0.05$)。**结论** 智能快速磁共振重建技术在头颅磁共振扫描中能明显提高图像质量, 且不改变组织信号强度, 具有潜在提高 MR 头颅扫描成功率、缩短扫描时间的临床应用价值。

PO-0783

头颈部 CTA 中 GSI Assist 单能量成像结合个体化对比剂注射方案的应用研究

刘娜

大连大学附属中山医院

目的 探讨能谱 CT 智能 mA 匹配技术 (GSI Assist) 结合个体化对比剂注射方案行头颈部 CTA 单能量成像降低辐射剂量和碘摄入量的可行性。**方法** 收集临床行头颈部 CTA 检查的患者 66 例, 男 42 例, 女 24 例, 年龄 30~90 岁, 随机分为常规组 (A 组, 33 例) 和 GSI 组 (B 组, 33 例)。A 组采用管电压 120kVp, 管电流 400mA; 对比剂 95ml, 流速 4.5ml/s。B 组采用 GSI 扫描模式, 管电压 80~140kVp 瞬切, 管电流使用 GSI Assist 模式设置, NI=15HU; 应用个体化对比剂注射方案: 300mg I/kg, 4.0ml/s; 重建 60keV 单能量图像, 统计两组辐射剂量和对比剂剂量。在 AW4.7 工作站由两位观察者对动脉重建图像进行主观评分, 比较评分一致性; 测量两组轴位图像颈总动脉 (CCA)、颈内动脉 C1 段 (ICA C1)、大脑中动脉 M1 段 (MCA M1) 和胸锁乳突肌的 CT 值及 SD 值, 计算各血管 SNR 和 CNR, 进一步比较图像质量主客观评估的组间差异。**结果** 两位观察者主观评分一致性良好 ($Kappa=0.87$), 两组图像质量评分差异无统计学意义 ($P>0.05$), 均能满足诊断要求。B 组颈内动脉和大脑中动脉血管 CT 值均高于 A 组 ($P<0.05$), 但 B 组背景 SD 值高于 A 组 ($P<0.05$)。除 B 组左侧颈内动脉、大脑中动脉 SNR 值高于 A 组外 ($P<0.05$), 其它各动脉 SNR 和所有动脉 CNR 值均无组间统计学差异 ($P>0.05$)。与 A 组相比, B 组容积 CT 剂量指数 (CTDIvol)、剂量长度乘积 (DLP)、有效剂量 (ED) 和碘摄入量分别下降 22.45%、20.63%、20.66%、30.18% ($P<0.05$)。**结论** 采用 GSI Assist+60keV 成像结合个体化对比剂注射方案可以在保证图像满足诊断要求的同时, 有效降低头颈 CTA 辐射剂量和碘摄入量。

PO-0784

异位甲状旁腺腺瘤的 CT 影像学表现及临床价值

蹇新梅、姚灵、段庆红

贵州医科大学附属肿瘤医院

【摘要】目的 : 探讨多层螺旋 CT 诊断异位甲状旁腺腺瘤的临床价值及 CT 影像表现, 以提高异位甲状旁腺腺瘤术前诊断的准确性。**方法** : 回顾性分析经手术和病理证实的 22 例异位甲状旁腺腺瘤的临床资料及 CT 影像学表现, 8 例患者行颈部 CT 增强+胸部 CT 增强及平扫, 13 例患者行颈部+胸部 CT 增强扫描, 1 例患者颈部+胸部 CT 增强+MRI 平扫, 22 例患者均行甲状腺超声检查, 19 患者行甲状旁腺放射性核素 (MIBI) 成像。**结果** : 22 例患者中病灶位置分别为: 上纵隔气管食管左右侧旁 16 例, 中纵隔主动脉弓-肺动脉主干之间 1 例, 前中纵隔胸腺内 2 例, 左侧颈部 1 例; 病灶大小位于 5.4mm×8.6mm-29.3mm×16.2mm 之间, CT 平扫呈软组织密度, 22 例患者 CT 增强扫描均呈明显强化, CT 值位于 87HU-219HU 之间, 其中 5 例见坏死及囊变。其中发现 CT 增强检查、甲状旁腺放射性核素成像均发现病灶并能准确定位, 8 例胸部 CT 平扫均漏诊病灶, 甲状腺超声中 16 例发现病灶, 6 例未发现病灶。**结论** : 异位甲状旁腺腺瘤好发于上纵隔胸骨上窝, CT 增强表现呈明显强化, 病灶较大者易坏死囊变, 但缺乏一定特征的 CT 征象。CT 增强扫描对异位甲状旁腺腺瘤定位诊断具有重要价值, 临床提示具有原发甲状旁腺功能亢进患者, CT 发现明显强化病灶时, 影像学应考虑到异位甲状旁腺腺瘤诊断。CT 平扫易漏诊, 临床怀疑该诊断时均应做 CT 增强扫描。

PO-0785

一种罕见的头颈部神经内分泌肿瘤-磷酸盐尿性间叶肿瘤的 CT 和 MR 表现

杨智云、吴柳晖
中山大学附属第一医院

【目的】探讨磷酸盐尿性间叶肿瘤 (PMT) 的 CT 和 MR 影像特征。【方法】回顾性分析 2016 年 12 月至 2021 年 6 月在中山大学附属第一医院经病理确诊为 PMT 的 9 例患者的临床及影像资料。【结果】共 9 例 PMT (男 7 例, 女 2 例) 患者, 中位年龄为 41 岁 (32-50 岁)。所有患者均有全身骨质疏松, 7 例有全身多发骨折。所有患者血磷减低、碱性磷酸酶 (ALP) 水平升高, 血钙正常; 5 例 1,25(OH)₂-VitD₃ 水平降低。9 例病灶中 5 例 (55.56%) 位于下肢, 2 例 (22.22%) 位于上肢, 2 例 (22.22%) 位于头颈部; 5 例发生在骨组织内, 4 例发生在软组织内。所有病灶 ⁶⁸Ga-DOTANOC PET/CT 均呈阳性, 其中 7 例行 ¹⁸F-FDG PET/CT 检查 6 例呈阳性。CT 表现为高密度或软组织密度, 病灶较大时会出现溶骨性骨质破坏; MR 表现为 T1WI 等-低信号, T2WI 信号多变, T2WI 压脂多呈稍高-高信号; CT/MR 增强扫描多为明显强化。【结论】PMT 发病率低, 起病隐匿, 但临床及影像学具有一定的特点, 掌握这些特点并综合临床表现、实验室及影像学检查对 PMT 的定位和准确诊断至关重要。

PO-0786

光谱 CT 鉴别慢性化脓性中耳炎与中耳胆脂瘤的价值

韩丹、尹成林
昆明医科大学第一附属医院

目的 探讨基于双层探测器光谱 CT 鉴别胆脂瘤型中耳炎与肉芽肿型中耳炎的最佳参数及诊断效能。方法 回顾性分析我院经双层探测器光谱 CT 常规平扫的慢性化脓性中耳炎患者共 50 例, 所有病例均经病理证实, 中耳胆脂瘤 27 例、肉芽肿型中耳炎 23 例, 分析两组病灶平扫影像学表现及多个能谱参数。采用受试者操作特征曲线获得各参数的诊断价值及阈值, 用曲线下面积 (AUC)、敏感度和特异度来评估其诊断效能。结果 (1) 在 HRCT 影像学表现方面, 两组病灶在乳突分型及病灶周围骨质破坏情况差异有统计学意义 ($P < 0.05$)。 (2) 平扫 CT 值、有效原子序数 (effective atomic number, Z_{eff})、能谱曲线对中耳胆脂瘤与肉芽肿型中耳炎鉴别均有一定价值, 有效原子序数的诊断效能 (AUC 0.955 敏感度 86.7%, 特异度 100%) 最高。在 40-140keV 水平单能量下, 两组病灶在 40-80keV 水平单能量下 CT 值差异有统计学意义 ($P < 0.05$), 而 90-140keV 水平单能量下 CT 值差异无统计学意义 ($P > 0.05$)。结论 双层探测器光谱 CT 可以通过多个光谱参数对胆脂瘤型和肉芽肿型中耳炎进行鉴别诊断, 其中有效原子序数与常规平扫 CT 值、不同水平单能级 CT 值、能谱曲线相比具有较高的诊断效能。

PO-0787

CT 直方图提高甲状腺癌微钙化检出率的可行性研究

刘旭琴、赵雯、胡星月
昆明医科大学第一附属医院

回顾性分析 130 例甲状腺癌患者的临床及影像资料, 将 130 例甲状腺癌按照超声显示有无微钙化, 分为微钙化组阳性组和微钙化阴性组, 其中阳性组 87 例, 阴性组 43 例。首先进行两组间临床特征分析, 计数资料采用卡方检验, 计量资料采用独立样本 t 检验。应用 MaZda 软件对两组数据 CT 图像上的 ROI 进行直方图分析, 提取直方图参数最小值、最大值、均值、方差、偏度、峰度、第 1 位百分数、第 10 位百分数、第 50 位百分数、第 90 位百分数、第 99 位百分数。采用独立样本 t 检验或 Mann-Whitney U 检验选出差异有统计学意义的直方图参数, 绘制受试者工作特征曲线 (ROC) 评估的直方图参数预测甲状腺癌微钙化的敏感性、特异性和准确率, 并使用 ROC 曲线下面积 (AUC) 评价预测效能。对临床特征及直方图参数构建联合诊断模型, 并绘制 ROC 曲线和列线图, 评估模型预测的敏感性、特异性和准确性, 并绘制校准曲线及决策分析曲线评价模型的效能。

【结果】1. 微钙化阳性组和微钙化阴性组临床特征比较: 两组间甲状腺癌患者的年龄、病灶长径存在统计学差异, 年龄 ≤ 45 岁, 长径 $> 1\text{cm}$ 发生微钙化的几率更大。2. 微钙化阳性组和微钙化阴性组直方图参数比较: 最小值、最大值、方差、偏度、峰度、第 1、10、99 百分位数中差异具有统计学意义, 其中最小值、第 1、10 位百分数微钙化阳性组低于微钙化阴性组, 而最大值、方差、偏度、峰度、第 99 百分位数微钙化阳性组高于微钙化阴性组。峰度的 AUC 为 0.851, 敏感度、特异度、准确性分别为 94.3%、69.8%、86.2%。3. 构建临床特征和直方图参数的联合模型, 训练集和测试集模型的敏感度、特异度和准确性分别为 94.3%、82.6%、86.5% 及 75.0%、88.9%、84.6%。

【结论】1. 甲状腺癌微钙化与患者年龄、病灶长径存在相关性。2. CT 直方图参数对于提高甲状腺结节微钙化的检出率具有一定价值。3. 临床特征联合直方图参数构建模型, 可提高甲状腺癌微钙化检出率。

PO-0788

侧颅底区病变类型及其 CT 和 MRI 特征分析

郭小平、张巧莹、孙鹏峰、公婷、高明、刘红生、董燕、马鸣岳
西安交通大学附属西安市中心医院

目的: 探讨侧颅底区不同病变类型及其 CT 和 MR 特征。方法: 回顾性分析经手术病理证实的侧颅底区病变的临床表现和 CT/MRI 特点, 包括病灶周围骨质破坏、病灶密度与 MRI 平扫及增强的信号特点, 及病灶的位置、大小和边界。结果: (1) 侧颅底区病变可有相同的临床表现。(2) 常见病变部位及类型, 颞骨下方: 颈静脉球体瘤、颈静脉孔区神经鞘瘤; 颞骨: 转移瘤、外耳道癌、中耳癌、面神经瘤、鼓室球体瘤、骨巨细胞瘤、朗格汉斯细胞组织细胞增生症、巨细胞修复性肉芽肿; 颞骨上方: 三叉神经瘤、脑膜瘤; 颞骨后方: 听神经瘤、内淋巴囊肿瘤。(3) 常见肿瘤的 CT 与 MRI 特点: 朗格汉斯细胞组织细胞增生症, 虫噬状骨质破坏, 无硬化边, 可伴死骨; 骨巨细胞瘤, 可明显囊变; 巨细胞修复性肉芽肿, 可伴多个液平面; 胆脂瘤, DWI 特异性高信号; 脑膜瘤, 骨质增生、可钙化, 硬脑膜尾出现; 神经鞘瘤, “哑铃”形; 副神经节瘤, “盐胡椒”征、渗透性骨质破坏; 软骨样肿瘤, 典型的软骨样弧形基质和环状钙化。结论: 侧颅底区不同类型病变有一定特征性, CT 与 MRI 结合应用有助于术前鉴别诊断。

PO-0789

四维血流磁共振成像 (4D flow MRI) 技术在颅内未破裂动脉瘤的血流动力学研究

张冀云¹、石滢²

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

目的 探索四维血流磁共振成像 (4D flow MRI) 技术在颅内未破裂动脉瘤的血流评估中应用的可行性及临床价值。

方法 回顾分析 2021 年 3 月至 2023 年 4 月于我院卒中中心行 DSA 检查证实位于大脑前交通动脉 10 例未破裂动脉瘤 (10 位患者), 得到 10 例动脉瘤原始数据 (载瘤动脉管壁横截面积、动脉瘤口直径、动脉瘤大小) 并通过计算流体力学 (computational fluid dynamics, CFD) 得到血流动力学参数 (通过动脉瘤平面速度、最大通过平面速度、平均速度、最大速度、平均及最大瞬时血流量)。10 位患者 10 例动脉瘤均再次行磁共振血管成像及 4D flow MRI 技术处理, 最终得到 10 例动脉瘤速度矢量场、流线、剪切速率、壁面剪切应力, 振荡剪切指数, 根据流速计算并显示 10 个病例的三维血液流动迹线 (Pathline); 提取动脉瘤颈部平均血流速度并计算两者之间的归一化均方根误差 (normalized root mean square error, NRMSE) 和线性相关系数 (R2); 最后比较动脉瘤最大截面处的速度分布图。

结果 4D Flow MRI 和 CFD 对比结果显示, 血液在载瘤动脉和瘤体内部的流动状态相似。瘤颈部平均流速符合较好。10 例动脉瘤颈部平均流速的 NRMSE 均值为 0.08452, R2 均值为 0.90132。显示出一致的高流速区域分布。

结论 4D Flow MRI 的测量结果和 CFD 的计算结果之间具有较好的一致性, 4D Flow MRI 可全面评估血流动力学, 且为无创检查, 能够提供更多精确数据, 提高评估动脉瘤破裂风险和预后的准确性。

PO-0790

四维血流磁共振成像 (4D flow MRI) 技术在血流导向装置植入术后血流动力学研究

张冀云¹、石滢²

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

目的 探索四维血流磁共振成像 (4D flow MRI) 技术在血流导向装置 (flow diverter, FD) 植入术后血流评估中应用的可行性及临床价值。

方法 回顾分析 2021 年 1 月至 2023 年 5 月于我院卒中中心行血流导向装置 (flow diverter, FD) 植入术患者 8 例, 术前所有患者经 DSA 证实单侧大脑中动脉狭窄且临床症状明显, 得到 8 例患者 8 根病变血管及对侧正常血管的原始数据 (动脉管壁横截面积、病变部位狭窄程度、斑块情况、侧枝循环形成) 并通过计算流体力学 (computational fluid dynamics, CFD) 得到血流动力学参数 (通过病变部位平面速度、最大通过平面速度、平均速度、最大速度、平均及最大瞬时血流量)。8 位患者 8 根病变血管及对侧正常血管共计 16 根血管均再次行磁共振血管成像及 4D flow MRI 技术处理, 最终得到 16 根血管速度矢量场、流线、剪切速率、壁面剪切应力、振荡剪切指数, 根据流速计算并显示 8 根病变血管的三维血液流动迹线 (Pathline); 提取病变部位血流速度并计算两者之间的归一化均方根误差 (normalized root mean square error, NRMSE) 和线性相关系数 (R2); 8 位患者 8 根病变血管行血流导向装置 (flow diverter, FD) 植入术 1 月后再次行 DSA 复查及 4D flow MRI 复查, 得

到血流动力学参数与术前对比, 采用配对 t 检验和组间 X^2 检验, 最终获得术前与术后 4D Flow MRI 和 CFD 对比结果。

结果 4D Flow MRI 和 CFD 对比结果显示, 血液在病变部位的流动状态相似; 病变血管平均流速符合较好。植入 FD 前、后血流模式改变 4D Flow MRI 的测量结果和 CFD 的计算结果二者相符。

结论 4D Flow MRI 的测量结果和 CFD 的计算结果之间具有较好的一致性, 4D Flow MRI 可全面评估血流动力学, 且为无创检查, 能够提供更多精确数据, 可用于评估 FD 植入, 有较高临床应用价值。

PO-0791

侧颅底巨细胞修复性肉芽肿的影像特点分析

孙鹏峰、郭小平、杨想春、马鸣岳、高明、董季平
西安市中心医院

目的 分析总结发生于侧颅底的巨细胞修复性肉芽肿(giant cell reparative granuloma, GCRG)的影像表现特点, 以提高对该病的认识及诊断准确率。**方法** 回顾分析 6 例经手术病理证实的侧颅底 GCRG 患者的 CT、MRI 及临床资料, 分析侧颅底 GCRG 的影像表现特征。**结果** 6 例患者均为单侧病变(左侧 2 例, 右侧 4 例), 均以颞骨鳞部为中心生长, 累及范围包括颞骨、蝶骨、颞颌关节及颞弓; CT 均表现为膨胀性溶骨性骨质破坏, 边缘较清, 6 例均可见病变周围骨质增生硬化, 邻近部分骨质硬化、增粗; 病变内见斑点状不规则高密度影(为钙化、骨化或者残存骨), 多位于靠近边缘部分。MRI 表现为 T1WI 以等低信号为主, 1 例可见短 T1 出血信号影; T2WI 多表现为以低信号为主的混杂信号影, 2 例可见明显高信号; 均未见到明显液-液平面; MRI 增强呈不均匀中度到明显强化。5 例病变延伸至中颅窝, 对邻近颞叶呈推压改变, 邻近中颅窝底脑膜增厚强化。**结论** 发生于侧颅底的病变呈溶骨性骨质破坏伴周围骨质增生硬化, MRI 平扫以低信号为主时, 要考虑到 GCRG 的可能; 病变边缘骨质增生硬化具有特征性, 可与骨巨细胞瘤鉴别。

PO-0792

MRI 多参数成像对鼻咽癌放射治疗后腮腺放射性损伤的研究

蔡楚逸、李凯、夏建笔、戴琦
宁波市第二医院

【摘要】目的: 通过研究鼻咽癌病人放疗前后动态增强磁共振成像(dynamic contrast-enhanced MRI, DCE)半定量参数值、表观扩散系数(apparent diffusion coefficient, ADC)值、多回波 Dixon 技术定量测得的质子密度脂肪分数(proton density fat fraction, PDFF)的变化, 探讨参数变化与腮腺放射性损伤的关系。**方法:** 前瞻性选取经病理证实的鼻咽癌患者 25 例, 所有患者放疗前及放疗结束 4 周后行 DCE-MRI、MRI-DWI、MRI 多回波 Dixon 序列扫描, 分别测量放疗前后左右腮腺的流入率(wash in rate, WIR)、达峰时间(time to peak, TTP)、增强曲线下初始面积(Initial area under curve, iAUC)、ADC 值、PDFF, 评估并记录患者口干程度, 研究腮腺 MR 各参数的变化情况与腮腺体积萎缩率、辐射剂量、口干程度的相关性。**结果:** 所有参数放疗前后均有明显统计学差异($P < 0.05$), 口干等级与放射剂量明显正相关($P < 0.05$), TTP 与 iAuc 与腮腺萎缩率呈明显正相关($P < 0.05$), WIR、PDFF 与腮腺萎缩率没有明显相关性($P > 0.05$), ADC 值与放射剂量明显相关($r = 0.521$, $P < 0.001$)。**结论:** MRI 多参数成像中 ADC 值、DCE 参数值 TTP 及 iAUC 可以无创评估腮腺放疗后损伤程度。

PO-0793

低剂量联合全模型迭代重建技术 IMR 对比迭代重建技术 iDose4 在头颈部 CT 血管成像中对图像质量的影响分析

孙宁达

吉林大学第一医院

目的:比较在 100k Vp 的低管电压下 IMR 和 120kVp 管电压下的 iDose4 的头颈部 CT 血管成像的图像质量,探讨 iDose4 和低管电压下 IMR 对头颈血管病灶显示的影响。

方法:收集行头颈部 CT 血管成像的患者 30 例,扫描管电压为 100/120kVp,用 IMR-2、IMR-3、iDose42、iDose44、iDose46 五种重建模式重建静脉期薄层的原始数据。客观评价:测量静脉期的主动脉弓、左右颈总动脉、左右颈内动脉及左右大脑中动脉的 CT 值及标准差,计算上述区域的信噪比、对比噪声比和血管周围脂肪密度分辨率。主观评价:根据图像的噪声、脑实变、脑出血、血管钙化和 ROI 的解剖位置的显示、图像质量和诊断信心,由三名医生按照 1-5 分对各模式重建图像主观评价。最后综合主客观评价选出低剂量下质量较优的重建模式,与常规剂量 IMR-1 重建的图像进行比较。

结果:1.五种模式下主动脉弓等上述部位的 CT 值差异没有统计学意义($P>0.05$)。所有组织的噪声值按 IMR-3、IMR-2、iDose46、iDose44、iDose42 的顺序减少($P<0.05$),头颈血管病灶的 SD 值在各组间有统计学意义($F=3.210, P=0.018$)。头颈血管病灶的 SNR 值按照 iDose46、iDose44、IMR-2、iDose42、IMR-3 的顺序减少($P<0.05$)。深度学习重建强度的增加,病灶 CNR 也依次增加,iDose46 最高,各血管组织 CNR 值也逐渐升高,五种模式下脂肪密度分辨率差异有统计学意义($H=15.955, P=0.002$),iDose46 最高。2.常规剂量结合 iDose42 与低剂量结合 IMR-1 重建图像相比下 SD 值降低,SNR、CNR 值升高以及血管周围脂肪密度分辨率也增加,两组间有统计学意义($P<0.05$),常规剂量下 iDose42 针对噪声、细小结构的主观评分低于低剂量下 IMR-1 的图像,两组间有统计学意义。结论:与 iDose4 相比,IMR 可以改善头颈血管成像的图像质量,低剂量下的 IMR 与常规剂量下的 iDose4 技术均可较好完成扫描及诊断任务,但 IMR 技术较 iDose4 技术更具一定优势。

PO-0794

基于临床及 CT 危险因素的列线图预测甲状腺乳头状癌患者术后复发风险的价值研究

徐海军¹、李登峰¹、杨倩²、刘周²、李琳¹、罗德红^{1,2}

1. 国家癌症中心/国家肿瘤临床医学研究中心/中国医学科学院北京协和医学院肿瘤医院影像诊断科

2. 国家癌症中心/国家肿瘤临床医学研究中心/中国医学科学院北京协和医学院肿瘤医院深圳医院放射诊断科

目的 评估基于临床病理及 CT 图像形态学危险因素构建的列线图个体化预测甲状腺乳头状癌 (PTC) 患者术后复发风险的价值。

方法 横断面研究。回顾性分析 2012 年 1 月至 2015 年 12 月于中国医学科学院肿瘤医院行 CT 检查的 338 例 PTC 患者的临床病理及 CT 图像资料。复发定义为手术后发现经病理学/细胞学证实的或由影像学检查确定的甲状腺癌病灶。使用留出法将患者按 7:3 的比例随机分为训练集和验证集,训练集中通过单因素分析筛选出的 P 值 ≤ 0.1 的因素纳入多因素 logistic 回归分析 (向前步进法),获得与 PTC 复发相关 ($P<0.05$) 的独立危险因素。使用 logistic 回归法联合所有独立危险因素构建列线图,绘制受试者工作特征曲线,计算曲线下面积 (AUC) 和特异度、灵敏度、准确度评估列线图预测 PTC 患者术后复发风险的效能。绘制校准曲线,探究列线图预测复发与临床实际复发的相符程度。

结果 本研究 338 例患者中,共 81 例患者在手术后出现复发。分析发现年龄 ($P = 0.003$)、肿瘤侵犯甲状腺周围组织 ($P = 0.029$)、淋巴结 CT 长径 ($P = 0.009$) 及转移淋巴结数目 ($P = 0.012$)

是 PTC 复发的独立危险因素。上述 4 个因素所构建的列线图在训练集的 AUC 为 0.757 (95%置信区间[CI]: 0.678~0.837), 特异度 87.8%, 灵敏度 58.6%, 准确度 80.7%; 在验证集中 AUC 为 0.846 (95% CI: 0.751~0.942), 特异度 79.2%, 灵敏度 78.3%, 准确度 79.0%。校准曲线表明列线图预测复发具有较高的准确性, 临床应用效果较好。

结论 年龄、肿瘤侵犯甲状腺周围组织、淋巴结 CT 长径及转移淋巴结数目是 PTC 患者术后复发的独立危险因素, 基于此构建的列线图对于个体化预测 PTC 术后复发具有较高的价值。

PO-0795

基于临床因素及 MRI 特征的评分模型预测脑桥旁正中梗死早期神经功能恶化的价值

宋杨柳、刘碧华
东莞市人民医院

目的 探讨基于临床因素及 MRI 特征的评分模型对脑桥旁正中梗死 (PPI) 的早期神经恶化 (END) 的预测价值。方法 采用回顾性队列研究设计, 选择 2019 年 1 月至 2023 年 6 月在东莞市人民医院收治的 163 例脑桥旁正中梗死患者作为研究对象。根据是否发生 END 将其分为 END (35 例) 组和非 END 组 (128 例)。筛选可能的临床因素及 MRI 特征后基于预测价值进行赋分建立评分模型, 并绘制受试者工作特性 (ROC) 曲线, 计算曲线下面积 (AUC)、灵敏度、特异度和约登指数。结果 同型半胱氨酸水平、梗死灶最大面积、脑白质疏松分级、病灶平均 ADC 值、病灶分布位置是脑桥旁正中梗死发生早期神经功能恶化的独立危险因素 ($P < 0.05$), 根据 OR 值进行赋分, 分别为 1、1、3、1、4, 建立评分模型, 该模型预测不良临床结局的 AUC 值为 0.910, 当分值 ≥ 6 , 灵敏度为 0.743, 特异度为 0.898。结论 基于临床因素及 MRI 特征的评分模型对于脑桥旁正中梗死的早期神经恶化有一定的预测价值。

PO-0796

扩散峰度成像和动态增强磁共振成像对腮腺肿瘤良恶性的鉴别诊断价值

刘姿均、文宝红、张焱
郑州大学第一附属医院

目的: 探讨扩散峰度成像 (diffusion kurtosis imaging, DKI) 和动态增强磁共振成像 (dynamic contrast-enhanced MRI, DCE-MRI) 在腮腺肿瘤良恶性鉴别诊断中的价值。

方法: 回顾性分析经病理证实的 142 例腮腺肿瘤患者资料, 其中良性肿瘤 98 例, 恶性肿瘤 44 例。治疗前均采用 Siemens 3.0 T skyra MRI 扫描仪及头颈联合线圈, 行常规 MRI 扫描及 DKI 和 DCE-MRI 检查。测量 DCE-MRI (对比剂的容量转移常数, K^{trans} ; 速率常数, K_{ep} ; 血管外细胞外间隙容积比, V_e) 和 DKI (扩散峰度, K ; 扩散系数, D) 的定量参数, 并计算定量参数的相对值 [相对值 = (患侧值 - 正常侧值) / 正常侧值], 比较组间各参数的差异。并且基于 logistic 回归分析进行参数组合用于鉴别诊断腮腺肿瘤。运用受试者工作特征曲线 (receiver operating characteristic curve, ROC 曲线) 曲线评价各参数及组合值鉴别诊断腮腺肿瘤的价值, 并计算相应的曲线下面积 (AUC)。 $P < 0.05$ 是差异具有统计学意义的标准。

结果: 腮腺良性肿瘤的 K 值、相对 K 值显著低于恶性肿瘤, 腮腺良性肿瘤 D 值、相对 D 值、相对 K_{ep} 值显著高于恶性肿瘤 (P 值均 < 0.01), 余 DCE-MRI 参数在两者之间均无明显差异。 D 值、相对 D 值、 K 值、相对 K 值、相对 K_{ep} 值鉴别诊断腮腺良性与恶性肿瘤 ROC 曲线下面积分别为 0.758,

0.688, 0.778, 0.743, 0.655。基于 logistic 回归分析进行参数组合后, K 值+相对 K 值, D 值+相对 K 值这两个组合得到了较前更高的 AUC, 分别为 0.781 和 0.787。

结论: 扩散峰度成像有助于腮腺肿瘤良恶性的鉴别, 但是动态增强磁共振成像在腮腺肿瘤良恶性的鉴别能力不如扩散峰度成像。定量参数相对值能够在一定程度提高扩散峰度成像和动态增强磁共振成像对腮腺肿瘤良恶性的鉴别能力。

PO-0797

基于超高分辨率 CT 的内耳骨性解剖与梅尼埃病的相关性研究

黄炎、赵鹏飞、王振常
首都医科大学附属北京友谊医院

目的: 基于超高分辨率 CT (ultra-high resolution computed tomography, U-HRCT) 探讨内耳相关骨性解剖与梅尼埃病的相关性。

方法: 回顾性收集我院 24 例 MD 患者资料, 这些患者均进行了颞骨 U-HRCT 检查和内耳钆造影。其中单侧 20 例, 双侧 4 例, 共 28 耳, 男性 15 例, 女性 20 例, 平均年龄 57.41 ± 13.45 岁。按照 1:1 的比例纳入性别、年龄相匹配的 24 例无耳部症状的 U-HRCT 受试者为对照组。基于 U-HRCT 观察前庭导水管全程显影情况, 测量球囊隐窝、前庭、外半规管骨岛大小。基于内耳 MR 钆造影评估内淋巴积水程度。分析 MD 组与对照组间内耳骨性结构差异情况, 分析前庭导水管显影评分 (1 分-未显示, 2 分-模糊, 3 分-清晰) 与积水程度的相关性。

结果: MD 患侧中前庭导水管未显示、模糊和清晰分别占比 (9/28)、(12/28) 和 (7/28), 正常对照组分别占比 (2/48)、(17/48) 和 (29/48), 两组之间的显影分布存在明显统计学差异 ($P < 0.05$)。MD 耳的前庭导水管显影评分为 1.00 (0.00, 1.75), 正常对照组的评分 2.00 (1.00, 2.00), MD 耳的前庭导水管显影评分显著低于正常对照组 ($P < 0.05$)。MD 患侧的平均前庭长径和短径、骨岛面积、球囊最大前后径和深度分别为 5.81 ± 0.43 mm、 2.14 ± 0.42 mm、 9.77 ± 2.60 mm²、 2.46 ± 0.44 mm 和 0.63 ± 0.19 mm, 正常对照组的平均前庭长径和短径、骨岛面积、球囊最大前后径和深度分别为 5.74 ± 0.26 mm、 2.29 ± 0.37 mm、 9.53 ± 2.31 mm²、 2.40 ± 0.38 mm 和 0.57 ± 0.15 mm, 两组之间内耳骨性指标均无明显统计学差异 ($P > 0.05$)。MD 侧耳的耳蜗和前庭积水程度与前庭导水管的显影评分均明显相关 ($P < 0.05$)。

结论: 内耳膜迷路积水不影响前庭骨性结构, 前庭导水管狭窄可能与梅尼埃病有关。

PO-0798

动脉自旋标记成像在干燥综合征腮腺损伤评估与诊断中的价值

张高正博、丁长伟、樊晓雪、田曼婷、蒋继萱
中国医科大学附属盛京医院

摘要目的: 探讨动脉自旋标记 (arterial spin labeling, ASL) 技术在干燥综合征 (sjögren's syndrome, SS) 诊断及腮腺损伤评估中的应用价值。

材料与方法: 前瞻性纳入 2021 年 8 月至 2022 年 10 月首次确诊的 SS 患者 54 例, 健康志愿者 35 例, 所有患者及健康志愿者接受双侧腮腺常规 MRI 及 ASL 检查, 随后在 ASL 伪彩图与 T1WI 融合图像中手动绘制感兴趣区 (region of interest, ROI), 得到腮腺的血流量 (blood flow, BF)。由两位医生将 SS 患者按照 MRI 形态学分级标准分为 0-4 级。采用非参数 Mann-Whitney U 检验比较健康志愿者与 SS 患者 BF 的差异性, 对于不同 MRI 形态学分级间 BF 的比较, 采用 Kruskal-Wallis

test, 采用 Spearman 秩和检验分析腮腺 MRI 形态学分级与 BF 的相关性。采用 Logistic 回归联合受试者工作特征 (receiver operating characteristic, ROC) 曲线评价 MRI 形态学分级、BF 及二者联合对 SS 患者的诊断效能。

结果: 0-3 级 SS 患者的 BF 均高于健康志愿者, 差异有统计学意义 ($P<0.05$), 4 级 SS 患者的 BF 与健康志愿者差异无统计学意义 ($P=0.699$)。腮腺 MRI 形态学分级 (0-3 级) 与 BF 呈强相关 ($r=0.785$, $P<0.001$)。基于 BF 的诊断效能 ($AUC=0.863$) 高于 MRI 形态学分级 ($AUC=0.806$), 但差异无统计学意义 ($P=0.09$), BF 与 MRI 形态学分级联合诊断的 AUC ($AUC=0.930$) 高于单独 MRI 形态学分级或单独 BF, 差异存在统计学意义 ($P<0.001$)。

结论: BF 对 SS 患者的诊断效能较高, BF 与 MRI 形态学分级联合能够提高诊断效能, 基于 ASL 技术获得的 BF 定量参数在 SS 患者腮腺损伤评估与诊断中具有一定意义, 是一种常规 MRI 诊断的重要补充工具。

PO-0799

双能量 CT 在缺血性卒中患者脑动脉机械取栓术后鉴别出血及对比剂外渗中的应用

杨旭

空军军医大学西京医院

目的: 探讨 Siemens 第三代 Force 双源 CT 虚拟平扫 (Virtualnon-contrast, VNC) 技术对缺血性卒中患者介入治疗后发生出血或对比剂外渗的鉴别诊断价值。方法: 回顾性分析我院 2021 年 10 月至 2023 年 2 月 173 例缺血性卒中患者介入治疗术后, 1 小时内利用双源 CT 双能量成像技术行头颅 CT 扫描, 将薄层图像传至 Siemens Syngo. Via VB10 工作站, 使用双能量软件处理并重建虚拟平扫 (VNC) 和碘分布 (IOM) 图像, 根据 VNC 和 IOM 图像不同组合分为: 1、出血, 即 VNC 图像上存在高密度灶, 而 IOM 图像上未见高密度灶; 2、出血合并对比剂外渗, 即 VNC 和 IOM 图像上均可见高密度灶; 3、对比剂外渗, 即 VNC 图像上无高密度灶, 而 IOM 图像上存在。以术后 24 至 72 小时的影像学随访检查和最终临床诊断结果为标准, 评价双能量 CT 成像鉴别介入术后出血及对比剂外渗的敏感性、特异性、误诊率、漏诊率、阳性预测率、阴性预测率、诊断准确率。结果: 173 例患者中, 双能量 CT 诊断单纯对比剂外渗的敏感性 100%、特异性 92.38%、误诊率 7.62%、漏诊率 0、阳性预测值 88.24%、阴性预测值 100%、诊断准确率 95.15%; 双能 CT 诊断对比剂外渗合并出血的敏感性 77.14%、特异性 99.23%、误诊率 0.07%、漏诊率 22.86%、阳性预测值 96.43%、阴性预测值 94.16%、诊断准确率 94.55%。结论: 双能量 CT 虚拟平扫技术能有效鉴别在神经介入术后造成的对比剂外渗或是再出血, 对指导临床治疗决策及患者预后评估具有很大的意义。

3D MRI 影像组学模型在颞下颌关节紊乱病患者翼外肌受损情况及严重程度的应用研究

陈艾琪¹、杜小萌¹、马宜传¹、吴志刚¹、钱宝鑫²、郭梁影¹、赵以惠¹

1. 蚌埠医学院第一附属医院

2. 慧影医疗科技(北京)有限公司

目的 探讨 MRI 影像组学在评估颞下颌关节紊乱病 (temporomandibular joint disorder, TMD) 患者翼外肌受损情况及严重程度中的作用, 为临床治疗提供支持。

资料与方法 对 174 位患者双侧颞下颌关节行 MRI 扫描, 除去不符合纳入标准的图像, 共得到 313 侧颞下颌关节影像, 将影像数据导入 Radcloud 平台。根据颞下颌关节盘是否移位分为正常组及移位组, 在矢状位 PDWI 图像上逐层勾画翼外肌感兴趣区 (region of interest, ROI), 后将勾画的所有 ROI 融合成三维容积感兴趣区。按照 8:2 将数据集随机分为训练集与测试集, 分别采用方差阈值法、单变量选择法及最小绝对收缩和选择算法筛选组学特征。使用支持向量机 (Support Vector Machine, SVM) 和逻辑回归 (Logistic regression, LR) 分类器训练模型, 绘制受试者工作特征曲线 ROC (Receiver operation characteristic) 曲线。测量移位组关节盘移位程度, 将移位组病例分为轻度组、中度组及重度组, 按照上述方法提取组学特征, 并进行降维处理。使用一对一方法, 建立了基于 SVM 或 LR 的 TMD 翼外肌损伤程度三类预测模型, 绘制 ROC 曲线。计算上述模型下训练集和测试数据的准确性、敏感性、特异性、精确率、F1-score、受试者工作特征曲线下面积 AUC (Area Under the ROC Curve) 及其 95%CI 以评估模型的性能。

结果 313 侧颞下颌关节中, 关节盘正常组占 33.5%; 移位组占 66.5%。移位组内轻度组占 29.8%; 中度组占 33.2%; 重度组占 37.0%。正常组、异常组 SVM 鉴别模型训练组、测试组 AUC 值分别为 0.80、0.77; LR 鉴别模型为 0.87、0.79。严重程度 SVM 鉴别模型为 0.80、0.77; LR 鉴别模型为 0.87、0.79。

结论 3D MRI 影像组学模型可初步作为 TMD 患者翼外肌功能评价的工具, 协助临床医生知悉患者翼外肌受损情况的演变进程, 有助于关节盘复位锚固术松解关节盘前附着时, 权衡对翼外肌上头附着点的松解程度。

PO-0801

Kartagener 综合征的多层螺旋 CT 诊断 (附 4 例报告)

杨燕、高瑾、周媛捷

云南省中医医院

目的 探讨 Kartagener 综合征 (Kartagener syndrome, KS) 的高分辨率 CT 表现, 提高对该病的诊断准确率。**方法** 回顾性分析 4 例 Kartagener 综合征患者的胸部及副鼻窦 MSCT 表现, 总结其 CT 表现特点。**结果** 4 例 Kartagener 综合征中, 完全型 3 例, 不完全型 1 例。所有病例均有全内脏转位, 表现为胸腹腔脏器均转位, 呈镜面像。心尖、主动脉弓及降主动脉右位; 双肺解剖结构与正常解剖呈镜面改变, 呈现左位中间段支气管、左位水平裂。肝脏、胆囊位于腹腔右侧; 脾脏、胃泡位于腹腔左侧。4 例患者均有不同程度支气管扩张, 其中 2 例患者呈现左肺中叶膨胀不全并支气管扩张。1 例出现左肺上叶舌段及右肺下叶支气管扩张。1 例出现双肺下叶细支气管炎。3 例完全型 KS 患者中 2 例合并上颌窦炎, 1 例合并全组副鼻窦炎。结论 Kartagener 综合征影像学检查均有内脏转位、支气管扩张, 伴或不伴副鼻窦炎, 是临床诊断的主要检查方法。

PO-0802

基于平扫 CT 影像组学对自发性脑出血短期内 血肿扩大风险的预测研究

于洋、乔琳、孙洪赞
中国医科大学附属盛京医院

目的：建立基于平扫 CT 图像脑出血周围水肿带的影像组学模型，并将其与临床模型、影像征象模型及联合模型进行比较，用以预测自发性脑出血患者短期内血肿扩大的风险。研究方法：回顾性分析了 2014 年 1 月至 2021 年 1 月就诊于我院经临床证实的自发性脑出血患者 139 例，所有患者均在发病后 12h 内进行了首次头 CT 平扫，复查 CT 时间在入院后 72h 内。血肿扩大定义为血肿相对体积增加 $>33\%$ 或绝对体积增加 $>6\text{ml}$ 。应用 LIFEx 软件勾画脑出血周围水肿带区域，提取纹理特征并构建影像组学模型。两位放射科医生共同评估影像征象。采用逻辑回归分析确定血肿扩大的独立危险因素。比较临床模型、影像征象模型、影像组学模型及联合模型的预测效能。构建 ROC 曲线评价模型的优劣并使用德隆检验评估模型间的差异。结果：139 例患者中有 51 例 (36.69%) 出现了短期血肿扩大。糖尿病、PLT、APTT、血肿边缘不规则、漩涡征、混杂密度征在血肿扩大组与非血肿扩大组之间具有显著差异 ($P<0.05$)。在临床模型中，糖尿病是 HE 的独立预测因子，训练集和验证集 AUC 分别为 0.673、0.781。在影像征象模型中，混杂密度征、漩涡征是 HE 的独立预测因子，训练集和验证集 AUC 分别为 0.698、0.763。影像组学模型表现最佳，训练集 AUC 值为 0.845，95% CI: 0.765-0.924，灵敏度：0.722，特异度：0.855；验证集 AUC 值为 0.787，95% CI: 0.641-0.933，灵敏度：0.733，特异度：0.769。联合模型相较临床模型、影像征象模型、影像组学模型均表现出更高的效能，训练集和验证集 AUC 分别为 0.899、0.944。结论：糖尿病、PLT、混杂密度征、漩涡征、影像组学评分是短期内血肿扩大的独立预测因素。基于头平扫 CT 构建的影像组学模型可以有效预测 ICH 患者短期血肿扩大。与临床模型、影像征象模型、影像组学模型相比，基于上述三者的联合模型在预测 HE 方面表现出更好的性能。

PO-0803

腮腺 T2mapping 磁共振成像在干燥综合征中的应用价值研究

张高正博¹、丁长伟²、田曼婷²、蒋继萱²
1. 中国医科大学附属第四医院
2. 中国医科大学附属盛京医院

目的：干燥综合征(SS)是一种病因不明的系统性自身免疫性疾病。T2mapping 技术分别能够从组织结构细微变化方面无创定量地评价 SS 患者的腮腺腺体相关改变，目前国内外鲜有 T2mapping 技术关于 SS 患者腮腺损伤的研究。本研究旨在探讨 T2mapping 技术在 SS 患者腮腺损伤评估及早期诊断的应用价值。

研究方法：本研究前瞻性纳入中国医科大学附属盛京医院 2021 年 8 月至 2022 年 10 月首次确诊的 SS 患者 54 例，健康志愿者 30 例，所有 SS 患者及健康志愿者接受双侧腮腺常规磁共振成像 (MRI) 及 T2mapping 检查。在 T2mapping 图像中手动绘制感兴趣区，得到 T2 值及 T2 值标准差，由两位医生将 SS 患者按照 MRI 形态学分级标准分为 0-4 级。比较 SS 患者与健康志愿者各参数的差异性采用非参数 Mann-Whitney U 检验，非参数 Kruskal-Wallis 检验用于比较相邻 MRI 形态学分级间各参差差异，Spearman 秩相关检验用于分析腮腺 MRI 形态学分级与 SS 患者各参数的相关性。Logistic 回归联合受试者工作特征 (ROC) 曲线用于评价 T2mapping 各参数鉴别健康志愿者与早期 SS 患者的诊断效能。

结果：SS 患者的腮腺 T2 值及 T2 值标准差高于健康志愿者 ($P<0.05$)，0-4 级 SS 患者腮腺的 T2 值及 T2 值标准差均高于健康志愿者 ($P<0.05$)。腮腺 MRI 形态学分级与 T2 值呈中等正相关

($r=0.547$, $P<0.001$), 腮腺 MRI 形态学分级与 T2 值标准差呈中等正相关 ($r=0.622$, $P<0.001$)。T2 值的 AUC 为 0.810, 敏感度为 79%, 特异度为 70%; T2 标准差的 AUC 为 0.649, 敏感度为 64%, 特异度为 65%。

结论: 腮腺的 T2 值及 T2 值标准差能够鉴别健康志愿者与 SS 患者, T2 值及 T2 值标准差可以体现不同程度脂肪沉积 SS 患者腮腺的相应改变, T2 值及 T2 值标准差三者联合可以提高诊断效能。T2mapping 技术在 SS 患者腮腺损伤评估与早期诊断中具有一定意义。

PO-0804

DCE-MRI 及 DKI 在鼻咽癌诱导化疗联合同步放化疗中的应用

杨晓玲、谢力斯、张静、陈科威、罗雨晴、余成新
湖北省宜昌市中心人民医院

目的: 探讨 DCE-MRI 及 DKI 定量参数单独和联合应用在预测鼻咽癌诱导化疗联合同步放化疗近期疗效中的价值。方法: (1) 自 2021 年 1 月至 2022 年 12 月回顾性收集 47 例经鼻咽镜活检病理证实为鼻咽癌的初诊患者, 所有患者接受诱导化疗联合同步放化疗前均行鼻咽部 DCE-MRI 及 DKI 序列扫描。(2) 飞利浦星云后处理工作站上测量 DCE-MRI 中的定量参数, 包括 K^{trans} 、 K_{ep} 、 V_e 、 V_p 。应用 MRlcroGL 及 MITK Diffusion 软件测量 DKI 中的定量参数, 包括 MD、MK。随访患者整个疗程结束的 6 个月后 MRI 检查结果。根据 RECIST1.1 评估近期疗效, 入组患者被分为治愈组和不完全治愈组。(3) 运用 SPSS26.0 软件进行统计分析, 对于计量资料组间比较采用 t 检验; 对于计数资料性别、TNM 分期、AJCC 分期 (分类变量、定性数据) 组间比较采用 χ^2 检验。在 Kolmogorov-Smirnov 检验获得的正态分布结果的基础上, 采用独立样本 t 检验或 Mann-Whitney U 检验分析两组治疗前 DCE-MRI 和 DKI 各参数的差异。通过 Logistic 回归和受试者工作特性曲线分析来检验单独及联合使用 DCE-MRI 和 DKI 参数在预测鼻咽癌近期疗效中的诊断效能。当 $P<0.05$ 认为差异有统计学意义。结果: (1) 治愈组的治疗前 K^{trans} 、 K_{ep} 值较不完全治愈组高 ($t=2.490$, $P=0.017$; $t=2.260$, $P=0.029$), 治愈组的治疗前 MD 值较不完全治愈组低 ($t=2.602$, $P=0.012$), 两组间的治疗前 K^{trans} 、 K_{ep} 和 MD 值均具有统计学差异。(2) 治疗前 K^{trans} 、MD 联合及 K^{trans} 、 K_{ep} 、MD 联合 AUC 最大, 均为 0.778, $P=0.01$ 。结论: 治疗前 DCE-MRI 中的 K^{trans} 和 K_{ep} 值及 DKI 中的 MD 值能够对鼻咽癌患者诱导化疗联合同步放化疗结束后 6 个月的疗效进行预测, 其中 K^{trans} 值预测效能更高。与单独使用 DCE-MRI 或 DKI 序列相比, DCE-MRI 与 DKI 序列联合应用可以获得更高的诊断准确性, 为鼻咽癌个体化治疗提供有力的支持和影像学依据。

PO-0805

能量 CT 在头颈癌诊断和随访中的临床价值

吴飞云
江苏省人民医院 (南京医科大学第一附属医院)

头颈癌是临床常见和重大疾病, 准确地早期诊断、治疗后的精准随访与评估对制定个体化治疗方案、改善患者预后具有重要的意义。

能量 CT 近年来发展迅速。除了提供传统的解剖学信息外, 能量 CT 还能提供很多定量参数与图谱, 为头颈癌的诊断、鉴别诊断、随访监测提供了新方法和新理论。

因此, 本文旨在结合近年来的文献进展和团队的临床、科研工作经验, 讨论能量 CT 在头颈癌诊断和随访中的临床价值。

PO-0806

MARS 成像技术在颅内动脉瘤血流导向装置术后的应用

刁乙珂

四川大学华西医院

目的：探讨 MARS 成像技术在颅内动脉瘤血流导向装置术后 CTA 中的临床应用价值。

方法：对 20 例颅内动脉瘤介入血流导向装置术后患者，在 GE Revolution APEX 上行 MARS 去金属伪影 CTA 成像，同时重建常规组作为对照组。比较常规组和 MARS 组图像的对比噪声比(CNR)以及主观图像质量评分，比较两组周围软组织的可视化差异。

结果：常规组和 MARS 组客观和主观数据间有统计学意义。与常规组对比,MARS 组的 SD 值、AI 值及主观评分差异均有统计学意义($P<0.05$);MARS 组可显著提高周围软组织的可视化。

结论：Mars 成像技术能有效去除血流动力学装置金属伪影,提高图像质量，显示颅内动脉瘤术后周围组织细微结构。

PO-0807

**腮腺中酰基质子转移成像 B1 强度调整：
一种图像质量调整策略及肿瘤检测可行性评估**伍晓倩、苏童、陈钰、徐振潭、王小奇、胡格丽、王云婷、张竹花、张涛、金征宇
北京协和医院东单院区

目的：在以往的研究中，应用酰胺质子转移加权 (APT_w) 成像方案评估肿瘤和腮腺时，不均匀性和高信号伪影仍然是一个障碍。本研究旨在提高 APT_w 成像质量，并评估具有不同 B1 值的 APT_w 图像检测腮腺肿瘤的可行性。

方法：共有 35 例腮腺肿瘤患者参与本研究。4 例患者因严重运动 (n=2) 或牙齿金属伪影 (n=2) 排除。患者在 3.0T 扫描仪上接受了三个序列的 T2WI 和 3D TSE APT_w 成像 (B1=2 μ T、1 μ T 和 0.7 μ T 对应 APT 1、2、3 序列)。由两名放射科医生独立评估，使用 4 分量表 (1=差，4=优) 最终确定 APT_w 图像质量的完整性和高信号伪影。比较了三个序列的图像质量，获得可评估组 (完整性得分>1) 和可信任组 (完整度得分>1 和高信号得分>2) 再在两组中进行正常腮腺组织和肿瘤的 APT_{mean} 比较。

结果：APT2 和 APT3 序列中肿瘤和腮腺的高信号伪影均少于 APT1 (均 $p<0.05$)。随着 B1 值的降低，APT2 中的肿瘤的完整性不如 APT1，APT3 中的肿瘤完整性低于 APT2 (分别为 $p=0.021$ 和 0.002)。在 APT1 序列中，肿瘤的 APT_{mean} 高于腮腺，但并不显著 (3.18% \pm 2.74% 对 2.21% \pm 2.12%， $p=0.014$)，但 APT_{mean} 差值 (APT_{mean}1-APT_{mean}2) 有显著差异 (2.59% \pm 2.48% 对 0.75% \pm 1.20%， $p=0.001$)。

结论：应用较低的 B1 值可以消除腮腺成像的高信号伪影，但也可能损害完整性；组合不同的 APT_w 序列可能提升肿瘤检测的可行性。

PO-0808

血管壁磁共振成像 3D 及 2D 序列评估大脑中动脉狭窄度的价值

张俊¹、尹雪梅¹、李文菲¹、赵晓慧^{1,2}、孙梦^{1,2}、吴磊¹、牛洪涛¹、刘兰祥¹

1. 秦皇岛市第一医院

2. 河北医科大学附属临床医学院

分别比较磁共振高分辨率血管壁成像 (Magnetic resonance high-resolution blood vessel wall imaging HR-MR-VWI) 3D 及 2D 序列与数字减影血管造影 (Digital subtraction angiography DSA) 评估大脑中动脉 (middle cerebral artery MCA) 狭窄率的一致性并评价其对重度狭窄及闭塞的诊断效能。资料与方法:回顾性收集 2022 年 03 月 01 日~2023 年 08 月 31 日期间接受 HR-MR-VWI 检查证实大脑中动脉狭窄和闭塞并行 DSA 手术的 80 名患者, 2 名神经放射及介入医师对纳入图像分别进行了测量方法的一致性评估, 在一致性良好的情况下, 其中 1 名高年资神经放射诊断医师对 HR-MR-VWI 3D 及 2D 多序列图像用 WASID 直径法计算 MCA-M1 段的狭窄率, 依据血管的狭窄率评估其狭窄度, 1 位高年资神经介入医师依据 WASID 直径法对纳入病例的 DSA 图像进行 MCA-M1 段评估其狭窄度, 利用一致性相关系数 (CCCs) 法评估 HR-MR-VWI 多序列与 DSA 测量 MCA-M1 段狭窄率之间的一致性; 并绘制 ROC 曲线, 评估 3D 及 2D 多序列图像诊断 MCA-M1 段重度狭窄 (狭窄率 $\geq 70\%$) 及闭塞的最佳诊断效能。结果: 2 名神经放射及介入医师测量方法的一致性良好, HR-MR-VWI 多序列与 DSA 的总体一致性非常好, CCC=0.924; HR-MR-VWI 多序列与 DSA 评估 MCA-M1 段闭塞的诊断效能 ROC 曲线下面积 (AUC) 为 0.820; HR-MR-VWI 多序列评估 MCA-M1 段重度狭窄的诊断效能 ROC 曲线下面积 (AUC) 分别为 3D 平扫=0.597、3D 强化=0.616、2D 平扫 T1WI =0.571、2D 平扫 T2WI =0.554、2D 强化 T1WI =0.625。结论: HR-MR-VWI 的 3D 及 2D 序列评估 MCA-M1 狭窄率与 DSA 比较总体一致性非常好, 评估 MCA-M1 段闭塞的诊断效能良好, 评估 MCA-M1 段重度狭窄的诊断效能中等。

PO-0809

眼眶孤立性纤维瘤影像表现及病理分类对照分析

唐言

上海交通大学医学院附属第九人民医院

目的 探讨分析眼眶孤立性纤维瘤 (SFT) 的常规 MRI、DWI、DCE-MRI 影像特点及病理、临床特征, 提高对该病的影像诊断正确率。方法 回顾性分析我院 2011 年~2022 年 24 例经手术病理证实的眼眶 SFT 的临床特点、病理学、MRI 图像等资料。MRI 图像包括平扫、DWI、DCE-MRI, 并获取时间-信号强度曲线 (TIC)、测量峰值强化指数 (CIpeak)、最大强化率 (ERmax) 和流出率 (WR); DWI b 值取 0、1000 s/mm², 测量病灶的表观扩散系数 (ADC) 值。结果 24 例眼眶 SFT 均为单发病变, 其中 3 例为复发患者, 病理上非典型 SFT 1 例。患者男女比例 13: 6, 年龄 22 岁~74 岁。临床表现眼球突出 20 例, 眼睑肿胀 10 例, 视力下降、视物重影、模糊 9 例, 溢泪 8 例, 眼球运动受限 5 例。影像病变位置上 3 例发生于肌锥内间隙, 14 例发生于肌锥外间隙, 7 例发生于跨肌锥内外间隙; 形状上 18 例肿瘤影像形态较规则, 呈类圆形、类椭圆形, 6 例肿瘤形态不规则, 最大径 2.5~5.5cm。常规信号特点相对于脑灰质, T1WI 上呈等、稍低信号, T2WI 上呈等、稍低或稍高信号 (4 例内见囊样信号), 22 例病变于肿瘤边缘或内部有流空血管影, 1 例伴有骨质破坏。增强后所有病灶明显较均匀一致强化 (共 4 例内见囊样无强化信号区)。DCE-MRI 获取的 TIC 曲线呈速升平台型或速升缓降型, CIpeak 0.95 \pm 0.23, ERmax 1.37 \pm 0.54, WR 6.58% \pm 3.66%, 平均 ADC 值为 (1.08 \pm 0.30) $\times 10^{-3}$ mm²/s, 4 例易复发、低度恶性潜能 ADC 值 (0.7~1.0) $\times 10^{-3}$ mm²/s, 平均 (0.85 \pm 0.13) $\times 10^{-3}$ mm²/s。结论 眼眶 SFT 见于成人, 好发于中青年男性, 临床表现多以眼球突出或眼睑肿胀多见, 眼眶单发肿块, 常规 T2WI 以等、稍低信号、边缘或内部流空血

管影较具特征性,联合 C_lpeak、ER_{max}、WR、TIC 类型及 ADC 值有助于眼眶 SFT 影像诊断正确率,其中 ADC 值低于 1.0×10⁻³mm²/s 提示恶性潜能。

PO-0810

IgG4 相关性疾病累及中耳的临床、病理与影像学表现

闫钟钰、王潇
北京同仁医院

目的 总结 IgG4 相关性疾病(IgG4-RD)累及颞骨中耳的临床特点及 CT 表现,以提高对该病的认识。方法 回顾性分析 7 例经手术病理确诊为 IgG4-RD 患者的临床表现、实验室资料、CT 表现、病理结果等。结果 与渗出性中耳炎相比, IgG4-RD 中耳炎临床表现无明显特异性; 白细胞计数及分类无异常,血清 IgG 水平升高,尤其是 IgG4 显著升高; CT 表现为中耳鼓室内软组织影,包绕听小骨、鼓膜增厚、覆盖前庭窗等; 鼓室内软组织病理学表现为大量淋巴细胞及浆细胞浸润和纤维化;糖皮质激素及免疫抑制剂治疗有效。结论 IgG4-RD 累及中耳乳突临床症状缺乏特异性,CT 表现鼓膜增厚,鼓室及乳突窦内肉芽肿样软组织影,双侧发病、鼓室内软组织密度不均匀,不伴有听小骨及邻近骨质破坏缺损,常伴有泪腺及鼻窦多器官累及有一定特征,易误诊或漏诊,需提高对该病的认识。

PO-0811

干燥综合征腮腺超声评分与 MRI 脂肪分级的相关性研究

蒋继萱、丁长伟
中国医科大学附属盛京医院

目的: 探讨干燥综合征(Sjögren's syndrome, SS)患者腮腺超声评分与 MRI 脂肪分级的相关性,提高对 SS 超声图像的认识。方法: 收集 28 例 SS 患者行双侧腮腺超声扫查及 MRI, 分别根据超声声像图和 MRI 脂肪沉积程度进行评分或分级, 分析二者的相关性和一致性。结果: 超声评分与 MRI 脂肪分级有很高的相关性(Spearman's 相关系数 $r_s=0.927$, $P=0.000$)和一致性(Kappa 值为 0.706, $P=0.000$)。结论: SS 患者腮腺超声评分与 MRI 脂肪分级具有很高的相关性和一致性,二者都是评价 SS 患者腮腺的病损程度的重要影像手段。

PO-0812

CTA-confirmed aortic in-stents floating thrombus after endovascular stenting

Lijie Zhang, Chuansheng Zheng, Bin Liang, Heshui Shi
Department of Radiology, Hubei Key Laboratory of Molecular Imaging, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1277 Jiefang Road, Wuhan 430022, China.

Background: Aortic in-stents floating thrombus (ASFT) is a rare complication after the stenting. CTA examination is recommended as the preferred imaging examination. The evolution of ASFT on CTA imaging and the treatment options remain under investigations.

Purpose: To study the imaging manifestations on computed tomography angiography (CTA), so as to make a definitive, timely diagnosis and to explore the safe and effective treatment options.

Materials and Methods: The imaging features of ASFT confirmed by CTA were retrospectively analyzed, such as the location, morphology, size, concomitant and dynamic changes during the

follow-up. The main laboratory tests before and after the surgery were recorded and the treatment protocol was also involved.

Results: Totally, 1626 cases were screened, and 10 cases were enrolled. The incidence rate of ASFT was 0.62% (10/1626). The higher trend was demonstrated in FIB, PT and D-dimer level before the surgery, while only the D-dimer level increased during the postoperative period ($P < .001$). Twenty-one ASFTs were detected by the CTA examination during the follow-up. The imaging manifestation of ASFT could be divided into 3 different types. Type 1, striated, irregular, or sheet-like in appearance, usually to be short. Type 2, striped in appearance with the head and tail of the thrombus connected to the inner wall of the stent. Type 3, a free-floating middle section in the cavity with one or multiple attachment points to the thickened inner stent wall. There were 7, 11, 3 ASFTs were classified as type 1, 2, 3, respectively. Spleen infarction occurred in 1 patient when ASFT developed. During the follow-up, the thrombus in 6 patients disappeared, while the lesions remained stable in 4 patients. Renal infarction occurred in 1 case. No new-onset ASFT occurred, and no patients died.

Conclusion: ASFT is an extremely rare disease. The concomitant disorders and postoperative hemodynamic changes could be the likely cause of ASFT. CTA examination presented as a safe and preferred imaging modality for evaluating the evolution and prognosis of ASFT. Conservative treatment may be a useful and effective option.

PO-0813

Analysis of Multislice Spiral CT Coronary Angiography Diagnosis of Vieussens Artery Ring, Coronary Pulmonary Fistula, and Aneurysm Triple Syndrome

Qin Xiao

Daping Hospital, Army Medical Center, Military Medical University

[abstract]

Background: The Vieussens arterial ring is a collateral pathway between the left and right conus branches of the coronary artery, often accompanied by coronary pulmonary artery fistula and aneurysm. MSCT coronary angiography has become the main non-invasive coronary artery imaging technology, providing detailed three-dimensional imaging of coronary arteries.

Objective: To explore the diagnostic value of multi-slice spiral CT angiography for Vieussens arterial ring, coronary pulmonary artery fistula, and aneurysm triple syndrome.

Method: A retrospective analysis was conducted on patients who had undergone coronary artery CTA and had Vieussens arterial ring, coronary pulmonary artery fistula, and aneurysm. The original images and clinical data were collected, and various post-processing techniques were performed on the original images, including multiplanar reconstruction (MPR), curved surface reconstruction (CPR), maximum density projection (MIP), and volume reconstruction (VR). The diameter of the pulmonary artery fistula and aneurysm were measured and recorded.

Result: Among the 22 patients with Vieussens arterial ring, 20 were complicated with coronary pulmonary artery fistula. Among them, there were 18 cases with "jet sign" and 14 cases with "thick staining sign" at the pulmonary artery fistula opening; There were 20 cases of combined aneurysms. There were 18 patients with Vieussens arterial ring, coronary pulmonary artery fistula, and aneurysm triple syndrome. Clinical manifestations included chest pain in 4 cases, palpitations in 7 cases, dyspnea in 4 cases, and asymptomatic symptoms in 4 cases. The mean length and 95% confidence interval of pulmonary artery fistula were (3.3 ± 1.3) mm and 2.6-3.9mm, while the mean length and 95% confidence interval of aneurysm were (15.0 ± 11.6) mm and 8.8-21.1mm.

PO-0814

CT-Based Radiomic Nomogram for the Prediction of Chronic Obstructive Pulmonary Disease in Patients with Lung cancer

Taohu Zhou, Li Fan
shanghai changzheng hospital

Rationale and Objectives: To develop and validate a model for predicting chronic obstructive pulmonary disease (COPD) in patients with lung cancer based on computed tomography (CT) radiomic signatures and clinical and imaging features.

Materials and Methods: We retrospectively enrolled 443 patients with lung cancer who underwent pulmonary function test as the primary cohort. They were randomly assigned to the training ($n = 311$) or validation ($n = 132$) set in a 7:3 ratio. Additionally, an independent external cohort of 54 patients was evaluated. The radiomic lung nodule signature was constructed using the least absolute shrinkage and selection operator algorithm, while key variables were selected using logistic regression to develop the clinical and combined models presented as a nomogram.

Results: COPD was significantly related to the radiomics signature in both cohorts. Moreover, the signature served as an independent predictor of COPD in the multivariate regression analysis. For the training, internal, and external cohorts, the area under the receiver operating characteristic curve (ROC, AUC) values of our radiomics signature for COPD prediction were 0.85, 0.85, and 0.76, respectively. Additionally, the AUC values of the radiomic nomogram for COPD prediction were 0.927, 0.879, and 0.762 for the three cohorts, respectively, which outperformed the other two models.

Conclusion: The present study presents a nomogram that incorporates radiomics signatures and clinical and radiological features, which could be used to predict the risk of COPD in patients with lung cancer with one-stop chest CT scanning.

PO-0815

CT whole lung radiomics nomogram: a potential biomarker for lung function evaluation and identification of COPD

Taohu Zhou, Li Fan
shanghai changzheng hospital

Purpose: To explore the performance of CT-based whole lung radiomics for the discrimination chronic obstructive pulmonary disease (COPD) from the normal subjects in five centers.

Materials and Methods: A total of 2785 subjects with pulmonary function test from five hospitals were enrolled in this retrospective study, and classified into normal subjects and COPD patients. Radiomic features were extracted from the whole lung volume. The least absolute shrinkage and selection operator logistic regression was applied for feature selection and radiomics signature construction. A radiomics nomogram combining the radiomics score and clinical factors were established. The receiver operating characteristic curve and decision curve analysis (DCA) were used to evaluate the predictive performance of the radiomics nomogram in the training cohort, internal validation, and independent external validation cohorts.

Results: Eighteen radiomics features collected from whole lung volume were applied in the construction of a radiomics model. The area under the curve (AUC) of our radiomics model in the training, internal and independent external validation cohorts was 0.89(0.87-0.91), 0.874(0.84-0.90) and 0.85(0.82-0.87), respectively. Moreover, the nomogram integrating radiomics score, age, gender, height, and smoking status, yielded better performance in the above three cohorts (AUC 0.89, 0.87 and 0.85, respectively). The model clinical usefulness was verified through DCA.

Conclusions: The CT-based whole lung radiomics, with an intuitive presentation of nomogram, showed good performance to identify COPD with high accuracy in this multicenter study.

PO-0816

Correlation between features of intra-nodular vessels and tumor invasiveness of lung adenocarcinoma presenting as ground-glass nodules: A deep learning 3D reconstruction algorithm-based quantitative analysis on non-contrast CT images

Baolian Zhao,Xiang Wang,Ke Sun,Han Kang,Kai Zhang,Hongkun Yin,Kai Liu,Yi Xiao,Shiyuan Liu
海军军医大学第二附属医院

Purpose: To evaluate the role of quantitative features of intra-nodular vessels based on deep learning (DL) in distinguishing pulmonary adenocarcinoma invasiveness.

Materials and Methods: This retrospective study included 512 confirmed ground glass nodules (GGNs) from 474 patients with 241 precursor glandular lesions (PGL), 126 minimally invasive adenocarcinomas (MIA), and 145 invasive adenocarcinomas (IAC). The pulmonary blood vessels were reconstructed on non-contrast CT (NCCT) images using DL-based region-segmentation and region-growing techniques. The presence of intra-nodular vessels was evaluated based on the automatic calculation of vessel prevalence, vascular categories, and vessel volume percentage. Further comparisons were made between invasive groups by the Mantel-Haenszel chi-square test, chi-square test, and ANOVA.

Results: The detection rate of intra-nodular vessels in PGL (33.2%) was significantly lower than that of MIA (46.8%, $p = 0.011$) and IAC (55.2%, $p < 0.001$), while the vascular categories were similar (all $p > 0.05$). Vascular changes were more common in IAC and MIA than in PGL, mainly in increased vessel volume percentage ($12.4 \pm 19.0\%$ vs $6.3 \pm 13.1\%$ vs $3.9 \pm 9.4\%$, $p < 0.001$). The average intra-nodular artery and vein volume percentage of IAC ($7.5 \pm 14.0\%$ and $5.0 \pm 10.1\%$) was higher than that of PGL ($2.1 \pm 6.9\%$ and $1.7 \pm 5.8\%$) and MIA ($3.2 \pm 9.1\%$ and $3.1 \pm 8.7\%$), with statistical significance (all $p < 0.05$).

Conclusions: The quantitative analysis of intra-nodular vessels on NCCT images demonstrated that the GGNs with increased internal vessel prevalence and volume percentages had higher possibility of tumor invasiveness.

PO-0817

Radiomic features add incremental benefit to conventional radiological feature-based differential diagnosis of lung nodules

Li Li,Zhou Liu,Yongsheng Xie,Honghong Luo,Qian Yang,Li jian Liu,Dehong Luo
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital & Shenzhen Hospital,
Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose

To investigate the incremental benefit of radiomic features to radiological feature-based differential diagnosis between benign and malignant lung nodules.

Materials & Methods

From May 2017 to March 2021, 393 patients with 465 pathologically confirmed lung nodules (benign: malignant = 205: 260) were enrolled. Based on manually segmented lung nodules, 1409 radiomic features were extracted. Sixteen radiological features were obtained. The least absolute shrinkage and selection operator (LASSO) was used to select the most informative features from the radiomic features set and radiological features set separately. Support vector machine (SVM) and logistic regression (LR) were used to build the models (radiomic model, radiological model, and combined model). Receiver operating characteristic (ROC) analysis was used to evaluate model performance with the area under the curve (AUC) compared using the DeLong test.

Results

After feature selection, six radiological features, including shape, vascular convergence sign (type III), margin, density, pleural traction sign, and spiculation, and nine radiomic features (2 first-order statistics features and 7 texture features) were selected. In the independent testing, radiological models had insignificantly higher AUCs than the corresponding radiomic models for both the SVM classifier (AUC: 0.803 vs. 0.773, $P = 0.635$) and LR classifier (AUC: 0.818 vs. 0.742, $P = 0.229$). However, they had significantly inferior performance than that of the corresponding combined models for both the SVM classifier (AUC: 0.803 vs. 0.871, $P = 0.015$) and LR classifier (AUC: 0.818 vs. 0.871, $P = 0.034$).

Conclusion

Radiomic features could add incremental benefit to conventional radiological feature_x0002_based differential diagnosis.

PO-0818

Risk Stratification Study of Non-calcified Coronary Plaques based on CT Pericoronary Adipose Tissue Measurement

Xiaoying Liu^{1,2}, Jie Jiang¹, Jun Li¹, Hui Duan¹, Jiayao Hu², Dan Han¹

1. the First Affiliated Hospital of Kunming Medical University

2. Baoshan People's Hospital

Objective To investigate the relevance of risk stratification of non-calcified plaques from different perspectives based on pericoronary fat attenuation index measurements.

Methods The CT angiography images and clinical data of 269 hospitalized patients with suspected coronary heart disease were retrospectively collected and divided into four groups according to the degree of luminal stenosis, including 60 patients in the normal group, 103 patients in the mild group, 63 patients in the moderate group and 43 patients in the severe group (only non-calcified plaques were present in the coronary arteries of the lesion group). The CT value, long diameter and short diameter of non-calcified plaque were measured. They were divided into three groups according to the CT attenuation value of plaques, including 21 patients in the low-attenuation group (CT value ≤ 30 HU), 84 patients in the medium-attenuation group ($30 < \text{CT value} \leq 50$ HU), and 104 patients in the high-attenuation group ($50 < \text{CT value} \leq 120$ HU). They were also divided into 106 patients with significant stenosis ($\geq 50\%$ stenosis) and 103 patients with nonsignificant stenosis ($< 50\%$ stenosis) according to whether coronary luminal stenosis caused by non-calcified plaques was clinically significant. According to whether $\text{FAI} \geq -70.1$ HU, 86 patients were divided into FAI high-risk group ($\text{FAI} \geq -70.1$ HU) and 183 patients into FAI low-risk group ($\text{FAI} < -70.1$ HU). Pericoronary adipose tissue was extracted and corresponding FAI values were obtained on digital coronary CT angiography image analysis software. To analyze the correlation between coronary artery non-calcified plaque and pericoronary fat measurement under different morphological parameters; The correlation between coronary non-calcified plaques under different morphological parameters and pericoronary fat measurements was analyzed; the differences in gender, age, plaque CT value, plaque diameter and clinical metabolic factors between the high-risk and low-risk groups of FAI were analyzed.

Results There were significant differences in sex, age, systolic blood pressure and FAI between the normal coronary artery group and the diseased group ($P < 0.05$). The FAI value in the diseased group was significantly higher than that in the normal group. The increase of luminal stenosis was positively correlated with the short diameter of non-calcified plaques ($R_s = 0.543$, $P < 0.05$), FAI value ($R_s = 0.534$, $P < 0.05$) and systolic blood pressure ($R_s = 0.156$, $P < 0.05$), and negatively correlated with plaque CT value ($R_s = -0.430$, $P < 0.05$). There was no significant correlation between different degrees of coronary artery stenosis and diastolic blood pressure, total cholesterol, triglyceride, low-density lipoprotein, high-density lipoprotein, uric acid, and fasting blood glucose. There were significant differences in FAI values between non-calcified plaques with different degrees of stenosis ($P < 0.05$), and there were significant differences in FAI values between the mild group and the moderate and severe groups ($P < 0.05$), but there was no significant difference in FAI values between the moderate and severe groups ($P > 0.05$). There were significant differences in FAI values between non-calcified plaques with different CT attenuation values ($P < 0.05$), and there were significant differences in FAI values between the low-attenuation group and the medium and high attenuation groups ($P < 0.05$), but there was no significant difference in FAI values between the medium attenuation group and the high attenuation group ($P > 0.05$). There was no gender difference in FAI value and the degree of coronary luminal stenosis between the significant stenosis group and the non-significant stenosis group ($P > 0.05$). There were significant differences in plaque short diameter, plaque CT value and FAI value around the plaque between the two groups ($P < 0.05$). The critical value of FAI value between the two groups was -69.5 HU. There was no significant difference in age and plaque long diameter between the two groups ($P > 0.05$). Men in the high-risk group of coronary FAI accounted for a higher proportion, plaque CT values in the high-risk group of FAI were lower than those in the low-risk group of FAI ($P < 0.05$), plaque short diameter in the high-risk group of FAI was higher than that in the low-risk group of FAI ($P < 0.05$), and plaque short diameter ROC area under the curve (AUC) was 0.659 [95% confidence interval (CI) 0.583 ~ 0.734].

Conclusion Based on the FAI value, a functional level risk stratification assessment of non-calcified coronary plaques can be performed, which is expected to predict the severity of coronary artery disease and the occurrence of acute coronary syndromes.

PO-0819

Solid Nodular Non-small Cell Lung Cancer: Spectral CT for Preoperative Diagnosis of N2 Station Lymph Nodes Metastasis

Yong Wang¹, Guanbin Zhu¹, Jin-an Wang¹, Minjie Li², Huita Wu³, Yongjun Zhang⁴

1. Department of Radiology, Zhongshan Hospital of Xiamen University, School of Medicine, Xiamen University, Xiamen, China
2. Department of Thoracic Surgery, Zhongshan Hospital of Xiamen University, School of Medicine, Xiamen University, Xiamen, China
3. Department of Oncology, Zhongshan Hospital of Xiamen University, School of Medicine, Xiamen University, Xiamen, China
4. Department of Pathology, Zhongshan Hospital of Xiamen University, School of Medicine, Xiamen University, Xiamen, China

Objective: To evaluate the diagnostic value of spectral CT for the preoperative diagnosis of N2 station lymph nodes metastasis in solid nodular non-small cell lung cancer (NSCLC).

Materials and Methods: For this retrospective study, dual-phase contrast agent-enhanced CT was performed in patients with NSCLC from September 2019 to September 2022. Quantitative spectral CT parameters measurement were performed by 2 radiologists independently. Logistic regression analysis and Delong test were performed.

Results: 60 NSCLC patients (mean age, 62.85 years \pm 8.49, 44men) were evaluated. A total of 121 lymph nodes (38 with metastasis) were enrolled. There was no significant difference in the slope of the spectral Hounsfield unit curve (λ Hu) on arterial phase (AP) or venous phase (VP) between primary lesions and metastatic lymph nodes ($P>0.05$), but significant difference in VP λ Hu between primary lesions and non-metastatic lymph nodes ($P<0.001$). The CT40KeV, λ Hu, normalized iodine concentration (nIC), normalized effective atomic number (nZeff) measured during both AP and VP were significantly lower in metastatic lymph nodes than in non-metastatic lymph nodes ($P<0.05$). The short diameter (S) of metastatic lymph nodes was higher than non-metastatic lymph nodes ($P<0.001$). Area under the curve (AUC) for S performed the highest (0.788) in diagnosing metastatic lymph nodes. When combined with VP λ Hu, VP nZeff, AUC increased to 0.871.

Conclusion: Spectral CT is a complementary means for the preoperative diagnosis of N2 station lymph nodes metastasis in solid nodular NSCLC. The combined parameters have higher diagnostic efficiency.

PO-0820

CT-Based Whole Lung Radiomics Nomogram: A Tool for Identifying the Risk of Cardiovascular Disease in Patients with Chronic Obstructive Pulmonary Disease

Xiaoqing Lin¹, Taohu Zhou¹, Jiong Ni², Yu Guan¹, Jie Li¹, Xin'ang Jiang¹, Xiuxiu Zhou¹, Yi Xia¹, Fangyi Xu³, Hongjie Hu³, Shiyuan Liu¹, Li Fan¹

1. Shanghai Changzheng Hospital

2. Tongji Hospital

3. Zhejiang University School of Medicine Sir Run Run Shaw Hospital

Rationale and Objectives: To evaluate the value of CT-based whole-lung radiomics nomogram for identifying the risk of cardiovascular disease in patients with chronic obstructive pulmonary disease.

Materials and Methods: 974 patients with COPD were divided into a training cohort (n=402), an internal validation cohort (n=172) and an external validation cohort (n=400) from three hospitals. Clinical data and CT findings were analyzed. Radiomics features of whole lung were extracted from the non-contrast chest CT images. A radiomics signature was constructed with algorithms. Combined with the radiomics score and independent clinical factors, multivariate logistic regression analysis was used to establish a radiomics nomogram. ROC curve was used to analyze and evaluate the prediction performance of the model.

Results: Age, weight, BMI, and gender were the independent clinical factors. 1218 features were extracted and reduced to 15 features to build the radiomics signature. In the training cohort, the combined model (area under the curve [AUC], 0.731) showed better discrimination capability ($p < 0.001$) than the clinical factors model (AUC, 0.605). In the internal validation cohort, the combined model (AUC, 0.727) performed better ($p=0.032$) than the clinical factors model (AUC, 0.629). In the external validation cohort, the combined model (AUC, 0.725) performed better ($p < 0.001$) than the clinical factors model (AUC, 0.690). Decision curve analysis presented the radiomics nomogram outperformed the clinical factors model in terms of clinical usefulness.

Conclusion: The CT-based whole lung radiomics nomogram has the potential to identify the risk of cardiovascular disease in patients with chronic obstructive pulmonary disease.

PO-0821

The characteristics of emphysema and pulmonary perfusion derived from spectral CT in smokers

Yu Guan

Department of Radiology, ChangZheng Hospital, Naval Medical University

Abstract

Objective:

To investigate the value of iodine maps from spectral dual-layer detector CT(DLCT) in assessing lung perfusion changes in smokers.

Method:

Forty-eight patients (19 smokers and 29 non-smokers) who underwent dual-phase contrast enhanced scans on a DLCT(Spectral 7500, Philips Healthcare, Best, the Netherlands) and pulmonary function test(PFT) were retrospectively collected. Emphysema were evaluated qualitatively and quantitatively on non-contrast images. Iodine maps at arterial phase image were reconstructed for qualitative and quantitative assessment of perfusion reduction or defect (PD). Emphysema and PD was scored visually according to the method of Goddard Score at bilateral lung fields of three anatomic levels(on the slice of the aortic arch, the carina, and the aperture of the inferior pulmonary veins). The scores were calculated based on the ratio of the abnormality occupied in the pulmonary field of each slice as seen below: point 0, lesion scope <5%; point 1, 5%≤lesion scope≤25%; points 2, 25%≤lesion scope≤50%; points 3, 50%≤lesion scope≤75%; points 4, 75%≤lesion scope. The sum of scores at bi-lung fields at 3 levels for each patient was calculated. The iodine density(ID) of PD and thoracic aorta were measured respectively(IDdefect, ID thoracic aorta), then calculating the ratio as the normalized ID (nID). Emphysematous parenchyma was defined as the lung attenuation less than -950HU. Emphysema index(EI) was calculated at whole lung level. FEV1% and FEV1/FVC of all patients were recorded. The differences of the emphysema and PD visual scores, IDdefect, nID, EI were analyzed by ANOVA between smokers and non-smokers. Correlations between emphysema, PD and FEV1%, FEV1/FVC were evaluated by Spearman correlation analysis.

Results:

The PD visual scores on ID images was significantly higher in smokers compared with that in non-smokers(7(IQR,6-9) vs 6(IQR,3.75-6), $p=0.014$), while no significantly difference was found for emphysema visual scores (1(IQR,0-5.5) vs 1(IQR,0-2.5), $p=0.402$). Both IDdefect and nID of PD were significantly lower in smokers compared with non-smokers(0.53(IQR,0.38-0.69) vs 0.78(IQR,0.59-1.14), $p=0.003$; 0.04(IQR,0.03-0.06) vs 0.06(IQR,0.04-0.07), $p=0.029$), while no significantly difference was found for EI(4.30(IQR, 3.15-7.20) vs 2.10(IQR, 0.725-6.025), $p=0.061$). Besides PD visual scores were negatively correlated with FEV1%($r=-0.61$, $P=0.025$) and FEV1/FVC($r=-0.62$, $P=0.024$) for smokers.

Conclusion:

In compared with emphysema, the iodine map derived from DLCT showed more sensitive to evaluate the pulmonary abnormalities in smokers.

PO-0822

Comparison of deep learning and radiomics-based machine learning methods for the identification of chronic obstructive pulmonary disease on low-dose CT images

Yu Guan

Department of Radiology, ChangZheng Hospital, Naval Medical University

Purpose: To establish five prediction models with deep learning and radiomics-based machine learning approaches in the identification of COPD on low-dose CT images and to compare the relative performance of different models to find the best model for identify COPD.

Method: This retrospective analysis included 1221 subjects (169 COPD patients and 855 control subjects). Five prediction models, including CT-based radiomics features, chest CT image, quantitative lung density parameters and clinical questionnaire features, were used as identification of COPD by deep learning (DL) or machine learning (ML). Model 1 was constructed by CT-based radiomics features by ML. Model 2 was constructed by the combination of the CT-based radiomic features, lung density parameters and questionnaire features by ML. Model 3 was constructed by CT images only by DL. Model 4 was constructed by the combination of CT images, lung density parameters and questionnaire features by DL. Model 5 was constructed by the combination of CT images, CT-based radiomic features, lung density parameters and clinical questionnaire features by DL. Performance was compared by accuracy, sensitivity, specificity, the highest negative predictive value (NPV), PPV (precision) and the area under ROC curve (AUC) for five prediction models. Comparisons among the AUC of different models were performed using DeLong Test.

Result: 107 radiomics features were extracted from each subject's CT images, 17 lung density parameters were acquired by quantitative measurement and 18 selected questionnaire features were recorded in this study. Model 2 achieved the highest AUC of 0.74, while model 4 achieved the lowest AUC of 0.57 in the test set. Model 2 also has the highest sensitivity of 0.80, the highest accuracy of 0.78 and NPV of 0.32. Its performance of AUC outperforms the model 1 and model 4 with statistical significance ($p=0.02$; $P=0.02$ respectively).

Conclusion: The results show that the identification ability of CT-based radiomics features combined with lung density parameters and questionnaire features using ML methods is better than that of the chest CT images-based DL methods. It is more suitable and beneficial for COPD identification.

PO-0823

Development and validation of CCTA-based radiomics signature for predicting coronary plaques with rapid progression

Qian Chen¹, Chunxiang Tang², Xindao Yin¹, Longjiang Zhang²

1. Nanjing First Hospital

2. Jinling Hospital

BACKGROUND: Rapid plaque progression (RPP) is associated with a higher risk of acute coronary syndromes compared to gradual plaque progression. We aimed to develop and validate a coronary computed tomography angiography (CCTA) based radiomics signature (RS) of plaques for predicting RPP.

METHODS: A total of 214 patients who underwent serial CCTA examinations from two tertiary hospitals (development group, 137 patients with 164 lesions; validation group, 77 patients with 101 lesions) were retrospectively enrolled. Conventional CCTA-defined morphological parameters (e.g.,

high-risk plaque characteristics and plaque burden) and radiomics features of plaques were analyzed. RPP was defined as an annual progression of plaque burden $\geq 1.0\%$ on lesion-level at follow-up CCTA. RS was built to predict RPP using XGBoost method.

RESULTS: RS significantly outperformed morphological parameters for predicting RPP in both the development group (area under the curve [AUC] 0.82 vs 0.74; $P=0.04$) and validation group (AUC 0.81 vs 0.69; $P=0.04$). Multivariable analysis identified RS (odds ratio: 2.35; 95% confidence interval, 1.32 to 4.46; $P=0.005$) as an independent predictor of subsequent RPP in the validation group after adjustment of morphological confounders. Unlike unchanged RS in the non-RPP group, RS increased significantly in the RPP group at follow-up in the whole dataset ($P<0.001$).

Conclusions: The proposed CCTA-based RS had a better discriminative value to identify plaques at risk of rapid progression compared to conventional morphological plaque parameters. These data suggest the promising utility of radiomics for predicting RPP in a low-risk group on CCTA.

PO-0824

The differential computed tomography features between small benign and malignant solid solitary pulmonary nodules with different sizes

Xiaoqun He, Li Qi

The First Affiliated Hospital of Chongqing Medical

Background Computed tomography (CT) has been widely known to be the first choice for the diagnosis of solid solitary pulmonary nodules (SSPNs). However, the smaller the SSPN is, the less the differential CT signs between benign and malignant SSPNs there are, which brings great challenges to their diagnosis. Therefore, this study aimed to investigate the differential CT features between small (≤ 15 mm) benign and malignant SSPNs with different sizes.

Material and Methods CT data of 794 patients with small SSPNs (≤ 15 mm) were retrospectively analyzed. SSPNs were divided into benign and malignant groups, and each group was further classified into three cohorts: cohort I (diameter ≤ 6 mm), cohort II (6 mm $<$ diameter ≤ 8 mm), and cohort III (8 mm $<$ diameter ≤ 15 mm). The differential CT features of benign and malignant SSPNs in three cohorts were identified. Multiple logistic regression analyses were conducted to identify independent factors for predicting benign SSPNs.

Results In cohort I, polygonal shape and angulation sign were more common in the benign group, whereas upper-lobe distribution was more common in the malignant group (all $P < 0.05$); Multiparametric analysis showed that angulation sign (adjusted odds ratio [OR]: 12.379; 95% confidence interval [CI]: 2.691–56.939; $P = 0.001$) was the most effective factor for predicting benign SSPNs, with an AUC of 0.735 (95% CI: 0.627–0.844; $P = 0.001$) and accuracy of 78.35%. In cohort II, polygonal shape and angulation sign were more common in benign SSPNs, whereas lobulation, pleural retraction, and air bronchogram were observed more frequently in malignant SSPNs (all $P < 0.05$); Multiparametric analysis showed that polygonal shape (OR: 9.537; 95% CI: 1.180–77.061; $P = 0.034$); the absence of lobulation (OR: 0.000; 95% CI: 0.000–NA; $P = 0.998$) and pleural retraction (OR: 0.296; 95% CI: 0.105–0.834; $P = 0.021$) were independent predictors of benign SSPNs, with an AUC of 0.749 (95% CI: 0.660–0.838; $P < 0.001$) and accuracy of 74.58%. In cohort III, angulation sign, calcification, halo sign, and satellite lesions were favor of benign lesions, while lobulation, air space, pleural retraction, bronchial truncation, and air bronchogram were favor of malignant SSPNs (all $P < 0.05$); Multiparametric analysis showed that angulation sign (OR: 4.106; 95% CI: 2.189–7.702; $P < 0.001$); calcification (OR: 3.889; 95% CI: 1.408–10.744; $P = 0.009$); halo sign (OR: 6.135; 95% CI: 2.757–13.649; $P < 0.001$); satellite lesions (OR: 6.060; 95% CI: 2.936–12.509; $P < 0.001$); and the absence of lobulation (OR: 0.065; 95% CI: 0.025–0.167; $P < 0.001$), air space (OR: 0.427; 95% CI: 0.225–0.811; $P = 0.009$), pleural retraction (OR: 0.265; 95% CI: 0.160–0.439; $P < 0.001$), bronchial truncation (OR: 0.147; 95% CI: 0.080–0.269; $P < 0.001$),

and air bronchogram (OR: 0.317; 95% CI: 0.183–0.549; $P < 0.001$) were independent predictors of benign SSPNs, with an AUC of 0.873 (95% CI: 0.845–0.901; $P < 0.001$) and accuracy of 80.14%.

Conclusion In conclusion, the differential CT signs vary between benign and malignant SSPNs with different sizes. Clarify the differential CT features based on different diameter ranges may help to minimize ambiguities and discriminate those benign SSPNs from malignant ones.

PO-0825

Applying of 7 T Cardiac Magnetic Resonance Imaging to investigate the effect of sodium selenite on right ventricular structure and function secondary to pulmonary arterial hypertension

Hongke Yin, Fabao Gao

Department of Radiology, West China Hospital, Sichuan University

Purpose: The condition of the right ventricle secondary to the onset of pulmonary arterial hypertension (PAH) is a crucial factor that affects the prognosis of PAH. Selenium, due to its antioxidant stress, anti-inflammatory, and pro-apoptotic properties, may be involved in the condition. However, the specific effects of Sodium selenite (SE) on the right ventricle secondary to PAH and the related mechanisms are yet to be proven. In this study, we aimed to investigate the effects of SE on RV structure and function secondary to PAH by cardiac magnetic resonance (CMR) and to elucidate its properties mentioned above

Materials and Methods: Sixty-two SD rats were housed for 7 months at the Qinghai-Tibet Plateau with hypobaric hypoxic environment and divided into four groups: CON, MCT, MCT+SE and MCT+SI. The model of MCT/Hypoxia induced PAH was established by intraperitoneal injection 60 mg/kg of monocrotaline (MCT). 0.7 mg/kg of SE and 5 mg/kg of sildenafil were given to the MCT+SE group and MCT+SI. Then, all groups of rats underwent CMR imaging to evaluate RV function, strain and edema. Eventually, the sample of blood, heart and lung were obtained for relevant tests

Results: Compared with the MCT group, SE intervention significantly elevated RV ejection fraction (51.98 ± 7.88 vs 61.30 ± 6.09), global longitudinal (-12.90 ± 3.53 vs -18.05 ± 3.43) and circumferential (-20.46 ± 2.47 vs -22.67 ± 1.32) strain. However, there was no significant difference in T2 relaxation time between groups. Additionally, the blood biochemical results showed that superoxide dismutase and glutathione peroxidase were significantly higher, while malondialdehyde. These findings may be related to upregulate the expression of NRF2 and HO-1, as verified by PCR, immunohistochemical and WB assay

Conclusion: Our study shows that SE treatment was found to significantly increase RVEF, GLS, and GCS by CMR. This may be related to the upregulation of NRF2 and HO-1 expression and the alleviation of oxidative stress damage

PO-0826

Aerodynamic simulation of small airway resistance: a new imaging biomarker for chronic obstructive pulmonary disease

Di Zhang¹, Yu Guan¹, Xiuxiu Zhou¹, Mingzi Zhang², Yu Pu¹, Pengchen Gu², Yi Xia¹, Yang Lu², Wenting Tu¹, Kunyao Huang², Jixin Hou², Hua Yang², Chicheng Yu², Qu Fang², Chuan He², Shiyuan Liu¹, Li Fan¹

1. Changzheng Hospital, Second Military Medical University, China

2. Shanghai Aitrox Technology Corporation Limited

Purpose:

To develop a novel biomarker (RSA) for early detection of chronic obstructive pulmonary disease (COPD) using a combination of pulmonary function test (PFT) and computational fluid dynamics (CFD) based on CT data.

Materials and Methods:

24 subjects who underwent chest CT scans and pulmonary function tests between May 2020 and December 2020 were enrolled retrospectively. Subjects were divided into three groups: normal (10), high-risk (6), and COPD (8). Airway resistance, FEV1, FEV1/FVC and FEV1 % predicted were main pulmonary function indicators considered in this study. The airway from the trachea down to the sixth generation of bronchioles was reconstructed by a 3D slicer. The small-airway resistance (RSA) and RSA as a percentage of total airway resistance (RSA%) were calculated by CFD combined with PFT. The correlation between RSA and other parameters was analyzed using Pearson's correlation coefficient.

Results:

Visualization of the airway aerodynamics revealed that airflow velocity in the trachea and the mean pressure-drop across the reconstructed airway model were both greater in the control group than in the high-risk group and the COPD group. The RSA and RSA% were significantly different among the three groups ($p < 0.05$) and related to the FEV1 % predicted ($r = -0.52$, $p = 0.009$; $r = -0.58$, $p = 0.003$) and the FEV1/FVC ($r = -0.59$, $p = 0.003$; $r = -0.54$, $p = 0.007$).

Conclusion:

Airway CFD combined with PFT is a valuable method for estimating the small-airway resistance, where the derived RSA will aid in the early diagnosis of COPD.

PO-0827

Chronic Obstructive Pulmonary Disease Rat Models: comparison of different construction methods using in/ex vivo micro-CT

Di Zhang, Yu GUAN, Yi XIA, Xiuxiu ZHOU, Wenting TU, Shiyuan LIU, Li FAN
Changzheng Hospital, Second Military Medical University, China

Purpose: To evaluate and compare the COPD rat models, established by smoking, protease instillation and the combination of them, in terms of inflammation, imaging and pathology. And to compare in vivo CT and ex vivo CT in the evaluation of COPD.

Materials and Methods: Rat models of COPD were established by smoking, protease instillation and the combination of them. Following that, the body weight and the levels of MMP-9 and IL-10 were measured. In addition, in/ex vivo micro-CT examination and pathological examination were used to assess %LAA (-700/-928), mean alveolar area (MAA), and mean linear intercept (MLI).

Results: The weight gain of rats in the smoking group and the protease instillation combined smoking group was slower than that in the control group since the 7th week ($P < 0.05$). Compared with the control group, the protease instillation group and the protease instillation combined

smoking group had lower levels of IL-10 and higher levels of MMP-9 during the early modeling phase ($P < 0.05$), whereas MMP-9 levels were higher in the smoking group during the latter modeling phase ($P < 0.05$). Emphysema was first observed on the ex vivo micro-CT and pathological images at the 4th week of modeling, which was confirmed by quantitative imaging and pathological analysis. The degree of lung tissue damage was higher in the protease instillation combined smoking group than in the smoking group and the protease instillation group.

Conclusion: Smoking combined with protease instillation can accelerate the COPD process. Ex vivo micro-CT is more sensitive than in vivo micro-CT in evaluating the effectiveness of rat COPD models.

PO-0828

Baseline CT-based Whole Lung Radiomics Phenotype Predicts the Survival of Chronic Obstructive Pulmonary Disease

Taohu Zhou, Li Fan
shanghai changzheng hospital

Objective: To evaluate the associations between baseline CT-based whole lung radiomics phenotype consensus clustering of COPD patients and clinical, laboratory, and pulmonary function test and predict the survival of patients.

Materials and Methods: A total of 479 consecutive patients with COPD from two hospitals between September 2015 and August 2022 with follow-up longer than 12 months and baseline chest CT scans were retrospectively included. Whole-lung radiomic analysis was performed on baseline CT images, and COPD severity was classified as Global Initiative for Chronic Obstructive Lung Disease (GOLD) I–II or GOLD III–IV. Patients were classified into clusters based on their radiomics features using consensus clustering, and clusters were compared with clinical, laboratory, PFT, and overall survival (Kruskal–Wallis test for continuous data, χ^2 or Fisher's exact test for categorical data, Kaplan–Meier curves, and log-rank test for overall survival). Cluster analysis was performed on the entire cohort and the COPD severity subgroups.

Results: There were 362 males and 117 females with a median age of 68.68 ± 10.11 years old and a mean follow-up of 45.58 ± 19.07 months. Three radiomic clusters were also identified. Cluster 1 was associated with higher globulin, lower forced vital capacity (FVC), and lower total lung capacity (TLC). Cluster 2 was associated with higher vital capacity and lower FEV1/FVC. Cluster 3 was associated with higher FEV1/FVC, higher FVC, and higher TLC, along with lower erythrocyte sedimentation rate and lower globulin. Cluster 3 showed a high risk of death not only within the entire cohort (log-rank test, $P = 0.049$) but also within the GOLD III–IV subgroup (log-rank test, $P < 0.0001$).

Conclusion: Baseline CT-based whole-lung radiomic consensus clustering could independently predict cumulative mortality risk in patients with COPD and enable the identification of associations between radiomic features and clinical, laboratory, and PFT parameters.

PO-0829

Acquired immunodeficiency syndrome-associated pulmonary Kaposi sarcoma: computed tomography staging and clinical prognosis

Yan Wang¹, Tian Yu², Gang Bao³, Qihua Cheng¹, Yuxin Yang², Gaowa Sairen², Yuxia Song³

1. Xiamen Medical College affiliate Second Hospital

2. Department of Radiology, the Eighth Affiliated Hospital of Xinjiang Medical University

3. HIV Clinical Diagnosis and Treatment Center, the Eighth Affiliated Hospital of Xinjiang Medical University

【Abstract】

Background: As an AIDS-defining malignancy, the incidence of Kaposi sarcoma (KS) is expected to increase as the survival rate of HIV-infected patients increases. Both endobronchial and transbronchial biopsy have a diagnostic yield of only 26–60%. This study reports computed tomography (CT) images and corresponding staging of pulmonary KS, providing reference for promoting clinical diagnosis and prognosis.

Materials and Methods: Retrospectively collected medical records and CT images of 93 AIDS-KS patients, 53 of whom had confirmed pulmonary KS and were followed up for 3/6/12 months. The CT findings of pulmonary KS (pKS) were analyzed by two physicians using lung CT images when the time diagnosis of pKS and after the end of the first course of therapy.

Results: Among the 53 cases, 51 cases were found to have cutaneous KS, 41 cases were found to have digestive tract KS. The CT findings of AIDS-associated pKS could be divided into I: bronchovascular thickening stage (6 cases); II: nodular stage (24 cases); and III: confluent consolidation stage (23 cases). The prognosis of 39 cases of pKS after the first course of therapy was as follows: stage I: 100% improved; stage II: 70.6% improved, 23.5% advanced, and 5.9% no response; stage III: 72.2% improved, 22.2% advanced, and 5.6% no response. Survival analysis showed that there was no statistically significant difference in clinical prognosis after 3, 6, and 12 months of follow-up for different stages of pulmonary KS.

Conclusion: Recognizing CT manifestation and staging of pulmonary KS is of help to guide clinical diagnosis early and mastery of the disease course to achieve disease control and symptom relief of quality of life.

PO-0830

CT-based Radiomics Predictive Model for Spread Through Air Space of IA Stage Lung Adenocarcinoma

Xiang Wang, Li Fan, Shiyuan Liu

Changzheng Hospital

Purpose: To construct a radiomics model based on computed tomography (CT) scans to predict the presence of spread through air spaces (STAS) in stage IA Lung adenocarcinoma, compared with the traditional clinical model.

Materials and Methods:

The study was approved by the institutional review boards and included 317 patients (median age, 57.21 years; range, 45.84–68.61 years) with pathologically confirmed stage I lung adenocarcinoma. A total of 122 patients (38.5%) were diagnosed as STAS by pathology after the operation. Two experienced radiologists independently segmented the lesions through MITK and extracted 1791 radiomic features by Python. Single-factor T-test or Mann-Whitney U-test and least absolute shrinkage and selection operator (LASSO) were used to screen for radiomic signatures related to

STAS. This study constructed a radiomics model, a clinical model and a combine model which combining radiomic and clinical features. Model performance was evaluated using the area under the receiver operating characteristic curve (AUC).

Results:

By single-factor analysis, 4 clinical features and 13 radiomic features were significantly associated with STAS. The three model (the clinical, the radiomics and the combine model) achieved predictive efficacy, with an AUC of 0.841, 0.897 and 0.939 in training, respectively. And in testing set, the AUC of 0.784, 0.851 and 0.876, respectively. The combine model also achieved best accuracy, sensitivity, specificity, ppv, and npv, reaching 0.914, 0.887, 0.985, 0.933 and 0.767, respectively.

Conclusion:

The combine model based on the radiomic and clinical features of preoperative chest CT could be used to preoperatively diagnose the presence of STAS in stage IA lung adenocarcinoma and has an excellent diagnostic performance.

PO-0831

Preoperative Left Atrial Reservoir Strain Derived from Cardiac Magnetic Resonance-Feature Tracking as an Independent Predictor of Outcome in Patients with Hypertrophic Obstructive Cardiomyopathy Following Surgical Myectomy

Shujuan Yang, Shihua Zhao
Fuwai Hospital

Purpose: Left atrial (LA) enlargement and dysfunction are frequently seen in patients with hypertrophic obstructive cardiomyopathy (HOCM). Feature tracking (FT) allows sensitive quantification of LA functional remodeling regardless of LA size. However, the association of preoperative LA strain assessed by cardiac magnetic resonance (CMR)-FT with the late outcome of HOCM patients after surgical myectomy remains unknown. This study aims to investigate the prognostic value of preoperative FT-derived LA strain among patients with HOCM following septal myectomy.

Methods and Materials: In this retrospective, single-center study, 802 adult patients with HOCM who underwent septal myectomy from January 2010 through December 2017 were included. All patients underwent preoperative CMR with complete clinical outcome follow-up. Preoperative LA phasic strains were measured using CMR-FT. Primary endpoint included all-cause mortality, heart transplantation, unscheduled hospitalization for heart failure, and stroke. Secondary endpoint included all-cause mortality and heart transplantation.

Results: Of the 802 patients in this study, 116 experienced primary endpoints, 38 experienced secondary endpoints, and 18 experienced SCD/aborted SCD during a median follow-up of 56.7 (IQR, 40.2-78.6) months. Among all LA volumetric and functional parameters, LA reservoir strain held the best performance for predicting the occurrence of adverse outcomes. Compared with the group with LA reservoir strain > 22.9% (median), the annual event rate of primary endpoint (4.2% vs. 1.7%, $P < .0001$), secondary endpoint (1.5% vs. 0.4%, $P = .0005$), and sudden cardiac death (SCD) (0.7% vs. 0.2%, $P = .047$) was significantly higher in the group with LA reservoir strain \leq 22.9%. In multivariable Cox proportional hazards regression analysis, LA reservoir strain \leq 22.9% was independently associated with primary endpoint (HR 1.98, 95%CI 1.26-3.11, $P = .003$) and secondary endpoint (HR 3.71, 95%CI 1.73-7.92, $P = .001$). Incorporating LA reservoir strain, the

performance of the 2014 HCM Risk-SCD score improved for sudden cardiac death prediction (C-statistic: from 0.62 to 0.69; log-likelihood: from -110.31 to -108.27, $P=0.04$).

Conclusions: In patients with HOCM undergoing septal myectomy, reduced preoperative LA reservoir strain assessed by CMR-FT is independently associated with postoperative adverse outcomes. LA reservoir strain shows the potential to optimize the risk stratification of SCD incidents in patients with HOCM after surgical myectomy.

PO-0832

Spatial-Temporal Heterogeneity of Tumor Immune Microenvironment: A Paired Primary Tumor and Brain Metastases of Non-small cell lung cancer Samples Study

Lu Yang, Jun Yang
云南省肿瘤医院

Purpose: To investigate whether there is spatial-temporal heterogeneity in the tumor immune microenvironment (TIME) in the primary tumors (PTs) and brain metastases (BMs) of non-small cell lung cancer (NSCLC) and to explore the correlation between the radiomics features and immune markers of NSCLC PTs and BMs.

Materials and methods: In total, 13 pairs of resected NSCLC PTs and BMs were included from June 2017 to May 2022. The expression levels of programmed death ligand 1 (PD-L1), cytokeratin 19 (CK19), and CD20 and the number of CD8+ tumor-infiltrating lymphocytes (TILs) in the PTs and BMs of NSCLC were calculated through multiple immunofluorescence (mIF) and digital image analysis to quantify changes in the TIME. Furthermore, we extracted the radiomics features of the PTs and BMs of NSCLC and assessed their associations with immunomarkers.

Results: Paired PTs and BMs showed a significant change in the density of CD8+ TILs ($p = 0.013$). The level of PD-L1 was not statistically significant in the paired PTs and BMs of NSCLC ($p = 1.000$). There was a correlation between the density of CD8+ TILs and the expression level of PD-L1 in the PTs ($R^2=0.4351$, $p=0.0142$). The standardized CT radiomics values in the PTs of NSCLC were correlated with the expression level of PD-L1 in BMs ($r=0.7455$, $p=0.0112$). The standardized CT and MRI radiomics values were correlated with CD8+ TIL density in BMs ($r=0.70$, $p=0.0204$; $r=-0.6545$, $p=0.0336$), as was the standardized CT/MRI radiomics value ($r=0.6364$, $p=0.0402$).

Conclusion: There is spatial and temporal heterogeneity in the TIME of the PTs and BMs of NSCLC, especially in terms of CD8+ TILs. Therefore, the spatiotemporal heterogeneity of the TIME should be considered in treatment decision-making. In addition, radiomics features are related to immune markers, potentially providing a noninvasive way to predict changes in the immune microenvironment in brain metastases.

PO-0833

The value of coronary CT in the evaluation of septal branches in hypertrophic cardiomyopathy

Ruoshui Zheng
Xijing Hospital, Air Force Medical University

Purpose

Septal branch characteristics in patients with hypertrophic cardiomyopathy (HCM) were assessed by coronary computed tomography angiography (CCTA) examination with a view to assisting in the clinical preoperative evaluation of patients requiring chemical ablation.

Methods

The study retrospectively included 50 patients with clinical guideline-confirmed HCM into the HCM group, and 50 people without hypertrophic cardiomyopathy were included as a control group; the two groups were matched for age, sex, and Coronary Artery Disease-Report and data system(CAD-RADS) classification. End-diastolic data were assessed after full phase reconstruction of all patients's data. The total diameter and length of the septal branches were measured, and the number and origin of the septal branches were recorded separately for each person. Descriptive statistics were used for the baseline data of HCM patients; Graphpad 9.0 software was applied to statistically analyze the imaging data of both groups.

Results

Thirty-five (70%) of the HCM patients were male and 15 (30%) were female, age 46.54 ± 13.32 , BMI 25.17 ± 3.643 , WHO in class III-IV were 35 (70%), 34 (68%) had symptoms of chest tightness, shortness of breath, and 27 (54%) had symptoms of chest pain. Eleven (22%) of the HCM patients showed 1 spacer branch, 29 (58%), showed 2 septal branches 10 (20%) showed 3 septal branches; in the control group 19 (38%) could not be evaluated because of the small size of the septal branches, 22 (44%) showed only 1 septal branch, 6 (12%) showed 2 septal branches, and 3 (6%) showed 3 septal branches. The diameter of the septal branches in the HCM patients was larger than that of the control group, with a statistically significant difference ($p < 0.001$), and the septal branch diameter in the HCM patients was larger than that of the control group, with a statistically significant difference ($p < 0.001$), and the total length of the septal branch was larger than that of the control group, with a statistically significant difference ($p < 0.001$), but there was no statistically significant difference in the distribution of the origin of the septal branch between the two groups.

Conclusions

Compared with the non-HCM population, the HCM population had a greater number of septal branches, larger diameters, and longer lengths, but there was no difference in the distribution of septal branch origins between the two groups. This suggests that there may be a compensatory blood supply to the septal branches in HCM, and these features may be suggestive for the preoperative evaluation of patients requiring chemical ablation.

PO-0834

Non-contrast cardiac computed tomography-derived mitral annular calcification scores in mitral valve disease

Jie Hou, Yu Sun, Benqiang Yang
General Hospital of Northern Theater Command

Background and aims: Mitral annular calcification (MAC) by computed tomography (CT) is reported as an independent predictor of poor outcomes. However, it currently remains unclear if quantitative MAC parameters provide more value for mitral valve disease (MVD) management, therefore, we examined the prognostic value of MAC-scores using non-contrast cardiac-CT in MVD-patients.

Methods: Between January 2020 and December 2021, we prospectively enrolled 300 consecutive patients with MVD (MAC-present=80 and MAC-absent=220) undergoing preoperative cardiac-CT and mitral valve (MV) surgery. Non-contrast cardiac-CT images were used to qualitatively detect MAC (present or absent) and evaluate MAC-scores. For analyses, we also collected baseline clinical data, intra-operative conversion (from MV repair to MV replacement) and follow-up arrhythmia data.

Results: Compared with the MAC-absent group, MAC-present patients were older (62 ± 7 vs. 58 ± 9 years, $p < 0.001$), mostly women (55% vs. 39.5% , $p = 0.017$), and also had aortic valve calcification (57.5% vs. 23.2% , $p < 0.001$), mitral stenosis (82.5% vs. 61.8% , $p < 0.001$), atrial fibrillation (AF, 30% vs. 11.8% , $p < 0.001$), and larger left atrial end-diastolic dimension [LADD, $49(44-56)$ vs. $46(41-50)$, $p = 0.001$]. Furthermore, MAC-present patients underwent more MV replacements (61.8% vs. 82.5% , $p = 0.001$) and experienced a higher intra-operative conversion prevalence (11.8% vs. 61.3% , $p < 0.001$). Multiple logistic regression analyses showed that the female gender [odds ratio (OR)/95%confidence interval (CI)/ $p = 2.001/1.042-3.841/0.037$] and MAC-scores

(OR/95%CI/p=10.153/4.434–23.253/ $p<0.001$) were independent predictors of intra-operative conversion. During a follow-up of 263 ± 134 days, MAC-present patients had more arrhythmias (42.5%vs.9.5%, $p<0.001$). Also, MAC-scores [hazard ratio (HR)/95%CI/p=6.841/3.322–14.089/ $p<0.001$] and LADD (HR/95%CI/p=1.039/1.018–1.060/ $p<0.001$) were independently associated with arrhythmias by Cox regression analyses.

Conclusions: Non-contrast cardiac CT-derived MAC-scores showed high risk for intraoperative conversion and follow-up arrhythmias in MVD-patients.

PO-0835

Cardiac magnetic resonance assessment of left ventricular myocardial strain and remodeling in essential hypertensive patients with asymptomatic hyperuricemia

Weifeng Yan¹, Xueming Li¹, Yuan Li¹, Yingkun Guo², Zhigang Yang¹

1. West China Hospital, Sichuan University

2. West China Second University Hospital, Sichuan University

Objective: This study used cardiac magnetic resonance (CMR) to investigate whether asymptomatic hyperuricemia (HU) was associated with further changes of left ventricular (LV) function and structure in patients with essential hypertension.

Methods: A total of 210 essential hypertension patients, comprising 86 with asymptomatic hyperuricemia [hypertension (HU+) group] and 124 without hyperuricemia [hypertension (HU-) group], and 65 controls were included in this study. Conventional LV function parameters and global LV myocardial strain parameters, namely, LV radial peak strain (GRPS), circumferential peak strain (GCPS), longitudinal peak strain (GLPS), were measured using CMR and compared among the three groups. Pearson correlation and regression analyses were conducted to assess the relationship between the physiological-biochemical index and CMR parameters in hypertensive patients of different genders.

Results: While ejection fraction did not show significant changes, LV GLPS decreased gradually from the normotensive control group to the hypertension (HU-) group and further to the hypertension (HU+) group. Furthermore, the LV GCPS and LV GRPS of the hypertension (HU+) group were lower than those of the control group. LV mass index (LVMI) and LV remodeling index (LVRI) increased gradually from the control group to the hypertension (HU-) group and then to the hypertension (HU+) group. Serum uric acid (SUA) was significantly correlated with LV GRPS, GCPS, GLPS and LVMI. Multiple regression analyses demonstrated that SUA was independently associated with LV GLPS. In male hypertensive patients, there was a close relationship between SUA and LVMI and LVRI, while such relationship did not appear in female patients.

Conclusions: The coexistence of HU suggests a further reduction in LV motor function in hypertensive patients. In patients with hypertension, there is a significant correlation between the decrease in LV myocardial strain and the increase in SUA levels. Additionally, the effect of elevated uric acid on LV remodeling may vary by gender.

PO-0836

Placental Transmogrification of lung misdiagnosed as cystic lung cancer: a case report

Chuanbin Wang

The First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China

A 57-year-old man with no past medical history, a 2-cm thin-walled cystic solid nodule with a benign morphology in the lower lobe of the right lung was found during a chest CT examination, but was suspected as a cystic lung cancer because of its inhomogeneous separations and papillary structures inside. The patient subsequently underwent segmentectomy, histopathology revealed that the papillary structures resembling placental villi, immunohistochemical stain for CD-10, CK7, TTF-1, SMA and CD34 were positive in clear cells, suggesting placental transmogrification of the lung (PTL).

PTL is a very rare benign cystic lesion of the lung, which was first described in 1979 as a subtype of bullous emphysema (1). However, PTL does not have any placental function, the name comes from its similar pathological morphology to that of the placenta (1). Its etiology and pathogenesis is still unknown, which maybe congenital, or associated with emphysematous lesions or pulmonary fibrochondromatous hamartomas (2). Clinically, PTL occurs most commonly in men aged 20-50 years old, accompanied with pneumothorax or chronic obstructive lung disease as the main symptom (3). Radiologically, PTL mainly shows as bullous lesions (pattern I), which were often misdiagnosed as bullae or emphysema, or presents as mixed thin-walled cystic solid nodule (pattern II) or solitary nodule (pattern III) but very rarely, which were often misdiagnosed as congenital cystic adenomatoid malformation, cystic tumors or hamartoma (4). The imaging findings of the case we reported was typical of pattern II, which is helpful to broaden the diagnostic thinking of radiologists for pulmonary cystic lesions and has instructive enlightening significance in the future. Surgical resection of PTL is the most curative treatment to relieve the patient's symptoms and improve respiratory function, and the follow-up is necessary and important to evaluate for recurrence (5).

PO-0837

Comparison of Clinical Radiomics Nomogram and Deep Convolutional Neural Network Model in Discriminating Atypical Pulmonary Hamartoma From Atypical Lung Adenocarcinoma

Chuanbin Wang

The First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China

Objectives To evaluate the value of clinical radiomic nomogram (CRN) and deep convolutional neural network (DCNN) model in distinguishing atypical pulmonary hamartoma (APH) from atypical lung adenocarcinoma (ALA).

Methods A total of 307 patients were retrospectively recruited from two institutions. Patients in institution 1 were randomly divided into the training (N = 184: APH = 97, ALA = 87) and internal validation sets (N = 79: APH = 41, ALA = 38) in a ratio of 7:3, and patients in institution 2 were assigned as the external validation set (N = 44: APH = 23, ALA = 21). A CRN model based on multivariate logistic regression and a DCNN model were established, respectively. Performances of two models were compared by delong test and receiver operating

characteristic (ROC) curves. In addition, we also conducted a human-machine diagnosis capability competition to evaluate the value of AI in the Lung-RADS classification.

Results The areas under the curve (AUCs) of DCNN model were higher than that of CRN model in the training, internal and external validation sets (0.983 vs 0.968, 0.973 vs 0.953, and 0.942 vs 0.932, respectively), however, the differences were not statistically significant ($p = 0.23, 0.31$ and 0.34 , respectively). With a radiologist-AI competition experiment, AI tended to downgrade more Lung-RADS categories in APH and affirm more Lung-RADS categories in ALA than radiologists.

Conclusions The DCNN model performed relatively better than the CRN model in distinguishing APH from ALA, and outperformed the radiologist in evaluating the Lung-RADS classification of target lesions.

PO-0838

Predictive value of epicardial adipose tissue for early left ventricular dysfunction in patients with suspected coronary artery disease

Na Li, Yukun Cao, Yumin Li, Kailu Zhang, Lijie Zhang, Qinyue Luo, Wengang Sun, Shi Heshui
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To investigate the relationship between epicardial adipose tissue (EAT) and myocardial strain and the severity of coronary artery disease (CAD), and to evaluate the predictive value of EAT parameters in early left ventricular (LV) diastolic dysfunction.

Methods: 170 patients with suspected CAD who underwent both coronary computed tomography angiography and echocardiography were enrolled in 2020. LV global strains were calculated using commercial software. Epicardial adipose tissue was defined as adipose tissue between -190 HU and -30 HU in the visceral pericardium from the level of pulmonary artery bifurcation to the apical level. EAT volume and average attenuation values were measured. LV diastolic dysfunction was determined by echocardiography.

Results: The mean age of the participants was 56.65 ± 12.64 years, and 57.65% were male. EAT volume and mean attenuation values were significantly correlated with CAD severity. EAT volume was significantly positively correlated with global longitudinal strain (GLS) ($r = 0.313, P < 0.01$), and EAT attenuation values were positively correlated with global circumferential strain and GLS ($r = 0.236, 0.164$, respectively, both $P < 0.05$). Age ($\beta = 0.125, OR = 1.134, P < 0.01$) and EAT volume ($\beta = 0.019, OR = 1.019, P = 0.018$) are independent predictors of LV diastolic dysfunction. Age combined with EAT volume improves the diagnostic efficacy of left ventricular diastolic dysfunction.

Conclusions: EAT parameters can reflect the severity of CAD. EAT volume is capable to predict early LV diastolic dysfunction. Compared with GLS, EAT volume may be able to predict LV diastolic dysfunction earlier.

PO-0839

Vaccination effect on patients with Delta variant of COVID-19 pneumonia: A study of longitudinal dynamic chest CTs using artificial intelligence model

Yi Sun,Xiaoyan Xin,Jun Hu,Xin Peng
Nanjing Drum Tower Hospital

The Delta variant of COVID-19 has been emerged and spreads globally since May 2021 and reported in more than 70 countries. The status of the vaccination, symptom onset time, and imaging signatures in the infected population have not been fully investigated and clarified. This study included 131 patients who were infected with the Delta variant of COVID-19. After screening, 106 patients with 458 follow-up CT scans were retrospectively selected and divided into complete and incomplete vaccination groups (66 and 40 patients, respectively). Imaging features were automatically extracted, and infection distribution in lung fields and progression pattern tendency were investigated. Furthermore, we extracted the most related clinical and imaging features to establish a vaccination-status classification model. An independent testing dataset with 55 patients from another inpatient ward was enrolled to evaluate the generalizability of the model. The severity of infection in lung and lung fields of the complete vaccination group was overall lower than those of the incomplete vaccination group. A relatively earlier peak CT abnormality was found on days 8-11 in the complete vaccination group than in incomplete vaccination group on days 12-15 after the first positive PCR time. The vaccination-status classification model achieved the highest performance with an AUC of 0.929, accuracy of 0.864 in the testing set, and an AUC of 0.858, accuracy of 0.727 in the independent testing set. In summary, compared to the incomplete vaccination group, the fully vaccinated patients had milder CT abnormalities and earlier peak time for chest impairment. Also, the vaccination status shows determinable through imaging and clinical features.

PO-0840

Accuracy of artificial intelligence-based coronary artery calcium scoring in non-gated low-dose chest CT

Kejie Yin
Nanjing Drum Tower Hospital

Objectives: To evaluate the risk category performance of artificial intelligence-based coronary artery calcium score (AI-CACS) software used in non-gated chest computed tomography (CT) on three types of thickness (1mm, 3mm, 5mm) images, considering the manual method as the standard.

Methods: A total of 112 patients who underwent both chest CT and electrocardiogram (ECG)-gated non-contrast enhanced cardiac CT with the same equipment at the same time in the study. AI-CACS software was based on a deep learning algorithm and was trained on multi-vendor, multi-scanner, and multihospital anonymized data from the chest CT database. The AI-CACS was automatically obtained from chest CT data by the AI-CACS software, while the manual CACS was obtained from cardiac CT data by the manual method. The correlation of the AI-CACS of different thicknesses and manual CACS, concordance rate and kappa value of the risk categories determined by the four methods were calculated. The risk category performance of the AI-CACS for dichotomous risk categories bounded by 0, 100 and 400 was assessed.

Results: The correlation of the AI-CACS of three different thicknesses (1mm, 3mm, 5mm) with the ECG-CT CACS were $p = 0.973(p < 0.001)$, $0.941(p < 0.001)$, $0.834(p < 0.001)$, respectively. The Bland-Altman plot (manual CACS minus AI-CACS of three different thicknesses) showed three

mean differences of -6.5,15.4,53.1, respectively and 95% limits of agreement of -95.0 to 81.9, -96.6 to 127.4, -187.8 to 294.0, respectively. The agreement of risk categories for the CACS was kappa (κ) = 0.868($p < 0.001$), 0.772($p < 0.001$), 0.412 ($p < 0.001$), respectively, and the concordance rate was 91%, 84.8%, 62.5%. As dichotomous risk categories bounded by 0, 100 and 400, area under the curve of the AI-CACS of three different thicknesses were 0.996 vs. 0.900 vs. 0.785, 0.993 vs. 0.995 vs. 0.975, and 0.995 vs. 1.000 vs. 0.981, respectively.

Conclusions: The 1mm-AI-CACS could accurately quantify CACS as well as categorize risk. Acceptable agreement will enable one-stop chest screening and risk assessment of cardiovascular diseases for healthy physical examining personnel.

PO-0841

Differentiation of solid nodular pulmonary cryptococcosis and pulmonary adenocarcinoma based on intranodal and perinodal enhanced CT radiomics

Li Yi,Minjing Zuo

The Second Affiliated Hospital of Nanchang University

Objective: We aimed to evaluate the role of intranodal and perinodal regional radiomics features in diagnosing nodal pulmonary cryptococcosis (PC) and lung adenocarcinoma (LAC) and to construct nomogram for the preoperative diagnosis of both diseases.

Materials and Methods: We retrospectively recruited 300 patients with pathologically and clinically confirmed PC and LAC. Regions of interest were outlined and radiomics features were extracted from thin-layer enhanced venous phase CT images. Redundant features were filtered using the Pearson/spearman correlation coefficient and the least absolute shrinkage and selection operator (lasso) method, and clinical radiology features were screened by univariate and multivariate analysis. Clinical radiology (C-R), intra-nodal radiomics (Intra-RS), peri-nodal radiomics (Peri-RS), interfacial transition zone radiomics (ITZ-RS), and combined clinical plus radiomics (Combine) were constructed using logistic regression. The performance of these models was assessed by evaluating the area under the receiver operating characteristic curve (ROC) (AUC), and the clinical decision curve was used to assess the clinical utility of these models.

Results: The AUC of the ITZ-RS model was higher than that of the Intra-RS and Peri-RS models (training set: 0.91 vs. 0.86 vs. 0.76; validation set: 0.89 vs. 0.85 vs. 0.70), and the three features of age, bronchial inflation sign, and pleural retraction were screened by multifactor analysis to form the C-R model. Combining ITZ-RS features and C-R features to build the Combine model and constructing the nomogram showed the best classification performance with AUCs of 0.94 and 0.91 in the training and validation sets, respectively.

Conclusion: Our proposed interface transition zone radiomics features showed good differential diagnostic performance in nodular pulmonary cryptococcosis and lung adenocarcinoma, and the constructed combined model nomogram is likely to be a powerful tool for the preoperative diagnosis of nodular PC and LAC in clinical practice.

PO-0842

Applicability of Multiphase-CTA Imaging with Pulmonary Artery Monitoring in Preoperative Evaluation of Left Atrial Appendage Closure

Bocheng Wang,WEI QING GAO,BING YI FANG, QIU FANG ZHU,HAI SHENG LIANG,JING ZHOU
the 9th hospital affiliated to Shanghai Jiao Tong University School of Medicine

Purpose: To evaluate the applicability of multi-phase left atrial appendage(LAA) CTA by monitoring pulmonary artery before percutaneous left atrial appendage closure with row 320 wide-body detector MSCT.

Methods: A total of 110 cases were retrospectively analyzed in 47 cases were examined with single-phase CTA by monitoring superior vena cava (SVC) as control group and 63 cases were examined with multi-phase LAA-CTA by monitoring pulmonary artery (PA) as study group. The statistics are blew: 1.We compared different monitoring sites with various phases scanning periods in image quality of contrast enhanced left atrial appendage. 2.The differences in diagnostic results between multi-phase LAA-CTA by monitoring pulmonary artery and two-dimensional transesophageal echocardiography (2D-TEE). 3.We analyzed the differences in thrombus and poor filling areas of the left atrial appendage between two groups.

Results: 1.The 95% confidence interval range of CT value of thrombus viscosity areas in the control group was greater than that in the study group,and the thrombus viscosity areas in the study group showed ascending slightly enhanced. 2. In study group,the mean CT value of left atrial appendage filling and the diagnostic accuracy were better than those of control group ($P<0.01$). 3.The study group was able to reduce the incidence of poor filling of left atrial appendage and precisely displayed its shape. ($P<0.01$).

Conclusion: The multi-phase scanning method of monitoring pulmonary artery with row 320 wide-body detector MSCT can accurately evaluate the filling and blood flow viscosity of left atrial appendage. It plays a good suggestive and diagnostic role in the investigation of space occupying and contrast medium filling shape before left atrial appendage clusion.In short,the multi-phase scanning method of monitoring pulmonary artery with row 320 wide-body detector MSCT is a simple and easy imaging technique.

PO-0843

Use ResViT Framework to identify COVID-19 pneumonia with Delta variant of SARS-CoV-2 from COVID-19 pneumonia based on Chest CT

Jun Hu,xiaoyan Xin

Department of Radiology, Nanjing Drum Tower Hospital, The Affiliated Hospital of Nanjing University Medical School, Nanjing, 210008, China.

Background:

Coronavirus disease 2019 (COVID-19) with Delta variant of SARS-CoV-2 has occurred in many countries since it was announced by WHO on 11 May 2021. It is very important to identify the type of COVID-19. Intelligent diagnosis methods based on imaging tools have attracted much attention, but existing works seldom study the Delta variant. Therefore, we propose a ResViT based on CT images to diagnose Delta variant from COVID-19 and normal controls.

Methods:

We collect 3D CT images from total 2285 subjects, including 390 Delta cases from Nanjing, 818 Covid-19 cases from six medical centers, and 1077 normal cases from three medical centers. Besides, part of Covid-19 cases and normal cases are collected from online public dataset.

Based on collected 3D CT images, we propose a deep learning framework (ResViT) to achieve the diagnosis task. The proposed ResViT can be divided into three parts: the 3D Convolutional Neural Networks (CNN), the transformer encoder, and the multi-layer perceptron (MLP). First, the 3D CNN extracts feature maps from chest CT images. The convolution kernels slide over input images with overlap and can extract fine-detailed local features. Second, the feature maps are reshaped and fed to the transformer encoder, which is used to learn the global representations between feature maps through the self-attention mechanism. Finally, the MLP outputs the classification scores of normal controls, COVID-19, and the Delta variant.

Results:

ResViT is trained on the training dataset and have shown excellent results across all the classes on the independent testing dataset. It surpasses other deep learning methods and obtains the best results of accuracy as 96.17% for three classification task Delta vs. Covid-19 vs. NC.

Conclusion:

The deep learning framework (ResViT) can detect COVID-19 pneumonia with Delta variant of SARS-CoV-2 from COVID-19 pneumonia based on Chest CT.

PO-0844

Association of liver Multi-parameter Quantitative Metrics Determined by Dual-Layer Spectral Detector CT With Coronary Plaque Scores: A Preliminary Study

Min Wang, Yue Ma, Xian Dai, Yu Lan, Ruobing Bai, Linlin Yang, Yang Hou
Shengjing Hospital of China Medical University

Objective: To explore potential impacts of liver quantitative metrics measured by dual-layer spectral detector CT (SDCT) on the extent and severity of coronary artery plaques.

Methods: Patients who underwent an unenhanced SDCT scan of the upper abdomen and coronary computed tomography angiography (CCTA) were enrolled. The segmental stenosis score (SSS) and segmental involvement score (SIS) were used to evaluate the extent and severity of plaques and then grouped by SIS and SSS. Liver fat quantification were assessed by polychromatic images and spectral metrics of the liver represented by virtual mono-energetic images at 40keV and 70keV, the slope of spectral attenuation curve and effective atomic number (written as CT40keV, CT70keV, λ HU and Zeff, respectively). Logistic regression model was used to evaluate the influencing factors of high SIS and SSS.

Results: 644 patients were enrolled, including low SIS (<5) group (n=451), high SIS (≥ 5) group (n=193), low SSS (<5) group (n=461) and high SSS (≥ 5) group (n=183). Except for the CT70poly value (p=0.115) differ no significant differences in SSS group, other liver spectral steatosis metrics were significantly different between SIS and SSS groups (All p<0.05). Compared with other spectral metrics, Zeff was more closely correlated with the SIS and SSS. Zeff was divided into four groups according to the interquartile interval. Compared with the patients in the lowest quartile of Zeff, the adjusted odds ratios (ORs) and 95% confidence intervals (CIs) for SIS were 2.401 (1.284–4.493), 3.215 (1.661–6.224), and 4.126 (2.152–7.911) for those in the second, the third, and the fourth quartile of Zeff, whereas the corresponding ORs (95% CI) for SSS were 2.098 (1.130–3.894), 3.078 (1.602–5.916), and 3.582 (1.876–6.840) for the upper three quartiles of Zeff, especially among these who were < 60 years old, male and visceral adipose tissue (VAT)/subcutaneous adipose tissue (SAT) < 1.18.

Conclusions: The quantitative parameter Zeff from SDCT, was an independent factor of the extent and severity of coronary artery plaques. Liver fat quantification may be useful for evaluating risk and prognosis of coronary artery disease.

PO-0845

Incremental Prognostic Value of CT-Based Liver Radiomics Signature over Coronary Computed Tomography Angiography Findings in Patients with Diffuse Coronary Artery Disease

Min Wang, Yue Ma, Xian Dai, Ruobing Bai, Linlin Yang, Yang Hou
Shengjing Hospital of China Medical University

Objectives : To explore the correlation between liver radiomics score (Rad-score) and the occurrence of major adverse cardiac events (MACE) in patients with diffuse coronary artery disease (CAD), as well as the additional risk stratification benefits for prognosis.

Materials and Methods: This retrospective analysis involved 238 patients with diffuse CAD who underwent upper abdomen CT and coronary computed tomography angiography (CCTA). Basic clinical data, adverse CCTA plaque findings and radiomics score of the liver were collected. Adverse CCTA plaque findings, defined as obstructive and/or high-risk plaque. MACE was the composite of cardiac death, acute coronary syndrome, and late revascularization. Selecting a 2 * 2cm square VOI in the right lobe of the liver for radiomics feature extraction. Radiomics signature was constructed by univariate and multivariate cox analysis and the least absolute shrinkage and selection operator algorithm (LASSO). Cox survival analysis is performed to assess the ability of Rad-score for predicting MACE and determine whether adding Rad-score to Framingham risk score (FRS) and adverse CCTA findings could improve predictive value of MACE in diffuse CAD. The C-index, net reclassification index (NRI) and Integrated discrimination improvement (IDI) were calculated to further confirm the incremental value of liver Rad-score for predicting MACE in diffuse CAD.

Results: MACE was observed in 34 (14.3%) patients. The MACE (+) group had higher Rad-score than MACE (-) group (1.21 ± 1.43 vs. -0.20 ± 1.11 , $P < 0.001$). After adjusted for FRS and adverse findings, multivariable cox regression analysis illustrated that liver Rad-score (HR: 5.942, 95% CI: 2.540-13.902, $P < 0.001$) was independent risk factors for MACE in diffuse CAD. Adding liver Rad-score to FRS and adverse CCTA plaque findings model significantly improved NRI (0.434, 95% CI: 0.228–0.665, $p < 0.001$), IDI (0.196, 95 % CI: 0.052–0.341, $p = 0.007$) and showed the highest discrimination index (C-statistics, 0.834).

Conclusions: In diffuse CAD patients, liver Rad-score was significantly associated with MACE and could improve the predictive value of MACE above FRS and CCTA adverse findings, which could provide incremental value for prognosis and early prevention of diffuse CAD.

PO-0846

The value of COPD prediction based on the quantitative features of CT mediastinal window and lung window image

Lei Gao¹, Ran Zhang², Wenxiu Zhang², Yiliang Wan², Dongxue Qin¹
1. Dalian Medical University Affiliated Second Hospital
2. Neusoft Medical Systems Co., Ltd

Reason: analysis based on computed tomography (CT) shows the potential for diagnosis and surveillance of chronic obstructive pulmonary disease (COPD). However, COPD is a respiratory disease involving different degrees of abnormal pulmonary parenchyma, and its diagnostic gold standard is still lung function test. Clinical and imaging challenges remain in the early screening and diagnosis of COPD. Because different CT lung windows and mediastinal windows are used between the studies, and the features and parameters obtained are also different, it is not known

whether different CT sequences and feature selection will affect the prediction performance. The purpose of this study was to compare the evaluation of COPD by pulmonary function test and computed tomography (CT). Based on the depth learning method, the quantitative characteristics such as CT value, percentage of low attenuation area (%LAA) and airway parameters of 0-4 grade on lung window and mediastinal window were automatically segmented and measured, respectively, to compare the performance of the two sequences in predicting COPD.

Methods: We conducted a retrospective study on the CT images of 79 cases of obstructive pulmonary disease and the CT images of 148 normal subjects in the second affiliated Hospital of Dalian Medical University from 2012 to 2021. According to the guidelines for the diagnosis and treatment of chronic obstructive Pulmonary Disease, the gold standard of diagnosis is that $FEV_1 < 2021$ or $FEV_1/FVC < 70\%$ in lung function examination is considered to have completely irreversible airflow limitation. Resample the inspiratory phase CT images to the volume of 1mm voxels and segment the lungs and 0-4 airway (NeuLungCare, Neusoft Medical Systems Co., Ltd., China.). The CT value, % LAA and 0-4 grade bronchial wall thickness and diameter of left and right lungs were extracted from mediastinal window and lung window respectively. 53 unique quantitative CT-based features are extracted from each CT image, as shown in figure 1. 53 unique features based on quantitative CT are extracted from each CT image. Kolmogorov Smirnov test and lasso feature dimensionality reduction method are used to test and evaluate 53 features of two CT sequences with three machine learning classifiers (SVM, Logical Regression, XgBoost): training / test segmentation, 70% of the queues as training queues and 30% of queues as test queues. The area under the curve (AUC) of the subject's working characteristic curve was used to evaluate the performance of the model, and delongtest showed the significance between the mediastinal window model and the lung window model.

Results: A total of 227 participants were evaluated (nasty 148 had no COPD, nasty 79 had COPD). There was no significant difference between gender groups (no COPD=48.6%; COPD = 36.9%; $p=0.11$). Among the 53 features extracted from lung window images screened by lasso, 5 features showed high contribution to predicting copd, namely, LAA910 of left lung, maximum thickness of grade 0 bronchial wall, maximum diameter of grade 0 bronchial wall, average diameter of grade 3 bronchial wall and maximum diameter of grade 4 bronchial wall. Among the 53 features extracted from mediastinal window images, 7 features showed high contribution to predicting copd after screening by lasso, which were LAA910 of left lung, LAA950 of left lung, LAA950 of upper lobe of right lung, LAA950 of middle lobe of right lung, pi10 of whole lung, maximum diameter of bronchial wall of grade 0 and percentage of bronchial wall area of grade 3.

The prediction AUC of XGBoost, SVM and logical regression for copd on lung window images were 0.8611 (95 CI:0.5870-0.7776), 0.8250 (95 CI:0.6196-0.8138) and 0.8102 (95 CI:0.5692-0.7718), respectively, the accuracy was 0.7391, 0.7536 and 0.6957, and the specificity was 0.8444, 0.8222, 0.7778, respectively. The sensitivity is 0.5417, 0.6250 and 0.5417 respectively. The prediction AUC of XGBoost, SVM and logical regression for copd on mediastinal window images were 0.9000 (95 CI:0.7859-0.9398), 0.8824 (95 CI:0.7287-0.8958) and 0.8269 (95 CI:0.6739-0.8467), respectively, the accuracy was 0.8986, 0.8406 and 0.7971, and the specificity was 0.9556, 0.9333, 0.9111, respectively. The sensitivity was 0.7917, 0.6667 and 0.5833, respectively. Overall, the AUC values of various feature selection and different classification models based on CT images are between 0.81 and 0.90. When XGBoost classifier is used to analyze the features of mediastinal window and lung window, and the first seven features selected based on lasso are retained, the best model for diagnosing COPD (AUC=0.90) is produced.

Conclusion: the quantitative characteristics of CT images are highly correlated with the results of pulmonary function test, which can replace pulmonary function test to diagnose and screen COPD to a certain extent. Different machine learning classifiers have different prediction effects on COPD. We find that the machine learning model based on the image feature analysis method based on mediastinal window and lung window shows acceptable performance.

PO-0847

Assessment of myocardial bridging and the pericoronary fat attenuation index on coronary computed tomography angiography: predicting coronary artery disease risk

Yang Lu

Third Affiliated Hospital of Soochow University

Background: The fat attenuation index (FAI) is a radiological parameter that represents pericoronary adipose tissue (PCAT) inflammation, along with myocardial bridging (MB), which leads to pathological shear stress in the coronary vessels; both are associated with coronary atherosclerosis. In the present study, we assessed the predictive value of FAI values and MB parameters through coronary computed tomography angiography (CCTA) for predicting the risk of coronary atherosclerosis and vulnerable plaque in patients with MB.

Methods: We included 428 patients who underwent CCTA and were diagnosed with MB. FAI values, MB parameters, and high-risk coronary plaque (HRP) characteristics were recorded. The subjects were classified into two groups (A and B) according to the absence or presence of coronary plaque in the segment proximal to the MB. Group B was further divided into Groups B1 (HRP-positive) and B2 (HRP-negative) according to the HRP characteristic classification method. The differences among the groups were analysed. Multiple logistic regression analysis was performed to determine the independent correlation between FAI values and MB parameters and coronary atherosclerosis and vulnerable plaque risk.

Results: Compared to the subjects in Group A, those in Group B presented greater MB lengths, MB depths and muscle index values, more severe MB systolic stenosis and higher FAI values (all $P < 0.05$). In multivariate logistic analysis, age (OR 1.076, $P < 0.001$), MB systolic stenosis (OR 1.102, $P < 0.001$) and FAI values (OR 1.502, $P < 0.001$) were independent risk factors for the occurrence of coronary atherosclerosis. Compared to subjects in Group B2, those in Group B1 presented greater MB lengths and higher FAI values (both $P < 0.05$). However, only the FAI value was an independent factor for predicting HRP (OR 1.641, $P < 0.001$).

Conclusion: In patients with MB, MB systolic stenosis was associated with coronary plaque occurrence in the segment proximal to the MB. The FAI value was not only closely related to coronary atherosclerosis occurrence but also associated with plaque vulnerability. FAI values may provide more significant value in the prediction of coronary atherosclerosis than MB parameters in CCTA.

PO-0848

Clinical value of fast left atrial long-axis strain in predicting atrial fibrillation in patients with apical hypertrophic cardiomyopathy

Yipei Song, Mengyao Hu, Lianggeng Gong

Medical Imaging Center of The Second Affiliated Hospital of Nanchang University

Purpose: To investigate the clinical value of cardiac magnetic resonance fast long-axis strain (CMR-LAS) in predicting atrial fibrillation (AF) in patients with apical hypertrophic cardiomyopathy (AHCM).

Methods and Materials: 98 patients with AHCM (54 pure-AHCM and 44 mixed-AHCM) and 29 healthy controls underwent conventional CMR imaging. LAS semi-automatically tracks the length analysis between the midpoint of the LA posterior wall and the left atrioventricular junction through the LAS plate of the post-processing software CVI42 workstation (version 5.13.7) and evaluates

three strain parameters, including reservoir (ϵ_s), conduit (ϵ_e), and booster (ϵ_a). The endpoint event was set as AF. A new joint predictor was constructed by fitting multiple predictors through a logistic regression model; The area under the receiver operating characteristic (ROC) curve (AUC) of each original index was compared with the ROC curve of each subject, and the optimal threshold was determined at the maximum value of the Yoden index.

Results: During a median follow-up of 34 months (IQR, 18-52 months), 12 patients (12.2 %) reached the endpoint event, including 3 pure and 9 mixed patients. Among patients with AHCM, those who developed AF were older ($58.17 \pm 11.78y$ vs. $49.7 \pm 11.25y$). In patients with AHCM, the average left ventricular myocardial mass index (LVMI) was 86.56 ± 16.29 g/m², and the median left ventricular maximum wall thickness (LVWT) was 16 mm.

Compared with the normal control group and AHCM without AF patients, AF patients had increased left atrial volume (LAVI max 67.35 ± 15.20 ml/m² vs. 46.96 ± 12.67 ml/m² vs. 37.29 ± 8.01 ml/m²; LAVI min 49.96 ± 11.87 ml/m² vs. 30.14 ± 12.12 ml/m² vs. 14.70 ± 4.09 ml/m²), left atrium decreased ejection fraction (TLAEF 37.76 ± 17.7 % vs. 46.58 ± 11.94 % vs. 62.02 ± 4.36 %). The ϵ_s (34.86 ± 3.95 %, 26.27 ± 6.18 %, 15.12 ± 4.36 %), ϵ_a (18.57 ± 3.16 %, 14.80 ± 4.28 %, 8.17 ± 2.03 %) and ϵ_e (16.29 ± 2.32 %, 11.47 ± 3.26 %, 6.95 ± 3.23 %) of the control group, without AF group and AF group showed a downward trend ($P < 0.001$). Multivariate logistic analysis showed that ϵ_s and LAVImin were joint predictors of AF. The AUC of AF predicted by the logistic regression model with the joint predictor fitted with the two variables, ϵ_s , and LAVI min, was 0.976 (95% CI: 0.948~1.000), which was higher than that of the two predictors individually, which were (0.933 (95% CI: 0.870~0.996)) and (0.882 (95% CI: 0.790~0.973), respectively.). The sensitivity of predicting AF was 91.7% and the specificity was 94.2% when the optimal threshold value of the joint predictor was determined as 0.236 with the maximum value of the Yoden index, which was about 0.859.

Conclusions: The LAS technique quantitatively assesses LA myocardial strain and detects early subclinical dysfunction in patients with AHCM, and LAS in combination with LAVI metrics has potential value in predicting the development of AF and guiding early clinical intervention.

PO-0849

Risk Factor Analysis for Major Mediastinal Vessel Invasion in Thymic Epithelial Tumors Based on Multi-slice CT Imaging

Yuhui Ma¹, Jie Zhang¹, Weiqiang Yan¹, Jiangtao Lan¹, Xiulong Feng¹, Shumei Wang², Guang Yang³, Yuchuan Hu¹, Guangbin Cui¹

1. Department of Radiology, Tangdu Hospital, Air Force Medical University

2. Department of Pathology, Tangdu Hospital, Air Force Medical University

3. Department of Thoracic Surgery, Tangdu Hospital, Air Force Medical University

Objective: To explore the characteristics and risk factors for major mediastinal vessel invasion in different risk grades of thymic epithelial tumors (TETs) based on computed tomography (CT) imaging, and to develop prediction models of major mediastinal artery and vein invasion.

Methods: One hundred and twenty-two TET patients confirmed by histopathological analysis who underwent thorax CT were enrolled in this study. Clinical and CT data were retrospectively reviewed for these patients. According to the abutment degree between the tumor and major mediastinal vessels, the arterial invasion was divided into grade I, II, and III (< 25%, 25 – 49%, and $\geq 50\%$, respectively); the venous invasion was divided into grade I and II (< 50% and $\geq 50\%$). The degree of vessel invasion was compared among different defined subtypes or stages of TETs using the chi-square tests. The risk factors associated with TET vascular invasion were identified using multivariate logistic regression analysis.

Results: Based on logistic regression analysis, male patients ($\beta = 1.549$; odds ratio, 4.824) and the pericardium or pleural invasion ($\beta = 2.209$; odds ratio, 9.110) were independent predictors of 25% artery invasion, and the midline location ($\beta = 2.504$; odds ratio, 12.234) and mediastinal

lymphadenopathy ($\beta = 2.490$; odds ratio, 12.06) were independent predictors of 50% artery invasion. As for 50% venous invasion, the risk factors include midline location ($\beta = 2.303$; odds ratio, 10.0), maximum tumor diameter larger than 5.9 cm ($\beta = 4.038$; odds ratio, 56.736), and pericardial or pleural effusion ($\beta = 1.460$; odds ratio, 4.306). The multivariate logistic model obtained relatively high predicting efficacy, and the area under the curve (AUC), sensitivity, and specificity were 0.944, 84.6 %, and 91.7 % for predicting 50% artery invasion, and 0.913, 81.8 %, and 86.0 % for 50% venous invasion in TET patients, respectively.

Conclusion: Several CT features can be used as independent predictors of $\geq 50\%$ artery or venous invasion. A multivariate logistic regression model based on CT features is helpful in predicting the vascular invasion grades in patients with TET.

PO-0850

Diagnostic value of radiological features and hemodynamic parameters of combined V / Q SPECT / CT and CT angiography in patients with nonthromboembolic pulmonary hypertension

Zhu Zhang

The First Affiliated Hospital of Chongqing Medical University

Purpose The aim of this study was to describe radiological features of nonthromboembolic pulmonary hypertension (NTEPH) combined V/Q SPECT/CT with CT Angiography. Furthermore, we tried to identify independent radiological variables to evaluate hemodynamic changes in NTEPH, and aimed to use non-invasive methods to replace right-sided heart catheterization(RHC).

Materials and methods A total of 182 patients (80 group I, 22 group II, 53 group III, 3 group V and 24 control group) suspected of having NTEPH who underwent imaging and hemodynamic evaluation in cardiology department of the First Affiliated Hospital of CQMU from February 2014 to June 2023 were retrospectively reviewed. Radiological features included pulmonary vascular, Cardiac, Systemic vascular, Parenchymal and V/Q SPECT/CT findings. Hemodynamic assessment involved (in) the mean pulmonary artery pressure (MPAP), pulmonary vascular resistance (PVR) and others. Differences in radiological features were determined using the Kruskal Wallis test and Fisher exact test. Following a univariate analysis, associations of hemodynamic parameters with radiological parameters were evaluated by multiple linear stepwise regression. The most vital features were used to make the best predictive model. Eventually, the established radiomics model was tested with an additional 41 patients.

Result With regard to CT features, the study revealed that bronchial hypertrophy, diffuse centrilobular ground glass nodule, mosaic perfusion classification 3, PH by visual perfusion assessment favored the diagnosis of group I. whereas mosaic perfusion classification 4, perfusion defects1(VQ1) favored the diagnosis of group III. Multiparametric analysis indicated that P/A, Pulmonary artery calcification, Peripheral tortuous vessels, Right ventricle diameter, Right ventricle free wall thickness, Centrilobular ground glass nodule, global perfusion defects (VQ3) were the independent predictors of MPAP. While Right ventricle free wall thickness, Centrilobular ground glass nodule, Peripheral tortuous vessels, pulmonary artery morphology2, Mosaic perfusion classification2, Bronchial hypertrophy were the independent predictors of PVR. In addition, we made a prediction equation, the correlation coefficient (r) of MPAP is 0.737 in the development cohort, center1, 0.715 in the external validation cohort, center2; the correlation coefficient (r) of PVR is 0.687 in the development cohort, center1, 0.608 in the external validation cohort, center2.

Conclusion Our results confirmed the diagnostic value of CTPA with V/Q SPECT/CT in evaluating patients with NTEPH, and opened a horizon to a new method in assessing hemodynamic changes in patients with NTEPH using radiological parameters, especially when right-sided heart catheterization (RHC) is not possible or contraindicated.

PO-0851

Pulmonary Circulation Coupling Index: A Novel Non-Invasive Marker for Prognosis in Pulmonary Hypertension Secondary to Heart Failure

Di Zhou, Minjie Lu

Fuwai Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objectives: Due to the complex underlying pathophysiological mechanisms, few studies have investigated non-invasive prognostic predictors in patients with pulmonary hypertension (PH) secondary to heart failure. This study aimed to valid a non-invasive marker we developed, named pulmonary circulation coupling index (PC-CI), which integrates left atrial booster function and right ventricular (RV) deformation could contribute to understand the complex mechanics of the uncoupling of left ventricle-PC and PC-right ventricle.

Methods: In this retrospective study, consecutive patients with PH due to heart failure who underwent cardiac MRI between December 2010 and December 2021 were enrolled. The composite endpoints were all-cause death, heart-lung transplantation, and left ventricular assist device implantation. Survival estimates were calculated by Kaplan-Meier curves and Cox regression analyses.

Results: A total of 174 patients with PH secondary to HF, with a mean age of $53.2 \text{ years} \pm 14.9$ [SD], and including 90 men, were included in the final analysis. During a median follow-up of 31.9 months, 58 patients with PH reached the endpoints. RV longitudinal strain had a fair-to-moderate correlation with pulmonary artery pressure ($r: 0.446-0.507$, all $p < 0.05$) and pulmonary vascular resistance ($r = 0.509$, $p = 0.006$). Active left atrial ejection fraction showed strong correlation with oxygen consumption at anaerobic threshold ($r = 0.769$, $p < 0.001$) and peak oxygen consumption ($r = 0.769$, $p < 0.001$). After adjusting for systolic blood pressure, PC-CI is an independent predictor for adverse events beyond the individual variables under consideration (C-statistic: 0.744). The estimated adjusted hazard ratio for patients with $\text{PC-CI} \leq 4.5$ was 2.5 (95%CI: 1.1-5.7, $p = 0.031$) when compared with those with $\text{PC-CI} > 4.5$.

Conclusions: Using cardiac MRI, a novel non-invasive marker we developed are of basic pathophysiological and clinical relevance in PH due to HF. The standardized index of active left atrial ejection fraction and RV longitudinal strain may be worthy of consideration for assessment disease severity and prognosis in patients with PH secondary to heart failure.

PO-0852

Solitary lung adenocarcinoma: follow-up CT, pathological-molecular characteristics, and surgical prognosis for different morphological classifications

Xingtao Huang¹, Qi Li², hongfan liao²

1. The 5th people's Hospital of Chongqing

2. The First Affiliated Hospital of Chongqing Medical University

Objective: In our clinical experience, SLADCs with different morphological appearances may exhibit different natural courses, pathological and molecular characteristics, and survival prognoses. A good understanding of these features may allow clinicians to choose the optimal treatment strategy and prognostication. We aimed to investigate the dynamic changes during follow-up computed tomography (CT), histological subtypes, gene mutation status, and surgical prognosis for different morphological presentations of solitary lung adenocarcinomas (SLADC).

Methods: This retrospective study compared dynamic tumor changes and volume doubling time (VDT) in 228 patients with SLADC (morphological types I–IV) who had intermittent growth during follow-ups. The correlation between the morphological classification and histological subtypes, gene mutation status, and surgical prognosis was evaluated.

Results: Among the 228 patients, 66 (28.9%) were classified as type I, 123 (53.9%) as type II, 16 (7%) as type III, and 23 (10.1%) as type IV. Type I had the shortest VDT (254 days), followed by types IV (381 days) and III (501 days), and then type II (993 days) ($p < 0.05$ each). Type I had a greater proportion of solid/micropapillary-predominant pattern than type II, and the lepidic-predominant pattern was more common in type II and III than in type I ($p < 0.05$ each). Furthermore, type II and IV SLADCs were correlated with positive epidermal growth factor receptor mutation ($p < 0.05$ each). Lastly, the Kaplan–Meier curves showed that the disease-free survival was longest for patients with type II tumors, followed by those with type III and IV tumors, and then those with type I tumors ($p < 0.001$ each).

Conclusion: A good understanding of the natural progression and pathological-molecular characteristics of different morphological SLADC types can help make accurate diagnoses, develop individual treatment strategies, and predict patient outcomes.

PO-0853

Clinical and Non-contrast Computed Tomography Characteristics and Disease Development in Patients with Benign Pulmonary Subsolid Nodules with a Solid Component ≤ 5 mm

Qi Li,jiwen huo,xin fan,yu peng,yue zhang

the First Affiliated Hospital of Chongqing Medical University

Objective: Familiarity with the computed tomography (CT) features of benign pulmonary subsolid nodules (SSNs) can facilitate early diagnosis and enhance management. We aimed to evaluate the clinical and non-contrast CT features of patients with benign SSNs with a solid component ≤ 5 mm and their development trends via follow-up CT.

Methods: We retrospectively collected 436 patients who had SSNs with a solid component ≤ 5 mm, including 69 with absorbable benign SSNs (ABs), 70 with nonabsorbable benign SSNs (NBs), and 297 with malignant SSNs (Ms). The clinical and imaging characteristics among groups were compared. Multiple logistic regression analyses were performed to identify the independent predictors for differentiating them. An external validation cohort to determine the models' efficiency

comprised 151 patients from another center. Furthermore, the developing trend of benign SSNs during follow-up CTs was carefully analyzed.

Results: Patients with AB were younger and exhibited respiratory symptoms more frequently than those with M ($p < 0.017$). The frequency of nodules detected during follow-up CT was in the following order: ABs > NBs > Ms ($p < 0.017$). NBs were smaller than Ms; ill-defined margins were more frequent in ABs than in NBs and Ms ($p < 0.017$). Benign SSNs exhibited irregular shape, target sign, and lower CT values more frequently than Ms, whereas the latter demonstrated bubble lucency more commonly than the former ($p < 0.017$). Furthermore, ABs showed more thickened interlobular septa and satellite lesions than Ms and Ms had more pleural retraction than ABs ($p < 0.017$). Model 1, 2, and 3 for distinguishing different types of SSNs had areas under the curve (AUCs) of 0.748, 0.920, and 0.824, respectively. Furthermore, the external validation cohort obtained AUCs of 0.790, 0.912, and 0.794 for Model 1, 2, and 3, respectively. Follow-up CT showed nodule progression in four benign SSNs.

Conclusions: The three types of SSNs with a solid component ≤ 5 mm have different clinical and imaging characteristics and a small number of benign SSNs can progress resembling malignancy.

PO-0854

SARS-CoV-2 Omicron Variant Infection Imaging Progression under Low Respiratory Viral Load

Qi Li,jiwen huo,yu peng,yue zhang,xin fan
the First Affiliated Hospital of Chongqing Medical University

Objective: In our clinical practice, we found that many patients infected with Omicron demonstrated imaging progression (IP) even after their RT-PCR results had become negative for SARS-CoV-2. In particular, a few patients progressed to severe disease because of inadequate attention to symptom aggravation. We aimed to investigate the computed tomography (CT) findings of SARS-CoV-2 Omicron variant in relation to respiratory viral loads determined by cycle threshold values in reverse-transcription polymerase chain reaction (RT-PCR).

Methods: From October 2022 to November 2022, 74 hospitalized patients with Omicron were included in this retrospective study. The radiological features, CT involvement scores in relation to the respiratory viral load, and factors associated with imaging progression (IP) after the RT-PCR results turned negative were analyzed.

Results: The most common CT patterns of Omicron were multiple round-like/patchy ground-glass opacity (GGO) or mixed GGO in the peripheral or diffuse areas. The grading of CT involvement scores exhibited an inverse pattern compared to viral loads from day 1 to day 8 and from day 13 to day 20 after diagnosis. Among the 65 patients with complete imaging data, 45 (69.23%) showed IP, with symptoms improved in 34 and aggravated in 11. Patients with IP were older than those with non-IP (NIP); the erythrocyte sedimentation rates, procalcitonin levels, and D-dimer levels on admission of patients with IP were significantly higher than those of patients with NIP, whereas the immunoglobulin G antibody level on admission and CT involvement score on initial CT of patients with IP were significantly lower than those of patients with NIP (all $P < 0.05$).

Conclusion: For patients with Omicron, the IP of lung abnormalities is common when the viral load decreases. Under these circumstances, paying more attention to changes in symptoms may contribute to better patient management and the mitigation of severe pneumonia.

PO-0855

Presurgical prediction of occult lymph node metastasis in early-stage small cell lung cancer based on intra- and peritumoral contrast-enhanced CT-based radiomics: A multicenter study

Xu Jiang¹, Chao Luo², Xin Peng³, Jing Zhang⁴, MengWen Liu¹, Meng Li¹

1. Cancer Hospital Chinese Academy of Medical Sciences

2. Sun Yat-sen University Cancer Center

3. The First Hospital of China Medical University

4. Shanxi Cancer Hospital

Purpose: To predict occult lymph node metastasis (OLM) in early-stage (clinical stage T1~2N0M0) small cell lung cancer (SCLC) patients in a noninvasive manner by using machine learning models that combine clinical parameters with intratumoral and peritumoral radiomic features.

Materials and Methods: This retrospective analysis included early-stage SCLC who underwent systematic lymph node dissection across four centers from January 2014 to September 2022. For each lesion, two ROIs were defined using the gross tumor volume (GTV) and peritumoral tumor volume of 15 mm around the tumor (PTV). We extracted 1595 enhanced CT-based radiomics features from the and the GTV and PTV individually. Five predictive models were constructed. The performances of the models were evaluated using standard metrics such as the area under the curve (AUC), accuracy, sensitivity, specificity, calibration curve, and decision curve analysis (DCA). A nomogram demonstrating practical value in clinical practice was developed, incorporating clinical parameters and rad_score (GTV and PTV radiomic features).

Results: A total of 242 patients (186 men, 56 women) with 242 lesions (OLM-negative, 160; OLM-positive, 82) were included and the rate of OLM positivity in all patients was 33.884% (82/242). The combined model, which integrated three radiomics features (constructed from GTV and PTV) and two clinical parameters (smoking status and location), showed powerful predictive ability. The maximum AUC value was 0.772 in the external validation cohort better than any other models. The nomogram exhibited favorable predictive performance and further assisted radiologists in enhancing diagnostic accuracy.

Conclusion: The combined model had the best diagnostic performance and a significant generalization effect in distinguishing positive OLM and negative OLM of early-stage SCLC patients noninvasively.

PO-0856

Clinicopathological and CT features associated with recurrence of stage IA invasive lung adenocarcinoma after sub-lobar resection

Xin Fan, Qi Li, Yue Zhang, Peiling Zou

ChongQing Medical University

Objective To investigate the correlation between clinicopathological and CT features of stage IA invasive lung adenocarcinoma (ILADC) and recurrence after sub-lobar resection. **Methods** The study included 307 patients with stage IA ILADC who underwent preoperative chest CT scan and sub-lobar resection from January 2011 to June 2020, of which 38 patients relapsed within three years after operation and 269 patients did not relapse. The clinical and CT features were compared between recurrent group and non-recurrent group. Independent prognostic factors for recurrence were identified by binary logistic regression analysis. An external validation cohort to test the

model's efficiency comprised 94 patients from another center. **Results** For clinicopathological characteristics, elderly patient, men, smokers and those with micropapillary/solid-predominant adenocarcinomas were more frequently observed in recurrent group than non-recurrent group (all $p < 0.05$). For preoperative CT features, Compared to non-recurrent group, patients having tumors with big size ($\geq 1.9\text{cm}$), solid-predominant density, spiculation, type II pleural tag, pleural adhesion, vascular convergence sign and peripheral fibrosis were more frequently observed in recurrent group (all $p < 0.05$). However, no significant differences in other CT features including tumor location, lobulation, air bronchogram, air space and type I pleural tags between the two groups (all $p > 0.05$). Binary logistic regression analysis showed that tumor size, density, spiculation, type II pleural tag and pleural adhesion were the most effective variations associated with recurrence, with an area under the curve (AUC) of 0.929. An external validation cohort had an AUC of 0.972. were independent risk factors for poor prognosis of patients with stage IA ILADC after sub-lobar resection. **Conclusion** Clinicopathological and CT characteristics are helpful to evaluate the prognosis of patients with stage IA ILADC after sub-lobar resection.

PO-0857

Impact of Mitral Regurgitation on Right Ventricular Dysfunction and Biventricular Interaction in Hypertensive Patients Evaluated by Cardiac Magnetic Resonance Feature Tracking

Sishi Tang,bing fu
Chengdu Fifth People's Hospital

Purpose: Hypertension can coexist with mitral regurgitation (MR). This study aimed to evaluate the impact of MR on right ventricular (RV) deformation impairment and investigate biventricular interaction in hypertensive patients with MR [HTN(MR+)].

Materials and methods: In total, 141 hypertensive patients without MR [HTN(MR-)], 59 HTN(MR+) patients and 67 age- and sex-matched controls were retrospectively enrolled and underwent cardiac magnetic resonance examination. The HTN(MR+) group was categorized into mild ($n=24$), moderate ($n=21$), and severe ($n=14$) regurgitation subgroups based on the calculated mitral regurgitant fraction. RV mass and volume index, ejection fraction and biventricular myocardial strains, including global radial (GRS), circumferential (GCS) and longitudinal (GLS) peak strains were analyzed and compared among different groups.

Results: The HTN(MR-) patients exhibited a significant decrease in biventricular GLS and increased RV mass index, while maintaining RV volume index and ejection fraction compared to controls. The HTN(MR+) group demonstrated a significant increase in RV volume and mass index, reduced ejection fraction and biventricular strains in comparison to the HTN(MR-) group. The moderate regurgitation group showed significantly reduced biventricular strains compared with the HTN(MR-) group. The severe regurgitation group showed significantly impaired biventricular strain compared with the mild regurgitation group. Multivariable linear regression analysis revealed that left ventricular GRS, GCS, and GLS were independent of RV GRS, GCS, and GLS, indicating biventricular interaction.

Conclusion: MR may aggravate RV deformation impairment in hypertensive patients. Left ventricular strain parameters were independent influencing factors of the RV strain parameters. It is vital to evaluate the effect of MR on RV dysfunction among hypertensive cases, which may facilitate clinical management and prognostic improvement.

PO-0858

Prediction of high-grade histological subtypes of stage I A lung adenocarcinoma based on CT radiomics model

Guojin Zhang
Sichuan Provincial People's Hospital

Purpose: This study aimed to investigate the value of CT radiomics model in predicting high-grade histological subtypes of stage I A lung adenocarcinoma (LADC).

Materials and Methods: A total of 236 patients with stage I A LADC were included, who were divided into low-grade group (n=112) and high-grade group (n=124) according to the pathological grading system, and randomly divided into training and validation sets according to a ratio of 7:3. Minimum redundancy maximum relevance and least absolute shrinkage and selection operator regression were used to screen the radiomics features. Multivariate logistic regression was used to screen independent predictors from baseline clinical data and traditional CT signs. The radiomics, clinical and clinical-radiomics models were established, respectively. Receiver operating characteristic curve curves were used to evaluate the model's predictive performance, decision curve analysis (DCA) to evaluate the model's clinical net benefit, and calibration curves to evaluate the model's goodness of fit.

Results: Eight radiomics features were significantly correlated with the high-grade group of LADC. The clinical-radiomics model combined with baseline clinical data, traditional CT signs and radiomic features had the best discriminant ability in predicting high-grade histological subtypes of LADC. In the training and validation sets, the areas under the curve were 0.950 (95% CI, 0.919-0.982) and 0.950 (95% CI, 0.910-0.973), respectively. DCA analysis showed that the clinical-radiomics model had better net clinical benefit.

Conclusion: Clinical characteristics combined with radiomics features were helpful for preoperative noninvasive prediction of high-grade LADC in stage IA.

PO-0859

The value of dual-energy spectral CT in differentiating mass pulmonary tuberculosis and peripheral lung cancer

Guojin Zhang
Sichuan Provincial People's Hospital

Purpose: This study aimed to analyze the value of dual-energy spectral CT in differentiating mass pulmonary tuberculosis and peripheral lung cancer. **Materials and Methods:** A total of 240 cases of mass pulmonary tuberculosis (n=80) and peripheral lung cancer (n=160) confirmed by surgery and pathology in our hospital from January 2018 to March 2022 were collected. All patients underwent dual-phase enhanced chest CT scans under the energy spectrum scanning mode. The energy spectral CT parameters include CT40keV value, CT70keV value, iodine (water) concentration (IC), water (iodine) concentration (WC), effective atomic number (Zeff) and energy spectral curve slope [$\lambda = (CT40keV - CT70keV) / 30$]. All data were measured during the arterial phase (AP) and venous phase (VP). The two-category variables were tested by Chi-square test, and the comparison between groups was performed using an independent sample t test. The area under the receiver operating characteristic curve (AUC), sensitivity, specificity, and accuracy were used to assess diagnostic performance. **Results:** Age and carcinoembryonic antigen were statistically different between the two groups ($P < 0.05$), while sex, smoking history and tumor location were not

statistically different between the two groups ($P > 0.05$). There were significant differences in spectral CT quantitative parameters (CT40keV value, CT70keV value, λ , Zeff, and IC) between the two groups ($P < 0.05$) during the AP and VP. However, WC was not statistically different between the two groups ($P > 0.05$). ROC curve analysis showed that the AUC in the AP and VP was 90.9% (95% CI, 0.873-0.945) and 83.4% (95% CI, 0.780-0.887), respectively. The highest diagnostic performance (AUC, 97.6%; 95% CI, 0.961-0.991) was obtained by combining the AP and VP. Conclusion: Dual-energy spectral CT can well differentiate between mass pulmonary tuberculosis and peripheral lung cancer

PO-0860

Granzyme B PET Imaging Inflammation and Remodeling in Myocardial Infarction

Zhuxin Wei¹, Shihua Zhao¹, Xing Yang²

1. MR Center, Fuwai Hospital, State Key Laboratory of Cardiovascular Disease, National Center for Cardiovascular Diseases of China, Chinese Academy of Medical Sciences and Peking Union Medical College
2. Nuclear Medicine and Laboratorial Center, Peking University First Hospital

Purpose The aim of this study was to evaluate whether granzyme B (GzmB) targeted positron emission tomography (PET) imaging agent (⁶⁸Ga-grazytracer) could characterize the cardiac inflammation and remodeling in myocardial infarction (MI).

Methods MI rats were performed GzmB-targeted PET/CT on 1, 3, 6, 14, 28 post-operative days. Autoradiography, Masson stain, immunohistochemical and Elisa were tested to verify the inflammatory response and remodeling after MI in vitro. Rats were treated with GzmB-inhibitor Z-IETD-FMK to improve cardiac remodeling. Cardiac function tests were performed by echocardiograph 6 weeks after MI.

Results The highest uptake of ⁶⁸Ga-grazytracer on day 3 after MI (0.294 ± 0.03 %ID/g at 3 days vs. 0.115 ± 0.01 %ID/g in sham group, $P < 0.001$). Immunohistochemical showed significantly higher expression of GzmB and CD8, in line with PET/CT imaging result. Autoradiography showed that ⁶⁸Ga-grazytracer accumulation was observed in the infarcted myocardium. The ⁶⁸Ga-grazytracer uptake of treated rats were significantly reduced compared with MI groups (0.199 ± 0.01 %ID/g vs. 0.261 ± 0.02 %ID/g; $P < 0.05$). Echocardiographic showed that left ventricular ejection fraction was lower in MI than in ischemia reperfusion group. GzmB-inhibitor treatment was shown to be effective in improving cardiac function without significant shortening of infarct size.

Conclusions: This study demonstrated the potential for using ⁶⁸Ga-grazytracer imaging to delineate adverse inflammatory response and pathological cardiac remodeling, which can help to predict heart function. PET/CT imaging-guided therapy may reduce myocardial injury and improve heart function in myocardial infarction.

PO-0861

Lung CT prediction of mortality in patients with severe influenza A H1N1 virus and ARDS

Xiaoli Xu¹, Tao Ouyang¹, Yanli Gao¹, Jialu Li¹, Cen Chen², Xiao Tang¹, Bing Sun¹, Qi Yang¹

1. Beijing chaoyang hospital

2. 北京核工业医院

Objectives: The relationship between chest computed tomography (CT) findings and intensive care unit (ICU) mortality in influenza A (H1N1) patients with acute respiratory distress syndrome (ARDS) has not been thoroughly investigated. This study aims to assess the predictive value of CT severity score in predicting in-hospital mortality for these patients.

Methods: Between March 1, 2016, to December 31, 2020, a retrospective enrollment of 345 confirmed ARDS patients was conducted. The total CT score and individual CT abnormality scores were respectively calculated based on the extent of lobar involvement ((0:0%; 1, < 5%; 2:5–25%; 3:26–50%; 4:51–75%; 5, > 75%; range 0–5; global score 0–25)). Demographics, laboratory findings, and short-term outcomes (survival or non-survival) were recorded. Prediction models were derived through logistic regression analysis, and model performance was evaluated using the area under the receiver operating characteristic curve (AUC) and compared by DeLong's test.

Results: A total of 72 patients diagnosed with ARDS due to H1N1 infection were finally included, with 56 survivors and 16 non-survivors. The univariate analysis revealed that, compared with survivors, non-survivors were more frequently found with older age, comorbid diabetes, prolonged prothrombin time (PT), elevated fibrinogen and Alanine Amino Transferase, coinfection, use of ECMO as well as higher total CT score and CT scores of GGO, reticular lesion, bronchial dilation, architectural distortion, higher percentages of consolidation volume and average lung density (all $p < 0.05$). The multivariate logistic analysis revealed that age, coinfection and total CT score were the most important and significantly independent prognostic factors for patients' mortality. ROC curve analysis showed that use of clinical variables combined with CT features (area under the ROC curve = 0.985) was superior to use of clinical variables alone (area under the ROC curve = 0.904) ($p = 0.013$).

Conclusions: Total CT severity score may be a potential quantitative indicator for predicting the mortality of patients with ARDS resulting from H1N1 infection. The optimal predictive performance was observed in the combined CT and clinical models.

PO-0862

Individualized Prediction of Solitary Sub-Solid Pulmonary Nodules Progression based on CT Semantic and Clinical Features: A 3-year Follow-Up Study

Zujiang Xiong
The Fifth Hospital of Chongqing

Purpose: Estimating the time to progression (TTP) of sub-solid pulmonary nodules (SSNs) is crucial to the successful management of them during follow-up. The purpose of this retrospective cohort study is to develop and validate a progressive prediction model for SSNs.

Methods: A total of 126 cases who met inclusion and exclusion criteria were included in the study. The primary endpoint of our study was TTP of SSNs. Baseline characteristics were assessed in terms of clinical and CT semantic features. Kaplan-Meier analysis and COX regression analysis were performed to determine the relationship between SSNs TTP and factors from the entire data set. The nomogram was constructed based on the result of multivariate analysis and internal validation was performed using the bootstrapping. The nomogram's performance was assessed with the C-index, calibration curves, and decision curve analysis (DCA).

Results: The median follow-up time of population was 42.5(21.5) months. On Kaplan-Meier analysis, patients with higher or positive values of the indices had higher cumulative progression rate ($p < 0.05$). Multivariate Cox regression models identified diameter, CTR, morphology and VDS as independent risk factors of TTP, these predictors were included in the final model to estimate individual probabilities of progression in the 3 years, which performed well in the discrimination (the C-index was 0.901 [95%CI:0.830–0.981] and 0.875 [95%CI: 0.805-0.942] in the training and internally validation sets).

Conclusions: Our radiological semantic features nomogram is a promising and favorable prognostic biomarker for predicting progression and may aid in clinical risk stratification and decision-making for SSNs.

PO-0863

The Study of the Enhancement Effect of AI-Assisted Software on Detection of Rib Fractures by Resident Physicians in Fatigued States

Tianhui Zhang,Zheng ZHONG,Xi LONG,Zhifeng HUANG,Weixiong FAN
People's Hospital of Meizhou

Objective: To explore the enhancement effect of AI assisted software on the detection of rib fracture by resident physicians in fatigue state. **Methods:** The data of 86 patients with rib fractures who underwent CT examination from January 2021 to May 2022 were retrospectively analyzed. The resident physicians perform CT readings in the following three methods: mode A was independent reading in normal state, mode B was independent reading in fatigue state (i.e., after working 8 hours a day), and mode C was AI-assisted reading in fatigue state, with an interval of 4 weeks between the three modes of reading. Comparison of the detection rate and reading time of rib fractures in different reading modes by resident physicians. **Results:** The detection rate of rib fractures by independent reading in the fatigued state of resident physicians was significantly lower and the reading time was significantly longer than that of independent reading in the normal state, and the differences were statistically significant ($P < 0.05$, respectively). The detection rate of rib fractures by applying AI-assisted reading in the fatigue state of resident physicians was significantly higher and the reading time was significantly shorter than that of independent reading in the fatigue state, and the differences were statistically significant ($P < 0.05$, respectively). The detection rate of rib fractures by AI-assisted reading in the fatigue state of resident physicians has exceeded the level of their normal state, and the reading time has been significantly shortened, and the differences were statistically significant ($P < 0.05$, respectively). **Conclusion:** The detection efficiency of rib fractures by resident physicians in fatigue state was significantly lower than that in normal state, but the detection efficiency of rib fractures by resident physicians in fatigue state could be significantly improved with the assistance of AI, and even exceeded the level of their normal state.

PO-0864

CT quantification of pulmonary function and compensation after lobectomy and segmentectomy in patients with lung cancer

Leqing Chen,Xiaoyu Han,Lijie Zhang,Heshui Shi
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: This retrospective study aimed to compare the effects of video-assisted thoracic surgery (VATS) lobectomy and segmentectomy on postoperative pulmonary function and compensatory changes in patients undergoing lung cancer surgery.

Methods: A total of 120 patients (82 VATS lobectomy, 38 VATS segmentectomy) were assessed for demographic characteristics, baseline pulmonary function, tumor volume, T stage, and histological grade. Postoperative pulmonary function and compensatory changes [percentage of the well-aerated lung to total/unilateral lung volume (WAL%) and non-operated lung (NOL)] were measured at multiple time points up to two years. Logistic regression analysis identified factors associated with WAL% decline after one year.

Results: Both VATS lobectomy and segmentectomy led to a decrease in pulmonary function, with no significant difference in the extent of decline between the two groups (all $P > 0.05$). Lobectomy

triggered a more pronounced compensatory response, characterized by increased ipsilateral NOL volume over time. Segmentectomy induced minimal compensatory changes and had a minimal impact on pulmonary function. Factors associated with decreased pulmonary ventilation after one year differed between the lobectomy and segmentectomy groups. In the lobectomy group, a higher preoperative WAL% of ipsilateral NOL (OR: 1.073; 95% CI: 1.017-1.133; P=0.010) was associated with a higher risk of decline in pulmonary function, whereas in the segmentectomy group, the only influencing factor was the preoperative contralateral mean lung density (MLD) (OR: 0.932; 95% CI: 0.884-0.984; P=0.010).

Conclusion: VATS lobectomy and segmentectomy demonstrate comparable decline in postoperative pulmonary function, with lobectomy inducing a greater compensatory response, while segmentectomy minimally affects pulmonary function.

PO-0865

Radiomics Analysis of Peri-coronary Adipose Tissue from Baseline CCTA Enables Prediction of Coronary Plaque Progression

Rui Chen¹, Changjing Feng², Shushen Lin³, Yi Xu¹, Yinsu Zhu⁴

1. The First Affiliated Hospital of Nanjing Medical University

2. Department of Radiology, Beijing Chaoyang Hospital, Capital Medical University

3. Siemens Healthineers, Shanghai

4. The Affiliated Cancer Hospital of Nanjing Medical University, Jiangsu Cancer Hospital, Jiangsu Institute of Cancer Research

Objective: The relationship between plaque progression and PCAT radiomics has not been comprehensively evaluated. Therefore, we aim to predict coronary plaque progression with radiomics features derived from PCAT on baseline CCTA and evaluate their incremental value over quantitative plaque characteristics.

Materials and Methods: Between January 2009 and December 2020, 500 patients with suspected or known coronary artery disease (CAD) who underwent serial CCTA ≥ 2 years apart were retrospectively analyzed and randomly stratified into a training and a testing dataset with a ratio of 7:3. Plaque progression was defined with annual change in plaque burden exceeding the median value in the entire cohort. Quantitative plaque characteristics and radiomics features of PCAT were extracted from baseline CCTA. Then we built three models including quantitative coronary plaque characteristics (Model 1), PCAT radiomics features (Model 2) and the combined model (Model 3) to compare the prediction performance evaluated by AUC.

Results: The quantitative plaque characteristics of the training set showed that the values of noncalcified plaque volume (NCPV), fibrous plaque volume (FPV), lesion length (LL), PCAT attenuation were larger in the plaque progression group than in the non-progression group ($p < 0.05$ for all). In multivariable logistic analysis, NCPV and PCAT attenuation were independent predictors of coronary plaque progression. PCAT radiomics exhibited significantly superior prediction over quantitative plaque characteristics both in the training (AUC 0.814 vs. 0.615, $p < 0.001$) and testing (0.736 vs. 0.594, $p = 0.007$) datasets.

Conclusions: NCPV and PCAT attenuation were independent predictors of coronary plaque progression. PCAT radiomics derived from baseline CCTA achieved significantly better prediction than quantitative plaque characteristics.

PO-0866

Preoperative prediction of perineural invasion in esophageal squamous cell carcinoma based on CT radiomics nomogram: a multicenter study

Hui Zhou

the Affiliated Cancer Hospital of Nantong University

Objective: To investigate the value of computed tomography (CT) radiomics nomogram in the preoperative prediction of perineural invasion (PNI) in esophageal squamous cell carcinoma (ESCC) through a multicenter study. Esophageal Cancer is an extremely aggressive tumour that currently ranks sixth among cancer-related death¹. It is divided into two pathological types: esophageal squamous cell carcinoma (ESCC) and esophageal adenocarcinoma. ESCC is the predominant pathological type of esophageal cancer worldwide, accounting for 80% of esophageal cancer cases, with a higher incidence in East Asia, East Africa, and South America². Surgery remains the dominant treatment modality for resectable esophageal cancer; however, its overall therapeutic efficacy remains suboptimal. The 5-year survival rate after surgery is approximately 15–40%³, and more than half of the patients experience recurrence within 1–3 years after lesion resection⁴⁻⁶. Owing to unsatisfactory clinical outcomes after surgery for ESCC, accurate preoperative risk assessment and stratification are essential for optimising treatment options. In this context, the identification of high-risk ESCC patients based on biomarkers and pathological parameters is crucial for enhancing pre-treatment decision-making in order to improve the efficacy of treatment and survival rate of patients. Perineural invasion (PNI) is a pathological process characterised by tumour cells invading the peripheral nerve structures and spreading along the nerve sheath⁷. PNI is an independent dissemination pathway for the invasion and metastasis of esophageal cancer that not only participates in the process of tumour development but also promotes tumour recurrence and metastasis⁸. PNI is one of the biomarkers associated with the recurrence and prognosis of esophageal cancer⁹. Esophageal cancer patients with PNI are at a higher risk of recurrence and have poorer prognoses⁸. Neoadjuvant therapy can reduce the rate of PNI positivity in patients¹⁰ and improve prognosis¹¹. The Chinese Society of Clinical Oncology (CSCO) guidelines¹² for esophageal cancer in the 2022 edition state that after endoscopic mucosal resection for superficial esophageal cancer, if the pathological evaluation reveals T1b or T1a stage with concurrent PNI, additional esophageal resection is needed. Moreover, studies¹³ also suggest that esophageal tumours infiltrating the submucosa (T1b) or deeper, and exhibiting other tumour features that increase the probability of lymph node involvement, such as invasion around lymphatic vessels or nerves, poorly differentiated histology, and multiple high-grade lesions, should be treated with esophageal resection instead of endoscopic therapy. Therefore, accurate prediction of PNI would be beneficial in selecting esophageal cancer patients who would benefit from preoperative neoadjuvant chemotherapy or in choosing personalized surgical approaches to avoid unnecessary additional surgeries for patients. However, currently, the diagnosis of PNI mainly relies on preoperative biopsies or postoperative pathological analysis. Biopsies are invasive and only provide localized samples, making it challenging to reflect tumour heterogeneity and possibly leading to missed diagnoses. Postoperative pathology is performed after surgery, thus not guiding preoperative clinical decisions. Therefore, there is a need for a reliable and accurate preoperative method to predict PNI, which would aid in identifying high-risk recurrent ESCC patients and provide a basis for their preoperative decision-making. Nowadays, enhanced computed tomography (CT) has a certain degree of clinical value in displaying lesion size, lesion boundary, and the relationship between the lesion and adjacent tissues in ESCC. However, conventional contrast-enhanced CT scans cannot reveal subtle peripheral nerve structures and thus fail to detect PNI status in ESCC patients. Radiomics is an emerging quantitative image analysis method that can consider the entire tumour as the research object and construct models using algorithms for high-throughput data mining to make quantitative predictions or differential assessments for research purposes¹⁴⁻¹⁸. Recently, a series of research advances in radiomics have been made to predict the PNI of tumours. For example, Chen et al.¹⁹ established a CT-based radiomics nomogram that achieved good

performance in preoperatively predicting the PNI in colorectal cancer with the area under the curve (AUC) of 0.88, and Zheng et al. 20 showed high diagnostic efficiency (AUC=0.82) in predicting the PNI in patients with gastric cancer using radiomics features combined with clinical factors. However, only few studies have focused on the value of CT radiomics in predicting PNI in esophageal cancer. This study aimed to investigate the value of a CT-based radiomics nomogram in predicting PNI, which can be used to individualise the prediction of PNI status and improve preoperative decision-making in ESCC patients.

Methods: We retrospectively collected postoperative pathological data of 360 ESCC patients with definite PNI status (131 PNI-positive and 229 PNI-negative) from two centres. Radiomic features were extracted from the arterial-phase CT images, and the least absolute shrinkage and selection operator and logistic regression algorithm were used to screen valuable features for identifying the PNI status and calculating the radiomics score (Rad-score). A radiomics nomogram was established by integrating the Rad-score and clinical risk factors. A receiver operating characteristic curve was used to evaluate model performance, and decision curve analysis was used to evaluate the predictive performance of the radiomics nomogram in the training, internal validation, and external validation sets.

Results: Twenty radiomics features were extracted from a full-volume tumour region of interest to construct the model, and the radiomics nomogram combined with radiomics features and clinical risk factors was superior to the clinical and radiomics models in predicting the PNI status of ESCC patients. The area under the curve values of the radiomics nomogram in the training, internal validation, and external validation sets were 0.856 (0.794–0.918), 0.832 (0.742–0.922), and 0.803 (0.709–0.898), respectively.

Conclusion: In this study, we developed and validated a CT radiomics nomogram for noninvasive individual preoperative identification of PNI status in patients with ESCC based on multicentre data, which helps improve preoperative management and treatment selection for patients. The study findings demonstrate that radiomics features extracted from CT images can be used as preoperative indicators to predict positive PNI. The selected features were primarily composed of Laplace of Gaussian (LoG) and wavelet features. LoG feature parameters can extract texture features with significant discriminatory power from multiple spatial ranges, as well as smooth images and remove noise, thereby improving the efficiency of capturing phenotypic features related to tumour heterogeneity. Similarly, wavelet features can reflect multi-frequency information at different scales that cannot be identified by the naked eye and quantify tumour heterogeneity. Compared to the first-order histogram feature, LoG and wavelet features are less affected by the imaging method and its parameters, and they contain high-dimensional information of the image, which can provide more valuable information about tumour heterogeneity. In addition, they can reveal valuable information regarding the PNI status of the lesion. Among the features extracted in this study, the wavelet feature (wavelet-HLL_firstorder_Maximum) had the most significant predictive value. Firstorder_Maximum refers to the maximum grey-level intensity in the ROI. In addition, a higher value represents a higher complexity of the ROI, which indirectly reflects greater spatial heterogeneity and invasiveness of the tumour. This study used a full-volume ROI to extract features, which can reflect richer and more comprehensive information about tumour heterogeneity and better quantify the internal heterogeneity of tumours. Therefore, the radiomics nomogram constructed by delineating the full-volume ROI in this study had good stability and predictive performance. This study's multifactorial analysis demonstrated that cT stage and cN stage are independent clinical predictors of PNI, indicating a significant correlation between tumour infiltration depth, lymph node metastasis, and PNI. As T stage and N stage increase, tumour cell proliferation and invasiveness intensify, leading to an elevated risk of perineural invasion in ESCC patients, consistent with previous research findings^{22,30}. Our investigation revealed that ESCC patients with a low AGR have a higher PNI positivity rate. Plasma albumin and globulin are two important components of human plasma that reflect the nutritional status of the body and correlate with chronic inflammatory responses^{31,32}. Moreover, a low AGR can be used as a marker of chronic inflammatory responses³². In a chronic inflammatory environment, the body secretes a variety of inflammatory chemokines, which promote tumour growth and infiltration by signalling to cancer cells and remodelling the local microenvironment³³. A previous study has shown that the depth of ESCC invasion (pT) is strongly related to positive PNI ($p < 0.001$)³⁰. As the depth of tumour

invasion increases, ESCC is more likely to develop PNI. AGR, a marker of chronic inflammatory response, reflects the cumulative exposure to various pro-inflammatory cytokines, suggesting the depth of tumour infiltration, and indirectly indicates the PNI status of ESCC patients. Multivariate regression analysis showed that cT stage, cN stage and AGR is an independent risk factor for PNI in patients with ESCC. Therefore, we combined the Rad-score with clinical risk factors (cT, cN and AGR) to construct a nomogram. Our results showed that the nomogram further improved the power of predicting PNI in ESCC compared to radiomics or clinical models. This was validated in both internal and external validation sets, suggesting that CT-based radiomics nomogram plays an important role in predicting PNI in ESCC patients, providing an important adjunctive value for individualised treatment of these patients. This study established that a CT-based radiomics nomogram can preoperatively and noninvasively predict the PNI status of ESCC patients. The nomogram constructed by combining the cT, cN, AGR and Rad-score in this study improved the prediction performance. Each influencing factor was quantified into a specific score based on its contribution to the outcome event in the nomogram. The total score was then matched to the outcome scale to obtain individual risk probabilities for PNI. The DCA further confirmed that the nomogram yielded a higher overall net benefit than the clinical model. These results suggest that the nomogram, when combined with clinical data and radiomics features, can provide additional, more personalised information for the preoperative prediction of PNI status in ESCC patients, thereby providing a reference for personalised treatment. In summary, the easy-to-use nomogram constructed in this study can be used to calculate the risk of PNI for each patient under different preoperative clinical scenarios and assist in clinical decision-making. The radiomics nomogram based on CT has excellent predictive ability; it can non-invasively predict the preoperative PNI status of ESCC patients and provide a basis for preoperative decision-making.

PO-0867

MRI features of thymic extranodal marginal zone mucosa-associated lymphoid tissue lymphoma

Gang Xiao, Yue Qin
Xi'an Daxing Hospital, China

Objective: To explore the MRI features of thymic extranodal marginal zone mucosa-associated lymphoid tissue (MALT) lymphoma for improving the MRI diagnostic ability of this disease. **Methods:** A total of 19 patients (3 males and 16 females; age from 29 to 68 years, average age 46.5 years) with thymic MALT lymphoma confirmed by histopathology from November 2013 to July 2021 in Tangdu Hospital were enrolled retrospectively. Nineteen patients underwent chest non-enhanced MRI and DWI scans, and 11 of them underwent dynamic enhanced MRI scan at the same time. The MRI features were evaluated independently by two chest radiologists in double-blinded manner, including tumor size, morphology, homogeneity, the extent of cystic change, apparent diffusion coefficient (ADC) value, and so on. Subsequently, we analyzed the inter-observer agreement of these MRI features. **Results:** Thymic MALT lymphoma varied in size and the longest diameter ranged from 2.3cm to 13.9cm, with an average length of (7.0 ± 3.2) cm. Three lesions (15.8%) appeared as regular shapes and were small in size; 16 lesions (84.2%) were irregular and showed long spindle or arrow-like shapes. All 19 lesions had clear boundaries and no peritumoral edema. Two lesions (10.5%) showed homogeneous signal intensity and were small in size; 17 lesions (89.5%) were heterogeneous with varying degrees of cystic change, including mild cystic change in 4 lesions (21.1%) and obvious cystic change in 13 lesions (68.4%). Eleven lesions underwent enhanced MRI scans and showed heterogeneous enhancement. Lymphadenectasis were found in 3 cases (15.8%), 2 of which showed cystic changes; tumors invaded pericardium in 2 cases (10.5%); no encased vessel, pleural effusion, pericardial effusion, pleural or pericardial metastasis in 19 cases. The solid component of tumor showed hyper-intensity on DWI, which was higher than that of pectoralis major at the same level. The ADC value of thymic MALT lymphoma ranged from

$1.01 \times 10^{-3} \text{ mm}^2/\text{s}$ to $1.97 \times 10^{-3} \text{ mm}^2/\text{s}$, with an average of $(1.76 \pm 0.31) \times 10^{-3} \text{ mm}^2/\text{s}$. Conclusions: Thymic MALT lymphoma is a low-grade malignant entity and more common in middle-aged and elderly woman. Thymic MALT lymphoma has certain characteristic MRI features, which is usually contain cystic changes to varying degrees.

PO-0868

Ability of apparent diffusion coefficient value and DWI-based texture features to differentiate between thymic carcinomas and primary anterior mediastinal lymphomas

Gang Xiao, Yue Qin
Xi 'an Daxing Hospital, China

Objectives: We aimed to evaluate the ability of apparent diffusion coefficient (ADC) value and texture features based on diffusion-weighted imaging (DWI) to differentiate between TC and PAML, histological subtypes of TC, and histological subtypes of PAML.

Methods: Clinical and MRI data for 165 patients with TC or PAML were retrospectively collected in this study. ADC value was calculated based on two different b values (0 and 1000 sec/mm²) and 75 texture features were extracted from DWI images for each patient. MRI morphologic features were also evaluated by two thoracic radiologists. Multivariate logistic regression analysis were performed to develop a multi-layer model for discriminating TC from PAML. The diagnostic performances were compared by receiver operating characteristic analysis and Delong test.

Results: At multivariate analysis, ADC value and two DWI-based texture features (Energy and Small area emphasis) were identified as independent predictors for differentiating TC from PAML, and they achieved better discriminative performances than MRI morphologic features. Integrating DWI-based texture features into a multi-layer model with age, MRI morphologic features, and ADC value had the highest discriminative ability, with a sensitivity, specificity, and area under the curve of 81.9%, 90.1%, and 0.922, respectively. Additionally, ADC value and certain DWI-based texture features also showed significant differences among TC subtypes and among PAML subtypes, respectively.

Conclusions: This proof-of-concept study indicates that ADC value and DWI-based texture features could serve as noninvasive and efficient imaging biomarkers for the differentiation of TC from PAML. **Advances in knowledge:** Integrating DWI-based texture features into a multi-layer model with age, MRI morphologic features, and ADC value could significantly improve the diagnostic ability in differentiating TC from PAML, which might be used to decrease the high rate of invasive surgical procedures in patients with PAML.

PO-0869

Observing pectinate muscles and discriminating pectinate muscles from thrombus of left atrial appendage in patients with atrial fibrillation with enhanced CT and TEE

Miao Qi^{1,2}, Benqiang Yang²

1. Northeastern university

2. General hospital of northern theater command

Objective: Enhanced CT and TEE were used to classify the morphology of left atrial appendage pectinate muscles and discriminate special morphology of left atrial appendage pectinate muscles from left atrial appendage thrombus in patients with atrial fibrillation.

Methods: A total of 8200 patients were collected from 2016 to 2023.6, including 5300 males and 2900 females. The age is from 25 to 85 years old, the mean age is 55 years old. Philips EPIC7C color Doppler ultrasound was used with ultrasound probe X7-2T and frequency of 5 to 7 MHz. Absolute diet was kept for 12 hours and 1~2 oral anesthesia was taken before TEE examination. TEE examination was done about 10 minutes later. The depth of the insertion probe is about 25~35cm from the incisor, and the morphology of left atrial pectinate muscle was carefully observed from 0~135 degrees, using 2D, 3D, pulse and color Doppler. Enhanced CT was performed using a 256-slice CT scanner (Brilliance CT, Philips Medical Systems, Cleveland, USA). Detailed scanning parameters were listed as follows: tube voltage, 120 kVp; detector collimation, 128 × 0.625 mm; pitch, 0.16; rotation time, 0.27 s; slice thickness, 0.9 mm;

section increment, 0.45 mm. Tube current was set using the ECG-based tube current modulation technique. About 60~70 mL of iodine contrast agent was injected at a rate of 4.5~5.5 mL/s via a high-pressure injector, followed by a 20~30 mL flush of saline at the same rate. Virtual reality vessels images without bone can be depicted through a postprocessing workstation. Both examination methods were completed in three days. The special types of left atrial appendage pectinate muscles were carefully identified, and differentiated from left atrial appendage thrombus. **Results:** According to the characteristics such as morphology, distribution and direction, pectinate muscle can be classified as four types:

1. Regular type: pectinate muscle, which is looked like a comb, arranges orderly. This kind of pectinate muscle is accounted for 45%.

2. Sparse type: the number of pectinate muscles is rare, which is only 2~3, and the morphology of it is short. The left atrial appendicular wall is relatively smooth. This type of pectinate muscles are accounted for 15%.

3. Irregular type: this kind of pectinate muscles are arranged disordered. Both of the thickness and length are irregular. Some pectinate muscle is large enough to occupy a big part of left atrial appendage. When such large pectinate muscle is accompanied by calcification, it may have some impacts on releasing the occlusion device during left atrial appendage occlusion process. This type of pectinate muscle is accounted for 25%.

4. Cluster-distribution type:

The pectinate muscles of those patients have a special shape, which is emitted a short pectinate muscle on the surface of the myocardial tissue, usually within 0.5~1.5cm of the left atrial appendage roof or lateral wall. Without carefully discrimination, the short pectinate muscle on the surface of this thickened myocardial tissue can be easily misdiagnosed as left atrial appendage thrombus in beginners. This type of pectinate muscle is accounted for 15%.

For this kind of pectinate muscle, we need to distinguish it from the left atrial appendage thrombus. Pectinate muscles in enhanced CT show similar Hounsfield with myocardium, also they show similar echo with myocardium in ultrasound. Sometimes, this part of myocardium exists several(2-4) small pectinate muscles. Besides, ultrasound can show pectinate muscles move synchronized with myocardium too.

Conclusion: Enhanced CT combined with transesophageal ultrasound to classify the morphological characteristics of patients with atrial fibrillation has practical value in clinical therapy.

PO-0870

Correlation Between Radiomics Features and Ki-67 Expression in Non-Small-Cell Lung Cancer

Lihua Fan, Dong Han, Yuxin Lei, Yunsong Zheng
Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: The association between radiomics features of non-small cell lung cancer and Ki-67 expression level remains unclear. To develop a radiomics signature based on CT image features to estimate the expression level of Ki-67 in non-small cell lung cancer.

Methods: A total of 107 non-small cell lung cancer patients, who underwent non-enhanced and contrast-enhanced CT scan in our hospital from May 2016 to November 2018, including 38 males and 69 females, aged 38 to 82 years old (median 57 years old). All the non-small cell lung cancers were confirmed by histopathological examination and undergone Ki-67 expression level test within 2 weeks after CT examination, including 58 cases of low Ki-67 expression and 49 cases of high Ki-67 expression, which were retrospectively analyzed and were divided into training (n=75) and validation cohorts (n=32) in a ratio of 7:3. The arterial phase images were imported into the AW4.6 workstation to manually delineate region of interest (ROI) of the entire-tumor of lung cancer. Each ROI included 396 radiomics features including Histogram, Gray Level Co-occurrence Matrix (GLCM), Grey Level Size Zone Matrix (GLSZM), Run Length Matrix (RLM), Form Factor, Haralick. In this study, the least absolute shrinkage and selection operator (Lasso) logistic regression (LLR) model was used for further feature screening, and 11 features with non-zero coefficients were selected. A formula was generated using a linear combination of selected features that were weighted by their respective regression coefficients. A radiomics score was calculated for each patient by the formula. Then multivariate logistic regression analysis was then combined with clinical information to screen out independent risk factors for predicting Ki-67 expression level. The predictive accuracy of the radiomics signature was quantified by the area under curve (AUC) of receiver operator characteristic (ROC) curve in both the training and validation cohorts. The Hosmer-Lemeshow test was performed to evaluate the calibration degree of the radiomics. We performed decision curve analysis (DCA) to assess the clinical usefulness of the radiomics signature.

The performance of the radiomics signature was evaluated using the area under curve (AUC) of receiver operating characteristic curve. We performed decision curve analysis (DCA) within training and validation cohorts to assess the clinical usefulness of the signature.

Results: Eleven radiomics features were chosen from 396 candidate features to build a radiomics label that significantly correlated with Ki-67 expression level. The model showed good calibration and discrimination in the training cohort, with an AUC of 0.856 (95%CI: 0.736-0.977), sensitivity of 94 % and specificity of 70%, calibration degree of 0.588. In the validation cohort, AUC was 0.842 (95% CI: 0.684-0.967), sensitivity was 91%, and specificity was 79%, calibration degree of 0.175. The gender difference between Ki-67 high expression and low expression was statistically significant ($P<0.05$), and there were no significant differences in age and pathological type ($P>0.05$). Using multivariate logistic regression model, radiomics signature were considered to be independent predictor of Ki-67 expression level in non-small cell lung cancer. DCA for the radiomics signature in the training cohort showed that if the threshold probability was between 8% and 99%, then using the radiomics signature to predict Ki-67 expression level added more benefit than treating either all or no patients.

Conclusions: The radiomics signature based on CT image features is helpful to predict the expression of Ki-67 in non-small cell lung cancer lesions, which can provide a non-invasive technique for assessing the invasiveness and prognosis for non-small cell lung cancer.

PO-0871

Impaired Right Atrial Function in Pulmonary Hypertension Assessed with Myocardial Deformation before Right Ventricle Systolic Dysfunction

Fan Yang, Yan Yan, Zhenwen Yang, Dong Li
Tianjin medical university general hospital

Background: Pulmonary hypertension (PH) patients with right ventricle systolic dysfunction (RVSD) is common, which is associated with more serious clinical characteristics and poorer prognosis. Early detection of PH before RVSD can prevent treatment failure. This study was to assess the characteristics of right atrium(RA) function with myocardial deformation in the early stage of PH before RVSD and during the progression of PH using cardiac magnetic resonance feature tracking(CMR-FT).

Methods: 96 precapillary PH patients, including 36 without RVSD(PH-nonRVSD) and 60 with RVSD(PH-RVSD), were studied and compared with the health control group of 20 healthy volunteers. RA reservoir function(RA total strain ϵ_s and strain rate SRs), conduit function(RA passive strain ϵ_e and strain rate SRe), and booster pump function(RA active strain ϵ_a and strain rate SRa) were evaluated, as well as the right ventricle (RV) global longitudinal(GLS). The parameters of RA volume and right atrial emptying fraction(RAEF) were accessed. The RV morphological and functional parameters were also acquired.

Results: Compared to the health controls, ϵ_s , ϵ_e , SRs, and SRe were significantly decreased in PH-nonRVSD(all $P < 0.05$) without significant morphological changes in both RA and RV(all $P > 0.05$). Both ϵ_s and ϵ_e were significantly correlated with right ventricular ejection fraction(RVEF), RV GLS, pulmonary vascular resistance, brain natriuretic peptide, cardiac index, and 6-minute walk distance. The receiver operating characteristic analysis demonstrated the superior performance of ϵ_e beyond RV GLS in differentiating PH-nonRVSD and health controls. ϵ_a , SRa, total RAEF showed no significant difference between PH-nonRVSD and health controls, whereas they were reduced in PH-RVSD($P < 0.001$).

Conclusions: RA function derived from CMR-FT has the potential role in detecting the right-sided heart dysfunction before RVSD and monitoring the disease progression in patients with precapillary PH.

PO-0872

Roles of Free-breathing GRASP-DCE and IVIM Diffusion MRI for Identification of the subtypes of Lung Tumors

Dandan Peng, Yuancheng Wang, Shenghong Ju
Zhongda Hospital, Medical School of Southeast University

Purpose

Our study aims were to assess the diagnostic value of quantitative dynamic contrast-enhanced MRI (DCE-MRI) and intravoxel incoherent motion (IVIM) diffusion weighted (DWI) magnetic resonance imaging (MRI) for indeterminate the subtypes of lung tumors, and to explore the relationship between DCE-MRI and IVIM.

Methods

A total number of 32 patients (33 lesions) were included in our study, and all the patients were divided into 4 groups, which are Adenocarcinoma, Squamous carcinoma, SCLC and benign lesions, according to the pathological results. All MR exams were performed on a 3 T MRI scanner (MAGNETOM Vida, Siemens Healthcare). Dynamic contrast-enhanced MR data were acquired GRASP during free breathing, and reconstructed with a temporal resolution of 2.9 sec/phase for

the first 26 periods and 7.6 sec/phase for the left 30 periods. The parameters of IVIM DWI with individual shimming were: TR/TE =4200/44ms, slice thickness = 6mm, slices = 20, b = 0, 50, 100, 150, 200, 400, 600, 800 sec/mm².

Results

There were 32 patients with 4 benign SPL and 29 LCs: 6 small cell carcinomas (SCLC), 7 squamous cell carcinomas (SCC), and 16 adenocarcinomas (Adeno-Ca). For all the calculated DCE maps, Ve values in the group of Adeno-Ca and benign were significantly higher than that of the SCLC group. For the IVIM model, the IVIM-D showed significantly lower value in the Adeno-Ca than that in benign lesions. The area under the ROC curve of the mean ADCs is 0.893, According to the Pearson correlation test, significant correlation was observed between f value and Ve with correlation coefficient $r=0.38$ ($p<0.05$) in Adeno-Ca group and no significant correlation in SCC group ($p>0.05$).

Conclusion

ADCs had highest diagnostic accuracy among various IVIM and DCE MRI parameters in Identification malignancy in solid pulmonary lesions. In our study, we found an optimal cutoff point is 1.940×10^{-3} mm²/s.

PO-0873

Exploratory study of the clinical value of cystic airspaces in nonsolid lung adenocarcinoma on CT

Hengfeng Shi¹, Yang Yang², Yan Liu⁷, Beibei Liang³, Hao Chen¹, Hui Wang⁴, Dengfa Yang⁵, Zongyu Xie⁷, Qianqian Liu⁶, Juan Zhu¹, Jian Wang⁶

1. Anqing Municipal Hospital
2. The First Affiliated Hospital of Bengbu Medical College
3. Anqing Medical College
4. Zhejiang University of Technology
5. Taizhou Municipal Hospital
6. Tongde Hospital of Zhejiang Province
7. Bengbu Medical College

Objective: To study the correlation between clinical data, CT image characteristics, and histopathology of patients with three types of nonsolid lung adenocarcinoma.

Methods: In total, 2146 patients with pathologically confirmed nonsolid lung adenocarcinoma in 3 hospitals in Anhui and Zhejiang were retrospectively analyzed from July 2017 to June 2022. The patients were divided into three groups according to their status of lung adenocarcinoma associated with cystic airspaces (LACA): the LACA0 group (no cystic airspaces, 1821 patients), the LACA1 group (cystic airspace diameter of <5 mm, 208 patients), and the LACA2 group (cystic airspace diameter of ≥5 mm, 117 patients). The relationships between the patients' clinical data (e.g., sex, age, and smoking status) CT image characteristics (e.g., location, lobulation, and long-axis diameter), and postoperative pathology were evaluated by univariate and multivariate analyses.

Results: In the LACA2 group, 66 (56.4%) patients were male, 57 (48.7%) patients' lesions occurred in the lower lobe, 45 (38.5%) patients' lesions were associated with pulmonary disease, 99 (84.6%) patients had lobular signs, and 50 (42.8%) patients had postoperative pathology findings of papillary, solid, or micropapillary adenocarcinoma. Multivariate logistic regression showed that sex, lobulation, long-axis diameter, location, and pulmonary disease were independent risk factors for LACA2.

Conclusion: When nonsolid nodules containing large cystic airspaces in the lower lobe are found on CT in men with pulmonary disease, the patients should stop follow-up and undergo elective surgery.

PO-0874

A comparative study of synthetic Hct and intravenous Hct for calculating cardiovascular magnetic resonance-derived extracellular volume

Jiani Yin, Jie Qin, Xiaomei Zhu, Yi Xu
the First Affiliated Hospital of Nanjing Medical University

Abstract

Objective: To obtain accurate and convenient myocardial extracellular volume (ECV) calculated by intravenous hematocrit (Hct) and synthetic Hct in cardiac magnetic resonance (CMR).

Methods: A total of 839 subjects over 18 years of age who with CMR scans from June 2018 to July 2021, and a Hct measurement within 24 hours of the CMR scan were retrospectively analyzed. The 413 subjects from 2018 to 2020 were enrolled in the derivation cohort to derive our local sex-specific models for synthetic Hct. The remaining 426 patients from 2020 to 2021 were enrolled in the validation cohort to access the agreement and correlation of conventional ECV (ECV₀) with ECV calculated by different venous Hct (ECV₁₋₇, ECV_{>7}, and ECV_{closest}) and by Hctsyn (ECV_{syn}). The factors including patients' characteristics, LV morphological and functional parameters affecting the accuracy of ECV_{syn} were assessed and an applicability usage scenario for synthetic Hct to calculate ECV was defined.

Results: Local sex-specific models for synthetic Hct were derived with moderate correlation ($R^2=0.332$ in female, $R^2=0.423$ in male, $P<0.001$). In the validation cohort, ECV₁₋₇ and ECV_{closest} had the best correlation and smallest bias with ECV₀ ($R = 0.959$ and 0.951 , bias= 0.02% and -0.03%), whereas ECV_{>7} and ECV_{syn} had a good correlation and minimal bias with ECV₀ ($R = 0.924$ and 0.929 , bias = 0.11% and 0.05%). When using an absolute 2% error as the standard, the performance of ECV₁₋₇ was best, which accuracy was 81.0%, followed by ECV_{closest} (78.8%), ECV_{>7} (77.2%) and ECV_{syn} (70.7%). Lower and higher Hct and decreased LVEF was associated with underestimation of ECV.

Conclusion: We recommend that the time interval between Hct and CMR scan could be extended to seven days for ECV calculation. Synthetic ECV should be used with caution, especially for patients with extremely low or high Hct and decreased cardiac function.

PO-0875

Evaluation of therapeutic effect of myocardial infarction patch by cardiac magnetic resonance imaging

Chengbin He¹, Linjie Zhang¹, Yang Zhu², Hongjie Hu¹

1. Department of Radiology, Sir Run Run Shaw Hospital (SRRSH), Zhejiang University School of Medicine
2. MOE Key Laboratory of Macromolecular Synthesis and Functionalization, Department of Polymer Science and Engineering, Zhejiang University

Background

Ventricular aneurysm is easy to form due to ventricular remodeling after myocardial infarction, but there is a lack of effective treatment in clinic at present. In recent years, the treatment concept of "heart patch" has been gradually popular. Patches made of polymer materials covered the lateral epicardium of infarcted myocardium could provide mechanical support for the damaged myocardium and prevent the occurrence of ventricular aneurysm. Cardiac magnetic resonance (CMR) can quantitatively evaluate myocardial fibrosis and evaluate cardiac function. In this study, CMR was used to analyze the morphology and function of the heart in pigs with myocardial

infarction before and after treatment with the patch, so as to objectively evaluate the therapeutic effect of the patch.

Materials and methods

Female Bama miniature pig was subjected to video-assisted thoracoscopic ligation of the left anterior descending coronary artery, and the success of modeling was judged by ECG. The pigs in the control group directly closed the thoracic cavity after ligation of the coronary artery, while the pigs in the patch group underwent patch implantation after successful modeling, and then closed the thoracic cavity. The CMR scan included pre-surgery, 2 and 8 weeks post-surgery. Data analysis was performed using CVI 42 software, including left ventricular ejection fraction, LGE% and left ventricular strain analysis. The CMR was completed and the animal was euthanized and the heart was taken for histological staining including TTC, HE, Masson and Sirius red.

Results

CMR showed that the local ventricular wall of the pigs in the control group became thinner and formed ventricular aneurysm, while the ventricular wall of the pigs in the patch treatment group still maintained a certain thickness, and patches of epicardium could be observed with low signal intensity. Compared with the control group, the pigs in the patch group had higher left ventricular ejection fraction, higher corresponding segmental strain index, and lower LGE percentage ($P < 0.05$). Pathological staining showed that the area of myocardial fibrosis in the patch group was smaller than that in the control group ($P < 0.05$).

Conclusion

CMR can noninvasively evaluate the therapeutic effect of cardiac patches and is a valuable imaging examination for quantitative analysis of the functional effects of biological materials.

Clinical application

Imaging plays an important role in evaluating the therapeutic effects of biomaterials. Based on non-invasive analysis of cardiac morphology and function, CMR evaluates the efficacy of myocardial infarction patches and objectively evaluates the feasibility of this new concept of patch treatment, which provides reference value for clinical prevention of ventricular aneurysm after myocardial infarction.

PO-0876

Estimation of mean pulmonary arterial pressure and pulmonary vascular resistance using CMR in connective tissue disease-associated pulmonary arterial hypertension

Kefan Ma¹, Yidan Zhu¹, Wangyan Liu¹, Xiaomei Zhu¹, Qiang Wang², Xiaoxuan Sun², Yinsu Zhu³, Yi Xu¹

1. The First Affiliated Hospital of Nanjing Medical University

2. Department of Rheumatology, The First Affiliated Hospital of Nanjing Medical University

3. The Affiliated Cancer Hospital of Nanjing Medical University, Jiangsu Cancer Hospital, Jiangsu Institute of Cancer Research

Background: Cardiac magnetic resonance (CMR) is a promising non-invasive tool for assessing pulmonary arterial hypertension (PAH). This study aimed to estimate mean pulmonary arterial pressure (mPAP) and pulmonary vascular resistance (PVR) by CMR metrics using right heart catheterization (RHC) as gold standard in connective tissue disease-associated PAH (CTD-PAH). Methods: Consecutive 70 patients diagnosed as CTD-PAH who underwent both CMR and RHC within 7 days from September 2017 to April 2023 were respectively enrolled. Ventricular volumes, functions, morphological, and T1 mapping parameters, as well as main pulmonary artery (MPA) hemodynamics data, were measured. Spearman correlation analysis was used to assess the relationship between CMR and RHC parameters. Segmental linear regression analysis was employed to identify the threshold of mPAP changes, and predictive models for mPAP and PVR were developed using regression analysis.

Results: Ventricular mass index (VMI), interventricular septal (IVS) angle, and IVS curvature were highly correlated with mPAP ($r = 0.74, 0.72$, and -0.71 respectively, all with $P < 0.01$), and VMI exhibited a strong positive correlation with PVR ($r = 0.72, P < 0.01$). Segmented linear regression revealed a pivotal RVEF threshold at 21%. When $RVEF > 21\%$, VMI, free-wall distance change (SFD), IVS curvature and MPA/ ascending aorta (AAo) diameter ratio were independently correlated with mPAP ($P < 0.05$). A CMR model for predicting mPAP was established: $31.167 + (16.400 * VMI) - (19.254 * IVS \text{ curvature}) - (6.971 * SFD) + (10.709 * MPA/AAo \text{ diameter ratio})$. Another CMR model for predicting PVR was developed: $11.798 + (16.723 * VMI) - (10.662 * IVS \text{ curvature}) - (0.045 * RVESVI) - (5.074 * RV \text{ SV/ESV})$.

Conclusions: CMR parameters can be established the models for estimating mPAP and PVR in CTD-PAH patients. It could provide a non-invasive method for assessment pulmonary arterial hemodynamics during the management of CTD-PAH.

PO-0877

Prediction of microvascular obstruction by coronary artery angiography score after acute ST-segment elevation myocardial infarction

Ziwen Li, Jiangtao Wang
Xiangyang Central Hospital

Background: Some coronary artery angiography (CAG) scores are associated with the no-reflow phenomenon after percutaneous coronary intervention (PCI) in patients with acute ST-segment elevation myocardial infarction (STEMI). However, quality evidence regarding the association between the CAG scores and microvascular injury is still needed. Our study aimed to validate the ability of the CAG scores in predicting microvascular obstruction (MVO) detected by cardiac magnetic resonance (CMR) imaging.

Methods: From October 2020 to October 2021, 141 consecutive patients with acute STEMI who underwent primary PCI and CMR were retrospectively reviewed. CMR imaging was performed between 3 and 7 days after PCI. The patients were divided into MVO and non-MVO group based on the CMR results. Three CAG scores (SYNTAX score, SYNTAX II score and Gensini score) were used to assess the severity of coronary artery atherosclerotic burden.

Results: A total of 122 patients were included (mean age 60.6 ± 12.8 years). MVO occurred in 51 patients (41.8%). Patients with MVO had higher SYNTAX scores, SYNTAX II scores and Gensini scores than those without MVO (all $p < 0.001$). The Gensini score ($r = 0.567, p < 0.001$) showed the strongest correlation with infarction size than SYNTAX score ($r = 0.521, p < 0.001$) and SYNTAX II score ($r = 0.509, p < 0.001$). The areas under the receiver operator characteristic curves of SYNTAX score, SYNTAX II score and Gensini score for predicting MVO patients were 0.726, 0.774 and 0.807. In multivariable regression analysis, peak troponin I (odd ratio [OR] = 1.236, $p = 0.001$) and SYNTAX II score (OR = 11.636, $p = 0.010$) were identified as independent predictors of MVO.

Conclusions: In patients with acute STEMI undergoing primary PCI treatment, the peak troponin I and SYNTAX II score may be an independent predictor of MVO.

PO-0878

Application value of cardiac magnetic resonance image fusion technique in patients with acute myocardial infarction

Ziwen Li, Jiangtao Wang
Xiangyang Central Hospital

Background: Diffusion-weighted imaging (DWI) is feasible for detecting acute myocardial edema in patients with acute myocardial infarction (AMI). However, cardiac motion artifacts can cause severe attenuation or loss of DWI signal in well-contracting myocardial segments. Our study aimed to investigate the application value of cardiac magnetic resonance (CMR) image fusion technique in patients with AMI.

Methods: Patients with AMI who underwent percutaneous coronary intervention and CMR were prospectively enrolled. Image fusion was performed on cardiac cine imaging and DWI. Using late gadolinium enhancement (LGE) as the reference standard, the acute myocardial edema diagnostic efficiency, image quality score and correlation with infarct size were compared between DWI and cine-DWI.

Results: A total of 52 patients with AMI were enrolled in this study. No significant difference was found in the positive rate of acute myocardial edema diagnosis between DWI and cine-DWI (92.3% vs. 96.2%, $p = 0.500$). Cine-DWI had higher normal and overall myocardial scores than DWI (all $p < 0.001$); no significant difference was observed in edematous myocardial score between DWI and cine-DWI ($p = 0.239$). Compared with DWI ($r = 0.826$, $p < 0.001$), the edema area measured using cine-DWI had a stronger correlation with the infarct size measured using LGE ($r = 0.905$, $p < 0.001$).

Conclusions: Compared with DWI, the fusion image base on cine and DWI improved the image quality, and its edema area had a stronger correlation with the infarct size measured using LGE.

Improvement in coronary microvascular dysfunction evaluated by cardiac magnetic resonance in patients with hypertrophic obstructive cardiomyopathy after transapical beating-heart septal myectomy

Yun Zhao¹, Lu Huang¹, Chenhe Li¹, Dazhong Tang¹, Yi Luo¹, Chunlin Xiang¹, Xiaoyue Zhou², Jing Fang¹, Xiang Wei¹, Liming Xia¹

1. Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology
2. MR Collaboration, Siemens Healthineers Ltd

Background: Coronary microvascular dysfunction (CMD) is a pathophysiological mechanism underlying hypertrophic obstructive cardiomyopathy (HOCM). However, few studies have investigated the potential effect of transapical beating-heart septal myectomy (TA-BSM) on coronary microvascular function. This study aimed to evaluate coronary microvascular function in HOCM after TA-BSM using cardiac magnetic resonance (CMR) and to investigate the determinants of improvement in coronary microvascular dysfunction.

Materials and Methods: 28 patients with HOCM who underwent TA-BSM were prospectively enrolled in this study from March 2022 to April 2023. All patients received CMR before and after TA-BSM. CMR-derived parameters were compared, including the maximum wall thickness, native T1 value, T2 value, late gadolinium enhancement (LGE), and perfusion indexes (Slopemax,

Timemax, and SImax). Univariate and multivariate linear regression identified variables associated with the rate of Slopemax change.

Results: Compared with the preoperative parameters, left ventricular function and myocardial perfusion were significantly improved after TA-BSM (all $P < 0.05$), although still lower than in healthy controls. In the analysis of the myocardial perfusion parameter rate of change, the rate of Slopemax change was the most significant ($P = 0.002$) in HOCM. In the multivariable regression analysis, age (adjusted $\beta = 0.551$), weight of the resected myocardium (adjusted $\beta = 0.191$), maximum wall thickness (adjusted $\beta = -0.406$), LGE (adjusted $\beta = 0.260$), and Δ left ventricular outflow tract (LVOT) pressure gradient (adjusted $\beta = -0.123$) were significantly associated with the rate of Slopemax change in HOCM ($P < 0.05$ for all).

Conclusion: Coronary microvascular dysfunction in both hypertrophic and non-hypertrophic myocardial segments was improved in patients after TA-BSM. Microcirculatory perfusion evaluated by CMR can be a potential tool to evaluate the improvement of CMD in HOCM.

PO-0880

Early reverse remodeling of left heart morphology and function evaluated by cardiac magnetic resonance in hypertrophic obstructive cardiomyopathy after transapical beating-heart septal myectomy

Yun Zhao¹, Chenhe Li¹, Dazhong Tang¹, Yi Luo¹, Chunlin Xiang¹, Lu Huang¹, Xiaoyue Zhou², Jing Fang¹, Xiang Wei¹, Liming Xia¹

1. Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. MR Collaboration, Siemens Healthineers Ltd

Purpose: Early assessment of cardiac morphology and function after myectomy is essential for noting the surgical effect and planning subsequent treatment. This study aimed to evaluate the early morphology and function of the left heart in hypertrophic obstructive cardiomyopathy (HOCM) after transapical beating-heart septal myectomy (TA-BSM) using cardiac magnetic resonance (CMR).

Materials and methods: Between April 2022 and January 2023, HOCM patients who underwent CMR before and three months after TA-BSM were prospectively and consecutively enrolled in the study. Preoperative and postoperative cardiac morphological and functional parameters, including those for the left atrium (LA) and left ventricle (LV), were compared. Healthy participants with a similar age and sex distribution were enrolled for comparison. Pearson or Spearman correlation analysis was used to investigate the relationships between the parameters and the left ventricular remodeling index (LVRI). Last, univariate and multivariate linear regression identified variables associated with the left ventricular mass index (LVMI) and LVRI.

Results: Forty-one patients (mean age \pm standard deviation, 46 ± 2 years; 27 males) and 41 healthy control participants were evaluated. Eighteen (43.9%) HOCM patients were classified as having a sigmoid septum, and 23 patients had a reverse septal curvature. LA size and function were significantly improved postoperatively, but still worse than healthy controls. Compared to before the operation, left ventricular wall thickness, left ventricular ejection fraction (LVEF), LVMI, and LVRI decreased after TA-BSM (all $p < 0.001$). The left ventricular end-diastolic volume index (LVEDVI) and left ventricular end-diastolic diameter (LVEDD) decreased in patients with a sigmoid septum. However, it increased in those with a reverse septal curvature (both $p < 0.001$). In addition, both preoperative and postoperative LVRI was positively correlated with LVMI ($r = 0.734$ and 0.853 , both $p < 0.001$) and maximum wall thickness ($r = 0.679$ and 0.676 , both $p < 0.001$), respectively. In the multivariable analysis, the weight of the resected myocardium (adjusted $\beta = 0.476$, $p = 0.005$) and Δ mitral regurgitation degree (adjusted $\beta = -0.245$, $p = 0.040$) were associated with Δ LVRI. Last, the Δ LVOTG (adjusted $\beta = 0.436$, $p = 0.018$) and baseline LVMI (adjusted $\beta = 0.323$, $p = 0.040$) were independently associated with greater left ventricular mass regression after TA-BSM.

Conclusion: Following TA-BSM, HOCM patients showed early reverse remodeling of left heart morphology and function.

PO-0881

Inter-observer Consistency on Subsolid Nodule Follow-up Recommendation Based on NCCN Guidelines in Low-Dose CT Lung Cancer Screening

Quanyang Wu, Lina Zhou, Shijun Zhao, Ning Wu

1Department of Diagnostic Radiology, National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing 100021, China

Abstract

Background: This study aimed to assess inter-observer agreement on NCCN guideline-based follow-up recommendation in subsolid nodules from low-dose computed tomography (LDCT) screening.

Methods: A retrospective collection of LDCT reports from 2014–2017 for lung cancer screening was conducted using the radiology information system and keyword searches, focusing on subsolid nodules. A total of 110 LDCT cases containing subsolid nodules were identified. Two senior radiologist provided standardised follow-up recommendation. Follow-up recommendation was categorized into four groups (12-month, 6-month, 3-month, and 0-month). To ensure overall balance and representativeness of the follow-up categories, 60 scans from 60 participants were included (distribution ratio 2:2:1:1). Cases were categorised into follow-up recommendation groups by five observers following NCCN guideline. Fleiss's kappa statistic was used to evaluate inter-observer agreement.

Results: Overall accuracy rate for follow-up recommendation among five observers was 72.3%. Chest radiologists' overall agreement was significantly higher than radiology residents ($p < 0.01$). Agreement was moderate among all five observers (Fleiss kappa = 0.437). The average Cohen kappa value for all paired readers was 0.603 (0.489–0.716). Chest radiologists achieving substantial agreement, with Cohen kappa = 0.655 (0.503–0.807), while the average Cohen kappa value among radiology residents was 0.533 (0.501–0.565). Most cases with discrepancies were related to the identical risk-dominant nodules (73.5%). A higher proportion of part-solid nodules was a risk factor for discrepancies. Of the 600 paired readings, substantial discrepancy were observed in 4.8% (29/600) of the cases.

Conclusion: In subsolid nodules, Category evaluation of observer follow-up recommendation based on NCCN guideline achieved moderate consistency. Disagreements were mainly caused by measurement and type disagreements of identical risk-dominant nodules. Part-solid nodules was a contributor for discrepancies in follow-up recommendation. In the management of subsolid nodules, substantial management discrepancies were observed in 4.8% of the cases.

PO-0882

Characterization and clinical significance of right cardiac chamber remodeling in patients with connective tissue disease analysis by tissue tracking cardiac magnetic resonance imaging

Yuanyuan Tang,Zhaoxia Yang,Jingyang Wen,Lu Huang,Liming Xia
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose:

This study focused on the changes of impaired right atrial (RA) and RV strain parameters derived from cardiac magnetic resonance feature-tracking (CMR-FT) in patients with connective tissue disease (CTD) and their association with other clinical factors.

Methods:

A total of 110 patients with CTD and 56 age- and sex-matched healthy controls who underwent CMR imaging were retrospectively included. CMR-FT was used to evaluate the RA longitudinal strain and strain rate (SR) parameters as well as RV global systolic peak strain and strain rate in circumferential and longitudinal directions for each subject. Univariable and multivariable linear regression analyses were used to analyze the clinical factors related to RA and RV strain parameters.

Results:

CTD patients had lower RA reservoir strain (ϵ_s), conduit strain (ϵ_e), conduit strain rate (SR ϵ), and RV global circumferential strain (GCS) than controls (all $p < 0.05$), and RV GCS remains impaired even in CTD patients with preserved RVEF ($\geq 45\%$) (-17.48 ± 3.85 vs. -18.92 ± 2.99 , $p = 0.035$). The decreased RV GCS significantly associated with the presence of pulmonary arterial hypertension (PAH) ($\beta = 0.259$, $p = 0.015$). Patients with idiopathic inflammatory myopathy (IIM) had significantly higher RA and RV strain and strain rates than non-IIM, except for RA booster strain (ϵ_a). Non-IIM was independent association with ϵ_s ($\beta = -0.265$, $p = 0.009$), ϵ_e ($\beta = -0.285$, $p = 0.003$), and RV global longitudinal strain ($\beta = 0.284$, $p = 0.006$) in all CTD patients. The elevated serum uric acid level also had an independent correlation with ϵ_s and ϵ_e ($\beta = -0.200$ and -0.216 , all $p < 0.05$).

Conclusions:

RA and RV strain parameters were significantly impaired in CTD patients, which independently correlated with the variety of CTD, presence of PAH, and serum uric acid level. There was an incremental value of RV GCS to detect the RV function alterations in CTD patients even with preserved RVEF, which might be a more effective tool for clinical disease monitoring.

PO-0883

The value of pulmonary magnetic resonance imaging-based radiological characteristics and texture analysis in the differentiation of benign and malignant pulmonary necrotic lesions

Yeqi Gao,Jie Lu,Jie Shen,Hai Xu,Tongfu Yu
Jiangsu Provincial Hospital (The First Affiliated Hospital with Nanjing Medical University)

Objective: To explore the value of pulmonary magnetic resonance imaging (MRI) radiological characteristics and MRI-based texture analysis in differentiating benign and malignant pulmonary necrotic lesions.

Materials and Methods: Data of 104 patients with pulmonary necrotic lesions were retrospectively analyzed. The clinical and radiological characteristics of the patients were analyzed retrospectively using the Chi-square test or Mann-Whitney U test. Two volume of interest (VOIs) were defined in the T2-weighted imagin(T2WI) and apparent diffusion coefficient(ADC) images of each patient, respectively. Texture features were extracted from each VOI and used to train different machine learning algorithms. Model performance was evaluated using receiver operating characteristic (ROC) curves and the area under the curve (AUC).

Result: The result showed that only the wall thickness of the necrotic lesion is an independent predictor of malignant necrotic lesions with multivariate analysis. Twenty features including radiologic features, first-order histogram features and texture features were selected to establish the combined model. The best performing model was linear discriminant analysis (LDA), which achieved an AUC of 0.918 in the test set and 0.916 in the train set.

Conclusion: We demonstrated that combining MRI radiological characteristics with MRI-based texture features can be used to accurately distinguish benign and malignant pulmonary necrotic lesions. This may assist in clinical decision-making by a non-invasive approach.

PO-0884

Natural History and Clinical Characteristics of Subsolid Pulmonary Nodules in Pediatric Patients

Hua Ren,Hong Yu
Shanghai Chest Hospital

Purpose: To investigate the natural course of subsolid nodules (SSNs) in pediatric patient population and to gain some insights on how to follow them up

Materials and Methods: From January 2010 to December 2020, patients age of 18 years or younger were retrospectively reviewed and assessed. The incidence of interval growth, clinical, radiologic and pathological features and follow-up outcomes of these SSNs were investigated.

Results: A total of 35 patients (median age, 17 years; range, 13–18 years; 16 women) with 52 SSNs (including 49 pure ground glass nodules [pGGNs] and three part-solid nodules [PSNs]) were analyzed and evaluated. Two of the 52 SSNs (3.8%) (one PGGN, one PSN) showed interval growth. The PSN showed an increase in nodule size, without changing in size of the solid component. The PGGN showed centripetal growth from reversed halo sign to a homogeneous ground glass nodules filled with higher ground glass opacity, who continued follow-up. The intervals from initial CT examination to growth were 20 and 12 months, respectively. Four SSNs (7.7%) (three PGGNs and one PSN) in four patients were disappeared within 2~7 months during follow-up. Among the twenty-one SSNs (18 PGGNs, 3 PSNs) in nineteen studied individuals were underwent pulmonary resection, eight IVAs, seven minimally invasive adenocarcinomas, five adenocarcinomas in situ and one bronchiolar adenoma. All patients survived without recurrence.

Conclusion: Only 4% of SSNs in children and adolescents with no history of malignancy showed subsequent growth. The much higher likelihood these persistent SSNs in pediatric patients that represents a primary lung tumor than metastasis or infectious causes, should be follow-up with long interval and appropriate surgical treatment after thoughtful discussion.

PO-0885

Restoring sinus rhythm reverses Left atrial remodeling in patients with atrial fibrillation and reduce LA fibrosis progression detected by LGE-MRI

Weixiang Song¹, Zheng Fang¹, Guangyong Ai¹, Fang Qin², Yuehui Yin², Dajing Guo¹

1. Department of Radiology, the Second Affiliated Hospital of Chongqing Medical University

2. Department of Cardiology, the Second Affiliated Hospital of Chongqing Medical University

BACKGROUND Atrial fibrillation (AF) is the most common sustained arrhythmia in clinical practice with its prevalence increasing along with the age of the population. Although the left atrial (LA) diameter has consistently been identified as a strong prediction of AF, the relationship between LA myocardial fibrosis and AF recurrence still remains unclear.

OBJECTIVES This study sought to determine the left atrial (LA) structural, functional and histological changes in patients with AF after treatment, and explore the relationship between atrial remodeling and recurrence of atrial fibrillation utilizing cardiovascular magnetic resonance (CMR).

METHODS A total of 27 consecutive patients with AF were studied at baseline and 3-6month follow-up after conservative treatment with specific drugs. The LA function, strain and LA-LGE were quantitatively analyzed and compared between AF recurrent and non AF recurrent group during sinus rhythm by cardiac magnetic resonance (CMR) late gadolinium enhancement (LGE) and feature_x0002_tracking, respectively. LA fibrotic burden was derived from the images using commercially available ADAS 3D-LA software. Local image intensity ratio (IIR) of the LA was calculated as the absolute pixel intensity to mean blood pool intensity ratio. The upper limit of normal IIR was 1.20; IIR values higher than 1.32 were considered dense scar of core zone. Image intensity ratio values between 1.2 and 1.32 identified interstitial fibrosis of border zone.

RESULTS During follow-up, 17 (63.0%) patients with non-AF recurrence had a decreased LA fibrotic burden in the border zone after treatment ($P < 0.05$). However, there was no difference in the degree of left atrial fibrosis in patients with AF recurrence before and after treatment, whether in the core or border zone. The LA reservoir (LA total EF, $p < 0.05$) and booster function (LA active EF, LA active strain(Ea), LA peak late-negative strain rate(SRa): all $p < 0.05$) were all increased in patients of the two groups after treatment, while LA conduit pump function of non-AF recurrence was preserved.

CONCLUSIONS Actively maintaining sinus rhythm can reverse cardiac remodeling and reduce the degree of fibrosis by rescuing some myocardium in the border zone, while dense scar in the core area is irreversible. Therefore, management of AF should focus on restoration of SR in clinical practice.

Background: The growing use of coronary CT angiography (CCTA) in patients with coronary artery disease (CAD) results in an increased referral rate for invasive coronary angiography (ICA). CCTA-derived fractional flow reserve (CT-FFR) improving ICA efficiency and clinical outcomes over CCTA alone remains insufficiently evidenced in the real-world setting.

Objectives: To compare the effectiveness of CCTA+CT-FFR with CCTA alone as an initial strategy for guiding the downstream care of patients with stable CAD.

Methods: In total 5,410 patients were randomly assigned with 1:1 to a strategy of initial testing with both CCTA and a novel, fully automatic, one-click, on-site CT-FFR (CCTA+CT-FFR) or CCTA alone for guiding downstream care. No any other interventions were taken. The primary endpoint was the ICA rate at 90 days. The secondary endpoint was major adverse cardiovascular events (MACE) during 90 days and 1-year follow-up.

Results: Over a median of 103 days follow-up period, ICA was performed in 269 of 2,689 patients (10.0%) in the CCTA+CT-FFR group and 332 of 2,697 patients (12.3%) in the CCTA alone group (absolute risk difference: -2.30; $P=0.006$). 90-day (0.5% versus 0.8%; $P=0.143$) and 1-year MACE (2.9% versus 3.0%; $P=0.742$) were similar between both groups. However, the CCTA+CT-FFR group had fewer cardiac events than CCTA alone group (0.5% vs. 1.2%; adjusted hazard ratio: 0.47; $P=0.019$) at 1-year follow-up duration.

Conclusions: CT-FFR added to CCTA led to a fewer ICA rate during 90 days follow-up and lower a 1-year cardiac events incidence than CCTA alone in the real-world setting.

11. Shukun (Beijing) Network Technology Co., Ltd. Beijing, China

Currently clinically available coronary CT angiography (CCTA) derived fractional flow reserve (CT-FFR) is time-consuming and complex. We propose a novel artificial intelligence-based fully-automated, one-click, on-site CT-FFR technology, which combines the automated coronary plaque segmentation and luminal extraction model with reduced order 3D computational fluid dynamics. A total of 463 consecutive patients with 600 vessels from updated China CT-FFR study in cohort 1 underwent CCTA and invasive FFR within 90 days were collected for diagnostic performance evaluation. For cohort 2, a total of 901 chronic coronary syndromes patients with index CT-FFR and clinical outcomes at a median 35 months follow-up were retrospectively analyzed. In cohort 3, the association between index CT-FFR from triple-rule-out CTA and major adverse cardiac events in patients with acute chest pain in the emergency department were further evaluated. The diagnostic accuracy of this CT-FFR in Cohort 1 was 0.82 with an area under the curve of 0.82. Compared with the manually dependent CT-FFR techniques, the operation time of this technique was substantially shortened by 3 times and the number of clicks from about 60 to 1. This CT-FFR has highly successful (> 99%) calculation rate and also provides superior predictor for major adverse cardiac events than CCTA alone both in patients with chronic coronary syndromes and acute chest pain. Thus, the novel artificial intelligence-based fully-automated, one-click, on-site CT-FFR technique can function as an objective and convenient tool for coronary stenosis functional evaluation in the real-word clinical setting.

PO-0888

Cardiac valve assessment with cardiovascular magnetic resonance imaging at 5 Tesla: a comparison study with 3 Tesla

Menglong Zheng¹, Shiyu Zhang², Kexue Deng¹

1. Department of Radiology, The First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China

2. Shanghai United Imaging Healthcare

Purpose: The purpose of this prospective study was to explore the feasibility of cardiac valve imaging at 5 T and evaluate the practical performance at 5 T for cardiovascular magnetic resonance (CMR) imaging as compared with 3 T.

Methods: Twenty healthy volunteers were prospectively recruited. Gradient-echo (GRE) CINE imaging was performed on each healthy volunteer at 5 T and 3 T and compared with balanced steady-state-free-precession (bSSFP) CINE imaging at 3 T. Additionally, GRE CINE scans with higher spatial resolution were performed at 5 T. For all CINE scans at both fields, each slice was acquired with routine ECG gating and end-expiratory breath-holding. Subjective image analysis of mitral valves, tricuspid valve, aortic valve and pulmonary valve was performed by two experienced radiologists using a four-point Likert scale.

Results: 5 T GRE CINE imaging demonstrated improved image quality with higher contrast between the valve leaflets and blood pool, and comparable artifacts when compared with 3 T GRE CINE imaging, and it also showed excellent capability for high resolution (1.0 × 1.0 × 6.0 mm³) imaging. Compared to 3 T bSSFP cine imaging, 3 T GRE CINE imaging achieved improved image quality with higher contrast between the valve leaflets and blood pool.

Conclusions: The initial study proved that 5 T MRI provides anatomical images of the cardiac valve with superior image quality when compared to 3 T MRI.

PO-0889

CT-guided percutaneous transthoracic needle biopsy of ground-glass opacity lesions: how to limit non-diagnostic sampling?

Shouxin Yang, Mai Lin Chen, Ying Shi Sun
Beijing Cancer Hospital

Objectives: To construct a nomogram model for predicting non-diagnostic results after CT-guided percutaneous transthoracic needle biopsy (PTNB) of ground-glass opacity (GGO) lesions.

Methods: Patients who underwent PTNB of persistent GGO lesions between November 2017 and February 2021 were selected retrospectively. In the training cohort, predictive factors were determined by univariate and multivariate analyses. Based on these factors, a predictive nomogram model was established. The performance of the model was validated by using a time-based validation cohort.

Results: A total of 323 patients underwent PTNB of GGO lesions in the training (n=256, mean age 64.4 ± 9.1 years, M/F=98/158) and validation (n=67, mean age 64.5 ± 10.0 years, M/F=30/37) cohorts. The overall incidence of non-diagnostic biopsy results was 13.6% (training cohort, n=34; validation cohort, n=10). In the training cohort, multivariate analysis revealed that the solid component (odds ratio [OR]=0.952, 95% confidence interval [95%CI] 0.910–0.996, $p=0.032$), needle tip not within the target (OR=6.149, 95%CI 2.396–15.776, $p<0.001$), and pathological sampling length <4 mm (OR=9.879, 95%CI 4.074–23.956, $p<0.001$) were predictive factors for non-diagnostic biopsy results of GGO lesions. The area under the receiver operating characteristic curve was 0.845 (95%CI 0.780–0.911) in the training and 0.771 (95%CI: 0.604–0.938) in the validation cohort.

Conclusion: The solid component of the GGO lesion, needle tip not within target, and pathological sampling length <4 mm were independent predictive factors for non-diagnostic results of GGO lesions. This predictive model may assist biopsy operators in limiting non-diagnostic biopsy results of GGO lesions.

PO-0890

Left atrial strain assessed with cardiac magnetic resonance feature-tracking to predict left ventricular adverse remodeling following ST-segment elevation myocardial infarction

Chaoxia Yang, Lu Huang, Liming Xia
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: Cardiac magnetic resonance feature-tracking (CMR-FT) allows quantitative assessment of left atrial (LA) strain, while little is known about the clinical relevance of LA strain in patients with first-time ST-segment elevation myocardial infarction (STEMI). The study aimed to investigate the potential utility of LA strain assessed with CMR-FT to predict left ventricular adverse remodeling (LVAR) after STEMI.

Methods: Patients with first-time STEMI treated by primary percutaneous coronary intervention were consecutively enrolled in the prospective observational study. CMR was obtained at 5 days and 4 months. LVAR was defined as an increase in the LV end-diastolic volume of $> 20\%$ from baseline to 4 months. Logistic regression analyses were performed to identify the predictors of LVAR.

Results: A total of 90 STEMI patients were analyzed, of which 20 developed LVAR at 4 months. At baseline, patients with LVAR showed more severe myocardial injury (infarct size [IS] and

microvascular obstruction), increased LA volume, and reduced LA strain (all $P < 0.05$). Notably, from baseline to 4-month follow-up, significant changes in LA phasic function occurred in non-LVAR group (all $P < 0.05$), not in LVAR group. In multivariate logistic regression analyses, IS, LA reservoir strain and booster strain were independent predictors of LVAR. The combination of IS, LA reservoir strain and booster strain could optimally predict the LVAR with the highest area under the curve of 0.843.

Conclusion: Post-STEMI patients with LVAR had impaired LA strain and displayed less recovery from cardiac function compared with non-LVAR patients. IS, LA reservoir strain and booster strain have predictive value for the development of LVAR within 4 months following STEMI.

PO-0891

Clinical Prognostic Assessment of ischemic heart disease Patients based on Combined Analysis of Infarct Myocardium by CMR and Viable Myocardium by SPECT/PET

Keyao Hui, Lei Zhao, Xiaohai Ma, Xiaoli Zhang
Beijing Anzhen Hospital, Capital Medical University

Object: To evaluate the prognostic value of combined assessment of infarct myocardial area by cardiac magnetic resonance imaging (CMR) and viable myocardium by gated ^{99}Tcm -MIBI SPECT and ^{18}F -FDG PET in patients with ischemic heart disease (IHD).

Background: Ischemic heart disease is a cardiovascular condition often accompanied by infarct myocardium and viable myocardium, the extent of which can impact the clinical outcome. While individual studies have investigated the prognostic implications of infarct myocardium or viable myocardium, the combined predictive value of these factors in ICM patients remains less explored.

Methods: Retrospectively included 74 patients with IHD who underwent SPECT, PET, and CMR examinations within 2 weeks at Beijing Anzhen Hospital, from January 2017 to August 2020. The extent of myocardial infarction and viable myocardium was assessed, and patients were grouped accordingly. The primary endpoint was all-cause death. The secondary endpoint is major adverse cardiovascular events (MACEs), defined as cardiovascular death or nonfatal myocardial infarction. Cox univariate and multivariate models were employed to analyze the independent risk factors for all-cause death. Survival analysis of risk factors was conducted using Kaplan-Meier curves and log-rank tests.

Results: Among 74 patients (91.8% male; 56.65 ± 10.02 years), according to the extent of infarct myocardium and viable myocardium, there were 10 cases (13.5%), 17 cases (23.0%), 17 cases (23.0%) and 30 cases (40.5%) in Group A, Group B, Group C and Group D, respectively. During follow-up 30.9 (16.7, 45.7) months, 11 (14.8%) patients died. The survival rates in Group A, Group B, Group C, Group D were 100%, 100%, 100%, 63.3%, respectively, $\log\text{-rank}\chi^2=21.842$, $P<0.001$. 17 (22.9%) patients experienced a MACE. The event rates in Group A, Group B, Group C, Group D were 0%, 5.9%, 17.6%, 43.3%, respectively, $\log\text{-rank}\chi^2=18.044$, $P<0.001$. Multivariate Cox regression analysis showed that combination of infarct myocardium and viable myocardium was the only independent predictor for all-cause death ($\text{HR}=16.926$, 95%CI: 1.379-207.724, $P=0.024$) and MACEs ($\text{HR}=4.096$, 95%CI: 1.876-8.942, $P<0.001$).

Conclusions: Combined assessment of infarct myocardium by CMR and viable myocardium by SPECT and PET could improve the risk stratification in patients with IHD.

PO-0892

The value of a new CT left ventricular functional index in obstructive hypertrophic cardiomyopathy

Zeming He

School of Medical Technology, Shaanxi University of Traditional Chinese Medicine

Purpose To investigate the feasibility of CT-based feature tracking technology to quantify left ventricular myocardial strain (MS) and its significance in patients with hypertrophic obstructive cardiomyopathy (HOCM). **Materials and Methods** The study was retrospective and included HOCM patients who underwent cardiac coronary angiography (CCTA) from March 2019 to December 2021 at the Department of Radiology, First Affiliated Hospital of the Air Force Military Medical University, in addition to randomizing those who were negative for CCTA among those who visited the hospital with suspected coronary artery disease. Routine cardiac function parameters and MS parameters were quantified separately in the two populations by post-processing software, and differences in cardiac function parameters obtained between the two study groups were analyzed using statistical methods. **Results** Compared to the control group, conventional LV function parameters such as maximum LV wall thickness, LV mass, LV mass index, LV ejection fraction, LV end-diastolic volume and stroke volume were significantly increased in the HOCM group (25.25 ± 7.13 vs 8.68 ± 1.29 、 198.04 ± 101.01 vs 91.62 ± 16.3 、 102.58 ± 47.7 vs 47.15 ± 6.27 、 77.09 ± 8.85 vs 73.83 ± 6.08 、 132.87 ± 33.52 vs 117.77 ± 29.99 、 102.43 ± 29.90 vs 86.19 ± 19.58 , $P < 0.05$), while end-systolic LV volume and cardiac output were not statistically significant between the two groups (30.45 ± 13.69 vs 31.58 ± 13.04 、 6.86 ± 1.93 vs 6.05 ± 2.02 , $P > 0.05$). The global longitudinal and radial strain values were significantly reduced, whereas the global subendocardial circumferential strain values were significantly increased (-44.16 ± 3.98 vs -41.21 ± 6.71 , $P < 0.05$). **Conclusion** The MS parameters quantified by the CT-FT technique are superior to LV ejection fraction in quantifying LV function, with longitudinal strain having the highest sensitivity and specificity for early myocardial function impairment, and the technique is reproducible, promising to be a new index for the assessment of myocardial function in patients with HOCM.

PO-0893

Application of CT Technology in Early Cardiac Function Assessment and Differential Diagnosis: The Crucial Role of Myocardial Strain Parameters in Hypertrophic Cardiomyopathy and Hypertensive Heart Disease

Zeming He

School of Medical Technology, Shaanxi University of Traditional Chinese Medicine

Abstract:

Objective: Hypertrophic cardiomyopathy (HCM) and hypertensive heart disease (HHD) both involve myocardial hypertrophy. Traditional imaging methods face challenges in distinguishing between these two diseases and are not sensitive enough to detect early cardiac functional impairments. Therefore, this study aims to explore the feasibility of using myocardial strain (MS) parameters obtained through CT technology to assess early left ventricular (LV) and left atrial (LA) function in HCM and HHD and to evaluate their capabilities in differentiating between these two diseases, providing valuable insights for clinical practice.

Materials and Methods: This study included 300 adult subjects with negative results in coronary computed tomography angiography (CCTA) conducted between September 2020 and April 2023

at the Air Force Medical University Xijing Hospital. Participants were categorized into HCM, HHD, and healthy control groups according to specific criteria. Subsequently, post-processing software was utilized to quantify LV and LA morphological characteristics, traditional cardiac functional parameters, and MS parameters in these three groups. Statistical analysis was performed to compare differences between these parameters and their abilities in distinguishing between the two diseases.

Results: In comparison to the HHD group, the HCM group exhibited varying degrees of reduction in absolute MS values of both LV and LA (LVMyoGCS: -22.92 ± 4.29 vs. -20.75 ± 3.75 ; LVEndoGCS: -35.96 ± 7.73 vs. -31.93 ± 7.74 ; LVGRS: 35.96 ± 7.73 vs. 31.93 ± 7.74 ; LAGCS: 28.39 ± 4.51 vs. 21.26 ± 6.83 ; all $p < 0.05$). Notably, longitudinal strain reduction was the most significant (LVMyoGLS: -20.19 ± 2.71 vs. -16.64 ± 2.46 ; LVEndoGLS: -24.28 ± 3.50 vs. -20.75 ± 4.33 ; LAGLS: 32.17 ± 4.75 vs. 23.91 ± 7.27 ; all $p < 0.05$). Multivariate logistic regression analysis demonstrated that the combination model of LVMyoGLS, LAGLS, and LVWT had the largest area under the ROC curve, reaching 0.930 (sensitivity: 88%, specificity: 83%).

Conclusion: The results of this study indicate that MS parameters obtained through CT technology can be used to accurately assess early cardiac functional impairments in both LV and LA in patients with HCM and HHD. Importantly, LA dysfunction may occur before LV impairment, with longitudinal strain damage being particularly evident. The combination model of LVMyoGLS, LAGLS, and LVWT exhibits superior capabilities in differentiating between these two diseases. These findings hold the potential to provide more precise diagnostic and therapeutic guidance in clinical practice.

PO-0894

Application of computer-aided diagnosis for NCCN-based Follow-up Recommendation in subsolid nodules: effect on inter-observer agreement

Quanyang Wu, Linlin Qi, Donghui Hou, Shijun Zhao

Department of Diagnostic Radiology, National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing 100021, China

Abstract

Background: To assess the impact of Computer-Aided Diagnosis (CAD) on inter-observer agreement in the follow-up management of subsolid nodules.

Methods: A dataset comprising 60 cases of subsolid nodules was constructed based on the National Cancer Center's lung cancer screening data, ensuring a balanced representation of all follow-up management categories. Five observers independently assessed all Low-Dose Computed Tomography (LDCT) scans and assigned follow-up management strategies to each cases based on NCCN guideline, both with manual measurements and CAD assistance. The CAD system presented all nodules larger than 3mm and automatically provided measurements of nodule size, nodule type, and predicted lung cancer risk. Inter-observer agreement was analyzed using the Fleiss kappa statistical method to assess consistency among multiple observers. The linearly weighted Cohen's kappa test was used to measure the consistency between paired observers.

Results: Five observers' agreement for NCCN follow-up management categorization was at a moderate level when measured manually, with Fleiss' kappa = 0.437 (95% confidence interval, 0.388, 0.487). Utilizing CAD assistance led to a notable enhancement in agreement, achieving a substantial consensus with a Fleiss' kappa value of 0.623 (95% CI: 0.573-0.673). the average Cohen kappa value was rising from 0.603(0.489-0.716) to 0.733 (0.673-0.793) for all paired observers. After using CAD, the proportion of major and substantial management discrepancies decreased from 27.5% (165/600) to 15.8% (95/600) and 4.8% (29/600) to 1.5% (9/600), respectively ($p < 0.01$; $p < 0.01$). In 23 cases of lung cancer presenting as part-solid nodules,

CAD significantly reduced substantial management differences (overall sensitivity, 82.6% vs. 92.2%; $p < 0.05$).

Conclusion: The application of CAD significantly improves inter-observer consistency in the follow-up management strategy of subsolid nodules. It also demonstrates the potential to reduce substantial discrepancies in lung cancer cases and elevated the sensitivity in detecting lung cancer cases presenting as part-solid nodules.

PO-0895

Left Atrial Strains in Discriminating Phenocopy Diseases from Hypertrophic Cardiomyopathy: A CMR Study

Xiaorui Xiang, Minjie Lu, Shihua Zhao
Fuwai Hospital

Objective

Uncommon inherited phenocopy diseases that mimic the clinical features of hypertrophic cardiomyopathy (HCM) had been increasingly recognized in clinical practice, including most prominently Fabry disease and Danon disease. Thus, this study aimed to investigate the potential clinical value of left atrial (LA) strains derived from cardiac magnetic resonance (CMR) feature tracking to discriminate Fabry cardiomyopathy (FC) and Danon cardiomyopathy (DC) from HCM.

Methods

Forty-two consecutive subjects (15 FC, 12 DC, and 15 HCM) from January 2018 to June 2023 who underwent 3T CMR were retrospectively enrolled. Comprehensive clinical evaluation and imaging investigation were obtained, including measurements of LA reservoir, conduit strain, and booster strain. The intra- and inter-observer reproducibility of the LA strain parameters were assessed in all the groups and compared. ROC curve analysis was performed to determine the diagnostic performances of the strain parameters in discriminability.

Results

The intra- and inter-observer reproducibility of the LA strains were excellent in the 3 groups (range of interclass correlation coefficients: 0.82–0.95). Patients with FC and DC showed a more prominent decrease of LA reservoir, conduit strain, and booster strain in comparison to individuals with HCM ($P < 0.001$ and $P = 0.002$, respectively). However, LA reservoir and booster strain was not significantly different between FC and DC ($P = 0.12$ and 0.25). The LA conduit strain demonstrated an independent and additive value in discriminating FC and DC from HCM. ROC curve analyses showed that the differential diagnostic performances of the LA conduit strain in discriminating FC and DC from HCM were good (AUC = 0.856; 0.914; respectively).

Conclusion

LA strains are promising diagnostic indicators to distinguish phenocopy diseases of FC and DC from HCM with high accuracy. LA conduit strain showed the highest diagnostic accuracy among all the LA strains.

PO-0896

CT, MRI imaging features and misdiagnosis of bronchogenic cyst

Xiaoyu Gu, Bo Yin
Huashan Hospital, Fudan University

Objective

To explore CT and MRI features and misdiagnostic reason of bronchogenic cyst.

Methods

Clinical and imaging data of 61 patients with pathologically confirmed bronchogenic cysts were retrospectively collected. 61 patients underwent plain CT scans in which 39 underwent contrast-enhanced CT scans. 1 patient received plain MR scans. 10 patients received both plain and contrast-enhanced MR scans.

Results

All the 61 cases were solitary masses. 52 roundish cases and 9 lobulated or irregular were recorded. 26 cases were located in the anterior mediastinum, 2 in the middle mediastinum, 20 in the posterior mediastinum, each 3 in lung, abdominal cavity and adrenal gland, each 1 in thyroid gland, chest wall, neck and stomach. Calcification of cyst wall occurred in 10 cases. On plain CT scans 11 lesions showed water-like density (0~20Hu) and 50 showed soft tissue-like density (21~80Hu). On T1WI, five cases showed slightly hyperintense, 4 showed isointense and 2 showed slightly hypointense. 11 lesions on T2WI showed hyperintense. 6 cases showed hypointense and 5 showed slightly hyperintense on DWI. 11 cases on ADC sequence showed hyperintense. 4 cases without enhancement and 6 with marginal mild enhancement were observed on contrast-enhanced MR scans. 14 were misdiagnosed as thymoma, 8 as neurogenic tumors, 5 as lymphangiomas, each 1 as lung cancer, pulmonary tuberculosis, gastrointestinal stromal tumor, adrenal adenoma and teratoma.

Conclusion

The attenuation values of BC on CT are generally higher than 20Hu, which primarily causes clinical imaging misdiagnosis. The uncertainty of the location of BC remains a challenge of diagnosis for radiologists.

PO-0897

Septal involvement of myocardial fibrosis in fulminant myocarditis survivors after ECMO treatment

Xiayun Shi, Xiaomei Zhu, Fan Y
The First Affiliated Hospital of Nanjing Medical University

Purpose

To detect the segmental tissue changes of acute myocardial injury with CMR in fulminant myocarditis (FM) survivors after extracorporeal membrane oxygenation (ECMO) treatment by comparing with common virus myocarditis (CVM).

Materials and Methods

In this retrospective single-center study, twenty-four FM survivors after ECMO and 35 CVM who underwent cardiac MRI between June 2018 and January 2023 were enrolled. Global and segmental (AHA model segments 1-16) late gadolinium enhancement (LGE%) of myocardium were assessed. Logistic regression analysis was used to distinguish the difference of tissue characteristics by MRI between two groups. Receiving Operating Characteristics (ROC) and Precision-Recall (PR) analysis were performed to determine the value of segmental LGE to evaluate the myocardial fibrosis features in FM survivors.

Results

The global LGE% was significantly higher in FM survivors compared to that in CVM. In FM survivors, the basal anteroseptal segment (Segment 2) had the highest LGE% among 16 segments and higher extent of LGE% in septal than no-septal segments (24.76% [Inter Quartile Range (IQR), 5.66%-46.02%] vs. 8.36% [IQR, 1.48%-20.16%], $p<0.001$). In the segment 2, the LGE% in FM group was obviously higher than CVM group (42.73% [IQR, 25.72%-60.06%] vs 2.93% [IQR, 0.14%-11.74%], $p<0.001$). Conversely, LGE% showed significantly lower value in FM group in segment 11 (5.59% [IQR, 5.58%-13.59%] vs. 11.79% [IQR, 3.90%-27.03%], $p=0.047$). Among 16 segments, higher LGE% in segments 2 (basal anteroseptal) and 14 (apical septal) were independent values to distinguish the myocardial injury. Combination of segments of 2 and 14 presented the different fibrosis between FM and CVM with AUC of 0.940 by ROC and AUC of 0.924 by PR analysis respectively.

Conclusion

In contrast to the mid inferolateral wall (Segment 11) being most easily involved in patients with CVM, the inter-ventricular septal area is most commonly affected and most severely involved by LGE in FM survivors after ECMO treatment. It reflected the distinguished septal involvement of myocardial fibrosis, which may be a potential cause of higher incidence of malignant arrhythmia in FM patients.

PO-0898

Cardiac MRI for detecting acute myocardial injury of fulminant myocarditis survivals in adults

Xiayun Shi, Xiaomei Zhu, Fan Yin
The First Affiliated Hospital of Nanjing Medical University

Purpose

To detect the acute cardiac changes in FM survivors after ECMO treatment and to demonstrate its significant differences from CVM by CMR. In addition, our study aimed to determine the correlation between CMR tissue characteristics and cardiac biomarkers to provide reference information for clinical practice.

Materials and Methods

This retrospective study enrolled 59 patients with clinically diagnosed AM who underwent CMR from June 2018 to January 2023, including 35 patients with CVM and 24 patients with FM. CMR parameters reflecting myocardial tissue characteristics including native T1, T2 and extracellular volume (ECV) of myocardium were assessed. Percentage of late gadolinium enhancement (LGE%) of myocardium was also taken into final analysis. Statistical analysis included the independent sample t test, Mann-Whitney U test and logistic regression analyses. The correlation of factors with response variables was then fitted into different mathematical models. A two-sided P-value < 0.05 was considered statistically significant.

Results

The values of T1-based imaging parameters were significantly higher in FM group (native T1: 1389.7 ± 114.0 ms vs 1319.3 ± 95.0 ms, $p=0.013$; ECV: $35.6\% \pm 5.5\%$ vs $31.3\% \pm 5.5\%$, $p=0.005$). Also, the burden of LGE was significantly higher in FM group (16.4% [IQR, 12.4%-25.3%] vs 11.0% [IQR, 4.5-14.1%], $p=0.001$). In contrast, no difference was observed among the two groups in terms of T2 value (45.0 ± 5.0 ms for FM vs 44.5 ± 5.3 ms for CVM, $p=0.707$). Furthermore, LGE% provided the best performance for observing the difference of myocardial injury in FM from in CVM (AUC: 0.763). Cubic relationships were relative best fit correlations to evaluate the nonlinear relationships of LGE% against logcTnT ($p=0.001$) and logNT-proBNP ($p=0.005$). By calculating the extreme point, cTnT value between 70 and 300 ng/L indicated a relative stable LGE% of 10.8% and cTnT value exceeding 300ng/L exhibited a rapid upward trend of LGE%.

Conclusion

In summary, our study demonstrated that all global T1 based parameters other than T2 were significantly increased indicating severe fibrosis but similar edema of myocardium in FM when compared with CVM. Furthermore, the LGE percentage was the most important factor for detecting the difference of myocardial injury. In addition, myocardial fibrosis keeps consistent with cTNT between 70-300ng/L and increases rapidly with cTNT exceeding 300ng/L in FM and CVM patients.

PO-0899

Assessing the efficiency of eligibility criteria for low-dose lung screening CT in China according to current guidelines

Yanyan Tang, Wei Tang, Ning Wu

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing 100021, China

Abstract

Objectives: To compare the efficiency of eligibility criteria recommended by four lung cancer screening (LCS) guidelines in the Chinese population.

Materials and methods: Between 2005 and 2022, 31,394 asymptomatic individuals were screened using low-dose computed tomography (LDCT) at the Cancer Hospital of the Chinese Academy of Medical Sciences. Demographic data, relevant lung cancer risk factors, were collected. The efficiency of the LCS for each guideline criteria was expressed as the efficiency ratio (ER). The inclusion rates, lung cancer detection rates, and screening efficiencies based on the different eligibility criteria of the four guidelines were comparatively analyzed. The four guidelines are as follows: CGSL, International Early Lung Cancer Action Program (I-ELCAP), National Comprehensive Cancer Network (NCCN), and US Preventive Services Task Force (USPSTF).

Results: Of 31,394 participants, 298 (155 women, 143 men) were diagnosed with lung cancer. For CGSL, NCCN, USPSTF and I-ELCAP guidelines, the inclusion rates were 19.0%, 9.5%, 9.3%, and 73.0%, respectively, the lung cancer detection rates were 29.2%, 16.4%, 14.8%, and 86.6%, respectively. Among the four guidelines, 73.0% of screening participants met the International Early Lung Cancer Action Program (I-ELCAP) eligibility criteria, but it has the lowest ER of 1.13%. The NCCN eligibility criteria had a maximum ER of 1.64% across the four guidelines; however, only 16.4% of lung cancer participants and 1.0% of women met the eligibility criteria. Males and females significantly differed in eligibility based on the criteria of the four guidelines ($P < 0.001$).

Conclusions: LCS efficiency is unsatisfactory, regardless of whether domestic or foreign guidelines were chosen, especially because a significant number of non-smoking women did not meet the eligibility criteria defined by smoking and age. However, for opportunistic screening, the I-ELCAP guideline recommended LCS eligibility criteria that are more likely to capture high-risk individuals and avoid missed lung cancer diagnoses. Further research is needed to investigate the eligibility criteria of the guidelines for the Chinese population, particularly sex disparities in LCS eligibility.

PO-0900

Predicting MET exon 14 skipping mutation in pulmonary sarcomatoid carcinoma by whole-tumour texture analysis combined with clinical and conventional contrast-enhanced computed tomography features

Lei Miao,Tian Qiu,Yan Li,Xiao Li,JianMing Ying,Meng Li
Cancer hospital Chinese Academy of Medical Sciences

Abstract

Objectives: To predict the MET exon 14 (METex14) skipping mutation in pulmonary sarcomatoid carcinoma (PSC) patients by whole-tumour texture analysis combined with clinical and conventional contrast-enhanced computed tomography (CECT) features.

Materials and methods: This retrospective study included 56 patients with PSC diagnosed by pathology. All patients underwent CECT before surgery or other treatment, and both targeted DNA- and RNA-based next-generation sequencing (NGS) were used to detect METex14 skipping mutation status. The patients were divided into two groups: METex14 skipping mutation and nonmutation groups. Overall, 1316 texture features of the whole tumour were extracted. We also collected 12 clinical and 20 conventional CECT features. After dimensionality reduction and selection, predictive models were established by multivariate logistic regression analysis. Models were evaluated using the area under the receiver operating characteristic curve (AUC), and the clinical utility of the model was assessed by decision curve analysis.

Results: METex14 skipping mutation was detected in 17.9% of PSCs. Mutations were found more frequently in those (a) who had smaller long- or short-axis diameters ($P<0.05$); (b) who had had lower T stages (I, II) ($P<0.05$); and (c) with pseudocapsular or annular enhancement ($P<0.05$). The combined model based on the conventional and texture models yielded the best performance in predicting METex14 skipping mutation with the highest AUC (0.89). The conventional and texture models also had good performance (AUC =0.81 conventional; =0.88 texture).

Conclusions: Whole-texture analysis combined with clinical and conventional CECT features may serve as a noninvasive tool to predict the METex14 skipping mutation status in PSC.

PO-0901

Effects of Diabetes Mellitus on Left Ventricular Function and Deformation in Patients with Restrictive Cardiomyopathies: A 3.0T CMR Feature Tracking Study

Yue Gao,Zhi-gang Yang
West China Hospital, Sichuan University

BackgroundDiabetes mellitus (DM) is the most common metabolic disease worldwide and a significant risk factor for adverse cardiovascular events. At the same time, the additive effects of DM on left ventricular (LV) deformation in restrictive cardiomyopathy (RCM) cohort remain unclear. Accordingly, we aimed to investigate the additive effects of DM on LV deformation in patients with RCM.

Materials and methods

One hundred thirty-six RCM patients without DM [RCM(DM-)], 46 with DM [RCM (DM+)], and 66 age- and sex-matched control subjects who underwent cardiac magnetic resonance (CMR) scanning were included. LV function, late gadolinium enhancement (LGE) type, and LV global peak strains (including radial, circumferential, and longitudinal directions) were measured. The determinant of reduced LV global myocardial strain for all RCM patients was assessed using

multivariable linear regression analyses. The receiver operating characteristic curve (ROC) was performed to illustrate the relationship between DM and decreased LV deformation.

Results

Compared with normal controls, both RCM (DM -) and RCM(DM+) patients presented increased LV end-diastolic index and end-systolic volume index and decreased LV ejection fraction. LV GPS in all three directions and longitudinal PDSR progressively declined from the controls to the RCM(DM-) group to the RCM(DM+) group (all $p < 0.05$). DM was an independent determinant of impaired LV GPS in the radial, circumferential, and longitudinal directions and longitudinal PDSR ($\beta = -0.217, 0.176, 0.253$, and -0.263 , all $p < 0.05$) in RCM patients. The multiparameter combination including DM showed an AUC of 0.81 (95% CI = 0.75–0.87) to predict decreased LV GLPS and an AUC of 0.69 (95% CI = 0.62–0.76) to predict decreased LV longitudinal PDSR.

Conclusions DM had an additive deleterious effect on LV dysfunction in patients with RCM, especially diastolic dysfunction in RCM patients, indicating the importance of early identification and initiation of treatment of DM in patients with RCM.

PO-0902

Quantitating myocardial fibrosis using extracellular extravascular volume determined from computed tomography myocardial perfusion imaging

Na Li¹, Xin Zhang¹, Jin Gu¹, Ming Yang¹, Lina Chen², Jie Yu¹, Heshui Shi¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. CT Collaboration, Siemens Healthineers Ltd

Purpose: To investigate the feasibility of using extracellular extravascular volume (EEV) derived from computed tomography (CT) perfusion imaging (VPCT) and extracellular volume quantification with single-energy subtraction CT (ECV-SECT) for quantifying myocardial fibrosis.

Material and Methods: 17 patients with suspected and known coronary artery disease underwent CT examination. The EEV was derived from dynamic whole-heart myocardial perfusion imaging (EEV-VPCT), and the ECV was calculated from late-enhanced images 5 min after bolus contrast injection by subtracting the non-contrast baseline. The late gadolinium enhancement on cardiac magnetic resonance imaging was used as a reference.

Results: In total, 11 patients and 73 segments exhibited positivity for LGE on CMR imaging. The segments were classified into three groups: fibrotic segments (group I, $n = 73$), nonfibrotic segments in LGE-positive patients (group II, $n = 103$), and segments in LGE-negative patients (group III, $n = 80$). ECV-SECT, EEV-VPCT, myocardial blood flow (MBF), and myocardial blood volume (MBV) significantly differed among groups (all $P < 0.05$). ECV-SECT was significantly higher and EEV-VPCT, MBF, and MBV were significantly lower in fibrotic myocardial segments than in nonfibrotic ones (all $P < 0.01$). ECV-SECT and EEV-VPCT independently affected myocardial fibrosis. The capability of EEV-VPCT to diagnose myocardial fibrosis was equivalent to that of ECV-SECT (area under the curve: 0.798 vs. 0.806, $P = 0.844$). EEV-VPCT of $< 10.3\%$ indicated myocardial fibrosis.

Conclusion: EEV-VPCT is actually first-pass distribution volume that can feasibly be used to quantify myocardial fibrosis. Furthermore, the diagnostic efficacy of EEV-VPCT is comparable to that of ECV-SECT.

PO-0903

Impact of a Novel Whole-Heart Motion-Correction Algorithm on Non-Contrast Cardiac CT Images and Coronary Artery Calcium Scores

Mengzhen Wang

Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Purpose: To evaluate the impact of a new whole-heart motion-correction algorithm (SnapShot Freeze 2, SSF2) on non-contrast cardiac CT images and the coronary artery calcium scores (CACS).

Materials and Methods: 100 consecutive patients were prospectively included to undergo ECG-gated CT CACS scanning. Images were reconstructed with both standard (STD) algorithm and SSF2. CACS was calculated by a semi-automatic software. Image noise and signal-to-noise ratio (SNR) of the aortic root were measured. Two radiologists co-evaluated the subjective image quality of coronary arteries and calcified plaques using a 5-point scale and 3-point scale, respectively.

Results: CACS of 278 vessels with calcified plaques in 100 patients were calculated. The overall median (range) Agatston score, volume score and mass score of SSF2 were 172.3(307.9), 138(252.9) and 38.3(65.6), respectively, lower than 193.4(342.0), 160.0(284.8) and 39.3(74.4) of STD (all $P < 0.001$). SSF2 provided lower noise (17.4 ± 2.7 VS. 18.5 ± 2.9 HU, $P < 0.001$) and higher SNR (2.90 ± 0.58 VS. 2.70 ± 0.55 , $P < 0.001$) than those of STD. The subjective image quality scores of SSF2 group were significantly higher than that of STD group (all $P < 0.001$).

Conclusion: The new whole-heart motion-correction algorithm improves non-contrast cardiac CT image quality, lowers CACS, and shows a potential for increasing CACS accuracy.

PO-0904

Feasibility and Utility of Dark-blood Images Derived from Dual-Energy Cardiac Computed Tomography on Evaluating the Left Atrial Fibrosis: A Preliminary Study

Huanhuan Chong¹, Lahu Like¹, Jiqiang Li¹, Zhihan Xu², Peng Wu³, Haipeng Dong¹, Fuhua Yan¹, Wenjie Yang¹

1. Department of Radiology, Ruijin Hospital, School of Medicine, Shanghai Jiao Tong University

2. Siemens Healthineers DI CT Collaboration

3. Philips Healthcare, Shanghai

Purpose: Left atrial fibrosis (LAF) has been considered an irreversible form of left atrial (LA) wall remodeling, associated with the progression of atrial fibrillation (AF), but non-invasive detection of LAF remains challenging for AF. Our aim is to determine the feasibility of dual-energy cardiac computed tomography (DE-CCT) on quantitative and qualitative evaluation of LAF in patients with AF, using the three-dimensional late gadolinium enhancement cardiac MRI (3D-LGE CMR) as reference.

Materials and Methods: This retrospective study included patients with AF who underwent contemporaneous LA-CMR and DE-CCT between Jan 2022 and March 2023. These scans were performed 30 and 5 minutes after injection of the corresponding contrast agent respectively and the presence of LAF was evaluated in seven LA segments. Regarding DE-CCT, dark-blood images were generated for qualitative evaluation by three-material deposition by replacing the first material (iodine) as the content of a region of interest placed in the LA for each patient. Iodine maps were also generated by postprocessing 'HeartPBV', and the iodine values (Hounsfield Units, HU) for LA-wall was measured and recorded via matching the dark-blood series with better visualization. Two independent radiologists reviewed dark-blood images and 3D-LGE images, and the location and

number of LAF were compared. The P-value of the iodine value difference between LA-wall subgroups were calculated by one-way analysis of variance with Tukey's multiple comparison test.

Results: A total of 36 patients (mean age, 60.86 ± 11.72 years; 24 males) were included, all of whom had at least one segment of LA-CMR enhancement, 17 (47.2%) of which had persistent AF. Using the 3D-LGE segment as the gold standard for LAF, the dark-blood images manifested a moderately matched with sensitivity, specificity, and accuracy of 66.20% (94/142 segments), 100% (110/110 segments), and 80.95% (204/252 segments), respectively. The intraclass correlation coefficient of iodine values measured by radiologists was 0.701, and the iodine values of the abnormal LA wall, normal LA wall, and blood pool indicated a gradually increasing trend (mean iodine values: 30.58 ± 16.15 HU, 72.12 ± 21.51 HU, 87.00 ± 20.02 HU, $P < 0.001$). Moreover, this mismatch between DE-CCT and LA-CMR mainly occurs in the atrial septum and left inferior pulmonary venous sinus, accounting for up to 88.89% (32/36 patients) and 80.56% (29/36 patients) respectively.

Conclusion: DE-CCT may provide a novel potential technique for quantitative and qualitative estimation of left atrial fibrosis in patients with atrial fibrillation.

PO-0905

Investigating the Peri-Saphenous Vein Graft Fat Attenuation Index on Computed Tomography Angiography: Relationship with Progression of Venous Coronary Artery Bypass Graft Disease and Temporal Trends

Liwen Han¹, Lahu Like¹, Mengzhen Wang¹, Mi Zhou¹, Yunpeng Zhu¹, Zhihan Xu², Fuhua Yan¹, Qiang Zhao¹, Wenjie Yang¹

1. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

2. Siemens Healthineers Computed Tomography (CT) Collaboration, Shanghai, China

Purpose

To clarify the fat attenuation index (FAI) change trend of peri-saphenous vein graft (SVG) and determine the association between FAI and graft disease progression based on CCTA images.

Materials and Methods

Patients with venous coronary artery bypass grafts (CABGs) were consecutively enrolled in this retrospective study. In study 1, 72 patients who had undergone 1, 3, and 5 years of CCTA examinations without graft occlusion were recruited, and generalized estimation equation was used to analyze the peri-SVG FAI change trend over time. In study 2, 42 patients with graft disease progression and 84 patients as controls were propensity score-matched and enrolled. Graft disease progression found at the 3-year follow-up CCTA examination was considered as the endpoint. Generalized linear mixed model, area under curve and continuous net reclassification improvement (NRI) were used for assessing the associations with progression. The FAI of the proximal right coronary artery (pRCA) was also measured.

Results

In study 1, both the FAI of pRCA and SVG decreased over time. In study 2, the 1-year CTA-derived FAI of grafts and graft anastomosis were independent indicators of graft disease progression at the 3-year CCTA follow-up (graft: odds ratio [OR] = 3.116; 95% confidence interval [CI] = 1.264–7.681, $P = 0.014$; graft anastomosis: OR = 4.944, 95% CI = 2.160–11.314, $P < 0.001$). Moreover, inclusion of the graft anastomosis FAI significantly improved reclassification compared with the entire graft FAI (graft anastomosis FAI: continuous NRI = 0.638, 95% CI: 0.345–0.931, $P < 0.001$).

Conclusions

A synchronism was found in the FAI change trend between native coronary artery and venous graft, which both decreased over time. The CCTA-derived FAI of venous grafts showed the potential of

demonstrating SVG disease progression and graft anastomosis served as the optimal measured location.

PO-0906

Development and Validation of a Preoperative Contrast-Enhanced-CT-Based Model to Predict 7 Histologic Types of Solid Pulmonary Tumors

shuxuan fan

Tianjin Medical University Cancer Institute and Hospital, National Clinical Research Center for Cancer ,Key Laboratory of Cancer Prevention and Therapy,Tianjin's Clinical Research Center for Cancer

Background: To develop and validate a contrast-enhanced CT based model for predicting histologic types of solid pulmonary tumors in clinical patients.

Methods: From January 2011 to July 2020, 1224 pathologically confirmed solid pulmonary tumors at two centers. The patients in TMUCIH center were randomly divided into two cohorts (708 development cohort, 304 internal validation cohort). The 212 patients in SHSMU center were set as external validation cohort. Twenty-three clinical and contrast-enhanced CT characteristics were included in multinomial multivariable logistic regression model.

Results: Totally 1224 preoperative patients with a solitary pulmonary solid tumor were collected from two independent institutions in China (median size, 27.0 [IQR, 18.0-38.0] mm; mean age, 57.6 [SD, 9.4] years; man, 59.2%). The mean AUCs of the model for predicting 7 histologic types were 0.95, 0.94, 0.92, and the accuracy of the model for predicting malignant and benign were 0.88, 0.86, 0.89 in the three cohorts, respectively.

Conclusions: Clinical information (age, gender) and contrast-enhanced CT characteristics were important features in multinomial multivariable logistic regression model for classifying histologic types of solid pulmonary tumors.

PO-0907

Contrast-enhanced CT-based radiomics machine-learning classifiers to differentiate Histologic Types of Solid Lung Tumors

Jianing Zhang,Xiaonan Cui,Zhiqi Li,Weijie Zhu,Jiaojiao Li,Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Objective

This study is aimed to develop and validate the best prediction model based on CT radiomics features combined with clinical-radiological signatures for histological classification of solid lung tumors preoperatively.

Methods

A primary dataset of 940 patients from the TMUCIH center was randomly divided into a development cohort and an internal validation cohort. The clinical-radiological signatures and radiomics features were extracted from contrast-enhanced CT images, followed by the dimension reduction of the features. The best radiomics signature was selected and combined with clinical-radiological features to establish a combined model for the classification of 7 histologic types. The AUC curve was used to assess the diagnostic performance of the model in the development and validation cohorts, separately.

Results

Ten clinical-radiological signatures and ten radiomics features were used to construct the multinomial multivariable logistic regression model, which showed different predictive values and were used to generate equations with relative weights for the classification of histologic types. ROC analysis showed that combined model were predictive in histological classification. The mean AUC for histological classification was 0.97 and 0.96 in the development and validation cohort, respectively. When determining the malignancy of tumors based on histologic types, the mean AUC of the model was 0.88 and 0.90, respectively.

Conclusions

We demonstrated that utilizing the combined model constructed by clinical-radiological characteristics and radiomic signatures could not only effectively stratify histologic types of solid lung tumors, but also enabled accurate assessment of tumor malignancy. Such a model has the potential to avoid unnecessary surgery for patients and to guide clinical decision making for preoperative treatment.

PO-0908

A nomogram based on intratumoral and peritumoral radiomics and clinical-radiological features for the preoperative prediction of spread through air spaces in patients with clinical stage IA non-small cell lung cancer: A Multicenter Study

Deng Lv, Yun Wang, Yi Xiao, Li Fan, Shiyuan Liu

Department of Radiology, Second Affiliated Hospital of Navy Medical University

PURPOSE: To investigate the value of intratumoral and peritumoral radiomics and clinical-radiological features for predicting spread through air spaces (STAS) in patients with clinical stage IA non-small cell lung cancer (NSCLC).

METHODS: A total of 336 NSCLC patients from our hospital were randomly divided into the training cohort (n=236) and the internal validation cohort (n=100) at a ratio of 7:3, and 69 patients from external hospitals were collected as the external validation cohort. Univariate and multivariate analyses were used to screen clinical-radiological features and construct a clinical model. The GTV, PTV5, PTV10, PTV15, PTV20, GPTV5, GPTV10, GPTV15, and GPTV20 models were constructed based on intratumoral and peritumoral (5mm, 10mm, 15mm, 20mm) radiomics features. Additionally, the radscore of the optimal radiomics model and clinical-radiological predictors were used to construct a combined model and plot a nomogram. Lastly, the ROC curve and AUC value were used to evaluate the diagnostic performance of the model.

RESULTS: Tumor density type (OR=6.738) and distal ribbon sign (OR=5.141) were independent risk factors for the occurrence of STAS. The GPTV10 model outperformed the other radiomics models, and its AUC values were 0.887, 0.876, and 0.868 in the three cohorts. The AUC values of the combined model constructed based on GPTV10-Radscore and clinical-radiological predictors were 0.901, 0.875, and 0.878. DeLong test results revealed that the combined model was superior to the clinical model in the three cohorts.

CONCLUSION: The nomogram based on GPTV10-Radscore and clinical-radiological features exhibited high predictive efficiency for STAS status in NSCLC.

PO-0909

Prediction of major adverse cardiovascular events by coronary artery calcification using cancer-screening LDCT in an asymptomatic population

Jianing Zhang, Xiaonan Cui, Wenzhen Jiang, Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Objectives To evaluate the potential application of coronary artery calcification (CAC) in identifying individuals at risk of major adverse cardiovascular events (MACE) on the basis of low-dose CT (LDCT) combined with clinical characteristics.

Methods We consecutively enrolled 933 asymptomatic participants who underwent LDCT scans and received the baseline questionnaire. The syngo.via software automatically scored the degree of CAC within the coronary artery. T-test and Mann-Whitney U test were performed to outline the CAC distribution. The association between CAC combined with the questionnaire and the risk of MACE occurrence was evaluated by logistic regression. ROC curves and the DeLong test were used to determine the efficiency of the prediction model.

Results CAC was detected in 361 individuals among the 933 participants, with a higher detection rate in males and the highest frequency in the left anterior descending artery. Most CAC-positive cases had CAC scores ≤ 100 and were detected mainly in a single branch. The positive rate of each branch and the proportion of multi-branch disease increased with risk grades. CAC, diabetes mellitus, and smoking were confirmed as predictive factors for MACE occurrence based on multivariate analysis. The odds ratio (OR) of MACE occurrence was 2.58 and 6.36 when $0 < \text{CAC} \leq 100$ and $\text{CAC} > 100$, respectively. The OR of MACE occurrence was 10.43 for diabetes mellitus and 2.40 for smoking. The AUC value of the logistic regression model (established by CAC, diabetes mellitus, and smoking) for predicting MACE was 0.85, which confirmed a significantly higher efficiency than that of each risk factor alone (AUC was 0.74 for CAC, 0.69 for diabetes mellitus, and 0.72 for smoking, respectively) ($P < 0.01$).

Conclusions CAC is frequently found in screening the asymptomatic population. LDCT-based CAC score combined with clinical covariates could cost-effectively predict the risk of MACE occurrence.

Abbreviations: MACE, major adverse cardiovascular events; CAD, coronary artery disease; CAC, Coronary artery calcification; LDCT, low-dose computed tomography; NCD, non-communicable chronic diseases; CBLAST, the Colorectal, Breast, Lung, Liver, And Stomach cancer Screening Trial; LM, left main artery; LAD, left anterior descending artery; LCX, left circumflex artery; RCA, right coronary artery; CAG, coronary angiography; EAT, epicardial adipose tissue.

PO-0910

Evaluating cardiac injuries in young adults following moderate Omicron infection using cardiovascular magnetic resonance imaging

Miao He¹, Kaiyue Diao², Bing Ji¹, Chaodong Xiang¹, Changhua Xu¹, Hongqin Liang¹, Jian Wang¹

1. Southwest Hospital, Army Medical University

2. West China Hospital, Sichuan University

Background: After recovering from Omicron infection, some patients reported cardiac discomfort. We utilized cardiovascular magnetic resonance (CMR) imaging to identify the characteristics of cardiac injuries in these individuals.

Method: This prospective study included 38 young adults who recovered from moderate Omicron infection and underwent CMR and laboratory testing during the course of infection. CMR scanning protocols included conventional (cine, late gadolinium enhancement [LGE]) and quantitative mapping (T1 mapping and extracellular volume [ECV]) sequences.

Results: Cardiac function, LGE lesions, native T1, and ECV were quantitatively evaluated and compared with 31 age- and sex-matched controls. The end-diastolic volume (EDV), stroke volume (SV), right ventricular end-diastolic volume (RVEDV), right ventricular end-systolic volume (RVESV) significantly decreased in all participants (all $P < 0.05$). Abnormal LGE findings were observed in 20 patients (52.6%), 42.1% of which were noted in the mid-wall and distributed at the basal septal segments (2, 3) in the short axis view. Global native T1 and ECV were significantly higher in infected patients than in controls (median [interquartile range]: native T1 1,248.9 ms [1,228.5–1,265.5 ms] vs. 1,207.9 ms [1,198.5–1,239.3 ms]; ECV 34.8% [29.0%–39.5%] vs. 30.1% [27.0%–32.5%]; $p = 0.001$ and $p < 0.005$, respectively). Myocardial injury indices were all within normal range.

Conclusions: Despite normal cardiac troponin levels, CMR revealed cardiac injuries following Omicron infection that included impaired cardiac function, focal fibrosis in LGE, and enhancement of T1 and ECV. These findings indicate the need to monitor for myocardial sequelae following Omicron infection.

PO-0911

Predictive value of CT and 18F-FDG PET/CT features on spread through air space in lung adenocarcinoma

Haijun Li, Lifeng Li, Dechang Peng
The First Affiliated Hospital of Nanchang University

Purpose We retrospectively analyzed preoperative CT and 18F-FDG PET/CT features to predict spread through air space (STAS) in lung adenocarcinoma.

Methods Between February 2022 and April 2023, 100 patients (108 lesions) who underwent surgery for clinical lung adenocarcinoma were enrolled. All these patients underwent 18F-FDG PET/CT, thin-section chest CT scan, and pathological biopsy. Univariate and multivariate logistic regression was used to analyze CT and 18F-FDG PET/CT image characteristics. Receiver operating characteristic (ROC) curve analysis was performed to identify a cut-off value.

Results The subjects consisted of 48 males and 52 females with a mean age of 62.7 years. 60 lesions (55.6%) were positive for STAS, and 48 lesions (44.4%) were negative for STAS. The STAS-positive was frequently observed in acinar predominant, however, STAS-negative was also frequently observed in minimally invasive adenocarcinoma. Univariable analysis results revealed that CT features (including nodule type, maximum tumor diameter, maximum solid component diameter, consolidation tumor ratio, pleural indentation, and lobulation, spiculation) and all 18F-FDG PET/CT image characteristics was statistically significant difference in STAS-positive and STAS-negative lesions. And multivariate logistic regression results showed that the maximum tumor diameter (OR: 2.656; 95%CI: 1.673, 4.218) and SUVmax (OR: 1.348; 95%CI: 1.180, 1.541) were the independent influencing factors of CT and 18F-FDG PET/CT in STAS, respectively. The area under the curve of maximum tumor diameter and SUVmax is 0.68 (95% CI 0.58-0.78) vs. 0.82 (95% CI 0.74-0.90). The cut-off value for maximum tumor diameter and SUVmax are 2.35 vs. 5.05 with a sensitivity of 50.0% vs. 68.3% and specificity of 81.2% vs 87.5%, which showed that SUVmax was superior to the maximum tumor diameter.

Conclusion We found the radiological features of SUVmax to be the best model for predicting STAS. These radiological features could predict STAS with excellent specificity but inferior sensitivity.

PO-0912

A CT-based whole-lung radiomics nomogram in distinction of severity of chronic obstructive pulmonary disease

Taohu Zhou, Li Fan
shanghai changzheng hospital

Objective: To develop and validate a radiomics nomogram on the basis of clinical and whole-lung computed tomography (CT) radiomics features to stratify chronic obstructive pulmonary disease (COPD) severity. **Methods:** A total of 1099 patients with COPD (including 308, 132, and 659 in the training, internal validation, and external validation sets, respectively), confirmed by pulmonary function test, were enrolled from two institutions. The whole-lung radiomics features were obtained after a fully automated segmentation. Thereafter, a clinical model, radiomics signature, and a radiomics nomogram incorporating radiomics signature as well as independent clinical risk factors were constructed and validated. In addition, receiver-operating characteristic (ROC) curve, area under the ROC curve (AUC), decision curve analysis (DCA), and the DeLong test were used for performance assessment and comparison. **Results:** In comparison with clinical model, both radiomics signature and radiomics nomogram outperformed better on the stratification of COPD severity in the training, internal and external validation set. The AUC of radiomics nomogram integrating age, height and Radscore, was 0.865 (95%CI, 0.818-0.913), 0.851 (95%CI, 0.778-0.923), and 0.781 (95%CI, 0.740-0.823) in the three sets, which was higher than that of radiomics signature (0.857, 95%CI, 0.808-0.906; 0.850, 95%CI, 0.779-0.921; 0.774, 95%CI, 0.731-0.817, respectively) but not significantly different ($P > 0.05$). Decision curve analysis demonstrated the superiority of the radiomics nomogram in terms of clinical usefulness. **Conclusions:** The present work constructed and verified the novel, diagnostic radiomics nomogram for identifying the severity of COPD, showing the added value of chest CT to evaluate not only the pulmonary structure but also the lung function status.

PO-0913

Cardiac magnetic resonance T2 mapping for evaluating myocardial edema in patients with advanced chronic kidney disease

Jingyu Zhang
The First Affiliated Hospital of Dalian Medical University, Dalian, China

Purpose

The aim of this study was to assess changes in myocardial edema in patients with advanced chronic kidney disease (CKD) over the course of different disease processes using T2 mapping.

Methods

We prospectively recruited 45 CKD patients who estimated glomerular filtration rate (eGFR) < 59 ml/min/1.73 m². All participants with CMR scans were performed on a 3.0T MRI scanner (Philips Ingenia, Philips Healthcare, Cleveland, Ohio, USA) for the acquisition of myocardial T2 mapping. T2 mapping (Gradient Recalled and Spin Echo sequences) was performed at identical mid short-axis levels. Typical T2 acquisition parameters: ECG triggered, flip angle 90°, voxel size $2 \times 2 \times 10$ mm, slice thickness 10 mm. Motion correction and fitting were performed to estimate coefficients of the decay function, which were then used to estimate T2 times. Commercially available dedicated software CVI42 (version 5.14, Circle Cardiovascular Imaging Inc., Calgary, Canada) was used to analyze the T2 value. We classified CKD as stage 3, stage 4, and stage 5 according to eGFR 30-59 ml/min/1.73m², 15-29 ml/min/1.73m², and < 15 ml/min/1.73m². The Shapiro-Wilk test assessed the normality of the data. Analysis of variance using Kruskal Wallis test.

Results

The T2 values for patients with CKD stages 3-5 were 49.6 ± 4.14 ms; 52.4 ± 3.83 ms; 55.53 ± 5.1 ms, respectively. T2 values were significantly higher in CKD stage 5 than in CKD stage 3 (55.53 ± 5.1 ms vs. 49.6 ± 4.14 ms, $p = 0.002$).

Conclusion

Myocardial T2 time increased with progressive CKD severity, which can help assess the association between the CKD disease process and myocardial edema.

PO-0914

Deep Learning Prediction of Survival in Patients with Heart Failure Using Chest Radiographs

Han Jia¹, yinsu zhu²

1. Jiangsu Provincial People's Hospital (The First Affiliated Hospital of Nanjing Medical University)

2. Jiangsu Cancer Hospital (The Affiliated Cancer Hospital of Nanjing Medical University)

Objectives : To develop and validate a deep learning survival prediction model using chest radiographs (DLSPCR) in patients with heart failure.

Materials and methods : The study retrospectively enrolled a cohort of 353 patients with heart failure who underwent chest radiographs at our institution between March 2012 and March 2017. The dataset was randomly divided into training ($n=247$) and validation ($n=106$) datasets at a 7:3 ratio. Univariate and multivariate Cox analysis were applied to the training dataset to develop clinical and imaging survival prediction models. The DLSPCR algorithm was trained and the selected clinical parameters were incorporated into DLSPCR (DLSPinteg). Discrimination performance was evaluated by using the time-dependent area under the receiver operating characteristic curves (TD AUC) at 1, 3, and 5-year survival. Goodness of fit was assessed using the Hosmer-Lem show test.

Results : Older age, higher N-terminal pro-B-type natriuretic peptide (NT-ProBNP), systolic pulmonary artery pressure (sPAP) >50 mmHg, New York Heart Association functional class (NYHA) III-IV, no hypertension, and cardiothoracic ratio (CTR) ≥ 0.62 predicted poor prognosis in patients with heart failure. DLSPCR had better performance at predicting 5-year survival than the imaging Cox model in the validation cohort (AUC: 0.757 vs 0.561, $P=0.01$). DLSPinteg outperformed the clinical Cox model (AUC: 0.818 vs 0.674, $P=0.03$) and imaging Cox model (0.818 vs 0.561, $P<0.001$). Moreover, DLSPinteg was slightly higher than DLSPCR (0.818 vs 0.757, $P=0.06$), although the difference was not statistically significant.

Conclusions : Deep learning models using chest radiographs can predict survival in patients with heart failure with acceptable accuracy.

PO-0915

Imaging and pathology of resected pneumonic-type lung adenocarcinoma: A comparative study

Wenping Li^{1,3}, Iijun Wu^{1,4}, pengfei Han¹, pengju Zhang², jinhuan Xu¹, chunjie Wang³, jie Gao¹, shaohong Zhao¹

1. 28 Fuxing Road, Haidian District, Beijing

2. the Fourth Medical Center, Chinese PLA General Hospital, Beijing

3. the Sixth Medical Center, Chinese PLA General Hospital, Beijing

4. Medical School of Chinese PLA , Beijing

Objective: To analyze the CT and pathological characteristics of surgically resected pneumonic-type adenocarcinoma (P-ADC), and to explore the corresponding histopathological basis of CT findings of P-ADC.

Methods: From January 2015 to October 2022, the clinical, imaging and pathological data of pneumonic-type adenocarcinoma on CT who underwent surgical resection were analyzed. The CT findings of P-ADC were correlated with pathology. Chi-square test or Fisher exact probability method were used to compare the clinical, imaging and pathological data. **Results:** A total of 62 patients with p-ADC were included, including pure mucinous adenocarcinoma (33 cases), mixed mucinous adenocarcinoma (20 cases), non-mucinous adenocarcinoma (9 cases). The main CT features were consolidation + ground glass opacity (44 cases), consolidation (17 cases), and pure ground glass (1 case). Associated abnormalities: nodule (9 cases), air bronchial sign (52 cases), cystic airspace (30 cases), crazy-paving sign (16 cases), thickened intralobular septum (22 cases), thickened interlobular septum (3 cases), and lymph node metastasis in 8 patients were included. The thickened interlobular septum ($\chi^2=13.813$, $P < 0.001$) was statistically significant in P-ADC patients with ground glass, when nodules appeared on CT, there was a statistically significant difference between the three groups of mucinous adenocarcinoma, mixed mucinous adenocarcinoma and non-mucinous adenocarcinoma ($\chi^2=10.604$, $P=0.003$), and there was a statistically significant difference between the two groups of mucinous adenocarcinoma and non-mucinous adenocarcinoma ($\chi^2=7.312$, $P=0.013$). Nodules were found in 6 of the 19 patients with micropapillary components, and the difference was statistically significant compared with other pathological types ($\chi^2=10.334$, $P=0.008$). The difference was statistically significant when the proportion of ground glass density in P-ADC patients with papillary components was more than 50% (8 cases) ($\chi^2=7.838$, $P=0.017$). **Conclusion** The pathological types of P-ADC can be mucinous or non-mucinous, which mainly contain papillary or micropapillary subtypes and spread through airspace.

PO-0916

Coronary artery calcium score combined with sleep quality predicts major adverse cardiovascular events: The Multi-Ethnic Study of Atherosclerosis

Jiali Liu,yuanqiang zhu,didi wen,ziliang xu,pengpeng zhang,minwen zheng
The First Affiliated Hospital of Air Force Medical University

Background: Both coronary artery calcium score (CACS) and sleep quality have predictive value for major adverse cardiovascular events (MACEs). However, the predictive value of radiographic measures, including the coronary artery calcium score (CACS), and sleep quality is unclear.

Objective: This study aimed to compare the predictive value of imaging factors and sleep quality for MACEs.

Methods: In The Multi-Ethnic Study of Atherosclerosis (MESA), 978 participants without cardiovascular disease completed coronary computed tomography (CT) and cardiac magnetic resonance imaging (CMR) between 2010 and 2013, along with 7 days of wrist actigraphy and one night of polysomnography for sleep assessment, and were prospectively followed up in 2016. MACEs included nonfatal and fatal cardiovascular events. Univariate and multivariate Cox regression were used to analyze traditional cardiovascular risk factors, imaging parameters, and sleep-related factors to evaluate risk factors for MACEs. The predictive values of imaging factors and sleep factors were compared.

Results: A total of 978 patients (mean age 67.4 ± 8.8 years; 978 persons). During a mean follow-up of 4.8 ± 0.8 years, MACEs occurred in 46 patients (4.7%). CACS > 400 (HR: 8.531, $P < 0.001$), sleep efficiency (HR: 0.972, $P < 0.004$), SaO₂ (HR: 1.025, $P=0.007$) 1.025(1.007-1.044) were independent predictors of MACEs. Imaging parameters combined with sleep factor had predictive value for MACEs, and imaging factors (C-index: 0.804) had incremental predictive value for MACEs. **Conclusions:** Calcium score, sleep efficiency, and nocturnal oxygen saturation $< 90\%$ were predictors of MACEs, but only imaging factors had increasing prognostic value. Compared with

sleep factors, imaging evidence, especially CACS, has more predictive value in predicting the risk of MACEs.

PO-0917

To evaluate the application value of combining low energy images in dual-energy spectral CT with a new adaptive statistical iterative reconstruction (ASIR-V) to improve the image quality of bronchial arteries.

Tianbao Zhang, Hui Li, Jun Yao, Heping Zhou, Zhengjun Li
AnKang Central Hospital

PURPOSE : To evaluate the application value of combining low energy images in dual-energy spectral CT with a new adaptive statistical iterative reconstruction (ASIR-V) to improve the image quality of bronchial arteries.

METHOD AND MATERIALS: We retrospectively analyzed patient images in contrast-enhanced CT scans using dual-energy spectral imaging mode. The monochromatic images in the 40-70 keV energy range (every 10keV) and reconstructed with the combination of ASIR-V with weightings of 40%, 60% and 80% were analyzed. A circular region-of-interest (ROI) with 2.8 mm² was placed at the center of bronchial artery, and on the vertical muscle as background to measure CT value and standard deviation and to calculate signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) for the artery, set as group B, group A as the control group (system default 120Kvp-like single energy group) of labyrinthine artery for objective evaluation. Two radiologists Use 5 points also evaluated the subjective score in terms of the sharpness and clarity of displaying bronchial arteries and their branches. The data collected were analyzed statistically and subjective scores were checked for consistency.

RESULTS: With the decrease of single energy, the CT value and noise of the bronchial arteries increased. Joint ASIR-V effectively reduced the image noise and increased the CNR and SNR group weights. 80% ASIR-V combined with 40keV BA (CT: 1385.75±317.79; CNR: 145.51±111.9; SNR: 43.76±34.97) was superior to 120Kvp-like combined with 40% ASIR-V BA (CT: 416.55±91.285; CNR: 43.93±27.79; SNR: 28.14±19.28), P-value <0.05; Subjective image quality reached a maximum at 40 keV, 50 keV combined with 80% ASIR-V binding.

CONCLUSION: The 40keV dual-energy spectroscopy combined with 80% ASIR-V monochromatic images on subjective and objective scores increases the contrast between the bronchial arteries and the surrounding tissue to optimize the image quality of the bronchial arteries.

CLINICAL RELEVANCE/APPLICATION: The 40keV dual-energy spectroscopy combined with 80% ASIR-V monochromatic images can show the length, number, origin, branching, shape, diameter and wall condition of the bronchial artery. The clinical treatment of various lung diseases and the evaluation of their efficacy provide helpful help.

PO-0918

CT-FFR versus Aortic valve Calcification Scores: Prediction of Clinical Outcomes after Transcatheter Aortic Valve Replacement

shuangxin li, Didi Wen, Wenxuan Yang, Minwen Zheng
Department of Radiology, Xijing Hospital, Fourth Military Medical University

BACKGROUND: CT angiography-derived fractional flow reserve (CT-FFR) and aortic valve calcification scores (AVCS) had prognostic values for clinical outcomes after transcatheter aortic valve replacement (TAVR) in patients with aortic valve diseases. However, the superior prognostic value between CT-FFR and AVCS remains unclear.

OBJECTIVES: This study was to compare prognostic values of CT-FFR and AVCS for major adverse cardiac events (MACE) (nonfatal myocardial infarction, unstable angina, cardiac death, or heart failure admission) after TAVR.

METHODS: Consecutive symptomatic patients with severe aortic valve diseases undergoing coronary CT before TAVR were retrospectively enrolled. The clinical factors, CT-FFR and AVCS were used to evaluate risk factors for MACE by using univariable and multivariable Cox regression analysis. The prognostic value of CT-FFR compared with AVCS was also analyzed.

RESULTS: A total of 251 patients were enrolled (mean age, 67 ± 10 years; 176 men). During a mean follow-up of 36.8 ± 14.8 months, 60 patients (23.90%) experience MACE. $AVCS \geq 2000$ (HR: 1.836, $P < 0.05$) and $CT-FFR \leq 0.8$ (HR: 2.504, $P < 0.05$) were independent predictors of MACE. The risk of MACE was significantly increased when presented $CT-FFR \leq 0.8$ and $AVCS \geq 2000$. CT-FFR (C-index: 0.685) but not AVCS (C-index: 0.658, $P = 0.031$) showed incremental prediction value for MACE.

CONCLUSIONS: CT-FFR and AVCS were predictors of MACE after TAVR, but only CT-FFR presented incremental prognostic value. Adding CT-FFR into the risk prediction of patients undergoing TAVR is worth consideration.

Thoracic First-Pass Perfusion Imaging for Detecting Emboli in Acute Pulmonary Embolism with Varying Risk Stratification: A Retrospective Analysis Using Detector- Based Functional CT

Yuhan Zhou¹, Weimeng Cao¹, Limin Lei¹, Zhihao Wang¹, Shushan Dong², Songwei Yue¹

2. Philips Healthcare

Objective This study aims to explore the performance of detector-based functional CT imaging to evaluate the degree of pulmonary perfusion defect in clinical risk stratification.

Methods This study retrospectively included 50 patients diagnosed as pulmonary embolism from February 2023 to April 2023. Multi-parameter functional CT was used for pulmonary angiography (CTPA). According to the simplified clinical risk stratification score of pulmonary embolisms, the patients were divided into low risk group (28 cases) and medium risk group (22 cases). The thoracic first-pass perfusion images were post-processed by utilizing iodine density (ID), effective atomic number (Zeff) and ID-Zeff fusion images (ID-Zeff), respectively. The Mastora score was used to evaluate the area of low perfusion areas in each group, and receiver operating characteristic (ROC) curves were plotted for each group. Area under curve (AUC) were calculated to compare the

diagnostic efficacy of each group in evaluating the risk stratification (medium or low) of risk acute pulmonary embolism.

Results Among the 50 patients, the Mastora scores of each group were: ID maps (low risk group 14 ± 5.2 , medium group 22 ± 4.5), Zeff maps (low risk group 16.5 ± 4.8 , medium group 24 ± 5.2). ID-Zeff maps (18.5 ± 4.8 in the low-risk group and 26 ± 5.8 in the medium group). Compared to the CI images (AUC 0.78, sensitivity 76%, specificity 82%), ID maps (AUC 0.86, sensitivity 86%, specificity 88.5%), the Zeff maps (AUC 0.882, sensitivity 89%, specificity 89%), and the ID-Zeff maps (AUC 0.905, sensitivity 89%, specificity 91%) has the highest predictive capabilities in low- to medium- risk patients with acute pulmonary embolism.

Conclusions The thoracic first-pass perfusion generated by ID-Zeff fusion images based on multi-parameter functional CT may improve the prediction capabilities in different risk patients with acute pulmonary embolism. This provides additional imaging evidence for risk stratification and short-term prognosis assessment of patients with acute pulmonary embolism.

Myocardial injury has occurred in HCM patients with preserved ejection fraction

Miao Wen^{1,2}, Zhi Yang², Bing Fu²

2. Chengdu Fifth People's Hospital

Objective:

Cardiotoxicity caused by smoking is associated with increased risk of heart failure and death. However, the relationship between smoking and left ventricular injury in patients with HCM (Hypertrophic Cardiomyopathy) is unclear. Therefore, this study hypothesized that smoking would exacerbate myocardial strain injury in patients with HCM.

Methods:

A total of 89 HCM patients with preserved ejection fraction and 37 healthy controls, who underwent CMR (Cardiac Magnetic Resonance) between January 2021 and March 2023, were included in the study. The HCM patients were divided into the smoking cohort (HCM-Smoking (+), n=30) and the non-smoking cohort (HCM-Smoking (-), n=59). CMR left ventricular strain parameters (including GLS (global longitudinal strain), GCS (global circumferential strain), GRS (global radial strain)) were calculated and comparisons between multiple groups were performed using analysis of variance (ANOVA).

Results:

HCM patients had significantly lower parameters in left ventricular GRS [(27.81 ± 9.65) vs (39.55 ± 7.60)] and GLS [(-10.93 ± 3.28) vs (-14.81 ± 2.61)] ($P < 0.05$) than healthy controls. Then, compared to the non-smoking group, the smoking group had lower parameters in left ventricular GRS [(23.76 ± 6.05) vs (29.87 ± 10.50)] and GLS [(-9.89 ± 3.51) vs (-11.46 ± 3.05)] despite normal LVEF ($P < 0.05$).

Conclusion:

Smoking produces myocardial strain injury in HCM patients with preserved ejection fraction, especially in GRS and GLS. This observation provides the evidence of heart damage caused by cigarette smoking.

Right Ventricular Myocardial Deformation Assessment by Magnetic Resonance-Feature Tracking in Takayasu's Arteritis-Pulmonary Artery Involved Patients Without Pulmonary Hypertension

Qing Li, Yue Ren, Zhen Zhou, Lei Xu
Beijing Anzhen Hospital, Capital Medical University

Objective: Pulmonary artery involved (PAI) is a subtype of Takayasu arteritis (TA). Persistently elevated pulmonary arterial pressure in TA-PAI patients leads to pulmonary hypertension (PH), and eventually cardiac death. Thus, the early detection of right ventricular myocardial injury before the onset of PH is crucial but remains a major challenge in clinical practice. Therefore, the current study aimed to explore the potential of right ventricular global peak longitudinal and circumferential strain (RVGLS and RVGCS, respectively) in detecting right ventricular myocardial damage in TA-PAI patients without PH.
