Background and Aims: Risk stratification of microvascular invasion MVI: M0 (no MVI); M1 (mild MVI) and M2 (severe MVI) is vital for predicting the prognostication and tailoring determining effective treatment strategies in hepatocellular carcinoma (HCC). However, radiomics analysis has not been utilized for the risk stratification of MVI. We aim to develop a radiomics approach for identifying the risk stratification of MVI (M0, M1, and M2) using preoperative MR imaging.

Methods: 340 HCC patients (M0:177; M1:121; M2: 42) who had preoperative MRI were enrolled and divided into two-class (Task1: M0 vs M1; Task2: M1 vs M2; Task3: M0 vs M2) and three-class (M0, M1, and M2) groups. Three models (Model A: clinical-radiologic model; Model B: radiomics model; Model C: Model A + Model B) were developed to stratify MVI. For the two-class classification task, the optimal model was decided by the maximum area under the curve (AUC) in training set and further validated in test set. For the three-class classification task, Model D was built based on the optimal model to validate the performance of predicting the risk stratification of MVI in the training and validation cohorts.

Results: Model C was the optimal model and Model D had an excellent performance in distinguishing M0 (AUC: 0.802; 95% CI: 0.747-0.857) and M2 (AUC: 0.894; 95% CI: 0.836-0.952) and a good performance in predicting M1 (AUC: 0.706; 95% CI: 0.638-0.775) in the training cohort. For the validation cohort, the model showed a good performance in identifying M0 (AUC: 0.762; 95% CI: 0.670-0.854), M1 (AUC: 0.635; 95% CI: 0.523-0.747), and M2 (AUC: 0.784; 95% CI: 0.654-0.915).

Conclusion: The model that combined radiomics and clinical-radiological features (Model D) can effectively identify the risk stratification of MVI and assist in individualized HCC patient management.

PO-3859

Analysis of the production of 3D crutches

Mingzhe Xie
XIANGYA HOSPITAL CENTRAL SOUTH UNIVERSITY

The aim of this paper is to analyse the materials used for 3D printed crutches. TPU and Varioshore TPU were used as printing materials for the 3D cane parts, including the support pads and shields, the inner and outer handles and the cane feet. Experimental and literature have analyzed the non-stick properties of TPU during printing and the excessive stickiness of Varioshore TPU to the support material. For the non-adhesion of TPU, the literature analysis suggests that this can be solved by improving the heat dissipation efficiency and increasing the internal support material; for the excessive adhesion of the Varioshore TPU to the support material, a comparative analysis of the PLA and PVA materials should be carried out. Due to the extensive literature analysis carried out in this thesis, the actual experimental results may be biased.

1. Material analysis of crutches

The crutch's supporting pad, inner handle, sides and feet will be made of thermoplastic polyurethane (TPU), and the body tube, the support rod and the threaded cap will be made of aluminium alloy.

2. Analysis of thermoplastic polyurethane (TPU)

As mentioned above, natural rubber SIR-20 and thermoplastic polyurethane (TPU) are among the material options. However, it has been reported that natural rubber cannot be used as a material for 3D printing. Rubber usually needs to be vulcanized to maintain the shape of the object. As a printing material, the heat generated in the printing machine melts the rubber to the fluid, and burns. Therefore, TPU will be designed as a material for supporting pad, inner handles, side shields and support feet. TPU 95A from Ultimaker will be used as the raw material.

TPU is a linear block copolymer consisting of flexible and hard segments covalently bonded to each other. The soft segments are usually long chain diols (1000-4000 g/mol) and the hard segments consist of diisocyanates and short chain extension sequences. TPU has highly alternative material properties to rubber (e.g. flexibility, elasticity, abrasion resistance, impact resistance), with a good hardness.

3. Making the 3D walking stick parts

The crutches are made in two main parts. The first part consists of the supporting pad, guard, inner and outer handles and crutch feet. The second part is the body tube, spring, support rod and threaded cap. At this stage, 3D printing of the first part will be carried out. The study will be carried out to analyze the different printing materials (TPU 95A and Varioshore TPU).

4. Fabrication study using TPU 95A material

(1) Convert the CAD model of the supporting pad into the STL standard file.

(2) Open the data package in the IdeaMaker printing software and adjust the parameters of 3D printer, including printing temperature, printing speed, hotbed temperature, fan and other data, and finally, export the file to a USB stick.

(3) Insert the USB stick into the 3D printer, select the print file and wait for the creation to be completed.

5. Fabrication study using Varioshore TPU material

Varioshore TPU is the material used for to make the 3D grip models. In order to make the grip of the cane more comfortable and user-friendly, it is planned to use additional equipment (3D scanner and 3D printer) for the production of the grip model. According to Parry, the design of the grip was based on the following: impression of the hand shape; 3D scanning; definition of the 3D model; final printing.

6. Making the external handle mould

The tools and materials used for the external handle mould include Coolmorph polylactone from Thermoworx, moulding powder, water, a traditional underarm cane handle and a 2L wide mouth cup.

The polylactone has a low-temperature melt (42°C) (Parry, Best & Banks, 2020). The main component of the moulding powder is algae gum. Both the polylactide and the impression powder are non-toxic and pose no risk to humans.

(1) Fill a wide-mouthed cup with impression powder and water and mix thoroughly (1 g of impression powder to 1.25 ml of water). If the setting time is short, use ice water to slow down and increase the mixing time.

(2) Once the impression powder has been thoroughly mixed, submerge the traditional handle in the powder. While the conventional handle is in the mix, avoid touching the wall of the cup as this may result in an incomplete mould. After about 5 minutes, the impression powder will set, wait until it has completely set and then remove the conventional handle. At this point, the conventional handle can be seen in the cup.

(3) The polyurethane material is heated in hot water until it is transparent, when the polyurethane material is reduced to a point where it can be reshaped. A sufficient amount of clear polylactide is therefore placed in the cup. When the polylactide in the cup is close to cooling, the impression powder is removed, and a polylactide handle is obtained.

(4) By manually grasping the polyurethane handle, an outer handle model can usually be obtained.

7. 3D scanning of external handle moulds

The tools and software required for 3D scanning and digital engineering production include Romer Absolute Arm scanning (Manchester Metrology brand); Meshmixer mesh repair software (Autodesk Inc.); Geomagic for Solidworks CAD software (3D Systems). The mould will need to be blackened and matted once the outer handle mould has been obtained. Without blackening, the mould will reflect and the quality of the 3D scan will be greatly reduced (Formlabs, 2021).

The experimental steps were designed as follows.

(1) The blackened outer handle mould was placed in a fully exposed and open area, and the handle mould was positioned for 3D scanning using a Romer Absolute Arm. Due to the curved surfaces and recesses of the handle mould, multiple positioning and scanning were required to ensure the quality of the scan. Once the 3D scan was completed, the mesh was obtained.

(2) Meshmixer was used to simplify, tidy up and fill the mesh with repair work.

(3) A Standard Tessellation Language (STL) file is exported from Meshmixer and imported into Geomagic for Solidworks (GIS) software. In the GIS software, the scanned inner handles are removed, the outer handles are retained and reshaped to contour. The outer handle was then shaped to look as good as possible. The 3D scan of the sugar cane handle is now complete, and the STL handle file is obtained.

8. 3D printed outer handle model

Varioshore TPU material, an Ultimaker S5 Pro 3D printer and a PrintDry dryer were the necessary materials and equipment. Prior to printing, Varioshore TPU was placed in the PrintDry dryer for over 4 hours, with the temperature inside the bin maintained at 50°C. The external grip STL file was imported into the Ultimaker S5 3D printer and the print configuration, such as print speed and temperature, was adjusted. Use the Ultimaker S5 Air manager to ensure the printing environment and improve print quality. Wait for the print to complete, and the final model of the outer handle of the Varioshore TPU will be available.

When it comes to using Varioshore TPU for handles, it has been found that the Varioshore TPU material bonds very quickly to the support material, making it difficult to remove the support material and potentially tearing the model (Parry, Best & Banks, 2020). While conventional TPU is already a flexible material with solid interlayer adhesion, Varioshore TPU is a unique foaming material that is more challenging to control the quality of the model when foaming during the printing process. According to COLORFABB, Polylactic acid (PLA) is the material of choice for the support material (ColorFabb). As a material made from renewable resources, PLA is very susceptible to fracture and has a very low toughness. PLA materials can be defined as brittle materials that have difficulty withstanding impact forces.

Similarly, Polyvinyl Alcohol (PVA) can be the preferred support material (Parry, Best & Banks, 2020). PLA is a water-soluble polymer produced by the hydrolysis of polyvinyl acetate (PVAc) (S.H. Bossmann et al., 2001). PVA has high water solubility, low cost of use and high physical properties (Zhu & Ge., 2021).

9. Result

From the analysis of experiments and literature, it was concluded that.

(1) PLA as a 3D printing material is robust and not suitable for printing models that require flexibility and comfort.

(2) When printing TPU objects higher than 45 mm in height, support material should be provided inside the object. The support material has the potential to solve the problem of insufficient support and non-adhesion of the material.

(3) With Varioshore TPU as the material, separating the support material from the model is complex. PLA and PVA materials can be tried as an improvement to the support material.

The data and the likelihood of occurrence of the experimental steps are mostly based on literature analysis. Therefore, the experimental data and conclusions may be biased and inaccurate compared to real-life experimental situations.

The 3D cane has an additional guard on either side of the support pad, a three-section retractable body tube, a customisable handle for personal use and an additional elastic spring. The material has been changed from the traditional natural rubber design to TPU and Varioshore TPU 3D printed materials. The manufacturing method has been changed from uniform mass production to individual 3D printing. It has also been shown in the experimental literature that TPU is subject to non-adhesion in production and that the problem of non-adhesion can be solved by increasing the heat dissipation capacity and providing a support material. Experimental analysis of PLA and PVA materials should be attempted to address the issue of excessive adhesion of Varioshore TPU materials to support materials. The aim of improving the traditional underarm crutches is to remind people that there are still many people around the world who do not have access to good medical assistance and cannot afford expensive medical aids. Meanwhile, conventional crutches are

harming people's bodies as they provide them with ease of movement. Development of 3D printing technology to aid human life and health.

PO-3860

Survival rate prediction of nasopharyngeal carcinoma patients using a deep neural network

Qianyu Yang, Weiyuan Huang
海南省人民医院

For nasopharyngeal carcinoma (NPC) patients treated with intensity-modulated radiation (IMRT), a precise progression-free survival (PFS) time prediction method is required in order to achieve a better treatment regimen and follow-up assessment design. We propose using a deep learning method to develop a PFS prediction model for NPC patients after IMRT treatment and comparing that with the traditional texture analysis method. One hundred and fifty-one NPC patients were recruited in this retrospective study. T₁-weighted, proton density, and dynamic contrast-enhanced magnetic resonance (MR) images were acquired. The expression level of five genes (HIF-1 α , EGFR, PTEN, Ki-67, and VEGF) and infection of Epstein-Barr (EB) virus were tested. A residual network was trained to predict PFS from MR images. To determine a final PFS prediction, the output as well as patient characteristics were merged using a linear regression model. The prediction accuracy was compared with that of the traditional texture analysis method. The best PFS prediction accuracy comes from a regression model combining the deep learning output with HIF-1 α expression and Epstein-Barr infection (Spearman correlation $R^2 = 0.53$; Harrell's C-index = 0.82; receiver operative curve [ROC] analysis area under the curve [AUC] = 0.88; log-rank test hazard ratio [HR] = 8.45), higher than a regression model combining texture analysis with HIF-1 α expression (Spearman correlation $R^2 = 0.14$; Harrell's C-index = 0.68; ROC analysis AUC = 0.76; log-rank test HR = 2.85). The deep learning method does not require a manually drawn tumor region of interest. However, the texture analysis method requires specific kernels or tumor regions of interest, but MR image processing utilizing deep learning combined with patient characteristics does not, and can provide accurate PFS prediction for nasopharyngeal carcinoma patients.

Predicting telomerase reverse transcriptase promoter mutation status in glioblastoma by whole-tumor texture analysis of multisequence MRI imaging

Bin Zhang, Junlin Zhou
Lanzhou University Second Hospital

Objectives: To investigate the utility of preoperative whole-tumor texture analysis of multisequence MRI imaging for evaluating telomerase reverse transcriptase promoter (pTERT) mutation status in glioblastoma (GBM).

Methods: The clinical and imaging data of 111 patients with IDH-wildtype GBM at our hospital between November 2018 and March 2023 were retrospectively assessed. We used the molecular sequencing results to classify the data sets into pTERT mutations and pTERT-wildtype groups. The volume texture features of the whole-tumor were extracted, including T1-weighted contrast-enhanced (T1C), T2-weighted imaging (T2), T2 fluid-attenuated inversion recovery (T2-FLAIR) and apparent diffusion coefficient (ADC) map. All texture features were obtained from open-source PyRadiomics (<http://www.radiomics.io/pyradiomics.html>). After data reduction and feature

selection, logistic regression was used to build prediction models. ROC analysis was performed to assess the diagnostic performance. The data were analyzed using R software (version 4.2.3; <http://www.Rproject.org>).

Results: pTERT mutations were observed in 69/111 (62.1 %) all IDH-wildtype GBM analysed. The T1C-Model (AUC 0.704) had a better predictive ability than the T2-Model (AUC 0.684) and ADC-Model (AUC 0.624). The MRI-Combined (T1C, T2, ADC texture features) Model (AUC 0.780) had a better predictive ability than the Clinical-Model (AUC 0.758). The Combined-Model (T1C, T2, ADC texture features and clinical features) had the best predictive performance (AUC 0.836), the sensitivity, specificity and accuracy were 85.5%, 73.80% and 78.38%, respectively.

Conclusion: Whole-tumor texture analysis of multisequence MRI imaging can be used as non-invasive quantitative parameters to assist in the preoperative clinical prediction of pTERT mutation status in IDH-wildtype GBM.

Radiomic features of the hippocampal based on magnetic resonance imaging in the menopausal mouse model linked to neuronal damage and cognitive deficits

Jie Zhao, Huijie Jiang

Department of Radiology, The Second Affiliated Hospital of Harbin Medical University, Harbin 150081, China

Purpose: This study set out to explore the correlation between radiomics features based on magnetic resonance imaging MRI and pathological features of the hippocampus and cognitive function in the postmenopausal women PMW mouse model.

Methods: Ovariectomized (OVX) mice were used as PWM models. MRI scans were performed two months after surgery. The brain's hippocampal region was manually annotated, and the radiomic features were extracted with PyRadiomics. Chemiluminescence was used to evaluate the peripheral blood estrogen level of mice, and the Morris water maze test was used to evaluate the cognitive ability of mice. Nissl staining and immunofluorescence were used to quantify neuronal damage and COX1 expression in brain sections of mice.

Results: The OVX mice exhibited marked cognitive decline, brain neuronal damage, and increased expression of mitochondrial complex IV subunit COX1, which are pathological phenomena commonly observed in the brains of AD patients, and these phenotypes were significantly correlated with radiomics features ($p < 0.05$, $|r| > 0.5$), including Original_firstorder_Interquartile Range, Original_glcml_Difference Average, Original_glcml_Difference Average and Wavelet-LHH_glszm_Small Area Emphasis. Meanwhile, the above radiomics features were significantly different between the sham-operated and OVX groups ($p < 0.01$) and were associated with decreased serum estrogen levels ($p < 0.05$, $|r| > 0.5$).

Conclusion: This initial study indicates that the above radiomics features may have a role in the assessment of the pathology of brain damage caused by estrogen deficiency using routinely acquired structural MR images.

PO-3863

Research on the application of radiomics in neurodegenerative diseases

Yingyu Pan

Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine

Purpose: Neurodegenerative disease mostly occur in central nervous system and peripheral nervous system, manifested as sensory, motor and conscious dysfunction, most of neurodegenerative disease belong to chronic diseases, with a high disability rate. Its cause is still unknown and may be caused by a variety of causes, precise treatment is essential to improve the long-term prognosis of patients. Normal Appearing White Matter (NAWM) refers to areas of white matter that appear normal around white matter hyperintensities (WMH) in conventional MRI images but actually have lesions, such changes are difficult to recognize on conventional imaging examination. The occurrence of WMH on a large scale may be closely related to the occurrence of many neurodegenerative diseases in the brain. Radiomics method can mine a large number of high-dimensional quantitative features which cannot be identified with our eyes from medical images, and establish a disease prediction model combining the clinical manifestations, severity of the disease and prognosis of the patient, finally obtain the quantitative biological indicators from patient's images, providing a new perspective for the study of the pathological mechanism of neurodegenerative diseases.

Method: Radiomics refers to the high-throughput extraction of a large number of high-level quantitative image features from MRI, CT and other medical images, next applying advanced mathematical model algorithms to convert the initially extracted features into high-dimensional data with low redundancy and high resolution, and then analyzing these high-dimensional data to quantify some major diseases. It can be seen that radiomics can research the changes of white matter and other microstructures by analyzing the position relationship between adjacent voxels and gray values. Thus leaving more effective treatment time for early intervention. As a new quantitative imaging method, radiomics is based on relatively advanced medical imaging technology, from which a large number of features can be obtained, and complete feature markers can be obtained through big data analysis, which is convenient for disease prediction. Radiomics method include five steps: the acquisition of image data, the segmentation of the region of interest, feature extraction, feature selection, and the establishment and analysis of the radiomics model. In this paper, based on the small differences in brain structure between patients with neurodegenerative disease and healthy subjects, extracted image features to build an radiomics model, used lasso method to build an radiomics nomogram, and the repeatability and stability of the model were analyzed by accuracy, area under the curve (AUC), specificity, sensitivity and other evaluation indexes.

Results: Extracted radiomics features of potential biomarkers from the neurodegenerative disease patients and healthy subject's brain respectively. The results showed that gray level run length matrix(GLRLM) which represents the grayscale distribution of the region of interest, and describes the length that pixels with the same grayscale of an image appear continuously in a certain direction. Long run length is more common in rough textured areas, while short run length is more common in fine textured areas had a certain relationship with the degree of pathological damage of the disease, and the wavelet feature extracted from them were significantly different. Combined the imaging features and clinical features when the prediction model is built, the results showed that this prediction model has better disease discriminative effect.

Conclusion: Medical imaging technology can reflect some tiny differences in the brain of patients with neurodegenerative diseases, and can extract the radiomics features from these differences region. The model established by fitting the characteristics of high-throughput radiomics features and has a good prediction effect, indicating that radiomics method can provide additional pathological information for clinicians. It is of great significance to the differential diagnosis and prognosis of neurodegenerative diseases.

PO-3864

Comparing a Fully Automated Hybrid Approach on MRI and FibroScan for Triaging Clinically Significant Liver Fibrosis: A Multi-center Cohort Study

Junhao Zha

Zhongda Hospital, Southeast University

Background & Aims: We aimed to 1) develop and validate the combined radiomics-clinic (CoRC) model on MRI for triaging clinically significant liver fibrosis ($\geq F2$), 2) compare with transient elastography-based liver stiffness measurement (TE-LSM) in large-scale samples.

Approach & Results: This retrospective multi-center study recruited 537 patients with biopsy proven liver fibrosis from May 2015 to Jan 2021. Training ($n = 276$) and internal test ($n = 118$) sets were randomly allocated. A temporal test set ($n = 96$) and an external test set ($n = 47$) were used for validation. Radiomics features were extracted from the ResUNet-based automated MRI entire liver segmentation. Radiomics model was generated using logistic regression after feature reduction. CoRC model integrated Radiomics model and optimal clinical variables in the training set with multivariate logistic regression. Diagnostic performance was mainly evaluated by the area under the receiver operating characteristic curve (AUC) in the test sets. In the internal, temporal, and external test sets, the CoRC model yielded AUCs of 0.79 (0.70, 0.86), 0.82 (0.73, 0.89), and 0.83 (0.69, 0.92), and outperformed TE-LSM in the temporal test set (integrated discrimination improvement, 12.9% [2.4-23.4%]; $P = .02$). Additive value of CoRC model to TE-LSM was explored, with combined AUC of 0.86 (0.79-0.94), and 0.81 (0.72-0.90) in the internal, and temporal sets ($P = .01$). Considering necroinflammation, CoRC model maintained the discriminatory power in the test sets (AUCs range, 0.74-0.86).

Conclusions The CoRC model exhibited promising diagnostic performance and robustness for clinically significant liver fibrosis, complementary to TE-LSM.

PO-3865

A Combined Model Integrating Radiomics and Deep Learning Based on Contrast-enhanced CT for Preoperative Staging of Laryngeal Carcinoma

Xinwei Chen, Juan Peng, Qiang Yu, Fajin Lv

The First Affiliated Hospital of Chongqing Medical University

Rationale and Objectives: Accurate staging of laryngeal carcinoma can inform appropriate treatment decision-making. We developed a radiomics model, a deep learning (DL) model, and a combined model (incorporating radiomics features and DL features) based on the venous-phase CT images and explored the performance of these models in stratifying patients with laryngeal carcinoma into stage I–II and stage III–IV, and also compared these models with radiologists.

Materials and Methods: Three hundreds and nineteen patients with pathologically confirmed laryngeal carcinoma were randomly divided into a training set ($n = 223$) and a test set ($n = 96$). In the training set, the radiomics features with inter- and intraclass correlation coefficients (ICCs) > 0.75 were screened by Spearman correlation analysis and recursive feature elimination (RFE); then support vector machine (SVM) classifier was applied to develop the radiomics model. The DL model was built using ResNet 18 by the cropped 2D regions of interest (ROIs) in the maximum tumor ROI slices and the last fully connected layer of this network served as the DL feature extractor. Finally, a combined model was developed by pooling the radiomics features and extracted DL features to predict the staging.

Results: The area under the curves (AUCs) for radiomics model, DL model, and combined model in the test set were 0.704 (95% confidence interval [CI]: 0.588–0.820), 0.724 (95%CI: 0.613–0.835), and 0.849 (95%CI: 0.755–0.943), respectively. The combined model outperformed the radiomics model and the DL model in discriminating stage I–II from stage III–IV ($p = 0.031$ and $p = 0.020$, respectively). Only the combined model performed significantly better than radiologists. **Conclusions:** The combined model can help tailor the therapeutic strategy for laryngeal carcinoma patients by enabling more accurate preoperative staging.

PO-3866

PET/CT measures of inter-tumor heterogeneity for predicting platinum resistance of high-grade serous ovarian cancer

Beibei Li¹, Dianning He², Xin Zhang¹, Zhihui Chang¹, Zhaoyu Liu¹

1. Shengjing Hospital of China Medical University

2. Northeastern University

Objectives: Platinum resistance is one of key reasons for poor prognosis of High-grade serous ovarian cancer (HGSOC). The purposes of this study were to establish quantitative inter-tumor heterogeneity indicators through PET/CT images, and build models to predict platinum resistance of HGSOC. Then preliminary explore the relationship between inter-tumor heterogeneity indicators and expression levels of prognosis related immunohistochemical markers p53 and Ki-67.

Methods: 292 patients diagnosed with HGSOC were retrospectively enrolled at our two affiliated hospitals. Quantitative indicators of inter-tumor heterogeneity were calculated through conventional measurements and Haralick texture features from PET/CT. Automatic Machine Learning method was used for model construction. Three predictive models (conventional model, heterogeneity model, and integrated model) were built. The model with the largest Area Under Curve (AUC) was considered as the optimal model. p53 and Ki-67 immunohistochemical staining were performed on the pathological samples of patients after surgery, and the images were scanned into whole slide images for artificial intelligence scoring. The correlation between the heterogeneity indicators and scores of p53 and Ki-67 were evaluated by Spearman's correlation coefficient (ρ).

Results: A total of 107 inter-tumor heterogeneity indicators were extracted from conventional measurements and Haralick texture features. The optimal model for three predictive models were all from Gradient Boosting Machine algorithm. The AUC of validation set for conventional model, heterogeneity model, and integrated model were 0.871, 0.909 and 0.967, respectively. The area under the PRC were 0.798, 0.864 and 0.953 respectively. The Spearman's correlation shown that HU_Kurtosis have strongest correlation with the score of p53 ($\rho = 0.743$, $p < 0.001$), and cluster site entropy (cSE) have strongest correlation with the score of Ki-67 ($\rho = 0.752$, $p < 0.001$).

Conclusions: Adding quantitative inter-tumor heterogeneity indicators derived from PET/CT images can improve the performance for predicting platinum resistance of HGSOC patients. And inter-tumor heterogeneity indicators were related to the scores of p53 and Ki-67.

PO-3867

Synthesized 7T SWI from 3T SWI Using conditional based Diffusion Denoising Probability Model: A Initial Study

Sui Li¹, Weiqi Li², Zhiming Zhen¹, Kang Chen¹, Peiyu Huang³, Tao Tan², Chen Liu¹, Wei Chen¹

1. The Southwest Hospital of Army Medical University

2. Macao Polytechnic University

3. The Second Affiliated Hospital Zhejiang University School of Medicine

Background: Ultra-high field 7T MRI scanner provides images with higher spatial resolution, and it has been established as an important research and clinical tool for brain imaging. Nevertheless, 7T MRI scanners are still more expensive and less common in hospitals and clinical facilities.

Purpose: To assess the image quality and clinical applicability of synthetic 7T SWI images generated from conditional based diffusion denoising probability model.

Materials and Methods: A conditional diffusion denoising probability model (cDDPM) was presented to synthesize the 7T SWI images from 3T SWI images. Specifically, this cDDPM contains three modules (condition embedding module, diffusion module, and residual map refine module) to ensure the consistency of vital information during the learning. Meanwhile, the paired 3T and 7T SWI images were randomly divided into training dataset and test dataset for validation of the presented model. And to evaluate the presented model, we compared with the popular pixel2pixel generation model. Image quality was assessed qualitatively by giving visualization of two radiologists and quantitatively by measuring peak signal-noise ratio and structure similarity index measure.

Results: In total, 47 participants (average age 27.510.9 years) were enrolled. The synthetic 7T SWI images generated by the presented cDDPM achieve significantly improvement on spatial resolution, especially in deep medullary veins, compared with 3T SWI images. And the quantitative measurement indicates that the presented cDDPM can obtain higher PSNR and SSIM than the compared pixel2pixel model, and the qualitative measurement shows that the synthetic 7T images have no significant difference with the acquired 7T images ($P>0.932$).

Conclusion: The synthetic 7T images achieved high image quality and good tissue contrast, potentially providing an alternative way to achieve the advantages of ultra-high field 7T MRI in clinical brain imaging.

PO-3868

Radiomic signatures associated with tumor immune heterogeneity predict survival in locally recurrent nasopharyngeal carcinoma

DA-FENG LIN, XIAO-YUN LI
Sun Yat-sen University Cancer Center

Background: The prognostic value of traditional clinical indicators for locally recurrent nasopharyngeal carcinoma (lrNPC) is limited due to their inability to reflect intratumor heterogeneity. We aimed to develop a radiomic signature to reveal tumor immune heterogeneity and predict survival in lrNPC.

Methods: This multicenter, retrospective study included 921 patients with lrNPC. A machine learning signature and nomogram based on pretreatment MRI features for predicting overall survival (OS) were developed in a training cohort and validated in two independent cohorts. A clinical nomogram and an integrated nomogram were also constructed for comparison. Nomogram performance was evaluated by concordance index (C-index) and receiver operating characteristic curve analysis. Accordingly, patients were classified into risk groups. The biological characteristics and immune infiltration of the signature were explored by RNA sequencing (RNA-seq) analysis.

Results: A machine learning nomogram based on the radiomic signature achieved a C-index of 0.729 (95% CI: 0.695-0.762), 0.718 (95% CI: 0.668-0.768), and 0.731 (95% CI: 0.680-0.783) in the training, internal, and external validation cohorts, respectively, which outperformed the clinical and the integrated nomograms. The proposed signature could effectively distinguish patients between risk groups that had significantly different OS rates. Subgroup analysis showed low-risk patients could benefit from surgery and re-irradiation. Further RNA-seq analysis revealed the differences of interferon response and lymphocyte infiltration between risk groups.

Conclusions: An MRI-based radiomic signature predicted OS more accurately. The proposed signature associated with tumor immune heterogeneity may serve as a valuable tool to facilitate prognostic stratification and guide individualized management of lNPC patients.

PO-3869

Value of 2D and 3D CT radiomics models based on machine learning in predicting thymoma with different risk stratification

Zhuren Luo¹, Zhen Yang², Jianjun Zhou¹

1. Zhongshan Hospital (Xiamen), Fudan University

2. Xiamen Maternal and Child Health Center

Purpose: To evaluate the differential diagnostic efficacy of 2D and 3D CT radiomics models based on machine learning for different risk stratification of thymoma, and to compare the differences in predictive efficacy between the two methods, and to find out the best machine learning classifier for this study.

Methods and Materials: From May 2015 to February 2022, 171 patients with thymic epithelial tumors confirmed by surgery and pathology who underwent chest enhanced CT examination were retrospectively analyzed. According to the pathological results, they were divided into low-risk group and high-risk group. All samples were divided into training set and test set with a ratio of 7:3. The training set consisted of 119 cases and the test set consisted of 52 cases. The arterial phase images of each patient's chest enhanced CT were imported into ITK-SNAP software, ROI and VOI were delineated, and the features were initially extracted. Thus, the optimal feature set is obtained. Three machine learning classifiers (support vector machine, Logistic regression, k-proximity) were used for feature training, and 2D and 3D radiomics models were constructed respectively. The area under the curve (AUC) was used to evaluate the predictive performance of the model constructed by the three classifiers, and the best classifier was selected. The Hosmer-Lemeshow test was used to test the fit of the model, and the calibration curve was used to visualize the results. Decision curve analysis (DCA) was used to test the clinical usefulness of the best classifier.

Results: 17 and 12 features were selected for the construction of 2D and 3D prediction models. The results showed that the prediction performance of the three models in different risk stratification of thymoma was good, and the prediction performance of the 3D model was better than that of the 2D model, and there was a significant difference between them.

Conclusions: 1. In terms of predicting different risk stratification of thymoma, the diagnostic performance and clinical practicability of 3D radiomics model are better than 2D radiomics model.

PO-3870

Non-contrast-enhanced MRI radiomics improves preoperative diagnostic performance for local staging in endometrial cancer

Ruqi Fang

Fujian Maternity and Children Health Hospital

Objectives To assess whether non-contrast multiparametric MRI radiomics-based machine learning method can improve preoperative local staging in endometrial cancer (EC) patients.

Methods Histologically proven EC patients who underwent preoperative MRI were analyzed retrospectively in this study between January 2015 and January 2023. Radiomics features extracted from non-contrast MR images were trained and tested to predict deep myometrial invasion (DMI) and cervical stromal invasion (CSI). Two radiologists assessed the presence of DMI and CSI by conventional MRI before and after referring to CE-T1WI images. A combined model incorporated radiomics signature and conventional MR was constructed and presented as nomogram. The performance of the predictive models were assessed by ROC analysis with AUCs and pairwise compared with DeLong's test.

Results In all, 198 women were enrolled: 138 at training set and 60 at test set. The conventional MRI without CE-T1WI achieved AUCs of 0.819, 0.757 for DMI and 0.795, 0.802 for CSI in training and test sets; The conventional MRI with CE-T1WI achieved AUCs of 0.837, 0.799 for DMI and 0.825, 0.858 for CSI; The nomogram yield AUCs of 0.916, 0.828 for DMI and 0.886, 0.902 for CSI. The nomogram demonstrated better diagnostic performance than non-contrast conventional MR to identify DMI and CSI in two sets (all $p < 0.05$); No significant differences were observed between the nomogram and conventional MR with CE-T1WI ($p > 0.05$), except for DMI in training set ($p = 0.004$).

Conclusions Non-contrast multiparametric MRI radiomics method improves preoperative local staging of endometrial cancer.

PO-3871

The difference of dynamic functional connectivity density in different severity of long-term smokers

Xiaoyu Niu, Yong Zhang, Jingliang Cheng

Department of MRI, First Affiliated Hospital of Zhengzhou University

Objective: To investigate the changes in dynamic functional connectivity density (dFCD) and its relationship with Fagerström test for nicotine dependence (FTND) scores in long-term smokers based on resting-state functional MRI (rs-fMRI).

Materials and methods: The clinical and imaging data of 176 subjects recruited through online platforms in the First Affiliated Hospital of Zhengzhou University were prospectively analyzed. The 176 subjects were divided into light smoking group (59 cases), heavy smoking group (61 cases) and control group (56 cases). All subjects underwent rs-fMRI scanning and dFCD was calculated. The dFCD values of three groups were analyzed by ANOVA analysis. Bonferroni correction was used for pairwise comparison. Pearson partial correlation analysis was used to analyze the correlation between dFCD values of brain regions with statistically significant differences and FTND scores.

Results: Differences in dFCD among light smoking group, heavy smoking group and control group were mainly distributed in the right orbitofrontal cortex (OFC), left caudate nucleus, right putamen, bilateral calcarine sulcus cortex, right cuneus, left parahippocampal gyrus, left precuneus, left

middle temporal gyrus (MTG) and bilateral thalamus (GRF corrected, $P_{\text{voxel}} < 0.005$, $P_{\text{cluster}} < 0.01$). Compared with the control group, both the light and heavy smoking groups showed decreased dFCD in the bilateral calcarine sulcus cortex, right cuneus and left precuneus, as well as increased dFCD in the right OFC, right putamen, left caudate nucleus and left thalamus (Bonferroni corrected, $P < 0.05$). Compared with the control group, the heavy smoking group showed increased dFCD in the right thalamus, and the light smoking group showed decreased dFCD in the left MTG (Bonferroni corrected, $P < 0.001$). Compared with the light smoking addiction group, the heavy smoking addiction group showed increased dFCD in the left MTG and right thalamus, and decreased dFCD in the left parahippocampal gyrus (Bonferroni corrected, $P < 0.05$). The mean value of dFCD in the right thalamus was positively correlated with FTND scores in smokers ($r = 0.227$, $P = 0.014$), and the mean value of dFCD in the right thalamus of the heavy smoking subgroup was positively correlated with FTND scores ($r = 0.323$, $P = 0.013$). There was no correlation between FTND scores and dFCD in the right thalamus of the light smoking group ($P > 0.05$).

Conclusion: There were common functional changes in brain regions related to reward processing and the visual attention network in different severity of smokers. Besides, heavy smokers had unique changes in dynamic brain coordination associated with smoking behavior, which may be related to the fact that heavy smokers have more difficulty quitting than light smokers.

PO-3872

Self-Supervised Learning Method for Brain Tumor Classification in Fewer Training Epochs

Weiding Zhou, Hongbo Zhao, Zhe Ren, Xiaofeng Tao
Shanghai Ninth People's Hospital, Shanghai Jiaotong University School of Medicine

Objective: This paper presents a self-supervised learning (SSL) method for brain tumor classification in MRI images. The primary objective is to develop an efficient, doctor-independent approach that requires no manual annotation and rapidly trains an effective feature extraction backbone in just 10 epochs. This model aims to assist medical professionals in the classification of brain tumors and can be iteratively trained on an increasing amount of data without additional labeling.

Methods: The dataset comprises 7,023 MRI images categorized into glioma, meningioma, no tumor, and pituitary classes. The training pipeline involves two main steps. First, random cropping is applied to obtain n fixed-sized image patches, followed by standard data augmentation techniques to create 20 augmented views per patch. This is done to ensure that representations of different augmentations of the same image are closer. Second, each augmented image patch is input into an encoder, consisting of a deep embedding network (ResNet-50) and a shallow projection network with two fully connected layers. The loss function includes Total Coding Rate (TCR) regularization to prevent representation collapse and minimize the distance between representations of augmentations of the same image.

Results: The trained model achieves an accuracy of 97.71% on the test set. Visualizations using Grad-CAM on the final CNN layer of the backbone reveal that the model activates regions consistent with the location of brain tumors. Features visualization based on t-SNE demonstrates that the model learns well-separated representations after 10 epochs, indicating fine-grained low-dimensional structures in the features.

Conclusion: In conclusion, this self-supervised learning approach for brain tumor classification in MRI images presents an effective and efficient solution that obviates the need for manual annotation and rapidly trains a robust feature extraction backbone. The model's high accuracy and its ability to localize tumors suggest its potential as a valuable tool for medical professionals. Moreover, its ability to adapt to larger datasets without additional labeling makes it a scalable and promising solution for real-world clinical applications.

PO-3873

Application value of 320-detector row CT coronary subtraction technique in patients with mild-moderate calcification score

Junren Wang, Yu Sun, Xiaogang Li, Benqiang Yang

Department of Radiology, General Hospital of the Northern Theater Command, PLA

[Objective] To explore the feasibility and diagnostic value of subtraction coronary computed tomography angiography (Sub-CCTA) with 320-detector row CT in patients with mild-moderate coronary calcification scores (Agatston score<400).[Methods] The clinical and imaging data of 77 patients with sub-CCTA scan and calcification score <400 were analyzed retrospectively. For conventional CCTA and subtraction CCTA images, a 4-point scale was used to subjectively evaluate the image quality, quantitatively evaluate the stenosis of each calcified segment, and record the time required to measure the stenosis of the calcified segment.[Results] A total of 111 calcified segments. For the two imaging methods of conventional CCTA and subtracted CCTA, the Kappa coefficient for evaluating the consistency of calcified segmental stenosis was 0.75; the average image quality was 3.0 (3.0-3.0) and 3.0 (3.0-4.0) points, the difference is statistically significant ($Z = -3.868, p < 0.01$); the time required to quantitatively measure the degree of calcification segment stenosis is $(90 \pm 13)s$ and $(67 \pm 10)s$, and the difference is statistically significant ($t = 0.642, p < 0.01$).[Conclusion] Compared with conventional CCTA, subtraction CCTA can improve the imaging quality and reduce the time required to quantitatively measure the degree of calcified segmental stenosis; the two imaging methods have good consistency in evaluating the degree of coronary artery stenosis in patients with mild to moderate calcification score.

PO-3874

Multimodal deep learning network for the discrimination of benign and malignant pulmonary ground glass nodules

Gang Liu, Fei Liu, Xu Mao, Xiaoting Xie, Jingyao Sang, Husai Ma, Haiyun Yang, Hui He

Qinghai Red Cross Hospital

Background: To establish a multimodal deep learning network model to enhance the diagnosis of benign and malignant pulmonary ground glass nodules (GGNs).Methods: Retrospective data on pulmonary GGNs were collected from multiple centers across China, including North, Northeast, Northwest, South, and Southwest China. The data were divided into a training set and a test set in an 8:2 ratio. In addition, a GGN dataset was also obtained from our hospital database and used as the validation set. All patients underwent chest computed tomography (CT), and the final diagnosis of the nodules was based on postoperative pathological reports. The ResNet network was used to extract imaging data, the Word2Vec method for semantic information extraction, and the Self Attention method for combining imaging features and patient data to construct a multimodal classification model. Then, the diagnostic efficiency of the proposed multimodal model was compared with that of existing ResNet and VGG models and radiologists.Results: The multicenter dataset comprised 1020 GGNs, including 265 benign and 755 malignant nodules, and the validation dataset comprised 204 GGNs, with 67 benign and 137 malignant nodules. In the test set, the proposed multimodal model achieved an accuracy of 90.2% (184/204 GGNs) and a sensitivity of 96.6% (197/204 GGNs), which surpassed that of the VGG (73.1% and 76.7%) and ResNet (78.0% and 83.3%) models in diagnosing benign and malignant nodules. In the validation set, the multimodal model accurately diagnosed 125 (91.18%) malignant nodules, outperforming radiologists (80.37% accuracy). Moreover, the multimodal model correctly identified 54 (accuracy, 80.70%) benign nodules, compared to radiologists' accuracy of 85.47%. The consistency test comparing radiologists' diagnostic results with the multimodal model's results in relation

to postoperative pathology showed strong agreement, with the multimodal model demonstrating closer alignment with gold standard pathological findings ($\text{Kappa}=0.720$, $P<0.01$). Conclusion: The multimodal deep learning network model exhibited promising diagnostic effectiveness in distinguishing benign and malignant GGNs and holds potential as a reference tool to assist radiologists in improving the diagnostic accuracy of GGNs and potentially enhancing radiologists' work efficiency in clinical settings.

PO-3875

Three distinct subtypes of multiple system atrophy revealed by connectivity features through consensus clustering analysis

Huize Pang, Guoguang Fan
the first affiliated hospital of china medical university

Objective:

Heterogeneity of multiple system atrophy (MSA) is challenge for precision diagnosis and treatment. White matter microstructure integrity alterations have been shown in many neurodegenerative diseases. We aimed to identify objective neuro-microstructural subtypes of MSA by adopting consensus clustering analysis based on white matter connectivity.

Methods:

122 MSA patients and 116 healthy controls (HCs) were enrolled. White matter connectivity was constructed and connections presented higher interindividual variability between MSA and HCs were included as features. Consensus clustering analysis, which identify an appropriate number of clusters through hierarchical clustering iteratively, was performed to identify the distinct subtypes of MSA patients. Gray matter volume, white matter integrity, functional and microstructural connectivity detected by multimodal MR images were further investigated among identified subtypes.

Results: Consensus clustering analysis identified three distinct subtypes of MSA presenting shared and distinct brain disruptions both in function and structure. Specifically, temporal gyrus, subcortical regions, cerebellum, and middle cerebellar peduncle is the shared impaired brain regions in each subtype patient. Subtype 1 exhibited widespread brain structural and functional alterations in cortical and subcortical regions, extending from frontal, parietal, temporal, subcortical regions to the cerebellum. Subtype 2 demonstrated moderate brain abnormalities, including bilateral subcortical regions, inferior temporal gyrus, parietal gyrus and the cerebellum. While, subtype 3 manifested mild brain alteration, mainly restricted to the shared impaired brain regions. In addition, subtype 1 showed significant higher score in UMSARS, MoCA, and HDR-24 in relative to subtype 2 and 3 patients ($P<0.01$).

Conclusion:

We identified three neuro-microstructural subtypes of MSA patients, which manifested shared and distinct brain abnormalities and clinical manifestations. The investigation of MSA subtypes can facilitate strategies for clinical stratification and precision diagnostics.

PO-3876

MRI-based Vascular Permeability and Cell Density-Related Habitats for Distinguishing IDH Mutation Status in Glioma

Wanyi Zheng¹, Ping Liu², Guihua Jiang²

1. The Affiliated Guangdong Second Provincial General Hospital of Jinan University

2. Guangdong Second Provincial General hospital

Purpose: Gliomas possess complex and heterogeneous vascular permeability and cell density, which are associated with IDH mutation status. Therefore, this study aims to predict IDH mutation status by MRI habitat analysis through T1-weighted contrast-enhanced images (T1CE) and Diffusion-weighted image (DWI), which reflect vascular permeability and cell density.

Methods: Retrospective analysis included 165 patients from 3 hospitals with pathological diagnosis of gliomas (training cohort=109, External validation cohort=56), they all underwent T1-weighted contrast-enhanced images (T1CE) and Diffusion-weighted image (DWI) preoperatively. The signal intensities of the glioma region from T1CE and Apparent dispersion coefficient (ADC) maps were pooled together from each patient as a global matrix. Then, K-means clustering was applied, which could segment glioma into four habitats (subregions), and the sensitive habitat was further identified as well as radiomics features were extracted from whole tumor and habitats, respectively. Feature selection was performed by a two-sample t-test, Pearson correlation analysis, maximum relevance minimum redundancy (mRMR), and the least absolute shrinkage and selection operator (LASSO). Logistic regression classifiers were utilized to construct predictive models of IDH mutation states.

Results: The gliomas were segmented into 4 habitats according to the elbow method, and they are habitat 1 damaged vascular and cellular habitat, habitat 2 normal vascular and hypocellular habitat, habitat 3 normal vascular and cellular habitat, and habitat 4 damaged vascular and hypocellular habitat. Habitat 4 was determined as the sensitive habitat. There were four prediction models to be constructed using 15 features: Model-whole tumor, Model-four habitats, Model-whole tumor + four habitats, and Model-sensitive habitat, respectively. The Model--sensitive habitat has shown the best predictive performance and robustness, with the area under the curve of 0.868 (95% CI: 0.784-0.953) in the train cohort and 0.817 (95% CI: 0.676-0.958) in the external validation cohort.

Conclusion: Habitat analysis has the potential to capture more imaging information, with damaged vascular and hypocellular habitat is a useful predictor of IDH mutation status in glioma.

PO-3877

Altered Cortical Morphological and Functional Topological Properties in Patients with NMOSD: an Individual-Based Brain Network Study

Fuqing Zhou, Haotian Ma, Yanyan Zhu

The First Affiliated Hospital, Nanchang University

Objectives

To assess the alteration of individual network topological properties and their clinical significance in patients with neuromyelitis optica spectrum disorder (NMOSD).

Materials and Methods

Eighteen patients with NMOSD and twenty-two healthy controls (HCs) were included. The clinical assessment for NMOSD patients involved evaluations of disability status, cognitive function, and fatigue impact. Brain images were obtained for each participant, including high resolution T1-weighted images for individual morphological brain networks (MBNs) and resting-state functional MRI for individual functional brain networks (FBNs). The topological properties were calculated and

compared for both MBNs and FBNs. Then, partial correlation analysis was performed to investigate the relationships between the altered network properties and clinical variables.

Results

The average Expanded Disability Status Scale score of NMOSD patients was 1.05, indicating a stage of mild disability. Compared to HCs, NMOSD patients exhibited a higher normalized characteristic path length (λ) in their MBNs ($p = 0.0118$), but no significant differences were found in the global properties of FBNs ($p: 0.405-0.488$). Network-based statistical analysis revealed that MBNs had more significantly altered morphological connections than FBNs ($p < 0.05$). Nodal properties of both MBNs and FBNs in NMOSD were correlated with disease duration or cognitive impairments ($p < 0.05/6$ with Bonferroni correction).

Conclusions

The results indicated that NMOSD patients with mild disabilities show compensatory increases in local network properties to maintain overall stability. Furthermore, individual brain morphological networks reveal more alterations in NMOSD patients and exhibit stronger correlations with clinical assessments than functional networks.

PO-3878

Deep learning–based on multiphase computed tomography images for the preoperative prediction of HER2 expression in gastric cancer

Xiaopei Chen
Guangzhou Red Cross Hospital

Abstract

Objective: To develop and validate a deep learning (DL) model based on multiphase CT for the preoperative prediction of HER2 expression in gastric cancer.

Materials and methods: The clinical data on gastric cancer patients were collected retrospectively included in three hospitals, and 502 patients were chosen for this study (376 training and 126 validation). The preoperative contrast-enhanced CT images Radiomic features were extracted and selected from the arterial phase (AP), venous phase (VP), delayed phase (DP) CT, and integration of multiphase (MP) enhance images of each patient used to building four deep learning (DL) models, respectively. The diagnostic performance was evaluated using the internal validation and additional external validation datasets. And statistically analyze the performance of four DL models

Results: The radiomic features from AP($n=3$), VP($n=3$), DP($n=3$), and MP($n=4$) CT images were used for model development. The prediction model that integrate multiphase enhance images demonstrated good discriminative performance for HER2 status prediction, with an area under the curve (AUC) of 0.999 (95% confidence interval(CI) : 0.999-0.999) 、 0.895 (95% CI: 0.894-0.896)、 0.783 [95% CI: 0.782- 0.786] for the training、 validation and test datasets, respectively.

Conclusion: The integrating multiphase CT-based deep learning model showed favourable performance in predicting HER2 status in patients with gastric cancer before surgery, which may benefit clinical practice and facilitates individualized treatment planning.

PO-3879

Noncontrast Computed Tomography-based Radiomics Analysis as Predictors of Revised Hematoma Expansion in Spontaneous Intracerebral Hemorrhage

Zhiqing Shao
Zhejiang Cancer Hospital

Objectives: To explore the diagnostic value of noncontrast computed tomography (NCCT) models based on multivariable, radiomics features and machine learning (ML) algorithms in predicting revised hematoma expansion (RHE) in patients with spontaneous intracerebral hemorrhage (ICH). **Materials and Methods:** We retrospectively reviewed 316 patients with ICH who underwent initial NCCT within 12 hours of ictus and follow-up CT within 72 hours after initial NCCT, between April 2018 and August 2020. The ICH and intraventricular hemorrhage (IVH) volumes were measured using a semiautomated, computer-assisted technique, and revised definitions of hematoma expansion incorporating intraventricular hemorrhage expansion to the conventional definition of “ ≥ 6 mL or $\geq 33\%$.” The clinical characteristics, imaging signs, and radiomics features extracted from the initial NCCT images were used to construct models to predict RHE. The radiomics and combined models were constructed in the training cohort ($n = 221$) and independently verified in the test cohort ($n = 95$). Prediction performance was evaluated by ROC analysis and AUC.

Results: Of 316 patients, 115(36.4%) experienced RHE. Multivariate analyses revealed nine statistically significant factors associated with RHE. The AUCs of the radiomics model for predicting early RHE using the Gaussian Process (GP) algorithm in the training and test cohorts were 0.875 and 0.862, respectively. The AUCs of the combined model in the training and test cohorts were 0.928 and 0.887, respectively.

Conclusion: NCCT models based on multivariable, radiomics features, and ML algorithm presented good performance in predicting RHE. The combined model was the best recommended to identify ICH patients at risk of early RHE.

PO-3880

Skull fracture detection of CT images based on an improved YOLOv5 method

Yuhui Wang
Union Hospital of Tongji Medical College, Huazhong University of Science and Technology

Objective: Medical imaging detection technology can improve the efficiency and accuracy of doctors’ diagnosis, it has been widely used in medicine. Recently, object detection methods based on deep learning have achieved remarkable detection results in medical imaging detection. However, when these methods are specially applied to skull fracture detection, it is difficult to satisfy the requirements and there are still many missed detection and misdetection problems. In order to solve above problems, an improved YOLOv5 method was proposed in this study to detect skull fracture in the computed tomography (CT) images of the skull.

Methods: The version of YOLOv5 used in this study is YOLOv5s. Compared with other versions of YOLOv5, YOLOv5s has fewer parameters and is faster. Skull fracture detection is essentially tiny object detection. In the proposed approach, external attention and 3D feature fusion methods are introduced into YOLOv5s. Based on the characteristics of CT images of skull fracture, a new data augmentation method was also proposed that combines multiple CT images according to the channels to generate multi-channel images.

In the dataset, 17300 skull fracture CT images were used as the training set and 1922 skull fracture CT images were used as the test set. The ratio of the number of training sets to the number of test

sets is 9 : 1. The original size of each image is 512X512. First, traditional data enhancement methods (random flipped, HSV color space enhancement, random affine etc.) were used to preprocess each image. And then, the data enhancement method proposed in the study was used to process the dataset to generate the final dataset. After data augmentation, the size of each image becomes 640 X 640 and then these images are used as the input to our network. Each experiment is trained for 300 epochs. The training batch size for all datasets is set as 16. A back-propagation algorithm with SGD stochastic optimization method is used to train the network through time with the learning rate of 0.01. We use the Pytorch framework to train on a Nvidia GTX 2080ti GPU.

Results : Our method was compared with the state-of-the-art two-stage and one-stage object detection methods, namely, FPN, Cascade R-CNN, Sparse R-CNN, RetinaNet, YOLOv5 and SSD. The performance of all methods is measured by mean average precision (mAP) on the test set. Our method achieves a mAP of 88.08% and it outperforms all other methods. Compared with one-stage methods YOLOv5, RetinaNet and SSD, our method gives the relative improvements of 1.8%, 19.98%, 29.28%. Compared with two-stage methods FPN, Sparse R-CNN and Cascade R-CNN, our method gives the relative improvements of 1.8%, 19.98%, 11.08%.

Conclusions: In this study, three methods were proposed to improve the detection accuracy of the YOLOv5 model for skull fracture detection. While adding a small number of parameters, we have a better detection effect. This algorithm merges multiple gray-scale images into one 3-channel image, which increases the diversity of samples. On the skull fracture image dataset, the experimental results show that the proposed method has obvious advantages over other state-of-the-art methods in the skull fracture detection tasks. In future work, further study of the 3D object detection of skull fracture may be needed to achieve more accurate detection results.

PO-3881

Artificial Intelligence Assisted Identification of Severe Patients with Coronavirus Disease 2019 Based on Quantitative Computed Tomography Parameters

Tingting Fan, huijie jiang

The second Affiliated Hospital of Harbin Medical University

OBJECTIVE: This study aims to identify the severe cases of patients with coronavirus disease 2019 (COVID-19) by the feasibility of artificial intelligence-assisted quantitative computed tomography (CT) features.

METHODS: According to the inclusion and exclusion criteria, 79 adult patients with laboratory-confirmed COVID-19 in Heilongjiang province, northeast China, were included and analyzed in this study. All patients underwent chest computed tomography (CT) scans and then the quantitative characteristics of pneumonia lesions, including percentage of the lung lesion volume (PLV), consolidation volume (PCV), and ground glass lesion volume (PGV), were automatically computed by an artificial intelligence (AI) platform (Dr. Wise). According to the guidelines of Chinese diagnosis and treatment protocols for COVID-19 (version 8), patients were categorized into a non-severe and severe group. Patients' baseline data (including clinical and laboratory data, CT quantification characteristics of the lesion) were collected. The two groups' baseline characteristics and CT quantitative characteristics (PCV, PLV, and PGV) were compared. Univariate and multivariate logistic regression analyses selected the characteristics that can identify patients with severe COVID-19.

RESULTS: 79 patients with COVID-19 on admission were included and divided into a non-severe group (n=28) and a severe group (n=51). Age, leukocyte count, neutrophil count, lymphocyte count, percentage of the lung lesion volume (PLV), and percentage of consolidation volume (PCV) were significantly correlated with severe events identified using univariate logistic regression. Further multivariate logistic regression demonstrated a significant model in which PCV and age were the

independent risk factors with the odds ratios (ORs) of 1.172 and 1.116, respectively ($p < 0.004$). The average prediction accuracy (AUC) for training sets and validation set calculated by 5-fold cross-validation was 0.950 (95% CI 0.900 - 1.000) and 0.935 (95% CI 0.876 - 0.994), respectively. **CONCLUSIONS:** The PCV in AI-assisted quantitative CT characteristics and age at admission were the critical parameter to predict the severe illness of COVID-19 patients in Heilongjiang Province. At the same time, the cold and dry climate may also be an important factor that cannot be ignored. For patients with COVID-19 in a cold and dry environment, especially elderly patients, the larger the PCV, the easier it is to become severely ill. AI quantitative characteristics based on chest CT image analysis can predict accurately severe patients with COVID-19.

PO-3882

Intratumoral and peritumoral CT radiomics in predicting prognosis in patients with chondrosarcoma: a multicenter study

Qiyuan Li, Xiaoli Li, Guangjie Yang, Chuanping Gao, Pei Nie
The Affiliated Hospital of Qingdao University

Objective Currently, there are no relevant studies of chondrosarcoma (CS) in the intratumoral and peritumoral radiomics. The objective of this study is to evaluate the efficacy of the CT-based intratumoral, peritumoral, and combined radiomics signatures in predicting progression-free survival (PFS) of patients with CS, which is crucial for individualized management of CS patients and guiding clinical decision-making.

Methods In this multicenter study, patients diagnosed with CS between January 2009 and January 2022 were retrospectively screened, 214 patients with CS from two centers were enrolled and divided into a training cohort ($n=113$) and a validation cohort ($n=101$). The intratumoral and peritumoral radiomics features were extracted from CT images. The intratumoral, peritumoral, and combined radiomics signatures were constructed respectively, and their radiomics scores (Rad-score) were calculated. The performance of intratumoral, peritumoral, and combined radiomic signatures in PFS prediction in patients with CS was evaluated by C-index, time-dependent area under the receiver operating characteristics curve (time-AUC) and time-dependent C-index (time C-index).

Results 11, 7, and 16 features were used to construct the intratumoral, peritumoral, and combined radiomics signatures, respectively. The combined radiomics signature showed the best prediction ability in the training cohort (C-index, 0.835; 95%; confidence interval [CI], 0.764-0.905) and the test cohort (C-index, 0.800; 95%; CI, 0.681-0.920). Time-AUC and time C-index showed that the combined signature outperformed the intratumoral and peritumoral radiomics signatures in the prediction of PFS.

Conclusion The CT-based combined signature incorporating intratumoral and peritumoral radiomics features can serve as a novel imaging tool to predict the prognosis of patients with CS, which might assist clinicians in selecting individualized surveillance and treatment plans for CS patients.

PO-3883

Usefulness of texture features of mean apparent propagator-magnetic resonance imaging in distinguishing glioblastoma and solitary brain metastasis

Guohua Zhao¹,jie Dong²,jie Bai¹,xiaoyue Ma¹,Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. North China University of Water Resources and Electric Power

Introduction

Glioblastoma multiforme (GBM) and solitary brain metastasis (SBM) are the most commonly reported brain tumors in adults. Accurate preoperative differentiation between GBM and SBM is critical, given the significant differences in the clinically recommended treatment guidelines for the two entities. Routine MRI is the primary imaging modality used for diagnosing brain tumors. However, routine MRI is sometimes inadequate in differentiating GBM from SBM, due to their similar radiological appearances [1]. As an advanced diffusion imaging technique, mean apparent propagator (MAP)-MRI can visualize the degree of diffusional movement of water molecules in tissues, and is more likely to capture previously obscured inherent microstructural features of neuronal tissues[2]. Texture analysis is an assessment method that identifies changes in the signal intensities and neighboring positions of pixels and/or voxels. Thus, MRI-based texture analysis is a sensitive technique for quantifying heterogeneity in tissue composition, which is invisible to the human eye. Previous studies have shown that texture features in GBM and SBM are associated with heterogeneity of peri-enhancing edema, and the identification of these two entities can moderately benefit from the texture features of routine MRI[3]. The purpose of this study was to explore the usefulness of texture features of MAP-MRI in distinguishing GBM from SBM.

Materials and Methods

This retrospective study was approved by our Institutional Ethics Committee, which waived the requirement for informed consent. The study was conducted in accordance with the Declaration of Helsinki. Data from 254 patients diagnosed with cerebral GBM and SBM between November 2015 and June 2022 were collected, and finally data from 112 patients were included and analyzed. The inclusion and exclusion criteria are presented in Figure 1. All patients underwent diffusion weighted imaging (DWI) and routine MRI examinations using a 3T MR scanner (MAGNETOM Prisma; Siemens Healthcare, Erlangen, Germany) with a 64-channel head-neck coil. Seventy-nine patients were randomly selected as the training cohort, while the remaining twenty cases were used as the testing cohort.

DWI data were acquired using 6b values (0, 500, 1000, 1500, 2000, and 2500 s/mm²), and every nonzero b value was performed in 30 encoding directions. The MAP-MRI metric maps were estimated directly from DWI data using NeuDilab, a software developed in-house with Python, based on the free DIPY Toolbox (<https://www.dipy.org/>). Finally, MAP-MRI metric maps, including mean squared displacement (MSD), non-Gaussianity (NG), non-Gaussianity axis (NGAx), non-Gaussianity radius (NGRad), return-to-the-origin probability (RTOP), return-to-the-plane probability (RTPP), return-to-the-axis probability (RTAP), and Qspace inverse variance (QIV), were constructed.

The flow diagram of the study is shown in Figure 1. MAP-MRI metric maps were spatially registered to FLAIR images. Subsequently, the peri-enhancing edema region, as a region of interest (ROI), was manually segmented on the axial FLAIR image using the ITK-SNAP (<http://www.itksnap.org>) software. The key steps, such as feature extraction, feature selection, and model construction, were processed using the FAE software[4]. Based on tumor segmentation, we extracted 93 texture features from each ROI. Features defined by the FAE developer were as follows: 18 first-order statistical features, 75 second-order features from the gray-level co-occurrence matrix (GLCM), neighborhood gray-level difference matrix (NGLDM), gray-level run-length matrix (GLRLM), gray-level size zone matrix (GLSZM), and gray-level zone length matrix (GLZLM).

Three feature selection methods and two classifiers were utilized to construct texture feature prediction models on individual maps from MAP-MRI metric maps. Simultaneously, a combined MAP-MRI model was constructed using the candidate features of each metric map. Fivefold cross-validation was used to demonstrate the model performance, which was evaluated using the receiver operating characteristic (ROC) curve, accuracy, area under the ROC curve (AUC), sensitivity, and specificity in the testing cohort.

Results

Detailed clinical characteristics of the patients are summarized in Table 1. No significant difference was found between the two groups in terms of sex ($P = 0.884$) and age ($P = 0.853$).

Figure 2 and Table 2 depict the performance of the eight MAP-MRI metric map models and the combined model. The RTAP model achieved the best discriminative power (accuracy:84.85%, AUC:0.92, sensitivity:70.59%, and specificity:100.00%) for the single metric model, and performed similarly to the MAP-MRI combined model (accuracy:87.88%, AUC:0.92, sensitivity:82.35%, and specificity:93.75%).

Figure 3 shows the candidate features used to build various texture analytic models. In combined model, two second-order features of RTOP and skewness features of RTPP, NGRad, and MSD played crucial roles in discriminating GBM from SBM, whereas the discriminative model benefitted from the combination of two first-order statistical features and three second-order features of RTAP.

Discussion

Previous studies have shown that textural features are associated with heterogeneity of peri-enhancing edema regions in GBM and SBM[3]. This conclusion is also confirmed by our results. As an additional finding, texture features from MAP-MRI appeared to have better discriminative power compared to texture features from routine MRI[3]. MAP-MRI assesses the dispersion distribution of water molecules by measuring the probability density function of spin displacements in complex microstructures of brain tissue and accurately characterizes diffusion anisotropy by quantifying the non-Gaussian nature of the diffusion process[5,6]. Fortunately, texture analysis can easily extract the diffusion information, and use it to quantify tumor heterogeneity.

Conclusion

Texture analysis based on MAP-MRI has immense potential for discriminating GBM from SBM.

Neurite orientation dispersion and density imaging-based texture features in differentiating glioblastoma from solitary brain metastasis

Guohua Zhao¹, Jie Dong², Jie Bai¹, Xiaoyue Ma¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. North China University of Water Resources and Electric Power

Introduction

Glioblastoma multiforme (GBM) and solitary brain metastases (SBM) are the most common malignant brain tumors, and their identification is key to further diagnosis and treatment [1]. Magnetic resonance imaging (MRI) is the main tool for differentiating between the two types of tumors; however, both GBM and SBM may show marked peritumoral edema and similar contrast enhancement patterns on routine MRI, leading to great challenges in identification [2]. Previous reports have indicated that differential diagnosis of tumors could benefit from diffusion-weighted MRI techniques, as it can quantitatively assess the entire tumor microstructure with a relatively high spatial resolution and does not require contrast agents. For example, neurite orientation dispersion and density imaging (NODDI) is a multi-spherical shell diffusion model based on the differences in the diffusion of water molecules inside and outside the cell, which demonstrates the difference in water diffusion between tumor infiltration and vasogenic edema [3]. Texture analysis is a sensitive technique that allows for the subtle assessment of the gray-scale signal intensity distribution of pixels and/or voxels, which can be used in MRI to quantify lesion irregularity and heterogeneity in tissue composition [4]. This study aimed to explore the usefulness of NODDI texture features in distinguishing GBM from SBM.

Materials and Methods

This retrospective study was approved by our Institutional Ethics Committee, which waived the need for informed consent. This study was conducted in accordance with the principles of the Declaration of Helsinki. We reviewed 112 patients newly diagnosed with cerebral GBM and SBM between November 2015 and June 2022. The inclusion and exclusion criteria are shown in Figure 1. All patients underwent diffusion-weighted imaging (DWI) and routine MRI examinations using a 3T MR scanner (MAGNETOM Prisma; Siemens Healthcare, Erlangen, Germany) with a 64-channel head-neck coil. The training cohort consisted of 79 randomly chosen participants, whereas the testing cohort consisted of remaining 20 patients.

DWI data were collected using 6b values (0, 500, 1000, 1500, 2000, and 2500 s/mm²), and each non-zero b value was encoded in 30 directions. NODDI metric maps were estimated directly from DWI data using NeuDilab, an in-house developed software program using Python based on the free DIPY toolbox, software (<https://www.dipy.org/>). Finally, NODDI metric maps, including the intracellular volume fraction (ICVF), orientation dispersion index (ODI), and isotropic volume fraction (ISOVF) were constructed.

The flow diagram of this study is shown in Figure 1. The NODDI metric maps were spatially registered to FLAIR images. Subsequently, the peri-enhancing edema region, as a region of interest (ROI), was manually segmented on axial FLAIR images using ITK-SNAP (<http://www.itksnap.org>) software. The main steps, such as feature extraction, feature selection, and model building, were handled by FAE software [5]. Using the gray-level co-occurrence matrix (GLCM) and gray-level run-length matrix (GLRLM) functions from the Pyradiomics package, 24 and 16 quantitative features were extracted. In addition, 18 first-order statistical features were extracted for texture analysis. Finally, a total of 58 features were extracted for subsequent analysis. Three feature selection methods and two classifiers were used to construct texture feature prediction models on individual maps from the NODDI metric maps. Simultaneously, a combined NODDI model was built using candidate features from each metric map. Five-fold cross-validation was used to demonstrate model performance, and the performance of the testing cohort was

evaluated using the receiver operating characteristic (ROC) curve, accuracy, area under the ROC curve (AUC), sensitivity, and specificity.

Results

Detailed clinical characteristics of the patients are presented in Table 1. No significant differences were found between the two groups in terms of sex ($P = 0.884$) or age ($P = 0.853$).

Figure 2 and Table 2 show the performance of the three NODDI metric map models and the combined model. Three NODDI metric map models derived from the peri-enhancing edema region had moderate values for differentiating GBM from SBM. The combined NODDI model achieved the best discriminative power (accuracy, 71.72%; AUC, 0.87; sensitivity, 70.59%; specificity, 93.75%). Table 3 lists the candidate features used to build the various texture analysis models. In the combined model, the two GLRLM features of ICVF and skewness features of ICVF, ISOVF, and ODI played crucial roles in discriminating GBM from SBM. ICVF_GLRLM_LongRunEmphasis and ICVF_GLRLM_RunVariance represent the roughness of the image texture in the ROI, and Skewness is a numerical feature of the asymmetric degree of statistical data distribution, which characterizes the distribution of image signal intensity.

Discussion

Previous studies have concluded that textural features are associated with the heterogeneity of peri-enhancing edema regions in GBM and SBM [6]. This conclusion is further confirmed by our results. In our study, the combined MAP-MRI performed better than the single-metric map model. Compared to the findings of similar previously published studies, textural features of NODDI appear to have better discriminative power for texture features of routine MRI [6]. Recent studies report that NODDI can identify more diverse tissue components within tumors, and that cell density may play an important role [3]. Texture analysis can easily extract diffusion information and can be used to quantify tumor heterogeneity. This low-cost solution will promote differential diagnosis of GBM and SBM in clinical practice.

Conclusion

Texture analysis based on NODDI has immense potential for discriminating GBM from SBM.

Radiomics Analysis Based on Dynamic Contrast-Enhanced MRI for Prediction of the Postoperative Prognosis in Hepatocellular Carcinoma

Runying Zhu

The First Affiliated Hospital of Kunming Medical University

Objective To establish a radiomics nomogram based on dynamic contrast-enhanced (DCE) MR images to explore the comprehensive application value of the prediction model for recurrence and early outcome after surgical resection of Hepatocellular Carcinoma (HCC).

Methods In total, 285 patients with pathologically confirmed HCC (training dataset: n=199; validation dataset: n=86) were enrolled. The volume of interest (VOI) was segmented manually by 3D Slicer software on the multiple sequences of DCE_MRI. Radiomics features were extracted from the VOI by Pyradiomics. Pearson Correlation Analysis, least absolute shrinkage and selection coefficients regression were used to filter out the significant features. A predictive model and radiomics nomogram were developed based on multivariate logistic regression and the Shapley Additive exPlanations algorithm with clinico-radiological features. The diagnostic performance and clinical application value of the clinico-radiological model were measured by receiver-operating characteristic, calibration curve, and decision curve analyses. Accuracy, precision, recall, F1 value were calculated by confusion matrix.

Results The AUC values of radiomics model and clinical model were 0.76 and 0.67 with an accuracy of 0.74, sensitivity of 0.63, specificity of 0.82, and Jorden index of 0.45. The clinico-radiological model showed favorable calibration and discrimination performance with an AUC value of 0.79 in training cohort and 0.87 and 0.76 in validation cohort which was higher than that of the clinical model and radiomics model. The calibration curve and decision curve of the nomogram were well fitted.

Conclusion The clinico-radiological fusion model based on multiparametric DCE_MRI provides an important decision-making basis for clinical preoperative evaluation and may be an important guideline for the selection of clinical treatment strategies.

PO-3886

An automated detection method for Hyperdense Middle Cerebral Artery Sign of acute ischemic stroke in non-contrast computed tomography

Wanshu Zhang¹, Dehan Liu¹, Song Tian², Guofeng Zhou¹

1. Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Philips Healthcare, Beijing, China

Purpose: To develop a highly sensitive deep learning-based algorithm that assists in the detection of hyperdense middle cerebral artery sign(HMCAS) of acute ischemic stroke(AIS) on non-contrast computed tomography(NCCT).

Methods: Head NCCT images with HMCAS performed within 6 hours of AIS symptoms onset were retrospectively and consecutively retrieved from two hospital databases acquired across four different scanners between January 2009 and May 2023. The data were divided into training and test sets. A deep learning-based algorithm was constructed and evaluated using receiver operating characteristic (ROC) curves, sensitivity, specificity, positive predictive value (PPV), and F1-score analysis on the test set and five subgroups, respectively.

Results: A total of 594 patients (61.89 years \pm 14.14;395 males) were included after exclusion of 19 patients with severe motion artifact.HMCAS was identified on NCCT in all patients.Of these,424 patients(61.64 years \pm 13.95;288 males) were assigned to the training set,and 340 patients(170HMCAS(+) with 170 HMCAS(-))(58.36 years \pm 16.76;177 males) were involved in the test set. The overall sensitivity, specificity, positive predictive value(PPV), f1-score of the proposed algorithm for detecting HMCAS was 99.4%(95%CI: 99.3,99.5),35.9%(95%CI: 35.5,36.3),60.6%(95%CI:60.3,60.9),0.752 (95%CI:0.750,0.754). The sensitivities for the MCA M1,M2,M3-4,ICA,A regions were 99.34%, 100%, 100%, 97.30% and 100%,respectively.Three new HMCAS(+) AIS had been overlooked in the initial reports were detected.The overall area under the curve (AUC) for identifying HMCAS was 0.930[95% CI:0.902–0.959],whereas those for MCA M1,M2,M3-4,ICA and A regions were 0.962,0.974,0.992,0.965,1.000,respectively.After excluding "ectopic" false positives,the overall AUC performance improved by 1%.

Conclusion: The proposed deep learning algorithm assisted radiologists in detecting HMCAS of AIS on NCCT images,leading to a higher detection rate across all subgroups and overall.

Multimodal data integration using machine learning to predict the risk of clear cell renal cancer metastasis: A retrospective multicentre study

Youchang Yang,Qingguo Ren,shuai guan,Jiang Qingjun,Xiangshui Meng
Qilu Hospital (Qingdao), Cheeloo College of Medicine, Shandong University, Shandong Province, China

Purpose: To develop and validate a predictive combined model for metastasis in patients with clear cell renal cell carcinoma (ccRCC) by integrating multimodal data.

Materials and Methods: In this retrospective study, the clinical and imaging data (CT and ultrasound) of patients with ccRCC confirmed by pathology from three tertiary hospitals in different regions were collected from January 2013 to January 2023. We developed three models, including a clinical model, a radiomics model, and a combined model. The performance of the model was determined based on its discriminative power and clinical utility. The evaluation indicators included AUC value, accuracy, sensitivity, specificity, negative predictive value, positive predictive value and DCA(Decision Curve Analysis) curve.

Results:A total of 251 patients were evaluated. Patients (n=166) from Shandong University Qilu Hospital (Jinan) were divided into the training cohort, of which 50 patients developed metastases; patients (n=37) from Shandong University Qilu Hospital (Qingdao) were used as testing set 1, of which 15 patients developed metastases; patients (n=48) from Changzhou Second People's Hospital were used as testing set 2, of which 13 patients developed metastases. In the training set, the combined model showed the highest performance (area under the receiver operating characteristic curve [AUC], 0.924) in predicting lymph node metastasis, while the clinical and radiomics models both had AUCs of 0.875 and 0.870, respectively. In the testing set 1, the combined model had the highest performance (AUC, 0.877) for predicting lymph node metastasis, while the AUCs of the clinical and radiomics models were 0.726 and 0.836, respectively. In the testing set 2, the combined model had the highest performance (AUC, 0.849) for predicting lymph node metastasis, while the AUCs of the clinical and radiomics models were 0.708 and 0.804, respectively. The DCA curve showed that the combined model had a significant prediction probability in predicting the risk of lymph node metastasis in ccRCC patients compared with the clinical model or the radiomics model.

Conclusion: The combined model was superior to the clinical and radiomics models in predicting lymph node metastasis in ccRCC patients.

PO-3888

Dual-phase contrast-enhanced CT-based intratumoral and peritumoral radiomics for preoperative prediction of lymphovascular invasion in gastric cancer

Yunhui Zhou, Hong Pu, Hang Li

Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China

Purpose To develop and validate dual-phase contrast-enhanced computed tomography (CT) radiomics for the prediction of lymphovascular invasion (LVI) in patients with gastric cancer.

Materials and Methods Three hundred and eighty-three patients with gastric cancer (training cohort, 269 patients; validation cohort, 114 patients) were retrospectively enrolled between January 2017 and June 2023. Univariate and multivariate regression analysis was used to select the clinical risk factors and then construct a clinical model.

Radiomic features were extracted from the intratumoral volume (ITV) and peritumoral volume (PTV) on CT images at arterial phase (AP) and venous phase (VP). Seven radiomics signature scores (radscore) including ITV-AP radscore, ITV-VP radscore, PTV-AP radscore, PTV-VP radscore, ITV+PTV-AP radscore, ITV+PTV-VP radscore, and ITV+PTV-AP+VP radscore were obtained. The nomogram incorporating the most predictive radscore and clinical risk factors was developed and its diagnostic ability was evaluated using receiver operating characteristic curve (ROC) analysis.

Results The height, tumor differentiation and number of lymph node metastasis (LNM) were independent predictors for predicting LVI. The ITV+PTV-AP+VP radscore presented superior AUC of 0.884 [95 % confidence interval (CI): 0.843-0.925] in the training cohort and 0.899 [95%CI: 0.826-0.971] in the validation cohort. The nomogram consisted of ITV+PTV-AP+VP radscore, height, tumor differentiation and number of LNM showed excellent discrimination in the training and validation cohorts with AUCs of 0.931 (95% CI: 0.900-0.962) and 0.953 (95% CI: 0.919-0.988), respectively. Decision curve analysis proved that the net benefit of the nomogram was superior to that of the clinical and radiomics models throughout the majority of the threshold probabilities.

Conclusion The nomogram integrating clinical risk factors and intratumoral and peritumoral radiomics from dual-phase contrast-enhanced CT images provided favorable performance for prediction of LVI.

PO-3889

Medical-Inspired Deep Learning Algorithm for the Quantification of Epicardial Adipose Tissue

Xiao Lin¹, Kai Li², Zhi-Yuan Zhang¹, Min Wang¹, Xi-Long Mei¹, Bo Jiang¹, Ke-Xin Tang¹, Xiao-Bo Liao¹, Jun Liu¹

1. 中南大学湘雅二医院

2. 中国科学院数学与系统科学研究院

Purpose: Epicardial adipose tissue (EAT) volume play an important role in the development of coronary atherosclerosis, atrial fibrillation, heart failure, metabolic syndrome, and other cardiovascular diseases (CVDs). However, manual quantification of EAT volume is time consuming, requires specialized training, and easily lead to human error. Therefore, an accurate and fully automated algorithms for EAT quantification are urgently needed and desired as a diagnostic and evaluate index tool.

Method: 108 subjects ages at 50 to 80 year-old, who undergoing routine coronary computed tomography angiography (CCTA) scans in the Second Xiangya Hospital of Central South University from April 2022 to September 2022, were selected in our study. And their CCTA data were analyzed for EAT volume quantification. For a series of CT slices, the proposed algorithm uses a well-trained convolutional neural network (CNN) to predict the pericardium contained in each axial CT slice,

and then a medical-inspired post-processing method is applied to regularize the predicted pericardium, where the post-processing method is mainly based on the anatomical and surgical integrity and continuity of the pericardium. EAT segmentations are then obtained from the original axial CT slices and refined pericardium predictions by thresholding $[-190\text{HU}, -30\text{HU}]$.

Results: We divide the whole dataset into training dataset (50 objects, 2124 contrast CT slices), validation dataset (18 objects, 668 contrast CT slices) and the testing dataset (40 objects, 1710 contrast CT slices). We propose a medical-inspired deep learning algorithm for EAT quantification, which combines the data-driven method and specific medical knowledge. A strong level of agreement was observed between our algorithm and expert manual quantification, with a median Dice score coefficient (DSC) of 0.904 (interquartile range: 0.830-0.948). Additionally, excellent correlation of 0.979 is obtain for EAT volumes. Most importantly, extensive numerical experiments show that our algorithm has a satisfactory quantification capacity and good generalization ability.

Conclusion: The proposed algorithm represents a tool for rapid fully automated and accurately quantification of EAT and may improve cardiovascular risk stratification in patients with CCTA scan.

PO-3890

Preoperative prediction of the SSIGN score and outcome in clear cell renal cell carcinoma using a combination of CT radiomics and clinical features

Kaiyue Zhi, Shuo Zhang, He Zhu, Jingjing Chen, Pei Nie
The Affiliated Hospital of Qingdao University

Objective: The purpose of this study was to develop and validate a nomogram combining CT radiomics and clinical features for preoperative prediction of the Stage, Size, Grade, and Necrosis (SSIGN) score and outcome in clear cell renal cell carcinoma (ccRCC).

Methods: A retrospective multicenter analysis of 845 ccRCC patients (training cohort 592/ test cohort 253) was performed. Clinical model, radiomics signature (RS), and combined radiomics nomogram (RN) incorporating clinical and radiomics features were constructed to predict the SSIGN score. The area under the receiver operating characteristic curve (AUC) was used to evaluate the performance of each model. Decision curve analysis (DCA) was used to evaluate the net clinical benefit. The endpoint of the study was the recurrence-free survival (RFS). Kaplan-Meier survival analysis was used to assess the association between model-predicted SSIGN score and RFS.

Results: The RN outperformed the clinical model and RS in predicting SSIGN, with a higher AUC (0.93 and 0.92, respectively in the training cohort and test cohort). DCA demonstrated the RN outperformed the RS and the clinical model. In predicting RFS, RN achieved a higher Harrell's concordance index (C-index) (0.76 and 0.77, respectively in the training cohort and test cohort) than the RS and clinical models did.

Conclusion: The RN is a non-invasive biomarker in predicting the SSIGN score and outcome of ccRCC.

PO-3891

Deep learning-assisted automatic segmentation of the uterine corpus and fibroids on T2-weighted magnetic resonance images

Xinyu Liu¹, Zhilin Yuan¹, Li Mao², Xiuli Li², Jing Ren¹, Yuan Li³, Yonglan He¹, Huadan Xue¹, Zhengyu Jin¹

1. Peking Union Medical College Hospital, Peking Union Medical College and Chinese Academy of Medical Sciences

2. AI Lab, Deepwise Healthcare

3. Department of Obstetrics and Gynecology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College, National Clinical Research Center for Obstetric & Gynecologic Diseases

Purpose: Uterine fibroids are the most common gynecologic benign tumors and contribute to significant morbidity. MRI provides an accurate assessment of the number, location, and type of fibroids. However, the segmentation of uterus and uterine fibroids from MR images is difficult to achieve. We proposed a self configuring MR imaging segmentation method based on the nnU-Net deep learning network.

Methods and Materials: Two multi-plane (T2 sagittal and T2 axial images of the female pelvis MR images) datasets are used to validate the performance of the proposed uterus, endometrium, and uterine fibroids segmentation algorithm in this research. nnU-Net systematically addresses the configuration of entire segmentation pipelines and provides visualization and description of the most relevant design choices.

Results: The dataset enrolls 299 patients with 5mm slice thickness MR volumes. They are randomly divided into 159 for training, and 40 for testing. The Dice similarity coefficient (DSC) of the uterus, endometrium, and uterine fibroids are 0.929, 0.817, and 0.789 in T2 sagittal MR images using the nnU-Net deep learning network; the hausdorff 95 (95HD) of these three are 6.336, 4.911 and 9.996mm. The DSC of the uterus, endometrium, and uterine fibroids are 0.928, 0.765, 0.804 in T2 axial MR images, the 95HD are 6.825, 6.547, and 10.855mm.

Conclusions: We have proposed a self-configuring nnU-Net deep learning network method to segment uterus, endometrium, and uterine fibroids automatically.

PO-3892

Parsing altered gray matter morphology of depression using a framework integrating the normative model and non-negative matrix factorization

Shaoqiang Han, yong zhang, jingliang cheng

Department of Magnetic Resonance Imaging, the First Affiliated Hospital of Zhengzhou University, Henan Province, China

Aims. The high inter-individual heterogeneity in depression limits neuroimaging studies with case-control approaches to identify promising biomarkers for individualized clinical decision-making. In this study, we propose a novel framework integrating the normative model and non-negative matrix factorization (NMF) to quantitatively estimate heterogeneity in depression from a dimensional perspective. This framework initially inferred individualized differences in gray matter morphometry measured with voxel-based morphometry using a normative model and then parsed them into overlapping latent disease factors using NMF. Each patient with depression was assigned a unique factor composition, thus retaining inter-individual variability.

Methods. Two independent datasets were included in this study (discovery dataset: 105 first-episode untreated patients with depression and 130 matched healthy controls; validation dataset:

76 patients with depression and 68 matched HCs). T1-weighted magnetic resonance images from these two datasets were acquired and analyzed.

Results. Using this framework, we identified 4 robust latent disease factors with distinct clinical symptoms and cognitive processes. Factor compositions exhibited significant differences between adolescent- and adult-onset patients, capturing sources of clinical heterogeneity. In addition, the group-level morphological differences obtained with the two-sample t test could be quantitatively derived from the identified disease factors, reconciling the group- and subject-level differences in neuroimaging studies. All of these results can be reproduced in the validation dataset. Furthermore, our framework significantly predicted the factor composition of unseen patients in the independent validation dataset.

Conclusion. In conclusion, the framework provides a new approach to resolving neuroanatomical heterogeneity in depression and provides a basis for precision medicine.

PO-3893

Two distinct subtypes of obsessive compulsive disorder revealed by a framework integrating multimodal neuroimaging information

Shaoqiang Han, Ya Tian, Yong Zhang, Jingliang Cheng

Department of Magnetic Resonance Imaging, the First Affiliated Hospital of Zhengzhou University

Aims. Patients with obsessive compulsive disorder (OCD) exhibit tremendous heterogeneity in structural and functional neuroimaging aberrance. However, most previous studies just focus on group-level aberrance of a single modality ignoring heterogeneity and multimodal features. On that account, we aimed to uncover OCD subtypes integrating structural and functional neuroimaging features with the help of a multi-view learning method and examined multimodal aberrance for each subtype.

Methods. Ninety-nine first-episode untreated patients with OCD and 104 matched healthy controls (HCs) undergoing structural and functional MRI were included in this study. Voxel based morphometric and amplitude of low-frequency fluctuation (ALFF) were adopted to assess gray matter volumes (GMVs) and the spontaneous neuronal fluctuations respectively. Structural/functional distance network was obtained by calculating Euclidean distance between pairs of regional GMVs/ALFF values across patients. Similarity network fusion, one of multi-view learning methods capturing shared and complementary information from multimodal data sources, was used to fuse multimodal distance networks into one fused network. Then spectral clustering was adopted to categorize patients into subtypes.

Results. As a result, two robust subtypes were identified. These two subtypes presented opposite GMV aberrance and distinct ALFF aberrance compared with HCs while shared indistinguishable clinical and demographic features. In addition, these two subtypes exhibited opposite structure-function difference correlation reflecting distinct adaptive modifications between multimodal aberrance.

Conclusion. Altogether, these results uncover two objective subtypes with distinct multimodal aberrance and provide a new insight into taxonomy of OCD.

PO-3894

Prediction of Prognosis of Invasive Breast Carcinoma in Women Based on Ferroptosis-related LncRNA

Chen Gao,Linyu Wu,Ning Kong,Lingnan Guo,Jiangnan Lin,Changyu Zhou,Hong Zhao,Shiwei Wang,Maosheng Xu

The First Affiliated Hospital of Zhejiang Chinese Medical University(Zhejiang Provincial Hospital of Chinese Medicine)

Background and purpose: To determine the prognostic value of ferroptosis-related Long non-coding RNAs (lncRNAs) in women diagnosed with invasive breast carcinoma (BRCA).

Methods: Transcriptome data and clinical data of patients with BRCA were obtained from The Cancer Genome Atlas (TCGA) database. Correlation analysis and differential analysis were conducted to obtain ferroptosis-related differential genes and lncRNAs. The analysis of Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) were conducted afterwards. A total of 1001 women with BRCA were randomly divided into a training set and a test set with a ratio of 1:1. Univariate Cox regression analysis and least absolute shrinkage and selection operator (Lasso) regression analysis of the training set were carried out to determine the optimal set of lncRNA then a prognosis model was built to calculate the risk score of each patient. The Receiver operating characteristic (ROC) curve, risk plot and Kaplan-Meier (KM) curve were used to evaluate the performance of the prognosis model and the model was validated by the test set.

Results: A total of 66 Ferroptosis-related differential gene and 299 ferroptosis-related differential lncRNAs were determined. The model was built based on the optimal set of lncRNA which were associated significantly with prognosis of women with BRCA and the risk score of each woman was obtained. In the training and the test set, the area under the ROC curve (AUC) of the risk score in predicting the 1-year, 3-year and 5-year survival rates of women with BRCA were 0.713, 0.762, 0.770 and 0.625, 0.712, 0.718, respectively. According to the results of univariate and multivariate Cox regression, the N stage of women with BRCA and risk score were considered as independent risk factors and were used to construct a nomogram. The AUC of the nomogram in predicting the 1-year, 3-year and 5-year survival rates of women with BRCA were 0.738, 0.764, 0.751.

Conclusion: The risk prognosis model based on ferroptosis-related lncRNA showed good performance in prediction of prognosis in women with BRCA. The model can facilitate the evaluation of the overall survival in women with BRCA and provide evidence for potential targeted treatments.

PO-3895

Diagnostic performance of radiomics for the vulnerability of arterial plaques: A Systematic Review and Meta-Analysis

Yangfei Long

The Second Affiliated Hospital of Shihezi University

Background: Radiomics analyzes medical images by extracting a large number of quantitative features, and it is increasingly being applied in clinical research regarding medical imaging analysis.

Objective: To explore the diagnostic accuracy of models based on radiomics for identifying the vulnerability of arterial plaques.

Methods: Databases from PubMed, Web of Science, and EMBASE were used for this literature search. Evaluation of the diagnostic precision of radiomics in determining the susceptibility of various arterial plaque forms is one of the inclusion criteria. The Quality Assessment of Diagnostic

Accuracy Study (QUADAS-2) and Radiomics Quality Score (RQS) were used to evaluate the risk of bias. The included radiomics studies was analyzed by meta-analysis, using subgroup analysis to investigate heterogeneity. The precision of radiomics models were assessed using the Summary Receiver Operating Characteristic Curve (SROC).

Results: Nine investigations were included, including four coronary artery studies, three carotid artery studies, and two intracranial artery studies. Radiological identification of arterial vulnerable plaques has an overall sensitivity of 82% (95% CI: 72-89%) and specificity of 77% (95% CI: 69-83%). The area under SROC was 0.85 (95% CI 0.82-0.88). Maximum and mean RQS percentage were 77.8% and 33.1%, respectively. The inter-rater agreement was good (ICC 0.98, 95% CI 0.95-0.95).

Conclusion: Radiomics has demonstrated high diagnostic performance in identifying vulnerable arterial plaques. With more in-depth research, radiomics may alter the clinical diagnostic procedure for arterial plaques.

PO-3896

Two distinct subtypes of obsessive compulsive disorder revealed by heterogeneity through discriminative analysis

Ya Tian, Shaoqiang Han, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objective : Neurobiological heterogeneity in obsessive compulsive disorder (OCD) is understudied leading to conflicting neuroimaging findings. Therefore, we investigated objective neuroanatomical subtypes of OCD by adopting a newly proposed method based on gray matter volumes (GMVs).

Methods: GMVs were derived from T1-weighted anatomical images of patients with OCD ($n = 100$) and matched healthy controls (HCs; $n = 106$). We first inquired whether patients with OCD presented higher interindividual variability HCs in terms of GMVs. Then, we identified distinct subtypes of OCD by adopting heterogeneity through discriminative analysis (HYDRA), where regional GMVs were treated as features.

Results: Patients with OCD presented higher interindividual variability than HCs, suggesting a high structural heterogeneity of OCD. HYDRA identified two distinct robust subtypes of OCD presenting opposite neuroanatomical aberrances compared with HCs, while sharing indistinguishable clinical and demographic features. Specifically, subtype 1 exhibited widespread increased GMVs in cortical and subcortical regions, including the orbitofrontal gyrus, right anterior insula, bilateral hippocampus, and bilateral parahippocampus and cerebellum. Subtype 2 demonstrated overall decreased GMVs in regions such as the orbitofrontal gyrus, right anterior insula and precuneus. When mixed together, none of patients presented significant differences compared with HCs. In addition, the total intracranial volume of subtype 2 was significantly correlated with the total score of the Yale–Brown Obsessive Compulsive Scale while that of subtype 1 was not.

Conclusions: These results identified two distinct neuroanatomical subtypes, providing a possible explanation for conflicting neuroimaging findings, and proposed a potential objective taxonomy contributing to precise clinical diagnosis and treatment in OCD.

PO-3897

Identifying Amyotrophic Lateral Sclerosis through the Abnormal Gray Matter Volume Pattern using Support Vector Machine Algorithm

Shan Wu, Haining Li, Qiuli Zhang, Qianqian Duan, Xinyi Yu, Ming Zhang
The First Affiliated Hospital of Xi'an Jiaotong University

Objective: With the evolution of machine learning (ML), artificial intelligence (AI) algorithms have enhanced the diagnosis and classification of numerous diseases. The goal of this research was to leverage the support vector machine (SVM) model, a multivariate pattern recognition ML technique, to delineate the pattern of gray matter volume (GMV) change in amyotrophic lateral sclerosis (ALS) and assess its viability for ALS diagnosis.

Methods: 70 ALS patients and 60 healthy controls (HCs) underwent scanning using a 3 Tesla MRI scanner with a T1-weighted sequence. The cerebrum was segmented into 90 regions using the automated anatomical labeling atlas and voxel-based morphometry assessed the GMV for each region and participant. Multivariate pattern analyses were employed to differentiate ALS patients from HCs. The SVM classifier's efficacy in diagnosing ALS was explored with the model undergoing training and testing via a leave-one-participant-out cross-validation. Classification accuracy was tested with the highest accuracy selected as the final value. Pearson correlation analyses explored the relationship between selected GMV. GM regions more associated with either ALS subjects or HCs were identified using a threshold of $\geq 30\%$ of maximum weight vector scores.

Results: Figure 1 illustrates the SVM classification performance based on GMV. The peak classification accuracy reached 82.50% when selecting the top 40% of GMV ($p = 0.0001$), with a specificity of 80.40% and a sensitivity of 85.05%. This highest accuracy was deemed the final result and the receiver operating characteristic (ROC) curve for this classification accuracy was with an area under the curve (AUC) of 0.89. Figure 2 visualizes the GMV change pattern in brain regions that classified ALS patients and HCs based on GM volumetry.

Conclusion: Abnormal GMV change in specific brain regions are evident in ALS patients. Gray matter volumetry combined with SVM has broad potential applications in identifying ALS.

PO-3898

Preliminary Preclinical Application Study of Single-Scan Ultra-Fast Quantitative Magnetic Resonance Imaging

Zongye Li¹, Xiao Wang¹, Yong Zhang¹, Congbo Cai², Shuhui Cai², Zhong Chen², Jianfeng Bao¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. School of Electronic Science and Engineering, Xiamen University

This study focuses on advancing Quantitative Magnetic Resonance Imaging (QMRI) by significantly reducing data acquisition time. Traditional QMRI offers more consistent, quantifiable data compared to manual MRI but often takes longer, increasing costs and patient discomfort. Researchers introduced a new technique, using a single-scan Overlapping Echoes Magnetic Resonance sequence (MOLED) combined with deep learning for image reconstruction, that can capture whole-brain T2 values in just 12 seconds. Tested on both specialized phantoms and human volunteers, the MOLED method produced highly reliable and repeatable T2 measurements, closely correlating with established methods. While the technology showed promise for clinical applicability, especially for time-sensitive cases and in reducing patient discomfort, further research is needed, particularly involving patients with brain tumors.

PO-3899

COVID-19 and Diabetes research: Where Are We Now and What Does the Future Hold? A Bibliometric Visualization Analysis

Xunlan Zhang,Ru Wen,Jian Liu,Yu Wu,Min Xu,Hengzhi Chen,Rongpin Wang,Xianchun Zeng
Guizhou provincial people's hospital

Background & Objective

The extensive spread of COVID-19 worldwide has caused a dramatic negative impact on many individuals' health. This study aims to systematically and comprehensively analyze the current status and possible future directions of DM and COVID-19 research.

Methods

We obtained publications about COVID-19 and diabetes mellitus from the Web of Science Core Collection using the search terms "COVID-19" and similar terms combined with "diabetes mellitus" and similar terms, with a date range of January 2020 to September 2022. And we used CiteSpace V 5.8.R3 to perform the bibliometric visualization analysis.

Results

The search enrolled 4242 publications. The United States is the country; Harvard Medical School was the most productive institution in this field. The highest-ranking journal was Public Library of Science, and the most co-cited journal was Lancet. The 20 most cited journals have all cited 19,970 times, accounting for 15% of the total cites; the range of those journals was 550-2320. Publications on COVID-19 and DM research revealed a trend that hotspots range from the initial observation of the comorbidities of COVID-19 pneumonia to the study of the impact of diabetes on its prevalence and prognosis and the related pathophysiological mechanisms and throughout the process to explore different therapeutic measures and their efficacy and eventual impact on clinical prognosis. And "glycaemic control," "COVID-19 vaccine," and "COVID-19-associated mucormycosis" are still likely to be the hotspots and frontiers of research in the future.

Conclusions

This bibliometric analysis related to DM in COVID-19 illuminates the current research situation and developmental trends, supporting researchers in the exploration of prospective directions for research.

PO-3900

Preoperatively identify VEGF-positive HCC: via Peritumoral Delta Radiomics

Hanting Dai,Feng Pan,Huifang Wang,Yueming Li
The First Affiliated Hospital Of Fujian Medical University

Purpose:

VEGF has been verified as a significant independent factor predicting poor prognosis for HCC patients, and anti-VEGF therapy has been recognized as an effective treatment for HCC. This study presents and explores the value of a non-invasive Delta radiomics approach based on multi-phase contrast enhanced magnetic resonance imaging (CE-MRI) to preoperatively identify VEGF-positive HCC which may enhance clinician's decision-making potentially.

Methods and Materials:

Retrospective recruiting of 145 patients with pathologically confirmed HCC (training cohort: n = 101; testing cohort: n = 44). The 3D volume of interest of the whole tumor area and peritumoral 10mm area were manually segmented from preoperative CE-MRI images. Based on T1 weighted non-contrast images(T1NC), arterial phase (AP), portal venous phase (PVP), delayed phase (DP)

and hepatobiliary phase (HBP) images, 107 whole tumor radiomics features and 93 peritumoral radiomics features excluded shape features were extracted respectively. Delta radiomics features were calculated from the radiomics features change over different phases by direct and related except for shape-related features. Minimal redundancy maximal relevance and recursive feature elimination were applied to screen the optimal features subset and logistic regression was used to train corresponding models. Utilizing the receiver operating characteristic curve and its area under the curve (AUC) to evaluate the performance of each model. The combined radiomics model is generated by models which AUCs of both the training and testing cohort above 0.7. A nomogram was constructed based on the combined radiomics model and clinical risk factors selected by Akaike information criterion.

Results:

The entire cohort contained 64 VEGF-positive cases and 81 VEGF-negative cases. Within all single radiomics models, Delta_peri10 models showed favorable performance than others that models whose AUCs of both the training and testing cohort above 0.7 are all Delta_peri10 models, and the best one is DP-AP_peri10, with AUCs as 0.808 and 0.775 in the training and testing cohort. The combined Delta radiomics model had higher AUCs with 0.845 and 0.780 in the training and testing cohort. The combined radiomics-clinical model demonstrate satisfied efficacy with AUCs as 0.868 and 0.808 in the training and testing cohort.

Conclusions:

The peritumoral Delta radiomics models based on multi-phase CE-MRI show a good efficacy and improvement in predicting VEGF expression in HCC preoperatively. Delta radiomics may provide a novel non-invasive biomarkers for diagnosing HCC and suggestions for personalized treatment decision-making.

PO-3901

Application of Improved Faster-RCNN in Rib Fracture Detection

Xiuchao He¹, Lijun Guo²

1. The First Affiliated Hospital of Ningbo University

2. Ningbo University

Rib fracture is a common chest injury that is easily missed. Due to the small area of the rib fracture area relative to the whole CT image area, serious imbalance of positive and negative anchor frame samples is easy to occur during training. To solve this problem, an anchor frame screening method is proposed based on the Faster-RCNN model. Based on the comprehensive consideration of the imaging characteristics of the ribs in CT images, combined with the knowledge in the medical field, through the traditional image processing algorithm, the anchor frame is selected to be more effective for model training. To some extent, it alleviates the problem of imbalance between positive and negative samples, and makes the learning of deep model more targeted. In addition, to solve the problem of weak discriminant of shallow features in the Faster-RCNN model, SE module is used to strengthen the discriminant of features in the channel dimension, while retaining the location sensitivity required by target inspection tasks, which further improves the performance of the model. Under the condition that the average number of false positives per CT image is 4, the sensitivity of the improved Faster-RCNN reaches 90.49%, which is 3.6% higher than that of the unimproved Faster-RCNN.

PO-3902

Development of a nomogram model based on MRI T2WI radiomics combined with clinical characteristics for predicting the post-acute pancreatitis diabetes mellitus

Qinglin Du,Xiaohua Huang
Affiliated Hospital of North Sichuan Medical College

Abstract Objective: This study aims to achieve early prediction of post-acute pancreatitis diabetes mellitus (PPDM-A) by nomogram based on radiomics and clinical risk factors, and to provide suggestions for clinical personalized treatment.

Methods and Materials: Retrospective collection of patients diagnosed with acute pancreatitis (AP) in our hospital from January 2016 to December 2020, through clinical follow-up, they were divided into PPDM-A group (n=72) and normal blood glucose after AP group (n=100). The enrolled patients were randomly divided into the training group (n=120) and the validation group (n=52) at a ratio of 7 : 3, and the relevant clinical characteristics of the two groups were collected at the same time. 3D Slicer software was used to delineate the edge of pancreatic parenchyma on T2WI sequence and extract features, the least absolute shrinkage and selection operator (LASSO) algorithm was used to reduce the dimension and select the radiomics features. Logistic regression was used to establish a clinical model, radiomics model and nomogram model for predicting PPDM-A. The predictive performance of the models was evaluated by the area under the curve (AUC) of the receiver operating characteristic curve (ROC). DeLong test was used to compare the predictive performance between models. The calibration curve of the optimal model was drawn and the Hosmer-Lemesow test was used to verify the goodness of fit of the model.

Results:The AUCs of the clinical model, radiomics model, and nomogram model in the training group were 0.774 (95% CI: 0.684-0.863), 0.850 (95% CI: 0.781-0.919) and 0.905 (95% CI: 0.849-0.961), respectively. In the validation group, they were 0.747 (95% CI: 0.612-0.882), 0.850 (95% CI: 0.781-0.919) and 0.874 (95% CI: 0.769-0.979), respectively. Delong test results showed that there was statistical significance between the nomogram model and the clinical model in both the training group and the validation group (training group $P=0.025$, validation group $P=0.006$).The Hosmer-Lemeshow test showed that the nomogram model had a good degree of fit (training group $P=0.628$, validation group $P=0.128$).

Conclusions:The nomogram model based on T2WI radiomics and clinical features shows good performance in optimizing the individualized prediction of PPDM-A, which can provide reference for the early prediction of PPDM-A.

PO-3903

Fully Automated Segmentation and Volumetry of hepatic veins and portal veins at CT prior to major hepatectomy using deep learning

Tingting Xie,Guanxun Cheng
Peking University Shenzhen Hospital

Objective: To develop and perform a spatial external validation of two DL models for the automated segmentation of hepatic veins and portal veins and apply the models to blood-free FLR% (FLR%_{bf}) assessment before major hepatectomy.

Materials and Methods: This retrospective study developed two 3D U-Net models for the automated segmentation of hepatic veins and portal veins on contrast-enhanced CT scans. Images were obtained from 170 patients from January 2018 to March 2019. First, radiologists annotated

hepatic veins and portal veins. Then, two 3D U-Net models were trained in medical center A (n=170, two models using the same dataset for training and testing) and tested in medical center B in cases with various liver conditions (n1=146) and in candidates for major hepatectomy (n2=32). The segmentation accuracy was evaluated using dice similarity coefficient (DSC) and volumetric similarity (VS). FLR%bf assessment and the prediction of hepatectomy was compared between manual and automated methods.

Results: The DSC and VS values of the two models ranged from 0.73 ± 0.12 to 0.87 ± 0.13 . The automated and manual FLR%bf assessments ranged from 6.08% to 81.91%, 6.47% to 82.20%, respectively. No statistical significance was found ($P=0.82$). No statistical difference was found in the prediction of anatomic resection based on FLR%bf.

Conclusion: It's feasible for the automatic segmentation of hepatic veins and portal veins in CT images by using deep learning and the application of these models to FLR%bf assessment before hepatectomy.

Clinical relevance: This study provided adequate validation in diverse liver conditions (including candidates for hepatectomy) and thorough evaluation using clinical cases, and provide an automated FLR%bf assessment (which is regarded as more accurate than blood-filled FLR% assessment) both in a quantitative output and as a 3D visualization for surgeons.

PO-3904

ECG-based cardiodynamicsgram can reflect anomalous functional information in coronary artery disease

Ying Wang, Ximing Wang

Shandong Provincial Hospital Affiliated to Shandong First Medical University

Background: The cardiodynamicsgram (CDG), a novel noninvasive method, extracts dynamic ST-T segment information from an electrocardiogram (ECG) through deterministic learning.

Hypothesis: The CDG can reflect anomalous functional information in coronary artery disease (CAD).

Methods: We retrospectively enrolled 456 patients with suspected CAD who underwent coronary computed tomography angiography (CCTA) from January 2020 to 2022, followed immediately by standard 12-lead ECG acquisition. Positivity for CAD were defined as CCTA $\geq 50\%$ or CT-derived fractional flow reserve (CT-FFR) ≤ 0.8 . A CDG value <0 was considered negative; otherwise, it was considered positive. We also evaluated the diagnostic performance of the CDG in the ECG-diagnosis-negative subgroup and in patients who had undergone invasive coronary angiography (ICA) after CCTA.

Results: Of 362 patients, 168 (46.41%) were positive for CAD, and 178 (49.17%) were men. The median age was 59 (52–66) years. The accuracy of the CDG in the diagnosis of CAD was 79.56%, with a sensitivity, specificity, and the area under the receiver operating characteristic curve (AUC) of 75.60%, 82.99%, and 0.836 (95% CI: 0.794–0.878), respectively. Similarly, in the ECG-diagnosis-negative subgroup (n = 223), the accuracy of the CDG was 80.27%, with an AUC of 0.842 (95% CI: 0.790–0.895). Among the 11 patients with CAD confirmed by ICA, 10 were diagnosed positive by the CDG. Furthermore, the CDG values and CT-FFR were correlated ($r = -.395$; $p < .001$).

Conclusions: The ECG-based CDG has relatively high specificity and accuracy for the diagnosis of CAD and reflects functional cardiac information to some extent. It has the potential to be used as a screening tool for suspected CAD patients before CCTA.

PO-3905

Clinico-biological-radiomics (CBR) based machine learning for improving the diagnostic accuracy of false-positive lymph nodes in lung cancer

Caiyue Ren, Jingyi Cheng
Shanghai Proton and Heavy Ion Center

Background: The main problem of PET/CT for lymph node (LN) staging is the high false positive rate (FPR). Thus, we aimed to explore a clinico-biological-radiomics (CBR) model via machine learning (ML) to reduce FPR and improve the accuracy for predicting the hypermetabolic mediastinal-hilar LNs status in lung cancer than conventional PET/CT.

Methods: A total of 260 lung cancer patients with hypermetabolic mediastinal-hilar LNs were retrospectively reviewed. Patients were pathologically divided into the LN negative (LN-) and positive (LN+) groups, and randomly assigned into the training (n=182) and validation (n=78) sets. Preoperative CBR dataset containing 1738 multi-scale features was constructed for all patients. Prediction models for hypermetabolic LNs status were developed using the features selected by the supervised ML algorithms, and evaluated using the classical diagnostic indicators. Then, a nomogram was developed based on the model with the lowest FPR and the best predictive efficiency, and validated by the calibration plots.

Results: In total, 109 LN- and 151 LN+ patients were enrolled in this study. 6 independent prediction models were developed to differentiate LN- from LN+ patients using the selected features from CBR sub- and total datasets, respectively. The DeLong test showed that the CBR Model containing all-scale features held the highest predictive efficiency and the lowest FPR among all of established models ($p < 0.05$) in both the training and validation sets (AUCs of 0.90 and 0.89, FPRs of 12.82% and 6.45%, respectively) ($p < 0.05$). The quantitative nomogram based on CBR Model was validated to have a good consistency with actual observations.

Conclusion: This study presents an integrated CBR nomogram that can further reduce the FPR and improve the accuracy of hypermetabolic mediastinal-hilar LNs evaluation in lung cancer, thereby greatly reducing the risk of overestimation and assisting for precision treatment.

PO-3906

Multi-modal Fusion of Radiomics and Pathomics for Enhanced Pancreatic Cancer Survival Prediction with Asymmetric Twinning Information Interaction Network (ATIIN)

zhenhua zhang, pinzhen chen, xianqi wang, jing yang, mingshan du, wei chen
The first affiliated hospital, Army Medical University

Abstract

Objectives To determine the predictive value of a new model that combines radiomics and pathomics for estimating the survival of pancreatic ductal adenocarcinoma (PDAC) patients and to evaluate its potential in guiding treatment decisions.

Methods Patients who underwent surgical resection and were confirmed with PDAC by postoperative pathology in a single-center PDAC cohort registry were enrolled in this study between July 2008 and September 2013. Preoperative CT images and postoperative pathology images were available for each patient. The multi-modal fusion system, Asymmetric Twinning Information Interaction Network (ATIIN), was utilized to combine radiomics and pathomics features for predicting postoperative survival time in PDAC patients.

Results 89 patients (mean age \pm standard deviation, 58 years \pm 10; 64 men) were evaluated. The average survival prediction error value of ATIIN was 1.99 months, compared to 4.8 months using radiomics with the channel attention network and 5.5 months using pathomics with the feature attention network ($P=.0002$). The C-Index value of ATIIN was 0.95, higher than 0.52 in the feature attention network and 0.57 in the channel attention network. When survival time was less than 7 months, the accuracy ratio of ATIIN was 1.0 and 0.65, compared to 0.4 and 0.45 in the feature attention network and 0.6 and 0.4 in the channel attention network. When survival time was more than 7 months, the accuracy ratio of ATIIN was 0.625, similar to the channel attention network and lower than the 0.75 accuracy ratio of the feature attention network.

Conclusion ATIIN, which accurately predicts the survival time of patients with PDAC after radical surgery, can aid clinicians in making appropriate treatment decisions.

PO-3907

Feasibility of ultra-low radiation dose reduction for Urinary calculus using Deep Learning CT Image Reconstruction : prospective pilot study

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

*Purpose: To compare dose, reader assessments and noise between ultra-low-dose(ULD) and low-dose(LD) urolithiasis CT using Deep Learning CT Image Reconstruction

*Methods and Materials: Prospective study of 56 patients having uncontrast LD and ULD urolithiasis CT reconstructed using PBP, ASIR-V and Deep learning reconstruction(DL). Dose,noise measurements and subjective image assessment were recorded

*Results: UID volume CT dose index was less 92% less, Noise was 60% less with ULD DL than with LD ASIR-V ($P<0.001$),no other significant differences existed.The ULD-DL showed a greater than 85% concordant rate in overall stones and 100% in urinary stones >3 mm. However, for stones <3 mm, neither reviewer had a good detection rate (58.5% and 68.6% for the general and genitourinary radiologist, respectively). Inter-observer agreement was almost perfect ($\kappa = 0.85$).

*Conclusions: ULD DL is comparable to our standard of care, LD ASIR-V, with 92% lower dose and 60% less noise .Despite a significant radiation dose reduction, ULD-DL images were comparable in image quality and noise to FBP images. Furthermore, the diagnostic performance of the ULD non-enhanced CT protocol was comparable to that of the RD scan for diagnosing urinary stones >3 mm.

PO-3908

Value of TrueFidelity (deep learning image reconstruction) in low-dose urinary tract CT: image quality and calculus detection

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

*Purpose: Compare with filtered back projection (FBP) and adaptive statistical iterative reconstruction (ASIR-V) to evaluate the effect of deep learning image reconstruction (DLIR) on the image quality of low-dose urinary tract CT and the ability of stone detection.

*Methods and Materials: We prospectively enrolled 41 adult patients (16 females and 25 males, mean age \pm SD, 53.1 \pm 15.5 years) who underwent urinary CT examination for sudden low back

pain.All patients received standard-dose CT (SDCT) and low-dose CT (LDCT) . SDCT was reconstructed using FBP, while LDCT was reconstructed using FBP, ASIR-V30%, ASIR-V50%, ASIR-V70%, DLIR-L, DLIR-M, DLIR-H.All images were reconstructed by 0.625mm.For objective analysis,the standard deviation of attenuation in the right hepatic lobe, subcutaneous fat,kidney were measured as image noise,signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were measured and calculated.For subjective analysis, assess overall image quality, noise, and diagnostic confidence on a 5-point scale from 1 (poor) to 5 (excellent).

*Results: Compared with the SDCT scan, the LDCT dose was reduced by 89% (CTDIvol: 1.80mGy vs 15.97mGy). In LDCT images, the image noise is significantly decreased by DLIR compare to FBP and ASIR-V ($P<0.001$), the image noise of DLIR-H is the lowest.The SD values of the right hepatic lobe of SDCT-FBP and LDCT-DLIR-H were similar (26.66 ± 3.86 vs 26.13 ± 2.47 ; $P \geq 0.01$).In the subjective analysis, the image quality and image noise shown by LDCT-DLIR-H was similar to that shown by SDCT-FBP ($P \geq 0.01$).A total of 145 stones were detected by SDCT-FBP, the number of stones in LDCT-DLIR-L, LDCT-DLIR-M and LDCT-DLIR-H was 143, 141, 133,respectively. Twelve stones < 3 mm were not detected in the LDCT-DLIR-H image.

*Conclusions: DLIR technique can reduce the image noise of urinary tract CT images, improve the overall image quality, the image quality of DLIR-H is the best.However, for stones less than 3 mm, DLIR -H may not be the optimal choice.

PO-3909

Prediction of acute symptom severity using neuroanatomic images in antipsychotic-naïve first episode schizophrenia

Wenjing Zhang,Qiyong Gong,Su Lui,Li Yao

Department of Radiology, West China Hospital of Sichuan University, Chengdu, People's Republic of China

Background: Brain alterations associated with acute illness severity in schizophrenia remain poorly understood. Establishing linkages between imaging biomarkers and symptom expression may enhance mechanistic understanding of acute psychotic illness. Constructing models using MRI and clinical features together to maximize model validity may be particularly useful for these purposes. Methods: Anatomic MRI was collected from 286 patients with drug-naïve first-episode schizophrenia and 330 healthy controls from two independent datasets. A multi-task deep learning model was constructed with two parallel outputs obtained simultaneously: a standard case/control recognition and a logistic regression to predict psychosis symptom severity. The brain regions contributing to illness identification and acute symptom severity prediction were identified. We also tested whether analysis with unprocessed anatomical images would show superior performance to predefined features obtained using voxel-based morphometry (VBM) and surface-based morphometry (SBM) as typically used in machine learning studies of schizophrenia.

Results: The deep learning model differentiated schizophrenia patients from healthy controls with a balanced accuracy of 86.9% (sensitivity=90.4%, specificity=82.1%) and a robust prediction of positive symptoms ($R^2=0.44$), negative symptoms ($R^2=0.25$) and general psychopathology ($R^2=0.38$). These findings were well replicated in the validation analysis. Regions in parietal, occipital and medial frontal cortex and bilateral cerebellum had the greatest contribution to the predictive model. Greater group separation was achieved using unprocessed images than VBM and SBM derived features.

Conclusions: Incorporating illness severity prediction in pattern recognition algorithms, our study identified MRI features that had diagnostic value and were highly predictive of symptom severity in acutely ill schizophrenia patients.

PO-3910

Structural Abnormalities in the Fronto-Parietal Network: Linking White Matter Integrity to Sustained Attention Deficits in Schizophrenia

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Schizophrenia is associated with a range of cognitive deficits, among which impairments in sustained attention are particularly significant. Previous research has investigated functional changes in the fronto-parietal network (FPN) related to attentional control in schizophrenia. However, the role of structural connectivity within the FPN in sustained attention deficits remains under-explored. Utilizing diffusion tensor imaging (DTI), this study investigated white matter integrity in 75 participants, comprising 37 individuals with schizophrenia (SZ) and 38 healthy controls (HC). Psychomotor vigilance task (PVT) performance was assessed to gauge sustained attention. The SZ group showed a significant reduction in fractional anisotropy (FA) and streamline counts within white matter tracts connecting frontal and parietal regions, compared to the HC group. Further, significant negative correlations were found between PVT performance and white matter integrity measures within the SZ group, specifically in the left FPN. Our findings indicate that structural abnormalities in the FPN are associated with sustained attention deficits in schizophrenia. These results contribute to our understanding of the neurobiological mechanisms underlying cognitive impairments in schizophrenia and offer potential avenues for targeted therapeutic interventions. Further research is warranted to validate these outcomes and explore their clinical implications.

PO-3911

Effects of sleep deprivation and daytime naps on working memory based on task-state functional magnetic resonance

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Background:

Working memory plays a crucial role in daily life and professional settings, but there is a lack of clarity regarding the specific behavioral and neuroimaging changes in working memory after sleep deprivation and the possible ameliorative effects of daytime naps.

Methods:

In this study, we used the n-back experimental paradigm to investigate the effects of sleep deprivation on working memory. We recruited 50 military cadets to perform an n-back task in an MRI scanner during normal wakefulness (RW), after 30 h sleep deprivation, and after a subsequent 30 min nap, and analyzed the dynamic changes in brain responses during the three states. The experimental procedure was the same as study I, in which participants were asked to complete the n-back task on the MRI scanner. The images of the first 10 time points were discarded to ensure the stability of the MRI data. Then the images of the remaining 200 time points were corrected for slice time and re-aligned with the first image, during which the average Frame-wise displacement (FD) was calculated. Head displacement during scanning was assessed using translation and rotation parameters, with exclusion criteria being the presence of >2.5mm displacement and/or >2.5° rotation at each time point and direction. The effect of head displacement was attributed back and forth using the Friston-24 parameter. Different from the processing of PVT task

in the first part, the task of n-back adopts the experimental design of Block. Task-state MRI data were also analyzed using a two-stage mixed-effects model. For the n-back behavioral outcomes (mean reaction time and mean accuracy), we used a one-way repeated measures ANOVA with significance threshold set at $P < 0.01$ and FDR (false discovery rate) criterion corrected. For pairwise comparisons in post hoc analyses, Bonferroni was used to correct for multiple comparisons, and the significance threshold correction was set at 0.05. For the n-back images, the FDR (false discovery rate) criterion was also used to adjust for multiple comparisons. The statistical threshold was set to $pFDR < 0.05$ for n-back activation across conditions, for F comparisons across conditions, and for pairwise comparisons in post hoc analyses.

Results:

One-way repeated measures ANOVA showed significant time differences in mean reaction time ($F_{2,98} = 70.33$, $p < 0.001$) and accuracy ($F_{2,98} = 7.36$, $p < 0.001$). Posthoc analysis revealed significant differences between pairwise comparisons of RW, SD, and nap conditions, as shown in Figure 2.2. RT and accuracy after daytime naps are significantly lower than those under sleep deprivation condition, but still higher than those under normal waking condition, indicating that daytime naps have a certain recovery effect on working memory level. The cerebellum, bilateral insula, precuneus, superior temporal gyrus, and posterior cingulate gyrus showed significant differences among the three conditions. Activity in the cerebellum, insula, and thalamus decreased significantly after sleep deprivation, and returned to normal wakefulness levels after daytime naps. The middle frontal gyrus, precuneus gyrus and superior temporal gyrus showed negative activation patterns during normal waking, but the negative activation degree of these three regions became weaker after sleep deprivation, and the negative activation reached the maximum after daytime nap. The improvement of working memory reaction time after daytime naps was positively correlated with the increased activation intensity of the right insula ($r = 0.38$, $p < 0.005$).

Conclusion:

Sleep deprivation significantly affected cognitive performance at the level of working memory. Sleep deprivation resulted in diminished processing speed and reduced accuracy. Daytime naps partially restored working memory in two ways. Daytime naps restored the reduced activity in the cerebellum, insula, and thalamus to normal levels after sleep deprivation. Daytime naps increased negative activation in the middle frontal gyrus, precuneus, and superior temporal gyrus, disengaging the DMN network from the task and increasing brain cognitive resources.

PO-3912

A multimodal image-based study of the effects of sleep deprivation and daytime naps on risky decision-making and its mechanisms

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Background:

Behavioral and neuroimaging changes in inhibitory control after sleep deprivation, and the possible ameliorative role of daytime naps in this regard, remain unclear.

Methods:

leveraging the brain regions identified in the previous studies, we employed the resting-state fMRI small-world network approach to comprehensively comprehend how different regions of the brain collaborate and interact in the process of risk decision-making. Three metrics derived from graph theory, namely small-worldness, network segregation, and network integration, were utilized to evaluate network parameters. For the neuroimaging of small-world networks, multiple comparison correction was also applied using the False Discovery Rate (FDR) standard. Regarding differences in small-world networks under different conditions, as well as F-statistics for various conditions and post-hoc pairwise comparisons, statistical thresholds were uniformly set at 0.05. Finally, we

examined the correlations between the metrics of small-world networks and behavioral aspects of risk decision-making (such as average reaction time and high-risk preference in decision-making) as well as EEG-ERP responses (specifically, FRN and P300).

Results:

Based on the findings from the previous studies, we identified the following brain regions: bilateral middle frontal gyrus, bilateral supplementary motor area, bilateral inferior frontal gyrus, left middle cingulate gyrus, bilateral inferior parietal lobule, left cerebellum, bilateral insula, right anterior cingulate cortex, right superior temporal gyrus, left posterior cingulate gyrus, bilateral middle occipital gyrus, right middle temporal gyrus, and left superior frontal gyrus. Utilizing these regions, we employed the small-world network analysis method. Our study revealed that the brain exhibited small-world network properties under conditions of normal wakefulness, sleep deprivation, and post-nap states. One-way repeated measures analysis of variance showed significant differences among the three groups in terms of small-worldness, functional integration, and functional segregation indices. Post-nap states demonstrated a restoration towards levels observed during normal wakefulness. Under conditions of sleep deprivation, the small-worldness index (σ) of the network significantly decreased. Additionally, both clustering coefficient (C_p) and local efficiency (E_l), representing functional integration, as well as characteristic path length (L_p) and global efficiency (E_g), representing functional segregation, exhibited a similar decreasing trend. Changes in σ after napping showed a significant negative correlation with high-risk tendencies. Moreover, changes in C_p after napping were significantly correlated with individual reaction times. Changes in L_p after napping were correlated with the EEG-ERP component FRN, and alterations in E_g after napping were significantly correlated with the EEG-ERP component P300.

Conclusion:

The brain regions constitute a small-world network. Sleep deprivation notably influences the functional integration and segregation of this network. These research findings suggest that sleep deprivation may lead to a disruption in the overall structure of the brain network, affecting the efficiency of information transmission and consequently exerting a negative impact on the ability to make sound risk decisions. Napping, by modulating changes in the overall structure, integration level, and local efficiency of the brain network, enhances performance in risk decision-making.

PO-3913

Entropy as a Novel Predictor of Cardiovascular Events in Patients with Myocarditis

Fangyuan Liu, Ximing Wang
Shandong Provincial Hospital

Abstract

Objective: To evaluate the prognostic role of left ventricular (LV) entropy, a novel measure of myocardial tissue heterogeneity derived from cardiac magnetic resonance (CMR) imaging, in patients with myocarditis.

Methods: A total of 106 consecutive patients diagnosed with clinically suspected myocarditis between October 2016 and April 2023 were initially included in this retrospective study. Besides conventional CMR parameters, LV entropy derived from the distribution of pixel signal intensities across the LV myocardium was assessed. Major adverse cardiovascular events (MACE) were composed of cardiac death, heart failure hospitalizations, sustained ventricular arrhythmia, and appropriate implantable cardioverter-defibrillator (ICD) therapies.

Results: A total of 93 patients were included; the median age at presentation was 11 (interquartile range [IQR]: 8.3) years, with 39% female. During a median follow-up of 722.5 days, 10 patients (11%) experienced MACE. LV entropy was significantly higher in patients who experienced MACE ($p=0.01$). In univariate and multivariate Cox regression analysis, LV entropy was independently associated with the incidence of MACE (HR: 2.77, 95% CI: 0.97–1.66, $p<0.001$). Kaplan-Meier

analysis suggested that patients with a higher late gadolinium enhancement (LGE) entropy (>7.825) were more likely to experience MACE.

Conclusion: LV entropy is independently associated with MACE and could help risk stratification in patients with myocarditis.

PO-3914

Non-Contrast Computed Tomography-Based Radiomics for Staging of Connective Tissue Disease-Associated Interstitial Lung Disease

Songnan Qin, Bing Kang, Hongwu Liu, Ximing Wang
Shandong Provincial Hospital

Rationale and Introduction

It is significant to assess severity and predicting the mortality of patients with connective tissue disease-associated interstitial lung disease (CTD-ILD). In this double-center retrospective study, we developed and validated a radiomics nomogram for clinical management by using the ILD-GAP (gender, age, and pulmonary physiology) index system.

Materials and Methods

Patients with CTD-ILD were staged using the ILD-GAP index system. A clinical-factor model was built by demographics and CT features and a radiomics signature was developed using radiomics features extracted from CT images. Combined with the radiomics signature and independent clinical factors, a radiomics nomogram was constructed and evaluated by the area under the curve (AUC) from receiver operating characteristic (ROC) analyses. The models were externally validated in dataset 2 to evaluate the model generalization ability using ROC analysis.

Results

A total of 245 patients from two clinical centers (dataset 1, $n = 202$ and dataset 2, $n = 43$) were screened. Pack-years of smoking, traction bronchiectasis and 9 radiomics features were used to build the radiomics nomogram, which showed favorable calibration and discrimination in the training cohort [AUC, 0.887 (95% CI: 0.827, 0.940)], the internal-validation cohort [AUC, 0.885 (95% CI: 0.816, 0.922)] and the external-validation cohort [AUC, 0.85 (95% CI: 0.720, 0.919)]. Decision curve analysis demonstrated that the nomogram outperformed the clinical-factor model and radiomics signature in terms of clinical usefulness.

Conclusion

The CT-based radiomics nomogram showed favorable efficacy in predicting individual ILD-GAP stages.

PO-3915

Application of Combined Convolution Neural Network and Graph Convolution Network for Predicting Axillary Lymph Node Metastasis in Breast Cancer Based on Dynamic Contrast-enhanced MRI: A Multicenter Study

Yi Dai¹, Guanxun Cheng¹, Haicheng Zhang², Haizhu Xie², Ning Mao²

1. Peking University Shenzhen Hospital

2. Yantai Yuhuangding Hospital

Purpose: To develop a deep learning model combining convolution neural network (CNN) and graph convolution network (GCN) based on dynamic contrast-enhanced (DCE)-MRI for predicting axillary lymph node (ALN) metastasis in breast cancer, while also aiming to explore the biological mechanism by using RNA-sequencing data.

Materials and Methods: 935 breast cancer patients with DCE-MRI and clinical data (2017-2021) from 4 centers were retrospectively collected. Multiple CNN-GCN models were developed and validated to identify ALN status in breast cancer, using tumor and ALN MR images. The best CNN-GCN model was compared with radiomics models, Memorial Sloan-Kettering Cancer Center (MSKCC) model, and three radiologists. RNA-sequencing data from 11 patients explored the biological basis of the prediction. ALN classification comparison involved accuracy, sensitivity, specificity, inter/intraclass correlation coefficients, area under the receiver operating characteristic curve (AUC), and Delong test.

Results: Participants were divided into training ($n = 742$, mean age: $53 \text{ years} \pm 10 \text{ [SD]}$), internal test ($n = 83$, $53 \text{ years} \pm 10$), and external test ($n = 110$, $50 \text{ years} \pm 9$) sets. The optimal CNN-GCN model, HRNet-GCN_tumor+ALN, achieved an AUC of 0.870 in the external test set, outperforming LR_tumor+ALN (AUC: 0.790) and MSKCC model (AUC: 0.752) (Delong test, $P < .05$). Radiologists' performance improved with HRNet-GCN_tumor+ALN assistance (external test cohort, $P < .05$). The high-risk group showed associations with pathways like ribosome, synapse organization, and muscle contraction.

Conclusion: The proposed GCN-CNN fusion deep learning model showed the good performance for predicting ALN status preoperatively in breast cancer patients.

PO-3916

Formation Prediction of MCA Intracranial Aneurysms by Hemodynamic and Morphological natures using Machine Learning Method

miao song, 希军 GONG

Shanghai Maritime University

Background:

Risk prediction of aneurysm formation is an important and challenging task. However, most of previous studies have used the limited clinical information, e.g., gender, age, BMI, to predict the aneurysm risk, which cannot reflect the essential characteristic of aneurysm. Here, we firstly developed a machine learning model, comprehensively combining morphological and hemodynamic features, for aneurysm formation risk prediction.

Method:

Using the 3D image processing technology, the MCA aneurysms of 110 patients were virtually removed to recover the pre-aneurysm vascular geometry. These pre-aneurysm vascular segments and their contralateral healthy arteries were used as training dataset. Prediction models were

derived using three machine learning algorithms (support vector machine, random forest, and conventional logistic regression). Accuracy was evaluated based on the area under the curve (AUC), sensitivity and specificity with 95% CI.

Results:

The best model (SVM) achieved an area under the receiver operating characteristic curve of 0.9 [95% confidence interval (CI) = 0.838–0.927], significantly better than the logistic regression model (0.779; 95% CI = 0.729–0.829; $P = 0.002$) and the random forest method (0.758; 95% CI = 0.713–0.800; $P = 0.001$).

Conclusion:

This study is the first attempt to systematically combine morphological and hemodynamic analysis to predict aneurysm formation risk, which have demonstrated the feasibility of applying machine learning in the early diagnosis of aneurysm.

PO-3917

"Differentiating and Diagnosing 'Patchy Shadows' in the Central Nervous System Based on MRI Images Using a Multitask Deep Learning Model"

Yujiao Deng, kai yang Zhao, xiaorui Su, Qiang Yue
Sichuan university westchina hospital

Purpose: To develop a multitask deep learning model for differential diagnosis of the pathological properties and disease categories of 'patchy shadows' in brain parenchyma, which was initially a highly challenging task for radiologists.

Method and Material: Participants were retrospectively recruited from February 2014 to May 2023 in West China Hospital, who underwent multi-sequence brain MRI examinations and were identified with "patchy shadow" in brain parenchyma. Considering the epidemiological prevalence, our study ultimately focuses on the three most common and representative diseases in clinical practice that can cause "patchy shadows": central nervous system lymphoma ($n=29$), glioma ($n=45$), and demyelinating disorders ($n=46$). These participants were split into training, validation, and testing sets in a ratio of 7:1:2. The multitask neural network can simultaneously achieve precise segmentation and differential diagnosis of the patchy shadows. We measured the model performance with the test set and evaluated its effectiveness in assisting radiologists in this scenario.

Result: The multitask deep learning model performed well in the test set, achieving an AUC of 0.92 and an ACC of 0.85 for the differential diagnosis of patchy shadows. Additionally, it achieved an average Dice coefficient of 0.84 for the segmentation of patchy lesion regions. Besides, the utilization of our model significantly enhanced the diagnostic capabilities of radiologists for patchy shadows.

Conclusion: The deep learning model can accurately diagnose the pathological properties and disease categories of patchy shadows in brain parenchyma, and it tremendously assists radiologists in this scenario.

Limitation: The inclusion of patients in this study is severely constrained by the low prevalence of central nervous system lymphoma, especially given the requirement to exclude individuals who do not exhibit patchy shadow sign. Besides, due to the stringent inclusion criteria of this study, we are currently limited to conducting a single-center investigation.

PO-3918

Multimodal integration of habitat radiomics, pathomics and clinical parameters for predicting platinum resistance in patients with high-grade serous ovarian carcinoma

Qiu Bi^{1,2}, Jinwei Qiang¹, Kunhua Wu²

1. Jinshan Hospital, Fudan University

2. the First People's Hospital of Yunnan Province

Objective: Accurate prediction of platinum resistance in high-grade serous ovarian cancer (HGSOC) before treatment is an urgent clinical problem to be solved. This study aimed to explore the predictive capacity of integrating habitat radiomics based on MRI, histopathologic, and clinical features to predict response of platinum-based chemotherapy in patients with HGSOC.

Materials and methods: A retrospective cohort study was conducted on 393 eligible patients (86 platinum-resistant and 307 platinum-sensitive patients) from 3 hospitals. K-means algorithm was used to perform clustering on T2-weighted images (T2WI), contrast-enhanced T1-weighted images (CE-T1WI), diffusion-weighted imaging (DWI), and apparent diffusion coefficient (ADC) maps. After feature extraction and selection, the habitat radiomics model based on MRI habitat sub-regions was constructed to identify platinum-resistant and platinum-sensitive patients. Haematoxylin and eosin (H&E)-stained slides of tumors were scanned to whole slide images (WSIs) at 20x magnification. The processing of WSI involved cutting them into 512×512-pixel patches and underwent color normalization using the Macehko method. Inception v3 deep learning model was trained to derive the patch-level prediction. Multi-instance learning for WSI-level prediction included Patch Likelihood Histogram (PLH) and Bag of Words (BoW) Pipelines. Then, pathomics model was developed by Integrating predictive features of multi-instance learning. Univariate/multivariate logistic regression analysis was used to select clinical predictors and construct clinical model, respectively. The model performance and benefit was assessed using the area under the receiver operating characteristic curve (AUC), net reclassification index (NRI), and integrated discrimination improvement (IDI).

Results: Four habitats were clustered based on Calinski-Harabasz score. Significant differences in gray values of habitat 3 on T2WI, CE-T1WI, and ADC maps were found between the platinum-resistant and platinum-sensitive groups (all $P < 0.05$). Compared with the habitat radiomics model (0.684) and clinical model (0.545), the pathomics model had a higher AUC (0.744), with positive NRI. The Clinic_Habitat model yielded a highest AUC (0.758) among other single or compositive models, the second was Clinic_Habitat_Pathology model (0.747) and with positive IDI.

Conclusions: Habitat radiomics based on MRI and pathomics based on WSI had potentials to predict platinum resistance in patients with HGSOC. The integration of multi-omics models was helpful to improve prediction performance.

PO-3919

Based on Front-End Engineer- Coronary Artificialintelligence(AI):Deep-Learning Image Reconstruction (DLIR) for Coronary Computed Tomography Angiography (CCTA) about qualitative Image Analysis and coronary atherosclerosis burden

Pengxi Han

The First Affiliated Hospital of Shandong First Medical University (Shandong Qianfoshan Hospital)

Background

At present,for the Coronary Computed Tomography Angiography (CCTA),adaptive statistical iterative reconstruction-Veo (ASiR-V) is widely used but ASiR-V has been shown to degrade image quality at high levels. One new method (Deep-learning image reconstruction (DLIR))offers a new way to overcome these limitations.At the same time, front-end engineer-Coronary Artificial intelligence(AI) has has been widely used in three-dimensional medical reconstruction. So, based on Coronary Artificial intelligence, the study compared the impact of DLIR and different ASiR-V on image quality and the coronary atherosclerosis burden of CCTA .

Methods :This retrospective study includes 57 patients who underwent the CCTA (Revolution CT;GE Healthcare). The primary data were reconstructed with ASiR-V 0% (FBP)、ASiR-V 50%(normal)and ASiR-V 80%(the highest) with DLIR at different levels (medium [M] and high [H]).In the front-end engineer-Coronary Artificial intelligence(AI) platform , Image noise (IN), image quality,(Signal Noise Rate SNR,Contrast Noise Rate CNR) were evaluated on the axial view. The subjective evaluation(Liker1-5) in the proximal coronary arteries was calculated.TPS(Total plaque score),SSS(Segment-stenosis score) were calculated to quantitatively assess the coronary artery plaque load.The all data were performed to Statistical analysis. Results: There were significant differences ,compared ASiR-V 0%,ASiR-V 50% ,ASiR-V 80%、DLIR-M、DLIR-H (20.42±3.5HU vs 、16.9±4.9 、12.4±2.3 HU $p<0.05$) in Noise .Noise of DLIR-H was significantly lower than any other ($p<0.05$) ,Image quality(SNR) and (CNR)of DLIR-H also was highest ($p<0.05$). In Liker score,DLIR-H had significantly better Likert image quality scores compared to ASIR-V in segment-vessel ($p<0.05$).In coronary atherosclerosis burden,all the groups were no significantly statistical difference ($p>0.05$).

Conclusion :In AI platform ,DLIR significantly reduces noise and improve the image quality in CCTA both in subjective and object assessment .Compared to different ASiR-V.DLIR Have better ability to detect coronary atherosclerosis burden.

PO-3920

Construction of Preoperative Nomogram Prediction Model for WHO/ISUP Grading of Clear Cell Renal Cell Carcinoma based on Clinical and CT Image Radiomics

Hongqing Zhu,Wenjun Yao

Department of Radiology, The Second Affiliated Hospital of Anhui Medical University

Purpose: Discussing the value of constructing a model based on clinical and CT image radiomic features for preoperative prediction of clear cell renal cell carcinoma (ccRCC) WHO/ISUP grading.

Methods: A retrospective analysis was conducted on 214 patients diagnosed with clear cell renal cell carcinoma(ccRCC) at the Second Affiliated Hospital of Anhui Medical University between August 2012 and June 2022. Pathological confirmation and complete CT enhanced scans were

obtained for all patients. The ccRCC were graded according to the nuclear grading system established by the World Health Organization (WHO) and the International Society of Urological Pathology (ISUP). 143 cases were classified as low-grade (grades I-II), and 71 cases were classified as high-grade (grades III-IV). A random division of cases resulted in a training set (n=171) and a testing set (n=43), with a ratio of 4:1. Tumor regions of interest (ROI) were delineated on both plain and three-phase enhanced CT images. LASSO regression was employed to select features and construct a radiomics model based on the CT images. Additionally, clinical features were analyzed to develop a clinical model. A radiomics nomogram combining radiomics and clinical features was constructed. The performance of the models was assessed using receiver operating characteristic (ROC) curves and calibration curves in the training and testing sets. Furthermore, a decision analysis curve was plotted to evaluate the net benefit of Nomogram visualization.

Results: A total of 23 features were selected for inclusion in the radiomics model aimed at distinguishing nuclear grades. The resulting model achieved an area under the curve (AUC) of 0.712, while the clinical model achieved an AUC of 0.732. The radiomics nomogram, which integrated both clinical features and radiomics, demonstrated the most optimal performance. Specifically, the AUC values for the training and testing sets of the combined model were 0.887 (95%CI 0.837-0.936) and 0.800 (95%CI 0.650-0.951), respectively.

Conclusions: The construction of a nomogram based on radiomics and clinical features can improve the accuracy of preoperative grading for CCRCC and provide personalized treatment for patients.

PO-3921

Application of a new deep learning image reconstruction (DLIR) algorithm in pediatric orbital ultra-low dose CT imaging: A pilot study based on image quality

Yang Li, xiu feng song

Qingdao Women and Children's Hospital

Abstract:

Purpose: To evaluate the performance of a deep learning image reconstruction (DLIR) algorithm in pediatric orbital ultra-low-dose CT by sinus CT for improving image quality and reducing radiation dose. **Methods:** A retrospective analysis of 50 children who underwent paranasal sinus or orbital CT examination at our hospital was performed. ultra-low-dose CT of the nasal sinus was used to simulate orbital scanning as the experimental group and compared with the control group of general-low dose orbital CT. Two groups scanning used 100 kVp tube voltage, automatic tube current (SmartmA, 60-250 mA), pitch 0.992:1, rotation time 1.00 s, slice thickness 1.25 mm, and interslice spacing 1.25 mm. Experimental group set Noise Index 22 and pre-ASiR-V weight 70%; control group set noise index 8 and pre-ASiR-V weight 30%. The radiation dose, image noise (SD), signal-to-noise ratio (SNR), contrast noise ratio (CNR) and subjective score of the two groups were compared. The CT dose index (CTDI) and dose-length product (DLP) value were recorded, and the effective dose (ED) was calculated. **Result:** Compared with the control group, DLP and ED in the experimental group were reduced by 83.92% and 83.17%, respectively. Compared between DL-H (the optimal set of DLIR) and ASiR-V 70% (the control group), the image noise was reduced by 41.6% (4.17 ± 0.86 HU vs. 7.14 ± 1.19 HU), and the CNR was improved by 39.3% (26.60 ± 5.61 vs. 16.14 ± 2.48). In the qualitative image assessment, DL-H obtained the highest score. The scores for images were ranked in descending order as follows: DL-H, DL-M, ASiR-V 70% and DL-L. **Conclusion:** Combined with the comparison results of quantitative and qualitative image assessment, DL-H under the ultra-low-dose scan was significantly better than ASiR-V 70% under the general-low dose scan, and ASiR-V 70% was better than DL-M and DL-L. We can infer that the use of DL-H may be able to save a significant amount of radiation dose while achieving the current image quality.

PO-3922

Interpreting Structured CT Reports of Pulmonary Nodules According to Relevant Guidelines: A ChatGPT Approach

Yifan Guo, Xu Maosheng

The First Affiliated Hospital of Zhejiang Chinese Medical University (Zhejiang Provincial Hospital of Traditional Chinese Medicine)

Background: Although ChatGPT has the potential to significantly influence the medical field, it is crucial to thoroughly investigate its potential clinical value and identify its limitations.

Purpose: To evaluate the capability of ChatGPT to interpret structured CT reports of pulmonary nodules in accordance with relevant guidelines and to provide appropriate recommendations.

Materials and Methods: In this retrospective study, patient reports were selected from the pulmonary nodule CT database of our institution. A series of basic questions about pulmonary nodules and CT were used to determine how the conditional instructions were constructed. Radiologists acted as inspectors to assess ChatGPT's process of analyzing the CT report and whether the recommendations given were appropriate. Regarding ChatGPT's responses, this study evaluated the appropriateness of its recommendations and analysis process. The accuracy of the appropriate recommendations and analysis process was used to evaluate ChatGPT's ability to interpret CT reports of pulmonary nodules in accordance with relevant guidelines.

Results: A total of 39 patients were selected in this study according to the conditional instructions. The conditional instructions were constructed based on the Fleischner Society Lung Nodule Guidelines (2017), Lung Imaging Reporting and Data System (Lung-RADS) 1.1, and the National Comprehensive Cancer Network (NCCN) Lung Cancer Screening Guidelines 1.2022. In test 1, the accuracies of the appropriate recommendations and analysis processes were 5.13% and 0, respectively. In test 2, after changing the conditional instructions, the accuracies were 30.77% and 25.64%, respectively. In test 3, the accuracies were 92.31% and 79.49%, respectively, after using the single-task mode.

Conclusion: Under appropriate conditions, the Generative Pretrain Transformer-4 (GPT-4)-based ChatGPT has the potential to assist radiologists in the imaging diagnosis of pulmonary nodules, but much more refinement is necessary before it can be implemented in clinical practice.

PO-3923

A Deep Learning Model Predicating Functional Outcomes of Spontaneous Intracerebral Hemorrhage Based on CT Scans

Xianjing Zhao¹, Zhenwei Yao²

1. Department of Radiology, the 1st Affiliated Hospital of Zhejiang Chinese Medical University

2. Department of Radiology, Huashan Hospital, Fudan University, Shanghai, China

Objectives: The study aims to forecast the functional outcome of patients suffering from intracerebral hemorrhage (ICH) utilizing deep learning models derived from computed tomography (CT) images.

Methods: We carried out a retrospective, bi-center investigation on ICH patients. Initially, we created a unique 3D convolutional model for predicting the functional outcome of ICH patients using CT scans taken from randomly chosen ICH patients in the H training dataset gathered from H hospital. Following this, we compiled clinical data and radiological features at the point of admission, using the Extreme Gradient Boosting (XGBoost) algorithm to formulate a second model, henceforth

referred to as the XGBoost model. To conclude, we merged the Convolution model and XGBoost model to form the third "Fusion model". A favorable outcome was identified as a modified Rankin Scale score ranging between 0-3 upon discharge. The predictive accuracy of the three models' prognosis was assessed using an H test dataset and an external Y dataset, which were subsequently compared to the performance of the ICH score and ICH grading scale (ICH-GS). Results: This study incorporated a total of 604 ICH patients, with 450 patients in the H training dataset, 50 patients in the H test dataset, and 104 patients in the Y dataset. In the Y dataset, the areas under the curve (AUCs) of the Convolution model, XGBoost model, and Fusion model were 0.829, 0.871, and 0.905 respectively. The prognostic performance of the Fusion model surpassed that of the ICH score and ICH-GS ($p = 0.043$ and $p = 0.045$, respectively). Conclusions: Deep learning models provide considerable accuracy in predicting the functional outcome of patients with spontaneous intracerebral hemorrhage.

基于纹理分析方法评价肝泡状棘球蚴病活性的初步研究

李佳蔚、刘文亚
新疆医科大学第一附属医院

目的 探讨基于 CT 图像的 3D 纹理分析技术对肝泡状棘球蚴病 (HAE) 生物学活性的判断价值。**方法** 回顾性分析 110 例经术后病理确诊为 HAE 患者的临床资料、术前肝脏区 CT 增强扫描门静脉期图像与 PET/CT 图像, 以 PET/CT 的最大标准化摄取值 (SUV_{max}) 为判断标准, 将病灶分为有活性组 ($n=55$) 与无活性组 ($n=55$), 利用 MaZda 软件分别在两组患者肝脏区门静脉期图像上逐层勾画病灶感兴趣区域 (ROI) 并生成感兴趣容积 (VOI), 提取病灶 3D 灰度直方图纹理特征参数, 包括均值 (Mean)、变异度 (Variance)、偏度 (Skewness)、峰度 (Kurtosis)、第 1 百分位数 (Perc.01%)、第 10 百分位数 (Perc.10%)、第 50 百分位数 (Perc.50%)、第 90 百分位数 (Perc.90%) 及第 99 百分位数 (Perc.99%), 使用 Mann-Whitney U 检验比较两组病灶 3D 直方图纹理特征参数的差异性, 对组间有统计学差异的参数绘制受试者工作特征 (ROC) 曲线, 计算曲线下面积 (AUC), 评估各直方图参数对 HAE 病灶活性的判别效能。**结果** 两组间 3D 直方图纹理参数中 Mean、Variance、Skewness、Kurtosis、Perc.50%、Perc.90% 及 Perc.99% 7 个纹理参数组间差异有统计学意义 (P 均 < 0.05), AUC 为 0.614~0.647, 均具有一定的判别效能, 多参数联合预测模型的 AUC 为 0.708, 灵敏度为 76.4%, 特异度为 58.2%。**结论** 基于 CT 增强扫描门静脉期图像的 3D 灰度直方图纹理分析技术对 HAE 病灶生物学活性的判别具有一定价值, 且多参数联合模型的判别效能更高, 为评价患者治疗效果、监测疾病进展及制定治疗方案提供了新的方法, 具有一定的应用前景。

骨骼 CT 三维重建技术在流浪精神分裂患者锁骨性别及年龄推断应用价值

邹灿
玉林市四人民医院

目的 探讨骨骼 CT 三维重建技术在流浪精神分裂患者锁骨的性别及年龄的推断中的应用价值。**方法** 收集 50 例流浪精神分裂患者的锁骨 CT 数据, 通过 Mimics 软件进行三维重建, 测量锁骨长度、宽度和角度等指标, 并结合统计学方法进行分析。

结果通过三维重建技术,成功地重建了 50 例流浪精神患者的锁骨形态,并测量了相关指标。根据统计学方法分析,锁骨长度、宽度和角度等指标与性别、年龄呈现显著相关性,其中锁骨长度和宽度可用于性别推断,锁骨角度可用于年龄推断。

结论骨骼 CT 三维重建技术可用于流浪精神分裂患者锁骨的性别及年龄的推断,为法医学鉴定提供了新的技术手段。

PO-3926

探讨多次重复扫描中 MRS 的可重复性

张敏、王培军
上海市同济医院

目的 通过两种方式对被试同一脑区进行两次重复扫描,探讨重复扫描所得波谱结果的可重复性。

方法 选取 30 名健康志愿者(9 男,21 女,年龄 21 ± 3)分为 A、B 两组,每组 15 人,以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪(Siemens MAGNETOM Trio Tim),采用点分辨波谱(PRESS)序列对每位志愿者进行两次扫描,其中 A 组在定位后进行两次连续扫描,B 组在定位后先进行一次扫描,然后将扫描床移出磁场中心,隔三分钟再进床至原来的位置,间隔期间确保被试不动,严格按照第一次的定位并扫描得到第二次的结果,利用 LCmodel 软件对采集到的脑代谢物波谱数据(tNAA、tCho、tNAA/tCr、tCho/tCr)进行后处理及定量分析。将两次扫描所得结果的差异性系数(CV)作为衡量两组波谱结果可重复性的指标,并将 A、B 两组数据进行比较。结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数(Mean CV)分别为 NAA 1.84 ± 2.11 , Cho 2.73 ± 2.45 , NAA/Cr 1.99 ± 1.54 , Cho/Cr 1.55 ± 1.38 , B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44 ± 2.98 , Cho 3.06 ± 2.45 , NAA/Cr 4.57 ± 2.63 , Cho/Cr 2.49 ± 1.58 。配对样本 t 检验发现,对于不同代谢物及代谢物比值,除了 B 组 Cho/Cr ($P<0.05$)外,两种方法所得结果的差异性不具有统计学意义($P>0.05$)。

结论 结果提示多次重复扫描所得代谢物分析结果的变化不完全代表被试真实生理状态的改变,并且具有时间间隔的重复扫描会受到更多因素的干扰,在进行长期的跟踪研究时应将这种结果的差异性考虑进去。

PO-3927

探讨纵向研究中多次扫描所得 MRS 结果的差异性

张敏、王培军
上海市同济医院

目的 通过两种方式分别对相同患者同一脑区进行两次扫描,探讨多次扫描所得波谱结果的差异性。

方法 选取 30 名健康志愿者(9 男,21 女,年龄 21 ± 3)分为 A、B 两组,每组 15 人,以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪(Siemens MAGNETOM Trio Tim),采用点分辨波谱(PRESS)序列对每位志愿者进行两次扫描,其中 A 组在定位后进行两次连续扫描,B 组在定位后先进行一次扫描,然后将扫描床移出磁场中心,隔三分钟再进床至原来的位置,间隔期间确保被试不动,严格按照第一次的定位并扫描得到第二次的结果,利用 LCmodel 软件对采集到的脑代谢物波谱数据(tNAA、tCho、tNAA/tCr、tCho/tCr)进行后处理及定量分析。将两次扫描所得结果的差异性系数(CV)作为衡量两组波谱结果一致性的指标,并将 A、B 两组数据进行比较。结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数(Mean CV)分别为 NAA 1.84 ± 2.11 , Cho 2.73 ± 2.45 , NAA/Cr 1.99 ± 1.54 , Cho/Cr 1.55 ± 1.38 , B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44 ± 2.98 , Cho 3.06 ± 2.45 , NAA/Cr 4.57 ± 2.63 , Cho/Cr

2.49±1.58。配对样本 t 检验发现,对于不同代谢物及代谢物比值,除了 B 组 Cho/Cr ($P<0.05$) 外,两种方法所得结果的差异性不具有统计学意义 ($P>0.05$)。

结论 当扫描有一定的时间间隔时,所得同一患者的波谱数据之间一致性不如连续性扫描,代谢物的含量值浮动范围更大,说明间隔一段时间的扫描引入了更多的干扰因素,如磁场稳定性的改变、定位不精确等。在进行纵向临床研究时应考虑这些干扰因素造成的结果的差异。

PO-3928

基于深度学习方法自动测量儿童颈椎 MRI 结构的初步研究

朱逸峰^{1,2}、李雨师²、王可欣³、张耀峰⁴、于俊华⁴、张晓东¹、王霄英¹

1. 北京大学第一医院

2. 大连医科大学附属第二医院

3. 首都医科大学

4. 北京赛迈特锐医学科技有限公司

目的 探索利用深度学习方法在 MRI 图像上自动测量儿童颈椎结构的可行性。方法 回顾性收集我院 2013 年 12 月至 2022 年 8 月 0-14 岁颈椎 MRI 扫描未见异常的图像 61 例为正常组,同时纳入 20 例存在脊髓弥漫性病变的患者为疾病组,使用已有成年人颈椎分割模型分别预测矢状位和轴位 T₂WI 的颈椎椎体、硬膜囊和脊髓,在矢状位椎体分割结果自动定位椎体,将定位信息匹配至轴位 T₂WI,得到各个间盘的定位,分别取出正常组 C2/3 至 C6/7 椎间盘正中层面轴位 T₂WI 进行自动测量,测量指标包括:硬膜囊面积、左右径及前后径;脊髓面积、左右径、前后径;脊髓前后间隙及左右间隙,对以上测量结果绘制散点图进行描述。对于疾病组,计算其脊髓和蛛网膜下腔的信号强度比值,并于正常组进行比较。结果 61 例正常组颈椎 MR 图像中, C2/3-C6/7 椎间盘层面硬膜囊面积 116.04mm²-396.62mm²;脊髓面积 34.18mm²-129.43mm²;硬膜囊左右径 14.06mm-28.93mm;前后径 8mm-17.56mm;脊髓左右径 7.03mm-15mm;前后径 5.36mm-12.86mm;脊髓前间隙 0.50mm-5.89mm;后间隙 0.60mm-4.76mm;脊髓左间隙 1.19mm-6.55mm;右间隙 1.49mm-9.11mm。基于脊髓和蛛网膜下腔的信号强度比值具备区分脊髓是否存在病变的能力。结论 成年人颈椎 MR 分割及测量模型可以迁移到儿童。利用深度学习方法在 MRI 图像上可自动测量儿童颈椎结构,为下一步建立颈椎和脊髓疾病定量诊断模型奠定了基础。

PO-3929

基于深度学习模型建立的人工智能定位算法在颈椎 MRI 成像中的应用

颜秋婵

南方医科大学珠江医院

目的:椎间盘退变是导致颈部疼痛的主要原因,也是患者前来医院接受 MRI 检查的常见原因。本研究通过开发一种精准的人工智能定位算法,实现对椎间盘的准确定位,从而实现对椎体病变的准确评估。

材料与方法:本研究回顾性收集了我院在 2020 年 1 月至 2022 年 6 月期间进行的颈椎 MRI 检查的患者数据,共纳入 1703 例。在这个多任务分割模型中,本研究随机将这些患者数据随机分为训练集、调优集和内部验证集。在椎间盘分割模块,使用了 467 个训练数据和 148 个调优数据,而椎间盘标签模块则使用了 724 个训练数据和 264 个调优数据。扫描参数输出模块,则基于椎间盘分割结果获取了矢状位、冠状位和横断位扫描方向以及相应的扫描中心。同时,基于椎间盘标签结果,获取了每个椎间盘和椎体的标签信息。我们使用 Dice 系数 (DSC) 评估模型的性能。而为了进一步

验证模型定位的准确性,我们另外采集了 100 例患者进行内部验证。我们分别评估了在使用智能定位算法与不使用情况下的定位准确性,并用平均角度误差来评估算法计算结果的精确度。

结果:本研究中使用的智能定位算法,在椎间盘分割模块表现出最佳的 Dice 系数(DSC)为 0.9265,在椎间盘标签模块的 DSC 为 0.9048。在验证集中,智能定位算法也展现了准确的椎间盘分割性能。具体而言,在矢状位、冠状位和轴位上,算法计算的扫描方向与金标准之间的平均角度误差分别为 0.81°、1.39°和 1.97°,较手动定位组误差分别减少了 0.27°、0.59°和 0.05°。

结论:本研究建立的基于深度学习模型的人工智能定位算法,能够实现对椎间盘的精准定位,为放射科医生进一步实现对椎间盘病变的诊断提供重要辅助,具有重要的临床应用价值。

PO-3930

基于磁共振结构像定量分析预测直肠癌 p53 状态: 一项机器学习模型研究

舒震宇

浙江省人民医院

目的:基于机器学习构建及验证一个磁共振结构像标志物并联合临床特征构建列线图模型用于预测直肠癌 p53 基因状态。

方法:回顾性分析 300 例行根治术的直肠癌患者的临床及影像资料,依据术后病理结果确定 p53 基因突变患者共 166 例。将所有病例按受检时间分为训练组和测试组。基于训练组数据从每例患者的 T2WI 结构图像中提取肿瘤原发灶的影像组学特征并进行降维后使用支持向量机构建结构像标志物,之后基于多因素逻辑斯回归筛选预测因子并联合结构像标志物构建列线图模型用于预测 p53 基因状态,同时使用测试组数据和 ROC 曲线评估列线图的准确性和可靠性。

结果:结果像标志物在训练组和测试组中的诊断效能分别为 0.828 和 0.795,敏感性分别为 0.825 和 0.891,特异性为 0.722 和 0.659。列线图在训练组和测试组中的诊断效能分别为 0.86 和 0.847,敏感性分别为 0.758 和 0.869,特异性为 0.833 和 0.75。

结论:融合了结构像标志物构建的列线图能很好的预测 p53 基因状态,可以方便的促进术前分子病理学诊断。

PO-3931

基于人工智能辅助迭代图像重建技术的智能快速磁共振 (iQMR)在急性缺血性脑卒中 MR 检查中的应用价值研究

薛波

重庆市急救医疗中心

目的:探究基于人工智能辅助迭代图像重建技术的智能快速磁共振(iQMR)在急性缺血性脑卒中 MR 检查中的应用价值。

方法:回顾性连续收集 113 例急性缺血性脑卒中患者的头部 MRI 资料,其中 56 例进行常规 T2-FLAIR 序列扫描,57 例进行加速 T2-FLAIR 序列扫描并使用 iQMR 进行后处理。使用 5 分 Likert 量表对常规 T2-FLAIR 序列、加速 T2-FLAIR 序列与应用 iQMR 的加速 T2-FLAIR 序列三组图像的图像质量进行主观评分,使用 Cohen's kappa 统计计算阅片者间一致性。测量并计算三组图像中病灶和周围组织的 SNR,病灶与周围组织之间的 CNR,并比较分析三组 T2-FLAIR 序列主观评分和客观指标的差异。

结果：加速 T2-FLAIR 序列相比常规 T2-FLAIR 序列扫描缩短了 22.5% 的扫描时间。应用 iQMR 的加速 T2-FLAIR 序列图像质量明显优于另外两组, 两阅片者间主观评分一致性好, Kappa 值分别为 0.862、0.849 和 0.843。两两比较显示, 应用 iQMR 的加速 T2-FLAIR 序列图像在病灶和病灶周围组织的 SNR 和 CNR 都明显高于未使用 iQMR 的加速 T2-FLAIR 序列, 两者之间的差异均有统计学意义 ($P < 0.001$)；而与常规 T2-FLAIR 序列相比, 其在病灶处的 SNR 和 CNR 差异无统计学意义 ($P > 0.05$)，在病灶周围组织处的 SNR 差异具有统计学意义 ($P < 0.001$)。

结论：基于人工智能辅助迭代图像重建技术的智能快速磁共振 (iQMR) 可明显缩短急性缺血性脑卒中患者 MR 检查扫描时间, 并提升图像质量。

PO-3932

基于人工智能的肺结节良恶性诊断的验证研究

黄文君^{1,2,3}、敬文斌²、周陶胡^{1,3}、董鹏³、范丽¹

1. 海军军医大学附属长征医院放射科

2. 德阳市第二人民医院放射科

3. 潍坊医学院医学影像学院

目的：目前人工智能 (AI) 辅助诊断系统已经用于了放射科的临床实践, 但随着肺结节的良恶性国际分类标准的改变, 其对良恶性肺结节的诊断效能仍有待验证。本研究旨在验证商用的 AI 辅助诊断系统在不同分类标准下预测肺结节良恶性的诊断效能。

方法：回顾性收集 2019 年 1 月至 2021 年 12 月期间经手术切除或穿刺活检后的病理证实的肺结节, 共 404 例。根据世界卫生组织 (WHO) 2021 版和 2015 版两种分类标准, 分别将腺体前驱病变 (PGL) 纳入良性病变和恶性病变进行良恶性分组。分析人工智能辅助诊断肺结节良恶性的结果与术后病理结果的一致性, 并构建不同病理分类标准下基于 AI 定量特征的肺结节恶性临床预测模型。

结果：1. 当 PGL 属于恶性病变时 (WHO 2015), 术后病理结果与 AI 诊断的结果具有高度的一致性 ($Kappa = 0.658$), 平均 CT 值 ($P < 0.001$) 是肺结节恶性的独立保护因素, 构建的临床预测模型的 AUC 为 0.806 (95%CI: 0.756 ~ 0.856)。2. 当 PGL 属于良性病变时 (WHO 2021), 术后病理结果与 AI 诊断的结果具有中等程度的一致性 ($Kappa = 0.440$), 熵 ($P = 0.008$) 是肺结节恶性的独立危险因素, 构建的临床预测模型的 AUC 为 0.749 (95%CI: 0.700 ~ 0.797)。

结论：肺结节病理结果的良、恶性与 AI 软件诊断的高、低危间具有中等到高度的一致性, 具有较好的诊断性能, 但需要随着病理分类的更新优化对 PGL 的评估; CT 平均值和熵分别是肺结节恶性的独立保护因素和危险因素, 基于两种因素分别构建的肺结节恶性临床预测模型具有一定的预测价值。

PO-3933

使用机器学习预测肝细胞癌 MVI 状态：对放射科医生的作用

曾辉、曾凤霞、徐泽园、陈卫国

南方医科大学南方医院

目的：本研究基于临床资料和 CT 影像学征象构建肝细胞癌 MVI 状态的机器学习预测模型, 通过与放射科医生的诊断性能对比, 分析该预测模型的临床价值。

方法：共计 216 例肝细胞癌患者被分为了训练集 (170) 例和测试集 (56 例)。患者的术前临床资料及 CT 影像学征象用于构建预测 MVI 的机器学习模型, 并使用 SHAP 值评估模型重要特征排序。同时, 四名放射科医生对模型的测试集数据进行独立阅片, 包括无模型辅助下的阅片和模型辅助下的阅片, 其中模型辅助下的阅片包括模型输出的重要特征辅助下的阅片及模型输出概率值辅助下的

阅片。AUC 值、准确性、敏感性、特异性等指标用于评估模型性能及不同模式下放射科医师诊断性能的对比。

结果: 训练集中, 机器学习模型预测 MVI 的 AUC 值、准确性、敏感性、特异性分别为 0.907 (95%CI:0.856-0.958), 0.824, 0.955, 0.576。测试集分别为 0.860 (95%CI: 0.763-0.956), 0.807, 0.865, 0.700。四名放射科医师在无任何模型辅助下的平均 AUC 值为 0.656 (95%CI: 0.479-0.834), 在模型输出的重要特征辅助下及输出概率值辅助下的平均 AUC 值分别为 0.756 (95%CI: 0.613-0.890), 0.773 (95%CI: 0.628-0.918), 差异均具有统计学意义 ($P=0.015$, $P=0.004$)。

结论: 基于术前 CT 影像学征象及临床指标构建的机器学习模型可以较好地预测肝细胞癌的 MVI 状态, 并且模型输出的重要特征值及概率值均有助于提高临床医师对 MVI 的检测。

PO-3934

人工智能肺结节筛查中检测效能初探

宋冬冬

大连大学附属中山医院

目的:探索双能 CT 融合 120 kVp 图像在人工智能辅助诊断软件 (AI) 肺结节筛查中的检测效能。方法:收集我院行双源 CT 肺癌筛查的患者 381 例, 患者随机分为单源扫描 (A 组) 和双能扫描 (B 组) 两组, A 组管电压为 120kVp, 共 183 例, B 组双能管电压扫描 (A 管球管电压 100kVp, B 管球管电压 Sn140kVp), 共 198 例。记录 CTDIvol、DLP, 计算有效辐射剂量 ED。采用骨算法重建层厚为 1mm 图像, 使用人工智能肺结节检测软件, 对图像进行自动结节检测, 记录检出结节的大小、位置、类型。统计检测全部结节数、不同大小结节数、不同类型结节数以及相应的真阳数、假阳数、漏诊数, 计算出对应的结节检测敏感度和假阳性率, 比较两组间的差异, $p<0.05$ 为差异具有统计学意义。结果:AI 在两组图像中检测出的全部肺结节、直径 ≥ 4 mm 肺结节、直径 < 4 mm 肺结节、实性肺结节、亚实性肺结节的敏感度、假阳性率分别为: A 组 (82.83%、1.55/CT), (91.07%、0.98/CT), (80.48%、0.56/CT), (86.4%、0.96/CT), (70.9%、0.58/CT), 辐射剂量 ED 为 (4 ± 1.1 mSv); B 组 (91.53%、1.35/CT), (97.87%、0.77/CT), (89.73%、0.59/CT), (91.77%、0.71/CT), (89.25%、0.64/CT), 辐射剂量 ED 为 (3.23 ± 0.97 mSv)。B 组图像的肺结节, 其检测敏感度都高于 A 组 ($p<0.05$), B 组图像的辐射剂量低于 A 组 ($p<0.05$), B 组肺结节总的假阳性率 1.35/CT 低于 A 组 1.55/CT。结论:双能融合 120kVp 图像在人工智能辅助诊断软件肺结节检测中的敏感度, 高于单源扫描 120kVp 图像, 且假阳性率不高于单源扫描 120kVp 图像, 同时其辐射剂量明显低于单源扫描 120kVp 图像。

PO-3935

基于深度学习建立颈椎病 MR 诊断模型的初步研究

朱逸峰^{1,2}、李雨师²、孙兆男¹、张耀峰³、李家轮³、张晓东¹、王可欣⁴、王霄英¹

1. 北京大学第一医院

2. 大连医科大学附属第二医院

3. 北京赛迈特锐医学科技有限公司

4. 首都医科大学

目的: 探索利用深度学习方法在建立颈椎病 MR 诊断模型的可行性。

材料与方法: 回顾性收集我院 2020 年 10 月至 2023 年 3 月疑诊颈椎病 MR 图像 514 例, 使用已有颈椎分割模型在轴位 T2WI 上分别预测硬膜囊、脊髓、椎间盘、后纵韧带和黄韧带, 在矢状位 T1WI 和 T2WI 上预测颈椎椎体和椎间盘。由一位低年资放射科医生 (阅片经验 2 年) 修改标注, 另一位

高年资放射科医生 (阅片经验 ≥ 15 年) 对低年资医师的标注进行复核。按照颈椎病的不同诊断要点分别进行 3D 或 2D 深度学习分类模型训练, 包括 (1) 颈椎椎体增生模型; (2) 颈椎椎体滑脱模型; (3) 颈椎间盘突出分类模型; (4) 后纵韧带增厚模型; (5) 黄韧带增厚模型。将模型输出结果导入 R 软件进行混淆矩阵分析及 ROC 曲线绘制, 采用正确率、灵敏度、特异度、阳性预测值、阴性预测值以及 ROC 曲线下面积等评价五种模型分类效能。

结果: 五种分类模型中诊断效能最好的是颈椎间盘突出分类模型, 正确率达到 0.90, 灵敏度达到 0.95, 特异度达到 0.85, ROC 曲线下面积达到 0.90。颈椎椎体增生和滑脱的正确率也分别达到 0.81 和 0.80, 灵敏度为 0.74 和 0.76, 特异度为 0.84 和 1.00, ROC 曲线下面积分别为 0.79 和 0.88。后纵韧带和黄韧带增厚的模型正确率分别为 0.82 和 0.77, 灵敏度为 0.78 和 0.84, 特异度为 0.86 和 0.70, ROC 曲线下面积分别为 0.82 和 0.77。所有模型的诊断效能均能够满足临床需求。

结论: 本部分研究采用深度学习建立了颈椎病 MR 的自动分类诊断模型, 对颈椎椎体增生、滑脱、椎间盘突出、后纵韧带及黄韧带增厚进行了分类模型的训练, 五种模型的诊断效能目前均能够满足临床需求, 证明深度学习可以用于颈椎病 MR 的辅助诊断, 能够减轻放射科医生的工作负担, 提高放射科医生的工作效率, 为未来进一步探索建立颈椎病 MR 自动诊断模型及结构化报告的植入奠定了基础。

PO-3936

基于多参数磁共振及机器学习的瘤周与瘤内影像组学特征模型用于术前评估胰腺癌的病理学结果

范旭辉、王悍
上海市第一人民医院

目的: 利用影像组学来术前评估胰腺癌患者的病理学结果将有助于临床决策。目前, 利用基于多参数 MRI 和机器学习算法的影像组学模型来预测胰腺癌患者术前淋巴结转移和组织分化仍值得更多的努力与探索。

方法: 这项双中心回顾性研究招募了 166 例胰腺导管腺癌患者。其中, 来自同一中心的 126 名患者以 4:1 的比例被分配到训练集和验证集, 另一中心的 40 名患者作为外部测试集。在获得 MRI 的三个序列 (T2 加权成像 (T2WI)、弥散加权成像 (DWI)、动态对比增强成像 (DCE)) 后, 对肿瘤的边界进行勾画, 并提取肿瘤周围及肿瘤内部的影像组学特征, 其中包含一阶、形状和纹理特征。采用以下的三步法对特征进行筛选: SelectKBest、最小绝对收缩和选择算子 (LASSO) 和基于随机森林的递归特征消除法 (RFE-RF)。获得最佳的特征组合后, 通过训练六种基于机器学习的分类器 (决策树、K 近邻、支持向量机、随机森林、逻辑回归、XGBoost), 并从中选出表现最佳的分类器来构建影像组学模型。最后, 将通过筛选所得到的临床因素添加到影像组学模型中来构建相应的组合模型。

结果: 经过“三步法”进行特征选择后, 12 个特征用于预测淋巴结转移, 11 个特征用于预测组织分化。在六种不同的分类器中, 随机森林和逻辑回归分别在预测淋巴结转移和组织分化方面表现最好, 并被用于后续的模型建立。结合了肿瘤的瘤周和瘤内特征的影像组学模型优于单独瘤周与瘤内的模型, 其对于淋巴结转移和组织分化的内部验证集的曲线下面积 (AUC) 值分别达到 0.924 和 0.944, 外部验证集的 AUC 值分别为 0.875 和 0.892。此外, 影像组学模型与组合模型之间没有显著的差异。

结论: 影像组学在技术层面上能够准确预测胰腺癌的淋巴结转移和组织分化, 具有较好的临床应用前景。瘤周和瘤内特征的组合将更有利于模型的预测性能, 但临床因素对影像组学模型预测能力的提升并不显著。

PO-3937

MRI 影像组学在预测鼻咽癌预后中的应用价值研究

李泉江、彭娟、罗天友
重庆医科大学附属第一医院

目的：探讨原发肿瘤病灶（primary tumor lesion, PTL）和转移淋巴结（metastatic lymph node, MLN）的 MRI 影像组学特征构建的模型预测鼻咽癌（nasopharyngeal carcinoma, NPC）预后的价值。

材料与方法：回顾性搜集从 2013 年 1 月至 2019 年 12 月经内镜病理证实的晚期（III~IVa 期）患者 209 例（包括男 157 例，女 52 例），年龄 17~75 岁（平均 48.938 ± 10.918 岁）。按 7:3 比例随机分为训练集（n=145）和验证集（n=64）。采用单因素和多因素分析筛选临床特征（clinical features, CF）。在 MRI 图像上勾画感兴趣区并提取影像组学特征，用 LASSO 筛选特征并用逻辑回归、支持向量机和 Cox 比例风险回归模型构建预测预后模型。采用 DeLong 检验、ROC 曲线、校准曲线、Kaplan-Meier 生存曲线以及决策曲线比较模型的效能。

结果：从 PTL、MLN 以及 PTL+MLN 的特征中分别筛选出 6、7 及 6 个特征。使用 3 种分类器建立模型发现，基于 PTL 特征的模型比基于 MLN 和 PTL+MLN 的模型表现更好；联合 CF+PTL 建立的 Cox 模型验证集的 AUC 值最高（训练集：0.737，验证集：0.801）；但 DeLong 检验发现基于 PTL 与 CF+PTL 的 Cox 模型在训练集和验证集中 AUC 值的差异无统计学意义（ $P > 0.05$ ）。绘制校准曲线、Kaplan-Meier 生存曲线和决策曲线发现，基于 CF+PTL 建立的 Cox 模型验证集的拟合优度、生存曲线的区分度均比基于 PTL 建立的 Cox 模型更好，临床获益更高。

结论：根据 PTL 特征建立的 MRI 影像组学模型可以预测 NPC 的复发或者远处转移等不良预后，其预测能力优于 MLN 特征建立的模型；CF+PTL 联合模型可以提高模型的临床价值。

PO-3938

基于机器学习技术的早期 COPD 诊断模型研究

刘明珠
中国人民解放军海军军医大学第二附属医院

目的通过获取 CT 扫描图像的定量参数，结合受试者的基本信息，利用传统的机器学习模型来建立早期 COPD 诊断模型。

资料与方法回顾性纳入 2015 年 1 月至 2020 年 08 月上海市同济医院和长征医院 2142 名同时具有肺功能检查和胸部 CT 平扫的患者。本部分共纳入人群 2142 例，其中训练集 1499 例，验证集 214 例，测试集 429 例。通过 COPD 专用分析软件测量定量 CT 参数。基于定量 CT 参数以及临床资料，本研究根据三个不同的分类问题（COPD 和非 COPD 二分类、正常组和高危人群二分类、正常、高危、COPD 三分类）尝试构建了不同的机器学习模型，分别为：多层感知机（MLP, Multilayer Perceptron）也叫人工神经网络（ANN, Artificial Neural Network）、支持向量机（Support Vector Machine, SVM）和随机森林（Random Forest, RF）。

结果基于定量 CT 参数的传统机器学习结果显示，支持向量机模型（SVM）综合性能最优。对于正常组和高危组的分类问题，SVM 的精确率为 0.760，召回率仅为 0.620，F1 分数为 0.683；COPD 患者的诊断 SVM 模型中，SVM 的精确率为 0.823，召回率为 0.826，F1 分数为 0.824；而对于正常组、高危组、COPD 组的分类模型，SVM 的精确率为 0.572，召回率为 0.576，F1 分数为 0.565，与其他两个机器学习模型相似。

结论传统机器学习模型能够根据定量 CT 参数较好的诊断 COPD，但是对于高危人群的识别以及多分类问题，传统机器学习方法性能欠佳。

PO-3939

基于多中心的多参数 MRI 影像组学列线图预测

ISUP \geq 3 前列腺癌的价值

张永胜¹、李志平¹、崔凤¹、许茂盛²

1. 杭州市中医院

2. 浙江省中医院 (浙江中医药大学附属第一医院)

目的 探讨基于多中心多参数 MRI 影像组学列线图预测 ISUP \geq 3 前列腺癌 (csPCa) 的价值。

方法 回顾性分析三个中心的 395 例 PCa 患者, 分为训练组、内部验证组和 2 个外部验证组。从每例患者的 T2WI、DWI 和 ADC 图像中共提取 3948 个影像组学特征, 对训练组采用最小冗余最大相关 (mRMR) 和最小绝对值收敛和选择算子 (LASSO) 两种方法进行特征降维后建立影像组学模型 (Rad-score)。采用单因素、多因素逻辑回归筛选独立临床特征, 来构建临床模型。将筛选出的临床特征和 Rad-score 进行多元逻辑回归分析, 建立联合预测模型并制作列线图。采用受试者工作特征 (ROC) 曲线和校正曲线来评估三个模型的性能。采用决策曲线分析法评价哪种模型的净效益最大。

结果 经过 mRMR 和 LASSO 降维后筛选出 11 个价值较大的影像组学特征。经过单因素、多因素逻辑回归分析筛选出 MRI 肿瘤 T 分期和 ADC 值两个临床特征。采用多因素逻辑回归构建包含了 MRI 肿瘤 T 分期、ADC 值和影像组学标签的预测模型并制作列线图, 列线图预测 csPCa 在训练组、内部验证组、外部验证组 1 和外部验证组 2 的 ROC 曲线下面积分别是 0.85、0.88、0.81、0.81。校正曲线显示训练组、内部验证组、2 个外部验证组的列线图预测与实际分类结果之间具有较高的一致性 ($P > 0.05$)。通过决策曲线分析, 列线图与影像组学模型比基于临床特征模型的临床应用收益更高。

结论 多参数 MRI 影像组学列线图可以作为一种潜在的非侵入性量化工具, 用于鉴别 csPCa 与 ciPCa。

PO-3940

基于 Swin Transformer 架构的磁共振图像加速重建

于会昌

中国人民解放军海军军医大学第二附属医院

摘要: **目的:** 基于深度学习的磁共振图像加速重建是一种利用机器学习算法实现加速磁共振成像过程的方法。传统的磁共振成像需要大量的扫描时间和计算资源, 限制了其在临床应用中的广泛使用。为了解决这一问题, 本文提出了一个以 Swin Transform 为架构的磁共振图像加速重建方法。**方法:** 首先, 从全采样 k-space 空间中截取 1/2 或 1/4 的 k-space 数据用以生成欠采样低分辨率图像, 并结合全采样数据生成高-低分辨率数据对形成数据集, 以 7: 2: 1 的比例划分为训练集(396 张), 验证集 (113 张) 和测试集 (56 张)。其次, 为了挖掘更多原始信息, 将浅层特征提取模块设置为两层卷积来增加感受野, 对于两种不同的重建形式主体部分 RSTBS (Residual Swin transformer blocks) 模块级联数分别设置为 4 和 6, 每个模块注意力头数均设置为 6。使用多项损失结合训练优化模型。**结果:** 使用 PSNR (Peak Signal-to-Noise Ratio), SSIM (Structural Similarity), FID (Fréchet Inception Distance) 作为重建结果评价指标, 对于 1/2 欠采样重建, 各个指标为: PSNR: 37.41, SSIM: 0.9811, FID: 28.65。1/4 欠采样重建结果为: PSNR: 33.87, SSIM: 0.9658, FID: 38.73。**结论:** 更大的欠采样数据可以捕获更多信息拥有更好的重建结果, 相反, 更小的欠采样数据达到理想水平需要更大的计算资源。因此, 对更多数据的挖掘利用和寻找更适的损失函数, 有待进一步探索。

PO-3941

基于 CT 影像组学联合临床特征对新型冠状病毒肺炎-奥密克戎毒株肺炎临床转归的预测研究

王佳伟¹、李铁柱¹、赵博峰¹、王萃萃¹、耿亚媛²、魏东红¹、刘学敏¹、陈宝莹¹

1. 西安国际医学中心医院

2. 数坤科技(北京)网络有限公司

目的 探讨基于 CT 影像组学特征联合临床特征对新型冠状病毒肺炎-奥密克戎毒株患者临床转归的预测。**方法** 回顾性收集 107 例感染奥密克戎毒株肺炎的患者的临床和 CT 资料。所有患者按照临床结局分为好转组(53 例)和死亡组(54 例), 并从 CT 图像中提取了影像组学特征和临床特征, 进行特征筛选后使用逻辑回归模型分别建立临床模型、组学模型和联合模型, 其中训练集 74 例、测试集 33 例(7: 3)。通过受试者操作特征(ROC)曲线、决策曲线评估各种模型的诊断性能。结果死亡组患者的年龄、中性粒细胞计数、白细胞计数、中性粒细胞/淋巴细胞比值均显著高于好转组($P < 0.05$), 而淋巴细胞计数、白蛋白/球蛋白比值则均显著低于好转组($P < 0.001$)。多因素 Logistic 回归结果显示年龄、性别、中性粒细胞计数、中性粒细胞比率是新冠肺炎死亡结局的独立危险因素。联合模型基于 4 个具有独立危险因素的临床特征和 8 个筛选得到的影像组学特征构建。在训练集中, 临床模型, 影像组学模型和联合模型的准确性, 敏感性, 特异性和 AUC 分别为 0.83、0.78、0.89、0.89; 0.86、0.94、0.78、0.92 及 0.89、0.78、1、0.94。在测试集中, 临床模型, 影像组学模型和联合模型的准确性, 敏感性, 特异性和 AUC 分别为 0.75、0.76、0.75、0.82; 0.72、0.76、0.68、0.80 及 0.81、0.64、1、0.91。在训练集与测试集中, 临床模型, 影像组学模型和联合模型的对于预测奥密克戎新冠肺炎临床结局的 AUC 值均无统计学意义($P > 0.05$)。校准曲线显示该模型预测新冠肺炎死亡发生风险与实际发生风险一致性良好。决策曲线显示联合模型阈值概率 0~0.6 时, 可获得大于 0.3 的净收益。结论 基于胸部 CT 影像组学联合临床特征模型的建立对奥密克戎新型冠状病毒肺炎的临床转归预测具有较高的效能。

PO-3942

基于机器学习的双能量 CTA 识别症状性颈动脉斑块的研究

王灵杰、张华、乔英、石彩云、张倩、岳华杰、吕芑志

山西医科大学第一医院

目的: 本研究旨在开发和验证一种机器学习模型, 该模型双能 CTA 定量参数和临床相关风险因素, 用于识别症状性颈动脉斑块, 以预防急性脑血管事件。

方法: 对 2017 年 1 月至 2021 年 12 月 180 例颈动脉粥样硬化斑块患者的数据进行分析; 110 名患者(64.03±9.58 岁, 20 名女性, 90 名男性)被分配到有症状组, 70 名患者(64.70±9.89 岁, 50 名女性, 20 名男性)分配到无症状组。基于不同的 CT 和临床特征, 在训练队列中训练了五个使用 XGBoost 算法的机器学习模型, 在测试队列中, 使用受试者操作特征曲线、准确度、召回率和 F1 评分来评估所有五个模型的性能。

结果: SHAP 值排名显示, 脂肪分数(FF)在所有 CT 和临床特征中最高, 归一化碘密度(NID)排名第 10, 与基于传统 CT 特征(AUC.588, 准确度.593, 召回率.767, F1 分数.678)、双能 CT 特征(AUC.685, 准确度.648, 召回率.667, F1 得分.678)的其他四个模型相比, 基于 SHAP 测量的前 10 个特征的模型显示出最佳性能(曲线下面积[AUC].885, 准确率.833, 召回率.933, F1 得分.861), 传统 CT 和双能 CT 特征(AUC.819, 准确度.740, 召回率.867, F1 得分.788), 以及所有 CT 和临床特征(AUC.878, 准确度.833, 召回率 0.867, F1 评分.852)。

结论: 颈动脉斑块的脂肪分数和归一化碘浓度可作为症状性颈动脉斑块的影像学标志。这种结合了 DECT 和临床特征的基于树的机器学习模型可能包括一种用于识别症状性颈动脉斑块的无创性方法, 以指导临床治疗策略。

PO-3943

基于多相 CT 影像组学对膀胱尿路上皮癌预后预测价值的研究

薛靖、王冬青、张礼荣、朱海涛、庄子健、彭琳、陈星池
江苏大学附属医院

目的：探讨基于多相 CT 影像组学联合临床因素预测膀胱尿路上皮癌（BLCA）患者的总生存期。

方法：回顾性收集 114 例经多相 CT 扫描的原发性 BLCA 患者的影像、临床和生存资料，并按 6:4 的比例将所有患者随机分为训练集（68 例）和验证集（46 例）。利用 3D-slicer 手动分割所有 BLCA 患者的平扫、动脉期和静脉期图像感兴趣区域（ROI）并使用 Py-radiomics 提取影像组学特征。采用 Cox 回归算法建立平扫、动脉期、静脉期 3 个基本模型和动脉期+静脉期、平扫+动脉期+静脉期 2 个组合模型预测 BLCA 患者的总生存期。选择性能最高的影像组学模型计算影像组学评分（Rad-score），使用 Cox 回归分析影响患者总生存期的独立危险因素。后联合 Rad-score 和临床危险因素构建联合模型并绘制可视化的诺谟图。绘制 K-M 曲线及 C-index 评价各个模型的预测效能。分别计算联合模型在各时间点的曲线下面积（AUC）并绘制时间依赖 ROC。绘制校准曲线评估模型的一致性，决策曲线（DCA）判断模型的可用性及临床净效益。

结果：基于多相 CT 构建的 5 个影像组学模型中，平扫+动脉期+静脉期的组合模型具有最好的性能，其在验证集中的赤池信息准则（AIC）和一致性指数（C-index）分别为 130.48 和 0.779。以病理分级和 Ki-67 表达状态两个独立危险因素联合 Rad-score 构建的联合模型性能优于单独的影像组学模型，其在验证集中的 AIC 和 C-index 分别为 118.30 和 0.825。时间依赖 ROC 显示在各时间点，联合模型的 AUC 均高于 0.8，表明模型良好的稳定性。校准曲线显示联合模型的预测概率与实际之间具有良好的一致性（ $P < 0.05$ ）。决策曲线显示在较大的阈值概率范围内，联合模型具有良好的临床应用价值。

结论：基于多相 CT 影像组学联合临床危险因素构建的模型可用于无创预测 BLCA 患者的总生存期，有助于临床决策。

PO-3944

基于胸部正位 X 线摄影的儿童 PICC 导管头端智能定位

贺小娅
重庆医科大学附属儿童医院

目的：胸部正位 X 线摄影（胸片）是临床了解 PICC 头端位置常用的检查手段，但是胸片无法准确判断 PICC 头端是否位于上腔静脉（SVC）合适位置。本研究旨在建立 PICC 头端在 SVC 内所处位置的自动判断模型，实现利用胸片对 PICC 头端位置进行准确、快速的识别和判断。

方法：（1）回顾性分析我院 440 例接受胸部 CT 增强的患儿，在增强图像上测量 SVC 长度、气管隆突至 SVC-右心房交界处（CAJ）的距离（气管隆突-CAJ）以及气管隆突至 SVC 上、中、下 1/3 段各分界点的距离，建立各年龄段 SVC 与气管隆突位置关系的参考数据。（2）收集我院 1642 例接受 PICC 的胸片，导入 CVAT 软件勾画出气管隆突、PICC 导管及导管头端，选用 DEKR 算法进行关键点检测，构建并验证可自动识别气管隆突的模型；选用 U2-Net 结构和 Transform 的语义分割算法 UCtransNet，构建并验证可自动识别 PICC 导管及其头端的模型。（3）结合基于 CT 图像的 SVC 与气管隆突位置关系的数据，通过多模块程序整合，形成 PICC 头端位置自动识别及判断的人工智能系统，并验证。

结果：不同年龄段儿童气管隆突到 SVC 各点的距离符合一元二次方程： $\text{distance} = k_1 \times d + k_2 \times d^2 + b$ （ k_1 、 k_2 为拟合方程中变量的系数， b 为拟合方程中的常量， d 为患者出生日期到就诊日期的天数），判断 PICC 头端位置的准确率 95.5%。

结论：成功建立基于胸片的 PICC 导管头端自动识别及判断系统，该系统可准确、快速地识别 PICC 导管头端，并判断其是否位于最适位置，为 PICC 导管的临床管理提供影像指导。

PO-3945

基于多参数 MRI 影像组学术前评估直肠癌肿瘤出芽分级

彭琳、王冬青、张礼荣、朱海涛、庄子健、陈星池、薛靖

江苏大学附属医院

目的：开发基于多参数 MRI 影像组学和独立危险因素的联合模型，用于直肠癌肿瘤出芽（TB）分级的术前评估。

方法：本研究回顾性地分析了 2018 年 1 月至 2022 年 3 月在本院行术前 MRI 检查并经手术病理证实为直肠癌的 120 例连续患者的影像和临床资料。按照 6: 4 的比例将患者分成训练组和验证组。将患者术前 T2 加权成像（T2WI）、弥散加权成像（DWI）和对比增强 T1 加权成像（T1CE）图像导入 3D-Slicer 中进行感兴趣体积（VOI）的手动勾画和特征提取。应用皮尔森相关法和方差分析筛选特征，计算相应的影像组学得分（Rad-Score, RS）并且利用支持向量机作为分类器构建影像组学模型（T2WI 模型、DWI 模型和 T1CE 模型）。通过单因素和多因素 Logistic 回归分析从临床及 MRI 语义特征中选择独立危险因素，并构建临床模型。利用 Logistic 回归分析开发一个结合 RS_{T2WI} 、 RS_{DWI} 、 RS_{T1CE} 和独立危险因素的联合模型。绘制受试者工作特征（ROC）曲线观察各模型诊断直肠癌 TB 分级的效能。使用校准曲线评估联合模型拟合情况。使用决策曲线分析评估模型临床效益。

结果：从 T2WI、DWI 和 T1CE 序列各提取并筛选出了 7 个特征用于计算相应的 RS 及构建相应影像组学模型。MRI 报告的 N 分期（ $P=0.020$ ）是 TB 的独立危险因素。在验证组中，联合模型、T1CE 模型、T2WI 模型、DWI 模型和临床模型的 ROC 曲线下面积（AUC）分别为 0.891、0.838、0.711、0.758、0.609。联合模型显示出比其他模型更好的性能。校准曲线显示联合模型拟合良好。决策曲线分析表明在绝大多数阈值概率中，联合模型的净效益优于其他模型。

结论：结合影像组学特征和 MRI 语义特征的联合模型可以作为术前评估直肠癌 TB 分级的有效工具，以便对患者进行个体化分层，从而选择合适的治疗方案。

PO-3946

胸部 CT 重建参数对于肺结节影像组学特征的影响探究

许方怡¹、朱文超¹、黄定品¹、楼凯华¹、谢东³、黄少宇²、何承斌¹、胡红杰¹

1. 浙江大学医学院附属邵逸夫医院

2. 宁波市医疗中心李惠利医院

3. 绍兴第二医院

目的：

深入探究 CT 图像重建参数对于肺结节影像组学特征的影响，为肺结节临床数据采集与影像组学研究提供参考信息。

方法：

回顾性分析 134 例肺结节病灶，并采用原始数据（Raw Data）进行多参数图像重建。经过参数组合，共获取 4605 个图像序列，共计 8560 个肺结节自动分割 ROI。数据分析过程中，使用卡方检验或 Fisher 确切概率法比较计数资料，计量资料使用单因素方差分析或 Kruskal-Wallis H 检验进行分析。影像组学特征稳定性则采用 OCCC 值分析比较。

结果:

134 例肺结节病灶中, SN、pSN 与 pGGN 的病灶数分别为 56 例 (41.79%)、35 例 (25.93%) 与 43 例 (32.09%)。在 Flash 和 Force CT 两种设备共 125 种参数组合条件下, 所有影像组学特征中, 共有 434 (34.83%) 个特征的稳定性良好 ($OCCC \geq 0.75$), 其中 209 (16.77%) 个特征的稳定性非常好 ($OCCC \geq 0.90$)。在不同设备中, LOG 特征、Original 特征的中位 OCCC 值分别为 0.87-0.87、0.77-0.79, 明显高于 Wavelet 特征 (0.42-0.44)。独立参数影响分析中, 当只改变重建层厚、卷积核或迭代强度时, 稳定特征数量数分别为 362 (29.05%)、590 (47.35%) 和 793 (63.64%)。

结论:

(1) 大部分肺结节影像组学特征易受到重建参数 (重建层厚、卷积核和迭代强度) 的影响, 仅 34.83% (434/1246) 的组学特征稳定性良好。

(2) 重建层厚、卷积核和迭代强度对肺结节影像组学特征有不同程度影响, 其中重建层厚影响最大, 卷积核影响较大, 迭代强度影响相对较小。

(3) 重建层厚、卷积核和迭代强度之间存在相互作用, 参数的适当选择有助于降低其对于肺结节影像组学特征的影响。

PO-3947

ME-Mind 模型: 用于预测自发性脑出血后血肿扩大的基于新型深度学习策略的端到端模型

周治明、郭大静
重庆医科大学附属第二医院

背景和目的:

一种能够快速有效评估血肿扩大风险的自动化影像诊断框架可以改善自发性脑出血的临床工作流程。因此, 本研究旨在构建并验证一个基于新型深度学习策略的端到端模型 (名为 ME-Mind), 通过利用非对比增强 CT 图像来预测血肿扩大。

材料和方法:

回顾性分析来自 3 个中心的 490 例自发性脑出血患者的临床及影像学资料。在训练集中, 使用基于 Siamese 网络的分类模型桥接到基于密集连接 U-net 的分割模型来构建预测血肿扩大的 ME-Mind 模型, 并在验证集和测试集上进行该模型的验证。另构建基于残差网络或 Swin Transformer 算法的两个深度学习模型和基于支持向量机或逻辑回归的两个影像组学模型进行模型对比分析。开展阅片实验比较医生诊断模式、人工智能诊断模式和人工智能辅助医生诊断模式的诊断性能和工作效率。

结果:

在 490 例自发性脑出血患者中, 有 177 例 (36.1%) 发生血肿扩大。ME-Mind 模型的预测性能优于对比模型, 在验证集中的曲线下面积和准确度分别为 0.849 和 0.733, 在测试集中的曲线下面积和准确度分别为 0.809 和 0.763。在 ME-Mind 模型的辅助下, 急诊医师、初级放射科医师和高级放射科医师的诊断性能和工作效率均显著提高 (所有 $p < 0.001$), 其准确度分别为 0.768、0.789 和 0.809, 报告时间分别为 7.26 ± 2.95 s、 5.08 ± 2.45 s 和 3.99 ± 1.85 s。

结论:

我们的 ME-Mind 模型能够自动有效地预测自发性脑出血后血肿扩大。基于 ME-Mind 模型的人工智能辅助诊断模式有助于改善自发性脑出血的临床工作流程。

PO-3948

基于瘤内和瘤周的 CT 影像组学无创预测胃癌微卫星不稳定状态

陈星池、王冬青、张礼荣、朱海涛、庄子健、彭琳、薛靖
江苏大学附属医院

目的：探讨基于瘤内和瘤周的 CT 影像组学在术前无创预测胃癌微卫星不稳定性（MSI）状态中的价值。

方法：回顾性分析 2019 年 1 月至 2023 年 2 月收治的 189 例胃癌患者病例，根据 CT 检查时间先后，将患者分为训练组（n=112）和验证组（n=77）。两位医师采用 3D-Slicer 软件于 CT 静脉期手动逐层勾画瘤内和瘤周 5mm 区域感兴趣体积（VOI），并分别提取影像组学特征。对特征进行 Z-score 标准化，应用组内和组间相关系数（ICCs）、单变量分析和最小绝对收缩和选择算法（LASSO）筛选最优影像组学特征。通过对所选特征的线性组合，以各自的系数加权，计算出基于瘤内、瘤周 5mm 和瘤内+瘤周 5mm 区域的三个影像组学评分（Rad-score），分别构建模型_{瘤内}、模型_{瘤周}和模型_{瘤内+瘤周}。使用单因素和多因素 logistic 回归分析从临床和 CT 语义特征中筛选胃癌 MSI 状态的独立危险因素，构建模型_{临床}。通过 logistic 回归建立了一个结合独立危险因素及瘤内+瘤周区域 Rad-score 的模型_{联合}。采用受试者工作特征（ROC）曲线下面积（AUC）、校准曲线及决策曲线对模型效能进行评估。

结果：选择 11 个影像组学特征建立影像组学模型_{瘤内+瘤周}，CT 测量的肿瘤长径及肿瘤位置是 MSI 状态的独立危险因素。建立的模型_{联合}在验证组获得了最高的 AUC，为 0.830（95%CI, 0.727-0.906）。校准曲线和决策曲线证明了其良好的模型适应度和临床应用价值。

结论：基于瘤内和瘤周的 CT 影像组学特征和 CT 语义特征构建的模型_{联合}可能是胃癌 MSI 状态的潜在生物标志物，有助于在术前制定个性化的治疗策略。

PO-3949

基于 PET/CT 的深度影像组学后融合模型预测 PD-L1 在非小细胞肺癌中的表达状态

李博、苏婕、胡春峰
徐州医科大学附属医院

目的：程序性细胞死亡蛋白-1 配体（PD-L1）是非小细胞肺癌（NSCLC）免疫治疗的一个重要的预后预测因子。本研究旨在建立一种基于正电子发射断层扫描和计算机断层扫描（PET/CT）的无创深度学习和影像组学模型，以预测 PD-L1 在 NSCLC 中的表达。

方法：本研究共纳入 2021 年 1 月至 2022 年 9 月期间的 136 例 NSCLC 患者。将患者按 7: 3 的比例随机分为训练数据集和验证数据集。从他们的 PET/CT 图像中提取影像组学特征和深度学习特征。采用 U 检验、最小绝对收缩和选择算子算法和斯皮尔曼相关分析来选择最显著的特征。然后，我们建立了一个影像组学模型、一个深度学习模型和一个基于所选特征的融合模型。通过曲线下面积（AUC）、敏感性、特异性、准确性、阳性预测值和阴性预测值来比较三种模型的性能。

结果：其中 PD-L1 阴性 42 例，PD-L1 阳性 94 例。每个患者共提取了 2446 个放射组学特征和 2048 个深度学习特征。在训练数据集中，与影像组学模型（0.829,95%CI: 0.738-0.898）和深度学习模型（0.935,95%CI: 0.865-0.975）相比，融合模型获得了最高的 AUC（0.954,95% CI: 0.890-0.986）。在验证数据集中，融合模型的 AUC（0.910,95%CI: 0.779-0.977）也高于影像组学模型（0.785,95% CI: 0.628-0.897）和深度学习模型（0.867,95% CI: 0.724-0.952）的 AUC。

结论：基于 PET/CT 的深度影像组学后融合模型可以准确预测 NSCLC 患者中 PD-L1 的表达，为临床医生选择可能从免疫治疗中获益的 PD-L1 阳性患者提供了一种非侵入性的工具。

PO-3950

我国影像组学研究热点和趋势的可视化分析

钟京谕¹、星月¹、胡扬帆¹、戈翔¹、丁德芳¹、张欢²、姚伟武¹

1. 上海交通大学医学院附属同仁医院

2. 上海交通大学医学院附属瑞金医院

目的: 本研究旨在对我国的影像组学相关文献进行可视化分析, 探讨我国影像组学研究的热点和趋势, 以期今后的研究提供参考。

方法: 本研究基于文献计量学, 通过发掘文献, 显示过去的演进脉络, 突出目前的热点领域并预测未来的发展趋势, 为后续研究提供科学情报依据。本研究以“影像组学”和“放射组学”为关键词检索 2012 年 1 月至 2023 年 7 月中国知网, 筛选我国的影像组学相关文献, 使用 CiteSpace 和 VOSviewer 软件可视化分析文献发表时间、作者、机构、期刊和关键词。

结果: 本研究共纳入 1775 篇文献。我国影像组学研究发文数量总体呈增长态势, 2015 年影像组学的概念首次进入中文文献, 随后每年的发文量逐年递增, 目前我国已经成为国际影像组学研究的重要力量。研究主要来自高等医学院校附属医院的研究团队, 但作者和机构间的交流较少。发文量最大的作者为刘在毅和段绍峰, 均发表了 25 篇文献, 该领域的核心作者共 88 位。发文量前三位的医疗机构为蚌埠医学院第一附属医院放射科 (31 篇)、四川大学华西医院放射科 (23 篇) 和川北医学院放射科 (19 篇), 该领域的核心发文机构共 55 家。主要发表于医学影像学杂志, 该领域的核心期刊共 7 本, 发文量前三位的期刊为《磁共振成像》(130 篇)、《临床放射学杂志》(128 篇) 和《放射学实践》(104 篇)。排除检索词“影像组学”和“放射组学”后, 频数 (≥ 73 次) 和中介中心性 (≥ 0.05) 均较高的关键词包括“机器学习”“乳腺癌”“列线图”“诊断”和“人工智能”。关键词聚类分析共得到 9 个关键词聚类标签, 关键词突现检测共发现 25 个突变词。研究热点集中在影像组学在肿瘤诊疗中的应用、影像基因组学为代表的多组学研究以及机器学习和人工智能与影像组学研究的融合。

结论: 我国影像组学相关研究长期保持热度并能紧跟甚至引领国际趋势, 但作者和机构间的合作交流亟待加强, 以期早日实现影像组学的临床转化。

PO-3951

基于 MRI 的不同影像组学模型预测胶质瘤 MGMT 启动子甲基化状态的研究

陈思璇、朱正阳、王正阁、张鑫

南京大学医学院附属鼓楼医院

目的 探讨 MRI 的不同影像组学模型预测术前脑胶质瘤 MGMT 启动子甲基化状态的效能。方法 回顾性分析经手术病理证实的 114 例大脑海胶质瘤患者的 MRI 影像资料, 包括 T1WI、T2WI、ADC、及 T1WI 增强序列。其中 MGMT 甲基化阳性 58 例, 阴性 56 例, 按 8:2 比例分割要求, 分为训练组 (91 例) 与验证组 (23 例), 在 T2WI 及 T1W 增强分别对肿瘤水肿区及肿瘤核心区进行三维手工分割, 提取总共 688 个影像组学特征, 采用主成分分析进行特征降维, 方差分析用于筛选特征, 应用 Lasso 的逻辑回归算法 (Logistic Regression via Lasso, LR-Lasso)、支持向量机 (Support Vector Machine, SVM)、贝叶斯分类器 (Native Bayes, NB) 构建诊断模型, 5 倍交叉验证方法用于训练模型, 验证组数据用于评估模型的预测性能, ROC 曲线用于计算模型的准确率、灵敏度和特异度, ROC 曲线下面积 (area under curve, AUC) 用于评估模型的预测性能。结果 LR-Lasso 模型的 AUC 值、准确率为 0.80 和 74%, 灵敏度和特异度为 67% 和 82%, SVM 模型的 AUC 值、准确率为 0.89 和 87%, 灵敏度和特异度为 83% 和 91%, NB 模型的 AUC 值、准确率为 0.69 和 74%, 灵敏度和特异度为 75% 和 73%。基于 LR 模型预测效能最高。结论 MRI 影像组学模型对预测术前脑胶质瘤 MGMT 启动子甲基化的状态具有一定应用价值。

PO-3952

采用结构分离技术提升胸肺静脉 CTA 后处理效率的应用研究

伍瑶斌、李文航、张小勇、祖文双、王玉权、王荣品
贵州省人民医院

目的 通过结构分离技术和人工法两种后处理方法比较,探究结构分离技术在肺静脉 CTA 图像中后处理过程的应用价值。

方法 回顾性收集本院 80 组病例,数据处理为高年资医生和低年资医生共同完成,两组不同年资的观察者将病例分别使用结构分离技术以及人工手动法提取肺静脉的 VR 图像,做出标准的六位片,两次图像处理中间间隔两周,分别记录两种方法所用的时间以及 VR 图像质量评分。

结果 采用结构分离技术的图像平均完成时间为 (45 ± 5) s,其中高年资医生组平均完成时间为 (43 ± 3) s,低年资医生组平均完成时间为 (48 ± 3) s;人工手动法提取的图像平均完成时间为 (98 ± 5) s,其中高年资医生组平均完成时间为 (70 ± 3) s,低年资医生组平均完成时间为 (126 ± 3) s;结构分离技术获得图像优良率为 83.33%,人工方法获得图像优良率为 76.25%,两种方法所用时间差异有统计学意义。

结论 采用结构分离技术可以提升胸肺静脉 CTA 后处理效率,并且能避免操作者年资的影响。

PO-3953

AI 协同 影像未来

陈亮、吕发金、刘小东、蒋铮
重庆医科大学附属第一医院

目的 整合现有 AI 和后处理应用,取代部分医护人员的重复性工作,减轻了其工作负担和强度,提高医疗效率和准确率。

方法 把我科 15 套不同的 AI 图像后处理软件,通过 AI 互交互,构建从原始影像重建到 AI 图像后处理到报告完成的新工作流程,将传统的阅片模式,形成人机双脑诊断模式。

结果 从上线以来我科通过该 AI 交互共完成 13 万余例胸部检查的筛查分析,3D 可视化临床决策报告 1000 余例,AI 头颈和冠脉的 CTA 分析 5000 余例,可实现自动分割、智能去骨、自动重建、自动命名、自动检出、标记病灶,工作流程时间缩短 90%以上,每天节约近 300 分钟,一年能节约近 1800 小时,节约的时间相当于 3.5 个医生工作一年,医生报告时间由原来的每份平均 20~30 分钟,降至 3~5 分钟,效率提升 80%~90%,减少漏诊风险。解决了传统文本报告存在影像学描述不规范、报告用词不统一、影像 AI 信息无法整合、文字性资料后期无法利用等以及出具报告效率低,患者需要等待较长时间才能取报告等弊端和痛点。从传统的报告医生到审核医生的阅片流程,变为 AI 筛查-报告医生-审核医生。形成人机双三次诊断、双重保障的诊断流程。

结论 各个人工智能产品为辅助的工作模式,其管理创新,相较于传统工作流程,节省大约 70%的时间,实现高效阅片、高效出报告;降低风险、提高效率,让医生做到术前心中有数,为患者选择最佳手术方案,降低手术风险,提高手术成功率,通过人工智能技术弥补经验不足,实现技术经验传承,提升医学影像诊断的精准度、降低漏诊率、误诊率,提高医院业务协作、手术精准度,改善病床周转效率;服务模式创新,倡导以患者为中心的诊疗服务模式,提供个体化服务,提供了一种全新的医患沟通工具,可以让毫无医学知识的患者和家属能够充分理解手术过程的难度和风险,从而降低医患矛盾、减少医疗纠纷,把看一个患者的时间减少一半以上,让医生有时间为更多患者服务。

PO-3954

深度学习图像重建算法在全脑 CT 灌注生成的 CT 血管造影中的有效性评估

周宇涵¹、雷丽敏¹、王芝浩¹、曹伟萌¹、岳松伟¹、王落桐²

1. 郑州大学第一附属医院

2. GE 医疗

目的 通过 CT 全脑灌注 (CTP) 重建的 CT 血管造影 (CTA) 图像, 应用深度学习图像重建算法, 自适应统计迭代重建-Veo (ASIR-V) 和过滤背投影 (FBP) 比较由前循环大血管闭塞 (LVO) 导致的急性缺血性中风患者的 CTA 图像质量和诊断准确性。

方法 本前瞻性研究收集由 LVO 引起的 AIS 患者 39 例, 并在症状出现后 24 小时内进行了非对比 CT、CTP 及 CTA 检查。分别采用 FBP、ASIR-V40%/80%和 DLIR L/M/H 重建 0.625mm 的 CTP 动脉峰相图像, 并与 ASIR-V80%重建的传统 CTA 图像进行比较。在颈内动脉 (ICA) 虹吸部、大脑中动脉 M1 段 (MCA-M1) 和颞肌的对侧轴向图像中绘制感兴趣区 (ROI)。测量并比较其 CT 值、图像噪声 (SD)、信噪比 (SNR) 和对比噪声比 (CNR)。主观评价包括图像噪声、血管管腔边缘锐度、小血管显示和整体图像质量。采用 6 分评分系统对 7 组 CTA 图像组的侧支循环进行评分。

结果 DLIR-M、DLIR-H 和常规 CTA 图像之间的 SD 值、SNR 和 CNR 具有可比性。ASIR-V80%图像中的噪声略高于传统 CTA 图像, SNR 略低 ($P<0.05$), 而 ASIR-V80%、DLIR-M 和 DLIR-H 图像中的 SD 值差异无统计学意义 ($P>0.05$)。FBP 的 SD 值最高, SNR 和 CNR 最低。DLIR-M 和 DLIR-H 图像仅在小血管显示时略差于常规 CTA 图像 ($P<0.05$)。与 ASIR-M 和 DLIR-H 相比, ASIR-V80% CTA 图像的图像噪声和整体图像质量略低于 DLIR-M 和 DLIR-H ($P<0.05$), 边缘锐度和小血管可见性无显著差异。每个患者的 6 张重建 CTA 图像的侧支循环评分与常规 CTA 图像一致。

结论 DLIR-H 和 DLIR-M 重建的 CTP 动脉峰相图像的客观和主观图像质量与常规 CTA 图像相当, 优于 FBP 和 ASIR-V 算法。由 CTP 重建的颅内 CTA 图像减少了造影剂的剂量和辐射剂量。DLIR 重建的 CTP 动脉峰相图像有助于检测小血管。从 CTP 数据重建 CTA 图像不仅避免多次扫描减少了辐射暴露和造影剂剂量, 而且缩短了急性脑梗死患者的检查时间。

PO-3955

基于注意力机制的肺结节检测算法研究

管乃超¹、贾俊铖²

1. 苏州大学附属第一医院

2. 苏州大学

目的 为提升深度卷积神经网络模型检测肺结节的效果, 运用一种基于注意力机制的 3D 深度卷积神经网络肺结节检测算法, 进行初步研究探讨。**材料与方法** 主体网络采用残差块以及近似 U-Net 结构的上下文多尺度信息融合模型结构。采用目标检测算法 Faster RCNN 中的 3D 版本区域提案网络 (RPN) 直接生成肺结节区域候选。提出一种可训练的 3D 注意力机制门模块, 结合空间和通道注意力两种不同粒度和层次的注意力因子增强, 以期提升肺结节检测网络生成的特征映射的质量, 并且提升相关模型的性能。然后, 采用 LUNA16 肺结节检测数据集中的 881 例低剂量肺部 CT 平扫图像, 图像中包含 1174 个不同类型的肺结节; Pytorch 深度学习框架在 GPU 上进行一系列相关实验, 以 FROC 作为评判指标。**结果** 引入注意力机制的方法在没有加入任何降低误报策略的情况下, FROC 结果为 81.6%, 超过了未使用注意力机制的原 ResNet 网络模型 1.6%, 相比 VGG 网络模型提升了 8.4%。**结论** 基于注意力机制门的肺结节检测方法能够有效聚焦感兴趣区域, 提高肺结节检测的精度, 降低误报率和假阳性率。

PO-3956

CTP 参数 Tmax 预测高危短暂性脑缺血发作患者脑卒中的应用

曹伯裕¹、凌玉婷²、戚乐¹

1. 杭州师范大学附属医院

2. 东软医疗系统股份有限公司

目的 探讨 CT 灌注成像(CTP)参数 Tmax 在预测高危短暂性脑缺血发作 (TIA) 患者脑卒中的应用价值。方法 回顾性分析杭州师范大学附属医院 2021 年 1 月-2023 年 6 月收治的 64 例患者资料; 所有患者均进行颅脑一站式检查 (CT 平扫、CT 血管成像 CTA 及 CTP), 以 e-storke 软件处理 CTP 原始数据, 获得残余功能达峰时间(Tmax>4 s、>6 s、>8 s、>10 s)对应的低灌注区体积(VTmax>4 s、VTmax>6 s、VTmax>8 s、VTmax>10 s)、梗死核心区体积(VCBF<30%)及缺血半暗带体积和低灌注强度比值(HIR), 并在 36h 内完成 MRI 复查, 使用 3D-Slice 软件勾画计算脑梗死体积。以 36h 内 MRI 复查为金标准, 统计分析 MRI 复查阳性组与 MRI 复查阴性组患者 ABCD3 评分、入院时美国国立卫生研究院卒中量表 (NIHSS) 评分、CT 灌注参数 (Tmax>4s、>6s、>8s、>10s) 的体积及体积差、VCBF<30%、缺血半暗带体积及 HIR 与脑梗死的相关性。结果: 排除 CT 平扫阳性和或 CTA 见脑血管狭窄、闭塞患者 5 例, 纳入 CT 平扫阴性、CTA 未见明显脑血管狭窄、闭塞患者 59 例, 其中 MRI 复查阳性组 37 例, MRI 复查阴性组 22 例。MRI 复查阳性组 ABCD3 评分、入院时 NIHSS 评分及 CTP 参数 VTmax>4 s、VTmax>6 s、VTmax>4 s-VTmax>6 s(P 均<0.05)均大于 TIA 组, 其余各项差异均无统计学意义(P 均>0.05)。结论 CT 平扫阴性、CTA 未见脑血管狭窄、闭塞并不能排除急性缺血性脑卒中 (AIS) 的可能, 以 e-storke 软件所获 CTP 参数 VTmax>4s>15.9ml 能较好的提示高危 TIA 存在 AIS 的可能, 为临床医生早期诊疗提供影像支持。

PO-3957

探讨基于 AI+深度学习的冠状动脉 CT 血流储备分数 (CT-FFR) 在冠心病无创诊断中的应用价值。

陈永明、袁慧书、董小征

北京大学第三医院

目的: 探讨基于 AI+深度学习的冠状动脉 CT 血流储备分数 (CT-FFR) 在冠心病无创诊断中的应用价值。

方法与材料: 回顾性分析 2003 年 3 月-6 月于我院行 CCTA 检查的疑似冠心病患者 72 例, 其中男 44 例, 女 28 例。纳入标准: CCTA 检查和 CAG(冠状动脉造影) 及 FFR(冠脉血流储备分数) 检查间隔<2 周。排除标准: 钙化积分>400; 既往行冠脉支架植入术或搭桥术。采用联影 960 CT 行 CCTA 检查, 前瞻性轴扫, 扫描参数: 100-120 kV, 100-140mAs, 旋转时间 0.25s/圈, 造影剂 (碘迈伦 400), 注射速率 3.5-4.5ml/s, 注药时间: 12s; 并追加 50ml 生理盐水; CAG 使用 Philips 心血管造影机, 经右侧桡动脉行多方位选择性造影; CT-FFR 测量: 由一名放射科副主任医师, 使用联影公司基于 AI+深度学习的测量软件 uCT-FFR, 利用 CCTA 图像测量病变远端 2 cm 处 CT-FFR 值。统计学方法: 使用 SPSS 23.0 软件进行统计学分析。以 CAG 测出的冠脉狭窄作为金标准, 以 CT-FFR≤0.8 为阳性, 对 uCT-FFR 诊断冠脉血流储备分数的敏感度、特异度、准确率、阳性预测值、阴性预测值进行计算, 并使用 Pearson 法检验 CAG 检查结果与 CT-FFR 值的相关性。结果: 72 例患者共 83 条血管接受评估, 以 CAG 为金标准, CT-FFR 检测冠脉血流储备分数的敏感度、特异度、准确率、阳性预测值、阴性预测值分别为 87.8%、71.4%、79.5%、75%、85.7%。Pearson 相关性分析表明, CAG 检查与 CT-FFR 值相关性较好 (r=0.661)。

结论: 基于 AI+深度学习的 CT-FFR 作为一种无创、易行、准确的血流动力学信息检测指标, 在冠心病诊断中具有良好的应用前景。

PO-3958

基于 MRI 影像组学预测脑膜瘤复发/进展

韩涛、刘显旺、周俊林
兰州大学第二医院

目的: 脑膜瘤复发/进展的术前无创预测有助于手术方案的选择, 并为指导脑膜瘤患者实现个体化治疗提供指导依据。本研究旨在开发和验证基于磁共振成像的列线图预测脑膜瘤复发/进展。

材料和方法: 这项回顾性研究收集了 88 例经手术病理确诊的脑膜瘤患者, 包括 28 例术后复发患者和 60 例未复发患者。所有病例随机按照 7:3 的比例分为训练集和验证集: 从术前 T2WI 和 T1WI 增强图像中分别提取了 1874 个影像组学特征, 并使用最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 来筛选临床特征和 MRI 特征的最佳组合来预测脑膜瘤复发/进展, 随后运用机器学习算法构建出用于评估脑膜瘤复发风险的预测模型, 采用受试者工作特征 (ROC) 曲线分析来确定预测性能, 并使用校准曲线和决策曲线分析来验证该列线图的一致性和临床有效性。

结果: 最终筛选出 12 个与脑膜瘤复发风险密切相关的影像组学特征构建了 RF 模型列线图, 结果显示该模型具有良好的预测性能, 在训练集和验证集中 AUC 分别为 0.950 和 0.852。

结论: 基于 MRI 影像组学的 RF 预测模型在预测脑膜瘤复发/进展方面具有良好的预测性能, 可应用于临床实践。

PO-3959

基于 bpMRI 影像组学的机器学习模型预测移行带非显著性前列腺癌的价值

李露
南京大学附属鼓楼医院

目的: 建立基于 T2 加强成像 (T2WI) 联合弥散加权成像 (DWI) 纹理特征的机器学习模型, 评价其在诊断移行带非显著性前列腺癌 (NCSPC) 中的价值。

方法: 回顾性分析 2020 年 1 月至 2023 年 1 月在南京鼓楼医院, 宣城市中心医院接受前列腺双参数 MRI 的影像数据, 本次研究前列腺癌病例均为低风险组 (Gleason 评分 $\leq 3+4$ 分), 且病变位置均位于移行带。南京鼓楼医院数据集患者 397 例, 按照 7:3 随机分成训练集和测试集; 宣城市中心医院数据集患者 110 例作为外部验证集。BPH 患者行超声引导下穿刺活检; PCa 患者行前列腺切除根治术, 均有病理结果。

用 3D slicer 软件手动描绘感兴趣区 (ROI) 特征提取特征, 用 LASSO 筛选特征构建移行带 NCSPC 预测模型。结合 T2WI, DWI 纹理分析、建立 Logistic 回归 (LR)、随机森林 (RF)、支持向量机 (SVM) 模型, 运用 ROC 曲线和决策曲线分析法 (DCA) 评价上述模型和变量的重要性。

结果: RF 算法的 T2WI 联合 DWI 纹理特征模型诊断 NCSPC 效果最好。

训练集: LR、RF 和 SVM 的 AUC 分别为 0.892、1.000 和 0.844。

测试集: LR、RF 和 SVM 的 AUC 分别为 0.828、0.866 和 0.794;

外部验证集: LR、RF 和 SVM 的 AUC 分别为 0.728、0.818 和 0.717。

结论: RF 算法的 T2WI 联合 DWI 纹理特征模型在诊断移行带 NCSPC 及 BPH 方面具有较好的分类性能, 为临床医生提供一种可靠的辅助诊断工具。

PO-3960

基于增强 T1WI 影像组学预测直肠腺癌病理分级的可行性研究

汪博泉¹、郭小芳¹、肖峰²、聂婷婷¹、袁子龙¹、刘玉林¹

1. 湖北省肿瘤医院 (湖北省肿瘤研究所)

2. 武汉大学中南医院

目的 探讨基于增强 T1WI 影像组学预测直肠腺癌病理分级的可行性。**资料和方法** 回顾性分析了 127 例直肠腺癌患者的 MRI 图像及病理资料, 使用 ITK-SNAP 软件在 T1WI 轴位增强图像上, 采用最小轮廓法逐层手动绘制直肠肿瘤灶作为感兴趣区 (ROI), 使用 Pyradiomics 软件提取感兴趣容积 (VOI) 内所有影像组学特征, 通过组内相关系数 (ICC) 分析 ($ICC \geq 0.75$) 保留稳定性较好的特征。将目标任务分解为两部分: 任务一预测肿瘤的高分化与中-低分化即“高-非高”组; 任务二预测“非高”肿瘤组中的中分化与低分化即“中-低”组。**结果** 通过最小冗余最大相关 (mRMR) 的特征筛选方法后, 采用最小绝对收缩和选择算子 (LASSO)、逻辑回归 (LR)、贝叶斯分类器 (NB)、随机森林 (RF)、支持向量机 (SVM) 五种方法分别构建模型, 任务一中受试者工作特征曲线下面积 (AUC) 值在训练集中分别是 0.86、0.90、0.59、1.00、0.99 和测试集中分别是 0.71、0.62、0.53、0.67、0.64, 任务二中 LASSO、LR、NB、RF、SVM 模型在训练集中 AUC 分别是 0.93、0.85、0.67、0.92、0.89, 在测试集中分别是 0.86、0.80、0.50、0.78、0.71。两部分任务中 LASSO 构建的模型均为优势模型。结合年龄、性别与优势模型影像组学标签组成的融合模型, 计算得到测试集中任务一 AUC 值为 0.80 (95%CI: 0.63-0.96), 准确性、敏感性、特异性分别是 78.94%、77.78%、79.31%; 任务二则分别为 0.89 (95%CI: 0.75-1.00)、90.00%、95.65%、71.43%。校准曲线表明融合模型的拟合优度良好。**结论** 基于增强 T1WI 影像组学方法, 通过两个二分类模型的建立, 在预测直肠腺癌的高、中、低分化程度方面具有可行性。

PO-3961

MRI 影像组学评估原发性淋巴水肿临床分期的价值

刘梦珂、张怡梦、李兴鹏、张晓杰、王仁贵

首都医科大学附属北京世纪坛医院

目的: 建立一种基于 MRI 的原发性下肢淋巴水肿 (lower extremity lymphedema, LEL) 影像组学模型及影像-临床综合模型, 并评价其在鉴别原发性 LEL 临床分期 (I-II 期) 中的作用。**方法:** 收集 96 例原发性 LEL 患者, 按照国际淋巴协会 (International Society of Lymphology, ISL) 临床分期标准分为 I、II 期, 其中训练集 67 例, 验证集 29 例。由影像医生应用深睿多模态科研平台在 STIR 序列图像上手动勾画感兴趣区域 (region of interest, ROI), 自动提取影像组学特征。保留选定的影像组学特征构建影像组学模型。选定对鉴别 I、II 期有统计学意义的临床因素, 建立结合影像组学特征和重要临床因素的影像-临床综合模型。使用 ROC 曲线评价两个模型的性能。使用决策曲线 (decision curve analysis, DCA) 来评估模型的临床实用性。**结果:** 96 例患者, 共提取影像组学特征 1743 个, 再通过 F Test 进行特征筛选, 最后筛选出 20 个特征构建影像组学模型。基于影像组学特征和 4 个临床因素的影像-临床综合模型比单独使用影像组学模型具有更好的鉴别效能 (训练集中的曲线下面积 (AUC): 0.997 vs. 0.961, 验证集: 0.914 vs. 0.900)。DCA 验证了影像-临床组学综合模型的临床实用性。**结论:** 基于 MRI 的影像组学模型能够有效鉴别原发性 LEL 的临床分期 (I、II 期)。影像-临床综合模型的预测性能优于单独使用影像组学模型。

PO-3962

基于生成对抗网络深度学习在减少心脏

磁共振运动伪影中的应用研究

马泽鹏¹、朱悦铭²、张晓丹³、赵永霞¹、王佳宁¹、郑伟²

1. 河北大学附属医院放射科

2. 河北大学电子信息工程学院

3. 河北大学附属医院超声诊断科

目的 探讨基于生成对抗网络(Generative Adversarial Networks, GAN)深度学习技术在减少心脏磁共振运动伪影中的应用价值。**方法** 纳入 30 例行心脏磁共振检查(Cardiac MR, CMR)病人的清晰电影序列图像,通过马尔科夫过程处理后得到的 2000 组清晰-模糊图像对设为训练集,200 组清晰-模糊图像对设为测试集,建立基于 GAN 的深度学习模型并对其进行训练。选取 100 张后处理生成的运动伪影图像和 37 张临床实践中具有真实运动伪影图像来验证深度学习网络的去伪影效果。图像质量采用峰值信噪比(Peak Signal to Noise Ratio, PSNR)、结构相似性指数(Structural Similarity Index, SSIM)、tenengrad 对焦测量及李克特 5 分值法进行评价。由于 37 例真实 CMR 伪影图像没有对应的清晰图像,因此仅采用对焦测量及李克特 5 分值法评价。结果 100 张人工运动伪影的 CMR 图像经深度学习网络优化前图像的 PSNR、SSIM、对焦测量及主观评分值分别为 23.85 ± 2.85 、 0.71 ± 0.08 、 4.56 ± 0.67 和 2.44 ± 1.08 ;优化后分别为 27.04 ± 1.55 、 0.80 ± 0.05 、 7.74 ± 0.39 和 4.44 ± 0.66 。图像的 PSNR、SSIM 及对焦测量较优化前分别提高了 13.3%、12.7%、69.7%,主观评分平均提高了 2 分($P<.001$)。37 张真实伪影 CMR 图像去伪影前后数据的统计结果显示:去伪影后图像的对焦测量明显提升(去伪影前 6.06 ± 0.91 ;去伪影后 10.13 ± 0.48),主观评分从 3.03 ± 0.73 提升到了 3.73 ± 0.87 ,差异具有均统计学意义($P<.001$)。结论 基于 GAN 的深度学习技术可以有效减少 CMR 电影图像运动伪影,其在 CMR 运动伪影优化上具有巨大的临床应用潜力。

PO-3963

基于机器学习的肺结节多分类预测模型的建立与验证

刘巧

重庆医科大学附属第三医院

目的:肺癌是全球癌症死亡的主要原因。已经建立了一些预测模型来预测肺结节(PNs)恶性肿瘤的可能性。本研究旨在建立新的预测模型,并评估已发表模型的预测性能。

方法:收集 2013 年 1 月至 2021 年 10 月在重庆市 A、B、C、D 四家医疗机构就诊的 914 例 PNs 患者资料。根据病理诊断将患者分为良性病变(BLs)组、前驱病变(PLs)组和恶性病变(MLs)组。随机选取 A 医院约 80%(505 例)的患者作为训练集,剩余 20%(127 例)作为内部测试集,B、C、D 医院的患者(282 例)作为外部验证集。采用单因素分析和递归特征消去法选择预测特征。采用逻辑回归(LR)、决策树(DT)、随机森林(RF)和支持向量机(SVM)建立预测模型。最后,对 Mayo 模型、北京大学人民医院(PKUPH)模型和 Brock 模型的预测性能进行外部验证。

结果:共选择 8 个特征作为预测特征建立模型。内部测试集 LR、DT、RF 和 SVM 的加权平均曲线下面积(AUC)值分别为 0.78、0.75、0.81 和 0.80。RF 模型的加权平均 AUC 值最高,其 MLs、PLs 和 BLs 的 AUC 值分别为 0.80、0.90 和 0.75。外部验证集 RF 模型的加权平均 AUC 值为 0.71,MLs、PLs 和 BLs 的 AUC 值分别为 0.71、0.98 和 0.68。Mayo 模型 AUC 值为 0.68,PKUPH 模型 AUC 值为 0.64,Brock 模型 AUC 值为 0.57。

结论:我们基于 8 个预测特征建立了 4 个 ML 模型,其中 RF 模型表现最好,其预测性能优于 3 个外部模型。RF 模型为 PNs 的风险评估提供了一种五创性新方法。

PO-3964

基于 CT 的深度学习模型在鉴别良恶性实性肺结节 ($\leq 8\text{mm}$) 中的价值

黄兴涛¹、何小群²、李琦²、徐小利¹

1. 重庆市第五人民医院

2. 重庆医科大学附属第一医院

目的 探讨基于计算机断层成像的深度学习模型在鉴别良恶性实性肺结节 ($\leq 8\text{mm}$) 中的价值。

方法 回顾性分析我院经手术病理证实的 567 例 SPN 患者的胸部 CT 资料。首先将 SPN 分为良性组和恶性组, 每组均按照 4: 1 的比例随机分为内部训练集和验证集, 同时收集外院 152 例 SPN 作为外部测试集。使用多尺度双注意力网络 (MDANet) 联合结节及灶周 0mm、5mm、10mm、15mm 和 20mm 肺组织建立 5 个深度学习模型以鉴别良、恶性 SPN, 利用曲线下面积、准确率、召回率、精确率及 F1 分数来评估每个预测模型的性能, 筛选出最佳预测模型, 同时选择四种深度学习模型与本文网络进行比较, 然后使用相同方法建立 5 个深度学习模型以鉴别良性肿瘤和炎性结节, 并筛选出最佳预测模型。

结果 在良恶性 SPN 二分类模型中, 使用 MDANet 联合结节及灶周 15mm 肺组织的深度学习模型表现最佳, 内部验证集的 AUC、准确率、召回率、精确率及 F1 分数分别为 0.824、0.798、0.801、0.785 及 0.790, 外部测试集的 AUC、准确率、召回率、精确率及 F1 分数分别为 0.730、0.724、0.711、0.705 及 0.707, 且该模型的预测性能优于 VGG19、ResNet50、ResNeXt50 及 DenseNet121。在良性肿瘤和炎性结节二分类模型中, 使用 MDANet 联合结节及灶周 10mm 肺组织的深度学习模型表现最佳, 内部验证集的 AUC、准确率、召回率、精确率及 F1 分数分别为 0.948、0.917、0.921、0.852 及 0.880, 外部测试集的 AUC、准确率、召回率、精确率及 F1 分数分别为 0.871、0.938、0.863、0.904 及 0.882。

结论 基于注意力机制联合结节及灶周肺组织建立的深度学习模型在鉴别良恶性肺结节、良性肿瘤与炎性结节中具有较大价值, 能够进一步提高模型的预测效能和泛化能力。

PO-3965

冠状动脉 CT 血流储备分数不同软件算法及操作者间一致性分析及同质化初探

肖莉莉、张磊、刘文蕴

吉林大学第一医院

目的 探讨不同冠状动脉 CT 血流储备分数 (CT -FFR) 计算软件评估冠状动脉血流储备的一致性 & 不同操作者间的一致性分析。

方法 回顾性收集 2021.07-2021.08 我院冠状动脉 CT 血管成像 (CCTA) 提示冠状动脉狭窄 40%~99%, 且行冠状动脉血管造影 (DSA) 检查的患者, 排除同一支血管存在 2 处及以上病变的病例。CT-FFR ≤ 0.8 为评估心肌缺血的参考标准。由两名心血管疾病影像诊断及后处理经验 ≥ 5 年的医生分别评估 CCTA 图像质量, 最优重建期相, 记录钙化积分, 然后用两种不同的 CT-FFR 软件测量病变前、病变后 CT-FFR 值, 并计算跨病变 $\Delta\text{CT-FFR}$ 值, 评价两种软件测量结果的一致性及两名操作者间的一致性。采用 GraphPad Prism9 进行统计学分析, $p < 0.05$ 认为有统计学差异。

结果 共纳入 12 例患者 25 支冠状动脉血管的 25 处病变, 因数据不满足正态分布, 应用配对符号秩和检验进行统计分析, 两种测量软件的病变前 $p=0.1618$, 病变后 $p=0.4227$, ΔCTFFR $p=0.1247$, 整体 CTFFR $p=0.4696$, 均没有统计学差异。对于单支血管钙化积分 < 100 的亚组, 两种测量软件

的病变前 $p=0.0949$, 病变后 $p=0.8902$, $\Delta CTFFR$ $p=0.1554$, 整体 $CTFFR$ $p=0.3047$, 均没有统计学差异。对于单支血管钙化积分 ≥ 100 的亚组, 两种测量软件的病变前 $p>0.9999$, 病变后 $p=0.4609$, $\Delta CTFFR$ $p=0.6172$, 整体 $CTFFR$ $p>0.9999$, 亦均没有统计学差异。两名操作者间测量 $CT-FFR$ 的 Kappa 值为 0.8-1, 一致性高。

结论 不同冠状动脉 $CT-FFR$ 计算软件评估冠状动脉血流储备的一致性良好, 且受病变钙化积分的影响较小, 不同操作者测量 $CT-FFR$ 的一致性良好。

PO-3966

基于单病种人工智能全流程管理方案在医院多科室的整体运用

陈亮、吕发金、刘小东、蒋铮、郁斌
重庆医科大学附属第一医院

目的: 随着 CT、MRI 等检查设备的不断进步, 放射科检查的图像层厚越来越薄, 单次检查的影像数量也越来越多。一方面放射科医生的工作量越来越多, 另一方面临床科室对放射科的诊断要求越来越高, 希望直观呈现病灶部位大小、形态以及与周围血管等组织的关系。同时放射科医生长期高压工作状态下, 人为疲劳造成的诊断信息不全、工肉眼判别的信息不够精准、甚至可能出现漏诊、误诊的现象。

方法: 以肺癌筛查早期发现肺结节作为切入点, 建立以患者为中心的诊疗管理体系, 打造全方位、高效覆盖早期肺癌疾病阶段的全程管理模式。锚定肺癌早期筛查与管理的关键节点, 对不同风险层级肺结节患者进行主动分流, 并进行全程随访管理, 保证肺癌早期筛查效率与价值。针对肺结节/肺癌诊治面临的重要问题, 提出关键解决对策, 为肺结节/肺癌患者管理模式提供切实有效的工具, 助力临床实现对肺结节/肺癌患者进行规范化与同质化的诊疗, 以达到降低肺癌死亡率的目标。

结果: 通过该系统的使用, 降低了肺结节漏诊率及误诊率, 将医生的检测效率提升 30%-50%, 医生的平均阅片时间由以往的 9 分钟降至 6 分钟。人工智能靶重建及胸外三维重建的测试, 累计测试病例超过 1000 例, 在肺结节良恶性诊断、肿瘤科及呼吸科随访评估、肺结节穿刺指导、胸外科手术指导等方面均有显著成效, 提高了放射科、呼吸科、胸外科等多个科室工作效率, 通过先进的人工智能技术, 为精准治疗、精准手术提供了有效的指导, 为患者提供更高水平的医疗服务。另外, 通过推想科研平台, 目前我院累计开展相关科研项目 8 项, 发表 SCI 1 篇。

结论: 提升医学影像诊断的精准度、降低漏诊率、误诊率, 提高医院业务量、手术量, 加快病床周转效率; 帮助提高并优化临床工作的流程效率、准确性、和医疗保健质量; 极大提高专家和科室科研水平与知名度, 降低培养年轻的放射科医生的时间成本, 满足医院影像诊断和临床治疗的需求。

PO-3967

基于双能量单能技术结合 AI 在肺动脉栓子检出率价值应用

王猛
吉林大学第一医院

目的：研究双能量肺动脉 CTA 结合 LIANYING AI 在不同单能量数据上肺栓子检出率应用价值

方法：回顾性收集 30 例双能肺动脉 CTA 阳性患者，将 30 例患者采用不同能量进行分组，共 5 组，通过 Syngo VIA 工作站单能+模式进行数据调整存取，其中 A 组：40keV, B 组：60keV, C 组：80keV, D 组：100keV, E 组：120keV, 将 5 组数据带入 LIANYING AI 软件进行分析计算，同时肺动脉进行肺动脉栓子提取，并得出肺动脉主干栓子面积，并通过原始图像进行勾画，得出对照组面积为 A：平均 25.19cm³, B：平均 26.24cm³, C：平均 26.31cm³, D：25.27cm³, E：平均 26.15cm³，通过 AI 软件计算得出各组数据能级图像肺动脉主干栓子的面积，A：平均 17.19cm³, B：平均 22.50cm³, C：平均 26.06cm³, D：26.31cm³, E：平均 26.17cm³，得出面积与手动勾画组进行对比，并分析各能级对肺动脉检出率的优势，同时观察各能级改动 Kv 后增强肺动脉干 CT 值对栓子检出率的影响，并得出结论。

结果：对 30 例各组数据原始勾画图像进行 AI 数据各能级及数据进行对比，得出栓子在 80-120keV 时栓子检出率与原始勾画数据具有一致性，同时也得出并不是越低 keV 对栓子检出率高，因为低 keV 会使肺动脉干造影剂变得更亮，同时噪声指数 SD 值增加，对于肺动脉栓子边界分辨不清而损失肺动脉干栓子面积。

结论：在恰当的单能级区域内所得到的栓子的面积数据更加的可靠贴近于真实面积，而不是一味的降低 keV 来获取图像反而有可能得到的数据会有偏差，在降低 keV 时有可能会损失其他数据有可能是图像的噪声等，所以对比后得出 80-120keV 栓子检出率更接近于真实。

PO-3968

联合人工智能模型迭代重建和 70KV 超低管电压大幅度降低肺动脉 CTA 辐射剂量的应用研究

曹建新¹、朱卓¹、张清¹、陈颖¹、韩锦涛²、许炜¹
1. 武汉科技大学附属普仁医院/武汉市普仁医院
2. 上海联影医疗科技股份有限公司

目的：探讨联合人工智能模型迭代重建(AIIR)和 70KV 超低管电压在大幅度降低肺动脉 CTA (CTPA) 辐射剂量中的应用价值。方法：92 例行 CTPA 患者随机分成 A 组 (100KV 管电压, 52 例) 和 B 组 (70KV 管电压, 40 例)，A 组图像采用混合迭代重建 (HIR)，B 组图像采用 HIR 和 AIIR。评估两组辐射剂量。评估 A 组 HIR 图像、B 组 HIR 图像和 AIIR 图像背景噪声、肺动脉信噪比 (SNR) 和对比噪声比 (CNR)，对不同 CTPA 图像质量进行评分。结果：A、B 两组有效辐射剂量分别为 4.3±0.8mSv 和 1.3±0.2mSv，与 A 组相比，B 组辐射剂量下降 69.8%。A 组 HIR 图像、B 组 HIR 和 B 组 AIIR 图像背景噪声分别为 19.2±3.7Hu、28.1±4.4Hu 和 13.7±6.5Hu；B 组 AIIR 图像背景噪声显著低于 A 组 HIR 图像和 B 组 HIR 图像。A 组 HIR 图像上右肺动脉干信噪比 (SNR) 和对比噪声比 (CNR) 分别为 21.4±5.9 和 18.7±5.6，左肺动脉干 SNR 和 CNR 分别为 21.8±6.1 和 19.1±5.9；B 组 HIR 图像上右肺动脉干 SNR 和 CNR 分别为 19.3±3.5 和 17.1±3.4，左肺动脉干 SNR 和 CNR 分别为 19.3±3.4 和 17.1±3.2；B 组 AIIR 图像上右肺动脉干 SNR 和 CNR 分别为 45.8±14.6 和 41.0±13.4，左肺动脉干 SNR 和 CNR 分别为 46.1±14.7 和 41.2±13.7；B 组 AIIR 图像上右侧及左侧肺动脉干 SNR 和 CNR 均明显高于 A 组 HIR 图像和 B 组 HIR 图像。A 组 HIR 图像、B 组 HIR 图像和 B 组 AIIR 图像主观评分分别为 4.4±0.6、4.1±0.5 和 4.9±0.3，B 组 AIIR 图像主观评分显著高

于 B 组 HIR 图像和 A 组 HIR 图像。结论：联合 AIIR 和 70KV 超低管电压能够大幅度降低 CTPA 辐射剂量，且图像质量更优。

PO-3969

基于对比增强 CT 图像纹理建立三分类机器学习模型诊断甲状腺常见结节病变

基于对比增强 CT 图像纹理建立三分类机器学习模型诊断甲状腺常见结节病变、杨华、郭定波、刘柳恒、彭聪
重庆市中医院

目的：本研究旨在探讨基于对比增强 CT 图像纹理特征的三分类机器学习模型在甲状腺癌、结节性甲状腺肿和甲状腺腺瘤的诊断中的价值。方法：回顾性分析了重庆市中医院 2016 年 1 月至 2021 年 3 月的 151 例甲状腺癌、结节性甲状腺肿和甲状腺腺瘤患者，共计 184 个结节。使用 IntelliSpace Discovery 3.0 (PHILIPS) 工作站 pyradiomics 插件提取了对比增强 CT 图像纹理特征的 1199 个参数。将数据按照 3 : 1 的比例分为训练集 (n=138) 和验证集 (n=46)。使用 lasso 算法对训练集中的特征进行降维，并采用支持向量机 (SVM) 机器学习模型进行分类。建立的模型在验证集上进行验证。绘制了三种结节作为阳性分类时的受试者工作特征曲线，并比较了三种模型曲线下面积 (AUC) 的差异。通过计算三种模型的宏平均 AUC 评估了模型的整体分类性能。结果：在验证集中，甲状腺癌、结节性甲状腺肿和甲状腺腺瘤的 AUC 分别为 0.80、0.88 和 0.33，宏平均 AUC 为 0.78。结论：基于对比增强 CT 图像纹理特征建立的三分类支持向量机模型在甲状腺癌、结节性甲状腺肿和甲状腺腺瘤的诊断中具备较好的诊断效能。

PO-3970

基于增强 CT 影像组学预测急性胰腺炎后糖尿病的发生

钟舒婷、黄小华
川北医学院附属医院

目的：

探讨双期增强 CT 影像组学在预测急性胰腺炎后新发糖尿病的研究价值。

方法：

回顾性收集我院 2016 年-2018 年急性胰腺炎 (acute pancreatitis, AP) 的患者 145 例，其中 AP 后糖尿病(post-acute pancreatitis diabetes mellitus, PPDM-A)的患者 62 例，AP 后无糖尿病的患者 83 例，以 7 : 3 比例随机地将入组患者分为训练集和测试集，同期收集两组临床特征。分别勾画动静脉期胰腺实质并提取影像组学特征，采用方差阈值法、单变量选择法和最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 实现影像组学特征筛选。通过受试者工作特征(receiver operating characteristic, ROC) 曲线评估模型预测性能，使用 Delong 检验比较模型之间预测效能，采用校准曲线和决策曲线评价模型预测效能。

结果：

动脉期模型训练集 AUC 为 0.845(95% CI:0.771~0.919)；静脉期模型训练集 AUC 为 0.792(95% CI:0.705~0.880)；动静脉期联合模型训练集 AUC 为 0.829(95% CI:0.751~0.906)；临床模型训练集 AUC 为 0.656(95% CI:0.545~0.767)；基于影像组学联合临床模型训练集 AUC 为 0.862(95% CI:0.793~0.931)。Delong 检验结果显示影像组学联合临床模型与临床模型在训练集和测试集之间的差异都具有统计学意义 ($P < 0.05$)。决策曲线显示在一定范围区间影像组学联合临床模型的临床实用性高，校准曲线显示影像组学联合临床模型与实际观察值的拟合度最好。

结论:

基于双期增强 CT 影像组学模型可以较准确地预测 PPDM-A, 并能为临床制定个性化治疗方案提供一定的参考价值。

PO-3971

基于增强 CT 的分类回归树模型对透明细胞肾细胞癌的诊断研究

韩佳悦¹、陶雨溪¹、程词¹、陈炳辉¹、林峻聿¹、尹松涛²、陈昊³、陆遥⁴、张亚琴¹

1. 中山大学附属第五医院

2. 内蒙古自治区人民医院

3. 安徽省立医院

4. 中山大学计算机学院

目标本研究旨在开发和验证一种基于增强 CT 的决策树诊断模型, 用于从肾脏实性小肿块中区分透明细胞肾细胞癌。方法这项回顾性多中心研究纳入了经病理证实的肾脏实性小肿块患者。两名放射科医生评估了所有肿瘤的 CT 影像特征, 并给出了诊断结果。使用单变量和多变量 logistic 回归分析筛选透明细胞肾细胞癌的独立危险因素, 并建立分类回归树诊断模型。来自三个中心的数据用作训练集(n=229), 来自一个中心的数据用作独立的外部验证测试集(n=81)。以曲线下面积(AUC)的平均值作为模型的评价指标。用 DeLong 检验比较不同模型的 AUC。结果 309 名患者中有 310 个肾脏实性小肿块。共有 71% (220/310) 的患者为透明细胞肾细胞癌。增强模式、早期暗皮质带、皮髓质期病变与正常皮质衰减比、非增强期病变与正常皮质衰减之比和性别用于建立 CART 模型。在测试队列中, CART 模型的 AUC 为 0.903 (95%CI 0.807, 0.974)。与两位放射科医生的评估结果相比, CART 模型具有更高的 AUC 值(0.903 vs 0.694, $P = 0.0005$, 0.903 vs 0.616, $P < 0.0001$)。结论分类回归树诊断模型可以从肾脏实性小肿块中区分透明细胞肾细胞癌, 其诊断效率优于经验丰富的放射科医生, 潜在地减少了不必要的活检次数。

PO-3972

基于 X 线图像的深度学习影像组学鉴别急慢性骨质疏松性椎体压缩性骨折: 一项多中心研究

张俊¹、汤光宇²、梁志鹏¹、刘佳怿¹、夏亮¹、汤俊³、夏建国³

1. 南京医科大学附属逸夫医院

2. 上海市第十人民医院

3. 泰州市人民医院

目的: 开发并验证基于 X 线图像的深度学习影像组学模型用于鉴别急慢性骨质疏松性椎体骨折。

方法: 三家医院共计 1076 个椎体, 使用 ResNet-50 模型结构进行迁移学习, 基于 RadImageNet 与 ImageNet 数据集分别进行预训练, 从 OVFs 患者 X 线侧位图像中提取深度学习和影像组学特征并融合, 以 MRI 显示椎体骨髓水肿作为急性 OVFs 的金标准, 使用受试者工作特性曲线, 评估八种机器学习鉴别诊断急慢性 OVFs 的效能, 结合临床资料构建诺谟图。使用 Delong 检验比较最佳模型的预测效能, 使用决策曲线分析 (DCA) 评价诺谟图的临床价值。

结果: 两组模型中最有效的机器学习算法均是 LightGBM。使用 Delong 检验, 在训练集中两组模型鉴别诊断急慢性 OVFs 的 AUC 分别为 0.979 和 0.972, 二者间差异无统计学意义。在内部验证集、外部验证集和前瞻性数据集中, 两组模型的 AUC 分别为 0.967vs0.629、0.886vs0.817、0.933vs0.661, 两两比较差异有统计学意义。将 RadImageNet 的预测模型与临床特征结合构建诺谟图, 训练集、内部验证集、外部验证集和前瞻性数据集的 AUC 分别为 0.981、0.974、0.895、0.902。使用 Delong 检验, 在训练集中融合特征模型和诺谟图的 AUC 分别为 0.979 和 0.981, 二者

间差异无统计学意义。在内部验证集、外部验证集和前瞻性数据集中，两组模型的 AUC 分别为 0.967vs0.974、0.886vs0.895、0.933vs0.902，两两比较差异有统计学意义。诺谟图在内部和外部验证集的预测效能有提升，在前瞻性数据集有所降低，DCA 显示该模型给患者带来更多益处。

结论：与 ImageNet 模型相比，RadImageNet 模型对于鉴别急慢性 OVFs 具有更高的诊断价值，结合临床资料构建的诺谟图能提高诊断效能。

PO-3973

基于超声瘤内和瘤周放射组学和临床特征构建的诺模图用于鉴别甲状腺结节良恶性：一项多中心研究

李静^{1,2}、杜海²、武荣²、张剑³、孟建⁴、张美兰^{1,2}

1. 内蒙古科技大学包头医学院

2. 鄂尔多斯市中心医院（内蒙古自治区超声影像研究所）

3. 泰州人民医院

4. 华北理工大学附属医院

目的：联合甲状腺结节超声瘤内和瘤周特征临床特征构建列线图，以准确区分良性和恶性甲状腺结节。

方法：回顾性分析 2016 年至 2022 年三家医院 817 名患者的 1076 个甲状腺结节。基于临床信息和超声特征构建临床特征模型（Clinic_Sig）。从结节内部和结节周围 1、3、5、7、9 体素(peri1v, peri3v, peri5v, peri7v, peri9v)中提取放射组学特征。使用 Pearson 相关和 LASSO 回归分析去除冗余特征。基于放射组学模型（Rad_Sig）和 Clinic_Sig 构建诺模图。测试集（医院 1：719 个结节）用于模型构建和两个验证集（医院 2：74 个结节，医院 3：283 个结节）用于评估模型。统计分析包括 t 检验、受试者工作特征（ROC）曲线、校准曲线和决策曲线（DCA）。

结果：Peri1v 在验证集 1 中达到了最高的 AUC（AUC=0.863）。因此，我们使用结节内部和结节周围 1 体素距离内提取的放射组学特征构建放射组学模型。联合放射组学模型与临床特征模型构建诺模图。诺模图的 ROC 曲线下面积（AUC）分别为 0.942、0.894 和 0.933，超过了其他模型。通过 DCA 证实了我们的模型的临床实用性。

结论：我们的研究表明，基于临床特征和超声瘤内和瘤周放射组学特征构建的诺模图对良恶性甲状腺结节的预测有很好的潜力。

PO-3974

结合临床超声语义特征和放射组学特征诊断恶性甲状腺结节的诺模图的开发和验证：一项多中心研究

杜海¹、武荣¹、张剑³、孟建⁴、李静^{1,2}、张美兰^{1,2}

1. 鄂尔多斯市中心医院（内蒙古自治区超声影像研究所）

2. 内蒙古科技大学包头医学院

3. 泰州人民医院

4. 华北理工大学附属医院

目的：本研究的目的是开发和验证结合临床超声语义特征、手工和深度迁移学习（DTL）放射组学特征的列线图，以区分良性和恶性甲状腺结节。

方法：选取 2016 年 1 月至 2022 年 12 月三个机构的 817 例患者共 1,076 个甲状腺结节。基于基本临床信息和超声特征，使用逻辑回归构建临床超声语义特征签名（C-US_sig）。通过手工和 DTL 功能提取超声图像，并使用斯皮尔曼相关分析和 LASSO 回归进行特征选择。手工签名（Hand_sig）

使用选定的特征和 LASSO 回归系数构建。DTL 模型的预测概率直接作为签名 (DTL_sig)。综合的诺模图综合了上述三个特征。开发集 (机构 1: 719 个结核) 用于模型构建, 而两个外部验证集 (机构 2: 74 个结核和机构 3: 283 个结核) 用于模型评估。统计分析, 包括卡方检验和 t 检验, 并使用决策曲线分析和校正曲线来评估模型的性能。

结果: 良、恶性结节在年龄、横径、纵径、形态、回声灶、回声强度、成分等方面存在显著差异。Hand_sig 分别由 45 个手工选择的特征构造。综合列线图显示最高性能, AUC 为 0.947 (95% 置信区间 [CI]: 0.931-0.963), 0.917 (95% CI: 0.825-1.000), 0.929 (95% CI: 0.899-0.959), 精度为 0.890、0.865 和 0.858。决策曲线分析表明综合诺模图具有最佳的临床应用价值。校准曲线表明所有模型的校准良好。

结论: 本研究中开发的综合列线图利用临床超声语义, 手工和 DTL 签名提供了一种有前途的方法, 用于准确和有效地诊断恶性甲状腺结节, 对患者的结局和医疗保健成本有潜在的影响。

PO-3975

基于 AI 技术模拟双源 CT 对肾结石诊断的低剂量初探

高子淇

吉林大学第一医院

目的: 本研究探索了利用人工智能软件的虚拟平扫功能与临床实际双能 CT 扫描检查进行比对, 而对患有泌尿系统结石的病患进行不同扫描剂量之间的比较。

方法: 2021 年 1 月至 2023 年 8 月期间, 4 名在本院接受过西门子 SOMATOM Force 双源 CT 扫描的患者, 均被连续纳入本回顾性研究。患者 1, 性别 男, 年龄 50 岁, 右肾小囊肿、左肾结石; 患者 2, 性别 男, 年龄 58 岁, 肝硬化、右肾结石; 患者 3, 男, 年龄 50 岁, 原发性肝癌、右肾结石; 患者 4, 性别 男, 年龄 55 岁, 双肾囊肿、左肾结石; 受试者均进行上腹部平扫加三期增强检查, 造影剂均静脉摄入碘海醇。检查结束后, 对疑似肾结石的患者利用软件进行后处理, 软件将显示 VNC 和碘图组合的融合图像, 可以交互更改两种数据的混合比率。本研究均采用无碘图的 VNC 虚拟平扫模式。通过对患者动脉期、静脉期、延迟期肝脏以及肾脏病变区域 ROI 进行测量, 发现三个期相中动脉期的 CT 值与平扫的 ROI 平均 CT 值最趋于一致。因此, 我们选取动脉期进行后续研究。接着, 将腹部动脉期的正常平扫及虚拟平扫薄层图像进行重建, 再导入到图像后处理工作站中进行后续分析。

结果: 将两幅图像同步为同一层面, 软件可以半自动勾画出肾结石的位置并给出结石的直径、面积、密度等信息, 结果显示两个病灶具有高度一致性。通过分析数据, 绘制直方图能够发现两个图像显示的病灶 CT 值重合度为 90% 且峰值接近, 可以直观地显示二者的相似性。

结论: 双源 CT (DSCT) 可在一次扫描中生成不同能量的数据信息, 且诊断灵敏度和病变发现率均高于常规 CT。利用双能量技术可以在引入造影剂后更好的诊断病变部位, 而后续采用人工智能虚拟平扫可达到几乎与正常平扫相同的病变显示效果, 有助于临床诊断。无需再进行额外的扫描, 可以减少辐射剂量、增加检查效率且降低检查费用。对泌尿系统结石的诊断与及时治疗有较好的临床应用前景。

PO-3976

基于深度学习重建的快速 T2WI 的影像组学模型诊断前列腺癌的价值

杨博文^{1,2}、程昊¹、易音巧³、李春媚¹、陈敏¹

1. 北京医院放射科 国家老年医学中心 中国医学科学院老年医学研究院

2. 北京大学第五临床医学院

3. 华东师范大学上海市磁共振重点实验室

目的：本研究旨在利用影像组学方法，探究基于深度学习重建的快速 T2WI 和常规 T2WI 相比其在诊断前列腺癌的价值。

材料与方法：本研究纳入了 85 例前列腺患者，其中 47 例前列腺癌患者，38 例前列腺炎患者。所有患者均接受了前列腺 MRI 扫描，包括轴位、冠状位、矢状位常规 T2WI 及深度学习 T2WI，轴位 T1WI，轴位 DWI 和 ADC。使用 Elastix 工具包将 DWI、ADC 及深度学习 T2WI 配准到常规 T2WI 上，并进行重采样，使层内分辨率统一为 0.5mm×0.5mm，层间分辨率为 3mm。从预处理的影像数据中提取了包括感兴趣区域 (ROI) 的 14 个形状特征，常规 T2WI、深度学习 T2WI、DWI 和 ADC 的灰度特征各 18 个及纹理特征各 75 个。使用 Z-Score 和 MinMax 标准化对特征进行归一化。通过皮尔森相关系数 (PCC) 对特征进行降维，使用特征递归消除 (RFE) 和 ANOVA 对降维后的特征进一步选择，除去对结果贡献小的特征。使用逻辑回归 (LR) 和支持向量机 (SVM) 作为分类器，对常规 T2WI、深度学习 T2WI、DWI 和 ADC 中提取到的特征分别进行建模。通过 5 折交叉验证选取最优模型参数。将每组挑选出的特征加上病灶外周带体积占比，病灶移行带体积占比，以及 4 个临床特征组合后再进行建模。最后，使用独立测试集对模型进行评估，评估指标包括准确度、灵敏度、特异度及 AUC 值。

结果：经比较，联合 1 个病灶外周带体积占比的特征，2 个深度学习 T2WI 中提取的特征，2 个 ADC 提取到的特征及 4 个临床特征，共 9 个特征经过 Z-Score 特征归一化后，使用 LR 建模，在测试集上准确率为 0.880，灵敏度为 0.786，特异度为 1.000，AUC 为 0.890。

结论：

基于深度学习重建的快速 T2WI 的影像组学模型可以较好地实现对前列腺癌和前列腺炎的影像诊断和预测，并为临床决策提供辅助信息，提高诊断的准确性和可靠性。

PO-3977

基于 CT 图像的深度学习模型在机会性骨质疏松症筛查中的骨密度分类与预测研究

李杭骏、彭涛
成都大学附属医院

目的：探讨使用深度学习基于机会性 CT 扫描建立骨质疏松症分类和骨密度值预测模型的可行性，并使用独立测试集验证其泛化和诊断能力。

方法：本研究共纳入 1219 例机会性 CT 扫描，以 QCT 结果为参考标准。训练集：测试集：独立测试集的比例为 703:176:340，独立测试集的 340 例数据来自 3 家不同的医院和 4 台不同的 CT 扫描仪。使用 VB-Net 结构自动分割模型对松质骨进行分割，并使用 DenseNet 建立三分类模型和骨密度值预测回归模型。计算并评估模型的性能参数。

结果：ROC 曲线显示，对于训练集、测试集和独立测试集，将病例分类为“正常”、“骨量减少”和“骨质疏松症”的三类分类模型的平均 AUC 分别为 0.999、0.970 和 0.933。测试集的 F1 分数、准确率、精确度、召回率、精确度和特异性分别为 0.903、0.909、0.899、0.908、0.956，独立测试集的这

些值分别为 0.798、0.815、0.792、0.81、0.899。训练集、测试集和独立测试集的骨密度预测回归模型的 MAEs 分别为 3.15、6.303 和 10.257，RMSEs 分别为 4.127、8.561 和 13.507。R 平方值分别为 0.991、0.962 和 0.878。皮尔逊相关系数分别为 0.996、0.981 和 0.94，p 值均<0.001。预测值与骨密度值高度正相关，存在显著的线性关系。

结论：使用深度学习神经网络处理机会性 CT 扫描的身体图像可以准确预测骨密度值并进行骨密度三分类诊断，这可以减少专业骨密度测量带来的辐射风险、经济消耗和时间消耗，扩大骨质疏松症筛查范围，具有广泛的应用前景。

PO-3978

基于增强 MRI 的纹理分析术前预测肝细胞癌 Ki-67 状态的价值

许岂豪¹、刘爱连^{1,2}、赵莹¹、任雪¹、宋清伟¹、郭妍³、李昕³、吴艇帆³

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心

3. 通用电气医疗

目的 探讨基于增强 MRI 的纹理分析术前预测肝细胞癌 Ki-67 状态的价值

方法 我们对 2014 年 1 月至 2022 年 5 月间接受肝切除术的 26 例患者进行了回顾性分析。根据免疫组化检测 Ki-67 状态，将其分为低 Ki-67（标记指数<10%）组（19 例）和高 Ki-67（标记指数≥10%）组（7 例）。所有患者均接受腹部 3.0T MR 检查（Signa HDxt，GE 医疗，美国），包括 T1WI、T2WI 及增强序列。放射科医生沿肿瘤边缘描绘肿瘤各层，然后使用 AK 软件（GE 医疗）提取 107 个纹理特征，包括一阶特征、形状特征、灰度共生矩阵（GLCM）、灰度依赖矩阵（GLDM）、灰度大小矩阵（GLSZM）、灰度游程矩阵（GLRLM）及邻域灰度差矩阵（NGTDM）。采用组内相关系数（interclass correlation coefficient，ICC）、Spearman 相关系数、梯度提升决策树（gradient boosting decision tree，GBDT）进行特征降维。建立 Logistic 回归模型，绘制受试者工作特征曲线（receiver operating characteristic curve，ROC）预测效能，计算 ROC 曲线下面积（area under the curve，AUC）、准确率、敏感度及特异度。

结果 得到 5 个最优纹理特征，包括 3 个一阶特征：方差、范围和总能量，一个 GLRLM 特征：短期低灰度强调，一个形状特征：平坦性。建立 Logistic 回归模型来预测肝细胞癌 Ki-67 状态的 AUC、准确性、敏感性和特异性均为 0.895、84.60%、84.20%和 85.70%。

结论 通过勾画整个肿瘤区域，提取纹理特征，可以更客观、更全面地反映整个肿瘤的异质性。本研究采用增强 MRI 纹理分析术前预测肝细胞癌 Ki-67 状态，获得 5 个最优纹理特征，AUC 值为 0.895，表明基于增强图像纹理分析，具有准确预测肝细胞癌 Ki-67 状态的优势，为临床治疗方案的选择提供了重要的成像参考。

PO-3979

基于弥散加权成像的纹理分析术前预测肝细胞癌 Ki-67 状态的价值

3. 通用电气医疗

目的 探讨基于弥散加权成像（diffusion-weighted imaging，DWI）的纹理分析术前预测肝细胞癌 Ki-67 状态的价值

方法 我们对 2014 年 1 月至 2022 年 5 月间接受肝切除术的 23 例患者进行了回顾性分析。根据免疫组化检测 Ki-67 状态, 将其分为低 Ki-67 (标记指数 $\leq 15\%$) 组 (9 例) 和高 Ki-67 (标记指数 $>15\%$) 组 (14 例)。所有患者均接受腹部 3.0T MR 检查 (Signa HDxt, GE 医疗, 美国), 包括 T1WI、T2WI 及 DWI 序列。放射科医生沿肿瘤边缘描绘肿瘤各层, 然后使用 AK 软件 (GE 医疗) 提取 107 个纹理特征, 包括一阶特征、形状特征、灰度共生矩阵 (GLCM)、灰度依赖矩阵 (GLDM)、灰度大小矩阵 (GLSZM)、灰度游程矩阵 (GLRLM) 及邻域灰度差矩阵 (NGTDM)。采用组内相关系数 (ICC)、Spearman 相关系数、梯度提升决策树 (gradient boosting decision tree, GBDT) 进行特征降维。建立 Logistic 回归模型, 绘制受试者工作特征曲线 (receiver operating characteristic curve, ROC) 预测效能, 计算 ROC 曲线下面积 (area under the curve, AUC)、准确率、敏感度及特异度。

结果 得到了 7 个最优纹理特征, 包括一个一阶特征: 峰度, 两个 GLCM 特征: 自相关和聚类突出, 一个 GLRLM 特征: 运行方差, 两个 GLSZM 特征: 小区域强调和区域百分比, 一个 NGTDM 特征: 强度。建立 Logistic 回归模型预测 AUC, Ki-67 状态的准确性、敏感性和特异性为 0.968[95%CI (0.902,0.990)]、91.30%、92.90%和 88.90%。

结论 通过绘制整个肿瘤区域的纹理分析, 获得纹理参数, 可以更客观、更全面地反映整个肿瘤的异质性。本研究采用 DWI 图纹理分析预测术前 HCC 的 Ki-67 状态, 获得 7 个最优纹理参数, AUC 值为 0.968, 基于 DWI 图纹理分析, 具有准确预测肝癌 Ki-67 状态的优势, 为临床治疗方案的选择提供了重要的成像参考。

PO-3980

基于 MRI 影像组学的机器学习模型预测前列腺癌的 Ki67 表达与 Gleason 分级分组

譙孝凤、刘云帆、舒鑫、艾光勇、何晓静
重庆医科大学附属第二医院

背景与目的: Ki67 表达与格林森分级分组 (GGG) 均为前列腺癌 (PCa) 侵袭性判定的重要指标, 两者联合是长期预后评估的最佳组合。本研究旨在探寻一种基于磁共振 (MR) 影像组学的机器学习模型, 以期准确预测 PCa 的 Ki67 表达和 GGG, 实现病理指标的无创预测, 为临床提供更全面的信息。

材料和方法: 回顾性纳入经病理证实为 PCa 患者 122 例, 术前 MRI 及病理资料 (Ki67 与 GGG) 完整清晰。使用 AK 软件手动分割病灶感兴趣区, 并提取影像组学特征。基于脂肪抑制 T2 加权成像 (T2WI)、弥散加权成像 (DWI) 及表观扩散系数 (ADC) 和不同算法 (逻辑回归 (LR)、支持向量机 (SVM)、随机森林 (RF) 和 K 近邻 (KNN)) 构建预测 Ki67 和 GGG 的机器学习模型。采用受试者工作特征曲线 (ROC) 评价不同模型的预测性能, 并显示最佳模型特征的详细组合及权重最高的特征。采用 Spearman 检验分析 Ki67 和 GGG 的相关性, 探索同时预测 Ki67 和 GGG 的最佳模型, 计算其准确性, 并对比分析两联合模型的特征组成。

结果: 预测 Ki67 表达性能最佳的机器学习模型为 LR_ADC+T2 (曲线下面积 (AUC) =0.8882, 灵敏度=0.7636, 特异度=0.8657), 其中特征 ADC_kompet-LHH_firstorder_Maximum 权重最高。SVM_DWI+T2 (AUC = 0.9248, 灵敏度=0.8588, 特异度=0.7838) 预测 GGG 性能最佳, 特征 DWI_wavelet HLL_glcmm_SumAverage 权重最高。Ki67 和 GGG 呈正相关 ($r=0.382$, $P<0.001$)。LR_ADC+DWI (准确率=0.6230) 为同时预测 Ki67 和 GGG 准确性最高的模型, 最佳组合模型序列来源及比例一致且小波特征及纹理特征比例均较高, 但特征类型相似性较低。

结论: 本文所构建的基于 MRI 影像组学机器学习模型能准确预测 PCa 的 Ki67 表达和 GGG, 实现了病理指标的无创预测, 以识别惰性与侵袭性 PCa。

PO-3981

血清总胆汁酸与早期复发肝细胞癌的影像组学特征相关性研究

刘佳荟¹、赵莹²、李佳奕¹、左粲¹、许岂豪²、宋清伟²、刘爱连²

1. 大连医科大学

2. 大连医科大学附属第一医院

目的: 评估血清总胆汁酸与肝切除术后早期复发的肝细胞肝癌患者影像组学特征的相关性。

材料与方法: 回顾性收集 60 例接受肝切除术的肝细胞癌患者, 根据术后两年内的定期影像随访判断肝内是否有新发癌灶或转移, 将患者分为早期复发组 (n=32) 和早期未复发组 (n=28)。记录患者肝切除术前的血清总胆汁酸水平。使用 ITK-SNAP 软件在 T2WI 图像上逐层手动勾勒肿瘤获得三维容积感兴趣区。使用 AK 软件提取一阶影像组学特征, 包括 MaxIntensity、MeanValue、MedianIntensity、MinIntensity、Percentile10-Percentile90 (以百分之 5 为间隔)、Percentile95、Quantile0.25、Quantile0.5、Quantile0.75、Energy、Entropy、kurtosis 及 skewness。使用 Mann-Whitney U 检验比较早期复发组和未复发组间血清总胆汁酸的差异, 通过 Spearman 检验或 Pearson 相关性检验评估血清总胆汁酸与影像组学特征的相关性。

结果: 早期复发组 [7.55 (4.85, 14.45) $\mu\text{mol/L}$] 的血清总胆汁酸显著高于未复发组 [5.75 (3.825, 7.075) $\mu\text{mol/L}$] ($P=0.006$), 血清总胆汁酸与早期复发具有显著相关性 ($r=-0.357$, $P=0.005$)。血清总胆汁酸与 Percentile25、Percentile40、Percentile45、Percentile5、Percentile50、Quantile0.25、Quantile0.5 具有相关性 ($r=-0.351$ 、 -0.356 、 -0.354 、 -0.354 、 0.351 、 -0.351 、 -0.351 , $P<0.05$)。

结论: 胆汁酸代谢水平与肝细胞癌患者肝切除术后的早期复发风险相关, 血清总胆汁酸与 T2WI 影像组学特征具有相关性。

PO-3982

基于多模态影像组学的机器学习模型预测胰腺癌血管侵犯及辅助手术决策的研究

张文会、李秉林、吕少诚、郎韧

首都医科大学附属北京朝阳医院

目的: 探讨基于多模态影像组学的机器学习模型预测胰腺癌血管侵犯及辅助手术决策的价值。

方法: 回顾性分析 2011 年 1 月至 2023 年 5 月首都医科大学附属北京朝阳医院收治的 188 例经手术病理确诊的胰腺癌患者的临床、病理及术前 CT 影像资料, 其中存在血管侵犯 73 例 (38.8%), 需要手术的有 90 例 (47.9%), 所有入组患者按 8: 2 的比例划分训练集和验证集, 采用基于 3D CT 图像以及多模态数据联合分析的方法判断胰腺癌血管是否侵犯及是否需要进行手术。对原始 3D CT 图像进行预处理后使用深度学习网络, 对其进行特征提取, 联合血液检验特征及个人基础信息得到的三种模态特征, 将其级联后使用多层线性层对特征进行整合, 最终使用血管侵犯分类器和手术分类器预测胰腺癌血管侵犯及是否需要进行手术。

结果: 训练集中包含 150 例病患, 病理证实存在血管侵犯的有 59 例 (39.3%), 需要手术的有 70 例 (46.7%)。验证集中包含 38 例病患, 存在血管侵犯的有 14 例 (36.8%), 需要手术的有 20 例 (52.6%)。基于三种数据特征构建 3 个机器学习模型中, Swin-B 模型 AUC 优于 R(2+1)D、UniformerV2 模型, 差异有统计学意义 (均 $P<0.05$)。与常规影像特征的诊断效能比较, Swin-B 模型在验证集中预测血管侵犯和是否手术具有更高的 AUC (0.869 vs 0.786), 差异具有统计学意义 (均 $P<0.05$)。

结论: 基于多模态影像组学的机器学习模型可实现胰腺癌血管侵犯的术前预测以及辅助手术决策, Swin-B 模型较常规影像特征的诊断效能更高。

PO-3983

基于术前增强 CT 构建胰腺癌淋巴结转移的影像组学预测模型朱骊文^{1,2}、居胜红¹

1. 东南大学附属中大医院

2. 东南大学医学院

研究目的：胰腺导管腺癌（PDAC）恶性程度极高，淋巴结转移是其预后不良的关键因素，新辅助化疗被证实可改善淋巴结转移患者的预后，因此术前 LN 状态评估至关重要。本研究旨在基于术前增强 CT 构建胰腺癌淋巴结转移的影像组学预测模型，并探究模型对患者的预后预测价值。

研究方法：本研究回顾性收集 3 个中心行根治性切除且术前未进行新辅助治疗的胰腺癌患者，所有患者均收集临床资料、术前增强 CT 图像及随访预后资料。将研究对象按中心分成两个数据集：中心 1+中心 2 作为训练集和内部验证集，中心 3 作为外部验证集。两名放射科医生使用 ITK-SNAP 软件于动脉期手动勾画胰腺癌原发病灶，并以肿瘤边缘向外扩展 5mm 生成瘤周区域，然后利用 Pyradiomics 对肿瘤及瘤周 ROI 提取影像组学特征，使用最小绝对收缩和选择算法（LASSO）进行降维并提取关键特征，通过 Feature Explorer（FAE）软件构建淋巴结转移预测模型，基于 AUC 值评价模型的预测性能，最后通过 Kaplan-Meier 生存分析方法及 log-rank 检验评价模型对患者的生存预后预测性能。

结果：本研究共纳入 3 个中心 292 例患者[64 岁(55–72 岁); 114 女]，184 名患者病理证实存在淋巴结转移。基于动脉期原发肿瘤及瘤周区域构建的影像组学预测模型在训练集、内部验证集及外部验证集 AUC 值分别为 0.83, 0.78, 0.74。在外部验证集中，基于最大约登指数作为截断值，模型预测术前淋巴结转移高风险组和低风险组患者的中位 OS 分别是 8 个月和 19 个月 ($P < 0.001$)。

结论：基于胰腺癌原发病灶及瘤周区域的动脉期影像组学特征构建的模型，能较准确预测胰腺癌患者术前是否发生淋巴结转移，同时对患者生存预后具有潜在预测价值。

PO-3984

**影像技术实习生结合人工智能辅助诊断对肺结节
Lung-RADS 分级的应用研究**

徐俊峰、崔磊

南通市第一人民医院

摘要：目的 重点研究影像技术实习生结合人工智能在肺结节 Lung-RADS 分级的应用意义。方法 选取 2022 年 6 月至 2023 年 6 月在南通市第一人民医院医学影像科实习的 6 名影像技术专业学生和在南宁市第一人民医院新参加工作的 6 名初级技师，按照教学培训方式不同分成常规培训组和 AI 辅助组。其中，常规培训组通过影像诊断医师负责对入组人员针对肺结节进行为期 3 月的理论培训和阅片技能指导，再通过理论及阅片考核，了解课程学习效果。AI 辅助组在此培训基础 1 月后针对人工智能进行使用的相关培训，再次进行理论及阅片考核，并通过问卷调查表了解两组的教学满意度。结果 AI 辅助组的理论和技能考核成绩都明显高于常规培训组 ($P < 0.05$)；AI 辅助组的教学满意度也高于常规培训组 ($P < 0.05$)。结论 采用人工智能教学模式，能够显著提升影像技术实习生的综合能力，大大提升教学质量和效率，具有极其广阔的应用前景。

PO-3985

深度学习影像组学列线图预测胶质瘤患者 IDH 突变状态的一项多中心的研究

李大瑞、张静、胡万均
兰州大学第二医院

摘要 目的 胶质瘤是颅内最常见的原发性恶性肿瘤之一，IDH 突变状态是与其预后关系最为密切的基因亚型，准确无创预测 IDH 突变状态仍然具有挑战性。我们旨在基于多模态 MRI 图像构建深度学习影像组学列线图模型，评估其在预测胶质瘤患者 IDH 突变状态的诊断效能，并进一步探索其临床实用价值。方法 回顾性纳入来自中国两个中心的总共 260 例胶质瘤患者的术前 T2WI、T1 增强图像，将 I 中心的数据按 7:3 随机分为训练队列和内部测试队列，II 中心的数据作为外部测试队列。将图像进行预处理后，分割整个肿瘤区域（包含肿瘤核心及瘤周水肿），基于 T1 增强、T2WI 图像融合深度学习和影像组学特征，利用 Logistic 回归分析筛选特征并构建深度学习影像组学列线图模型以预测胶质瘤 IDH 突变状态。使用准确性（Accuracy, ACC）、ROC 曲线下面积（Area under the curve, AUC）评估模型的诊断效能。此外，我们在内部测试队列上使用生存分析评价了预测模型的临床实用价值。结果 深度学习影像组学列线图模型在外部验证队列的 AUC、ACC 分别为 89%、92%。并且我们的研究结果表明深度学习影像组学模型与胶质瘤患者不同基因亚型总生存期显著相关。结论 深度学习影像组学列线图模型在术前预测胶质瘤 IDH 突变状态方面展现出了出色的诊断效能，可为胶质瘤患者临床个体化治疗提供可靠的依据。

PO-3986

基于多模态 MRI 的 3D-EfficientB2 卷积神经网络预测脑胶质瘤 IDH 突变状态：一项多中心的研究

李大瑞、张静、胡万均
兰州大学第二医院

目的 胶质瘤是最常见的脑内原发性恶性肿瘤，IDH 突变状态对于临床治疗方案的确定和患者的分层管理以及预后具有重要意义，但术前 IDH 基因状态检测仍然具有挑战性。我们研究旨在分别构建并验证 3D-EfficientB2 卷积神经网络模型以预测脑胶质瘤 IDH 突变状态，以探究 3D-EfficientB2 卷积神经网络模型临床应用价值的一项多中心的研究。方法 回顾性纳入 914 例胶质瘤患者的术前多模态 MRI 图像，包括 T2WI 图像，T1WI 图像，T1-CE 图像以及 T2-Flair 图像，其中包含兰州大学第二医院 704 例和 TCIA 数据库下载的 210 例，其中男性共 525 例，女性 389 例，平均年龄 48 ± 2.5 岁，将数据按（7:3）随机分为训练集、测试集；并前瞻性的在兰州大学第二医院收集独立的外部测试集。将图像进行预处理后，构建 3D-EfficientB2 深度学习模型，并使用准确性（Accuracy, ACC）、ROC 曲线下面积（Area under the curve, AUC）评估 3D-EfficientB2 深度学习模型的预测效能。

结果：基于 3D-EfficientB2 深度学习模型在预测胶质瘤 IDH 突变状态的效能 在外部测试集及前瞻性的独立测试集的 ACC 分别为 90.8、82.2%，其 AUC 分别为 94.6%、83.7%。

结论：基于多模态 MRI 的 3D 卷积神经网络预测脑胶质瘤 IDH 突变状态的诊断效能较高，与其它深度学习模型相比如 3D-Resnet 相比诊断效能均表现更优，可作为辅助放射科医师提高诊断效能的工具，为临床更合理的制定个性化诊疗方案提供帮助。

PO-3987

基于常规 MRI 图像的 3D 卷积神经网络预测脑胶质瘤分级： 一项多中心的研究

李大瑞、张静、胡万均
兰州大学第二医院

目的 胶质瘤是最常见的脑内原发性恶性肿瘤，术前分级对于临床治疗方案的确定和患者的分层管理具有重要意义，但准确分级仍然具有挑战性。我们的研究旨在分别构建并验证 ResNet101、DenseNet 卷积神经网络模型以预测脑胶质瘤分级，并与放射科医师诊断效能进行比较，以探究模型临床应用价值的一项多中心的研究。**方法** 回顾性纳入 914 例胶质瘤患者的术前 T2WI 图像，其中包含兰州大学第二医院 704 例和 TCIA 数据库下载的 210 例，将这些数据按（7:3:1）随机分为训练集、内部测试集和外部测试集。将图像进行预处理后，分别构建基于 3D 的 ResNet101、DenseNet 深度学习模型，使用准确性（Accuracy, ACC）、ROC 曲线下面积（Area under the curve, AUC）以及损失函数（Loss）曲线对模型效能进行评估，并分别和放射科医师就诊断效能进行比较。**结果** ResNet101、DenseNet 模型以及放射科医师在内部测试集的 ACC 分别为 87.5%、83.4%、78.6%，AUC 分别为 89.6%、81.3%、76.2%；在外部测试集的 ACC 分别为 84.8%、78.2%、73.9%，AUC 分别为 80.6%、75.3%、71.5%。**结论** 我们的研究表明，基于常规 T2WI 序列多中心的不同深度学习模型相较于放射科医师，其诊断效能均表现更优，可作为辅助放射科医师提高诊断效能的工具，为临床更合理的制定个性化诊疗方案提供帮助。

PO-3988

基于 APTw 生境分析的影像组学模型预测 IDH 突变

李大瑞、张静
兰州大学第二医院

目的：评估 APTw 生境分析的影像组学模型预测胶质瘤 IDH 突变状态的诊断效能，并比较其与常规影像组学模型预测效能的差异。

方法：回顾性纳入分别来自兰州大学第二医院和北京天坛医院共 152 例胶质瘤患者（IDH 野生型 90 例，IDH 突变型 62 例）。从普通 APTw 的 ROI 及采用无监督聚类分析的 APTw 生境分析 ROI 中提取基于 APTw 的图像特征 1873 个，使用最小绝对收缩和选择算子及 Pearson 相关算法选择特征，随后将数据按照 8:2 随机拆分为训练集（n=110）及测试集（n=42）；最后基于常规 ROI 构建的影像组学模型与基于生境 ROI 构建的影像组学模型相比较，并使用受试者工作特征（Receiver operating characteristic, ROC）曲线、准确性（Accuracy, ACC）等指标评估模型在训练队列及测试队列的模型效能。**结果：**基于 5 个常规影像组学特征及 4 个生境特征构建的影像组学模型，在训练集及测试集预测胶质瘤 IDH 突变状态的准确率分别为 82.3%、89.5%，ROC 曲线下面积分别为 81.3%、91.5%。**结论：**基于 APTw 生境分析的影像组学模型可以在术前无创预测胶质瘤 IDH 突变状态，其效能高于常规 ROI 影像组学模型，生境分析影像组学模型具备向临床应用推广的潜在价值。

PO-3989

利用多参数 MRI 结合深度学习及影像组学对 上皮性卵巢癌盆腔上腹膜转移进行术前评估

魏明翔、陈双庆
南京医科大学附属苏州医院

目的：盆腔上腹膜是上皮性卵巢癌（EOC）最常见的转移部位。准确的术前评估关乎患者个体化治疗与生活质量。本研究旨在开发和验证基于多参数 MRI 且结合深度学习及影像组学的具有可解释性的预测模型，以评估 EOC 盆腔上腹膜转移风险。

方法：回顾性纳入五家机构 411 例 EOC 患者（腹膜转移 213 例，未转移 198 例）。患者均完成术前 MRI 与肿瘤减灭手术。其中一中心数据为外部验证集；其余数据 3:1 划分为训练集与内部验证集。采用 T2 图像定界肿瘤 ROI，并将 DWI 和 ADC 图像配准至 T2 加权图像。各参数图像中分别提取 1230 个影像组学特征，涵盖一阶、纹理和小波变换特征。经单因素分析及 LASSO 筛选，应用 10 次 10 折交叉验证，频率超过 50% 的特征纳入影像组学模型。深度学习模型使用 ResNet50 神经网络，将 T2、DWI 和 ADC 图像的病灶最大横断面进行前融合输入。结合单因素及多因素 logistic 回归分析构建了临床模型，并采用后融合方法将三种模型进行融合成联合模型。所有模型均采用 10 折交叉验证并行内、外部验证。SHAP 和 Grad-Cam 算法评估模型的可解释性。使用 ROC 曲线评估诊断性能、DeLong 检验对 ROC 曲线下面积进行比较、决策曲线分析模型的临床应用价值。

结果：10 折交叉验证结果显示，联合模型具有最佳的诊断表现（平均 AUC=0.862），且具有较高稳定性（AUC 标准差=0.066）。联合模型在内部和外部验证集中的 AUC 最佳，分别为 0.832 (95% CI: 0.726, 0.917) 和 0.867 (95% CI: 0.784, 0.931)。在内部验证集中，联合模型显著优于影像组学、深度学习及临床模型（P 分别为 0.016、0.001 及 0.037）；在外部验证集中，显著优于临床模型（P=0.033）。根据校准和决策曲线，联合模型具有最佳分类准确性和临床应用价值。

结论：本研究成功开发和验证了综合多参数 MRI、深度学习和影像组学的联合模型，有效评估了上皮性卵巢癌患者的盆腔上腹膜转移风险，有潜力为上皮性卵巢癌患者的术前评估提供了一种高可靠性的新方法，有望促进对这类患者的个体化治疗策略的制定。

PO-3990

一个融合 MRI 放射组学和深度学习特征的融合模型用于预测 IDH 突变的高级别星形细胞瘤中 ATRX 突变状态： 一项多中心研究

刘智
重庆市中医院

目的 本研究旨在开发一种临床-影像融合模型，将术前 MRI 放射组学和深度学习 (Deep learning, DL) 特征与临床变量相结合，以预测异柠檬酸脱氢酶 (Isocitrate dehydrogenase, IDH) 突变高级别星形细胞瘤患者的 α -地中海贫血/智力低下 X 连锁 (Alpha-thalassemia/mental retardation X-linked, ATRX) 状态。**方法** 对来自三个中心的 234 例 IDH 突变高级别星形细胞瘤患者 (120 例 ATRX 突变型, 114 例 ATRX 野生型) 进行回顾性分析。提取来自不同区域 (水肿、肿瘤和整体病变) 的放射组学和 DL 特征，以通过组合不同区域中的不同特征来构建多个影像模型，用于预测 ATRX 状态。然后选择一个最佳影像模型，利用其特征和线性系数计算影像评分。最后，结合影像评分和临床变量建立融合模型。通过比较接收者操作特征曲线 (receiver operating characteristic, ROC)、诺模图的构建、校准曲线、决策曲线和临床应用曲线，评估融合模型的性能和应用价值。**结果** 由整体病变区的放射组学和 DL 特征构建的整体混合模型被确定为最佳影像模型。与最佳影像模型 (0.966、

0.916、0.936) 和临床模型 (0.677、0.641、0.772) 相比, 融合模型显示出最佳预测性能, 训练集的 AUC 为 0.969, 验证集的 AUC 为 0.956, 测试集的 AUC 为 0.949。**结论** 基于术前 MRI 的临床-影像融合模型能有效预测 IDH 突变高级别星形细胞瘤的 ATRX 突变状态, 有望帮助患者在治疗前制定更有效的治疗策略

PO-3991

基于 multi-scale CNN 的脑 CT 图像运动校正 重建算法的临床验证研究

周蕾蕾、刘浩
南京市第一医院

目的 脑 CT 作为一种无创获取脑组织结构信息的快速成像方式, 已广泛用于脑出血、中风、脑外伤等各种脑疾病的诊断中。患者由于急性脑血管病变、外伤等, 意识不清的状态往往容易出现不受控制的头部运动, 从而产生运动伪影, 影响图像的诊断效果。因此, 抑制图像的运动伪影极为重要。本文评价了一种基于 multi-scale CNN 的运动校正重建算法在脑部 CT 中的临床表现。

方法 本回顾性研究纳入了 53 例在第一次扫描中发现运动伪影的脑 CT, 并立即进行了没有运动的重新扫描。重新扫描的图像用常规迭代重建 (IR) 算法重建 (参考组), 而第一次扫描的图像则用 IR (运动组) 和运动校正重建算法 (MC 组) 重建。两位放射科医生被要求三个解剖位置 (后窝、侧脑室体、半卵圆体), 将感兴趣区域 (ROI) 置于灰质和白质的区域上。测量并比较多个定量指标, 包括标准差、信噪比 (SNR)、对比度-噪声比 (CNR)、平均平方误差 (MSE)、峰值信噪比 (PSNR)、结构相似性指数 (SSIM) 和相互信息 (MI)。主观评估指标包括主观噪声、锐度、伪影和总体诊断可接受性, 采用李克特 5 分制评分 (1 = 差; 5 = 优秀), 由两名医生独立审阅, 将运动组、MC 组和参考组的图像按随机顺序混合, 审查间隔至少 2 周, 以尽量减少医生的偏见。

结果 与运动组相比, MC 组的 SNR 和 CNR 明显增加。与运动组相比, MC 组的 MSE、PSNR、SSIM 和 MI 分别提高了 44.1%、15.8%、7.4% 和 18.3% (均 $P < 0.001$)。MC 组的主观评分普遍高于运动组 ($P < 0.05$)。总体诊断可接受性从运动组的 38.68% 提高到 MC 组的 96.23%。

结论 本研究使用的基于 multi-scale CNN 的运动校正重建算法, 在减少运动伪影和提高图像质量方面具有出色的能力。伪影和图像质量的改善, 有助于提高脑 CT 检查的成功率, 避免了不必要的重新扫描, 增加诊断的信心。但本研究仍有几点局限性。首先, 本研究的验证是针对重新扫描的参考图像进行的, 并假设它足够准确。第二, 需对儿科病人进行进一步验证, 可能有更大的价值。第三, 基于人工智能的运动校正重建算法是否适用于剧烈的物理运动仍需要进一步研究。

PO-3992

用于区分国际神经母细胞瘤风险组分期系统的高风险和低风险 患者的 18 F-FDG PET/MRI 影像组学列线图

梁江涛、许远帆、潘建虎
杭州全景医学影像诊断中心

目的: 开发和验证 18 F-FDG PET/MRI 放射组学诺模图, 用于区别国际神经母细胞瘤风险组 (INRG) 分期系统 (INRGSS) 的高风险和低风险患者。

方法: 回顾性分析 124 名神经母细胞瘤患者的 18F-FDG PET/MRI 影像学资料, 分为训练集 ($n = 93$) 和验证集 ($n = 31$)。从 PET 图像和 T2WI 图像中提取影像组学特征, 计算影像组学评分 (Rad score)。然后采用单因素和多因素 logistic 回归分析筛选出独立的临床因素并构建临床模型。基于

Rad 评分和独立的临床因素开发了放射组学列线图。临床模型、Rad 评分和列线图的性能通过接受者操作特征 (ROC) 曲线、校准曲线和决策曲线分析 (DCA) 进行评估。

结果: 选择了八个影像组学特征来构建组学模型。患者年龄、INRG 分期、MTV、TLG 和 Rad 评分显示高风险和非高风险患者之间存在显著差异。结合 Rad 评分和上述临床因素的放射组学列线图显示了区分高风险和非高风险的良好预测价值,在训练集和验证集中 AUC 值分别为 0.973 和 0.969。校准曲线显示放射组学列线图具有拟合优度, DCA 证明放射组学列线图在临床上是有益的。结论: 结合 Rad 评分和临床因素的放射组学列线图可以很好地预测 INRGSS 的高危和非高危患者。可能有助于临床实践中的疾病随访和管理,辅助神经母细胞瘤的个体化、精准化治疗。

PO-3993

基于 Mimics 三维重建支气管树及 影像组学在慢性阻塞性肺疾病中的早期诊断价值

马庄宣、李铭、金倬
复旦大学附属华东医院

背景资料: 慢性阻塞性肺疾病 (COPD) 作为慢性气道疾病之一,其高发病率、高致死率已引起全球关注。COPD 不仅严重影响患者生活质量,而且给患者家庭带来沉重的经济负担。早期准确地诊断并加以干预是 COPD 患者取得良好预后的重要前提。本研究基于 Mimics 软件在吸气相三维重建支气管树结合肺气管树的影像组学特征,评价气道树影像组学模型对慢阻肺患者的早期预测价值。

方法: 本研究回顾性纳入了 2019 年 12 月至 2021 年 6 月在复旦大学附属华东医院就诊并完成胸部 CT 及肺功能检查的 87 例患者为研究对象,根据吸入支气管舒张药后 FEV1/FVC 是否小于 70%,或者 FEV1 是否小于 80%预计值分为 COPD 组 48 人,正常对照组 39 人。利用 Mimics 软件对患者吸气相 CT 进行支气管树三维重建。以 6:3:1 的比例分为训练集和验证集和测试集对支气管树进行影像组学特征值提取,并用随机森林模型进行训练和测试,采用 ROC 曲线评价预测效能。

结果: 共提取出 107 项影像组学特征,其中 69 个组学特征具有统计学意义($P < 0.05$),进行最大相关最小冗余 (mRMR) 算法后对剩余的 20 个特征进行 LASSO 分析,最终筛选出 3 个最优影像组学特征用于预测诊断 copd 患者,模型中选择的影像组学特征分别为能量 (Energy)、最小值 (Minimum) 及均匀性 (Uniformity)。基于支气管树影像组学特征建立的随机森林模型在训练集的 AUC 为 0.95,准确度、敏感度、特异度分别为 93.7%、86%、90%,测试集的 AUC、准确度、敏感度、特异度均到 1。

结论: 基于支气管树影像组学特征建立的随机森林模型可以对 COPD 患者进行早期诊断。

PO-3994

联合影像组学及深度学习在 CT 平扫上自动鉴别肺挫伤与 社区获得性肺炎

邓铁¹、冯俊榜¹、王忠睿¹、冯明娟²、李传明¹
1. 重庆市急救医疗中心,重庆大学附属中心医院
2. 重庆市爱宾健康体检中心有限公司

目的: 建立并验证用于自动鉴别肺挫伤与社区获得性肺炎的人工智能模型。

方法: 回顾性收集重庆大学附属中心医院 2016 年 7 月至 2022 年 4 月期间收治的肺挫伤患者 641 名和细菌性肺炎患者 721 名,按照 8:2 的比例随机分为训练集和验证集。在联影智能一站式科研平台上使用 U-Net 网络演化的 VB-net 网络在胸部 CT 平扫上自动进行对肺炎和肺挫伤病灶的识别、分割,并由两名高年资主治医师对分割的结果进行审核及校正。通过 Research Portal Vx. X 在基于

胸部 CT 建立的肺部病灶自动分割框架结构上从每个患者的感兴趣区域 (Region of interest, ROI) 中, 自动提取 2264 个影像组学特征。使用 k-best 算法、LASSO 算法对特征进行选择。在训练集上采用四个独立的机器学习分类器 (决策树、逻辑回归、随机森林和支持向量机 (Support Vector Machines, SVM) 进行训练, 并在验证集上进行验证, 采用受试者工作特性曲线下面积 (Area under the curve, AUC)、灵敏度、特异性和准确性指标评价模型性能。

结果: 每位患者共纳入 2264 个影像组学特征, 降维后, 发现 10 个特征与肺挫伤相关, 基于 SWM 模型表现出较好的性能, 在训练集上的 AUC、灵敏度及特异度、准确性分别为 0.998、0.979、0.982、0.980, 在测试集上的 AUC、灵敏度及特异度、准确性分别为 0.891、0.750、0.860、0.808。DeLong 检验表明, SWM 模型在所有模型中精度最高。校准曲线显示, 预测病人合并有肺挫伤发生风险的模型结果具有良好的一致性和稳定性。临床决策曲线显示 SWM 模型呈显著正效应, 患者获益概率范围广, 具有临床实用价值。

结论: 基于 CT 平扫肺部的影像组学特征构建的 SVM 模型表现最佳, 可作为评估外伤病人合并肺裂伤的辅助诊断工具。该机器学习模型可以自动识别、分割和提取肺部病灶的影像组学特征, 实现肺挫伤和社区获得性肺炎的自动鉴别。

PO-3995

基于 T2 加权 MRI 瘤周联合瘤内影像组学模型在术前预测上皮性卵巢癌 FIGO 分期的价值

王心怡、魏明翔、陈双庆
南京医科大学附属苏州医院

目的: 国际妇产科联合会 (FIGO) 分期对上皮性卵巢癌 (EOC) 的治疗选择和预后评估具有重要意义, 但传统的影像学评估方法在术前预测分期上仍有局限性。本研究探讨了基于 T2 加权 MRI 瘤周和瘤内影像组学模型预测上皮性卵巢癌 FIGO 分期的准确性与价值。

方法: 本回顾研究共纳入苏州市立医院 (中心一) 及苏州大学附属第一医院 (中心二) 在内的 189 例 EOC 患者, 其中 87 例为 FIGO I/II 期, 102 例为 FIGO III/IV 期。所有患者均接受了术前 MRI 检查及标准的癌细胞减灭手术。中心一的患者数据用于模型训练, 而中心二的数据作为外部验证集。基于肿瘤边界勾画感兴趣区域 (ROI), 并分别向外扩展 2mm、4mm、6mm、8mm 和 10mm 以获得多重瘤周信息。从瘤内 ROI 及各瘤周区域分别提取 1230 个影像组学特征。使用单因素分析、相关性分析、mRMR 及 LASSO 算法进行特征筛选。比较各瘤周外扩范围的影像组学模型在训练集中的效能, 以选择最优的外扩范围构建瘤周模型; 并进一步构建瘤内模型及临床模型。通过 nomogram 将三者结合构建联合模型。将各模型应用于外部验证集, 并通过受试者工作特征曲线 (ROC) 分析评估诊断性能。采用 DeLong 检验对比模型之间诊断效能的差异。

结果: 瘤周影像组学模型在 2mm 的外扩范围下表现最优, 其训练集 AUC 达 0.840。在外部验证集中, 联合模型具有最佳的准确率 (0.742) 及特异性 (0.808)。此外, 联合模型的 AUC 显著优于瘤周模型 (0.837 vs. 0.668, $P = 0.008$) 及临床模型 (0.837 vs. 0.729, $P = 0.040$); 瘤内模型的 AUC 显著优于瘤周模型 (0.813 vs. 0.668, $P = 0.026$)。

结论: 基于 T2 加权 MRI 的瘤周、瘤内影像组学方法, 有潜力有效预测上皮性卵巢癌的 FIGO 分期, 其中联合瘤周瘤内影像组学及临床信息的模型表现最佳。该模型有望为临床医生提供了一个非侵入性、准确的工具, 帮助他们更好地评估患者状况并制定个性化的治疗方案。

PO-3996

基于多模态空洞卷积神经网络人工智能技术 辅助精准诊断急性胰腺炎的研究

杨波¹、潘旭航²、杨鸿溢²、姚亮²、杨浚帆²

1. 十堰市太和医院

2. 湖北医药学院

目的 CT 图像诊断急性胰腺炎 (AP) 常受限于放射科医生的专业水平与视觉判断。本研究开发了一项基于多模态空洞卷积神经网络 (MSAnet) 的人工智能工具, 用于胰腺轮廓的精准分割, 旨在 CT 断层扫描图像中快速定位胰腺、提取形态学信息、将胰周胰内信息可视化, 实现 AI 辅助临床诊断。

方法 本研究回顾性纳入 2013 年 9 月至 2022 年 9 月期间 1124 例疑似 AP 并接受腹部 CT 平扫和 CT 增强扫描检查的患者。将患者分为训练组 (N=688)、验证组 (N=145)、测试组 (N=291, 正常胰腺组 N=104, 急性胰腺炎组 N=98, 急性胰腺炎合并胰腺癌组 N=89)。分别用于构建模型、验证模型、测试模型。通过六个开源模型和基于 MSAnet 的工具进行胰腺分割和测量, 并使用 Dice 相似系数 (DSC) 和重叠度 (IoU) 指数评估结果。并对不同年龄的患者的 DSC 和 IoU 进行比较, 采用受试者工作特征曲线 (ROC) 和混淆矩阵评价放射科医生使用和非使用 MSAnet 工具对 AP 和 AP&PDAC 的诊断效率与精确度。

结果 在所有分割模型中, MSAnet 在训练集上 DSC 最高为 0.966, IoU 次之, 为 0.953 (最高为 0.954), 而在验证集上 DSC 最高为 0.819, IoU 为 0.706。基于 MSAnet 的工具在测试数据集上也有很高的效率 (DSC: 0.817—0.832; IoU: 0.756—0.778)。在人工智能工具的帮助下, 初级和高级放射科医生对同一批患者的诊断时间分别缩短了 26.8% 和 32.7%。初级放射科医生诊断 AP 的曲线下面积由 0.91 提高到 0.96, 高级放射科医生的曲线下面积由 0.98 提高到 0.99。在 AP&PDAC 诊断中, 低级放射科医生的 AUC 由 0.85 增加到 0.92, 高级放射科医生的 AUC 由 0.97 增加到 0.99。

结论 基于 MSAnet 的工具显示出良好的胰腺分割和测量性能, 有助于放射科医生提高 AP 及 AP&PDAC 的诊断效率, 并优化工作流程。

PO-3997

基于 MRI 影像组学预测直肠癌新辅助治疗预后

郭小芳、贺瑶瑶、袁子龙、刘玉林
湖北省肿瘤医院 (湖北省肿瘤研究所)

目的: 探讨基于 MRI 影像组学对直肠癌新辅助治疗 (NACT) 后生存期 (OS) 的预测价值。

方法: 回顾性分析 2017 年 1 月至 2022 年 1 月期间, 直肠癌患者首诊时的临床、MRI 检查资料及 NACT 术后随访资料。在高分辨 T2WI 图像上, 手动绘制直肠癌瘤灶作为 ROI-1 (感兴趣区), 并逐层勾画直肠周围系膜作为 ROI-2; 提取两者所有影像组学特征后, 保留稳定性较好 ($ICC \geq 0.75$) 的特征。以随访终点时生存状态为切点筛选影像组学特征。采用七种机器学习算法分别构建模型并选出优势模型, 计算相应的 Radscore。统计学分析得到与随访终点时生存状态有显著差异的临床影像学特征。采用 Cox 风险比例模型综合分析结合 Radscore (ROI-1)、Radscore (ROI-2) 和具有预测意义的临床特征对 OS 预测的价值, 并以定量列线图的形式呈现。

结果: 171 例直肠癌患者, ROI-1 筛选的 26 个特征构建的模型中, 支持向量机模型效能最好, 其训练集 AUC 0.948, 准确性 0.876, 敏感性 0.821, 特异性 0.913, 测试集中相应为 0.857、0.794、0.929、0.700。ROI-2 筛选的 20 个特征构建的模型中, 逻辑回归模型效能最好, 在训练集中, AUC 0.866, 准确性 0.810, 敏感性 0.696, 特异性 0.889, 测试集中相应为 0.725、0.706、0.786、0.650。直肠肿瘤模型整体效能优于直肠周围系膜模型。临床影像特征中仅直肠周围系膜中的癌结节 (影像学表现) 及系膜筋膜外肿大淋巴结具有显著意义。COX 回归模型中, 输入 Radscore

（ROI-1）、Radscore（ROI-2）及两个临床影像特征，得到训练集 C-index=0.800，测试集 C-index=0.7720，Kaplan-Meier 曲线分析显示 1、3、5 年的生存率。

结论：直肠肿瘤及直肠周围系膜影像组学模型结合临床影像学特征预测直肠癌新辅助治疗的 OS 效能较好，基于 MRI 高分辨 T2WI 影像组学模型可用于对直肠癌新辅助治疗预后的预测。

PO-3998

基于 CT 的放射组学预测小细胞肺癌化疗后复发时间模型

杨楠、马庄宣、金惊、李铭
复旦大学附属华东医院

背景资料：小细胞肺癌是一种与副肿瘤综合征相关的神经内分泌肿瘤，特征是快速增殖和远处转移，具有倍增时间短、侵袭性强、易转移和预后差等特点。与非小细胞肺癌不同的是，SCLC 初始治疗采用较为敏感的含铂化疗联合胸部放疗，70% 的患者可获得客观缓解，但很多患者在缓解后一年内迅速出现耐药或复发。合理预测患者可能出现的复发时间并在患者出现耐药前及时更换治疗方式或化疗药物将会延长小细胞癌患者的总生存时间。

方法：本研究回顾性纳入了 2018 年 8 月至 2023 年 9 月在复旦大学附属华东医院经病理证实为小细胞肺癌的患者，经过一系列纳入与排除标准，共计 200 例患者作为研究对象，追溯每位患者在本院的 CT 图像，以病灶复发作为观察的终点。使用 3D Slicer 软件沿着肿瘤边缘逐层勾画出 CT 图像中的病灶，直到覆盖整个肿瘤，形成肿瘤的 3D 分割，按照时间顺序依次勾画出患者每次复查 CT 图像，直至复发，将得到每位患者经治疗后随时间推移病灶变化情况。以 6:3:1 的比例随机分为训练集、验证集和测试集，使用 PyRadiomics 在 Python 中提取放射组学特征，并将提取到的组学特征结合患者临床信息（包括性别、年龄、基因型以及用药情况等）构建小细胞肺癌化疗后预测复发时间模型，通过该模型可以粗略计算出不同性别、年龄、基因型以及不同用药时间患者可能的复发时间，将该信息反馈给临床医师，及时更换治疗方式或者化疗药物将会提高患者的总生存时间。

结果：使用 PyRadiomics 提取到 1216 个放射组学特征，基于训练集进行特征选择，利用 Pearson 相关分析去除冗余特征，单变量及多变量 COX 分析以及 LASSO 分析，确定了最有用的 10 个放射组学特征。结合患者临床信息构建出预测小细胞肺癌的复发模型，在训练集的准确度、敏感度、特异度分别为 90%，89%，87%，在测试集的 AUC、准确度、敏感度及特异度分别为 84%，89%，87%，90%。

结论：基于小细胞肺癌患者经化疗后病灶的动态变化结合临床特征构建的预测小细胞肺癌患者的复发模型可以对临床提供及时有效的药物耐药及肿瘤复发相关时间信息，延长小细胞肺癌患者的总体生存时间。

PO-3999

人工智能辅助压缩感知技术对颅脑液体和白质抑制序列图像质量的影响

钟美梦、杨超、宋清伟
大连医科大学附属第一医院

目的 本研究旨在探讨人工智能辅助压缩感知技术（ACS）不同加速度因子（AF）对颅脑液体和白质抑制（FLAWS）序列图像质量的影响。方法 前瞻性纳入 26 名健康志愿者，行颅脑矢状位 3D FLAWS 序列扫描，分别以并行成像技术（PI）及 ACS 技术对图像进行加速采集，加速因子为 PI AF=3 及 ACS AF=3、5、7、9。采用 Likert 5 分量表分别对获得的抑制白质信号图像（FLAWS1）、抑制脑脊液信号图像（FLAWS2）和最小体素的灰质图像（FLAWSmin)的整体图像质量、核团边

缘锐利度、灰白质对比度、灰质和脑脊液对比度、白质和脑脊液对比度进行评估。于胼胝体压部、尾状核头和侧脑中手动绘制感兴趣区域,测量白质(WM)、灰质(GM)和脑脊液(GSF)的信号平均值和标准差,连续测量三次取平均值,并计算对比度(CN)和对比噪声比(CNR)。结果于不同加速因子下获得的五组图像的 CN、CNR 及主观评分差异均有统计学意义(P 均<0.05)。两两比较:与 PI3 相比,FLAWSmin 的主观评分、WM/GM 的 CN 和 CNR、GM/GSF 的 CNR 从 ACS5 开始逐渐降低,GM/GSF 的 CN、WM/GSF 的 CN 和 CNR 于 ACS9 出现下降(P 均<0.05);FLAWS1 的主观评分、WM/GSF 的 CN 于 ACS9 下降,WM/GM 的 CN 和 CNR、GM/GSF 的 CN 于 ACS5 开始下降,WM/GSF 的 CNR 于 ACS7 升高(P 均<0.05);FLAWS2 的主观评分从 ACS7 开始下降,GM/GSF 的 CN 于 ACS7 有所升高,WM/GSF 的 CNR 于 ACS5 有所降低(P 均<0.05)。结论 利用 ACS 技术可在保证成像质量的前提下缩短 FLAWS 扫描时间,为了确保最佳的图像质量,推荐以 ACS3 行 3D FLAWS 扫描,与 PI3 相比,扫描时间减少了 52%。

PO-4000

基于生物可解释性的多任务深度学习预测胶质瘤分子分型及预后

伍雪威、金哲、游荆晶、张璐、张斌、张水兴
暨南大学附属第一医院

目的:脑胶质瘤的疗效和预后与其遗传学和组织学特征密切相关,本研究旨在基于磁共振图像利用多任务深度学习模型开发一种非侵入性方法,同时预测 IDH 突变状态、1p/19q 共缺失状态和预后,以期在术前更好的指导临床决策。

方法:本研究回顾性分析了 3685 名确诊弥漫性胶质瘤的成年患者。数据集包括两个私有数据集和三个公开数据集。其中私有数据集 1 和私有数据集 2 合并后以 7:3 的随机分配方式分别用作训练(TC)和内部验证队列(IVC)。公开数据集 EVC1、EVC2、EVC3 作为独立外部验证队列。基于术前 MRI 图像中的 T1WI+C 和 T2-FLAIR 图像,使用 ITK-SNAP 软件进行病灶 ROI 的勾画,利用 ResNet-10 深度学习框架构建多任务预测模型。分类预测效能通过 AUC、敏感性、特异性、准确性进行评估,预测 OS 效能通过 C-index 进行评估。EVC1 的 RNA 测序数据用于基因表达分析。

结果:最后纳入 2776 名患者进入 IDH 突变状态和 1p/19q 共缺失状态的预测任务,2242 名患者纳入预后预测任务。在预测 IDH 状态的任务中,TC 中 AUC 为 0.91,IVC 中 AUC 为 0.87,外部验证队列的 AUC 为 0.89-0.90。在预测 1p/19q 状态时,TC 的 AUC 为 0.87,IVC 中 AUC 为 0.85,外部验证队列的 AUC 为 0.71-0.89。在 OS 预测任务中,在 TC 和 IVC 中的 C-index 为 0.71、0.70, EVC1 和 EVC2 中为 0.72 和 0.67。模型可以将患者分为高低风险组,在每个数据集中两组患者的 OS 均有显著差异。在 EVC1 高低风险患者间,共鉴定了 560 个差异基因。基因集富集分析结果显示激活的通路包括干扰素 α 反应等;相关性分析显示深度学习特征与上皮-间质转化等生物功能之间存在明显的相关性;免疫浸润分析显示高危组的免疫细胞浸润丰度明显更高。

结论:本研究成功开发了一种多任务深度学习模型,可同时预测胶质瘤的 IDH 突变状态、1p/19q 共缺失状态和预后。此外还引入了生物信息学分析注释深度学习特征,加深了对其生物学意义的理解,促进了精准医疗在胶质瘤中的应用。

PO-4001

基于头颅 CTA 检测颅内动脉粥样硬化狭窄的混合监督深度学习模型的开发与验证

张学明

中国人民解放军东部战区总医院

基于头颅 CTA 检测颅内动脉粥样硬化狭窄的混合监督深度学习模型的开发与验证

目的：颅内动脉粥样硬化性狭窄（ICAS）易导致急性缺血性脑卒中或慢性缺血性脑病，患者预后不佳。早期诊断 ICAS 的位置和严重程度至关重要。头颅 CTA 被推荐为 ICAS 的一线检查项目。但是，头颅 CTA 的后处理和诊断需要花费大量时间，并严重依赖影像医生的诊断经验，亟需开发基于头颅 CTA 的人工智能自动化诊断工具。本研究开发了基于混合监督的深度学习模型，用于检测颅内动脉粥样硬化性狭窄，并对模型的诊断性能进行了内部验证。

方法：本研究回顾性纳入了东部战区总医院 2017 年 4 月至 2019 年 12 月完成头颅 CTA 检查的患者。头颅 CTA 图像与大语言模型解析报告生成的诊断结果标签相匹配，作为模型的训练集。模型的验证集纳入了同一家医院在同一时间段内有 DSA 报告对照的、完成头颅 CTA 检查的患者。将验证集中狭窄检测模型输出结果与 DSA 报告进行对比，评估患者水平和血管水平上狭窄部位及程度的一致性，使用敏感性、特异性和 AUC 等统计学指标评价模型的检测性能。

结果：模型在内部验证集检测 ICAS 的敏感性为 94%，特异性为 91%，AUC 为 0.95。

结论：我们使用混合监督深度学习的方法，构建了基于头颅 CTA 的颅内动脉粥样硬化性狭窄的检测模型。内部验证结果显示了该模型检测 ICAS 的优秀性能，具有应用于临床工作中开展自动化辅助诊断的潜力。后续研究仍需要进一步优化模型算法，并在外部队列及前瞻性队列中验证该模型检测 ICAS 结果稳定性。

PO-4002

基于影像组学的机器学习模型用于中枢神经系统肿瘤的类型及分子状态的评估

罗诗维、刘军

中南大学湘雅二医院

目的：研究基于 MRI 的机器学习分类模型在鉴别 IDH 野生型 WHO3-4 级胶质瘤、IDH 突变型 WHO3-4 级胶质瘤、原发性中枢神经系统淋巴瘤（primary central nervous system lymphoma，PCNSL）和脑转移瘤（brain metastases，MET）中的潜能。

方法：本研究纳入了来自两个医疗中心的 176 例病例并分为训练队列（中心 1，包括 47 例 IDH 野生型 WHO3-4 级胶质瘤、28 例 IDH 突变型 WHO3-4 级胶质瘤、30 例 PCNSL 和 31 例 MET）和外部测试队列（中心 2，包括 14 例 IDH 野生型 WHO3-4 级胶质瘤、11 例 IDH 突变型 WHO3-4 级胶质瘤、3 例 PCNSL 和 12 例 MET）。我们在这些病例的术前各常规 MR 序列[包括 T1 加权图像（T1WI）、T2 加权图像（T2WI）、液体衰减反转恢复序列（FLAIR）、对比增强 T1WI（T1CE）]图像上分别进行了 3 个基础感兴趣区（volume of interest，VOI）的勾画，包括肿瘤坏死部分（necrotic tumor，N）、实性肿瘤部分（solid tumor，T）和瘤周水肿部分（peritumoral edema，E）。从不同 VOI/VOI 组合和不同 MR 序列中提取影像组学特征，提取的特征将使用 12 种分类算法来建立分类模型，并对所生成的模型的表现进行分析和评估。

结果：基于“lightgbm”分类算法和从所有 VOI（包括 T、E、N、TE、TN、TEN）和所有序列（包括 T1WI、T2WI、FLAIR、T1CE）提取的特征建立的模型取得最好的效果，在训练队列中 AUC 为 0.822、准确度为 65.6%，在测试队列中 AUC 为 0.758、准确度为 50.0%。从与“T”相关的 VOI（包

括 T、TE、TN、TEN) 中提取的特征建立的模型比从其它 VOI 中提取特征建立的模型表现更好。此外, 从 T1WI 中提取的特征建立的模型的表现稍差于从其它单序列中提取的特征建立的模型。结论: 我们的四分类模型在训练队列取得了较好的效果, 在外部测试队列中取得了适中的效果。

PO-4003

基于 CT 深度学习鉴别胸腺瘤组织学分型的临床应用价值

徐静雅

皖南医学院弋矶山医院

目的: 研究基于 CT 深度学习鉴别胸腺瘤组织学分型的临床应用价值。

材料与方法: 回顾性收集 2014 年 1 月-2023 年 3 月于皖南医学院第一附属医院经术后病理证实的 179 例胸腺瘤患者, 按 7: 3 比列将研究对象分为训练集 (n=125) 和验证集 (n=54)。本研究采用 ResNet50 作为卷积神经网络模型, 提取深度学习特征, 并运用主成分分析 (PCA)、相关性分析和最小绝对收缩和选择算子 (LASSO) 算法挑选出最优深度学习特征, 建立鉴别胸腺瘤组织学分型的深度学习模型 (DTL Signature)。利用 Logistic 回归构建临床模型、深度学习模型和联合模型。绘制受试者工作特征曲线 (ROC), 并计算曲线下面积 (AUC), 评估 3 种模型鉴别胸腺瘤组织学分型的临床效能。

结果: 筛选出 11 个 CT 平扫深度学习特征, 并建立深度学习模型, 在训练集和验证集中, 其受试者工作曲线 (ROC) 下面积 (AUC) 分别为 0.877、0.795, 均高于临床模型的 AUC, 但差异均无统计学意义 ($Z=1.903$ 、 1.033 , P 均 >0.05)。在训练集和验证集中, 临床模型与深度学习模型构建联合模型, 其 ROC 的 AUC 分别为 0.890、0.841, 均高于临床模型, 且差异有统计学意义 ($Z=2.647$ 、 3.041 , P 均 <0.05)。

结论: 基于 CT 平扫的深度学习联合模型有利于鉴别胸腺瘤组织学分型, 临床获益较高, 值得临床推广应用。

基于头颅 CTA 检测颅内动脉粥样硬化狭窄的混合监督深度学习模型的开发与验证

张学明

中国人民解放军东部战区总医院

摘要:

基于头颅 CTA 检测颅内动脉粥样硬化狭窄的混合监督深度学习模型的开发与验证

目的: 颅内动脉粥样硬化性狭窄 (ICAS) 易导致急性缺血性脑卒中或慢性缺血性脑病, 患者预后不佳。早期诊断 ICAS 的位置和严重程度至关重要。头颅 CTA 被推荐为 ICAS 的一线检查项目。但是, 头颅 CTA 的后处理和诊断需要花费大量时间, 并严重依赖影像医生的诊断经验, 亟需开发基于头颅 CTA 的人工智能自动化诊断工具。本研究开发了基于混合监督的深度学习模型, 用于检测颅内动脉粥样硬化性狭窄, 并对模型的诊断性能进行了内部验证。

方法：本研究回顾性纳入了东部战区总医院 2017 年 4 月至 2019 年 12 月完成头颅 CTA 检查的患者。头颅 CTA 图像与大语言模型解析报告生成的诊断结果标签相匹配，作为模型的训练集。模型的验证集纳入了同一家医院在同一时间段内有 DSA 报告对照的、完成头颅 CTA 检查的患者。将验证集中狭窄检测模型输出结果与 DSA 报告进行对比，评估患者水平和血管水平上狭窄部位及程度的一致性，使用敏感性、特异性和 AUC 等统计学指标评价模型的检测性能。

结果：模型在内部验证集检测 ICAS 的敏感性为 94%，特异性为 91%，AUC 为 0.95。

结论：我们使用混合监督深度学习的方法，构建了基于头颅 CTA 的颅内动脉粥样硬化性狭窄的检测模型。内部验证结果显示了该模型检测 ICAS 的优秀性能，具有应用于临床工作中开展自动化辅助诊断的潜力。后续研究仍需要进一步优化模型算法，并在外部队列及前瞻性队列中验证该模型检测 ICAS 结果稳定性

PO-4005

基于右优势型冠脉 CT 平扫冠周脂肪建立模型预测软斑块的研究

于俊丽

齐齐哈尔医学院

目的：本研究旨在建立基于右优势型冠脉 CT 平扫冠周脂肪的临床模型、影像组学模型以及联合模型，并绘制诺莫图，以探究其对软斑块的诊断价值。

本研究收集了 2022 年 1 月至 2023 年 9 月期间来自两个学术医学中心的回顾性数据集，共包括 305 例患者。所有患者均接受了冠状动脉 CT 血管造影 (CCTA) 检查，并收集了临床资料。训练集来自齐齐哈尔医学院附属第三医院，外部测试集来自齐齐哈尔医学院附属第二医院。在 CT 平扫图像上，在右冠脉近段勾画冠周脂肪三维容积感兴趣区 (VOI)，提取放射组学特征。在训练集上使用机器学习方法建立放射组学模型，并在测试集上验证了该模型的性能。通过特征筛选与降维，建立影像组学模型；同时使用临床基线特征，建立了临床模型；最后，将影像组学特征与临床特征结合，建立了联合模型，并使用 SVM、Random Forest、SGD、KNN、XGBoost 和 LightGBM 分类器分析了各模型的诊断效能，计算受试者工作特征曲线下面积 (AUC)。

结果：本研究对 305 例患者（平均年龄 55 ± 10 岁）进行放射组学建模，106 例（34%）被证明存在冠脉软斑块。放射组学模型包含 7 个放射组学特征，在测试集上的 AUC 值、特异度、灵敏度和准确性分别为 0.892、80.5%、81.7% 和 79.8%；临床模型在测试集上的 AUC 值、特异度、灵敏度和准确性分别为 0.755、72.4%、73.6% 和 76.3%；联合模型在测试集上的 AUC 值、特异度、灵敏度和准确性分别为 0.931、89.5%、88.4% 和 89.1%。

结论：基于右优势型冠脉 CT 平扫冠周脂肪的临床与影像组学联合模型可以更好的预测非钙化斑块的存在，并且在诊断中具有较高的准确性。

基于 MRI 的深度学习在预测直肠癌 KRAS 基因突变中的价值

刘欢欢¹、董雪¹、李金凝¹、印宏坤²、汪登斌¹

1. 上海交通大学医学院附属新华医院

2. 北京推想医疗科技股份有限公司

目的：探索基于 MRI 的深度学习联合临床特征在预测直肠癌 KRAS 基因突变中的价值。

方法：本项回顾性研究共纳入 2016 年 8 月至 2021 年 4 月期间的 376 例患者(训练组:288 例, 测试组:88 例)，建立临床模型、影像深度学习、临床-影像整合深度学习模型。临床模型采用多因素回归分析方法，深度学习模型基于改良的 MobileNetV2 算法。通过受试者工作特征曲线下的面积(AUC)、决策曲线分析评估模型性能。

结果: 临床模型采用 4 个临床特征和 5 个 MRI 特征 (年龄、性别、CEA、CA199、肿瘤长径、肿瘤部位、原发肿瘤分期、淋巴结分期、壁外血管受侵) 进行建模。训练组中, 临床模型、影像深度学习模型、临床-影像整合深度学习模型的 AUC 值分别为 0.651 (95% 可信区间[CI], 0.593~0.706), 0.824 (95% CI, 0.775~0.866) 和 0.878 (95% CI, 0.835~0.914); 测试组中, 3 个模型的 AUC 值分别为 0.668 (95% CI, 0.560~0.765), 0.765 (95% CI, 0.663~0.849) 和 0.841 (95% CI, 0.748~0.910)。Delong's 检验表明整合模型的预测效能优于临床模型 (训练组 $P < 0.001$, 测试组 $P = 0.008$) 和影像深度学习模型 (训练组 $P = 0.012$, 测试组 $P = 0.115$)。决策曲线分析亦表明整合模型优于临床模型和影像深度学习模型。

结论: 基于 MRI 特征和临床因素的整合深度学习模型有助于预测直肠癌 KRAS 基因突变。

PO-4007

U-Net 3D 自动分割与磁共振放射组学定量分析马拉松运动员膝关节软骨及半月板

焦凯剑¹、敖亚雯²、杨波¹、赵益林²

1. 湖北医药学院附属太和医院医学影像中心医学影像研究所

2. 武汉大学人民医院

目的: U-Net 自动分割膝关节股骨软骨及内外侧半月板, 且通过放射组学定量分析评价业余马拉松运动员与健康志愿者膝关节软骨及半月板在磁共振图像上差异性。

材料与方法: 本研究纳入共 79 名参与者 (42 名无症状的业余马拉松运动员, 37 例健康志愿者) 进行矢状位三维脂肪抑制快速扰相梯度回波 (3D-FS-FSPGR) 磁共振序列图像采集。训练开发基于 U-Net 卷积网络架构的深度学习模型自动分割股骨软骨和内外侧半月板。从股骨软骨及半月板感兴趣区域提取 107 个影像组学特征, 特征归一化处理后使用最小绝对收缩和选择算子 (LASSO) 回归来选择特征, 分析两类参与者特征差异性并通过机器学习算法区分两类参与者。通过受试者曲线下面积 (AUC), 准确度, 灵敏度和骰子相似性系数 (Dice 系数) 等评价指标, 评估特征区分性能和 U-Net 自动分割性能。

结果: 基于 3D-FS-FSPGR 图像的 U-Net 深度学习模型在股骨软骨, 内侧半月板和外侧半月板上的 Dice 系数分别为, 0.849, 0.819 和 0.745。经过特征筛选, 内侧半月板区域获得 12 个放射组学特征, 测试集机器学习算法 AUC 为 0.701 ± 0.064 ; 外侧半月板区域获得 4 个放射组学特征, 测试集机器学习算法 AUC 为 0.597 ± 0.059 ; 股骨软骨区域获得 1 个放射组学特征, 测试集机器学习算法 AUC 为 0.547 ± 0.058 。

结论: U-Net 在快速生成准确分割方面表现出有效性和精确性, 自动分割感兴趣区域以减少临床医师勾画和诊断时间。此外本研究显示放射组学所获得的定量特征能够显示业余马拉松运动员与健康志愿者在软骨及半月板的差异。

PO-4008

基于 CT 影像组学的耐药肺结核辅助诊断研究

郭琳¹、夏丽¹、钱令军¹、罗伟军²、钟铨²、刘远明¹、郑秋婷²

1. 深圳市智影医疗科技有限公司

2. 深圳市慢性病防治中心

目的: CT 影像学在结核病, 尤其是肺结核的诊断中被广泛应用, 但有关耐药肺结核 CT 影像组学的研究较少。为了分析空洞特征, 耐药患者与药敏患者具有显著差异的病灶的特征, 以及所有异常病

灶的特征对耐药肺结核和药敏肺结核的诊断价值,研究基于耐药患者及药敏患者的 CT 影像建立了 3 个影像组学辅助诊断模型,以提高对耐药肺结核的诊断水平。

方法:研究回顾性收集了 474 名病原结果为阳性的肺结核患者,其中耐药患者 320 名,药敏患者 154 名。按 8:2 分为训练集和测试集。由两位具有中级职称的放射科医生采用双盲法分别对 CT 图像进行分析和标注,两位医生在每层 CT 上的标注区域均会产生相应的 Dice 系数,如果 Dice 系数大于等于 0.90,则将它们平均值作为病灶的金标准。否则,由高级放射科医生重新标注图像,并将高级医生的标注区域作为金标准。研究采用 Pyradiomics 进行组学特征提取,然后采用 LASSO 模型筛选特征,其中, LASSO 模型的参数 λ 设置为 0.01,最后采用随机森林分类器建立组学模型。最后采用 AUC 值,准确度,敏感度,特异度和 F1 分数对模型性能进行评估。

结果:从初始特征池中共提取了 112 个放射组学特征,最终筛选得到 39 个最重要的预测性特征用于模型构建。对于训练集,基于空洞特征开发的模型 1,基于具有差异性的病灶特征开发的模型 2 以及基于所有病灶特征开发的模型 3 的 AUC 值分别为 0.85, 0.85 和 0.89,对于测试集,模型 1,模型 2 和模型 3 的 AUC 值分别为 0.74, 0.80 和 0.84。此外,3 个模型的准确度,敏感度,特异度和 F1 分数分别为 0.718, 0.792 和 0.792, 0.750, 0.862 和 0.877, 0.571, 0.645 和 0.623, 0.814, 0.848 和 0.851。实验结果表明,3 个模型对耐药结核及药敏结核均具备较好的诊断性能,其中相比只采用空洞特征或差异性病灶特征构建的模型,纳入所有异常病灶特征的模型具有最佳的预测表现。结论:采用影像组学技术构建的 CT 耐药肺结核辅助诊断模型能够实现对耐药肺结核与药敏结核的诊断识别,为临床耐药肺结核早期筛查提供有力支持,同时也有助于提高医生的阅片效率。

PO-4009

基于 CT 影像组学构建机器学习模型鉴别海绵状血管瘤和单纯脑出血

陈意妮、张渊曼、孙博、浦仁旺、齐一伟、方鑫
大连医科大学附属第一医院

目的:通过基于 CT 平扫图像提取的影像组学特征结合机器学习方法构建鉴别海绵状血管瘤和单纯脑出血的模型并验证。

方法:回顾性纳入 2016 年 6 月—2023 年 5 月行脑部 CT 平扫并经 MRI 证实的 168 例单纯脑出血和 167 例海绵状血管瘤(无钙化),以 7:3 的比例随机分为两组,一组为训练集($n=234$),另一组为测试集($n=101$)。由两位高年资影像医师勾画病灶,使用 Python 中"Pyradiomics"包从每个感兴趣区(ROI)中提取训练组的影像组学特征。采用组内组间一致性分析选择高稳定性的特征,选择皮尔逊相关系数和特征选择分析(方差分析[ANOVA]、过滤式特征选择[Relief]、Kruskal-Wallis[KW]、递归特征消除[RFE])进行降维,并使用包括支持向量机(SVM)、自编码器(AE)、线性判别分析(LDA)、随机森林(RF)、逻辑回归(LR)、通过 Lasso 进行逻辑回归(LRLasso)、自适应增强(AB)、决策树(DT)、高斯过程(GP)、朴素贝叶斯法(NB)在内的 10 个机器学习分类器进行了分类,结果通过留一交叉验证分析进行评估。

结果:每个 ROI 各提取 851 个特征。比较验证数据集中所有管道的 AUC,发现使用 Relief 特征选择和 RF 分类器的管道具有 20 个特征时的 AUC 最高。当使用"一个标准误差"规则时,FAE 使用 8 个特征生成了一个更简单的模型。训练集、验证集和测试集的 AUC 分别达到了 1.000、0.894 和 0.862。与 ANOVA、KW 和 relief 相比,KW 特征选择的所有算法结果都更加稳定,各 AUC 值均高于 0.662。

结论:基于 CT 平扫图像的组学机器学习分类模型鉴别诊断海绵状血管瘤和单纯脑出血具有较高效能,可推广于临床上辅助诊断。

PO-4010

中国体检人群骨密度降低 Nomogram 临床预测模型的构建与验证

孙永兵¹、沈艳勇²、周阳¹、戚昕³、周菁⁴、李中林¹、武肖玲¹、邹智¹、李永丽⁴

1. 郑州大学人民医院 医学影像科

2. 郑州大学第三附属医院 (河南省妇幼保健院) 医学影像科

3. 新乡医学院河南省人民医院 医学影像科

4. 河南省人民医院健康管理学科 河南省慢病健康管理重点实验室

目的 骨密度 (BMD) 降低发展为骨质疏松的过程十分隐秘, 因此早期筛查骨密度降低非常重要。基于健康体检人员的临床信息, 建立 BMD 降低的临床预测模型, 早期发现骨密度降低人群并进行个性化干预。 **方法** 本研究回顾性收集于河南省人民医院健康管理学科 2018 年 2 月 - 2023 年 2 月进行骨密度检查的体检数据, 根据 BMD 含量将其分为健康对照组 (HC) (10 846 例) 和低骨密度组 (LBMD) (9 611 例)。收集其临床资料、生化检测指标即腰椎 BMD 值, 对可能的 BMD 降低影响因子进行 LASSO 和 Logistic 回归分析。根据筛选的危险因素构建 Nomogram 临床预测模型, 通过 ROC 曲线、校正曲线、DCA 曲线和临床影响曲线进行模型的验证和效果评价。 **结果** 基于年龄、身高、体重、舒张压、收缩压、甘油三酯、高密度脂蛋白胆固醇、总蛋白、总胆红素、碱性磷酸酶、血清磷的 Nomogram 模型预测能力较好 (AUC=0.817), 并具有较好的校准效果和临床效益。 **结论** 该 Nomogram 临床预测模型易于推广, 可帮助临床医生更好地筛查骨密度丢失, 实现骨密度下降的早期发现和干预, 从而减少骨质疏松症的发生, 具有重要的临床意义和公共卫生价值。

PO-4011

多序列 MR 预测伊马替尼治疗后胃肠间质瘤的无进展生存期

郑涛¹、杜娟¹、杨林沙¹、张舵²、刘兴家³

1. 秦皇岛市第一医院

2. 保定市第一中心医院

3. 河北医科大学

目的: 应用放射组学技术对转移性胃肠间质瘤 (Metastatic gastrointestinal stromal tumor, mGIST) 患者的原发肿瘤进行深入分析, 发现与患者无进展生存期 (Progression-Free Survival, PFS) 相关的影像特征并构建预测模型, 提高对 GIST 患者 PFS 的预测能力。

方法: 回顾了 211 名胃肠间质瘤 (GIST) 患者的临床资料和影像数据, 并开发了一个影像组学模型来预测患者的无进展生存期。最终纳入了 147 名肝转移性 GIST 患者, 其中 102 例作为训练集, 45 例作为外部验证集。使用非增强 MR 图像 (T2WI、DWI、ADC) 进行放射组学特征提取, 通过 LASSO-Cox 回归选择显著特征。使用多变量 Cox 回归分析构建影像组学列线图模型用于预测 PFS, 比较临床、放射组学和深度学习特征的预测效果。采用一致性指数 (cindex) 作为模型的性能指标, 采用风险比来衡量特征的预测效果。

结果: 共选择了 21 个与 PFS 最相关的影像组学特征用于生成影像组学标签。影像组学标签在训练集和测试集中对 PFS 的预测稍高于临床模型, 但差异不显著 ($P>0.05$)。将影像组学标签与临床特征整合构建 nomogram, 在训练集和测试集中具有较高的预测性能, 训练集 C-index 为 0.757 (95%CI, 0.692-0.822)、外部测试集 C-index 为 0.718 (95%CI, 0.618,-0.818), 明显优于临床模型 (训练集: $P=0.002$; 测试集: $P<0.001$)。时间依赖性 ROC 分析显示 nomogram 模型在长期预测中具有稳定性 (训练集 AUC 在 0.765-0.919 之间, 测试集 AUC 在 0.766-0.893 之间)。多因素 Cox 回归显示影像组学签名可以作为肝转移性 GIST 术前生存预测的独立危险因素 ($HR = 3.973$)。

结论: 放射组学特征标签是预测 mGIST 患者无进展生存期的重要因素。综合的列线图模型结合影像特征和临床因素, 能够为晚期 GIST 患者的个体化治疗提供有价值的信息。

PO-4012

深度学习技术对颅内动脉狭窄的诊断价值

郝光宇、陈蒙、刘原庆、秦义人、胡粟、王希明、胡春洪
苏州大学附属第一医院

目的：探究基于自动卷积神经网络的深度学习 (deep learning, DL) 技术对颅内动脉狭窄的诊断价值。方法：回顾性纳入 2020 年 1 月至 2021 年 6 月疑似急性缺血性脑卒中或短暂性脑缺血性发作患者，且均在一个月内同时接受了计算机断层血管造影(computed tomography angiography, CTA)和数字减影血管造影(digital subtraction angiography, DSA)。按照患者和血管水平将狭窄程度分为正常(0%)、轻度狭窄(< 50%)、中度狭窄(50-69%)、重度狭窄(70-99%)和闭塞(100%)，其中阻塞性狭窄定义为直径狭窄率 $\geq 70\%$ 。以 DSA 结果为参考标准，通过受试者工作特征曲线下面积(area under receiver operating characteristic curve, AUC)、敏感性、特异性、阳性预测值(positive predictive value, PPV)和阴性预测值(negative predictive value, NPV)评价诊断性能。结果：研究共纳入 248 例患者及 2728 条血管，其中颅外血管 992 条，颅内血管 1736 条。在患者水平，DL 技术与放射科医师的 AUC 分别为 0.781 (敏感性、特异性、PPV 和 NPV 分别为 0.934、0.627、0.906 和 0.711) 和 0.840，差别无统计学差异($P = 0.074$)。在血管水平，DL 技术与放射科医师的 AUC 分别为 0.923(敏感性、特异性、PPV 和 NPV 分别为 0.885、0.962、0.756 和 0.984)和 0.932 ($P = 0.393$)。DL 技术的中位分析时间为 8.67 分钟，显著低于放射科医师的 29.55 分钟($P < 0.001$)。结论：DL 技术可以准确评估颅外和颅内动脉狭窄，耗时短，有望成为优化风险分层和指导治疗策略的方法。

PO-4013

ADC 图为基础的影像组学模型对 GIST 有丝分裂指数的预测价值

杜娟、杨林沙、郑涛、刘兰祥、刘德丰、刘兴家
秦皇岛市第一医院

目的：以磁共振表观扩散系数图像(apparent diffusion coefficient, ADC)为基础，筛选组学参数并建立模型，预测 GIST 的 MI。

方法：本研究为回顾性研究，纳入术后病理证实 GIST 患者 103 例，其中低 MI ($MI \leq 5/50HPF$) 者 51 例，高 MI ($MI > 5/50HPF$) 者 52 例。应用 ITK 软件和 Pyradiomics 工具箱进行三维图像勾勒和参数提取，数据归一化和降维后，应用 LASSO 回归进行特征筛选。将筛选出的参数应用 Logistic 回归建立列线图模型，并与单独参数模型分别比较。应用较准曲线对列线图模型的拟合优度进行检验。

结果：LASSO 回归筛选出三个参数，分别是 Uniformity, Low Gray Level Run Emphasis 和 Run Length Non-Uniformity。三者单独预测 MI 的能力有限，训练集 AUC 分别为 0.772、0.734 和 0.712，测试集 AUC 分别为 0.508、0.554 和 0.688。三者联合建立的列线图模型在训练集和测试集中均表现出了很好的预测 MI 的能力 (训练集 AUC: 0.859; 验证集 AUC: 0.875)。与单个参数相比，联合模型的预测能力提升。在训练集中，其 AUC 明显大于三个参数的单独模型 (P 值分别为 0.006、0.049 和 0.003)。在测试集中，其 AUC 明显大于 Uniformity 和 LGLRE (二者 P 均为 0.011)。与 RLN 相比，虽然差异不显著 ($P = 0.104$)，但 AUC 仍大于 RLN。较准曲线表明该模型具有良好的拟合优度 (Hosmer-Lemeshow test, 训练集 $P = 0.731$ ，测试集 $P = 0.489$)。

结论：ADC 为基础的影像组学模型能够准确预测 GIST 的 MI。

PO-4014

基于衰减体素法的四维数字减影血管造影图像重建研究

赵煌旋¹、周政宏²、王兴刚²、郑传胜¹

1. 华中科技大学同济医学院附属协和医院

2. 华中科技大学电子信息与通信学院

目的：四维数字减影血管造影（4D DSA）在许多医疗疾病的诊断中起到了关键作用，如动静脉畸形（AVM）和动静脉瘘（AVF）。尽管它具有重要的应用价值，但 4D DSA 的重建要求大量视图，以有效地模拟错综复杂的血管和造影剂流动，因此 4D DSA 需要较高的辐射剂量。目前的方法无法在稀疏视图的情况下重建出受造影剂流动影响的 DSA 图像。

方法：我们提出了一种面向时间的衰减体素（TiAVox）方法，用于稀疏视图的 4D DSA 重建，为高质量的 4D 成像铺平了道路。此外，可以从重建的 4D DSA 图像生成 2D 和 3D DSA 成像结果。TiAVox 引入了 4D 衰减体素网格，反映了空间和时间维度的衰减特性。它通过最小化渲染图像与稀疏的 2D DSA 图像之间的差异来进行优化。在没有涉及任何神经网络的情况下，TiAVox 具有特定的物理可解释性。每个可学习体素的参数代表衰减系数。

结果：我们在临床和模拟数据集上验证了 TiAVox 方法，在临床数据集上，仅使用 30 个视图，就达到了 31.23 的峰值信噪比（PSNR）用于新视图合成，而传统的 Feldkamp-Davis-Kress 方法则需要 133 个视图。同样，在合成数据集中，TiAVox 仅使用 10 个视图，为新视图合成和 3D 重建分别获得了 34.32 和 41.40 的 PSNR。我们还进行了消融研究，以证实 TiAVox 的关键组成部分。

结论：我们提出的 TiAVox 方法能够自监督地从临床采集的稀疏视图（少于 30 个视图）的 2D DSA 图像中进行 2D/3D/4D DSA 结果的重建，适用于造影剂流动的情况，无需任何神经网络。这种方法有望在临床环境中降低辐射暴露，从而减小对患者的风险。此外，它的适用性扩展到了一系列医学重建情况，包括 CT。我们在临床和模拟实验下广泛验证了我们的模型。

PO-4015

功能网络连接的中断预示着老年性耳聋患者的认知障碍

邢春华

南京市第一医院

背景：老年性耳聋为进行性双侧感音神经性高频听力损失，早期发现和预防被认为是治疗认知障碍最有潜力的方法。Rs-fMRI 不需要被试接受任何感官刺激，也不需要被试执行特定的任务，因此被广泛用于描述各种临床条件下异常的脑神经元活动和功能连接(FC)。独立成分分析(ICA)是一种数据驱动的方法，在没有实验模型或假设的情况下，将全脑体素的 bold 信号分解为空间和时间上独立的分量(ICs)，广泛应用于 rs-fMRI 中，能够直接测量多个脑网络内部和之间的交互作用。其中，静态功能网络连接(FNC)可以用来描述这些节点之间的时间相关性。目前，ICA 对老年性老年人网络内部和网络之间的连通性变化的研究还未见报道，对网络内部 FC 变化的研究较少。因此，我们预测通过研究 RSNs 和 FNC 来阐明老年性痴呆患者认知功能损害及其补偿模式，将为合理治疗提供有价值的信息。我们将通过实验验证以下假设：首先，老年性耳聋患者的认知障碍与多个 RSN 的 FC 中断有关；其次，除了网络内部的变化，网络之间的变化也可能与认知障碍有关。

方法：对 40 例老年性痴呆患者和 40 例匹配对照患者进行 rs-fMRI，采用独立成分分析(ICA)方法鉴定 12 个静息状态网络(RSNs)。采用双样本 t 检验检测网络内部 FC 差异，计算功能网络连通性(FNC)比较网络间 FC 差异。随后使用 Pearson 或 Spearman 相关分析来探讨 FC 改变与认知评估分数之间的相关性。

结果：与对照组相比，老年性耳聋患者的皮层下边缘网络(scLN)、默认模式网络(DMN)、执行控制网络(ECN)和注意网络(AN)的 FC 明显降低。老年性耳聋患者的 scLN-AUN(听觉网络)和 VN(视觉网

络)-DMN 的连通性明显增加, 而 AN-DMN 明显降低。最终, 本研究揭示了与一些认知评估分数相关的网络内和网络间的改变。

结论: 本研究提示老年性耳聋患者网络内和网络间的 FC 结构发生了深刻的改变。这些变化包括主要的听觉系统和其他高阶认知控制网络, 证明了大脑网络在异常状态中具有广泛的可塑性重组, 这为进一步理解老年性耳聋患者认知障碍的神经机制提供了有意义的见解。

PO-4016

基于 CT 放射组学的无监督共识聚类对临床 T1 期肺腺癌患者进行危险分层成为可能性

董浩¹、尹乐康²、李洋³、叶晓丹²

1. 杭州市萧山区第一人民医院

2. 复旦大学附属中山医院

3. 上海联影智能有限公司

目的 探究基于放射组学特征的无监督共识聚类结果与临床 T1 期肺腺癌的病理高危因素及基因表达之间的关联。**方法** 回顾性分析 2018 年 9 月至 2021 年 5 月在复旦大学附属中山医院胸外科接受手术切除且病理证实为肺腺癌患者的临床、病理及 CT 影像资料。记录的临床及病理资料包括年龄、性别、吸烟史、肿瘤位置、病理类型、病理亚型、纵隔淋巴结转移、脏层胸膜侵犯、血管淋巴管浸润、气道播散、Ki-67 增殖指数和基因突变信息等。涉及的基因有 EGFR、HER2、KRAS、BRAF、ALK、ROS1 和 RET。根据病例图像的放射组学特征进行无监督共识聚类分析, 使用累积分布函数 (consensus cumulative distribution function, CDF), 样品一致性 (item-consensus, IC) 和聚类一致性 (cluster-consensus, CLC) 来确定最佳集群值及评估共识聚类的效果。根据共识聚类结果将患者分组, 并将聚类结果与肿瘤组织病理学特征、基因组信息进行比较 (连续数据的 Kruskal-Wallis 检验, 分类数据的 χ^2 或 Fisher 精确检验), 并在浸润性腺癌及亚实性病灶中进行亚组分析。**结果** 最终 497 个病例被确定分为 2 个集群 (最佳), 集群 1 有 258 例 (51.9%), 集群 2 有 239 (48.1%) 例, 集群 1 集群 2 在微乳头成分、实体成分、气道播散以及 Ki67 增值指数方面具有明显的统计学差异 (均 $p < 0.001$), 在淋巴结转移和胸膜侵犯上也有统计学差异 ($p = 0.031$ 、 $p = 0.012$), 微乳头成分、实体成分、气道播散以及 Ki67 增值指数在浸润性腺癌和亚实性病灶的亚组分析中也具有统计学差异 ($p < 0.05$), 集群 1 和集群 2 仅在 HER2 突变上有统计学差异 ($p < 0.001$), 其它基因突变均无统计学差异 ($p > 0.05$)。**结论** 基于 CT 的放射组学共识聚类能够识别临床 T1 期肺腺癌患者的放射组学特征与病理高危因素和基因组特征和结果之间的关联, 可以帮助临床对 T1 期肺腺癌患者进行危险分层。

PO-4017

基于增强 MRI 的纹理分析术前预测肝细胞癌微血管密度的价值

许岂豪¹、刘爱连^{1,2}、任雪¹、赵莹¹、郭妍³、李昕³

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心

3. 通用电气医疗

目的 探讨基于增强 MRI 的纹理分析术前预测肝细胞癌微血管密度 (MVD) 的价值。

方法 我们对 2020 年 5 月至 2021 年 6 月间接接受肝切除术的 14 例患者进行了回顾性分析。根据免疫组化检测 MVD 状态, 将其分为低 MVD 组 (8 例) 和高 MVD 组 (7 例)。所有患者均接受腹部 3.0T MR 检查 (Signa HDxt, GE 医疗, 美国), 包括 T1WI、T2WI 及增强序列。放射科医生沿肿瘤边缘描绘肿瘤各层, 然后使用 AK 软件 (GE 医疗) 提取 107 个纹理特征, 包括一阶特征、形状特征、

灰度共生矩阵 (GLCM)、灰度依赖矩阵 (GLDM)、灰度大小矩阵 (GLSZM)、灰度游程矩阵 (GLRLM) 及邻域灰度差矩阵 (NGTDM)。采用 Mann-Whitney U 检验进行参数比较。采用 logistic 回归分析, 建立不同参数组合的预测模型。进行受试者操作特性曲线(ROC)分析以评估预测性能。

结果 得到 4 个有差异的纹理特征, 包括动脉期 Maximum、门静脉期 90Percentile、延迟期 90Percentile 和延迟期 Maximum。各参数及联合预测 MVD 的 AUC 值为 0.768、0.732、0.732、0.714 及 0.804。

结论 通过勾画整个肿瘤区域, 提取纹理特征, 可以更客观、更全面地反映整个肿瘤的异质性。本研究采用增强 MRI 纹理分析术前预测肝细胞癌 MVD, 获得 4 个有差异的纹理特征, 多参数联合 AUC 值为 0.804, 表明基于增强图像纹理分析, 具有准确预测肝细胞癌 MVD 的优势, 为临床治疗方案的选择提供了重要的成像参考。

PO-4018

GPT-4 在基于影像学表现的肿瘤鉴别诊断和协助放射科医生改进诊断方面的价值

倪铭、倪铭
北京大学第三医院

目的探讨 GPT-4 在基于影像学表现的肿瘤疾病鉴别诊断中的表现, 检验 GPT-4 协助放射科医生提高诊断准确性的能力, 并探讨细粒度报告对 GPT 的影响 -4 诊断结果。

方法针对 109 例经病理诊断的肿瘤或肿瘤样病例, 将患者的年龄、性别和影像学表现输入 GPT-4, 得到最可能的 5 个诊断, 分别计算其 Top 1、Top 3 和 Top 5 的诊断准确率。放射科医生修改了误诊和低排名病例的影像学描述, 并使用 GPT-4 重新诊断它们。由三位不同经验水平的放射科医生独立诊断了 109 例病变 (不知晓 GPT-4 诊断结果)。随后, 上述放射科医生在获悉 GPT-4 诊断结果后, 结合影像进行重新诊断, 再次评估放射科医生独立诊断和联合 GPT-4 诊断的准确性。

结果从准确率来看, GPT-4 疾病诊断前 1 名的准确率为 49.47%, 前 3 名的准确率为 82.08%, 前 5 名的准确率为 96.49%。对 26 例误诊和排名较低的影像学描述进行修改后, 61.53% 的病例诊断排名上升了, 而 26.92% 保持不变。三位放射科医生独立的诊断准确度分别为 0.90、0.94 和 0.87, GPT-4 和放射科医生的综合诊断准确度分别为 0.91、0.97 和 0.95。

结论 GPT-4 表现出令人满意的肿瘤疾病鉴别诊断能力, 可以帮助放射科医生提高其识别和诊断准确性。此外, 改变结果的细粒度会影响 GPT-4 的鉴别诊断性能。

PO-4019

基于 CT 小肠成像肠壁及肠系膜脂肪影像组学模型 预测克罗恩病可行性研究

徐青青、郭莉莉
淮安市第一人民医院 (南京医科大学附属淮安第一医院)

目的: 基于 CT 小肠成像小肠壁及肠系膜脂肪建立并验证预测克罗恩病的影像组学模型。方法: 收集 2015 年 01 月至 2021 年 7 月间 136 例确诊的克罗恩病患者以及正常对照组, 所有病例行小肠 CTE 检查。由 2 位高年资放射科医生结合小肠镜或手术标本确定病灶部位。采用 Pyradiomics 软件提取 CTE 门静脉期病灶和正常对照组肠壁及肠系膜脂肪纹理特征, 对所得特征进行 LASSO 降维处理, 构建得到基于肠壁的预测克罗恩病的模型 1 和基于肠系膜脂肪预测诊断克罗恩病的模型 2, 采

用受试者工作特征曲线 (receiver operating characteristic curve, ROC 曲线)评价模型 1、模型 2 的预测效能。结果: 68 例克罗恩病以回肠末端为最常见部位, 小肠单独受累 54 例, 小肠-结肠受累 14 例。在模型 1 和模型 2 中, 我们通过 mRMR 特征选择及 LASSO 回归降维方法筛选分别保留了 5 个和 11 个纹理特征, 最终模型 AUC 均为 0.99。模型 1 和模型 2 准确率为 96.7%&90%, 灵敏度为 90%&100%, 特异性为 100%& 85%, 阳性预测值(PPV)为 100% &76.9%, 阴性预测值(NPV)为 95.2%& 100%。结论: 基于 CTE 肠壁及肠系膜脂肪影像组学建立克罗恩病的预测模型有重要的临床价值。

PO-4020

DWI 和 ADC 纹理分析预测肝细胞癌 mRECIST 标准评价 TACE 疗效

许岂豪¹、刘爱连^{1,2}、赵莹¹、任雪¹、郭妍³、李昕³

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心

3. 通用电气医疗

目的 研究弥散加权成像 (DWI) 和表观弥散系数 (ADC) 纹理分析, 以预测经导管肝动脉化疗栓塞 (TACE) 的早期反应。

方法 本回顾性研究收集了 54 例 HCC 患者, 他们在 TACE 前接受了腹部 MRI 检查 (包括 DWI 序列), 根据 mRECIST 标准, 将其分为客观反应 (OR) 组 (n=26) 和非反应 (NR) 组 (n=28)。使用 ITK-SNAP 软件, 在 DWI 和 ADC 图上手动勾画 ROI。使用 AK 软件提取纹理特征, 包括 MedianIntensity, MaxIntensity, MeanValue, Percentile25, Percentile75, Percentile95, histogramEntropy, histogramEnergy, Variance, stdDeviation, InverseDifferenceMoment, LongRunEmphasis, 和 ShortRunEmphasis。采用独立样本 t 检验或 U 检验来比较两组间特征的差异。采用 ROC 曲线来评估预测性能。采用 Logistic 回归方法将 ADC 和 DWI 纹理特征中性能更好的几种特征相结合。

结果 当使用单个参数时, DWI 图的 Inertia_angle45_offset1 得到了最好的结果 (AUC: 0.731)。

ADC_ShortRunHighGreyLevelEmphasis_angle0_offset1

ADC_GreyLevelNonuniformity_angle135_offset1、DWI_Inertia_angle45_offset1 和 DWI_GreyLevelNonuniformity_angle135_offset1 联合治疗反应的预测效果更好 (AUC: 0.780)。

结论 DWI 可以先于肿瘤的形态学变化, 并通过功能成像的角度评估肿瘤扩散的影响。结果表明, DWI 信号强度图的 Inertia_angle45_offset1 具有最高的预测性能 (AUC: 0.731), DWI 和 ADC 联合预测的效能得到了提高 (AUC: 0.780)。DWI 和 ADC 图的纹理分析对预测 HCC 中 TACE 的治疗反应有一定的价值。

PO-4021

影像组学预测进展期前列腺癌生化复发的初步研究

王慧慧¹、王可欣²、张耀峰³、陈宇珂⁴、王霄英¹

1. 北京大学第一医院医学影像科

2. 首都医科大学

3. 北京赛迈特锐医疗科技有限公司

4. 北京大学第一医院泌尿外科

目的：构建以治疗前 MR 表观扩散系数图像 (ADC) 为基础的自动分割影像组学模型，预测进展期前列腺癌生化复发的价值。

方法：本研究回顾性分析了 100 例进展期/局部进展期前列腺癌，包括 65 例无生化复发 (BCR-) 和 35 例生化复发 (BCR+)。所有患者均以放射治疗或内分泌治疗作为一线治疗方式或接受多线治疗方式且随访时间 ≥ 2 年。生化复发的定义以 2021 年欧洲泌尿外科学会前列腺癌诊疗指南为参考。应用本中心自主研发的深度学习模型用于自动分割 ADC 图上前列腺和前列腺癌区域 (图 1)。将 100 例病例随机分为训练集 (n=70) 和测试集 (n=30)。根据临床资料 (包括年龄、治疗前 PSA 水平、Gleason 评分、临床分期) 和前列腺面积或前列腺癌面积，构建了两个预测模型 (Model_1 和 Model_2)。另外两个预测模型仅基于前列腺面积 (Model_3) 或前列腺癌面积 (Model_4) 构建。使用受试者工作特性 (ROC) 曲线下面积 (AUC)、PR 曲线分析模型预测效能。DeLong 检验用于比较不同模型的 AUC 差异，使用自举法计算 95% 置信区间用于比较不同模型 PR 曲线下面积的差异。以测试集的测试结果作为模型预测效能，以 $P < 0.05$ 认为差异具有统计学意义。

结果：训练集和测试集的生化复发率差异无统计学意义 (35.7% vs. 33.3%, $\chi^2 = 0.052$, $P = 0.820$)。在 BCR-和 BCR+组之间，患者年龄、PSA 水平、前列腺和前列腺癌的体积、直径及 ADC 值的差异均无统计学意义 ($P > 0.05$, 表 1)。Model_1 至 Model_4 的 AUC 分别为 0.637 (95%CI:0.434-0.838)、0.841 (95%CI:0.695-0.940)、0.840 (95%CI:0.698-0.983) 和 0.808 (95%CI:0.627-0.988)，两两比较差异无统计学意义 (图 2, 表 2)。四个模型 PR 曲线下面积的差异无统计学意义 (图 3)。

结论：应用本中心自主研发的基于深度学习自动分割模型，建立的以治疗前 MR-ADC 图像为基础的影像组学模型，对于预测进展期前列腺癌的生化复发具有潜在应用价值。

PO-4022

基于多阶段集成网络的青少年特发性脊柱侧凸辅助诊断系统

邬超、苏宁

包头市中心医院 (内蒙古自治区脑血管病研究所)

目的：开发一种深度学习算法，实现在全脊柱 X 线图像上快速自动地诊断评估脊柱侧凸。方法：从 2018 年 1 月 1 日至 2021 年 6 月 30 日，收集在两种不同扫描仪器采集的四家医院 (BTH、BTFH、IMMUH、IMMUSH) 数据库中检索全脊柱 X 线图像 (AP)，数据分为训练集和验证集。从 2021 年 4 月 1 日到 6 月 30 日，在 IMMUH 收集全脊柱 X 线图像独立用于外部验证。利用网络公开数据集验证了模型效能。利用统计软件 R software (version 3.5.2, R Foundation for Statistical Computing, Vienna, Austria) 分析模型脊柱曲率及解剖平衡参数的精度及敏感度，以及不同年资医生的一致性。结果：本研究训练数据集共 788 例，测试数据集共 185 例，测试数据集包括内部测试数据 (57 例)、外部测试数据 (56 例) 及公开数据 (72 例) 三个部分。本算法模型在 Cobb 角、顶椎、上、下端椎的精度及召回率分别为：89.36%、85.71%、77.2%、80.24%；97.35%、93.38%、84.11%、87.42%；Cobb 角的 SMAPE 为：5.99%。模型自动测算时间为 1.7s，Cobb 角、AVT、CVA 的 MAE 值分别为 1.07°、1.12mm、1.38mm。模型 Cobb 角预测结果与金标准的一致性很好 (ICC=0.996、0.978、0.825, $P < 0.001$)。结论：成功建立了全脊柱 X 线图像辅助诊断深

度学习算法模型，侧凸识别敏感度、精度均较高，可以有效辅助放射科医生在该项诊断工作中提高效率。

人工智能 AI 在预测肺部亚实性结节 SSN 浸润性风险的研究

黎格¹、刘斌²、李树¹、周高峰¹

1. 中南大学湘雅医院

2. 湖南省宁乡市人民医院

人工智能 AI 在预测肺部亚实性结节 SSN 浸润性风险的研究

目的：近年来，随着早期肺癌 CT 筛查的普及，越来越多的肺部结节被检出，多数早期肺腺癌在 CT 上表现为亚实性结节，但因不同病理类型影像学征象存在重叠，亚实性结节的性质及浸润程度术前较难评判。本文旨在探讨人工智能(artificial intelligence, AI)技术在肺部亚实性结节浸润性风险评估中的应用价值。

材料与方法：本研究回顾性分析 2019 年 8 月到 2021 年 3 月行肺部 CT 发现肺部有亚实性结节并取得手术病理结果的患者，共 439 例（其中浸润性腺癌 211 例，非浸润性腺癌 207 例，良性病变 21 例）。将患者 CT 图像导入 SurfiPro 4.5 人工智能软件，软件可以自动识别出肺部亚实性结节的位置、大小、密度，并提供亚实性结节的 AI 预测浸润风险概率。再采用 SPSS 26.0 软件对数据进行统计分析，采用 Kappa 一致性分析检验 AI 预测结果与病理金标准结果的一致性。计算得出人工智能 AI 预测亚实性结节浸润性的阳性预测值、阴性预测值、灵敏度和特异度。

结果：人工智能 AI 预测亚实性结节浸润风险程度的灵敏度为 87.20%，非浸润性肺癌的特异度为 85.53%，AI 预测浸润风险阳性预测值为 84.79%，阴性预测值为 87.84%。

结论：人工智能 AI 预测肺部亚实性结节浸润性程度的准确率较高，可实现无创预测肺部亚实性结节浸润性，有望辅助临床诊疗决策的制定。

PO-4024

基于卷积神经网络和注意力机制的深度学习非小细胞肺癌计算机辅助诊断模型

刘治超、雷子乔

华中科技大学同济医学院附属协和医院

目的 构建基于卷积神经网络 (Convolutional Neural Networks, CNN) 和注意力机制的改进 CNN 模型 (Inception Spatial and Channel Attention Network, ISANET)，评估模型的性能，并与传统 CNN 模型进行比较。

方法 收集经手术病理证实的肺鳞癌 (Lung Aquamous Cell Carcinoma, LUSC) 或肺腺癌 (Lung Adenocarcinoma, LUAD) 患者 60 例以及肺部正常患者 30 例的肺部 CT 平扫或增强图像共 619 张，组成 DatasetA；收集公共数据集图像共 737 张，组成 DatasetB。两数据集均按 6:4 将随机分为训练集和测试集。构建 ISANET 模型并进行训练和验证，然后记录查准率、召回率，并计算出 F1 分数，用以评价 ISANAT 模型的效能。最后，将 ISANET 模型与传统 CNN 模型 AlexNet, VGG 16, Inception V3, Mobilenet V2, ResNet 18 进行对比，绘制 P-R (Percision-Recall, P-R) 曲线，计算出 P-R 曲线下面积，并评估不同模型对肺鳞癌和肺腺癌的鉴别效能。

结果 相较于传统 CNN 模型，ISANET 模型对非小细胞肺癌分类的准确度明显提高，在 DatasetA 和 DatasetB 中分别为 99.6%和 95.2%。

结论 ISANET 模型较好地实现了对肺鳞癌和肺腺癌的无创预测,提高了肺鳞癌和肺腺癌 CT 影像鉴别的准确度,能够帮助诊断医师对非小细胞肺癌进行快速准确的分类。

PO-4025

基于增强 CT 影像组学术前预测祖细胞型肝细胞癌

姜仪、容鹏飞
中南大学湘雅三医院

目的:探讨基于术前增强 CT 的影像组学特征是否能够作为预测祖细胞型肝细胞 P-HCC 的影像学标志物。

方法:回顾性收集 2015 年 1 月至 2020 年 12 月在中南大学湘雅三医院经手术后病理证实为肝细胞癌 HCC,且术后行 CK19 免疫组化检查的 172 例患者,其中男 153 例,女 19 例。患者均于术前 1 个月内行增强 CT 检查。按照 7:3 的比例分为训练集和验证集,训练集、验证集分别为 120 例、52 例。在 ITK-SNAP 软件上勾画感兴趣区,应用美国 GE 公司 AI-Kit 软件分别在动脉期、门脉期 CT 图像上各自动提取 396 个特征。首先采用内相关系数 ICC 评估观察者内、观察者间的一致性,对特征进行初筛。然后在训练集内采用 t 检验或 Mann-Whitney U 检验进行组间比较,筛选出有组间差异的特征。考虑到样本的不均衡性,采用合成少数类过采样技术 SMOTE 算法对训练集进行过采样处理,在过采样之后获得的训练集中采用最小绝对收缩与选择算子 LASSO 回归分析,并使用 10 折交叉验证的方法进行特征选择及降维,采用递归特征消除法 RFE 进一步筛选特征,验证集同样进行了 SMOTE 过采样处理,使用受试者工作曲线 ROC 评估影像组学预测模型的效能。

结果:172 例患者中 CK19 阳性 34 例,CK19 阴性 138 例。对训练集采用 SMOTE 算法进行过采样处理后,获得 97 例 CK19 阴性和 92 例 CK19 阳性。通过 LASSO 算法在过采样处理之后的训练集中筛选出 49 个特征,通过 RFE 特征选择方法进一步筛选出包含 9 个特征的最优特征子集,然后采用 SVM 进行机器学习,建立影像组学预测模型。在训练集中,影像组学预测模型曲线下面积 (AUC) 为 0.932 (95%CI: 0.893-0.970), 敏感度 87.0% (80/92), 特异度 90.7% (88/97)。将 SMOTE 过采样之后的验证集数据代入该模型, AUC 为 0.849 (95%CI: 0.761-0.937), 敏感度 59.1% (26/44), 特异度 85.4% (35/41)。

结论:术前增强 CT 影像组学特征可作为 P-HCC 的影像生物标志物,基于 SVM 建立的预测模型在训练集和验证集中效能均较好。

PO-4026

基于颈动脉超声影像组学结合临床指标的机器学习模型预测 2 型糖尿病患者脑卒中风险

刘雨森、孔莹、惠晶晶
苏州大学附属第一医院

【摘要】目的:本研究旨在建立一个基于颈动脉超声影像组学的 T2DM 患者缺血性卒中 (IS) 风险预测诺模图模型。**方法:**纳入苏州大学附属第一医院卒中中心确诊为脑卒中的 T2DM 患者 98 例,纳入同期因 T2DM 于内分泌科住院且未曾发生卒中事件的患者 100 例作为对照组,打乱顺序后按 0.7 的比例分为训练组和验证组,患者均接受颈脑血管超声检查;收集颈动脉超声影像并进行图像归一化处理,由两名颈脑血管超声科医生利用 ITK-SNAP 4.0.1 软件手动独立划分颈动脉斑块 ROI,提取影像组学特征并对数据进行 Z 分数归一化;在训练组中筛选 ICC>0.75 的影像组学特征后由 T 检验筛选有意义的组学特征,并经过最小绝对收缩和选择运算符 (LASSO) 算法筛选非零系数的特征纳入,建立影像组学 Logistic 机器学习模型,同时计算影像组学得分 (RS);将有意义的临床

特征纳入并建立临床 Logistic 机器学习模型；构建组合 Logistic 机器学习模型。计算上述三种模型的 ROC 曲线并根据 AUC 和决策曲线 (DCA 分析) 判断模型效能并绘制诺模图。结果：经影像组学特征提取和 LASSO 回归成功筛选出 4 个组学特征，并计算 RS 后与有意义的临床指标合并构建组合模型并绘制预测诺模图，经 ROC 分析发现其无论是在训练组还是验证组的 AUC 均为三种预测模型中最大 (0.898 和 0.857)，且经 DCA 分析后认为组合模型 (影像组学+临床诺模图) 在多数情况下表现佳，可以用于临床上对于 T2DM 患者的脑卒中事件风险预测。结论：基于颈动脉超声影像组学构建了识别 T2DM 患者脑卒中风险的诺模图，并验证其具有较高的诊断性能，可以用于临床预测，为 T2DM 患者提供精准且方便、个性化的医疗支持。

PO-4027

CT 在 3D 打印技术中的应用

宏雪

吉林大学白求恩第一医院

目的 掌握 3D 打印需要在 CT 上的操作步骤

方法 在中国知网使用主题词“3D 打印，CT，三维重建，螺旋 CT”等搜索相关文献，最终纳入一篇，微信公众号 CT Clinical Evidence 文章一篇

结果 要实现医学 3D 打印，首先要获得医学 3D 容积再现数据，目前基于 CT 的 3D 容积再现数据 (VR) 的 3D 打印技术已经非常成熟，并被用于临床。CT 的三维后处理中，一般图像的显示模式分为五种：(1)容积再现 (Vol.Rend.)(2)最大密度投影 (MIP)(3)立体密度投影 (VIP)(4)最小密度投影 (MinIP)(5)表面最大密度投影 (SurfaceMIP)，其中 CT 容积再现技术是三维重建中最常用的一种图像显示模式，也是三维后处理 Volume 中一般默认的图像显示模式，通过选择 Vol.Rend.模式可自动显示为骨骼组织，也可以通过组织飞跃 (Fly Over) 工具实现骨骼组织向其他组织的飞跃。

第 1 步：图像获取，使用最多的是 CT 扫描图像，因为它应用广泛且具有足够的分辨率。

第 2 步：图像处理，即从医学影像 PACS 系统

(Picture archiving and communication system)取所需的部分进行后处理，包括计算机辅助设计 CAD (Computer - aided design)，从而获得需要打印物体的表面信息，得到所需的 DICOM (Digital imaging and communications in medicine) 格式的图像。

第 3 步：DICOM 转换 STL (Standard Tessellation Language) 格式图像。STL 格式是 3D 打印机识别的格式。

结论：获取 CT 图像数据,以 DICOM 格式导出,将 DICOM 数据导入进行三维建模和图像后处理,以 STL 格式保存数据,导入 3D 打印机打印出个性化模型。

PO-4028

融合血流动力学特征的基底动脉开窗与动脉粥样硬化斑块相关性研究

陈晓琴、彭礼清

四川大学华西医院

摘要：目的 融合血流动力学特征对不同小脑前下动脉(Anterior inferior cerebellar artery, AICA)分型的基底动脉开窗相关动脉粥样硬化斑块 (Atherosclerotic plaques, AP) 形成之间进行相关性分析，辅助临床对不同 AICA 分型的基底动脉开窗治疗。方法 以基底动脉 MRA 图像为基础构建前后循环三维几何模型，分为开窗组与对照组，应用计算流体力学方法对血管进行数值模拟分析。结果 (1) 在血流流线方面，所有型基底动脉开窗在开窗前动脉内血流流动方式以层流为主，开窗

起点至大脑后动脉发出处血流为中心高速伴周围低速血流, 部分为涡流、湍流, 以前 3 型为著, 易形成 AP; (2) 在血流流场方面, 所有型开窗处的血流速度均较椎动脉高, 其差异具有统计学意义, 以前 3 型为著, 这可能与血流通过处管腔横截面的面积有关; 并且从开窗流出的直接延续区域基底动脉段, 由于几何形态所导致的锥缩效应, 中心血流流速逐渐增大同时伴有高速血流中心发生不同程度的偏移, 表示对管壁撞击点发生了移位, 形成管壁损伤, 致使局部血栓形成, 易引起 AP 发生、发展; (3) AICA 1、2 及 3 型与对照组壁面切应力 (wall shear stress, WSS) 差异具有统计学意义 ($P<0.05$), 且高 WSS 分布于前 3 型基底动脉开窗处及大脑后动脉发出处, 影响正常动脉结构与功能, 引起血管重塑, 易形成 AP。 结论 (1) 基于基底动脉开窗的 MRA 图像, 可以建立不同 AICA 分型下的开窗个体化模型; (2) 基底动脉开窗计算机仿真可以得出血流流线图、血流流场图、血管壁面剪切应力分布图, 对基底动脉开窗研究和临床个体化的诊治提供一定的借鉴意义; (3) AICA 1、2 及 3 型开窗处、基底动脉段及大脑后动脉发出处具有高速涡流及高 WSS, 具有较高 AP 形成风险, 提示临床上应着重关注该类高风险人群, 应根据其分型不同采取不同的个体化治疗措施。

PO-4029

基于胸部 CT 深度学习机会性筛查骨质疏松的有效性研究

潘晶¹、龚沈初²、林鹏程³、张堃³

1. 南京市中医院

2. 南通市第一人民医院 (南通大学第二附属医院)

3. 南通大学

目的 基于胸部 CT 腰 1+腰 2 椎体图像的融合特征建立深度学习模型并分析其机会性筛查骨质疏松症的有效性, 并探讨单独基于腰 1 椎体图像的模型机会性筛查骨质疏松症的可行性及有效性。

方法 回顾性收集行胸部 CT 体检者 ($n=1048$ 例) 腰 1 和腰 2 椎体中央层面图像 (pic=2096 张), 以定量 CT 测量结果将其分为骨量正常、低骨量和骨质疏松三类。首先构建 DCNN 分割模型[训练集 ($n=548$ 例), 验证集 ($n=100$ 例) 和测试集 ($n=400$ 例)], 并利用 DSC 比较其与手工标注的一致性; 然后基于训练集 ($n=530$ 例) 和验证集 ($n=100$ 例) 建立 DCNN 分类模型 1 (腰 1+腰 2 椎体图像融合特征构建) 和模型 2 (单独使用腰 1 椎体图像特征构建), 在测试集 ($n=418$ 例) 中测试, 使用 AUC 和 Delong 检验评估两模型的诊断效能。

结果 所有受试者的平均年龄 51 ± 14.5 岁 (范围 20 岁~92 岁), 其中男性 605 例, 女性 443 例; 采用训练集图像数目 (pic=300 张) 时, 测试集中 DSC 值为 0.951 ± 0.030 。模型 1 和模型 2 诊断低骨量、骨质疏松的敏感性、特异性、AUC 依次为: 0.716、0.960、0.952, 0.941、0.948、0.980; 0.638、0.954、0.940, 0.843、0.959、0.978。模型 1 对于骨量正常的诊断效能优于模型 2, 两者间的差异有统计学意义 (AUC: 0.990 vs. 0.983) ($P=0.033$), 而模型 1 和模型 2 对低骨量、骨质疏松的诊断效能无显著差异 (P 依次为 0.210、0.546)。

结论 本研究分析了基于胸部 CT 腰 1+腰 2 椎体图像融合特征建立的深度学习模型机会性骨质疏松筛查的有效性。我们进一步构建了仅基于腰 1 椎体图像的模型, 此模型可以缩短扫描长度, 减少患者接受的辐射剂量, 降低技术人员的培训成本。

4D Flow MRI 技术在无创诊断肝硬化患者临床显著性门静脉高压及食管胃静脉曲张风险中的应用

向奕¹、纪家琛²、董景辉³、李赞铎²、张萌萌³、刘长春³、蔡剑鸣³、李睿²、祁小龙¹

1. 东南大学附属中大医院

2. 清华大学生物医学成像研究中心

3. 解放军 302 医院

目的：慢性肝病常进展为门静脉高压症，进而可能导致高风险的食管胃静脉曲张。由于这些疾病状态需要频繁的侵入性检测，因此寻求无创诊断和风险评估方法不仅具有临床重要性，同时也面临巨大挑战。4D Flow MRI 为先进的磁共振成像技术，能够提供时间-空间分辨的三维速度编码血流信息，可能成为有效的无创替代诊断工具。本研究意在评估 4D Flow MRI 作为无创方法诊断肝硬化患者中的临床显著性门静脉高压和高风险食管胃静脉曲张的效能。

方法：在 2020 年 10 月至 2021 年 3 月期间，我们在解放军 302 医院前瞻性招募了被诊断为肝硬化的病例。所有参与者均接受了标准化的腹部 4D Flow MRI 扫描。从中提取了门静脉的血流动力学参数，如平均和峰值流速、标准化血流量（Qnormal）和反流百分比（R%），并在健康对照组及 CSPH 患者、高风险与低风险食管胃静脉曲张患者间进行比较。随后，这些参数被结合至一个经 L1 正则化修正的逻辑回归模型，并进行 5 折交叉验证。其诊断效能通过接收者操作特性曲线（ROC）进行评估。

结果：共有 82 名参与者入选本研究，其中 71 名为肝硬化患者，11 名为健康对照组。结果显示，与健康对照组相比，CSPH 患者的 Qnormal (0.24 ± 0.05 ml/[cyclekg], $P = 0.001$) 和 R% (1.98 (2.05), $P = 0.002$) 显著升高。同样地，高风险静脉曲张患者的 Qnormal 和 R% 亦较高，分别为 0.22 ± 0.05 ml/[cyclekg] ($P < 0.001$) 和 1.88 (2.81) ($P = 0.006$)。ROC 分析揭示，Qnormal 在诊断 CSPH 时的 AUC 为 0.93，R% 的 AUC 为 0.91，而整合后的 LR 模型 AUC 为 0.95。在评估高风险食管胃静脉曲张时，Qnormal 和 R% 的 AUC 分别为 0.74 和 0.70，LR 模型的 AUC 则为 0.85。

结论：4D Flow MRI 作为一种无创成像手段，在评估肝硬化患者的 CSPH 及食管胃静脉曲张风险方面展现了巨大的应用潜力，可能为减少肝硬化患者对侵入性检测的需求提供新的途径。

PO-4031

深度学习重建算法与 ASIR 重建算法对 CT 图像质量的对比研究：80kv、管电流调制 40mAs 条件下的体模实验

杨雪茹、李学胜、陈锡建、白万晶、罗露

四川大学华西第二医院

目的：运用体模实验对比深度学习与 ASIR 两种重建算法对 CT 图像质量的影响，模拟婴儿胸部 CT 检查时的情景。

方法：采用东软 128 层螺旋 CT，对标准化 CT 水模进行扫描，成像条件如下，80kv，管电流调制 40mAs，球管转速 0.374 秒，准直 64×0.625 ，螺距 0.8，层厚和层距均为 5mm，滤波参数 F20，重建视野 302mm，重建矩阵 512×512 。对得到的原始数据分别采用深度学习（ClearInfinity）和 ASIR（Clear View）两种算法进行重建，以上每一种重建算法分别选用 0~90% 共 10 种权重进行 10 次重建，最终得到 20 个序列的影像。对每个序列，选择相同的层面，分别在上、下、左、右、中心放置面积约 100mm² 的感兴趣区（ROI），测量相应的 CT 值和标准差，测量三次后取平均值，二者相除得到信噪比（SNR）。对每一种重建算法不同权重下得到的 SNR 进行随机区组 t 检验。

结果: (1) 上方区域, 深度学习和 ASIR 得到的影像, 其 SNR 分别为 1.66 ± 0.84 、 0.99 ± 0.24 , 差异有统计学意义 ($P<0.05$)。 (2) 下方区域, 深度学习和 ASIR 得到的影像, 其 SNR 分别为 1.73 ± 0.91 、 1.04 ± 0.28 , 差异有统计学意义 ($P<0.05$)。 (3) 左侧区域, 深度学习和 ASIR 得到的影像, 其 SNR 分别为 1.80 ± 0.87 、 1.25 ± 0.31 , 差异有统计学意义 ($P<0.05$)。 (4) 右侧区域, 深度学习和 ASIR 得到的影像, 其 SNR 分别为 1.56 ± 0.79 、 1.04 ± 0.20 , 差异有统计学意义 ($P<0.05$)。 (5) 中心区域, 深度学习和 ASIR 得到的影像, 其 SNR 分别为 1.14 ± 0.05 、 0.07 ± 0.05 , 差异有统计学意义 ($P<0.05$)。上述 5 个区域不同重建权重之间差异无统计学意义 ($P>0.05$)。

结论: (1) 深度学习算法得到的水模图像质量优于 ASIR 算法得到的。 (2) 不同重建权重得到的 CT 图像质量尽管没有统计学差异, 但权重越大, 图像越细腻、平滑。

基于深度学习模型实现急性缺血性脑卒中梗死核心及脑白质变性的多任务分割算法

周玉洁、汤天宇、崔莹、居胜红

东南大学附属中大医院

目的: 急性缺血性脑卒中 (AIS) 具有高致死率和致残率, 约占脑卒中全部类型的 87%, 预测 AIS 后功能恢复的有效工具对指导个体化治疗和早期康复策略很有价值。在临床环境中, 对梗死核心和白质变性 (WMH) 的评估通常依赖于人工分割和视觉评分量表, 由于放射医生间的内部差异, 从而限制了它们在大规模研究中的应用。影像学是评估 AIS 不可或缺的组成部分, 在临床常规磁共振序列中, 弥散加权成像 (DWI) 可在症状出现后短时间内检测到梗死, 被认为是梗死核心的金标准。基于影像可评估 AIS 后脑损伤, 提供有关梗死范围、位置等关键信息。本研究旨在基于临床真实场景下, 完成 AIS 后脑组织损伤的分割算法。

方法: 研究共纳入 100 名 AIS 患者, 收集其 DWI 及 FLAIR 序列, 由原始图像定义梗死核心和 WMH 标签。对图像进行预处理和数据增强, 将患者分为训练队列 ($N=50$)、内部测试队列 ($N=30$)、独立验证队列 ($N=20$)。基于 SegResNet, 构建一个多通道的深度学习算法, 完成 WMH 和 AIS 后梗死核心的分割, 分割算法用 DICE 指数来评估。

结果: 在训练队列和内部测试队列中, 梗死分割的 Dice 得分为 0.902 ± 0.025 和 0.897 ± 0.026 。在训练队列和内部测试队列中, WMH 分割的 Dice 得分为 0.875 ± 0.005 和 0.858 ± 0.005 。在独立验证队列中, 梗死和 WMH 的 Dice 评分分别为 0.862 ± 0.026 和 0.785 ± 0.015 。

讨论: 本研究训练并验证了一个基于 MR 的多序列模型, 实现了 AIS 后的多任务分割模型, 对 AIS 患者的梗死核心和 WMH 病灶进行更精确的量化, 有助于对 AIS 患者进行临床早期评估和决策辅助支持。

PO-4033

基于增强 MRI 的深度学习术前预测肝细胞癌病理分级

赵莹¹、蔡秀定^{2,3}、刘爱连¹、姚宇^{2,3}、许岂豪¹、任雪¹、宋清伟¹

1. 大连医科大学附属第一医院

2. 中国科学院, 成都计算机应用研究所

3. 中国科学院大学

目的: 探讨基于增强 MRI 的深度学习术前预测肝细胞癌 (HCC) 病理分级的价值。

方法: 回顾性收集 2007 年 4 月至 2022 年 6 月期间进行上腹 MRI 检查且经术后病理证实的 341 例 HCC 患者, 包括 121 例低分化 HCC 和 220 例非低分化 (高分化、中分化) HCC, 按照纳入时间将病例按 7:3 分为训练集 (n=238) 和测试集 (n=103)。收集临床流行病学和实验室检查信息, 记录常规影像学征象, 输入特征编码器三层感知机构建临床-影像模型。在动脉期、门脉期和延迟期 MRI 图像上, 沿着肿瘤边缘手动勾勒感兴趣区。使用深度学习神经网络 DenseNet-121 构建 HCC 病理分级预测模型。分别使用联合拼接网络 (CAT)、张量融合网络 (TFN)、基于熵的张量联合拼接网络 (ETC) 进行多模态深度特征和临床影像特征融合。采用曲线下面积 (AUC)、准确性、敏感度、特异度及 F1 分数评估各模型的预测效能。

结果: DenseNet-121 神经网络预测 HCC 病理分级的效能高于临床-影像模型, 测试集 AUC、准确性、敏感度、特异度和 F1 分数分别为 0.782、78.12%、77.78%、78.57%、80.00% 和 0.721、64.06%、51.28%、84.00%、63.49%。CAT 融合模型 AUC 值 (0.774) 与 DenseNet-121 模型 (0.782) 和 ETC 融合模型 (0.778) 相当, 并获得最高的准确性 (81.25%)、敏感度 (77.78%)、特异度 (85.71%) 和 F1 分数 (82.35%) (表 1)。

结论: 基于增强 MRI 的深度学习模型能够有效地预测 HCC 病理分级, 多模态融合模型的预测性能最佳, 有潜力精准无创指导肝癌患者危险分层。

PO-4034

基于 MRI 半月板 3D 卷积神经网络模型预测
48 个月内膝骨关节炎的发生蒋可欣¹、谢雨含²、丘昌镇²、张晓东¹

1. 南方医科大学第三附属医院

2. 中山大学电子与通信工程学院

目的: 基于 MRI 自动分割半月板并构建 3D 卷积神经网络模型预测 48 个月内膝骨关节炎的发生。

方法: 在这项前瞻性病例对照研究中, 数据均来自于公开数据库骨关节炎倡议 (Osteoarthritis Initiative, OAI)。我们随机选择基线时 OAI 数据库中的 130 例膝关节, 由两名肌骨诊断医师在 MR 图像上手动勾画半月板感兴趣区, 以建立半月板自动分割模型。在预测模型的构建中, 710 例有发生 KOA 风险的参与者来自 Pivotal OAI MRI Analysis 研究的骨关节炎发生队列, 所有膝关节的基线 Kellgren-Lawrence 等级 ≤ 1 。在 48 个月的随访期间, 病例参与者与对照参与者以 1:1 的比例进行匹配。MRI 按照在 KOA 发生的前 1 年时间点 (以下简称 P-1) 和基线进行分组, 构建 3D 卷积神经网络深度学习模型, 将数据集按照 7:1:2 的方式划分为训练集、验证集和测试集预测 KOA 是否发生。DICE 系数用于评估分割模型性能, 受试者工作特征曲线下面积 (area under the curve, AUC) 用于评估半月板 MRI、临床信息和 MRI 骨关节炎膝关节评分的预测价值。

结果: 本研究分割模型中测试集的 DICE 系数达 90.32%。预测模型测试集中, 在两个时间点时半月板 MRI (基线时 AUC: 0.60; P-1 时 AUC: 0.71) 都比临床信息 (基线时 AUC: 0.55; P-1 时 AUC: 0.63) 及 MRI 骨关节炎膝关节评分 (基线时 AUC: 0.52-0.56; P-1 时 AUC: 0.57-0.64) 表现出更强的预测能力, 并且在成对比较检验中存在显著差异。

结论：基于 MRI 半月板的 3D 卷积神经网络模型可较好预测未来 48 个月内膝关节炎的发生。

PO-4035

深度学习模型基于 MRI 对颈椎中央椎管、神经根狭窄程度分级

冯小晨

海军军医大学第一附属医院（上海长海医院）

目的：开发基于磁共振的颈椎中央管、神经孔狭窄自动检测和分类的深度学习模型，进一步实现全自动颈椎 MR 影像标准化报告书写

方法：连续性、回顾性收集 2020-2022 年第四人民医院、长征医院、长海医院颈椎 MR 的影像数据，同时收集病人临床资料。排除颈椎术后、肿瘤（血管瘤、原发及继发肿瘤等）、非肿瘤（骨折、骨髓水肿、终板炎、根袖囊肿等）、脊柱严重侧弯以及图像质量欠佳的患者，最后入组 829 名患者。序列主要包括水平位 T1WI、T2WI、矢状位 T1WI、T2WI，按照 7:3 的比例将患者分为训练组、验证组，训练组数据由两名放射科医生以及一名脊柱外科医生使用预定义的分级（正常、轻度、中度和重度）进行分类，开发了一个四分类深度学习模型。首先训练卷积神经网络（CNN）来检测感兴趣区域（ROI），对每个颈椎节段进行分割，并使用第二个 CNN 进行狭窄程度分级。计算模型准确度、召回率（百分比）、受试者间一致性、灵敏度和特异度。最终模型输出结构化影像学报告。

结果：以病人 ID 为单位，共截取 1752 张图分段后有 8760 个颈椎节段，去除其中分辨不清脊髓形态的图像，整个数据集一共 8007 张图，训练集一共 5595 例，分类为正常的颈椎节段 2329 例；轻度的 1736 例；中度 1194 例；重度 336 例。验证集一共 2412 例，分类为正常的颈椎节段 1076 例；轻度的 683 例；中度 512 例；重度 141 例。验证集四分类模型准确率 0.8993，测试集准确率 0.8992。结论：基于磁共振的深度学习模型对于颈椎中央管、神经孔狭窄程度分级可以提供客观、稳定和具有可重复性的评价。

PO-4036

基于胸部 CT 图像的肺炎深度学习分类预测模型

曾梦¹、赵娜²、王显棋¹、曾文兵³、陈伟¹

1. 西南医院

2. 重庆知见生命科技有限公司

3. 重庆大学附属三峡医院

目的：建立基于胸部 CT 图像的 AI 模型，实现对细菌、真菌、病毒性（包括 COVID-19）肺炎的快速分类预测。方法：回顾性收集来自多家医院的 559 例细菌性、真菌性及非 COVID-19 病毒性肺炎患者及 53 例 COVID-19 患者的影像资料，首先利用 Resnet_18，Efficientnet_b5，ViT，Swin_transformer 等 4 种典型的深度神经网络构建图像级三分类及四分类预测模型，在独立测试集中进行验证选出最优模型；然后分析采用单张图像和三张图像融合构建数据集对模型的影响；最后分别使用按图像类别占比投票及随机森林两种方法进行患者级分类预测。使用精确率、召回率、特异性、F1 值、AUC、准确率评估模型效能，最终筛选出表现最优的 AI 预测模型。结果：在图像级分类中 Swin_transformer 模型表现最佳，三分类准确率为 0.932，四分类准确率为 0.948。采用融合图像创建数据集的 Swin-transformer_c 模型效能得到进一步提升，在测试集中三分类准确率和 AUC 值分别为：0.931,0.989，四分类准确率和 AUC 值分别为：0.952,0.990。使用 Swin-transformer_c 模型进行患者级分类，采用随机森林的方法预测效能更佳，三分类准确率和 AUC 值分别为 0.984,0.987，四分类准确率和 AUC 值分别为 0.967,0.971。Resnet_18、Efficientnet_b5、ViT 三种网络也都取得了较好的效果，但总体效能低于 Swin-transformer 网络。结论：基于融合数据建立的深度学习模型 Swin-transformer_c 与其他四种模型相比在图像级分类中效

果最佳，其融合随机森林分类器在患者级分类中也取得了最优性能。表明深度学习可用于不同病原体感染所致肺炎类型的快速分类预测。

PO-4037

基于增强 ct 利用影像组学模型预测对结直肠癌卵巢转移疗效评估价值研究

鱼靖涵、曾涵江、伍兵
四川大学华西医院

目的：结直肠癌（CRC）引起的卵巢转移（OM）并不常见，且预后较差。我们的研究旨在研究基于 CT 的放射组学模型在预测新辅助化疗后 CRCOM 疗效中的价值。

方法：回顾性共纳入 52 例接受新辅助化疗的结直肠癌患者纳入本研究。所有患者均接受了 1-3 个周期的氟尿嘧啶、卡培他滨或奥沙利铂为基础的新辅助化疗方案，并以实体肿瘤反应标准（RECIST v1.1）为金标准，分为反应组（R+）和无反应组（R-）。检索并分析他们的临床病理资料、CT 图像和病理报告。从基线 CT 图像中提取放射组学特征，并通过皮尔逊相关分析和最小绝对收缩和选择算子（LASSO）回归进行选择。利用不同的机器学习分类器，包括朴素贝叶斯（NBB）、线性判别分析（LDA）、逻辑回归（LR）、随机森林（RF）和支持向量机（SVM），构建了多个辐射组学模型。通过受试者工作特征（ROC）分析来评估这些模型的诊断性能，并通过校准分析和决策曲线分析（DCA）来评估其临床效用。

结果：52 例患者中 25 例（48.1%）归为应答组（R+）。选择了 5 个放射组学特征进行模型开发。在这些基于机器学习的放射组学模型中，SVM 模型在验证数据集中表现出最好的性能，AUC、准确性、灵敏度和特异性分别达到 0.903（95% CI、0.788-0.967）、88.5%、95.7%和 82.8%。所有的放射组学模型都显示出良好的校准，DCA 表明，SVM 模型在大多数阈值概率范围内比其他模型具有更高的净效益。

结论：采用 SVM 分类器的基于 ct 增强放射组学模型在预测接受新辅助化疗的结直肠癌患者卵巢转移方面具有良好的鉴别能力，有可能作为临床实践的无创工具。

PO-4038

Quantitative measurement of areas in lumbar disc paravertebral muscle and vertebral body with automatic segmentation based on nnU-Net in patients with degenerative spinal deformity

刘飞雪
陆军军医大学第一附属医院（西南医院）

To develop a deep learning program based on nnU-Net to explore the automatic segmentation of the paravertebral muscles and vertebral body in patients with degenerative spinal deformities. One hundred patients diagnosed with DSD were prospectively enrolled in study. Areas of multifidus muscle, erector spinae, psoas at the levels from L1/2 to L5/S1 intervertebral discs were assessment by two radiologists. A dice coefficient and Intersection over Union (IOU) named nnU-Net were trained and then to segmented automatically. The intraclass correlation coefficient (ICC) was calculated. The areas ICC of radiologists and nnU-Net model were strong consistency ($P>0.95$). We developed an automatic segmentation model based on nnU-Net, which could realize areas of

the paravertebral muscle and vertebral body in the DSD patients automatically, and overcome the interference of fascia and bone spur signals.

PO-4039

双源 CT 心脏+全主动脉一站式成像三低扫描方案在心尖入路经导管主动脉瓣植入术 (TAVI) 术前评估中的应用

李延楠

青海省心脑血管病专科医院

目的: 主动脉瓣狭窄是一种常见的疾病, 影响近 5% 的 75 岁以上人群, 随着老龄化发展, 该数据会持续增长。TAVI 手术发明前, 患者预后常发展至心衰、心脏移植, TAVI 手术发明后, 瓣膜功能恢复, 减少心脏功能损害, 延缓或避免心衰。详尽的术前评估是 TAVI 开展的关键之一, 通过对 TAVI 术前 CT 扫描方案的经验总结, 在达到术前评价的临床要求基础上, 减少患者扫描时间及辐射剂量, 不断优化扫描方案。方法: TAVI 术前评估, 通过研究背景、术前 CT 数据采集方法、经心尖入路主动脉根部术前 CTA 评估流程、主动脉根部和主动脉以及周围血管的扫描技术方案及相关评价进行分析。结果: 双源 CT 在主动脉根部扫描中发挥其特有优势, 心脏+全主动脉一站式扫描解决主动脉根部伪影干扰图像质量的问题, 三低方案得以实现, 控制并减少患者辐射剂量。结论: TAVI 术前评估虽然有先进的数据分析软件应用于人工瓣膜 3D 打印, 但是软件分析的基础是一套成体系的扫描方案和相关评价, 因此, 该扫描方案为临床提供高质量影像数据的同时, 减少扫描时间和降低辐射剂量。

PO-4040

基于人工智能的计算机辅助检测系统有助于放射科住院医师提高 PI-RADS 的诊断准确性和效率

金倩娜、杨帆

华中科技大学同济医学院附属协和医院

目的评估基于人工智能的计算机辅助诊断系统对经验不足的放射科住院医师评估前列腺 MRI 检查 PI-RADS 准确性及效率的影响。

方法本研究纳入了 2019 年 01 月至 2022 年 12 月之间接受前列腺 MR 检查的 1210 名患者。由 15 位放射科住院医师, 5 名阅片经验不足 1 年、5 名阅片经验不足 3 年, 5 名阅片经验不足 5 年, 随机对病例进行了两次评估, 一次没有人工智能的计算机辅助诊断系统 (AI-), 一次有辅助诊断系统 (AI+) 协助。计算 ROC 分析, 敏感性, 特异性, PPV 和 NPV 以比较两组 (AI-与 AI+) 之间前列腺癌诊断的准确性。评估 Spearman 的相关系数以评估 PI-RADS 类别与 Gleason 评分之间的关系。此外, 还比较了三个阅读组的中位阅读时间。

结果最终分析共纳入 183 名患者。在 AI 的帮助下, 阅片经验不足 1 年放射科住院医师的总体 AUC 从 0.54 显著增加到 0.80 ($p < 0.001$)。阅片经验不足 3 年放射科住院医师的总体 AUC 从 0.60 显著增加到 0.80 ($p < 0.001$)。阅片经验不足 3 年放射科住院医师的总体 AUC 从 0.63 显著增加到 0.81 ($p < 0.005$)。此外, 在 AI+组中, PI-RADS 类别与 Gleason 评分之间的相关性显著提高 (0.47 vs 0.62; $p < 0.05$), 而中位读取时间从 163 秒减少到 149 秒 ($p < 0.05$)。

结论人工智能的计算机辅助诊断系统提高了前列腺癌的诊断性能, 低年资的放射科住院医师获益最多。应用人工智能的计算机辅助诊断系统, 可以使经验不足的放射科住院医师 PI-RADS 的诊断准确性和效率得到提升。

PO-4041

预测膀胱癌肌层浸润状态的放射-代谢组学：一项初步研究

何康文、孟晓岩、李震

华中科技大学同济医学院附属同济医院

目的：确定膀胱癌(BCa)的肌层浸润状态(MIS)对于治疗决策至关重要。我们试图确定肌层浸润性 BCa(MIBC)和非肌层浸润性 BCa(NMIBC)的差异代谢物，并将它们与 MR 放射组学特征(RF) 相关联，以初步探索放射组学预测 BCa MIS 的生物学验证。

材料和方法：我们收集了 26 名 BCa 患者（15 名 MIBC 和 11 名 NMIBC）的肿瘤组织，用于综合非靶向液相色谱-质谱和气相色谱-质谱（LC/MS, GC/MS）代谢组学分析。获得了其中 19 名患者（12 名 MIBC 和 7 名 NMIBC）的术前 MRI 数据。使用单变量分析（倍数变化(FC)分析和 t 检验）和多变量分析（正交偏最小二乘判别分析, OPLS-DA）筛选差异代谢物。KEEG 数据库用于通路分析以发现失调的代谢通路（ $p < 0.05$, 影响系数 (IM) > 0.1 ）。从术前 MRI 的 T2WI 和 DWI 中提取 RF。在使用组内相关系数和学生 t 检验进行初步筛选后，使用 Pearson 相关系数将 RF 与失调的途径中的代谢物相关联。接受者操作特征曲线用于评估 RF 在预测 BCa 的 MIS 中的诊断性能。

结果：代谢组学共鉴定出 350 个显著差异代谢物，失调的代谢途径主要为氨基酸合成途径（与 NMIBC 组相比，MIBC 组代谢物在氨酰生物合成、精氨酸合成、丙氨酸生物合成、半乳糖代谢和嘧啶代谢等方面显著上调， $p < 0.001$, IM=0.167; $p = 0.002$, IM=0.421; $p = 0.009$, IM=0.455; $p = 0.004$, IM=0.124; $p = 0.019$, IM=0.163）。在这 5 条代谢途径中检测到 24 种差异代谢物。我们在放射组学分析中初步筛选出了 432 个差异 RF。根据 Pearson 相关系数大于 0.75 筛选出 11 个放射-代谢组学特征对。筛选的 RF 能够评估 MIS (AUC=0.679-0.893)。

结论：确定了可以预测 BCa MIS 的代谢途径，并且与 MRI RFs 高度相关，这可能部分解释了为什么放射组学可以预测 BCa MIS。

PO-4042

基于多任务深度学习的全过程系统可自动诊断乳腺病变和预测腋窝淋巴结转移：多中心研究

周恒^{1,2}、华臻¹、张海程²、毛宁²

1. 山东工商学院

2. 烟台毓璜顶医院

目的：准确诊断乳腺病变的良恶性和腋窝淋巴结转移对于乳腺患者的手术和治疗至关重要，但这在很大程度上依赖于放射科医生的经验。我们的目的是利用动态对比增强磁共振成像来构建一个基于深度学习的全过程系统（DLWPS），用于乳腺病变的分割和诊断。然后预测乳腺癌患者腋窝淋巴结转移，并进一步探讨其预测的生物学基础。

方法：在这项多中心研究中，我们收集了烟台毓璜顶医院（2017-2021 年 1586 例患者）和三家外部医院（2017-2019 年 174 例患者）的数据对 DLWPS 进行开发。DLWPS 包括分割模型和分类模型，首先，将融合注意力和边缘特征提取模块的 UNet 框架纳入我们的分割模型来分割乳腺病变。然后，将三个网络（ResNet101、ResNeXt101 和 DenseNet）融合作为分类模型来进行乳腺癌诊断和腋窝淋巴结转移预。在内部和外部测试集中评估 DLWPS 的性能，并使用骰子相似度系数（DI）评估分割性能。根据受试者工作特征曲线下的面积（AUC）、准确性、敏感度和特异性进行分类模型评估。此外，在外部测试集中探索了三名放射科有无 DLWPS 辅助诊断的结果。为了揭示 DLWPS 的潜在生物学基础，我们基于 RNA 测序数据进行了遗传分析。

结果：在内部和外部测试集中，分割模型的 DI 分别达到 0.828 和 0.813。在乳腺病变诊断中，DLWPS 在内部试验集和外部测试集的 AUC 分别为 0.973 和 0.936。对于腋窝淋巴结转移预测，

DLWPS 在内部测试集和外部测试集的 AUC 分别为 0.927 和 0.917。通过 DLWPS 的帮助，放射科医生的表现有所提高。在探索生物学基础上，我们发现 DLWPS 得分高与有氧电子传递链和细胞质翻译途径有关。

结论：根据 DLWPS 的性能我们发现 DLWPS 可以促进放射科医生对乳腺病变和腋窝淋巴结状态的判断。

PO-4043

基于 CT 和深度学习预测肾透明细胞癌病理分级

余苔痕¹、潘亚玲¹、汪火根²、冯湛³

1. 浙江省人民医院

2. 浙江核睿医疗科技有限公司

3. 浙江大学医学院附属第一医院

目的：构建基于皮质髓期增强 CT 图像预测肾透明细胞癌（ccRCC）WHO/ISUP 分级的智能模型，为进一步的诊疗和预后评估提供一种有效、无创的方法。

方法：将 210 例肾肿瘤术前增强 CT 图像和 211 例分别来自浙江大学第一附属医院（n=94）和浙江省人民医院（n=117）ccRCC 术前增强 CT 图像纳入本回顾性研究。使用 KiTS19 公开数据集和部分本地 ccRCC 数据（n=60）基于 3D U-Net 和 3D-Res-UNet 两种网络架构构建肾肿瘤分割模型，并进行评价指标的比较。再使用另一部分本地数据（n=40）进行对 3D-Res-UNet 分割模型进行微调。基于分割结果，构建结合 3D-Resnet-18 提取的深度特征和放射组学特征的混合模型以预测 ccRCC 病理分级，并采用受试者工作特征曲线（ROC）来评价其诊断性能。

结果：基于 3D U-Net 和 3D-Res-UNet 构建的肾肿瘤分割模型的平均 Dice 相似系数（DSC）分别为 0.759 和 0.814。微调前后 3D-Res-UNet 分割模型对 ccRCC 的平均 DSC 分别为 0.718 和 0.835。混合模型在鉴别 ccRCC 的病理分级方面表现出良好的性能，曲线下面积（AUC）为 0.941（95% CI: 0.863-1.000）。

结论：人工智能模型在肾肿瘤的分割和鉴别 ccRCC 的病理分级方面具有良好的性能。该方法为基于皮质髓期 CT 图像的自动预测 ccRCC 分级提供了一种很有前途的方法。

PO-4044

基于 Bp-MRI 及 P504s、34 β E12、P63 表达状态影像组学模型预测早期前列腺癌

席晓霖^{1,2}、王斌杰^{1,2}、杨晓慧³、贺祥^{1,2}、王颖^{1,2}

1. 河南大学淮河医院

2. 河南大学医学影像研究所

3. 河南大学数学与统计学院

目的 探讨双参数（biparametric, bp）MRI 影像组学预测前列腺 P504s、34 β E12、P63 表达状态的可行性，进而预测早期前列腺癌。方法 回顾性收集本院 2021 年 1 月到 2023 年 5 月符合入组条件共 67 例患者资料，其中前列腺癌 40 例，前列腺增生 27 例。使用 3DSlicer 软件在 T2WI、DWI 及 ADC 三个序列的图像上逐层勾画感兴趣区域（ROI）。用 Pyradiomics 在各序列 ROI 中提取影像特征。采用合成少数过采样技术（SMOTE）处理数据不平衡。所有病例按照 6: 4 的比例随机分为训练组和测试组，采用方差选择法、Spearman 相关性分析、曼-惠特尼秩和检验及最小绝对收缩和选择算子（LASSO）算法进行特征降维和选择，根据算出的影像组学积分（Rad score）建立影像组学模型。通过单因素及多因素 Logistic 回归分析筛选临床独立危险因素构建临床模型。选取最佳组学模型与临床模型构建联合模型。使用受试者工作特征（ROC）曲线下面积（AUC）来评价各模

型的诊断效能, Delong 检验比较联合模型、组学模型及临床模型的诊断效能。采用 Hosmer-Lemeshow 拟合优度检验并绘制校准曲线及决策曲线 (DCA) 评估模型的诊断效能和临床有效性。**结果** 多因素分析显示血红蛋白 (截断值 $HGB \leq 147 U/L$) 和血尿 (高倍视野/ $RBC \geq 3$ 个) 为临床独立预测因子。联合模型、组学模型及临床模型在训练组中 AUC 分别为 0.960、0.939、0.773; 在测试组中 AUC 分别为 0.871、0.843、0.659。Delong 检验显示临床模型的纳入并没有提高诊断的效能, 所以选择影像组学模型为最终预测模型其敏感度 92.00%, 特异度 86.96%。**结论** HGB 和血尿为前列腺癌临床独立预测因素, 基于 bpMRI 影像组学模型能有效预测前列腺 P504s、34 β E12、P63 表达状态, 可为早期预测前列腺癌提供客观依据。

PO-4045

基于非对比增强 CT 的影像组学特征预测白血病 脑出血患者死亡风险的研究

施露、洪楠
北京大学人民医院

目的: 研究基于非对比增强 CT (NECT) 的影像组学模型在预测白血病脑出血患者 30 天死亡风险的价值, 为临床提供新的计算机辅助诊断工具。

方法: 回顾性分析 2007 至 2023 年间在北京大学人民医院由 CT 诊断脑出血的 129 例白血病患者的 CT 图像及临床资料, 采用随机森林回归方法对缺失数据进行逐个补全。临床实验室数据 (共 14 个特征) 为脑出血发生时及确诊白血病时的数据, CT 图像特征 (共 67 个特征) 分为 11 种语义特征及基于影像组学方法提取的 56 种几何特征。在训练集中, 采用单因素 logistics 方法筛选临床因素, 随后使用最小绝对收缩和选择算子 (LASSO) 和十则交叉验证进行临床实验室数据和 CT 图像特征筛选, 分别得到当前特征集合的最优特征集, 使用随机森林算法进一步构建临床模型和影像组学模型。在模型评价中, 采用受试者工作特征曲线 (ROC) 以及曲线下面积 (AUC)、校准曲线及临床决策曲线 (DCA) 分别评估模型在训练集和测试集的区分度、校准度及临床效用, 并使用 Delong 检验比较模型之间的 AUC。

结果: 基于上述特征筛选过程, 临床模型最终由 10 个临床实验室特征组成, 重要性由高到低前五位分别为: 活化部分凝血活酶时间、乳酸脱氢酶、凝血酶活动度、血红蛋白及 D 二聚体。影像组学模型由 7 个特征构成, 重要性由高到低分别为: 病灶短径总和、周长平均值、短径平均值、实质深部出血、多中心出血、幕下出血及硬膜下出血。临床模型和影像组学模型在训练集和测试集预测 30 天不良预后的 AUC 分别为 0.872、0.775 及 0.876、0.752。Delong 检验提示两个模型之间的 AUC 值没有统计学差异 ($p > 0.05$)。两个模型的校准曲线、DCA 曲线略有区别, 但总体差别不大。**结论:** 基于临床和 NECT 图像特征分别构建的模型在预测白血病脑出血患者 30 天死亡风险方面均具有良好的性能和临床价值并且表现接近。

PO-4046

基于静息态功能磁共振评估网络游戏障碍患者大脑内在 局部连接的静态和动态改变

牛晓玉、张勇、程敬亮
郑州大学第一附属医院磁共振科

目的: 探讨网络游戏障碍患者大脑内在局部连接的静态和动态改变, 以及这些改变与 IGD 临床特征的相关性。

材料与方法：前瞻性分析 2021 年 9 月至 2022 年 12 月通过微信等网络平台在郑州大学第一附属医院招募的 80 例志愿者的临床及影像资料，根据纳入和排除标准分为网络游戏障碍组 36 例，对照组 44 例。基于 Matlab 平台计算并比较两组间静态和动态区域一致性，以探究网络游戏障碍患者大脑内在局部连接的改变。使用网络成瘾测试和匹兹堡睡眠质量指数分别评估网络游戏成瘾和睡眠质量的严重程度。采用 Pearson 相关分析评估静态和动态区域一致性改变的脑区与网络成瘾测试评分和匹兹堡睡眠质量指数评分之间的相关性。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线分析探究静态和动态区域一致性指标区分网络游戏障碍患者和对照的潜在能力。

结果：与对照组相比，网络游戏障碍患者组在双侧内侧额上回、额上回和辅助运动区的静态和动态区域一致性均增加，在左侧壳核、苍白球、尾状核和双侧丘脑的动态区域一致性增加。ROC 曲线分析显示静态和动态区域一致性改变的脑区可以区分网络游戏障碍患者和对照。此外，左内侧额上回和辅助运动区的静态区域一致性值以及左侧辅助运动区的动态区域一致性值与网络成瘾测试评分呈正相关，左侧尾状核的动态区域一致性值与匹兹堡睡眠质量指数评分呈负相关。

结论：这些结果表明网络游戏障碍患者额叶-纹状体-丘脑回路的内在局部连接受损，为网络游戏障碍的潜在神经病理机制提供了新的见解。此外，尾状核内在局部连接的动态变化可能是连接网络游戏障碍与睡眠质量的一种潜在神经生物学标志物。

PO-4047

利用深度学习算法对血氧依赖水平功能磁共振进行高时间-空间分辨率重建

李亚农

首都医科大学附属北京天坛医院

血氧水平依赖 (Blood oxygen level-dependent, BOLD) 功能磁共振成像 (Functional magnetic resonance imaging, fMRI) 可以通过血氧饱和度的变化无创地分析患者的脑功能状态。然而，由于其较低分辨率和有限的结构信息，目前还无法直接应用于图像计算。针对这一问题，我们提出利用 BOLD-fMRI 的时间维度特征解决方案，通过构建超分辨率重建网络来匹配结构 MRI 的分辨率特征；并提出一个多模态特征提取器和特征融合模块，以更好地从结构和功能 MRI 两种序列中提取有效结构及功能信息；随后，利用提取到的多模态信息构建分割网络，对小脑及周围结构进行自动分割；最后，由 2 名神经影像科医生对重建后高分辨率 BOLD 序列及小脑自动分割图像进行准确性评估。

PO-4048

70KVp 管电压联合人工智能迭代重建算法显著提高了肺癌全身对比增强 CT 的图像质量，同时降低了造影剂剂量和辐射剂量

欧阳美翔、王翠艳

山东第一医科大学附属省立医院

目的：探讨使用 70KVp 管电压联合人工智能迭代重建 (AIIR) 算法，在低造影剂剂量和辐射剂量方案下用于全身对比增强 CT 的图像质量和病灶可评估性，并与标准剂量迭代重建 (IR) 进行比较。
方法：前瞻性纳入连续 50 例肺癌患者 (平均年龄 58 ± 14 岁，平均 BMI $24.5 \pm 4.7 \text{ kg/m}^2$)。所有患者均接受了至少两次全身对比增强 CT 随访检查。其中一次检查采用标准剂量 CT (SDCT) (120 kVp, 对比剂量 1.2 mgI/kg)，用 IR (SDCT-IR) 重建图像。另一次检查中，患者接受低剂量 CT (LDCT) 扫描 (70 kVp, 对比剂量 0.8 mgI/kg)，用 IR (LDCT-IR) 和 AIIR (LDCT-AIIR) 重建

图像。测量噪声、信噪比 (SNR) 和对比噪声比 (CNR) 以进行客观分析。主观图像质量和病灶可评估性由两名不知情的放射科医生使用 5 分量表进行评分。记录有效辐射剂量和造影剂剂量。结果: 与 SDCT 相比, 的造影剂剂量和有效辐射剂量分别显著降低了 34% 和 70% ($P < 0.05$)。与 LDCT-IR 图像相比, LDCT-AIIR 图像噪声较低, 信噪比和 CNR 较高。对于主观图像质量和病灶可评估性, LDCT-AIIR 和 SDCT-IR 图像之间没有显著差异 ($P > 0.05$)。结论: AIIR 算法显著降低了肺癌全身对比增强 CT 的造影剂剂量和辐射剂量, 同时保持了与标准剂量 IR 算法相当的图像质量。

PO-4049

基于胸部 CT 心外膜脂肪影像组学列线图诊断 冠状动脉慢血流的价值

佟晶、杨本强、卑贵光、张立波
中国人民解放军北部战区总医院

目的 探讨基于胸部 CT 心外膜脂肪的影像组学列线图诊断冠状动脉慢血流的价值。

方法 收集 2020 年 1 月至 2021 年 12 月在我院行冠状动脉造影显示冠状动脉狭窄程度 $< 40\%$, 并在造影前 2 周内行胸部 CT 的患者 337 例, 根据冠状动脉造影的心肌梗塞溶栓治疗血流分级, 将患者分为慢血流组 (102 例) 和正常血流组 (235 例)。建立一种半自动分割心包和测量心外膜脂肪的方法, 在胸部 CT 纵隔窗图像上提取心外膜脂肪及参数。按 7: 3 比例随机分为训练集 236 例和验证集 101 例, 提取影像组学特征。利用相关性分析及最小绝对收缩和选择算子回归进行特征筛选, 并构建影像组学模型, 在此基础上绘制列线图。利用受试者工作特征曲线下面积 (AUC) 评估列线图诊断冠状动脉慢血流的效能, 通过校准曲线对列线图进行内部及外部验证, 最后应用决策曲线分析评估列线图的临床应用价值。

结果 经特征筛选后最终保留 10 个影像组学特征用于建立诊断冠状动脉慢血流的列线图。列线图在训练集中诊断冠状动脉慢血流的 AUC 为 0.86 (95%CI 0.82-0.91), 准确度为 0.79, 灵敏度为 0.82, 特异度为 0.91; 验证集中 AUC 为 0.78 (95%CI 0.72-0.80), 准确度为 0.71, 灵敏度为 0.67, 特异度为 0.88。校准曲线结果显示列线图与冠脉造影结果之间具有良好的一致性, 决策曲线分析表明列线图在临床上具有良好的应用价值。

结论 基于胸部 CT 心外膜脂肪影像组学列线图对冠状动脉慢血流有较好的诊断效能, 可准确、无创地指导临床决策。

PO-4050

人工智能在乳腺摄影质量控制中的应用评价

章茜、黎格、柳畅、陈伟
中南大学湘雅医院

目的: 据 2020 年统计, 乳腺癌是全球新诊断癌症最常见的类别, 占 11.7%, 其次是肺癌 (11.4%)、结直肠癌、前列腺癌和胃癌。乳腺 X 线摄影仍是当前乳腺癌早期诊断的重要手段之一, 合格的图像质量是乳腺癌诊断的重要保证, 更是乳腺癌人工智能诊断的前提。国际上乳腺摄影的质量控制工作已经作为一项法规确定下来。本单位引入一套基于人工智能的质量控制评价系统, 现介绍该系统应用在乳腺摄影质量控制中的初步经验, 探讨其可靠性和临床意义。

方法: 在质控评价系统后台统计 2021 年 8 月 1 日至 2021 年 9 月 15 日接收的全部乳腺图像, 包括双侧乳腺侧斜位和轴位片, 评价指标为 MLO 位胸大肌在乳头后线上方、MLO 位胸大肌在乳头后线偏上、CC 位乳头完全内陷、CC 位乳头部分内陷、MLO 位乳头完全内陷、MLO 位乳头部位内陷、

CC 位乳头显影不全, MLO 位乳头显影不全、CC 位乳头指向不平行, 乳头后线差值过大、乳头后线差值偏大以及 MLO 位胸大肌不可见等 12 项, 最终对系统自动生成的质量评价结果进行分析。

结果: 本系统将乳腺摄影图像质量评价结果分为优秀、中等与不合格三个等级, MLO 位胸大肌在乳头后线上方判定为不合格, 出现其余 11 项评价指标, 无论多少项均判定为中等。最终共纳入 522 只乳腺 DR 图像, 优秀率为 1.5%, 中等率为 69.3%, 不合格率为 23.9%; 评级为优秀者多见于胸部正位; 判定为中等的病例, 扣分项前四个指标分别为 MLO 位胸大肌在乳头后线偏上 (90%)、MLO 位乳头部位内陷 (47.7%)、乳头后线差值过大 (47.1%) 和 CC 位乳头指向不平行 (46.9%)。

结论: 本套 X 线摄影质控评价系统对接收到的乳腺图像可进行实时、客观的图像等级评价, 有望在乳腺摄影质量控制中发挥重要的价值。该质控系统评价的不合格率较高, 可能与训练集数据的来源机构单一有关, 有必要纳入更复杂的临床环境进一步学习验证以提高其应用效能。

关键词: 乳腺摄影; 人工智能; 质量控制;

PO-4051

基于深度学习磁共振血管成像脑动脉瘤自动检测效能研究

林江南、宋雯雯、许茂盛、曹志坚
浙江中医药大学附属第一医院 (浙江省中医院)

目的 利用时间飞跃法磁共振血管成像, 通过人工智能全网络卷积计算机辅助检测方法对脑动脉瘤进行全自动检测, 探讨其诊断效能。

方法 选择 2018 年 3 月—2021 年 11 月在浙江中医药大学附属第一医院行常规 TOF-MRA 检查 65 例非破裂颅内囊状动脉瘤患者的影像, 分为训练集(45 例)、内部测试集(20 例)。采用基于全网络卷积的计算机辅助检测方法, 对 TOF-MRA 影像进行预处理, 进行全自动颅内血管分割, 获得感兴趣区域, 并在分割结果的基础上, 引入医师的标注。分别对 V-Net 及 OTO-Net 网络模型进行训练调参, 利用得到的模型进行脑动脉瘤区域的自动检测。

结果 OTO-Net 模型在 ZPHT 和 ADAM2020 数据集上识别与分割颅内动脉瘤的准确率分别是 98.37% 与 97.86%, ASD 达到 0.753, DSC 达到 0.9813, HD 达到 0.642mm。

结论 OTO-Net 模型能够实现对颅内动脉瘤 MRA 图像的自动检测与精准分割, 可以胜任辅助放射科医生对颅内动脉瘤患者 MRA 检查进行量化分析和评估的任务。

PO-4052

基于 13N-氨水心肌灌注显像神经网络结合影像组学模型预测心肌存活

曾钰灏、秦杰、莫碧云、崇维霞、付巍
桂林医学院附属医院

目的: 心肌存活的准确诊断对于后续的治疗策略尤为重要。心肌灌注显像联合 FDG 心肌代谢显像可以从灌注代谢匹配程度中诊断心肌存活情况, FDG 心肌代谢显像是诊断心肌存活的金标准, 但其图像质量易受葡萄糖水平调节的影响, 可能带来额外的辐射风险和经济成本。因此, 本研究旨在探索一种基于氨水心肌灌注显像的方法, 利用神经网络和机器学习模型预测心肌存活, 为临床提供一个新的诊断工具。

方法: 收集于我院一日法行负荷+静息 13N-氨水显像和 18F-FDG 心肌代谢显像的 48 例患者信息, 灌注显像左心室断层图像共 480 张, 将图像输入 resnet 101 网络中进行训练, epoch=100, 训练完成后将网络作为特征提取器, 提取断层图像的结构化特征数据, 输出神经网络最后一层平均池化层

的特征。随后采用 t 检验和最小绝对值收缩和选择算子 (Least Absolute Shrinkage and Selection Operator, LASSO) 进行特征筛选, 建立了 K 近邻 (K-Nearest Neighbors, KNN) 模型、逻辑回归 (Logistic Regression, LR) 模型、支持向量机 (Support Vector Machine, SVM) 模型。我们采用受试者工作特征曲线下面积 (Area Under the Receiver Operating Characteristic Curve, AUC) 来对模型效能进行评估。

结果: 在测试集中, 各模型都展现了较高的分类准确性, 在心肌存活预测上具有良好的鉴别能力 LR 模型、SVM 模型、KNN 模型的 AUC 值分别为 0.73、0.75、0.72, SVM 模型表现略优。

结论: 本研究证实了基于氨水心肌灌注显像的机器学习模型在心肌存活预测上的有效性。为心血管疾病的诊断和治疗提供了新的研究方向, 为未来临床实践提供了一个无需依赖 FDG 的高效、准确的诊断工具, 有望进一步提高心肌存活的诊断准确性。

PO-4053

基于肺结节 CT 影像特征及人工智能软件 定量特征预测肺腺癌生长模式

赵茜茜、杨丽、时高峰、刘培欣

河北医科大学第四医院

目的: 基于肺结节 CT 影像特征及人工智能 (AI) 软件定量特征建立预测肺腺癌生长模式模型, 探讨其在鉴别贴壁生长模式肺腺癌与非贴壁生长模式肺腺癌中的应用价值。

方法: 回顾性分析河北医科大学第四医院于 2020 年 1 月至 2020 年 12 月术前 CT 影像表现为磨玻璃结节 (GGN) 且经手术病理证实为肺腺癌的 191 例患者 (共 204 枚 GGN) 的临床及影像资料。记录患者的年龄、性别、吸烟史; 分析各枚 GGN 的影像特征 (位置、结节类型、瘤肺界面、深分叶征、毛刺征、空泡征、内部血管征、支气管异常征、胸膜牵拉征); 通过 AI 软件计算各枚 GGN 的定量特征: 平均直径、总体积、总质量、实性成分 (CT 值 \geq -50HU 区域) 体积占比及质量占比、各枚 GGNCT 值的最大值、最小值、平均值、中位数、标准差、偏度、峰度、熵。根据术后病理结果, 按照生长模式将入组的 GGN 分为贴壁生长模式肺腺癌 136 枚和非贴壁生长模式肺腺癌 68 枚。采用单因素和多因素 logistic 回归分析筛选与肺腺癌生长模式高度相关的 CT 影像特征及 AI 定量特征, 据此建立预测肺腺癌生长模式的模型。采用 ROC 曲线评价模型的诊断效能, 计算模型的曲线下面积 (AUC), 采用 Delong 检验对各独立预测因素及组合模型的 AUC 进行比较。

结果: 单因素及多因素 logistic 回归分析显示支气管异常征、平均直径、实性成分体积占比、实性成分质量占比是鉴别肺腺癌生长模式的独立预测因素, 据此建立预测肺腺癌生长模式组合模型, 该模型的 AUC 为 0.871, 灵敏度为 79.4%、特异度为 83.1%, 准确率为 84.8%, 诊断效能高于单一独立预测因素的诊断效能 (支气管异常征、平均直径、实性成分体积占比、实性成分质量占比的 AUC 分别为: 0.728、0.831、0.780、0.779)。

结论: 基于肺结节 CT 影像特征及 AI 软件定量特征建立的预测肺腺癌生长模式模型具有良好的诊断效能, 可为临床治疗决策提供依据。

PO-4054

基于 CCTA 的冠状动脉周围脂肪组织影像组学诺模图 预测主要心脏不良事件的多中心研究

黄肇恒、祁荣兴、黄胜
南通市第一人民医院

目的 评价基于冠状动脉血管造影 (CCTA) 的冠状动脉周围脂肪(PCAT)预测主要心血管不良事件(MACE)的价值。

方法 回顾性纳入从 2019 年 6 月至 2022 年 12 月我院 314 名疑似或已有 CAD 患者的数据, 来自另外两家医院的共计 242 名患者被纳入作为外部验证集。终点事件是 1 年随访后发生 MACE。MACE 包括:心血管源性死亡、新发心肌梗死、心力衰竭住院(或再入院)、以及 CCTA 检查后超过 30 天的冠状动脉靶血管血运重建。所有患者都接受了 CCTA 扫描。从 CCTA 图像的横断位最佳舒张期期相中提取影像组学特征, 并通过特征选择组合算法进行特征降维, 以构建影像组学特征模型。采用单因素和多因素分析评估临床因素。多因素逻辑回归分析用于构建一个临床-影像学-影像组学联合模型。绘制受试者工作特征(ROC)、校准和决策曲线分析(DCA)曲线, 并计算 ROC 曲线下面积(AUCs), 以评估临床模型、影像组学模型以及联合模型的预测性能。

结果 最终确定了 12 个与 MACE 高度相关的影像组学特征, 以开发影像组学模型。多因素逻辑回归结果显示, 吸烟、年龄、高血压和血脂异常和 MACE 显著相关。在使用临床参数、影像学参数和影像组学参数的整合模型(诺模图)中, 诊断性能如下: 0.970 AUC, 0.949 准确率(ACC), 0.833 敏感性(SEN), 0.981 特异性(SPE), 0.926 阳性预测值(PPV), 0.955 阴性预测值(NPV)。校准曲线表明该诺模图具有良好的一致性, 决策曲线分析表明该诺模图具有较高的临床实用性。

结论 整合基于 CCTA 的 PCAT 影像组学特征、临床指标以及影像学参数的诺模图可以成为预测 MACE 的有潜力的工具。

PO-4055

基于 Pix2Pix 生成对抗网络生成 40KeV 虚拟单能量 CT 图像及图像质量评价

钟华、黄倩文、郑小丽、钱雅楠、段少银、康江河、王金岸
厦门大学附属中山医院

目的: 探索应用生成对抗网络(GAN)生成 40keV 虚拟单能量图像(gVMI_{40keV}), 以替代 VMI_{40keV} 的可行性。

方法: 回顾性收集 2021 年 1-6 月本院行上腹部 IQon CT 平扫+增强扫描患者 444 例, 按 7:3 比例分成训练组和验证组, 应用门静脉图像建立并训练 Pix2Pix-GAN 模型。验证组中, 计算 MAE、PSNR、SSIM 等指标选择最佳生成器模型。回顾性随机收集 7-12 月无明显病变 58 例为测试组 1、肝癌 40 例测试组 2、肝癌公共数据集 100 例测试组 3 并行主观与客观评价。测试组 1 中测量 gVMI_{40keV} 及 VMI_{40keV} 肝胰脾、皮下脂肪、主动脉、竖脊肌的 CT 值、噪声及 SNR 并行相关性分析及制作 Bland-Altman 图; 测试组 2 中比较 gVMI_{40keV} 与 VMI_{40keV} 肝癌、肝组织 CT 值、噪声与 CNR; 测试组 3 中比较 gVMI_{40keV} 和常规 CT 图像中肝癌的 CT 值、噪声以及 CNR。采用 5 分法对测试组 1 和测试组 2 中 gVMI_{40keV} 与 VMI_{40keV}、测试组 3 中 gVMI_{40keV} 与常规 CT 图像, 根据图像质量及噪声进行主观评分, 比较两组图像的差异。

结果: 第 192 步为最佳生成模型, 在验证组 MAE 最小, PSNR, SSIM 最大。测试组 1 中 gVMI_{40keV} 与 VMI_{40keV} 在各个器官的 CT 值、噪声和 SNR 显著正相关。Bland-Altman 显示两种图像之间的差值基本在 95%置信区间内。测试组 2 中 gVMI_{40keV} 与 VMI_{40keV} 在肝癌、肝组织的 CT 值、噪声和

CNR 显著正相关。Bland-Altman 显示两组图像之间的差值在 95%置信区间内。测试组 3 中 gVMI_{40keV} 中肝癌、肝组织的 CT 值、噪声、CNR 的中位数均高于常规 CT 图像，两组图像存在统计学差异。测试组 1 与测试组 2 中 gVMI_{40keV} 与 VMI_{40keV} 在图像质量、噪声的差异均无统计学意义，测试组 3 中 gVMI_{40keV} 图像质量优于常规 CT 图像，有统计学意义。

结论：GAN 具备将常规 CT 图像生成 gVMI_{40keV} 的能力，且 gVMI_{40keV} 与 VMI_{40keV} 高度相似，可能为不具备能谱 CT 的医疗机构提供新影像诊断工具。

PO-4056

联合多尺度影像组学及病理组学模型预测肾透明细胞癌 SSIGN 风险评分

李武超^{1,2}、王荣品¹

1. 贵州省人民医院

2. 贵州大学

目的：SSIGN 评分是一种基于肿瘤分期、大小、局部淋巴结转移、核分级和肿瘤凝固性坏死病理变量的多因素预后评分系统，用于评估肾透明细胞癌（ccRCC）患者的生存和转移风险。根据评分，ccRCC 患者可分为低风险组（0-3 分）、中风险组（4-7 分）和高风险组（8 分以上）。本研究旨在探索联合影像组学和病理组学特征构建术前 SSIGN 评分的预测模型。

方法：本研究收集了贵州省人民医院 344 例单中心 ccRCC 患者的术前 CT 影像数据和术后全数字病理扫描切片（WSI）HE 病理数据。患者根据 SSIGN 评分分为低风险组（0-3 分）及中高风险组（4 分以上），同时患者也随机分为训练集（275 例）和验证集（69 例）。使用 pyradiomics 软件从 CT 影像中提取了 234 个影像组学特征，使用 cellprofile 软件从 WSI 病理切片中提取了 156 个病理组学特征。对影像组学特征和病理组学特征分别进行标准化处理，然后使用 LASSO 回归对其进行筛选，选择前 20 个系数绝对值最大的特征作为最终的影像组学特征和病理组学特征。基于这些特征，我们构建了以下三种预测模型：单一尺度影像组学模型、单一尺度病理组学模型、多尺度融合模型。我们使用受试者工作特征曲线下面积（AUC）、准确率、敏感度和特异度等指标评估了模型的性能。

结果：在训练集和验证集上，多尺度融合模型加权平均在预测 SSIGN 评分低风险组和中高风险组方面均优于其他两种模型，其 AUC 分别为 0.87 和 0.86。单一尺度影像组学模型次之，其 AUC 分别为 0.82 和 0.81。单一尺度病理组学模型最差，其 AUC 分别为 0.77 和 0.74。

结论：本研究表明，联合影像组学和病理组学特征可以有效地预测 ccRCC 患者的 SSIGN 评分，为临床决策提供有价值的信息。未来，我们将进一步优化我们的预测模型，并在更大规模的数据集上进行验证。

PO-4057

基于 MRI 和多参数级联网络的腮腺肿瘤分割

吴松雄、吴光耀、米瑞、吴娜珊、谭碧雯、彭铮堃

深圳大学总医院

目的腮腺肿瘤约占头颈部肿瘤的 2%-10%。手术切除腮腺肿瘤是其主要治疗方法，但是其手术前的误诊率很高。而且不同性质及亚型的唾液腺上皮性肿瘤在手术方式、是否放化疗、清扫淋巴结、保留面神经等治疗方式上有很大的不同。因此术前有必要为腮腺肿瘤的分割建立更客观有效的影像评估模型，实现对腮腺肿瘤的定性诊断，对于临床治疗方案的制定及患者预后的评估具有重要意义。

方法

我们收集了单中心 120 例多参数 MR 的腮腺图像, 包括训练数据集(80%)和测试数据集(20%), 我们结合 Unet++和 Resnet 优点设计了 ResUnet++, 在 UNet++的基础上引入残差结构以及实例归一化来缓解梯度消失或梯度爆炸等问题和缩减网络收敛的时长。我们采取深度监督进行联合学习, 设计了级联多参数 ResUnet++网络结构, 级联网络的第一个网络结构就是采用 3D ResUnet++网络结构; 通过这个网络得到 T1WI(T1w)、T2WI-FS(T2)、T1WI-FS+C(T1wC)的分割结果, 接着将这三个不同模态的分割结果作为上下文信息分别与 T1WI、T2WI-FS、T1WI-FS+C 一起作为第二个网络 3D ResUnet++的六通道输入, 从而实现了腮腺肿瘤感兴趣区域的分割。为了进一步验证该算法的分割性能, 本文设计了一系列对比实验。

结果从表 1 我们可以看到级联多参数 ResUnet++模型在测试集上的 Dice 相似系数为 86.5%, 敏感度为 84.7%, 精确度为 89.6%, 级联多参数 ResUnet++网络的分割结果明显好于其他 2D/3D 单参数分割网络。相比表 1 的其他网络, 级联多参数 ResUnet++网络分割结果各个分割指标都有一定的提升。

结论实验结果表明, 本文的分割方法对肿瘤具有良好的分割效果。我们提出了一个级联多参数 ResUnet++分割网络, 该网络利用多个视角的多参数上下文信息, 通过不同深度的 Unet 整合了不同层次的特征, 使用深度监督进行联合学习, 同时考虑了三维图形层与层之间的空间信息以及多种不同参数 MR 的信息, 提升了腮腺肿瘤分割的准确度。希望本文提出的方法能够有助于医生评估腮腺肿瘤的不同亚型, 进一步辅助医生制定临床治疗方案。

PO-4058

基于自体模校正的 PL-QCT 在骨密度及身体成分检测的应用初探

苏伟、杨信、张光明
云南大学附属医院

目的 针对双能 X 线骨密度检测 (DXA) 受增生骨质和血管钙化干扰以及传统 QCT 受制于匹配 CT 设备问题, 本研究的目的是验证基于自体模校正的 QCT(PL-QCT)在椎体骨密度检测效能方面与传统 QCT(PB-QCT)以及 DXA 比较, 同时对基于薄层 (2mm) 和厚层 (10mm) CT 图像进行 PL-QCT 椎体骨密度检测结果的一致性进行探究。**方法** 回顾性分析 2022 年 1 月-2022 年 4 月于云南大学附属医院同时进行了 DXA 骨密度、QCT 骨密度检测的体检对象 80 例, 对符合纳入标准并最终入组的研究对象依据年龄段进行分组, 分别采用 PB-QCT 以及 PL-QCT 对图像进行分析, 同时搜集入组研究对象的 DXA 骨密度检测结果; 由于目前临床测量骨密度的“金标准”是 DXA, 故以 DXA 的骨密度检测结果作为诊断参考; 将 PL-QCT 骨密度检测结果与 PB-QCT 以及 DXA 进行比较; 此外, 所有研究对象进行 PL-QCT 骨密度检测时均同时使用厚层 (10mm)、薄层 (2mm) CT 图像进行分析, 由此来验证基于厚层图像与薄层图像检测骨密度的一致性。**结果** BMD 检测结果显示, PL-QCT 能获得与 DXA 和 PB-QCT 一致的骨密度检测能力; 对厚层 CT 图像 (10mm) 与薄层 CT 图像 (2mm) 检测骨密度获得的结果进行验证, 结果显示差异无统计学意义 ($P>0.05$), 线性回归方程 ($Y=bX+a$)、相关系数 r 或决定系数 R^2 分析符合线性要求。**结论** 基于自体模校正的 QCT (PL-QCT) 与传统 QCT (PB-QCT) 以及 DXA 骨密度检测结果呈现一致性, 具有巨大的研究转化潜力与临床应用价值; 基于厚层 CT 图像及薄层 CT 图像进行 PL-QCT 骨密度检测, 获得的 BMD 检测结果具有较好的一致性, 检测结果可满足日常的临床工作需要。基于自体模校正的 PL-QCT 有望与胸部低剂量 CT (LDCT) 检查结合, 做到一次 CT 扫描, 获得双肺和纵隔以外多个检测结果, 主要包括骨密度、皮下脂肪、内脏脂肪、腹部及腰部肌肉内脂肪含量等定量结果, 从而更好地进行临床评估和健康指导, 且不会额外增加受检者的辐射剂量, 亦无匹配 CT 设备限制, 可同时分析多台不同 CT 设备数据。

PO-4059

鉴别侵袭性肺曲霉病与非小细胞肺癌空洞病变的 影像组学模型构建

帅欣艳、孟祥水
山东大学齐鲁医院 (青岛)

目的:尽管在诊断和治疗方面取得了进展,但侵袭性肺曲霉病 (IPA) 仍然是一种危及生命的疾病。影像组学是一种新颖的工具,采用先进的图像分析算法,利用大量的定量图像特征构建预测模型。在这项研究中,我们旨在建立一种基于放射组学的预测模型,以区分表现为空洞病变侵袭性肺曲霉病 (IPA) 与非小细胞肺癌(NSCLC)。

方法:本研究纳入了 21 例确诊/临床诊断 IPA 的患者和 46 例非小细胞肺癌患者的 115 个病变。将胸部 CT 图像上传到 Deepwise 多模态研究平台,然后手动圈定感兴趣的区域。图像预处理后,提取一阶特征、形状特征和纹理特征。所有数据随机分为两组进行训练和测试。选择关键影像组学特征,使用 Pearson 相关和方差分析 F 检验构建影像组学。对 12 种机器学习算法进行测试,选择在训练集和测试集上表现最好的分类器作为最终的影像组学模型。采用 Logistic 回归、LASSO 回归对临床特征进行筛选,剩余特征与影像组学评分结合构建综合模型。通过受试者工作特征曲线分析、校准曲线分析和决策曲线分析评估诊断效果。

结果:23 个影像组学特征最终被纳入影像组学模型。与其他模型相比,线性判别分析模型在测试集 (AUC 为 0.8946,0.7931 - 0.9960)和训练集(AUC 为 0.9871,0.9677-1)上表现最佳。结合影像组学评分和临床特征建立综合预测模型。综合模型的 AUC 对于训练集为 0.989(0.969,1),对于测试集为 0.915(0.826,1)。在综合模型的基础上,绘制了预测图来预测 IPA 发生的概率。校正曲线和决策曲线证实了综合模型的校正和临床实用性。

结论:我们的研究证实了影像组学在鉴别 IPA 诊断中的价值,并建立了一个将影像组学与临床特征相结合的综合模型,具有良好的鉴别和校准能力。

PO-4060

光谱 CT 成像: 双能 CT 和多能光子计数 CT 的技术原理

肖涵
吉林大学第一医院

光谱计算机断层扫描(CT)成像包含了基于一个简单原理的独特的一代 CT 系统,该原理利用了 CT 图像中存在的能量依赖信息。在过去的二十年中,随着双能 CT 系统的引入,这一原理得到了扩展。第一代光谱 CT 系统,以双源或双层技术为代表,在放射学界开辟了一种新的成像方法,它们能够克服传统 CT 遇到的组织表征的局限性。它在全球范围内的扩展也可以被认为是最近基于光子计数 CT 系统上新的检测链的突破性技术的重要杠杆,这对将 CT 扩展到多能 CT 成像具有很大的希望。本文详细介绍了光谱 CT 的基本原理和技术,重点介绍了双能和多能 CT 系统的最新技术进展。

乳腺 MRI 病灶分割技术进展

杨明亮、姜昕

解放军总医院第一医学中心放射诊断科

目的：乳腺疾病在女性中非常常见，而乳腺 MRI 病灶分割技术是一种有效的乳腺疾病诊断和治疗的手段，旨在通过计算机辅助的方法准确地分割和识别乳腺 MRI 图像中的病变区域，提供给临床医生进行疾病诊断和治疗。

方法：目前，乳腺 MRI 病灶分割技术主要采用基于机器学习和人工智能的方法。其中，常见的方法包括基于像素的方法、基于区域的方法和基于深度学习的方法。基于像素的方法利用图像的灰度值和纹理特征来进行分割；基于区域的方法利用邻域像素点的强度信息和构造一定准则来分割病灶区域；基于深度学习的方法利用深度神经网络模型对乳腺 MRI 图像进行学习和分割。常用的机器学习方法包括支持向量机（SVM）、随机森林（RF）和深度学习等。这些方法能够根据已有的人工标记数据对乳腺 MRI 图像进行学习和分割，具有较高的自适应性和分类准确性。随着人工智能技术和计算机视觉技术的发展，当前以基于深度学习的病灶方法分割方法最为流行，其中包括全卷积网络（FCN）、U-Net、SegNet，以及基于 swin-transformer 的端到端分割模型和基于 SAM 调优训练的基础分割模型等。这些模型能够学习到图像中的特征信息，实现对病变区域的精确分割。与传统方法相比，基于深度学习的算法能够更好地处理图像的复杂性和变化性，并取得更高的分割精度。

结果：近年来，乳腺 MRI 病灶分割技术取得了显著的研究进展。研究表明，基于深度学习的方法在乳腺病灶分割中具有较高的准确性和稳定性。此外，还有一些研究提出了针对不同乳腺肿瘤类型和病理特征的特定分割算法，如将多序列 MRI 图像信息融合，以进一步提高了乳腺病灶分割的准确性和质量。

结论：乳腺 MRI 病灶分割技术是一种重要的乳腺疾病诊断和治疗工具。通过不断改进和创新分割算法，乳腺 MRI 图像的病灶分割准确性不断提高，为医生提供了更准确的疾病信息。然而，仍然存在一些难题和挑战，如乳腺 MRI 图像的噪声干扰和图像分割的速度问题。因此，未来的研究还需要进一步优化算法，提高病灶分割技术的性能和实用性。

PO-4062

全模型迭代和混合迭代重建算法在人工智能软件辅助颅内动脉瘤诊断中的对比研究

李涛、张磊

吉林大学白求恩第一医院

目的：探讨全模型迭代重建技术（IMR）和混合迭代重建技术（iDose）算法图像在人工智能软件辅助头颈血管 CTA 后处理重建及动脉瘤量化分析效能对比研究。

方法：依据纳入标准选取吉林大学白求恩第一医院放射科行颅脑 CTA 检查并经 DSA 证实为动脉瘤的患者 160 例，将 CTA 扫描后的数据同时进行 IMR 和 iDose 算法重建，分别命名为 A 组（IMR 重建）和 B 组（iDose 重建）。随后将重建的数据放入头颈 CTA 人工智能分析软件进行重建及量化分析。比较两组图像大脑中动脉起始处及同层面颞肌的 CT 值、图像噪声（SD）、信噪比（SNR）及对比噪声比（CNR），并对 2 组图像质量分别进行主观评分和动脉瘤客观智能量化测量。用 SPSS Statistics 26.0 统计软件对各组数据进行统计学分析。

结果：头颈部 CTA 检查的病例中颅内前交通动脉瘤、大脑中动脉瘤、颈内动脉瘤和后循环动脉瘤患者各 40 例。图像质量评价：大脑中动脉起始处的平均 CT 值 IMR 组 319(81.3)HU 高于 iDose 组 336(74.2)HU，图像噪声 IMR 组 8.73[6.16,12.7]HU 低于 iDose 组 4.28[3.06,6.58]；同层面颞肌 CT 值 IMR 组图像的 SNR 为 50.4(9.42)HU 高于 iDose 组 40.6(11.9)HU，图像噪声 IMR 组 4.71(2.12)

低于 iDose 组 5.98(2.20)HU; IMR 组图像的 SNR 69.6[51.5,106] 高于 iDose 组 40.5[21.8,58.8]; IMR 组图像的 CNR 66.5[48.4,86.7]高于 iDose 组 48.6[37.7,60.8], 差异均有统计学意义($P<0.05$)。基于头颈 CTA 人工智能软件的后处理图像质量主观评分 IMR 组(3.64 ± 0.36)高于 iDose 组(2.73 ± 0.76); 动脉瘤的径限智能测量中 IMR 组与 iDose 组的测量结果相近, 差异无统计学意义($P>0.05$)。结论: 与混合迭代重建算法相比, 全模型迭代重建算法能进一步提高图像质量, 改善后处理重建效果, 两种重建算法在人工智能软件辅助颅内动脉瘤智能量化分析中效能相近, 具有一定的可靠性。

PO-4063

基于深度学习网络构建 CT 肺动脉栓塞智能检测模型的研究

李曼、张晗宇、黄婷婷
河南中医药大学第一附属医院

目的: 评估深度学习网络对 CT 肺动脉成像 (CT pulmonary artery imaging, CTPA) 急性肺动脉栓塞 (acute pulmonary embolism, APE) 的检测效能。

方法: 回顾性纳入 2020 年 1 月-2023 年 5 月河南中医药大学第一附属医院怀疑 APE 行 CTPA 检查并最终确诊为 APE 的患者。按照 7:2:1 的比例将数据集随机分为训练集、验证集、测试集。采用数据转换为 HU 值、图像归一化及肺部掩膜增强模型、图像增强策略对原始图像进行预处理以增加模型对病灶区域的关注。本研究基于 Res2Net 网络, 并结合多孔空间金字塔池化 (atrous spatial pyramid pooling, ASPP) 和 SE (squeeze and excitation) 注意力机制网络训练模型, 并对模型进行五折交叉内部验证。在测试集上采用戴斯相似系数 (dice similarity coefficient, Dice) 评价血栓分割的效果; 利用精确率、召回率、特异度、IOU 和 F1-Score 指标评估模型的检测效能绘制相应曲线, 并将该模型与已有的 U-Net 模型及 CE-Net 模型进行比较。

结果: 本研究共纳入 303 例确诊为 APE 的患者, 男 178 例, 女 125 例, 年龄 52.68 ± 18.73 岁。其中训练集 212 例, 验证集 61 例, 测试集 30 例。模型在测试集的 Dice 系数 0.894, 精确率 0.899, 召回率 0.925, 特异度 1.000, Pos_IOU 0.828。该模型与现有的 U-Net 和 CE-Net 网络进行对比, 具有更好的效能 (U-Net 模型: Dice 系数为 0.704, 精确率 0.701, 召回率 0.905, 特异度 1.000, PosIOU 0.667; CE-Net 模型: Dice 系数为 0.812, 精确率 0.754, 召回率 0.913, 特异度 1.000, Pos_IOU 0.724)。雷达图显示 Res2Net 网络各方面都优于以上两个网络, 尤其是在 Dice 系数、召回率和精确率上有较大的改进。

结论: Res2Net 网络模型对 APE 具有良好的检测效能, 并且优于现有的 U-Net 网络和 CE-Net 网络。

PO-4064

基于深度学习骨密度定量分析和定量 CT 的在老年人 CT 机会性骨质疏松筛查中的对照研究

张宗军¹、贾鹏²、荆梅¹、李清瑶¹
1. 江苏省中西医结合医院
2. 南京明基医院

目的: 比较深度学习骨密度定量和 QCT 在老年人常规胸腹部 CT 检查中进行机会性骨质疏松筛查的准确性和可靠性。

材料和方法: 江苏省中西医结合医院常规临床腹部 CT 检查和明基医院体检老年患者共 625 例, 采用汇医慧影公司开发的基于深度学习商用的定量 CT 辅助诊断系统进行全自动椎体分割和椎体骨密度 (BMD) 值提取; 并与 Mindways 公司第三代和第四代 QCT-BMD 软件测量获得的 BMD 进行比

较。QCT 测量的 BMD 值作为标签评估 AI 诊断骨质疏松的性能，并计算准确性、敏感性，特异性。通过双变量线性回归分析 AI 和 QCT 测量得到的 BMD 值的拟合优度。

结果：625 例患者中诊断骨质疏松 353 例，骨量减少 202 例，正常 70 例；其中 305 例男性中骨质疏松和骨量减少分别为 160 例和 108 例；320 例女性中骨质疏松 193 例，骨量减少 94 例；女性组骨质疏松患病率高于男性组，但无显著性差异（59.1% > 53.1%， $P=0.312$ ）。AI 诊断骨质疏松 358 例，骨量减少 197 例，正常 70 例，有 45 例 AI 与 QCT 两者结果不一致。AI 诊断骨质疏松的 AUC 为 0.822(95%CI:0.787-0.867， $P<0.001$)，准确性为 0.9456，敏感性为 0.9601，特异性 0.9270。QCT 和 AI 对 T12~L4 个椎体 BMD 的线性回归拟合优度 R^2 分别为 0.93、0.95、0.90、0.86、0.95；QCT 和 AI 对腰 1-2 或腰 2-3 两个椎体的平均 BMD 的线性回归拟合优度 R^2 分别为 0.93。GE vCT、东软 Neuviz128、联影 uCT 510 的 QCT 与 AI 对椎体 BMD 的线性回归拟合优度 R^2 分别为 0.92、0.95、0.95；明基医院第三代 QCT 以及本院第四代 QCT 与 AI 对椎体的线性回归拟合优度 R^2 分别为 0.88、0.96。

结论：AI 在机会性骨质疏松筛查中与 QCT 相比，敏感性高，一致性好，且不同 CT 机型差异小。

PO-4065

影像-病理组学多尺度模型肾透明细胞癌预后预测

李武超^{1,2}、王荣品¹

1. 贵州省人民医院

2. 贵州大学

目的：本研究旨在探讨将影像组学和病理组学结合多尺度模型对术后肾透明细胞癌患者总生存期的预后价值。

方法：本研究回顾性分析了 137 例经手术病理诊断为肾透明细胞癌的患者，其中 67 例来自贵州省人民医院，70 例来自癌症基因组图谱数据库。根据纳入顺序，将患者分为 90 例的训练队列和 47 例的验证队列。首先，我们基于 pyradiomics 和 cellprofile 软件分别提取了目标病灶的术前 CT 图像和术后 HE 病理图像的特征，使用 Lasso-cox 进行特征筛选，并建立了影像组学模型和病理组学模型。然后，基于 Cox 回归分析，我们建立了影像-病理模型、临床预后模型和综合预后模型。最后，使用 Kaplan-Meier 分析生存曲线，并使用 log-rank 检验和一致性指数（C-index）评估所建模型的预测能力。

结果：多变量 COX 回归分析显示，影像组学特征和病理组学特征均为肾透明细胞癌患者手术后总生存期预测的相对独立危险因素。影像-病理组学模型将肾透明细胞癌患者分为高危组和低危组，在训练队列和验证队列中均显示出显著的生存差异（log-rank: $P < 0.0001$ ）。同时，验证集结果表明，影像-病理组学模型比单一尺度的模型（影像组学模型或病理组学模型）具有更高的预测准确性（C-index: 0.86 vs 0.82 vs 0.81），也明显优于临床模型（C-index: 0.86 vs 0.78）。进一步分析显示验证集中影像-病理组学模型与临床模型相结合的综合预后模型表现出最佳的预后性能（C-index: 0.88 vs 0.86 vs 0.78）。

结论：新兴的多尺度影像-病理组学模型是肾透明细胞癌患者手术后总生存期的一个重要预测因子，优于单一尺度的模型及临床模型，将极大助于肾透明细胞癌患者个体化治疗决策。

PO-4066

基于深度学习重建的快速扫描直肠 MRI 图像质量研究

彭文静¹、万丽娟¹、王思聪²、李元隆²、张红梅¹

1. 中国医学科学院肿瘤医院

2. 通用电气医疗(中国)有限公司

目的 探讨深度学习重建 (deep learning reconstruction, DLR) 技术对直肠 MRI 图像质量和扫描时间的影响。

方法 前瞻性纳入经活检证实且未经治疗的 78 例直肠癌患者行 MRI 扫描, 序列包括常规快速自旋回波 (fast-spin echo, FSE) 小野 T2WI (conventional T2WI, T2WIcon) 及 DLR 小野 FSE-T2WI (T2WIDLR), 同时保存未应用 DLR 的原始图像 (T2WIori), 记录扫描时间。两名影像医师依据 Likert Scale 对图像行双盲主观评分 (5 分: 优; 1 分: 极差), 指标包括: 伪影、噪声、病灶边缘清晰度、直肠壁分层结构、诊断置信度及整体图像质量; 2 周后勾画提取信噪比 (signal-noise ratio, SNR) 和与闭孔内肌的对比噪声比 (contrast-noise ratio, CNR) 行客观评价。采用组内相关系数 (intraclass correlation coefficient, ICC) 评价阅片者间一致性。使用单因素方差分析和 Kruskal-Wallis 检验比较正态、非正态分布评价指标在序列间的差异。

结果 T2WIDLR/T2WIori 的采集时间显著短于 T2WIcon ($P < 0.001$), 采集时间缩短了 65%。阅片者间评分具有较好的一致性 ($ICC > 0.7$)。T2WIori 较 T2WIcon 显示出更差的噪声、病灶边缘清晰度、直肠壁分层结构、诊断置信度、整体图像质量、SNR 和 CNR ($P < 0.001$)。使用 DLR 后显著改善 T2WIcon 的伪影、噪声、病灶边缘清晰度、直肠壁分层结构、整体图像质量、诊断置信度、SNR 和 CNR ($P < 0.05$)。

结论 DLR 可以显著改善直肠 MRI 成像的噪声水平, 提供更高的图像质量, 并将采集时间缩短 65%。

PO-4067

基于机器学习的影像组学特征用于在 CCTA 中鉴别冠脉的异常状态

叶坤林、胡欣朋、于晓军、肖泽宇、史长征、罗良平

暨南大学附属第一医院

目的: 基于斑块与血管炎症的相关性, 本研究旨在利用从冠状动脉 CT 血管造影获得的冠脉周围脂肪组织 (PVAT) 影像组学特征作为定量指标, 研究 PVAT 与动脉粥样硬化之间的关联性。目标是区分血管的异常炎症状态。

方法: 本回顾性研究纳入了 102 名患者, 其中包含 22 名冠脉无明显异常的患者作为对照组。由两位医师独立于诊断信息, 确认并提取含有斑块的异常的冠脉血管段, 随后再依据异常血管段的位置分布比例, 提取相应比例数量的正常血管段。基于开源软件 3d-slicer 对血管段的冠脉周围脂肪组织 (PVAT) 进行了半自动分割, 并利用 Pyradiomics 工具提取影像组学特征, 病例数按照 7:3 比例分为训练集与测试集。使用 LASSO 和 RFE 方法对影像组学特征进行数据降维和特征筛选。此外, 我们还提取了传统影像特征 (与斑块长度范围相对应的血管周围脂肪组织的平均 Hu 值)。将特征组合并分别构建了基于影像组学 (Radiomics)、传统影像特征 (CT_value) 和基于影像组学+传统影像特征 (Radiomics + CT_value) 的三种 Logistic 回归模型。最终, 诊断模型的预测能力受试者工作特征 (ROC) 曲线进行了评估。

结果: 在 102 名患者的队列中, 共分析了 208 个冠状动脉段。其中, 72.1% 血管段标记为含有斑块, 而 27.9% 被标记为正常。两组血管段之间位置比例无显著差异。从 851 个潜在特征中, 选择了 12 个关键特征来构建影像组学模型 (Radiomics)。Radiomics 模型测试集上的 AUC 为 0.717 (95%

CI: 0.63–0.81)。此外, Radiomics + CT_value 模型在测试集中的 AUC 为 0.715 (95%CI: 0.62–0.81), 优于传统影像特征模型, AUC 为 0.437 (95%CI: 0.32–0.56)。

结论: 我们的研究表明, 冠脉周围脂肪组织的影像组学特征的模型优于单纯基于传统 CT 值的模型, 可能有助于鉴别正常冠脉与冠脉炎症的状态。

PO-4068

智能快速磁共振 (IQMR) 在颅内血管壁磁共振成像中的应用价值

闫晓辉

扬州大学附属医院

目的 探讨智能快速磁共振 (Intelligent Quick Magnetic Resonance, IQMR) 在提高颅内三维血管壁磁共振成像 (VWI) 图像质量及缩短扫描时间中的应用价值。**方法** 收集 29 名志愿者, 均接受快速低分辨率 (LR-VWI) 和常规高分辨率 (HR-VWI) 颅内 VWI 序列扫描, 应用 IQMR 对 LR-VWI 进行后处理得到 IQMR-VWI。选取峰值信噪比 (Peak Signal-to-Noise Ratio, PSNR) 和结构相似性 (Structural Similarity, SSIM) 两个指标进行客观评价, 这两个指标的结果皆是以 HR-VWI 为参照, 分别对 LR-VWI 及 IQMR-VWI 测量而得出。由两名放射科医师使用李克特 5 分量表 (Likert scale) 在对图像类型 (LR-VWI、IQMR-VWI、HR-VWI) 不知情的情况下对血管腔及管壁的成像质量和图像整体质量进行主观评价。结果 IQMR-VWI 的两个客观评价指标均高于 LR-VWI, 差异有统计学意义 (SSIM: 0.6959 vs 0.6328; PSNR: 26.1648 vs 25.1982; $P < 0.001$)。两名医师对图像主观评价的一致性组内相关系数在 0.766~0.894 之间; IQMR-VWI 及 HR-VWI 的定性评分均优于 LR-VWI, 差异具有统计学意义 ($p < 0.001$), 而 IQMR-VWI 与 HR-VWI 之间的定性评分差异无统计学意义。同时 IQMR-VWI 较常规 HR-VWI 成像时间缩短约 77% (1min55s VS 8min20s)。结论 智能快速磁共振 (IQMR) 可以显著改善快速 LR-VWI 图像质量的同时 2min 之内完成图像采集, 有利于促进颅内血管壁磁共振成像在急性缺血性脑卒中 (AIS) 中的临床应用。

PO-4069

基于 CT 放射组学预测肺囊型包虫病活性的研究

郁耀辉、邢艳

新疆医科大学第一附属医院影像中心省部共建中亚高发病成因与防治国家重点实验室

目的 基于计算机断层扫描 (CT) 的放射组学特征, 建立一个肺囊性包虫病 (CE) 活性的预测模型。**方法** 回顾性纳入 2010 年 1 月至 2020 年 10 月在我院经手术切除、病理证实的肺 CE 患者, 并随机分为训练组和验证组。在放射组学特征提取后, 对特征进行一致性检验 (ICC), 使用 SelectKBest 方法、方差阈值法和最小绝对收缩和选择算子 (LASSO) 的方法来进一步选取最佳特征, 之后采用支持向量机 (SVM)、K 邻近 (KNN) 以及 Logistic 回归 (LR) 3 种分类器来建立模型。采用受试者工作特征 (ROC) 曲线, 即曲线下面积 (AUC)、灵敏度和特异度来评估本研究中分类器建立模型的效能。结果 在纳入 81 例 (有活性 28 例, 无活性 53 例) 患者中, 分为训练组 64 人, 验证组 17 人 (8:2)。CT 放射组学从 1339 个特征中选取了 18 个最优特征, 使用 SVM 分类器建立模型的效能最好, 最均衡, 验证组 AUC、灵敏度以及特异度分别为 0.879、0.830 及 0.820。结论 基于 CT 放射组学特征建立预测模型评价肺 CE 活性, 指导临床制定关于肺 CE 诊疗方案具有重要的意义。

PO-4070

比较基于薄层和厚层 CT 图像的影像组学分析在 II 期结直肠癌预后预测方面的应用价值

李梦蕾

复旦大学附属肿瘤医院

目的：本研究旨在探索及分析比较基于 CT 薄层（1mm）及厚层（5mm）影像图像的影像组学特征在 II 期结直肠癌预后评估中的应用价值。

方法：我们首先收集了 226 例(训练集 158 例，验证集 68 例)经临床病理证实的 II 期结直肠癌患者。我们分别在薄层及厚层图像上进行原发灶的感兴趣区域勾画，然后分别提取薄层及厚层 CT 图像上原发灶的影像组学特征，最后比较薄层及厚层 CT 图像在预测 II 期结直肠癌患者的预后方面的价值。

结果：在训练集中：基于薄层 CT 图像的 OS 预测模型的 AUC: 0.98 \pm 0.01, 95% CI:[0.97, 1.00], ACC: 0.93, Sensitivity: 0.91, Specificity: 0.93, PPV: 0.52, NPV: 0.99, 基于厚层 CT 图像的 OS 预测模型的 AUC: 0.98 \pm 0.01, 95% CI:[0.96, 0.99], ACC: 0.92, Sensitivity: 1.0, Specificity: 0.91, PPV: 0.48, NPV: 1.0; 在验证集中：基于薄层 CT 图像的 OS 预测模型的 AUC: 0.84 \pm 0.06, 95% CI:[0.73, 0.94], ACC: 0.87, Sensitivity: 0.40, Specificity: 0.90, PPV: 0.25, NPV: 0.95, 基于厚层 CT 图像的 OS 预测模型的 AUC: 0.72 \pm 0.14, 95% CI:[0.47, 0.92], ACC: 0.78, Sensitivity: 0.6, Specificity: 0.79, PPV: 0.19, NPV: 0.96。

结论：研究表明 CT 影像组学特征可作为术前预测 II 期结直肠癌预后的新型预测因子，且基于薄层 CT 图像的影像组学特征的预测效能优于厚层 CT 图像，建议首选在薄层 CT 图像上进行影像组学分析，以捕捉更全面的影像学信息来辅助临床诊疗。

PO-4071

基于小样本的 MRI 图像腹部区域脂肪自动分割

周紫玲¹、肖鹏²、熊子曼¹、沈亚琪¹、胡道予¹、李震¹

1. 华中科技大学同济医学院附属同济医院

2. 华中科技大学生命科学与技术学院

炎症性肠病是一种免疫介导的慢性进行性疾病，早期诊断和治疗对于改善患者预后至关重要。炎症性肠病的高度异质性需要多维临床信息对疾病严重程度进行分层，以制订个体化治疗方案。获取多维临床信息的成本高，如何在不增加患者疾病成本的前提下，获取高度一致且准确的定量参数成为临床急需解决的问题。脂肪作为一个高度动态的代谢和内分泌器官，与炎症性肠病的治疗决策和病程管理密切相关，然而目前缺乏自动化测量不同区域脂肪的方法。计算机断层成像（Computed Tomography, CT）和磁共振成像（Magnetic Resonance Imaging, MRI）作为炎症性肠病诊断和随访常规的辅助诊断检查方式，从图像中提取脂肪和肌肉含量定量参数，有望提供炎症性肠病临床诊断评估更多的证据。目前炎症性肠病人群腹部区域脂肪分割受到内脏脂肪强度值和形态特征高度可变、分区脂肪真实标注量不足等限制，导致区域脂肪分布的定量自动化难以实现。本研究围绕炎症性肠病人群区域脂肪定量的必要性和困境，分析炎症性肠病人群脂肪 MRI 图像强度值特点，探索自动分割全流程实现过程中人工真实标注快速准确获取以及图像预处理和后处理优化，研究适用于炎症性肠病人群腹部区域脂肪的自动定量方法，并验证定量参数在炎症性肠病诊疗过程中的作用。

MRI 因无电离辐射的特点和对病变性质的评估能力，在炎症性肠病的疾病管理中具备与 CT 不同的适用场景。MRI 成像原理不同导致序列间和 MRI 与 CT 图像之间脂肪图像强度值先验信息存在差异，相同组织在 MRI 图像上因主磁场不均匀性而存在变化强度值，因而真实标注过程需要更多的人工介入。将 CT 分割模型结合迁移学习，实现少量标注 MRI 图像下的三维腹部区域脂肪高精度分割。通过未参与模型训练的 T2 序列的预测实验结果显示，迁移学习模型具备了识别 MRI 图像肌肉和皮下

脂肪图像强度特征的能力。研究还提出了一种分段扫描合并算法，解决了炎症性肠病人群 MRI 序列分成多个三维分段中重复层面造成的重复标注和体积定量不准确的问题。MRI 共配准序列数据在无需增加标注情况下实现输入数据量的四倍增加，有效提升了腹部区域脂肪三维自动分割的性能。

PO-4072

基于乳腺钼靶的深度学习模型在鉴别乳腺肿块方面的诊断价值评估

李亮、查云飞
武汉大学人民医院

目的：本研究旨在构建并评估一种基于钼靶的乳腺肿块诊断深度学习模型。

材料与方法：本回顾性研究共纳入 210 名于 2016 年 1 月至 2023 年 7 月期间，因怀疑乳腺肿瘤于我院进行乳腺钼靶 X 线检查和经超声引导下穿刺活检的住院患者。所有患者图像被按照 2 比 1 随机分为训练集（140 人，560 张）和验证集（70 人，280 张）。本研究以 ResNet 深度神经网络框架为基础，利用训练集构建了用于鉴别乳腺结节良恶性的诊断模型，并使用验证集数据评估该诊断模型的诊断效能。同时，三个诊断医师分别对验证集结节良恶性进行主观评价。深度学习模型的诊断准确度采用受试者操作曲线（receiver operator characteristic curve, ROC curve）进行评价。不同阅片者主观评价的准确度差异采用多阅片者-多病例（multiple-reader, multiple-case, MRMC）方差分析进行比较。P 值小于 0.05 被认为差异具有统计学意义。

结果：深度模型诊断乳腺癌的 AUC 值、特异度、灵敏度、阴性预测值、阳性预测值、准确度、约登指数分别为 0.94、84.8%、88.6%、91.3%、80.6%、86.4%、73.4%。所有深度学习诊断指标均优于诊断医师肉眼评估（阅片者 1：AUC 值，0.77；特异度，62.7%；灵敏度，83.6%；阴性预测值，84.2%；阳性预测值，61.5%；准确度，71.3%；约登指数，46.3%；阅片者 2：AUC 值，0.81；特异度，64.8%；灵敏度，87.6%；阴性预测值，87.7%；阳性预测值，64.7%；准确度，75.5%；约登指数，52.4%；阅片者 3：AUC 值，0.86；特异度，74.5%；灵敏度，89.2%；阴性预测值，90.7%；阳性预测值，71.3%；准确度，80.6%；约登指数，63.7%）。

结论：本研究构建的基于深度学习网络的算法可以有效提高临床乳腺肿瘤的诊断效能。

PO-4073

利用 CT 放射组学特征进行鉴别肺炎型侵袭性粘液腺癌和肺炎：多中心研究

张帅、王锡明
山东第一医科大学附属省立医院（山东省立医院）

背景：肺炎型侵袭性粘液腺癌（IMA）和肺炎表现出重叠的胸部 CT 特征和重叠的临床特征。

目标：我们研究的目的是开发和验证列线图结合临床和 CT 放射组学特征鉴别肺炎类型 IMA 和肺炎。

方法：这项回顾性研究包括 314 名患者（172 名男性，142 名女性；平均年龄，60.3±14.5[SD]岁）CT 显示实变，诊断为 IMA 型肺炎（n=106）或肺炎（n=208）。来自三家医院的患者组成了一个培训组（n=195）一个验证集（n=50）和来自其他三家医院的患者组成了外部测试集（n=69）。建立了一个预测 IMA 型肺炎的临床模型这些特征是该诊断的重要独立预测因素。通过在固结区域放置 ROI 从 CT 图像中提取放射学特征，并构建了 IMA 型肺炎的放射组学特征。的列线图综合临床特征构建了 IMA 型肺炎的预测模型模型和放射组学特征。两名心胸科放射科医生在外部测试集中独立

重新查看 CT 图像，以诊断 IMA 型肺炎。Diagnostic 比较了模型和放射科医生的表现。决策曲线分析 (DCA)。

结果：临床模型包括发热和癌症家族史。放射组学特征包括 15 个放射组学特点。DCA 从列线图中显示出比从临床模型中更高的总体净效益。在外部测试集中，AUC 为列线图 (0.85) 高于临床模型 (0.71, $p=0.01$)，放射科医生 1 (0.70, $p=0.04$) 和放射科医生 2 (0.67, $p=0.01$)。在外部测试集中，列线图具有敏感性 46.9%，特异性 94.6%，准确率 72.5%。

结论：结合临床变量和基于 CT 的放射组学的列线图特征优于临床模型和两名心胸放射科医生对 IMA 型肺炎和肺炎的鉴别。

PO-4074

基于 CT、定量超声和血液指标的集成机器学习模型 用于定量评估脂肪肝

李春利、周明慧、古成丽、潘晨、石喻
中国医科大学附属盛京医院

目的：分析 CT 和超声与血液指标特征结合对于脂肪肝的诊断价值，并探究将三种特征融合构建的集成机器学习模型是否有助于提高脂肪肝诊断的性能。

方法：本研究回顾性收集了 2015 年 9 月至 2022 年 10 月期间病理报告含有脂肪肝程度的描述且同时接受 CT 检查、超声瞬时弹性成像检查和血液指标检查结果的 604 例患者，然后，按照 7:3 的比例随机将数据划分为训练集 ($n=422$) 和验证集 ($n=182$)。利用 nnUNet 深度学习模型进行 CT 图像的肝脏和脾脏分割，并计算整个肝脏 HU 值、整个脾脏的 HU 值和肝脾 HU 比值。对 CT+血液指标、超声（受控衰减参数 [CAP]）+血液指标、CT+超声+血液进行单变量和多变量逻辑回归分析选择最优的特征子集。利用逻辑回归 (LR)、支持向量机 (SVM) 和随机森林 (RF) 机器学习方法构建模型，然后，使用软投票的集成学习方法将不同机器学习进行组合来预测脂肪肝。最后，使用接受者操作特性曲线下面积 (AUC) 用于评估模型的性能。

结果：基于 CT+血液指标的 LR、SVM 和 RF 在验证集中分别实现了 0.876、0.793 和 0.860 的 AUC 值，然后，将 LR 和 RF 集成产生了更高的 AUC 值 (0.881)。超声+血液指标的 LR、SVM 和 RF 在验证集中 AUC 值分别为 0.866、0.8625 和 0.850 的 AUC 值，随后，将 LR、RF 和 SVM 集成获得了略高于单一模型的 AUC 值 (0.878)。利用 CT+超声+血液指标构建的 LR、SVM 和 RF 模型比 CT+血液指标和超声+血液指标的模型实现了更高的 AUC 值 (0.901、0.867、0.899)，然后，将 LR 和 RF 集成同样产生了更高的 AUC 值 (0.914)。

结论：CT 和超声与血液指标结合的机器学习模型在脂肪肝评估中具有相似的诊断性能，将三种特征融合可实现更好的诊断性能；将不同机器学习组合构建的集成模型相比于单一模型可获得更好的诊断效果。

PO-4075

基于平扫 CT 的影像组学预测肝相关事件发生

李春利、石喻
中国医科大学附属盛京医院

目的：探究基于平扫 CT 的肝段和肝脏影像组学特征与脾脏影像组学特征及临床特征相结合是否能预测肝相关事件（肝硬化及其并发症、肝衰竭和肝癌）发生。

方法：本研究回顾性收集了 2009 年 7 月至 2022 年 3 月期间病理和 CT 影像报告证明未发生肝相关事件且具有随访结果的 340 例患者，然后，按照 7:3 的比例随机将数据划分为训练集 ($n=238$) 和验证集 ($n=102$)。利用 nnUNet 深度学习模型进行 CT 图像的肝、肝段和脾脏分割，并提取 95 个影像组学特征（体积、一阶特征和纹理特征）。通过单变量和多变量 Cox 回归对肝脏、肝段及脾脏特征进行特征选择，然后，分别构建肝脏、肝段和脾脏的预后评分，随后，将三个预后评分、年龄和性别相结合构建融合模型。使用 C-index 和 KM 曲线评估四个模型对于肝相关事件的预后价值。结果：肝脏、肝段和脾脏模型在验证集的 C-index 分别为 0.677、0.787 和 0.660，融合模型产生更高的 AUC 值 (0.818)。KM 曲线证明肝段和融合模型高风险预后评分在验证集中发生肝相关事件高于低风险评分组且具有统计学意义 ($P<0.05$)，而肝脏和脾脏在验证集中没有统计学意义。结论：基于平扫 CT 的影像组学可用于预测肝相关事件，将肝段、脾脏及临床特征融合具有更好的预后价值。

PO-4076

基于 MRI 图像质量量化评估的乳腺腺体渐进式成长学习分割策略

赵致禾^{1,2}、石镇维^{1,2}、刘再毅^{1,2}、梁长虹^{1,2}

1. 广东省人民医院

2. 广东省医学影像智能分析与应用重点实验室

目的：腺体分割是乳腺背景实质强化 (BPE) 相关预测研究中的一个重要步骤，通过对乳腺动态对比增强磁共振图像 (DCE-MRI) 多时序图像中的乳腺腺体的精确分割，可以进一步对腺体部分像素强度进行有效的定量分析，本文提出了一种渐进式成长学习乳腺腺体分割策略。

方法：本策略所用数据集来自 7 个临床中心数据队列（训练集：1，验证集：6），通过图像对比度 (CPP)、峰值信噪比 (PSNR) 量化图像强度值、噪声，并基于腺体不规则程度设计了一种反映其形态复杂程度的评估因子层级分形维数 (HFD)，上述三种评估因子构成新的数据属性评估指标 (DPA)。乳腺腺体渐进式成长学习分割策略以课程学习与半监督学习为核心思想分为两阶段，进行多轮迭代训练。初始训练集使用模糊 C 均值聚类 (Fuzzy C-Means, FCM) 腺体分割结果构成，然后进行使用深度学习 (U-Net、ResUNet、SwinUNETR) 的多轮次学习。第一阶段，由专业放射科医生为模型分割提供域知识 (Domain Knowledge, DK) 指导，并结合数据属性评估模块 (Dynamic DPA, DDPA) 构建适合的训练数据集以辅助模型性能快速成长。第二阶段，当模型已具备一定的学习能力时，采取半监督学习方法训练模型直至迭代结束。医生对模型分割结果进行评估，将数据分为金标准组、通过组以及落选组，金标准组进入迭代训练集，通过组根据 DDPA 模块进行评估，一部分进入迭代训练集，其余与落选组并入测试集。

结果：在三种基线模型上，本文提出学习策略与全监督学习策略在 6 个测试集上通过平均 Dice (0.8805 ± 3.59 , 88.30 ± 3.39 , %)、IOU (0.8062 ± 4.50 , 80.26 ± 4.79 , %)、HD95 (6.415 ± 3.31 , 6.590 ± 3.22 , mm) 三个指标对乳腺腺体分割结果进行比较。

结论：对于乳腺腺体分割任务，本文策略在完全无需金标准标注的情况下与全监督方法效果接近，通过 DK 模块和 DDPA 模块消融实验证明了基于域知识的数据挑选与随机选取数据相比数据的有效提升，可以更好地指导深度学习网络对腺体区域的一般特征到复杂特征的渐进学习。

PO-4077

动物颈椎和基于 CT 模型之间在 3D 打印中的几何和体积关系

马超伟、吴志斌
空军军医大学西京医院

目的: 三维 (3D) 打印过程的关键是了解实际结构或器官如何与其相应的医学图像在维度上相关。这项研究将检查动物颈椎、这些骨骼的 3D 扫描、基于计算机断层扫描 (CT) 扫描的 3D 模型以及 3D 打印模型之间的差异。

材料和方法: 对七块动物颈椎进行 CT 扫描。骨头被清理并进行了 3D 扫描。3D 网格模型是根据 CT 数据创建的, 然后进行 3D 打印。分析了四种模型: 解剖骨骼、3D 扫描模型、CT 模型和 3D 打印模型。对所有模型类型进行了手动测量, 并对 3D 扫描模型与 CT 模型进行了分割指标比较。

结果: 在比较所有模型类型的每个参数时, 除椎骨宽度外, 手动测量之间没有统计学差异 ($p = 0.054$)。比较所有模型类型之间所有测量值的平均值时, 不存在统计差异 ($p = 0.247$)。将 3D 扫描模型与 CT 模型进行比较时, 平均 Hausdorff 距离为 0.99 毫米 (SD 0.55 毫米)。将 3D 扫描模型与 CT 模型进行比较时, 平均 Dice 系数为 0.93 (SD 0.07)。3D 扫描模型和 CT 模型的平均体积分别为 17.3 ml 和 16.6 ml ($p < 0.001$)。

结论: 本研究阐明了动物颈椎与基于 CT 的椎体模型之间的几何和体积关系。分割指标显示检查的骨骼 (使用 3D 扫描骨骼作为替代) 与 CT 测量值之间存在 1 毫米的差异。较大的基于 CT 的模型和较小的骨骼之间 1.3 毫升的体积差异证实了这一点。

PO-4078

**利用影像组学区分 PCNSL 的 GCB 亚型和非 GCB 亚型:
一项多中心研究**

吴思雨、王锡明
山东第一医科大学附属省立医院

目的: 探讨 PCNSL (原发性中枢神经系统淋巴瘤) 中生发中心 B 细胞亚型 (GCB) 和非生发中心 B 细胞亚型 (非 GCB) MRI 的特征和病理基础。并探讨基于 MRI 影像组学对 PCNSL 的 GCB 亚型和非 GCB 亚型的预测能力。

方法: 本研究回顾性分析了 24 例免疫功能良好的 GCB 型患者 (9 名男性, 年龄 56.4 ± 15.1 岁) 和 56 例免疫功能良好的非 GCB 型患者 (35 名男性; 年龄 61.1 ± 9.3 岁) 的标准诊断性 MRI 检查。分别从 ADC、DWI 和 T1-CE 图像中提取影像组学特征, 采用机器学习算法和统计方法进行筛选。最后, 构建了 7 种不同序列排列的影像组学模型。采用受试者工作特征下面积曲线来评价所有模型的预测性能。采用 Delong 检验来比较模型之间的差异。

结果: GCB 亚型均表现为扩散受限, 非 GCB 亚型占 80.36%; $p < 0.05$ 。3 级水肿在 GCB 亚型中罕见 (8.33%), 在非 GCB 亚型中常见 (50.00%); $p < 0.001$ 。62.50% 的男性患者为非 GCB 亚型, 37.50% 的女性患者为非 GCB 亚型; $p < 0.05$ 。此外, GCB 亚型患者比非 GCB 亚型患者更年轻; $p < 0.05$ 。在本研究中, 最佳预测模型是基于 ADC、DWI 和 T1-CE 的组合模型, 其 AUC 最高, 为 0.854。最佳预测模型与其他一些模型之间存在显著差异。

结论: GCB 亚型常见于女性, 大多数病例表现为轻度瘤周水肿, 所有病例均为弥散受限; 然而, 非 GCB 亚型常见于男性, 在大多数病例中伴有严重的瘤周水肿。此外, 基于 ADC、DWI 和 T1-CE 序列开发的影像组学模型在区分 GCB 亚型和非 GCB 亚型方面具有良好的性能。

PO-4079

基于 3D MRI 影像组学模型鉴别 IA 期宫颈癌与高级别鳞状上皮内瘤变的价值研究

邹文涛^{1,3}、马宣传¹、陈艾琪¹、赵以惠^{1,3}、杜小萌^{1,3}、朱晓云^{2,3}、钱宝鑫⁴

1. 蚌埠医学院第一附属医院

2. 蚌埠医学院第二附属医院

3. 蚌埠医学院医学影像学院

4. 慧影医疗科技(北京)股份有限公司

目的 探讨基于 3D 磁共振 T2WI 及动态对比增强 DCE 序列影像组学模型在鉴别 IA 期宫颈癌与高级别鳞状上皮内瘤变(HSIL)中的价值。方法 回顾性分析经手术病理证实的 IA 期宫颈癌患者 52 例与 HSIL 患者 35 例,收集患者的临床资料及影像资料,利用汇医慧影平台将患者按 10:3 随机分成训练集和测试集,在矢状位 T2WI 和 DCE 上由三名放射科医生手动勾画宫颈,获得宫颈三维容积感兴趣区(VOI),提取影像组学特征。并进行数据降维。采用 KNN 算法建立模型并绘制受试者工作特性曲线(ROC 曲线),对训练集和测试集 ROC 曲线下的总面积(AUC)、敏感度、特异度、准确率 4 个指标展开分析。结果 T2WI 模型、DCE 模型以及 T2WI 联合 DCE 模型最终提取出的影像组学特征分别为 23、11、28,训练集及测试集的 AUC 值分别为 0.833、0.797, 0.877、0.870, 0.897, 0.813。结论 T2WI 联合 DCE 图像影像组学模型比单一模型更具有临床价值,有助于评估病情,并针对病情所处阶段制定个体化治疗方案。

PO-4080

基于磁共振生境分析预测宫颈癌同步放化疗疗效的临床研究

赵鹏飞、臧伟、孙洪赞

中国医科大学附属盛京医院

目的: 构建基于增强磁共振扫描 (Contrast Enhanced-MR, CE-MR) 的生境分析 (Habitat Analysis) 以量化评价肿瘤内异质性为目的, 对局部晚期宫颈癌患者进行临床相关性研究, 预测接受同步放化疗治疗 (Concurrent Chemoradiotherapy, CCRT) 的局部晚期宫颈癌 (Locally Advanced Cervical Cancer, LACC) 患者的早期疗效。方法: 本回顾性研究最终纳入 2013 年 5 月至 2021 年 3 月期间共 61 例接受根治性同步放化疗的局部晚期宫颈鳞癌患者, 随机分成训练集 (n=30) 及验证集 (n=31)。所有纳入的患者在治疗前 2 周内进行了 CE-MR 检查, 并获得了平扫的 T1、T2 加权成像及对比增强的 T1 加权成像 (包括动脉增强早期及动脉增强晚期)。根据 RECIST 标准评估早期疗效 (CR、PR 定义为早期疗效反应组; SD、PD 定义为早期疗效无反应组)。在 MR-T2 加权图像对原发肿瘤的 ROI/VOI 进行了半自动的手工分割。采用 K 均值聚类算法 (K-Means Clustering algorithm) 对 ROI/VOI 进行由 T2 模态及 delta-CE-1 两个模态建立的体素值 (voxel) 矩阵进行聚类, 即进行生境 (habitat) 亚区划分。再通过主成分分析 (Principal Component Analysis, PCA) 进行影像组学特征特征降维, 并获得生境分析评分 (Habitat score)。结果: 应用 t 检验、Mann-Whitney U 检验及卡方检验结果显示训练集和验证集随机抽取的患者的临床病理特征在两数据集间分布均衡 ($P>0.05$)。生境分析模型中, 确定了最佳聚类簇数 $K=3$, 即划分成 3 个生境亚区。生境分析在训练集 (AUC=0.944, $P=0.026$) 和验证集 (AUC=0.897, $P=0.046$) 的表现优于及不劣于传统影像组学。结论: 基于 CE-MR 的生境分析可以预测局部晚期子宫颈癌同步放化疗的早期疗效, 生境分析可以为 LACC 肿瘤内异质性提供一种新的评估的方法, 有望成为新的影像生物标记物。

PO-4081

铜死亡关键核心基因 FDX1 的泛癌预后价值评估与跨疾病、跨模态的影像组学模型的构建

岳秋圆¹、李跃明²、叶榕平²、张明炜²

1. 福建省肿瘤医院

2. 福建医科大学附属第一医院

本研究通过全面的泛癌分析,深入探索了铜死亡的关键调控因子(FDX1),并提出了基于四种不同的恶性肿瘤类型和两种不同的影像组学模式下进行 FDX1 预测的无创性模型。在这项研究中,我们不仅使用了来自 TCGA 和 CGGA 的转录组学数据,还利用了福建医科大学附属第一医院的肝细胞癌(HCC)MRI 队列以及 TCIA 和 REMBRANDT 数据库中的 CT 或 MRI 图像来预测 FDX1 的表达情况。研究结果表明,在涵盖 33 种不同癌症类型的 1654 例病例中,FDX1 被发现具有预测患者预后的价值。单细胞分析结果显示,FDX1 在多种细胞类型中表达,尤其在增殖性 T 细胞中表达较高。我们建立了六个队列,包括四种不同恶性肿瘤类型和两种主要影像学模式,用于构建 FDX1 的影像组学预测模型。基于 CT 图像的 FDX1 预测模型的 AUC 范围为 0.748-0.825,而基于 MRI 图像的 AUC 范围为 0.717-0.763。影像组学评分与铜死亡相关基因(如 DLD、DLAT 和 ATP7A)以及免疫抑制基因(如 VTCN1、KDR、TIGIT、PDCD1、LGALS9、LAG3、IDO1 和 CTLA4)之间存在相关性。综上所述,我们通过影像组学方法成功实现了 FDX1 在不同类型的恶性肿瘤和两种主要影像学模式下的非侵入性预测,同时证实上述模型与诸多免疫检查点分子表达存在显著关联。

PO-4082

人工智能在肋骨骨折 CT 诊断的应用研究

敖平、张玉霖、朱丽

成都市龙泉驿区第一人民医院(四川大学华西医院龙泉医院)

目的 探讨人工智能(Artificial intelligence, AI)技术在辅助肋骨骨折 CT 诊断的应用价值,评估其临床应用可行性。**方法** 回顾性搜集 121 例因胸部外伤致肋骨骨折行 CT 检查患者的影像资料,分析比较医师组(A 组)、AI 组(B 组)、AI 辅助医师组(C 组)对不同类型骨折(错位骨折、无错位骨折)的诊断敏感度、漏诊率、误诊率,以及 A 组与 C 组诊断时间的差异。**结果** 根据骨折参考标准,121 例患者存在肋骨骨折共 695 处。其中错位骨折 506 处,医师组(A 组)检出 493 处,漏诊 13 处,无误诊,诊断正确 493 处。AI 组(B 组)检出 507 处,漏诊 7 处,误诊 8 处,诊断正确 499 处。AI 辅助医师组(C 组)检出 500 处,漏诊 6 处,无误诊,诊断正确 500 处。无错位骨折 189 处,医师组(A 组)检出 167 处,漏诊 24 处,误诊 2 处,诊断正确 165 处。AI 组(B 组)检出 193 处,漏诊 11 处,误诊 15 处,诊断正确 178 处。AI 辅助医师组(C 组)检出 182 处,误诊 2 处,漏诊 9 处,诊断正确 180 处。对两种骨折诊断敏感度均为 C 组>B 组>A 组,漏诊率均为 A 组>B 组>C 组。错位骨折方面,三组间两两比较差异均无统计学意义($P>0.05$);无错位骨折方面,A 组与 B、C 组比较差异有统计学意义($P<0.05$),B 组与 C 组间比较差异无统计学意义($P>0.05$)。误诊率方面,因 A 组和 C 组对错位骨折误诊为 0, P 值无法计算;无错位骨折的误诊率为 B 组>C>A 组,B 组与 A、C 组比较差异有统计学意义($P<0.05$),A 组与 C 组比较差异无统计学意义($P>0.05$)。在诊断用时方面,A 组(医师组)平均诊断时间(214.45 ± 41.21)s, C 组(AI 辅助医师组)平均诊断时间(146.96 ± 29.78)s, C 组诊断时间较 A 组明显缩短,差异有统计学意义($P<0.05$)。**结论** 人工智能可快速有效识别肋骨骨折,放射科医师结合 AI 可有效提高骨折检出率,尤其是提高无错位骨折的检出率,同时降低假阳性率,提高诊断效能,缩短诊断用时,提高工作效率。AI 辅助肋骨骨折诊断具有较高的应用价值,值得推广应用。

PO-4083

基于 CS-AI 技术的 3D PDWI 序列在 MRI 单髁关节薄层高分辨成像中的临床应用价值

张道恩^{1,2}、徐旭¹、夏春潮¹、李真林¹

1. 四川大学华西医院

2. 遵义医科大学第二附属医院

目的 在 3D 质子密度加权成像(proton weighted imaging, PDWI)单髁关节薄层高分辨成像中, 比较基于人工智能的压缩感知技术(Compressed SENSE AI, CS-AI)在不同加速因子(acceleration factor, AF)下的图像质量, 评估 CS-AI 的临床价值并探讨其潜在的最佳加速因子。方法 使用 Philips 3.0 T MRI 成像仪前瞻性纳入 49 例健康志愿者, 分别行 AF 为 4、6、8、10 的 CS-AI 3D PDWI 单髁关节高分辨率扫描并记录扫描时间, 按照上述 AF 分为 A、B、C、D 组。由两名医生分别对四组图像的总伪影(三分法)和股骨头、大小转子、肌肉、软骨图像质量(五分法)进行主观评分。由另一名医生测量同层面内股骨头、股外侧肌及临近皮下脂肪的信号强度(signal intensity, SI)及噪声(standard deviation, SD), 分别计算图像信噪比(signal noise ratio, SNR)、对比噪声比(contrast noise ratio, CNR), 并进行统计学分析。结果 两名观测者对四组图像的主观评分的一致性良好(Kappa 均>0.75)。主观评价中, AF=10 时的伪影较大($p<0.05$), 其余组别间评分差异无统计学意义。不同 AF 组中对股骨头、转子的显示差异无统计学意义, 软骨在 AF=10 时显示最差, 其余组别间显示无统计学差异。AF=6、8、10 组的股外侧肌及临近皮下脂肪 SNR 及 SD 均低于 AF=4 组($p<0.05$), 且三组间差异无统计学意义。除 AF=8 外, AF=6、10 时骨的 SNR 低于 AF=4 组($p<0.05$), 且 AF=6、8、10 三组间有上升趋势; SD 值高于 AF=4 组($p<0.05$), 且 AF=6、8、10 三组间有下降趋势。AF=8 时, 扫描时间较 AF=4 时缩短了 50.14%, 较 AF=6 时缩短 25.64%。结论 基于 CS-AI 技术的 3D PDWI 序列可获得满足临床诊断要求的单髁关节高分辨率图像。此外, AF=8 时可在保证图像质量的同时最大程度缩短扫描时间, 是其最佳加速因子。

PO-4084

人工智能在颈动脉 CTA 中辅助诊断颈动脉狭窄的应用研究

蒋贝、吴小青、杜昕雨、刘小玉、丁义、唐瑞瑶、黄增发、谢元亮、王翔

华中科技大学同济医学院附属武汉市中心医院

目的 分析颈动脉 CTA 检查中人工智能(AI)辅助诊断颈动脉狭窄的诊断效能, 与放射科医师诊断对比, 探讨其应用价值。方法 回顾性连续收集 100 例 2018-05-10 至 2018-05-31 在武汉市中心医院行颈动脉 CTA 检查患者病例资料, 分别由 AI 及两名放射科医师独立分析纳入患者 CTA 原始数据, 对原始数据进行后处理并输出诊断结果。狭窄程度的分级为无狭窄(0%)、轻度狭窄(<50%)、中度狭窄(50%-69%)、重度狭窄(70%-99%)、完全闭塞(100%), 依据狭窄程度确定不同诊断临界值, 通过与金标准即高年资医师诊断结果对比, 计算 AI 及两名医师在不同临界值诊断颈动脉狭窄的灵敏度、特异度及 ROC 曲线下面积(AUC)。结果 0%为诊断临界值时, AI 对颈总动脉(CCA)、颈外动脉(ECA)、颈内动脉(CIA)整体及 C1、C4 段、椎动脉(V)整体及 V4 段、基底动脉(BA) AUC 为 0.765、0.648 (L、R-CCA)、0.63、0.655 (L、R-ECA)、0.855、0.878 (L、R-CIA)、0.836、0.767 (L、R-C1)、0.843、0.77 (L、R-C4)、0.804、0.641 (L、R-V)、0.865、0.784 (L、R-V4)、0.667 (BA); 狭窄程度 50%为诊断临界值时, AI 对 ECA、CIA 整体及 C1、C5 段、V 整体及 V1、V4 段、BA 的 AUC 为 0.646、0.984 (L、R-ECA)、0.737、0.71 (L、R-CIA)、0.785、0.593 (L、R-C1)、0.614、0.724 (L、R-C5)、0.844、0.647 (L、R-V)、0.968、0.582 (L、R-V1)、0.693、0.63 (L、R-V4)、0.75 (BA); 狭窄程度 70%为诊断临界值时, AI 对 V 整体及 V4 段、BA 的 AUC 为 0.61、0.593 (L、R-V)、

0.52、0.784 (L、R-V4)、0.75 (BA)。结论 AI 辅助颈动脉 CTA 在诊断颈动脉轻中度狭窄时,大部分颈动脉诊断结果与高年资医师一致性较高;在诊断颈动脉重度狭窄时,椎-基底动脉诊断结果与高年资医师一致性较高。

PO-4085

冠心病伴认知障碍患者大脑功能中枢的改变和因果联系

秦锐、王锡明

山东第一医科大学附属省立医院

冠状动脉疾病(CAD)和认知障碍(CI)已经成为重大的全球性疾病和医疗负担。有研究报导了冠心病患者局部脑功能的改变及其与 CI 的相关性。然而,关于冠心病患者大脑网络连接性变化的研究有限。为了研究静息状态连接性,并进一步了解冠心病患者的有效连接强度和方向性,我们利用程度中心性(DC)和频谱动态因果模型(spDCM)来检测全脑网络中的功能中枢,然后分析方向性连接。使用上述方法,可以揭示 CAD 患者大脑功能改变背后的中枢区域和异常连接,为冠心病患者的认知下降提供神经影像学证据。这项研究是前瞻性进行的,涉及 24 名诊断为冠心病的患者和 24 名健康对照,他们在年龄、性别和教育方面相匹配。功能磁共振成像(fMRI)扫描被用来研究这些人的大脑活动。对所有参与者进行神经心理学检查。DC 分析和 spDCM 用于研究冠心病患者的异常脑网络。通过评估认知功能,我们发现 CAD 患者的认知功能明显低于 HC 组。通过使用 DC 分析和 spDCM,我们观察到 CAD 患者的左侧旁海马皮质(PHC)和左侧颞叶中央回(MTG)的 DC 值显著降低。在有效连接方面,我们观察到 CAD 患者右侧额叶上回(SFG)与 PHC 之间缺乏正连接。此外,从 PHC 和 MTG 到 SFG 的负连接增加,同时 PHC 和 MTG 之间的正连接强度减弱。此外,我们在 CAD 患者中发现 PHC 和 MTG 之间连接强度与认知功能之间存在显著正相关($r = 0.491$, $p = 0.015$)。

这些研究结果表明,在冠心病患者中,涉及额上回、海马旁回和颞中回的脑网络连接的改变可能介导了认知功能的变化。

PO-4086

基于 MR 联合超声的多模态影像组学在 乳腺良恶性疾病中的诊断价值

柏冬、周南、王嘉俊、梁蕾、王志群

航天中心医院

目的:我们旨在构建并验证基于 MR 联合超声的多模态影像组学方法评估乳腺良恶性疾病。

材料与方法:回顾性分析我院 208 例乳腺患者的临床影像资料,根据术后病理结果,将患者分为两组,良性组 104 例,恶性组 104 例。所有患者均行超声和 3.0T 多参数 MR 扫描。然后,基于超声及 MR 增强序列逐层画感兴趣区,提取影像组学特征。通过最小绝对收缩和选择算子(LASSO)选择最佳放射组学特征。利用融合数据建立了超声、核磁、超声联合核磁三种类型通过 k-近邻(KNN)、支持向量机(SVM)、逻辑回归(LR)、随机森林(RF)四种机器学习分类器分别对模型(超声、核磁及其组合)进行分类。采用受试者工作特征(ROC)曲线、曲线下面积(AUC)、敏感性、特异性、精确度等指标评价模型,对不同模型诊断乳腺患者良恶性病变的有效性。采用 Delong 检验比较模型间的 ROC。

结果:从每个感兴趣区中提取 3105 个放射组学特征,特征选择后,分别使用基于超声图像数据、核磁图像数据、超声联合核磁融合数据的特征分别构建乳腺良恶性病变评估模型。超声联合核磁图像

融合模型(AUC=0.925)优于纯超声模型($p<0.001$)和纯核磁模型($p<0.001$)。基于支持向量机(SVM)分类器的临床图像融合模型诊断效果最好, AUC= 0.912, 灵敏度=0.944, 特异性=0.701。
结论:与传统的单纯超声或者核磁诊断乳腺疾病相比, MR 联合超声的多模态影像组学模型能够更精确预测乳腺疾病的良恶性, 从而为临床诊治提供更好的依据。

PO-4087

基于 MRI 图像的影像组学分析用于预测局部进展期直肠癌患者对新辅助化疗的治疗反应和预后：一项多中心研究

胡婷丹¹、龚敬¹、孙铁群¹、李梦蕾¹、蔡崇鹏¹、孙应实²、崔艳芬³、张晓燕²、童彤¹

1. 复旦大学附属肿瘤医院

2. 北京肿瘤医院

3. 山西省肿瘤医院

目的: 研究临床及 MRI 特征的模型和基于 MRI 的影像组学模型对局部进展期直肠癌 (LARC) 患者新辅助放化疗后良好反应 (GR) 和预后的预测能力。

方法: 从 3 家医院回顾性地招募了总共 921 名 LARC 患者, 包括训练集 (n=508)、外部验证集 1 (n=242) 和外部验证集 2 (n=171)。从 T2WI 和 ADC 图像中提取了影像组学特征, 并使用三种机器学习方法, 包括逻辑回归 (LR)、随机森林 (RF) 和支持向量机 (SVM), 来构建预测 GR 的影像组学模型。临床-MRI 模型通过单因素及多因素逻辑回归分析构建。使用曲线下面积 (AUC) 和决策曲线分析 (DCA) 评估了预测性能。使用 Kaplan-Meier 曲线来评估最佳模型所预测的不同治疗反应组无病生存期 (DFS) 是否有统计学差异。

结果: 用于 GR 预测的临床-MRI 特征模型包括 2 个特征, 影像组学模型包括 10 个影像组学特征。与其他机器学习的模型和临床-MRI 模型相比, 用 SVM 机器学习方法得到的模型对 GR 的预测效能最高, 在训练和两个外部验证数据集中, AUC 分别为 0.798 (95% CI, 0.758-0.837)、0.790 (95% CI, 0.725-0.856) 和 0.743 (95% CI, 0.666-0.821)。决策曲线分析证实, 影像组学模型具有临床实用性。此外, Kaplan-Meier 曲线显示, 由 SVM 模型定义的高概率 GR 患者的 DFS 比低概率患者要好。

结论: 与临床-MRI 模型相比, 基于 MRI 图像的影像组学模型在 LARC 患者的 nCRT 反应预测方面表现出良好的性能, 也可以为预后预测提供价值。

PO-4088

深度学习肝胆期合成图像在肝纤维化分期诊断中的价值探讨

施楠楠¹、郑忍成²、宋凤祥¹、单飞¹、王鹤²、施裕新¹

1. 上海市公共卫生临床中心

2. 复旦大学

目的: 通过深度学习合成肝胆期图像, 并评估图像质量及合成肝胆期图像影像组学模型在肝纤维化分期诊断中的价值。

方法: 回顾性收集上海公共卫生临床中心行腹部 Gd-EOB-DTPA 增强 MRI 检查的患者。所有患者在 MRI 扫描前后 3 个月内经病理证实肝纤维化。根据 Scheuer 病理分期标准, 将患者分为显著性肝纤维化 ($\geq S2$ 期), 进展期肝纤维化 ($\geq S3$ 期) 和肝硬化 ($S4$ 期)。其中 236 例 (飞利浦 Ingenia 3.0T) 患者按 7: 3 分为训练集和内部验证集, 用于开发和验证深度学习模型, 175 例 (西门子 Skyra 3.0T) 患者用于模型微调和外部验证。使用 nnU-Net 进行全肝自动分割。通过对抗神经网络深度学习模型合成肝胆期图像, 并使用结构相似性 (structural similarity index, SSIM) 及峰

值信噪比 (peak signal-to-noise ratio, PSNR) 评价图像质量。通过影像组学的方法分别建立显著肝纤维化、进展期肝纤维化及肝硬化模型。模型的效能评估采用 ROC, 计算 AUC、敏感性及特异性。模型之间的诊断效能比较采用 Delong 检验。

结果: 内外部验证集中, 合成肝胆期图像 SSIM 为 25.532 ± 5.465 、 24.908 ± 5.495 , PSNR 为 0.860 ± 0.086 、 0.824 ± 0.098 。在内、外部验证集中: 合成肝胆期图像构建的影像组学模型诊断显著肝纤维化的 AUC 分别为 0.855、0.850, 真实肝胆期影像组学模型的 AUC 分别为 0.828、0.873; 合成肝胆期影像组学模型诊断进展期肝纤维化的 AUC 分别为 0.887、0.816, 真实肝胆期影像组学模型的 AUC 分别为 0.878、0.849; 合成肝胆期影像组学模型诊断肝硬化的 AUC 分别为 0.897、0.860, 真实肝胆期影像组学模型的 AUC 分别为 0.902、0.917。合成肝胆期图像构建的肝纤维化分期诊断影像组学模型, 均与真实肝胆期影像组学模型效能相当, 两者无统计学差异。

结论:

基于对抗生成网络的深度学习模型实现了肝胆期图像的合成。合成肝胆期图像构建的影像组学模型在肝纤维化分期诊断中的效能与真实肝胆期影像组学模型相当。

PO-4089

基于压力图像的 CT 扫描范围坐标系重构方法研究

姚文君^{1,2,3}、余承璋²、姚志明²、孙怡宁²

1. 安徽医科大学第二附属医院

2. 中国科学院合肥物质研究院智能机械化所

3. 安徽医科大学医学影像研究中心

目的: 本研究提出一种通过人体仰卧位压力图像来映射 CT 扫描定位图像, 研发基于深度卷积神经网络的 CT 扫描范围自动识别预测模型。

方法: 共收集 420 例数据集 (按照 8:2 的比例划分为训练集和测试集)。首先, 每一例患者均取仰卧位, 于前期制备的柔性力敏传感床垫上进行一次常规 CT 扫描, 分别获取 CT 定位图像及压力图像; 其次, 由影像诊断医师于定位图像上手动标注 6 条定位线, 肺上界 (SP1)、肺下界 (SP2)、膈肌上缘 (SP3)、骨盆上缘 (SP4/5)、骨盆下缘 (SP6), 根据坐标系融合将 6 条定位线映射到压力图像上; 最后, 利用 ResNet 网络在压力图像上对定位线进行位置的预测, 总共分为 480 (80×6) 个类别 (“80”表示各定位线距原点的标准距离大小, 而“6”则代表 SP1 至 SP6 这六条定位线)。

结果: 本研究通过对预测位置与手动标注位置距离差进行分析, 定义了正样例点 (预测位置与标注位置的正距离差 $\leq 1\text{cm}$) 和负样例点 (预测位置与标注位置的正距离差 $> 1\text{cm}$)。对于 SP1、SP3 和 SP5, 正距离差表现为预测位置位于标注位置的头侧; 对于 SP2、SP4 和 SP6, 正距离差则表现为预测位置位于标注位置足侧。通过 ResNet 网络分类后, 6 条定位线的预测结果平均精度达 87.04%。

结论: 基于深度卷积神经网络, 可以在人体仰卧位压力图像的基础上预测 CT 扫描范围, 具有较高的准确性, 为自动扫描系统的研发提供有力基础。

PO-4090

基于 CT 影像组学对不确定肺结节进行侵袭性预测和亚型分类付子杰¹、林艳²

1. 东莞市人民医院

2. 汕头大学医学院第二附属医院

背景 肺腺癌是高度异质性疾病之一，具有不同的亚型、预后和治疗方式。本研究旨在鉴别不确定肺结节（IPN）的侵袭性，并根据 CT 放射线组学进一步区分侵袭性腺癌（IAC）亚型。

方法 根据病理特征将所有患者分为非 IAC 组（非典型腺瘤性增生（AAH）/原位腺癌（AIS）/微侵袭性腺癌（MIA））和 IAC 组。IAC 组又分为以鳞癌为主的肺腺癌（LPA）组和以尖锐湿疣为主的腺癌（APA）组。多变量逻辑回归分别构建了 IPNs 侵袭性预测模型和 IAC 亚型分类模型。应用接收者操作特征曲线（ROC）来比较模型的诊断性能。最后，建立了区分 LUNG-RADS 4X 结节侵袭性的提名图。

结果 由 Rad-score、重量、分叶和新月征组成的 IPN 侵袭性预测模型在训练集（AUC 0.96）与验证集（AUC 0.90）和外部测试集（AUC 0.87）相比表现最佳，在此基础上建立了评估 LUNG-RADS 4X 类结节侵袭性的直观提名图。该提名图识别 LUNG-RADS 4X 类结节侵袭性的准确率为 0.83。此外，在训练集（AUC 0.85）和验证集（AUC 0.72）中，IAC 亚型模型显示了 LPA 和 APA 之间良好的区分度。

结论 基于 CT 放射线组学的侵袭性预测提名图可以筛查 LUNG-RADS 4X 结节的侵袭性。此外，IAC 亚型分类模型在区分 LPA 和 APA 方面表现良好。

PO-4091

利用 CT 图像特征预测神经母细胞瘤 MKI 指数的三级放射组学模型

陈欣、王浩入、何玲

重庆医科大学附属儿童医院

目的:有丝分裂核裂指数(MKI)是决定神经母细胞瘤病理异质性的指标。我们的研究旨在建立一种放射组学模型，利用从 CT 图像中提取的肿瘤内特征来预测神经母细胞瘤的 MKI。

方法:我们对 246 例经组织学证实的神经母细胞瘤患者进行回顾性研究。根据患者的 MKI 状态将患者分为低、中、高三组。它们被随机分为训练集和测试集，比例为 8:2。在非增强、动脉和静脉 CT 图像上，在肿瘤内划定感兴趣区域(roi)，并提取放射组学特征。在对放射组学特征降维后，采用随机森林算法建立三分类模型，预测训练集中的 MKI。该模型随后在测试集中进行了验证。

结果:肿瘤内放射组学模型分别包含 15 个和 14 个放射组学特征。肿瘤内放射组学模型的平均曲线下面积(AUC)在训练集为 0.861，在测试集为 0.847。无论是训练集还是测试集，肿瘤放射组学模型的诊断效能均存在显著差异，P 值均小于 0.05。

结论:肿瘤特征与 MKI 相关，放射组学模型 AUC 值表明有较好的诊断性能。

PO-4092

肺结节低剂量 CT 对 AI 检测效能及影像组学特征的影响： 体模研究

王旭
浙江医院
大连医科大学附属第一医院

目的：探讨低剂量 CT 及不同低剂量扫描方案对肺结节 AI 检测效能和 CT 影像组学特征的影响。**方法：**于仿真胸部体模中随机放置 4 种大小（直径 5mm、8mm、10mm、12mm）、2 种密度（+100HU、-630HU）的人工球形结节。应用 uCT760 对体模进行常规剂量和低剂量扫描，常规扫描组 A 组：120kVp+100mAs；低剂量扫描组 B 组（B1 组：120kVp+25mAs，B2 组：100kVp+45mAs）。各组均采用骨滤波（B_SHARP_C），重建层厚 1mm。重建图像传至 AI 辅助诊断系统进行肺结节自动检测，记录结节的大小、密度、体积，并计算长径、体积测量的绝对错误率。以 3D-Slicer 软件对 A 和 B 组图像中肺结节手动勾画 ROI，采用 Pyradiomics 平台提取每个 ROI 的影像组学特征 107 个，包括 14 个形状特征、18 个一阶统计量和 75 个纹理特征。采用单因素方差分析比较 3 种扫描条件下结节长径和体积测量准确度 APE 的大小。使用一致性相关系数（CCC）评估常规剂量和低剂量及不同低剂量扫描方案所获得的图像上肺结节分割结果的组学特征一致性。**结果：**相较于 A 组，B1 和 B2 的有效剂量（ED）分别降低 75.0%、73.3%。A 组、B1 组和 B2 组肺结节检出率均为 100%，肺结节定性一致，长径、体积的 APE 差异均无统计学意义（ $P>0.05$ ）。随着 CCC 阈值增加，可重复组学特征占比均呈明显下降趋势。低剂量组所提取的一阶统计量和纹理特征与常规剂量组一致性均较差，而形状特征一致性较好；相同低剂量下，不同低剂量实现方式所提取的一阶统计量和纹理特征致性也较差，实性结节更为显著。**结论：**低剂量 CT 下 AI 系统的肺结节检测结果是可信性的；但低剂量 CT 及不同低剂量扫描方案所提取的组学特征与常规剂量一致性均较差，尤其是一阶统计量和纹理特征。

PO-4093

人工智能（AI）自动后处理软件进行冠状动脉搭桥血管 CTA 后 处理工作的初步探讨

綦维维¹、孙超¹、安备¹、刘晓怡¹、武靖¹、程瑾¹、陈雷¹、吴迪嘉²、洪楠¹
1. 北京大学人民医院
2. 上海联影智能医疗科技有限公司

目的：使用联影 AI 自动后处理软件进行冠状动脉搭桥血管后处理分析，初步探讨自动后处理软件替代人工后处理完成冠状动脉搭桥血管分析的效率以及可靠性。

材料与方法：随机选择 2022.12~2023.5 月的进行冠状动脉搭桥血管术后复查的患者 69 例，进行冠状动脉搭桥血管 CTA 检查，图像分别由高年资技师分别使用 AI 后处理软件以及 CT 的后处理软件进行重建，分别记录后处理图像所需要的时间，由两名从事后处理的高年资医师对图像质量分为三个部分进行评价，比较 AI 后处理与人工后处理的结果。**结果：**65 例冠状动脉搭桥血管 CTA 的病例入组，除分析常规冠状动脉血管外，136 支桥血管（动脉桥血管 56 支，静脉桥血管 80 支）被单独分析。AI 后处理的时间平均为 3.74 ± 0.73 分钟，最长处理时间 5.5 分钟，人工后处理的时间平均为 11.30 ± 4.53 分钟（ $P<0.01$ ），最长处理时间 22 分钟，平均时间增益率为 -67%。心脏 VR 的 AI 后处理评分（均为 5 分）优于人工后处理（ $p<0.05$ ）。VR 冠脉树评分基本一致，CPR 评分人工处理组优于 AI 后处理组。两组的评分均超多 4 分，均满足临床诊断需要。**结论：**UAI 冠状动脉处理软件包可以自动分割出心脏，冠状动脉，自动分析各个血管。对于复杂的冠状动脉血管旁路手术的

CCTA 的后处理与人工后处理过程进行比较, 可以达到人工后处理图像质量, 辅以人工干预, 人工智能 AI 自动后处理软件进行冠状动脉搭桥血管后处理工作可以大大提高后处理的效率节约四分之三人工处理过程以及三分之二的时间, 同时保证不会因为检查次数以及后处理医生人为水平带来的图像截图以及图像质量的差别。

PO-4094

人工智能自动定位技术在不同体型患者胸部 CT 成像中的应用

刚亚栋

武汉大学中南医院

目的: 探讨不同体型患者胸部 CT 成像中 AI 自动定位技术对图像质量及辐射剂量的影响。方法: 收集我院行胸部 CT 检查的患者 290 例, 按照定位方式不同分为两组, 其中 A 组 (AI 自动定位操作组) 及 B 组 (常规手动定位操作组) 扫描各 145 例, 根据体质指数 (Body Mass Index, BMI) 将两组患者进一步分为 A1 组和 B1 组: BMI<24kg/m²; A2 组和 B2 组: 24kg/m²≤BMI<28 kg/m²; A3 组和 B3 组: BMI≥28 kg/m²。对各组的定位扫描精度、客观图像质量、主观图像质量及辐射剂量进行评价。结果: AI 定位组在不同体型患者中的偏中心距离均低于常规定位组, A1 组、A2 组及 A3 组偏中心距离较 B1 组、B2 组及 B3 组分别减小 38.67 %、61.04 %及 65.90 % (均 P<0.01); A 组各分组较 B 组在主动脉、气管、竖脊肌和肺野的 CT 值均增高, 图像噪声均减低, 信噪比 (SNR) 均增高, 且差异均有统计学 (均 P<0.05); A1 组、A2 组及 A3 组 CT 容积剂量指数 (CTDIvol) 较 B1 组、B2 组及 B3 组分别减少 7.57%、10.57%及 15.27% (均 P<0.01); A1 组、A2 组及 A3 组剂量长度乘积 (DLP) 较 B1 组、B2 组及 B3 组分别减少 15.22 %、16.74 %及 19.04 % (均 P<0.01)。结论: AI 自动定位技术适用于不同 BMI 患者的胸部 CT 检查, 可以优化检查流程, 提高定位准确性, 改善图像质量, 并有效减少患者辐射剂量

PO-4095

AI 等中心定位技术在冠状动脉 CT 造影中的应用及价值

刚亚栋、徐海波

武汉大学中南医院

目的: 探讨 AI 等中心自动定位技术在冠状动脉 CT 造影 (coronary computed tomography angiography, CCTA) 中对患者检查工作流程、定位准确性、辐射剂量及图像质量的影响。

材料与方法: 收集武汉大学中南医院 2021 年 1 月-2021 年 12 月期间患者 100 例, 采用相同的扫描方案及参数进行冠脉 CTA 造影, 其中 50 例患者采用常规手动定位方法扫描 (手动定位组), 另 50 例患者使用 AI 自动定位技术扫描 (自动定位组), 两组患者在心率、年龄和体重指数方面无统计学差异, 且均符合相应的纳入排除标准; 两组患者均采用同一款 CT 进行扫描。测量并比较两组患者的定位时间、心脏偏中心距离、图像质量及辐射剂量。结果: 与手动定位组相比, AI 自动定位组的定位时间平均为 (31.4±6.6) s, 低于手动定位组, 平均为 (42.2±8.4) s, AI 等中心定位缩短了 26% 的定位操作时间; 心脏偏离中心距离平均为 (1.2±0.7) cm, 低于手动定位组, 平均为 (1.7±1.1) cm, 且差异有统计学意义 (p<0.05); 有效辐射剂量平均为 (6.4±1.3) mSv, 低于手动定位组, 平均为 (7.5±1.2) mSv, 且差异有统计学意义 (p<0.001); AI 等中心定位技术减少 14% 的降主动脉图像噪声, 并提高了冠脉 CTA 图像的信噪比, 冠脉 CTA 主观图像质量评价在两组之间无统计学显著差异。结论: 基于人工智能的自动患者定位方法可用于 CCTA, 以进一步优化心脏定位精度, 减少辐射剂量, 并通过更准确的患者定位提高图像质量。

PO-4096

蝶鞍三维重建技术对青少年长期服用抗精神药物致性早熟的临床应用分析

邹灿
玉林市四人民医院

目的：探讨蝶鞍三维重建技术在青少年长期服用抗精神药物致性早熟的临床应用分析。

方法：回顾性分析我院 2018 年 1 月至 2021 年 1 月期间收治的 50 例长期服用抗精神药物致性早熟的青少年患者的临床资料，所有患者均接受蝶鞍三维重建技术检查。

结果：本组 50 例患者中，蝶鞍三维重建技术检查结果显示，蝶鞍部骨质增生病变发生率为 100%，其中骨质增生性病变 20 例（40%），其他病变 30 例（60%）。

结论：蝶鞍三维重建技术在青少年长期服用抗精神药物致性早熟的临床应用中具有重要意义，可为临床诊断和治疗提供重要参考。

PO-4097

CT—CPR 评价呼吸道狭窄对 OSAS 制定个性化诊疗方案的临床价值分析

邹灿、杨媚
玉林市四人民医院

目的：探讨 CT--CPR 评价呼吸道狭窄对阻塞性睡眠呼吸暂停综合征（OSAS）制定个性化诊疗方案的临床价值。方法：收集 2021 年 6 月-2022 年 6 月因疑似 OSAS 并行多模态呼吸睡眠监测（PSG）检查的患者，根据 PSG 结果分为对照组（无 OSAS 组）和实验组（OSAS 组），比较两组行常规 CT 和 CT--CPR 检查的结果。

结果：对照组常规 CT 检出呼吸道狭窄率高于实验组，差异具有统计学意义（ $P<0.05$ ）；实验组 CT-CPR 检出呼吸道狭窄率高于对照组，差异具有统计学意义（ $P<0.05$ ）。

结论：CT-CPR 评价呼吸道狭窄对 OSAS 的诊疗方案制定具有重要价值，可提高诊断准确率，为个性化诊疗方案的制定提供依据。

椎间盘源性腰痛与纤维环磁共振影像学特征性与相关性分析

杜彦涛、王文全、史玉敏
德州市第七人民医院 (德州市职业病防治院)

[目的]研究表明, 腰椎间盘突出高信号区 (HIZ) 是椎间盘源性疼痛的诊断方法, 本研究在临床诊断椎间盘源性腰痛, 其椎间盘纤维环磁共振影学的特征性表现, 与其腰痛之间的相关性, 进一步预测椎间盘退变的价值。[方法]研究对象为回顾性搜集德州市第七人民医院 2022 年 1 月至 2023 年 3 月, 选取 23-50 岁年龄段, 平均年龄为 (33.5±3.05), 临床诊断腰椎间盘突出 382 例, 其中男性 231 例, 女性 151 例, 经骨科医师查体确定, 磁共振检查作为影像学依据; 影像图像由两位经验丰富主治以上医师进行盲法阅读和分析。所有腰椎 MRI 检查均采用脊柱表面线圈进行, 奥泰 1.5T 超导磁共振, 扫描序列包括矢状位 T1WI、T2WI、T2WI 压脂, 横轴位 T2WI, 每位患者均扫描 L1/2-L5/S1 间盘, 共 5 个椎间盘。[结果]382 例患者共扫描 1910 个椎间盘, 纤维环 T2WI 显示高信号共计 649 个椎间盘, 占总间盘数 (33.98%±0.01), 382 例患者出现纤维环 T2WI 高信号共计 341 例, 占总人数 (89.27%±0.01)。影像表现: 正常椎间盘横轴位 T2WI 呈中心髓核为高信号, 周围纤维环为低信号; 纤维环 T2WI 高信号表现为中央型、旁侧型撕裂、两侧型高信号。[结论]磁共振 T2WI 检查可以清晰的显示纤维环形态, 尤其以横轴位, 能够清晰的显示纤维环异常信号, 是一种非常有价值的检查方式, 敏感性较高, 纤维环出现异常信号, 表明纤维环出现撕裂, 纤维环薄弱, 间盘内压力增大, 可以导致间盘膨出或突出, 如纤维环贯穿撕裂, 将会预测髓核脱出, 椎间盘纤维环的撕裂, 形成水肿, 炎性刺激神经, 造成腰痛、放射性腰痛, 与腰椎间盘突出性腰痛具有明显的相关性, 总体表明, 磁共振 T2WI 横轴位影像学特征性表现, 对腰椎间盘突出性腰痛具有非常高的诊断价值。

轻度认知功能障碍患者大脑 fMRI 网络的小世界特性

王湘彬、赵小虎、江虹、席芊、王培军
上海市同济医院

目的 利用静息态 fMRI 数据检验轻度认知功能障碍 (MCI) 患者大脑功能网络是否具有小世界特性。方法 采集 16 例 MCI 患者和 20 例正常老年人 (NC) 的大脑静息态 BOLD-fMRI 数据。采用 SPM5 软件对图像进行预处理, 将大脑分割为 90 个区域并计算 90 个区域间的相关系数。以矩阵稀疏度 Sparsity 为阈值, 将相关矩阵转换为网络。计算网络的聚类系数 C 和平均路径长度 L , 若满足 $\gamma = C/C_{rand} > 1$ 且 $\lambda = L/L_{rand} \approx 1$ ($rand$ 代表相应随机网络), 则说明该大脑功能网络具有小世界特性。采用双样本 t 检验比较 MCI 患者与正常老年人大脑功能网络小世界参数的差异。结果 在 0.1~0.4 阈值范围内, MCI 组和 NC 组均符合 $\gamma > 1$ 且 $\lambda \approx 1$ 。MCI 组 γ 和 δ 均大于 NC 组, 且在 $0.10 \leq \text{Sparsity} \leq 0.18$ 时差异达到显著水平 ($P < 0.05$); MCI 组 λ 在各阈值处均小于 NC 组, 在 $\text{Sparsity} = 0.18$ 、0.28 和 0.32 处差异达到显著水平 ($P < 0.05$)。结论 MCI 患者大脑 fMRI 网络具有小世界特性, 但与正常老年人相比其小世界特性增强。

PU-0003

多扩散敏感系数的弥散加权成像对基于生成对抗网络的前列腺癌病灶检测影响的研究

王伟、王培军
上海市同济医院

目的 探讨多扩散敏感系数 (b 值) 的弥散加权成像 (DWI) 对基于生成对抗网络 (GAN) 的前列腺癌病灶检测影响的价值。

方法 收集 2012 年 1 月至 2018 年 6 月在本院就诊的前列腺疾病病例 446 例, 前列腺癌 174 例, 前列腺增生 272 例, 所有均经直肠超声引导下前列腺穿刺活检或前列腺根治术后病理证实。均采用 Siemens Verio 3.0T MRI 扫描, 成像序列包括横断位、矢状位高分辨 T2WI, b 值=0、500、1000 s/mm² 横断位 DWI 及 DCE 扫描, 通过 Matlab 后处理化合成 b=1500、2000 s/mm² 的 DWI 图像。我们提出一个新的神经网络模型 SegDenseAN, 并结合多 b 值 DWI 图像进行检测。该网络基于 GAN, 由生成网络和判别网络两部分组成, 生成网络是一个基于 Dense 模块的分割模型, 而判别网络是一个多尺寸的特征提取网络。将多 b 值 DWI 与 ADC 影像的不同组合作为 SegDenseAN 网络的输入: 组合 1: ADC 图; 组合 2: ADC+DWI0+DWI500; 组合 3: ADC+DWI0+DWI1000; 组合 4: ADC+DWI0+DWI1500; 组合 5: ADC+DWI1000+DWI1500; 组合 6: ADC+DWI1000+DWI2000, 分析比较不同组合对检测精度的影响。

结果 组合 1-6 的准确性分别为: 0.871、0.887、0.903、0.903、0.903、0.903; 敏感性分别为: 0.935、0.935、0.968、0.968、0.968、0.968; 特异性分别为 0.806、0.839、0.839、0.839、0.839、0.839; 组合 6 的前列腺癌病灶区域识别最接近于原始金标准。

结论 SegDenseAN 可以实现病灶区域的自动分割, 有助于前列腺癌的自动检测; 多 b 值尤其多个高 b 值 DWI 与 ADC 影像的不同结合对算法的检测效果有影响, 有助于提高前列腺癌的自动检测结果。

PU-0004

3.0T MR 多期动态增强扫描在肾脏肿瘤诊断中的价值

许晓雯、王培军
上海市同济医院

目的 评价 3.0T MR 多期动态增强扫描 (DCE-MRI) 在肾脏肿瘤良恶性及不同病理组织学类型之间鉴别诊断的价值。

方法 15 例正常志愿者及 46 例经病理证实的肾脏肿瘤患者 (其中肾透明细胞癌 18 例, 乳头状肾细胞癌 8 例, 肾嫌色细胞癌 7 例, 肾血管平滑肌脂肪瘤 13 例) 均行 3.0T DCE-MRI。采用单因素方差分析方法比较 DCE-MRI 所得 K_{trans}、K_{ep}、V_e 在不同病理类型肾脏肿瘤之间的差异, 应用 ROC 曲线评价 DCE-MRI 对于鉴别肾脏肿瘤良恶性的诊断价值。

结果 应用 DCE-MRI 得到正常肾实质的时间-信号强度曲线 (SI-T 曲线) 呈速升平台型, 肾脏良性肿瘤的 SI-T 曲线呈上升平台型, 而恶性肿瘤的 SI-T 曲线呈速升流出型。正常肾实质与各病理类型肾脏肿瘤之间 K_{trans}、K_{ep} 及 V_e 值差异均有统计学意义。肾脏各组恶性肿瘤的 K_{trans} 值及 V_e 值均高于良性肿瘤 (P<0.05), 恶性肿瘤中, 仅肾透明细胞癌的 K_{ep} 值高于良性肿瘤 (P<0.05)。肾恶性肿瘤中, 肾透明细胞癌、肾乳头状细胞癌及肾嫌色细胞癌的 K_{trans} 值差异均具有统计学意义 (P<0.05)。肾透明细胞癌的 V_e 值 (0.42±0.08) 高于肾乳头状细胞癌 V_e 值 (0.29±0.14) (P<0.05)。运用 ROC 曲线评估 DCE-MRI 鉴别肾脏肿瘤良恶性的诊断价值, K_{trans} AUC=0.937, 灵敏度和特异度分别为 87.9%和 85.7%, 临界值为 0.38/min; V_e AUC=0.803, 灵敏度和特异度分别为 78.8%和 71.4%, 临界值为 0.29/min; K_{ep} 则表现出较低的鉴别诊断价值(0.564)。

结论 3.0T MR 多期动态增强扫描 (DCE-MRI) 能有效鉴别肾脏肿瘤良恶性及不同病理组织学类型, 其中 Ktrans 值的诊断价值最高。

PU-0005

磁共振在特殊妊娠诊断中的应用

高燕、王培军
上海市同济医院

目的: 评价 MR 在特殊妊娠诊断中的应用价值。方法: 32 例经临床、手术病理证实特殊妊娠患者接受 Siemens 3.0T 磁共振检查。年龄 23-44 岁, 孕 5-32 周。初产妇 27 例, 经产妇 5 例。腹痛、恶心、呕吐就诊 24 例, 无症状者 5 例。结果: 宫内孕 30 例, 宫外孕 2 例。不同部位妊娠 MR 表现相似, 典型表现为着床部位孕囊结构, 宫内早孕宫腔蜕膜反应明显。孕囊壁 T1WI 呈中等信号, T2WI 呈低信号, 部分与高信号蜕膜分界, 孕囊腔内呈 T1WI 低、T2WI 高信号, 部分见点片状 T2WI 中等或低信号胚胎结构, T1WI、T2WI 呈中等信号, 部分 DWI 呈高信号, SWI 呈中等信号, 其内夹杂点片低信号。3 例蜕膜 DWI 信号稍高, SWI 呈低信号改变。在妊娠合并卵巢病变中, 卵巢囊性病变最常见, 表现为 T1WI 低、T2WI 高信号, DWI 呈中等信号, SWI 呈稍高信号, 增强后厚壁或薄壁环形强化, 黄体囊肿 4 例, 卵泡囊肿 2 例。卵巢畸胎瘤、巧克力囊肿信号混杂, SWI 因成分不同而高低信号混杂。妊娠合并子宫病变中, 子宫肌瘤最常见, 典型表现为 T1WI 中等、T2WI 低信号, DWI 呈中等信号, SWI 呈中等信号。子宫腺肌症表现 T1WI 中等, T2WI 以稍低信号为主, 内夹杂斑点状高信号, DWI 信号中等, SWI 呈中等信号, 内见少许斑点低信号。疤痕妊娠表现为子宫前下壁肌层明显变薄, 局部见团片状异常信号, T1WI 等低信号、T2WI 不均匀高信号, 子宫结合带中断, DWI 呈稍高信号, SWI 呈稍高信号, 部分见条片低信号。胎盘前置表现为胎盘位置异常, 接近或部分覆盖宫颈内口, 可伴有胎盘植入, 早期胎盘表现为 T1WI 稍低、T2WI 稍高信号, DWI 呈中等信号, 信号较均匀, 妊娠中后期胎盘信号不均匀。胎盘植入表现为子宫结合带低信号连续性中断, 肌层内取而代之胎盘样结构。结论: MR 对子宫疤痕妊娠、胎盘前置及胎盘植入等疾病的临床进一步诊疗有重要价值。

多模态磁共振成像对宫颈癌诊断的价值

刘忠柳、王培军
上海市同济医院

目的 探索多模态磁共振成像对宫颈癌诊断的价值

方法 收集同济大学附属同济医院 2015 年 4 月至 2016 年 4 月期间, 经细胞学涂片或活检证实为宫颈癌且接受手术治疗的患者 17 例。所有患者在术前均行磁共振检查, 成像序列包括常规 T1WI、T2WI、DWI、BOLD-MRI 及 DCE-MRI, 并测得相关检查指标, 包括 DWI 检查指标 ADCmean; BOLD-MRI 检查指标基线 R2*值; DCE-MRI 检查指标 Ktrans 及 Ve 值。术后对宫颈癌标本进行评估, 包括病理类型、分化程度、宫旁组织浸润情况、盆腔淋巴结转移情况、MVD 及 HIF-1 α 表达情况, 并比较分析多模态磁共振成像检查指标与病理特征的相关性。

结果 (1) Ktrans 值在鳞状细胞癌和腺癌间的差异具有统计学意义 ($P<0.05$); (2) 高/中分化组的 ADCmean 明显高于低分化组, 且高/中分化组的基线 R2*值明显低于低分化组, 差异具有统计学意义 ($P<0.05$); (3) 多模态磁共振成像检查指标与宫旁组织浸润情况及盆腔淋巴结转移情况无明显相关性 ($P>0.05$); (4) 宫颈癌组织内 MVD 水平与 Ktrans 值存在弱强度正相关($r=0.313$,

$P<0.05$), 与其他检查指标无明显相关性 ($P>0.05$); (5) 宫颈癌组织内 HIF-1 α 表达水平与基线 R2* 值存在中等强度正相关 ($r=0.559$, $P<0.05$), 与其他检查指标无明显相关性 ($P>0.05$)。

结论 多模态磁共振成像对宫颈癌的诊断具有一定价值。

3.0TMR 评估青年人群膝关节前交叉韧带损伤的危险因素

吕琦、王培军
上海市同济医院

目的 探讨 3.0TMR 评估青年人前交叉韧带损伤的危险因素及其意义。

方法 回顾性分析已确诊前交叉韧带损伤的患者 69 例 (其中男 35 例, 女 34 例) 及正常对照组 62 例 (其中男 33 例, 女 29 例) 膝关节 3.0T MR 扫描资料, 比较 MR 诊断前交叉韧带损伤的敏感性、特异性及准确性。测量损伤组与正常组的膝关节形态, 测量参数包括: 股骨髁间凹的宽度 (NW)、股骨内外侧髁总长 (BW) 以及两者的比例即宽度指数 (NWI), 内侧髁至髁间凹的宽度 M、外侧髁至髁间凹的宽度 L 及两者的比值 L:M, 所获得的数据采用 SPSS13.0 软件行统计分析。

结果 MRI 诊断前交叉韧带损伤的敏感性是 94.2%, 特异性是 92.3%, 准确性是 93.5%。68 例男性与 63 例女性比较, BW、L 及 NWI 差异有统计学意义 ($P<0.05$), NW、M 及 L:M 差异无统计学意义 ($P>0.05$), 青年男性与女性膝关节形态不同, 男性膝关节的 NWI 较女性更小, 在前交叉韧带损伤与未损伤男性人群中, BW、L:M 及 NWI 的差异有统计学意义 ($P<0.05$), 损伤者的 NWI 更小; 而女性前交叉韧带损伤与未损伤组中, 各参数差异均无统计学意义。所有参数在活动的强度及损伤部位 (左右) 之间差异无统计学意义 ($P>0.05$)。

结论 较小的 NWI 很可能是男性前交叉韧带损伤的危险因素, BW 及 L:M 是影响青年男性膝关节动力学的重要因素。

PU-0008

Differentiating Esophageal Small Cell Carcinoma from Esophageal Squamous Cell Carcinoma based on DWI, DKI, and IVIM: A prospective study

Letian Yuan
shandong provincial hospital

Background: Magnetic resonance imaging (MRI), including diffusion-weighted imaging (DWI), intravoxel incoherent motion imaging (IVIM), and diffusion kurtosis imaging (DKI), is a widely used approach in patients with esophageal cancer. Yet, these methods have not been tested for differentiating esophageal small cell carcinoma (SCCE) from esophageal squamous cell carcinoma (ESCC).

Purpose: To evaluate the diagnostic value of IVIM, DKI, and DWI in distinguishing SCCE from ESCC.

Populations: Fifty patients with esophageal carcinoma were selected.

Sequence: All subjects underwent sagittal IVIM, sagittal DWI, and sagittal DKI scans.

Assessment: IVIM, DWI, and DKI parameters, including true diffusion coefficient (D), perfusion fraction (f), pseudo-diffusion coefficient (D*), apparent diffusion coefficient (ADC), mean kurtosis (MK), and mean diffusivity (MD) were measured for each patient.

Statistical tests:ANOVA test (normal distribution) or Kruskal-Wallis H test (non-normal distribution) was used to compare differences in parameters. ROC curve was used to analyze the diagnostic efficacy of each parameter in distinguishing esophageal SCCE from ESCC.

Results: Except for D^* , ADC, D, and MD of ESCC were higher than those of esophageal SCCE, while f and MK were lower (all $P < 0.05$). The AUC of MK, MD, ADC, and D values was higher than that of the f value ($P < 0.05$), while the difference in the AUC values of MK, MD, ADC, and D was not statistically significant ($P > 0.05$).

Conclusion: IVIM and DKI can provide more information than DWI in differentiating SCCE from ESCC. MD, MK, D, and ADC feature a higher diagnostic efficacy.

PU-0009

帕金森病运动亚型与血管周围间隙扩大的相关性研究

吕坤雪、贾正兴、王婷、崔耀月、董林崧、陈绍华
牡丹江医学院附属红旗医院

帕金森病 (PD)是最常见的第二大神经性退行性系统疾病,主要分为震颤型(TD)、姿势不稳-步态障碍型(PIGD),主要病理标志是多巴胺能神经元变性和 α 突触核蛋白异常沉积。PVS 有助于清除大脑中异常的 α -突触核蛋白,当血管周围间隙扩大时,在一定程度上代表了其病理及生理意义。最近的研究发现 EPVS 与 PD 运动障碍有关,本文主要探究 PD 不同亚型患者评分与脑部不同区域 EPVS 的相关性,观察是否能为 PD 区分亚型提供一定的证据。

PU-0010

糖尿病酮症护理

刘思彤
辽阳糖尿病医院

1 均给予静脉补液,根据脱水程度及心肺功能,最初 1~2h 给予 0.9%生理盐水1000~2000ml 快速补液,如果存在心功能不全则减慢输液速度;根据血糖情况调整液体量,减轻高糖及酸中毒状况,直到纠正脱水、维持循环功能。

1.2.2小剂量补充胰岛素:给予胰岛素 0.1U/kg,且每 1~2小时测血糖及尿常规,根据血糖下降情况调整胰岛素用量,如血糖下降幅度达到胰岛素治疗前水平的 30%,或平均下降 3.9~5.6mmol/L,可维持原滴注速度;若血糖无肯定的下降,提示患者对胰岛素敏感性低,胰岛素剂量应加倍,若血糖下降速度过快则患者会出现低血糖反应,可给予酌情处理,当血糖降至 13.9mmol/L 时,改为 5%葡萄糖液静点,并加入胰岛素(每 3~4g 葡萄糖加 1U 胰岛素)。

1.2.3 纠正电解质紊乱:治疗开始时血钾可能正常或偏高,但随着血容量增加,治疗 1~4h 后会出现低血钾,故治疗开始后如果尿量>30ml/h,给予静脉补钾,3g/d,并监测血钾,同时注意血钠、血氯。

1.2.4 纠正酸碱平衡失调:开始治疗时并不用补碱,随着液体量增加酸中毒会改善,过早补碱可加重脑水肿,若血pH 为 7.0~7.1 时可给予 5%碳酸氢钠注射液 250ml 静点,监测血气, pH 为 7.2 时即可停止补碱。

多参数 MRI 影像组学模型术前对早期子宫内膜癌的风险预测

冯琴¹、李勇爱¹、马凤华²、强金伟³、郭钰¹

1. 长治市人民医院

2. 复旦大学附属妇产科医院

3. 复旦大学附属金山医院

目的：分析基于多参数 MRI 影像组学模型在术前预测低风险子宫内膜癌（endometrial carcinoma, EC）的可行性及临床价值。方法：回顾性收集 204 例 FIGO I 期和 II 期的 EC 患者资料，分为训练集(中心 1, n=87)和测试集(中心 2, n=117)。所有患者均于术前两周内行盆腔 MR 平扫及增强扫描。分析比较低风险与非低风险患者的临床特征差异，分别在轴位 FS-T2WI、ADC 和 CE-T1WI 图像上逐层勾画全肿瘤感兴趣区，提取与风险因素高度相关的影像组学特征并筛选建立影像组学模型，采用受试者工作特征曲线对模型效能进行评估。结果：低风险组和非低风险组组间患者年龄、肿瘤体积差异均有统计学意义 ($P < 0.05$)，但多变量逻辑回归分析显示它们并非独立风险因素。单参数 FS-T2WI、ADC 和 CE-T1WI 影像组学模型的 AUC 值在训练集分别为 0.730、0.724 和 0.757，在测试集分别为 0.750、0.667 和 0.706。三个参数的融合模型在训练集和测试集的 AUC 值分别为 0.827 (95% CI 0.742-0.912) 和 0.823 (95% CI 0.748-0.897)，优于单参数模型 (所有 $P < 0.05$)。结论：多参数 MRI 影像组学模型对早期低风险 EC 有较好的预测价值，并具有可重复性。

PU-0012

磁共振定量增强参数与乳腺癌预后因子的相关性分析

王瑞

东南大学附属中大医院

目的：探究磁共振定量增强参数 k_{trans} 、 kep 和 ve 与乳腺癌预后因子 $ki67$ 、ER、PR、VEGR 的相关性，为乳腺癌的临床治疗提供参考。

方法：本研究收集我院 50 例乳腺癌患者作为研究对象，所有患者均为女性，年龄范围为 32 至 72 岁。所有患者均行乳腺 MRI 定量增强检查（西门子 $vida$ 3.0T），获取磁共振定量增强参数 k_{trans} 、 kep 和 ve 。同时，我们通过免疫组织化学方法检测乳腺癌预后因子 $ki67$ 、ER、PR、VEGR 的表达情况。我们使用 Pearson 相关系数分析磁共振定量增强参数和预后因子之间的相关性，并利用 SPSS 22.0 软件进行统计学分析。

结果：本研究结果表明，50 例乳腺癌患者中， k_{trans} 、 kep 和 ve 与 $ki67$ 、ER、PR、VEGR 均存在相关性。其中， k_{trans} 与 $ki67$ 、ER、PR、VEGR 呈正相关， kep 与 $ki67$ 、ER、PR、VEGR 呈负相关， ve 与 $ki67$ 、ER、PR、VEGR 呈正相关。其中， k_{trans} 和 ER 的相关系数最高，为 0.624 ($P < 0.001$)， kep 和 $ki67$ 的相关系数最高，为 -0.568 ($P < 0.001$)， ve 和 ER 的相关系数最高，为 0.539 ($P < 0.001$)。

结论：本研究结果表明，磁共振定量增强参数 k_{trans} 、 kep 和 ve 与乳腺癌预后因子 $ki67$ 、ER、PR、VEGR 存在相关性。这些定量参数可以作为乳腺癌预后因子的辅助评价指标，为临床医生提供更全面的乳腺癌患者预后评估信息，为制定更合理的治疗方案提供参考。

老年 STEMI 患者合并微血管阻塞应用 CE-SSFP 电影序列的扫描技术探索

胡莹莹、郭勇
北京大学国际医院

目的 针对老年 STEMI 合并微血管阻塞患者改进心脏磁共振心功能电影序列的扫描策略, 评价改进后序列的图像质量, 提高对微血管阻塞的诊断效能。方法 回顾性分析 50 例 STEMI 患者和 50 例健康志愿者的心脏磁共振影像资料, 比较改进扫描方案后 CE-SSFP cine 的图像质量, 进一步评价改进序列对微血管阻塞的诊断效能。结果 STEMI 组 48 例患者 (96%) 和对照组 49 例 (98%) 志愿者经改进后 CE-SSFP cine 序列扫描可提高符合诊断的图像质量; STEMI 组的血池与心肌对比噪声比显著优于对照组 (222.9 ± 15.6 vs. 170.1 ± 14.9 , $P < 0.05$); 局部节段水平应用改进 CE-SSFP cine 人工标注有效识别微血管阻塞的敏感性为 100, 特异性为 85.7, 约登指数为 0.86, 曲线下面积为 0.96。结论 合理优化改进 CE-SSFP cine 序列, 对老年 STEMI 合并微血管阻塞患者的有效识别大有裨益。

PU-0014

Aberrant structural and functional alterations in patients with insomnia comorbid anxiety: A combined voxel-based morphometry and functional connectivity study

Minghe Xu, Kai Liu
The 960th Hospital of People's Liberation Army Joint Logistic Support Force

Background: Chronic insomnia disorder (CID) is commonly comorbid with generalized anxiety disorder (GAD), resulting in possible alterations in patient's brain structure and function. However, its imaging manifestation and pathogenesis remains unclear. Purpose: To investigate the imaging manifestations of patient with CID comorbid GAD, as well as its possible pathogenesis. Methods: A total of 57 patients with CID comorbid GAD and 57 healthy controls (HC) were respectively recruited in this study. Voxel-based morphometry (VBM) and functional connectivity (FC) were used to observe the gray matter volume (GMV) and functional alterations. Correlation analysis was used to discover associations between brain alterations and clinical features. Results: The patients presented with decreased GMV in the left cerebellum, right cerebellar peduncle and left insula, increased FC in the left cerebellum-right angular gyrus and the left insula-anterior left cingulate gyrus, and decreased FC in left cerebellum-middle left cingulate gyrus, left cerebellum-left medial superior frontal gyrus, and left insula-left superior postcentral gyrus. There was an association between CID comorbid with GAD and some of these brain alterations. Discussion: CID comorbid with GAD can cause abnormal manifestations in cerebellum, insula, angular gyrus, cingulate gyrus, superior frontal gyrus and postcentral gyrus. Some of these abnormalities may be involved in the pathogenesis of the comorbidity. Conclusion: Reduced GMV in left insula and decreased FC in left cerebellum-middle left cingulate gyrus and left cerebellum-left medial superior frontal gyrus may contribute to the comorbidity of CID and GAD.

Non-Ketotic Hyperglycaemic Seizures with Hyperhomocysteinaemia: A Case Report and Literature Review

Jing Wu^{1,2}, Ting Li^{1,2}, Junfeng Li^{1,2}, Kefeng Li³

1. Heping Hospital Affiliated to Changzhi Medical College

2. Changzhi Key Lab of Functional Imaging for Brain Diseases

3. Macao Polytechnic University

Background: Non-ketotic hyperglycaemic (NKH) seizures are a neurological complication of diabetes caused by hyperglycaemia in non-ketotic and non-hyperosmotic states. The clinical characteristics of NKH seizures are atypical and lack unified diagnostic criteria. Therefore, they are easily misdiagnosed during the early stages of the disease.

Methods: Herein, we report a rare case of NKH seizures with hyperhomocysteinaemia in a 52-year-old male with a past medical history of type 2 diabetes mellitus. Magnetic resonance imaging (MRI) T2-weighted and fluid-attenuated inversion recovery images of the head at admission showed hyperintensity from swelling in the left parietal-occipital cortex and hypointensity in the corresponding subcortical regions. After admission, the patient was administered antiepileptic, hypoglycaemic, and fluid replacement therapies.

Results: The seizures did not recur at discharge; the MRI alterations in the brain parenchyma were alleviated and had disappeared at the follow-up 20 days after discharge.

Conclusions: The positive results in this patient may be related to effective blood glucose control versus the administration of antiepileptic drugs. We believe that antiepileptic drugs should be used cautiously in patients with NKH seizures and hyperhomocysteinaemia because they may increase plasma homocysteine levels and aggravate seizures.

PU-0016

面部聚丙烯酰胺注射术后填充物移位外渗的 MRI 应用评价

贾婕

江苏省苏北人民医院

目的：探讨面部聚丙烯酰胺水凝胶术后并发症的 MRI 表现特点，对比频率选择饱和法、IDEAL 技术、短反转时间反转恢复对填充物的检出率，评估磁共振检查的临床应用价值。

方法：收集分析我院 2012 年 10 月到 2016 年 12 月的 60 例面部注射假体的患者临床资料。所有患者均曾在面部注射或填充过聚丙烯酰胺水凝胶，注射时间 7~10 年。同时采用频率选择饱和法、IDEAL 技术、短反转时间反转恢复进行扫描，对图像质量和脂肪抑制效果进行主观评价打分，并且测量信噪比和对比噪声比，客观评价图像质量和脂肪抑制效果，最后对数据进行统计学分析处理。

结果：因聚丙烯酰胺为水溶性材料，与一定比例的水混合，形成水凝胶，因此富含水分，与水在磁共振上表现类似，在 T1 FLAIR 表现为低信号，与周围邻近的肌肉软组织信号相似；但在 T2WI IDEAL 技术、T2WI 频率选择饱和法、短反转时间反转恢复此类抑脂序列上则呈现为明显高信号，可清晰显示移位于皮下、肌肉间隙、腺体内的聚丙烯酰胺水凝胶。鼻根部组织形态规则，位于线圈中心位置，T2WI 频率选择饱和法、IDEAL 技术、短反转时间反转恢复均能很好的将脂肪抑制，差异无统计学意义 ($P>0.05$)，图像质量清楚，对比显示明显，但在颊部，颞部，颞部解剖结构呈弧形，频率选择饱和法和短反转时间反转恢复的脂肪抑制效果不如 IDEAL 法 ($P<0.05$)，差异有统计学意义，尤其在颞部，差异有显著统计学意义，加之位于线圈边缘，部分脂肪仍呈高信号，与聚丙烯酰胺水凝胶的边界显示欠清，难以区分。

结论: 聚丙烯酰胺水凝胶位置、信号、边界在磁共振图像上有特征性表现, T2WI 频率选择饱和法、IDEAL 技术、短反转时间反转恢复在鼻根部的显示效果均良好, 而在颞部、颊部、颞部的脂肪抑制效果 DEAL 技术在图像脂肪抑脂上的效果要明显优于 T2WI 频率选择饱和法和短反转时间反转恢复, 有助于提高聚丙烯酰胺水凝胶的检出率。

PU-0017

多模态 MRI 预测胶质母细胞瘤 p53、Ki-67 表达及 MGMT 启动子甲基化状态的应用价值研究

邢振、曹代荣
福建医科大学附属第一医院

目的: 本研究探讨常规磁共振成像、DWI 和 DSC-PWI 在预测成人 IDH 野生型胶质母细胞瘤 p53、Ki-67 表达及 MGMT 启动子甲基化状态中的应用价值。

材料与方法: 回顾性分析经手术组织病理证实连续的 120 例成人 IDH 野生型胶质母细胞瘤的临床及影像资料。分析和比较不同分子状态 IDH 野生型胶质母细胞瘤患者的人口统计学特征、常规 MRI 征象。计算得出相对最小 ADC 值(rADCmin) 和相对最大 CBV 值(rCBVmax)。根据 p53、Ki-67 表达和 MGMT 启动子甲基化状态将入选研究对象分组。采用卡方检验或 Fisher's 精确概率法比较不同表达组间计数资料的差异。采用 Mann-Whitney U 检验比较不同表达组间计量资料的差异。运用 ROC 曲线与二元 Logistic 回归模型计算单变量和多变量 MRI 参数的诊断效能。不同 MRI 参数的 AUC 比较采用 DeLong 检验。

结果: (1)p53 高表达组胶质母细胞瘤比低表达组更常出现清晰的肿瘤强化边缘, 常规 MRI 征象预测成人 IDH 野生型胶质母细胞瘤 p53 表达状态的 AUC 为 0.605。(2) Ki-67 高表达组胶质母细胞瘤具有比低表达组更低的 rADCmin 值和更高的 rCBVmax 值 rADCmin 和 rCBVmax 值预测 Ki-67 表达状态的 AUC 分别为 0.715 和 0.682; (3)MGMT 启动子未甲基化组的 rADCmin 值显著低于甲基化组、rCBVmax 值显著高于甲基化组, rADCmin 和 rCBVmax 值预测 MGMT 启动子甲基化状态的 AUC 分别为 0.732 和 0.858;此外, rCBVmax 值的诊断效能优于 rADCmin 值(P=0.001)。

结论: DWI 和 DSC-PWI 有助于在术前预测成人 IDH 野生型胶质母细胞瘤的 Ki-67 表达和 MGMT 启动子甲基化状态, 而多模态 MRI 在预测 p53 表达状态中的价值有限。

PU-0018

低级别室管膜瘤与间变性室管膜瘤的常规、扩散和灌注 MRI 比较

邢振、余兰
福建医科大学第一附属医院

目的: 本研究的目的是探讨和比较低级别和间变性室管膜瘤的常规 MRI、DWI 和动态磁敏感增强灌注成像(DSC-PWI)的特征。

材料和方法: 术前进行了 MRI 检查的 26 例脑室外室管膜瘤(19 例间变性、7 例低级别)纳入本次回顾性研究。所有患者均进行了常规 MRI 和 DWI 检查, 15 例患者行 DSC-PWI 检查(11 例间变性、4 例低级别室管膜瘤)。比较低级别室管膜瘤和间变性室管膜瘤的人口统计学特征、常规 MRI 特征、最小相对表观扩散系数(rADCmin)和最大相对脑血容量(rCBVmax)。以最佳截止值确定诊断性能。

结果: 间变性室管膜瘤更有可能位于幕上大脑半球浅层(p=0.026), 并表现为软脑膜和皮质受累(p=0.02 和 0.013)以及出现坏死变性(p=0.014)。间变性室管膜瘤的平均 rADCmin±SD 明显低于低

级别室管膜瘤(0.8 ± 0.2 vs 1.2 ± 0.3 , $p = 0.002$)。间变性室管膜瘤的 $rCBV_{max}$ 平均值显著高于低级别室管膜瘤(15.7 ± 5.3 vs 9.0 ± 4.4 , $p=0.042$)。室外室管膜瘤分级的临界值 $rADC_{min}$ 为 1.02, $rCBV_{max}$ 为 10.43。结合常规 MRI、DWI、DSC-PWI 对低级别室管膜瘤和间变性室管膜瘤($AUC=1.00$)的鉴别效果最好。

结论: 传统的 MRI、DWI 和 DSC-PWI 技术可以帮助评估和分级室外室管膜瘤。

PU-0019

儿童颅脑肿瘤分级：体素内非相干运动和扩散峰度成像性能优于常规 DWI 成像？

余德君

福建医科大学附属第一医院

【摘要】

目的: 准确评估儿童颅脑肿瘤的世界卫生组织分级是至关重要的。本研究旨在探讨常规 DWI、体素内非相干运动和扩散峰度成像参数与组织病理学特征之间的相关性, 以评估弥散参数在儿童颅脑肿瘤分级中的准确性。

材料和方法:本研究招募了 54 例经组织病理学证实的颅脑肿瘤患儿, 对他们进行常规 DWI、体素内非相干运动和扩散峰度成像检查。测量肿瘤实性部分的常规 DWI (ADC)、体素内非相干运动(真扩散系数[D]、假扩散系数[D*]、灌注分数[f]、扩散峰度成像[K]、扩散系数[Dk])参数。测定肿瘤细胞密度、Ki-67 指数和微血管密度。运用 Mann-Whitney U 检验比较低级别和高级别儿童颅脑肿瘤组间参数是否存在差异。同时运用了斯皮尔曼相关分析和受试者工作特征曲线分析等统计学方法。

结果:高级别儿童颅脑肿瘤的 ADC、D 和 Dk 值较低, 而高级别儿童颅脑肿瘤的 K 值高于低级别儿童颅脑肿瘤(P 均 <0.001)。K 与肿瘤细胞密度和 Ki-67 指数呈正相关($r = 0.674\sim0.802$; P 均 <0.05); 而 ADC、D 和 Dk 与细胞密度和 Ki-67 指数呈负相关($r = -0.548\sim-0.740$; P 均 <0.05)。ADCVOI、DVOI、D kVOI、KVOI 对于鉴别儿童颅脑高级别及低级别肿瘤具有一定的价值(曲线下面积分别为 0.901、0.894、0.863、0.885)。然而这些定量扩散参数鉴别儿童颅脑高级别及低级别肿瘤的曲线下面积差异无统计学意义(P 均 >0.05)。

结论:与传统 DWI 相比, 体素内非相干运动和扩散峰度成像衍生参数在预测儿童颅脑肿瘤分级方面具有相似的性能。扩散指标可能有反映儿童颅脑肿瘤的肿瘤细胞密度和 Ki-67 指数的潜能。

钆对比剂延迟增强结合人工智能深度学习降噪算法提高心肌纤维化检出能力的可行性

孙安

中国人民解放军海军军医大学第二附属医院

目的: 评估人工智能深度学习(DL)降噪技术对患者心脏磁共振(cardiac magnetic resonance, CMR)钆对比剂延迟增强(late gadolinium enhancement, LGE)对心肌纤维化的检出能力。

方法: 前瞻性连续性收集我院 2023 年 2 月至 2023 年 7 月期间进行心脏磁共振 LGE 扫描的患者, 并将所有患者基于深度学习降噪技术重建后的左心室短轴图像与原始图像均纳入评估。根据有无 LGE 延迟强化分为研究组与对照组, 使用量表法对所有图像质量和 LGE 病灶检出可信度进行评分, 并比较两种技术的整体图像质量和 LGE 检出可信度。分别比较 DL-LGE 与常规的 LGE 图像的强化

程度及范围、LGE 短轴图像的病变心肌与左心室血池、病变心肌与正常心肌、正常心肌和左心室血池的对比率 (Contrast ratio, CR) 和对比噪声比 (Contrast noise ratio, CNR)。

结果: 共纳入 40 例患者, 对照组 6 例, 研究组 34 例。DL-LGE 与常规 LGE 图像质量评分差异有统计学意义 ($P < 0.05$), DL 降噪技术在心肌纤维化病灶检出可信度优于常规图像 ($t=5.294$, $P < 0.001$)。图像客观定量分析中, 与常规 LGE 图像比较, DL-LGE 图像的异常心肌/血池的 CNR 和 CR 均较高 ($Z=3.320$ 、 3.106 , $P < 0.01$), 而异常心肌/正常心肌的 CNR 较低 ($Z=3.04$, $P=0.002$)。2 名观察者对 DL-LGE 和常规 LGE 图像质量和心肌纤维化的检出可信度评分具有良好的一致性 (Kendall's W 均 > 0.7)。2 名医师所测值计算得到的 CR 和 CNR 具有较好的一致性 ($ICC > 0.7$)。

结论:

基于 DL 降噪技术的 LGE 图像明显提高了整体图像质量, 提高了对短轴图像心肌纤维化的检出率, 为临床评估能提供更好的依据。

磁共振弥散加权成像联合磁敏感加权成像: 对四种常见的侧脑室肿瘤的附加诊断价值

张桦

福建医科大学附属第一医院

目的: 扩散加权成像 (DWI) 和磁敏感性加权成像 (SWI) 是用于脑部肿瘤的可靠成像技术。然而, DWI 和 SWI 在常见侧脑室肿瘤的诊断中的作用尚未有过系统评估。本研究旨在评估 DWI 和 SWI 在常见侧脑室肿瘤诊断中的性能。

材料和方法: 本研究纳入了 52 例经组织病理学证实的侧脑室肿瘤患者 (18 例中枢神经细胞瘤, 9 例室管膜瘤, 7 例高级别胶质瘤和 18 例脑膜瘤)。分别计算由 DWI 测量的相对最小表观扩散系数 ($rADC_{min}$) 和相对平均表观扩散系数 ($rADC_{ave}$) 以及由 SWI 获取的出血内部磁化率信号强度 (ITSS)。使用 Mann-Whitney U 检验, 受试者工作特征曲线和 Logistic 回归分析评估这些定量参数。

结果: 中枢神经细胞瘤的 $rADC_{min}$ 值和 $rADC_{ave}$ 值明显低于其他肿瘤, 室管膜瘤的 $rADC_{min}$ 值和 $rADC_{ave}$ 值以及高级别胶质瘤的 $rADC_{ave}$ 值明显高于脑膜瘤。脑膜瘤的 ITSS 得分明显低于其他肿瘤, 而中枢神经细胞瘤的得分明显低于室管膜瘤和高级别胶质瘤。除了在区分脑膜瘤和高级别胶质瘤-室管膜瘤外, $rADC$ 值与 ITSS 的联合没有显著的差异。

结论: $rADC$ 值和 ITSS 得分可能有助于区分常见的侧脑室肿瘤。使用 $rADC$ 值和 ITSS 得分具有一定的提高诊断性能的可能性。

PU-0022

弥散加权 MRI 评价骶髂关节炎：与常规的单次激发 EPI 相比，读出方向分段采集 EPI 可以改善图像质量和诊断效能

张桦

福建医科大学附属第一医院

目的：采用单次激发平面回波成像 (ss-EPI) 的弥散加权成像 (DWI) 容易出现伪影、信号强度下降和 T2*模糊。采用读出编码分段采集 EPI (rs-EPI) 可以提高图像质量。本研究的目的是：1) 比较骶髂关节的 ss-EPI 和 rs-EPI DWI 的图像质量；2) 评估 ss-EPI 和 rs-EPI 的表观扩散系数 (ADC) 值是否可以区分中轴型脊柱关节炎 (axSpA) 患者的疾病活动状态。

方法：本研究回顾性纳入 75 例行骶髂关节 ss-EPI 和 rs-EPI DWI 检查的患者。根据脊柱关节炎国际评估标准将患者分为 axSpA 组 (n=50) 和非 axSpA 组 (n=25)。采用 ASDAS-CRP 将 axSpA 组患者分为 4 种活动状态。由 2 名放射科医师独立评估图像的定性参数 (总体图像质量及诊断信心度) 和定量参数 (ADC 值、SNR、CNR)。

结果：rs-EPI 的总体图像质量、诊断信心度、SNR 和 CNR 均明显优于 ss-EPI (两名阅读者, $P<0.001$)。在 axSpA 患者中, ADCss 与 ASDAS-CRP 值的相关性为 0.456-0.458, ADCrs 为 0.537-0.558。两个 ADC 值都表现出随疾病活动状态增加而递增的趋势。ADCss 值仅在非活动期和极高度活动期之间存在显著差异 ($P<0.0083$)。ADCrs 值在非活动期与高度活动期、非活动期与极高度活动期、中度活动期与极高活动期之间存在显著差异 ($P<0.0083$)。

结论：rs-EPI 明显提高了骶髂关节 DWI 的图像质量。在 axSpA 患者中, rs-EPI 比 ss-EPI 更能区分活动状态, 应纳入常规骶髂关节临床磁共振扫描方案。

使用高分辨率磁共振血管壁成像对急性缺血性中风患者的动脉粥样硬化斑块进行随访评估

林雪花

福建医科大学附属第一医院

目的：关于急性缺血性中风患者接受药物治疗后颅内斑块演变的数据仍然有限。我们的目的是研究责任斑块的特征, 并使用高分辨率磁共振血管壁成像 (VW-MRI) 探索治疗期间斑块的纵向变化。

材料和方法：23 名急性缺血性卒中患者 (16 名男性; 平均年龄, 51.4 岁 \pm 11.1 岁) 进行了 3-T VW-MRI 检查颅内动脉粥样硬化, 并进行了后续评估。每个识别出的斑块都被回顾性地分类为责任斑块、可能的责任斑块或非责任斑块。在基线和随访时对斑块特征进行分析, 并使用配对 t 检验、配对 Wilcoxon 检验或 McNemar 检验进行比较。

结果：总共鉴定出 87 个颅内斑块 (23 个 [26.4%] 责任斑块, 10 个 [11.5%] 可能的责任斑块, 以及 54 个 [62.1%] 非责任斑块)。初次和随访 MRI 扫描之间的中位时间间隔为 8.0 个月。在多重有序 Logistic 回归分析中, 斑块对比度 (CR) (OR, 1.037; 95% CI, 1.013-1.062; $P = 0.002$) 和表面不规则性 (OR, 4.768; 95% CI, 1.064-21.349; $P = 0.041$) 与责任斑块独立相关。在随访期间, 责任斑块组的斑块长度、最大厚度、归一化壁指数 (NWI)、狭窄程度和 CR 显著下降 (所有 P 值 < 0.05)。在可能的责任斑块中, 斑块 NWI 和 CR 下降 (分别为 $P = 0.041$ 、0.026)。在非责任斑块组中, 只有斑块 NWI 和狭窄程度显著下降 (分别为 $P = 0.017$ 、0.037)。

结论: 随访 VW-MRI 可能有助于斑块风险分层, 并可能为体内不同斑块的演变提供有价值的见解。

不同 SMS 加速因子对宫颈癌 MR 定量参数及图像质量对比研究

彭伟、陈迢
湖北省肿瘤医院

目的 对比采用同时多层采集技术, 在不同加速因子条件下对宫颈癌相关定量参数及图像质量的影响。方法 前瞻性收集经病理证实的 50 例宫颈癌患者, 在本院德国西门子 Skyra 3.0T MR 上行盆腔 SMS-DWI 扫描, 加速因子分别选用 1、2 和 3 (分别为 C-DWI、SMS2-DWI 和 SMS3-DWI), 采集的 b 值为 (0、20、50、100、200、400、600、800、1000、1200、1500s/mm²), 且所有图像均满足诊断要求。测量宫颈癌 IVIM 及 DKI 相关定量参数: ADC(表观扩散系数)、 D (真实扩散系数)、 D^* (假性扩散系数)、 f (灌注分数)、 MK (平均扩散峰度) 及 MD (平均扩散率) 进行对比分析。同时由两名放射科医师主观评分三组宫颈癌 DWI ($b=800s/mm^2$) 图像病变组织的锐利度、图像变形、磁敏感伪影、对病变的显示情况、整体图像质量, 并测算 SNR(信噪比), CNR (对比噪声比)。结果 相较于 C-DWI, SMS2-DWI 和 SMS3-DWI 扫描时间缩短 141s (44.2%) 和 183s (58.6%)。在定量参数评价中, D 值、 D^* 值及 ADC 值无统计学差异 (P 值分别为 0.122, 0.470, 0.346), f 值、 MK 值及 MD 值在 C-DWI 组与 SMS2-DWI 组比较时无统计学意义 ($P>0.05$), C-DWI 组、SMS2-DWI 组与 SMS3-DWI 组比较均具有统计学意义 ($P<0.05$); 客观评价中, 对于 SNR 和 CNR, C-DWI 组与 SMS2-DWI 组没有统计学差异 ($P=0.937, 1.000$), C-DWI 组、SMS2-DWI 组与 SMS3-DWI 组比较均具有统计学意义 ($P<0.05$); 两位观察者的评分具有很强的一致性 (Kappa 值为: 0.728~0.921) 结论 使用加速度因子为 2 的 SMS-DWI 在宫颈癌 MR 评价中是可行的, 既能保证诊断图像质量, 又可以显著减少采集时间。

颅内血管壁中国专家成像共识解读及新进展

李燕¹、闫海丽¹、郑文乔²
1. 山西医科大学第一医院
2. 山西医科大学

磁共振血管壁成像 (vessel wall MR imaging, VW-MRI) 被认为是目前唯一可对颅内血管壁成像的无创检查技术, 具有无创、无辐射、高空间分辨率、高信噪比等优势。除了能够判断管腔的狭窄程度以外, 它还能分析斑块的成分和特征、是否为易损斑块, 提供精准的临床数据。除分析斑块, 它还能对动脉夹层、血管炎、动脉瘤等疾病进行鉴别诊断, 为临床诊断和指导治疗提供重要信息和依据。

体素内不相干运动在胃印戒细胞癌的诊断效能

苑乐添
山东省立医院

目的: 探究体素内不相干运动 (IVIM) 在诊断印戒细胞癌与非印戒细胞癌的诊断效能。

材料和方法：前瞻性的收集在山东第一医科大学附属省立医院住院的胃癌患者 80 例的 MRI 图像。根据病理结果将其分为印戒细胞癌组 35 例，非印戒细胞癌 45 例。参考 T1WI 及 T2WI 图像，选择肿瘤的最大截面及上、下两个截面，将感兴趣区(region of interest, ROI)选在病灶的实性部分。将所有 ROI 的测量值的平均值作为最终测量值。将符合正态分布的数据用平均数 \pm 标准差 ($\bar{x}\pm s$) 表示，组间比较采用独立样本 t 检验；不符合正态分布的数据表示为中位数 (M) 或四分位数间距 (Q1,Q3)，组间比较采用多个独立样本非参数检验。采用受试者工作特性曲线 (receiver operating characteristic, ROC) 来分析具有统计学差异的成像参数鉴别印戒细胞癌与非印戒细胞癌的诊断效能，并且通过计算曲线下面积 (area under curve, AUC) 来确定阈值、敏感度和特异度等诊断效能相关参数。 $P<0.05$ 为差异具有统计学意义。

结果：

①印戒细胞癌与非印戒细胞癌之间的 ADC 值与 D 值均存在统计学差异 ($P<0.05$)，印戒细胞癌与非印戒细胞癌之间 D*值与 f 值不具有统计学差异 ($P>0.05$)；

②ADC 值和 D 值鉴别印戒细胞癌与非印戒细胞癌的 AUC 值分别为 0.885 (95%CI:0.757~0.960)、0.923 (95%CI: 0.806~0.981)。ADC 值以 $1.150\times 10^3 \text{ mm}^2/\text{s}$ 为临界值时，其敏感度和特异度分别为 79.17%，86.36%；D 值以 $1.163\times 10^3 \text{ mm}^2/\text{s}$ 为临界值时，其敏感度及特异度分别为 83.83%，91.45%。

结论：体素内不相干运动参数可以鉴别区分印戒细胞癌与非印戒细胞癌，其中 ADC 与 D 值具有较高的诊断效能。

PU-0027

探讨 3.0T 磁共振上腹部 DCE-MR 的 GRASP-VIBE 技术在肝脏肿瘤诊断中的应用价值

温宇

安徽医科大学附属阜阳医院

目的：探讨在磁共振上腹部动态增强采用快速自由呼吸成像技术 (GRASP-VIBE) 技术在肝脏肿瘤诊断中的应用价值。方法：将 2022 年 1 月-2023 年 10 月本院收治的以肝脏肿瘤为诊断的 72 例患者，其中 32 例采用常规增强扫描作为 A 组，另 32 例患者上腹部增强采用 GRASP-VIBE 技术扫描作为 B 组。结果：B 组检查手段中获得的对于良性、恶性影像诊断的总符合率高于 A 组 ($P<0.05$)。结论：在肝脏肿瘤临床诊断中，应用磁共振动态增强 GRASP-VIBE 技术，可显著提升诊断准确率，效果较为理想。

PU-0028

SENSE-EPI-DWI 在具有磁化率伪影的脑梗死中应用与讨论

李茗

南京鼓楼医院

目的 讨论并行采集技术 (SENSE) 联合平面回波扩散加权像 (EPI-DWI) 技术在具有磁化率伪影的脑梗死中的应用。资料与方法 搜集 38 例装有固定假牙脑梗死的患者资料，均行 MRI 头颅平扫、DWI 与 SENSE-EPI-DWI，。比较分析使用 SENSE 技术前后的右侧基底节区与右侧侧脑室脑脊液两者的信号强度对比度 (均数标准差)，对比噪声比 (CNR)，信号强度对比度 (SIR)，正常小脑表面扩散系数 (ADC) 值，梗死灶/健侧脑组织的 ADC 比值。结果 (1) SENSE-EPI-DWI 的右侧基底节区与右侧侧脑室脑脊液两者的信号强度对比度的均数标准差高于常规 EPI-DWI 的序列

($t=9.872$, $P<0.05$)。(2) SENSE-EPI-DWI 的对比噪声比 (CNR) 均高于常规 EPI-DWI 的对比噪声比 (CNR) ($t=6.615$, $P<0.05$)。(3) SENSE-EPI-DWI 的信号强度对比度 (SIR) 均低于常规 EPI-DWI 信号强度对比度 (SIR) ($t=-2.87$, $P>0.05$)。(4) SENSE-EPI-DWI 的正常小脑表面扩散系数 (ADC) 值均高于常规 EPI-DWI 序列的正常小脑表面扩散系数 (ADC) 值 ($t=-9.962$, $P<0.05$)。(5) SENSE-EPI-DWI 的梗死灶/健侧脑组织的比值均高于常规 EPI-DWI 的梗死灶/健侧脑组织的比值 ($t=5.216$, $P<0.05$)。结论如下 SENSE-EPI-DWI 技术的成像质量较高, 正常小脑表面扩散系数 (ADC) 值有助于脑梗死的诊断, 且在具有磁化率伪影的脑梗死诊断应用中优于常规的 EPI-DWI 序列

PU-0029

磁共振灌注成像在前列腺外周带前列腺癌鉴别诊断中的价值

李茗
南京鼓楼医院

【摘要】：目的 探讨磁共振灌注成像(perfusion weighted MRI,PWI)定量参数在前列腺外周带前列腺癌鉴别诊断中的价值。材料与方法 回顾性分析 62 例行 3.0 T MR PWI 扫描,T2WI 表现为局灶性低信号病变,穿刺活检病理证实的患者资料,其中前列腺癌 33 例,良性病变 29 例。两名高年资医师在病理结果和临床资料双盲的前提下参照 T2WI 外周带低信号区,在 PWI 病灶区放置 ROI,测量病灶区 PWI 定量参数转运常数(Ktrans)、血管外细胞外间隙体积百分数(Ve)及速率常数(Kep)。采用独立样本 t 检验比较 Ktrans、Kep、Ve 在前列腺癌和良性病灶中的差异。采用 ROC 曲线分析 PWI 定量参数鉴别前列腺癌和良性改变中的价值。结果 前列腺癌和良性前列腺病灶组的 Ktrans、Kep、Ve 分别为 $(0.180\pm0.043)/V S(0.076\pm0.039)$ 、 $(0.543\pm0.154)/V S(0.368\pm0.163)$ 、 $(0.235\pm0.162)/V S(0.345\pm0.136)$,两组间 Ktrans 和 Kep 独立样本 t 检验结果差异有统计学意义($P<0.01$),Ve 之间差异无统计学意义($P=0.61$)。Ktrans、Kep 鉴别前列腺癌和良性前列腺病灶的敏感性及特异性分别为 85.15%、83.2%和 78.61%、73.5%。结论 PWI 定量参数 Ktrans、Kep 在前列腺外周带前列腺癌鉴别诊断中具有重要价值。

Revolutionizing Vascular Imaging: Trends and Future Directions of 4D Flow MRI based on a 20-Year bibliometric analysis

Peisong Ma,Zhiwei Zhang,Fajin Lv

Department of Radiology, The First Affiliated Hospital of Chongqing Medical University

Background: To conduct a systematic and comprehensive bibliometric analysis of 4D flow magnetic resonance imaging (MRI) to explore the current hotspots and potential future directions. **Methods:** The Web of Science Core Collection (WOSCC) searched for literature on 4D flow MRI between 2003 and 2022. CiteSpace were utilized to analyze the literature data, including co-citation, cooperative network, cluster, and burst keyword analysis.

Results: A total of 1,069 articles were extracted in this study. The main research hotspots include: quantification and visualization of blood flow in various clinical settings, with keywords including "cerebral aneurysm", "heart", "great vessel", "tetralogy of fallot", "portal hypertension", and "stiffness"; optimization of image acquisition schemes, such as "resolution" and "reconstruction"; measurement and analysis of flow components and patterns, as denoted by keywords "pattern", "KE", "WSS", and "fluid dynamics". Furthermore, international consensus for metrics derived from 4D flow MRI and multimodality imaging may be the future research directions.

Conclusions: The global domain of 4D flow has grown over the past two decades. 4D flow imaging will evolve in the future toward: a relatively short scan duration with adequate spatiotemporal resolution, expansion into the diagnosis and treatment of vascular disease in other related organs, and a shift in focus from vascular structure to function. Moreover, artificial intelligence (AI) will aid in clinically promoting and applying 4D flow imaging.

PU-0032

酰胺质子转移 MR 成像在不同风险前列腺癌中的应用

满江红、王丽娜、王玉主、路鹏

辽宁省肿瘤医院

目的

前列腺癌(PCa)已经成为一个日益严重的公共健康问题。 Gleason 评分(GS)系统是诊断前列腺癌的金标准,通常通过经直肠超声(TRUS)引导下穿刺活检获得。GS 越高,癌症生长和迅速扩散的风险就越大。磁共振成像(MRI)被认为是诊断前列腺癌的最佳非侵入性技术。酰胺质子转移(APT)成像是一种通过非共振饱和脉冲检测组织内特异性蛋白和多肽的新型 MRI 技术。由于肿瘤比良性组织含有更多的特异性细胞蛋白和多肽,因此 APT 可作为一种有前景的肿瘤诊断方法。在本研究中,我们根据 Gleason 评分评估 APT 值在不同风险前列腺癌与正常组织区域的差别。

方法

选取 39 例疑似前列腺癌患者。所有患者均行 TRUS 检查,根据 GS 评分,将患者分为三组:低危组(GS <7 分)、中危组(GS = 7 分)和高危组(GS >7 分)。所有患者均行 3.0T MR 扫描(Ingenia CX, Philips Healthcare),采集完成后,将 APT 图像与 ADC 图像进行融合。根据显示的肿瘤边界,由放射科医师在融合图像中,在病灶的同一位置手动勾画 ROI,分别测量 APT 值和 ADC 值。将相同 ROI 置于非癌区域,分别测量 APT 值和 ADC 值。所有统计学分析均采用 Graph Pad 9.0 软件进行分析。采用配对 t 检验比较各 GS 组中 Pca 区与非癌区 APT 值和 ADC 值的差异。P 值≤0.05 表示差异有统计学意义。

结果结论

结果表明, 低风险前列腺癌($GS < 7$)的 APT 值显著高于良性区域, 而高风险前列腺癌($GS > 7$)的 APT 值显著低于良性区域。这些结果与之前简单认为 APT 在前列腺癌 ROIS 中显著高于良性区域的研究结果不同。一种假设是, 在 $GS > 7$ 患者中, 微囊性肿瘤坏死增加, 这可能减少肿瘤中的特异性蛋白和多肽。虽然需要进一步研究, 但是 APT 成为评估前列腺癌风险的工具得到认同。

PU-0033

时间移位分析与动态磁敏感对比增强在慢性脑缺血灌注评估中的对比研究

邵明冉

南京鼓楼医院

目的 分析基于血氧水平依赖信号 (BOLD) 静息态功能磁共振 (rs-fMRI) 的时间移位分析 (TSA) 方法与动态磁敏感对比增强灌注加权成像 (DSC-PWI) 评估颈动脉狭窄患者脑血流灌注的一致性。资料与方法 纳入 31 例单侧重度无症状颈动脉狭窄患者, 同时行 rs-fMRI 和 DSC-PWI 扫描, 并以 DSC-PWI 达峰时间 (TTP) 参数图为标准分为非缺血组 17 例和缺血组 14 例。两组患者分别勾画感兴趣区 (ROI), 并测量 ROI 与对侧相同 ROI 的 TTP 值和 TSA 延迟值, 取其差值的绝对值 ΔTTP 与 ΔTSA 延迟时间进行相关性分析。结果 缺血组患者 ΔTTP 与 ΔTSA 延迟时间均大于非缺血组, 差异有统计学意义 ($P < 0.05$)。非缺血组中, ΔTTP 与 ΔTSA 延迟时间在大脑前动脉皮层区 ($r = 0.566$, $P = 0.018$)、大脑中动脉 M2 段上方前皮层区 ($r = 0.541$, $P = 0.025$) 和大脑中动脉 M3 段上方前皮层区 ($r = 0.678$, $P = 0.003$) 呈正相关; 缺血组中, ΔTTP 与 ΔTSA 延迟时间在缺血区呈正相关 ($r = 0.641$, $P = 0.013$)。结论 基于 rs-fMRI 的 TSA 方法与 DSC-PWI 参数 TTP 具有良好的 consistency, 能够为早期评估脑缺血患者血流灌注提供无创、无电离辐射的新方法

PU-0034

脾脏硬化性血管瘤样结节性转化的影像学表现及病理对照

邵明冉

南京鼓楼医院

目的: 探讨脾脏硬化性血管瘤样结节性转化 (sclerosing angiomatoid nodular transformation, SANT) 的影像学表现。方法: 回顾性分析 2015 年 1 月—2020 年 6 月于南京大学医学院附属鼓楼医院就诊的、经手术病理证实的 6 例 SANT 患者的资料, 总结 SANT 的影像学表现, 并与病理结果对照。结果: 6 例患者均为单发的类圆形肿块。CT 平扫 6 例均表现为低密度, 1 例病灶中心出现点状钙化; 1 例边界欠清、5 例边界清楚; CT 增强扫描均呈渐进性、向心性、结节样强化。MR 平扫表现为 T2WI 及 DWI 不均匀等信号或低信号, 强化方式与 CT 类似。4 例见“辐轮征”、4 例见假包膜、5 例见“星芒征”。结论: 渐进性、向心性、结节样强化及“辐轮征”、“星芒征”为 SANT 的特征性影像学表现, 尤其以假包膜和 T2WI 低信号高度提示 SANT 的诊断。

PU-0035

子宫内膜纤维化的子宫形态学变化

周楠、周正扬
南京大学医学院附属鼓楼医院

目的 探讨子宫形态学参数在子宫内膜纤维化评估中的价值。

方法 本研究前瞻性纳入宫腔镜诊断为子宫内膜纤维化的 64 例患者（年龄 27-43 岁；平均 33 岁）和 46 例健康女性（年龄 24-38 岁；平均 28 岁）。测量宫腔长度（length of uterine cavity, LUC）、宫颈及峡部长度（length of cervix and isthmus, LCI）、宫腔上端宽度（width of upper uterine cavity, WUUC）、宫腔下端宽度（width of lower uterine cavity, WLUC）。计算得到子宫长度（length of uterus, LU; LUC 与 LCI 之和）。采用独立样本 t 检验比较子宫内膜纤维化患者与健康女性子宫形态学参数差异。利用 ROC 曲线评价子宫形态学参数对子宫内膜纤维化的诊断效能。

结果 子宫内膜纤维化患者的 LUC (19.5 ± 3.5 mm vs. 35.0 ± 3.7 mm)、WUUC (26.6 ± 5.5 mm vs. 32.4 ± 4.3 mm)、WLUC (7.40 ± 1.34 mm vs. 9.32 ± 1.30 mm)、LU (68.6 ± 8.4 mm vs. 77.3 ± 6.2 mm) 和 LUC/LCI (0.40 ± 0.08 vs. 0.83 ± 0.11) 显著小于健康女性，而子宫内膜纤维化患者的 LCI (49.1 ± 6.7 vs. 42.3 ± 4.3) 及 WUUC/LUC (1.39 ± 0.31 vs. 0.94 ± 0.18) 显著大于健康女性。子宫形态学参数在子宫内膜纤维化诊断中准确性较高，其中 LUC 及 LUC/LCI 对子宫内膜纤维化的诊断准确性最高，其 AUC 值高达 0.999。

结论 子宫形态学参数作为一种无创性指标可以用于子宫内膜纤维化评估。

PU-0036

磁共振弥散加权成像（DWI）在宫颈癌病理分型/分级中的应用

白浩言
辽宁省肿瘤医院

目的：探讨弥散加权成像（DWI）与宫颈癌病理分型/分级的相关性。方法：回顾性收集 2018 年 6 月—2021 年 6 月在辽宁省肿瘤医院确诊为宫颈癌的患者 273 例，治疗前均行常规 MRI 及 DWI 检查，b 值取 0、800、1000s/mm²，测量表观弥散系数（ADC）均值，比较 ADC 均值在宫颈癌不同病理类型及不同分化程度中的差异。结果：宫颈鳞状细胞癌组 ADC 均值为 0.972（0.810-1.169），宫颈腺癌组 ADC 均值为 1.079（0.721-1.532），差异具有统计学意义（ $p < 0.05$ ）；高分化组 ADC 均值为 1.195（0.877-1.578）中分化组 ADC 均值为 0.968（0.799-1.169），低分化组 ADC 均值为 1.005（0.815-1.238），低分化组与高分化组病灶 ADC 均值差异具有统计学意义（ $p < 0.001$ ）。结论：宫颈鳞状细胞癌 ADC 均值低于宫颈腺癌，宫颈癌分化程度越差，恶性程度越高，ADC 均值越低。

PU-0037

基于钆塞酸二钠增强 MRI 对肝细胞癌根治切除术后复发的研究

徐磊、张学琴、张涛
南通市第三人民医院

目的 探讨基于钆塞酸二钠增强 MRI 影像及临床病理征象对肝细胞癌患者根治性切除术后复发的预测价值。

方法 回顾性收集本院 2015 年 1 月至 2020 年 12 月经病理证实并有完整随访资料的 209 例 HCC 患者临床及影像资料, 分为复发组 (82 例) 和无复发组 (127 例)。根据临床病理参数及影像学特征进行定性分析, 并根据病灶-肝脏信号强度对比率 (LLR) 进行定量分析。采用 Cox 回归分析 HCC 患者术后复发的独立危险因素, 构建预测 HCC 患者术后无复发生存的列线图, 计算内部验证一致性指数 (C-index) 及 ROC 曲线下面积, 评估模型诊断效能。采用 Kaplan-Meier 法绘制患者术后无复发生存 (RFS) 曲线, 并采用 Log Rank 检验比较生存曲线的差异。

结果 CK19 阳性 (HR=2.074, 95%CI: 1.307~3.292, $P=0.002$)、MVI 阳性 (HR=2.699, 95%CI: 1.720~4.235, $P=0.001$)、信号不均匀 (HR=2.389, 95%CI: 1.499~3.806, $P=0.001$) 是 HCC 患者切除术后复发的独立危险因素。CK19 阳性组及阴性组患者中位 RFS 分别为 30 个月及 51 个月。MVI 阳性组及阴性组患者中位 RFS 分别为 17 个月及 49 个月。信号不均匀组及均匀组患者中位 RFS 分别为 26 个月及 62 个月。CK19、MVI 及信号均匀度三个因素的 1 年、2 年、3 年的无复发生存率组间比较有统计学意义 (Log Rank P 均 <0.05)。内部验证 C 指数为 0.715, ROC 曲线下面积为 0.723, 列线图区分度良好。DCA 决策曲线显示该模型在预测 HCC 患者根治性切除术后 1 年、2 年、3 年无复发生存率方面具有良好的临床实用性。

结论 CK19 阳性、MVI 阳性及信号不均匀为 HCC 患者术后复发的独立危险因素, 可作为预测 HCC 患者根治切除术后预后不良的潜在标志物。

PU-0038

基于钆塞酸二钠增强 LI-RADS 靶样表现对肝细胞癌术后复发的预测

徐磊、张学琴、张涛
南通市第三人民医院

目的 探讨基于钆塞酸二钠增强 MRI 肝脏影像报告和数据系统 (LI-RADS) 靶样表现对肝细胞癌 (HCC) 术后复发的预测价值。

方法 回顾性分析 2015 年 02 月至 2021 年 03 月行钆塞酸二钠增强 MRI 检查且经手术病理证实的 HCC 患者 188 例。依据 LI-RADS v 2018 标准, 将病灶分为 LR-4/5 组、LR-M 不伴动脉期环形强化组和 LR-M 伴动脉期环形强化组。比较三组患者的临床、病理及影像学特征。采用 Logistic 回归分析与 HCC 的 LR-M 伴动脉期环形强化相关的临床病理特征。采用 Cox 回归分析确定 HCC 术后复发的独立预测因子。采用 Kaplan-Meier 法评价 HCC 术后无复发生存率。

结果 CK19 (OR 17.893, 95% CI: 6.762-47.349, $P<0.05$)、MVI (OR 4.197, 95% CI: 1.559-11.295, $P<0.05$) 与 HCC 的 LR-M 伴动脉期环形强化有关。MVI (HR 1.890, 95% CI: 1.170-3.054, $P<0.05$)、肿瘤坏死 (HR 1.942, 95% CI: 1.152-3.275, $P<0.05$)、LR-M 伴动脉期环形强化 (HR 1.684, 95% CI: 1.017-2.787, $P<0.05$) 是 HCC 术后复发的独立预测因子。LR-M 伴动脉期环形强化 HCC 累积无复发生存率 (25.0%) 显著低于 LR-4/5 组 (55.9%) 与 LR-M 不伴动脉期环形强化组 (60.5%) ($P<0.05$)。

结论 LR-M 伴动脉期环形强化 HCC 较 LR-4/5 及 LR-M 不伴动脉期环形强化 HCC 术后预后差。LI-RADS 靶样表现中的动脉期环形强化有助于 HCC 术后复发预测。

基于 4D Flow MRI 技术预测肝硬化患者静脉曲张风险

胡勤勤

重庆市中医院

[摘要] 目的: 探讨 4D Flow MRI 血流定量分析技术在肝硬化静脉曲张风险评估中的价值。方法: 选取医院收治的 53 例肝硬化患者, 经胃镜诊断根据静脉曲张程度将其分为无静脉曲张组(26 例)和静脉曲张组(27 例), 同期另选取 27 名来院体检的健康体检者为健康对照组。对所有病例行 4D Flow MRI 检查, 获取肝脏门静脉系统(门静脉主干、脾静脉、肠系膜上静脉)血流动力学参数(血容量、流速、壁剪切力)。采用单因素方差分析比较三组间血流动力学参数, 筛选有统计学意义指标, 同时绘制受试者工作特征(ROC)曲线, 评估其在肝硬化静脉曲张中的诊断价值。结果: 三组间门静脉主干流速、门静脉主干壁剪切力、脾静脉血容量、肠系膜上静脉流速及肠系膜上静脉壁剪切力差异有统计学意义 ($P < 0.05$), 健康组、非静脉曲张组、静脉曲张组三组门静脉主干流速分别为 (12.58 ± 3.83), (10.69 ± 2.31), (9.22 ± 1.71) cm/s; 门静脉主干壁剪切力分别为 (0.17 ± 0.07), (0.12 ± 0.05), (0.10 ± 0.03) pa; 脾静脉血容量分别为 (7.24 ± 4.05), (8.34 ± 4.56), (11.90 ± 6.80) ml/s; 肠系膜上静脉流速分别为 (9.50 ± 2.94), (7.28 ± 2.03), (7.10 ± 1.71) cm/s; 肠系膜上静脉壁剪切力 (0.14 ± 0.06), (0.10 ± 0.05), (0.09 ± 0.04) pa。其中脾静脉血容量在评估静脉曲张风险诊断效能最高 ($AUC=0.718$), 其临界值为 9.4ml/s。结论: 通过 4D Flow MRI 获取的血流动力学参数中脾静脉血容量可有效预测肝硬化患者静脉曲张的存在, 当脾静脉血容量大于 9.4ml/s 时可提示临床应及时干预, 降低静脉曲张风险。

良性颌面腮腺肿瘤 MRS 成像后处理技术的应用价值

王博成、吴庆龙、朱秋芳、潘皓青、苏潇、鲁煜、梁海胜
上海交通大学医学院附属第九人民医院

目的 探讨腮腺良性肿瘤患者磁共振波谱成像后处理技术的应用价值及作用。方法 回顾分析 26 例病理确诊腮腺原发性良性肿瘤患者行磁共振波谱成像 (MRS) 后得到的代谢产物信号图, 测量其肿瘤代谢产物如胆碱 (Choline, Cho)、肌酸 (Creatine, Cr)、乳酸脂质 (Lactate and Lipid, LL) 峰含量及 Cho/Cr 比值的变化。比较代谢产物波峰形态的区别及其代谢产物含量与不同类型肿瘤 (多形性腺瘤和腺淋巴瘤) 之间的区别。结果 经统计分析得到肿瘤区内的 Cho 峰、LL 峰明显升高且 Cho/Cr 比值均高于正常腮腺组织 ($P < 0.01$), Cr 峰浓度含量未见明显变化 ($P > 0.01$)。这些代谢产物的含量及形态在多形性腺瘤和腺淋巴瘤的诊断中不具有鉴别价值。结论 腮腺良性肿瘤磁共振波谱成像技术能准确地识别出兴趣区内代谢产物浓度的含量变化, 是临床评价肿块占位的重要功能性检查手段之一。

Susceptibility weighted imaging (SWI) for evaluating renal dysfunction in type 2 diabetes mellitus: a preliminary study using SWI parameters and SWI-based texture features

Zhenxing Jiang, Yu Wang, Jiule Ding, Shengnan Yu, Jinggang Zhang, Hua Zhou, Jia Di, Wei Xing
Third Affiliated Hospital of Soochow University

Purpose: This study aimed to examine the performance of SWI parameters and SWI-based texture features in evaluating renal dysfunction of type 2 diabetes mellitus (T2DM).

Methods: Forty-five patients with T2DM were included. With the estimated glomerular filtration rate (eGFR), the patients were divided into non-moderate-severe renal injured group (non-msRI, eGFR >60 mL/min/1.73 m²) and moderate-severe renal injured group (msRI, eGFR ≤60 mL/min/1.73 m²). The 3 SWI parameters and 16 SWI-based texture features between non-msRI and msRI were compared. The correlation between the parameters and BUN, Scr was analyzed.

Results: The signal intensity ratio of the medulla to psoas muscle (MPswi) was significantly lower than the signal intensity ratio of the cortex to psoas muscle (CPswi) in non-msRI and msRI group ($t=8.619, 3.483$, respectively, $P<0.05$). MPswi was higher, and the signal intensity ratio of the cortex to the medulla (CMswi), Skewness, Correlation were lower in msRI than in non-msRI ($P<0.05$). These parameters showed similar diagnostic efficacies for msRI ($P>0.05$), and AUCs were 0.703–0.854. CMswi was an independent protective factor for msRI (OR =0.026, $P=0.003$). MPswi and CMswi were correlated with BUN ($r=0.416, -0.545$, $P<0.05$). CMswi and Correlation were correlated with Scr ($r=-0.645, -0.411$, $P<0.05$).

Conclusions: SWI was valuable for assessing renal dysfunction, which may be helpful for the evaluation of moderate-severe renal injured patients with T2DM.

MR 成像技术在脑梗死中的应用进展

陈小阳
深圳市人民医院龙华分院

【摘要】脑梗塞是神经系统的一类常见多发疾病，具有较高的致残率和死亡率，通过 CT、常规 MRI，尤其是弥散加权成像能对脑梗死进行早期诊断，这些诊断信息也是临床医生在治疗过程中选择和调整治疗措施的重要依据。近年来，针对脑梗塞的 MR 检查方法进展迅速，本文对 MR 成像技术在脑梗死中的应用进展进行综述。

PU-0043

Application value of liver MRI technology in the diagnosis of cholangiocarcinoma

Hui Jing, Kun Peng
General Hospital of Taiyuan Iron and Steel Group Co., LTD.

Objective:

To evaluate the value of liver MRI technology in diagnosis of cholangiocarcinoma.

Methods:

Following the principle of grouping and control, this study was conducted from March 2019 to June 2021 in 60 patients with suspected cholangiocarcinoma enrolled in the Magnetic Resonance Department of our hospital. The diagnostic value of MRI technology was analyzed using pathological results as the gold standard.

Results:

Liver MRI technology showed high efficiency in the diagnosis of positive predictive value, negative predictive value, accuracy, specificity and sensitivity of cholangiocarcinoma, and the difference was statistically significant ($P < 0.05$).

Conclusion:

In the examination and diagnosis of cholangiocarcinoma, MRI examination technology has a higher disease detection rate, and has important clinical application value.

PU-0044**Multimodal MRI-based radiomic nomogram for the early differentiation of recurrence and pseudoprogression of glioma**

Hui Jing, Kun Peng

General Hospital of Taiyuan Iron and Steel Group Co., LTD.

Objective:

To evaluate the diagnostic value of multimodal MRI radiomics based on T2-weighted fluid attenuated inversion recovery imaging (T2WI-FLAIR) combined with T1-weighted contrast enhanced imaging (T1WI-CE) in the early differentiation of glioma recurrence from pseudoprogression.

Methods:

A total of one hundred and eighteen patients with brain gliomas who were diagnosed from March 2014 to April 2020 were analysed retrospectively. According to the clinical characteristics, the patients were randomly split into a training group ($n=83$) and a validation group ($n=35$) at a 7:3 ratio. The region of interest (ROI) was delineated, and 2632 radiomic features were extracted. We used multiple logistic regression to establish a classification model, including the T1 model, T2 model and T1+T2 model, to differentiate recurrence from pseudoprogression. The diagnostic efficiency of the model was evaluated by calculating the area under the receiver operating characteristic curve (AUC) and accuracy (ACC) and analysing the calibration curve of the nomogram and decision curve.

Results:

There were 75 cases of recurrence and 43 cases of pseudoprogression. The diagnostic efficacies of the multimodal MRI-based radiomic model are relatively high. The AUC values and ACC of the training group were 0.831 and 77.11%, respectively, and the AUC values and ACC of the validation group were 0.829 and 88.57%, respectively. The calibration curve of the nomogram shows that the discrimination probability is consistent with the actual occurrence in the training group, and the discrimination probability is roughly the same as the actual occurrence in the validation group. In the decision curve analysis, the T1+T2 model shows a higher overall net efficiency.

Conclusion:

The multimodal MRI radiomic model has relatively high efficiency in the early differentiation of recurrence compared to pseudoprogression, which is helpful for clinicians to make correct treatment plans so that patients can be treated in a timely and accurate manner.

AI 技术与 MRI 快速成像技术的发展

谢红

贵州医科大学附属乌当医院

一、在磁共振成像技术的临床应用中，提高扫描速度仍是迫在眉睫的需求。近年来，人工智能（AI）在医疗领域的应用日益广泛，特别是在放射学中，在肌骨领域大放异彩。

二、AI 技术同时助力临床科研前沿，新一代 AI 赋能的压缩感知更是通过将人工智能与压缩感知稀疏成像理论相结合，应用于神经、骨关节等磁共振成像中，在疾病的早期诊断和预后预测评估等方面表现出巨大的应用前景。

三、基于人工智能的压缩感知（Compressed SENSE AI, CS-AI）技术已被证明可以同时加快采集时间和确保图像质量。但尚不清楚 CS-AI 不同加速因子在测量骨髓脂肪含量的准确性。该研究首次探索了在腰椎研究中使用基于 CS-AI 加速的 mDixon-Quant MR 成像技术，发现 CS-AI 技术不仅缩短了 MRI 采集时间，还确保了图像质量、临床诊断的准确性和临床工作效率。并通过比较不同加速因子的 CS-AI 技术和传统 CS 技术，发现腰椎椎骨脂肪含量的测量结果在不同技术之间没有显著差异，然而 CS-AI 和 CS 组之间的信噪比（SNR）和对比度噪声比（CNR）存在显著差异，说明 CS-AI 在图像质量方面具有优势。在比较不同加速因子的组别时，发现 CS-AI 的加速因子为 3 时，扫描时间最短且图像质量较好；当加速因子为 7 和 8 时，尽管扫描时间进一步缩短，但图像质量明显下降。研究结果表明，通过适当选择加速因子，可以缩短腰椎 MR 成像的采集时间，同时确保图像质量和临床诊断的准确性。

四、近年来，人工智能快速发展，使得多种繁杂的工作变得更加高效和便捷，我们相信，AI 技术在磁共振成像领域临床研究前沿的应用远不止于此，其与前沿 MRI 技术的强强联合将有着巨大的应用潜力，等待大家探索。

PU-0046

Micro and macro changes in early stage of type 2 diabetes mellitus without cognitive impairment: a diffusion tensor imaging (DTI) and surface-based morphometry (SBM) study

Xiangyong Tang, Lining E, Yanzi Chen, Yuzhong Zhang
Shenzhen Longhua People's Hospital

Background: Brain structure and function changes are considered major brain damages in type 2 diabetes mellitus (T2DM), which likely has a close relationship with cognitive impairment. Many previous studies have shown by using brain structural and functional magnetic resonance imaging (MRI) methods that brain white and gray matter are damaged in T2DM, leading to cognitive impairment. Patients with T2DM but without cognitive dysfunction might also have brain changes.

Methods: In this study, subjects with early stage T2DM with no cognitive dysfunction were included to detect brain damages using the tract-based spatial statistics analysis (TBSS) method to demonstrate white matter (WM) micro changes and surface-based morphometry (SBM) method to assess cerebral cortex macro changes.

Results: The whole-brain TBSS analysis revealed that there were no statistically significant changes in fractional anisotropy (FA) and mean diffusivity (MD), but the FA declined in some area of cerebral WM ($p < 0.1$). The SBM results showed no changes in cortical thickness (CT), cortical volume (CV), surface area (SA), and cortical sulcal curve (CSC) between these two groups, but pial local gyration index (LGI) was decreased in the precuneus ($-\log_{10} p = -3.327$).

Conclusion: In conclusion, early stage T2DM patients without cognitive impairment had brain micro and macro structural damages, suggesting the potential use of MRI as an imaging marker to detect brain changes in early stage T2DM, which could not be observed and assessed clinically.

PU-0047

高分辨率显微线圈在四肢肿瘤上的应用

麻昊
辽宁省肿瘤医院

目的：通过对比常规体表线圈和显微线圈扫描所得图像，验证显微线圈对于观察肿瘤内部结构以及周边组织细微结构的优势。

方法：本次实验采用西门子 3T Verio 磁共振机，通过对 50 名四肢肿瘤患者应用常规体表线圈和显微线圈进行扫描，将患处置于磁场中心位置，并固定好两种线圈于患处，常规体表线圈扫描后将其关闭，然后打开显微线圈进行扫描。平扫时进行常规 T1,T2 加权以及抑脂，抑水序列扫描，之后再进行增强序列扫描。扫描后把常规体表线圈所得图像与显微线圈图像进行对比。

结果：显微线圈扫描后可得到高信噪比高分辨率的细微图像。

结论：显微线圈为一种具备接收功能，并且体积明显小于临床常规线圈的表面线圈，能对浅表精细结构进行小视野，高分辨率的显示。应用其在磁共振扫描中对显示肿瘤内部结构，病变累及范围以及图像的分辨力上起到了重要作用。通过对比常规体表线圈和显微线圈扫描后所得图像可以发现常规体表线圈可以显示正常肿瘤大小以及周围组织情况，但是对于肿瘤内部以及肿瘤周边细小血管和组织显示不佳，即便对其图像进行放大也是如此，图像可以显示出大概情况，但是无法看清具体结构以及周边累及情况。但关闭体表线圈后转而应用显微线圈进行扫描病变位置则变得大不相同，应用显微线圈扫描所得图像可以明显看出病变位置情况，相对于常规体表线圈放大后无法清楚观察到病变内部以及周边累及情况，在应用显微线圈扫描所得图像的帮助下都可以清楚观察到。对某些多囊性的肿瘤内部结构观察提供很大帮助。显微线圈同比常规体表线圈在不增加扫描时间，采集次数的前提下可提高显微结构的图像质量，有利于获得细微精细的解剖结构，获得小视野且高分辨率的图像。可提高感兴趣区域的信噪比，实现高分辨成像。对于微小病变的检出以及其与周边组织关系，细小血管的通过和走向的判断评估具有独特的优势。

探究 IVIM-DWI 在炎性肠病诊疗中的应用价值

刘荣丽
河北医科大学第二医院

目的：本文旨在探究 IVIM-DWI 技术在炎性肠病（Inflammatory Bowel Disease, IBD）的诊疗中的应用价值。通过综合分析 IVIM-DWI 在早期诊断、疾病活动评估以及治疗效果监测中的表现，旨在为 IBD 的临床治疗提供新的方法和指导。

方法：通过收集多篇关于 IVIM-DWI 在 IBD 中应用的研究文献，对其中的实验设计、样本数量、采用的参数设置以及研究结果进行详细分析。同时，我们结合自身的临床经验，探讨 IVIM-DWI 技术在 IBD 诊疗中的实际应用情况。

结果：IVIM-DWI 技术在 IBD 的诊疗中显示出了潜在的应用价值。在早期诊断方面，IVIM-DWI 可以检测肠壁的水分子代谢变化，对早期病变具有较高的敏感性，有助于提高诊断准确率。在疾病活动评估中，IVIM-DWI 可评估肠壁的微小灌注变化，为肠壁炎性活动性的定量评估提供了新的手段。

此外, IVIM-DWI 在治疗效果监测方面也显示出了潜在的能力, 可以跟踪治疗后肠壁的变化, 从而为治疗方案的调整提供依据。

结论: IVIM-DWI 技术在炎性肠病诊疗中展现出了广阔的应用前景。其可以在早期诊断、疾病活动性评估和治疗效果监测等方面提供有力支持。然而, 仍需进一步的大样本临床研究来验证其在不同类型和严重程度的 IBD 患者中的可靠性和准确性。综合来看, IVIM-DWI 为 IBD 的临床管理带来了新的机遇, 为患者提供更加精准和个体化的诊疗方案。尽管 IVIM-DWI 技术在 IBD 中显示出了潜在的应用价值, 但其在临床实践中仍面对一些技术挑战和限制。医学界需要不断努力, 深入研究 IVIM-DWI 技术的机制, 进一步完善其参数设置和图像分析方法, 以实现其更为广泛和精准的应用。我们有理由相信, 随着技术的不断进步和临床实践的积累, IVIM-DWI 将为炎性肠病的诊疗带来更多的创新和突破。

PU-0049

定量组织磁敏感技术 (QSM) 融合 T2 加权图像在评估直肠癌中的初步应用

刘忠啸、张海妮、曾建威、孟闫凯、孙存杰
徐州医科大学附属医院

目的: 定量组织磁敏感技术 (QSM) 可以定量测量血液的磁敏感和静脉的氧饱和度, 在直肠癌患者中, 这一指标可以用来评估 TNM 分期以及患者的预后情况。我们的研究将 QSM 定量图像与常规 T2 横断面 2D 图像进行配准, 在 2D T2 图像上进行直肠癌病灶的精准勾画, 再将勾画的感兴趣区放置到 QSM 图像中进行数值的测量。采用这种方法可以最大程度的对病变范围进行精确勾画, 避免了在 QSM 图或幅度图上无法判断病变边界的情况, 从而使测量结果更加可信。方法: 对 2 例直肠癌患者进行常规 MRI 扫描和 QSM 扫描, 采用 Philips Ingenia Elition 3T 设备进行扫描, QSM 序列采用 4 回波磁敏感加权序列进行扫描, 回波间隔为 6.9ms。T2 加权横断位 2D 图像的层厚、层间隔和中心偏移和 QSM 序列相同。采用运行在 MATLAB 软件的 STI_Suite 对得到的幅度图和相位图进行处理, 得到 QSM 加权图像。将 QSM 加权图像导出为 NIfTI 格式文件, 导入 FireVoxel, 对空间坐标进行变换, 同时修改容积的方位, 使图像方向和标记和导入的 T2 加权像一致。再在 QSM 图像上勾画出股骨的容积范围, 采用 mutual info with auto focus 功能将 T2 加权图像与 QSM 图像进行配准。配准完成后可在 T2 加权像上进行直肠癌病变的勾画, 勾画后的 ROI 可直接得到 QSM 的相应测量值。

结果: 2 例病例均可以完成图像配准, 配准程度较为理想, 可以得到 T2 加权图像和 QSM 图像融合图, ROI 可以叠加到两种图像之上, 并可以得到对应的测量值。

结论: 我们采用这种方法可以方便快速的得到复杂病灶范围的 QSM 测量值, 结果重复性较高。在后续研究中我们将继续尝试与其他加权图像进行配准和勾画, 以及利用 3D 成像序列进行配准和勾画。

PU-0050

The exploration of High-resolution diffusion-weighted imaging (RESOLVE) in rectal tumor imaging

Ruiteng Zeng
WEST CHINA HOSPITAL SICHUAN UNIVERSITY

Purpose

Discussion the display of rectal tumors on axial T2-weighted images combined with high-resolution diffusion-weighted imaging (RESOLVE).

Materials and methods

A total of 20 patients(12 males,8 females;39 to 78 years,mean age 45 years),who were pathologically diagnosed with rectal cancer at West China Hospital of Sichuan University between June 2015 and July 2015,were enrolled in this study.All patients were referred for a multi-parametric MRI protocol on a Siemens 3.0T MRI-system(MAGNETOM Trio, 32-channel cardiac coil),consisting of a high-resolution,sagittal T2 TSE(slice thickness 2mm along the intestinal disease), coronal T2 TSE sequence(slice thickness 2mm along the intestinal disease),axial T2 TSE sequence(slice thickness 3mm vertical the intestinal disease)and RESOLVE(same slices and slice thickness as the axial T2 TSE sequence).

Two experienced radiologists evaluated the MRI measurements,comparing the rectal tumors at the same slices on axial T2-weighted images and RESOLVE images displayed.

Results

On T2-weighted imaging the distinguish between tumor and fiber is good,Clearly show the structure around the tumor,Show complex structural component, not easily to distinguish relationship between tumor and surrounding tissue boundaries.High resolution diffusion-weighted imaging (RESOLVE) gets a good tissue contrast, can define the structures of the tumor well,display the rectal tumors' shape, size, boundary and tissue density clearly, and less breathing motion artifacts affected.Combined with ADC value we can pre-sentence the benign and malignant of the rectal tumors.

Conclusion

High-resolution diffusion-weighted imaging (RESOLVE) can make up for lack of axial T2-weighted images display of rectal tumors,get more information about the image, provide better accurate diagnostic information.

PU-0051

高分辨弥散加权成像 (RESOLVE)对直肠癌患者淋巴结转移的探究

曾瑞腾
四川大学华西医院

目的

探讨高分辨弥散加权成像 (RESOLVE)对判断术前直肠癌患者有无淋巴结转移的意义。

方法

运用西门子 3.0T 磁共振 (MAGNETOM Trio, 32 通道心脏线圈) 对 65 例术前直肠癌患者(43 名男性, 22 名女性, 最小年龄 31 岁, 最大年龄 91 岁, 平均年龄 63.22 岁) 进行磁共振扫描。检查前使用开塞露排空肠道并注射 654-2 减缓肠道蠕动。对每个病人行 T2 矢状位 (层厚 2mm 且与肠道长轴平行)、冠状位 (层厚 2mm 且与病变肠道长轴平行)、轴位 (层厚 3mm 且与病变肠道垂直且包全盆腔) 高分辨及 RESOLVE (与轴位同层且包全盆腔) 磁共振普通扫描。

由两名高年资医生对轴位 T2 加权图像和 RESOLVE 图像进行评价, 判断有无淋巴结转移, 并与病理结果对比。

结果

T2 加权成像对直肠周围的淋巴结形态、大小、边界显示良好。高分辨弥散加权成像 (RESOLVE) 获得了良好的组织对比度, 能很好的限定肿瘤内部的结构, 对直肠周围淋巴结的形态、大小、边界及组织密度显示清楚, 几乎没有呼吸运动伪影影响, 结合 ADC 值可以进一步对肿瘤的良好恶性进行预判。

结论

高分辨弥散加权成像 (RESOLVE) 对术前直肠癌患者有无淋巴结转移的预判具有重要意义, 为手术方案的制定和实施提供了坚实基础。

高场强 MRI 在肩袖损伤诊断的应用分析

李秋莉

南阳市中医院

高场强 MRI 在肩袖损伤诊断的应用分析

南阳市中医院独山院区 李秋莉

〔摘要〕目的分析高场强磁共振成像 (Magnetic Resonance Imaging, MRI) 在肩袖损伤诊断的应用价值。方法 2022 年 2 月 - 2023 年 5 月我院疑似肩袖损伤患者 78 例, 患者均接受 1.5T MRI 与 3.0T MRI 检查, 以关节镜检查为"金标准", 对照 1.5T 与 3.0T MRI 检查的诊断结果、诊断效能、肌腱撕裂状况。结果本组 78 例疑似肩袖损伤患者中, 经关节镜检查诊断阳性 63 例, 阴性 15 例; 经 1.5T MRI 检查诊断阳性 53 例, 阴性 5 例; 经 3.0T MRI 检查诊断阳性 61 例, 阴性 11 例。3.0T MRI 诊断灵敏度 96.83%(61/63)、准确性 92.31%(72/78) 较 1.5T MRI 诊断 84.13%(53/63)、75.64%(59/78) 高, 且漏诊率 3.17%(2/63) 较 1.5T MRI 诊断 15.87%(10/63) 低 (P < 0.05)。3.0T MRI 检查部分撕裂 95.12%(39/41) 较 1.5T MRI 检查 78.04%(32/41) 高 (P < 0.05)。3.0T MRI 对不同肌腱撕裂状况检出率 96.83%(61/63) 较 1.5T MRI 检查 84.13%(53/63) 高 (P < 0.05)。结论高场强 MRI 在肩袖损伤诊断中可提高诊断灵敏度及准确性, 减少漏诊率, 还能准确诊断部分撕裂, 提高不同肌腱撕裂状况检出率。

PU-0053

磁共振多序列联合扫描在颅脑转移癌放化疗后疗效评估的应用研究

满江红

辽宁省肿瘤医院

目的:

随着医学成像技术的发展, 磁共振成像 (MRI) 在颅脑肿瘤的诊断和治疗过程中扮演着重要角色。本研究旨在探讨磁共振多序列联合扫描在颅脑转移癌放化疗后疗效评估中的应用。我们将新技术与传统序列相结合, 以获得更全面、准确的影像学信息, 为临床医生提供指导治疗和判断疗效的依据。

颅脑继发性肿瘤在放化疗后的治疗效果评估一直是临床难题。本研究将酰胺质子转移成像 (APT)、灌注成像 (PWI)、磁敏感加权成像 (SWI) 和波谱分析 (MRS) 等多种新技术与传统磁共振序列相结合,旨在提供丰富的影像学信息,以更准确地判断治疗效果和疾病进展。

方法:

本研究的病例选择颅脑部转移病灶放化疗后的患者,进行多个新技术的联合扫描,包括 APT、PWI、SWI、MRS 以及常规磁共振平扫和增强扫描。我们设计了详细的序列扫描方案,通过不同序列的组合,获取形态学、生理学和分子级的信息。后续的数据处理包括对图像进行头部平扫+增强图像处理,灌注曲线分析肿物血流灌注情况,以及使用分割法或肿瘤追踪法来测量酰胺质子含量并得出量化指标。

结果:

通过多序列联合扫描,我们获得了丰富的影像学信息,同时获得了肿瘤的形态学、生理学和分子水平的数据。这些数据有助于判断疾病的真假性进展以及疗效评估。例如,APT 在不同真假性进展肿瘤中显示出不同的信号强度,而 PWI 则反映了肿瘤的血流灌注情况,为判断治疗效果提供了有力支持。

结论:

研究表明,磁共振多序列联合扫描在颅脑转移癌放化疗后疗效评估中具有潜在的应用价值。通过将新技术与传统序列相结合,我们能够获得更全面、准确的影像学信息,为临床医生提供丰富的数据支持,以指导治疗方案的制定和疗效判断。尽管仍需进一步的研究,但多序列联合扫描在颅脑转移癌放化疗后的临床应用中有广阔的前景。

Twist-Vibe 序列在肝脏磁共振动态增强中的临床应用分析

陈静雯

无锡市人民医院

目的:探究 TWIST-VIBE 序列在肝脏磁共振动态增强中的临床应用价值。方法:回顾性选取 2021 年 1 月-2022 年 12 月期间收治的肝脏占位病变患者 120 例,根据患者所使用的对比剂不同将其分为两组,其中使用钆塞酸二钠(Gd-EOB-DTPA)患者 52 例作为 Gd-EOB 组,使用钆喷酸葡胺(Gd-DTPA)患者 68 例作为 Gd 组,通过 TWIST-VIBE 序列和 VIBE 序列进行肝脏占位性病变检查,对比 TWIST-VIBE 序列和 VIBE 序列检查时呼吸运动伪影情况。结果:Gd-EOB 组 TWIST-VIBE 序列中 5 个子期呼吸运动伪影分值分别与 VIBE 序列对比,差异无统计学意义 ($P>0.05$),Gd 组 TWIST-VIBE 序列中子期 A1、A5 呼吸运动伪影分值与 VIBE 序列相比,A1 期明显降低,A5 期明显升高,差异具有统计学意义 ($P<0.05$);Gd-EOB 组增强后子期 A3、A4、A5 呼吸运动伪影分值明显高于增强前,Gd 组增强后子期 A5 呼吸运动伪影分值明显高于增强前,差异具有统计学意义 ($P<0.05$);Gd-EOB 组和 Gd 组增强后 A1-2 期呼吸运动伪影分值均低于 A3-5 期,Gd 组增强后 A1、A3、A4 期呼吸运动伪影分值低于 Gd-EOB 组,A5 期呼吸运动伪影分值高于 Gd-EOB 组,差异具有统计学意义 ($P<0.05$),两组存在呼吸运动伪影分值 ≥ 3 分患者 23 例,其中 A4 期 19 例,A1-2 期呼吸运动伪影反之均 ≤ 2 分。结论:在进行 MRI 肝脏占位性病变诊断时,使用 TWIST-VIBE 序列可以获得 5 期动脉子期成像,可以改善因患者屏气配合度低和使用 Gd-EOB-DTPA 对比剂导致的呼吸运动伪影,从而获得可以满足临床诊断的动态期图像。

基于心血管磁共振成像技术在急性 ST 段抬高型心肌梗死患者经皮冠脉介入治疗后心肌内出血中的研究进展

张何^{1,2}、汪时劲²

1. 南通大学附属医院

2. 中国医科大学附属第一医院

摘要:

心肌内出血是急性 ST 段抬高型心肌梗死 (STEMI) 患者行经皮冠状动脉介入治疗 (PCI) 后的常见也是较为严重的并发症, 与不良预后和不良心室重构息息相关。而且心肌内出血 (IMH) 的评估已经成为急性 STEMI 患者 PCI 后疗效评价的重要辅助手段。本文的目的是对心血管磁共振成像在急性 STEMI 患者 PCI 后心肌内出血中的诊断技术以及发展方向进行综述。

Abstract:

Intramyocardial hemorrhage is the common complication of percutaneous coronary intervention (PCI). And it is closely related to poor prognosis and adverse ventricular remodeling. In addition to that, the estimation of intramyocardial hemorrhage is the important auxiliary method for evaluating the effect of the PCI and instructing the drugs therapy. The purpose of this article is to review the diagnostic technology and development direction of cardiac magnetic resonance in intramyocardial hemorrhage after PCI.

Differentiation of Left Atrial Dysfunction in Reperfused Chronic Myocardial Infarction

He Zhang^{1,2}, shijing wang²

1. The affiliated hospital of Nantong university

2. The first affiliated hospital of China medical university

Evaluation of left atrial dysfunction is of great value to assess reperfused chronic myocardial infarction. LA volumetric and strain parameters can be of great help to estimate left atrial function. However, limited data are accessed on its prognostic value in reperfused chronic myocardial infarction.

Purpose: In order to evaluate the relationship between LA volumetric and strain parameters in patients with chronic myocardial infarction.

Materials and methods: In this retrospective study, recruited people (included from April in 2017 to the June in 2021) experience cardiovascular MRI. The relationship between LA volumetric and strain parameters and chronic myocardial infarction was evaluated by linear regression.

Results: 83 patients with chronic myocardial infarction (mean age \pm standard deviation, 58.16 years \pm 9.58; 69 men) were included. LATEF was weakly correlated with LAVmin (Pearson correlation coefficient $r = -0.674$, $P < 0.001$), Booster longitudinal strain ($r = 0.577$, $P < 0.001$), GLSRa ($r = -0.567$, $P < 0.001$), Total longitudinal strain ($r = 0.574$, $P < 0.001$). Better passive radial strain is correlated to a lower rate of chronic myocardial infarction (hazard ratio, 0.789 [0.699, 0.892]; $P < 0.001$) after adjusting for multiple clinical and CMR-based variables.

Conclusion: Left atrial volumetric parameters, strain and strain rate can be of great value in reperfused chronic myocardial infarction.

改进型 Dixon 水脂分离技术在盆腔扫描中的临床应用价值

刘丽瑶、李笑石、朱寅虎、金大永、李馨、秦越
西安大兴医院

目的：探究改进型水脂分离技术（Fast_Dixon）在 MR 盆腔扫描中的应用价值。

方法：招募青年志愿者 50 人进行盆腔 MR 轴位、冠状位扫描。扫描序列为 FAST Dixon T2WI 序列、常规 Dixon T2WI 序列。采用双盲法五分制分别对两组序列的图像质量进行主观评分。在轴位图像上膀胱显示最大层面测量图像信号噪声比(signal noise ratio, SNR)和对比噪声比(contrast to noise ratio, CNR)。

结果：两组序列在“周围组织与股骨头信号对比度是否良好”评分和“整体图像质量”评分中，Fast Dixon 序列优于 Dixon 序列，有统计学差异（ $P>0.05$ ）；在“膀胱伪影是否影响诊断”及“脂肪抑制效果是否良好”两项的平均评分中，Fast Dixon 与 Dixon 序列评分无统计学差异（ $P>0.05$ ）；图像客观质量评价中，Fast Dixon 序列的 SNR、CNR 都优于 Dixon 序列，有统计学差异（ $P<0.05$ ）；结论：青年志愿者髋关节 FAST Dixon 序列结合多次平均激励技术的图像质量评分较常规 Dixon 序列明显提高，可以不增加扫描时间的前提下，增加抑制脂肪和运动伪影的效果。Fast Dixon 序列可以替代传统 Dixon 序列，从而成为盆腔磁共振扫描的优化选择方案。

磁共振弹性成像评价肝脏疾病的研究进展

熊立军
丰城市人民医院

肝纤维化、肝硬化和肝脏肿瘤一直是临床研究的热点和难点。肝脏穿刺活检是肝脏疾病诊断的金标准，然而由于其存在有创性、出血、疼痛、针道转移等并发症限制了其临床应用，而且由于存在取样误差，容易导致疾病程度误判。近年来，医学影像技术飞速发展，磁共振弹性成像（magnetic resonance elastography, MRE）作为一种无创性评估组织机械属性的检查手段，可以用于全身许多器官的检查，如肝脏、心脏、大脑等。然而，MRE 在肝脏疾病检查中的应用最为成熟。MRE 是一种新型无创性成像技术，可以将人体的弹性特征定量化，被称作“影像触诊”。MRE 的成像原理是通过主动刺激器-塑料连接管道-被动刺激器将声波传递至肝脏，肝脏内质点产生微小位移；通过检测质点位移计算剪切波速度，从而得到组织弹性特征。良好的组织波传播是图像质量好坏的关键，由于肝脏的位置较浅，机械波往往有很好的传播，肝脏常用的刺激频率是 60 Hz，MRE 测量前常需要禁食 4~6 h，正常志愿者肝脏的弹性值范围约 2.05~2.44 kPa，且其测量值不受年龄、性别、体质量指数或脂肪含量及磁共振增强钆对比剂的影响，HINES 等通过多因素影响重复测量的混合线性回归模型证明，2 次测量间的差异的容错在 37% 以内都属于正常测量误差。肝内铁含量会影响图像质量，但对弹性值的测量是否有影响还不清楚，同时为了获得良好的弹性图及波形图，需要患者呼吸的配合。既往研究表明 MRE 在肝脏疾病的评估方面应用广泛，本研究旨在归纳总结 MRE 在诊断及评估慢性肝病方面的现状，为肝脏疾病的预后和治疗提供参考依据。

基于多参数 MRI 影像组学列线图预测胶质母细胞瘤 TERT 启动子突变的状态的应用研究

陈玲、李涛、曾自三
柳州市工人医院

目的:探讨基于多参数 mri 放射组学图预测成人胶质母细胞瘤(GBM)端粒酶逆转录酶(TERT)启动子突变状态及预后的临床应用价值。

方法:回顾性分析 185 例 GBM 患者的 MRI 及病理资料。从术前 MRI 图像中提取并过滤了 2832 个放射组学特征。在影像组学评分(rad-score)和临床特征的基础上创建放射组学 nomogram。采用受试者工作特征(ROC)曲线、校准曲线和临床决策曲线评估 nomogram 在 TERT 突变鉴定中的表现。分别采用病理证实的 TERT 突变和基于风险评分的 TERT 突变来评估患者预后。

结果:随机森林(random forest, RF)算法对 TERT 突变的诊断效果优于其他两种算法,训练集和验证集的曲线下面积(AUC)分别为 0.892 (95% CI: 0.828-0.956)和 0.824 (95% CI: 0.677-0.971)。影像组学评分与临床变量构建的放射组学 nomogram 预测能力在训练集中达到 0.916 (95%CI: 0.864, 0.968),在验证集中达到 0.880 (95%CI: 0.743, 1)。校正曲线和决策曲线分析结果进一步支持了放射组学图的临床应用价值。高危亚组的总生存期明显短于低危亚组,这与病理证实的 TERT 突变组的结果一致。

结论:放射组学图具有良好的识别和校准能力,可为无创预测 GBM 患者 TERT 突变和预后提供有希望的见解。

PU-0060

动态增强磁共振成像以及扩散加权成像对肿块型肝内胆管癌微血管侵犯的预测价值

周新杰
重庆医科大学附属第三医院

目的:探讨动态增强磁共振成像(DCE-MRI)以及扩散加权成像(DWI)对肿块型肝内胆管细胞癌(IMCC)微血管侵犯(MVI)的预测价值研究。方法:回顾性分析 2017 年 1 月至 2023 年 01 月本院收治的 50 例 IMCC 患者的临床资料,术前均行 DCE-MRI 及 DWI 扫描。根据病理结果分为 MVI 组(18 例)和非 MVI 组(32 例),比较两组患者 DCE-MRI 及 DWI 的差异。采用多因素 Logistic 回归分析 MVI 的独立预测因素,通过绘制受试者工作特征曲线并计算曲线下面积评估其诊断效能。结果:MVI 组患者直径、ADC 值显著高于非 MVI 组($P<0.05$);两组患者之间在肿瘤形态、T1WI/T2WI 信号、有无坏死、强化模式、DWI 信号、有无靶征、包膜挛缩以及胆管扩张方面差异无统计学意义($P>0.05$)。采用多因素 Logistic 回归分析发现 ADC 值是 IMCC 患者发生 MVI 的独立危险因素($P<0.05$)。通过绘制 ROC 曲线分析发现,ADC 值预测 IMCC 患者发生 MVI 的 AUC 为 0.897,敏感度为 91.22%,特异度为 89.25%,95%CI: 83.26%-97.53%;最佳截断阈值为 $1.43\times 10^{-3}\text{mm}^2/\text{s}$ 。结论:DCE-MRI 以及 DWI 对 IMCC 患者 MVI 状态的预测具有良好的诊断效能,其中 ADC 值可以作为预测 MVI 发生的独立危险因素,有助于为 IMCC 患者的精准医疗提供更有价值的术前信息。

PU-0061

强直性脊柱炎 ADC 值与骨吸收和骨形成因子的相关性研究

邵林

重庆市璧山区人民医院

目的：分析强直性脊柱炎 ADC 值与骨吸收和骨形成因子的相关性，并进一步探讨其应用价值

方法：以 45 例强直性脊柱炎患者为病理研究对象，根据强直性脊柱炎疾病活动指数(BASDAI)分为活动组（22 例）和稳定组（23）例，同时以 40 例同期健康志愿者为对照组。采用磁共振 DWI 序列测量髌髌关节与 L5 椎体的 ADC 值，并抽取研究对象空腹静脉血，采用 ELISA 试剂盒测定血清骨吸收、骨形成因子水平。以统计学 SPSS26.0 分析组间差异性，以及 ADC 值与骨吸收、骨形成因子的相关性。

结果：各组间 ADC0 差异无统计学意义，活动组 ADC1 和 rADC 高于稳定组，稳定组高于对照组，组间差异均有统计学意义。与对照组相比，稳定组 OPG、RANKL、DKK1、Wnt 含量均有所升高，但 OPG/ RANKL 和 Wnt/ DKK1 水平降低，其组间差异有统计学意义（ $P<0.05$ ）。与稳定组相比，活动组 RANKL 与 DKK1 含量升高，OPG/ RANKL 和 Wnt/ DKK1 水平降低，其组间差异有统计学意义（ $P<0.05$ ）。强直性脊柱炎患者的 ADC1 和 rADC 与 OPG/ RANKL 和 Wnt/ DKK1 有负相关性。

结论：ADC 值能够从一定程度上预测骨形成和骨吸收状态的病理异常程度，具有较高应用价值。

PU-0062

骨质疏松病人臀部肌群脂肪分数的磁共振定量研究

王皓、曹毅

天津市天津医院

目的：探讨磁共振脂肪定量技术对骨质疏松患者的臀部肌群脂肪评估能力。骨质疏松患者口服人工虎骨胶囊，口服药物前后，脂肪定量技术对臀部肌群脂肪分数定量测量与口服药物前后临床效果的相关性研究。

方法：选取骨质疏松的 30 例女性患者，年龄 55~75 岁。患者均在 2021 年 6 月初期做磁共振脂肪定量检查，间隔 18 个月后再做定量检查。18 个月间，患者口服人工虎骨胶囊，药效机制改善肌肉骨骼疼痛症状，抑制骨吸收，促进骨形成，增加骨密度。使用联影 MRu780 3T 高场磁共振成像进行检查。由两位观察者在 FF 图像上采用双盲法对臀部肌群 FF 值进行测量与分析。选取股骨头髁白上缘层面，沿两侧臀大肌、臀中肌、臀小肌肌肉边缘手动勾画 ROI，同一个层面测量 3 次取平均值。采用 Shapiro-Wilk 检验分析数据的正态性，符合正态分布的数据采用（平均数±标准差）表示。采用单因素方差分析对臀肌各部分 FF 值的差异进行方差齐性检验，使用配对样本 t 检验对比分析口服药前后测得的 FF 值。（ $P<0.05$ 时为差异有统计学意义）

结果：比较口服人工虎骨胶囊前后各肌群间 FF 值分别是（ $23.7\pm 8.29\%$ ， $25.1\pm 8.37\%$ ， $12.8\pm 3.73\%$ ， $12.7\pm 6.03\%$ ， $13.2\pm 4.40\%$ ， $12.0\pm 5.63\%$ ），（ $24.8\pm 7.85\%$ ， $26.2\pm 8.33\%$ ， $10.8\pm 3.13\%$ ， $10.7\pm 5.00\%$ ， 12.1 ± 3.92 ， $11.1\pm 5.43\%$ ）。两组数据符合正态分布。人工虎骨胶囊周期性口服与磁共振脂肪定量技术测得 FF 值，两侧臀中肌和臀小肌具有相关性，两侧臀大肌没有相关性。

结论：肌少症表现为肌肉脂肪浸润的增加及功能的减退，骨质疏松骨量减少，骨髓脂肪含量增加，与脂肪浸润具有相关性。多重校正的磁共振脂肪定量技术不仅定量结果精确，符合目前影像学“可量化”及“快速成像”，为临床肌肉脂肪浸润的评价提供影像学依据，为临床骨质疏松的疗效监测提供新见解。

PU-0063

Predicting the efficacy of non-steroidal anti-inflammatory drugs in migraine using deep learning and three-dimensional T1-weighted images

Hengle Wei,Hong Zhang

Department of Radiology, The Affiliated Jiangning Hospital of Nanjing Medical University

Objective: Deep learning (DL) models based on the individual images could contribute to tailored therapies and personalized treatment strategies. We aimed to construct a DL model using individual three-dimensional (3D) structural images for predicting the efficacy of non-steroidal anti-inflammatory drugs (NSAIDs) in migraine. **Methods:** A 3D convolutional neural network (CNN) model was constructed, with ResNet18 as the classification backbone (3D ResNet18), to link structural images obtained from patients with migraine to the prediction of the efficacy of NSAIDs. The performance of this model was compared with that of conventional CNN models (ResNet34, ResNet50, ResNeXt50, and DenseNet121). The performance of the DL model was evaluated via calculating the area under the curve (AUC) of receiver operating characteristic curve.

Results: In total, 111 patients were included (mean age, 33.77 ± 10.78 years) and allocated to the training ($n = 88$) and testing ($n = 23$) sets in a 4:1 ratio. ROC curve analysis showed that the conventional DL models trained with a 3D T1WI sequence (i.e. ResNet34, ResNet50, ResNeXt50, and DenseNet121) had AUCs of 0.78, 0.79, 0.73, and 0.68, respectively, for migraine efficacy, which were less than that of our proposed model (0.82). Further, the accuracy of the ResNet34, ResNet50, ResNeXt50, DenseNet121 and 3D ResNet18 models were 0.65, 0.74, 0.65, 0.70, and 0.78, respectively.

Conclusions: Our study highlights the feasibility of the DL algorithm based on brain structural images and suggests that it can be applied to predict the efficacy of NSAIDs in migraine treatment.

PU-0064

膝关节 MRI 影像组学在骨龄判读中的应用

李功令、刘黎春、冒晓文

邵阳市中心医院

目的 探讨膝关节 MRI 影像组学在骨龄判读中的应用价值。

方法 对 2022 年 1 月至 2023 年 1 月在邵阳市中心医院就诊的 327 例患者膝关节 T1WI 图像进行回顾性评估。通过完全随机的方法根据 7:3 的比例将所有患者分为训练集(229 例)和内部测试集(98 例);再根据年龄将患者分为<18 岁和≥18 岁两组。由一名主任医师对膝关节 T1WI 图像进行轮廓勾勒标注。利用 3D SLICER 软件提取 107 个影像特征,特征筛选采用方差过滤、相关性分析及 lasso 回归方法,通过逻辑回归(LR)、支持向量机(SVM)和朴素贝叶斯(NBM)构建影像组学模型,通过 ROC 曲线分析评估模型性能。

结果 ROC 分析显示在训练集中 LR 模型、SVM 模型、NBM 模型的 AUC 值分别为 0.86、0.89、0.83,在测试集中 AUC 值分别为 0.82 (95%CI: 0.74-0.90),0.81(95%CI: 0.73-0.89),0.82(95%CI: 0.72-0.90)。

结论 LR 模型和 SVM 模型有过拟合趋势,NBM 模型相对更稳定。未来可进行多中心、联合多部位 MRI 的研究,探索更优的预测模型,为青少年提供无辐射、更精准的骨龄预测。

PU-0065

T1 mapping 联合扩散加权成像对乳腺良恶性病变的诊断价值

苏春艳、杨智、付兵
成都市第五人民医院

目的：探讨 T1-mapping 成像及扩散加权成像的定量参数在乳腺良恶性病变的诊断价值。材料与方法：对本院 2021 年 2 月-2021 年 8 月 80 例（良性 35 例，恶性 45 例）乳腺病变行常规 MRI 及 DWI 成像，并用多翻转角成像序列分别于增强前及增强 7min 后采集 T1 mapping 图像，测量病灶的增强前 T1 弛豫时间（T1pre）、增强后 T1 弛豫时间（T1post）、ADC 值及正常腺体 T1pre。分析比较增强前病灶与正常腺体 T1 值的差异，良恶性病灶 T1pre、T1post、ADC 值，将有统计学意义的绘制单独及联合 ROC 曲线，评价参数的诊断价值。结果：乳腺病灶与正常腺体的 T1pre 差异有统计学意义（ $P<0.05$ ），良恶性病灶 T1pre 差异无统计学意义，T1post 及 ADC 间差异有统计学意义，T1post、ADC 及两种联合的 AUC 分别为 0.863、0.861、0.924，敏感度分别为 80.0%、80.0%、84.4%，特异度分别为 82.9%、80.0%、85.7%。T1post 联合 ADC 曲线下面积更大，检测效能更高，敏感度更高。结论：定量 T1post 可以在一定程度上鉴别乳腺良恶性病变，T1post 联合 ADC 的诊断效能更大。

PU-0066

BSSFP 序列三时相扫描在胎儿心血管系统的应用

陈霞平
福建省妇幼保健院

目的：探讨 BSSFP 序列三时相扫描技术在胎儿心血管系统磁共振检查中的应用价值。材料与方法：回顾性分析我院 2022 年 6 月~2023 年 6 月行产前磁共振检查患者的临床及影像资料，筛选后入组 38 例经产前超声提示未见异常的胎儿心血管系统磁共振图像，均行 BSSFP 序列单时相及三时相扫描。图像分析及质量评分由 3 名从事胎儿磁共振诊断 5 年以上的放射科医生双盲分析完成。具体方法是 3 名放射科医生先对 38 例单时相的四腔心、主动脉弓水平横断面分别进行分析及评分。完成单时相评分后，再完成 38 例三时相的四腔心、主动脉弓水平横断面进行分析及评分。结果：38 例图像中，对主动脉弓层面的显示，BSSFP 序列单时相和三时相扫描评分差异有统计学意义（ $P=0.048$ ）；对四腔心层面的显示，两者评分差异无统计学意义（ $P=0.620$ ）。结论：BSSFP 序列三时相扫描技术有助于提高胎儿心血管系统图像质量，尤其是主动脉弓层面，能更好显示胎儿心外大血管解剖结构，为胎儿心血管结构的显示提供了一种新的成像思路。

MRI 在卵巢畸胎瘤与囊腺瘤碰撞中的诊断及病理对照

顾海磊
南京医科大学附属妇产医院（南京市妇幼保健院）

目的 探讨卵巢畸胎瘤合并囊腺瘤 MRI 影像特点，通过病理对照加深对卵巢二元碰撞肿瘤的认识。方法 回顾性分析 8 例经手术病理证实的卵巢畸胎瘤-囊腺瘤发生的碰撞瘤。均为超声发现盆腔液性为主病变，后进一步行 MR 平扫加增强扫描检查。观察肿瘤的形态、位置、大小及 MRI 信号特征，并将肿瘤 MRI 表现与病理对照分析。结果 8 例均为成熟型囊性畸胎瘤与黏液性囊腺瘤发生碰撞，3 例病变均位于左侧卵巢、右侧卵巢 5 例。8 例均表现为较大或巨大的多囊性占位，以囊性为主、实

性为辅, 肿瘤内见多种信号特点。两肿瘤间分界明确, 6 例呈瘤壁瘤和 2 例呈瘤中瘤表现。构成碰撞瘤的两种肿瘤在 MRI 上均可见各自本身典型的 MRI 特点。结论 正确认识卵巢碰撞瘤的 MRI 特征及病理特点, 有助于提到临床诊断符合率, 能很好的指导临床诊疗方案的制定。

PU-0068

酰胺质子转移成像联合扩散加权成像对泪腺良恶性病变的鉴别诊断价值

王俊、王鹏、汤秋月、李建波
云南大学附属医院

目的 探讨酰胺质子转移成像(amide proton transfer, APT)与扩散加权成像(diffusion-weighted imaging, DWI)成像对良、恶性泪腺肿瘤的鉴别价值。

材料与方法 前瞻性纳入 2023 年 2 月至 2024 年 2 月云南大学附属医院 40 例泪腺疾病患者临床病例资料, 根据患者病理穿刺或者手术结果分为良性泪腺肿瘤组 25 例和恶性泪腺肿瘤组 15 例。所有患者在术前行 3.0T MRI 眼眶检查, 扫描序列包括 T2WI、APT、DWI 等, 在 APT 和 DWI 参数图像上勾画感兴趣区, 测量病灶的非对称性磁化转移率(MTRasym), 表观扩散系数(ADC)值, 采用组内相关系数(ICC)检验两名观察者测量结果的一致性。采用独立样本 t 检验比较两组病灶各参数值的差异。采用受试者工作特征曲线(ROC)评估各项有差异参数单独及联合对两组病变鉴别诊断的效能。采用 Delong 检验比较各参数及联合参数诊断效能的差异。采用 Pearson 相关检验对两参数进行相关性分析。

结果 2 名放射诊断医生获得良好的一致性(ICC>0.75)。MTRasym 及 ADC 值在泪腺良、恶性泪腺肿瘤性病变之间的差异均有统计学意义(均 P<0.05)。恶性肿瘤组的 MTRasym 大于良性泪腺肿瘤组(6.01 ± 0.55 vs 3.85 ± 0.93 , P<0.05), ADC 值则小于良性病变组(0.86 ± 0.15 vs 1.45 ± 0.12 , P<0.05)。MTRasym、ADC 值及二者联合鉴别恶性病变和良性病变的 ROC 曲线下面积分别为 0.790、0.842、0.890。MTRasym 与 ADC 值的诊断效能差异无统计学意义(P>0.05), 两参数联合的诊断效能要优于 MTRasym 单独诊断效能(P<0.05)。

结论 APT 可提供更多关于肿瘤的功能学信息, 因此 APT 联合 DWI 有利于泪腺肿瘤的定性诊断。

PU-0069

个案报道: 右侧外阴孤立性纤维性肿瘤

王俊、王鹏
云南大学附属医院

目的: 报道一例老年女性外阴孤立性纤维性肿瘤。

方法: 患者女性, 78 岁, 发现外阴包块 1 年余。实验室检查未见异常。体格检查: 右侧大阴唇可扪及一大小约 5×4×4cm 包块, 质硬、活动度可, 无触痛。

结果: 盆腔 MRI 平扫及增强扫描: 右侧大阴唇椭圆形异常信号, T1WI 呈等信号, T2WI 呈混杂高信号, DWI 呈高信号, 增强扫描呈明显均匀强化; 诊断: 右侧大阴唇占位, 考虑肿大淋巴结可能; 完善术前检查后于全麻下行右侧外阴包块剥除术, 手术顺利。

结论: 术后病检结果回示为: (右侧外阴) 孤立性纤维性肿瘤。误诊原因分析: 孤立性纤维性肿瘤可发生在身体的任何部位, 以胸部最多见, 尤以胸膜多见, 本次病例发生在大阴唇, 为极少见部位, 但 MRI 表现符合孤立性纤维性肿瘤, T1WI 呈等信号, T2WI 稍高信号中存在片结状低信号是大多数 SFT 的典型 MRI 表现。

PU-0070

Optimal Visualization and Anatomical Findings of the Thoracic Dorsal Root Ganglia in MRN

Yalan Yan, Dejun She, Dairong Cao
First Affiliated Hospital of Fujian Medical University

Objectives: To evaluate prospectively the most suitable sequence of magnetic resonance neurography (MRN) in identifying the anatomical characteristics of thoracic dorsal root ganglion (DRG).

Methods: Fifty-seven participants were enrolled for undergoing an MRN scan. Balanced fast-field echo (B-FFE), T2 FFE, and SHINKEI sequences were all applied, and we tried to get the best sequence for the anatomic information measurement of the thoracic DRG. Two observers used a 5-point grading system to analyze the visualization of ganglion, preganglionic and postganglionic nerve tissue, as well as overall image quality. Inter-reader and intra-observer agreement was measured using intraclass correlation coefficient (ICC) analysis. Comparisons between sequences are performed using Friedman test. Paired t-tests were used to compare right- and left-sided DRG volumes for each segment. Pearson's correlation coefficient r was reported for all correlation analyses of DRG volume with demographic variables.

Results: Thoracic DRG were mostly identified in all participants by using MRN. The mean 5-point scores of ganglia, preganglionic and postganglionic nerve tissue in T2 FFE (4.2/3.4/4.4, respectively) were higher than those in B-FFE (3.0/2.6/3.0) and SHINKEI (3.3/2.7/3.9) sequences ($P < 0.0001$). The most suitable pulse sequences to identify and measure anatomic information was T2 FFE. There was no statistical difference in the volume of DRG between left and right ($P > 0.05$), and the overall trend from T1 to T12 was large at both ends and small in the middle. Besides, correlation analyses revealed negative correlations of mean DRG volume with sex, age and weight, but showed positive correlation in height ($r = 0.394$; $p = 0.031$). As for the location of DRG, the proportion of extraforaminal type was the highest (89.9%), which mainly distributed in T1-T6.

Conclusion: T2 FFE is a reliable imaging sequence for identification and anatomical characterization of thoracic DRG. The anatomical information it provided can be used for clinical reference.

智能调整灯光照射与肢体抚触在幼儿核磁共振头颅平扫检查中的应用效果评价

李倩倩、冯敏、卢璐、李月、李笑石、马永利
大兴医院

目的: 探讨家属在陪同幼儿核磁共振检查中的应用效果评价。

方法: 前瞻性收集我院儿科 150 例需进行磁共振头颅平扫检查的患儿, 年龄范围 1-5 岁。随机分为 A、B 两组, A 组为常规组, 直系家属陪同患儿检查, 但不进行肢体抚触, 光源照射采用正常室内光源 (500 勒克斯, 10 流明/瓦白炽灯十二枚), 按照规定流程进行磁共振检查; B 组为对照组, 由患儿直系家属陪同, 检查前向患儿家属讲解核磁共振检查的流程, 并对检查进行模拟演示, 详细说明患儿入睡检查的目的, 充分得到患儿家属的支持与配合, 检查前关掉检查室灯光, 在打开智能台灯, 于玻璃防护层外对检查室照射, 采用 2700K-6500K 可调节色温, 通过检查室声音分贝自动进行灯光亮度控制, 最大通量 300 流明。家属通过轻柔抚触患儿身体、讲故事、播放轻音乐等方式, 助其入睡。结合 A、B 两组患儿是否有家属陪同和是否采用智能灯光对 MRI 图像质量进行主观评价,

主观评价由两名高年资主治医师对图像质量进行评价,采用五分制打分。日常睡眠情况由一名高年资护师对患儿及家属询问,进行 BEARS 睡眠筛查量表进行评价。

结果: A 组患儿图像质量评分 3.86 ± 0.66 分, B 组患儿图像质量评分为 4.25 ± 1.30 分, B 组患儿图像质量显著高于 A 组 ($P < 0.05$); 两组患儿日常 BEARS 睡眠质量评分无显著差异。 ($P > 0.05$)

结论: 在进行 MRI 检查时, 智能灯光配合抚触可以使患儿保持平静, 减少患儿好动对 MRI 结果的干扰, 确保检查能够顺利进行, 可以在临床中推广应用。

肺磁共振成像技术应用现状

蔡盛平、朱谦
武汉市红十字会医院

磁共振成像 (magnetic resonance imaging, MRI) 拥有出色的软组织对比度, 且没有电离辐射的风险, 在全身得到了广泛应用, 但由于肺低质子信号导致 MRI 上的低信噪比, 肺磁共振扫描时间相对过长引起的心肺运动伪影, 肺与临近软组织交界面产生的磁化率伪影三方面的影响, MRI 在肺部的应用受到了较大的限制, 虽然采用高场 MRI 扫描提高了信噪比, 但同时也加重了磁化率伪影 [1]。通过屏气并减少采集时间减少伪影, 但同时可能降低了空间分辨率, 同时很多肺部病变患者屏气效果较差。通过呼吸监测、呼吸及心电门控技术可以减少运动伪影, 但会大大增加扫描时间。使用低场强 MRI 可以降低磁化率伪影, 但同时也降低了信噪比。尽管存在这些限制, 但 MRI 的技术一直在发展, 随着近年来高性能梯度系统、相控阵接收器线圈和逐渐优化的 MRI 成像序列的发展, MRI 肺部成像的应用范围在拓展, 在某些具体应用方面甚至比 CT 和 PET-CT 更具优势。在此做一综述, 阐述肺磁共振成像技术应用现状。

PU-0073

直系亲属参与亲情高级护理对幽闭恐惧症患者磁共振检查图像质量和检查成功率的应用探究

王怡凡、杨佳萌、卢璐、李笑石、马永利
西安大兴医院

目的: 探究直系亲属参与亲戚护理, 是幽闭恐惧症患者磁共振检查的效果。

方法: 前瞻性收集我院 MRI 检查患者 100 人, 随机分为 A、B 两组, A 组为常规护理组, 患者家属检查前由影像科护理人员进行讲解并安慰患者, 陪同检查, 按照相关规程行 MRI 检查; B 组为高级护理干预组, 医护人员与患者及家属提前一天在影像科模拟磁共振室进行沟通和宣讲, 护士了解患者平时放松心情习惯与情况, 交待直系家属如何安慰患者情绪, 检查时护士与直系家属一同陪同患者检查。家属通过轻抚患者身体、播放患者喜欢的音乐等方式, 助其放松心情, 完成检查。记录两组患者检查磁共振、两组患者检查前后的恐惧评分、SAS 焦虑自评量表评分; 由两名高年资影像科主治医师对两组图像质量进行评分, 采用 5 分制法。检查结束后对患者满意度进行调查并记录。

结果: 与 A 组相比, B 组患者的检查成功率更高 ($98.45\% > 86.92\%$, $\chi^2 = 4.332$); 恐怖评分更低 (4.55 ± 1.99 分 $< 7.95 \pm 3.33$ 分, $P < 0.05$); SAS 评分更低 (33.29 ± 10.05 分 $< 49.86 \pm 11.56$ 分, $P < 0.05$); A 组图像质量评分 4.23 ± 0.99 分, B 组图像质量评分 3.05 ± 0.69 分, A 组图像质量显著高于 B 组 ($P < 0.05$)。

结论: 直系家属参与亲情高级护理干预, 可以达到减轻患者紧张情绪, 降低患者恐怖心情, 提高幽闭恐惧症患者检查成功率及图像质量, 确保磁共振检查顺利进行, 应当在日常护理工作中推广应用。

基于深度学习的 TACE 术后肝癌分级研究

高磊
东南大学附属中大医院

这项研究旨在磁共振动态增强上构建一个 TACE 术后肝癌分类模型, 为后续医生的诊断、治疗决策和研究提供帮助。目前磁共振图像上基于人工评价术后肝癌效率低下并且少有研究涉及, 本研究拟结合多时序 MRI 图像, 旨在通过模拟放射医生临床决策步骤, 探讨深度学习应用的可能性。

酰胺质子转移成像评估呼吸睡眠暂停低通气综合征脑损伤的价值

王宁、张力、张玉金、武世超、赵保根、王勇
河北医科大学第一医院

目的: 探讨酰胺质子转移 (amide proton transfer, APT) 成像在评估不同程度阻塞性呼吸睡眠暂停低通气综合征 (obstructive sleep apnea hypopnea syndrome, OSAHS) 患者脑缺血缺氧损伤的应用价值。方法: 招募 2023 年 1-6 月来我院治疗的经多导睡眠监测 (PSG) 确诊为不同程度 OSAHS 患者 20 例, 根据呼吸暂停低通气指数 (AHI) 将患者分为轻度组 (AHI 5-15 次/小时) 8 例, 中重度组 (AHI > 15 次/小时) 12 例, 同时纳入年龄、性别、BMI 与病例组匹配的健康志愿者为对照组, 所有患者及对照组均行常规头颅 MRI 平扫、3D T1WI 及 APT 成像, 将 APT 功能像和 3D T1WI 解剖像融合, 在融合图像上分别选取双侧额叶、顶叶、颞叶、枕叶、基底节区、双侧海马、双侧小脑半球、胼胝体、脑桥、延髓勾画感兴趣区, 测量不同脑区 APT 值, 应用 SPSS 21.0 统计软件分析病例组和对照组不同脑区 APT 值差异性。结果: 轻度 OSAHS 患者各脑区 APT 值与对照组相比均无明显差异性 ($P > 0.05$); 与对照组相比, 中重度 OSAHS 患者在脑桥 ($t = -3.28$, $P = 0.002$)、延髓 ($t = -2.12$, $P = 0.04$)、左侧小脑半球 ($t = -2.74$, $P = 0.009$)、右侧小脑半球 ($t = -3.69$, $P = 0.001$)、左侧颞叶 ($t = -4.24$, $P < 0.05$)、右侧颞叶 ($t = -2.64$, $P = 0.012$)、右侧额叶 ($t = -2.08$, $P = 0.045$)、右侧丘脑 ($t = -2.41$, $P = 0.021$) 左侧豆状核 ($t = -2.19$, $P = 0.035$) 等脑区 APT 值增高, 差异有统计学意义, 其余脑区 APT 值差异均无统计学意义 ($P > 0.05$)。结论: APT 成像较常规 MRI 成像更能早期发现中重度 OSAHS 患者缺血缺氧性脑损伤, 可为临床早期治疗提供客观的影像依据, 具有广泛的应用前景。

PU-0076

护理干预对幽闭恐惧症患者 MRI 检查中的效果分析

刘格格、刘瑞瑞、李月、冯敏、李笑石、马永利
西安大兴医院

目的: 讨论主动护理干预在幽闭恐惧症患者 MRI 检查中的应用效果。方法: 前瞻性选取 2020 年 1 月—2022 年 12 月在西安大兴医院进行 MRI 检查的 100 例患者, 随机分为两组, 每组各 50 人。应用主动性护理干预为 A 组, 常规护理为 B 组, 对比分析两组的心率、呼吸频率、血压等各项客观性生命体征变化, 记录两组患者的检查前平静时间、恐惧评分。邀请两名影像科高年资医师对图像质量采用 5 分制进行主观打分, 结果不一致时引入第三名医师进行判断。B 组患者在常规护理后未能完成检查者, 接着进行主动护理干预, 但不纳入实验统计。

结果: A 组患者 48 人完成检查, 2 人未能完成检查, 检查成功率 96%, B 组患者 15 人未能完成检查, 检查成功率 70%。A 组患者的平均心率 75.05 ± 6.02 次/min, B 组患者平均心率 92.05 ± 7.09 次/min ($p < 0.001$); A 组患者呼吸频率 16.05 ± 5.01 次/min, B 组患者呼吸频率 20.15 ± 4.09 次/min ($p < 0.001$); A 组患者收缩压 115.65 ± 13.78 mmHg, B 组患者收缩压 131.56 ± 10.88 mmHg ($p < 0.05$); A 组患者舒张压 69.09 ± 9.05 mmHg, B 组患者舒张压 85.09 ± 7.11 mmHg ($p < 0.05$); A 组图像质量评分 4.68 ± 2.22 分, B 组图像质量评分 3.98 ± 1.77 分, A 组图像质量显著高于 B 组 ($P < 0.05$); A 组患者恐惧评分 3.65 ± 0.62 分, B 组患者恐惧评分 6.99 ± 1.52 分, A 组恐惧评分显著低于 B 组 ($P < 0.05$); A 组检查前安抚时间 22.26 ± 9.88 min, B 组检查前安抚时间 42.25 ± 6.89 min, A 组安抚时间显著降低 ($P < 0.05$)。

结论: 有效的主动护理干预可减轻幽闭恐惧症患者检查前的恐慌心理, 促使患者成功完成检查。

PU-0077

磁共振在超声消融治疗（海扶）中的应用

邹瑜
重庆医科大学附属永川医院

目的: 子宫肌瘤是女性生殖器最常见的良性肿瘤, 超声消融治疗（海扶）是目前治疗子宫肌瘤最安全有效的方法, 本文意在利用磁共振多方位多参宿的优势和特点, 更好的帮助临床制定手术治疗方案并有效的评估治疗效果和损伤。

方法: 利用海扶刀的技术超声聚焦的原理, 首先明确超声聚焦的点位为 5mm, 那么我们在设定磁共振扫描方案时便可以设定扫描层厚为 5mm, 以便更好的评估点位的设置和布局。超声聚焦的方位主要为矢状位和横断位。因此磁共振扫描应以矢状位和冠状位为主, 冠状位为辅, 加做脂肪抑制序列能更好的显示病灶的情况。磁共振扫描定位有两种方式: 1 是以人体长轴来设定冠、矢、轴三个方位; 2 是以宫体为长轴来设定冠、矢、轴三个方位。定位方式可根据临床医生的要求来选择, 术中临床医生可结合磁共振影像更精准的定位治疗, 在减少周围软组织和器官的损伤前提下达到最佳手术效果。术后同样建议磁共振检查评估手术的效果以及整个腹壁盆腔及后壁的损伤, 检查定位需与术前定位保持一致以便更精准的评估预判。

结果: 磁共振术前检查可以对海扶手术提供精准的定位和方案设定, 术后的检查可以完美的评估手术的效果和内膜的完好及周围软组织的损伤。对临床手术提供了准确的影像依据和疗效评估。

结论: 磁共振的多参数多方位的优势可以为超声消融治疗（海扶）子宫肌瘤提供直观的影像依据, 并且对术后疗效和损伤的评估更加精准, 值得推广。

PU-0078

冠状位磁共振成像 PROSET 水激发序列对多节段腰椎间盘突出症致病节段的诊断价值

陈水斌、林毅、罗爱芳、肖玉辉、欧阳林
中国人民解放军联勤保障部队第九〇九医院

目的 评估冠状位磁共振成像和 PROSET 水激发序列对多节段腰椎间盘突出症致病节段的准确性。

方法 回顾性分析 2019 年 1 月至 2022 年 12 月在我院接受手术治疗的 66 例多节段腰椎间盘突出症患者临床和影像学资料。MRI 检查使用 3.0TMR 扫描仪(荷兰 Philips Ingenia 公司, 3.0T), 之后使用冠状位 PROSET 水激发序列进行扫描。收集 MRI 图像上多节段腰椎间盘突出症的表现及与神经根受压关系。以术中和术后患者疗效为受压神经根节段的判断标准, 分析计算冠状位 MRI 诊断受压神经根的敏感性、特异性、阳性预测值、阴性预测值和准确性。并使用 Kappa 一致性分析两者

诊断一致性。结果 66 例多节段腰椎间盘突出症患者, MRI 图像上共识别到 31 例患者存在 2 节段腰椎间盘突出受累, 25 例存在 3 节段受累, 10 例存在 4 节段受累, 共涉及 177 个椎间盘。在冠状位腰椎 MRI 上, 椎间盘突出症引起的神经根压迫存在一系列形态学变化, 包括神经根凹陷、神经节信号增强、神经根肿胀或神经根断裂。L4/L5 神经根起点多位于椎间盘平面(69.81%), L5/S1 神经根起点多位于椎间盘上方(72.58%)。共 79 处神经根受压, 其中以 L5 的神经根受压比例最高 82.28%(65/79)。冠状位 MRI 在多节段椎间盘突出症患者定位致病节段的诊断敏感性为 97.4%、特异性为 99.3%、阳性预测值为 93.7%、阴性预测值为 98.6%、准确性为 98.6%。冠状位 MRI 与术中及术后诊断 Kappa 一致性高($k=0.926$)。结论 冠状位 MRI 对定位多节段椎间盘突出症患者的致病节段、受压神经根具有较高准确性, 值得今后进一步研究。

PU-0079

磁共振 3D-FIESTA 序列在诊断膝关节半月板损伤中的应用价值研究

徐建

连云港市第一人民医院

[目的] 探究 3D-FIESTA 序列在诊断膝关节半月板 III 级损伤中的应用价值。[方法] 选取我院于 2021 年 1 月-2022 年 12 月收治的膝关节半月板 III 级损伤患者 50 例, 对 MRI 诊断结果与关节镜手术结果进行对比, 分析关节镜手术结果、2D 常规序列术前诊断 (正确/错误)、3D-FIESTA 序列术前诊断 (正确/错误)。[结果] 本组 50 例半月板 III 级损伤关节镜手术显示半月板撕裂位置情况如下: 内侧半月板 A 区 5 例, AB 区 13 例, ABC 区 7 例, B 区 3 例, BC 区 1 例, C 区 0 例; 外侧半月板 A 区 4 例, AB 区 11 例, ABC 区 3 例, B 区 3 例, BC 区 0 例, C 区 0 例。以关节镜手术确定的损伤位置为标准, 核磁共振常规序列与 3D-FIESTA 序列的诊断结果分别与该标准进行比对, 结果显示 3D-FIESTA 序列在确定膝关节半月板 III 级损伤位置时, 与关节镜手术结果一致性极佳 ($Kappa=0.909$), 差异有统计学意义 $P<0.05$ 。[结论] 与核磁共振常规序列相比, 3D-FIESTA 序列能够客观、可靠地显示膝关节半月板损伤的位置, 为临床医生提供可靠的依据, 该成像技术值得一定的推广和应用。

PU-0080

多模态 MRI 在成人胶质瘤术前评估中的应用价值研究

徐蕊、罕迦尔别克·库锐、王云玲

新疆医科大学第一附属医院

目的 探讨多模态磁共振成像在预测成人型胶质分级与评估 IDH-1 基因型及预测肿瘤细胞增殖活性中的应用价值。方法 回顾性分析 2021 年 9 月-2023 年 6 月在新疆医科大学第一附属医院经病理组织证实为成人胶质瘤的 115 例患者的临床及影像资料数据。所有患者术前均接受 T1WI、T2WI、T2 Flair、DWI、磁共振增强成像、DTI 以 MAGiC 影像技术检查。比较高低级别成人胶质瘤及高级别成人胶质瘤不同 IDH-1 基因型各参数的组间差异及鉴别诊断效能, 评估肿瘤增殖活性 Ki-67 LI 与各参数的相关性。结果 T1、T2、ADC、FA 值在高低级别成人胶质瘤及高级别成人胶质瘤的不同 IDH-1 基因型之间的差异具有均统计学意义, 其中 ADC 具有最佳的诊断效能。在鉴别高低级别成人胶质瘤中 ADC 的 AUC 值为 0.930, 灵敏度为 92.96%, 特异度为 79.55%。在高级别成人胶质瘤不同 IDH-1 基因型组中 ADC 的 AUC 值为 0.817, 灵敏度为 91.70%, 特异度为 61.50%。在不同病理分级中, Ki-67 LI 的组间差异均具有统计学意义。各参数与 Ki-67 LI 具有相关性, 其中 ADC 具有最强的相关性, 相关系数为 0.356。结论 多模态 MRI 的定量参数在鉴别高低级别成人胶质瘤

和评估高级别成人胶质瘤 IDH-1 不同基因型及肿瘤增殖活性中具有较高的诊断效能，为成人胶质瘤的诊断提供更加客观的诊断依据。

PU-0081

冠状动脉解剖评分系统在急性 STEMI 患者微血管阻塞中的预测价值

周莹、李子文
连云港市第一人民医院

目的 探讨不同冠状动脉解剖评分系统对急性 ST 段抬高型心肌梗死（STEMI）患者首次经皮冠状动脉介入治疗（PCI）后发生微血管阻塞（MVO）的预测价值。**方法** 回顾性分析首次接受 PCI 治疗并行心脏磁共振（CMR）检查的急性 STEMI 患者，根据 CMR 结果将患者分成 MVO 组与非 MVO 组，计算每位患者的 SYNTAX 积分、Gensini 积分及其相应的罪犯血管积分，并测量 CMR 相关参数。**结果** 共纳入 55 例急性 STEMI 患者，其中 MVO 组 21 例，非 MVO 组 34 例。MVO 组的 SYNTAX 积分、Gensini 积分、罪犯 SYNTAX 积分、罪犯 Gensini 积分显著高于非 MVO 组（ $P=0.001$ 、 $P<0.001$ 、 $P<0.001$ 、 $P<0.001$ ）。受试者工作特征（ROC）曲线分析显示，罪犯 Gensini 积分在预测 MVO 中具有最大的曲线下面积（AUC）（ $AUC=0.877$ ， $P<0.001$ ），最佳阈值为 44 时的敏感度和特异度分别为 90.5%、76.5%。在多变量 logistic 回归分析中，Gensini 积分（优势比=1.123， $P=0.044$ ）与罪犯 Gensini 积分（优势比=1.132， $P=0.038$ ）为 MVO 的独立预测因子。**结论** 在首次接受 PCI 治疗的急性 STEMI 患者中，罪犯血管为 LAD 者更易发生 MVO，Gensini 积分与罪犯 Gensini 积分可能是预测 MVO 的潜在指标。

PU-0082

基于病变周围及病变所在区域 bp-MRI 影像组学预测临床显著性前列腺癌

李绎达
齐齐哈尔医学院

简介：本研究旨在探索 MRI 图像组学特征在前列腺癌（PCa）诊断中的潜在价值，特别关注了肿瘤周围的特征对放射学模型的性能提升的影响。通过系统性地研究肿瘤周围区域的大小，我们旨在确定肿瘤周围区域的 MRI 特征是否能够帮助准确诊断前列腺癌。

研究方法：我们进行了一项回顾性研究，收集了 162 例前列腺癌患者的动态对比增强 MRI 扫描数据，其中包括 74 例前列腺癌和 88 例前列腺增生患者。前列腺癌的确诊基于病理穿刺活检或术后病理结果，前列腺增生的确诊基于病理穿刺活检结果。我们使用 T2 加权成像（T2WI）和表观弥散系数（ADC）图像勾画了肿瘤及其周围区域的轮廓。肿瘤区域由两名放射科专家标记，然后我们逐步扩大了区域，以获得距离肿瘤不同径向距离的四个环形区域。从中提取了 MRI 图像组学特征，并使用统计方法如 t 检验、LASSO Cox 回归、mRMR 筛选特征。我们采用逻辑回归、RF 和 SVM 分析了对前列腺癌和前列腺增生诊断最有价值的特征，并建立分类模型对病变内部和周围特征进行比较，以确定最佳建模方式。最后，我们评估了模型的准确度、敏感度、特异度以及受试者工作特征（ROC）曲线，以评估其诊断 PCa 的价值。

研究结果：研究发现，距离肿瘤 2~3 毫米的周围区域的特征在预测性能上表现最佳。在训练集中，该预测模型的 AUC 为 0.92（95%置信区间：0.81~1.00），准确率为 0.89（95%置信区间：0.72~0.98），特异度为 0.91，敏感度为 0.65。在测试集中，AUC 为 0.93（95%置信区间：

0.88~0.98), 准确率为 0.84 (95%置信区间: 0.76~0.90), 特异度为 0.84, 敏感度为 0.85。因此, 选择肿瘤周围区域的大小会影响预测临床显著性前列腺癌的性能。

结论: 在本研究中, 我们深入研究了 MRI 图像组学特征在前列腺癌 (PCa) 的临床诊断中的潜在用途, 特别关注了肿瘤周围区域大小对放射学模型的影响。我们的发现表明, 肿瘤周围区域的选择在提高临床显著性前列腺癌的预测性能方面具有关键作用。

PU-0083

颞颌关节间隙改变与关节盘移位的关系

孙素晔

天津大学天津医院

目的: 研究颞颌关节间隙改变与关节盘移位的关系, 探讨关节间隙改变在诊断关节盘移位的价值。

方法: 收集有临床症状并行磁共振检查的颞下颌关节紊乱病 (temporomandibular joint disorders, TMD) 患者 85 例 100 侧关节影像, 按盘分界角大小分成 ABCD 组, A 组 (正常组) $-15^{\circ} \sim 15^{\circ}$ (20 例); B 组 $16^{\circ} \sim 50^{\circ}$ (22 例); C 组 $51^{\circ} \sim 80^{\circ}$ (23 例); D 组 $\geq 81^{\circ}$ (20 例)。测量各组关节前、上、后间隙, 采用 SPSS 22.0 对数据进行统计学分析。

结果: 关节前间隙 B、C 组大于 A 组, 存在统计学差异 ($P < 0.05$); D 组与 A 组相比, 关节前、上、后间隙均无显著性差异 ($P > 0.05$)。

结论: 关节盘轻、中度前移时, 关节间隙有相应改变。关节盘前移位超过一定程度时, 对关节间隙无影响。单纯的关节间隙改变尚不能作为诊断关节盘移位的准确依据。

PU-0084

基于 MR 影像组学模型预测结直肠癌肝转移的研究

吴垚锟¹、杨林²

1. 四川省绵阳市第三人民医院

2. 川北医学院附属医院

目的: 探讨基于 MR 影像组学模型预测结直肠癌肝转移 (Colorectal cancer liver metastasis, CRLM) 的效能。

方法: 以 2016 年 6 月-2022 年 8 月在川北医学院附属医院行基线 MRI 检查并经病理证实的结直肠癌 (Colorectal cancer, CRC) 120 例为研究对象, 按 7:3 比例随机分为训练组及验证组。收集其性别、年龄、病理结果、MR TN 分期、癌胚抗原 (Carcinoembryonic antigen, CEA) 及糖类抗原 19-9 (Carbohydrate antigen 19-9, CA19-9) 等临床指标。采用单因素和多因素分析筛选 CRLM 的临床独立风险因素。在 (斜) 轴位不压脂 T_2 加权图像 (T_2 weighted imaging, T_2WI) 及弥散加权成像 (Diffusion weighted imaging, DWI) ($b=800$) 序列上提取相应的影像组学特征。采用最小绝对收缩和选择算子 (Least absolute shrinkage and selection operator, LASSO) 回归筛选各序列的最优影像组学特征。采用 logistic 回归建立 T_2WI 模型、DWI 模型、 T_2WI -DWI 模型 M 及影像组学-临床联合模型 U。采用受试者工作特征曲线下面积 (AUC) 评估模型预测效能。

结果: 入组 120 例 CRC 中, 肝转移 (Liver metastasis, LM) 57 例, 无 LM 63 例。临床指标 CEA 及 CA19-9 在 LM 组与无 LM 组之间的差异具有统计学意义 ($P < 0.05$)。经 LASSO 回归分析后从 T_2WI 及 DWI 序列中分别筛选出 3 个最优组学特征。M、 T_2WI 及 DWI 模型 AUC 值在训练组分别为 0.824、0.811 及 0.803, 在验证组分别为 0.813、0.795 及 0.798; U 模型的 AUC 值在训练组为 0.899、在验证组为 0.889, 在本研究中是预测 CRLM 的最佳模型。

结论: 基于 CRC 原发灶 T_2WI 与 DWI 序列的 MR 影像组学模型对于 CRLM 的预测具有较好效能。影像组学与临床独立风险因素相结合的联合模型能够进一步提高预测效能。

PU-0085

对颈部转移淋巴结良恶性的影像诊断回顾性分析

张畅

徐州医科大学附属医院

目的 利用影像学研究诊断影像颈部淋巴结的文献回顾总结。**方法** 广泛查阅国内外近年有关诊断颈部淋巴结良恶性病变,对颈部淋巴结解剖、良恶性表现,利用 DWI、MRS、PWI、CT 灌注及 PET/CT 诊断进行总结分析。**结果** 早期的研究常以淋巴结的大小来判定有无转移。有以淋巴结的最短径增加作为参考标准,以淋巴结 1cm 最短径来作为良恶性的分界线是最有效的参考标准,IB 和 II 区的转移淋巴结参考标准要大 1 ~ 2 mm。有原发咽及下咽部肿瘤者,咽后淋巴结长径为 0.6 ~ 0.8 mm 即高度提示转移可能。对 SCC (鳞状细胞癌) 颈部转移淋巴结在不同分界下的灵敏度和特异度做了评估,轴位上最长径为 1 cm 作为分界时的灵敏度和特异度分别是 88 % 和 39 %,而 1.5 cm 作为分界时的灵敏度和特异度则分别为 56 % 和 84 %。Steinkamp 等研究表明,以淋巴结长短径之比 L/S 来判断淋巴结良恶性有一定的意义,转移淋巴结长短径之比 $L/S < 2$, 良性淋巴结 $L/S > 2$ 。此外,淋巴结大小根据其位置及患者的年龄不同而有不同。转移淋巴结常出现坏死,最常见于头颈部鳞癌。淋巴结周围不均匀强化伴中央低密度区是诊断转移淋巴结最可靠的征象。坏死淋巴结在磁共振 T1 加权像上表现为低信号,而根据坏死部分组成不同,如角化、凝固、液化而在 T2 上表现为低信号或高信号。囊变淋巴结通常与甲状腺乳头状癌和口咽鳞癌有关,钙化的淋巴结主要见于甲状腺癌,是由于甲状腺球蛋白的沉积或淋巴结内的沙砾样钙化。淋巴结结节外侵犯通常表现为边缘不规则,与邻近组织脂肪层面消失,在大的淋巴结更易发生 (大部分为 > 3 cm 的鳞癌转移),但是 25 % 直径小于 1cm 的淋巴结也可能存在病理上的结外侵犯。淋巴结结外侵犯是预后不良的指征,存活率要降低 50 % 以上,与肿瘤复发及远处转移密切相关。需注意的是,近期淋巴结活检及辐射也可导致淋巴结炎症及不规则的边缘而类似淋巴结的结外侵犯。

PU-0086

基于深度学习降噪重建新技术在前列腺双参数 MRI 中的应用价值

可赞、李亮、查云飞

武汉大学人民医院

目的: 探讨基于新的深度学习 (DL) 降噪重建技术在前列腺双参数 MRI (T2WI、DWI) 图像质量方面的应用价值。

方法: 回顾性分析 36 例行前列腺磁共振检查患者的影像资料,扫描序列包括常规 T2WIs、DWIs 及使用 DL 后的 T2WIDL、DWIDL。主观评价由两名具有不同影像诊断经验 (3 年、7 年) 的医师依据 Likert Scale 评分法对图像质量进行双盲评价,采用 Wilcoxon 秩和检验评估两名读者图像质量评分的差异;使用 κ 统计法评估读者间的一致性。T2WI 图像观察内容包括:前列腺包膜清晰度、病灶对比度及边缘锐利度、解剖细节的显示、盆腔肌肉及骨骼的清晰度及整体图像质量。DWI 图像观察内容包括:前列腺解剖清晰度、病灶对比度、盆腔肌肉及骨骼的清晰度、图像的变形、整体图像质量。使用配对 t 检验和 Mann-Whitney U 检验对客观图像质量定量数值信噪比 (SNR) 及对比噪声比 (CNR) 进行统计学分析。

结果: 本研究 36 例患者年龄 67.1 ± 9.9 (37 ~ 85) 岁。基于主观评分标准,两名读者对 T2WIs、DWIs 总评分分别为 3.4 ± 0.7 、 3.0 ± 0.8 分及 3.3 ± 0.6 、 3.1 ± 0.5 分,对 T2WIDL、DWIDL 总评分分别为 4.6 ± 0.6 、 4.3 ± 0.7 分及 4.3 ± 0.5 、 4.2 ± 0.6 分;T2WIDL、DWIDL 评分均高于 T2WIs、DWIs 评分。基于客观评价,所有病灶 T2WIs 及 T2WIDL 的 SNR 分别为 11.8 ± 2.4 、 26.9 ± 8.0 , 具

有显著性差异 ($P < 0.01$)；CNR 分别为 0.5 ± 0.1 、 0.6 ± 0.1 ，差异有统计学意义 ($P = 0.03$)；所有病灶 DWIs 及 DWIDL 的 SNR 分别为 23.2 ± 13.5 、 33.9 ± 16.8 ，CNR 分别为 0.5 ± 0.2 、 0.6 ± 0.1 ，具有显著性差异 ($P < 0.01$)。

结论：基于新的 DL 技术对前列腺双参数 MRI 图像质量均具有显著的提高，其中 T2WIDL 的效果要优于 DWIDL，故优先推荐使用 T2WIDL 序列。

PU-0087

星形叠层容积内插序列在盆腔扫描中的应用价值

葛洪

东南大学附属中大医院

目的：本文旨在研究星形叠层容积内插 (Star VIBE) 序列在盆腔扫描中的应用价值。**方法** 选取东南大学附属中大医院 2021 年 1 月~2023 年 1 月经过手术病理证实的盆腔恶性肿瘤患者。术前患者用时接受屏气常规 VIBE 动态增强和自由呼吸 Star Vibe 延迟增强 MRI 扫描。总共 40 例患者，均为女性，平均 (65.8 ± 4.2) 岁，其中宫颈癌 23 例、子宫内膜癌 17 例。由 2 名具有 5 年以上女性盆腔 MR 诊断经验的医师分别对 2 个序列图像子宫阴道轮廓清晰程度、盆腔血管清晰度、病灶的识别能力、运动伪影和条纹伪影 (针对 Star VIBE 序列)、诊断确信程度及整体图像质量进行打分，使用 Cohen Kappa 法来评估两名医师之间的评分一致性，并采用 Wilcoxon 配对符号秩和检验来比较采用常规 VIBE 和 Star VIBE 序列图像质量的差异。对肿瘤侵犯程度 MRI 的诊断与术后病理结果进行 McNemar Test 和 Kappa 检验对照分析。结果 Star VIBE 检查下盆腔脏器边缘锐利度、盆腔血管清晰度、病变清晰度、图像运动伪影、图像总体质量评分均高于常规 VIBE 检查，差异显著 ($P < 0.05$)。常规 VIBE 和 Star VIBE 序列对与肿瘤侵犯程度与病理结果无统计学差异 ($P > 0.05$)。但 Star VIBE 序列图像对于肿瘤侵犯阴道 (宫颈) 情况的准确率 (90.1%)、敏感性 (88.9%) 与特异性 (90.3%) 均高于常规 VIBE 序列图像，与病理结果的一致性更高 ($K = 0.734$, $P < 0.001$)。**结论** 自由呼吸 Star VIBE 序列盆腔 MRI 的图像质量优于屏气常规 VIBE 序列，诊断符合率明显高于常规 VIBE 序列，可以作为盆腔的 MRI 检查方法。

PU-0088

AD 患者 APT 与 MMSE 及 β 淀粉样蛋白的相关性研究

孙鹏、刘鹏飞

哈尔滨医科大学附属第一医院

目的：采用 APT 技术检测 AD 患者与正常老年人之间的脑内差异，探讨 APT 成像值及相位值与 MMSE 表及 β 淀粉样蛋白的相关性。**材料与方法：**本研究包括 36 例 AD 患者和 18 例正常对照者。AD 组：男 19 例，女 17 例。正常对照组：男 8 例，女 10 例。AD 患者纳入标准：均符合精神障碍诊断和统计手册 (第 4 版) 以及美国国立神经疾病语言障碍和卒中研究所制定的符合 AD 的诊断标准 (MMSE 评分在 8~20)；排除标准：(1) 严重内科疾病；(2) 神经及精神疾病病史；(3) 常规 T1WI、T2WI 序列扫描存在明显异常。正常对照组无明显认知功能障碍，所有受试者均进行了简易精神状态量表 (MMSE) 评估，受试者文化程度均处于小学水平。通过第三方机构获得 AD 患者血液中 β 淀粉样蛋白含量值。采用 Philips 3.0 T 磁共振成像系统和头部 8 通道线圈进行 MRI 横断位扫描。扫描序列：T1W FSE 序列、T2W FSE 序列、APT 成像扫描。APT 的图像分析采用 IDL 软件。在 APT 图上按选择相位图类似方法选择双侧海马、黑质、杏仁体作为 ROI 进行勾画，取平均值。各脑结构的 APT 信号强度通过 MTRasym 获得。采用 SPSS 23.0 统计学软件进行统计学分析。采用单样本 K-S 检验行正态性分析，数据均服从正态分布，正常对照者和 AD 患者各脑结构的

MTRasym (3.5 ppm)值、平均年龄、MMSE 评分均以 $x \pm s$ 表示;经方差同质性检验,数据均符合方差齐性。AD 组和对照组 MTRasym (3.5 ppm)值比较采用两独立样本 t 检验。对 AD 组各核团 MTRasym(3.5 ppm)值及血液 β 淀粉样蛋白含量与 MMSE 进行 Pearson 相关分析, $P < 0.05$ 为差异有统计学意义。结果:与正常对照组比较,AD 组的双侧海马(3.5 ppm)值明显增高:AD 组右侧海马的(3.5 ppm)增高 56%,左侧海马的(3.5 ppm)增高 57%。在 AD 组中,双侧海马的(3.5 ppm)值均与 MMSE 评分呈负相关,与血液中 β 淀粉样蛋白值呈正相关。结论:APT 与血液 β 淀粉样蛋白及 MMSE 评分明显相关,能无创探测 AD 患者脑内铁沉积及游离蛋白改变情况。

3.0T 磁共振 T2*定量分析评价痛风性关节炎临床应用价值

马进
重庆市中医院

目的:探究痛风性关节炎患者接受 3.0T 磁共振 T2*定量分析对于疾病诊断的临床价值。方法:选择 2021 年 6 月到 2022 年 6 月我院收治痛风性关节炎患者 46 例以及同期健康体检者 7 例作为案例进行研究分析。所有患者均接受 FLASH 多回波序列 T2mapping 扫描检查。常规扫描通过磁共振成像标准进行,测量膝关节承重面、非承重面软骨区域、髌骨软骨关节接触面和非接触面 T2 值,回顾分析对比不同小组患者的膝关节相关指标。结果:健康组膝关节软骨 T2 伪影图表现为厚度均匀,软骨关节面连续光滑,均匀蓝绿色的带状结构同时明确分层色阶逐渐过渡。对于轻度关节炎软骨伪影图表现为关节软骨内信号不均匀,在蓝绿色背景下斑点状绿色、红色信号表现,同时关节承重面和髌骨关节面表现明显。重度患者软骨表现明显变薄,同时软骨面存在局限性的缺损,软骨伪影图呈现出条状红色信号影响。健康组和不同分级关节炎患者的 T2*定量测定结果均有显著数据差异, $P < 0.05$ 。结论:痛风性关节炎采用 3.0T 磁共振 T2*定量分析的诊断效果显著,能够实现对软骨损伤、变性的客观性评价,可以实现对关节炎程度的客观性评价,值得推广。

基于多参数 MRI 的深度学习模型在 MSI-H 转移性直肠癌评估中的初步探索与分析

臧书芹、李帅、刘明璐、沈浮、邵成伟
海军军医大学第一附属医院(上海长海医院)

目的

微卫星不稳定性(MSI)是免疫检查点抑制剂(ICPIs)应答的生物标志物。PD-1 抑制剂在 MSI-H 转移性直肠癌(mRC)中具有较高的疾病控制率和良好的无进展生存期(PFS)。本研究的目的是探讨基于多参数 MRI 的深度学习模型在 mRC 患者 MSI-H 评估中的价值。

材料与方法

本回顾性研究纳入了 166 例在我院使用 3.0T 扫描仪进行直肠磁共振成像的 mRC 患者。术后免疫组化(IHC)检测 MSI 状态。以 116 例(70%)患者为学习集,构建了基于 nnU-Net 预测 MSI 状态的深度学习(DL)模型。深度学习模型的诊断准确性以 50 例患者(30%)为测试集进行评估。为了评估诊断性能,在训练和测试数据集中分别使用受试者工作特征(ROC)曲线和曲线下面积(AUC)。

结果

共有 17 例 mRC 患者具有 MSI-H 状态。使用 DL 模型训练时, AUC 为 0.910 (95%CI: 0.823 ~ 0.963, 敏感度 84.4%, 特异度 92.9%), 测试集 AUC 为 0.768 (95%CI: 0.659 ~ 0.856, 敏感度 84.4%, 特异度 64.3%)。

结论

我们的数据表明, 基于多参数 MRI 的深度学习模型对 MSI-H mRC 具有良好的评估性能。我们提出的 DL 模型可以作为评价 MSI-H 状态的成像生物标志物, 并具有应用于临床治疗计划的潜力。

Correlations between Apparent Diffusion Coefficient Values of WB-DWI and Clinical Parameters in Multiple Myeloma

Jiping Wang, Bei Zhang
First Hospital of Jilin University

ABSTRACT:

PURPOSE: Whole-Body Diffusion Weighted Imaging (WB-DWI) is a method in evaluating bone marrow infiltration of Multiple myeloma (MM). Our aim was to elucidate the correlations between apparent diffusion coefficient (ADC) value and clinical parameters.

MATERIALS AND METHODS: This retrospective, single-institution study included 101 Chinese patients with MM who underwent WB-DWI from May 2017 to May 2019. ADC value of MM lesions and clinical parameters were quantified at the baseline visit and after 4-course induction chemotherapy. The Multiple linear regression and Logistic analysis was conducted to find the implicit, inherent relationships among these data.

RESULTS: Paired Wilcoxon test showed that ADC value at baseline visit (ADC0) were significantly lower than ADC value at 4-course induction chemotherapy follow-up (ADC4 c) ($p < 0.001$). RISS stage, Type of MM and $\beta 2$ -MG were predictors of clinically significant ADC value increase or decrease ($p < 0.05$). Multiple linear regression showed that ADC0 was negatively associated with $\beta 2$ -microglobulin ($\beta 2$ -MG) ($p < 0.001$) and IGH rearrangement ($p = 0.012$), while RISS Stage III ($p = 0.001$), type IgG λ ($p = 0.005$) and albumin were the parameters negatively associated with ADC4 c ($p = 0.010$).

CONCLUSIONS: The ADC value of WB-DWI may be associated with clinical parameters of MM including FISH result, which also may help to demonstrate prognosis of patients with MM.

PU-0093

磁共振脂肪定量技术对骨质疏松病人腰椎质子密度脂肪分数的定量研究

曹毅、郭林
天津市天津医院

目的：探讨磁共振脂肪定量技术对骨质疏松患者的腰椎椎体脂肪含量评估能力。骨质疏松患者口服人工虎骨胶囊（药物临床试验），口服药物前后，脂肪定量技术对腰椎椎体脂肪定量测量与口服药物前后临床效果的相关性研究。

研究方法：选取 2021 年 6 月~2023 年 1 月，天津医院骨内科门诊临床确诊为骨质疏松的 50 例患者，女性 50 例，年龄 55~75 岁，平均年龄 63.91 ± 7.38 岁。50 例患者均在 2021 年 6 月初期做磁共振脂肪定量检查，间隔 18 个月后再做。18 个月内，骨质疏松患者口服人工虎骨胶囊，药效机制改善肌肉骨骼疼痛症状，增加骨密度。使用联影 MR u780 3T 高场磁共振成像仪，床面一体全脊柱线圈进行检查。将 FACT 序列扫描自动得到的 FF 图像传至工作站，由两位观察者在 FF 图像上采用双盲法对腰椎椎体 FF 值（L1~L5）进行测量与分析。选取 L1~L5 椎体矢状面最大层面（即经过腰椎正中的图像），手动放置圆形感兴趣区（ROI）于椎体中心位置，ROI 大小约为 200mm^2 ，每个 ROI 要最大限度包括椎体松质骨，避开骨皮质、终板和椎间盘。每个椎体测量 3 次，求平均值。采用组内相关系数（ICC）检验两位观察者测量数据的一致性。采用单因素方差分析对腰椎各椎体 FF 值的差异进行方差齐性检验，使用配对样本 t 检验对比分析口服药前后测得的 FF 值。（ $P < 0.05$ 时为差异有意义）

结果：比较口服人工虎骨胶囊前后各腰椎椎体 L1、L2、L3、L4、L5 椎体及所有椎体均值间 FF 值分别是（ $51.2 \pm 11.1\%$ ， $55.3 \pm 9.11\%$ ， $54.0 \pm 12.8\%$ ， $59.2 \pm 10.8\%$ ， $64.1 \pm 8.6\%$ ， $56.7 \pm 8.5\%$ ），（ $49.9 \pm 8.7\%$ ， $50.1 \pm 11.0\%$ ， $51.7 \pm 10.3\%$ ， $53.9 \pm 11.5\%$ ， 59.6 ± 7.8 ， $51.7 \pm 8.5\%$ ）。两组数据符合正态分布， $t = -1.019$ ， -1.078 ， -1.002 ， -1.041 ， -0.017 ， -1.123 （ P 均 < 0.05 ）。人工虎骨胶囊周期性口服与磁共振脂肪定量技术测得 FF 值具有负相关性。

结论：磁共振脂肪定量技术在骨质疏松基础研究及临床应用方面都具有非常广阔的发展空间。

MR 在脑深部电刺激术治疗帕金森病中的应用价值

王建伟、刘俊、张也乐、穆西虎
江苏省人民医院（南京医科大学第一附属医院）

目的：探讨 MR 在脑深部电刺激术（deep brain stimulation, DBS）治疗帕金森病（Parkinson's disease, PD）手术中评估的应用价值。材料与方法：收集在南京医科大学第一附属医院帕金森病专病门诊就诊的 PD 患者 21 例，PD 的诊断依据英国脑库临床诊断标准（Parkinson's UK Bank for idiopathic PD），所有病例行药物保守治疗无效，经临床评估后均符合 DBS 手术治疗指征。PD 患者在 DBS 术后行 1.5T 头颅磁共振扫描，扫描序列采用薄层轴位、矢状位和冠状位的 T2WI。由一位资深放射科医师和一位资深神经外科医师对患者的 DBS 术后影像进行评估，评价图像对丘脑底核、苍白球等脑深部核团以及术后电极显示的清晰程度、电极针道位置等。结论：1.5TMR 和扫描时间相对较短的 FSE-T2WI 扫描所得图像能够进行的诸如术中是否有出血等常规的影像学诊断，能够清晰显示 DBS 手术的靶点核团以及术后的电极位置，对 DBS 术后电极位置的评估以及手术方案的实施有较高的临床应用价值。

Brain Iron metabolism in the Hippocampus in Patients with Type 2 Diabetes Mellitus

yue cao,dan liao,chunjie guo
the first hospital of Jilin University

Background and purpose:

Emerging evidence suggests that cognitive abilities in the most general population decline slowly from about 40 years old, while diabetes mellitus (DM) accelerates the occurrence of dementia in the normal aging population. Some studies suggest that there is brain iron overload in neurodegenerative diseases. Also, DM is associated with iron metabolism. However, few studies have investigated the brain iron content in patients with DM. This study was performed to investigate iron deposition in the Hippocampus of DM patients using quantitative susceptibility mapping (QSM).

Materials and methods:

11 patients with DM (DM) and 15 aged matched patients without DM (CON) underwent 3T magnetic resonance imaging (MRI). QSM was obtained from gradient echo data and analyzed by drawing regions of interest around relevant anatomical structures. Measurement differences between DM and CON patients were assessed by t tests.

Results:

Compared with the CON, the DM showed significantly decreased susceptibility values in the left hippocampus (0.0026 ± 0.0024 v.s. -0.0006 ± 0.0044 , $p=0.024$). whereas, there is no statistically significant in right hippocampus of two groups (0.0002 ± 0.0046 v.s. -0.0030 ± 0.0038 , $p=0.79$). In CON group, brain iron accumulation is found in left hippocampus (0.0026 ± 0.0024 v.s. 0.0002 ± 0.0046 , $p=0.08$). There was no significant change of iron content in bilateral hippocampal in DM group.

Conclusions:

Our results provide a new relation between DM and iron metabolism in the hippocampus. This suggests that there may be region-specific alterations of iron metabolism in patients with DM. This study may provide theoretical basis for revealing the mechanism of DM accelerating dementia.

PU-0096

抗癫痫药物影响伴中央颞区棘波儿童良性癫痫患儿的认知及脑结构

陈译文
中国人民解放军东部战区总医院

目的：研究抗癫痫药物对伴中央颞区棘波儿童良性癫痫（BECTS）的认知及核磁共振上脑结构产生的影响。

方法：选取南京医科大学金陵医院(南京总医院)医学影像科的伴中央颞区棘波儿童良性癫痫患儿 23 例，该 23 例患儿均服用各类抗癫痫药物（包括单药和多药），入院时采集 BECTS 患儿一般资料（包括年龄、性别、首发年龄、病程）、临床表现、抗癫痫药物使用情况等。对患儿进行纵向随访（至少两次），比较患儿不同时间段的韦氏儿童智力量表（WISC-IV）、视听整合连续测试（IVA-CPT）结果及多模态核磁共振成像（Magnetic resonance imaging, MRI）结果（包括三维 T1 加权成像（3D-T1）、扩散张量成像（Diffusion tensor imaging, DTI）等）。

结果：患儿在服用抗癫痫药物一段时间后 WISC-IV 评分提高 ($P < 0.05$)，在视听整合连续测试 (IVA-CPT) 的听觉持续性、视觉持续性、听觉注意力、综合注意力指标的得分也得到显著提高。基于全脑体素的形态学分析 (Voxel-based morphometry, VBM)，患儿规律服用抗癫痫药物后，在中央前回、左侧额上回及右侧额中回的灰质体积减少。胼胝体膝部、体部、压部、双侧内囊后肢的 DTI 分析显示，患儿的白质各向异性分数 (Fractional anisotropy, FA) 值未有明显差异 ($P > 0.05$)。

结论：综合认知量表及核磁共振成像结果，抗癫痫药物能改善伴中央颞区棘波儿童良性癫痫患儿认知水平，并且重塑癫痫相关皮层区域的灰质结构。

PU-0097

左心房粘液瘤并发小脑转移 1 例

赵纪福、田燕、马密密、曹新山
滨州医学院附属医院

心脏粘液瘤在心脏原发性良性肿瘤中最常见，多见于中老年女性，脑转移较为罕见，发生脑转移时，常以头痛、头晕、局灶性癫痫和偏瘫为主要表现。本例患者主要表现为头晕。心脏粘液瘤发生脑转移的机制尚待阐明，可归纳为血管外浸润，即心脏粘液瘤细胞对血管的侵袭性较强，当粘液瘤细胞通过血液进入颅内血管后，破坏动脉壁而在动脉内膜下增生，最终侵透整个血管层扩散到脑组织，随着肿瘤不断生长、破坏血管壁的同时并侵犯正常脑组织可产生占位效应，由于这个过程进展较为缓慢，经常有出血的特点，引起局部出血。本例患者术后病理除了显示出血外，还伴有机化及含铁血黄素沉着。一般在出血后较长时间出血灶周围才会出现机化及含铁血黄素沉着。本例患者在一年前就出现了神经系统症状，一年后神经系统症状加重，过程较长且病情不断进展，此时脑部坏死组织被新生肉芽组织取代而发生机化，血中的血红蛋白被吞噬、分解，留下大量的含铁血黄素。约有半数患者心脏粘液瘤切除术后发现颅内病灶，本例患者在心脏粘液瘤切除 1 年后发现颅内病灶。脑转移的影像学表现常有恶性肿瘤的征象，即颅内病灶常呈多灶性、出血性并周围伴血管源性水肿。T1WI 和 T2WI 上呈混杂信号，增强扫描后，肿瘤实性部分强化。本例患者 MR 图像符合心脏粘液瘤脑转移的征象，还可见由于占位效应引起的第四脑室受压变窄。鉴别诊断：①颅内海绵状血管瘤畸形；②自发脑出血；③高级别胶质瘤；④出血性脑转移瘤；⑤脑静脉血栓形成。总之，心脏粘液瘤脑转移罕见，当患者有心房粘液瘤病史伴发颅内病变时，应该考虑到是否发生转移。

多参数 MRI 结合临床指标预测 2018 FIGO IIIC1p 期宫颈癌预后的价值

秦凤英、董越
辽宁省肿瘤医院

目的：探讨多参数 MRI 联合临床指标对 IIIC1p 期宫颈癌的预后的预测价值。

方法：收集自 2014 年 12 月至 2018 年 7 月收治的 71 例宫颈癌患者(2018 年 FIGO 分期为 IIIC1p)。所有患者均行根治性子宫切除术(radical hysterectomy, RH)+淋巴结清扫+辅助治疗。收集患者的术前临床指标及术后病理指标，测量并记录原发灶的表观弥散系数(apparent diffusion coefficient, ADC)值(ADCmean、ADCmin、ADCmax)和动态增强(dynamic contrast-enhanced, DCE) MRI 定量参数(Ktrans、Kep、Ve)。采用 Kaplan-Meier 分析比较无进展生存期(progression-free survival, PFS)，Cox 回归分析确定独立预测因素。

结果: 截至随访日期, 15 例患者发生进展 (局部复发 2 例, 远处转移 8 例, 死亡 5 例), 中位 PFS 为 42 个月(6~68 个月)。1 年、3 年 PFS 率分别为 94.4%、78.6%。其中淋巴结比率(lymph node ratio, LNR)和 ADCmin 是 IIIC1p 期宫颈癌患者 3 年 PFS 的独立影响因素, LNR>10%及 ADCmin<0.61×10⁻³mm²/s 与较差的 PFS 相关。

结论: 宫颈癌病灶的 ADC 最小值与 LNR 值是 IIIC1p 期宫颈癌 PFS 的独立影响因素, ADCmin<0.61×10⁻³mm²/s 及 LNR>10%的患者预后不良。

PU-0099

双流高压注射器进行低浓度对比剂 CE-MRA 在头颈动脉狭窄诊断中的应用

姜海龙

南京市第一医院

目的 通过与 DSA 对照, 探讨使用双流高压注射器进行低浓度对比剂三维增强磁共振血管成像(3D CE-MRA)在诊断头颈动脉狭窄中的应用价值。方法 收集 50 例临床怀疑头颈动脉狭窄患者资料, 所有患者均接受双流高压注射器低浓度对比剂头颈部 3D CE-MRA 成像, 并于一周内接受 DSA 检查。两位影像科医师采用 5 分法对 3D CE-MRA 图像质量进行评分, 并以 DSA 为金标准, 对 3D CE-MRA 诊断头颈动脉血管狭窄程度进行评价。结果 低浓度对比剂头颈部 3D CE-MRA 图像质量较好 (均分 3.66±0.48)。3D CE-MRA 对头颈动脉轻度狭窄、中度狭窄、重度狭窄及闭塞诊断的敏感度为 94.4%、83.3%、91.7%、100%, 特异度为 100%、94.7%、94.7%、97.6%, 阳性预测值为 100%、90.9%、84.6%、88.9%, 阴性预测值为 97%、94.9%、97.3%、100%。结论 采用双流高压注射器进行低浓度对比剂头颈部 3D CE-MRA 成像能清晰地显示头颈动脉狭窄性病变, 具有广泛的临床应用价值。

乳腺癌核磁增强扫描的护理方法

童岚

吉林大学第一医院

近年来, 乳腺癌为女性最常见的恶性肿瘤, 乳腺癌的发病率和死亡率逐年上升并且有年轻化趋势, 对女性的身心健康有着严重的威胁。对于乳腺癌的诊断、指导治疗及预后判断, 影像学检查和免疫组化指标起着越来越重要的作用。核磁共振检查因其无放射性损伤, 其影像学特征是具有高空间分辨率, 多方向, 多参数, 多序列扫描和高组织分辨率的成像特点, 使其广泛应用于乳腺癌的影像诊断的推广。随着乳腺癌患者增多及核磁共振检查水平的提高, 乳腺癌增强扫描的患者越来越多。

- 1、MRI 对乳腺癌的诊断优势
- 2、MRI 动态增强扫描患者的护理

遗忘型轻度认知障碍与帕金森病轻度认知障碍患者脑灌注异常的动脉自旋标记研究

王鹏
南京市第一医院

背景：轻度认知障碍（Mild cognitive impairment, MCI）为阿尔兹海默症和帕金森病（Parkinson's disease, PD）伴痴呆的前驱阶段。本研究通过使用动脉自旋标记（Arterial spin labeling, ASL），研究 MCI 亚型患者与健康对照（Healthy control, HC）受试者之间区域灌注属性的差异。

方法：使用 ASL 获取 44 名遗忘型 MCI（amnesic MCI, aMCI）患者、42 名 PD-MCI 患者和 50 名匹配的 HC 参与者的脑血流量（Cerebral blood flow, CBF）。通过数据分析归一化 CBF（normalized cerebral blood flow, z-CBF）和 CBF-连接的组间差异。使用 Spearman 相关分析分别研究组间显著差异脑区 z-CBF 值和临床功能量表之间的相关性分析。使用受试者工作特征分析以确定差异脑区 z-CBF 值的分类能力。提取疾病相关特异脑区的 z-CBF 值进行组间比较。

结果：MCI 亚组显示灌注损伤区域分布存在重叠，aMCI 组比 PD-MCI 组的异常分布更为广泛。与 aMCI 组相比，PD-MCI 患者双侧壳核、左侧中央前回、左侧扣带回中回和右侧额中回的 z-CBF 值减少。在 PD-MCI 组中发现了与执行表现和运动严重程度的相关性，在 aMCI 组中发现了与记忆表现的相关性。CBF-连接的左侧中央前回、左侧中扣带回的连接脑回和右额中回发生显著改变。所有显著差异脑区均具有良好的分类效能。

结论：通过 ASL 测量的归一化 CBF 揭示了 aMCI 和 PD-MCI 患者之间不同的灌注模式，且与其自身的特征性的神经损伤机制有关。本研究表明 z-CBF 可以为进一步 MCI 的机制研究提供较为敏感的灌注信息。

广西南宁地区近 10 年地中海贫血心脏、肝脏铁过载变化趋势及影响因素

罗朝天、彭飞、唐成、彭鹏
广西医科大学第一附属医院

目的：地中海贫血（地贫）是由于珠蛋白肽链基因缺陷而导致的遗传性溶血性贫血，由于长期反复输血和肠道铁吸收增加导致铁过载，而人体排铁的生理功能有限，从而导致脏器发生铁过载，进一步引起组织细胞损伤和器官功能衰竭，最终引起死亡。广西是地贫的重灾区，本研究分析地贫患者心脏、肝脏铁过载的变化趋势及影响其变化的因素，为防治地中海贫血心脏、肝脏铁过载予以参考。

材料与方法：收集在广西医科大学第一附属医院就诊的地中海贫血患者病例资料。基于 MRI-T2* 统计分类心脏、肝脏铁过载，横断面（n=2153）及纵向研究（n=249），分别使用 Jionpoint 回归分析变化趋势及分段和 Logistics 回归分析影响心脏、肝脏铁过载变化的因素。结果：肝脏铁沉积仅在性别组间差异具有统计学意义（ $p=0.003<0.05$ ）。铁过载正常与轻度合并、中度与重度合并，分析心脏、肝脏铁过载的相关性，结果显示存在弱相关（ $p<0.05$ ）。各组 10 年平均年度变化百分比均无统计学意义（ $p>0.05$ ）。年度变化百分比：心肌未见铁沉积组 2013~2015 年为 19.59%，轻度肝脏铁沉积 2013~2015 年为 -25.93%、2015-2022 年为 1.18%，重度肝脏铁沉积 2013~2017 年为 20.23%（ $p<0.05$ ），其余均无统计学意义（ $p>0.05$ ）。纵向研究部分，对性别、年龄、是否为输血依赖型、是否进行骨髓移植、祛铁方案等进行二分类 logistic 单因素、多因素分析，结果显示 p 值均大于 0.05。结论：心脏铁过载与肝脏铁过载具有一定的相关性，但是相关性较弱。

Jionpoint 回归分析显示, 在 2013-2015/2017 年间的变化趋势具有统计学依据支持, 但是在 2015/2017 年后, 无明确统计学依据支持检查数的趋势的变化, 笔者推测 2015/2017 年后检查数的增加、治疗手段的进步、患者年龄的增长等混杂因素共同作用所致。在纵向调查中, 以往研究中直接或间接影响心脏、肝脏铁过载的因素, 在本研究中均无统计学意义, 笔者推测可能是由于回顾时间较长, 部分患者所提供的资料及医疗干预信息的缺失有关。

PU-0103

Association between intracranial aneurysm wall enhancement and intracranial atherosclerotic plaque: a study using high-resolution vessel wall imaging

Yucheng Lu, Yifang Bao, Yuxin Li

Department of Radiology, Huashan Hospital, Fudan University

Objective: To investigate the association between characteristics of aneurysm wall and intracranial large arterial plaque using high-resolution vessel wall imaging (HR-VWI). **Methods:** A total of 109 patients with 128 saccular UIAs in the anterior circulation were enrolled. All patients underwent HR-VWI and three-dimensional time-of-flight magnetic resonance angiography (3D-TOF MRA). Patients and UIAs were divided into two groups according to with and without plaque in the M1 segment of the MCA. Clinical information and aneurysm characteristics were compared between the two groups. We graded the aneurysm wall enhancement (AWE) and M1 plaque from 0 to 2 according to enhancement on HR-VWI. Based on the grading, we analyzed the correlation between AWE and M1 plaques. **Results:** There were 56 patients with 65 UIAs in the group with M1 plaque and 53 patients with 63 UIAs in the group without plaque. There were significant differences between the two groups in both clinical information (age and hypertension) and aneurysm characteristics (AWE pattern and AWE degree). In the M1 lesion group, UIAs were more likely to show a higher grade of AWE pattern and AWE degree. Among the group with M1 plaque, the grade of M1 plaque was positively correlated with the grade of AWE pattern (correlation coefficient $R = 0.41$, $P = 0.001$) and the grade of AWE degree (correlation coefficient $R = 0.50$, $P < 0.001$). **Conclusions:** MCA atherosclerosis plaque was associated with the AWE of saccular aneurysms. When evaluating UIAs, attention should also be paid to the large arterial wall, which may be suggestive in assessing the stability of the aneurysm and for better clinical decision-making.

PU-0104

磁共振方法对肝细胞癌早期复发的术前预测能力：一项系统回顾和荟萃分析

董雪¹、卢明杰²、王晨²、卓弈²、杨正汉¹

1. 首都医科大学附属北京友谊医院

2. 贵州医科大学

目的: 评价影像组学在预测肝细胞癌患者根治性肝切除后早期复发的准确性, 同时评价了在这种情况下影像组学是否具有比非影像组学更好的预测性能。

方法: 检索 PubMed(包括 MEDLINE)、EMBASE 数据库中从开始到 2023 年 4 月 7 日的合格研究, 仅纳入了具有明确规定的参考标准(组织病理学确认和/或临床/成像随访)的研究, 以确定利用非影像组学和影像组学方法评估肝细胞癌早期复发的研究。通过 Deeks 漏斗图评估发表偏倚。提取数据并对检索到的研究进行 Quips 质量评估。使用随机效应或固定效应模型计算合并的敏感性、特异

性、阳性似然比和阴性似然比,并得到森林图,同时生成总结受试者工作特性曲线和曲线下面积,以评估影像组学模型和非影像组学模型的诊断准确性。统计分析包括汇总数据、异质性检验和发表偏倚。进行荟萃回归和亚组分析,以探索异质性的潜在来源。

结果:该分析包括 4 项研究非影像组学研究和 6 项影像组学研究。对于非影像组学而言,受试者工作特征的联合灵敏度、特异性和曲线下面积分别为 0.75、0.78 和 0.83。合并的阳性似然比和阴性似然比分别为 3.45 和 0.32。未在此研究中发现显著的异质性 ($I^2=0$)。对于影像组学而言,受试者工作特征的联合灵敏度、特异性和曲线下面积分别为 0.84、0.80 和 0.89。合并的阳性似然比和阴性似然比分别为 4.28 和 0.20,在此研究中观察到显著的异质性 ($I^2=90\%$) 和可能的发表偏倚 ($P=0.04$)。亚组分析显示,样本量和肿瘤大小是异质性的来源之一。

结论:这项 meta 分析表明,基于术前 MRI 的模型可用于预测肝细胞癌的早期复发,影像组学较非影像组学模型表现出较高的诊断准确性及良好稳定性,但现有研究受到可能的发表偏倚的限制,对待此结果应谨慎。

PU-0105

关于 t1_vibe-grasp_fs_cor_dyn 序列在核磁增强中的价值讨论。

王子惠

吉林大学白求恩第一医院

目的:评估 t1_vibe-grasp_fs_cor_dyn 序列在核磁增强中对诊断垂体病变的应用价值。

方法:对 40 例垂体平扫加增强核磁检查的图像进行回顾性分析,观察垂体组织及病变。其中 20 例进行 t1_vibe-grasp_fs_cor_dyn 序列垂体核磁平扫加增强检查,其余 20 例进行垂体核磁平扫加普通增强检查,对比分析这两类检查的图像效果。

结果:40 例增强检查患者正常组织及病变均有强化,其中 t1_vibe-grasp_fs_cor_dyn 序列垂体核磁平扫加增强检查比普通平扫加增强能更好地显示病变并且为临床诊断提供了有价值的信息。

结论:t1_vibe-grasp_fs_cor_dyn 序列在核磁增强中对诊断垂体病变具有较高的应用价值。

PU-0106

腰椎脊索瘤误诊脊柱结核一例

袁婷婷

吉林大学第一医院

病例 男,56 岁,因腰痛 5 年,双下肢麻木、无力 5 个月,加重及二便困难 1 个月入院。查体:腰 2 椎体棘突压痛及叩击痛(+),无放射痛。双侧足底感觉减退,双下肢膝反射、跟腱反射减弱。

腰椎 MRI 显示:腰 2 椎体略变扁,椎体内可见片状长 T1 稍长 T2 异常信号,压脂像呈高信号,累及椎板、棘突,椎旁可见长 T1 长 T2 异常信号,并突向后方椎管内。腰椎 CT 显示:腰 2 椎体变扁,椎体密度增高,椎体骨质破坏,椎旁可见低密度影,与双侧腰大肌分界不清。

手术所见 棘突剪刀剪除 L2 棘突,咬骨钳咬除 L2 右侧椎板、咬除 L2 右侧椎弓根。见 L2 椎体破坏,内有死骨和少许灰白色粘液样肿瘤瘤体。清除 L2 椎体右半部,并向外探查椎旁肌肉内肿瘤组织,见肿瘤组织浸润于左侧椎旁肌。术后患者一般状态良好。

讨论 此患者在术前误诊为腰椎结核,分析原因如下:该患虽然无结核低热、盗汗等典型临床表现,但患者病史较长,实验室红细胞沉降率明显高于正常值,影像表现椎体骨质破坏,椎体周围异常密度明显低于软组织,误认为椎旁冷脓肿。认真分析患者可见患者病灶未累及椎间盘,而累及腰 2 椎体附件,椎旁低密度影与双侧腰大肌紧邻,但边缘比冷脓肿清晰。综上所述,我们应仔细观察影像学特点,给临床提供正确诊断,为患者手术方案制定提供指导。

PU-0107

水通道蛋白分子成像对亚急性脑梗死病灶转归的预测价值研究

吴雅琪^{1,2,3}、翁烨^{1,2,3}、郑雨杉^{1,2,3}、陈秋雁^{2,3}、施黎炜^{1,2,3}、魏鼎泰^{1,2,3}

1. 福建医科大学第三临床医学院

2. 宁德师范附属宁德市医院

3. 宁德师范学院附属宁德市医院脑脉管性疾病与分子影像实验室

目的

探讨水通道蛋白分子成像 (AQP-MRI) 技术对亚急性脑梗死患者梗死灶转归的预测价值。

方法

本研究纳入亚急性脑梗死患者 11 人, 对照组 11 人, 实验组首次检查进行 MRI 常规序列及 AQP-ADC 序列检查, 并于发病 3 个月后复查 T2WI-FLAIR 序列。本研究还纳入 26 只成年雄性 SD 大鼠, 将其随机分为两组, 实验组和假手术组, 实验组经历 1h 短暂性大脑中动脉栓塞建立脑缺血模型。所有大鼠分别于再灌注后 1h、24h、3 周采用 Zea-Longa 评分标准对各组大鼠神经功能进行评分, 于再灌注后 24h 行 MR 扫描, 扫描序列同病人。3 周后进行 MRI 复查, 并行苏木素-伊红(H&E)染色、免疫荧光检测胶原纤维酸性蛋白(GFAP)及磷酸肌酸蛋白聚糖(phosphacan)表达情况。

结果

AQP-ADC 伪彩图较 ADC₁₀₀₀ 伪彩图更能显示病灶的异质性。无论在大面积或小面积梗死灶中, AQP-ADC 明显减低区域与软化灶相匹配, 但在部分小面积梗死灶中, 软化灶的形成范围与病灶周围 AQP-ADC 高信号带存在与否相关。在亚急性脑梗死患者与实验组大鼠中, 软化灶与胶质增生区之间的相对 AQP-ADC 值在存在统计学差异 ($p < 0.05$)。软化灶、胶质增生区的相对 T2 信号值与 AQP-ADC 所示明显减低区域、部分减低区的相对 AQP-ADC 值仅在亚急性脑梗死患者中具有明显相关性 ($p < 0.05$)。将实验组单只大鼠的 AQP-ADC 图像与其相应的免疫荧光、HE 染色结果对比显示, AQP-ADC 明显减低区域 HE 染色上细胞成分明显减少, 软化灶形成, 免疫荧光未见荧光显影; 在 AQP-ADC 上信号部分减低区域神经元排列紊乱, 变性细胞明显增多, 见较多胶质细胞增生, GFAP 和 phosphacan 表达明显升高。

结论

AQP-MRI 成像对亚急性脑梗死患者的软化灶及胶质增生区具有预测价值。

PU-0108

髋关节孟唇撕裂影像学再认识!

潘小磊

郑州市骨科医院

背景: 临床检查髋关节孟唇撕裂以 MR 检查为主, 但是一些学者认为常规 MRI 诊断并没有太大的价值, 更多的学者比较认可 MR 髋关节造影技术。在诊断髋关节孟唇撕裂时常规 MR 具有一定的局限性, 具体如下: ①多使用大扫描野、双侧髋关节同时成像的模式, 导致空间分辨率比较低; ②正常臼唇的大小与形态有着很大的不同; ③当关节剂量比较少时, 在区分塌陷的款关节囊与臼唇有一定的难度; ④臼唇-软骨连接区是纤维软骨向透明软骨的移行区, 通过 MRI 可见略高信号, 在特别情况下想要和撕裂鉴别开具有一定的难度。MR 髋关节造影对关节腔进行穿刺, 然后注入对比剂, 有效的扩张了关节囊, 也可以观察到对比剂有没有进入到臼唇-软骨连接区, 弥补了常规 MR 检查的不足。

MR 髋关节造影技术操作简单, 诊断孟唇撕裂有着较高的敏感度与准确度, 但是 MR 髋关节造影技术为有创检查, 有着感染的风险, 因此有的患者并不能接受 MR 髋关节造影检查。有学者曾作出

研究,对比 3.0T 场强下单侧髋关节常规 MRI 及 MR 髋关节造影,这两种诊断方式诊断髋关节孟唇撕裂的诊断准确率均比较高,且没有差异。

目的:分析髋关节孟唇撕裂的 3.0T 髋关节磁共振造影与常规磁共振成像(MRI)诊断结果

方法:

方法:收集 2018 年 3 月至 2019 年 3 月在我院确诊为髋关节孟唇撕裂的 30 例患者,均予以常规 MRI 与磁共振髋关节造影检查,对比检查结果

结果:

结果:常规 MRI 检查诊断准确率为 100.0%,磁共振髋关节造影检查诊断准确率为 97%,组间据比较差异无统计学意义($P>0.05$)

结论:髋关节孟唇撕裂的 3.0T 髋关节磁共振造影与常规 MRI 诊断准确率均比较好,当患者不能接受磁共振髋关节造影有创检查时,可进行常规 MRI 检查,该检查技术更具有较高的空间分辨率。

PU-0109

基于多模态影像技术对肌骨肿瘤性质的定量评估分析

潘小磊

郑州市骨科医院

目的:分析动态对比增强(DCE)-磁共振成像(MRI)定量参数联合弥散加权成像(DWI)对肌骨肿瘤性质的评估价值。

方法:选取 68 例肌骨肿瘤患者作为研究对象,所有患者均行 DCE-MRI、DWI 检查和病理学诊断,根据病理学诊断结果,将恶性病变患者纳入恶性组,将良性病变患者纳入良性组。询问并记录两组一般资料[性别、年龄、肿瘤直径、病变部位、合并症],比较两组一般资料及 DCE-MRI 定量参数[容量转移常数(K_{trans})、速率常数(K_{ep})、血管外细胞外间隙容积比(V_e)、血浆内对比剂容积分数(V_p)]和 DWI 参数[表观弥散系数(ADC)],检验 DCE-MRI 定量参数联合 DWI 对恶性肌骨肿瘤的评估价值。

结果:纳入的 68 例肌骨肿瘤患者,经病理学检测出恶性 42 例,占 61.76%;良性 26 例,占 38.24%;两组一般资料比较,差异无统计学意义($P>0.05$)。恶性组 K_{trans} 、 K_{ep} 、 V_e 值均大于良性组,ADC 值小于良性组($P<0.05$);两组 V_p 值相比,差异无统计学意义($P>0.05$)。绘制受试者工作特征曲线图(ROC)显示, K_{trans} 、 K_{ep} 、 V_e 、ADC 值单独及联合诊断恶性肌骨肿瘤的曲线下面积(AUC)分别为 0.784、0.784、0.806、0.796、0.864,均有一定评估价值。

结论:DCE-MRI 定量参数联合 DWI 评估肌骨肿瘤性质具有一定价值。

PU-0110

核磁 PWI 在小关节扫描中的应用价

徐丹

甘肃中医药大学附属医院

摘要:核磁造影(Perfusion-weighted imaging, PWI)是一种非侵入性的影像技术,可以评估组织的血流灌注情况。在小关节扫描中,核磁 PWI 技术的应用逐渐受到关注。本文旨在探讨核磁 PWI 在小关节扫描中的应用价值,通过实验研究和分析,评估其在小关节疾病诊断和治疗中的潜在作用。

实验过程:

患者选择与数据收集：选择一组小关节疾病患者和一组健康对照者。收集患者的临床资料和病史，并进行核磁 PWI 扫描。

核磁 PWI 扫描：使用核磁共振设备对患者进行小关节扫描，获取 PWI 图像数据。

数据分析：利用专业的图像处理软件对 PWI 图像进行分析，计算关节区域的血流灌注参数，如平均灌注值 (mean transit time, MTT)、灌注容积 (cerebral blood volume, CBV) 和灌注峰值 (time to peak, TTP)。

结果比对与统计分析：将患者组和对照组的 PWI 参数进行比对，并进行统计学分析，评估小关节疾病与正常关节之间的差异。

实验结论：通过核磁 PWI 技术在小关节扫描中的应用，我们得出以下结论：

核磁 PWI 可以提供小关节血流灌注的定量信息，有助于评估关节组织的血液供应情况。

核磁 PWI 可以帮助鉴别小关节疾病的程度和类型，如关节炎、滑膜炎等。

核磁 PWI 在小关节疾病的早期诊断和治疗过程中具有潜在的临床应用价值。

核磁 PWI 可以监测小关节疾病的治疗效果，评估治疗方案的有效性。

综上所述，核磁 PWI 在小关节扫描中具有广泛的应用价值，可以为小关节疾病的诊断、治疗和随访提供重要的辅助信息。然而，还需要进一步的研究和临床验证来完善该技术在临床实践中的应用。

PU-0111

Association of peripheral inflammation with disrupted brain functional network topology in bipolar disorder

Guixian Tang, Guanmao Chen, Ying Wang
First Affiliated Hospital of Jinan University

Background: Increasing evidences show that inflammation might be involved in bipolar disorder (BD), but the association between abnormal brain function and inflammation in BD patients is still unclear. In this study, we tried to explore the disrupted brain functional network topology, peripheral cytokines and their correlations to demonstrate the role of inflammation in brain functional network topology in BD.

Methods: In this study, 53 BD patients and 47 healthy controls (HCs) underwent resting-state magnetic resonance imaging scans. Graph theory analysis was performed to investigate the topological properties of whole-brain functional connectome at both global and nodal levels. Serum levels of interleukin-4 (IL-4), interleukin-6 (IL-6), interleukin-8 (IL-8), interleukin-10 (IL-10), and tumor necrosis factor- α (TNF- α) were measured in all participants. Correlations between topological properties, clinical variables and cytokines levels in BD were calculated. Furthermore, mediation analysis was employed to determine whether inflammatory cytokines affect depressive symptoms by affecting brain network properties.

Results: Patients with BD showed significantly greater normalized characteristic path length, and marginally greater characteristic path length (Lp) and lower global efficiency (Eglo). Furthermore, the BD group showed lower nodal degree centrality (Degi) in the bilateral lingual gyrus, and lower nodal efficiency (Enodal) in the bilateral lingual gyrus, right postcentral gyrus, right superior frontal gyrus (SFG), and the left middle temporal pole (MTP). Besides, IL-4, IL-6, IL-8, IL-10 levels were higher in BD than HCs. Correlation analyses revealed that elevated levels of IL-10 were correlated with the greater Lp and lower Eglo, and elevated levels of IL-8 was correlated with the greater . Furthermore, the Enodal in the left MTP was negatively correlated with IL-4 and IL-8 levels in BD. Moreover, the Enodal of the left MTP mediated the effect of IL-4 levels on the 24-item HDRS scores.

Conclusions: Our study provided preliminary evidence of the association between disrupted brain functional network topology and neuroinflammation in BD. The current study demonstrated

disrupted topological organization in the whole brain and regional connectivity was associated with inflammatory cytokines of the IL-4, IL-8 and IL-10 levels in BD. Moreover, our results indicated that higher IL-4 levels and impaired regional connectivity in the temporal pole may be associated with the severer depressive symptoms in BD.

PU-0112

One-stop-shop evaluation of Liver disease with GD-EOB-DTPA enhanced MR

Chunyu Zhang,jiaxin liu,yu fu
The First Hospital of JILIN University

Objectives:To do One-stop-shop evaluation of liver disease with GD-EOB-DTPA enhanced MR.

Methods:This retrospective study was obtained 783patients. These patients had high risk factors of hepatocellular carcinoma (HCC), They contained 546males,age from 25to 85 years old. They all underwent GD-EOB-DTPA enhanced MR and IDEAL-IQ scan.We drew interested area at each segment in the liver to evaluate lipid and iron deposition with fat-fraction and R2* images.We evaluate whether the lesion contains fat or lipid with In-phase and out-of-phase images.For suspected malignant or unsure intrahepatic lesions, we evaluated vein and bile duct in liver with Gd-EOB-DTPA-enhanced MRI before surgery. we spotted lesions, at hepatobiliary phase, that were not found by common enhancement scan.

Results:We can evaluate lipid and iron deposition with fat-fraction and R2* images.We can evaluate whether the lesion contains fat or lipid with In-phase and out-of-phase images.We can evaluated vein and bile duct in liver with Gd-EOB-DTPA-enhanced MRI before surgery.For 56 patients, we spotted lesions, at hepatobiliary phase, that were not found by common enhancement scan, which changed our treatment accordingly.Among them,the smallest lesion is smaller than 1cm.

241 patients have no lesions, we assessed lipid and iron depositions

33 patients had different degrees of lipid deposition and 5 patients had different degrees of iron deposition in the liver.

Conclusions:Gd-EOB-DTPA-enhanced MRI and IDEAL-IQ scan can do one stop-shop evaluation of conditions both of liver and lesion.

PU-0113

基于 CTE 影像组学在克罗恩病炎性肠段活动性预测效能的研究价值

刘荣丽
河北医科大学第二医院

目的： 本文旨在探讨基于 CTE（计算机断层扫描增强）影像组学在克罗恩病所致炎性肠段活动性预测中的研究价值。通过综合分析 CTE 影像组学技术在克罗恩病诊断和治疗过程中的应用，我们探讨其在炎性肠段活动性预测方面的潜在效能，以及为克罗恩病患者提供更准确、早期干预的新途径。引言： 克罗恩病是一种复杂的慢性炎性肠道疾病，其临床表现多样，诊断和治疗存在一定的挑战。CTE 影像组学作为一种先进的医学影像分析技术，可以从大规模的 CTE 图像中提取丰富的特征信息，为医生提供更全面的诊断依据。方法： 本研究将收集克罗恩病患者的 CTE 影像数据，应用影像组学技术提取多维度的影像特征，如肠壁增厚程度、病变分布、血管分布等。同时，将结合临床指标，如病情活动指数、临床症状等，建立预测模型，评估 CTE 影像组学在预测克罗恩病炎性肠段活动性方面的效能。结果： 预计 CTE 影像组学技术在预测克罗恩病所致炎性肠段活动性

方面将具有重要价值。通过多维度特征的综合分析, 预测模型可能能够准确预测患者的肠段活动性, 为临床医生提供及早干预的机会。此外, CTE 影像组学还可能揭示不同炎性程度之间的影像特征差异, 有助于深入理解炎性肠段的病理生理过程。结论: 基于 CTE 影像组学在克罗恩病所致炎性肠段活动性预测方面的研究具有重要的临床应用前景。该技术有望提高克罗恩病的早期诊断和治疗效果评估水平, 为临床决策提供更全面的影像信息支持。然而, 为了更好地发挥其潜力, 需要进一步的大样本研究和临床验证, 同时结合其他临床指标进行综合分析, 以确保预测模型的可靠性和准确性。

PU-0114

Multiparametric magnetic resonance imaging-based assessment of the effect of adenomyosis on determining the depth of myometrial invasion in endometrial cancer

Xuxu Meng

Beijing Friendship Hospital Affiliated to Capital Medical University

Purpose: To evaluate the accuracy of multiparametric MRI (mpMRI) in diagnosing deep myometrial invasion (DMI) in endometrial cancer (EC) with adenomyosis compared with EC without adenomyosis and to evaluate the effect of different adenomyosis subtypes on MI depth in EC.

Methods: Patients with histologically confirmed International Federation of Gynecology and Obstetrics stage I EC who underwent preoperative MRI were included in this two-center retrospective study. The case group included EC coexisting adenomyosis, and the control group included EC without adenomyosis, matched 1:2 according to age \pm 5 years and tumor grade. A senior radiologist assessed the MRI adenomyosis classification in the case group. Two radiologists (R1/R2) then independently interpreted all images and assessed MI depth. Accuracy, sensitivity, specificity, and the areas under the receiver operating curve (AUC) were calculated. The chi-square test was used to compare the accuracy of diagnosing DMI. Interobserver agreement was evaluated using the Fleiss κ statistics.

Results: A total of 70 cases in the case group and 140 cases in the control group were included. The accuracy, sensitivity, and specificity of consensus were 94.3% vs. 92.1%, 60.0% vs. 86.7%, and 96.9% vs. 93.6% (case vs. control groups, respectively). There was no significant difference in the diagnostic accuracy of DMI between the groups (R1/R2): PT2WI=0.136/0.167, PDWI=0.503/0.329, PT1CE=0.896/0.184, PmpMRI=0.506/0.371. The AUC for T2WI, DWI, T1CE, and mpMRI (R1/R2), respectively, were 0.59/0.78, 0.63/0.77, 0.69/0.79, and 0.91/0.89 (case group) and 0.83/0.85, 0.83/0.86, 0.88/0.86, and 0.91/0.87 (control group). Interobserver agreement was highest with mpMRI (κ =0.387/0.695 (case/control)). The consensus results of MRI categorization of adenomyosis revealed no significant difference in the accuracy of diagnosing DMI by adenomyosis subtype.

Conclusion: The presence of adenomyosis or adenomyosis subtype had no significant effect on the interpretation of the depth of myometrial invasion.

PU-0115

未经治疗的中重度阻塞性睡眠呼吸暂停患者海马亚区动态功能连接异常

黄玲

南昌大学第一附属医院

目的: 探讨阻塞性睡眠呼吸暂停(OSA)患者海马前、后亚区与其他脑区动态功能连接(dFC)的动态变化特征及其与认知功能的关系, 并探讨这些特征是否可用于区分 OSA 患者与健康对照组(HCs)。

方法: 纳入 85 例新诊断的中重度 OSA 患者和 85 名 HCs。所有受试者均接受静息态功能磁共振成像(fMRI)检查。采用两样本 t 检验比较 OSA 患者和 HCs 海马各亚区与其他脑区的 dFC 值的差异。采用相关分析评估 OSA 患者 dFC 与临床资料及认知功能之间的关系。使用支持向量机, 以差异脑区的 dFC 值作为分类特征区分两组。

结果: 与 HCs 相比, OSA 患者左侧海马前部与右侧小脑前叶、右侧海马前部与左侧舌回间、左侧海马后部与左侧中央前回间的 dFC 值显著降低, 左侧海马后部与楔前叶间的 dFC 值显著升高。OSA 患者左侧海马后部与楔前叶的 dFC 值与睡眠相关指标及蒙特利尔认知评估量表评分相关。支持向量机分析结果显示, 不同脑区的 dFC 值可以区分 OSA 患者和 HCs。

结论: OSA 患者海马各亚区与小脑、默认网络、感觉运动网络和视觉功能网络之间的 dFC 模式发生改变, 可能与认知功能下降有关。此外, 差异脑区的 dFC 值可以有效区分 OSA 患者和 HCs。这些发现为认识 OSA 患者的神经认知机制提供了新的视角。

基于 HR 3D mDixon-quant 的脂肪分数图与 R2*图的影像组学特征对棕色脂肪组织的识别价值

张钦和¹、安琪¹、林良杰²、刘爱连¹、何辉¹、杨一帆¹

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的: 本研究旨在使用高分辨率(high-resolution, HR) mDixon-quant 评估棕色脂肪组织(brown adipose tissue, BAT)和白色脂肪组织(white adipose tissue, WAT)的影像组学特征的差异。

材料与方法: 共招募 35 名健康志愿者。所有志愿者均在 3.0T MRI (Ingenia CX, 飞利浦)上使用 HR 3D mDixon-quant 序列进行扫描, 该序列可以自动在线重建 R2*图和脂肪分数图像。HR 3D mDixon-quant 扫描参数: FOV=576mm×576mm×75mm, TR=4ms, 层厚/层间距=2.0/-1.0mm, 回波=6。使用联影医疗研发的 uAI Research Portal 软件在 HR mDixon-quant 脂肪分数图上将 ROI 分别放置在预期的 BAT 和 WAT 测量值的锁骨上和皮下区域, 并复制于 R2*图。锁骨上脂肪组织的 ROI 放置在没有覆盖骨和皮下脂肪的锁骨上区域, 皮下脂肪组织的 ROI 放置在背部脂肪组织分布最厚的区域。使用 uAI Research Portal 软件进行影像组学分析。通过最小冗余-最大相关性(mRMR)和最小绝对收缩和选择算子(LASSO)算法对提取的特征进行降维处理。使用随机森林模型(Random forest, RF)构建影像组学模型。

结果: 最终本研究纳入 10 个影像组学特征并用于构建模型。RF 模型显示, 训练集和测试集的 AUC 分别为 0.939 和 0.846。在测试集中, 灵敏度、特异性、准确度分别为 0.810、0.667 和 0.738。

结论: 基于 HR 3D mDixon-quant 的脂肪分数图与 R2*图的 BAT 和 WAT 的影像组学特征存在差异。该模型提高了 WAT 和 BAT 的检测的特异性。可以为未来 WAT 和 BAT 与代谢性疾病和肥胖疾病研究提供更可靠的方法。

探究适用于隐匿性脊髓栓系综合征的 MRI 扫描体位

史征、杨瑞、刘继伟、和燕斐、王建军、冯晓刚
河南省胸科医院

目的:

脊髓栓系综合征(tethered cord syndrome, TCS)按病因可分为五种类型: 脊髓脊膜膨出、脂肪瘤型、终丝型、脊髓纵裂畸形、潜毛窦型。近年来有研究发现某些终丝型脊髓栓系综合征患者圆锥位置可以不降低, 故 Khoury 等提出了隐匿性脊髓栓系综合征(occult tethered cord syndrome, OTCS)的概念。OTCS 是终丝型脊髓栓系综合征的一种特殊类型, 与 TCS 症状相似, 主要表现为大、小便功能障碍, 双下肢感觉、运动功能异常。OTCS 患者终丝可不发生脂肪变性, 传统检查手段难以确诊。有学者对诊断考虑为 OTCS 的患者进行俯卧位 MRI 检查发现, 相较于正常儿童, OTCS 患者的终丝由于张力升高而向背侧贴近。

方法:

采用我院 3.0T 联影 uMR770 磁共振成像仪, 对 OTCS 患者分别行仰卧位与俯卧位的腰骶椎磁共振扫描。使用呼吸门控, 在呼气末采集信号, 以避免患者呼吸运动伪影; T2 加权像采用快速自旋回波的衍生序列三维可变翻转角快速自旋回波序列, 即 T2_MX3D 序列, 并使用长 TE 参数, 用以凸显纤细的马尾及终丝; T1 加权像采用三维快速扰相梯度回波序列并采用水脂分离技术, 即 T1_quick3D_wfi 序列, 一次扫描重建出脂肪像、水像、同相位图像和反相位图像用以区分有无马尾终丝脂肪化。

结果:

仰卧位影像表现: 腰骶椎椎管内硬膜囊未见明显异常, 脊髓、马尾及终丝粗细均匀, 形态、结构及信号强度未见明显异常。俯卧位影像表现: 脊髓圆锥尖位于腰 1 椎体下缘水平, 腰椎椎管内一条纤细终丝沿椎管后缘走行至骶椎; 未见马尾及终丝增粗; 椎管内未见明显异常信号。经过对照同一天患者仰卧位与俯卧位腰骶椎磁共振图像, 发现相较于正常患者, 在俯卧位 MRI 检查时, OTCS 患者的终丝更靠近背侧, 而其他马尾神经根更靠近腹侧; 有部分患者的终丝及马尾神经出现典型"日出"现象(即终丝、马尾分离现象); 同时终丝贴向硬脊膜囊的节段更靠上。

结论: 俯卧位腰椎 MRI 终丝与马尾神经分离现象及终丝贴壁位置可作为 OTCS 的辅助诊断依据, 优于仰卧位腰椎 MRI 扫描。

PU-0118

Qualitative and Quantitative Performance of Magnetic Resonance Image Compilation (MAGIC) Method: An Exploratory Analysis for Temporomandibular joint Region

Qi Sun

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

The present exploratory study investigates the performance of a new, rapid, synthetic MRI method for diagnostic image quality assessment in temporomandibular joint and related muscles. The multi-dynamic multi-echo (MDME) sequence was used for data acquisition, followed by synthetic image reconstruction on a 3T MRI scanner for 10 patients. The vendor termed the combined package Magnetic Resonance Imaging Compilation (MAGIC). In total, 20 regions of interest (ROIs) were analyzed, drawn on disc, muscles and joint in the TMJ region. Mean T1 and T2 values obtained from three groups were measured, respectively. A total of 672 images from both synthetic MRI and conventional clinical imaging were assessed by the radiologists to provide the rating for T1w and T2w image contrasts. The synthetically generated qualitative T2w images

were acceptable and comparable to conventional diagnostic images (89% acceptability rating for both).The benefit of MAGIC in TMJ imaging is twofold, providing radiometry maps in a clinically feasible time and the ability to generate a different combination of contrast images in a single acquisition.

一种全自动的脑部 MR 图像分割算法

缪正飞

南京市第一医院

目的 噪声和灰度不均使得脑部 MR 图像的全自动分割更具挑战性, 本文提出一种改进的模糊 C 均值聚类算法, 并将其

应用于脑部 MR 图像分割。**方法** 首先, 采用同质滤波器和对比度扩展作为图像预处理, 去除图像的奇异区域; 然后, 采用直方图峰值点检测算法求得阈值点, 避免初始聚类中心选取的盲目性; 接着, 采用模糊 C 均值聚类算法进行图像分割; 最后, 采用基于模糊关联隶属度算法进行图像后处理, 达到平滑模糊边界和去除噪声的效果, 得到最终分割图像。**结果** 选用噪声程度 0~9%和灰度不均匀度 0 和 40%的脑部 MR 图像进行仿真实验。视觉分析表明基于本文算法的分割图像边缘清晰, 图像质量优于没有预处理或后处理所得; 定量评估结果显示基于本文分割算法获得的敏感性、特异性和相似性均高于改进的模糊 C 均值算法和现存的 FSL 图像分割软件。**结论** 本文提出的算法收敛更快, 能实现全自动分割脑部 MR 图像, 在噪声和灰度不均的情况下均表现出强健性、优越性和普适性, 是一种可行的图像分割算法。

DWI 梗死体积与 FLAIR 血管高信号-DWI 不匹配及预后的相关性研究

缪正飞

南京市第一医院

目的 探讨 DWI 梗死体积与 FVH-DWI 不匹配、预后间的相关性。**方法** 前瞻性纳入 2017 年 1 月-2018 年 12 月收住入院并接受血管再通治疗患者 38 例。均于治疗前及治疗后 24 h 内接受 MRI 检查。收集所有患者的 FVH-DWI 不匹配、DWI 体积(V DWI)、3 个月功能预后(mRS 评分)及一般临床资料等。统计学方法分析 DWI 梗死体积与 FVH-DWI 不匹配、卒中预后之间的相关性,应用多元逻辑回归分析预测卒中预后的独立预测因子。**结果** 与无 FVH-DWI 不匹配组(n =15)相比,FVH-DWI 不匹配组(n =23)治疗前 V DWI (15.13 ± 22.96 vs 56.88 ± 50.99 ; $P = 0.008$)较小、治疗后 V DWI (32.15 ± 39.38 vs 101.40 ± 86.39 ; $P = 0.009$)较小、V DWI-G 较小(17.01 ± 23.36 vs 44.52 ± 41.69 ; $P = 0.031$)。Spearman 相关分析显示治疗前 V DWI ($r = 0.540$; $P = 0.000$)、治疗后 V DWI ($r = 0.579$; $P = 0.000$)、V DWI-G ($r = 0.489$; $P = 0.002$)与 FVH-DWI 不匹配呈正相关。治疗前 V DWI ($r = 0.414$; $P = 0.010$)、治疗后 V DWI ($r = 0.486$; $P = 0.002$)、V DWI-G ($r = 0.467$; $P = 0.003$)、FVH-DWI 不匹配($r = 0.327$; $P = 0.045$)均与 3 个月 mRS 间呈正相关。逻辑回归分析显示治疗后 V DWI 为预测卒中预后的独立预测因子(OR 95% CI):1.031(1.006 ~1.057);($P = 0.017$)。**结论** 综合评估 DWI 梗死体积、FVH-DWI 不匹配,尤其是治疗后 DWI 梗死体积可以有效的判断卒中的功能预后、指导治疗。

4D flow 在颈动脉粥样硬化狭窄应用

邱冬冬
吉林大学第一医院

目的 利用四维 MRI 成像 (4D flow MRI) 对单侧颈动脉中重度粥样硬化性狭窄血管进行血流动力学研究, 探讨影响颈内动脉粥样硬化性狭窄相关危险因素。

材料与方法 收集经吉林大学第一医院收治的经超声诊断为单侧颈动脉粥样硬化中重度狭窄患者 (n=20) 和同期年龄及血管条件相匹配的正常志愿者 (n=26) 的临床资料, 研究组和健康对照组均分别行 TOF-MRA、4D flow MRI、常规 T1WI、T2WI、FLAIR 及 DWI 检查, 分别将研究组和对照组原始 Flow 影像数据导入 CVI42.0 软件中处理, 并获得血流量、血流速度、壁面剪切力 (WSS)、最大压力梯度、能量损失等血流动力学参数, 分析狭窄处血流动力变化情况, 评估研究组和对照组的血流动力学参数差异, 并对急性期脑梗死及非急性期脑梗死进行分析, 探讨狭窄处血流动力学变化对卒中发生的影响。

结果 研究组的平均血流、最大血流、总容量及平均相对压差明显低于对照组 ($P<0.05$), 而最大能量损失、平均能量损失高于对照组 ($P<0.05$); 重度狭窄血管平均血流低于中度狭窄; 各狭窄血管狭窄上游、中心及下游的血流动力学比较结果显示, 平均血流、平均速度、最小速度、最大血流、总容量、平均轴向壁剪切力 (WSS) 存在显著差异 ($P<0.05$)。狭窄下游急性期脑梗死组最大压力梯度小于非急性期脑梗死组 ($P<0.05$)。

结论 1、4D 血流 MRI 可实现对颈动脉粥样硬化血流动力学的可视化及量化, 对颈动脉粥样硬化的诊断及治疗可能具有积极意义。2、颈动脉狭窄后血流量减少, 随着狭窄程度的增加而减少; 狭窄两端的能量损失较大, 对于显示颈动脉狭窄有一定帮助。3、低 WSS 对脑卒中的发生有一定影响, 颈动脉狭窄下游最大压力梯度可能作为预测脑卒中的潜在生物学标志物。

PU-0122

药物洗脱心脏支架在磁共振检查中的适应性研究

孔宪荣
华中科技大学同济医学院附属同济医院

摘要

目的: 通过研究体内植入药物洗脱心脏支架患者在磁共振检查中的舒适度, 评估药物洗脱支架在磁共振检查中的适应性。

材料与方法: 选择 2023 年 1 月—2023 年 5 月在我院行磁共振检查的患者为研究对象, 随机选取体内植入药物洗脱支架的患者 50 例为观察组, 体内无任何植入物的患者 50 例为对照组, 采用 Kolcaba 舒适状况量表, 以问卷调查的方式在两组患者检查完毕后进行舒适度及各维度评价。

结果: 观察组舒适度总分为 80.98 ± 4.138 分, 对照组舒适度总分为 82.32 ± 3.966 分, 两组差异无统计学意义 ($t=-1.653$, $P>0.05$); 两组在生理维度、精神维度及社会文化及环境维度的舒适度得分无统计学差异 ($P>0.05$); 在心理维度方面, 观察组得分为 26.6 ± 2.0702 分, 对照组得分为 27.5 ± 2.4419 分, 差异有统计学意义 ($t=-2.165$, $P<0.05$)。

结论: 药物洗脱支架在磁共振检查中无任何不良反应, 患者适应性良好; 体内置入药物洗脱支架的患者在心理层面上舒适度低于对照组, 需要放射科工作者给予更充分的心理支持。

动态网络的时间和拓扑特性反映视神经脊髓炎谱系障碍患者的残疾

王瑶、周福庆
南昌大学

目的: 视神经脊髓炎谱系疾病 (NMOSD) 的每次炎症发作都会导致残疾增加, 并且伴随着功能网络的改变。然而, 目前尚不清楚功能网络如何与 NMOSD 患者的临床残疾状态相关。因此, 本研究旨在探索 NMOSD 患者功能网络的静态强度、时变和拓扑特性的改变, 以及与残疾的关联。

方法: 本研究一共招募了 30 名 NMOSD 患者 (37.70 ± 11.99 岁) 和 45 名健康对照者 (HC, 41.84 ± 11.23 岁)。所有患者都接受了功能 MRI 和残疾评估。使用独立成分分析, 我们构建了静息状态功能网络 (RSNs), 使用方差分析评估 NMOSD 和 HC 之间的 RSNs 的强度、时间和拓扑特性的组间差异, 通过斯皮尔曼相关评估 RSNs 参数与残疾的关系。

结果: 与 HC 相比, NMOSD 患者在动态网络而非静态网络中表现出显著变化。时变特征包括 3 种状态, 状态 1 (State 1) 的特点是网络内和网络之间的低连接。与 HC 相比, NMOSD 患者在 State 1 中表现出更高的分数时间 ($P < 0.001$) 和更多的停留时间 ($P < 0.001$) 以及较少的转换次数 ($P = 0.028$)。相关性分析表明 NMOSD 患者 State 1 的更高的分数时间 ($r = 0.421$, $P = 0.029$)、更多的停留时间 ($r = 0.461$, $P = 0.031$) 和较少的转换次数 ($r = -0.383$, $P = 0.049$) 与更高的残疾相关。ROC 曲线分析表明 State 1 的分数时间和停留时间可以显著区分 NMOSD 和 HC (曲线下面积: $0.991-0.996$)。此外, NMOSD 患者还出现动态网络的中枢节点的度中心性和聚类系数降低 ($P < 0.05$, FDR 校正), 并且楔前叶 ($r = -0.387$, $P = 0.046$) 和丘脑 ($r = 0.406$, $P = 0.036$) 的聚集系数降低与残疾相关。

结论: NMOSD 患者表现在低连接状态 (State 1) 表现出更高的分数时间、更多的停留时间和较少的转换次数, 与更高的残疾相关。

PU-0124

CEST 评估肾脏缺血再灌注损伤氧化还原状态的可行性研究

米文夏
常州市第一人民医院

目的: 探讨 CEST 成像检测肾脏 IRI 氧化还原状态的可行性。

方法: 选取雌性新西兰大白兔 56 只, 随机分为对照组和缺血再灌注损伤 (IRI 术后 1h、12h、24h、72h、7d 和 14d) 组, 每组 8 只。对照组在假手术后行 MRI 检查, IRI 组夹闭兔左侧肾蒂 45 min 后再灌注建立 IRI 模型, 并在建模后不同时间点行 MRI 检查。扫描序列包括冠状位 SSFSE T2WI, 轴位 SSFSE T2WI, CEST。各组扫描完成后测取每组实验兔皮质及外髓 MTRasym 值, 取血检测血清肌酐、尿素氮含量, 取左肾组织行 HE 染色、PAS 染色、ROS 荧光染色、行生化/Elisa 检测相关氧化指标 (8-OHdG、MDA、XOD) 及抗氧化指标 (T-SOD、SOD-1、SOD-2、GPx) 的含量或活力。采用最小显著差法或 Kruskal-Wallis 检验比较不同组别之间 MTRasym 值、血液学指标、肾脏损伤程度病理评分、肾脏 ROS 荧光强度、肾脏组织氧化指标及抗氧化指标的差异。采用 Spearman 相关系数比较 MTRasym 值与氧化应激指标的相关性。

结果: IRI-1h、24h 组血尿素氮浓度较对照组升高 ($P < 0.05$)。IRI-24h 组较对照组肾小管损伤加重 ($P < 0.05$)。ROS 荧光染色结果显示 IRI-12h 组皮质、外髓平均 IOD 值比对照组高 ($P < 0.05$)。CEST 显示 CEST 效应最明显处即 MTRasym 值最大值波动范围在 1.00-4.00ppm, 且在 1.00、2.00、3.00、3.50ppm 处 IRI-1h 组皮质、外髓 MTRasym 值明显低于对照组 ($P < 0.05$)。与对照组相比, IRI 组氧化指标 8-OHdG、MDA、XOD 含量增高, 抗氧化指标 T-SOD、SOD-1、

SOD-2、GPx 含量或活力减低。皮质及外髓在 1.00-4.00ppm 处 MTR_{asym} 值与氧化指标 8-OhdG、MDA、XOD 含量呈中度负相关 ($P<0.05$), 与抗氧化指标 SOD-2 活力呈中度正相关 ($P<0.05$)。

结论: CEST 可以反映 IRI 后氧化还原状态的动态变化, 间接反映 IRI 后氧化应激水平。

针刺治疗对原发性痛经患者脑结构协变网络变化的影响

张聪¹、马萧童²

1. 陕西中医药大学

2. 陕西中医药大学附属医院

目的 观察针刺治疗原发性痛经 (PDM) 患者脑结构协变网络变化特点及其与临床量表的相关性。

方法 前瞻性采集 50 例 PDM 患者 (PDM 组) 及 47 名健康对照者 (HC 组) 的高清分辨率 T1 结构像数据, 记录痛经相关临床量表评分; 之后对 PDM 组行针刺治疗, 在治疗后第二次采集高清分辨率 T1 结构像及临床量表评分, 比较 PDM 组与 HC 组的灰质体积 (GMV) 差异, 以差异脑区作为感兴趣区基于全脑水平构建结构协变网络 (SCN), 分析结构协变与临床量表的相关性。结果 与 HC 组相比, PDM 组在右侧中央前回、左侧楔前叶、右侧颞中叶皮质、左侧基底外侧杏仁核 GMV 增加 ($P<0.05$)。针刺 PDM 组后以感兴趣区构建 SCN, 右侧中央前回 SCN 中双侧中央后回、左侧中央前回、右侧角回、右侧枕中回、右侧楔前叶、双侧舌回 GMV 减少 ($P<0.05$); 左侧中央后回、左侧枕中回、左侧内侧额叶皮层 GMV 增加 ($P<0.05$)。左侧楔前叶 SCN 中左侧后扣带回、左侧角回、右侧中扣带回、左侧前额叶皮层 GMV 减少 ($P<0.05$); 双侧丘脑、右侧内侧额叶皮层 GMV 增加 ($P<0.05$)。右侧颞中回 SCN 中左侧颞中回、左侧中央前回减少 ($P<0.05$)。左侧基底外侧杏仁核 SCN 中左侧舌回、右侧基底外侧杏仁核 GMV 减少 ($P<0.05$); 右侧脑岛 GMV 增加 ($P<0.05$)。PDM 组右侧楔前叶 GMV 与抑郁自评量表 (SDS) 正相关 ($r=0.296$, $P=0.027$)。结论 针刺治疗 PDM 涉及到大脑不同区域的神经网络调节, SCN 分析可以作为一种补充方法揭示针刺治疗对 PDM 脑灰质结构的整体影响, 为了解针刺治疗 PDM 的镇痛机制提供了新的视角。

PU-0126

The impact of H-type hypertension on intracranial plaque enhancement in patients with ischemic stroke: a high-resolution magnetic resonance imaging study

Zhongkai Zhou, Hongjun Li, Juming Ma
Beijing Youan Hospital, Capital Medical University

Purpose: H-type hypertension is associated with the stability of extracranial atherosclerotic plaque and poor prognosis in patients with acute ischemic stroke (AIS). This study aims to explore the impact of H-type hypertension on intracranial atherosclerotic plaque enhancement to early medicate atherosclerotic plaque risk factors and predict the prognosis of patients with AIS.

Materials and methods: A total of 148 patients with AIS were included [H-type hypertension group ($n=70$), isolated hypertension group ($n=27$), isolated hyperhomocysteinemia group ($n=31$), and control group ($n=20$)]. All patients underwent high-resolution magnetic resonance imaging within 4 weeks after the onset of AIS, with which all the characteristics of plaque were determined. Ordinal univariate and multivariate logistic regression were used to analyze the correlation between H-type hypertension and plaque enhancement.

Results: Grade 2 plaque enhancement appeared more frequently in H-type hypertension group (65.2%, $P=0.003$). After adjusting for covariates, H-type hypertension (OR: 24.459, 95%

confidence interval [CI]: 1.436-4.957) and hyperhomocysteinemia (OR: 16.494, 95% CI: 0.973-4.633) remained independent risk factors for plaque enhancement.

Conclusion: Aggressive treatment of hypertension and hyperhomocysteinemia contribute to reducing plaque instability and incidence of AIS.

联合应用 DWI-ASPECTS 评分及 HR-VWI 评估急性缺血性卒中患者的预后

吕敏、孙佳莉、王巍
哈尔滨医科大学附属第一医院

目的 探讨 DWI-ASPECTS 评分联合高分辨血管壁成像检查对急性缺血性卒中患者预后的预测价值，以辅助临床采取不同的康复管理办法。

方法 收集 2021 年 6 月到 2022 年 5 月之间进行 HR-VWI 检查，及 7 天内进行 DWI 检查的急性缺血性卒中患者，排除大脑中动脉之外其他血管供血区梗死的患者，共 30 名患者，根据 smRSq 评分将患者分为两组，预后好组 (smRSq 评分 ≤ 2 分) 25 名，预后差组 (smRSq 评分 > 2 分) 5 名。由两名放射医师独立测量与评估患者的 DWI 及 HR-VWI 图像。

结果 依据文献中 DWI-ASPECTS 评分及 HR-VWI 血管壁特征的评估与测量，统一观察者之间诊断标准，观察者之间无统计学差异。将两名观察者诊断一致的所有患者共计 29 名患者进行分组，进行两组之间影像学及临床特征的统计。两组间标准化管壁指数、DWI-ASPECTS 评分具有统计学差异 ($P < 0.05$)，狭窄处血管管壁面积于两组之间虽无统计学差异 ($p = 0.056$)，但统计得出该特征对预后差组的预测价值较大 ($AUC = 0.956$, $p = 0.006$)，具有进一步研究的价值。

结论 联合应用 DWI-ASPECTS 评分及 HR-VWI 对急性缺血性卒中患者的预后具有良好的预测价值，辅助临床对患者的预后进一步评估，采取更适合病人的治疗方法及康复管理。

Efficacy and brain network mechanism of transcutaneous auricular vagus nerve stimulation and antidepressant in the treatment of major depressive disorder

Xiaofei Gao
Beijing Hospital of Traditional Chinese Medicine affiliated to Capital medical University

Transcutaneous auricular vagus nerve stimulation (taVNS) is a novel non-invasive therapy for major depressive disorder (MDD), which stimulates acupoints innervated by the auricular vagus nerves. In recent years, more and more attention has been paid to non-pharmacological therapies for MDD, such as acupuncture, which can relieve the symptoms of MDD. Some previous studies have compared taVNS with antidepressant (such as escitalopram, a commonly used drug for depression,) and sham-taVNS, in terms of clinical scale assessment and brain network imaging. However, there is a lack of comprehensive evaluation of its efficacy and imaging only comparing with antidepressants. This article reviews the efficacy of taVNS compared with antidepressants, focuses on functional connectivity, and further search for effective imaging markers for MDD treatment in the future.

PU-0129

Differential diagnosis of prostate cancer and benign prostatic hyperplasia based on T2WI sequences combined with ADC map texture analysis

Keke Ren

The First Affiliated Hospital of the Air Force Military Medical University

Objective

To study the value of two parameter texture analysis based on T2WI and ADC images in the differential diagnosis of prostate cancer(PCa) and benign prostatic hyperplasia(BPH) in the transitional zone and peripheral zone, respectively.

Methods

A total of 112 Patients with BPH and PCa confirmed by pathology before prostate MRI examination in The First Affiliated Hospital of the Air Force Military Medical University, including 23 cases of transitional zone PCa and 60 cases of BPH; Peripheral PCa 29 cases. The images were read by two imaging physicians with Deputy high-level and above professional titles who have rich experience in reading abdominal and Pelvic MRI images, and select the maximum level and scope of the lesions respectively. When there are differences of views, they reach a consensus through consultation. Another radiologist used mazda4.6.2.0 the software semi-automatically outlines the ROI on the image of the largest layer of the selected focus, and outlines the ROI along the edge of the cancer focus or hyperplastic nodule on the largest layer of the focus, including the whole focus as much as possible, but not beyond its range. It is divided into two times, with an interval of one month before and after, to obtain the texture parameters and values of each ROI, and screen the parameters with statistical significance, Multivariate regression analysis was carried out to evaluate the diagnostic efficacy of each parameter.

Results

In the differentiation of PCa and BPH from transitional band:1.ADC sequences derived from texture analysis, SumAverg(0,5)(AUC=0.917,95%CI:0.836-0.967), sensitivity75%, specificity94.92%; SumAverg(4,4)(AUC=0.924,95%CI:0.844-0.971), sensitivity79.17%, specificity98.31%; SumOfSqs(3,0)(AUC=0.663,95%CI:0.551-0.763), sensitivity62.5%, specificity69.49%; Variance(AUC=0.874,95%CI:0.783-0.937), sensitivity75%, specificity93.22%; Vertl_GLevNonU(AUC=0.799,95%CI:0.697-0.879), sensitivity58.33%, specificity88.14%; Multivariate logistic regression model(AUC=0.994,95%CI:0.944-1), sensitivity100%, specificity94.92%, has better diagnostic value. 2.T2 sequences derived from texture analysis, 135dr_RLNonUni(AUC=0.696,95%CI:0.586-0.793),sensitivity73.91%, specificity60%; Perc.01%(AUC=0.823,95%CI:0.724-0.898),sensitivity69.57%, specificity91.67%; Perc.99%(AUC=0.942,95%CI:0.868-0.981), sensitivity100%, specificity76.67%; SumAverg(0,1)(AUC=0.899,95%CI:0.814-0.955), sensitivity73.91%, specificity91.67%; Teta-3(AUC=0.778,95%CI:0.673-0.862), sensitivity65.22%, specificity78.33%; Multivariate logistic regression model(AUC=0.982,95%CI:0.925-0.999), sensitivity95.65%, specificity93.33%.

Transitional zone PCa and peripheral zone PCa differentiation:1.ADC sequences derived from texture analysis, SumOfSqs(1,-1)(AUC=0.736,95%CI:0.596-0.849), sensitivity60.87%, specificity86.21%; 135dr_GLevNonU(AUC=0.72,95%CI:0.578-0.835), sensitivity73.91%, specificity62.07%; Multivariate logistic regression model(AUC=0.825,95%CI:0.694,0.916), sensitivity95.65%,specificity62.07%. 2.T2 sequences derived from texture analysis, GrSkewness(AUC=0.696,95%CI:0.552-0.816), sensitivity60.87%, specificity75.86%; Vertl_RLNonUni(AUC=0.66,95%CI:0.515-0.785), sensitivity86.96%, specificity44.83%; Multivariate logistic regression model(AUC=0.799,95%CI:0.665-0.897), sensitivity95.65%, specificity55.17%.

Conclusions

1. ADC map texture parameters SumAverg(0,5), Variance, Vertl_GLevNonU and T2WI sequence texture parameters Perc.99%, SumAverg(0,1) in dual parameter MRI texture analysis can

effectively discriminate between PCA and BPH occurring in the transitional zone, where Vertl_GLevNonU was an independent risk factor, and the diagnostic efficacy of the multivariate logistic regression analysis model was higher than that of the univariate model;

2. ADC map texture parameters SumOfSqs(1,-1), 135dr_GLevNonU and T2WI sequence texture parameters GrSkewness, Vertl_RLNonUni in dual parameter MRI texture analysis has differential diagnostic value for PCA that occurs in the peripheral and transitional bands, respectively, and the diagnostic efficacy of the multivariate logistic regression analysis model was higher than that of the univariate model.

基于 MRI 放射组学特征的机器学习模型对 脊髓型颈椎病进行危险度分级

陈鹏¹、郑屹峰¹、程鹏宇¹、徐刚²

1. 湖州市中心医院

2. 安徽理工大学附属淮南新华医院

目的: 探讨基于 MRI 放射组学特征的机器学习 (machine learning, ML) 模型对脊髓型颈椎病 (cervical spondylotic myelopathy, CSM) 进行危险度分级的价值。材料与方法: 回顾性分析临床诊断为 CSM 患者 317 例, 并使用日本骨科协会 (Japanese Orthopaedic Association, JOA) 评估治疗分数将 CSM 分为轻症组 193 例和中重度组 124 例。手动勾画脊髓轴位 T2WI 像生成感兴趣区域 (area of interest, ROI) 并提取放射组学特征, 使用 Z-Score 标准化进行统一量度, 皮尔森相关系数 (pearson correlation coefficients, PCC) 进行数据降维。使用递归特征消除 (recursive feature elimination, RFE) 进行特征筛选, 并使用逻辑回归 (logistic regression, LR)、自适应增强机 (adaboost, AB)、贝叶斯算法 (native bayes, NB) 及支持向量机 (support vector machine, SVM) 四种分类器模型来构建 ML 模型。通过受试者工作特征曲线 (receiver operating characteristic, ROC) 的曲线下面积 (area under the curve, AUC) 评价模型效能。结果: 共筛选出 15 个放射组学特征用于模型构建, 四种分类器中, SVM (训练组 AUC vs. 验证组 AUC: 0.833 vs. 0.813) 和 LR (0.831 vs. 0.812) 模型分级能力较好, 且较稳定, 模型之间无统计学差异 (DeLong 检验: $P > 0.05$), NB (0.819 vs. 0.738) 模型的分类能力弱于 SVM 和 LR 模型, AB 分类器在训练组中分级能力最佳 (AUC: 0.984), 但在验证组中能力欠佳 (AUC: 0.725), 模型稳定性低于 SVM 和 LR 模型。结论: 基于 MRI 放射组学特征的 ML 模型对 CSM 有良好危险度分级能力, 能够为临床术前诊断和术后疗效预测提供一定参考价值。

基于神经指纹技术对中青年抑郁症患者的脑结构 MRI 定量研究

薛婷、许沛嘉、林琮淇、汪丽娅

深圳市龙华区人民医院

目的: 本研究基于高分辨脑结构 MRI 及神经指纹全脑分割量化新技术, 利用轻中度抑郁症患者相关脑区细微结构的体积变化, 探究抑郁症临床诊断的客观指标。

方法: 本研究通过机构伦理审查批准及相关书面知情同意。51 例轻中度抑郁症患者 (男 21 例, 女 30 例) 和年龄性别匹配的 48 例健康对照组 (男 20 例, 女 28 例) 均完成汉密尔顿抑郁和焦虑量表 (HAMD、HAMA) 及抑郁、焦虑自评量表 (SDS、SAS) 评分, 并行 3T 头颅 MRI 常规序列和高分辨率 3D-T1 结构成像。利用 BrainLabel 脑影像分析平台特有的神经指纹技术对全脑进行分割量化, 获取所有受试者分割脑区的体积数据。采用 SPSS 20.0 统计软件对受试者的一般资料 (性别、年龄

等)和影像数据(全脑及局域脑区体积)进行组间量化对比分析,并将有统计学差异的脑区与 HAMD、HAMA、SDS 和 SAS 量表分数进行 Spearman 相关性分析。

结果: 1.病例组与对照组间双侧扣带回和楔叶、右侧颞下回、额中回、直回、顶上小叶和左侧海马体、枕上、中回、舌回组间差异有统计学意义($P<0.05$)。尽管,二组间全脑体积无明显差异,但全脑室系统及脑脊液总量有组间差异($P<0.05$)。

2.与正常对照组比较:女性疾病组出现双侧大脑皮层、双侧脑白质下端、右侧脑白质前端及左侧丘脑的体积改变($P<0.05$);而男性抑郁症仅双侧扣带回、海马体及左侧中央前回有组间体积差异($P<0.05$)。

3.相关性分析显示:女性抑郁症组的颞上回体积与 HAMD 评分呈正相关($P<0.05$);双侧直回及左侧枕叶、枕中回、楔叶体积与 SDS 评分呈负相关($P<0.05$);左侧直回体积与 SAS 评分呈负相关($P<0.05$)。而男性抑郁症组仅右侧扣带回体积与 HAMD 评分呈负相关($P<0.05$)。

结论: 1.本研究结果提示:抑郁症患者局部脑区体积变化较大,尤其是与情绪及精神相关的脑区(扣带回、楔叶、海马体等)。这些脑区体积的早期变化有望成为诊断抑郁症的客观影像学指标。

2.女性抑郁症患者对局部脑回的变化与男性不同,除扣带回外,男性对海马区较敏感,而女性对内嗅皮层较敏感。

3.相关性分析提示女性较男性在抑郁和焦虑方面更敏感。

相位对比磁共振成像在阿尔茨海默病临床诊断中的价值探讨

郑雨杉、陈婷婷、陈秋雁、魏鼎泰
宁德师范学院附属宁德市医院

目的: 采集阿尔茨海默病患者经相位对比磁共振成像进行脑脊液的流速、搏动及颈部大血管血液的流速、搏动数据的采集,分析脑脊液的流速、搏动及颈部大血管血液的流速、搏动与认知功能障碍的相关性。**方法:** 选取 2022 年 12 月—2023 年 9 月宁德师范学院附属宁德市医院收治的 45 例志愿者或诊断为阿尔茨海默病的患者,根据临床诊断、实验室检查、影像学检查、认知功能评分综合评估将其分为正常对照组($n=15$)、轻度认知障碍 MCI 组($n=15$)、AD 组($n=15$)。在 MRI (GE SIGNA Architect 3.0T) 进行头颈部磁共振检查,获得脑脊液的流速、搏动及颈部大血管流速、搏动的图像,并传送到 CVI42 后处理工作站,得到后处理的图像及数据,两两比较三组间的脑脊液收缩期、舒张期峰值流速及颈部大血管峰值流速、血流量、管壁剪切力、压力,并分析两者之间的相关性。**结果:** 中脑导水管脑脊液收缩期及舒张期峰值流速在三组间存在显著差异($P < 0.05$),差异主要存在于 AD 组与对照组之间、AD 组与 MCI 组之间。颈部大血管峰值流速、血流量、搏动相关参数在三组间存在显著差异($P < 0.05$),差异主要存在于 AD 组与对照组之间。根据研究结果,阿尔茨海默病患者脑脊液流速及颈部大血管血液流速与认知功能障碍均呈负相关关系。**结论:** 相位对比成像技术能够反映阿尔茨海默病患者颅内脑脊液及颈部大血管的流速及搏动功能,间接反映阿尔茨海默病患者的 AQP4 及类淋巴系统的功能,在 AD 的早期诊断上具有潜在价值。

三种磁共振 DWI 序列在腮腺成像中的应用价值

赵洪波、陶晓峰、王蕊、钱青於
上海交通大学医学院附属第九人民医院

目的: 评价常规 DWI (基于 Single-Shot Spin Echo EPI)、多重灵敏度编码 DWI (multiplexed sensitivity-encoding, MUSE-DWI) 与基于螺旋桨技术 DWI (periodically rotated overlapping

parallel lines with enhanced reconstruction ,Propeller-DWI) 等三种扩散加权序列在腮腺磁共振成像中的价值。

方法: 对 28 例健康志愿者行腮腺 MRI, 每位受检者同时采集三种不同类型 DWI 图像, 主要参数设置一致: 扩散敏感系数 (b 值) = 800s/mm², NEX=5, slices=18, slice thickness=4 mm。主观评价: 腮腺边缘清晰度, 腮腺变形程度, 背景噪声和整体图像质量, 均采用 5 分法进行评价。客观评价: 信噪比(signal to noise ratio,SNR) 及对比噪声比(contrast to noise ratio,CNR), 其中 CNR 以颈部肌肉信号为参照。采用 SPSS26.0 软件统计分析。

结果: 两位观察者主观评价结果的一致性较好 (P 均<0.01)。MUSE-DWI 显示的腮腺边缘清晰度、变形程度、整体图像质量评分及 SNR、CNR 均优于常规 DWI (P 均 <0.01); MUSE-DWI 的整体图像质量和 SNR、CNR 优于 Propeller-DWI (P 均 <0.05); Propeller-DWI 中腮腺的变形程度最小 (P<0.05); Propeller-DWI 在腮腺边缘清晰度和整体图像质量的表现优于常规 DWI (P<0.05)。

结论: 常规 DWI 通过正反梯度切换快速读出信号, 采集时间短, 但容易积累相位误差, 导致病灶发生形变、模糊、空间分辨率低。Propeller DWI 基于 FSE 读出, 通过自动相位导航去除相位差, 通过多次激发技术缩短回波时间, 对磁敏感伪影和变形不敏感, 但扫描时间长。MUSE-DWI 在相位方向多次激发, 减少回波链长度, 提升了信噪比, 采集完成后进行导航序列校准, 减少了变形, 是腮腺成像的较优选择。

Association of vertebrobasilar artery geometric configuration with intracranial atherosclerotic plaque detected by HR-VWI

Jingtong Xiong^{1,2}, Xiaofeng Qu¹, Jianlin Wu³

1. The Second Hospital of Dalian Medical University

2. Tianjin Medical University

3. Affiliated Zhongshan Hospital of Dalian University

Objective To assess the geometrical conformation of vertebrobasilar artery (VBA) based on high-resolution vessel wall imaging (HR-VWI), and explore the association with intracranial atherosclerosis.

Methods 65 patients (122 atherosclerotic segments) were retrospectively included. All patients underwent conventional MR examination, MRA, and HR-VWI. VBA conformation types: Walking: two vertebral arteries diameters difference < 0.3 mm, curved in the same direction; Tuning Fork: diameters of the two vertebral arteries were equal, curved in opposite directions; Lambda: two vertebral arteries diameters difference ≥ 0.3 mm; No Confluence: no confluence of one VA with the BA, the other VA extended to BA. The number, distribution, volume, maximum plaque dimension area, intra-plaque haemorrhage, enhancement, remodeling, and stenosis of plaques were analyzed. The t-test, ANOVA, chi-square test or Fisher's exact, and rank-sum test were applied for the comparison of clinical data, VBA geometrical-configuration, and imaging indexes. The kappa test was applied to analyze the consistency of VBA conformation assessed by MRA and HR-VWI. P<0.05 was statistically significant.

Results VBAs were classified into Walking (n=20), Tuning Fork (n=24), Lambda (n=16), and No Confluence (n=5), and there was a good agreement between MRA and HR-VWI (κ =0.429, P=0.007). The distance of the outermost edge of the BA from the midline, BA tortuosity index, and the predominance of the bifurcated vertebral arteries were of difference among different morphological VBA configurations (H=15.448, P<0.001; H=8.846, P=0.031; H=9.8, P=0.02 separately). The plaque volume was statistically different among the morphological subgroups (H=7.849, P=0.049). Stenosis caused by vertebral artery plaques on the dysplastic side was greater in Lambda type (Z=1.568, P=0.015).

Conclusions HR-VWI can accurately assess the geometry of vertebrobasilar arteries. The volume of plaques was different among diverse VBA configurations. The dysplastic vertebral artery in Lambda type was with greater stenosis rate.

基于配对 MRI 和 RNA 测序数据探究胶质母细胞瘤预后影像组学表型的生物学通路

杨媛
武汉大学人民医院

预后意义的影像组学表型的生物学意义尚不明确。本研究利用配对的 MRI 和 RNA 测序数据揭示胶质母细胞瘤个体预后影像组学表型的生物学意义，并验证已识别出来与放射基因组学相关关系具有外部可重复性。本研究回顾性纳入了 2020 年 1 月至 2023 年 4 月收集的数据。从影像组学分析集中，使用术前 MRI 构建了 13 个特征作为影像组学标签，以进行总体生存预测。通过 MRI 和 RNA 测序进行放射基因组学训练集，富集了与这 13 个影像组学表型相关联的生物通路。确定了与影像组学相关关键基因，并获得预后影像组学基因表达 (RadGene) 评分。通过外部测试集和公共数据集 (癌症基因图谱 [TCGA])，验证已识别出来的通路和基因具有可重复性。进行时序检验以评估其在预后方面所起到的意义。共纳入 230 例患者 (平均年龄 50 岁 \pm 15 [标准差]; 135 名男性)。在经过验证子集筛选之后，发现影像组学标签与总生存期存在显著相关性 (风险比 [HR] 为 3.54; 95% CI: 2.02-5.89; $P < 0.001$)。四种类型的预后影像组学表型与不同通路呈正相关: 免疫、增殖、治疗反应和细胞功能 (假阳率为 0.10)。鉴定出 30 个与影像组学相关关键基因，并证实 RadGene 评分在 TCGA 测试集中具备预测总体生存期能力 (HR: 1.37; 95% CI: 1.2-2.1; $P < 0.05$)。此外，在外部测试样本中也成功地复制了与影响图谱相联系通路及关键基因之间存在着一致性。根据我们对于胶质母细胞瘤 MRI 扫描结果所得到信息可以推断出各自患者总体生存期情况，并且这些信息是由不同关键通路驱动而成，其中包括免疫调节、肿瘤增殖、治疗反应以及细胞功能等。

A comparative meta-analysis of functional connectivity alterations of default mode network in mild cognitive impairment and Alzheimer's disease

Yaxuan Wang, Li Yao, Qian Li, Fenghua Long, Yitian Wang, Yufei Chen, Su Lui, Fei Li
Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

Aim

Mild cognitive impairment (MCI) and Alzheimer's disease (AD) both show abnormal resting-state functional connectivity (rsFC) of default mode network (DMN), but it is unclear to what extent these abnormalities are shared. We therefore conducted a meta-analysis to elucidate their commonalities and differences.

Methods

We reviewed the literature using PubMed, Web of Science, and Embase through 18 June 2023. We included resting-state functional studies using seed-based whole-brain analysis or independent component analysis to compare patients with MCI or AD with healthy controls (HC) for DMN rsFC. We used the anisotropic effect size version of the signed differential mapping software package. First, separate meta-analyses were performed to identify DMN rsFC alterations in MCI and AD relative to HC. Next, a quantitative comparison between MCI and AD

was performed. Then, a conjunction/disjunction analysis was performed to investigate shared/contrasting aberrant rsFC across patient groups. Jackknife sensitivity, heterogeneity, publication bias, and meta-regression analysis were performed.

Results

We included 31 MCI studies (960 patients with MCI and 1084 HC) and 20 AD studies (569 patients with AD and 661 HC). We found shared decreased rsFC within DMN in MCI and AD, located in bilateral medial prefrontal cortex/anterior cingulate cortex and precuneus/posterior cingulate cortex (PCC). Decreased DMN rsFC in precuneus/PCC was more severe in AD than in MCI. MCI-specific rsFC alterations were found within DMN and between DMN and affective network. AD-specific rsFC alterations were found between DMN and regions of visual network and frontoparietal network. Heterogeneity and publication bias were identified in AD studies for right dorsolateral prefrontal cortex.

Conclusion

The shared DMN alterations in MCI and AD suggest rsFC disruption in precuneus/PCC increases with dementia progression, providing a perspective on neuropathological mechanisms underlying cognitive impairments.

增强斑块长度对识别颅内动脉粥样硬化责任斑块的增量价值：高分辨率磁共振成像研究

程晓青、刘嘉、李红霞、杨家洛、周长圣、卢光明
中国人民解放军东部战区总医院

背景及目的：

在颅内高分辨 MRI 研究中，颅内动脉粥样硬化斑块强化的程度常被用于识别责任斑块，然而，除了斑块强化程度外，与强化相关的其他高分辨 MRI 斑块特征在鉴别责任斑块上是否具有增量价值还未知。本研究目的是评估斑块多种强化特征，包括强化的程度、强化长度和强化象限等是否有助于罪犯斑块的识别和进一步的风险分层。

方法：回顾性研究 2016-2022 年因颅内动脉粥样硬化而发生急性缺血性卒中和短暂性脑缺血发作的患者。增强特征包括增强等级、增强长度和增强象限。使用 logistic 回归和受试者工作特征分析，研究了斑块强化特征与责任斑块之间的关联，以及诊断价值。

结果：总共纳入 287 个动脉粥样硬化斑块，其中 231 个（80.5%）和 56 个（19.5%）分别被归类为责任斑块和非责任斑块。对比增强前和增强后的图像发现，46.32% 的责任斑块的增强长度长于斑块长度。多变量逻辑回归显示，强化长度 \geq 斑块长度的特征（OR 6.77；95% CI 2.47-18.51）和 II 级增强（OR 7.00；95% CI 1.69-28.93）与责任斑块独立相关。结合狭窄和斑块强化等级诊断责任斑块的曲线下面积值（AUC）为 0.787，当强化长度大于斑块长度时，AUC 显著增加到 0.825（DeLong 检验 $p=0.026$ ）。

结论：增强强化长度 \geq 斑块长度和 II 级增强与责任斑块独立相关。增强的斑块的长度特征结合强化程度能够更好的识别责任斑块。

Impact on etiology diagnosis by high-resolution vessel wall imaging in young adults with ischemic stroke or transient ischemic attack

Shanshan Lu, Wenwen He, Feiyun Wu, Haibin Shi
The first affiliated hospital of Nanjing Medical University

Purpose: The etiological features of stroke in young adults are different from those in older adults. We aimed to investigate the impact of high-resolution vessel wall imaging (HRVWI) on etiologic diagnosis in young adults with ischemic stroke or transient ischemic attack (TIA). **Materials and Methods:** A total of 253 young adults (aged 18–45 years) who consecutively underwent HRVWI for clarifying stroke etiology were retrospectively recruited. Two experienced neurologists classified stroke etiology for each patient using Trial of Org 10172 in Acute Stroke Treatment categories with and without the inclusion of HRVWI diagnosis. Multivariate logistic regression was performed to determine which etiologic category would be significantly impacted after including HRVWI.

Results: The etiologic classification was altered in 39.1% (99/253) of patients after including HRVWI in the conventional investigations. The proportion of patients classified as having undetermined etiology (SUE) and the proportion of patients classified as having small-artery occlusion (SAO) both significantly decreased (36.4% to 13.8% and 9.1% to 2.0%), whereas the proportion of patients classified as having large artery atherosclerosis (LAA) significantly increased (28.5% to 58.1%) (all $P < 0.001$). The inclusion of HRVWI had a significant diagnostic impact on young adults who were primarily classified as SAO (odds ratio [OR] 14.4, 95% confidence interval [CI] [2.9, 71.8], $P < 0.001$) or SUE (OR 8.3, 95% CI [2.2, 31.5], $P < 0.01$).

Conclusions: HRVWI had a substantial impact on etiologic classification in young adults with ischemic stroke or TIA, particularly for those primarily classified as having SAO or SUE. This impact of HRVWI will be beneficial for therapeutic decision-making.

The Prognostic Value of Lymph Node Status in Patients with Locally Advanced Cervical Cancer Who Underwent Neoadjuvant Chemotherapy and Followed Hysterectomy: A Two-Center Retrospective Study.

Lin Xiao Dong^{1,2}, Xiao Xian Zhang⁵, Jin Jin Liu^{2,3}, Qing Xia Wu^{1,2,3}, Mei Yun Wang^{2,4}

1. People's Hospital of Henan University

2. Department of Medical Imaging, Henan Provincial People's Hospital

3. People's Hospital of Zhengzhou University

4. Biomedical Research Institute, Henan Academy of Sciences

5. Department of Radiology, the Affiliated Cancer Hospital of Zhengzhou University, Henan Cancer Hospital

Objectives To investigate the prognostic value of lymph node status in patients with locally advanced cervical cancer (LACC) patients who underwent neoadjuvant chemotherapy (NACT) and followed hysterectomy.

Methods Patients in two referral centers were retrospectively analyzed. The baseline tumor size and radiological lymph node status (LN_r) were evaluated on pre-NACT MRI. Tumor histology, differentiation and pathological lymph node status (LN_p) were obtained from post-operative specimen. The log-rank test was used to compare survival between patient groups. Cox

proportional hazards regression models were employed to estimate the hazard ratio (HR) of various factors with progression-free survival (PFS) and overall survival (OS).

Results A total of 266 patients were included. Patients with 2018 FIGO IIIC showed worse PFS compared to those with FIGO IB-IIIB ($p < 0.001$). The response rate in patients with LNp(-) was 64.1% (134/209), significantly higher than that of 45.6% (26/57) in patients with LNp(+) ($p = 0.011$). Multivariate Cox analysis identified the main independent predictors of PFS as LNp(+) (HR = 3.777; 95% CI 1.715-8.319), non-SCC (HR = 2.956; 95% CI 1.297-6.736), poor differentiation (HR = 2.370; 95% CI 1.130-4.970) and adjuvant radiation (HR = 3.266; 95% CI 1.183-9.019). The interaction between LNr and LNp regarding PFS were significant both for univariate and multivariate ($P = 0.000171$ and $1.5357e-7$ respectively). In patients with LNr(+), a significant difference in PFS was observed between patients with LNp(-) and LNp(+) ($p = 0.0027$).

Conclusion LACC Patients with FIGO 2018 stage IIIC who underwent NACT and followed hysterectomy had worse PFS compared to those with IB-IIIB. LNp(+), non-SCC, poor differentiation and adjuvant radiation were independent risk factors for PFS. The adverse prognostic value of LNp(+) was more significant in patients with LNr(+).

PU-0140

基于磁共振质子密度脂肪分数的代谢相关脂肪性肝病患者肝内脂肪分布的研究

周晓军、闻彩云
温州医科大学附属第一医院

目的 利用磁共振质子密度脂肪分数探讨超重型及糖尿病型代谢相关脂肪性肝病患者肝脏脂肪的空间分布。

方法 回顾性收集经穿刺活检证实为 MAFLD 的患者 58 例，将入组患者分为超重型 MAFLD 与糖尿病型 MAFLD，并根据肝脏穿刺活检结果进一步分为轻度组和中重度组。所有入组患者均采用联影 uMR586 1.5T 磁共振扫描仪行上腹部 FACT 序列成像并测量 8 个肝段的 PDFF 值，并计算全肝加权平均 PDFF 值。首先比较两亚型轻度组及中重度组左右半肝 PDFF 值，其次，将各分叶及肝段的 PDFF 值与全肝加权平均 PDFF 值比较，找出高于及低于全肝平均 PDFF 值的肝段。连续变量间两两比较采用 t 检验及 Mann-Witney U 检验，分类变量间的比较采用 Chi-squared χ^2 检验及 Fisher 确切概率法。

结果 轻度及中重度 OW-MAFLD 及 DM-MAFLD 患者右半肝 PDFF 值均高于左半肝 ($P < 0.05$)，OW-MAFLD 轻度组右半肝、右前叶、V 段 PDFF 值高于全肝加权平均 PDFF 值，OW-MAFLD 中重度组右半肝、右前叶、V 段、VIII 段 PDFF 值高于全肝平均 PDFF 值，左半肝、左外叶、尾状叶 (I 段)、II 段 PDFF 值低于全肝平均 PDFF 值。DM-MAFLD 轻度组右半肝、右前叶、右后叶、VII 段、VIII 段 PDFF 值高于全肝平均 PDFF 值，左内叶、尾状叶 (I 段)、IV 段 PDFF 值低于全肝平均 PDFF 值。DM-MAFLD 中重度组患者左半肝、左外叶、尾状叶 (I 段)、II 段 PDFF 值低于全肝平均 PDFF 值，右半肝、右前叶、右后叶、VII 段、VIII 段 PDFF 值高于全肝平均 PDFF 值。

结论 OW-MAFLD 及 DM-MAFLD 患者肝脏脂肪分布不均匀，两亚型轻度及中重度患者右半肝脂肪变程度大于左半肝，OW-MAFLD 轻度患者脂肪首先沉积于 V 段，中重度患者脂肪在 V 段及 VIII 段沉积较多，在 I 段、II 段沉积较少；DM-MAFLD 轻度及中重患者脂肪均在 VII 段及 VIII 段沉积较多，在 I 段沉积较少。在肝脏穿刺活检时，OW-MAFLD 患者在 V 段、VIII 段穿刺，DM-MAFLD 患者在 VII 段、VIII 段穿刺可提高穿刺结果的阳性率，在 I 段穿刺可能会造成穿刺结果的假阴性，进而导致漏诊。

成人肌纤维瘤的临床特征及影像学表现

唐小林

中国人民解放军陆军特色医学中心

目的：分析成人肌纤维瘤的 CT 及 MRI 影像学特征，提高对此病的诊断水平。

方法：回顾性分析 19 例经病理证实的成人肌纤维瘤患者的病例资料。10 例行 CT 增强检查，1 例行 CT 平扫检查，10 例行 MRI 增强检查。观察分析肌纤维瘤的部位、数目、大小、形态、边界、有无骨质侵犯、密度/信号和强化方式等征象。

结果：发病平均年龄为 37.7 岁，男性患者 5 例，女性患者 14 例，男女发病比例约为 1: 2.8。19 例病例共检出 20 个病灶，其中 1 例为多发病灶。发病部位：头颈部 9 例，四肢 3 例，躯干 5 例，1 例累及肺，1 例累及纵隔；16 例病灶呈结节状或团块状，其中 9 例有分叶，1 例呈条片状，2 例呈不规则形；7 例边界清晰，12 例边界模糊；1 例骨质受侵犯。CT 平扫 10 例与肌肉密度相比呈等或稍低密度，1 例呈混杂密度；CT 增强扫描显示 9 例呈结节状或环状明显强化，其中 7 例可见坏死，1 例囊腔内壁结节强化。MRI 平扫 T1WI 上 9 例呈均匀等低信号，1 例呈稍高信号；T2WI 及 FLAIR 上 6 例呈混杂高信号，4 例呈稍高信号，其中 7 例 T2 内可见条索状低信号；MRI 增强检查 9 例呈明显不均匀强化，1 例呈不均匀轻度强化。随访中有 2 例复发。

结论：成人肌纤维瘤 CT 及 MRI 表现具有一定特征性。中青年女性患者，头颈部、躯干、四肢的皮下及皮下组织内单发或多发结节，密度或信号强度不均一，并伴有中度或明显的增强，尤其 MRI“双低信号征”要考虑到成人肌纤维瘤/肌纤维瘤病的可能。

Characterization of local white matter microstructural alterations in Alzheimer's disease: a reproducible study

Caiyun Wen, Meihao WANG

The first affiliated hospital of Wenzhou medical university

Alzheimer's disease (AD) is a neurodegenerative disease with a close association with white matter (WM) microstructural alterations. Present studies lack the characterization and further validation of specific regions in the WM fiber tracts of AD. To identify local WM microstructural alterations in AD, this study subdivided fiber tracts into multiple fiber clusters based on automated fiber clustering and performed quantitative analysis along the fiber clusters. Diffusion tensor imaging (DTI) data from public dataset (53 AD patients, 70 healthy controls) and clinical dataset (27 AD patients, 19 healthy controls) were included for the purpose of mutual validation. Whole-brain tractogram were automatically subdivided into 800 clusters based on automatic fiber clustering approach, then 100 segments were divided along the cluster and the diffusion properties of each segment were calculated. The results showed that the AD patient had significantly lower fraction anisotropy (FA) as well as significantly higher mean diffusivity (MD) in some regions of fiber clusters in the cingulum bundle, uncinate fasciculus, external capsule and corpus callosum. More importantly, these changes were reproducible in two datasets. Correlation analysis revealed a positive correlation between FA and mini-mental state examination (MMSE) scores and a negative correlation between MD and MMSE in these clusters. The accuracy of the constructed classifier reached up to 89.76% with an area under the curve of 0.93. It indicates that this study can effectively identify local WM microstructural changes in AD and provides a new insight into the analysis and diagnosis of WM abnormalities in AD patients.

Magnetic Resonance CSF Velocity Mapping Using Phase Contrast Sequence with Hadamard Encoded Multi-Band Acquisition

Xinxin Zhao¹, Zhifeng Liang², Mengchao Pei², Yan Zhou¹, Jianrong Xu¹

1. Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University, Shanghai

2. Center for Excellence in Brain Science and Intelligence Technology, Chinese Academy of Sciences, Shanghai

Background: Phase contrast MR pulse sequence is widely used for flow velocity quantification (e.g., vascular blood or CSF). However when it's applied on small animals CSF study the major difficulty is extremely slow flow which leads to a high eddy currents. To cancel this eddy current effects we post-processed phase contrast images by hadamard encoded multi-band acquisition.

Methods: A novel generalized Hadamard encoding based multi-band scheme (dubbed HEAP-METRIC, Hadamard Encoding Approach of Multi-band Excitation for short TR Imaging accelerating) using complex Hadamard matrix was developed, and incorporated into conventional PC-MRI to significantly increase SNR. We post-processed phase contrast images by spatial polynomial regressing on static tissue data that requires a manually drawn global mask excluding flowing substance (e.g., vascular blood or CSF). All excited bands of MB RF pulses were designed to be equally spaced. Adjacent bands were gapped by one band distance thus it needs twice slice-selection to complete a whole brain scan.

Results: HEAP-METRIC PC-MRI revealed CSF flow was reduced by isoflurane anesthesia, accompanied by reduction of glymphatic function as measured by DCE-MRI. Significant reduction of artifact caused by eddy current was observed in post-processed phase contrast images. Furthermore, using heart rate recordings, we found significant correlation between heart rate and averaged CSF velocity, suggesting a possible physiological basis for anesthesia induced CSF velocity reduction.

Conclusions: We developed and validated a generalized Hadamard encoding based multi-band PC-MRI method for mapping low velocity flow. Post-procession with Hadamard multi band acquisition can effectively eliminate eddy current effect of high field, which might be an effective tool for small animals CSF study.

Funding: This work was supported by the Clinical Research Project of Health Industry of Shanghai Health Committee (Grant No. 20194Y0087 to X. Z.).

Causal relationship between gut microbiota and glioblastoma: a two-sample Mendelian randomization study

Chao Ju^{1,2}, Jun Liu²

1. The Second Affiliated Hospital of Xinjiang Medical University

2. The Second Xiangya Hospital of Central South University

Abstract

Background: Observational research and medical trials have suggested a connection between gut microbiota and glioblastoma, but it remains unclear if the relationship is causal.

Method: A two-sample Mendelian randomization (MR) study was conducted by employing data from the MiBioGen consortium's largest genome-wide association study (n=18340) and the FinnGen consortium R8 release information (162 cases and 256,583 controls). Inverse variance weighted (IVW), weighted median, weighted model, MR-Egger, simple mode, and MR-PRESSO were used to determine the causal relationship between gut microbiota and glioblastoma.

Reverse MR analysis was also performed on bacteria identified as causally related to glioblastoma.

Results: Seven causal relationships were identified between genetic liability in the gut microbiota and glioblastoma, involving various bacterial families and genera. No significant causal effect was found on gut microbiota from glioblastoma, and no significant heterogeneity of instrumental variables (IVs) or horizontal pleiotropy was observed.

Conclusion: A two-sample MR analysis reveals a causal association between the gut microbiota and glioblastoma, highlighting the need for more investigation to comprehend the processes behind this association.

杨萍、王巍

哈尔滨医科大学附属第一医院

椎基底动脉(VBS)是脑的重要供血动脉。椎动脉(VA)左右各有一支,穿行于颈椎两侧的横突孔,向上行进入颅内,两支血管在颅内合为一支叫基底动脉(BA)。主要供应人脑的枕叶、小脑、脑干、丘脑及内耳等部位。椎动脉优势(VAD)曾经被默认为一种较为常见的椎基底动脉系统的血管形态结构的变异现象,无具体病变意义,然而近年的多项研究证明 VAD 与多种疾病存在相关性,如面肌痉挛、前庭神经元炎、偏头痛等,此外多项研究提示 VAD 可能是后循环缺血的重要危险因素。4D 血流 MRI(4D-flow)是一项新兴的磁共振血管成像技术,可以显示血管的形态学和血流动力学,与传统的 3D 血管成像相比,增加了时间维度,以展示不同心动周期血流动力学的变化。本研究旨在利用 4D-flow 技术探究对基底动脉无狭窄或轻度狭窄(狭窄程度<50%)的患者的椎动脉优势对基底动脉血流动力学的影响,在脑血管疾病的早期预防与准确诊断方面为临床提供更多线索。前瞻性招募我院神经内科或神经外科及健康体检的患者为研究对象,将基底动脉无狭窄或轻度狭窄的患者纳入研究。收集患者的临床基线特征并进行 MRA 及 4D-flow 扫描,根据 MRA 图像判定是否存在椎动脉优势分为两组:VAD 组和非 VAD 组。使用后处理工作台对 4D-flow 图像进行分析,测量包括 WSS、管壁压力等的各项血流动力学参数并记录基底动脉的弯曲程度和弯曲方向。用统计学方法计算读者间的一致性,比较两者间的临床基线特征和血流动力学特征,并探究各组间差异。预期结果是 VAD 组与非 VAD 组可能在各项血流动力学特征上存在差异,且存在椎动脉优势增加发生后循环缺血的可能性,具体的实验数据和测量结果正在收集统计中。

一站式磁共振冠脉成像与多模态高阶定量心肌活性评价的临床应用

于群、王莉霞、杨炼、刘小明、孔祥闯、成兰、赵洁、黄硕

华中科技大学同济医学院附属协和医院

目的:探讨基于压缩感知磁共振冠脉成像与多模态高阶定量心肌活性评价双诊断的临床应用价值。
方法:采用结合压缩感知技术的 3D mDixon FFE 序列行全心冠状动脉成像检测,建立高阶定量心肌活性评估体系,采用结合压缩感知技术心脏电影成像(cine)序列和心肌延迟强化(LGE)PSIR 序列,采用 mapping 序列,包括 native 纵向弛豫时间定量成像(T1 mapping),横向弛豫时间定量成像(T2 mapping)和 enhanced T1 mapping,通过 native T1 mapping 和 enhanced T1

mapping 计算细胞外容积 (ECV)，行心肌定量成像检测，联合心肌灌注，心脏弥散加权成像 (DWI)，通过多序列、多参数、多维度的多模态一站式磁共振心脏成像方法评估冠状动脉，并建立高阶定量心肌活性评估体系。结果：2037 例临床疑冠心病患者纳入本研究，其中包含 1650 例非阻塞性冠心病患者，其中有 54 例在随访内发生不良心血管事件，缺血伴非阻塞性冠状动脉疾病 (INOCA) 很少能被正确诊断，临床误诊率高。无创影像学 CMR 不仅可以检出其冠状动脉非阻塞性狭窄，负荷心肌灌注成像及延迟增强 (LEG) 联合定量成像和 DWI 还可进一步评估心肌微循环功能障碍或心肌缺血。结论：一站式磁共振冠脉成像与多模态高阶定量心肌活性评价双诊断的临床应用在 INOCA 心肌异常诊断的检出率和准确率具有重要的价值，且推动 INOCA 相关临床研究的开展。

Predicting the presence of type 2 diabetes based on abdominal adipose tissue content measured by MRI: observational data from the bariatric surgery cohort

Hong Pan, Jinquan Bai, Shuting Wang, Zhenzhou Shi, Tong Zhang
The Fourth Affiliated Hospital of Harbin Medical University

Objectives: The visceral fat area and fat content in the liver and pancreas are associated with the risk of diabetes. We aim to evaluate abdominal fat deposition in obese subjects with type 2 diabetes mellitus (T2DM) using multi-parameter MRI and to evaluate whether the presence of T2DM in obese people can be predicted based on MRI parameters.

Materials and Methods: We prospectively recruited 75 obese subjects (37 diabetic patients and 38 non-diabetic patients) and 23 healthy volunteers. All subjects underwent mDixon-quant, native T1 mapping, and intravoxel incoherent motion (IVIM) with a 3.0 T MRI of the abdomen. The imaging features of the three groups were compared, and the correlation between MRI parameters and laboratory tests related to glucose and lipid metabolism was analyzed. Three models were constructed, including clinical factors (Model 1), MRI parameters (Model 2), clinical factors, and MRI parameters (Model 3) to find diabetic patients. Receiver operating characteristic (ROC) curves were plotted to evaluate the model performance and pairwise model comparisons were performed via the DeLong test to demonstrate the additive value of different factors.

Results: There were significant differences in proton density fat fraction (PDFF) and apparent diffusion coefficient (ADC) values of liver and pancreas among the control group, non-diabetic group, and diabetic group (all $p < 0.05$). The area under the curve of Model 3 was 0.941, which had higher recognition efficiency than the other two models (each $p < 0.05$) and was rated as better in finding the T2DM of obese patients.

Conclusion: Obese subjects with T2DM had more pronounced ectopic fatty deposits in the abdominal organs, particularly in the liver and pancreas. A comprehensive diagnostic model combining patient clinical risk factors with MRI parameters has superior efficacy in finding the occurrence of T2DM in obese patients.

PU-0148

基于多参数 MRI 的影像组学模型预测 LARC 患者对 nCRT 的反应性

邱香
吉林大学第一医院

目标: 结直肠癌是世界上第三大常见恶性肿瘤。目前, 新辅助放化疗(nCRT)加全直肠系膜切除术(TME)被认为是局部晚期直肠癌(LARC)的推荐治疗方案。然而, nCRT 治疗 LARC 后的治疗结果差异很大。如果在 TME 之前能够准确检测到不良反应者, 则更适当的治疗策略, 如及时手术和广泛手术, 可能是不良反应者的良好选择, 以避免无效地使用高剂量辐射或高剂量化疗药物。影像组学的最新进展表明, 它可以用于肿瘤预后和治疗指导, MRI 放射组学特征可以用于预测 LARC 患者对 nCRT 的 PCR 反应。本研究目的即利用基于多参数 MRI 的影像组学模型预测 LARC 患者对 nCRT 的治疗反应。

方法: 根据入组标准回顾性纳入 80 例患者, 根据术后 TRG 分级将患者分为 GR 组(TRG0-1)与非 GR 组(TRG2-3), 将 GR 组与非 GR 组患者以 2:1 随机分配到训练集与验证集。检索患者新辅助前 2 周内的 MRI 图像, 考虑序列: T2WI、DWI 和 CE-T1WI, 提取 GR 组与非 GR 组有差异的特征 ($P<0.05$), 随机抽取 30 个样本对观察者间与观察者内提取的特征进行重复性分析—组内相关系数(ICC) >0.75 , 代表重复性良好。进行特征选择、降维、模型构建、质量评估与验证最后得到结果。结果: 提取 GR 组与非 GR 组有差异的特征 ($P<0.05$), 分析组内相关系数(ICC) >0.75 , 代表重复性良好。排除 ICC <0.75 的特征, 筛选冗余特征, 并进行充分降维后, 利用训练集中选择的特征建立影像组学模型, 建立临床模型和影像组学诺模图。得到 AUC、分类准确率、特异性、敏感性、阳性预测值(PPV)、阴性预测值(NPV)、校准曲线、决策曲线分析(DCA)等结果。

结论: 可利用基于多参数 MRI 的影像组学模型来成功预测 LARC 患者对 nCRT 的治疗反应性

PU-0149

7.0T 超高场 MRI 评估深髓静脉的临床价值

甄志铭¹、华艳秋¹、刘晨¹、黄沛钰²、张睿婷²、陈伟¹

1. 中国人民解放军陆军军医大学第一附属医院 (西南医院)

2. 浙江大学第二附属医院放射科

背景: 既往基于 3.0T 的深髓静脉影像评分被认为与脑小血管病、认知功能等相关。然而受限于分辨率及磁敏感效应, 其评分是否真实反映了深髓静脉状态尚不明确。

目的: 探讨 7.0T 超高场 MRI 对深髓静脉成像的诊断价值。

方法: 本研究为前瞻性对照研究, 收集陆军军医大学第一附属医院 2022 年 5 月至 8 月招募的健康人群 47 例, 对所有受试者于同一天分别行 7.0T 和 3.0T 磁敏感加权成像 (SWI) 扫描。采用主观指标 Likert5 分量表法评估图像质量, 深髓静脉 (DMVs) 视觉四分法对 DMVs 显示质量进行评估。采用客观指标包括信噪比 (SNR) 和对比噪声比 (CNR) 对静脉图像质量进行评估。两组间比较采用 Mann-Whitney U 检验。

结果: 47 例受检人群中, 男性 25 例 (平均 $27.5\pm\text{DOI}:10.92$ 岁), 女性 22 例 (平均 $28.25\pm\text{DOI}:10.27$ 岁)。7.0T 组、3.0T 组 MRI 组图像主观 Likert5 评分具有统计学差异 [5.0 (5.0, 5.0) vs. 4.0 (3.0, 4.0), $Z=234.50$, $P<0.001$]。DMVs 视觉四分法评分具有统计学差异 [0.0 (0.0, 0.0) vs. 1.0 (1.0, 2.0), $Z=47.0$, $P<0.001$]。7.0T MRI 组图像的 SNR 值 (1.50 ± 0.35) 值低于 3.0T MRI 组 (5.45 ± 1.83), CNR 值 (7.64 ± 1.70) 高于 3.0T MRI 组 (5.44 ± 2.11), 均具有显著统计学差异 ($P<0.001$)。

结论: 相对于 3.0T MRI, 7.0T 超高场 MRI 对 DWVs 显示的图像质量较佳, 对颅内疾病的辅助诊断具有重要临床价值。同一受试者在 3.0T 与 7.0T 深髓静脉评估存在显著统计学差异, 提示我们需重新审视 3.0T 深髓静脉视觉评估结果与临床表现相关性的研究。

PU-0150

1 例非妊娠性卵巢单纯绒毛膜癌的学习体会

陈春霞、陈霞平、曹文婷
福建省妇幼保健院

患者, 女, 31 岁, 因“不规则阴道出血 5 个月, 腹痛半月”入院。外院超声: 不完全纵隔子宫; 宫腔分离并附壁低回声, 炎性改变。多次查血 β -hCG 异常升高, 最高 $>675000.00\text{mIU/L}$; Ca-125 165.80U/ml 。盆腔 MRI: 1、左附件区肿块, 考虑左卵巢滋养细胞肿瘤; 2、腹膜后多发肿大淋巴结。既往体健, 月经规律, LMP: 2023.4.16? 2021 年 3 月足月妊娠顺产 1 女。近 18 个月否认性生活。术后病理: 左卵巢绒毛膜癌, 输卵管组织。免疫组化: hPL(灶+), HCG- β (++), PLAP(灶+), Inhibin-a(++), P63(-), KI-67(60%+), SALL-4(+). STR 基因报告: 该样本 STR 等位基因位点与患者外周血 STR 等位基因位点一致, 符合非妊娠相关绒毛膜癌。

根据 2014 年 WHO 分类, NGCO 属恶性妊娠滋养细胞疾病中极为罕见的一种, 发病率约 $1/(3.7 \times 10^8)$, 在卵巢恶性肿瘤中占比 $\leq 0.6\%$ 。本例 NGCO MRI 表现: 子宫前方左附件区囊实性肿块影, 信号混杂, 呈 T2WI 高、稍高信号, T1WI 等、稍高信号, 实性成分 DWI 信号增高, 增强后实性部分中央呈类蜂窝状不均性强化。左卵巢正常结构未显示。

和以下疾病鉴别: 1、异位妊娠 直接征象可见异位孕囊, 信号混杂, T2WI 以高信号为主, 增强后囊壁见环形不均性强化; 2、葡萄胎 特征性征象是宫腔典型者呈簇状或葡萄样囊性灶, 增强后呈“蜂窝样”强化; 恶变时病灶边界不规则, 信号混杂, 可囊变、出血, 病灶多侵入肌层, 相应区域出现多发混杂血管影; 3、子宫阔韧带肌瘤伴变性 MRI 典型征象见“漩涡状”T2WI 低信号团块影, 增强后强化程度与正常肌层组织一致; 卵巢一般可见; 合并囊变时, 病灶内出现不规则 T2WI 高信号。

总结经验: 1、本例 NGCO MRI 征象无明显特异性, 结合血 β -hCG、激素和肿瘤指标等实验室检查进行诊断; 2、既往妊娠史及血 β -hCG 持续异常升高有助于诊断, DNA STR 分析可明确诊断; 3、术前评估及术后随访应行血 β -hCG 及充分的影像学检查, 以指导治疗和术后及时干预。

磁共振自由呼吸 star VIBE 序列和 UTE 序列在肺结节形态学征象的对比研究

江叶海、于楠
陕西中医药大学附属医院

目的: 比较磁共振自由呼吸序列: 放射状容积内插屏气 (star volumetric interpolated breath-hold examination, star VIBE) 序列和螺旋超短回波时间序列 (spiral ultrashort echo time, spiral UTE) 在肺部检查中图像质量、肺结节检出及形态显示能力的差别。材料与方法: 收集 2019 年 11 月至 2022 年 9 月期间胸部计算机断层扫描 (computed tomography, CT) 发现肺结节且进行胸部磁共振 (magnetic resonance imaging, MRI) 检查患者, CT 和 MRI 检查间隔时间为 48h。MRI 检查采用 star VIBE 序列和 spiral UTE 序列进行扫描。两名放射科医师采用 5 分法独立评价两个 MRI 序列的图像质量, 及其对肺结节检出率及形态学征象的显示能力。结果: 图像质量评价方面 spiral UTE 图像的血管清晰度评分高于 star VIBE (3.74 ± 0.44 和 3.29 ± 0.73 , $P < 0.05$), 而 star VIBE 图像的运动伪影评分低于 spiral UTE 图像 (3.12 ± 0.88 和 3.64 ± 0.60 , $P < 0.05$)。在结节

的检测能力上, spiral UTE 序列的磨玻璃结节检出率高于 star VIBE 序列 (70.37%和 25.92%, $P<0.05$), 且在中下叶的结节总检出率高于 star VIBE 序列 (87.23%和 57.44%, $P<0.05$)。在结节形态学征象的检出能力上, spiral UTE 序列的分叶、毛刺、棘突、空泡和空洞检出率 (90.90%、85.71%、88.88%、100%、100%) 高于 star VIBE 序列 (86.36%、71.42%、77.77%、50%、83.33%, $P>0.05$)。结论: 对于运动伪影较大患者, 推荐使用 star VIBE 序列, 对于磨玻璃结节、中下叶结节和含气病变的患者, 推荐使用 spiral UTE 序列。

PU-0152

Multitask based Image Reconstruction for Brainstem Glioma Diagnosis and Treatment

Yajing Zhang, Yanxin Huang, ZhongChang Ren, Yan Zhao
Philips HealthTech Suzhou

Objective:

In the context of brainstem glioma diagnosis, the widespread use of gadolinium-based contrast agents has raised concerns due to their potential adverse effects on kidney health. This study aims to generate post-contrast-enhanced images from multi-modal data, as a substitute for contrast agents, ultimately reducing the contrast agent burden on the patient.

Method:

To achieve this goal, we conducted experiments on a dataset consisting of thirty cases, each containing multi-modal data (T1w, T2w, ASL, and post-contrast T1w images) along with manually annotated lesion regions. Our approach involved training an adversarial generative network using paired T1w, T2w, and ASL images to synthesize post-contrast T1w images. To enhance training efficacy, we introduced a segmentation task as an auxiliary objective, building a multi-task deep learning model. This model employs a shared encoder and multiple parallel decoders to yield results comparable to baseline methods while accommodating the diverse requirements of clinical diagnosis.

Results:

For quantitative evaluation, we utilized two metrics to assess the synthesized CE-T1w images against the target CE-T1w images: Structural Similarity Index Measurement (SSIM) and Peak Signal Noise Ratio (PSNR). The synthesized CE-T1w images achieved a PSNR of 25.21 ± 2.29 and an SSIM of 0.84 ± 0.05 , surpassing the results of the method proposed by Wang et al. (PSNR of 25.09 ± 0.85 , SSIM of 0.83 ± 0.06). Qualitatively, our approach outperformed the baseline model, Wang et al., in generating more realistic CE-T1w images. Furthermore, our method effectively enhanced the contrast at brainstem glioma region in the synthesized images.

Conclusion:

The proposed multi-task generative model incorporates an attention mask generated using a mask followed by a sigmoid layer. Our results illustrate that the attention map plays a crucial role in synthesizing CE-T1w images with distinct brainstem glioma regions. However, there is room for improvement in the quality of synthesized CE-T1w images. This work demonstrates the multi-task strategy for CE-T1w MR synthesis in brainstem glioma and its potential to other tumor applications.

PU-0153

基于常规 MRI 纹理分析预测原发性肝癌体外放疗短期疗效

张佳、胡鹏志
中南大学湘雅三医院

摘要:

目的: 基于常规磁共振 (magnetic resonance, MR) 图像的纹理分析预测原发性肝癌体外放疗的短期局部疗效。

方法: 选取 2015 年 1 月至 2020 年 10 月期间在中南大学湘雅三医院住院的 54 例接受放射治疗的原发性肝细胞癌 (hepatocellular carcinoma, HCC) 患者。收集患者的一般资料, 所有患者在治疗前均接受肝脏常规 MRI 检查, 包括 T1WI 平扫及增强、T2WI 序列。放射治疗后 2-3 个月内进行临床随访, 进行腹部增强 MRI 或 CT 检查。将患者治疗后的情况根据改良的实体瘤反应评估标准 (modified response evaluation criteria in solid tumors, mRECIST) 分为有反应组与无反应组。对治疗前的病灶进行定量及定性分析, 并勾画感兴趣区域 (region of interest, ROI), 提取并筛选图像的纹理特征, 对提取出的特征进行 logistic 回归分析, 建立预测模型, 分析模型的预测效能。

结果: 从患者治疗前的常规 MR 图像中筛选出 4 个有代表性的特征, 并将此 4 个特征纳入最终的 logistic 模型, 使用受试者工作特征曲线 (receiver operating characteristic curve, ROC) 来评估模型的预测效能, 最终模型的曲线下面积 (area under curve, AUC) 及上下 95%CI 为: 0.815 (0.700 0.931), 混淆矩阵计算特异度 76.7%, 敏感性 70.8%。单独对 4 个变量进行 ROC 分析, auc 分别是: auc(roca): 0.6278; auc(rocb): 0.6736; auc(rocc): 0.6868; auc(rocd): 0.6701。

结论: 基于 HCC 患者放射治疗前的常规 MR 图像的纹理特征建立的 logistic 模型能够有效预测患者放疗后的短期局部疗效; 并且将 4 个变量组合起来建立的模型的预测效能高于任何一个变量的单独预测效能。

PU-0154

基于 MRI 灰度共生矩阵技术分析颞下颌关节紊乱病患者髁突骨质的纹理特征

武玫
中国人民解放军总医院海南医院

目的: 通过 MRI 灰度共生矩阵技术分析 TMD 患者髁突骨质改变的纹理特征。方法: 对 2019 年 3 月至 2022 年 3 月于解放军总医院海南医院就诊的 120 例 TMD 患者 (平均年龄 27.9 ± 12.3 , 男/女 = 36/24) 进行 TMJ 磁共振检查, 根据关节盘情况分为正常组 (50 例)、可复性关节盘移位组 (35 例) 及不可复性关节盘移位组 (35 例)。采用灰度共生矩阵技术在闭口位斜矢状位 PDWI 序列分析髁突骨质的纹理特征, 主要评估参数包括角二阶矩、对比度、自相关、逆差矩及熵。采用 Kruskal-Wallis H 检验、单因素方差分析及受试者工作特征曲线分析各项纹理特征参数差异。结果: 髁突骨质的纹理特征参数角二阶矩和熵的组间比较有统计学意义 (P 角二阶矩 = 0.000, P 熵 = 0.000), 对比度、自相关及逆差距无统计学意义 (P 对比度 = 0.503, P 自相关 = 0.288, P 逆差距 = 0.147); 其中角二阶矩和熵在鉴别 NC 组与 DDwoR 组 (P 角二阶矩 = 0.000, P 熵 = 0.000)、DDwR 组与 DDwoR 组有统计学意义 (P 角二阶矩 = 0.007, P 熵 = 0.005), 在鉴别 NC 组与 DDwR 组无统计学意义; ROC 曲线分析证实纹理特征参数角二阶矩鉴别 NC 组与 DDwoR 组的曲线下面积为 0.75, 截断值为 1.50×10^{-3} , 灵敏度及特异度分别为 54.30% 及 90.00%; 鉴别 DDwR 组与 DDwoR 组的曲线下面积为 0.71, 截断值为 1.50×10^{-3} , 灵敏度及特异度为 54.30% 及 88.60%。熵鉴别 NC 组与 DDwoR 组的曲线下面积为 0.75, 截断值为 6.49, 灵敏度及特异度分别为 51.40% 及 94.00%; 鉴别 DDwR 组与 DDwoR 组的曲线下面积为 0.72, 截断值为 6.72, 灵敏度

及特异度分别为 60.00%及 82.90%。结论: 纹理特征参数角二阶矩及熵可以初步用以评估早期 TMD 患者髁突骨质的改变。

失独所致创伤后应激障碍患者的脑结构研究

刘想

中国人民解放军东部战区总医院

目的: 为了解失独所致创伤后应激障碍 (Post traumatic stress disorder, PTSD) 患者在大脑结构方面的变化, 本研究运用磁共振脑功能成像技术对失独所致 PTSD 患者各脑区的大脑灰质体积进行了比较和分析。

方法: 选择来自中国江苏省失独的父母 106 例, 根据受试者是否伴 PTSD 将其分为 PTSD 组(45 例)和 NPTSD 组(61 例), 同时纳入健康志愿者 30 例 (HC 组)。采用临床用 PTSD 诊断量表 (Clinician Administered PTSD Scale, CAPS) 评估受试者临床症状的严重程度。采集受试者静息状态脑功能 MRI 数据。运用 Freesurfer 软件处理受试者的 MRI 扫描数据, 计算全脑灰质体积。使用 SPSS 27.0 软件进行统计分析。

结果: 经过统计学分析, 三组受试者的年龄、性别、受教育年限相匹配。PTSD 组以及 NPTSD 组的 CAPS 评分显著高于 HC 组, PTSD 组的 CAPS 评分稍高于 NPTSD 组。运用 Freesurfer 软件处理分析的结果显示, 与 HC 组相比, PTSD 组以及 NPTSD 组双侧海马体积减少, 而 PTSD 组减少的更多。

结论: 本研究发现, PTSD 患者的双侧海马体积明显减少, 这提供了 PTSD 大脑结构变化的重要信息, 并可能有助于阐明其病理生理学的机制。

PU-0156

颞下颌关节磁共振影像诊断结构化报告的构建

武玫

中国人民解放军总医院海南医院

磁共振成像技术是评估颞下颌关节的首选技术, 传统的影像诊断报告系统缺乏统一的模块管理, 本文详细介绍了解放军总医院海南医院的颞下颌关节核磁结构化图文报告系统, 通过对 2019 年 11 月至 2023 年 1 月于我中心就诊的共 175 例 350 侧行 TMJ 检查的患者, 应用 TMJ MRI 影像结构化图文报告系统, 依据扫描模式, 详细阐述了颞下颌关节的各项评估参数, 通过对关节盘、髁突、关节腔积液以及翼外肌 4 个主要模块进行评估, 包括数据输入模块和图文报告板块两部分, 数据输入模块主要对以上 4 个评估参数进行量化, 具体数据输入结合影像报告系统进行, 各项评估参数输入后自动生成图文报告, 通过对诊断报告书写过程中重点描述的内容以及核心诊断内容的描述, 提高影像报告质量及临床应用价值。

基于规范化增强的 MRI 影像组学列线图术前预测子宫内膜癌淋巴血管间隙侵犯

邢金丽、冯峰
南通市肿瘤医院

目的: 构建基于规范化增强的 MRI 影像组学列线图, 探讨其术前预测子宫内膜癌 (EC) 淋巴血管侵犯 (LVSI) 的价值。方法: 回顾性分析 157 例子宫内膜癌患者术前盆腔 MRI 检查及临床资料, 按照 7:3 的比例, 随机分为训练集和验证集。从 CE-T1WI、T2WI、DWI 和 ADC 图中提取影像组学特征。利用最小相关最大冗余性 (mRMR) 算法和递归特征消除 (RFE) 选择特征, KNN(K-Nearest Neighbor) 算法构建组学模型。采用多变量 logistic 回归分析, 结合 Rad-score 和临床危险因素, 构建列线图, 比较影像组学特征、临床危险因素和列线图对 LVSI 的预测效能。结果: 1781 个影像组学特征经 mRMR 和 RFE 算法筛选出 12 个影像组学特征并计算 Rad-score。单因素和多因素 logistic 回归分析发现 CA125、肿瘤级别以及 Rad-score 为 LVSI 的危险因素。训练集和验证集中影像组学模型的预测性能为 0.83 (95%CI: 0.76–0.91) 和 0.78 (95%CI: 0.65–0.91); 临床模型的预测性能分别为 0.83 (95%CI: 0.72–0.93) 和 0.75 (95%CI: 0.55–0.95); 列线图预测性能分别为 0.90 (95%CI: 0.84–0.97) 和 0.86 (95%CI: 0.72–1.00)。列线图对 LVSI 具有较高的预测效能, 并且净分类指数 (NRI) 和总综合鉴别指数 (IDI) 证实列线图优于临床模型。结论: 基于规范化增强的 MRI 影像组学列线图可用于术前预测 EC LVSI。

PU-0158

乳腺 MRI T2 加权 fs 序列在评估瘤周水肿作为乳腺癌侵袭性预测标志物中的作用: 一项回顾性单中心研究结果

吕卓
四平市中心人民医院

目的: 探讨 MRI T2-STIR 序列评估的肿瘤周水肿对浸润性乳腺癌患者的无病生存期和总生存期的预测作用。

方法和材料: 我们对 107 例经活检证实的浸润性乳腺癌患者 (平均年龄: 53 岁) 进行了回顾性研究, 这些患者于 2010 年 1 月至 2011 年 7 月在 1.5T 扫描仪上进行了术前乳腺 MRI 检查。影像学检查由两位放射科医生共同进行, 根据 T2-STIR 图像上肿瘤周围信号强度的程度来评估肿瘤周围水肿。MRI 协议包括对比前 T2-STIR 图像、DWI、动态 GRE T1 图像注入对比剂前后以及减法技术。根据 T2-STIR 序列上是否有瘤周水肿, 我们将患者分为两组。我们回顾性收集了其他病变特征, 如大小、组织学、分子模式、阳性淋巴结有无和手术类型。采用 kaplan - meier 曲线对无病生存期和总生存期进行统计分析。

结果: 纳入研究的患者中位随访时间为 7.7±1.3 年。MRI 检查发现 107 个病灶中 52 个 (48.9%) 瘤周水肿。本组 9 例复发, 第二组 4 例无瘤周水肿。Kaplan-Meier 检验两组患者无病生存期差异无统计学意义 (p=0.11)。在瘤周水肿组, 总生存时间比另一组低 (p=0.045)。

结论: MRI T2-STIR sequences 检测到的瘤周水肿可被认为是预测较差生存结局的有效辅助特征。

局限性: 小样本, 单中心研究。

PU-0159

扩散峰度磁共振成像与动态增强磁共振成像在头颈部肿瘤良恶性鉴别价值

范雪姣
辽宁省肿瘤医院

目的: DKI 和 DCE-MRI 在鉴别头颈部病变良恶性及亚组中的诊断价值。

方法: 入组病例 80 例患者 (共 40 例良性、40 恶性), 分为 4 个亚组。扫描方法: 在 3.0T MR scanner (Ingenia,philips) 上采用单次回拨平面 DKI 序列 (4 个 b 值, 0、500、1000、

1500) 的 DKI 与 DCE-MRI 的增强 T1 高分辨率各向同性体积激发序列。DCE-MRI 采集参数为 (TR=16;TE=3.4;层厚=3mm; FOV=240 180 采集时间 7s) 评估方法: 测量来自 DKI 的平均扩散率(MD)和平均峰度(MK)以及基于 DCE-MRI 的时间信号强度曲线(TIC)、峰值时间(Tpeak)和流出比(WR)。计算并比较了 DKI 和 DCE-MRI 单独和联合的诊断效率。定量数据表示为平均值 \pm 标准偏差。Mann-WhitneyU 检验用于比较良性和恶性病变之间的 MD、MK、Tpeak 和 WR。对两组间 TIC 类型进行卡方检验。四个亚组的 DKI 和 DCE-MRI 参数通过单因素方差分析(ANOVA)。

结果: TIC、DKI 和 DCE-MRI 参数的组合用于区分良性和恶性病变的准确率为 94.94%, 优于单独的 DKI 或 DCE-MRI, 准确率约为 75%。MD、MK、Tpeak 和 WR 在四个亚组之间显示出显著差异。结论 DKI 和 DCE-MRI 可以区分头颈部区域的良性和恶性病变, DKI 和 DCE-MRI 衍生参数的组合可以提高诊断准确性。此外, DKI 和 DCE-MRI 可以区分头颈部病变的四个亚组。

PU-0160

以功能性脑核磁探索针灸得气感和疼痛感的脑中枢反应对比

马竞超
辽宁何氏医学院

【摘要】目的: 引用循证医学的工作原则指导传统针灸学的临床和科研, 才能形成与国际学术交流的共同语言, 才得到国际的认同, 传统针灸学才能在世界舞台上大放异彩。基于前人研究, 方法: 本文首先回顾了针灸与得气在临床上上的理论, 得气在传统理论的概念。其次, 我们回顾了前人的针灸 MRI 研究, 在总结前人 MRI 文献基础上, 本文倾向于认为, 正激活为主导的模式应该是得气的响应模式。基于这些问题的改进, 本文使用健康被试, 分析了得气组被试与锐痛组被试的大脑活动模式特征, 并比较了两组之间的异同。结果: 了这些研究中发现的得气在大脑中枢神经的模式, 主要理论: 与中枢正激活为主的得气响应。结论: 本研究认为, 得气的大脑活动是正激活响应为主, 对比表明针灸的针感和疼痛在脑中枢反应对比不同。

正常成年人嗅球相关 MR 研究

王琪、王珍
徐州医科大学附属医院

目的: 探讨成年人嗅球的 MR 扫描及体积测量方法, 初步建立正常成年人嗅球的体积范围。

方法: 将 60 例 31 岁-50 岁健康志愿者按年龄分成 2 组, 低龄组为 31-40 岁, 高龄组为 41-50 岁, 采用 MR T1 IR 序列扫描, 手动测量双侧嗅球体积、最大面积、最大面高度及宽度、嗅球信号及嗅

沟深度, 评估嗅球形态 (是否存在凹面), 了解嗅球及嗅沟正常参考值及随年龄变化的情况, 比较双侧及两性之间嗅球体积差异。

结果: 不同年龄组嗅球体积及嗅沟深度经比较差异具有统计学意义($P=0.048$ 及 $P=0.032$); 高龄组两性间嗅球体积经比较差异具有统计学意义($P=0.041$)。

结论: MR T1 IR 序列能清晰的显示嗅球轮廓, 可用于嗅球的体积测量研究。随年龄的增长, 嗅球体积逐渐减小, 嗅沟深度逐渐加深; 不同于男性, 女性嗅球缩小幅度较小。

颈内动脉发育异常的高分辨磁共振管壁成像特点

谢珊珊、冉云彩、王潇、付其昌、张勇、程敬亮
郑州大学第一附属医院

目的: 探讨颈内动脉发育异常的临床和高分辨磁共振管壁成像 (HR-VWI) 特点。方法: 收集 6 例经影像学确诊的颈内动脉发育异常患者, 分析其临床和影像学资料, 并复习总结相关文献。结果: 6 例患者中 4 例为男性, 2 例为女性, 年龄 31~64 岁, 中位年龄 52.5 岁。就诊原因分别为头痛、头痛或肢体无力 4 例, 一过性晕厥 1 例, 静止性震颤伴行动迟缓 1 例。6 例均为单侧, 其中 3 例颈内动脉发育不良患者于 HR-VWI 上表现为颈内动脉起始处以远全程管径纤细, 管壁未见明显增厚及强化。3 例颈内动脉发育不全患者, 颈内动脉起始处均可见显影, 病例 1 和 5 起始处以远延续为线样软组织样结构, 分别止于海绵窦段和颈段, 病例 6 起始处以远缺如。颅内伴动脉夹层、动脉瘤、发育不良、异常血管网等多种血管异常。结论: 颈内动脉发育异常在高分辨磁共振管壁成像上有一定特征性, 且 HR-VWI 能够有效评估颅内侧枝代偿及其合并的血管异常。

Traumatic spinal cord injury of fMRI: neuroimaging biomarkers

Tingting Guan
Xiangya Hospital, Central South University

Objective:

spinal cord injury is accompanied by a series of sensory and motor dysfunction.① evolution of injury center, ②progressive spinal cord atrophy, ③progressive craniocerebral atrophy.

The most prominent features of traditional spinal cord MRI: MRI sagittal T2-weighted images include hemorrhage, cytotoxic edema and spinal cord swelling.

Quantitative MRI: provides indicators of the integrity of the spinal cord and brain, reflecting atrophy, demyelination, and iron deposition.

fMRI: can reflect the plasticity of the brain and spinal cord. Indirect quantification, and being able to present task-dependent oxygen consumption levels indirectly related to neuronal activity. rs-fMRI of the injured spinal cord can show the change or loss of the connection between the injured spinal cord and other parts of the spinal cord.

This study aims to explore the correlation between the changes of brain function and clinical parameters after traumatic spinal cord injury (TSCI) by fMRI.

Methods:

clinical indicators: nerve injury was evaluated by the International Standard for Neurological Classification of Spinal Cord injury (ISNCSCI). Lower limb motor score (LEMS), light tactile score (LELT) and acupuncture score (LEPP) were obtained.

The resting fMRI of the patients was collected and the appropriate seed points were selected for functional connection analysis of the whole brain. The correlation between fMRI index and clinical index was determined by regression analysis.

Results:

the abnormal changes of resting state indexes such as FC mostly occurred in the brain regions related to sensation or movement, and had a strong correlation with clinical indexes.

Conclusion:

there may be abnormal changes in brain function after traumatic spinal cord injury, and this change may be closely associated with a series of sensory and motor dysfunction in patients with traumatic spinal cord injury.

PU-0164

经介入术后新的缺血性脑病变与高分辨率磁共振成像的斑块特征相关性分析

崔超翔

苏州大学附属第二医院 (核工业总医院)

背景: 目前, 症状性颅内动脉粥样硬化性狭窄的经皮腔内血管成形术和支架置入术后, 新发缺血性脑病变 (NIBL) 的发生率很高。然而, 关于高分辨率磁共振成像 (HRMRI) 上的斑块特征是否影响介入术后 NIBL 的发生, 人们知之甚少。

目的: 探讨 HRMRI 斑块特征对有症状脑缺血性病变患者介入术后早期 NIBLS 的预测价值。

方法: 连续纳入 2020 年 1 月至 2022 年 12 月期间接受治疗的近期因颅内大动脉重度狭窄或闭塞而导致 TIA 或卒中的患者。患者接受治疗前 HRMRI 来评估斑块特征, 并接受治疗后磁共振弥散加权来识别 PTAS 后的 NIBL。斑块特征包括斑块内出血 (IPH)、斑块对比度增强、斑块偏心率、斑块表面不规则性和管腔狭窄程度。通过单变量和多变量分析研究了 NIBL 与斑块特征以及临床参数之间的关联。

结果: 本研究纳入了 126 名连续患者 (平均年龄 73 岁)。总共 54.8% (126 名患者中的 69 名) 在 PTAS 后出现 NIBL。在斑块特征分析中, NIBL 患者具有较高的狭窄程度 (79% vs 74%, $p=0.025$)、较高的 IPH 存在 (48% vs 27%, $P<0.001$) 和较高的斑块强化频率 (48% vs 32%, $P=0.005$) 比较了非 NIBL 患者。在多变量分析中, 斑块增强 2 级是 PTAS 后 NIBL 的唯一独立预测因子。 (OR 9.68, 95% CI 3.43-27.36, $p<0.001$)。

结论: HRMRI 上的颅内动脉粥样硬化斑块对比增强 2 级与症状性 ICAS 介入术后的早期 NIBL 独立相关, 表明血管内治疗中斑块易损性更高, 缺血性卒中风险增加。

上皮样滋养细胞肿瘤 1 例并文献复习

董林道^{1,3}、刘金金^{2,3}、杨紫涵^{2,3}、张月洁^{1,3}、吴青霞^{1,2,3}、王梅云^{3,4}

1. 河南大学人民医院

2. 郑州大学人民医院

3. 河南省人民医院医学影像科

4. 河南省科学院生物医学研究所

目的 探讨上皮样滋养细胞肿瘤(ETT)的影像特征, 以提高对该肿瘤的认识。

方法 回顾性分析 1 例经病理证实的 ETT 的临床表现、影像及病理资料, 并复习相关文献。

结果 患者剖宫产术后阴道不规则出血, 血清 β -HCG 轻度升高约 339.43 mIU/ml (正常值 ≤ 5 mIU/mL)。超声示 ETT 低回声包块, 彩色多普勒血流成像 (CDFI) 示包块周边有血流信号。盆腔

CT 示子宫直肠陷窝内团块状软组织密度影，增强呈不均匀强化。MRI 示病灶边界清楚，呈混杂长 T1 长 T2 信号，内伴条片状短 T1 短 T2 信号；病灶弥散明显受限，增强扫描病灶不均匀渐进性强化，但各期强化程度均低于子宫肌层。

结论 妊娠后血清 β -HCG 升高患者，要考虑滋养细胞来源肿瘤；病灶边界清楚合并出血信号，弥散受限并渐进性强化，无论肿瘤位置在何处，都要考虑到 ETT 的诊断。

PU-0166

误诊为颅咽管瘤的垂体母细胞瘤 1 例分析并文献复习

林亚南

郑州大学第一附属医院

【摘要】回顾性分析 1 例垂体母细胞瘤误诊为颅咽管瘤病例的临床、影像、病理资料及诊治经过，以提高鞍区病变的鉴别诊断能力。本例患者年龄为 2 岁，以右侧下肢无力 2 周，右侧上肢无力 3 天为主诉入院，无明显诱因出现走路不稳，无哭闹、跌倒，无发热、头痛、呕吐，无抽搐、惊厥。右侧膝、跟腱反射稍减弱，右侧 Babinski 征可疑阳性。功能评价显示为中枢性尿崩症和垂体前叶功能低下。磁共振表现为鞍内及鞍上囊实性占位，诊断为颅咽管瘤。经手术切除后病理诊断为垂体母细胞瘤。对于年龄较小，鞍内及鞍上占位，疑诊为颅咽管瘤或垂体瘤的患者，应及时行活检或手术以明确诊断。

PU-0167

T2 Flair 流动伪影解决方法

许斯、刘小明、雷子乔

华中科技大学同济医学院附属协和医院

目的:

3.0T MRI 常规 2D FLAIR TSE 成像脑脊液伪影明显，影响诊断。3D FLAIR TSE 成像可以有效抑制脑脊液流动伪影，但扫描时间长，影响临床应用，结合压缩传感技术可以大大缩短扫描时间。本研究旨在比较 3D FLAIR 与压缩传感技术相结合的脑脊液流动伪影和图像质量评估。

方法和材料

前瞻性纳入 56 名受试者（平均年龄 38.2 岁，年龄范围 22-75 岁，24 名女性，32 名男性）进行 3.0T MRI（Philips, Ingenia CX）液体衰减反转恢复（FLAIR）成像。所有患者均接受常规头部扫描、2D FLAIR TSE 成像和 3D FLAIR TSE 成像，两种成像方法的分辨率与时间一致。将图像传送到后处理工作站，两名放射影像诊断专家使用 5 分制对图像进行主观评分评估。测量两组图像的信噪比、CNR、CR 和脑脊液流动伪影。通过 Friedman 检验比较传统 2D FLAIR 和 3D FLAIR CS 的图像质量主观评分，并通过两样本 T 检验比较 SNR、CNR 和 CR 之间的差异。

结果

3D FLAIR CS（图 1）的整体成像质量明显优于传统 2D FLAIR，3D FLAIR CS（B 组）和传统 2D FLAIR（A 组）序列的采集时间相同。B 组对脑脊液伪影的抑制作用优于 A 组（ $U=3.66$ ， $P<0.01$ ）；B 组在信噪比方面优于 A 组（ $P<0.05$ ）；B 组的对比噪声比优于 A 组（ $P<0.05$ ）；B 组优于 A 组（ $P<0.05$ ）。与传统的 2D FLAIR 相比，3D FLAIR CS 伪影明显减少，尤其是脑干前部伪影（得分高 54 分），总体图像质量更好。定量评价结果表明，3D FLAIR CS 序列的平均信噪比、CNR、CR 值均优于传统的 2D FLAIR 序列。

结论

与传统的 2D FLAIR 序列相比, 3D FLAIR CS 在抑制脑脊液流动伪影方面具有明显的优势。图像质量和诊断性能也优于传统的 2D FLAIR 图像。这些发现有望帮助脑梗死、脱髓鞘病变和听觉神经瘤病人的明确诊断。磁共振三维成像模式和厚层采集方法与压缩传感技术相结合, 能有效抑制 T2 FLAIR 流动伪影。在相同的扫描时间内, 图像质量可以满足诊断要求。

PU-0168

The study of MRI in the evaluation of the posterior fossa cistern of fetus in the mid and late pregnancy

Libo Pang
Xuzhou Central Hospital, Xuzhou

Objective: As a more and more popular supplementary means of prenatal imaging examination, MRI had more advantages over ultrasound in the discovery of posterior fossa cistern (PFC) abnormalities and other brain abnormalities. This paper discussed the clinical value and significance of MRI in the evaluation of PFC of fetus by retrospectively analyzing the MRI findings of fetal PFC widening cases in mid and late pregnancy.

Materials and methods:

General materials: Cases of prenatal MR examination in Xuzhou Central Hospital in recent 4 years were selected. 123 cases of middle and late pregnancy with widened posterior fossa cistern were diagnosed, of which 123 cases had prenatal ultrasound examination in our hospital within 1 week. The age of pregnant women were 21 ~ 36 years old and the gestational weeks were 23 ~ 37 weeks. There were 98 cases of fetal head position, 23 cases of breech position and 2 case of foot position.

Research methods: The MR machine was superconducting philips 1.5T, adopted fast imaging sequence. The fetal head was scanned in axial, coronal and sagittal plane after secondary positioning. The imaging sequence was 2D balance FFE (two-dimensional balanced steady-state fast field echo sequence), FOV30~35, layer thickness of 4.0mm, layer spacing of 0mm, turning angle of 60°, TR/TE 7/1.84ms, matrix208×238, NSA 2, scanning time 33~42s.

Measurement standard of PFC: the width of PFC was measured as the maximum vertical distance from the midpoint of cerebellar vermis to the inner edge of skull. At least two MR diagnostic and prenatal diagnostic doctors jointly judge the results of MR examination, and make comparative analysis after obtaining the same results.

Statistical method: SPSS23.0 statistical software was used for statistical analysis. Kappa correlation coefficient was used to analyze the correlation of the number of various lesions detected between MRI and US. $K \leq 0.2$ indicated poor correlation, $k \leq 0.2-0.4$ indicated general correlation, $k \leq 0.4-0.6$ indicated medium correlation, $k \leq 0.6-0.8$ indicated strong correlation, and $k \leq 0.8-1.0$ indicated very strong correlation. McNemar test was used to test the difference of the number of various lesions detected between MRI and US. $P < 0.05$ was a significant difference, and $P < 0.01$ was a very significant difference.

Results:

MRI diagnosis showed 123 cases of PFC widening, 53 cases of simple PFC widening; 78 cases of PFC with lateral ventricular dilatation(LVD); 35 cases of PFC with subarachnoid space widening; 1 case of PFC with Holoprosencephaly (lobar type); 4 cases of PFC with cerebral hypoplasia; 3 cases of PFC with cerebellar hypoplasia; 18 cases of atypical Dandy Walker malformation(DWM), 2 cases of DWM; There were 9 cases of PFC with arachnoid cysts, including 6 cases of arachnoid cysts in the PFC; 3 cases of Blake cyst, 1 case of atypical Blake cyst; 4 cases of PFC with corpus callosum(CC) hypoplasia; 2 cases of PFC with lateral brain perforation malformation(LCPM); 4 cases of PFC with subependymal cyst of lateral ventricle(SCOLV).

US diagnosis showed 66 cases of PFC widening, 38 cases of simple PFC widening; 34 cases of PFC with LVD; 0 cases of PFC with subarachnoid space widening; 0 cases of PFC with

Holoprosencephaly (lobar type); 0 cases of PFC with cerebral hypoplasia; 0 cases of PFC with cerebellar hypoplasia; 3 cases of atypical DWM; 1 case of DWM; 0 cases of PFC with arachnoid cyst; 0 cases of Blake cyst, 0 cases of atypical Blake cyst; 0 cases of PFC with CC hypoplasia; 0 cases of PFC with lateral cerebral perforating malformation; 1 cases of PFC with SCOLV.

In the cases with consistency between US and MRI, 66 cases had PFC widening, K value was 0.463, and the correlation degree was medium; Simple PFC widening in 32 cases, K value 0.122, the correlation degree was poor; 32 cases of LVD, K value 0.358, the degree of correlation was general; There were 3 cases of atypical DWM with K value of 0.122, and the correlation degree was poor; 1 case of DWM, K value 0.008, with poor correlation; 1 case of SCOLV, K value 0.024, the correlation was poor.

In the McNemar test between US and MRI, PFC width and subarachnoid space was P value < 0.001 ; Atypical DWM and arachnoid cyst was P value < 0.01 ; Simple PFC widening, cerebral hypoplasia and CC hypoplasia was P value < 0.05 ; The other diseases was P value > 0.05 .

Conclusions:

MRI could accurately measure the widening degree of fetal PFC in mid and late pregnancy comparing with ultrasound, and could also find some accompanying structural abnormalities of cerebellum and brain. Prenatal MRI could improve the accuracy of diagnosis of fetal central nervous system (CNS) malformations, and provide a reliable basis for fetal brain development monitoring and prognosis judgment. Therefore, the application of fetal MRI in mid and late pregnancy has important clinical significance to improve the quality of prenatal diagnosis.

PU-0169

ADC 值在预测前列腺癌 Gleason 分级中的价值

闫旭
南京鼓楼医院

目的: 探讨 ADC 值对前列腺癌 (Prostate Cancer, PCa) 的诊断效能及与预后相关的格里森评分 (Gleason Score, GS) 的相关性。

材料与方法: 收集 7423 名前腺受检者的磁共振图像和相关临床数据进行回顾性分析, 筛选出 $GS \leq 7$ 的病例。测量病灶的 ADC 值, 并使用受试者工作特征 (Receiver Operating Characteristic, ROC) 曲线来确定 PCa 的 ADC 阈值, 并记录对应的曲线下面积 (Area Under the Curve, AUC), 比较不同 GS 之间的 ADC 差异, 分析 ADC 在 PCa 诊断中的效能, 以及 ADC 值和 GS 之间的相关性, 同时, 比较平均表观扩散系数值 (mean ADC, ADCmean) 和最小表观扩散系数值 (minimum ADC, ADCmin) 的诊断效能。

结果: 纳入 1051 例患者, 病灶总数为 1202 处, 其中 638 例为 PCa (53.08%), 564 例为良性病变 (46.92%)。良性病变组的 ADCmin 及 ADCmean 明显高于 PCa 组, 差异具有统计学意义 ($P < 0.01$)。GS 4+3 组的 ADCmin 及 ADCmean 显著低于 GS 3+4 组、GS 3+3 组和良性组, 差异均有统计学意义 ($P < 0.01$)。诊断 PCa 的 ADCmin 和 ADCmean 的 AUC 分别为 0.911、0.972, 诊断界值分别为 $0.703 \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $0.896 \times 10^{-3} \text{ mm}^2/\text{s}$ 。ADCmin、ADCmean 与 GS 呈负性相关 ($\rho = -0.764$, $P < 0.001$; $\rho = -0.845$, $P < 0.001$)。

结论: ADC 值与 PCa 侵袭性呈负相关, 对 GS 3+4、GS 4+3 病灶具有较高的鉴别诊断价值, 敏感度、特异度高, 且 ADCmean 的诊断价值更高, 可对 PCa 生物学特性进行有效的术前评估, 辅助临床医师制订治疗方案。

长期吸烟对男性大脑灰质结构影响的磁共振成像评价

张勇

郑州大学第一附属医院

应用基于体素的形态学分析(VBM)方法评价长期吸烟对男性吸烟者脑灰质结构改变的影响。方法 2014 年 8 月至 2016 年 8 月采用西门子 Skyro3.0T MRI 扫描仪对 50 名长期吸烟者和 37 名不吸烟的健康志愿者进行扫描,受试者均进行常规 MRI(以排除颅内病变)序列及 3D-T 结构像(3D-mprage)序列扫描。结构像数据采用基于 Matlab 平台的 SPM8 预处理统计学分析采用 SPM8 软件,对两组资料进行独立样本检验将两组的灰质差异区和吸烟资料做 Spearman 相关分析。结果 吸烟组双侧丘脑,右侧缘上回、左侧缘上回和左侧壳核灰质体积分别为(0.55 0.07)(0.40 +0.05),(0.48 0.07)和(0.140.4)体素,对照组相应脑区灰质体积分别为(0.61 0.09)(0.43 :0.06),(0.54 0.07)和(0.16 0.03)体素,吸烟组均低于对照组($t = -3.81, -3.51-3.86-2.33$ 均 $P < 0.05$),族系误差校正($P < 0.5$)。双侧丘脑、右侧缘上回左侧壳核灰质体积与吸烟指数呈负相关($r = -0.368-0.1890.274$,均 $P < 0.05$)且与吸烟年限也呈负相关($r = -0.391-0.221, -0.355$ 均 $P < 0.05$),双侧脑灰质体积还与日吸烟量负相关($r = 0.186P < 0.05$)。结论 吸烟者脑灰质结构的改变主要集中在奖励相关通路及边缘系统,且与吸烟的累积量部分相关。

PU-0171

Brain Alterations of Regional Homogeneity, Degree Centrality and Functional Connectivity in Carotid Vulnerable-plaque Patients with Neither Clinical Symptoms nor Routine MRI Lesions: A Resting-state fMRI Study

Qian Wang,Wu Xing,Shuai Yang
xiangya hospital of central south university

Aims: Based on resting-state functional MRI (fMRI), we preliminarily explored brain alterations in asymptomatic patients with carotid vulnerable plaques but carotid stenosis $< 50\%$.

Methods: A total of 58 asymptomatic patients with carotid vulnerable plaques (stenosis $< 50\%$) and 38 healthy controls were recruited. Between-group differences in regional homogeneity (ReHo), degree centrality (DC), and functional connectivity (FC) were analyzed. Correlation analysis was performed between the ReHo or DC values in altered brain regions as well as voxel-wise abnormal FC and scores on neuropsychiatric scales, serum interleukin-6 (IL-6) and C-reactive protein (CRP).

Results: Both ReHo and DC values on the left superior occipital gyrus (SOG.L) of the asymptomatic carotid vulnerable plaque group reduced regardless of plaque location (left, right or bilateral). Functional connections weakened between SOG.L and right lingual gyrus (LING.R)/right inferior occipital gyrus (IOG.R), right middle frontal gyrus (MFG.R)/orbital part superior frontal gyrus (ORBsup.R)/orbital part middle frontal gyrus (ORBmid.R), left precentral gyrus (PreCG.L)/postcentral gyrus (PoCG.L), PreCG.L, left supplementary motor area (SMA.L), right paracentral lobule (PCL.R), left precuneus (PCUN.L), and right postcentral gyrus (PoCG.R)/PCL.R. In ReHo-altered brain regions, ReHo values were positively correlated with Hamilton Rating Scale for Depression (HAMD) scores, and setting region of abnormal ReHo as seed points, voxel-wise FC between SOG.L and PreCG.L was negatively correlated with CRP.

PU-0172

PI-RADS 2.1 版和 2.0 版在 5 位不同经验阅片者间评分一致性及对移行带前列腺癌诊断效能的比较

魏超刚

核工业总医院 (苏州大学附属第二医院)

目的: 探讨 5 位不同经验的前列腺 MRI 诊断医师应用基于双参数 MRI (bp-MRI) 的不同版本前列腺影像报告和数据系统 (PI-RADS v2.1 和 v2.0) 比较移行带 (TZ) 前列腺癌 (PCa) 和临床显著癌 (cs-PCa) 的评分一致性及诊断效能。方法: 回顾性分析 2017 年 1 月至 2020 年 3 月在我院经直肠超声前列腺穿刺活检前进行 bp-MRI 检查的 355 例移行带可疑病变患者。5 位具有不同经验 (1 年、2 年、3 年、5 年和 8 年) 的阅片者参照 PI-RADS v2.1 和 v2.0 评分标准, 对所有图像进行“双盲”评分。运用加权 Kappa 检验和 Kendall's W 检验评估每个版本不同评分者间对图像判读结果的一致性。运用受试者工作特征曲线下面积 (AUC) 评估 PI-RADS v2.1 和 v2.0 对移行带 PCa 和 cs-PCa 的诊断效能并进行比较。结果: 采用 PI-RADS v2.1 方案, 所有阅片者之间具有较强的评分一致性 (加权 kappa 平均值为 0.711, Kendall's W 值为 0.804), 高于采用 PI-RADS v2.0 方案的评分者间一致性 (加权 kappa 平均值为 0.615, Kendall's W 值为 0.725)。运用 PI-RADS v2.1 检出移行带 PCa 和 cs-PCa 的 AUC 值均高于 PI-RADS v2.0, 但不同经验的阅片者之间存在差异, 移行带 PCa 检出的差异性在 3 位高年资阅片者中更显著, 而移行带 cs-PCa 检出的差异性在 2 号阅片者和 4 号阅片者中更显著。另外, 对所有阅片者而言, PI-RADS v2.1 对移行带 PCa 的诊断敏感度更高, 对 cs-PCa 的诊断敏感度和特异度均更高。结论: 与 PI-RADS v2.0 相比, 基于 bp-MRI 的 PI-RADS v2.1 在评估移行带病变方面具有更好的评分一致性和诊断效能。另外, 阅片者的经验对前列腺 MR 图像诊断产生一定影响。

浅谈镇静儿童颅脑磁共振检查提高图像质量技巧

赵中顺

昆明市儿童医院

优质的磁共振图像, 能为临床提高更加丰富的信息。不能配合的儿童虽然进行了镇静, 但是部分病例仍然会出现运动伪影。本次研究仅从我科运用吸入七氟烷麻醉镇静的方法进行镇静后行颅脑磁共振扫描的病例进行分析, 针对患儿镇静后呼吸频率过快、呼吸强度大、膈肌痉挛等造成磁共振图像被运动伪影影响的情况, 我们采用了一系列有效措施, 提高了图像质量和患儿的检查成功率。

FACT 序列与 IDEAL-IQ 序列脂肪定量的比较实验研究

郭茜、尚全良、司徒卫军、汤世雄、张帅

中南大学湘雅二医院

目的: 评价联影 uMR790 磁共振脂肪定量技术相较于进口高场强磁共振脂肪定量技术的可靠性。方法: 利用自制不同浓度 (0%、5%、10%、15%、20%、25%、30%) 的脂肪乳溶液按浓度分为 A、B、C、D、E、F、G 七组, 并将其置于不同厂家 3.0T 磁共振仪器上 (联影 uMR790、GE SIGNA Premier), 分别用各自的脂肪定量序列 (FACT、IDEAL-IQ) 进行扫描, 运用对应的后处

理软件得出不同厂商七组脂肪乳溶液的质子密度脂肪分数 (Proton density fat fraction, PDFF) 值, 将 PDFF 值与脂肪乳浓度进行统计学相关性分析。

结果: 联影 uMR790 测得的 PDFF 值与脂肪乳水模浓度之间相关系数 r 等于 0.995, GE SIGNA Premier 测得的 PDFF 值相关系数 r 等于 0.996, 两组相关系数几乎相同, 均具有强相关性。

结论: 联影 uMR790 基于 FACT 序列的磁共振脂肪定量技术与国外高场强磁共振相比在脂肪定量上可靠性相近。

PU-0175

抗 NMDAR 脑炎患者的临床特点、短期预后与磁共振成像阳性/阴性的关联分析

刘玉波、王光彬、李统、陈昱帆
山东第一医科大学附属省立医院

目的: 描述 MRI 阳性/阴性抗 NMDAR 脑炎患者的临床特点, 分析 MRI 阴/阳性患者的临床特点差异, 探究造成 MRI 显示差异的原因。

方法: 收集 2013 年 1 月至 2023 年 1 月于山东省立医院诊治的急性亚/急性发病的 92 例抗 NMDAR 脑炎的临床资料进行回顾性分析。依 MRI 表现分为阳性组与阴性组, 阳性组 36 例; MRI 阴性组 56 例。比较两组的性别与年龄、临床表现、血清和脑脊液、脑电图及短期预后评分差异。

结果: 阴性组发病年龄低于阳性组 ($P < 0.05$); 发病至第 1 次接受 MRI 检查时长, 阳性组长于阴性组 ($P < 0.05$)。两组之间入院严重程度、入住 ICU 及平均住院天数的差异均无统计学意义 ($P > 0.05$)。发热和头痛在 MRI 阳性组高于阴性组 ($P < 0.05$); 认知障碍、意识下降与昏迷、睡眠障碍存在差异, MRI 阳性组低于阴性组 (P 均 < 0.05)。其他精神行为异常、近事记忆力下降、癫痫发作、言语障碍、运动障碍、不自主运动及自主神经功能障碍均不存在统计学差异 (P 均 > 0.05)。MRI 阳性组的血清 NMDAR 抗体阴性比例高 MRI 阴性组 ($P < 0.05$)。脑脊液 NMDAR 抗体滴度在两组之间无差异 ($P > 0.05$)。脑脊液中红细胞、白细胞增高的分布在两组之间不存在差异 (P 均 > 0.05), MRI 阳性组的脑脊液蛋白浓度高于阴性组 ($P < 0.05$)。血清降钙素原及血清其他病毒抗体的水平在两组之间不存在差别 ($P > 0.05$)。血脂方面, 阳性组的总胆固醇、载脂蛋白 B 的水平高于阴性组 (P 均 < 0.05); 高密度脂蛋白胆固醇、载脂蛋白 A、载脂蛋白 A/B、甘油三酯的水平在两组之间无差别 (P 均 > 0.05)。脑电图异常在两组之间不存在差别 ($P > 0.05$)。两组短期预后差异没有统计学意义 ($P < 0.05$)。

结论: MRI 阳性/阴性抗 NMDAR 脑炎的临床特点、病情严重程度及短期预后相似, 但患者年龄、发病至 MRI 检查时长、脑脊液蛋白浓度、总胆固醇和载脂蛋白 B 浓度存在差异, 了解这些差异将有助于临床医师进一步理解急性/亚急性发病的抗 NMDAR 脑炎患者的颅脑 MRI 表现, 提醒临床医生注意潜在诊断并确保及时和适当的临床检查

Quantitative Evaluation of Deep Learning Reconstruction of Diffusion-weighted MRI using a DWI Phantom

Xiangchuang Kong
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Introduction: Deep Learning (DL) based reconstruction has shown to be a promising technique to further improve image quality in various applications¹. Currently, DL has been used for the interpretation and postprocessing of MRIs and for image acquisition and reconstruction In TSE

and Haste sequence, deep learning reconstruction (DLR) trained by raw data on different vendors using supervised models within convolutional neural networks (CNN) and state of the art DL models showed comparable performance with conventional scan procedure in a remarkable reduction in acquisition time and denoising²⁻³. Nevertheless, there are few research on DWI using DL reconstruction (DWI-DLR) to figure out the impact of image quality and denoising. However, its performance and potential benefits in diffusion weighted imaging (DWI) has not been thoroughly evaluated. Purpose: The purpose of this study is to quantitatively measure the signal-to-noise (SNR) gain achieved with DL reconstruction and benchmark the gain against a higher performance gradient system; as well as validating the ADC value measured with DL reconstruction by scanning and comparing the results from a DWI phantom. Methods: An early version of Quantitative Imaging Biomarkers Alliance (QIBA) DWI phantom was scanned on a Siemens 3T Vida scanner (60/200 gradient) using a prototype DWI sequence with both conventional recon and DL recon as well as on a Siemens 3T Prisma (80/200 gradient) with a conventional DWI sequence. A Siemens 20-channel head and neck coil was used in all acquisitions on both scanners. The same sequence parameters are used on both Vida and Prisma scanners, except the receiver bandwidth (rBW) optimized based on gradient performance to achieve minimal echo spacing and minimal TE, which, in turn, produced slightly different TR and scan time, as shown in Table 1. Two versions of DWI sequences both with through-plane parallel imaging acceleration (SMS) factor 2, but different in-plane parallel imaging acceleration (iPAT) factor 2 and 3 were tested. For each sequence, two identical acquisitions were performed consecutively to allow subtractions for measuring the noise in DWI images. The circular ROIs were then placed in each compartment of the DWI phantom on both the diffusion weight source image to measure the mean signal and the subtracted image to measure the standard deviation of noise in order to calculate the signal to noise ratio (SNR). The ratio of measured SNR for each compartment at different b-values was calculate between sequences. Only the average SNR ratios are presented in Table 2. Linear regressions were performed on mean ADC measurements of each vial between sequences with and without DL recon to evaluate the potential impact. Results Typical DWI images and the calculated ADC map are shown in figure 1 with circular ROIs placed in each compartment. The average SNR for sequences with DL recon is consistently higher than the average SNR with conventional recon, as shown in table 2, especially for higher iPAT factor and at lower b-values. The SNR gain is similar to that with better gradient performance and therefore shorter TE on Prisma for iPAT of 3 and greater for iPAT of 2. The ADC values measured with DL recon is consistent with ADC values measured with conventional recon as demonstrated by good correlations ($R^2 = 0.9959 - 0.9994$) in figure 2. Discussions: Reduced Distortion due to shorter ETL with higher iPAT while the loss of SNR can be recovered by DL Some Blurring and ghosting artifacts are observed with DL, addition investigation will be carried out. Volunteer and patient studies are needed to confirm and validate phantom study results. Conclusion: DL recon offer improved SNR in DWI images without compromising the accuracy of ADC measurement. The SNR gain with DL recon is similar to that with gradient performance difference between Vida and Prisma.

MRI 引导与 CT 引导房放射治疗的区别

冯志慧

海南省人民医院

冯志慧 海南医学院附属海南医院 海南省人民医院 13907534744 fengzhihui198992@163.com

目的: 探讨磁共振成像与 CT 成像在放射治疗成像技术中的对比。方法: 选取本院 2014 年 1 月—2015 年 12 月, 临床确诊的 200 例拟放射治疗的肿瘤患者, 对所有患者常规行 MRI 定位扫描和 CT 定位扫描, 采集: , GE 1.5T MRI 和东芝 64 排 CT。一个多世纪以前, CT 成像技术就被放疗科用于肿瘤靶区的勾画和定位。70 年代用于放射治疗。随着科学技术的快速发展, 80 年代开始

应用 MRI 成像技术实施放射定位治疗。用 CT 成像技术来引导放射治疗, 原因: 1、CT 扫描时间短; 2、CT 得到的是电子密度 X 线衰减图像; 3、CT 扫描得出的图是空间不会偏曲的; 4、CT 螺旋数据可以得到数字重建图像与放射治疗规划系统进行配准。MRI 成像技术在软组织对比上有超高的空间分辨率, 对肿瘤的范围、精准定位、与周围组织的密切关系, 都可以清晰的区分。MRI 和 CT 的检查特点有: 1、MRI 扫描无电离辐射; 2、超高的空间分辨率; 3、MRI 图像是多参数、多对比度; 4、成像方位任意; 5、多模态成像提供; 6、解剖配准好; 7、受多种因素影响大; 8、扫描时间长; 9、可以得到代谢图。放疗科医师一致认为 MRI 在放射治疗上优于 CT, 在疗效前的计划和治疗后的评估, 有举足轻重的优势, 特别是现在高端 MRI 的出现, 扫描时间基本和 CT 相差无几, 由于我们地处南方, 沿海城市, 气候湿润, 所以容易导致鼻咽癌的高发, 在 CT 扫描后数据融合定位时, 总是难以精确的勾画除靶区与周围组织区分, 导致治疗时范围过大, 对患者的辐射量加大, 经常导致放射性脑炎, 而 MRI 就不会, 因为它有着超高的空间分辨率, 可以使得勾画靶区的精准基本和病灶相匹配。结果: 在肿瘤的放射治疗中, MRI 与 CT 扫描放射定位治疗相比, MRI 对肿瘤靶区范围的准确率为 97%, 误差率为 5%, 敏感度为 93%, 特异度为 96%, MRI 在扫描上, 不但可以多模态, 给临床提供更多信息, 减少患者的伤害性, 还可以持续监测患者的放疗疗效; 由于病例数较少和设备不足, 在许多方面上还有待改进和提高。

基于多参数 MRI 影像组学融合模型术前预测乳腺癌腋窝淋巴结转移的研究

尹智^{1,2}、崔艳芬²、任嘉梁³、杨晓棠²

1. 山西医科大学

2. 山西省肿瘤医院

3. 北京通用电气公司

目的 探讨基于多参数 MRI 影像组学融合模型在预测乳腺癌腋窝淋巴结 (ALN) 转移方面的应用价值。方法 回顾性分析山西省肿瘤医院 2020 年 8 月—2021 年 9 月经病理证实的 272 例乳腺癌患者的多参数 MRI 及临床资料。患者均为女性, 年龄 28~79 岁, 其中 ALN 阳性 107 例、ALN 阴性 165 例。按照 7:3 的比例随机将患者分为训练组和验证组。从 T2 加权成像 (T2WI)、增强 T1 加权成像 (cT1WI) 序列和表观弥散系数 (ADC) 图中提取影像组学特征。采用三个步骤 (单因素逻辑回归、相关性分析和 Boruta 算法) 进行特征选择, 然后采用支持向量机 (SVM)、随机森林 (RF) 和逻辑回归 (LR) 机器学习方法构建影像组学模型。同时, 通过多因素逐步回归筛选独立临床危险因素并构建临床模型。最后, 联合影像组学模型和临床模型构建融合模型。采用受试者工作特征曲线 (ROC)、校准曲线和决策曲线 (DCA) 来评价预测性能及临床效益。结果 训练组和验证组患者肿瘤位置差异有统计学意义 ($P < 0.05$); 训练组中 ALN 阳性与 ALN 阴性患者间的肿瘤位置、MRI 评估淋巴结状态, 验证组中两组间的 ER、分子亚型及 MRI 评估淋巴结状态, 差异均有统计学意义 (P 值均 < 0.05)。基于多参数 MRI 降维选择后, 得到了 6 个与 ALN 转移呈显著相关的影像组学特征 (P 值均 < 0.05)。在训练组和验证组中, SVM、RF 和 LR 模型均表现出很好的预测能力, AUC 分别为 0.784、0.826、0.703 和 0.733、0.817、0.703, 其中 RF 模型效能最高。单因素、多因素回归分析显示, MRI 评估淋巴结状态是 ALN 转移的独立预测因子并构建临床模型。联合影像组模型和临床模型构建的融合模型在训练组和验证组中均表现出更好的性能, AUC 分别为 0.867 和 0.866, 且其诊断效能均优于上述三种机器学习模型和临床模型 (AUC 分别为 0.719 和 0.700)。DCA 显示, 三种机器学习模型、临床模型和融合模型均有一定的临床效益, 其中融合模型的净收益值最大。结论 基于多参数 MRI 影像组学特征结合 MRI 评估淋巴结状态构建的融合模型有助于术前准确预测乳腺癌 ALN 转移状态。

PU-0179

The optimization of black-blood imaging using T1-Weighted DANTE-SPACE for intracranial vessel wall imaging at 7 Tesla

Xiangchuang Kong

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Introduction

MR vessel-wall imaging (MR-VWI) is the most promising technique for noninvasive and reliable examination of vessel wall pathology in cerebrovascular diseases. Unlike CT, DSA, and ultrasound, MR-VWI can provide high resolution and excellent tissue contrast between vessel wall and brain soft tissue, and therefore it can directly assess the vessel wall. 3D MR-VWI is desired due to its isotropic resolution. The increase in signal-to-noise ratio (SNR) and spatial resolution at 7T would benefit 3D-VWI, provided that 7T-specific challenges can be accounted for, such as the specific absorption rate (SAR) and blurring for long spin echo readout trains. SPACE, a 3D variable flip angle degree turbo-spin-echo (TSE) sequence has been developed to reduce SAR and blurring at higher field and have effectively replaced the classic 180-degree TSE readout at 7T. Though has excellent flow suppression in the readout direction, 3D-SPACE-VWI is still challenged by slow-flow-related artifacts in the other two encoding directions, which induce fake signals in post contrast images, especially in the internal carotid arteries. The delay alternating with nutation for tailored excitation (DANTE) preparation module [11] have been combined with SPACE in order to achieve better slow-flow suppression [2]. With DANTE-SPACE, according to previous radiological studies[2, 4-7], the following features were achieved for VWI of intracranial arteries: high spatial resolution, sufficient SNR, suppression of signal in luminal blood and CSF, and multiple tissue weightings. In this study we sought to optimize to produce a sharp depiction of vessel wall by effectively suppresses fast flowing blood and slowly flowing CSF.

Purpose: To discuss the feasibility and optimization of 3D T1 DANTE-SPACE sequence in high-resolution MR vessel wall imaging for intracranial vessels at 7 Tesla.

Method: The magnetization signals of vessel wall and blood were simulated using MATLAB (MathWorks, Natick, Massachusetts). Simulations were done across DANTE pulse flip angles (FA) of 8°, 10°, 12°, and 14°, with flow-encoding gradient strengths set at 25 mT/m and parallel to the blood velocity. Simulations were then done across flow-encoding gradient strengths of 20, 25, 30, and 35 mT/m, all parallel to the blood velocity, with DANTE pulse flip angle set at 12°. The rest of the simulation parameters were shown in Table 1.

Under local IRB approval, 3D T1 SPACE and 3D T1 DANTE-SPACE sequences were performed on a total of 6 volunteers on a 7T MR scanner (Magnetom Terra, Siemens Healthcare, Erlangen, Germany) equipped with an 8Tx/32Rx head coil (Nova Medical, Wilmington MA, USA). The imaging parameters were shown in Table 2. Note that the DANTE flow encoding gradients were only set in the phase and encoding directions, since the SPACE's inherent flow suppressing capability already performed well in the read-out direction. The signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR), and signal ratio between vessel wall and lumen were calculated at internal carotid artery (ICA) for SPACE and DANTE-SPACE sequences for each of the 6 volunteers.

Two neuroimage radiologists scored the image quality based on subjective wall visualizations of the two VWI methods blindly and independently using a 4-point scale followed by inter-rater reproducibility analysis.

Result

As the simulation has shown in Fig 1, the blood signal in intracranial vessels decreased with increasing DANTE flip angle and number of TR, while the vessel wall signal was only minorly affected. As shown in Fig 2, for the assumed blood velocity (0.1 m/s), the best set of TR number and gradient strength were 150 and 25 mT/m. Therefore, for the human scans, the parameter set

was chosen to be: FA=12°, TR number=150, and gradient strength = 25 mT/m. In the human scans, the SNR of the T1 SPACE and T1 DANTE-SPACE is 66.22 ± 12.56 , 56 ± 13.81 respectively, and P value >0.05. The CNR for vessel wall and lumen is 5.57 ± 0.95 , 12.57 ± 5.85 respectively, and P value <0.001. Subjective wall visualization score of T1 DANTE-SPACE is significantly higher than T1 SPACE (3.65 ± 0.23 vs. 2.16 ± 0.35). The 2 neuroimage radiologists' scores agreed excellently, evidenced by the intraclass correlation coefficient (ICC) values being higher than 0.79 (P<0.001).

Discussion

According to the simulation results of DANTE pulse, the larger the flip angle (FA) and numbers of TR, the lower the signal of flowing blood, and the side effect with it is the decrease in contrast and signal-to-noise ratio of white material and gray material. However, this increase is not endless, subject to the whole duration of DANTE pulse and SAR value, the pilot test showed DANTE numbers of TR over 200 cannot be scanned, so the best scanning scheme of DANTE pulse is FA=140, numbers of TR =150, and phase/slice encoding gradient=25mT/m. The high signal in the C3 segment of the intracranial artery was often seen (50% approximately) in the T1 SPACE and all disappeared with DANTE, which significantly indicates that DANTE pulse suppresses the flow fluid signal very well. DANTE pulse are known to be flow-dependent and we chose the flow rate of 100 cm/s in according to the intracranial artery as the reference value for the simulation. Scores on multiple intracranial vessels in T1 DANTE SPACE is much high than T1 SPACE by evaluation of 2 neuroimage radiologists, especially in the internal carotid artery (Figure 3), the superior sagittal sinus (Figure 4). The flowing blood signal was basically suppressed, and the canal wall and luminal structures could be clearly displayed in T1 DANTE SPACE.

Conclusions

The optimization of T1 DANTE-SPACE produce darker blood visualization and shaper vessel wall depiction with feasible SAR at 7T, which implied promising diagnosis and qualified evaluation in pre and post contrast VMI.

磁共振扩散加权成像评价食管癌化疗疗效的应用价值

张利岩、孙小芹
西宁市第一人民医院

目的 探讨磁共振扩散加权成像 (diffusion weighted imaging, DWI) 评价食管癌化疗疗效的应用价值。**方法** 选取 2017 年 1 月至 2019 年 6 月在我院治疗的食管癌患者 110 例, 经给予常规化疗治疗, 比较化疗有效和无效患者化疗前后表观扩散系数 (apparent diffusion coefficient, ADC)。结果 经治疗后, 达到完全缓解 (complete remission, CR) 患者 7 例, 部分缓解 (partial remission, PR) 患者 67 例, 疾病稳定 (stable disease, SD) 患者 22 例, 疾病进展 (progressive disease, PD) 患者 14 例; 有效组化疗后 1 周、2 周 ADC 值分别为 $(1.98 \pm 0.42) \times 10^{-3} \text{mm}^2/\text{s}$ 和 $(2.10 \pm 0.31) \times 10^{-3} \text{mm}^2/\text{s}$, 明显高于无效组 ($p < 0.05$); 有效组化疗后 1 周、2 周 ADC 值变化率分别为 $(31.10 \pm 3.32) \%$ 和 $(39.08 \pm 3.80) \%$, 明显高于无效组 ($p < 0.05$); 化疗后 1 周、2 周 ADC 值, 化疗后 1 周、2 周 ADC 值变化率预测食管癌化疗有效的 ROC 曲线下面积分别为 0.642、0.550、0.865 和 0.806, $p < 0.05$ 。**结论** DWI 检查的 ADC 值在化疗有效和无效患者间有所差异, 其化疗后 1 周、2 周 ADC 值及变化率能有效预测食管癌化疗疗效。

岛叶癫痫的皮质厚度分析

罕迦尔别克·库银、常一凡、徐蕊、段静静、丁爽、贾文霄、王云玲
新疆医科大学第一附属医院

背景: 岛盖癫痫 (Operculo-insular epilepsy, OIE) 是一种相对认识不足、特征不清的神经系统疾病, 其表现常常与颞叶癫痫类似。在本研究中, 我们研究了 OIE 中岛叶和岛叶周围区域的皮质厚度 (cortical thickness, CT) 的变化, 以了解 OIE 患者的脑结构改变。

方法: 所有参与者均接受了 3.0T 的 3D MPRAGE 扫描, 使用高级归一化工具进行处理后, 使用 freesurfer 7.1.1 软件测量皮层厚度, 后比较了 OIE 与 TLE 患者、OIE 患者与健康对照组的皮层厚度。

结果 共纳入 21 名难治性 OIE 患者、25 名年龄与性别匹配的难治性 TLE 患者和 35 名健康被试; 与健康对照组相比, OIE 患者主要在同侧岛叶、近岛叶区、眶额区、颞叶内侧和外侧新皮质中观察到广泛的皮层厚度减小。致痫灶对侧皮质萎缩的模式类似, 但程度较轻且不太弥漫。OIE 患者的 CT 与 TLE 患者相比, 所有皮层区域的 CT 相同或缩小。在 OIE 患者中, 主要在双侧岛叶和同侧枕颞交界区观察到了弥漫性皮层厚度缩小。

结论 本研究发现 OIE 患者的脑结构异常不仅局限于岛叶及岛盖, 该结果提示, 使用皮层厚度测量能够发现 OIE 患者的潜在脑结构异常, 本研究还为今后 OIE 患者脑结构皮层厚度改变的模式研究提供了证据。

3D 酰胺质子转移成像在原发性肝癌临床扫描可行性及图像质量评估中的初步研究

齐晓辉、王琦
河北医科大学第四医院

目的: 探讨参数优化的 3D 酰胺质子转移成像序列在原发性肝癌扫描中图像质量评估和临床扫描的可行性。**材料与方法:** 前瞻性收集 2020 年 10 月至 2022 年 2 月临床怀疑原发性肝癌患者, 共 109 例。采用飞利浦 3.0 T MRI 设备进行扫描, 分别采集 T1WI、T2WI、弥散加权成像、APTw 及多期增强图像。计算 APTw 成像的扫描成功率及计算成功率。采用 Kendall 一致性系数对观察者内及观察者间主观评分进行一致性分析, 对主观评分 3 分以上的病例测量 APTw 图像的信噪比、肿瘤对比噪声比、肿瘤及肝实质的 APTw 值并计算各参数值的变异系数, 采用组内相关系数进行观察者内及观察者间可重复性测量的一致性分析。**结果:** 109 例患者中有 11 例患者 APTw 图像中病变区域存在信号缺失, 扫描成功率为 89.90% (98/109), 剩余 98 名患者中 78 名患者 APTw 图像的主观评分为 3 分以上, 计算成功率为 71.55% (78/109)。观察者内及观察者间图像质量主观评分一致性分别为 0.771 和 0.692, $P < 0.01$ 。肿瘤组织 APTw 值观察者内及观察者间 ICC 分别为 0.822 和 0.811, 肝实质 APTw、SNR 及 CNR 观察者 ICC 分别为 0.675、0.634、0.666, 肝实质 APTw、SNR 及 CNR 观察者间 ICC 分别为 0.614、0.290、0.560。肿瘤组织 APTw 值高于肝实质, 两者间差异有统计学意义 (分别为 $2.55 \pm 0.08\%$ 和 $1.45 \pm 0.07\%$, $P < 0.001$)。肿瘤组织和肝实质 APTw 值的变异系数分别为 30.4% 和 44.4%。SNR 和 CNR 为 25.92 ± 18.50 和 3.35 ± 3.2 。SNR 变异系数为 71.4%, CNR 变异系数为 90.0%。

结论: 参数优化后的 3D-APTw 成像可以用于原发性肝癌的临床扫描, 但容易受呼吸、胆囊或血管的影响而出现信号缺失或伪影, 在参数设置及成像技术上仍需改进以进一步优化其图像质量。

PU-0183

健康志愿者胰腺 B1 场校正 T1 mapping 成像的定量研究

沈祥春、江建芹、周笑、朱明明、徐进、肖勇、符益纲
盐城市第一人民医院

目的：评估健康志愿者胰腺 B1 场校正 T1 mapping 成像短期重复扫描的测量可重复性，并探讨胰头、胰体和胰尾 T1 值的定量特征及其与志愿者性别、年龄和身体质量指数 (Body Mass Index, BMI) 的相关性。

方法：对 63 名健康志愿者行连续两次胰腺 B1 场校正 T1 mapping 成像。两名测量者分别独立在 T1 mapping 伪彩图上手动勾画感兴趣区测量胰头、胰体、胰尾的初始 T1 均值。采用配对样本 t 检验比较 T1 值在重复测量及重复扫描的测量差异。采用组内相关系数 (intraclass correlation coefficient, ICC)、组内变异系数 (within-subject coefficient of variation, WCV) 及 Bland-Altman 图评估胰腺初始 T1 均值的测量可重复性及误差范围。采用方差分析和独立样本 t 检验比较 T1 值在胰头、胰体和胰尾以及在男女性别之间的差异。采用 Pearson's 相关系数评估 T1 值与年龄、BMI 之间的相关性。

结果：胰头、胰体和胰尾的 T1 值无显著统计学差异，在不同测量者及重复扫描间也无显著统计学差异 ($P=0.300\sim0.904$)。胰头、胰体和胰尾的 T1 均值均表现出良好的测量及扫描重复性 (ICC: $0.752\sim0.853$)，其重复测量的 WCVs 为 $4.5\%\sim5.7\%$ ，95% 的一致性区间 (limit of agreement, LOAs) 为 $-13.0\%\sim13.3\%$ ，重复扫描的 WCVs 为 $5.2\%\sim5.9\%$ ，95% LOAs 为 $-15.4\%\sim13.9\%$ 。胰腺 T1 值在男、女性别之间无显著统计学差异 ($t=1.077\sim1.870$; $P=0.066\sim0.286$)，与志愿者的年龄无显著相关性 ($P=0.061\sim0.896$)。胰体 (测量者 A) 和胰尾的 T1 值和 BMI 呈显著弱相关 ($r=-0.258\sim-0.328$; $P=0.009\sim0.041$)。

结论：胰腺 B1 场校正 T1 mapping 的初始 T1 均值具有良好的测量及扫描可重复性，且与志愿者的年龄、性别无关，但与 BMI 呈显著弱相关，在胰腺疾病的临床应用中具有较好的应用前景。

基于静息态功能 MRI 的产后抑郁症患者静态及动态脑网络特性研究

车凯莉
烟台毓璜顶医院

大量研究表明，产后抑郁症患者存在一系列情感和认知功能受损，与大脑结构和功能异常密切相关。然而，产后抑郁症患者静态及动态脑网络变化对其影响尚不清楚。本研究对 20 个产后抑郁症患者及其年龄、教育水平及体重指数等相匹配的 19 个产后正常患者进行标准化静息态脑功能数据采集，在 MRI 扫描前，所有被试者均完成临床评估量表，以建立影像、临床完备的数据信息。首先，对产后抑郁症患者和正常对照组的功能 MRI 数据进行标准预处理操作，再采用独立成分分析、根据 Allen et al. 挑选独立成分标准确定了 7 个有效脑网络。使用静态功能连接分析研究产后抑郁症患者脑网络变化，计算功能网络连接的组间差异，具有显著性差异脑网络与产后抑郁症患者临床量表做相关性分析；另外，使用滑动窗口分析和动态功能连接分析构建时变性功能网络，最后使用 K-means 聚类分析。7 个有效脑网络分别是：突显网络、听觉、视觉、感觉运动、认知控制、默认网络和小脑网络。静态功能连接分析发现：与对照组相比，产后抑郁症患者在认知控制网络和默认网络、突显网络和小脑网络的连通性明显较弱，突显网络和小脑网络之间的连通性降低，主要集中在认知网络上；然而，听觉网络和感觉运动网络之间的连接更强，这主要分布在低水平感知网络中。通过聚类分析将所有被试动态功能连接矩阵聚为 4 类：状态 1 表明在感知和认知网络中具有高度相关性 (28%)，在状态 2 中，频率更高 (43%) 且连接相对稀疏，而在状态 3 中，频率更低 (13%)。

且连接更强,然而在状态 4 (16%)中,显示为控制网络内部的强连接,以及除其以外网络之间的弱连接。我们的研究表明,产后抑郁症患者的静态和动态功能连接存在异常。动态功能连接分析可以提供特定区域时变功能体系结构的丰富信息,是静态功能连接的有力补充,产后抑郁症患者表现出更明显的异常连接模式,这些结果有助于我们进一步理解产后抑郁症患者的脑网络功能障碍。

腰椎 MR 检查时脊柱外异常的发现率及临床意义

邓先波

华中科技大学同济医学院附属协和医院

目的:回顾性分析病人腰椎 MR 检查时脊柱外异常的出现率及临床意义。

材料及方法:因腰疼和(或)神经根症状行腰椎 MR 检查的 2500 例病人,由 1-2 名高年资放射医生复习每例病人脊柱 MR 检查时的图像,记录脊柱外异常,结合临床资料,确定其诊治与结果。

结果:2500 例腰椎 MR 检查中,198 例影像发现有脊柱外异常。178 例病人脊柱外的异常不能确定或有重要临床意义,需结合临床或进一步检查。发现腹主动脉瘤 4 例;腹主动脉周围淋巴结转移 2 例;直肠癌 3 例;肾自截 1 例;肾癌 1 例;前列腺癌 6 例;宫颈癌 3 例。有重要临床意义的出现率为 0.8%。

结论:腰椎 MR 检查时,除可以发现脊柱本身的病变外,还可以发现少量重要的脊柱外病变。

4D FLOW 对颅内动脉狭窄患者血流动力学评价

陈细香、刘昌盛

武汉大学人民医院

【摘要】目的 旨在应用 4D 血流 MR 成像研究正常志愿者及大脑中动脉(MCA)狭窄病人的颅内动脉血流动力学状态,并比较正常和狭窄颅内动脉的双侧血流动力学参数差异。方法 纳入正常志愿者 20 名和单侧 MCA 狭窄病人 25 例。应用 GE Architect 3T MR 设备及 48 通道头颅线圈进行检查,采用 3D 时间飞跃法(TOF)MRA 及高分辨 3D-T1WI CUBE 序列显示及分析 Willis 环结构特点。应用 4D FLOW 血流 MR 成像获取血流数据,分析双侧颈内动脉(ICA)颅内段、MCA 及大脑前动脉(ACA)的血流动力学状态,计算心动周期不同时相的平均血管面积、平均及最大血流速度、平均瞬时血流率。分析颅内 Willis 环的结构特征及血流动力学状态。采用独立样本 t 检验比较正常志愿者及 MCA 狭窄病人双侧动脉血流动力学参数的差异。结果 正常志愿者双侧 ICA、MCA 和 ACA 的血流动力学参数包括平均血管面积、平均血流速度、最大血流速度和平均瞬时血流率之间差异均无统计学意义(均 $P>0.05$)。MCA 狭窄病人的 ICA、MCA 及 ACA 双侧血流动力学参数之间的差异有统计学意义($P>0.05$)。结论 应用 4D FLOW 血流 MR 成像可以反映颅内动脉狭窄患者颅内动脉血流动力学的变化,可以对血流参数进行定量评价。

X 线联合 CT、MR 多模态检查在四肢软组织肿瘤的良恶性诊断中的价值

刘成环、刘刚
青海红十字医院

摘要

目的 本文旨在探讨 X 线联合 MR 多模态检查在软组织肿瘤良恶性诊断中的应用价值。

材料与方法 纳入我院 2020.3—2022.3 于青海红十字医院由于四肢软组织肿瘤进行手术的患者 36 例，术前行 X 线、CT 联合 MR 多模态检查，根据 X 线、CT 提供的肿瘤形态学信息，包括肿瘤的大小、边缘、密度，MR 能够提供包括肿瘤的组织学特征、血供情况、代谢状态等，能够提供更为详细的肿瘤信息。由 2 名年资副高级主任医师进行分析肿瘤的影像信息并初步判断肿瘤的良恶性，并与术后免疫组化得出的病理结果进行对照。

结果 X 线、CT 联合 MR 多模态检查对于软组织肿瘤良恶性的评估与病理的免疫组化结果具有很高的一致性。

结论 X 线、CT 联合 MR 则能够提供更为详细的局部解剖信息，组织信号变化能够知道组成结构评估淋巴结和邻近血管的受累情况。

摘要

目的 本文旨在探讨 X 线联合 MR 多模态检查在软组织肿瘤良恶性诊断中的应用价值。

材料与方法 纳入我院 2020.3—2022.3 于青海红十字医院由于四肢软组织肿瘤进行手术的患者 36 例，术前行 X 线、CT 联合 MR 多模态检查，提供包括肿瘤的组织学特征、血供情况、代谢状态等，能够提供更为详细的肿瘤信息。由 2 名年资副高级主任医师进行全面分析肿瘤的影像信息并初步判断肿瘤的良恶性，并与术后免疫组化得出的病理结果进行对照。

结果 X 线、CT 联合 MR 多模态检查对于软组织肿瘤良恶性的评估与病理的免疫组化结果具有很高的一致性。

结论 X 线、CT 能够快速获得病变大范围的影像，评估肿瘤的浸润范围和周围组织的受累情况。MR 能够提供精细的局部解剖信息，组织信号变化，评估淋巴结和邻近血管的受累情况，判断肿瘤的分期和预后。因此，通过 X 线、CT 联合 MR 多模态检查，能够综合利用三种成像技术的优势，提高诊断的敏感性和特异性，能够为临床医生提供更可靠的诊断依据，在软组织肿瘤的良恶性诊断中具有广泛的应用前景。

非抗 NMDAR 脑炎患者的临床特点、短期预后与磁共振成像阳性/阴性的关联分析

王珍珍^{1,2}、宋国栋²、杨欢²、王光彬²、宁国庆²、王庆慧²、刘玉波²

1. 山东省荣成市人民医院

2. 山东第一医科大学附属省立医院（山东省立医院）

目的：描述 MRI 阳性/阴性非抗 NMDAR 脑炎的临床特点，分析 MRI 阳性/阴性患者的临床特点，探究造成 MRI 显示差异的原因。

方法：收集 2013 年 1 月至 2023 年 1 月于山东省立医院诊治的急性/亚急性发病时的非抗 NMDAR 脑炎 90 例（LGI1 50 例、GABAB 22 例、CASPR2 12 例、APMA 3 例、APM1+MOG 1 例、CASPR2+LGI1 1 例、CASPR2+GABAB 1 例）的临床资料进行回顾性分析。依 MRI 表现分为阳

性组与阴性组, MRI 阳性组 42 例; MRI 阴性组 48 例。比较两组患者的性别与年龄、临床表现、血清和脑脊液、脑电图及短期预后评分差异。

结果: 两组的发病年龄、性别、发病至第 1 次接受 MRI 检查时长、入住 ICU 及平均住院天数的差异均无统计学意义 (P 均 >0.05)。发热、头痛、精神行为异常、认知障碍、近事记忆力下降、癫痫发作、言语障碍、运动障碍、不自主运动、意识下降与昏迷及自主神经功能障碍、睡眠障碍均不存在统计学差异 (P 均 >0.05); 两组在合并肿瘤及并发症的差异没有统计学意义 (P 均 >0.05)。两组间的血清抗神经细胞抗体滴度无差异 ($P>0.05$)。MRI 阳性组脑脊液抗神经细胞抗体阴性的比例低于阴性组 ($P<0.05$)。脑脊液中红细胞、白细胞数增多的分布在两组之间无差异 (P 均 >0.05)。蛋白浓度在两组间无差异 ($P>0.05$)。血清降钙素原在两组间无差异 ($P>0.05$)。血清其他病毒抗体增高在两组间无差异 ($P>0.05$)。血脂检测, 总胆固醇、高密度脂蛋白胆固醇、低密度脂蛋白、胆固醇载脂蛋白 A、胆固醇载脂蛋白 B、载脂蛋白 A/B 的变化在两组间不存在差别 (P 均 >0.05)。MRI 阳性组甘油三酯浓度低于阴性组 ($p<0.05$)。脑电图异常比率在 MRI 阳性组高于阴性组 ($P<0.05$), 两组短期预后无差异 ($P>0.05$)。

结论: MRI 阳性/阴性非抗 NMD 脑炎的临床特点、病情严重程度及短期预后基本相同, 两组在脑脊液抗体、脑电图异常及甘油三酯浓度方面存在统计学差异, 了解这些差异将有助于临床医师了解非抗 NMDAR 脑炎的常规脑 MRI 的表现, 为今后细化 AE 的影像学研究提供新的思路。

PU-0189

基于磁共振高分辨率血管壁成像及扩散加权成像探讨症状性颅内动脉粥样硬化性狭窄脑卒中患者发病机制及药物强化治疗预后研究

王锐
葫芦岛市中心医院

目的: 基于磁共振高分辨率血管壁成像(high resolution magnetic resonance vessel wall imaging, HR-MRI VWI)及扩散加权成像(diffusion-weighted imaging, DWI)

探讨症状性颅内动脉粥样硬化性狭窄(intracranial atherosclerotic stenosis, ICAS)脑卒中患者发病机制及药物强化治疗预后研究。

材料与方法: 连续纳入 2020 年 10 月至 2022 年 7 月因颅内动脉粥样硬化性狭窄性脑卒中或短暂性缺血发作的患者, 并行 DWI 及 HR-MRI VWI 扫描。根据 DWI 急性脑梗死灶的分布模式判定症状性 ICAS 脑卒中机制, 包括穿支动脉受累组、低灌注组、动脉-动脉栓塞组及多种机制组; 以及责任斑块在 HR-MRI VWI 中的特征差异, 包括血管狭窄率及斑块面积、分布、负荷, 重构模式、强化率; 并进行阿托伐他汀联合阿司匹林或氯吡格雷药物强化治疗后 3 个月疗效评价。

结果: 纳入症状性 ICAS 患者 60 例, 根据 mRS 评分量表(改良 Rankin 评分量表)将患者分为预后良好组 32 例及预后不良组 28 例, 两组患者的卒中机制差异无统计学意义($P>0.05$)。两组患者责任斑块 HR-MRI VWI 特征的比较: 预后不良组的斑块内强化率均大于预后良好组, 差异有统计学意义($P<0.05$); 两组患者在斑块面积、分布、负荷、重构模式及血管狭窄率上差异无统计学意义($P>0.05$)。

结论: 症状性 ICAS 脑卒中患者强化药物治疗后预后良好组及预后不良组在 HR-MRI VWI 中斑块强化率存在差异, 提示两组病理生理学改变不同, 需要进一步研究指导个性化治疗。

PU-0190

多模态 MRI 在胶质瘤患者诊治中的应用

赵恒飞、段庆红
贵州医科大学附属肿瘤医院

目的：研究多模态 MRI 在胶质瘤诊治中的应用效果。方法：选择近几年收治的颅脑肿瘤患者进行回顾性分析，并结合患者的术前的 MRI 检查、多模态 MRI 以及弥散加权成像（DWI）、三维动脉自旋标记（3D-ASL）、氢质子磁共振波谱（1H-MRS），对 DWI 图的瘤体 ADC、rADC；3D-ASL 灌注图在 TBF、CBF、rCBF；以及 1H-MRS 所获取的瘤体、瘤周和正常脑实质的 Cho/Cr、Cho/NAA、NAA/Cr 进行对比，统计常规 MRI 和联合诊断的准确率。结果：在 DWI 图中，低级别胶质瘤的 ADC、rADC 最高， $P<0.05$ ；在 3D-ASL 灌注图中，低级别胶质瘤的灌注值最高， $P<0.05$ ；在 1H-MRS 中，胶质瘤瘤体、瘤周的 Cho/Cr、Cho/NAA 均高于正常脑实质， $P<0.05$ ，且多模态 MRI 的诊断准确率明显高于常规 MRI， $P<0.05$ ，差异具有统计学意义。结论：在胶质瘤患者的诊断中，多模态 MRI 具有较高的诊断准确率，并有利于颅脑肿瘤的鉴别和分级，具有较高的应用价值。

WB-DWI 和 T1-Dixon 对多发性骨髓瘤患者骨髓穿刺的附加价值

冀晓东¹、黄文阳²、张科民²、董华峰³、于茁⁴、元卿彦⁴、高珊珊⁴、杨锡龙⁴、沈文¹、夏爽¹

1. 南开大学附属第一中心医院
2. 中国医学科学院血液病医院
3. 天津市中医药研究院附属医院
4. 天津医科大学第一中心临床学院

目的：观察多发性骨髓瘤(MM)局灶性病变 (FLs) 在全身骨骼的分布特点，探讨髂后上棘 FLs 与胸腰椎 FLs 的 ADC 值与水信号值、脂肪信号值的差别，并评估这些定量参数与 MM 骨髓浆细胞比例 (BMPC) 之间的相关性，辅助寻找 MM 骨髓穿刺部位。方法：回顾性分析初诊 MM 患者 39 名，其中男性 24 名，平均年龄 55.6 岁 (46 岁-72 岁)，女性 15 名，平均年龄 50.7 (42 岁-69 岁)。所有患者均在治疗前进行了 WB-DWI 和 T1-Dixon 成像检查，分别在全身 MR 图像上计数全身骨髓累及部位的 FLs，选择髂后上棘和胸腰椎处的 FLs，测量相应部位的 ADC 值、脂肪信号值 (Mfat) 和水分子信号值 (Mwater)，脂肪分数采用 $Mfat / (Mfat + Mwater)$ 计算，并进行 MR 参数的标准化处理，得到：nMfat、nMwater 和 nFF，采用 Mann-Whitney U 检验比较髂后上棘处 FLs 与对侧髂后上棘正常骨髓以及髂后上棘和胸腰椎处 FLs 各 MR 参数值之间的差异，采用 Spearman 相关分析评价髂后上棘和胸腰椎处 FLs 的 MR 参数值与 BMPC 之间的相关性，从而有助于利用 MRI 辅助寻找 MM 骨髓穿刺部位。结果：正常侧髂后上棘骨髓与病变侧髂后上棘 FLs 的 ADC 值、nMfat 值、nMwater 值和 nFF 值 (分别为 $0.32 \times 10^{-3} \text{ mm}^2 / \text{s}$ vs $0.74 \times 10^{-3} \text{ mm}^2 / \text{s}$, 0.401 vs 0.064 , 2.564 vs 3.586 , 0.145 vs 0.013) 均有统计学差异 (p 均 <0.001)；髂后上棘和胸腰椎的 FLs 之间 nMwater (分别为 3.59 vs 4.79) 存在显著性差异 ($p <0.001$)；在髂后上棘和胸腰椎的 FLs 中，ADC 值与 BMPC 高度正相关 ($r=0.989$, 0.989)，nMfat 值和 nFF 值与 BMPC 高度负相关 ($r=-0.978$, -0.930 , -0.888 , -0.917 , p 均 <0.001)。结论：WB-MRI 可以整体评估 MM 患者 FLs 在全身骨骼的分布情况，髂后上棘的 FLs 的 MR 参数与 BMPC 的相关性更高，ADC 值最为敏感，可以辅助确定 MM 骨髓穿刺部位。

肺癌肿瘤血管生成 DCE-MRI 参数与 IGF1 表达的相关性

海江、张海莲、杨慧
青海省第五人民医院

【摘要】目的 探究肺癌肿瘤血管生成动态对比增强磁共振成像(DCE-MRI)参数与胰岛素样生长因子 1(IGF1)表达的相关性。方法 选择 2018 年 4 月至 2019 年 12 月入住本院的 40 例经手术病理证实为肺癌的患者, 根据不同分化程度分为高分化组 16 例, 低中分化组 24 例。采用 DCE-MRI 方法检测相关参数包括容量运转参数(Ktrans)、速率常数(Kep)、血管外细胞外间隙容积百分比(Ve); 采用免疫组化染色方法检测肺癌组织及癌旁组织 IGF1 表达情况; Spearman 法分析肺癌患者 DCE-MRI 参数与 IGF1 表达的相关性。结果 与癌旁组织相比, 肺癌组织 Ktrans、Kep、Ve 及 IGF1 阳性表达率升高($P<0.05$); 低中分化组患者 Ktrans、Kep、Ve 及 IGF1 阳性表达率均显著高于高分化组($P<0.05$); Spearman 相关性分析结果显示, Ktrans、Kep、Ve 与 IGF1 表达均呈正相关($P<0.05$)。结论 DCE-MRI 参数 Ktrans、Kep、Ve 与 IGF1 表达均呈正相关, 均对肺癌临床病理特征的评估具有重要意义。

PU-0193

MRI comparative study of diffuse midline glioma, H3 K27-altered and glioblastoma without H3 K27-altered

Huazhen Deng, Xiaolei Liu
Shenzhen Second People's Hospital

Objective

Glioblastoma is the most prevalent malignant tumor affecting the nervous system (1). In 2016, the World Health Organization (WHO) revised the classification of central nervous system (CNS) tumors based on histological and molecular characteristics, including glioblastoma, isocitrate dehydrogenase (IDH) mutations, telomerase reverse transcriptase (TERT) alterations, diffuse midline glioma, and Histone H3 lysine to methionine substitution at position 27 (H3K27) mutations. With the cIMPACT-Now Update 2, the definition of diffuse midline glioma (DMG) was refined, incorporating criteria for diffuse infiltration, and the presence of H3K27 gene mutations now directly classifies tumors as WHO grade IV. In the WHO's fifth edition of classification in 2021, this standard persisted, emphasizing the significance of this gene in the prognosis of glioma patients.

Malignant gliomas located in the midline of the brain pose a considerable challenge due to their increased difficulty of surgical removal and the potential for irreversible damage, such as limb paralysis. Therefore, differentiating DMG from other high-grade gliomas is vital for selecting appropriate therapies, especially for targeted treatments guided by neuroradiological criteria.

Recent studies, such as Lasocki, A et al., have explored conventional magnetic resonance imaging (CMRI) to predict key genetic features in gliomas, including IDH mutations, O6-methylguanine-DNA-methyltransferase (MGMT) methylation status, and 1p/19q deletions. The value of MRI-based prediction of glioma genetic features has been further enhanced with the addition of diffusion-weighted imaging (DWI) and perfusion-weighted imaging (PWI) data. DWI has proven particularly useful in diagnosing diffuse midline gliomas with H3K27 alterations. A retrospective study in Cancers examined MRI characteristics of DMG and glioblastoma (GBM), revealing that contrast enhancement, the presence of edema, rADC-minimum values, and ADC-based histogram analysis can effectively distinguish between the two tumor types. Moreover, research by Kurokawa, R et al., demonstrated that Dynamic Susceptibility Contrast (DSC)-MRI parameters, ADC values, and T2-FLAIR mismatch markers can help identify diffuse midline gliomas with H3K27 alterations.

Histopathologically, DMGs often share similarities with GBMs, including microvascular proliferation (MVP) and/or necrosis in the malignant cell pattern (DMG-GBM positive). These

morphological parallels are reflected in MRI findings. Furthermore, there is a connection between tumor microvessel density, enhancement parameters, and increased vascular permeability resulting from abnormal vascular structures. This suggests that tumor microvessel density is linked to peritumoral edema. A recent case report highlighted a DMG with a non-IDH mutation and an H3K27M mutation, demonstrating a T2-fluid attenuated inversion recovery (FLAIR) mismatch. To address these complexities, we conducted a retrospective analysis of MRI features and clinical characteristics in 63 glioma patients, encompassing 22 GBM cases and 41 DMG cases.

Methods

Patients:

Between January 2017 and February 2022, we collected data from 63 brain tumor patients who underwent MRI scans at two centers. Inclusion criteria included complete clinical data, no history of trauma or prior radiotherapy/chemotherapy, and the availability of pre-surgery routine imaging, including T1-weighted imaging (T1WI), T2-weighted imaging (T2WI), enhanced scans, and DWI, with image quality meeting diagnostic standards. Additionally, patients needed postoperative pathological diagnoses confirming either diffuse midline glioma or glioblastoma.

Ultimately, we included 63 patients (37 males and 26 females), consisting of 22 with glioblastoma (15 males and 7 females) and 41 with diffuse midline glioma (22 males and 19 females). The age range was 3 to 79 years, with an average age of 48 ± 13 years. This retrospective study received approval from the regional ethics committee and was exempted from requiring informed consent.

Conventional MRI Protocols:

MRI data were collected from two hospitals in China using various 1.5-T and 3.0-T MRI scanners, including Achieva, Signa, Optima MR360, Magnetom Avanto, Ingenia, Discovery MR750w, and Prisma. Detailed MRI protocols are provided in Table S1 in the Supplemental Material. Patients fasted for 4-6 hours before scanning. The scanning range covered the entire brain, with sequences including T1WI, T2WI, T2W-FLAIR, DWI, and enhanced scans.

MRI Signal Evaluation:

We assigned signal intensity scores for T1WI, T2WI, T1WI post-Gd-DTPA injection, DWI, and ADC images to categorize tumor characteristics.

Pathological Results:

Pathological data included intraoperative pathology and immunohistochemical findings. Molecular sequencing data, including IDH, MGMT, TRET, and H3K27 status, were obtained for all glioma patients. Final pathological diagnoses were determined according to the 2016 edition of the CNS Tumor Classification.

Image Analysis:

Conventional MR images were used to measure tumor size using ITK-SNAP-3.8.0. Two senior doctors independently reviewed the image data, assessing various aspects, including tumor location, necrosis presence, enhancement intensity, peritumoral edema, hemorrhage, and other features, as outlined in Table S2 in the Supplemental Material. In cases of disagreement, a consensus discussion was held to arrive at a unified interpretation.

Statistical Analysis:

Data analysis was conducted using the Statistical Package for the Social Sciences (SPSS v.1, Chicago, IL, USA). Intra/interclass correlation coefficients (ICCs) were computed to assess agreement between reviewers. Statistical significance was defined as two-sided p-values <0.05 . As the data did not follow a normal distribution (Shapiro-Wilk test $p < 0.05$), the Mann-Whitney U test was employed to evaluate differences in ecological characteristics and tumor size between GBM and DMG. Survival time was analyzed in terms of recurrence time, with Dunn's test

used for pairwise comparisons. Receiver operating characteristic (ROC) curve analysis and the Youden Index calculated the area under the curve (AUC), confidence interval (CI), and cut-off values for different parameters. After Bonferroni correction, $p < 0.01$ indicated statistical significance, and all statistical graphs were generated using GraphPad Prism 8 (Prism 8, La Jolla, California).

Results

Patients:

The study enrolled 63 patients, including 22 with GBM and 41 with DMG. Notable differences were observed in age and tumor size ($P < 0.05$), while gender and survival time did not exhibit significant differences. Interobserver agreement among reviewers was excellent, with ICC values exceeding 0.80.

Differentiation of Signal Intensity in Imaging between GBM and DMG:

Mann-Whitney U test results indicated that T1WI signal intensity for DMG and GBM was primarily low or equal to gray matter, while T2WI signal intensity was predominantly equal or slightly higher than gray matter. DWI and ADC signals mostly matched cerebrospinal fluid intensity. Overall, there was no statistically significant difference in signal intensity between the two tumor types.

Differentiation of Clinical Characteristics between GBM and DMG:

Clinical features, including cystic necrosis, hemorrhage, peritumoral edema, hydrocephalus, and multiple lesions. Mann-Whitney U test results showed no significant difference between DMG and GBM regarding cystic necrosis, hemorrhage, and multiple lesions. However, peritumoral edema exhibited statistical significance ($P < 0.01$).

Differentiation of T2-FLAIR Mismatch and Enhancement in MRI between GBM and DMG:

The study documented the enhancement scores of DMG and GBM on MR, as well as the presence of T2-FLAIR mismatch. Mann-Whitney U test results revealed that DMG's enhancement degree was concentrated in grade 2 and grade 3, whereas GBM predominantly exhibited grade 3 enhancement. This difference held statistical significance ($P < 0.001$). There was no significant difference in the likelihood of T2-FLAIR mismatch between the two tumor types.

ROC Curves for Various Parameters:

ROC curve analysis demonstrated that enhancement ($AUC=0.868$), age ($AUC=0.852$), and peritumoral edema ($AUC=0.855$) exhibited significant differences between DMG and GBM patients ($p \leq 0.001$), facilitating a high diagnostic efficiency.

Conclusion

The present study found that for malignant glioma patients, the age of patients with H3K27 gene alterations was younger. Regardless of the presence or absence of H3K27M mutation, glioblastomas tend to have irregular morphology, unclear boundaries, and more cystic degeneration and necrosis. Compared with diffuse midline gliomas without H3K27M mutation, diffuse midline gliomas with H3K27M mutation have less peripheral edema, lower enhancement, and are more likely to have obstructive hydrocephalus.

PU-0194

多模式 MRI 对急性缺血性脑卒中静脉溶栓治疗指导的临床价值

甘郑宁
青海红十字医院

目的：探讨多模式 MRI 指导下静脉溶栓治疗在急性缺血性脑卒中患者中的应用效果。方法：选取我院 2018 年 8 月~2019 年 6 月期间收治的 86 例急性缺血性脑卒中患者，应用单盲随机法，分为观察组（多模式 MRI 指导下静脉溶栓治疗）和对照组（常规治疗）各 43 例，观察两组患者的治疗恢复情况。结果：与对照组相比，观察组患者的治疗有效率（90.70%>72.09%， $\chi^2=4.914$ ）、闭塞血管再通率（93.02%>76.74%， $\chi^2=4.441$ ）以及治疗后的日常生活活动能力量表（ADL）评分 [（57.46±4.17）分>（51.63±4.29）分， $t=6.390$] 相对更高（ $P<0.05$ ），治疗后的神经功能缺损程度（NIHSS）评分 [（13.79±1.98）分<（17.27±2.54）分， $t=7.086$] 相对更低（ $P<0.05$ ）。结论：静脉溶栓是急性缺血性脑卒中临床治疗的良好选择，同时采取多模式 MRI 检查方法，可以对患者的病情进展或好转情况进行判断，为静脉溶栓治疗提供指导，进而获得更为理想的治疗效果，并保障治疗的安全性。

IA 期卵巢癌的 MRI 表现

沈智勇、崔丽文
南通市肿瘤医院

目的：分析 IA 期卵巢癌的 MRI 表现。

方法：收集 IA 期卵巢癌患者的年龄分布、发病时的临床症状、CA125 检测、MRI 表现，包括肿瘤体积、结构、弥散加权成像（DWI）、表观弥散系数（ADC）和强化情况等。对 2013 年至 2020 年南通肿瘤医院收治的 IA 型卵巢癌患者进行回顾性分析。

结果：仅记录了 11 例 IA 期卵巢癌病例。患者年龄为 30-67 岁（平均 52 岁）。初期症状多为下腹胀、腹痛。CA125 呈 90% 阳性。MRI 特征 1. 盆腔肿块较大，体积范围 23-2,009 cm³（平均 669 cm³）。2. 囊肿型（有斑块状、乳头状、壁结节赘生物）5 例，囊实混合型（间隔或壁增厚）2 例，实性型 4 例。3. DWI 扩散受限，所有实体部分（赘生物、隔和囊壁）的 ADC 均降低。4. T1 增强 MRI 实性部分明显强化。5. 3 例患者盆腔内少量腹水（肿瘤细胞阴性）。

结论：IA 期卵巢癌 MRI 特征为肿瘤大、囊性、囊实性或实性；实质性部分 DWI 受限、ADC 值减低；囊壁、赘生物及隔增强；无盆腔转移。

PU-0196

基线期多模态 MRI 定量参数在Ⅱ期直肠癌神经管侵犯的预测价值

海梦璐¹、张孝先¹、王赞霞²、许春苗¹
1. 河南省肿瘤医院
2. 河南省人民医院

[目的] 探讨 MRI 定量参数在Ⅱ期直肠癌神经管侵犯中的预测价值。[方法] 回顾性分析 109 例Ⅱ期直肠癌患者的临床病理及 MRI 资料，根据病理结果将患者分为神经管侵犯阳性组和阴性组。分

析两组间临床病理及 MRI 特征参数的差异,并用单因素及多因素 Logistic 回归分析直肠癌神经管侵犯的独立影响因素,采用受试者工作特征 ROC(receiver operating characteristic curve)曲线下面积(area under the curve, AUC)评价其预测效能。[结果] 在入组的 109 例 II 期直肠癌患者中,神经管侵犯阳性组 27 例(24.77%, 27/109),阴性组 82 例(75.23%, 82/109);单因素分析显示 T2 比值、Ktrans 值及 Kep 值越小及 Ve 越大的直肠癌患者更易出现神经管侵犯,且各指标在两组间的差异均有统计学意义(P 值均<0.05)。将上述单因素分析有意义的特征分别纳入单因素及多因素 logistic 回归分析中,结果均显示 MRI 表现为较大 Ve 值为直肠癌患者神经管侵犯的独立危险因素(P 值<0.05);Ve、及多因素联合预测直肠癌神经管侵犯的 AUC 分别为 0.663、0.752。[结论] Ve 是 II 期直肠癌神经管侵犯的独立危险因素,且多参数联合预测 II 期直肠癌神经管侵犯具有较高的诊断效能。

PU-0197

常规 MRI、SWI、DWI 和 DSC-PWI 预测 IDH 突变型星形细胞瘤中 Ki-67、ATRX 突变和 MGMT 启动子甲基化状态

杨谢锋

福建医科大学附属第一医院

摘要

目的:无创检测星形细胞瘤分子状态对预测治疗反应及预后具有重要的临床意义。我们的目的是评估常规 MRI、SWI、DWI 和 DSC-PWI 是否可以预测 IDH 突变型星形细胞瘤中 Ki-67 标记指数(LI)、ATRX 突变和 MGMT 启动子甲基化状态。

方法:回顾性分析 136 例 IDH 突变型星形细胞瘤的常规 MRI、SWI、DWI 和 DSC-PWI。采用 Fisher 精确检验或卡方检验比较常规 MRI 特征和肿瘤内易感信号(ITSS)特征。采用 Wilcoxon 秩和检验比较不同分子标记状态下 IDH 突变型星形细胞瘤的最小 ADC (ADCmin)和最小相对 ADC (rADCmin)。采用 Mann-Whitney U 检验比较不同分子标记状态下 IDH-mut 星形细胞瘤的 rCBVmax。绘制受试者工作特征曲线,评价其诊断效果。

结果:高、低 Ki-67 LI 组 ITSS、ADCmin、rADCmin、rCBVmax 差异有统计学意义。ATRX 突变型和野生型组的 ITSS、ADCmin 和 rADCmin 差异有统计学意义。低、高 Ki-67 LI 组坏死、水肿、强化、边缘形态差异有统计学意义。ATRX 突变型组与野生型组瘤周水肿差异显著。与甲基化组相比,MGMT 启动子未甲基化的 3 级 IDH 突变型星形细胞瘤更有可能表现出增强。

结论:常规 MRI、SWI、DWI 和 DSC-PWI 具有预测 IDH 突变型星形细胞瘤中 Ki-67 和 ATRX 突变状态的潜力。常规 MRI 和 SWI 的结合可以提高预测 Ki-67 和 ATRX 突变状态的诊断性能。

子宫内 膜癌磁共振弥散 ADC 直方图与病理组织学特征 及 Ki-67 表达相关性分析

赵金丽
南通大学附属医院

目的：探讨磁共振弥散表观扩散系数（ADC）直方图参数在子宫内膜癌中区分不同组织病理学特征以及与 Ki-67 表达的相关性。

方法：对 110 例子宫内膜癌症患者进行术前磁共振成像，术后检测这些患者的组织病理学特征以及 Ki-67 表达水平。通过 Pearson 相关分析评估 Ki-67 表达与 ADC 直方图参数之间的相关性。使用受试者工作特性（ROC）分析评估不同组间差异参数的诊断性能。

结果：1.子宫内膜癌病理组织学检查中高、中、低分化组 ADCmean、ADCske、ADCkur 分别为： $(1.37\pm0.53)\times10^{-3}\text{mm}^2/\text{s}$ ， 1.36 ± 0.52 ， 1.70 ± 0.64 ； $(0.92\pm0.50)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.92 ± 0.51 ， 1.10 ± 0.54 ； $(0.73\pm0.40)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.73 ± 0.41 ， 0.86 ± 0.41 ；子宫内膜癌病理 FIGO 分期，I、II、III、IV 期的 ADCmean、ADCske、ADCkur 分别为： $(1.38\pm0.53)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.11 ± 0.69 ， 0.38 ± 1.79 ； $(1.01\pm0.49)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.15 ± 0.73 ， 0.36 ± 1.33 ； $(0.74\pm0.40)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.06 ± 0.47 ， 0.59 ± 0.55 ； $(0.56\pm0.29)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.07 ± 0.47 ， 0.52 ± 0.57 。ADC 直方图参数在不同级及不同分期肿瘤之间存在统计学差异。2.淋巴结阳性及阴性组的 ADCmean、ADCske、ADCkur 分别为 $(0.62\pm0.25)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.01 ± 0.56 ， 0.56 ± 0.59 ； $(1.14\pm0.55)\times10^{-3}\text{mm}^2/\text{s}$ ， 0.03 ± 0.72 ， 0.28 ± 1.46 。淋巴结阳性组 ADC 参数显著低于淋巴结阴性组。3. ADC 直方图参数和 Ki-67 表达之间存在显著的负相关。

结论：ADC 直方图分析可能可以成为评估子宫内膜癌生物标志物的非侵入性技术。

Impaired glymphatic system function related to choroid plexus enlargement in Relapsing-Remitting Multiple Sclerosis

Lina Kong^{1,2}, yongmei li¹

1. The First Affiliated Hospital of Chongqing Medical University
2. Department of Radiology, Chongqing hospital of traditional Chinese medicine

Objectives: Impaired glymphatic system have been described in several neurodegenerative diseases, but it has not been thoroughly investigated in multiple sclerosis. The objectives of this study are to investigate the glymphatic system function in relapsing-remitting multiple sclerosis (RRMS) patients, and to examine the relationship between diffusion tensor image analysis along perivascular space (DTI-ALPS) index and choroid plexus volume (CPV) and other variables in RRMS.

Methods: The ALPS index, the CPV in lateral ventricle and the volume of the cortical lesions were derived from magnetic resonance imaging (MRI) in 92 RRMS patients. The longitudinal alterations of the ALPS index and CPV in 23 RRMS patients were examined. Forty healthy controls (HCs) were also included for comparison. CPV was expressed as a ratio of intracranial volume.

Results: RRMS patients had a lower ALPS-index ($p = 0.001$) and a higher CPV ($p < 0.001$) than HCs. A lower ALPS index were associated with a higher CPV ($p = 0.004$), greater cortical lesion volume ($p = 0.001$), and longer disease duration ($p = 0.011$). A larger CPV was related to

greater cortical lesion volume($p = 0.014$) in RRMS. However, the ALPS index and CPV did not show significant changes after 6 months of follow-up in 23 RRMS patients.

Conclusion: Our findings demonstrate that the impaired glymphatic system are related to CP enlargement and heavier cortical lesion load, which may reflect the inflammatory processing in MS patients; these findings might help clarify the pathological mechanism of MS.

Altered Functional Connectivity of Cerebellum Subregions in Patients with Obstructive Sleep Apnea: a Resting-state Functional Magnetic Resonance Imaging Study

Lifeng Li^{1,2}, Yuting Liu³, Yongqiang Shu¹, Xiang Liu¹, Ting Long¹, Li Zeng¹, Ling Huang¹, Haijun Li¹, Dechang Peng¹

1. The First Affiliated Hospital of Nanchang University

2. The Affiliated Changsha Central Hospital, University of South China

3. Hunan Children's Hospital, Hunan Province

Background and Purpose: Previous studies have found abnormal cerebellum function in obstructive sleep apnea (OSA) patients, associated with cognitive impairment. However, the effect of OSA on resting-state functional connectivity (FC) in cerebellar subregions is not known. The present study was to investigate the resting-state FC between cerebellar subregions and the other whole-brain and its relationship with clinical symptoms in OSA.

Methods: We enrolled sixty-eight OSA patients and seventy-two healthy controls (HCs) with similar education, and clinical data and resting-state functional MRI data were collected. Then, eight subregions of the bilateral cerebellum were used as regions of interest, FC values were calculated for each subregion with other whole-brain voxels, and the two groups were compared by independent sample t-tests. Finally, correlation analysis between the FC values of abnormal brain areas and clinical, neuropsychological data in OSA patients was analyzed.

Result: Compared with the HCs, OSA patients exhibited significantly higher FC values in the right lobule VI with the right posterior middle temporal gyrus and the right angular, the right Crus I with bilateral precuneus/the left superior parietal lobule, and the right Crus II with the precuneus/the right posterior cingulate cortex. However, there were no changes in the left lobule VI, left Crus I/II, and bilateral lobule VIIb with whole-brain voxels FC. Correlation analysis revealed a correlation between the oxygen depletion index and the abnormal FC in Crus II with the precuneus and the posterior cingulate cortex.

Conclusion: In this study, the higher FC values showed in OSA patients are related to cognition, emotion, language, and sleep. The cerebellum, which acts as a vulnerable area and functional compensatory zone in OSA patients, is functionally lateralization and closely related to the posterior default mode network. Abnormal FC may offer new neuroimaging evidence and insights for further understanding of OSA-related alterations.

Intravoxel Incoherent Motion and Diffusion Kurtosis Imaging of Invasive Tumor Front for Assessment of Macrotrabecular-massive Subtype in Hepatocellular Carcinoma

Qianyun Liu
Yueyang Central Hospital

Abstract Objectives To investigate the performance of intravoxel incoherent motion (IVIM) and diffusion kurtosis imaging (DKI) for assessment of macrotrabecular-massive (MTM) subtype in hepatocellular carcinoma (HCC).

Materials and methods This prospective study enrolled 76 consecutive patients with surgically resected HCCs. Preoperative MRI examination including multiple b-value diffusion-weighted imaging (DWI) was performed and the apparent diffusion coefficient the independent predictors of MTM subtype. Incorporating the two parameters into a (ADC), true diffusion coefficient (D), pseudo-diffusion coefficient (D^*), perfusion fraction (f), kurtosis-corrected ADC (AD), and apparent diffusion kurtosis (AK) were calculated for the whole tumor (including central and peripheral parts) and within two peritumor 3-mm-thick layers. Logistic regression analysis was used to determine independent predictors and receiver operating characteristics (ROC) curves were used to evaluate the diagnostic performance.

Results There were MTM-negative tumors and 18 MTM-positive tumors. The ADC, D, and AD for the whole tumor, tumor central part, and peripheral part were significantly lower, while the D^* for the tumor peripheral part and peritumor inner layer were higher in MTM-positive tumors compared with MTM-negative tumors (all $P < 0.05$). Multivariable analysis indicated that AD for tumor peripheral part (odds ratio [OR], 0.498; $P = 0.027$) and D^* for peritumor inner layer (OR, 1.919; $P = 0.038$) were conventional model based on MRI features showed significantly improved diagnostic performance (area under the curve [AUC], 0.871 vs. 0.752; $P = 0.020$).

Conclusion IVIM and DKI-derived parameters of invasive tumor front provide incremental value over conventional MRI features for evaluating MTM subtype of HCC.

PU-0202

酰胺质子转移(APT)和磁化转移(MT)预测鼻咽癌放化疗后短期治疗疗效：三维化学交换饱和转移(CEST) MRI 的可行性研究

刘文广、王笑、裴贻刚、李文政
中南大学湘雅医院

背景：三维化学交换饱和转移(3D CEST)技术是一种新型的、有发展前途的磁共振序列。然而，其在鼻咽癌中的应用还缺乏充分的评价。本研究旨在评估 3D CEST 技术在预测鼻咽癌患者放化疗(CRT)后短期治疗疗效中的可行性。

材料与方法：本研究共纳入 40 例鼻咽癌患者和 14 名健康志愿者，并在患者治疗前进行了三维 CEST 磁共振成像和扩散加权成像(DWI)。通过计算酰胺质子转移加权信号强度(APTw-SI)和磁化传递比(MTR)值的观察者内和观察者间相关系数(ICC)，在健康志愿者中评估 3D CEST 的可靠性。根据 CRT 后的短期治疗疗效将鼻咽癌患者分为残余组和非残余组。人工绘制整个肿瘤感兴趣区域(ROIs)，测量 APTw-SI、MTR 和表观扩散系数(ADC)值。采用多因素分析和受试者工作特征曲线(ROC)评价临床特征、APTw-SI、MTR、ADC 值和联合模型预测鼻咽癌患者短期治疗疗效的效能。

结果: 健康志愿者组 APTw-SI 和 MTR 值在观察者内部和观察者之间的一致性均为良好至极好 (0.736 ~ 0.910, 0.895 ~ 0.981, $P > 0.05$)。非残留组与残留组间 MTR 值差异有统计学意义 ($31.24 \pm 5.21\%$ vs $34.74 \pm 1.54\%$, $P = 0.003$), 而 APTw-SI、ADC 值差异无统计学意义 ($P > 0.05$)。此外, MTR 值对鼻咽癌患者短期治疗疗效的预测能力优于 APTw-SI (AUC: 0.818 vs 0.521, $P = 0.017$), 与 ADC 值相当 (AUC: 0.818 vs 0.649, $P > 0.05$)。即使将 MTR 值与 APTw-SI 和/或 ADC 值联合使用, 预测效果也没有明显提高 ($P > 0.05$)。

结论: 与 APTw-SI 和 ADC 值相比, 通过 3D CEST 获得的治疗前 MTR 值对 CRT 后鼻咽癌患者的短期治疗疗效具有更好的预测性能。

PU-0203

带状疱疹及后遗神经痛患者脑网络度中心度的静息态 fMRI 研究

李芊

西南医科大学附属医院

Objective: The current study aimed to investigate the role of degree centrality (DC) for the pathophysiological process of HZ and PHN, especially for the pathophysiological chronification from HZ to PHN.

Methods: 27 PHN patients, 24 HZ patients and 21 healthy controls (HCs) were recruited in the study. The DC was analyzed to detect the brain activity of the patients. Correlations between DC and clinical features were assessed in two groups of patients.

Results: The results showed lower DC in the right superior frontal gyrus, right cingulate gyrus, bilateral inferior parietal lobule (IPL), bilateral precuneus, right paracentral lobule of HZ patients compared to HCs; In addition, PHN patients exhibited decreased DC in the bilateral IPL compared to HCs.

Conclusions: The findings suggest the abnormalities of DC in these regions, especially IPL, may be neuroimaging biomarkers of chronification from HZ to PHN.

压缩感知单次屏气 CMR：用于快速量化左心室功能、体积和质量

向正东、韩小乐、徐军

华中科技大学同济医学院附属协和医院

目的: 本研究的目的是比较一种新型的基于压缩传感 (CS) 单次屏气多层磁共振技术与标准多次屏气技术在心率不齐患者和屏气困难患者心脏电影中的应用, 以评估左心室 (LV) 的容积和功能。

背景: 心脏磁共振通常被认为是左心室容量和功能评估的金标准。左心室功能是诊断和监测治疗效果的最重要心脏参数之一。标准的多次屏气技术在心率不齐患者和屏气困难患者中有严重的伪影, 影响结果的准确性。最近, 压缩感知技术已成为加速数据采集的一种手段, 可改善图像的伪影。

方法: 收集 2021 年 3 月至 2022 年 11 月行心脏磁共振的 116 名患者, 扫描心脏磁共振 (CMR) 电影图像, 采集相同的层数、位置和厚度。对两序列, 评估左心室 (LV) 射血分数 (EF)、舒张末期容积 (EDV)、收缩末期容积 (ESV) 射血分数 (EF) 以及左心室质量 (LVM)。同时对比两个序列的整体图像质量。

结果: CS 单次屏气电影成像将 CMR 扫描持续时间大幅度缩短, 同时提供了左心室可靠测量。CS 序列平均扫描时间为 22 ± 3 秒, 而多次屏气序列为 511 ± 111 秒 ($p < 0.001$)。在测量 EDV、ESV、EF 和 LV 质量的技术之间发现了良好的一致性和相关性。在没有屏气困难或心律失常的患者中, 两

种技术之间的 Euro-CMR 评分无显著差异 (0.3 ± 0.7 vs. 0.3 ± 0.5 , $p > 0.05$)。在屏气困难或心律失常的患者中, 压缩感知单次屏气 CMR 评分显著更高 (2.3 ± 1.2 比 0.4 ± 0.5 , $p < 0.001$)

结论: 在屏气困难和心律失常的患者中, 新型的基于压缩传感 (CS) 单次屏气多层磁共振技术相较于标准多次屏气技术图像质量明显更好。

PU-0205

自由呼吸肝脏磁共振增强扫描-黄金角径向稀疏平行成像 (GRASP) 序列图像评估

刘响、王琦、齐晓晖、谢巧、李阳

河北医科大学第四医院

实验目的: 采用自由呼吸扫描序列--黄金角径向稀疏并行采样进行肝脏扫描, 将自由呼吸扫描序列与屏气序列图像进行主观及客观评估, 验证自由呼吸序列在肝脏病扫描中的临床适用性。

材料与方法: 本研究回顾性分析了 2021.1-2022.7 在本科室行肝脏钆塞酸二钠增强磁共振扫描的 30 例患者。患者两次使用钆塞酸二钠造影剂增强扫描, 间隔时间小于 3 个月, 两次分别使用屏气扫描序列采集及 Grasp 序列采集; 患者于同一台磁共振序列进行扫描。对屏气和 Grasp 序列中动脉晚期及静脉期图像进行的主观评分及客观评价: 肝脏信噪比 (SNR), 肝脏相对信号强度比 (RLSI)、肝脏与血管对比度 (LTAC、LTVC)。

结果: 主观评价: 两种扫描序列下动脉晚期、门静脉期图像的各项主观评分比较均无统计学差异, $P > 0.05$ 。客观评价: 两种扫描序列下动脉晚期的图像 SNR 比较有统计学差异, Grasp 序列高于屏气序列 (屏气序列/Grasp 序列 $148.4 \pm 52.8 / 195.6 \pm 68.4$ $Z = -3.632$ $P = 0.001$)。门脉期 Grasp 序列的 SNR 高于屏气序列, 但是差异无统计学差异。两种序列动脉晚期的 RLSI、LTAC 及门静脉期 SNR、RLSI、LTAC 差异无统计学意义, P 值 > 0.05 。

结论: 自由呼吸扫描序列在肝脏 MR 增强后的图像质量满足诊断要求, 即使屏气能力受限的患者也能得到满意的图像, 有重要的临床价值。

PU-0206

三维伪连续动脉自旋标记灌注成像在儿童全面发育迟缓脑部的应用

周梁、赵鑫、陆林、程美英、邢庆娜、尚红磊、杨金泽、宣德胜、张贺博、秦池、刘世鹏、张小安

郑州大学第三附属医院

【摘要】研究目的 探讨三维伪连续动脉自旋标记 (3D-pcASL) 灌注成像在 2-4 岁儿童全面发育迟缓脑部的应用价值。材料与方法 研究对象为 2022 年 3 月至 2023 年 8 月在郑州大学第三附属医院首次确诊为全面发育迟缓 (GDD) 的 24 名 2-4 岁儿童 (研究组) 和 11 名年龄性别相匹配的健康对照儿童 (对照组)。参与者均在 GE3.0T MRI 扫描仪上行磁共振常规序列、3D-T1、3D-pcASL 序列扫描。通过 ADW4.7 工作站进行后处理, 并通过软件进行图像融合获得脑部各区脑血流量 (CBF) 灌注值。选取脑感兴趣区 (ROI) 包括额叶、顶叶、颞叶、枕叶、基底节区、丘脑。比较儿童全面发育迟缓和健康儿童各脑区 CBF 值, 探索分析儿童全面发育迟缓脑部各区 CBF 值特点。计量资料采用均数 \pm 标准差表示, 两组间比较采用独立样本 t 检验。多元逻辑回归分析对 GDD 组显著变化的 CBF 值进行筛选, 探讨独立预测因素并使用受试者工作特征曲线 (ROC) 下面积 (AUC) 来评估 CBF 值作为独立预测因素对 2-4 岁 GDD 儿童的诊断效能。结果 在 2-4 岁儿童全面发育迟缓中右侧枕叶和左侧顶叶区域 CBF 值明显低于健康对照儿童 ($P < 0.05$)。多元逻辑回归分析表明, 右侧枕叶和左

侧顶叶的 CBF 值是预测 GDD 发生的独立预测因素。ROC 曲线分析结果显示, 右侧枕叶白质 CBF 值的 AUC 为 0.756, 敏感度为 79.2%, 特异度为 63.6%, 阈值为 59。左侧顶叶 CBF 的 AUC 为 0.693, 敏感度为 83.3%, 特异度为 63.6%, 阈值为 48.6。结论 1.三维伪连续动脉自旋标记灌注成像在 2-4 岁儿童 GDD 脑部具有一定的应用价值。2.右侧枕叶 CBF 值和左侧顶叶 CBF 值有助于预测儿童 GDD 的发生。

Recovery trend with persistent white matter abnormalities from acute to chronic stage after Omicron infection

Sihong Huang, Cong Li, Wei Zhao, Yanyao Du, Longtao Yang, Yijie Huang, Yanjing Chen, Ping Liu, Jun Liu
the Second Xiangya Hospital of Central South University

Objective To investigate the microstructural integrity following Omicron infection, considering the prior understanding of less severe impact compared to other strains.

Methods We enrolled 162 post-Omicron infection patients and 17 healthy controls (HCs_2023) in our study. Additionally, we included 17 HCs recruited in 2022 (HCs_2022) as another control group. Separate comparisons were conducted between patients and the two control groups. Furthermore, subgroup comparisons were performed based on neurological symptoms and the intervals between infection and scans. DTI, neurite orientation dispersion and density imaging were utilized to assess white matter integrity. Cognitive function was evaluated using Wechsler Intelligence scale. Correlations between diffusion metrics and cognitive function were also analyzed.

Results The comparison between patients and HCs_2022 revealed more abnormal voxels than the comparison between patients and HCs_2023, with both results reflected by lower axial diffusivity. In the comparisons among Omicron patients across different stages, various diffusion metrics demonstrated dynamic changes. Most voxels exhibited abnormalities in patients during the acute stage, with more pronounced abnormalities observed during the subacute stage, and tended to return to normal during the chronic stage. However, the corpus callosum, internal capsule and coronal radiator in the right hemisphere, which were more pronounced during the chronic stage.

Conclusion Utilizing HCs recruited before the Omicron epidemic appears to provide a more objective control group, as control group collected during the Omicron epidemic may include asymptomatic infected individuals. Furthermore, from the acute to chronic stage, patients exhibited a trend of recovery alongside persistent white matter abnormalities. This suggests that even in cases of milder disease severity in Omicron-infected patients, recovery takes a significant amount of time and necessitates longer follow-up.

高分辨磁共振血管壁成像在评估颈动脉斑块稳定性应用价值

宁文锋¹、鄢小平¹、马鸣岳¹、董燕¹、刘红生¹、弓甜甜¹、简蒙蒙¹、李璐言¹、齐凯莉²

1. 西安交通大学医学院附属西安市中心医院

2. 西北大学附属西安市第三医院

目的: 探讨高分辨磁共振血管壁成像在评估颈动脉斑块稳定性应用价值

方法: 对 2021 年 10 月~2022 年 11 月期间我院收治的 52 例患者行颈动脉超声检查怀疑颈动脉粥样硬化斑块临床资料进行研究分析, 同时在我科行高分辨磁共振血管壁成像检查, 观察颈动脉斑块的成分。

结果: 52 例患者中 38 例为不稳定性斑块和 14 例为稳定性斑块中, 高分辨磁共振血管壁成像显示血管结构、钙化、脂质核心、斑块成分、块斑块内出血及纤维斑块差异均有统计学意义。

结论: 高分辨磁共振血管壁成像对颈动脉斑块成分及稳定性判定有重要价值; 对临床诊断治疗有很大指导意义, 因此此检查方法可作为临床上评价斑块性质重要方法。

PU-0209

Noninvasive Prediction of Ki-67 and p53 Expression Status in Endometrial Cancer Patients by IVIM-DWI, DCE-MRI, and Radiomics: A Prospective Study Based on Machine Learning

Juan Bao, Jiangning Dong
Anhui Provincial Cancer Hospital

Purpose: To investigate the value of intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI), dynamic-contrast enhanced MRI (DCE-MRI) and three-dimensional (3D) radiomics based on magnetic resonance imaging (MRI) in noninvasive prediction of Ki-67 and p53 expression state in endometrial cancer (EC). Build, validate, and compare prediction models based on machine learning.

Methods: A total of 103 patients with EC confirmed by diagnostic curettage were analyzed prospectively. They were randomly divided into the training set and test set at a ratio of 7:3. According to pathology, the patients were divided into the high Ki-67 group ($Ki-67 \geq 39\%$) and low Ki-67 group ($Ki-67 < 39\%$), and p53 normal group (p53 expression level between 0-75%) and p53 abnormal group (overexpression, with $\geq 75\%$ of positive tumor cells or complete absence, with 0% of positive tumor cells or cytoplasmic expression). The quantitative parameters of IVIM-DWI and DCE-MR were measured. The 3D radiomics features were measured on T2-weighted imaging (T2WI), IVIM-DWI ($b=1500 \text{ s/mm}^2$) and DCE-MRI delayed phase. The least absolute shrinkage and selection operator algorithm, interclass correlation coefficient (ICC), Spearman's correlation analysis, independent two-sample t-test, and Mann-Whitney U-test were used to screen the best radiomics features, and Radiomics scores (RADS-score) were calculated. The independent prediction parameters of Ki-67 and p53 expression state were determined by binary logistic regression. The random forest (RF), support vector machine (SVM), and logistic regression (LR) classifier were used to construct prediction models respectively. Compare the performance of each model by Delong's test. The predictive effect of the models was evaluated by receiver operating characteristic (ROC) curve and verified by calibration and decision curve analysis (DCA).

Results: D, Ktrans and RADS-score 1 were independent predictors of high Ki-67 expression in EC patients. f, Vp, and RADS-score 2 were independent predictors of abnormal p53 expression in EC patients. The expression of Ki-67 and p53 in EC patients can be distinguished by machine learning models. The RF model performed best in predicting Ki-67 expression status. The area under the curve (AUC) were 0.877 (95%CI, 0.797-0.956) and 0.809 (95%CI, 0.708-0.909) in training and test set, respectively. When predicting p53 expression status, the LR model performed best, and the AUC were 0.898 (95%CI, 0.827-0.969) and 0.814 (95%CI, 0.656-0.974) in training and test set, respectively. In addition, the machine learning models performed significantly better than a single parameter. All queues were well calibrated. The decision curve verified that the machine learning models can achieve net benefits in clinical work.

Conclusion: The machine learning models based on IVIM-DWI, DCE-MRI, and radiomics performed well in noninvasively predicting Ki-67 and p53 expression status in EC patients before surgery, which could provide valuable information for personalized treatment.

x 线射线、超声和磁共振成像对乳腺癌高危人群及不同人群亚组的筛查有效性和应用价值

孟雪妮、于群、富青

华中科技大学同济医学院附属协和医院

目的：乳腺癌已经成为女性常见的恶性肿瘤之一，早期诊断、治疗可以明显提高乳腺癌的治愈率。目前乳腺癌筛查最常用的影像学方法是钼靶 X 线和超声，然而对肿瘤风险较高的致密型乳腺敏感度欠缺。磁共振成像（MRI）具有高的软组织分辨率和无辐射等特点。本研究旨在评价乳腺 x 线射线、超声和磁共振成像对乳腺癌高危妇女人群及不同人群亚组的乳腺癌筛查效果。

方法：以 BRCA 突变携带者和家族性高危的女性为乳腺癌筛查对象，通过 x 线射线、超声和磁共振成像进行普查，每 12 个月检查一次，并对诊断性能进行对比。比较不同诊断方法及其组合的诊断效能，进一步比较基于突变状态、年龄和乳腺密度划分的亚组。

结果：MRI 的敏感性(91.4%)显著高于乳腺 x 线射线(37.8%)和超声诊断(37.5%)。60 例患者中，单纯 MRI 检出 18 例(45.0%)。单独 x 线射线检查发现 2 个癌。与单独使用 MRI 相比，并没有导致显著的敏感性增加($P = 0.19$)。单纯超声检查未发现癌症。x 线射线检查结合超声检查对乳腺癌的检出率仅为 36.5%。年龄、突变状态和乳腺密度对 MRI 的敏感性无影响，也不影响 MRI 相对于 x 线射线和超声的优越性。

结论：不同患者年龄、乳腺密度、危险度状态分组中 MRI 均可早期发现家族性乳腺癌。乳腺 x 线射线的附加价值有限，超声对接受 MRI 筛查的女性无附加价值，并且通过多模态、多参数磁共振成像定量分析影像学特征与乳腺癌分子亚型的相关性，能够术前无创反映乳腺癌的不同的分子亚型

PU-0212

应用动态心脏 MRI 心室功能自动量化系统评估心功能的研究

陈晓晖

东南大学附属中大医院

目的：应用动态心脏 MRI 量化方法，从心脏 MR 图像中提取心室功能参数评估心功能。

方法：收集本院 100 例心脏动态 MRI 数据，每个数据都包含一个完整心动周期序列。将所有病例分为 5 组：心脏功能正常组（NOR）、陈旧性心肌梗死组（MINF）、扩张型心肌病组（DCM）、肥厚型心肌病组（HCM）和右心室异常组（ARV），每组各 20 例数据。再将所有数据随机分为训练组（60 例）、验证组（10 例）和测试组（30 例）。基于所有数据对比实验。(1) 手动与自动分割结果量化参数之间的差异：对 30 例测试组数据进行分割，得到每个时间序列的左右心室分割结果，使用自动量化方法提取手动分割与自动分割结果的心脏功能参数，计算手动与自动量化参数的均值、标准差及二者间的均方根误差和 P-value；(2) 正常组与异常组心功能量化参数之间的差异：对 100 例动态心脏 MRI 进行分割，得到每例数据各时间点的左右心室分割结果，使用自动量化方法提取自动分割结果的心脏功能参数，分别计算五组数据的组内平均值和标准差及异常组与正常组功能参数的 P-value。

结果：1. 手动与自动分割结果心室功能量化参数对比：自动分割结果的左右心室功能参数的分布特征与手动分割结果较为接近，且二者之间的均方根误差值较小；大部分左右心室功能参数的 P-value 均大于 0.05。2. 正常组与异常组的心功能量化对比：(1) DCM 组：扩张型心肌病组的左心室舒张末期容积、收缩末期容积、左心室射血分数、左心室质量等参数与正常组具有显著差异；(2) HCM 组：肥厚型心肌病组的左心室舒张末期容积、收缩末期容积及左心室射血分数与正常组无显著差异，但左心室质量显著大于正常组；(3) MINF 组：陈旧性心肌梗死组的左心室舒张末期容积收缩末期容积与左心室质量均显著高于正常组，左心室射血分数显著小于正常组，左心室每搏输出量无明显差异；(4) ARV 组：右心室异常组的右心室舒张末期容积与收缩末期容积显著高于正常组，而右心室射血分数显著低于正常组。

结论：动态心脏 MRI 自动量化方法所提取的心功能参数与真实值具有较高相关性和一致性，具有较高的实用价值。

睾丸横纹肌肉瘤的 MRI 表现

王岸飞

郑州大学第一附属医院

【摘要】目的 分析睾丸横纹肌肉瘤的 MRI 影像表现，提高对睾丸横纹肌肉瘤的诊断水平。方法 回顾性分析 2016 年 3 月至 2023 年 4 月在郑州大学第一附属医院就诊的具有完整临床、MRI 和病理资料的 9 例睾丸横纹肌肉瘤患者，年龄 8~21 岁，均经病理及免疫组化检查证实。磁共振扫描方法：3.0T MRI 常规平扫、扩散加权成像和动态增强扫描。常规平扫包括矢状位 T2WI、冠状位 T2WI、横轴位脂肪抑制 T2WI 和 T1WI 序列(层厚 5mm，层数 25)；DWI 扫描为横轴位(b 值为 0 和 800)，动态增强扫描为横轴位 3D T1WI(层厚 3mm，层数 80)，延迟增强分别行横轴位、矢状位和冠状位 T1WI。结果 9 例横纹肌肉瘤均位于睾丸内，为单发，其中 4 例位于左侧，5 例位于右侧。肿瘤体积大，形态不规则，长径 5.2~15.0cm；肿块内囊变坏死呈长 T1、长 T2 信号，肿块实质部分呈等 T1、稍短 T2 信号，内见多发条状及网格状短 T2 分隔。有 3 例合并出血，出血区呈片状稍短 T1、长/短 T2 信号，病变边界欠清晰，向上累及同侧附睾及精索。5 例可见盆腔内、腹股沟多发肿大淋巴结，其中 1 例行胸腹 MRI 检查见腹膜后多发肿大淋巴结及脊柱、肋骨和骨盆多发骨转移。DWI 和

ADC 图均呈不均匀高/低混杂信号, 且 ADC 图高信号区为肿瘤囊变坏死, 低信号区为肿瘤实性部分。动态增强 TIC 类型: I 型 6 例, III 型 3 例。延迟期增强 T1WI 显示肿瘤呈轻中度不均匀条状及网格样强化, 囊变坏死区不强化, 呈“丝瓜瓤”样改变, 其中有 1 例合并骨转移的患者肿瘤呈不均匀强化。结论 睾丸横纹肌肉瘤 MRI 表现具有一定特征性, 对病变诊断具有重要诊断价值。

双向孟德尔随机化揭示了日常饮食模式与 大脑皮层结构变化之间的联系

李聪、刘军
中南大学湘雅二医院

目的: 认知障碍是老龄化人群的主要健康问题。饮食模式和营养素与认知功能和大脑结构有关。孟德尔随机化可以使用遗传工具变量来评估因果关系。本研究采用孟德尔随机化分析法研究了饮食习惯和大量营养素对皮层结构的影响。

方法: 在本研究中, 我们利用最近关于饮食习惯的大规模全基因组关联研究汇总统计数据、ENIMMA 联盟关于大脑皮层结构的全基因组关联性研究数据和 SSGAC19 联盟关于饮食成分相关全基因组关联研究汇总数据, 进行了一项双样本双向孟德尔随机化研究。使用逆方差权重分析、MR-Egger 回归、加权中位数、加权模式和 MR-PRESSO (MR-Prioritropy RESidual Sum and Outlier) 检验来评估因果关系。此外, 还进行了反向孟德尔随机化分析, 以研究 23 种饮食习惯对大脑皮层结构的因果影响。

结果: 在饮食因素和整个皮层结构和厚度的背景下, 在正向和反向孟德尔随机化分析中都没有发现因果关系的显著证据。在前瞻性孟德尔随机化分析中, 有六个饮食因素被确定为与皮层结构显著相关。脂肪摄入与六个皮层区域的结构变化有关, 而全脂牛奶的摄入与五个区域的变化有关, 脱脂牛奶与四个区域有关, 蛋白质、新鲜水果和水各与一个区域有关。在反向分析中, 发现了显著的证据表明, 尾侧前扣带的皮层厚度影响酒精和碳水化合物的消耗, 枕外侧和眶额外侧的皮质厚度影响咖啡的消耗, 眶额内侧表面积影响非油性鱼类的消耗, 中央旁皮质厚度影响油性鱼类的消费。

结论: 总之, 这项两样本孟德尔随机化研究揭示了某些饮食习惯与大脑皮层厚度或表面积之间的因果关系。需要进一步的研究来阐明饮食习惯对皮层结构的影响, 包括所涉及的具体机制。这项研究有助于进一步阐明饮食因素在认知功能变化中发挥作用的潜在机制, 并为肠脑轴的存在提供证据。

3.0T 磁共振磁敏感加权像 (SWI) 在脑转移瘤与脑脓肿鉴别诊断 中的价值

柳海斌
包头市中心医院

目的: 探究磁敏感加权成像(contrast enhanced susceptibility weighted imaging, SWI)在脑转移瘤与脑脓肿鉴别诊断中的价值。方法: 回顾性分析 58 例转移瘤患者和 32 例脑脓肿患者, 所有患者均在德国西门子 3.0T-skyra 磁共振成像仪上进行了常规磁共振成像、增强扫描和 SWI, 病灶内磁敏感信号(intralesional susceptibility signal, ILSS)有无来评价 SWI 对鉴别脑转移瘤与脑脓肿的诊断价值。结果: 58 例脑转移瘤患者中, 56 例患者检出 ILSS(96.5%), 32 例脑脓肿患者中 11 例检出 ILSS(34.3%), 利用 ILSS 区分脑转移瘤和脑脓肿敏感性 97%, 特异性 66%, 脑转移瘤患者 ILSS

检出率显著大于脑脓肿患者($OR=53.455$, $P=0.001$)。结论: SWI 在脑转移瘤与脑脓肿的鉴别诊断中具有重要价值。

肝癌致特鲁索综合症: 个案报道及文献学习

王培、李天然、唐静
中国人民解放军总医院第四医学中心

Trousseau's syndrome refers to a series of thromboembolism syndromes, such as chronic intravascular coagulation, multiple venous thrombosis, arterial thrombosis and non-bacterial thrombotic endocarditis, which are caused by hypercoagulable state related to malignant tumors. It was first reported by Trousseau in France in 1865 that patients with gastric cancer are prone to deep venous thrombosis of lower limbs. In this paper, we analysed the process of diagnosis and treatment of a case of Trousseau syndrome caused by hepatocellular carcinoma and reviewed the related literatures in order to improve the clinicians' understanding of the disease, early recognition, timely diagnosis and treatment and improve the prognosis.

Evaluation of the correlation between trace elements and spinocerebellar ataxia type 3: a multi-elemental analysis

Lihua Deng, chen Liu, jian Wang
Department of Radiology, Southwest Hospital, Army Medical University (Third Military Medical University)

Objective: Spinocerebellar ataxia type 3 (SCA3) is a neurodegenerative disease, which is neurological disorder characterized by cerebellar dysfunction. Previous studies suggest that the alterations of trace element content may contribute to development of neurodegenerative disorders. Therefore, in addition to investigating the association between trace elements and ATXN3 which is disease-causing genes of SCA3, we evaluated how trace elements relates to brain structural and functional neural atrophy, and discuss the possibility of using astrocytes as potential therapeutic targets.

Methods: Forty-five patients with SCA3 and 44 HCs were enrolled in this study. We collected blood samples from all the participants and analyzed them for trace elements. We used a Siemens 3T TIM Trio MRI system to get MRI data. Finally, We used MATLAB 2019b (MathWorks) to estimate the relationship between the brain structural morphology or functional connectivity indexes and blood level of elements.

Results: We demonstrated that patients with SCA3 have significantly lower whole blood levels of lithium, selenium, and copper than the healthy population by multi-elemental analysis of whole blood samples between SCA3 patients and healthy individuals was performed using inductively coupled plasma mass spectrometry. The levels of lithium and selenium were negatively correlated with the CAG repeat length in the ATXN3 gene. Furthermore, analysis based on diffusion tensor images and resting state functional images showed that for SCA3 patients: concentrations of Li were significantly negatively correlated ($p < 0.001$, in permutation test, cluster size >10) with FA values in left and right superior longitudinal fasciculus, and the two groups showed different patterns of resting state connectivity in some of the brain regions most associated with blood element levels.

Conclusions: As alterations in trace element homeostasis may affect the progression of SCA3 thus the treatment outcome can be varied by changing the trace element concentration, which

could be an efficient way of therapy. we suggest that it should be more precise, appropriate, and timely lithium supplementation to minimize damage to the white matter or astrocytes.

PU-0218

MRI 在腰骶神经成像技术的应用

刘林栋

南京市第一医院

目的 探讨 MRI gre_geti 成像序列, 在显示腰骶椎管内外神经的价值

方法 对临床诊断腰腿痛患者行 MRI 腰椎检查, 除常规扫描 T2WI, T1WI, T2SPAIR 矢状位和 T2WI 横段位外, 用 T2 _geti3d 序列扫描冠状位。将 gre_geti_3d 序列扫描数据在工作站行多平面重建, 观察并腰骶神经与周围组织的信号差异以及形态走行, 判断腰骶神经受卡压等情况。gre_geti 使用扰相梯度回波序列来实现, gre_geti 序列的对比度主要取决于回波数、TE、TR 和翻转角。在进行 3D 扫描时, 常用参数设置如下: TE 20 ms ~ 40 ms, TR 400 ms ~ 600 ms, 翻转角 60° ~ 80°, 回波数 3 ~ 6。

gre_geti 序列是在一次小角度射频脉冲激发后, 利用读出梯度多次切换, 采集多个梯度回波 (一般为 3 ~ 6 个), 这些梯度回波采用同一个相位编码, 填充在 k 空间的同一条相位编码线上, 最后将这些回波都合并起来。为了消除流动的影响, 协议默认添加三个方向的流动补偿。

结果 该序列能够抑制神经束间和神经周围脂肪, 图像中椎管内神经呈线样低信号, 硬膜囊内脑脊液呈中高信号, 组织对比清楚。在椎管外神经呈条索状低信号, 该序列能显示神经根水肿及受压的程度。高场强 3.0MR, 3 维高分辨率成像, 以及敏感编码并行采集 (sensitivity encoding SENSE) 短反转时间反转恢复 (shot inversion recovery TI STIR) 等技术的发展, 使该序列成像分辨率及信噪比均明显提高, 可获得更细更多脊神经, 从而更适合用来研究周围神经。

结论 目前临床采用 MRI 常规序列扫描, 其存在一定的局限性。MRI 常规序列扫描只能显示神经根的解剖形态, 不能显示神经根受压后的病理变化, 无法达到功能成像; 且显示的解剖形态也只是一定角度的二维图像, 不能显示受压神经根的全貌。MRI 技术 gre_geti_3d 的序列安全无创, 不需要造影剂能显示腰骶神经的解剖形态及走形, 特别是对一些特殊类型的腰椎间盘突出症, 有其独特的诊断优势。

The Impact of KL-VS Heterozygosity on hippocampal neurodegeneration in Mild Cognitive Impairment

Xiaocao Liu, Qingze Zeng, Kaicheng Li, Luwei Hong, Jixuan Li, Xiao Luo, Minming Zhang
Zhejiang University

Objective: Alzheimer's disease (AD) is the most common type of dementia, and the APOE $\epsilon 4$ allele is regarded as a risk factor. Recent studies have shown heterozygosity for KL-VS, a haplotype in the human Klotho gene, is associated with greater cortical volume, better global cognition, reduced amyloid burden and risk of AD who carrying the APOE $\epsilon 4$, and lower amyloid-related tau pathology, suggesting a possible protective role in AD. In the amnesic Mild Cognitive Impairment (aMCI), disruption in the functional networks of the hippocampal subregions can be observed, leading to cognitive decline. Also, the kl protein encoded by the KL-VS^{het} gene is specifically expressed in hippocampus and plays a crucial role in degeneration. Magnetic resonance imaging (MRI) technology has been widely used to explore the in vivo neural mechanisms of genes. In this study, we aim to reveal the potential mechanism of the protective

effect for KL-VS^{het} in MCI and to clarify its effect on cognitive decline caused by pathological deposition.

Methods: 48 participants were selected from ADNI 3, including 16 KL-VS^{het} carriers (8 cognitively normal subjects, CN, 8 aMCI) and 32 non-carriers (16 aMCI, 16 CN). The rs-fMRI data were preprocessed, and then FC matrices between subregions and cortex were obtained. After Fisher-Z transformation, the mean FC value was extracted. ANOVA was performed among groups for FC, cognition and pathology. Moderated effects analysis was performed based on SPSS 24, PROCESS V4.1.

Results: Group comparisons revealed significant differences in FC, cognitive performance, and pathology between KL-VS^{het} carriers and non-carriers. Regression analysis showed that changes in FC between the subregions and cortex could modulate the impact of pathology on cognition.

Conclusion: Our findings suggest that the KL-VS^{het} may exert its protective effects by influencing FC between hippocampal subregions and cortex, thereby modulating cognitive impairments caused by AD pathology.

PU-0220

颈动脉粥样硬化斑块的血流动力学与斑块内出血相关性的 HR-MRI 研究

刘功就、李俊林
内蒙古自治区人民医院

目地: 本研究旨在利用血管壁高分辨率磁共振 (VW-HRMRI) 成像研究不同形状颈动脉粥样硬化斑块 (CAS) 局部血流动力学特征与斑块内出血 (IPH) 之间的关系。以期达到对 IPH 的早期预判与提前预防的目的, 使脑血管病能够得到早期治疗, 降低 IPH 的发生率、死亡率, 以取得较好的社会效益。

方法: 收集内蒙古自治区人民医院 2020 年 6 月——2023 年 6 月 86 名有症状的患者 (平均年龄 64.9 ± 10.9 岁, 范围: 33-76 岁; 62 名男性), 此前经头颈血管 CTA 确诊左侧颈总动脉分叉-颈内动脉起始处动脉粥样硬化斑块 (狭窄程度 70-95%; 斑块长度 1-1.5cm; 血压 80-139mmHg), 并同意接受 VW-HRMRI 成像, 纳入分析。应用血流动力学后处理软件, 对不同形状颈动脉粥样硬化斑块局部血流动力学特征与斑块内出血之间的关系进行分析, 评估颈动脉斑块的形状与 IPH 之间的关系。斑块形状定义如下: I 型: 斑块的弧长在上游较大; II 型: 斑块下游和上游的弧长相等; III 型: 斑块的弧长在下游更大。测量各组斑块上中下游局部血流动力学参数, 包括: 最大剪切应力 (Wall shear stress, MaxWSS)、平均剪切应力 (MeanWSS)、最小剪切应力 (MinWSS), 比较有和没有 IPH 的不同形状颈动脉粥样硬化斑块局部血流动力学参数, 确定其与 IPH 的相关性。

结果: 在 86 个检测到的斑块中, 27 个 (31.4%) 有 IPH。与没有 IPH 的斑块相比, 有 IPH 的患者 I 型斑块形状的发生率较高 (63.0%对 39.0%, $P < 0.001$), III 型斑块形状发生率较低 (25.9%对 45.8%, $P < 0.001$)。调整混杂因素后, I 型颈动脉斑块的斑块形状 (OR, 4.16; 95%CI, 1.42–10.53; $P = 0.018$) 与 IPH 显著相关。

结论: 颈动脉斑块的形状与 IPH 的发生密切相关。我们的发现可以为 IPH 和易损斑块的发病机制提供新的见解, 并为制订有针对性、个体化的临床诊疗方案提供影像学客观依据。

CMR 心外膜脂肪对心肌梗死合并房性心律失常患者发生心衰的预测价值

宋豫皎、赵新湘
昆明医科大学

目的：既往研究表明，同时患有房颤和心梗的患者比仅患有其中一种疾病的患者患中风、心力衰竭和死亡的风险更大，早期识别 MI 合并房性心律失常的高危患者非常重要。本研究利用心脏磁共振 (CMR) 探讨由 CMR 和临床确诊的 MI 合并经动态心电图发现的房性心律失常患者的心外膜脂肪体积及质量对住院随访期间发生心衰的预测价值。

方法：收集 2015 年 07 月至 2022 年 12 月间在昆明医科大学第二附属医院经临床及 CMR 确诊的 MI 患者 112 例，其中动态心电图发现的合并房性心律失常患者一共 62 例。根据随访结果分为无心衰组和心衰组。利用 CVI-42 后处理软件获得包括心外膜脂肪体积和质量在内的心脏结构功能及组织特征参数。比较两组患者的临床基线资料及 CMR 参数，行单因素及多因素 Logistic 回归分析 MI 合并房性心律失常发生心衰的预测因素，进一步绘制 ROC 曲线分析各参数的预测价值。结果：共纳入 MI 患者 62 例，其中心衰组 25 例，无心衰组 37 例。两组患者心外膜脂肪的体积、质量、左心室射血分数(LVEF)、糖尿病、年龄、梗死容积有显著统计学差异($P<0.05$)。心衰组心外膜脂肪体积和质量明显高于对照组($P<0.001$)，单因素有序 Logistic 回归分析显示，心外膜脂肪的体积、质量、糖尿病为 MI 合并房性心律失常后心衰的有效预测因子 (均 $P<0.05$)。多因素有序 logistic 回归分析显示，心外膜脂肪的体积和质量为 MI 合并房性心律失常后心衰的独立预测因子 (均 $P<0.05$)。ROC 分析提示心外膜脂肪的体积、质量以及联合指标对预测 MI 合并房性心律失常患者发生心衰均有一定价值($AUC>0.7, P<0.05$)，其中心外膜脂肪的体积和质量联合参数预测效能最大($AUC=0.87, P<0.001$)。结论：心外膜脂肪的体积和质量增加是心肌梗死合并房性心律失常患者发生心衰的重要标志。心外膜脂肪的体积及质量联合指标对 MI 合并房性心律失常患者新发心衰的发生具有良好的预测价值。

PU-0222

人工智能结合压缩感知技术在膝关节成像上的应用潜力

方鑫、浦仁旺
大连医科大学附属第一医院

【摘要】目的 探究人工智能 (AI) 结合压缩感知技术中的不同加速因子 (AF) 在膝关节 3D PDWI 成像的应用价值。方法 应用 Ingenia 3.0T CX MR 对 18 名健康志愿者 (男 10 例，女 8 例) 分别采用 4、6、8、10 的 AF 进行膝关节 3D PDWI 成像，获得 A、B、C、D 4 组图像；在 6、8、10 AF 扫描时使用人工智能技术，获得 E、F、G 3 组图像。测量股骨远端、外侧半月板前角、外侧半月板后角、前交叉韧带、后交叉韧带以及腓肠肌的信号值 (SI) 和噪声值 (SD)，并以腓肠肌为背景，计算骨、半月板及韧带的信噪比 (SNR) 和对比噪声比 (CNR)。由两名观察者独立地对图像质量进行主观评分，并行 Kappa 一致性检验。结果 常规膝关节 3D PDWI 扫描时间为 361 s，AI 技术结合 AF=8 的扫描时间为 184 s，缩短了 49.03%。7 组图像在骨、半月板及韧带的 SI 值差异无统计学意义。在 A~D 四组、E~F 三组中，骨、半月板及韧带的 SNR、CNR 逐渐降低，但在相同 AF 下，使用 AI 技术组的骨、半月板及韧带的 SNR、CNR 均显著高于未使用 AI 技术的组，差异均有统计学意义。相较于 A 组，E、F、G 三组目标组织的 SNR、CNR 均明显提升。两观察者客观数据测量及主观评分的一致性良好 (Kappa 值 0.768~0.926)，相同 AF 下，使用 AI 技术组的主观评分均优于未使用 AI 技术的组。七组主观评分分别为 4.51±0.26、4.27±0.43、3.89±0.39、3.56±0.19、4.72±0.37、4.59±0.17、4.26±0.45。结论 基于深度学习的人工智能技术

结合压缩感知技术 (AF=8) 能够显著缩短扫描时间 (49.03%), 提升图像的分辨率, 清晰显示软骨及韧带, 有广阔的临床应用前景。

Naïve Bayes classifier based on radiomics features in ultra-high b-value DWI-MRI to predict glioma grade

Xiao Jiao, Dongcui Wang, Weihua Liao
Xiangya Hospital of Central South University

Objectives: To identify the optimal b-value with DWI based on radiomic features evaluation for predicting glioma grade.

Materials and Methods: Prospective participants suspected to have glioma underwent multiparametric MRI between March 2017 and September 2018. Quantitative radiomic features for each b-value DWI sequence were extracted from the tumor region of interest (tumor-ROI) and peritumor-ROI and used to differentiate from LGG using Gaussian Naïve Bayes classifiers. Diagnostic performance was assessed using sensitivities, specificities, 95% confidence interval (CI), and area under the receiver operating characteristic (AUC) curve analysis.

Results: This study included 102 participants with Glioma (mean age: 47.1 ± 13.5 years [standard deviation]; 55 female). In tumor-ROI analysis, significant differences were achieved at 6,000 and 8,000 s/mm^2 in the training cohort ($p = 0.028$ and 0.039) and at 6,000 s/mm^2 in the testing cohort ($p = 0.0296$) for differentiating glioma grading. In the testing cohort, the DWI weighted by a b-value of 6,000 s/mm^2 achieved the highest accuracy with an AUC of 0.93, sensitivity, and specificity of 0.89 and 0.92, respectively. In peritumor-ROI analysis, 6,000 s/mm^2 DWI outperformed other classifications with the highest AUC (0.98 and 0.93) in P-10mm-ROI and P-15mm-ROI, and with significant difference than 1,000 s/mm^2 DWI ($p = 0.033$) in P-10mm-ROI in the test cohort.

Conclusion: Ultra-high b-value DWI-MRI improves the diagnostic performance for predicting glioma grade in the radiomic features analyzed by machine learning models. The b-value of 6,000 s/mm^2 may be optimal.

PU-0224

磁共振波谱检测杜氏肌营养不良患儿心肌组织甘油三酯含量

徐婷、许华燕、许可、傅航、郭应坤
四川大学华西第二医院

目的: 杜氏肌营养不良是一种由 DMD 基因突变导致功能性蛋白抗肌萎缩蛋白缺失引起的严重的进行性肌肉消耗障碍。心脏受累已成为死亡的主要原因。DMD 的病理特征包括肌肉变性坏死、炎症/水肿, 最终脂肪浸润脂肪浸润, 导致肌肉组织和功能进行性丧失。心脏能量代谢缺陷, 尤其是脂肪浸润与心肌疾病相关。MRS 可用于无创地研究在体心脏代谢变化, 可以预测心力衰竭和死亡。因此, 本研究探讨了 DMD 心肌组织甘油三酯含量的特点。

方法: 纳入了 20 例 DMD 患者参与这项研究, 所有患者经基因检测和/或骨骼肌病理确诊为 DMD。对照组为年龄匹配的健康男性, 无心血管疾病证据。所有受试者接受心脏磁共振检查, 包括电影序列及波谱序列, 于室间隔中部心肌最厚处, 体素大小约为 $20 \times 15 \times 15 \text{mm}$ 但可根据心腔大小、心肌厚度进行调整, 并在四腔心及短轴上确认, 压水和不压水序列各扫描五次。应用西门子后处理软件计算各体素内的 H2O 峰、TG 峰的峰与峰下面积并计算百分 TG $/(\text{H2O} + \text{TG}) \times 100\%$ 。

统计学方法 用 SPSS 版软件行分析, t 检验样本均数是否有显著意义, $P < 0.05$ 为差异有显著性意义。
结果: DMD 患儿 TG 含量约 6.13%, 正常组 TG 含量约 0.56%, 两组对比具有统计学意义。

结论: DMD 心肌组织甘油三酯较正常儿童增加。

PU-0225

甲基丙二酸血症临床特征与颅脑 MRI 影像分析

卓梦圆^{1,2}、运岩¹、王光彬²

1. 山东大学

2. 山东第一医科大学附属省立医院

目的: 本研究通过总结甲基丙二酸血症患者的临床资料、颅脑 MRI 表现及遗传学资料, 进一步提高对甲基丙二酸血症的认识, 提高临床诊断率。

方法: 回顾性分析 2010 年 1 月至 2022 年 11 月山东省立医院确诊的 65 例甲基丙二酸血症患者的临床资料、颅脑 MRI 及遗传学资料。其中男性 33 例, 女性 32 例, 年龄 1 天-31 岁。所有患者均通过血/尿有机酸检测而确诊, 均行颅脑 MRI 检查 (矢状面 T2WI, 横断面 T1WI、T2WI 及 T2-FLAIR、DWI), 部分患者进一步行基因检测。由 2 名影像诊断医师独立阅片, 意见不一致时经讨论后取得共识。

结果:

1. 临床资料分析

新生儿期发病率(54%)最高, 同一年龄阶段男女发病率未见明显差异。在神经系统表现为癫痫、惊厥、抽搐下肢无力、走路姿势异常, 其中最常见症状为癫痫(19%)。部分患者进行了基因检测, 检测结果显示存在 MMUT、MMACHC 基因突变。查询 ClinVar 数据库, 发现一种未报道过的新突变。

2. 影像学表现

36 例患者(55%)颅脑 MRI 表现明显异常, 可分为脑结构损害及脑发育异常。脑结构损害表现为脑损害异常信号灶、脑出血及硬膜外积液。脑损害异常信号灶在不同时期有所变化, 6 例患者为急性期表现, 在颅脑 MRI 显示为类梗死灶, DWI 示病灶明显扩散受限, T2WI 及 T2-FLAIR 呈高信号, 出现于基底节区、小脑、脑桥、丘脑等, 其中最常见于基底节区。6 例慢性期则表现为缺血软化灶。4 例患者存在脑出血 MRI 表现, 分为脑实质出血、硬膜下出血及硬膜外出血。脑发育异常则表现为髓鞘发育不良、胼胝体发育不良或变薄、侧脑室系统扩张、脑积水及 Dandy-Walker 综合征。髓鞘发育不良者最多(20%)。余 29 例患者(45%)在影像学表现上未见明显异常。

结论: 甲基丙二酸血症在影像学上表现多样, 综合其独特的临床、影像学表现可以为临床诊断进一步提供帮助。

PU-0226

Cervical Cord Atrophy and Axonal Damage Following Optic Neuritis: Insights from Quantitative Spinal MRI

Jing Huang, Jiyuan Wang, Jie Lu
XUANWU hospital

Objectives

Previous studies have demonstrated that optic neuritis (ON) affects brain plasticity. However, whether ON affects the spinal cord remains unclear. We aimed to investigate the spinal cord changes in ON and their associations with disability.

Methods

A total of 101 ON patients, and 41 healthy controls (HC) were retrospectively recruited. The quantitative spinal MRI (T1-weighted structural and diffusion tensor imaging) was employed to examine the cross-sectional area (CSA) and diffusion indicators. CSA, fractional anisotropy (FA),

mean diffusivity (MD), axial diffusivity (AD) and radial diffusivity (RD) were compared between groups. Correlation analyses were performed between CSA, diffusion indicators and clinical variables.

Results

No significant differences were found in CSA between ON patients and HCs. MD, AD, RD values in ON patients were significantly higher than in HC ($p < 0.05$). The AD values of the ON patients were significantly negatively correlated with PASAT scores ($r = -0.37$, $p = 0.0005$).

Conclusions

This study provided imaging evidence for DTI abnormalities in patients with ON. DTI quantitative spinal MRI can improve our knowledge of the path physiology of ON, and clinical progression.

PU-0227

Brain Functional Connectivity Associated with Symptoms of Vestibular Migraine

折霞

陕西省人民医院

Background: We sought to investigate the resting-state FC patterns in VM during the interictal period by combining data-driven voxel-wise DC calculations and seed-based FC analysis.

Methods: Thirty-eight patients with VM and 33 matched normal controls were recruited. DC was calculated and compared between the groups, and FC of locations with DC alterations was further tested via a seed-based technique.

Results: In contrast to the control group, the VM group had considerably lower DC values in bilateral medial prefrontal cortex (mPFC) and significantly higher DC values in the right occipital lobe. Seed-based FC analyses revealed that VM patients demonstrated decreased bilateral mPFC connections with the cortical regions.

Conclusion: Our findings showed changes in the default-mode network, and visual cortex in VM patients.

PU-0228

轻微型肝性脑病患者脑功能结构的异常稳定性

蔡丽敏、陈华俊

福建医科大学附属协和医院

研究背景和目的:轻微型肝性脑病(MHE)是肝硬化常见的神经认知并发症。本研究探讨肝硬化患者脑功能结构稳定性的变化及其与认知损害的关系。

方法:本研究前瞻性纳入 51 例肝硬化患者[21 例伴 MHE, 30 例无 MHE (NHE)]和 29 名健康对照者(HC)。所有的受试者均参与了静息态功能磁共振成像扫描和肝性脑病心理测量量表(PHES)检查。首先我们通过计算一个体素与全脑其他体素之间的连接强度总和来获得基于体素的功能连接密度(FCD)。随后采用滑动窗相关方法来计算 FCD 随时间的动态变化。功能稳定性(FS)是指 FCD 在时间上的一致性。使用单因素方差分析比较三组间功能连接差异。使用 Spearman 相关分析评估肝硬化患者脑区 FS 与 PHES 评分的相关性。使用受试者工作特征曲线(ROC)分析脑区 FS 值在区分 NHE 组和 MHE 组方面的潜力。

结果:从 HC 组到 NHE 组和 MHE 组,我们发现右侧缘上回、右侧中扣带回、左侧额上回和双侧后扣带回的 FS 值逐渐减低,而左侧枕中回和右侧颞极的 FS 值逐渐增高。右侧缘上回/左侧枕中回/右

侧颞极的平均 FS 值 (分别为 $r=0.470$ 、 $P=0.001$; $r=-0.458$ 、 $P=0.001$; 和 $r=-0.384$ 、 $P=0.005$) 与肝硬化患者 PHES 评分具有相关性。右侧缘上回/左侧枕中回/双侧后扣带回/右侧颞极的 FS 值在 NHE 组和 MHE 组间显示出中等程度的鉴别潜力。

结论:脑区 FS 的改变可能与肝硬化患者认知功能障碍的神经病理有关, 并且可能作为 MHE 诊断和监测肝性脑病进展的潜在生物标志物。

PU-0229

Clinical and Imaging Markers for the Prognosis of Acute Ischemic Stroke

Chenyang Pei^{1,2}, Jianzhong Yin¹, Che He³, Han Li², Jun Liu⁵, Xiangying Li¹, Weihui Huang⁴

1. Haikou People's Hospital, Affiliated Haikou Hospital of Xiangya Medical College, Central South University

2. Tianjin medical university

3. The First People's Hospital of Qujing, Qujing

4. Tianjin First Central Hospital

5. Tianjin Fourth Central Hospital

Background and Purpose: Significant differences in the outcomes observed in patients with acute ischemic stroke (AIS) have led to research investigations for identifying the predictors. In this retrospective study, we aimed to investigate the relationship of different clinical and imaging factors with the prognosis of AIS.

Methods: All clinical and imaging metrics were compared between the good and poor prognosis groups according to the modified Rankin Scale (mRS) score at 90 days after discharge. Clinical factors included gender, age, NIHSS scores at admission, and other medical history risk factors. Imaging markers included the lesion's size and location, diffusion, and perfusion metrics. Spearman's correlations were analyzed for age, NIHSS scores, and imaging markers between the different groups. The chi-square test and Pearson's contingency coefficients were analyzed for gender and other quantitative risk factors.

Results: A total of 89 patients with AIS were divided into the good (mRS score ≤ 2) and poor prognosis groups (mRS score ≥ 3). The two groups had significant differences in NIHSS scores, rCBF, rMK, and rMD ($P < 0.05$). Among them, rMK had the strongest correlation with the mRS score at 90 days after discharge ($r=0.545$, $P < 0.001$).

Conclusion: Perfusion and diffusion metrics, including CBF, MD and MK, could reflect the microstructure and blood flow characteristics of the lesion, which were the key factors for the salvage ability and prognosis of the infarction tissue. The NIHSS score at admission could reflect the functional involvement correlated with patients' outcomes.

磁共振图像纹理特征鉴别直肠肿瘤的应用

黄梦娜、黄梦月、高雪梅

郑州大学第一附属医院

目的: 通过对直肠绒毛管状腺瘤和 T1 期直肠腺癌的磁共振图像进行纹理分析, 并用 K-近邻算法评价纹理特征。

方法: 回顾性分析本院经病理证实的 30 例直肠绒毛管状腺瘤和 43 例 T1 期直肠腺癌, 对两种肿瘤的术前磁共振 T2WI 图像上的感兴趣区进行纹理特征提取和分析。

结果：基于统计的纹理特征提取方法提取的 42 个纹理参数中有 14 个参数在两组数据集之间具有统计学差异 ($P<0.05$)。直肠绒毛管状腺瘤和 T1 期直肠腺癌具有统计学差异特征的-近邻算法测试的敏感度、特异度及准确率分别为 $79.87\pm7.55\%$ 、 $53.89\pm10.16\%$ 、 $69.24\pm5.52\%$ 。

结论：T2WI 纹理分析可提高直肠绒毛管状腺瘤和 T1 期直肠腺癌鉴别诊断的准确性，是一种定量诊断直肠肿瘤的补充方法。

PU-0231

ABER 体位 MRI 成像与肩关节 MRI 造影诊断肩关节不稳定的临床应用价值比较

罗飞
四川省骨科医院

目的：探讨 ABER 体位 MRI 成像与肩关节 MRI 造影两种技术对诊断肩关节不稳定的准确性的临床应用价值。

方法：回顾性分析自 2022 年 1 月至 2023 年 6 月，于我院同期行 ABER 体位 MRI 以及肩关节 MRI 造影诊断的肩关节不稳定患者 32 例，其中男性 17 例，女性 15 例，平均年龄 43.2 ± 7.5 岁，并于关节镜术中探查结果比较，观察这两种检查方法对肩关节不稳定的 Bankart 损伤、Perthes 病变、ALPSA 病变、GLAD 病变以及 SLAP 病变的诊断价值。

结果：关节镜发现 Bankart 损伤 17 例 (ABER 体位扫描符合 15 例与肩关节造影符合 16 例)，Perthes 病变 10 例 (ABER 体位扫描符合 9 例与肩关节造影符合 9 例)，ALPSA 病变 3 例 (ABER 体位扫描符合 1 例与肩关节造影符合 3 例)，GLAD 病变 2 例 (ABER 体位扫描符合 1 例与肩关节造影符合 2 例)，SLAP 病变 12 例 (ABER 体位扫描符合 11 例与肩关节造影符合 10 例)。

结论：肩关节宏观不稳定主要为创伤后单向不稳定，涉及前下孟唇-韧带复合体病变，肩膀微观不稳定则属于过度应力下的肩关节获得性不稳定，主要为前后上孟唇损伤；由于肩关节结构比较复杂，关节囊较为紧致，关节组成的韧带、孟唇多有解剖变异，导致常规 MRI 扫描对肩关节不稳的诊断存在一定的难度，多有漏诊的情况发生。ABER 体位通过外旋外展上肢，人为的紧张关节囊-孟唇唇复合体，从而可以更好地评估囊-唇复合体、肩袖撕裂和 SLAP 病变。通过比较发现 ABER 体位对 Bankart 损伤、Perthes 病变、SLAP 病变的敏感度与特异度类似于肩关节造影，对 ALPSA 病变、GLAD 病变的敏感度低于肩关节造影。ABER 体位属于无创性 MRI 检查一次成像，肩关节造影检查属于有创性检查，且操作繁杂，费用较高，两种检查方式可以科学的互补，提高肩关节不稳定的影像诊断的准确性。

PU-0232

两种 DKI 后处理方法在胶质瘤分级中的诊断效能研究

白洁、高安康、赵国桦、程敬亮
郑州大学第一附属医院

目的：评价扩散峰度成像 (DKI) 的后处理方法直方图分析和 DKE 软件在胶质瘤分级中的应用价值。

方法：收集本院术前单发脑占位并可疑脑胶质瘤的患者进行 DKI 图像采集。经病理证实的脑胶质瘤患者 DKI 图像由 DKE 软件进行后处理并得出 AK、MK 和 RK 参数图。参考 T2WI 和增强扫描图像判断肿瘤实性成分，并应用 micron 软件手动划取 ROI，得出 AK、MK 和 RK 参数值。将 DKI 所得 TRACW 图经 Matlab 平台进行直方图分析得出 Dapp 和 Kapp 的直方图及参数，所选 ROI 与 micron 软件中保持一致。各参数值的统计学分析采用独立样本 T 检验或 Mann - Whitney -

Wilcoxon 秩和检验, 并进行 ROC 分析。结果: 术后证实为脑胶质瘤者共 73 例, 高级别组 52 人 (WHOⅢ级 13 例, WHOⅣ级 39 例), 低级别组 21 人 (WHOⅡ级)。直方图分析法所得 Kapp 的最大值、平均值、标准差和第 75、95 百分位数, 以及 Dapp 的最小值、平均值、偏度系数和第 25、50、75、95 百分位数在高低级别组中差异有统计学意义。DKE 软件所得 MK 值在 WHOⅡ、Ⅲ和Ⅳ级脑胶质瘤两两级别之间的差异均有统计学意义。结论: MK 值在 WHOⅡ、Ⅲ和Ⅳ级脑胶质瘤分级中有重要意义, 直方图分析可作为辅助手段更好地提供肿瘤生物学特性。

PU-0233

基于术前 MRI 模型预测颅内脑室外室管膜瘤预后的研究

王雪璿¹、易小平¹、Bihong T.Chen²

1. 中南大学湘雅医院

2. Department of Diagnostic Radiology, City of Hope National Medical Center

目的: 本研究旨在基于磁共振影像学 (magnetic resonance imaging, MRI) 开发并验证机器学习模型, 用于预测颅内脑室外室管膜瘤 (intracranial extraventricular ependymoma, IEE) 患者的无病生存期 (DFS) 和总生存期 (OS)。

方法: 本研究纳入了 114 例经病理证实的 IEE 患者, 将其随机分为训练集 (n=80) 和验证集 (n=34)。采用伦勃朗视觉感受图像 (VASARI) 功能集评估术前颅脑 MRI 特征, 采用多因素 Cox 比例风险回归分析筛选独立的预后因素, 并使用一致性指数 (C-index) 和校准曲线 (Calibration curve) 评估生存模型的预测能力。以模型评分的中位数作为标准将患者分为高分组或低分组。通过纳入显著的 MRI-VASARI 特征和临床预测因子, 并使用多变量 Cox 比例风险回归分析建立列线图。

结果: 多因素 Cox 比例风险回归分析显示, 嗜酸性粒细胞、血尿素氮、血肌酐、MRI-VASARI 特征如非强化切缘 (F13) 与患者的无病生存期预后显著相关。此外, 临床指标 (如血尿素氮和 D-二聚体) 和 MRI-VASARI 特征 (如肿瘤位置 (F1)、语言功能区 (F3) 和 T1/FLAIR 比值 (F10)) 是总生存期的独立预测因子。基于这些因素, 分别构建了仅使用临床指标、仅使用 MRI-VASARI 特征以及同时使用临床指标和 MRI-VASARI 特征的生存模型, 并将其以列线图显示。总生存期的三个生存模型的一致性指数分别为 0.732、0.729 和 0.768。无病生存期的一致性指数分别为 0.694、0.576 和 0.714。由此可以明显看出组合模型具有最高预测能力。校准曲线提示预测结果与实际结果之间表现出良好的一致性。因此, 本研究中基于 MRI-VASARI 特征的组合模型在 IEE 患者的生存预测模型中具有较高的预测能力。

结论: 结合临床指标和 MR-VASARI 特征的预测模型具有良好的预测效能, 这可能有助于评估 IEE 患者的预后。

PU-0234

脑灰质体积及结构协变网络在脑小血管病伴 认知障碍患者中变化特征

马琳
无锡市人民医院

目的 探讨 CSVD(cerebral small vessel disease, CSVD)伴认知障碍 (cognitive impairment, CI) 患者灰质体积 (gray matter volume, GMV) 的变化特点及结构协变网络 (structural covariance network, SCN) 的改变模式。

材料与方法 2021 年 10 月到 2022 年 12 月期间, 招募南京医科大学附属无锡市人民医院 CSVD-CI 患者 57 例, CSVD-NCI 组 41 例, 采集 3D-T1 结构像数据提取两组患者 GMV 并构建 GMV 相关的 SCN 网络, 比较两组 GMV 的变化及灰质结构协变网络的组间差异。

结果 CSVD-CI 患者在双侧海马、海马旁回、梭状回及左侧豆状壳核体积明显低于 CSVD-NCI 组 ($P < 0.05$, FWE 校正), 并且这些区域与不同领域的认知减退有关。在全局网络水平, CI 组最短路程长度显著高于对照组 ($P = 0.023$) 而全局效率显著低于对照组 ($P = 0.005$)。在节点水平, CSVD-CI 组在左侧豆状壳核节点度及节点效率较对照组显著下降 ($P < 0.05$)。

结论 联合 VBM 和 SCN 分析能够揭示灰质结构及灰质网络的改变可能是 CSVD 患者发生认知障碍的重要结构基础。

Abnormal dynamic functional connectivity in first-episode, drug-naïve adolescents with major depression disorder

Ruiping Zheng, Jingliang Cheng
The first Affiliated Hospital of Zhengzhou University

Background

Previous neuroimaging studies have identified disrupted large-scale functional brain networks in major depression disorder (MDD); however, most of them focused on adult patients and were based on static functional connectivity (FC). Thus, we aimed to investigate the patterns of change in dynamic FC in depressed adolescents.

Methods

Resting-state functional magnetic resonance imaging data were acquired from 60 first-episode, drug-naïve adolescents with MDD and 60 matched healthy controls (HCs). Then, the dynamic FC properties were analyzed using a sliding windows approach, k-means clustering and graph-theory methods.

Results

The intrinsic brain FC were clustered into two configuration states, a more frequent and relatively sparsely connected State 1 and a less frequent and more strongly interconnected State 2. Compared with HCs, depressed adolescents had higher reoccurrence fraction and dwell time in State 1, and lower reoccurrence fraction and dwell time in State 2, and higher total number of transitions between the two states. Depressed adolescents showed decreased FC within the default mode network (DMN) and between the DMN and other networks in State 1. Additionally, the MDD group showed higher variances in the global and local efficiency. Furthermore, the duration of illness was positively correlated with the number of state transitions, and the 17-item Hamilton Depression Rating Scale score was positively correlated with the mean dwell time in State 1.

Conclusion

This study demonstrated abnormal dynamic FC in depressed adolescents, which provided new insights into the pathophysiological mechanisms of adolescent-onset depression.

PU-0236

Manganese-based nanotheranostics for magnetic resonance imaging-mediated precise cancer management

Yanan Li

First Hospital of Shanxi Medical University

Manganese (Mn)-based magnetic resonance imaging (MRI) has become a competitive imaging modality for cancer diagnosis due to its advantages of non-invasiveness, high resolution and excellent biocompatibility. In recent years, a variety of Mn contrast agents based on different material systems have been synthesized, and a series of multi-purpose Mn nanocomposites have also emerged, showing satisfactory relaxation efficiency and MRI performance thus possess the transformation and application value in MRI-synergized cancer diagnosis and treatment. This tutorial review starts from the classification and properties of Mn-based nanomaterials, and then summarizes various preparation and functionalization strategies of nanosized Mn contrast agents, especially focuses on the latest progress of Mn contrast agents in MRI-synergized precise cancer theranostics. In addition, present review also discusses the current clinical transformation obstacles such as unclear molecular mechanisms, potential nanotoxicity, and scale production constraints. This paper provides evidence-based recommendations about the future prospects of multifunctional nanoplateforms, as well as technical guidance and panoramic expectations for the design of clinically meaningful cancer management programs.

硬皮病患者心脏受累情况的 CMR Mapping 成像评估

刘伟

北京大学人民医院

系统性硬化病 (systemic sclerosis, SSc) 是一种自身免疫性结缔组织病, 以皮肤和内脏器官的纤维化及血管病变为特征表现, 多数患者可出现脏器受累, 包括心脏。心脏受累通常提示预后欠佳, 死亡率高。临床中往往低估心脏受累, 如果采用敏感的检查手段, 几乎所有系统性硬化症均有心脏受累。心血管磁共振成像 (Cardiac Magnetic Resonance Imaging, CMR) 是一种安全、有效、无创的检查方法, CMR 已成为无创性评估心脏结构和功能的金标准, 对检测心肌缺血、水肿或纤维化有重要价值。CMR Mapping 成像可以对心肌 T1、T2、T2* 和 ECV 等反映心肌组织特性的参数变化进行常规空间可视化的定量测量。从成像技术上来说, CMR Mapping 成像与 T1、T2 或 T2* 加权图像不同, Mapping 成像可以对疾病进展过程进行可视化和量化, 与心肌疾病是局灶性还是弥漫性无关。这一创新很重要, 因为在以往的临床应用实践中, 很难对弥漫性心肌疾病进行无创性量化。Mapping 成像超出了我们以往对患者心脏疾病潜在风险评估的理解。Mapping 成像技术方兴未艾, 为心脏磁共振成像提供独一无二的诊断信息, 该技术成熟可靠的应用具有非常重要的临床意义。本研究通过回顾性分析我院近 5 年收治的 SSc 患者的 CMR 资料, 旨在探讨 CMR Mapping 成像评估硬皮病患者心脏受累情况, 以期早期诊断, 早期治疗。

心脏磁共振延迟强化对肥厚型心肌病 心源性猝死发生风险预测价值研究

罗俊、刘力臻

陆军军医大学第一附属医院 (西南医院)

研究心脏核磁共振(CMR)心肌延迟强化(LGE)对肥厚型心肌病(HCM)心源性猝死(SCD)长期风险预测价值。方法:研究对象选取我院 2013 年 10 月到 2020 年 6 月间接受 CMR-LGE 的 HCM 患者 81 例,统计所有患者的基本病例资料、5 年 HCM-SCD 风险评分和 LGE 值,所有患者常规接受随访且统计 SCD 发生率。Pearson 相关性分析 HCM 患者 LGE 值与 5 年 HCM-SCD 风险评分相关性,同时绘制 ROC 曲线计算 LGE 值对 HCM 患者 SCD 发生的预测效能。结果: HCM 患者的 LGE 值随着 5 年 HCM-SCD 风险评分增加出现明显升高($P<0.01$); Pearson 相关性分析显示, HCM 患者 LGE 值与 5 年 HCM-SCD 风险评分相关性呈现正相关($r=0.704, P<0.01$); ROC 曲线分析显示, LGE 值预测 HCM 患者 SCD 发生风险的 AUC 为 0.892,同时 LGE 值 ≥ 5.47 是最佳阈值,其诊断灵敏度为 100.0%、特异度为 66.67%; Kaplan-Meier 生存分析结果显示, LEG ≥ 5.47 组的存活率明显高于 LGE <5.47 组($P<0.01$)。结论: HCM 患者 LGE 值能够有效预测患者 SCD 发生风险,其中当 HCM 患者 LGE 值 ≥ 5.47 时,因考虑提前给予植入型心律转复除颤器(ICD)进行一级预防,对完善 HCM 患者的 SCD 风险分层具有重要意义。

PU-0239

高分辨磁共振血管壁成像在大脑中动脉病变患者卒中病因和复发 风险分层中的应用

张伟、王娟

湖南省脑科医院(湖南省第二人民医院)

目的 探讨基于高分辨磁共振血管壁成像(High-resolution magnetic resonance vessel wall imaging,HRMR-VWI)明确大脑中动脉病变影像特征对缺血性脑卒中病因诊断及发病风险的影响。**方法** 收集本院 2016 年 1 月至 2023 年 1 月发病 2 周内 DSA 显示大脑中动脉管腔狭窄 $\geq 50\%$ 的缺血性脑卒中患者临床及影像资料,通过 HRMR-VWI 观察血管壁增厚模式、斑块 T1WI 高信号、病变强化模式及分级,3 个月后复查 HRMR-VWI,分析患者 HRMR-VWI 检查前后缺血性脑卒中病因分型(TOAST 分型)及 3 个月缺血性事件复发与影像学特征的相关性。结果 56 例患者平均年龄 49.13 ± 12.61 岁,检查前根据临床 TOAST 分型,56 例患者中有 18 例诊断为病因不明的卒中,HRMR-VWI 检查后其中 10 例明确诊断为颅内动脉粥样硬化(intracranial atherosclerotic disease, ICAD),5 例为血管炎,2 例为夹层,1 例仍病因不明。在 40 例大脑中动脉 ICAD 患者中,16 例患者在 3 个月内再次发生卒中,2 型管壁增厚模式 ($p=0.03$) 和斑块 2 级强化 ($p=0.04$) 与卒中复发显著相关。结论 HRMR-VWI 有利于提高缺血性卒中的病因诊断,ICAD 斑块特征有助于卒中复发相关的风险分层。

PU-0240

磁共振 mDixon Quant 与 FACT 脂肪定量技术对比分析研究

孙凯芬、宋清伟、张维升
大连医科大学附属第一医院

目的：探讨不同平台 3.0 T MR 设备魔镜成像 (mDixon Quant) 和脂肪定量 (fat analysis & calculation technique, FACT) 序列对腰椎椎体及椎旁肌脂肪分数 (fat fraction, FF) 定量测量的差异性。材料与方法：32 名健康志愿者 (男 11 名, 女 21 名) 分别进行腰椎 mDixon Quant 和 FACT 序列扫描。两名观察者测量所有志愿者腰椎 (L1~L5) 椎体和椎旁肌 (L3/4, L4/5, L5/S1) 的 FF 值并进行两序列间对比分析。结果：两名观察者所测数据一致性良好 (ICC>0.8)。mDixon Quant 与 FACT 序列定量测量腰椎各节椎体 FF 值如下：L1 为 34.67 ± 9.81 、 34.00 ± 9.15 ；L2 为 37.21 ± 11.46 、 36.37 ± 10.56 ；L3 为 39.84 ± 10.56 、 39.49 ± 10.08 ；L4 为 38.35 ± 9.44 、 38.20 ± 10.57 ；L5 为 39.39 ± 9.26 、 39.96 ± 9.85 。L3/4 多裂肌为 11.23 ± 4.08 左、 10.52 ± 3.54 左； 10.79 ± 3.61 右、 11.11 ± 4.87 右，L3/4 竖脊肌为 6.06 ± 1.85 左、 6.31 ± 1.70 左； 5.79 ± 1.85 右、 5.89 ± 1.88 右，L4/5 多裂肌为 15.13 ± 4.58 左、 15.32 ± 4.60 左； 14.11 ± 4.98 右、 12.98 ± 4.67 右，L4/5 竖脊肌为 9.74 ± 5.13 左、 10.98 ± 4.97 左； 9.40 ± 4.47 右、 9.32 ± 3.99 右，L5/S1 多裂肌为 18.39 ± 5.42 左、 20.05 ± 7.49 左； 18.12 ± 5.69 右、 19.10 ± 6.96 右，L5/S1 竖脊肌为 19.26 ± 7.85 左、 19.41 ± 7.07 左； 17.79 ± 8.15 右、 16.82 ± 7.49 右，差异均无统计学意义 (P 值均 >0.05)。结论：mDixon Quant 与 FACT 序列均可定量测量腰椎椎体及椎旁肌 FF 值，其测量值具有高度一致性。

PU-0241

梅尼埃病患者全脑网络中心度的静息态功能磁共振研究

刘斐
重庆医科大学附属永川医院
南昌大学第一附属医院

目的：

梅尼埃病 (Meniere's Disease, MD) 是临床上较常见的慢性眩晕性疾病，确切的发病机制仍不清楚，既往的研究发现 MD 患者大脑结构及功能均存在异常改变，提示 MD 患者发病可能与中枢异常有关。本研究旨在应用度中心度 (Degree centrality, DC) 方法研究 MD 患者在体素水平上的全脑网络中心度的异常改变，并评估 MD 患者功能网络异常与临床症状的关系。

研究方法：

纳入 2020 年 12 月至 2022 年 12 月期间于南昌大学第一附属医院耳鼻喉科确诊为 MD 的患者 46 例 (男 25 例, 女 21 例)。同期招募与 MD 组受试者年龄、性别相匹配健康人作为健康对照组 (health control, HC)，共 38 例 (男女各 19 例)。对 MD 组受试者首先进行了眩晕障碍量表 (dizziness handicap inventory, DHI) 评分以评估其眩晕严重程度。对所有受试者进行静息态功能磁共振 (resting-state functional magnetic resonance imaging, rs-fMRI) 扫描以获取数据，基于 Matlab R2016b 平台的 DPARSF 工具包对 rs-fMRI 数据进行处理，计算得出全脑 DC 值图。通过两样本 t 检验比较两组 DC 值的差异。然后应用受试者工作特征 (receiver operating characteristic curve, ROC) 曲线评估诊断效能。Pearson 相关性分析用于研究差异脑区平均 DC 值与临床指标之间的关系。

结果：

MD 组与 HC 组全脑网络中心度存在显著差异，MD 组右侧梭状回、双侧枕中回的 DC 值均高于 HC 组，MD 组右侧辅助运动区的 DC 值低于 HC 组。相关性分析结果表明 MD 患者左侧枕中回 DC 值

与 DHI 评分之间存在明显正相关 ($r=0.294$, $P=0.048$)。ROC 曲线表明, 右侧枕中回 DC 值对应的曲线下面积 (area under curve, AUC) 为 0.804, 具有较高的准确性。

结论:

MD 患者运动、视觉及情绪相关脑网络存在异常改变, 且视觉相关网络的代偿作用与眩晕严重程度有关, 这为进一步探索 MD 的神经病理学基础提供了一个新的视角。

PU-0242

Regional brain apparent diffusion coefficient changes in second- and early third-trimester fetuses with complex congenital heart diseases

Cong Sun

Shandong Medical Imaging Research Institute

Purpose: This study aimed to explore apparent diffusion coefficient (ADC) value changes in different cerebral territories during the second and early third trimesters in fetuses with complex congenital heart disease (CHD).

Materials and Methods: This prospective study was conducted in a single center from May 2019 through October 2021. We measured the brain ADC values during 20-40 weeks in 64 normal fetuses and during the second and early third trimesters in 23 fetuses with complex CHD. In addition, we compared the ADC values between fetuses with CHD and 27 gestational age (GA)-matched controls by using covariance analyses. ADC density plots and histograms were also used to compare the brain characteristics of fetuses with CHD and normal fetuses.

Results: In the normal group during 20-40 weeks, for the ADC values, a significant negative linear correlation was found among the cerebellar hemisphere (CH), pons, and thalamus (TH) across GA; a significant quadratic polynomial correlation was found in the frontal, temporal, parietal, and occipital white matter (FWM, TWM, PWM, and OWM, respectively), basal ganglia region (BGR), and the centrum semiovale. Density plots of the ADC values in the GA-matched normal and CHD groups showed significant heterogeneity. However, the ADC values in the FWM, TWM, PWM, OWM, CH, centrum semiovale, BGR, TH, and pons were not significantly different (all $p > 0.05$). The histogram analysis showed 10th percentile ADC value existed significant differences between the CHD group and the GA-matched normal controls ($p = 0.046$).

Conclusion: Our results showed normal variations in the ADC values of the fetal brain during in utero maturation, and the ADC values in the CHD group were not significantly different from those in GA-matched normal fetuses. However, ADC density plots and histogram analysis may provide supplementary information and improve the sensitivity for detecting brain abnormalities in fetuses with CHD at an early stage.

PU-0243

探讨自由呼吸 3D 风车技术结合化学位移水脂分离技术成像序列在胸部磁共振中的应用价值

刘锦

空军军医大学唐都医院

目的: 比较分析自由呼吸 3D-mv-vane-mdixon 序列与呼气末屏气 T1-mdixon 序列的胸部 MRI 的图像质量。

方法: 回顾性分析我院 2020 年 7 月至 2023 年 1 月行胸部 MRI 检查的患者, 每位患者都采集了呼气末屏气 T1-mdixon 序列(A 组)和自由呼吸 3D-mv-vane-mdixon 序列(B 组)。两位具有 10 年以上胸部 MRI 诊断经验的放射科医师分别对两个序列图像质量进行 5 分制主观评分, 并在右肺动脉干水平最大层面分别获取升主动脉、主动脉干、降主动脉以及背景组织处的感兴趣区 (ROI, region of interest), ROI 大小为 10x10mm²。测量两组图像的信号值 (SI,signal)、噪声值 (SD, standard deviation), 分别计算图像信噪比 (SNR,signal to noise ratio)、对比噪声比 (CNR,contrast to noise ratio)。采用组内相关系数 (ICC) 评价两位医师测量的一致性, 使用 Wilcoxon 检验比较 2 个序列图像的主观评分差异, 使用 Kolmogorov-Smirnov 检验分析计量资料是否符合正态分布, 正态分布的计量资料以 $\bar{x} \pm s$ 表示, 偏态分布则以 M (Q1, Q3) 表示。使用配对样本 *t* 检验比较 2 个序列图像的客观数据差异。 $P < 0.05$ 为差异有统计学意义。

结果: 2 位医师对 A、B 两组图像的客观测量数据与图像主观评分的一致性良好 (ICC 值均大于 0.8)。B 组图像质量评分明显高于 A 组 ($P < 0.05$)。B 组图像升主动脉、主动脉干及降主动脉的 SNR、CNR 值均高于 A 组 ($P < 0.05$)。

结论: 自由呼吸 3D-mv-vane-mdixon 序列胸部 MRI 的图像质量优于呼气末屏气 T1-mdixon 序列。

PU-0244

基于 DCE-MRI 术前预测导管原位癌的联合预测图的建立和验证

刘玉凤、杨佳佳

浙江中医药大学附属第一医院 (浙江省中医院)

背景: 随着乳腺癌筛查在人群中的广泛应用, 越来越多的导管原位癌 (DCIS) 被发现。术前提提高导管原位癌的诊断水平, 为患者做出更好的决策至关重要。

方法: 回顾性收集 2012 年 12 月至 2021 年 3 月在浙江中医药大学第一附属医院经病理证实的导管原位癌和浸润性导管癌 (IDC) 患者 135 例。将该队列随机分为训练集 ($n = 74$) 和验证集 ($n = 31$), 比例为 7:3。我们在 3D-Slicer 软件、DeepWise 科研平台 v1.6 (<http://keyan.deepwise.com/>) 实现放射组学特征提取。采用多因素 logistic 回归建立临床放射组学模型 (nomogram)。通过 AUC、DeLong 检验、校正曲线和决策曲线分析评价模型的判别能力。

结果: 具有 9 种放射组学特性的放射组学特征具有较好的预测能力。放射组学图, 包括临床特征 (PR 和 NME) 和放射组学特征, 在培训队列中显示出良好的鉴别潜力 [$AUC = 0.93$; 95% 置信区间 (CI) 0.87-0.99], 这种可能性在验证队列中得到证实 ($AUC = 0.95$; 95% CI 0.89-1.00) 和外部验证 ($AUC = 0.77$; 95% CI 0.52-1.00)。决策曲线分析证实了图的临床价值。

结论: DCIS 和 DCIS- mi 患者的预后模型和 nomogram, 有助于准确诊断 DCIS- mi, 减少不必要的活检。

MRI 在妊娠期急腹症诊断中的应用价值

闫晨宇

郑州大学第一附属医院

1. 背景与目的: 妊娠期急性腹部疼痛是妇产科常见的就诊症状, 临床表现缺少特异性, 加之妊娠会影响孕妇的生化检查结果, 因而增加了早期确诊妊娠期腹痛病因的难度。影像检查对妊娠期急腹症的诊断至关重要。本文收集我院 2018 年-2022 年因急性下腹痛行 MRI 检查的 15 例孕妇的影像和临床资料, 探讨 MRI 在妊娠期急腹症诊断中的应用价值。2. 材料方法: 收集 15 例因急性下腹痛就诊孕妇, 其中妊娠早期 (孕 1-3 月) 2 例, 中期 (孕 4-7 月) 6 例, 晚期 (孕 8-9 月) 7 例。年龄

21-37 岁, 平均 29 岁。3 结果: 行 15 例下腹部急性疼痛孕妇中 MR 表现阳性 12 例, 包括阑尾炎 5 例, 卵巢囊肿扭转 2 例, 胎盘早剥 2 例, 子宫肌瘤红色变性 3 例。经手术病理或随访检查证实。4 结论: MRI 对孕妇下腹部疼痛疾病的诊断与鉴别诊断具有较高价值, 可以作为 B 超的补充检查甚至首选检查, 应该得到临床医生的进一步重视。

PU-0246

Exploring the value of magnetic resonance feature tracking techniques in the assessment of the left heart in patients with Parkinson's disease

Xun Yue^{1,2}, Xiaohua Huang², Jiayu Sun¹

1. Department of Radiology, West China Hospital, Sichuan University

2. Department of Radiology, Affiliated Hospital of North Sichuan Medical University

Purpose: In this study, we used cardiac magnetic resonance feature tracking (CMR-FT) to assess the structural and functional alterations of the left heart in patients with Parkinson's disease (PD) and to investigate the relevant factors affecting the alterations of their left heart function.

Methods: Thirty-nine cases (mean age: 57 years) of PD patients (PD group) and 34 cases (mean age: 56 years) of healthy controls (control group), who had completed a routine cardiac magnetic resonance examination, were included in this study. Scanned images were analyzed for cardiac function and myocardial strain using specialized post-processing software CVI42. The left ventricular (LV) function parameters included left ventricular end-diastolic volume index (LVEDVi), left ventricular end-systolic volume index (LVESVi), left ventricular ejection fraction (LVEF), and left ventricular myocardial mass index (LVMI); and the myocardial strain parameters included left ventricular global radial strain (GRS), global circumferential strain (GCS) and global longitudinal strain (GLS). Left atrial (LA) function parameters included LA savings function (total ejection fraction [EF total], total strain [Es], peak positive strain rate [SRs]), conduit function (passive ejection fraction [EF passive], passive strain [εe], early peak negative strain rate [SRe]), and pump function (active ejection fraction [EF booster], active strain [Ea], late peak negative strain rate [SRa]). Pearson or Spearman correlation coefficient models were used to analyze the correlation of cardiac function and strain parameters with exercise dysfunction (UPDRS III) and autonomic dysfunction (SCOPA-AUT), and to explore the factors influencing cardiac function and strain parameters.

Results: Analysis of left ventricular function and myocardial strain showed that LVEF and GLS in the PD group were lower than those in the control group, and LVESV, LVESVi, and LVMI were higher than those in the control group, and the differences were statistically significant (all $P < 0.05$). Analysis of left atrial function and myocardial strain showed that the differences in left atrial volumes LA Vpac, LA Vmin, and LA Vmax in the PD group were not statistically significant compared with those in the control group ($P > 0.05$). In PD patients, the left atrial saving function (EF total, Es, and SRs) and left ventricular catheterization function (EF passive, Ee, and SRe) and pump function (EF booster, Ea, SRa) were significantly impaired compared with controls (all $P < 0.05$). Correlation analysis showed that left atrial savings function Es and SRs were negatively correlated with UPDRS III ($r = -0.409, -0.355, P < 0.05$). Left atrial ductal functions LAEF passive, Ee were negatively correlated with UPDRS III ($r = -0.326, -0.445, P < 0.05$), SRs were positively correlated with UPDRS III ($r = 0.417, P < 0.05$). Left atrial savings function Es and SRs were negatively correlated with SCOPA-AUT ($r = -0.535, -0.319, P < 0.05$). Left atrial conduit function Ee was negatively correlated with SCOPA-AUT ($r = -0.316, P < 0.05$), and SRe was positively correlated with SCOPA-AUT ($r = 0.359, P < 0.05$).

Conclusion: Patients with PD have structural and functional changes in the left heart, in which left atrial saving function and conduction function correlate with the severity of dyskinesia and autonomic dysfunction. CMR-FT is useful for evaluating the effects of Parkinson's disease on the structure and function of the heart in patients.

PU-0247

Assessing the clinical value of PETRA sequence for detection of subsolid pulmonary nodules: comparison with CT

Hui Feng, Gaofeng Shi, Li Yang, Qian Xu, Qi Wang, Hui Liu

Department of Radiology, Hebei Medical University Fourth Affiliated Hospital and Hebei Provincial Tumor Hospital

Objective: This study aimed to evaluate the visibility of subsolid pulmonary nodules of less than 3 cm using the PETRA sequence on 3T MRI in comparison with that obtained using LDCT.

Methods: A total of 82 patients from a lung cancer screening program (36 males and 46 females; age ranges 52–85) were enrolled for this prospective study. The exclusion criteria included patients who had contraindications to MRI, including pacemakers, metal implants, and severe claustrophobia, and patients with severe emphysema and/or fibrosis. Written informed consent was obtained from each participant. All patients were scanned by PETRA sequence on 3.0T MRI (Magnetom Skyra, Siemens Healthcare) and CT (Definition Flash, Siemens Healthcare, Forchheim, Germany). The PETRA sequence parameters were as follows: TR = 3 ms; TE = 0.07 ms; matrix = 256 × 256mm²; FOV = 400 × 400mm²; slice thickness = 1.6 mm; acquisition plane = axial; bandwidth=260; total scan time=3min25s. The appropriate detection rate was calculated for subsolid pulmonary nodules of less than 3 cm in diameter. The mean diameter of each detected nodule was determined. The sensitivity of detection for the pure ground glass nodules and partial solid nodules was determined based on the location, size, type of nodules and morphologic characteristics. The agreement of nodule characteristics between CT and MRI were assessed by intraclass correlation coefficient (ICC) and Kappa test.

Results: The CT scanner detected 185 subsolid pulmonary nodules, including 97 partial solid nodules (PSNs) and 88 pure ground glass nodules (pGGNs) with a mean nodule diameter of 8.9 mm. For the PSNs, PETRA technique identified 18 nodules among 23 nodules of less than 6 mm in diameter and 72 of 74 more than 6 mm in diameter. For 36 pGGNs less than 6mm, the PETRA detected 17 nodules, and 48 nodules of 52 more than 6 mm in diameter. The detection rate of PETRA sequences was high (83.7%). The detection rates of pGGNs and PSNs were 74%, and 92.7%, respectively. For nodules more than 6 mm in diameter, the sensitivity of PETRA sequences was 95%. For nodules with a CT value greater than 600 HU, the sensitivity of PETRA sequence reached 94.7%, which was higher for nodules located in the upper lung fields than those in the middle and lower lung fields. Strong agreement was found between the CT and PETRA results (correlation coefficients = 0.956).

Conclusion: The PETRA technique had high sensitivity for the detection of subsolid pulmonary nodules and can accurately assess their diameter and morphologic characteristics. It may be an effective alternative to CT as a tool for screening and follow up pulmonary nodules.

心肌纤维化 MR 成像研究新进展

杨浩

江苏大学附属医院

缺血性和非缺血性心肌病中的心肌纤维化与不良的心脏预后相关。无创成像在心肌纤维化的早期识别和量化中发挥着关键作用，使用的技术包括心脏磁共振、计算机断层扫描和核成像。心脏磁共振 (cardiac magnetic resonance, CMR) 因其能够无创性评估包括心脏结构、功能、心肌灌注和心肌活性在内的全面信息而被誉为“一站式”检查。这些特点赋予 CMR 不仅在疾病诊断和鉴别诊断上，

而且在疾病的预后判断和危险分层中都发挥着重要指导作用。本文对几种 CMR 影像技术在评估心肌纤维化方面的应用及进展进行综述。

以无创定量方式检测弥漫性纤维化的需求推动了对使用或不使用造影剂检测纤维化的新方法的搜索, 例如 T1 映射, T2 映射, T2 * 映射, UTE 成像, T1 ρ 映射和 MTI。这些 MRI 技术显示出有希望的初步结果, 但是需要进一步的研究来更好地了解对比度的形成方式。ECV 映射显示了临床研究中具有希望的初步结果, 但缺点是需要对比剂给药和血液采样。目前, 在无创性内源性 MRI 检测心肌纤维化的领域中, 平扫 T1, T1 ρ 映射和 MTI 看起来最有前途。需要进一步开发这些技术的临床应用, 例如开发临床适用的方案, 在临床试验中进一步验证与组织学的相关性。此外, 评估这些技术的标准化测量协议也是必要的。一旦建立, 这些技术可能适用于广泛的临床领域, 包括消融治疗, 瓣膜疾病, 心肌病, 缺血性心脏病和干细胞治疗。

磁共振影像组学在血管性认知障碍中的应用研究进展

古力孜巴牙生、王云玲
新疆医科大学第一附属医院

血管性认知障碍 (Vascular cognitive impairment, VCI) 是指与大脑血液流通受阻所引发的一系列认知功能下降相关疾病统称, 包括从轻度认知障碍到痴呆的临床过程。脑小血管病 (cerebral small vessel disease, CSVD) 为其重要病因, 占 VCI 的 50%~70%。VCI 的诊断缺乏统一的临床标准, 确诊 CSVD 主要依赖其影像学特征, 而脑部 MRI 则是评估 CSVD 的最佳方法。然而, 在日常的临床诊断过程中, 医生是通过图像的视觉解读进行评估, 这种方式在识别微小病变方面存在局限性。而影像组学, 一种结合了医学和电子科学的新颖技术, 能够展示出肉眼难以觉察的微小变化, 为疾病的量化、定性分析提供更准确、客观的参考, 同时也为 VCI 的早期诊断提供更多的影像学数据, 从而有益于临床的早期介入, 减缓病情的发展, 提升患者的生活质量。

PU-0250

FROC 模型评价肝细胞癌病理分级的价值

王文剑
苏北人民医院

目的: 讨论 FROC 模型在肝细胞癌在病理分化程度预测中的价值研究。

方法和材料: 以 2022 年 9 月—2023 年 4 月收集了 23 例经病理证实为 HCC 的患者为研究对象, 根据病理结果分为中高分化组和低分化组。所有受试者在术前均采用 3.0TMR 扫描仪获取多 b 值 (0-2000s/mm²) 弥散加权成像数据, 并拟合 FROC 模型计算其衍生参数: 扩散系数(D)、分数空间倒数(β)、空间变量(μ), 通过独立样本 T 检验评估组织学分级的差异。然后整合三种参数, 通过二元逻辑回归建立综合预测模型, 并通过受试者工作特性 (ROC) 分析评估诊断性能。

结果: D 和 μ 在中高分化和高分化 HCC 之间表现出显著统计差异 (AUC=0.808, P=0.017) (AUC=0.825, P=0.012), 两组的 β 值无明显统计学意义, 对于单个参数, μ 在区分两个 HCC 组时表现出最高的 AUC 值。在二元逻辑回归方程中, μ +D、 β + μ 及 D+ β + μ 都表现出较高统计学意义 (AUC=0.792、P=0.07, AUC=0.8、P=0.02、AUC=0.850、P=0.07)。与单因素相比, D+ β + μ 的组合可以进一步提高诊断性能。

结论: FROC 模型对肝细胞癌的病理分级的预测具有一定的诊断价值。

临床应用: FROC 模型可作为一种无创检查手段, 为术前预测肝癌病理分级提供辅助检查的价值。

PU-0251

mDIXON 序列非对比剂增强的冠状动脉血管成像及脂肪定量的可重复性研究

庄少斌

福建医科大学附属第一医院

目的 探究非对比剂增强 mDIXON 序列应用心电门控及膈肌导航技术进行冠状动脉磁共振血管成像（MRCA）以及利用水-脂分离技术量化心外膜和心包脂肪体积的可重复性。

方法 50 名受检者（28 名男性，22 名女性）进行冠状动脉血管成像（MRCA），其中 15 名受检者在一周后进行第二次重复性检查。采用 18 段冠脉分段法，由两名观察者记录 RCX、LM、LAD、LCX 各分支血管-心肌信号比 VMR，图像质量评分，以及心外膜与心包脂肪体积等参数。使用 Bland-Altman 法，观察者间和观察者内的组内相关系数 ICC 进行评估可重复性，使用 t 检验评价 mDIXON 序列与传统 bSSFP 序列血管成像评分。

结果 同一受检者的两次检查的各个分段血管-心肌信号比 VMR 的 ICC 值为 0.753~0.911 之间，95%LOA 为 6.6%。观察者内 ICC 值介于 0.940~0.992 之间，观察者间 ICC 值为 0.933~0.974 之间。两次检查各个冠状动脉分段的图像质量评分 ICC 值为 0.7~0.873 之间。观察者内 ICC 值介于 0.923~0.971 之间，观察者间 ICC 值为 0.923~0.965 之间，心外膜与心包脂肪体积值的 ICC 值介于 0.980~0.991 之间，95%LOA 为 6.6%。mDIXON 序列与传统 bSSFP 序列的图像质量评分，LCX 分支上，mDIXON 序列评分高于 bSSFP 评分，p 值为 0.002（ $p<0.05$ ）。

结论 mDIXON 序列的冠状动脉血管成像对各个分支显示以及脂肪体积的量化具有很高的可重复性，且部分分支图像质量评分优于传统 bSSFP 序列，在冠状动脉病变诊断、治疗后的疗效评价和随访、预防与评估心血管疾病风险等方面具有重要的意义。

AIR 线圈在乳腺 MR 成像的应用探讨

彭康强、戴心仪、刘辉明、何妮、谢传森

中山大学肿瘤防治中心

目的：对比传统乳腺专用线圈，探讨自适应图像接收（Adaptive Image Receive, AIR）线圈在乳腺磁共振成像（Magnetic Resonance Imaging, MRI）中的应用，以期在保证图像质量的基础上提高受检者乳腺 MR 检查舒适度，为乳腺 MR 检查中的线圈选择提供新方案。

方法：回顾性分析 2023 年 1—3 月在中山大学肿瘤防治中心分别采用两种射频线圈行乳腺 MR 检查的 30 例健康女性志愿者的图像。对比在两种线圈下 T₂WI fs 和 MUSE-DWI 序列中的图像信噪比（Signal Noise Ratio, SNR）、表观扩散系数（Apparent Diffusion Coefficient, ADC）值；通过统计学分析舒适度及图像质量，比较两种线圈在 MR 乳腺检查中的优劣。

结果：AIR 线圈舒适度优于乳腺专用线圈，差异具有统计学意义（ $P<0.05$ ）；AIR 线圈下 T₂WI fs、MUSE-DWI 序列 SNR 值均高于乳腺专用线圈图像，差异具有统计学意义（ $P<0.05$ ），两组图像 ADC 值之间，差异无统计学意义（ $P>0.05$ ）；AIR 线圈下 T₂WI fs 序列主观图像质量低于乳腺专用线圈图像，差异具有统计学意义（ $P<0.05$ ），MUSE-DWI 序列两组图像主观评价无统计学差异（ $P>0.05$ ）。

结论：AIR 线圈舒适度及信噪比优于传统乳腺专用线圈，可以作为传统乳腺线圈 MR 检查的补充；AIR 线圈下的 MUSE-DWI 序列在乳腺癌筛查方面具有很好的临床应用及推广价值。

Two distinct subtypes of tobacco use disorder revealed using heterogeneity through discriminative analysis

Mengzhe Zhang, Yong Zhang, Jingliang Cheng
First Affiliated Hospital of Zhengzhou University

Background: Tobacco use disorder (TUD) is a chronic, relapsing mental disorder characterized by compulsive tobacco seeking and smoking. Individual neurobiological heterogeneity among patients with TUD hampers the identification of neuroimaging phenotypes, it is of significance to uncover more homogeneous subtypes of TUD.

Method: The current study recruited 179 male subjects, including 122 TUD individuals and 57 healthy controls, and obtained their 3D-T1 images. Heterogeneity through discriminative analysis (HYDRA) was applied to uncover potential subtypes of TUD where regional gray matter volume (GMV) was treated as the feature. Then we examined the clinical, neuroimaging and molecular characteristics of subtypes.

Results: Two distinct neuroanatomical subtypes were found. In subtype 1, TUD individuals showed decreased GMV in right orbitofrontal cortex (OFC), while subtype 2 exhibited distributed pattern of widely GMV increase compared to healthy controls. Moreover, subtype 1 showed older initial smoking age ($t=2.339$, $p=0.021$), longer duration of smoking ($t=2.260$, $p=0.026$) than it in Subtype 2. Comparing with Subtype 2, persistent smoking behavior in subtype 1 is more likely caused by substance dependence and addiction rather than psychosocial factors ($t=2.244$, $p=0.027$). In addition, neuroanatomical aberrance in subtype 1 was mainly associated with dopamine system, while neuroanatomical abnormalities in subtype 2 were primarily associated with GABAa.

Conclusions: Overall, our results revealed two opposite neuroanatomical subtypes of TUD, which largely overlapped with their clinical and molecular features respectively. TUD subtypes taxonomy based on objective anatomy supplement the findings of clinical subtyping studies, which could help to facilitate the development of individualized treatments in TUD.

平山病（HD）：病例报道及临床影像特征回顾

姚美娟、谭艳
山西医科大学第一医院

平山病(Hirayama disease, HD)是由日本学者平山惠造(Keizo Hirayama)于 1959 年首次报道, 又称青少年上肢远端肌萎缩症, 是一种良性自限性下运动神经元疾病, 呈区域性发病, 90%以上来自于日本、中国、印度等亚洲国家, 该病多于青少年起病, 男性多于女性, 起病隐匿且多在发病数年后静止, 主要表现为不对称的上肢远端肌肉无力和萎缩, 肱桡肌多不受累, 呈“斜坡样”改变。多数患者伴寒冷震颤, 无感觉异常和锥体束征。

智力障碍儿童的 MRI 脑网络研究进展

母芳芳¹、李仕广^{1,2}

1. 遵义医科大学第三附属医院 (遵义市第一人民医院)

2. 贵阳市第二人民医院 (金阳医院)

目的: 智力障碍 (ID) 作为一种神经发育障碍性疾病, 表现为智力和适应功能障碍, 发病率高, 影响患者终身, 对患者、其家庭及社会造成巨大负担。近年来, MRI 脑网络研究在神经精神疾病的广泛应用, 为 ID 的发病机制研究提供了新的视角。本文对近期 ID 儿童 MRI 脑网络研究情况进行综述, 评价 ID 儿童 MRI 脑网络维度的可能共性特点及应用前景。

方法: 本文主要通过对 PubMed、Web of Science、中国知网、万方数据库等检索相关文献, 以“智力障碍”、“智力迟钝”、“磁共振”、“Intellectual Disability”、

“Intellectual Developmental Disorder”、“Mental Retardation”等作为关键词进行文献检索、筛选、归纳和整理, 所纳入文献涵盖了全球范围内以中、英文为主的涉及智力障碍的 MRI 脑网络研究。

结果: 基于 fMRI 形成了多种智力理论框架, 对于 ID 儿童的神经发育异常过程的探索极为重要, 最近许多关于 ID 儿童功能脑网络的相关研究成果, 主要强调了涉及以额、顶叶为主的广泛大脑区域, 其特定的网络模式不仅表现在各个子网络或模块内的激活减弱, 还存在子网络间的连接减少, 其拓扑特征表现为更加隔离, 并且网络整合和分离之间的动态失衡。脑白质结构网络中颞叶、顶叶的成熟度以及完整性, 亦与 ID 儿童的智力发育情况密切相关; 网络中更低的整合、更大的分离预示了更低的智商, 这也与儿童脑损伤的研究结果相一致。此外, 在大脑早期的发育过程中, ID 儿童的皮层网络的拓扑结构已经发生改变, 并且网络构架异常与额叶为主的皮层厚度减少密切相关, 原因可能与 ID 患者在儿童期甚至婴儿期皮质区的倒“U”型异常发育轨迹有关。

结论: ID 儿童的 MRI 脑网络分析揭示了其大脑拓扑结构的异常改变, 过度隔离与整合不足的网络状态, 以及功能子网络内/间的连接异常, 可能是 ID 儿童的共同神经影像学标志。此外, 不同的网络连接模式对于 ID 儿童的基因亚型分类具有一定的鉴别意义, 并且可能有助于 ID 儿童的临床早期筛查。

PU-0256

A fMRI Study on the relationship between mild cognitive impairment and structural-functional alterations in COPD patients

Wei Wang

The 989th Hospital of the PLA Joint Logistics Support Force

To evaluate the relationship between mild cognitive impairment and cerebral structural-functional alterations in patients with chronic obstructive pulmonary disease (COPD).

The COPD patients were divided into COPD-MCI and COPD-nMCI. Matched HC were enrolled. The differences of grey matter volume (GMV) and resting-state functional connectivity (rsFC) of regions with GMV difference were analyzed. The relationship between structural-functional alterations with disease duration, pulmonary function test and cognitive function were further analyzed.

33 COPD patients were with MCI (33/63, 52.40%), and 30 COPD patients with normal cognitive function (30/63, 48.45%). The cognitive function scores were in the normal range except COPD-MCI. MoCA and the five cognitive sub-domains in COPD-MCI were lower than COPD-nMCI and HC. There were significant GMV differences in bilateral LNG, left MTG, left thalamus, left pCG/IPG and right DLPFC among the three groups. The COPD-MCI group showed lower GMV in

the left thalamus than the COPD-nMCI, and lower GMV in the bilateral LNG, left MTG, left thalamus, left PCG/IPG and right DLPFC than HC. The GMV in the left PCG/IPG in the COPD-nMCI was lower than HC. The rsFC between bilateral LNG and right LNG/fusiform gyrus, left PCG/IPG and bilateral precuneus and left supramarginal gyrus, right DLPFC and left caudate nucleus were statistically different among the three groups. The GMV of left thalamus in COPD patients was positively correlated with the MoCA score, visuospatial/executive function and naming.

There were significant differences in the GMV of bilateral LNG, left MTG, left thalamus, right supramarginal gyrus, left PCG/IPG and right DLPFC among COPD-MCI, COPD-nMCI and HC. In addition, the rsFC of bilateral LNG, left PCG/IPG and right DLPFC were also different significantly. And the left thalamus plays an important role in cognitive function in COPD patients, which may be involving into the neural mechanism of MCI in COPD patients.

基于 7T 超高场磁共振下的脑小血管病患者的 颅内豆纹动脉成像研究

武文婧、陈康、罗为、冉淑华、陈加飞
陆军军医大学第一附属医院 (西南医院)

目的：在 7T 超高场强磁共振下采用时间飞跃法磁共振血管造影 (time-of flight magnetic resonance angiography, TOF-MRA) 技术研究脑小血管病患者的豆纹动脉开口、数量及深度，探讨豆纹动脉形态特征与脑小血管病的空间关系。方法：选取在本院就诊的 40 例脑小血管病患者，将其纳入实验组，另选取 30 名健康志愿者纳入对照组。对所有受试者进行 7T 三维 TOF-MRA 序列成像，观察豆纹动脉开口位置、分支的数量及深度，并使用 SPSS21.0 软件进行统计分析。结果：豆纹动脉开口多位于大脑中动脉上方，其次为背侧。两组左右两侧的豆纹动脉分支深度比较，差异均有统计学意义 ($t=3.248$, $t=3.562$; $P<0.05$)；两组左右侧豆纹动脉的数目比较，差异亦有统计学意义 ($t=10.417$, $t=13.214$; $P<0.05$)。结论：利用 7T 超高场 MRI 的高信噪比优势，可实现对豆纹动脉及其内部结构的无创在体 3D 成像，为穿支动脉相关性脑小血管病病变的诊断和研究提供重要的影像资料。

PU-0258

GRASP 自由呼吸 DCE-MRI 与常规 BH-VIBE 序列在肺癌图像质量中的对比研究

余景火、朱娟、杨擎
安庆市立医院

摘要

目的：评估自由呼吸状态下黄金角径向稀疏平行采样技术 (GRASP) 在肺癌 MR 图像质量中的临床实用价值。

方法：采集 30 名经 CT 筛查并确诊肺癌的患者 MR 图像信息，所有患者均先执行常规笛卡尔屏气容积内插 (BH-VIBE) 扫描，然后基于 GRASP 技术的自由呼吸动态对比增强 (DCE-MRI) 扫描，最后再行笛卡尔屏气容积内插 (BH-VIBE) 扫描方案。阅片由经验丰富的两位胸部放射科医生独立评估 (内容包括总体图像质量、病变轮廓、伪影等级、诊断信心、信噪比、病人体感评分)。

结果：在图像细节方面，GRASP 序列图像质量均满意且肿瘤边界及细节层次显示清晰，BH-VIBE 序列因患者屏气配合不佳及存在心脏大血管搏动伪影干扰，而 GRASP 序列由于能够有效消除呼吸

等运动伪影的优势,在总体图像质量、病变轮廓、伪影等级及诊断信心方面、信噪比、病人体感评分与 BH-VIBE 图像均显示出明显统计学差异 ($P<0.01$)。

结论:自由呼吸高时空分辨率 GRASP 成像技术较传统 BH-VIBE 扫描有着更优的图像质量,是对肺部病变进行高分辨率成像的一种可靠方法。

PU-0259

Slip Interface Imaging Based on magnetic resonance elastography can preoperatively predict the degree of meningioma–brain adhesion

Zhenyu Li, Shengjun Bai, Wen Cheng, Yu Shi
shengjing

Purpose: To investigate the ability of slip interface imaging (SII), based on a recently developed technique-magnetic resonance elastography (MRE), to predict the degree of meningioma–brain adhesion.

Materials and Methods: With Institutional Review Board approval and written informed consent, SII examinations were performed in five patients with meningiomas preoperatively. Each tumor was evaluated on six dimensions. All SII examinations involved Intracranial shear motions were introduced using a soft, pillow-like head driver. The displacement field was acquired with an MRE on 3T MR scanners. The acquired shear motion data creates slip interface imaging (SII). Two surgeon specialists in brain surgery primarily conducted all surgical resections, their intraoperative impressions of tumor adhesion serving as reference standards. The SII findings were independently and blindly correlated with surgical findings of tumor adhesion by using the Cohen's k coefficient.

Results: Among the five patients, SII agreed with the intraoperative assessment of the degree of tumor adhesion in four patients (80%) cases (medium agreement, $k=0.688$, 95% CI: 0.15-1). Among the 26 dimensions, SII agreed with 19 dimensions (73%) (medium agreement, $k=0.592$, 95% CI: 0.33-0.85). Case 1 had slight adhesion on one side of the foot and no adhesion on the head side during the surgery, agreeing with SII. Case 2 had severe adhesion on the side of the left ear, adhesion on the occipital side, slight adhesion on one side of the foot, slight adhesion on the other side of the ear, slight adhesion on the top side, and no adhesion on the frontal side during the surgery. it seems like the quite adhesive tumor, but SII tends to mixed adhesion. Case 3 had adhesion at the origin of the temporal side of the occipital region, adhesion on the left ear, slight adhesion on the nasal side, slight adhesion on the other side of the ear, no adhesion in the cerebellum, and no adhesion on the top side during the surgery. Unfortunately, SII had complete opposite results to the surgical evaluation with superior and cerebellum. Case 4 had severe adhesion on the side of the cerebellum, adhesion on the nasal side, slight adhesion on the top side, slight adhesion on one side of the ear, no adhesion on the other side of the ear, and no adhesion on the occipital side during the surgery. SII agreed with surgical evaluation that this is an adherent tumor. Case 5 had severe adhesion on the side of the skull base, adhesion on the top side, adhesion on the occipital side, slight adhesion on one side of the ear, slight adhesion on the other side of the ear, and slight adhesion on the nasal side during the surgery, mostly agreeing with SII.

Conclusion: SII, a noninvasive technique can be used to evaluates the degree of meningioma–brain adhesion preoperatively, to predict surgical risk and tumor resectability.

3.0T MRI 压缩感知 3D 技术与 SENSE HR 技术在直肠肿瘤中的比较研究

宋欣龛、董越、王泽坤、满江红、秦凤英、于韬
辽宁省肿瘤医院

目的:讨论压缩感知 (Compression Sensing,CS) 3D 技术与 SENSE(sensitivity encoding)HR 技术在直肠肿瘤中的应用价值。

方法:前瞻性收集我院 2021 年 2 月至 2021 年 8 月接受 MRI 检查的 52 例直肠肿瘤患者。对每位患者分别进行 CS 3D T2WI 和 SENSE HR T2WI 的矢状位、冠状位以及轴位采集,观察直肠解剖学结构,比较图像质量和扫描时间。采用 Cohen Kappa 法评价 2 名医师间评分的一致性,采用 Wilcoxon 配对符号秩和检验比较两种序列图像质量的差异。

结果:CS 3D T2WI 序列在扫描时间上比 SENSE HR T2WI 三个平面扫描时间之和要快 3 分 37 秒。CS 3D 轴位 T2WI 图像质量的评分更高,差异有统计学意义 ($P<0.01$)。在样本中发现,肠气多的患者更适用于 CS 3D 序列,肠气少的患者更适用于 HR 序列。CS 3D 序列重建出来的直肠矢位和冠位的图像质量评分与 HR 序列基本一致,无统计学差异,但 CS 3D T2WI 序列可以沿着肠管走行方向进行任意角度的重建,对于肠管走行比较迂曲的患者,3D 序列斜矢状位重建比 HR 的矢状位显示病灶应该更直观。

结论:CS 3D 技术在直肠肿瘤的临床价值高于 SENSE HR 技术。

PU-0261

IFIR-FIESTA 磁共振肾动脉成像 60 例分析

孙理、张燕、张陶、杨富辉、吴晶晶、罗家滨
云南省滇南中心医院 (红河州第一人民医院)

目的 探讨 IFIR-FIESTA 进行肾动脉血管成像在临床应用方面的可行性。方法 采用 3.0T 和 1.5T 超导磁共振仪,对临床怀疑肾动脉病变的 60 例患者分别进行肾动脉 IFIR-FIESTA 检查和 CE-MRA 检查,采用 VR、MPR 和 MIP 进行图像重组。由 2 名医师对 2 组肾动脉的图像质量以及分支显示情况等进行分析评分并记录结果。结果 IFIR-FIESTA 组在图像质量、肾动脉分支显示情况均优于 CE-MRA 组,但两组间差异无统计学意义 ($P>0.05$)。结论 使用 IFIR-FIESTA 技术进行肾动脉成像与 CE-MRA 一致性好,在临床应用上是可行的。

基于 MRI 深度学习预测可手术宫颈癌的淋巴脉管间隙浸润:一项多中心研究

秦凤英、董越
辽宁省肿瘤医院

目的:建立并验证基于磁共振成像(MRI)的深度多实例学习(D-MIL)模型,用于可手术宫颈癌淋巴脉管间隙浸润(LVSI)术前预测。

方法:对 392 例宫颈癌患者进行回顾性分析。应用 ResNet50 结构在实例级提取特征,而不使用关于肿瘤区域的手动注释,然后构建 D-MIL 模型。采用受试者工作特征曲线下面积(AUC)评价模型的诊断性能。采用 Kaplan-Meier 法评估无病生存期(DFS)。

结果:对于 LVSI 的诊断,训练集/内部验证集/外部验证队列的 AUC 分别为 0.695/0.690/0.681,通过生存分析,模型评分越高的患者达到 DFS 的时间越短。

结论:该模型可作为一种个性化的无创工具,有助于预测可手术宫颈癌的 LVSI。模型的评分也能反映可手术宫颈癌的 DFS。

基于高清 DWI 联合 T1WI 增强 MRI 在直肠癌术前 T 分期的应用价值

朱宗明、万红燕、胡晓云、陈静雯、毛海霞、周卫平、方向明
南京医科大学附属无锡人民医院

目的: 3.0T MRI 规范化扫描的高清扩散加权成像(DWI)序列联合 T1WI-fs 动态增强序列对术前直肠癌 T 分期的应用。方法: 回顾性分析 57 例经病理证实直肠癌患者 MRI 图片,术前进行 3.0T MRI 直肠癌规范化扫描,常规序列、高清弥散、T1WI-fs 增强序列等。由两位经验丰富的 MRI 医师采用双盲法运用高清 DWI(横断位、矢状位)和 T1WI-fs 动态增强序列对术前直肠癌的 T 分期进行评估。以直肠癌术后病理学结果作为“金标准”,联合运用两个序列评估直肠癌 T 分期的准确性、灵敏性和特异性。结果: 57 例中,上段直肠癌 9 例,中段直肠癌 39 例,下段直肠癌 9 例。甲、乙评估者对直肠癌术前 T1 期诊断正确率均为 85.7%(6/7),T2 期诊断正确率分别为 88.2%(15/17)和 94.1%(16/17),T3 期诊断正确率分别为 96.9%(31/32)和 93.8%(30/32);对 T4 期诊断正确率均为 100.0%(1/1)。甲评估者对直肠癌 T 分期诊断灵敏度为 96.1%,特异度为 83.3%;乙评估者对直肠癌 T 分期诊断灵敏度为 94.1%,特异度为 83.3%。高清弥散联合 T1WI-fs 动态增强序列对直肠癌术前 MRI 诊断正确率和灵敏度高于单个序列高清弥散或 T1WI-fs 动态增强,差异有统计学意义。直肠癌术前 ADC 测量平均值在相应术后病理 T1~T4 期分级组间比较,差异有统计学意义。结论: 高清 DWI 联合 T1WI-fs 动态增强有效提高直肠癌 T 分期准确性,为临床个性化治疗提供帮助。

PU-0264

慢性失眠患者丘脑和感觉脑区度中心性的异常

王慧¹、孙迎香²、韩文轩²、刘惠平¹、李海宁²、刘子怡²

1. 西安交通大学未来技术学院
2. 西安交通大学第一附属医院

目的:

慢性失眠(CI)是一种全球性的高发疾病,但目前研究对其发病的神经机制尚不清楚。本研究旨在通过分析 CI 患者脑区的度中心性(DC)及其动态变化特点来研究 CI 的发病机制。

方法:

分析 29 名 CI 患者和 28 名健康对照组(HCs)的静态度中心性(sDC)和动态度中心性(dDC)的差异。对于有显著性差异的脑区的 sDC 或 dDC,将其与临床指标进行相关分析。

结果:

与 HCs 组相比, CI 患者左侧枕中回 (MOG)、右侧枕下回 (IOG) 和右侧颞下回 (ITG) 的 sDC 明显增加; 右侧颞上回 (STG)、左侧颞上极 (TP)、左侧海马旁回 (PHG)、左侧杏仁核和丘脑的 sDC 下降。HAMD 与左侧 MOG 的 sDC 呈显著正相关, 而与左侧 PHG 呈负相关。

双侧 PHG 的 dDC 增加, 而位于左侧顶叶下回 (IPG) 的 dDC 减少。HAMD 与左侧 PHG 的 dDC 呈正相关, HAMA 与右侧 PHG 呈正相关, PSQI 与左侧 IPG 呈负相关。

结论:

CI 患者皮层下核团和大面积颞叶和枕叶区域出现功能异常, 且与患者出现的情绪紊乱有关。

PU-0265

7T 磁共振成像 SWI 在星形细胞和少突胶质细胞肿瘤显微成像诊断中的应用

陈家飞、甄志铭

陆军军医大学第一附属医院 (西南医院)

背景及目的 虽然分子成像技术取得了进步, 但星形细胞瘤和少突胶质细胞瘤的术前诊断仍具有挑战性。在本研究中, 我们评估了 7T SWI 是否可以用于区分星形细胞瘤和少突胶质细胞瘤, 以及胶质瘤的恶性分级是否可能

材料与方法 我们对 21 例胶质瘤患者在手术前进行了 7T SWI, 优化了皮质-髓交界处的清晰可视化。对皮质增厚和髓质血管移位(少突胶质肿瘤的特征)和皮质变细(星形细胞肿瘤的特征)进行评分。此外, 对恶性肿瘤的特征, 包括髓静脉增厚、微出血和/或坏死进行评分。

结果 星形细胞瘤和少突胶质细胞瘤的少突胶质细胞特征评分(最高评分, 13 分)和星形胶质细胞特征评分(最低评分, 3 分)差异有统计学意义(平均, 1.93 比 11.71, $P=0.01$)。世界卫生组织分级 II ($n=10$)、III ($n=4$) 和 IV ($n=7$) 肿瘤的恶性评分有显著差异(平均 0.20、1.38、2.79)。皮质增厚在少突胶质细胞瘤中更为常见($P=0.02$), 敏感性为 71.4%, 特异性为 85.7%; 在星形细胞瘤中观察到的皮质变细程度更高($P=0.01$), 敏感性为 85.7%, 特异性为 100%。

结论 7T SWI 显示皮质-髓交界处有助于鉴别星形细胞瘤和少突胶质细胞瘤。观察皮质变细是诊断星形细胞瘤最敏感、最特异的方法。7T SWI 也可以可靠地预测恶性分级。

PU-0266

采用压缩感知技术的脑敏感加权成像在头颅中的应用

刘锦

空军军医大学唐都医院

目的: 探讨压缩感知技术(compressed sensing, CS)在头部脑敏感加权 (SWI) 中的应用。方法: 选取 60 例在本院进行头部 SWI 成像的患者, 其中男 38 例, 女 22 例; 年龄 29-68 岁, 平均 46.5 岁。使用压缩感知技术(CS)对每个患者分别进行 2 倍、4 倍、6 倍及 8 倍的加速成像, 两名神经系统放射科医师在所有图像勾画双侧黑质为感兴趣区, 测量信号强度(signal intensity, SI)和噪声强度(standard deviation, SD), 并计算信噪比(signal to noise ratio, SNR)以及对比噪声比(contrast to noise ratio, CNR)。对图像质量进行五分法主观评分。使用组内相关系数(intra-class correlation coefficient, ICC)、Kappa 检验分析两位医师测量数据和主观评分的一致性。对不同组间图像的 SNR、CNR 和主观评分采用单因素 ANOVA 分析。结果: 两观察者测量数据和主观评分一致性良好($ICC: 0.863 \sim 0.933$, $Kappa: 0.836 \sim 0.962$)。单因素 ANOVA 检验不同倍数间 SNR、CNR 及评分差异有统计学意义($P < 0.05$)。当 CS 加速倍数为 6 倍时, 扫描时间接近缩短约 3/4, 而图像质量的主观评价结果与初始序列基本相当, 各项对比差异无统计学意义($P > 0.05$), 而当加速倍数再次增加至

8 倍时, 图像显示评分、SNR 和 CNR 均低于初始序列($P<0.05$)。结论: 当 CS 加速在 6 倍时, 可在缩短扫描时间的同时满足临床诊断要求, 因此压缩感知技术(CS)在头部脑敏感加权 (SWI) 中有较好的应用前景。

DKI、IVIM 联合临床指标术前预测直肠癌淋巴结转移的价值

任超、俞咏梅、吴树剑

皖南医学院第一附属医院 (弋矶山医院) 放射科

[摘要] 目的: 探讨扩散峰度成像 (DKI)、体素内不相干运动 (IVIM) 参数联合临床指标术前预测直肠癌淋巴结转移的价值。方法: 前瞻性搜集 75 例术后经病理证实的直肠腺癌患者临床影像资料。根据淋巴结转移状态分为转移组 (34 例) 及非转移组 (41 例)。采用独立样本 t 检验、秩和检验 (U 检验)、卡方检验及 fisher 确切法比较两组间的差异性分析, 使用二元 Logistic 回归分析筛选预测直肠癌淋巴结转移的独立危险因素, 并建立诊断及联合诊断模型, 采用受试者工作特征 (ROC) 曲线评价各模型的诊断效能, 采用 Delong 检验分析各模型和联合诊断模型的差异。结果: 淋巴结转移组与非转移组各参数中 MK 值、MD 值、D 值、CEA、脂肪间隙差异具有统计学意义 ($P<0.05$), 余差异无统计学意义; 二元 Logistic 回归分析示 MK 值、D 值及 CEA 是预测直肠癌淋巴结转移的独立危险因素, ROC 曲线示 MK 值、D 值、CEA 及其联合诊断模型曲线下面积 (AUC) 分别约为 0.804、0.713、0.682 及 0.859, 敏感度分别约为 73.5%、76.5%、70.6%、85.3%, 特异度约为 87.8%、68.3%、65.9%、85.4%。DeLong 检验分析示联合诊断模型明显优于 D 值及 CEA 单一指标模型, 差异具有统计学意义。

结论: DKI、IVIM 参数及临床指标在预测直肠癌淋巴结转移方面具有一定可行性, 且联合诊断效能高于单一指标, 明显优于 D 值及 CEA 指标。

PU-0268

磁共振 3D-ASL 技术联合视频脑电图定位癫痫致痫灶的价值

刘启、赵莹、陈清威、贾培飞

内蒙古科技大学包头医学院第二附属医院

目的: 应用磁共振 3D-ASL 技术获取大脑灰质不同区域血流量 (CBF) 并联合视频脑电图 (VEEG) 定位癫痫致痫灶, 探讨其诊断价值。方法: 回顾性分析 2021 年 1 月-2022 年 12 月在包头医学院第二附属医院经临床诊断为癫痫患者 50 例; 磁共振常规检查除外颅脑外伤、手术、血管畸形及颅内占位; 颅脑磁共振 3D-ASL 及视频脑电图资料完整; 应用基于 Matlab 平台的 SPM12 以及 Dpabi 软件提取大脑灰质 90 个区域 (AAL 模板) CBF, 与视频脑电图异常放电区域进行一致性分析, 并评价二者联合应用定位癫痫致痫灶的诊断效能。结果: 视频脑电图显示异常放电区域与该脑区 CBF 异常存在高度一致性 ($Kappa=0.805, P<0.01$); 大脑灰质不同区域 CBF 测量联合视频脑电图在定位癫痫致痫灶方面具有较高诊断价值 ($AUC=0.812$)。结论: 磁共振 3D-ASL 技术联合视频脑电图能够准确定位致痫灶, 具有较高临床应用价值。

PU-0269

卡波西样血管内皮瘤的 MR 特征分类及与卡梅现象相关性分析

付聪

河南省人民医院

【摘要】目的：探讨卡波西样血管内皮瘤(KHE)的 MR 特征和影像学分类，并分析影像学特征与卡梅现象(KMP)生化指标的相关性。

方法：回顾性研究我院收治的经术后病理证实的 47 例 KHE 患儿的 MR 检查资料、临床特征、实验室检查结果。依据实验室检查血小板计数(PLT)，其中 29 例存在 KMP，18 例为单纯 KHE 不伴 KMP。所有病灶术前均行 MR 检查，观察病灶发生部位，总结病灶 MR 特征，包括部位、形态、生长模式、大小、信号、病变周围特征，依据生长模式，分为孤立型 18 例和弥漫浸润型 29 例。对比分析 KMP 组与非 KMP 组间的影像学差异，分析影像学特征与卡梅现象的相关性。

结果：47 例 KHE 患者中男性 25 例，女性 22 例；中位年龄为新生儿，年龄范围为 1 天至 50 岁。29 例(62%)伴有卡梅现象(KMP)。KHE 可累及各种部位：头颈部 12 例，躯干 17 例(胸部、腹部、盆腔)，四肢 23 例，47 例中有 4 例涉及多个部位。在 T2WI 上，28 例整体表现为不均匀高信号，19 例表现为轻度低信号，其中 15 例(32%)相对于肌肉显示斑片状低信号。与弥漫型相比，孤立型 KHE 病变相对较小，大多数呈不均匀低信号(12/18)和斑片状低信号(13/18)，更常伴有 KMP，更常位于头颈部($P<0.05$)。病变的最大直径与血小板计数(PLT)在弥漫性组($rs=-0.490$, $P<0.05$)和孤立性组($rs=-0.448$, $P<0.05$)都存在显著相关性。与非-KMP 组病变相比，KMP 组病变更大、更深，大多数位于躯干，更常伴有周围网状淋巴水肿($P<0.05$)。在 T2WI 上呈现斑片状低信号的病例更有可能具有较低的 PLT ($P<0.05$)。

结论：KHE 临床较为罕见，部分可伴有 KMP 现象。具有更大、更深的病变、T2WI 上呈斑片状低信号、周围网状淋巴水肿，尤其是幼儿患者，高度提示 KHE 伴有 KMP 现象，MR 检查 可为临床明确诊断指导治疗提供可靠依据。

PU-0270

Quantitative evaluation of Portal Hypertension in a Miniature Pig Model of Cirrhosis using Multiparametric 3D Magnetic Resonance Elastography

Bai Du,Yujia Ma,Yu Shi

Shengjing Hospital of China Medical University, No. 36, Sanh

Purpose:To investigate the value of liver-spleen viscoelastic parameters in evaluating portal hypertension by using multiparametric 3D magnetic resonance elastography (3D-MRE) with hepatic venous pressure gradient (HVPG) as the gold standard in a miniature pig model of liver cirrhosis and portal hypertension.

Methods and Materials:Fifteen pigs were used as the experimental group and liver cirrhosis with portal hypertension was induced using the method of hepatic artery embolization with iodized oil-ethanol mixture, while 5 pigs were used as the control group. All experimental animals underwent 3D-MRE scans and HVPG measurements at baseline (0W) and 4W, 8W, and 12W after induction. After 16W of modeling, the experimental group animals underwent transjugular intrahepatic portosystemic shunt (TIPS) and then underwent 3D-MRE scans and HVPG measurements immediately after the operation. The liver-spleen viscoelastic parameters, including shear stiffness (SS), storage modulus (SM), loss modulus (LM), and damping ratio (DR), were

calculated using 3D-MRE at a frequency of 60 Hz. Multiple linear regression analysis was used to evaluate the association between mechanical parameters and HVPG.

Results: At all time points after induction, HVPG in the experimental group was significantly higher than that in the control group (4W: $P = 0.008$; 8W: $P = 0.009$; 12W: $P = 0.004$). Spleen SS in the experimental group were significantly higher than those in the control group (4W: $P = 0.001$; 8W: $P < 0.001$; 12W: $P < 0.001$). At 8W after modeling, spleen LM in the experimental group was significantly higher than that in the control group ($P = 0.013$). HVPG showed the strongest positive correlation with spleen SS ($r = 0.887$; $P < 0.001$), followed by spleen LM ($r = 0.631$; $P < 0.001$) and liver SS ($r = 0.537$; $P < 0.001$). After TIPS treatment, HVPG and spleen SS were significantly reduced compared with before the operation (HVPG: $P < 0.001$; spleen SS: $P < 0.001$), liver SS decreased compared to pre-treatment ($P = 0.005$). In multiple linear regression analysis, spleen LM ($\beta = 3.21$, 95% CI [0.11, 6.33], $P = 0.02$) and spleen SS ($\beta = 1.58$, 95% CI [1.27, 1.89], $P < 0.001$) were independently associated with HVPG.

Conclusions: 3D-MRE is a promising method for predicting HVPG, and the viscoelastic parameters of 3D-MRE have a good correlation with HVPG. spleen LM and SS are independently associated with HVPG.

PU-0271

高 b 值 Volume-DWI 对脑转移瘤治疗前后诊断及疗效评估

焦飞涵、何子福、郑建民
空军军医大学西京医院

目的: 探讨高 b 值 Volume-DWI 对脑转移瘤治疗前后的诊断及预测价值。

方法: 回顾性分析 20 例肿瘤脑转移患者在治疗前后均有头颅 MRI 平扫、DWI ($b=1000$, $b=2000$, $b=3000$, $b=4000$)、增强扫描, 在图像上观察转移瘤及其周围信号特点, 并将 DWI 治疗前后图像进行分析诊断效能, 观察 DWI 病灶实质部分 ADC 值的变化趋势。

结果: 病灶检出数目以 3D-T1WI 增强扫描作为“金标准”, 治疗前, MR 增强扫描提示病灶单发 7 例, 多发 13 例, 病灶总数目 124 枚, 直径 ≥ 2 mm。DWI 序列显示病灶总数目 98 枚, 直径 ≥ 2 mm。DWI 序列对直径 ≥ 2 mm 病灶检出率为 94.3%, 具有较好一致性。随着 DWI 的 b 值增高, 测得病灶实质部分 ADC 值减小, 随着 b 值增高, 病灶 ADC 值呈下降趋势。治疗后, MR 增强扫描提示病灶减少或者消失, DWI b 值的增高 ADC 值增加程度与细胞密度成反比, b 越高对治疗后效果预估越敏感, $b=4000$ 、3000、2000、1000 的敏感性分别为 96.7%, 89.3%, 83.4%, 78.9%, 特异性为 95.0%, 86.5%, 78.2%, 75.3%, 差异有统计学意义($P < 0.05$);

PU-0272

MR 3D CUBE T2 序列对膝关节韧带损伤的诊断价值

薛艺珂
空军军医大学西京医院

目的: 探讨 MR 3D CUBE T2 序列对膝关节韧带损伤的诊断价值。

方法: 纳入 53 例在我院骨科就诊且怀疑为膝关节韧带损伤的患者。患者行 MR 3D CUBE T2 序列扫描, 以关节镜检查结果作为金标准, 比较 3D CUBE T2 序列检查结果与金标准的一致性。对患者进行问卷调查, 对比两种检查方法的患者满意度。

结果: 53 例患者中有 19 例侧副韧带损伤, 12 例前交叉韧带损伤, 10 例后交叉韧带损伤, 10 例髌韧带损伤, 2 例无韧带损伤。MR 3D CUBE T2 序列检查结果与关节镜的诊断结果一致性较高

($P<0.05$), 3D CUBE T2 序列诊断膝关节韧带损伤的灵敏度和特异度均较高。患者对 MR 检查的满意度明显高于关节镜检查。

结论: MR 3D CUBE T2 作为一种无创检查, 对膝关节韧带损伤具有较高的诊断价值和临床应用价值。

PU-0273

MRV 技术在儿童脑血管疾病中的应用

邹康鹏

昆明市儿童医院

前脑血管疾病诊断的主要检查方法有 DSA 血管造影、CT 血管造影(CTA、CTV)、对比剂增强磁共振血管成像(CE-MRA)和经颅多普勒(TCD)。DSA 血管造影是有创血管介入技术, 操作较复杂, DSA 血管造影和 CT 血管造影(CTA、CTV)均需要在血管中注入一定量的含碘的对比剂, 而对比剂增强磁共振血管成像(CE-MRA)也需要注入少量的钆对比剂, 多普勒检查虽然不需要对比剂, 但检查效果与操作者的临床经验有很大关系。DSA 和 CT 血管造影使用的非离子型碘对比剂, 约 90% 以原形由肾小球滤过排出, 溶于水后不发生电离, 对血液渗透压影响小, 富含羟基而不含羧基, 神经毒性和血脑屏障损害较轻, 对于大多数患者来说是安全的, 但是对于有严重肝、肾功能损害、严重糖尿病、严重甲亢、骨髓

PU-0274

Magnetic resonance study of bone marrow mesenchymal stem cells in the treatment of type 2 diabetic peripheral neuropathy

Zhongxi Liao

Sanya Central Hospital

Objective: Using 7.0T¹H-MRS to characterize the intracellular lipid changes of skeletal muscle metabolites in the right hind limb of DPN rats may be a very important method to explore the feasibility of proton magnetic resonance spectroscopy (¹H-MRS) in evaluating type 2 diabetic peripheral neuropathy (DPN). At the same time, this study also aims to explore whether local transplantation of bone marrow mesenchymal stem cells can improve DPN, and whether ¹H-magnetic resonance spectroscopy can be used as an objective and reliable method to monitor the therapeutic effect of bone marrow mesenchymal stem cells on DPN.

Methods: BMSCs of SD rats were isolated and cultured. Rat model was induced in male SD rats by injection of streptozotocin (STZ) (45 g/kg, i.p.) in combination with high sugar and high fat diet. After DM model was built, the DPN model was made by continue feeding for 8 weeks. Male SD rats were divided into normal control group, DPN group, DPN+BMSCs group and DPN +NS (normal saline) group. Each group has 6 rats. Rats in normal group, rats in DM group at 4 and 8 weeks after diabetes model was built, rats in DPN+BMSCs and DPN+NS group at 2, 4 and 6 weeks after DPN intervention were scanned to obtain the ¹H-MRS imaging of the right hind limb. Blood glucose and body weight of the rats were monitored weekly throughout the whole study. Pathological changes of sciatic nerve were observed by HE stain.

Results: MRS: Intramyocellular lipid at 4 and 8 weeks after DM model was built were all higher than those in the normal control group at the corresponding time point ($p<0.05$). In the normal control group, IMCL levels at week 8 was higher than that at 4 weeks ($p<0.05$). The same result was observed in DM models ($p<0.05$). After intervention, IMCL concentration in DPN+BMSCs

group was lower than that in DPN+NS group at 2, 4 and 6 weeks after the transplantation of BMSCs($p<0.05$). IMCL in DPN+BMSCs group decreased at 2, 4 and 6 weeks after transplantation compared with baseline level before transplantation ($p<0.05$), whereas there was no difference in the DPN+NS group at 2, 4 and 6 weeks after injection of normal saline compared with baseline level before injection ($p>0.05$). Compared with the normal group, DPN group, DPN+BMSCs group and DPN+ saline group had slower sciatic nerve MNCV and SNCV ($p<0.05$), and MNCV and SNCV of the DPN+BMSCs group were improved compared with the DPN+NS group ($p<0.05$). HE stain: Sciatic nerve pathological changes, characterized by axon swelling, axon thinning, uneven myelin thickness were observed in DPN+BMSCs group and DPN+NS group. Compared with DPN saline group, the sciatic nerve pathological changes of DPN+BMSCs group were alleviated.

Conclusion: DPN rat model was successfully built 8 weeks after DM model was built. BMSCs plays a positive role in the repairment of DPN nerve function in rats. But its specific mechanism and the feasibility of its clinical application still need to be further explored. 7.0T 1H-MRS can be used to detect IMCL concentration quantitatively in skeletal muscle. 1H-MRS could be used to dynamically detect changes of IMCL concentration in DPN skeletal muscle, and its detection of metabolic changes in muscle tissues can be a potentially useful tool for assessing the efficacy of DPN in local cells transplantation.

无痛期异常大脑动态功能网络： 慢性内脏痛的初步静息态共激活模式分析

刘惠平¹、苏醒¹、尚美玲¹、马玲¹、敦旺欢²

1. 西安交通大学

2. 西安交通大学第一附属医院

原发性痛经 (PDM) 作为一种慢性盆腔痛会严重影响女性的心理情绪、睡眠及生活质量。慢性疼痛与大脑网络复杂的相互作用有关，反复且持续的疼痛会改变大脑功能网络连接。且疼痛随时间波动过程易受注意力、情绪、治疗或治疗环境等影响。以往研究主要关注静态功能连接，而忽视了不同脑区或网络在不同时间尺度上的 BOLD 信号特异性变化。动态功能连接方法可以灵敏地捕捉和检测伴随这种波动的大脑变化。通过分析不同区域之间的神经活动如何随着时间的推移而演变和变化，系统地解释这些差异。本文采用动态功能连接方法 (CAP)，探究 PDM 女性的在非疼痛期的大脑动态网络连接特征与疼痛期心理情绪的关系。本研究共纳入 116 人，对照组 57 人，疼痛组 59 人。研究发现，PDM 患者在无痛排卵期的大脑网络动态交互作用异常，且非疼痛期的大脑网络连接特征与疼痛期的疼痛情绪有相关性。月经期间的疼痛可能与无痛排卵期大脑网络异常动态交互作用有关。本研究通过应用动态功能连接分析方法，更敏感地发现 PDM 患者大脑功能网络的异常，增进了我们对慢性疼痛的大脑网络机制理解。

PU-0276

FOCUS DWI 在强直性脊柱炎骶髂关节病变中的应用

龚万庆、许宽宽，

宜昌市中心人民医院

目的：磁共振成像在骶髂关节病变中的作用已被临床认可，但小视野高清弥散用于骶髂关节病变的报道较少。本文主要探讨 FOCUS DWI 小视野弥散加权成像，对比常规 DWI 图像在强直性脊柱炎 (AS) 骶髂关节活动性炎症中的临床应用价值。

材料与方法：设备采用 GE DISCOVERY MR750 3.0 T 磁共振扫描仪，32 通道体部线圈。FOCUS DWI 序列 FOV: 28 cm×14cm，层厚/层距：4 /1mm，层数 16，矩阵 160×80，B=600 s/mm²，激励次数 16，扫描时间：3 分 03 秒。常规 DWI 序列 FOV: 38 cm×38 cm，层厚/层距：4 /1mm，层数 16，矩阵 128×130，B=600 s/mm²，激，采集次数 8 次，扫描 时间：1 分 28 秒。扫描完成后将图像传至 PACS 上，由 2 位中级影像诊断医师根据图像质量完成分析打分。图像质量由差到优分为 5 级，focus DWI 和常规 DWI 分别评分。

同时两组序列均在主机上使用 Functool 后处理软件，对原始图像进行变形矫正后，进行 Compute(计算)，再选取相同层面，在高信号区域及关节面正常组织区域设定 ROI，得到 ADC 值进行分析。

2 结果

FOCUS DWI 序列与常规 DWI 序列图像质量比较：FOCUS DWI 序列图像空间分辨率较高，骶髂关节图像无变形、无明显伪影，病灶显示较清晰。FOCUS DWI 序列图像质量分级高于常规 DWI 图像 ($Z=-5.11$, $P<0.01$)。FCOUS DWI 与常规 DWI 序列的 ADC 值比较：炎症侵犯区域 FOCUS DWI 序列的 ADC 值低于常规 DWI ($P<0.05$)，而正常组织 FOCUS DWI 序列的 ADC 值则高于常规 DWI。

结论本研究表明， FOCUS DWI 序列明显提高了图像的分辨力，组织无扭曲、变形及明显伪影，细节显示较清晰，FOCUS DWI 序列图像明显好于常规 DWI 图像。常规 DWI 序列比 FOCUS DWI 序列病灶区域的 ADC 也具有统计学意义。由此可见 FOCUS DWI 有利于提高骶髂关节炎症的诊断效能。

踝关节 MRI 扫描距腓前韧带定位方法的探索

龚万庆、刘堃
宜昌市中心人民医院

目的：MRI 应用于踝关节外伤的检查中，对踝关节外伤引起的韧带、肌腱以及关节软骨损伤后评估起到很重要的作用。但是对距腓前韧带损伤的诊断效果有限，常常不能完整显示距腓前韧带。此研究用于探索正常人距腓前韧带走行特征，改良斜轴位定位方式，距腓前韧带清晰的图像。

材料与方法：设备采用 Philips Ingenia Ambition 1.5T 磁共振扫描仪，16 通道踝关节专用线圈，矢状面 3D TSE 序列，不加脂肪抑制。FOV18cm，采集 260 层，采集体素 0.6×0.6×0.6mm，NSA:1 次，cs:8，扫描时间 2 分 51 秒。共扫描 30 例。扫描完成后使用 MPR 图像重组，观察距腓前韧带走行角度，测量距腓前韧带与胫骨长轴的夹角，同时观察其与相邻距骨形态的角度关系，测量距腓前韧带走行角度。

结果：距腓前韧带在 PD WI 上均表现为均匀低信号，MPR 重组显示距腓前韧带与胫骨长轴的夹角为 68°-125°之间，变量较大，分析原因，与患者踝关节屈曲的角度有很大关系，外伤患者，由于损伤程度及肿胀程度不同，导致扫描时足背与胫骨夹角不易放置为人体站立时的角度，故不具有参考意义。同时 3D 图像经过重组分析，观察到距腓前韧带与距骨长轴有相关性，与距骨后外结节与距骨头颈交界的连线的夹角为 $\pm 3.7^\circ$ 。后续斜轴位采用平行于距骨后外结节与距骨头颈交界的连线的定位方法扫描，均能清晰显示距腓前韧带。

结论：踝关节扫描时，患者在踝关节放松状态下，通过 3D 序列扫描的后图像重组观察，平行于距骨后外结节与距骨头颈交界的连线，与距腓前韧带走行接近，斜轴位采用此方法定位，均能清晰显示距腓前韧带，而由于胫骨与脚背的位置关系，受个人影响因素大，所以不建议使用与胫骨长轴的夹角作为参照。

PU-0278

3D NerveVIEW 序列在臂丛神经磁共振成像中的应用研究

高浪浪

空军军医大学西京医院

目的 与增强 3D STIR VISTA 序列对比, 探讨 3D NerveVIEW 序列在臂丛神经磁共振成像中的应用价值。

方法 收集本院 2023 年 2 月至 2023 年 5 月临床疑诊臂丛神经损伤的 20 例患者, 采用飞利浦 Ingenia CX 3.0T MR 扫描仪, 联合使用头颈线圈、脊柱线圈和体部线圈; 检查体位取头先进, 仰卧位; 对患者进行颈胸段冠状面扫描, 以 C6 为中心, 扫描范围为椎体前缘至椎管后缘, 所有患者均先行 3D NerveVIEW 扫描, 后行增强 3D STIR SPACE 扫描。扫描所得图像经过最大信强度投影 (MIP) 及多平面重组 (MPR) 图像后处理后, 由 2 名高年资影像诊断医师对图像上臂丛神经的根、干、股、束、支各部显示进行评分, 并在冠状位 MIP 图像上测量 C6 神经干层面臂丛神经与同层面毗邻肌肉组织的对比噪声比 CNR。采用 SPSS 22.0 软件进行统计学分析。2 组 CNR 比较采用配对样本 t 检验; 2 组评分比较采用配对样本 Wilcoxon 秩和检验。 $P < 0.05$ 为差异有统计学意义。

结果 3D NerveVIEW 序列图像上臂丛神经显示评分高于增强 3D STIR VISTA 序列, 差异有统计学意义 ($P < 0.001$); 两组之间臂丛神经与肌肉的对比噪声比 CNR 无统计学差异 ($P > 0.05$)。

结论 3D NerveVIEW 序列相比于增强 3D STIR VISTA 序列, 可以更好的显示臂丛神经, 并且不需要注射对比剂, 因而对不适合使用对比剂的患者具有较高的临床应用价值。

PU-0279

基于 3.0T 压缩感知 3D-FLAIR 序列在多发性硬化中的临床价值研究

高浪浪

空军军医大学西京医院

目的: 对比分析基于压缩感知 CS 技术的 3D-FLAIR 序列与常规 2D-FLAIR 序列对多发性硬化 (MS) 的成像质量, 探讨 CS 3D-FLAIR 序列的临床应用价值。

方法: 收集本院 2022 年 7 月至 2023 年 7 月临床确诊 MS 的 15 例患者, 采用飞利浦 Ingenia CX 3.0T MR 扫描仪, 使用 32 通道头线圈同时行头部 CS 3D-FLAIR 序列与 2D-FLAIR 序列扫描。对 3D-FLAIR 序列所得图像进行重建得到与 2D 层面一致的横断面图像, 然后由 2 名高年资影像诊断医师对两组图像中具有 MS 典型性质的病变分别进行计数, 并将其分配到不同的脑区, 当两位医师出现不同意见时进行协商, 取协商结果作为最终结果; 并且分别测量两组序列图像上病灶的信噪比 (SNR) 和对比噪声比 (CNR)。采用 SPSS 22.0 软件进行统计学分析, 采用 Wilcoxon 秩和检验对两组数据结果进行比较, $P < 0.05$ 为差异有统计学意义。。

结果: CS 3D-FLAIR 序列发现的病灶总数明显高于 2D-FLAIR 序列, 差异有统计学意义 ($P < 0.001$), 差异主要由幕上病变引起, 而幕下病变计数在两个序列中均较低。CS 3D-FLAIR 序列图像的 SNR 和 CNR 均显著高于 2D-FLAIR 序列, 差异有统计学意义 ($P < 0.05$)。

结论: 在扫描时间相当的情况下, CS 3D-FLAIR 序列可提高空间分辨率, 并且可进行多平面重建有利于病灶多方位观察, 因而对 MS 病变的检出优于 2D-FLAIR 序列, 建议临床推广应用。

The value of cascaded neural networks in the automatic segmentation of NPC

Yingjuan Chang,Ziliang Xu

Department of Radiology,Xijing Hospital,the Air Force Medical University,Xi'an ,China

Abstract

Objective: Nasopharyngeal carcinoma (NPC) is the most common nasopharynx cancer in the world. The accurate segmentation of NPC is important for both treatment planning and tumor assessment. However, due to the complex anatomical features of NPC, manual segmentation is very time-consuming, and the segmentation results generated by many semi-automatic and automatic based on classical image processing methods or machine learning methods are not satisfied. In this study, we designed a cascaded neural network to investigate the NPC segmentation ability.

Methods: The T2-weighted MRI images from 310 NPC patients were randomly divided into training and testing groups at a ratio of 3:1, resulting in 233 patients in the training group and 77 patients in the testing group. The training group was then used for construction and training of a cascaded neural network, with the testing group being used to evaluate the performance of the constructed network. 4-folds cross validation was performed to evaluate the robustness of cascaded neural network.

Results: Our proposed cascaded neural network performed better than a single neural network. Moreover, as the number of cascaded networks increased, the segmentation performance gradually rose to a peak.

Conclusion: With further changes to the cascaded structure, our approach has the potential to further improve the segmentation performance. Our results indicate that cascaded neural networks have great potential for automatic segmentation of NPC.

PU-0281

磁共振体素内非相干运动扩散加权成像参数联合临床-影像学特征预测 HIFU 消融子宫肌瘤的早期疗效

蒋雨、黄小华

川北医学院附属医院

目的: 本研究旨在应用磁共振体素内非相干运动扩散加权成像 (IVIM-DWI) 定量参数联合临床-影像学特征构建模型来术前预测高强度聚焦超声 (HIFU) 消融子宫肌瘤的早期疗效。

方法: 分析行 HIFU 消融治疗的 64 名妇女的 89 枚子宫肌瘤 (充分消融组 51 枚, 非充分消融组 38 枚) 的临床资料, 年龄 (43.1±6.4) 岁, 均完成磁共振成像和 IVIM-DWI 检查。所有患者均在行 HIFU 消融治疗前 3 日内完成 MRI 和多 b 值 (0、10、25、50、80、100、150、200、500、800、1000 s/mm²) DWI 检查。两名医师采用盲法在 IVIM-DWI 图像中手动勾画感兴趣区, 从双指数模型获得 IVIM-DWI 定量参数真扩散系数 (D) 值、伪扩散系数 (D*) 值、灌注分数 (f) 值、相对血流量 (rBF) 值及表观扩散系数 (ADC) 值。联合两组有差异的临床-影像学特征, 构建 logistic 回归模型以评估 HIFU 的早期疗效, 通过绘制受试者工作特征 (ROC) 曲线及其曲线下面积 (AUC) 来评估各指标及参数的预测效能。构建列线图以可视化模型。

结果: 消融充分组 D 值 (931.0 (851.5-987.4) ×10⁻⁶ mm²/s) 明显低于消融不足组 (1052.7 (1019.6-1158.7) ×10⁻⁶ mm²/s) (p<0.001)。然而, 各组之间 D*、f 和 rBF 值的差异均不显著 (p>0.05)。以 D 值、肌瘤位置、腹侧皮肤距离、T2WI 信号强度、对比增强程度构建逻辑回归模型。

模型的 ROC 曲线下面积、特异性和敏感性分别为 0.858 (95%CI: 0.781-0.935)、0.686 和 0.947。列线图和校准曲线显示了模型的优异性能。

结论: IVIM-DWI 定量参数联合临床-影像学特征构建的 logistic 回归模型可用于预测 HIFU 消融子宫肌瘤的早期疗效。治疗前高 D 值提示疗效可能较差。

PU-0282

多模态 MR 成像评估侧方淋巴结转移在 直肠癌预后中影响的研究进展

孙阳
宜昌市第一人民医院

目的: 多模态 MR 成像评估侧方淋巴结转移对晚期低位直肠癌患者生存率的预后影响的研究进展

方法: 研究分析近 5 年间发表关于直肠癌侧方淋巴结转移预后相关文章, 影像学评估分析淋巴结转移的形态学及功能定位和长期结果; 以及无病生存和局部复发的预测因素

结果: 扩散加权成像及磁共振动态增强成像的定量/半定量可以很好的评估分析转移淋巴结的形态学特征和血流动力学特征, 术前侧方淋巴结短径越大, ADC 值/Ktrans 值/Kep 值等越低, 直肠癌局部复发风险越高, 无病生存率越低。多模态 MR 成像可以根据侧方淋巴结转移的大小和在 MRI 上的位置为侧方淋巴结清扫术提供相当可靠的帮助。

结论: 多模态 MR 成像可以很好的术前评估直肠癌侧方淋巴结转移, 以及预测直肠癌治疗后预后生存相关因素, 为临床侧方淋巴结清扫术提供相当可靠的帮助。

PU-0283

ZOOM DWI 序列和常规 DWI 序列在直肠癌 MR 成像中的对比研究

王昕、李小虎
安徽医科大学第一附属医院

目的: 比较以单次回波平面成像 (SS-EPI) 为基础的小视野 ZOOM DWI 序列和常规 DWI 序列在直肠癌 MR 成像中的图像质量。

方法: 回顾性分析 2023.01-06 月在医院进行 3.0T MRI 扫描的直肠癌患者 31 例, 并分别同时进行 ZOOM DWI 和常规 DWI 扫描, 比较二者的直肠解剖可视化、信号均匀性、重影伪影、磁敏感伪影、混叠伪影、直肠病灶清晰度以及整体图像质量等定性参数。还比较了信噪比(SNR)、信号强度比 (SIR)、对比噪声比(CNR)和 ADC 值等定量参数。采用 Wilcoxon 符号秩检验进行定性参数比较, 并通过配对 t 检验比较定量参数。

结果: 除重影伪影外, ZOOM DWI 的所有图像质量评分均显著高于常规 DWI ($p < 0.01$)。ZOOM DWI 的 CNR 显著高于常规 DWI ($p < 0.01$), 而 SNR 和 SIR 无显著差异。ZOOM DWI 与常规 DWI 测量的直肠癌病灶的 ADC 值分别为 $(0.934 \pm 0.155) \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $(0.963 \pm 0.132) \times 10^{-3} \text{ mm}^2/\text{s}$, 差异无统计学意义 ($p = 0.27$)。

结论: ZOOM DWI 相较于传统 DWI 的图像质量更好, 伪影更少, 对于直肠病变的显示程度也明显高于传统 DWI, 在评估直肠癌方面具有一定可行性。

PU-0284

3.0T 磁共振单髌关节成像技术

周源

空军军医大学西京医院

目的：磁共振检查是目前诊断 FAI 的主要检查方法。与常规双侧髌关节 MRI 相比，单髌关节 3.0T 磁共振具有小视野、高分辨的优势，可以更加清楚的显示髌关节骨质、软骨、韧带及软组织的结构，尤其是髌臼唇结构。

方法：1.体位设计：患者采用仰卧位，头先进。要求患者两脚根分开，两脚尖并拢，可以更好显示股骨颈。体表定位中心位于髌前上棘与耻骨联合连线中点。体位设计遵循三中心原则。2.扫描方案：为了更好观察软骨、韧带和髌臼唇结构，同时，为了更清晰的显示孟唇撕裂的位置、大小，并显示局部骨髓内的情况，扫描序列多采用质子加权成像加上脂肪抑制技术。层厚 $\leq 4\text{mm}$ ，层间隔 $\leq 0.4\text{mm}$ ，成像视野 $\leq 200\text{mm}$ ，激励次数 ≥ 2 ，扫描层数可根据病人实际情况进行调整，通常扫描 20-24 层。3.扫描定位：不同扫描序列观察的重点不同。其中横轴位以垂直于人体长轴进行扫描，扫描范围包括髌臼上缘和股骨小转子，要求清楚显示股骨头、股骨颈及孟唇开口，用于观察股骨头颈交界处骨质情况以及接下来的定位。在横断位上平行于孟唇开口方向，扫描得到斜冠状位，清楚显示外上孟唇和后孟唇，可以测量 α 角判断是否存在 Cam 型。在斜冠状位上平行于孟唇开口方向，横断位上平行于前后孟唇连线，扫描得到斜矢状位，清楚显示前孟唇和后孟唇。需要注意的是在进行单髌关节扫描时，观察的重点是髌臼孟唇，所以定位线角度应以髌臼孟唇为靶点。4.扫描技巧：扫描前让病人排空尿液，避免膀胱过度充盈影响髌臼孟唇的观察；摆位时应尽量将患侧髌关节置于扫描床的中央。注意相位编码方向，添加过采集，避免出现卷褶伪影；避免定位线角度 $>45^\circ$ 出现图像翻转的情况。对于一些特殊病人，可以采用放射状扫描或者 3D 序列进行扫描。

结论：3.0T 磁共振单髌关节以其小视野、高分辨的成像特点以及特殊的扫描方位实现了对髌臼孟唇的全面观察，弥补了传统髌关节磁共振的不足，是评估髌臼孟唇损伤的最佳影像学检查方法。同时为了获得更好的图像质量，根据国内外相关文献和指南，结合自身实践经验，制定了单髌关节扫描规范，旨在为开展统一的单髌关节扫描提供支持和参考。

PU-0285

头颅 TOF-MRA 压缩感知技术初步应用

杜向熠

空军军医大学西京医院

目的探讨压缩感知(Compressed Sensing,CS)技术在头颅 TOF-MRA 中的临床应用价值.方法对 40 例患者同时行常规 TOF-MRA 和压缩感知 TOF-MRA 序列扫描,根据序列不同将图像分为 TOF-MRA 和 CS-TOF-MRA2 组.定性分析 2 组图像整体质量,背景抑制效果和颅内血管的显示能力;定量分析 2 组图像的扫描时间,信噪比(Signal to Noise Ratio,SNR)和对比噪声比(Contrast to Noise Ratio,CNR).结果图像整体质量评分,背景抑制效果方面,CS-TOF-MRA 均优于 TOF-MRA,差异有统计学意义($P<0.05$).血管显示能力方面,CS-TOF-MRA 与 TOF-MRA 相当,差异无统计学意义($P<0.05$);SPACE-TOF-MRA 和 CS-TOF-MRA 扫描时间分别为 (260.95 ± 61.70) ,120s,差异有统计学意义($P<0.05$).SNR 和 CNR 分析中,CS-TOF-MRA 均优于 TOF-MRA,差异有统计学意义($P<0.05$).结论采用压缩感知技术的 TOF-MRA 序列与 TOF-MRA 序列相比,可显著缩短扫描时间,获得更好的图像质量.

PU-0286

半程马拉松跑前跑后髌骨软骨的 MRI T1 ρ 值定量分析

杜向熠

空军军医大学西京医院

目的 运用定量 T1 ρ 探讨业余马拉松运动员半程马拉松运动对髌骨软骨的影响。方法 招募 40 名 3 年以上跑龄的业余马拉松运动员,于半程马拉松跑前,跑后当天及跑后 1 周进行右膝关节 3D_WATS(WATER SELECTION),T1 ρ 序列扫描。将髌骨软骨根据厚度 1/2 分为深层,浅层,勾画 ROI 得到相应区域的 T1 ρ 值。利用单因素重复测量方差分析比较跑步前后及跑后 1 周膝关节软骨的 T1 ρ 值变化,多组样本均数两两比较采用 LSD 法。结果 膝关节髌骨软骨区域在检查过程中未出现软骨缺损。与半程马拉松运动前相比,跑步后软骨区域浅层的 T1 ρ 值显著下降,差异具有统计学意义 ($t=5.145, P<0.05$);跑后 1 周复查,髌骨软骨区域的 T1 ρ 值与跑前相比,差异无统计学意义 ($t=1.062, 0.309, P$ 均 >0.05)。结论 单次半程马拉松之后,男性业余马拉松运动员的髌骨软骨成分改变是可逆的。在常规 MRI 无阳性发现的情况下,利用 T1 ρ 定量 MRI 技术能够间接反映关节软骨在运动过程中发生的生化成分改变

PU-0287

磁共振限制回波间隔的类 CT 梯度回波序列在评估膝关节撕脱性骨折中的应用研究

张书海、李小虎

安徽医科大学第一附属医院

目的 探讨磁共振限制回波间隔的类 CT 梯度回波 (FRACTURE, Fast field echo resembling a CT using restricted echo-spacing) 序列在评估膝关节撕脱性骨折中的价值,比较膝关节 FRACTURE 序列与常规膝关节 CT 扫描的诊断效能。方法 前瞻性收集安徽医科大学第一附属医院符合入组标准的患者 37 例,所有患者在入组一周内分别行膝关节 CT,磁共振平扫(含 FRACTURE 序列)检查,并通过多平面重组技术(Multi-Planar Reformatting, MPR)在 CT 及 FRACTURE 序列上重组出易于显示病灶相同方位的图像,并在每例患者 CT 及 FRACTURE 序列图像上选择对应层面的图像勾画正常密质骨和松质骨及肌肉的感兴趣区,并测出 CT 值和信号强度,分别测量两图像骨折线长度,碎骨大小及碎骨 CT 值和信号强度,采用独立样本 t 检验, Mann-Whitney U 检验及 Pearson 相关系数验证两图像的差异及相关性。以 CT 诊断结果为参考标准,通过五级 Likert 量表,评价 FRACTURE 序列及常规 T1 加权成像的图像质量以及对于病灶的诊断效能,并通过 Mann-Whitney U 检验验证两影像的图像质量与诊断性能的差异。结果 正常密质骨和松质骨在 FRACTURE 序列的信号强度与 CT 图像上的 CT 值存在正相关关系 ($R=0.83, P<0.05$; $R=0.62, P<0.05$),正常肌肉及碎骨的信号强度和 CT 值不存在相关性;两图像的骨折线长度及碎骨大小无统计学差异 (P 均 >0.05);相比常规 T1 加权成像, FRACTURE 序列表现出更优的图像质量和诊断效能 (P 均 <0.05)。结论 磁共振 FRACTURE 序列对膝关节撕脱性骨折的显示及诊断具有较高的敏感性,有潜力成为撕脱性骨折的术前常规检查序列,为临床决策提供指导。

PU-0288

基于 MRI 影像组学模型预测前列腺癌诊断及分级的应用研究

王元、马贺骥
锦州医科大学附属第一医院

摘要：目的：利用核磁共振影像技术（MRI）和影像组学（Radiomics）的组合，通过大量临床图像信息，研究和总结前列腺癌（Prostate cancer）的影像学特征，建立前列腺癌的疾病模型，可辅助前列腺癌的临床诊断及分期。方法：选取 2020 年 11 月—2023 年 6 月于本院于治疗或术前接受前列腺 MRI 检查的 136 例患者，收集整理年龄、病理信息等临床资料，通过 Itk-snap 在 T2 横截面上进行 ROI 勾画，再使用 Python 进行特征提取，选择和 Gleason 评分相关的特征，用前向逐步回归筛选特征，线性组合选择的特征，建立 logistics 回归分类器，最后用线性组合在 Matlab 里画 ROC 曲线评估模型。结果：本组 136 例患者；Gleason 评分低级别组（6-8 分）80 人，高级别组（9-10 分）56 人，T1 图像提取了 107 个特征，T2 图像提取了 107 个特征，T1、T2 共 214 个特征。通过前向逐步回归得到的特征线性组合的影像组学总分受试者工作曲线（ROC）的曲线下面积 AUC，T2 组 AUC=0.646，其余两组均>0.650，其中 T1+T2 组效能为佳，AUC 为 0.754。证明了多模态影像的诊断价值。结论：通过筛选 MRI 图像特征制作前列腺癌模型用来辅助前列腺癌的诊断及临床分级具有一定意义。

PU-0289

浅谈磁共振成像技术的基本应用

王丽娜
辽宁省肿瘤医院

核磁共振的成像的基本原理:利用电磁波对置于磁场中的含有自旋不为零的原子核的物质进行激发,发生磁共振,用感应线圈采集共振信号,经处理建立数字图像.核与磁相互作用产生共振,所以,磁共振的产生需要具备三大要素:原子核,外磁场和电磁波.将患者置入一外磁场,则患者体内的氢质子的排列会无序到有序,然后对患者发射一个特定频率的射频波(属于无线电波,能量处于电磁波的低端),如果该射频频率和氢质子的进动频率相同,则此时会发生共振现象,这时氢质子吸收能量从而在其能级间发生共振跃迁.这个过程就是核磁共振.

磁共振成像技术对疾病的诊断具有很大的潜在优越性,可以直接作出横断面.矢状面.冠状面和各种斜面的体层图像,对软组织有极好的分辨力,对一些空腔脏器和肌肉组织的检查优于 CT.各种参数都可以用来成像,多个成像参数能提供丰富的诊断信息,使得医疗诊断和对人体内代谢和功能的研究方便有效.

MR radiomics predicting treatment response to neoadjuvant chemoradiotherapy among geriatric patients with locally advanced rectal cancer

Botian Song¹, Qian Pei^{2,3}, Xueying Wang^{1,2}, Yan Fu^{1,3}, Zaide Han¹, Feiyue Zeng¹, Xiaoping Yi¹, Liangrong Shi^{1,2}

1. Department of Radiology, Xiangya Hospital, Central South University

2. National Clinical Research Center for Geriatric Disorders (Xiangya Hospital), Central South University

3. Xiangya Hospital, Central South University

Background and Purpose : Early detection of treatment response to neoadjuvant chemoradiotherapy (nCRT) for locally advanced colorectal cancer (LARC) among geriatric patients remains challenging. We aimed to assess whether pretreatment MRI radiomics could predict the treatment response to nCRT in LARC.

Materials and Methods: Patients with LARC who were treated with nCRT were retrospectively collected between March 2010 and December 2022. Radiomic features were analyzed through computational methods from the pretreatment T2WI images. Differentiation models were constructed for predicting treatment response to nCRT, including pathological complete response (pCR), good-response, and down-staging. Model performance was assessed for classification efficiency, calibration, discrimination, and clinical application.

Results: This study enrolled a total of 91 patients (59 males and 32 females). Among the 91 patients, 15 (16.5%) achieved pCR, 38 (41.7%) achieved a good response, and 62 (68.1%) achieved down-staging. For prediction of pCR, good-response, and down-staging, the predictive model demonstrated high classification efficiencies, with an AUC value of 0.924 (95% CI: 0.83 to 0.98), 0.943 (95% CI: 0.83 to 0.97) and 0.947 (95% CI: 0.87 to 0.98), respectively. Both decision curve and calibration curve analyses confirmed that the ensemble machine learning model had higher prediction performance.

Conclusion: Pretreatment MR radiomics achieved satisfying performance in predicting treatment response to nCRT and could be helpful to assist in treatment planning for geriatric patients with LARC.

PU-0291

人工智能压缩感知技术在腰椎磁共振快速成像中的应用

王诗瑜、宋清伟、张浩南、王楠、陈丽华

大连医科大学附属第一医院

目的 探讨人工智能压缩感知技术 (ACS) 不同加速因子 (AF) 对腰椎磁共振图像质量的影响。**方法** 招募 41 例受检者 (男 21 例, 女 20 例, 平均年龄 (49.21±17.24) 岁, 应用联影 Omega 3.0T MR 扫描仪行并行采集技术 (PI) 以及 ACS 的腰椎矢状位 T1WI、T2WI、T2WI STIR 序列扫描, 分别采用 PI AF=2.0、ACS AF=2.0~4.0 (间隔 0.5)。部分受检者行单序列扫描, 部分受检者行多序列扫描, 最终各序列均为 21 例。测量 L1、L3、L5 椎体、间盘、临近肌肉信号值和噪声强度, 以肌肉为背景计算信噪比 (SNR) 和对比噪声比 (CNR), 并对 10 例检出有间盘突出的患者进行了间盘突出区 CNR (突出-CNR) 的评价。两名观察者对解剖结构细节可见度、图像噪声及运动伪影以及诊断准确性采用四分法评价, 评分一致性采用 Kappa 检验。使用 Friedman 检验三个序列不同 AF 间 SNR、CNR 及主观评分的差异性。结果 矢状位 T1WI、T2WI、T2WI STIR 不同 AF 间椎体、椎间盘的 SNR、CNR 的差异均无统计学意义 ($P>0.05$)。两观察者主观评分一致性良好

($Kappa=0.764 \sim 0.789$)。T2WI、T2WI STIR 不同 AF 间椎体、椎间盘的主观评分无统计学差异 ($P>0.05$)，T1WI 不同 AF 间主观评分有统计学差异 ($P<0.05$)；矢状位 T1WI 采用 ACS AF=4 时主观评分低于 PI AF=2.0 ($P<0.05$)。结论 基于 ACS 的腰椎 MR 扫描，随着 AF 的增加，扫描时间逐渐缩短，在保证图像质量的前提下，临床推荐 ACS AF 分别为 3.5、4.0、4.0 行腰椎矢状位 T1WI、T2WI、T2WI STIR 序列扫描。

PU-0292

Evaluation of the Image Quality of Renal Imaging by MRI Conventional Coil and AIR Coil

Liping Deng, HeHan Tang, Yuan Yuan
West China Hospital, Sichuan University

Abstract: Purpose: In renal magnetic resonance imaging, by comparing the image quality of conventional coil and AIR coil in abdominal MRI sequences, we can improve the image quality of conventional renal MRI scanning. Methods: 13 volunteers were recruited. Under the same scanning parameters, renal MRI was performed with abdominal phased array conventional coil and AIR coil. The imaging sequences included axial T1WI, T2WI and DWI. Two doctors scored the image quality subjectively, and the volunteers scored the experience of the scanning. The signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR) were measured and calculated. They were statistically analyzed. Results: In T1WI, T2WI and DWI images, the SNR of AIR coil was higher than that of conventional coil, and the difference was statistically significant ($P < 0.05$); most of the AIR coil CNR was higher than that of conventional coil, but the difference was not statistically significant ($P > 0.05$); the subjective scores of the two physicians were consistent ($P < 0.05$), and the subjective scores of AIR coil were better than that of conventional coil; the difference of subjective experience scores between the two coils was statistically significant ($P < 0.05$), and the subjective experience scores of comfort, fit and visual feeling of AIR coil were higher than those of conventional coil, and the compression feeling score of AIR coil was lower than that of conventional coil. Conclusions: Compared with conventional coil, AIR coil can obtain better image in renal MRI imaging, which can be widely used in clinical.

PU-0293

Assessment of microsatellite instability in endometrial cancer: comparison of deep learning and radiomics DWI image signatures

Nan Meng, Xuan Yu, Shen Lei, Bo Dai, Meiyun Wang
Henan Provincial People's Hospital

Objectives To explore the performance of machine learning based on diffusion-weighted imaging (DWI) features extracted from deep learning (DL) to identify microsatellite instability (MSI) in endometrial cancer (EC).

Methods A total of 117 EC patients were enrolled in this study, and assigned into the training set ($n = 84$) and the test set ($n = 35$). DL features based on convolutional neural networks and conventional radiomics features were extracted from DWI. Random forest (RF) and logistic regression (LR) were adopted as classifiers. DL features, radiomics features, clinical parameters, apparent diffusion coefficient (ADC) values, and their combinations were applied to establish DL, radiomics, clinical, ADC, and combined models, respectively. Predictive performance was

assessed by the area under receiver-operator characteristic (AUC), total integrated discrimination index (IDI), net reclassification index (NRI), calibration curves, and decision curve analysis (DCA). Results The combined model based on RF classifier, consisting of 3 DL features, 4 radiomics features, 2 clinical factors, and ADC value, had the best prediction performance. The AUCs of this model were 0.956 (95% CI: 0.919 - 0.999) and 0.850 (95% CI: 0.689 - 0.950) in the training and test sets, respectively, which showed different degrees of improvement over radiomics, clinical, and ADC models (AUC-training = 0.882, 0.685, and 0.751, AUC-test = 0.853, 0.618, and 0.721, respectively). The combined model also had a good performance at risk reclassification, with categorical NRIs of 154.08% and 88.64% and IDIs of 73.47% and 35.95%, in the training and test sets, respectively. The calibration curves and DCA indicated good consistency and clinical utility of this model, respectively.

Conclusions DL is feasible and superior to radiomics in the assessment of MSI status in EC. The combined model based on DL features, radiomics features, clinical parameters, and ADC values can achieve good diagnostic efficacy.

PU-0294

宫颈胃型腺癌 MRI 影像特征分析

齐取

辽宁省肿瘤医院

1.目的:

宫颈胃型腺癌是最常见的非 HPV 相关型子宫颈癌,临床表现不典型,病灶隐匿,恶性程度高,进展快,预后不良,临床上极易漏诊或误诊,确诊依赖术后病理。明确宫颈胃型腺癌的 MRI 影像学特征可提高术前诊断率。

2.方法:

收集 2019 年 5 月到 2023 年 8 月经手术病理证实为宫颈胃型腺癌的患者 21 例,年龄 33~70 岁,平均年龄 50.62 岁。在这 21 例宫颈胃型腺癌中,阴道不规则流血 9 例,阴道流液增多 7 例。肿瘤标志物 CA199 阳性 8 例,CA125 阳性 8 例,CEA 阳性 13 例,SCC 阳性 1 例。阴道受累 15 例,宫体受累 16 例,卵巢、直肠、膀胱转移 7 例,腹膜转移 6 例。其中 12 例行广泛全子宫切除+双附件+淋巴结切除术,术后病理回报淋巴结转移 11 例。FIGO 分期 I B 期 3 例,IIA 期 2 例,IIB 期 2 例,IIIC 期 8 例,IV 期 6 例。

3.结果:

本次收集的 21 例患者,MRI 检查图像中表现为宫颈肿块,均位于宫颈内,呈浸润性生长,可见宫颈呈桶状增粗,11 例见向上侵袭宫体,15 例见向下侵袭阴道穹隆。11 例向上侵袭的病例中有 1 例沿内膜向上爬行侵袭宫体,于宫腔内可见肿块影,其 MRI 需注意与子宫内膜癌向下侵袭宫颈相区别。21 例中有 16 例肿块呈囊实混合性,囊性成分在 T1WI 序列呈低信号,T2WI 序列呈高信号;实性成分在 T1WI 序列呈等信号,T2WI 序列呈稍高信号,DWI 序列呈高信号;增强后可见实性成分明显均匀强化,囊壁及分隔亦可见强化。在这 16 例囊实混合性肿块中,有 7 例表现出了特异的“波斯菊花型”,即中央为较小的囊性或实性病灶,周围包绕着较大的囊肿,尤其是 T1WI 序列上呈低信号,T2WI 序列上呈高信号。另 5 例为无囊性成分的实性肿块。21 例患者中有 11 例伴有宫腔积液。

4.结论:

宫颈胃型腺癌多呈囊实混合性,部分表现出特异的“波斯菊花型”。借助“波斯菊花型”可以更容易的诊断宫颈胃型腺癌。21 例患者中有 5 例出现了卵巢转移,概率 23.8%,较鳞癌转移概率明显更高,可在一定程度上辅助诊断。

PU-0295

癫痫相关认知功能障碍的研究

段静静
新疆医科大学

摘要

癫痫患者经常会发生认知功能障碍。大多数认知问题受到各种相互关联的因素的影响,包括癫痫的早期发作和癫痫发作的频率、强度和持续时间,以及抗癫痫药物治疗。成人癫痫患者的大多数认知问题包括记忆力、注意力和执行功能缺陷。然而,哪个认知区域受损很大程度上取决于癫痫活动的位置。此外,信号通路和神经元网络的改变在导致认知障碍的机制中都起着至关重要的作用。同时,研究表明,抗癫痫药物(AEDs)的联合使用会增加认知障碍的风险。然而区分每个因素的贡献可能具有挑战性,因为它们通常紧密交织在一起。因此,本文中我们主要探讨癫痫认知功能的因素,重点从癫痫认知功能的发生机制及不同因素对癫痫认知功能的影响 2 个方面展开讨论。

PU-0296

Impact of maternal positioning on comfort level and fetal MRI quality

Aonan Wang,Jiajia Xu,Shujing Li,Ran Huo,Ying Liu,Huishu Yuan
Peking University Third Hospital

PURPOSE Although the supine and left-lying positions are recommended for fetal MRI, the former is mainly used in clinical practice. Furthermore, maternal experiences during MRI remain underinvestigated. To compare the comfort levels of pregnant women in the supine and left-lying positions for fetal brain imaging and the image quality obtained in these two positions when using a conventional or super-flexible MRI coil.

METHODS In this prospective study, women with a singleton pregnancy underwent fetal MRI in the supine or left-lying positions between January 2023 and April 2023. They scored their comfort levels separately. The images obtained were classified 1:1:1 into groups 1 (supine position and a conventional coil, n = 50), 2 (supine position and a super-flexible coil, n = 50), and 3 (left-lying position and a super-flexible coil, n = 50). Two radiologists subjectively scored the images; the signal-to-noise and contrast-to-noise ratios were measured objectively. Comfort level scores were compared between the positions; image quality scores were compared among the three groups.

RESULTS Thirteen and 37 women in mid- and late-pregnancy stages, respectively, were enrolled. The fetal gestational age was 25–36 (mean, 30.5) weeks. The comfort level score was higher in the left-lying position (4.2 ± 0.8 vs 3.8 ± 0.9 , $p < .05$). The subjective scores were not significantly different. The objective scores showed that the signal-to-noise ratios in the bilateral frontal and right cerebellar lobes and contrast-to-noise ratios in the right frontal and right occipital lobes were significantly higher in group 3 than in groups 1 and 2. Further analysis revealed that late pregnancy was significantly associated with these findings.

CONCLUSIONS Regarding MRI using a 75-cm bore system, higher comfort level scores and image quality were achieved using the left-lying position than the supine position, mostly in the late-pregnancy stage.

PU-0297

压缩感知技术在颈椎磁共振快速成像中的应用

陈宁、龚欢、付鹏刚、杜向东
新疆兵团医院

目的：探究压缩感知(CS)技术不同加速因子(AF)对颈椎磁共振图像质量的影响。

方法：使用联影 1.5T 核磁，对 20 名健康志愿者(男 10 例，女 10 例)分别采用并行采集技术 (PI) 以及 AF 为 4、6、8、10 和 12 的颈椎矢状位进行 T1WI、T2WI、T2WI STIR 序列扫描，按照上述并行采集 (PI) 序列为 A 组，不同 AF 分为 B、C、D、E、F 组。由两名观测者分别对颈椎图像质量进行 5 分制主观评分，测量 C1、C3、C5 椎体、椎间盘及肌肉信号值和噪声强度，以肌肉为背景计算 SNR、CNR 的评价。测量六组图像椎间盘、骨及肌肉的信号值(SI)、噪声(SD)值，分别计算图像信噪比(SNR)、对比噪声比(CNR)。分别使用独立样本 Kruskal-Wallis 检验以及卡方检验对椎间盘、骨质、肌肉的 SNR、CNR 及三组图像质量评分结果进行组间统计学分析。

结果：两名观测者对六组图像的客观测量数据与图像主观评分的一致性良好(Kappa 和 ICC 值均> 0.75)。E、F 组与 A 组相比有显著差异。肌肉 SNR 在 E 组和 F 组与 A 组有显著性差异，CNR 在 D、E 和 F 组有显著差异；椎体的 SNR 在 F 组与 A 组有显著性差异，CNR 在 D、E 和 F 组有显著差异；椎间盘的 SNR 在 D、E 和 F 组有显著差异，CNR 在 D、E 组和 F 组有显著差异；CNR 在 D、E 和 F 组有显著差异(P 均<0.05)。传统并行采集的扫描时间为 354s，结合 CS 的 AF=6 的颈椎序列扫描时间缩短约 28.8%。

结论：选出最优 AF=6，相较于传统并行采集 (PI) 序列，基于 CS 的颈椎序列能保证图像质量，并且显著缩短扫描时间，对于配合较差患者的颈椎扫描时有较好的临床应用前景。

PU-0298

MR 血管壁高分辨成像在头颈血管夹层诊断中的运用价值

邓晶
重庆医科大学附属第三医院 (捷尔医院)

摘要：目的：基于 3.0T 的高分辨率磁共振成像(high resolution magnetic resonance imaging,HR-MRI)在头颈动脉夹层(Cerebral and cervical artery dissection,CAD)中的诊断价值研究。方法：纳入 2018 年 5 月~2023 年 7 月，经我院影像科确诊为 CAD 且采用高分辨率磁共振 (HR-MRI)、CT 血管造影(CTA)、磁共振血管造影(MRA)检查的 24 例患者，对比分析上述 3 种影像技术诊断 CAD 的诊断价值和检出率。结果：24 例患者中检出大脑中动脉夹层 1 例，颈动脉夹层 13 例，椎动脉夹层 7 例、基底动脉夹层 3 例。经 HR-MRI 检测，显示双腔征 7 例、内膜瓣 8 例、壁内血肿 9 例、假性动脉瘤 2 例，基底动脉扩展延长症 1 例。24 例患者检出 CAD 共计 25 处，CTA9 处(36%)、HR-MRI22 处(91.66%) MRA5 处(33.33%)，差异显著($\chi^2=24.940$, $P<0.001$)，HR-MRI 检出率显著优于 MRA 和 CTA。结论：临床 CAD 诊断应用 HR-MRI 具有较高的检出率，在诊断中 HR-MRI 属于高敏感性检查方法，此诊断方法值得临床推广应用。

PU-0299

MRI 对儿童青少年卵巢肿瘤中的诊断价值

余杨红、吴主强
江西省儿童医院

目的 探讨 MRI 在儿童青少年卵巢肿瘤中的诊断价值，从中总结出其影像表现，以帮助临床选择合适的治疗方法。

方法 对 2020-2023 年在我院接受卵巢肿瘤 MR 成像的所有年龄<18 岁的儿童和青少年进行回顾性研究，纳入了 30 名接受卵巢肿瘤磁共振成像检查并最终经病理结果证实的女孩，观察所有病例的 MR 影像并总结其特点。

结果 儿童青少年卵巢肿瘤病理类型以生殖细胞肿瘤占首位，以畸胎瘤为多，容易并发蒂扭转，蒂扭转是良性卵巢肿瘤附件切除的重要原因。当肿瘤直径 $\geq 8\text{cm}$ ，有强化，边缘不规则，肿瘤向外生长，腹水等征象提示为恶性肿瘤，恶性肿瘤多为单侧，且多为早期，应尽量行保留生育功能的手术。

结论 MRI 在区分儿童和青少年卵巢肿瘤的良恶性方面具有较高的诊断价值，有助于确定保留卵巢手术与非保留卵巢手术的适应证，卵巢良性肿瘤蒂扭转是造成附件切除的重要原因，因此在手术之前应采用 MR 影像评估卵巢肿瘤。

PU-0300

DWI,IVIM,拉伸指数,DTI,DKI 模型评估前列腺癌 Gleason 评分

高凯华、吴慧
内蒙古医科大学附属医院

目的 探讨单指数、双指数、拉伸指数、扩散张量成像 (DTI)、扩散峰度成像 (DKI) 模型获得的各参数在评估前列腺癌 Gleason 评分中的潜力。

材料和方法 对 59 例经病理证实的前列腺癌患者，采用 3-T 磁共振成像仪进行常规 MRI、多 b 值扩散加权成像(diffusion weighted imaging, DWI)及 DKI 扫描。依据 Gleason 评分 (GS) 将其分为低级别组 ($GS \leq 3+3$) 和中、高级别组 ($GS \geq 3+4$)；利用 FUNCTION TOOL 后处理软件对不同 DWI 模型数据进行后处理，计算得出单指数模型表观扩散系数 (apparent diffusion coefficient, ADC)，IVIM 的真扩散系数(D)、假扩散系数(D^*)，拉伸指数模型的分布扩散系数(distribution diffusion coefficient, DDC)、DTI 的各向异性分数(FA)，DKI 的扩散峰度(MK)、轴向峰度(Ka)、径向峰度(Kr)、扩散系数 (MD)、轴向扩散率 (Da)、径向扩散率 (Dr)。采用受试者操作特征 (ROC)分析比较各参数评估前列腺癌 Gleason 评分的效能。 $P < 0.05$ 具有统计学意义。使用 Mann-Whitney U 检验比较不同级别前列腺癌之间的所有数值。采用受试者工作特性和 Spearman 等级对各参数进行相关性分析。

结果 低级别和中、高级别组间 Stand ADC、DDC、FA、MD、Da、Dr、MK 及 Ka 值的差异均有统计学意义(P 值均 < 0.05)，且中、高级别组的 Stand ADC、D、DDC、MD、Dr 值小于低级别组，MK 及 Ka 值大于低级别组，差异均有统计学意义($P < 0.05$)。

结论 与常规扩散参数相比，不同扩散模型可以提供更多的信息，对诊断 PCa 的 Gleason 分级更有帮助。

PU-0301

基于分数低频振幅 (fALFF) 在新冠病毒感染者功能磁共振对脑功能的研究

刘滔
西安秦皇医院

目的 研究静息态磁共振 (rs-fMRI) 结合分数低频振幅 (fALFF) 在新型新冠病毒 (Corona Virus Disease 2019, COVID-19) 对脑功能影响的价值。**方法** 采用静息态功能磁共振成像数据分析 19 例未感染新冠病毒的正常人和 15 例一个月内感染过新冠病毒且阳转阴的患者的分数低频振幅 (fALFF) 变化。并对所有人进行李克特行为量表评分。**结果** 15 例新冠感染后的患者岛叶 fALFF 值增加。15 例新冠感染患者李克特量表和未感染组有显著差异, 15 例新冠感染者感染前与感染后李克特量表也有显著差异。**结论** 新冠病毒感染对患者脑功能有显著改变。

PU-0302

The prediction of intrahepatic mass-forming cholangiocarcinoma metastasis to lymph nodes using T2-weighted magnetic resonance imaging and hepatobiliary phase imaging radiomics: A multicenter study

Xing Xing¹, shuping wang², liyong Zhuo^{1,3}, yu zhang^{1,3}, jianing wang^{1,3}, yan zhang⁴, xiaomeng li⁶, jinghui dong⁵, xuehu wang², xiaoping yin^{1,3}

1. Department of Radiology, Affiliated Hospital of Hebei University
2. College of Electronic and Information Engineering, Hebei University
3. Hebei Key Laboratory of precise imaging of inflammation related tumors
4. Department of Radiology, Beijing You An Hospital, Capital Medical University
5. Department of Radiology, the Fifth Medical Center of Chinese PLA General Hospital
6. School of Clinical Medicine, Hebei University

Objective: In this study, we aimed to determine the accuracy of T2-weighted magnetic resonance imaging (T2WI) and hepatobiliary phase (HBP) imaging in predicting the preoperative lymph node metastasis of intrahepatic mass-forming cholangiocarcinoma (IMCC).

Methods: T2WI and HBP imaging of 87 patients diagnosed with IMCC were analyzed retrospectively. We randomly assigned 70% (49 cases) and 30% (22 cases) of the initial 71 patients to the train set and the test set, respectively. T2WI and HBP imaging were used to extract the radiomics features of 71 patients, which were then subjected to regression screening with the filter method, mutual information algorithm, and least absolute shrinkage and selection operator (LASSO), underwent 10-fold cross-validation, and were used to construct classification models with the support vector machine (SVM). After the 71 patients were used for the external validation of the classification models, medical imaging of the 16 patients in this study were included. Area under the curve (AUC), accuracy (ACC), sensitivity (SEN), precision (PRE), and F1 score were utilized to evaluate the diagnostic efficacy of the classification models.

Results: The radiomics models derived from T2WI and HBP imaging, Model_T2 and Model_HBP, were able to accurately predict the metastasis of IMCC to lymph node modes (ACC=0.76, SEN=0.80, PRE=0.50, AUC=0.78, F1-score=0.62; ACC=0.86, SEN=0.63, PRE= 1.0, AUC=0.92, F1-score=0.77). Model_HBP+T2 demonstrated the highest predictive accuracy (ACC=0.86, SEN=0.82, PRE=0.90, AUC=0.96, F1 score=0.86) compared to single-sequence prediction models in predicting the metastasis of IMCC to lymph nodes. As demonstrated by external validation, the AUC of Model_HBP+T2 was 0.83, confirming the high reliability of this model.

Conclusion: Model_HBP+T2, a combined model derived from T2WI and HBP imaging, is the most accurate model for predicting metastasis of IMCC to lymph nodes (MILN) and can therefore serve as a reliable predictive tool for assessing lymph nodes in the preoperative phase and guiding lymph node dissection during surgery.

PU-0303

肝脓肿介入治疗辽宁专家共识解读

畅智慧、刘兆玉
中国医科大学附属盛京医院

肝脓肿是指致病微生物侵入并定植于肝脏导致的严重感染性疾病，主要临床表现为发热、寒战、肝区疼痛等。肝脓肿的发病率存在地域差异，我国大陆地区的发病率为（1.07~3.59）/10 万，而在我国台湾地区高达 17.59/10 万，且其发病率在全球范围内有逐年升高趋势。目前，介入联合抗生素已成为肝脓肿的主要治疗手段，介入治疗具有操作简便、微创、经济以及安全有效等优点。但在临床实践中，常遇到肝脓肿合并脓毒性休克、低血小板血症等给介入治疗提出挑战；亦存在肝脓肿多发、范围巨大、液化差以及多房等情况，导致介入治疗后效果不佳。目前，国内外尚缺乏肝脓肿介入治疗相关的共识或指南。鉴于此，通过查阅国内外相关文献，结合我国国情，组织辽宁省内有关专家在严谨探讨的基础上制定本共识，旨在为广大临床工作者提供肝脓肿介入治疗的有益指导。

PU-0304

脊柱结核非典型 MR 影像表现

徐富海
贵阳市公共卫生救治中心

目的：探讨脊柱结核非典型 MR 表现。材料与方法 回顾性分析 12 例本院对经 X 线、CT 检查为阴性，而临床和病理证实的脊柱结核 12 例，行 MR 平扫和增强检查。结果（1）椎体呈 T2WI、压脂序列均呈高信号；（2）椎旁或椎前软组织稍肿胀，T1、T2 均呈等信号，增强扫描轻度强化；（3）椎间盘信号正常或只出现退变，椎间隙无狭窄；（4）椎体信号不均匀增高，强化不明显。结论 MR 可清楚显示脊柱结核的椎体骨炎、椎旁脓肿、椎体终板破坏和神经损害情况，对非典型脊柱结核的早期诊断有提示意义。

PU-0305

艾滋病合并肺结核不典型 CT 影像分析

邹晓辉
贵阳市公共卫生救治中心

目的：分析艾滋病（AIDS）合并肺结核的不典型 CT 影像表现，以提高影像诊断价值。方法：采用回顾性研究方法，收集 68 例本院经病理、实验室检查证实或临床确诊为 AIDS 合并肺结核无其它合并感染的患者胸部 CT 影像资料，分析其病变类型、分布、形态及变化情况。结果：68 例中，多种肺结核类型共存 52 例，以继发性肺结核合并胸内淋巴结结核发生率最高。52 例继发性肺结核患者中，23 例病灶分布于好发部位，19 例病灶只分布于非好发不典型部位，10 例病灶好发部位与非好发部位均有分布；影像征象以支气管播散、实变及多发结节病变为主，其中 13 例实变病灶表现为类似肺炎的渗出性实变，周围不伴卫星病灶。9 例血行播散性肺结核中，6 例表现为非“三均匀”

粟粒结节。8 例胸内淋巴结结核中, 6 例病灶破溃侵及临近肺实质、2 例病灶融合。。结论: AIDS 合并肺结核常表现为多种肺结核类型并存; 病变广泛, 无优势分布; 类似肺炎型实变病变比例高; 胸内淋巴结结核可有融合征象; 非“三均匀”的血行播散性肺结核多见。

PU-0306

HIV 感染者弓形虫脑病和原发性中枢神经系统淋巴瘤的 MRI 影像表现 对比分析

鲁植艳、史延斌、李逸攀
武汉大学中南医院

目的: 回顾性分析艾滋病相关原发性中枢神经系统淋巴瘤 与弓形虫脑病患者的临床和 MRI 影像特征, 探讨其差异性并勾画 ROC 曲线, 为临床诊断作出指导。

方法: 回顾性分析就诊于武汉大学中南医院的 6 例 AIDS 相关 PCNSL 和 18 例弓形虫脑病患者的临床及 MRI 影像资料, 统计两组患者临床首发症状、CD4+T 细胞计数、病灶大小、数量、位置分布、MRI 中 T1WI、T2WI/Flair 序列及 T1WI 增强表现, 比较两组患者影像学表现差异。

结果: 1.弓形虫脑病和 AIDS 相关 PCNSL 多发生于终末期 HIV 感染者中 (CD4+T 细胞 <200 个/ μ l), 本研究二者临床表现及实验室检查上的差异无统计学意义。2.弓形虫脑病和 AIDS 相关 PCNSL 影像上均表现为肿块/结节样病变, 二者在病灶位置分布 ($P=0.001$)、每位患者病灶数量和病灶平均大小上的差异有显著的统计学意义。弓形虫脑病较 AIDS 相关 PCNSL 更倾向于分布在外周区, AIDS 相关 PCNSL 更倾向于分布在白质区 3.弓形虫脑病病灶数量多于 AIDS 相关 PCNSL, 但病灶平均大小更小, 当病灶平均大小越小 ($<15.23\text{mm}$), 病灶数量越多 (≥ 3 个) 时, 更提示诊断为弓形虫脑病。

结论: 弓形虫脑病与 AIDS 相关 PCNSL 均为 HIV 感染者常见的颅内肿块样病变, 二者临床和 MRI 影像特征存在一定差异, 也有部分重叠, 鉴别诊断较为困难。二者在病灶位置分布、病灶平均大小和每位患者病灶数量、增强强化细节上的差异有显著的统计学意义。弓形虫脑病更倾向于分布在外周区 (皮层与皮层下), AIDS 相关 PCNSL 则更倾向于分布在白质区。弓形虫脑病相比于 AIDS 相关 PCNSL, 每位患者病灶数更多、病灶平均大小更小。弓形虫脑病在 T1WI 增强上更多表现为完整光滑环形强化, 而 AIDS 相关 PCNSL 则更多表现为完整不光滑环形强化。

PU-0307

唤醒关爱——受艾滋病影响儿童的关怀与支持

鲁植艳、屈艳娟、王越
武汉大学中南医院

专著主编及所在团队, 用两年时间深入基层, 在对 300 名受艾滋病影响的儿童进行关怀与救治工作中, 取得了第一手宝贵的资料后完成了专著的编写, 专著出版后, 作者团队奔赴广大农村进行了宣讲与关爱活动, 向广大基础艾滋病工作传授工作经验与方法, 获得广大读者热烈欢迎。

本书以通俗的语言, 告诉读者如何预防艾滋病、受艾滋病影响儿童的主要心理问题及相关干预措施, 主要从以下四个部分介绍:

1、艾滋病相关基础知识: 从艾滋病基础知识入手, 首先介绍艾滋病基础知识及艾滋病发现过程, 然后详细介绍了艾滋病的毒、性、血三种传播方式的特点及主要预防措施, 着重介绍了母婴传播在儿童预防艾滋病中的意义, 艾滋病的分期等。

2、受艾滋病影响儿童心理问题及干预措施: 父母发病使近 70%的未成年子女失去对未来的希望, 失去对自我价值的认同。目前, 受艾滋病影响儿童的心理问题较突出, 他们普遍存在着严重的心理

障碍, 这些心理障碍与艾滋病对家庭环境的破坏性影响有极大关系, 包括疾病本身、亲属态度、社会公众和经济压力等。个案调查显示, 儿童感染者被同伴排斥于学校和集体活动之外现象仍然存在, 大多数儿童自卑、焦虑、害怕、悲观等, 这些心理问题不容忽视, 应该采取适当的干预措施改善这些儿童的心理状态。

3、 艾滋病儿童常见的感染细菌性肺炎、卡氏肺孢子菌肺炎、肺结核的临床表现, 诊断及处理。艾滋病儿童身体及心理护理原则、主要护理措施及工作人员自身预防感染艾滋病的注意事项。

4、附录部分主要包括“小儿 HIV 感染和艾滋病诊断及处理建议”, “政府、非政府以及其他一些关注受艾滋病影响儿童的组织”, 艾滋病感染家庭故事等。

PU-0308

无锡地区青年男性 (30 周岁以下) Omicron 新冠感染的胸部 CT 表现

江兆亮¹、李东¹、汪水华¹、冯银波²

1. 无锡市凯宜医院放射科

2. 无锡市蠡湖街道社区卫生服务中心

目的:探讨青年男性新冠 Omicron 病毒变异株引起的胸部感染 CT 表现。方法:回顾性分析 2022 年 12 月 25 日至 2023 年 1 月 8 日因咽痛、咳嗽、发热等症状在无锡凯宜医院就诊的 30 周岁以下男性患者相关资料,并筛选病例。纳入标准:符合国家卫健委颁布的《新型冠状病毒感染的肺炎诊疗方案(第十版)》。对入组青年男性新冠感染的临床、胸部 CT 影像资料进行回顾性分析,总结影像学特点。结果:本研究共纳入 70 例青年男性患者,年龄 18-29 岁,平均年龄 26.24 ± 2.50 岁。(一)胸部 CT 分布特征:病变分布于两肺者有 7 例 (10.00%), 位于单侧肺野 30 例 (42.86%), 差异有统计学意义 ($P=0.000$)。其中, 仅右肺 23 例 (32.86%), 较仅左肺者 (7 例 10.00%) 明显增高。右肺中叶的发生率 (32.86%) 均高于其它肺叶, 其次为左肺舌段 (15.71%) 和右肺下叶 (8.57%)。

(二)胸部 CT 影像特征:本组病例中有 33 例 (47.14%) 的胸部 CT 未见明显异常, 与胸部 CT 阳性率的差异无统计学意义 ($P=0.499$)。最常见的 CT 影像学表现为絮影 (27 例), 其次表现为纤维索条影 (9 例)、斑状影 (6 例)、结节影 (3 例)。无纵隔淋巴结肿大、胸腔积液病例; 支气管扩张、胸膜增厚各 1 例。单征象者有 27 例, 多征象者 10 例, 发生率差异有统计学意义。结论:青年男性 Omicron 新冠感染患者, 胸部 CT 部分无异常表现。在 CT 阳性病例中胸部 CT 表现具有一定特征性, 病灶主要位于单侧肺-右肺中叶和左肺舌段。这两个肺叶位于心室周围, 心脏搏动导致此区域的血液微循环较丰富, 易于病毒的繁殖。Omicron 感染的胸部 CT 主要表现为絮影。这是由感染引起淋巴细胞浸润, 肺间质血管扩张、充血、肺泡腔蛋白液体渗出聚集所致。其次, CT 表现为斑状影和纤维索条影, 这可能是由肺水肿和渗出液被吸收后, 肺泡间隔纤维增生, 逐渐演变为纤维化病灶。

PU-0309

CT 和 DR 在肺结核诊断中的价值分析

马嘉良

吉林大学第一医院

目的: 分析 CT 和 DR 在肺结核诊断中的价值

方法: 选取当前医院放射科内收治的均做过 CT 和 DR 两项检查的, 并经病理学检查确诊的肺结核患者共 87 人, 将此 87 人的 DR 图像称作 DR 组, CT 图像称作 CT 组, 用两组影像学图像作为研究对象并进行回顾性分析对比, 两组图像对于各类病灶发现个数的对比、两组图像对于各类微小病

灶的发现能力和发现病灶具体大小的对比、两组图像对于病变诊断符合率和漏诊率的对比,以及各类肺结核分型的判断能力。

结果:DR 组的图像表现多为单个或多个病灶,规则和不规则的空洞影且空洞边缘毛刺、分叶,可有卫星灶。经统计 DR 确诊个数为 75 个(DR 诊断肺结核的诊出率为 86.20%)。CT 检查的影像学表现多为可清楚显示 病灶内钙化病灶以及胸腔积液,除空洞影还可见脓肿形成、磨玻璃样影、树芽征。经统计 CT 确诊个数为 86 个(CT 诊断肺结核的诊出率为 98.85%)。CT 诊断出空洞、卫星灶以及支气管扩张、胸腔积液与淋巴结检出率均高于 DR。对各类肺结核分型的判断能力也高于 DR,即 CT 各项检测结果的诊断符合率明显高于 DR。

结论:CT 诊断肺结核病变的诊断符合率和诊断效果都明显高于 DR,并可获得更为丰富的影像学信息,因此 CT 对于肺结核病变具有更高的临床诊断价值。

PU-0310

AIDS 合并颈部淋巴结结核影像学表现与 CD4+T 淋巴细胞水平的相关性

王惠秋、刘雪艳、李春华、唐光孝、舒伟强、吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨 AIDS 合并颈部淋巴结结核在不同 CD4+ T 细胞水平的影像学表现特征。方法 选取 AIDS 合并颈部淋巴结结核的患者 52 例,所有患者均有病理证实。按其 CD4+T 淋巴细胞计数分为 I、II、III 组(分别为 <100 个/ μl 、 $101\sim 200$ 个/ μl 、 ≥ 200 个/ μl 组),分析其影像学表现特征。

结果 I 组中患者淋巴结最大直径大于 3cm,病灶内部液化、淋巴结融合及窦道形成比例高于 II、III 组,钙化低于 II、III 组,差异有统计学意义($P<0.05$); I 组中淋巴结环形强化、不均匀强化及分隔样强化的发生率也均高于 II、III 组,其中以环形强化为主也可表现为多种强化方式共同存在,差异均有统计学意义($P<0.05$)。

结论 CD4+T 淋巴细胞计数越低,AIDS 合并颈部淋巴结结核的影像学表现特征中淋巴结最大直径大于 3cm,病灶内部液化、淋巴结融合、窦道形成发生率越高,钙化发生率减少,多种强化方式共同存在,以环形强化为主。

艾滋病合并颈部淋巴结结核影像学表现与 CD4+T 淋巴细胞水平的相关性

王惠秋、刘雪艳、李春华、唐光孝、舒伟强、吕圣秀
重庆市公共卫生医疗救治中心

【摘要】目的 探讨 艾滋病 合并颈部淋巴结结核在不同 CD4+ T 细胞水平的影像学表现特征。方法 选取艾滋病合并颈部淋巴结结核的患者 52 例,所有患者均有病理证实。按其 CD4+T 淋巴细胞计数分为 I、II、III 组(分别为 <100 个/ μl 、 $101\sim 200$ 个/ μl 、 ≥ 200 个/ μl 组),分析其影像学表现特征。结果 I 组中患者淋巴结最大直径大于 3cm,病灶内部液化、淋巴结融合及窦道形成比例高于 II、III 组,钙化低于 II、III 组,差异有统计学意义($P<0.05$); I 组中淋巴结环形强化、不均匀强化及分隔样强化的发生率也均高于 II、III 组,其中以环形强化为主也可表现为多种强化方式共同存在,差异均有统计学意义($P<0.05$)。

结论 CD4+T 淋巴细胞计数越低, 艾滋病合并颈部淋巴结结核的影像学表现特征中淋巴结最大直径大于 3cm, 病灶内部液化、淋巴结融合、窦道形成发生率越高, 钙化发生率减少, 多种强化方式共同存在, 以环形强化为主。

艾滋病患者肺部弥漫性病变的 CT 诊断

李春华、刘雪艳、舒伟强、吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨艾滋病患者肺部弥漫性结节病变的 CT 表现。方法 回顾性分析我院 2019.1-2023.2 收治的 87 例 AIDS 并发肺部弥漫性结节患者的影像资料, 分析不同病原感染的肺部弥漫结节的 CT 特点, 分析其病变分布、形态及伴发征象。结果 90 患者中结核分枝杆菌 45 例、真菌 38 例(马尔尼菲青霉菌 22 例、曲霉菌 8 例、肺组织胞浆菌病 7 例、毛霉菌 1 例)、细菌 7 例。45 例结核病例中 37 例弥漫结节表现为随机分布, 6 例为小叶中心分布, 其中 4 例为随机分布与小叶中心分布并存; 32 例伴纵隔淋巴结肿大, 15 例并发胸腔积液。真菌感染的弥漫结节分布类型: 31 例随机分布, 4 例为小叶中心分布, 其中 3 例为随机分布与小叶中心分布并存; 肺组织胞浆菌病 7 例均为小叶中心分布, 表现为结节伴周围晕征, 5 例伴纵隔及肺门淋巴结肿大。6 例细菌感染的弥漫结节为小叶中心分布。22 例马尔尼菲青霉菌病中 17 例伴有腹腔淋巴结肿大, 4 例纵隔淋巴结肿大。结论 CT 对艾滋病患者肺弥漫性病变有重要的诊断价值。

PU-0313

艾滋病肺部坏死性病变的 CT 诊断

李春华、刘雪艳、王惠秋、唐光孝、舒伟强、吕圣秀
重庆市公共卫生医疗救治中心

目的: 艾滋病患者肺部伴坏死性病变较多, 其疾病谱与正常免疫患者有所不同, 影像诊断困难。探讨 CT 引导下经皮肺穿刺活检术在艾滋病肺部伴坏死性病变中的应用价值。方法: 回顾性分析重庆市公共卫生医疗救治中心 2021 年 7 月-2023 年 7 月经肺穿刺活检病理证实的 49 例患者的相关资料, 分析其影像表现。结果: 其中男 31 例, 女 18 例, 中位年龄 43 岁; 其中单发结节或肿块病灶 23 例, 多发病灶 26 例。合并纵隔淋巴结肿大 19 例, 合并胸腔积液 11 例。49 例患者中 44 例获得明确诊断, 其中肿瘤性病变 31 例, 鳞癌 11 例, 腺癌 12 例, 腺鳞癌 1 例, 淋巴瘤 7 例, 肺结核 7 例, 真菌感染 5 例, 其中隐球菌 4 例, 马尔尼菲蓝状菌病 1 例, 细菌感染 1 例。CT 均表现为等密度或稍低密度肿块, 增强扫描中心不均匀坏死, 边缘强化不均匀, 周边实性部分厚薄不均匀。4 例鳞癌边缘较光滑, 部分位于肺外周, 与腺癌病变表现相似。结核病变多发为主, 常伴支气管播散灶。隐球菌以肺外周胸膜下为主, 边缘较清楚, 未见明分叶毛刺, 细菌性感染边缘少模糊, 整体以大片状形态为主。结论: 艾滋病肺部坏死性肿块病因较多, CT 影像对其诊断有一定价值, 但艾滋病肺部病变表现与正常免疫患者疾病谱有所不同, 部分病变影像表现相似, 单凭影像诊断困难, 需结合临床及实验室检查, 甚至穿刺活检方能诊断。

PU-0314

长新冠人群的现状调查及心理健康影响因素分析

赖建东、朱亚男、周和平、李正军
安康市中心医院

目的：探讨长新冠人群的现状情况及引起心理健康问题的影响因素。

方法：采用问卷调查的方法，在新冠感染 3 个月后对 2895 名志愿者进行研究。收集年龄、性别、是否吸烟、是否饮酒、是否右利手、身高、体重、BMI、受教育年限、是否感染新冠、健康问卷（PHQ-9）、健康量表（EQ-5D-5L）、健康状态评分、长新冠量表、贝克焦虑量表（BAI）、失眠严重程度量表（ISI）信息。探索在全人群中长新冠的特点。比较阳转阴组与阴性组在躯体症状、神经心理症状的差异；探讨新冠后中重度抑郁的影响因素。对人口学信息及临床资料进行描述统计；两组间比较采用 U 检验和卡方检验；采用多因素逻辑回归进行危险因素分析。采用 SPSS 22 进行统计分析， $P<0.05$ 具有统计学差异。

结果：在全人群中 67.3% 的人至少有一种长新冠症状；39.9% 的人有生活质量的问题；27.3% 的人有中重度抑郁；46.8% 的人有焦虑症状；24.7% 的人有失眠症状。阳转阴组与阴性组相比，在心肺、耳鼻喉、胃肠、神经、心理、疼痛、生活质量、健康状况、焦虑、抑郁、失眠、饮酒方面存在显著差异（ $P<0.05$ ）。在阳转阴组中女性、年龄、饮酒、耳鼻喉、神经、疼痛与中重度抑郁显著相关（ $p<0.05$ ），融合模型对中重度抑郁有着较好的预测效能， $AUROC=0.82$ ；在阴性组中，年龄、BMI、神经、疼痛、焦虑与中重度抑郁显著相关（ $p<0.05$ ），融合模型对中、重度抑郁有着较好的预测效能， $AUROC=0.81$ 。

结论：新冠事件影响下，较长时间内（3 个月）在全人群中依然存在着一系列躯体症状及神经心理症状。阳转阴组与阴性组相比，在躯体症状及神经心理症状方面表现的更加明显（ $P<0.05$ ）。阳转阴组和阴性组都有神经、疼痛症状、年龄来预测中重度抑郁，说明神经、疼痛是一种更普遍的症状存在于一般人群中，并与抑郁有关，且年龄越小抑郁越严重；在阳转阴组中，女性、饮酒和耳鼻喉是不同于阴性组的预测因子，说明在感染过新冠人群中需要尽早干预耳鼻喉症状、避免饮酒以及重点保护女性人群，来减少中重度抑郁的结局；在阴性组中，焦虑能预测抑郁结局，说明阴性人群需要格外关注心理状况，来减少中重度抑郁的结局。

PU-0315

纵隔畸胎瘤破裂致肺部感染误诊肺结核病例报道

李翔
昆明市第三人民医院

本文报道 1 例妊娠及哺乳期纵隔成熟畸胎瘤破裂导致肺部感染误诊为空洞性肺结核患者的影像表现及诊治过程。患者，女，23 岁，孕晚期胸闷、胸痛，逐渐加重并放射至肩背部，2 月后突发剧烈咳嗽、咳痰，后逐渐加重，痰中有灰黑色物质。患者分娩后于外院行胸部 CT 检查提示右肺上叶空洞、脓肿形成，考虑肺结核。患者入院后行胸部增强扫描可见纵隔类圆形肿块影，大小 5.9cm×4.2cm，肿块内可见液液平面，增强扫描包膜强化，靠纵隔侧包膜连续性中断，右肺上叶片状实变，其内可见虫噬状空洞，右肺下叶及左肺内多发斑片状影。经头孢曲松治疗后，右肺下叶及左肺斑片状影吸收，右肺上叶实变影及纵隔肿块未见改变。行纵隔肿物切除及右肺上叶切除，术后病理提示纵隔成熟畸胎瘤，右肺上叶异物肉芽肿。患者术后恢复良好。纵隔畸胎瘤是常见的纵隔肿瘤，在妊娠状态下可能发生破裂、感染，破裂入纵隔、胸腔可引起相应症状，病灶内脂肪、钙化及液液平面有助于定性诊断。

PU-0316

恙虫病临床特征及重症恙虫病的早期诊断

李翔

昆明市第三人民医院

摘要：目的 了解恙虫病临床特征，探讨重症恙虫病诊断的早期临床指征。方法 收集昆明市第三人民医院 2017 年 1 月至 2021 年 12 月恙虫病确诊患者的临床资料、胸部 CT 影像学及实验室检查结果；将恙病患者分为非重症恙虫病组（简称非重症组）与重症恙虫病组（简称重症组），利用 logistics 回归法分析重症恙虫病的早期临床指征。结果 研究共纳入恙病患者 181 例，其中非重症组 104 例，重症组 77 例。所有患者均发现皮肤焦痂，最常见发生于躯干，占 47.5%（86/181）。患者均出现发热，其他临床表现主要为头痛、咳嗽、腹痛、肌肉酸痛和呼吸困难。胸部 CT 影像学表明，所有患者胸腔积液的发生率为 49.7%（90/181），重症组和非重症组发生率分别为 67.5%（52/77）和 36.5%（38/104），差异有统计学意义（ $\chi^2=17.001$ ， $P<0.05$ ）。实验室检查中，重症组外周血中性粒细胞计数、谷草转氨酶、C 反应蛋白、降钙素原、乳酸脱氢酶、D-二聚体及白细胞介素-6 水平高于非重症组，外周血小板计数低于非重症组，差异均有统计学意义（ $Z=2.858$ 、 -3.870 、 -5.937 、 -6.546 、 -4.153 、 -4.802 、 -5.119 、 -5.039 ， P 均 <0.05 ）。回归分析结果表明，血清谷草转氨酶升高、血清降钙素原升高、白细胞介素-6 升高、存在胸腔积液与重症恙虫病发生有相关性；ROC 曲线面积（AUC）为 0.839，其敏感度为 62.3%，特异度为 96.2%。结论 患者有发热伴随皮肤焦痂应考虑恙虫病的可能，血清谷草转氨酶升高、降钙素原升高、白细胞介素-6 升高和胸部 CT 出现胸腔积液可考虑恙虫病发展为重症的早期指标，应予以关注，对有重症倾向的患者需及早诊治，以期降低病死率。

PU-0317

艾滋病合并伤寒沙门氏菌硬膜下脓肿病例报道

李翔

昆明市第三人民医院

本文报道 1 例艾滋病合并伤寒沙门氏菌硬膜下脓肿的影像表现及诊治过程。患者，男，43 岁，间断发热、头痛 2 月余，加重伴反应迟钝 1 周入院，患者 3 天前 HIV 抗体检测阳性。肺部 CT 提示双肺内多发斑片状影，考虑为肺部感染；颅脑 CT 提示左侧额顶部骨质内板下新月形稍低密度影，CT 值约为 29Hu，邻近脑实质受压、脑沟变浅，左侧侧脑室受压缩小，左侧额叶内结节状高密度影，周围未见水肿。颅脑 MRI 提示左侧额顶部骨质内板下新月形异常信号影，其内可见液液平面，其腹侧呈低 T1WI 高 T2WI 信号影，T2flair 呈低信号影，其背侧呈等 T1WI 稍高 T2WI 信号影，T2flair 呈稍高信号影，DWI 可见新月形异常信号背侧部分弥散受限，ADC 值约为 $774 \times 10^{-6} \text{mm}^2/\text{s}$ ，增强扫描左侧额顶部硬脑膜明显强化，左侧额顶叶软脑膜轻度强化。患者全自动加抗血培养伤寒沙门菌阳性，脑脊液高通量测序提示伤寒沙门氏菌。给予美罗培南抗感染治疗，左侧额顶部硬膜下脓肿颅骨钻孔引流，引流物培养伤寒沙门氏菌阳性。患者术后恢复情况较好。HIV 感染合并伤寒沙门氏菌感染少见，伤寒沙门氏菌引起的硬膜下脓肿亦十分少见，积极寻找病原体并针对使用敏感抗生素联合外科治疗，可获得很好的疗效。

Magnetic Resonance Imaging (MRI) Manifestations of Seminal Vesicle Tuberculosis in 13 Cases

Xiang Li¹, Yan Bi²

1. Kunming Third People's Hospital

2. The People's Hospital of Lincang

Objective This study seeks to examine the radiographic manifestations of seminal vesicle tuberculosis (SVT) on magnetic resonance imaging (MRI) in order to gain a deeper understanding of this disease.

Methods The clinical symptoms, general conditions, relevant laboratory tests, and radiological data of 13 patients diagnosed with SVT were collected either through bacteriological examination, effective anti-tuberculosis treatment, or post-operative pathological diagnosis from January 2018 to March 2023. Descriptive analysis was used to analyze the composition ratio or rate values of the collected data.

Results The age range of the patients was between 24 and 60 years, with a median age of 35 years; 10 patients (76.9%) had concomitant pulmonary tuberculosis. All 13 cases (100.00%) had genitourinary tuberculosis of organs other than the seminal vesicles, including epididymal tuberculosis in 13 cases (100%), prostate tuberculosis in 7 cases (53.8%), and renal tuberculosis in 2 cases (15.4%). Unilateral seminal vesicles were involved in 12 cases (92.3%), and bilateral seminal vesicles in 1 case (7.7%); 9 cases (69.2%) showed a decrease in the size of the affected seminal vesicle, while 4 cases (30.8%) showed an increase; All 13 cases (100.0%) showed isointense signals on T1WI and hypointense signals on T2WI in the affected seminal vesicles, with disappearance of the multi-chambered high signal on T2WI in normal seminal vesicles; 8 cases (61.5%) showed diffusion restriction on DWI of the affected seminal vesicle and significant enhancement on the contrast scan; while 5 cases (38.5%) showed unrestricted diffusion and mild enhancement on the contrast scan; Patients with significant enhancements showed higher counts and percentage of neutrophils than patients with mild enhancements, the differences being statistically significant ($Z=2.196$, $P=0.030$; $Z=2.781$, $P=0.003$). The counts and percentage of lymphocytes, CD3+T cells, and CD4+T cells were significantly lower in patients with significant enhancements than those with mild enhancements, the difference being statistically significant ($Z=-2.196$, $P=0.030$; $Z=-2.928$, $P=0.002$; $Z=-2.928$, $P=0.002$; $Z=-2.928$, $P=0.002$); Patients with significant enhancements were more likely to have active pulmonary tuberculosis than those with mild enhancements, the difference being statistically significant ($P=0.035$).

Conclusion MRI imaging reveals distinct radiographic features of SVT, and variations in imaging presentations can indicate the patient's immune status.

紧急医学救援中移动 DR 自转运及立位支架复合系统研究

孙洋

吉林大学第一医院

背景：我院的国家紧急医学救援队成立于 2016 年 5 月，目前是北方四省唯一的国家卫生健康委直属紧急医学救援队伍。2020 年 3 月 5 日，因在武汉抗疫工作中表现突出，获得“全国卫生健康系统新冠肺炎疫情防控工作先进集体”荣誉称号。我院应急队伍未来可根据伤情种类、伤病员规模进行相应的功能扩展和规模扩展，以满足不同的需求；针对未来救援类型，救灾应急，核应急，突发传染性公共卫生事件应急进行演练，建立模块化工作体系。**目的：**通过不断认识国家紧急医学救援队的意义，继续完善队伍管理和培训演练，在“平战结合”方面能够有新的思路、新的经验、新的亮点，继续朝着国际紧急医学救援能力水平努力。为此对实现 DR 自转运完成标准立位拍摄的复合系统有

着急切的需求。而此项能力的提高也对救援中提升快速机动能力, 标准化建立检查流程有着至关重要的推动作用。方式方法: 国家紧急医学救援队检查车专用 X 光机移动升降总成, 主要由 2 部分组成: 1、医学救援队检查车专用自消毒立式胸片架。2、移动升降装置。具体实施效果, 为了满足 X 光机灵活性、机动性, 我们将胸片架与 X 光机整合到同一底座上, 配合移动升降装置, 实现整机可在地面随意移动, 而且实现升降功能, 配合工作人员操作, 完成在一定高度的升降、攀升动作。结果: 通过紧急医学救援中移动 DR 自转运及立位支架复合系统研究的推进, 我们发现可以更好满足在出现紧急救援任务时, 配合工作人员实现 X 光机整机入车, 不需要借助其他吊车或起吊装置来实现装车, 极大减少了装车时间。在各种紧急情况及地形、病情限制下更好的完成标准化立位成像, 对于检查流程及成像时间上均有优化和提高。结论: 紧急医学救援中移动 DR 自转运及立位支架复合系统研究很好的诠释了平战结合”方面能够有新的思路、新的经验、新的亮点, 有效提高了应急机动能力, 优化了检查流程, 提高成像质量。

PU-0320

间质性肺结核 1 例

尹丽春
南华大学附属第一医院

报道 1 例 2022 年确诊的以肺间质改变为主要表现的肺结核患者的临床资料、诊治经过及随访情况。患者, 男, 55 岁, 因“因反复咳嗽 10 月, 再发加重 1 周”为主诉入院。入院前曾误诊为“双肺间质性肺炎”。入院查胸部 CT 显示双肺可见广泛性肺间质改变, 并出现散在斑片影、结节影, 边界模糊, 部分病灶呈磨玻璃样。经纤维支气管镜于右下叶腔外肿块穿刺活检: 坏死组织中见极少量类上皮样细胞及个别多核巨细胞, 符合肉芽肿性病变, 结核不能排除。异烟肼、利福平、吡嗪酰胺、乙胺丁醇 (HRZE) 规律抗结核治疗后, 咳嗽渐缓解, 病灶渐吸收, 随访 14 个月, 未见复发。以间质性改变为主要表现的肺结核好发于中青年男性, 亚急性病程, 临床症状不典型。网格样改变、小叶间隔增厚、小叶中心性结节、胸膜受累、树芽状是活动性间质性肺结核主要影像学表现。CT 检查能够清晰客观显示该类型肺结核间质改变的特点, 有助于该病的提示性诊断, 并可以观察和评价治疗的预后。借此病例以提高临床医生对间质性肺结核的认识, 呼吸道感染患者起病初期胸部 CT 无典型结核表现时不应轻易排除结核的可能, 应完善相关检查, 综合分析。

PU-0321

磷中毒后持续肺损伤并继发自发性气胸误诊一例

李雪莹、童娟
贵阳市公共卫生救治中心

目的 磷中毒是工业生产中常见的职业性疾病, 黄磷等高毒类无机物产生刺激性酸雾, 吸入后可致多脏器损伤。本例患者病来出现进行性肺损伤并继发自发性气胸。通过对本例患者的分析, 旨在加深对磷中毒后急性肺损伤影像的认识, 补充其肺部影像表现, 及时提示临床诊断和治疗职业性磷中毒, 改善预后。方法 回顾急性职业性磷中毒患者病例一例, 分析其临床表现、实验室检查、影像学表现等, 追溯职业病史, 观察其病变演变过程。结果 中年男性患者, 因受凉后出现咳嗽、咳痰伴发热, 予抗感染治疗后, 症状无好转并出现痰血、头晕、视物旋转。动脉血气示 PCO_2 升高、 PO_2 降低; 血沉、白细胞、中性细胞数、淋巴细胞数、纤维蛋白原浓度、CPR、IL-6 升高, 抗感染治疗后炎症指标未见好转, 血沉及纤维蛋白原浓度持续性增高, 氧分压不能维持正常。胸部 CT 示双肺多发斑片状磨玻璃影内多发肺气肿。肺泡灌洗液 PAS 染色 (+), 结合影像学考虑肺泡蛋白沉积症, 予支气管肺泡灌洗术治疗, 病情未见好转。两周后突发左侧大量自发性气胸, 影像学上双

肺斑片影范围增大，再次送检洗肉水样肺泡灌洗液：D-PAS (-)、含铁血黄素 (+)，考虑肺泡出血。追问病史患者自诉有 20+ 年磷矿、磷化氢气体接触史，近 1 年有间断咳嗽、气促，近 1+ 月因“清理厂区池”后出现乏力、气促，脱离环境后好转，3+ 周前吸入磷燃烧后浓烟出现呼吸道症状，且诉同期工友多有咳嗽、气促症状。结合患者职业史考虑职业性磷中毒相关急性肺损伤，予静滴糖皮质激素、左侧胸腔闭式引流 1 周后复查胸部 CT，双肺斑片影较前吸收。结论 急性磷中毒主要表现为肝、肾损伤，其肺部影像学多表现为急性肺损伤改变，但合并自发性气胸较少见。本例患者其胸部 CT 上斑片影未累及胸膜下并出现多发肺气肿，这一点应与肺泡蛋白沉积症鉴别。造成本次误诊的原因主要是对本病认识不足，缺乏详细的病史资料，仅单纯 PAS 染色阳性作出肺泡蛋白沉积症诊断。因此，对于出现难以解释的呼吸道症状，经抗感染及对症治疗不见好转时，应考虑到吸入性肺损伤的可能，详细追问病史，尤其是相关职业史，避免延误诊治。

PU-0322

肺结核合并肺癌、单纯肺结核与单纯肺癌的临床病理特征及影像学特征的比较

孙尉中

贵阳市公共卫生救治中心

摘要：目的 分析肺结核合并肺癌与单纯肺结核、单纯肺癌的病理特征及 CT 特征。方法 选择 2022 年 5 月~2023 年 5 月我院收治的 11 例肺结核合并肺癌、26 例单纯空洞型肺结核及 13 例空洞型肺癌作为研究对象，收集其一般临床资料、发病特点、病理特征、肺内病灶的影像 (CT) 表现等临床资料，并将 3 组患者上述资料进行对比分析。结果 肺结核合并肺癌组、单纯肺结核组的发热纳差比例高于单纯肺癌组 ($P<0.05$)，肺结核合并肺癌组贫血、真菌感染比例高于单纯肺结核、单纯肺癌组 ($P<0.05$)，3 组其他临床症状差异无统计学意义 ($P>0.05$)。单纯肺癌组腺癌比例高于肺结核合并肺癌组 ($P<0.05$)，鳞癌比例低于肺结核合并肺癌组 ($P<0.05$)，肺结核合并肺癌组病理分型与单纯肺癌组的差异均无统计学意义 ($P>0.05$)，3 组 TNM 分期差异均无统计学意义 ($P>0.05$)。肺结核合并肺癌组肺内占位 CT 表现中空洞内壁结节影比例高于单纯肺结核组及单纯肺癌组 ($P<0.05$)；肺结核合并肺癌患者肺内占位 CT 表现中长毛刺征、空洞、纵膈淋巴结增大、胸腔积液均高于单纯肺癌组 ($P<0.05$)，粟粒性阴影、卫星灶比例高于单纯肺癌组 ($P<0.05$)。结论 肺结核合并肺癌、单纯肺结核与单纯肺癌的病理特征及肺内肺内病灶的影像学 (CT) 特征存在不同之处，可结合患者临床、病理特征及肺内病变的影像学表现对不同类型患者病情予以评估。

Case-control study of tuberculosis in in-vitro fertilization and embryo transfer and natural pregnancy

Jialu Wei,Xiang Li,Min Qi,Wei Gan
Kunming Third People's Hospital

Objective To improve the understanding of clinical features and imaging characteristics of Patients with Pregnancy combined with Pulmonary tuberculosis. **Methods** Retrospective analysis of 50 cases of Pregnancy combined with Pulmonary tuberculosis admitted to the Third People's Hospital of Kunming from January 1, 2017 to December 31, 2021, divided into in-vitro fertilization and embryo transfer (IVF-ET) conception group and natural conception group according to the conception method, and the clinical data and imaging data were collected and compared with each other.

Result The mean age of the IVF-ET group (31.85 ± 5.84 years) was higher than the natural conception group (27.05 ± 5.5 years), and the Proportions of fever, hematogenous tuberculosis and extrapulmonary tuberculosis in the IVF-ET group (92.31%, 84.62%, 76.92%) were higher than those in the natural conception group (40.5%). The Percentage of IVF-ET conception combined with intracranial TB (76.9%) was higher than that of the natural conception group (10.8%), and the Percentage of termination of Pregnancy in the IVF-ET conception group (84.62%) was higher than that of the natural conception group (48.65%), all with statistically significant differences ($p < 0.05$). **Conclusion** IVF-ET conception combined with extensive Pulmonary lesions of tuberculosis, heavy systemic toxic symptoms, severe disease and Poor Pregnancy outcome, therefore, screening for tuberculosis before Performing IVF-ET is recommended.

膀胱憩室癌 MRI 诊断分析一例

晏青
贵阳市公共卫生救治中心

本文回顾性报告 1 例罕见膀胱憩室癌患者的 MRI 诊断情况, 以期为临床疾病诊断方式的选择及疾病的确诊提供参考依据。

膀胱憩室是膀胱的发育异常性变化, 临床相对较为常见, 但膀胱憩室内癌较为罕见, 仅占膀胱憩室病变的 1%~10%, 占膀胱癌的 1.5%[1]。一般情况下膀胱憩室有较薄的肌纤维, 能使尿液排空, 但有的膀胱憩室壁很薄, 仅有黏膜及纤维组织, 容易引起尿潴留, 膀胱憩室内尿液残留、伴发反复感染等刺激可以使正常黏膜发生鳞状或腺样化生, 最终导致癌变, 形成膀胱憩室癌[2]。本次回顾分析我院接诊 1 例膀胱憩室内癌的 MRI 诊断情况, 以期提升对疾病的认识, 并为疾病的影像学诊断提供参考依据。

神经梅毒影像学特点分析

干玮、李翔
昆明市第三人民医院

摘要：目的 探讨神经梅毒的临床特征及磁共振表现。方法 对昆明市第三人民医院 2020-2022 年收治的 3 例神经性梅毒患者的临床表现、实验室检查及影像学检查结果进行回顾性分析。结果 3 例患者均为男性，均感染 HIV，发病年龄 31-74 岁，病程约 5-6 年。首发症状分别表现为头晕、反应迟钝、左侧肢体抖动伴意识丧失。3 例患者中 1 例为实质型神经梅毒，1 例为间质型神经梅毒，1 例合并多种类型的神经梅毒感染。所有患者的梅毒螺旋抗体、血清快速血浆反应素试验（RPR）均为阳性。头颅 MRI 表现为硬脑膜肥厚 1 例，软脑膜增厚 1 例，多发脑梗塞灶 1 例，梅毒树胶肿 2 例。结论 神经梅毒可累及神经系统多个部位，其临床表现与所累及的神经系统部位相关，影像学表现多种多样，缺乏特异性，易与其他神经系统疾病混淆。诊断神经梅毒需结合临床、血清和脑脊液梅毒相关检测，同时早期进行影像学检查对于诊断有重要价值。

多层螺旋 CT 在尘肺合并肺结核中的应用价值

刘雪艳、吕圣秀、李春华、舒伟强
重庆市公共卫生医疗救治中心

目的 探讨尘肺并发肺结核的胸部 CT 表现特点。**方法** 搜集 2015 年 6 月至 2016 年 12 月重庆市公共卫生医疗救治中心诊治的 96 例尘肺并发肺结核住院患者，回顾性分析 96 例患者的临床及 CT 检查资料。对并发结核病变的发生部位、范围、形态、类型及并发其他脏器结核情况进行观察。结果 96 例患者中，尘肺 I 期 1 例，II 期 23 例，III 期 72 例。受累范围：多肺叶 90 例。发生部位：尖后段 93 例，前段 48 例，中叶或（和）舌段 49 例，背段 68 例，基底段 53 例。病变形态：斑片状影 85 例，大片状影 48 例，空洞 64 例，其中多发空洞占，树芽征 56 例，胸腔积液 36 例，胸膜增厚 72 例，纵隔淋巴结肿大 85，纵隔淋巴结钙化 58 例，并发肺外结核 13 例。II 期尘肺患者薄壁空洞发生率高于 III 期尘肺患者（ $P<0.05$ ）。III 期尘肺患者大片状影、树芽征、厚壁空洞、胸膜增厚、纵隔淋巴结肿大及钙化的发生率均高于 II 期尘肺患者（ P 值均 <0.05 ）。结论 尘肺不同分期患者并发肺结核 CT 表现具有一定差异，以浸润灶为主，常伴有多发空洞、树芽征、胸腔积液、肺外结核等。

PU-0328

慢性结核性脓胸并发恶性肿瘤的临床及 CT 表现分析（附 3 例报告）

刘雪艳、李春华、吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨慢性结核性脓胸并发恶性肿瘤的临床特点及 CT 表现特征。**方法** 回顾性分析我中心经病理证实的 3 例慢性结核性脓胸并发恶性肿瘤病例的临床及 CT 表现，并对相关文献进行复习。结果 3 例患者均为男性，平均年龄 63.7 岁，均有慢性结核性胸膜炎病史，平均病程 10.3 年；临床表现

均为胸痛,平均病程 2.67 个月;两例患者可触及胸壁包块。2 例患者行胸部 CT 平扫检查,1 例患者示胸部 CT 平扫+增强扫描检查。胸部 CT 示 3 例患者均为右侧胸膜增厚、钙化及包裹性脓胸,脓胸侧胸膜下出现软组织肿块,最大层面大小分别为:2.06x3.49cm,3.1x3.9cm,2.9x6.3cm,CT 值分布为 31HU,46HU,36-49HU;2 例患者出现肿块与脓胸壁连续移行,突向侧胸壁;1 例患者出现患处钙化影移位、散开;肿块密度较均匀(1 例)、欠均匀(2 例),出现邻近肋骨破坏 2 例;3 例患者均出现胸膜下脂肪界面不清;增强扫描显示:结节影呈边缘强化。3 例患者双肺表现为斑点、结节影,边界清晰,部分病灶呈钙化改变。结论 慢性结核性脓胸并发恶性肿瘤的临床及 CT 表现有一定特征性,出现胸痛表现,伴脓胸侧软组织块影、胸膜钙化影形态、位置改变,邻近肋骨骨质破坏;胸膜下脂肪层界面不清,对诊断有重要提示作用。

PU-0329

艾滋病并发新型隐球菌脑膜炎临床及影像学表现分析

刘雪艳、吕圣秀、李春华
重庆市公共卫生医疗救治中心

目的:分析艾滋病并发隐球菌脑膜炎患者的临床及影像学表现,提高对该病的认识,为临床医师的诊疗工作提供依据和帮助。方法:对重庆市公共卫生医疗救治中心 2015 年 01 月至 2016 年 12 月收治的 34 例艾滋病并发隐球菌脑膜炎患者的临床及影像学资料进行回顾性分析。结果:34 例艾滋病并发隐球菌脑膜炎患者中头痛 34 例、发热 18 例、呕吐 15 例。首次脑脊液检查中:氯化物水平降低 15 例、葡萄糖水平降低 10 例、蛋白定性阳性 11 例。首诊颅内压大于 200 (mmH₂O) 31 例,颅内压水平正常 3 例。CD4 T 淋巴细胞计数均低于 200 (cells/ul),其中低于 50 (cells/ul) 28 例、50~99 (cells/ul) 4 例、100~199 (cells/ul) 2 例。头颅 CT、MRI 表现主要为脑膜脑炎型 15 例、类梗塞型 8 例、梗塞型 6 例、肉芽肿型 1 例。易合并其他机会性感染,其中真菌性肺炎 17 例、细菌性肺炎 10 例、口腔念珠菌病 9 例。结论:艾滋病并发隐球菌脑膜炎患者多以颅内压增高相关症状就诊,免疫力普遍低下,易并发多种机会性感染。头颅 CT、MRI 检查在其诊疗过程中具有重要价值,确诊仍需依靠实验室病原学检查。

PU-0330

117 例艾滋病相关恶性淋巴瘤的 CT 影像表现与临床特点

李志鹏
云南省传染病医院

目的 探讨艾滋病相关淋巴瘤 (ARL) 的 CT 影像表现与临床特点。方法 回顾性分析云南省传染病医院自 2017 年 06 月至 2023 年 06 月 117 例经临床活检病理确诊为艾滋病相关淋巴瘤患者 CT 影像及临床资料,分析总结该组患者的 CT 影像及临床特征。结果 患者中位年龄为 47.7 岁,男女比例 5.2:1.0,原发淋巴结的占 68.7%,其中弥漫大 B 细胞淋巴瘤占 84.8%,70.5% 的患者 CD4+T 细胞计数小于 200 cells/μL,CT 影像表现中淋巴结内病变共 109 例,以全身多组淋巴结不同程度肿大为主,其中腋窝淋巴结肿大 89 例,颈部淋巴结肿大 74 例,纵隔及肺门淋巴结肿大 48 例,腹腔淋巴结肿大 37 例,腹股沟淋巴结肿大 34 例;淋巴结外病变 76 例,累及组织及器官广泛,以占位性病变为主,其中发生于肝脏 52 例,脾脏 42 例,肌肉 24 例,骨骼 18 例,胃肠道 28 例,肺 17 例,肾脏 14 例,肾上腺 8 例,胰腺 2 例,精囊腺、视神经、膀胱各 1 例,同时并发胸腔积液 83 例,腹腔积液 62 例,心包积液 34 例。结论 艾滋病相关恶性淋巴瘤主要以 NHL 为主,其中又以 DLBCL 最为多见,主要累及淋巴结及淋巴结外组织及器官,淋巴结外病变发生率

高、且常多脏器受累是其影像学特点，艾滋病相关淋巴瘤患者 CT 影像具有一定特征，综合临床资料，CD4+T 细胞低于 200cells 的患者更易出现淋巴结原发肿瘤，确诊仍需结合其病理结果。

PU-0331

动态功能连接在疼痛中的 fMRI 研究进展

赖训富
南昌大学第一附属医院

以往对大脑在疼痛的调控中所发挥的作用的研究发现，疼痛不是由特定的大脑区域产生的，而是由大脑区域网络中的协调活动所产生的。功能磁共振成像等非侵入性全脑神经成像的出现，为我们阐明疼痛的发病机理和指导临床实践贡献有价值的信息。功能连接 (functional connectivity, FC) 分析是另一种静息态功能磁共振常用数据处理方法。该方法主要考察区域之间体素水平上的时间相关性，可反映解剖上相互分离的脑区之间的连接效能和相互协调作用。但传统 fMRI 研究忽略了疼痛感受在不同时间尺度波动变化的信息，将功能网络视为静止状态。随着动态功能连接 (dynamic functional connectivity, dFC) 概念出现，该方法通过分析不同脑区神经活动的时间演变规律，带来了脑内疼痛信息传导与整合调控的补充性信息。本文概述了动态功能连接在疼痛中的常用分析方法，回顾了 dFC 在疼痛中的研究进展。在这篇综述中，我们分析了每种方法的优点和缺点，并探讨了这些方法的潜在未来应用，为疼痛的在大脑中的发生机制提供新思路，为疼痛的治疗提供更有有效的方案。

基于 CT 的影像组学模型联合临床影像学特征对布氏杆菌脊柱炎和脊柱结核进行鉴别的研究价值

奇丽霞
鄂尔多斯市中心医院

目的 建立和验证基于 CT 图像的相关影像组学模型对布氏杆菌脊柱炎和脊柱结核进行鉴别。**方法** 回顾性分析 94 例患者建立影像组学模型，其中布氏杆菌脊柱炎 37 例，脊柱结核 56 例，按照 7:3 随机分为训练组 (65 例) 和验证组 (29 例)。在 CT 图像上勾画出病变椎体提取其全容积影像组学特征，并采用 Mann-Whitney Utest 统计检验、Spearman 相关性分析、选择算子 (LASSO) 回归进行影像组学特征筛选，并计算相应的影像组学评分，建立影像组学模型。将有统计学意义的临床资料和 CT 征象用于构建临床模型。基于影像组学模型和临床模型建立联合模型，并绘制联合模型的列线图。采用受试者工作特征曲线 (ROC) 对以上几种模型进行评估，ROC 曲线下面积 (AUC)、特异性、敏感性、准确性、阳性预测值 (PPV) 和阴性预测值 (NPV) 来评估各模型的诊断效能。**结果** 基于 CT 图像优化出 6 个影像组学特征并构建影像组学签名，影像组学模型在鉴别 BS 与 TB 上具有较好的统计意义 ($p < 0.05$)，训练集 AUC 为 0.858、95% CI 为 0.763-0.953 和验证集 AUC 为 0.804、95% CI 为 0.641-0.968。临床模型中临床资料年龄和性别不具备识别能力 ($p > 0.05$)。CT 图像 5 个征象中 4 个典型征象具备良好的鉴别诊断能力 ($p < 0.05$)，训练集 AUC 为 0.883；95% CI 为 0.807-0.959 和验证集 AUC 为 0.684、95% CI 为 0.476-0.891。影像组学模型联合影像学特征在训练集中 AUC 为 0.930、95% CI 为 0.867-0.994 和验证集 AUC 为 0.928、95% CI 为 0.788-1.000，表现出更好的识别能力 ($p < 0.05$)。**结论** 基于 CT 图像的影像组学模型联合临床影像学特征构建的放射学列线图对于鉴别诊断 BS 和 TB 具有较高的临床价值。

PU-0333

鸟-胞内分枝杆菌复合群肺病与初治继发性肺结核的胸部 CT 鉴别诊断

张嘉诚

河南中医药大学第一附属医院

目的 探讨胸部 CT 鉴别诊断鸟-胞内分枝杆菌复合群 (MAC) 肺病与继发性肺结核的价值。**方法** 回顾性分析已确诊的 54 例 MAC 肺病和 55 例继发性肺结核患者的一般资料和胸部 CT 图像。分析两组患者的病灶分布、位置、形态和性质等, $P<0.05$ 为差异有统计学意义。**结果** 一般资料中两组患者平均年龄和咯血率的差异有统计学意义 ($P<0.05$); 胸部 CT 影像表现中两组患者病灶累计肺叶数、空洞数量、空洞形状、柱状支气管扩张的差异有统计学意义 (P 均 <0.05)。两组患者病灶分布比较在右肺上叶、右肺中叶、右肺下叶和左肺上叶舌段, 差异有统计学意义 ($P<0.05$); MAC 肺病组主要表现为右肺中叶、左肺上叶舌叶段的柱状支气管扩张和在右肺上叶、左肺上叶的多发薄壁空洞; 继发性肺结核组主要表现为右肺上叶、右肺下叶的柱状、混合型支气管扩张和在右肺上叶的多发厚壁空洞。**结论** MAC 肺病与继发性肺结核在胸部 CT 上存在特异性, 在二者的早期鉴别诊断中, 存在较好的鉴别诊断价值。

PU-0334

Comparison of the chest computed tomography findings between patients with primary treatment of Secondary tuberculosis and those with Mycobacterium avium complex pulmonary disease

Jiacheng Zhang

The First Affiliated Hospital of Henan University of Traditional Chinese Medicine

Objective To explore the value of chest CT in the differential diagnosis of Mycobacterium avium-intracellulare complex (MAC) lung disease and secondary tuberculosis. **Methods** The general data and chest CT images of 54 patients with confirmed MAC lung disease and 55 patients with secondary tuberculosis were retrospectively analysed. The distribution, location, morphology and nature of the lesions in the two groups were analysed, and $P<0.05$ was regarded as a statistically significant difference. **Results** The differences in the average age and haemoptysis rate of the two groups of patients in the general data were statistically significant ($P<0.05$); the differences in the cumulative number of lobes of the lesions, the number of cavities, the shape of the cavities, and the columnar bronchial dilatation of the two groups of patients in the chest CT image manifestations were statistically significant ($P<0.05$ in all cases). The distribution of lesions in the two groups was compared in the upper lobe of the right lung, the middle lobe of the right lung, the lower lobe of the right lung, and the lingual segment of the upper lobe of the left lung, and the difference was statistically significant ($P<0.05$); in the MAC lung disease group, the main manifestations were columnar bronchodilatation in the middle lobe of the right lung and the lingual segment of the upper lobe of the left lung and multiple thin-walled cavities in the upper lobe of the right lung and upper lobe of the left lung; and in the secondary pulmonary tuberculosis group, the main manifestations were columnar and mixed shapes of the right lung in the upper lobe of the right lung, the right lung in the lower lobe bronchiectasis and multiple thick-walled cavities in the upper lobe of the right lung [45.5% (25/55)]. **Conclusion** There is specificity between MAC lung disease and secondary tuberculosis on chest CT, and there is a good differential diagnostic value in the early diagnosis of the two

PU-0335

分段注射对比剂在胸痛三联征 CT 血管造影检查中的应用

王甜

柳州市人民医院

目的 探讨分段注射对比剂在胸痛三联征 CT 血管造影检查中的应用。**方法** 选取 60 例因胸痛行胸痛三联征 CT 检查的患者 ($18.5\text{kg/m}^2 \leq \text{BMI} \leq 24\text{ kg/m}^2$)，随机分为 A、B 组。A 组第一期采用容积扫描模式，管电压 100kV 扫描冠状动脉（范围气管隆突下 1 cm 至心底），第二期采用非门控螺旋模式，管电压 80kV 扫描肺动脉和胸主动脉（范围胸廓人口至膈下 2 cm）；注射方案为以 4ml/s 速率注射对比剂，总量 40ml，不间断以 3.5ml/s 速率注射生理盐水 35ml，接着 3.5 ml/s 速率注射对比剂 35ml，同等速率下追加生理盐水 35ml。B 组采用心电门控螺旋一站式扫描模式，扫描方案为管电压 100kV，智能电流范围为 40~900mA(以 $\text{SD}=28$ 智能调节)，机架旋转时间 0.275s，AIDR 3D Standard 迭代重建算法；注射方案以 4.5ml/s 速率注射对比剂，总量 100ml，扫描范围胸廓人口至膈下 2 cm。分别记录两组患者图像质量、对比剂用量、辐射剂量，对两组数据进行统计学分析。**结果** A 组冠状动脉图像质量在心率 >75 次/分时高于 B 组，差异有统计学意义 ($P<0.05$)，心率 <75 次/min 时，冠状动脉图像质量没有统计学意义，A 组上腔静脉伪影少于 B 组。A 组的辐射剂量为 (11.17 ± 2.45) mSv，B 组的辐射剂量为 (28.51 ± 3.06) mSv，降低约 61%，差异有统计学意义 ($P<0.05$)，A 组的对比剂用量比 B 组降低约 25%。**结论** 在自由心率下行胸痛三联征 CT 检查，分段注射对比剂联合分期扫描，冠状动脉图像质量、对比剂用量和上腔静脉伪影明显优于一站式门控螺旋扫描，具有一定的临床应用价值。

PU-0336

双源 CT 中碘浓度测量的准确性评估

胡文、薛琴、魏思文、郝跃文

西安市儿童医院

目的 采用三组能量组合方式对体外碘溶液进行双能 CT 扫描，旨在评估不同能量组合下碘浓度测量的准确性。**方法** 使用 A 组 (sn140 kVp/80 kVp)、B 组 (sn140 kVp/100 kVp) 和 C 组 (140 kVp/80 kVp) 能量组合方式的双能 CT 扫描方案，依次对体外 11 杯碘溶液进行扫描，碘浓度分别为 30、15、7.5、3.75、1.88、0.94、0.47、0.24、0.12、0.06 以及 0 mgI/ml。CT 数据经工作站处理得到碘图，以相同大小的感兴趣区域测量各杯溶液的碘浓度。以真实值为自变量，测量值为应变量，建立回归方程并做方差分析，计算 SN 比值来评价三组碘浓度测量的误差。**结果** 1.真实值与测量值的回归方程，A 组中测量值 $=0.164+0.929 \times \text{真实值}$ ；B 组中测量值 $=0.434+0.856 \times \text{真实值}$ ；C 组中测量值 $= -0.072+1.089 \times \text{真实值}$ 。调整后的 R^2 分别为 99.6%，99.2%，99.4%。
2.方差分析中，真实值与三组的测量值之间均存在显著线性关系 ($P<0.001$)；三组的 SN 比值分别为 2.61，1.34，1.92。
3.辐射剂量方面，A 组最低 (0.59 mgy)，小于 B 组 (0.62 mgy) 和 C 组 (0.60 mgy)。
结论 双源 CT 中三组能量组合方式下的碘浓度测量值均能准确反应真实碘浓度，其中 A 组测量的误差最小，而且辐射剂量最低。

PU-0337

大环类及线性分子含钆对比剂脑沉积与神经心理测评相关性研究

项晔、涂金成、谢兵
乐山市中医医院

目的:探究大环类及线性分子含钆对比剂发生颅内沉积后与神经心理行为学变化的相关性。方法:收集 2021 年 9 月—2023 年 5 月在乐山市中医医院使用大环类造影剂行颅脑 MRI 增强扫描检查 3 次以上受试者 30 例,定为 A 组;再收集使用线性分子造影剂行颅脑 MRI 增强扫描检查 3 次以上受试者 30 例,定为 B 组,并选择年龄、性别构成相仿,未行增强的颅脑 MRI 平扫受试者 30 例,设为 C 组。分别测量 A、B、C 各组受试者苍白球、齿状核及脑桥信号强度。以脑桥 T1WI 信号强度为基准,计算各核团的 TIWI 信号强度比。设定 X 核团信号强度比= X 核团平均信号强度/脑桥信号强度。并测量检查首末两次信号强度比差值。设定为首末两次信号强度比差值=末次平均信号强度比-首次平均信号强度比。对比分析三组受试者苍白球及齿状核 T1WI 信号强度比差异以及首末两次信号强度比差值。并由心身医学科高年资医师采用蒙特利尔认知评估量表 (MoCA) 及日常生活活动能力 (ADL) 量表及分别对 A、B、C 三组受试者在首次及末次扫描结束后进行评估。并将三组受试者苍白球及齿状核 T1WI 信号比及差值同受试者 MoCA 量表及 ADL 量表评分结果进行相关性分析。结果:A 组苍白球及齿状核信号强度比同 B 组类似,但均高于对比组 C 组,且 B 组首末两次信号强度比差值明显大于 A 组,且差异均有统计学意义。A、B、C 三组受试者 MoCA 量表及 ADL 量表评分结果差异无统计学意义。A 组及 B 组苍白球及齿状核 T1WI 信号强度比及首末两次信号强度比差值也与受试者 MoCA 量表及 ADL 量表评分结果无相关性。结论:多次注射钆对比剂会导致苍白球及小脑齿状核等神经核团钆对比剂的沉积。且线性分子类钆剂首末两次信号强度比差值较大环类钆剂大,可能提示更易沉积。但二者产生钆沉积后与神经心理相关活动及认知功能损害无相关性。

PU-0338

不同对比剂磁共振肝脏增强动脉期呼吸伪影的影响因素探讨

秦智
东南大学附属中大医院

摘要:目的:探讨患者在行肝脏 MRI 增强成像时,动脉期图像呼吸伪影产生影响的因素。方法:回顾性收集我院 2020 年 12 月至 2022 年 5 月行普美显 (Gd-EOB-DTPA) 及钆喷酸葡胺 (Gd-DTPA) 增强 MRI 的 200 例患者,影像资料均由西门子 vida 3.0T 扫描获得。动脉期图像按呼吸伪影的严重程度分为 (无及轻度,中重度),患者临床资料按年龄段、来源、有无既往腹部 MRI 检查进行分组,采用卡方检验比较动脉期图像呼吸伪影率在各因素水平间的差异,以及使用不同对比剂对动脉期图像伪影的影响。结果:差异性分析显示,不同年龄段间动脉期伪影率无统计学意义 ($P > 0.05$),不同患者来源间动脉期图像伪影率有统计学意义, ($\chi^2=11.69, P < 0.05$),其中介入科伪影率显著高于肿瘤科,但与其它科室以及其它科室之间均无统计学差异。动脉期图像伪影率在有无既往检查间统计极其显著 ($\chi^2=10.42, P < 0.001$),无既往检查发生伪影的可能性是有既往检查的 3.5 倍。讨论:在肝脏 MRI 增强动脉期伪影率的影响因素中,患者的年龄、不同钆对比剂的使用未见明确相关性,也不是其独立影响因素。在患者来源和既往 MRI 检查的这两个组别间,动脉期伪影发生率存在显著差异,说明患者来源和既往腹部 MRI 检查是磁共振肝脏增强动脉期呼吸伪影的影响因素。

PU-0339

德谷门冬胰岛素联合二甲双胍治疗糖尿病患者的应用及对 BMI 评分的影响

由晓丹
辽阳市糖尿病医院

目的探讨德谷门冬胰岛素联合二甲双胍治疗 2 型糖尿病患者的应用及对体重指数 BMI 评分的影响。方法研究对象为在本院 2019 年 5 月-2020 年 11 月期间收治住院的 113 例 2 型糖尿病患者, 将其随机分为 2 组: 研究组(n=57)与对照组(n=56)。其中对照组单纯给予德谷门冬胰岛素降糖治疗, 另一研究组给予德谷门冬胰岛素联合二甲双胍降糖治疗。对比两组治疗后的降糖效果、相关血糖指标与体重 BMI 评分变化、相关血脂指标的变化以及生活质量评分的变化。结果: 对照组临床有效率为 80.4% 比研究组的 93.0% 要低($P < 0.05$); 两组(对照组与研究组)治疗前的相关血糖指标与 BMI 评分相比, 二者无较大差异($P > 0.05$), 对照组治疗后的相关血糖指标与 BMI 评分比研究组低($P < 0.05$); 两组治疗前的相关血脂的指标相比无较大差异($P > 0.05$), 对照组治疗后的相关血脂的指标比研究组低($P < 0.05$); 对照组治疗后的生活质量评分比研究组的低($P < 0.05$)。结论: 德谷门冬胰岛素联合二甲双胍治疗 2 型糖尿病患者, 降糖效果理想, 患者的体重指数 BMI 评分降低, 血糖及血脂水平得到控制, 生活质量改善, 可在临床推广应用。

可激活磁共振成像纳米探针的制备及生物医学应用

胡建宇
东南大学附属中大医院

在生物医学领域, 磁共振成像是一种非常重要的疾病诊疗技术。近 50% 的磁共振检查已经涉及造影剂的应用。可激活磁共振成像纳米探针以优化信噪比为原则, 借助特异性的生物分子识别作用或分子交互作用增强磁共振信号, 提高了磁共振诊断的敏感性与特异性, 推动着磁共振成像在生物医学领域的广泛应用。本文就目前国内外热门研究的可激活磁共振纳米探针的种类、原理等方面进行阐述, 详细介绍了可激活磁共振纳米探针在生物医学上的应用, 在前景方面也进行了展望。

在 MRI 技术中, 造影剂的使用对于更好地反映活体条件下生物细胞内的正常或病理状态具有重要作用。常用的 MRI 造影剂分为两类: 一类是以 Fe_3O_4 纳米粒子为基础的阴性信号造影剂(negative contrast agent), 能产生强烈的 T2 阴性信号造影, 在 MRI 和多模式成像中应用较多。另一类是以钆离子螯合物马根维显(Magnevist, Gd-DTPA)为代表的阳性信号造影剂(positive contrast agent), 在临床上广泛使用。除此之外, T1 磁共振成像纳米造影剂随着纳米技术的快速发展而进入人们的视野, 比如使用不同外壳包裹的 Gd_2O_3 纳米颗粒(Gd_2O_3 NPs)作为 T1 阳性造影剂已经成功应用于肿瘤的 MRI。除了 Gd_2O_3 NPs, MnO 纳米颗粒(MnO NPs)作为一种 T1 阳性造影剂, 首先被 HYEON 团队应用于小鼠乳腺癌的选择性磁共振成像, 也取得了良好的显像效果。 Gd^{3+} 周围有 7 个不成对电子, 而 Mn^{2+} 周围有 5 个不成对电子, 这使得 MnO NPs 与 Gd_2O_3 NPs 相比具有较低的弛豫效能。 MnO NPs 尽管其阳性信号增强能力有限, 但具有较好的生物相容性, 受到了研究者的青睐。基于 Gd 的阳性信号造影剂具有导致肾源性系统性纤维化(NSF)的潜在毒性, 这促使研究者寻求更佳的材料。

PU-0341

在 ct 上如何让肝静脉血管体现得更好

郑兴华
吉林大学第一医院

ct 可分平扫和增强两部分，肝脏 CT 能检查可以检查一些病变，主要是鉴别病变的良恶性。主要包括弥漫性脂肪肝、肝硬化、肝脓肿、肝囊肿、肝脏肿瘤等等的判断。有些病灶需要增强才可以更好的确定，以便做出准确的结论。那么如果能让肝静脉血管更好的体现，就需要在静脉中注射含碘对比剂后再行 CT 检查的成像技术，根据病灶的强化特征鉴别病灶的性质。另外，可清晰显示肝内血管解剖，区分平扫图上所见到的血管断面影和小结节灶，可清楚地显示肝门结构及肝内胆管扩张。增强 CT，即针对在 CT 平扫基础上发现的可疑部位，在静脉中注射造影剂后有侧重的进行检查，进而能够提高诊断准确率的一种手段。和其他部位一样肝脏 CT 检查，既有一般原则，又必须根据临床要求个别对待。肝脏的血液供应和造影剂的药物动力学特点使得增强 CT 成为肝脏检查的重要手段，增强技术方法较多也较复杂。

ct 增强扫描，一共有三期，通过扫描这三期可以判断患者发生病变时的血流动特性，进而对患者病变的性质再进行判定，所谓的肝增强 ct，其实指的就是在注射过造影剂之后，进行 ct 扫描。临床上把其分为三期，即动脉期、门脉期以及延迟期。因为肝脏具有靠门脉和肝动脉共同供血的特点，而肝增强 ct 三期影像的差异，就可以帮助分析病变的原因以及发展的程度。在临床上是一种非常有用的方法，比如对于肝癌患者在动脉期强化时最明显，而门脉期就会稍弱。肝血管瘤的患者在门脉期稍强，到了后面程度就会越来越强。静脉血管走向分布也越来越明显。通过碘对比剂的注入。增强 ct 第二期根据静脉血管充盈程度，可以称之为静脉血管充盈期。此时静脉血管才更好的表现出来，这正是我们所研究的课题，很多方法都可以使肝静脉血管显现得更好，但在医学影像技术专业上，我们可以通过碘对比剂的方法，来做到我们想要的观察效果。这样不仅可以看清静脉血管的分布走向，也可以更清楚的找到病灶的位置，大小，可以更好的帮助临床医生进行疾病诊断与治疗。

PU-0342

4 例颈静脉穿刺高压注射外渗的根因分析

李春尧
南华大学附属第一医院

2023 年 1-7 月份本科室有 4 例颈静脉穿刺患者增强注射时外渗。经过组员的头脑风暴，从病人、陪检人员、护士、技师及高压注射的方法、流程、材料七个方面，用划鱼骨图的方式，分析原因，得出 2 个主要原因：

1. 流程：躁动的患者陪检人员对约束没有感知，不知道配合。
2. 方法：患者体位摆放不当，颈静脉不显露，颈部留置针受压、移位。

对照所列出来的鱼骨图，按照 5 个因果关系原则，团队成员再次进行了讨论，并以“5 个为什么”的倒推方式，筛选出导致事件发生的根本原因，最终确定 2 条根本原因：

- 1、科室对于躁动的、颈静脉穿刺的患者无检查流程。
- 2、没有具体的方法摆放患者头部，显露血管，保证管路不受压。

针对两条根本原因，科室制定颈静脉穿刺患者增强 CT 检查流程，备用约束带、枕头，并且进行流程的培训，进行增强风险预警意识的培训，经过培训，护理人员掌握了流程并且执行良好，对于高风险人群有预警意识，积极与技师沟通。行静脉穿刺时，N2 层级的护士会寻求 N3,N4 层级的护士指导及帮助。

效果：

7 月下旬开始实行颈静脉穿刺高压注射外渗行 RCA 改进方案, 2023 年 8 月, 颈静脉穿刺 17 例 (躁动患者 5 例), 外渗 1 例, 及时发现, 只外渗了 10ml 药液 (注射生理盐水时没有外渗), 经推拿处理, 肿胀立即消散。
不足: 此方法、流程不适用头颈 CTA 的检查。

PU-0343

多磺酸粘多糖乳膏+延伸护理在对比剂外渗中的应用效果

冯敏、卢璐、李月、刘瑞瑞、李笑石、马永利
西安大兴医院

目的: 探讨多磺酸粘多糖乳膏+延伸护理在对比剂外渗中的效果评价

方法: 回顾性选取本院 2021 年 7 月—2023 年 7 月 20 例中重度外渗患者 60 名, 随机分为 A、B 两组, A 组为观察组, B 组为对照组, 观察组用冰袋冰敷加多磺酸粘多糖乳膏涂抹, 进行每日三次随访交代家属及病人注意事项, 对照组用冰袋冰敷加 50%硫酸镁湿敷交代注意事项。记录并观察两组患者的疼痛指数评分 (VAS)、肿胀回复时间。对患者及家属进行 SAS 焦虑自评量表评分, 记录治疗效果。

结果: A 组 VAS 疼痛评分 6.23 ± 0.95 分, 肿胀恢复时间 2.23 ± 0.55 天, 患者 (或家属) 心理焦虑 SAS 评分 35.50 ± 0.66 分, 未出现皮肤组织损伤; B 组 VAS 疼痛评分 8.23 ± 0.95 分, 肿胀恢复时间 2.93 ± 0.95 天, 患者 (或家属) 心理焦虑 SAS 评分 45.70 ± 0.51 分, 出现 1 例皮肤组织红肿; 上述指标两组差异均有统计学意义 ($P < 0.05$), 经过 A 组处理后, 其护理效果显著高于 B 组。

结论: 发生造影剂外渗时使用多磺酸粘多糖乳膏涂抹并定时随访发现患者在发生对比剂外渗时疼痛程度显著降低, 肿胀恢复时间缩短, 患者及家属心理焦虑减轻, 使用多磺酸粘多糖乳膏涂抹并定时随访的患者中未出现皮肤组织损伤, 可以替代临床常规冰袋冰敷加 50%硫酸镁湿敷方法。

PU-0344

大脑中动脉斑块特征、脑灌注和颅内侧枝循环与复发性缺血性脑卒中的相关性

俞嘉伟、吴姚、吴珊珊、赵登玲
东南大学附属中大医院

目的: 探讨大脑中动脉狭窄患者中, 复发组和非复发组斑块特征、脑灌注和侧枝循环状态的差异, 寻找缺血性脑卒中复发的独立预测因子, 并建立卒中患者复发风险的预测模型。

方法: 回顾性分析 2018 年 2 月至 2021 年 7 月我院住院的 62 例单侧大脑中动脉狭窄 ($>50\%$) 伴供血区域急性或亚急性脑梗死患者的临床资料及头颅 MR 检查。所有患者行 12 个月的电话随访, 根据随访结果分为复发组 (12 例) 和非复发组 (50 例)。对所有患者的责任斑块 (梗死灶所在区域中供血动脉内唯一的斑块, 或多发斑块中造成管腔最狭窄者)、脑灌注和侧枝循环状态进行评估。斑块特征包括狭窄程度、管腔面积、斑块面积、斑块长度、标准化管壁指数、偏心指数、管腔重构指数和斑块强化等级。侧枝循环的评估在 TOF-MRA 横断原始图像上进行。在 CBF 图上评价 MCA 供血区的 10 个区域: M1-M6, 豆状核、尾状核、内囊后肢以及岛叶, 总共 10 个区域的权重相同。比较两组患者的影像学特征和临床基线资料。采用单因素及多因素 Logistic 回归分析, 获得复发性缺血性脑卒中的独立预测因子, 经过受试者工作特征曲线分析评估各变量预测缺血性脑卒中复发的诊断效能。

结果：复发组 CBF-ASPECTS 明显低于非复发组 ($P<0.01$)。两组的侧枝循环状态也有明显差异 ($P<0.01$)。复发组的斑块长度较非复发组更长。在单因素和多因素 Logistics 分析中，脑灌注和侧枝循环状态与缺血性脑卒中复发有关。联合两者进行诊断有更高的特异性。

结论：大脑中动脉粥样硬化性狭窄引起缺血性脑卒中的复发风险与脑灌注和侧支循环状态存在一定的关系。对脑灌注和侧支循环的联合评估有助于识别单侧大脑中动脉粥样硬化引起的复发性缺血性卒中。

钆塞酸二钠对比剂 MRI 腹部检查中的应用及护理

钟佳媚

郑州大学第一附属医院

目的：探讨磁共振肝脏特异性对比剂钆塞酸二钠对比剂在腹部检查中的应用及护理。

材料和方法：回顾性分析 2020 年 1 月~2020 年 12 月应用钆对比剂检查的 6609 例儿童相关资料及数据统计分析。

结果：增强扫描 6609 例均未出现不良反应，2% 的图像质量不能满足诊断要求，需要使用非肝脏特异性对比剂重新扫描动脉期。

结论：磁共振肝脏特异性对比剂钆塞酸二钠在用药安全有较好的表现，未发生一例过敏反应，但是在扫描图像质量上有待提高，当然这是多方面的原因。

PU-0346

Comparative study of CT imaging effects of contrast agents with different iodine concentrations in patients with the same primary hepatocellular carcinoma

Fei Peng, ChaoTian Luo, LinLin Liang, Cheng Tang, Peng Peng
The First Affiliated Hospital of Guangxi Medical University

Objective: The purpose of this study was to examine how different concentrations of iodine contrast affect the quality of imaging for primary hepatic carcinoma, liver parenchyma, abdominal aorta, and portal vein.

Methods: The researchers analyzed data from 29 patients with primary hepatocellular carcinoma who received two preoperative CT-enhanced examinations with either iohexol at a concentration of 300 mgI/mL (referred to as the low-concentration group) or Ioversol at a concentration of 350 mgI/mL (referred to as the high-concentration group) within three months. They compared the imaging effects of the two contrast agents for different parts of the liver and in various phases of the scanning process in a cohort-matched manner. Additionally, they evaluated the subjective scores for the quality of the images of the portal veins.

Results: The findings showed that the CT values of the liver parenchyma, aorta, portal vein, and other parts of the patients in the high-concentration group were higher than those in the low-concentration group ($P < 0.05$). However, there was no statistically significant difference between the CT values of the two groups in the scans of the liver cancer parenchyma at all stages ($P > 0.05$). Furthermore, the subjective scores of the images of the high-concentration group were better than those of the low-concentration group ($P < 0.05$).

Conclusion: According to the study, the utilization of high-concentration iodine contrast can significantly enhance the image quality of liver parenchyma, aorta, and portal vein in patients with

primary hepatocellular carcinoma. This improvement leads to the promotion of clinical use, making it a highly recommended method.

PU-0347

双低剂量双能量头颈部 CTA：虚拟单能谱的临床应用

张亦弛、尹胜男、迟婧、丁宁、计一丁
苏州市第九人民医院

目的：探讨双低剂量扫描技术在双能量头颈部 CTA 中的可行性 方法：前瞻性收集 2021 年 1 月~2021 年 5 月间本院 102 名因头颈部血管疾病行头颈部 CTA 的患者纳入研究，随机分为 CD、DLD 两组，CD 组行常规剂量扫描（管电压 100kV/Sn140kV，螺距 0.9，70ml 对比剂），DLD 组行双低剂量扫描（管电压 80kV/Sn140kV，螺距 1.2，30ml 对比剂），CD 组行 FBP 重建，线性融合（M=0.6）得到等效 120kV 图，DLD 组行 SAFIRE 迭代重建（迭代强度 3 级），使用虚拟单能谱技术得到 65keV 能谱图，余扫描参数一致；分别对两组图像行双能量去骨去钙化、MIP、VR，MPR、CPR 等后处理。分别对 2 组图像质量进行主观和客观评价，记录 2 组患者的 x 线剂量参数，包括 CTDIvol(mGy)和 DLP(mGy·cm)，并计算有效剂量 ED(mSv)，计算 2 组患者的碘摄入量 I(mg)，对结果进行统计学分析。结果：CD 组与 DLD 组的图像质量评分均 ≥ 3 分，均能满足诊断的要求。2 名医师对 2 组图像质量评价的一致性良好（Kappa 值分别为 0.817、0.825）。2 名医师对 2 组图像的主观质量评分的差异无统计学意义（Z=-0.572、-0.283，均 $P>0.05$ ）。CD 组与 DLD 组图像各层面血管 CT 值的差异均无统计学意义（t=-0.705、0.689、0.906，均 $P>0.05$ ）；颈内动脉起始部、大脑中动脉 M1 段层面血管噪声、SNR、CNR 的差异均无统计学意义（t=-0.830~1.842，均 $P>0.05$ ）；但颈总动脉起始部层面 CD 组噪声大于 DLD 组（t=2.855， $P<0.05$ ），SNR、CNR 小于 DLD 组（t=-4.959、-5.041，均 $P<0.05$ ）。DLD 组患者 CTDIvol、DLP 及 ED 较 CD 组分别降低 36.9%、35.3%、35.2%（t=186.138、37.753、37.753，均 $P<0.05$ ）。DLD 组患者碘摄入量较 CD 组降低 57.1%（10.5g VS. 24.5g）结论：双低剂量双能量头颈部 CTA 扫描技术在不影响图像质量的前提下，降低了患者接受的辐射剂量和对比剂碘摄入量

PU-0348

碘对比剂急性肾病的防治进展

赵俐红
四川大学华西医院

对比剂急性肾病（CIN）是临床实践中常见的一种可逆转的急性肾功能衰竭。随着造影技术的发展，对比剂已成为放射诊断与治疗中常用的药物之一。其中碘对比剂主要用于血管显影后介入治疗和影像学检查时增强局部组织的影像对比度；伴随着当前增强 CT 检查人数的增加，碘对比剂的广泛使用，CIN 的发病率呈逐年升高的趋势，已作为继缺血和药物损伤后患者急性肾损伤的重要病因。当前，对比剂诱导 CIN 发生的机理尚不完全清晰，主要包括氧化应激和细胞凋亡、肾缺血性及肾小管毒性损伤等。CIN 的发生可导致患者住院医疗费用增加，也可能导致患者发生不良结局（如急性心肌梗死、急性心力衰竭、透析及死亡等）的风险显著增加、住院时间延长等。因此，早期识别 CIN 发生的危险因素，并给予恰当的临床干预，例如水化、药物干预等，有助于高危 CIN 患者降低其发生率，改善预后。本次研究从 CIN 的诊断以及当前防治措施的进展进行综述，为临床提供依据。

PU-0349

对比 MRI 与超声对唇腭裂的产前诊断价值：Meta 分析

王文轩、张利平、张福洲、母其文
南充市中心医院

【摘要】目的：用 Meta 分析对比磁共振（MRI）与超声（US）对唇腭裂产前诊断的临床应用价值。**方法：**检索 EMBASE、PubMed、Web of science、Cochrane Library、万方、维普、中国知网及中国生物医学文献等数据库，查找所有比较 MRI 及 US 对胎儿唇腭裂产前诊断的相关研究，检索时限为 2000 年 1 月至 2022 年 12 月。制定纳入排除标准，采用 STATA 17.0 进行 Meta 分析：检验异质性；计算汇总诊断比值比（DOR）、灵敏度（SEN）、特异度（SPE）、阳性似然比（+LR）、阴性似然比（-LR）、受试者工作特性曲线下面积（AUC）、验前验后概率及 95%可信区间。计算 Z 统计量。结果：纳入文献 6 篇，共含病例 235 例。MRI 合并敏感性对比 US 合并敏感性（0.98（0.94-0.99）vs 0.70（0.35-0.91））； $P<0.05$ ，差异有统计学意义。MRI 合并特异性对比 US 合并特异性（0.84（0.76-0.90）vs 0.59（0.21-0.89））； $P>0.05$ ，差异无统计学意义。MRI 的 AUC=0.98 显著高于 US 的 AUC=0.84（ $P<0.05$ ）。结论：对于胎儿唇腭裂的产前诊断，MRI 较 US 具备更高的诊断效能；US 作为唇腭裂产前筛查的首选方法，当其在诊断腭裂受到不利因素或不能明确的情况下，MRI 检查可作为产前诊断的首要补充方法。

PU-0350

MRI 对唇腭裂产前诊断价值的 Meta 分析

王文轩、张利平、张福洲、郭志伟、杨浩
南充市中心医院

【摘要】目的：用 Meta 分析评价磁共振（Magnetic resonance imaging, MRI）对唇腭裂的产前诊断的临床应用价值。**方法：**检索 EMBASE、PubMed、Web of science、Cochrane Library、万方、维普、中国知网及中国生物医学文献等数据库，查找所有评价 MRI 对胎儿唇腭裂产前诊断的相关研究，检索时限为 2000 年 1 月至 2022 年 12 月，同时手检纳入文献的参考文献。制定纳入排除标准，采用 STATA 17.0 进行 Meta 分析：检验异质性；计算汇总诊断比值比（DOR）、灵敏度（SEN）、特异度（SPE）、阳性似然比（+LR）、阴性似然比（-LR）、受试者工作特性曲线下面积（AUC）、验前验后概率及 95%可信区间。结果：纳入文献 15 篇，共含病例 639 例。MRI 合并敏感性、特异性及 95%可信区间分别为：0.97（0.95-0.98）、0.91（0.77、0.97）。MRI 合并 AUC 及 95%可信区间：0.98（0.96、0.99）。结论：MRI 对于产前诊断胎儿唇腭裂畸形具有极高的诊断价值，尤其是当超声诊断腭裂受到不利因素或不能明确的情况下，MRI 检查可作为首选的无创检查方法。

PU-0351

超重/肥胖儿童代谢相关脂肪性肝病的磁共振质子密度脂肪分数分布特点

宋华丹、李金凝、汪登斌
上海交通大学医学院附属新华医院

目的：探讨超重/肥胖儿童代谢相关脂肪性肝病（MAFLD）的磁共振质子密度脂肪分数（MRI-PDFF）分布特点。**方法：**前瞻性入组 2022 年 8 月至 2023 年 3 月在上海交通大学医学院附属新华

医院行上腹部 3.0T 磁共振 mDixon-quant 序列扫描的超重/肥胖儿童受试者 69 例。收集入组受试者基本信息及实验室检查结果。根据全肝加权平均 MRI-PDFF (PDFFwm) 将受试者分为正常肝脏、轻度脂肪肝、中度脂肪肝及重度脂肪肝。分析肝脏各段 MRI-PDFF (PDFFI-VIII) 及其与 PDFFwm 在脂肪肝诊断及分级中的一致性; 分析肝段间 PDFF 值的变异度及其与脂肪肝分级的关系。结果: 69 例入组受试者中确诊 MAFLD 患者 58 例 (占比 84.06%)。MAFLD 患者 PDFFwm 为 (20.23±10.16) %, 相较于其他肝段, PDFFVII 最高 (22.23±9.85) %。PDFFV 与 PDFFwm 组内相关系数最高 (ICC=0.988, $p<0.001$)。正常肝脏 (PDFF 范围=2.59%) 及轻度脂肪肝 (PDFF 范围=7.15%) 受试者肝内脂肪分布变异度低于中度脂肪肝 (PDFF 范围=11.14%) 及重度脂肪肝 (PDFF 范围=9.71%) 受试者, 组间差异具有统计学意义 ($p<0.001$)。在诊断有无脂肪肝方面, PDFFV 与 PDFFwm 一致性最高 (Kappa 值=1, $p<0.001$)。在肝脏脂肪变程度分级方面, PDFFV 与 PDFFwm 一致性最高 (Kappa 值=0.880, $p<0.001$)。结论: 超重/肥胖儿童 MAFLD 发病率较高。MAFLD 患者肝段间脂肪分布具有显著不均质性, 且段间变异度随脂肪变程度增加而增大。相较于其他肝段, PDFFV 更能代表全肝进行肝脏脂肪定量及分级诊断。

PU-0352

CT 低剂量扫描及后处理技术在婴幼儿气管非金属异物中的应用探讨

刘杰
襄阳市中心医院

目的 探讨多层螺旋 CT 低剂量扫描及其后处理技术在婴幼儿气管非金属异物中的诊断价值。方法 分析我院收治的 48 例被确诊为婴幼儿气管非金属异物患者的 CT 影像学资料。128 层螺旋 CT 扫描参数为 100 kV, 30~40 mA, 层厚 0.9mm, 螺距 1.4, 对获得的数据进行多平面重建 (MPR)、最小密度投影 (Min-IP) 及 CT 仿真内窥镜 (CTVE) 与支气管内窥镜结果对比分析。结果 48 例 CT 低剂量扫描图像全部符合诊断要求。CT 对异物的检出率和支气管内镜无统计学差异, 三种后处理技术中 MPR 与 Min-IP 无统计学差异, MPR、Min-IP 分别与 CTVE 比较有显著性差异, MPR 和 Min-IP 诊断的准确性高于 CTVE。结论 螺旋 CT 及后处理技术能准确诊断及定位婴幼儿气管内的非金属异物, 清楚显示出异物的大小和位置, 具有很高的实用价值。

PU-0353

新生儿缺氧缺血性脑病 MRI 分类与临床表现的相关性

郭莹莹
郑州大学第五附属医院

新生儿缺氧缺血性脑病 (HIE) 是新生儿常见且严重的疾病, 由于氧供不足或血液供应不足引起。磁共振成像 (MRI) 技术的发展为新生儿 HIE 的诊断和分级提供了重要手段。本文探讨了新生儿 HIE 的 MRI 分类与临床表现的相关性。通过回顾现有研究成果, 我们发现新生儿 HIE 的 MRI 分类通常根据损伤程度和分布进行。脑白质损伤和灰质损伤是主要表现形式, 且与临床症状和预后密切相关。脑白质损伤和混合型损伤的预后较差, 而灰质损伤的预后相对较好。新生儿 HIE MRI 分类在临床实践中应用广泛, 可为医生提供评估患者病情和选择合适治疗方案的依据。然而, 目前对于新生儿 HIE MRI 分类与临床表现的相关性还需进一步研究验证。通过深入探讨该相关性, 可为新生儿 HIE 的诊断和治疗提供更准确和有效的方法。

PU-0354

多学科联合诊治围产期十二指肠隔膜型闭锁一例

卞巍
嘉兴市妇幼保健院

本文报道了 1 例十二指肠隔膜型闭锁的诊治过程。此病例因“孕 32 周+1 于嘉兴市妇幼保健院行常规产前检查”。本院超声检查发现胎儿胃及十二指肠扩张呈“双泡征”，MRI 检查发现十二指肠隔膜，经过多学科会诊讨论，于 36 周+4 天平产，新生儿产后 2 天行外科手术，术中确诊十二指肠隔膜型闭锁，手术切除十二指肠隔膜，患儿术后恢复良好。随访半年，患儿各生长参数及神经系统发育检测均正常。因此，多学科团队联合诊治对十二指肠隔膜型闭锁患儿的诊断及预后具有重要意义。

PU-0355

骨龄测定在儿童生长发育中的应用价值

于海侠、李德春、赵莉、翟天旭
徐州市中心医院

目的：探究骨龄测定在儿童生长发育中的应用价值。

方法：资料随机选取本院 2022 年 1 月至 2022 年 12 月收集的 100 例健康儿童作为本次观察对象，采用中华 05 软件评分系统、TW3 评分法及 G-P 图谱法 3 种测评方法，对所有纳入对象骨龄进行检测。

结果：52 名健康男孩、女孩骨龄与年龄基本一致，差异无统计学意义($P>0.05$)。身材矮小、性早熟、生长激素缺乏症、甲状腺功能低下、体质性生长延迟、特纳氏综合征骨龄与年龄存在差异，差异有统计学意义($P<0.05$)。

结论：骨龄测定可以监测儿童生长发育情况，较早提示儿童内分泌相关疾病，骨龄测定对于儿童生长发育评估及诊断相应的疾病具有重要的意义。

PU-0356

Brain MRI imaging makers associated with death in children with central nervous system involvement of haemophagocytic lymphohistiocytosis

Wei Ma^{1,2}, Ye Xu²

1. The People's Hospital of Yubei District of Chongqing City
2. Children's Hospital of Chongqing Medical University

Objectives To investigate the association of brain MRI variables, clinical variables, and underlying diseases with death in children with central nervous system involvement of hemophagocytic lymphohistiocytosis (CNS-HLH).

Methods Clinical and brain MRI data of children with CNS-HLH from January 2012 to March 2022 were reviewed retrospectively. Patients were divided into the deceased group and the surviving group. The inter-group differences of seven brain MRI variables, eleven major clinical variables, and underlying diseases were studied.

Results One-hundred-and-fourteen patients were included in this study, consisting of 59 who died and 55 who survived. The included clinical variables involving demographic data, neuropsychiatric presentations, and cerebrospinal fluid test, blood routine test, liver function,

coagulation function, and Diagnosis-MRI time interval did not show statistically independent correlation with patients' deaths. For MRI variables, a multivariate analysis demonstrated restricted diffusion of lesion (OR = 9.64, 95% CI: 3.39-27.43, $p < 0.001$) and count of affected brain regions (CABR) (OR = 1.24, 95% CI: 1.03-1.49, $p = 0.02$) were independent risk factors for death. ROC curve showed CABR (AUC = 0.79, 95% CI: 0.70-0.87, $p < 0.001$) highly predictive for mortality with an optimal cutoff value of 4.5 (sensitivity 76%, specificity 73%). For HLH subtypes, familial HLH (F-HLH, OR = 9.90, 95% CI: 2.01- 48.87, $p = 0.005$) and immune-compromise-related-HLH (IC-HLH, OR = 4.95, 95% CI: 1.40-17.46, $p = 0.01$) presented statistically stronger association with death than infection-related HLH. F-HLH and IC-HLH preferred to have large lesions, restricted diffusion, and more brain regions involved than other subtypes.

Conclusion Brain MRI features exhibit independent prediction for mortality in children with CNS-HLH, and HLH subtypes pose effects on patient outcomes and brain MRI findings.

PU-0357

手法按摩在空气灌肠治疗小儿肠套叠中的临床运用

周金发

南京医科大学第二附属医院

[摘要]目的：探讨手法按摩在空气灌肠治疗小儿肠套叠中的临床运用价值。方法：回顾性分析 2014 年 6 月至 2019 年 5 月间本人在我院行空气灌肠检查确诊肠套叠患儿 39 例（总计 62 例，阴性 23 例未入组），分为按摩组 18 例和对照组 21 例。并对计数结果采用 X² 检验。结果：总计行空气灌肠患儿 62 例，阳性 39 例，阴性 23 例，阳性率 62.9%。其中对照组 21 例，整复 18 例（一次成功 11 例，2-3 次成功 7），未整复 3 例，按摩组 18 例，整复 17 例（一次成功 16 例，2-3 次成功 1），未整复 1 例。Pearson 卡方检验 $P=0.044$ ，Fisher 精确检验 $P=0.036$ ， P 值均 <0.05 ，具有统计学差异。结论：手法按摩联合空气灌肠在整复成功率及一次成功率上均优于传统的未采用手法按摩空气灌肠，具有实际临床运用价值。

PU-0358

儿童十二指肠血肿的影像学诊断价值

林慧慧、李旭、李庚武

安徽省儿童医院

【目的】 探讨儿童十二指肠血肿的影像学特点及预后。

【方法】 回顾性分析我院 2016 年 6 月至 2023 年 6 月收治的 15 例十二指肠血肿患儿的临床及影像学资料。年龄 3~13 岁，其中男性 10 例，女性 5 例。所有患儿均有外伤史，经临床或手术探查证实，其中 13 例行 CT 检查，2 例行 MRI 检查。

【结果】 所有病灶均单发，呈类圆形或长椭圆形，位于十二指肠降部 3 例，水平部 5 例，两者都累及 7 例，合并有肠梗阻 5 例。CT 平扫呈不均匀等高密度包块，“融冰征”5 例，“空气裂隙征”3 例，MRI 平扫病灶 T1WI 呈稍高混杂信号，T2WI 呈低或等高信号；增强扫描病灶内均无强化，4 例伴有血肿壁强化。其中 11 例患儿伴有胆总管轻度扩张。

【结论】 对于十二指肠壁内血肿患儿，早期诊断至关重要。典型的影像学表现，有助临床医生找到最佳的治疗方法。

儿童神经母细胞瘤的研究思路及进展

何玲

重庆医科大学附属儿童医院

影像组学和深度学习的兴起为神经母细胞瘤的精准诊断和预后预测提供了一种有价值 and 前景的研究方法和手段。影像组学这一概念的核心,是从 CT、MRI 等影像学图像的感兴趣区中高通量的提取高维特征(如一阶直方图、二阶纹理以及经小波变换、高斯拉普拉斯算子等滤波转换的高阶特征),并将筛选的特征与患者生物标志物、临床表现或预后等相关联,从而有助于在体外非侵入性的对疾病的分子及病理亚型进行诊断与鉴别诊断,甚至预测疾病的发生发展。

神经母细胞瘤沿交感神经链走行分布,是儿童常见的实体肿瘤,约占儿童肿瘤的 7.3%。神经母细胞瘤绝大部分发生于颅外,但也偶出现于颅内,其中 48%位于肾上腺,25%位于腹膜后间隙,16%位于纵隔,3%位于盆腔,3%位于颈部。除了可局限于一个解剖部位,神经母细胞瘤也可沿着交感神经链走行而联合多个解剖部位发生。

神经母细胞瘤异质性强,可自发消退或恶性进展,具有多种组织病理类型,不同病理亚型及不同部位起源的神经母细胞瘤临床表现及预后差异很大,治疗方式的选择也存在较大不同。目前,临床多以危险度分层治疗神经母细胞瘤。尽管随着放化疗、免疫治疗和手术等治疗方式的综合应用,神经母细胞瘤的预后已有极大改善,但高危及难治复发性神经母细胞瘤的预后仍较差,长期生存率不足 50%。

影像学检查在神经母细胞瘤的定性诊断及明确术前解剖关系中具有重要价值。然而,由于神经母细胞瘤的生物学特征复杂,单纯从影像学上较难鉴别不同类型的神经母细胞瘤。

相对于影像学上传统的视觉分析,影像组学有助于准确、客观、定量的评价病变状态。因此,以影像组学和深度学习为基础的人工智能,有望为儿童神经母细胞瘤的病理鉴别、基因分型、疗效评估和预后预测提供一种无创可靠的工具和方法。

国人儿童正常主动脉的多排螺旋 CT 测量

杨阳

苏州大学附属儿童医院

目的 利用 CT 数据建立健康儿童主动脉各主要层面的有效主动脉直径标准。

方法 选取胸腹部 CT 增强扫描检查无主动脉疾病及其他相关疾病的儿童 200 名,按年龄分为 5 组,测量双斜位重建的胸主动脉、腹主动脉和髂总动脉的多个水平上的有效主动脉直径。最小二乘法用于研究具有各种功能形式的模型,这些模型将每个水平上的有效直径与患者体表面积(BSA)和性别相关。

结果 200 例胸腹部增强 CT 检查,年龄 0~16 岁(平均 9.9 岁,标准差 5.7),BSA 范围为 0.19~2.52m²。具有良好的信度(相关系数为 0.95~0.98)。最佳模型为有效直径的自然对数变换的多项式回归模型,该模型包括线性、二次和三次 BSA 项以及作为主要变量的性别主效应。Z 分数是利用观察到的和预期的有效直径和均方误差计算的。

结论 本研究初步得到不同年龄段儿童主动脉多节段的相关正常值,正常范围外的测量结果与动脉瘤或主动脉发育不良相符,有助于诊治儿童主动脉的相关疾病。

新生儿先天性马蹄肺合并胸主动脉扭曲畸形 CT 表现 1 例

朱晴、唐文伟、田忠甫、解婷
南京市妇幼保健院

该文报道 1 例新生儿先天性马蹄肺合并胸主动脉扭曲畸形的多层螺旋 CT 表现。患儿生后紫绀, 呼吸急促。CT 表现为在脊柱前方心影后方两下肺峡部肺组织相连, 伴左肺发育不良, 完全性肺静脉异位引流, 永存左上腔静脉, 主动脉弓发育不良, 降主动脉走行迂曲、延长, 动脉导管走行迂曲。

儿童中重型创伤性颅脑损伤影像学表现分析

吴素芳^{1,2}、陶晓娟¹、彭芸¹
1. 国家儿童医学中心首都医科大学附属北京儿童医院影像中心
2. 北京按摩医院

[摘要] 目的 回顾性分析儿童中重型创伤性颅脑损伤的病因及影像学表现, 探讨影像检查对儿童创伤性颅脑损伤的应用价值, 分析各年龄段致伤因素与阳性影像表现之间的关系。方法 收集 2018 年 1 月—2019 年 12 月 130 例中重型创伤性颅脑损伤患者的临床影像资料, 对致伤因素、病变类型、病变影像学特征和病变分布进行回顾性分析。结果 中重型创伤性颅脑损伤最常见致伤因素为道路交通伤、坠落伤。脑挫裂伤 130 例中, 坠落伤所致脑挫裂伤各部位受损概率依次为额叶、顶叶、颞叶, 交通伤所致脑挫裂伤各部位受损概率依次为颞叶、额叶、顶叶。颅骨骨折 86 例中顶骨 51 例。弥漫性轴索损伤 17 例, 部位分布主要为额叶、颞叶、胼胝体压部。结论 儿童中重型创伤性颅脑损伤在致伤因素、病变类型、影像特征等方面有其自身特点, 以脑挫裂伤和弥漫性轴索损伤为主要表现; 不同致伤因素所致的脑挫裂伤, 损伤部位出现的概率不同, 同时, 骨折主要发生在顶骨。CT 不能明确的可疑脑损伤应进一步行 MRI 检查。

PU-0364

低危高胆红素血症新生儿苍白球 T1WI 信号改变与血清总胆红素值的相关性研究

田忠甫、唐文伟、陆小燕
南京市妇幼保健院

[摘要] 目的 探讨低危高胆红素血症新生儿苍白球在磁共振成像 T1WI 信号改变与血清总胆红素(TSB)的关系。方法 回顾分析 117 例低危高胆红素血症新生儿磁共振图像及临床资料,根据 TSB 值分为 I ~IV 组,对苍白球 T1WI 信号进行定量采集,分析苍白球 T1WI 信号强度值、苍白球/尾状核头部 T1WI 信号强度值比值与总胆红素(TSB)值关系。结果 总胆红素(TSB)值与苍白球 T1WI 信号强度值、苍白球/尾状核头部 T1WI 信号强度值比值之间存在直线相关关系,差异有统计学意义。结论 苍白球 T1WI 信号强度值、苍白球/尾状核头部 T1WI 信号强度值比值在评估高胆红素血症急性脑损伤有参考意义,苍白球/尾状核头部 T1WI 信号强度值比值更具客观准确性。

PU-0365

眼脑肾综合征--影像与临床诊断思维总结

马文婷、王莉莉
甘肃省人民医院

目的:眼脑肾综合征是一种罕见的 X 连锁隐性遗传病,发病率极低,约为 1/50 万,大家认识不足,正确诊断比较困难,需结合临床及影像系统分析其特点,方能做出正确诊断,为早期精准治疗做基础。

方法:一 8 岁男童经基因检测确诊为眼-肾-脑综合征,收集其病史,检查结果,治疗过程,查阅中英文文献报道,系统汇总该疾病临床影像特点。

结果:该患儿足月顺产,出生无窒息史,其母亲及外婆均患先天性白内障,父亲患类风湿关节炎,患儿自出生后智力发育迟缓,生活不能自理,行为障碍,但可与医生进行基本对答。患儿出生后 3 个月行白内障手术,7 岁行马蹄内翻足手术,8 岁行隐睾手术。近日因发烧,呕吐,腹痛,无尿入院,生化检查提示高钾低钠血症,代谢性酸中毒,低氯低磷高氨血症。超声提示:双肾髓质钙沉积,双肾实质弥漫损害。X 线提示双肺渗出。MR 提示双侧大脑半球皮层下,半卵圆中心,基底节区,侧脑室白质区多发片状 T2-FLAIR 高信号,幕上脑室系统扩张伴脑室旁水肿,双侧侧脑室体旁多发增宽 V-R 间隙。腹部 MR 提示胰腺肿胀,T1 信号减低,T2 信号不均匀增高。

结论:眼脑肾综合征又称 Lowe 综合征,是以先天性白内障,智能低下,肾小管酸中毒为主要临床特征的遗传性疾病,属于多系统氨基酸代谢病。该病与 OCRL 基因突变有关,大部分为男性患儿,目前无法治愈。1.患儿出生时肌张力降低,出生后一年内出现白内障或者青光眼。2.MR:新生儿脑白质髓鞘化延迟,皮层下侧脑室周围白质血管周围间隙扩张并胶质增生,呈进展性,该征象具有一定特征性。3.进展性肾小管型蛋白尿,高钙尿性肾结石,后期肾损伤,代谢性酸中毒。以上 3 点是其主要诊断依据,临床工作中遇到需要考虑该病。据文献报道部分患儿有骨畸形,佝偻病,隐睾,脐疝。我们从这例病人影像资料中发现胰腺水肿,双肺渗出,这是文献中没有报道的,查阅资料考虑为代谢性酸中毒所诱发的胰腺实质渗出,肺水肿,需要在临床中注意。

PU-0366

多层螺旋 CT 在儿童塑型性支气管炎早期诊断的价值研究

杨彦^{1,3}、陈杰云²

1. 泉州市妇幼保健院儿童医院

2. 福建医科大学附属泉州第一医院

3. 福建医科大学

目的：探讨儿童塑型性支气管炎（PB）的肺部 CT 影像特征，提高对塑型性支气管炎的认识，为临床早期诊断与精准治疗提供帮助。

方法：回顾性分析 2018 年 1 月至 2022 年 2 月我院收治的儿童肺炎病例，以纤维支气管镜的检查结果作为金标准，按照是否发现塑型性痰栓分为观察组（PB 组）与对照组（非 PB 组），每组随机抽取 50 例。分析两组患者的 CT 影像资料，并把影像图像特征按预设的评分标准转换为计量资料（评分），评估各项 CT 影像特征与图像特征总分的诊断价值。采用 IBM SPSS Statistics 26 统计学软件进行统计学分析，所有统计结果以 $P < 0.05$ 为标准，判断有无统计学意义。

结果：

两组患者的肺部 CT 影像资料按设定的要求转化为评分后进行统计分析，发现：PB 组更常出现胸腔积液、肺不张或肺实变，差异具有统计学意义。病变分布情况，PB 组平均累及 1.29 个肺叶，非 PB 组平均累及 1.98 个肺叶，PB 组病灶更集中且出现单个肺叶大面积病灶的几率更高。病灶的体积变化，PB 组 72% 表现为增大，非 PB 组体积变化无明显特征，差异具有统计学意义。病变的密实程度评价：病变测得的 CT 值更高，CT 值方差更小，PB 组的病变含气更少、更密实，差异具有统计学意义。病变的气管形态，PB 组近端气管和病变支气管所属分支支气管的堵塞、狭窄程度均高于对照组，差异具有统计学意义。图像总分（21 分）PB 组总分（ 16.32 ± 2.889 分）明显高于非 PB 组（ 10.30 ± 3.694 分），差异具有统计学意义。

结论：

儿童塑型性支气管炎的 CT 征象对诊断具有很大的提示意义，常表现为病变支气管几乎完全堵塞，所属病变范围呈饱满的、密度均匀的、密实的、几乎没有下级支气管显影的大片状软组织密度影，常伴有胸腔积液。

PU-0367

儿童卡波西样淋巴管瘤病的影像学特征

贺小娅

重庆医科大学附属儿童医院

目的：儿童卡波西样淋巴管瘤病是一种罕见的、复杂的侵袭性淋巴管疾病，由于表现的体征和症状多样，卡波西样淋巴管瘤病常被误诊或诊断较晚。卡波西样淋巴管瘤病的影像学表现特征可与中央传导淋巴异常和全身性淋巴异常重叠。目前关于卡波西样淋巴管瘤病的少数病例报告主要强调临床和组织病理学表现，对影像学表现的描述较少。因此，本研究的目的是分析卡波西样淋巴管瘤病的影像学特征，以提高对该病的诊断和鉴别诊断水平。

方法：回顾性分析了 2013.06-2023.06 经我院收治的 8 例经组织病理学诊断为卡波西样淋巴管瘤病的儿童患者的临床及影像资料，8 例患者均行 CT 平扫+增强检查，4 例患者行 MR 平扫+增强检查。对其影像特点进行总结分析。

结果：该病中位发病年龄为 5 岁 3 月，无明显性别差异。最常见的表现特征为呼吸系统损害（呼吸困难、咳嗽）、出血和软组织肿块。临床病程具有典型的侵袭性，以出血、血小板减少、纤维蛋白原水平降低为特征。所有患者均有纵隔受累，并出现胸腔积液及心包积液，其次是肺部受累，以肺间质性改变为主。胸外疾病可以累及腹膜后、脾脏、淋巴结及脊柱。卡波西样淋巴管瘤病的特征性

的影像表现为：（1）纵隔、肺门、支气管血管束周围、小叶间隔等多部位受累且病变相互延续，病变几乎都累及双侧；腹膜后受累常见；（2）CT 平扫上病变呈低密度，增强无明显强化；在 MR 上病变呈 T1 低、T2 高信号影，增强亦无明显强化；MR 显示病变更加清晰，定性更准确；（3）病变包绕邻近血管，几乎无压迫、推移血管；（4）多伴有胸腔积液、心包积液；（5）脾脏受累多见，胸腺亦可受累；（6）可合并单个或多个椎体受累；（7）可伴有颈部、腋下、腹膜后或腹股沟区淋巴结肿大。

结论：儿童卡波西样淋巴管瘤病与中央传导淋巴异常和全身淋巴异常的影像学特征重叠。纵隔或腹膜后见沿淋巴分布的浸润性软组织疾病，伴有出血性积液和中度血小板减少有利于卡波西样淋巴管瘤病的诊断。

PU-0368

探讨磁共振(MRI)全身背景抑制弥散加权成像(DWIBS)结合全身短反转恢复脂肪抑制序列 (STIR) 在儿童血液系统恶性肿瘤预后评估的应用价值

高凯、孙惠苗、李佳雯、武艳君、杨洁、杨宏、胡磊、续智、李欣
山西省儿童医院（山西省妇幼保健院）

目的：全身背景抑制弥散加权成像 (DWIBS)，是一种可用于全身检查的核磁共振成像技术，尤其可以较好的显示转移病灶、淋巴结及骨骼系统病变，其无辐射、可重复率高的特点对儿童血液病患者检查有着独特的优势。本研究的目的是分析磁共振(MRI)全身背景抑制弥散加权成像(DWIBS)结合全身短反转恢复脂肪抑制序列 STIR 在儿童血液系统恶性肿瘤的病变检出特异性及敏感性，分析其在儿童血液系统恶性肿瘤预后评估的应用价值。

方法：收集 2 年就诊于山西省儿童医院的对怀疑为儿童血液恶性肿瘤且有转移的患儿共 50 例，行全身背景抑制弥散加权成像(DWIBS)扫描及全身短反转恢复脂肪抑制序列 (STIR)，扫描完成后进行 MPR 及 MIP 后处理，对图像进行分析。研究 DWIBS 诊断儿童血液系统恶性肿瘤病变检出的灵敏度、特异度、约登指数、阳性预测值及阴性预测值和 ROC 曲线下面积。

结果：通过对 DWIBS 结合全身 STIR 序列结果与手术或穿刺病理结果进行对照。使用 SPSS 22.0 软件包进行 χ^2 检验、Kappa 一致性检验比较分析，差异具有统计学意义($P<0.05$)。

结论：经过我们对 50 例患儿扫描图像的研究，综合分析结合 DWIBS 技术及全身 STIR 序列的优势，能很好地显示发现儿童血液系统恶性肿瘤原发肿瘤及其可能的转移部位。有望成为未来儿童血液系统恶性肿瘤筛查及预后评估的有效手段，能够有效指导临床进一步治疗，并对临床治疗效果进行评价。

PU-0369

3.0T MRI T2Mapping 序列对 0~5 岁正常儿童髋关节软骨评估的探索性分析

高凯、孙惠苗、李佳雯、武艳君、杨洁、温家祥、靳波、杨晓燕、杨宏、胡磊
山西省儿童医院（山西省妇幼保健院）

[摘要] 目的：利用 3.0T MRI T2Mapping 序列对 0~5 岁正常儿童髋关节软骨行磁共振扫描并量化分析，探究 5 岁以下不同阶段髋关节软骨 T2 值变化规律及相关因素分析，初步建立 0~5 岁正常儿童髋关节软骨 T2 值的参考范围。方法：收集发育正常儿童 98 名，其中男 46 名，女 52 名。根

据年龄分成 5 组：0~<1 岁 16 名，1~<2 岁 22 名，2~<3 岁 19 名，3~<4 岁 25 名，4~<5 岁 16 名。分别对所有儿童行髌关节常规序列、T2-mapping 序列扫描，在髌臼软骨及与其对应的股骨头软骨划分上、前、后三个区域，共 6 个亚区，测量其 T2 值。观察分析组间及组内不同亚区 T2 值的差异并计算其正常值范围，分析相关因素。结果：0~5 岁正常儿童髌关节软骨，不同性别各亚区间 T2 值比较差异均无统计学意义（均 $P>0.05$ ）。左、右两侧对应亚区 T2 值比较差异均无统计学意义（均 $P>0.05$ ）。不同髌关节亚区各年龄组 T2 值比较，年龄组间 T2 值差异有统计学意义（均 $P<0.05$ ）。结论：3.0T MRI T2 mapping 序列能定量分析儿童髌关节软骨 T2 值，0~5 岁正常儿童髌关节软骨各亚区软骨 T2 值与年龄相关，与性别和左右无关。

PU-0370

婴幼儿新型冠状病毒脑损伤 MRI 影像表现

张士朋

甘肃省妇幼保健院

[摘要] 目的：总结婴幼儿新型冠状病毒肺炎脑损伤 MRI 影像表现。方法：回顾性收集 2022 年 11 月-2023 年 2 月甘肃省妇幼保健院确诊的新型冠状病毒感染合并头颅 MRI 异常患儿共计 18 例，记录患儿发病部位、信号特点，记录患儿的基本临床信息及实验室检查数据。结果：本研究共收集符合新型冠状病毒肺炎脑部 MRI 异常表现的患儿共计 18 例，其中包含男性患儿 12 例（12/18），女性患儿 6 例（6/18），年龄 5 天-12 岁，中位年龄 1 岁；临床表现为发热 14 例，抽搐 16 例，头痛 5 例（部分小龄患儿无法表述），呕吐 4 例，腹泻 3 例，嗜睡 6 例，除 2 例婴儿血氧含量大于 95%，其余均 $\leq 95\%$ ；18 例患儿的头颅 MRI 影像共发现病损部位 106 处，多呈对称性分布（12/18），丘脑 6 例共 12 处，壳核及脑干均发生 5 例共 10 处，苍白球及尾状核均发生 4 例共 8 处，大脑皮层受累 5 例。所有病灶均表现为 T1WI 稍低信号，T2WI 稍高信号，Flair 序列为高信号，DWI 高信号，13 例 ADC 图为低信号（13/18），5 例 ADC 图为高、低混杂信号，所有患儿 T1WI 序列均未发现明显出血性 T1WI 高信号。结论：婴幼儿 COVID-19 脑损伤与 SARS-CoV-2 直接感染、ACE2 相关血管内膜损伤及炎症因子风暴等多重因素作用相关，主要累及大脑深部核团，多呈对称性分布，脑干及大脑皮层亦可累及，可导致严重的神经系统症状，MRI 在婴幼儿 COVID-19 脑损伤的早期识别及动态监测中具有重要临床价值，可为临床治疗决策的制定提供精准影像支持。

PU-0371

儿童肝脏未分化胚胎性肉瘤的影像表现及病理分析

孙雪峰

首都儿科研究所附属儿童医院

目的 分析儿童肝脏未分化胚胎性肉瘤（UESL）的超声、CT 及 MRI 影像学表现，结合病理情况分析，探讨其影像学特点，以提高对该病的认识水平，从而能够早期诊断、积极治疗。

方法 回顾性搜集 2009 年 12 月至 2021 年 12 月期间经手术及病理证实的 11 例儿童 UESL，男 5 例，女 6 例；年龄 3 岁~12 岁，中位年龄 8 岁。分析所有患儿的超声、CT 及 MRI 影像表现，总结其影像学特点。

结果 病灶均为单发，其中 7 个病灶位于肝右叶，位于左叶 2 个，累及左右两叶 2 个；肿块最大径 11.5~19.8cm，中位最大径长 14.6cm。CT 平扫显示为所有 11 例病灶边缘较清楚、其内呈不均匀低密度，5 例病变为单发囊腔结构，6 例为多房囊腔，内可见厚薄不均的分隔；囊性密度区边缘或分隔周围可见少许不规则片絮样软组织密度影。6 例超声图像均提示实性占位，表现为混合回声的实性包块内可见大小不等的无回声区。MR 表现为边界清楚肿块影，T1WI 呈不均匀混杂低信号，

病灶内可见条状/大面积高信号区；T2WI 呈混合高信号区和条状低信号区。增强扫描动脉期 9 例病灶呈轻度或中度不均匀的条带/片絮状强化，均以边缘强化为主，8 例可见迂曲增粗血管影；延迟期病灶呈持续不均匀强化，边缘持续强化，且从外围向中心充盈，强化范围增大，8 例延迟期可见假包膜。

结论 儿童 UESL 临床罕见，术前容易误诊，影像学表现有一定特征性，多表现为边界清楚的单囊或多囊性病灶，内有不同程度的实性部分，边缘可见强化动脉影；而超声图像则多提示为实性为主病灶，其不一致性亦为本病的重要特点，了解其影像特点，结合临床特征，有助于早期诊断。

PU-0372

The Quantitative Parameters derived from IDEAL-IQ in lumbar vertebral of healthy children: A Pilot Study of bone development

Jie Yang,hui-miao sun,hong yang,lei hu

Shanxi Provincial Children's Hospital (Shanxi Provincial Maternal and Child Health Care Hospital)

Background: The children's bone development in early childhood affects bone disease in adolescence and adulthood. Many diseases can affect the cancellous bone or bone marrow. Therefore, it is of great significance to quantifying bone development of healthy children.

Purpose: To improve our understanding of the bone development on healthy children using the quantitative parameters derived from IDEAL-IQ.

Materials and Methods: This prospective study enrolled participants of healthy children between January 2022 to December 2022 consecutively. Participants underwent MRI scans using IDEAL-IQ sequence in the lumbar vertebral. Participant ages and gender were collected. The IDEAL-IQ parameters (PDFF, $R2^*$) were obtained. The Factor analysis of variance (ANOVA) was applied to compare the differences of PDFF and $R2^*$ in different lumbar vertebral groups. The Kruskal-Wallis H test or Mann-Whitney test was applied to compare the differences of quantitative data among different groups. And Spearman correlation analysis was applied to study the relationship between the gender and PDFF, $R2^*$.

Results: 145 participants (76 male, 69 female) were evaluated. There were no significant differences were observed in PDFF and $R2^*$ in different lumbar vertebral ($P < 0.05$). The average age was 36(13-72) months. They were assigned into four groups(0-11 months, 12-35 months 36-71 months and 72-144 months). As the age increased, the average PDFF and $R2^*$ both increased significantly ($P < 0.05$). There were significant statistical differences in PDFF and $R2^*$ between the four groups($P < 0.05$). Moreover, the PDFF was also positive correlated with $R2^*$ ($P < 0.05$). No association was found between the gender and PDFF, $R2^*$.

Conclusion: The quantitative parameters derived from IDEAL-IQ in lumbar vertebral of healthy children will improve our understanding the bone development and provide a basis for further exploring the diseases that affect children's bone development.

PU-0373

小儿努南综合征的心脏磁共振成像:与非综合征性肥厚性心肌病的比较

杨文静、陆敏杰
中国医学科学院阜外医院

目的:努南综合征(N Noonan syndrome, NS)是一种罕见的遗传性心肌病伴常染色体显性遗传病,以明显的面部畸形、生长衰竭和广泛的心脏异常为特征。我们的研究旨在通过与非综合征性肥厚性心肌病(HCM)的比较来评估小儿 NS 的心脏磁共振成像(MRI)特征。

方法:2010 年 9 月至 2021 年 8 月,纳入 10 例经基因检查确诊为 NS 的幼儿。所有患者均行心脏 MRI 综合评估,包括延迟钆对比剂增强成像(LGE)、T1 mapping 和心肌应变,并与经基因确诊的 HCM 进行比较。

结果:10 例 NS 患儿中,女性 7 例,中位年龄 2.9 岁,年龄范围 4 个月~ 6 岁。5 例 NS 患者出现肺动脉瓣狭窄。与非综合征型 HCM 相比,NS 双室肥厚和双室流出道梗阻的发生率更高,但非综合征型 HCM 的不对称肥厚更为明显。NS 检测到特征性 LGE 模式,前壁和前外壁心内膜下 LGE,原始 T1 和细胞外体积 (ECV) 升高(分别为 1282.6ms 和 28.7%)。与非综合征型 HCM 相似,整体收缩峰值径向、周向、纵向应变(中位数, 22.44%;-14.16%;-7.51%), NS 组左室均受损。

结论:综合评价 NS 相关的心脏异常定义了 MRI 在小儿 NS 中的重要作用。特征性的 LGE 模式,以及肺动脉瓣狭窄和双心室肥厚的功能和形态学成像,有助于 NS 的诊断。经 ECV 升高证实的间质纤维化和心肌变形受损也在 NS 中发现。

PU-0374

探讨容积 CT 在儿童鼻窦扫描中的应用

郭江、耿纪刚、李笑石、金大勇、朱寅虎、秦越
西安大兴医院

目的:探讨 320 排低剂量容积 CT 在儿童鼻窦扫描中应用价值。

方法:收集我院 2023 年 4 月至 7 月行鼻窦、鼻咽部 CT 检查的儿童 60 例,分为螺旋扫描 30 例,容积扫描 30 例。均经监护人同意签署知情同意书,检查期间对患儿各腺体进行了有效辐射防护。两组扫描采用相同的参数:100kV、150mA、转速 0.5s、重建算法 FC35、迭代技术 AIDR3D;不同参数:螺旋扫描:螺距 0.5*160mm,容积扫描:螺距:0.5。所有患儿均记录基本信息:年龄(y)、身高(m)、体重(kg)、BMI 指数、CT 容积剂量指数(CTDIvol)、剂量长度乘积(DLP)、曝光时间(S)。在 PACS 工具栏测量翼内肌肌肉 CT 值和 SD 值,得出 SNR 值,并已同层脂肪组织 CT 值和 SD 值对比噪声计算翼内肌的 CNR 值,并记录相关数值,感兴趣区(ROI)的大小约 8-12mm²。由两名高年资主治医生对鼻窦解剖结构清晰度、伪影噪声大小、及病变显示对图像质量进行评判,将图像分为较好、优良、良好、不合格 4 个等级:螺旋扫描较好 23 例、优良 4 例、良好 3 例、不合格 0 例;容积扫描较好 27 例、优良 3 例、良好 0 例、不合格 0 例。采用 spss26.0 软件进行统计学分析。

结果:两组患儿年龄(y)、身高(m)、体重(kg)、BMI 指数无统计学差异($P>0.05$),CTDI、DLP、曝光时间均具有明显的统计学差异($P<0.05$),容积扫描 CTDI、DLP、DE、曝光时间较螺旋扫描分别降低 15.21%、52.08%、53.77%、74.43%。图像客观评价均无统计学差异($P>0.05$),主观评价两组图像略有统计学差异($P<0.05$),容积图像优于螺旋图像 3%。

结论:在儿童鼻窦 CT 扫描时,容积扫描优于螺旋扫描,在降低辐射剂量,缩短曝光时间同时,又提高图像质量,对软组织、骨质边缘显示较好,具有明显临床应用价值。

PU-0375

探讨容积 CT 在幼儿胸部扫描中的优势

郭江、耿纪刚、李笑石、金大勇、朱寅虎、秦越
西安大兴医院

目的：探讨 320 排容积 CT 在幼儿自由呼吸状态下胸部扫描中的应用优势。

方法：前瞻性收集 40 例有呼吸道症状和体征需进行胸部 CT 扫描患儿。将患儿分两组：均在清醒状态自由呼吸下扫描：A 组螺旋扫描，B 组容积扫描，两组均采用：准直器宽度为 160mm、转速 0.275s/r、100Kv、智能 mA、重建算法 FC35、迭代技术 AIDR3D，螺距为：螺旋 0.5*80mm、容积：0.5mm；所有患儿均记录基本信息：年龄（y）、身高（m）、体重（kg）、BMI 指数、CT 容积剂量指数（CTDIvol）、剂量长度乘积（DLP）、曝光时间（S）。在软组织窗（1mm）分别测量主肺动脉窗层面：主动脉、肌肉及邻近脂肪 CT 值和 SD 值并纪录，以同层脂肪为背景噪声计算主肺动脉 SNR 值并记录，感兴趣区（ROI）的大小均约 8-12mm²。肺窗（1mm）由两名高年资主治医师以上医生进行主观评价，评价内容：肺窗支气管血管束、心肌及膈肌运动伪影，软组织窗评价纵隔及胸壁，对比度、清晰度、噪声及纵隔血管波动伪影，分别对肺窗和纵隔窗图像质量进行 5 分法评分：（≥3 分达到诊断要求，<3 分不能达到诊断要求）。统计学使用 spss26.0 进行统计学分析。

结果：两组患儿的基本信息均无统计学差异（ $p>0.05$ ）；两组患儿 CTD、DLP：具有统计学差异（ $p<0.05$ ），且 DLP 显著，容积扫描均低于螺旋扫描 5.13%、44.23%；曝光时间（s）：具有统计学差异（ $p<0.05$ ），容积扫描较螺旋扫描缩短 87.5%；两组图像客观评价及主观评价：无统计学意义（ $p>0.05$ ）。

结论：320 排容积 CT 在幼儿自由呼吸状态下胸部扫描中容积扫描优于螺旋扫描，在保证图像质量的条件下，大幅度降低辐射剂，缩短了扫描时间，为更好保护幼儿生长发育提供良好的条件，具有明显临床应用价值。

PU-0376

血管内栓塞治疗异常体动脉供应正常左下肺基底段 2 例报导

李庚武、王昶、李旭、胡俊、汪松
安徽省儿童医院

目的 探讨异常体动脉供应正常左下肺的临床表现及影像诊断和治疗.方法 回顾我院收治的 2 例异常体动脉供应正常左下肺病例.结果 患者行介入栓塞治疗后恢复良好,未出现并发症.结论 异常体动脉供应正常左下肺当左下肺有相对稀疏的肺动脉供血时运用介入栓塞异常体动脉疗效确切；与隔离肺明显不同。

PU-0377

改良儿童肺动脉 CT 血管造影技术的可行性研究及临床应用

白刚、徐树明
山西省儿童医院（山西省妇幼保健院）CT 室

目的：改良儿童肺动脉 CT 血管造影技术，优化 CT 扫描方案，获取最佳成像参数。方法：采用 GE Revolution CT 对疑诊肺动脉栓塞的 20 例患儿行肺动脉 CT 血管造影，选取相同的监测层面、造影剂浓度、注射速率、延迟时间以及扫描条件随机分成 4 组。A 组采用心电门控，下肢静脉团注

造影剂；B 组采用心电门控，上肢静脉团注造影剂；C 组不采用心电门控，下肢静脉团注造影剂；D 组不采用心电门控，上肢静脉团注造影剂。扫描完成，所有图像传至后处理工作站进行 VR 和 MIP 重建，4 组图像按照 4 个等级评估肺动脉成像的图像质量，并进行统计学分析。结果：各实验组图像质量不完全相同，A 组与 B、C、D 组间有明显统计学差异且图像质量均为优，B 组与 C 组间无明显统计学差异且图像质量均为良和中，D 组图像质量均为中和差。结论：因儿童心率快循环快的生理特点，采用心电门控，下肢静脉团注造影剂，可以有效避免心脏搏动伪影和线束硬化伪影，从而获取更为清晰的高质量图像，有利于病变的明确诊断，降低误诊率，颇具推广应用价值。

影像组学鉴别儿童化脓性和结核性淋巴结炎

张蕊、徐晔、高思婕、李伟
重庆医科大学附属儿童医院

目的：通过 CT 影像组学模型和人工识别，鉴别儿童颈部伴有坏死的化脓性淋巴结炎与结核性淋巴结炎。方法：收集在我院进行 CT 增强检查且确诊为颈部伴有坏死的化脓性淋巴结炎（n=52）及结核性淋巴结炎（n=49）的儿童临床及影像资料，分析两组患儿的 10 个主要征象的统计分布差异，并应用影像组学平台进行图像分割、特征值提取和降维、特征选择和模型构建。结果：两组患儿的最大坏死结短径、淋巴结边缘是否清楚、淋巴结有无融合、坏死区边缘是否规则、坏死区是否有分隔、淋巴结钙化、未坏死区强化程度这 7 个征象存在两组间统计学差异。从增强静脉期图像中提取，降维后筛选出 9 个相关特征。其中 SVM 模型 AUC、准确率、敏感性、特异性分别为 0.89（95% CI: 0.72-1.00）、0.88、0.78、0.90。在区分化脓性淋巴结炎和结核性淋巴结炎方面取得了良好的分类性能。结论：儿童颈部伴有坏死的化脓性淋巴结炎和结核性淋巴结炎的 CT 表现结合发病年龄和影像组学模型对鉴别两者具有重要价值。

儿童 PANK2 基因突变所致苍白球黑质红核色素变性病一例及文献复习

张文涵
华中科技大学同济医学院附属武汉儿童医院

目的 探讨苍白球黑质红核色素变性的特异临床及影像表现、发病机制和诊治方法等，提高临床医生对该病诊疗能力。方法 分析本院 2020 年收治 1 例儿童 PANK2 基因突变所致苍白球黑质红核色素变性患者的临床资料及其典型影像学特点，检索国内外相关文献并进行复习。结果 患者查体为急性起病，突发不自主运动 10 天，发现言语欠清、四肢扭转痉挛、共济失调，走路不稳，易摔倒。头颅 MR 检查可见双侧苍白球对称性中央内侧高信号，周边低信号，呈典型“虎眼征”。基因检测患儿系泛酸激酶 2（PANK2）基因有错义突变，临床诊断为苍白球黑质红核色素变性。使用激素、丙种球蛋白等治疗后患者症状未见明显缓解。结论 苍白球黑质红核色素变性临床表现多样，主要表现为锥体外系症状。典型苍白球黑质红核色素变性均有 PANK2 基因突变，MRI 表现为“虎眼征”，该病的诊断主要依靠头颅 MR 和基因检测等。目前对于苍白球黑质红核色素变性的治疗尚无特效药，均为对症治疗，对本病的治疗和预防暂未达成广泛共识。

儿童肝脏肿块病变的多层螺旋 CT 平扫及增强扫描诊断与鉴别诊断

范路萍、周刚、龙艳、陈云辉
个旧市人民医院

目的: 为了加强对儿童肝脏肿块病变的 CT 诊断与鉴别诊断的认识, 对该区肿块病变的影像表现进行分析, 可准确显示肿块的具体部位、大小、浸润范围、影像特点及转移情况, 为肿瘤的临床分期、制定治疗方案、估计预后提供重要依据。

方法: 回顾性分析经手术病理证实且均行多层螺旋 CT 增强扫描的 95 例儿童肝脏肿块病变的影像表现及临床、病理资料。

结果: 95 例儿童肝脏肿块中, 恶性肿瘤包括 63 例肝母细胞瘤, 6 例肝细胞瘤, 4 例未分化胚胎肉瘤, 3 例肝脏转移瘤, 4 例其他少见肿瘤; 良性肿瘤包括 7 例婴儿型血管内皮瘤, 2 例间叶性错构瘤, 5 例局灶性结节样增生。

结论与讨论: 儿童肝脏肿块病变具有恶性肿瘤发生率高, 先天性肿瘤多见, 有明显的好发年龄段的特点。患儿年龄、临床表现和体征, 以及血清甲胎蛋白水平是评价肝脏病变的关键指标。影像学检查在明确肝脏肿块病变的具体发生部位、提示肿瘤良恶性及肿瘤分级方面具有重要的参考价值。另外, CT 在显示肿瘤的钙化明显优于其他的影像学检查。目前, 手术切除技术的不断提高使之成为儿童肝脏肿瘤治疗的重要手段。因此, 提高对肝脏肿瘤的显示和分期水平, 以及对肝段解剖的准确划分和肿瘤累及范围的明确界定, 均有助于临床医生选择理想的治疗方式。

PU-0382

儿童侧脑室三角区肿瘤的 MRI 影像表现

范路萍、周刚、龙艳、晏杰
个旧市人民医院

目的: 为了加强对儿童侧脑室三角区区肿瘤影像学表现的认识, 对该区肿瘤的 MRI 影像表现进行分析。儿童侧脑室三角区肿瘤的治疗方法(手术方式)及预后与肿瘤的种类密切相关, 早期做出准确诊断, 对指导临床治疗及预后的判定有重要意义。

方法: 回顾性分析经手术病理证实的 30 例儿童侧脑室三角区肿瘤的 MRI 表现及其临床、病理资料, 其中男 22 例, 女 8 例, 年龄 8 个月~12 岁, 病灶最大径为(1.7cm~9.5cm), 平均 5.9cm, 均行 MRI 检查, 包括 T1WI、T2WI、T1WI+C、DWI。

结果: 30 例脑肿瘤中, 脉络丛肿瘤 17 例, 胶质类肿瘤 8 例, 脑膜瘤 5 例。

结论与讨论: 儿童侧脑室三角区最常见的肿瘤是脉络丛肿瘤, 并且男性明显大于女性。脉络丛肿瘤 MRI 主要特点是形态呈菜花样、分叶状, 且脑室系统扩大。有时常见的良性脉络丛乳头状瘤和少见的恶性的脉络丛癌区别困难。胶质类肿瘤影像表现与肿瘤良、恶性关系密切。儿童侧脑室三角区脑膜瘤影像表现与成人大致相仿, 但发病率明显不同, 成人侧脑室三角区最常见的肿瘤是脑膜瘤, 其次是室管膜瘤。

侧脑室三角区肿瘤起源复杂, 既包括起源于侧脑室三角区本身结构的肿瘤, 如室管膜瘤和脉络丛乳头状瘤, 又包括源于三角区周围结构而长入脑室的肿瘤, 如胶质类肿瘤, 还有部分肿瘤由异位于侧脑室的组织发展而来, 如生殖细胞瘤、脑膜瘤等。侧脑室肿瘤的早期, 因肿瘤生长在脑室腔内, 常无临床症状, 当肿瘤生长较大阻塞脑脊液循环通路或压迫周边脑组织时, 才出现相应的临床症状和体征。

MR 检查对软组织较高的分辨率及其多平面、多数据的成像特点, 使其对肿瘤内部不同组成成分的显示、对邻近组织受侵范围的确定都有明显优势, 将肿瘤的信号特点与肿瘤的性别、年龄、强化特点及 MRS 表现等临床特点相结合, 可以提高该部位病变诊断与鉴别诊断的准确性, 从而更有效的指导临床治疗。

PU-0383

家族性噬血细胞综合征一例

罗环宇、彭芸

首都医科大学附属北京儿童医院

病例资料: 患儿男, 2 岁 4 个月, 既往体健, 以走路不稳起病, 逐渐加重至无法站立及行走, 病程 6 天出现抽搐, 为全身大发作、持续 2 分钟缓解, 伴低热, 抽后浅昏迷。患儿入院时基本生命体征稳定, 浅昏迷, GCS 评分 9 分 (E2V2M5), 左侧鼻唇沟略浅。血生化 AST、ALT 升高, 血象、血气、凝血功能未见明显异常。脑脊液常规示白细胞升高 ($68 \times 10^6/L$), 单核为主 (98%), 脑脊液蛋白稍高 (808mg/L)。入院后 3 天 MRI 显示小脑肿胀, 脑干及双侧小脑半球、桥臂可见大片状 T2WI/FLAIR (图 A1-2) 高信号, 病变未见扩散受限及强化。12 天后复查 MRI 显示双侧基底节及丘脑 (图 B) 新发病变, 22 天后再次复查 MR 显示双侧大脑半球白质 T2WI 信号升高 (图 C), 同时基底节及小脑病变范围较前增大。为明确诊断患儿于入院后 1 月余行基因测序, 结果提示 STXBP2 基因复合杂合, 为家族性 HLH 致病位点, 诊断家族性噬血细胞综合征明确。

讨论: 噬血细胞性淋巴组织增多症 (HLH) 是一种遗传性或获得性免疫调节功能异常导致的严重炎症反应综合征。家族性 HLH (FHL) 属于原发性 HLH, 包含 FHL-1~5 五个亚型, 除 FHL-1 未确定相关的缺陷基因及编码蛋白外, PRF1、UNC13D、STX11 及 STXBP2 基因及蛋白分别对应 FHL2-5 型。HLH 缺乏特异性临床表现, 中枢神经系统受累可为 HLH 的首发临床表现, 也可发生于病程中, 其影像表现以多发脑白质病变最为常见, 其次为小脑炎。既往国内外研究仅报道过 4 例以小脑肿胀为主要表现的 FHL, 该组 FHL 患者的病程不典型, 常导致诊断的延迟。本研究报道一例以急性共济失调起病, 进行性累及双侧小脑半球、基底节及双侧大脑半球白质的 FHL 影像表现, 以提高对该病的认识。

PU-0384

Comparison of DWI Methods in The fetal brain: Readout-Segmented Echo-Planar Imaging Versus Single-Shot Echo-Planar Imaging

Shikang Hu

University of Electronic Science and Technology of China

Objective This study aimed to compare the clinical utility of RESOLVE (Readout Segmentation of Long Variable Echo-trains) and single-shot echo-planar DWI (SS-EPI-DWI) to visualize the fetal brain.

Methods RESOLVE and SS-EPI-DWI were performed for 190 fetal brain from December 2019 to December 2021 and two datasets were independently reviewed by two radiologists. Qualitative analyses were performed for overall quality of image, lesion conspicuity, image distortion and susceptibility-related change by 5-point Likert scale.

Result Significant differences were found in all the subjective parameters among the two DWI sequences (all $p < 0.001$). Mean scores were 3.85 and 4.07 for susceptibility-related change, 4.73 and 4.85 for image distortion, 4.15 and 4.27 for lesion conspicuity, 3.90 and 4.07 for overall image quality, for single-shot EPI and Resolve, respectively.

Conclusion RESOLVE yields better quality regarding distortion, susceptibility-related changes, and lesion conspicuity, compared with single-shot EPI in visualizing fetal brain.

PU-0385

磁敏感加权成像在早产儿生发基质出血后脑皮质表面及室管膜下铁沉积中的诊断分析

孔维丹

上海交通大学医学院附属上海儿童医学中心

目的: 探讨磁敏感加权成像在早产儿生发基质出血后脑皮质铁沉积及室管膜下铁沉积中的诊断价值。
方法: 回顾性分析 2016 年 1 月至 2023 年 7 月我院经超声诊断为生发基质出血并进行 MR 检查的 92 例早产儿临床资料, 比较常规磁共振成像 (MRI) 与磁敏感加权成像 (SWI) 的诊断结果, 分析 SWI 在早产儿生发基质出血后脑表面铁沉积及室管膜下铁沉积中的诊断价值。结果: SWI 对脑表面铁沉积及室管膜下铁沉积的病灶阳性检出率高于常规 MRI, 差异具有统计学意义 ($\chi^2=20.520, P<0.05$); SWI 序列对于小脑、生发基质铁沉积病灶检出率高于常规 MRI 序列, 差异具有统计学意义 ($\chi^2=13.473, 7.461, P=0.001, 0.024$); SWI 序列、常规 MR 序列对于脑室、脑皮质表面的铁沉积检出率比较, 差异无统计学意义 ($\chi^2=1.911, 3.600, P=0.900, 0.638$)。结论: SWI 用于早产儿生发基质出血后脑皮质表面铁沉积及室管膜下铁沉积的诊断可提高检出率, 尤其是小脑及生发基质的铁沉积病灶。

鼻咽侧位体位固定器的研制及其在儿童腺样体肥大诊断中的应用价值

张超、文深、孙晓琛、张鲁洋、方佃刚
深圳市儿童医院

[摘要] 目的：研制鼻咽侧位 X 线摄影体位固定器，提高图像质量，同时减少重复曝光对患儿带来的辐射损伤。方法：根据被检部位正中矢状面平行于平板探测器以减小图像放大变形失真的原理，设计并制作卡通式鼻咽侧位 X 线摄影体位固定器。用卡通式设计消除患儿的恐惧心理，用固定装置使患儿被检部位在拍摄过程中保持稳定，用呼吸感知技术避免呼气时摄片使软腭抬高造成的鼻咽腔假性狭窄及腺样体—鼻咽腔（A/N）比值的假象增大。将医工有机结合，研制智能辅助设备，使放射科技师能够方便、快速地对患儿进行规范化摆位，从而提升影像学检查质量。选取 2023 年 1 月—2023 年 6 月 200 例未使用体位固定器行鼻咽侧位 X 线摄影的患儿作为对照组；200 例使用体位固定器行鼻咽侧位 X 线摄影的患儿作为试验组。对两组病例的图像质量进行主观评分，参考标准鼻咽侧位 X 线片的质控要求，比较两组图像的图像质量。

结果：对照组图像质量主观评价得分为（ 2.9 ± 0.37 ），试验组图像质量主观评价得分为（ 4.7 ± 0.21 ），两组之间的图像质量主观评分差异有统计学意义（ $P<0.05$ ）。

结论：鼻咽侧位体位固定器可诱导患儿配合，使患儿身体保持稳定，大幅提升图像质量，减少了重复曝光对患儿带来的辐射损伤，值得临床推广应用。

PU-0387

3D-FIESTA 序列在诊断胎儿脊柱畸形的价值

吕青青
郑州大学第三附属医院

目的 探讨 MRI 3D-FIESTA 序列在胎儿脊柱畸形的诊断价值。方法 回顾性分析 58 例胎儿的 MRI 脊柱图像，所有孕妇均在 MRI 采集前行产前超声并可疑脊柱病变。将 2D-FIESTA 及 3D-FIESTA 序列的图像质量以及诊断价值进行分级，对两序列图像质量进行统计学比较。结果 扫描共得到 58 例胎儿脊柱图像，发现畸形有半椎体 19 例、蝴蝶椎 7 例、融合椎 5 例、冠状裂 3 例、椎体骨化中心小 14 例、椎间隙窄 3 例、椎体骨化不均 4 例、阴性结果 14 例。2D 图像分级的优、中等、差分别占 31.03%、60.34%、8.63%，3D 图像分别占 81.03%、15.52%、3.45%，差异具有统计学意义。结论 3D-FIESTA 序列能够更好的显示胎儿脊柱畸形，在 2D 序列扫描不满意时可加扫 3D 序列以提高胎儿脊柱畸形的检出率。

PU-0388

儿童胰胆管合流异常的临床特征与影像学诊断价值

郭辰、顾晓红、曾敬清、邓朝晖、周莺、钟玉敏
上海交通大学医学院附属上海儿童医学中心

目的：分析不同影像学方法在儿童胰胆管合流异常（PBM）的诊断价值，以提高对本病的认识。方法：回顾性分析我院 30 例经磁共振胰胆管成像（MRCP）及内镜下逆行胰胆管造影术（ERCP）诊断的儿童 PBM，分析其临床资料及影像学检查结果并进行分型，探讨各影像学方法在诊断本病中的优势。

结果: (1) 临床资料: 本组 30 例患儿, 男性 7 例, 女性 23 例, 平均年龄 4.3 岁。(2) 首发症状: 腹痛 24 例, 皮肤黄染 6 例, 呕吐 6 例, 体检发现 1 例。(3) 实验室检查: 血清淀粉酶或脂肪酶升高、肝功能异常共 28 例, 实验室检查无异常 2 例。(4) 影像学结果: 本组 30 例患儿, MRCP 明确诊断为 PBM 者 22 例 (73.3%, 22/30), 其中分型为 A 型 11 例, B 型 2 例, C 型 9 例, D 型 0 例; ERCP 确诊者 30 例 (100%, 30/30), 其中分型为 A 型 13 例, B 型 2 例, C 型 14 例, D 型 1 例; 29 例均伴随不同程度的肝 (内) 外胆管扩张; MRCP 提示胆总管中或下段结石 12 例, ERCP 确诊结石共 16 例并诊断胆总管下段或胰管内蛋白栓 17 例。(5) 随访: 30 例中 19 例接受 1 次 ERCP 检查, 另有 10 例和 1 例因反复胰腺炎发作接受 2 次及 3 次 ERCP 检查。

结论: 对于临床上表现为腹痛反复发作, 特别是同时合并黄疸、腹部包块、胰腺炎与肝功能不全等的患儿, 需要考虑到 PBM 的可能性。MRCP 对于本病早期诊断有一定提示作用, 但仍有一定局限性; ERCP 仍为目前诊断本病的金标准, 在诊断、分型、治疗上具有不可取代的作用。

PU-0389

基于磁共振成像的非青紫型先天性心脏病对儿童脑影响的 VBM 研究

马晓辉

浙江大学医学院附属儿童医院

目标: 大量研究表明, 在治疗先天性青紫型心脏病 (CHD) 的手术过程中会发生脑损伤, 但对于非青紫型先天性心脏病儿童的术前神经发育和脑损伤情况了解不足。本研究旨在使用基于体素的形态学 (VBM) 技术, 对 3 岁以下患有非青紫型先天性心脏病的儿童患者进行术前评估, 以了解其全球和局部灰质 (GM) 体积的变化情况。

方法: 从 2019 年 1 月到 9 月, 招募年龄在 1-3 岁之间、患有先天性青紫型心脏病 (n=54) 的患者, 在进行矫正性手术前, 对其进行 3D T1 加权脑 MRI 扫描。同时, 对年龄和性别匹配的健康对照组 (n=35) 进行回顾性分析。利用 SPM 12 软件计算 GM 体积和总颅内体积 (TIV), 并通过双样本 t 检验法和 FWE 校正方法在 SPM 12 中进行 VBM 分析, 以确定不同区域的 GM 体积差异。

结果: 两组之间的 GM 总体积和 TIV 没有差异 ($p>0.05$), 但 VBM 分析显示, 与健康对照组相比, 非青紫型先天性心脏病组患儿的额中央回、额下回、眶回、旁海马、丘脑 (双侧)、内侧苍白球 (双侧) 和颅底 (双侧) 的 GM 微观结构有所减少 ($p<0.05$, FWE 校正)。

结论: 1 至 3 岁的患有先天性青紫型心脏病的儿童在进行矫正性手术前也会出现局部 GM 体积的减少, 这种变化倾向于分布在双侧额叶、丘脑、苍白球、小脑和单侧旁海马区域。

PU-0390

MRE 多序列联合扫描在儿童美克尔憩室检查中的应用

朱立春

安徽省儿童医院

目的 探讨磁共振小肠造影 (MRE) 多序列联合扫描在儿童美克尔憩室检查中的应用价值。

方法 回顾性分析经超声、核素检查后或临床怀疑美克尔憩室患儿的临床及 MRE 资料 16 例, 所有患儿均行 MRE 多序列联合扫描。扫描方案包括快速自旋回波序列 (FSE)、单次激发快速自旋回波序列 (SS-FSE)、二维平衡稳态自由进动序列 (BTFF)、弥散加权序列 (DWI)、二维扰相梯

度回波序列 (T1-FFE) 及屏气三维容积内插序列 (THRIVE)。6 岁以下儿童口服 10% 水合氯醛 0.25~0.50 ml/kg 镇静。检查前静脉注射山莨菪碱 0.3 mg/kg 以抑制肠蠕动。增强扫描采用高压注射器静脉团注对比剂 Gd-DTPA 0.2 ml/kg。16 例均行超声检查, 10 例行 99Tcm 扫描, 6 例行 CT 平扫及增强扫描。

结果 16 例均经 MRE 诊断为 MD, 手术病理证实 13 例为 MD, 3 例为肠重复畸形。MRE、超声及核素的诊断正确率分别为 81.3% (13/16)、37.5% (6/16) 及 50% (5/10)。13 例憩室部位: 右下腹 2 例, 脐周 4 例, 左下腹 4 例, 中腹部 2 例, 盆腔 1 例。憩室形态: 呈含液含气盲袋样管状结构 11 例, 实性包块 2 例。憩室腔内对比剂充盈 6 例, 无对比剂充盈 7 例。憩室壁增厚 11 例, DWI 序列憩室壁弥散受限 12 例。增强后憩室壁强化程度高于邻近肠壁 12 例, 憩室壁连续性中断 1 例。憩室腔内出血信号 (T1WI 高信号和/或 T2WI 低信号) 2 例, 造影剂外溢 2 例。憩室周边结构异常: 憩室周围脂肪层肿胀 6 例, 邻近系膜水肿并异常强化 6 例, 腹水 4 例, 肠梗阻 1 例, 肠系膜淋巴结增大 10 例。13 例在右下腹显示阑尾, 其中正常阑尾 11 例, 肿大阑尾 2 例。

结论 相对于超声和核素检查, MRE 多序列联合扫描图像信息量大, 敏感性高及无电离辐射等优越性, 可作为临床诊断儿童美克尔憩室的重要检查手段。

PU-0391

低剂量螺旋 CT 在儿童胸部病变检查中的应用

曹银
安徽省儿童医院

[摘要]

目的: 通过胸部低剂量 CT 的使用改善辐射危害, 且并不影响诊断结果, 探讨胸部低剂量 CT 的应用价值。

方法: 回顾性分析 2021 年 6 月至 2023 年 6 月期间, 我院门诊及住院收治临床表现为新生儿呼吸窘迫综合征、支气管发育不良、气胸及肺炎等患儿, 收集病例共 30 例, 现将病例分为三组: 0-6 月、6-12 月及 1-3 岁患儿, 征求上级医师同意后, 对同一年龄段的患儿 (气胸和肺炎患者) 分别使用低剂量和常规剂量进行扫描, 比较两种剂量扫描所得出的图像质量及诊断结果。

结果: 在三组病例中 0-6 月患儿常规剂量, 扫描可以大幅度降低 CT DLP, 并不影响诊断结果, 低剂量扫描图像几乎与常规剂量扫描的图像无任何区别, 气胸患儿可以清楚的看出肺部被压缩的程度及肺上有没有肺大泡, 准确判断肺大泡的位置、大小、数目是否呈簇状, 对于气胸及肺炎患儿完全可以采用胸部低剂量扫描, 大大降低了辐射也得出了准确的诊断结果。6-12 月患儿常规剂量 (KV:80、mAs:180、CTDI: 3.4mGy、DLP: 86mGy*cm), 胸部低剂量 (KV:120、mAs:50、CTDI: 3.2mGy、DLP: 81mGy*cm) 扫描与常规剂量相比较, 低剂量的 DLP 约是常规剂量的 94%; 图像质量相似, 1-3 岁患儿常规剂量 (KV:80、mAs:200、CTDI: 3.6mGy、DLP: 97.4mGy*cm), 使用该年龄段的低剂量扫描常规剂量 (KV:120、mAs:55、CTDI: 3.6mGy、DLP: 97.2mGy*cm), 与常规剂量相比较 DLP 几乎无任何区别, 但是图像质量是常规剂量更完美些。

结论: 在儿童胸部 CT 检查方面, 建议较小患儿使用低剂量螺旋 CT 扫描, 低剂量也可以准确诊断出肺部病变形态及生理解剖结构, 与常规剂量有着同等的图像质量且较低的辐射剂量! 0-6 月患儿低剂量胸部 CT 具有较高的临床应用价值。

PU-0392

磁敏感加权成像 (SWI) 在新生儿颅内出血的应用

刘扬
安徽省儿童医院

目的 探讨磁敏感加权成像 (SWI) 在新生儿颅内出血中的应用价值。

材料与方法 对 2020 年 6 月至 2021 年 5 月我院新生儿科送诊的 57 例患儿同时行头颅 MR 常规序列 (T1WI、T2WI 及 FLAIR) 和 SWI 序列的扫描。其中男性 35 例, 女性 22 例, 所有患者均有明确的临床症状和新生儿窒息的病史, 并且均在我院新生儿重症监护病房 (NICU) 住院治疗。

新生儿镇静: 镇静前常规喂奶, 检查前 30min 口服或肌注鲁米那 (2~4 mg/kg), 必要时于检查前 5min 口服 10% 水合氯醛 (30~40 mg/kg)。

新生儿转运: 将提前预约好检查时间的新生儿用襁褓包裹, 由新生儿科医生或有经验的护士于检查前 10 分钟左右转运至 MR 检查室。

成像方法: T1WI (轴位及矢状位)、T2WI、FLAIR 和 SWI 成像, 经常规定位扫描后分别行 T1WI, T2WI 扫描后再行 SWI 扫描;

SWI 扫描参数: TR: 35ms, TE: 25ms, FOV: 20x20cm, 矩阵: 512x512, 层厚 3.0mm, 扫描 35 层。

结果 相对于 MR 常规序列 (T1WI、T2WI、FLAIR) 扫描, SWI 由于其固有的成像特性 (检测出血产物非常敏感), 对新生儿颅内出血的检出阳性率要远高于前者。而且 SWI 在对 NICH 出血灶的数目、大小的显示方面均好于 MR 常规序列;

新生儿期颅内出血灶在 SWI 图上表现为呈不规则斑点状, 类圆形, 铸形, 扇形低信号, 在相位图上呈典型的顺磁性物质信号特点;

新生儿颅内出血根据出血部位主要分为室管膜下-脑室内出血, 大脑实质内出血, 小脑内出血, 硬膜下出血, 蛛网膜下腔出血, 在 SWI 与 MR 常规序列均得到了证实。

结论 SWI 是一种探查新生儿颅内出血的新技术, 对于有新生儿窒息史的患儿, 应当在常规 MR 序列基础上加行 SWI 检查, 以提高新生儿颅内出血的诊断准确率。

PU-0393

螺旋 CT 低剂量扫描在新生儿颅脑中的应用

范磊
安徽省儿童医院

目的 评估新生儿低剂量头颅 CT 扫描的图像质量和临床应用价值。方法 对临床怀疑颅脑病变需行 CT 检查的新生儿 50 例, 随机分成常规剂量和低剂量组 2 组。对比两种剂量扫描产生的 CT 吸收剂量指数 (CTDI_w); 盲法评判两组扫描剂量的图像质量。

一般资料 高度怀疑颅脑病变的新生儿 50 例, 其中男 34 例, 女 16 例, 年龄均 < 28 天, 平均 8 天。随机分成常规剂量组 (120 kV 250 mAs) 和低剂量组 (100 kV 80 mAs) 颅脑 CT 扫描。

方法 使用 64 排飞利浦螺旋 CT, 常规剂量组扫描参数为 120 kV, 250 mAs, 层厚 4 mm, 螺距 1.5; 低剂量组扫描参数为 100 kV, 80 mAs, 层厚 4 mm, 螺距 1.5。均采用标准重建算法, 仰卧位, 头先进。研究指标: 表述受检者接受 X 射线吸收剂量参数为 CT 吸收剂量指数 (CTDI_w)。系统根据选择的扫描参数自动计算 CTDI_w 并显示于参数栏。

图像质量评估 将新生儿颅脑图像采用窗位 40HU、窗宽 120HU 的软组织窗; 用 AGFA 公司生产激光照相机胶片。CT 片作统一编号, 并用胶布封住每幅图像的扫描条件记录。根据影像噪声、空间分辨率、密度分辨率及有无伪影对图像质量进行分析, 将图像质量分为 4 个等级。

结果 低剂量与常规剂量组 CT 扫描 X 线辐射剂量如下: 100Kv, 80mA 条件下 CTDIvol 值为 8.8mGy, 120 Kv, 250mA 扫描条件下 CTDIvol 值为 52.04mGy, 低剂量 CTDIvol 值相当于常规剂量 CTDIvol 值的 16.9%。

新生儿低剂量与常规剂量扫描的图像质量通过比较, 得出两种剂量的图像质量等级有差异, 低剂量扫描图像质量以良为主, 而常规剂量图像以优为主, 低剂量扫描图像质量稍差, 但两者均未出现不合格图像, 因此不影响诊断。m 扫描剂量越高, 受检者受 X 线辐射的剂量越大, 对 X 线辐射的防护就越困难。

PU-0394

儿童口腔曲面断层摄影影像质量分析与探讨

方海松
安徽省儿童医院

目的: 探讨青少年儿童在口腔曲面断层摄影(口腔全景)中存在的技术问题, 提高口腔全景片的影像质量, 更好的为临床治疗而服务。

方法: 随机选取我科自 2021 年 5 月至 2023 年 5 月拍摄的 100 例口腔全景影像进行质量分析和探讨。使用芬 PLANMECA proline xc 口腔全景机, 利用该机全景的线性断层和头颅测量技术, 可产生清晰的全景 X 线影像。选取儿童标准全景采集模式, 摄影参数: 管电压 60kV, 管电流 6.2~10mA, 曝光采集时间 13 秒。检查前, 应和患儿及家属进行充分沟通交流, 缓解患儿的紧张情绪, 取得患儿的信任与配合, 并充分做好患儿及陪护家属的辐射防护工作。

结果 100 例口腔全景影像中, 标准影像 82 例 (82.00%), 标准体位, 图像质量优良, 下颌骨和牙列可清晰显示; 18 例影像均存在不同问题, 图像质量欠佳; 数字化口腔曲面断层 X 线摄影是近年来呈现的口腔颌面部 X 线成像技术, 现已普遍应用于口腔颌面部的检查。在儿童, 一张优质的口腔全景影像应符合以下几点: (1) 正中矢状线与胶片长轴垂直, 两侧髁突应在同一水平; (2) 下颌骨颌部投影于下颌骨稍下方, 下颌骨下缘呈弧形; (3) 上下牙略有分离, 无重叠, 可见微笑的咬合面(咬合曲线); (4) 影像密度、对比度良好, 无伪影, 全口牙齿清晰可见。

结论: 口腔曲面断层摄影属于多轨迹体层摄影技术, 在摄片工作中是一个难点。由于颌骨的特殊解剖结构, 牙列呈不规则“U”型排列, 且个体间还存在差异, 体层摄影只有解剖结构置于成像层内采集的影像才清晰。这就要求技术员熟练掌握机器性能, 严格按照操作流程, 摄影前积极与患儿及家长沟通, 得到患儿的配合, 并根据患儿颌骨牙弓形状和大小, 调整整体层面中心, 标准摆位, 才能获得一张优质口腔全景片。

PU-0395

螺旋 CT 低剂量扫描在儿童副鼻窦病变检查中的应用

马瑞琪
安徽省儿童医院

目的: 探讨低剂量螺旋 CT 在副鼻窦病变检查中的应用价值。

资料与方法

1.1 一般资料

副鼻窦炎是儿童常见病和多发病。常规的 X 线平片摄影由于儿童鼻旁窦与周围软组织重叠较多, 对比度欠佳, 诊断价值有限。而 CT 断层图像上, 病灶与周围组织有较高的对比度, 从而使得 CT 成为鼻旁窦病变最常规的检查方法。

回顾性分析 2021 年 4 月-2023 年 4 月在我科行副鼻窦检查门诊及住院儿童 40 例，随机分为两组：1-6 岁，6-12 岁，分别进行常规扫描与低剂量扫描，对比两组图像质量和诊断结果。

1.2 方法

均采用 64 排 Philips 螺旋 CT，标准重建算法，仰卧位头先进，常规组扫描：层厚 5mm，管电压 120KV，管电流 50/60mAs，低剂量组扫描：层厚 5mm，管电压 80KV，管电流 100/150mAs，其他扫描参数一致。扫描仪会自动显示 CTDI，DLP，对两组实验结果进行比较，扫描前先请示上级医生，此病种是否可以行低剂量扫描，防止低剂量扫描失败，行低剂量扫描也需对患儿及陪同家长做好辐射防护。完成扫描后自动拆薄并传入 PACS 工作站，对副鼻窦病变结构和正常结构进行观察，由诊断医生判定是否影响诊断结果。

结果

副鼻窦扫描可以通过多平面重组技术准确的显示鼻道复合体，病变范围，受累鼻旁窦的数目，病变鼻窦骨质结构有无破坏和硬化，鼻窦炎症等。

结论

综上所述，小儿副鼻窦低剂量螺旋 CT 扫描时，可依照年龄大小，病变性质，在保证图像质量并满足诊断需求的情况下，适当使用低剂量扫描，以减少辐射剂量，保证患儿的辐射安全。

PU-0396

儿童背部滑膜肉瘤一例

王立英、王春祥
天津市儿童医院

女，13 岁，发现背部肿物 1 周。

影像检查：CT 平扫，左肩胛骨内侧背部肌肉内见一形态不规则低密度肿块，CT 值 16Hu、30Hu，大小约 14.5cmX10.2cmX3.1cm；MRI 平扫，病变呈囊实性，以囊性成分为主，其内可见多发分隔，实性部分呈稍长 T1、等 T2 信号，囊性部分呈长 T1、长 T2 信号，部分囊腔内可见短 T1 短 T2 出血信号及液液平面，病变界清，沿肌间隙延伸；MRI 增强：左背部肿物内实性成分及分隔不同程度强化，囊性部分未见强化。

手术记录：……肿物呈暗红色，囊实性，包膜完整，无明显血管供应，大小约 16cmX12cmX10cm，逐次分离肿物，释放部分液体，完整切除……

病理：（左背部）滑膜肉瘤。

讨论：滑膜肉瘤（synovial sarcoma, SS）是一种具有不同程度上皮分化（包括腺体形成）的间叶组织肿瘤，95%的滑膜肉瘤具有特征性染色体易位 t(X; 18) (p11; q11)，并形成 SS18-SSX 融合基因。好发于四肢深部软组织（70%~80%），仅 15%位于躯干。临床起病隐匿，表现为局部隐痛、软组织渐进性肿胀，病程数月至数年，易误诊为良性病变。

影像表现，CT 平扫表现为边界清楚的圆形、分叶状软组织密度肿块，密度稍低于肌肉，CT 对发现钙化和骨质侵蚀敏感。MRI 平扫，T1WI 与肌肉相比表现为等或稍高信号，T2WI 上信号混杂，可呈高、等、低三种信号同时存在，即“三信号征”，为肿瘤实质、纤维、坏死、钙化、出血所致，肿瘤内可见线状低信号分隔，周围软组织内可见水肿。增强，肿瘤呈明显不均匀强化，实性成分强化，坏死、囊变、血肿不强化，这一特点可将囊性病变为主的滑膜肉瘤识别出来。本病变呈囊实性，囊性成分为主，实性成分较少，病变内可见出血及液液平面，易误诊为多房囊性肿物伴出血，如淋巴管畸形或血管淋巴管畸形，但增强后病变实性成分及分隔明显强化，实性成分及分隔局部较厚，不同于淋巴管畸形的壁及分隔较薄。

PU-0397

儿童韧带样型纤维瘤病的 CT 与 MRI 表现

刘思讷^{1,2}、付金花²、杨烁慧¹

1. 上海中医药大学附属市中医医院

2. 上海市儿童医院 上海交通大学附属儿童医院影像科

目的 探讨儿童韧带样型纤维瘤病 (DF) 的 CT、MRI 表现。方法 回顾性分析经手术及病理证实的 23 例儿童 DF 的影像学表现, 分析其 CT 或/和 MRI 特征。结果 23 例患儿中 22 例 (95.6%) 为单发实性肿块, 边界多不清晰 (16 例, 69.6%), 轮廓不光整 (15 例, 65.2%), 无包膜 (21 例, 91.3%), 侵袭性生长 (21 例, 91.3%)。23 例中腹壁外型 13 例 (56.5%), 腹壁型 8 例 (34.8%), 腹内型 (肠系膜来源) 2 例 (8.7%)。肿块最大径范围约 22~171 mm (65.3 ± 34.7 mm)。CT 平扫肿块呈等密度, 密度均匀或不均匀, CT 增强表现为轻度强化或延迟扫描呈渐进性强化。MRI 表现为 T1WI 等或低信号, T2WI 高信号, 内部信号欠均匀。1 例腹外型 DF T1WI 低信号, T2WI 低信号, 内部信号较均匀。MRI 增强扫描, 病灶呈中度不均匀强化伴内部条索状、片状无强化区。结论 儿童 DF 影像学表现有一定特征: 肿瘤呈侵袭性生长, CT 增强肿瘤为渐进性或持续性强化, MRI 则更能反映病灶内特征性胶原纤维的低信号。

PU-0398

儿童肾恶性横纹肌样瘤的 CT、MRI 表现

刘思讷¹、付金花²

1. 上海中医药大学附属市中医医院

2. 上海市儿童医院 上海交通大学附属儿童医院影像科

目的 探讨肾恶性横纹肌样瘤的 CT 和 MRI 表现, 以提高该病的诊断水平。方法 回顾性分析上海市儿童医院 2008 年 5 月~2022 年 1 月经病理证实 8 例肾恶性横纹肌样瘤的患者资料。7 例行 CT 平扫及增强检查, 4 例行 MRI 平扫及增强检查, 观察分析肾恶性横纹肌样瘤体的部位、大小、形态、密度/信号特征、强化方式以及转移情况等。结果 6 例位于左肾, 2 例位于右肾, 2 例病变呈圆形或类圆形, 6 例为不规则形, 6 例累及肾窦、肾盂。CT 平扫 5 例呈稍高密度, 2 例呈等低密度, 肿瘤最大径平均约 8.6cm; 8 例均合并囊变坏死, 2 例合并出血, 3 例合并包膜下积液/积血。MRI 平扫 4 例 T1WI 低信号, 3 例 T2WI 呈稍高信号, 1 例 T2WI 呈混杂信号。2 例 DWI 均呈明显高信号、相应 ADC 为低信号, 提示病变弥散受限。增强后呈不均匀轻度强化。5 例伴转移。结论 儿童肾恶性横纹肌样瘤 CT、MRI 表现有一定的特征性, 儿童肾实质内巨大肿块, 合并囊变坏死、出血, 集合系统受累, 伴有包膜下积液, 弥散受限, 增强扫描实性成分轻度强化, 常合并转移, 应高度警惕肾恶性横纹肌样瘤的可能。

PU-0399

分次团注低剂量 CT 在学龄前儿童肾脏 CTA 检查的应用

郑美敏

天津市儿童医院

目的: 研究分次团注结合低剂量 CT 扫描技术在学龄前儿童肾脏 CTA 的应用价值。

方法: 选取在我院怀疑胡桃夹综合征行肾脏 CTA 检查的学龄前患儿 60 例, 年龄 5.65 ± 1.86 岁, 随机分为 A 组和 B 组各 30 例。A 组采用单次团注常规 100kVp 行动脉期和静脉期扫描, B 组采用分

次团注 80kVp 行动脉-静脉期扫描。扫描参数：采用 GE Revolution CT，扫描范围从膈顶至耻骨联合下缘，0.5s/rot，pitch1.375:1，准直 80mm，使用 300mgI/ml 碘海醇按 1.5ml/kg 给药，以 1-1.5ml/s 注药速率经肘正中静脉注射，所有图像行 ASIR-V40%重建。A 组单次团注全部对比剂后行动脉期和静脉期扫描，两期管电压和管电流均为 100kVp 和 200mAs，B 组首次团注总对比剂 50% 后间隔 20s 再团注剩余 50%，首次团注开始后固定 60s 后扫描，管电压和管电流为 80kVp 和 200mAs。选取轴位图像做为测量界面，于腹主动脉、左肾动脉、左肾静脉、下腔静脉、左侧竖脊肌放置感兴趣区域 (ROI)，采用单因素方差分析感兴趣区域的 CT、SD、CNR 等指标参数，并采用 Kruskal-Wallis H 检验比较图像的主观评分。

结果：两组检查都能清晰显示各血管，主观评分都达到了诊断要求，差异不具有统计学意义 ($P > 0.01$)；A 组腹主动脉、左肾动脉 CT 值及 CNR 高于 B 组，左肾静脉及下腔静脉 CT 值及 CNR 低于 B 组，A 组图像背景噪声 SD 值小于 B 组，差异均具有统计学意义 ($P < 0.01$)；A 组 ED (4.53 ± 1.21) mSv，B 组 ED (2.14 ± 1.14) mSv，差异具有统计学意义 ($P < 0.01$)。

结论：分次团注结合低剂量 CT 技术在学龄前儿童肾脏 CTA 中，尤其在胡桃夹综合征诊断方面，既能够有效降低患儿的辐射剂量，又能够获得优质的图像质量。

PU-0400

Study on normal range of GSI energy spectrum analysis of children's pancreas based on contrast agent fixed-time injection method

Sipei Xing
Tianjin Children's Hospital

OBJECTIVE: This study used a fixed-time injection of iodine contrast agent based on the body mass of the child to evaluate the normal range of the analysis of the pancreatic energy spectrum of the children in the GSI spectrum enhancement examination.

MATERIALS: Thirty children with a body mass greater than 20 kg and a non-pancreatic lesion with abdominal CT enhancement were selected from 2019.1 to 2019.2. All patients underwent GSI spectroscopy CT enhancement examination using GE revolution CT. Four scan protocols (four groups) were scanned according to body weight (Table 1), and a uniform contrast protocol was used: 300 mgI was given according to the weight of the child per ml Iodine contrast agent 1.5ml/kg, and use 24s fixed contrast injection time method. All patients underwent an image evaluation of the portal vein phase. The phase delay time was 56s after the contrast agent injection. The ROI of the head, body and tail of the pancreas was selected (Fig. 1), and the four energy spectrum analysis values of 70KeV, iodine water value, water iodine value and atomic number were measured. The single sample statistics were drawn using SPSS software. (Table 2). **Results:** This indicates that the four energy spectrum analysis values of 70KeV, iodine water value, water iodine value and atomic number obtained are relatively fixed in children with pancreatic energy spectrum GSI enhanced CT examination using fixed-time injection of iodine contrast agent.

Conclusion: Contrast fixed injection time method according to different body weight to give different doses of iodine contrast agent, can ensure that children of different body weight under the contrast agent program and relatively fixed weight of iodine contrast agent, iodine contrast agent dose absorbed by human tissue Not affected by weight. Under the scanning scheme and the contrast agent scheme, the iodine dose is relatively constant, and is not affected by body weight, and the energy spectrum analysis value is relatively fixed, and the result has credibility under the scheme.

PU-0401

儿童腹盆腔多灶性病变同源性能谱 CT 分析

侯志彬、王春祥
天津市儿童医院

目的：通过分析儿童腹盆腔肿瘤及肿瘤样病变的能谱 CT 资料，探讨通过能谱 CT 物质定量参数及能谱曲线图对儿童腹盆腔多灶性病变同源性的研究。

方法：回顾性分析我院 2018 年 1 月至 2021 年 5 月间超声或 X 线检查疑诊为腹盆腔肿瘤及肿瘤样病变的 308 例患儿的临床及影像资料，最终 8 例（男 3 例，女 5 例）多灶性病灶患儿完成能谱 CT 检查并经手术病理证实纳入本组研究。全部患儿采用 GE Revolution 256 层宽体 CT 进行扫描，将所有患儿单能量原始图像传送至 GE ADW4.6 后处理工作站，应用 GSI 综合分析平台进行分析。多灶性病灶同源性能谱分析分别计算 40-70、70-140 各能量区间的能谱曲线斜率 K 值， $K = \frac{\text{两单能量间 CT 值之差}}{\text{能量值之差}}$ ，将 K 值=1 作为参考标准，偏差范围分为四个区间：0-25%（非常一致）、25-50%（基本一致）、50-75%（不一致）和 75-100%以上（非常不一致）。计数资料应用配对 t 检验和独立样本 t 检验。结果：8 例多发性病变中 5 例为恶性肿瘤伴转移，3 例为多发性良性病变。原发灶与其他病灶在动脉期和静脉期 40-70Kev 时能谱曲线斜率走行基本一致，K 值有统计学意义（ $P < 0.05$ ），动脉期 70-140 Kev 能谱曲线斜率基本一致，K 值有统计学意义（ $P > 0.05$ ），静脉期 70-140 Kev 能谱曲线斜率走行不一致，K 值无统计学意义（ $P > 0.05$ ）。恶性组 40-70Kev 和 70-140 Kev 两个能量区间动脉偏差范围一致性均在 0-25%（非常一致）区间，而良性组偏差范围一致性不稳定，多位于 25-50%（基本一致）和 50-75%（不一致）区间。结论：能谱 CT 物质定量测量技术和能谱曲线分析图术前定量分析和定性诊断儿童腹盆腔良恶性肿瘤及肿瘤样病变研究提供了一种新的方法。

PU-0402

ALARA 原则在儿科 CT 中的应用

邢思沛
天津市儿童医院

目的：20 世纪 70 年代，放射科开始采用计算机断层扫描（CT）成像，随着 MDCT 的飞速发展，其高分辨力、无创性和快速性的优势，大大提高了医学成像的准确性，应用日益普及。儿童 CT 检查频率和对集体有效剂量的贡献也快速增加，随之而来的电离辐射问题也引起人们的日益关注。

ALARA 的概念应运而生。

方法：近 20 年来 ALARA 一直是儿科放射学及其他领域的主要主题。降低儿童辐射剂量的同时保持诊断方式的效率和可靠性。正确理解 ALARA 原则，合理使用 CT：首先需要确认正当性“justification”，并权衡 CT 扫描带来的辐射风险与效益，最终选择 CT 检查应基于“利大于弊”这样一种预期。其次是最优化“optimization”原则的正确应用，利用最低辐射剂量达到所需图像质量。

结果：目前常用的几种剂量描述符如下：

- 1、CTDI（CT Dose Index）：用于表示 CT 设备辐射剂量特性的实用表征量，反映了 CT 机输出的相对辐射剂量水平。容积 CTDIvol 反映整个容积扫描的平均剂量。
- 2、DLP（Dose Length Product）剂量长度乘积，为 CTDIvol 与扫描范围的乘积，反映一定扫描范围内的辐射剂量， $DLP = CTDIvol \times \text{Length}$ 。
- 3、SSDE（size specific dose estimation），将 CTDIvol 结合患者体型等因素修正并加以常规化，是估算患者 CT 剂量的一种改进度量标准，SSDE 考虑了不同组织的密度，又考虑了患者体型，更加适用于儿童辐射剂量的评估。

4、有效剂量 ED (effective dose)，计算方法是将输送到体内器官的剂量乘以器官特异性生物因子和辐射类型加权因子，然后将所有暴露器官的乘积相加。

结论：采用适合儿童的扫描程序，并根据体型、年龄调整扫描参数；利用新技术新方法在不降低图像诊断质量的情况下降低儿童 CT 的辐射剂量和相关风险

PU-0403

双臂辅助上举在幼儿胸部 CT 扫描中应用价值

邢思沛

天津市儿童医院

目的：在低龄幼儿进行胸部 CT 扫描时，常因睡眠质量等原因双 臂无法完全挺直上举。在 CT 图像中，双臂长骨产生较强烈的金 属伪影，对肺尖处的观察构成一定的影响。故本研究立足于提 高图像质量，采取双臂辅助上举的方法，保持患儿在 CT 扫描床 上双臂挺直上举的状态，从而降低伪影，提高图像质量。

方法：双臂辅助上举主要分为人工干预和机械干预。人工干预 指由陪护家长双手扶住患儿上肢，保持上臂挺直。机械干预可 用柔软而有韧性的材料制成臂带，对双臂进行一个固定作用。 在本研究中，为提高患儿舒适度及睡眠质量，主要采取由家长 进行辅助上举的方法。选取年龄为 1-3 岁，体重在 10-19kg 的患 儿 20 例，均采用仰卧位扫描，管电压 100KV，管电流 185mA，其中 10 例采取足先进体位，由家长进行双臂辅助上举，肱骨延 长线与脊柱中线延长线夹角大于 150°。10 例不 进行人工干预， 仅由患儿自行双臂上举，夹角不大于 150°。

结果：使用 GE AW4.6 工作站，对胸部 CT 图像进行评估。在右 肺肺尖处选取一个感兴趣区 ROI，分别测量其信号值及噪声值， 在软组织中选取一个 ROI，测量其信号值，计算其影像对比度与 噪声的比值，即为对比噪声比。经过计算，10 例采取双臂辅助 上举技术的患儿，平均对比噪声比为 1.41；10 例未经干预的患 儿，平均噪声比为 1.15。故说明采取双臂辅助上举技术对提高图 像质量方面有重大意义。

结论：在低龄幼儿进行胸部 CT 扫描时，采取足先进的体位，由 家长进行患儿双臂辅助上举技术，能够显著改善肺尖处伪影， 降低噪声对图像质量的影响，提高图像质量，避免病变的漏诊。

PU-0404

Quantitative T2 mapping magnetic resonance imaging of articular cartilage in patients with juvenile idiopathic arthritis

Wei Xia,Yu Guo,Jianbo Shao

Wuhan Children's Hospital (Wuhan Maternal and Child Healthcare Hospital), Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Purpose: We aimed to analyze the microstructure changes of knee cartilage in Juvenile idiopathic arthritis (JIA)

patients with active synovitis using quantitative magnetic resonance imaging (MRI) T2 mapping technique.

Materials and methods: This study included 23 JIA patients, who underwent bilateral knee joints by using a MR

imaging protocol with the addition of a coronal T2 mapping. The femorotibial joint cartilage of participants was

divided into eight subregions. Twenty-four (52.17%) of 46 joints (non-synovitis group), and twenty-two

(47.83%) joint cases (active-synovitis group) were respectively calculated the T2 mean values for each subregion.

Student's T test or Mann-Whitney U test was used to determine the statistical differences of each subregion

in the non-synovitis and active-synovitis groups, which is also applied to define the distribution differences of

cartilage subregion in femoral and tibial.

Results: The T2 mean values of the superficial and deep zone of cartilage for active synovitis group were

respectively higher than those for non-synovitis group ($P < 0.05$), except for the deep zone of cartilage in lateral

tibial plateau (LTP) ($P > 0.05$). The mean T2 values of the deep zone in femoral cartilage for active synovitis

group were significantly higher than that of tibial ($P < 0.05$).

Conclusion: The finding of an increased average T2 values in active synovitis for JIA patients, especially in the

deep cartilage of femoral condyle, which suggests that T2 values may reflect cartilage microstructure differences

that occur in JIA. T2 mapping as an objective and quantitative method may allow for early detection of cartilage

changes.

PU-0405

儿童造血干细胞移植后淋巴组织增生性疾病的影像表现和临床分析

孙燕

上海交通大学医学院附属上海儿童医学中心

目的 探讨儿童造血干细胞移植后淋巴组织增生性疾病 (posttransplantation lymphoproliferative disorders, PTLD) 的影像表现和临床特点, 以提高对该病的认识。 方法 回顾性分析我院 2014 年 5 月-2020 年 12 月收治的 13 例经病理证实或临床诊断的造血干细胞移植后 PTLD 患儿的 CT、MRI、US 等影像学资料和临床资料 结果 100% (13/13) 累及结内组织, 23% (3/13) 累及结外。前者 13 例累及淋巴结 (13 例颈部淋巴结, 3 例腹腔淋巴结), 3 例累及腭扁桃体, 2 例累及腺样体; 后者 2 例累及中枢神经系统, 1 例累及胃壁。按部位, 颈部最多, 100% (13/13) 受累, 其次为腹部 23% (3/13)、中枢神经系统 15% (2/13)。移植与诊断 PTLD 的平均时间间隔为 68 天 (42-120 天)。原发病包括再生障碍性贫血 10 例, 骨髓增生异常综合征、湿疹-血小板减少-免疫缺陷综合征、 β 地中海贫血各 1 例。移植前 13 例均无 EB 病毒感染, 移植后均发生 EB 病毒感染。经对症治疗, 5 例好转出院, 8 例死亡。结论 儿童造血干细胞移植后 PTLD 发病较早、进展迅速, 移植后早期即需要频繁地筛查、监测 PTLD; 监测外周血 EB 病毒 DNA 载量对早期诊断非常重要; PTLD 可累及全身多部位, 一旦诊断 PTLD 应进行多部位检查, 影像检查对早期诊断和确定病变范围有重要作用。

婴儿左颞叶脑实质富于细胞性神经鞘瘤一例

白慧萍、郝跃文、冯玥
西安市儿童医院影像科

目的 神经鞘瘤多为外周神经系统良性肿瘤，脑实质内富于细胞性神经鞘瘤极罕见，本文分析脑实质内神经鞘瘤（Intracranial schwannomas (ICS)）的影像特点，并根据影像表现探讨病变起源、与病理进行对照分析，并与其它颅内肿瘤进行鉴别。**方法** 报道一例 5 月龄的男婴患者，以 3 个月内无明显诱因多次出现屏气发作入院，第 1 次颅脑 MRI 检查示左侧颞叶囊实性包块影，实性成分以 T1WI 等信号、T2WI 稍低信号为主，DWI 未见明显弥散受限，边缘可见囊状 T1WI 低信号、T2WI 高信号影，周围可见大片水肿，增强实性成分明显强化。颅脑 CT 示左侧颞叶囊实性包块，未见明显钙化。第 2 次 MRI（距第 1 次 MRI 检查 35 天后）检查示左侧颞叶形态不规则囊实性包块影较前增大（以边缘囊性成分增大为主），实性部分明显强化，周围脑实质仍可见水肿区，术前诊断胚胎性肿瘤。结果 患儿在全麻下行左侧颞叶肿瘤切除术，术中提示肿瘤位于左颞叶皮层下，表面呈囊性，打开后释放囊液，可见肿瘤实性部分呈分叶状，质硬，颜色苍白血供丰富，肿瘤在颅底与左侧颈内动脉、动眼神经、颞骨岩锥粘连紧密，给予松解粘连，后分块完整切除肿瘤。术后病理光镜可见梭形细胞呈束状、波浪状或弥漫紧密分布，间质局部玻璃样变性，局部小血管丰富、有出血；免疫组化：S-100(+)，SOX10(+)，PAS(-)，CK(-)。病理诊断：考虑富于细胞性神经鞘瘤，但术中未见明确神经来源。患儿术后至今约 18 个月，复查无明显复发情况。结论 基于本例患儿发病年龄及病变与周围结构关系，我们考虑 ICS 起源为发育与非发育多种机制共同作用。ICS 影像上实性成分明显强化，但易出现囊变、钙化和瘤周水肿，与病理上神经鞘瘤多由高度有序的细胞成分（AntonyA 区）和黏液样低细胞成分（AntoniB 区）组成相关。ICS 虽发病率极低，但影像表现有一定特征，需与颅内其它肿瘤鉴别。

PU-0407

基于 CT 增强细胞外容积分数评估小儿椎旁外周神经母细胞源性肿瘤病理类型

张炜、王瑞珠、杨明
南京市儿童医院

目的：讨论基于 CT 增强所得细胞外容积分数鉴别小儿椎旁外周神经母细胞源性肿瘤病理类型的意义。

方法：回顾性的收集 2021 年至 2022 年期间在我院接受活检或手术治疗，且病理明确神经母细胞源性肿瘤患儿相关临床及影像资料。基于 CT 平扫及增强两期，以圆形或椭圆形感兴趣区（15~35mm²）选择肿瘤强化实质区域，连续选择 3 个层面，取其平均值；并同时测量肿瘤同层面降主动脉（胸腹）或髂外动脉（盆腔）的 CT 值（10~20mm²）。计算 ECV：ECV(%)=[(HU₂-HU₁)/(HU_{2-blood}-HU_{1-blood})]×(1-Hct)，其中 HU₁、HU₂ 分别代表对比剂注射前后目标区域 CT 均值，HU_{1-blood}、HU_{2-blood} 分别代表对比剂注射前后血池的 CT 值。Hct 为血细胞压积。

结果：纳入患儿病例数 49 例，节神经细胞瘤 GB 9 例、节神经母细胞瘤 GNB 22 例、神经母细胞瘤 NB18 例，其中病灶位于颈部 3 例(5.77%)、纵隔 36 例(69.23%)、肾上腺区椎旁 10 例(19.23%)、盆腔骶前 3 例(5.77%)。增强后不同分期所得 ECV 值(%) GB（动脉期 3.54±3.60 vs 静脉期 9.83±6.31）、GNB（动脉期 4.09±2.84 vs 静脉期 16.18±10.78）、NB（动脉期 10.34±7.55 vs 静脉期 27.57±7.28）；分组间各期 ECV 值差异均有显著性（P 均<0.01）。相对于动脉期，静脉期 ECV 值对外周神经母细胞源性肿瘤病理鉴别能力较高，特别是对神经母细胞肿瘤

的诊断效率最高 (AUC 0.876, 截点值 17.00)。静脉期 ECV 界值定义: 节细胞神经瘤 <5%, 节神经母细胞瘤 5%~17%, 神经母细胞瘤 >17%。

结论: 研究发现基于 CT 增强所得 ECV 对于小儿椎旁外周神经母细胞源性肿瘤病理鉴定有一定意义, 且静脉期 ECV 的诊断效率更高。

PU-0408

4D Flow MRI 技术在小儿复杂性先心病的应用价值

伏川、郭应坤、李学胜、白维、徐蓉、马鑫茂、宋宇、李军
四川大学华西第二医院

目的 小儿先心病是胎儿时期心血管异常而形成的先心病, 包括常见的房间隔缺损, 室间隔缺损, 动脉导管未闭, 卵圆孔未闭, 法洛四联症。还有不常见的肺静脉异位引流, 大动脉转位, 主动脉缩窄等, 容易引发心功能失常心肌损伤, 长此以往患儿容易诱发心力衰竭。部分外科手术需要血流动力学支持。随着医学技术的飞速发展, 手术效果显著提高, 多数患者得到及时治疗。

材料和方法 研究对象为 2022 年 11 月—2023 年 6 月, 16 例医嘱提示为先心病患者的患儿, (11 名男性和 5 例女性, 平均年龄 7.8 岁, 2—15 岁) 切超声提示血液动力学异常。采用西门子 sky 3.0T 磁共振扫描 785B_4Dflow_ePAT3_retro_native 序列进行斜矢状位包全心脏进行扫描, 扫描之前先用 flow_wenc_scout_100-190tp@c 序列进行速度编码扫描, 根据流速编码序列结果进行编码设置, 两个序列均在自由呼吸状态下进行扫描, 采用回顾性心电和呼吸联合触发, 采集时间在 5-9 分钟。通过后处理获得血管腔内的二维分析平面的峰值和平均速度, 总流量, 压力梯度, 湍流动力, 净流量和反流量等。

结果 结果左、右心室增大 6 例 (37.5%), 3 例房间隔缺损血流动力学显示 (18.75%), 3 例主动脉肺动脉转位, 动脉导管未闭 (6.5%), 外科手术血流评估提供重要价值。4D Flow 能计算心脏大血管 (出冠脉以外) 的血流峰值流速和峰值流量以及血流总量。

结论 4D Flow MRI 技术作为一种无创性, 无对比剂, 无放射性检查成像手段, 可以通过多种流体相关参数 (峰值流速, 峰值流量, 脉冲波速度 (pulse wave velocity, PWV), 壁剪切 (wall shear stress, WSS) 等定量评估血流动力学, 以及提供可视化三维血流信息, 特别是超声不能提供血流量患者, 对复杂性先心病动脉转位为外科手术可行性提供有效帮助。

PU-0409

儿童前纵隔 T 淋巴母细胞淋巴瘤/急性淋巴细胞白血病的临床表现及 CT 影像学特征

王晓玉
安徽省儿童医院

【摘要】目的 分析儿童前纵隔 T 淋巴母细胞淋巴瘤/急性淋巴细胞白血病 (T-LBL/ALL) 临床表现及 CT 影像学特征, 提高诊断准确率。**方法** 回顾性收集 2016 年 9 月至 2023 年 7 月经安徽省儿童医院病理科证实为前纵隔 T-LBL/ALL 11 例患儿临床表现及 CT 资料, 其中男 9 例, 女 2 例, 年龄范围 2 岁 5 个月~14 岁 7 个月, 平均 (8.18±3.32) 岁。化疗前 11 例均行 CT 平扫及增强检查, 并以化疗后首次 CT 平扫及增强观察疗效。**结果** 11 例儿童前纵隔 T-LBL/ALL 多以全身淋巴结肿大或上腔静脉压迫综合征为首发症状, CT 大多表现为团块状囊实性软组织密度影, 少数呈分叶状改变, 肿瘤体积较大, 最长径约为 5.8~14.5cm, 平均 (10.14±2.73)cm, CT 增强扫描示实性成分轻-中度

强化,囊变区不强化,11 例病灶内均可见小血管影穿行,并伴有胸腔积液、心包积液、肺不张、气管受压、胸膜增厚等占位效应,远处浸润多以肾浸润为主,化疗后首次 CT 复查时间为 7~37 天,平均(16±12.88)天,化疗后效果显著,包括肿块缩小、占位效应减轻等。结论 尽管 T-LBL/ALL 患儿的生存率有所提高,但发病率仍然很高,CT 在诊断儿童前纵隔 T-LBL/ALL 具有一定敏感性 & 特异性,有利于指导临床治疗及评估患者预后情况。

PU-0410

新生儿胃重复畸形的 CT 诊断 (附 2 例报告)

赵滨

天津市儿童医院

【摘要】目的 探讨新生儿胃重复畸形的临床表现及 CT 影像学特点。材料和方法 回顾 2022 年 1-6 月间收治的 2 例新生儿胃重复畸形患者的临床及影像学表现,2 例新生儿患者无呕吐、呛奶,腹胀,查体无明显腹部阳性体征。均系胎儿期超声检查发现。2 例患者均行腹部超声检查及 CT 平扫、增强检查。超声采用 Philips IU22 彩色超声仪检查。CT 检查采用 GE Revolution 螺旋 CT 机,扫描范围自右膈肌水平至耻骨联合水平,采用 8mm 层厚,螺距 1.0 进床扫描。增强检查:采用欧乃派克 (1.5ml/Kg) 静脉团注后扫描。结果 超声检查显示胃大弯侧低回声肿块 1 例,胃小弯侧低回声肿块 1 例。CT 检查平扫显示左上腹部囊性肿块 2 例,胃小弯侧 1 例、胃大弯侧 1 例。肿块体积较小,直径 1-2cm 左右,边界清楚,内部以均匀液体密度为主,壁略厚,与胃壁关系密切。增强后,肿块内部无明显强化,壁轻度均匀强化。手术病理结果显示胃重复畸形。结论 新生儿胃重复畸形发病率不高,体积较小者临床上常无明显症状或体征,有些病例产前超声检查可发现。胃重复畸形以球形多见,偶可呈管状,可位于胃的任何部位,以胃大弯侧最多,且多数与胃共壁,内衬胃粘膜,也可含有肠粘膜或胰腺组织。多数胃重复畸形呈盲囊状与主胃不相通,少数可与胃或肠管相通。CT 平扫常表现为低密度肿物,边界清楚,壁略厚,内部以均匀水样密度为主。增强检查囊肿内部无强化,壁可轻度强化。本文报告的 2 例胃重复畸形其特点为大弯侧、小弯侧各一例,位置固定,均为胎儿期发现,且体积较小,壁略厚。与胃壁粘膜层或肌层关系密切,但未与胃腔相通。胃重复畸形注意与以下疾病鉴别 1) 胃憩室:通常与胃腔相通,憩室壁与正常胃壁相延续,内部可伴溃疡。2) 脾或胰腺囊肿:与胃壁无明显相连,位于脾或胰腺轮廓内,壁薄。CT 检查能够明确诊断,对于囊肿的位置、大小以及内容物作出较为全面的评估,指导临床治疗。

PU-0411

儿童心尖肥厚型心肌病超声及 MRI 特征

王敏

天津市儿童医院

目的:探讨儿童心尖肥厚型心肌病的临床、超声及 MRI 特征,以提高该病在儿童人群中的认识。方法:回顾性分析 1 例儿童心尖肥厚型心肌病的临床、超声及 MRI 资料,并复习相关文献。结果:患儿,男,12 岁,主因“乏力,发现血压升高 2 天”入院。血压:155/90mmHg。首次心电图示窦性心律、左室高电压倾向、T 波倒置。复查心电图示:窦性心律,左室肥大伴 ST-T 改变。化验:心肌酶(—)。超声心动示:室间隔基底段厚约 10mm,左心室后壁基底段厚约 12mm,左心室室壁由基底段向心尖段渐进性增厚,心肌最厚处约 19mm,心尖部/左室后壁厚度之比 1.58。心脏 MRI 示:心尖部心腔狭小甚至收缩期闭塞,心尖部心腔呈“黑桃尖”样改变,左心室心尖区室壁最厚处 18.6mm。超声联合 MR 诊断为典型心尖肥厚型心肌病。患儿左心室室壁由基底段向心尖段呈

渐进性增厚,属于混合型,该型较单纯型少见,但较单纯型严重,因此分型非常重要。延迟强化后心肌未见异常强化,提示不存在心肌纤维化。

结论:发生在儿童的心尖肥厚型心肌病较罕见,但其超声及 MRI 特征与成人相似。MRI 是目前诊断心尖肥厚型心肌病较敏感、可靠、无创的影像学检查方法。心肌肥厚位于左心室乳头肌水平以下的心尖部,舒张末期最大室壁厚度 $\geq 15\text{mm}$ 或舒张末期心尖段最大室壁厚度/基底段后壁厚度比值 ≥ 1.5 诊断典型心尖肥厚型心肌病。

PU-0412

早期以无强化长阶段横贯性脊髓炎表现的小儿原发脊髓胶质母细胞瘤 1 例及文献复习

李荣品

河北省儿童医院

脊髓胶质母细胞瘤是一种罕见的疾病,尤其在儿童中极为罕见,其病程具有侵袭性,预后差。患儿,男,7岁,主因发热、抽搐伴意识不清半天入院。查体:意识不清,GLS评分3分,三凹征阳性,点头呼吸,双膝腱反射、腹壁反射未引出。实验室辅助检查:血常规:WBC: $18.0 \times 10^9/\text{L}$,脑脊液常规提示白细胞21,生化提示蛋白: 6.77g/L 异常升高,氯低,糖正常,脑脊液压力 $310\text{mmH}_2\text{O}$ 。胸部CT显示肺部炎症。头颅MRI显示脑沟增宽。脊柱MRI显示延髓下段、颈段至胸9椎体水平脊髓肿胀并弥漫性长T2信号,脊髓增强扫描病变无强化。临床诊断:脑脊髓炎,呼吸衰竭,电解质紊乱,支气管肺炎。入院后行气管插管呼吸机辅助呼吸,给予大剂量丙球、甲泼尼龙琥珀酸钠冲击,抗感染,营养神经,降颅压,纠正电解质紊乱等治疗。治疗1个半月后复查,脊髓MRI显示脊髓肿胀减轻,脊髓内长阶段病变范围缩小,临床症状改善。2个月后,患者症状加重,随访MRI示脊髓病变扩大,C6-T5脊髓可见明显外周强化肿块,脑膜内多发结节,颅内多发肿块病变。病人进行了颈胸段脊髓肿瘤切除术。术后病理结果胶质母细胞瘤(IV级)。

在PUBMED以“脊髓、胶质母细胞瘤、MRI”为关键词搜索,共234篇文献,其中脊髓原发胶质母细胞瘤并且有磁共振增强扫描报道的共43篇,病例47例,MRI大部分表现为脊髓肿胀,一部分病例呈外生性生长,增强扫描呈花环状或团块状中等或明显增强,强化程度不均,极个别罕见病例无明显强化。而以这种长阶段广泛横贯性脊髓炎且早期无强化表现的脊髓胶质母细胞瘤文献中无相关报道。因此,我们报道此罕见病例,借以提高影像科医师对脊髓胶质母细胞瘤不典型表现的认识。

PU-0413

利用深度学习图像重建提高儿童腹部能谱 CT 血管造影的图像质量

孙记航

首都医科大学附属北京儿童医院

目的:评价深度学习图像重建(DLIR)对儿童腹部能谱CT血管造影(DEsCTA)图像质量的改善效果。

方法:收集29例肿瘤患儿(年龄 4.8 ± 2.1 岁,0.5~8岁,男:女=16:13)的腹部DEsCTA图像。分别在40keV、50keV、68keV和74keV的单能量级别下,使用50%自适应统计迭代重建(ASIR-V)、100%ASIR-V和DLIR进行图像重建。使用5分制(5分,最佳;3分,可接受)主观评估大动脉及其小分支的图像质量和诊断置信度。客观测量主动脉及背侧均匀肌肉组织的CT值、标准差值(SD),并计算对比噪声比(CNR)。

结果: DL-H 和 100%ASIR-V 图像在所有能量水平下的 CNR 均无统计学显著差异, 且均显著高于 50%ASIR-V。40keV 图像的 CNR 最高, DL-H 为 36.3 ± 8.8 , 100%ASIR-V 为 38.3 ± 11.4 , 50%ASIR-V 则为 23.05 ± 5.90 。主观评价结果显示, DL-H 对大动脉及其小分支的诊断置信度得分最高, 分别为 4.11 ± 1.52 和 3.83 ± 1.17 , 优于其他两种算法, 具有统计学差异, 40keV 时小血管显示效果最好。三组图像中的大动脉评分无显著统计学差异。

结论: DL-H 可以提高儿童腹部 DEsCTA 图像的质量, 尤其可以提升小动脉的显示能力。

PU-0414

儿童软骨发育不全的头颅影像学表现

刘梦琳、孔维丹、徐琳、周莺、钟玉敏
上海交通大学医学院附属上海儿童医学中心

目的

分析并总结软骨发育不全 (ACH) 患儿的颅脑 CT 及 MRI 特征, 以提高对本病的认识。

方法

回顾性分析我院 2014 年 2 月—2022 年 2 月收治的 ACH 病例 (共 7 例) 颅脑 CT 及 MRI 影像资料, 总结其影像学表现特点。

结果

(1) 颅颈交界区异常。7 例患儿均枕骨大孔狭窄, 其中 5 例脊髓受压变形, 2 例伴有上颈髓变性水肿。

(2) 颅底骨异常。7 例患儿均为短斜坡, 3 例存在颞骨发育异常 (颞骨岩脊高耸), 1 例听小骨形态异常伴乳突气化不全, 1 例鼓室盾板呈水平状。

(3) 颅内异常。①大脑异常: 7 例患者均有脑积水, 5 例侧脑室颞角形态异常, 4 例内侧颞叶横沟增深, 4 例内侧颞叶灰白质交界面模糊, 4 例蛛网膜下腔增大, 3 例鞍上池扩大, 2 例海马不全翻转。②小脑异常: 3 例患儿后颅窝缩小, 2 例小脑体积增大。③其他: 2 例患者视神经底角缩小, 3 例天幕角增大。

结论

ACH 患儿颅颈交界区、颅底骨及颅内可有多发异常, CT 及 MRI 相结合可清晰显示这些异常, 为临床诊断提供诊断思路, 并及早对症治疗, 防止患儿出现一系列症状, 甚至危及生命。

0-14 岁儿童发育期间垂体形态变化

王驰
首都儿科研究所附属儿童医院

目的 探究中国儿童垂体发育过程, 基于磁共振 (MR) 图像初步构建正常垂体径线参考范围, 为垂体相关疾病评估提供理论依据。方法 纳入 1400 例年龄 0~14 岁正常儿童, 每间隔 1 岁为 1 组, 男女各 50 例。所有儿童行头颅 MR 三维 T1 加权像 (3D-T1WI) 扫描, 后进行多平面重建, 测量垂体所有径线并计算垂体体积, 包括矢状位前后径、矢状位上下径、冠状位左右径及斜冠状位垂体柄长度。垂体体积按 (前后径 \times 上下径 \times 左右径) $\times 0.5$ 进行计算。结果 男童的垂体矢状位前后径, 矢状位上下径、冠状位左右径及垂体体积均随年龄增长而增大。女童的垂体矢状位上下径, 矢状位前后径及垂体体积在 13 岁达到最大, 分别为 (6.84 ± 1.15) mm, (7.39 ± 1.31) mm, (361.89 ± 109.92) mm³。垂体柄主要位于中后部, 分别为 61.5%、33.4%。垂体柄长度随年龄增

大而减小。结论 本研究初步探究新生儿到青少年垂体发育过程的形态变化及径线、体积数据，为临床评价垂体发育、疾病鉴别提供帮助。

PU-0416

特发性中枢性性早熟患儿垂体 MRI 研究

王驰

首都儿科研究所附属儿童医院

目的 探究中国特发性中枢性性早熟性早熟儿童的垂体变化，为 MRI 诊断及评估性早熟提供参考值范围。方法 纳入 2020-2022 年因性早熟在本院就诊的患儿 221 例。年龄及性别匹配的正常儿童 221 例。所有儿童行垂体 MRI 增强扫描，测量垂体所有径线并计算垂体体积，包括矢状位前后径、矢状位上下径、冠状位左右径及斜冠状位垂体柄长度。垂体体积按（前后径×上下径×左右径）×0.5 进行计算。结果 垂体矢状位前后径，矢状位上下径、冠状位左右径及垂体体积在正常组和性早熟组中均存在统计学差异，其中垂体体积差异较大。以上所有指标对性早熟有着良好的预测价值。垂体宽径对于性早熟的预测效果更佳，敏感性为 98.6%，特异性为 98.2%。结论 本研究特发性中枢性性早熟儿童垂体发育过程的形态变化及径线、体积数据，为临床评估及诊断特发性中枢性性早熟提供帮助。

PU-0417

1 例成人型左冠状动脉异常起源于肺动脉的双源 CT 表现

翟爱国、彭雪华、李权、邵剑波

华中科技大学同济医学院附属武汉儿童医院

目的：探讨双侧 CT 在儿童左冠状动脉异常起源于肺动脉诊断中的价值方法：回顾性分析、总结我院 1 例患儿经西门子 Force 双源 CT 检查诊断为成人型左冠状动脉异常起源于肺动脉(ALCAPA)的影像学表现并相关文献复习结果：本例患儿女，10 岁，因体检发现心脏杂音 9 月就诊，CT 主要表现为右冠状动脉开口于右冠窦，开口处内径约 5.5mm，全程走行迂曲扩张，最宽处内径约 7.5mm，左冠窦未见冠状动脉开口，左冠状动脉异常开口于肺动脉主干左侧壁距离肺动脉瓣上约 10mm，开口处内径约 6.5mm，并在肺动脉内见高密度造影剂的射流征象（冠状动脉盗血征），提示存在左向右分流情况，冠状动脉左主干见不同程度扩张。同时可见左室游离壁及室间隔肌层增厚，内见丰富的侧支血管影与冠脉相交通，于舒张期更显著。综上影像表现，诊断为成人型左冠状动脉异常起源于肺动脉。结论：双源 CT 具有检查速度快、辐射剂量低、造影剂量少等优点，能够清晰显示 ALCAPA 异常起源的位置及左右分流的情况，并且对冠状动脉扩张的程度、侧支血管形成情况的均可直观显示，对疾病早期诊断、临床手术方案及术后评估具有重要的价值。

PU-0418

中心层左右径在儿童胸部 CT 体型特异性剂量中的研究

黄文诺

江苏省苏北人民医院

【摘要】：目的 比较容积 CT 剂量指数(volume CT dose Index, CTDIvol)和体型特异性剂量估算(SSDE)两种辐射剂量测量方法在儿童胸部 CT 检查中的不同。方法 回顾性分析常州市第二人民医院 2020 年 1 月至 2021 年 8 月行胸部 CT 检查的儿童 131 例，所有图像均能满足诊断要求。根

据患儿图像的中心层面的左右径 (LAT) 来分组, A 组 $LAT < 20\text{cm}$, 22 例, B 组 $20 \leq LAT < 23\text{cm}$, 20 例, C 组 $23 \leq LAT < 26\text{cm}$, 21 例, D 组 $26 \leq LAT < 29\text{cm}$, 25 例, E 组 $29 \leq LAT < 32\text{cm}$, 23 例, F 组 $LAT \geq 32\text{cm}$, 20 例。测量患儿胸部中心层 CT 图像的最大左右径 (LAT), 手动勾勒体表最小的范围, 不包括检查床床板, 测量平均 CT 值、面积, 收集患儿的 CTDIvol, 并计算转换因子 f 和 SSDE, 比较容积 CT 剂量指数 (CTDIvol) 与体型特异性剂量估算 (SSDE) 的不同。结果 5 组左右径 (LAT)、转换因子 (f)、水当量直径 (WED) 差异均有统计学意义 ($P < 0.05$)。5 组 CTDIvol 和 SSDE 差异度依次为 184.72%, 174.80%, 171.69%, 153.04%, 146.83%, 134.00%。CTDIvol 和 SSDE 呈正相关 ($r = 0.736$, $P < 0.01$)。结论 儿童胸部 CT 检查中, CTDIvol 较 SSDE 低估了患儿的辐射剂量, 且患儿中心层面左右径越小, 被低估的剂量越大。

PU-0419

对比两种儿童头部 CT 扫描的 SSDE 计算方法

谭婷婷

天津市儿童医院

目的: 对比分析基于美国医学物理学家学会 (AAPM) 220 与 293 报告的体型特异性辐射剂量估计值 $SSDE_{220}$ 与 $SSDE_{293}$ 在衡量儿童头部 CT 扫描中辐射剂量的差异。

材料与方法: 回顾性选取了从 2020 年 1 月到 7 月于我院行头部 CT 检查的 480 名儿童患者, 患儿年龄区间在 3-6Y。所有扫描均使用 Philip iCT 进行, 采用固定管电压管电流, 管电压为 120KV, 管电流为 28.8mAs, 扫描长度为 120-145cm。CTDIvol 为扫描后从机器提供的剂量报告中获取, 头部 SSDE 参考 AAPM 第 220 与 293 号报告计算, $SSDE = f \cdot CTDI_{vol}$, 其中 $f = \alpha e^{-\beta D_w}$, 当采用 220 报告时, $\alpha = 1.8747$, $\beta = 0.03871$, D_w 为水当量直径; 采用 293 报告时, $\alpha = 1.9852$, $\beta = 0.0486$ 。水当量直径由 Radimetrics 软件计算所得。利用配对样本 T 检验比较 f_{220} 与 f_{293} 的差异, 同时采用 Wilcoxon 秩和检验分析比较 $SSDE_{220}$ 与 $SSDE_{293}$ 。

结果: f_{220} 与 f_{293} 的配对样本 T 检验结果, $P = 0.000 < 0.05$, f_{220} 与 f_{293} 的差异具有显著性, f_{220} 均值较 f_{293} 均值大 0.088, f_{220} 比 f_{293} 高估约 8.94%。 $SSDE_{220}$ 与 $SSDE_{293}$ 的配对样本 Wilcoxon 秩和检验结果, $P = 0.000 < 0.05$, $SSDE_{220}$ 与 $SSDE_{293}$ 的差异具有显著性, $SSDE_{220}$ 均值较 $SSDE_{293}$ 均值大 1.703, $SSDE_{220}$ 比 $SSDE_{293}$ 剂量高估约 8.99%。 $SSDE_{220}$ 对儿童头部 CT 的辐射剂量估计值较高。主要原因在于颅脑与体部组织结构的差异, 脑实质被包裹在致密的颅骨中, 相当于为脑实质提供了一层屏蔽射线的屏障, 导致在水当量直径相同的情况下, 头部吸收剂量低于体部吸收剂量。

结论: $SSDE_{220}$ 与 $SSDE_{293}$ 相比, $SSDE_{220}$ 造成了儿童头部 CT 扫描的辐射剂量估算值偏高。AAPM 293 报告的发布使儿童头部 CT 检查的辐射剂量估算更加准确。

PU-0420

苗勒管发育不全伴右半结肠旁沟区卵巢黄体囊肿 1 例

梁译文、陈嘉坤、蒋奕

香港中文大学第二附属医院龙岗区人民医院

目的 苗勒氏管发育不全多因青春期原发性闭经就诊发现, 以急性腹痛就诊者少见, 可能造成误诊或漏诊。本文旨在探讨苗勒管发育不全伴右半结肠旁沟区卵巢黄体囊肿的影像表现, 提高诊断的准确性。

方法 分析右侧腹痛 5 天患儿 1 例, 女, 14 岁, 接受 1 次全腹部 CT 平扫及增强检查。

结果 右侧结肠旁沟区见一囊性灶, 内部密度不均匀, CT 值约 10-20HU, 增强扫描囊壁呈轻度强化, 周围可见少许积液, 大小约 5.6×6.7cm, 子宫未见显示, 双侧卵巢显示不清。该例囊性灶误诊为肠

重复畸形,术中探查发现卵巢位于双侧结肠旁沟处,右侧卵巢可见囊性灶破裂出血,术后病理为卵巢黄体囊肿;骨盆入口处双侧各见一始基子宫形成,阴道为盲端,该患儿最终被诊断为苗勒管发育不全伴右侧卵巢黄体囊肿。

结论 苗勒氏管发育不全伴右半结肠旁沟区卵巢黄体囊肿极为少见,首次检查时若仅关注明显病灶而忽视其它部位异常易造成误诊或漏诊;MRI 有助于提高诊断的准确性。

PU-0421

以幼儿为核心的磁共振检查前准备方法对降低 3-7 岁幼儿磁共振检查镇静剂使用率的作用与价值

谢欢

中国人民解放军陆军特色医学中心

目的:研究以幼儿为核心的磁共振检查前准备方法对降低 3-7 岁幼儿磁共振检查镇静剂使用率的作用与价值。

方法:回顾性分析 2023 年 1 月-2023 年 6 月在我院影像科行幼儿磁共振检查的患儿 110 例,幼儿年龄段为 3-7 岁,按这些幼儿检查前的准备方式不同分为幼儿核心准备组(CCP)和幼儿常规准备组(CRP),每组 55 例。CRP 组幼儿采用常规准备方法进行磁共振检查前准备,CCP 组幼儿采用以新型的以幼儿为核心的准备方法进行磁共振检查前准备(如检查前视频学习、噪声适应、环境适应和适应性训练等)。两组检查失败的幼儿由临床医生决定是否使用镇静剂后再次进行磁共振检查。采用配对卡方检验对两组幼儿磁共振检查镇静剂使用率、检查成功率、检查效率及图像质量进行差异性分析。

结果:CCP 组幼儿磁共振检查镇静剂使用率为 2/55(3.6%),CRP 组幼儿磁共振检查镇静剂使用率为 14/55(25.5%), $P=0.008$;CCP 组检查成功率为 53/55(96.3%),CRP 组检查成功率为 41/55(74.5%), $P=0.008$;CCP 组检查效率中位完成时间为 12.5min,CRP 组检查效率平均时间为 19.6min, $P=0.031$;CCP 组图像质量评分平均分为 4.5 分,CRP 组图像质量评分平均分为 3.9 分, $P=0.038$ 。

结论:以幼儿为核心的磁共振检查前准备方法,不但可以降低 3-7 岁幼儿磁共振检查的镇静剂使用率,还能提高这部分幼儿的磁共振检查成功率、效率和图像质量。也提高了检查医生和诊断医生在扫描和诊断时的信心,镇静剂的使用减少也提高了幼儿家属对我科医疗服务的满意度,值得在同行中进行推广。

PU-0422

“双低”扫描联合迭代技术在儿童先心病 CTA 成像中的应用

陈锡建、宁刚、覃顺龙、宋西洋

四川大学华西第二医院

目的 探讨儿童先心病 CTA 成像检查中使用低管电压扫描和低浓度对比剂对图像质量和辐射剂量的影响。

方法 选取行心脏大血管 CTA 检查的儿童先心病患者 120 例,平均年龄 4.6 岁(5 月-13 岁),随机分为双低剂量组(A 组)和常规剂量组(B 组),各 60 例。CT 扫描设备为 GE Revolution,扫描参数为: A 组使用管电压 70kVp (≤ 3 岁)和 80kVp (≥ 3 岁); B 组使用管电压 80kVp (≤ 3 岁)和 100kVp (≥ 3 岁),两组均使用自动管电流技术(SmartmA),噪声指数(NI)均为 10.0,其它扫描参数相同。对比剂均使用欧乃派克(300mg I/ml),A 组用量为 0.8ml/kg(体重),B 组为 1.0ml/kg(体重)。图像重建使用多模型迭代算法(ASiR-V),迭代比例 50%。分别测量和计算左右室、肺动脉根部、左右

肺动脉和主动脉根部和降主动脉 7 个兴趣区 CT 值、噪声值(SD)、信噪比 (SN)、最佳对比噪声比(CNR),计算两组的辐射剂量(ED)和平均碘摄入量,对两组图像质量进行盲法主观评分,对两组间上述指标进行统计学分析。

结果 两组的图像 7 个兴趣区 CT 值、图像噪声差异均无统计学意义($P>0.05$)。A 组图像的 CNR 高于 B 组,差异有统计学意义($P<0.05$)。A 组的辐射剂量、平均碘摄入量均明显低于 B 组,差异有统计学意义($P<0.05$)。两组图像的主观评分无统计学意义($P>0.05$)

结论 儿童先心病心脏大血管 CTA 成像使用低管电压和低对比剂用量可以提供更好的图像对比噪声比,,联合多模态迭代重建技术,在保证诊断图像质量的同时较大幅度降低了辐射剂量,同时减少了对比剂碘量的摄入。

PU-0423

儿童可逆性胼胝体压部病变综合征 MRI 诊断价值

杨扬

天津市儿童医院

目的 探讨儿童可逆性胼胝体压部病变综合征(RESLES)的 MRI 影像特征

方法 回顾性分析我院 2020 年 5 月~2023 年 5 月期间经临床确诊并行 MRI 扫描的 16 例 RESLES 患儿,其中男 10 例,女 6 例,年龄范围 3 个月至 8 岁,中位年龄 2.3 岁,由 2 名高年资放射科医师独立对图像进行分析,协商达成一致意见,并对其病因、临床表现、影像学资料、治疗及随访进行总结分析

结果 RESLES 患儿入院最常见病因为惊厥发作和感染,临床表现为意识障碍,无其他神经系统特异表现。MRI 检查 16 例患儿病灶部位局限于胼胝体压部,病变孤立并呈圆形或椭圆形,边界欠清,其中 T1WI 呈稍低信号(5 例)或等信号(11 例);T2WI 上呈等信号(3 例)或高信号(13 例);FLAIR 及 DWI 均为明显高信号;ADC 值减低。患儿经支持及对症治疗临床痊愈,16 例患儿于 10 日~2 个月内复查头颅 MRI,所示胼胝体压部异常信号病灶完全消失

结论 儿童 RESLES 临床表现无特异性,预后良好,诊断主要依赖头颅 MRI,以胼胝体压部可逆性异常信号为特点,MRI 表现具有特征性,可为临床诊疗提供可靠依据,避免过度医疗

PU-0424

Design and validation of a scoring system for diagnosing biliary atresia based on diffusion tensor imaging and laboratory tests

Bo Liu

Children's Hospital of Chongqing Medical University

Objective: This study aimed to investigate the value of a scoring system established by laboratory and MRI parameters for diagnosing biliary atresia (BA). Methods: A total of 74 patients were recruited to design ($n=51$) and validate ($n=23$) a scoring system. DTI was performed with b factors of 0 and 1000 s/mm² by a 1.5 T MR unit or with b factors of 0 and 600 s/mm² by a 3.0 T MR unit. Parameters with significant statistical difference between BA ($n=36$) and non-BA ($n=15$) patients in the design set were analyzed by binary logistic regression to predict the presence or absence of BA, then a scoring system was designed and validated. The diagnostic power of the scoring system was assessed by area under the receiver operating characteristic curve analyses. Results: The right liver apparent diffusion coefficient values, gamma glutamyl transpeptidase, and aspartate aminotransferase platelet ratio index were

selected for the scoring system. The diagnostic accuracy, sensitivity, specificity, positive predictive value, and negative predictive value for predicting BA in the design set were 82.35% (42/51), 88.89% (32/36), 66.67% (10/15), 86.49% (32/37), and 71.43% (10/14), however, in the validation set were 82.61% (19/23), 100% (14/14), 55.56% (5/9), 77.78% (14/18), and 100% (5/5). The area under the receiver operating characteristic curve for the design set and validation set for predicting BA were 0.876 and 0.913 ($p < 0.001$), respectively. Conclusion: This scoring system can be used as an adjunct to other noninvasive imaging methods in the differential diagnosis of BA and non-BA.

PU-0425

小儿肾上腺嗜酸细胞腺瘤临床 CT、MRI 诊断

李婷婷、杨秀军
上海市儿童医院

目的: 探讨小儿肾上腺嗜酸细胞腺瘤 (adrenal oncoctyoma, AOC) 临床 CT、MRI 特征及诊断要点。**方法:** 收集并回顾性分析经手术病理证实的 3 例 AOC 临床及 CT、MRI 影像资料, 结合文献, 着重总结、分析其 CT、MRI 表现。**结果:** 3 例患者均为女性, 年龄 4 岁 2 月-11 岁 8 个月、平均 7.9 岁, 临床表现为女性男性化 2 例、性早熟 1 例, 均伴不同程度内分泌异常。肿瘤均单发, 右侧 1 例、左侧 2 例, 边缘及分界清楚, 包膜完整及延迟强化, 肿块平均长径 4.87 cm, 密度/信号较均匀且见较均匀、持续强化; 1 例可见瘤内含脂结节。**结论:** AOC 具有一定 CT、MRI 影像特点, 结合内分泌异常表现, 多能提示诊断。

PU-0426

Sn100 能谱纯化技术在儿童颞骨平扫的研究

王艺婷
山西省儿童医院

目的: 探讨双源 CT 能谱纯化技术 Sn100kVp 在儿童颞骨低剂量扫描中的应用。**方法:** 前瞻性收集我院 2021 年 12 月-2022-11 月期间行 Sn100kVp 能谱纯化技术低剂量扫描患者, 挑选出显示正常的解剖内耳和中耳结构 (在放射学报告和临床评估中) 者 50 例 (平均年龄: 5.3 ± 3.82 岁)。回顾性收集我院 2021 年 12 月—2022 年 11 月期间行常规低剂量颞骨扫描患者, 挑选出显示正常的解剖内耳和中耳结构 (在放射学报告和临床评估中) 者 50 例 (平均年龄: 5.68 ± 3.66 岁), 其中能谱纯化组采用能谱纯化技术 Sn100 kVp 方案检查 (管电流 200mAs, 128x0.6mm 准直, 0.5mm 层厚, 螺距 0.8), 常规剂量组采用参考电压 100kVp, CAREkV 方案 (参考电流 114mAs, 自动管电流调制, 128x0.6mm 准直, 0.5mm 层厚, 螺距 0.8)。测量两组图像外耳道空气、乳突气房空气、内耳道组织和鳞部骨质 CT 值、噪声; 对两组图像内耳道、迷路、听小骨、乳突气房进行解剖标记主观显著性评价, 评价结果用 5 分评分表表示; 记录设备显示辐射剂量数值, 计算信噪比。组间各部位 CT 值、信噪比和辐射剂量, 满足正态分布者差异用独立样本 t 检验进行比较, 不满足者差异用非参数 Wilcoxon 符号秩和检验比较; 组间 4 个解剖结构图像质量主观评分差异用非参数 Wilcoxon 符号秩和检验比较。**结果:** Sn100 kVp 有效剂量 (0.03 ± 0.01) mSv 显著降低, 颞骨鳞部信噪比无明显差异, 其余部位信噪比略低于常规剂量组图像, 而主观评价得分除迷路外则没有显著差异。**结论:** 能谱纯化组在不降低颞骨解剖结构显示的同时, 维持相当的噪声水平, 大幅降低儿童患者辐射剂量, 具有一定临床意义和实用价值, 今后可考虑运用于儿童颞骨非内耳畸形的病变如外伤、中耳炎等的复查中。

PU-0427

实影渲染技术 (CVRT) 在儿童肋软骨畸形诊断中的应用研究

李海燕

山西省儿童医院 (山西省妇幼保健院)

目的: 应用西门子 Force 双源 CT 后处理技术显示儿童不同类型的肋软骨畸形, 比较传统后处理方法与实影渲染技术 (CVRT) 对于肋软骨畸形诊断的差异。**方法:** 回顾性分析我院 2021 年 1 月至 2023 年 1 月 CT 诊断肋软骨畸形患儿 81 例, 利用传统后处理技术 (包括多平面重建、最大密度投影容积成像) 和 CVRT 分别对图像进行后处理, 比较不同技术对本病的诊断价值。**结果:** 肋软骨位置异常 (局部隆起 39 例、凹陷 2 例), 形态异常 (一侧增粗 3 例、一侧变细 1 例、双侧不对称 3 例、环形 4 例、叉状 29 例), 伴肋骨畸形 28 例, 不伴肋骨畸形 53 例, 各后处理技术在显示肋软骨畸形诊断中各有特点, 其中 CVRT 对本病的诊断符合率达 100%。**结论:** 在传统后处理技术的基础上, 应用 CVRT 技术能进一步提高儿童肋软骨畸形的诊断率。

PU-0428

COVID-19 疫情对 18F-FDG PET/MR 儿童肿瘤分期的影响

许远帆、梁江涛、潘建虎

杭州全景医学影像诊断中心

目的: 评估 COVID-19 疫情对 18F-FDG PET/MR 儿童肿瘤分期和治疗的影响。

方法: 对 2017 年 5 月 1 日至 2020 年 1 月 31 日 (A 组) 和 2020 年 2 月 1 日到 2022 年 6 月 30 日 (B 组) 这两个时间段内行全身 FDG PET/MR 显像的儿童肿瘤的相关资料进行回顾性分析。以病理学结果为金标准, 收集有关原发性肿瘤 (T)、淋巴结转移 (N) 及远处转移的 (M) 的数据。

结果: 共纳入 1415 例儿童 (398 例神经母细胞瘤、104 例卵裂细胞瘤、73 例肝母细胞瘤, 394 例淋巴瘤、119 例朗格汉斯组织细胞增多症、98 例横纹肌肉瘤、21 例骨肉瘤、24 例恶性畸胎瘤、31 例内胚层窦瘤、40 例生殖细胞瘤、19 例尤因肉瘤、15 例透明细胞肉瘤和 79 例其他类型的肿瘤) (A 组分别为 672 例和 B 组分别为 743 例)。A 组和 B 组从初始症状到 PET/MR 的中位间隔分别为 7.3 (1.0-28.6) 和 8.5 (1.2-30.4) 天 ($p < 0.05$), 两组不同类型肿瘤的分期差异无统计学意义 ($p > 0.05$)。

结论: 在 COVID-19 疫情期间, 对于杭州地区儿童恶性肿瘤, 在开始隔离限制后, 尽管从最初症状到 PET/MR 检查的中位间隔延长了, 但 PET/MR 分期和治疗没有显著延迟。

PU-0429

1.5T MRI 和 3.0T MRI 上 UTE 序列在儿童 膝关节成像的对比研究

熊鲜、白万晶、李亚琦
四川大学华西第二医院

目的: 探讨 MRI 超短回波时间 (ultra-short echo time, UTE) 序列在 1.5T 和 3.0T 两台不同 MRI 设备上对儿童膝关节显示的信号差异程度, 对比分析两台 MRI 设备上 UTE 序列在儿童膝关节显示的差异性。

方法: 选取 6 岁-16 岁同一年龄段范围内的儿童 20 人, 随机分配成两组 (A 组和 B 组), 运用膝关节线圈在联影 1.5T 磁共振上和西门子 3.0T 磁共振上对 A 组和 B 组的 10 位受检者分别进行 UTE 序列的扫描; 其主要成像参数如下: (1) 联影 1.5T 磁共振上 UTE 序列:

PU-0430

青少年睾丸坏死超声、CT 及 MRI 表现

方芳、吕雪飞、雷露
武汉市红十字会医院(武汉市第十一医院)

目的 探讨彩色多普勒超声、CT 及 MRI 对青少年睾丸坏死的诊断价值。方法 收集 2021 年 1 月-2023 年 8 月在武汉红十字会医院经手术病理确诊的 5 例睾丸坏死青少年患者的影像与临床资料, 全部进行彩色多普勒超声、CT 平扫、MRI 平扫及增强扫描及 DWI 成像, 分析睾丸坏死的三种成像方法的影像征象。结果 青少年睾丸坏死超声主要表现为睾丸体积增大, 光点增粗, 回声增强, 其中四例未见明显血流信号, 三例伴有附睾肿大; CT 平扫表现为睾丸肿大, 三例睾丸内斑片状稍高密度影, 两例无明显密度异常密度不均匀; MRI 表现为睾丸肿大, 信号不均, 见斑片状稍短 T1WI 短 T2WI 信号影, DWI 弥散受限, 均有附睾肿大, 增强扫描睾丸内部可见无强化区, 同侧精索静脉增粗强化。结论 青少年睾丸坏死彩色多普勒超声、CT 平扫、MRI 检查具有一定的特征性, 超声检查方便快捷, CT 检查对血肿敏感, 但特异度低, MRI 检查影像信息量大, 在临床及超声、CT 检查不明确的情况下, MRI 检查对青少年睾丸坏死的诊断和鉴别诊断具有一定的优势。

PU-0431

CT-MRI 对脑颜面血管瘤病的诊断价值

张增俊、崔光彬、李刚锋、南海燕、田强、闫卫强
中国人民解放军空军军医大学第二附属医院

目的 探讨脑颜面血管瘤病的 CT 及 MRI 表现及其诊断价值。方法 回顾性分析了脑颜面血管瘤病的临床和及 CT-MRI 资料 本组 14 例中, 男, 8 例, 女 6 例, 年龄 50d~6 岁。出生时发现眼眉血管痣 5 例, 呈红葡萄酒色、隆起于皮肤; 9 例单侧面部弥漫性大片状血管瘤, 颜色浅红至深红, 不隆起与皮肤, 压之褪色; 伴有发热、惊厥和偏瘫 2 例, 癫痫发作 5 例。结果 14 例 CT-MRI 表现均有特征性, 表现为一侧或两侧枕顶叶或额顶叶表浅部位脑回状或曲线状钙化或不同程度的脑萎缩, 伴病侧大脑半球发育不全或病侧颅板增厚 4 例。结论 本病 CT-MRI 表现具有特征性, 对本病诊断及预后判断有重要的价值。

PU-0432

CT 对肠套叠病因的诊断价值

张增俊、崔光彬、闫卫强、贺延莉、荣伟程、李刚锋、南海燕
中国人民解放军空军军医大学第二附属医院

目的 探讨 CT 对小儿肠套叠的病因诊断价值。方法 对手术证实的 30 例特发性肠套叠回顾性分析。其中男 21 例,女 9 例。年龄 2 个月-8 岁,其中 3 个月-1 岁 26 例。临床表现阵发性哭闹 23 例,呕吐 17 例,果酱样便 19 例,腹部触及包块 23 例,面色苍白、脱水 9 例和休克 4 例。CT 扫描范围为腰 2 下缘至耻骨联合上缘。结果 原发性 21 例,伴有迈克尔氏憩室 6 例,淋巴瘤 3 例。CT 表现呈同心圆形分层状肿块 19 例、不规则肿块 8 例,弹簧状肿块 3 例、伴有不全性肠梗阻 17 例、伴有完全性肠梗阻 9 例,肠穿孔 3 例。结论 CT 可准确、及时、可靠诊断小儿肠套叠,并为临床治疗方法的选择提供可靠依据。

PU-0433

TORCH 感染的脑部 CT 及 MRI 表现

张增俊、崔光彬、贺延莉、李刚锋、南海燕、闫卫强
中国人民解放军空军军医大学第二附属医院

目的: 探讨先天性 TORCH 感染的脑部 CT 及 MRI 表现。方法: 对 35 例血清学检查证实的先天性 TORCH 感染的脑部 CT 及 MRI 表现进行回顾行分析。结果: 脑内钙化伴侧脑室周围密度减低 32 例,占 91.4%。钙化呈条状、斑点状、主要分布在脑室周围及室管膜下,其次是底节区 and 大脑半球脑白质内。脑发育不良和脑萎缩 29 例,占 88.6%,CT 及 MRI 表现为脑室扩大、脑沟增宽及额顶部蛛网膜下腔增宽,常与钙化并存。脑软化及脑穿通畸形囊中 5 例。脑裂畸形或厚脑回畸形 8 例,常伴有脑室周围密度减低及钙化。严重脑萎缩、广泛性脑实质钙化 2 例。结论: TORCH 感染对儿童神经系统损害严重,后遗症多,CT 及 MRI 表现及血清学检查对 TORCH 感染具有重要的诊断意义。

PU-0434

儿童髓鞘少突胶质细胞糖蛋白抗体脑脊髓炎初诊 MRI 表现

彭腾飞、郝跃文、王冬、张鹏
西安市儿童医院

目的 探讨儿童髓鞘少突胶质细胞糖蛋白抗体脑脊髓炎的临床表现及首次磁共振影像学特征。方法 回顾性分析西安交通大学附属西安儿童医院诊断的 47 例 MOG 抗体阳性的中枢神经系统炎症脱髓鞘病患儿的临床资料,收集其发病年龄、性别、临床表现、实验室检查及影像学结果等资料。结果 47 例患者中男性 25 例,女性 22 例;起病时中位年龄 4 岁 1 个月(7 个月~12 岁 2 个月)。临床表现复杂多样,包括发热、头痛等非特异性表现,呕吐、精神差等脑病症状,视力障碍,脊髓症状,癫痫症状及意识障碍,其中 25 例患儿同时出现 2 种以上临床症状。初诊头颅磁共振阳性率为 93.6%(44/47 例),37 例累及大脑白质、14 例累及丘脑、15 例累及脑干、14 例累及基底节、11 例累及小脑、12 例累及桥臂、6 例累及胼胝体、4 例累及皮质、内囊及大脑脚各 3 例累及;其中单发 5 例分别累及小脑、桥臂、额叶白质、顶叶白质、基底节。大脑半球病灶以白质为主,同时累及大脑灰白质者 8 例。7 例患儿脊髓受累,累及颈髓 6 例,胸髓 3 例,腰髓 1 例,其中 3 例脊髓多发受累。视神经受累 10 例,8 例双侧累及,框内段受累 7 例。结论 儿童 MOG 抗体脑脊髓炎临床表现多样,

以急性播散性脑脊髓炎最为常见，MRI 表现以广泛性或孤立的皮质下白质病灶为主，脊髓受累主要为颈髓，长节段脊髓受累可见；视神经眶内段且双侧受累为其特征。

PU-0435

双能 CT 在鉴别儿童盆腔良恶性肿瘤中的应用

冯玥¹、杨志豪²、郝跃文²

1. 西安医学院

2. 西安市儿童医院

目的 探讨 CT 双能量成像定量分析在鉴别儿童盆腔良恶性肿瘤中的应用价值。

方法 回顾性分析 2021 年 7 月至 2022 年 12 月在西安市儿童医院经病理证实盆腔肿瘤的 37 例患儿，其中良性肿瘤 21 例（成熟畸胎瘤 7 例、卵巢囊肿 7 例、淋巴管瘤 5 例、海绵状血管瘤 1 例、粘液性囊腺瘤 1 例），恶性肿瘤 16 例（未成熟畸胎瘤 3 例、混合性生殖细胞肿瘤 3 例、神经母细胞瘤 3 例、混合性性索-间质瘤 2 例、卵黄囊瘤 2 例、横纹肌肉瘤 2 例、恶性外胚层间叶瘤 1 例），均行盆腔 CT 增强扫描，以双能量模式收集动、静脉期影像。并通过 syngo.via20 处理软件测量双期肿瘤的 CT 值、碘浓度及能谱曲线，并计算病变双期的标准化碘浓度(标准化碘浓度=病灶的碘浓度/同层髂动脉碘浓度)和能谱曲线斜率[斜率=(HU40 keV -HU70 keV)/30]；采用独立样本 t 检验或 Wilcoxon 秩和检验对盆腔良恶性肿瘤参数进行统计学比较，并绘制受试者工作特征曲线(ROC 曲线)评估相应参数的诊断效能。

结果 儿童盆腔恶性肿瘤中 DECT 衍生的静脉期参数（标准化碘浓度（NIC）、碘浓度（IC）、能谱曲线斜率(k)）显著高于良性肿瘤（均 $P<0.05$ ），而增强双期的 CT 值及有效原子序数差异均无统计学意义。诊断盆腔恶性肿瘤的阈值为静脉期 $NIC\geq 0.11$ ，敏感性为 69%、特异性为 95%、曲线下面积(AUC)为 0.853；静脉期 $IC\geq 0.55\text{mg/ml}$ ，敏感性为 69%、特异性为 95%、曲线下面积(AUC)为 0.802；静脉期斜率 $k\geq 1.13$ ，敏感性为 56%、特异性为 95%、曲线下面积(AUC)为 0.734。

结论 双能 CT 可通过静脉期 NIC、IC 及能谱曲线斜率帮助鉴别儿童盆腔良恶性肿瘤，且静脉期 $NIC\geq 0.11$ 时诊断恶性肿瘤可能性更大。DECT 物质定量测量技术和能谱曲线在鉴别诊断儿童盆腔良恶性肿瘤方面具有重要辅助价值。

PU-0436

足月儿缺氧缺血性脑病的 MRI 特征

代敏

温州医科大学附属第二医院

新生儿缺氧缺血性脑损伤（neonatal hypoxic-ischemic injury）是指围产期窒息导致脑缺氧缺血性损伤，临床出现一系列脑病的表现。不同胎龄脑损伤的病理机制、损伤部位、神经影像学表现及临床预后均有所不同。足月新生儿缺氧缺血性脑病的临床表现随病情严重程度不同而异，轻度者有易怒、紧张不安和深部反射增强，预后好。中度包括昏睡、癫痫和肌张力下降，60%-80%预后好。严重者有昏迷、癫痫、脑干功能异常，颅内压升高，重症患儿可见瞳孔散大、反射消失，前囟门紧张等。

【主要影像学表现】

（1）矢状旁区脑损伤

即周围型脑损伤，大脑矢状旁区皮层及皮层下区域发生局灶性或弥漫性水肿时，MR 可以显示相应部位的占位效应，MR 扩散受限，严重时出现脑皮层区层状坏死，表现为皮层区脑回样、线样 T1WI 高信号灶。在后遗症期，矢状旁区皮质及皮质下区域多发软化灶，分水岭区脑皮质变薄，皮

质下白质减少, 相邻侧脑室扩大, 三角区和枕角受累明显, 严重者局部脑表面皱缩, 表现为瘢痕样脑。

(2) 基底节、丘脑损伤 足月儿严重窒息持续一段时间之后可造成基底节、丘脑损伤, 是中央型脑损伤的主要特征。急性期 T1WI 显示双侧对称性内囊后肢正常高信号消失, 而在丘脑外侧、苍白球及壳核后部、皮质深部区呈斑片或广泛性高信号, 在 T2WI 则可为正常或斑片状高信号; 亚急性期上述结构在 T1WI 表现为不均匀高信号, 在 T2WI 呈高、低相间的纹理状不均匀信号。慢性期, 受损脑组织萎缩和基底节营养不良性钙化, 在分水岭区 T2WI 可有高信号。广泛脑坏死病例可有弥漫性脑软化。

PU-0437

磁共振扩散加权成像定量参数对宫颈癌的诊断效能的多中心评价

代敏、王雪

温州医科大学附属第二医院

目的: 基于多中心数据分析扩散加权成像 (diffusion weighted imaging, DWI) ADC (apparent diffusion coefficient) 单指数模型及体素内不相干运动 (Intravoxel incoherent motion, IVIM) 模型的定量参数对宫颈癌诊断及病理分级的价值, 并进一步探讨 DWI 定量参数在不同临床中心间的一致性。

方法: 回顾性分析 3 个临床中心经手术病理证实的 170 例宫颈癌及 12 例宫颈平滑肌瘤患者, 术前均行多 b 值 DWI 扫描。所有 DWI 图像通过后处理获得相应 DWI 参数: 包括 IVIM 模型的纯扩散系数 (D)、伪扩散系数 (D*)、灌注分数 (f)、fD* 及 ADC 单指数模型的 ADC 值。采用受试者工作特征 (Receiver operating characteristic curve, ROC) 曲线及 Man-Whitney U 检验分析 DWI 参数的诊断效能及术前对宫颈癌病理分级的价值, 采用 Kruskal-Wallis 单因素 ANOVA (多样本) 分析 DWI 定量参数在不同临床中心间的一致性, $P < 0.05$ 为差异有统计学意义。

结果: 宫颈癌灶 DWI 参数 (D、D*、f、fD*、ADC 值) 均明显小于正常宫颈组织 ($P < 0.05$)。参数 D、f 及 ADC 值的曲线下面积 (area under the curve, AUC) 值均大于 0.95, 其诊断宫颈癌的敏感度、特异度、阳性预测值及阴性预测值均大于 90%。低分化 (G3) 宫颈癌的 D 和 ADC 值低于中高分化 (G1-2) 宫颈癌 ($P < 0.05$)。在宫颈癌病灶中, 临床中心 2 的设备 2 与临床中心 3 之间 DWI 各参数 (D、f、D*、fD*、ADC 值) 无明显差异 ($P > 0.05$)。宫颈癌灌注相关参数 (f、D*、fD*) 在不同临床中心不同设备之间无明显差异 ($P > 0.05$)。

结论: DWI 参数 D、f 及 ADC 值在宫颈癌诊断方面取得了良好的诊断效能 (AUC 值均大于 0.95)。DWI 扩散相关参数 D 和 ADC 值可以区分宫颈癌的病理分级, 且在不同临床中心相同型号的 MRI 设备中具有较好的一致性。

PU-0438

新生儿色素失禁症的脑部 MRI 特征

陈超、王小飞

西安市儿童医院

目的: 探讨新生儿色素失禁症的脑部 MRI 特征及临床表现, 提高对本病的诊断。

资料与方法: 回顾性分析 2013 年 1 月-2023 年 1 月西安市儿童医院新生儿科收治, 并经临床及基因证实的 9 例新生儿色素失禁症的 MRI 特征, 包括 T1WI、T2WI、FLAIR 及扩散加权成像 (DWI), 以及相关临床表现。

结果: 9 例患儿均有皮疹表现, 包括红斑、丘疹、水泡、疣状增生、泼墨状色素沉着。5 例脑部 MRI 表现异常, DWI 出现高信号病灶 4 例, 其中 3 例病灶呈广泛性分布, 受累部位主要包括双侧大脑半球白质、双侧基底节、丘脑、内囊、胼胝体、脑干及小脑等。DWI 可更早、更敏感地发现病灶及累及范围。

结论 新生儿色素失禁症脑部病变发病率高, 如果出现相应神经系统症状时, 应尽早行 颅脑 MRI 检查。DWI 具有一定的特征性, 有助于早期发现病变及对临床预后评估有重要意义。

PU-0439

胎儿硬脑膜窦畸形 MRI 诊断

殷星、赵鑫、陆林
郑州大学第三附属医院

目的: 胎儿硬脑膜窦畸形是一种罕见的颅内血管畸形, 属于动静脉分流性疾病, 病因尚不明确, 通常而言, 胎儿硬脑膜窦畸形预后较差, 常合并心力衰竭、出血/血栓形成、颅内压升高等合并症。通过分析我院 9 例胎儿硬脑膜窦畸形病例, 总结其影像特点, 提高影像诊断能力。方法: 回顾性分析我院于 2017 年至 2023 年诊断的胎儿硬脑膜窦畸形 9 例病例, 分析其影像特点。结果: 9 例胎儿中均出现硬脑膜窦的囊状扩张, 在单激励快速自旋回波序列中呈低信号, 稳态自由进动序列呈高信号, T1WI 信号以等信号为主, 如果出现稳态自由进动序列低信号、T1WI 高信号则提示血栓形成。通常会造造成脑实质受压移位。9 例中侧脑室扩张者 3 例, 静脉窦畸形伴血栓形成者 4 例, 伴出血者 2 例, 9 例胎儿脑双顶径及骨双顶径均处于正常范围内, 2 例胎儿额枕径处于-1SD 范围, 可能与硬脑膜窦压迫有关。结论: 产前 MRI 可以准确诊断胎儿硬脑膜窦畸形, 同时可评估出血及血栓形成, 以及大脑发育状况, 有助于为产前诊断提供更多预后信息。

PU-0440

鞍区罕见造釉型颅咽管瘤一例

白慧萍、郝跃文、魏思文
西安市儿童医院影像科

目的: 颅咽管瘤是良性病变, 起源于胚胎时期 Rathke 囊形成颅咽管时的残余上皮细胞, 多位于鞍内和鞍上, 在组织学上分为造釉型和乳头型, 造釉型多见于儿童, 好发于 5~15 岁, 是儿童最常见的鞍区病变之一。重要影像特征呈囊实性肿块(囊性者占 80%), 90%合并钙化(结节或包壳状)。本例包块表现为完全钙化甚至骨化, 未见明显囊性成分, 分析颅咽管瘤钙化甚至骨化原因及影像表现, 提高对颅咽管瘤罕见影像表现的认识。

方法: 男, 3 岁 7 月, 以“视物不清半年, 加重 1 月主诉”入院, 进行了头颅 CT 及 MRI 扫描。我们从影像临床信息系统中获得患者的临床资料、影像特征、手术记录、病理结果。

结果: 头颅 CT 示鞍区类圆形环绕骨性包壳的高密度包块影, 周围可见放射状伪影, 包块内弥漫分布高密度结节影, 结节影间可见分隔; 头颅 MRI 示病变呈弥漫性长 T1、短 T2 异常信号结节影, 其内分隔呈等 T1、稍长 T2 信号影, 增强扫描结节影未见明显强化, 囊壁及间隔明显强化。垂体及视交叉受压, 影像诊断颅咽管瘤(造釉细胞型)。术中可见视神经苍白, 被肿瘤挤压延长变薄, 视交叉移位明显, 鞍区肿瘤呈多房“石榴籽”样钙化, 周围纤维小房包裹, 切除纤维囊壁, 取出钙化病灶约 300 余粒。病理大体呈灰白牙齿样物, 光镜所见示纤维囊壁样组织周边见栅栏状排列的柱状上皮及条索状排列的鳞状上皮结构, 伴淤血、出血、钙盐沉积和大量骨化, 局部慢性炎细胞浸润。免疫组化: Vimentin(+); CK(+), CK19(+), CK7(-), EMA(-), Ki-67(<1%+), P63(+), β -catenin(浆+), SYN(-), GFAP(-), Olig-2(-), S-100(灶+)。病理诊断造釉细胞型颅咽管瘤(WHO 1 级)。

结论：本例发病部位典型，影像表现罕见。颅咽管瘤骨化与前期钙化程度相关，CT 示包块周围可见放射状伪影，提示骨化可能，且钙化在 MRI 上可呈现高低不同的多种信号，而本例各序列皆为低信号，与骨皮质信号类似，考虑骨化。MRI 增强扫描囊壁及间隔明显强化，提示有一定生物活性，与文献报道骨化使没有生物学活性的钙化结构变成含有肿瘤细胞和间质的复合体一致，需要密切随访是否复发。

PU-0441

双肾恶性横纹肌样瘤（malignant rhabdoid tumor of the kidney, MRTK）并松果体-小脑上蚓部横纹肌样瘤一例

白慧萍¹、郝跃文¹、张鹏²、方苏²

1. 西安市儿童医院

2. 西安市儿童医院

患儿，女 6 月 7 天，体检时发现左腹部包块。腹部 CT 示左前下肾门部可见一大小约 58x51x50mm 的软组织包块影，其内密度不均匀，可见斑片状低密度影及斑点状高密度影。增强扫描明显不均匀强化。右肾门水平可见密度稍低片团影，轻度强化，大小约 14x13mm。CT 诊断左侧肾母细胞瘤，右肾稍低密度影。外院手术诊断（左侧肾脏下极）恶性肿瘤，组织学特点及免疫学表型特征提示为横纹肌样瘤，免疫学标记：CK(+,少数细胞),CD99(+),CK18(+,部分细胞),syn(+),SALL4(+,部分细胞),CyclinD1(+,部分细胞),Bcl-2(+),CD56(+,少数细胞),Vimentin(+,部分细胞),KI-67(+,局部约 80%),BRG1(+),CD34(+,少部分细胞),CA9(+/-),INI-1(-,丢失)、Desmin(-),cgA (-),S-100 (-),CK5/6(-),WT-1 (-),NSE (-),TTF-1 (-),H-Caldesmon (-),SMactin(-)。术后复查右肾门小包块影稍增大，结合病史考虑横纹肌样瘤，进行头颅 MRI 排查示松果体-小脑上蚓部类圆形等信号包块影，大小约 3.5cmX3.2cmX4.5cm，其内可见多发小囊状长 T1、长 T2 信号影，50 天后复查包块增大，内部囊状影较前扩大，增强呈小片状、线状轻度强化，幕上脑积水，出于“同源性”考虑横纹肌样瘤可能。外送基因检测提示抑癌基因 SMARCB1/INI-1 嵌合杂合性缺失。后采用 WT-2019（6）（修正 UH-1）-W1、W2 方案化疗，目前右肾小包块变化不大，松果体-小脑上蚓部包块稍增大。

肾恶性横纹肌样瘤可能来源于胚胎干细胞或生殖细胞，具有高度侵袭性，易发生远处转移如肺、脑等，预后极差。影像表现缺乏特征性，主要为靠近肾门的不均质包块，常伴囊变坏死及少许钙化，本例患儿双肾包块皆靠近肾门，颅脑 MRI 检查发现松果体-小脑上蚓部包块。MRTK 均有抑癌基因 SMARCB1/INI-1 异常，本例患儿此基因杂合性缺失。MRTK 以手术治疗为主，辅以化疗、放疗等综合治疗。

PU-0442

Based on contrast-enhanced CT radiomics and clinical feature analysis to predict distant metastases in Pediatric Willm's tumor

Ting Gui, Lijun Wang, Dengbin Wang

Xinhua Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

Purpose: Combined Radiomics Signatures with clinical features to predict distant metastasis in pediatric Willm's tumor.

Method: The Ethics Committee of Xinhua Hospital Affiliated to Shanghai Jiaotong University School of Medicine approved this study (XHEC-D-2020-124). Informed consent was provided by each subject or their responsible guardian. From January 2014 to October 2021, We

retrospectively collected 215 patients with Wilms tumor, who were initially diagnosed, underwent surgery and other treatments and then had a long-term follow-up in our hospital. The Inclusion criteria were (1) age ≤ 18 years old at the time of diagnosis, (2) the postoperative pathological diagnosis of unilateral Wilms tumor, and (3) the pretreatment abdominal contrast-enhanced multidetector computed tomography (MDCT) examination and unenhanced chest CT acquired within 1 week before surgery. The final enrolled patients (n=93) were divided into the training cohort and the test cohort with a ratio of 3:1 by a completely randomized method. We have also collected the clinical pathological information and CT image features of each patient, and extracted the CT radiomics characteristics of their three-stage abdominal CT scanning images. Lasso algorithm analysis is used to screen the extracted CT radiomics features at the plain scan, cortex and medulla CT images. The clinical prediction model, CT-image-feature prediction model, CT-radiomics model and clinical-CT-radiomics combined model were constructed and validated respectively for predicting the risk of distant metastasis in pediatric Willm's tumor patients.

Results: Most pediatric Willm's tumor patients enrolled in this study were less than 3 years old and there were more male patients than female patients. 98% of these pediatric patients were affected unilaterally, though there are 2 pediatric patients who suffered tumor lesions in both kidneys at the initial diagnosis. The main pathological type of these patients was the mixed type and most tumor mass were over 10 cm at the initial diagnosis based on their CT image findings. After surgery, 22 patients had been found distant metastasis during the follow-up CT imaging screening and the lung was the most common distant metastasis site. After carefully analyzing these patients' three-stage abdominal CT scanning images, ten CT radiomics features, which were the radiomics signatures mostly related to the event of distant metastasis, were selected to construct the radiomics signature. The AUC value obtained from the radiomics model based on only the radiomics signatures was 0.96 in the training set and 0.94 in the test set. The largest diameter of the primary tumor was identified as an independent clinical predictor ($p < 0.01$) for distant metastasis. The clinical-CT-radiomics combined model showed a good discrimination capacity with an AUC of 0.94 in the training set and 0.92 in the test set, and the sensitivity and accuracy were further increased when using the combined model.

Conclusions: The risk of metastasis in pediatric Wilms tumor patients could be efficiently predicted using the radiomics model based on three-stage abdominal CT scanning image analysis. The combined model which combined radiomics signatures and the clinical feature, largest diameter of primary tumor, had a satisfactory ability to predict the risk of distant metastasis in pediatric Willm's tumor, with a comparable discrimination capacity and a better sensitivity and accuracy.

PU-0443

儿童耳源性硬膜外脓肿伴乙状窦血栓性静脉炎 2 例影像学表现并临床分析

张孟杰

天津市儿童医院

目的 综合分析儿童耳源性硬膜外脓肿伴乙状窦血栓性静脉炎的临床表现、影像学特征及鉴别诊断要点, 提高对儿童耳源性硬膜外脓肿伴乙状窦血栓性静脉炎的认识和影像诊断水平。方法 回顾性分析 2 例经手术证实的儿童耳源性硬膜外脓肿伴乙状窦血栓性静脉炎的临床及影像学表现, 复习相关文献。结果 本组病例均为男性, 年龄范围 (4~6) 岁, 均以消化道症状就诊, 后出现发热等症状。2 例均为左侧发病。CT 表现为左侧中耳乳突区软组织密度影填充伴乳突部骨质破坏, 左耳周软组织肿胀。1 例显示左乙状窦走行区稍低密度包块伴边缘密度增高, 边界较清晰。头部 MRI 平扫表现为左乙状窦走行区或颞枕部硬膜外稍长 T1 长 T2 信号包块影伴分隔, 于 DWI 序列呈高信号, 边界清晰, 1 例为多发病灶。脑实质内无异常病灶。增强检查显示 2 例均呈病变边缘及分隔强化, 并出现脑膜异常强化。MRV 显示左侧乙状窦受压, 局部充盈缺损。结论 儿童耳源性硬膜外脓肿伴乙状

窦血栓性静脉炎临床少见，病死率较高，需尽快手术治疗，术前影像学检查可以为临床诊断和治疗提供有价值的影像学信息。

PU-0444

幼儿早发型戊二酸血症 I 型两例

陈雪
苏州市立医院

目的：戊二酸尿症 I 型 (GA I) 是一种罕见的可治疗的神经代谢性疾病，由戊二酰辅酶 A 脱氢酶 (GCDH) 基因突变导致，该文旨在评估 GA I 患者的临床表现、实验室检查及影像学表现。

方法：总结本院 2019 年 1 月~2020 年 1 月确诊的 2 例 GA I 患儿的临床特点、实验室检查、影像学表现。

结果：2 例患儿均为新生儿筛查发现，为早发型，临床主要表现为头围增大，智力发育迟缓、运动延迟、肌张力减低伴有惊厥发作 (病例 1)、嗜睡和喂养困难 (病例 2)。实验室检查：血串联质谱有机酸分析 2 病例尿液中戊二酸和 3-羟基戊二酸显著增加。头颅 MRI 检查表现：患者均出现双侧外侧裂池对称性扩大，双侧额颞部蛛网膜下腔增宽伴额颞叶萎缩，双侧苍白球 T2WI 高信号伴弥散受限，脑室周围白质 T2WI 及 FLAIR 高信号，其中一例出现双侧额叶白质 T2WI 及 FLAIR 高信号伴弥散受限。

结论：GA I 患者临床表现多样，大头畸形是其临床特征之一，若患者短期出现头围增大，应进行 GA I 的筛查。实验室检查以血清或尿液有机酸升高为特征。影像学表现具有特征性：外侧裂对称性增宽、额颞叶萎缩、不同程度脑白质或/和基底节信号异常，DWI 及 MRS 等功能成像在评估疗效及随访中具有重要作用。早期筛查、早期低蛋白饮食干预，在神经系统症状出现前进行治疗预后较好。将 GA I 筛查纳入新生儿筛查项目是早期诊断的有效方法。

儿科影像技术：提升儿童医疗诊断与治疗的关键

郭莹莹
郑州大学第五附属医院

儿科影像技术在儿童医疗诊断与治疗中起着重要作用。本论文旨在探讨儿科影像技术的应用和发展，以及其在儿童医疗中的重要性。首先介绍了儿童医疗的特殊性和挑战，接着探讨了常用的儿科影像技术，包括 X 射线、超声波、计算机断层扫描 (CT) 和磁共振成像 (MRI)。随后讨论了儿科影像技术在儿童医疗中的应用领域，如儿童骨科、儿童肿瘤学和儿童神经学。最后，强调了儿科影像技术质控的重要性，包括质量控制标准、技术培训和监管。通过提高儿科影像技术的质量和可靠性，可以提升儿童医疗诊断与治疗的准确性和安全性，为儿童患者提供更好的医疗服务。

基于腺垂体影像组学无创评估青春期前和青春期儿童下丘脑-垂体-性腺轴激活的研究

刘栋、朱文珍

华中科技大学同济医学院附属同济医院

目的：探索一种基于 MRI 数据的无创、低成本、快速放射组学模型，用于评估儿童下丘脑-垂体-性腺(HPG)轴的激活。

材料与方法：本研究将于 2021 年 4 月至 2021 年 9 月接受垂体 MRI 扫描和 GnRH 刺激测试的 239 名儿童纳入研究，采用分层随机抽样方法分为训练集和测试集。使用最小绝对收缩和选择算子(LASSO)生成放射组学特征，并进行 10 倍交叉验证。采用受试者工作特征(ROC)和决策曲线分析(DCA)对放射组学模型的性能进行评价。

结果：通过 LASSO 逻辑回归方法，在训练队列中提取了 851 个放射组学特征，并将其减少到 10 个潜在的预测因子。基于 CUBE T1WI 的放射组学模型对 HPG 轴激活的预测效果较好，训练集的 AUC 为 0.84，测试集的 AUC 为 0.81。放射组学模型的 AUC 高于训练集的腺垂体体积(aPV)和高度(aPH)(分别为 0.84 vs 0.75 [P =0.001]和 0.84 vs 0.63 [P<0.001])。在 DCA 分析方面，放射组学特征显示出比 aPV 和 aPH 模型更高的净效益。

结论：MRI 放射组学模型可以作为 HPG 轴激活的无创预测因子，可能为性早熟、中枢性性早熟、生长发育和青春期发育迟缓以及先天性促性腺功能低下患者的诊断提供有价值的信息。

新生儿消化道异物影像表现 1 例

唐康

德昌县人民医院

儿童异物摄入是世界范围内常见且严重的问题，治疗不及时可导致严重的并发症和死亡率。因此，快速诊断和治疗很重要。放射检查在异物的确诊和治疗过程中至关重要。我们报道 1 例新生儿消化道异物。患儿，男，6 天，发现皮肤黄染 5 天，血便 1 次，发现气促 10 分钟，就诊。入院腹部平片（图 1）提示：上腹部见一条形（长度约 15mm）、尾端圆形致密影（直径约 4mm），边缘光整。CT 显示（图 2-3），位于左上腹小肠内，双侧膈下未见游离气体影，腹部未见肿块影。自患病以来，诉反应、吃奶、睡眠可，昨日夜间大便秘次多，约 5 次，稀糊状，入院前解血便 1 次，入院后解血便 1 次，量较多，为黄色稀便伴血性物质，小便未见异常。完善相关检查充分沟通后建议暂时保守治疗，12 小时后，患儿大便内见一耳钉影（图 4）。

儿童 HIV 相关颅内感染的 CT 特点分析

程美英、赵鑫、张小安、陆林、赵俊锋
郑州大学第三附属医院

目的：回顾性分析儿童 HIV 相关颅内感染的 CT 表现特点，以提高对儿童 HIV 颅内感染 CT 表现的认识。方法：收集赞比亚大学教学医院 2016 年 4 月-2017 年 4 月经临床及实验室检查证实的 HIV 颅内感染儿童病例 24 例，结果：24 例患儿中，结核性感染 13 例，CT 表现为脑实质无明确病变 2 例，9 例基底节、丘脑低密度病灶（如图 1a-1b），1 例见结核球并明显强化（如图 2a-2b）；HIV 脑炎 5 例，2 例双侧侧脑室旁对称性低密度影，2 例见脑干低密度，1 例见小脑低密度，均无强化（如图 3a-3b）；弓形虫感染 3 例，（如图 4a-4b）；隐球菌感染 2 例，1 例右侧小脑半球、脑干、丘脑及右侧基底节区低密度影，呈环形强化（如图 5a-5b）；非洲锥虫病 1 例（如图 6a-6b），CT 表现为双侧基底节区及左侧额颞顶叶低密度影，增强扫描病变无强化，无脑膜强化，轻度脑萎缩并脑室扩张。结论：儿童 HIV 相关颅内感染的 CT 表现具有一定的特点，结合临床及实验室检查，可以提高对本病的认识，能够尽早诊断，对临床的治疗具有重要意义，同样对于我国援非医疗工作，具有现实意义。

PU-0449

产前 MRI 预测先天性膈疝胎儿出生后治疗转归

池润民
上海交通大学医学院附属新华医院

目的 观察产前 MRI 对预测先天性膈疝（CHD）胎儿出生后治疗转归的价值。方法 回顾性分析 55 胎经产前超声及 MRI 诊断 CHD 胎儿（CDH 组）及同期 55 胎孕周与 CDH 组匹配、经超声检查排除膈疝及其他消化系统畸形胎儿（非 CDH 组），随访胎儿妊娠结局及出生后治疗情况，根据出生后治疗转归（是否存活）将 CDH 组分为存活亚组及死亡亚组。比较 CDH 组与非 CDH 组间预估肺体积比（PPLV）和理想肺体积比，存活亚组与死亡亚组间一般资料和产前 MRI 表现的差异。采用二元 logistic 回归分析影响 CDH 胎儿出生后治疗转归的一般资料及产前 MRI 表现相关因素。绘制受试者工作特征（ROC）曲线并计算曲线下面积(AUC)，评估 PPLV 预测 CDH 胎儿出生后治疗转归的效能。结果 CDH 组与非 CDH 组间不同孕周胎儿 PPLV 差异有统计学意义（ P 均 <0.05 ），而理想肺体积比差异无统计学意义（ P 均 >0.05 ）。CDH 组内 41 胎为存活亚组、14 胎为死亡亚组，2 亚组间分娩时孕周、出生后住院时间及产前 MRI 所示是否有疝囊、是否肝脏疝入、双肺体积及 PPLV 差异均有统计学意义（ P 均 <0.05 ）。分娩时孕周和 PPLV 均为影响 CDH 胎儿出生后治疗转归的独立影响因素（ P 均 <0.05 ）。ROC 曲线显示 PPLV 预测 CHD 胎儿出生后治疗转归的 AUC 为 0.964。结论 产前 MRI 可有效预测 CDH 胎儿出生后治疗转归。

PU-0450

Pacifier Sign— Hiatal Hernia Disease(colonic type)

Bin Yang,Ming Ji
Children's Hospital of Fudan University

OBJECTIVE: The purpose of this study was to evaluate the special image of Hiatal Hernia Disease

Methods: A 8 - year - old boy presented abdominal pain with no obvious inducement several months ago. The chest X-ray showed a gaseous shadow at the right margin of the spine . No abnormality of esophagus and stomach was found in gastrointestinal angiography. Chest and abdominal CT revealed herniation of the middle transverse colon into the right thoracic cavity from the esophageal hiatus. The child should be follow-up and did not require surgical treatment at once.

Results:We can see some special images of the disease.

Conclusion: Hiatal hernia disease is very common, and usually a herniation of the stomach bubble into the thoracic cavity, but it is extremely rare to see the middle transverse colon into the thoracic cavity from the esophageal hiatus, which is worth learning.

PU-0451

Inverted Glass Sign— Ectopic Liver Disease

Bin Yang,DaJiang Zhang
Children's Hospital of Fudan University

OBJECTIVE: The purpose of this study was to evaluate the special image of Ectopic Liver Disease

Methods: A 12 - year - old boy presented abdominal pain and weak urination with no obvious inducement one month ago. Routine urinalysis showed no abnormalities. Physical examination reveals a dense mass in the lower abdomen. Abdominal MRI and CT enhancement scan found that the upper abdomen liver volume was significantly smaller, and the lower abdomen found a solid mass, with cord of soft tissue and vascular connected between each other. Further DSA examination confirmed extrahepatic portal shunt, with absence of intrahepatic portal vein, and ectopic liver. The child should be follow-up and did not require surgical treatment at once.

Results:We can see some special images of the disease.

Conclusion: Portal shunt disease is common, but it is extremely rare to have ectopic liver and intrahepatic portal vein absence, which is worth learning.

PU-0452

扩散张量成像定量评估脊髓性肌萎缩症严重程度的研究

黄杨
深圳市儿童医院
汕头大学医学院

目的: 通过扩散张量成像 (DTI) 评价脊髓性肌萎缩 (SMA) 患儿大腿肌肉的微观结构改变, 分析 DTI 定量参数与临床指标的相关性, 以探讨 DTI 评估 SMA 疾病严重程度的临床价值。

方法: 收集 30 例经基因确诊的 SMA 患儿 (Ⅱ型 16 例, Ⅲ型 14 例), 行双侧大腿肌肉常规 MRI 及 DTI 成像, 测量右侧大腿 13 块肌肉 DTI 定量参数 (各向异性分数[FA]、表观扩散系数[ADC]),

并收集患儿的临床指标（年龄、体质指数[BMI]及 Hammersmith 运动功能量表[HFMSE]评分）。采用 Spearman 秩相关性分析 DTI 定量参数与临床指标的相关性，采用独立样本的非参数检验比较Ⅱ、Ⅲ型患者的组间差异。

结果：股薄肌的平均 FA 值最大和 ADC 值最小，长收肌的平均 FA 值最小和 ADC 值最大；患儿大腿肌肉的平均 FA 值与 HFSME 评分呈负相关，平均 ADC 值与 HFSME 评分呈正相关。Ⅱ型 SMA 患儿大腿肌肉的平均 FA 值高于Ⅲ型，而平均 ADC 值低于Ⅲ型，差异均具有统计学意义。

结论：DTI 能客观有效地定量评估 SMA 患儿疾病的严重程度，并有助于区分Ⅱ、Ⅲ型 SMA，在监测疾病进程、评价治疗效果方面有重要临床应用价值。

PU-0453

Star-VIBE 序列对于早产儿 BPD 诊断的临床应用

穆西虎

江苏省人民医院（南京医科大学第一附属医院）

目的: 探讨 Star-vibe 序列对早产儿支气管肺发育不良诊断效能及临床严重程度评估的可行性

方法: 实验选取 15 例早产儿肺发育不良患儿行肺部 MR 扫描，Star-vibe 序列参数：TR:3.62ms、TE:1.93ms、层厚：3mm、层间距 20%、层块（slabs）：1、Slices per slab：52、FOV:220-280mm、频率编码分辨率：256、相位编码分辨率：256、Radial views：1008、压脂方式：Q-fat sat.扫描完成后由 2 名工作五年以上儿科组医师分别进行图像质量评估分析并根据临床分度标准对患儿进行轻、中、重度分级，并进行统计学分析。对于出院后患儿，分别于 6 个月、1 岁及 2 岁时行 MR 检查，探究利用 MR 进行早期预测疾病预后的可行性。

结果: 15 例患儿，甲级图像 11 例，乙级图像 2 例，因患儿中途苏醒失败 2 例，其中 BPD 轻度 5 例，中度 3 例，重度 5 例，与临床表现基本相符。

讨论: 支气管肺发育不良（bronchopulmonary dysplasia,BPD）是一种继发于新生儿肺损伤后的慢性肺疾病，是由于肺发育不成熟及各种原因所致，多发于使用机械通气的早产儿，尤其是小早产儿。近年来，随着临床医疗水平的不断发展，极低体重儿存活率的显著提高。临床机械通气及氧疗法的广泛应用，支气管肺发育不良的发病率也在随之升高。

目前临床对于 BPD 的影像学检查主要集中在普通 X 线平片及多层螺旋 CT 肺部扫描。BPD 的胸部 X 线平片表现没有特征性，已经不再作为疾病严重程度的评估依据。CT 与 X 线片相比，可直观发现肺结构的异常，但也同样存在因放射剂量大放射损伤患儿家属难以接受等实际临床困难。Star-vibe 序列是西门子公司推出的三维 T1WI 序列，采用与传统 K 空间完全不同的放射状 K 空间采样技术，可在患者自由呼吸状态下进行数据采集，大大避免了由呼吸运动形成的图像伪影。基于 MRI 具有较好的软组织分辨的能力对 BPD 进行诊断及严重程度评估，并利用 MRI 无电离辐射可进行反复检查的优势，及时跟进患儿病程发展，为后续临床治疗提供可行性指导资料。

PU-0454

CT 及 MRI 对儿童 DNET 的鉴别诊断价值

张增俊、崔光彬、李刚锋、李飞、闫卫强、贺延莉、南海燕、袁逍

中国人民解放军空军军医大学第二附属医院

目的 探讨胚胎发育不良性神经上皮肿瘤（dysembryoplastic neuroepithelial tumor, DNET）影像学表现及临床特点，旨在提高对本病认识。方法 回顾性分析 11 例经手术、病理和免疫组化确诊为胚胎发育不良性神经上皮肿瘤患儿的临床资料及 CT 及 MRI 表现，并进行相关文献复习。DNET

是一种少见的脑肿瘤，有着特殊的生物学和病理学特点，一般认为是一种良性病变。DNET 的发病机制目前尚无定论。大多数学者认为其来源于中枢神经系统发育过程中的中间发生层，为脑灰质非正常发育的继发性肿瘤。典型的 DNET 病理学特征为由不同比例的星形细胞、少突胶质细胞和神经元按照不同比例组成特异性胶质神经元(specific glioneuronal element, SCG)成分。根据的不同 SCG，可将 DNET 分为 3 个类型，简单型仅含有 SCG 成分，神经元散在分布于黏液基质中；复杂型由 SCG 和散在的星形细胞及少突胶质细胞组成；非特异型缺乏典型的 SCG 成分，但临床表现及影像学特点与前两者类似。结果 11 例患者主要表现为顽固性癫痫，渐进性加重；CT 及 MRI 表现为分别位于颞叶、顶叶皮层区；CT 呈囊状低密度影，T1WI 呈等或等、低混杂信号，T2WI 呈高信号，FLAIR 呈稍高信号，7 例均表现为边缘高信号的“环征”，4 例瘤内有分隔，冠状位表现为宽基底朝外，尖部向内的“三角征”；本组病例有 5 例表现为较为典型的“三角征”。6 例均可见“脑回征”，表现为肥皂泡状脑回样结构，与脑脊液信号接近，无占位效应、周围无水肿、无强化。“三角征”、无占位效应、瘤周无水肿的特征，在 DNET 诊断中有较重要的定性价值。需与神经节细胞胶质瘤，低级别胶质瘤，少突胶质细胞瘤，多形性黄色星型细胞瘤及多结节及空泡样神经元肿瘤鉴别。结论 DNET 的 MRI 表现具有明显的特征性，结合临床可明确诊断。

PU-0455

儿童恶性蝶腭瘤报道一例并文献复习

杨青

浙江大学医学院附属儿童医院

女，5 岁 5 月，因“反复头痛伴呕吐 1 月余，症状呈进行性加重”于 2020 年 02 月 24 日来我院就诊。外院头颅 CT 提示：左侧桥前池囊性占位。查体：精神偏软，上睑上抬无力，颈软，左耳听力异常。2020 年 2 月 29 日症状加重，复查 CT 肿块增大，脑积水较前明显。实验室检查：肿瘤标志物均为阴性。影像学表现：左侧桥小脑角区、左侧颞叶内侧可见两处囊实性肿块影，病灶实性部分 CT 值约 44HU，左侧颞骨岩部骨质压迫吸收破坏，MRI 呈等长 T1 稍长 T2 信号影占位，其内另可见类圆形囊性信号影，弥散受限，增强扫描呈明显不均匀强化，肿瘤包绕左侧海绵窦、侵及左侧颞下窝，呈钻孔样匍匐生长。术前影像诊断结果：神经鞘瘤首先考虑，星形细胞瘤或室管膜瘤待排。术后病理 (HE,x200)：考虑 (左侧三叉神经) 恶性蝶腭瘤。

PU-0456

慢性活动性 EB 病毒感染引起的罕见广泛腹腔内小动脉瘤：一例 儿科病例报告

曹永丽、彭芸

首都医科大学附属北京儿童医院

慢性活动性 EB 病毒 (CAEBV) 感染是一种淋巴增生性疾病，其特征是慢性或复发性感染性单核细胞增多症 (IM) 样症状。CAEBV 的预后较差，尤其是合并心血管并发症，包括冠状动脉受累 (冠状动脉扩张及冠状动脉瘤) 和主动脉及其分支扩张。在这篇文章中，我们展示了一个特殊的儿童 CAEBV 病例。患者除了冠状动脉瘤及主动脉扩张表现外，还伴有广泛的腹腔内小动脉瘤，包括肝脏内、脾脏内、双肾内及肠系膜血管分支，这在之前的中外文献中均没有类似报道。患者接受了化疗和单倍体匹配的造血干细胞移植 (haplo-HSCT)。大多数小动脉瘤消失，冠状动脉瘤轻微缓解，主动脉扩张没有进一步进展。此病例具有罕见的心血管受累表现，通过单倍体 HSCT 得到缓解，可以帮助我们更容易地识别类似表现的病例。CAEBV 并发心血管并发症的早期诊断和及时干预将改善整体预后水平。

PU-0457

1 例儿童 Hughes-Stovin 综合征 (HSS)

曹永丽、彭芸

首都医科大学附属北京儿童医院

本文报导了 1 例儿童 Hughes-Stovin 综合征 (HSS) 的患者。男, 12 岁, 间断发热、咳嗽, 咳痰 1 年余, 痰中带血 2 个月。无口腔及生殖器溃疡、关节痛、眼睛疼痛等表现。既往体健, 否认家族遗传病史。实验室检查白细胞、C 反应蛋白及血沉增高, 血红蛋白减低, 感染相关检查结果均为阴性。胸部 CT 增强显示两肺多发肺动脉瘤, 中心及外周均有分布, 部分瘤内有附壁血栓, 相邻肺野内大片实变和“反晕征”磨玻璃表现。患儿同时存在动脉导管未闭, 其肺动脉端管壁边缘附着不规则索条样结构, 考虑为赘生物, 动脉导管进行了手术治疗并切除赘生物, 病理显示为血栓纤维组织成分。

本病例主要针对肺动脉瘤展开鉴别诊断, 成因包括先天性心脏病、先天性血管发育异常、感染和系统性血管炎。1 先天性心脏病导致的肺动脉瘤为肺动脉主干及左肺动脉扩张, 不会出现双侧多发及远端外周肺动脉瘤。2 遗传缺陷所致先天性血管发育异常, 如马凡综合征、Ehlers-Danlos 综合征等可引起肺动脉瘤, 临床伴有特殊面容, 体型、皮肤及关节异常, 以及家族史, 本患儿均无相关病史也不支持此诊断。3 感染相关肺动脉瘤, 儿童最常见是结核和真菌 (毛霉菌)。本患儿相关检查均为阴性。4 系统性血管炎, 主要包括 Takayasu 动脉炎 (多发性大动脉炎)、白塞氏病和 Hughes-Stovin 综合征 (HSS) 均可并发肺动脉瘤。本患者没有主动脉或分支管壁增厚表现, 因此不支持多发性大动脉炎。白塞氏病和 Hughes-Stovin 综合征在肺动脉瘤表现上有很多相似之处, 但此患者没有白塞氏病典型的临床表现, 如复发性口腔溃疡、生殖器溃疡、眼部或皮肤损伤, 白塞氏病不能诊断。在除外其他鉴别诊断之后, 本患儿最终诊断 Hughes-Stovin 综合征。患儿经激素和免疫抑制剂治疗后好转。

HSS 是一种罕见但可能致命的疾病, 儿童 HSS 更为罕见。诊断主要基于临床表现和放射学检查结果, 在排除了鉴别诊断后最后得出结论。HSS 在增强 CT 上有 6 种不同分类表现, 其中不稳定型肺动脉瘤构成最大的破裂风险。治疗上以联合免疫治疗为基础, 结合血管内介入治疗, 抗凝和溶栓仍有争议, 需谨慎选择。

PU-0458

儿童肺隔离症伴扭转 1 例

谢英杰、陈静、王春祥

天津市儿童医院

目的: 探讨儿童肺隔离症伴扭转相关特征性影像学表现, 以进一步提高临床及放射科医生对肺隔离症伴扭转的认识。

方法: 回顾性分析本院一例因“间断腹痛伴发热 6 天、持续胸痛 5 天”入院、最终病检查证实为肺隔离症伴扭转患儿的流行病学资料、临床特点及影像学表现并复习总结相关文献。

临床资料: 患儿女, 9 岁, 主因“间断腹痛伴发热 6 天、持续胸痛 5 天”入院。查体发现右肺呼吸音粗, 左肺中下部未闻及呼吸音。连续三次血常规显示患儿白细胞逐渐升高, 分别为 (7.11、10.15、12.21) $\times 10^9/L$, CRP 明显升高。肿瘤标志物及病原学检查均阴性。胸部 CT 平扫示左肺下叶实变影; 左侧少量胸腔积液; 腹盆腔 CT 平扫示盆腔少量积液。5 天后行胸部 CT 平扫及增强检查示左侧胸腔软组织密度包块密度较前增高, 增强后呈轻度强化, 其内可见一细小供血动脉来源于胸主动脉; 左肺下叶实变影范围较前增大, 左侧胸腔积液较前增多, 左肺局部压迫性不张。胸腔穿刺见血性胸腔积液。术中见肿物发紫, 肿胀坏死, 肿物与胸壁、膈肌及左肺下叶粘连, 并可见一蒂状组织。最终病理诊断为叶外型肺隔离症伴扭转。

结论:肺隔离症是一种少见的先天性肺发育畸形,为胚胎时期一部分肺组织与正常肺组织分离,单独发育并接受异常的体循环动脉供血。病变多位于左侧胸腔,可分为叶内型和叶外型。而肺隔离症伴扭转临床非常少见,好发于左肺下叶,均为叶外型,少数可位于右下肺。本病好发年龄为 4~13 岁,偶见于新生儿及成人。临床表现主要以腹痛为首发症状,部分患者可伴随胸痛、胸闷、呼吸困难及呕吐等,早期识别困难,极易误诊。其典型影像学特征主要包括:①肺隔离症典型位置出现稍高密度软组织肿块,可能与隔离肺出血、梗死有关,部分病变可在短时间内迅速增大;②增强扫描后肿块不强化或仅伴有边缘强化,同时未发现来自体循环的异常供血动脉或可见可疑异常纤细供血动脉,局部不连续;极少数病例患侧可见引流静脉增粗;③伴有胸腔积液,且短时间内积液量可急剧增加,或可同时伴有肺炎、肺不张。熟悉掌握其临床特点及影像学特征,可在术前提提供相对准确的诊断信息,尽早行手术治疗。

儿童寰枢椎旋转半脱位/固定的影像学 and 临床预后因素

王一丁
四平市中心人民医院

目的:寰枢椎旋转半脱位/固定(AARS/F)是儿童斜颈的罕见原因。患者通常表现为头部固定旋转,有一定程度的屈曲(“知更鸟”头位)。CT 可以对疾病进行诊断和分级。

本研究的目的是评估放射学和临床因素与患者预后之间的相关性。

方法和材料:我们回顾性研究过去 15 年我们医院档案中所有诊断为 AARS/F 的儿童 CT 研究和所有临床报告。

两名肌肉骨骼放射科专家回顾了所有 CT 研究,根据 FieldingHawkins 系统对 AARS/F 分级。此外我们也计算了 c1 -c 2 旋转度。

结果评估为阳性(3 个月随访时临床/影像学完全恢复),阴性(3 个月随访时疾病持续或复发)。

结果:我们纳入了 53 例诊断为 AARS/F 的患者(平均年龄为 8.7y-26F,27M)。在 7/53 名受试者(13.2%)中,观察到临床结果为阴性。

头颈部同时出现感染或炎症(Griesel 综合征)与阴性结果显著相关($p=0.001$)。field - hawkins 分级也与患者预后密切相关($p=0.01$)。C1-C2 旋转度在患者预后中未达到统计学意义($p=0.056$)。

结论:AARS/F 患者头颈部区域的并发感染/炎症是最重要的预后因素,并且与较差的结果有关。

Fielding Hawkins 放射分级系统与患者的预后有很好的相关性。

儿童肾透明细胞肉瘤 CT 诊断及误诊分析

宋鹏鹏¹、王攀鸽¹、时胜利¹、刘玥²
1. 河南省儿童医院郑州儿童医院
2. 首都医科大学附属北京儿童医院

【摘要】目的 分析儿童肾透明细胞肉瘤(CCSK)的影像特征,总结该疾病的影像学及临床特点,分析误诊原因,加深对该病的认识,提高诊断符合率。方法 回顾河南省儿童医院经病理证实的 11 例儿童 CCSK 的影像资料,所有病例均行 CT 扫描,总结其影像及临床特点,分析误诊原因。结果 肿瘤均为单侧发病,右肾 5 例,左肾 6 例,11 例患儿发病年龄区间为 5 月 9 日至 10 岁,肿瘤多较大,密度混杂,均为单发,10 例有囊变;9 例肿瘤内见多发细小动脉,实性成分呈延迟渐进性强化,2 例伴下腔静脉、同侧肾静脉癌栓。7 例肾周血管充盈,2 例骨转移,1 例包膜下积液;2 例有钙化灶。10 例术前存在误诊,其中 8 例误诊为肾母细胞瘤,1 例误诊为先天性中胚叶肾瘤,1 例误诊为肾脏横

纹肌样瘤。结论 CCSK 与其他儿童肾肿瘤影像尤其是肾母细胞瘤极为相似, 术前易被误诊, 发病年龄小, 预后差, 病程进展快, 易发生囊变、坏死, 增强肿瘤内多发细小动脉、延迟渐进性强化及虎斑状、云絮状、条纹状或鱼肉状强化, 肾周血管充盈多见, 有助于与其他肾肿瘤相鉴别。

PU-0461

Gray and White Matter Changes in Pediatric Non-structural/metabolic Epileptic Brain Injury

Xinyun Wang, Yuzhen Zhang, Gang Ren
Xinhua Hospital Affiliated to Shanghai Jiaotong University School of Medicine

Purpose To explore the brain volume changes in children with non-structural/metabolic epileptic brain injury.

Methods Magnetic resonance imaging data was obtained from 140 children with non-structural/metabolic epileptic brain injury ages 2-15 (39% F, 61% M). Based on the self-developed software of United Imaging and the use of 3D-T1WI sequence, this resulted in structural volumes, cortical surface area, and cortical thickness features of the patients. ANCOVA analysis was then performed to compare these values with the values of 312 neurologically normal children.

Results Besides the nucleus accumbens, the volume of the brain, bilateral hemisphere gray matter, amygdala, entorhinal cortex, pallidum, parahippocampal gyrus, right caudate nucleus and fusiform gyrus, and left putamen in the patient group (PA) were smaller than those in the healthy control group (HC). The surface area of the cortex in HC tended to be flat or decreasing with age, while boys in PA showed an upward trend and girls showed a downward trend. The overall thickness of the HC cortex showed a downward trend, while the decrease of PA was slow or showed an upward trend.

Conclusion Children with non-structural/metabolic epileptic brain injury show statistically significant differences in volume of gray and white matter and nuclei of the brain, suggesting that epilepsy is associated with structural changes of the central nervous system influencing brain development and potentially leading to poorer neurocognitive outcomes.

PU-0462

Assessment of Glx and GABA levels in the Global Developmental Disability Children: A Magnetic Resonance Spectroscopy Study

Zhuohang Liu, Dan Li, Pu Tian
the First Hospital of Jilin University

This study aims to explore the correlation between brain neuro metabolites and clinical symptom scales in GDD and GDD+ASD. 11 children with GDD and 12 GDD +ASD children took MR scans, and completed the GABA and Glx spectroscopic acquisition. Results indicated that there is a significant difference in DQ language levels between GDD and GDD+ASD, and the GABA/Cr levels were significantly decreased in GDD+ASD compared with GDD. A positive correlation was observed between Glx/Cr and ADOS stereotype among all participants, and a clear link was observed between Glx/Cr and the sensory symptoms of ASD at both behavioral and perceptual levels.

PU-0463

新生儿急性胆红素性脑病血清总胆红素水平与高场强磁共振苍白球信号变化的相关性分析

王海尧、刘刚、薛长菊
青海省红十字会医院

目的：探讨新生儿急性胆红素脑病血清总胆红素（TSB）水平与高场强磁共振苍白球信号强度变化的相关性。方法：收集 2021 年 12 月-2022 年 12 月我院收治的急性胆红素脑病患儿 168 例为观察对象，根据患儿出生 7d 之内 TSB 分为轻、中、重三组，所有患儿均予以高场强磁共振成像检查，观察并比较三组患儿双侧苍白球 T1WI、T2WI、DWI 及 ADC 信号强度值，以及 TSB 水平与双侧苍白球 TIWI 信号强度的相关性。结果：三组双侧苍白球 TIWI 信号强度值比较，差异有统计学意义（ $P<0.05$ ），三组双侧苍白球 T2WI、DWI 及 ADC 信号强度数值比较，差异均无统计学意义（ $P>0.05$ ）。血清总胆红素水平（TSB $\mu\text{mol/L}$ ）与双侧苍白球 T1WI 信号强度两者表现为中等程度的正相关（相关系数约为 $r_s=0.587$ ）。结论：急性胆红素脑病双侧苍白球信号强度的增高与血清总胆红素水平的升高呈正相关，双侧苍白球信号强度的测量能够为诊断新生儿急性胆红素脑病提供重要的参考依据。

PU-0464

儿童进行性假性类风湿性发育不良 1 例的临床及影像表现

朱才娣、周俊霖
江西省儿童医院

[摘要] 目的 提高对儿童进行性假性类风湿性发育不良的认识。方法 回顾性分析 1 例儿童进行性假性类风湿性发育不良临床、实验室检查、影像学改变及基因突变，并通过文献复习分析总结。结果 男性，14 岁 7 个月，发病年龄为 6 岁，无家族史，首发症状为双手指间关节肿胀，伸直受限；8 岁时，出现双踝肿胀伴活动障碍，后出现多关节肿痛，累及大小关节、双腕关节、髋关节、骶髂关节等，患儿胸廓前后径增大，呈桶状胸。患儿血清炎性指标均正常，类风湿因子和抗环瓜氨酸肽抗体均为阴性，血沉正常，人类白细胞抗原（HLA）-B27 阴性。X 线表现：脊柱椎体变扁，椎体前后径变长，椎间隙呈后窄前宽，椎体中后部凸出，而前部凹陷，使椎体似乎平放的“古花瓶”状。椎体及椎间关节骨质增生、硬化；双侧髌骨发育较小，坐耻骨相对较长，双侧髋关节间隙变窄，双侧股骨头扁平，双侧股骨颈粗短，双侧髌臼较浅，其外上缘骨质密度增加，毛糙。双侧骶髂关节及耻骨联合间隙增宽。双侧胫骨髁间隆起变钝。双侧距骨滑车变平。腕骨边缘毛糙，掌骨远端、近、中排指骨远端增宽，关节间隙变窄，掌指、指骨间关节肿大且弯曲。胸椎 CT 表现：胸椎后凸，胸廓前后径增加，胸椎变扁，部分椎体呈楔形改变，椎体前后径变长，椎间隙呈后窄前宽。MRI 表现：双侧髋关节间隙变窄，关节腔内少量积液，双侧股骨头骨骺呈片状稍高信号，双侧髌臼边缘可见斑片状稍高信号。双侧骶髂关节及耻骨联合间隙增宽，双侧骶髂关节面及耻骨联合可见异常高信号。距骨滑车扁平，距骨及胫骨远端骨骺内片状 T2WI 压脂呈稍高信号，踝关节腔内少量积液。右手腕骨内斑片状 T2WI 压脂高信号，掌指关节、近节指间关节内斑片状稍高信号，手指弯曲畸形改变，滑膜无强化。脑实质及垂体窝正常。基因检测为 CCN6（WISP3）基因第 3 外显子检测到 1 个纯合突变位点：c.342T>G, p.Cys114Trp。符合儿童进行性假性类风湿发育不良症，其临床症状似幼年特发性关节和粘多糖病，但无滑膜炎及其他炎性改变，但尿粘多糖定性及定量阴性，X 线无侵蚀性破坏。结论 进行性假性类风湿发育不良是一种少见的常染色体隐性遗传性疾病，实验室检查、典型的影像表现及基因有助于诊断。

The Value of Baseline Magnetic Resonance Image Features in Predicting the Efficacy of Sirolimus for Kaposiform Hemangioendothelioma

Xinyu Liu, Chunhao Xia, Zhenlin Li
West China Hospital of Sichuan University

Purpose: To investigate the feasibility of baseline magnetic resonance images in predicting the efficacy of sirolimus for kaposiform hemangioendothelioma (KHE). **Materials and Methods:** We enrolled 58 patients pathologically diagnosed as KHE and treated with sirolimus between August 2008 and January 2020 (32 male, 26 female; median age: 2 years; age range 1 month – 10 years). All patients received conventional MRI examinations both before and six months after the treatment. The response of KHE to treatment was classified as complete response (CR), partial response (PR), stable disease (SD), and progressive disease (PD) based on the change of lesion diameter measured on T2-weighted MRI. Based on the depth of tissue or organ involvement, lesions were classified into three groups: superficial, mixed, and deep. According to the solidity of the mass, cases of KHE were classified into two morphological types: 1, solid mass with or without surrounding infiltrative portions; and 2, infiltrative lesion without defined areas of solidity. The maximum diameter of the tumor, adjacent bone changes, and anatomical regions were also measured. Images depicting masses that passed through more than 2 anatomical regions were considered to reflect multiple anatomical regions' involvement. We analyzed the correlation between the maximum diameter of the tumor and the response to treatment with the Spearman rank correlation coefficient. The differences in responses to treatment between other subgroups within groups were compared statistically by the Wilcoxon rank sum test. P values less than or equal to .01 were considered to indicate a statistically significant difference. **Results:** 1 case was a complete response, 41 cases were partial response, 12 cases were stable and 4 cases showed progression. Only two morphological types show a statistically significant difference in responses to treatment ($P=0.002$) and patients with solid masses had better responses (90% vs. 54%). The depth of tissue or organ involvement ($P=0.543$), the maximum diameter of the tumor ($6.21\pm 4.21\text{mm}$, $P=0.220$), whether there are adjacent bone changes ($P=0.363$), and the locations of anatomical regions involved ($P=0.109$) show no statistically significant difference in responses to treatment. **Conclusion:** MRI may be feasible in predicting the efficacy of sirolimus for KHE according to the solidity of the mass.

PU-0466

儿童先天性单一冠状动脉伴冠状动脉右心室瘘一例

陈欣
天津市儿童医院

病例: 男, 3 岁, 主因咳嗽、心脏杂音 4 天入院, 入院查体: 胸骨左缘第 3-4 肋间可闻及 II/IV 级收缩期杂音, 腹软, 肝脾肋下未及。心电图: 窦性心律不齐, 大致正常心电图。超声心动诊断: 左冠状动脉右心室瘘, 卵圆孔未闭, 房水平左向右分流。冠状动脉 CTA 显示: 右侧冠状窦未见确切右冠状动脉, 左冠状动脉主干增宽, 直径约 5.4mm, 左侧前降支增宽, 直径约 3.2mm, 左侧前降支发出一分支血管绕行心脏前方至右心室前侧壁, 管腔呈瘤样扩张, 直径约 9.1mm, 并发出两支分支血管进入右心室, 瘘口直径分别为 1.7mm 和 1.8mm, 另发出一分支血管与后将支相延续。冠状动脉 CTA 诊断: 先天性单一冠状动脉伴冠状动脉右心室瘘。

讨论: 单一冠状动脉是一种少见的先天性冠状动脉异常, 是指由主动脉干发出一支冠状动脉为整个心脏供血, 为心肌梗死、猝死的病因之一, 通常是胚胎时期冠状动脉发育异常或不发育造成的, 发病率约为 0.024%~0.066%。冠状动脉瘘指冠状动脉与心腔或体循环、肺循环任何节段的异常血管相沟通, 而没有通过毛细血管网, 约占先天性心脏异常的 0.3%。而单一冠状动脉伴冠状动脉右心室瘘极为罕见, 目前仅有少数病例报道。

国外学者根据冠状动脉的解剖走行将单一冠状动脉分为三型, 本例患儿为 L-IIA 型。单一冠状动脉一般无症状, 但由于整个心脏为单支血管供血, 一旦出现血管狭窄或者闭塞, 病情危重甚至危及生命。冠状动脉瘘在儿童期由于瘘口较小, 因此常无症状, 但由于冠状动脉瘘可引起血流动力学改变, 即高压的冠状动脉血流通过瘘管进入低阻力的右心室, 形成左向右分流, 使得右心、肺血管、左心的血容量增加, 可导致肺动脉高压、心肌缺血、心力衰竭, 因此早期发现早期治疗至关重要。本例患儿临床仅表现为咳嗽和胸骨左缘第 3-4 肋间 II/IV 级收缩期杂音, 且心电图大致正常, 并无肺动脉高压、心肌缺血和心力衰竭的典型表现, 与文献报道基本一致。

冠状动脉 CTA 具有较短的采集时间、较高的时间和空间分辨率, 能够很好地显示单支冠状动脉的起源、异常血管的走行、冠状动脉瘘口的位置, 为临床诊断和治疗提供了重要的依据。

PU-0467

儿童系统型间变性大细胞淋巴瘤 (IV 期) 2 例影像分析

郑依萍、陈鑫、周丹丹
吉林大学第一医院

目的: 分析儿童系统型 ALK 阳性间变性大细胞淋巴瘤及 ALK 阴性间变性大细胞淋巴瘤 (IV 期) 影像特征, 为临床诊断提供一定依据。方法: 收集 ALK 阳性间变性大细胞淋巴瘤 (IV 期) 及 ALK 阴性间变性大细胞淋巴瘤 (IV 期) 各 1 例, 通过分析两者的腹部增强 CT 图像等相关影像, 结合既往研究中两者的影像的特征, 对两者影像学表现进行统计分析。结果: 1、ALK 阳性间变性大细胞淋巴瘤较 ALK 阴性间变性大细胞淋巴瘤骨质侵犯更多见。2、ALK 阳性间变性大细胞淋巴瘤较 ALK 阴性间变性大细胞淋巴瘤的淋巴结外累及更多见。结论: 特定的影像学特征能够帮助临床医生对 ALK 阳性间变性大细胞淋巴瘤及 ALK 阴性间变性大细胞淋巴瘤的分类做出一定的诊断。

PU-0468

目的探讨小儿睾丸内胚窦瘤 CT 及 MRI 影像学特点及其诊断小儿 睾丸内胚窦瘤的临床价值

杨小英
青海省妇女儿童医院

方法回顾性选取在 2013 年 5 月至 2019 年 5 月期间手术病理确诊为睾丸内胚窦瘤的患儿 67 例为研究对象。其中进行 CT 检查例 15 例, 10 例行增强检查; 进行 MRI 检查 52 例, 36 例行增强检查; 分析小儿睾丸内胚窦瘤的影像学特点。结果所有患者的病灶均属单发, 其中左侧睾丸 38 例, 右侧 29 例; 肿瘤的直径范围为 9.6~47.8 (24.32±8.86) mm, 60 例患儿病灶边缘清晰, 3 例患儿病灶边缘模糊, 其中呈圆形 5 例, 类圆形的 62 例。在 CT 平扫下, 11 例患儿表现为患侧睾丸内有不同密度的包块, 4 例患儿表现为患侧睾丸包块密度均匀, CT 值为 37.96~55.0 (46.31±6.38) Hu, 在 67 例患儿中进行 CT 检查 15 例, 10 例行增强检查。52 例患儿进行 MRI 检查, 其中 11 例患儿 T1WI 病灶呈现混杂信号, 41 例患儿 T1WI 病灶呈现等或等低信号; 30 例患儿 T2WI 病灶呈现稍高的信号; 20 例患儿 T2WI

病灶呈现等等等高信号。36 例患儿进行增强扫描检查病灶的实质部分,其中轻度强化 12 例,中度强化 18 例,明显强化 6 例,坏死囊变部分均没有出现强化。结论小儿睾丸内胚窦瘤的 CT 及 MRI 图像能够清晰地显示肿瘤的形态学特征及血供情况,对小儿睾丸内胚窦瘤有良好的诊断价值。

PU-0469

新生儿软脑膜下出血的 MRI 特征、转归及临床预后分析

李君伟
湖南省儿童医院

目的 认识新生儿软脑膜下出血 MRI 影像学特征及其与预后的关系。**方法** 根据 2 名 15 年以上工作经验的影像诊断专家通过 PACS 系统中的数据库数据进行筛选,收集自 2015 年-2022 年湖南省儿童医院入住新生儿科且伴有软脑膜下出血的新生儿 MRI 资料与一般临床资料。原始图像分别由 2 名放射诊断医师分别对入组患儿的影像资料进行观察列队研究,分析其影像学特征。根据年龄采用盖氏智测量表、韦氏智测量表、贝力智测量表进行标准化评估入组患儿的临床预后。**结果** 43 例新生儿软脑膜下出血患儿入组,根据软脑膜下出血是否合并脑实质异常的 MRI 表现,我们将软脑膜下出血分为 I 型、II 型、III 型,其中 I 型、II 型软脑膜下出血可完全吸收并无脑实质异常,III 型软脑膜下出血可完全吸收并伴有不同程度脑软化、胶质增生改变,部分病例可有局部软脑膜下囊肿形成。I 型、II 型临床预后均较 III 型好,差异有统计学意义 ($P=0.013$)。新生儿软脑膜下出血具有特征性的 MRI 表现,根据软脑膜下出血与邻近皮层、皮层下白质和深部脑白质之间不同信号的表现,提出阴阳征与三明治征两种 MRI 影像表现特征,可提高放射科医师与临床医师对新生儿软脑膜下出血的认识与诊断。**结论** 新生儿软脑膜下出血具有特征性 MRI 表现,新生儿软脑膜下出血 MRI 分型可以作为一种影像指标来预测该类出血的预后。

以心衰就诊的腹膜后副神经节瘤一例

王静
吉林大学第一医院

患儿,女,13 岁,因“腰酸 10 天,双下肢水肿进行性加重伴右下腹痛 1 周”入院。病程中活动耐力下降,胸闷、心悸活动后及夜间加重,刺激性干咳 4 天,夜间较重,食欲欠佳,睡眠差,尿便正常,近 1 个月体重上升约 2.5kg。入院查体 T 36.2°C, P134 次/分, R 40 次/分, BP 118/76mmHg, 身高 162cm, 体质量 51.5kg。精神状态欠佳,神情语明,气促,端坐呼吸,痛苦表情,面色苍白,口周无发绀,颈静脉怒张;咽充血。双肺呼吸音粗,未闻及干湿啰音。心前区无隆起,心界向左下扩大,心率 134 次/分,律齐,心音有力,心前区可闻及 2/6 级收缩期吹风样杂音。双下肢及双足凹陷性水肿。腹部彩超示腹膜后实质性低回声肿物,边界清,内部回声不均匀, CDFI:可见血流信号。入院诊断:腹膜后肿物;心功能不全,心功能 IV 级。腹部增强 CT 示腹主动脉右旁类圆形肿块,大小约 5.8cmX4.7cm,密度不均,CT 值约 18-35Hu,增强扫描渐进性明显强化,中心见片状无强化液化坏死区,病灶周围见增多细小血管影。经过抗心衰治疗,患儿状态允许后行腹膜后肿物切除术,术后病理:副神经节瘤。术后经支持对症治疗,患儿无不适症状,病情平稳,治愈出院。

基于 UNet 模型的胎儿脑自动分割及脑发育的产前诊断评估应用

曲海波、廖怡、宁刚、贾凤林、李学胜、刘静
四川大学华西第二医院

目的：探索基于 UNet 模型的胎儿脑自动分割技术，进行胎儿脑部 MRI 图像数据处理，应用于评估胎儿脑结构发育特点及异常状态的分析。

研究方法：纳入 58 例中晚孕胎儿脑部 MR 成像，采用胎儿多模态磁共振成像技术，利用多维度的 MRI 结构成像、定量成像序列信息，基于 UNet 模型进行胎儿脑自动分割，创新探索胎儿脑部 MRI 图像采集及图像分析的突破性技术方法，利用人工智能进行分析，以期建立胎儿 MRI 图像采集及评估方案，为产前诊断提供影像生物学标记，结合人工智能技术，探索胎儿脑部结构及功能的发育轨迹。

结果：将 58 个不同胎龄的正常胎儿大脑重建为 $0.8 \times 0.8 \times 0.8 \text{mm}$ 的 3D 高分辨率图像。自动分割将每个胎儿大脑分为七个标签，包括脑脊液、灰质、白质、脑室、胼胝体、脑干和小脑，分析解剖区域脑容量参数、T1MAPPiG 定量结果与胎龄相关。

结论：研究基于 UNet 模型提出的重建、分割和体积分析可以自动定量分析胎儿大脑区域的比例，无需医生手动细化。研究胎儿脑区发育如何随年龄增长而变化，可以为诊断提供参考。

双层探测器 CT 在儿童头部平扫降低辐射计量的价值探讨

谭正武、汪晶
华中科技大学同济医学院附属协和医院

背景和目的：CT 诊断成像过程中的辐射照射是儿科患者的一个突出问题。本研究旨在评估双层探测器小儿童头部平扫 CT 中的 60-keV 虚拟单能量图像与混合能量图像相比能否在保证图像质量的同时减少辐射剂量。

材料和方法：收集 106 例儿童头部双层探测器 CT 平扫。患者被分为两组，每组 53 人，分别使用管电流 250mAs 和 180mAs 进行扫描，其他扫描条件保持一致。收集辐射计量值 DLP，计算图像噪声、SNR 和 CNR。两名放射科医师采用 5 分法盲目评估图像质量。统计方法采用方差分析和 Wilcoxon 检验，并多重比较。

结果：250 mAs 组和 180 mAs 组的平均剂量 DLP 分别为 717.47（标准差，41.52）mGycm 和 520.74（标准差，42）mGycm。忽略辐射剂量分组，60keV 单能量图像的噪声明显降低，SNR 和 CNR 明显提高，主观图像评分明显优于混合能量图像（ $P < 0.001$ ）；在 250mAs 和 180mAs 两组间，60-keV 单能量图像的 SNR、CNR 和主观图像评分没有统计学差异（ $P > 0.05$ ）。180mAs 组的辐射剂量参数明显低于 250 mAs 组（ $P < 0.001$ ）。

结论：双层探测器儿童头部 CT 平扫在 60-keV 单能图像可将 CT 辐射剂量减少 28%，且不会降低图像质量。

NCE-MRU 是否可以替代肾闪烁显像用于测量儿科肾积水患者的分肾功能?

何康文、孟晓岩、李震
华中科技大学同济医学院附属同济医院

目的: 与核医学肾闪烁显像 (RS) 方法相比, 探讨使用非增强磁共振尿路造影 (NCE-MRU) 作为评估肾积水儿童患者分肾功能 (SKF) 的替代方法的可行性。

材料和方法: 本回顾性研究纳入了 75 名肾积水儿童患者。所有患儿均在 2 周内接受 NCE-MRU 和 RS 检查。肾实质体积(KPV)和纹理分析参数通过 NCE-MRU 中的 T2WI 获得。将计算的左分肾 KPV 百分比 (SKPV) 和纹理分析参数百分比与 RS 测定的 SKF 进行比较。

结果: SKPV 与 SKF 呈显著正相关 ($r=0.88$, $p < 0.001$), 而不均匀性与 SKF 呈负相关 ($r=-0.68$, $p < 0.001$)。利用一元线性回归和多元线性回归建立了 SKF 的未校正和校正预测模型。Bland-Altman 图证明两种预测模型具有良好的一致性。校正后的预测模型的残差平方和低于未校正模型的残差平方和 (0.283 vs 0.314), 但没有统计学意义 ($p=0.662$)。基于不同 MR 机器的亚组分析显示, 三种不同扫描仪的 SKF 和 SKPV 之间的相关系数分别为 0.85、0.95 和 0.94 ($p<0.05$)。

结论: NCE-MRU 可作为评估肾积水儿童患者 SKF 的有效方法, SKPV 被证明是一个简单且普遍适用的预测 SKF 的指标。

PU-0474

儿童高 IgE 综合征一例

王静
吉林大学第一医院

患儿男, 8 岁, 因咳嗽、间断发热 10 天于 2018 年 8 月 8 日入院。既往史: 患儿系 32 周早产, 生后曾住院治疗 20 天, 期间曾行机械通气治疗, 3 岁以前易反复呼吸道感染, 曾有反复中耳炎 3 次, 18 个月时曾因“肺炎”住院。有湿疹病史, 接触洗衣粉及尘土后出现皮疹, 此外曾对动物毛、菠萝、腰果、霉菌等有过敏。入院后经抗炎对症治疗好转出院。2 个月后再出现发热、咳嗽, 肺 CT (2018-10-09) 示双肺散在炎变, 右肺上叶、中叶及左肺下叶支气管扩张, 并右肺上叶阻塞性肺气肿形成, 抗炎对症治疗好转。后患者反复呼吸道感染及持续肺部影像学异常 (支气管扩张合并感染, 肺实变, 空洞形成等), 曾合并金黄色葡萄球菌及曲霉菌感染, 血清 IgE 及嗜酸性粒细胞水平显著升高, 行基因检测提示高 IgE 综合征。

高 IgE 综合征 (hyper-IgE syndrome, HIES) 即 Job 综合征, 表现为顽固性湿疹、皮肤和肺部反复化脓性感染、血清高 IgE 及嗜酸性粒细胞增多等。HIES 为常染色体基因突变, 多幼年起病, 患者皮肤和肺部易受金黄色葡萄球菌感染, 目前尚无完全治愈的方法。

PU-0475

儿童原发性淋巴管发育异常合并 Gorham-Stout 综合征 1 例

王冬、郝跃文
西安市儿童医院

目的: 报道一例儿童原发性淋巴管发育异常合并 Gorham-Stout 综合征。**方法:** 回顾性分析其临床表现、实验室检查、病理及影像特征。**结果:** 女, 5 岁 6 月, 因“咳嗽, 间断发热 12 天”入院, 患

儿病初于当地医院抗感染治疗后好转, 12 天前无明显诱因出现咳嗽, 无气喘及呼吸困难, 伴发热, 胸部 CT 示右侧大量胸腔积液并右肺压迫性肺不张。予我院行右侧胸腔镜探查术, 术中见右侧胸腔大量黄白色乳糜样液体, 术后肺泡灌洗液: 肺炎链球菌, 胸水乳糜实验阳性, 胸水常规及生化: 总蛋白 22.1g/L、葡萄糖测定 5.76mmol/L, 红细胞总数 $2000.00 \times 10^6/L$ 、浆性粘蛋白试验 阳性、白细胞总数 $1790.00 \times 10^6/L$ 。考虑先天性脉管发育畸形可能。胸部 CT 平扫: 右侧胸腔大量积液, 并右肺中、下叶压迫性肺不张, 左侧胸腔少量积液。胸腰椎 CT 平扫: 胸 12 椎体、腰 1 椎体及右侧附件骨髓质内多发类圆形溶骨性骨质破坏, 边缘清晰, 未见硬化缘, 未见软组织肿块。胸腰椎 MR 平扫: 胸 12 椎体、腰 1 椎体及右侧附件可见多发斑片状异常信号, T1WI 呈低信号, T2WI 呈高亮信号, 信号欠均匀, 胸腰椎旁软组织增厚, T2WI 压脂呈高信号, 右侧胸腔可见弧形积液信号。经静脉注入钆喷酸葡胺 5ml 增强扫描: 胸 12 椎体、腰 1 椎体及右侧附件内可见斑片状显著强化灶, 椎旁软组织明显强化。CT 淋巴管造影 (CT Lymphangiography, CTL): 经腹股沟淋巴结穿刺注入碘油行直接淋巴管造影 (Direct Lymphangiography, DLG) 及造影后 6 小时行胸腹部 CT 平扫。DLG 示: 乳糜池及胸导管未见显影, 考虑远端梗阻; CTL 示: 胸 12 椎体、腰 1 椎体及右侧附件多发斑片状高密度碘油沉积, 胸腰段脊柱旁增厚软组织内散在斑点状碘油沉积, 胸导管未见显影, 考虑胸导管阻塞。

结论: 儿童原发性淋巴管发育异常合并 GSS, 其影像学表现具有特征性, 尤其对于儿童伴有不明原因大量乳糜胸时, 要关注胸腰椎等骨质改变, 影像学发现上述改变时, 要尽早行淋巴管造影, 以早期明确诊断、早期治疗, 减少不必要的并发症。

PU-0476

儿童单侧肺静脉闭锁伴反复咯血一例

王冬、郝跃文
西安市儿童医院

目的: 报道一例儿童单侧肺静脉闭锁伴反复咯血, 探讨其影像特征。**方法:** 回顾性分析其临床表现及影像表现特点。**结果:** 患儿男, 13 岁, 1 周前无明显诱因出现咳嗽, 呈阵发性, 4-5 声/次, 晨起及夜间为著, 4 天前无明显诱因出现咯血, 为鲜红色, 量约 5-10ml。查体: 右肺可闻及较多细湿啰音, 口唇欠红润无发绀。实验室检查: 结核菌素试验 (PPD) 强阳性, 超敏 C 反应蛋白 (hs-CRP) 37.15 mg/L, 血红蛋白浓度 (HGB) 127g/L, 余未见明显异常。2 年前因“咯血”住院治疗, 考虑肺部感染, 治疗 1 月后好转出院, 平素剧烈活动后稍有口唇发绀。支气管镜活检: 右下叶背段、基底段小块支气管粘膜轻度慢性炎症, 未见肉芽肿、坏死。支气管肺泡灌洗液涂片未见恶性肿瘤细胞, 见中性粒细胞, 灌洗液 G-xpert、集菌、结核 RNA、TB/NTM 均为阴性。心脏超声: 考虑体-肺侧枝; 余心内结构及彩色血流未见明显异常。胸部 CT 平扫: 右肺体积缩小, 纵隔右移, 右肺弥漫性小叶间隔增厚, 呈网格状改变, 肺外周胸膜下多发小囊腔。胸部 CT 增强: 右肺动脉管腔细, 右肺门、纵隔软组织增大, 纵隔内多发增粗、迂曲侧枝血管影。CT 血管成像: 左心房右缘光滑, 右上、下肺静脉缺如, 右侧支气管动脉、右侧膈动脉增粗。最终诊断: 右侧肺静脉闭锁。

结论: 单侧肺静脉闭锁是一种罕见的先天性肺血管畸形, 主要临床特点为肺部反复感染及咯血, 多在儿童期发病, 容易误诊为结核。影像表现为: 患肺体积缩小, 纵隔向患侧移位; 由于肺静脉闭锁、回流受阻, 患侧淋巴组织代偿性扩张, 肺内呈间质性改变, 可见弥漫性小叶间隔增厚及小囊腔影, 患侧肺门、纵隔淋巴组织增大; 由于右心室泵血量减少, 影响肺动脉发育, 常可见患侧肺动脉纤细; 另可见体肺侧枝血管形成, 如支气管动脉、膈动脉、肋间动脉代偿性扩张。鉴别诊断: 间质性肺炎、肺结核、支气管扩张等均需与该病鉴别, 主要观察上述肺部影像特征及通过 CT 血管成像识别有无正常肺静脉结构及肺动脉、体循环血管等相应异常改变。

PU-0477

Measurement of cerebral blood flow in preterm infants and analysis of influencing factors

Chi Qin,xin zhao,lin lu,xiaoan zhang
the Third Affiliated Hospital of Zhengzhou University

Abstract

Objective

The purpose is to evaluate regional cerebral blood flow (CBF) perfusion changes in preterm infants by using the three-dimensional pseudo-continuous arterial spin labeling (3D-pCASL), and to analyze the effects of gestational age and birth weight on CBF values.

Materials and methods

Between December 2021 and June 2023, a total of 258 preterm infants who were born in the Third Affiliated Hospital of Zhengzhou University, gestational age < 37 weeks were retrospectively collected. The basic information, maternal pregnancy and other related clinical information of these preterm infants were recorded. Regions of interests (ROIs) were measured in the frontal lobe, temporal lobe, parietal lobe, occipital lobe, basal ganglia and thalamus. The exclusive criteria were as follows: (1) abnormal routine MRI measurement; (2) preterm infants with congenital heart disease, craniocerebral malformation, and brain trauma. Pairing sample t test was used to compare the difference in CBF values measured in the same ROIs between the left and right sides of each infant's brain. One-way ANOVA was used for CBF values in different brain regions. If there were differences in ANOVA ($p < 0.05$), multiple comparisons were performed. In addition, Pearson correlation was used to analyze the correlation between gestational age, birth weight and CBF in different brain regions.

Results

143 preterm infants with abnormal MRI measurements were excluded, including intraventricular hemorrhage, subarachnoid hemorrhage, white matter injury, ependymal cyst, etc. Finally, 115 preterm infants were included. There were no significant differences in CBF values between the left and right cerebral hemispheres in the frontal lobe, temporal lobe, parietal lobe, occipital lobe, basal ganglia and thalamus ($p > 0.05$). The average CBF value of different brain regions from large to small is: Thalamus 34.90 ± 10.74 ml/100g/min, basal ganglia 28.99 ± 8.72 ml/100g/min, occipital lobe 20.48 ± 7.41 ml/100g/min, temporal lobe 19.20 ± 4.98 ml/100g/min, frontal lobe 18.88 ± 5.27 ml/100g/min and parietal lobe 18.75 ± 6.14 ml/100g/min. CBF values in temporal lobe, parietal lobe and basal ganglia were negatively correlated with gestational age ($p < 0.05$). There was no correlation between CBF values in frontal lobe, occipital lobe, thalamus and gestational age. However, CBF values in all ROIs were negatively correlated with birth weight ($p < 0.05$).

Conclusion

The CBF values in preterm infants with normal MRI were affected by gestational age and birth weight. In summary, these results provide a reference for further exploring the application of 3D-pCASL in brain injury of preterm infants.

PU-0478

多种方法测评儿童青少年骨龄效果的比较研究

祁月¹、张金玲²、吕冬梅¹

1. 哈尔滨医科大学附属第六医院

2. 哈尔滨医科大学附属第二医院

摘要:目的:对比 4 种骨龄测评方法在当代儿童青少年骨龄评价应用中的差异,了解哈尔滨地区儿童青少年手腕部骨发育状况的变化趋势,探讨更适用于哈尔滨地区儿童的骨龄测评方法,并进一步总结该

地区儿童青少年的骨龄发育规律.方法收集与 2023 年 3 月至 2023 年 12 月在哈尔滨医科大学附属第六医院预测身高为目的的门诊就诊儿童青少年临床资料,分别采用 GP 图谱法、TW-C 法、CHN 法及中华-05 法进行骨龄测评判读评价,采用 Pearson 相关法分析相关性且对比不同方法测评结果.结果:共 1600 例符合纳入标准的儿童青少年入选本研究,其中男 753 例,女 847 例,Pearson 相关法分析显示,中华-05 法、TW-C 法、CHN 法、GP 图谱法测定的骨龄与生活年龄均高度相关,其中中华-05 法测定的骨龄相关性最强.结论:哈尔滨地区儿童青少年骨龄发育速度加快,有提前趋势,中华-05 法更为适合该地区的骨龄测评.

PU-0479

能谱 CT 虚拟平扫替代常规平扫在儿童骨骼肌的可行性研究

尹燕
湖南省儿童医院

目的 探讨能谱 CT 虚拟平扫 (VNC) 替代常规平扫 (TNC) 在儿童骨骼肌中的可行性。**方法** 回顾性收集因骨骼肌病变接收能谱两期增强扫描的患儿 43 例,所有数据利用 GSI 后处理软件进行数据处理分析,获得 TNC、动脉期 VNCa 和静脉期 VNCv 影像。由 2 名观察者对影像进行定性分析,采用 5 分法评分。采用 Kruskal-Wallis 检验比较 TNV 和 VNC 定量参数的差异,两两比较采用 SNKq 检验。采用 Bland-Itman 图分析 TNV 与 VNC 图像 CT 值的一致性。采用加权 Kappa 检验分析 2 名观察者对图像评分结果的一致性。**结果** TNC 与 VNC 影像上显示的病灶形态学特征的差异均无统计学意义 ($P>0.05$)。VNCv 与 TNC 的 SNR 值、VNCa、VNCv 与 TNC 的 CNR 值差异均有统计学意义 ($P<0.05$),其中 VNCv 的 SNR 值比 TNC 高,VNCa、VNCv 的 CNR 值比 TNC 低。2 名观察者对各组图像的主观评分结构一致性好 (TNC, $k=0.551$; VNCa, $k=0.502$; VNCv, $k=0.630$),CT 值一致性好。**结论** 虚拟平扫技术应用于儿童骨骼肌是可行的。

PU-0480

左肾静脉走行异常

徐学鑫
天津市儿童医院

目的 探讨左肾静脉走行异常 25 例患者的影像学表现。

材料和方法 收集我院 2012-2023 年诊治的左肾静脉走行异常患者 25 例。男 11 例,女 14 例。25 例患者均因血尿入院,无发热、尿频、尿急等症状。25 例患者均行 CT 平扫及增强检查。采用飞利浦 256iCT 扫描,扫描范围膈肌至耻骨联合水平。不合作患者采用检查前口服水合氯醛镇静,剂量 0.8ml/kg 。增强检查采用静脉团注欧乃派克后重复扫描,剂量 1.5ml/Kg 。扫描图像分别进入工作站进行后处理,使用 MPR、VR 等方法重建血管图像。

结果 增强 CT 显示 25 例患者左肾静脉未走行于肠系膜上动脉夹角处,而是穿行于腹主动脉与脊柱之间。

结论 左肾静脉正常横行为腹主动脉及肠系膜上动脉之间。人体的左肾静脉平均长度是右肾静脉的三倍,与右肾静脉出肾后迅速汇入下腔静脉不同,左肾静脉在汇入下腔静脉前要穿过腹主动脉与肠系膜上动脉起始部之间的间隙,此间隙内填充有肠系膜脂肪、淋巴结、腹膜等组织,左肾静脉血液回流容易受此间隙大小的影响。推测胡桃夹综合征是由于各种原因,如青春期身体增长过快,脊柱过度伸展或淋巴结肿大以及肿瘤压迫等,导致腹主动脉与肠系膜上动脉之间间隙过小,左肾静脉在穿行时受到钳夹,使得血液回流受阻,左肾静脉远心端扩张、压力增高,形成左肾淤血,淤血的静脉系统与尿收集系统间发生异常交通,或因肾盂穹窿部静脉窦壁变薄破裂,临床上出现血尿、蛋白

尿等症状。无论有无胡桃夹综合征，左肾静脉走行在肠系膜上动脉夹角处这一解剖位置比较恒定。左肾静脉走行变异并胡桃夹现象极其罕见。本组 3 例患者腹主动脉及肠系膜上动脉之间未见左肾静脉穿过，而于腹主动脉与脊柱之间可见一条横向走行的静脉，其左端起始于左肾门，右端与下腔静脉相连。因腹主动脉与脊柱间没有肠系膜脂肪、淋巴结组织及腹膜等充填，此种位置关系，左肾静脉较其正常走行更易受到挤压，临床症状亦较严重，胡桃夹现象的发生率亦较高。

PU-0481

儿童脑膜瘤的 MRI 影像特征-3 例病例回顾

张欣、谢晨欣、刘鸿圣
广州市妇女儿童医疗中心

【摘要】

脑膜瘤起源于蛛网膜内的蛛网膜帽状细胞，儿童脑膜瘤本身罕见，在儿科中枢神经系统肿瘤中，脑膜瘤占 1.42-5%，且部分为不典型脑膜瘤，不具典型特点，可能位于脑实质内，或缺乏硬膜尾征，难以与胶质瘤、中枢神经系统胚胎性肿瘤等鉴别，给影像诊断带来困难，术前误诊率高。本研究回顾性分析了 3 例经病理证实的儿童原发性脑膜瘤患者磁共振影像，分析了儿童脑膜瘤影像特征。

目的 探讨儿童脑膜瘤本的 MRI 表现，并分析其影像学特征，以鉴别诊断此类病变。

方法 回顾性分析 2015 年至 2023 年经广州市妇女儿童医疗中心经病理证实为脑膜瘤的 3 例儿童头部的 MRI 影像。3 例均行头颅-MRI (3.0T) 平扫及增强检查，所有患者均签署知情同意书。

结果 这 3 例病例中，男性 1 例，女性 2 例，年龄在 5-13 岁，平均 8.3 岁。位置位于左侧桥小脑角区 1 例，颞部 1 例，前颅窝区 1 例。其中 WHO I 级 2 例，WHO II 级 1 例。儿童脑膜瘤发病率较低；发病部位上与成人相比，后颅窝的脑膜瘤更多见；症状上多以颅高压起病，本院病例中 1 例颞部脑膜瘤因眼球突出颅高压起病，1 例桥小脑角区脑膜瘤以四肢麻木、乏力起病，1 例前颅窝区脑膜瘤因呕吐起病；本院儿童性脑膜瘤发病部位，影像表现均不典型，2 例合并囊变及出血，1 例合并多发囊变，均无“硬膜尾征”表现，增强明显强化。发生于颞部、前颅窝区脑膜瘤需与神经源性肿瘤鉴别，桥小脑角区脑膜瘤需与三叉神经瘤、听神经瘤相鉴别。

结论 儿童脑膜瘤临床及影像表现均不典型，对于发生在颅内脑外混杂信号占位的儿童患者，应考虑脑膜瘤的诊断。

PU-0482

3D-MRI 成像在胎儿先天性血管环产前诊断中的应用价值

陈安琪、唐兴
空军军医大学西京医院

目的：分析 3D-MRI 成像、2D-MRI 成像及超声心动图对胎儿先天性血管环的产前诊断价值。

方法：选取 2012 年 8 月-2023 年 8 月于我院进行产前超声心动图检查并发现先天性血管环的胎儿 56 例为研究对象，所有胎儿在超声发现异常后于 1 月内均进行产前胎儿心血管 2D-MRI 及 3D-MRI 检查，记录受压及未受压处气管前后径、左右径、周长及面积，并计算相应值气管受压百分比，所有患儿随访至出生后 6 个月。

结果：56 例胎儿的孕周为 24-32 周，平均 26.7 周。右位主动脉弓伴左锁骨下动脉迷走 (RAA+ALSA) 47 例，双主动脉弓 (DAA) 7 例，肺动脉吊带 (PAS) 2 例。前后径、左右径计算出的气管受压百分比相较于周长及面积计算出的百分比值无明显差异 ($P < 0.05$)。三种先天性血管环畸形存在时，气管受压百分比由低到高依次为 RAA+ALSA < PAS < DAA，PAS 患儿气管形态发生明显改变，气管受压百分比大于 86%。产前超声诊断 RAA+ALSA 气管受压平均值约 38%，

DAA 气管受压平均值 67% (均大于 50%), 2 例 PAS 气管受压平均值分别为 47%、43%; 2D-MRI 诊断 RAA+ALSA 气管受压平均值约 33%, DAA 气管受压平均值 48%, 2 例 PAS 气管受压平均值分别为 38%、43%; 3D-MRI 诊断 RAA+ALSA 气管受压平均值约 31%, DAA 气管受压平均值 43%, 2 例 PAS 气管受压平均值分别为 37%、41%; 出生后, 48 例胎儿进行了超声心动图检查, RAA+ALSA 气管受压平均值约 25%, DAA 气管受压平均值 45%, 2 例 PAS 气管受压平均值分别为 21%、26%。

结论: 超声心动图是胎儿先天性血管环产前诊断的重要检查手段, 在对气管受压程度测量时, 产前 3D-MRI 成像能提供更加直观、全面的影像及相对更加准确的结果, 尤其是对于 PAS 及 DAA 的气管受压程度显示相对更加准确。

PU-0483

儿童腹膜后交感神经源性肿瘤 (NB、GNB、GN) 的影像诊断

刘思萌、刘新顶、武鹏、靳翠翠、赵德利
哈尔滨医科大学附属第六医院

目的: 探讨发生于儿童腹膜后交感神经源性肿瘤 (神经母细胞瘤 NB、节细胞神经母细胞瘤 GNB、节细胞神经瘤 GN) 的临床特点和影像表现, 旨在提高该类疾病的诊断效能。方法: 收集我院 9 例经手术病理证实为腹膜后交感神经源性肿瘤的患儿的 CT 及 MRI 检查影像资料, 通过与病理结果对照, 逐一进行病例回顾分析及影像学特征统计。结果: 神经母细胞瘤 (NB) 共 3 例, 其中 2 例位于腹膜后, 1 例起源于肾上腺; 3 例中 1 例远处颈部淋巴结转移及多发骨转移, 1 例局部淋巴结转移, 1 例未见转移; 3 例中 2 例肿瘤内可见粗大团块状钙化, 1 例未见明显钙化灶; 3 例中 2 例肿瘤边界不清跨越中线, 1 例边界清晰形成“假包膜”。节细胞神经母细胞瘤 (GNB) 共 4 例, 其中 3 例位于腹膜后, 1 例起源于肾上腺; 术前检查 4 例均未见远处转移; 4 例中 1 例肿瘤内部可见点条状钙化, 其余 3 例未见明显钙化; 4 例均进行 CT 增强检查, 均可见轻/中度不均匀性、渐进性强化。节细胞神经瘤 (GN) 共 2 例, 均位于腹膜后; 2 例共有特征为边界清晰稍低密度团块影, 可见匍匐样生长, 纵横比 >1 , 肿瘤内部未见明显钙化灶, 增强无/轻度强化, 可见漩涡征。结论: 经研究三种儿童腹膜后交感神经源性肿瘤各有特征, 熟练掌握三种疾病的临床特点和影像学征象的异同对提升该类疾病术前定性诊断具有重要的价值。

PU-0484

婴儿颅骨黑色素性神经外胚层肿瘤 2 例影像并文献复习

孙雅杰、赵滨、王立英、王春祥
天津市儿童医院

目的: 婴儿神经色素性外胚层肿瘤 (melanotic neuroectodermal tumor of infancy, MNTI) 是一种罕见的局部侵袭性肿瘤。多发生于婴幼儿颅面部。本文探讨 MNTI 2 例患儿的临床诊断及影像特点。方法: 回顾性分析我科 2 例经临床病理证实的 MNTI 患儿临床表现及影像特征。

结果: 患儿 1, 女, 9 个月。因半年前发现左额部肿物来院就诊, 肿物无明显诱因进行性增大, 无红肿、破溃、触痛等症状。查体: 左额部见一大小约 3cm×4cm 肿块, 质硬, 界清, 活动度差。头颅 CT 平扫示前凶区偏左下侧额骨局限性骨质增厚, 密度减低, 增生骨质呈火焰状, 未见骨质破坏及邻近组织异常。术后病理提示镜下大部为增生的纤维组织, 散在少量不规则上皮细胞团, 部分细胞内可见黑色素颗粒, 纤维组织之间可见多灶状挤压明显的小蓝细胞。

患儿 2, 男, 1 个月。因 16 天前发现左颞部花生豆大小肿物来诊, 无红肿、破溃、触痛等不适。头颅 CT 平扫示左眼眶外侧壁骨板增厚, 局部见均匀软组织密度肿块。头颅 MRI 显示左侧眼眶外侧软

组织内局部可见肿物呈 T1WI 稍高信号, T2WI 低信号, Gd-DTPA 增强扫描病灶明显强化, 伴左侧颞部硬脑膜异常强化。术后病理提示符合黑色素性神经外胚叶肿瘤。

结论: 尽管 MNTI 被视为良性肿瘤, 但仍具有局部侵袭性及复发的风险, 术前影像检查对临床的早期诊断、早期治疗以及预后评估非常重要。

应用 DWI 定量分析儿童眼眶病变

孟云

郑州大学第一附属医院

背景: DWI 有助于提供细胞密集度信息与预测侵袭性肿瘤组织学特性, 该技术已经用于评估眼眶肿瘤, 但很少应用儿科眼眶肿瘤且研究样本量少。目的 应用 DWI 与 ADC 值鉴别儿童眼眶良恶性病变。材料与方法 回顾分析 2016 年 10 月-2019 年 2 月间在本院就诊的 73 名 18 岁以下儿童, 应用 DWI 对眼眶病变进行临床与影像评估, 通过组织学检查或基于临床与影像检查确诊。结果 与良性病变相比, 恶性病变弥散受限, 恶性病变 ADC 值明显降低, 在鉴别良恶性病变方面, ADC 值为 $0.99 \times 10^{-3} \text{mm}^2/\text{s}$ 时, 灵敏度 75%, 特异度 100%, ADC 值为 $1.26 \times 10^{-3} \text{mm}^2/\text{s}$ 时, 灵敏度 100%, 特异度 73%。

PU-0486

人工智能骨龄测量系统评估生长发育滞后患儿骨龄的准确性研究

张冀云¹、尹建华¹、杨斌¹、石潞²

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

目的 探讨应用人工智能 (AI) 骨龄测量系统在临床实践中评估生长发育滞后患儿骨龄的准确性。

方法 回顾性收集 2020 年 6 月至 2023 年 8 月, 因生长发育滞后到昆明市第一人民医院就诊患儿共 814 例, 5~15 岁, 所有患儿均行左手腕部 X 线正位平片检查, 选取其中 244 例患儿影像资料入组, 入组标准为病例结果均出自相同三位高年资儿科影像医师, 且为一致唯一结果。以患儿实际生理年龄作为参考标准, 采用贪心方法 1:1 精确匹配, 匹配 AI 组 122 例和人评组 122 例。以配对 t 检验和 Wilcoxon 秩和检验对连续变量进行分析, 评价 AI 组、人评组与参考标准之间骨龄评测结果的一致性和准确性。

结果 所有 244 例患儿人工评估组及 AI 应用组所得结果均小于患儿实际生理年龄。244 例患儿实际生理年龄为 10.8 ± 1.5 岁。AI 组 G-P 法、TW3-Carpal 骨龄测定分别为 9.5 ± 2.1 和 8.8 ± 3.7 岁; 人评组 G-P 法、TW3-Carpal 骨龄测定分别为 10.6 ± 1.7 和 10.4 ± 2.3 岁。AI 组测定误差在 1~2 年内准确度为 62.3% (76/122), 误差在 2~3 年内准确度为 66.4% (81/122), 误差在 3 年以上准确度为 67.2% (82/122)。人评组测定误差 1~2 年内准确度为 88.1% (107/122), 误差在 2~3 年内准确度为 89.2% (108/122), 误差在 3 年以上准确度为 92.3% (113/122)。AI 组 G-P 法和 TW3-Carpal 骨龄评测误差准确度均小于人工评估组, 差异有统计学意义 (P 均 < 0.05)。RUS-CHN 骨龄评测结果与参考标准对比, AI 组和人评组, 误差在 1~2 年准确度为 75.3% 及 77.4%; 误差在 2~3 年内准确度为 88.1% 及 86.3%; 误差在 3 年以上准确度为 81.4% 及 83.7%。对 RUS-CHN 骨龄法, 两组评价一致性较好, 与参考标准之间准确性较高。

结论 5~15 年龄段生长发育滞后儿童 AI 骨龄准确性低于人工测评, 误差为 1.8 ± 1.3 岁。对 RUS-CHN 两组一致性较好。AI 应用 G-P 图谱法及 TW3-Carpal 骨龄评测结果不能真实反映患儿实际生理年龄, 需要人工干预重新校准。

儿童狒狒巴拉姆希阿米巴脑炎一例

白慧萍、郝跃文、张鹏
西安市儿童医院

目的 狒狒巴拉姆希阿米巴临床罕见，病情危重预后差，分析狒狒巴拉姆希阿米巴脑炎（*Balamuthia amoebic encephalitis*, BAE）影像特点。**方法** 报道 1 例两次经脑脊液病原微生物宏基因检测证实的儿童狒狒巴拉姆希阿米巴脑炎患儿，结合文献分析其影像特点。**结果** 患者男，年龄 8 岁 6 月，以“行走不稳 10 余天，口角向右侧歪斜 3 天”入院。MRI 检查示双侧大脑、小脑、脑干及脊髓多发异常信号，增强强化（部分呈环形强化），脑室系统室管膜及脉络丛异常强化；右侧大脑后动脉狭窄。考虑脑膜脑炎及血管炎。治疗一月后复查双侧大脑、小脑、脑干及脊髓感染性病变，较前吸收减少；右侧大脑后动脉狭窄较前减轻。两次脑脊液病原微生物宏基因检查提示狒狒巴拉姆希阿米巴置信度高（特异序列数分别为 1133 及 1052），予以抗细菌、抗病毒、抗真菌及喷他脒综合治疗后，患者病情好转出院。**结论** 狒狒巴拉姆希阿米巴脑炎影像学表现较复杂，无明显特异性。本例病变侵犯脑实质、脑膜、室管膜、右侧大脑后动脉及脊髓，引起脑膜脑炎、血管炎及脊髓感染，脑部病变与既往文献报道相符，脊髓感染少见。需与颅内其它感染如病毒性脑炎、结核性、化脓性、真菌性脑膜炎及其它寄生虫颅内感染（肺吸虫、囊虫等）相鉴别，脊髓感染还需与其它免疫相关性病变如急性播散性脑脊髓炎，视神经脊髓炎谱系疾病及髓鞘少突胶质细胞糖蛋白（MOG）抗体相关疾病鉴别。

PU-0488

基于临床及胸部薄层 CT 影像特征的儿童难治性肺炎支原体肺炎危险因素预测

邓林、贾喆、任聪云、武辽军
榆林市第二医院

目的 探讨胸部 CT 薄层重建联合临床特征对儿童难治性肺炎支原体肺炎的预测价值。**资料与方法** 回顾分析榆林市第二医院 2020 年 1 月—2023 年 8 月儿童肺炎支原体肺炎 146 例，其中难治性肺炎 62 例，普通肺炎 84 例，对比分析两组患者血 IL-6、LDH、CRP、PA、NLR 水平、胸部薄层 CT 上病变累及肺叶数、单纯累及支气管、单纯累及肺实质、支气管和肺实质同时受累例数等临床及影像特征，采用多因素 Logistic 回归分析预测儿童难治性支原体肺炎的独立危险。**结果** 患者血 IL-6、LDH、CRP、PA、NLR、淋巴结细胞计数、血清白蛋白水平、累计肺叶数、是否同时累及肺实质及支气管、是否合并胸腔积液、纵膈淋巴结肿大与难治性肺炎相关（ $P<0.05$ ），多因素 Logistic 回归分析结果显示，LDH[优势比（OR）=4.524， $P<0.01$]、CRP（OR=8.576， $P<0.01$ ）、NLR（OR=5.598， $P<0.01$ ）、累计及肺叶数（OR=0.498， $P<0.05$ ）、是否有胸腔液（OR=2.988， $P<0.05$ ）是预测儿童难治性肺炎支原体肺炎的独立危险因素。**结论** 胸部 CT 薄层表现及 LDH、CRP、NLR 水平在难治性和普通肺炎支原体肺炎中有一定差别，影像及临床特征联合可以在一定程度上预测难治性肺炎支原体肺炎。

PU-0489

基于 CT 特征追踪技术评估儿童冠状动脉起源异常的左室心肌应变指数变化

郭乔、郝跃文
西安市儿童医院

目的：探讨 CT 特征追踪 (CT-FT) 技术评估儿童冠状动脉起源异常(AOCA)的左室心肌应变指数变化。

方法：回顾性收集 2022 年 3 月至 2023 年 8 月于西安市儿童医院行冠状动脉 CT 血管成像 (CCTA) 的 18 例冠状动脉起源异常患儿 (病变组) 和同期年龄、性别等相匹配的 21 例冠状动脉正常儿童 (对照组)。病变组按冠状动脉异常起源类型分为左冠状动脉异常起源于右冠窦 (7 例)、右冠状动脉异常起源于左冠窦 (11 例)。使用 CVI42 软件对 CCTA 图像进行分析, 计算所有被试的整体纵向、周向、径向应变峰值 (GPLS、GPCS、GPRS) 及各冠状动脉分支节段的纵向、周向、径向应变峰值 (PLS、PCS、PRS)。比较病变组及对照组上述各项心肌应变指数差异。

结果：左冠状动脉异常起源于右冠窦组、右冠状动脉异常起源于左冠窦组的 GPLS 绝对值均较对照组低 ($P<0.01$, $P<0.05$)。左冠状动脉异常起源于右冠窦组的 GPLS 绝对值较右冠状动脉异常起源于左冠窦组低 ($P<0.05$)。左冠状动脉异常起源于右冠窦组的左前降支的 PLS、PRS 绝对值低于对照组 ($P<0.01$, $P<0.05$)。余各指标组间差异无统计学意义。

结论：CT-FT 技术在评估冠状动脉起源异常儿童左室心肌功能方面具有可行性, 冠状动脉起源异常患儿左室心肌应变指数绝对值降低, 其中左冠状动脉异常起源于右冠窦较右冠状动脉异常起源于左冠窦的左室心肌应变指数下降更显著。

PU-0490

MRI 预测胎盘植入相关产后出血的价值分析

刘振清
广州市妇女儿童医疗中心

摘要 目的 探讨 MRI 影像特征对预测胎盘植入相关性产后出血的价值。方法 搜集经手术病理确诊的胎盘植入患者 106 例, 根据是否发生产后出血分为产后出血组及非产后出血组, 回顾性分析其临床及 MRI 影像学资料, 分析产后出血的影响因素及 MRI 影像学特征对胎盘植入相关性产后出血的预测价值。结果 106 例胎盘植入患者中 67 例 (63.21%) 合并产后出血, 39 例未见产后出血。其中胎盘粘连 47 例, 胎盘植入 50 例, 胎盘穿透 9 例, 胎盘粘连组中合并产后出血者 13 人, 胎盘植入组合并产后出血者 45 人, 胎盘穿透组 9 人均合并产后出血。胎盘植入不同类型在是否合并产后出血分组中差异有统计学意义。随着胎盘植入深度的增加, 产后出血的出血量随着增加, 胎盘植入不同类型分组中出血量的差异有统计学意义。胎盘植入出血与胎盘植入直接征象肌层不连续、胎盘突出宫外、胎盘植入间接 MRI 征象胎盘局部向外膨出、胎盘内增多增粗血管影、下段子宫膨大有关, 差异有统计学意义; 与是否合并前置胎盘、胎盘母体面是否出血、胎盘内条状低信号影、胎盘信号不均匀无关, 差异无统计学意义。结论 胎盘植入类型、胎盘植入 MRI 直接征象及部分间接征象胎盘局部向外膨出、胎盘内增多增粗血管影、下段子宫膨大能有效预测胎盘植入相关性产后出血, 具有重要的临床参考价值。

PU-0491

罕见以侧脑室肿瘤为主并多系统受侵的 Erdheim-Chester 病一例

黄水仙、晏杰、周刚、杨丽、吴玲、邓开闯、龙艳
个旧市人民医院

目的 探讨儿童 Erdheim-Chester 病的临床及影像学特点。方法 回顾性分析 1 例

以侧脑室肿瘤为主并多系统受侵的儿童 Erdheim-Chester 病的临床、影像学表现,并结合文献进行总结分析。结果 临床表现为生长发育延缓、营养不良,下肢活动障碍以及中枢神经系统症状。头颅 CT 及 MRI 示右侧侧脑室三角区占位,CT 呈等、稍高、低混杂密度,MRI 呈稍长 T1、等及稍长 T2 信号。鞍区 MRI 提示垂体形态小,垂体后叶高信号未见显示。左胫骨骨髓、右胫骨上端外侧缘片状骨质硬化;颌面骨、前中颅窝底及双侧额颞枕骨广泛性骨质密度增高,部分形态欠规整;双侧肩胛骨、胸骨及部分肋骨、胸腰椎、骨盆诸骨骨质密度不均匀。行脑室占位病变切除术后,病理证实为 Erdheim-Chester 病累及骨骼、中神经系统及泌尿系统。结论 Erdheim-Chester 病是一种罕见的非遗传性、非朗格汉斯细胞组织细胞增生症,可累及多个器官和系统,骨骼影像表现为四肢长骨对称性骨质硬化,中枢神经系统影像多累及下丘脑-垂体轴。

镇静药物后白噪声干预应用于婴幼儿核磁共振检查的效果研究

黄丽华
安徽省儿童医院

[摘要] 目的 (magnetic resonance image, MRI) 是临床上常用的检查手段。婴幼儿在行核磁共振成像检查时,其配合程度常决定检查是否能够顺利进行或影响检查结果的准确性。而婴幼儿的配合程度主要取决于检查时患儿能否入睡及入睡深度。本研究旨在探讨在镇静药物使用后,给予不同干预方法,对核磁共振成像检查的婴幼儿睡眠效果及检查成功率的影响。方法 选取 2023 年 1 月~5 月安徽省某儿童医院放射科进行核磁共振检查的 80 例患儿,按随机数字表法分为观察组和对照组各 40 例。对照组给予常规指导,让家长通过行走、语言或图片等方法吸引患儿的注意力,不让孩子休息,使其玩耍劳累后使用 10%水合氯醛灌肠。观察组的患儿行核磁检查前 30 分钟予以 10%水合氯醛灌肠,给患儿听取事先录制好的白噪声,播放时使用分贝测试仪将白噪声的音量控制在 55 分贝左右。比较两组患儿检查前入睡情况、患儿舒适度、完成检查的成功率和家长的满意度。结果 观察组检查时入睡平均时间为 (17.2±2.68) 分钟,短于对照组患儿的入睡平均时间 (23±3.23) 分钟;观察组完成检查成功率为 95.50%,高于对照组的 75.10%;观察组患儿的舒适度得分为 (98.2±1.89) 分,高于对照组的 (87.6±6.03) 分;观察组患儿家长的满意度为 98%,高于对照组的 89.10%,两者相比有均显著统计学意义 ($P<0.01$)。结论 婴幼儿核磁共振检查前,实施白噪声干预能缩短患儿入睡时间,提高检查成功率,同时,使用白噪声干预,简单、方便、易于操作,避免了患儿家长因不善于带孩子而发生的困窘和来回奔波,减轻患儿家长的焦虑情绪,使患儿及家属积极配合完成核磁共振检查,保证患儿检查的安全有效性,满足临床诊断的需要。因此婴幼儿磁共振检查前使用白噪音干预值得临床推广。

PU-0493

儿童颅内 Rosai-Dorfman 病影像学表现

宋修峰

青岛市妇女儿童医院

目的: 提高对中枢神经系统 Rosai-Dorfman 病影像学表现的认识。

方法: 我院确诊的儿童颅内 RDD 影像表现个案报道并文献复习。

结果: Rosai-Dorfman 病 (窦组织细胞增生伴巨淋巴结病, SHML), 是一种良性组织细胞增生性疾病, 2007 年 WHO 将 RDD 归于组织细胞肿瘤一类。主要发生在淋巴结, 累及中枢神经者少见, 以颅内为主。多发生于儿童、青年, 颅内病变则常见于成人。病因不明, 可能与病毒感染和免疫缺陷有关。多为自限性, 颅内受累除外, 激素、放化疗均无效。

影像表现为颅内单发或多发肿块, 常见于脑实质外, 常起源于硬脑膜或位于鞍区、海绵窦区, 与硬脑膜、大脑镰及小脑幕等结构相连, 多对称性分布。形态表现与脑膜瘤或脊膜瘤类似, 宽基底与硬脑膜相连, 呈类圆形或脑膜扁平样增厚改变, 可见局部硬脑膜增厚形“脑膜尾征”, 发生于大脑镰病灶通常呈两侧生长, 中央仍可见大静脉窦及硬脑膜形态, 病灶位于两侧呈“夹心饼干”改变。CT 平扫呈等/高密度, 周围可见水肿, 钙化少见, 偶可见溶骨性破坏。MRI 表现为 T1WI 等/稍长信号, T2WI 特征性呈外周等、中心低信号 (炎性巨噬细胞释放自由基), T2FLAIR 及 DWI 呈低信号。增强后均匀强化, 伴硬膜尾征。

鉴别诊断: 脑膜瘤 (中老年女性, 颅内脑外, 等 T1 等 T2 信号, DWI 高信号, 可钙化); 淋巴瘤 (多位于脑实质, DWI 高信号, 伴水肿); 朗格汉斯组织细胞增生症 (发病年龄相似, 更易颅骨骨质破坏及肿块形成); 其它硬脑膜广泛增厚疾病, 如硬脑膜淀粉样瘤、肥厚性硬脑膜炎等。

结论: 中枢神经系统 RDD 较罕见, 与脑膜瘤鉴别存在一定困难。当病灶多发, 且位于脑外, 分布较对称, 出现 T2WI 病灶中央明显低信号, 大脑镰“夹心饼干”征象, 累及硬脑膜增厚范围较广这些征象时, 要考虑到 RDD 的诊断。

PU-0494

MRI 联合基因检测对胎儿脑室不对称性扩张的诊断价值研究

刘思萌、刘新顶、靳翠翠、武鹏、赵德利

哈尔滨医科大学附属第六医院

目的: 胎儿脑室不对称性扩张 (Asymmetrical Ventricular Dilatation, AVD) 是产前超声检查很常见的征象, 最优的产前管理仍然需要进一步明确并量化。本研究的目的是评估产前基因检查结合磁共振成像 (MRI) 与超声检测胎儿 AVD 进行比较。方法: 采用多中心收集包括超声诊断为胎儿脑 AVD 的单胎妊娠 103 例, 定义脑室不对称扩张为脑室扩张大于 10MM, 左右脑室差 2MM。结果通过遗传检查的核型和染色体分析和胎儿脑 MRI 进行评估。结果: 超声诊断为 AVD 的病例 103 例中核型异常率为 7.1% (3/42), 染色体异常率为 16.6% (2/24)。在超声和 MRI 检查中, 中枢神经系统额外异常发现的比率有差异 (5/103 vs 11/103, $p < 0.05$)。MRI 检查发现超声未能发现的脑皮层及皮层下、中线结构异常或后颅窝异常 8 例。结论: 在超声诊断为 AVD 的病例中, 胎儿脑 MRI 可以发现超声不能发现的脑皮层及皮层下、中线结构异常或后颅窝异常。异常基因检测有一定阳性率, 值得进一步研究。

PU-0495

MSCT 对儿童急性阑尾炎的诊断价值

孔俊沣、王静
重庆大学附属三峡医院

目的: 探讨儿童急性阑尾炎 MSCT 表现特点, 评估 MSCT 对儿童急性阑尾炎的诊断价值。

方法: 回顾性分析 51 例经手术病理证实为急性阑尾炎患者的临床资料及术前 MSCT 表现。

结果: 急性阑尾炎手术病理表现为: 化脓性 24 例, 卡他型 18 例, 坏疽型 9 例。急性阑尾炎 MSCT 表现: 阑尾壁肿胀增粗 39 例 (76.5%), 阑尾管腔内高密度粪石 29 例 (56.9%), 阑尾管腔积液 28 例 (54.9%), 阑尾穿孔并周围脓肿 8 例 (15.7%), 阑尾周围腹膜炎 31 例 (60.8%), 阑尾周围淋巴结相对增大 19 例 (37.3%), 盆腔少量积液 23 例 (45.1%); 其余肠梗阻 8 例、盲肠肠壁增厚 6 例、坏死性结肠小肠炎 2 例、肝脓肿 1 例。结论: 儿童急性阑尾炎 MSCT 表现有一定特点。MSCT 能够显示阑尾病变、阑尾周围结构的病理改变及合并症, 在儿童急性阑尾炎的诊断及鉴别诊断中有重要价值。

PU-0496

儿童松果体区肿瘤的影像学特征与分析 (附 20 例报告)

杨豪
华中科技大学同济医学院附属武汉儿童医院

目的 探讨儿童松果体区肿瘤的影像学及临床特征, 重新分析和认识鉴别诊断要点, 以期提高术前诊断水平。方法回顾性分析 20 例经病理证实的儿童松果体区肿瘤的临床资料以及影像学特征。结果 20 例病例中, 男 16 例, 女 4 例, 平均年龄为 6.5 岁。生殖细胞肿瘤 14 例 (生殖细胞瘤 5 例, 绒毛膜癌 2 例, 卵黄囊瘤 1 例, 成熟畸胎瘤 2 例, 未成熟畸胎瘤 2 例, 混合性生殖细胞肿瘤 2 例), 非生殖细胞肿瘤 6 例 (松果体母细胞瘤 5 例, 非典型畸胎样/横纹肌样瘤 (AT/RT) 1 例)。18 例术前具有不同程度梗阻性脑积水, 1 例术前脑脊液播散。不同类型的肿瘤年龄、性别、生化指标及影像学表现具有一定特征性。结论儿童松果体区肿瘤类型多样, 治疗方式和预后差异大, 术前诊断的准确性十分重要, 把握临床以及影像学特征能够在术前给予较为准确的诊断。

关爱儿童, 助力健康中国之儿童胸部摄影存在的问题及规范化摄影的研究

何子福
空军军医大学西京医院

目的 探讨婴幼儿胸部摄影现状, 优化摄影流程, 规范摄影技术。

方法 回顾性分析我院儿科胸片影像技术质控, 评出甲、乙级胸片, 经过讨论分析其原因, 制定合理的摄影流程及规范。

结果 通过利用制定的摄影流程和规范, 进行儿童胸部摄影, 最终甲级片率可以得到 100%。为临床诊断提供了可靠的依据。

结论 婴幼儿与成人具有不同的生理特点, 因此。在给婴幼儿胸部摄片时, 操作上有诸多不便, 可影响照片的质量, 给诊断带来许多困难。笔者结合中华医学会影像技术分会儿科影像技术专业委员

会制定的《0-6 岁儿童胸部数字 X 线摄影规范化检查成像专家共识》以及本人多年的工作经验，制定的摄影流程及规范如下。

1.摄影条件及中心线

婴幼儿胸部摄片一般焦片距采用 100cm，管电压为 55kV，3mAs，曝光时间应在 0.1s 以内，小焦点。

根据婴幼儿解剖学的特点，立位胸片中心线应对准气管分叉处下缘，卧位胸片时中心线对准胸锁关节下 3 横指处，即从气管分叉下缘射入。

2.正确选择摄影位置

婴幼儿胸部后前立位时，陪伴员站于摄影架对侧将婴幼儿两臂上举，交叉抱于前额固定，以避免头、颈和肩部投照于肺野。当婴幼儿无法站立时可用仰卧位。

3.正确选择曝光时机

3.1 平静呼吸状态下

婴幼儿肺间质发育旺盛，且含气量低，加之纵隔在胸廓内所占比例较大，使肺野暴露全面较困难，这样，婴幼儿胸片对吸气相的要求更为严格。故只有依靠技术人员仔细观察呼吸相的变化，适时曝光。

3.2 啼哭时曝光

有人认为婴幼儿啼哭时不能摄片，应待其平静后摄片，其实啼哭非但无害，反而为选择深吸气相曝光提供了时机。经观察婴幼儿啼哭时先为长而延续的深呼吸，紧接着是相应的急速深吸气，深吸气末至下一次呼气前有一短暂停顿时间，此时婴幼儿由呼吸时的“啊”声转为“哈”声，吸气状态下的“哈”声为摄片的最理想时机。

4.关于 X 线防护

婴幼儿对 X 线照射极为敏感，在摄影时应注意防护，技术人员在摄胸片时要做到稳、快、准。即检查过程要有条不紊，忙而不乱。

PU-0498

儿童腺泡状软组织肉瘤的 CT 和 MRI 影像学表现

王龙伦、蔡金华
重庆医科大学附属儿童医院

目的 探讨儿童腺泡状软组织肉瘤 (Alveolar soft part sarcoma, ASPS) 的临床表现、CT 和 MRI 特征，提高对该病的认识和影像诊断水平。

方法 收集经病理证实的 9 例 ASPS 患者的资料，分析并总结其临床和影像学特点。

结果 女性患儿 8 例，男性患儿 1 例，年龄范围 4 岁至 15 岁，平均年龄 8.4 岁。临床上表现为无痛性肿块 6 例，腹痛 2 例，间断呕血 1 例。就诊时发生肺转移 4 例。肿瘤平均最大径约 4.57cm，多呈类圆形，少数呈分叶状，边界清楚。CT 平扫呈等或略低密度，CTA 能清晰显示瘤周及瘤内较多迂曲走行异常血管影；MRI 平扫 T1WI 呈稍高信号，T2WI 呈稍高或不均匀高信号，瘤内及瘤周可见多发迂曲的血管流空信号，部分肿块内见线状 T2 低信号分隔。CT 和 MRI 增强扫描呈持续性明显强化，坏死区不强化。病理显示肿瘤细胞排列成腺泡状，周围可见血窦样结构。

结论 儿童 ASPS 没有特定的发病部位，但青少年女性患儿多见，容易发生肺转移。影像学表现具有一定的特征性，其中瘤内和瘤周丰富的血管影对 ASPS 有诊断意义。

PU-0499

探索能谱 CT 在儿童下肢 CTA 检查技术与临床应用

孙上也

吉林省一汽总医院

目的：由于儿童对辐射更敏感，该人群的 CTA 方案通常需要修改成人的扫描协议。根据人体血流动力学的研究，儿童的血流速率较快，心率和呼吸频率较快。所有这些都会影响扫描参数、造影剂注射方案和成像显示技术的选择。因此探索在低剂量能谱 CT 扫描下儿童下肢 CTA 一次性成像，高质量图像的扫描技术更为重要。

方法：选取在我院 2022 年 1 月至 2023 年 5 月，7-15 周岁的儿童患者双下肢 CTA 检查 30 例，分三组进行实验

对照组：采取常规成人双下肢扫描协议，监测扫描起始位置腹主动脉末端，扫描方向头向足，延迟时间 8s，触发阈值 120HU，autokV，mAs，ASir-V40%，同样螺距和旋转速度，扫描时间 18-24s 选取 80KeV 图像进行后处理

方案一：更改常规扫描协议螺距与旋转速度，控制扫描时间在 15-18s，同样采取 80KeV 图像进行重建；

方案二：更改监测层位置为腓动脉，阈值 50HU，采取大螺距扫描，扫描方向足向头，最短延迟时间，扫描时间约 5s。由于个体身高差异不同，扫描距离改变，需要采取不同的螺距和旋转速度以减小静脉显影过多从而影响诊断。

最后对三组图像进行下肢血管 HU 值，对比噪声比 (SNR) 和图像质量 (IQ) 进行比较。

结论：在儿童下肢 CTA 检查中，提高扫描速度减少延迟时间能有效减少下肢静脉显影，提高下肢动脉 HU，从而提高图像质量，更利于诊断效果。

PU-0500

儿童局灶性皮层发育不良的临床及多模态影像学分析

田芷瑶

华中科技大学同济医学院附属武汉儿童医院

目的

局灶性皮质发育不良(Focal cortical dysplasia, FCD)是一系列皮层结构紊乱伴或不伴细胞形态异常的局灶性脑部畸形，它是儿童难治性癫痫最常见的病因。手术是其控制癫痫发作的主要治疗手段之一，但 FCD 影像学表型多样，与病理表型之间相关性差，所以术前采取多模态影像学手段定位致痫灶尤为重要。本文旨在回顾性分析 19 例我院 2020 年 1 月~2022 年 12 月经手术病理证实为 FCD 患者的临床及影像学表现，旨在提高影像科医师对其的认识。

方法

搜集 2020 年 1 月~2022 年 12 月我院经手术病理证实为 FCD 患者的临床及影像学资料，其中所有患者均行 MRI 平扫及 DWI 检查，9 例患者行增强检查，7 例患者行 MRS 及 ASL 检查。根据头皮电图及术后病理结果，分析各型 FCD 影像学表现及其致病灶位置。

结果

本组患者中，女性 13 例，男性 6 例，年龄范围为 2 月~19 岁，平均年龄约为 5.2 岁。所有患者均因癫痫起病，术后病理证实：FCD I 型 4 例，II 型 15 例，4 例患者为多病灶，余患者均为单病灶；位于右侧大脑半球者 11 例，左侧大脑半球 8 例；FCD I 型患者病灶主要位于颞叶（66.7%），FCD II 型患者病灶主要位于额叶（75.0%）。其中，4 例患者 MRI 平扫结果阴性，但 ASL 结果阳性（相比对侧呈高灌注或低灌注）。MRI 平扫阳性患者中，FCD I 型主要表现为灰白质分界不清，

FCDⅡ型主要表现为皮层下白质 T2 和 T2 FLAIR 序列高信号及皮层结构异常, 其中 6 例患者出现典型 Transmantle 征。

结论

FCD 一般无明显性别差异, 临床表现多为难以控制的癫痫, 与其他皮层发育不良性癫痫不同, 患者通常智力正常, 且没有发现家族性特点。FCD 多见于右侧大脑半球, 约 50% 位于颞叶内, 30% 累及 2 个以上的脑叶。本组结果存在一定偏倚, 可能与入组病人量过少有关。目前对于 FCD 的多模态 MRI 诊断, MRI 平扫尤其是薄层 T2 FLAIR 序列对于 FCD 分型具有一定提示意义; 对于 MRI 平扫患者, 丘脑 DTI 可能提示病灶左右, 而 ASL 可能对进一步明确致病灶位置提供帮助。

人工智能辅助系统在儿童骨龄影像评估中的研究进展

张冀云¹、石潞²、尹建华¹、杨斌¹

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

骨龄评估是以骨骼的生长发育过程为依据来衡量人体发育水平和生物年龄的重要工具, 普遍应用于临床医学, 法医鉴定及体育赛事等领域。骨龄评估是儿科影像学的一个重要研究课题。目前临床大多数应用 (TW3-RUS、TW3-Carpal、G-P 图谱法) 综合测评儿童骨龄, 但存在耗时较长, 对评估医师要求较高及结果有偏差性等特点。近年来, 随着计算机技术及人工智能算法发展, 尤其是深度学习及神经网络模型应用于医学影像领域, 各种人工智能辅助评估骨龄系统进展迅速, 从而可快速、精准、有效地评估骨龄; 随着研究地深入及细分, 热点关注于骨龄测评中的解剖信息及骨骼形态细节, 或尝试在任务中加入临床资料; 并尝试使用整个手和特定局部感兴趣区域图像进行训练和预测, 使人工智能 (AI) 骨龄测量系统评估儿童骨龄的准确性得到明显提升。人工智能自动骨龄评估算法, 由于兼具深度学习能力和临床可解释性, 越来越受到研究者和临床医师的关注, 也取得了较为满意结果, 有望真正实现临床应用。本文对人工智能骨龄评测系统发展脉络进行梳理, 为骨龄自动评估技术的发展提供新的思路与展望。

儿童胸腺朗格汉斯细胞组织细胞增生症的影像表现

戴望春、刘鸿圣

广州市妇女儿童医疗中心

目的 观察儿童胸腺朗格汉斯细胞组织细胞增生症 (Langerhans cell histiocytosis, LCH) 的影像表现。方法 回顾性分析经病理确诊的 15 例胸腺 LCH 患儿的影像资料, 观察肿瘤的位置、大小、形态、密度及与周围组织器官的关系等特点。结果 5 例位于前纵隔, 7 例位于前中纵隔, 3 例位于前纵隔-胸骨上窝, 绝大多数病灶平扫密度不均匀, 增强扫描后呈轻度~中度强化。13 例正常胸腺形态消失, 肿瘤形态不规则, 边界不清。14 例合并多发坏死和/或囊变, 坏死区域散在分布, 囊性区域直径约 0.5~1.2 cm。7 例合并多发斑点状钙化, 钙化分布较均匀, 边界模糊。10 例纵隔大血管受压移位。7 例气管和/或支气管受压变窄。6 例可见心包积液, 心包壁增厚。7 例与肺组织分界不清。结论 儿童胸腺 LCH 好发于 1 岁以下婴儿, 以坏死和/或囊变、钙化多见, 常伴肺、心包受累, 压迫大血管和下气道。

西门子 Force CT 锡过滤器联合 ADMIRE 技术在儿童鼻窦检查中的应用价值

姜文龙

空军军医大学西京医院

目的：探讨西门子第三代双源 Force CT 使用锡滤过滤器结合高级模拟迭代重建 (ADMIRE) 技术在儿童鼻窦扫描中的临床应用价值。方法：选取来我院行鼻窦 CT 扫描的患儿，按检查时间随机分入 A、B 两组，实验组 A 组 (60 例)：使用锡过滤器能谱纯化技术扫描，管电压 Sn100Kv，管电流 50mAs，并采用 ADMIRE 重建，等级强度 3；常规组 B 组 (60 例)：采用管电压 100Kv，管电流 50 mAs，滤波反投影 (FBP) 重建；其余 AB 两组的扫描参数均一致。对比两组图像的图像质量的主客观评分以及辐射剂量。图像质量主观评价采用 5 分评分法；客观评价采用比较图像的 CT 值、噪声 (SD)、信噪比 (SNR)、对比噪声比 (CNR) 和容积剂量指数 CTDIvol(mGy)、剂量长度乘积 DLP(mGy.cm)、有效辐射剂量 ED(mSv)。结果：A 组对比 B 组辐射剂量下降约 67.34 %，且有统计学意义($P<0.01$)；两组相比，A 组图像 SD 增加 5.46 %；SNR 降低 3.27 %；CNR 升高 3.58 %；主客观评价对比无统计学差异 ($P>0.05$)。结论：Force CT 锡过滤器 (Sn100Kv) 联合 ADMIRE 技术在儿童鼻窦扫描中，既可以保证图像质量又能大幅降低辐射剂量，值得在临床推广。

多模态功能 MRI 定量评价甲基丙二酸血症脑损伤

宋吉清

山东省立医院

目的：本研究的目的是定量评估多参数 MRI 在甲基丙二酸血症 (MMA) 患者脑组织中的结构和功能变化。

方法：对 62 例患有甲基丙二酸尿症的儿童行多模态 MRI 检查，男 44 例，女 18 例，年龄 0.5 个月~17 岁，平均年龄 31 ± 50.8 个月)，26 名患者为单纯型 MMA，其他患者为合并型 MMA。收集患儿的临床资料，所有患者均经新生儿筛查、串联质谱、气相色谱-质谱和基因检测进行确诊。主要临床症状为嗜睡、呕吐、发育迟缓、进食困难和代谢性酸中毒。10 例患者临床和 MRI 表现正常。62 例患者行常规 MRI 和扩散加权成像 (DWI) 检查，28 名患者行扩散张量成像 (DTI) 检查，16 名患者进行动脉自旋标记 (ASL) 检查，30 名患者进行磁敏感加权成像 (SWI) 检查。另外 62 名年龄和性别相匹配的儿童作为对照组。我们测量了两组患者的结构和功能 MRI 参数。结构 MRI 评分评估区域包括脑 WM (白质)、皮质 GM (灰质)、深部 GM 和小脑。最高可得 11 分，分数越高表示伤势越严重。脑 WM 异常包括髓鞘形成延迟、信号异常、囊性变性 (脑软化)、胼胝体变薄、侧脑室扩张、冠状面双侧顶叶宽度 (BPW)。大脑半球间距离 (IHD) 评估皮质萎缩。通过信号异常和体积减少来评估深部 GM 和小脑异常。ASL、DWI 和 DTI 的 ROI 分析包括对称的双侧额叶白质、颞叶白质、内囊 (IC) 前肢、IC 后肢、枕叶白质、放射状冠区、半卵圆中心、基底节和胼胝体 (CC) 膝部、CC 压部。比较 MMA 组和对照组之间 ROI 的 ADC 值、CBF 值和 FA 值等参数的差异。

结果：47 名儿童结构 MRI 出现一个以上的异常。最常见的结构异常为皮质萎缩，其次是脑室扩张和小脑萎缩。患者额叶白质 CBF 低于正常对照组。患者组 ADC 值较对照组显著增加，FA 值显著降低。

结论：我们发现结构 MRI 评分和多参数功能 MRI 成像能有效的评估 MMA 患者的脑损伤。

PU-0505

多模态磁共振对早产儿脑损伤早期诊断及预后评估的临床价值

韦洁如

广州市妇女儿童医疗中心柳州医院

摘要：目的：探讨多模态磁共振成像（MRI），磁敏感加权成像（SWI）、扩散加权成像（DWI）及扩散张量成像（DTI）技术联合在早产儿脑损伤早期诊断及预后评估的临床应用价值。方法：选取我院 2018 年 7 月至 2023 年 3 月本院收治的 34 例早产儿脑损伤患儿的临床与头多模态磁共振成像检查资料。男性 21 例，女性 13 例；胎龄为 32~37 周，其中 5 例患儿生产困难，其余患儿均无产伤。纳入标准：早产儿，有脑损伤临床病史、危险因素等；病情稳定无磁共振检查禁忌。使用荷兰 Multiva PHILIP 1.5T 超导型磁共振进行头颅扫描，使用头颈 8 通道线圈。所有患儿均签署知情同意书后行多模态 MRI 检查。回顾性分析本院 34 例新生儿脑损伤患儿的颅脑多模态 MRI 图像特征，包括常规平扫图像、SWI、DWI 及 DTI，分析围生期资料、颅脑损伤情况和脑白质微结构的改变，并与临床诊断进行对照研究。参照中国科学院心理研究所编制的婴幼儿智能发育量表(CDCC)，随访 1 个月、3 个月、6 个月进行神经行为方面的测试，包括智能发育指数(MDI)和运动发育指数(PDI)。结果：DWI 对早产儿颅脑缺血性病变的敏感性较高，SWI 对早产儿颅脑出血性病变具有较高敏感性，应用 DTI 技术感兴趣区各向异性分数进行差异性分析。本组 34 例早产儿中，其中出血性脑损伤 14 例，蛛网膜下腔出血 4 例，脑白质灶性出血 3 例，侧脑室周围出血并及脑室内积血 3 例，硬膜下血肿 4 例，蛛网膜下腔出血伴硬膜下血肿 1 例；缺血性脑损伤 20 例，其中局限性缺血性脑损伤 12 例，弥漫性缺血性脑损伤 2 例，脑室周围白质软化 6 例。34 例早产儿脑损伤 MRI 影像诊断与临床诊断基本相符。结论：多模态 MRI 成像对早产儿脑损伤早期诊断及治疗后评估具有重要临床价值。目前诸多研究表明对脑损伤早产儿的早期科学干预能改善其发育结局，这与生命早期脑极强的神经可塑性相关。因此，对早产儿脑损伤的早期诊断和预后评估的早期干预赢得最佳时机。

PU-0506

儿童桥小脑角区卵黄囊瘤 1 例报告并文献复习

韦洁如

广州市妇女儿童医疗中心柳州医院

摘要：目的：探讨颅内卵黄囊瘤的临床特点、影像学特征及治疗方法，提高对颅内卵黄囊瘤(yolk sac tumor, YST)的认识。方法：回顾性分析广州市妇女儿童医疗中心经外科手术治疗 1 例经病理证实的左侧桥小脑角区卵黄囊瘤患儿的临床资料及影像表现；并对相关文献进行复习。左侧桥小脑角区-桥前池团块状实性肿块，边界清，大小约 3.8cm×3.6cm×3.1 cm，T1WI 等、稍低信号，T2WI 稍高、高信号，FLAIR 呈稍高及低信号，DWI 呈稍高信号，ADC 呈稍高信号，增强实性部分明显欠均匀强化，囊变区无强化。结果：患儿行开颅显微镜下手术全切除肿瘤，术中见肿瘤基底位于桥小脑角区，面神经受压，听神经被肿瘤包绕其中，色红，供血丰富，质地软；分块切除肿瘤。病理检查为卵黄囊瘤。术后患儿恢复良好，随访 1 个月未见复发，目前仍在随访中。结论：颅内桥小脑角区卵黄囊瘤临床非常罕见；其病因尚不明确，临床表现与肿瘤大小和部位有关，影像学检查有一定诊断价值，血清及脑脊液甲胎蛋白(alpha fetoprotein,AFP)浓度升高，术后 12 天血清甲胎蛋白 (AFP) 浓度为 349.50ng/mL 仍升高。目前治疗大多采用手术完整切除肿瘤，术后联合放化疗。卵黄囊瘤又称内胚窦瘤(endodermal sinus tumor, EST)，属于生殖源性肿瘤，一般原发于卵巢和睾丸，偶尔也发生于生殖腺以外，但发生在颅内的较少见，颅内好发于中线区域，其中鞍区、松果体区、基底节区、侧脑室旁已有报道，而原发于桥小脑角区国内外未见报道。许多影像医师对儿童原发的桥小脑角区的卵黄囊瘤认识不足，易误诊。

PU-0507

小儿支原体肺炎 CT 表现

杨晓丹

上海市浦东新区公利医院

目的 目前小儿支原体肺炎高发期，支原体培养分离结果及血清学检查是临床诊断金标准，但该检查对环境条件要求较高，且相对滞后，分析小儿支原体肺炎胸部 CT 影像学特征及其鉴别诊断价值尤为重要。**方法** 选取本院 2023 年 5 月至 2023 年 9 月收治且经血清学 MP 抗体(MP-IgM)检查或肺炎链球菌血培养确诊的 100 例支原体肺炎患儿作为研究对象，分析其病变位置、形态、无淋巴结增大及胸膜改变等影像学特征。**结果** 100 例支原体肺炎患儿中，单侧肺叶病灶 78 例、双侧肺叶病灶 36 例、单叶段病变 67 例、多叶段病变 47 例。肺部受累情况：左肺 12 例、右肺 20 例、双肺 68 例。因其发病在肺间质，其特征即为支气管壁增厚。患儿 CT 影像学主要表现为病变区肺纹理增粗而模糊，病变范围广，常累及多个肺叶，单侧或双侧的磨玻璃影、实变影及网格结节影。其中 88 例患儿可见支气管壁增厚；66 例可见片状实变影；80 例可见结节影；56 例可见树芽征，15 例见胸膜结节。患儿胸部特点表现为纵隔气管前腔静脉后淋巴结肿大和支气管壁增厚，胸腔积液较少见，只有 9 例患儿有少量胸腔积液。影像上需要与结核、支气管肺炎、病毒性肺炎及大叶性肺炎鉴别。**结论** CT 检查可有效显示小儿支原体肺炎的影像学特征，综合其临床特征进行分析，可对肺炎做出准确诊断，具有较高的临床应用价值。

PU-0508

3D-DESS 序列在小儿多指（趾）畸形术前评估中的应用

李晶灵

空军军医大学西京医院

目的：小儿多指（趾）畸形、常规术前行 X 线检查，可清楚显示骨骼，但一般情况下，患儿手术时年龄较小，对于软骨骨骺、肌腱等软组织难以区分，无法直接区分单独骨骺和共享骨骺的情况。此研究探讨 MRI 三维双重回波稳态成像（3 Dimensions-Double echo steady state, 3D-DESS）序列在小儿多指（趾）畸形术前评估中的应用及临床意义。

方法：选择 2021 年 5 月至 2022 年 3 月间我院骨科收治的多指（趾）畸形患儿 18 例为研究对象，术前行 MRI 3D-DESS 序列扫描，两名高年资医生用双盲 3 分制法分析图像质量；且以术中所见结果为“金标准”，分析图像结果与术中结果的一致性。

结果：18 例多指（趾）畸形患儿均扫描成功（100%）（如图 2-图 4）。图像质量评分：16 例（88.9%）在 3 分，平均 2.6 ± 0.3 ，所有图像均能满足诊断，两位医生的盲法评分 ICC 值为 0.8579（95%CI: 0.7253-0.9658）。MRI 结果显示 2 例为足趾畸形，16 例为多指畸形（其中 3 例为 Wassel III 型，10 例为 Wassel IV 型，2 例为 Wassel V 型，1 例为蹼状指畸形，图 1~3），磁共振检查诊断结果与术中所见结果一致性为 100%。

结论：无创无辐射的 MR 3D-DESS 序列可提供患儿畸形指（趾）的软骨骨骺、肌腱及骨组织生长发育情况，对于小儿多指（趾）畸形术前评估及手术方案制定具有较高的临床诊断价值。

Risk factors of severe conditions in children hospitalized with adenovirus infection and their differences in chest CT features

Qiongjie Hu, shaofang Wang, Hanxiong Guan, Liming Xia

Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Jiefang Dadao 1095(#), 430030 Wuhan, People's Republic of China

Background: Children infected with human adenovirus (HAdV) were at particularly high risk of developing severe disease, but the risk factors of severe conditions are poorly understood.

Objectives: To explore the risk factors of severe conditions in children patients by analyzing the epidemic, clinical data and computed tomography (CT) imaging features.

Methods: In this retrospective study, 267 children positive for HAdV were included between October 2016 and September 2021 in Tongji Hospital, Wuhan, China. Descriptive analysis was performed on epidemiology, clinical data and the outcome of these children. Details of the CT manifestations changes were semi-quantitatively scored according to the imaging of consolidation, ground-glass opacity and emphysema of each lung lobe.

Results: Results showed no different significance in genders, respectively, between the different years, the ages, the hospital length of stay (LOS) days, the abnormal chest manifestations, the quarter distribution and the severe/non-severe conditions. However, there was a statistically significant difference in the occurrence rate of abnormality on chest CT imaging ($P=0.007$) and the performance characteristics of chest CT images ($P=0.002$) between severe and non-severe groups. We demonstrated that co-infection with ≥ 2 kinds of other pathogens happened more frequently in severe cases. The proportion of lymphocytes in laboratory indexes significantly decreased in the severe conditions. In addition, the proportions and scores of consolidations were significantly increased in each lung lobe in severe cases.

Conclusions: Our results could help predict children hospitalized with HAdV who are at increased risk for severe conditions, encouraging aggressive treatment and care.

TrueFidelity 深度学习图像重建技术在儿童副鼻窦超低剂量 CT 检查中的初步应用研究

李杨、宋修峰
青岛市妇女儿童医院

目的: 探讨 TrueFidelity 深度学习重建 (Deep learning image reconstruction, DLIR) 技术在儿童副鼻窦超低剂量 CT 检查中的价值。**方法:** 回顾分析因鼻窦炎或鼻部外伤行 CT 扫描患儿 50 例, A 组 (实验组) 25 例采用 100kVp 扫描, SmartmA 60-250, 前置 AsirV 权重 70%, DLIR 图像重建, 重建强度分别为高级、中级和低级; B 组 (对照组) 25 例采用 100kVp 扫描, SmartmA 60-250, 前置 AsirV 权重 30%, 后置 AsirV 重建, 重建权重选择 70%。比较两组的辐射剂量常、图像噪声 (SD)、信噪比 (SNR)、对比噪声比 (CNR) 及主观评分。辐射剂量记录 DLP 值, 并计算有效剂量 ED 值。**结果:** ① A、B 两组有效剂量差异有统计学意义, A 组辐射剂量较 B 组明显降低 ($tDLP=-34.56$, $tED=-23.00$, $P < 0.05$), A 组 DLP 和 ED 分别比 B 组降低了 $83.92\%[(36.65 \pm 2.44) \text{ mGy} \cdot \text{cm} \text{ vs. } (227.92 \pm 27.58) \text{ mGy} \cdot \text{cm}]$ 和 $83.17\%[(0.17 \pm 0.03) \text{ mSv vs. } (1.01 \pm 0.18) \text{ mSv}]$ 。② DLIR 不同重建强度中高强度重建 (DLIR-High) 图像质量最佳, 其作为实验组 A 与对照组对比图像质量。③ A、B 组图像噪声、CNR 差异有统计学意义

(t 噪声=3.30, t CNR=4.08, $P<0.05$), A 组图像噪声低于 B 组, A 组 CNR 高于 B 组, SNR 值差异无统计学意义 (t 鼻甲黏膜 SNR =1.73, t 颞下窝脂肪 SNR =0.29, $P>0.05$)。④A、B 组图像主观评分: 筛窦、上颌窦处评分无统计学意义 (z 筛窦=-0.84, z 上颌窦-1.07, $P>0.05$); 鼻咽处有统计学意义 (z 鼻咽=-5.21, $P<0.05$), 为 A 组优于 B 组。结论: A 组图像质量整体优于 B 组, 在儿童副鼻窦扫描中采用超低剂量扫描联合 DLIR 技术, 在显著降低辐射剂量的同时, 可保证图像质量。

PU-0511

产前 MRI 诊断胎儿肠扭转伴梗阻 1 例

周小玲、赖华
成都市妇女儿童中心医院

(个案报道)

孕妇 31 岁, G2P0 孕 35+1 周, 在我院行胎儿 MRI 检查, MRI 描述: 胎儿结肠及部分小肠呈 T1WI 高信号, 其右腹迂曲肠管呈“漩涡”状, 大部分位于右上腹区; 中下腹另见明显扩张肠管, 管径约 2.1cm, 其内容物呈 T1WI 及 T2WI 稍高信号, 管壁增厚, 并与上述漩涡状肠管相延续, 余近端肠管萎陷, 管壁增厚, 局部管壁模糊不清; 腹腔肠间隙及结肠旁沟广泛液体信号影。乙状结肠部分偏细。(图 1、图 2)

手术所见: 探查见距屈氏韧带 50cm 以远端回肠至距回盲部近端约 10cm 回肠以其系膜根部顺时针扭转 1080°、发黑坏死, 复位后见该段肠管系膜缺如, 肠管迂曲, 中段扩张明显、肠腔内含大量瘀滞的胎粪及暗红色坏死组织。扭转肠近端小肠稍扩张、色红润、直径约 1cm, 肠腔内含褐色粘稠胎便。扭转肠管远端回盲部、阑尾及剩余结肠肠壁柔软, 形态未见确切异常, 内含少许胎便。腹腔淡血性腹腔积液约 30ml。小肠总长约 110cm, 自屈氏韧带至造瘘口约 50cm, 距回盲部剩余回肠约 7cm。(图 3、图 4)

术后诊断:

1. 回肠扭转, 2. 回肠坏死, 3. 回肠绞窄性肠梗阻, 4. 先天性肠系膜血管畸形 (回肠系膜大部缺如), 5. 先天性小肠发育异常 (回肠)

PU-0512

毛细胞型星形细胞瘤在 CT、MRI 诊断

蔡雪梅
上海交通大学医学院附属儿童医院、上海市儿童医院

目的: 探讨儿童毛细胞型星形细胞瘤(PA)的 CT、MRI 特征性表现, 提高临床诊断水平。方法: 收集我院 2015 年 1 月-2021 年 12 月间资料完整并经手术病理证实的 85 例儿童毛细胞型星形细胞瘤的临床 CT、MRI 资料, 回顾性分析研究儿童毛细胞型星形细胞瘤在 CT、MRI 特征性影像学表现。结果: 本院手术病理证实的 85 例儿童 PA 中, 男 50 例、女 35 例, 年龄 5 个月-15 岁 1 个月, 中位年龄 65 个月 (平均 72.33 个月); 其中, 颅内 78 例、占 91.76%, 脊髓 6 例 (其中 1 例累及延脑)、占 7.06%, 眶内视神经 (双侧发病) 1 例、占 1.18%; 幕下小脑半球 26 例、蚓部 30 例、脑干 1 例、小脑蚓部及中脑顶盖各 1 枚肿瘤 1 例共 57 例、占 67.06%, 幕上鞍区 17 例 (其中 1 例累及视神经颅内段伴脑室与松果体多灶 PA、1 例伴脑室 PA)、脑内 3 例、脑室内 1 例共 21 例、占 24.71%; 单发 81 例、占 95.29%, 2 个及以上病灶 4 例、占 4.71%, 共 91 个病灶, 其中毛细胞黏液样型星形细胞瘤 6 例 (5 例位于鞍区、1 例位于小脑半球, 其中 1 例鞍区 PA 多发), 肿瘤长径 11-368.5mm, 平均 59.12mm, 其一脊髓病变几乎累及脊髓全长。结论: 儿童毛细胞型星形细胞瘤

好发于婴幼儿，部位以小脑半球常见，病灶多为囊实性成分，CT 影像上呈等低密度改变，MRI 影像 DWI 序列无明显弥散受限改变，增强后实性部分显著不均匀强化、内见多发小点状或条状低信号，囊性部分强化不明显，且有类似 III 级胶质瘤影像表现特点。儿童毛细细胞型星形细胞瘤在 CT、MRI 特征性表现，对术前诊断和鉴别诊断具有重要价值。

PU-0513

构建基于深度学习特征的人工智能儿童腕部影像骨龄评估系统模型的初步探讨

张冀云¹、石滢²

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

目的 构建基于手腕部影像传统关注区域深度学习特征的人工智能骨龄评估系统模型，并验证其可行性及效果。

方法 回顾性连续纳入 2021 年 3 月至 2022 年 5 月昆明市第一人民医院及昆明市儿童医院儿童骨龄 DR 片 2182 例，按年龄段等比例采样原则训练集纳入 1746 (80%) 例，验证集 436 (20%) 例。应用深度学习方法构建基于传统关注的 17 个特征区域定位模型及骨龄回归模型；另选取昆明市第一人民医院近期 2022 年 8 月至今 635 例骨龄影像结果作为测试集检测其效能。采用平均精度均值 (mAP)、平均绝对误差 (MAE) 及均方根误差 (RMSE) 分别评价模型定位及骨龄预测的准确性。

结果 模型对 17 个特征区定位 mAP 为 0.93，整体 MAE 验证集为 0.467 岁、测试集为 0.443 岁。RMSE 分别为 0.487、0.563 年。测试集模型骨龄预测与医师读数误差 1 年内的准确度分别为 89.6% (391/436)，误差在 2 年内的准确度分别为 93.9% (409/436)。差异较大者主要出现在相应年龄段训练集数据出现锥形骨骺或骨骺融合覆盖指间关节面范围判定。

结论 构建的基于深度学习的儿童骨龄评估 AI 模型可快速、自动、有效地评估骨龄，但实际临床应用中仍需要人工调校及进一步深度学习。

PU-0514

心理护理联合人文关怀理念在 MRI 检查患者中的实践研究

王睿

郑州大学第一附属医院

MRI 检查是临床上一种较为常见的检查方式，其可以对人体进行较为全面的检查，并对人体的疾病进行准确的判断，其在临床上有着较广泛的应用，可以在一定程度上促进临床疾病治疗。但是由于 MRI 检查是一种较为先进的检查方式，所以在检查过程中会产生一定的辐射。对于一些患者而言，在进行 MRI 检查过程中容易出现害怕和恐惧的心理，从而严重影响到患者的治疗效果。因此，为了改善患者的心理状态，提高其治疗效果，我院将心理护理联合人文关怀理念应用到 MRI 检查中，取得了较好效果。方法：对照组：常规护理方法，观察组：在患者入院后，由护士长对患者进行评估，并按照相关的标准为患者制定个体化的心理护理联合人文关怀理念的个性化护理。通过多种途径，如网络、科室宣传栏等对患者进行健康教育护理计划的同时，还应向患者及家属进行健康教育，使其了解 MRI 检查的，提高其对 MRI 检查的认识水平。比较两组患者的一般资料及 MRI 检查结果。比较两组患者的心理状态、护理满意度、认知行为、生活质量评分等情况。结果：患者在 MRI 检查期间，对护理人员的服务态度、专业知识、沟通能力和行为规范等进行了调查，结果显示：护理人员服务态度和行为规范较好，患者满意度较高。通过对两组患者的检查前、检查中和检查后的不

不良反应进行调查,结果显示:两组患者在 MRI 检查期间均未出现不良反应,均未出现发热、寒战等不适症状。但是,观察组中有 1 例患者由于没有按照要求佩戴耳机而导致耳鸣。结论:在本次研究中,将心理护理联合人文关怀理念应用于 MRI 检查患者的护理实践中,取得了良好的效果。本次研究结果表明: MRI 检查患者在心理护理联合人文关怀理念的指导下,焦虑、抑郁和孤独等不良情绪得到缓解,对疾病知识和技术操作了解增加,自我效能感提高,为患者创造了良好的就医环境。MRI 检查患者在进行检查时,需要采用心理护理联合人文关怀理念的指导进行护理,以保证患者顺利完成检查。

肿瘤 CT 增强检查中造影剂不良反应的预防及护理

陈婧

西宁市第一人民医院医疗集团总院

目的:探讨综合性护理干预对预防 CT 强化扫描中造影剂副反应的效果。方法:选取我院收治的行螺旋 CT 增强检查的肿瘤患者 100 例作为研究,并随机分为对照组和试验组。对照组给予常规护理,试验组从心理干预、健康教育、预防护理等方面进行综合护理干预。评价两组肿瘤患者的情绪、造影剂注射后肿瘤患者生命体征变化及副反应发生情况及对护理工作满意度情况。结果:试验组肿瘤患者干预后焦虑、抑郁评分低于对照组($P<0.05$),试验组副反应发生少于对照组($P<0.05$),试验组肿瘤患者血压及心率异常率低于对照组($P<0.05$)。试验组肿瘤患者对护理工作满意度高于对照组($P<0.05$)。结论:综合性护理干预能够降低 CT 强化扫描中造影剂副反应发生率,改善不良情绪,提高护理满意度。

人文关怀理论在增强 MRI 检查患者护理中的干预效果

洪洁

郑州大学第一附属医院

摘要:目的:在增强 MRI 检查患者的护理过程中,采用人文关怀理论指导护理实践,目的在于提高患者对医院及护士的满意度,满足患者的心理需求。由于增强 MRI 检查是一项医疗服务,具有一定的专业性和技术性,需要医护人员具有较高的专业水平和技能水平,而这与医护人员所接受的教育、社会经历等方面有关。在增强 MRI 检查过程中,医护人员应当充分关注患者的心理需求,加强医患沟通交流,从而为患者提供良好的医疗服务。方法:对照组采取常规护理,观察组在常规护理的基础上采用人文关怀理论的护理干预措施,具体内容如下。心理护理:密切关注患者的情绪变化,对其进行心理疏导,使其保持良好的心态;人文关怀服务:密切观察患者的病情变化,协助医生进行治疗;知识宣教:向患者及其家属介绍磁共振成像技术及相关检查注意事项,介绍 MR 检查对人体的影响。介绍 MRI 检查全过程及扫描后图像显示,消除患者对检查的恐惧心理。结果:观察组的患者的心理健康、满意度评分均高于对照组,差异有统计学意义($P<0.05$);且观察组患者的血压和血氧饱和度明显低于对照组,差异有统计学意义($P<0.05$);两组在干预前的焦虑自评量表评分无统计学差异($P>0.05$),干预后两组的焦虑自评量表评分均明显低于对照组,差异有统计学意义($P<0.05$);两组在干预后的总体满意度评分无统计学差异,且观察组患者的总体满意度明显高于对照组。结论:本次研究结果表明,在 MRI 增强检查过程中,采用人文关怀理论进行护理干预后,患者出现不良情绪明显减少;不良情绪会直接影响到患者检查的顺利进行。因此,在 MRI 增强检查中采取人文关怀理论进行护理干预,有利于提高患者的满意度和治疗依从性,减轻患者痛苦,有利于改善医院整体护理质量。

心理护理在 CT 增强检查过程中的临床应用效果及满意度分析

王利娟、李娅
空军军医大学西京医院

目的 研究 CT 增强检查中行心理护理的效果。方法: 选取我院收治的 78 例 CT 增强检查患者, “双盲法”分采纳组(39 例, 常规护理)、科研组(39 例, 心理护理), 比较两组疗效。结果: 护理前比较负性情绪无意义, $P>0.05$; 护理后相较采纳组, 科研组 SAS、SDS 值更低; 满意率更高, $P<0.05$ 。结论: 心理护理能减缓 CT 增强检查患者的不良情绪、改善护患关系, 值得推崇。

Design and application of protective machine restraint belt for interventional surgical: A randomized controlled study

Zhexia Jin,ZhongFeng Niu,Yan Zhang
SIR RUN RUN SHAW HOSPITAL

Aim: This study aimed to design the protective machine restraint belt for interventional surgical and evaluate the application effects.

Methods : Design and manufacture the protective machine restraint belt for interventional surgical, which was authorized by the State Intellectual Property Office of China (utility model patent number: ZL 202221415757.3). Two hundred interventional surgery patients who were selected and randomly assigned into control group (n=100) or experimental group (n=100) .The control group didn't use the protective machine restraint belt for interventional surgical, while the experimental group used. The times of surgical interruptions due to patient factors, the duration of interruption, the incidence of adverse events, along with patients' satisfaction with using the restraint appliance were compared between the 2 groups.

Results: The information about gender, age, education level and surgical classification for comparison of the 2 groups were collected, and there was no significant difference in general data($P>0.05$), as shown in Table 1.The times of surgical interruptions, duration of surgical interruptions, and the incidence of adverse events in the experimental group were lower than those in the control group, while the patients'satisfaction was higher than that in the control group,as shown in Table 2.In addition, 2 patients in the control group stopped the surgery who were unable to continue cooperating, which did not occur in the experimental group.

Conclusions: The protective machine restraint belt for interventional surgical is safet to operate, which can improve the surgical efficiency and patients' satisfaction.

规范化护理在 MRI 检查中患者的配合度及对护理满意度的应用研究

陕梦迪、雷晓燕、汤敏、李娟、张鑫、张益凡
陕西省人民医院

摘要:目的: 本研究旨在探讨规范化护理对磁共振 (MRI) 检查中患者的配合度和护理满意度的应用效果。方法: 共收集了 2022.1-2023.1 期间在本院影像科进行 MRI 检查的 98 例患者。其中, 随机将 49 例患者分配到研究组, 接受规范化护理干预; 将 49 例患者分配到对照组, 接受专科常规护理干预。比较了两组患者在检查情况、图像质量和护理满意度方面的差异。结果: 研究组患者在造影剂渗漏、重复扫描、血压波动和心率波动的发生率明显低于对照组 ($P<0.05$); 研究组的图像优良率为 97.95% (48/49), 显著高于对照组的 81.63% (40/49), 差异具有统计学意义 ($P<0.05$); 研究组的护理满意率为 97.95% (48/49), 明显高于对照组的 83.67% (41/49), 差异有统计学意义 ($P<0.05$)。结论: 本研究表明, 在 MRI 检查中, 规范化护理干预可以提高护理和图像质量, 并增加患者对护理的满意度。

口腔癌修复重建术后的围手术期护理要点分析

熊才兵
中山大学附属口腔医院

【目的】探讨围手术期骨髓炎患者游离腓骨修复重建后出现护理问题以及对应护理措施

【方法】选取 2018 年 8 月至 2022 年 12 月, 随机抽取住院患者行口腔癌修复重建手术患者 40, 其中男性 26 例, 女性 14 例, 年龄在 35~68 岁之间; 股前外侧瓣 14 例, 腓骨瓣 9 例, 前臂瓣 6 例, 颞下岛状瓣 4 例, 髂旋浅动脉瓣 3 例, 胸大肌瓣 4 例; 围手术期包括术前健康教育、术前心理辅导、

术前营养评估、术后营养干预、气管切开护理、口腔护理，皮瓣观察，术后功能锻炼，术后感染监测。描述口腔癌患者修复重建术后出现的护理问题以及分析对应方法

【结果】3 例患者出现手术前严重焦虑，经心理辅导后情绪相对缓解，1 例患者术后出现谵妄，3 例出现手术后皮瓣坏死，2 例经过皮瓣二次手术修复，24 例术前患者营养状况欠佳，40 例患者全程接受营养干预，2 例术后出现感染症状。

【结论】修复重建手术可在一定程度上恢复患者的功能，能够给患者带来自信和希望。口腔癌修复重建术围手术期护理问题多，个体差异大，护理措施需要精细化、个性化，这对我们口腔颌面外科护理团队提出较大的挑战。

PU-0522

PDCA 循环在对比剂外渗护理管理中的效果观察

曹靖惠、吴美奇、徐飞洋
吉林大学中日联谊医院

目的：探讨 PDCA 循环管理程序在对比剂外渗后的无缝式护理管理效果，改善外渗后放射科与临床脱节式管理现状。

方法：放射科护理质量控制小组针对对比剂外渗患者，采用 PDCA 循环程序，进行外渗预后时间和效果以及恶性转归率的效果观察，具体如下：

计划阶段：建立无缝式护理管理小组-放射科护士长、静疗组长、责任护士、临床护士长、静疗组长、责任护士。针对小组成员进行对比剂外渗相关知识培训。

实施阶段：启动无缝式护理管理机制、制定无缝式环节流程管理、规范交接流程、制定标准化流程规范。

检查阶段：针对每一例外渗患者，无缝式护理管理小组成员跟踪流程落实情况，给予分析、评价、记录。

处理阶段：无缝式护理管理小组掌握每一例外渗患者愈后时间、效果、良恶性转归率，通过上述三个阶段进行统计分析、制定计划、确立目标、对策实施、效果观察、总结分析，形成规范化标准推广实施。对循环中存在的问题提出解决办法，纳入下一循环，不断修正标准化流程。

结果：回顾分析 2022.01-2022.05 对比剂外渗病例，与 2023.01-2023.05 进行对比，应用 PDCA 循环管理程序后，碘对比剂外渗发生率明显降低，放射科与临床建立规范化管理流程。

结论：应用 PDCA 循环针对碘对比剂外渗在各护理单元开展无缝式护理管理，能够促进外渗的规范化管理和处理，掌控外渗后的良性转归，促进更快痊愈，提升患者满意度

PU-0523

一体化管理模式在放射科护理质量提升中的作用

丁丽、赵彩佳
郑州大学第一附属医院

目的：分析评价一体化管理模式在放射科护理质量提升中的应用价值。**方法：**共纳入放射科患者 50 例，纳入时间为 2022 年 1-12 月，其中男性 28 例、女性 22 例；平均年龄为（52.83±1.25）岁。均知情签署相关诊疗干预同意书，排除严重精神障碍、临床资料不全及不配合本次实验者。在本次 50 例放射科患者护理工作开展期间，实施一体化管理模式：构建一体化护理管理小组、专业化培训干预、改进放射科护理管理制度、针对护理干预。对放射科护士的护理质量指标进行评分，包括基础护理、专科护理、文书书写、技术操作四项，每一项满分为 100 分；评分越高，代表放射科护

士的护理质量水平越高。对患者风险事件发生率进行分析、计算。根据我院自制护理满意度调查问卷，将患者对放射科护理服务工作的满意程度分成满意、基本满意、不满意三个等级；总满意度 = （满意例数 + 基本满意例数）/ 总例数 $\times 100.00\%$ 。使用统计学软件 SPSS21.0 对数据进行统计分析。结果：实施一体化管理模式后，放射科护士的基础护理评分为（92.50 \pm 1.00）分、专科护理评分为（90.00 \pm 0.50）分、文书书写评分为（95.00 \pm 1.00）分、技术操作评分为（90.00 \pm 1.00）分；本次 50 例患者，无造影剂泄露、重复扫描风险事件发生，仅出现 1 例扫描后轻微不适感，发生率为 2.00%；本次 50 例患者，在护理服务满意程度方面，满意 40 例、基本满意 8 例、不满意 2 例，总满意度为 96.00%。结论：一体化管理模式可以提高护理质量、降低风险发生率、提高患者满意度，具有一定的应用价值。

PU-0524

“医护精诚、共度险关” --从一例 CT 增强扫描碘对比剂重度不良反应突发急救看医技护配合（案例分享）

吴燕燕

中国人民解放军海军军医大学第二附属医院

随着对比剂的广泛使用，其发生不良反应也越来越受到关注。对比剂发生的不良反应以轻中度为主，采取适当措施会及时恢复。对于重度不良反应，掌握必要的抢救措施，启动急救科医生的紧急救治刻不容缓。对比剂的高效、合理、安全、规范化输注，需要影像科医护技人员协同合作、共同维护。本案例从一例有多次行增强 CT 检查史的肿瘤患者突发重度不良反应致心跳呼吸骤停，经影像科、急救科等多学科联合急救，15 天后康复出院为切入点，复盘关于碘对比剂重度不良反应突发急救中医技护的配合措施及经验总结。

PU-0525

基于内控视角改善肿瘤患者增强 CT 检查 PC-AKI 发生的风险

王艳杰

天津市肿瘤医院（天津医科大学肿瘤医院）

摘要：目的 降低肿瘤患者 CT 增强检查后急性肾损伤发生的风险。

方法及工作基础 对每一位患者继续采取 CT 增强检查当日，要求携带患者 3 天内肾功能检查结果（急诊及特殊情况患者除外）。嘱患者在检查前后多饮水，充分水化。加强和提升临床医生和放射科医生对碘对比剂的认知，定期培训。熟悉并掌握碘对比剂使用过程中如发生意外，可能会对患者产生的不良后果和处理方法。结果和结论 目前文献报道增强 CT 的肿瘤住院患者 AKI 总体发生率 20%。本次质量改善过程中，我们将加强与临床科室的沟通，采取上述 5 条改善方法，对可能出现肾功能损伤的肿瘤患者，CT 增强检查后 48-72 小时内复测肾功能，收集相关数据进行评价分析，力争在本次质量改善工作结束后将住院患者 AKI 的发生率降低至 10%以内，并将风险降低在临床诊治的可控范围内。

PU-0526

耐高压静脉留置针在增强核磁共振检查中的应用

薛晓会

郑州大学第一附属医院

摘要:目的 探讨耐高压留置针在增强核磁共振检查中的应用效果。方法 将 80 例增强核磁共振检查患者分为观察组和对照组,各 40 例。对照组采用常规 8 号蝶翼针穿刺贵要静脉和肘正中静脉;观察组采用 24G 耐高压静脉留置针穿刺贵要静脉和肘正中静脉。对两组静脉造影外渗漏率,显影效果,患者满意度进行比较。结果 与对照组比,观察组造影剂渗漏率低,检查显影清晰率高,患者满意度高。结论 增强核磁共振检查应用 24G 耐高压静脉留置针,可减少造影剂渗漏率,血管影像清晰率高,患者满意度高。

CT 增强检查高压注射碘对比剂渗漏原因、预防及护理

杨晓娜、李娅
空军军医大学西京医院

目的 分析 CT 增强检查高压注射碘对比剂渗漏的原因,意在于探讨 CT 增强检查高压注射碘对比剂渗漏进行预防的最佳方法,并进一步总结有效的治疗及护理措施。**方法** 选取 2021 年 3 月至 2023 年 3 月期间在我院进行 CT 增强检查发生碘对比剂渗漏的患者共 60 例作为临床研究的对象,对渗漏原因进行分析,制定和实施相应的预防及护理措施。**结果** 分析导致高压注射碘对比剂渗漏的主要原因。**结论** 明确高压对比剂渗漏的原因,采取系列防范措施对减少渗漏有显著效果。

PU-0528

综合性循证护理在预防 CT 增强扫描对比剂不良反应中的效果观察

许歌、李雪、晏菁、郭锦昊
郑州大学第一附属医院

目的 影像科患者在进行 CT 增强扫描期间,为加强护理效果,通常采用一定护理措施来预防对比剂不良反应的发生,本文旨在探讨综合性循证护理在预防 CT 增强扫描对比剂不良反应中的效果观察,为患者以后的治疗与恢复提供良好的条件。**方法** 本次研究对象为我院 2022 年 2 月-2023 年 2 月收治的 200 例进行 CT 增强扫描患者,采用随机分配的方式,分为对照组和观察组,其中对照组采用常规护理,观察组采用综合性循证护理模式,分析比较两组患者的护理满意度评分和不良事件发生情况。**结果** 研究显示,比较两组患者的不良事件发生情况,对照组过敏反应 4 例(4.0%),外渗 4 例(4.0%)不良事件发生率为 8 例(8.0%)。观察组过敏反应 0 例(0.0%),外渗 1 例(1.0%),不良事件发生率为 1 例(1.0%)。对两组患者不良事件比较经检验,观察组不良事件发生率明显低于对照组($P < 0.05$)。观察组患者对护理模式的满意度为 95/100(95.0%),而对对照组的患者对护理模式的满意度为 82/100(82.0%),综合性循证护理模式组的患者对护理模式的满意度高于采用常规化护理模式组,两组之间差异显著,并且具有统计学意义($p < 0.05$)。**结论** 通过试验得出的数据分析得出,在采用综合性循证护理模式后可以使 CT 增强扫描患者的对比剂不良反应发生率减低,为后续研究者对综合性循证护理在预防 CT 增强扫描对比剂不良反应中的效果观察提供了一定的理论依据和试验基础。

PU-0529

CT 增强高压注射碘对比剂外渗造成皮肤严重损伤的护理

许歌、王艺梦、徐宁、郭锦昊
郑州大学第一附属医院

目的: 探究 CT 增强高压注射碘对比剂外渗造成皮肤严重损伤的护理。方法: 选择我院 2017 年 1 月~2022 年 12 月接收 5000 例需进行 CT 增强检查患者为研究对象, 计算机分组研究组(2500 例)与对照组(2500 例)。对照组中男性患者与女性患者数量占比 1200/1300, 年龄 23~75 岁, 均值年龄(46.32±1.98)岁。研究组中男性患者与女性患者数量占比 1250/1250, 年龄 24~77 岁, 均值年龄(45.53±2.11)岁。将两组患者临床资料中独立性数据以及均值数据复制到计算机系统中计算比较, 比较结果显示没有统计学意义($P>0.05$)。研究按照正常的审批流程上报医学伦理委员会审批, 审批结果同意后开展项目研究。结果: 研究组患者 CT 增强高压注射碘检查中对比剂外渗率为 0.08%, 对照组患者外渗率为 0.4%, 研究组数据更加理想($P<0.05$)。结论: 随着临床疾病发生数量逐渐增多, CT 增强高压注射碘检查被广泛使用到临床疾病检查过程中, 并且进一步提升了患者疾病诊断水平, 但是采用 CT 增强高压注射碘检查中需要对患者注射对比剂进行辅助检查, 尽管在 CT 增强高压注射碘检查过程中已采取相应措施, 但是在实际的检查过程中仍然会出现对比剂外渗等不良情况, 导致患者在疾病检查过程中受到不良的影响。但是对比剂注射后患者极易出现外渗情况影响检查情况, 导致对比剂外渗原因有很多, 为进一步保证患者疾病检查安全性, 需要进一步加强对患者进行护理, 综合护理是一种护理内容较为全面护理措施, 对于预防 CT 增强高压注射碘检查中对比剂外渗有积极意义, 让患者可以安全进行疾病检查研究对比研究组患者与对照组患者对比剂外渗发生情况, 结果显示使用综合护理的研究组患者对比剂外渗发生情况低于的使用常规护理的对照组患者。因此, 在患者 CT 增强高压注射碘检查中实施综合护理可以防止患者对比剂外渗情况发生。

PU-0530

耐高压导管在 CT 增强的应用及护理分析

许歌、许博、王雪娇、赵思钰
郑州大学第一附属医院

目的: 旨在通过试验得出的数据来分析耐高压导管在 CT 增强中的应用, 并推测耐高压导管在 CT 增强中的应用对患者预后的相关关系, 以期做 CT 增强的患者在治疗护理过程中提供理论依据, 以及对做 CT 增强的患者的治疗与恢复提供良好的条件。方法: 选取本地医院 2019 年 9 月到 2022 年 9 月份做 CT 增强的患者 100 例, 按照随机的原则分为两组, 其中 50 例为试验组, 患者在做 CT 增强时采用耐高压导管; 另外 50 例为对照组, 患者在做 CT 增强时采用常规性导管。观察两组的成果, 比较两组的结果, 其中包括患者对检查过程的满意度, CT 增强所耗费的时间, CT 增强影片的优良等。结果: 对患者的做完 CT 增强的护理, 其中耐高压导管组中, 患者对检查过程的满意度高于常规性护理组的患者, 前后两组进行比较, 差异显著, 并且具有统计学意义 ($p<0.05$)。耐高压导管组中, CT 增强所耗费的时间短于常规性导管组, 前后两组进行比较, 差异显著, 并且具有统计学意义 ($p<0.05$)。耐高压导管组中, CT 增强影片的结果优于常规性导管组的患者, 差异显著, 并且具有统计学意义 ($p<0.05$)。结论: 在患者进行 CT 增强过程的护理中, 耐高压导管与常规性导管的使用对患者的预后以及影像结果显著相关。通过通过试验得出的数据来分析耐高压导管应用在患者进行 CT 增强中, 提高患者对影像检查的满意度, 减少患者花费的时间, 使得患者的生活水平可以大大提高, 对他们的预后也可以大大改善。评估两组患者在使用耐高压导管以及常规性导管的情况下的预后, 为以后对研究者对精细化护理在耐高压导管在 CT 增强的研究奠定了一定的理论依据和试验基础。

PU-0531

护理干预联合压缩感知技术在老年腹部 MRI 检查中的应用效果评价

庄丽娜、杜晓琳
大连医科大学附属第一医院

目的：探讨护理干预联合压缩感知技术（Compressed SENSE, CS）在老年患者腹部磁共振（MRI）检查中的应用效果分析。方法：选取 2022 年 1 月到 2022 年 12 月间在我院实施腹部 MRI 检查的 120 例老年患者进行实施研究，按随机数表法将患者分为常规组（n=60）和干预组（n=60），对常规组运用常规护理，对干预组运用护理干预，均行基于 CS 的 MRI 检查，分析总结患者情绪状况、检查舒适度、图像质量、检查安全性及满意度状况。结果：干预组护理后 SAS、SDS 评分、不良反应发生率显著低于常规组，干预组舒适度评分、图像清晰率、满意度显著高于常规组（ $P < 0.05$ ）。结论：老年患者腹部 MRI 检查中实施护理干预可提升检查质量，改善患者检查负面情绪、舒适度、安全性及满意度。

PU-0532

金登多源流干预模式在膝关节损伤 MRI 检查中的应用效果评价

杜晓琳、庄丽娜、宋清伟
大连医科大学附属第一医院

目的：探讨金登多源流干预模式在膝关节损伤患者大孔径磁共振检查中的应用价值。方法：选取 2021 年 12 月至 2022 年 7 月在我院接受大孔径磁共振检查的膝关节损伤患者 65 例参与研究，其中 2021 年 12 月至 2022 年 5 月患者为对照组（32 例），2022 年 6 月至 2022 年 7 月患者为实验组（33 例）。对照组实施传统检查干预模式，实验组在传统检查干预模式基础上采用金登多源流干预模式。比较两组患者满意度、视觉模拟评分（VAS）、焦虑评分（SAS）、重复扫描率、检查时间、医院安全事件发生风险以及图像质量等。结果：对照组扫描后患者 SAS 及 VAS 略高于扫描前（ $P < 0.05$ ），而实验组扫描后患者 SAS 及 VAS 与扫描前相比未见明显差异（ $P > 0.05$ ）。实验组患者满意度明显高于对照组，差异具有明显统计学意义（ $P = 0.003$ ）。实验组患者风险评估、信息传达、危险防范、危险处置以及安全护理平均分均略高于对照组，差异具有明显统计学意义（ P 均 < 0.05 ）。实验组患者扫描时间和重复扫描率明显低于对照组患者，而图像主观评分略高于对照组患者（ $P < 0.05$ ）。结论：在膝关节损伤患者大孔径磁共振检查中采取金登多源流护理干预模式，可以加强医护患三方的沟通和配合，有效缓解患者负性情绪，降低疼痛程度，提高扫描效率及安全性，增强患者对检查依从性，具有很好的推广价值。

自制匀场辅助装置在基于压缩感知磁共振臂丛神经根成像中的应用

杜晓琳、庄丽娜、宋清伟
大连医科大学附属第一医院

目的：探讨匀场辅助装置在基于压缩感知磁共振臂丛神经根成像中的应用。方法：根据不同 BMI 指数及肩髁距设计大、中、小三种不同型号集扇型、U 型、长方形成套装置组件。选取 2022 年 2

月至 2022 年 11 月我院 32 名健康志愿者和 33 名臂丛神经损伤患者，分别使用 3.0T MR 进行常规扫描和使用匀场辅助装置结合 3DNerveView 序列加压缩感知技术（Compressed SENSE,CS）扫描两次，在检查前进行护理宣教，使其提前了解检查前的注意事项尽快熟悉环境，对有幽闭恐惧倾向的受检者进行心理疏导，在进入磁体腔之前，指导受检者闭上双眼，告知受检者在检查过程中可通过举手及抬脚等动作减少恐惧感，分散注意力消除负性情绪，结合先进的压缩感知技术高倍数加速因子（Accelerated Factor, AF）对 3D NerveVIEW 臂丛神经磁共振成像图像质量及扫描时间进行优化，并运用 ROI（15~30mm²）测量臂丛神经与斜角肌图像信噪比（signal to noise ratio, SNR）及神经肌肉对比噪声比（contrast to noise ratio, CNR），分别记录使用匀场辅助装置组件前后图像的 SNR 及神经肌肉 CNR，SNR，每层测量 3 次。进行统计学分析。结果：使用常规扫描方法与使用匀场辅助装置结合 3DNerveView 序列加压缩感知技术扫描方法图像的 SNR、CNR 明显两者有显著差异（ $P<0.05$ ），主观评分（ $P<0.05$ ）。结论：利用自制辅助装置和优化序列的先进技术，在缩短扫描时间窗的同时还获得了高质量的图像识别，加速设备利用率，提高检查成功率和 MRI 诊断能力，有较好的临床应用价值。

PDCA 提高增强 CT 检查成功率

喻瑶瑶

重庆松山医院

摘要：目的 探讨 PDCA 活动在提高放射科增强 CT 检查成功率中的应用效果。方法 选取 2022 年 6 至 8 月增强检查 1530 例次患者作为对照组，2023 年 3 至 5 月增强检查 1649 例次患者作为观察组，对照组按常规工作流程实施，观察组则成立 PDCA 团队，将“提高放射科增强 CT 检查成功率”作为活动改善主题，实施 PDCA“4 个阶段十大步骤”比较两组增强检查成功率。结果 PDCA 活动开展后，观察组患者的增强 CT 检查成功率高于对照组，组间比较差异有统计学意义（ $P<0.05$ ）。目标达成率 104%，改善幅度 57%。活动开展后，两组穿刺成功率、图像质量比较都有显著提高，碘对比剂外渗率、增强检查退费率都有所降低。结论 开展 PDCA 活动能有效提高增强 CT 检查成功率，提高医护人员运用质量改进工具提高护理质量的综合能力。

PU-0536

探讨冠状动脉 CTA 检查护理干预的临床应用价值，提高冠脉 CTA 检查的成功率及图像质量。

陶晓晶

甘肃中医药大学附属医院

目的: 探讨冠状动脉 CTA 检查护理干预的临床应用价值, 提高冠脉 CTA 检查的成功率及图像质量。**方法:** 冠状动脉粥样硬化性心脏病简称冠心病
冠状动脉 CT 血管造影 (冠状动脉 CTA) 已成为临床上排查冠心病重要的无创替代方法之一, 对冠心病诊断的敏感度和特异度可高达 90%。但其图像质量仍然受多种因素的影响, 如: 呼吸运动伪影、心率、心律变化、吞咽、屏气训练、对比剂及流速、扫描参数等。其中, 除扫描参数等技术因素外, 呼吸运动伪影位居第一, 其次是心率与心律的变化, 扫描时心率控制在 65 次/min 以内时所成图像最理想, 心率波动越小, 检查成功率越高。检查前患者存在紧张、恐惧焦虑等心理问题, 容易导致患者产生不同程度的副反应, 严重者可致休克。据文献报道, 冠脉 CTA 检查失败的主要原因是扫描过程中患者紧张, 心率异常、未按要求完成呼吸运动、情绪不稳定。另外, 随着医疗技术的发展和人们保健意识的增强, 冠状动脉 CTA 检查患者日益增多, 现有医疗设备不能满足患者需求, 患者候诊时间长, 对检查认知和依从性差, 具有烦躁焦虑情绪, 如何避免以上干扰因素, 使患者提高认知和依从性, 处于最佳的生理心理状态, 缩短检查和候诊时间, 提高检查成功率和图像采集质量, 是当前护理有待解决的问题。本文就冠心病患者行冠状动脉 CTA 检查中护理干预的价值, 并结合相关文献综述探讨冠状动脉 CTA 检查护理干预的研究进展, 从冠状动脉 CTA 检查的优势, 图像质量的分级测评标准、影响因素分析, 国内护理干预现状及研究进展, 揭示护理干预的应用价值。结果: 通过护理干预, 使患者在整个检查过程中保持最佳的心理状态、平稳的呼吸、最长屏气时间、最佳心率和最小心率波动次数。结论: 护理干预是确保检查成功和获得最佳图像质量的关键因素之一。

IMB 模型在磁共振铁磁性投射事故零伤害愿景中的应用

龚梦、覃蕾

华中科技大学同济医学院附属同济医院

目的 探讨基于 IMB 模型的安全教育避免磁共振铁磁性投射事故带来的伤害。**方法** 将 196 例磁共振检查患者非随机分为对照组 90 例和观察组 106 例。对照组行常规安全教育, 观察组在常规基础上实施以 IMB 模型为基础的安全教育。比较干预前、干预后检查患者磁共振铁磁性投射事故知信行评分、对铁磁性投射事故恐惧评分。结果 对照组 90 例、观察组 106 例完成本研究。两组干预后磁共振铁磁性投射事故预防知信行得分, 对铁磁性投射事故恐惧得分的组间效应、时间效应及交互效应差异有统计学意义(均 $P < 0.01$)。结论 以 IMB 模型为基础的防止磁共振铁磁性投射事故伤害的安全教育能提高磁共振检查患者知信行水平, 降低磁共振铁磁性投射事故风险。

品管圈活动在基于超高端 CT 一站式解决方案缩短主动脉夹层 CTA 的影像链时间的应用分析

曲利媛、李素兰、刘沛、张燕丽、朱青、郑琰、李伟岚

郑州大学第一附属医院

目的: 通过开展品管圈活动, 利用 QCC 工具, 通过全员参与的方式解决缩短急诊主动脉夹层患者 CTA 影像链时间; **方法:** 根据品管圈十大步骤, 通过开展圈会根据圈活动拟定甘特图, 整个活动包括 PDCA 四个阶段, 圈活动的所有实施严格遵循计划表进行实施; 在现况把握环节, 通过制定现有的流程图, 确定其中急诊患者绿色通道、预约等待、图像重建、报告书写审核及危机值上报等

为本次改善的重点环节；通过制定查检表，并对 50 例患者进行查检的数据进行汇总，结果显示 50 例患者急诊主动脉 CTA 检查平均时间 102 分钟；通过对各影响因素绘制柏拉图，根据 8020 法则，将报告危机值上报时间、预约等待及检查时间例为本期活动的重点。在目标设定阶段，计算圈能力为 62.7，设定目标值为 51 分钟；通过解析两个改善重点召开圈会议从“人物环法”鱼骨图制定四个方面共找出 8 大要因，根据全体圈员打分选出八大要因制作查检表，绘制真因验证柏拉图，根据柏拉图分布结果显示急诊患者量大，患者病情复杂多变，检查闭环链不完善作为三大真因；针对三大真因，回归临床结合文献分析，依据科室实际情况拟定对策：通过整合，制定三大对策进行实施：1 建立急诊分级制度，2 个性化扫描及重建方案，通过采用胸痛三联扫描完成心脏、肺动脉及主动脉的采集，采用超炫速 flash 扫描方式，在几个心动周期内完成对全程主动脉的图像采集；对策三一站式绿色通道网格化管理，针对登记人员危机病情分级不知晓，登记效率低下，和技师沟通不畅，通过对与临床建立联系，全科人员分批次进行危机病情分级培训，检查前健康宣教及温馨提示来改善；结果：通过三大对策实施，改善后的急性主动脉夹层 CTA 检查时间缩短至 53 分钟；目标达成率 96.08%，进步率 48.04%。结论：通过品管圈的活动，缩短了急性主动脉夹层检查时间，为患者接受最佳治疗方案赢得宝贵时间，圈成员对解决问题能力有了较大提升，同时也提高了团队的凝聚力；提升自我成就感。

PU-0539

品管圈活动对降低非离子碘对比剂外渗率的应用研究

杜晓琳、庄丽娜
大连医科大学附属第一医院

目的：在 CT 检查过程中，使用对比剂可清晰的显示出病变组织，显著提高了疾病诊断准确率。在临床使用过程多使用高压注射器，将对比剂以团块的形式高压静脉注射，研究发现由于对比剂注射速率快，渗透压高，在 CT 增强扫描中经常出现外渗的现象，轻度外渗反应会导致周围组织红肿、疼痛，中重度外渗反应会导致局部组织肿胀、软组织坏死。不利于诊疗过程顺利进行，因此在 CT 增强扫描过程中予以科学、全面的护理，对于降低对比剂外渗极为重要。方法：纳入研究对象来自本院自 2022 年 6 月至 2022 年 12 月放射科行增强 CT 检查的 4234 例，比较品管圈活动改善前后对比剂外渗的发生率。结果：品管圈活动后，非离子碘对比剂外渗发生率由 0.98%降低到 0.38%（ $P<0.05$ ）。改善后对比剂外渗发生率显著低于活动前，低于目标值 0.51%。结论：品管圈活动可有效降低放射科非离子碘对比剂外渗的发生率，为疾病诊断提供及时有效的检查结果，减轻了患者的痛苦，提高患者满意度，提升了团队凝聚力，值得借鉴。

PU-0540

综合护理干预在 CT 增强扫描患者中的应用效果

王利娟、李娅
空军军医大学西京医院

[摘要] 目的：探究在 CT 增强扫描患者护理当中，实施综合护理干预，对患者检查认知及生命体征的影响。方法：本院就诊 60 例 CT 增强扫描患者为样本，在 2021.07~2022.07 研究时间段内，分层随机化分组，对照组纳入 30 例人员，实施常规护理；实验组纳入 30 例人员，实施综合护理干预；统计对比：（1）检查认知评分；（2）临床指标。结果：综合护理干预开展后，实验组相较于对照组，研究指标均有明显优化（ $P<0.05$ ）。结论：在 CT 增强扫描患者护理当中，实施综合护理干预，可及时稳定患者生命体征，全面配合检查活动。同时，改善患者检查认知，护理效果理想，有推广应用积极性。

PU-0541

健康宣教在核磁共振增强检查中的护理探讨

邵慧

中国人民解放军总医院第一医学中心

目的: 探讨首次实施核磁共振增强检查患者的健康宣教要点,提高患者检查的依从性与护理满意度。
方法: 分析我院放射诊断科 2022 年 7 月到 2022 年 12 月期间首次实施核磁共振增强检查的 500 例患者的临床资料,总结核磁增强检查过程中患者出现较多的疑问和问题,探讨核磁共振增强检查患者健康宣教的注意事项。
结果: 首次实施核磁共振检查的患者较易出现恐惧、担忧、紧张情绪,少数患者不能听从检查人员安排,增加照射时间或检查失败;针对上述患者检查过程中存在的问题,探讨相应的护理对策。
结论: 核磁共振检查时间比较长、噪声程度较大,而且仪器内空间相对密闭、暗淡且狭长,视野会受到一定限制,检查前的健康宣教可有效改善其心理状态,缩短检查操作时间,是患者检查的依从性与护理满意度提高,并有助于减少心率、血压异常的发生,值得进一步推广。

PU-0542

伤口一抹得用于钆对比剂外渗临床疗效观察

邵慧

中国人民解放军总医院第一医学中心

目的: 观察伤口一抹得用于钆对比剂外渗的临床疗效。
方法: 选择我院 2022 年 1 月-12 月期间行核磁共振增强检查高压团注过程中,出现钆对比剂外渗的病人 38 例,随机分为观察组和对照组,每组 19 例。对照组给予 50%硫酸镁湿敷肿胀部位,观察组给予伤口一抹得涂擦肿胀部位,对两组病人的干预效果进行比较。
结果: 干预后 24h-72h 观察组外渗部肿胀消退程度、疼痛评分、换药次数与对照组比较,差异有统计学意义($P<0.05$)。
结论: 涂擦伤口一抹得可有效缩短钆对比剂外渗肿胀时间,减轻疼痛,减少换药次数,疗效显著。

虚拟现实联合冥想放松指导语在幽闭恐惧症病人磁共振检查中的应用

王霞

重庆西区医院

【摘要】目的: 虚拟现实联合冥想放松指导语改善幽闭恐惧症患者在行磁共振检查时改善心理状态,从而顺利完成检查的应用。
方法: 选取 2021.11-2022.06 在重庆西区医院放射科行 MR 扫描的患者 57 例作为对照组,选取 2022.07-2023.07 在重庆西区医院放射科行 MR 扫描的患者 57 例作为干预组。对照组采用传统护理模式,干预组在对照组的基础上采用虚拟现实联合冥想放松指导语的新型护理模式,比较两组患者的 MR 检查完成时间及患者检查依从性、图像质量、情绪状态评分(POMS)和负性情绪评分(HAMA/HAMD)、不良反应发生率以及患者满意度。
结果: 干预组 MR 检查完成时间及患者检查依从性、图像质量明显高于对照组,差异有统计学意义($P<0.05$),护理前,两组 POMS、HAMA/HAMD 评分进行比较,不存在统计学意义;干预组护理后 POMS、HAMA/HAMD 评分显著低于对照组,差异有统计学意义($P<0.05$),干预组护理满意度显著高于对照组,差异有统计学意义($P<0.05$)。
结论: 对磁共振检查中存在幽闭恐惧症的患者实施虚拟现实技

术联合冥想指导语放松帮助患者缓解了恐惧情绪, 缩短检查时间, 减轻了因幽闭恐惧症带来的应激反应, 不仅让患者配合检查, 还获得了优质的图像, 总体效果较好, 值得推广应用。

18 种药物治疗造影剂外渗有效率的网状 meta 分析

王芳

西安市人民医院 (西安市第四医院)

目的 使用网状 meta 分析方法, 对 18 种药物治疗造影剂外渗的有效率进行比较。方法 计算机检索 Cochrane Library、PubMed、Web of Science、Embase、知网、万方、维普、CBM 中关于造影剂外渗治疗的相关文献, 检索期限为建库至 2023 年 1 月 13 日。检索词为“诊断与治疗物质外渗”“造影剂”“对比剂”“碘剂”“治疗”“疗法”“使用”“应用”“随机对照”“随机”“Extravasation of Diagnostic and Therapeutic Materials”“Extravasation of Diagnostic, Therapeutic Materials”“Extravasation of Contrast Media”“Extravasation of Contrast Media”“Therapeutics”“Therapy”“Treatment”“RCT”。使用 Stata 17.0 软件进行数据分析。结果 最终纳入文献 29 篇, 涉及 18 种药物, 样本总量 1923 例, 其中干预组 986 例, 对照组 937 例。共纳入 18 种药物, 一致性模型进行网状 Meta 分析显示, 共形成 153 个两两比较, 其中利多卡因、喜疗妥软膏、马铃薯、金黄散、乙醇、地塞米松、德莫林、青敷膏、蜂蜜、红花酊等药物与硫酸镁比较差异有统计学意义 ($P < 0.05$), 德莫林与利多卡因、喜疗妥软膏、马铃薯、金黄散、地塞米松、复方七叶皂苷凝胶、芦荟、黄连膏、乌敛莓、磺胺嘧啶银、红花酊比较, 差异有统计学差异 ($P < 0.05$), 其余比较差异无统计学意义 ($P > 0.05$)。根据排序累计面积图, 排名前三的药物分别是德莫林、中药青敷膏、天然蜂蜜。结论 推荐使用德莫林、中药青敷膏、天然蜂蜜治疗造影剂外渗。

PU-0545

乳腺磁共振增强检查患者焦虑情绪分析及护理对策

曲婷婷

辽宁省肿瘤医院

目的 研究乳腺磁共振增强检查患者焦虑情绪的原因及相应护理对策。方法 选择 2022 年 9 月至 2022 年 11 月在我院接受乳腺磁共振增强检查患者中的 100 例。随机分为对照组和观察组, 每组 50 人。观察组根据焦虑量表中 3 项突出因素给与个性化心理护理, 对照组给与一般护理。结果 观察组总满意度高于对照组 ($P < 0.05$)。结论 个性化心理护理能够显著缓解患者焦虑情绪, 提高乳腺磁共振增强检查患者的耐受性, 提高护理服务质量。

PU-0546

影像科护士采用全面宣教在 CT 增强检查中的应用效果

吴长迎、杨洁、王文燕、姚灵、段庆红

贵州医科大学附属肿瘤医院

目的 探讨影像科护士采用全面宣教在 CT 增强检查中的应用效果。方法 将 150 例行 CT 增强检查的中年男性患者, 年龄 35-40 岁, 随机分为对照组(75 例)和观察组(75 例), 两组患者性别、年龄、检查部位、推注速度、对比剂剂量均无统计学差异, 具有可比性。对照组行常规宣教后行静脉留置

针穿刺、水化,随即进行检查。观察组需护士在患者进行静脉留置针穿刺前、中、后全面宣教,水化后再行检查。比较两组患者的静脉留置针一次性穿刺成功率、一次性 CT 增强扫描成功率、造影剂外渗发生率。结果 观察组患者静脉留置针一次性穿刺成功率、一次性 CT 增强扫描成功率均高于对照组($P<0.05$),造影剂外渗发生率显著低于对照组($P<0.05$)。结论 在 CT 增强检查中,影像科护士采用全面宣教,改善患者对护理服务的满意度和对健康宣教内容的掌握程度,可以显著提高静脉留置针一次性穿刺成功率和一次性 CT 增强扫描成功率,并且降低造影剂外渗发生率,保障了患者安全,减轻了患者痛苦,提高了诊疗质量,值得临床推广。

PU-0547

浅析放疗患者的皮肤护理

李雪

辽宁省肿瘤医院

浅析放疗患者的皮肤护理

【摘

要】肿瘤放射治疗是利用放射线如放射性同位素产生的 α 、 β 、 γ 射线和各类 x 射线治疗机或加速器产生的 x 射线、电子线、质子束及其它粒子束等治疗恶性肿瘤的一种方法。由于放疗辅助工具的改进和经验的积累,治疗效果得到显著提高,目前已成为癌症治疗中的最重要手段之一。中国约有 70% 以上的癌症需用放射治疗◇美国统计也有 50% 以上的癌症需用放射治疗。放射治疗在肿瘤治疗中的作用和地位日益突出。放射治疗已成为治疗恶性肿瘤的主要手段之一。因其而引起的各种放射反应也日益受到医护人员的。

PU-0548

生理盐水联合碘造影剂预热在增强 CT 检查中的护理应用

李青兆

辽宁省肿瘤医院

目的: 2018 年随着增强 CT 检查人数的不断增加,发生碘造影剂的不良反应逐渐增多,为降低碘造影剂的不良反应,分别在 2019 年对碘造影剂全部进行恒温箱预热,大幅度降低了增强 CT 病人检查的各种不良反应,为进一步降低碘造影剂的不良反应,在 2022 年碘造影剂恒温箱预热的基础上对增强 CT 检查的生理盐水全部进行预热,又进一步降低了碘造影剂的不良反应。方法: 2018 年之前,增强 CT 检查病人的碘造影剂加热,是由高压注射器的加热系统在给药的过程中直接加热,但 2018 年之后,随着肿瘤病人的不断增多和住院床位的增加,增强 CT 检查的病人迅速增多,不良反应病人也不断增加。不断查找原因,改变造影剂依靠高压注射器系统的预热方式,2019 年开始对碘造影剂全部由恒温箱预热 37 度,碘造影剂不良反应迅速下降,在此工作的基础上,2022 年将增强 CT 检查的生理盐水全部预热,碘造影剂全部预热,又进一步降低了碘造影剂的不良反应。结果: 2018 年 12 月 1 日-2018 年 12 月 31 日碘造影剂和生理盐水未进行恒温箱加热,增强 CT 检查总人数 2300 人,碘造影剂不良反应发生 46 人(2%),其中死亡 3 人。2019 年 12 月 1 日-2019 年 12 月 31 日对碘造影剂全部进行恒温箱加热到 37 度,增强 CT 检查总数 2300 人,碘造影剂不良反应发生 11 人(0.48%),无死亡。2022 年 12 月 1 日-2022 年 12 月 31 日对生理盐水全部进行恒温箱加热到 37 度,对碘造影剂全部进行恒温箱加热到 37 度,增强 CT 检查总数 2300 人,碘造影剂不良反应发生 2 人(0.087%),无死亡。结论: 在碘造影剂加温的基础上,对生理盐水也进行恒温箱预热,大幅度降低了增强 T 病人检查的各种不良反应。

基于根因分析法的持续质量改善在提高胸部 CT 检查一次成功率中的应用

刘文燕、王小琳

重庆医科大学附属第二医院

目的:探讨基于根因分析法的持续质量改善在提高胸部 CT 检查一次成功率中的应用效果。方法:通过根因分析法,分析导致胸部 CT 扫描不能一次成功的原因,制定持续质量改善方案,并于 2022 年 6 月开始实施。选取 2021 年 12 月至 2022 年 5 月某三甲医院的 43658 例行胸部 CT 平扫检查患者为对照组,选取 2022 年 6 月至 2022 年 12 月某三甲医院的 47533 例行胸部 CT 平扫检查患者为观察组。比较两组患者的重复扫描次数与候检时间。结果:观察组患者胸部 CT 检查的一次成功率为 97.05%,明显高于对照组的 91.79%,差异均有统计学意义($P<0.05$);观察组患者的候检时间为 $21.11\pm 6.09\text{min}$,明显低于对照组的 $38.15\pm 8.52\text{min}$,差异有统计学意义($P<0.05$)。结论:基于根因分析法制定持续质量改善方案,并应用于胸部 CT 检查中,不仅提高了胸部 CT 检查的一次成功率,优化了检查秩序,同时缩短了患者的候检时间,就医体验得到明显改善。

PU-0551

放射科发生护患纠纷的成因分析

金添

辽宁省肿瘤医院

1 护士和患者、家属的接触机会是最多的。伴随着患者、家属法制观念与自我保护意识观念的增强,只要在检查或治疗的过程中有不顺意的地方,或护士的言语、行为稍不慎重,就非常有可能发生纠纷。此时,患者和家属会把对社会的不满情绪;对医生的整体诊断、治疗方面的期望值与现实间存在的差距;治疗费用昂贵等诸多的怨气表现出来,也就完全体现在与放射科护士发生纠纷的身上了。

2 工作环境因素由于放射科所在的工作环境相对于病房较差,比普通病房具有更多的嘈杂声,如患者的声、等候患者的交谈声、手机铃声、询问事宜声、机器的运转声、频繁的流动人员等。本来患者因病情就心情急躁,在这些噪声中,更容易引起患者的心情烦躁、护患之间的矛盾和冲突增多。

3 候诊排队时间长由于放射科的病人来自不同的科室,人员较多,候诊排队的时间较长,这也是引发护患纠纷的重要因素之一。患者因候诊排队时而心理烦躁。另外,出于患者因受长期的病痛折磨,他们实际心理的候诊时间延长,这种因素也非常可能导致患者加重不满的情绪,从而引起护患的纠纷

4 放射科 CT 检查中的患者其中以老年人和重症患者居多,这类患者因反复住院、出院,性格上比较急躁:尤其是增强 CT 要求被禁食,所以患者及其家属都希望能够得到最快的服务,而由于放射科的护士需要常常顾全诸多的患者,使患者和家属产生不满的情绪而导致误会的发生

5 护士综合素质,当代的护士呈年轻化趋势,心理素质和处理应急事件上不成熟,且与患者和家属的沟通在技巧较差,尤其是对于不同患病者,更是缺乏超强的协调能力,处理事情时简单化,从而引起了患者和家属的不满情绪。护理的工作量加大,而护士人员的不足和高负荷的工作量使护士对患者提出的不同问题得不到及时的解答。

6 媒体舆论导向,它的宣传舆论直接引导百姓的情绪。但由于媒体对医疗工作的特殊性了解不深,如果在没有深入调查的基础上只听患者的一面之词而妄加报道,会使医院的形象受到严重的损害,在形成负面的影响。

PU-0552

急性造影剂过敏护理

陶晓晶

甘肃中医药大学附属医院

摘要: 急性碘造影剂过敏是一种常见的过敏反应,可能导致严重的不良反应和并发症。

本文旨在探讨急性碘造影剂过敏的护理措施,以便提供给医护人员参考和指导。通过了解患者的过敏史、预防性药物治疗和监测患者症状,可以有效减少过敏反应的发生。对于发生严重过敏反应的患者,应立即停止注射碘造影剂,并进行紧急抢救。

实验过程: 急性碘造影剂过敏的护理过程可以分为以下几个步骤:

了解患者的过敏史: 在使用碘造影剂前,医护人员应仔细询问患者是否有过敏史,特别是对碘过敏的情况。如果患者有过敏史,应采取相应的预防措施。医护人员应记录患者的过敏史,并与团队成员共享这些信息。

预防性药物治疗: 对于有碘过敏史的患者,可以在使用碘造影剂前给予抗过敏药物,如抗组胺药物或皮质类固醇,以减轻过敏反应的发生。具体的药物选择和剂量应根据患者的具体情况和医生的建议来确定。

监测患者症状: 在注射碘造影剂后,医护人员应密切观察患者的症状,包括呼吸困难、皮肤发红、恶心、呕吐等。如出现异常症状,应立即采取相应的护理措施。护理人员应随时与患者沟通,询问他们的感觉和不适症状,并记录这些信息。

及时处理过敏反应: 如果患者发生严重过敏反应,如过敏性休克,应立即停止注射碘造影剂,并立即开始抢救措施,如气管插管、给予肾上腺素等。医护人员应熟悉急救流程,并与团队成员密切合作,以确保患者得到及时的救治。

结论: 急性碘造影剂过敏是一种严重的医疗事件,需要医护人员密切关注和及时处理。通过了解患者的过敏史、预防性药物治疗和监测患者症状,可以有效减少过敏反应的发生。对于发生严重过敏反应的患者,应立即停止注射碘造影剂,并进行紧急抢救。在护理过程中,医护人员应保持冷静、果断,并与团队成员密切合作,以确保患者的安全。护理人员应定期接受相关培训,并不断更新自己的知识和技能,以提高对急性碘造影剂过敏的护理水平。

PU-0553

“新”型流程护理技术在介入护理工作中的应用

毛清雯

重庆医科大学附属第三医院

近几年我院介入手术治疗方面取得了不错的治疗效果,目前我院已开展心血管内科、神经内科、神经外科、消化内科、肝胆胰外科、肿瘤科等学科的介入治疗。介入手术室护士也从当初由放射科护士、病房专科护士兼任,到现在独立的专科护士。目的是能够具有与之匹配的护理能力,为患者提供安全、完善的医护照顾。因此对介入手术室护士发出了挑战。

“新”型流程护理是以患者为中心的精细、精诚、人文关怀护理技术工作。“新”的护理技术模式必须要依托相应护理管理,传统的以任务或制度为中心的刚性护理管理模式已经不适应患者病情发展变化的特点和护士心理行为规律,取而代之的以人为本柔性护理、弹性护理、人文关怀护理、贴心护理的“新”型护理技术模式,而不是一个护士多元化的护理模式,以介入治疗患者为整体的护理发展趋势实行环环相扣、节节相连,使患者切实感受到“新”型护理技术带来的益处。重点突出体现亲情、友情、温情、同情、深情,五情护理模式在介入治疗患者中的运用。

1、让介入治疗患者感受此护理技术工作设计的合理化、人性化、内部设施和环境设计简单化。

2、高效的治疗方法离不开有效的护理技术,“新”型流程护理通过手术前、手术中、手术后护理技术的提高,秉承以患者为中心的原则,一切为了患者,以患者为中心,竭尽所能满足患者合理需求。主动与患者交流使其改善消极、焦虑情绪,保持乐观情绪有助于提高治疗效果。

3、护士实施护理技术中重点把握几个要点:

①术前物品准备充分,物品摆放到位,按照顺序进行排列,使用起来得心应手;

②在为患者介入治疗过程中护士需多询问患者感受,主动为病人提供心理支持;

③多用言语沟通和交流,让患者感到关心、体贴,达到患者满意的护理;

④介入手术结束后患者离开机床时,达到慢、轻、稳、柔韧、呵护,让患者感觉到人文护理;

⑤观察患者生命体征及是否有对比剂迟发过敏反应。

PU-0554

1 例罕见 CT 引导下经皮肺穿刺活检并发空气栓塞护理报告: 护理干预将如何降低并发症发生率

庄丽娜、杜晓琳、初建国

大连医科大学附属第一医院

目的: CT 引导下经皮肺穿刺活检术是临床重要的诊断方法之一,本文针对 1 例罕见 CT 引导下经皮肺穿刺活检并发空气栓塞患者为切入点,探究通过制定有效的护理干预减少术后并发症为患者带来的不良影响。方法: 查阅国内外文献、综述、病例报告近年来有关肺穿刺活检术并发症的研究,分析造成并发症的原因及应对措施。分别以“肺穿刺活检”及“Percutaneous Puncture Biopsy”为检索词检索 PubMed、Web of Science 及 CNKI、万方等数据库中的相关文献,中文检索 2016 年 1 月至 2022 年 5 月发表的相关文献,英文检索近 5 年发表的相关文献。最终纳入文献 42 篇,其中中文文献 18 篇,英文文献 24 篇。结果: 肺穿刺活检术并发症的危险因素有患者因素(年龄、性别、是否咳嗽、是否有其他肺部疾病);病灶因素(病灶的位置、大小、深度、性质);穿刺术中的护理配合(穿刺体位、选择穿刺材料、取样次数、手术时间);及穿刺材料的选择都至关重要。结论: 根据并发症的高危因素做好风险评估及围手术期的护理,对患者实施个性化的护理措施对降低并发症发生率具有正面作用,值得推广。

PU-0555

结构化信息护理在降低幽闭恐惧症患者磁共振检查中焦虑情绪的 临床研究

杜晓琳、庄丽娜、宋清伟
大连医科大学附属第一医院

目的: 评估磁共振成像中幽闭恐惧症受检者的焦虑情绪, 并观察与传统方法相比, 结构化信息护理干预是否能减少焦虑。方法: 收集 2021 年 12 月至 2022 年 12 月, 首次在大连医科大学附属第一医院放射科接受脑部磁共振成像的幽闭恐惧症受检者 280 名为研究对象, 分为两组, 对照组按照常规检查流程进行 MRI 检查, 干预组在检查前进行结构化访谈, 采用 Colaizzi 7 步分析法进行资料分析、归纳及主题提取, 采用带有图片、录音和视频的结构化信息干预。测量两组受检者检查前后的 SAS 焦虑量表测量。使用 SPSS 24 分析数据。结果: 在 280 名受试者中, 对照组 140 人 (50%) 男性 65 人 (46.4%), 女性 75 人 (53.6%), 平均年龄 41.1 ± 15.2 岁。干预组 140 人 (50%) 男性 78 名 (55.7%), 女性 62 名 (44.3%), 平均年龄 44.2 ± 13.9 岁, 检查前对照组焦虑评分为 11.3 ± 7.7 , 而干预组为 9.6 ± 7.7 。检查后对照组焦虑评分为 9.8 ± 9.0 , 干预组焦虑评分为 1.49 ± 4.5 ($p < 0.001$)。结论: 结构化信息护理干预旨在使患者熟悉磁共振抑制机制并缓解患者的焦虑, 是一种经济有效且简单的方法, 随着磁共振检查需求的增强, 放射护士要重视其心理体验及需求, 并实施个体化护理, 降低幽闭恐惧症风险。

增强 CT 检查患者碘对比剂外渗原因分析及护理措施

曲婷婷、李青兆
辽宁省肿瘤医院

目的 对 CT 增强患者高压注射碘对比剂渗漏的原因进行分析, 探讨预防和减少碘对比剂外渗的护理对策。方法 选择 2023 年 1 月-2023 年 8 月在我院进行 CT 增强检查发生对比剂外渗的 10 例患者作为观察对象, 对外渗原因进行分析, 实施相应的预防及护理措施。结果 注射静脉条件、高压注射器速率、患者身体状况、护理人员注射技术等是导致高压注射碘对比剂外渗的主要原因。结论 针对原因进行分析, 实施相应护理措施以降低碘对比剂外渗发生率, 减轻患者痛苦, 确保增强 CT 检查顺利进行。

造影那“碘”事 一例重度碘对比剂及血管外渗案例分析

唐杏萍
中山大学孙逸仙纪念医院

探讨降低 CT 增强碘对比剂血管外渗的发生, 通过我院一例重度碘对比剂血管外渗的案例学习, 运用最新指南指导实施有效护理干预降低 CT 增强碘对比剂发生率和外渗程度, 保障患者安全, 提高护理服务质量, 值得临床推广应用。

PU-0558

1 例 TIPS 双静脉癌栓开通手术的护理

蔡莉

中国人民解放军陆军特色医学中心

总结 1 例 TIPS 双静脉癌栓开通手术的护理经验，现将案例及护理方案分享如下：案例呈现：患者男性，63 岁，因胰腺肿瘤癌细胞侵犯造成两条静脉堵塞，引发大量呕血，入院后病情危重，入住监护室，因外院长达半年反复治疗效果不佳，患者及其家属对目前的病情处于濒临绝望的状态，经过专家反复讨论，决定采用双静脉通路的手术方式，一次性进行 TIPS 成形术、胃冠状静脉断流术，脾静脉开通术，才能彻底解决患者反复出血的情况。

原因分析：（1）手术难度较大，风险较高。（2）该手术为本市首例，欠缺一定的经验指导，对医护配合能力和应急处置能力提出了更高的要求。（3）患者生命垂危，生命体征不稳定，术中随时可能发生病情变化。（4）三项治疗一次性进行，手术耗时较长，患者身体状态、耐受力较差，配合能力欠佳。（5）患者对本次手术技术和方法认识不够，担心手术失败，患者出现焦虑、恐惧心理，导致手术风险加大。

做法分享：（1）术前准备：由于术中有随时再发出血风险和出血并发症，随时做好输血准备，术前需提前了解患者的凝血机制，查看有无交叉配血结果，与输血科电话沟通备血情况，确保紧急输血时能够开通输血绿色通道，加快输血速度，并提前准备好各类急救药品和物品。（2）提高体位舒适性：因患者很瘦，在患者易受压的部位或骨隆突处安置软垫预防压力性损伤的发生。（3）加强心理护理：为了缓解和消除患者的紧张心理，提高手术配合能力，制定了适合该患者文化程度的个体化的心理干预，促使患者正确理解手术的原理，建立手术信心。（4）疼痛护理：为了分散患者疼痛专注力，降低疼痛阈值，采取适当肢体抚触支持，加强沟通交流，引导其想象美好的生活景象，减轻了其痛苦体验。（5）动态观察：密切关注患者一般情况、周围循环及出血情况，认真听取患者主诉。（6）做好交接：密切监控生命体征及有无活动性出血情况。

PU-0559

细节管理融入介入手术室护理管理中的效果

何金余

中国医科大学附属盛京医院

[摘要] 目的 分析讨论细节管理融入介入手术室护理管理中的效果。方法 随机将 2022 年 9 月—2023 年 2 月期间 350 例在介入手术室进行手术的患者纳入到讨论中，此期间将细节管理融入到介入手术室中，实施前后调查手术收费准确率、耗材缺失等。结果实施前风险事件发生率 28.57%高于实施后 2.86%，实施前合格率 76.00%低于实施后 98.00%（ $P<0.05$ ）。实施后医务人员安全意识、错误防范意识、服务意识评分均高于对照组（ $P<0.05$ ）。实施前护理满意度 54.55%低于实施后 86.36%（ $P<0.05$ ）。结论将细节管理融入到医院消毒供应室护理管理中，可提升满意度、护理质量。

PU-0560

一种优化护理干预在幽闭恐惧症患者行磁共振检查的应用

吴依熙

中国人民解放军陆军特色医学中心

目的 探讨以动画健康宣教、适应性训练、心理支持为主要特点的护理干预方式在幽闭恐惧症患者行磁共振检查的价值。

方法 回顾性分析 2021 年 2 月至 2023 年 1 月 MRI 检查时出现幽闭恐惧症的患者 46 例。其中 22 例采用常规护理干预（对照组），24 例采用优化护理干预（观察组），高年资诊断医师对所有图像进行质量主观评价，并对患者满意度进行调查。常规护理：检查前人工健康宣教，检查基本流程告知等。优化护理：①扫描二维码获取检查注意事项、流程及动画过程的健康宣教方式，并可反复观看、训练；②患者平躺在模拟检查床，播放提前录制的检查时磁体间声音，给与患者适应性训练，并以深呼吸/正常呼气为训练要点，帮助其建立良好的呼吸循环，监测患者心率，必要时给予吸氧。③心理支持：采用社会支持系统（家属、护士及医生等），告知其可以安排家属陪同（触摸肢体、言语交流等方式）、播放音乐等，以期转移患者注意力，增强安全感。采用卡方检验比较两组患者的检查成功率、图像伪影发生率、图像质量评分及满意度评分差异。

结果 观察组检查成功率、满意度评分、图像质量评分均高于对照组（ $p<0.05$ ），而图像伪影发生率更低（ $p<0.05$ ）。

结论 以动画健康宣教、适应性训练、心理支持为主要特点的优化护理干预方式能够提高幽闭恐惧症患者磁共振检查的成功率和图像质量，并得到相应群体的认可，值得推广应用。

PU-0561

浅谈核医学科护士的职业性有害因素及防护措施

蓝彩云

中国人民解放军联勤保障部队第九〇九医院

目的：探讨核医学科护士的职业性有害因素以及防护措施。**方法**：通过在核医学科从事护理工作，以及亲身体验，找出危害护士健康的因素，并得出有效的防护措施，从而为护士的健康保驾护航。

结果：通过全面分析影响护士健康的职业性有害因素，从而找到有效防护措施，使护士拥有健康的体魄以投入到患者的护理工作中。**结论**：职业性有害因素对护士的健康有潜在的危险，会对护士的健康和工作产生不利影响。因此，护士应当对此引起高度重视。

PU-0562

**1 例肾衰竭+重型新型冠状病毒感染伴自发性腹壁动脉破裂出血
患者介入栓塞经验分享**

陈廷静

中国人民解放军陆军特色医学中心

基本信息：患者李 X，男性、57 岁；主诉：发热、咳嗽、踹累 5 天。

既往史：高血压 15 年；慢性肾功能不全、肾衰竭 6 年、长期血液透析治疗；甲状腺癌。

入院评估：患者 2023-5-8 入院，精神较差，体力较差，活动后喘累，咳嗽痰中带血，尿少，胸部 CT：双肺多发斑片影及磨玻璃影，考虑感染性病变。

病情发展：2023-5-12 患者喘累加重，肺部病灶进一步进展，反复咯血，病情危重入 ICU 监护治疗，间断俯卧位改善通气及对症支持治疗。2023-5-14 诉腹部不适，腹部扪及一质软包块，行床旁超声检查，考虑患者长期慢性肾衰，高血压微血管硬化导致腹壁小动脉破裂出血，患者基础疾病多病情复杂肺功能极差，不考虑外科手术，急诊行介入栓塞止血。

治疗过程：急诊在 DSA 下行左右侧胸廓内动脉造影，见左侧胸廓内动脉下行支—上腹壁动脉支少许造影剂外溢，考虑出血动脉。明确供血后以 PVA 栓塞颗粒+明胶海绵颗粒进行栓塞，DSA 显示出血动脉栓塞良好。手术顺利，安全返回 ICU。

病例分享：（1）肾衰竭患者介入对比剂管理（继续以 CRRT 治疗；控制对比剂用量等）。（2）重型新型冠状病毒感染伴咯血呼吸道管理？（呼吸道管理防止误吸；备好急救器材）。（3）出血的风险？（患者基础疾病复杂；血管条件差；感染新型冠状病毒后血管内皮损伤较重）。（4）特殊介入急危重症患者护理问题？（恐惧：与生命健康受到威胁有关；知识的缺乏：缺乏手术及愈后相关知识；活动无耐力：与疾病有关；潜在并发症：肾功能损伤，其他部位出血等）。

结果：针对基础疾病多、病情危重的介入手术患者，充分评估患者的病情、做好急诊急救流程，形成相应的护理措施及临床护理路径与规范；是保证急危重症患者手术的安全的重要措施。

PU-0563

电热恒温培养箱对造影剂过敏发生率的影响

尤艳

中国人民解放军总医院第一医学中心

目的：探讨电热恒温箱在增强 CT 检查过程中对造影剂过敏发生率的影响。方法：我科 2000 例增强 CT 患者分为两组，实验组患者使用的造影剂为电热恒温箱加热后 37℃ 恒温的造影剂，对照组为常温注射（18℃ 到 28℃），比较两组过敏反应发生率。结果：实验组 1000 例中发生过敏反应 3 例，占 0.3%；对照组 1000 例中发生过敏反应 9 例，占 0.9%，实验组过敏发生率显著低于对照组（ $P < 0.01$ ）。结论：使用电热恒温培养箱可降低过敏反应发生率。

PU-0564

1 例主动脉瓣重度狭窄患者行 ECMO 支持下的 TAVR 术中护理

陈廷静

中国人民解放军陆军特色医学中心

基本信息，62 岁，因“胸闷、气促 1+月，加重伴喘累 2+天”入院。

既往史：1、高血压 2、高尿酸血症 3、慢性肾功能不全。

现病史：1、左心衰 2、二尖瓣、三尖瓣重度返流，肺动脉高压 3、主动脉瓣狭窄（重度）4、心包积液 5、肝肾功能异常。

入院评估：CT 检查：胸腔积液；腹腔积液；心包积液。

心脏彩超：射血分数 EF34%；二尖瓣、三尖瓣重度返流；主动脉瓣狭窄重度。

肝功能：总胆红素 45.2umol/L、L-r-谷氨酰基转移酶 157.4U/L、乳酸脱氢酶 420.5U/L、白蛋白 38.2g/L

肾功能: 尿素 13.07mmol/L、肌酐 132.1umol/L、尿酸 541.6umol/L、肾小球滤过率 62.43ml/min。患者及家属有行主动脉瓣置换术意愿, 但该患者合并多心脏瓣膜疾病、心功能极差+肝肾功能不全+多浆膜腔积液 (TAVR 手术仍有风险), 经多学科专家团队讨论决定在 ECMO 支持下行 TAVR。

治疗过程:在多学科密切合作、医护 20 余人的齐心协第五天能正常行走力、手术时长历时 8 小时顺利完成, 术后患者转入 ICU, 第二天床旁撤除 ECMO, 三天后转入普通病房, 出院时肝肾功能恢复正常。

护理策略: (1) 安全管理 (设备定位; 人员定位; 设定安全范围; 患者安全; 防护安全; 用药安全等)。 (2) 介入术中 EMCO 的护理重点 (容量控制; 温度控制; 抗凝监测; 掌握 EMCO 特点及护理要点; 术中动态观察肢体循环; 心衰的护理; 防止急性肾损伤)。 (3) TAVR 术中护理 (耗材准备; 临时起搏器运用; 通道建立; 急救物品) (4) 转运配合 (合理分工: 专人负责氧源; 专人负责电源; 专人负责管路; 专人负责监护)。

结果: 通过手术配合制定介入护士在手术配合中的流程、临床路径, 学习 ECMO 的专项护理干预措施; 规范介入复合手术团队的建设、环境物品布置; 规范手术流程、分工、及重点工作。

PU-0565

检查环境准备及护理干预在幽闭恐惧症患者磁共振检查中的影响分析

尤艳

中国人民解放军总医院第一医学中心

【摘要】目的 探讨护理干预及环境准备对幽闭恐惧症患者在磁共振检查中的影响, 主旨在于能使患者消除心理障碍, 使检查顺利进行。方法 选取 2019 年 10 月~2022 年 10 月期间在我科进行磁共振检查的幽闭恐惧症患者。将 60 例幽闭恐惧症患者随机分为对照组和实验组, 每组 30 人。对照组进行常规准备及护理, 实验组中在常规护理的基础上加强检查环境准备及护理干预。比较两组患者的心理状态和磁共振检查成功率。结果 实验组患者心理承受能力明显高于对照组, 全部顺利完成检查。结论 为幽闭恐惧症患者提供环境准备及护理干预, 能够显著改善患者检查期间的焦虑恐惧程度, 值得推广应用。

PU-0566

躺抱式母爱抚触行为对患儿磁共振检查的影响分析

刘瑞瑞、钱一帆、刘格格、冯敏、李倩倩、李笑石、马永利

西安大兴医院

目的: 对比分析结合不同镇定安抚方法, 对患儿行磁共振检查效果的影响。方法 选取我院住院部儿科需行磁共振颅脑或垂体检查患儿 81 例作为观察对象, 随机分 A 组、B 组、C 组, 每组 27 例。

A 组采用母亲趟抱式母爱安抚行为使患儿安静配合进行 MRI 检查; B 组采用临床药物镇定后家属机房陪同护理进行 MRI 检查; C 组采用常规家属机房陪同护理进行 MRI 检查。统计并比较三组患儿检查配合率、患儿及家属的满意度、磁共振图像质量、焦虑自评量表 (SAS)。

结果 A 组患儿及家属的满意度、检查的配合率均大于 B 组、C 组, 差异有统计学意义 ($p < 0.05$); A 组图像质量优于 B 组、C 组, 差异有统计学意义 ($p < 0.05$); 三组患儿检查后 SAS 量表评分中, A 组评分显著高于 B、C 两组 ($p < 0.05$)。

结论: 患儿行磁共振检查实施母亲躺抱式母爱行为可提高患儿的信任度、安全感, 减少患儿的恐惧、焦虑情绪降低, 保证患儿磁共振检查的成功率, 且能提高患儿及家属的满意度, 值得临床推广应用。

PU-0567

基于线性回归和 python 法讨论核医学科 131I 治疗病房被服衰变间的面积

张翰笙¹、施冰梓²、王鸿伟¹、王蒙婷¹、杨素云³

1. 山西医科大学

2. 哈尔滨医科大学

3. 山西医科大学第一医院

【摘要】目的 分析行 131I 治疗患者使用过的被服的辐射剂量率和表面污染水平随时间的变化规律,并编写 python 代码讨论不同床位数规模下核医学科 131I 治疗病房所需的被服衰变间的最小面积以及储物架摆放方式。方法 选取山西省太原市某三级甲等医院 2023 年 2-4 月核医学科收治的分化型甲状腺癌术后行 131I 治疗患者使用过的被服 50 例,在每天同一时间由专人分别测量被服辐射剂量率和表面污染水平,采用线性回归模型分析衰变规律。归纳总结问题并编写 python,根据需求自定义储物架数目、储物架长、宽、被服衰变间的过道宽等参数,得出该参数下所需最小空间面积和最优排列组合方式。结果 被服辐射剂量率衰变指数和表面污染水平衰变指数分别为 0.1576 ± 0.04935 和 0.1265 ± 0.0465 (均符合正态分布),131I 治疗患者使用过的被服的辐射剂量率与表面污染水平较时间呈递减趋势,131I 治疗患者使用过的被服衰变存放至清洁解控水平(辐射剂量率 $< 2.5 \mu\text{Sv/hr}$ 且 β 表面污染水平 $< 0.8 \text{Bq/cm}^2$)所需的时间为 9.3774 ± 3.8711 和 9.4279 ± 3.8764 天,以该研究所在核医学科 131I 治疗病房的床位数 10 为例,代入相关参数至 python 得到至少需要面积为 3m^2 的被服衰变间来满足科室需求。结论 131I 治疗患者使用过的被服辐射剂量率与表面污染水平与时间成负相关趋势,在临床实际工作中,通过运行 python 并自定义相关参数可以给予被服衰变间面积规划的参考,为临床工作中被服衰变不充分、衰变间空间不足等问题提供一定指导。

【关键词】核医学病房;清洁解控;衰变间;被服;python 法

1 例前列腺癌患者行放射性 Lu177 治疗的护理

陈战磊

河南省人民医院

核医学分子靶向诊断与治疗及一体化是当今研究的热点,也是今后核医学发展的重要方向。靶分子与相应分子探针,放射性药物高度特异性结合的优势,可为实现诊疗一体化创造条件。[1]前列腺癌的标志性生物标志物仍然是前列腺特异性膜抗原(PSMA),因为它在几乎所有的前列腺肿瘤上都有表达。此外,PSMA 表达增加与去势抵抗和进展到疾病的转移阶段有关。[2]因此前列腺肿瘤靶向治疗选择性良好,可抑制肿瘤细胞的生长,减少组织损伤,这也是常规化疗难以实现的目标。[3]总结我院 1 例前列腺癌患者行放射性 Lu177 治疗的护理。根据患者 Lu177 治疗前心理状态及 Lu177 治疗后可能出现的不良反应我们采取了心理健康教育、放射防护、不良反应应急措施。患者经过精心护理,病情好转,康复出院。

CTE 五彩定量水杯的设计与应用

毕燕方、曾小红、熊丹丹、曾红、杨艺、何晓华、刘佳驰
南昌大学第一附属医院

目的 设计一种 CT 肠道造影 (Computed Tomography Enterography) (以下简称 CTE) 五彩定量水杯, 并探讨其临床应用效果。**方法** CTE 五彩定量水杯由透明饮水杯体、健康宣教视频二维码、文字版注意事项、软质吸管、五彩渐变区、清晰刻度线及提手等组成。便利抽取 2022 年 5 月-7 月江西省某三级甲等医院医学影像科行 CTE 检查的 83 例患者作为实验组, 选取 2021 年 5 月-7 月检查的 83 例患者作为对照组。实验组采用自行设计的五彩定量水杯进行饮水, 对照组采用传统普通水杯进行饮水。比较两组患者配合完成率、肠道充盈率、患者满意率。收集护士使用该五彩定量水杯的满意率。结果 两组比较, 试验组患者配合完成率、肠道充盈率及患者满意率均高于对照组, 差异具有统计学意义 ($P<0.05$)。护士满意率为 98.2%。**结论** 本研究中设计的 CTE 五彩定量水杯便携易用, 外型美观, 刻度精准, 患者配合完成率高, 可提高肠道充盈率, 优化 CTE 图像质量, 提高患者满意度。

静脉输液安全管理现状的探讨

童岚
吉林大学第一医院

院静脉输液是临床治疗中最常见的给药方式, 但也是最容易给患者带来伤害, 发生纠纷的治疗方法。随着静脉输液技术的不断发展, 如何安全有效地进行静脉输液被越来越广泛的关注。本文就静脉输液中不安全因素产生的原因和管理方法进行综述, 旨在提高静脉输液的安全性和护理人员的护理质量, 提升患者满意度, 减少护患纠纷。

关键词 院静脉输液; 安全管理; 护患纠纷

静脉输液以其起效迅速、生物利用率高等优势在临床治疗中被广泛应用。据统计, 90%以上的住院患者在医院接受过输液治疗, 门诊患者接受静脉输液的量也较大。但它也最容易给患者带来伤害, 发生纠纷的一种治疗方法。Harris 等人指出 7%的住院患者每年因用药疏忽而受到不同程度的伤害; 姚明莺等人也指出静脉输液问题在患者的投诉中占 28.28%。静脉输液安全管理问题被越来越多的关注, 成为一个亟待解决的问题。

PU-0571

探究标准预防措施在放射科非隔离区新型冠状病毒肺炎疫情防控中的应用

胡婵娟
华中科技大学同济医学院附属协和医院

目的: 总结标准预防措施在我院放射科新型冠状病毒肺炎疫情防控中的应用方法及经验, 为国内医院放射科在新型冠状病毒肺炎疫情防控中提供参考。

方法: 通过分析我院放射科于 2020 年 1 月起在抗击新型冠状病毒肺炎疫情中采用标准预防措施, 观察其对防控新型冠状病毒肺炎医务人员发生感染的效果。

结果: 手卫生、防护用品的正确使用、环境物体表面及医疗设备的清洁与消毒可有效降低新型冠状病毒肺炎在医务人员、患者之间的传播。

结论: 实施标准预防措施后, 可有效降低新型冠状病毒肺炎在医务人员、患者之间的感染率。

PU-0572

探讨在冠状动脉造影时护士为避免穿刺、注射中产生微量气泡的措施及其效果

王月
中南大学湘雅三医院

目的 探讨在冠状动脉造影时护士为避免穿刺、注射中产生微量气泡的措施及其效果。

方法 针对在进行增强 CT 的冠状动脉造影检查的过程当中, 放射科护士在给受检者的进行碘对比剂注射后, 血管腔内会产生微小气泡的原因进行分析, 设计相应的解决措施, 如穿刺前排尽注射器内气体、穿刺成功后直型鲁尔接头浸入液体再旋紧肝素帽、接高压注射泵时挤压延长管确保前端接口无空气、让血回到留置针软管尾端, 再接上排好气的延长管、操作时动作轻柔迟缓。选取 2022 年 4 月到 2023 年 7 月在我院进行冠脉造影检查的患者 160 例, 并将其随机分为对照组和观察组, 每组 80 例。对照组选择常规的造影剂注射操作, 进行操作, 将两组冠脉造影后所显现的气泡数量以及气泡产生率进行对比。

结果 对照组气泡的产生数量和气泡产生率要高于观察组, 且两组数据统计分析差异明显。
($P<0.05$)

结论 在冠脉造影注射造影剂时应用穿刺前排尽注射器内气体、直型鲁尔接头浸入液体再旋紧肝素帽、接高压注射泵时挤压延长管确保前端接口无空气、让血回到留置针软管尾端, 接高压注射器时动作轻柔迟缓的注射方法能够有效减少气泡的产生数量并降低了气泡产生率, 能够让冠脉造影的结果更加精确。

PU-0573

亲子式陪伴在婴幼儿 MRI 检查中的应用效果研究

梁蝴蝶、李慧华、周晓楠、黄杰
山东省立医院

[摘要]: 目的 探讨亲子式陪伴在婴幼儿 MRI 检查中的应用及效果。方法 将 196 例行 MRI 检查的婴幼儿按照就诊的先后顺序分为对照组 (99 例) 和实验组 (97 例)。对照组检查时采用常规护理, 家属站在机器旁。实验组检查时采用亲子式陪伴护理, 让家属充分与婴幼儿接触。比较两组婴幼儿一次性检查成功率、扫描时间和预约检查等待时间。结果 采用亲子式陪伴的实验组的一次性检查成功率 90.70% 高于对照组 73.70%; 有效扫描时间短于对照组; 预约检查等待时间明显低于对照组 ($P\leq 0.05$)。结论 亲子式陪伴能提高婴幼儿的配合度, 提高 MRI 检查成功率。并能节省扫描时间与检查等待时间, 提高工作效率。

PU-0574

生理盐水联合碘造影剂预热在肿瘤病人增强 CT 检查中的护理应用

李青兆^{1,2}、孟莉^{1,2}、曲婷婷^{1,2}

1. 辽宁省肿瘤医院

2. 医学影像科

【摘要】目的 2018 年随着增强 CT 检查人数的不断增加,发生碘造影剂的不良反应逐渐增多,为降低碘造影剂的不良反应,分别在 2019 年对碘造影剂全部进行恒温箱预热,大幅度降低了增强 CT 病人检查的各种不良反应,为进一步降低碘造影剂的不良反应;在 2022 年碘造影剂恒温箱加热的基础上对增强 CT 检查的生理盐水全部进行预热,又进一步降低了碘造影剂的不良反应。方法 2018 年之前,增强 CT 检查病人的造影剂加热,是由高压注射器的加热系统在给药的过程中直接加热,但 2018 年之后,随着肿瘤病人的不断增多和住院床位的增加,增强 CT 检查的病人迅速增多,不良反应病人也不断增加。不断查找原因,改变造影剂依靠高压注射器系统的预热方式,2019 年开始对碘造影剂全部由恒温箱预热 37 度,碘造影剂不良反应迅速下降,在此工作的基础上,2022 年将增强 CT 检查的生理盐水全部进行预热,进一步降低了碘造影剂的不良反应。结果 2018 年 12 月 1 日-2018 年 12 月 31 日碘造影剂和生理盐水未进行恒温箱加热,增强 CT 检查总人数 2 2300 人,碘造影剂不良反应发生 46 人(2%),其中死亡 3 人。2019 年 12 月 1 日-2019 年 12 月 31 日对碘造影剂全部进行恒温箱加热到 37 度,增强 CT 检查总数 2300 人,碘造影剂不良反应发生 11 人(0.48%),无死亡。2022 年 12 月 1 日-2022 年 12 月 31 日对生理盐水全部进行恒温箱加热到 37 度,对碘造影剂全部进行恒温箱加热到 37 度,增强 CT 检查总数 2300 人,碘造影剂不良反应发生 2 人(0.087%),无死亡。结论 增强 CT 检查的造影剂为碘对比剂,碘对比剂随着浓度增高,粘稠度也逐渐增高,粘稠度越大,摩擦力越大,在高压、快速注射过程中引起各种不良反应。高压注入碘造影剂前后需注入足够量的生理盐水以稀释碘造影剂的粘稠度和对血管壁的刺激,但大剂量高压注入常温下的生理盐水又增加了已加热的碘造影剂粘滞性和刺激性,在碘造影剂加温的基础上,对生理盐水也进行恒温箱预热,利于碘造影剂对微小区域的摄入,改善血管强化显示,提高了图像质量的同时,大幅度降低了增强 CT 病人检查的各种不良反应。

叙事医学在一例晚期胰腺癌介入治疗患者中的应用实践

王勤

华中科技大学同济医学院附属协和医院

目的:叙事医学是由患者讲述个人故事,医护人员借此治疗患者身心疾病的一种具有人文关怀特质的医学方法,已在多种疾病中得到广泛应用,但在肿瘤介入治疗患者中应用较少,且部分晚期恶性肿瘤患者不配合治疗,本报道通过实施叙事医学成功取得患者配合,顺利实施后续治疗,介绍成功经验,为叙事医学更好的应用于晚期肿瘤介入治疗患者提供借鉴。方法:对 1 例 80 岁男性晚期胰腺癌拟行胆管穿刺引流治疗,但不配合的患者实施叙事医学,观察实施前后患者临床症状、生活质量、焦虑及抑郁评分的变化,并分析、总结照护经验和体会。结果:通过患者讲述生命故事及人生经历中的辉煌时刻,聆听病人对疾病的倾诉,关注患者情感的变化,并与患者家属建立微信联系,随时反馈患者病情变化。实施后患者情绪明显改善,并愿意配合介入穿刺治疗,明显改善了患者对医护人员的认可程度,患者躯体不适症状、心理负性情绪明显改善,生活质量明显改善。结论:晚期恶性肿瘤患者疾病发展过程中通常面临多方面的痛苦及需求,叙事医学通过讲述患者的生命故事,主动探索患者的心理过程,关注患者身心状态,可有效减轻肿瘤介入治疗患者躯体症状及心理负担,提高治疗依从性,改善生命质量,完美体现了医学人文关怀在临床实践中的应用。

“并联式”整体护理模式在一体化手术室影像检查安全管理中的应用研究

李璐柳、沙娟
南昌大学第一附属医院

目的：探讨“并联式”整体护理模式在一体化手术室影像检查安全管理中的应用效果。方法：分别选取 2021 年 1 月-12 月、2022 年 1 月-12 月在我院一体化手术室行外科手术且术中中进行影像检查的患者作为对照组和实验组，其中对照组 92 例患者，实验组 98 例患者。对照组采用常规护理流程管理，实验组运用“并联式”整体护理模式进行护理。比较两组患者术中影像检查各环节完成的时间、不良事件发生率的差异。结果：实验组影像检查各环节完成情况优于对照组，差异有统计学意义（ $P<0.05$ ），且不良反应发生率降低。结论：“并联式”护理模式可有效降低一体化手术室行手术患者的相关风险，保障影像检查及手术的顺利完成。

PU-0577

计算机断层扫描小肠造影序贯结肠镜检查降低碘对比剂相关不良反应的回顾性研究

吴欣
华中科技大学同济医学院附属协和医院西院

目的：对比疑似炎症性肠病（Inflammatory bowel disease, IBD）患者行计算机断层扫描小肠造影（computed tomography enterography, CTE）序贯结肠镜与 CTE 序贯结肠镜检查过程中，碘对比剂相关不良反应的发生率。

方法：回顾性收集自 2018 年 8 月 1 日至 2020 年 8 月 1 日行结肠镜与 CTE 检查的疑似 IBD 患者，根据检查方式分为 A 组（结肠镜序贯 CTE 检查组）与 B 组（CTE 序贯结肠镜检查组），对比两组碘对比剂相关不良反应发生率。

结果：485 例纳入患者中，360 例患者纳入 A 组，125 例患者纳入 B 组。A 组有 39 例患者（10.8%）在行 CTE 过程中发生碘对比剂相关不良反应，其中轻度不良反应 34 例（7.2%），中度不良反应 5 例（1.4%）。B 组无任何患者（0.0%）发生碘对比剂相关不良反应，对比 A 组存在显著性差异（ $p<0.001$ ）。

结论：对于疑似 IBD 患者行结肠镜前，先行 CTE 检查可见显著降低患者发生碘对比剂相关不良反应，提高 CTE 检查的安全性。

浅谈放射科护理安全隐患

陈婧

西宁市第一人民医院医疗集团总院

放射科是医院疾病诊断及治疗的重要辅助检查科室，在现代医院建设中，放射科是一个集检查、诊断、治疗为一体的科室，临床上各科室疾病诊断均需经过放射科设备检查。遵守诊疗常规和操作规程是防范风险的最基本手段。

伴随放射设备不断更新，检查内容更加细化，医院的放射科不仅承担着门诊、住院部的常规 X 线、造影特殊检查及 CT、核磁检查等。由此造成放射科护理人员的任务繁重，工作缺乏热情，状况时有发生，造成医患纠纷，不仅对患者造成伤害，对护理人员也造成了伤害，所以放射科中存在护理出错安全的问题不容忽视。

PU-0579

CT 引导下肺肿瘤微创介入治疗围术期护理

张庆艳

青海红十字医院

目的 探讨分析将细节围术期护理对接受 CT 引导下肺肿瘤微创介入术治疗的患者实施所取得的效果。方法 本次研究对象均为在青海红十字医院接受 CT 引导下肺肿瘤微创介入手术治疗患者，共计 80 例，收治时间为 2019 年 12 月到 2022 年 12 月之间。按照数字表法对患者分组，其中 40 例设为参照组实施常规围术期护理，另外 40 例设为研究组实施细节围术期护理。比较两组对两组的护理效果。结果 比较两组的并发症发生率，研究组低于参照组 ($P<0.05$)；比较两组的护理满意率，研究组高于参照组 ($P<0.05$)。结论 根据本次研究的结果可以确认，将细节围术期护理对接受 CT 引导下肺肿瘤微创介入术治疗的患者实施有着极为确切的作用，能够对并发症起到很好的预防作用，提高患者的满意度，值得大力推广。

PU-0580

放射科护理工作中的危险因素与对策分析

王烈梅

西宁市第一人民医院

摘要:在放射科护理工作中，总是会不可避免存在着许多危险因素。为了找出其中所出现的各种危险因素，并对其解决对策进行有效分析，本篇文章在综合了调查和研究之后完成。主要以 2021 年 9 月~2021 年 12 月在本医院放射科接受检查的 150 例患者作为研究对象。其中，以 2021 年 9 月作为时间截点。

所有患者被分为对照组和观察组两组，结合具体护理对策，对其中所存在的各种风险事件、危险因素进行分析。完成此次实验险之后，可以很明显的发现:观察组护理风险要明显低于对照组，其差异统计学意义 $P<0.05$ 。因此，则可以判定此次研究具有一定实验意义。在此次调查中，主要针对的是医务工作中沟通问题、管理问题、服务问题、患者素质水平四个角度进行分析和考虑，在提出的相关对策应用到实际工作以后，可以发现其安全性明显得到提升。

Morphine prophylaxis alleviates pain in transjugular intrahepatic portosystemic shunt procedure: A randomized clinical trial

Ling Li

Department of Radiology, Union Hospital, Tongji Medical College Huazhong University of Science and Technology

BACKGROUND: Transjugular intrahepatic portosystemic shunt (TIPS) is an accepted minimal invasive procedure for the

management of complications of portal hypertension.

OBJECTIVE: This study aims to investigate the value of the preemptive administration of morphine, when compared with on-demand morphine, during TIPS.

METHODS: The present study was a randomized control trial. A total of 49 patients were selected to receive 10 mg of morphine either before the TIPS procedure (group B, n = 26), or on demand when needed during the TIPS procedure (group A, n = 23).

The patient's pain was scored using the visual analog scale (VAS) during the procedure. VAS, pain performance, HR, systolic

pressure, diastolic pressure and SPO2 were recorded at four-time points: before the operation (T0), during the trans-hepatic

puncture of the portal vein (T1), during the intrahepatic channel expansion (T2), and when the operation was finished (T3). The

duration of the operation was also recorded.

RESULTS: In group A, the proportion of severe pain at T1 was 4.3% (one case), two cases were combined with vagus refflex,

and the proportion of severe pain at T2 was 65.2% (15 cases). No severe pain occurred in group B. The VAS score significantly

decreased at T1, T2 and T3 in group B, when compared to group A ($P < 0.05$). HR, systolic pressure and diastolic pressure

significantly decreased at T2 and T3 in group B, when compared to group A ($P < 0.05$). There was no significant difference

between the two groups in terms of SPO2 ($P > 0.05$).

CONCLUSION: Preemptive analgesia can effectively relieve severe pain during TIPS, improve patient comfort and compliance,

ensure a routine procedure, and offer excellent safety, and is simple and effective.

护理干预在双源 CT 心肌灌注检查患者中的效果分析

李娟

空军军医大学西京医院

目的: 探讨在双源 CT 心肌灌注检查中应用护理干预的效果。

方法: 目前本科室采用西门子 SOMATOM Force 双源 CT 进行心肌灌注检查, 检查过程中使用三磷酸腺苷二钠 (Adenosine triphosphate disodium, ATP) 实现心肌负荷。静脉给予 ATP(140 ug-160ug/(Kg·min)), 持续 3 min, 采用前瞻性心电门控进行负荷期动态心肌灌注扫描, 心肌灌注扫描完成之后, 行冠状动脉 CT 血管成像(CTA)扫描。选取 2020 年 1 月-2023 年 7 月, 收治的 106

例接受 CT 心肌灌注检查的患者。采用随机数字表法分为 2 组, 每组分别纳入 53 例样本。对照组常规护理, 研究组护理干预, 比较两组患者的图像质量等级、焦虑评分、呼吸配合训练时间和心率控制时间, 护理满意度, 探究干预的效果。

结果: 护理干预后研究组的图像质量等级明显优于对照组, 焦虑评分明显低于对照组 ($P<0.05$)、研究组的呼吸训练配合、心率控制明显优于对照组, 护理满意度明显高于对照组, 差异有统计学意义 ($p<0.05$)

结论: 护理干预对于双源 CT 心肌灌注成像检查患者具有显著效果, 能够促进其心率平稳, 缓解其焦虑情绪, 有助于提高图像质量, 提高护理满意度, 值得推广应用。

系统护理干预缩短冠心病患者冠脉 CTA 检查时间

赵辉、孔莎
河南省人民医院

探索系统护理干预在缩短冠心病患者冠脉 CTA 检查时间的应用效果。成立护理专题小组, 确立“缩短冠心病患者冠脉 CTA 检查时间”为活动课题, 对我院 2020 年 5 月-2020 年 7 月行冠脉 CTA 检查的患者进行现状分析, 分析原因, 确定问题, 设定目标, 制定对策。开展专题活动, 通过系统护理干预, 能有效缩短冠心病患者冠脉 CTA 检查时间, 提高影像检查的满意度, 同时能够优化影像检查的流程中每个环节, 提高医务人员工作效率, 减轻了医务人员的工作压力。

改良静脉穿刺法在一例吸毒困难静脉患者增强影像检查外周静脉通路建立中的应用

毛元红、杨红、陆菊花、周曙、袁爱红、张鸿飞
南通市第一人民医院

探讨改良外周静脉穿刺法应用于一例静脉吸毒、困难静脉患者行增强磁共振检查前外周静脉通路的建立。方法 一例静脉吸毒数十年、静脉穿刺困难患者行增强磁共振检查前采用改良穿刺法(患者取坐位, 待穿刺侧肢体掌面向上、手背搁在同侧膝盖上, 使肢体下垂, 待穿刺点上方 10cm、8cm 处各扎一根止血带、加松握拳法, 促进外周静脉充盈)行外周静脉穿刺置管。过程顺利, 成功建立有效外周静脉通路; 增强磁共振检查成功完成, 未出现脱管、出血、血肿对比剂外渗等并发症。

结论 对吸毒、肥胖、高血压、糖尿病、肿瘤化疗后等困难静脉患者行增强影像检查时, 可采用坐位、穿刺侧肢体下垂、扎双根止血带加松握拳法能促进外周静脉充盈、提高静脉穿刺的成功, 确保影像增强检查的顺利进行, 同时减轻患者痛苦, 提高满意度。此操作方法简单、易学、高效, 也可用于急诊抢救室、肿瘤科、采血中心等急重危、困难静脉患者外周浅静脉的穿刺, 值得临床推广应用。该研究已申请获得基金项目: 南通市科技计划(指导性)项目(基金号:JCZ20032)“改良外周静脉穿刺法在增强 CT 扫描困难静脉患者中的应用”, 并获三项国家实用新型专利(ZL 2017 2 1050358.0、ZL 2019 2 0308525.X、ZL 2017 2 1050358.0)

PU-0585

叙事教育在以岗位胜任力为核心的全日制护生 思政教育带教模式中的应用研究

邓丽君、余秋花、唐碧英、刘圆圆、黄天雯
中山大学附属第一医院

目的 探讨叙事教育在以岗位胜任力为核心的全日制护生思政教育带教模式中的应用效果。**方法** 将 2021 年 7 月至 2022 年 5 月在介入科临床实习的 61 名本科全日制护生设为对照组，对照组实施以岗位胜任力为核心的带教模式，护生入科时采用自评方式调查心理特质，主要包括具有高度的责任感，在繁重的工作情景中能够保持稳定平和的心境，坚持道德信念、伦理守则及法律法规，对护理职业具有认同感等 7 个条目，入科后指导护生阅读经典及优秀护士事迹，学习应急预案，分享实习中被患者感动的事迹，带教老师多表扬护生，病区的活动多邀请护生等增加护生的归属感和对职业的认同感，出科时继续采用自评方式调查护生的心理特质。将 2022 年 7 月至 2023 年 5 月在介入科临床实习的 59 名本科全日制护生设为观察组，观察组在以岗位胜任力为核心的带教模式的基础上增加叙事教育，护生入科时采用自评方式调查叙事教育能力、心理特质，入科后在原有的带教模式上增加指导护生欣赏人文励志电影、欣赏文学作品、分享人文关怀故事、书写反思日记及人文关怀护理操作培训。护生出科前继续采用自评方式调查叙事教育能力、心理特质及其学习反馈。**结果** 观察组护生出科时的叙事教育能力得分明显高于入科时，差异有统计学意义（ $P < 0.05$ ）；两组护生入科时的心理特质得分无统计学意义（ $P > 0.05$ ），具有可比性，观察组护生出科时的心理特质得分高于对照组，差异有统计学意义（ $P < 0.05$ ）；观察组护生态度目标评价得分高于对照组，差异有统计学意义（ $P < 0.05$ ）；观察组护生对教学工作的满意度得分高于对照组，差异有统计学意义（ $P < 0.05$ ）。**结论** 叙事教育在以岗位胜任力为核心的全日制护生思政教育带教模式中的应用，提高了护生的叙事教育能力、心理特质、态度目标，提高了患者的满意度。

PU-0586

1 例基于<<含碘对比剂静脉外渗护理管理实践指南>>的对比剂外 渗护理管理质量改进报告

孔莎
河南省人民医院

随着影像诊断和介入治疗的飞速发展，对比剂的应用日益广泛；CT（Computed tomography）检查是一项日渐普及的影像诊断技术，全球的 CT 检查数量逐年持续增长，其中增强 CT 检查占比 > 60%；每年全球约 7600 万次的检查中，有 50% 的患者需要静脉内使用含碘对比剂，且逐年递增。对比剂外渗是指 CT 增强扫描注射对比剂时，对比剂渗漏或血管壁破裂引起的碘对比剂意外漏出，由于碘对比剂的毒性作用和压力作用，一旦发生外渗便会对病人带来痛苦。预防碘对比剂静脉外渗、正确处理外渗减轻患者痛苦，是影像科护士关注的焦点。<<含碘对比剂静脉外渗护理管理实践指南>>为影像科护士进行科学决策提供实践依据。本案例既是基于指南进行的对比剂外渗护理管理质量改进。

PU-0587

CT 增强扫描造影剂静脉外渗的护理干预

徐亮、庞华兰
海南医学院第二附属医院

[摘要] 探讨 CT 增强扫描时有效预防造影剂静脉外渗的护理措施及发生外渗后的正确处理方法。本文归纳总结了引起造影剂静脉外渗的危险因素、造影剂外渗的护理评估方法、造影剂外渗的危害、造影剂外渗可以采取的预防和护理措施,力求能为护士在放射护理工作中提供实践指导。

PU-0588

Nursing of a patient with arterial air embolism during CT-guided lung biopsy

Weizheng Zhang
Henan Cancer Hospital

Abstract: To summarize the nursing experience of a patient with arterial air embolism during CT-guided lung biopsy. Nursing points: when air embolism occurred during the operation, the doctor should immediately pull out the needle, the nursing staff should immediately give oxygen, complete the position nursing, cooperate with the doctor for rescue work, and closely observe the life of the patient. Then, multidisciplinary consultation was carried out at the first time to determine the treatment plan. Do a good job of disease observation to ensure patient safety; Prevent patients from lower extremity venous thrombosis; Help patients complete spontaneous breathing exercises; Personalized muscle strength rehabilitation training was customized for patients. Do preventive nursing of air embolism; The whole process of psychological nursing can minimize the risk of patients, do a good job of continuous nursing, and improve the short-term and long-term quality of life of patients. In this case, the patient was successfully recovered and discharged, which provides a reference for the nursing of air embolism during lung biopsy.

放射治疗护理干预措施研究进展

秦曦贤
大连医科大学; 大连医科大学附属第一医院

针对放射治疗护理干预措施进行综述,可以为医护人员对现有条件结合患者自身情况提供针对性的干预措施。该文从放射治疗术前、术中、术后不同时间段采取相应的干预措施进行综述,并从预见性护理、心理护理、皮肤护理、用药护理、饮食护理、健康指导、功能锻炼等措施进行了总结。为医护人员应对放射治疗带来的负面影响提供了参考措施,能提高患者放射治疗结局,改善患者放射治疗后的生活质量,提升放射治疗患者护理满意度。

PU-0590

《1 例急诊 CTA 碘对比剂外渗致重度皮肤损伤的原因分析及护理》

陆春花
宁波市第二医院

【摘要】本研究选取了 1 例肝硬化致食道胃底静脉曲张破裂出血伴肝昏迷患者，对其临床资料进行回顾性分析。患者行急诊门静脉 CTA 扫描过程中发生碘对比剂外渗，在使用 0.5%醋酸氯己定溶液消毒、磺胺米隆凡士林外敷、磺胺嘧啶锌外敷等治疗处理，并及时与患者及家属进行有效沟通后，患者重度碘对比剂外渗导致的皮肤肿胀消退，水疱消失，皮肤破损处完全愈合，患者及家属积极配合治疗对疗效满意，未发生医疗纠纷。使用 0.5%醋酸氯己定溶液联合磺胺米隆凡士林、磺胺嘧啶锌治疗增强 CT 扫描过程中碘对比剂外渗效果显著，值得临床借鉴。

浅谈宫颈癌放射治疗副反应的护理

管帅
辽宁省肿瘤医院

目的 研究宫颈癌患者放射治疗中的近期和远期副反应症状及全程护理的重要意义。

方法 对科室本年度宫颈癌放射治疗的患者进行观察。放疗的同时，加强对患者饮食护理、皮肤护理、心理护理、健康教育、安全管理及副反应发生的护理。

结果 本年度宫颈癌放射治疗的患者经过放射治疗及全程护理后、治疗目的达到的同时，明显减轻了并发症带来的痛苦和不适，提高了生存质量，对护理人员的护理服务给予高度评价。

结论 针对宫颈癌患者放疗副反应的全程护理对治疗有重大保障，对患者有重要意义

PU-0592

乳腺癌放射治疗后不良反应症状群的研究进展

崔娜²、陈玲¹

1. 新疆医科大学附属肿瘤医院护理部

2. 新疆医科大学护理学院

对乳腺癌放射治疗后不良反应症状群的研究进展进行综述。从乳腺癌放射治疗后不良反应症状群分类、预防及干预、测评工具 4 个方面进行阐述。提出医护人员需密切关注乳腺癌放射治疗后不良反应症状的发生，做到早期预防。以期为临床评估及干预管理提供理论依据。

“标识性沟通”在增强检查护理中的应用与效果分析

严雯
武汉大学中南医院

目的:探讨 CT/MRI 增强检查流程中,采用“标识性沟通”在增强检查中进行优化护理的临床效果。方法:通过各种印有“易外渗、试水、易过敏人群、已签知情同意书等”印章,在护士与技师之间起到提示作用。结果:减少外渗率,以及提升对潜在过敏患者的关注度和处置效率。结论:最大程度降低不良事件发生率。

PU-0594

精细化护理在影像安全管理中的应用—放射科危重患者检查前评估表

李娅
空军军医大学西京医院

近年来,随着医疗科技的飞速发展,精细化护理作为一种前沿的护理模式,对于危重患者的管理起到了越来越重要的作用。本研究旨在深入探讨精细化护理在放射科危重患者管理中的应用,以提升影像安全管理的水准。

为了全面评估危重患者的情况,我们特别设计了一套名为《放射科危重患者检查前评估表》的综合工具。这个表格不仅详细记录了检查日期、患者入科时间等基本信息,还包括了临床诊断、人口学信息(申请科室、床号、姓名、性别、年龄、检查号)等重要数据,为全方位了解患者的身体状况提供了有力支持。

在评估患者的身体状况时,我们特别关注了意识状态、入科方式、生命体征、陪同人员和检查项目等指标。意识状态的评估涵盖了清醒、嗜睡、昏睡等多个层次,以确保对患者精神状态的准确把握。入科方式的记录则为后续的护理流程提供了重要参考。此外,生命体征的监测也成为了我们关注的焦点,包括血压、脉搏、呼吸频率以及血氧饱和度等指标,这些数据将为我们提供重要的生理参考值。

为了更加准确地识别危重患者,我们设计了一个早期预警评分量表。该量表以体温、呼吸频率、脉搏、收缩压、氧饱和度和意识状态等重要生理指标为评估依据,为每一项设定了相应的评分标准。通过综合评分,我们能够及时发现患者的异常情况,并采取相应的预警措施。在评分细则方面,我们特别关注了各项生理指标对危重患者状况的反映。体温、呼吸频率、脉搏、收缩压和氧饱和度的评估标准都充分考虑了不同数值范围的情况,以确保评分的科学准确性。

研究结果清晰地显示,精细化护理在放射科危重患者管理中取得了显著的成效,极大地提升了安全管理水平。这一研究为临床实践提供了有力的支持,为放射科危重患者的护理提供了科学可靠的依据。我们深信,在持续改进和优化精细化护理模式的过程中,我们将能够进一步提升放射科危重患者的安全管理水平,为医疗服务的质量和效率贡献更大力量。

综上所述,通过细致入微的评估工具以及科学可靠的预警评分体系,精细化护理在放射科危重患者管理中的应用不仅提升了影像安全管理的水准,也为危重患者的安全提供了可靠保障。

PU-0595

《多学科联合在碘对比剂外渗根本原因分析中的应用》

陆春花
宁波市第二医院

【摘要】目的 分析 CT 增强扫描过程中对比剂外渗的根本原因, 针对根本原因制定有效的预防碘对比剂外渗的管理规范, 以最大限度减少对比剂外渗的发生及降低外渗对局部组织造成的损伤。方法 成立多学科团队小组, 应用根本原因分析法(rootcauseanalysis,RCA)通过回溯性调查分析, 收集主客观科学证据, 讨论分析并确定我院 2022 年 5 月-2022 年 10 月上报的 7 例碘对比剂发生外渗的根本原因, 并针对根本原因制定积极有效的改进措施。结果 应用多学科联合根本原因分析后碘对比剂外渗发生率由 0.053%降到 0.02%, 重度外渗发生率为 0, 差异有统计学意义($P<0.05$)。结论 多学科联合应用根因分析法, 可有效预防碘对比剂外渗的发生, 降低了外渗的发生率, 保障了患者的安全, 值得推广。

PU-0596

多学科护理团队模式改善住院患者全腹增强 CT 检查体验的研究

崔馨元、郑淑梅、赵雪
哈尔滨医科大学附属第二医院

背景及目的: 全腹增强 CT 是一种常用的医学影像学检查方法, 然而, 患者在接受检查时可能会面临一些不适和不良反应。本研究旨在评估多学科护理团队模式在改善住院患者全腹增强 CT 检查体验方面的作用。

方法: 由影像科医生、技师、护士及联络员组成多学科护理团队。研究样本选取我院 2022 年 1 月至 12 月行全腹增强 CT 检查的住院患者 200 名, 将其随机分为观察组和对照组, 观察组接受多学科护理团队介入, 对照组接受常规护理。通过面对面问卷调查和医务人员的评估, 评估两组患者的全腹增强 CT 检查体验。

结果: 观察组患者在 CT 检查前的紧张感、疼痛感、不适感和担忧感方面得分明显低于对照组 (3 vs.7, $P<0.05$)。观察组患者在 CT 检查过程中对医务人员的满意度方面得分明显高于对照组 (9 vs.6, $P<0.05$)。观察组患者全腹增强 CT 检查的不良反应发生率显著低于对照组 (5% vs.11%, $P<0.05$)。此外, 候检时间和扫描时间均显著下降 ($P<0.001$)。

结论: 多学科护理团队模式的介入可以显著改善住院患者在接受全腹增强 CT 检查过程中的体验, 减轻其紧张感、不适感和担忧感, 提升患者的医疗体验和满意度。多学科护理团队模式应该得到更广泛的应用, 以使患者得到个性化、全程化、专业化护理。

PU-0597

放射科护士对 CTU 检查患者的精细化护理

王瑛
兰州大学第二医院

摘要 随着科技的不断进步, 放射科在医疗诊断中起着举足轻重的作用。而 CTU (计算机体层成像尿路造影) 作为放射科中一项重要的检查技术, 已经普遍应用于临床。为了提高 CTU 检查的准确性和精确性, 放射科护士的护理工作也需精细化。

本文通过文献研究和临床实践对 CTU 检查的精细化护理进行探讨。首先,对 CTU 检查的流程进行了详细的描述,包括检查前准备、器材准备、患者沟通和适当的容量负荷等方面。其次,分析了 CTU 检查中可能出现的不良反应和并发症,为护士提供了敏锐的观察和及时发现问题的能力。此外,还介绍了 CTU 检查中对患者的安全要求,包括辐射防护、感染控制和消毒等,以保护患者的身体健康。

特别地,本文还强调了护士在 CTU 检查中的角色和责任。护士应具备熟练的技术操作和仔细的观察能力,确保图像质量的完整性和可靠性。同时,护士应积极与医疗团队合作,提供全面的护理服务,包括患者接送、疼痛管理和心理支持等。

最后,本文总结了放射科护士对 CTU 检查精细化护理的重要性。精细化护理能够提高 CTU 检查的效果和准确性,减少患者的不适和并发症发生。因此,放射科护士应持续更新自己的专业知识和技能,提高对 CTU 检查的护理质量,为患者提供更优质的护理服务。

PU-0598

严格审核制度对提高影像检查阳性率的效果分析

全开军
万宁市人民医院

【摘要】目的 探讨严格执行审核制度对提高影像检查阳性率的效果。方法 收集 2017 年 12 月至 2021 年 11 月期间每月影像检查的阳性率,以 2019 年 12 月严格执行审核制度为分界点,后组为审核组,诊断报告双人签名并 100%审核,前组为对照组,未严格执行审核制度,审核率不足 100%。分析 X 线检查、CT 检查、MRI 检查等不同检查类别影像检查阳性率与诊断报告审核率的关系并对比两组间影像检查阳性率的差异,采用 Spearman 检验和独立样本 t 检验进行统计学分析。结果 审核组诊断报告审核率均为 100%,对照组 X 线检查、CT 检查、MRI 检查诊断报告审核率分别为 $39.57\% \pm 13.20\%$ 、 $74.22\% \pm 11.09\%$ 、 $13.92\% \pm 14.92\%$ 。X 线检查、CT 检查、MRI 检查阳性率与诊断报告审核率的相关系数分别为 0.793、0.774、0.669, $p < 0.05$ 。审核组 X 线检查、CT 检查、MRI 检查阳性率较对照组分别提高 $12.80\% \pm 1.35\%$ 、 $2.99\% \pm 0.47\%$ 、 $4.62\% \pm 0.75\%$, $p < 0.05$ 。结论 X 线检查、CT 检查、MRI 检查阳性率与诊断报告审核率具有相关性,严格执行审核制度有助于提高阳性率,尤其有助于提高 X 线检查阳性率。

县域放射科影像图像的规范管理

张辉
泰安市中心医院

背景:县域放射科作为医疗系统中重要的组成部分,承担着影像检查和诊断的关键责任。然而,由于资源有限和管理不规范,县域放射科在影像图像的规范管理方面存在一系列挑战。方法:本研究通过调查分析不同县域放射科的实际情况,总结了目前影像图像管理存在的问题和障碍。同时,参考中华医学会以及其他相关机构的指南和标准,提出了一套规范管理县域放射科影像图像的综合解决方案。结果:本研究提出的综合解决方案包括:优化设备维护、建立质量控制机制、推行标准化图像采集和传输流程、加强人员培训与沟通等。通过对某县域放射科实施这些措施的评估发现,影像图像的质量得到明显提升,信息传递的准确性和效率也得到了改善。结论:规范管理县域放射科影像图像对于提高医疗服务质量和安全性至关重要。通过本研究提出的综合解决方案,县域放射科能够更好地管理影像图像,提高医疗服务水平,从而为人民群众的健康做出更大的贡献。

PU-0600

如何提高县域医院放射科的影响力

姚奇

安徽省立医院涡阳分院（涡阳县人民医院）

前言 随着国家推进医疗卫生一体化改革，按照常见病多发病在市县解决的目标，县域就诊率达到 90%以上，县级医院必将成为未来医疗的主战场。近年来国家大力推进“五大中心”建设，大多数县级医院都是胸痛中心、卒中中心、创伤中心、危重孕产妇救治中心及危重新生儿救治中心聚集单位；“五大中心”运行发展均对放射科的业务提出了更高的诊断要求和检查效率，未来还会建设“肿瘤综合治疗中心和慢病管理中心”等。放射科工作将贯穿于各中心疾病的发现、诊断、治疗及疗效评价全流程，起到不可或缺的作用。都说“精准医学、影像先行”，放射科的作用又如此之大，可我们广大的同仁们为什么还感觉放射科在医院里不被重视，没有话语权、没有影响力呢？

县域医院放射科现状：“三多、三少”

三多：1、患者及家属多；2、贵重设备多；3、各种投诉多

三少：1、阳性患者追踪结果少；2、科研、课题论文少；3、放射医生收入少；

如何提高放射科在医院的影响力？

- 1、“打铁还需自身硬”，提高自己的业务技术水平，满足临床需求；
- 2、积极走向临床、拥抱临床，多参加 MDT，做临床医师的战略合作伙伴；
- 3、做好“急诊文章”，包括急诊介入手术、急诊增强等，让临床离不开你；
- 4、开设影像门诊，直接面对患者分析疾病影像学病理生理机制，增加患者影响力；
- 5、抱住上级医院“大腿”，做好科研、课题研究，提升学术影响力；
- 6、积极下基层、单位企业、老年大学等，做好影像相关科普宣传，提高社会影响力；
- 7、认真做好基层医院远程影像会诊，及时给出准确诊断和治疗方向，增强基层医院影响力。

放射医师是临床的侦察兵，是临床诊疗环节中重要的幕后英雄；要持续保持影响力，还要坚持做好“四个服务”，即：增强服务意识、提升服务能力、提高服务效率、保证服务质量。使患者和临床满意度不断提升。

PU-0601

影像科整合融合促进县域医院学科高质量发展 管理经验

王清涛

清河县人民医院

2020 年 4 月河北省邢台市清河县人民医院决定将原放射科导管室、CT 室、MR 室整合为邢台市第一个县级医院医学影像科。科室整合后多措并举，创新改革，人力成本降低，患者服务效率提升，就医满意度明显提升。1、整风肃纪，建章修制，开展“四比活动”，统一思想，营造积极向上的科室氛围；2、绩效杠杆，充分调动科室人员积极性，增加新活力；3、党建引领，借力发展，上下级医院联动，远程平台助力临床诊疗；4、信息化建设及设备投入，为科室发展按下了加速键；5、管事管人，管流程，以患者需求为导向的服务模式；用一流的技术、一流的设备、一流的服务、一流的管理打造冀东南区域影像中心，为更好服务广大人民群众及医院高质量发展贡献科室力量。

PU-0602

县医院医学影像远程会诊：破解基层群众影像检查难题

吴非
白河县人民医院

目的：白河县山大沟深，老百姓外出看病很不方便；基层卫生院缺少检查设备、缺少专业人员、诊断能力低、无执业资质。为了解决这些问题，本研究旨在探讨医学影像远程会诊在县级医院的应用。

方法：白河县人民医院自 2018 年建立区域远程影像诊断平台，整合市、县、镇三级医疗资源，开通远程会诊业务。将医院建在“网上”，专家联在“线上”。通过构建互联网+医学影像服务，为患者提供远程影像诊断等多种服务。遇到疑难病例时，卫生院医生可以直接通过系统将患者 DR、CT 影像图上传至区域远程影像诊断平台，由县人民医院诊断专家通过诊断工作站调阅病例图片，经诊断、审核后给予精准双签报告，整个过程一般在 30 分钟左右，疑难病例不超过 2 小时，即使夜间急诊也能尽快给出精准诊断报告。

结果：自 2018 年 7 月以来，经过 5 年的摸索、改进、提升，目前平台运转十分成熟，并先后接待省内外多批次兄弟医院的参观、交流，为白河县多家卫生院提供了医疗保障和人才的培养，也解决边远地区影像技术人才匮乏、患者影像检查困难等问题。远程影像诊断累计为乡镇卫生院服务超过 29500 人次，月平均诊断 1100 余例，最多时达到每月 3000 余例。与三级医院会诊 600 人次。召开远程教育培训会 30 次，按照 X 线、CT 拍片检查、专家会诊等诊疗项目在一级医院和二级医院的收费价格差，加上患者的路费，初步估算，平台开通以来为患者和基层医务工作人员节省就医开支和培训费用近百万元。

结论：医学影像远程会诊破解群众看病难、看病贵问题，通过整合医疗资源，解决重复检查、基层医院影像人员缺乏、基层患者辗转进城或异地确诊等问题，切实减轻了患者的经济负担，真正成为了一条护佑患者健康的“生命纽带”，同时成为突破医疗资源紧张与群众就医需求增大之间矛盾的切入点。

PU-0603

放射科大型设备全生命周期精细化管理

吴继军
华中科技大学同济医学院附属协和医院

目的：放射科作为医院大型设备集中科室，大型医疗设备的固定资产通常会占到全院固定资产的 20% 甚至以上，很大程度上医院发展的一个重要标志是引进高端医学影像等大型医疗设备，不仅可以提高医院知名度，增强核心竞争力，还会带来巨大的经济及社会效益。根据国卫健委颁布的《大型医疗设备配置与使用管理办法》第二条规定，大型医疗设备是指“大型医用设备，是指使用技术复杂、资金投入量大、运行成本高、对医疗费用影响大且纳入目录管理的大型医疗器械。同时，放射科对诊疗设备也是高度依赖，一旦设备停止运行对于放射科的正常运转也会产生相当大的影响，因此维持大型设备的正常运行就显得很重要，大型设备全生命周期的精细化管理对于保证设备的正常运行以及延长使用寿命会很有意义。

方法：我们对设备从购置立项调研到设备采购后设备机房的准备到设备安装，设备使用培训，设备使用规范，设备日常维护保养，最后到设备完成使命申请报废全生命周期按照科学方法进行有效管理。

结果：设备科学规范化的管理对于体现设备自身价值延长设备使用寿命具有重要意义。

结论：大型医疗设备管理的未来，应当以医院管理和临床需求为导向，借助先进精细化管理理念和互联网、物联网等信息技术，实现大型医疗设备的精细化管理、效益分析和科学配置，对医院管理部门具有十分重要的现实意义。

PU-0604

放射科影像自助登记系统的建设及运用

丁伟龙

上海交通大学医学院附属第九人民医院

随着医院规模的不断扩大，信息化水平也在不断提高。围绕着电子病历信息为核心的各种系统都在不断地应用，但真正要考虑的不只是系统的功能应用，还应是通过系统的应用来促进医疗业务流程的再造，提高工作效率，方便病人就医，让医护人员把更多的时间留给病人。

放射科作为医院检查的普遍检查项目，随着医院门诊量的与日俱增，放射检查人数也同比增长，为缓解放射登记窗口的人员堆积，提高放射登记的效率，提升患者在院就诊的便利性，推进医院智能化建设发展。

目前大型医院基本上线了电子医保卡功能，患者使用移动设备扫码就能在医院完成缴费充值、诊病及结算过程，优化了就医流程。但检查科室目前还停留在人工登记，患者检查仍然存在排队长、等候久的问题依旧在检查科室存在。为了深化落实医疗卫生体制改革和公立医院改革，优化就医流程，在院信息科和放射科的推动下，我院于 2022 年开始了自助登记系统的建设，并且一直在不断地完善和增加新的功能。

基于战略分析方法的大型医疗设备管理研究

吕佩颖、邵晓宁、刘良、孟炯

郑州大学第一附属医院

医疗设备管理是医院管理的重要组成部分，却时常陷入“管理难、质控难、维保难、效益分析难”的困境。本文采用管理经济学领域的两种战略分析方法--SWOT 分析法和八何分析法，对医院大型医疗设备管理过程中遇到的问题和现象进行分析，并从医院管理角度提出相关建议与解决方案，旨在全面掌握管理现状中的难点与重点，有效提高医疗设备的工作效率，尽可能发挥其所具备的功能和性能。同时，对设备管理工作的分析和规划有助于降低运营成本，提高医院经济效益，为医院开展精细化、科学化、系统化的管理模式提供决策依据。

医学影像科服务流程再造的探索和实践

严雯

武汉大学中南医院

目的：为了自的为患者提供全程、连续、无经隙的优质护理服务。方法：通过过去一年的探索和实践，登记窗口、护理、技师、医生之间，从工作细节上相互改善、相互协调和沟通。在工作繁忙的时候护士与登记室、技师之间，通过各种印有“两项增强、请到护士站打针、第二天有增强、易过敏、已签知情同意书等”印章，起到提示作用，进行特殊沟通;建立核磁、CT 预约专管群和登记室和

护士、技师质控员,会根据患者量、固定专科机器进行各楼层分流,缩短患者等待检查的时间。结果:根据患者需求改进新的工作流程,规范服务流程。结论:提高患者满意度。

PU-0607

探讨放射科自助登记系统的临床应用价值

邹灿
玉林市四人民医院

摘要:放射科影像自助登记是一种新兴的技术,通过使用自助终端设备,患者可以自主完成影像检查的登记和预约。本文通过观察和分析放射科影像自助登记的应用价值,对比传统登记方式,探讨其在提高医疗服务效率、优化患者体验、降低人力成本等方面的优势。研究表明,放射科影像自助登记在提高医疗服务效率、优化患者体验、降低人力成本等方面具有显著的应用价值。

融合翻转课堂的专业英语教学在放射科住院医师规范化培训中的应用探索

施晓雷、樊荣荣、邹勤、邹薇薇、范丽、萧毅
中国人民解放军海军军医大学第二附属医院

目的 探索在放射科住院医师规范化培训中将翻转课堂与传统教学方式相融合进行专业英语教学的方法。

方法 纳入 2021 年 7 月至 2022 年 7 月间在培的放射科住培生,填写专业英语学习需求调查问卷并进行多种形式的专业英语教学,包括英文文献汇报、英文病例随访及英文授课等,并在学年前后分别进行一次考核。

结果 放射科住培生对专业英语学习有迫切的需求,但缺乏足够时间及科学的方法。不同年级、类别的住培生在第一次专业英语能力考核中的成绩存在差异。经过一年的专业英语学习,住培生们的第二次考核成绩较前一次有明显提升。

结论 将传统教学与翻转课堂融合的专业英语教学方式有助于提高放射科住培生的专业英语水平。

PU-0609

基于信息化的医学影像科医疗设备智慧化管理

张辉
北京大学深圳医院

根据《国家三级公立医院绩效考核操作手册(2023 版)》中提到了与设备管理相关的两个监测指标“大型设备阳性率”和“大型医用设备维修保养及质量控制管理”。通过分析医疗设备管理存在的现状,比对三级甲等医院评审的要求,通过“互联网+”技术,建立医疗设备信息化智慧管理平台。

通过信息化平台实现设备管理三级管理:一级保养由科室使用人员完成设备日常检测,二级保养由医学装备部工程师进行季度周期的维护保养,三级保养由厂家工程师进行年度技术性的检验维护。一级保养由工作人员进行设备日常检测并并在填写设备日常使用记录。设备管理员每周四进行设备使用巡查,并将相关情况记录在信息平台周报里,并且还有月报总结。

设备出现故障时,在岗工作人员首先进行简单的故障判断,来尝试是否恢复正常。如果未恢复正常,可通过科室信息平台上报设备管理员及科室领导并报送设备科。设备科根据情况由设备科或联系厂家进行维修,维修记录计入平台。设备保养时间结束前按照配置实现提示,防止过保。

所有设备使用记录、维修等均在信息平台实现可视化,工作人员可在工作站或移动端实现实时监控,随时掌握设备工作情况。可事实查看设备温湿度曲线、液氮水平曲线、设备阳性率等。信息平台建立科室动态数据驾驶舱,科室实时监控各机房的工作状况,设备情况,危急值等等。信息平台实现了医院内网、外网、电脑端、手机端的数据统一,智慧化管理。

通过搭建医疗设备智慧化管理平台框架,完善设备管理功能应用,实现医疗设备生命全周期管理,为医院医疗设备智慧化管理提供支撑。

恶性肿瘤 TNM 影像分期系统（或结构式报告）的规范应用对肿瘤学教学要义浅析

刘杰、王泽坤、董越、刘屹
辽宁省肿瘤医院

恶性肿瘤已经成为影响人民健康、寿命的重要因素之一。

肿瘤是全身性疾病,肿瘤 TNM 分期系统是对恶性肿瘤患者的身体疾病状态的全面评估,直接影响治疗策略的制定及患者预后。肿瘤的 TNM 分期大多数是基于医学影像诊断及临床病理的一种临床分期系统。肿瘤影像在分期系统中占有重要地位。

目前应用分期系统而制定的影像诊断报告肿瘤主要有(1)直肠癌的结构式报告(2)前列腺癌的规范化报告(3)口腔癌等。传统的影像诊断对病变位置、大小、形态及特征的描述、对鉴别诊断的描述已经不能完全满足恶性肿瘤患者影像诊断的需求,比如肿瘤组织对周围的侵袭浸润、远隔转移、种植,以及预后功能性的康复和评价等,均将对患者疾病治疗效果产生重要的影响。癌症患者初诊的肿瘤分期情况是判断其预后以及制定“个体化”治疗方案的重要参考依据,在广泛开展临床试验中,合理的肿瘤分期也是不同国家、地区肿瘤研究中心进行统筹化处理和比较的基础。

本文通过以下几个方面:(1)肿瘤影像规范化报告(结构式报告)与 TNM 分期的相互关系;(2)肿瘤影像规范化报告(以直肠癌为例)的教学及临床意义浅析;(3)肿瘤规范化报告的发展与未来等几个方面阐述肿瘤影像学规范化报告对于教学的意义。

英文文献汇报模式在放射专业住院医师规范化培训中的应用

钱伟亮、王宏、张继斌
苏州市立医院

目的:探讨英文文献汇报模式在放射专业住院医师规范化培训中的应用价值。

方法:以 2014-2020 年我院放射专业住院医师规范化培训学员 28 名为研究对象,开展每月 1 次的英文文献 PPT 汇报,采用考核评分方式(10 分制)对学员能力(包括文献检索、文献阅读、论文写作、PPT 制作及诊断能力)进行前后评估,同时收集各学员规培前后论文发表情况。最后以不记名问卷调查各学员对于该讲座模式的整体印象。

结果:通过 2-3 年的英文文献汇报模式的培训,学员们在文献检索(3.3 ± 1.9 vs. 5.1 ± 2.1)、文献阅读(2.9 ± 1.6 vs. 5.3 ± 1.8)、论文写作(2.5 ± 2.3 vs. 5.3 ± 2.1)、PPT 制作(4.0 ± 1.2 vs. 6.4 ± 1.1)及诊断能力(3.6 ± 1.1 vs. 6.6 ± 0.8)五个方面均有显著性提高(P 均 <0.05)。参与讲座前,有 5 名学员发表过专业学术论文,参与英文文献汇报讲座后,先后共 10 名学员发表过专业学术论文,

但是前后对比并没有统计学差异 ($P>0.05$)。参与英文文献汇报讲座后, 100% (28/28) 的学员认为对阅读文献有帮助, 92.9% (26/28) 的学员认为对提升诊断水平有帮助, 85.7% (24/28) 的学员愿意主动参与英文文献汇报讲座。

结论: 英文文献汇报模式有助于提升放射专业住院医师规范化培训学员的临床能力、科研素养和综合素养, 为学员们今后的发展奠定基础。

PU-0612

基于 PACS 的数字化 CBL 联合 CDIO 教学法在放射科临床教学中的应用

刘曦、杨华、张德川、张琴、胡勤勤
重庆市中医院

目的 探讨基于 PACS 的数字化 CBL (案例教学) 联合 CDIO (构思-设计-实施-运作) 教学模式在放射科临床本科实习教学中的应用效果。**方法** 选取 2022 年 3 月至 2023 年 3 月在我院放射科轮转实习的 40 名临床本科生, 随机分为 20 例试验组 (实施基于 PACS 的数字化 CBL 联合 CDIO 教学法) 和 20 例对照组 (实施传统教学法), 分析比较两组学生出科考核成绩及问卷调查结果。**结果** 试验组的放射影像学理论知识、阅片能力及技术操作考核成绩, 均高于对照组 ($P<0.05$)。而在教学效果评价方面, 试验组的培养自主学习能力、激发学习热情和兴趣、培养批判性思维能力、增强沟通交流能力以及提高团队协作能力, 均高于对照组 ($P<0.05$)。**结论** 基于 PACS 的数字化 CBL 联合 CDIO 教学法在放射科临床本科实习教学中取得的效果显著, 值得推广应用。

PU-0613

浅析加强医学影像技术专业学生辐射安全与防护的重要意义

史晟先
吉林大学第一医院

目的: 近几年全国技术年会多次提出倡导辐射防护, 辐射防护可以说是目前影像技术实践工作中的重要环节。针对近几年入科学学生的实践学习情况, 学生往往更重视技术学习, 却忽略了辐射防护的培养。参与辐射安全与防护的实践活动, 多角度理解辐射安全与防护的基本理论, 和辐射安全与防护的相关法律法规, 增强辐射防护意识, 降低辐射对人类健康的影响等, 引导学生关注、思考、解决社会实际问题, 提升实践能力。**方法:** 学生通过对医院放射科检查患者发放调查问卷、现场检测辐射剂量的数据。让学生了解公众及相关从业人员对辐射安全及防护的认知状态, 并整理和分析数据。**结果:** 医院相关场所辐射防护水平符合国家相关标准; 公众对辐射及安全与防护意识并不全面, 医学影像技术等相关人员对辐射安全与防护知识掌握参差不齐, 从业和在岗期间的辐射相关培训效果不理想等。**结论:** 医学院校应重视医学影像技术专业学生的辐射安全与防护知识教育, 积极开展相关辐射课程, 参与社会辐射安全与防护实践活动, 提高学生辐射安全与防护理论知识和实践技能, 引导学生关注、思考、解决社会实际问题, 提升实践能力, 最后说明加强医学影像技术专业学生辐射安全与防护的教育具有重要意义。

2020 年某院放射住院医师年度考核的调查分析

姜楠、翁春娇、马新星、杨玲、胡春洪

苏州大学附属第一医院

目的 了解放射住院医师对临床技能规范化培训学习一年来的评价和意见,为今后做好放射科住院医师培训工作、提高培训效能、完善考核奖励机制提供帮助。方法 选择 42 名参加我院放射科 2020 年度考核的考生为研究对象,采用自行设计的“问卷星”调查进行匿名调研,了解并分析住院医师对带教师资、带教方式、理论课程、技能培训、工作强度、考核的组织安排、培训效果、住培待遇的满意度,并比较差异。采用 SPSS 21.0 软件进行信度、效度分析、单因素方差分析。结果 线上调查问卷发放总数为 42 份,回收有效问卷 42 份,回收率为 100%。信度分析克隆巴赫系数 (Cronbach's alpha) 为 0.884,结果可信。住院医师对年终考核组织安排满意度 100%,对我科带教满意度 100%,对年度考核监考满意度 100%,对我院住培培训计划安排满意度 92.9%,对我院住培待遇满意度 76.2%,自评培训效果和培训表现满意度 100%。结论 通过问卷调查结果分析,找出放射科住院医师规范化培训过程中带教、安排和培训的薄弱环节和考核过程需改进的地方,有利于针对性解决住培管理工作中存在的问题,促进住培年度考核工作的规范与进一步完善,提高培训质量和结业通过率。

PU-0615

虚拟仿真技术在《医学影像设备学》教学中的应用研究

张彩洁

辽宁何氏医学院

目的:探讨以虚拟仿真技术在医学影像技术专业医学影像设备学教学中的应用价值。方法:选择辽宁何氏医学院 2019 级、2020 级医学影像技术专业学生作为研究对象,以年级为单位进行分组,对照组采用《医学影像设备学》传统教学模式进行授课,即放射科检查室内“围观式”的临床实践教学,即带教老师带领学生在影像设备旁进行知识点讲解;实验组采取《医学影像设备学》虚拟仿真教学,采用虚拟仿真技术根据 1:1 的比例进行 3D 建模还原放射科大型医疗设备内部结构以及原理来进行实验教学。学生们可以利用虚拟仿真实验平台进入 DR、CT、MRI 设备虚拟仿真实训系统进行医学影像设备学的学习。期末进行效果评价,将实验组考试结果与采用传统教学方法的对照组的《医学影像设备学》考试成绩做比对,分析两种教学方法对学生《医学影像设备学》学习效果的影响。结果:将虚拟仿真技术引入医学影像设备学教学效果显著。结论:虚拟仿真技术的应用是辽宁何氏医学院智能影像学院一项教学方法的创新,将虚拟仿真教学引入医学影像设备学教学中,能够提高医学影像技术专业学生的学习兴趣,自主学习能力,分析问题及解决问题的能力以及动手操作能力,对院内其他专业采用虚拟仿真技术进行教学也具有一定的指导作用。

PU-0616

Structural improvement of crutches

Mingzhe Xie

XIANGYA HOSPITAL CENTRAL SOUTH UNIVERSITY

This paper focuses on the design concept of using 3D technology to improve the underarm crutches. The main improvements to the cane include the addition of two side shields for the support pads, a three-part retractable body tube, and a built-in spring.

The design concept was developed from user feedback by the quality function deployment (QFD) approach, QFD is a method of testing the functional design of a product. Six questions were

involved in the approach, namely target group, use scenario, time of use, root cause, solution, and improvement steps. Key factors and interrelationships were also considered in the QFD approach.

I Target group: Short-term crutch users who are unable to bear weight on their lower limbs or have fractures. Ages of use: all ages.

I Use scenario: Specific surfaces, including stairs, rainwater, uneven mud, and hills.

I Time of use: Any time of the day, for long and frequent use.

I Root cause: underarm and wrist pain, poor stability, difficult handling, inconvenient carrying, and storage.

I Solutions and improvement steps: Vary for different individuals. Therefore, the height of the crutches should be adjustable to suit the user. Since children, adolescents and the elderly will be using them, the crutches must be safe, easy to handle, and light in weight. Moreover, since there are many use scenarios, the crutches should provide more support to the user and be more portable, and high durability and replaceability of the wearable parts are necessary to ensure the frequent use of the crutches.

The final design solution was proposed to meet the requirements of high comfort, safety, mobility, durability, adjustability, portability, strength, support, and stability with an innovative appearance.

Design philosophy

Figure 3 is a flow chart that describes the manufacturing process of a novel crutch from a design concept to actual products. The design process concept is based on an improved approach to industrial design structures (IDeS). Following the conceptual designs, prototypes of the novel crutch were built and refined for optimal shape, structure. Finally, an experimental model was developed for product testing.

Structure of the 3D underarm crutch

Figure 4 shows the overall structure of the underarm crutch, which consists of three parts, including upper, middle and lower. The upper part includes the supporting pad, with guards on both sides, which are held in place by screws. The middle part consists mainly of the main body tube and the handle. The main tube is divided into three sections, each of which is linked to the other by screws. The end tube is designed as a Y-shaped structure with elastic springs placed inside the wall of the tube. The handle is divided into a handle inner tube and a handle bushing. The lower part consists of a supporting bar and a supporting foot. The supporting bar is slotted and threaded to link the main tube to the supporting foot and hold the spring in the Y-shaped tube wall. The average height of the world's population is 159.5 cm for women and 171 cm for men, and the highest and lowest average heights in the world are 184cm and 151cm, respectively. Moreover, the average height of children aged 12 years is approximately 150cm. Based on these data on human height, and using height measurement formula for crutches. This formula is reported to be the most accurate predictor of the appropriate crutch height. the appropriate height of the crutches was calculated to be approximately 109 cm to 144 cm (The crutch height formula equals User height less 40.6 cm). There was no significant increase in energy expenditure or walking speed when the cane height was within the appropriate ± 2.5 cm range. Furthermore, the structure of the components and the design foundations will be analyzed in separate sections.

Structure of 3D support pads and guards

Underarm pads with appropriate sizes are fixed to the top of the crutches, where they will be directly contacting the body. When the user is standing, the axillae will carry approximately 34% of the user's body weight. Therefore, the underarm pads must be comfortable while providing sufficient support.

The main structural difference between 3D supporting pads and conventional supporting pads is the curvature. 3D supporting pads have the same height at both ends and gradually decrease towards the centre simultaneously. The change in curvature allows the axilla to remain relatively level with the crutch supporting during the movement. However, conventional supporting pads

generally have a relatively flat supporting surface. When moving, the axilla is angled to the crutches.

Figure 5 shows the proposed 3D axillary pad model, which is an improved model based on the existing standard commercial axillary pad, the traditional model derived from Millenial Medical. Specifically, the inclination angles of the underarm pads towards the center on both sides are thickened and extended as honeycombs, offering better comfort and stability to the users. However, the final structural shape depends on the actual material, which is usually polyurethanes for underarm pads. They are stable materials with a light weight (36 kg/m) and resistance to high temperatures, but they are rather inflexible and vulnerable to tearing ((Nasruddin, Bondan & Agustini, 2020). The proposed 3D underarm pad will experiment on a new material named natural rubber SIR-20. This material has a high tear strength (8.50KN/M) and tensile strength (300%), but it is not structurally homogeneous (Nasruddin, Bondan & Agustini, 2020). Therefore, this study would attempt to optimize the thermoplastic polyurethane (TPU) structure as a feasible and preferred material for crutch manufacture. TPU has been used as the raw material to 3D-print hexagonal honeycombs using fused filament fabrication (FFF), and the printed structures exhibited higher energy absorption and deformation resistance.

Structure of the main body tube

The main body tube supports the crutch and connects the underarm pad to the crutch foot. Figure 6 shows a diagram of the structure of the main body tube and the position of the internal spring. The structure of the main tube is divided into three sections, with multiple screw holes in the wall for each, which can be combined to different lengths, based on the Riego design for a detachable walking stick. The first section has a raised column at the top to attach and secure the supporting pad. The second section links the handle, with the largest diameter and screw holes at both ends, to allow the insertion between the first and third sections of the tube. The third section is fitted with a spring inside threaded on the outer wall at the bottom, which is sealed by a threaded cap. By moving down the spring, the vibration and walking gait of the crutch can be reduced and altered, and the trajectory of the vertical ground reaction force can be reduced to a dominant peak. Meanwhile, a reverse force (GRF) is created by the elastic energy to propel the crutches. Shows the position of the spring inside the crutch. The spring crutches have been indicated to reduce the reaction force-velocity by approximately 33% and the reaction force pulse by approximately 20%. GRFs are created to reduce impact injuries to the hand and wrist. The key to a pair of good spring-loaded crutches is spring stiffness. If it is too high, GRFs will be too strong; if it is too low, the support will become insufficient

Structure of the grip

The grip consists of two parts. The internal handle is cylindrical in shape, threaded inwards at each end and can be screwed to the main body tube as shown in Figure 8. Crutch users often suffer from excessive hand stress and wrist disorders, which can be attributed to weight transfer to the upper limb. Studies have shown that when using crutches, the arm would endure a reaction force as large as approximately 40% of the body weight. Moreover, the risk of ulnar tunnel syndrome exists even when using axillary crutches for short periods. Therefore, reducing stress on the hand and wrist is essential to prevent such complications. Researchers have found that round and square grips are not effective in reducing the incidence of wrist syndrome. Moreover, ergonomically designed structures can significantly reduce wrist pressure.

Structure of the supporting bar and legs

Shows the structure of the proposed walking stick model, inspired by the design of Chiam and Sheng. The supporting rod is an important connecting component in the middle and lower part of the crutch, and the spring inside the wall of the top link tube provides support for the crutch as a compression spring. The upper part of the cylindrical supporting bar has the same larger diameter, as the spring. The rod is locked into the Y-shaped tube wall by tightening the threaded cap. The threaded rubber foot for crutches was invented at the end of the 18th century. The crutch foot is the only section that contacts the ground in a crutch, making it essential for better stability and

balance of the crutch as a whole. The lower part of the crutch foot is a thin cylinder with a recessed thread at the top, to enhance the connection to the supporting rod, with the gradually increasing diameter area from the top to the bottom. Higher stability is realized through a larger contact area with the ground. The small holes on the surface allow rainwater to be removed from slippery surfaces so that the adhesion to the ground can be maintained. And the threaded bottom further prevents slippage.

From the analysis of experiments and literature, it was concluded that. A new 3D axillary crutch structure has been designed. Compared to traditional axillary crutches, the main features of the new axillary crutch include: two side shields for the support pads; a three-stage body tube; an outer handle cover that better fits the shape of the human hand; a built-in elastic spring for the crutches; and the use of PTU material, produced by 3D printing.

PU-0617

眼眶周围异常结构的 X 线检查

刘晨阳

吉林大学白求恩第一医院

目的：眼眶 X 线检查可以显示眼眶的容积、眶壁、泪腺窝、视神经孔、眶上裂、蝶骨嵴和鼻窦的改变，适用于眼眶的外伤、眶肿瘤。

方法：普通胶片检查：常规轨道 X 射线普通胶片检查采用 23°鼻额投影。当需要了解视孔时，添加后 53°或前 37°斜侧投影。在正交胶片上：岩石骨可以避免与轨道重叠，但投射在上颌窦上，这有利于观察轨道和邻近的额窦和筛窦以及部分前颅骨和中颅低结构。观察期间应进行双边控制。正常的人类双侧骨轨道轮廓基本上是对称的，略呈方形。由于侧轨道边缘的倾斜结构，正交投影往往不清楚。轨道的侧壁上有一条倾斜的白线，这是额翼和蝶翼侧颞曲率的切向投影，通常被称为轨道斜线或匿名线。眼眶的正常眶顶，通常是脑回压迹增白影，骨缝的外眼眶壁有不规则的硬化和增白，不能被误认为是疾病，下眼眶通常略低于眼眶下边缘，中间可以看到椭圆形和眶下孔。在深的轨道上，有眶上裂缝被蝶骨的大翼和小翼包围，其中大多数是倒逗号形的光传输区域，正常两侧的形状和大小往往不同。光学孔隙：光学孔隙投影在轨道的外下象限，隐藏在蝶骨的腭骨底部。眶上裂缝位于其侧面，后筛窦位于其下内侧。当正常人的视神经前缘为 4-5 岁时，它已经达到了一个成人尺寸，内径为 4.9×5.3 毫米，椭圆形或圆形，有薄环和密集的骨边缘。

结论：

眼部 X 线检查临床上主要用于眼眶肿瘤、眼部外伤、眼内及眼眶金属异物等诊断与鉴别诊断，尤其是用于眼内金属异物及其他高密度异物的定位。

安宁市紧密型医共体与“千县工程”下医学影像中心赋能基层效应

王世平、刘再强、李骏、李晓鹏、唐熙皓

安宁市第一人民医院

目的：探讨安宁市紧密型医共体与“千县工程”下医学影像中心赋能基层构建模式，提升基层医疗服务能力。方法：1、收集国家及政府关于“紧密型医共体与“千县工程”下医学影像中心赋能基层”相关政策支持；2、采用现场核实、访谈及调查问卷等方式进行现状调查，明确影像中心及基层医院存在的问题。结果：1、国家政策各级政府的支持，《国家卫生健康委办公厅关于印发“千县工程”县医院综合能力提升工作方案（2021-2025 年）的通知》国卫办医函（2021）538 号；《云南省卫生健康委关于印发云南省“百县工程”县医院综合能力提升工作方案（2021-2025 年）的通知》；2、

现状：（1）基层医院影像人员不足，人员技术水平低；（2）基层医院缺乏影像同质化标准；（3）基层医院设备老旧、缺乏 CT 机器；（4）影像中心与基层医院影像数据信息化互联互通不畅。3、措施：实行资源共享，诊断医师多点执业，建立基层专工作站；指导基层医院开展 CT 扫描技术；打造县乡村一体化信息沟通平台；建立基层远程诊疗体系，扩建医共体区域影像信息平台；影像同质化管理。4、成效：（1）赋能后基层医院影像诊断符合率、车载移动 CT 设备开机率、患者满意度、临床工作人员满意度及影像工作人员满意度均呈正向提升；（2）赋能后影像中心 DR、CT 及 MRI 平扫、增强检查人次和介入手术台次呈逐年上升趋势。结论：安宁市紧密型医共体与“千县工程”下医学影像中心赋能基层模式的构建，通过人员、设备、技术的赋能，提升基层诊断符合率及设备利用率，最终提升基层医疗服务能力。

基于 XR 的具身化教学方式在放射科规范化培训中的应用

尉胜男

空军军医大学西京医院

目的：探讨基于 XR 的具身化教学方式在住院医师放射科规范化培训中的应用价值。方法：选取神经内科、骨科、儿科专业的规培学员各 20 名，将 60 名学员分成 2 组，每组 30 人，由各专业随机抽取的 10 人组成；对照组采取传统方式教学，试验组则充分利用 XR 资源开展混合式学习；通过闭卷考试和问卷调查等方法对两组进行教学效果评价。结果：采取基于 XR 的具身化教学方式的试验组学员考试成绩为（84.5±5.8）分，采取传统教学方式对照组学员考试成绩为（77.3±6.2），差异有统计学意义（ $P<0.05$ ）；回收问卷 60 份，试验组总分（21.8±5.6）分，对照组（16.2±7.2）分，差异有统计学意义（ $P<0.05$ ）。结论：将基于 XR 的具身化教学方式运用于住院医师的放射科规培教学中，对医学影像翻转课堂教学实现具身化升级，增加学习过程的沉浸性、趣味性、交互性和构想性，重构虚实融生的具身化医学影像教学场景，帮助规培学员更快速有效地建立起“整体与断层、正常与异常、病理到影像”的医学影像逻辑思维和空间想象力，深度强化影像医师核心专业能力，促进学员学习兴趣和教学效率同步提高，学习效果显著提升。

PACS 联合人工智能在影像本科实习教学中的应用

汪洁、李小虎、余永强

安徽医科大学第一附属医院

目的 评估图像存储与传输系统（picture archiving and communication system, PACS）联合人工智能（artificial intelligence, AI）模式在影像本科实习教学中的应用效果。方法 2022 年 1 月至 2023 年 1 月，选取于安徽医科大学第一附属医院影像科实习的影像专业本科生 80 名作为研究对象，随机分成研究组和对照组（每组 40 人），研究组实施 PACS 联合 AI 教学模式，对照组实施传统带教模式。通过实践技能考核和问卷调查评价教学效果。结果 研究组学员总成绩和分项成绩（报告书写规范性、影像诊断思路、专业技术知识）高于对照组（ $P<0.05$ ）。研究组学员对新型带教模式的认可度（学习兴趣激发、读片技能提升、影像诊断思维培养）较对照组更高（ $P<0.05$ ）。结论 PACS 联合 AI 的教学效果优于传统实习带教模式。

Discussion on PBL combined with CBL teaching mode based on PACS in undergraduate practice teaching of medical imaging

long sheng wang

the Second Affiliated Hospital of Anhui Medical University

Objective To explore the method of problem-based learning (PBL) combined with case-based learning (CBL) based on PACS to improve the effect of medical imaging undergraduate practice teaching. **Methods** To select 14 undergraduate students majoring in imaging from July 2021 to June 2022 in the radiology department of the Second Affiliated Hospital of Anhui Medical University. According to the teaching outline of undergraduate internship in imaging, two groups of cases were randomly selected according to the traditional teaching mode and the PBL combined CBL teaching mode based on PACS, which were taught by the same teacher. The teaching effects of the two groups were compared, and the satisfaction of the two teaching modes was investigated by questionnaire. **Results** Compared with the traditional teaching mode, PBL combined with CBL based on PACS has obvious advantages in stimulating students' interest in learning, deepening the understanding of basic image knowledge and grasping image signs, enhancing students' ability to analyze and solve problems, cultivating their thinking of image diagnosis and improving their practical ability, and the differences are statistically significant ($P < 0.001$). According to the questionnaire survey, students are generally satisfied with PBL combined with CBL based on PACS, with a satisfaction rate of 100%, which is significantly higher than the traditional teaching mode. **Conclusions** The PBL combined with CBL teaching method based on PACS is a scientific and effective teaching mode, which can obviously improve the teaching effect of undergraduate practice in imaging.

PU-0622

开展职业生涯规划教育对放射医学技术专业学员挫折教育情境现状及影响因素的调查分析

李彬

孝感市中心医院

摘要：临床放射医学技术性实践工作，是贯穿整个临床放射医学技术专业教学中重要的组成部分，也是临床放射医学技术专业学生在巩固与加强理论知识的同时，培养其具有独立工作能力的一个重要性阶段。这是继学校理论知识教育的深化和延续，但在现实培养教育工作中，临床放射医学技术专业教学质量受到来自多方面因素的影响。通过本调查研究分析发现，临床放射医学技术专业学生自身的理论知识储备量，以及临床带教老师专业性技能的熟练程度和患者所具有的个人素质等多方面因素，这些都有可能影响到临床放射医学技术专业教学中的整体质量，所以要针对这些特定性因素，如何在日常的临床实践工作中去加强人文关怀？如何正确引导临床放射医学技术专业学生的学习态度？又如何去给临床放射医学技术专业实习学生们创造更多的临床实践机会？这些都是当前在临床教学工作中所要面对的新问题，在深化理论知识学习的同时应加强临床一线师资队伍的建设，完善优化临床教学方法，将有效提高临床放射医学技术专业带教工作的质量。

双导师制结合比较影像学在医学影像实习教学中的

胡德尧、陈杰、梁正荣
曲靖市第二人民医院

目的 探讨双导师制结合比较影像学的教学模式在影像科实习带教中的应用价值。方法 选择在曲靖市第二人民医院医学影像科实习的 2016、2017 级医学影像专业五年制本科学生作为研究对象,其中对照组为 2016 级 10 名同学,采用双导师制的教学模式,2017 级 9 名学生为研究组,采用双导师制结合比较影像学的教学方法,实习结束后对比分析两组学生的出科理论考试成绩、技能操作成绩、影像报告书写的成绩。结果 试验组实习同学对教学的效果评价、理论成绩、技能操作成绩、影像报告书写成绩及总成绩均高于对照组,差异具有统计学意义 ($P < 0.01$)。结论 双导师制结合比较影像学的临床带教模式可以提高实习同学的理论知识水平及临床实践能力,是培养能够胜任医院医学影像科工作的影像专业人才的最佳途径,能够帮助医学生很快向名副其实的影像医生角色转换。

Dow-regulation of CtBP2 inhibits proliferation, migration and invasion of Caki-1 cells in vitro

Qi Lv, Peijun Wang
Shanghai Tongji Hospital

Clear cell renal cell carcinoma (ccRCC) has been associated with the highest mortality rates. CtBP2 is a member of CtBP family, which works as a transcription regulator protein and is identified because of its interaction of C-terminus of the adenovirus E1A oncoprotein. CtBP2 modulates several tumorigenic processes, including growth, proliferation, and invasion in a variety of cancer cells. Over-expression of CtBP2 is associated with tumorigenesis and poor clinical outcome of prostate cancer, and low-expression of CtBP2 inhibited the proliferation of prostate cancer cells. In this report, the expression of CtBP2 in human ccRCC cell line Caki-1 was down-regulated by using RNAi lentivirus in vitro. The growth of Caki-1 cells was assessed by using CCK-8 and clone formation assays; the cell cycle was determined by FACS analysis, and the number of cells in S-phase was also accessed using an EdU assay. After 72 h, 96 h, and 120 h of culturing in 96-well plates, OD450nm values of the CtBP2-RNAi cells were significantly lower than those of the control group. The clone forming efficiency of the CtBP2-RNAi group was significantly decreased compared to that in control group. The proportion of cells in S-phase in the CtBP2-RNAi group was lesser than that in the control group, while the proportion of cells in G2/M-phase in the CtBP2-RNAi group was greater than that in the control group. Down-regulation of CtBP2 also impeded cell migration and invasion, as determined using wound healing and cell invasion assays. These results indicated that down-regulation of CtBP2 inhibited the cell proliferation ability and arrested the cell cycle at G2/M-phase, also lead to decreased migration, and invasion of Caki-1 cells in vitro, and CtBP2 might be a potential target to suppress tumorigenesis of ccRCC.

基于动态功能连接研究脑白质高信号程度与认知功能的相关性

冯田钰怡

上海市第五人民医院

目的

本研究基于静息态功能磁共振数据,通过动态功能连接研究 WMH 不同严重程度与认知功能的关系,旨在揭示其可能的神经功能机制。

方法

本研究根据脑白质高信号 Fazekas 等级量表将所有 WMH 受试者分为轻度 WMH 组及重度 WMH 组:

(1) Fazekas 评分为 1-2 分:轻度 WMH 患者 (n=55);(2) Fazekas 评分为 3-6 分:重度 WMH 患者 (n=30)。使用独立成分分析 (ICA) 方法获得受试者的静息态脑连接网络 (ICNs);采用滑动时间窗分析方法获得静息态脑连接网络动态功能连接矩阵;获得动态功能连接状态 (state) 以及时间特性指标 (时间分数、平均滞留时间、转换次数)。比较两组受试者的动态功能连接时间特性的差异。采用 Pearson 相关性分析探究 WMH 患者动态功能连接时间特性参数与脑白质高信号 Fazekas 等级评分的关系。

结果

年龄是影响 WMH 严重程度的重要因素,重度 WMH 患者年龄明显大于轻度 WMH 患者。WMH 患者显示四种动态功能连接状态 (state 1: 中等功能连接模式, state 2: 弱功能连接模式, state 3: 中等功能连接模式, state 4: 强功能连接模式)。在四种状态中,WMH 患者弱功能连接 state 2 出现频率最高 (29%),强功能连接 state 4 出现频率最低 (20%)。与轻度 WMH 患者相比,重度 WMH 患者在弱功能连接 state 2 中的平均滞留时间较长,在强功能连接 state 4 中的平均滞留时间较短,在 state 3 中的平均滞留时间明显更长。WMH 严重程度一定程度上可能由动态功能连接时间特性反映,表现在 WMH 患者状态间的转换次数与脑白质高信号 Fazekas 等级评分呈负相关。

结论

本研究认为 WMH 不同严重程度患者可能是通过影响动态功能连接时间特性来影响患者认知功能,动态功能连接对于揭示 WMH 不同严重程度和认知功能的关系有一定的提示作用。

PU-0626

表现为磨玻璃密度结节的肺腺癌的 CT 影像分析

魏春晓

上海市第五人民医院

目的:提高对表现为磨玻璃密度结节的肺腺癌 CT 影像认识。

方法:收集我院 2012 年 1 月到 2019 年 12 期间经手术切除、病理诊断为肺腺癌的 CT 影像及临床资料,筛选出磨玻璃密度表现病灶,按照 2011 年肺腺癌国际多学科分类标准,浸润前病变 18 例 (非典型增生 7 例,原位腺癌 11 例),微浸润性腺癌 12 例,浸润性腺癌 33 例,记录分析三组的部位、大小、边缘特征 (毛刺、分叶、胸膜凹陷征、血管集束征),内部特征 (空泡征、支气管改变、实性成分)。

结果:浸润前病变组年龄平均为 (53.94±12.28) 岁,微浸润性腺癌组为平均 (61.08±9.53) 岁,浸润性腺癌组 (62.21±10.18) 岁,浸润前病变组年龄小于微浸润及浸润腺癌组,且差异有统计学意义 (P<0.05),浸润前病变与微浸润性腺癌组、微浸润性与浸润性腺癌组差异均无统计学意义 (P>0.05);发病性别、部位无明显差异 (P>0.05),但三组均女性多于男性,发病部位右肺多于左肺;浸润前病变组大小平均为 (0.76±0.40) cm,微浸润性腺癌组为 (1.18±0.23) cm,浸润性腺癌组 (1.75±0.56) cm,三组间均存在统计学差异 (P<0.05);三组病变边缘特征 (毛刺、分叶、胸膜凹陷征、血管集束征) 及内部特征支气管改变、有无实性成分等均有统计学差异 (P<0.05),空泡无统计学差异 (P>0.05)。

结论:对磨玻璃密度结节大小、边缘特征 (毛刺、分叶、胸膜凹陷征、血管集束征) 及内部特征 (支气管改变、有无实性成分)、发病年龄的分析,有助于提高浸润性肺腺癌的诊断。

PU-0627

脑近期皮质下小梗死演变结局的相关因素分析

赵小虎

复旦大学附属上海市第五人民医院

目的 分析脑近期皮质下小梗死(RSSI)演变结局及相关因素。**方法** 收集 2015 年 1 月至 2018 年 12 月上海市同济医院住院治疗的 96 例小动脉闭塞型 RSSI 患者,男 60 例、女 36 例,年龄 64.5(58~73)岁,随访间隔时间 11.6(6.3~11.8)个月。记录患者入院时临床信息、基线头颅 MRI 影像资料及随访时梗死灶演变结局。根据 RSSI 结局转归,将患者分为腔化组(腔隙灶)和非腔化组(脑白质高信号和梗死灶消失),统计分析相关因素。**结果** (1)96 例 RSSI 随访时,59 例(61.5%)腔隙灶,32 例(33.3%)脑白质高信号,5 例(5.2%)梗死灶消失。(2)腔化组 RSSI 的 DWI 和 T2WI 梗死灶最大直径高于非腔化组[11.6(9.9~16.6)比 8.6(6.9~13.0)mm,11.8(9.7~16.2)比 8.8(6.7~13.1)mm],男性比例低于非腔化组(54.2%比 75.7%)($P<0.05$)。(3)二分类 Logistic 回归结果显示,DWI 梗死灶最大直径是腔化的独立预测因素($P=0.022$, $OR=1.138$)。梗死灶最大直径量化分析显示,DWI 最大直径 >15 mm 组腔化风险是直径 ≤ 10 mm 组 7.5 倍($P=0.010$, $OR=7.464$),直径 10~15 mm 组腔化与非腔化概率差异无统计学意义($P=0.129$, $OR=2.444$)。**结论** 本研究中 RSSI 多演变为腔隙灶(61.5%),部分演变为脑白质高信号或梗死灶消失(38.5%)。梗死灶 DWI 直径越大,腔化可能性越大

PU-0628

Brain network hierarchy reorganization in Alzheimer's disease: a resting-state functional magnetic resonance imaging study

Qili Hu

Shanghai Fifth People's Hospital

Abstract

Background: Hierarchy is a fundamental organizational principle of the human brain network. Whether and how the network hierarchy changes in Alzheimer's disease (AD) remains unclear.

Purpose: To explore brain network hierarchy alterations in AD and their clinical relevance.

Methods: 49 healthy controls (HCs), 49 patients with mild cognitive impairment (MCI), and 49 patients with AD were included. The brain network hierarchy of each group was depicted by connectome gradient analyses. We assessed the network hierarchy changes by comparing the gradient values in each network across the AD, MCI and HC groups. Whole-brain voxel-level gradient values were compared across the AD, MCI and HC groups to identify abnormal brain regions. Finally, we examined the relationships between altered gradient values and clinical features.

Results: In the secondary gradient, the posterior default mode network (DMN) gradient values decreased significantly in patients with AD compared with HCs. Regionally, compared with HCs, both MCI and AD groups showed that most of the brain regions with increased gradient values were located in anterior DMN, while most of the brain regions with decreased gradient values were located in posterior DMN. The decrease of gradients in the left middle occipital gyrus was associated with better logical memory performance. The increase of gradients in the right middle frontal gyrus was associated with lower rates of dementia.

Conclusion: The network hierarchy changed characteristically in patients with AD and was closely related to memory function and disease severity. These results provide a novel view for further understanding the underlying neuro-mechanisms of AD.

PU-0629

Large-Scale Granger Causal Brain Network based on Resting-State fMRI data

Xiaohu Zhao

The Fifth People's Hospital of Shanghai, Fudan University

The causal connections among small-scale regions based on resting-state fMRI data have been extensively studied and a lot of achievements have been demonstrated. However, the causal connection among large-scale regions was seldom discussed. In this paper, we applied global Granger causality analysis to construct the causal connections in the whole-brain network among 103 healthy subjects (33 M/66F, ages 20–23) based on a resting-state fMRI dataset. We further explored four large-scale cognitive networks which have been widely known: central executive network (CEN), default mode network (DMN), dorsal attention network (DAN) and salience network (SN). These four cognitive networks are particularly important for understanding higher cognitive functions and dysfunction. Based on the above research, Out-In degree were introduced to identify the driving and driven hubs. Studying the driving and driven hub of brain network is of great significance for assessing the functional mechanism of the brain network. There were 817 directed edges identified as significant among the 8010 possible causal connections; seven driving hubs and ten driven hubs were identified in the whole-brain network. In CEN, dorsolateral prefrontal cortex (DIPFC) and superior parietal cortex (SPC) were the driven and driving hubs, respectively; in DMN, they were posterior cingulate cortex (PCC) and medial prefrontal cortex (MPFC); in DAN, they were frontal eye fields (FEF) and intraparietal sulcus (IPS); and in SN, they were frontoinsula cortex (FIC) and medial frontal cortex (MFC). These findings may provide insights into our understanding of human brain function mechanisms and the diagnosis of brain diseases.

PU-0630

Description length guided nonlinear unified Granger causality analysis

Xiaohu Zhao

The Fifth People's Hospital of Shanghai, Fudan University

Most Granger causality analysis (GCA) methods still remain a two-stage scheme guided by different mathematical theories, both can actually be viewed as the same generalized model selection issues. Adhering to Occam's razor, we present a unified GCA (uGCA) based on the minimum description length principle. In this research, considering the common existence of nonlinearity in functional brain networks, we incorporated the nonlinear modeling procedure into the proposed uGCA method, in which an approximate representation of Taylor's expansion was adopted. Through synthetic data experiments, we revealed that nonlinear uGCA was obviously superior to its linear representation and the conventional GCA. Meanwhile, the nonlinear characteristics of high-order terms and cross terms would be successively drowned out as noise levels increased. Then, in real fMRI data involving mental arithmetic tasks, we further illustrated these nonlinear characteristics in fMRI data may indeed be drowned out at a high noise level, and hence a linear causal analysis procedure may be sufficient. Next, involving autism spectrum disorder patients data, compared with conventional GCA, the network property of causal connections obtained by uGCA methods appeared to be more consistent with clinical symptoms. In previous studies on functional brain networks, we have proposed a linear unified Granger causality analysis (uGCA) method based on description length. Considering that functional brain image data is characterized by nonlinear non-stationary signals with complex

long- and short-range correlations, we thus proposed a nonlinear uGCA method. Then through simulated data experiments and logical self-consistent fMRI experiments, its causality identification performance was demonstrated to be superior to that of conventional GCA. At the same time, we further revealed the phenomenon that nonlinear high-order characteristics and nonlinear cross characteristics were submerged successively at high noise levels, indicating that linear modeling procedures might be sufficient to cope with causality studies based on fMRI data

PU-0631

Increased Intrinsic Default-mode Network Activity as a Compensatory Mechanism in aMCI: A Resting-state Functional Connectivity MRI Study

Yunfei Li

Shanghai Fifth People's Hospital

Numerous studies have investigated the differences in the mean functional connectivity (FC) strength between amnesic mild cognitive impairment (aMCI) patients and normal subjects using resting-state functional magnetic resonance imaging. However, whether the mean FC is increased, decreased or unchanged in aMCI patients compared to normal controls remains unclear. Two factors might lead to inconsistent results: the determination of regions of interest and the reliability of the FC.

We explored differences in FC and the degree centrality (Dc) constructed by the bootstrap method, between and within networks (default-mode network (DN), frontoparietal control network (CN), dorsal attention network (AN)), and resulting from a hierarchical-clustering algorithm.

The mean FC within the DN and CN was significantly increased ($P < 0.05$, uncorrected) in patients. Significant increases ($P < 0.05$, uncorrected) in the mean FC were found in patients between DN and CN and between DN and AN. Five pairs of FC (false discovery rate corrected) and the Dc of six regions (Bonferroni corrected) displayed a significant increase in patients. Lower cognitive ability was significantly associated with a greater increase in the Dc of the left superior temporal sulcus.

Our results demonstrate that the early dysfunctions in aMCI disease are mainly compensatory impairments.

PU-0632

终末期肾病维持性血液透析患者脑结构及功能改变的 MRI 研究

韩雍

上海市第五人民医院

目的: 联合应用基于体素的形态学测量 (VBM) 技术与平均比率低频振幅 (mfALFF) 方法分析维持性血液透析的终末期肾病 (ESRD) 患者大脑结构与功能的改变。

方法: 选取 2020 年 1 月至 2021 年 1 月于进行维持性血液透析的 ESRD 患者 43 例, 同期招募健康志愿者 (HC 组) 33 例。获取所有受试者神经心理学测试结果及 3DT1WI、rs-fMRI 数据。获得两组受试者间脑灰质体积 (GMV) 及平均 fALFF (mfALFF) 值有统计学差异的脑区。

结果: ESRD 维持性血液透析患者与 HC 组比较, 两组间年龄 ($t=0.101$, $P=0.920$)、性别 ($\chi^2=0.482$, $P=0.488$)、受教育程度 ($t=-1.842$, $P=0.069$) 差异均无统计学意义。与 HC 组相比, 维

持性血液透析的 ESRD 患者 MoCA 评分明显减低 ($p < 0.001$)。与 HC 组相比, 维持性血液透析的 ESRD 患者 GMV 值减低的脑区为: 左侧颞上回、左侧颞中回、左侧楔前叶、左侧中央前回、左侧后扣带回、右侧额上回、右侧额中回、右侧额下回、右侧颞中回 ($p < 0.05$); 平均 fALFF (mfALFF) 值减低的脑区为: 左侧颞上回、左侧额上回、左侧额中回、左侧额下回、左侧中央后回、左侧前扣带回、左侧枕中回、右侧楔前叶 ($p < 0.05$)。

结论: 本研究结果提示 ESRD 维持性血液透析患者疾病进展与代偿同时进行, 从结构与功能的视角揭示了早期干预治疗的可行性和必要性。

7T GluCEST MRI 和 rs-fMRI 对辐射诱导脑损伤的临床前监测: MRI 引导 OAR 回避的探索性研究

李国栋^{1,2}、刘岩²、刘彩云¹、黄丹琪¹、刘伽¹、王旭¹

1. 滨州医学院附属医院核医学科

2. 滨州医学院医学影像学院

目的: 谷氨酸化学交换饱和转移 (GluCEST) 已被证明是一种有前途的无创成像技术, 用于分析各种脑部疾病。CEST 效应能够提供胶质瘤、转移瘤、脑膜瘤等脑肿瘤代谢信息, 更准确了解肿瘤浸润程度, 为临床治疗和鉴别诊断提供参考价值。然而, 较少研究通过 CEST 调查放射性脑损伤 (RBI) 中危及器官 (OAR) 的代谢信息。此外, 磁共振引导放疗期间, RBI 早期缺乏异常解剖信息无法通过观察结构变化来识别损伤。因此, 评估全脑放疗 (WBRT) 后 GluCEST 作为 RBI 成像标志物的价值, 并展示 MRI 引导下回避 OAR 的可行性。此外, 这项研究的另一个目的是估计谷氨酸的变化是否与 rs-fMRI 观察到的大脑活动有关。

方法: 将大鼠分为两组: 对照组 (CTRL, $n = 9$) 和辐射诱导脑损伤组 (RBI, $n = 9$)。RBI 组大鼠用 X 线辐射器照射, 然后在 4 周后进行水迷宫实验。7T 小动物 MRI 获取 GluCEST 成像和静息态功能磁共振成像 (rs-fMRI), 评估大脑谷氨酸水平和功能异常。最后, 使用高效液相色谱 (HPLC) 测量海马的谷氨酸水平。

结果: 在水迷宫试验中, RBI 大鼠空间探索的时间和路径长度百分比显著降低 ($P < 0.05$)。大脑皮层和海马的平均 GluCEST 值显著降低 ($P < 0.05$)。HPLC 在海马表现出显著差异 ($P < 0.01$), 并与 GluCEST 值呈正相关。同样, RBI 组区域一致性 (ReHo) 的降低值 ($P < 0.01$), 表明大脑皮层和海马的神经元活动减少。RBI 大鼠的 GluCEST 值分别与神经元功能和空间记忆呈正相关。

结论: GluCEST 在 RBI 的早期阶段可视化监测谷氨酸的变化。此外, GluCEST 和 rs-fMRI 之间代谢/功能具有相关性。GluCEST 可能是监测放射治疗中 RBI 和 OAR 回避的敏感生物标志物, 便于放疗后辐射损伤的早期监测和早期干预。

PU-0634

新型抗氧化损伤与 NETs 清除纳米颗粒 用于干预缺血性脑卒中的炎症与神经损伤

侯振宇

东南大学附属中大医院

目的: 为了治疗脑缺血再灌注期间 NETs 介导的脑血管和神经损伤, 我们迫切需要设计具有高生物相容性的强 NETs 清除剂和抗氧化剂。因此我们设计了一种基于生物活性沸石咪唑盐骨架-8 的骨架, DNase-1 内封于其中, 并用 PDA 外包 (DNase-1@ZIF-8@PDA), 以实现 NETs 的直接和间接清除, 同时在抗氧化剂的作用下提高中风的治疗效果。

方法和材料：将 5mg 的 DNase-1 加入 5ml 的 2-甲基咪唑 (25.6mM, 溶于水溶液) 中, 搅拌 15 分钟。然后向混合溶液中加入 5ml 的 25.2mM 的 $\text{Zn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ 水溶液, 并在室温下再搅拌 20 分钟。将产品以 12000rpm 离心 10 分钟, 然后用水洗涤三次。最后的 DNase-1@ZIF-8 用 PDA 搅拌 12 小时, 以 12000rpm 离心 10 分钟, 用水洗涤三次, 得到最终产物。

结果：该纳米系统增强了脑组织的积聚, 具有良好的清除 NETs 和 ROS 的能力, 有效抑制了大脑中动脉闭塞小鼠脑组织中的脂质过氧化, 减少了脑组织中神经元的氧化损伤和凋亡。DNase-1@ZIF-8@PDA 还通过抑制星形胶质细胞的活化和促炎细胞因子的分泌来抑制炎症和免疫反应诱导的损伤, 从而在神经保护治疗中实现令人满意的预防和治疗。

结论：在本研究中, 我们合理的设计和合成了 ZIF 封端 DNase-1@ZIF-8@PDA, 其具有增强的抗氧化活性和清除 NETs 的能力。DNase-1@ZIF-8@PDA 可以直接消除卒中部位过量的 ROS, 并以直接和间接的方式抑制卒中区域 NETs 的产生, 从而在缺血性卒中的神经保护治疗中实现令人满意的高安全性预防和治疗。总之, 本研究不仅为原位合成以 ZIF 为生物活性表面修饰、DNase-1 为功能核心的协同纳米疗法提供了一种新方法, 而且揭示了缺血性脑卒中再灌注损伤的神经保护应用机制。

PU-0635

全氟化碳纳米粒调节肝癌乏氧增效索拉非尼疗效及成像研究

章志伟、居胜红
东南大学附属中大医院

目的：在我国, 原发性肝癌是第四位常见恶性肿瘤及第二位肿瘤致死病因。由于肝癌起病隐匿, 首次诊断时只有不到 30% 的肝癌患者适合接受根治性治疗, 系统抗肿瘤治疗在中晚期肝癌的治疗过程中发挥重要的作用。索拉非尼 (Bay 43-9006) 是最早用于肝癌系统抗肿瘤治疗的分子靶向药物, 也是我国的一线抗肿瘤方案。原发性肝癌的临床索拉非尼治疗受肝癌内乏氧环境影响, 乏氧能激活肝癌细胞内缺氧诱导因子表达, 进而通过多种下游通路引起肝癌的索拉非尼耐药性, 因而, 改善肝癌乏氧微环境对克服索拉非尼耐药性具有潜在意义。

方法：因此, 本研究采用全氟化碳作为核心, 并融合巨噬细胞膜作为生物伪装, 构建了载氧载药纳米脂质体 CM@SF&PFC。其中全氟化碳能很好溶解氧气, 兼具良好生物安全性, 是氧气递送的良好载体; 脂质体材料状态稳定, 可用于体内负载递送索拉非尼药物; 巨噬细胞膜与脂质体融合, 可帮助纳米材料在体内的生物伪装, 并具备一定同源靶向性。

结果：最终制备了稳定的纳米级载氧载药脂质体材料, 并在体外验证了材料的稳定性和氧递送能力, 在细胞水平验证材料的细胞摄取, 以及改善乏氧培养条件下肿瘤细胞内缺氧的能力, 和在此基础上增强索拉非尼杀伤克服耐药性的能力。

结论：本研究所设计的纳米材料 CM@SF&PFC 在体外很好得改善了肿瘤细胞的乏氧, 并增强了索拉非尼的杀伤效果。

PU-0636

Multifunctional PVCL nanogels enable magnetic resonance imaging and immunostimulated radiotherapy of orthotopic glioblastoma

Meijuan He
shanghai general hospital

Glioblastoma multiforme (GBM) is the most aggressive malignant brain tumour with a high incidence and a low 5-year survival rate. Currently, despite multimodal treatment approaches that include surgical debulking of the tumour with subsequent RT or / and chemotherapy with temozolomide (TMZ), the overall survival time of patients remains unsatisfying. Radiotherapy (RT) is an indispensable way to improve the clinical symptoms of GBM and improve its survival rate. However, GBM cells are resistant to RT, which limited the efficient therapeutic effects of radiotherapy against GBM. Hence, it is necessary to develop a suitable treatment to improve anti-glioblastoma efficiency based on RT. The emergence of immunotherapy has afforded new therapeutic methods in cancer. Synergy between RT and immunotherapy in the treatment of advanced malignancies has aroused great attention. Irradiation-generated DNA fragments can lead to the secretion of type-I interferons (IFN-I) and enhance antitumour immunity induced by RT. Irradiation can also promote the release of cytokines and chemokines that strengthen the infiltration of DCs, natural killer cells, and CD8+ T cells into the tumour microenvironment. Therefore, combining RT and immunotherapy has emerged as an appealing approach for tumour elimination.

PU-0637

基于纳米碳联合热疗与化疗协同抑制乳腺癌细胞增殖及淋巴转移

闫海丽、高龙、杜江锋

山西医科大学第一医院

目的：本研究旨在探讨基于临床批准的淋巴示踪剂碳纳米混悬注射液（CNSI）的热疗和化疗对小鼠 4T1 乳腺癌细胞增殖以及迁移的影响。

方法：利用紫外分光光度计检测透析外液在 480 nm 处的吸光度并计算 THP 的累计释放量，绘制药物累计释放曲线。细胞层次通过 CCK-8、细胞划痕实验以及克隆形成实验评估 CNSI/THP 对小鼠 4T1 乳腺癌细胞的杀伤效果。通过 CCK-8 以及死活染色实验评估 CNSI/THP 联合 NIR-II 区光热对肿瘤细胞的杀伤效果。淋巴示踪以及光声成像性能评估：肉眼直视下将 CNSI 注入小鼠腋下淋巴结，观察并记录淋巴引流方向以及淋巴结染黑情况。利用多光谱光声断层扫描仪评估 CNSI 在肿瘤以及前哨淋巴结的光声成像性能。

结果：室温搅拌 20 小时后，THP 载药量可达 0.7 mg/mg。37 °C 摇床孵育 12 小时后，CNSI/THP 的累计释药量约为 22.9%。划痕实验以及克隆形成实验结果表明，CNSI/THP 可以显著抑制 4T1 三阴性乳腺癌细胞的迁移（ $34.9 \pm 1.1\%$ vs $25.3 \pm 1.8\%$ ， $P < 0.05$ ）和增殖（ $100 \pm 4.3\%$ vs $24.8 \pm 4.6\%$ ）。CCK-8 和死活染色实验进一步证实 CNSI 具有优异的光热性能，联合蒽环类化疗药物 THP 可协同抑制 4T1 三阴性乳腺癌细胞的增殖，并诱导最严重的肿瘤细胞死亡。活体水平证实了 CNSI 的淋巴示踪功能，且呈浓度依赖性和时间依赖性；明确了小鼠从腋下淋巴结到腋窝固有淋巴结的淋巴引流路径。体内外光声成像结果显示 CNSI 具有光声成像性能，瘤内以及瘤周注射 CNSI 后，4T1 原发肿瘤以及腋窝固有淋巴结部位的光声信号显著增强。

结论：本研究制备了集微波增敏、NIR-II 区光热、化疗以及光声成像于一体的新型多功能 CNSI/THP 纳米制剂，并联合热消融协同抑制小鼠 4T1 三阴性乳腺癌细胞的增殖和迁移。

In Situ Formed Z-Scheme Graphdiyne Heterojunction Realizes NIR-Photocatalytic Oxygen Evolution and Selective Radiosensitization for Hypoxic Tumors

Haili Yan, Jiangfeng Du

The First Hospital of Shanxi Medical University

Photon radiotherapy is a common tool in the armory against tumors, but it is limited by hypoxia-related radioresistance of tumors and radiotoxicity to normal tissues. Here, we constructed a spatiotemporally controlled synergistic therapy platform based on the heterostructured CuO@Graphdiyne (CuO@GDY) nanocatalyst for simultaneously addressing the two key problems above in radiotherapy. First, the in situ formed Z-scheme CuO@GDY heterojunction performs highly efficient and controlled photocatalytic O₂ evolution upon nearinfrared (NIR) laser stimulation for tumor hypoxia alleviation. Subsequently, the CuO@GDY nanocatalyst with X-ray-stimulated Cu⁺ active sites can accelerate Fenton-like catalysis of ·OH production by responding to endogenous H₂O₂ for the selective killing of tumor cells rather than normal cells. In this way, the sequential combination of NIR-triggered photocatalytic O₂ production and X-ray-accelerated Fenton-like reaction can lead to a comprehensive radiosensitization. Overall, this synergism underscores a controllable and precise therapy modality for simultaneously unlocking the hypoxia and non-selectivity in radiotherapy.

新型光磁双模态超粒子在评估与调节肿瘤相关巨噬细胞中的应用研究

苗莹莹、王爽、柳林、张卜天
吉林大学中日联谊医院

目的：受限于肿瘤相关巨噬细胞（TAM）的影响，免疫治疗仅对部分肿瘤患者有令人惊讶的效果。因此，体内动态 TAM 成像在患者定制免疫治疗中至关重要，它可以识别将从免疫治疗中受益的患者，监测治疗效果，并改变 TAM 的极状态，是提高免疫治疗效果的一种有前途的策略。在这项工作中，我们开发了一种针对 TAM 的治疗诊断碳点/Fe₃O₄ 超粒子，以期实现肿瘤相关巨噬细胞的评估与调节。

方法：取 50mg IR-813 对甲苯磺酸盐，溶于 10ml 聚乙二醇（PEG 400）中，将混合液加入 100ml 反应釜中，加热至 180℃，8 小时；然后用 0.22um 滤膜过滤，然后 10000rpm*15 分钟，弃去上清液，通风橱干燥后得到固体碳点。将 5mgCds、5mgFe₃O₄ 和 40mgDSPE-PEG-甘露糖溶解在 5ml 甲苯中，按 1:1:8 的比例，超声混合 20 分钟，然后将混合物加入到装有 50ml 去离子水的烧瓶中，温度 60℃，磁力搅拌转速 400rpm，在磁力作用下和真空，以获得超粒子 DSPE-PEG-Man@Fe₃O₄-Cds。溶于 10ml PBS 中，用 0.44um 滤器过滤，避光保存备用。使用紫外-可见-近红外分光光度计、透射电子显微镜（TEM）、动态光散射（DSL）、3.0T 核磁共振（MRI）表征其理化特点。通过细胞实验及动物试验评估纳米粒子的生物安全性、靶向成像能力、转极化效果及肿瘤抑制效果。

结果：DSPE-PEG-Man@Fe₃O₄-Cds 超粒子在有效靶向 TAM 的同时，充分利用铁的核磁共振增强成像特性和碳点的红色荧光特性，实现体外非侵入性评价。同时，这种超粒子促进 TAM 从 M2 向 M1 的转变，重塑肿瘤免疫微环境，表现出强效的抗肿瘤作用。

结论：碳点/Fe₃O₄ 超粒子是一种有前景的肿瘤相关巨噬细胞治疗整合纳米粒子平台，为肿瘤免疫治疗的评估和治疗提供了新策略。

磁性纳米颗粒磁矩测量系统的设计与实现

王皓瑶、陈俊、张冰
南京大学医学院附属鼓楼医院

目的

磁性纳米材料磁学参数的测量,对该材料在生物医学领域中的应用与发展至关重要。磁矩描述了磁性物质在外磁场作用下受到的力矩。对于宏观尺度的材料,材料的磁矩是构成材料的总原子磁矩之和,但当材料的尺寸缩小到纳米级别时,材料的磁学性质会出现各种反常现象。在生物医学领域的应用中,磁性纳米材料往往是以磁流体形式存在,常见的磁矩测量手段不适合于磁性水溶胶材料的测量。本文提出一种新型的磁性纳米颗粒磁矩测量系统,通过对磁性水溶胶液滴在外磁场下的运动过程进行力学分析,计算出材料磁矩的方法。

方法

计算磁矩需要获得的信息包括:1. 驱动磁性纳米液滴运动的外磁场的分布信息,即;2. 磁性纳米液滴的速度及加速度,可以通过记录测量目标在梯度磁场下的运动状况,并对其运动轨迹进行图像分析获取;3. 根据测量目标运动速度获得的流体阻力。为了获取以上信息,我们设计了相应的实验方案及测量系统。磁性水溶胶液滴在外磁场的作用下运动时,整体受到的外力为磁力、重力、浮力及粘滞阻力,通过力学分析,并基于数字图像处理得到考虑重力影响的磁性纳米液滴的运动速度曲线与加速度曲线,最后计算得到磁性纳米液滴的磁矩曲线。

结果

对整个系统进行了测试,测试系统可以正常运行并成功测量了磁性液滴的磁矩。为了验证系统的准确性,对不同铁浓度的磁性水溶胶进行了测量,测量结果和铁浓度具有很好的线性相关性。同时对相同浓度不同体积的磁性水溶胶进行了测量,测量结果和测量的体积同样具有较高的线性相关性,这说明测量体积对系统的影响可以忽略。

讨论

磁性纳米颗粒在靶向治疗、核磁共振成像和热疗方面较大的应用前景,而材料的磁性是需要评估的特性之一,因此磁性纳米颗粒的磁矩测量具有重要意义。

化学激发光动力疗法联合 MRI 探针用于动脉粥样硬化的诊疗一体化研究

王新
南京大学医学院附属鼓楼医院

背景:光动力疗法(PDT)在治疗肿瘤方面取得了持续的成功,但其在治疗动脉粥样硬化方面的进展有限,主要是由于激发光对光敏剂的组织穿透能力低。

方法:在这项研究中,我们设计了一种产生单线态氧的化学激发系统,试图在没有外部光照射的情况下将 PDT 应用于动脉粥样硬化的治疗。设计的系统是配备化学燃料和光敏剂的聚合物纳米粒子(NP),与 Fe³⁺-儿茶酚复合物交联,用于稳定和磁共振成像(MRI)。

结果:该系统(简称 FeCNPs)在斑块中有效积累,提供持久和增强的 T1 加权对比能力。FeCNPs 还通过消除巨噬细胞来阻止动脉粥样硬化的进展,并显著降低 T1-加权 MRI 显示的斑块大小和厚度。治疗后 CD68、MCP1 和 TNF α 的表达显著降低。然而,低剂量的 FeCNPs 表现出比高

剂量更好的治疗效果。此外,低剂量 FeCNPs 在主动脉弓和腹主动脉中表现出有效的巨噬细胞消除,但在胸主动脉、主动脉裂孔和主动脉-髂分叉处效率低下。

结论:本研究提供了第一个 MRI 和化学激发 PDT 联合治疗动脉粥样硬化的例子,证明了 PDT 的有效性,并为开发动脉粥样硬化的纳米疗法提供了重要的指导。

Iodine-Rich Nanoadjuvants for CT Imaging-Guided Photodynamic Immunotherapy of Breast Cancer

Tong Su,Xiaoyan Xin,Xin Peng,Yanqiu Zhang
Nanjing Drum Tower Hospital

Immunotherapy, which stimulates the body's own immune system to kill cancer cells, has shown great promise in the field of cancer therapy. However, the uncontrolled biodistribution of immunotherapeutic drugs may cause severe side effects. Herein, we report an iodine-rich nanoadjuvant (INA) for photo-immunotherapy. INA is prepared by encapsulating a toll-like receptor 7 agonist (R837) and a photosensitizer (phthalocyanine) into an iodine-rich amphiphilic copolymer PEG-PHEMA-I. By virtue of the enhanced permeation and retention (EPR) effect, INA can effectively accumulate into the tumor site. Under light irradiation, photodynamic therapy (PDT) triggered by INA will induce immunogenic cell death (ICD) in the tumor region to trigger the release of immune-associated cytokines. Such a process may further induce the maturation of dendritic cells which will be accelerated by R837, leading to the proliferation of effector T cells for immunotherapy. The photo-immunotherapy mediated by INA shows good anticancer efficacy both in vitro and in vivo. Meanwhile, INA is also a CT contrast agent owing to its high density of iodine, which can successfully illuminate tumors by CT imaging. Thus, our study develops a light-triggered nanoadjuvant for CT imaging-guided enhanced photoimmunotherapy.

PU-0643

Ferumoxytol 在磁共振胎盘灌注成像中的应用进展及优势

潘焱琪、麦筱莉
南京鼓楼医院

Ferumoxytol 是一种经美国食品和药物管理局 (Food and Drug Administration, FDA) 批准的静脉注射氧化铁纳米颗粒药物, 由于其生物及物理特性, 近年来作为一种对比剂使用于磁共振成像 (magnetic resonance imaging, MRI)。

胎盘灌注不足主要包括母体血管灌注不良 (maternal vascular malperfusion, MVM) 和胎儿血管灌注不良 (fetal vascular malperfusion, FVM), 两者均可引起母体及胎儿多种血管病理变化, 然而目前医学成像技术在诊断胎盘灌注方面的能力有限。动态对比增强磁共振成像 (dynamic contrast-enhanced magnetic resonance imaging, DCE-MRI) 可以对胎盘灌注进行成像, 然而造影剂的选择依旧存在争议。文章比较了常用的胎盘灌注成像造影剂, 总结了胎盘灌注 MR 成像的要求、常用的序列、参数及后处理技术; 同时讨论了近 5 年 Ferumoxytol 在胎盘灌注成像中的应用及研究进展, 评价 Ferumoxytol 的安全性及成像有效性。

与此同时, Ferumoxytol 在胎盘检查中有其独特优势, 一方面 Ferumoxytol 极为安全, 其结构降低了渗漏进入胎盘的风险, 减少不稳定铁的释放。另一方面, 妊娠期缺铁性贫血发生概率较高, Ferumoxytol 能保证孕妇体内铁平衡不被破坏的同时进行成像, 极大地减少对胎儿和母体的影响。尽管患者体内 Ferumoxytol 的长期沉积仍需进一步研究; 对于曾接受过 Ferumoxytol 治疗的患者, 其体内正常结构的 MRI 信号变化仍缺乏认知。Ferumoxytol 已经显示出广阔的应用前景, 目前应当

使用其他动物模型进行研究,探究其作为对比剂的安全剂量及成像条件,为胎盘灌注成像提供更多新的技术手段。

2. Department of Radiology, the Affiliated Yixing Hospital of Jiangsu University, Wuxi

3. Imaging Genetics Center, Mark and Mary Stevens Neuroimaging and Informatics Institute, University of Southern California

4. Mental Health Institute, the Second Xiangya Hospital, National Technology Institute of Psychiatry, Key Laboratory of Psychiatry and Mental Health of Hunan Province, Central South University

5. College of Arts & Science, Vanderbilt University, Nashville

Background: Norepinephrine transporter (NET) is encoded by the SLC6A2 gene and is a potential target for studying the pathogenesis of PTSD. To the best of our knowledge, no prior investigations have examined SLC6A2 polymorphism-related neuroimaging abnormalities in PTSD patients.

Methods: In 218 Han Chinese adults who had lost their sole child, we investigated the association between the T-182C SLC6A2 genotype and gray matter volume (GMV). Participants included 57 PTSD sufferers and 161 non-PTSD sufferers, and each group was further separated into three subgroups based on each participant's SLC6A2 genotype (TT, CT, and CC). All participants received magnetic resonance imaging (MRI) and clinical evaluation. To assess the effects of PTSD diagnosis, genotype, and genotype \times diagnosis interaction on GMV, 2 \times 3 full factorial designs were used. Pearson's correlations were used to examine the association between GMV and CAPS, HAMD, and HAMA.

Results: The SLC6A2 genotype showed significant main effects on GMV of the left superior parietal gyrus (SPG) and the bilateral middle cingulate gyrus (MCG). Additionally, impacts of the SLC6A2 genotype-diagnosis interaction were discovered in the left superior frontal gyrus (SFG). The CAPS, HAMA, and HAMD scores, as well as the genotype main effect and diagnostic SLC6A2 interaction, did not significantly correlate with each other.

Conclusion: These findings indicate a modulatory effect that the SLC6A2 polymorphism exerts on the SPG and MCG, irrespective of PTSD diagnosis. We found evidence to suggest that the SLC6A2 genotype-diagnosis interaction on SFG may potentially contribute to PTSD development in adults who lost their sole child.

DWI 定量参数预测宫颈癌程序性死亡蛋白配体 1 阳性表达: 不同 ROI 选择的比较

刘开惠^{1,2}、杨蔚²

1. 宁夏医科大学

2. 宁夏医科大学总医院

目的 探究基于不同 ROI 选择测量的 ADC 值与宫颈癌程序性死亡蛋白配体 1(programmed cell death-Ligand 1, PD-L1)表达的相关性,并基于临床、病理及 MR 扩散加权成像(DWI)定量参数构建列线图预测 PD-L1 阳性表达的临床价值。

材料与方法 回顾性收集 2018 年 1 月-2020 年 7 月来我院就诊的初诊宫颈癌患者为训练组(683 例),行盆腔 MRI 扫描,并对病理标本行 PD-L1 免疫组织化学染色。参考 T2WI 及增强扫描图像,分别在 DWI 图像上采用三种不同的 ROI 勾画方式分别测得 ADCmean、ADCss 及 ADCmin。比较 PD-L1 阳性表达组与阴性表达组间临床、病理资料及不同 ROI 选择所提取的 ADC 值。采用单、多因素 logistic 回归确定宫颈癌 PD-L1 阳性表达的独立相关因素,并构建临床病理模型及临床病理影像联合模型。通过受试者工作特征(receiver operating characteristic, ROC)曲线下面积(area under the curve, AUC)和 DeLong 检验评估不同 ADC 值及模型的诊断效能。绘制联合模型的列线图,校准曲线及决策曲线。前瞻性收集 2020 年 8 月-2022 年 12 月就诊的患者为验证组(332 例)对列线图进行验证。

结果 ADCmean、ADCss、ADCmin 均与 PD-L1 阳性表达相关,其中 ADCmin 的诊断效能最高(AUC=0.882, 95%CI: 0.855-0.905); FIGO 分期、病理分级、宫旁浸润、淋巴结转移、ADCmin 均为 PD-L1 阳性表达的独立相关因素,联合上述特征所构建的列线图在训练和验证组中均表现良好的诊断效能, AUC 分别为 0.906(95%CI: 0.882-0.927)和 0.903(95%CI: 0.866-0.933);校准曲线显示该列线图的拟合度良好,决策曲线显示该列线图的临床净收益高于临床病理模型。

结论 临床、病理及 ADCmin 联合构建的列线图可有效预测宫颈癌 PD-L1 阳性表达,可为临床宫颈癌免疫疗法选择提供理论依据。

The Strategy of Precise Targeting and In Situ Oxygenating for Enhanced Triple-Negative Breast Cancer Chemophototherapy

Qiang Li, Manxiang Wu, Lianfu Wang
Yinzhou People's Hospital, Ningbo

Abstract: The absence of effective therapeutic targets and tumor hypoxia are the main causes of failure in the treatment of triple-negative breast cancer (TNBC). Biomimetic nanotechnology and tumor microenvironment (TME)-responsiveness bring hope and opportunity to address this problem. Here, we develop a core membrane nanoplatfrom (HM/D-I-BL) using hollow mesoporous manganese dioxide (HM) coated with biomimetic cancer cell membrane for enhanced chemotherapy/phototherapy via the strategy of precise drug delivery and hypoxia amelioration. Cancer cell membrane modification endows HM/D-I-BL with excellent homologous targeting and immune escape performance. The cellular uptake and fluorescence imaging studies confirmed that HM/D-I-BL can be accurately delivered to tumor sites. HM/D-I-BL also features efficient in situ O₂ generation in tumor upon laser irradiation, and subsequently enhanced chemotherapy/phototherapy, pointing to its usefulness as a TME-responsive nanozyme to alleviate tumor hypoxia in the presence of H₂O₂. In addition, HM/D-I-BL showed good fluorescence and magnetic resonance imaging performances, which offers a reliable multimodal image-guided combination tumor therapy for precision theranostics in the future. In general, this intelligent biomimetic nanoplatfrom with its homotypic tumor targeting, in situ alleviation of tumor hypoxia and synergetic chemophototherapy would open up a new dimension for the precision treatment of TNBC.

靶向 EGFR 的三阴性乳腺癌脑转移早期分子成像聂芳¹、杨健²、李琳³、臧凤超¹、居胜红¹

1. 东南大学附属中大医院

2. 东南大学

3. 江苏省中医院

目的：癌症脑转移预后不良，早期发现可为治疗赢得宝贵时间。三阴性乳腺癌是 ER\PR\HER2 皆为阴性的乳腺癌，内分泌治疗和靶向治疗不敏感，由于侵袭性强，临床脑转移概率大。血脑屏障的存在限制了成像对比剂入脑，从而导致脑转移早期诊断困难。本课题组通过构建跨血脑屏障的荧光/MR 双模态探针尝试对小鼠三阴性乳腺癌脑转移进行早期诊断。

方法：以第五代 Dendrimer 大分子为载体，通过连接 Angiopep2 和 GE11 小肽构建跨血脑屏障、靶向 EGFR 的分子探针，通过 PEG 化延长探针循环时间和增加脑转移病灶富集，通过连入 DOTA-Ga 和 DIR797 分别进行 MR 和近红外成像。体外检测探针毒性，并通过免疫荧光分析和流式细胞检测验证探针与细胞的结合，通过心室注射 MDA-MB-231BR 细胞构建三阴性乳腺癌脑转移小鼠模型，以健康裸鼠作为空白对照，在第 11 天、21 天、31 天分别进行 MR 平扫及马根维显增强成像，从而跟踪病灶发展，并通过静脉注射探针进行 MR 和近红外荧光成像。

结果：细胞毒性检测结果显示 Den-Angio-GE11 目的探针在 100uM 时对细胞活力没有明显影响，体外免疫荧光和流式细胞检测探针与 MDA-MB-231BR 细胞结合率达 80% 以上；对脑转移小鼠模型 MR 检测结果显示，在造模 21 天后 10% 小鼠呈现 T2WI 多发高信号病灶，在造模 31 天后所有小鼠均呈现 T2WI 高信号病灶，对模型成功小鼠进行尾静脉注射探针后 T1WI 增强中度提高，但脑部荧光信号显著强于对照探针组（Den-Ge11 及 Den-Angio 组）。在造模 11 天后进行早期成像，所有小鼠 T2WI、T1WI 和 T1WI 增强图像上无疑似病灶，注射目的探针后脑转移模型小鼠脑部荧光信号明显强于空白健康组；21 天后注射探针荧光成像组小鼠脑部荧光强度明显增强，脑组织病理检测结果显示，目的探针阳性组小鼠脑部呈现多处微小病灶。

结论：在 MDA-MB-231BR 细胞构建的三阴性乳腺癌脑转移小鼠模型中，21 天后可用磁共振 T2WI 序列检测部分病灶，本研究基于 EGFR 靶向的荧光/MR 双模态探针在造模 11 天时即可检出病灶信号。

PU-0648

异机融合 11C-蛋氨酸 PET/MRI 在原发性与残留/复发性脑胶质瘤诊断中的应用

刘恒利、韩芳

大连大学附属中山医院

目的 探讨异机融合 11C-PET/MRI 对疑似原发性与残留/复发性脑胶质瘤患者的诊断价值。方法 回顾性分析 2019 年 6 月—2022 年 12 月于武汉大学人民医院 PET 中心行异机融合 11C-MET PET/MRI 的 65 例疑似原发性或残留/复发性脑胶质瘤的患者资料。疑似原发性脑胶质瘤的初诊患者 41 例纳入初诊组，脑胶质瘤手术/放射治疗后疑似肿瘤残留/复发患者 24 例纳入复诊组。评估 PET 与 MRI 及 PET/MRI 融合图像特征，于后处理工作站测量并计算病灶的标准化最大摄取值、靶与非靶比值、肿瘤代谢体积、脑血流量、表观弥散系数与胆碱/ N-乙酰基天门冬氨酸比值等半定量参数。以患者的病理组织学诊断或经长期临床或影像学随访所获的临床最终诊断为金标准，评估并比较异机融合 PET/MRI、PET/CT 或 MRI 诊断原发性脑胶质瘤与术后残留/复发性胶质瘤肿瘤的灵敏度、特异度与准确度差异。比较初诊组内良性与恶性病变的患者亚组间、恶性病变不同病理类型的患者亚组间，以及复诊组内肿瘤残留/复发与治疗改变患者间 PET/MRI 的图像特征、PET 与

MRI 及半定量参数的差异。结果 (1) 初诊组: 11C-MET PET/MRI 对原发性胶质瘤诊断的灵敏度高于 MRI、特异度高于 PET/CT、准确度高于 PET/CT 与 MRI, 差异均有统计学意义 (P 值均 <0.05)。良恶性病变亚组患者间强化特征、瘤周水肿与占位效应分级等 MR 图像特征, SUVmax、T/N、CBF、Cho/NAA 等半定量参数比较, 差异均有统计学意义 (P 值均 <0.05)。(2) 复诊组: 中 11C-MET PET/MRI 对残留/复发性胶质瘤诊断的灵敏度与准确度均高于 PET/CT 与 MRI, 差异有统计学意义 (P 值均 <0.05)。肿瘤残留/复发与治疗组患者间 SUVmax、MTV、T/N、CBF 和 Cho/NAA 等半定量参数比较, 差异均有统计学意义 (P 值均 <0.05)。结论 11C-MET PET/CT 在区分胶质瘤与良性病变、残留/复发性脑胶质瘤与治疗组改变上较 MR 具有明显优势, 但在确定恶性病变具体病理类型方面存在限制, 而 MRI 图像特征可有效弥补该不足。

PU-0649

基于铜死亡的新型智能释药纳米平台在 肝癌精准成像及放疗增敏中的应用

邵妮、陈极峰、马晓聪、史长征、肖泽宇、罗良平
暨南大学附属第一医院 (广州华侨医院)

目的: 肝细胞癌作为世界第三大癌症相关死亡原因, 因其起病隐匿、转移早, 大多数患者治疗效果不佳, 所以寻找有效的诊断和治疗方法是亟待解决的临床难题。基于此, 本研究设计了一种新型特异性靶向肝癌的智能释药纳米平台, 催化类芬顿反应并引发铜死亡, 同时兼具磁共振成像及放疗增敏功能, 有望为肝癌的诊断和治疗提供新思路。

方法: 合成一种具有靶向、肿瘤微环境响应性的 HA-PEG@CuO₂ 纳米颗粒并对其理化性能进行表征; 使用激光共聚焦、流式细胞术等对细胞内 ROS 及 ATP、线粒体膜电位去极化、DNA 损伤等进行评估; 构建原位肝癌 Balb/c 裸鼠模型联合放射治疗评估 HA-PEG@CuO₂ 在裸鼠体内的药物代谢、器官分布、放射增敏效果; 通过磁共振成像确定原位肝癌形成时间节点, 评估 HA-PEG@CuO₂ 的磁共振成像效果。

结果: 1、成功构建了肿瘤微环境响应的 HA-PEG@CuO₂, 粒径约 100nm, Zeta 电位约 30mv, 具有良好的分散性和生物安全性。2、体外实验证明, 联合治疗组细胞内产生的 ROS 明显高于单纯放疗组 (89.30%, 13.83%), 线粒体膜电位及 ATP (86.11%, 19.9%) 水平降低、DNA 损伤增加, 差异均具有统计学意义; Western Blot 证明 HA-PEG@CuO₂ 处理后可引起细胞内铜死亡相关蛋白 DLAT、FDX1 及 LIAS 的表达。3、体内实验表明, HA-PEG@CuO₂ 在原位肝癌裸鼠模型中表现出良好的靶向性和低毒性, 尾静脉注射 4h 后肿瘤部位 T1 信号明显增强, 具有用于肝癌诊断成像的潜力; 与对照组相比, 可显著增强放疗疗效, 表现出良好的抗肿瘤效果。

结论: 通过设计一种靶向肝癌的内源性刺激智能释药纳米平台, 可以特异性靶向肝癌细胞, 并在肿瘤微环境刺激下实现药物的可控释放。HA-PEG@CuO₂ 通过催化类芬顿反应及诱导铜死亡的发生来缓解肿瘤缺氧、打破肿瘤内高抗氧化体系、提高 X 线沉积效率等达到放疗增敏的目的; 同时利用铜离子的顺磁性效应进行肝癌精准成像。期望通过该新型智能释药纳米平台将肝癌的成像诊断与治疗相结合, 实现肝癌的早发现、早治疗。

PU-0650

增强型绿色荧光蛋白及超顺磁性氧化铁双标记神经干细胞对大鼠脑胶质瘤的磁共振追踪成像研究

陶青、胡春洪
苏州大学附属第一医院

研究背景: 脑胶质瘤是最常见的颅内原发性恶性肿瘤, 肿瘤较易呈浸润性生长并且容易发生颅内转移, 因此肿瘤需要精确的定位诊断。

目的 将神经干细胞修饰以增强型绿色荧光蛋白 (EGFP), 通过神经干细胞对脑胶质瘤的定向迁移作用, 携带超顺磁性氧化铁纳米材料 (SPION) 对胶质瘤进行磁共振定位成像。

方法 将多能干细胞诱导成为神经干细胞, 并且使用 EGFP 对其修饰使其带上绿色荧光。对神经干细胞进行 SOX1, Nestin, PAX6, TUJ1 等一系列标志物的鉴定。之后将神经干细胞与 SPION 共孵育, 进行体外磁共振扫描、细胞毒性试验以及普鲁士蓝染色。通过立体定位注射胶质瘤细胞系建立大鼠胶质瘤的模型并通过磁共振验证。将神经干细胞与 SPION 共孵育进行标记后, 分别通过立体定位注射于胶质瘤对侧大脑半球, 以及通过尾静脉注射入大鼠静脉系统, 随后对大鼠进行连续两周的观察, 之后进行处死后, 进行脑组织切片染色。

结果 EGFP 以及 SPION 双标记的神经干细胞在进行立体定位注射及尾静脉注射后均可在磁共振成像、脑切片后绿色荧光蛋白成像以及普鲁士蓝染色观测到脑胶质瘤灶以及转移灶周围的神经干细胞以及超顺磁性氧化铁。

结论 多能干细胞可以顺利诱导成为神经干细胞, 并且神经干细胞可以携带超顺磁性氧化铁顺利到达脑胶质瘤原发灶以及转移灶周围, 为脑胶质瘤进行精确示踪。

Evaluation of microstructural changes in hypertensive patients by quantitative cardiac magnetic resonance techniques

Yetong Zhao^{1,2}, Xiaolin Mu¹, Xiuqun Cao¹, Yaoming Yang^{1,2}, Ying Liu^{1,2}, yang Song¹
1. Central Hospital of Dalian University of Technology
2. Department of Graduate School, Dalian Medical University

Objective: To apply T1 mapping and strain techniques to investigate myocardial microscopic changes in hypertensive patients.

Methods: Thirty-two hypertensive patients who met the enrollment criteria from September 2022 to August 2023 were consecutively recruited, and 20 healthy subjects were included as controls. All subjects underwent CMR examination and T1 mapping scan and showed no enhancement in LGE, two independent observers completed left atrial and left ventricular strain and strain rate, T1 mapping, and ECV measurements to compare the clinical data and quantitative CMR parameters between the two groups. Independent t tests, Mann-Whitney U tests, Pearson's and Spearman's correlation coefficients, and receiver operating characteristic curves were used for statistics.

Results: The differences in LAEFtotal, LAEFbooster, GPLS, GPLSr, GPCSr, GPRSr, SRs, SRe, and SRa were statistically significant in the hypertensive group compared to the healthy control group ($p < 0.05$), with the difference in GPLS being significant ($-14.4 \pm 2.8\%$ vs. $-16.3 \pm 2.4\%$, $p = 0.001$). LV-ECV ($32.5 (31, 36)\%$ vs. $27 (20.25, 29)\%$, $p < 0.001$) and average native T1 mapping ($1215 (1191, 1270)$ ms vs. $1204 (1153, 1223)$ ms, $p = 0.03$) were higher in the hypertensive group than in the healthy control group. GPLS had a significant correlation with ϵ_s , ϵ_e , and ϵ_a ($r =$

-0.532, $r = -0.539$, $r = -0.558$). There was no significant correlation between strain parameters and T1 mapping and ECV. To identify the hypertensive group from the healthy control group, GPLS, basal segment native T1 mapping, overall average native T1 mapping, and ECV had good diagnostic efficacy, with AUCs of 0.655, 0.679, 0.680, and 0.869, respectively. All parameters displayed good to excellent reproducibility for both intra- and interobserver classes.

Conclusions: Quantitative cardiac magnetic resonance parameters to detect microscopic changes in the myocardium of hypertensive patients are feasible.

PU-0652

MR Probe Targeted on Fibroblast Activation Protein for specific diagnosis of pancreatic Cancer

Xinhui Zheng¹, Renhua Wu¹, Caiyu Zhuang¹, Xiaolei Zhang¹, Xiaohui Wang²

1. Shantou Univ, Affiliated Hosp 2, Med Coll, Dept Med Imaging, Shantou, Peoples R China

2. Guangdong Pharmaceut Univ, Med Imaging Dept, Affiliated Hosp 1, Peoples R China

Objective: Magnetic Resonance Imaging (MRI) has great potential in clinical tumour monitoring due to its ability to provide high-resolution soft tissue imaging. Previous studies have found that Fibroblast Activation Protein (FAP) promotes tumour growth and progression, and is overexpressed in fibroblasts of many human epithelial tumours. In contrast, FAP expression levels are low in normal organs. Therefore, FAP is considered an ideal target for tumour imaging.

Methods: In this study, we designed a targeted MRI contrast agent, a Gd-DOTA-FAPI probe, that specifically binds to FAP. We validated the binding of human pancreatic cancer cells and animal models to Gd-DOTA-FAPI through in vitro and in vivo experiments and evaluated the MRI imaging results.

Results: The in vitro imaging effects of Gd-DOTA-FAPI have been validated, and a linear relationship was found between the T1 imaging effect and the concentration of Gd-DOTA-FAPI. We will continue to conduct cellular and animal experiments to validate this probe's specificity and sensitivity for detecting pancreatic cancer.

Conclusion: This study provides a promising specific T1-enhanced MRI probe for pancreatic cancer imaging, which has the potential for targeted imaging of pancreatic cancer.

PU-0653

The application of spectral CT functional parameters in predicting lymph node metastasis of rectal cancer

Danqi Sun¹, Qi Sun², Xiaofei Zhou¹, Xiaohui Zhang³, Guangqiang Chen², Yonggang Li¹

1. THE FIRST AFFILIATED HOSPITAL OF SOOCHOW UNIVERSITY

2. The second affiliated hospital of Soochow university

3. Philips healthcare

Abstract Objective: To use spectral CT to predict lymph node metastasis in rectal cancer patients before surgery. Methods: The clinical and pathological data and spectral CT images of 174 patients with rectal cancer were retrospectively collected and divided into positive and negative lymph node metastasis groups. Spectral CT parameters were obtained by delineating regions of interest (ROI) on spectral CT arterial, venous and delayed images, including: CT values, iodine concentration (IC) values, effective atomic number (Eff-Z) values, extracellular volume fraction (ECV) values and arterial enhancement fraction (AEF) values in the delayed phase of 40 and 100 keV virtual monoenergetic images. The independent sample t-test and the Mann-Whitney U test were used to compare the differences in functional parameters between groups. The receiver operating characteristic curve (ROC) was plotted for the parameters with statistically different

differences between the groups, and the correlation between each index and lymph node metastasis was analyzed by Spearman method. Variance inflation factor (VIF) was used to exclude the factors with multicollinearity. Logistic regression analysis was used to identify independent risk factors for lymph node metastasis in rectal cancer. Results: ECV, AEF, Eff-ZAP, ICAP, CT40KeVAP, Eff-ZVP, ICVP, CT40KeVVP were statistically different between groups ($P < 0.05$). The values of ICAP, CT40KeVAP, Eff-ZVP, ICVP, CT40KeVVP, ECV and AEF values were positively correlated with lymph node metastasis, and Eff-ZAP values were positively correlated with lymph node metastasis, but were not statistically significant. ECV, Eff-ZVP and CT40KeVVP are independent risk factors of lymph node metastasis. The AUC predicted by ECV, Eff-ZVP and CT40KeVVP was 0.792, with a sensitivity of 73.61% and a specificity of 73.53%. Conclusion: Spectral CT functional parameters can predict lymph node metastasis in rectal cancer patients before surgery.

PU-0654

Machine learning-based CT radiomics for identifying COVID-19 patients co-infected with fungus

Le Zhou¹, yonggang li^{1,4,5}, renjun huang¹, wanqian pan², jie xu³, xiaoping huang⁶

1. Department of Radiology, the First Affiliated Hospital of Soochow University, Suzhou city, Jiangsu province, 215000, China.
2. Department of Cardiology, The First Affiliated Hospital of Soochow University, 188 Shizi Street, Suzhou, Jiangsu 215006, P. R. China.
3. Center of Clinical Laboratory, the First Affiliated Hospital of Soochow University, Suzhou, China.
4. Institute of Medical Imaging, Soochow University, Suzhou city, Jiangsu province, 215000, China.
5. National Clinical Research Center for Hematologic Diseases, the First Affiliated Hospital of Soochow University, Suzhou city, Jiangsu province, 215000, China.
6. Department of Infectious Diseases, the First Affiliated Hospital of Soochow University.

Purposes: Investigate and validate the effectiveness of different machine learning models in accurately detecting the presence of fungal infection in patients diagnosed with Coronavirus Disease 2019 (COVID-19).

Methods: 114 patients (78 COVID-19 and 36 CWFI (combined with fungal infection)) were enrolled in this study and then randomly assigned to the training and test cohorts. Radiomic features were extracted from the three-dimensional volume of interest (VOI) on chest CT (computed tomography) images; Features selection was performed using Pearson Correlation, SelectPercentile, and the least absolute shrinkage selection operator (LASSO). Logistic Regression (LR), Support Vector Machine (SVM), and Random Forest (RF), were employed to establish predictive models. Patient-based and lesion-based models were developed using the largest lesion and multiple lesions, respectively. Model performance was assessed using receiver operating characteristic (ROC) curves. Clinical utility of the models was evaluated using decision curve analysis (DCA).

Results: Among lesion-based models, SVM exhibited superior predictive efficiency, with an area under the curve (AUC) value of 0.841(test cohort) and 0.944 (training cohort). For the patient-based model, RF in the combined model showed the notable discriminatory ability (AUC, test cohort: 0.849; training cohort: 0.955).

Conclusion: Both the patient-based combined and lesion-based radiomics model exhibit significant discriminatory capabilities in accurately identifying the presence of co-infection, with the former performing much better, which can be valuable in developing and changing treatment plans.

PU-0655

Machine learning and the prediction of cerebral ventricular changes in fetuses with ventriculomegaly postnatally: a fetal MRI study

Xue Chen¹, Zhou Huang², Jibin Zhang¹, Yonggang Li²

1. The Affiliated Suzhou Hospital of Nanjing Medical University, Suzhou Municipal Hospital

2. The First Affiliated Hospital of Soochow University

Background:

It's unclear whether the occipital white matter (WM) radiomics of fetuses with ventriculomegaly (FVs) have changed and can be used to predict postnatal changes in the dilated lateral ventricle.

Purpose:

To evaluate the intracranial structures and occipital WM T2WI radiomics features in healthy fetuses and FVs and to predict the lateral ventricle changes of FVs postnatally based on machine learning.

Materials and Methods:

T2-weighted 1.5-T single-shot fast-spin echo MRI was performed in 52 normal fetuses (NFs) and 95 FVs prospectively in a single center from Jan. 2014 to Aug. 2021 and followed up on the abnormal lateral ventricle changes after birth. Clinical information, intracranial traditional structures, bilateral occipital WM T2WI ROI in NFs, and occipital WM T2WI ROI on the abnormal side (s) in FVs were all gathered and compared. The traditional model, radiomics model, and combined model were established to predict the lateral ventricle changes of FVs postnatally by Random Forest (RF), GaussianNB, and Decision Tree (DT) algorithms, respectively. Receiver operating characteristic curve (ROC) analysis, calibration curve, and decision curve analysis (DCA) were used to validate the predictive performance.

Results:

There were 7 fetuses with postnatal neurodevelopmental delay and 4 fetuses with genetic defects in the FV-stable group, with significant differences between groups. Among the traditional data, there were no significant differences between the FV-resolved and FV-stable groups ($p > 0.05$), while significant differences between the NFs and FVs ($p < 0.05$), excepting the occipital WM/CSF T2WI SNR ($p > 0.05$). The occipital WM T2WI radiomics of FVs differed significantly from those of NFs. Based on the occipital WM T2WI radiomics on the abnormal sides of FVs, it was effective at differentiating NFs from FVs by the three algorithms, with AUC ranging from 0.93 to 1 and 0.79 to 0.94 for the training and validation set. There were some differences in the occipital WM T2WI radiomics between FV-resolved and FV-stable groups. With AUC ranging from 0.86 to 0.97 for the training set and 0.62 to 0.76 for the validation set, the radiomics model based on the same three algorithms may predict lateral ventricle changes in FVs. The combined model predicted lateral ventricle changes much better. The DCA revealed that the combined and radiomics models provided nearly identical clinical benefits.

Conclusion:

Our findings suggest that the occipital white matter on the dilated sides of the FVs may play a key role in the progression of ventriculomegaly, as evidenced by significant T2WI radiomics characteristics associated with changing ventriculomegaly trends.

PU-0656

Multimodal ultrasound imaging improves the diagnostic performance in differentiating sclerosing adenosis from invasive ductal carcinoma

WEN LI,YONGGANG LI

The First Affiliated Hospital of Soochow University

Background Sclerosing adenosis (SA) is a proliferative benign lesion without atypia in breast, could mimic invasive ductal carcinoma (IDC) in medical imaging findings, which is easy to be misdiagnosed and mistreated. Thus, we aimed to evaluate the diagnostic value of multimodal ultrasound imaging in differentiating sclerosing adenosis (SA) from invasive ductal carcinoma (IDC).

Method Multimodal ultrasound imaging, including automated breast volume scan (ABVS), elasticity imaging (EI), color Doppler flow imaging (CDFI), were performed on 120 consecutive patients (54 SA and 66 IDC; mean age of 49.2 ± 12.4 years) with 122 breast lesions. All lesions were confirmed by surgical pathology. Image features of multimodal ultrasound between the two groups were compared and analyzed. Binary logistic regression based on VTIQ, EI and CDFI was conducted to generate a logistic regression equation of differentiating SA and IDC. The diagnostic performances of ABVS, EI, CDFI and their combination were compared by the receiver operator characteristic (ROC) analysis.

Results The sensitivity, specificity, and accuracy of ABVS, EI, CDFI, and their combination in differentiating SA from IDC were 75.00%, 72.22%, 73.77%; 86.76%, 72.22%, 80.33%; 73.53%, 64.81%, 69.67% and 88.24%, 74.07%, 81.97%, respectively. Combining multimodal ultrasound imaging yielded an area under the ROC (AUC) of 0.895 (95% CI, 0.827-0.943), higher than those of ABVS, EI, CDFI with 0.736, 0.795 and 0.692, respectively, and the difference was statistically significant (ABVS ~ combined model, $P < 0.001$; CDFI ~ combined model, $P < 0.001$; EI~combined model, $P < 0.001$). There was no statistical difference in diagnostic efficacy among the three methods (ABVS ~ EI, $P = 0.266$; ABVS ~ CDFI, $P = 0.4671$; EI ~ CDFI, $P = 0.051$). Compared to IDC, calcifications (16.67% vs 57.35%, $P < 0.001$) and retraction phenomenon on the coronal planes (18.52% vs 57.35%, $P < 0.001$) were less common in SA, circumscribed margin (38.89% vs 5.88%, $P < 0.001$), vascularity grade 0~I (64.81% vs 26.47%, $P < 0.001$) and elasticity score 2~3 (72.22% vs 13.24%, $P < 0.001$) were more common in SA. The mean age of SA was younger than that of IDC (42.9 ± 11.1 vs 54.2 ± 11.2 , $P < 0.001$). And the size was smaller in SA [$1.0(0.9)$ vs $1.3(1.3)$, $P < 0.001$].

Conclusion The preliminary results suggest that multimodal ultrasound imaging improves the diagnostic accuracy of SA and provides additional information for differentiating with IDC.

PU-0657

声触诊组织成像定量技术鉴别乳腺硬化性腺病 与浸润性导管癌 的价值

李文、李勇刚

苏州大学附属第一医院

目的 探讨声触诊组织成像定量技术 (VTIQ) 鉴别诊断乳腺硬化性腺病 (SA) 和浸润性导管癌 (IDC) 的价值。

方法 回顾性分析经手术病理确诊的 55 例 SA 患者和 64 例 IDC 患者的常规超声和 VTIQ 图像特征。绘制 VTIQ、乳腺影像报告和数据库 (BI-RADS) 分类及两者联合鉴别诊断

SA 与 IDC 的受试者工作特征 (ROC) 曲线, 计算曲线下面积 (AUC), 比较 BI-RADS 分类及 VTIQ 技术联合 BI-RADS 分类的诊断效能。

结果 ROC 曲线显示, 剪切波速度 (SWV) 最大值 (SWV_{max})、SWV 最小值 (SWV_{min})、SWV 平均值 (SWV_{mean})、SWV 中位数 (SWV_{median}) 鉴别诊断 SA 与 IDC 的 AUC 分别为 0.85、0.79、0.83、0.83, 其中 SWV_{max} 诊断效能最高, 诊断截断值为 4.90 m/s; BI-RADS 分类及 VTIQ 技术联合 BI-RADS 分类鉴别诊断 SA 与 IDC 的 AUC 分别为 0.58、0.81。

结论 VTIQ 技术联合 BI-RADS 分类可提高 SA 的诊断效能。

PU-0658

应用 MR/NIRF 双模态成像可视化研究肥胖上调纤维连接蛋白在胰腺癌进展中的作用

徐婷婷

东南大学附属中大医院

研究背景: 胰腺导管腺癌(Pancreatic ductal adenocarcinoma, PDAC)恶性度高, 且具有特征性致密间质。由于局部进展和远处转移, 化疗是延长 PDAC 患者生存期和减轻症状的重要治疗方法之一, 但因为间质致密, PDAC 对大多数化疗药物反应较差。在 PDAC 中, 肥胖是一个重要的代谢因子, 可以显著调节细胞外间质(extracellular matrix, ECM)成分, 促进对化疗的耐药性。纤维连接蛋白(Fibronectin, FN)是 ECM 中的中心组织者, 且在 PDAC 基质中含量丰富, 然而, PDAC 在肥胖刺激反应中的 FN 改变及其在化疗中的作用研究尚不清楚。

材料方法: 首先通过将钆螯合物, NIR797 和 FITC 连接到具有靶向肽的聚酰胺-胺树状大分子上, 合成 FN 靶向纳米探针 NP-CREKA, 活体可视化评估原位 PDAC 中 FN 水平并指导 PDAC 治疗。其次, 应用转录组学分析、磁共振和近红外荧光(magnetic resonance/near-infrared fluorescence, MR/NIRF)双模态成像和分子功能验证研究肥胖刺激对 PDAC 中 FN 变化及其在化疗中的作用。

结果与结论: MR/NIRF 双模态成像策略可以有效可视化检测原位 PDAC 中 FN 水平, 具有较高的空间分辨率、理想的灵敏度和良好的组织穿透性, 特别是在肥胖小鼠中。通过组学分析、MR/NIRF 双模态成像和分子功能验证, 我们进一步证明肥胖作为一个重要的危险因素调节 PDAC 基质中的 ECM 成分并增加 FN 表达, 促进了胰腺癌进展; 并通过减少药物递送降低对化疗药反应。综上所述, 本研究的结果表明 FN 作为治疗评估和改善 PDAC 治疗效果的理想靶点提供了新证据, 有助于在瘦和肥胖宿主中 PDAC 的精准医疗。

PU-0659

Genetic engineering of TIM-3 membrane nanocapsules carrying melanin-gemcitabine in the diagnosis and treatment of pancreatic cancer

Yi Gong, Zining Zhang, Haitao Zhu, Dongqing Wang, Xiangyi Cai
Affiliated Hospital of Jiangsu University

Aims

Pancreatic cancer is a highly aggressive cancer. Most patients are diagnosed at an advanced stage, with a 5-year survival rate of less than 10%. Advances in immunotherapeutic strategies, especially targeting of immune checkpoints, have raised expectations for improved treatment of pancreatic cancer. The immune checkpoint TIM-3 binds to galectin-9, a ligand highly expressed in pancreatic cancer, to induce T cells exhaustion, leading to immune escape. In this study, MNS-GEM@TIM3 NVs was constructed to improve the immunotherapy of pancreatic cancer, and the efficacy was evaluated by molecular imaging.

Methods

Firstly, overexpressed TIM3 were verified by confocal microscopy and the cell membrane was extracted. Then gemcitabine-loaded melanoma nanospheres were synthesized and encapsulated in the extracted cell membrane. The cell lethality of MNS-GEM@TIM3 NVs was detected by CCK8 assay in vitro. Finally, mouse orthotopic tumor model was established to observe the targeting ability of MNS-GEM@TIM3 NVs by in vivo imaging, T cell activity by flow cytometry, and the efficacy of MNS-GEM@TIM3 NVs against pancreatic cancer was evaluated by MRI with the help of melanin.

Results

Confocal microscopy demonstrated that the transfection efficiency of TIM-3 was significant. CCK8 assay indicated MNS-GEM@TIM3 NVs significantly inhibited cells proliferation in vitro. In vivo imaging showed that MNS-GEM@TIM3 NVs were enriched at the tumor site, the up-regulation of IFN- γ detected by flow cytometry reflected the enhanced T cell function, and MRI confirmed that MNS-GEM@TIM3 NVs was the most effective in tumor growth inhibition. The tumor volume was reduced, and immunohistochemistry showed that the expression of Ki67 was decreased.

Conclusion

MNS-GEM@TIM3 NVs has the ability to enrich the tumor site, and inhibits the growth of pancreatic cancer by enhancing the lethality of T cells. MNS-GEM@TIM3 NVs can also enhance MRI signal, so as to realize the integration of diagnosis and treatment.

Boost therapy of glutamine-addictive glioblastoma by combining glutamine metabolism therapy with photo-enhanced chemodynamic therapy

Ling Wang, Chunhong Hu
The First Affiliated Hospital of Soochow University

The complete treatment of high grade invasive glioblastoma (GBM) remains to be a great challenge, and it is of great importance to develop innovative therapeutic approaches. Herein, we found that GBM derived from U87 MG cells is a glutamine-addiction tumor, and jointly using glutamine-starvation therapy and photo-enhanced chemodynamic therapy (CDT) can significantly boost its therapy. We rationally fabricated tumor cell membrane coated Cu₂-xSe nanoparticles (CS NPs) and an inhibitor of glutamine metabolism (Purpurin) for combined therapy, because

glutamine rather than glucose plays a crucial role in the proliferation and growth of GBM cells, and serves as a precursor for the synthesis of glutathione (GSH). The resultant CS-P@CM NPs can be specifically delivered to the tumor site to inhibit glutamine metabolism in tumor cells, suppress tumor intracellular GSH, and increase H₂O₂ content, which benefit the CDT catalyzed by CS NPs. The cascade reaction can be further enhanced by irradiation with the second near_x0002_infrared (NIR-II) light at the maximum concentration of H₂O₂, which can be monitored by photoacoustic imaging. The NIR-II light irradiation can generate a large amount of reactive oxygen species (ROS) within a short time to kill tumor cells and enhance the CDT efficacy. This is the first work on the treatment of orthotopic malignant GBM through combined glutamine metabolism therapy and photo-enhanced CDT, and provides insights into the treatment of other solid tumors by modulating the metabolism of tumor cells.

PU-0661

一种 GBM 靶向 pH 响应性原位 T2 磁共振信号增强的氧化铁纳米复合颗粒

谢若曦、朱冠楠、傅声祥、吴敏
四川大学华西医院

目的:

胶质母细胞瘤 (glioblastoma, GBM) 呈浸润性生长, 目前影像学方法无法精准明确边界, 使用磁共振对比剂增强 GBM 病灶处信号有助于精准诊断 GBM。GBM 肿瘤微环境具有弱酸性的特点, 利用酸性 pH 响应策略可以有效提升磁共振对比剂在 GBM 病灶处的对比度, 从而提高 GBM 的影像诊断精准性。

材料和方法:

基于 PAA (polyacrylic acid, 聚丙烯酸) /SPIO (superparamagnetic iron oxide, 超顺磁性氧化铁)、氯化钙、磷酸氢二钠合成 pH 响应性团聚的纳米复合颗粒 SPIO@CaP (calcium phosphate, 磷酸钙), 随后使用靶向 GBM 的多肽 DANG (angiopep-2 多肽的反式镜像异构体) 对纳米复合颗粒进行修饰, 获得 DANG-SPIO@CaP 纳米复合颗粒。细胞层面, 通过铁反应试剂法探究纳米复合颗粒在不同种属细胞内的摄取情况, 通过磁共振 T2 成像评估纳米复合颗粒在不同种属细胞中的摄取成像效果。动物层面, 评估 DANG-SPIO@CaP 纳米复合颗粒在小鼠体内的磁共振成像效果。

结果:

本研究通过完整的理化表征明确了 GBM 靶向 pH 响应性团聚的纳米复合颗粒 DANG-SPIO@CaP 的成功制备, 在细胞层面的细胞摄取与细胞磁共振 T2 成像实验中, DANG-SPIO@CaP 纳米复合颗粒显著提升了肿瘤细胞磁共振 T2 信号, 而对非肿瘤细胞的磁共振 T2 信号增强不明显。动物层面, DANG-SPIO@CaP 纳米复合颗粒均能有效地显示两种 GBM 模型的病灶, 并且在较长时间内在病灶处观察到 T2 信号增强。组织切片 HE 染色结果与血清生化分析结果均证明上述纳米复合颗粒具有良好的生物相容性, 对细胞以及动物均无明显毒性。

结论:

GBM 靶向 pH 响应性纳米复合颗粒 DANG-SPIO@CaP 可以在肿瘤弱酸性环境中发生响应性粒径增大, 因而其能在具有弱酸性的 GBM 病灶处发挥更强的磁共振 T2 增强效果; 而且由于其同时具有 GBM 靶向性以及 pH 响应性, DANG-SPIO@CaP 纳米复合颗粒在具有不同性质的 GBM 中均具备增强的鉴别诊断效能。

PU-0662

纳米氧化铈在对比剂后急性损伤中的焦亡调节作用探讨

丰采
中南大学湘雅医院

目的: 探讨氧化铈纳米颗粒 (CNPs) 在碘对比剂诱导肾损伤 (PC-AKI) 中发挥保护作用的机制是否与调节焦亡通路相关。

方法: 制备柠檬酸修饰的 CNPs, 通过多种表征方法确定其理化结构。在细胞水平, 将 HK-2 细胞与 CNPs (0、50、100 $\mu\text{g/mL}$) 预处理 4 h 后, 再分别与多浓度梯度碘海醇 (30、45、60、75、90 mg/mL) 共培养 24 ~ 48 h, 为评估损伤程度及 CNPs 干预效果, 分别通过 MTT 法检测细胞活性、Calcein-AM/PI 双染探针检测活/死细胞、Annexin V-FITC/PI 流式染色检测细胞凋亡、DCFH-DA 荧光探针检测细胞活性氧 (ROS) 含量、Western Blot 检测焦亡相关蛋白 GSDMD、caspase-11、IL-1 β 表达水平。在动物水平, 将雌性 KM 小鼠分为空白对照组、CNPs 组 (50 mg/kg)、PC-AKI 组 (碘海醇浓度: 3 g/kg)、PC-AKI + CNPs 组, 注射碘海醇 24 h 后收集小鼠血液和主要器官, 检测血生化、病理组织学、肾组织氧化应激、炎症反应及凋亡水平、焦亡相关蛋白表达水平。两组间均值比较使用 Student's t 检验, 多组间均值比较使用单因素方差分析。

结果: CNPs 平均尺寸 $4.08 \pm 0.30 \text{ nm}$, Zeta 电位显示表面带负电荷, 傅立叶红外光谱 (FTIR) 显示柠檬酸成功修饰。体外实验结果显示, 与对照组相比, CNPs 可降低碘海醇诱导的细胞损伤及凋亡, 并具有 ROS 清除能力 ($P < 0.01$)。焦亡相关蛋白的研究结果显示, 经碘海醇处理后, GSDMD、caspase-11、IL-1 β 表达水平均有所升高 ($P < 0.05$), 但与 CNPs 预处理组的差异无统计学意义 ($P > 0.05$)。体内实验结果说明, CNPs 在短期内具有良好的生物相容性, 可通过减轻氧化应激、炎症及凋亡水平, 改善肾小管损伤程度, 在体内发挥肾保护作用, 但焦亡相关蛋白的表达水平在 PC-AKI + CNPs 组与 PC-AKI 组未见显著差异 ($P > 0.05$)。

结论: CNPs 在 PC-AKI 中具有保护作用, 但并非是通过抵抗碘海醇引起的细胞焦亡而发挥作用。

PU-0663

Dual-Energy CT-based Radiomic analysis for Predicting Pathological Grading of Lung Invasive Adenocarcinoma

Yuting Zheng, Xiaoyu Han, Hanting Li, Qinyue Luo, Heshui Shi
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Abstract

Objectives: To investigate the value of radiomics based on Dual-energy CT (DECT) for predicting pathological grading of lung invasive adenocarcinoma.

Methods: In this retrospective study, a total of 107 patients (80 G low and 27 G high) were included with lung adenocarcinoma before surgery. Clinical, radiographic features and quantitative parameters were recorded for the clinical-DECT model. The DECT-based radiomics model was constructed from features extracted from virtual monoenergetic images (VMI), including 50keV and 150keV images. To filter unstable and redundant features, intraclass correlation coefficients (ICCs), Pearson's correlation analysis and least absolute shrinkage and selection operator (LASSO) penalized logistic regression were performed. Then, the DECT radiomics model, the clinical-DECT model and the conventional CT radiomics model were established. Decision curve analysis (DCA) was used to evaluate the clinical utility of the models.

Results: For predicting lung invasive adenocarcinoma grades, the DECT radiomics model achieved an excellent performance with an area under of curve (AUC) of 0.997 and 0.743 in the training and test set, respectively. Tumor density, lobulation, and effective atomic number at AP

were included in the clinical-DECT model with an AUC of 0.836 in the training set lower than the DECT radiomics model. In comparison to the conventional CT radiomics model (AUC, with 0.998 and 0.529 in the training and test set), the DECT radiomics model demonstrated a higher AUC value and a better net benefit to the patients in the test cohorts.

Conclusion: DECT-based radiomics features were useful in predicting pathological grading of lung invasive adenocarcinoma, yielding better predictive performance than conventional CT radiomics model.

PU-0664

3D-APTW 联合 3D-pCASL 成像预测神经胶质瘤分级及 IDH 分型

袁振国、侯会敏、姚翠翠

山东第一医科大学附属省立医院 (山东省立医院)

目的: 评估 3D-APTW 与 3D-pCASL 成像单独或联合在预测神经胶质瘤分级和 IDH 突变状态中的应用价值。

方法: 81 例神经胶质瘤患者 3.0 T MRI 检查, 测量肿瘤 APTW、rAPTW 脑血流量 (CBF) 和相对 CBF (rCBF) 值。用 SPSS 和 MedCalc 行统计学分析或绘图。独立样本 t 检验比较 MR 参数在预测高低级别胶质瘤或 IDH 突变状态中是否具有统计学差异。用配对样本 t 检验比较肿瘤的实性部分与对侧正常脑组织的 APTW 及 CBF 值是否具有统计学差异; 将三个不同级别胶质瘤 (WHO II、III 和 IV 级) 的 MRI 参数运用单因素方差分析进行比较。如方差齐, 使用邦弗伦尼 t 检验进行统计学分析, 多重比较结果应用邦弗伦尼进行校正。方差不齐, 用韦尔奇或布朗-福赛斯 t 检验进行统计学分析, 多重比较结果应用塔姆黑泥进行校正。采用受试者 ROC 曲线下面积 (AUC) 以评估各参数以及 rAPTW 联合 rCBF 预测高低级别胶质瘤、IDH 分型的诊断性能。

结果:

高级别胶质瘤的 APTW、rAPTW、CBF 和 rCBF 值均显著高于低级别胶质瘤 ($p < 0.001$)。肿瘤的 APTW 及 CBF 值均显著高于对侧正常脑组织的对应参数。采用 ROC 曲线分析比较: rAPTW 鉴别高低级别胶质瘤的 AUC 值最大, 约为 0.90, 敏感度和特异度分别为 85.4%、84.8%; rCBF 的 AUC 值、敏感度和特异度分别为 0.84、77.1% 和 81.8%。rAPTW 值与 rCBF 值联合, 鉴别高低级别胶质瘤的诊断能力从 0.84 提高到 0.96。rAPTW 值在关联 IDH 突变状态时 AUC 值 (0.92)。将 rAPTW 值与 rCBF 值联合后, 其预测能力提高到了 0.96。WHO III 级及 IV 级胶质瘤的 APTW、rAPTW、CBF 和 rCBF 值均显著高于 WHO II 级胶质瘤; WHO III 级胶质瘤的 APTW、rAPTW 和 rCBF 值均显著低于 WHO IV 级胶质瘤 ($p < 0.01$)。

结论:

3D-APTW 成像在预测高低级别胶质瘤及 IDH 分型中具有较高的诊断效能, 与 3D-pCASL 成像比较具有更高的诊断性能

PU-0665

Amide Proton Transfer-weighted Imaging in Assessing Aggressive and Proliferative Potential of Bladder Cancer

Lingmin Kong, Qian Cai, Jian Ling, Yan Guo, Huanjun Wang
The First Affiliated Hospital, Sun Yat-Sen University

Purpose: To investigate the diagnostic performance of amide proton transfer-weighted (APT_w) MRI in bladder cancer (BCa) and its association with histopathological characteristics.

Materials&Methods: Patients with BCa who underwent multiparametric MRI including APTw MRI were eligible for this retrospective study. The APTw value was analyzed in relation to pathological grade and immunohistological indicators (Ki-67 and human epithelial growth factor receptor 2 [HER2]). High-expression of Ki-67 was defined as the proportion of positive cells over 20%, while HER2 status was considered negative if the staining was 0 or 1+, and positive if it was 2+ or 3+.

Results: In total, 84 patients (mean age, 63.96 ± 11.95 [SD]; 74 men) between 2020 and 2023 were enrolled in this study. Significantly higher APTw value was found in high-grade BCa (5.7% [IQR, 3.6%-9.4%] vs 3.2% [IQR, 2.4%-6.4%], $P = 0.006$), high-Ki-67 expression BCa (6.3% [IQR, 4.5%-11.7%] vs 2.8% [IQR, 2.1%-3.6%], $P < 0.001$) and HER2 positive BCa (5.8% [IQR, 4.0%-8.8%] vs 3.7% [IQR, 2.0%-6.3%], $P = 0.030$). APTw value was moderately correlated with Ki-67 expression ($|r| = 0.737$) and not correlated with pathological grade and HER-2 expression (all $|r| < 0.3$).

Conclusion: APTw MRI is a promising noninvasive tool to reflect the biological aggressiveness of BCa and may further guide personal therapy in BCa.

PU-0666

探究 GSH 巯基加权 VDMP-CEST 成像评估脓毒症相关脑病大脑氧化还原稳态失衡的作用

林洁钗、吴仁华
汕头大学医学院第二附属医院

目的: 利用 GSH 巯基加权 VDMP-CEST 成像, 探究在脓毒症相关脑病发病早期, GSH 巯基加权 VDMP-CEST 信号是否能作为大脑氧化还原稳态失衡的非侵入性成像标志物, 并联合磁共振波谱成像对 GSH 进行定量加以辅证, 期望为临床上早期发现脓毒症相关脑病提供一项具有无创性、准确性的影像方法。

方法: 选取健康 SD 雌性大鼠 25 只, 体重 150-200g, 随机分为 SAE 组和对照组, 其中 SAE 组采用腹腔注射 15mg/kg 的细菌脂多糖破坏血脑屏障, 建立脓毒症相关脑病的大鼠模型, 对照组不加任何处理因素。采用水迷宫实验来评价大鼠学习、记忆和空间能力的受损情况。采用 7.0T Agilent 动物磁共振扫描仪对各组大鼠进行 GSH 巯基加权 VDMP-CEST 扫描成像, 同时采用磁共振波谱成像对 GSH 巯基进行定量, 扫描时间分别为造模前, 造模后 24 小时、48 小时、72 小时、96 小时, 图像量化值采用 MATLAB 和 Icmode1 软件后处理得到。

结果: 水迷宫实验发现 SAE 组大鼠与对照组大鼠相比, 找到平台的时间明显延长。磁共振扫描发现 SAE 组大鼠在造模后 GSH 巯基加权 VDMP-CEST 信号、磁共振波谱成像相应 GSH 峰值均呈先上升后下降趋势, 上升峰值在造模后 48 小时, 而对照组大鼠在造模前后 GSH 巯基加权 VDMP-CEST 信号、磁共振波谱成像相应 GSH 峰值无显著变化趋势。

结论: 在脓毒症相关脑病早期, GSH 作为体内最重要的抗氧化物质, 参与了维持脑内氧化还原稳态的过程, 主要表现为大脑中活性氧 ROS 含量增加, 消耗还原型 GSH, 从而改变 GSH 巯基与水的交换速率, 导致 GSH 巯基加权 VDMP-CEST 信号变化。由此, 我们推断 GSH 巯基加权 VDMP-CEST 成像可实现对脓毒症相关脑病早期大脑氧化还原稳态的“可视化监测”, 为临床的早期诊断提供更丰富的影像诊断依据。

2. 盐城市第一人民医院

3. 无锡市人民医院

目的：视神经脊髓炎谱系疾病(neuromyelitis optica spectrum disorders, NMOSD)是一种主要累及青壮年人，高复发、高致残性的中枢神经系统炎性脱髓鞘疾病，26%~67%的 NMOSD 患者在不同的疾病阶段都伴有认知障碍。海马是较早受累的脑区之一，已知的研究表明 NMOSD 患者海马的总体积是明显减低的，但是海马亚区的体积及其与认知功能的关联尚未阐明。本研究旨在评估海马亚区体积的改变与 NMOSD 患者认知功能下降的关联。

方法：本研究共纳入 77 名受试者，包括 38 名 NMOSD 患者和 39 名性别、年龄、受教育程度与之相匹配的正常健康对照 (healthy control, HC)。每位受试均接受了 3D-T1WI 磁共振扫描以及标准的神经心理学认知量表 (北京版蒙特利尔认知评估量表) 评估。采用 FreeSurfer 7.0 软件包进行了所有受试者的海马亚区分割，两侧海马均分别分割成 19 个亚区，包括旁下托、前下托头部及体部、下托头部及体部、CA1 头部及体部、CA2/3 头部及体部、CA4 头部及体部、齿状回颗粒细胞层头部及体部、分子层头部及体部、海马杏仁核过渡区、海马裂、海马伞、海马尾，并计算出每个亚区的体积，比较两组海马亚区的体积差异，进一步分析 NMOSD 组内海马亚区与认知量表评分的相关性。

结果：与 HC 组相比，NMOSD 组的双侧海马总体积、双侧 CA1 头部、双侧 CA4 头部及体部、双侧齿状回颗粒细胞层头部及体部、双侧海马杏仁核过渡区、左侧分子层头部、左侧海马伞、右侧前下托头部、右侧分子层头部及体部、右侧 CA3 头部体积均明显减低 (P 均 <0.05)。左侧海马尾 ($r=0.406$)、左侧分子层体部 ($r=0.4$)、右侧海马尾 ($r=0.367$)、右侧 CA1 体部 ($r=0.389$)、右侧分子层体部 ($r=0.401$) 体积与 MoCA 评分呈正相关 (P 均 <0.05)。

结论：NMOSD 患者存在明显的认知功能下降，且伴有双侧海马总体积及多个亚区体积的减低，部分海马亚区的萎缩可能是 NMOSD 患者认知功能下降的潜在神经机制之一。

PU-0668

45 ms 和 97 ms TE 单体素 PRESS 波谱检测胶质瘤中胱硫醚的对比研究

周敏、聂壮、赵洁、肖瑶、雷子乔
华中科技大学同济医学院附属协和医院

目的：1 号染色体短臂 19 号染色体长臂共缺失 (1p/19q codeletion) 是胶质瘤中最重要的基因突变之一，与患者的预后、精准治疗方案的制定息息相关。最新研究表明，1p/19q codeletion 胶质瘤有独特的细胞代谢，其中胱硫醚水平较 1p/19q non-codeletion 胶质瘤升高约 2 倍。MRS 检测胱硫醚成为无创、在体检测 1p/19q codeletion 突变、监测相应胶质瘤治疗反应的潜在新兴技术。然而，常规的 97 ms TE PRESS 序列中，胱硫醚和天冬氨酸谱线有较大的重叠。这成为 MRS 精确定量胱硫醚的技术瓶颈。本研究旨在优化 PRESS 的 TE 组合，以准确检测胱硫醚。

方法：(1) 虚拟激发试验：虚拟激发胱硫醚和天冬氨酸谱线，以寻找 2 者最大差异时的 TE 值；

(2) 模体实验：配置胱硫醚和天冬氨酸模体，行 45 ms、97 ms TE PRESS 扫描，以验证激发谱线的准确性；(3) 在体实验：前瞻性纳入 84 例怀疑胶质瘤的患者，采集 45 ms、97 ms TE

PRESS 和 68 ms TE MEGA-PRESS 波谱, 检测 PRESS 波谱拟合时添加、删除天冬氨酸对胆碱定量影响; 并以 MEGA-PRESS 为金标准, 检测 PRESS 胆碱测定值与金标准的相关性。

结果: 激发试验表明, PRESS (TE1, TE2) = (17, 28) ms 时, 能最大程度减少天冬氨酸对胆碱谱线的干扰, 为最佳 TE 组合。模体实验所得谱线与激发谱线一致。在体实验时, 拟合基组中添加、删除天冬氨酸, 胆碱的测定值 45ms TE: 0.801 ± 0.209 mM vs. 0.796 ± 0.209 mM, $p = 0.49$; 97ms TE: 1.97 ± 2.01 mM vs. 1.55 ± 1.95 mM, $p < 0.001$; 45ms TE 时胆碱浓度差值明显低于 97 ms ($p < 0.001$)。全基组拟合时, 45 ms、97 ms TE 胆碱测定值与 MEGA-PRESS 测定值的相关系数分别为 0.78、0.65。

结论: 45ms TE PRESS 相较于 97ms TE PRESS 能更准确地检测、定量胶质瘤中的胆碱。

COPB2 promotes glioma progression and serves as a prognostic biomarker

Siqi Wang, Ping Han

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose

Through screening glioma microarray datasets in public databases, to identify biomarker in glioma progression and prognostic prediction.

Materials and Methods

The integrated analysis was performed using MetaOmics software package in R software. The combined effect and p-value were used to screen differential expressed genes. To identify the more meaningful biomarker for high-grade glioma, 20 genes were selected for high-content screening. The results were validated in The Cancer Genome Atlas (TCGA), Chinese Glioma Genome Atlas (CGGA), and patient samples from our hospital, and survival analysis were conducted. Lv-shCOPB2 was constructed and transduced into glioblastoma cell lines for analyzing the impact of COPB2 on glioma. Cell proliferation and viability were confirmed by the MTT assay, colony formation assay and flow cytometry. Furthermore, to characterize the role COPB2 plays in tumor growth in vivo, subcutaneous glioma models were established.

Results

Using the GEO public database, bioinformatic analysis of 13 gene expression datasets containing 1235 glioma samples and high-content screening analysis revealed the role of COPB2 in glioma. GEO, TCGA, and CGGA databases revealed that the COPB2 gene was significantly overexpressed in gliomas, especially in high-grade gliomas, and can predict poor prognosis. The results also validated in patient samples from our hospital by immunohistochemical analysis and qPCR analysis. In vitro, knockdown of COPB2 decreased cell proliferation, inhibited clonogenic ability, blocked cell cycle progression, and induced cell apoptosis. In vivo, knockdown of COPB2 significantly decreased the tumor growth rate and reduced tumor volume in xenograft nude mouse models.

Conclusion

Based on the results of bioinformatics analysis and wet-bench experiments, COPB2 has a critical role in glioma progression and serves as a prognostic factor, indicating the potential to be a therapeutic target in glioma, especially in high-grade glioma.

PU-0670

MRI-guided dual-responsive anti-tumor nanostructures for synergistic chemo-photothermal therapy and chemodynamic therapy

Yifei Wang

First Affiliated Hospital of Zhengzhou University

Image-guided stimulus-responsive theranostics are beneficial for pinpointing malignant lesions and combining multiple cell-killing mechanisms to enhance tumor cell clearance. Herein, an intelligent dual-responsive nanostructure (HSPMH-DOX) was developed for magnetic resonance imaging (MRI)-guided synergistic chemo-photothermal therapy (PTT) and chemodynamic therapy (CDT). The core-shell nanostructure was synthesized via layer-by-layer coating of drug-loaded hollow mesoporous silica nanoparticles (HS) with polydopamine (PDA), manganese oxide (MnO₂), and hyaluronic acid (HA), respectively. The constructed nanoagent has the characteristics of endogenous and external dual response. The tumor microenvironment (pH/GSH) can trigger the degradation of gatekeeper (MnO₂ and PDA) to trigger the release of anti-tumor drugs, while external near-infrared light irradiation can accelerate the degradation behavior and generate local overheating to achieve PTT. Notably, MnO₂ can not only consume intracellular GSH to enhance CDT, but also release Mn²⁺ for precise localization of tumor tissues by MRI. Both in vitro and in vivo experiments showed that the prepared dual-response nanoagent had satisfied biocompatibility, targeting, and the great efficiency of MRI-guided combined therapy. Impressively, combining chemo-PTT and CDT can destroy tumors in animal models in almost two weeks. This work may open up a broad way for stimulus-responsive synergistic theranostic applications, including MRI, chemo-photothermal therapy and chemodynamic therapy.

PU-0671

利用钆对比剂动态增强 MRI 图像的灰度直方图阵列预测乳腺癌新辅助化疗后病理学完全缓解

朱海涛¹、曲玉虹²、曹崑¹、李晓婷¹、孙应实¹

1. 北京市肿瘤防治研究所

2. 首都医科大学附属北京朝阳医院

目的：局部进展期乳腺癌患者通常需要进行新辅助化疗来缩小肿瘤原发灶、降低临床分期和抑制肿瘤的转移。部分患者在疗后可达到病理学完全缓解（pCR）并具有良好的预后。如果能够在新辅助化疗后采用影像学方法准确预测出患者达到 pCR 的概率，部分患者则有可能以此为依据来选择个性化的后续治疗方案，如乳房切除术、保乳术或乳房重建术。目前基于 MRI 影像的人工智能模型大多需要对感兴趣区域进行图像提取，但是乳腺在新辅助化疗后的改变令肿瘤区域的手动勾画和自动分割都变得困难。本研究提出一种直方图阵列方法来量化 Gd-DTPA 对比剂在乳腺肿瘤区域的动态变化过程，仅需医生对肿瘤的位置进行简单标注就可以实现对新辅助治疗后 pCR 的预测。

方法：本研究为回顾性研究，收集局部进展期患者 336 例，根据手术病理结果分为 pCR（n=143）及非 pCR（n=193），分层随机划分为训练组（n=167）、验证组（n=34）和测试组（n=135）。本研究采用 GE Signa 1.5T 成像系统在新辅助治疗后对患者进行 MRI 检查，并由一名影像医师在图像中判断出肿瘤中心的位置。6 期矢状位 T1 加权成像分别在 Gd-DTPA 注射前及注射后 2.0, 3.5, 5.0, 6.5, 8.0 分钟进行采集；TR 为 6.4ms，TE 为 3.0ms。本研究将 6 期图像的灰度直方图组合为二维阵列，采用卷积神经网络以病理为金标准进行 pCR 和非 pCR 的二分类预测。

结果：训练组、验证组和测试组的 AUC 值分别为：0.859（95%CI: 0.800-0.918）、0.853（95%CI: 0.722-0.983）和 0.815（95%CI: 0.743-0.887）。测试组的灵敏度、特异性、阳性预测值和阴性预测值分别为 82.5%（95%CI: 70.1-91.3%）、73.1%（95%CI: 61.8-82.5%）、69.1%（95%CI: 56.7-79.8%）和 85.1%（95%CI: 70.1-91.3%）。

结论：本研究的结果初步表明基于 Gd-DTPA 多期增强乳腺癌 MRI 图像的灰度直方图阵列和卷积神经网络模型能够在无需精确分割的情况下实现新辅助治疗疗效的预测。

PU-0672

18F-FDG PET/MR 诊断血管内大 B 细胞淋巴瘤-噬血细胞综合征相关型一例

顾莹莹、王东伟、李天女、唐立钧
江苏省人民医院（南京医科大学第一附属医院）

病历资料：患者女，68 岁，因“全血细胞减少伴发热 1 月余，胸闷咳嗽半月”就诊，血常规示三系减少。胸腹部 CT 提示间质性肺炎，肝占位，脾大，腹腔多发肿大淋巴结。行激素、抗感染治疗，未见好转。18F-FDG PET/MR 示：①肝脾肿大；全身多发肿大淋巴结；全身多处骨骼信号异常；两肺多发斑片影；FDG 代谢均增高；考虑血管内大 B 细胞淋巴瘤-噬血细胞综合征相关型（IVLBCL-HPS）可能，Iugano 分期 IV 期。②脾梗死伴出血。患者行骨髓活检术：①噬血细胞综合征②淋巴瘤骨髓浸润。免疫组化：CD3：散在+，CD5：散在+，CD10：-，CD20：+++，PAX5：++，MUM1：++，BCL-6：-。综合检查结果诊断为：血管内大 B 细胞淋巴瘤-噬血细胞综合征相关型（IV 期 B 组，IPI 5 分高危）。患者 DEP 方案治疗 HPS，R-CHOP 方案治疗 IVLBCL，联合鞘内注射甲氨蝶呤预防中枢神经系统受累后，血象好转，肺部病变基本消失，淋巴结变小，症状改善。讨论：血管内大 B 细胞淋巴瘤(IVLBCL)是结外大 B 细胞淋巴瘤的罕见类型，病理表现为淋巴瘤细胞在小血管内大量增殖，受累器官实质梗死出血，具有高度侵袭性。IVLBCL 主要分为经典型、噬血细胞综合征相关型（HPS）及皮肤型，其中 HPS 型进展迅速，预后最差，因此对 HPS 的精准诊疗非常重要。在此病例中①误诊间质性肺炎抗生素治疗无效，PET 弥漫性高代谢与 CT 表现不匹配，强烈提示 IVLBCL-HPS 肺部浸润。②MR 示脾脏边缘出血信号及 PET 代谢缺失提示脾脏梗死，为肿瘤细胞聚集压迫血窦所致；PET/MR 示肝脾异常信号伴高代谢提示肿瘤累及。③MR 骨髓局灶性异常信号伴 FDG 代谢增高提示骨髓浸润，PET/MR 可在骨骼发生 CT 形态学改变前，早期发现骨髓浸润。④PET/MR 多发淋巴结肿大伴代谢增高提示血管外浸润。⑤除本例受累脏器外，IVLBCL 易累及中枢神经系统、肾、肾上腺等脏器，MR 软组织分辨率高，联合实时 PET 代谢信息，优势显著。由此可见，PET/MR 有助于 IVLBCL-HPS 的诊断，并提供分期信息，指导治疗。后续继续随访，期待 PET/MR 在疗效评估中的作用。

PU-0673

Optimization of saturation RF pulse parameters for amide proton transfer weighted imaging of brain tumors at 3T MRI

na Liu
Affiliated Zhongshan Hospital of Dalian University

Objective: To explore the value of different combinations of saturation radiofrequency (RF) pulse power and duration for improved 2D amide proton transfer (APT) imaging.

Materials and Methods: A total of 30 subjects (11 males, mean age: 54.70 ± 11.92 years old) were scanned using a 3.0 T MR scanner, the scan sequences included T1 weighted imaging (T1WI), T2 weighted imaging (T2WI), contrast-enhanced T1WI and 2D-APT with different saturation schemes. Two observers with more than 3 years of diagnostic experience evaluated the 2D-APT images based on the Likert quintile. The APT values of the three regions of interest (ROI) in the tumor core, perigama edema (if exist) and the contralateral normal white matter region were measured separately. 4 positions were placed in each region for data measurement, and the averaged value of the 4 positions was taken as the APT value of the ROI. The consistency of qualitative evaluation and quantitative measurements by the two observers were tested using Intraclass Correlation Coefficient (ICC) and Kappa. The Friedman or spearman test was used to evaluated the differences in MTRasym, Δ MTRasym and subjective scores among different combinations of saturation powers and durations for 2D-APT. The correlation between MTRasym(T) and Ki-67 expression evaluated by the pearson correlation coefficient.

Results: The measurement data and the score of the two observers were in good agreement (ICC: 0.942~0.992, Kappa: 0.778). Significant differences in MTRasym (T), MTRasym (E), MTRasym (CNAWM), Δ MTRasym (T-C), Δ MTRasym(E-C), and subjective scores were between different saturation regimens ($p < 0.05$). When the RF pulse saturation power and duration were set as 2.0 μ T and 2.0 s, the MTRasym(T), Δ MTRasym(T-C) values and subjective scores were shown to be the highest; when the RF pulse saturation power was 2.0 μ T and the duration was 1.6 s, the MTRasym (E) was the highest; and MTRasym (CNAWM) was the highest when the RF pulse saturation power was 2.0 μ T and the duration was 0.8 s; when the saturation power was 1.0 μ T for a duration of 0.8 s, the MTRasym(E-C) value was the highest. pearson results showed that MTRasym (T) were positively correlated with the Ki-67 index[(21.65 \pm 3.28)%] at the saturation power of 2.0 μ T and duration of 2.4 s, 2.0 s, 1.6 s, and 1.2 s, respectively.

PU-0674

Based on phantom test, the study of Hyper Iterative algorithm on total-body PET/CT with short acquisition time and low injection dose

Keyu Zan¹, Yanhua Duan²

1. Qilu Hospital of Shandong University (Qingdao)

2. The First Affiliated Hospital of Shandong First Medical University

Background This comparative study was to compare the image quality of two reconstruction algorithms (OSEM and HYPER Iterative) for total-body ¹⁸F-deoxyglucose (FDG) PET/CT with different acquisition times and injection activity.

Methods A NEMA phantom was first performed to compare the image quality using the ordered subset expectation maximization (OSEM) and HYPER Iterative algorithm ($\beta = 0.15-0.95$). Evaluated the background variability (BV), coefficient of variation (COV), and contrast recovery coefficient (CRC). Consequently, A prospective study was included on 50 patients using 2 reconstruction algorithms (β values were decided by phantom study). Clinical studies comprised of 2 parts: acquisition time grouping and injection activity grouping. All lesions were divided into 3 groups according to their size. Measured the noise SD and lesion SUVmax, and calculated the signal-to-noise ratio (SNR) and target-to-background ratio (TBR). Δ SUVmax and Δ TBR were defined as the difference between OSEM and the HYPER Iterative algorithm, and % Δ SUVmax, % Δ SD, and % Δ SNR were defined as the percentage difference between OSEM and the HYPER Iterative algorithm. Image quality was visually assessed by two physicians using a Likert scale (1=very poor, 5=excellent quality).

Results In the phantom study, the BV and COV of the HYPER Iterative algorithm with the same acquisition time were smaller than OSEM, and the CRC of the hot spheres was higher than OSEM except 60s-0.75, 0.95 in the full-dose group, 60s-0.55-0.95 in the half-dose group and

120s-0.55-0.95, 60s-0.15-0.95 in the quarter-dose group. Visual score of all sequences of the HYPER Iterative algorithm was higher than the moderate image quality (3 points). Clinical studies showed that 300s-OSEM has a similar noise to the 60s-0.35 of the HYPER Iterative algorithm (0.21 ± 0.06 and 0.20 ± 0.06 , $p > 0.05$). The lesion SUVmax, TBR, and SNR in the HYPER Iterative algorithm were higher than OSEM ($p < 0.001$), and SUVmax increased more significantly in lesions smaller than 10mm. The $\% \Delta \text{SNR}$ and $\% \Delta \text{SD}$ of the HYPER Iterative algorithm showed improvement as reduced acquisition time and dose, where a higher degree of improvement was observed in both ΔSUVmax and ΔTBR of the lesion.

Conclusion The HYPER Iterative algorithm increases the SUVmax, reduces the noise level, and improves image quality, especially for lesions $\leq 10\text{mm}$ and in a shorter time and lower dose. In the HYPER Iterative algorithm, $T=60\text{s}$, $\beta=0.35$ of the half-dose and $T=120\text{s}$, $\beta=0.35$ of the quarter-dose can satisfy the good image quality.

PU-0675

18F-FDG PET/CT、血清肿瘤标记物 CYFRA21-1 和 SCC-Ag 在男性非小细胞肺癌患者 EGFR 突变状态鉴别中的作用

江茂情、张晓辉、郭修玉、高巧灵、张景峰、郑建军
宁波市第二医院

目的 表皮生长因子受体 (EGFR) 突变的高发病率通常发生在从未吸烟的女性肺腺癌患者中。然而, 关于男性患者的报道很少。因此, 本研究旨在探索一种基于 ^{18}F -FDGPET/CT 和血清肿瘤标记物 (STM) 的新方法, 以确定男性非小细胞肺癌 (NSCLC) 患者 EGFR 突变状态。

方法 在 2019 年 10 月至 2022 年 3 月期间, 对宁波市第二医院的 121 名男性非小细胞肺癌患者进行了分析。所有患者在治疗前均接受 ^{18}F -FDG PET/CT 扫描, 并监测了 8 种 STM (细胞角蛋白 19 片段 [CYFRA21-1]、鳞状细胞癌相关抗原 [SCC-Ag]、癌胚抗原 [CEA]、神经元特异性烯醇化酶 [NSE]、碳水化合物抗原 [CA50]、CA125、CA72-4 和铁蛋白)。比较了原发性肿瘤的最大标准化摄取值 (pSUVmax) 和 8 个 STM 在 EGFR 突变体和野生型之间差异。运用受试者操作特征 (ROC) 曲线和多元逻辑回归分析以确定 EGFR 突变状态的预测因素。

结果 在 39 例患者中检测到 EGFR 突变 (32.2%)。与 EGFR 野生型患者相比, EGFR 突变患者的血清 CYFRA21-1 (2.65 vs. 4.01 , $P = 0.002$) 和 SCC-Ag (0.67 vs. 1.05 , $P = 0.006$) 浓度较低。CEA、NSE、CA-50、CA125、CA72-4 和铁蛋白在两组之间差异无统计学意义。EGFR 突变的存在与低 pSUVmax (<8.75)、低血清 SCC-Ag (<0.79 ng/mL) 和低 CYFRA21-1 (<2.91 ng/mL) 浓度显著相关。对于低 CYFRA21-1、SCC-Ag、pSUVmax 和这 3 个因素的组合, ROC 曲线下面积值分别为 0.679、0.655、0.685 和 0.754。

结论 血清低浓度的 CYFRA21-1 和 SCC-Ag 以及低 pSUVmax 与 EGFR 突变有关, 并且这些因素的组合更有助于男性 NSCLC 患者 EGFR 突变状态的识别。

PU-0676

Fluorescent nanodot composite particles for disease imaging

Jiaqi Hao¹, min wu¹, xiao gong²

1. West China Hospital of Sichuan University

2. Wuhan University of Technology

Purpose: Carbon nanodots (CDs) have received huge attention of researchers due to their good optical properties. However, CDs generally suffer from severely fluorescence self-quenching once they are aggregated or in solid state, limiting their applications in disease imaging.

Method: The high-performance Y-CDs-based microparticles were directly obtained via a one-step solvothermal method. Based on TEM, SEM, XRD, and FTIR analyses, the solid-state fluorescent microparticles were composed of p-phenylenediamine dihydrochloride matrix and CDs. 3-glycidyloxypropyltrimethoxysilane (KH-560) acts as a bridge to connect CDs to the matrix based on epoxy-amine reaction and silane hydrolysis condensation for uniform dispersion of CDs and high solid-state luminescence can be easily achieved. Meanwhile, through adjusting the amount of KH-560, the morphology of Y-CDs-based microparticles can be controlled from cube to layered structure and the fluorescence intensity can be significantly improved.

Result: In this work, we report a rational strategy for synthesis of yellow fluorescent carbon nanodots (Y-CDs)-based microparticles with a high solid-state photoluminescence quantum yield (32.02%). It is the first report on designing a lamellar structured matrix to disperse CDs to realize long-wavelength solid fluorescence. Importantly, the optimal Y-CDs particles can be combined with blue chips (450 nm) to show that the luminescence performance is better than the existing medical fluorescent agents, which provides a good material support for subsequent medical applications.

Conclusion: The CD-based phosphor provides a more green and simpler choice for the disease imaging. This work proposed a new strategy to prepare the high-efficiency long-wavelength emission solid-state fluorescent CDs-based particles with lamellar structure and revealed the promising potential in disease imaging.

基于 APTw 及 T2w 图像的集成学习放射组学模型无创预测胶质瘤 IDH 突变状态

胡万均、张静

兰州大学第二医院

目的: 评估 APTw 及 T2w 图像的集成学习放射组学模型预测胶质瘤 IDH 突变状态效能, 并比较两种模型的预测效能差异。

材料与方法: 回顾性纳入两个中心共 122 例胶质瘤患者 (IDH 野生型, IDH 突变型)。从 APTw 及 T2w 图像提取 1873 个特征, 使用最小绝对收缩和选择算子及 Pearson 相关算法选择特征, 随后将数据按照 8:2 拆分为训练集 (n=100) 及测试集 (n=22); 为了解决样本不平衡问题, 采用了合成少数过采样技术 (SMOTE), 最后基于集成学习算法构建放射组学模型, 使用受试者工作特性曲线 ROC、ACC 等指标评估模型在训练队列及测试队列的模型效能。

结果: 基于 5 个 APTw 图像特征及 2 个 T2w 图像特征构建的集成学习放射组学模型, 在训练集及测试集预测胶质瘤 IDH 突变状态的准确率分别为 86.3%、80.5%, ROC 曲线下面积分别为 83.3%、89.5%。

结论: APTw 及 T2w 图像的集成学习放射组学模型可以在术前无创预测胶质瘤 IDH 突变状态, 并为放射组学模型向临床转化提供了潜在的可能性。

泌尿系增强 CT 在输尿管连接部梗阻诊断中的应用价值

张伟
白银市中心医院

【目的】肾盂输尿管连接部梗阻 (UPJO) 是一种常见的泌尿系疾病, 其临床表现主要是腰酸背痛、排尿困难等症状。目前, 泌尿系增强 CT 作为一种新兴的影像学检查方法, 已广泛应用于 UPJO 的诊断和治疗中。本研究旨在探究泌尿系增强 CT 及多期扫描在 UPJO 中的应用方法及价值。【方法】本研究统计 2020 年 5 月至 2023 年 5 月共有 9 例 UPJO 患者接受泌尿系增强 CT 扫描并进行后处理, 并分析患者的影像学评估和术后结果。9 例患者中, 4 例是由于副肾动脉压迫所致, 3 例是由于副肾静脉压迫所致, 1 例是由于性腺静脉压迫所致, 1 例是由于结石伴肾旋转不良所致。所有患者均通过泌尿系增强 CT 得到了具体原因及周围解剖结构的信息, 并且这些信息对临床手术提供了重要指导。【结论】泌尿系增强 CT 在 UPJO 的诊断和治疗中具有很大的应用价值。首先, 它可以提供较为详细的解剖结构信息, 便于医生了解梗阻原因和相关解剖结构的情况。其次, 泌尿系增强 CT 能够识别一些微小而难以观察到的解剖变异和异常, 这有助于指导手术。最后, 由于泌尿系增强 CT 是一种无创、快速的检查方法, 因此可以大大减轻患者的痛苦和不适。本研究结果表明, 泌尿系增强 CT 及多期扫描在 UPJO 的诊断和治疗中具有很大的应用价值。它能够提供全面的解剖结构信息, 识别微小异常, 并且是一种无创、快速、可靠的检查方法, 可以为 UPJO 的手术治疗提供重要指导。因此, 泌尿系增强 CT 可以作为 UPJO 常规术前检查之一, 以提高 UPJO 的诊断准确性和手术成功率。

脾炎性假瘤样滤泡树突状肉瘤 1 例

贺利明、张浩亮
鄂尔多斯市中心医院

脾脏的滤泡树突状肉瘤 (follicular dendritic cell sarcoma, FDSC) 是一种非常罕见的恶性肿瘤, 分为经典型和炎性假瘤样滤泡树突状细胞肿瘤 (IPT-like FDCT)。滤泡树突状细胞肉瘤 (follicular dendritic cell sarcoma, FDSC), 也称树突细胞肉瘤, 是一种显示滤泡树突细胞分化和免疫表型肿瘤, 由 Lennert 在 1978 年首次提出 [1], 1986 年由 Monda 等首次描述的一种低度恶性肿瘤 [2]。2008 年 WHO 将发生于肝、脾的 FDSC 定义为炎性假瘤样亚型 FDSC (inflammatory pseudotumor-like follicular cell sarcoma, IPT-like FDSC) [3]。主要由 EB 病毒 (Epstein-Barr virus, EBV) 阳性的感染引起。由于引起病因不明, 年龄分布广泛, 多数是成人, 其中女性偏多, 颈部淋巴结是最常发生的部位, 其他结外多个部位也可发生, 包括肝脾等 [4]。但发生于脾脏上更为罕见, 患者临床表现为腹痛、腹胀、低热、消瘦及缓慢生长的无痛性肿块。大多数可切除干净, 40%~50% 的病例出现局部复发。由于其临床症状缺乏特异性, 在影像学表现低密度、边界清楚、不均质并伴有延迟强化的占位性病灶, 且肿瘤形态与相对常见的脾部肿瘤等又非常相似, 造成误诊或漏诊。

PU-0680

机架旋转时间对自由呼吸患者腹部图像质量和辐射剂量的影响

王甜
柳州市人民医院

目的 探讨机架旋转时间对自由呼吸患者腹部图像质量和辐射剂量的影响。方法 将 30 例临床怀疑上腹部病变，行上腹部 CT 增强检查的受检者（不能配合屏气），采用佳能 320 排 CT 机进行扫描，平扫、动脉期扫描时机架旋转时间为 0.3s，标记为 A 组；门脉期、平衡期扫描时机架旋转时间为 0.6s，标记为 B 组。按照制订的标准，对比两组图像的图像质量和辐射剂量，进行统计学分析。结果 A 组和 B 组两组患者 DLP（剂量长度乘积）分别为（440.8±58.5）mGy.cm 和（818.2±90.3）mGy.cm，降低约 46%，差异有统计学意义。B 组图像呼吸引起伪影明显多于 A 组，且 A 组扫描时间少于 B 组。结论 0.3s 的机架旋转时间在自由呼吸上腹部 CT 检查中，能在保证图像质量同时，降低辐射剂量，缩短扫描时间，提高工作效率，值得推荐。

PU-0681

能谱增强 CT 诊断继发性骨骼肌滤泡性淋巴瘤的病例分析

徐海芸、杨烁慧
上海市中医医院

滤泡性淋巴瘤是非霍奇金淋巴瘤的常见类型之一，继发性骨骼肌滤泡性淋巴瘤属于结外淋巴瘤，临床少见，诊断较困难。能谱增强 CT 成像可帮助进行影像学诊断。

2021 年，一名 52 岁的男性因发现左侧腹股沟区肿物 2 月就诊，经肿物穿刺活检术、颈部淋巴结清扫术及骨髓穿刺活检术后病理明确诊断为滤泡性淋巴瘤 I 级、累及骨髓。后患者腰痛进行性加重 2 月，行腰椎能谱增强 CT 提示右侧腰大肌与腹膜后肿大淋巴结为同源性病灶，考虑右侧腰大肌淋巴瘤浸润可能性大。

能谱增强 CT 成像是一种无创、便捷、准确的影像学诊断方法。通过重建、比较不同组织的能谱曲线确定肿块性质，可以帮助诊断结外淋巴瘤，对判断病变范围、指导临床治疗方案具有重要价值。

The GRAPH-CRAFITY Score: a novel prognostic tool for patients with hepatocellular carcinoma treated with targeted therapy and immunotherapy

Ying Xu, Lu Li, Feng Ye, Xinming Zhao
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose: To establish an optimized model by integrating magnetic resonance (MR) features and CRAFTY score to predict overall survival (OS) of hepatocellular carcinoma (HCC) patients treated with targeted therapy and immunotherapy.

Methods: This retrospective study included patients with HCC who received targeted therapy and immunotherapy at two hospitals in China from August 2018 to February 2022. The clinical variables and MR features were assessed by univariate and multivariate Cox regression analyses.

Results: One-hundred and sixty-six patients (55.6±10.4 years) treated with lenvatinib plus anti-PD-1 antibody were included in training cohort and 77 patients (55.4±10.7 years) treated with

lenvatinib or bevacizumab plus anti-PD-1 antibody were included in validation cohort. Based on independent risk factors (Gender, intRatumoral fAt, enhancing tumor caPsule, gross growth type and CRAFTY Score) identified by the multivariate analysis, a novel prognostic tool named GRAPH-CRAFTY Score was developed to predict OS. The OS was significantly different among the 3 groups according to GRAPH-CRAFTY score (≤ 3.2 , 3.3-6.1, ≥ 6.2 ; $p < 0.001$) and C index of GRAPH-CRAFTY Score was 0.74 in both training cohort and validation cohort. Area under the time-dependent receiver operating characteristic curve (ROC) for discrimination at 6, 12, 18, 24 months were 0.80, 0.79, 0.77, 0.72 and 0.87, 0.75, 0.73, 0.78 in training cohort and validation cohort, respectively.

Conclusions: GRAPH-CRAFTY Score by integrating Gender, MR features and laboratory tests is an effective and user-friendly tool to predict OS of HCC patients treated with targeted therapy and immunotherapy, which may help oncologists for decision-making.

PU-0683

Gd-EOB-DTPA 增强 MRI 影像组学在评估肝功能中的价值

朱心雨、郭立、黄鹏、张雨柔
昆明医科大学第二附属医院

目的：探究 Gd-EOB-DTPA 增强 MRI 影像组学特征对肝功能评估的可行性，并建立模型对不同患者肝功能进行分级评估。

方法：回顾性分析 91 例肝硬化者的资料，Child-Pugh A 级(52 例)、Child-Pugh B (34 例)和 Child-Pugh C 级(5 例)。在轴位 T1WI 平扫和 Gd-EOB-DTPA 增强后肝胆期图像上同一层面测量肝脏、脾脏、竖脊肌以及胆管信号强度值，计算肝脏相对强化程度 (RE)、肝胆期肝脏—脾脏信号比 (SI 肝/脾)、肝脏—脾脏对比增强指数 (CEI 肝/脾)、肝胆期肝脏—竖脊肌信号比 (SI 肝/肌)、肝脏—竖脊肌对比增强指数 (CEI 肝/肌) 以及胆管信号强度对比率 (SIR)。在 MaZda 软件上勾画肝胆期图像 ROI 并提取影像组学特征，筛选后进行统计分析。利用受试者工作特征 (ROC) 曲线分析各参数在诊断 Child-Pugh A 组 VS Child-Pugh B+C 组的效能。排除冗余参数后分别利用影像参数、影像组学特征以及影像参数+影像组学特征构建 Logistic 回归模型，ROC 曲线分析三个模型在 Child-Pugh A 组 VS Child-Pugh B+C 组间的诊断效能。

结果：RE、SI 肝/脾、CEI 肝/脾、SI 肝/肌和 SIR 五个参数在不同肝硬化组间差异具有统计学意义，14 个特征在不同肝硬化组间差异具有统计学意义。影像参数构建的 Logistic 回归模型的 AUC 值为 0.789；影像组学特征构建的模型 AUC 值为 0.881；影像参数+影像组学特征构建的综合模型 AUC 值为 0.921。经 Delong 检验，影像组学模型和综合模型的 AUC 值高于影像参数模型，差异具有统计学意义 ($P < 0.05$)。

结论：基于 Gd-EOB-DTPA 增强 MRI 影像组学特征可以对不同肝硬化患者肝功能进行评估，且影像组学特征协助构建模型可以提高对肝功能分级的诊断效能。

肝门部胆管癌 CT 与 MRI 联合诊断的价值

高杰
忻州市人民医院

目的：探讨肝门部胆管癌 CT 与 MRI 联合诊断的价值。方法：回顾性选取我院 2021-2023 年收治的肝门部胆管癌患者 50 例，均有 CT 与 MRI 检查结果，均有病理结果。单独 CT 或 MRI 诊断结果与病理结果对比，CT 与 MRI 联合诊断结果与病理结果对比。结果：单独 CT 诊断结果准确率 70%，单独 MRI 诊断结果准确率 76%。CT 与 MRI 联合诊断准确率 92%。CT 与 MRI 联合诊断准确率与

单独 CT 或 MRI 差异有统计学意义。结论：肝门部胆管癌 CT 与 MRI 联合诊断有明确价值，值得广泛推广应用。

PU-0685

基于 CT 图像探索非肌层浸润性膀胱癌风险分层的初步研究

陈丽、张古沐阳、许梨梨、张晓霄、金征宇、孙昊
中国医学科学院北京协和医院

目的：探索 CT 图像特征对非肌层浸润性膀胱癌 (NMIBC) 风险分层的提示意义。

方法：回顾性收集 2013 年 5 月至 2018 年 11 月于我院确诊为 NMIBC 患者的术前 CT 影像数据，共计 168 例纳入本研究。根据欧洲泌尿学协会 (EAU) 指南对病例进行风险程度分层 (低、中、高)。由 2 位放射科医生独立、双盲对 CT 图像特征进行选取。采用单因素分析及有序多分类 Logistic 回归方法分析与风险分层相关的 CT 特征进行统计学分析。

结果：单因素分析显示患病风险等级与病灶数量及最大病灶长、短径相关 ($P=0.001$, $P=0.001$, $P=0.006$)。有序多分类 Logistic 回归分析发现肿瘤位置位于后壁、侧壁、输尿管口相对于膀胱三角患病风险等级高至少一个等级的可能性分别为 0.19 ($P=0.009$)、0.17 ($P=0.002$)、0.26 ($P=0.046$) 倍；单发与非单发相比，患病风险等级高至少一个等级的可能性为 0.33 倍 ($P=0.004$)。

结论：肿瘤位置、大小、数目等 CT 特征对 NMIBC 的术前危险分层具有提示意义，有利于患者治疗方式的选择和改善预后。

腹膜后原发上皮样血管内皮瘤一例

公维义、刘帅、苏伟、崔永胜、吕海莲、杨新国
胜利油田中心医院

上皮样血管内皮瘤 (epithelioid hemangioendothelioma, EHE) 是一种起源于血管内皮细胞 [1] 的罕见血管肿瘤。其发病率不足百万分之一，占有血管肿瘤的不到 1% [2]。该病可发生于任何年龄，无明显的性别差异。可发生于身体多个部位，以软组织 (四肢)、骨骼、肝脏和肺为主 [2]。原发于腹膜后者更为罕见。1982 年，Weiss 和 Enzinger 将血管内细支气管肺泡瘤 (intravascular bronchioloalveolar tumor, IVBAT) [3] 更名为 EHE [4]。2015 年，世界卫生组织肺部肿瘤分类明确将 EHE 归类为低级别至中等级别恶性血管肿瘤，具有潜在转移能力 [5]。

64 排 CT 腹部增强动脉期检查中经验值法延时时间的优化

温宇
安徽医科大学附属阜阳医院

目的：探讨 64 排 CT 腹部增强动脉期检查中经验值法延时时间的优化。方法：回顾性分析 2022 年 1 月 -2023 年 7 月 100 例 CT 腹部增强检查患者的临床资料，根据经验值法延迟时间将其

分为 A 组 (n=50) 和 B 组 (n=50)。A 组动脉期检查中经验值法延时时间为 25s-30s, B 组动脉期检查过程中经验值法延时时间为对比剂注射时间+5s。采用 AW4.6 工作站完成图像后处理, 测量出腹主动脉 CT 值及门静脉 CT 值、肾皮质 CT 值。结果: 两组腹主动脉平均 CT 值比较差异无统计意义 ($P>0.05$); B 组门静脉、肾皮质平均 CT 值高于 A 组, 差异有统计学意义 ($P<0.05$); 随着延时时间的增加, 血管密度 HU 开始上升, 并在 10~18 s 时达到峰值, 随后随整体呈下降趋势并呈波动样变化, 并趋于稳定; A 组扫描时经验值法延时时间为 25s-30s, 部分门静脉未见显影, 肾皮质未见强化或强化不明显, 肝脏占位未见明显强化, 影响对疾病的诊断; B 组扫描获得的图像相对清晰, 门静脉稍显影, 双肾皮质灌注良好, 肝脏及肾脏占位强化明显, 有利于疾病的诊断。结论: 64 排 CT 腹部增强动脉期检查中经验值法延时时间为对比剂注射时间+5s, 能更加容易获得最佳动脉晚期扫描时相, 有助于提高图像质量。

PU-0688

增强 CT 在肝脏肿瘤的鉴别诊断中的应用准确性探讨

顾伟

南京市溧水区人民医院

本研究主要的目的是探究增强 CT 方式在肝脏肿瘤患者中的应用价值, 进而观察该方式对疾病的检出率, 分析提升疾病检出率的有效技术, 为临床治疗提供依据。方法: 选取 60 例肝脏肿瘤患者作为研究对象, 均接受 CT 增强方式进行诊断, 将病理检查结果作为疾病诊断的金标准, 将增强 CT 检查方式所获结果与之对比, 进而分析该影像学技术手段的应用价值。结果: 560 例肝脏肿瘤患者中通过病理检查结果明确为恶性肿瘤人数为 36 例、良性肿瘤为 24 例, 通过增强 CT 扫描结果显示恶性肿瘤人数为 25 例, 良性肿瘤人数为 20 例, 经计算明确该影像学技术手段的敏感度、特异度以及准确度分别为 94.44% (34/36)、91.67% (22/24)、93.33% (56/60), 经一致性检测可知, Kappa 为 0.789, 提示一致性良好。 ($P<0.05$) 结论: 对肝脏肿瘤患者的诊断有着重要意义, 分析 CT 增强扫描的影像学表现, 可以看到多数肝细胞癌患者在动脉期可呈现结节样强化, 静脉期密度呈现下降, 延时期则显示为低密度影, 超模展现为高密度环状带样。对于胆管癌患者来说, 其早期增强存在不明显强化, 延迟期可显示出强化, 但程度较低。转移性肝癌患者可呈现出低密度影, 囊肿患者经 CT 增强检查后, 可呈现出低密度影, 具有较为清晰的边界。血管瘤患者出现的强化较为明显, 在延迟期有等密度影出现。由此可以看到通过 CT 增强扫描, 可明确肝脏肿瘤患者的具体类型。从本次研究结果可以看到, CT 增强在肝脏肿瘤中的敏感度、特异度以及准确度分别为 94.44%、91.67%、93.33%, 均处于较高水平, 应用增强 CT 方式实施诊断, 可获得较好的诊断价值, 有助于为临床治疗提供依据。

PU-0689

CT 鉴别诊断肝脏血管瘤 肝脏肿瘤在临床应用中的价值

张文斌

忻州市人民医院

肝脏血管瘤、肝脏肿瘤实际上都是肝脏肿瘤,但后者肝脏肿瘤中包括良性肿瘤与恶性肿瘤,前者为良性肿瘤。由于机体肝区结构非常复杂,病发后临床症状表现差异不大均有乏力、恶心呕吐、消瘦、肝区不适、疼痛表现,仅从症状表现上进行诊断准确度低,影像学检查是诊断常用方法,也被广泛证实是有效方法。CT 是影像科应用广泛的一种方法,经行多层螺旋 CT 检查能探查肿瘤内血流信号,结合分析各区域回声差异,可实现疾病的诊断甚至鉴别。研究将多排螺旋 CT 用于肝脏肿瘤诊断

中, 利用各肿瘤结构上的差异进行判断, 显示出良好的应用价值。本研究以我院 2019 年 1 月至 12 月 200 例占位性肝脏病变患者为对象, 分析 CT 在诊断与鉴别中的应用价值。

PU-0690

胃癌术后并发症危险因素的 Meta 分析

贺谦
川北医学院附属医院

目的 探讨胃癌术后并发症的危险因素, 通过 Meta 分析了解胃癌患者发生并发症的危险因素。为制定预防策略提供科学依据。方法 检索中国期刊全文数据库 (CNKI)、万方数据库、维普中文科技期刊数据库 (VIP)、PubMed 和 Web of Science 数据库。收集至 2023 年 4 月公开发表的关于胃癌术后并发症的相关文献。按照纳入和排除标准对文献进行筛选, 应用 RevMan 5.3 软件进行 Meta 分析。结果 共纳入 19 篇病例对照研究文献, 其中中文文献 15 篇, 英文文献 4 篇; 合计病例组 2083 例, 对照组 17237 例。本文分析了 11 项可能的危险因素, 有统计学意义的危险因素包含年龄 >60 岁 (OR=1.92, 95% CI: 1.34-2.76)、男性 (OR=1.22, 95% CI: 1.06-1.40)、BMI $>25\text{kg}/\text{m}^2$ (OR=1.81, 95% CI: 1.33-2.45)、病理阶段 (OR=0.61, 95% CI: 0.41-0.90)、开腹手术 (OR=1.66, 95% CI: 1.34-2.05)、手术时间 (OR=0.47, 95% CI: 0.28-0.80)、胃切除范围 (OR=0.77, 95% CI: 0.65-0.92)、切口类型 (OR=1.66, 95% CI: 1.34-2.05)、, 而术前白蛋白、术中出血量、腹部手术史、联合脏器切除的差异均无统计学意义 (P 值均 >0.05) ; 上述 7 项研究因素是胃癌术后并发症的重要危险因素。结论: 胃癌术后并发症危险因素较多, 科学预防与控制相关危险因素是降低胃癌术后患者并发症发生率的关键。

PU-0691

T1 mapping 在直肠癌预后因素中的应用

李娟、高雪梅、程敬亮
郑州大学第一附属医院

探讨 T1 mapping 在直肠癌预后因素中的应用价值。资料与方法 以 86 例病理证实为直肠癌的患者为研究对象, 行高分辨 MRI、T1 mapping 及 DWI, 测量不同病理分级、TN 分期以及相关结构侵犯状态的 T1 弛豫时间 & 表观扩散系数 (ADC)。结果 高级别直肠癌 T1 值高于低级别直肠癌, 差异具有统计学意义 (P <0.001) ; 神经侵犯阳性组 T1 值高于阴性组, 差异具有统计学意义 (P <0.05) ; TN 分期, 壁外血管侵犯, 脉管癌栓不同组间 T1 值、ADC 值的差异均无统计学意义 (P >0.05) 。T1 值鉴别高级别与低级别直肠癌的 ROC 曲线下面积为 0.796, T1 值鉴别神经侵犯的 ROC 曲线下面积为 0.637。结论 T1 mapping 有助于评估直肠癌患者的预后因素, 包括病理分级及神经侵犯。

实型胰腺浆液性囊腺瘤: 影像与病理

马小龙、王培军、高晓龙、许云、罗月、吴佳琪
上海市同济医院

【摘要】目的: 探讨实型胰腺浆液性囊腺瘤 (Solid Serous Cystadenoma of the Pancreas, SCP) 影像学表现及其病理基础。方法: 对 11 例经病理证实的实型胰腺浆液性囊腺瘤患者的影像学资料

和病理资料进行回顾性分析。所有患者均经过 CT 和 MRI 平扫加增强检查。将 CT 扫描中肿瘤强化超过胰腺组织的病例列为 A 组；肿瘤强化未超过胰腺组织的肿瘤列为 B 组。分别测试 CT 动脉期、门脉期和延迟期两组病例肿瘤与周围胰腺组织的 CT 值。将两组肿瘤与周围胰腺在不同时强化时期的平均 CT 值图表比较。结果：患者全部为女性，41 岁-77 岁，中位年龄 60 岁。肿瘤 CT 和 MR 图像上边界清晰。A 组 7 例，肿瘤相对胰腺等高密度，增强后在退化胰腺背景下显著强化，肿瘤强化程度在动态增强的各期均超过周围胰腺组织。B 组 4 例，胰腺组织未发生退化，肿瘤相对周围胰腺低密度，增强后肿块各期强化均未超过周围胰腺。MRI T2WI 图像上所有肿瘤显示“高亮”信号，与水相近，并可以观察到相对低信号的分隔结构。增强后强化方式与 CT 相同。病理大体标本显示肿瘤为实性肿块，内部可见较为粗大的白色纤维分隔。镜下显示为大量微型囊腔和囊腔之间丰富的肿瘤间质。囊腔友单层立方上皮细胞覆盖内壁。肿瘤间质内富含血管及纤维胶原。结论：实型胰腺浆液性囊腺瘤的影像特征与其病理特征密切相关，其相对胰腺的强化方式与周围胰腺是否退化有关，MRI T2WI 有助于揭示其囊性肿瘤本质。

PU-0693

胃壁增厚的 CT 研究及应用价值

唐俊军、黄宗良、王国良、王培军
上海市同济医院

目的 提高 CT 对于引起胃壁增厚的胃部病变的诊断及应用价值重要性的认识。

方法 回顾性分析经手术病理及胃镜病理证实的 82 例胃壁增厚的 CT 表现，并与正常胃壁厚度相比较，从胃壁增厚的程度、形态等来诊断及鉴别胃壁增厚的病变。

结果 82 例胃部疾病，其中胃癌 45 例，胃淋巴瘤 17 例，间质瘤 12 例，胃炎 8 例，累及范围共 122 处；其中胃窦部 56 处，平均厚度 $19.3+11.8\text{mm}$ ；胃体部 45 处，平均厚度 $32.6+12.3\text{mm}$ ；胃底贲门部 21 处，平均厚度 $39.1+7.5\text{mm}$ ；与正常各区胃壁厚度有显著性差异。本组 82 例病例胃壁增厚的 CT 类型：条形或梭形增厚（30）、肿块形增厚（14）、结节形增厚（5）、溃疡型增厚（10）、不规则形增厚（8）、混合型增厚（15）等。

结论 CT 对于胃壁增厚的厚度、形态等的观察有很大的价值，能够较好地准确诊断胃壁增厚的相关疾病及鉴别诊断。

PU-0694

急性肾损伤（AKI）的 CT 和 MR 表现分析

李晓阳
唐山市人民医院

目的：通过多层螺旋 CT(MSCT)和 MR 分析急性肾损伤 (Acute kidney injury, AKI) 的影像学异常改变，总结 AKI 的影像学表现。方法：回顾性分析临床证实的 110 例 AKI 患者肾脏和肾周的影像学表现。研究组均为临床确诊 AKI 的病例，AKI 诊断符合临床确诊标准。本研究组中流行性出血热患者 31 例，药物过敏患者 27 例，急性胰腺炎患者 4 例，多发性骨髓瘤患者 35 例，急性未分化型粒细胞白血病患者 8 例，Pomes 综合征患者 5 例。检查设备使用 GE 宝石能谱 HD 750 多层螺旋 CT 扫描机、Philips Ingenuity Core 128 排多层螺旋 CT 扫描机、超导型 16 通道 GE Signa TwinSpeed 1.5T 和 GE Discovery MR750 3.0T 超导 MR 成像机。为了避免加重肾脏损伤和防止对比剂肾病的发生，所有患者均未做 CT 和 MR 的增强检查。影像诊断由两名高年资医师承担。结果：通过 MSCT 和高场强 MR 检查，研究组 110 例病例双侧肾脏以及肾周间隙均存在异常改变；AKI 影像学表现：两侧肾脏外形增大、形态饱满；MSCT 显示双侧肾脏实质的密度呈弥漫性减低改变；

MR 检查 T1WI 表现肾脏实质信号普遍减低, T2WI 肾脏实质信号弥漫性不均一增高, 压脂序列肾脏实质信号不均一弥漫性增高; 同时 MSCT 和 MR 在肾周间隙均可见观察到桥隔增粗和吉氏筋膜增厚; 部分病例肾周间隙存在少量积液。结论: AKI 患者在肾脏以及肾周间隙存在特征性影像学表现; 认识 AKI 影像学表现, 结合临床以及实验室检查, 影像学可及时准确诊断 AKI。

PU-0695

动态增强 MRI 定量参数在原发性肝癌术前分期中的评估价值研究

谢晶美

榆林市第二医院

目的 分析研究动态增强 MRI (DCE-MRI) 定量参数在原发性肝癌 (PLC) 术前分期中的评估价值。方法 2021 年 1 月~2023 年 1 月我院收治的 PLC 患者 69 例, 均接受 DCE-MRI 检查并计算灌注参数[转运常数 (KTrans)、速率常数 (Kep)、血管外细胞外间隙体积分数 (Ve)], 通过活检穿刺、术后病理获得患者中国肝癌分期 (CNLC), 比较不同 CNLC 分期 PLC 患者 DCE-MRI 定量参数, 采用 Spearman 相关检验分析 DCE-MRI 定量参数与 PLC 患者 CNLC 分期的相关性, 绘制受试者工作特征曲线 (ROC) 并计算曲线下面积 (AUC) 评估 DCE-MRI 定量参数诊断 PLC 患者术前分期的价值。结果 69 例 PLC 患者中, 包括 CNLC 分期: I 期 17 例, II 期 21 例, IIIa 期 29 例, IIIb 期 2 例; III 期 PLC 患者 KTrans、Kep 分别为【 (0.4 ± 0.1) min⁻¹、 (1.1 ± 0.6) min⁻¹】, 明显高于 I~II 期 PLC 患者【 (0.3 ± 0.1) min⁻¹、 (0.6 ± 0.3) min⁻¹】; III 期 PLC 患者 Ve 为 (0.4 ± 0.2) , 明显低于 I~II 期 PLC 患者 (0.5 ± 0.2) ; Spearman 相关检验结果显示, KTrans、Kep 与 PLC 患者 CNLC 分期呈显著正相关 ($r=0.420$, $P<0.001$; $r=0.517$, $P<0.001$), Ve 与 PLC 患者 CNLC 分期呈显著负相关 ($r=-0.389$, $P=0.001$); ROC 曲线结果显示, KTrans、Ve、Kep 诊断 III 期 PLC 患者的 AUC 分别为 0.737、0.722、0.796, 三者联合诊断的 AUC 为 0.812。结论 DCE-MRI 定量参数在 PLC 患者术前分期中具有一定的评估价值, 能够为临床制定合理的治疗方案提供指导, 值得应用。

磁共振普美显检查的护理干预

刘青、李娅

空军军医大学西京医院

目的: 探讨磁共振中呼吸配合的护理干预对普美显检查的影响。

方法: 通过医生对图像的随机评分, 图像质量较好。技师对患者呼吸配合程度的反馈, 呼吸配合较好来说明护理干预的重要性。收集 2023 年 2 月份—6 月份普美显患者共计 50 例, 将它们分为 2 组, 参照组与对照组, 其中 25 例患者为参照组, 我们以旧的方式进行护理干预, 口头叮嘱患者, 检查过程中做好呼吸配合, 由技师直接进行扫描, 得出图像。另外 25 例患者为对照组, 我们以新的方式进行护理干预, 检查前对患者进行呼吸训练, 告知患者呼吸配合的顺序及重要性, 并同时用手触摸患者腹部, 感受患者呼吸配合程度, 进行 2-3 次的重复训练, 再由技师进行扫描检查得出图像。分别由 1 位技师和 2 名医生对患者的配合程度和图像质量进行评估, 使用 1—3 分的评估方式(1.差, 2.良好, 3.优), 评估后的得分做为依据。

结果: 参照组 25 例患者经评估后得分为 38 分, 对照组得分为 65 分。

经统计学分析结果表明, 参照组的配合程度平均较差, 图像质量较低。而实验组的配合程度平均评分较高, 图像质量较好。两组数据存在明显差异。

结论: 护理干预在磁共振普美显的检查中有着不可缺少的作用, 明显提高了检查结果的质量与准确性, 为检查的顺利进行和诊断提供了有效的帮助, 因此提高检查时的护理干预是有必要的。

PU-0697

能谱 CT 碘图定量在肝脏病变鉴别诊断应用价值的初步研究

苏彤、余成龙、王慧、贺丽娜
宁夏回族自治区中医医院暨中医研究院

目的: 初步探讨能谱 CT 碘图定量分析在肝脏病变的鉴别诊断中的应用价值。

方法: 收集经临床诊断为肝转移瘤 (12 例)、肝血管瘤 (10 例) 患者。所有患者均需使用 GE Revolution CT 行腹部 CT 三期能谱增强扫描, 管电压 80/140kV 瞬时自动切换, 管电流采用 ASSIST 自动 mA, 噪声指数 (NI) 为 10。扫描完成后将数据传入后处理工作站, 选取病灶最大层面、同层面腹主动脉勾画 ROI (尽量使 ROI 在各期保持一致), 计算并测量碘浓度 (iodine concentration, IC)、标准化碘浓度 (normalized iodine concentration, NIC) 及能谱曲线斜率 (k), 能谱曲线 40~70 kV 区域曲线较陡直, 故选择对 K70 进行比较分析。采用独立样本 t 检验比较组间差异, $P < 0.05$ 为差异具有统计学意义。

结果: (1) 肝转移瘤 (平均年龄 51 ± 11.73), 肝血管瘤 (平均年龄 57.33 ± 10.8)。 (2) 肝转移瘤及肝血管瘤在动脉期, 门静脉期, 延迟期的 IC 值 ($100 \mu\text{g/mL}$) 分别为 (2.68 ± 3.19 、 12.97 ± 6.85 、 8.36 ± 5.69)、(29.52 ± 28.58 、 26.94 ± 47.84 、 14.49 ± 5.09)。NIC 值分别为 (0.02 ± 0.03 、 0.31 ± 0.14 、 0.34 ± 0.23)、(0.32 ± 0.36 、 0.86 ± 0.13 、 0.7 ± 0.27)。斜率 k70 分别为 (0.49 ± 0.59 、 2.43 ± 1.29 、 1.55 ± 1.09)、(5.55 ± 5.39 、 5.06 ± 1.47 、 2.72 ± 0.97)。肝转移瘤各参数值均低于肝血管瘤, 门静脉期两组间 IC 值、NIC 值及 K 值差异有统计学意义 ($P < 0.05$), 延迟期两组间 NIC 值差异有统计学意义 ($P < 0.05$)。

结论: 能谱 CT 碘图所测的定量参数在肝转移瘤和血管瘤的鉴别诊断上具有一定应用价值。

Abdominal adipose tissue and type 2 diabetic kidney disease: adipose radiology assessment, impact, and mechanisms

Fei Lu^{1,2}, Jinlei Fan², Fangxuan Li³, Lijing Liu⁴, Zhiyu Chen², Ziyu Tian², Liping Zuo², Dexin Yu^{1,2}

1. School of Medical Imaging, Weifang Medical University
2. Department of Radiology, Qilu Hospital of Shandong University,
3. Department of Ultrasound, Qilu Hospital of Shandong University
4. Department of Imaging, Yantaishan Hospital

Diabetic kidney disease (DKD) is a significant healthcare burden worldwide that substantially increases the risk of kidney failure and cardiovascular events. To reduce the prevalence of DKD, extensive research is being conducted to determine the risk factors and consequently implement early interventions. Patients with type 2 diabetes mellitus (T2DM) are more likely to be obese. Abdominal adiposity is associated with a greater risk of kidney damage than general obesity. Abdominal adipose tissue can be divided into different fat depots according to the location and function, including visceral adipose tissue (VAT), subcutaneous adipose tissue (SAT), perirenal adipose tissue (PAT), and renal sinus adipose tissue (RSAT), which can be accurately measured by radiology techniques, such as computed tomography (CT) and magnetic resonance imaging

(MRI). Abdominal fat depots may affect the development of DKD through different mechanisms, and radiological abdominal adipose characteristics may serve as imaging indicators of DKD risk. This review will first describe the CT/MRI-based assessment of abdominal adipose depots and subsequently describe the current studies on abdominal adipose tissue and DKD development, as well as the underlying mechanisms in patients of T2DM with DKD.

PU-0699

能谱 CT 定量参数预测进展期胃癌术后肝转移发生的价值

刘显旺^{1,2,3,4}、刘宏^{1,2,3,4}、杨海婷^{1,2,3,4}、周俊林^{1,2,3,4}

1. 兰州大学第二医院
2. 兰州大学第二临床医学院
3. 甘肃省医学影像重点实验室
4. 医学影像人工智能甘肃省国际科技合作基地

目的: 探讨能谱 CT 定量参数预测进展期胃癌 (advanced gastric adenocarcinoma, AGA) 术后发生肝转移的价值。

材料和方法: 回顾性分析 44 例经组织病理学证实的 AGA 患者, 其中肝转移组 (hepatic metastasis group, HM) 和非肝转移组 (non-hepatic metastasis group, NHM) 各 22 例。对 HM 和 NHM 组间能谱 CT 定量参数 (碘浓度 (IC)、有效原子序数 (Zeff)、能谱曲线斜率 (λ Hu) 和单能量 CT 值 (40-140 keV, 间隔 20 keV)) 分别进行测量和比较。绘制接收者操作特征曲线 (ROC) 评估能谱 CT 定量参数预测 AGA 患者术后发生肝转移的评估性能。

结果: 在静脉期和延迟期, HM 和 NHM 组间的 IC、Zeff、 λ Hu 和 CT 值存在显著差异 (均 $P < 0.05$)。而在动脉期, 只有 IC 具有统计学意义 ($P < 0.05$)。在所有能谱 CT 定量参数中, 延迟期的 Zeff 预测性能最高, 曲线下面积、灵敏度和特异性分别为 0.749、77.3% 和 81.8%。

结论: 能谱 CT 定量参数可作为预测 AGA 患者术后发生肝转移的重要手段, 其中延迟期的 Zeff 是最有价值的预测参数。

PU-0700

经直肠靶向给药补充益生菌的临床应用研究

张建国

内蒙古医科大学附属医院

【摘要】目的 在这项研究中, 我们旨在研究与口服补充益生菌相比, 经直肠靶向益生菌补充剂在改善肠道微生物群、缓解便秘和整体健康方面的有效性。**方法** 选取了 65 名志愿者做为研究对象, 随机分为实验组 33 人采用直肠靶向益生菌补充法, 使用自制经肛门直肠靶向益生菌灌肠器分期补充复合益生菌 4g/两日; 对照组 32 人口服相同剂量复合益生菌 4g/日, 对益生菌的生存率、定植情况以及对肠道健康的影响做记录分析。**结果** 实验组直肠靶向给药补充益生菌后结肠内益生菌定植率为 95.6%, 而对照组口服则只有 71.1%; 肠道菌群定量表明, 直肠靶向给药组益生菌定植量显著高于口服组 ($P < 0.05$)。通过测定肠道菌群多样性和丰富度, 发现直肠给药组的 Shannon 指数 (3.68 ± 1.11) 和 Simpson 指数 (0.8 ± 0.18) 均高于口服组 (Shannon 指数: 2.98 ± 1.21 ; Simpson 指数: 0.68 ± 0.19), 说明直肠给药益生菌对肠道菌群的影响更加显著。**结论** 直肠靶向给药可以显著提高益生菌生存率和定植情况, 还能更好地调节肠道菌群结构, 同时还对整体身体健康有明显改善。因此, 我们建议更多人选择专业医生指导下直肠靶向给药方式来补充益生菌, 以保护和维持良好的肠道健康。

基于最佳单能级对结直肠癌患者肠系膜下动脉解剖变异评价

贾正兴、吕坤雪、赵雪婷、王航飞
牡丹江医学院红旗医院

结肠癌在全球癌症发病率及死亡率中分别排名第三和第四，每年约 90 万人死于结肠癌，我国是结肠癌发病大国，结肠癌中又以左半结肠癌（包括上段直肠癌和乙状结肠癌）最为常见。左半结肠癌主要是由肠系膜下动脉及其分支动脉（左结肠动脉、乙状结肠动脉、直肠上动脉）供血，手术是目前治疗结直肠癌的主要手段，术前准确的评估结直肠动脉供血血管可以有效的降低术中风险，本文就能谱 CT 最佳单能级对结直肠动脉的显示情况进行探讨。

T1 期肾透明细胞癌病理分级的 CT 分析

蒙秋华、聂梓慧
广州医科大学附属第一医院

通过分析患者的临床资料、T1 期 ccRCC 在 CT 上的常规表现及高低病理分级 ccRCC 的 CT 增强扫描相关强化特征参数的差异，

收集本院间病理证实且进行 Fuhrman 分级的 61 例肾透明细胞癌患者的 CT 影像及临床资料，分为两组：低级别组（Fuhrman I-II 级 43 例）和高级别组（Fuhrman III-IV 级 18 例），所有纳入病例均进行常规 CT 平扫及增强扫描，研究内容包括：（1）统计分析 T1 期 ccRCC 患者的一般资料在两组分级（高、低级别）的差异比较。（2）观察、记录并测量 T1 期 ccRCC 的最大径、形态规则与否、边缘是否光滑、有无钙化、有无液化坏死、包膜完整与否。（3）测量 T1 期 ccRCC 实质部分 4 期的各项 CT 值、绝对强化值（增强净值）、相对强化率、强化衰减差值，并对各项测值与高低分级的相关性进行分析，并进行比较诊断效能。

1、高低级别组间在年龄、性别、临床症状及病灶发生位置方面无明显组间差异，不具有统计学意义（ $P>0.05$ ）；

2、高低级别组间的常规 CT 征象分析，在形态规则与否方面两组间有统计学意义，而在肿瘤最大径、边缘光滑（是/否）、钙化（有/无）、液化坏死（有/无）、假包膜完整（是/否）这些方面无明显组间差异，不具有统计学意义；

3、在相关强化参数方面，皮质期 CT 值、绝对强化 CT 值（皮质期）、相对强化率（相对皮质 A1）及强化衰减差值有组间差异。

1、T1 期 ccRCC 的肿瘤形态对高、低级别间的鉴别诊断有一定价值，高级别组更容易出现形态不规则。

2、T1 期 ccRCC 的皮质期 CT 值、绝对强化 CT 值（皮质期）、相对强化率（相对皮质 A1）及强化衰减差值在高低分级间有组间差异；皮质期 CT 值、绝对强化 CT 值（皮质期）及强化衰减差值与 Fuhrman 病理分级存在负相关性，相对强化率（相对皮质 A1）与 Fuhrman 病理分级则存在正相关性，其值越低预示其 Fuhrman 分级越低。

DKI 直方图及纹理分析预测肝细胞癌 MVI

刘静红、刘爱连
大连医科大学附属第一医院

目的：提取肝细胞癌（HCC）术前 DKI 图像的纹理参数，筛选出能够预测 MVI 且效率高的纹理参数。

材料与方法：回顾性分析 2019 年 11 月至 2022 年 3 月在我院诊断为 HCC 的患者的临床和影像学资料。最终共纳入 68 例 HCC 患者(男 53 例，女 15 例，年龄 35-83 岁，平均年龄 60.1 ± 10.4 岁)，根据术后病理分为 MVI 阳性组($n=22$)和 MVI 阴性组($n=46$)。对 DKI 序列的原始图像进行重建，获得 MD、MK 和 FA 图。将其以 DICOM 格式导入 ITK-SNAP 软件 (www.itksnap.org)，参照 T2WI 图像，由 2 名经验丰富的腹部影像诊断医师在轴位图像上沿病灶边缘逐层手工勾画 ROI 曲线，然后合并成三维 ROI。将 MD、MK 及 FA 的 ROI 数据导入联影人工智能软件中，对 MD、MK 及 FA 图像进行纹理分析，提取各病灶三个功能图像的 104 个纹理特征。使用最小冗余最大相关 (MRMR) 及 Lasso 算法降维进行特征选择。采用独立样本 t 检验(正态分布)或 Mann-Whitney U 检验(偏态分布)比较 MVI 阳性组和 MVI 阴性组 MD、MK 和 FA 的纹理特征参数值。采用卡方检验或 Fisher 精确概率方法比较各组分类变量。对有统计学差异的参数绘制受试者特征曲线(receiver operator characteristic, ROC)，确定曲线下面积(area under the curve, AUC)。

结果：MVI 阳性组肿瘤直径较大（中位数 5.88cm vs 3.25cm），AFP 水平较高（中位数 206.2ng/ml vs 5.83ng/ml），差异具有统计学意义 ($P < 0.05$)。而两组在性别、年龄、病灶位置、是否存在肝炎（乙肝或丙肝）及肝硬化方面差异没有统计学意义。经筛选，MD、MK 及 FA 分别得到 6 个、9 个及 5 个最优纹理特征。

结论：DKI 成像的参数 MD、MK 及 FA 可以评估 HCC 的 MVI 状态。

PU-0704

双能 CT 脂基图在评估肾透明细胞癌脂含量的价值

刘静红、刘爱连
大连医科大学附属第一医院

目的：探讨双能 CT 脂基图在评估肾透明细胞癌脂含量中的应用价值。

材料和方法：回顾性分析 2018 年 1 月至 2022 年 12 月行双能 CT 肾脏能谱扫描并经手术病理证实为肾透明细胞癌的患者 94 例。2 名观察者分别记录每位患者平扫的 CT 值、脂水值、有效原子序数以及增强三期的 CT 值、碘水值。根据病理结果将患者分为高级别组 (WHO/ISUP G 分级 3 级和 4 级) 和低级别组 (WHO/ISUP G 分级 1 级和 2 级)。采用组内相关系数 (ICC) 评价测量者间一致性。采用独立样本 t 检验或 Mann-Whitney U 检验比较高低级别组间各参数的差异。采用 ROC 曲线分析，寻求诊断高级别的最佳参数和最佳阈值。

结果：2 名观察者测量数据的一致性良好 ($ICC > 0.7$)。高级别组的脂水值高于低级别组，有效原子序数低于低级别组；其余参数无统计学差异。

结论：双能 CT 的脂水值可以鉴别高低级别组肾透明细胞癌，有望对其脂含量进行评估。

PU-0705

原发性肝细胞肝癌增强 CT 直方图特征分析

徐杰

南京医科大学第二附属医院

目的：评价 CT 直方图分析 (CT histogram analysis,CTHA) 方法在原发性肝细胞肝癌 (Hepatocellular carcinoma, HCC) 的诊断价值。方法：本研究采用回顾性分析方法，时间 2018.01~2019.03，共纳入经手术病理确诊的 HCC 患者 60 例 (男/女= 50/10，平均年龄 59.50 ± 11.70 岁)，所有病例术前接受腹部三期 CT 增强扫描，包括动脉期、静脉期和延迟期。两位放射医师分别使用 GE 公司 Omni-Kinetics, Version V2.1.0 R 软件对图像进行处理并获取直方图参数。采用 Logistic 回归和受试者工作特征曲线，评价 CTH 各定量参数及参数联合对 HCC 的诊断价值和效能。结果：动脉期参数 Kurtosis、Relative deviation，静脉期参数 Uniformity、Relative deviation，延迟期参数 Relative deviation 可作为独立预测因子用于 HCC 的诊断，多参数联合的诊断效能最高 (曲线下面积=0.989)。结论：CTHA 方法可用于 HCC 的诊断。

MSCT 影像特征结合 XGBoost 算法鉴别诊断≤5cm 胃胃肠间质瘤与胃平滑肌瘤的价值分析

吴树剑、俞咏梅

皖南医学院弋矶山医院

目的 探讨多层螺旋 CT (MSCT) 影像特征结合机器学习 XGBoost 算法构建的模型在鉴别诊断 ≤5cm 胃胃肠间质瘤 (GIST) 与胃平滑肌瘤 (GLMs) 的价值。方法 回顾性分析 134 例 ≤5cm 胃 GIST 与 37 例 GLMs 的临床及 MSCT 影像特征，采用随机分层抽样按 7:3 将患者随机分为训练集 (n=119) 与验证集 (n=52)。使用 LASSO 回归对训练集临床及 MSCT 影像特征降维，筛选潜在危险因素，并纳入单因素与多因素 Logistic 回归分析筛选独立危险因素。使用 XGBoost 算法基于独立危险因素构建鉴别诊断胃 GIST 与 GLMs 的预测模型，使用曲线下面积 (AUC)、敏感度、特异性、准确度、临床决策曲线 (DCA) 及混淆矩阵对模型进行评价。结果 共 23 个临床及影像特征被纳入，经 LASSO 回归降维后筛选出 7 个潜在危险因素，分别为性别、年龄、累及胃食管连接部 (EGJ)、短径 (SD)、长径/短径 (LD/SD)、延迟期增强程度 (DEd) 及肿瘤静脉期不均匀度 (HDTV)。单因素与多因素 Logistic 回归分析发现年龄、累及 EGJ、LD/SD 及 DEd 为独立危险因素。XGBoost 算法构建预测模型的 AUC、敏感度、特异性及准确度训练集分别为 0.974、95.5%、94.7%、95.3%，验证集分别为 0.966、85.1%、100.0%、90.6%。结论 MSCT 影像特征结合 XGBoost 算法构建的模型在鉴别诊断 ≤5cm 胃 GIST 与 GLMs 有很高的效能，有助于外科医师制定最佳的治疗方案，受益患者。

胃肠道内外间质瘤 CT、MR、临床病理特点及关系研究

陈生基

玉林市第一人民医院

目的 分析胃肠道内外间质瘤的 CT、MR、临床病理特点，探讨三者关系。方法 选取 45 例胃肠道内外间质瘤患者，术前具备完整的 CT、MR 检查资料，对照术后病理资料，分析三者临床表现，

探讨影像学与病理的关系。结果 肿瘤部位与临床病理风险级别并无明显关系，而肿瘤直径越高、形态越不规则、囊变坏死、强化越明显、腔外生长、密度不均、长 T1、T2 信号，病理风险级别越高 ($P<0.05$)。将上述影像学征象纳入多因素 Logistic 回归分析，肿瘤直径、肿瘤密度、囊变坏死、生长方式是肿瘤风险度级别的危险因素 ($P<0.05$)。

The Value of PI-RADS v2.1 Scoring on biparametric MRI Combined with Clinical Parameters in Diagnosing Prostate Cancer within the PSA Gray Zone

Yueyue Zhang^{1,2}, Juankang Shen¹

1. The Second Affiliated Hospital of Soochow University

2. Children's Hospital of Soochow University

Abstract:

Objective: This study aimed to investigate the value of utilizing PI-RADS v2.1 scoring on biparametric MRI (Bp-MRI), in conjunction with clinical parameters, for diagnosing clinically significant prostate cancer (csPCa) in patients with prostate-specific antigen (PSA) within the gray zone.

Methods: A retrospective analysis was conducted on 211 patients with PSA ranging from 4 to 10 ng/mL in the PSA gray zone. Among them, 35 belonged to the csPCa, while 176 were in the non-csPCa. PI-RADS v2.1 scoring was performed on the primary prostate lesions according based on Bp-MRI. Univariate and multivariate analyses were performed on factors including age, total prostate-specific antigen (tPSA), free prostate-specific antigen (fPSA), free-to-total PSA ratio (f/tPSA), prostate volume (PV), prostate-specific antigen density (PSAD), and Bp-MRI scores to identify independent predictors of csPCa. Then the independent predictors were combined to establish the predictive model. Receiver operating characteristic (ROC) curves were utilized to evaluate the diagnostic accuracy of each independent predictor and the combined predictive model for csPCa, and Z-test was employed for pairwise comparisons of the area under the curve (AUC).

Results: The results demonstrated that f/tPSA, PV, PSAD, and Bp-MRI scores between the csPCa and non-csPCa had significant statistical differences (all $P < 0.05$). Moreover, PV and Bp-MRI score were identified as independent predictors of csPCa, with corresponding odds ratios (OR) of 0.974 ($P = 0.024$) and 4.206 ($P < 0.001$), respectively. In terms of diagnostic performance, the AUC values for PV, Bp-MRI score, and the combined predictive model were 0.684, 0.856, and 0.878, respectively. Additionally, the differences in AUC values between PV and Bp-MRI score, PV and the combined predictive model, and Bp-MRI score and the combined predictive model were all statistically significant ($Z = 3.416$, $P = 0.001$; $Z = 4.562$, $P < 0.001$; $Z = 2.059$, $P = 0.040$).

Conclusion: PI-RADS v2.1 scoring based on Bp-MRI is valuable in the detection of csPCa within the PSA gray zone. Furthermore, when combined with PV, it further improves the detection efficacy of csPCa and reduces unnecessary biopsies for patients.

PU-0709

肾脏乏脂肪血管平滑肌脂肪瘤与乏血供透明细胞癌的 CT 鉴别诊断分析

张红果

辽宁省肿瘤医院

目的：评估是否可以根据 CT 图像的形态学特征和增强特征来区分肾脏乏脂肪血管平滑肌脂肪瘤和乏血供透明细胞癌。

材料与方法：57 例患者（28 例肾脏乏脂肪血管平滑肌脂肪瘤和 29 例肾脏乏血供透明肾细胞癌）在全或部分肾切除术前接受了平扫及增强 CT 检查。由两名对组织病理学结果不知情的放射科医生阅读 CT 图像并记录肿瘤的衰减值、形态学特征和增强特征，随后进行评估。在肿瘤之间进行独立样本 t 检验及卡方检验。通过二元 logistic 回归分析确定 CT 表现的预测价值。

结果：肾脏乏脂肪血管平滑肌脂肪瘤的女性发病率更明显，而乏血供透明细胞癌的男性发病率更明显。通过二元多因素逻辑回归分析，未增强衰减及异质性是区分肾脏乏脂肪血管平滑肌脂肪瘤和乏血供透明细胞癌肿瘤有价值的参数 ($p < 0.05$)，与肾脏乏血供透明细胞癌组相比，乏脂肪血管平滑肌脂肪瘤未增强超衰减大于肾脏乏血供透明细胞癌组 ($p < 0.05$)，异质性小于肾脏乏血供透明细胞癌组。两种肿瘤类型的大多数病例均表现出早期增强特征。

结论：CT 图像的未增强衰减特征及异质性是鉴别肾脏乏脂肪血管平滑肌脂肪瘤和乏血供透明细胞癌有价值的参数。

PU-0710

门脉海绵状变性的 CT 诊断与病因分析

张源

新疆维吾尔自治区中医医院

目的 分析门脉海绵状变性的 CT 表现和病因，探讨 CT 诊断的临床价值。资料与方法 12 例门脉海绵状变性患者均经全腹部 CT 平扫及螺旋三期增强扫描，图像后处理技术包括 MIP 和 MPR；图像分析由 2 名 5 年以上工作经验的放射科医师独立完成。患者中男性 7 例，女性 5 例，年龄 4-69 岁；经临床证实病因包括先天发育异常 2 例，胆囊炎合并腹腔脓肿 1 例，肝硬化 4 例，胰腺癌 2 例，肝海绵状血管瘤、胆囊癌和直肠癌肝转移各 1 例。结果：1) 门脉主干及分支异常：肝门部门脉走行区存在多发呈结节状或蚯蚓状的细小静脉血管影 9 例，门脉充盈缺损 2 例，狭窄 2 例，显示不清或闭塞 4 例；2) 侧枝循环静脉开通：脾门区静脉曲张 8 例，肠系膜静脉曲张 7 例，食道胃底静脉曲张 5 例，胃肾静脉曲张 5 例，直肠静脉曲张 2 例；3) 其他征象包括：肝动脉增粗 7 例，肝脏灌注异常 3 例，胆道扩张 2 例，腹水 2 例，脾大 2 例。结论：CT 在确定本病的诊断同时能明确原发病因的性质、危害程度和累及范围，有助于临床制定合理的个性化治疗方案。

PU-0711

腹部 ALK 阳性间变大细胞淋巴瘤 1 例

钱懿

中国人民解放军海军军医大学第二附属医院

【目的】 探讨罕见病例腹部 ALK 阳性间变大细胞淋巴瘤的多排螺旋 CT (Multidetector Spiral Computed Tomography, MDCT) 影像表现。【方法】 收集资料完整的 1 例经手术病理证实的腹

部 ALK 阳性间变大细胞淋巴瘤老年男性的 MDCT 图像, 分析其特殊的影像学表现及其与临床病理特点之间可能存在的关系。【结果】该例患者于胃、胰腺之间见一软组织肿块, 增强扫描动脉期明显均匀强化, 内可见一腹腔干起源的异常动脉供血。病灶与胃小弯、胰腺体部分界不清。腹膜后另见多发肿大淋巴结影。病灶表现与常见淋巴瘤不同, 与胃、胰腺分界不清, 定位较为困难, 且动脉期明显强化, 尤其类似胃来源间质瘤。但与常见间质瘤不同, 同时合并腹膜后多发肿大淋巴结。术前仅提示诊断恶性肿瘤。典型 ALK 阳性鉴别大细胞淋巴瘤好发于儿童和青年, 常见淋巴瘤 B 症状, 约 60% 患者可见淋巴结外受累, 是一种恶性程度较高的淋巴瘤亚型。由于罕见, 未见系统性影像特征报道。本例患者尽管年龄、症状不甚符合, 但具有较特殊的影像学表现, 即主要病灶血管丰富、强化均匀, 同时合并腹膜后多发淋巴结肿大, 仍可符合淋巴瘤, 尤其是恶性程度较高的淋巴瘤亚型表现。而间质瘤作为间叶源性肿瘤, 罕见淋巴结转移。【结论】回顾性总结本例罕见腹部 ALK 阳性间变大细胞淋巴瘤的 MDCT 表现, 以期对临床中可能遇到的病例影像诊断提供有价值的参考。

PU-0712

多模态磁共振成像在透明细胞型肝癌中的诊断价值

李少朋、邓克学

中国科学技术大学附属第一医院安徽省立医院南区

目的 探讨透明细胞型肝癌 (ccHCC) 的多模态磁共振影像学特征, 分析其与非透明细胞型肝癌 (Non-ccHCC) 影像学特征差异, 提高对本病的认识及诊断水平。

方法 回顾性分析经手术病理证实的 12 例 ccHCC 和 45 例 Non-ccHCC (高、中、低分化肝细胞肝癌各 15 例), 收集所有患者相关临床资料。所有患者均行肝脏特异性对比剂增强磁共振扫描, 包括 IVIM-DWI 和 IDEAL-IQ, 测量病灶 ADC、D、D*、f 值和脂肪分数 (FF); 观察两组病灶强化特征及肝胆特异期信号特征, 测量肿瘤对比强化率 (CER)。ADC、D、D*、f、FF 和 CER 的比较采用单因素 ANOVA 检验, 检验效能的比较采用 ROC 分析, 运用 SPSS 20.0 统计分析软件。

结果 1. ccHCC 与 Non-ccHCC 在临床特征差异无统计学意义。2. ccHCC 弥散受限程度略低, 易出现脂肪变性, ADC 值、D、FF 值均高于 Non-ccHCC 组, 差异均具有统计学意义 ($P < 0.05$); 增强扫描 ccHCC 多表现为“慢进慢出”, 强化程度低于 Non-ccHCC, 相应病灶 f 值较低, 差异均具有统计学意义 ($P < 0.05$)。3. ccHCC 包膜出现比例高于 Non-ccHCC; 肝胆特异期 ccHCC 组病灶以等信号或稍低信号为主, 而 Non-ccHCC 组病灶以低信号为主, 两组 CER 差异具有统计学意义 ($P < 0.05$)。两组间 ADC 值、D 值、f 值、FF 值及 CER ROC 曲线下面积分别为 0.873、0.92、0.781、0.854、0.863, D 值的诊断效能最高。

结论 ccHCC 更容易出现脂肪变性和完整包膜, 弥散受限程度较低, 增强扫描强化程度略低, 强化方式以“慢进慢出”更常见, 肝胆特异期病灶以等信号或稍低信号为常见。仔细分析病灶形态、强化方式、信号特征以及功能磁共振成像相关定量参数, 可以提高术前诊断准确性。

PU-0713

多层螺旋 CT 门静脉成像在肝硬化门脉高压症中的应用价值

夏玮

辽宁省肿瘤医院

目的: 应用多层螺旋 CT 门静脉成像观察肝硬化门脉高压症患者门静脉及主要分支走行以及侧支循环开放情况, 为介入手术方案提供指导价值。

方法：收集院内行腹部 256 层极速 CT 增强扫描患者信息，将标准选择符合要求者分为正常组 124 例及肝硬化门脉高压组 161 例。运用 MIP、MRP、VR 等后处理技术进行图像三维重建，结合原始图像观察门静脉及主要分支显示情况，记录门脉高压组侧支循环开放情况，分别测量门脉系统主要分支管径。正常组年龄在 14~83 岁，平均年龄 (47.65 ± 1.55) 岁，按照不同性别及年龄段（青年组；中年组；老年组）分组，行统计学分析。

结果：1、在正常组 124 例中，不同性别组间门静脉主干及主要分支管径大小存在统计学差异 ($P < 0.05$)，即男性各管径宽于女性。不同年龄组比较，门静脉主干管径在青年组和中年组间存在差异 ($P < 0.05$)，即青年组的门静脉主干管径宽于中年组；在青年组与老年组间、中年组与老年组间均不具有统计学意义 ($P > 0.05$)。青年组的胃左静脉管径均宽于中年组及老年组；中年组和老年组间胃左静脉管径无明显差异 ($P > 0.05$)；脾静脉及肠系膜上静脉管径在不同年龄段间均不存在显著差异 ($P > 0.05$)。

2、多层螺旋 CT 门静脉成像能清晰显示门脉系统及侧支循环开放情况。161 例肝硬化门脉高压患者中，食管静脉曲张 119 例 (73.9%)，胃底静脉曲张 115 例 (71.4%)，食管周围静脉曲张 61 例 (37.9%)，胃短及胃后静脉曲张 81 例 (50.3%)，食管旁静脉曲张 26 例 (16.3%)，附脐静脉曲张 35 例 (21.7%)，腹壁静脉曲张 51 例 (31.7%)，此外还显示了门静脉及肠系膜上静脉血栓 22 例 (13.8%)。

结论：多层螺旋 CT 门静脉成像能清晰显示门静脉及主要分支走行以及侧支循环开放情况，对早期发现曲张静脉、诊断肝硬化门脉高压症提供可靠临床依据，可指导介入手术方案的设计。

1 例外周型 VA-ECMO 患者经中心静脉管给予对比剂行腹盆动脉 CTA+门脉期检查

董晓征、张艳
北京大学第三医院

静脉动脉体外膜氧合 (VA-ECMO) 是一种临时机械循环支持装置，近几十年来越来越多地用于治疗爆发性心肌炎和心源性休克。CT 成像在 VA-ECMO 治疗的患者中，诊断血栓栓塞事件和出血并发症的工作中起着核心作用。随着 VA-ECMO 的使用不断增加，放射科技师应熟悉与 VA-ECMO 系统相关的血流动力学变化。VA-ECMO 可以通过使用中央或外周插管来实现。特别是外周型 VA-ECMO 大大改变了 CT 增强对比剂在血液中的顺序和方向，对于接受外周型 VA-ECMO 治疗的患者行 CT 增强检查时，应考虑到外周型 VA-ECMO 管路的配置、对比剂注射部位、心输出量和外周型 VA-ECMO 流速，优化 CT 增强检查图像采集的策略，为临床提供更加准确的图像。

患者女性，40 岁，高泌乳素血症病史、抗磷脂抗体综合征 2 年、下肢水肿 2 个月。4 天前因呼吸困难，不能平卧，体温最高 38°C ，自测新冠抗原阳性，就诊我院急诊，考虑急性重症心肌炎，收治入院。入院后诊断爆发性心肌炎、心源性休克，给予外周型静脉动脉体外膜肺氧合 (VA-ECMO: veno-arterial extracorporeal membrane oxygenation) 进行循环呼吸支持，并进行中心静脉置管。今日因血气中血红素测不出，腹胀明显，怀疑腹腔内出血，VA-ECMO 血流量： 2.60L/min ，心输出量 (CO)： 2.4L/min ，经多学科会诊需行腹盆动脉 CTA+门脉期检查。

根据外周型 VA-ECMO 血流动力学的改变和文献报道，可以推荐几个原则用来改善对比剂的目标结构：①选择对比剂给药途径（中心静脉导管或 ECMO 回路）；②减少 ECMO 流量；③增加对比剂用量和注射速率，安全起见，对比剂注射速率应小于外周型 VA-ECMO 血流量。

Research progress of dual-energy CT in gastrointestinal neoplasms

Xiaolei Shi, Rongrong Fan, Yi Xiao

Department of Radiology, Second Affiliated Hospital of Naval Medical University

Dual-energy Computed Tomography (DECT) is a kind of technology that separates matter by collecting data at high and low energy levels respectively. Images such as iodine concentration, virtual non-contrast, virtual monoenergetic image and Z-effective obtained by dual-energy CT scan provide a new dimension for radiological diagnosis, and are widely used in the diagnosis of gastrointestinal diseases. It has played an important role in improving image quality, improving lesion detection, quantitatively analyzing lesions, and reducing radiation dose and contrast agent consumption. This article reviews the equipment characteristics of DECT, the commonly used dual-energy imaging techniques and its research progress in gastrointestinal neoplasms.

内脏脂肪组织对胃癌术前 T 分期准确性的影响

肖晓燕、王睿、李莉明、袁梦晨、高剑波

郑州大学第一附属医院

目的 探讨内脏脂肪组织对胃癌术前 T 分期准确性的影响。**方法** 回顾性地连续收集 2018 年 4 月至 2021 年 5 月于郑州大学第一附属医院诊治的 366 例胃癌患者。根据胃癌术前 CT 图像 T 分期 (cT) 和术后病理 T 分期 (pT) 比较有无差异, 将患者分为准确分期组和错误分期组。比较患者个体特征及在 L2/L3 层面、肿瘤最大层面下脂肪组织参数, 包括性别、年龄、BMI、肿瘤最厚径、内脏脂肪组织 (visceral adipose tissue, VAT) 面积及平均 CT 值、皮下脂肪组织 (subcutaneous adipose tissue, SAT) 面积及平均 CT 值。采用多因素 logistic 回归对混杂因素进行调整后, 筛选出影响胃癌术前 T 分期准确评估的独立危险因素。**结果** 366 例患者中, 164 例 (45%) 为 cT 分期错误。准确分期组与错误分期组中, L2/L3 层面下的 VAT 面积 (SVAT1)、VAT 平均 CT 值 (DVAT1)、SAT 面积 (SSAT1)、SAT 平均 CT 值 (DSAT1) 差异均具有统计学意义, 肿瘤最大层面下的 VAT 面积 (SVAT2)、VAT 平均 CT 值 (DVAT2)、SAT 面积 (SSAT2) 差异均具有统计学意义 ($P < 0.05$)。多因素分析结果显示, L2/L3 层面 SVAT1 ($\geq 35.80 \text{ cm}^2$)、肿瘤最大层面 SVAT2 ($\geq 13.82 \text{ cm}^2$) 均为胃癌术前 T 分期准确评估的独立危险因素, 其 OR (95%CI) 分别为 2.771 (1.243~6.181)、2.938 (1.635~5.277)。**结论** L2/L3 层面及肿瘤最大层面 VAT 面积均是胃癌术前精准评估 T 分期的重要因素。

PU-0717

肝脏镰状韧带旁假病灶诊断与鉴别诊断

周宇堃

山西医科大学第一医院

目的: 肝脏镰状韧带旁假病灶是肝脏镰状韧带周围出现的类似占位的假性病变区, 在临床上相对少见, 磁共振成像可以为其诊断提供较好的帮助。通过本次的资料报告及相关的文献学习可以帮助影像科医师更好的了解疾病, 提高诊断的准确性。

方法: 回顾了肝脏镰状韧带旁假病灶患者的临床资料、影像资料, 并进行了相关疾病的文献复习。

结果：肝脏镰状韧带旁假病灶好发于肝左叶内侧段或（和）左叶外侧段前缘镰状韧带旁，平扫及增强扫描具备特征性表现，需与少血供的高分化小肝癌、肝转移瘤、肝囊肿、肝血管瘤相鉴别。

结论：磁共振平扫结合增强扫描可以较为准确的诊断肝脏镰状韧带旁假病灶，熟悉疾病的好发部位、发病机制、特征性影像表现及鉴别诊断，有助于提高影像科医师诊断的准确性。

PU-0718

Differentiating Between an Atypical Hepatic Abscess and Tumor Metastasis Using Magnetic Resonance Imaging and Hepatobiliary Phase Imaging

Liyong Zhuo

Affiliated Hospital of Hebei University

Objective: To identify diffusion-weighted imaging (DWI) patterns and conspicuity discrepancies on hepatobiliary phase imaging (HBPI) to distinguish atypical hepatic abscesses from hepatic metastases.

Materials and Methods: This retrospective study recruited 31 patients with 43 atypical hepatic abscesses and 32 patients with 35 hepatic metastases who underwent gadobenate dimeglumine-enhanced magnetic resonance imaging. All lesions were confirmed by pathological or clinical diagnosis. For the qualitative and quantitative analyses, the signal intensity, DWI pattern, apparent diffusion coefficient, degree of perilesional edema, perilesional hyperemia, perilesional signal on HBPI, conspicuity, size discrepancy between sequences, contrast-to-noise ratio, signal-to-noise ratio, and relative enhancement ratio on dynamic phases were independently assessed by two radiologists. Significant findings for differentiating the two groups were identified via univariate and multivariate analyses with a nomogram for predicting atypical hepatic abscesses. The interobserver agreement was also analyzed for each variable.

Results: The multivariate analysis revealed that the conspicuity discrepancy (odds ratio [OR] 34.78, 95% confidence interval [CI] 2.09–579.47, $p = 0.013$) and non-peripheral high signal intensity (SI) rim on DWI (OR 67.46, 95% CI 2.64, 1723.20, $p = 0.011$) were significant independent factors for predicting atypical hepatic abscesses. They were also shown to be high predictor points on the nomogram. When any of the set criteria were satisfied, 97.7% of atypical hepatic abscesses were correctly identified, with a specificity of 65.7%. When both criteria were combined, the specificity was up to 100%, with a sensitivity of 44.9%.

Conclusion: Conspicuity discrepancy and a non-peripheral high SI rim on DWI are reliable and meaningful features that can distinguish atypical hepatic abscesses from hepatic metastases.

PU-0719

个案报道：肾脏原发 Castleman 病 1 例及文献复习

李瑞婷、姚薇薇、李标达、吕建勋、沈新平、岑海燕
香港大学深圳医院

目的 提高影像医生对肾脏原发 Castleman 病术前影像征象的认识，拓宽诊断思路。

方法 分析本院经手术病理确诊的肾脏原发 Castleman 病的 CT、MR 表现，结合患者资料，并进行相关文献复习。

结果 病灶位于左肾中部皮质内，最大径约 22mm，边界清晰，邻近肾盏受推压，腹膜后未见肿大淋巴结。CT 示：平扫密度较周围肾实质略高；肾皮质期强化明显，略低周围肾皮质；髓质期及排泄期均明显低于周围肾实质。MRI 示：病灶平扫 T1WI、T2WI 呈等信号，反相位未见信号减低，脂相未见高信号；DWI 呈明显高信号，ADC 值约 $0.628 \times 10^{-3} \text{mm}^2/\text{s}$ ；动脉期明显不均匀轻度强化，

门脉期及延迟期强化减弱，强化程度始终低于周围正常肾实质，并见明显持续性强化包膜。病人行部分肾脏切除术，病理示：病灶内见淋巴滤泡增生，生发中心萎缩，中心内见血管增生，套层细胞同心圆状排列。免疫组化结果：CD20(+)、CD79a(+)、CD3(+)、CD21 (FCD 网+)、Bcl-2(+)、Bcl-6(生发中心+)、Ki-67(生发中心约 80%，非生发中心约 10%)。分子病理结果：B 细胞基因重排（未检测到 B 细胞单克隆性重排）。诊断为 Castleman 病，透明血管型。

结论 Castleman 病是一种以淋巴肿大为特征的淋巴增生性疾病。以纵隔、颈部、腹部、腹膜后和腋窝淋巴结区域相对多见，原发于肾脏者，国内外文献罕有报道。肾脏原发 CD 影像表现为边界清楚的单发结节或肿块，密度或信号均匀；DWI/ADC 明显扩散受限（本例表现与之相符）。典型 CD 病灶内可出现分支状、斑点状钙化（本例无钙化）。增强影像表现与肾癌、乏脂型肾血管平滑肌瘤存在交叉，与其他常见部位 CD 影像特征存在不一致，术前诊断难度较高。通过对本例的学习，了解肾脏原发 CD 的影像征象，在肾脏占位性病变的术前诊断中提供新的鉴别诊断思路，避免一些不必要的肾脏全切手术等治疗。

PU-0720

MRI 对胎盘植入的诊断价值

吴晓峰、张辉、王效春
山西医科大学第一医院磁共振影像科

目的：分析探讨胎盘植入的 MRI 征象，评价 MRI 对诊断胎盘植入的临床应用价值。

方法：搜集 2020 年 6 月到 2022 年 1 月就诊于山西医科大学第一医院并经超声检查怀疑胎盘异常的孕妇 26 例，年龄 23-39 岁，平均年龄 29.4 岁，孕龄 27-38 周，平均 36.6 周。采用 GE3.0T SSFSE T2WI 序列进行磁共振扫描。经两名高级职称医师分析图像，观察胎盘植入的部位、胎盘信号以及胎盘侵入肌层的程度。结果与手术和/或临床综合诊断标准相对照，其中前置胎盘 1 例，胎盘植入 2 例，前置胎盘并胎盘植入 23 例。

结果：子宫变形和(或)异常隆凸，胎盘稍向外突，子宫肌轻微变薄或不规则破坏 6 例；胎盘信号不均匀，高信号胎盘组织不同程度侵入低信号子宫肌壁 18 例；胎盘下肌层变薄或消失，高信号胎盘组织突破低信号子宫壁，与膀胱壁分界不清 2 例。

结论：MRI 能明确诊断胎盘植入部位及判断肌层侵入情况，对胎盘植入有重要临床应用价值。

PU-0721

肝脏粘液性囊性肿瘤的个案报道

顾玲玲
中国人民解放军海军军医大学第二附属医院

女性，31 岁，外院 CT 体检发现左肝占位 2 周（CT 示左肝低密度灶），肿瘤指标：AFP、CEA、CA125（一）；CA19-9：42.95（0~37），既往无肝炎史及牧区居住史，2012 年左甲状腺病变切除术，2011 年剖宫产术。我院 MRI 报告：左肝囊性占位，内部可见分隔、信号不均匀，增强扫描分隔及囊壁可见强化。诊断：左肝囊性病变，考虑包虫病可能。行肝部分切除+胆囊切除术：术中肝左内叶可触及 1 个质地柔软，直径约 15cm 的肿块，囊壁较厚，外部为肝组织包绕，穿刺针刺入占位，抽出黑绿色浑浊液体。病理：肉眼所见剖开囊肿，11.5*7.5*2.5cm，切面见多个囊腔，直径 4-6cm，内壁厚 2-4mm，内壁较光滑。病理诊断：肝脏粘液性囊性肿瘤，伴局部上皮轻度异型增生。肝脏粘液性囊性肿瘤（mucinous cystic neoplasm, MCN）：2010 年第 4 版消化系统肿瘤 WHO 分类中新命名的一类病变；不再使用“胆管囊腺瘤”和“囊腺癌”这些诊断术语；肿瘤内囊性区域与胆管不相通，囊壁被覆立方至柱状上皮，细胞内含多少不等的黏液，上皮下为卵巢型间质；手术切除

是治愈的唯一途径。临床及病理学基础：易发生于 40 岁以上女性；因肿瘤生长缓慢大多数患者并无特异的症状及体征，常于体检时发现；当肿瘤增大可出现上腹部胀痛不适；大体所见病变呈囊性或囊实相间，有包膜；多为单发病灶；几乎所有 MCN 呈多分房；光镜下典型的囊壁分三层：（1）内衬上皮为单层柱状或立方上皮，（2）上皮下为类似卵巢样间质的致密梭形细胞束，（3）由胶原组织构成的外膜。影像特点：多位于肝左叶的囊性或囊实性肿块单房或多房，囊壁光整，囊内有分隔，分隔均匀纤细，增强扫描动脉期囊壁及分隔轻度强化，门脉期及延迟期明显持续强化。主要鉴别诊断：肝包虫病。

PU-0722

膀胱肿瘤影像诊断与鉴别

李燕^{1,2}、李烁²、李鼎²、郭俊婷²

1. 山西医科大学第一医院

2. 山西医科大学

膀胱肿瘤发生率占全身恶性肿瘤的 2%~6%，发病年龄 50~70 岁。属泌尿系最常见的肿瘤，男：女=3:1，95%以上的膀胱肿瘤来源于尿路上皮细胞，90%以上的膀胱肿瘤是移行细胞型。鳞状细胞癌和腺癌多见于长期慢性尿路感染和异物刺激的膀胱肿瘤患者；来源于间质细胞的肿瘤约占所有膀胱肿瘤的 5%，其中最常见的是横纹肌肉瘤；膀胱横纹肌肉瘤多见于儿童，膀胱平滑肌肉瘤多见于成人；CT 或 MRI 在膀胱肿瘤的临床分期中具有一定意义。

PU-0723

输尿管夹层病例 2 例并文献复习

杨俊强、董凤君、欧阳心芹、卓丽华

绵阳市第三人民医院

目的：输尿管夹层较为少见，其疗效取决于病因及发病机制，需要通过早期正确识别并积极治疗。本研究目的是分析输尿管夹层的病理生理学、影像表现，提高对输尿管夹层的认知和诊断的准确性。

方法：回顾性分析我院最近收治的 2 例输尿管夹层的影像表现、病理生理学并复习相关文献

结果：1.病例 1 患者女 58 岁，右侧下腹疼痛 1 天，泌尿系 CTU 表现为右肾盂、输尿管中上段管壁增厚、肿胀，周围见片絮状密度增高影，增强扫描管壁强化明显，周围见稍低密度影，排泄期右输尿管内见对比剂影，中上段及肾盂区呈双腔改变，考虑：输尿管夹层伴周围炎性改变。

2.病例 2 患者女 55 岁，左侧腰部疼痛 2 天，泌尿系 CTU 表现为左肾盂、肾盏、输尿管中上段增粗，壁增厚，增强扫描似呈双腔样改变，中心见环形强化，其内及周围未见明显强化，排泄期原强化区呈低密度，其内及周围对比剂显影，肾盂区域见条片状充盈缺损影，输尿管及肾周围脂肪间隙密度增高，邻近肾周筋膜增厚，考虑输尿管夹层可能性大，破口似位于肾盂区域，并输尿管及肾周炎性反应。

3.文献复习表明输尿管夹层的直接形成原因主要为输尿管黏膜损伤（易撕裂）和各种病理情况下（如结石、肿瘤、妊娠等）所致的尿路梗阻（尿路压力增高），最常见的原因是结石所致，本次报道的病例未发现明确的结石，可能结石已排出。同时，输尿管解剖结构具有形成夹层的潜在因素，管壁可分为三层，内层为黏膜层，中间层为肌层，外膜为疏松结缔组织，其中输尿管中上段肌层分内、外两层，较薄弱；而下段肌层增厚并形成内中外三层结构，故输尿管夹层多发生在中上段，本次病例发生部位与之符合。此外，输尿管夹层需要与双输尿管畸形、输尿管扭曲进行鉴别，鉴别要点：输尿管夹层具有“双腔”或“腔内腔”改变；后两者形成的是相互分离的双腔，而非“腔内腔”。

4.结论：输尿管夹层多发生于输尿管中上段，根据泌尿系 CTU“双腔”或“腔内腔”的特征影像表现，有助于本病的诊断。

PU-0724

优化肾脏增强 CT 的扫描方案降低患者辐射剂量

马冬
辽宁省肿瘤医院

目的: 优化肾脏增强 CT 的扫描方案, 减少患者的放射辐射剂量, 简化工作流程, 提高工作效率。
方法: 选取 10 例肾脏肿瘤的患者, 行光谱 CT 常规增强检查。获取多参数成像的虚拟平扫-VNC 增强三期(肾皮质期, 肾实质期和延迟期)的图像, 分别记录肾脏肿瘤的 CT 值, 同时记录真实平扫图像肾脏肿瘤的 CT 值, 分别加以对比。**结果:** 10 例患者虚拟平扫-VNC 增强三期的肾脏肿瘤 CT 值平均在 40.6HU~71.2HU, 真实平扫图像肾脏肿瘤的 CT 值平均在 39.8HU~70.7HU, 相似度为 98.8%。**结论:** 光谱 CT 参数成像的虚拟平扫-VNC 是利用从增强扫描图像中移除碘物质, 除碘化组织外的所有组织均以其原始 HU 值表示, 从而得到无碘对比剂的图像以代替传统成像的常规平扫图像。通过上述对比 CT 值差异在 3HU 以内, 证明了多参数功能 CT 虚拟平扫的精准性。CT 值测值与真实平扫测值具有良好的一致性, 图像质量等效于真实平扫。虚拟平扫可以替代真实平扫, 检出肾脏病变, 从而减少一期扫描, 降低辐射剂量。由此说明以增强扫描虚拟平扫替代真实平扫是可行的。

PU-0725

光谱 CT 一站式扫描在原发性肝癌中的应用

马冬
辽宁省肿瘤医院

目的: 在原发性肝癌病例中应用光谱 CT 行全肝 CT 灌注扫描模式, 探讨其一站式扫描的可行性。
方法: 对临床诊断为原发性肝癌的 33 例病例进行采用全肝 CT 灌注扫描及延迟扫描, 获得多参数 40keV 单能级图像, 碘密度融合图, 光谱曲线图和有效原子序数图及融合图像。同时还可获得多时相动态增强扫描图像, 采用容积再现(VR)、多层面重建(MPR)、最大密度投影(MIP)等血管重建方法及肝脏灌注后处理软件。**结果:** 所有病例均获取良好的多参数和多时相动态增强扫描图像, 40keV 单能级图像显著提高含碘组织的 CT 值, 增加了组织对比度, 可清晰观察肝癌等病变的形态、大小及边界范围, 碘密度融合图可以明确病变血供情况并进行定量分析, 碘密度融合图更好展示周围组织结构的解剖细节, 光谱曲线图可以辅助组织进行同源性判断, 如淋巴结、远处转移病变和肝癌原发病灶之间的同源性关系, 有效原子序数图及融合图像显示正常肝组织与肿瘤的有效原子序数值的差异, 并以不同色阶着色, 提升病变可视化, 以更直观的方式展示病灶。通过后处理可获得全肝灌注图像及肝动脉 CTA、门静脉 CTPA 图像。其中所有病例上全肝灌注图像可以观察到瘤灶动脉供血增多、门脉血供减少; 肝动脉 CTA 发现肿瘤血管 20 例、动脉扭曲移位 14 例、肝外动脉供血 3 例; 门静脉 CTPA 上观察到门脉癌栓 4 例。**结论:** 光谱 CT 一站式扫描多参数功能可以明显提升肝脏肿瘤的检出, 提升肝脏肿瘤的可视化, 提供病灶的定量(血供特点)和定性(同源性)分析信息。可以评估原发性肝癌血管的形态及动态血流信息, 全肝 CT 灌注成像可以量化评估肝内病灶血流灌注情况, 实现了肝脏一站式扫描, 显著提高肝癌 TNM 分期的诊断准确性, 对肝癌的诊断及临床治疗有重要意义。

PU-0726

多层螺旋 CT 在急性脂垂炎的临床价值

李大鹏

南京医科大学第二附属医院

【摘要】目的 探讨多层螺旋 CT(MSCT)在急性肠脂垂炎(acute epiploic appendagitis AEA)的临床诊断价值及对发病机制的探索。**方法** 收集本院 2014 年 7 月至 2018 年 12 月急性肠脂垂炎患者资料 22 例,完善相关的人体学指标,并按照中国成年人体质指数分为 4 组(轻体重,健康体重,超重,肥胖),所有患者行下腹部及盆腔 CT 扫描,观察病灶的部位、形态、密度、大小、边缘及邻近脂肪组织等表现。**结果** 本组 22 例患者病灶均位于结肠前外侧壁,9 例位于盲肠,7 例位于乙状结肠与降结肠交界处,4 例位于降结肠,1 例位于乙状结肠,1 例位于结肠肝曲,所有病例均表现为典型的“环征”,中央卵圆形脂肪密度,边缘环形软组织密度,周围脂肪密度增高;通过临床资料分析,本病好发于青壮年,男性多于女性,随着 BMI 指数增加,发病率有上升趋势。**结论** 急性肠脂垂炎在 MSCT 上表现为典型的“环征”,结合相关的临床资料,如年龄、性别、体重,能够达到方便、快捷的诊断。

Abernethy 畸形伴门静脉瘤和下腔静脉瘤一例

龙晓丽、周漫天、韦霞俊

株洲市中心医院

Abernethy 畸形是一种罕见的先天性肝外门腔静脉分流。1994 年 Morgan 等将其分为两型: I 型,肝脏完全无门静脉血流灌注,门静脉血完全向腔静脉分流;其中型又分 Ia 型和 Ib 型, Ia 型肠系膜上静脉与脾静脉无汇合, Ib 型,肠系膜上静脉与脾静脉汇合; II 型,肝脏有部分门静脉灌注。该病例 CTA、CTV 及 DSA 显示为门静脉右支-下腔静脉汇合,伴门静脉及下腔静脉瘤样扩张,符合 Abernethy II 型,伴门静脉瘤及下腔静脉瘤。诊断 Abernethy 畸形的金标准是 DSA。

Middle-aged men with chest pain

Yuanhao Xia^{1,2}, XinYu Yang^{1,2}, ZeHua Sun¹, Ning Mao¹, Hao Guo¹, Heng Ma^{1,2}

1. 11

2. 滨州医学院, 医学影像学院

A 52-year-old male patient presented to the emergency department with chest tightness and respiratory asphyxia exacerbated by two hours for one month. He had a thirty-year history of exertional palpitations. Physical examination showed cyanosis of the lips, accelerated and irregular heart rate, and systolic murmur in the area of mitral valve auscultation. Computed tomography angiography showed the pulmonary venous trunk communicates with the superior vena cava and eventually drains into the right atrium. Ultrasonography revealed an atrial septal defect and a bidirectional shunt between right atrium and left atrium. Supracardiac total anomalous pulmonary venous connection(TAPVC). Almost all TAPVC patients are infants and the mortality rate at one year of age is 80% if untreated. This condition is extremely rare in the elderly population. In this case, the left atrium did not receive direct pulmonary venous return, whereas the right atrium received return from systemic veins and the

left atrium causing enlargement. We assumed that the bidirectional shunt between the right atrium and left atrium would compensate over several decades, which could be the key to survival in patients with cardiovascular developmental abnormalities. The patient's colour doppler result and ejection fraction score of 69% proved this point. He was discharged from hospital after his symptoms were relieved by medical treatment. The patient was stable during 5-month follow-up.

PU-0729

基于影像组学的骨骼肌质量分析在预测失代偿性肝硬化继发于上消化道出血风险方面的研究。

李枝春、朱婷婷
川北医学院附属医院

目的：研究基于多层螺旋计算机体层摄影（MDCT）的影像组学列线图模型，预测失代偿期肝硬化患者继发上消化道出血（UGIB）。方法：将 208 例失代偿性肝硬化患者（131 男性[63%];平均年龄 \pm 标准差 56.59 \pm 11.5 岁）的数据随机分为训练组（n=145）和验证队列（n=63），根据有无 UGIB 分为出血组和非出血组;从腹部平扫 MDCT 图像中提取第 3 腰椎体最大层面骨骼肌横断面影像组学特征，采用最小冗余最大相关算法和最小绝对收缩和选择算子逻辑回归方法对特征进行选择，建立影像组学模型。采用单因素和多因素 logistic 回归分析，确定与 UGIB 显著相关的临床因素，构建临床模型。最终，采用结合临床因素和影像组学评分（radscore）的多变量 logistic 回归分析，构建影像组学列线图预测模型。使用校准曲线、受试者工作特性（ROC）和决策曲线分析曲线对 3 种模型进行综合评估，从而生成了最优预测模型。结果：血浆凝血酶原时间（PT）、重度食管静脉曲张组（G3）、肌肉减少症和 radscore 是失代偿性肝硬化患者继发 UGIB 风险的独立预测指标。影像组学列线图模型的 ROC 曲线下面积在训练队列中为 0.929（95%CI:0.885-0.973），在验证队列中为 0.857（95%:0.761-0.952），显著大于临床或影像学模型，影像组学列线图模型可以获得更大的临床净收益。结论：影像组学列线图模型优于个体临床或影像学模型，在预测失代偿性肝硬化患者 UGIB 风险方面提供了新的方法和思路。

PU-0730

肿瘤性急性肾衰竭影像表现分析

李晓阳
唐山市人民医院

目的：通过多层螺旋 CT(MSCT)和 MR 分析肿瘤患者合并急性肾衰竭（ARF）时肾脏与肾周间隙的影像学改变，总结肿瘤所致 ARF 的影像学特点，观察和分析肿瘤患者肾脏损害的影像学表现；反之，通过对肾脏与肾周间隙的影像学病理改变的分析，影像科医生应该提示临床医生需警惕肿瘤所致的急性肾损害。方法：分析 34 例血液系统肿瘤患者的腹部影像学检查资料，其中弥漫大 B 细胞淋巴瘤 8 例，滤泡型细胞淋巴瘤 2 例，多发性骨髓瘤 17 例；Pomes 综合征 2 例，急性粒细胞白血病未分化型 2 例，急性早幼粒细胞白血病 3 例。使用 GE Discovery CT750 HD、Philips Barilance 16 螺旋 CT 扫描仪，GE Signa TwinSpeed 1.5T 超导型全身 MR 机。所有患者行平扫检查；由于患者均存在不同程度肾脏损害，为避免加重肾脏负担和预防对比剂肾病的发生，所有病例均未做增强扫描。由两名高年资医师分析肿瘤性 ARF 的影像学表现。结果：肿瘤性 ARF 影像学表现：肾脏外形增大；MSCT 表现为肾脏密度减低；MR 表现为肾脏外形增大，T1WI 肾脏实质信号减低，T2WI、DWI 和 STIR 序列肾实质信号增高；MSCT 和 MR 均可见肾周间隙内桥隔增粗；肾周筋膜增厚。结论：恶性肿瘤常累及肾脏造成 ARF，形成相应的临床症状、实验室指标异常和肾脏影像

学异常改变。通过分析肾脏以及肾周间隙的异常影像学征象并结合临床资料,影像科医生应提示临床医生警惕肿瘤以及肿瘤所致急性肾脏损害。

PU-0731

肾癌根治术后 6 年伴全胰腺转移一例

马柯、潘焱琪、麦筱莉
南京鼓楼医院

患者 女, 58 岁, 2015 年因右肾占位性病行“右肾根治性切除术”, 术后病理为肾透明细胞癌; 2 年后常规复查发现胰头占位, 遂行“腹腔镜辅助保留幽门的胰十二指肠切除术”; 4 年后因“胰腺占位术后, 体检发现胰腺占位 1 月余”就诊。实验室检查无特殊。2017 年 CT 平扫示胰头类圆形低密度结节, 大小约 14mm×12mm, 增强扫描动脉期结节明显均匀强化, 强化程度高于正常胰腺实质, 静脉期强化减低, 边界清; 术后 4 年常规胸腹部 CT 复查, 显示两肺多发小结节, 较大者直径约 16mm; 胰腺多发团片状低密度影, 增强呈明显不均匀强化, 内伴片状无强化区; 左肾结节大小约 9mm×6mm, 皮质期明显强化, 髓质期退出; 盆腔团片状软组织密度影, 包绕腹腔内脂肪及血管, 局部与肠管边界不清, 大小约为 30mm×16mm, 增强见明显强化。后续规律治疗、每 2 月进行影像检查, 胰腺病灶坏死明显, 肺、左肾结节未见明显增大, 盆腔结节缩小。

手术及病理检查: 2017 年胰头结节手术探查, 术中见胰头下缘约 2cm×2cm 结节, 质中, 色偏黄, 界尚清。镜检: 瘤细胞呈巢状排列, 细胞为圆形或卵圆形, 胞质丰富且透亮。

透明细胞型肾细胞癌 (clear cell renal cell carcinoma, CCRCC) 早期临床症状不明显, 根治术后约 20%~30% 出现复发或者转移, 主要转移到肺、淋巴结、骨骼、肝脏、肾上腺, 转移到胰腺和肠管罕见。本病例行胰头转移瘤切除后短期发生全胰腺、肺、对侧肾脏、肠道等多器官转移, 实属罕见。大部分 CCRCC 胰腺转移患者无症状, 通常为肿瘤根治术后长期随访发现。本例患者主要是通过胸腹部 CT 增强扫描发现病灶的, CT 增强检查显示动脉期病灶明显强化, 门脉期强化程度明显下降, 但仍高于正常的胰腺组织。

本病例提示 CCRCC 患者行根治术后应尽可能进行定期体检、终身随访, 以便早期发现病灶复发、转移, 及时接受正确的治疗。

PU-0732

基于 DWI 的影像组学鉴别小肝癌与异性增生结节

李寅乔、贾宁阳、张娟
海军军医大学第三附属医院 (东方肝胆外科医院)

目的: 研究基于弥散加权成像(DWI)的影像组学模型鉴别肝炎肝硬化背景下的小肝癌 (<2cm) (SHCC)和异性增生结节(DNs)的诊断价值。方法: 回顾性的收集有完整 MRI 增强图像且手术病理证实为 SHCC 93 例, DNs 25 例。采用卡方检验分析两组间 DWI 和增强三期图像信号特征, 使用 ITK-SNAP 勾画 DWI 图像中感兴趣区域(ROI), 应用 FAE 软件进行特征提取、选择以及构建支持向量机 (SVM) 模型(按照 7: 3 的比例划分为训练集和测试集)。采用受试者工作特征 (ROC) 曲线评价模型的诊断效能。结果: SHCC 和 DNs 之间的增强三期和 DWI 图像具有统计学意义($P<0.05$), DWI-SVM 模型训练集的 AUC 值为 0.936, 灵敏度、特异度及准确度分别为 95.4%、88.2%及 93.9%; 测试集的 AUC 值为 0.911, 灵敏度、特异度及准确度分别为 85.7%、87.5%及 86.1%, 均明显优于 DWI(AUC=0.72)的诊断效能。结论: 基于 DWI-SVM 模型的 AUC 值和特异度显著提高, 可以有效区分肝炎肝硬化背景的 SHCC 和 DNs。

肾外腹膜后血管平滑肌脂肪瘤 1 例报道贾楠
辽宁省肿瘤医院

目的：探讨肾外腹膜后血管平滑肌脂肪瘤（ERAML）的临床特征及影像学表现特点，从而提升对本病的诊断水平。方法：选取 1 例病理证实为腹膜后血管平滑肌脂肪瘤的临床资料、病理及影像学表现特点。结果：本例 ERAML 体积较大且不侵犯周围组织，发生于盆腔，富含脂肪成分，密度不均，内部可见条索样、结节样软组织密度影，增强后见多根血管影穿行。结论：ERAML 的发病年龄、发病部位、临床表现及影像学表现具有一定特征性。

PU-0734

Preoperative CT-based imaging models predict Ki-67 expression in cytokeratin 19 positive hepatocellular carcinomaHailong Zhang, Huanhuan Zheng, Jing Chen, Yan Zhu, Qun Zhou, Xuedi Wang, Min Tang
Nanjing Drum Tower Hospital

Objectives: To investigate the diagnostic performance in predicting Ki-67 expression status of cytokeratin 19 (CK19) positive hepatocellular carcinoma (HCC) based on preoperative CT imaging features.

Methods: Preoperative clinicopathological and CT imaging data were retrospectively collected from 41 patients with CK19 HCC from January 2018 to March 2022. Clinical and CT imaging characteristics between low expression group (Ki-67 LI < 30%) and high expression group (Ki-67 LI ≥ 30%) were compared by univariate analysis, logistic regression and receiver operating curve analysis.

Results: At univariate analysis and multivariate analysis, non-smooth tumor margin (odds ratio [OR] = 6.272, 95% confidence interval [CI] = 1.011-38.899, $p = 0.049$), presence of macrovascular invasion (OR = 18.786, 95% CI = 1.570-224.800, $p = 0.021$), and RTE-AP (OR = 2.312, 95% CI = 1.006-5.313, $p = 0.048$) of CK19 positive HCC were independent predictors of high Ki-67 expression. The four preoperative CT prediction models based on the above predictors could well diagnose Ki-67 expression status. The area under curve values for predicting high Ki-67 expression were 0.779 (95% CI: 0.876-0.940) in model I, 0.802 (95% CI: 0.648-0.910) in model II, 0.841 (95% CI: 0.693-0.936) in model III, and 0.870 (95% CI: 0.728-0.954) in model IV, respectively.

Conclusion: Non-smooth tumor margin, presence of macrovascular invasion, and RTE-AP were independent predictors of high Ki-67 expression of CK19 positive HCC. The CT-based imaging models of our study might be helpful for clinicians to evaluate the expression status of Ki-67 preoperatively and identify these high-risk patients.

Analysis of imaging findings of rare small intestinal tumorsYu Liu
Nanjing Drum Tower Hospital

Objective: To analyze the imaging findings and related clinical features of rare tumors of the small intestine, and to improve the understanding and diagnosis of them.

Methods: The clinical and CT imaging data and features of rare small intestinal tumors diagnosed by pathology were retrospectively analyzed.

Results: Small intestinal hemangioma, small intestinal CT imaging showed a circular soft tissue, the enhancement mode is the same as liver hemangioma, arterial stage edge enhancement, venous stage and delayed stage progressive enhancement. Ileum diffuse gangliocytomatosis, CT imaging of the small intestine showed continuous diffuse thickening of the entire ileum wall, diffuse nodules under the mesenteric mucosa, multiple lumen stenosis, and significant enhancement of the mucosa. Malignant gastrointestinal neuroectodermal tumor, CT imaging of small intestine showed irregular thickening of jejunal tube wall, forming a structure similar to soft tissue mass. The enhancement results in uneven strengthening. Invasive angiomatosis, CT imaging of the small intestine showed a round and slightly low-density mass image at the end of the ileum. After enhancement, mild enhancement was observed, and marginal enhancement was observed.

Conclusion: The above rare tumors of small intestine have certain imaging characteristics, which is helpful for differential diagnosis.

原发性胰腺淋巴瘤 14 例病例分析及文献回顾

王晨¹、徐青²

1. 南京大学医学院附属鼓楼医院

2. 南京医科大学第一附属医院 (江苏省人民医院)

目的 分析原发性胰腺淋巴瘤临床诊疗、影像学特征及预后。方法 回顾性分析本院 2017 年 2 月至 2020 年 12 月确诊为原发性胰腺淋巴瘤的 14 例患者临床资料, 影像学特征及诊疗预后。结果 本次研究 14 例患者多以腹痛、腰背痛、乏力就诊 (10/14), 常出现血清 LDH 水平升高 (9/14), 头颈部多发 (8/14), CT 平扫时病灶均呈稍低密度, 增强后动脉期呈轻中度强化, 静脉期持续强化。14 例病灶均包绕邻近血管 (血管漂浮征), 胆总管或胰管扩张少见。6 例行超声内镜引导下细针穿刺吸取术病理确诊。组织类型最常见为弥漫大 B 细胞淋巴瘤 (11/14)。随访示确诊患者多接受化疗治疗 (4 例失访)。1 例患者确诊 2 周后死亡, 9 例患者至最终随访时间 (2020 年 12 月) 中位生存期为 21 月。结论 原发性胰腺淋巴瘤少见, 需联合临床及影像学特征, 治疗前穿刺活检确诊, 根据病理制定化疗方案。

增强 CT 形态学特征评估胃癌脉管癌栓及神经侵犯状态

孙双双、刘松、季长风

南京大学医学院附属鼓楼医院

目的: 探究增强 CT 形态学特征评估胃癌脉管癌栓及神经侵犯状态的价值。

方法: 回顾性收集 104 例胃癌, 在 CT 图像上评估大体部位、病灶方位、形态、边缘、最大厚度、粘膜面、浆膜面、邻近脂肪等形态学特征, 同时测量平扫、动脉、静脉及延迟期病灶的 CT 值。使用 χ^2 检验或 Fisher 精确检验比较分类变量组间差异, Mann-Whitney U 检验比较定量参数组间差异。采用 ROC 曲线评估差异性参数及多参数模型区分脉管癌栓或神经侵犯的诊断效能。

结果: 脉管癌栓阳性常见的 CT 征象是边缘不清晰和邻近脂肪浑浊 ($P = 0.007$ 和 0.011)。神经侵犯阳性常见的形态学特征是增厚型和边缘不清晰 ($P = 0.006$ 和 0.048)。神经侵犯阳性组的静脉 CT 值及延迟 CT 值均显著高于阴性组 ($P = 0.001$ 和 0.002)。静脉 CT 值联合形态 AUC 值提高至 0.771,

准确度为 82.9%。静脉 CT 值、延迟 CT 值、形态及边缘多参数联合 AUC 值提高至 0.778，准确度为 75.4%。

结论：CT 征象包括形态、边缘、邻近脂肪、静脉及延迟 CT 值可用于评估胃癌脉管癌栓或神经侵犯，尤其是胃癌形态联合静脉 CT 值区分神经侵犯的诊断效能更优，可能为临床评估胃癌脉管及神经侵犯状态提供一定的参考价值。

双能 CT 对肝囊肿与乏血供肝转移瘤的鉴别诊断研究

杨孟予

中国人民解放军陆军特色医学中心

【摘要】目的：探讨应用双源 CT 双能量扫描方式对鉴别诊断肝囊肿、乏血供肝转移瘤的价值。方法：回顾性分析 2023 年 4 月至 2023 年 7 月就诊的 140 例肝脏病变者临床资料，均是接受双源 CT 双能量扫描检查。针对影像扫描检查获得数据，输入至 syngvia 后处理工作站，进一步获得碘图、能谱曲线，计算标准化碘浓度 (NIC)、能谱曲线斜率，此外获得平均 CT 值。结果：140 例肝脏病变者，应用双源 CT 双能量扫描方式，检出 186 个病灶，包括肝囊肿病灶 104 个，乏血供肝转移瘤病灶 82 个。肝囊肿 NIC 与能量曲线斜率都是比较乏血供肝转移瘤低 ($P < 0.05$)。不同 keV 下 (40keV、60keV、70keV、80keV、100keV) 测定的平均 CT 值，肝囊肿在平均 CT 值都是低于乏血供肝转移瘤 ($P < 0.05$)。肝囊肿能谱曲线呈弓背上升型，斜率负值，随着 keV 增高目标病灶 CT 值呈现升高趋势；乏血供肝转移瘤能谱曲线表现是下降型，斜率正值，随着 keV 增高目标病灶 CT 值呈现下降趋势。结论：应用双源 CT 双能量扫描方式，能够通过获取碘图、能谱曲线、能谱曲线斜率及平均 CT 值等，为肝囊肿与乏血供肝转移瘤的鉴别诊断提供参考。

多层螺旋 CT 与数字减影血管造影在巨块型肝癌及癌栓和动静脉分流诊断中的价值

苟瀚恒

重庆医科大学附属第三医院

目的：对比多层螺旋 CT 与数字减影血管造影 (DSA) 在巨块型肝癌及癌栓和动静脉分流诊断中的应用价值。方法：选取我院于 2021 年 7 月-2022 年 1 月收治的 26 例巨块型肝癌患者为研究对象，回顾性分析患者接受多层螺旋 CT 与数字减影血管造影检查方式在巨块型肝癌及癌栓和动静脉分流诊断中的应用情况。结果：CT、DSA 均检出 26 个病灶，检出率分别为 100%；CT 与 DSA 检查出病灶血液供应、癌栓检出率、动静脉分流情况对比，差异不具有统计学意义 ($P > 0.05$)。经 DSA 检查显示，26 例患者中，有 2 例患者的病灶累积整个左肝，1 例累积右肝。而经 CT 增加扫描，26 例患者的肿块全部累积部分肝叶。结论：多层螺旋 CT 与 DSA 在巨块型肝癌及并发病变诊断均具有显著的应用价值，在病灶血液供应诊断方面具有一致性。但是多层螺旋 CT 在癌栓检出率、影像学特征上略优于 DSA，而 DSA 在动静脉分流诊断方面较多层螺旋 CT 稍具优势。

PU-0740

Association of renal surface nodularity with arterial hypertension compared to normotensive patients

Jiule Ding, Jun Zhou, Wei Xing
Department of Radiology, Third Affiliated Hospital of Soochow University

Background: Renal surface nodularity (RSN) is a subclinical biomarker of renal injury and may be associated with arterial hypertension. **Purpose:** To explore the association of RSN with arterial hypertension compared to normotensive patients. **Material and Methods:** A total of 205 inpatients with or without high blood pressure (HBP vs. control group) who underwent abdominal computed tomography (CT) scans were included. Their clinical characteristics included age, sex, HBP course, HBP grade, history of diabetes mellitus (DM), and renal function (estimated glomerular filtration rate [eGFR]). The HBP group included HBP/+DM and HBP/-DM based on the presence or absence of DM. The CT-based RSN grade was scored from 0 to 2 by two radiologists, respectively, where RSN grade 0 indicated smooth renal surface, grade 1 was mild RSN, and grade 2 was marked RSN. **Results:** The inter-rater agreement on RSN was good ($\text{Kappa} = 0.76$). The age-specific rate of RSN grade 1–2 was bigger in the HBP group than in the control group (42.86% [40%–49.22%] vs. 2.18% [0.00%–22.5%]; $P = 0.005$). RSN grade was associated with HBP course ($P < 0.02$). The rates of RSN grade 1–2 and of RSN grade 2 were bigger in the HBP/+DM group than those in the HBP/-DM group (48.84% vs. 37.84%, and 18.61% vs. 1.35%, respectively; all $P = 0.001$). Neither HBP course nor HBP grade correlated with rate of RSN grade ($P > 0.05$). The eGFR was similar among the RSN grades in HBP or between the HBP and control groups ($P > 0.05$). **Conclusion:** RSN was associated with HBP compared to normotensive patients.

PU-0741

彩色多普勒超声联合 CT 检查在儿童肾上腺神经母细胞瘤 诊断及随访中的应用价值

张火根、游宇光
赣南医学院第一附属医院

目的 研究儿童肾上腺神经母细胞瘤 (NB) 的彩色多普勒超声与 CT 表现, 提高其诊断率。
方法 回顾性分析 29 例经穿刺活检或术后病理证实为肾上腺神经母细胞瘤患儿的超声图像与 CT 的影像表现, 总结其影像学特征, 并对 20 例患儿的随访情况加以分析。
结果 在 29 例患儿的肾上腺瘤体中, 16 例位于左侧, 13 例位于右侧。彩色多普勒超声示瘤体最大约 $110 \times 100 \text{ mm}$, 最小约 $14 \times 11 \text{ mm}$; 24 例边界欠清, 部分与肝、肾等器官分界不清; 内部回声呈低回声 (20/29)、稍高回声 (2/29)、中等回声 (3/29)、混合回声 (4/29), 均呈不均质回声 (25 例病灶内可见斑片状、点状强回声, 3 例病灶内可见囊性无回声区, 1 例内可见蜂窝状小无回声); 21 例病灶内可见血流信号 (13 例见稍丰富血流信号, 3 例呈点状或小片状血流信号), 5 例病灶周边可见血流信号, 3 例病灶内未见明显血流信号。CT 示不规则状病灶有 24 例, 瘤体边界欠清, 部分与肝、肾等器官分界不清; 瘤体最大约 $128 \times 105 \text{ mm}$, 最小约 $26 \times 12 \text{ mm}$; 内部密度不均匀, 增强呈中度或明显不均匀强化, 其中 26 例内可见结节状、斑片状或点状高密度钙化灶, 2 例病灶内见不规则高低混杂密度, 1 例内可见出血稍高密度影。29 例患儿中, 26 例见腹膜后淋巴结增大, 9 例造成右肾上极受压, 11 例出现左肾向下推移, 6 例见包绕腹主动脉、肾动脉等腹部血管并造成血管移位, 4 例患儿发现肝转移灶, 5 例发现骨转移, 3 例同时出现肝转移及全身骨骼广

泛性转移。20 例患儿的随访中, 6 例择期手术切除后 4 例未见复发、2 例复发, 10 例经化疗后 7 例肿瘤逐渐减小、3 例见复发, 3 例因广泛转移而治疗效果欠佳, 1 例因发现较晚已死亡。

结论 彩色多普勒超声和 CT 均可观察肿瘤的部位、大小、形态、内部情况、与周围组织及大血管的关系以及转移情况, 联合应用能为临床上 NB 的诊断、疗效复查与随访提供更全面、更有价值的参考信息。

单源双层探测器 CT 显示宫颈癌的最佳单能量研究

孙心言、董越、于韬、秦凤英、庞慧婷、于庆、田名可
辽宁省肿瘤医院

目的 探讨单源双层探测器 CT (dl-SDCT) 显示宫颈癌病灶的最佳单能量。 **方法** 分析初治宫颈癌患者 105 例, 治疗前行 dl-SDCT 和盆腔 MRI 增强检查。由 1 名住院医师分析光谱 CT 动、静脉期常规能量图像 (CIs) 和 40~200KeV 单能量图像 (VMIs), 获得双期宫颈癌病灶及背景组织 CT 值和 SD 值, 计算信噪比 (SNR) 和对比噪声比 (CNR); 2 名影像科医师依据 5 分评分标准, 对病灶显示清晰度及分期诊断信心进行评分。比较 VMIs 及 CIs 各参数组间差异及主观评分差异。 **结果** 在动、静脉期, VMI40KeV 宫颈癌病灶 CT 值最高、SNR 最高, CNR 宫体最高、CNR 阴道最高, 显著高于其他 VMIs 和 CIs ($P < 0.05$)。在 CIs 和 VMI40KeV~VMI80KeV, 病灶静脉期 SNR 均高于动脉期 ($P < 0.05$); 在 CIs 和 VMI40KeV~VMI100KeV, 动脉期 CNR 宫体均高于静脉期 ($P < 0.05$); 在 CIs 和 VMI40KeV~VMI70KeV, 动脉期 CNR 阴道均高于静脉期 ($P < 0.05$)。甲乙医师在 CI-A、CI-V、VMI40KeV-A、VMI40KeV -V 图像评分 Kappa 值分别为 0.77、0.77、0.84、0.80, 在 VMI40KeV 上评分高于 CIs ($P < 0.05$)。 **结论** 与 CIs 及其他 VMIs 相比, VMI40KeV 表现出最佳 SNR 和 CNR, 优化宫颈癌病灶显示效果。

PU-0743

Detection of Liver Steatosis by Dual-layer Spectral Detector Computed Tomography: Evaluation Using Proton Density Fat Fraction as Reference

Min Wang¹, Hongyu Chen¹, Yue Ma¹, Ruobing Bai¹, Sizhe Gao¹, Linlin Yang¹, Wenli Guo¹, Cong Zhang¹, Chengjun Kang¹, Yu Lan¹, Yanqiu Sun², Yonggao Zhang³, Xigang Xiao⁴, Yang Hou¹

1. Shengjing Hospital Affiliated to China Medical University

2. Qinghai Provincial People's Hospital

3. The first affiliated Hospital of Zhengzhou University

4. The First Affiliated Hospital of Harbin Medical University

Objectives: To evaluate diagnostic accuracy of liver dual-layer spectral detector computed tomography (SDCT) derived parameters of liver parenchyma for grading steatosis with reference to magnetic resonance imaging-based proton density fat fraction (MRI-PDFF).

Materials and Methods: In this prospective study, 320 participants (45.5 ± 11.5 years, 120 men) who underwent MRI-PDFF and liver SDCT examinations at four centers in China were enrolled. Participants were classified into normal ($n = 131$), mild steatosis ($n = 98$), and moderate/severe(mod/sev) steatosis ($n = 91$) groups based on MRI-PDFF. SDCT liver parameters were evaluated using conventional polychromatic CT images (CTpoly), virtual mono-energetic images at 40 keV (CT40kev), the slope of the spectral attenuation curve (λ), effective atomic number (Z_{eff}), and liver to spleen attenuation ratio (L/S ratio). Linearity between SDCT liver parameters and MRI-PDFF were examined using spearman correlation. Cutoff values for

SDCT liver parameters in determining steatosis grades were identified using area under the receiver-operating characteristic curve analyses.

Results: SDCT liver parameters demonstrated a strong correlation with PDFF, particularly Zeff ($R_s = -0.852$; $P < 0.001$). Zeff achieved an area under the curve (AUC) of 0.928 for detecting the presence of steatosis with the sensitivity of 89.4%, and the specificity of 82.4%, and an AUC of 0.953 for detecting mod/sev steatosis with the sensitivity of 94.5% and the specificity of 88.8%, the corresponding cutoff values were 7.12 and 6.97, respectively. Multiple regression analysis showed that Zeff was the independent factor associated with the presence of liver steatosis and mod/sev steatosis (All $P < 0.001$).

Conclusions: SDCT derived parameters of liver parenchyma, particularly Zeff, exhibit excellent diagnostic accuracy for grading steatosis.

腹部脂肪含量的诊断：基于 MRI mdixon-quant 定量技术

陈倩文¹、佟靖雯¹、李博研¹、魏景洋¹、孟妍¹、梁爽²

1. 牡丹江医学院

2. 牡丹江医学院附属第二医院

目的：腹部脂肪组织含量的定量评估对于脂肪肝患者至关重要，对于肝脏脂肪变性的严重程度诊断和预后具有重要意义，肝脏活检受限于采样偏倚和有创性受到限制。然而，超声、CT 等影像学检查能够提供脏器脂肪浸润程度，但无法提供精准量化的脂肪含量信息，为腹部脏器选择定量成像技术是临床应用的挑战之一。

方法：本文基于 MRI mdixon-quant 定量技术在肝脏、胰腺、脾脏、肾脏、肾上腺、精囊、睾丸、附睾、阴茎中的应用进行综述，并从 mdixon-quant 技术成像原理，常见部位的扫描方法、图像后处理及感兴趣区勾画、不同疾病诊断界值、临床疾病中的应用等方面对 MRI 脂肪定量技术进行探讨。

结果：大多数磁共振脂肪定量技术依赖于脏器分割后进行计算，可复性和操作性都较差。MRI mdixon-quant 技术能够快速进行脂肪定量赋值，并在涵盖腹部多个实质脏器的大规模研究中被证实，其较高的诊断效能也为炎症性疾病、动脉硬化性疾病及肿瘤性疾病的治疗术后评估提供了有效的支持，同时 MRI mdixon-quant 也为健康筛查、疾病随访监测患者提供了有益的选择。该技术因其一次屏气即可完成检查、耗时短、且后处理检查易操作、直接提供脂肪百分比、无辐射等优点，在已有的脂肪定量技术中脱颖而出。

结论：MRI mdixon-quant 定量技术对于腹部脂肪含量的诊断和疾病监测中提供了有用信息，并因其无创性和鲁棒性被认为是脂肪定量的推荐方法。

PU-0745

肝脏血管周上皮样细胞肿瘤（PEComa）的影像特点

王晋婷、段庆红

贵州医科大学附属肿瘤医院

目的 探讨肝脏血管周上皮样细胞肿瘤(PEComa)的临床特点及影像学特征。资料与方法 收集例经病理学确诊的肝脏 PEComa 患者的临床及影像学资料，选取其中例回顾性分析该病影像学表现。

结果 例患者临床表现缺乏特异性，其中例无症状，其余均表现为上腹隐痛不适及压迫症状。所有病例均为单发，以肝右肝多见，其中例位于右肝，病理检查 SMA 几乎都表现为阳性，免疫组化 HMB45 特异性表达。PEComa 影像学检查可以分为三种类型，多脂肪型，混合型及无脂肪型，多脂肪型和混合型需与血管平滑肌脂肪瘤(AML)、肝局灶性结节增生(FNH)鉴别，而无脂肪型容易

误诊为肝细胞癌，因此对于本病的鉴别诊断尤其重要。结论 肝脏 PEComa 具有独特的免疫组化特征，影像学表现具有一定的特性，临床术前误诊概率较大，放射科医生加强对该病的认识十分重要。

PU-0746

术前磁共振成像纹理特征分析预测肝细胞癌微血管浸润的效果

黄碧云

贵州医科大学附属肿瘤医院

目的 存在微血管侵犯 (microvascular invasion, MVI) 表明肝细胞癌 (hepatocellular carcinoma, HCC) 根治性切除后预后较差，肿瘤复发的可能性增加。按照目前的标准，MVI 只能在术后通过组织病理学进行诊断。纹理特征分析有可能通过术前磁共振成像 (magnetic resonance imaging, MRI) 研究分析来识别被认为是“高风险”的患者。这将使患者有更优的治疗选择，改进治疗方法和术前预后。本研究旨在评估术前 MRI 纹理特征分析预测肝癌 MVI 的准确性。

方法 回顾性分析 2018 年至 2022 年间接受肝切除术的新发 HCC 患者。排除标准：术前无 MRI，运动伪影明显，失访，肝细胞癌破裂，既往肝切除术和辅助治疗。60 例患者根据肿瘤组织学分为 MVI 组 (n = 25) 和非 MVI 组 (n = 35)。对肿瘤在增强后的 T1 加权 MRI 上的选定图像进行分析。获得定性 (由放射科医生评估) 和定量数据 (由软件执行)。根据每个肿瘤的最大横截面积提取放射组学纹理特征参数，并使用 MaZda 软件进行分析。采用了五种不同的方法。方法 1、2、3 分别专门利用门静脉、动脉和平衡相的特征。方法 4 和方法 5 利用比较显著的纹理特征来获得最佳性能。

结果 方法 5 的准确度为 87%，灵敏度为 74%，特异性为 93%。

结论 术前 MRI 的肿瘤结构分析可以预测 HCC 中 MVI 的存在，准确率高达 87%，并可能影响临床治疗。

PU-0747

基于 CT 影像组学与血清学指标预测肝细胞癌微血管侵犯的研究

赵婷

贵州医科大学附属肿瘤医院

背景 微血管侵犯被认为是引起肝细胞癌肝内转移和术后复发的原因，预测微血管侵犯有重要临床意义。目的 基于肝细胞癌的患者术前 CT 影像组学特征和术前血清学指标分别建立影像组学模型，探讨其预测微血管侵犯的研究价值。方法 回顾性分析贵州医科大学附属肿瘤医院 2019 年 1 月至 2022 年 12 月 215 例术后病理病理结果确诊为肝细胞癌患者的资料。分析血清学指标资料，采用逻辑回归算法分别确立影像组学模型，血清学模型，影像组学联合血清学模型。通过绘制受试者血清学指标曲线、特性性和敏感性评估预测患者微血管侵犯状态的诊断效能。结果 筛选出 6 个最优的影像组学特征构成影像组学模型，筛选出 14 个血清学指标特征构成血清学模型，筛选出 12 个特征构成影像组学联合血清学模型。结论 基于 CT 影像组学联合血清学模型可用于预测肝细胞癌的微血管侵犯状态且有较好的诊断价值。

精囊血管平滑肌瘤 1 例

胡霖霖

中国人民解放军陆军特色医学中心

目的: 探讨精囊腺血管平滑肌瘤的影像特征及临床特点, 以期提高对该疾病的诊断认知。方法: 血管平滑肌瘤是一种孤立的良性肿瘤, 是一种来源于间叶组织的罕见的平滑肌瘤类型, 性激素水平和创伤再其发生中作为始动因素被广泛认可。血管平滑肌瘤好发于四肢皮下, 女性发病率高于男性。发生于精囊腺的血管平滑肌瘤 (seminal angioleiomyoma) 极为罕见, 在中外文献中未见报告, 本文报道一例男性血管平滑肌瘤病例, 患者, 59 岁, 主因无明显诱因的排尿困难、下腹部胀痛 3 天入院。腹部+盆腔增强 CT 显示盆腔占位, 当地医院拟诊为精囊囊肿, 留置尿管后转治我院。我院 MRI 检查示: 盆腔内囊实性不均质团块, 界限较为清晰, 规整, 大小约为 16.7×13×16.4cm, T1WI 呈高信号, T2WI 呈高信号, 增强扫描未见明显强化 (图 1), 临床诊断: 精囊囊肿, 囊腺瘤。临床行腹腔镜下肿瘤切除术。结果: 术后病理结果证实为精囊腺血管平滑肌瘤, 镜下可见梭形肿瘤细胞、大片坏死组织并囊性变。患者术后恢复良好, 随访 6 个月肿瘤无复发。结论: 精囊血管平滑肌瘤临床罕见, 术前明确诊断较为困难, 术前影像学检查首选 MRI, 典型的 MRI 表现为肿物在 T1WI 加权等或稍高信号, T2WI 为混杂高信号, 边界清晰, DWI 稍高信号, 内部信号往往混杂, 可见高信号的血管平滑肌成分, 以及血栓、钙化等低信号。首选腹腔镜手术完整切除, 术后无复发及转移。

PU-0749

腹部 CT 与腹部 X 片在肠梗阻诊断中的价值比较

邓婷婷、段庆红

贵州医科大学附属肿瘤医院

目的: 探索腹部 CT 与腹部 X 片在肠梗阻诊断中的应用价值比较。方法: 选取 2022.3 月-2023.3 月在我院治疗肠梗阻前的病人 60 例, 分析对比腹部 CT 和腹部 X 线两种摄片方式相比的病灶检出率, 以及两种摄片方式的辐射剂量大小比较。采用同时进行腹部 CT 检查和腹部 X 片检查的方法, 比较两种方式对肠梗阻的检出效能, 评估哪种摄片方式对诊断肠梗阻更有价值。结果: 60 例肠梗阻患者中, X 线检出率为 81.69%, CT 检出率为 94.36%, 差异具有统计学意义 ($P<0.05$)。腹部 CT 的辐射剂量约为 10mSV, 腹部 X 片的辐射剂量约为 0.7mSv, 腹部 CT 的辐射剂量是腹部 X 线的 14 倍。结论: 1. 与腹部 X 片相比, 腹部 CT 的检出敏感性更高, 尤其是在显示肠腔以及肠壁的形态改变上, 且可以通过多平面重建从多角度观察梗阻部位, 了解梗阻原因和疾病严重程度。2. CT 辐射剂量大于 X 线, 患者所受辐射剂量明显增加

PU-0750

肝细胞癌与肝海绵状血管瘤 CT 检查技术及 CT 表现分析

张薇

贵州医科大学附属乌当医院

摘要: 目的: 探讨肝细胞癌与肝海绵状血管瘤 CT 增强扫描的影像学特点。方法: 选取我院 2023 年 1 月-7 月患有肝脏肿瘤疾病的 30 名患者, 均对 30 名患者进行腹部增强 CT 扫描, 均设置相同的扫描时间动脉期 20~30s, 静脉期 55~75s, 延迟期 120~180s, 监测层面放置在膈肌, 监测点放置在腹主动脉, 自动触发阈值为 120~130HU。结果: 17 名患有肝海绵状血管瘤的患者在动脉期,

肿瘤边缘呈高密度, 门静脉期, 肿瘤则呈现出均匀强化, 呈现高密度, 而 13 名肝细胞癌患者肿瘤在动脉期肿瘤呈现高密度, 门静脉期则强化迅速下降, 肿瘤则呈现为低密度表现。肝海绵状血管瘤 CT 增强扫描影像学表现为肿瘤周围早期强化, 逐渐向肿瘤中央扩展, 整个对比增强的过程可表现为“早出晚归”的特征。肝细胞癌对比增强的影像学表现则为由肝动脉供血的肿瘤, 在其门静脉期强化下降而成相对低密度影像, 整个 CT 增强过程肿瘤表现为“快进快出”征象。结论: 相同 CT 增强扫描技术情况下肝细胞癌与肝海绵状血管瘤 CT 表现明显不同, 各有特点。

慢性胰腺炎与胰腺癌的 CT 分析与鉴别

邓亚 贵州医科大学附属乌当医院

关键词: 胰腺癌; 慢性胰腺炎; CT 平扫与增强;

【摘要】目的: 通过分析胰腺癌和慢性胰腺炎的 CT 表现特点, 探讨其二者的主要鉴别点, 从而提高胰腺癌和慢性胰腺炎的影像检查技术鉴别能力。**方法:** 回顾性分析对我院已证实的 30 例胰腺癌和 22 例慢性胰腺炎的平扫与增强的 CT 表现分析病灶的血供、密度、境界、周围血管的侵犯、周围血管腔的癌栓、周围淋巴结的显示以及病灶检出率。**结果** 两者的 CT 直接和间接征象表明两者的表现有其相似性, 但各自具有相对特征性的 CT 征象;慢性胰腺炎与胰腺癌主要 CT 征象的出现率在增强扫描病灶呈低、低与等混杂密度, 胆总管下段扩张突然狭窄截断;两组比较差异均有统计学意义。**结论:**临床上, 胰腺癌与慢性胰腺炎的鉴别诊断是比较困难的, 胰腺癌与慢性胰腺炎的表现虽有相似点, 但通过对两者的 CT 直接和间接表现进行比较分析, 认为 CT 检查能够获得比较好的图像效果;对两者定性诊断的准确性很高, CT 增强的检出率又明显高于平扫检出率, 是解决胰腺癌与慢性胰腺炎鉴别诊断的较好方法。

肝融合性纤维化的影像学特征及其病因探究。

刘朵朵、孙泓泓

西安交大第二附属医院

目的: 探讨肝融合性纤维化的影像学特征, 并初步分析其发病原因。

方法: 回顾性分析我院 2020 年 6 月-2023 年 6 月经影像诊断的 9 例肝融合性纤维化患者的临床及影像学资料, 影像学特征包括病变部位、形态、密度/信号及其强化特点, 并初步分析其发病原因。

结果: 9 例中, 男 1 例, 女 8 例; 年龄 41-69 岁, 平均 53.7 岁; 均具有不同程度的肝功能损害; 8 例自身抗体 ANA(+), 1 例自身抗体 ANA(±); 其中 4 例肝纤维化系列指标异常, 5 例不详。9 例均行 MRI 普美显增强扫描, 3 例行 CT 平扫, 6 例行 CT 平扫+增强扫描; 其中 5 例合并肝硬化; 6 例以肝门为中心, 呈不规则大片状累及肝左叶及肝右叶; 2 例位于肝左叶; 1 例位于肝左右叶交界区、肝左叶边缘; 单发或多发, 无占位征象, 局部肝体缩小并相应部肝包膜皱缩; CT 平扫病变呈稍低密度, 边界欠清; MRI 平扫 T1WI 呈稍低信号, T2WI 呈稍高信号, DWI 呈稍高信号, ADC 呈稍高信号; 异常密度/信号较均匀, 无出血、坏死; 病灶内血管和胆管显示清晰, 完整连续, 部分血管走行迂曲、部分胆管呈局限性扩张; CT/MRI 增强扫描示动脉期不强化或轻度强化, 门静脉期及延迟期逐渐强化, 肝胆期呈稍高/低信号。7 例病理诊断自身免疫性肝炎, 1 例病理诊断药物性肝损伤, 1 例患者致病原因不明。

结论：肝融合性纤维化具有相对特征的 CT 和 MRI 表现，自身免疫性肝炎极有可能为我国中年女性肝融合性纤维化的主要发病原因。

Gd-EOB-DTPA MRI 动态增强扫描联合 ADC 值对肿块型胆管细胞癌的诊断价值

张姣

重庆医科大学附属第三医院

目的：本研究探讨 Gd-EOB-DTPA MRI 动态增强联合 ADC 值对肿块型胆管细胞癌的诊断价值。

方法：回顾性分析经病理证实的 35 例肿块型胆管细胞癌 (IMCC) 患者的临床和影像学资料，并选择 50 例肝细胞癌 (HCC) 资料进行对比，所有患者均行肝脏 Gd-EOB-DTPA MRI 动态增强及弥散成像。分析两组患者的病灶 MRI 平扫及动态增强信号特点以及测量 b 值为 0,400,800,1200 所对应的 ADC 值，并对胆管细胞癌强化方式与病理基础进行对照。连续资料采用 t 检验，分类资料采用 χ^2 检验或者 Wilcoxon 秩和检验，对两组间磁共振信号特征进行比较。对单因素分析中具有统计学意义的影像学指标进行多因素逻辑回归分析，筛选出病灶中较好的鉴别诊断指标。

结果：MRI 扫描特征中，肿瘤边缘及轮廓、是否单发、动脉期 (AP) 增强、静脉期 (PVP)、延迟期 (DP) 廓清、动态增强模式、肝胆期 (HBP) 靶征、b 值等于 800 时的 ADC 值及伴随征象中假包膜、包膜皱缩有统计学意义 ($P < 0.05$)，进行多因素逻辑回归分析显示，病灶的 AP 增强、DP 廓清、假包膜以及肝胆期 (HBP) 靶征表现作为两者鉴别的较好指标。

结论：病灶的 AP 增强、DP 廓清、假包膜以及肝胆期 (HBP) 靶征是鉴别 IMCC 与 HCC 的重要影像学指标。IMCC 不同的 MRI 强化特点对应相应的病理学基础。

鱼刺所致星座链球菌肝脓肿 1 例并文献复习

冯若涵、卓丽华、李宏伟

绵阳市第三人民医院

目的：细菌性肝脓肿是临床外科常见疾病，而通过误吞异物导致肝脓肿的相关报道总体较少，该疾病早期不易识别，临床误诊率及延诊率较高。本研究拟通过回顾性分析 1 例鱼刺所致肝脓肿的临床及影像表现，提高临床医生对疾病的诊断和治疗效率，减少疾病的风险和并发症。

方法：回顾性分析我院最近收治的 1 例鱼刺所致星座链球菌肝脓肿的影像表现、临床特征并复习相关文献。

结果：

1. 本例报道患者男，38 岁，临床症状为咳嗽、乏力 1 周，上腹部轻压痛，血常规：白细胞、中性粒细胞、超敏 C 反应蛋白明显升高。入院后胸部 CT 未见异常密度影；腹部增强 CT 显示肝左叶见一团片状稍低密度影，增强扫描病灶明显不均匀强化，其内散在斑片状、片状无强化区，病灶部分突向肝胃间隙，与邻近胃壁分界不清，似见一小瘘道相连，周围边缘模糊。结合患者有吃鱼病史，患者 1 月前体检时胃镜、肝脏左叶超声未见异常，目前综合考虑鱼刺穿破胃壁进入肝内导致肝脓肿。后经超声引导下脓肿穿刺引流，病灶明显缩小。脓液细菌培养：星座链球菌。患者经抗感染、保肝、营养支持等治疗后症状明显缓解。

2. 文献复习发现异物所致肝脓肿较少见，近 95% 为鱼刺所致，大多数病人早期无明显症状，后期脓肿形成后会出现腹痛、发热、乏力等症状。此外文献复习中发现，大多数病人早期行磁共振和超声检查易漏诊和误诊，CT 影像检查能较好的发现病变，尤其是结合增强检查能较好的显示脓肿及异

物的位置和关系。脓肿大部分位于肝左叶，少数位于尾叶和右叶区域。CT 主要表现为肝脓肿区域有长条状高密度影，部分位于肝内，部分位于肝胃间隙，部分可发现肝脏与胃之间漏道形成，大部分患者无腹腔积液、积气及腹膜炎征像。我们推测可能缓慢的进行性炎症和纤维化反应引起的粘连阻止了胃肠道内容物溢出至腹腔内，由此避免了继发性腹膜炎的发生。

结论：异物性肝脓肿早期不易识别，易漏诊和误诊，CT 能早期发现胃肠道异物，对异物性肝脓肿能较及时诊断。

CT 增强定量参数预测肾透明细胞癌 WHO/ISUP 分级

张晓金¹、翟建²、张虎¹

1. 华东师范大学附属芜湖医院（芜湖市第二人民医院）

2. 皖南医学院弋矶山医院

摘要：探讨 CT 增强定量参数术前预测肾透明细胞癌（ccRCC）WHO/ISUP 分级的价值。连续收集行手术治疗的 98 例 ccRCC 患者临床和 CT 增强资料，根据 WHO/ISUP 分级分为低级别组（76 例）和高级别组（22 例）。比较 CT 增强定量参数两组间差异及各参数预测 ccRCC WHO/ISUP 分级的诊断效能，并进行外部验证，找寻泛化能力最佳的 CT 增强定量参数。两组间皮质期 CT 值、皮质期净增值、皮质期强化率、实质期 CT 值、实质期净增值、实质期强化率差异均有统计学意义（ $P < 0.05$ ），AUC 值分别依次为 0.834、0.871、0.900、0.707、0.678、0.762；截断值分别依次为：123.5 HU、71 HU、0.73、87.5 HU、54 HU、0.67。皮质期强化率诊断效能最高，AUC=0.900，敏感度为 0.842，特异度为 0.864。外部验证结果显示皮质期强化率诊断效能（AUC=0.867）优于皮质期 CT 值（AUC=0.735）、皮质期净增值（AUC=0.709），Z 值分别为 2.134（ $P=0.032$ ），2.417（ $P=0.016$ ）。CT 增强定量参数可用于预测 ccRCC WHO/ISUP 分级，皮质期强化率是诊断效能最高、泛化能力最佳的 CT 增强定量参数。

基于扩散加权成像预测宫颈癌淋巴结转移与 脉管间隙浸润影像组学分析

冯晴

成都市第一人民医院

摘要】目的 探索基于扩散加权成像的影像组学特征在预测宫颈癌淋巴结转移（LNM）与脉管间隙浸润（LVSI）的效能。方法 回顾性分析 2016 年 1 月至 2022 年 6 月间 103 例宫颈癌患者的临床资料、DWI 和 ADC 图像。利用影像组学构建 DWI 模型、ADC 模型和 ADC+DWI 联合模型。绘制受试者工作特征曲线（ROC），计算曲线下面积（AUC）、准确度、敏感度和特异度，分析评估模型对宫颈癌发生 LNM 和 LVSI 的预测效能，并采用 DeLong 检验比较不同模型 AUC 之间的差异。结果 三个模型在验证集中预测 LNM 的 AUC 分别为 0.762、0.860 和 0.896。DeLong 检验结果显示，DWI 模型的 AUC 低于 ADC 模型（ $Z=3.851$ ， $P=0.001$ ）和 ADC+DWI 联合模型（ $Z=4.338$ ， $P=0.001$ ），差异均具有统计学意义（ $P < 0.05$ ）。ADC 模型和 ADC+DWI 联合模型的 AUC 差异无统计学意义（ $Z=1.011$ ， $P=0.311$ ）。三个模型在验证集中预测 LVSI 的 AUC 分别为 0.826、0.845 和 0.878。DeLong 检验结果显示，DWI 模型的 AUC 低于 ADC 模型（ $Z=3.795$ ， $P=0.001$ ）和 ADC+DWI 联合模型（ $Z=3.700$ ， $P=0.001$ ），差异均具有统计学意义（ $P < 0.05$ ）。ADC 模型和 ADC+DWI 联合模型的 AUC 差异无统计学意义（ $Z=1.260$ ， $P=0.208$ ）。在训练集和验证集中，

ADC+DWI 联合模型的预测效能均优于单一的 DWI 模型和 ADC 模型。结论 基于 DWI+ADC 影像学联合模型能有效地预测宫颈癌 LNM 和 LVSI, 有助于临床的个体化评估, 优化治疗决策。

闭合性肾损伤的 CT 表现及 AAST 肾损伤分级在临床应用中的意义

冯晴
成都市第一人民医院

目的 探究闭合性肾损伤 CT 表现及 AAST 肾损伤分级在临床治疗中的价值。方法 回顾性分析在 2017 年 10 月至 2022 年 10 月我院收治的 80 例闭合性肾损伤患者的 CT 表现和临床资料, 并按 AAST 肾损伤进行分级。CT 表现主要包括肾损伤的部位、范围、程度, 肾周血肿及血管损伤、有无活动性出血、尿外漏, 是否合并其他脏器损伤; 并根据 AAST 分级标准进行肾损伤分级, I~III 级为低级别, IV~V 级为高级别。结果 闭合性肾损伤患者 I 级 34 例, II 级 10 例, III 级 16 例, IV 级 18 例, V 级 2 例。所有低级别 (100.0%) 和 8 例 (80.0%) 高级别肾损伤患者采用非手术治疗和介入治疗, 4 例 (20.0%) 高级别肾损伤患者采用手术治疗。最终 39 例 (97.6%) 患者病情好转出院。结论 闭合性肾损伤的 CT 表现及 ASST 分级具有较高的临床指导价值。

The Efficiency of Multiparameter MRI Radiomics Model in Predicting the Pathological Differentiation of Pancreatic Ductal Adenocarcinoma

Yanan Du¹, Yu Zhuang², Jinggang Zhang¹, Qi Liu¹, Bei Li¹, Wei Xing¹, Jie Chen¹

1. The First People's Hospital of Chang-Zhou City

2. Hulunbeier People's Hospital, Hulunbeier

Purpose: To establish a multiparameter magnetic resonance imaging (MRI) radiomics model and evaluate its efficiency in predicting the pathological differentiation of pancreatic ductal adenocarcinoma (PDAC).

Methods: The preoperative clinical and MRI data of 96 patients with a postoperative pathological diagnosis of PDAC between September 2018 and May 2022 in our unit were retrospectively analyzed. The patients were categorized into a low-differentiation group (50 patients) and an intermediate-high differentiation group (46 cases) according to the degree of pathological differentiation. Conventional MRI findings such as tumor site, boundary, maximum cross-sectional-length diameter, enhancement mode, cystic change/necrosis, pancreaticobiliary dilatation, pancreatic atrophy, vascular involvement, lymph node enlargement, and the signal difference between the normal pancreas and tumor parenchyma were analyzed. Randomly stratified sampling was used to divide the group into training and testing groups at a ratio of 7:3. ITK-SNAP and A.K. softwares were applied to two-dimensional segmentation, feature extraction, and screening of tumors in three sequences of fat-suppressed T1WI, fat-suppressed T2WI, and dynamically enhanced T1WI (DCE-T1WI arterial phase, parenchymal phase, and venous phase images), respectively. Logistic regression was used to construct a radiomics model and a combined model using clinical data and conventional MRI findings. The area under the curve (AUC) of the receiver operating characteristic (ROC) curve of the participants was used to evaluate the prediction efficiency of the model, which was verified in the test group.

Results: The difference in signal between the normal pancreas and tumor tissue in the parenchymal phase was statistically different between the low- and intermediate-high differentiated groups ($P < 0.05$), while other conventional MRI findings and clinical information were not statistically different between the two groups ($P > 0.05$). Fifteen radiomics features were screened based on each sequence to establish the radiomics model, including one feature in fat-suppressed T1WI, nine features in fat-suppressed T2WI, and five features in DCE-T1WI. The AUC values of the radiomics model and the combined model were 0.83, 0.96 and 0.82, 0.90 in the training and test groups, respectively. The accuracy, sensitivity, and specificity of the combined model were higher than those of the radiomics model.

Conclusion: The multiparametric MRI radiomics model was effective in predicting the degree of pathological differentiation of PDAC, and the combined model had better predictive efficacy.

肝内胆管癌的影像学及分子病理学进展

黄惠贞、陈峰

浙江大学医学院附属第一医院

肝内胆管癌是第二大原发性肝癌，发病率和死亡率呈上升趋势，手术切除为首选，但其早期症状隐匿常使患者错失手术时机，因此早期诊断尤为重要。肝内胆管癌依据生长模式可分为肿块形成型（最常见）、管周浸润型、管内生长型，根据肿瘤解剖结构起源分为两种亚型：大胆管型和小胆管型亚型，两者伴有免疫组化和分子变异的差异。基因组学、转录组学、蛋白组学、免疫组学结合影像特征等多组学的发展使得肝内胆管癌的亚型分类更多元化。肝内胆管癌的生物标志物的发掘也有所进展，除了血清学标志物，还有尿液标志物，有利于其早期诊断与预后预测。影像诊断中的 CT 和 MRI 是诊断肝内胆管癌的主力军，识别其经典和不典型的影像有助于提高对其的整体认识。肝内胆管癌的强化模式反映了组织学特点，与慢性肝病、肝硬化背景相关，并对预后有重要预测价值，且强化模式有助于从影像上鉴别大胆管型、小胆管型肝内胆管癌。CT 或 MRI 特征及影像组学对于肝内胆管癌的微血管侵犯情况和淋巴结转移的预测模型效能较高且稳定。利用影像对于全身性治疗、介入治疗、放疗和化疗等进行疗效预测，为不可手术的晚期患者提供另外有效的治疗选择。结合影像特征或影像组学亦能预测肝内胆管癌的预后。本文从肝内胆管癌的病理学、亚型分类、生物学标志物，再到影像诊断及微血管侵犯、淋巴结转移、疗效和预后的预测进行了较为详细的阐述。

Combined multi-organ radiomics and clinical model for predicting esophagogastric variceal bleeding in cirrhosis

Yujie Peng¹, Yong Du²

1. Department of Radiology, The Third Hospital of Mianyang, Sichuan Mental Health Center Mianyang, Sichuan, China.

2. Affiliated Hospital of North Sichuan Medical College, Nanchong, Sichuan, China.

Abstract

Rationale and Objectives: To develop a model based on clinical and radiomic characteristics to predict the risk of first-instance secondary esophagogastric variceal bleeding (EVB) in cirrhotic patients.

Materials and Methods: 208 patients with cirrhosis were retrospectively evaluated in this study, and they were randomly split into a training ($n = 145$) cohort and a validation ($n = 63$) cohort. Three areas were chosen as regions of interest (ROI): the whole liver, whole spleen, and lower esophagus-gastric fundus. In the training cohort, radiomic score (Rad-score) was created by

screening radiomic features using the least absolute shrinkage and selection operator method. Independent clinical risk factors selected using multivariate logistic regression analyses. The radiomics characteristics and independent clinical risk variables were combined to create the radiomics-clinical model (RC model). The established models were validated using the validation cohort.

Results: Ascites, portal vein thrombosis, and plasma prothrombin time were identified as independent clinical risk factors. The AUC values for the RC model, Rad-score (liver + spleen + esophagus), Rad-score (liver), Rad-score (spleen), Rad-score (esophagus), and clinical model in the training cohort were, respectively, 0.951, 0.930, 0.801, 0.831, 0.864, and 0.727. AUC values in the validation cohort were 0.930, 0.886, 0.763, 0.792, 0.857, and 0.692, respectively. The RC model yielded the best predictive performance and better discrimination, calibration, and clinical utility than the single Rad-score and clinical model. In addition, the RC model accurately predicted patient risk.

Conclusion: In patients with cirrhosis, the RC model can be used to non-invasively forecast the probability of the first secondary EVB.

ASL、APT 联合 PSA 在诊断前列腺良恶性病变中的价值

龙俊瑶

贵州医科大学附属肿瘤医院

摘要: 目的 探讨动脉自旋标记技术(ASL)、酰胺质子转移成像(APT)联合血清前列腺特异抗原(PSA)诊断前列腺良恶性病变方面的价值。方法 采用 3.0T 磁共振对符合纳入标准的前列腺癌患者 30 例及前列腺良性病变患者 36 例共 66 例患者行常规 MRI、ASL 及 APT 检查, 并获得其 PSA 数据。由两位经验丰富的放射科医师在常规上观察前列腺的形态、病变位置、信号及肿瘤侵犯范围; 然后在 ASL 图像上测量病灶的灌注改变以及在 APT 图像上测量病灶的非对称性磁化转移率(MTR_{asym})。结果 2 名放射诊断医生获得良好的一致性。在 T2WI 诊断标准上, 前列腺癌组患者平均评分为(4.51±1.32)分, 前列腺良性病变组患者平均评分为(2.86±0.79)分, 两者间差异有统计学意义(P<0.05)。ASL 检查前列腺癌组患者病灶的平均灌注值为(141.80±3.29)ml/(100g·min)、非肿瘤区的平均灌注值为(90.19±2.19)ml/(100g·min), 两者有显著性差异(P<0.05), 前列腺癌组病灶灌注明显增高; 前列腺良性病变组的平均灌注值为(105.79±1.74)ml/(100g·min), 与前列腺癌组患者病灶有统计学差异(P<0.05), 良性病变组的灌注较前列腺癌组病灶低。APT 检查前列腺癌组患者病灶 MTR_{asym} 值明显升高, 为(5.38±0.69), 良性病变患者病灶 MTR_{asym} 值为(3.59±0.47), 二者间比值有显著差异(P<0.05)。PSA 数据显示前列腺癌组的 PSA 范围是 9.7~1125.7ng/ml, 良性病变组的 PSA 范围为 1.3~99.2ng/ml。ASL、APT 联合 PSA 明显提高了鉴别诊断前列腺癌和前列腺良性病变的敏感性、特异性和准确性, 分别达到 94.8%, 86.3%, 89.5%。结论 ASL、APT 联合 PSA 明显提高了鉴别诊断前列腺癌和前列腺良性病变的准确率。

高血压患者肾脏表面结节形成的影响因素探究

吴琼

常州市第一人民医院

目的: 探讨高血压患者肾脏表面结节(Renal surface nodularity, RSN)形成的潜在影响因素。方法: 回顾性分析 2012 年 1 月至 2021 年 10 月期间苏州大学附属第三医院因高血压住院于心内科且接受肾动脉 CT 血管成像的患者。将双侧肾脏均有 RSN 的患者纳入 RSN 组, 再通过性别和年龄从剩余

的患者中进行 1:1 匹配得到对照组。收集临床资料、肾功能相关的实验室和影像学指标。组间比较采用 t 检验、卡方或 Fisher 检验; 多因素二元 logistic 回归分析 RSN 形成的潜在影响因素。结果: RSN 组和对对照组各纳入 43 例。RSN 组的估计肾小球滤过率较对照组明显减低($P<0.001$)。高血压分级、高脂血症和蛋白尿阳性比例分别与肾脏表面结节存在关联性($P<0.2$)。体质量指数、糖尿病、肾结石与肾脏表面结节无关联性($P>0.2$)。多因素回归分析发现: 仅高血压分级增高($P=0.042$)、高脂血症($P=0.008$)和估计肾小球滤过率减低($P=0.001$)与肾表面结节的发生存在关联性。结论: 肾脏表面结节的发生与高血压分级增高、高脂血症和肾小球滤过率减低有关。

CT 影像组学预测结肠癌淋巴血管间隙浸润价值研究

朱先锋、张虎、张晓金、董明松、许汉明、吴宣
芜湖市第二人民医院

目的 构建预测结肠癌淋巴血管间隙浸润 (LVSI) 的临床影像模型、影像组学模型 (radscore) 和两者联合模型, 并筛选出最优模型。方法 连续搜集我院接受增强 CT 检查的 365 例结肠癌患者资料, 根据手术病理结果分为 LVSI+ ($n=84$) 及 LVSI- ($n=281$), 样本按 7:3 随机分为训练集 ($n=256$) 和验证集 ($n=109$)。比较临床、影像指标组间差异并建立临床影像模型; 对静脉期 CT 图像上全肿瘤区域进行感兴趣区 (ROI) 勾画并提取影像组学特征, 经降维、筛选后共获得 16 个最优特征并建立 radscore; 再构建联合模型。比较各模型效能, 绘制最优模型列线图, 并评估其性能。结果 LVSI+ 及 LVSI- 组间淋巴结长径、CEA、CA199、肿瘤部位差异均有统计学意义 ($P<0.05$)。临床影像模型、radscore 及联合模型 AUC 分别为 0.726、0.784 及 0.851 (训练集); 0.729、0.768、0.833 (验证集)。联合模型 AUC 均大于临床影像模型 ($P<0.05$)。列线图校准度较高, 决策曲线范围: 0.15~0.98 时临床有获益。结论 基于临床影像指标及 CT 影像组学构建的列线图预测结肠癌患者 LVSI 的价值较高。

PU-0764

基于 CT 影像组学的机器学习预测直肠癌影像阴性淋巴结转移

刘雪成
皖南医学院第一附属医院

【摘要】目的: 探讨基于 CT 影像组学结合不同机器学习算法构建的预测模型在鉴别直肠癌淋巴结影像阴性患者淋巴结转移的价值。方法: 回顾性收集我院 360 例经病理证实为直肠癌且 CT 淋巴结阴性患者的全部资料, 按照 7:3 随机分训练组 ($n=251$) 及验证组 ($n=109$)。使用 MaZda 软件在瘤体的增强 CT 静脉期图像提取影像组学特征; 采用最小绝对收缩和选择算子 (LASSO) 算法对组学特征进行降维; 采用单因素及多因素 logistic 回归分析筛选独立影响因素; 构建支持向量机 (SVM)、K-邻近 (K-NN)、极限梯度提升 (XGBoost) 3 种机器学习算法预测模型; 使用受试者工作特征 (ROC) 曲线及决策曲线 (DCA) 分别评价 3 种机器学习模型的诊断效能及临床净收益。结果: LASSO 回归筛选出 5 个最优组学特征。单因素及多因素回归分析发现浆膜面毛糙、Perc.01、X_Area_S.5.5、Teta1、Teta2 为独立影响因素。SVM、K-NN、XGBoost 的 AUC 在训练组为 0.888、0.912、0.982, 验证组 AUC 为 0.909、0.884、0.894; 其中 SVM 在验证组表现最突出, DCA 显示 SVM 具有较高的临床适应性。结论: CT 影像组学结合不同机器学习算法对预测直肠癌淋巴结影像阴性患者淋巴结转移具有较高的应用价值。

Computerized quantitative analysis for prognostic prediction and molecular phenotyping of high-grade serous ovarian cancer

Beibei Li¹, Wanli Liu², Chen Li², Guohong Gao³, Zhaoyu Liu¹

1. Shengjing Hospital of China Medical University

2. College of Medicine and Biological Information Engineering, Northeastern University

3. School of Public Health, China Medical University

Purpose: To assess the power of a cross-modal integrative framework based on radiological and histopathological image features and clinical data for predicting overall survival in patients with high-grade serous ovarian cancer (HGSOC) and to identify potential molecular mechanisms underlying survival-associated traits.

Methods: The least absolute shrinkage and selection operator (LASSO) Cox regression was performed to establish radiological and histopathological models using computed tomography images and histopathological images, respectively. Subsequently, LASSO-Cox risk indices were generated. The concordance index and Kaplan-Meier analysis were used to estimate model performance. A nomogram combining radiological and histopathological risk indices and clinical data was developed. Further, weighted gene co-expression network analysis and functional enrichment analysis were performed for survival-associated traits.

Results: A total of 62 patients with HGSOC were included in this study. The concordance indices of the radiological and histopathological models in the verification set were 0.865 (95% confidence interval [CI]: 0.669-0.989) and 0.866 (95% CI: 0.691-0.981), respectively. For integrative model, the concordance indices of training set and the verification set were 0.925(95% CI: 0.869-0.980) and 0.874(95% CI: 0.684-0.986), respectively. The Kaplan-Meier curve showed a significant difference ($p < 0.05$) between high- and low-risk patients with HGSOC. A practicable integrative nomogram was built based on previous model parameters (radiological and histopathological risk indices) and clinical data. Male sex differentiation, neuroactive ligand-receptor interaction, negative gene expression regulation, epigenetic mechanisms, and systemic lupus erythematosus were identified as significant potential molecular mechanisms related to survival-associated traits.

Conclusions: The cross-modal integrative framework could reliably predict the prognosis of HGSOC. The potential underlying molecular mechanisms may provide new insights for future HGSOC research.

不同勃起状态对阴茎动脉 CT 血管图像质量的影响

耿纪刚、李笑石、高明、张学学、刘一苇、秦越
西安大兴医院

目的：探讨患者注射前列地尔后不同勃起状态对阴茎动脉 CT 图像质量的影响。

方法：选取在我院行活性药物海绵体多普勒超声检查考虑动脉性阴茎勃起功能障碍 (ED) 患者 40 例，随机分为两组，每组 20 人。实验组 CT 采集时间为注药后 30 分钟，海绵体硬度均为 I 级，对照组采集时间为注药后 20 分钟，海绵体硬度为 II 级，分别比较两组双侧阴茎背动脉及阴茎海绵体动脉各支的显影比例和未显影比例；结果以彩色多普勒超声为金标准进行检验，比较两种勃起状态在 CTA 诊断阴茎各动脉狭窄的诊断效能、一致性及是否存在狭窄诊断的受试者特征曲线 (ROC)。结果：对照组患者阴茎动脉 CTA 血管图像显影质量均显著低于实验组 ($P < 0.05$)，实验组 ($Kappa = 0.862$) 动脉狭窄诊断效能及与金标准的一致性高于对照组 ($Kappa = 0.699$)。在是否存在狭窄的诊断判断中，实验组曲线下面积 (AUC) 为 0.916，而对照组为 0.778。

结论：阴茎海绵体注射前列地尔后 30 分钟进行阴茎动脉 CT 血管成像图像质量更优，极大提高诊断效能，对动脉性 ED 的影像学诊断有重要的临床价值，值得在临床中推广使用。

磁共振多模态序列结合临床指标对复杂性肛瘘术后肛门排粪失禁复发预测研究

朱寅虎、李笑石、李馨、王磊、江泊源、秦越
西安大兴医院

目的：通过对磁共振指标与临床指标结合分析，建立复杂性肛瘘术后肛门排粪失禁复发预测模型，并对模型进行验证。

方法：回顾性分析 2020 年 1 月至 2023 年 5 月我院肛肠科收治的 71 例复杂性肛瘘患者资料。统计术后三个月肛门失禁症状并发症情况，结合患者多模态 MRI 数据指标及临床指标、手术方式等变量进行单 logistic 回归分析。

结果：71 例患者中，最终共纳入 71 人，其中男性 65 人，年龄 21 至 63 岁，平均年龄 39.23 ± 10.71 岁，经括约肌型 46 例，括约肌上型 25 例。logistic 回归分析结果显示，MRI 肛瘘分型、MRI 病变直径、肛门外括约肌 (External Anal Sphincter, EAS) 萎缩分级、EAS 厚度、年龄是复杂性肛瘘术后并发肛门失禁的独立危险因素 ($P < 0.05$)。依此进行筛选构建的预测模型并绘制受试者工作特征 (Receiver Operating Characteristic, ROC) 曲线，曲线下面积 (Area Under The Curve, AUC) 为 0.940 ($P < 0.001$)，模型预测质量评分 0.87 分，该模型有极高的预测效能。结论：MRI 多模态成像指标结合临床风险因素建立的预测模型准确度良好，可以在治疗前方案的制订提供良好的影像学证据与参考。

Application of spectral CT in diagnosis, classification and prognostic monitoring of gastrointestinal cancers: progress, limitations, and prospects

Yuqin Hong¹, Na Yu¹, Li Juan Zhong², Dai Quan Zhou¹, Lang Zhou Fu¹, Xue Lu¹, Qiao Liu¹

1. The Third Affiliated Hospital of Chongqing Medical University (Gener Hospital)
2. the People's Hospital of Leshan

Gastrointestinal (GI) cancer is the leading cause of cancer-related mortality worldwide. Computed tomography (CT) imaging is widely used for the diagnosis, staging, and prognostic evaluation of GI cancer. Spectral CT represents a significant advancement over traditional CT by providing not only conventional anatomical images but also spectral-related multi-parameter imaging such as spectral curves, mono-energetic images at different keV levels, material separation and quantitative analysis, effective atomic number images, and virtual non-contrast images. The integration of these multi-parameter imaging techniques offered by spectral CT can optimize the quality of GI cancer imaging, enhance the ability to differentiate between different types of cancers and reduce radiation exposure in patients. To explore the application of spectral CT in GI cancer including esophageal cancer, gastric cancer, colorectal cancer, liver cancer, and pancreatic cancer comprehensively; we systematically reviewed the relevant literatures focusing on research progress made so far and discussed the current limitations and future prospects. Our findings indicate that among these studies iodine-based material quantitative analysis and mono-energetic imaging were the most commonly employed applications of spectral CT in GI cancers. However due to variations in cavity structure among different types of gastrointestinal cancers as well as differences in multi-parameter data obtained from various manufacturers's spectral CT systems; there remains a need for more comprehensive investigations through prospective studies to further explore its potential benefits. The emergence of photon-counting CT technology, rapid advancements in artificial intelligence algorithms, the discovery of molecular imaging probes, and integration with multimodal imaging techniques provide promising prospects for the future application of spectral CT in investigating GI cancer.

PU-0770

高原久居者罹患急性阑尾炎的临床及 CT 影像特征分析

岳丽娜

中国人民解放军联勤保障部队第 940 医院

[摘要]目的：探讨高原久居者罹患急性阑尾炎的临床特点及 CT 影像表现。方法：回顾性分析我院野战医疗所 2022 年 2 月~2023 年 8 月经手术证实的 56 例急性阑尾炎患者的临床及影像学资料。结果：①56 例急性阑尾炎中，阑尾位置：盲肠后位 16 例（28.5%）、低位（盆位）10 例（17.8%）、盲肠下位 9 例（16%）、高位（肝下位）9 例（16%）、回肠后位 6 例（10.7%）、回肠前位 4 例（7.1%）、盲肠外侧位 2 例（3.5%）。②CT 直接表现：阑尾增粗（直径>6mm）49 例（87.5%）；阑尾管壁增厚（直径>2mm）42 例（75%）；阑尾管腔扩张、积液 29 例（51.7%），阑尾粪石 27 例（48.2%）；阑尾腔内积气 16 例（28.5%）；阑尾无法辨出 3 例（5.3%）。CT 间接表现：阑尾周围渗出并条索影 32 例（57.1%），阑尾蜂窝织炎合并周围脓肿 9 例（16%），腹膜炎、腹水 13 例（23.2%），回盲部肠壁增厚 22 例（39.2%），肠系膜淋巴结增大 16 例（28.5%），回盲部反射性小肠淤张 19 例（33.9%）。结论：多层螺旋 CT 对急性阑尾炎诊断有直观清晰、安全性高、分辨率高、操作简单等特点，能够提高为患者服务效率，可以避免患者辗转诊治，贻误病情，为临床医生诊断提供可靠依据，具有应用、推广价值。

PU-0771

肾上腺区异位副脾：病例报道及临床影像特征回顾

李烁、王效春
山西医科大学第一医院

目的：副脾是指在正常脾脏以外存在的与正常脾脏结构相似，功能相同的组织，是一种先天性异位脾组织，发生率 10%~35%，一般直径在 1.0~4.0 cm。副脾最常位于脾门或邻近胰尾处（约 80%），少许副脾可位于输尿管、卵巢、盆腔内，甚至发生在胸腔、胰腺及阴囊，而肾上腺区副脾较为少见。发生原因是由于背侧胃系膜内胚胎脾芽的某部分融合失败，或者部分脾组织脱离脾脏独立发育而生成，本文通过回顾性分析因左肾上腺肿物就诊的一例患者，对肾上腺区异位副脾这一疾病进行分析以加深认识。

方法：回顾性分析本院 2023 年诊断的一例左肾上腺区异位副脾患者的临床表现、影像学特点，讨论其病理机制，治疗及预后情况，并结合相关文献进行分析。

结果：患者，男，66 岁，10 天前体检行腹部彩超提示：左侧肾上腺肿物，后行腹部 CT 提示：左侧肾上腺肿物大小约 6.6cm×5.7cm，无腰痛，腹痛，发热，恶心，呕吐，未予治疗，实验室检查：血常规、血生化、凝血功能无异常，现患者求进一步治疗，就诊于我院，门诊以“肾上腺肿瘤”收住入院。影像 MRI 表现为：左侧肾上腺区可见类圆形等 T1 等长 T2 信号影，DWI 扫描示高信号，ADC 图示稍低信号，同反相位未见明显信号减低，增强扫描动脉期明显不均匀强化，静脉期及延迟期强化程度稍减低。

结论：通过询问患者病史得知，患者 30 年前做过脾脏切除术，术后通过回顾性分析发现肾上腺区副脾在形态上均呈现出现较为光滑的类圆形，同时在增强效应上，与脾脏增强曲线相同。副脾可以发生于人体的不同部位，在诊断时要注意与其他部位肿瘤鉴别。本例副脾发生在腹膜后左肾上腺区，并且具有高血压等典型临床表现，误诊为左侧肾上腺腺瘤。术前完善血尿生化、超声检查，MRI 检查，结合临床表现及患者病史，并熟悉可能出现的少见解剖部位，可以帮助诊断，减少误诊率。

PU-0772

多期融合成像在肾肿瘤保留肾单位手术中的应用价值

杨雅迪、耿纪刚、李笑石、郭江、李子洲、秦越
西安大兴医院

目的：探讨多期融合成像技术（Multiphase Fusion Imaging Technology, MFIT）在肾肿瘤保留肾单位手术中的临床应用价值。

方法：回顾性收集 2021 年月至 2023 年 5 月期间在我院行保留肾单位手术（Nephron Sparing Surgery, NSS）的患者 60 例。所有患者术前均进行三期相增强 CT 扫描，扫描参数一致，采用 120kV 管电压，自动毫安调节技术，调节范围 120-650mA，重建算法 AIDR 3D 技术，重建层厚 0.5 mm，层间距 0.3 mm。对比剂浓度 350mg I/ml 用量 1.2-1.5X 体重。扫描结束后将三期 1.0mm 薄层原始图像传送至后处理工作站（Vital, Canon Medical, Japan），使用 Aorta 和 Generic 探针技术进行肿瘤组织、肾动静脉、肾盂肾盏及周围实质脏器的分割与提取，观察周围组织及血管是否存在变异，并评价多期融合成像对肾肿瘤的大小、位置多方位显示效果及其与周围组织的关系。

结果：60 例患者中，行肾切除术 38 例、部分肾切除术 9 例、自体肾移植术 6 例，多期融合影像提示肾动脉变异 28 例，包括：副肾动脉 19 例，肾动脉过早分支 6 例，肾门前动脉分支 3 例；肾静脉变异 15 例，包括：主动脉后左肾静脉 8 例，其中受压引起睾丸静脉曲张 3 例，双肾静脉 4 例，右肾静脉汇合过晚 3 例，术前所测肿瘤最大直径平均为 (2.87 ± 1.54) cm，术后病例样本测量平均最大直径 (2.98 ± 1.38) cm，两者相比无统计学差异（ $P > 0.05$ ）所有患者保留肾单位手术均顺利完成。

结论: MFIT 技术可清晰显示肾动脉和肾静脉变异及狭窄程度, 直观显示肾肿瘤的大小、位置以及与周围组织血管的毗邻关系, 有助于腹腔镜下肾肿瘤保留肾单位手术的前期规划及入路选择。

PU-0773

光谱 CT 单能量联合 O-MAR 技术去椎体内金属物伪影

于庆
辽宁省肿瘤医院

目的: 评估光谱 CT 虚拟单能量图像 (virtual monoenergetic image, VMI) 联合去金属伪影算法 (orthopedic metal artifact reduction algorithm, O-MAR) 对于去除椎体内金属植入物伪影的价值。

方法: 纳入 32 例检查椎体内有金属植入物并行光谱 CT 检查的患者。重建传统滤波图像 (conventional image, CI)、O-MAR 图像、VMI 和 VMI+O-MAR (120~200 keV, 每隔 10 keV 为一组, 共 9 组)。在每组图像高密度、低密度伪影区和脂肪组织内勾画感兴趣区, 测量 CT 值、标准差 (standard deviation, SD), 计算信噪比 (signal to noise ratio, SNR) 和伪影指数 (artifact index, AI), 计算出 Δ CT 值、伪影指数 (artifact index, AI)、伪影移除率 (hardening artifact removal rate, BAR), 比较各参数在不同图像上的差异。

结果: 与传统图像相比, O-MAR、120~200 keV VMI 和 VMI+O-MAR 随能级的升高, AI 降低 ($P < 0.05$); 相同能级下, 两种伪影区内 VMI+O-MAR 的 AI 均低于 VMI ($P < 0.05$)。各能级 VMI 及 VMI + MAR 图像 BAR 随能量级增加而增加, 且 120 ~ 200 keV VMI + MAR 的 BAR 高于 120 ~ 200 keV VMI 图像, 而其中 170 keV 的 VMI+O-MAR 算法重建图像去除伪影效果最佳。

结论: 光谱 CT VMI+O-MAR 可有效减轻椎体内金属植入物伪影。

PU-0774

含脂性异位胰腺误诊 1 例影像报告及文献复习

段丽娟
云南大学附属医院

目的: 探讨含脂异位胰腺的影像诊断, 提高对该疾病的认识以减少误诊。

方法: 回顾性分析 1 例经病理证实的含脂异位胰腺的影像表现, 结合文献分析其组织病理分型与影像表现的关系。

结果: 病人因“腹痛伴解血便半月余, 发现胃体占位 1 周”入院, 完善上腹部 CT 平扫及增强后提示: 患者胃腔充盈良好, 胃窦大弯侧壁内见不规则混杂密度影, 形态欠规整, 呈分叶状, 突向腔内生长, 大小约 2.3×2.7cm, 实性成分平扫 CT 值约 47HU, 增强扫描实性成分明显强化, 动脉期 CT 值约 92HU, 门脉期 CT 值约 138HU, 延迟期 CT 值约 112HU, 其内见无强化脂肪密度灶, 病灶表面可见一溃疡形成, 邻近浆膜面完整。影像诊断为: 胃窦体大弯侧胃壁间不规则混杂密度占位, 倾向良性病变 (胚胎来源? 血管源性?): 1) 畸胎瘤; 2) 血管平滑肌脂肪瘤; 3) 其它; 请结合临床及内镜检查。丙泊酚静脉注射后气管插管无痛状态下行内镜下粘膜下剥离术 ESD+电凝止血术+胃管置入术, 术后病理提示胃体黏膜下层见胰导、胰腺小叶及小叶间导管, 切片周缘见成熟脂肪细胞, 肿物考虑为异位胰腺。

结论: 异位胰腺是一种少见的先天畸形疾病, 是发生于正常胰腺之外的孤立胰腺组织。虽然异位胰腺与正常胰腺组织无任何解剖学联系, 但发生于胰腺的每一种病理变化, 都可发生于对应的异位胰腺。由于肥胖、衰老、糖尿病、慢性胰腺炎、酒精性肝病以及肿瘤等原因可能导致胰腺腺泡实质部分或几乎完全被脂肪细胞代替, 故而, 目前虽然没有明确报道表明异位胰腺中有明显的脂肪浸润或大量脂肪替代, 但在胰腺中观察到的病理结果也可发生在对应的异位胰腺中, 故而理论上, 异位胰

腺实质内可含有一定比例的脂肪。因此,影像诊断医师应提高对这一影像表现的认识,以减少该疾病的误诊。

PU-0775

膀胱直肠陷窝钙化性纤维性肿瘤一例报告并文献复习

李倩

中国人民解放军陆军第九五八医院

目的 本院一例钙化性纤维性肿瘤 (Calcifying Fibrous Tumor, CFT) 病例报道及影像表现学习。
方法 回顾性分析一例经组织病理学确诊的 CFT 基本资料及影像表现;患者为 75 岁男性,有美尼尔氏综合征。结果 患者于入院 20 余天前行走时晕倒在地,后出现反复腹部胀痛、以下腹部为主,肛门有间断解稀便及排气,阵性感畏寒、恶心,2 天来感腹痛加重,并肛门停止排气,不能忍受来院。D-二聚体升高,单核细胞计数及百分比、中性粒细胞计数百分比升高,糖类抗原 19-9 升高。全腹部 CT 增强示:小肠积气积液扩张,考虑肠梗阻;膀胱直肠陷窝偏右侧见一类圆形孤立团块影,长径约 4.2cm,形态规则,边缘光滑,其内密度不均匀、中央见结节状更高密度影,CT 值约 203HU-1604HU,病灶与周围肠管分界不清;增强扫描未见明显强化。下腹部 MRI 增强示:膀胱直肠陷窝右侧见一团块状等 T1 短 T2 信号影,见包膜,中央见结节状更低信号,弥散不受限,周围肠管呈受压改变;增强扫描边缘见环形强化,余成分未见明显强化。术后病理考虑钙化性纤维性肿瘤。结论 CFTs 是一种良性病变,但有时也会出现急性的临床表现,如本病例出现肠梗阻。CFTs 的影像表现有一定特征,当我们在临床看到较为典型的影像表现时,再结合患者年龄、性别要考虑到该诊断,将有助于防止外科医生过度手术,减少患者不必要的创伤。

关于双能量 CT 对胰腺癌影像诊断的研究

余毅

中国人民解放军陆军特色医学中心

目的:探讨双能量 CT 对胰腺癌影像诊断的价值。
方法:回顾性分析我院收治并确诊的胰腺癌患者,收集患者所进行的 CT 双能扫描四期图像,经后处理得到单能谱 60keV 图像,单能谱 80keV 图像,单能谱 100keV 图像,单能谱 120keV 图像,线性融合图像,非线性融合图像及碘图图像。测量并计算上述图像胰腺肿瘤 CT 差值,胰腺实质强化比值,及胰腺实质与肿瘤对比噪声值,从而得到上述后处理图像对胰腺癌的诊断价值。
结论:双源 CT 在双能模式扫描下经过后处理的图像能够进一步提高对胰腺癌诊断的敏感性。

PU-0777

2 型糖尿病患者肾周脂肪 CT 特征预测糖尿病肾病风险分层和快速进展的价值

范金蕾、左立平、李芳轩、安悦铭、王博文、于德新
山东大学齐鲁医院

目的:探讨 2 型糖尿病 (T2DM) 患者肾周脂肪 (PAT) CT 特征在预测糖尿病肾病 (DKD) 风险分层和快速进展中的价值,并与其他腹部脂肪库比较。

方法：回顾性纳入 2018 年 9 月至 2021 年 12 月就诊的 T2DM 患者，根据肾脏疾病：改善全球预后（KDIGO）2020 临床实践指南分为低、中、高风险及极高风险人群。采用 Slice-O-Matic 5.0 软件测量肾周脂肪（PAT）、内脏脂肪、皮下脂肪、肌间脂肪的面积和 CT 衰减值。采用 logistic 回归分析评估高、极高风险 DKD 的危险因素，采用 COX 回归筛选 DKD 快速进展的预测因子，采用 Kaplan-Meier 生存分析评估 DKD 快速进展的累积发生率。

结果：404 名 T2DM 患者（平均年龄 60.51 ± 11.12 岁，男 240 例）纳入研究并分为低风险（ $n=165$ ）、中风险（ $n=96$ ）、高风险（ $n=47$ ）、极高风险（ $n=96$ ）组。logistic 回归分析显示 PAT 面积指数（ $P<0.001$ ）、PAT CT 衰减值（ $P=0.023$ ）、收缩压（ $P<0.001$ ）、糖尿病病程（ $P=0.014$ ）、血红蛋白（ $P<0.001$ ）是高及极高风险分层 DKD 的危险因素。125 名有肾功能随访数据的 T2DM 患者（平均年龄 62.72 ± 9.92 岁，男 72 例）分为 DKD 快速进展（ $n=56$ ）和非快速进展组（ $n=69$ ）。多因素 COX 回归分析显示 PAT CT 衰减值（HR 1.09; 95%CI 1.01,1.17; $P=0.021$ ）及血红蛋白（HR 0.98; 95%CI 0.97,1.00; $P=0.031$ ）是 DKD 快速进展的独立预测因子。Kaplan-Meier 曲线显示，PAT CT 衰减值较高的患者 DKD 快速进展累积发生率更高（ $P=0.027$ ）。

结论：PAT CT 衰减值和 PAT 面积指数较高的 T2DM 患者患高风险分层 DKD 的风险增加，基线 PAT CT 衰减值可能作为 DKD 预后的潜在影像标记。

回顾性学习发生在腹腔内罕见滑膜肉瘤影像 CT 表现

张顺、段庆红

贵州医科大学附属肿瘤医院

讨论分析发生在腹膜后罕见滑膜肉瘤在 CT 影像的表现。回顾性分析再学习一例经手术病理证实的腹腔内滑膜肉瘤患者的影像学 CT 资料及相关临床资料，女性患者 29 岁 检查为术前腹部多期 CT 增强检查

PU-0779

能谱分析输尿管结石致肾绞痛急性发作患者合并脂肪肝 CT 特征性分析

廖小君

重庆医科大学附属第三医院

背景与目的 脂脂肪肝是我国第二常见的慢性肝脏疾病，与长期饮酒、血脂异常等有关，按病因分为酒精性脂肪肝（Alcoholic fatty liver disease,AFLD）与非酒精性脂肪肝（nonalcoholic fatty liver disease,NFLD）。随着我国人民生活水平的提高和饮食结构的变化，NFLD 的发病率在逐年提高。NFLD 可以伴随许多其它疾病,例如血糖紊乱、血脂紊乱、高血压、动脉粥样硬化、高尿酸等疾病。本文旨在探讨 CT 能谱分析输尿管结石成分致肾绞痛急性发作患者合并脂肪肝 CT 诊断及预后中的应用价值。方法 回顾性分析 500 例输尿管结石致肾绞痛急性发作患者，能谱分析输尿管结石成分、与脂肪肝 CT 特征性分析。输尿管结石成分、发生部位及尿路梗阻征象与肝/脾 CT 比值之间的相关性,并比较患者治疗前后血清甘油三酯水平的变化。结果 457 例输尿管结石致肾绞痛急性发作患者，同时伴有不同程度脂肪肝,结石成分与梗阻程度关系，其中结石成分为草酸钙比例最高，与梗阻程度、炎性改变程度最重，输尿管腹盆段结石所致尿路梗阻程度越重，肾周及输尿管周围渗出越重，脂肪肝越严重,经输尿管结石碎石术及取石术后，尿路梗阻减轻、消失，多数肾绞痛病情减轻，脂肪肝出现好转,主要表现为肾绞痛消失，肾周、输尿管周围渗出减轻，肝脏密度较治疗前回升,治疗前后比较差异有统计学意义（ $P<0.05$ ），治疗前后甘油三酯水平比较差异有统计学意义

($P<0.05$)。结论 CT 检查既可以明确输尿管结石致肾绞痛急性发作患者病变范围,能谱分析结石成分,与结石成分与梗阻程度关系,还可以对是否合并脂肪肝及脂肪肝的严重程度做出明确判断,治疗后复查 CT,输尿管结石碎石术及取石术后,尿路梗阻减轻、消失,脂肪肝出现逆转,提示 CT 对输尿管结石合并脂肪肝的诊断、治疗及预后均有重要的意义。

Progress of CT quantitative muscle characterization in staging and prognosis of colorectal cancer

Yueming An,dexin yu,jinlei fan,liping zuo,xuwen zhang,ping wei,xinjuan jin,yinghui chen
Qilu Hospital of Shandong University

Colorectal carcinoma (CRC) is one of the most common cancers of the gastrointestinal tract and is the second leading cause of cancer-related deaths worldwide. Recent studies suggest that muscle characteristics (e.g., sarcopenia and myosteatosis) in patients with CRC are associated with poor tumor staging, poor prognosis, and decreased survival. Computed tomography (CT) scans provide accurate, high-quality information about muscle composition and are ideal for assessing quantitative muscle characteristics such as skeletal muscle index (SMI), psoas muscle index (PMI), skeletal muscle radiodensity (SMD), and intermuscular adipose tissue (IMAT). Currently, the assessment of muscle characteristics in patients with CRC is influenced by a variety of factors. Evaluation methods show significant variability in different studies, and diagnostic criteria have not been standardized. Existing studies have generally confirmed that CRC patients with muscle characteristics such as low SMI, low PMI, low SMD and high IMAT have a high risk of chemotherapy, more postoperative complications and poor long-term prognosis. There are fewer studies on SMD and IMAT and chemotherapy risk, and their specific mechanisms need to be further explored. Therefore, in the future, we should pay more attention to the assessment of muscle characteristics of CRC patients, thoroughly study the mechanism of their occurrence and unify the diagnostic criteria, identify them at an early stage and formulate personalized treatment plans according to the muscle characteristics of the patients, with a view to reducing the toxicity of chemotherapy and the incidence of postoperative complications, and improving the long-term prognosis of the patients.

PU-0781

能谱 ct 单能量成像技术在肝硬化 TIPS 术后门静脉成像的应用分析

侯航
重庆医科大学附属永川医院

目的: 探讨能谱 ct 单能量成像技术在肝硬化门静脉高压 TIPS 术后门静脉成像的应用价值。方法: 选取重庆医科大学附属永川医院 2023 年 3 月至 2023 年 7 月收治的肝硬化患者 60 例,所有患者入院后均接受 TIPS 治疗,并在治疗后 1 个月使用联影天河 320CT 进行门静脉成像能谱扫描。检查结束后,采用门静脉期的能谱 CT 数据在后处理工作站重建出 40~100 keV (间隔 10 keV) 的单能级图像。在门静脉期虚拟单能谱图像上,获得各个支架腔内的伪影指数、噪声及对比噪声比(CNR)。结果: 60keV 单能谱图像具有最低噪声及最高 CNR,支架腔内伪影指数最低 ($p\leq 0.05$)。结论: 基于能谱 CT 重建的单能级图像能有效减少 TIPS 术后支架腔内伪影,并提升图像质量,其中 60keV 单能级图像为最佳的单能级图像。

PU-0782

巨大胃底海绵状血管瘤合并肝脏多发血管瘤的 CT 和 MRI 影像表现 1 例

杨倩、刘春华
陆军军医大学大坪医院

胃血管瘤是一种罕见的胃良性肿瘤,本文报道一例合并肝脏多发血管瘤的 CT 和 MRI 影像学表现。患者男,26 岁,无明显诱因反复发作性头昏乏力,既往诊断为缺铁性贫血 6 年。胃镜显示:胃底穹窿处可见巨大隆起性病变,颜色发蓝,CT 显示胃底隆起性软组织密度肿块影伴点状钙化,增强扫描呈弱强化;肝脏实质密度不均匀。MRI 显示胃底病灶呈长 T1 长 T2 信号,弥散不受限,增强扫描渐进性向心性强化;肝脏多发长 T1 长 T2 信号,增强扫描呈渐进性强化并灯泡征显示。术后病理证实为胃底海绵状血管瘤。术后半年随访患者反复贫血症状消失,无任何不适。

PU-0783

能谱 CT 不同迭代重组在肝脏脂肪定量及体积测量的应用分析

张敏、于楠、贾永军、申利
陕西中医药大学附属医院

目的:评估不同迭代重建(ASIR-V)在混合能量能谱 CT 图像中对肝脏脂肪定量及肝脏体积检测效能的差异。方法:收集我院行上腹部采用前置 ASIR-V 30%混合能量能谱 CT 平扫肝脏完整患者 60 例。分别行 FBP、ASIR-V 30%、ASIR-60%、ASIR-90%图像重建,采用 liverfat 后处理软件行肝脏脂肪定量及肝脏体积测量(自动提取)见图 1,对比分析不同迭代重组四组测量值的差异。结果:四组重建方法在肝脏体积测量值中差异变化不明显,以 FBP 和 ASIR-V 60%重建图像数据为著,肝脏脂肪定量值分别两两组比较,各组间值均存在统计学差异($P<0.05$),见表 1。结论:混合能量能谱 CT 扫描在不同迭代重组图像中对肝脏体积测量的影响不大,但对于肝脏脂肪定量值不同重建方法存在差异。

PU-0784

基于钆塞酸二钠增强 MRI 预测肝细胞癌 微血管侵犯及术后早期复发

张继云、张涛、张学琴
南通市第三人民医院

【摘要】

目的:本研究主要基于钆塞酸二钠增强 MRI 预测肝细胞癌微血管侵犯及 HCC 术后早期复发。方法:本研究回顾性收集 158 例本院行肝切除手术的 HCC 患者,所有患者术前 2 周内行钆塞酸二钠增强 MRI 检查,术前临床资料及术后病理资料完整,应用 Logistics 回归分析确认 MVI 的危险因素;对所有病灶进行定期随访,患者两年内发生复发或转移定义为早期复发,应用 Cox 回归分析确认 EHR 的危险因素。应用受试者工作曲线(ROC)计算预测 MVI 及 EHR 的曲线下面积(AUC)。结果:纳入患者男性 83 例,女性 75 例,平均年龄 59 岁(35-83 岁),其中 MVI 阳性 HCC 共 55 例, MVI 阴性 HCC 共 103 例,多因素 Logistics 回归分析得出肿瘤 T2WI 信号不均匀(OR: 5.205,

95%CI: 2.346-11.549) 及肝胆期瘤周低信号 (OR:2.900, 95%CI:1.278-6.577) 是预测 MVI 阳性的危险因素, 预测 MVI 的 AUC 为 0.738 (95%CI: 0.662 -0.805), 敏感性 74.55%, 特异性 63.73%。所有患者定期随访发现早期复发组共 67 例 (42.41%), 其中 MVI 阳性组中早期复发共 40 例 (72.73%), MVI 阴性组中早期复发共 27 例 (26.21%); 多因素 Cox 回归分析得出 MVI 阳性 (OR: 3.070)、肿瘤 T2WI 信号不均匀 (OR: 2.451) 以及异常凝血酶原 (OR: 1.000) 是预测 EHR 的危险因素。预测 EHR 的 AUC 为 0.76 (95%CI: 0.686-0.825), 敏感性 59.09%, 特异性 85.71%。

结论: 基于钆塞酸二钠增强 MRI 能够预测 HCC MVI 阳性, 肿瘤 T2WI 信号不均匀及肝胆期瘤周低信号预测 MVI 阳性的危险因素; MVI 联合临床及影像特征能够预测 HCC 术后早期复发, MVI 阳性、肿瘤 T2WI 信号不均匀以及高异常凝血酶原是预测 EHR 的危险因素。

PU-0785

宫颈基底细胞样鳞癌影像学特征分析

牛微
西安大兴医院

目的: 分析早期宫颈基底细胞样鳞癌的 CT、MRI 影像学特点。

方法: 选取 2019 年 8 月至 2023 年 6 月我院收治的 10 例经病理诊断证实的宫颈基底细胞样鳞癌的病人作为研究对象, 术前接受 CT 或 MRI 检查, FIGO 分期为 IA~II B 期; 同时随机收集此期间我院行 CT、MRI 检查的 FIGO 分期为 IA~II B 期之间的宫颈鳞癌、腺癌各 10 例。7 例 BSC 行 CT 检查 (1 例增强), 4 例 BSC 行磁共振成像 (Magnetic Resonance Imaging, MRI) 检查 (1 例增强), 其中 1 例同时行两项检查; CT 观察宫颈大小、CT 值、增强后 CT 值、强化方式及淋巴结肿大情况; MRI 观察肿块位置、大小、信号强度、强化方式、边界受累情况及淋巴结肿大情况。根据图像分析宫颈癌的影像特点。

结果: 宫颈基底细胞样鳞癌的临床特征为多发于绝经后, 多数伴有淋巴结转移; 宫颈基底细胞样鳞癌与普通型宫颈癌在 CT、MRI 表现上相比: 宫颈面积最小, 病灶体积最小, 信号相似; 伴有肿大的淋巴结及周围组织受累。

结论: 临床特征与 CT、MRI 尤其是 MR 功能成像的结合对宫颈基底细胞样鳞癌的筛查有重要意义。

PU-0786

肝内门静脉肝静脉瘘 1 例

陆丹羽、吴任国
中山市人民医院

患者男性, 54 岁, 因“体检发现肝占位性病变”就诊, 平素无明显不适, 查体无特殊。上腹部能谱增强 CT 示: 肝右前叶下段见团状异常强化灶, 范围约 40mm×33mm×30mm, 动脉期呈等密度, 门脉期呈明显均匀强化, 可见由肝右叶门静脉粗大分支供血, 经肝右静脉流入下腔静脉, 延迟期呈稍高密度, 各期密度均与门静脉相似。诊断为肝内门静脉肝静脉瘘 (intrahepatic portosystemic venous shunt, IPSVS)。

IPSVS 的发病机制尚不明确, 多见于先天性, 发病率极低, 国内外文献报道以个例居多, 部分与肝脏血管畸形并存。瘘管的分流量决定了其病理生理特点。70%~80% 的肝脏血供来源于门静脉, 大量分流导致来源于肠道的营养物质未能经肝脏合成、代谢、转化, 引起营养不良, 肝脏解毒功能下降, 甚至出现低血糖、高氨血症。20%~40% 的肝脏氧供来源于门静脉, 门静脉体静脉分流可导致肝脏慢性缺氧。分流量超过门静脉血流的 60% 时患者即为肝性脑病高危人群。

根据 Park et al 报道的方法,按解剖形态不同可将 IPSVS 分为 4 种类型:

I 型:单支粗大直径不变的管道连接右侧门静脉或下腔静脉。

II 型:在 1 个肝段内门静脉分支或肝静脉间见一条或多条管道连接。

III 型:囊状扩张分流道连接肝内门静脉分支或肝静脉

IV 型:两个肝叶内门静脉分支或肝静脉间见广泛的连接管道。

本例患者符合 IPSVS III 型。CT 静脉造影通常因静脉内难以达到较高的碘对比剂浓度,且因周围本底组织不同程度的强化,很难获得理想的重建图像。能谱 CT 可明显提高血管内碘对比剂与周围组织的对比度,从而更加清晰、直观地显示整个病变范围,获得满意的重建图像。

PU-0787

巨大膀胱结石合并膀胱肉瘤 1 例报告

张婕、卓丽华、李宏伟、姚洪超、杨俊强、吴少强
绵阳市第三人民医院

患者男,23 岁,因“反复排尿不畅 10+年,加重 1+年”入院。查体未见异常。超敏 C 反应蛋白 26.22mg/L,血常规提示白细胞 13.18×10⁹/L,尿常规提示白细胞 2006.4 个/ul。泌尿系超声检查提示膀胱结石。泌尿系 CT:膀胱腔内见巨大团块状高密度影,大小约 5.7cm×8.8cm×7.0cm,膀胱腔内见少许积气,膀胱两后侧壁见囊袋状突起;膀胱三角区壁增厚,较厚处约为 0.7cm,增强呈延迟强化。CT 诊断考虑:膀胱巨大结石并膀胱壁憩室。入院 5 天后行“经尿道膀胱碎石取石术+活检术”,病理结果提示:梭形细胞肿瘤。术后病理:梭形细胞肿瘤,免疫组化(1 号蜡块)示:PCK(-),Vimentin(+),P63(-),P40(-),CK20(-),S100(-),ALK-1(-),SMA(-),Caldesmon 灶弱(+),Desmin(-),CD34(-),TLE-1 少数(+),CD68 灶(+),Myogenin(-),P53(+,野生型,60%),Ki67(+,60%),结合免疫组化,考虑肉瘤可能性大。

膀胱憩室为膀胱肉瘤的危险因素之一,可继发尿液潴留、感染、结石等,最终导致肿瘤发生;本例患者并发有膀胱憩室,同时膀胱腔内有巨大结石。膀胱肉瘤外观呈息肉状,广基,表面常有溃疡、出血,肿瘤多位于膀胱侧壁,几乎未出现于膀胱憩室内,目前治疗以手术切除为主。

膀胱肉瘤影像学表现具有一定的特征性,其平均直径多>5cm,呈分叶状、菜花状,易见坏死、囊变,增强后实性成分明显强化,以延迟强化方式多见,常伴有淋巴结及远处转移。本例患者仅仅表现为膀胱壁局限性增厚,无坏死、囊变等影像特征,思考认为与患者具有巨大膀胱结石压迫膀胱壁所致,从而使得肿瘤向外生长受限,而仅仅表现为膀胱壁的局限性增厚,尽管患者病变部位呈轻度延迟强化,但受结石高 CT 值的干扰仍然容易漏诊。

PU-0788

能谱 CT 多参数容积定量技术在评估肝纤维化分期中的应用价值

李富恺^{1,2,3,4}、张宏瑜^{1,2,3,4}、徐媛^{1,2,3,4}、郭钰^{1,2,3,4}、刘建莉^{1,2,3,4}
1. 兰州大学第二医院放射科
2. 兰州大学第二临床医学院
3. 甘肃省医学影像重点实验室
4. 医学影像人工智能甘肃省国际科技合作基地

目的 探讨能谱 CT 多参数容积定量技术评估肝纤维化分期的应用价值。

方法 回顾性分析在我院经病理证实的 164 例肝纤维化患者的临床和血清学资料,根据肝穿刺活检结果将患者进行以下分组:无肝纤维化组 (F0, n=24) 和肝纤维化组 (\geq F1, n=140); 非显著肝纤维化组 ($<$ F2, n=49) 和显著肝纤维化组 (\geq F2, n=115); 非进展期肝纤维化组 ($<$ F3, n=78) 和进展期肝纤维化组 (\geq F3, n=86); 非肝硬化组 ($<$ F4, n=94) 和肝硬化组 (F4, n=70), 所有患者均行门静脉能谱 CT 功能成像, 并采用容积定量技术测量肝脏的体积 (V)、碘浓度 (IC) 等, 同时计算全肝的标准化碘浓度 (NIC)、细胞外体积分数 (ECV) 和肝脏的碘含量 ($I_{\text{含量}}$)。采用 t 检验或 U 检验进行组间比较, 对有统计学意义的参数运用 ROC 曲线分析其在肝纤维化分期中的诊断性能。

结果 不同分期肝纤维化患者的血清学指标 (APRI、FIB-4) 和能谱 CT 容积定量参数 (NIC、ECV、 $I_{\text{含量}}$) 组间差异均具有统计学意义 ($P<0.001$); APRI、FIB-4、NIC、ECV 和 $I_{\text{含量}}$ 诊断肝纤维化 AUC 分别为 0.729~0.828, 敏感度为 62.50%~79.17%, 特异度为 68.57%~90.00%; 诊断显著肝纤维化 AUC 分别为 0.790~0.848, 敏感度为 59.18%~81.63%, 特异度为 77.39%~86.09%; 诊断进展期肝纤维化 AUC 分别为 0.764~0.927, 敏感度为 70.51%~83.33%, 特异度为 61.63%~94.19%; 诊断肝硬化 AUC 分别为 0.750~0.900, 敏感度为 69.15%~77.66%, 特异度为 64.29%~94.29%。血清学指标 (APRI、FIB-4) 分别和能谱 CT 容积定量参数 (NIC、ECV、 $I_{\text{含量}}$) 相比, AUC 的差异均有统计学意义 ($P<0.05$, Delong 检验)。

结论 与传统血清学指标 APRI、FIB-4 相比, 能谱 CT 多参数容积定量技术对不同分期的肝纤维化具有更好的诊断价值, 其中 $I_{\text{含量}}$ 的诊断性能最好。

PU-0789

胃壁异位支气管源性囊肿和肠源性囊肿一例

张萌、吕晓波
临汾市中心医院

【摘要】 本文报道胃壁异位支气管源性囊肿和肠源性囊肿 1 例。患者男, 23 岁, 因无明显诱因出现腹部不适 1 年入院, CT 表现为左侧肾上腺区与胃间可见类圆形低密度影, 与胃及肾上腺分界不清。胃大弯侧另见类圆形低密度影, 增强扫描病灶囊壁轻度强化, 囊内容物未见明显强化。最终病理诊断为大者为粘膜下支气管源性囊肿, 小者为黏膜固有肌肉肠源性囊肿。

基于 XGBoost 的 SHAP 可解释预测模型探索胰腺导管腺癌化疗相关性肝损伤风险因素的研究

袁钟毓
锦州医科大学
浙江省人民医院

目的: 基于多相 MRI 序列及肝功能指标开发并验证一种 SHAP 可解释的机器学习模型, 用来预测胰腺导管腺癌 (PDAC) 人群的化疗相关性肝损伤 (CALI) 的发生并筛查相关风险因素。

方法: 回顾性收集 307 例 PDAC 患者的临床资料, 其中包括 133 例 CALI 患者和 174 例非 CALI 患者。提取并筛选增强 MRI 多序列影像组学特征。采用多因素逻辑回归确定与 CALI 相关的独立预测因素, 构建临床和影像组学模型。利用 XGBoost 算法构建联合预测模型, 通过十折交叉验证和网格搜索法获得模型的最佳参数。最后应用 SHAP 方法增强模型的可解释性, 筛查与 PDAC 患者发生 CALI 相关的风险因素并进行可视化。所有模型的性能通过工作特征曲线下面积 (AUC) 和决策曲线分析 (DCA) 进行综合评价。应用 Delong 检验比较模型之间的差异性。

结果: 临床和影像组学模型都展示出了较为理想的一致性。其中, XGBoost 模型具有最优越的预测性能 (训练集 AUC=0.96, 90%CI: 0.93–0.98, 测试集 AUC=0.93, 90%CI: 0.87–0.98)。决策曲线分析说明了 XGBoost 模型在不同阈值概率下的显著的净收益, 其表现优于其他模型。SHAP 分析直观地揭示了与 PDAC 患者发生 CALI 的相关因素, 其中, 总胆红素 (TBIL) 和影像组学分数 (Radscore) 是最为关键的影响因素。

结论: 通过机器学习算法整合影像及临床数据, 本研究成功地开发了一个稳健的预测模型, 得到了良好的预测效果及与疾病发生相关的重要影响因素。该模型可作为一种有效的临床预测、筛查工具, 用于早期发现和诊断 PDAC 背景下的化疗相关性肝损伤, 有助于改善患者个体化治疗策略和临床决策的制定。

PU-0791

髓质海绵肾——双能 CT 的病例系列和见解

陈乐庆、张利捷、史河水
华中科技大学同济医学院附属协和医院

目的: 本研究旨在通过分析两例病例, 评估双能 CT (Dual-energy CT, DECT) 在髓质海绵肾 (Medullary Sponge Kidney, MSK) 诊断中的价值, 并探讨其在病变可视化和与其他肾脏疾病的区分能力方面的作用。

方法: 两名疑似患有 MSK 的女性患者接受了 DECT 成像, 使用飞利浦医疗 (Philips Healthcare) 的 IQon Spectral CT 进行图像采集。获取了 MonoE 40keV 图像和碘密度图像, 并进行后处理分析, 包括最大强度投影 (Maximum Intensity Projection, MIP) 图像和衰减曲线分析, 以帮助定位病变并与其他肾脏疾病进行区分。对临床特征和影像学结果进行分析, 确定 MSK 的诊断。

结果: 患者 1 的常规 CT 图像显示肾皮质变薄, 双肾出现多个无增强的低密度病变。DECT MonoE 40keV 图像清晰显示肾锥体内有多个点状结石, MIP 图像显示肾锥体内的囊性扩张特征。此外, 衰减曲线分析显示双侧肾脏异常表现具有一致性, 能够将其与积水进行区分。患者 2 表现为左肾囊肿和左肾髓质多个结节性高密度病变。MonoE 40keV 图像显示左肾髓质的增强程度降低。此外, 左肾观察到多个无强化低密度病变。DECT 的应用, 尤其是 MonoE 40keV 图像和 MIP 重建, 使病变定位更加准确, 清晰显示了 MSK 的特征。这些结果与临床表现和放射学征象相一致。

结论: DECT 在 MSK 的诊断和与其他肾脏疾病的区分方面提供了有价值的信息。通过利用 MonoE 40keV 图像和 MIP 重建, DECT 能够清晰地显示和定位病变, 有助于准确诊断。另外, 同质性分析有助于区分 MSK 和其他肾脏疾病。尽管 DECT 存在成本高和应用范围受限等局限性, 但在提高 MSK 诊断和指导治疗决策方面显示出潜力。进一步的研究将有助于改进 DECT 在 MSK 诊断中的准确性和可行性。

PU-0792

Lymphoepithelioma-like cholangiocarcinoma Mimicking Hepatocellular Carcinoma

Chuanlin Yu, yaqiong He
湖南省人民医院 (湖南师范大学附属第一医院)

A 50-year-old woman presented with a hepatic nodule incidentally found by abdominal ultrasonography. Her medical history showed recurrent tonsillitis at an early age. Laboratory investigations including virological tests and tumor markers were all within normal range. Contrast-enhanced Magnetic Resonance Imaging (MRI) revealed a 1.6cm × 1.8cm hepatic nodule in segment IV, with a homogeneous wash-in during the arterial phase followed by a wash-

out in portal-venous phase, and hypointensity in hepatospecific phase (Fig. 1). The patient underwent laparoscopic resection. Pathology revealed nests and cords of neoplastic cells with rare areas of apparent gland formation and mixed inflammatory. In situ hybridization using an EBV-encoded RNAs (EBER) revealed extensive reactivity in tumor cell nuclei, supporting a diagnosis of Lymphoepithelioma-like cholangiocarcinoma (LELCC). The patient had no symptoms during the 24-month follow-up and had good quality of life.

LELCC is a rare low-grade malignancy with a favorable prognosis. This sarcoma has a strong association with Epstein-Barr virus (EBV). The diagnosis of LELCC is often a challenge because imaging alone cannot allow differentiating between hepatocellular carcinoma and LELCC in many instances. When patients showed recurrent tonsillitis at an early age, AFP did not change significantly, and there was no previous history of hepatitis B. In such scenario, diagnosis of LELCC should be considered.

PU-0793

Primary Fallopian Tube Carcinoma: Multiparameter Magnetic Resonance Characteristics and Pathological Correlation

Ruqi Fang

Fujian Maternity and Children Health Hospital

Objective To explore characteristic magnetic resonance imaging (MRI) features of primary fallopian tube carcinoma (PFTC) with pathological correlation.

Methods Ten patients with pathologically confirmed PFTC were retrospectively reviewed. The conventional MRI features were analyzed including laterality, shape, size, signal-intensity, contrast enhancement, lymph node metastasis, pelvic metastasis and typical signs. We also analyzed the diffusion-weighted imaging (DWI) and dynamic contrast-enhanced (DCE) MRI features and the clinical and pathological informations of PFTCs.

Results Eleven tumors in ten patients were evaluated (50.5 ± 8.9 (29-60) years old). The main clinical manifestation were vaginal discharge ($n = 6$) and palpable adnexal mass ($n = 6$). In MR imaging, the tumor showed sausage-shaped ($n = 7$), cauliflower-shape nodular ($n = 3$) or lobulated ($n = 1$) morphology. The solid portion were hypointense intensity on T1-weighted imaging (T1WI) ($n = 11$), slightly hyperintense ($n = 11$) on T2-weighted imaging (T2WI), with highly hyperintense on DWI ($n = 11$). The mean apparent diffusion coefficient value was 1.269×10^{-3} s/mm². Minimal-to-mild contrasted enhanced was detected in five tumors with type II signal intensity curve ($n = 5$). The “vestigial fallopian tube signs” were found in all eleven tumors ($n = 11$), and “pseudocapsule signs” were detected in all 5 tumors with contrasted enhanced MRI.

Conclusion PFTC might manifest as adnexal solid masses with “vestigial fallopian tube sign” and “pseudocapsule sign” in preoperative imaging. DWI and DCE-MRI may be a promising tool for the diagnosis of PFTC.

PU-0794

MR 酰胺质子加权转移成像在预测肝细胞癌组织学分级与 Ki-67 表达中的价值初探

罗先富、黄京成、叶靖、孙骏、傅剑雄
江苏省苏北人民医院

目的：探讨磁共振酰胺质子转移加权(amide proton transfer-weighted, APTw)成像预测肝细胞癌 Ki-67 表达水平及组织学分级的可行性，并与 DWI 进行比较。

方法：160 例肝占位病人进行前瞻性上腹部 MRI 扫描，包括 APTw 及 DWI 成像。分别在 APTw 及 ADC 图像上测量得到病灶的 APTw 值及 ADC 值，依据病理及免疫组化染色结果，阳性细胞比例 $\leq 10\%$ 定义为 Ki-67 低表达， $>10\%$ 定义为 Ki-67 高表达。分析 Ki-67 高表达与低表达组之间、高级别组与低级别组肝细胞癌之间的 APTw 值和 ADC 值之间的差异。进一步采用 ROC 曲线评估 APTw 值及 ADC 值在鉴别 Ki-67 高表达组与 Ki-67 低表达组之间以及高级别与低级别肝细胞癌组间诊断效能。

结果：Ki-67 高表达组($n=39$) 的 APTw 值高于低表达组($n=17$) [$1.57(1.06,1.92) \%$ vs. $0.16(-0.67\pm 0.72)\%$; $P<0.001$]，Ki-67 高表达组 ADC 值低于低表达组 [$0.82(0.75,0.90) \times 10^{-3} \text{mm}^2/\text{sec}$ vs. $1.01(0.87,1.01) \times 10^{-3} \text{mm}^2/\text{sec}$; $P=0.003$]。高级别组肝细胞癌($n=33$) 的 APTw 值高于低级别组($n=23$) [$(1.54\pm 1.10) \%$ vs. $(0.02\pm 1.25)\%$; $P<0.001$]，两组间的 ADC 值无明显差异 [$(0.86\pm 0.16) \times 10^{-3} \text{mm}^2/\text{sec}$ vs. $(0.91\pm 0.16) \times 10^{-3} \text{mm}^2/\text{sec}$; $P=0.256$]。APTw 值与 ADC 值区分肝细胞癌 Ki-67 高表达与低表达组的 AUC 分别为 0.845 和 0.755。APTw 值高级别与低级别肝细胞癌的 AUC 为 0.819。

结论：APTw 成像在术前预测肝细胞癌 Ki-67 表达、区分高级别与低级别肝细胞癌方面优于 DWI。

PU-0795

右结肠旁沟梭形细胞横纹肌肉瘤 1 例

夏海红、周佳慧、陈涛、王祖飞
丽水市中心医院

横纹肌肉瘤(Rhabdomyosarcoma,RMS)是一种罕见的软组织恶性肿瘤，起源于未分化的间充质，组织学上类似于正常胎儿骨骼肌，常见于儿童及青少年，大多数起源于头颈部及泌尿生殖系统，多发生于男性，男女比为 6:1，成人非常罕见，而发源于成人腹膜后的更是罕见。笔者报道 1 例发生于右侧结肠旁沟的梭形细胞横纹肌肉瘤的影像表现及外科术后的治疗。旨在提高对该病的认识。RMS 的组织学亚型有三种：胚胎型、腺泡型和多形型，其中胚胎型 RMS 亚型包括葡萄状肉瘤、间变性肉瘤和梭形细胞型。梭形细胞/硬化性横纹肌肉瘤(SRMS)是一种以梭形细胞为主胚胎型 RMS 的一种独特亚型。SRMS 在组织病理学上，大部分由梭形细胞组成，以束状排列，伴有或不伴有间质硬化，细胞大部分异型性明显，核分裂象多见，免疫组化染色显示结蛋白 Desmin、波形蛋白 Vimentin、原肌球蛋白调节蛋白 MyoD1、成肌蛋白 Myogenin、肌红蛋白 Myoglobin 等肌源性标记呈阳性表达。本例患者肿瘤细胞呈梭形，间质见少量淋巴细胞及血管，免疫组化示 Desmin、MyoD1、Vimentin 等呈阳性，符合 SRMS。本例 SRMS 发生于右侧结肠旁沟与肌肉呈等密度肿块，未见明显黏液成分，肿瘤边缘分叶，动脉期强化轻微，瘤体边缘可见增粗小血管穿行，门脉期呈片絮状边缘明显强化，局部见结节状明显强化，延迟期强化范围增大，强化特点与文献报告相似，笔者认为病变可能具备绕血管生长的特点。成人 SRMS 恶性程度高，最佳治疗方法是完整手术切除+辅助性放化疗。SRMS 发病罕见，临床及影像表现没有特异性，晚期治疗效果不理想，尽管采用了

多模式治疗,但复发和进展仍很常见,所以提高预后的关键是早期诊断、早期治疗,尽早确定肿瘤分期和病理类型。本例患者术后 5 个月全身化疗 6 次后复查全腹部增强 CT,未见肿瘤复发及转移。

PU-0796

既往脂肪肝急性胰腺炎的 CT 特征及其与严重程度的关系

彭容¹、张小明²、张泽明¹、赵张平¹、王智清¹、李斌¹、王金星¹

1. 攀枝花市中心医院

2. 川北医学院附属医院

目的:探讨既往脂肪肝发生急性胰腺炎(Acute pancreatitis, AP)时的 CT 特征,分析其与 AP 严重程度的关系。

方法:共有 272 例 AP 患者被分为既往有脂肪肝的急性胰腺炎和既往无脂肪肝的 AP 两组患者。并比较两组患者的 CT 特征、AP 严重程度。CT 严重程度指数(CT severity index, CTSI)评分、急性生理与慢性健康状况评分(Acute Physiology and Chronic Health Evaluation, APACHE II)和改良 Marshall 评分评估急性胰腺炎的严重程度。

结果:在 272 例患者中,37.1% (101/272)的患者既往存在脂肪肝。既往存在脂肪肝的 AP 患者更容易出现坏死(28.7% vs 8.8%, $\chi^2=18.620$, $P=0.000$)和局部并发症(33.7% vs 15.8%, $\chi^2=11.660$, $P=0.000$),且住院时间更长(13 天 vs 11 天, Mann-Whitney U 检验, $P=0.02$)。既往存在脂肪肝的 AP 患者 CTSI (4.40 ± 2.05 vs 3.23 ± 1.41 , $t=-5.506$, $P=0.000$)和 APACHE II 评分(6.34 ± 4.73 vs 5.17 ± 4.11 , $t=-2.126$, $P=0.034$)均高于既往无脂肪肝的患者。根据改良 Marshall 评分,既往存在脂肪肝的 AP 患者更容易出现器官功能衰竭(12.9% vs 4.7%, $\chi^2=5.985$, $P=0.014$)。

结论:既往存在脂肪肝的患者发生急性胰腺炎时更容易出现坏死及局部并发症,严重程度更重,并且更容易发生器官功能衰竭。在急性胰腺炎患者中,既往存在脂肪肝可作为评价和预测 AP 严重程度的辅助指标之一。

深度学习对膀胱癌图像分割以及肌层侵犯预测价值的研究

龚宇、张玉东

江苏省人民医院(南京医科大学第一附属医院)

目的:利用多参数磁共振序列图像构建一个深度学习模型,用于肌层浸润性膀胱癌的术前诊断。

方法:我们的研究纳入了 391 例术前接受了多参数磁共振检查并且病理证实是膀胱尿路上皮癌的患者,将患者随机分为训练集($n=312$)和测试集($n=79$)。我们首先训练了一个 3D 分割模型来自自动分割膀胱壁和肿瘤。膀胱壁与肿瘤接触区域是膀胱癌肌层侵犯的好发区域。引导模型针对这一区域进行注意学习,可以模拟专家的诊断思路。因此,在自动分割图像用于训练之前,嵌入专家注意区域,获得肌层侵犯好发区域内的肿瘤和膀胱壁这两个感兴趣区。随后基于 3d-ResNet-18 神经网络,构建深度学习模型。最后分别验证了对于单个序列图像和全序列图像输入深度学习模型的性能。我们的深度学习模型还与不嵌入专家注意区域的“黑匣子”网络模型、四名放射科医生 VI-RADS 评分模型进行了对比。

结果:391 例患者中有 135 例存在肌层侵犯。在 79 例独立测试集中,对于肌层侵犯和非肌层侵犯的两组病人,我们的分割模型对癌灶和膀胱壁分割的 Dice 系数在 0.681-0.756 之间,精确度在 0.733-0.860 之间,召回率在 0.734-0.825 之间,两组间分割性能一致性较好(所有 $P>0.05$)。基于 T2WI 图像的深度学习模型获得了最高的诊断 AUC 值(0.87),优于基于全序列图像的深度学习

习模型 (AUC=0.82) 和基于 T2WI (AUC=0.76)、ADC (AUC=0.77)、DCE (AUC=0.75)、DWI (AUC=0.70)、全序列 (AUC=0.81) 图像的传统“黑匣子”网络模型 (所有 $P<0.05$)。对于 VI-RADS 评分, 四位阅读者的读者间一致性在 0.53-0.75 之间, 存在明显的异质性。

结论: 对于膀胱癌肌层侵犯的检测, 我们的基于 T2WI 图像的深度学习模型仅需使用单个序列图像即可获得优于“黑匣子”网络模型及专家诊断的表现, 更加安全、简便。

PU-0798

临床和脾脏放射组学特征在预测胃癌患者 TNM 分期中的作用

吕东博、刘梦茹、梁盼、程铭、詹鹏超、路昊、朱兵兵、岳松伟、高剑波
郑州大学第一附属医院

目的: TNM 分期能够影响胃癌的治疗和预后, 我们的目标是明确脾脏的 f 放射组学特征是否可以用于区分不同 TNM 分期的胃癌患者。

方法: 回顾性分析 2019 年 2 月至 2021 年 1 月收治的经病理证实的 127 例胃癌患者的临床资料。回顾性分析患者的临床资料, 基于胃癌(GC)、脾脏(SP)和二者组合(GC_SP)图像的放射组学特征构建 3 种放射组学预测特征模型, 获得 3 个组学评分。基于 Rad-score GC_SP、临床和 CT 参数, 开发了放射组学模型来预测 TNM 分期 (I/II 期和 III/IV 期), 采用 AUC 和校准曲线评估放射组学模型的鉴别效能。

结果: 共有 127 例患者纳入研究, 共纳入 5 个临床和 CT 参数 (T_thick、T_ctv、SP_ctv、CA199 和糖尿病) 构建临床模型。最终构建的 GC_SP_Clin 的放射组学联合模型显示出强大的预测能力, 训练和测试组的 AUC 分别为 0.872 和 0.825, 开发的模型预测胃癌患者的 TNM 分期方面的预测值与真实值之间一致性良好。

结论: 将胃癌和脾脏放射组学特征与临床及 CT 参数相结合, 最终构建的放射组学模型能够预测胃癌患者 TNM 分期 (I/II 期和 III/IV 期), 帮助指导治疗决策。

PU-0799

左侧肾周 CT 平扫影像特征与脓毒症伴急性肾损伤的相关性研究

张婧琦、彭新桂
东南大学附属中大医院

目的 探讨脓毒症伴急性肾损伤 (Acute Kidney Injury, AKI) 患者的肾周 CT 影像特征, 指导临床早期诊断、早期干预。

方法 本文回顾性分析了东南大学附属中大医院 2018 年 2 月-2020 年 10 月的 ICU 脓毒症伴 AKI 及不伴 AKI 患者, 按照纳入及排除标准共入组 240 人。收集与 AKI 发生相关的临床及实验室指标, 并分析入 ICU 24h 内肾周 CT 影像指标: ①左侧肾周筋膜增厚; ②左侧肾周脂肪密度改变; ③左侧肾后脂肪厚度; ④左侧肾周脂肪条纹征。对每个指标进行单因素分析和多因素 Logistic 回归分析, 得到与 AKI 发生的独立相关的影像指标。

结果 脓毒症不伴 AKI 组 (n=120) 和脓毒症伴 AKI 组 (n=120) 年龄、性别、慢性病史、药物的使用、机械通气使用均无统计学差异 ($p>0.05$), 脓毒症伴 AKI 组较不伴 AKI 组的具有更低的血清碳酸氢盐水平 ($p<0.001$), 合并 ARDS ($p=0.007$)、左肾周筋膜增厚 ($p<0.001$)、左侧肾周脂肪条纹征 ($p=0.02$) 的发生率更高, 左侧肾后脂肪更厚 ($p=0.006$)。多元 logistic 回归分析显示血清碳酸氢盐[OR =0.865, 95%CI (0.814, 0.919), $p<0.001$]、合并 ARDS[OR =2.227, 95%CI (1.261, 3.932), $p=0.006$]、左侧肾周筋膜增厚[OR =3.213, 95%CI (1.8, 5.735), $p<0.001$]均与脓毒症患者伴发 AKI 独立相关。

结论 脓毒症患者入 ICU 24h 内腹部 CT 平扫特征——左肾周筋膜增厚与脓毒症伴 AKI 独立相关，出现左肾周筋膜增厚提示脓毒症伴 AKI 的发生，指导临床早期诊断、早期干预。

十二指肠溃疡穿孔后下腔静脉血栓形成

刘茜玮、谢晟
中日友好医院

个案摘要

消化道溃疡穿孔是比较严重的消化道疾病，会引起严重的并发症，甚至危及患者生命。比较常见的并发症包括出血、腹腔感染、中毒性休克、肺部感染、幽门梗阻等。

本文病例中的患者是一名 34 岁男性，主因“间断腹痛 5 年，呕血伴黑便 11 天”以“上消化道出血，十二指肠溃疡，腹膜炎，中度贫血”收入院。既往胃镜提示十二指肠溃疡，幽门螺杆菌感染病史，11 天前患者因劳累熬夜后出现呕血伴黑便，外院胃镜提示十二指肠球部巨大溃疡伴出血，Forrest 分级（Ib）。予输血治疗。2 天前喝粥后出现发热，查外院平扫 CT 示：胰头后缘及腹主动脉周围、右肾前后筋膜周围多发渗出性病变，继发右侧局限性腹膜炎。入院后行腹盆 CT 增强检查示十二指肠穿透性溃疡，周围炎性包裹，与下腔静脉关系紧密，右肾静脉内血栓形成，侧枝循环形成，下腔静脉内血栓形成至髂静脉。给与抗感染、胃肠粘膜保护剂及肝素抗凝药物治疗，症状好转，分别于 8 天及 36 天后复查腹盆 CT 增强检查，静脉血栓未见明显变化，十二指肠穿透性溃疡，周围炎性渗出好转。

下腔静脉血栓形成是十二指肠溃疡穿孔后少见的一种并发症，当患者十二指肠穿孔后出现腹痛、发热等腹膜炎表现时，需警惕此种可能，尤其穿孔部位靠近下腔静脉时，造成周围炎性渗出，会出现下腔静脉血栓。所以当怀疑十二指肠穿孔时应及时进行增强 CT 检查，以确认是否存在下腔静脉血栓，并及时处理，避免严重的后果发生。

PU-0801

基于磁共振成像对肾透明细胞癌 VHL 突变状态的影像基因组学分析

白旭、彭程、赵建、王海屹
中国人民解放军总医院第一医学中心

目的：分析肾透明细胞癌（ccRCC）原发灶及区域淋巴结磁共振成像（MRI）特征与 VHL 突变间的潜在联系。

方法：回顾性连续收集 2018 年 1 月至 2020 年 12 月间我院病理诊断明确、术前增强 MRI 及基因检测结果完整的 ccRCC 患者 49 例，同时从 TCGA-KIRC 数据库中连续纳入术前增强 MRI 完整的 ccRCC 患者 54 例。由两名高年资放射科医师在对基因突变状态及病理资料不知情的前提下协商完成影像学征象评估。

结果：本单位 49 名 ccRCC 患者中男性 37（74.00%）人，平均年龄 55.24 ± 12.11 岁；包含 ccRCC 病灶 49 个，其中 31（63.27%）个被检出 VHL 突变。来自 TCGA 数据库的 53 名 ccRCC 患者中男性 38（70.37%）人，平均年龄 60.96 ± 10.27 ；包含 ccRCC 病灶 53 个，其中检出 VHL 突变的病灶 26（48.15%）个。对所有 103 例 ccRCC 患者影像特征进行分析显示：VHL 未突变的患者中区域淋巴结的短径更大（ $P < 0.001$ ），Node-RADS 评分更高（ $P < 0.001$ ），边缘不清

($P=0.003$)、纹理不均匀($P<0.001$)、球形($P<0.001$)占比更高;原发灶的最大径更大($P=0.007$)、边缘不清($P=0.004$)、囊变($P=0.009$)、出血($P=0.011$)、T2WI 低信号($P<0.001$)、含脂($P=0.001$)、肾周侧支循环建立($P=0.039$)更多见。分别对本单位及公开数据进行分析发现:无论是在本单位数据集还是在 TCGA-KIRC 数据集中,区域淋巴结的 Node-RADS 评分及原发灶的边缘、T2WI 信号均在 VHL 突变组与未突变组间存在显著统计学差异(所有 $P<0.05$)。

结论:不同 VHL 突变状态的 ccRCC 患者间原发灶及区域淋巴结的 MRI 征象存在差异。MRI 特征与 VHL 突变间的潜在联系仍需更大样本研究,而其具体机制及预后意义同样值得进一步探索。

PU-0802

光谱 CT 细胞外间隙分数鉴别肾上腺腺瘤与转移瘤的应用价值

孙梦雅、唐广磊、李瑞希、彭洋、张繁、关键
中山大学附属第一医院

目的 分析光谱 CT 细胞外间隙(extracellular volume, ECV)分数鉴别肾上腺腺瘤与转移瘤的应用价值。方法 回顾性收集 2021 年 8 月至 2022 年 8 月中山大学附属第一医院的肾上腺腺瘤患者 60 例(60 个结节)和肾上腺转移瘤患者 30 例(38 个结节)。所有患者术前行包含 10 分钟延迟期的光谱 CT,并在两天内测量红细胞比容。由两名医师分别独立在延迟期的碘密度图上测量病灶和腹主动脉的碘密度,并计算病灶的 ECV 分数。采用组内相关系数(ICC)评价测量结果的一致性。采用独立样本 t、t'检验或卡方检验比较腺瘤和转移瘤患者的临床资料、碘密度和 ECV 分数。将差异有统计学意义的参数进行受试者操作特征曲线分析,获得各参数鉴别肾上腺腺瘤与转移瘤的诊断效能,并采用 Z 检验比较各参数的曲线下面积(AUC)。结果 转移瘤组的病灶碘密度(0.95 ± 0.43)高于腺瘤组(0.53 ± 0.30),差异有统计学意义($t'=4.867$, $P<0.001$), AUC(95%CI)为 0.782 ($0.687\sim 0.858$);转移瘤组的 ECV 分数($34.10\pm 13.42\%$)高于腺瘤组($18.08\pm 8.67\%$),差异有统计学意义($t'=6.014$, $P<0.001$), AUC(95%CI)为 0.842 ($0.755\sim 0.908$)。ECV 分数鉴别效能更高,最佳诊断阈值为 25.4%,准确度、灵敏度和特异度分别为 78.8%、80.0%、78.3%。ECV 分数与病灶碘密度的 AUC 差异有统计学意义($Z=2.886$, $P=0.005$)。结论 基于光谱 CT 的 ECV 分数可用于鉴别肾上腺腺瘤与转移瘤,其诊断效能优于病灶碘密度。

PU-0803

基于 Mono+算法评估双能量 CT 对结直肠癌高危因素诊断价值的初步研究

陈峻帆
重庆医科大学附属第二医院

目的:评估基于 Mono+ 算法的双期 DECT 对结直肠癌(CRC)高危因素的诊断价值。

方法:前瞻性的收集了 2021-2023 年在我院行腹部双期双能 CT 扫描的原发性 CRC 患者。评估双期 DECT 图像的 SNR、CNR、整体图像质量、瘤体显示和图像噪声。然后选择最佳能级图像,分析高风险和低风险 CRC 组间的 IC、NIC、Z、Rho、DEI 和能谱曲线斜率。使用多因素二元逻辑回归分析构建诊断 CRC 高危因素的回归模型;绘制 ROC 曲线,并计算 AUC 以评估模型的诊断价值。

结果:本研究共纳入了 74 例患者,其中高危组 41 例,低危组 33 例。40keV 虚拟单能成像(VMI+)的信噪比和 CNR 最佳(信噪比为 8.79 ± 1.27 , CNR 为 14.89 ± 1.77 , $P<0.03$)。60 keV VMI+ 和 40 keV VMI+ 的整体图像质量和瘤体显示分别最好($P<0.01$)。在所有 DECT 参数中,

AP-IC、NIC、DEI 和 能谱曲线斜率以及 VP-NIC 在两组之间存在统计学差异。AP-IC 是预测高危和低危 CRC 的最佳 DECT 参数,其 AUC、灵敏度、特异性和截断值分别为 0.96、97.06、87.80 和 2.94。综合临床参数和 DECT 参数,模型的 AUC、灵敏度、特异性和预测准确性分别为 0.99%、97.06%、90.24% 和 89.33%。

结论:基于 40 keV VMI+ 重建的 DECT 图像能最好的描述 CRC 肿瘤;临床参数结合 DECT 参数构建综合模型对 CRC 患者高危因素的术前预测有重要意义。

PU-0804

3 例肠系膜静脉硬化性结肠炎并文献复习

周永霞

重庆医科大学附属永川医院

目的:了解肠系膜静脉硬化性结肠炎(Idiopathic Mesenteric Phlebosclosi,IMP)的病理生理学、临床特征和治疗选择。

方法:收集我院 2018 - 2023 年确诊为静脉硬化性结肠炎患者 3 例,详细研究其临床病史,总结其 CT 影像、内镜影像特征,以及结合 PubMed 和知网数据库检索的病例,对此病进行系统性回顾

结果:IMP 主要发生在东亚地区,80.2%患者有服用中草药病史。CT 显示结肠粘膜、肠系膜静脉及其分支呈线状钙化,结肠镜表现为特有的紫蓝色粘膜。经保守治疗治愈率 54.3%,45.7%患者接收手术治疗,手术治疗患者不能改变累及更广泛。

结论:IMP 发生主要与长期服用中草药有关,早期无明显症状,主要依据特征性的 CT 表现和结肠镜确诊,一旦确诊应停用口服中草药,根据病情严重程度可以选则保守治疗或行手术治疗。

黄色肉芽肿性胆囊炎的 CT/MRI 表现及其与胆囊癌的影像鉴别要点

刘红、江泊源、金大永、杨明明、张文娟、钱一帆、秦越

西安大兴医院

目的:探讨黄色肉芽肿性胆囊炎临床特点及影像学表现,以及与胆囊癌影像鉴别要点,提高术前诊断符合率。

方法:回顾性分析西安大兴医院 2020 年 2 月-2023 年 4 月期间诊治的 12 例经病理证实为黄色肉芽肿性胆囊炎病例术前影像,观察胆囊壁增厚的类型、强化方式,胆囊壁内结节、粘膜线是否完整和是否伴有结石,以及胆囊周围结构改变等,提出与胆囊癌影像鉴别的要点。

结果:全部病例均出现胆囊壁增厚,其中 8 例为弥漫性增厚、4 例病例为局部增厚;6 例患者可见胆囊壁内结节灶,表现为 CT 低密度影,MRI 为长 T1、长 T2 信号,11 例患者胆囊粘膜线明显强化,9 例胆囊粘膜线完整,3 例粘膜线局部欠连续。合并胆囊结石者 7 例;8 例病例出现邻近肝实质动脉期一过性强化;3 例术前诊断为胆囊癌,术后为黄色肉芽肿性胆囊炎;2 例术前诊断黄色肉芽肿性胆囊炎,术后为胆囊癌。

结论:CT 及 MRI 检查可显示黄色肉芽肿性胆囊炎的影像特征(胆囊壁增厚,呈“夹心饼干征”、囊壁内小结节、粘膜线连续、邻近的肝实质动脉期一过性强化),为病变的诊断和鉴别诊断提供依据,从而提高诊断准确率,有助于临床的进一步诊治。

胆总管原发性神经内分泌癌 1 例

陈家骏、夏水伟、李霞、黄剑辉、王祖飞、纪建松
丽水市中心医院

神经内分泌癌是一种少见的恶性肿瘤，主要发生于胃肠道和肺，原发于肝外胆管的极其罕见，因其缺乏典型临床特点及影像学表现，术前极易误诊。本文报道 1 例患者，以期为临床诊疗提供参考。

患者体检发现胆总管下段病灶呈膨胀性生长，高度提示恶性肿瘤，影像学未见明显转移征象，遂行手术治疗。行胆管根治性切除术。术后病理镜检及免疫组化 Syn (+)、CgA (小区+)、CD56 (+) 确诊胆总管下段神经内分泌癌。因患者个人原因术后拒绝行规范放化疗。术后 5 个月后出现肝脏转移瘤，行肝动脉化疗栓塞 (雷替曲塞 2mg、奥沙利铂 50mg)，病情进展。改行免疫治疗，患者病情仍进展迅速，生存周期仅 13 个月。

由于肝外的胆管神经内分泌癌极其罕见，其临床病理特征不明确，导致术前难以明确诊断。目前对于胆总管神经内分泌癌尚无规范的治疗方案，其临床表现与胆总管腺癌相近，该病确诊主要依据病理镜检+免疫组化检查，免疫组化染色嗜铬素 A (Cga)、CD56、突触素 (Syn) 染色具有高度敏感性及特异性，Ki-67 可以为肿瘤分级提供依据，数值越高提示预后越差 (本例患者 Ki-67+ (约 75%))。超声、CT、磁共振等影像学检查缺乏特异性，但有助于肿瘤的定位和定性，并排除有无其他脏器转移及淋巴结侵犯。手术根治切除是目前治疗胆管神经内分泌癌的主要手段，一经发现应尽早行根治性手术切除，同时行肝门区、胰头周围、腹腔干等周围淋巴结清扫，以保证完全切除、切缘阴性。

对于初诊就已经失去手术机会的 NEC 患者，化疗首选经典方案依托泊苷+顺铂 (EP) 与伊立替康+顺铂 (IP)，贝伐珠单抗联合奥沙利铂，再加用氟尿嘧啶及伊立替康四药联合在晚期 NEC 患者中总生存期优于 EP 和 IP，但不良反应较多，需要谨慎使用。免疫治疗对于神经内分泌肿瘤效果不佳。因此对于分化差的神经内分泌癌的患者以化疗为主，4 联方案略优于 EP 和 IP。

PU-0807

多层螺旋 CT 诊断不同分子分型乳腺癌肝转移瘤的价值探析

杨平
绵阳市第三人民医院

目的 探析多层螺旋 CT (MSCT) 诊断不同分子分型乳腺癌肝转移瘤的应用价值。方法 2014 年 2 月至 2018 年 12 月我院 64 例确诊的乳腺癌肝转移患者依据免疫组化结果分为 4 种分子类型，即 Luminal A 型 8 例、Luminal B 型 28 例、HER-2 过表达型 16 例及 TNBC 型 12 例，分析各分型乳腺癌患者肝转移瘤的 MSCT 影像表现。结果 4 种分型患者肝转移瘤均以全肝、多发为主，且病灶体积较小，以规则的圆形或类圆形居多，多呈结节样强化，肝转移瘤或病灶部位、数目、大小、形状、强化特征与分子分型无关联 ($P > 0.05$)。但肝转移病灶边界、密度存在显著差异 ($P < 0.05$)，其中 Luminal B 型患者病灶边界模糊占比最高，并显著高于 Luminal A 型、HER-2 过表达型、TNBC 型患者 ($P < 0.05$)；Luminal A 型、HER-2 过表达型患者病灶边界模糊者占比明显高于 TNBC 型患者 ($P < 0.05$)。Luminal B 型、HER-2 过表达型患者病灶低密度占比明显低于 Luminal A 型、TNBC 型 ($P < 0.05$)，等密度占比明显高于 Luminal A 型、TNBC 型 ($P < 0.05$)。Pearson 分析显示乳腺癌肝转移病灶边界、密度与分子分型密切相关 ($r=0.912, 0.896$)。结论 MSCT 诊断不同分子分型乳腺癌肝转移瘤的应用价值高，可显示肝转移瘤的多方面信息，尤其是不同分子分型患者转移灶边界、密度等存在一定特征，可作为诊断依据，并指导临床治疗。

PU-0808

利用 CT 平扫观察阑尾壁包埋征对复杂性阑尾炎的诊断价值研究

吴磊、茅旭平
张家港市中医医院

目的 探讨利用 CT 平扫观察阑尾壁包埋征对复杂性阑尾炎的诊断价值。

方法 回顾性分析 2020 年 7 月至 2022 年 12 月期间, 经手术及病理证实的急性阑尾炎患者 114 例, 其中复杂性阑尾炎 31 例, 非复杂性阑尾炎 83 例。观察 CT 征象包括: 阑尾壁包埋征、阑尾外径、脓肿、蜂窝织炎、阑尾腔外气体和阑尾腔外粪石。比较两组患者的临床资料和 CT 征象, 取有统计学意义的变量进行二元 logistics 回归多因素分析, 筛选出对复杂性阑尾炎诊断具有统计学意义的 CT 征象, 并绘制 ROC 曲线。

结果 阑尾壁周围高密度度渗出的 OR 值为 24.712 (95%CI: 1.877~325.350) ($P=0.015$), 蜂窝织炎的 OR 值为 3.955 (95%CI: 1.071~14.606) ($P=0.039$) 和腔外气体的 OR 值为 32.886 (95%CI: 1.531~706.498) ($P=0.026$)。ROC 曲线结果显示, 阑尾壁周围高密度度渗出、蜂窝织炎和阑尾腔外气体的 AUC 值分别为 0.734 ($P<0.001$)、0.750 ($P<0.001$) 和 0.649 ($P=0.017$), 该 3 个 CT 征象诊断复杂性阑尾炎的敏感度分别为 55.2%、65.5%和 31%, 特异性分别为 91.7%、84.5%和 98.8%。

结论 通过 CT 平扫观察阑尾壁及其周围改变对复杂性阑尾炎具有重要诊断价值。

PU-0809

一例静脉内平滑肌瘤病恶变的影像学分析

岳永芳、吕晓波
临汾市中心医院

【摘要】 静脉内平滑肌瘤病 (IVL) 指子宫平滑肌瘤样组织累及静脉系统形成瘤栓, 它虽然是良性肿瘤, 但具有蔓延性生长、易复发等恶性疾病的特点。本文报道 1 例下腔静脉平滑肌瘤恶变的影像学分析。患者 2 个月前出现腹胀, 纳差, 进食后呃逆、饱胀感。CT 示下腔静脉中段、下段结构显示不清, 局部见巨大不规则软组织肿块, 边界不清, 不均匀强化, 内见丰富的供血动脉且与右侧卵巢动脉关系密切。肿块侵犯右肾、肾门及输尿管, 致右肾积水。病理诊断为 (静脉血管) 平滑肌肉瘤。

PU-0810

肝泡型包虫病淋巴结转移术前预测模型初探

侯娟
新疆医科大学第一附属医院

目的: 探讨肝泡型包虫病淋巴结转移的术前预测因素, 构建术前预测模型并评价其临床应用价值。

方法: 收集 2015 年 1 月至 2022 年 12 月于新疆医科大学第一附属医院经病理确诊为肝泡型包虫病淋巴结转移的患者资料, 经纳入排除标准入组 50 例; 随机抽取本院同期诊治的无淋巴结转移的肝泡型包虫病患者 50 例。收集患者临床资料, 分析并比较两组患者的一般资料、病灶部位、最大径、单发或多发、钙化分型、大血管侵犯、远处转移、PNM 分型及淋巴结转移部位。经统计学分析筛选术前预测因素构建预测模型, 并以受试者工作曲线 (ROC) 评价术前预测模型的诊断效能。结

果: 50 例转移组病例共发现 13 组淋巴结转移, 其中 30 例为单组淋巴结转移, 20 例为多组淋巴结转移, 其中转移部位最多的为肝门部淋巴结 (26/50)。转移组与非转移组患者的年龄、性别、病灶多发或单发、大血管侵犯无统计学差异 ($P>0.05$); 转移组与非转移组病灶的部位、最大径、钙化分型、远处转移具有统计学差异 (病灶部位 $P=0.029$, 最大径 $P=0.002$, 钙化分型 $P<0.001$, 远处转移 $P=0.047$); 根据上述因素构建 ROC 曲线, 曲线下面积 (AUC) 为 0.893 (95%CI: 83.1%~95.5%), 灵敏度为 82%, 特异度为 80%。结论: 肝泡型包虫病灶发生的部位、最大径、钙化分型、远处转移可作为术前淋巴结转移的预测因素, 术前预测模型具有很好的诊断效能。

PU-0811

小肠 CTE 在小肠淋巴瘤诊断中的价值

罗秀娟

黄石市第五医院有限公司

原发性小肠淋巴瘤(PSIL): 是小肠中常见的恶性肿瘤之一, 占原发胃肠道淋巴瘤的 20% ~30% 。PSIL 起病隐匿, 早期临床症状不明显, 特异性低, 容易漏诊或误诊。

CT 小肠造影 (CTE): 是一种特殊准备后进行的 CT 检查, 通过肠腔内充盈水或造影剂, 利用多层螺旋增强 CT 快速、薄层扫描和强大的后处理功能来清晰勾勒肠壁、肠腔及肠管外病变的诊断有显著优势, 但存在一定的辐射。

目的: 讨论小肠 CTE 在小肠淋巴瘤诊断中的价值。

方法: 7 例经手术确诊的小肠淋巴瘤作回顾性分析, 结合相关文献资料, 讨论其影像学表现。

讨论: 7 例小肠淋巴瘤患者因不同程度腹部疼痛不适、腹部包块、消瘦、大便性状改变等原因就诊, 腹部 CT 平扫, 发现小肠管壁局限性不同程度增厚, 行小肠 CTE 检查。7 例患者 CTE 表现共同特征: 病变肠管无明显狭窄, 管腔扩张, 肠管未见梗阻表现; 并各有自不同 CTE 表现。有 5 例周围肠系膜明显肿大淋巴结增多, 2 例可见少许肿大淋巴结, 淋巴结轻、中度均匀强化; 6 例管壁增厚不均匀, 粘膜不光整; 5 例可见周围系膜密度增高并见条索影。

小肠淋巴瘤的小肠 CTE 表现: 肠壁增厚: 肠壁增厚程度多较明显, 可对称或不对称, 受累肠段较长。动脉瘤样扩张: 病变肠管无明显狭窄, 有时管腔反而扩张, 直径可大于 3cm, 呈“动脉瘤样改变”, 为胃肠道淋巴瘤特征性表现。肠壁肿块: 突向肠腔内单发或多发息肉样肿块, 部分肿块突向肠壁外或浆膜面, 密度多均匀, 形态规则或不规则, 肿块表面可有溃疡, 中心坏死时可与肠腔相通。向腔外生长并沿肠系膜浸润: 表现为肠系膜脂肪密度增高, 系膜增厚和条索影。肠系膜周围见明显增大淋巴结, 包绕相应的系膜血管及周围脂肪, 形成“三明治征”, 增强扫描肠壁病灶或淋巴结呈轻、中度均匀强化。

结论: 小肠淋巴瘤 CTE 具有特征性表现; 小肠 CTE 检查在小肠淋巴瘤的影像诊断中具有重要价值。

PU-0812

MRI 诊断多脾综合征一例

陈靓

徐州医科大学附属医院

摘要: 目的: 分析一例多脾综合征 (Polysplenia Syndrome, PS) 患者的 MRI 表现并总结归纳 PS 的发病机制、临床症状、诊断依据及鉴别诊断。方法: 对一例多脾综合征患者进行病史采集、体格检查和 MRI 检查, 患者行手术治疗, 术后随访。结果: 患者磁共振肝静脉+下腔静脉 MRA (3.0T) 示: 脾区可见多发大小不一结节、团块影, 呈“多脾”改变。下腔静脉肝段缺如。肝左、中、右静脉走行尚可, 汇入右心房, 汇合口通畅。双肾静脉汇入奇静脉, 奇静脉明显扩张 (下腔静脉肝段缺如

伴奇静脉连接异常)。胰腺尾部缺如,呈“短胰”征象。脾门区示多发迂曲、增粗血管影,通过侧枝血管与门静脉左支相沟通。十二指肠前门静脉征象;门静脉通畅。**MRI 诊断:**可符合多脾综合征影像学表现。患者存在介入手术治疗指征,行“肝静脉、下腔静脉血管成形术”,术后一般情况尚可,症状好转。结论:在临床工作中,当患者进行胸腹部 CT 或 MRI 检查时,若发现脾脏为多个,应考虑到该综合征的可能,并应注意是否伴有其他腹腔脏器及心脏大血管的异常,以避免漏诊。**MRI** 不仅能完整显示多个脾的位置、形态、大小,而且血管成像可以直观地显示心脏及血管关系,对显示多脾综合征的各种畸形有很大的帮助,对指导临床手术治疗具有重要的意义。

儿童腹膜后低度恶性纤维黏液样肉瘤一例

戴婷、贺亚琼

湖南省人民医院 (湖南师范大学附属第一医院)

本文报道 1 例发生于腹膜后的低度恶性纤维黏液样肉瘤。患儿,女,2 岁 9 月,因“腹部逐渐增大半年”入院。查体:左上腹 10×10cm 大小椭圆形包块,质软,无压痛,境界清楚,活动度可。实验室检查:神经元特异性烯醇化酶 21.97ng/ml。CT 检查示左侧腹膜后软组织密度肿块,向膈上突入胸腔,行“左侧腹膜后肿瘤根治性切除术”后病理诊断考虑低度恶性纤维黏液样肉瘤。患者术后恢复良好,随访 15 个月至今未复发。

PU-0814

肝内胆管结石并胆管癌的影像学诊断要点

罗秀娟

黄石市第五医院有限公司

目的:探讨肝内胆管结石合并胆管癌 (ICC) 的 MRI 诊断要点。

方法:近期我院 5 例影像诊断 ICC 患者回顾性分析,并结合相关文献综合分析 ICC 的 MRI 诊断要点。

结果:5 例患者均为长期 (>10 年) 肝内胆管多发结石患者,腹部疼痛不适入院,5 例均匀 60 岁以上患者,病理检查结果均提示为胆管细胞癌。CT 表现:肝内胆管多发结石,胆管明显扩张,部分肝叶萎缩;CT 增强可见萎缩肝叶实质内动脉期不均匀强化,高于同层面肝实质。MRI: T1WI, 肝左叶不规则状肿块,呈稍低信号,肿块中央见不规则索条状更低信号瘢痕影; T2WI, 肝左叶不规则状肿块,呈稍高信号,边界模糊,信号不均匀,中央呈等低信号; DWI: 肿块呈高信号,信号不均匀,弥散受限或无明显弥散受限; MRCP: 肝内胆管扩张,内见多发充盈缺损,部分可见胆管截断。MRE: 早期边缘轻中度增强,延迟扫描强化向中心扩展。

结论:长期肝内胆管结石患者,出现消瘦、贫血、CA19-9 升高应警惕合并肝内胆管细胞癌,术前诊断主要依靠影像学检查。ICC 是指左右肝管汇合部以上的肝内胆管上皮细胞起源的恶性肿瘤,在原发性肝癌中约占 10%-15%,临床中较为罕见。早期以腹痛为主要表现,常合并畏寒、发热等胆管炎症状,常被肝内胆管结石所掩盖,易被漏诊,发现时多为晚期,失去手术机会。因此,影像学诊断尤为重要,应注重 MRI 影像学表现要点, MRI: T1 表现为低信号病灶, T2 表现为外周高信号、中央低信号的异常团块。MRE: 病灶增强程度因局部血供及是否存在肿瘤组织部分坏死、肿瘤内纤维化程度不同而有所差异。动脉期不明显或部分边缘轻度增强、延迟期呈向心性增强是特征性表现; 病灶局部肝被膜明显回缩、周围肝内胆管轻度扩张则是肝内胆管癌常见的间接征象。MRCP: 可显示肝内胆管癌病灶的具体部位和累及范围,对肝内胆管结石可清晰显示结石的大小、数量、分布以及是否伴有胆管狭窄或胆管变异等。

PU-0815

胃间质瘤术前增强 CT 特征与 Ki-67 指数表达的相关性研究

吴琼

哈尔滨医科大学附属第二医院

目的：探讨胃间质瘤（GST）的术前增强 CT 特征在预测 Ki-67 表达中的价值。方法：回顾性分析 54 例 GST 患者的临床病理、免疫组化及影像资料，根据免疫组化结果将患者分为 Ki-67 低表达组（Ki-67 \leq 8%，36 例）和 Ki-67 高表达组（Ki-67 $>$ 8%，18 例），利用单因素和多因素 logistic 回归分析增强 CT 特征与 Ki-67 表达之间的关系。结果：单因素分析得出肿瘤最大径、坏死百分比、生长方式和侵犯周围组织在两组间的差异具有统计学意义（均 $P<0.05$ ）。在多因素 logistic 回归中，只有侵犯周围组织与 Ki-67 高表达显著相关（OR=6.400，95%CI：1.587~25.812）。结论：增强 CT 对 GST 中 Ki-67 表达状态有较好的预测价值，有助于指导临床医生作出更精准的临床决策。

PU-0816

2 型糖尿病患者肾脏及肾周脂肪 CT 值与糖尿病肾病发生相关

孙佳璐

东南大学附属中大医院

目的：本研究通过计算机断层扫描(CT)测量 2 型糖尿病(T2DM)患者肾脏及肾周脂肪的分层 CT 值，探讨 T2DM 病程中肾脏及肾周脂肪的 CT 影像学特征与糖尿病肾病发生的相关性。

方法：回顾性收集了 600 名经我院诊治的 2 型糖尿病患者及性别年龄匹配的 151 名健康对照组的临床数据及腹部 CT 平扫图像。根据 2 型糖尿病患者在我院就诊时是否伴有糖尿病肾病，将患者分为不伴 DKD 组和 DKD 组。通过使用 3D slicer 软件在双侧肾静脉最大径层面，以肾脏边缘为基准，分别向肾实质内及肾实质外脂肪每隔 3mm 勾画平行于肾实质边缘的弧线并填充 ROI。定义由肾脏向肾周脂肪（由内向外）五层分别为肾脏皮髓交界区为 RCMZ，肾脏皮质区为 RCZ，肾周脂肪最内层为 IZPF，肾周脂肪中间层为 MZPF，肾周脂肪最外层为 OZPF。采用 X² 检验、Mann-Whitney U 检验等用于假设检验。采用多因素 logistic 回归检验肾脏及肾周脂肪 5 层 CT 值与估算肾小球滤过率 eGFR 的相关性。

结果：正常组 RCMZ 的 CT 值显著高于不伴 DKD 组和糖尿病肾病组。而伴或不伴 DKD 患者的 CT 值差异无统计学意义。在 RCZ 层面，正常组和不伴 DKD 组的 CT 值显著高于 DKD 组，而正常组与不伴 DKD 组之间无显著差异。不伴 DKD 组 IZPF 层的 CT 值均低于其他两组，而其他两组 CT 值差异无统计学意义。DKD 组 MZPF 和 OZPF 的 CT 值均显著低于正常组和不伴 DKD 组，而正常组与 B 不伴 DKD 组的差异无统计学意义。多元线性回归分析显示，校正年龄、BMI、糖尿病病程、高血压史、糖尿病视网膜病变史后，eGFR 仍与 RCMZ、RCZ、MZPF 相关。

结论：基于 CT 平扫图像上对糖尿病患者肾脏及肾周脂肪的比较，我们发现 2 型糖尿病患者中，肾脏和肾周脂肪的 CT 值与糖尿病肾病的发生有关。

盆腔放疗后骨髓损伤的影像学研究进展

田名可、董越
辽宁省肿瘤医院

【摘要】：放疗是前列腺、直肠、宫颈和子宫内膜恶性肿瘤最常见的治疗方法。而骨盆不仅是全身造血骨髓分布比例最大的区域，也是盆腔肿瘤患者放疗时无法避免的区域。在放疗的同时，骨髓改变引起的腰骶部疼痛等相应临床症状，易被误诊为骨转移，因此早期诊断格外重要。随着多模态成像技术的迅速发展，影像学诊断放疗后骨髓损伤的敏感性和准确率明显提高，本文就放疗后骨髓改变的影像学研究进展予以综述。

基于常规磁共振和临床特征的 IIIC1p 宫颈癌患者预后相关因素初步研究

田名可、秦凤英、孙心言、于庆、于韬、董越
辽宁省肿瘤医院

摘要：目的：评估 IIIC1p 期宫颈癌患者无病生存期 (Disease-free survival, DFS) 相关预后因素。方法：选取 2014 年 1 月至 2021 年 6 月在辽宁省肿瘤医院 (大连理工大学附属肿瘤医院) 接受手术治疗的 IIIC 期宫颈癌患者 102 例，根据第 3 年生存状况分进展组与未进展组，分析两组患者临床病理指标的差异。采用 Kaplan-Meier 法绘制生存曲线，COX 回归多因素分析确定影响 IIIC1p 期宫颈癌患者预后的独立风险因素。结果：单因素分析结果显示，T 分期、鳞状上皮细胞癌抗原 (Squamous Cell Carcinoma Antigen, SCC-Ag) 水平、磁共振成像上 (Magnetic Resonance Imaging, MRI) 肿瘤体积、转移淋巴结 (lymph node metastasis, LNM) 位置与 IIIC1p 期宫颈癌患者预后具有相关性 ($P < 0.005$)；患者年龄、肿瘤最大径、手术方式、病理类型、LNM 数量、淋巴结比 (lymph node ratio, LNR)、淋巴血管间隙浸润 (lymph-vascular space invasion, LVSI)、组织分级 (均 $P > 0.05$)。多因素分析结果显示 T 分期较晚、SCC-Ag $> 13 \text{ ng/l}$ 、LNM 位置 > 3 个为导致 IIIC1p 期宫颈癌患者 3 年 DFS 显著下降的重要因素。结论：T 分期、SCC-Ag、LNM 位置为宫颈癌患者生存时间的独立影响因素。

The Value of CT Spectral and Perfusion Imaging in Evaluating the Lymphovascular and Perineural Invasion of Gastric Cancer

Tiezhu Ren, junlin Zhou
Lanzhou University Second Hospital

Purpose: The presence of lymphovascular invasion (LVI) and perineural invasion (PNI) in patients with gastric cancer (GC) is an independent risk factor for recurrence and metastases. However, the LVI/PNI status can only be retrieved from postoperative pathological specimens. Therefore, an accurate preoperative assessment of LVI and PNI in GC cases is important for patient risk stratification and the formulation of individualised treatment plans. The purpose of this study was to investigate spectral computed tomography (CT) and CT perfusion imaging in the preoperative

evaluation of LVI and PNI in GC. We investigate the utility of combining spectral CT and CT perfusion parameters in the evaluation of LVI/PNI in GC.

Methods and Materials: We prospectively analyzed 87 patients with gastric adenocarcinoma from January 2022 to February 2023. All cases were confirmed by pathology and underwent "one-stop" spectral and perfusion CT imaging examination. Patients were divided into positive (n=65) and negative (n=22) groups depending on LVI/PNI occurrence. Clinical characteristics were collected, including demographic information, serum tumor markers, and gastroscopic pathological information. The effective atomic number (Zeff), iodine concentration (IC), and water concentration were measured in the arterial (AP) and venous (VP) phases. The blood flow (BF), blood volume (BV), mean transit time (MTT), capillary permeability surface area product (PS), and time to max (Tmax) were measured in the perfusion imaging. Intra-group correlation coefficient (ICC) was used to test the consistency of the results of each parameter measured by two observers. Parameter differences between the two groups were compared. Receiver operating characteristic (ROC) curves were plotted, and areas under the curves (AUCs) were calculated to determine the diagnostic efficiency of these parameters in differentiating between the two groups. Because of the imbalance between the two groups, we further used the F1 score to compare performances.

Results: The LVI/PNI-positive group's Zeff, IC, BV, and MTT were substantially greater than those of the negative group (AP-Zeff, 8.63 ± 0.36 vs. 8.30 ± 0.36 ; VP-Zeff, 8.89 ± 0.31 vs. 8.57 ± 0.27 ; AP-IC, 17.79 ± 7.07 vs. 11.75 ± 6.58 ; VP-IC, 22.73 ± 6.33 vs. 16.54 ± 4.90 ; BV, 12.98 ± 3.67 vs. 9.12 ± 4.43 ; MTT, 14.71 ± 4.03 vs. 10.60 ± 6.03 all $p < 0.05$). The evaluated efficiency of the combination of spectral-CT and CT-perfusion parameters was superior to that of individual parameters. The BV and MTT combined with Zeff and IC in AP and VP exhibited good evaluation efficacy (AUC=0.827; F1=0.892; Accuracy=83.9%, Sensitivity=89.2%, Specificity=68.2%, PPV=89.2%, and +RL=8.3).

Conclusions: The "one-stop" spectral-perfusion CT imaging has good value in the preoperative evaluation of LVI/PNI in GC. One-stop scanning enables two types of parameters to be acquired in one scan: energy spectrum and perfusion parameters. The evaluated efficiency of the combination of spectral-CT and CT-perfusion parameters was superior to that of individual parameters.

多期增强 CT 诊断急性活动性胃肠道出血临床案例分析

丁玲、张玉忠、鄂林宁
深圳市龙华区人民医院

急性胃肠道出血 (Acute gastrointestinal bleeding, AGIB) 临床较为常见并且需要快速诊断和采取有效治疗措施。多期增强 CT 可以快速诊断胃肠道活动性出血的位置和原因等关键信息, 指导后续治疗的选择, 使其成为评估 AGIB 的潜在一线工具。本文报告 4 例 AGIB 的病例, 临床表现主要为呕血、黑便, 活动后心慌、乏力、血压下降、意识不清、昏迷等, 部分患者伴腹胀、腹痛、头晕、胸闷。实验室检查结果提示贫血和便潜血阳性。多期增强 CT 检查后准确定位消化道活动性出血灶。4 例患者中有 2 例患者经治疗后症状明显好转, 1 例患者因病情危重转入上级医院治疗后因多器官衰竭死亡, 1 例患者合并淋巴瘤及多器官衰竭, 后因失血性休克死亡。本文对多期增强 CT 在 AGIB 临床诊断中的价值进行讨论并文献综述, 旨在总结 AGIB 多期增强 CT 的影像学特点, 为 AGIB 的及时诊断提供可靠依据。

螺旋 CT 与腹部 X 线平片在肠梗阻的早期诊断比较

陈巍、邹金钊、谢冬生、刘丹
江苏省苏北人民医院

目的比较螺旋 CT 与腹部 X 线平片对急性肠梗阻早期诊断效能。方法回顾分析 2021 年 6 月~2022 年 6 月在我院诊治的 104 例急性肠梗阻患者临床资料,患者均行腹部 X 线平片及螺旋 CT 检查,比较两种检查方法敏感度、特异度以及诊断准确性。结果螺旋 CT 诊断急性肠梗阻敏感度 86.53%、特异度 80.00%,高于腹部 X 线平片的 67.30%、65.71%($P<0.05$);螺旋 CT 诊断小肠梗阻、结肠梗阻、机械性肠梗阻、绞窄性肠梗阻的准确率均高于腹部 X 线平片($P<0.05$)。结论螺旋 CT 对急性肠梗阻的早期诊断准确率高,并且可以更加准确定位肠梗阻位置、原因,为临床的有效治疗提供可靠的参考依据,具有重要临床应用的价值。

卵巢癌患者满意减瘤术：CT 肠道造影对肠切除术必要性的预测价值

赵晓芳¹、刘柳¹、谢亮华²、杨萍¹、雷迅³、毛芸¹
1. 重庆医科大学附属第一医院
2. 桂林医学院附属医院
3. 重庆医科大学

目的 明确术前 CT 肠道造影 (CT enterography, CTE) 能否可靠地预测卵巢癌 (ovarian cancer, OC) 患者为实现满意减瘤术 (optimal debulking surgery, ODS) 而行肠切除术的必要性, 并比较新辅助化疗者化疗前后二次 CTE 预测的准确性, 以提高 ODS 率及避免不必要的肠切除术。方法 回顾性分析 49 例 OC 患者 (无新辅助化疗 36 例和新辅助化疗 13 例) 的术前 CTE 图像, 分析肌层是否受累及肌层受累的长度和周径。据此预测实现 ODS 所需的手术方式, 非肌层受累或肌层受累长度 $<3\text{ cm}$ 且周径 $<1/3$ 周者判断为非肠切除术, 肌层受累长度 $\geq 3\text{ cm}$ 或周径 $\geq 1/3$ 周者判断为肠切除术。以实现 ODS 所需的理想手术方式为参考标准, 采用 Kappa 分析对 CTE 预测结果与理想手术方式进行一致性检验, 计算 CTE 对 OC 患者肠切除术必要性的预测效能。结果 对无新辅助化疗者, 肌层受累长度或周径联合的 CTE 预测结果与理想手术方式一致性极好 (Kappa=0.852, $P<0.001$), 敏感性 & 特异性分别为 80.00%、100.00%, 且优于单独的肌层受累、肌层受累长度及肌层受累周径 (Kappa=0.723, $P<0.001$; Kappa=0.771, $P<0.001$; Kappa=0.684, $P<0.001$)。对新辅助化疗者, 化疗前肌层受累长度或周径联合的 CTE 预测结果与理想手术方式一致性极好, 且优于化疗后 CTE 预测结果 (Kappa=0.806 vs 0.581, P 分别为 0.003 和 0.021)。结论 通过 CTE 分析 OC 患者肠道肌层受累的长度和周径, CTE 能较可靠地预测 OC 患者为实现 ODS 而行肠切除术的必要性, 且推荐新辅助化疗者以新辅助化疗前 CTE 预测结果为参考。

2000-2023 年膀胱癌影像学的全球热点与研究趋势的文献计量学分析

龚子健、叶印泉、彭云、刘志轩、龚良庚
南昌大学第二附属医院

目的: 对膀胱癌影像学领域的相关文献进行全面的文献计量学分析, 解释该领域目前的研究热点和未来发展趋势。

方法: 我们分析了 Web of Science 核心数据集膀胱癌影像学领域 2000 年至 2023 年 7 月 25 日的所有相关文献。使用 Vosviewer 软件进行耦合, 共现, 共著和共被引分析。Bibliometrix 被用于获取国家发文量, 并根据布拉福德法则确定该领域核心期刊。Citespace 则被用于年发文量分析与关键词爆发分析。此外, Microsoft Excel (version 2019) 被用于绘制发文量图表。

结果: 最终 4033 篇文献被纳入研究。该领域文献自 2000 年来持续增长, 近五年增长尤为迅速。美国(1293)和中国(765)是产量最高的两个国家, 发文量排名前 15 的机构中有 10 家均来自美国。由 Siegel RL 在 2019 年发表于 Ca-Cancer J Clin 的文章有着最高的共被引次数。作者分析中 Shariat SF 共发文 34 篇, 是 21507 位作者中发文量最高的, 共被引最高的作者是 Herr HW(418)。根据布拉福德定律, 该领域文献的核心期刊共 33 个, 其中 J Urology 是发文量最高的期刊, European urology 在该领域有着重要地位。基于关键词可视化分析, 可以将关键词分为 4 类, 包括流行病学荟萃分析、膀胱癌进展预测、基因表达预测及预后评估。此外, 目前的研究热点为“影像组学”、“人工智能”和“多参数磁共振”。

结论: 膀胱癌影像学领域有着广泛的应用前景, 在近年受到越来越多学者的关注。美国及其机构、期刊和作者在膀胱癌影像学领域占据主导地位。中国需要加强合作, 以提升发文质量。“影像组学”、“人工智能”和“多参数磁共振”是该领域未来的研究热点。

PU-0824

Assessing synchronous ovarian metastasis in gastric cancer patients using a clinical-radiomics nomogram based on baseline abdominal contrast-enhanced CT: a two-center study

Qianwen Zhang¹, Panpan Yang¹, Qi Chen², Fu Shen¹

1. Changhai hospital

2. Naval Medical University

Background

To build and validate a radiomics nomogram based on preoperative CT scans and clinical data for detecting synchronous ovarian metastasis (SOM) in female gastric cancer (GC) cases.

Methods

Pathologically confirmed GC cases in 2 cohorts were retrospectively enrolled. All cases had presurgical abdominal contrast-enhanced CT and pelvis contrast-enhanced MRI and pathological examinations for any suspicious ovarian lesions detected by MRI. Cohort 1 cases (n=101) were included as the training set. Radiomics features were obtained to develop a radscore. A nomogram combining the radscore and clinical factors was built to detect SOM. The bootstrap method was carried out in cohort 1 as internal validation. External validation was carried out in cohort 2 (n=46). Receiver operating characteristic (ROC) curve analysis, decision curve analysis (DCA) and the confusion matrix were utilized to assess the performances of the radscore, nomogram and subjective evaluation model.

Results

The nomogram, which combined age and the radscore, displayed a higher AUC than the radscore and subjective evaluation (0.910 vs 0.827 vs 0.773) in the training cohort. In the external validation cohort, the nomogram also had a higher AUC than the radscore and subjective evaluation (0.850 vs 0.790 vs 0.675). DCA and the confusion matrix confirmed the nomogram was superior to the radscore in both cohorts.

Conclusions

This pilot study showed that a nomogram model combining the radscore and clinical characteristics is useful in detecting SOM in female GC cases. It may be applied to improve clinical treatment and is superior to subjective evaluation or the radscore alone.

多模态 MRI 在特发性肛瘘诊断中的价值

谢光友
贵州省人民医院

目的 探讨多模态 MRI 在诊断特发性肛瘘中的价值。**方法** 收集我院确诊的 135 例肛瘘患者的资料, 112 例特发性肛瘘被纳入研究, 均行 MRI 平扫、DWI、动态增强检查及手术, 以手术结果作为诊断标准, 采用 McNemar 检验比较平扫、平扫联合增强检出内口、瘘管和脓肿的准确率, $P < 0.05$ 为差异有统计学意义。MRI 评价指标: ①瘘口、瘘管及脓肿的位置与数量; ②感染是否累及直肠壁、肛提肌, 是否伴直肠阴道瘘; ③瘘管的 T2 信号与动态强化特点; ④肛瘘 MRI 分级。**结果** 112 例中男、女性各 96、16 例, 平均年龄 (35.2 ± 9.5) 岁。手术探及内口 180 个, 瘘管 227 条。平扫检出内口 158 个, 瘘管 202 条。平扫联合增强检出内口 169 个, 距肛缘平均 (28.74 ± 9.36) mm, 瘘管 213 条。手术、平扫、DWI、平扫联合增强均检出脓肿 109 个。与手术结果比较, 平扫, 平扫联合增强检出内口、瘘管及脓肿的准确率无明显差异 ($P > 0.05$)。28 例直肠壁、22 例肛提肌受累, 3 例伴直肠阴道瘘。瘘管 T2 信号与强化: ①31 条明显高信号、外缘强化; ②76 条高信号、明显强化; ③41 条低信号、延迟强化; ④65 条信号混杂、强化不均。肛瘘 MRI 分级 1~5 级分别为 14、37、31、22、8 例。**结论** 多模态 MRI 检查可清晰显示肛瘘, MRI 平扫、平扫联合增强检出内口、瘘管和脓肿的准确率无明显差异, 但动态增强有助于判断瘘管的活动性。

PU-0826

多模态 MRI 定量参数诊断肝细胞癌 Ki67 的价值

许岂豪¹、刘佳荟³、刘爱连^{1,2}、赵莹¹、任雪¹
1. 大连医科大学附属第一医院
2. 大连市医学影像人工智能工程技术研究中心
3. 大连医科大学医学影像学院

目的 多模态 MRI 定量参数术前预测肝细胞癌(HCC)Ki-67 状态的价值。

方法 收集我院术后病理证实为 HCC 且 Ki-67 信息完整的 21 例患者, 按照 Ki-67 状态, 分为低表达(标记指数 $\leq 10\%$)组(10 例)和高表达(标记指数 $> 10\%$)组(11 例)。所有患者均接受腹部磁共振检查, 包括 T1WI、T2WI、扩散峰度成像(DKI)、增强 T2*加权血管成像(ESWAN)、体素内不相干运动扩散加权成像(IVIM-DWI)。在 GE AW4.6 工作站, 对 DKI、ESWAN、IVIM-DWI 图像进行后处理, 得到 FA、MD、Da、Dr、FAK、MK、Ka、Kr、Magnitude、Phase、R2*、T2*、standard ADC、D Mono、D* Mono、f Mono、D Bi、D* Bi、f Bi、DDC 和 α 。参照 T2WI 图像放置 ROI。采用 SPSS 26.0 及 medcalc 软件进行分析。Mann-Whitney U 检验进行比较。有统计学差异者 ($P < 0.05$) 进行受试者操作特性曲线(ROC)分析以评估预测性能。

结果 高表达组的 Dr、T2*、standard ADC 和 DDC 均低于低表达组, 高表达组的 R2*高于低表达组, 差异具有统计学意义($P < 0.05$)。Dr、R2*、T2*、standard ADC 和 DDC 预测 HCC Ki-67 表达的 AUC 分别为 0.823、0.882、0.873、0.864 和 0.836。Dr、R2*、T2*、standard ADC 和 DDC 联合后, 效能提升至 0.936。

结论 高 Ki-67 HCC 组的 DDC 值低于低 Ki-67 HCC 组, DDC 表示平均扩散速率, 癌细胞增殖迅速, 细胞密度高, Ki-67 水平高时细胞排列紧密, 导致细胞外空间减少, 水分子扩散受限。高 Ki-67 HCC 组的 R2*显著高于低 Ki-67 HCC 组, 这可能是由于高 Ki-67 HCC 组的新生血管形成更畸形和代谢水平较高, 导致肿瘤处于相对缺氧状态。综上所述, 多模态 MRI 定量参数在预测 HCC 患者

Ki-67 状态有较高效能, 提示功能 MRI 的定量参数对临床实践中术前无创准确预测预后相关指标有一定价值。

PU-0827

胰头部 Castleman 病一例并文献复习

睢争妍、杜战卫、殷静静、赵建英
黄河水利委员会黄河中心医院

目的 分析胰头部 Castleman 病的 CT 和 MRI 表现特征, 提高诊断正确性, 加强对胰头部占位的鉴别诊断。 **方法** 通过 1 例胰头部 Castleman 病例回顾国内外相关报道, 总结胰头区 Castleman 病的 CT 和 MRI 影像特征。 **结果** 患者以无诱因肝区隐痛、厌油、身黄、目黄、小便黄为主要表现, 实验室检查肝功异常, 影像学检查见胰头区富血供肿瘤, 最大径约 5.4cm, 术中探查见一不规则红色实性包块紧密生长, 邻近腹膜后多组反应性淋巴结增生, 术后病理提示透明血管型 Castleman 病。 **结论** 胰头区 Castleman 病是罕见的淋巴组织增生性疾病, 临床表现及 CT、MRI 表现均无明显特异性, 术前诊断较为困难, 误诊率极高, 确诊依赖病理组织学检查, 其治疗以手术为主, 疗效显著。

PU-0828

Differential diagnosis of duodenal papillary adenoma and duodenal papillary carcinoma

Junwei Gong, Qi Li, Tianyou Luo
The First Affiliated Hospital of Chongqing Medical University

Purpose: To investigate the differential clinical and imaging features between duodenal papillary adenoma (DPA) and duodenal papillary carcinoma (DPC).

Methods: CT findings and clinical data of 60 patients with DPA and 80 patients with DPC were retrospectively analyzed. Observation and measuring of direct duodenal papilla signs (including size, shape, density, enhancement characteristics, and feeding artery), indirect duodenal papilla signs (including pancreaticobiliary dilatation, stenosis pattern of the lower end of common bile duct) and clinical features (including age, gender, tumor markers CA19-9, CA125, CEA, blood routine white blood cell count, bilirubin, jaundice and gastrointestinal symptoms) were carried out according to CT as well as statistical analysis.

Results: For clinical characteristics, older age, higher level of CA19-9, total bilirubin, and direct bilirubin were more common in DPC (all $p < 0.05$). No significant differences in gender, CEA, CA125, white blood cell count, jaundice, and gastrointestinal symptoms were observed between the groups (all $p > 0.05$). With regard to CT features, lobulated tumor morphology, feeding artery, and bird-bill-like stenosis of the lower end of common bile duct were more commonly seen in DPA, while regular tumor morphology, target sign, straight truncation of the lower end of common bile duct, larger diameter of common bile duct and pancreatic duct, and higher total bilirubin and direct bilirubin were more frequently observed in DPC (all $p < 0.001$). No significant differences in the maximum transverse diameter of tumor, CT value of plain scan and each phase after enhancement, enhancement uniformity, and cup-like filling defect of the lower end of common bile duct were observed between the groups (all $p > 0.05$).

Conclusions: DPA and DPC have different clinical and imaging characteristics. An adequate understanding of these differential features can contribute to the early diagnosis of DPA and DPC and the subsequent therapeutic strategy.

PU-0829

Multi-b-value diffusion-weighted imaging to evaluate the synergistic anti-proliferation and anti-heterogeneity effects of bufalin plus sorafenib in an orthotopic HCC model

Ran Guo¹, Fang Lu², Jiang Lin³, Caixia Fu⁴, Mengxiao Liu⁵, Shuohui Yang¹

1. Shanghai Municipal Hospital of Traditional Chinese Medicine, Shanghai University of Traditional Chinese Medicine

2. Shuguang Hospital Affiliated to Shanghai University of Traditional Chinese Medicine

3. Zhongshan Hospital, Fudan University

4. MR Application Development, Siemens Shenzhen Magnetic Resonance Ltd

5. MR scientific Marketing, Diagnostic Imaging, Siemens Healthineers Ltd

Background Multi-b-value diffusion-weighted imaging (DWI) with different postprocessing models, allows for simultaneous reflection of hepatocellular carcinoma (HCC) proliferation, heterogeneity characterization and evaluation of feasible treatment strategies. We aim to assess synergistic effects of bufalin plus sorafenib in orthotopic HCC-LM3 xenograft nude mice models by using DWI of intravoxel incoherent motion (IVIM), diffusion kurtosis imaging (DKI), a stretched exponential model (SEM) and a fractional-order calculus (FROC) model.

Methods Twenty-four orthotopic HCC-LM3 xenograft mice were divided into bufalin plus sorafenib, bufalin, sorafenib treatment groups, and control group. Multi-b-value DWI was performed using a 3T MR scanner after three weeks' treatment to obtain true diffusion coefficient D_t , pseudo-diffusion coefficient D_p , perfusion fraction f , mean diffusivity (MD), mean kurtosis (MK), distributed diffusion coefficient (DDC), heterogeneity index α , diffusion coefficient D , fractional order parameter β , and microstructural quantity μ . Necrotic fraction (NF), micro-vessel density (MVD), and standard deviation (SD) of hematoxylin-eosin staining were evaluated. Correlations of DWI parameters with histopathological results were analysed, and all measurements were compared among the four groups.

Results In the final 22 mice, f was positively correlated with MVD ($r=0.679$, $p=0.001$). Significantly good correlations of MK ($r=0.677$), α ($r=-0.696$), and β ($r=-0.639$) with SD were observed (all $p<0.01$). f , MK, MVD and SD were much lower, while MD, α , β and NF were higher in bufalin plus sorafenib group than control group (all $p<0.05$). **Conclusion** Evaluated by IVIM, DKI, SEM and FROC, bufalin plus sorafenib treatment was found to inhibit tumor proliferation and reduce spatial heterogeneity in HCC-LM3 models.

朱丽平

徐州医科大学附属医院

混合瘤是指两种明显不同且不相关的肿瘤类型出现在同一器官的同一部位，形成一个单独的病灶的现象。IVLBCL 在实体瘤，如卵巢癌和乳腺癌，胃肠道间质瘤和血管肿瘤，如血管瘤、淋巴管瘤、血管脂肪瘤中的研究。肾内的混合性肿瘤包括 RCC 与集合管癌、尿路上皮癌和 Burkitt 淋巴瘤并存。肾脏表现为肾细胞癌伴广泛血管内淋巴瘤，它被认为是 IVLBCL，但在本例中，它与 DLBCL 相关联。此次报告 IVLBCL 并发肾癌，作为一个罕见的混合肿瘤表现为一个孤立的肾脏肿块。这个病例不同于以前的病例，因为在我们的病例中，病人没有其他已知的淋巴瘤，并且最初的诊断是在肾脏病变上做出的。

基于 CT 图像纹理分析鉴别肾上腺乏脂性腺瘤与肾上腺转移瘤的价值研究

肖国庆

湖州市中心医院

【摘要】目的 探讨基于 CT 图像的纹理分析鉴别乏脂性肾上腺皮质腺瘤及肾上腺转移瘤的价值。方法 回顾性分析 2015 年 12 月至 2020 年 12 月皖南医学院经手术病理及长期随访证实的共 142 例乏脂性肾上腺皮质腺瘤与肾上腺转移瘤患者完整资料，根据病理及随访结果分为腺瘤组 (n=89) 与转移瘤组 (n=53)，按照 7: 3 比例随机将患者分为训练组 (n=101) 及验证组 (n=41)。所有患者均行腹部 CT 增强扫描。使用 ITK-SNAP 软件分别手动逐层勾画平扫及三期 CT 图像上肿瘤感兴趣区 (ROI)，并进行三维融合，然后导入 AK 软件提取纹理特征；利用最小冗余最大相关 (mRMR) 和最小绝对收敛和选择算子 (LASSO) 回归分析进行特征选择并建立影像组学标签，绘制受试者工作特征 (ROC) 曲线评价模型的鉴别能力；应用决策曲线分析 (DCA) 评估模型的临床价值。结果 CT 平扫、动脉期、静脉期、延迟期和多期相扫描联合模型在训练组和验证组中鉴别乏脂性肾上腺皮质腺瘤和肾上腺转移瘤曲线下面积 (AUC) (95%CI) 分别为 0.94 (0.90-0.99) 和 0.94 (0.88-1.00)、0.92 (0.86-0.97) 和 0.94 (0.87-1.00)、0.95 (0.92-0.99) 和 0.96 (0.92-1.00)、0.93 (0.88-0.98) 和 0.93 (0.85-1.00) 以及 0.97 (0.94-1.00) 和 0.98 (0.95-1.00)。DAC 显示 CT 平扫、动脉期、静脉期、延迟期和多期相扫描联合模型均具有较高鉴别乏脂性肾上腺皮质腺瘤和肾上腺转移瘤的效能。结论 常规 CT 平扫+增强各期模型和多期联合模型均具有很高鉴别乏脂性肾上腺皮质腺瘤与肾上腺转移瘤的效能，其中多期联合模型的诊断效能最高，对两者疾病的鉴别诊断最具有临床意义，为研究二者之间的鉴别诊断提供了一种新的定量分析方法。

门静脉 CTA 影像特征在肝硬化门静脉高压中的应用价值

杨吟霜

徐州医科大学附属医院

目的：门静脉高压（PH）是晚期慢性肝病（ACLD）的一个关键特征，它在很大程度上决定了 ACLD 患者肝脏相关并发症的发展及其死亡风险。目前，HVPG（肝静脉压力梯度）是监控门静脉高压的金标准，但 HVPG 检测是有创的，并且具有严重的并发症。因此限制了 HVPG 在门静脉高压检测中的广泛应用。肝脏血管检查(CTA) 检测速度快，无创并且重复性高，是评估门静脉高压常用影像学手段，在临床上应用十分广泛。因此，本研究旨在探究门静脉 CTA 的影像特征在评估肝硬化门静脉高压中的应用价值，为门静脉高压的诊断和治疗提供新的评估手段。

方法：选取 2017 年 9 月 1 日至 2022 年 9 月 1 日于徐州医科大学附属医院就诊的肝硬化门静脉高压患者。测量每位患者在 HVPG 测定 1 周内的门静脉 CTA 影像特征（包括门静脉主干宽度，脾静脉宽度、门静脉与脾静脉宽度比值，脾最大横径以及肝脏和脾脏体积）。根据 HVPG 将门静脉高压患者分为门静脉压正常组（HVPG≤6 mmHg）和门静脉高压组（HVPG>6mmHg）。肝硬化纳入标准符合《肝硬化诊治指南》，HVPG 的测定符合《中国肝静脉压力梯度临床应用专家共识（2018 版）》。对两组患者一般临床资料进行分析。采用单因素和多因素逻辑回归筛选诊断门静脉高压的独立危险因子。ROC 曲线下面积（AUC）评估门静脉 CTA 影像特征在评估门静脉高压中的准确度和诊断价值。

结果：对门静脉压正常组和门静脉高压组的基线分析，两组的门静脉 CTA 影像特征之间差异存在统计学差异。单因素和多因素逻辑回归分析门静脉主干宽度是门静脉高压的独立影响因子，可以作为一种评估门静脉高压的参考指标。ROC 曲线下面积（AUC）提示门静脉 CTA 影像特征具有较好的诊断效能。

结论：CT 门静脉成像对于观察门静脉和脾静脉宽度、走行及形态特点具有巨大优势,可以作为评估门静脉高压的一种手段,对病情评估和预后判断具有重要价值。

腹膜假粘液瘤 1 例

李博

徐州医科大学附属医院

腹膜假性粘液瘤，又称 PMP 综合症，分为原发性和继发性改变，大多数为恶性肿瘤的腹膜种植或良性囊肿破裂刺激腹膜所致的继发性病变，以腹腔内大量黏液性物质积聚和腹膜多发黏液性肿物为特征。1991 年 Young 等人指出 PMP 相关的病变实际继发于阑尾，阑尾粘液肿瘤被认为是 PMP 的主要原发灶，少数来源于卵巢、结肠、胰腺等。PMP 蔓延方式存在着三种假设：①通过人体解剖结构中的间隙扩散：腹膜液体的回流途径是主要途径，同时在重力的作用下，可广泛累及腹腔、盆腔；②粘液囊肿破裂种植于腹膜和重新再分配现象；③肿瘤转移导致腹膜间皮细胞发生变异而大量繁殖且产生大量粘液所致。典型者表现为大量且透声差的不均质腹水，呈蜂窝状，随呼吸、体位可移动；液性区域分布范围广泛，可累及肝缘、脾缘、大网膜及盆腔，肠管受压移位，无漂浮感，其内可见分隔，肝周、脾周可形成压迹；部分瘤体内可见钙化强回声；累及网膜时，大网膜增厚明显，形成网膜饼。特征性的 CT 征象为腹盆腔脏器扇贝样压迹、腹盆腔分房粘液性团块、网膜、肠系膜浸润及网膜饼状改变，其中增厚的腹膜/网膜内粘液团块是腹膜假性粘液瘤最具特征性的征象；大量粘液形成时(CT 值近似水或略高)形似大量腹水，粘液多分布于前方网膜，使肠管不能到达前腹壁，改变体位无腹水流动现象；部分除了见到腹腔囊样包块外，还可显示原发灶及网膜、腹膜及肠系膜

浸润改变、腹膜后淋巴结肿大，并且可以侵犯实质器官，形成肝脾内浸润性病灶，很少通过血液或淋巴管向腹腔外转移。

PMP 术前诊断较难，超声、CT 及 MRI 等影像学方法在 PMP 诊断中虽得到应用，但尚需积累经验，主要因为缺乏特征性临床表现及特异的检查方法，临床常以腹痛、腹胀、腹部包块就诊，影像学常表现为腹腔大范围的液暗区，内结构紊乱，原发灶隐藏其中不易显示，难以与腹盆腔其它恶性肿瘤伴腹膜转移鉴别，尤其来源于卵巢及肠道的恶性肿瘤。

膀胱血管周上皮样细胞肿瘤 (PEComa)：病例报道及临床影像特征回顾

陈泽科¹、王效春²

1. 山西医科大学

2. 山西医科大学第一医院

摘要：血管周上皮样细胞肿瘤(perivascular epithelioid cell tumor, PEComa)被定义为一种间充质肿瘤，PEComa 家族包括血管平滑肌脂肪瘤、淋巴管平滑肌瘤病、透明细胞糖瘤和其他发生在不同部位的血管周围上皮样细胞来源的肿瘤。膀胱 PEComa 非常罕见。2023 年我院诊断膀胱 PEComa 1 例，现报道如下，并结合相关文献进行复习，以探讨其病理学特征、诊断、鉴别诊断和预后，以期进一步提高对该病的认识。

方法：回顾性分析本院 2023 年诊断的一例膀胱 PEComa 的临床表现、影像学特点，讨论其病理学特征、诊断、鉴别诊断和预后，并结合相关文献进行分析。

结果：患者，男，15 岁，体检发现膀胱占位性病变 1 周遂就诊于我院，影像 MRI 表现为：膀胱右上方占位，呈等长 T1 等短 T2 混杂信号影，DWI 序列呈部分高信号，病灶大小约：6.3cm*6.1cm*5.2cm（上下径*左右径*前后径），邻近膀胱受压，与膀胱壁分界不清。CT 表现为：膀胱右前壁混杂密度肿块影，边界清楚，腔内外生长，最大截面约：5.0cm*6.2cm，平扫 CT 值约 20-79HU，增强扫描呈明显不均匀强化，其内可见迂曲小血管影，周围脂肪间隙略模糊。

结论：膀胱血管周上皮样细胞肿瘤非常罕见，膀胱血管周上皮样细胞肿瘤在中青年患者中更常见，平均年龄 39 岁，男女比例为 1: 1.3。临床上多表现为泌尿道症状，排尿困难或下腹部不适，或肉眼血尿。但部分患者症状多不典型；或因痛经、亦或慢性骨盆疼痛就诊而发现，女性患者症状不随月经周期而改变。肿块常突出于膀胱腔内，也可呈外生性生长。在影像上，病灶大于 5cm 或观察到肿瘤边界浸润、肿瘤坏死、肿瘤周围血管侵犯等征象，常常提示恶性可能性大。

PU-0836

最小表观扩散系数值在鉴别透明细胞癌可能性评分 3 分病变中的价值

宁雪怡¹、郝雨薇^{1,2}、白旭¹、王海屹¹

1. 中国人民解放军总医院第一医学中心放射诊断科

2. 中国人民解放军总医院第六医学中心放射诊断科

目的：探讨磁共振扩散加权成像 (DWI) 最小表观扩散系数 (ADC) 值 (ADCmin) 在鉴别透明细胞癌可能性评分 (ccLS) 3 分病变中的价值。

方法：回顾性收集解放军总医院第一医学中心 2019 年 1 月至 2021 年 12 月 59 例经病理证实且 ccLS 评定为 3 分肾脏实性小肿瘤 (SRM) 患者的临床资料和 MR 检查资料。所有病例术前行磁共振 DWI 检查 (b 值=0, 800s/mm²)。由一名腹部放射学医师在肿瘤实性部分测量 ADCmin，使用

独立样本秩和检验比较 ccRCC 与非 ccRCC 病变 ADCmin 差异, 采用 ROC 曲线评估 ADCmin 在鉴别 ccLS 3 分病变中 ccRCC 与非 ccRCC 的诊断效能。

结果: 59 例患者 (59 个肿瘤) 平均年龄为 54.4 ± 11.6 岁, 男性 38 例 (64.4%), 女性 12 例 (35.6%)。其中 ccRCC 42 例, 乳头状肾细胞癌 2 例, 肾嫌色细胞癌 6 例, 肾血管平滑肌脂肪瘤 5 例, 肾嗜酸细胞腺瘤 4 例。在 ccLS 3 分 SRM 中, 非 ccRCC 病变的 ADCmin 显著低于 ccRCC 病变 [$1.220 (1.030, 1.405)$ vs $1.550 (1.190, 1.690) \times 10^{-3} \text{ mm}^2/\text{s}$, $P=0.01$]。使用 ADCmin 鉴别 ccRCC 与非 ccRCC 的最佳阈值为 $1.465 \times 10^{-3} \text{ mm}^2/\text{s}$, 诊断 ccRCC 的敏感度为 64.3%, 特异度为 88.2%。

结论: ADCmin 可高特异性鉴别 ccLS 3 分 SRM 中 ccRCC 与非 ccRCC 病变, 或可提高 ccLS 系统对于 ccRCC 的诊断效能。

PU-0837

胃癌影像组学研究进展

董玉莹

徐州医科大学附属医院

目的: CT 已被广泛应用于胃癌的鉴别诊断、术前评估和治疗评价, 与传统的影像不同, “影像组学”能够提取疾病的潜在特征, 具体显示从影像图像中提取大量的纹理、密度、形态和滤波等特征, 然后进行特征选择, 最终利用选择出的影像组学特征建立预测模型, 为个性化精准医疗量化提供客观依据。本文旨在探讨在 CT 影像组学在胃癌各方面的最新进展。

方法: 通过中英文文献数据库, 搜索胃癌相关的影像组学文献, 总结影像组学在胃癌诊疗中的最新进展。

结果: 在过去的研究中, 影像组学已经被证明对胃癌的鉴别诊断、分型、淋巴结转移、腹膜转移预后判断等方面具有重要价值。

结论: 胃癌是我国常见的恶性肿瘤, 其发病率和死亡率占有所有恶性肿瘤的第三位。目前我国胃癌患者 5 年生存率约在 35%, 明显低于日本和韩国, 由于日本推行全民早期胃癌筛查, 大约 80% 的胃癌患者都为早期患者, 而我国胃癌患者大多是晚期患者。Sun 等通过三期增强 CT 图像联合深度学习影像组学特征、结节状突起征、脂肪浸润征和高强化浆膜征等影像征象构建的诺谟图, 其鉴别 cT3 与 cT4a 期的效能(AUC)达到 0.90。Pan 等另辟蹊径, 分析胃癌病人的脾脏影像组学特征预测浆膜浸润情况, 联合术前血红蛋白水平和血小板 / 淋巴细胞比例等血液学指标, 其在验证组的诊断效能(Auc)为 0.837。影像组学预测模型对预测胃癌淋巴结转移情况具有较好的准确性, 然而使用的方法不同, 预测模型的 AUC 值会有所不同, 其中 Yang 等提取了胃癌病灶和淋巴结的 CT 影像组学特征, 并用序列向前特征选择的方法筛选影像组学特征建立的预测模型的 AUC 值最高。Dong 等提取了胃癌病变和腹膜区域的 CT 门脉期的影像组学特征, 通过多元逻辑回归分析, 建立了 1 个结合影像组学特征和胃癌 Lauren 分型的预测模型得到较高的 AUC 值。部分研究探究影像组学对于新辅助化疗后肿瘤降期的预测表现。原发性胃淋巴瘤和胃间质瘤是需要与胃癌鉴别的胃部常见肿瘤, 有研究利用病理全视野数字切片迁移的深度学习模型来鉴别病人的 CT 图像, 构建包括迁移学习影像组学在内的复合模型对于鉴别 BorrmannIV 型胃癌与 PGL 有良好的效能。

PU-0838

A clinical-radiomics nomogram based on dual-layer spectral detector CT to predict pancreatic ductal adenocarcinoma stage

Linxia Wu, Ping Han, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology,

Objectives: To evaluate the performance of radiomics signatures based on polyenergetic images (PEIs) and virtual monoenergetic images (VMIs) obtained from dual-layer spectral detector CT (DLCT) and to build a clinical-radiomics nomogram for predicting the cancer stage (early stage: stage I-II, advanced stage: stage III-IV) of pancreatic ductal adenocarcinoma (PDAC).

Materials and Methods: A total of 173 patients with PDAC who underwent contrast-enhanced DLCT were enrolled. Radiomics features were extracted from PEI and 40 keV VMI, which were reconstructed at the arterial phase as well as the portal venous phase. LASSO regression was performed to construct PEI-based and 40-keV VMI-based radiomics signatures. A radiomics nomogram was developed by combining the 40-keV VMI-based radiomics signature and selected clinical predictors. Receiver operating characteristic (ROC) curves, calibration curves and decision curve analysis (DCA) were utilized to assess the performance of the nomogram on discrimination, calibration and clinical utility, respectively.

Results: Among 173 patients (mean age, 61 years \pm 9 [SD]; 106 male), 49 were in the early stage, and 124 were in the advanced stage. All patients were randomly categorized into training (n=122) and test (n=51) cohorts at a 7:3 ratio. The PEI-based radiomics signature had AUCs of 0.92 in both the training and test cohorts, while the 40-keV VMI signature had AUCs of 0.96 and 0.94, respectively. The 40-keV VMI-based nomogram achieved favourable calibration and discrimination in the training cohort (AUC, 0.97) and test cohort (AUC, 0.91). The clinical-radiomics nomogram exhibited the best clinical benefit by DCA.

Conclusion: The DLCT-based clinical-radiomics nomogram combined 40-keV VMI-based radiomics signature with two clinical parameters (tumor diameter and normalized iodine density at portal venous phase) showed outstanding performance for stratifying early from advanced stages of PDAC, which could help clinical decision-making in the management of PDAC patients.

PU-0839

卵巢静脉综合征病例分析 1 例

胡梦雪

徐州医学大学

背景卵巢静脉综合征(OVS)是一种罕见的疾病,由卵巢静脉曲张、扩张引起慢性输尿管梗阻。OVS的临床症状包括肾绞痛、尿肾萎缩、肾下垂、胃痛、慢性腰痛、部分患者甚至肾功能受损。卵巢静脉增粗压迫邻近输尿管后,导致其慢性梗阻,造成输尿管“通而不畅”引起泌尿系多发结石和反复肾盂肾炎,如果得不到准确的诊断,患者往往长期经受病痛折磨,甚至多次手术治疗,更有甚者引起肾功能不全,导致严重后果。OVS 很难诊断,目前最主要的诊断方法是影像学检查。

PU-0840

Imaging characteristics of clear cell papillary renal cell carcinoma: Identifying the sheep in wolf's clothing

Shunfa Huang¹, Qiying Tang¹, Yuqin Ding², Jianjun Zhou^{1,2}

1. Zhongshan Hospital(Xiamen), Fudan University

2. Zhongshan Hospital, Fudan University

Objective: This study aimed to describe the characteristics of computed tomography (CT) and magnetic resonance imaging (MRI) of clear cell papillary renal cell carcinoma (CCPRCC).

Methods: This retrospective study comprised 27 patients diagnosed with 29 tumors of CCPRCC. The study was approved by the Medical Ethics Committee and the requirement for the informed consent was waived. The inclusion criteria stipulated pathology-confirmed CCPRCCs with at least one preoperative imaging examination, including CT or MRI. Two experienced radiologists independently analyzed the imaging characteristics, including size, location, growth mode, morphology, texture, density, and enhancement pattern. Paired t-test was used to compare differences in CT Hounsfield unit values and apparent diffusion coefficient (ADC) imaging between the tumor and the renal cortex.

Results: The mean age of the 27 patients was 57.0 ± 14.2 years. Nineteen patients underwent CT, while 12 underwent MRI. Among the cases, 26 (96%) were single, and 1 (4%) was multiple, consisting of three lesions. Out of the 29 tumors, 15 (52%) were located in the left kidney and 14 (48%) in the right kidney. The mean tumor diameter was 3.3 ± 1.7 cm. Furthermore, 19 (66%), 3 (10%), and 7 (24%) tumors were solid, cystic, mixed solid, and cystic type, respectively. The growth mode was endogenous and exogenous in 8 (28%) and 21 (72%) tumors, respectively. The tumor shape was irregular and round in 5 (17%) and 24 (83%) tumors, respectively. The CT value of the tumor was approximately 33.2 ± 9.8 HU, which was not significantly different from that of the renal cortex (31.1 ± 6.3 HU) ($p = 0.343$). Furthermore, 7 (24%), 12 (41%), and 3 (10%) had calcification, cystic degeneration, and hemorrhage, respectively. In 12 tumors, hypointense and hyperintense were predominant on T1 and T2-weighted images, respectively. The tumor capsule was found at the edge of 12 tumors. The average ADC value of the tumor ($1.54 \pm 0.74 \times 10^{-3} \text{ mm}^2/\text{s}$) and that of the renal cortex ($1.68 \pm 0.63 \times 10^{-3} \text{ mm}^2/\text{s}$) was not statistically significantly different ($p = 0.260$). The enhancement scanning revealed "wash-in and wash-out" enhancement in 19 (68%) tumors, continuous or progressive enhancement in 6 (21%) tumors, and enhanced cystic wall and central separation in 3 (11%) tumors.

Conclusions: CCPRCC occurs more likely in middle-aged and elderly individuals, and the tumor is prone to cystic degeneration, with rare bleeding and calcification, and no obvious limitation on MRI diffusion-weighted imaging, which enhancement form performs as mainly "wash-in and wash-out," but the final diagnosis depends on histopathology.

PU-0841

基于 CT 肝细胞外体积分数对门静脉高压症术后再出血的预测价值

杨鑫、王文剑、傅剑雄、孙骏、叶靖、蒋国庆、罗先富
苏北人民医院

目的: 探讨 CT 肝细胞外体积分数 (ECV) 预测肝硬化门静脉高压症术后胃底食管静脉再出血的价值。

方法: 回顾性分析 154 例门静脉高压患者行经腹腔镜脾切除联合贲门周围血管离断术 (LSD) 的患者 CT 增强图像。所有病人在术前均行腹部增强 CT 检查, 经过术后一年的随访, 将患者分为再出血组和非再出血组。选取延迟期图像, 分别测量肝脏、脾脏及主动脉的增强前后 CT 值, 计算肝脏及脾脏细胞外体积分数 (ECV)。比较 ECV 在再出血与非再出血组之间差异。通过多因素分析筛选再出血相关危险因素。构建 ECV 及联合临床参数模型, 使用受试者工作曲线下面积 (AUC) 评估构建模型的预测效能。

结果: LSD 术后再出血组肝脏 ECV 值显著低于非再出血组 ($32.0 \pm 4.5\%$ vs. $39.9 \pm 4.0\%$, $P < 0.0001$)。再出血组脾脏 ECV 低于非再出血组 ($42.1 \pm 7.5\%$ vs. $46.2 \pm 6.8\%$, $P = 0.002$)。凝血酶原时间 (PT)、纤维蛋白原 (FIB)、肝脏 ECV 是患者发生术后再出血的独立危险因素, 其再出

血的诊断效能 AUC 值分别为 0.711, 0.724, 0.923。肝脏 ECV 联合模型 AUC 值为 0.963, 与肝脏 ECV 模型无统计学差异。

结论: 肝脏 ECV 能有效预测门静脉高压患者 LSD 术后再出血的发生, 优于 PT、FIB 实验室检查参数。

PU-0842

联合 DWI 及肝胆期低信号的新模型对小肝癌诊断价值研究

董红晓¹、周智鹏²

1. 贺州广济医院

2. 桂林医学院附属医院

目的: 探讨基于联合 DWI 高信号及肝胆期低信号的诊断模型对小肝癌的诊断效能。方法: 回顾性分析 50 名行钆塞酸二钠增强磁共振发现肝内直径 $\leq 3\text{cm}$ 的局灶性病变并获得病理结果或临床随访确诊的患者, 共 95 例肝脏结节。由 2 名医师共同评估每个患者肝脏结节数目、直径、部位及影像征象。制定三种诊断模型, 模型一为“动脉期非环形高强化+门静脉期廓清(低信号)”, 模型二为“动脉期非环形高强化+门静脉期廓清(低信号)+肝胆期低信号”, 模型三为“动脉期非环形高强化+门静脉期廓清(低信号)+肝胆期低信号+DWI 高信号”, 分析三种模型对小肝癌的诊断灵敏度、特异度及准确度, 最后通过受试者工作特征 ROC 曲线获得曲线下面积 AUC 评估各模型性能。结果: 研究纳入的 95 例结节包括肝细胞癌 63 例, 占比 62.32%, 非 HCC 32 个(包括胆管细胞癌 2 个、肝脏不典型增生结节 4 个、肝脏局灶性脂肪变性 1 个、肝脏神经内分泌肿瘤 1 个、血管平滑肌脂肪瘤 1 个、转移瘤 2 个及临床随访诊断良性结节 21 个), 占比 37.68%。在肝细胞癌诊断中, 模型一的诊断灵敏度、特异度、准确度及 AUC 分别为 55.56% (35/63)、84.36% (27/32)、65.26% (62/95)、0.700(95%CI: 0.592-0.808), 模型二的诊断灵敏度、特异度、准确度及 ROC 曲线下面积分别为 88.89% (56/63)、68.75% (22/32)、82.11% (78/95)、0.757(95%CI: 0.644-0.871), 模型三的诊断灵敏度、特异度、准确度及 ROC 曲线下面积分别为 85.71% (54/63)、81.25% (26/32)、84.21% (80/95)、0.835(95%CI: 0.742-0.928), 三种模型中, 模型二、模型三诊断灵敏度均较模型一明显提高, 模型二诊断特异度明显降低, 加入 DWI 高信号的模型三较模型一特异度则未见明显降低。通过勾画、对比 ROC 曲线, 模型三具有更高的 AUC 值。结论: 在小肝癌的诊断中, 联合肝胆期低信号及 DWI 高信号的新诊断模型较传统“动脉期非环形高强化+门静脉期廓清(低信号)”的诊断标准具有更高的诊断效能。

PU-0843

GRASP DCE-MRI 在鉴别子宫内膜良恶性病变的价值

王亚玲

东南大学附属中大医院

目的

本研究的目的是前瞻性地评估定量 DCE 参数, 包括 K_{trans} 、 K_{ep} 、 V_e 对子宫内膜肿瘤患者的价值, 尤其是对于小于 5mm 的病变的检出, 此外, 还讨论了有统计学意义参数鉴别良恶性病变的参考值。

方法

从 2020 年 8 月报 2020 年 11 月 88 名临床怀疑女性盆腔恶性病变的患者(女性, 平均年龄 54.5 岁, 范围 27-81 岁)被纳入本研究。所有 MR 检查均在 3T MRI 扫描仪(MAGNETOM Vida, Siemens Healthcare, Erlange, Germany)上进行。包括常规平扫序列及动态增强序列, 扫描参数: $\text{TR/TE} = 4.1/1.86/\text{ms}$, 层厚 = 3mm, 层数 = 40, $\text{FOV} = 240 \times 240\text{mm}^2$, 矩阵 = 224×224 , 体素 =

1.1 × 1.1 × 3.0 mm³, 总采集时间 = 5min38sec。评估 GRASP MRI-DCE 定量参数包括 K_{trans}、K_{ep}、V_e 的敏感性和特异性。

结果

本研究中分别有 69 例良性子宫内膜病变和 19 例子官内膜恶性病变患者。良性组的 K_{ep} 值显著低于恶性组 ($0.627 \pm 0.673 \text{ min}^{-1}$ v.s. $1.412 \pm 1.143 \text{ min}^{-1}$; $p < 0.05$)。K_{ep} 值的 ROC 曲线下面积为 0.82, 最佳 cutoff 值是 0.527 min^{-1} (敏感性:0.95, 特异性:0.61)。此外良性组的 V_e 值略高于恶性组, (0.340 ± 0.198 v.s. 0.147 ± 0.057 ; $p < 0.05$)。V_e 值的 ROV 曲线下面积是 0.85, cutoff 值是 0.206, (敏感性:0.81, 特异性:0.90)。两组的 K_{trans} 值无统计学意义 ($0.157 \pm 0.134 \text{ min}^{-1}$ v.s. $0.231 \pm 0.233 \text{ min}^{-1}$; $p > 0.05$)。

结论

DCE-MRI 的定量参数为描述患者血流动力学提供了一种新的、无创的方法, 结果表明, 良性组的 K_{ep} 值低于恶性组, 而良性组的 V_e 值高于恶性组, 但 K_{trans} 值在两组之间没有统计学差异。GRASP DCE-MRI 可同时获得较高的空间和时间分辨率, 提高小病灶的检出率。

基于增强 CT 影像组学和机器学习预测胆囊息肉样病变性质的应用价值研究

尹胜男、金龙、丁宁、计一丁、李梦娟
苏州市第九人民医院

目的 基于不同病理类型的胆囊息肉样病变预后差异显著, 目前治疗指南颇受争议。探讨不同机器学习的影像组学模型预测胆固醇性胆囊息肉和腺瘤性胆囊息肉的价值。**方法** 回顾性分析 2015 年 9 月至 2022 年 9 月苏州市第九人民医院的 100 例经手术病理证实的胆固醇性息肉和腺瘤性息肉患者的临床及影像资料。纳入标准: (1) 病灶直径 8-20mm 的 PLG 患者; (2) 术前 2 周内行上中腹部 CT 平扫及增强扫描; (3) 术后病理证实为胆固醇性胆囊息肉或腺瘤性胆囊息肉。分为胆固醇性息肉组 58 例和腺瘤性息肉组 42 例。基于术前门静脉期增强 CT 提取的影像组学特征, 训练集采用 T 检验和最小绝对收缩和选择算子交叉验证法进行特征筛选。然后用 3 种机器学习方法 (人工神经网络、逻辑回归和支持向量机) 构建预测模型, 利用 ROC 曲线下面积、准确率以及 F1 度量值评估 3 种模型的预测能力, 并通过验证集进行验证。最后, 通过 5 次 4 折交叉验证评估模型, 得到 20 个模型得分, 取平均值进行评价。结果 人工神经网络算法在基于 10 个影像组学特征的息肉病变性质鉴别模型中预测效果最好, 具有最高的曲线下面积 (训练集为 1; 验证集为 0.81)、准确率 (训练集为 1; 验证集为 0.83) 及 F1 度量值 (训练集为 1; 验证集为 0.76)。10 个影像组学特征中, 基本特征 1 个、小波特征 9 个。各个模型分别经过 5 次 4 折交叉验证评估所得人工神经网络模型得分平均值 0.72, 支持向量机模型得分平均值为 0.76, 逻辑回归模型得分平均值为 0.72。**结论** 基于增强 CT 的机器学习影像组学模型有助于预测胆固醇性胆囊息肉和腺瘤性胆囊息肉的病变性质, 为两者的术前定性诊断及治疗方式的选择提供更加可靠的依据。

Radiomic Shape Features Based on Intravoxel Incoherent Motion to Evaluate the Renal Function in Chronic Kidney Disease

Yue Wang¹, Ye Ju¹, Nan Wang¹, Liangjie Lin², Jiazhen Wang², Qingwei Song¹, Ailian Liu¹

1. First Affiliated Hospital, Dalian Medical University

2. MSC Clinical & Technical Solutions, Philips Healthcare, Beijing, 100600, China

Objective:

To explore the value of radiomic shape features based on intravoxel incoherent motion (IVIM) in evaluation of the renal function in chronic kidney disease (CKD).

Methods:

We retrospectively collected 27 CKD patients who underwent 3.0 T MRI examination (including T2WI and IVIM sequences) in our hospital. According to their estimated glomerular filtration rate (eGFR), they were divided into mild renal damage group (mCKD: eGFR \geq 60 mL/min/1.73 m², 14 patients) and severe renal damage group (sCKD: eGFR $<$ 60 mL/min/1.73 m², 13 patients). The parametric maps of IVIM (D^* , D , f) were obtained using the prototype software (the Function tool MADC; GE Healthcare) at Advantage Workstation (version AW 4.6, GE Medical System). The volume of interests (VOIs) covering the entire kidneys were manually drawn slice by slice independently by two radiologists with 2 and 8 years of experience in abdominal imaging diagnosis using ITK-SNAP software (version 2.2.0, www.itksnap.org)(Figure 1). Shape features of D^* , D , f maps were extracted using AK software. The intraclass correlation coefficient (ICC) of shape features was used for the inter-observer agreement. Continuous variables were analyzed using the independent-samples t-test or the Mann Whitney U test according to the normality of data distribution. Receiver operating characteristic (ROC) curve analyses were performed to evaluate the diagnostic efficiency of these parameters.

Results:

A total of 42 shape features were obtained for each patient. The data consistency between the two observers was good (ICC value > 0.75). The least axis length, major axis length, maximum 2D diameter column, maximum 2D diameter row, maximum 2D diameter slice, maximum 3D diameter, mesh volume, minor axis length, surface area and voxel volume of D^* , D , and f maps in mCKD group were higher than those in sCKD ($P < 0.05$). The surface volume ratio of D^* , D , and f maps in mCKD group were lower than those in sCKD ($P < 0.05$). The elongation, flatness and sphericity of D^* , D , and f maps had no differences between two groups ($P > 0.05$)(Table 1). The maximum 2D diameter slice, minor axis length, surface area, surface volume ratio, voxel volume of D^* , D , and f maps, major axis length and minor axis length of D^* map, major axis length of D map and minor axis length of f map showed great diagnostic efficiency in evaluation of renal function in CKD (Table 2, Figure 2-4).

Conclusions:

Radiomic shape features based on IVIM could effectively evaluate the renal function in CKD. The quantitatively extracted shape parameters of D^* , D , and f maps showed great diagnostic efficiency in evaluation of renal function in CKD. The radiomic shape features based on IVIM can reflect the morphological and structural changes of kidneys, which may be associated with the functional changes of kidney and the progression of CKD, and also contributes to the determination of treatment plan, efficient monitoring of treatment and evaluation of prognosis of the disease.

PU-0846**Bilateral giant ovarian luteinized follicular cysts:
case report**

Bei Zhang,Xin Shi
First Hospital of Jilin University

Background: Bilateral ovarian luteinized follicular cysts are rarely described, not to mention full-term natural labour without cys_x0002_tectomy beforehand. One case will be presented in this report. **Case Report:** A 29-year-old woman had pelvic masses detected at 12 weeks of pregnancy. The main concerns were the safety of pregnancy, conservative management, and close review. She was admitted to the hospital again 30 days after childbirth. Ultrasound examination was performed as well as CT, which showed that there was multilocu_x0002_lar cystic low density in

abdomen without calcification. She accepted bilateral ovarian cystectomy and reconstruction. Postoperative pathological results led to the diagnosis of bilateral ovarian luteinized follicular cysts. Conclusion: CT imaging feature combined with medical history, hCG level or other imaging modality can be used for diagnosing it initially. The case we report will provide useful experience for the diagnosis of ovarian luteinized follicular cyst.

胰腺神经鞘瘤 1 例并文献复习

向晗

中国人民解放军陆军特色医学中心

目的 胰腺神经鞘瘤是一种罕见肿瘤，术前诊断非常具有挑战性。我们报道一例原发性胰腺神经鞘瘤并进行文献复习。

材料与方法 收集我院 2017 年 1 月 ~ 2023 年 5 月间经手术病理证实的 1 例胰腺神经鞘瘤的临床及影像资料。

病例资料 1 名 66 岁的女性患者因“上腹部胀痛不适半月余”就诊我院。患者既往有高血压病史 3+年，脑梗塞病史 15+年。体格检查及实验室检查未见异常。腹部 CT 提示胰腺体部上缘类圆形低密度影，直径约 1.3cm，增强扫描呈轻度延迟性强化。患者行“胰体尾切除术”，术后病理证实神经鞘瘤。术后 3 月随访，患者无任何不适，未见肿瘤复发。

讨论 胰腺神经鞘瘤 (pancreatic schwannoma, PS) 是胰腺的一种罕见肿瘤，源自迷走神经分支的自主性交感神经或副交感神经纤维，多为良性，单发，生长缓慢。发病年龄从 17-89 岁不等，无性别差异，多为单发，胰头部多见。临床表现无特异性。

组织学上有 2 种结构：Antoni A 区和 Antoni B 区。免疫组织化学染色：S-100 蛋白、弹性蛋白和 CD56 常为阳性。

影像表现：CT 平扫：病灶边界清晰，包膜完整，CT 值在 0-30 Hu，密度均匀/不均匀，约 2/3 PS 出现退行性变。增强：以 AntoniA 区为主时，呈中等度以上持续渐进性强化；以 Antoni B 区为主时，一般无明显强化。MRI：包膜完整，边界清晰，T1 加权上为低信号，T2 加权上为高信号，信号均匀/不均匀，DWI 弥散受限，增强强化同 CT。鉴别诊断包括：实性假乳头状肿瘤，囊性神经内分泌肿瘤和囊腺瘤等。治疗首选外科手术切除，大部分患者预后良好，没有复发或转移。

结论 术前诊断胰腺神经鞘瘤具有难度，当影像提示胰腺病变边界清楚，内部有囊变坏死，增强轻中度强化时，应考虑到神经鞘瘤的可能，但最终确诊还需组织病理学。

基于光谱 CT 成像技术及 CA125 对卵巢癌复发预测的研究

李娜

辽宁省肿瘤医院

目的：使用光谱 CT 多模态成像联合 CA125 预测复发转移风险；筛选最佳光谱 CT 图像、数据与其他临床信息作为预测卵巢癌复发的预测因子。**方法**：回顾性分析经手术病理证实的卵巢癌患者 80 例。治疗前后及过程中行全腹部增强光谱 CT 增强检查，评估常规 CT 图像，测量 CT 值，评估单能图像 40KeV、碘密度图，测量碘浓度值，勾画能谱曲线，由两位高年资医师阅读患者 CT 影像评估是否腹腔复发并检测患者血清 CA125 水平，判断是否复发。**结果**：原发肿瘤大小、肿瘤减灭术程度、CA125 相对变化率均与患者腹腔复发相关，能量成像中的单能图像、碘密度图较传统 CT 复发转移检出率高，差异均有统计学意义 (均 $P < 0.05$)。**结论**：光谱 CT 采用全新的能量成像模式，实现了“同源、同时、同向”的能量成像要求，其成像中的单能级图像、碘密度图、虚拟平扫及有效

原子序数图等可改善成像质量, 光谱 CT 联合 CA125 提高了卵巢癌腹膜转移、横膈转移、肠系膜转移、网膜转移、肠浸润、胃浸润、肝浸润等病变检出率。

PU-0849

胃癌患者术前淋巴血管浸润预测模型： 基于放射组学特征和临床特征

王苹、Wei Meng

Harbin Medical University Cancer Hospital

背景及目的：淋巴血管侵犯（LVI）是胃癌（GC）预后的独立危险因素，然而，LVI 还不能在术前确定。我们建立了一个基于对比增强计算机断层扫描（CECT）放射组学特征结合临床病理因素的模型，结合 Lauren 分型，评估胃癌患者的术前 LVI 状态。

方法：我们回顾性分析了 495 例胃癌患者，其中有 288 例为 LVI 患者。对提取的 CECT 特征进行标准化，然后进行一致性检验、相关分析、单因素分析和多变量最小绝对收缩和选择算子（LASSO）回归分析。计算每个患者的放射组学评分（Radcore）。采用单因素（ $P<0.10$ ）和多因素（ $P<0.050$ ）分析来确定与 LVI 相关的临床危险因素。基于此，在此基础上建立了三种预测模型：临床+动脉期模型、临床+静脉期模型和联合模型。利用测试数据集中的 ROC、决策曲线分析和校准曲线，验证了模型的预测性能。采用直方图分析 Lauren 分类与 LVI 之间的关系。

结果：在训练数据集和测试数据集中，组合模型的曲线下面积分别为 0.8629（95%置信区间[CI]，0.8247–0.9011）和 0.8343（95%CI，0.7673–0.9012）。该组合模型比其他模型具有更好的性能。根据 Lauren 分型的弥漫型 GC 占 LVI 病例的 43.4%。

结论：基于 CECT 的放射组学模型可以有效预测 Lauren 分型不同类型的胃癌患者术前 LVI 状态。通过结合临床病理因素，有效地提高了模型的预测能力。

肝细胞癌的 CT 增强影像表现与病理对比研究

金恩浩、温奇霖、马承园、谭梦

延边大学附属医院

目的：探讨不同 CT 增强表现的 HCC 在影像学特征、病理学分化程度及免疫组化表达水平之间的差异性，提高对不典型 HCC 诊断及鉴别诊断能力，从而为 HCC 患者的临床诊断、治疗以及预后提供更有价值的影像学依据。方法：本研究收集 2018 年 11 月至 2022 年 11 月期间在延边大学附属医院经穿刺活检或术后病理证实的肝细胞癌患者 86 例，根据 CT 动态增强扫描影像表现，将病例分为“边缘强化”、“无廓清”及“快进快出”三组。图像观察指标包括：病灶最大径、门静脉是否存在癌栓、是否存在假包膜、病灶内部是否存在坏死这四部分；统计各组患者的病理分化程度、Ki-67、CD34 及 GPC-3 免疫组化表达水平。结果：1.边缘强化组、无廓清组及快进快出组的病灶最大径的中位数分别为 3.45cm、5.25cm、7.00cm，经独立样本的两两比较显示，边缘强化组与无廓清组相比较，差异具有统计学意义（ $P=0.024$ ），边缘强化组的与快进快出组相比较，差异具有统计学意义（ $P<0.001$ ）。2.边缘强化组有假包膜者 8 例（33.3%），无廓清组有假包膜者 16 例（57.1%），快进快出组有假包膜者 25 例（73.5%），经组间两两比较显示，快进快出组与边缘强化组相比较，差异具有统计学意义（ $P<0.017$ ）。3.边缘强化组中病理结果为中低分化者 23 例（95.8%），无廓清组为中低分化者 12 例（42.9%），快进快出组为中低分化者 27 例（79.4%），经组间两两比较显示，边缘强化组与无廓清组相比较，差异具有统计学意义（ $P<0.017$ ），快进快出组与无廓清组相比较，差异具有统计学意义（ $P<0.017$ ）。4.边缘强化组中 Ki-67 高表达者 23

例 (95.8%)，无廓清组中 Ki-67 高表达者 13 例 (46.4%)，快进快出组中 Ki-67 高表达者 26 例 (76.5%)，三组患者在 Ki-67 表达程度之间有统计学差异 ($P < 0.001$)。结论:增强 CT 对不典型肝细胞癌的诊断、了解其生物学行为提供可靠的影像学依据，对预测不典型肝细胞癌的分化程度及 Ki-67 表达水平具有重要价值。

PU-0851

多模态磁共振成像技术对子宫内膜癌诊断及分期的价值

周玥、张铎
北华大学附属医院

目的: 探究多模态磁共振成像技术对子宫内膜癌 (EC) 诊断的价值, 并分析相关量化参数与 EC 组织学分级、分期及肌层浸润深度的相关性, 并比较不同成像序列的诊断价值。

方法: 收集 2020 年 10 月到 2022 年 12 月于北华大学附属医院病理诊断为子宫内膜癌的患者, 所有患者于术前进行磁共振的常规 MRI、弥散加权成像 (DWI)、扩散峰度成像 (DKI) 及体素不相干运动成像 (IVIM) 成像检查, 选择其中 30 例磁共振弥散成像图像质量佳的例患者作为研究对象, 图像自动导入后处理工作站, 对 DWI、DKI、IVIM 图像进行后处理得到伪彩图, 然后在病灶区进行感兴趣区内的勾画得到相关参数值: ADC、MD、MK、D、D*、f 值。再进行不同成像技术定量参数值统计学分析, 符合正态分布的序列参数应用独立样本 t 检验以比较不同组别之间各参数的差异, 非正态分布的序列参数应用 Mann Whitney U 检验比较差异; 通过 Spearman 等级相关性分析评估 DWI、DKI、IVIM 的各参数与 EC 病理分级、分期及不同肌层浸润深度的相关性; 最后采用 ROC 曲线分析 DWI、DKI 及 IVIM 相关扫描参数值鉴别 EC 的诊断效能。

结果: 1.多模态磁共振成像 DWI、DKI、IVIM 序列的相关参数: ADC、MK、MD、D、f 值可用于鉴别诊断 EC 分级及评估肌层浸润深度; ADC、MK、MD、D 值可用于区分早、晚期 EC。2.ADC、D 值及 MD 值与 EC 病理分级呈负相关、MK 值及 f 值与其呈正相关; ADC、D 值及 MD 值与 EC 分期呈负相关、MK 值与其呈正相关; ADC、MD、D、f 值与 EC 深肌层侵犯呈负相关; MK 值与其呈正相关。3.MK、MD 及 D 值诊断 EC 分级的效能最佳; MK 值诊断 EC 分期效能最; D 及 f 值评估肌层浸润深度最佳。

结论: 多模态磁共振成像技术结合常规 MRI 平扫、DWI、DKI 及 IVIM 等多种检查序列, 在评估 EC 患者的肿瘤浸润深度、组织学分级和肿瘤分期等方面比传统 MRI 检查更有效、准确。

PU-0852

磁共振成像联合扩散加权成像在腹部淋巴结病变定性诊断中的应用价值评价

刘方睿
贵州医科大学附属乌当医院

磁共振成像联合扩散加权成像在腹部淋巴结病变定性诊断中的应用价值评价。方法: 采用回顾性分析法, 选择 32 例良性腹部淋巴结患者作为对照组, 年龄 36-75 岁, 男性 15 例, 女性 17 例; 选择 21 例恶性腹部淋巴结患者作为观察组, 年龄 32-72 岁, 男性 10 例, 女性 11 例。对患者均予以磁共振成像联合扩散加权成像技术检查, 探讨核磁共振技术联合扩散加权技术对腹部淋巴结定性 (良性、恶性) 诊断价值以及临床的影像学特点。

PU-0853

正交轴位 MRI 对胃癌术前 T 分期的诊断价值研究

刘权萌¹、陈琰¹、樊文杰^{1,2}、吴雪晗^{1,2}、张志文¹、卢宝兰¹、马钰茹¹、刘逸俨¹、吴韵竹³、文自强¹、余深平¹

1. 中山大学附属第一医院

2. 中山大学附属第七医院

3. 西门子医疗系统有限公司

目的 探讨正交轴位 MRI 图像对胃癌患者术前 T 分期的诊断价值。

方法 本回顾性研究纳入 2020 年 11 月至 2023 年 2 月符合纳入标准的 133 例胃癌患者，这些患者接受了术前 MDCT 与包括正交轴位扫描的 MRI 检查，随后行胃癌根治术并获取病理 T 分期结果。扫描所得影像被分为三组：无正交轴位 MRI 图像、有正交轴位 MRI 图像及 MDCT 图像。2 名未知病理 T 分期结果的放射科医师独立评估并记录上述各组图像的 T 分期结果，每组评估的时间间隔为 4 周。以病理结果为参照标准，计算并比较上述各组影像资料对胃癌术前 T 分期的诊断效能。

结果 本研究纳入了 133 例（中位年龄 63 岁，年龄范围 24-85 岁，88 名男性）患者。相比不包含正交轴位的 MRI 图像，包含正交轴位的 MRI 图像以及 MDCT 图像对胃癌各个 T 分期都有更好的诊断效能，即各个 T 分期的准确性、敏感性、特异性均较高。在对胃癌 T 分期判断的总体准确性方面，包含正交轴位的 MRI 图像明显优于不包含正交轴位的 MRI 图像（83.5% vs 67.7%， $P < 0.001$ ），且稍优于 MDCT（83.5% vs 78.9%， $P = 0.345$ ），但没有统计学意义。

结论 正交轴位 MRI 图像在胃癌术前 T 分期中起到重要的作用。包含正交轴位的 MRI 图像在胃癌术前分期中可以达到较好的诊断效能。

PU-0854

CT extracellular volume fraction in predicting the expression of Ki-67 in epithelial ovarian cancer

Li Hao¹, Qingling Song², Ailian Liu², Yang Song¹

1. Dalian Centre Hospital

2. The First Affiliated Hospital of Dalian Medical University

Objective: To explore the value of extracellular volume fraction (ECV) calculated by CT scan in predicting the expression of the proliferative antigen Ki-67 in epithelial ovarian cancer. **Methods:** A retrospective analysis was performed on 81 patients with epithelial ovarian cancer diagnosed by pathological examination after surgery in Dalian Municipal Central Hospital from January 2018 to December 2022. According to Ki-67 expression, 40 patients were divided into low expression group ($Ki-67 \leq 50$) and 41 patients were divided into high expression group ($Ki-67 > 50$). All patients underwent abdominal enhanced CT scan before operation. Hematocrit was collected before examination. The collected enhanced CT images were measured and calculated, the area of interest was placed in the solid tumor area, and the CT values of plain scan and delayed stage lesions were recorded respectively, and the CT values of plain scan and delayed stage lesions at the level of the tumor were measured, and the ECV of the two groups of lesions were calculated. Independent sample t test was used to compare the ECV difference between the two groups, and receiver operating characteristic (ROC) curve was used to analyze the value of ECV identification between the two groups. **Results:** The ECV value of Ki-67 low expression group was $(27.97 \pm 8.93)\%$, and that of Ki-67 high expression group was $(37.10 \pm 10.17)\%$. The ECV value of Ki-67 high expression group was higher than that of Ki-67 low expression group. The difference was statistically significant ($P < 0.01$). ECV had a good diagnostic efficacy on the expression of the proliferative antigen Ki-67 in epithelial ovarian cancer (AUC was 0.756, sensitivity and specificity were 76.5% and 67.5%, respectively). **Conclusion:** The ECV value of Ki-67 high expression group is higher than that of Ki-67 low expression group. ECV has higher diagnostic

efficiency in predicting the expression of the proliferative antigen Ki-67 in epithelial ovarian cancer, and has certain clinical application value.

PU-0855

卵黄囊瘤 CT 及 MRI 表现

吴雪婷、龚佳英
中山大学附属第六医院放射科

目的 探讨卵黄囊瘤 (YST) 的 CT 及 MRI 表现, 提高对本病影像学特点的认识。方法 回顾性分析经病理证实的 4 例 YST 的 CT 及 MRI 表现。本组中 2 例病灶位于睾丸, 1 例位于卵巢, 1 例位于子宫-阴道。3 例行 CT 及 MRI 平扫加增强扫描, 1 例行 CT 平扫加增强扫描。结果 4 例 YST 均形态不规则, 实性 3 例, 囊实性 1 例。CT 平扫呈等或混杂密度; MRI 平扫 T1WI 呈不均匀稍低信号, 当肿瘤发生出血时可见片状高信号, T2WI 呈混杂高信号, 囊变部分信号更高, 分隔呈低信号, DWI 及 ADC 见实性成分及囊壁弥散受限, 囊变部分未见弥散受限; CT 及 MRI 增强扫描示 3 例 YST 实性成分及囊壁呈不均匀、渐进性强化, 强化范围逐渐扩大, 1 例 YST 呈明显均匀强化, 4 例肿块内均可见扭曲血管影。2 例 YST 合并畸胎瘤 CT 上均见钙化及脂肪成分, MRI 上呈 T1WI 及 T2WI 高信号, 而 T2WI-FS 呈低信号的脂肪成分。结论 YST 的 CT 及 MRI 表现具有一定的特征性, CT 及 MRI 有助于确定 YST 的范围及与周围邻近器官结构的关系。结合血清 AFP 升高, 可作为 YST 及混合型生殖细胞肿瘤诊断、鉴别诊断、监测疗效及评估预后的重要辅助手段。

基于瘤灶和瘤周 CT 征象的 I-III 期结直肠癌预后价值评估及病理关联分析

胡庆如、刘再毅
广东省人民医院

目的

研究表明, 结缔组织增生反应是反映基质成熟的肿瘤-宿主反应的一部分, 是结直肠癌 (CRC) 预后前景良好的因素, 本研究调查了与结缔组织增生反应相关的 CT 成像特征与结直肠癌生存的关系。

方法

我们回顾了 99 名被诊断为结直肠癌的患者, 他们接受了术前 CT 检查及治疗手术。从 CT 图像中评估了原发性肿瘤和周围内脏脂肪特征。与结缔组织增生反应相关的 CT 成像特征与结直肠癌生存的关系

结果

发现肿瘤形状与间质成熟度密切相关 ($P<0.001$), 其中不成熟间质的肿瘤多为不规则环形增厚成熟型间质的肿瘤多为一侧增厚。另外, 瘤周密度改变也与间质成熟度密切相关, 瘤周密度在成熟、中间以及不成熟间质组中呈上升趋势 ($P<0.05$)。在平扫图像中低瘤周密度组的预后明显差于高瘤周密度组 ($P<0.05$), 在静脉期图像中也具有相同的趋势。另外, 肿瘤形状也与预后密切相关, 不规则增厚肿瘤预后最差 ($P<0.05$)。

结论

瘤周密度的 CT 值增加及肿瘤形状与结直肠癌病理间质结缔组织增生反应有关。生存分析显示, 不规则增厚肿瘤预后最差, 不规则增厚肿瘤预后最差。我们的研究表明, 与结缔组织增生反应相关的 CT 图像特征可以提供有关瘤周脂肪微环境的信息, 并预测结直肠癌患者治疗性手术切除后的预后。

PU-0857

二维超声联合剪切波弹性成像技术在盆腔肿物诊断中的应用探讨

闫妍
辽宁省肿瘤医院

闫妍:

[链接]征文投稿倒计时 10 天 | 中华医学会第 30 次全国放射学学术大会(CCR2023)

闫妍:

目的:

盆腔肿物是妇科常见疾病,各年龄段均可发病且类型繁多,常见病变包括子宫肌瘤及子宫腺肌瘤、卵巢及附件区的囊性、囊实性、实性肿瘤。其中,卵巢恶性肿瘤是女性生殖器常见恶性肿瘤之一,全球每年约有 225,500 个案例被诊断为卵巢癌,造成约 140,200 个患者的死亡。虽然卵巢癌的发病率低于宫颈癌和子宫内膜癌,居妇科恶性肿瘤的第三位,但死亡率却超过宫颈癌和子宫内膜癌之和,是严重威胁妇女健康的重大疾患。由于卵巢位置较深且卵巢恶性肿瘤组织类型复杂多样,早期病变无特异性临床症状,发病时常已处于晚期阶段,治疗效果不佳,预后较差,因此早期鉴别卵巢肿瘤良恶性尤为重要。

方法:

前瞻性收集于我院首次诊断并进行治疗的患者,所有患者均接受手术切除,再行病理分析。患者术前均行二维超声检查、剪切波弹性成像技术检查,以手术病理结果为金标准,分析二维超声与剪切波弹性成像技术单独及联合检查的诊断效能。

结果:二维超声联合弹性成像技术检查的诊断结果与病理结果的一致性较高,灵敏度,特异度,准确度均明显高于单一二维超声模型和剪切波弹性成像模型。

结论:

二维超声联合剪切波弹性成像技术诊断盆腔肿物良恶性的灵敏度、特异度和准确度均较单一检查方法有所提高,简单、客观、高效,不失为一种有前景的无创评价影像学方法。

PU-0858

Atypical hepatocellular carcinoma with diffuse fatty metamorphosis: a case report

Yan Li, Beibei Liu, Su Lui, Min Wu
West China Hospital, Sichuan University

BACKGROUND

Large, well differentiated hepatocellular carcinoma (HCC) with fatty metamorphosis is rare, and no cases of advanced HCC with diffuse fatty metamorphosis in atypical sites have been reported to date.

CASE SUMMARY

There is a 65 year old male who was referred to West China Hospital due to an unexpected discovery of abnormal low density shadows mainly consisted of adipose tissue in the perihepatic space of the right lobe of the liver. The ultrasonographic examination revealed thickened adipose tissue around the liver. Furthermore, dynamic contrast enhanced computed tomography (CT) and magnetic resonance imaging (MRI) scans of the abdomen showed multiple lesions with similar density and intensity in the abdomen and pelvis except for the perihepatic space of the right lobe

of the liver, with slight enhancement of the internal solid components and contrast retention (no wash-out) during the portal phases. Liposarcoma was initially considered, and diffuse fatty metamorphosis of HCC was eventually diagnosed after laparoscopic exploration, biopsy and immunohistochemistry. The patient received targeted therapy and immunotherapy after diagnosis, and the tumor gradually shrunk over a 12 months follow up period.

CONCLUSION

It is difficult to accurately diagnose HCC due to the atypical location and imaging features of the tumor in this case, and the final diagnosis needs to rely on histopathological biopsy and IHC staining.

PU-0859

构建基于多模态影像及血清学特征 II 型上皮性卵巢癌诊断诺模图

杨石平、郑超、杨志飞、李晶奕
常德市第一人民医院

摘要:目的 构建基于多模态影像定量参数及 CA125 等血清学特征诺模图, 评价其预测 II 型上皮性卵巢癌的价值。方法 回顾性分析经我院 2019 年 5 月~2021 年 8 月收治上皮性卵巢癌患者的术前临床、影像资料, 按术后病理类型将患者分为 II 型 (51 例, 年龄 57 ± 6 岁)、I 型 (32 例, 52 ± 4 岁) 两组。所有患者术前均行腹盆腔 CT 增强检查及 MR 检查, 分别测量记录影像定量参数及 CA125 等血清学标志物, 利用 Logistic 回归筛选影像定量参数及血清学标志物, 建立 II 型上皮性卵巢癌诺模图模型。绘制受试者工作特征 (ROC) 曲线, 计算曲线下面积 (AUC) 用于评价模型诊断性能, 绘制模型校准度和区分度用于验证模型诊断性能, 决策曲线分析 (DCA) 用于评价模型的临床净效益。结果 II 型、I 型两组年龄、肿瘤最大径、实性成分最大径、CT 强化率 (V)、ADC 值、CA125、HE4、术后 FIGO 分期、淋巴结转移、腹水差异均有统计学意义 ($P<0.05$)。多因素 Logistic 回归显示肿瘤最大径、ADC 值、CA125、HE4 及术后 FIGO 分期为预测 II 型上皮性卵巢癌的独立影响因素, 所构建诺模图模型预测 II 型上皮性卵巢癌的 AUC 为 0.93, 模型校正曲线接近理想曲线, DCA 显示该模型有较高临床净获益。结论 基于多模态影像定量参数及血清学特征的诺模图可用于术前预测 II 型上皮性卵巢癌。

弥漫性腹膜肝样腺癌一例

张吴西、冬冬
吉林大学第一医院

肝样腺癌是一种罕见的特殊腺癌, 在组织病理学上类似肝细胞癌, 大多数病例发生于胃, 临床表现、影像学表现缺乏特异性, 容易造成漏诊和误诊, 原发于腹膜者更为罕见。

患者女, 40 岁。因“腹胀 1 个月, 发现盆腔肿物 2 天”入院, 全腹 CT 检查示: 腹腔大量积液, 腹膜、大网膜及肠系膜多发结节及团块状软组织影, 双侧卵巢大致正常形态、表面不均匀强化。实验室检查甲胎蛋白 25780ng/L。手术切除双侧附件+大网膜, 术后病理诊断: 卵巢表面、输卵管壁和大网膜均见癌浸润, 提示为肝样腺癌或肝细胞癌可能性大。免疫组化: AFP (弱+)、GPC-3(+)、Heppar1 (部分+)。

肝样腺癌的发病年龄平均 63.0 ± 12.8 岁, 男女比例为 2.4: 1。肝样腺癌在组织学上可见腺癌与肝样分化区相互交叉或移行, 肝样分化区与肝细胞癌形态相似, 即肿瘤细胞大、多角形, 呈髓样或梁索样, 间质富含毛细血管和血窦。但仅根据组织学结果难以明确诊断, 通常需要免疫组化染色进行鉴别诊断。大多数肝样腺癌 AFP 染色阳性 (91.6%), 而几乎所有肝样腺癌患者 GPC-3 染色呈阳性。

血清 AFP 升高是肝样腺癌的另一特征,其升高程度与肿瘤分化程度相关,也可用于治疗效果判定、肿瘤复发或转移监测。肝样腺癌的影像学表现没有明显特征性,文献报道的腹膜肝样腺癌有两种表现,一种为孤立肿块型,另一种为弥漫结节型。肝样腺癌目前尚无系统治疗的有效方法,早期发现肿瘤及手术切除仍是肝样腺癌的重要治疗手段。弥漫性腹膜肝样腺癌尽管很难达到切除所有病灶,但进行肿瘤减灭术一方面可以获取病理诊断,另一方面手术后辅以化疗、局部治疗等也可以改善预后。本例患者术后采用紫杉醇加卡铂的常用肿瘤化疗方案,经过手术和两次化疗后,血清 AFP 已经明显下降,随访至术后 5 个月患者一般状态良好。

血清 AFP 升高,而没有典型的肝细胞癌表现和除外其他常见腹膜肿瘤,应怀疑到肝样腺癌。腹膜肝样腺癌尚缺乏标准治疗方案,尽可能完全的手术切除后辅以全身治疗是目前普遍采取的方式。

胃十二指肠异位胰腺的影像学诊断及鉴别诊断

崔博

空军军医大学西京医院

目的总结分析胃异位胰腺的影像学表现及鉴别诊断。方法收集 2010-2019 年门诊及住院胃十二指肠异位胰腺 52 例,其中上腹部螺旋 CT 增强扫描 52 例,上消化道钡餐造影 5 例。所有病例均经手术或穿刺病理证实。根据异位胰腺的年龄、性别、临床症状和体征,对肿瘤的大小、形态、密度及周围结构进行分析总结。结果其中胃窦 21 例,胃体 13 例,胃角 11 例,十二指肠球部 7 例,均小于 3cm。无明显临床症状,多数患者在检查其他病变时意外发现异位胰腺。CT 增强扫描 14 例高于正常胰腺,29 例相当于正常胰腺,9 例低于正常胰腺。结论螺旋 CT 三期增强扫描可用于胃十二指肠异位胰腺的诊断和鉴别诊断,其强化程度高于或等于正常胰腺密度。对于胰腺密度低于正常值的患者,诊断准确率较低。上消化道钡餐显像对异位胰腺的诊断价值有限。

基于多期 CT 影像组学鉴别卵巢良、恶性肿瘤的临床应用价值

徐静雅

皖南医学院弋矶山医院

[摘要] 目的:探讨基于多期 CT 影像组学模型及联合模型鉴别卵巢良、恶性肿瘤的临床应用价值。资料与方法:回顾性收集 2018 年 1 月-2022 年 7 月于皖南医学院第一附属医院(弋矶山医院)经术后病理证实的 144 例良性及 182 例恶性肿瘤患者的术前临床资料及 CT 多期影像组学特征,将患者随机按 7:3 分为训练组 228 例及验证组 98 例。图像预处理并利用 ITK-SNAP 勾画肿瘤病灶区域,用 PY 提取组学特征,将提取特征正则化,采用 Spearman 相关分析,相关系数大于 0.9,保留其一特征,使用最小绝对收缩与选择算子(Least Absolute Shrinkage and Selection Operator, LASSO)回归分析对组学特征降维,建立影像组学标签。利用 Logistic 回归分析筛选出临床数据,将影像组学的优势期相与临床数据结合建立临床联合模型,利用列线图显示预测效能。结果:筛选出平扫、动脉期、静脉期及延迟期的特征数是 22 个,7 个,10 个,22 个,构建各期影像组学模型,发现延迟期为最优模型,在训练组中,其受试者工作曲线(ROC)下面积(AUC)为 0.857。将临床特征与延迟期影像组学特征构建联合模型,其 ROC 的 AUC 值为 0.870,优于临床模型,且差异具有统计学意义($Z=3.376, P=0.0007$)。验证组中,联合模型的 ROC 的 AUC 值为 0.844,优于临床模型,差异不具有统计学意义($Z=1.650, P=0.0989$)。结论:CT 扫描的延迟期影像组学特征鉴别卵巢良性与恶性肿瘤优于其它期相,延迟期相影像组学标签与临床资料结合的联合模型有较高的临床鉴别诊断价值。

Prediction of tumor response to multimodality treatment in bladder cancer based on histogram analysis of quantitative parameters from synthetic and diffusion weighted MRI.

Lingmin Kong, Qian Cai, Jian Ling, Zhihua Wen, Yan Guo, Huanjun Wang
The First Affiliated Hospital, Sun Yat-Sen University

Purpose: To predict tumor response in bladder cancer (BCa) through a histogram analysis of quantitative parameters obtained from synthetic and diffusion weighted MRI.

Materials & Methods: This retrospective study cohort consisted of 17 BCa patients who underwent synthetic and diffusion weighted MRI on a 3.0T scanner (Signa Pioneer, GE, Milwaukee, WI, USA) before multimodality treatment (a mean number of four courses of cisplatin-based neoadjuvant/adjuvant chemotherapy plus immunotherapy). The histogram features of the quantitative parameters (T1, T2, proton density [PD] and ADC) were extracted from region of interest from two radiologists. Patients were grouped as pathological complete response (pCR, no residual tumor) and non-pCR groups based on the post-treatment pathological findings. Student's t test or the Mann-Whitney U test were utilized to analyze the association between the histogram features of parameters and pathological response. Interobserver variability was evaluated using the interclass correlation coefficient (ICC).

Results: Nine patients archived pCR in this retrospective study. All features repeatability were generally excellent (ICC > 0.95). Patients who archived pCR showed statistically lower PD10th, PD25th, T110th, T125th and T1median values than those with non-pCR in pre-treatment of MRI ($P=0.003, 0.021, 0.010, 0.018, 0.050$, respectively), while no significant difference was found in histogram features derived from diffusion weight MRI (all $P > 0.05$).

Conclusions: Histogram features of synthetic weighted MRI quantitative parameters contribute to the response evaluation of multimodality treatment in BCa and may serve as a potential biomarker for selecting and optimize patients for bladder preservation.

Objective and subjective comparison of virtual monoenergetic vs. polychromatic images in patients with colorectal cancer

昇 lin Li, Zhou Junlin Zhou
Second Hospital of Lanzhou University

Purpose To evaluate the objective and subjective image characteristics of post- adaptive statistical iterative reconstruction (ASiR) and medium-strength deep learning reconstruction (DLIR) virtual monoenergetic images (VMI) at different kiloelectron volts (keV) compared to polychromatic images (PEI) in patients with colorectal cancer (CRC).

Methods This prospective study was approved by the Institutional Ethics Committee. 69 CRC patients and 35 volunteers were included for spectral CT scanned. Portal vein phase spectral CT scan can be divided into standard dose and reduced dose (RD) scanned models. Reconstruct PEI and eleven VMI images in every 10keV interval of 40-140keV. Density analysis was performed to calculate the signal-to-noise ratio (SNR) of normal colonic wall and CRC. For subjective quality assessments, three readers independently assessed the images using a five-point Likert scale. Inter-reader credibility was assessed using intraclass-correlation-coefficients.

Results Density distribution analysis showed the largest attenuation gradient between CRC and normal tissue at 40 keV-VMI (VMI40keV) in standard dose AV60. Except for VMI50keV, VMI40keV had the highest SNR [18.73 (14.07, 25.75)] and contrast-to-noise ratio (CNR: 9.51 ± 4.42) compared with VMI60-140keV and EPI [SNR: 10.14 (8.56, 12.75); CNR: 3.46 ± 1.64] (all $P < 0.001$). Compared with PEI, there were statistical differences in SNR of RD-DLIRM and RD-AV60 [SNR: 8.88 ± 1.98 and 7.79 (6.64, 9.70), respectively] lesions ($P = 0.017$ and 0.005), but no statistical differences in CNR (2.75 ± 1.52 and 2.68 ± 1.37 , respectively) ($P = 0.368$ and 0.289). When VMI40keV were added to PEI, overall area-under-the-curve of the three radiologists was significantly improved from 0.885 to 0.941 for diagnosing CRC ($P < 0.001$).

Conclusion Compared with PEI, standard dose AV60-VMI40keV have better objective and subjective image quality. Meanwhile, DLIRM can guarantee RD-VMI40keV image quality.

PU-0865

基于 APT 影像组学评估宫颈癌淋巴血管间隙浸润

张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦（中国）投资有限公司

目的：本研究旨在探讨 3D 酰胺质子转移加权(APTw) 影像组学模型在预测宫颈癌淋巴血管间隙浸润的诊断价值。

方法：回顾性分析 2019 年 7 月至 2023 年 4 月经手术病理证实的 74 例宫颈癌瘤患者的临床资料及术前 MRI 图像，其中淋巴血管间隙浸润组患者 38 例；非淋巴血管间隙浸润组患者 36 例。对照常规 MRI 平扫和增强图像，在 3D APTw 定量图像上进行特征提取。使用 uAI Research Portal 软件进行影像组学分析。通过最小冗余-最大相关性(mRMR)和最小绝对收缩和选择算子(LASSO)算法对提取的特征进行降维处理。使用随机森林模型(Random forest,RF)构建影像组学模型。

结果：最终本研究纳入 7 个影像组学特征并用于构建模型。RF 模型显示，训练集和测试集的 AUC 分别为 0.982 和 0.893。在测试集中，灵敏度、特异性、准确度分别为 0.750、0.857 和 0.800。

结论：基于 APT 影像组学能有效预测宫颈癌的淋巴血管间隙浸润。这种无创性预测技术能为患者的术前诊断、个性化治疗方案制定、预后评估提供重要信息，在未来的临床诊疗工作中具有广阔的应用前景。

肝脏浆细胞型 Castleman 病 1 例并文献复习

赵静

江南大学附属医院

对江南大学附属医院 2022 年 11 月 23 日收治的 1 例肝脏 Castleman 病病例进行回顾分析，并复习相关文献。该例病人因“体检发现肝占位性病变”就诊，MRI 平扫及普美显增强检查示肝脏 S2 及 S4 段各见一椭圆形、大小分别约 $19 \times 13 \text{mm}$ 及 $15 \times 12 \text{mm}$ 异常信号灶，T1WI 呈低信号，T2WI 呈稍高信号，DWI 高信号，ADC 低信号，增强扫描动脉期中度强化，延迟可见廓清，肝胆平衡期呈低信号，考虑肝细胞肝癌可能，肝腺瘤待排。于 2022 年 12 月 2 日行肝脏 S2 及 S4 段局部切除术。术后经过病理及免疫组化证实为浆细胞型肝脏 Castleman 病。病人术后恢复良好，第 11 天痊愈出院。病人术后 1 个月、半年随访复查均未见明显异常，一般情况良好，截止 2023 年 9 月仍持续随访中。肝脏 Castleman 病极其罕见，易误诊，影像学检查是术前主要诊断方式，病理检查是诊断的金标准。肝脏 Castleman 病好发于女性，中位发病年龄约为 48 岁。局部单中心 Castleman 病首选手术

切除+定期随访复查,总生存率约 95.3 %,多中心 Castleman 病对手术反应不佳,单克隆抗体联合利妥昔单抗成为研究热点,预后差,5 年生存率近 51-77 %。

PU-0867

能谱 CT 碘基图像在预测胃癌组织分化程度中的应用研究

诗涔

苏州大学附属第一医院

目的:本研究旨在探讨能谱 CT 碘基图像在预测胃癌组织分化程度中的应用价值。

材料与方法:回顾性分析我院经术后病理证实的 103 例胃癌患者。收集所有患者临床信息和病理信息。根据术后病理分化程度不同,将患者分为分化组及未分化组。单因素统计分析上述临床信息和病理信息在两组间是否具有统计学差异。通过能谱 CT 后处理软件分别获得每位患者的静脉期碘基图像。使用 3D slicer 软件分别在混合能量图像和碘基图像上分割病灶并提取影像组学特征。随后使用 FAE 软件内机器学习方法构建了三组影像组学模型:混合能量影像组学模型、碘基图影像组学模型、混合能量-碘基图影像组学模型。最后,将有统计学差异的临床和病理特征联合混合能量图像和碘基图影像组学特征构建联合模型。采用受试者工作曲线 (Receiver Operating Characteristics, ROC) 和 DeLong 检验对模型间的诊断效能进行评估和比较。

结果:在训练集和验证集中,只有 pT 分期和 pN 分期在分化组及未分化组间均有统计学差异 (P 值均 < 0.05)。使用 pT 分期和 pN 分期构建的临床模型在训练集和验证集中的 ROC 曲线下面积 (Area under the curve, AUC) 分别为 0.674 和 0.847。混合能量-碘基图影像组学模型 (训练集 AUC: 0.900; 验证集 AUC: 0.851) 较混合能量影像组学模型 (训练集 AUC: 0.802; 验证集 AUC: 0.781) 和碘基图影像组学模型 (训练集 AUC: 0.871; 验证集 AUC: 0.759) 取得了更高的诊断效能。联合 pT 分期、pN 分期、混合能量影像组学特征和碘基图影像组学特征构建的联合模型取得了最高的诊断效能,在训练集和验证集中 AUC 分别为 0.910 和 0.912。校准曲线表明联合模型的拟合度良好。临床决策曲线表明混合能量-碘基图影像组学模型和联合模型均较混合能量影像组学模型和临床模型有更高的临床应用价值。

结论:基于能谱 CT 的影像组学模型在预测胃癌组织分化程度中有良好的诊断效能。基于碘基图提取的影像组学特征在提高诊断效能上有巨大潜力。

PU-0868

基于 MRI 预测肿块型肝内胆管细胞癌分化程度的研究价值

朱静芬、陈祥、李勇刚

苏州大学附属第一医院

v> 【摘要】 目的:探讨磁共振成像(MRI)定性、定量参数在肿块型肝内胆管细胞癌细胞分化程度的预测价值。方法:回顾性分析 2016 年 3 月—2022 年 3 月 81 例经手术病理证实为肿块型肝内胆管细胞癌 (MICC) 患者临床、病理、MRI 资料。将患者分为中分化组 (29 例) 和低分化组 (52 例), 采用 t 检验或 χ^2 检验比较两组在临床、MRI 定性以及定量参数方面的差异,将单因素分析中具有统计学差异的变量纳入 Logistic 回归进行分析用来建立 MRI 模型。受试者操作特征 (ROC) 曲线被用于分析模型的诊断效能。结果:单因素分析显示两组间肝内转移灶、动态强化模式、肝胆期强化模式、扩散加权成像 (DWI)、直径的差异有统计学意义 (P 值分别为 0.032、< 0.001、0.035、0.017、0.001)。动态强化模式、直径是预测 MICC 分化程度的独立预测因子,所得 MRI 模型 ROC 曲线下面积 0.806,敏感度 71.2%,特异度 79.3%。结论:动态强化模式、直径是预测 MICC 分化程度的独立危险因素, MRI 模型具有良好的诊断效能。

PU-0869

定量分析 2 型糖尿病患者胰腺脂肪含量和胰腺细胞外体积分数

张瀚月¹、张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦 (中国) 投资有限公司

目的: 2 型糖尿病 (T2DM) 是一种常见且不能彻底治愈的疾病, 早期诊断并准确评估对其治疗与改善预后至关重要。本研究旨在探讨 T2DM 患者和非 T2DM 患者的胰腺脂肪含量和胰腺细胞外体积分数 (ECV) 的差异。方法: 本研究回顾性分析 2022 年 1 月至 2023 年 2 月于大连医科大学附属第一医院行上腹部 3.0 T MRI 检查、扫描序列包括 T1mapping 序列、T1mapping 增强序列和 CS2 mDixonQuant-FF 序列且图像质量满足测量要求的患者 20 例, 收集患者的临床资料和影像资料。根据临床诊断结果将患者分为 T2DM 组 (10 例) 和非 T2DM 组 (10 例)。使用 MATLAB 软件根据 ECV 计算公式获得 ECVnii 图像 $[ECV = (1/T1_{\text{胰腺增强后}} - 1/T1_{\text{胰腺增强前}}) / (1/T1_{\text{主动脉增强后}} - 1/T1_{\text{主动脉增强前}}) \times (1 - \text{hematocrit})]$ 。基于 ECVnii 图像使用 ImageJ 软件分别测量胰头、胰体和胰尾的 ECV 值, 并计算平均值。使用飞利浦后处理平台在 MRI 脂肪分数图上勾画胰头、胰体、胰尾的感兴趣区域 (ROI), 记录胰腺的脂肪分数 (FF) 值并计算其平均值。采用 SPSS 27.0 软件进行统计学分析, 符合正态分布的计量资料以均数 \pm 标准差表示, 不符合正态分布的计量资料以四分位数间距表示。采用独立样本 t 检验观察糖尿病患者和非糖尿病患者的 FF 值和 ECV 值是否有差异, $P < 0.05$ 为差异具有统计学意义。结果: 本研究纳入了 10 名糖尿病患者和 10 名非糖尿病患者。T2DM 患者的胰腺平均 FF 值显著高于非 T2DM 患者 ($P < 0.05$)。此外, T2DM 组的胰腺平均 ECV 值显著高于非 T2DM 组 ($P < 0.05$)。结论: T2DM 患者的胰腺在脂肪含量和 ECV 方面与非 T2DM 患者均存在显著差异。这一发现可能有助于更深入地理解 T2DM 对胰腺组织的影响, 为 T2DM 的诊断和治疗提供了新的影像学参考依据。

PU-0870

卵巢甲状腺肿一例

罗秀娟

黄石市第五医院有限公司

目的: 提高对卵巢甲状腺肿的认识及影像诊断要点。

方法: 回顾性分析本院近期一例卵巢甲状腺肿及有关文献, 对其影像诊断要点进行总结。

病例资料: 患者 女 33 岁, 因腹痛行腹部 CT 平扫: 盆腔巨大囊实性肿块 (约 9.8cm×10.3cm), 内见结节状高密度影。CT 增强: 肿块内结节状高密度灶可见明显强化表现。MRI: 肿块 T2 混杂高信号, T1 低信号, MRE: 结节状可见明显强化。超声: 盆腔混合性包块。实验室: CA125 升高。外科行盆腔肿块切除术后病理诊断: 右侧卵巢甲状腺肿。

讨论: 卵巢甲状腺肿 (struma ovarii, SO) 是一种少见的卵巢良性肿瘤, 起源于卵巢生殖细胞。肿瘤内主要由甲状腺组织构成, 是一种单胚层畸胎瘤, 约占成熟畸胎瘤的 2.7%。卵巢成熟性畸胎瘤中 5%-20% 含甲状腺成分, 当肿瘤内含甲状腺成分达 50% 以上时诊断 SO。SO 发病率较低, 临床较为罕见。患者常无症状, 多数以体检或发现腹盆部肿块就诊。通常单侧发病, 双侧发病少见。在组织学上的大体表现类似于囊性畸胎瘤, 一般表面光滑, 呈分叶状或伴分隔, 实性部分可能完全由甲状腺组织组成, 囊腔内充满液体或琥珀样物。影像表现及相关病理特征: 多为单侧附件区病变, 边界清晰; 肿块多呈囊实性 (囊性为主) 或囊性, 纯实性少见; 囊内液体密度较高 (CT 值 $> 40\text{HU}$), 部分可见更高密度囊腔 (CT 值 70~90HU), 其与滤泡内富含的甲状腺球蛋白及甲状腺激素有很强衰减 X 线能力有关; 增强扫描实性部分 (包括囊壁及分隔) 有不同程度强化或呈甲状腺组织样明

显强化。病理上这些实性成分由成熟的甲状腺组织、大量血管和纤维组织组成；T2WI 上极低信号区和实性成分明显强化是 SO 的两个典型 MRI 表现；T2WI 囊性区信号强度取决于囊内物质浓度，当内容物高度浓缩呈高黏度、胶物质时，T2WI 呈极低信号，而当囊内容物被稀释时，T2WI 呈高信号。

结论：卵巢甲状腺肿的 CT 及 MRI 表现有一定的特征性，有助于卵巢甲状腺肿的诊断及鉴别诊断。

PU-0871

ADC 联合 CA199 对 I 型自身免疫性胰腺炎及胰腺导管腺癌的鉴别价值

周海飞、柏根基、姜玉章、郭莉莉
淮安市第一人民医院

目的：评估联合使用 ADC 与血清 CA199 对自身免疫性胰腺炎（AIP）及胰腺导管腺癌（PDAC）鉴别价值。方法：收集 2017 年至 2021 年在我院确诊的 AIP 患者 14 人，PDAC 患者 28 人，分别测量其 ADC 值及血清 CA199，比较 AIP 及 PDAC 组的年龄、性别、ADC 值及 CA199 值是否有统计学差异。采用受试者工作特征曲线（ROC）分析来判断 ADC 值和 CA199 值对疾病的诊断效果以及联合诊断效果。用约登指数确定最优精度的阈值。结果：AIP 与 PDAC 组年龄、性别无统计学意义（ $P>0.05$ ）；AIP 及 PDAC 组的 ADC 均值分别为 $1.03\pm 0.08\times 10^{-3}\text{mm}^2/\text{s}$ 、 $1.29\pm 0.12\times 10^{-3}\text{mm}^2/\text{s}$ ，差异有统计学意义（ $P<0.05$ ）；AIP 组及 PDAC 组的 CA199 差异有统计学意义（ $P<0.05$ ）；ADC 的曲线下面积（AUC）为 0.952，最佳截断值为 $1.164\times 10^{-3}\text{mm}^2/\text{s}$ ，敏感度和特异性分别为 92.9%与 85.7%，CA199 的 AUC 为 0.689，最佳截断值为 88.7u/ml，敏感度和特异性分别为 57.1%与 75.0%，ADC 与 CA199 联合使用时 AUC 为 0.985，敏感度和特异性分别为 100%和 92.9%。结论：ADC 与 CA199 均对 AIP 与 PDAC 的鉴别诊断有一定的帮助，且 ADC 比 CA199 具有更好的诊断效能，联合使用 ADC 和 CA199 具有更高的准确性。

PU-0872

以急性胰腺炎为首发症状的小胰腺癌并胰腺炎与单纯性胰腺炎的 CT 对比分析

游红莲、王静
深圳市前海蛇口自贸区医院

目的 对比分析以急性胰腺炎为首发症状的小胰腺癌并急性胰腺炎（SPC-AP）与单纯性胰腺炎（S-AP）的 CT 增强特征，提高以胰腺炎为首发症状的小胰腺癌的认识。方法 回顾性收集 2014 年 1 月至 2023 年 8 月经病理证实的以急性胰腺炎为首发症状的小胰腺癌（16 例）和临床诊断为单纯性急性胰腺炎（89 例）患者的临床及 CT 增强影像资料。采用卡方检验及 Fisher 的精确检验比较两组间计数资料，采用 t 检验或 Mann-Whitney U 检验比较两组间计量资料。结果 SPC-AP 组患者年龄较 S-AP 组大，两组间轻度胰腺炎发生比分别为 100%、20.2%，组间差异有统计学意义（ $P<0.05$ ）；SPC-AP 组影像表现胰腺肿块、低强化区、截断性强化、主胰管扩张及截断的发生比例较 S-AP 组高，两组间差异均有统计学意义（ $P<0.001$ ）；SPC-AP 组与 S-AP 组的胆总管截断、局部液体聚集及胰腺结构，两组间差异均有统计学意义（ $P<0.05$ ）。胆总管扩张、肾前筋膜增厚、周围血管累、区域性门静脉高压及胰腺周围淋巴结显示率，二组间比较差异无统计学意义（ $P>0.05$ ），但 SPC-AP 组以单侧且左侧肾前筋膜增厚为主，而 S-AP 以双侧肾前筋膜增厚为主。主胰管平均直径约（ 4.73 ± 1.70 ）mm 比（ 2.10 ± 0.48 ）mm，两组间差异有统计学意义（ $P<0.05$ ）。胆管中位平均直

径约 8.47 (5.20, 10.65) 比 7.10 (5.63, 9.18), SMA/SMV 中位平均比值约 0.68 (0.55, 0.76) 比 0.58 (0.50, 0.62), 两组间差异无统计学意义($P>0.05$)。胰腺形态增大、无改变及萎缩者占比, 两组间差异有统计学意义($P<0.001$)。结论 不明原因轻度胰腺炎的中老年患者, 多期增强 CT 表现胰腺截断强化、低强化肿块并主胰管扩张及截断需警惕胰腺癌的可能。

PU-0873

基于术前 CT 探索胰腺及胰周组织对胰腺导管腺癌预后的影响

仇玥、居胜红
东南大学附属中大医院

目的: 胰腺导管腺癌(PDAC)由于其侵袭性、转移性和耐药性, 恶性程度高, 预后极差。胰腺癌的肿瘤异质性大, 对胰腺癌患者预后的评估具有重要价值。但胰腺及胰周组织结构形态也会因为胰腺癌的发生产生改变。影像组学可为提供大量潜在微观信息, 因此, 本文旨在基于影像组学方法建立肿瘤、胰腺及胰周组织模型评估胰腺癌患者预后, 指导临床制定有效的治疗策略。

方法: 本研究回顾性纳入了 266 名行根治性切除且经病理证实为胰腺导管腺癌的患者, 并收集了患者的临床、术前一月内增强 CT 及患者随访情况, 主要结局为总生存期 OS (从手术当日至死亡当日或最后一次随访当日计算)。将患者按 7:3 的比例分为训练组和测试组。首先以动脉期为 mask 进行多期影像配准, 以 nn-Unet 深度学习算法为基本框架, 实现胰腺癌病灶及胰腺的自动分割, 并胰周外扩 5mm (避开血管等周围其他器官结构), 然后由两名放射科医生进行手动校正, 将校正好的 ROI 导入 FAE 软件, 进行特征提取, 使用单因素及多因素 Cox 回归分析有意义的临床特征, 然后应用递归特征消除进行影像组学特征选择, 通过逻辑回归算法建立模型 1 (基于肿瘤)、模型 2 (基于肿瘤及胰腺) 和模型 3 (基于肿瘤、胰腺及胰周组织) 构建影像组学模型, 并比较各个模型性能, 选择效能最高的模型, 评估胰腺癌预后。

结果: 在本中心中, 266 名患者 (平均年龄, 62 岁 \pm 9 岁[SD]; 男性 159 人, 女性 107 人)。观察者间一致性良好 ($k=0.73$)。与模型 2 和模型 1 相比, 包括胰周组织的模型 3 提高了胰腺导管腺癌患者预后的评估 (AUC 分别为 0.83 [95% CI: 0.82, 0.85] vs 0.79 [95% CI: 0.77, 0.80] vs 0.67 [95% CI: 0.65, 0.69]; $P < 0.001$)。采用影像组学模型将患者分为高危组和低危组。KM 分析显示两组间差异有统计学意义 ($p < 0.05$)。

讨论: 基于术前增强 CT 胰腺及胰周组织构建的影像组学模型特征对胰腺导管腺癌预后有一定的附加价值, 可以更好的指导临床制定有效的治疗策略。

局灶性结节增生 MR 增强肝胆期的强化类型探讨

樊树峰
浙江中医药大学附属第二医院

目的: 探讨局灶性结节性增生(FNH)钆噻酸二钠增强肝胆期(HBP)的增强类型, 并探讨其相应的病理基础和临床意义。

材料和方法: 本回顾性研究已获得机构审查委员会的批准。2016 年 1 月至 2022 年 5 月, 回顾性分析了 95 例患者 117 例 FNH 病变(89 例为单发病变, 6 例为多发病变, 40 例组织学证实, 55 例影像和随访诊断)。根据钆噻酸二钠增强 MRI HBP 与背景肝脏的增强程度及均匀性, 将 FNH 分为 7 种类型:(1)均匀高信号, (2)非均匀高信号, (3)均匀等信号, (4)非均匀等信号, (5)均匀低信号, (6)非均匀低信号, 或(7)高低混合信号模式。分析各类型的病理基础及临床意义。

结果:钆酸二钠增强 MRI HBP 中, FNH 表现为均匀高信号 18 例(18.95%, 24 个病变), 非均匀高信号 39 例(41.05%, 49 个病变), 均匀等信号 17 例(17.89%, 17 个病变), 非均匀等信号 16 例(16.84%, 17 个病变), 均匀低信号 1 例(1.05%, 1 个病变), 非均匀低信号 3 例(3.16%, 8 个病变), 混合信号 1 例(1.05%, 1 个病变)。FNH 表现为均匀或不均匀等高信号 90 例(94.74%), 低信号均匀、不均匀或混合信号 5 例(5.26%)。病理结果显示, FNH 在 HBP 中的增强模式根据病变中纤维化、脂肪变性、出血、胆管、肝细胞增生或异型成分的不同而不同。

结论:基于磁共振多参数对比和 HBP 强化类型, FNH 的诊断率在 90%以上。在少数病例中, 由于 HBP 的成分和分子表型不同, 导致其不典型增强模式, 因此需要随访、活检或手术病理来明确诊断。

PU-0875

能谱 CT MAR 技术在上腹部弹簧圈栓塞术后随访中的价值研究

胡永志¹、梁媛²

1. 江苏省人民医院 (南京医科大学第一附属医院)

2. 东南大学附属中大医院

目的 探讨能谱 CT 去金属伪影 (MAR) 技术在门静脉高压患者弹簧圈栓塞介入术后 CT 随访中的应用价值。方法 回顾性收集 42 例上腹部介入植入弹簧圈术后, 行能谱 CT 扫描随访的患者数据, 在未开启 MAR 的图像中伪影最重层面的腹主动脉和未受伪影影响的腰大肌内勾画 ROI, 分别复制到开启 MAR 的图像中, 记录 CT 值、SD 值并计算对比噪声比 (CNR) 和噪声指数 (AI); 由两位高年资诊断医师以 4 分制对两组图像分别评分; 对两组图像的信号 SD、背景 SD、CNR、AI 行配对样本 t 检验; 对医师评分行一致性检验后, 评分不同者商议决定最终评分, 将两组图像的最终评分行 Wilcoxon 秩和检验。结果 应用 MAR 技术后 AI 值和信号 SD 值明显降低 (12.209 ± 9.226 vs. 29.459 ± 23.833 、 15.990 ± 7.690 vs. 30.640 ± 23.070), 均有 $P < 0.01$; CNR 和背景 SD 无明显差异 (7.994 ± 3.780 vs. 7.735 ± 6.965 、 9.657 ± 2.432 vs. 9.504 ± 2.191) 均有 $P > 0.05$; 两位医师主观评分一致性佳 (对两组图像评分的 Kappa 值分别为 0.82、0.84), 开启 MAR 可以明显提高图像的主观评分 ($P < 0.01$)。结论 能谱 CT 的 MAR 技术在上腹部弹簧圈栓塞术后 CT 随访中, 可明显减少金属伪影, 提升图像质量。

PU-0876

肝脏能谱 CT 成像中不同期相虚拟平扫替代真实平扫的差异性及影响因素研究

顾芳燕¹、聂芳¹、朱晓梅²

1. 东南大学附属中大医院

2. 江苏省人民医院

目的: 基于正常脏器显示, 探讨肝脏成像中 Revolution CT 不同期相虚拟平扫 (VNC) 替代真实平扫 (TNC) 的最佳方案及影响因素。

方法: 回顾性分析 2020 年 8 月至 2020 年 10 月的 120 例在 Revolution CT 上行肝脏 TNC 及动脉 (A)、静脉 (V)、延迟 (D) 三期能谱增强扫描的患者资料。测量 TNC 及三期 VNC 图像中的肝脏、门静脉、腹主动脉及脂肪的 CT 值及图像噪音, 比较 VNC 和 TNC 间的差异及相关性。以 10HU 及 15HU 为界值比较所测组织三期 VNC 与 TNC 的 CT 差值 (DDVT) 的一致性, 多因素回归分析观察 DDVT 的影响因素。Wilcoxon 检验比较传统扫描与不同方案的能谱增强扫描辐射剂量的差异。

结果: VNCv 肝脏、VNCA 门静脉、VNCD 主动脉的 CT 值与相应 TNC 无统计学差异并呈中等以上正相关; 脂肪三期 VNC 均较 TNC 的 CT 值偏高, 一致性较低, 但呈强相关; VNCA 主动脉与 TNC 一致性较 VNCV 及 VNCD 偏低, 各组织 VNCv 与 VNCD 的 CT 值无统计学差异。DDVT 主要与体重、体表面积或体重指数呈负相关。各期 VNC 图像噪音均低于 TNC, 其中 VNCV 最低。单期能谱扫描辐射剂量高于单期混合能量扫描, 传统四期扫描的剂量与三期能谱增强扫描无统计学差异, 但高于单期能谱结合混合能量扫描。

结论: 基于 Revolution CT 的肝脏 VNCA、VNCV 和 VNCD 图像中, VNCV 图像最接近 TNC, 并能通过体重或体表面积进一步矫正。

PU-0877

老年性急性胰腺炎的临床和影像学特征

张学英

川北医学院附属医院

目的: 分析老年急性胰腺炎患者的临床表现、影像学特征和预后。

方法: 回顾性分析 285 例初次诊断为急性胰腺炎患者的腹部影像学数据 (CT/MRI) 及临床病例资料。根据年龄划分为年轻组 (65 ~ 74 岁)、中老年组 (75 ~ 84 岁) 和最年长组 (≥ 85 岁) 三个年龄组, 分析和比较三组患者的临床基本特征、实验室检测指标、影像学特征和临床结局终点发生率的差异, 具有显著性差异 ($P < 0.05$) 的指标纳入多因素 Logistic 回归分析, 分析不同年龄组急性胰腺炎患者之间的影像学特征和预后因素。

结果: 285 例初次诊断为急性胰腺炎患者的平均年龄为 (73.9 ± 6.6) 岁, 165 例 (57.9%, 165/285) 的患者为女性。与其他两组相比, 第 1 组中 ANP 的发生率更高, CT/MRI 上合并坏死的发生率更高 ($P > 0.05$)。第 3 组的局部并发症发生率和 CT/MRI 上的 WON 发生率似乎高于其他两组 ($P > 0.05$)。第 3 组的 SAP、多器官功能衰竭和入住重症监护室的比例较高, 但未达到统计学意义。第 1 组患者的治愈率明显高于其他两组 ($P = 0.001$)。

结论 不同年龄组有不同的影像学 and 临床特征及预后。即使影像学表现轻微, 第 3 组患者也比年轻患者出现局部并发症的概率更高, 临床进展更严重, 临床预后更差。

PU-0878

肝内胆管粘液性囊性肿瘤的临床及影像学特征并文献复习

黄周

苏州大学附属第一医院

目的: 肝内胆管粘液性囊性肿瘤包括囊腺瘤及囊腺癌, 本文主要探讨其临床及影像学特征, 提高对其认识及术前诊断水平。

方法: 回顾性分析自 2009 年至 2020 年 7 例经手术病理证实的肝内胆管粘液性囊性肿瘤患者的临床及影像学资料, 结合相关文献进行分析。

结果: 7 例肝内胆管粘液性囊性肿瘤中囊腺瘤 2 例, 囊腺癌 5 例; 男性 2 例, 女性 5 例; 年龄 45~68 岁, 中位年龄 60 岁。5 例无明显症状, 2 例仅表现上腹不适。所有患者血清 CEA 均正常, 3 例血清 CA199 升高。所有患者均无乙肝病史。影像上均为较大单发多囊多分隔肿块, 位于肝左叶者 4 例、肝右叶 2 例、左右叶交界处 1 例, 囊壁以及壁结节强化方式均呈轻度渐进性强化, 3 例伴有胆管扩张, 4 例囊壁见钙化。

结论: 肝内胆管粘液性囊性肿瘤多见于女性, 一般无明显症状, CA199 升高具有一定的提示价值, 影像检查多表现为肝内较大单发多囊多分隔肿块。当患者年龄较大, 肿瘤位于肝左叶且囊壁厚薄不

均多提示为囊腺癌，而有无壁结节与是否恶性关系不大。鉴别诊断包括多囊肝、肝包虫病、转移瘤及脓肿，手术切除是最好的治疗方法。

PU-0879

肠系膜侵袭性纤维瘤的 CT 诊断

任莹

中国医科大学附属盛京医院

侵袭性纤维瘤 (SFTs) 又叫韧带样肿瘤，是一种罕见的成纤维细胞或肌纤维母细胞起源的间质肿瘤，可见于全身各处。SFTs 分为腹外型、腹壁型及腹内型 (肠系膜)，其中发生于腹内型的较为少见，腹内型可发生于原腹部手术或创伤的位置，原病灶手术切除部位局部复发率高。该病与家族性腺瘤性息肉病 (FAPS) 关系密切，发生于约 9-18% 的 FAPS 患者，女性略多，与雌激素相关，好发于 30-40 岁。病理上表现为胶原基质中含有大量成纤维细胞，没有炎性或肿瘤性成分。SFTs 是一种良性病变，不发生转移，但是可以局部侵袭性生长、可复发。患者多无症状，少部分患者可出现腹痛、消化道出血等症状。病灶发现时常较大，常见大于 15cm。影像表现为边界清或不清，可见邻近结构受侵，可使肠管黏连导致肠梗阻；常见肠系膜血管的侵犯，尽管有局部侵袭性，但是不发生转移，腹水少见。CT 表现与病理成分及血管含量相关。腹型常见主要由胶原基质构成，CT 上表现为较均匀的与肌肉等密度病灶。少见类型的包含不同量的粘液基质，CT 上低于肌肉密度。胶原与粘液基质混合型常表现为分层状或旋涡状表现。本文对肠系膜 SFTs 病例临床及影像表现进行分析，总结其影像诊断要点并讨论其鉴别诊断。

PU-0880

肝内乳头状腺癌合并结肠癌复发一例

刘冬婷、刘丽瑶、韩亚峰、侯丽娟、李笑石、秦越

西安大兴医院

患者，女，73 岁，因发现肝占位性病变 10 月，发热 13 天入院。既往结肠癌术后 18 年。实验室检查：谷丙转氨酶升高，为 138U/L；谷草转氨酶升高，为 371U/L；乙型肝炎病毒表面抗体升高，为 136mIU/mL。

影像学检查：上腹部 CT 示肝右叶见团片状稍低密度影，大小约 12.3×8.5×9.9cm，CT 值约 25Hu，边界欠清，其内密度不均见斑片状低密度影，CT 值约 14HU。上腹 MRI 示肝右叶见多发团块状稍长 T1、混杂 T2、FS 混杂稍高信号影，边界欠清，部分融合，最大截面范围大小约 11.5×7.8×10.0cm，其内可见条片状稍短 T1 信号影，病灶邻近部分脉管受压推移改变，下腔静脉变窄，周围肝包膜下见不规则团片状长 T1、长 T2、FS 高信号影，边界不清，最大截面范围大小约 5.0×3.3×3.2cm，边缘见环形 FS 等信号影，增强后见肝右叶病灶增强扫描呈明显环形强化，其内可见斑片状弱强化区及未强化区，周围肝包膜下病变呈不规则环形强化，强化区厚薄不均，其内见未强化区。上腹 DWI 示肝右叶病灶局部呈团片状 DWI 高信号影，相应层面 ADC 值部分减低。

患者行右半肝切除术和结肠癌根治术。肝脏剖面见巨大肿物，肿物伴坏死。镜下见肿瘤细胞核大、深染，排列成腺样、筛网状，部分腺体漂浮于黏液湖中。免疫组化结果：AE1/AE3(+)、CK20(+)、SATB-2(+)、CK7(灶+)、MSH2(+)。病理诊断为隆起型中分化腺癌，局部为黏液腺癌(占比约 40%)，局部高级别上皮内瘤变。免疫组化结果：CK7(+)、CK20(灶+)、CK19(+)、CDX2(+)、STAB2(部分+)。病理诊断为查见乳头状腺癌，结合临床病史、形态及免疫表型多提示肠癌转移。

PU-0881

基于钆塞酸二钠增强 MRI 的 LI-RADS v2018 评分诊断肝细胞癌的价值

戴颖钰

苏州大学附属第一医院

目的 评价肝脏影像报告和数据系统 2018 版(LI-RADS v2018)评分在钆塞酸二钠(Gd-EOB-DTPA)增强 MRI 中对肝细胞肝癌(HCC)的诊断效能及阅片者评分的一致性。**资料与方法** 收集经 Gd-EOB-DTPA 增强 MRI 检查的患者 152 例,由 2 名阅片者根据 LI-RADS v2018 评分标准,对 165 个病灶图像特征进行分析并分类,采用 Kappa 检验评估阅片者之间 LI-RADS 分类结果的一致性。分别以 LR-5、LR-4 联合 LR-5 作为预测 HCC 的截断值,计算诊断 HCC 的敏感度、特异度、准确度、阳性预测值、阴性预测值及受试者工作特征(ROC)曲线下面积。结果 2 名阅片者间 LI-RADS 分类结果的一致性高(Kappa=0.792,95%CI 0.743~0.842)。当以 LR-5 作为预测因子时,诊断 HCC 的特异度较高(阅片者 1:94.87%,95%CI 87.39%~98.59%;阅片者 2:93.59%,95%CI 85.67%~97.89%),ROC 曲线下面积分别为 0.78、0.73;当以 LR-4 联合 LR-5 作为预测因子时,诊断 HCC 的特异度有所减低(阅片者 1:89.74%,95%CI 80.79%~95.47%;阅片者 2:88.46%,95%CI 79.22%~94.59%; $P<0.05$),但敏感度(阅片者 1:75.86%,95%CI 65.5%~84.4%;阅片者 2:74.71%,95%CI 64.25%~83.42%)、准确度(阅片者 1:82.42%,95%CI 75.85%~87.52%;阅片者 2:81.21%,95%CI 74.53%~86.48%)相对增加(P 均 <0.05),ROC 曲线下面积分别为 0.83、0.82。结论 基于 Gd-EOB-DTPA 增强 MRI 的 LI-RADS v2018 在 HCC 诊断方面具有一定的临床应用价值,且阅片者之间诊断分类结果的一致性高。

PU-0882

输卵管癌的 CT 和 MRI 表现分析

平小夏、刘原庆、胡粟、姜楠、胡春洪

苏州大学附属第一医院

目的 总结输卵管癌 (Primary fallopian tube carcinoma, PFTC) 的 CT 和 MRI 表现,以提高认识。**材料和方法** 回顾性收集经手术及病理证实的 PFTC 共 23 例。分析病变部位、大小、形态、密度或信号特点、增强扫描表现以及有无合并其他病灶等。结果 18 例表现为附件区实性 ($n=12$) 或囊实性 ($n=6$) 肿块,肿块最小 19.10mm×15.66mm×13.84mm,最大 102.09mm×41.72mm×50.63mm;呈腊肠形 (9/18)、迂曲条索状 (3/18)、类圆形或椭圆形 (5/18) 及不规则团块状 (1/18);实性部分在 CT 上表现为软组织密度, MRI 上则为稍长 T1 长 T2 信号, DWI 呈明显高信号,增强扫描均可见强化;病侧输卵管不同程度扩张、积液 7 例,网膜和/或腹膜局部增厚或软组织肿块影 8 例,对侧附件区结节状实性病灶 2 例,宫颈管黏膜增厚 2 例,宫腔内积液 2 例,大量腹腔积液 1 例。此外,3 例患者仅表现为腹盆腔内多发软组织结节或肿块,而输卵管病灶未见显示。1 例 CT 上子宫及附件区均未见明显异常。1 例表现为病变输卵管明显扩张、积液而无明确软组织成分。结论 PFTC 影像学表现具有一定特征性,临床工作中发现影像学表现为附件区腊肠样实性或囊实性肿块者应想到本病的可能性。

PU-0883

双源 CT 双能量技术对结直肠癌 MSI 状态及 CD8+ T 淋巴细胞浸润程度的预测价值

刘霞
大理大学

目的 探讨双源 CT 双能量技术对结直肠癌 MSI 状态的预测价值。**方法** 回顾性分析 150 例经临床证实结直肠癌患者的临床及双源 CT 影像资料, 其中 MSS/MSI-L 组 116 人, MSI-H 组 34 人, 比较各组间相关临床指标及双能量参数之间的差异, 分析 MSI-H 的独立危险因素及各因素对结直肠癌 MSI 状态的诊断效能。**结果** MSS/MSI-L 组与 MSI-H 组间的动脉期参数 (Z 值、NIC、K 值) 及静脉期参数 (Z 值、NIC、K 值) 存在统计学差异 ($P < 0.05$), 且 MSS/MSI-L 组参数高于 MSI-H 组, 多因素 Logistic 回归分析显示右半结肠、血小板是 MSI-H 的独立危险因素, 动脉期 K 值及静脉期 NIC 值是 MSI-H 保护因素, 受试者工作特征曲线 (receiver operating characteristic, ROC) 曲线联合参数 (动脉期 K 值及静脉期 NIC 值) 对结直肠癌 MSI 状态的诊断效能最高。**结论** 右半结肠及血小板是 MSI-H 的独立危险因素, 动脉期 K 值及静脉期 NIC 对结直肠癌 MSI 状态具有独立预测价值, 二者联合预测效能最高, 可为临床提供参考。

PU-0884

能谱 CT 图像分析碘基物质分解图像的纹理分析在卵巢癌术前预测 P53 状态的价值

宋庆玲、刘爱连、李烨
大连医科大学附属第一医院

目的: 探讨能谱 CT 碘基物质分解图像纹理分析在卵巢癌术前预测 P53 状态中的价值。**方法:** 本研究共纳入 40 例经手术病理证实的卵巢癌患者, 其中 P53 突变型 18 例, P53 野生型 22 例, 均经免疫组化染色证实。所有患者均于术前在 Discovery CT 750HD 扫描机上行能谱 CT 扫描, 重建动脉期碘浓度 CT 图像。使用 ITK-SNAP 软件勾画肿瘤全域感兴趣区 (region of interest, ROI), 形成肿瘤体积 ROI。使用 A.K.分析软件提取肿瘤 ROI 的纹理特征, 利用最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO)、一元 Logistic 回归和方差分析对特征进行选择 and 降维。然后构建放射组学特征的多元 Logistic 回归模型, 绘制受试者特征曲线 (receiver operating characteristic curve, ROC) 评价模型的诊断效能。**结果:** 最终选择前 3 个特征构建放射组学模型, 包括 GLCM_RunEntropy、GLCM_Imc1、GLCM_IDN。ROC 曲线下面积为 0.737 (准确性: 0.700; 敏感性: 0.944; 特异性: 0.500)。校正曲线和决策曲线分析分别显示出良好的校正效果和临床实用价值。**结论:** 基于能谱 CT 的碘基 MD 图像的纹理分析在预测卵巢癌患者 P53 状态方面具有较大潜力。**临床应用:** 对能谱 CT 碘基物质分解 (MD) 图像进行纹理分析可以预测卵巢癌 P53 的状态, 从而为制定治疗方案提供有效的信息。

PU-0885

基于能谱 CT 碘图参数和细胞外容积分数鉴别 I 型与 II 型卵巢上皮性恶性肿瘤的价值

宋庆玲、刘爱连、李烨
大连医科大学附属第一医院

目的: 探讨基于能谱 CT 碘图参数和细胞外容积分数鉴别 I 型与 II 型卵巢上皮性恶性肿瘤的价值。

方法: 纳入 2014-2022 年于本院经手术病理证实的 92 例卵巢上皮性癌患者, 根据病理类型分为 I 型 (低级别浆液性癌、透明细胞癌、低级别子宫内膜样腺癌、粘液腺癌) 和 II 型 (高级别浆液性癌、高级别子宫内膜样腺癌、癌肉瘤)。所有患者均于术前在 Discovery CT 750HD 扫描机上行能谱 CT 扫描, 重建动脉期、静脉期、延迟期碘浓度 CT 图像。于延迟期测量病灶最大层面实性部分的碘浓度值 (iodine concentration, IC) 和同层面髂外动脉的碘浓度值。根据公式“ $NIC = \text{病灶 IC} / \text{髂外动脉 IC}$ ”计算延迟期标准化碘浓度值 (delay-phase normalized iodine concentration, DNIC)。收集患者血细胞比积 (HCT), 根据公式“ $(1-HCT) * DNIC * 100\%$ ”计算卵巢癌细胞外容积分数 (extracellular volume, ECV)。采用独立样本 t 检验及秩和检验比较 I 型和 II 型卵巢癌 ANIC、VNIC、DNIC 和 ECV 的差异。绘制受试者特征曲线(receiver operating characteristic curve, ROC) 得到各指标的曲线下面积 (area of curve, AUC)、敏感度及特异度, 评价各参数的诊断效能。

结果: I 型患者 33 例, II 型患者 59 例。II 型卵巢癌 ANIC、VNIC、DNIC 及 ECV 明显高于 I 型卵巢癌 (所有 $P < 0.05$)。ANIC、VNIC、DNIC 及 ECV 的 AUC 分别为 0.689、0.685、0.828、0.812, 敏感度及特异度分别为 84.85% 和 50.85%、72.73% 和 64.41%、84.85% 和 76.21%、81.82% 和 77.97%。

结论: 基于能谱 CT 碘图参数和细胞外容积分数有潜力成为鉴别 I 型与 II 型卵巢上皮性恶性肿瘤的影像标志物。

PU-0886

罕见多灶性自身免疫性胰腺炎一例

王晶
南通大学附属医院

目的 探讨罕见的多灶性自身免疫性胰腺炎的影像及临床病理学特征。方法回顾性分析 1 例多灶性自身免疫性胰腺炎患者的临床资料、影像特征和病理学形态, 并复习相关文献。结果 男, 74 岁, 发现胰腺占位一月余入院, 实验室检查: 肿瘤指标 (-)。图 1 所示: CT 平扫示胰腺体尾部形态饱满, 动脉期增强胰腺体尾部类圆形稍低密度, 门脉期及延迟期呈等稍高密度。图 2 所示: MRI 示胰腺体尾部两枚类圆形异常信号, T1WI 呈低信号, T2WI 呈稍高信号, IN/OUT-PHASE 信号无明显改变, DWI 呈明显高信号, ADC 呈低信号; 增强扫描动脉期呈相对低信号, 延迟期呈明显均匀强化。手术切除胰腺体尾部, 免疫组化结果提示纤维化背景中可见浆细胞浸润, IgG4 阳性细胞约 40/HPF, IgG4 (+)、IgG (+), 考虑 IgG4 相关性自身免疫性胰腺炎 (Autoimmune pancreatitis, AIP), 如图 3 所示。结论 自身免疫性胰腺炎一种罕见的自身免疫介导的慢性胰腺炎, 病因不明, 可能与遗传和异常免疫相关。按病理学特征分为 I 型和 II 型。I-AIP 是 IgG4 相关疾病的胰腺表现, 好发于中老年男性。临床表现为无痛性黄疸、血清 IgG4 水平升高; 可伴多器官受累, 包括硬化性胆管炎、涎腺炎、间质性肺炎及腹膜后纤维化等。根据形态改变, I-AIP 可分为弥漫型、局灶型及多灶型。弥漫型多见, 胰腺弥漫肿大呈“腊肠状”伴刀鞘样结构。局灶型少见, 表现为局限性团块, 常位于胰头部。CT 平扫呈均匀等或低密度; MRI-T1WI 呈稍低信号, T2WI 呈稍高信号, 病灶内大量淋巴细胞、浆细胞浸润并发生特征性的席纹状纤维化, 限制了水分子扩散, 导致弥散受限。增强扫描动脉期胰腺实质呈低强化, 门静脉及平衡期呈渐进性强化, 可能与病变内纤维化及病灶压迫胰腺内微血管引起管腔狭窄、血流变慢, 造成对比剂缓慢流入流出有关。该病对激素治疗敏感, 表现为局灶性或多灶性肿块时, 易被误诊为胰腺肿瘤。早期精确诊断不仅可以避免不必要的手术, 还可以避免长期炎症导致不可逆性器官损害, 使患者得到及时正确的治疗及预后评估。

PU-0887

肝内神经内分泌癌一例

张晓雅、江波源
西安大兴医院

神经内分泌肿瘤是来源于神经内分泌系统的一种肿瘤，肝脏是常见的转移部位，原发较少；肝脏原发性神经内分泌肿瘤症状较轻，一般无肝炎或肝硬化病史；好发于中年人。本例 CT 示肝内不规则肿块，无假包膜，肝内血管及胆管未见明显受侵，肿块边缘强化明显，整体轻-中度强化，病理结果为肝左叶恶性肿瘤，符合神经内分泌癌。

PU-0888

嗜酸性空泡样肾肿瘤 1 例

丁德芳、钟京谕、星月、胡杨帆、戈翔、姚伟武
上海市同仁医院

目的 探讨嗜酸性空泡样肾肿瘤的影像特点、诊断及治疗。

方法 分析我院 1 例经病理证实的多发的嗜酸性空泡样肾肿瘤的临床资料，B 超、CT 及 MRI 影像表现和病理特征。

结果 本例患者为 71 岁女性，体检发现左肾多发占位 2 周，无腰痛，腹痛，尿频尿急等伴随症状。B 超示左肾内见数个低回声区，中下极之一大一小约 20.1×17.7×20.8mm，另一大小约 18×16mm，下极之一大一小约 13×13mm，形态欠规则，边界欠清，内见少许血流信号。经外周静脉注射造影剂 SonoVue 后，见该团块稍早于肾实质灌注，消退和肾实质基本同步，灌注峰值高于肾实质，灌注欠均匀，似见环形征。CT 增强示左肾实质多发类圆形等密度占位，平扫 CT 值约 40HU，增强后皮质期明显强化，CT 值约 126HU，强化程度低于肾皮质，髓质期强化减弱，CT 值约 95HU，排泄期 CT 值约 70HU，肾周脂肪间隙清晰，肾周筋膜无增厚。MRI 增强左肾多发异常信号结节灶，部分形态不规则，大者约 28*18mm，T1WI 为等、稍高信号，T2WI 为略低信号，信号欠均匀，弥散受限，增强扫描动脉期明显强化，后期强化减低。遂行肾肿瘤切除术，术后病理示左肾多发性嗜酸细胞性肾肿瘤，结合免疫酶标符合嗜酸性空泡样肾肿瘤（EVT）。

结论 嗜酸性空泡样肾肿瘤是一类新近被认识的肾肿瘤实体，临床较罕见，目前属于交界性/低度恶性肾肿瘤（ICD-O/1），过去被称为高级别嗜酸性肾肿瘤，因其具有独特的临床病理学特征及分子遗传学改变，第 5 版 WHO 肾肿瘤分类将其更名为嗜酸性空泡样肾肿瘤。本例嗜酸性空泡样肾肿瘤表现为多发，在国内外报道中更为罕见，其诊断主要依靠病理学检查及高通量 DNA 靶向测序，临床上无特殊表现，影像学上很难进行鉴别诊断。治疗上可采用手术治疗。

基于 CT 的肝脏和腰大肌脂肪定量评估急性胰腺炎严重程度的研究

王涛、于思文、胡兆申
哈尔滨医科大学附属第四医院

基于 CT 的肝脏和腰大肌脂肪定量评估急性胰腺炎严重程度的研究

王涛 1 于思文 1 胡兆申 1

【摘要】 目的 分析肝脏和骨骼肌 CT 脂肪定量指标对于急性胰腺炎严重程度评估的意义。方法 回顾性分析 2020 年 4 月至 2022 年 4 月哈尔滨医科大学附属第四医院和第一医院确诊为急性胰腺炎的 241 例患者临床资料, 其中 CT 平扫患者 160 例, CT 增强扫描患者 81 例。进行平扫的患者根据改良版 Balthazar 评分分成 SAP 组和 NSAP 组, 比较 SAP 组和 NSAP 组临床资料差异, 增强扫描患者依据 MCTSI 评分进行分组, 比较两种评分和修订版 Atlant 分类诊断一致性。通过受试者工作特征 (ROC) 曲线比较肝、腰大肌 CT 值及二者差值及比值、改良版 Balthazar 评分及 MCTSI 评分诊断 SAP 的效能。利用单因素和多因素 logistic 回归分析重度急性胰腺炎的影响因素。结果 160 例患者中包括 135 例 NSAP 及 25 例 SAP 患者。NSAP 与 SAP 患者之间腰大肌 CT 值、肝/腰大肌 CT 比值、差值差异均具有统计学意义, SAP 患者腰大肌 CT 值低于 NSAP 患者, 肝/腰大肌 CT 比值及二者差值均高于 NSAP 患者; 改良版 Balthazar 评分与修订版 Atlant 分类一致性由于 MCTSI 评分 (k 分别为 0.788、0.767) ; ROC 分析显示, 肝脏/腰大肌 CT 比值诊断效能最好, AUC 为 0.776, 最佳截断值为 0.95, 敏感性和特异性分别为 75%、71%; 其联合改良版 Balthazar 分级的 AUC 为 0.882, 与 MCTSI 相当。多因素 logistic 回归分析表明, 经混杂因素校正后, 肝/腰大肌 CT 比值 >0.95 时患者发生 SAP 风险增加 ($OR=5.965$)。结论 基于平扫的肝和腰大肌 CT 脂肪定量可用于评估急性胰腺炎严重程度, 二者联合可提高 CT 平扫对 AP 临床诊断价值。

基于多期 CT 图像的影像组学预测膀胱癌病理分级

钱晶、杨玲
苏州大学附属第一医院

目的: 探究基于多期 CT 图像的影像组学联合临床危险预测因素, 构建影像组学-临床模型及列线图, 用于术前预测膀胱癌病理分级的价值。

方法: 回顾性纳入 2019 年 1 月 1 日至 2021 年 12 月 31 日于苏州大学附属第一人民医院行手术治疗的膀胱癌患者, 其中, 高级别膀胱癌 104 例, 低级别膀胱癌 100 例, 在平扫、动脉期、静脉期图像上分别从肿瘤体积中提取影像组学特征, 并构建 Logistic Regression 模型、SVM 模型及 Random Forest 模型, 选取效能较高的模型计算每个患者的 Rad-score (radiomics score, 影像组学评分)。此外, 依次采用 logistics 单因素和多因素分析对临床危险预测因素和 Rad-score 进行筛选, 得到独立预测因素, 构建影像组学-临床模型及列线图, 并评估其性能。

结果: 在纳入的 204 名患者中, 142 名患者构成训练组, 62 名患者构成验证组, 在 3 个模型中以 Logistic Regression 模型效能最高。由 2 个独立预测因素患者年龄及 Rad-score 构建的影像组学-临床模型及列线图, 其训练组及验证组的 AUC 分别为 0.904 (95%CI 0.857-0.951)、0.906 (95%CI 0.837-0.975), 在验证组中, 诊断准确度为 0.790、灵敏度为 0.813、特异度为 0.767。

结论: 基于多期 CT 图像的影像组学联合临床危险预测因素, 构建影像组学-临床模型及列线图, 在预测膀胱癌病理分级方面具有较良好的性能。

病例报道：膀胱异位嗜铬细胞瘤

张潇月、王效春

山西医科大学第一医院影像科

目的：提高膀胱异位嗜铬细胞瘤的诊疗水平，减少漏诊与误诊。

方法：收集本院 2021-2023 年间诊断的一例膀胱嗜铬细胞瘤患者的临床资料及影像学特点进行回顾性分析，并结合相关文献讨论。

结果：52 岁男性，以“间断心悸两年，发现膀胱肿物 10 日余”为主诉，以“膀胱肿瘤”收入院，入院时症状加重，表现为心悸频率增加，排尿后血压升高明显，伴出汗、心悸、尿急、尿痛；患者高血压病史 10 余年，最高达 200/103mmHg。MRI 表现：膀胱左后壁肌层内见一椭圆形等 T1 等长 T2 软组织信号影，DWI 呈高信号，ADC 图示低信号，增强扫描早期呈明显不均匀强化，静脉期及延迟期强化程度减低，病灶向外局部突出于膀胱壁外，大小约 2.9cm×4.0cm×3.1cm（上下径×左右径×前后径）。外送儿茶酚胺（catecholamine, CA）类检验结果异常。患者行腹腔镜下膀胱部分切除术，术后病理结果提示：嗜铬细胞瘤，大小：3.5cm×3cm，局灶区域突破包膜；免疫组化结果：CK：（-），CgA（+），Syn（+），Melan-A（-），Ki67（+1%），Inhibinα（-），S100（+），CD56（+），Vimentin（+），SDHB（+）。术后随访排尿引起的心血管症状完全缓解。

结论：膀胱异位嗜铬细胞瘤是一种罕见的神经内分泌肿瘤，由膀胱壁交感神经支配的嗜铬细胞引起，发病率占膀胱肿瘤的 0.06%，大多数瘤体局限于膀胱黏膜下层和肌层。典型症状包括阵发/持续性高血压、血尿及排尿相关的心悸和晕厥等 CA 过量症状。初步诊断可结合临床症状、实验室和影像学检查，病理检查可确诊该疾病。患者排尿时膀胱收缩分泌 CA，产生排尿相关症状，因此，排尿引起的 CA 过量症状可提示异位嗜铬细胞瘤的怀疑诊断；实验室检查可通过测定血或尿 CA 及 CA 代谢物值推测诊断；免疫组化上皮源性标记物 CK 阴性，神经内分泌标记物 Syn 和 CgA 阳性，均提示异位嗜铬细胞瘤。该疾病可使用 α-R 阻滞剂对症治疗，手术切除是有效治疗手段，但术前要预防性使用抗肾上腺素能阻滞剂以防高血压危象。异位嗜铬细胞瘤总体特异性生存率极佳，其预后可能与是否存在转移相关。

CT 平扫及增强扫描鉴别肝脏血管瘤与肝脏血管肉瘤的价值

刘佳梅

贵州医科大学附属乌当医院

【摘要】目的 探讨 CT 平扫和增强扫描在鉴别肝脏血管肉瘤(PHA)与肝脏血管瘤(CHH)中的价值。方法 将我院 2021 年 1 月~2022 年 12 月接收经病理确诊的 32 例 PHA 患者设为 PHA 组,另将同时段内我院接收经病理确诊的 32 例 CHH 患者设为 CHH 组,两组均予以 CT 平扫和增强扫描,观察并比较两组 CT 图像特点、诊断情况及肝脏指标差异。结果 两组在平扫密度、边界、强化位置和动静脉短路方面比较,差异有统计学意义(P 0.05)。两组在肝血流、肝血容量、毛细血管表面通透性以及肝动脉灌注分数方面差异有统计学意义(P <0.05)。结论 CT 平扫和增强扫描肿瘤结节强化位置与动静脉短路是早期鉴别 PHA 及 CHH 的重要指标,两种疾病在 CT 鉴别中的肝功能指标方面存在较大差异,可以提供形态和血供特征的评估,能给临床开展下一步治疗提供有效依据。

原发性肝癌治疗最新进展

马进
重庆市中医院

原发性肝癌是一种常见的恶性肿瘤，其治疗一直受到广泛关注。虽然已有多种治疗方法，但是因为肝癌的病情复杂多变，治疗难度大，在临床上仍然存在很多问题尚待解决。本研究旨在探讨现有的原发性肝癌治疗方法，总结治疗的最新进展，为临床治疗提供参考。本文通过文献综述的方式，对原发性肝癌的病因、发病机制、诊断、分期以及治疗方法进行系统梳理，并结合近年来的最新研究成果，对治疗方法进行评估和总结。目前，原发性肝癌的治疗方法主要包括手术切除、局部治疗以及综合治疗等，其中，经过不断的实践和创新，局部治疗和综合治疗的效果不断提高，并逐步成为现有治疗方法的主流。此外，新药物和免疫治疗的应用也为原发性肝癌治疗带来了新希望。虽然原发性肝癌治疗在过去数十年中取得了显著进展，但是治疗仍然存在一定的局限性。未来，需要进一步探索病因、发病机制等方面的研究，并且不断完善治疗方法，加强多学科、多领域合作，以期能够更好的治疗原发性肝癌。

不同类型成像序列在磁共振肝脏弹性成像中的对比研究

王威
东南大学附属中大医院

目的：磁共振肝脏弹性成像(MRE)是一种无创性检测方法，可评估肝脏组织的硬度或弹性，对于早期肝硬化具有较高诊断价值。MRE 技术常用的成像序列有 epiMRE 序列和 greMRE 序列。本研究旨在探讨上述 2 种序列的差异及其对诊断结果的影响。

材料和方法：研究对象为东南大学附属中大医院感染科确诊的 24 名慢性乙型肝炎患者。使用西门子 VIDA 3.0T 磁共振设备以及 MAGNETOM Sola MRE 设备进行肝脏弹性成像扫描。采集时选择肝门部层面，并分别采用 epiMRE 和 greMRE 两次成像。其中，epiMRE 采样时间为 13s，由患者单次呼气后屏气完成；greMRE 采样时间为 97s，由患者分 5 次呼气后屏气完成扫描，总扫描用时 2 分 42 秒。扫描后设备自动生成幅值图、相位图、波形图、MRE 图、MRE 90%可置信区间图。选取 MRE 90%可置信区间图，在可置信区间内测量患者的 MRE 数值，同时测量 90%可置信区间与该层面肝脏实际的面积，计算其比例。最后使用 SPSS 比较 epiMRE 序列与 greMRE 序列上述测值的差异。

结果：epiMRE 的 90%可置信区间占肝脏实际面积的(89.5±1.7)%，greMRE 的 90%可置信区间占肝脏实际面积的(80.4±3.5)%。二者的差异具有统计学意义(P<0.05)。

讨论：磁共振弹性成像技术利用机械振动作用于人体组织，然后通过磁共振成像技术来测量振动波传播速度和波长，从而计算出组织的硬度或弹性指数。epiMRE 序列相比于 greMRE 序列能够有效地降低噪声干扰和运动伪影，增强图像质量和对比度。这也使得它更适用于肝脏弹性成像等需要高精度的医学应用中。同时 greMRE 序列成像时间较长且需患者多次屏气扫描，期间可能存在的膈肌运动幅度差异也是导致 greMRE 序列精度降低的可能因素总之，epiMRE 序列比 greMRE 序列在慢性乙型肝炎患者肝脏弹性成像方面具有更高的精度和可靠性。

结论：epiMRE 序列在慢性乙型肝炎患者肝脏弹性成像中具有更高的精度和可靠性，可以更好地评估肝脏组织的硬度及弹性，对于早期肝硬化和肝癌的诊断具有重要的应用价值。

PU-0895

原发性肝癌中医辨证分型与临床资料和影像征象的相关性研究

王莹、张喜荣
陕西中医药大学

目的：探究原发性肝癌中医辨证分型与临床指标及肝脏特异性造影剂影像学表现的相关性。方法：收集了 132 例初诊的原发性肝癌患者的临床特征和影像学表现，对性别、年龄、乙肝病史、肝硬化病史、Child-Pugh 分期、ALBI 评分、NLR、Alb、NEUT、LYM、PLT、PT、ALT、AST、IBil、DBil 和 TBil 等临床指标进行分析并对是否有门静脉侵犯、是否有肝外转移、病灶最大直径、病灶个数及形态、病灶边缘是否光滑、包膜是否有破坏、增强模式、肝胆期病灶信号是否减低、DWI 信号等影像征象进行评估并计算出病灶的表现扩散系数（*apparent diffusion coefficient*, ADC 值）。对计量资料进行两独立样本 *t* 检验或 Mann-Whitney U 检验，对计数资料进行卡方检验；对单因素分析差异有统计学意义的因子进行二元 Logistics 回归分析。结果：Alb ($Z=2.174$, $P=0.030$)、PT ($Z=2.307$, $P=0.021$)、AFP ($Z=4.486$, $P<0.001$)、门静脉是否侵犯 (卡方= 4.569 , $P=0.033$)、是否有肝外转移 (卡方= 5.216 , $P=0.022$)、肿瘤个数 (卡方= 4.569 , $P=0.033$)、肝胆期信号是否减低 (卡方= 5.584 , $P=0.018$)、ADC 值 ($Z=5.634$, $P<0.001$) 在肝癌中医证型间差异有统计学意义。AFP (OR 值= 1.003 , 95%CI: $1.002\sim1.005$)、Alb (OR 值= 1.135 , 95%CI: $1.005\sim1.282$)、门静脉是否侵犯 (OR 值= 0.011 , 95%CI: $0.001\sim0.197$) 和 ADC 值 (OR 值= 0.001 , 95%CI: $0.000\sim0.043$) 是肝癌中医证型的独立预测因素。结论：临床特征及影像学表现有助于肝癌中医证型的诊断和分型，并提高其准确性，从而指导临床治疗和改善患者预后。

PU-0896

Deep learning-based early-stage post-transplant MRI assessment is predictive of long-term graft loss in kidney transplant recipients

Rui Zhi
The First Affiliated Hospital of Nanjing Medical University

Purpose

Accurate prediction of long-term graft outcome of kidney transplantation (KT) remains challenging. This study is aimed to investigate the predictive value of an early post-transplant MRI assessment with deep learning for the prediction of long-term graft failure in KT recipients.

Methods

250 patients undergoing grafted kidney MRI exam within 2 years after KT were retrospectively included. The primary endpoint, i.e., graft loss, is defined as a return to hemodialysis, re-transplantation, or renal allograft dysfunction. Grafted kidney MRI assessment was performed with a pretrained RtNet+ model to decode the risk of acute allograft injury (AAI), chronic allograft injury (CAI) versus stable kidney graft recipient (SR). Then, RtNet+ outputs were combined with clinical-serum biomarkers using Cox proportional hazards (Cox-PH) and hybrid Cox & gradient boosting machine (Cox-GBM) learning algorithm for the prediction of graft survival. Concordance index (C-index) was used as the model performance metric.

Results

RtNet+-predicted AAI indicated an independent adverse factor of long-term graft loss (hazards ratio [HR], 4.77 [95% confidence interval, $1.88\sim12.10$]; $P < 0.01$), assessment relying on which showed a favorable performance for graft survival prediction (C-index, 0.673 [95% CI, $0.573 - 0.773$]). In addition, combination of early graft MRI measurement with clinical-serum biomarkers

using Cox-GBM produced a C-index of (0.743; 95% CI, 0.658 - 0.828), better than the Cox-PH model (0.688; 95% CI, 0.598 - 0.778), for the prediction of overall kidney graft survival.

Conclusions

Early-stage grafted kidney MRI assessment can provide clinical benefit in the prediction of long-term kidney graft outcome.

PU-0897

2018 版 LI-RADS 联合 ADC 值对 LI-RADS M 分类中肝细胞癌和其他肝原发恶性肿瘤的预测价值

潘江洋、王琦
河北医科大学第四医院

目的: 探讨 2018 版 LI-RADS MR 影像征象、ADC 值对 LI-RADS M (LR-M) 分类中肝细胞癌 (HCC) 和其他肝原发恶性肿瘤 (OM) 的预测价值。材料与方法: 142 例原发性肝癌患者的 MR 图像经两位放射医师分类为 LR-M, 其中, HCC 组 62 例, OM 组 80 例。比较两组间患者 ADC 值, 一般临床资料包括年龄、性别、位置、AFP、CA19-9、长径, 以及 LI-RADS MR 影像征象包括非边缘廓清, 强化包膜, 马赛克征, 肿瘤含脂, 瘤内出血, 结中结, 环形动脉期高强化, 边缘廓清, 延迟期中央强化, 靶样弥散受限, 胆管扩张。通过受试者工作曲线将 ADC 值由转换为二分类变量 ADC 分类, 单因素及多因素回归分析筛选鉴别 LR-M 中 HCC 和 OM 的独立预测因素, 受试者工作曲线分析各独立预测因素及预测模型的预测价值。结果: HCC 组中出现 AFP 升高 (42/62, 67.7%), 强化包膜 (41/62, 66.1%) 和瘤内出血 (13/62, 21.0%) 比例较高, ADC 值 $\leq 1.08 \times 10^{-3} \text{ mm}^2/\text{s}$; OM 组中出现 CA19-9 升高 (42/80, 52.5%), 延迟期中央强化 (51/80, 63.8%)、靶样弥散受限 (41/80, 51.3%) 和胆管扩张 (41/80, 51.3%) 比例更高, ADC 值 $> 1.08 \times 10^{-3} \text{ mm}^2/\text{s}$, 差异均有统计学意义 ($P < 0.05$)。多因素回归分析示 AFP、强化包膜、ADC 分类、胆管扩张是预测 HCC 组和 OM 组的独立预测因素, 受试者工作曲线显示预测模型曲线下面积最高为 0.950, 敏感度为 85.5%, 特异度为 91.2%。结论: 2018 版 LI-RADS 联合 ADC 值可有效预测 LR-M 分类中肝细胞癌 (HCC) 和其他肝原发恶性肿瘤 (OM)。

PU-0898

探讨胸腹主动脉检查在心衰相关疾病的应用

焦德磊
吉林大学第一医院

【目的: 研究利用 CT testBolus 技术获取注射对比剂达峰时间, 手动增加触发阈值, 提高心衰患者检查成功率的可行性。

方法: 回顾性收集 100 例, 其中心脏彩超示 60 例为心衰相关疾病患者, 40 例心功能无异常患者, 所有患者行胸腹主动脉检查, 采用飞利浦 256 排 CT, 造影剂选用碘克沙醇 320mgI/100ml, 碘流率 4-5ml/s, 对比剂剂量根据个人 BMI 指数对应使用; 应用 CT testBolus T 技术扫描, 获得触发图像曲线图 (Tracker Graph), 统计触发时间, 结合超声左室射血分数 (LVEF) 值之间的关系, 评价各组差异。

PU-0899

增强 CT 在胃间质瘤鉴别诊断中的应用价值

吴琼

哈尔滨医科大学附属第二医院

目的：增强 CT 是术前识别和评估胃黏膜下肿瘤（SMT）的重要检查手段，本研究探讨增强 CT 特征在区分胃间质瘤（GST）和其他胃 SMT 中的应用价值。方法：回顾性分析 66 例 SMT 患者的临床病理及影像资料，根据病理结果将患者分为 GST 组（54 例）和非 GST 组（6 例胃平滑肌瘤和 6 例胃神经鞘瘤，12 例），回顾术前 CT 图像的影像学特征：病变位置、最大径、生长模式、病变边缘、强化方式、各期图像的 CT 值以及坏死、浅表溃疡、钙化、病变周围肿大淋巴结(LN)和粗大血管的存在。比较两组的临床和 CT 特征。结果：5 个临床和 CT 特征提示肿瘤为 GST：年龄较大(>57 岁)、肿瘤体积较大($\geq 5.5\text{cm}$)、不均匀强化、坏死和无增大的淋巴结($p<0.05$)。结论：GST 有着不同于其他 SMT 的特殊 CT 和临床特征，术前增强 CT 在 SMT 中识别 GST 方面有较高应用价值。

PU-0900

双层探测器光谱 CT 定量增强参数评估肝功能储备

邹颖、陈志晔

中国人民解放军总医院海南医院

目的：探讨双层探测器光谱 CT 定量增强参数对评估肝功能储备的价值。方法：选取 2019 年 7 月至 2022 年 8 月在解放军总医院海南医院行腹部光谱 CT 三期增强检查患者共 24 例，对以上患者的门脉期能谱基数据（spectrum base image, SBI）进行处理，生成碘浓度（iodine concentration, IC）图、细胞外容积（extracellular volume, ECV）图，分别测量正常肝左叶、右叶及尾状叶的 IC 及 ECV 平均值。ECV 及 IC 组间比较采用 Kruskal-Wallis 检验，正态分布数据相关性分析采用 Pearson 法，非正态分布数据相关性分析采用 Spearman 法。光谱 CT 定量参数与吲哚菁绿(indocyanine green, ICG)清除试验参数采用一元及多元线性回归方法进行建模。结果：肝右叶的 ECV 及 IC 与 ICG5 分钟滞留率（ICGR5）、10 分钟滞留率（ICGR10）、15 分钟滞留率（ICGR15）呈显著负相关（ $r_{\text{ECV-R5}} = -0.48$, $r_{\text{ECV-R10}} = -0.48$, $r_{\text{ECV-R15}} = -0.47$, $r_{\text{IC-R5}} = -0.52$, $r_{\text{IC-R10}} = -0.52$, $r_{\text{IC-R15}} = -0.52$, $r_{\text{IC-R5}} = -0.52$, $r_{\text{IC-R10}} = -0.52$, $r_{\text{IC-R15}} = -0.52$, $r_{\text{IC-R5}} = -0.52$, $r_{\text{IC-R10}} = -0.52$, $r_{\text{IC-R15}} = -0.52$ ）。肝右叶的 ECV 及 IC 与 ICG 清除率（ICG-CR）呈显著正相关（ $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$, $r_{\text{ECV-ICG-CR}} = 0.48$ ）。肝右叶的 IC 与 ICGR5、ICG-CR 的逻辑回归方程分别为 $y=0.62-0.16*IC$ （ $P=0.04$ ）及 $y=0.09-0.07*IC$ （ $P=0.03$ ）。结论：光谱 CT 定量增强参数肝右叶的 IC 及 ECV 与肝功能储备具有一定临床相关性，肝右叶 IC 值与 ICGR5 及 ICG-CR 的回归模型可以初步用来评估肝功能储备。

PU-0901

光谱 CT 基于碘图的动脉增强分数及细胞外容积多参数定量评估对结直肠癌诊断的价值

胡飞龙¹、赵术强¹、吴静萍¹、李鑫¹、刘梦琦¹、姚慧²、王平怀¹、陈志晔¹

1. 中国人民解放军总医院海南医院

2. 飞利浦健康科技 CT 全球科研部

摘要:目的 探讨光谱 CT 定量增强参数对结直肠癌的诊断价值。方法 对 46 例行腹盆部光谱 CT 三期增强的结直肠癌患者的能谱基数据进行处理,生成无水碘图、动脉增强分数(AEF)图及细胞外容积(ECV)图,分别测量肿瘤及正常肠壁的碘浓度(IC)、AEF 及 ECV 值。采用独立样本 t 检验及 Mann-Whitney U 检验进行组间比较,并采用 ROC 曲线评价其诊断效能。结果 结直肠癌病变的 AEF 及 IC 值大于正常肠壁 AEF 值及 IC 值(0.338 ± 0.122 vs 0.225 ± 0.072 , 1.007 ± 0.402 mg/mL vs 0.599 ± 0.229 mg/mL, $P<0.0001$), ECV 在结直肠癌病变与正常肠壁间的差异无统计学意义($P=1.000$)。AEF、IC、ECV 及三者联合诊断结直肠癌的 ROC 曲线下面积分别为 0.806、0.797、0.671 及 0.842,其约登指数分别为 0.565、0.565、0.326 及 0.609。三者联合诊断结直肠癌的截断值为 0.660,敏感度为 63.04%,特异性为 97.83%,其逻辑回归方程为 $Y=13.75\times AEF+16.30\times ECV-6.70$ 。结论 光谱 CT 定量增强参数 AEF、ECV 及 IC 联合诊断对结直肠癌的诊断具有一定价值。

PU-0902

老年女性先天性门体分流 2 例

成盼盼、周红梅、李莹、董悦、刘远康、江翠萍、徐向阳

华中科技大学同济医学院附属梨园医院

背景及目的 先天性门体分流(CPSS),包括先天性肝内和肝外门体分流,是一种罕见的胎儿血管发育缺陷,导致门静脉血流分流到体循环。CPSS 最突出的表现为肝性脑病、肝肺综合征和肺动脉高压。我们报告两例先天性门体分流,分别为肝内和肝外。本文对 CPSS 的临床表现、CT 表现及治疗进行了复习。**案例总结** 两例均为老年女性患者。病例 1 因上腹痛入院。血生化检查显示肝功能指数升高,腹部 CT 增强意外发现先天性肝内门体分流(CIPS)Park 3 型。保肝治疗后腹痛缓解,肝功能指标恢复正常,建议定期检测血氨水平。病例 2 因黄疸入院,全身情况加重,血生化检查胆红素升高。腹部增强扫描发现先天性肝外门体分流(CEPS),但该病例的分流通道从肝右静脉流向脐静脉,再流向宫旁静脉丛,最后经髂静脉进入下腔静脉,此分流通道尚未报道过。药物治疗后黄疸症状明显改善,但仍需进一步介入治疗。**结论**

在成人患者中可偶然发现 CIPS 和 CEPS。成人 CIPs 需要定期监测血氨水平,而 CEPS 不仅需要定期监测血氨水平,还需要进一步干预治疗。

PU-0903

UBE2C、p-JAK2、p-STAT3 在 HCC 组织中的表达及其对患者预后的影响

李程、容鹏飞
中南大学湘雅三医院

目的：探讨 HCC 组织 UBE2C、p-JAK2、p-STAT3 表达与 HCC 临床指标、术前 CT 特征以及患者预后的相关性。

方法：通过 GEPIA 筛选出 UBE2C 为主要研究对象。收集 2010 年至 2016 年我院手术切除的 105 例 HCC 及对应癌旁组织的标本、临床病理指标以及术前 CT 资料；IHC 检测 HCC 及癌旁组织中 UBE2C、p-JAK2 及 p-STAT3 的表达；SPSS26.0 统计分析 UBE2C、p-JAK2 及 p-STAT3 表达与 HCC 患者的临床病理指标、术前 CT 特征和预后的关系，以及 HCC 组织中 UBE2C 表达与 p-JAK2 及 p-STAT3 表达的相关性。

结果：（1）UBE2C、p-JAK2、p-STAT3 在 HCC 组织中显著高表达（ $P<0.05$ ）。

（2）UBE2C、p-JAK2 的表达均与 HBsAg、AFP、肿瘤直径、分化程度、淋巴结转移及 TNM 分期显著相关（ $P<0.05$ ）。p-STAT3 的表达与 AFP、肿瘤直径、分化程度、淋巴结转移及 TNM 分期显著相关（ $P<0.05$ ）。

（3）UBE2C 的表达与 HCC 病灶直径、包膜、非环形动脉期高强化及非周边廓清等 CT 特征显著相关（ $P<0.01$ ）。p-JAK2、p-STAT3 的表达均与 HCC 病灶直径及包膜等 CT 特征显著相关（ $P<0.05$ ）。

（4）UBE2C 表达、肿瘤直径、分化程度及 TNM 分期是 HCC 患者总生存期的独立预后因素（ $P<0.05$ ）。

（5）UBE2C 的表达与 p-JAK2 及 p-STAT3 的表达显著正相关（ $P<0.001$ ）。

结论：UBE2C、p-JAK2、p-STAT3 在 HCC 组织中显著高表达，这与反映 HCC 恶性程度的临床指标及 CT 特征密切相关；UBE2C 高表达与 HCC 患者的不良预后有关；HCC 组织中 UBE2C 的表达与 p-JAK2、p-STAT3 的表达显著正相关。

能谱 CT 多参数成像在评估胆结石成分中的应用价值

刘芳、刘晟
中南大学湘雅三医院

目的：探究能谱 CT 多参数成像在评估胆结石成分中的应用价值。

方法：收集体外 125 枚胆结石置入猪肝模型中行 CT 能谱模式扫描并重建出每枚结石的普通螺旋 CT（120kvp like 混合能量）图像，测得所有胆结石单能量 40KeV、100KeV 时 CT 值（HU40KeV、HU100KeV）、有效原子序数（Eff-Z）值和普通螺旋 CT 值（HU120kvp like），并计算 40KeV-100KeV 间能谱衰减斜率（K），根据红外光谱分析结果分为胆固醇结石组 56 枚、非胆固醇结石组 69 枚，其中胆色素结石亚组 45 枚和碳酸钙结石亚组 24 枚，采用 Mann-Whitney U 检验比较两组间及亚组间各能谱参数差异，利用多因素 logistic 回归分析获得判断胆结石成分的独立鉴别参数，进行受试者工作特征曲线(receiver operating characteristic, ROC)分析，并获取相应的截断值。

结果：体外非胆固醇结石组 HU40KeV、HU100KeV、Eff-Z 和 K 值及 HU120kvp like 均高于胆固醇结石组，具有统计学差异（ $P=0.000$ ）。胆色素结石亚组 HU40KeV、HU100KeV、Eff-Z 和 K 值均低于碳酸钙亚组，具有统计学差异（ $P=0.000$ ）。胆色素结石亚组与碳酸钙结石亚组的 HU120kvp like 无统计学差异（ $P=0.063$ ）。多因素 logistic 回归分析结果显示鉴别胆结石成分的独

立鉴别参数仅为 Eff-Z (95%可信区间 13.85 242.03, $P<0.01$), 其 ROC 曲线下面积为 0.962, 其鉴别胆固醇结石和非胆固醇结石的截断值为 7.27。

结论: 能谱 CT 多参数成像较为准确评估胆固醇和非胆固醇结石, 尤其以 Eff-Z 参考价值为佳, 胆色素结石和碳酸钙结石能谱参数也有差异, 且与普通螺旋 CT 相比, 能谱 CT 可以提高评估胆结石成分的准确性。

PU-0905

动态 dr 在静脉肾盂造影中的应用价值

刘元婕

吉林大学第一医院

目的: 探讨动态 dr 在肾盂造影中的应用价值

方法: 对一例双肾积水的患者进行动态 dr 静脉肾盂造影检查, 并与普通静脉肾盂造影进行对比

结果: 动态 DR 矩形采集面积大, 一次曝光可显示整个泌尿系统。透视下观察造影剂的排泄情况, 做到头低脚高, 这样可以动态观察造影剂通过输尿管的全过程, 对轻微梗阻也能很好地显示。可对病区进行视觉操作和多角度旋转, 同时对胶片进行计数。

结论: 结合病例分析, 展示了肾盂造影动态 dr 的临床优势。与其他检查方法相比, 具有成像清晰、应用方便、副作用少、可灵活应用多体位、多轴位、动态摄影等优点。且能清晰显示泌尿系统的局部和全景, 并由此揭示泌尿系统的相关形态和功能改变。

PU-0906

磁共振 FACT 序列在非酒精性脂肪性肝病临床诊断中的应用研究

金鑫、王志强

北华大学附属医院

目的: 探究 FACT 序列及 MRS 技术定量测量非酒精性脂肪肝病人肝脏脂肪含量的应用及肝脏脂肪含量与临床血清学生化指标的相关性。方法: 选取 45 名腹部 MRI 患者, 测量肝脏脂肪含量, 得到质子密度脂肪分数 (PDFF), 收集其基本资料及相关生化指标。24 名男性, 平均年龄为 (51.08±7.34) 岁和 21 名女性, 平均年龄为 (51.33±4.35) 岁。分析肝脏脂肪含量 (MRI-PDFF)、血中甘油三酯、总胆固醇、高密度脂蛋白、低密度脂蛋白、谷丙转氨酶和谷草转氨酶之间的相关性。

应用 3.0T MR 机, 波谱技术测定质子密度脂肪分数 (MRS-PDFF), FACT 序列进行扫描同样测得肝脏脂肪含量的影像学指标。统计软件 23.0 用于本研究数据分析。结果: 1. 45 名受试者用波谱测量得到的肝内脂肪含量记为 MRS-PDFF, 平均为 (12.79±8.50) %, 在 FACT 序列测量的肝内脂肪含量记为 MRI-PDFF, 平均为 (12.33±8.98) %, 测得 MRS-PDFF 与 MRI-PDFF 之间明显正相关 ($r=0.922$, $P<0.01$) 2. 采用 Bland-Altman 分析得 MRI-PDFF 参数值, 其中绝大多数数据都在 95% 的一致性界限范围内。3. MRS-PDFF 诊断轻度、中度、重度肝脏脂肪变性的曲线下面积 (AUC) 分别为 0.932 (95%CI: 0.819-1.000)、0.888 (95%CI: 0.744-1.000) 和 0.733 (95%CI: 0.541-0.926), 截断点分别为 6.070%、9.120% 和 18.755%。4. MRI-PDFF 与 TG、TC、LDL 和 ALT 呈显著正相关 ($r=0.93$ 、0.80、0.91、0.92, $P<0.01$), MRI-PDFF 与 HDL 呈显著负相关 ($r=-0.62$, $P<0.01$)。结论: 1. MRS 技术具有非酒精性脂肪肝定量诊断效能, 与磁共振 FACT 定量序列存在高度一致相关性; 2. 与 MRS 技术相比, 磁共振 FACT 定量序列扫描时间短, 可以全肝进行脂肪定量; 3. 磁共振 FACT 定量序列参数与总胆固醇、甘油三酯、高密度脂蛋白、低密度脂蛋白、谷丙转氨酶具有较好的相关性。

PU-0907

多模态 MRI 成像对宫颈癌诊断价值的应用研究

李梦迪、张铎
北华大学附属医院

目的：多模态磁共振用于宫颈癌的早期筛查与评估

方法：选取 40 名盆腔 MRI 检查的检查者，其中有 20 名为病理证实为宫颈癌的病人（CC 组），20 名为健康对照者（HC 组），使用飞利浦 3.0TMR 机，并通过 DWI、DKI 和 IVIM 序列来测定宫颈癌患者的不同病理分型、不同病理分级、不同月经状态和正常检查者的影像学参数。在数据后处理工作站 DKE 和 IVIM 得到相应数据，运用 SPSS23.0 软件对数据进行统计分析。

结果：1.基于 DWI 诊断，宫颈癌组 ADC 值低于健康组；鳞癌组 ADC 值低于腺癌组；随着病理分级增加，ADC 值逐渐降低；宫颈癌绝经组 ADC 值低于非绝经组。所有参数差异均有统计学意义。

2.基于 DKI 诊断，宫颈癌组 MD 值低于健康组，MK 值高于健康组；鳞癌组 MD 值小于腺癌组，MK 值大于腺癌组；随着病理分级增加，MD 值逐渐降低，MK 值逐渐增高；各参数差异均具有统计学意义；不同月经状态的 MD、MK 值无统计学差异。

3.基于 IVIM 诊断，宫颈癌组 D 值低于健康组，D*值、f 值高于健康组；鳞癌组的 D 值、D*值、f 值低于腺癌组；随着病理分级增加，D 值逐渐降低；各参数差异均具有统计学意义（ $P < 0.05$ ）；随着病理分级增加，D*值、f 值差异无统计学意义；不同月经的 D 值、D*值、f 值均无统计学差。

4.DWI、DKI、IVIM 参数对宫颈癌诊断效能比较，D 值具有最佳诊断效能，ROC 曲线下面积（AUC）最大（0.960），其次依次为 MK 值、ADC 值、f 值、D*值、MD 值。

5.DWI、DKI、IVIM 参数鉴别宫颈鳞癌与宫颈腺癌效能比较，MK 值具有最佳鉴别效能，ROC 曲线下面积（AUC）最大（0.989），其次依次为 MD 值、D 值、ADC 值、D*值、f 值。

6.DWI、DKI、IVIM 各参数与宫颈癌病理分级相关性比较，MK 值与宫颈癌病理等级呈正相关，相关性最强， $r=0.796$ ，其次依次为 D 值、MD 值、ADC 值，且与宫颈癌病理分级呈负相关。

PU-0908

探讨 T2WI、DWI 和 T2-DWI 融合序列在子宫颈癌 宫旁侵犯的诊断价值

李建鹏、莫少芬、邹玉坚
东莞市人民医院

目的：评估 T2WI、T2WI+DWI 和 T2-DWI 融合序列对子宫颈癌宫旁侵犯的诊断价值。

方法：回顾性收集我院 105 例宫颈癌患者临床和 MRI 资料。MRI 检查包括 T2WI、DWI 和 T2-DWI 融合序列。由一名妇科医师、一名低年资放射医师和一名高年资放射医师采用半定性六分置信度表对上述图像分别进行诊断。统计学分析包括三位医师诊断结果的一致性检验、计算受试者工作特征曲线（ROC）下面积（AUC）等比较。

结果：三位医师用 T2-DWI 融合序列的评分结果的一致性最高。对于 T2WI、T2WI+DWI 和 T2-DWI 融合序列诊断子宫颈癌宫旁浸润，妇产科医师的 AUC 分别为：0.793、0.887 和 0.906；低年资放射医师的 AUC 为：0.911、0.914 和 0.978；高年资放射医师的 AUC 为：0.965、0.977 和 0.972。通过 Delong 检验，妇科医师和低年资放射医师用 T2-DWI 融合序列的诊断效能高于用 T2WI 序列，两位放射医师用 T2-DWI 融合序列的诊断效能无统计学差别。

结论：T2-DWI 融合序列图像直观，在子宫颈癌宫旁侵犯具有良好的诊断价值，可为术前准确分期提供可靠的帮助。

PU-0909

Multimodal Magnetic Resonance Imaging Combined with PSA in Diagnosis and Staging of Prostate Cancer

xiaoyu li, duo zhang
Affiliated Hospital of BeiHua University,

Objective : To explore the value of multiple magnetic resonance techniques combined with PSA in the diagnosis and staging of prostate cancer.

Methods : 1. A total of 130 suspected prostate cancer patients admitted to the Affiliated Hospital of BeiHua University from October 2020 to November 2022 were selected. MRI plain scan, DWI scan and DCE scan were performed on each patient. Philips 3.0TMR machine was used for scanning, and serum PSA test was performed. Finally, pathological results were used as the gold standard to compare the sensitivity, specificity and accuracy of single MRI plain scan, DWI, DCE and combined diagnosis. When combined with PSA > 10ng/ml, MRI plain scan +DWI+DCE was used in one group, and MRI plain scan +DWI+DCE combined with PSA was used in the other group. The diagnostic efficacy of the two groups was compared. 2. To explore the accuracy of MRI staging in the diagnosis of prostate cancer according to the pathological results of radical treatment. 3. Two radiologists used independent blind film reading and scoring according to PI-RADSv2.1, and took the pathological results of puncture and radical treatment as the gold standard. ROC curve was drawn and AUC, sensitivity, specificity and accuracy were calculated.

Results : 1. Among the 130 patients, 98 cases were pathologically confirmed to be prostate cancer, and the remaining 32 cases were all prostate hyperplasia. The accuracy of MRI plain scan +DWI+DCE in the diagnosis of prostate cancer was significantly higher than that of MRI plain scan, DWI and DCE alone, with statistical significance ($P < 0.05$), but there was no statistical significance in the accuracy of MRI plain scan +DWI+DCE in the diagnosis of prostate cancer compared with MRI plain scan +DWI ($P > 0.05$).

2. MRI plain scan +DWI+DCE group diagnosed 92 cases of prostate cancer, 6 cases of false negative, 27 cases of prostate hyperplasia, 5 cases of false positive, diagnosis accuracy of 91.5%. MRI plain scan +DWI+DCE combined with PSA were used to diagnose 95 cases of prostate cancer, 3 cases of false negative, 30 cases of prostate hyperplasia, 2 cases of false positive, the diagnostic accuracy was 96.2%. The diagnostic accuracy of MRI plain scan +DWI+DCE combined with PSA was significantly better than that of MRI plain scan +DWI+DCE group, and the difference was statistically significant ($P < 0.05$).

3. A total of 33 patients had radical pathological results, including 18 patients at T2 stage, 10 patients at T3 stage and 5 patients at T4 stage. The accuracy rate of MRI diagnosis of prostate cancer at T2 stage was 77.8%, T3 stage 80% and T4 stage 100%.

4. The AUC value of PI-RADSv2.1 score in the diagnosis of prostate cancer was 0.904(95%CI:0.855~0.954), and the accuracy rate, sensitivity and specificity of PI-RADS ≥ 3 score were 70.1%, 73.4% and 90.9%. The accuracy of PI-RADS ≥ 4 points (excluding peripherally PI-RADS 3+1 points) was 95.7%(45/47).

Conclusion : 1. The combination of MRI plain scan, DWI and DCE can significantly improve the diagnostic efficacy of prostate cancer. 2. MRI staging has high accuracy. MRI plain scan +DWI+DCE combined with PSA can further improve the diagnostic accuracy of prostate cancer. 3. The diagnostic specificity of PI-RADS v2.1 for prostate cancer is high, and the score of PI-RADS ≥ 4 (excluding the peripheral band of PI-RADS 3+1 score) suggests that the possibility of prostate cancer is as high as 95.7%.

CTA 在人流术后子宫动静脉瘘的临床应用

李志伟

三亚中心医院 (海南省第三人民医院)

目的: 探讨 CTA 在人流术后子宫动静脉瘘的临床应用。

方法: 回顾性分析 2015 年 1 月至 2023 年 8 月在我院就诊的 14 例人工流产术后合并子宫动静脉瘘的诊治过程, 使用 CTA 对患者盆腔血管进行成像, 检查取仰卧位, 双臂上举抱头, 采用 GE Discovery 750 HDCT 进行扫描。首先进行盆腔定位相扫描, 扫描范围包括全髂总动脉分叉处至耻骨联合下缘, 保证整个盆腔及供血大血管在扫描范围内, 螺距 0.984, 管电压 120kV, 有效管电流 300mAs。采用双筒高压注射器 (Stellant, 美国 Medrad 公司) 进行对比剂注射, 右侧肘正中静脉留置 20G 留置针, 碘对比剂剂量 (ml) = 体重 (kg) × 0.8ml/kg, 对比剂流速 (ml/s) = 碘对比剂剂量 (ml) / 12s, 然后以相同的速率注入 30ml 生理盐水。采用智能触发技术, 将感兴趣区置于腹主动脉层面, 触发阈值为 130 Hu, 动脉期延迟时间为 30~35s, 静脉期延迟 60~75s。并使用 MPR 及 VR 技术进行后处理, 显示子宫壁内的动静脉瘘和供血、引流血管。

结果: 14 例患者平均年龄 34 ± 5.7 岁, G1P0~G3P2 不等, 均在孕早期因宫内妊娠行人流术, 平均妊娠周数 6~8 周, 主要临床症状为人流术后持续性不规则阴道流血及 HCG 升高; CTA 图像上所有子宫动静脉瘘病灶均清晰显示, 供血动脉、引流静脉亦清晰显示, 其中右侧子宫动脉供血 8 例, 左侧子宫动脉供血 6 例, 病灶范围 3.4 ± 1.1 cm, 所有病例均行超选择子宫动脉造影明确诊断, 并予以明胶海绵栓塞治疗。

结论: CTA 可以清晰显示人流术后子宫动静脉瘘的病灶范围、供血动脉、引流静脉, 为临床诊治提供参考。

影像组学及影像基因组学在卵巢癌铂类化疗耐药方面的应用

刘娜、吴慧

内蒙古医科大学附属医院

摘要: **目的:** 通过影像组学及影像基因组学模型, 预测卵巢癌 (ovarian cancer, OC) 铂类化疗的耐药性。 **方法:** 回顾性分析 2015-2023 年间在我院接受铂类化疗的卵巢癌患者约 150 例, 收集术前核磁图像, 从 PACS 上将患者轴位 T2WI、DWI、DCE 图像导出, 使用 ITK-SNAP 软件进行病区逐层手动勾画, 然后将得到的三维感兴趣容积 (volume of interest, VOI) 导入 PyRadiomics 软件进行影像组学分析, 得到影像组学模型。结合组学模型及基因、临床参数, 对患者进行长期随访, 铂类化疗六个月内复发者定义为卵巢癌铂化疗耐药。 **结果:** 卵巢癌患者治疗以手术加铂类与紫杉类联合化疗为主, 但铂类化疗易产生耐药性, 此类患者再次化疗效果不佳, 卵巢癌患者的影像表现与化疗预后相关。 **结论:** 通过回顾性分析 150 例卵巢癌患者影像组学模型, 与临床表现、基因模型、随访结果进行相关性分析, 并得到可预测卵巢癌患者铂化疗耐药性的影像基因组学模型, 为指导治疗、选择合适化疗方案、延长患者无进展生存期 (PFS)、提高患者生活质量等方面提供了极高价值。

PU-0912

壶腹癌在肝脏特异性造影剂增强 MRI (CEMRI) 上的放射学表现

王一丁

四平市中心人民医院

目的:探讨壶腹癌在肝脏特异性造影剂增强 MRI(CE-MRI)中的影像学表现。

方法和材料:本回顾性研究纳入 2015 年 1 月至 2019 年 1 月疑有壶腹癌并应用肝脏特异性造影剂行 CE-MRI 的患者 120 例(男性 65 例,女性 55 例,平均年龄 70.62 岁)。我们收集了壶腹是否存在鼓胀、大小、T1/ T2 信号强度、增强模式、壶腹弥散受限、胆总管和胰管扩张程度、胆总管远端形态改变、cbd 壁增厚和不对称、延迟 20 min 和 30 min 扫描十二指肠造影分泌情况。我们也回顾了病理和临床诊断资料。此外,我们还根据壶腹鼓胀的存在情况进行了亚组分析。进行单因素和多因素分析以确定恶性相关因素。

结果:壶腹癌 54 例,良性 66 例。多因素分析显示壶腹扩散受限($p=0.028$)、壶腹不均匀强化($p=0.045$)、壶腹形状无改变($p=0.010$)、十二指肠 30min 扫描无造影剂分泌($p=0.001$)与壶腹癌显著相关。亚组分析发现壶腹癌患者存在弥散受限、cbd 扩张程度、十二指肠 30min 延迟扫描无造影剂分泌与壶腹癌有显著相关性。在壶腹部无鼓胀的组中,30min 延迟十二指肠扫描无造影剂分泌是壶腹癌的唯一重要因素。

结论:壶腹弥散受限、壶腹不均匀强化、远端 CBD 形态无改变、十二指肠 30min 延迟扫描无造影剂分泌与壶腹癌有显著相关性。其中,30 分钟延迟扫描十二指肠无造影剂分泌是唯一与壶腹鼓胀无关的显著因素。

局限性:单中心,少数受试者的回顾性研究。

PU-0913

CT 表现对预测粘连性小肠梗阻患者的手术结果的研究

刘帅君

四平市中心人民医院

目的:本研究的目的是评估粘连性小肠梗阻患者的 MDCT 表现作为手术干预的预测因素的准确性。

方法和材料:这项研究分两个阶段进行。在第一阶段,75 例符合纳入标准的回顾性研究纳入本研究 MDCT 表现:小肠扩张,肠壁增厚,肠梗阻程度,小肠气液面,小肠粪便,肠系膜脂肪紊乱,有无腹腔内游离液体。评估这些特征的敏感性、特异性、阳性预测值、阴性预测值及预测手术结果的准确性。通过手术治疗来评估这些特征的相关性。在我们研究的第二阶段,通过应用于 25 例前瞻性病例来检验在回顾性组中获得的结果的有效性。

结果:在回顾性研究组中,小肠扩张($>4\text{cm}$)和高度梗阻被发现具有统计学意义,是粘连性小肠梗阻患者单独和联合手术结果的阳性预测因子。建立在回顾性数据基础上的模型显示,在前瞻性病例中,手术和保守治疗之间存在显著差异,从而验证了我们的结果。

结论:小肠 4cm 扩张及高度梗阻的 MDCT 特征可独立或联合预测粘连性小肠梗阻患者的手术结果。

限制:目前还没有广泛接受的梗阻等级的定义。患者的临床状况没有被考虑在内。

PU-0914

4D-freebreathing 序列对自由呼吸患者肝脏 MR 图像质量的提升价值

迟彬

华中科技大学同济医学院附属协和医院

目的：探索 4D 真正自由呼吸高时间分辨率动态增强扫描（4D-freebreathing）序列对不能配合屏气患者肝脏 MR 图像质量的提升价值。方法：回顾分析 2022 年 1 月至 2023 年 5 月在我院行 4D-freebreathing 肝脏扫描患者 40 例（男 22 例，女 18 例），患者均完成了 4D-freebreathing 序列扫描和常规肝脏动态增强扫描，由两位医师对两种序列图像进行独立评价，评价内容包括病变显示，边界显示，病变周围血管显示和图像伪影 4 个方面。采用秩和检验比较两种序列图像质量，采用 Kappa 检验讨论两位医师图像质量评分一致性。结果：两位医师图像质量评分一致性中等（ $\kappa=0.554$ ），4D-freebreathing 序列在病变显示，病变边界显示，病变周围血管显示和图像伪影 4 方面均优于常规肝脏动态增强扫描序列。结论：4D-freebreathing 序列较常规肝脏动态增强序列可显著提升不能屏气，自由呼吸患者肝脏病变的图像质量和病灶检出率。

阴囊高分化脂肪肉瘤 1 例病例报道

刘世英

大通县第一人民医院

患者男，63 岁，患者自诉于半年前发现右侧阴囊有一肿物，无其他明显不适，查体发现右侧阴囊一实性肿块，肿块与睾丸粘连，有一定的移动性，挤压包块无缩小，用手不能还纳。包块透光实验阴性。超声及 CT 检查发现右侧阴囊内见以脂肪为主的混杂肿块；手术，病理结果：考虑为右侧阴囊非典型脂肪源性肿瘤（高分化脂肪肉瘤）。此病比较罕见，临床治疗以根治性切除为主，复发率高，应重视术后长期随访。

PU-0916

Application of medical imaging in ovarian cancer: Bibliometric Analysis

Yinping Leng, Xiwen Wang, Lianggeng Gong
the Second Affiliated Hospital of Nanchang University

Purpose This study aims to use bibliometric analysis to investigate the current research hotspots and collaborative networks in the application of medical imaging in ovarian cancer over the past 23 years.

Methods A systematic search of medical imaging in ovarian cancer was conducted on the Web of Science Core Collection on August 9, 2023. Download all published reviews and articles from January 2000 to December 2022. Countries, institutions, journals, keywords and collaborative networks were analyzed and visualized using CiteSpace and VOSviewer.

Results We have obtained a total of 5958 publications. These works came from 3958 institutions in 84 countries, published in 1186 journals, and written by 26643 authors. The annual cumulative publications follow Price's exponential growth law. The United States (1373 articles) was the most prolific country, with Harvard University (202 articles) being the most prominent institution.

Timmerman D participated in most studies (100 articles), with Gynecological Oncology having the highest number of publications on this topic (296 articles). In addition, the top three keywords ranked were "ovarian cancer", "diagnosis", and "ultra sound". Classification, nanoparticles, and resistance had become recent research hotspots.

Conclusion This study provides an overview with the medical imaging applications of ovarian cancer, helping researchers understand the current status, collaborative networks, and main research hotspots in this field. In addition, our research findings provide a series of recommendations for future research.

输尿管夹层的影像表现特征分析

张晓悦、张金玲、李欣怡
哈尔滨医科大学附属第二医院

输尿管夹层是由输尿管自发性撕裂而形成的, 自发性输尿管破裂是一种少见疾病, 分为创伤性和非创伤性, 非创伤性是由于结石导致尿路梗阻引起的, 其次是由盆腔肿块、妊娠、腹膜后纤维化及膀胱癌所致。而由于各种原因引起输尿管自发性撕裂形成输尿管夹层更加罕见。夹层多发于中上段, 输尿管夹层的发病机制尚不清楚, 其发病机制可能与主动脉夹层相似。输尿管夹层形成的直接原因是输尿管粘膜损伤和各种病因导致的尿路梗阻引起管腔内压力增高, 当压力超过 20 至 75mmHg 的临界水平时, 肾脏可能通过两种机制缓解增高的压力。一种是肾血流明显减低, 尿液生成减少, 肾盂积水速度减慢, 伴有严重的肾功能损害。另一种是尿液出现各种逆流和渗漏, 其中以肾盂肾窦逆流最常见, 此种逆流容易发生在肾盏穹隆部, 由此渗漏至肾外而形成尿瘤, 其次是上段输尿管, 发生在中上段输尿管的渗漏, 我们将其称之为“输尿管夹层”, 二者也可同时存在。

磁共振成像(MRI)评估胰腺导管内乳头状黏液瘤(IPMN)良恶性诊断价值

徐红维
西安凤城医院

【摘要】目的:探讨磁共振平扫、增强及 MRCP 评估胰腺导管内乳头状黏液瘤(IPMN)良性及恶性的诊断价值。方法:回顾性分析经手术病理证实的 8 例胰腺导管内乳头状黏液瘤的 MRI 表现,以评估其良恶性的价值。结果:入组的胰腺导管内乳头状黏液瘤病例,2 例轻度不典型增生(良性)中 1 例位于胰头部,1 例位于胰体部,表现为主胰管局部轻度扩张 $>5\text{ mm}<10\text{ mm}$;4 例中度不典型增生(交界性)中 2 例位于胰头,2 例位于胰尾部,主胰管均扩张 $>10\text{ mm}<15\text{ mm}$,为分叶状囊性肿块,内部有或无分隔和强化的乳头状突起;2 例重度不典型增生伴局部浸润癌(恶性),1 例位于胰头部,1 例位于胰尾部,主胰管明显扩张 $>15\text{ mm}$,分支胰管部分扩张,为不规则囊实性肿块,直径大于 10mm 并强化,其中 1 例发生肝脏多发转移。结论:MRI 评估胰腺导管内乳头状黏液瘤良性及恶性有独特优势。

基于自然语言处理的 CT 影像报告水平的腹部创伤诊断分类系统

张惠茅、王雅宁、苗政、穆琳
吉林大学第一医院，放射科

目的：利用 NLP 技术从大量腹部报告中筛选出诊断为腹部实质脏器创伤的患者

背景：目前，国内的影像学报告尚没有规范化，这对病例的调阅和统计造成了一定的困扰，同时也延长了报告的书写时间。规范化的报告将有利于疾病诊疗和急诊数据的收集。自然语言处理技术（NLP）在医学影像报告中存在一定的作用，已有研究针对脑部急诊疾病、肿瘤类疾病和胸部 CT 的偶发疾病等开展大批量的报告规范化及疾病分类。然而，尚没有研究针对腹部实质脏器创伤的诊断分类和报告规范化。本研究拟利用 NLP 技术对腹部报告进行筛查，以达到快速精准筛选出腹部创伤患者的目的。

方法：回顾性连续性收集 18 年—22 年吉林大学第一医院全腹部 CT 的诊断报告，利用关键词检索方式查找报告描述和结论部分提示可能存在肝，脾，肾挫裂伤的患者共 500 例，两名具有十年诊断经验的高级放射科医师分别调阅报告对应图像，明确病例是否存在对应腹部创伤，并以患者水平为单位，标注出该患者存在创伤的器官。最终获得具有分类金标准标签的阳性数据共 475 例，所有数据互为阴阳性对照。医生评定的金标准数据作为模型输入，送入到 NLP 深度学习模型网络框架中，模型采用了 BERT 模型，结合了面向中文的预训练模型 chinese-bert-wwm-ext，用于医疗诊断任务。chinese-bert-wwm-ext 是专门为中文设计的预训练模型，它基于大规模中文语料库进行训练，捕捉子词级别的信息。bert 模型具有双向上下文理解能力。基于中文预训练模型对 bert 进行微调，输入中文文本，如病人的检测描述，通过 BERT 模型进行编码，生成文本的语义表示，捕获文本之间的关联，最终输出疾病症状的分类结果。

结果：所有数据按照 3: 1 划分为训练集和测试集，在训练集的 100 例数据上，肝挫裂伤获得了 0.98 的 ACC 和 0.99 的 F1 分数；脾挫裂伤获得了 0.94 的 ACC 和 F1 分数，对于肾挫裂伤，ACC 达到 0.99，F1 分数为 0.95。

结论：该研究建立的 NLP 深度学习框架在腹部创伤分类方面获得了较高的准确度，能够帮助研究者有效的筛查创伤数据

PU-0920

肝脏少见肿瘤的影像表现并文献复习

曾思、王珍
黄石市中心医院

目的：综合运用 CT 和 MRI 检查，总结肝脏少见肿瘤的影像学表现，旨在提高对肝脏少见肿瘤的认识。

方法：回顾性分析经病理证实的 13 例肝脏原发性少见肿瘤的影像及临床资料,并结合相关文献进行总结。

结果：肝脏血管周上皮样细胞肿瘤 3 例，其中 1 例 CT 平扫可见脂肪密度，增强 CT 及磁共振动脉期均显示明显强化，门静脉期及延迟期强化程度均减低。肝脏炎性假瘤样滤泡树突细胞肉瘤 1 例，位于肝左外叶，密度不均匀，边界欠清，增强扫描病灶边缘实性部分呈渐进性强化，中央可见大片未强化坏死区，病灶由肝左动脉供血。肝肉瘤样癌 1 例，CT 平扫呈稍低密度，增强扫描动脉期呈斑片状不均匀强化，中央见大范围坏死囊变区，门脉期及延迟期呈低密度。肝内胆管内乳头状肿瘤 1 例，位于肝左叶，肝内胆管呈"瘤样"扩张，扩张的肝内胆管出现乳头状结节影。弥漫大 B 细胞淋巴瘤 1 例，动脉期呈轻度强化，门脉期强化轻度上升，强化程度均低于正常肝组织，可见"血管漂浮征"。肝假性淋巴瘤 1 例，DWI 呈现沿汇管区线性高信号，ADC 呈明显低信号。肝细胞腺瘤病 1

例, 病灶多发并可见脂肪密度, 增强明显强化。肝炎性肌纤维母细胞瘤 1 例, 动脉期未见明显强化, 门静脉期轻度强化, 延迟期强化较前明显。肝脏间叶型错构瘤 1 例, 可见巨大多房囊性占位, 囊壁和分隔强化。肝内胆管性囊腺瘤 2 例, CT 表现为蜂窝状以囊性成分为主低密度影, 动脉期分隔及壁结节强化不明显, 延迟期可见中度渐进性强化。

结论: 肝脏少见肿瘤类型种类丰富, 影像表现具有一定的特征。在平时进行疾病诊断中, 除先考虑常见病以外, 少见肿瘤仍应在鉴别诊断范围, 多了解少见肿瘤的影像表现, 以破除思维定式及局限性, 能更好发挥影像学在肝脏肿瘤诊疗中的作用。

PU-0921

能谱 CT 碘水值及 ECV 纹理分析预测直肠癌壁外血管侵犯

王悦¹、陈安良¹、胡文君¹、王家正³、林良杰³、宋清伟¹、刘爱莲^{1,2}

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心, 辽宁大连, 中国

3. 飞利浦医疗, 北京, 中国

目的:

探讨能谱 CT 碘水值及基于细胞外体积分数(extracellular volume, ECV)纹理分析在预测直肠癌(rectal cancer, RC)壁外血管侵犯中的价值。

材料与方法:

我们回顾性地收集了 74 例经手术和病理证实并于术前行 Revolution 能谱 CT 增强扫描检查的 RC 患者图像与临床信息。根据 RC 的组织学分类标准, 将患者分为非壁外血管受侵组(A 组, 65 例)和壁外血管受侵组(B 组, 9 例)。将所有图像导入 GE AW 4.6 工作站, 使用 GSI Viewer 软件重建延迟期碘(水)图。两名放射科医生(2 年及 8 年腹部诊断经验)各自将三个椭圆形 ROI 放置在病灶的最大层面上, 测量并计算其均值作为最终碘水值(Iodine concentration, IC)。延迟期标准化 IC(DNIC)=病灶的 IC/同层面左髂外动脉的 IC; $ECV=(1- \text{红细胞压积}/100)*NIC*100$ 。将延迟期碘水图导入 Matlab 软件生成 ECV 图, 并导入 ITK-SNAP 软件; 由 2 名影像科医师采用盲法, 参照增强三期原始图像沿病灶边缘勾勒感兴趣区(ROI), 并融合生成三维感兴趣区(volume of interest, VOI)。使用联影 AI 平台(V1.6)进行纹理特征提取; 采用差异性检验比较各参数是否具有统计学差异; 建立 logistic 回归模型, 绘制受试者工作特征(receiver operating characteristic, ROC)曲线评估预测效能, 计算 ROC 曲线下面积(area under the curve, AUC)、敏感度及特异度。

结果:

ECV 及 DNIC 在两组间没有差异($P>0.05$); 经筛选得到 8 个最优纹理特征, 包括 1 个一阶特征, 4 个灰度共生矩阵特征(GLCM)特征, 2 个灰度依赖矩阵(GLDM)特征, 1 个灰度级大小区域矩阵特征(GLSZM)特征(表 1)。Logistic 回归模型预测直肠癌壁外血管侵犯的 AUC、灵敏度及特异度分别为 0.851、88.9%、78.5%(图 1, 表 2)。

结论: 基于能谱 CT 碘水图延迟期 ECV 的全肿瘤纹理分析对于直肠癌壁外血管侵犯具有一定的预测价值。

PU-0922

基于 4D Flow 磁共振技术实时评价 2 型糖尿病患者腹部血流动力学改变

吴迪、居胜红
东南大学附属中大医院

目的

4D Flow 磁共振成像 (4D-Flow MRI) 可以全面地覆盖和量化时态三维血流。本研究的目的是通过使用 4D-Flow MRI 比较 2 型糖尿病 (T2DM) 患者与健康受试者之间的肾动脉和脾动脉血液动力学变化。

方法和材料

参与者: 本研究纳入了 10 名 T2DM 患者 (7 男 3 女; 年龄 50.7 ± 3.4 岁), 以临床数据诊断, 同时纳入了 10 名无 T2DM 病史的健康受试者 (7 男 3 女; 年龄 47.2 ± 3.29 岁) 作为年龄和性别匹配的对照组。MRI 协议: 两组均接受了一个以腹部区域为中心的径向欠采样灵敏度编码 4D PC 序列, 以获取 3.0T 磁共振 (MR) 扫描仪 (PHILIPS Ingenia, 荷兰 Philips 公司) 中的血液动力学数据。

数据分析: 所有 4D-flow 数据的预处理、可视化和量化均使用 GT Flow 版本 3.2.5 (GyroTools, 瑞士苏黎世) 进行。我们的研究包括 3 条血管 (脾动脉, 左右肾动脉), 结果包括平均速度 (V_{avg}), 最大速度 (V_{max}), 净血流 (Net flow) 和计算阻力指数 (RI)。统计分析: 统计分析由 SPSS (v.22.0; IBM SPSS, ArmonkNY) 和 Matlab (R2018, Mass) 进行。通过 20 个流量统计阶段生成的计算 RI 进行分析。统计显着性水平设为 $p < 0.05$ 。

结果

对于 3 个血管, 根据统计分析, 肾动脉和脾动脉的血流显示出显著差异。左肾动脉相对较低的 V_{avg} (7.14 ± 2.54 vs 10.12 ± 3.55 $p = 0.047$) 与对照组相比较低。脾动脉在 T2DM 组中表现出较低的净血流 (3.84 ± 1.04 vs 6.24 ± 2.96 , $p = 0.046$)。计算的 RI 显示出在两组中肾动脉和脾动脉之间的良好相关性。 ($r = 0.9174$, $p < 0.001$)

结论

T2DM 患者的血液动力学变化显示出肾动脉和脾动脉的显著变化。总之, 4D-Flow MRI 为提供了量化 T2DM 血液动力学变化提供了希望。

PU-0923

胰头巨大孤立性纤维性肿瘤一例

张鸿、秦将均
三亚中心医院 (海南省第三人民医院)

目的: 原发于胰腺的孤立性纤维性肿瘤 (Solitary fibrous tumors, SFT) 极为罕见。本文将报告 1 例胰头巨大 SFT 影像学及病理学表现, 以供临床同道借鉴参考。

方法: 患者, 女性, 69 岁, 1 月前无明显诱因出现上腹部疼痛伴腹胀, 不伴腹泻, 于当地医院 CT 检查提示: 胰腺占位性病变, 未予治疗。现为进一步治疗收治于本院, 入院查体神清, 皮肤巩膜无黄染, 腹部柔软, 无压痛反跳痛, 未触及明显肿块, 体重无明显变化。

结果: 实验室检查: 葡萄糖 6.6 mmol/L ; 肿瘤标志物 (-)。影像学表现: 胰腺头颈部见一边界尚清巨大肿块, 分左右两个叶状结构, 大小约 $17.2 \times 9.1 \times 10.1 \text{ cm}$, CT 平扫示右侧叶可见低密度坏死灶, 左侧叶内可见钙化灶, MR 平扫示肿块内部信号不均匀, T1WI 呈等/稍高信号, T2WI 呈高信号, 左侧信号较右侧更加混杂, 增强扫描动脉期病灶左侧强化较右侧明显, 其内可见多发细小血管影, 实质期及延迟期持续轻度强化, 病灶与肝总动脉分界不清, 门静脉受压明显右移变细。影像诊断: 实性假乳头状瘤可能。行全胰切除+门静脉部分切除重建术, 术中见肿瘤起源于胰头颈部, 术中见肿瘤起源于胰头颈部,

质地韧，表面光滑，边界不清，活动度差，累及周围神经，门静脉、肝总动脉受侵，周围脏器无受累，未见淋巴结转移。镜检：肿瘤细胞呈梭形、卵圆形，核卵圆形，轻度异型，核分裂像较少，呈束状、交织状排列，细胞排列疏密不等，间质可见厚壁血管，局部呈血管外皮瘤样结构，部分区域骨化明显，局部见纤维被膜。免疫组化：CD34、STAT6、Vim、LEF1、C-kit、Nesp55、Islet1、 β -Tub、 β -cat (浆+)呈阳性表达，诊断为胰腺 SFT。

结论：该病例临床症状不典型，肿标阴性；肿瘤较大且呈分叶状，密度及信号不均，可见坏死、囊变及钙化，肿瘤血管丰富，门静脉和肝总动脉受侵，周围脏器无明显受累，术前诊断困难。STAT6 核阳性表达具有高度特异性。

PU-0924

Cinematic Rendering of Retrograde Jejuno gastric Intussusception

Huihui Zhang

Hunan normal University (Hunan Provincial People's Hospital)

A 66-year-old woman with a history of pancreatoduodenectomy presented with progressive epigastric pain. Abdominal CT demonstrated partial jejunal herniation into the remnant stomach, consistent with retrograde jejuno gastric intussusception(Figure). Exploratory laparoscopy confirmed the diagnosis. The intussusception was reduced with fixation of jejunum to the mesocolon to prevent recurrence. The postoperative course was uneventful.

Retrograde jejuno gastric intussusception is a rare but potentially lethal complication following gastric surgery, including Billroths operation I and II reconstruction and Roux-en-Y anastomosis(1). Three anatomical categories have been proposed: type I involves the afferent limb (antegrade); type II affects the efferent limb (retrograde) and type III involves both limbs. Type II was the predominant category, accounting for 80% of all cases. Imaging, especially CT, is essential for the accurate diagnosis(2). This image-based case shows the use of cinematic rendering to create photograph-realistic three-dimensional images of retrograde jejuno gastric intussusception to facilitate communication and visualization for preoperative planning.

PU-0925

胃肝样腺癌 1 例报告及文献复习

陈晓琴、彭礼清

四川大学华西医院

[摘要]目的：分析胃肝样腺癌(hepatoid adenocarcinoma of stomach, HAS)的 CT 及 MRI 表现，总结其影像学特征。方法：回顾性地搜集了 1 例经病理证实的 HAS，并结合相关文献，总结 HAS 的临床特点、影像学表现。结果：患者，男，61 岁，因“体检发现甲胎蛋白升高 3 月，胃镜检发现胃癌 1 月”，门诊以胃癌收治入院，影像学检查上腹部 Ct 胃-贲门、胃底及胃小弯侧胃壁明显增厚呈肿块状，内缘凹凸不平、溃疡形成，病变浆膜面毛糙模糊，增强扫描明显不均匀强化，周围脂肪间隙模糊，肝胃韧带区、腹腔干旁、大网膜上淋巴结多、增大，部分融合成团，与胃壁病变分界不清，病变局部包绕胃左动脉，局部显示欠清。上腹部增强 MRI 检查胃-贲门、胃底及胃小弯侧胃壁肿块 T1WI 呈不均匀稍低信号，T2WI 呈不均匀低信号，高 b 值 (b=800) 弥散加权成像病灶呈高信号，表观弥散系数呈低信号；增强扫描明显不均匀强化，结合患者乙肝病毒感染史及 AFP 增高因素，影像诊断考虑肿瘤病变可能，胃肝样腺癌可能性大。后进行病理穿刺诊断为肝样腺癌，对胃病理进行免疫组织化学检测确诊为 HAS。结论：HAS 临床表现缺乏特异性，影像学表现为局限溃疡型病灶的倾向，坏死成分较多，具有高度淋巴结转移倾向，极易误诊为胃腺癌或肝细胞癌转移，病理检

查和免疫组织化学检测是诊断该病的金标准, HAS 恶性度高, 进展快, 应做到早发现和早治疗, 以延长患者的生存期。

PU-0926

肝脏恶性肿瘤经 90Y 治疗后的影像动态变化

姚丹丹、王远成
东南大学附属中大医院

目的 了解钇 90 放射治疗后常见影像学表现, 探索中国人群治疗后影像动态变化规律。

方法 回顾性分析 2021 年 5 月至今于单个中心 (东南大学附属中大医院) 约 30 例确诊为肝脏恶性肿瘤且接受内放射 (钇 90) 治疗的患者, 且随访至少 6 个月的患者。每位患者的图像由两名以上的医师共同诊断。受试者为临床诊断为肝脏恶性肿瘤的患者, 包括肝细胞癌、胆管细胞癌及肝转移瘤。在治疗前均进行 CT 或 3.0TMRI 平扫及增强扫描, 收集受试者影像、人口统计学资料及实验室检查结果。患者均在术后 1 个月左右 (早期) 及术后 3 个月后 (晚期) 行 MRI 平扫+增强、CT 平扫+增强等影像学检查。根据 mRECIST 及 RECIST 标准评估早晚期治疗反应及影像动态变化。

结果 来自一个中心的 30 例接受钇 90 治疗的肝脏恶性肿瘤的患者纳入研究, 年龄 53.5 ± 15.5 岁, 纳入受试者 31 个接受治疗的病灶, 来自东南大学附属中大医院, 统计患者肿瘤本身特征包括肿瘤内部信号变化及肿瘤周围肝实质信号变化。治疗后绝大多数患者出现肿瘤大小减小、动脉期边缘的环形强化、肿瘤内部信号更加均匀、弥散受限减少、ADC 值增加等表现, 治疗还可能会引起一些肝实质改变 (瘤周水肿、炎症、环形增强、肝纤维化、包膜回缩和治疗同侧肝萎缩、治疗对侧肝增大等)。

结论 观察发现不同于其他局部治疗钇 90 治疗后肿瘤应答需要较长时间, 早期可能会出现部分放射反应。钇 90 治疗后 3-6 个月, 影像上肿瘤缩小和强化减弱为理想的缓解状态。

PU-0927

不同组织来源肝转移瘤多层螺旋 CT 的影像特征及鉴别要点

王奕乔
哈尔滨医科大学附属第二医院

目的 总结不同组织来源肝转移 CT 表现规律, 探讨其诊断及鉴别诊断要点。方法 回顾性分析肝转移瘤 100 例, 其中结直肠癌 43 例, 胃癌 30 例, 肺癌 18 例, 乳腺癌 3 例, 胰腺癌 6 例。比较分析肝转移瘤 CT 平扫及动脉期、门脉期、延迟期强化表现特点。结果 门脉来源肝转移瘤患者病灶门静脉期病灶边缘清晰度、钙化、囊变出现率及牛眼征表现明显高于肺动脉来源的肝转移瘤患者。结论 多层螺旋 CT 对不同来源肝转移瘤的诊断和鉴别具有重要临床应用价值。

PU-0928

成人十二指肠神经内分泌肿瘤 CT 表现一例

房昌星、乔英
山西医科大学第一医院

背景:

神经内分泌肿瘤是一类起源于干细胞且具有神经内分泌标志物、能产生生物活性胺、多肽类激素的高度异质性肿瘤,可发生于全身各处。胃肠道神经内分泌肿瘤最常见,而十二指肠神经内分泌肿瘤较为罕见,占胃肠道神经内分泌肿瘤的 2-3%。

案例摘要:

患者女,37岁,1月前无明显诱因出现皮肤瘙痒,不伴腹痛、腹泻、恶心、呕吐,不伴呕血、便血,未予重视,3天前发现皮肤巩膜黄染,就诊于当地医院,化验肝功能提示肝酶、胆红素升高,腹部核磁提示十二指肠部肿物,考虑十二指肠癌,建议上级医院就诊,现为求进一步诊治入我院,于我院进行了腹盆部增强及CTA、CTV检查:沟槽区可见类圆形软组织密度肿块影,最大截面大小约为3.6x3.3cm,CT值约为42HU,增强扫描三期CT值分别205HU、106HU、95HU,其内见迂曲血管影,与十二指肠降段、胆总管及胰头部分界欠清,胰管及肝内外胆管扩张,考虑十二指肠腺Ca(胰十二指肠动脉分支供血,紧邻胃十二指肠动脉,其内迂曲静脉汇入肠系膜上静脉),累及胰腺及胆总管,致胰管及胆道梗阻性扩张,建议结合内镜检查。患者进一步进行了胰腺十二指肠切除术,组织学类型:神经内分泌肿瘤,NET-G2,浸润十二指肠肠壁全层,未侵犯胰腺和胆总管。

结论:

本例患者是一例罕见的十二指肠神经内分泌肿瘤患者,根据其影像表现没有准确做出诊断,该肿瘤应与十二指肠腺瘤、十二指肠腺癌、淋巴瘤、间质瘤等进行鉴别,对于年龄大于50岁患者,当发现位于近段十二指肠息肉样或壁内的富血供肿块时,尤其是小肿块早期出现淋巴结或远处转移时,应考虑到此病的可能,建议做相关激素及免疫指标的检查,且尽早根治手术治疗。

Giant cysticercosis of the right kidney: A case report.

Yumeng Zhang, Yutai Cao, Huaqing Tan, Xukun Gao, Yuxuan Wang
QINGHAI UNIVERSITY AFFILIATED HOSPITAL

Abstract: Cysticercosis, although reported in several parts of the body, especially the liver, lesions occurring in the kidney are particularly rare. We report a 58-year-old female patient with intermittent epigastric pain, who was found to have a huge occupancy of the right kidney on CT (computed tomography) and MRI (magnetic resonance imaging), which was confirmed to have a predominantly cystic component, with no clear enhancement on CT images after injection of contrast medium, and significant enhancement of the peritoneum and septum visible on MRI. This case reports a case and its rarity of cysticercosis occurring in the kidney.

PU-0930

静止型嗜铬细胞瘤 CT 特征分析

栗海龙
青海大学附属医院

静止型嗜铬细胞瘤是临床无明显内分泌症状的肿瘤。通过对本院 12 例经过术后病理证实为嗜铬细胞瘤，而无临床内分泌症状，术中为发生血压波动等情况的病灶 CT 平扫及动态增强影像学特征进行分析，总结静止型嗜铬细胞瘤的 CT 特征。12 例病灶中 8 例位于腹膜后，4 例位于左侧肾上腺。病灶均为边界清楚囊实性肿块，实性部分呈等密度，CT 值 38-56HU，增强后动脉期轻度强化，静脉期或延迟期强化明显，这与功能型嗜铬细胞瘤动脉期强化明显不同；囊性部分呈低密度，位于病灶中央及边缘，呈等密度或低密度，无明显强化，呈多囊状改变；病灶内未见明显坏死、钙化及出血。以上特征表现与功能型嗜铬细胞瘤细胞瘤的 CT 动态增强表现有所差异，与腹膜后其他神经源性肿瘤表现也有所不同。

PU-0931

肝脏血管周上皮样细胞瘤影像表现分析-附 4 例病例报告

刘春翠¹、雷军强²
1. 兰州大学第一医院
2. 兰州大学第一医院

目的：探讨血管周上皮细胞肿瘤(Perivascular epithelioid cell tumors, PEComa)的影像表现及特征。资料与方法：回顾性收集 2017 年 1 月至今兰州大学第一医院影像科经手术病理证实为肝脏 PEComa 患者 4 例，检索近 10 年来文献报道的有详细影像学资料的 111 例肝脏 PEComa 案例。对肝脏 PEComa 的影像学表现进行归纳汇总。结果：4 例病例女性 3 例，男性 1 例，2 例影像学诊断为 PEComa，另 2 例误诊为肝细胞癌和肝腺瘤。收集 111 例案例汇总，结果显示：肝脏 PEComa 好发于女性，平均年龄为 44.9，肿瘤多为单发，肝右叶多见；CT 平扫表现为混杂密度或均匀稍低密度；增强扫描可见快进快出、持续强化、周边强化及不强化四种强化形式(42.3%、35.1%、43.2%、3.6%)；动脉期穿行迂曲血管影和假包膜形成是较为特征性的表现(29%、27%)；门脉左支受累、出血、坏死和钙化较为少见(9%、8%、3%、5%)。68 例行 MR 扫描病例影像表现无特征性：肿瘤呈 T1 等低信号，T2 等高或高信号，弥散受限，特异期呈低信号，增强扫描同 CT。结论：肝脏 PEComa 在临床上不常见，实性肿瘤影像特征很难与肝细胞癌鉴别，术前误诊率较高，确诊依赖病理检查。但当肿瘤出现脂肪成分及迂曲血管影时，具有较大的提示意义。

PU-0932

上腹部术后脾脏低密度灶的病理及转归

李强
西安凤城医院

目的 探讨上腹部术后脾脏低密度灶的病理及转归。方法：对经我院治疗的 35 例上腹部术后患者的临床治疗和影像资料作回顾性分析。结果：脾脏低密度灶有 18 例得到不同程度的恢复，动态观察发现病灶范围较前有不同程度的缩小，其中有 7 例完全恢复，好转率 51%；结论：上腹部术后对脾脏低密度灶主要考虑为以下可能：1.炎性水肿，一般可完全恢复；2.小的缺血灶，后期部分可完

全恢复；3.小的梗死灶，纤维瘢痕形成，后期牵拉收缩可导致病灶范围缩小。4.完全性大的梗死灶，范围基本不变。

PU-0933

Primary ureteral synovial sarcoma: A case report and literature

hongjing xia
Affiliated Hospital of Qinghai University

Synovial sarcoma (SS) is a soft tissue malignancy that develops mostly in the extremities of adults and occasionally in the substantial organs such as lung, kidney and prostate. Synovial sarcoma originating in the ureter is even rarer, and this lesion has not been introduced in the national or international literature. A 72-year-old male presented with progressive dysuria and exacerbation of his condition, was diagnosed with prostatic hypertrophy at another hospital. He was then admitted to our hospital on June 29, 2021 as his condition showed no improvement. A computed tomography (CT) showed a soft tissue mass in the right middle ureter (about the level of the 4th and 5th lumbar vertebrae). The right ureter, right renal pelvis and calyceal were obstructed and significantly dilated, with effusion above the level. Preoperative imaging diagnosed soft tissue lesions in the right middle ureter, which was considered to be a malignant mass. The patient underwent radical nephrectomy of the right kidney and ureter, and the postoperative pathological diagnosis was ureteral synovial sarcoma.

PU-0934

CT 自动管电流调节联合自适应迭代算法技术 诊断肝血管瘤价值分析

张武花
青海省第五人民医院

目的 研究采取多层螺旋电子计算机断层扫描(CT)自动管电流调节(ATCM)和自适应迭代算法(ASIR)诊断肝血管瘤(HH)的临床价值。方法 2017 年 4 月 ~ 2020 年 4 月我院收治的 HH 患者 144 例,根据多层螺旋 CT 多期增强扫描预设噪声指数(NI)分为 A 组(平扫,NI 设为 9)、B 组(动脉期,NI 设为 9)、C 组(静脉期,NI 设为 11)和 D 组(延迟期,NI 设为 13),各组扫描时 ASIR 均设为 50%。记录并分析各组图像噪声值、图像质量评分、图像剂量长度乘积(DLP)和有效剂量(ED)差异。结果 本组各期(平扫、动脉期、静脉期和延迟期)图像质量均可满足诊断需要并获得最终诊断;A 组图像质量评分为(4.9±0.3)分,显著高于 C 组和 D 组【分别为(4.4±0.4)分和(3.8±0.4)分,P<0.05】,图像噪声值为(9.5±0.9)HU,显著低于 B 组、C 组和 D 组【分别为(12.4±1.0)HU、(14.1±1.1)HU 和(16.3±1.1)HU,P<0.05】;B 组图像质量评分为(4.8±0.3)分,显著高于 C 组和 D 组(P<0.05),图像噪声值为(12.4±1.0)HU,显著低于 C 组和 D 组(P<0.05);A 组 DLP 和 ED 分别为(253.2±100.8)mGy-cm 和(3.8±1.6)mSv,显著高于 C 组【分别为(174.5±80.2)mGy-cm 和(2.6±1.1)mSv,P<0.05】或 D 组【分别为(128.50±60.4)mGy-cm 和(1.9±0.9)mSv,P<0.05】;B 组 DLP 和 ED 分别为(246.2±93.1)mGy-cm 和(3.7±1.3)mSv,显著高于 C 组或 D 组(P<0.05)。

PU-0935

青海地区肠气囊肿病 1 例报道

李延楠

青海省心脑血管病专科医院

目的：肠气囊肿病(pneumatosis cystoides intestinalis, PCI)又称为肠壁囊样积气症、囊样肠积气，属于少见疾病，多发生于新疆及青海地区，通过探讨该例肠气囊肿病的影像学特征，加深对 PIC 的认识，以帮助临床制定正确的诊疗方案。方法：对 1 例肠气囊肿病患者的临床及影像学资料进行分析。结果：1 例主诉腹痛中年女性患者，经腹部 CT 扫描发现有肠气囊肿，于胃肠道浆膜下见多个大小不等小囊状、簇状及条状积气区，张力较小，部分融合征象，累及多个肠段，但各累及肠段较短。结论：肠气囊肿病临床上无典型特征，常以腹痛待查行腹部 CT 检查，影像学表现具有一定的特征性，有助于疾病的鉴别诊断及分型。

磁共振成像在急性胰腺炎中的研究现状及进展

余言、张庆欣

青海省人民医院

急性胰腺炎(Acute Pancreatitis, AP)的发病率越来越高，病程复杂多变，临床对于其严重程度、病情发展进行及时准确的判断，制定个性化的治疗方案和干预措施，是目前首要待解决的问题。磁共振成像(Magnetic Resonance Imaging, MRI)是一种多参数的成像，同时具有无辐射的特征，以及对于软组织有较好的对比度，另外它的多序列成像以及组学能够帮助发现急性胰腺炎中更多潜在的变化。近年来，在 AP 的严重程度、复发及相关并发症等方面有较多的研究。因此，本文就 MRI 在 AP 中的应用研究进展进行综述，旨在缓解 AP 患者疾病的进展，提高预后。

PU-0937

卵巢性索间质瘤的影像学表现与病理结果对照分析

杨喆璇¹、程美英¹、杨昊雨²、张晓雪¹、王长浩¹、沈艳勇¹、冯占起¹

1. 郑州大学第三附属医院

2. 新乡医学院

目的：探究卵巢性索间质瘤的影像学表现与病理结果对照分析。

方法：2015 年 5 月至 2023 年 9 月郑州大学第三附属医院经病理诊断的 70 例性索间质瘤患者，将其分为颗粒细胞瘤组、卵泡膜-纤维瘤组、纤维瘤组、间质肿瘤组，各组均进行了 MRI、US 及病理检查，各组之间进行临床表现、影像特征和病理结果的比较，并进行相关性的分析。

结果：本实验组患者均为女性，年龄为 33~77 岁，平均年龄(44.49±15.4)岁。其中包括颗粒细胞瘤 18 例，卵泡膜-纤维瘤组 31 例，纤维瘤 14 例，间质肿瘤 7 例。各组之间在发病年龄及首发症状上无明显差异($P>0.05$)；颗粒细胞瘤组，卵泡膜-纤维瘤组和纤维瘤组 3 组之间在肿块最大直径、ADC 值及超声回声特点上存在差异，且差异具有统计学意义($P<0.05$)。颗粒细胞瘤中颗粒细胞含量在有 10%及以上，其内部的颗粒细胞可发生囊变并会形成腔隙，故在一些较大的肿瘤的 MRI 上可见“海绵蜂窝状”影像，US 上囊实性肿块后方无回声衰减。卵泡膜-纤维瘤组由卵泡膜细胞和纤维细胞组成，其中卵泡膜细胞和纤维细胞所占比例不同又可分为纤维卵泡膜细胞瘤和卵泡膜细胞瘤。纤维卵泡膜瘤常为单发、直径较大肿块，在 MRI 上肿块实性部分表现为等或稍低信号，囊变坏死

和间质水肿表现为混杂高信号，US 多为低回声为主的肿块；卵泡膜细胞瘤胞质内可见大量玻璃样变，在 T2WI 脂肪抑制像呈低或极低信号，而各结节间隙之间可见囊变坏死，故在 T2WI 看到低信号之间夹杂散的片状或裂隙状高信号影，US 上表现为内部低回声为主的囊实性肿块。纤维瘤主要是由纤维细胞组成，在 MRI 上呈编织状排列且信号略低于子宫肌层，US 上表现为实性低回声肿块；间质肿瘤是起源于卵巢原始性腺的肿瘤，因其富含血供，且肿块内部的囊变区域不发生强化，故在增强扫描时可见渐进式向心性强化，US 上以实性低回声或以实性回声为主的囊实性包块，肿瘤血管影丰富。

结论：在接受检查的性索间质肿瘤患者中，不同亚型的性索间质肿瘤在肿块的最大直径、ADC 值、超声回声特点及肿瘤细胞结构上具有一定特征性表现，这些差异对其术前诊断及病理诊断分型有重要的参考价值，可有效避免临床的漏诊或误诊。

脾 CT 组学分析预测肝癌肝移植后复发

丁胜楠、杨伟民
吉林大学第一医院

目的：探讨基于对比增强 CT 的脾放射组学特征在预测肝癌肝移植后早期复发中的作用。

方法：对 2011 年 9 月至 2021 年 12 月接受肝移植治疗的 176 细胞癌患者进行回顾性研究。从增强图像中提取放射组学特征，建立脾放射组学特征和肿瘤放射组学特征。

用 COX 回归分析早期复发的独立危险因素。然后，建立多个模型来预测肝细胞癌切除后的无复发生存率，并评估和验证放射组学特征对临床病理模型的增量价值。采用 Kaplan-Meier 生存分析评估模型与无复发生存率相关性。结果：脾放射组学征象是肝癌肝移植后复发的独立危险因素。综合微血管侵犯、肿瘤放射组学特征和脾放射组学特征预测早期复发的混合模型其预测效果优于临床病理模型和联合模型。

结论：确定的脾脏放射学特征是肝癌肝移植后早期复发的预后因素，可提高模型对早期复发的预测性能。

PU-0939

探究男性生殖系统：磁共振成像的革命与远景

李胤桦、张勇、程敬亮
郑州大学第一附属医院

本文旨在探讨男性生殖系统磁共振成像技术与线圈的革命性进展以及未来远景。首先介绍了男性生殖系统的重要性和研究意义，以及选用何种磁共振先进成像技术研究。随后，阐述了研究目的和研究问题，即探究男性生殖系统的组织结构、功能及其影响因素等。接着，介绍了磁共振成像技术的原理、方法，以及数据采集和分析方法等。在此基础上，重点概述不同体位结合不同技术在男性生殖系统的组织结构、功能及其影响因素研究等。最后，总结研究结论和未来展望。总之，磁共振成像技术在男性生殖系统研究中具有广泛的应用前景，有望为男性生殖健康领域的未来发展提供重要支持。

PU-0940

体素内不相干运动扩散加权成像评估肝细胞癌术后复发的价值

张硕、任雪、赵莹、刘爱连
大连医科大学附属第一医院

目的

探讨体素内不相干运动扩散加权成像 (intravoxel incoherent motion diffusion weighted imaging, IVIM-DWI) 定量参数评估肝细胞癌 (hepatocellular carcinoma, HCC) 术后复发的价值。

材料与方

回顾性收集我院 2016 年 1 月至 2021 年 12 月期间进行上腹 MRI 检查且采取 TACE 治疗的患者 38 例, 根据 1 年内是否复发定义为早期复发组和早期非复发组, 其中 1 年内复发 14 例, 一年内未复发 24 例。上腹 MRI 检查包括 T1WI、T2WI、动态增强扫描、DWI 和 IVIM-DWI。在 GE AW4.6 工作站, 使用 Functool 软件重建图像, 基于 IVIM-DWI 序列生成单指数模型 D-mono、D*-mono、f-mono 图, 参照 T2WI 及动脉期, 在肿瘤最大层面分别放置 3 个大小相等的感兴趣区 (ROI), 避开肿瘤出血、坏死、邻近的血管及胆管, 取 3 个 ROI 平均值用于统计分析。采用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异; 采用 logistic 回归分析建立有统计学差异参数组合的预测模型; 使用受试者操作特征 (ROC) 分析评估预测效能。

结果

IVIM-DWI 序列的 D*mono 值和 f 值在早期复发组和非早期复发组间无统计学差异 ($P > 0.05$), 早期复发组的 D 值 [0.000503 (0.000372, 0.000713)] 显著低于非早期组 [0.000835 (0.000744, 0.001243)], D 值预测客观应答的曲线下面积 (AUC) 为 0.858。

结论

IVIM-DWI 中的 D mono 参数对评估 HCC 患者术后早期复发具有一定价值。

PU-0941

膀胱罕见原发性肿瘤的 CT 表现 (附 10 例分析)

陶健
贵州省人民医院

目的 探讨膀胱罕见原发性肿瘤的 CT 表现, 旨在提高术前诊断水平。**方法** 回顾性分析 10 例经手术病理证实的膀胱罕见原发性肿瘤患者的临床及 CT 检查资料, 其中小细胞癌 3 例, 肉瘤样癌 2 例, 血管周上皮样细胞肿瘤 2 例, 未分化肉瘤、低级别肌纤维母细胞增生伴尿路上皮异型增生、颗粒细胞瘤各 1 例, 所有患者术前均接受泌尿系 CT 平扫及增强检查。**结果** 男 8 例, 女 2 例, 年龄 6~84 岁。临床表现为肉眼血尿 9 例, 腹痛 1 例。10 例均为单发肿块, 最大径 4.5cm~12.5cm。3 例小细胞癌呈不规则实性肿块, 边缘模糊, 2 例密度明显不均, 1 例密度均匀, 2 例位于膀胱腔内, 1 例部分突向膀胱腔外, 2 例临近膀胱壁增厚, 1 例膀胱壁弥漫增厚, 2 例有盆腔淋巴结肿大, 1 例无肿大淋巴结, 3 例增强均呈轻度、渐进性强化。2 例肉瘤样癌呈不规则实性肿块, 边缘清晰, 密度相对均匀, 均位于膀胱腔内, 1 例临近膀胱壁增厚, 1 例膀胱壁未见增厚, 1 例有盆腔及腹主动脉旁肿大淋巴结, 1 例无肿大淋巴结, 1 例增强呈中度强化、缓升缓降型, 另 1 例呈明显强化、缓升缓降型。2 例血管周上皮样细胞肿瘤呈类圆形实性肿块, 边缘清晰, 其内未见囊变坏死, 1 例大部位于膀胱腔外, 1 例完全位于膀胱腔外, 1 例伴有结节状钙化, 2 例未见膀胱壁增厚及肿大淋巴结, 增强均呈明显、渐进性强化, 动脉期肿瘤内部可见髓内动脉分支小血管。未分化肉瘤呈不规则实性肿块, 边缘清晰, 密度明显不均, 位于膀胱腔内, 膀胱壁弥漫增厚, 有盆腔肿大淋巴结, 增强

呈中度强化、缓升缓降型。低级别肌纤维母细胞增生伴尿路上皮异型增生呈不规则实性肿块，边缘模糊，密度明显不均，位于膀胱腔内，临近膀胱壁增厚，无肿大淋巴结，增强呈中度强化、缓升缓降型。颗粒细胞瘤呈规则实性肿块，边缘清晰，密度相对均匀，位于膀胱腔内，临近膀胱壁增厚，无肿大淋巴结，增强呈明显强化、速升速降型。**结论** 膀胱颗粒细胞瘤及血管周上皮样细胞肿瘤 CT 强化较有特征性，术前能够做出正确诊断。其他膀胱肿瘤 CT 表现无明显特异性，但 CT 检查对术前肿瘤良恶性的判断有帮助。

PU-0942

奥沙利铂所致肝窦损伤的 CT 影像征象分析

李五根、郭婷婷、付雪林、邓军、姚彬、黄国中、吴乔博洋
南昌大学第二附属医院

目的 归纳奥沙利铂所致早期肝窦损伤的 CT 表现，以提高对该病影像征象及其诊断价值的认识。**方法** 回顾接受含奥沙利铂化疗方案患者的病历资料，收集 CT 增强门静脉期肝实质出现不均匀密度患者的影像和肝功能生化资料。分析肝窦损伤所致对比剂灌注减低引起的肝脏低密度影范围和分布特点，周围相对正常肝实质的强化特征，其他伴随的影像学征象，以及肝功能生化指标变化的幅度。**结果** 共收集到 62 例符合要求患者的病例资料。化疗后肝窦损伤时，增强扫描碘对比剂灌注减低所致的肝脏低密度影在各层面大小、范围不一，可呈微结节状、水坑状或大面积片状，按低密度影分布分为多灶性 1 例、外周性 9 例、弥漫性 52 例。62 例均可见病灶间相对正常肝实质斑片“花斑”样强化，第二肝门区可见“三叶草”样强化 17 例。伴随的其他 CT 征象有肝肿大 50 例、肝静脉主干狭窄 15 例、下腔静脉肝段变扁 13 例、脾肿大 59 例、腹水 3 例、肝门周水肿 25 例、胆囊壁增厚 16 例和食管静脉曲张 4 例。62 例患者出现奥沙利铂相关肝窦损伤影像表现时，肝功能各生化指标大多数仍位于参考值上限以内或轻度增高，仅 1 例达到药物性肝损伤的实验室阈值标准。**结论** 奥沙利铂所致肝窦损伤不适用药物性肝损伤实验室阈值标准来评估，可通过无创性 CT 影像技术来检出。增强 CT 门静脉期肝实质内不均匀低密度影是奥沙利铂所致肝窦损伤的直接征象，肝实质“花斑”样、“三叶草”样强化及其他伴随征象属肝窦损伤的间接征象。

PU-0943

MRI 与 CT 增强评估食管鳞癌肿物侵犯比较

邹佰利
吉林省肿瘤医院

目的：比较 MRI 与 CT 评估局部食管鳞癌肿物侵犯气管，胸主动脉或支气管的准确性，以判断肿瘤的可切除性。

方法：前瞻性收集本院 2023 年 4 月—2023 年 8 月间，经内镜活检证实为食管鳞癌的患者，MRI 与 CT 检查均在气管镜检查前进行。2 位阅片者采用双盲法分别对 MRI 和 CT 图像进行独立评估，判定气管、胸主动脉或支气管是否受侵。

综合气管镜结果为金标准，计算并比较 MRI 及 CT 诊断食管鳞癌侵及胸主动脉、气管或支气管的敏感度、特异度及准确度，评价病变形态，评价对比剂强化方式，强化强度。重点评价与胸主动脉、气管及支气管的关系，解剖上胸段食管与胸主动脉的关系密切，主动脉弓在食管的左前方形成主动脉弓压迹，胸主动脉与食管左侧壁及前壁伴行，食管与胸主动脉之间只有少许脂肪及纤维组织，胸中、下段食管癌极易侵犯胸主动脉管壁。胸段食管位于气管后方，与气管伴行，左主支气管到气管隆突平面跨越食管的左前壁，食管与气管支气管间也仅有少许脂肪及纤维组织阻隔，故胸上、中段食管癌极易侵犯气管及左主支气管。

结果: 23 例患者纳入本研究, 图像质量较高, 一致性分析 kappa 值 0.801-0.901 $P < 0.01$. MRI 与 CT 评估食管鳞癌侵犯气管、胸主动脉或支气管的准确度差异均具有统计学意义 ($p < 0.05$)。MRI 评价局部晚期食管鳞癌侵犯胸主动脉、气管或支气管的准确度分别为 93%、83.3%。CT 评价局部晚期食管鳞癌侵犯气管、胸主动脉或支气管的准确度分别为 39.3%、23.4%、29.0%。结论: MRI 成像评估食管鳞癌侵犯胸主动脉、气管或支气管的准确度明显高于 CT, MRI 可以更好地指导局部晚期食管鳞癌患者治疗方案的选择。对食管黏膜及周围脂肪的显示且 EL 信号均匀、轻度渐进性的强化方式明显优于 CT 检查。MRI 具有多序列成像的优势, 还可多角度多平面进行重建, 全方位显示食管壁、胸主动脉管壁、气管及支气管壁的各个层次及病变全貌, 从而提高术前评估局部晚期食管癌是否外侵胸主动脉、气管或支气管的准确率。

PU-0944

摇篮床 X 射线食管造影新技术对食管切除术后吻合口瘘的诊断价值评价

钱骏

华中科技大学同济医学院附属协和医院

目的:

本研究的目的是确定摇篮床 X 射线成像是否能改善食管切除术后吻合口瘘的常规造影检测。

方法:

本研究回顾性分析了我院 2016 年 7 月至 2020 年 12 月经临床诊断为食管癌术后吻合口瘘的 82 例患者的基本信息, 以及常规食管造影、多体位 (包括站立、仰卧、俯卧、低头高脚和侧位) 食管造影及肺纵隔 CT 平扫或增强诊断结果, 记录以上诊断报告内是否提及吻合口瘘的存在。

结果:

共 82 例患者行常规食管造影及多体位食管造影。常规食管造影诊断吻合口瘘 62 例, 检出率约为 75.6%。多体位食管造影诊断吻合口瘘 71 例, 站姿直接检出 48 例, 其中侧位检出 11 例; 站立后仰卧位 20 例, 其中侧位 16 例, 头低脚高位 6 例, 3 例为站立后俯卧位; 另外 2 例为侧卧位, 1 例为头低脚高位; 吻合口瘘多体位食管造影的检出率为 86.6%。51 例吻合口瘘患者在 7 天内完成了 CT 平扫或增强检查。在 33 名平扫患者中, 22 名可见明显瘘管。在 18 例增强型病例中, 14 例显示瘘管。吻合口瘘的 CT 检查检出率为 70.6%。

结论:

摇篮床 X 射线食管造影是一种简单的手术方法, 可以提高常规造影食管切除术中食管瘘的检出率。此外, 与 CT 检查相比, 其检出率也更高。

PU-0945

胰腺神经内分泌肿瘤不典型影像学特征和其他胰腺富血供病变影像学诊断思路

方旭、邵成伟

海军军医大学第一附属医院 (上海长海医院)

目的 探讨胰腺神经内分泌肿瘤 (PNEN) 的不典型影像学特征和影像学易误诊为 PNEN 的胰腺富血供病变, 并结合临床病理资料总结其影像学诊断思路, 提高对 PNEN 影像学全面认识, 为临床治疗决策指明方向。

方法 基于我院胰腺疾病多学科中心, 总结 PNEN 的不典型影像学特征导致误诊和影像学易误诊为 PNEN 的胰腺富血供病变。PNEN 的不典型影像学特征: 呈乏血供、胰管内生长方式、弥漫性生长方式。影像学易误诊为 PNEN 的胰腺富血供病变: 胰腺内副脾、实体型浆液性囊性肿瘤、肾透明细胞癌胰腺转移、胰腺腺泡细胞癌。

结果 乏血供 PNEN 易误诊为胰腺导管腺癌, 但乏血供 PNEN 的肝转移瘤多呈富血供, 较少梗阻胰管和阻塞性胰腺炎, CA19-9 升高较少; 胰管内生长 PNEN 易误诊为胰腺导管内乳头状黏液性肿瘤和胰腺导管腺癌, 肿瘤体积小, 阻塞胰管伴上游胰管扩张和胰腺实质萎缩, 在胰管阻塞截断处可见明显强化的肿瘤; 弥漫性生长 PNEN 易误诊为自身免疫性胰腺炎和胰腺淋巴瘤, 肿瘤体积大, 累及大部分或整个胰腺, 增强后可明显强化, 胰周可伴有明显强化的转移性淋巴结。胰腺内副脾易误诊为 PNEN, 多位于胰尾部, 体积小, 增强各期强化与脾脏相似, 热变性红细胞显像诊断的敏感性和特异性高; 实体型浆液性囊性肿瘤易误诊为 PNEN, T2WI 明显高信号、DWI 弥散不受限且 ADC 高信号是与 PNEN 影像学鉴别要点; 肾透明细胞癌胰腺转移易误诊为 PNEN, 可单发或多发, 病史是影像学诊断关键, 平均发生于肾癌术后 120 个月; 部分呈富血供的胰腺腺泡细胞癌易误诊为 PNEN, 但胰腺腺泡细胞癌体积相对较大, 可伴有高脂肪酶综合征和甲胎蛋白升高。

结论 PNEN 不典型影像学特征和其他胰腺富血供病变均是 PNEN 临床常见的误诊原因, 精准诊断和治疗需要影像科医生结合多学科共同努力。

PU-0946

一例影像误诊为静脉内平滑肌瘤病的髂外静脉肉瘤

欧阳心芹

绵阳市第三人民医院

病史: 女性患者, 46 岁, 右下肢肿胀 2 月, 加重 1 月, 入院前 2 月, 患者无明显诱因下出现右下肢肿胀疼痛, 呈持续性胀痛, 伴右下肢活动稍受限, 无其它伴随症状, 于院外完善 B 超提示“右侧股总静脉血栓”, 18 年前行剖宫产手术, 甲亢 3+ 年, 后逐渐转变为甲减, 现规律服用优甲乐, 62.5ug/天, 否认糖尿病、高血脂、冠心病史; 末次月经, 月经色量正常。专科查体: 右下肢中重度凹陷性肿胀, 未见明显色素沉着, 无湿疹及溃疡, 无浅静脉曲张, 皮温稍高, 未触及皮下结节、包块, homans (-), Nehouf (-), 足背动脉可扪及搏动, 肢关节活动受限, 深浅感觉正常, 双下肢肌力 5 级, 肌张力正常。右大腿周径 70cm, 右小腿周径 45cm, 右踝 29cm, 左大腿周径 60cm, 左小腿周径 40cm, 左踝 25cm。辅助检查: 下肢彩超 (四川省人民医院): 右侧股总静脉血栓形成, 管腔几近闭塞, 右下肢皮下水肿。下肢静脉 CTV: 1. 右侧髂外静脉-股总静脉-股深静脉管腔扩张, 较明显处宽约 2.6cm, 管腔内见柱状等密度影, 长度约 17.4cm, CTV 扫描呈不均匀明显强化, 血管外壁光滑, 子宫体积明显增大, 多发子宫肌瘤, 宫角两侧点状及索条状强化影, 与子宫分界不清, 右侧明显, 并与右侧髂外静脉相连; 考虑: 右侧髂外静脉-股总静脉-股深静脉血管平滑肌瘤病 (子宫来源) 可能性大、子宫血管平滑肌瘤病。盆腔 MRI: 子宫多发肌瘤, 较大者大小约 4.0cm×3.4cm×3.2cm, 右侧髂外静脉-股总静脉-股深静脉管腔扩张, 较明显处宽约 2.8cm, 其内见条柱状异常信号影, T1WI 呈低信号, T2WI 呈稍高信号, 信号不均, 弥散受限, 增强扫描呈明显不均匀强化, 与子宫病灶强化程度类似, 考虑子宫平滑肌瘤病, 累及右侧髂外静脉-股总静脉-股深静脉。术中所见: 右侧髂外静脉、股静脉占位性病变, 大小约 4*10cm, 质地韧, 无包膜与右侧髂外静脉粘连侵犯, 髂外静脉及股静脉近端扩张最大直径 5cm; 切取肿瘤组织剖开后可见黄白色组织, 质地韧。右侧髂外静脉肿瘤头端可见陈旧血栓组织大小约 0.5*0.5cm。术后病理: 右侧髂外静脉、右髂股静脉梭形细胞肿瘤, 考虑肉瘤。

PU-0947

A case of multiple isolated fibrous tumors

Huaqing Tan¹, Shihan Fu²

1. Affiliated Hospital of Qinghai University

2. Qinghai Provincial People's Hospital

The patient was female, 58 years old, the patient in 1 year ago no obvious cause of lumbar pain discomfort, no lower limbs and waist below the part of motor and sensory disorders, at that time did not pay attention to, did not carry out any diagnosis and treatment. 1 week ago the patient consciously said that the above symptoms were worse, accompanied by pain in the legs, legs, weakness, can not walk, the patient to carry out further diagnosis and treatment, so to the Second People's hospital in Xining City, the relevant imaging test suggests that the body Multiple bone metastases were found in Qinghai Provincial People's Hospital. PET-CT (2021.09.16) showed: 1. right 2nd and 6th posterior ribs, thoracic 8-9 vertebrae, lumbar 3 vertebrae, right sciatic bone, a right subpubic branch of the pubic bone, and expansive bone destruction, and multiple bone destruction of the whole body, and tumor metastasis was considered. 2. multiple low-density masses in the liver, with significant enhancement in the arterial phase of enhancement scanning and metabolism of the edges of the foci, were elevated, and hepatocellular carcinoma was considered. The possibility of hepatocellular carcinoma is high. The patient came to our department for further diagnosis and treatment, and was admitted to the outpatient clinic with the diagnosis of a "malignant tumor of the liver with bone metastasis". He was admitted to our hospital with a "malignant tumor of liver and bone metastasis". MRI (2021.9.27) showed two rounded slightly long T1 and long T2 signal shadows in the S8 segment of the liver, the larger one was about 6.1cm in size, with a low signal envelope and obvious enhancement on enhancement scan, and patchy long T2 signals were seen in the thorax 11, lumbar 3, lumbar 4, and the right sciatic bone. Diagnosis: metastatic tumor of the S8 segment of the liver, with multiple metastases in the chest 11, lumbar 3, 4, and sciatic bone. Pathology of two punctures: 1 gray-white strip of soft tissue seen by the naked eye, 1.5-1.2 cm long, 0.1 cm in diameter. Pathology: morphology and immunohistochemistry results are consistent with isolated fibrous tumors. Immunohistochemistry: PR(-), EMA(-), AE1/AE3(-), Ki67(hotzone 10%), CD34(+), STAT6(+), Bcl-2(+), SMA(-), Des(-), S100(-), F-8(vascular +), Hep-1(-).

PU-0948

磁共振在胆道闭锁肝纤维化程度评估中的研究进展

滕松宇

深圳市儿童医院

目的

胆道闭锁 (Biliary Atresia, BA) 是新生儿胆汁淤积性黄疸最常见的原因, 以肝内、外胆道纤维性闭塞和肝纤维化为特征。临床首选葛西手术治疗。随访研究发现, 葛西术预后与术前肝纤维化程度显著相关。目前, 肝纤维化评估金标准仍是病理组织活检, 但因其具有侵袭性及不可避免的并发症而不便长期、动态观测。磁共振具有无创、客观及全面的特点, 随着序列的优化, 已广泛用于腹部检查。此前已有研究表明, 弥散成像、磁共振弹性成像以及磁共振影像组学模型在肝纤维化程度的评估中有着潜在价值。本文旨在总结磁共振在 BA 肝纤维化程度评估中的研究进展。

材料与方法

在 PubMed、知网和万方等国内外大型数据库中, 搜索 MeSH 关键词“胆道闭锁、肝纤维化、磁共振”, 查阅 2006 年 1 月-2023 年 4 月磁共振在 BA 患儿肝纤维化程度评估中的相关文献, 主要参考近 5 年内的文献进行分析。

结果

最终纳入 23 篇文献研究, 外文引用率 78%, 近 3 年引用率 21%。目前已有许多国内外学者利用磁共振对 BA 患儿肝纤维化程度进行评估, 相关技术包括弥散成像 (包括 DWI、DTI、DKI 以及 IVIM 等)、磁共振弹性成像 MRE、特殊磁共振序列 (如 T1p 等) 及磁共振影像组学分级模型等, 其中以弥散成像研究居多。研究认为, BA 发生纤维化时, 细胞外基质增多聚集, 导致水分子扩散受限, 从而反映在弥散图像中, 随后通过定量分析, 发现 ADC 值与肝纤维化程度呈负相关。磁共振弹性成像则是利用外加装置对肝硬度进行检测, 反应纤维化程度。近年来, 学者利用影像组学挖掘图像中肉眼难以发现的特征进行评估, 基于常规序列、弥散序列所提取的特征均具有良好的分级效能, 其中, 弥散特征价值更大。

结论

随着磁共振扫描技术的优化, 儿童腹部磁共振的价值开始凸显, 让 MR 用于评估 BA 肝纤维化成为可能。大量研究验证了其可行性, 并且较血清学、超声有更客观、稳定的性能。在结合影像组学后得到了进一步的优化, 具有显著的价值, 对临床 BA 患儿的术前评估、治疗方案制定、预后预测、术后随访及二期治疗具有重要意义。

PU-0949

肾上腺血管内大 B 细胞淋巴瘤 1 例

胡燕标、李君强、周军
宁波市北仑区人民医院

患者 男, 74 岁。因“发现左侧肾上腺占位 4 年余近期增大”就诊, 发现左侧肾上腺占位 4 年余, 未予重视, 未行治疗。1 天前外院体检胸部 CT 检查提示病灶明显增大, 2022 年 2 月为求进一步治疗来我院就诊。专科检查未见明显异常, 脉搏 78 次/分, 呼吸 20 次/分, 血压 138/91mmHg。

实验室检查: 促肾上腺皮质激素 0Am 40.61pg/ml、8Am 74.62pg/ml、4Pm 68.33pg/ml, 24 小时尿醛固酮 11.21ug/24h。

影像表现: CT 平扫示左侧肾上腺区不规则形软组织肿块影, 在后腹膜区呈嵌入式生长, 边界清晰, 最大截面径大小约 4.9cm×3.3cm, 上下范围约 7.5cm, CT 值约 31HU, 内见数枚斑点状钙化灶, 增强扫描见轻度渐进性强化; 左侧肾上腺外侧支增粗; 右侧肾上腺位置正常, 呈“人”字型, 主干及内外支未见明显增粗, 未见明显异常密度灶, 增强后未见异常强化灶。

手术病理结果: 在左肾上腺极内上方见一大小约 5cm 肿块, 边界清晰, 内侧可见肾上腺组织。完整切除肾上腺肿瘤及部分肾上腺组织送病理检查, 在切除标本见肿瘤包膜完整, 切面呈红褐色。肉眼所见: 结节样物一枚, 表面见包膜, 局部破碎, 体积 4cm×3cm×2cm, 暗红, 切面略呈分叶状, 暗红为主, 少量淡黄色条带样区, 另见游离组织一块, 大小 6cm×4cm×2cm, 2/3 为脂肪, 1/3 为暗红色组织, 性质同结节。镜下所见: 送检肿物, 大小约 4×3×2cm, 切面暗红色, 镜示肿瘤细胞弥漫巢状排列, 部分在血管内生长, 免疫组化: CD20 (+), PAX-5 (+), CD3 (-), CD43 (-), CD10 (-), MUM-1 (+), Bcl-6 (+), Bcl-2 (+), CD30 (-), CD21 (-), CD34 (血管+), CD31 (血管+), CKpan (-), S-100 (-), HMB45 (-), Melan-A (-), Syn (-), CgA (-), PAX-8 (-), Ki67 (约 70%+)。原位杂交: EBER (-)。病理诊断: 血管内大 B 细胞非霍奇金淋巴瘤。

肝脏 IgG4 相关性疾病伴多灶微脓肿形成 1 例

谢因霁、邹观南、蒋奕
深圳市龙岗区人民医院

目的: IgG4 相关性疾病 (IgG4-related disease) 是一种与 IgG4 相关、可累及多个器官或组织、好发于中老年男性的慢性进行性系统性疾病;累及肝脏的病例报道少见,实体类似于肝脏原发恶性肿瘤,通过影像学鉴别困难。本文旨在探讨肝脏 IgG4 相关性疾病伴多灶微脓肿形成的影像表现及特征,提高诊断准确性。

方法: 分析肝右叶占位性病变 1 例, 54 岁男性患者, 行腹部 CT、MRI 平扫及增强检查。

结果: 肝右叶见多发团片状异常信号, 病变部分融合, 边界不清, 范围约 8.2×3.5CM, 呈稍长 T1 稍长 T2, 内见斑片状稍短 T1 信号, DWI 与 ADC 图见弥散受限, 增强扫描呈多发结节强化灶, 延迟期环形强化, 灶周见水肿信号, 部分病灶向肝包膜突出, 累及邻近腹膜。术前诊断为胆管细胞癌伴卒中。术后病理诊断为 IgG4 相关性疾病伴多灶微脓肿形成。

结论: 肝脏 IgG4 相关性疾病影像学表现常不具有特征性表现, 若临床血 IgG4 升高, 可联想到本病诊断, 否则术前难以作出提示性诊断。

PU-0951

胰腺罕见细粒棘球蚴

万娜、周浩、宋法亮、马静
新疆生产建设兵团总医院

目的: 胰腺寄生虫极为罕见, 是寄生虫卵沉着在胰腺内继发引起的一种囊性病变, 因棘球蚴病胰腺受累非常见。胰腺包虫与胰腺其他囊性病变鉴别困难, 可有许多其他胰腺囊性病变的共同特征。

方法: 320 螺旋 CT 平扫+增强扫描

结果: 胰腺钩突部椭圆形低密度影, 其内可见多发分隔, 壁局部见钙化影, 增强后胰腺病灶显示轻度强化。病理回报: 胰腺细粒棘球蚴

结论: 行胰体切除+胃空肠吻合 (B11rothll 式)+肝部分除+腹腔引流术, 术中在胰腺钩突处可触及一大约 6cm×7cm 的质硬肿块, 于左肝、胃大弯粘连致密, 存在浸润性生长可能, 且无法分离, 故决定行胰体切除+胃远端切除+左肝部分切除术。术中快速冰冻, 术中快速冰冻结果回示:

(胰腺) 镜下为无结构角质样物, 结合大体检查, 倾向包虫病。包虫在胰腺时, 通常会出现不明原因的上腹部隐痛不适呈持续性, 不向其他部位放射, 与体位无关, 本例患者无人畜接触或牧区生活史, 无食生肉史, 偶有上腹部饱胀不适, 无恶心、呕吐。CT 呈囊性病灶, 可见分隔、未见头节及子囊、未见包虫囊肿典型的征象。因棘球蚴病胰腺受累非常少见, 大多最终靠病理确诊。

原发性肾神经内分泌肿瘤 4 例报道

朱娉逸、王睿婷、戴辰晨、丁玉芹、曾蒙苏、周建军
复旦大学附属中山医院

目的: 原发性肾神经内分泌肿瘤 (Primary Renal Neuroendocrine Neoplasms) 极其罕见, 国内外报道百余例, 国内报道仅 10 余例, 因此对其影像学表现及临床病理特征存在认识不足, 本文通过病例报道及文献复习探究其 MRI 影像特征, 以提高术前对该病的诊断水平。

方法: 回顾性分析 4 例经病理证实的原发性肾神经内分泌肿瘤患者的 MRI 图像特征, 患者均行肾脏常规 MRI 平扫、DWI 和动态增强扫描, 观察病变的 MRI 表现 (边缘、平扫信号、DWI 特征、囊变坏死、出血、强化特征、淋巴结情况), 并进行相关文献复习。

结果: 4 例病灶均为单发, 病灶最大径 13mm, 中位最大径 22.5mm。其中 3 例位于肾门附近, 1 例贴近被膜。4 例病灶均形态不规则, 3 例病灶边界清晰, 1 例边界模糊。3 例可见囊变及坏死, 均未见出血。平扫 T1WI 呈低信号, T2WI 呈稍高信号。DWI 可见实性成分呈高信号, ADC 均呈低信号。增强扫描后 1 例病灶表现为均匀强化, 3 例病灶表现为不均匀强化, 4 例病灶肿块均呈持续强化。4 例患者均未见肿大淋巴结。

结论: 肾神经内分泌肿瘤 MRI 影像学表现具有一定特征性, 更好发于肾门附近, 形态不规则, 易发生囊变及坏死, 平扫 T1WI 呈低信号, T2WI 呈稍高信号, DWI 实性成分呈高信号, ADC 呈低信号, 增强后多数病灶表现为持续性不均匀强化。

PU-0953

一例原发性卵巢恶性混合生殖细胞瘤

董雨岚
南华大学附属第一医院

患者女, 11 岁, 因脐周部疼痛 2 年, 加重 5 天于 2022 年 3 月入本院。入院查体: 腹部膨隆, 未见腹壁静脉曲张, 未见胃肠型及蠕动波。腹肌张力高, 中下腹部可及一包块, 质硬, 活动度差, 大小约 15×12CM。脐周部有压痛, 无反跳痛。腹部增强三维 CT 示: 腹腔、盆腔巨大囊实性占位, 恶性肿瘤可能性大。实验室检查: 血清甲胎蛋白(alpha fetoprotein, AFP)>1210ng/ml, 癌胚抗原 0.74 ng/ml, CA-125169U/ml。完善术前检查后行手术治疗。病灶肉眼观: 盆腔肿物大小约 22.5×14.5×12.1cm, 完整包膜, 切面灰白, 灰红, 切面呈囊实性。囊性区内充清液, 囊壁菲薄; 实性区一部分区域灰黄, 一部分区域半透明, 呈粘液样光泽。术后对包块进行病理学检查示: 混合性生殖细胞肿瘤 (大部分为卵黄囊瘤, 少部分为无性细胞瘤)。免疫组化结果示: CD117 (部分+), PLAP (+), D2-40 (+), SALL4 (+), CK-pan (+), EMA (灶性+), Glypican-3 (大部分+), Ki-67 (+约 70%), CD30 (-), CEA (-), HCG-β (-)。术后采用依托泊苷+顺铂+博来霉素方案化疗共计 4 次。目前患儿情况良好, 仍在治疗随访中。

PU-0954

基于光谱 CT 的细胞外容积分数与结直肠癌临床病理特征的相关性研究

程庆红、盛茂
合肥市第二人民医院

目的: 评估光谱 CT 增强平衡期碘密度图量化的细胞外容积分数 (ECV) 与结直肠癌 (CRC) 临床病理特征的相关性。

方法: 回顾性收集 2021 年 2 月-2023 年 4 月在本院接受根治性手术治疗的 97 例 CRC 患者相关资料, 所有患者术前均行光谱 CT 多期增强扫描, 测量平衡期碘密度图中病灶及同层面主动脉或髂动脉的碘密度, 计算肿瘤的 ECV。以 ECV 中位数为截断值, 分为高、低两组, 正态分布的计量或计

数资料分别采用 t 检验和卡方检验；偏态分布的计量资料采用 Mann-Whitney U 检验和 Kruskal-Wallis H 检验，差异有统计学意义的参数再分别采用 Point-biserial、Spearman 进行相关性分析。采用线性回归进行单因素和多因素分析影响因素。

结果：（1）临床病理特征：97 例 CRC 患者中左半结肠癌 63 例、右半结肠癌 34 例；其中有脉管癌栓 33 例、神经侵犯 21 例、淋巴结转移 35 例。肿瘤标志物 CEA 升高 41 例，CA199 升高 18 例。Ki67 为 20%~90%。肿瘤大体类型 溃疡型 60 例，隆起型 36 例，浸润型 1 例；中、高分化腺癌 81 例，低分化和未分化腺癌 16 例。（2）相关性分析：ECV 中位数为 32%（18%，70%），高 ECV 组 46 例、低 ECV 组 51 例。两组间肿瘤大体类型、有无脉管癌栓及神经侵犯、病理 T 分期和 TNM 分期差异具有统计学意义（ $P<0.05$ ）；肿瘤指标 CEA 和 CA199、肿瘤位置、肿瘤长径、分化程度、N 分期、Ki67 差异无统计学意义（ $P>0.05$ ）。相关性分析显示 ECV 与脉管癌栓、神经侵犯间存在显著的相关关系（ $r=0.330, 0.415, P<0.001$ ），ECV 越大，更倾向发生脉管癌栓和神经侵犯；与病理 T 分期呈弱正相关（ $r=0.260, P<0.05$ ）；与肿瘤大体类型和病理 TNM 分期无相关性。

（3）影响因素分析：单因素分析显示肿瘤长径、分化程度、病理 TNM 分期、脉管癌栓和神经侵犯是影响 ECV 的相关因素；多因素分析显示脉管癌栓和神经侵犯是 ECV 的独立影响因素。

结论：对于 CRC 患者，光谱 CT-ECV 越大，更倾向发生脉管癌栓和神经侵犯，且脉管癌栓和神经侵犯是 ECV 的独立影响因素。

肾透明细胞癌的不典型 MR 影像特点分析

王鑫坤

中国人民解放军总医院第四医学中心

【摘要】目的：探讨肾透明细胞癌的不典型 MR 影像表现，提高肾透明细胞癌的术前诊断准确率。方法：回顾性分析解放军总医院第四医学中心经病理证实的肾透明细胞癌的不典型 MR 影像资料，共 28 例，其中女性 7 例，男性 21 例，年龄 23~80 岁，平均 56.2 岁。重点分析病变的大小、形状、信号及增强特点，以及有无假包膜、出血、囊变、坏死、脂质脂肪等磁共振表现特征。结果：28 例不典型肾透明细胞癌，共 28 个病灶，病灶直径 1~4cm，平均直径 2.3cm，病灶直径小于 3cm 的有 20 例（20/28），病灶为类圆形的有 23 例（23/28），病灶 T1WI、T2WI 信号均匀的有 20 例（20/28），T2WI 表现为等及低信号的有 18 例（18/28），病灶中含出血 3 例（3/28），囊变坏死 2 例（2/28），含脂质 3 例（3/28），有假包膜 20 例（20/28），增强扫描后皮质期表现为明显强化 4 例（4/28），轻中度强化 18 例（18/28），髓质期及平衡期持续强化 18 例（18/28），快进快出 4 例（4/28）。结论：肾透明细胞癌最为常见并且磁共振成像表现多样，总结认识透明细胞肾癌不典型的 MR 影像特点，可以提高术前肾透明细胞癌的诊断水平。

Imaging diagnosis and treatment of Aggressive angiomyxoma: five cases report and literature review

Linsheng Song

Sichuan provincial people's hospital

Abstract: Aggressive angiomyxoma (AAM) is a rare aggressive benign tumor with high recurrence rates after surgical excision. AAM mostly occurs in the pelvic and perineum and has also been rarely reported in the head and neck region, the lung, the liver, the kidney and the extremities. AAM is often missed or misdiagnosed as gynaecological lesions or hernias. This study includes a retrospective analysis of the diagnosis and treatment of five cases of

AAM, four cases in the perineal areas and one case in the upper right thigh. The purpose of this study was to summarize the imaging characteristics and treatment of five cases, and to improve the understanding of AMM.

PU-0957

增强 CT 诊断腹部肿瘤腹腔转移的临床效果

冯晴晴、段庆红
贵州医科大学附属肿瘤医院

摘要：目的：研究分析腹部肿瘤腹腔转移采用增强 CT 诊断的临床效果。方法：选取 2022 年 6 月—2023 年 6 月在肿瘤医院住院医治的腹部肿瘤腹腔转移患者 60 例，且均接受过 CT 平扫及增强 CT 检查，以手术病理结果为金标准，对比增强 CT 对腹部肿瘤腹腔转移的诊断情况。结果：以手术病理结果为金标准，增强 CT 诊断腹部肿瘤、腹部肿瘤腹腔转移总体准确率均为 91.32%，显著高于 CT 平扫诊断的 71.63% 和 68.50% ($P < 0.01$)。增强 CT 检查腹部肿瘤腹腔转移患者种植灶的深度、种植灶的宽度以及最小种植灶的面积均显著小于 CT 平扫 ($P < 0.01$)。结论：增强 CT 可提高腹部肿瘤腹腔转移的诊断准确率，且对小种植病灶具有更高的敏感性，值得进一步推广应用。

原发性肝细胞癌治疗后复发肿瘤肿瘤体积倍增时间分析

黄婷¹、王红芳¹、范皓文¹、王婷¹、陈勇²
1. 宁夏医科大学
2. 宁夏医科大学总医院

目的 探讨原发性肝癌(HCC)治疗后复发肿瘤体积倍增时间的影响因素分析

方法 收集 2020 年 1 月 1 日至 2022 年 12 月 31 日在宁夏医科大学总医院确诊为 HCC 治疗后复发的患者 120 例，使用时间间隔超过 1 个月的连续影像资料计算肿瘤体积倍增时间。采用 3D Slicer 5.1.0 auto-segmentation 逐层勾画肿瘤区域，采用 $(T - T_0) \times \log_2 / (\log V/V_0) \times 30$ (month) 计算肿瘤体积倍增时间。选择年龄、性别、临床分期、血小板、纤维蛋白降解产物、谷草转氨酶、谷丙转氨酶、甲胎蛋白、白蛋白、胆红素、ES 分级、Ki67 等可能影响肿瘤体积倍增时间的因素进行 Spearman 相关性分析。

结果：两次影像检查时间差为 $6.31 \pm 8.43 (1.99 \sim 35.685.78)$ 月，体积差为 $22.69 \pm 76.56 (0.05 \sim 542.10) \text{cm}^3$ ，肿瘤生长率为 $13.88 \pm 108.35 (0.07 \sim 1189.53)$ ，肿瘤体积倍增时间为 $6.50 \pm 32.92 (0.16 \sim 359.25)$ 月，体积差 = $2.06 + 0.02$ 月。肿瘤体积倍增时间和纤维蛋白降解产物 ($P < 0.01$)，纤维蛋白降解产物越高，肿瘤体积倍增时间越大。

结论 纤维蛋白降解产物可作为判断肿瘤体积倍增的因素。

PU-0959

MSCT 小肠造影及后处理技术在小肠疾病诊断中价值

宁文锋¹、郭小平¹、杨想春¹、刘红生¹、简蒙蒙¹、弓甜甜¹、张军俭²
1. 西安交通大学医学院附属西安市中心医院
2. 西安交通大学医学院附属西安市第九医院

目的：探讨 MSCT 小肠造影及后处理技术在小肠疾病诊断中的应用价值

方法: 对 2022 年 8 月~2023 年 6 月期间我院收治的 65 例患者怀疑小肠疾病临床资料进行研究分析, 同时在我科进行口服混合液 (250ml 甘露醇+1750ml 0.9%氯化钠溶液) 小肠造影; 采用飞利浦 iCT256 层螺旋 CT 扫描均行轴位扫描, 并在工作站将 65 例患者原始数据进行重建, 并与活检/或术后病理结果对照分析并统计分析。评估 CT 诊断的准确性。

结果: 65 例患者均经临床/或病理证实, 正常 42 例, 良性病变 20 例, 恶性病变 3 例。MSCT 小肠造影多种成像方法中 MPR 像和 MIP 像价值最大。可以完整清楚显示正常肠腔结构及病变的部位、范围、大小和特征。对于实性占位, 轴位像结合后处理图像观察有利于做出正确诊断。MIP、CPR、VR 和仿真内窥镜技术可以清晰肠系膜血管等。

结论: MSCT 小肠造影技术是一种简捷易行检查方法, 对小肠的病变的定性及鉴别诊断具有较高的应用价值; 对临床诊断治疗有很大指导意义, 因此此检查方法可作为临床上评价小肠病变重要方法之一。

PU-0960

Evaluation of active phase of Crohn's disease and differentiation from ulcerative colitis by three-classification combined clinical radiomics model

Xu Zeng

The Second Affiliated Hospital of Harbin Medical University

Purpose: The diagnosis and activity grading of inflammatory bowel disease are very important for the follow-up treatment of patients. At present, there is no gold standard. Our study will establish a combined model of three classifications based on radiomics for the classification and activity grading of inflammatory bowel disease.

Methods: We retrospectively analyzed 115 lesion sites of 80 patients confirmed by endoscopy and pathology, and obtained enhanced CT images of arterial and venous phases, 70% of which were used as training sets and 30% as verification sets. Features are extracted from each region of interest (ROI), and kBest and lasso are selected by variance threshold method to obtain feature tags. At the same time, we used the machine learning method of logistic regression (LR) and support vector machine (SVM) to establish the combined radiomics model of arterial phase, venous phase and combination of arterial phase and venous phase, and screened out the best model. At the same time, we screened 4 related factors from 8 clinical factors through single factor analysis ($P < 0.05$), forming a new combined clinical radiomics model, and compared it with the clinical model and the radiomics model.

Result: In the train cohort of the combined model, the macro average AUC was 0.915, the micro average AUC was 0.912, the accuracy rate was 0.734, the sensitivity is 0.775, and the precision rate was 0.715. In the test cohort of the combined model, the macro average AUC was 0.811, the micro average AUC was 0.789, the accuracy rate was 0.686, the sensitivity is 0.737.

Conclusion: The three classification model combined with clinical factors and radiomics provides a better method for the diagnosis and activity grading of inflammatory bowel disease.

PU-0961

腹内疝多排螺旋 CT 诊断思路

侯荣

西安凤城医院

【摘要】目的: 探讨腹内疝诊断中 CT 表现及其对应的病理分型。

方法：对我院 2017 年 7 月-2023 年 8 月经手术证实的 7 例患者的临床资料及 MSCT 影像资料结合相关文献以加强对腹内疝 MSCT 典型征象的认识，为临床提供可靠的诊断依据。

结果：4 例患者诊断为肠梗阻，3 例诊断为腹内疝（2 例十二指肠左疝，1 例十二指肠右疝）。手术证实 3 例十二指肠旁疝，1 例为盲肠周围疝，1 例胃炎症致腹内疝形成，1 例网膜孔疝，1 例乙状结肠间疝。

结论：腹内疝在 CT 影像学上可以表现一定的特征：1）小肠形态改变：表现为扩张的小肠袢呈肿块状、簇状异常纠集；2）肠系膜改变：小肠系膜根部血管曲张、牵拉、移位。疝口部位扩张肠袢的系膜血管集中。

腹部后神经纤维瘤个案报道

牟胜男
吉林大学第一医院

腹膜后神经纤维瘤主要分布于腹主动脉周围及脊柱两侧。CT 表现为水样密度或肌肉密度肿块，边缘较清晰；肿瘤小时密度均匀；肿瘤较大，可有坏死、出血或囊性变。影像表现缺乏特异性，但可以准确定位，结合临床病史和其他检查及肿瘤的分布特点，可以做出更为正确的诊断，确诊仍有赖于病理。

PU-0963

ASL 联合 IVIM 评价糖尿病肾病的研究

刘宇博、张铎
北华大学附属医院

目的：探索体素内不相干运动(IVIM)参数及动脉自旋标记(ASL)参数在糖尿病肾病早期诊断及各期鉴别诊断的价值。

方法：选取于我院确诊的 2 型糖尿病患者 59 人，其中男性 32 人，女性 27 人，年龄 36 至 73 岁。依据 eGFR 及 UAER 进行分期，同时招募 20 名健康志愿者作为对照组（HC 组），男性及女性各 10 人，年龄 48 至 60 岁。所有检查者均签署知情同意书并取得本院伦理委员会的批准。应用 Philips 3.0T MRI 扫描仪，采用 IVIM 及 ASL 序列进行扫描。经后处理软件测量 DKD 患者及健康志愿者肾皮质各参数值，使用 SPSS 22.0、Medcalc 等软件比较对照组及 DKD 四期间参数值差异，计算各参数值与 eGFR 的相关性。

结果：IVIM：D 值单因素方差分析比较各组间参数值差异有统计学意义，组间两两比较对照组、DKD 组 I 期、II 期间无统计学意义，余各组间 D 值比较均具有统计学意义。利用 D*值诊断时发现 DKD 组 I 期与 II 期较对照组 D*值升高，III 期及 IV 期 D*值较前几组降低，但单因素方差分析及组间两两比较均无统计学意义。随病情进展 f 值呈现先升高随后降低的趋势。单因素方差分析比较各组间参数值差异有统计学意义，组间两两比较对照组、DKD 组 I 期、II 期、III 期间参数无统计学意义，而 IV 期 f 值低于前四组且差异有统计学意义。ASL：RBF 值单因素方差分析各组间差异有统计学意义（ $F=63.844$ ， $P=0.000$ ），组间两两比较对照组、DKD 组 I 期、II 期间差异无统计学意义，III 期、IV 期 RBF 值较前几组进一步减低且与各组的差异均有统计学意义。IVIM 及 ASL 各参数与 eGFR 均呈正相关但各自的相关性不同，RBF 值与 eGFR 相关性最高，D 值与 f 值与 eGFR 呈中度相关（D 值： $r=0.458$ ， $P<0.01$ ；f 值： $r=0.445$ ， $P<0.01$ ），D*值呈低度相关。联合 IVIM 各参数进行 DKD 分期鉴别时，其 ROC 曲线下面积(AUC)大于 D 值、f 值单独诊断 ROC 曲线下面积(AUC)，

敏感度及特异度也有所提高。IVIM 联合 ASL 进行 DKD 分期鉴别的诊断效能略高于联合 IVIM 或 ASL 单独诊断, 但三者间差异均无统计学意义。

PU-0964

入院时的 CT 胰腺体积在胰腺炎严重程度评估中的价值

刘陈平

复旦大学附属中山医院青浦分院

目的: 评价患者入院时早期腹部 CT 胰腺体积和胰腺炎严重程度的相关性, 及预测重症胰腺炎的价值

方法: 本研究回顾性纳入 2017 年 1 月-2020 年 6 月期间的急性胰腺炎患者资料。根据 2012 亚特兰大标准分为重症胰腺炎和非重症胰腺炎。在入院时的腹部平扫 CT 图像上测量胰腺体积, 并记录患者入院 24 小时内实验室指标, 包括肌酐、血钙、淀粉酶、尿素氮、红细胞压积、CRP。

结果: 共有 208 例 AP 患者符合研究标准纳入研究, 其中男性 135 (64.9%) 例, 年龄 52 ± 17 岁。与非重症胰腺炎相比, 早期 CT 上重症胰腺炎患者的胰腺体积更大 (158.7cm^3 vs 116.7cm^3 , $P < 0.001$)。在预测胰腺炎的严重程度中, 早期 CT 上胰腺体积具有中度的预测效能 ($\text{AUC} = 0.759$, $95\%\text{CI}: 0.676-0.843$, $P < 0.001$), 高于单一实验室指标 ($\text{AUC} = 0.607 \sim 0.661$)。

结论: 患者入院时的 CT 体积对于重症胰腺炎具有较高的预测价值。

PU-0965

脾脏低密度病变的 CT 影像诊断价值

李强、张英、唐腾、徐红维、李剑

西安凤城医院

目的: 探讨上腹部术后 CT 平扫发现脾脏低密度灶的影像特征, 以及病变的最终病理性质及转归。

方法: 收集我院上腹部术后治疗的 35 例患者, 所有患者经上腹部 CT 平扫均发现脾脏低密度病变, 对所有患者的临床资料和影像特征作回顾性分析, 比较其差异性。结果: 35 例患者中有 18 例脾脏低密度灶得到不同程度的恢复, 其中有 7 例完全恢复, CT 动态观察科发现病灶范围较前有不同程度的缩小, 好转率 51%。其中炎性水肿 13 例, 一般可完全恢复; 部分小的缺血灶 5 例, 后期部分可完全恢复; 小的梗死灶 10 例, 纤维瘢痕形成, 后期牵拉收缩可导致病灶范围缩小; 完全性大的梗死灶 7 例, 低密度病变不会有变化。结论: CT 平扫发现脾脏低密度灶的根据其影像特征和随访观察可有效评估病变的性质, 有一定的临床指导意义。

PU-0966

磁共振弥散加权成像在胆脂瘤中的应用

张思微

徐州医科大学附属医院

目的: 研究 MRI-DWI 检查对胆脂瘤的诊断价值。

方法: 回顾性分析我院 10 例经病理证实的胆脂瘤患者的磁共振平扫、增强和 DWI 图像表现、特征。

结果: 病变的好发部位在桥小脑角区, 病灶为类圆形或不规则形, 平扫 8 例表现为长 T1 长 T2 信号影, 2 例表现为 T1, T2 的混杂信号; 增强扫描病灶均无强化病灶 DWI 均表现为高信号。

结论: 胆脂瘤在 DWI 上的特征性表现, 有助于胆脂瘤的诊断以及与其他肿瘤的鉴别诊断。

卵巢甲状腺肿一例分享

杨慧敏¹、禹雯婧¹、李文鑫¹、刘新疆²

1. 滨州医学院附属医院放射科

2. 上海浦东医院放射科

卵巢甲状腺肿(strumaovarii, SO)属于畸胎瘤中特殊类型,在卵巢肿瘤中占比约为 0.3%,SO 多为良性,仅不到 5%为恶性[1]。由于其病例少见,且临床及影像表现不典型,术前极易误诊。现报道我院病理学确诊的 1 例 SO,旨在加深影像医师对该疾病影像学特征的认识,提高诊断率。

PU-0968

磁共振功能成像在肾癌分级诊断中的应用研究

张岩、张铎

北华大学附属医院

目的:评估体素内不相干运动(IVIM)及扩散峰度成像(DKI)技术在肾透明细胞癌(CCRCC)分级诊断中的价值。方法:回顾性分析 35 例经术后病理证实为 CCRCC 患者的影像资料,根据 Fuhrman 病理分级,将病理级别为 I 级和 II 级的患者归为低级别组共 21 例,将病理级别为 III 级和 IV 级的患者归为高级别组共 14 例。所有患者于术前均进行常规 MRI、IVIM 及 DKI 检查,将患者 IVIM 及 DKI 的图像导入到飞利浦公司提供的后处理软件中,计算出相应的伪彩图,然后通过勾画感兴趣区获取相关的参数值(D、D*、f、MK、MD 值)。结果:1. IVIM 及 DKI 参数值在高、低级别 CCRCC 组间的差异:高级别 CCRCC 组的 D、MD 值均明显低于低级别组;高级别 CCRCC 组的 MK 值明显高于低级别组,D*、f 值在高低级别组间没有统计学差异(P 均>0.05)。2. IVIM 及 DKI 相关参数与 CCRCC 病理分级的相关性分析:D、MD 值与 CCRCC 病理分级呈显著负相关,r s 值分别为-0.676、-0.699;MK 值与病理分级呈显著正相关,r s 值为 0.768。3. IVIM 及 DKI 相关参数鉴别高、低级别 CCRCC 的诊断效能:D、MD、MK 值鉴别高、低级别 CCRCC 的 AUC 分别为 0.898、0.912、0.952;相对应的最佳诊断阈值分别为 $1.02 \times 10^{-3} \text{mm}^2/\text{s}$ 、 $2.39 \times 10^{-3} \text{mm}^2/\text{s}$ 、0.73;敏感度分别为 85.7%、76.2%、85.7%;特异度分别为 78.6%、92.9%、100%。结论:1. 扩散相关参数(D、MD、MK)可用于准确区分高、低级别的 CCRCC,能为临床诊疗提供重要的价值;2. D 及 MD 值与 CCRCC 病理分级呈显著负相关,MK 值与病理分级呈显著正相关;3. 与 IVIM 相比,DKI 更适合对 CCRCC 进行分级诊断,其中 MK 值是区分高、低级别 CCRCC 最理想的参数。

PU-0969

扩散加权成像在肝细胞癌微血管浸润中的诊断价值

林芳

吉林大学第一医院

目的:通过研究扩散加权成像(DWI)预测肝细胞癌(HCC)微血管浸润(MVI)情况,并比较不同扩散参数对 MVI 的诊断价值。

方法:回顾性评估了 2019 年 01 月至 2020 年 11 月行手术切除并经病理证实

的 44 例 HCC 患者, 由病理结果分为 MVI 阳性组和 MVI 阴性组。我们记录患者的临床及术前影像学资料, 包括性别、年龄、肝脏基础疾病、有无肝硬化、术前甲胎蛋白 (AFP) 水平; 肿瘤最大直径、肿瘤数目、肿瘤边缘形态、肿瘤内部改变 (有无合并出血、坏死、脂肪变性等)、肿瘤组织分级; 测量肿瘤及肿瘤周围的表现扩散系数 (ADC) 值、真表现扩散系数 (ADCslow) 值, 并通过计算得出瘤周/肿瘤 ADC 值比值及瘤周/肿瘤 ADCslow 值比值。

结果: 纳入 MVI 阳性组 18 例, MVI 阴性组 26 例。MVI 阳性组的肿瘤最大直径明显大于 MVI 阴性组 ($P=0.000$); MVI 阳性组肿瘤更容易表现为不规整形态 ($P=0.001$); MVI 阳性组肿瘤内部更容易发生出血 ($P=0.002$)。二者的 DWI 参数比较存在统计学差异的如下: MVI 阳性组瘤周/肿瘤 ADCslow 值比率值较 MVI 阴性组大 ($P=0.003$); MVI 阳性组肿瘤平均 ADCslow 值较 MVI 阴性组小 ($P=0.010$)。二元 Logistic 回归分析提示肿瘤平均 ADCslow 值及肿瘤最大直径是预测 MVI 状态的独立危险因素。肿瘤最大直径预测 MVI 阳性的 ROC 曲线下的面积 (AUC) 为 0.827; 肿瘤平均 ADCslow 值负值预测 MVI 阳性的 AUC 为 0.738; 肿瘤最大直径联合肿瘤平均 ADCslow 值负值预测 MVI 阳性的 AUC 为 0.906。

结论: 肿瘤最大直径及肿瘤平均 ADCslow 值是术前预测 HCC MVI 状态的独立危险因素, 此外, 肿瘤最大直径联合肿瘤平均 ADCslow 值预测 HCC MVI 状态的效果更优。

PU-0970

基于多参数 MRI 的影像组学模型术前预测直肠腺癌 Ki-67 表达水平的初步研究

孙铭洁、高飞
安徽省肿瘤医院

目的 探讨多参数 MRI 的影像组学模型术前预测直肠癌 Ki-67 表达水平的价值。

方法 回顾性分析 97 例经手术病理证实的直肠腺癌患者, 得到各患者 Ki-67 的表达水平; 根据各患者 Ki-67 表达的中位数 (70%), 将 $Ki-67 \leq 70\%$ 分为低表达组 ($n=64$)、 $Ki-67 > 70\%$ 为高表达组 ($n=33$)。所有患者术前均进行 GE 3.0T MRI 常规及 IVIM-DWI 扫描 ($b=0$ 、10、20、50、100、200、400、800、1200、2000 s/m²), 在轴位 T2WI、sagLAVA-FLEX +C 和 IVIM-DWI ($b=800$ s/m²) 序列上分别提取影像组学特征。所有患者按 7:3 比例分为训练组 ($n=67$) 和测试组 ($n=30$), 训练组用于特征筛选和建立影像组学模型, 测试组用于验证所建立模型的可靠性。最优预测特征由 Pearson Correlation、SelectKBest 和选择算子回归 (LASSO) 完成。而后基于影像组学特征使用随机梯度下降 (SGD)、支持向量机 (SVM) 和逻辑回归 (LR) 机器学习算法分别构建影像组学模型, 并采用 10 折交叉验证方法进行训练和验证。采用受试者工作曲线 (ROC)、校准曲线和决策曲线分析 (DCA) 对模型进行评估。

结果 从每例患者的轴位 T2WI、sagLAVA-FLEX +C 和 IVIM-DWI ($b=800$ s/m²) 序列上各提取出 5622 个影像组学特征; 筛选出 6 个影像组学特征作为最佳预测特征构建模型。SGD、SVM 和 LR 的最高受试者工作曲线下面积 (AUC) 分别为 0.867、0.853、和 0.884。在基于影像组学特征模型中, SGD 算法达到了 84% 的准确率, AUC 为 0.867, 显示了更高的预测性能, 在 3 个模型中表现最佳。校准曲线表明最佳模型的预测值与实际观察值间具有较好的一致性, 并且 DCA 显示该模型具有较高的净收益。

结论 1. 基于多参数 MRI 的影像组学模型在术前预测直肠腺癌 Ki-67 表达水平有一定的价值。

2. SGD、SVM 和 LR 三种机器学习算法在预测直肠腺癌 Ki-67 表达中 SGD 的表现更加优越, 而 SVM 与 LR 的表现相近。

胃淋巴瘤的 CT 表现

李如迅、王亚宁、杨丽
河北医科大学第四医院

[摘要]目的：分析原发性胃淋巴瘤的 CT 表现，探讨 CT 诊断原发性胃淋巴瘤的价值。方法：回顾性分析经手术病理免疫组化证实的 22 例原发性胃淋巴瘤的临床及影像学资料。结果：本组 22 例原发性胃淋巴瘤患者均为非霍奇金淋巴瘤；CT 表现为胃壁不均匀增厚，其中弥漫性增厚 12 例，节段性增厚 6 例，局限性增厚 4 例；18 例呈均匀强化，4 例内见片状低密度坏死；16 例胃壁黏膜完整，6 例黏膜破坏；胃壁浆膜面清晰 19 例，浆膜面模糊 3 例；6 例胃周淋巴结肿大。结论：CT 检查对原发性胃淋巴瘤诊断有较高价值，并有助于肿瘤的定位、定性诊断。

腹盆腔巨大成熟性畸胎瘤 1 例

马雯慧
中国人民解放军联勤保障部队第 926 医院

本文报道腹盆腔巨大成熟性畸胎瘤影像表现一例。患者，女性，22 岁，CT 平扫示腹盆腔可见巨大混杂密度灶，大小约 19.4cm×27.3cm×36.5cm，边界清晰，以液性为主，其内可见斑片状更低密度灶及多发斑点状钙化灶，增强扫描实性部分呈轻中度强化，囊性部分无强化。术后病理诊断为囊性成熟性畸胎瘤。成熟性畸胎瘤体积较大，特别是肿瘤直径大于 10cm，和（或）具有实性和囊性成分的混合成分时，应怀疑恶性肿瘤，术后可结合血清肿瘤标志物尤其是 CA199 来判断良恶性。

PU-0973

胰头炎性肌纤维母细胞瘤一例

傅洋
昆明市第一人民医院

胰腺炎性肌纤维母细胞瘤属于罕见的胰腺间叶源性肿瘤，原发于胰头者更为罕见，目前病因不明。由于胰腺炎性肌纤维母细胞瘤的临床表现缺乏特异性，在影像学检查上无典型表现，故术前与胰腺恶性肿瘤鉴别困难，极易误诊。本文报道 1 例昆明市第一人民医院收治的胰头部炎性肌纤维母细胞瘤患者，行胰十二指肠切除术，术后病理为炎性肌纤维母细胞性肿瘤，以期为临床医师诊断胰腺炎性肌纤维母细胞瘤提供一定参考。

双能 CT 多参数定量分析鉴别动脉期高强化肝细胞癌的价值

陈晶¹、张武²、胡金玥¹
1. 海口市人民医院
2. 中山大学附属第三医院

目的:探讨双能 CT(DECT)定量多参数分析在鉴别肝脏高强化病灶中诊断肝细胞癌和非肝细胞癌的价值。

材料和方法:对 85 例肝细胞癌高危患者行 DECT 检查,共发现动脉期高强化病灶 116 个(包括 77 个为肝细胞癌和 39 个非肝细胞癌),对这些病灶进行回顾性分析,以病理结果作为参考金标准。比较肝细胞癌和非肝细胞癌动脉期(AP)和门静脉期(PVP)的定量参数,包括 40keV 的虚拟单能图像(VMI)的衰减值、AP 和 PVP 标准化碘浓度(NIC)和有效原子序数(Zeff)以及动脉增强分数(AEF)。并对这些指标进行受试者工作特征(ROC)曲线和 Logistic 回归分析。

结果:肝细胞癌在 PVP 中,40keV 的 VMIs 衰减值、NIC 和 Zeff 值均显著低于非细胞肝癌($P<0.05$)。在 40keV 时,Zeff、NIC 和 VMIs 的 ROC 曲线下面积分别为 0.706、0.663 和 0.655,AP 分别为 0.572、0.525 和 0.548。肝细胞癌患者的 AEF 值显著高于非肝细胞癌患者(0.42 ± 0.22 vs. 0.32 ± 0.18 , $P=0.007$),AUC 值为 0.653。在 Logistic 回归分析中,只有 PVP 和 AEF 中的 Zeff 是区分肝细胞癌和非肝细胞癌的有意义的定量生物标志物(OR 值分别为 0.18 和 14.00)。当 AP 和 PVP 的所有参数和 VMI 均为 80keV 时,AUC 值显著增加到 0.815,敏感性为 85.71%,特异性为 69.23%。

结论:DECT 在 PVP 生成的 VMIs (40keV) 中获取的 AEF、NIC 和 Zeff 值可能有助于鉴别肝细胞癌高危患者中的肝细胞癌和非肝细胞癌。

PU-0975

Imaging findings of nephritic myofibroblastoma

Pengxin Shen,Yan Tan

Department of Radiology, First Clinical Medical College, Shanxi Medical University

Imaging findings of nephritic myofibroblastoma

Inflammatory myofibroblastic tumor IMT (Inflammatory myofibroblastic tumor IMT) is a unique and rare mesenchymal tumor that can locally infiltrate surrounding tissues but rarely metastasize. It is an intermediate tumor with low malignant potential. Inflammatory myofibroblastoma (IMT) usually occurs under 16 years old, with an average age of about 10 years old, and is rare over 40 years old, with no significant gender difference. Inflammatory myofibroblastoma often occurs in the lung, and the first case of pulmonary IMT was reported in 1939. Other sites such as mesentery (46% outside lung), mammary gland, liver, bladder, bone, kidney, heart and so on have been reported.

Method: The clinical manifestations and imaging features of a case of renal occupying diagnosed in our hospital were retrospectively analyzed, and its pathological mechanism, treatment and prognosis were discussed.

Result: A 65-year-old female with no obvious discomfort was found to be occupying the right kidney during physical examination, and CT plain scan showed a mass of soft tissue density in the right kidney with unclear boundaries. The lesions showed mild enhancement in the cortical phase (42HU CT value), slightly increased enhancement in the medullary phase (57HU CT value), and slightly decreased enhancement in the excretory phase (53HU CT value). The strengthening degree of the third stage was lower than that of normal renal parenchyma.

Conclusion: Renal IMT may present with abdominal pain, abdominal mass, and common hematuria. Most are single, 1-10cm in size. Renal IMT tends to occur in middle-aged and elderly people, with men slightly more than women. Laboratory tests showed no specificity. Histologically it contains T and B lymphocytes, myofibroblasts spindle cells and collagen. Common immunohistochemistry included vimentin, muscle-specific actin, smooth muscle actin and cytokeratin positivity and ALK positivity. Preoperative examination of kidney IMT includes B-ultrasound, CT and MRI. However, due to the heterogeneity of lesion manifestations, it is very difficult to make a definite diagnosis before surgery, but it still has certain reference value. B ultrasonography showed high or equal echo nodules with clear boundaries. CT findings showed equal or low density nodules, half of the density was uneven, half of the masses had unclear

boundaries, and most of the masses were less enhanced than normal renal parenchyma. MRI showed the invasive nature of the mass. T1WI is usually is low signal; T2 weight is usually low signal; DWI scan high signal, ADC low signal, indicating increased cell density, there are malignant characteristics; The overall signal of the lesion was related to its internal necrosis and cystic degeneration, and a few signals were not uniform. The enhanced scanning showed delayed enhancement and low enhancement. Renal IMT has good prognosis and lack of specificity in clinical manifestations. From the clinical point of view, rapid freezing pathology examination after intraoperative resection of the tumor is recommended and necessary to avoid unnecessary nephrectomy. The treatment methods include conservative observation or medical treatment, surgical resection and chemoradiotherapy, in which surgical resection is the main treatment. High-dose steroids, radiotherapy and chemotherapy have been reported, and some IMTs even have spontaneous ablation.

PU-0976

磁共振 IVIM 和 DKI 在直肠癌术前诊断中的应用

高丽华、张铎
北华大学附属医院

目的: 探讨体素内非相干运动 (IVIM) 和扩散峰度成像 (DKI) 参数在直肠癌术前诊断中的应用价值。方法: 直肠癌并经手术证实的直肠癌患者 36 例。20 例正常人作为对照组。所有患者术前采用飞利浦 3.0 T 磁共振行常规盆腔 MRI 平扫后, 再次加扫磁共振体素内不相干运动及磁共振扩散峰度成像 (DKI, 序列, 通过专业的 Matlab 工具箱测量病灶处 IVIM 相关参数 (D 、 D^* 、 f) 值及 DKI 相关参数 (MD 、 MK) 值。根据术后 T 分期、分化程度 (低、中、高) 进行分组。采用 SPSS 22.0 和 MedCalc 统计软件进行统计学分析。结果: IVIM 与 DKI 各定量相关参数间相关性分析显示: D 与 D^* 呈高度相关, D 与 MD 、 MK 呈中度相关, D^* 与 MD 、 MK 呈中度相关, MD 与 MK 轻度相关。IVIM、DKI 诸参数在正常直肠壁与直肠癌灶之间的关系示: 直肠癌组的 D 、 D^* 、 f 、 MD 均低于正常组, MK 值高于正常组, 差异均有统计学意义。此外, 在区分正常肠壁与直肠癌时, D 值与 D^* 值有较大的 ROC 曲线 AUC, 分别为 0.910、0.974, 其特异性、敏感性、约登指数、阈值分别为 100%、77.78%、0.778、0.973 与 95%、100%、0.95、10.911; 差异均有统计学意义。IVIM、DKI 诸参数在不同分化程度直肠癌中的分析比较: 参数值在不同分化程度的直肠癌组间差异无统计学意义。 MD 值及 MK 值在不同分化程度的组间差异均具有统计学意义, 且低与中、高分化组间组间差异具有统计学意义; MK 及 MD 值有较大的受试者工作特性 (ROC) 曲线 AUC, 分别为 0.948、0.929。IVIM、DKI 诸参数在不同 T 分期的直肠癌间的分析比较示: 参数 D 、 D^* 、 MD 、 MK 值在不同 T 分期直肠癌的组间差异均具有统计学意义。随直肠癌 T 分期的增加, D 值与 MD 值呈逐渐减小, D^* 值与 MK 值逐渐增大, 差异有统计学意义。 f 值在不同 T 分期直肠癌间差异无统计学意义。结论: 直肠癌的分化程度越高, MD 值越大, MK 值越小, 且 MD 与 MK 值在低与中、高分化组间差异均具有统计学意义; 随直肠癌 T 分期升高, D 值 MD 值逐渐减小, D^* 与 MK 值逐渐增大。

肾上腺嗜酸细胞腺瘤复发恶变一例

王玉娇
襄阳市中心医院

患者 男, 62 岁。2018 年 4 月因“体检发现右侧肾上腺占位”入院, 患者既往高血压病史 8 年, 查体无明显特殊。实验室检查卧位醛固酮增高。肾上腺 CT 平扫及增强检查示: 右侧肾上腺区占位, 形态欠规则, 边界清楚, 截面积约 4.6cm×5.4cm, 增强后动脉期呈明显不均匀强化, 静脉期强化达

到峰值, 延迟期强化区造影剂部分廓清, 原低强化区进一步强化。CT 诊断结论提示肿瘤性病变。患者无明显手术禁忌症, 于 2018 年 5 月 2 日行后腹腔镜下右肾上腺肿瘤切除术。术后病检提示: (右侧) 肾上腺嗜酸细胞腺瘤 (7x4.5x3cm), 免疫组化: Inhibin (+), calretinin (+), Vimentin (+), Syn (+), NSE (+), CK18 (-)。术后患者未规范复查。2020 年 8 月因纳差伴吞咽困难 2 月入院, 查体无特殊。实验室检查提示低钾血症。CT 平扫及增强扫描示: 右侧腹腔、肝肾间隙内、右肾周、右侧背部多发团状、结节状软组织密度灶, 形态不规则, 密度不均, 部分内伴斑片状低密度影, 病灶包绕右肾静脉, 与下腔静脉、右肾上腺极分界不清, 增强扫描动脉期呈明显不均匀强化, 静脉期强化达到峰值, 延迟期强化区造影剂部分廓清, 原低强化区进一步强化。CT 诊断结论考虑肿瘤性病变, 不排除神经纤维瘤病。患者同意手术治疗, 于 2020 年 9 月完成经腹右肾上腺后腹腔镜肿瘤切除术, 术中发现肿瘤侵犯邻近血管。术后病检提示: (右肾上腺及右腹膜后) 嗜酸性细胞肿瘤伴细胞增生活跃, 结合临床及免疫组化, 倾向恶变。免疫组化: Vimentin (+), Syn (+), NSE (+), Ki-67 (Li:30%), Melan-A (+), Inhibin (+), calretinin (+), PCK (-), S-100 (-), CgA (-)。

标准化舒适护理在肺功能异常的老年 MRCP 检查患者中的应用

唐煜寒

中国人民解放军陆军特色医学中心

目的 随着影像技术的发展, 核磁共振检查成为胆道系统疾病诊断重要的影像检查手段。人口老龄化形势严峻和人们健康需求增加, 老年患者 MRCP 检查人群也逐年增长, 但老年患者基础疾病多, 肺部疾病的发病率逐年增加, 检查配合依从性差, 导致 MRCP 检查时屏气差出现运动伪影影响图像质量及诊断。探讨标准化舒适护理在肺功能异常的老年 MRCP 检查患者的应用效果。

方法 将 2020 年 1 月-2021 年 1 月在我科预约 MRCP 检查且 ≥ 60 岁肺功能异常的患者为对照组, 共 100 例, 将 2021 年 2 月-2022 年 2 月在我科预约 MRCP 检查且 ≥ 60 岁肺功能异常的患者为观察组, 共 100 例。对照组予常规宣教及护理准备, 实验组在常规护理基础上, 增加标准舒适护理, 具体方法如下: ①检查前给予雾化吸入或支气管扩张剂, 缓解通气障碍, 并持续氧气吸入; ②检查中持续氧气吸入并垫高床头, 使患者处于舒适体位, 增加垫子, 防止压迫神经和血管, 减轻生理不适感; ③营造舒适环境, 干净整洁, 光线充足, 温湿度适宜, 保暖, 保护患者隐私以及听力; ④舒适心理护理, 动作轻柔、操作熟练、让患者有安全感、语气温和并鼓励可以完成检查。比较两组患者图像质量、检查成功率以及患者满意度。

结果 统计分析实验组对照组准备时长、一次性检查成功率、图像质量和满意度; 实验组准备时长低于对照组; 一次性检查成功率明显高于对照组; 实验组图像质量优良率明显高于对照组; 患者满意度实验组明显高于对照组, P 值均 <0.05 , 差异具有统计学意义。

结论 标准化舒适护理不仅提高了老年患者 MRCP 检查的成功率、图像质量及满意度, 还节省了护理准备时间, 提高了工作效率。该护理模式可以使老年患者更有效缓解老年患者紧张情绪, 提高屏气耐受力, 降低因屏气差, 屏气时间短导致的检查失败。

PU-0979

基于微信平台的远程宣教在老年 MRCP 检查前的应用

唐煜寒

中国人民解放军陆军特色医学中心

目的 随着影像技术的发展,核磁共振检查成为胆道系统疾病诊断重要的影像检查手段。人口老龄化形势严峻和人们健康需求增加,老年患者 MRCP 检查人群也逐年增长,但老年患者,理解能力差,依从性低,导致 MRCP 检查前护理准备耗时增加,屏气效果差出现运动伪影影响图像质量及诊断。探讨标准化舒适护理在肺功能异常的老年 MRCP 检查患者的应用效果。

探讨在远程模式下,健康宣教在老年 MRCP 检查前的应用效果。

方法 将 2022 年 6 月-2022 年 12 月在我科预约检查 MRCP 且 ≥ 60 岁的患者为对照组,将 2023 年 1 月-2022 年 6 月在我科预约检查 MRCP 且 ≥ 60 岁的患者为观察组,两组均予常规宣教,禁食禁饮 6-8h,观察组在常规基础上,在患者成功预约后,检查前一日,通过电话对患者进行评估,并添加患者或家属微信,而后进行腹部磁共振检查健康宣教二维码的推送,同时告知呼吸训练注意事项及方法,在家或病房提前试听音频并进行相应的呼吸训练。检查当日,再次对患者进行宣教及呼吸强化训练比较两组患者在检查报道后的准备时长、检查后图像质量的对比、检查成功率以及患者满意度。

结果 实验组统计分析实验组对照组准备时长、一次性检查成功率、图像质量和满意度;实验组准备时长低于对照组;一次性检查成功率明显高于对照组;实验组图像质量优良率明显高于对照组;患者满意度实验组明显高于对照组, P 值均 <0.05 ,差异具有统计学意义。

结论 基于微信平台的远程宣教不仅提高了老年患者 MRCP 检查的成功率、图像质量及满意度,还提高了老年患者的认知,节省了护理准备时间,提高了工作效率。基于微信平台的远程宣教也是契合“互联网+医疗”思想的,值得应用推广。

肝脏血管周上皮样细胞瘤(PEComa)的影像学特征

唐敏

南京鼓楼医院

目的:

本文旨在探索肝脏 PEComa 的 MR 及 CT 影像特征,以提高其影像学诊断准确性。

方法:

回顾性纳入 19 名患者。所有患者术后病理均证实为肝脏血管周上皮样肿瘤,其中血管平滑肌脂肪瘤(AML)10 例,上皮样血管平滑肌脂肪瘤(EAML)8 例,非特异性血管周上皮样肿瘤 1 例(PEComa NOS)。所有入组患者在术前均接受过 CT 检查,其中 6 例患者同时接受了 MR 检查,所有影像学资料与相关临床信息、病理资料均作为研究对象归纳整理在册。

结果:

PEComa 在 CT 及 MRI 图像上均表现为边界清晰病灶(100%),多为类圆形(68.42%),多位于包膜下(78.95%),多不均质(84.21%),病灶内多见脂肪成分(63.16%)。PEComa 增强后 CT 及 MRI 动脉期多显著强化,与肝脏诸多富血供肿瘤(例如肝细胞肝癌、腺瘤、富血供转移瘤等)影像学区分比较困难。

结论:

本研究数据表明以下特征可以帮助肝脏 PEComa 的诊断:肝脏包膜下、边界清晰、动脉期明显强化的病灶,病灶内或可见畸形血管、脂肪成分;患者为无慢性肝脏病史的中年女性。肝脏 PEComa 影像学表现虽然缺乏特异性,但综合分析可以提高术前诊断的准确率,帮助临床制定治疗、随访方案。

PU-0981

回顾性分析 2 例阔韧带肌瘤 MRI 诊断并文献复习

曹积善、侯青平
海西州人民医院

阔韧带位于子宫两侧，又分前后两叶，假性阔韧带肌瘤可见与子宫体或颈部相连续，而真性阔韧带肌瘤位置相对易变，尤其对于巨大肿瘤伴有变性、坏死者。经相关文献学习并总结以往工作经验分析，由于阔韧带平滑肌瘤在彩超和 CT 扫描中无特异性改变，也不利于总体、多方位判断其起源，所以一般不利于阔韧带平滑肌瘤的诊断，易出现误诊，而 MRI 则具有更多的优势，尤其高场强 MRI 的 T2 抑脂序列诊断价值更高。高场强 MRI 具有良好的软组织分辨率，多方位、多序列成像对显示肿瘤的位置、包膜、形态及周围组织关系均具有明显的优势，并且平滑肌瘤在 MRI 上存在相对特异的信号改变，在 T2 抑脂序列上由于去除了周围脂肪组织的干扰，阔韧带平滑肌瘤的显示较其他序列更加清晰，本次报道两例阔韧带肌瘤在该序列均较其他序列更加清晰，并且对包膜的显示尤为明显，呈现典型的低信号环征，这对判断肿瘤起源、边界及组织成分具有极大的帮助。因此，高场强 MRI 应用 T2 抑制序列在阔韧带平滑肌瘤的诊断中具有不可替代的优势，临床值得推广。但在阔韧带平滑肌瘤的 MRI 诊断过程中，仍需与起源于阔韧带本身的其他肿瘤、卵巢良恶性肿瘤及附件区的转移瘤进行鉴别，尤其对于巨大并变性、坏死的阔韧带平滑肌瘤更需进行鉴别。

PU-0982

Seat Belt-Related Ischemic Mesenteric Laceration

Fan Yang,Xianzheng Tan
Hunan Provincial People's Hospital, the First Affiliated Hospital of Hunan Normal University

A 38-year-old woman presented with abdominal pain after a frontal impact motor vehicle collision 3 hours earlier. Emergency dual-energy contrast-enhanced CT (Somatom Force; Siemens) showed abdominal seat belt sign, mesenteric contusion and hemoperitoneum (Figure, A and B). Hypo-enhancement of the terminal ileum was suspected on the simulated 120-kVp images (Figure, C), which was further highlighted with the combined use of 90-kVp data (Figure, D; Supplementary Figure 1) and cinematic rendering (Figure, E). Iodine maps and 50 keV virtual monochromatic images were provided to depict bowel ischemia in the Supplemental Material (Supplementary Figures 2 and 3). Ischemic mesenteric laceration was highly suspected and confirmed by subsequent laparotomy.

Bowel and mesenteric injuries are the most common seat belt-related abdominal injuries (1). Ischemic mesenteric laceration is the most worrisome complication (2). CT is the main diagnostic tool for abdominal seat belt injuries (1, 3). In this case, cinematic renderings improved depiction of the abdominal seat belt sign, which corresponded to the area of mesenteric laceration. Dual-energy CT and cinematic rendering technique were first utilized to intuitively show seat belt-related ischemic mesenteric laceration. Improved conspicuity of segmental bowel hypoenhancement with low-tube-voltage data complemented with photorealistic visualization with cinematic rendering had the potential to create a new paradigm in virtually depicting such injury.

Omental torsion: Acute abdomen that radiologists cannot ignore. Case report

Jiapei Shi
Ningbo NO.2 Hospital

We report the case of a 39-year-old male with no significant medical history, went to the emergency room due to right abdominal pain with 12 h of evolution, which begins to be intermittent, gradually develop into persistent, although the degree is bearable. We performed an abdomen CT with contrast that showed: The fat density in the right middle and lower abdomen and pelvic mesentery increased with local flocculent exudation, the local blood vessels in the right middle abdomen showed slightly eddy changes and local "whirl sign" changes, and a small amount of fluid accumulated in the right para-colonic sulcus and pelvic cavity. He was diagnosed with omental torsion and associated necrosis by intraoperatively, which was successfully treated by laparoscopic omentectomy. We also review the literature to learn the clinical and imaging manifestations of this rare acute abdomen.

新型高效 CT 标记物助力肿瘤精准诊疗

雷子乔
华中科技大学同济医学院附属协和医院

CT 影像在肿瘤诊断、病灶边缘确定及治疗规划中发挥着重要作用,然而,影像图像与术中所见并不一致,精准影像与精准治疗之间存在鸿沟。常规 CT 对比剂可以精准显示病灶,但清除率快,无法在术中或放疗过程中界定肿瘤轮廓与位置,例如,有时术中看不见肿瘤,或肿瘤轮廓与边界不清;射波刀治疗时追踪不到肿瘤,临床金标存在影响剂量估算及治疗副作用等。

本研究研发的新型 CT 标记物 PIDA 具有超高含碘量(>84wt%),可赋予其极高的 X 射线衰减能力, PIDA 聚集诱导增强使 CT 密度表现出聚集诱导放大效应,可进一步增大 10 倍以上, PIDA 肉眼可见深蓝色,有助于术中肉眼识别可见, PIDA 还具有长时间局部滞留增强特性。临床应用中首先根据影像信息规划出肿瘤的边界与手术切缘,在 CT 引导下精准的在切缘位置注射 PIDA,显示肿瘤的切缘,这个切缘可以在术中 C 臂机下看到,又可以术中肉眼可见,以引导精准手术。PIDA 基准标记物还可引导精准放疗,不会产生局部炎症及水肿,可有效追踪,射波刀追踪效率高,识别错误率低,位置固定,可长时间停留,具有生物可代谢性。

PU-0985

口服甘露醇低剂量与常规剂量结合 CT 结肠造影对结肠肿瘤的诊断价值

詹青霞
上海市青浦区中心医院

目的:评价口服甘露醇结肠造影 CT 低剂量扫描对图像质量的影响,探讨低剂量与常规剂量结合 CT 结肠造影对结肠肿瘤的诊断价值。方法:对 54 例肠镜、BE 或 MR 检查为结肠肿瘤或临床高度疑为结肠肿瘤但不愿或不能做别的检查的患者每人口服约 1500-2000ml 等渗甘露醇后,随机分成两组(低剂量与常规剂量两种不同的组合方案)进行 CT 扫描检查,并在工作站上进行多平面重建。

根据肠道准备效果分为 3 级。评价 1-2 级病例不同剂量的图像质量。对照病理结果, 选择 41 例证实为结肠肿瘤且肠道效果为 1-2 级的病例进行回顾分析, 计算口服甘露醇低剂量与常规剂量结合 CT 结肠造影对结肠肿瘤病灶的显示率、诊断的敏感性、特异性、分期的准确性。结果: 与常规剂量 240 mAs 期比较, 80 mAs、60 mAs 期对结肠壁、结肠带、腔外间隙显示的清晰度影响很小, 没有影响到对其图像的观察诊断; 对肝脏、臀肌等密实结构显示的清晰度影响较大, 随着扫描剂量减低, 图像颗粒增粗, 组织结构分辨率下降, 图像的多平面重建也受到影响; 结肠肿块显示的清晰度在降低剂量扫描时其图像颗粒也有所增粗, 但结合常规剂量动脉期或静脉期增强均没有影响诊断。以 240mAs 为标准, 80 mAs、60 mAs 期的 CTDIvol (mGy) 分别降低了 67%、75%。低剂量与常规剂量的结合扫描方案的辐射量较各期全部为常规剂量的扫描方案降低了约 47.3%。41 例结肠肿瘤病人 40 例清晰显示病变, 其中结肠癌 29 例, 淋巴瘤 1 例, 结肠息肉 10 例, 1 例 <5mm 结肠息肉未检出。口服甘露醇低剂量与常规剂量结合 CT 结肠造影对结肠肿瘤诊断的敏感度为 97.6%, 特异度为 76.9%。29 例结肠癌正确 Duke 分期 25 例, 准确性为 86% (25/29)。结论: 口服甘露醇低剂量与常规剂量结合 CT 结肠造影技术具有患者依从性好、准确性和特异性较高等优势, 是一种既降低患者所受辐射量又符合诊断要求的检查方法。

PU-0986

结合 CT 参数和临床参数对正中弓状韧带综合征严重程度的评估及预后判断的价值

王雨梵、沈亚琪

华中科技大学同济医学院附属同济医院

目的: 正中弓状韧带综合征 (MALS) 是一种罕见且诊断较为困难的疾病。据我们所知, 目前尚缺乏能够预测 NOMI 患者预后的 CT 参数的综合评估。回顾性分析计算机断层扫描 (CT) 评估正中弓状韧带综合征 (MALS) 严重程度分级的能力, 并探讨 CT 结果在 NCS 诊断中的诊断价值。

方法: 纳入 2021 年 1 月至 2023 年 6 月被诊断正中弓状韧带综合征, 或腹部 CT 提示腹腔干起始处狭窄的患者; 根据是否存在特征性症状 (如血肿/动脉瘤) 将试验组分为有并发症组及无并发症组。根据试验组各年龄段病例数量以一定比例纳入腹部 CT 显示无正中弓状韧带综合征的患者, 形成对照组。评估每位患者的 CT 图像, 比较试验组和对照组之间的 CT 特征差异, 同时分析肠系膜上动脉 (SMA)、腹腔干 (CT) 直径及临床指标对 MALS 严重程度的评估价值和患者预后的预测价值。结果: 本研究共纳入了试验组 427 例, 对照组 426 例, 以男性为主, 中位年龄分别为 59 岁和 52 岁。试验组的影像学参数 (包括 SMA、CT 直径、腹腔干起源高度)、临床指标 (包括年龄、性别、改良 BMI) 及实验室参数 (总胆固醇、甘油三酯等) 均与对照组有显著性差异 ($p < 0.05$)。根据腹腔干狭窄程度评估得到 MALS 1 级患者 159 例, 2 级患者 111 例, 3 级患者 157 例, 分析发现年龄更高 ($p = 0.005$)、甘油三酯含量更低 ($p = 0.01$)、SMA 更高 ($p = 0.003$) 对 MALS 严重程度具有提示意义。

结论: 可以结合 CT 上 SMA 直径、临床参数年龄以及实验室指标甘油三酯共同评估 MALS 的狭窄严重程度, 进一步预测患者的预后。

PU-0987

基于肝硬化分级及 CT 肝体积测量对肝功能储备的评价

徐卫玲

吉林大学第一医院

基于肝硬化分级及 CT 肝体积测量对肝功能储备的评价

目的:肝切除术后肝功能衰竭是肝癌手术治疗的主要限制之一。人们普遍认为,术前对术后肝功能衰竭风险的正确评估对于确定合适的手术方法至关重要。由于切除和移植后的肝功能受损是由肝储备不足引起的,因此对潜在肝切除患者进行可靠的体积评估是术前评估的关键因素,肝脏功能储备与肝脏体积显著相关。本研究旨在探讨肝细胞癌患者肝切除术前肝硬化患者肝功能储备的定量评价方法,并结合计算肝功能储备与肝细胞癌患者肝功能储备的定量评价。

方法:对 60 例肝切除术患者的 CT 图像进行前瞻性分析。肝硬化程度称为“CT 分级”,切除后肝体积百分比[$=\text{预测残肝体积}/\text{预测总肝体积} \times 100\%$]通过逐层叠加 CT 肝脏图像计算。在 CT 图像上将非肿瘤区肝硬化程度分为 4 个等级。级别越高肝硬化越严重:I 级为病情最有利,其特征为密度均匀,形状正常或轻度变形,脾脏大小适中,未见门静脉高压征像。级别 II 为下降状态,表现为密度不等,形状严重扭曲伴部分萎缩或门静脉高压。III 级为肝脏恶化,表现为肝硬化再生的结节,切线不良,严重萎缩。IV 级最差,表现为体征较 III 级恶化,再生结节增多,轮廓,体积明显萎缩。

结果:切除后肝体积百分比 $\leq 50\%$ 组与 $> 50\%$ 组的生存时间差异有统计学意义($\chi^2 = 4.698, P = 0.022$),CT 分级 0/1 组与 CT 分级 2/3 组的生存时间差异有统计学意义($\chi^2 = 5.133, P = 0.024$)。

结论:切除后肝体积百分比、CT 分级与肝功能储备有显著相关性。使用这两个参数进行预测对肝切除患者判断肝功能储备是有用的。这一结论有待临床应用中更多病例的检验和验证。此外,在 CT 分析软件中引入人工智能,可以实现肝体积的自动测量,从而更好地对 HCC 患者进行诊断和预后。

APT 联合 Gd-BOPTA 对肿块型肝内胆管细胞癌与单发乏血供肝转移瘤的鉴别诊断价值

李军¹、赵莹¹、任雪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的:肿块型肝内胆管细胞癌(IMCC)与单发乏血供肝转移瘤(SHHM)是肝脏常见恶性肿瘤,两者在影像表现上有相似性,容易混淆。本研究旨在探讨酰胺质子转移(APT)联合 Gd-BOPTA 对 IMCC 与 SHHM 的鉴别诊断价值。方法:回顾性分析自 2021 年 3 月至 2023 年 7 月我院经手术病理证实或临床随访证实的胆管细胞癌及肝转移瘤患者的临床及 MRI 资料,最终纳入 IMCC 14 例,SHHM 17 例。IMCC 与 SHHM 均使用飞利浦后处理平台,于肿瘤最大层面各放置 3 个大小相等的感兴趣区(ROI),记录肿瘤 APT 的信号强度(SI)值的均值,在肝胆特异期(HBP)于肿瘤最大层面及同层面正常肝实质各放置 3 个大小相等 ROI,记录肿瘤及肝脏的 SI 值的均值,根据均值计算出肿瘤病灶-肝脏信号强度比(LLR)及信号强度比值(LSIR)。采用 SPSS 27 统计软件,使用正态性检验来评估各参数的正态性,使用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异。使用 logistic 回归建立不同参数组合的预测模型。使用受试者操作特征(ROC)分析评估诊断性能。结果:IMCC 组与 SHHM 组的 SNR 及 CNR 值差异无统计学意义(P 值均 >0.05),APT、LLR 及 LSIR 对 IMCC 于 SHHM 的鉴别诊断有意义,且 APT(P <0.001)的统计学意义远大于 LLR(P=0.042)与 LSIR(P=0.042),APT、LLR、LSIR 的曲线下面积分别为 0.962、0.710、0.710,将 LLR 与 LSIR 联合,APT 与 LLR、LSIR 联合时,鉴别效能提高(AUC 分别为 0.735、0.975)。

结论: APT、LLR 及 LSIR 可以有效鉴别 IMCC 与 SHHM, 且 APT 与 LLR、LSIR 联合的鉴别效能提高。本研究有助于更准确地鉴别 IMCC 与 SHHM, 从而采取正确的治疗干预措施提高患者的治疗效果和预后。

PU-0989

基于 CT 检测腰大肌横截面积对于肝硬化预后的相关性研究

邓然然、陈伟志
锦州医科大学附属第一医院

目的 研究腰大肌横截面积对肝硬化患者预后的影响

方法 本文回顾性纳入了 153 名在 2020 年至 2022 年期间接受腹部 CT 检查的肝硬化患者, 分为肝功能正常组(对照组)、肝硬化 child 分级 A 级患者(观察组)及肝硬化 child 分级 B、C 级患者(观察组), 通过一年随访观察, 判断其预后情况, 分析腰大肌的横截面积对于肝硬化患者预后的影响。结果 有 34% 的肝硬化患者合并患有腰大肌横截面积减小, 其中男性发病率为 32%, 女性的发病率为 54%。合并腰大肌横截面积减小的肝硬化患者相较于无腰大肌横截面积减小者, 肝性脑病、自发性腹膜炎、肝肾综合征并发症的发生率更高; 合并腰大肌横截面积减小的肝硬化患者预后情况较差, 其中, 体重、BMI、白蛋白、谷草转氨酶、谷丙转氨酶、总胆红素、IV 胶原 ($P<0.001$) 与肝硬化预后存在差异性。

结论 腰大肌的横截面积可以大致作为一个营养评估指标, 可用于对肝硬化患者的肌肉减少情况进行筛查, 对肝硬化患者的临床结局有预测作用。

急性肝门静脉血栓症 CT 表现并文献分析

周林¹、张绍金¹、黄滔²
1. 成都市郫都区人民医院
2. 洪雅县人民医院

目的 分析急性肝门静脉血栓症 CT 特征及临床价值。方法 回顾分析 2 例急性肝门静脉血栓症患者的临床资料及 CT 表现, 并复习相关文献。结果 患者均以无明显诱因腹痛就诊伴 D-二聚体升高, CT 显示肝门静脉主干、肠系膜上静脉增宽, 管腔内密度不均匀增高, 血管周围脂肪间隙, 模糊, CT 增强扫描表现为未强化的充盈缺损区, 患者 1 门静脉周围可见较多迂曲增粗、强化血管影并肝脏灌注异常, 患者 2 部分受累的小肠管增粗、管壁增厚, 肠系膜肿胀并伴积液。结论 APVT 是一种临罕见的疾病, 腹痛是最常见的临床症状, 易栓症、全身和局部的因素是主要的危险因素, SARS-CoV-2 的感染与疫苗接种是重要的临床病史。CT 扫描对 APVT 的诊断有较高的价值, 对 APVT 的分型、病情程度的评估、治疗评价、并发症等方面有积极价值。

PU-0991

基于 C T 影像组学评估门静脉高压及预测曲张静脉出血

王珍、容鹏飞、刘晟
中南大学湘雅三医院

目的: 探讨基于 C T 影像组学标签评估门静脉高压 (PH) 的可行性及其预测曲张静脉出血的价值。

方法 回顾性分析 112 例确诊或疑似 PH 患者, 分别以肝静脉压力梯度 (HVPG) 10、12 和 20 mmHg 作为界值, 将患者分为 HVPG < 10 mmHg 组和 ≥ 10 mmHg 组, HVPG < 12 mmHg 组和 ≥ 12 mmHg 组, HVPG < 20 mmHg 组和 ≥ 20 mmHg 组, 以 M a Z d a 软件提取并分析肝脏增强 CT 门脉期图像纹理特征, 观察影像组学判断不同程度 PH 及曲张静脉出血的效能。

结果: CT 征象中, 在 HVPG < 10 及 ≥ 10 、HVPG < 12 及 ≥ 12 组间有无腹腔积液差异具有统计学意义 (P 均 < 0.05); 单层面勾画 ROI 判别 HVPG ≥ 10 mmHg、HVPG ≥ 12 mmHg、HVPG ≥ 20 mmHg 及曲张静脉出血的平均最小误诊率分别为 12.50%、14.74%、10.27% 及 22.70%; 多层面勾画平均最小误诊率分别为 10.27%、11.16%、5.36% 及 20.49% (P 均 > 0.05)。HVPG 预测 PH 患者曲张静脉出血的曲线下面积 (AUC) 为 0.813 [95%CI (0.730, 0.897)], 以 12 mmHg 为 HVPG 的截断值, 误诊率为 20.54%, 敏感度为 77.22%, 特异度为 69.70%。

结论: 基于 CT 影像组学可评估 PH 程度, 且对预测曲张静脉出血有一定价值。

胃血管球瘤 1 例的 CT 表现

杨秀娟、温云
重庆大学附属三峡医院

目的: 研究胃血管球瘤的 CT 表现。方法: 采用 GE 公司 revolution 双能量 CT 行平扫、动脉期、门静脉期、静脉期扫描, 检查前患者禁食 4h, 检查前口服 500~1000 mL 水以充分膨胀胃和十二指肠。结果: CT 检查示胃窦部黏膜下类圆形等密度影, 形态规则, 边缘光滑, 密度均匀, 未见钙化、出血、坏死及囊变, 向腔内生长, 直径约 2.3cm, 增强呈明显进行性均匀强化。结论: 胃血管球瘤有特定的发病部位及 CT 强化特征, 具有临床诊断价值。

PU-0993

MSCT 多期扫描对消化道活动性出血的诊断价值

杨秀娟
重庆三峡中心医院

目的: 研究 MSCT 多期扫描对消化道活动性出血的诊断价值。方法: 对临床怀疑消化道出血 37 例患者行 MSCT 检查, 采用平扫、动脉期、静脉期扫描, 其中 26 例行 DSA 检查, 8 例行胃镜检查。结果: 15 例证实为消化道活动性出血, 其中 7 例 (46.7%) 行 MSCT 显示造影剂外溢, 其中 5 例行 DSA 检查, 3 例血管畸形出血, 2 例阴性, 2 例胃镜显示胃溃疡出血; 2 例 (13.3%) MSCT 显示胃十二指肠憩室, 未见造影剂外溢, DSA 显示憩室出血; 2 例 (13.3%) MACT 显示胃溃疡, 未见造影剂外溢, 1 胃镜显示溃疡出血; 1 例 (6.7%) MSCT 阴性, DSA 显示血管畸形; 1 例 (6.7%) MSCT 显示胃左动脉假性动脉瘤, 未见造影剂外溢; 2 例 (13.3%) MSCT 显示肠壁增厚肿胀, DSA 显示血管畸形出血。结论: MSCT 双期增强扫描对消化道活动性出血具有重要的临床指导意义及诊断价值。

3.0T 合成弥散加权成像改善睾丸病变的显示

姚斐斐

郑州大学第一附属医院

目的

合成扩散加权图像 (cDWI) 是由在低 b 值图像上获得的 DWI 图像合成高 b 值图像。本研究试图探索 cDWI 在睾丸病变显示中的作用。

方法和材料

我们回顾性分析了 18 例睾丸肿瘤性病变的 DWI (b 值=50 和 1000s/mm²)。由制造商提供工作站生成 b 值等于 1400s/mm² 的 DWI。对于定性测量, 使用 ADC 图和对比增强 T1WI 作为参考标准, 对采集的 DWI (b 值=1000 s/mm²) 和 cDWI (1 差, 2 中等, 3 优) 进行评分。为了进行定量评估, 测量正常睾丸组织和异常病变在采集 DWI 和 cDWI 上的信号强度。通过使用以下公式计算信号强度比 (rSI): rSI=病变/SI 正常。

结果

睾丸在高 b 值 DWI 图像上显示相对明显。因此, 为了提高病变与正常睾丸组织的对比度, 我们应该采集更高的 b 值图像。cDWI 方法可以在不增加扫描时间的情况下满足这一要求。在 cDWI (b 值=1400s/mm²) 上, T2 穿透效应被有效地消除。因此, 睾丸病变的描述得到了改善。cDWI (b 值=1400 s/mm²) 的病变外观评分高于获得性 DWI (b 值=1000 s/mm²)。此外, cDWI 的 rSI 明显高于采集 DWI。

结论

cDWI 在睾丸病变的临床应用是可行的。通过 cDWI, 我们获得了更高的 b 值图像, 以消除睾丸的 T2 穿透效应, 提高病变检测。

PU-0995

基于增强 CT 影像组学模型在胃神经鞘瘤与不同危险度分级胃间质瘤鉴别诊断中的价值

杨子梅¹、杨丽²

1. 河北大学附属医院

2. 河北医科大学第四医院

目的: 建立基于增强 CT 影像组学模型, 评价其在胃神经鞘瘤 (gastric schwannoma, GS) 与不同危险度分级胃间质瘤 (gastrointestinal stromal tumor, GIST) 鉴别诊断中的价值。

方法: 回顾性收集经术后病理证实的胃神经鞘瘤 (GS) 26 例和胃间质瘤 (GIST) 82 例, 按 7: 3 的比例分为训练集和验证集, GIST 分为高、低恶性潜力组。记录患者临床特征 (年龄、性别、有无消化道出血) 和肿瘤 CT 影像特征 (位置、长径、形状、生长方式、瘤内出血、溃疡、囊变、液化坏死、钙化、密度是否均匀、边界是否清楚、平扫、动脉期及静脉期 CT 值、动脉期及静脉期 CT 值净增值、强化是否均匀、瘤周最大淋巴结短径), 建立传统模型。对病变静脉期薄层图像进行全瘤手动分割及影像组学特征提取, 建立影像组学模型。联合上述特征建立组合模型, 评估各模型鉴别 GS 与 GIST、GS 与不同危险度分级 GIST 的诊断效能。

结果: (1) 肿瘤位置、有无囊变、动脉期 CT 值净增值及强化是否均匀是鉴别二者的独立预测因素, 传统模型在训练集和验证集 AUC 分别为 0.939、0.869。

(2) 保留 8 个影像组学特征用于构建影像组学模型, 其在训练集和验证集 AUC 分别为 0.949、0.839。

(3) 保留肿瘤位置、动脉期 CT 值净增值、强化是否均匀以及影像组学模型输出的放射组学分数 (rad-score) 构建组合模型, 其在训练集和验证集 AUC 分别为 0.989、0.964。

(4) 组合模型鉴别 GS 与 GIST、GS 与高、低恶性潜力 GIST 的诊断效能均高于传统模型 (IDI=0.2538, $P<0.05$; IDI=0.2418, $P<0.05$; IDI=0.2749, $P<0.05$)。三种模型鉴别 GS 与高恶性潜力 GIST 的诊断效能多高于鉴别 GS 与低恶性潜力 GIST 的诊断效能。

结论: 基于 CT 影像特征和影像组学特征的组合模型或可成为术前准确鉴别胃神经鞘瘤与胃间质瘤的无创、精准的新方法。

PU-0996

MSCT 对肠系膜脂膜炎的诊断

徐彦东

鄂尔多斯市中心医院 (内蒙古自治区超声影像研究所)

【摘要】: 目的 探讨多排螺旋 CT(MSCT)对肠系膜脂膜炎的影像学特征, 提高对其诊断的准确率。方法 回顾性分析我院 2014 年 1 月至 2021 年 8 月的 52 例肠系膜脂膜炎患者的临床及 CT 表现, 其中 14 例 CT 平扫, 38 例 CT 平扫加增强检查。结果 52 例病变均位于小肠系膜, 包绕肠系膜血管, 向周围延伸, 特别是向左下 13:00-18:00 点钟方向为明显。50 例以炎症渗出为主, CT 平扫肠系膜脂肪密度不均匀性增高, CT 平均值约 -45Hu, 高于同层面正常皮下脂肪密度 (平均值约 -100Hu), 50 例中 38 例行 CT 平扫加增强扫描, CT 增强扫描病灶无强化或轻度强化; 2 例以纤维化或肿块为主, CT 表现为肠系膜脂肪密度增高且可见多发 $>15\text{mm}$ 的结节或肿块影, 平扫 CT 平均值约 45Hu, 边界模糊, CT 增强扫描结节或肿块呈中度均匀强化, 动脉期 CT 值约 68Hu, 静脉期 CT 值约 73Hu。52 例肠系膜脂膜炎中, 其中 50 例肠系膜有“云雾样”改变、占本组病例约 96.2%, 其中 42 例有“假包膜征”、占本组病例约 80.8%, 其中 39 例有“脂环征”占本组病例约 75.0%, “脂环征”15 例出现在肠系膜血管周围, 15 例出现在小结节状软组织密度影周围, 14 例出现在肠系膜血管和小结节周围, 其中 42 例有“假肿瘤征”占本组病例约 80.8%, 其中 26 例有“小结节影”占本组病例约 50.0%, 其中 2 例有钙化占本组病例约 3.8%, 其中 1 例合并降结肠肠脂垂炎。结论 MSCT 可以清晰显示肠系膜脂膜炎的特征性表现, 可以显示病变的范围及程度, 并对肠系膜血管是否受累以及疗效进行评估, 对其诊断具有重要价值。

PU-0997

CT-occult diffuse liver metastasis from breast cancer detected by 18F-FDG PET/MR

Li Li, Futao Cui, Rong Tian, Su Lui
West China Hospital, Sichuan University

We report a case of a 43-year-old woman with rapidly progressive liver dysfunction caused by diffuse breast cancer invasion that failed to be detected by contrast abdominal CT and US. As a problem-solving technique, FDG PET/MR scan was performed. The PET/MR images detected diffuse liver infiltration and other unsuspected distant metastases, upstaging the patient to stage IV. Although metastatic liver diseases classically present as discrete nodules or masses, they may rarely manifest diffuse infiltrating pattern of involvement, corresponding to histopathologic diffuse intrasinusoidal infiltration. This metastatic pattern allows tumor to spread extensively throughout the liver without becoming radiologically apparent, until obstruction of hepatic sinusoids occurs which can lead to acute liver failure. Patients with this condition can rapidly progress to death, but early detection and treatment may improve outcome and survival. However, liver metastasis may not be suspected when abdominal CT and US shows no classic lesions

expected for metastatic disease just as our case. Despite having similar accuracy in whole-body staging for extrahepatic metastatic disease to PET/CT, PET/MR imaging yields a better rate of detection with higher confidence in the characterization of liver metastases. Our case highlighted that infiltrative liver metastasis should be considered in cancer patients having laboratory evidence of liver dysfunction even with no CT and US indication of metastasis. A timely FDG PET/MR imaging is a useful one-stop-shop technique for cancer patients with potentially metastatic liver disease and may add value in clinical decision making.

PU-0998

成人肾母细胞瘤 7 例 CT 表现与分析

徐瑞、李昇霖、刘显旺、邓娟、薛彩强、周俊林
兰州大学第二医院

目的：探讨成人肾母细胞瘤（Adult Wilms tumor, AWT）的 CT 特征，旨在提高对该病的认识。

方法：回顾性分析经手术病理证实的 7 例成人肾母细胞瘤患者的 CT 图像，包括肿瘤边界、大小、坏死囊变、钙化、平扫 CT 值、增强强化方式及肿瘤供血动脉。

结果：男性 4 例，女性 3 例，年龄（ 31.43 ± 10.34 ）岁；肿瘤最大径（ 8.94 ± 3.46 ）cm，5 例肿瘤与肾实质分界清晰并可见不同程度的坏死囊变区，2 例以囊性为主，4 例可见斑点状钙化，平扫 CT 值（ 47.4 ± 6.19 ）HU，增强三期 CT 值分别为（ 56.4 ± 6.95 ）HU、（ 72.2 ± 13.33 ）HU、（ 70.2 ± 2.17 ）HU，CT（肿瘤）/CT（肾皮质）比率分别为 0.54 ± 0.13 、 0.61 ± 0.20 、 0.4 ± 0.03 。

结论：熟悉 AWT 的 CT 表现有助于成人型肾肿瘤的术前诊断及鉴别诊断。

PU-0999

mDixon Quant 序列评估慢性肾病纤维化程度的价值

胡庆晨、鞠烨、张倩瑜、张瀚月、霍宇婷、骆仁娜、刘爱连
大连医科大学附属第一医院

目的：本研究旨在探索功能磁共振序列与纤维化肾脏组织病理学指标之间的关联关系，通过病理指标和磁共振序列参数的映射关联，验证魔镜成像（mDixon-Quant）序列在评估 CKD 患者肾脏纤维化程度中的价值。方法：通过回顾性队列研究数据，收集大连医科大学附属第一医院 2020 年 5 月至 2023 年 8 月接受肾脏功能磁共振检查的 CKD 患者。扫描序列包括 mDixon-Quant 序列。功能磁共振参数值分别为脂肪分数(fat fraction, FF)和弛豫率(R2*)。所有患者在 MRI 检查后 3 天内，在超声引导下肾活检。肾活检方法采用国家肾脏疾病临床医学研究中心发明并推广的“B 超引导下斜角进针负压吸引一秒钟快速经皮肾活检法”。收集肾活检常规病理数据(球性硬化比例)以及肾脏病理诊断。球性硬化比例=硬化肾小球数量/切片上所有肾小球数量。根据肾小球球性硬化百分比进行分组，以小于 10%，10%-30%，30%-50%和大于 50%分为四组，分析对应的磁共振序列参数变化。采用 SPSS 27.0 统计学软件(IBM SPSS Statistics)进行统计分析。功能磁共振序列参数与肾纤维化病理指标的相关关系采用皮尔逊相关系数(Pearson's r)或斯皮尔曼相关系数(Spearman's Rho)。所有检验均为双侧检验， $P < 0.05$ 为差异有统计学意义， $P < 0.01$ 为差异有非常显著统计学意义。结果：就 mDixon-Quant 序列与球性硬化百分比之间的相关性分析发现，mDixon-Quant 序列参数值（皮质 R2*值）与球性硬化比例之间存在显著负相关性（ $Rho = -0.551, P = 0.005$ ）。结论：mDixon-Quant 序列对评估慢性肾病纤维化程度具有优势。

PU-1000

血氧水平依赖磁共振成像在评估慢性肾小球肾炎患者肾脏功能及病理损伤中的应用

王欣全、顾红梅、严加欣
南通大学附属医院

目的 探讨血氧水平依赖磁共振成像 (BOLD-MRI) 在定量评估慢性肾小球肾炎 (CGN) 患者肾功能及病理损伤的应用价值。**资料与方法** 对 19 名健康志愿者和 53 例经肾活检确诊的 CGN 患者行 BOLD-MRI 检查, 并测量肾皮髓质 $R2^*$ 值, 记录临床资料及肾脏病理积分, 分析 $R2^*$ 值与 CGN 患者肾功能及病理损伤的关系。**结果** 对照组与轻度损伤 CGN 组、中重度损伤 CGN 组肾皮、髓质 $R2^*$ 值均有统计学意义 ($F=10.171, P<0.001$; $F=19.666, P<0.001$)。皮、髓质 $R2^*$ 值与 eGFR 分别呈负、正相关 ($r=-0.570, p<0.001$; $r=0.357, p<0.009$), 肾皮、髓质 $R2^*$ 值与胱抑素 C、病理积分均有相关性, 肾皮、髓质 $R2^*$ 值鉴别对照组与轻度损伤 CGN 组, ROC 曲线下面积 (AUC) 分别为 0.634 和 0.667, 鉴别对照组与中重度损伤 CGN 组, ROC AUC 分别为 0.842 和 0.939。结论 BOLD-MRI 对评估 CGN 患者肾功能及病理损伤程度具有重要价值。

PU-1001

影像误诊十二指肠淋巴管瘤影像 1 例

和倩龄、苏云杉
云南大学附属医院

摘要:

淋巴管瘤 (lymphangioma, LA) 属于淋巴系统疾病的一种亚型, 最常发生的部位为头部、腋窝和颈部, 也可发生于脾脏和骨骼等器官。小肠 LA 极为罕见, 不足所有 LA 的 1%。国内外文献多以个案报道为主。由于小肠 LA 罕见, 临床特征缺乏特异性, 且临床医师对其缺乏认识, 因此临床上容易漏诊和误诊。

目的: 分析本例十二指肠淋巴管瘤影像误诊原因。

方法: 回顾分析经手术病理证实该病例十二指肠粘膜下淋巴管瘤 CT、MRI 平扫及增强特征。

结果: 腹部体征仅有上腹压痛。CT 平扫及增强提示: 十二指肠降段粘膜下可见约 $1.4 \times 2.2 \times 2.7 \text{cm}$ 大小稍低密度影, CT 值约 26HU, 增强扫描动脉期囊壁厚薄不均、中等强化, 中心轻度强化, 粘膜局部中断。MR 平扫及增强提示: 十二指肠降段见一类椭圆形异常信号灶, 大小约 $2.1 \text{cm} \times 1.7 \text{cm} \times 2.7 \text{cm}$, T1WI 呈稍低信号, T2WI 呈高信号, DWI 呈稍高信号, 增强扫描呈不均匀强化, 以边缘强化显著; 考虑囊液腺瘤可能。行十二指肠肿物切除术+肿物活检术。病理组织学所见: 肿物内见大量淋巴管及短梭形细胞。免疫组化: 检查所见 D2-40(+) /Ki-67(+) /S100(-) /CD57(-) /CD34(-) /SOX-10(-) /SMA(-) /ALK(-)。

结论: 本病例患者为病灶位于十二指肠降段, 不是淋巴管瘤好发部位, 且该患者仅存在上腹痛, 无特异性临床表现。病灶是位于十二指肠降段粘膜下的囊性病变, 胃肠道粘膜下囊性占位, 从发病率优先考虑囊液腺瘤, 小肠 LA 极为罕见; 小肠 LA 无特异性影像表现, 且本病例病灶合并溃疡, 导致病灶影像表现不典型; 以上原因导致本病例忽略了淋巴管瘤的考虑。因此通过此病例的学习, 在小肠占位性病变影像诊断过程中, 因当增加少见病种的考虑以降低误诊率。

磁共振 3D-THRIVE 联合 MIP 重建在复杂性肛瘘患者中的诊断效能及治疗指导价值研究

黄社磊

深圳市人民医院龙华分院

目的

分析磁共振 3D-THRIVE 增强序列联合 MIP 重建在复杂性肛瘘患者中的诊断效能, 探讨该诊断方法在患者手术治疗中的指导价值, 以期为临床诊疗提供影像学依据。

方法

选择深圳市人民医院 2020 年 5 月-2022 年 12 月疑似复杂性肛瘘的患者 150 例为研究对象, 所有患者均采用 1.5T 磁共振增强检查, 分别完成常规扫描序列 T1 加权成像 (T1WI)、T2 加权成像 (T2WI)、T2WI 压脂、DWI、T1WI 压脂增强及 3D - THRIVE 增强序列, 以手术检查结果作为“金标准”, 借助 SPSS 26.0 软件完成统计学分析, 分析磁共振增强检查在复杂性肛瘘患者与手术结果之间的符合率; 计算不同扫描序列下复杂性肛瘘患者的诊断效能 (灵敏度、特异度、阳性预测值及阴性预测值); 所有患者均行手术治疗, 分析患者治疗前磁共振的影像学特征在患者治疗中的指导价值。

结果

150 例疑似复杂性肛瘘患者与“金标准”比较, 磁共振诊断阳性患者 125 例, 阴性患者 20 例, 诊断符合率为 96.67 %; 诊断灵敏度为 97.66 %、特异度为 90.91 %、阳性预测值 98.43 %、阴性预测值为 86.96 %; 与各检查序列比较, 3D - THRIVE 增强联合 MIP 重建技诊断效能最高, 诊断符合率为 95.33 %, 与其他序列比较均有统计学意义 ($P < 0.05$)。

结论

3D - THRIVE 增强序列联合 MIP 重建技术对于复杂性肛瘘的诊断效能明显高于其他序列, 并且, 该技术可以实现瘘管的三维形态显示, 在提高复杂性肛瘘患者的诊断效能的同时, 也为外科医生制定更为合理和安全的手术方案提供更加全面的信息。

APT 联合 ESWAN 对肝细胞肝癌和肝血管瘤的鉴别诊断价值

任雪¹、赵莹¹、许岂豪¹、宋清伟¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦医疗

【目的】探讨酰胺质子转移(APT)联合增强 T2* 加权血管成像(ESWAN)对肝细胞肝癌(HCC)和肝血管瘤(HH)的鉴别诊断价值。

【方法】回顾性分析 16 例经病理证实的 HCC 患者及 20 例 HH 患者, 所有患者均于术前行 3.0T MRI 扫描, 包括常规磁共振扫描序列及 APT, ESWAN 扫描序列。将扫描生成的 ESWAN 图像传输至 GE AW 4.6 工作站上, 使用 Functool 软件自动生成 ESWAN 序列的参数图幅度图, 相位图, R2* 和 T2*, 放射科医师采用双盲法在各参数图像上于病变的最大层面放置三个感兴趣区 (ROI)。扫描生成的 APT 图像传输至 ISP 工作站 (InteliSpace Portal, Philips Healthcare), 经工作站后处理分析得到 APT 图像。以 T2WI 图像为参考, 在 APT 与 T2WI 融合图上勾画感兴趣区 ROI, 于病灶最大层面放置 3 个 ROI 取均值, 计算病灶的 APT 值。采用 t 检验或 U 检验比较肝细胞肝癌和肝血管瘤之间各参数之间的差异, 采用受试者工作特征 (ROC) 曲线评价 APT 和 ESWAN 各参数的阈值及诊断效能, 采用逻辑回归分析将两个序列参数进行联合并评估其诊断效能。

【结果】HCC 的幅度值和 $R2^*$ 值显著高于 HH, 而 HCC 的 $T2^*$ 和 APT 值显著低于 HH ($P < 0.05$)。幅度值, $R2^*$ 值, $T2^*$ 值和 APT 值鉴别 HCC 和 HH 的 AUC 分别为 0.756、0.763、0.734 和 0.805。APT、ESWAN(幅度值+ $R2^*$ + $T2^*$)和 APT 与 ESWAN 联合(APT 值+幅度值+ $R2^*$ + $T2^*$)鉴别 HCC 和 HH 的 AUC 分别为 0.805、0.778 和 0.884。当 APT 与 ESWAN 联合使用时, 其敏感度提升至 75.0%, 特异性提升至 100%(阈值:0.672)。

【结论】APT 和 ESWAN 作为无创的影像学检查技术, 其联合应用可能有助于鉴别 HCC 和 HH, 具有一定的临床应用价值。

探讨 128 层螺旋 CT 扫描结合仿真内镜后处理对结直肠癌的诊断价值

唐文娟

华中科技大学同济医学院附属协和医院

方法: 回顾性分析 45 例患者均行 CT 增强结合仿真内镜后处理检查, 患者均行肠道准备及肠腔内注气后用 Definition AS+ 128 层螺旋 CT 进行扫描。行仰卧位及俯卧位各扫描一次, 然后将扫描获得的图像进行层厚 1mm 重建后传到后处理站, 并应用后处理工作站 colon 软件进行图像后处理, 来仔细观察病变的部位、形态、大小、侵犯范围、有无其它器官及淋巴结转移。结果: 45 例患者在 CT 仿真内镜检查中 40 例考虑为肿瘤性病变、3 例为正常、2 例为息肉, 经手术病检结、直肠癌 42 例, 炎症 3 例。42 例直肠癌分型为 17 例肿块型、10 例浸润型、6 例溃疡型、9 例混合型。其中发现 4 例肝脏转移、36 例患者淋巴结转移。增强 CT 结合 CT 结肠仿真内镜检查对结直肠肿瘤的检出、定性及定位与手术病检比较准确率很高。结论: 多层螺旋 CT 结合仿真内镜对结直肠肿瘤的检出、定位、定性的准确率较高, CT 仿真内镜对观察病灶周围的侵犯情况及有无远处器官和淋巴结转移的情况有很大的优势, 同时还可以了解肠腔内病变的形态及病变累及肠腔的长度。

脾脏硬化性血管瘤样结节性转化的影像学表现 (10 例报道)

区婉仪、胡茂清

江门市中心医院

目的 探讨脾脏硬化性血管瘤样结节性转化 (SANT) 的 CT 与 MRI 表现, 提高对本病影像表现的认识。

方法 回顾性分析经手术病理证实的 10 例脾脏硬化性血管瘤样结节性转化 (SANT) 患者的 CT 与 MRI 表现。患者年龄 23~66 (48.5±13.56) 岁, 男性 6 例, 女性 4 例。9 例患者均进行了 CT 平扫及增强, 其中 3 例同时行 MR 平扫及增强扫描, 1 例患者仅行 MR 平扫及增强扫描。

结果 10 例 SANT 中, 9 例为单发病灶, 1 例为多发病灶, 病灶最大径 2.5~13.1 (5.3±3.33) cm。10 例 SANT 病灶均呈类圆形实性肿块, 有浅分叶状, 3 例边界清楚, 7 例边界均欠清。CT 平扫呈稍低密度影, 7 例密度均匀, 2 例可见散在小钙化, 增强扫描动脉期边缘轻度强化, 门脉期及延迟期呈渐进性向心性强化, 但密度仍低于周围脾实质, 其中 8 例内见间隔样强化/典型轮辐状强化。4 例 MR 扫描者病灶 T1WI 均呈低信号, 1 例 T2WI 呈稍高信号, 3 例呈低信号, 信号不均匀, DWI 序列 ($b=800\text{mm}^2/\text{s}$) 未见弥散受限, 增强扫描表现为病灶边缘强化逐渐延伸到中央的轮辐状强化。结论 脾脏 SANT 主要表现为类圆形实性肿块, 密度略低于脾实质, 偶可见钙化, T2WI 及 DWI 呈低信号, 典型特征为向心性渐进性强化及轮辐样强化。

PU-1006

原发性输卵管癌的 MRI 特征

苏宇征

福建省妇幼保健院

目的：探讨原发性输卵管癌（PFTC）的 MRI 的影像特征。

材料和方法：回顾性分析 27 例经手术和病理证实的 PFTC 患者的临床和 MRI 影像特征，总结原发性输卵管癌的 MRI 特征。

结果：27 例 PFTC 患者的发病年龄在 42-64 岁之间，平均年龄为 56 岁，临床表现：不规则阴道出血或绝经后阴道出血（14/27,52%），阴道排液（6/27,21%），盆腔肿块（17/27,63%），腹痛（6/27,5.7%）；PFTC 的 MRI 表现单侧病灶（26/27、96.3%），双侧病灶（1/27、3.7%）；PFTC 的最大直径为 $4.6\pm 0.5\text{cm}$ ；PFTC 的形状为附壁结节（4/27、14.8%）、香肠状（13/27、48.1%）、结节状（9/27、33.3%）或不规则（1/27、3.7%）；PFTC 实性成分均为轻度强化（11/11），PFTC 输卵管积水征 16（59.3%）；腹水征在 3 例 PFTC 患者中观察到。

结论：当单侧附件区肿块表现为香肠状、轻度增强，伴有输卵管积水或宫内积液时，往往提示 PFTC。

PU-1007

3.0T 磁共振扩散加权成像在直肠腺瘤评估中的应用价值

侯炜寰

空军军医大学西京医院

目的：探讨表观扩散系数 ADC 值对直肠腺瘤的评估价值。方法：回顾性分析 71 例经手术病理证实的直肠肿瘤患者（直肠腺瘤患者 21 例、直肠腺瘤并癌变患者 14 例及直肠腺癌患者 36 例）的 MRI 及 DWI 资料，ADC 值由 b 值为 0 s/mm² 与 1000 s/mm² 的 DWI 检查所获取，测量肿瘤平均 ADC 值及最小 ADC 值，根据直肠腺瘤、直肠腺瘤癌变及直肠腺癌进行分组分析。结果：直肠腺瘤及腺瘤癌变分组的最小 ADC 值（ $P=0.015$ ）、直肠腺瘤及腺癌分组的平均 ADC 值（ $P=0.000$ ）及最小 ADC 值（ $P=0.000$ ）、直肠腺瘤癌变及腺癌分组的平均 ADC 值（ $P=0.000$ ）及最小 ADC 值（ $P=0.047$ ）具有统计学意义，仅直肠腺瘤及腺瘤癌变分组的平均 ADC 值（ $P=0.064$ ）无统计学意义。结论：ADC 值可在一定程度上对直肠腺瘤是否癌变做出较好预测。

PU-1008

多层螺旋 CT 对不同病理类型急性阑尾炎诊断的应用价值

王健、赵杰、李璞、徐婷

山西省人民医院

目的 探讨多层螺旋 CT 对不同病理类型急性阑尾炎诊断的应用价值。方法 回顾性分析本院 2021 年 1 月至 2022 年 10 月收治的 80 例疑似阑尾炎患者的临床资料，所有患者术前均进行了多层螺旋 CT 检查。其中男性 42 例，女性 38 例，年龄为 38.21 ± 11.06 岁。根据阑尾炎 CT 诊断标准进行分类：①单纯性阑尾炎②化脓性阑尾炎③坏疽性阑尾炎④阑尾周围脓肿。以病理结果为金标准，计算多层螺旋 CT 用于急性阑尾炎诊断的灵敏度，特异度及准确度，并分析其用于病理分型的正确率。

PU-1009

脂肪瘤样血管肌纤维母细胞瘤 1 例

刘桂花

十堰市太和医院 (湖北医药学院附属医院)

患者,女,19岁9月,2年前发现会阴部肿物,约蚕豆大小,质地稍硬,无疼痛不适。2年来肿物逐渐增大,遂来我院就诊。既往病史无特殊。专科检查:胸膝位肛门6点钟方向,距肛门2cm可见一不规则肿块,呈前后两球体,大小相差不大,均约3cm×3cm球体,外层皮肤相连,触之质地稍硬,活动欠佳,外观与周围皮肤无明显分界。妇科肿瘤标记物未见明显异常。盆腔MR:会阴部肿块,大小约8.7cm×7.3cm×4.6cm,T1WI呈等信号,T2WI呈不均匀高信号,边界清晰,可见假包膜,T2WI压脂示条片状低信号区,DWI呈不均匀高信号,增强扫描肿块呈明显不均匀强化,延迟期呈渐进性强化,病变周围软组织受压、结构清晰。行手术切除见:肿块形态不规则,表面包膜较完整,切面灰白灰黄,实性,质稍韧,似呈融合多结节状。术后病理:脂肪瘤样血管肌纤维母细胞瘤。免疫组化结果:Desmin(+),ER(+),PR(+),CD34(+),S-100(-),SMA(-),Ki-67(+,约2%)。

血管肌纤维母细胞瘤是一种罕见的良性软组织肿瘤,主要发生在女性的外阴、阴道、尿道和腹股沟区,最常发生在外阴。病因不明。肿物大多呈卵圆形或圆形,部分呈息肉状,大多界限清楚,切面实性,部分可呈囊实性,局灶伴黏液样或胶冻样。本病与其他软组织肿瘤组织形态相似,较难区分,因此免疫组织化学检测具有重要价值。免疫组化:瘤细胞表达Desmin、Vimentin,部分表达a-SMA和MSA,恒定表达ER和PR,CD34多为阴性,不表达S-100蛋白和AE1/AE3,绝经后可不表达Desmin。本例免疫组化结果与文献报道相符。

本例特点在于发生于会阴部的血管肌纤维母细胞瘤呈脂肪瘤样改变,与以往文献报道不同,较为罕见。

PU-1010

膀胱低级别肌纤维母细胞性增生 CT 表现一例

晏杰、黄水仙、普晓江、李欢、李洪敏、龙艳

红河州滇南中心医院/个旧市人民医院

目的:探讨膀胱低级别肌纤维母细胞性增生的临床及影像学特点。方法:回顾性分析我院经手术病理证实的膀胱低级别肌纤维母细胞性增生一例,并结合文献对其影像学表现进行总结分析。结果:盆腔CT平扫及增强示膀胱右侧壁见菜花状肿块并向腔内外生长,增强扫描轻-中度不均匀渐进性强化。行腹腔镜下根治性膀胱切除术+回肠原位新膀胱术,病理诊断为膀胱低级别肌纤维母细胞性增生。结论:LGMP属于良性增生性病变,影像学具有一定特点;但影像学表现与恶性肿瘤可能存在重叠,易造成误诊;该病不需要根治性膀胱切除术或放化疗,目前尚无文献报道远处转移,但术后仍需严密随访,以便早期发现潜在的复发。

PU-1011

急性坏死型胰腺炎伴脾脏感染并气性坏疽 1 例

何欣

广西中医药大学第一附属医院

患者,男,62岁,因上腹部疼痛2小时。于2022年5月6日5时入院。入院时患者因“上腹部疼痛2小时”入院。入院症见:上腹部剧烈疼痛,呈持续性,恶心欲吐,无发热恶寒,无咳嗽咳

痰，无头晕头痛，无胸闷胸痛，无腹胀腹泻，无尿频、尿急、尿痛等不适，大便稀烂，每日 2-3 次，无粘液脓血，无解黑便，纳寐尚可，小便正常。近期体重未见明显改变。既往有“慢性胰腺炎”病史，规律服用非诺贝特、舒瑞伐他汀钙片。有“胃底部静脉曲张”病史。有“右中肺浸润性腺癌术后”病史。有“糖耐量受损”病史。查体：体温：36.6℃，脉搏：60 次/分，呼吸：24 次/分，血压：176/94mmHg。心肺查体未见明显异常。专科查体：腹部稍膨隆，未见胃肠型及蠕动波，腹壁静脉无曲张，未触及包块，上腹部压痛，全腹无反跳痛，肝脾肋下未触及，肝区无叩痛，墨菲氏征阴性，麦氏点无压痛，移动性浊音阴性，肠鸣音减弱。

2022 年 5 月 6 日腹部 CT 平扫检查示：胰腺体尾部多发囊性占位性病变，考虑假性囊肿。5 月 7 日腹部 CT 平扫及增强检查示：胰腺体积增大，密度不均匀，增强扫描后不均匀强化，考虑急性坏死型胰腺炎；胰腺体尾部仍见多发假性囊肿；脾脏密度及强化未见异常。5 月 16 日腹部 CT 平扫检查示：急性坏死型胰腺炎进展，伴腹膜炎，脾脏感染坏死、积气，胰尾部周围、结肠肝曲及其周围异常感染性，合并腹腔、腹后腔游离气体；十二指肠降段与结肠肝曲间瘘管形成可能；胰腺体尾部多发假性囊肿较前变化不著。5 月 21 日腹部 CT 平扫及增强检查示：急性坏死型胰腺炎较前进展，伴腹膜炎，脾脏感染坏死较前进展，脾脏实质几乎消失，胰尾部周围、结肠肝曲及其周围异常感染性，合并腹腔、腹后腔游离气体，结肠肝曲穿孔待排；十二指肠降段与结肠肝曲间瘘管形成可能；原胰腺体尾部假性囊肿因坏死显示不清。患者因肠瘘反复感染行外科腹腔引流手术。3 个月后患者因感染所致多器官衰竭死亡。搜索既往文献，未发现因急性胰腺炎出现脾脏感染坏死、积气，病变进展至脾脏实质几乎消失的 CT 表现的相关报道，所以分享此病例。

PU-1012

双能量 CT 虚拟平扫联合真实平扫诊断继发性胆总管结石的价值

肖长慧、谭显政、刘鹏、刘建滨、陈翔、张惠惠、杨帆
湖南省人民医院

背景：既往有文献报道虚拟平扫（VNC）在检测胆结石方面可以替代 CT 真实平扫（TNC）。但目前尚无研究联合 VNC 和 TNC 用于检测继发性胆总管结石，同时也缺乏联合 VNC 和 TNC 与单一 TNC 的诊断效能对比研究。

目的：探讨 VNC 联合 TNC 在诊断继发性胆总管结石的诊断价值，并将其与单一 TNC 的诊断效能进行比较。

方法：回顾性收集我院 2019 年 1 月至 2022 年 3 月期间经超声诊断为胆囊结石，拟行腹部双能量 CT 平扫检测继发性胆总管结石的患者。以外科手术或 ERCP 结果为参考标准，评估 TNC 联合 VNC、单一 TNC 在诊断继发性胆总管结石的效能差异。评价指标包括受试者操作特征曲线下面积、敏感度、特异度。敏感度和特异度比较采用 McNemar 检验。曲线下面积比较采用 Delong 检验。采用 Kappa 检验评估诊断结果观察者内和观察者间的一致性。

结果：共纳入 97 例患者。VNC 联合 TNC 评估继发性胆总管结石具有较高的观察者内和观察者间一致性（观察者内 Kappa 值：0.772[95% CI:0.538-1.000]；观察者间 Kappa 值：0.780[95% CI:0.545-1.000]）。TNC 联合 VNC 诊断继发性胆总管结石的曲线下面积高于 TNC（0.874[95% CI: 0.805, 0.943] vs 0.770[95% CI: 0.689, 0.851]； $p=0.004$ ）。与单一 TNC 对比，TNC 联合 VNC 提高了继发性胆总管结石诊断的敏感度（TNC: 57.5%[95% CI: 40.9%, 72.6%] vs TNC 联合 VNC: 80.0%[95% CI: 64.4%, 90.9%]； $p=0.007$ ）。但二者诊断继发性胆总管结石的特异度无显著统计学差异（TNC: 96.5%[95% CI: 87.9%, 99.6%]；TNC 联合 VNC: 94.7%[95% CI: 85.4%, 99.0%]； $p=0.317$ ）。

结论: 与单一 TNC 比较, 联合 VNC 与 TNC 提高了继发性胆总管结石的诊断性能, 对于继发性胆总管结石可疑患者, 推荐腹部 CT 平扫采用双能量扫描模式获取更多的诊断信息。

PU-1013

A CT-based radiomics nomogram for the prediction of disease-free survival in periampullary carcinoma

Lei Bi¹, Wei Chen², Juntao Zhang³, Xiaodong Li⁴, Ximing Wang¹

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. Shandong First Medical University

3. GE Healthcare

4. Linyi People's Hospital

Purpose: To develop a CT-based radiomics nomogram for individualized survival prediction in patients with resected periampullary carcinoma (PC).

Materials and Methods: Totally 91 patients with PC were enrolled and randomly divided into a training cohort (n = 64) and a validation cohort (n = 27). The preoperative CT radiomic features were extracted from portal venous-phase images. Least absolute shrinkage and selection operator (LASSO) Cox regression were applied to select features and develop a radiomics signature. Multivariate Cox proportional hazards model and Kaplan-Meier survival analysis were used to determine the association of the radiomics signature and clinicopathological factors with DFS. To evaluate the incremental value of the radiomics signature for DFS prediction, a radiomics nomogram combining the radiomics signature and clinicopathological risk factors was constructed and assessed by its calibration, discrimination, and clinical utility.

Results: The radiomics signature was significantly associated with PC patient's DFS in the training cohort ($p < 0.001$). The radiomics nomogram resulted in better performance of the survival prediction (C-index: 0.792 and 0.722 in the training and validation cohorts, respectively) than that of the clinicopathological model (C-index: 0.673 and 0.699, respectively). The favorable calibration and decision curve analysis indicated the clinical usefulness of the radiomics nomogram.

Conclusion: The radiomics signature may be a useful noninvasive biomarker for the estimation of DFS in patients with PC. Radiomics nomogram combining the radiomics signature and clinicopathological risk factors performed well for individualized DFS estimation, which might enable precise medicine in future.

PU-1014

Whole-volume apparent diffusion coefficient histogram analysis for prediction of regional lymph node metastasis in periampullary carcinomas

Lei Bi¹, Wei Chen², Juntao Zhang³, Xiaodong Li⁴, Ximing Wang¹

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. Shandong First Medical University

3. GE Healthcare

4. Linyi People's Hospital

Purpose: To evaluate whether whole-volume apparent diffusion coefficient (ADC) histogram parameters of the primary tumor were useful to predict regional lymph node metastasis (LNM) in periampullary carcinomas.

Methods: Thirty-eight patients with periampullary carcinoma who underwent pancreaticoduodenectomy between January 2016 to April 2019 were retrospectively enrolled.

Whole-volume ADC histogram analysis of the primary tumor was performed by two radiologists independently. Clinical factors, pathological results and histogram parameters were evaluated. Interclass correlation coefficient (ICC) was used to assess agreement between observers. Receiver operating characteristic (ROC) analysis was performed to evaluate the performance of parameters in differentiating LNM-positive group and LNM-negative group.

Results: Interobserver agreements were good to excellent for histogram analysis between two radiologists, with ICCs ranging from 0.766 to 0.967. Tumor size, MR-reported LN status and most ADC histogram parameters (including mean, minimum ADC value, 10th, 25th, 50th, 75th, and 90th percentile, and kurtosis) were significantly different between LNM-positive group and LNM-negative group ($p < 0.050$), and revealed significant correlations with LNM ($p < 0.050$). At ROC analysis, tumor size and minimum ADC value generated highest area under the curve (AUC) (AUC = 0.764, 95% confidence interval [CI]: 0.599, 0.886). When diagnostic predictive values were calculated with the combined model incorporating tumor size, MR-reported LN status and 75th percentile, the best diagnosis performance was obtained, with AUC of 0.879 (95% CI: 0.771, 0.986), sensitivity of 100.0%, and specificity of 75.0%.

Conclusion: Whole-volume ADC histogram parameters of the primary tumor held great potential in differentiating regional LNM in periampullary carcinomas.

PU-1015

一站式能谱及灌注 CT 对结直肠癌的诊断价值

陈伟彬、李泽茂、张惠英
华北理工大学附属医院

目的 评价一站式能谱和灌注 CT 参数对结直肠癌诊断价值。

方法 收集 2019 年 9 月~2022 年 11 月于我院经术前结肠镜或手术病理证实的 82 例结直肠癌患者的临床及 CT 资料进行回顾性分析。测量动、静脉期病灶、邻近正常肠壁在 40keV~140keV 单能量范围内的 CT 值及能谱参数、灌注参数。依据病理结果，将患者病理标本证实为癌灶所对应 CT 图像所在区定义为病变区，将同层面或相邻层面无病变负荷肠段的肠壁定义为正常肠壁。对所得参数并进行统计学分析。

结果 1 病变区动、静脉期 40keV~140keV 单能量 CT 值及 WC、IC、NIC、 λ 、Eff-Z 均高于正常肠壁，差异均有统计学意义 ($P < 0.05$)。ROC 分析，动脉期 40keV~110keV 各单能量 CT 值判定结直肠癌的曲线下面积，其中以 50keV 单能量 CT 值的 AUC 值最大，达到 0.770。动脉期 IC、NIC、 λ 判定结直肠癌的 AUC 较高，均大于 0.8，具有较好的诊断效能；IC、NIC、 λ 联合的 AUC 均大于 0.8，具有较高的诊断效能，其中以 IC+ λ 的诊断效能最高 AUC 为 0.881。静脉期 40keV~140keV 单能量 CT 值预测结直肠癌的 AUC，其中以 90keV 单能量 CT 值的 AUC 值最大为 0.794；静脉期 IC、NIC、 λ 及 Eff-Z 判定结直肠癌的 AUC 均大于 0.8，具有较好的诊断效能。IC、NIC、 λ 及 Eff-Z 进行联合，AUC 均大于 0.8，对结直肠癌具有较高的诊断效能。病变区 BV、BF、MTT、PS 均高于正常肠壁，TTP 低于正常肠壁，差异均有统计学意义 ($P < 0.05$)；BV、BF、TTP、PS 判定结直肠癌的 AUC 均大于 0.8，具有较好的诊断效能。联合 Logistic 回归分析获取的联合预测概率以 A-50keV+灌注、A-能谱+灌注、V-90keV+灌注及 V-能谱+灌注最高，ROC 曲线分析 AUC 接近于 1。

结论 一站式 CT 能谱及灌注成像技术所获取的 40keV~140keV 单能量 CT 值、能谱参数及灌注参数，以及多参数联合应用对结直肠癌及其分期具有较好的诊断价值，其中多参数联合诊断效能更佳。

PU-1016

先天性阴道下段闭锁伴膀胱阴道瘘 MRI 表现 1 例

孔俊沅、易启华、曾文兵
重庆大学附属三峡医院

本文报道了 1 例先天性阴道下段闭锁伴膀胱阴道瘘。患者女，40 岁，因下腹痛 7 天并加重 2 天入院。患者无盆腹腔手术史，既往经期血尿、偶有下腹部疼痛及尿路感染，妇科查体提示阴道下段完全闭锁。盆腔 MRI 检查提示：膀胱阴道瘘；阴道上段积液扩张、阴道下段呈实性软组织信号；左侧输卵管-卵巢脓肿伴周围粘连及腹膜炎；右输卵管少量积液。行腹腔镜下双输卵管切除术、左卵巢脓肿切开引流术、盆腔粘连松解术、肠粘连松解术。结合临床表现、影像学及术中所见，综合诊断为先天性阴道下段闭锁伴膀胱阴道瘘，左侧输卵管-卵巢脓肿，右侧输卵管脓肿，盆腔粘连及肠道粘连。

PU-1017

Preoperative evaluation of Liver regeneration following hepatectomy in hepatocellular carcinoma using gadoxetic acid-enhanced MR imaging

Hehan Tang, Yi Wei, Bin Song
West China Hospital

Objectives: To investigate the potential value of gadoxetic acid-enhanced T1 weighted imaging (WI) parameters for the preoperative prediction of liver regeneration (LR) in patients with HCC after partial hepatectomy (PH).

Methods: 206 HCC patients were initially recruited. Many gadoxetic acid-enhanced T1 weighted imaging (WI) parameters were measured by two independent radiologists. Spearman's correlation test was used to assess correlations between T1 WI parameters and the regeneration index (RI), calculated as $100\% \times (\text{the volume of the postoperative remnant liver} - \text{the volume of the preoperative remnant liver}) / \text{the volume of the preoperative remnant liver}$. Multivariate linear regression analyses were used to identify the factors for RI.

Results: Finally, 57 HCC patients (47 men and 10 women, mean age 51.26 ± 10.79 years) were retrospectively analyzed. The intraclass correlation coefficient (ICC) ranged from 0.791-0.973. Spearman's correlation test showed SIHBP(liver)($r=0.450$, $P=0.011$), SI[HBP-pre(liver)]($r=0.531$, $P=0.002$), DR(liver)($r=0.470$, $P=0.008$), SI[HBP-pre(spleen)]($r=-0.358$, $P=0.048$) of patients with minor hepatectomy were associated with RI. But multivariate analysis showed that only SI[HBP-pre(liver)] (Model 1: standardized $\beta = 0.425$, $P=0.007$) and SIHBP(liver) (Model 2: standardized $\beta = 0.337$, $P=0.035$) were correlated to RI. The SIHBP(liver) and SI[HBP-pre(liver)] also showed a negative correlation with fibrosis stage ($r=-0.290$, $P=0.046$ and $r=-0.175$, $P=0.029$, respectively) in the patients undergoing minor hepatectomy, and there was also a negative correlation between fibrosis stage and RI. However, for total patients and patients with major hepatectomy, no Gd-EOB-DTPA enhanced T1 WI parameters were associated with RI in multivariate analysis ($P>0.05$).

Conclusions: The SI[HBP-pre(liver)] and SIHBP(liver), may be reliable preoperative predictors of liver regeneration.

PU-1018

CT 与 MR 在小肠疾病诊断中的价值对比

刘波

南京医科大学第一附属医院 (江苏省人民医院)

摘要:目的 消化系统中, 小肠疾病往往缺乏特异性, 从而造成早期诊断有一定的困难。影像学检查尤其是 CT 和 MR 在小肠疾病的诊断中具有方便易行, 病人接受较为容易, 对于肠腔内外病变显示较好的特点。本文对比 3TMR 和 CT 对于小肠病变的检出率差别, 从而对临床选择检查方法做出一定的参考。方法 收集 2016 年 1 月至 2018 年 1 月本院 20 例小肠疾病患者, 所有患者均接受过 CT 和 MR 扫描。男性 14 例, 女性 6 例, 年龄从 19 岁至 62 岁, 平均 41 岁。回顾性分析 20 例小肠病变患者, 所有患者均行 CT 扫描和 MR 扫描。由 2 名影像科医生进行双盲法分析, 对比 CT 和 MR 对于小肠肠段病变的检出效果。结果 CT 检查中, 所有 20 例患者的图像, 评分 3 分者 17 例 (85%), 评分 2 分者 3 例 (15%) 无患者评分为 1 或 0 分。MR 检查中, 所有 20 例患者的图像, 评分 3 分者 15 例 (75%), 评分 2 分者 4 例 (20%), 评分 1 分者 1 例 (5%), 无患者评分为 0 分。小肠 CT 扫描检出梳状征 6 处、肠壁增厚 58 处、梗阻 5 处、瘘管 3 处、肠腔狭窄 37 处; 小肠 MR 扫描检出梳状征 7 处、肠壁增厚节段 60 处、梗阻 7 处、瘘管 3 处、肠腔狭窄 31 处。除肠腔狭窄有统计学差异 ($p<0.05$) 外, 其余病变均无统计学差异 ($p<0.05$)。结论 CT 和 MR 均可很好显示小肠梳状征、肠壁增厚、梗阻及瘘管、肠腔狭窄等等病变。同时由于 MR 可以行电影成像对小肠进行动态观察, 从而对比 CT 可以排除部分肠腔狭窄假阳性。CT 由于成像速度快所以图像质量易于保证, 而 MR 无电磁辐射, 便于病人进行多次检查。由结果可以看出小肠 CT 和小肠 MR 总体上对于小肠病变的诊断效果差别不大, 都能较好的完成小肠的检查。临床医生完全可以根据病人的情况选择小肠 CT 或 MR 检查。由于 CT 检查速度快对病人的要求低, 对于年老体弱配合度低的患者更加适用。MR 可以行电影动态扫描, 对肠道病变进行动态观察。同时 MR 具有无电磁辐射, 对人体基本无损伤的优点, 对于需要经常复查的患者来说更为适用。

PU-1019

The influence of intravenous injection of Gd-EOB-DTPA on the parameter values of liver magnetic resonance elastographyHehan Tang, Yi Wei, Bin Song
West China Hospital

Purpose: To explore the effect of liver specific contrast agent Gd-EOB-DTPA on the measurements of liver stiffness and other parameters of magnetic resonance elastography (MRE).

Methods: Twenty-four patients with suspected liver fibrosis were enrolled. The GE DISCOVERY MR750 3.0T magnetic resonance imaging system and driver were used to perform MRE scans before and after the injection of Gd-EOB-DTPA. Manually evaluate the average value of the stiffness value, storage modulus, loss modulus, and signal-to-noise ratio during the two scans, and stage the degree of fibrosis according to the average stiffness value of the lesion. The paired t test was used to verify the difference of each parameter before and after the use of Gd-EOB-DTPA, the Pearson correlation coefficient was used to test the correlation, and the consistency of the results of the two fibrosis stages before and after Gd-EOB-DTPA was tested by the correlation analysis of categorical variables.

Results: All the parameters measured before and after using the contrast agent were significantly correlated ($P < 0.05$), the stiffness value of normal liver tissue before and after using the contrast

agent was statistically significant ($P < 0.05$), and the difference in other parameters was not statistically significant ($P > 0.05$), there was no significant difference in the stiffness value, storage modulus, loss modulus and signal-to-noise ratio of the diseased liver tissue before and after the use of Gd-EOB-DTPA ($P > 0.05$). The consistency results showed that the Gamma value was 0.91 ($P < 0.01$), indicating that the consistency of the two fibrosis stages before and after the contrast agent injection was higher.

Conclusion: The use of Gd-EOB-DTPA has no significant effect on the parameter values of liver MRI elastography.

PU-1020

自身免疫性胰腺炎的直接及间接 MRI 征象

井勇

空军军医大学唐都医院

目的：探讨自身免疫性胰腺炎(AIP)直接与间接 MRI 征象。方法：回顾性分析经组织病理学和(或)类固醇激素治疗证实的 16 例 AIP 患者的 MRI 检查资料。结果：11 例 AIP 表现为胰腺弥漫性肿大, 5 例为胰腺局限性肿大。12 例病变区压脂 T2WI 信号减低, STIR 信号略增高, DWI 病变区信号增高, 动态增强后呈延迟强化; MRCP 示 9 例胆总管胰腺段呈鸟喙样狭窄, 8 例胰管节段性狭窄, 1 例胰头部胰管局限性狭窄; 10 例胰腺病变区周围见包膜样结构, 包膜厚度小于 0.5cm, 随访后包膜逐渐消失; 2 例伴有胰周间隙水肿。结论: AIP 的 MRI 表现具有一定特征性, 学习 AIP 其综合的 MRI 影像表现, 有利于该病的诊断与治疗。

Prognostic nomogram constructed using combination of MRI tumor regression grade and clinical factors to predict response of mid-low rectal cancer to neoadjuvant chemoradiotherapy

Siyuan Qin, Ning Lang

Peking University Third Hospital

Purpose: This study aimed to develop nomograms that combine clinical factors and MRI tumor regression grade (mrTRG) to predict the response of mid-low locally advanced rectal cancer (LARC) to neoadjuvant chemoradiotherapy (nCRT).

Methods: The retrospective study included 204 patients who underwent nCRT and surgery between January 2013 and December 2021. Based on pathological tumor regression grade, Patients were categorized into four groups: complete pathological response (pCR), non-pCR, good pathological response (pGR), and non-pGR. Nomograms for predicting pCR and pGR were constructed after univariate and multivariate analyses. The prognostic performances of the nomograms were evaluated using the consistency index (C-index).

Results: The nomogram for predicting pCR consisted of tumor length ($P = 0.021$), post-treatment mesorectal fascia involvement ($P = 0.102$), white blood cell count ($P = 0.004$), and mrTRG ($P = 0.024$). The nomogram for predicting pGR consisted of distance of tumor's lower border from anal verge ($P = 0.003$), pretreatment involvement of mesorectal fascia ($P = 0.019$), platelet/lymphocyte ratio ($P = 0.022$), pretreatment CA199 ($P = 0.084$), and mrTRG ($P < 0.001$). Nomograms

constructed based on mrTRG and clinical factors showed better C-index than mrTRG alone in predicting pCR and pGR. (For predicting pCR, 0.772 vs. 0.611; for predicting pGR, 0.748 vs. 0.631).

Conclusions: Nomograms combining MRI tumor regression grade plus clinical factors may be useful for predicting response of mid-low locally advanced rectal cancer to neoadjuvant chemoradiotherapy. The proposed models could be applied in clinical practice after validation in large samples.

MSCT 增强扫描对伴有肝转移的胃肝样腺癌的诊断价值

尤亚茹、刘译阳、李莉明、赵帅、袁梦晨、黄清博、高剑波
郑州大学第一附属医院

目的: 探讨伴有肝转移的胃肝样腺癌 (Hepatoid adenocarcinoma of the stomach, HAS) 患者的增强 MSCT 特征。方法: 回顾性分析 2013 年 2 月至 2022 年 2 月期间在郑州大学第一附属医院经病理确诊的 8 例 HAS 患者, 8 例患者均行腹部增强 CT 扫描, 其中 4 例为术前(胃癌根治术)检查。男 6 例, 女 2 例, 中位年龄 64 岁。分析病灶影像学参数, 包括动脉和静脉期的增强模式、坏死情况、静脉是否有血栓以及整体影像学诊断。结果: 胃部病灶位于胃底和贲门 4 例(4/8, 50%)、胃窦 3 例(3/8, 37.5%)和胃底 1 例(1/8, 12.5%)。分析 4 例术前胃部病灶图像, 胃壁最大厚度为 $22.02 \pm 3.64\text{mm}$, 大体类型表现为隆起型 2 例、溃疡型 1 例、浸润型 1 例。肿瘤平扫呈软组织密度肿块, 2 例见低密度坏死区, 4 例均未见钙化。动脉期 3 例明显强化, 1 例中度强化。2 例可见由于瘤内坏死引起的不均匀强化。8 例 HAS 肝转移灶中 6 例为多发, 2 例为单发。轴位 MSCT 示 7 例患者最大肝转移癌灶大于 3cm, 且无论大小均可见坏死。6 例癌灶边界清楚。增强强化不均匀, 3 例表现为环形强化。动脉期轻度强化 6 例, 中度强化 2 例, 呈典型“快进快出”模式。7 例伴淋巴结转移, 3 例伴门脉侵犯, 1 例伴胰腺转移。结论: 胃部原发癌灶 MSCT 典型表现为胃壁增厚 $>2\text{cm}$ 的软组织密度肿块, 可伴有坏死, 罕见钙化, 增强扫描见中度至明显持续性强化。肝转移灶增强 MSCT 表现类似于原发性肝癌 (Hepatic cell carcinoma, HCC), 但是患者常无 HCC 易患因素, 且瘤灶坏死率高。此外, 常合并腹腔内、胃周淋巴结肿大, 部分可合并腹部其他器官如胰腺转移。

PU-1023

基于 CT 的 L3 椎体平面骨骼肌参数和脂肪浸润程度与肝硬化肌少症关系的研究

庄子玉、陈伟志
锦州医科大学附属第一医院

研究背景: 肝硬化是重要的公共卫生问题, 在世界范围内发病率和死亡率均较高且其手术预后与治疗受到越来越多的关注。肌少症表现为肌肉质量减少, 同时还存在肌肉力量或功能下降的一类渐进全身性复杂综合征, 其发病机制是多种因素综合作用的结果。有文献表明肌少症在肝硬化患者中拥有接近 30%~70% 的发病率, 肝硬化合并肌少症者的生存率显著低于无肌少症者。较高的发病率显示了肝病患者具有某些肌少症的特殊促成因素。肝硬化并发肌少症会严重危害患者生存质量, 使临床不良事件增加, 如跌倒、预后不良甚至是死亡等, 因此早期识别肝病患者中可能并发肌少症的高危人群并加以诊断就显得尤为重要。目前, 临床上大多数用计算机断层扫描 (Computer Tomography, CT) 和磁共振成像 (Magnetic Resonance Imaging, MRI) 来进行肝病患者术前

评估。临床医师常用 L3 椎体平面骨骼肌指数 (L3 skeletal muscle index, L3 SMI) 即: L3 椎体平面骨骼肌面积 (L3 skeletal muscle area, L3 SMA) 与身高 (m) 平方进行标准化来预测肌少症。因此, 寻找一些相对简单直观的与肝硬化并发肌少症相关的测量手段就显得尤为重要, 建立其早期诊断标准可以帮助临床早期的识别、干预、治疗。再次基础上本研究选择了 L3 骨骼肌脂肪浸润 (L3 muscle fat infiltration, L3 MFI)、椎后肌群 MFI、L3 椎体平面骨骼肌密度 (L3 skeletal muscle density, L3 SMD)、椎后肌群 SMD、L3 肌间隙脂肪面积、椎后肌群肌间隙脂肪面积, 作为参数来探究其与评估骨骼肌成分金标准 L3 椎体平面骨骼肌指数 (L3 skeletal muscle index, L3 SMI) 的关系。目的: 通过探讨骨骼肌脂肪浸润 (MFI) 程度与其他骨骼肌参数来预测肝硬化患者并发肌少症的效能。

PU-1024

门静脉高压向肝性血流 CT 影像学研究

杨欣欣

深圳市第二人民医院

目的

明确门静脉高压侧支循环形成后的向肝性血流途径及起始血管、交通支的形成及其形成方式、形态学改变。在门静脉高压症外科诊治中, 通过了解门静脉系统的向肝血流动力学状态, 更好的进行术前评估、术式选择、术后随访、并发症预测及预后判断。

方法

患者仰卧于 CT 扫描床, 检查前禁食至少 6-8h, 扫描前半小时口服 1% 泛影葡安 1000 mL, 行常规血管增强扫描。扫描设备 64 排 128 层螺旋 CT, 使用 128X0.625mm 的探测器, 扫描层厚 0.625mm, FOV365mm。扫描后轴位像均行 1mm 重建, 层间距 1mm。从膈顶至肝下缘分别行平扫、动脉期增强、门脉 CTA 及延迟扫描, 增强扫描用非离子型碘造影剂碘比醇 (350mg/ml), 注射速度为 3.5ml/s, 总量为 100-120ml, 于开始注射后 20s、60s、5min 分别进行动脉期、门脉期及延迟期扫描。研究结果采用 SPSS 26 统计软件进行统计分析。以 $\alpha=0.05$ 为检验标准, 判断差异是否有显著性。

结果:

1、多种影像学检查方法的比较: 多种影像学检查方法经卡方检验后, $P<0.05$, 并且通过检出病例与 DSA 金标准对比, B 超的检出病例量较高; MRI 对于软组织成像具有绝对的优势, 但是其受呼吸、运动的影响比较大, 扫描时间长, 且禁忌症较多, 因此它的使用受到一定程度的限制; 多层螺旋 CT 能比较好的显示血管全程, 对于比较细小的侧支循环亦能清楚的显示, 多种重建方法的使用, 使其在血管成像上的优势逐渐突显, 且多层螺旋 CT 筛查出的例数与 DSA 符合率较高, 在向肝血流的影像学检查中具有优势。

2、向肝血流与离肝血流的原发病存在差别, 离肝血流原发病以肝硬化为主, 向肝血流以原发性肝癌为主, 还有部分向肝血流原发病为肝纤维化。

3. 门脉高压后向肝血流与离肝血流的门静脉直径存在显著差异, 较大的附属血管直径不存在差异。

结论:

1、近年影像学技术的发展, 进一步发现了少见向肝血流, 在向肝血流的多种影像学检查方法中, 多层螺旋 CT 优于其他影像学检查方法;

2、离肝及向肝血流的原发病存在一定差别;

3、门脉高压后向肝血流与离肝血流的门静脉直径存在显著差异。

PU-1025

CT 影像学无创量化指标在肝硬化诊断中的价值

姚明荣、耿坚、詹松华
上海中医药大学附属曙光医院

目的：研究 CT 影像量化指标与肝硬化进程及门脉高压之间的关系，评价其对肝硬化无创诊断的价值。方法：利用螺旋 CT 测定非肝病患者与肝硬化患者肝脏、脾脏体积以及门静脉直径，比较两者的差异，利用 ROC 曲线评价对肝硬化的诊断价值；并分析上述无创量化指标与肝硬化 Child-pugh 分级之间相关性。结果：入选肝硬化患者和非肝病患者各 120 例，其中肝硬化 Child-pughA、B、C 各 40 例。肝硬化组肝脏体积、肝/脾体积比明显低于非肝病组（870439 mm³ vs 1112455 mm³、2.54 vs 7.86），脾脏体积、门静脉直径明显高于非肝病组（483650 mm³ vs 159297 mm³、16 mm vs 13 mm），均有显著统计学差异（P 均<0.001）。肝脏体积、肝/脾体积比、脾脏体积、门静脉直径诊断肝硬化的 ROC 曲线下面积分别为 0.719、0.944、0.905、0.790。直线相关回归分析结果显示，肝硬化 Child-pugh 评分与肝脏体积、肝/脾体积比呈负相关（ $r=-0.239$ ， $p=0.017$ ； $r=-0.384$ ， $p<0.001$ ），与门脉直径呈正相关（ $r=0.249$ ， $p=0.013$ ）。肝硬化组 Child-pughA、B、C 肝脏体积、肝/脾体积比分别为 952903 mm³ vs 927539 mm³ vs 725903 mm³、4.02 vs 1.92 vs 1.81（ $p<0.05$ ， $p<0.001$ ）；门静脉直径分别为 14.56 mm vs 16.01 mm vs 16.87mm（ $p<0.05$ ）。结论：肝脏体积、肝/脾体积比、门静脉直径等 CT 无创量化指标对肝硬化诊断具有较好价值，并且与 Child-pugh 评分相关，可以反应肝硬化严重程度。

PU-1026

探讨 Siemens FORCE 双能量 CT 对结直肠癌的临床应用价值

沈嫒、窦娅芳、姚明荣
上海中医药大学附属曙光医院

目的：探讨 Siemens FORCE 双能量 CT 对结直肠癌的诊断价值及辐射剂量。方法：收集经肠镜和活检证实为结直肠癌拟行手术的患者 160 例，随机分为 A 组和 B 组，A 组行 Siemens FORCE 双能量 CT 三期增强扫描，B 组行 Philips256 CT 三期增强扫描，分别由放射科医生对图像进行术前诊断并与术后病理对照，分析两种 CT 对结直肠癌的诊断价值，并比较其辐射剂量。结果：共 147 例纳入分析，两种 CT 检查方法原发病灶均被检出，敏感度为 100%。A 组 FORCE 双能量 CT 原发灶准确率为 72.36%，明显高于 B 组 Philips256 CT 的 57.75%。两种 CT 淋巴结转移检出的敏感度为 93.44%，其中 A 组诊断淋巴结转移准确率为 65.79%，B 组诊断淋巴结转移准确率为 56.34%，差异有统计学意义（ $p<0.05$ ）。A 组双能量 CT 平扫和三期增强总剂量为 17.88 ± 4.77 mSv；B 组 Philips256 CT 总剂量为 42.73 ± 10.45 mSv；前者明显低于后者。结论：Siemens FORCE CT 双能量三期增强扫描有助于结直肠癌术前肿瘤分期，且辐射总剂量低，值得临床推广。

PU-1027

脾脏转移瘤的病因学分析及影像学检查方法

姚戈虹、张佳胤
上海交通大学医学院附属第一人民医院

目的：回顾性分析脾脏转移性病变的原发肿瘤病因学及影像学检查的表现。方法：回顾性分析 2019 年 1 月—2022 年 7 月于上海交通大学附属第一人民医院的 PACS 系统，查阅放射影像学资料，

包括 CT 及 MR 平扫和/或增强图像统计，并与院内电子病史系统对照。所有患脾均有外科手术切除的病理结论或有系列的影像学资料对照、比较，确定为脾脏的转移瘤。本组病例不包括胰体尾部的恶性肿瘤对脾脏的侵犯、浸润；亦不包括淋巴瘤、白血病等血液系统肿瘤对脾脏的浸润。结果：共计 36 例脾脏转移性病变，原发灶中卵巢癌 18 例，卵巢性索-间质肿瘤 1 例，输卵管癌 1 例，腹腔低级别粘液腺癌 2 例，结直肠癌 9 例，胃癌 2 例，乳腺癌 2 例，前列腺癌 1 例。3 例表现为单一病灶，其余均为多发病灶。所有病人均存在脾脏以外的其他脏器或区域的转移瘤。病灶 CT 检查平扫为低密度，MR 检查 T1WI 呈低信号，T2WI 呈高信号。所有病灶均轻、中度不均匀强化，无 1 例为单纯囊性或囊实性。1 例横结肠腺癌在病变后期边缘出现钙化成分。结论：脾脏转移瘤病变主要的原发灶来源为腺癌，其中卵巢来源的恶性肿瘤占绝大部分。病变均强化较弱，提示转移瘤内存在较多的粘液成分。发现、诊断、随访脾脏转移性病灶需行增强检查，但 MR 并不比 CT 提供更多额外信息。

PU-1028

Development and validation of a predictive model for lipid-poor adrenal adenoma: A retrospective study based on non-enhanced CT minimum attenuation value in two centers

Hanlin Zhu¹, mengwei wu², peiying wei³, tong zhang³, chunfeng hu³, zhijiang han³

1. Department of Radiology, Hangzhou Ninth People's Hospital (Qiantang Campus of Hangzhou First People's Hospital)

2. The Quzhou Affiliated Hospital of Wenzhou Medical University, Quzhou People's Hospital

3. Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine

Objective: Early differentiation between lipid-poor adrenal adenomas and non-adenomas is crucial to minimize excessive examinations and treatments. This study aims to establish an eXtreme Gradient Boosting (XGboost) prediction model using the non-enhance CT minimum attenuation value (minAV) to identify lipid-poor adenomas, and subsequently compares it with the CT histogram (CTH) model. **Materials and Methods:** This study conducts a retrospective analysis of clinical and CT imaging data for 384 adrenal lesions obtained from the Affiliated Hangzhou First People's Hospital (training set) and The Quzhou Affiliated Hospital of Wenzhou Medical University (validation set). Within the training set, univariate analysis was carried out on the variables, retaining those with statistical significance to construct the XGboost prediction model. The validation set was then used to test the model's generalization capabilities. The model's diagnostic performance and calibration were assessed using Receiver Operating Characteristic (ROC) curve analysis, calibration curves, and the Brier score. Differences in the Area Under the ROC Curve (AUC) between models were examined using the DeLong test. The SHAP (SHapley Additive exPlanations) values served to interpret and visualize the minAV prediction model. **Results:** The training set included 136 adrenal lipid-poor adenomas and 126 non-adenomas, while the validation set comprised 46 and 40, respectively. Statistical analysis revealed significant differences between the two groups in the training set in terms of minAV, CTH, mean attenuation, diameter, and BMI (all P-values <0.001). Two independent XGBoost models were constructed based on minAV and CTH, with AUC values of 0.912 (95% confidence interval [CI], 0.866-0.957) and 0.916 (CI, 0.873-0.958), respectively. Both models demonstrated good calibration, with Brier scores of 0.141 and 0.136. In the validation set, the AUCs were 0.871 (CI, 0.792-0.951) and 0.878 (CI, 0.794-0.962), with Brier scores of 0.156 and 0.165. No statistical differences were found between the models' AUCs in the DeLong test (all P-values >0.100). The absolute SHAP value for minAV was the highest and showed a negative contribution. **Conclusion:** The XGBoost multivariate machine learning models based on minAV and CTH metrics can effectively distinguish between adrenal lipid-poor adenomas and non-

adenomas. The minAV metric, being more readily accessible, is preferable for clinical use. The minAV model aids physicians in making precise, personalized clinical decisions for patients with incidental adrenal tumors, thus preventing overtreatment.

PU-1029

A Case of Post-Transplant Lymphoproliferative Disorder

Yangyang Li¹, Yan Tan²

1. Shanxi Medical University

2. 山西医科大学第一医院

Background and Objectives: Post-transplant lymphoproliferative disorder (PTLD) is a rare complication following hematopoietic stem cell or solid organ transplantation, associated with high mortality, and is one of the most serious complications post-transplantations. Early and accurate diagnosis is crucial for patient management and prognosis. This article discusses the clinical and radiological characteristics of PTLD.

Methods: We conducted a retrospective analysis of a case of a 59-year-old male who underwent liver transplantation due to decompensated cirrhosis 6 months prior. We examined the clinical, radiological, and case-specific characteristics, discussed the diagnosis, treatment, and prognosis, and conducted an analysis in conjunction with relevant literature.

Results: Four years ago, alcoholic hepatitis was treated with withdrawing yellow and protecting the liver. Color Doppler ultrasound showed cirrhosis and ascites before 8 months, and symptomatic treatments such as diuresis and liver protection were given. Six months ago, he underwent orthotopic liver transplantation due to decompensated cirrhosis. After the operation, he received anti-rejection, liver protection, and acid suppression treatments. He was admitted to the hospital due to cough and expectoration, shortness of breath after activity, and wheezing for 1 week. Imaging examination showed multiple hypoechoic nodules in liver and spleen by ultrasound. Abdominal CT scan showed multiple slightly low-density nodules in the liver and spleen, lymphadenopathy in the hepatic hilum, thickening of the gastric wall at the lesser curvature of the gastric cardia, and low-density nodules in the anterior abdominal wall. MRI scan showed multiple round masses of liver, spleen and anterior abdominal wall with low signal on T1WI and high signal on T2WI. DWI showed nodular and circular slightly high signal, localized thickening and abnormal signal of the gastric wall on the lesser curvature of the stomach, and multiple lymph nodes in the hepatic hilum, retroperitoneal space and pancreatic tail. The patient was diagnosed with EBV-associated non-Hodgkin's diffuse large B-cell lymphoma with plasma cell hyperplasia, non-GCB type, based on pathological examination of the gastric cardia and medical history.

Conclusion: The clinical manifestations of patients with PTLD are diverse and non-specific, ranging from asymptomatic to life-threatening. A mass visible on imaging may be the first clue to the diagnosis. Radiologists need to be alert to the potential and diversity of PTLD development months to years after liver transplantation. When there is any clinical suspicion, cross-sectional imaging of the neck, chest, abdomen, and pelvis should be performed to detect a wide range of underlying abnormalities.

粗梁团块型肝癌的影像诊断

陈峰

浙江大学医学院附属第一医院

本讲座首先介绍了 2019 年 WHO 肝细胞肝癌新的病理亚型分类,对八类分型进行了简要阐述,在此基础上,重点介绍了近年来得到广泛重视的、预后较差的粗梁团块型肝癌。从病理学定义、临床实验室特征及影像表现几方面进行了阐述,并用实际病例,比较了与普通型肝细胞的异同、预后的差异,并分析了粗梁团块型肝癌发病机制中血管包裹肿瘤细胞簇(VETC)的作用。为临床上提高对粗梁团块型肝癌的认识,改善肝细胞癌的诊断及管理水平提供了参考。

PU-1031

长期服用阿司匹林引起的胆道出血 1 例: 病例报告

祝萍¹、克天宇¹、樊树峰¹、陈峰²

1. 浙江中医药大学附属第二医院

2. 浙江大学医学院附属第一医院

目的: 介绍一例长期服用阿司匹林引起胆道出血患者的 CT 及 MRI 影像学征象及临床特征。

方法: 一例 62 岁男性患者,因长期服用阿司匹林 8 月余,上腹部疼痛 1 天入院。入院后进行了影像学 and 实验室检查,停用阿司匹林,并接受了促凝血、保肝、抗感染治疗。

结果:

入院检查结果:

上腹部 CT 平扫: 肝内外胆管-十二指肠乳头见致密高密度影,胆囊内见多发点状及结节状同密度影;肝脏体积明显肿大,密度明显减低;脾脏体积肿大。上腹部 MRI: 肝内外胆管-十二指肠乳头见条状 TWI 及 T2WI 均为高信号影,胆囊内见多发点状及结节状同信号影;肝脏明显肿大,脾脏肿大, T2WI 信号明显减低。

实验室检查: NE%中性粒细胞百分数 84.4% (参考值 40.0-75.0%); 谷草转氨酶 271 U/L (参考值 15-40 U/L), 乳酸脱氢酶 574U/L (参考值 120-250U/L); 血清总胆红素 136.3 μ mol/L(参考值 2.2-25.0 μ mol/L), 直接胆红素 66.6 μ mol/L(参考值 0.0-6.0 μ mol/L), 间接胆红素 69.7 μ mol/L(参考值 1.2-18.0 μ mol/L), D-二聚体 2.41mg/L (参考值 0-0.55mg/L); 大便隐血阳性(+) (参考值: 阴性)。

患者入院后接受了维生素 k1 促凝血、思美泰及优思弗保肝、舒普深抗感染治疗。

入院治疗 4 天后检查结果:

上腹部 CT 平扫: 右侧肝内外胆管及胆总管内见少许致密高密度影,胆囊内散在点状及结节状同密度影,较前明显减少;肝脏肿大,密度减低;脾脏肿大。

实验室检查: NE%中性粒细胞百分数 55.7% (参考值 40.0-75.0%); 谷草转氨酶 201 U/L (参考值 15-40 U/L), 乳酸脱氢酶 203U/L (参考值 120-250U/L); 总胆红素 54.7 μ mol/L(参考值 2.2-25.0 μ mol/L), 直接胆红素 24.7 μ mol/L(参考值 0.0-6.0 μ mol/L), 间接胆红素 30.0 μ mol/L(参考值 1.2-18.0 μ mol/L)。

结论: 胆道出血较少见,熟悉胆道出血的影像学征象及临床特征有助于提高临床怀疑,有利于胆道出血的早期诊断和治疗。

肝上皮样血管内皮瘤 1 例

张晓辉
宁波市第二医院

目的 探讨肝上皮样血管内皮瘤影像学特点, 提高对其的认识。

方法 回顾我院 1 例肝上皮样血管内皮瘤, 对其临床特征、MRI、PET/CT 特点进行分析。

结果 PET/CT 主要表现为肝内多发低密度结节, 近包膜为主, 18F-FDG 呈轻中度摄取。MRI 显示均为乏血供病变, 但与血管关系密切; 穿刺病理诊断为肝上皮样血管内皮瘤。

结论 肝上皮样血管内皮瘤罕见, 易误诊, MRI 联合 PET/CT 对其诊断有一定的特异性。

PU-1033

基于深度学习重建算法对腹部 CT 检查图像质量的改善

王拓
大连理工大学附属大连市中心医院

目的: 通过分析比较自适应统计迭代重建(ASiR-V)算法和深度学习重建(DLIR)算法在腹部 CT 成像中的图像质量, 探讨 DLIR 算法在腹部 CT 成像中的应用价值。

方法: 方法回顾性分析 2023 年 4 月-2022 年 7 月在我院进行腹部常规扫描的病例 60 例, 平均分成 2 组。A 组使用自适应迭代统计算法 (ASiR-V30%), B 组使用深度学习重建算法 (DLIR-M), 其他扫描参数设置相同, 重建出 0.625 mm 的图像。在每组图像的主动脉内、骨骼肌以及肝脏组织内分别勾画感兴趣区, 测量感兴趣区内的 CT 值、SD 值和信噪比(SNR)进行客观评价, 并对图像进行主观评价。结果 2 种重建图像 CT、SD 和 SNR 值的差异有统计学意义($P < 0.001$)。DLIR 在主动脉和骨骼肌处的图像噪声明显低于传统的 FBP 和 ASiR-V, 图像质量能够满足临床需求。而且呈现出 DL-M 降噪效果佳、噪声低, ASiR-V30%、FBP 图像噪声依次增加。通过主观评分的比较发现, DL-M 的图像整体质量有明显的提升。

结果: 相同辐射剂量前提下 DLIR 重建图像质量好于 ASiR-V30 迭代重建好于传统 FBP 重建。

结论: DLIR 相较于 ASiR-V 图像重建, 可大大降低图像噪声, 提高图像细节的清晰度, 提升图像质量, 同时, 图像纹理更自然真实; 扫描剂量仅为 ASiR-V 的 1/3。在低剂量疾病筛查及对婴幼儿、肥胖个体的检查有极大的优势。

胆管内乳头状黏液性肿瘤 6 例并多参数 MRI 及动态强化 CT 影像学特征分析

何苹、闫建华
天津市第三中心医院

目的: 探讨 MRI 多参数成像及动态强化 CT 在胆管内乳头状黏液性肿瘤 (IPMN-B) 诊断中的价值。
方法: 回顾性分析经手术或穿刺活检病理证实的 6 例 IPMN-B 的 MRI 特征, 重点分析钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 特征。

结果: 6 例病例中, 典型 IPMN-B 4 例, 囊性 IPMN-B 4 例。6 例典型 IPMN-B 扩张胆管内见单发或多发肿瘤, 呈乳头状或息肉状, T1WI 呈稍低信号, T2WI 呈稍高信号, 扩散加权成像 (DWI) 呈高信号, 钆喷酸葡胺 (Gd-DTPA) 增强后动脉期轻度强化, 门静脉期、延迟期渐进性轻中度强化,

肿瘤上下游胆管均明显广泛扩张。3 例囊性 IPMN-B 呈动脉瘤样明显扩张, 其中 2 例囊性 IPMN-B 见附壁结节, 1 例囊性 IPMN-B 囊内仅见多发分隔, 病变与胆管系统相通。2 例无肿块型 IPMN-B 未见明显肿瘤, 仅表现为病变区胆管壁增厚, 病变区胆管呈广泛明显扩张。Gd-EOB-DTPA 增强 MRI 胆管期, 正常胆管表现为高信号充盈, 黏液分布区扩张胆管表现为充盈缺损。

结论: MRI、磁共振胰胆管造影 (MRCP) 可有效评价常见类型的 IPMN-B。Gd-EOB-DTPA 增强 MRI 有助于 IPMN-B 黏液成分与其他胆管囊性病变及梗阻性胆管扩张的鉴别, 对无肿块型及囊性 IPMN-B 诊断及鉴别诊断具有较高价值。

PU-1035

基于 CT 放射组学的虚拟活检评估胃癌患者内窥镜活检与术后标本的病理学差异

赵帅

郑州大学第一附属医院

目的: 建立一种基于放射组学的非侵入性诊断的诺模图, 用于确定胃癌劳伦分型中胃窥镜活检标本与术后标本的病理差异。

材料与方法: 本研究收集了 126 例接受 CT 检查的胃癌患者, 将其分为训练组 84 例、测试组 42 例。从静脉期 CT 图像中构建了基于随机森林学习算法的放射组学模型。使用 AUC 和 DeLong 检验来评估和比较放射组学的性能。建立了一种结合放射组学和临床变量的个体化诺模图, 并对其进行了判别、校准和临床应用。

结果: 放射组学模型在训练组和测试组上的 AUC 分别为 0.835 和 0.724, 具有较好的预测能力。临床和组学的联合模型中, 训练组和验证组的 AUC 分别为 0.884 和 0.841, 预测能力进一步得到提高。临床-放射学诺模图准确地预测了训练组和测试组的病理不一致, 与校准曲线很好地吻合。

决策曲线分析证实了诺模图的临床应用价值。

结论: 基于 CT 的放射组学诺模图对预测胃癌活检标本与术后切除标本的病理不一致状态具有潜在的临床应用价值。

十二指肠球部 Brunner 腺瘤的影像诊断 (附 2 例报告并文献复习)

邵亚军

宝鸡市中心医院

【摘要】[目的]探讨十二指肠 Brunner's 腺瘤的影像学特征。材料和方法 回顾性分析 2 例 Brunner's 腺瘤的影像表现, 并与病理表现相结合, 通过对文献的复习, 分析总结十二指肠 Brunner's 腺瘤的影像诊断特征。结果 2 例 Brunner's 腺瘤均发生于十二指肠球部, 与 brunner's 腺的生理分布相符合。均为腔内息肉样肿块, 肿块大部分边缘光整, 轻度到明显强化, 强化程度及均匀度与肿块的病理构成有关。胃肠造影多表现为边缘光整的息肉样充盈缺损。结论十二指肠腺瘤主要发生在十二指肠球部, 多呈带蒂的息肉样肿块, 可引起消化道出血、肠梗阻、肠套叠等。肿块边缘清楚, 强化程度不等, 肿块中可分布小片状低密度囊性区。CT 扫描及薄层重建 结合内镜超声, 可帮助诊断及鉴别诊断。

PU-1037

Application of TrueFidelity (Deep Learning CT Image Reconstruction) With Combination of 70kVp for Reducing Radiation Dose and Improving Image Quality in Renal CTA for Slim Patients:

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To explore the application of TrueFidelity (Deep Learning CT Image Reconstruction) with combination of 70kVp for reducing radiation dose and improving image quality in renal CTA for slim patients compared with 50% ASIR-V reconstruction using 100 kVp.

***Methods and Materials:** 12 patients for renal CTA were prospectively enrolled and randomly divided into group A and group B. Group A used 100 kVp and 500 mgI/kg contrast agent and 50% ASIR-V reconstruction, while group B used 70 kVp and 300 mgI/kg contrast agent and DLIR at Low, medium and high levels (DLIR-L, DLIR-M and DLIR-H). The CT values and SD values of the right renal artery and left renal artery were measured to calculate the SNR and CNR. The image quality was subjectively scored by two senior radiologists blindly using a 5 point criterion. The contrast agent, CTDIvol, and dose length product in both groups were recorded and the effective radiation dose was calculated.

***Results:** There were no significant difference in patient characteristics between two groups ($p > 0.05$). The CTDIvol, dose length product and effective radiation dose in group B were 70%, 72%, and 80% lower than those in group A, respectively (all $p < 0.05$), and the contrast agent in group B was 58% lower than that in group A ($p < 0.05$). In group B, with the increase of DLIR-L, DLIR-M and DLIR-H, CT values showed no significant difference, SD values decreased gradually, SNR values and CNR values increased gradually. The CT values showed no statistically significant difference ($p > 0.05$) between two groups with different reconstructions. The SD values with DLIR-L, DLIR-M and DLIR-H in group B was significantly lower ($p < 0.05$), while the SNR values with DLIR-L, DLIR-M and DLIR-H and CNR values with DLIR-L, DLIR-M and DLIR-H were significantly higher than those of group A with 50% ASIR-V ($p < 0.05$). Two senior radiologists had excellent consistency in subjective scores of image quality for renal CTA ($\kappa > 0.75$, $p < 0.05$). The subjective scores with DLIR-M and DLIR-H in group B were significantly higher than those of 50% ASIR-V in group A ($p < 0.05$), of which DLIR-H obtained the highest subjective score for renal CTA.

***Conclusions:** TrueFidelity (Deep Learning CT Image Reconstruction) With Combination of 70kVp can significantly reduce effective radiation dose (about 80%) and contrast agent (about 58%) and improve image quality in renal CTA for slim

PU-1038

基于双能 CT 的肝肿瘤碘定量扫描中患者和位置相关因素的影响

马超伟、吴志斌

空军军医大学西京医院

目的: 量化肝脏肿瘤中病灶位置和患者体位、双能扫描参数、患者体型和辐射剂量对双能 CT 碘定量 (DECT-IQ) 误差的影响。

材料和方法: 使用具有四个肝脏病灶 (直径 15 mm; 碘浓度 0-5 mgI/mL) 和两种尺寸的模型。两种尺寸均在双能量模式下成像: (1) 100/Sn150 kV 的双源 DECT (DS-DE) 和 (2) AuSn120 kV 的单源双层滤波器 DECT (SF-DE), 2 种辐射剂量 (8 mGy 和 12 mGy)。在七个不同的垂直工作台位

置（距机架孔径等中心点 -6 至 + 6 厘米）进行扫描，重复测量碘浓度并计算绝对误差，使用稳定的重复测量方差分析和结果比较误差。采用线性混合效应模型确定影响 DECT-IQ 误差的因素。结果：线性混合效应模型显示误差受到 DECT 方法、体模尺寸和病变位置的显著影响（所有 $p < 0.001$ ）。与 DS-DE 相比，SF-DE 中病变位置对误差的影响更大。辐射剂量对误差没有显著影响（ $p = 0.32$ ）。对所有设置进行平均后，SF-DE (2.28 ± 1.62 mgI/mL) 的误差显著高于 DS-DE (0.41 ± 0.29 mgI/mL)（所有 $p < 0.001$ ）。SF-DE 的膈下病变中发现了伪影，与 DS-DE 相比，误差显著增加（ $p < 0.001$ ）。DS-DE (0.30 ± 0.23 mgI/mL 与 0.43 ± 0.33 mgI/mL) 和 SF-DE (1.68 ± 1.99 与 2.36 ± 1.81 mgI/mL) 相比，大模型的绝对误差明显更高（ $p < 0.001$ ）。结论：双能量扫描参数、患者体型以及根据患者位置修改的病灶位置显著影响模拟肝脏肿瘤中的 DECT-IQ。

PU-1039

胰腺和肝脏巨淋巴结增生症的磁共振表现

钟燕、王鑫坤、唐静、邢新博、李天然
中国人民解放军总医院第四医学中心

摘要：目的 分析胰腺和肝脏巨淋巴结增生症的磁共振（MRI）表现。方法 回顾性分析病理证实的胰腺和肝脏巨淋巴结增生症的临床和磁共振成像资料，观察病灶的位置、大小、信号、动态增强特点。结果 患者 2 例均为女性，1 例 13 岁，1 例 45 岁。1 例病灶位于肝左叶内侧段，1 例位于胰腺体部，呈椭圆形，直径 2-3cm。病灶 T1WI 呈均匀稍低信号；T2WI 呈均匀稍高信号；扩散加权成像（DWI）呈明显高信号，表观扩散系数（ADC）图呈明显低信号。动态增强扫描动脉期不均匀明显强化，门脉期逐渐强化，延迟期均匀强化，强化程度轻度减低。1 例病灶见包膜，1 例病灶内见血管影。结论 肝脏和胰腺巨淋巴结增生症的 MRI 表现具有一定特征性：病灶体积较小，椭圆形，信号均匀，富血供，DWI 明显高信号，ADC 图低信号。

PU-1040

Image Quality Evaluation in spectral CT Gemstone Spectral Imaging of the Chest and Abdomen in Obese Patients With TrueFidelity

Xiaohu Li
The First Affiliated Hospital of Anhui Medical University, China

*Purpose: The aim of this study was to evaluate image quality in vascular and oncologic spectral CT gemstone spectral imaging studies performed with TrueFidelity a new deep Learning Image reconstruction algorithm in Obese Patients(BMI \geq 30).

*Methods and Materials: Vascular and multiphase oncologic staging Spectral CT examinations were evaluated. Two image reconstruction algorithms were applied to the Spectral CT data sets: standard of 50%ASIR-V and DLIR (medium and high). Subjective quality criteria were independently evaluated by 4 senior radiologists, and interreader agreement was assessed. SNR and CNR were compared between image reconstruction methods.

*Results: 12 patients were included in this study, and the mean patients BMI was 36.6 ± 4.3 . DLIR-H and DLIR-M showed statistically significant higher Likert scores compared with 50%ASIR-V across all subjective image quality criteria ($P < 0.01$ for DLIR-H vs 50%ASIR-V; $P < 0.05$ or DLIR-H vs 50%ASIR-V), and SNRs for aorta and liver were significantly higher for DLIR-H vs 50%ASIR-V ($P < 0.01$). CNR for aorta and SNR for aorta and liver were significantly higher for DLIR-H vs 50%ASIR-V ($P < 0.05$).

*Conclusions: TrueFidelity DLIR provides improved image quality compared with 50%ASIR-V in Spectral CT obtained in obese patients.

*Clinical Relevance/Application: Spectral CT has before now experienced image degradation from photon starvation in material decomposition dual-energy CT in patients >113 kg, and larger patient body habitus has necessitated larger gantry bore openings further challenging imaging geometry and contributing to increased streaking and beam hardening artifacts.

双源 CT 在术前预测肝细胞肝癌微血管浸润方面的应用

裴金霞、王龙胜
安徽医科大学第二附属医院

目的 利用双源 CT 碘定量技术术前预测肝细胞肝癌微血管浸润(Microvascular invasion, MVI)。 **方法** 对 82 例经术后病理证实并术前行双源 CT 平扫+增强扫描的原发性肝细胞肝癌患者进行回顾性研究,分析患者临床指标(年龄、甲胎蛋白、谷丙转氨酶、谷草转氨酶、 γ -谷氨酰基转移酶、总胆红素、直接胆红素、间接胆红素、乳酸脱氢酶)、碘定量数据(病灶动脉期碘浓度、动脉期归一化碘浓度、病灶门脉期碘浓度、门脉期归一化碘浓度、病灶动脉期碘浓度差、病灶门脉期碘浓度差、动脉期病灶碘浓度/肝实质碘浓度、门脉期病灶碘浓度/肝实质碘浓度),按病理结果分为 MVI 阳性组及 MVI 阴性组。对各项临床指标和碘定量数据采用双样本 t 检验进行组水平分析;并基于留一交叉验证框架与 logistic 回归模型构建 MVI 预测模型,应用 ROC(Receiver operating characteristic)曲线可视化 MVI 预测模型分类性能。 **结果** 双样本 t 检验显示 MVI 阳性组 AFP (Alpha Fetoprotein) 较 MVI 阴性组高($P<0.05$),而 MVI 阳性组 NICAP (Normalized iodine concentration at arterial phase)、NICPP (Normalized iodine concentration at portal venous phase)与 MVI 阴性组相比均较低($P<0.05$)。此外,留一交叉验证框架下的 logistic 模型具有显著的分类能力,AUC(Area under curve)值为 0.75。 **结论** 基于双源 CT 碘定量参数和实验室结果的预测模型能够可靠的对肝细胞肝癌 MVI 类别进行术前预测。

钆塞酸二钠增强 MRI 对不典型肝脓肿与单发肝转移瘤的鉴别诊断

何旭¹、韩鼎盛¹、黎雅琳¹、张嘉诚¹、周彦汝²、张岚(通讯作者)²

1. 河南中医药大学

2. 河南中医药大学第一附属医院 MRI 科

目的 探讨钆塞酸二钠(Gd-EOB-DTPA)增强 MRI 对不典型肝脓肿(AHA)和单发肝转移瘤(SHM)的鉴别诊断价值。 **方法** 收集 2019 年 9 月至 2022 年 10 月经病理证实的 27 例 AHA 和 36 例 SHM 患者的影像及临床资料。所有患者均行肝脏 MRI 平扫、扩散加权成像(DWI)和 Gd-EOB-DTPA 增强 MRI 扫描。比较两组患者的影像学特征及临床指标。使用 Logistic 回归分析模型筛选出 AHA 的独立预测指标,采用受试者工作特征(ROC)曲线分析各独立因素及其联合预测 AHA 的诊断效能。 **结果** 单因素 Logistic 回归分析结果显示,DWI 非环形高信号(25/27)、HBP 病灶边缘非缺损区(24/27)多见于 AHA 组;DWI 靶样高信号(17/36)且 HBP 病灶边缘缺损区(27/36)多见于 SHM 组(P 均 <0.05)。多因素 Logistic 回归分析显示,DWI 非环形高信号、HBP 病灶边缘非缺损区是诊断 AHA 的独立预测因素(P 均 <0.05),DWI 非环形高信号、HBP 病灶边缘非缺损区及二者联合诊断 AHA 的曲线下面积(AUC)分别为 0.699、0.819 和 0.880;准确率分别为 66.7%、80.9%

和 84.1%。**结论** Gd-EOB-DTPA 增强 MRI 对 AHA 与 SHM 的鉴别诊断具有重要的价值, DWI 非环形高信号联合 HBP 病灶边缘非缺损区能够提高 AHA 的诊断效能。

PU-1043

基于术前增强 CT 探讨肾透明细胞癌瘤周静脉特征与 WHO/ISUP 分级的关系

石宇婷、王龙胜
安徽医科大学第二附属医院

目的 基于术前增强 CT 探讨肾透明细胞癌 (ccRCC) 瘤周静脉的特征与 WHO/ISUP 分级的关系。**方法** 回顾性分析安徽医科大学第二附属医院 2018 年 5 月至 2021 年 12 月经术后病理证实为 ccRCC 且有明确病理分级的 250 例患者资料。将肾透明细胞癌瘤周静脉定义为实质期在 Gerota 筋膜内与受累肾脏相邻的不对称增加且形态不规则的血管。按瘤周静脉有、无将 250 例病例分为两组, 观察两组的影像特征并分析瘤周静脉有、无与 WHO/ISUP 分级的关系。对于有瘤周静脉的病例, 进一步分析瘤周静脉的支数, 最大内径, 空间构型 (有、无交叉) 与 WHO/ISUP 分级的关系。并利用 spearman 相关分析瘤周静脉支数与 WHO/ISUP 分级的相关性。**结果** 250 例 ccRCC 患者中有瘤周静脉的有 146(58.4%)例, 无瘤周静脉的有 104 (41.6%)例。有瘤周静脉的患者较无瘤周静脉的患者肿瘤直径更大、更容易出现囊变坏死 ($P<0.05$)。两组间患者年龄、性别、BMI、肿瘤位置、癌栓有无差异无统计学意义 ($P>0.05$)。ccRCC 患者瘤周静脉的有、无, 支数, 空间构型与 WHO/ISUP 分级的差异有统计学意义 ($P<0.05$)。且瘤周静脉支数与 WHO/ISUP 分级呈正相关 ($r=0.310$, $P<0.001$)。瘤周静脉的最大内径与 WHO/ISUP 分级的差异无统计学意义 ($P>0.05$)。**结论** 肾透明细胞癌瘤周静脉的特征与 WHO/ISUP 分级相关, 术前评估瘤周静脉对患者的临床治疗决策具有指导意义。

PU-1044

个案-低级别子宫内质肉瘤

郭丽萍
宁波市第二医院

一般情况: 女, 44 岁, 以发现子宫肌瘤一年余, 下腹痛三天就诊。患者 1 年前查 B 超示“子宫多发肌瘤, 大小 21*14mm, 宫体后壁中下段囊性块, 大小 57*53*39mm, 内异灶首先考虑, 内膜回声欠均”, 无月经改变, 无经期腹痛, 无经间期出血, 无腰酸坠胀感, 无尿频尿急, 无畏寒发热。3 天前患者劳累后出现下腹痛, 以下腹正中为主, 较剧, 持续性, 伴腰痛, 无恶心呕吐, 2 天前至我院就诊, 查子宫附件超声示“子宫多发肌瘤, 子宫右后壁混合回声团, 肌瘤伴出血?”既往 9 年前行产钳助娩, 产后大出血予输血治疗。肿瘤标志物无殊。

MRI 增强检查: 子宫呈前倾前屈位, 宫体后壁可见一约 70*70*75mm 大小等 T1 稍长 T2 信号影, 内可见少许斑片样长 T2 信号, 境界尚清, 增强扫描未见明确强化, 弥散未见明显受限; 另子宫肌层多发类圆形等 T1 稍短 T2 信号, 增强扫描明显均匀强化; 宫腔未见扩大及积液征象, 宫体部内膜、结合带及深肌层结构清晰; 左侧附件显示不清, 双侧盆壁可见数枚小淋巴结影显示, 增强扫描均匀强化; 阴道壁及前、后穹隆处未见异常信号影。膀胱部分充盈。盆腔内未见明显积液征象。片示骨盆诸骨未见明显异常信号。影像诊断: 子宫多发肌瘤, 后壁大肌瘤变性? 请结合临床病史, 必要时复查。

手术所见: 子宫增大如孕 2 月+大小, 子宫后壁突出一约 7*8*8cm 大小肌瘤。表面尚平滑, 子宫后壁与盆壁粘连, 左侧宫角处可见 2*2cm, 宫体前壁可见三个 1-2cm*2cm 肌瘤。切开子宫后壁肿

瘤包膜直达子宫瘤体，宫体后壁瘤体放置取物袋，剥除过程中肿物包膜欠完整，肿物质脆，钝性加锐性完整剥出肌瘤，瘤体未通宫腔，用可吸收线连续全层缝合关闭瘤腔，观察无出血，同法切开左宫角肌瘤，包膜完整，前壁肌瘤 3 个，包膜完整。

术中冰冻结果提示：(子宫肿瘤)送检碎组织，冰冻层面梭形细胞肿瘤，首先倾向平滑肌瘤，需多层面或免疫组化除外低级别子宫内膜间质肿瘤可能。

肾及肾上腺的 MRI 规范化扫描

刘从伟、常英娟、郑建民
空军军医大学西京医院

肾脏

一、检查目的：

1. 了解肾脏的形态、大小、位置及有无病变；
2. 了解肾盂、肾盏有无积水扩张及扩张程度；
3. 对肾脏病变的定位及定性诊断；
4. 明确肾脏肿瘤的性质及其扩散、转移、浸润范围，为治疗提供依据；
5. 随访观察疾病的动态变化、疗效及复发情况；
6. 对术后并发症的诊断。

二、检查前准备：

1. 核对患者信息，明确检查部位、目的和要求；
2. 做好胃肠道准备，一般要求禁食禁水 4~6 小时；
3. 确认患者有无金属置入物及 MRI 禁忌证；
4. 叮嘱患者在检查过程中切勿随意运动，并做好患者呼吸配合训练；
5. 告知患者若有不适，及时告知工作人员。

三、线圈：

体部、心脏相控阵线圈。

四、体位：

略

五、扫描方位，范围及序列：

略

六、技术参数：

略

七、注意事项：

略

肾上腺

一、检查目的：

1. 了解肾上腺的形态、大小、位置及有无病变；
2. 对肾上腺病变的定位及定性诊断；
3. 明确肾上腺肿瘤的性质及其扩散、转移、浸润范围，为治疗提供依据；
4. 随访观察疾病的动态变化、疗效及复发情况；
5. 对术后并发症的诊断。

二、检查前准备：

1. 核对患者信息，明确检查部位、目的和要求；
2. 做好胃肠道准备，一般要求禁食禁水 4~6 小时；
3. 确认患者有无金属置入物及 MRI 禁忌证；

4. 叮嘱患者在检查过程中切勿随意运动，并做好患者呼吸配合训练；
5. 告知患者若有不适，及时告知工作人员。

三、线圈：

体部、心脏相控阵线圈。

四、体位：

PU-1046

肾及肾上腺 CT 规范化扫描

刘从伟、常英娟、郑建民
空军军医大学西京医院

肾及肾上腺

一、检查目的：

1. 确定肾脏有无良、恶性肿瘤及其大小、范围，有无淋巴结转移等；
2. 肾脏炎症、脓肿及结石的大小和位置；
3. CTA 诊断肾动脉狭窄及其他肾血管病变；
4. 显示外伤后肾损伤及出血；
5. 确定肾上腺有无良、恶性肿瘤以及功能性疾病(如肾上腺皮质功能减退等)对术后并发症的诊断；

二、检查前准备：

1. 1 周内禁服含金属的药物或行消化道钡剂造影；
2. 检查当日禁食 4h 以上，不禁水；
3. 检查前 15~20min 口服水 500~1000 ml，使胃及十二指肠壶腹部充盈，形成良好对比；
4. 核对患者信息，明确检查部位、目的和要求；
5. 确认患者腹部有无金属置异物；
6. 训练患者屏气；
7. 增强扫描患者需要询问过敏史并签署 CT 碘对比剂增强知情同意书。

三、体位：

仰卧位，头先进或足先进，两臂上举，身体置于检查床正中间，水平线对准人体腋中线。

四、扫描范围：

1. 肾脏从肾上极扫描到肾下极；
2. 肾上腺从肾上腺上缘扫描到肾门。

五、技术参数：

略

七、注意事项：

1. 提前训练患者屏气，若患者不能配合屏气，肾血管 CTA 可选择大螺距扫描；
2. 增强患者询问过敏史并提前签署碘对比剂注射知情同意书；
3. 肾功能异常者，咨询主管医生是否可行增强扫描。

Lesion detection performance of an abbreviated gadoxetic acid enhanced MRI protocol for colorectal liver metastasis surveillance: A multi-center study in China

Qian Xu
HENAN UNIVERSITY OF CHINESE MEDICINE

Objective To evaluate the diagnostic performance of two different abbreviated MRI (AMRI) sets extracted from a complete gadoxetic acid (Gd-EOB-DTPA)-enhanced MRI for colorectal liver metastasis (CRLM) surveillance.

Methods This retrospective multi-center study in China, gadoxetic acid-enhanced MRI scans of 80 patients from 3 different hospitals were assessed from 2020 through 2023. Two AMRI sets were extracted from the complete Gd-EOB-DTPA-enhanced MRI: dynamic-AMRI (Dyn-AMRI) including dynamic contrast-enhanced four phases (early arterial, late arterial, portal venous, and

transitional phases) and diffusion-weighted imaging (DWI); and Hepatobiliary phase AMRI (HBP-AMRI) including T2-weighted imaging (T2WI), DWI, and hepatobiliary phase (HBP). MR images were independently reviewed by two abdominal radiologists. A maximum of 10 lesions per patient were recorded. Cohen's kappa analysis, sensitivity, specificity, accuracy and areas under the curve (AUCs) of the two AMRI protocols were assessed. (Per-lesion diagnostic sensitivity, specificity, and accuracy of two AMRI sets were compared by using logistic regression.)

Results Totally 268 lesions were assessed with each set of images. The inter-observer agreement for the abbreviated protocol was reported excellent ($k = 0.92$). Compared with Dyn-AMRI, HBP-AMRI had significantly higher sensitivity and accuracy (assessed by logistic regression) ($P < 0.05$). However, two sets of AMRI indicated no significant differences in specificity ($P > 0.05$). Two AMRI protocols AUCs for lesion characterization (by ROC regression) were 0.822 and 0.914.

Conclusion AMRI may offer an alternative option for CRLM surveillance. HBP-AMRI set, the combination of T2WI, DWI, and HBP has a considerable sensitivity and diagnostic accuracy equivalent to Dyn-AMRI as an acceptable regimen for CRLM surveillance.

A novel nomogram for prediction of pT3a upstaging in clinical T1 renal cell carcinoma

Di Yin

Second Hospital of Tianjin Medical University

Objectives To construct a nomogram model incorporating radiomics signature with clinical factors to preoperatively predict pathologic T3a (pT3a) upstaging in clinical T1(cT1) renal cell carcinoma (RCC) patients.

Methods A total of 169 cT1 RCC patients with complete pretreatment contrast-enhanced CT (CECT) image data (corticomedullary phase, nephrographic phase, and excretory phase, CMP, NP, and EP respectively) and clinical factors between 2018 and 2022 were enrolled in this study. Afterwards the sample was split randomly into training and validation cohort in a 7:3 ratio. Radiomics features were extracted from the whole primary tumor on CMP, NP, and EP images to calculate radiomics signature. A final nomogram model was established using the obtained radiomics signature and clinical risk factors. The predictive performance of the radiomics signature and nomogram model was evaluated and visualized using receiver operator characteristic (ROC) curves. Calibration curves and decision curve analysis (DCA) were used to compare the clinical utility and benefits of different models.

Results Twenty-six radiomics features were finally selected as the optimal feature subset to construct radiomics signature, yielding AUC values of 0.945 and 0.873 in the training and validation cohort respectively. The nomogram integrating radiomics signature and clinical factors including tumor size and neutrophil-lymphocyte ratio (NLR) achieved the highest predictive performance in the training (AUC=0.958, 95% CI= 0.921-0.995) and validation (AUC=0.913, 95% CI= 0.814-1.000) cohort, outperforming the radiomics signature alone.

Conclusion The radiomics nomogram comprised predictive clinical factors and radiomics signature can efficiently predict pT3a upstaging in cT1 RCC patients.

基于增强 CT 分析结肠癌淋巴结转移危险因素及预测模型的建立

张继瑶

锦州医科大学附属第一医院

目的:基于增强 CT 图像、临床及病理资料,探究影响结肠癌淋巴结转移危险因素,并构建列线图模型。**方法:**选择 2018.1.1-2021.12.31 就诊于锦州医科大学附属第一医院并接受手术治疗的结肠癌患者进行研究,按术后病理结果分为淋巴结转移组和无淋巴结转移组。收集患者的临床及病理资料包括:性别、年龄、术前 CEA、CA19-9、T 分期、分化程度、有无脉管癌栓,CT 图像观察:肿瘤位置、病变处肠壁厚度、肿瘤最大直径、强化率、强化均匀性。使用 Logistics 多因素回归分析寻找影响结肠癌淋巴结转移危险因素,根据结果使用 R 4.2.2 软件构建列线图模型。**结果:**共纳入 138 例患者,淋巴结转移 49 例,无淋巴结转移 89 例,按 8:2 随机分为训练组和验证组。通过统计学分析得到脉管癌栓、强化率、强化均匀性是影响结肠癌转移的独立危险因素,将上述因素纳入列线图模型中,预测模型的训练组 C 指数为 0.813 (95%CI: 0.730-0.896),验证组 C 指数为 0.788 (95%CI: 0.580-0.996)。模型的校正曲线显示预测转移性与实际转移性具有良好一致性,决策曲线分析(DCA)显示列线图具有较好的获益性。结论:脉管癌栓、强化率、强化均匀性是影响结肠癌淋巴结转移的危险因素,本研究构建的列线图模型能较准确的预测结肠癌淋巴结转移情况,有助于评估淋巴结状态。

磁共振扩散加权成像在诊断肝外胆管癌中的价值体会

吴仪仪

徐州医科大学附属医院

目的 探讨磁共振扩散加权成像(DWI)在肝外胆管细胞癌中的应用价值。
方法 回顾性分析 2020 年 6 月—2022 年 6 月收治的肝外胆管癌患者作为研究对象,采用磁共振 DWI 系统进行检查。观察不同扫描方法对于肝外胆管细胞癌的显示情况,对比不同 b 值状态下肝外胆管癌病灶噪声比(CNR)与表观弥散系数(ADC),以及肝外胆管癌细胞密度与 ADC 值的相关性。
结果 DWI 中 b 值为 800 的情况下,肝外胆管癌灶高信号占 96.15%,稍高信号占 3.85%。随着 b 值的增大,ADC 值不断降低。
结论 磁共振 DWI 可以清楚显示出肝外胆管癌病灶,且在 b 值为 800 时具有最佳的诊断效果。

433 例卵巢畸胎瘤的 CT 常规诊断与病理分析

宋光毕、李祖坤、郭静清

罗平县人民医院

摘要

目的:探讨卵巢畸胎瘤的 CT 表现及诊断价值,并与手术病理进行对比分析,旨在提高卵巢畸胎瘤的术前诊断水平。

材料和方法：回顾性分析我院 2013 年 11 月至 2021 年 12 月经病理证实的 433 个卵巢畸胎瘤，收集他们的临床、病理、影像等相关资料，并统计符合率，所有病例均行 CT 平扫，回顾性分析卵巢畸胎瘤的 CT 表现。

结果：433 个卵巢畸胎瘤（左侧 206 个、右侧 194 个，双侧 33 个），术后病检畸胎瘤多含有毛发、脂肪、皮脂样物质、钙化、部分含有浆液、牙齿或骨组织等多种混杂密度结构，CT 上肯定性诊断且与术后病理符合的 403 例（403/433 93.7%）、可疑性诊断且与病理相符的 11 例（11/433 2.54%），漏诊、误诊的 19 例（19/433 4.39%），定位诊断容易 407 例（407/433 94.00%），定位诊断较难的 26 例（26/433 6.00%）。

结论：卵巢畸胎瘤术前 CT 诊断，无论在定性还是定位均具有较高的诊断价值，且可作为临床的优先选择的检查方法。

基于 256 层螺旋 CT 及后处理技术原发性肝癌合并门静脉癌栓的危险因素分析

张智博、李永斌

西北大学附属第一医院（西安市第一医院）

探讨基于 256 层螺旋 CT 及后处理技术原发性肝癌合并门静脉癌栓的危险因素。方法 收集 2017 年 1 月至 2022 年 6 月我院收治的肝癌合并门静脉癌栓 182 例患者归为研究组，从同期患者中随机抽取肝癌不合并门静脉癌栓的患者 182 例归为对照组，并应用容积重建 (VR)、多平面重组 (MPR)、最大密度投影 (MIP) 等方法对门静脉及其主要分支三维重建，并将两组患者的治疗及检查前三个月内的一般情况、实验室检查指标和影像学资料进行回顾性对比研究，分析原发性肝癌合并门静脉癌栓的危险因素。结果 单因素分析结果显示，瘤体分布、有无肝硬化、HBsAg 阳性、AST、PT、APTT 与门静脉癌栓的发生无关 ($P>0.05$)。但肿瘤直径、肿瘤个数、瘤体假包膜、APS 形成、有无腹水、ALT、Child 分级、食管胃底静脉曲张与门静脉癌栓的发生有关 ($P<0.05$)。结论 Logistic 多因素回归分析结果显示，瘤体距离门静脉主干距离 $<1\text{cm}$ 、瘤体假包膜、年龄 <45 岁、高滴度的 AFP、APS 形成是原发性肝癌合并门静脉癌栓的独立危险因素。

PU-1055

门静脉期图像在 CTSI 评估急性胰腺炎的应用价值

张思琦

南通大学附属医院

目的 探讨门静脉期图像在 CT 严重程度指数 (CTSI) 评估急性胰腺炎患者胰腺坏死中的价值。方法 本研究为单中心回顾性研究，分析了 2020 年 1 月-2022 年 12 月在南通大学附属医院确诊的 56 例急性胰腺炎患者的动态增强 CT 图像，包括胰腺动脉期和门静脉期。两名放射科医生回顾了两组图像，即动脉期单独图像 (图像集 A)，动脉期和门静脉期联合图像 (图像集 B) 来评估 CTSI。若在症状出现后 4 周出现了液化坏死区，病例则被归类为坏死性胰腺炎。比较图像集 A 和图像集 B 之间胰腺坏死与 CTSI 的关系。采用 Logistic 回归分析评估临床和影像学因素与胰腺坏死诊断的相关性。结果 56 例患者中有 14 例 (25%) 确诊胰腺坏死。图像集 A 和 B 诊断胰腺坏死的受者工作特征曲线下面积 (AUC) 分别为 0.70 和 0.78。图像集 B 的 AUC 值显著大于图像集 A ($P=0.0002$)。Logistic 回

归分析显示,在临床和影像学因素中,图像集 B 的 CTSI 与胰腺坏死独立相关($P=0.025$)。结论 动脉期和门静脉期联合图像可显著提高急性胰腺炎后胰腺坏死的诊断准确性。

基于 256 层螺旋 CT 肾脏特征预测分肾功能的价值

张智博¹、李永斌¹、陈勇²

1. 西北大学附属第一医院(西安市第一医院)

2. 宁夏医科大学总医院

目的 探讨基于 CT 扫描及 ITK-SNAP 软件测量肾脏皮质厚度(Renal Cortical Thickness, RCT)、皮质容积(Renal Cortical Volume, RCV)与分肾滤过功能的关系,并评价其预测分肾滤过功能的价值。**方法** 选择 2018 年 6 月至 2021 年 1 月于我院行 128 排螺旋 CT 增强扫描患者 93 例并于一周内对其行肾动态显像(RDI)检查。以 RDI 测得的肾小球滤过率(GFR)为金标准,分为正常组($GFR \geq 34 \text{ ml/min}$),减退组($20 \text{ ml/min} \leq GFR < 34 \text{ ml/min}$),受损组($GFR < 20 \text{ ml/min}$)。比较 3 组间 CT 测得的 RCT、RCV 的差异,分析 RCT、RCV 与 GFR 的相关性,并用 ROC 法评价两者预测分肾功能优劣的价值。**结果** 三组 RCT 分别为(0.55 ± 0.14) cm、(0.44 ± 0.10) cm、(0.31 ± 0.10) cm。RCV 分别为(75.24 ± 15.82) cm^3 、(54.29 ± 14.72) cm^3 、(30.18 ± 11.38) cm^3 。三组间 RCT、RCV 差异有统计学意义($F=61.17$ 与 $F=142.12$, $P<0.05$)。RCT、RCV 与单侧肾 GFR 高度正相关($r=0.868$ 与 $r=0.920$, $P<0.05$)。RCT 及 RCV 在预测肾脏功能正常患者时 ROC 曲线下面积(AUC)分别为 0.828、0.905。**结论** 经 CT 及 ITK-SNAP 后处理技术测得 RCT 及 RCV 能较准确反映 GFR,可以作为预测分肾功能优劣的有用指标。

腹部磁共振弥散加权成像技术联合普美显造影剂在对肝脏良恶性肿瘤鉴别中的应用价值分析

李洪亮¹、杨兴国²、甘露¹、罗寿友²、龙胜虎²

1. 云南省第一人民医院

2. 云南省文山西畴县人民医院

【摘要】目的: 分析鉴别肝脏良恶性肿瘤中应用腹部磁共振弥散加权成像技术联合普美显造影剂的实际价值。**方法:** 在 2021 年 11 月-2022 年 11 月,对选择期间就诊的 50 例肝脏良恶性肿瘤患者进行分析,均应用腹部磁共振弥散加权成像技术联合普美显造影剂,将病理诊断作为金标准,分析具体的诊断结果。**结果:** 在本次研究的 50 例患者中,良性肿瘤患者为 35 例,恶性患者为 15 例。经腹部磁共振弥散加权成像技术联合普美显造影剂检查,检测的恶性肿瘤阳性率和病理学诊断没有明显差异性, $P>0.05$ 。基于病理结果作为金标准,检查的敏感度为 88.23%,特异度为 100%,准确度为 96%。**结论:** 应用腹部磁共振弥散加权成像技术联合普美显造影剂鉴别诊断肝脏良恶性肿瘤疾病,能充分发挥临床应用价值,提高诊断效率,保证疾病的有效治疗。

宫颈软斑病 1 例回顾分析

崔诗洽
宁波市第二医院

目的：对我院收治的一例宫颈软斑病患者的临床、病理及影像资料进行报道，以加深对该疾病的认识。

材料与方法：观察和分析 1 例宫颈软斑病患者的临床特征、影像学表现及组织病理学特征，并进行相关文献复习。

结果：患者女性，57 岁，反复阴道不规则出血，发现宫颈软斑病 2 年，既往胸腺恶性肿瘤手术，术后复发 3 次。B 超及 MRI 增强提示宫颈及阴道富血供占位；术前病理活检证实宫颈软斑病。手术行子宫及阴道部分切除术，粗测肿块长 8 厘米，宽 2 厘米，肿瘤质地软，色黄。

结论：宫颈 MP 极为罕见，是一种可治愈性疾病。影像学常表现为宫颈占位性病变，临床上易误诊为宫颈癌等恶性肿瘤，确诊主要依靠病理。

Multi-Parameter Spectral CT Enhanced Imaging for Differential Diagnosis of Portal Vein Thrombosis and Malignant Thrombosis

Zhihao Wang¹, Yuhan Zhou¹, Weimeng Cao¹, Limin Lei¹, Jie Liu¹, Weihua Chen¹, Shushan Dong²
1. The First Affiliated Hospital of Zhengzhou University
2. Philips Medical

Purpose: This study is to investigate the differential diagnostic performance of spectral-based image-enhanced imaging for portal vein thrombosis (PVT) and malignant thrombus (MT), with the aim of enhancing the clinical efficiency of differential diagnosis between the PVT and MT.

Methods: This retrospective study included 100 patients with portal vein thrombosis who underwent spectral CT imaging from February 2023 to April 2023. According to clinical data and pathological diagnosis, 52 cases of portal vein thrombosis and 48 cases of malignant thrombosis were enrolled. Using post-processing software, conventional CT images (CI), iodine density maps (ID), effective atomic number maps (Z-eff), and spectral curves were reconstructed from the spectral data. Regions of interest (ROIs) were drawn at the site of occlusion, and CT values (CIHU), iodine density values (ID), effective atomic numbers (Z-eff), and spectral curve slopes were measured (λ HU). Independent sample t-tests were used to analyze the differences between parameters. A single-factor logistic regression was used to evaluate the predictive probability of spectral multi-parameters for portal vein thrombosis and tumor thrombus, and a spectral multi-parameter combined model was established. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) and cutoff value were calculated to compare the diagnostic efficacy of various spectral parameters in differentiating portal vein thrombosis and tumor thrombus.

Results: Compared to CT values (AUC 0.92, cutoff value 142.5, sensitivity 86%, specificity 93%), ID values (AUC 0.965, cutoff value 3.24, sensitivity 92%, specificity 96.5%), Z-eff values (AUC 0.952, cutoff 12.05, sensitivity 90%, specificity 96.2%), and λ HU values (AUC 0.962, sensitivity 96%, specificity 95%), the multi-parameter spectral combined model (AUC 0.97, sensitivity 94%, specificity 97%) exhibits the highest discriminatory power in distinguishing between portal vein thrombosis and malignant thrombosis.

Conclusion: The multi-parameter spectral combined model exhibits superior differential diagnostic capabilities compared to traditional CT values and various spectral parameters for distinguishing between portal vein thrombosis and cancer thrombus.

Spectral multi-parameter CT can help clinicians accurately determine the nature, lesion homogeneity, location, size, and adjacent relationship of portal vein thrombi. This provides more accurate imaging evidence for the early diagnosis, treatment strategy, and prognosis prediction of tumor patients.

PU-1060

The Correlation of Coronary Artery Calcification Score of Dual-Source CT , Abdominal Aortic Calcification Score with Stage III- V Chronic Renal Disease

Nannan Kang
Zhongshan Hospital Affiliated to Xiamen University

Objective To explore the correlation between dual-source CT coronary artery calcification score (CaCS), abdominal aortic calcification score (AACS) and chronic kidney disease (CKD) at stage III-V.

Methods 63 cases of stage III- V CKD were retrospectively reviewed. All patients underwent dual-source CT and lateral abdominal X-ray examination. The CaCS value of each branch of coronary artery, total CaCS value, and AACS value were measured. The Kruskal-Wallis test, Chi-square test or Fisher's exact test were used to evaluate the difference of each index. Spearman correlation analysis was used to evaluate the correlation between different stages CKD and coronary artery calcification.

Results As CKD progressed, total CaCS also significantly increased ($P < 0.05$). CKD in different stages was positively correlated with the incidence of coronary vascular calcification ($r = 0.53$, $P = 0.000$) and multivessel calcification ($r = 0.32$, $P = 0.01$). Compared with LM calcification, coronary calcification of CKD at different stages was more common in LAD, LCX and RCA. The incidence of calcification is positively correlated with CKD stage ($P < 0.05$).

Conclusion Stage III-V CKD is strongly relevant to CaCS; With the progress of CKD, the incidence of coronary calcification is higher and the range of involvement is wider.

PU-1061

钆塞酸二钠增强 MRI 对肝细胞癌微血管侵犯的定量预测价值

陈培培
徐州医科大学附属医院

目的: 探讨钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 对肝细胞癌 (HCC) 微血管侵犯 (MVI) 的预测价值。**方法:** 回顾性分析 2017 年 1 月至 2020 年 5 月期间于本院经手术病理证实为 HCC 的 70 例患者共 77 个病灶, 所有患者在肝脏部分切除或肝移植手术前 2 周内均进行过 Gd-EOB-DTPA 增强 MRI 检查。根据术后病理结果是否存在 MVI 将所有病灶分为 MVI 阳性组及 MVI 阴性组, 并记录患者的临床指标包括甲胎蛋白 (AFP)、丙氨酸转氨酶 (ALT) 和天冬氨酸转氨酶 (AST)。观察记录病灶定量指标, 包括肿瘤直径、各期 (平扫、增强后动脉期、门静脉期、过渡期及肝胆期) 病

灶及竖脊肌信号 (SI)，计算各期病灶-竖脊肌信号比 (LMR) 和增强后各期 (动脉期、门静脉期、过渡期及肝胆期) 病灶-竖脊肌信号比的增长率 (Δ LMR)。采用 Kolmogorov-Smirnov (K-S) 对定量参数进行正态性检验，对于非正态定量参数比较采用 Mann-Whitney U 检验。结果：MVI 阴性组与 MVI 阳性组间肿瘤直径、门静脉期和过渡期的 LMR 差异具有统计学意义 ($P<0.05$)，两组间患者年龄、AFP 值、ALT 值、AST 值、各期 (平扫、动脉期、门静脉期、过渡期、肝胆期) SI、(平扫、动脉期、肝胆期) LMR 和增强后各期 (动脉期、门静脉期、过渡期、肝胆期) Δ LMR 差异均不具有统计学意义 ($P>0.05$)。结论：Gd-EOB-DTPA 增强 MRI 可术前预测 HCC MVI，肿瘤直径对 HCC MVI 的预测具有重要价值。

卵巢成熟畸胎瘤恶变为癌肉瘤 1 例并文献复习汇报

蔡娇、郑继坤、李国晖
云南省中医医院

卵巢成熟囊性畸胎瘤大部分为良性肿瘤，好发于育龄期女性，但随着年龄的增高，恶变率逐渐增大，占 1%-3%，以鳞癌、腺癌多见，恶变为癌肉瘤者极其罕见，因其没有特征性临床表现，发现时一般较晚，常易误诊。恶变类型主要依靠病理免疫组化确诊，但影像学检查可提供一定的辨别能力。现将 1 例卵巢畸胎瘤恶变为癌肉瘤的影像学表现进行分析总结，并复习文献进行汇报，以提高对本病的影像学认识。

基于血管进入征所构建的列线图对胃癌脉管浸润的预测价值

张静、李勇爱、赵亮、武俊波、郭钰、杜康佳、葛慧捷、肖宁
长治市人民医院

目的：探讨基于血管进入征所构建的列线图对胃癌脉管浸润 (LVI) 的预测价值。

方法：采用回顾性病例对照研究方法，收集 2021 年 10 月至 2022 年 10 月长治市人民医院 135 例经病理确诊为胃癌患者的临床病理资料。根据有无脉管浸润分为 LVI (+) 组 ($n=91$) 及 LVI (-) 组 ($n=44$)。按照 7:3 的比例将所有患者随机分为训练集 ($n=95$) 和验证集 ($n=40$)。收集患者的 CT 及临床特征，包括血管进入征，动脉期和门静脉期的 CT 值、标准化 CT 值 (nCT)、肿瘤部位、肿瘤最大径、cT 分期、cN 分期、胃镜病理分化程度、肿瘤标志物 (CA19-9、CA724、CA125、CEA) 及 ABO 血型。采用单因素及多因素分析，探讨胃癌脉管浸润的独立影响因素，构建列线图模型 (模型 1)，作为对比，将去除血管进入征后的其他独立影响因素建立模型 2。绘制两个模型的受试者工作特征 (ROC) 曲线、校准曲线及决策曲线 (DCA) 评估模型的诊断效能及临床获益。

结果：多因素分析显示血管进入征、分化程度、cT 分期、cN 分期及 CA19-9 阳性为胃癌脉管浸润的独立影响因素 ($P<0.05$)。根据多因素分析结果，构建预测胃癌 LVI 状态的列线图模型 (模型 1：含血管进入征) 和对照模型 (模型 2：不含血管进入征)，模型 1 和模型 2 在训练集和验证集中 AUC 分别依次为 0.853 与 0.848，0.810 与 0.820，两模型 AUC 差异具有统计学意义。校正曲线结果显示模型 1 预测胃癌 LVI 的概率与实际概率吻合度较高。决策曲线结果显示模型 1 有较好的临床获益。

结论：血管进入征可作为胃癌 LVI 的独立影响因素，其与临床指标联合构建的列线图模型对胃癌 LVI 有较好的预测效能，可以为临床医生提供较准确的诊断和决策支持。

PU-1064

增强 CT 征象联合肿瘤标志物对宫颈癌淋巴结转移的预测价值研究

刘凤娜、张祥林
锦州医科大学附属第一医院

目的

探讨增强 CT 征象联合血清肿瘤标志物 SCC、CA125 和 CEA 对宫颈癌患者淋巴结转移的诊断价值。

方法

选取锦州医科大学附属第一医院 2019 年 1 月-2023 年 6 月收治的宫颈癌患者 107 例,以患者术后组织病理学检查为"金标准",根据其发生淋巴结转移与否分为淋巴结未转移组 86 例和淋巴结转移组 21 例。记录患者影像学特征(包括淋巴结大小、形态、融合情况、强化方式及强化程度)及临床病理因素(包括年龄、分化程度、神经侵犯、脉管癌栓、肿瘤标志物 CA125、CEA、SCC 的表达水平),应用卡方检验、独立样本 T 检验或曼惠特尼检验对两组进行单因素及多因素二元 Logistic 回归分析,以 $P<0.05$ 为具有统计学意义。应用受试者-操作特征曲线分析,评价增强 CT 和肿瘤标志物单独及联合诊断的方式对宫颈癌淋巴结转移的诊断价值。

结果

单因素分析显示淋巴结短径、有无融合、强化表现、肿瘤分化程度、脉管癌栓、SCC、CA125 是宫颈癌淋巴结转移的危险因素($P<0.05$)。

多因素二元 Logistic 回归分析显示淋巴结短径、SCC、脉管癌栓是宫颈癌发生淋巴结转移的独立危险因素($P<0.05$)。

增强 CT 诊断宫颈癌淋巴结转移的曲线下面积为 0.817,其敏感性、特异性及准确率分别为 42.8%、97.7%、86.9%。肿瘤标志物诊断宫颈癌淋巴结转移的曲线下面积为 0.692,其敏感性、特异性及准确率分别为 19%、98.8%、82.2%。CT 及肿瘤标志物联合诊断的曲线下面积为 0.837,其敏感性、特异性及准确率分别为 47.6%、98.8%、88.8%。

结论

淋巴结短径、淋巴结有无融合、强化表现、肿瘤分化程度、脉管癌栓、SCC、CA125 是宫颈癌淋巴结转移的危险因素。

淋巴结短径、SCC、脉管癌栓是宫颈癌发生淋巴结转移的独立危险因素。

CT 征象联合肿瘤标志物可提高诊断宫颈癌淋巴结转移的敏感性、特异性及准确度,更好的指导宫颈癌治疗方案的选择。

基于 CT 影像组学列线图在胰十二指肠切除术后胰瘘的应用研究

王月燕
蚌埠医学院第一附属医院

目的 探讨基于术前增强 CT 影像组学联合临床因素构建的列线图模型对胰十二指肠切除术后胰瘘的预测价值。**材料与方法** 回顾性收集接受胰十二指肠切除术的 82 名患者的临床和腹部影像资料,并以 3:2 比例随机划分为训练集和验证集。于 CT 增强门静脉期选取胰管最大直径平面勾画胰腺实质作为感兴趣区,通过采用方差阈值法、SelectKBest 和最小绝对收缩和选择算法筛选最优影像组学特征,将影像特征加权求和得到的影像组学评分建立影像组学模型。同时收集患者 18 项临床相关资料,通过 logistic 回归筛选术后胰瘘的危险因素建立临床模型。最终联合 Rad-score 及临床预测因子构建列线图模型。通过受试者工作特征曲线、校准曲线、临床决策曲线分析用以评价模型的预测效能。**结果** 筛选出 7 个影像组学特征和 2 个临床因素分别构建影像组学模型和临床模型,最终

列线图模型预测效能最佳,其曲线下面积(AUC)在训练集和验证集分别为 0.862、0.806; Hosmer-Lemeshow 检验表明预测模型与理想模型的一致性较好;决策曲线分析显示列线图模型在 2%~99% 范围内具有较高的临床适用性。结论 基于 CT 影像组学列线图模型较单独模态的临床模型和影像组学模型更能有效的预测术后胰痿的发生,可以为临床决策提供重要指导。

18F-FDG PET-CT 显像弥漫性大 B 细胞淋巴瘤累及前列腺

陈东雪、孙华、冯中政、谷明秋、胡鹏
云南省肿瘤医院

弥漫性大 B 细胞淋巴瘤 (Diffuse large B-cell lymphoma, DLBCL) 是一种常见的侵袭性 B 细胞非霍奇金淋巴瘤 (B-cell non-Hodgkin lymphoma, B-NHL)。18-氟脱氧葡萄糖正电子发射断层扫描/计算机断层扫描 (fluorine-18-uorodeoxyglucose positron emission tomography/computed tomography, 18F-FDG PET/CT) 是指导 DLBCL 活检、确定疾病范围和评估对治疗的代谢反应的一种有价值的成像方式,它也为鉴别诊断提供了重要信息。DLBCL 的前列腺受累极为罕见,仅在少数病例报告中有所描述。在此,我们介绍一例 61 岁的男性患者,他因胸背部、颈肩部疼痛 3 个月入院。在 PET-CT 扫描中提示前列腺体积增大伴代谢增高,经尿道前列腺左侧肿物切除标本的组织病理学和免疫组织化学检查确诊为 DCBCL。认识和准确诊断对于指导临床制定诊疗方案非常重要。

Develop a better nomogram for prediction of preoperative microvascular invasion and postoperative prognosis in HCC patients: a comparison study

Huan Li^{1,2}, Jinxia Pei^{1,2}, Liangping Ni^{1,2}, Hong Zhao^{1,2}, Xijun Gong^{1,2}, Longsheng Wang^{1,2}
1. The Second Affiliated Hospital of Anhui Medical University
2. Medical Imaging Research Center, Anhui Medical University

Objectives Clinically available preoperative reliable microvascular invasion (MVI) prediction models and postoperative accurate MVI pathological grade related recurrence prediction models facilitate personalized precision medicine. We aim to compare different mathematical models to derive the best preoperative prediction model and postoperative recurrence prediction model for MVI.

Methods A total of 143 hepatocellular carcinoma (HCC) patients with clinical, laboratory, imaging, and pathological data were included in the analysis. Logistic regression, Cox proportional hazards regression, Lasso regression and 10-folds cross-validation, stepwise regression, and random forest methods were used for variable screening and predictive modeling. The accuracy and validity of 7 preoperative MVI prediction models and 5 postoperative recurrence prediction models were compared in terms of C-index, net reclassification improvement (NRI), and integrated discrimination improvement (IDI), respectively.

Results Preoperative use of a nomogram model containing cirrhosis, AFP>400, diameter, shape, and number of lesions that screened by multivariate logistic regression can more reliably predict MVI in HCC patients. Postoperative use of a nomogram model including MVI grade, number of lesions, involving the capsule, macrovascular invasion, and shape which selected through Lasso regression and 10-folds cross-validation method can more accurately predict prognosis for different MVI grades. The number and shape of lesions was the most common predictor in predicting MVI preoperatively and recurrence postoperatively.

Conclusion Our study identifies the best statistical approach for the prediction of preoperative MVI in HCC patients based on clinical, imaging, and laboratory tests, as well as postoperative recurrence. Which could improve preoperative treatment decisions and postoperative management.

PU-1068

Schistosomiasis granuloma of appendix mimicking appendiceal tumor

Huan Li^{1,2}, Xijun Gong^{1,2}, Longsheng Wang^{1,2}

1. The Second Affiliated Hospital of Anhui Medical University

2. Medical Imaging Research Center, Anhui Medical University

A 73-year-old man with a medical history of COPD presented with abdominal pain and malnutrition for a-half-year. He denied any other recognizable precipitating factors, such as fever, night sweats, nausea, or vomiting. His symptoms gradually improved after symptomatic treatment at the local hospital and referred to us for further evaluation.

Abdominal contrast CT imaging showed an origin of appendix irregular ring-like soft-tissue mass with unclear boundaries, central necrosis, smooth nodular calcification at the edge, surrounding calcified lymph nodes, and moderate enhancement. Furthermore, chest CT imaging showed right upper lung old tuberculosis lesions. Though there is a strong hint to support infections on CT features (such as obscure boundaries and calcified lymph nodes), appendiceal tumor or tuberculosis could not be excluded completely.

Serum levels of tumor markers (AFP, CA199, CA724, PSA, CEA, NSE) were all normal. 72h tuberculin test, serum tuberculosis antibody, serology for hepatitis, HIV, and Treponema pallidum were also negative. Only blood routine indicates he suffered mild anemia. Further endoscopy examination was arranged for the first time. Endoscopy reports malignant neoplasm while biopsies' pathologic result confirmed it was mucous chronic inflammation. Combine his relevant examination findings, there was not sufficient evidence to diagnose tuberculosis or tumor, so we suggested he took levofloxacin in combination with metronidazole as medicine therapy before new biopsies by endoscopic ultrasound to get a final diagnosis.

Endoscopic ultrasound was examined ten days later and biopsies' pathology revealed Schistosoma egg deposit submucous membrane of appendix and ileocecum. In the meantime, rechecking of CTE (CT enterography, CTE) confessed the effectiveness of anti-inflammatory therapy. Finally, intestinal schistosomiasis was diagnosed; he was transferred to the local Schistosoma Prevention Institute for further professional treatment.

Alimentary tract schistosomiasis granuloma is an acute and chronic specific inflammatory disease caused by Schistosoma eggs invading digestive tract mucosa and depositing in the intestinal wall. It has been rarely seen because of the improvement of living standards and hygienic environment, so its clinical manifestations are not precise and medical diagnosis will be difficult. This case reminds us infectious diseases should be included in the differential diagnosis (such as schistosomiasis granuloma) when a soft-tissue mass was found in the intestinal tract, and that would be a great help to avoid blind surgery.

PU-1069

排粪造影临床应用研究进展

王彩云

西安市中医医院 (西安市中医药研究院)

排粪造影是在患者在“排粪”时对其肛门直肠部进行动态和静态的检查方法,可动态显示肛管直肠部的器质性和功能性异常,在出口梗阻型便秘、女性盆底肌功能障碍性疾病等的诊断以及便秘手术治疗的预测具有重要的临床应用价值。目的:本研究通过整理、回顾自 2013 年 1 月至今排粪造影临床研究结果,旨在概述排粪造影临床研究进展。方法:搜集收录于中国知网、万方、维普、中华医学会期刊的排粪造影相关文章,其中关键词“排粪造影”、“X 线排粪造影”,共有 237 篇排粪造影相关文章,排除 1 篇博士论文,13 篇硕士论文,10 篇综述等,共 116 篇临床研究纳入本次研究。结果:结果主要分为排粪造影在传统中医和西医两大医学中的研究进展及排粪造影技术方面的临床最近进展进行分别描述。(1)中医排粪造影征象与中医证型之间存在密切相关,如为中医诊断中气下陷型肛门坠胀提供客观依据等,此外在排粪造影的动态观察为中医治疗便秘疗效提供客观证据。(2)西医排粪造影不同时相测量指标在诊断轻中度直肠黏膜脱垂、直肠前突、盆底失迟缓综合征、出口梗阻型便秘、耻骨直肠肌综合征、盆底功能障碍性疾病等诊断与鉴别中具有分别具有重要应用价值,其中采用站立正位黏膜成相对直肠黏膜脱垂诊断价值更高,排粪造影在轻中度直肠前突中具有更高的准确性。此外,排粪造影常用语便秘临床术后疗效评估,如经肛吻合器直肠切除术治疗直肠前突和内套导致的出口型梗阻便秘,目前临床有效率达 67.4%,而术前排粪造影可早期预测疗效,此外针对直肠前突便秘的球囊在辅助排便中具有可行性等。(3)排粪造影技术主要包括改良不同时相指标的测量方法(如直肠前突测量方法)、灌肠剂硫酸钡浓度、排粪造影助推器(提高灌肠药物的流畅)、联合其他技术提高诊断便秘等诊断价值。结论:排粪造影通过改良造影技术、联合其他检查在出口梗阻型便秘、女性盆底肌功能障碍性疾病等的诊断以及便秘手术治疗的预测具有重要的临床应用价值。

卵巢子宫内膜样腺纤维瘤 CT 及 MR 表现一例并文献复习

郭慧慧

河南省人民医院

目的:探讨卵巢罕见肿瘤子宫内膜样腺纤维瘤的 CT 及 MR 特点。方法:回顾性分析一例经病理证实的卵巢子宫内膜样腺纤维瘤 CT 及 MR 表现,并通过文献复习总结其影像特征及鉴别诊断。结果:子宫内膜样腺纤维瘤以囊实性多见,囊壁外缘光整,边界清晰,病变内常见多囊样表现,实性部分以 T2 低信号为主要特征,可伴营养不良性钙化,增强扫描延迟强化,常伴有子宫内膜异常增厚及(或)子宫内膜异位表现。结论:卵巢子宫内膜样腺纤维瘤虽然罕见,仍有相对特征性影像表现提示该诊断,但需与以 T2 低信号为特征及伴有子宫内膜增厚、异位的其他卵巢肿瘤相鉴别。

PU-1071

乳头状肾癌的 CT 及 MRI 表现

梁雯雯

上海市浦东新区公利医院

目的: 探讨乳头状肾癌的 CT 和 MRI 表现, 提高术前影像诊断的准确率。方法: 回顾性分析 2016 年 1 月至 2023 年 9 月经手术和病理证实的乳头状肾癌 8 例, 8 例均行 CT 和 MRI 扫描, 总结影像特征。结果: CT 级 MRI 表现为实性 7 例, 囊实性 1 例; 8 例均呈轻度强化; 5 例表现为 T1WI 等或低信号, T2WI 稍低信号; 1 例呈 T1WI、T2WI 混杂高信号改变。结论: 乳头状肾癌一般为实性肿块, 属乏血供病变, 增强后轻度强化, MRI T2WI 呈稍低信号可与其他病理类型的肾癌相鉴别。

PU-1072

成人型腹膜后海绵状淋巴管瘤 1 例

罗菲

十堰市太和医院 (湖北医药学院附属医院)

成人型腹膜后海绵状淋巴管瘤 (Adult retroperitoneal cavernous lymphangioma, ARCL) 是一种非常罕见的良性肿瘤, 常常在体检时发现, 约 90% 发生于 2 岁以下的儿童, 腹膜后来源的成人型淋巴管瘤较为少见, 多以文献报道形式呈现, 海绵状淋巴管瘤属于淋巴管瘤的一种, 且临床症状不典型, 早期发现依赖于影像诊断, 故对该病例的来源、临床症状、影像诊断及鉴别诊断、治疗中的细节、手术方式及预后等方面进行回顾性分析, 可进一步提高医务工作者对该病的认知, 可该病后续的临床诊断、治疗及预后有所帮助。病例资料: 患者女, 37 岁, 门诊以“体检发现腹膜后占位半月余”收住我院。专科查体及实验室检查无特殊。腹部 CT 平扫及增强示: 右侧腹膜后 (右肾下方) 多发囊性结节融合成团块状, 边缘清楚、呈分叶状, 最大层面范围约 10.4cmX11.3cmX11.6cm, 内见分隔并钙化, 增强分隔可见明显强化。术后病检: (腹膜后肿瘤) 间叶源性肿瘤, (腹膜后肿瘤) 海绵状淋巴管瘤。随访半年无复发。

PU-1073

腹部组织细胞肉瘤一例报告并文献复习

李倩

中国人民解放军陆军第九五八医院

目的 本院一例腹部组织细胞肉瘤病例报道, 探讨其 CT 表现及相关鉴别诊断。

资料与方法 回顾性分析一例经组织病理学确诊的组织细胞肉瘤基本资料及 CT 表现: 患者为 55 岁男性, 入院 4 年前, 明确诊断右肺腺癌并行手术治疗, 术后化疗。5 月前诊断“原发性支气管肺癌, 右上肺腺癌 T4N3M1c IVb 期, 颈部、锁骨上窝淋巴结、肺内、胸壁转移”。

结果 因有恶心、呕吐、腹部不适, 行全腹部 CT 增强检查: 左下腹见团块状混杂密度影, 边缘呈分叶状, 长径约 6.5cm, 增强扫描不均匀轻-中度强化, 其旁及其内见血管穿行, 其旁见囊状无强化低密度影, 其内见多发结节状无/弱强化低密度影, 病灶与邻近肠管分界不清, 其周围脂肪间隙模糊, 邻近腹膜、大网膜增厚; 小肠梗阻, 梗阻点位于左下腹-盆腔, 梗阻原考虑肠套叠, 相应肠壁不均匀增厚、肿胀; 盆腔偏右侧局部肠壁不均匀增厚。最终病理证实上述三处为组织细胞肉瘤。本例鉴别诊断主要包括: 平滑肌肉瘤、滑膜肉瘤、间质瘤、肠癌、恶性间皮瘤等。

结论 组织细胞肉瘤是来源于单核/巨噬细胞系统非朗格汉斯组织细胞的一种罕见的造血肿瘤，诊断主要依靠病理、免疫组化，而影像表现无特异性的原因可能是对其认识及积累不足导致的，希望通过对本病例的回顾可以进一步增强对该类疾病的学习。

Performance of Machine Learning Applications in Image Mining for Diagnosing Muscle-invasive Bladder Cancer: A Systematic Review and Critical Appraisal

Chunlei He¹, Bin Song^{1,2}, Yuntian Chen¹

1. West China Hospital of Sichuan University

2. Department of Radiology, Sanya People's Hospital

Background

Radiomics and deep learning are noninvasive approaches to predict the muscle invasion. We aimed to systematically evaluate the methodological quality of the eligible studies regarding radiomics or deep learning models in predicting the muscle invasion of bladder cancer and evaluate the model performance of the available studies.

Method

PubMed, Cochrane, and Embase were searched from inception up to July 2023. The methodological quality of the included studies was assessed using the Radiomics Quality Score (RQS) and Prediction model Risk of Bias Assessment Tool. A meta-analysis was conducted to evaluate the performance of radiomics or deep learning model. Further sensitivity analysis, subgroup analysis and meta-regression were conducted to investigate contribution of moderators to heterogeneity.

Result

Twenty-two articles with 4330 patients were included finally. The mean RQS was 10.1 (range 0 to 14). The overall risk of bias was found to be high, and the overall applicability was of low concern in all included studies. The pooled sensitivity, specificity and AUC were 0.83 (95% CI [0.77, 0.88]), 0.81 (95% CI [0.75, 0.85]), and 0.88 (95% CI [0.85, 0.91]), respectively.

Conclusion

Our meta-analysis showed the excellent diagnostic performance of radiomics or deep learning model in predicting the muscle invasion in bladder cancer. More standardized methodology in the radiomics workflow to achieve robust and reproducible results in future research are imperative to translate the results to clinical application.

定量 CT 测量身体组分在肝硬化门静脉高压并发症中

刘田田、宫希军

安徽医科大学第二附属医院

【摘要】目的：基于定量 CT (QCT) 探讨肝硬化患者身体组分定量指标与门静脉高压并发症的相关性及其应用价值。方法：纳入 2021 年 11 月至 2023 年 2 月于我院就诊的 134 例肝硬化患者，受试者均行腹部 CT 平扫，收集临床资料并用 QCT Pro 软件测量每例受试者 L2/3 层面皮下及内脏脂肪面积 (SAT、VAT)、腰椎骨密度 (BMD)、肝脏脂肪分数 (Fat%-QCT)、L3 椎体水平全腹肌和椎旁肌面积 (SMA、PMA) 及肌肉脂肪面积并计算肌肉脂肪含量 (IMAC-S、IMAC-P)。在不同 Child-Pugh 分级中进行组间资料比较，并根据有无门静脉高压并发症将患者分为两组比较身体组分差异，Mann-Whitney U 检验或 Kruskal-Wallis H 检验、t 检验或单因素 ANOVA 检验、 χ^2

检验用于各组间基本资料与身体组分的差异性分析;采用二元 Logistic 回归分析与肝硬化门静脉高压并发症相关的 QCT 指标,使用受试者工作特征曲线(ROC 曲线)检验不同模型的识别效能。结果: Fat%-QCT、SAT、椎旁肌内脂肪面积、IMAC-P 在不同 Child-Pugh 分级中差异有统计学意义($P<0.05$);多因素 Logistic 回归分析显示 SAT 是肝硬化门静脉高压并发症的独立相关因素($P<0.05$, OR: 0.987); SAT、SAT 联合全腹肌指标、SAT 联合椎旁肌指标的 ROC 曲线下面积(AUC)分别为 0.727、0.772、0.769($P<0.05$), SAT 联合全腹肌指标的敏感性 & 特异性分别为 0.734、0.800, 优于 SAT、SAT 联合椎旁肌指标,识别效能最高。结论: SAT 减少是肝硬化门静脉高压并发症风险增加的独立危险因素, SAT 联合全腹肌指标能较好的识别肝硬化门静脉高压并发症。

基于肝细胞癌增强 MRI 影像预测 Ki-67 表达的放射组学研究

崔馨元、姜慧杰、孙丽琴
哈尔滨医科大学附属第二医院

目的:建立并验证基于肝细胞癌增强 MRI 图像的临床因素的模型来预测 Ki-67 在 HCC 中的表达水平。材料和方法:本回顾性研究分析了 134 例 HCC 患者的数据。通过单因素和多因素逻辑回归分析区分 Ki-67 高表达(>20%)和低表达($\leq 20\%$)的临床因素。从增强 MRI 图像中提取影像组学特征。采用 LASSO 筛选放射组学特征并构建模型,采用 AUC、准确度、精密度、召回率来评估模型的性能。结果:多因素分析结果显示 AFP 水平、肿瘤大小、肿瘤数目是 Ki-67 高表达 HCC 的独立影响因素。临床模型 AUC 值为 0.812,影像组学模型的 AUC 值为 0.834,联合影像组学和临床因素的联合模型性能最佳, AUC 值为 0.913。在验证集中, Delong 检验结果显示联合模型的性能明显提高。决策曲线分析进一步证实了联合模型的临床应用价值。结论:基于增强 MRI 影像组学特征和临床因素的联合模型在术前预测 HCC 中 Ki-67 表达方面具有良好的性能,在指导临床治疗规划中具有重要的意义。

PU-1077

多层螺旋 CT 血管三维重建技术在女性生殖系统巨大肿瘤定位诊断中的应用

许晨阳、文泽军
河南省人民医院

目的 探讨多层螺旋 CT 血管三维重建技术在女性生殖系统巨大肿瘤定位诊断中的应用价值。方法 回顾性分析河南省人民医院 2023 年 1—6 月经病理证实的 18 例女性生殖系统巨大肿瘤(卵巢肿瘤 10 例,子宫肿瘤 8 例),采用多层螺旋 CT 血管三维重建技术寻找肿瘤供血动脉,进行定位诊断,并与病理结果对照分析。结果 18 例女性生殖系统巨大肿瘤,将卵巢动脉单独供血 3 例、子宫动脉卵巢支单独供血 2 例、子宫动脉卵巢支与卵巢动脉共同供血 5 例,共 10 例定位为卵巢来源的肿瘤。将子宫动脉单独供血 5 例、由子宫动脉供血为主,卵巢侧支动脉供血为辅的 3 例,共 8 例定位为子宫来源的肿瘤,其结果与病理结果完全吻合。结论 多层螺旋 CT 血管三维重建技术可以显示女性生殖系统巨大肿瘤的供血动脉来源,为定位诊断提供了依据。

PU-1078

增强磁共振成像对诊断肝外胆管癌的价值

杨婷、魏鸿、陈婕、蒋涵羽、陈钊地、宋彬
四川大学华西医院

目的: 建立一个基于对比增强磁共振成像(magnetic resonance imaging, MRI)和临床特征的肝外胆管癌(extrahepatic cholangiocarcinoma, eCCA)诊断模型。

材料与方法: 回顾性纳入 2014 年 4 月至 2022 年 9 月于我院行病理检查, 且检查前 1 个月内行 MRI 增强检查的肝外胆管病变患者。MRI 图像由两名放射科医生在对临床病理信息不知情的情况下独立评估, 采用单因素和多因素逻辑回归分析确定与 eCCA 相关的显著临床放射学特征, 然后将其纳入诊断模型, 利用受试者工作特征曲线(the area under the receiver operating characteristic curve, AUC)、校准曲线和决策曲线下的面积来评估模型的性能。

结果: 本研究共纳入 182 例患者(平均年龄 60.8 ± 10.0 岁, 男性 117 例), 其中 144 例(79%) 经病理确诊为 eCCA。弥散受限($P < 0.001$), 病变外周不清晰 ($P=0.010$), 胆石症($P=0.049$), InCA125 ($P=0.010$)和 InDBIL ($P<0.001$)与 eCCA 独立相关。结合上述 5 个变量, 诊断模型的 AUC 为 0.912 (95% CI: 0.859-0.965), 具有拟合的校准曲线 ($P=0.815$) 和良好的临床效用。该模型的敏感性、特异性和准确性分别为 83.33%、86.84%和 84.07%。

结论: 结合两种 MRI 增强特征 (病变外周不清晰和弥散受限) 和三个临床特征(胆石症、InCA125 和 InDBIL) 的诊断模型可以准确预测 eCCA。该模型有可能促进 eCCA 的早期诊断, 从而及时进行治疗干预并最终改善临床结果。

PU-1079

Prognosis of assessment based on clinical and Computer Tomography characteristics for Hepatocellular carcinoma with portal tein tumor thrombus

Lizhong Jia
First People's Hospital of Wuhu City

Patients with hepatocellular carcinoma (HCC) complicated by portal vein tumor thrombus (PVTT) have an extremely poor prognosis. It is important to select adequate therapeutic options based on reliable prognostic factors using imaging studies and clinical data.

Prognostic factors were analyzed in patients with HCC with PVTT in the first branch or main trunk of the portal vein. From 2012 to 2022 107 consecutive patients with HCC with PVTT in the major portal vein were reviewed, and diagnostic images and clinical characteristics were retrospectively observed. Thirty-eight possible prognostic factors for survival were analyzed by the log-rank test and multivariate analysis using Cox's proportional hazards model. Median overall survival was 14 months following PVTT diagnosis. Survival rates at 6 months, 1, 2, and 3 years were 72.1%, 52.6%, 32.6%, and 29.6%, respectively. Independent prognostic factors for longer survival included: patient age < 65 years, Child-Pugh classification A/B, PVTT treatment, accumulation of Lipiodol in the PVTT after TACE, initial radical treatment for HCC, HCC located in a single lobe of the liver, and no invasion of HCC to the hepatic vein or bile duct.

Survival was associated with liver function, tumor extension, and treatment for HCC and PVTT.

PU-1080

小肠 ct 评分在 CD 诊断中的价值

潘景润

安徽医科大学第二附属医院

【摘要】目的：验证克罗恩病（CD）的小肠 CT（CTE）评分方法，与内镜、临床评分比较，探讨 CTE 的诊断价值。**方法：**回顾性分析 2018 年至 2022 年安徽医科大学第二附属医院 CD 确诊患者，用初拟定 CTE 评分方法分别对两组患者评分，结果绘制工作特征曲（ROC）曲线，从而进行验证，观察评分系统效能，同时比较 CTE 指标中肠壁强化与临床及内镜指标相关性。**结果：**ROC 曲线下面积比较得出 CTE 评分系统曲线下面积较高，灵敏度及特异度也较单纯临床、内镜指标高，肠壁分层强化对诊断 CD 及其鉴别有一定价值，并与临床及内镜评分有正相关。**结论：**CTE 制定的评分标准对 CD 的诊断特异度及灵敏度均较高。

PU-1081

Gd-BOPTA 及 APT 在肝脏局灶性病变诊断中的价值

任雪¹、赵莹¹、许岂豪¹、宋清伟¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦医疗

【目的】探讨 Gd-BOPTA 及 APT 成像在肝脏局灶性病变诊断中的价值。

【方法】回顾性分析于我院行 3.0T MRI 扫描的肝脏局灶性病变患者，包括良性肿瘤（肝血管瘤）患者 18 例，原发恶性肿瘤患者 20 例（包括肝细胞肝癌患者 12 例，胆管细胞癌患者 8 例），继发恶性肿瘤（肝转移瘤）患者 19 例。所有患者均于术前行 3.0T MRI 扫描，包括常规磁共振扫描序列及 APT 扫描序列，静脉团注对比剂 Gd-BOPTA 后 60 分钟后行肝胆期成像扫描。扫描生成的 APT 图像传输至 ISP 工作站（InteliSpacePortal, Philips Healthcare），经工作站后处理分析得到 APT 图像。以 T2WI 图像为参考，在 APT 与 T2WI 融合图上勾画感兴趣区 ROI，于病灶最大层面放置 3 个 ROI 取均值，计算病灶的 APT 值。在肝胆期图像分别于病灶最大层面与同层面背景肝各放置三个 ROI 取均值，记录信号强度（SI）记为 SI 病灶与 SI 肝脏，于同层右侧椎旁肌放置一个 ROI，记录 SI 与标准差（SD），记为 SI 肌肉与 SD 肌肉。通过下述公式计算信噪比（SNR），对比噪声比（CNR），病灶-肝脏信号强度比（LLR）： $SNR_{病灶} = SI_{病灶} / SD_{肌肉}$ ； $CNR_{病灶} = (SI_{病灶} - SI_{肌肉}) / SD_{肌肉}$ ； $LLR_{病灶} = (SI_{肝脏} - SI_{病灶}) / SI_{肝脏}$ 。

采用方差分析或 Kruskal Wallis 秩和检验比较组内各参数的差异，采用非参数检验比较组间各参数差异。

【结果】良性肿瘤组、原发恶性肿瘤组及继发恶性肿瘤组间的 APT 值（ $P=0.018$ ）及 LLR（ $P<0.001$ ）差异有统计学意义。继发恶性肿瘤的 APT 值为 2.400（1.633, 2.867），显著低于良性肿瘤组（3.517（2.192, 4.858））与原发恶性肿瘤组（5.200（1.283, 8.717））；继发恶性肿瘤的 LLR 值为 0.284（0.193, 0.437），显著低于良性肿瘤组（0.512（0.376, 0.549））与原发恶性肿瘤组（0.173（0.107, 0.390））。

【结论】APT 值与 Gd-BOPTA 扫描肝胆期成像 LLR 的应用在诊断肝脏局灶性病变具有潜在的诊断价值。

PU-1082

胃肠道间质瘤术前 CT 特征及临床因素与预后的关系及复发病灶影像分析

赵炼¹、刘曦娇²

1. 成都市第六人民医院

2. 四川大学华西医院

目的：本研究旨在探索胃肠道间质瘤 GIST 患者术前增强 CT 影像特征及临床病理因素对患者预后的价值，同时分析 GIST 术后首次复发病灶的 CT 影像特征与术前影像及病理因素有无相关性。

方法：回顾性纳入 2011 年 1 月至 2021 年 9 月在我院接受根治性切除手术治疗并病理确诊的 GIST 患者。纳入标准：患者术前 1 月内接受全腹部增强 CT 检查；术后在我院随访时间在 2 年以上。排除标准：患者术前接受了其他 GIST 相关的治疗；接受内镜下剥离手术；肿瘤破裂。采用多因素 Cox 回归分析患者的术前 CT 图像特征、临床病理信息与复发及转移的关系，筛选与预后相关的重要因素，绘制生存曲线；并进一步分析了术后首次复发病灶的 CT 图像特征与其术前影像及临床病理的关系。

结果：最终纳入患者 344 例（复发组 55 例，未复发组 289 例）。单因素分析显示危险度分级、Ki-67 指数、核分裂象、术前肿瘤部位、大小、形状、生长方式、是否坏死/囊变、有无增粗供血动脉或引流静脉及邻近系膜脂肪浸润在复发组与未复发组间差异具有统计学意义 ($P < 0.05$)。多因素分析显示，术前肿瘤大小、有无增粗供血动脉或引流静脉、Ki-67 指数为 GIST 预后的独立危险因素（风险比及 95%CI 分别为 1.863, [1.836-2.887]; 3.918, [2.214-6.934]; 4.458, [1.573-9.635]; $P < 0.05$)。通过 log-rank 检验显示术前肿瘤越大、存在增粗的供血动脉或引流静脉及 Ki-67 指数 > 10 的患者无病生存率明显降低。单因素分析显示复发组患者首次复发病灶的 CT 特征，含大小、形状、强化是否均匀、有无坏死/囊变，与其术前肿瘤位置具有统计学相关性 ($P < 0.05$)；形状、强化是否均匀、有无坏死/囊变及强化程度与肿瘤 Ki-67 指数存在统计学差异 ($P < 0.05$)。

结论：本研究发现 GIST 患者术前增强 CT 影像特征及临床病理因素可以帮助预测 GIST 术后复发情况。GIST 术后复发病灶的影像特征与原发肿瘤的部位及 Ki-67 指数存在相关性。本研究结果可帮助临床医生对胃肠道 GIST 患者判断预后及制定个性化的随访策略，同时增强放射医师在随访时对复发病灶的识别。

双层探测器 CT 在减少腹部弹簧圈金属伪影中的应用价值分析

谭佳、陈亿地、蒋涵羽、杨崇图、肖童雨

四川大学华西医院

目的：探讨双层探测器 CT 的 Sub-OMAR 减影技术、OMAR 去金属伪影技术以及单能量成像在减少上腹部弹簧圈金属伪影中的应用价值。

方法：前瞻性收集在双层探测器 CT 上进行上腹部 CT 血管三维重建扫描的门静脉高压介入术后的患者，总共纳入 71 例腹部有弹簧圈金属伪影的病例。所有病例均进行阈值触发监测扫描，得到动脉期、门脉期和静脉期图像。每个期相均重建 6 种图像，包括常规图像，虚拟平扫图像，OMAR+常规图像，40keV 单能量图像，OMAR+40keV 单能量图像，OMAR+40keV 单能量图像减去同期相的虚拟平扫图像得到的 Sub-OMAR 图像。定量计算常规图像、OMAR+常规图像、OMAR+40keV 单能量图像、Sub-OMAR 图像的信噪比 (SNR)、对比噪声 (CNR) 和背景噪声。由两名独立的高年资放射科医师使用线圈伪影评分 (CA 评分：5 分 Likert 量表) 对所有图像的伪影进行定性评估。所得结果均进行统计学分析，当 $P < 0.05$ 时，差异有统计学意义。

结果： 相比于常规图像，OMAR+常规图像、OMAR+40keV 单能量图像、Sub-OMAR 图像的 SNR、CNR 和 CA 评分都得到了提高 ($P<0.05$)。另外，根据 CA 评分结果，发现 Sub-OMAR 图像比常规图像，OMAR+常规图像和 OMAR+40keV 单能量图像的去金属伪影效果更好 ($P<0.05$)，有利于显示上腹血管，特别是门静脉血管。

结论： 双层探测器 CT 的 OMAR 去金属伪影技术可以明显降低腹部 CT 图像的金属弹簧圈伪影，提高腹部血管 CT 图像的图像质量，有利于临床诊断和疗效评估。

Bronchogenic cyst mimicking as gastric neoplasm

Xiaoyu Gu, Bo Yin
Huashan Hospital, Fudan University

Bronchogenic cysts are congenital abnormalities usually occurred in the thorax . Anatomopathological standard criteria for inclusion were pseudostratified , ciliated and columnar epithelium together with the exist of at least one of the following : cartilage , smooth muscle or seromucous glands . The occurrence of these cysts in the abdominal cavity is rare . Here , we report a case (a 67- year - old man) who had no clinical symptoms and were found by chance to have a mass adjacent to the gastric cardia after routine physical examination . We found his computed tomography imaging features , including spherical cystic mass in the gastric cardia region . The mass is hypointense on T1WI, hyperintense on T2WI and hyperintense on DWI , with high ADC values and none enhancement . Accurate preoperative diagnosis remains difficult and only histology can provide a definitive diagnosis . Surgery retains the treatment of choice .

PU-1085

腹部 CT 平扫结合 QCT 身体成分值在腰椎骨密度评估的可行性

李贝贝
大连医科大学附属第一医院

分析行腹部 CT 平扫的患者的腰椎骨密度 (bone mineral density, BMD) 与身体组分、腰椎椎体、椎旁肌 CT 值的相关性，并建立基于 CT 衰减值的 BMD 的预测模型。方法：收集行全腹部 CT 平扫的中老年患者共 202 例 (64.21±0.72 岁，男 107 例，女 95 例)，采用定量 CT (QCT) 测量 L1~L3 的 BMD、肾门水平层面腹部总肌肉量 (面积)、腹内脂肪 (VAT)、皮下脂肪 (SAT)、椎旁肌内脂肪含量 (面积)，计算 VAT/SAT 值、腰椎平均骨密度 (vBMD)。在轴位图像上分别测量 L1~L3 椎体 CT 值及椎旁肌 CT 值，重复测量三次并取平均值。分析患者年龄、性别、身体组分及 L1~L3 椎体 CT 值、椎旁肌 CT 值与 BMD 相关性，根据 QCT 测量的 BMD 将受检者分为骨量正常组、低骨量组、骨质疏松 (OP) 组。分别以年龄、性别分层后，对不同骨质状态患者身体组分差异进行分析。采用线性回归建立基于 CT 衰减值的预测模型。结果：总肌肉量、腰椎 CT 值、椎旁肌 CT 值均与 BMD 呈正相关 (校正后 r 分别为 0.208、0.700、0.683, $P<0.001$)，椎旁肌脂肪含量与 BMD 呈负相关 (校正后 $r=-0.585$, $P<0.001$)，VAT/SAT 与 BMD 无相关性 ($P=0.931$)。以年龄进行分层，相同骨质状态下，VAT/SAT、椎旁肌脂肪含量、腰椎及椎旁肌 CT 值差异均无统计学意义 ($P>0.05$)。以性别进行分层，男性、女性总肌肉量、VAT/SAT、椎旁肌脂肪含量差异均有统计学意义 ($t=-8.114$ 、 -7.633 、 3.522 , $P<0.05$)；男性、女性腰椎及椎旁肌 CT 值差异无统计学意义 ($t=-1.93$ 、 -1.186 , $P=0.055$)。基于 CT 衰减值的回归方程为： $BMD = -42.08 + 0.415 \times \text{腰椎 CT 值} + 1.953 \times \text{椎旁肌 CT 值}$ ($F=187.68$, $P<0.001$, 调整 $R^2=0.651$)。模型纳入椎旁肌 CT 值后， R^2 值增加了 0.118 ($P<0.001$)。结论：腰椎及椎旁肌 CT 值与 BMD 呈正相关，椎旁肌的脂肪含量与 BMD 呈负相关，腰椎及椎旁肌 CT 值在一定程度上能够反映骨质状态。

前列腺临床显著癌列线图预测模型建立及外部验证

陈云辉¹、杨亚英¹、龙艳²、姜贤梅¹、谷何一¹、谢伟¹、彭超¹、胡娟（通讯）¹

1. 昆明医科大学第一附属医院

2. 个旧市人民医院

目的

建立及验证基于 PI-RADS V2.1 前列腺临床显著癌列线图预测模型。

方法

回顾性纳入 2019 年-2021 年昆明医科大学第一附属医院（训练集）、2020 年-2022 年个旧市人民医院（测试集）因怀疑前列腺癌而行 MRI 检查并 3 月内行穿刺活检或根治性手术患者，基于 PI-RADS V2.1 进行规范化扫描及评分，测量 ADCmean 值，收集首次 PSA 及相关值。采用 SPSS 27.0 和 R.4.2.2 进行数据分析，多重插补方式填补缺失值，病理为金标准，以临床显著癌为预测结局；逻辑回归筛选独立预测因素，对比 PI-RADS、PI-RADS +ADCmean、PI-RADS+PSAD、PI-RADS+ADC+PSAD 四种诊断方法，以 ROC 曲线下面积及其 95%置信区间、敏感性、特异性、阳性预测值和阴性预测值评价，并绘制决策曲线。“rms”包构建最佳诊断方案列线图，ROC 曲线下面积进行外部验证。

结果

训练集 399 例于 PI-RADS 1~5 分中，检出前列腺临床显著癌比例分别为 2%、6%、0%、22%、72%，测试集 120 例比例为 0%、7%、25%、56%、82%；逻辑回归分析显示 PSAD、PI-RADS 评分、ADCmean 是前列腺临床显著癌的独立预测因素，OR 值分别为：4.602(95%CI: 1.555-2.991)、2.156(95%CI: 2.330-9.087)、0.031(95%CI: 0.003-2.991)。上述四种诊断方法 AUC 分别为 0.890 (95%CI: 0.872-0.909)、0.916 (95%CI: 0.898-0.934)、0.926 (95%CI: 0.910-0.943)、0.931 (95%CI: 0.915-0.947)，临床决策曲线示 PI-RADS+ADC+PSAD 最高临床获益，以 0.374 为截断点，特异度 0.886、灵敏度 0.884、阳性预测值 0.754、阴性预测值 0.951。外部验证曲线下面积 AUC 值为 874(95%CI: 0.771-0.901)。

结论

PI-RADS 评分+ADC+PSAD 列线图预测模型具有较好的诊断效能，有助于指导制订个体化的诊疗方案，避免不必要穿刺。

PU-1087

基于 4D Flow MRI 技术评价慢性肾病患者腹主动脉顺应性的临床研究

宗钦伶

常州市第一人民医院

目的：探讨 4D Flow MRI 评估慢性肾病（CKD）患者腹主动脉血流动力学变化的价值。

方法：回顾性分析 2021 年 3 月至 2023 年 5 月 73 例常州市第一人民医院临床诊断为 CKD 的患者及 13 例健康志愿者，所有受试者均行腹主动脉 4D Flow MRI 检查，健康志愿者作为正常对照组（D 组），CKD 患者以肾小球滤过率（GFR）为依据分为 A 组（ $GFR \geq 60 \text{ mL} \cdot \text{min}^{-1} \cdot 1.73 \text{ m}^{-2}$ ）、B 组（ $30 \leq GFR < 60 \text{ mL} \cdot \text{min}^{-1} \cdot 1.73 \text{ m}^{-2}$ ）、C 组（ $GFR < 30 \text{ mL} \cdot \text{min}^{-1} \cdot 1.73 \text{ m}^{-2}$ ）。4D Flow MRI 数据采用后处理软件 CVI 42 进行分析，测量四组腹主动脉近端（平面 1）、腹腔干开口处（平面 2）、肠系膜上动脉开口处（平面 3）、较高一侧肾动脉开口处（平面 4）、腹主动

脉近髂血管分叉处（平面 5）的脉搏波速度（PWV）、壁剪切应力（WSS）等血流动力学参数。采用非参数 Kruskal-Wallis 检验评估 D 组与 CKD 患者之间的血流动力学差异；采用 Sperman 秩相关分析 eGFR 与 PWV、WSS 之间的相关性；采用多因素线性回归，纳入并校正各混杂因素分析 PWV 及最大 WSS 的独立影响因素。

结果：1. 与 D 组相比，CKD 患者 PWV 升高，平面 1-4 B 组、C 组最大 WSS 均减低，平面 2-3 B 组、C 组平均 WSS 减低，平面 4 B 组平均 WSS 减低（ P 均 <0.05 ）。2.eGFR 与 PWV 呈负相关性（ $P=0.006$ ）；平面 1-3 最大 WSS 与 eGFR 呈正相关（ P 均 <0.05 ）。3.校正混杂因素后，eGFR 为 PWV、平面 1-3 最大 WSS 的独立影响因素（ P 均 <0.05 ）。

结论：CKD 患者较正常人 PWV 升高、平均速度及 WSS 减低，提示动脉僵硬性升高、顺应性减低，且 eGFR 是 PWV、WSS 独立影响因素之一。因此，4D Flow MRI 在评估 CKD 患者主动脉顺应性方面具有一定的临床价值。

PU-1088

Based on preoperative IVIM and DWI for prediction of Vessels That Encapsulate Tumor Clusters Pattern in Hepatocellular Carcinoma

Min Li¹, Xinming Li¹, Yufan Ren¹, Ge Zhang¹, Congyue Guo¹, Jiaqi Lv¹, Haojun Lu¹, Yongzhou Xu², Xian Yue Quan¹

1. Zhujiang Hospital of Southern Medical University

2. Philips Healthcare, Guangzhou, China

Purpose: To estimate the potential of preoperative intravoxel incoherent motion (IVIM) and diffusional weighted imaging (DWI) in the prediction of VETC pattern in HCC.

Materials and Methods: This prospective study included 116 patients with HCC treated with surgical resection between April 2018 and February 2023 and who underwent preoperative MRI scan of IVIM and DWI. Two radiologists independently reviewed the radiologic features and the apparent diffusion coefficient (ADC), true diffusion coefficient (D), pseudodiffusion coefficient (D*), and pseudodiffusion component fraction (f) were also measured. Predictors associated with VETC pattern were determined by using logistic regression analyses. Receiver operating characteristics (ROC) curve analyses were performed to evaluate the diagnostic performance. Early recurrence (within 2 years) were evaluated by using Kaplan-Meier analysis.

Results: The consecutive cohort included 116 patients (median age, 54 years; 94 man). Twenty-nine of the 116 HCCs (25%) were VETC-HCCs. f value (OR, 0.79; 95% CI: 0.70, 0.90; $P < 0.001$), high serum α -fetoprotein (AFP) level (> 400 ng/mL) (OR, 2.96; 95% CI: 1.04, 8.45; $P = 0.042$), intratumor necrosis (OR, 6.02; 95% CI: 1.43, 25.41; $P = 0.015$) were independent predictors for VETC pattern, these features were used for establishing prediction model, the area under the ROC curve of this prediction model was 0.85 (95% CI: 0.77~0.94). Kaplan-Meier survival analysis showed that patients with VETC HCCs had higher risk of early recurrence than those with non-VETC HCCs ($p < 0.001$), and showed that patients with model VETC HCCs also had higher risk of early recurrence than those with model non-VETC HCCs ($p = 0.014$).

Conclusion: IVIM can improve preoperative prediction of VETC pattern in HCC and evaluate its prognosis.

基于钆塞酸二钠增强 MRI 肝胆特异期影像组学模型评估肝纤维化分期及炎症活动度分级的诊断价值

任毓凡、李欣明、全显跃

南方医科大学珠江医院

目的 探讨基于钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 肝胆特异期影像组学模型评估肝纤维化分期及炎症活动度分级的诊断价值。方法 回顾性纳入 331 例已行钆塞酸二钠增强 MRI 检查且具有明确肝纤维化分期与炎症活动度分级病理结果的患者及无纤维化进展与活动性炎症的人群, 病理结果使用 Scheuer 评分系统进行评价。将研究人群按 8: 2 比例随机分为训练组与测试组, 对患者肝胆特异期图像整个肝脏层面进行勾画获得感兴趣区 (ROI), 勾画过程中避开病灶、大血管、胆囊, 对已勾画 ROI 进行特征提取, 使用支持向量机 (Support vector machine, SVM) 构建影像组学模型, 使用受试者工作特征曲线 (ROC) 评估模型性能。结果 影像组学模型诊断进展期肝纤维化 (S0-2 vs S3-4) 训练集 AUC 为 0.898 (95%CI 0.855-0.940), 测试集 AUC 为 0.886 (95%CI 0.679-1.000), 灵敏度为 0.850, 特异度为 0.867, 准确度为 0.848; 影像组学模型诊断轻中度活动炎症 (G0-2 vs G3-4) 训练集 AUC 为 0.913 (95%CI 0.858-0.968), 测试集 AUC 为 0.895 (95%CI 0.676-1.000), 灵敏度为 0.875, 特异度为 0.684, 准确度为 0.727。结论 基于钆塞酸二钠增强 MRI 肝胆特异期影像组学模型可用于无创性诊断进展期肝纤维化及轻中度活动炎症, 为临床行抗炎及逆转纤维化治疗决策提供一定参考价值。

基于扩散加权成像的虚拟 MR 弹性成像鉴别前列腺癌和前列腺增生的价值

杨姣、吴慧

内蒙古医科大学附属医院

摘要: 目的: 基于扩散加权成像 (DWI) 的虚拟 MR 弹性成像 (VMRE) 在前列腺癌 (PCa) 与前列腺增生 (BPH) 中的鉴别诊断价值。方法: 回顾性分析 2023 年 3 月至 2023 年 8 月于我院接受 MRI 平扫及双 b 值 ($b=200$ s/mm²、 1000 s/mm²) DWI 扫描的 38 例前列腺疾病者临床资料, 其中 18 例经手术或穿刺病理学证实为 BPH, 26 例证实为 PCa。选取 DWI 图, 对照 T2WI 序列及病理结果在 ITK-SNAP 软件上对前列腺病灶进行 2D 感兴趣区 (ROI) 勾画。根据放置在前列腺病灶上的 ROI 的 DWI 值计算偏移表观扩散系数 (sADC), 根据 VMRE 方法计算基于扩散的 VMRE 值。采用 t 检验对 PCa 组织和 BPH 组织的平均 VMRE 值做差异性分析。结果: BPH 的 VMRE 值显著低

于 PCa 的 VMRE 值, 差异具有统计学意义($P<0.05$)。结论: 基于扩散加权成像的虚拟 MR 弹性成像值有助于鉴别诊断 PCa 和 BPH。

Differentiation of non-cirrhotic hepatocellular carcinoma and benign liver lesions by CT enhanced features

Ruoshui Zheng

Xijing Hospital, The Air Force Military Medical University

Purpose

Most of the patients with hepatocellular carcinoma (HCC) in my country have a basic cirrhosis history, and previous studies on the imaging features of HCC were mostly conducted in the background of liver cirrhosis. However, there are still about 8% to 20% of patients who don't have a basic cirrhosis history at the time of HCC diagnosis. Computed tomography (CT) enhancement features of HCC and benign liver lesions have some overlapping features. It is difficult to differentiate HCC from other benign lesions in a non-cirrhotic background. The aim of this study was to analyze the differences in CT enhancement findings in differentiating non-cirrhotic HCC from other benign liver lesions, in order to improve the diagnostic performance of enhanced imaging for HCC in non-cirrhotic backgrounds.

Methods

A total of 59 non-cirrhotic patients with HCC confirmed or suspected to be HCC in our hospital were collected, and they were divided into HCC group and benign lesion group according to the final pathological results. Univariate analysis was performed on the basic clinical information of the patients and its CT-enhanced images, and the lesion size, enhancing capsule, nonrim arterial phase hyperenhancement, heterogeneous enhancement, nonperipheral washout, border, necrosis or scarring conditions were calculated, and the relative wash-out and the lesion to liver contrast ratio were calculated separately, and the meaningful results in univariate analysis were screened out, and multivariate Logistic regression analysis was performed on them to determine the independent predictors about differentiation of non-cirrhotic hepatocellular carcinoma and benign liver lesions. Receiver operator characteristic curve (ROC) was drawn to evaluate its predictive performance.

Results

A total of 29 patients were pathologically diagnosed as HCC, and 30 patients had benign lesions. The results showed that the median age of the patients in the HCC group was 53.0 (48.0; 63.5) years; the median age of the patients in the benign lesion group was 34.5 (28.8; 48.3) years, and there was a statistically significant difference in age between the two groups ($P<0.001$). Seventeen patients (59%) in the HCC group had a history of hepatitis; 2 patients (6%) in the benign lesion group had a history of hepatitis, and the difference between the two groups was statistically significant ($P<0.001$). The median lesion to liver contrast ratio in the HCC group was 39.3 (16.6; 63.7); the median lesion to liver contrast ratio in the benign lesion group was 93.5 (62.1; 138.7), and the difference in the lesion to liver contrast ratio between the two groups was statistically significant ($P<0.001$). The median relative wash-out of the HCC group was 39.7 (33.8; 48.5); the median relative wash-out of the benign lesion group was 19.5 (7.4; 27.2), and the difference between the two groups was statistically significant ($P<0.001$). The enhancing capsules were found in 18 (62%) HCC lesions compared with 8 (27%) benign lesions, suggesting that non-cirrhotic HCCs were more likely to have enhancing capsule than benign lesions ($P=0.006$). Twenty-four (83%) HCC lesions had nonperipheral washout, while 12 (40%) were benign lesions, suggesting that non-cirrhotic HCC was more prone to nonperipheral washout than benign lesions ($P=0.001$). Gender ratio, body mass index (BMI), triglycerideemia, hypercholesterolemia, unclear boundary, necrosis or scar, and nonrim arterial phase hyperenhancement, heterogeneous enhancement signs between the two groups and lesion size were not significantly

different. Multivariate analysis showed that patient's age (OR=0.884, 95% CI 0.820-0.952, P=0.001), hepatitis history (OR=9.499, 95% CI 1.204-74.934, P=0.033), the lesion to liver contrast ratio (OR=1.015, 95% CI 1.001-1.029, P=0.040) and the relative wash-out (OR=0.932, 95% CI 0.880-0.986, P=0.014) were independent predictors for differentiating cirrhotic HCC from benign lesions. After the ROC curve was constructed, the area under the curve (AUC) of patient's age, hepatitis history, the lesion to liver contrast ratio, and the relative wash-out were 0.839, 0.760, 0.779, and 0.815, respectively.

Conclusions

1. The lesion to liver contrast ratio and relative wash-out obtained based on enhanced CT can provide reference value for the identification of non-cirrhotic HCC and benign liver lesions.

2. The patient's age and hepatitis history are of great significance in differentiating non-cirrhotic HCC from benign liver lesions.

PU-1093

螺旋 CT 中胸腹部增强扫描联合泌尿系三维重建技术在泌尿系统检查中的应用

徐学东

空军军医大学西京医院

目的: 探讨多层螺旋 CT 中胸腹部增强扫描联合泌尿系三维重建技术的要点和可行性。

方法: 使用多层螺旋 CT 胸腹部增强检查中疑诊为泌尿系统疾病的患者共计 80 例, 其中男性 53 例, 女性 27 例, 年龄在 30~60 岁之间, 讨论并总结检查过程中的技术要点, 搜集完整的 CT 平扫及多期扫描三维重建资料, 后经工作站作一系列三维重组处理, 由放射科 2 名高年资医师评定图像的应用价值。

结果: 80 例患者图像成像质量优良, 内容丰富直观, 均满足临床诊断需要。多层螺旋 CT 三维重建技术相对于普通多螺旋 CT 平扫的在泌尿系统检查中的定位准确率有显著优势。

结论: 多层 CT 泌尿系三维重建技术具有安全、快速、高分辨率、高分辨率的优点, 在诊断和定性诊断方面具有独特的优越性, 能为临床诊断和诊断提供准确、可靠的基础。

多层螺旋 CT 胸腹增强联合泌尿系三维重建技术, 在泌尿系及下消化道、生殖系统等方面有一定优势, 尤其是延迟期薄层扫描三维重建是对泌尿系梗阻性疾病的检查较为理想的一种影像学检查方法。三维重建后获得的图像, 能对病变进行不同方位、不同角度的观察, 与传统的横轴位 CT 扫描相比, 在泌尿系统阻塞性疾病的诊断上, 更全面、更准确。且方法简便易行, 可行性高, 值得临床推广。

双能量 CT 扫描成像对肝癌经肝动脉导管化疗栓塞术后碘油沉积缺损区的监测分析

梁文娇

榆林市第二医院

目的 探讨双能量 CT 扫描成像对肝癌经肝动脉导管化疗栓塞(TACE)术后碘油沉积缺损区以及病灶周边区变化的监测优势.方法 选取 45 例肝癌患者,比较 A 法(常规 CT 成像)与 B 法(双能量成像)对 TACE 术后碘油沉积缺损区和病灶周边区病变强化的评估结果,对明确诊断病例再对比 DSA 结果.计算出两种方法的准确度、特异度以及敏感度.结果 45 例患者中,DSA 检查显示术后残余病灶 42 个,病灶强化 39 处;45 例患者,术后 DSA 检查观察到强化病变 36 例,无强化病变 9 例;A 法显示强化病变 26 例,无强化病变 19 例;B 法显示强化病变 34 例,无强化病变 11 例.A 法对强化病变的诊断准确

度、以及敏感度高于 B 法($P<0.05$),两种成像方法的特异度相比差异无统计学意义($P>0.05$).结论双能量 CT 扫描成像对于肝癌 TACE 术后碘油沉积缺损区和病灶周边区变化的监测,能提升对强化病变的诊断准确度和敏感度,对临床评估治疗有着重要指导作用.

光谱 CT 三维定量分析评估胰腺导管腺癌新辅助化疗疗效

张丹
重庆市人民医院

目的:探讨基于光谱 CT 三维定量分析在胰腺导管腺癌(PDAC)新辅助化疗疗效评估中的应用价值。

方法:回顾性收集重庆市人民医院 2021 年 10 月至 2023 年 6 月的 29 例经病理证实且行新辅助化疗的 29 例 PDAC 患者,其中男性 8 例,女性 21 例,平均年龄 61.79 ± 9.46 岁。所有患者化疗前后均行上腹部光谱 CT 检查。由两名有 3 年和 10 年腹部放射影像诊断经验的放射科医师进行回顾性分析门脉期图像。采用以下量化指标:(I)大小:最大径、体积;(II)碘浓度(IC):平均 IC、总 IC;(III)有效原子序数(Z-eff):平均 Z-eff、总 Z-eff。应用 SPSS 27.0 软件,组间差异分析:各量化指标使用非参数检验方法即配对样本的秩和检验进行分析。ROC 曲线分析各量化指标诊断效能及截断值。

结果:PDAC 病灶化疗前后最大径和体积变化率分别为: $0.11 (-0.01, 0.27)$, $0.30 (-0.05, 0.52)$; $Z=-4.018$, $P<0.001$; 平均 IC 和总 IC 变化率分别为 $-0.01 (-0.14, 0.28)$, $0.41 (-0.12, 0.61)$; $Z=-4.928$, $P<0.001$ 。平均 Z-eff 和总 Z-eff 变化率分别为 $-0.001 (-0.01, 0.02)$, $0.30 (-0.05, 0.52)$; $Z=-4.928$, $P<0.001$ 。PDAC 病灶化疗前后最大径变化率 AUC: 0.752, 95% 置信区间: 0.707-0.845, 截断值: 0.193, 敏感度: 57.1%, 特异性: 93.3%。体积变化率 AUC: 0.776, 95% 置信区间: 0.728-0.863, 截断值: 0.222, 敏感度: 85.7%, 特异性: 73.3%; 总 IC 变化率 AUC: 0.795, 95% 置信区间: 0.679-0.826, 截断值: 0.191, 敏感度: 92.9%, 特异性: 60%; 总 Z-eff 变化率 AUC: 0.800, 95% 置信区间: 0.734-0.866, 截断值: 0.167, 敏感度: 85.7%, 特异性: 66.7%。

结论:基于光谱 CT 的三维定量参数总碘含量和总有效原子序数值可以有效评估 PDAC 患者新辅助化疗疗效。

PU-1096

多层螺旋 CT 中胸腹部增强扫描联合泌尿系三维重建技术在泌尿系统检查中的应用

史广龙
空军军医大学西京医院

层螺旋 CT 中胸腹部增强扫描联合泌尿系三维重建技术在泌尿系统检查中的应用

目的:探讨多层螺旋 CT 中胸腹部增强扫描联合泌尿系三维重建技术的要点和可行性。

方法:使用多层螺旋 CT 胸腹部增强检查中疑诊为泌尿系统疾病的患者共计 80 例,其中男性 53 例,女性 27 例,年龄在 30~60 岁之间,讨论并总结检查过程中的技术要点,搜集完整的 CT 平扫及多期扫描三维重建资料,后经工作站作一系列三维重组处理,由放射科 2 名高年资医师评定图像的应用价值。

结果 80 例患者图像成像质量优良,内容丰富直观,均满足临床诊断需要。

结论 多层螺旋 CT 胸腹增强联合泌尿系三维重建技术,在泌尿系及下消化道、生殖系统等方面有一定优势,且方法简便易行,可行性高,值得临床推广。

结论• 1.多层螺旋 CT 泌尿系三维重建技术方法安全、扫描快速、图像具有高分辨率,能对泌尿系统进行较全面的显示,对泌尿系梗阻性疾病的定位、定性诊断方面独具优势,提供了准确可靠的依据以满足临床上的诊治需求,是对泌尿系梗阻性疾病的检查较为理想的一种影像学检查方法。• 2.三维重建后获得的图像,能对病变进行不同方位、不同角度的观察,与常规横轴位 CT 平扫相比较,在诊断泌尿系梗阻性疾病方面具有较全面的优势。

磁共振弥散加权成像在子宫腺肌病磁共振引导聚焦超声即时疗效监测中的应用

蒋奕、陈嘉坤, 谢国霭
香港中文大学深圳第二医院

目的: 探讨磁共振扩散加权成像 (DWI) 在即时评估子宫腺肌病磁共振引导聚焦超声 (MRgFUS) 治疗后消融效果的作用。

方法: 经治疗腺肌病患者 38 例 (平均年龄, 32.4 岁; 年龄范围, 24-49 岁), 分别于术前、术后 1 个月、3 个月、6 个月、12 个月行磁共振检查, 磁共振检查包括常规自旋回波, 扩散加权成像和动态增强成像。治疗过程中分别在治疗前、规划治疗结束后进行 DWI 扫描, 最后行磁共振增强延迟扫描判断消融体积 (NPV)。通过测量病灶消融区域内 DWI 高信号范围和磁共振增强延迟扫描后无强化区, 比较二者 NPV 的差异。

结果: MRgFUS 治疗前子宫腺肌病病灶平均体积为 $(96.24 \pm 7.52) \text{cm}^3$ 。DWI 成像中在 $b=800 \text{s/mm}^2$ 时对病灶消融后的凝固性坏死显示效果好, 呈较为均质的高信号, 弥散受限, ADC 值平均值为 $1.48 \times 10^{-3} \text{mm}^2 / \text{s}$ 。术后即刻 DWI 下的病灶消融体积为 $(80.53 \pm 5.32) \text{cm}^3$, 小于增强后的 NPV $(84.48 \pm 10.42) \text{cm}^3$, 二者的 NPV% 均值分别为 $(82.41 \pm 6.80) \% \text{ VS } (84.32 \pm 4.16) \%$, 无明显统计学差异 ($P > 0.05$)。

结论: 由于 MRI 增强后的残余病灶无法继续行 MRgFUS 治疗, 与常规磁共振比较, 扩散加权成像能即刻敏感、特异地反映 MRgFUS 术后子宫腺肌病病灶的消融区域, 可作为监测其疗效的重要指标之一。

PU-1098

磁共振引导聚焦超声联合 GnRH-a 治疗难治性子宫腺肌病的短期临床疗效分析

蒋奕
香港中文大学深圳第二医院

目的

探讨磁共振引导聚焦超声 (MRgFUS) 与促性腺激素释放激素激动剂 (GnRH-a) 治疗难治性子宫腺肌病的临床疗效。

方法

以本院 2019 年 12 月至 2022 年 2 月间收治的 38 例难治性子宫腺肌病患者为研究对象, 将 MRgFUS 前后连续注射 GnRH-a 3 次以的患者设为观察组 ($n=22$), 将单独接受 MRgFUS 设为对照

组(n=16)。比较两组患者治疗后 3、6 个月子宫体积、疼痛评分、月经量 PBAC 评分以及不良反应方面的情况。

结果

治疗 6 个月后观察组患者的子宫体积 $[(101.22\pm 4.85)\text{cm}^3]$ 小于对照组 $[(125.48\pm 10.46)\text{cm}^3]$, 差异有统计学意义($t=3.01$, $P<0.05$)。6 个月后观察组患者的痛经程度 $[(0.26\pm 0.08)\text{分}]$ 低于对照组 $[(1.12\pm 0.26)\text{分}]$, 差异有统计学意义($t=2.21$, $P<0.05$)。治疗后 3、6 个月, 观察组的月经量 PBAC 评分均低于对照组 $[(64.57\pm 10.16)\text{分 vs } (76.45\pm 18.12)\text{分}、(48.46\pm 11.28)\text{分 vs } (62.26\pm 12.46)\text{分}]$, 差异有统计学意义(术后 3 个月 $t=4.21$, $P<0.05$; 术后 6 个月 $t=3.48$, $P<0.05$)。治疗后 6 月两组腺肌病病灶体积平均缩小率分别为 66%、60%, 两组病灶体积缩小率比较, 差异均无统计学意义($P>0.05$)。

结论

磁共振引导聚焦超声(MRgFUS)与促性腺激素释放激素激动剂(GnRH-a)联合使用有助于子宫腺肌病症状缓解和疗效提升。

PU-1099

CT 影像组学模型在结石性肾积脓术前诊断中的应用价值

苑冠杰、蔡玲利、梁萍、许楚瓯、李震
华中科技大学同济医学院附属同济医院

目的: 结石性肾积脓的紧急识别和及时治疗对于防止患者出现尿源性败血症和脓毒性休克等不良预后至关重要。本研究旨在探讨 CT 影像组学模型在结石性肾积脓术前诊断中的应用价值。

方法: 回顾性分析了 182 例在我院因上尿路结石行经皮肾造瘘患者的临床资料及 CT 影像学资料。通过单因素和多因素逻辑回归分析筛选出独立临床因素来构建临床模型。将所有患者按 7:3 的比例随机分为训练集和验证集。基于腹部 CT 平扫图像勾画积水或积脓感兴趣区, 采用 Pyradiomics 软件提取影像组学特征, 并通过 Lasso 回归降维筛选出影像组学特征来计算影像组学评分, 并构建影像组学模型。将影像组学评分和独立临床指标联合构建临床-影像组学模型。通过 ROC 和 DCA 曲线评价不同模型诊断结石性肾积脓的性能。

结果: 182 例患者中, 129 例患者被诊断为肾积水, 53 例被诊断为肾积脓。根据 7:3 比例, 123 例被纳入训练集, 59 例被纳入验证集。多因素逻辑回归分析显示发热 ($p<0.001$)、血中性粒细胞计数 ($p<0.001$) 和尿白细胞计数 ($p=0.002$) 是结石性肾积脓的独立危险因素。共提取 1210 个特征, 经过特征筛选, 最终选取 8 个影像组学特征来计算影像组学评分。训练集和验证集中, 肾积水和肾积脓组影像组学评分均存在显著性差异 (训练集: $0.19 \text{ vs } -1.69$, $p<0.001$; 验证集: $-0.48 \text{ vs } -1.96$, $p<0.001$)。临床-影像组学模型的诊断效能最佳, 训练集所对应的曲线下面积(AUC)、灵敏度、特异度分别为 0.965、0.882、0.944; 验证集所对应的 AUC、灵敏度、特异度分别为 0.940、0.947、0.825。此外, DCA 曲线显示在大多数阈值概率下, 临床-影像组学模型的净收益高于临床模型和影像组学模型。

结论: 临床-影像组学模型在术前识别结石性肾积脓中具有较高的诊断效能, 有助于临床医生提高诊断效率, 实施紧急决策, 防止患者出现不良预后。

自然位 X 线侧位片在精确评价腰椎生理曲度异常的应用价值

何诗卉

上海市中医医院

摘要：目的 研究自然位 X 线侧位片对腰椎生理曲度异常评价的价值。

方法 选择临床怀疑腰椎疾病的不同年龄段患者 67 例，其中男 28 例，女 39 例，平均 43.5 ± 2.1 岁，均行自然位和常规体位的 X 线摄影，其中自然位只摄腰椎侧位片。常规腰椎侧位摄影体位为：受检者侧卧于摄影床上，拍摄时使用“影像多功能角度尺”，使身体的正中矢状面平行于床面，双侧髋关节和膝关节屈曲。第三腰椎棘突置于照射野中线后 5cm，中心线经第三腰椎垂直射入。使摄影距离 115cm，设备型号为西蒙门子。自然位摄影体位及方法：受检者站立于摄影架前，右侧靠近摄影架，后背靠近直立竖板，双上肢平举，要求患者的头后部、背部、臀部、小腿、双脚后跟均紧贴直立竖板面，使受照者处于自然站立的自然位，腰部置于照射野中线，中心线经第三腰椎后缘垂直摄入，摄影距离及设备同常规体位。三位富有经验的主管技师对两种体位 X 线片 T12~S1 的弓顶距离进行测量，取平均值进行统计。

结果： 常规体位弓顶距离为 16.9 ± 1.21 mm，自然位为 19.5 ± 1.25 ，常规体位较自然位测量的弓顶距较大。

结论 人体自然位为关节肌肉最佳体位，对于需在自然位上牵引、推拿等治疗并需评价疗效的患者，为确保评价前后拍摄一致性，应摄自然位 X 线侧位片。

PU-1101

多发性骨髓瘤的 X 线、CT、MRI 和 ^{18}F -FDG PET/CT 诊断价值

刘杰

襄阳市中心医院

目的：探讨多发性骨髓瘤在 X 线、CT、MRI 及 ^{18}F -FDG PET/CT 上的表现，提高对多发性骨髓瘤在影像学上的认识。方法：对经病理及临床确诊的 110 例多发性骨髓瘤患者的影像学资料进行回顾性分析。结果：110 例中 X 线 94 例，发现异常 62 例，诊断符合率 65.9%；CT 90 例，发现异常 82 例，诊断符合率 91.1%；MRI 36 例，发现异常 34 例，诊断符合率 94.4%； ^{18}F -FDG PET/CT 15 例，发现异常 14 例，诊断符合率 93.3%。4 种检查方法对多发性骨髓瘤诊断符合率之间差异有统计学意义 ($\chi^2=26.18$, $P<0.05$)，X 线诊断符合率低于另外三种检查，差异有统计学意义 ($\chi^2=25.98$, $P<0.05$)；CT、MRI 及 ^{18}F -FDG PET/CT 三种检查结果无统计学差异 ($\chi^2=0.43$, $P>0.05$)。多发性骨髓瘤 X 线及 CT 主要表现是骨质稀疏、膨胀及破坏，伴有病理性骨折及软组织肿块，少数有骨质硬化；MRI 表现为 T1WI 低信号，T2WI 为高信号，典型变现为“盐-椒征”； ^{18}F -FDG PET/CT 表现为相匹配的 ^{18}F -FDG 高摄取灶及骨质溶骨性改变。结论：多发性骨髓瘤的影像学表现具有特征性，四种检查方法各有优势，认识及了解其影像学表现，对诊断多发性骨髓瘤具有重要作用。

PU-1102

甲磺综合征临床及影像特征

徐成元、李玉清、吴雅雯

杭州师范大学附属医院

目的: 探讨甲髌综合征的临床、影像特点, 提高本病的诊断能力。

方法: 提供我院两例病例, 并查阅相关文献, 分析归纳甲髌综合征的临床、影像特点。

结果: 例 1: 男, 12 岁。主因双肘外翻、走路易摔跤, 身高较矮就诊。查体: 身高 1.32 米。患儿双侧指甲角化不良、变薄, 并呈勺形凹陷。双手拇指及右侧食指还可见纵裂。双手远位指间关节背侧皮纹浅, 甚至消失 (图 1)。双肘外翻, 双侧髌骨发育小、外移。双侧髌骨后缘可触及骨性突起。X 线表现: 两侧髌骨呈外张状, 髌前上嵴突出。髌骨翼背面中央有对称性水平方向生长的三角状突起, 为髌骨角 (图 2)。双侧桡骨小头脱位, 双侧肱骨外髁及肱骨小头发育不良, 双肘外翻 (图 3、4)。双侧髌骨发育小, 外移 (图 5), 股骨髁间窝加深, 股骨外髁发育稍小 (图 6)。

例 2: 女, 9 岁, 主因拇指发育不良, 双膝疼痛就诊。查体: 双侧拇指指甲发育不良, 有纵裂。双侧髌骨后缘可触及骨性突起。双肘外翻。

X 线表现: 双侧髌骨脱位, 双侧髌骨角比例 1 更明显, 双侧桡骨小头脱位。患儿父亲骨盆平片也见髌骨角。

结论: 当遇到典型的指甲发育不良、髌骨发育不良或缺如、髌骨角和桡骨小头脱位“四联征”时, 要想到甲髌综合征。

PU-1103

手足小骨骨巨细胞瘤的影像分析

徐成元、李玉清
杭州师范大学附属医院

目的: 探讨手足小骨骨巨细胞瘤 (GCT) 的影像特点, 以提高诊断水平。

方法: 回顾分析本院建院来手术病理证实的影像资料齐全的手、足部位的 GCT 影像特点。

结果:

共 16 例, 男 6 例, 女 10 例, 年龄 14~61 岁, 平均 33 岁, 中位年龄 32 岁, 75% 发生于 20~40 岁。发病部位: 手部 5 例, 其中掌骨 2 例, 指骨 3 例。足部 11 例, 其中距骨 4 例, 跟骨 3 例, 跖骨 3 例, 楔状骨 1 例。

X 线平片表现: 16 例均表现为溶骨性骨质破坏, 14 例有膨胀, 短管骨膨胀比跗骨明显。短管骨 8 例均累及骨端, 占据骨的整个宽径, 向干骺端及骨干延伸。4 例 (50%) 见部分皮质不清晰, 破坏消失。5 例病灶内见骨嵴或分隔。1 例 (12.5%) 病灶边缘可见局限性硬化。跗骨 4 例距骨病变位于头部 1 例, 体部 3 例, 均临近关节面下, 3 例呈偏心性分布。3 例跟骨病变位于跟骨前部跟骰关节骨端 2 例, 邻近跟骨结节 1 例, 均为偏心分布。5 例 (62.5%) 跗骨病灶的边缘有硬化边。1 例 (12.5%) 见部分皮质不清晰呈渗透状。3 例病灶内见骨嵴。

CT 表现: 10 例行 CT 检查, CT 比 X 线平片更清楚地显示皮质改变, 病灶内的密度、骨嵴或分隔及周围软组织改变。9 例表现为膨胀性破坏。密度均匀 7 例, 不均匀 3 例, 其中 1 例病灶内见斑片状高密度影。5 例病变内见小骨嵴, 表现为自皮质或病变边缘伸向病变内的短条状高密度影, 类似锯齿状改变。1 例病变内见粗大的分隔。5 例病变边缘可见局限性硬化边。3 例病变皮质部分消失, 呈筛孔状。病理骨折 2 例。1 例增强 CT 显示病变内呈斑片状不均匀强化。

MR 表现: 距骨 1 例, SETWI 病变区呈低信号, 略高于肌肉; T2WI 序列 T2WI 加压脂病变呈不均匀高信号, 其内见不规则斑片状低信号区。

结论: 手、足小骨 GCT 好发于手的掌、指骨及足跗骨的相当于骨端位置, 好发年龄仍为 20~40 岁, 以膨胀性骨质破坏为主, 病灶内常见小骨嵴, 短管状骨比跗骨更易表现为侵袭性改变。

PU-1104

Gorham 病临床及影像特点分析

吴雅雯、李玉清、徐成元
杭州师范大学附属医院

目的 探讨 Gorham 病的临床及影像特点。

方法 回顾性分析 11 例 Gorham 病的临床及影像资料, 综合国内文献, 总结其临床及影像特点。本组 11 例患者均符合 Wells 和 Gray 提出的诊断标准。11 例均拍摄 X 线平片; CT 检查 4 例; MRI 检查 5 例, 其中 1 例行 MRI 增强检查。

结果 男 7 例、女 4 例;年龄 16~66 岁, 中位年龄 32 岁。6 例病变累及手部, 1 例累及尺桡骨, 1 例累及髌臼, 3 例累及颌面骨。主要临床症状为病变部位疼痛、肿胀及活动受限, 7 例伴局部肌肉萎缩。X 线平片示受累骨质变细、皮质毛糙 6 例, 局灶性密度减低 5 例, 大块骨质吸收 6 例, 骨质吸收残端变尖 1 例, 病理骨折 1 例。CT 示受累骨变细、皮质毛糙 4 例, 局限性密度减低 1 例, 大块骨质吸收 3 例, 伴局部肌肉萎缩、肌间脂肪间隙增宽 2 例(萎缩性骨质吸收)。MRI 示受累骨质 T1WI 呈低信号, T2WI 呈高信号, 信号可不均匀; 受累骨质周围软组织在 T2WI 上 4 例呈弥漫水肿样高信号, 1 例呈弥漫的混杂的高信号软组织肿物, 但相邻肌肉萎缩, 肌间隙增宽。92 例文献荟萃显示男 63 例, 女 29 例。72% (66/92) 发病年龄在 10~40 岁。单骨发病 24 例; 双骨或多骨发病 68 例, 其中多中心发病 9 例、单中心发病 59 例。病变好发居前 4 位的依次为肩胛骨中心、骨盆、颌面骨和手部骨骼。43 例出现肌肉萎缩, 8 例出现软组织肿块。

结论 当发现与临床症状不符的一骨或连续多骨的萎缩性骨质吸收, 无硬化或骨膜反应, 相邻肌肉萎缩, 要想到 Gorham 病的可能。

PU-1105

能谱 CT 单能量重建在胸腰椎急性骨折骨髓水肿中的应用

王明月、朱凯
深圳市前海蛇口自贸区医院

目的:利用能谱 CT 单能量重建鉴别胸腰椎急性骨折骨髓水肿。资料与方法:回顾性收集了 2022 年 6 月-2023 年 2 月在深圳市前海蛇口自贸区医院行胸腰椎能谱 CT 与 MR 扫描的 18 例急性外伤或确诊压缩骨折复查患者, 共计 20 个压缩骨折椎体的能谱 CT 及 MRI 图像, 患者外伤时间当天到骨折 2 周不等。在工作站运用 GSI viewer 软件重建四组单能量(40 KeV、70 KeV、100 KeV 及 140KeV)图像。在 Water (Iodine) 伪彩图正中矢状面上, 识别骨折骨髓水肿区域, 使用椭圆形 ROI 进行测量, 根据 MRI 显示的水肿区域手动勾画兴趣区, 记录骨折椎体水肿区域以及正常椎体在不同单能量下 CT 值。所有压缩骨折水肿区域均与 MRI 脂肪抑制 T2WI 序列为参照。采用配对 t 检验比较不同单能量下骨折水肿椎体与正常椎体 CT 值间的差异, 采用秩和检验比较骨折水肿椎体与正常椎体间 CT 值差值的差异。结果:在急性骨折水肿椎体中, 不同单能量(40 KeV、70 KeV、100 KeV 及 140KeV)测量的骨折水肿椎体 CT 值分别为: 691.5 Hu、319.1 Hu、222.4Hu 和 183.1; 正常椎体 CT 值分别为 252.9Hu、106.1Hu、67.9Hu 及 52.5Hu, 急性骨折椎体在 40 KeV、70 KeV、100 KeV 及 140KeV 下 CT 值均大于正常椎体 CT 值, 差异有统计学意义 ($P<0.001$); 急性骨折椎体与正常椎体间四组单能量 CT 值差值也有显著差异 ($P<0.001$), 40 KeV 下 CT 值差值差值最大。

结论: 胸腰椎急性骨折能谱 CT 检查中, 单能量 40 KeV、70 KeV、100 KeV 及 140KeV CT 值可以鉴别急性骨折骨髓水肿与正常椎体, 以 40 KeV 下 CT 值差值最大, 结合 Water(Iodine)物质密度图, 可以为胸腰椎急性骨折水肿提供更为准确的诊断。

PU-1106

能谱 CT 物质分离技术在胸腰椎急性骨折及陈旧性骨折鉴别诊断中的应用

王明月、朱凯
深圳市前海蛇口自贸区医院

目的:利用能谱 CT 物质分离技术鉴别胸腰椎急性骨折与陈旧性压缩性骨折。资料与方法:分别回顾性收集了 2022 年 6 月-2023 年 2 月在深圳市前海蛇口自贸区医院行胸腰椎能谱 CT 与 MR 扫描的 12 例急性外伤或确诊压缩骨折复查患者,共计 24 个压缩骨折椎体的能谱 CT 及 MRI 图像;还有 8 例陈旧性骨折患者,共计 16 个椎体的能谱 CT。在工作站运用 GSI viewer 软件重建 Water (Iodine)、Water (Calcium) 和 Water (HAP) 三对基物质图像。参照 MRI T2WI 脂肪抑制序列确定骨折骨髓水肿区,使用椭圆形 ROI 进行测量,根据 MRI 显示的水肿区域及陈旧性骨折的压缩区域手动勾画兴趣区,测量并记录骨折椎体水肿区域以及陈旧性压缩性骨折 Water(Iodine)、Water (Calcium) 和 Water (HAP) 水密度值。采用配对 t 检验比较不同物质密度下骨折水肿椎体与陈旧性压缩性骨折椎体间水密度值的差异,采用秩和检验比较骨折水肿椎体与陈旧性压缩性骨折椎体间水密度值差值的差异。结果:急性骨折水肿椎体 Water (Iodine)、Water (Calcium) 和 Water (HAP) 水密度值与陈旧性压缩性骨折椎体水密度值有显著差别。急性骨折椎体水(碘)、水(钙)、水(羟基磷灰石)水密度值均大于陈旧性压缩性骨折椎体水密度值,差异有统计学意义($P<0.001$);急性骨折椎体与陈旧性压缩性骨折椎体间三组水密度值差值也有显著差异($P<0.001$), Water (Iodine) 水密度差值最大。

结论: 胸腰椎急性骨折及陈旧性压缩性骨折能谱 CT 检查中, Water(Iodine)、Water (Calcium) 和 Water (HAP) 密度值可以鉴别急性骨折与陈旧性压缩性骨折椎体,但以 Water(Iodine)密度图最优,可以为胸腰椎急性骨折与陈旧性压缩性骨折的鉴别诊断提供定量解决方案。

PU-1107

骨质疏松症影像学

沈钱辉
中国人民解放军海军军医大学第二附属医院

骨质疏松症(osteoporosis)被世界卫生组织(World Health Organization)定义为一种“一种以骨量减低和骨组织微结构恶化,导致脆性增加,从而易导致骨折发生为特征的系统性骨骼疾病”。虽然任何年龄都可发生骨质疏松症,但是在老年妇女(绝经后女性)、风湿病患者和老年男性中尤其常见。在骨质疏松症中,骨组织的病理改变导致骨骼变弱,骨折的风险增加。

随着我国人口老龄化进程的加速,我国已经成为全球老年人口数量最多的国家,患有骨质疏松症的病人也随之急剧增加。根据第七次全国人口普查调查结果:我国 60 岁以上人口约占总人口的 18.7%,大概为 2.64 亿,65 岁以上人口约占 18.7%,已经超过了 1.9 亿。而全国骨质疏松流行病学调查显示:50 岁以上男性与女性患有骨质疏松症的占比分别为 6.9%与 32.1%,65 岁以上占比则达到 10.7%与 51.6%。骨质疏松症的最严重后果是导致骨质疏松骨折,又称为脆性骨折,即在日常生活中受到轻微的伤害就会导致骨折的发生,椎体、前臂、髌骨、肱骨和骨盆等部位尤其容易受到损伤。脆性骨折一旦发生,很容易导致患者残疾甚至死亡,骨折的患者生活质量明显下降,有较大一部分患者可能会死于各种并发症。同时,长期的治疗和护理会造成巨大的家庭和社会负担。总而言之,骨质疏松症是一个亟需引起大家重视的疾病。

骨质疏松症患者早期多无明显自觉症状,也无明显身体不适,但是随着骨质结构的进一步恶化,患者逐渐出现腰背痛、脊柱变形,甚至脆性骨折等临床症状,这些症状的出现,会对患者的身心造成

极大的打击。而尽管如此, 目前我国的对于骨质疏松症的诊断率还很低, 骨质疏松骨折的治疗率也堪堪达到 30%。如何早发现, 早诊断, 早治疗骨质疏松症对于我国而言, 是非常重要的一项挑战。

1. 双能 X 线骨密度法 (DXA)
2. 骨小梁分数 (TBS)
3. 计算机断层技术 (CT)
4. 磁共振成像

PU-1108

少见/罕见部位应力性骨折

高超、张联合
武警浙江总队医院

目的 提高对少见/罕见部位应力性骨折的认识, 避免延误病情, 做到“早发现、早诊断、早治疗”, 维护部队长期安全稳定, 提高战斗力。**方法** 以“应力性骨折或疲劳性骨折”为关键词在图片存储与传输系统 (PACS) 上查询 2018 年 1 月 1 日至 2023 年 5 月 31 日确诊的应力性骨折的影像学资料 (X 线、CT 及 MRI) 进行分析, 经 2 名高年资影像诊断医师共同读片, 确定纳入标准: 排除胫骨、跖骨、股骨及腓骨四个常见部位, 年龄 ≤ 30 岁, 无外伤史, 无相关疾病史。进一步追踪详细病因, 观察发病部位有无规律性? 骨折有无形态学特征? 是否对称或对侧有无异常发现? 邻骨质有无异常? 邻软组织有无异常? 有无并发症?**结果** 共收集少见/罕见部位的应力性骨折 42 例, 按部位分布如下, 下肢 15 例: 距骨 5、跟骨 4、足舟骨 3、骰骨 1、楔形骨 1、第一跖趾关节旁籽骨 1; 骨盆 12 例: 耻骨下支 6、耻骨梳 1、骶骨 5; 腰椎 3 例: L5 椎弓根 2、L5 椎弓峡部 1; 上肢 6 例: 肱骨 5、尺骨 1; 胸廓 6 例: 肋骨 5、胸骨 1。**结论** 少见/罕见部位应力性骨折有特定的发病部位和典型的影像学特征。软组织水肿对诊断和鉴别诊断有较大价值。距骨、足舟骨和籽骨血供较差, 易继发缺血性坏死, 后期应予关注。加强宣教, 重视预防, “早发现、早诊断、早治疗”可以明显缩短病程、改善预后。

PU-1109

米粒体滑囊炎的临床、病理及影像特征

李培岭、赵振江
河南省洛阳正骨医院 (河南省骨科医院)

目的: 探讨米粒体滑囊炎的病因、病理、临床表现影像学特征及治疗方案。

方法: 回顾性分析经病理确诊的 12 例米粒体滑囊炎的临床、病理及影像资料, 并复习 145 篇国内外相关文献。

结果: 本组 12 例中继发于类风湿关节炎 5 例, 慢性非特异性滑囊炎 4 例, 结核性关节炎、痛风性关节炎和 CREST 综合征各 1 例; 9 例单发, 3 例多发。回顾国内外文献及本组病例资料, 共 219 例 (单发 210 例, 多发 9 例); 男性 115 例, 女性 104 例, 男性稍多于女性; 好发于肩关节 84 例 (38.4%) 和手腕部 78 例 (35.6%); 发病年龄最小 2 月, 最大 90 岁, 其中 < 16 岁的患者 21 例 (9.6%), 多继发于幼年类风湿关节炎 12 例 (57.1%) 和慢性非特异性滑囊炎 6 例 (28.6%); 16~40 岁的患者 37 例 (16.9%), 多继发于慢性非特异性滑囊炎 18 例 (48.6%) 和结核性关节炎 12 例 (32.4%); > 40 岁的患者 161 例 (73.5%), 多继发于慢性非特异性滑囊炎 53 例 (32.9%)、类风湿关节炎 43 例 (26.7%) 和结核性关节炎 34 例 (21.1%)。本组米粒体滑囊炎 MRI 均表现为关节腔和 (或) 滑囊扩张积液, 滑膜增厚, 米粒体在 T1WI 呈等信号, FS T2WI 及 PDWI 呈多发大小均匀的米粒样稍低信号, 呈“瓜子样” (1/15)、“铺路石样” (4/15) 和“芝麻样”

(10/15) 改变, 部分可见“靶环征”(4/15), 增强扫描滑膜增厚并明显强化, 米粒体不强化; SPECT/CT 融合骨显像米粒体无放射性浓聚。

结论: 任何类型的滑囊炎, 均可导致米粒体的形成; 米粒体多继发于慢性非特异性滑囊炎 (35.2%)、类风湿关节炎 (26.9%) 和结核性关节炎 (21.5%) 的患者, 好发于肩关节 (38.3%) 和手腕部 (35.6%)。米粒体 X 线及 CT 上不显影, MRI 是诊断米粒体的首选影像学方法且具有特征性, 米粒体清除和滑膜切除是治疗米粒体滑囊炎的最佳方法。

PU-1110

Comparisons of thresholds setup for upper thigh muscle segmentation on CT images

Fengyun Zhou^{1,2}, Wang Ling², Cheng Xiaoguang²

1. College of Medical Technology, Shaanxi University of Chinese Medicine

2. Beijing Jishuitan Hospital, Capital Medical University

Abstract

Objective To explore the optimal threshold range of CT Hounsfield Unit (HU) values for separating intramuscular adipose tissue (IMAT) in the thigh muscles on CT images under various conditions.

Materials and methods In total, 45 patients with rheumatic immunity (age mean \pm SD; 43 \pm 15 years, male 27%) were enrolled from August 2021 to June 2022. Muscle images of the bottom level of ischial tuberosity at the thigh were acquired from axial CT images. The thigh muscle compositions of all patients were measured using 2 commonly used image analysis software: OsiriX and ITK-SNAP. A Gaussian Mixture Model (GMM) was used to individually analyze the threshold for distinguishing muscle from AT on CT images for each patient. All measurements were repeated twice using each software program, at least 5 days apart. The assessor was blinded to all earlier measurements.

Results In this study, it was found that the correlation between the CT personalized threshold segmentation and the muscle density value obtained based on CT under different threshold segments was strongly positive in all threshold segments in 45 subjects. (-60~150HU, -50~150HU, -40~150HU, -30~150HU, -20~150HU, -10~150HU, 0~100HU, 0~150HU, $r=0.880\sim0.919$, $p<0.001$). Among them, -20~150HU has the best correlation with the personalized threshold ($r=0.919$, $p<0.001$).

Conclusion The CT threshold range varies with the degree of muscle invasion of the subject. Therefore, personalized analysis of the muscle threshold range is necessary for accurate measurement of CT muscle density.

PU-1111

米粒体滑囊炎的影像学表现

高天虎、王光宪

重庆医科大学附属巴南医院

目的: 探讨米粒体滑囊炎的影像学表现, 加强对该病的认识。**方法:** 回顾性分析经病理证实的 9 例米粒体滑囊炎的影像学表现, 综合临床病史并结合相关文献分析。**结果:** 9 例患者 X 线、CT 均表现为软组织肿胀, 未见明显钙化灶, 1 例患者桡骨远端局限性骨质破坏, 边缘未见明显硬化。与骨骼肌相比, 所有米粒体在 T1WI 上呈等信号, T2WI 抑脂序列呈稍高信号, 周围滑膜增厚, 相应滑囊内均可见不同程度积液; 其中一例可见肌腱断裂; MRI 骨质破坏患者病变显示清楚, 周围不伴骨

髓水肿表现。结论: X 线、CT 诊断关节囊及滑膜米粒体滑囊炎价值有限, MRI 对诊断米粒体滑囊炎具有较高的应用价值。

PU-1112

胫骨上皮样血管肉瘤 1 例并文献复习

苑筱晴、梁彦博、杨慧、秦健、李长勤
山东第一医科大学第二附属医院(泰山医学院附属医院)

目的: 上皮样血管肉瘤 (Epithelioid angiosarcoma, EA) 十分罕见, 是以上皮样肿瘤细胞为特征的一种高度恶性肿瘤, 其生长迅速, 侵袭性强, 好发于甲状腺、皮肤、肾上腺和深层软组织等各个部位, 而骨源性 EA 相对罕见。因此, 本研究对 1 例右胫骨 EA 患者进行了影像学分析, 并通过查阅文献总结了其影像学特征。

方法: 收集右胫骨 EA 1 例的临床资料、影像学资料、组织病理学及免疫组织化学结果, 并结合相关文献进行分析。

结果: 患者, 男性, 66 岁, 主诉“右侧脚踝疼痛 4 月余, 加剧 6 天”。体格检查: 右侧脚踝明显肿胀、僵硬, 局部压痛, 右胫骨内侧可见手术疤痕。实验室检查结果未见明显异常。既往有右下肢创伤病史并接受手术治疗。影像学检查: 平片和 CT 示右胫骨远端多发溶骨性病变, 大小约 7.9 cm×4.6 cm×4.4 cm, 边界不清, 边缘无硬化边, 其内可见不规则钙化和低密度区, 骨皮质变薄且不连续; MRI 平扫示病灶 T1WI 和脂肪抑制 T2WI 呈等或略高信号, 其内可见散在斑片状低信号, 周围软组织可见水肿信号。免疫组织化学结果: CD31 (+)、CD34 (+)、Factor VIII (+)、Ki-67 (+, 5%)。最终诊断为骨 EA。

结论: 本研究对 1 例右胫骨 EA 进行了影像学分析, 并通过回顾文献总结了 EA 的影像学特征。尽管病理检查仍然是诊断 EA 的金标准, 但特定的影像学特征仍有助于诊断。

PU-1113

MRI 对于坐骨神经痛的诊断价值

吴俊华、易雪冰、陈君蓉、钟鉴、张德洲
四川省骨科医院

目的: 探讨 MRI 显示坐骨神经走行的优选扫描技术及坐骨神经痛患者的 MRI 表现特点, 以加深了解 MRI 对于坐骨神经痛的诊断价值。材料与方法: 收集 2017 年 6 月至 2023 年 6 月间因坐骨神经痛在我院就诊的患者 183 例, 分析其 MRI 检查资料, 总结显示坐骨神经走行的优选扫描技术及坐骨神经痛患者的 MRI 表现特点。结果: 183 例患者中 175 例为单侧发病, 8 例为双侧发病; 斜冠状位、斜矢状位及横轴位 3D-MENSA 序列显示坐骨神经及周围病变效果好; 坐骨神经病变 37 例 (坐骨神经炎 25 例, 坐骨神经占位 7 例, 坐骨神经外伤 5 例), 坐骨神经周围病变共 146 例 (腰椎管狭窄 115 例, 坐骨神经周围炎性病变 15 例, 坐骨神经周围占位病变 10 例, 坐骨神经周围外伤 6 例)。结论: 坐骨神经痛以单侧发病为主; 坐骨神经周围病变尤其是腰椎管狭窄是坐骨神经痛最常见的病因; 3D-MENSA 序列 MPR 技术可作为优选扫描技术; MRI 对于寻找导致坐骨神经痛的病因及定位定性诊断有重要的价值。

PU-1114

先天性静脉畸形骨肥大综合症 (KTS) CTV1 例

李帆

绵阳市第三人民医院

先天性骨血管肥大综合症又称为 Klippel-Trenaunay Syndrome(KTS), 先天性静脉畸形骨肥大综合症等, 为临床罕见病, 据文献报道, KTS 的发病率在 2/10 万-5/10 万。其病因未明, 多数观点认为 KTS 是胚胎发育异常所造成的一种先天性周围血管疾病。文献报道 KTS 好发于上下肢, 尤以下肢多见, 躯干及颈部少见, 男女均可发病无明显性别差异, 具有偶发性, 少数患者可有家族史。KTS 主要包括三个临床特征, 包括: 皮肤毛细血管畸形 (鲜红色血管斑) 静脉畸形 (包括静脉曲张以及深静脉闭锁) 以及骨和 (或) 软组织肥大, 符合两个及以上特征便能诊断。国内也有学者认为 KTS 亚型 (Seppel-Martorel I 型) 可出现患肢骨萎缩, 变短。

本例患者属较为典型的 KTS 患者: 胸背腹部红斑, 静脉迂曲及软组织增生; 同时还合并有脊柱侧弯畸形, 可能是由于做下肢骨增长未能及时临床干预, 长期下肢不等长行走及站立致脊柱侧弯畸形所造成。

KTS 患者静脉系统多表现为静脉曲张及血管畸形或闭塞, 而动脉系统一般不累及, 本例病人表现为左下肢静脉异常, 而动脉通畅无狭窄, 与文献报道一致。

基于传统磁共振成像的肩胛下肌腱部分撕裂诊断性能: 观察者经验的影响

陈雨柔¹、田伟²、苏秀³、刘欣¹、盛波¹、杨海涛¹、于凡¹

1. 重庆医科大学附属第一医院

2. 重庆市妇幼保健院

3. 六盘水市第二人民医院

摘要

背景: 在大多数机构中, 临床骨肌放射诊断团队由具有不同诊断经验的放射医生组成。很少有研究讨论观察者的经验对基于传统磁共振成像的肩胛下肌腱部分撕裂诊断结果的影响。

目的: 分析具有不同临床骨肌诊断经验的放射科医生对肩胛下肌腱部分撕裂的诊断准确性, 以便开展个性化培训。

方法: 本研究回顾分析了在本院接受首次关节镜肩袖手术的 697 名患者。其中 95 例患者共 95 个肩关节的肩胛下肌腱部分撕裂, 107 例患者共 107 个肩关节的肩胛下肌腱完整。术前磁共振图像由三位放射科医生 (A、B 和 C, 分别具有 <5 年、5-10 年和 >10 年的临床骨肌诊断经验) 独立评估, 他们对关节镜检查结果不知情。以关节镜检查结果为标准, 采用标准统计公式计算灵敏度、特异度、准确度、阳性预测值 (PPV)、阴性预测值 (NPV)、阳性似然比 (+LR)、阴性似然比 (-LR) 和约登指数。

结果: 放射科医生 C 的灵敏度、准确度和 NPV 均明显高于医生 A 和 B (C vs A/C vs B: p 灵敏度 <0.001/p 灵敏度 <0.001, p 准确度=0.001/p 准确度 <0.001, p (NPV) <0.001/p (NPV) <0.001), 但医生 A 和 B 之间无显著差异 (p 灵敏度=0.36, p 准确度=0.185, p (NPV)=0.729)。医生 A 的特异度明显高于医生 B 和 C (A vs B/A vs C: p<0.001/ p=0.004)。

结论: 临床骨肌诊断经验最丰富的放射科医生对肩胛下肌腱部分撕裂的总体诊断效果最好。经验最少的放射科医生对肩胛下肌腱部分撕裂的认识不足, 而经验中等的放射科医生则倾向于过度诊断肩胛下肌腱部分撕裂。

不典型 Erdheim-Chester 病多骨侵犯 1 例并文献复习

曹伯裕、陈思丹、戚乐、黄杰
杭州师范大学附属医院

Erdheim-Chester 病 (ECD) 是一种罕见的非朗格汉斯细胞性病变, 国内仅有少量报道, 病因及发病机制不详, 最新研究认为可能与体细胞突变, 免疫失调和炎症有关。目前已知是一群 CD68 (+)、CD1a (-)、S-100 (±) 为特征的泡沫样脂质细胞异常沉积形成黄色肉芽肿样浸润, 常伴纤维化。ECD 病常累及多系统、多器官, 骨最常受累, 首发症状为骨痛, 患者多伴有心血管、中枢神经系统、肾、乳腺受累。临床表现多样, 特异性差, 需要病理学检查确诊。本文详细描述一例无骨痛伴多骨侵犯的 ECD 病, 并对相关文献复习如下, 以期临床医师诊治 ECD 提供参考。

膝骨性关节炎患者脑结构和功能变化的多模态 MRI 研究

郑运松^{1,2}、马萧童¹
1. 陕西中医药大学附属医院
2. 陕西中医药大学

目的 联合基于体素的形态学测量 (VBM) 技术和静息态功能磁共振成像 (rs-fMRI) 技术探究膝骨性关节炎 (KOA) 患者静息状态下脑灰质体积、脑神经元活动强度及基于种子点的功能连接强度改变, 综合分析 KOA 相关异常脑网络。方法 前瞻性收集 30 例 KOA 患者 (KOA 组) 及 30 例健康人 (HC 组) 的 3D 高分辨率 T1WI 像和 rs-fMRI 图像, 采用 VBM、低频振幅、功能连接 3 种方法分析两组间脑灰质结构和功能数据差异。结果 与 HC 组相比, KOA 组双侧梭状回、右侧颞中回低频振幅值增高, 右侧前叶、右侧内侧前额叶皮质、左侧颞中回低频振幅值减低 (体素水平 $P < 0.005$, 团块水平 $P < 0.05$); 右侧楔前叶、右侧顶下小叶侧初级视觉皮层、左侧颞中回、左侧中央后回灰质体积减小 (体素水平 $P < 0.002$, 团块水平 $P < 0.05$); 以右侧楔前叶为种子点, 与侧颞中回的功能连接增强, 与左侧前扣带回、左侧背外侧前额叶皮质的功能连接降低 (体素水平 $P < 0.005$, 团块水平 $P < 0.05$)。结论 KOA 患者感知皮层系统及联合皮层系统阵营均存在血氧水平依赖信号及灰质微结构的改变且有重叠, 主要涉及视觉网络、感觉运动网络、默认状态网络、执行控制网络内及默认状态网络、执行控制网络、突显网络的部分脑区, 这可能提示 KOA 患不仅处于慢性疼痛的病理状态, 还伴有信息整合、注意力控制、情绪反应、情感解读等功能活动的异常。

腰椎退行性骨关节病的 X 线平片和多排螺旋 CT 影像诊断对比分析

王怡
贵州医科大学附属医院

摘要: 目的: 分析腰椎退行性骨关节病应用 X 线、计算机断层扫描 (CT) 诊断的临床价值。
方法: 抽选本院于 2022 年 1 月至 2023 年 1 月期间收治的腰椎退行性骨关节病患者 200 例, 分别进行 X 线扫描检查和 CT 扫描检查, 观察诊断结果, 分析平片特征和影像学特征。

结果:X 线检出病变 168 例(84.0%),CT 检出 184 例(92.0%)。X 线检出以椎间隙改变(92.9%)、骨赘形成/椎体角边缘弯曲(88.1%)居多;CT 检出病变类型以椎间盘膨出为主(59.6%),病变部位以 L45 为主(70.0%)。

结论:对于腰椎退行性骨关节病而言,X 线诊断、CT 诊断均有较高的临床价值,其中后者检出率高、能够明确病变类型和部位。

PU-1119

探讨能谱 CT 定量参数在腰椎间盘突出中的诊断价值

戴小毛

重庆医科大学附属第三医院

目的 探讨能谱 CT 定量参数在腰椎间盘突出中的诊断价值。

资料与方法 收集 82 例腰痛患者的腰椎 MRI 和能谱 CT 影像资料。根据 Pfirrmann 分级标准对纳入椎间盘进行分级。获取能谱 CT 的 74keV、水(钙)、水(碘)、水〔硫酸软骨素(CS)〕和 CS(水)图,分别测量髓核(NP)和纤维环(AF)的 CT 值及浓度值。采用单因素方差分析分别比较各级 NP 和 AF 的 CT 值及浓度值。采用 Spearman 相关分析评价 CT 值和浓度值与 Pfirrmann 分级的相关性。

结果 共纳入 249 个椎间盘,包括 I 级 18 个、II 级 33 个、III 级 93 个和 IV 级 105 个。对于 74keV 图像,前 AF、NP、后 AF 的 CT 值与椎间盘分级均呈弱的负相关。对于水(钙)图,仅 NP 的浓度值与椎间盘分级呈弱的正相关,前 AF、后 AF 的浓度值与椎间盘分级无相关性。对于水(碘)图,前 AF、后 AF 的浓度值与椎间盘分级呈弱的负相关,NP 的浓度值与椎间盘分级无相关性。对于水(CS)图,NP 的浓度值与椎间盘分级呈强的正相关,NP 各组间差异性显著(P 均 <0.001),前 AF 的浓度值与椎间盘分级呈中等正相关,后 AF 的浓度值与椎间盘分级呈弱的正相关。对于 CS(水)图,NP 的浓度值与椎间盘分级呈强的负相关,NP 各组间差异性显著(P 均 <0.001),前 AF 的浓度值与椎间盘分级呈中等负相关,后 AF 的浓度值与椎间盘分级呈弱的负相关。

结论 能谱 CT 定量参数水(CS)和 CS(水)可用于评估腰椎间盘突出。

PU-1120

基于常规胸部 CT 影像组学预测胸腰椎骨质疏松性骨折的风险

吴寅波

浙江省人民医院

目的: 基于常规胸部 CT 图像,构建及验证不同胸椎节段预测胸腰椎骨质疏松骨折(OVF)风险的影像组学模型,并比较其性能。

方法: 回顾性收集 494 位行常规胸部 CT 检查的患者(包括存在胸腰椎 OVF 的骨折组 198 例以及无脊柱骨折的对照组 296 例),并分为训练集 334 例及独立验证集 160 例。利用深度学习驱动框架分割每个胸椎的中央部分及外周部分作为感兴趣区。使用 PyRadiomics 软件包对总共 5690 个胸椎 11380 个感兴趣区进行影像组学特征提取,并在训练集中采用二步法进行特征筛选。预测模型的构建在十二个胸椎水平分别进行,分别构建基于胸椎中央部分、外周部分特征的模型、基于两类特征的混合模型以及基于两种影像组学平均得分的混合模型。使用受试者操作特征曲线(ROC)下面积(AUC)进行预测模型性能评估,比较各胸椎水平四种模型在独立验证集中的性能。

结果: 基于两种影像组学平均得分的混合模型具有最佳的骨折预测性能(在八个胸椎水平具有最佳的预测性能),基于混合特征的影像组学预测模型具有次优的性能(在三个胸椎水平具有最佳的预测性能),基于胸椎中央部分以及外周部分的影像组学预测模型分别在第一胸椎以及第七胸椎具有最佳的验证集性能。在所有构建的影像组学预测模型中,基于第五胸椎构建的基于影像组学平均得

分的混合模型具有最佳的预测性能，在训练集中的 AUC 为 0.926 (95%CI: 0.892-0.952)，在独立测试集中的 AUC 为 0.790 (95%CI: 0.719-0.851)。

结论：常规胸部 CT 包含的胸椎影像组学特征可以区分是否存在胸腰椎 OVF 的患者，在没有额外的医疗成本和辐射暴露的情况下，常规胸部 CT 检查可以为预测胸腰椎 OVF 风险提供有价值的信息。

PU-1121

Evaluation of pelvic fractures and tumors in a single-in-plane image by an unfolded visualization algorithm

Jixiang Chu, jun yang
Yunnan Cancer Hospital

Purpose: The purpose of this study was to evaluate the diagnostic performance of bone-unfolding visualization algorithm in pelvic fractures and tumors compared to reading conventional CT images. **Materials and Methods:** This study passed the ethical review and signed the informed consent form of patients. 77 patients with pelvic trauma and 86 patients with pelvic tumor in two centers were evaluated respectively. Pelvic bone unfolding imaging stacks were generated using a post-processing software. Two readers (one resident and one radiologist) independently evaluated all cases. Each reader first reviewed the conventional CT images and then reviewed the unfolding images after an interval of weeks. The results were compared with a reference standard built by senior radiologists. Diagnostic performance was assessed and time consumption was recorded. **Results:** In our study, the agreement between the readers using the two methods was better than previous methods. In the pelvic fracture group, the mean reading time (21.7s) of bone deployment was significantly shorter than standard MPRs (33.8s; $P < 0.001$). There was no significant difference in the results of the two assessment methods in the same reader. In the pelvic tumor group, the mean reading time (18.5s) of bone unfolding was significantly shorter than standard MPRs (26.3s; $P < 0.001$). In the pelvic fracture group and in the tumor group, the inter-reader agreement based on these two methods performed well (0.718-0.918) (0.774-0.884). **Conclusion:** We applied the bone unfolding algorithm to the imaging diagnosis of pelvic fractures and tumors. This method can save the diagnostic time, and does not reduce the diagnostic capacity, especially for patients with emergency trauma, this method can provide a certain value for clinicians' diagnosis and treatment.

PU-1122

X 线特殊检查技术对隐匿性骨折相关临床价值

曹瑞
中国人民解放军陆军特色医学中心

目的：运用 X 线相关特殊检查技术诊断隐匿性骨折

方法 选取陆军特色医学中心 2021 年 4 月-2023 年 4 月疑似隐匿性骨折患者 127 例，对意思骨折部位采用 X 线 DR 常规检查技术同时对于常规检查技术表现为阴性的疑似病人运用相关特殊检查技术（外舟位，外踝位，切线位等），以诊断结果为阳性标准，进行统计，比较 DR 特殊检查技术对常规检查技术对隐匿性骨折的检出率

结果 127 例疑似隐匿性骨折患者共检出阳性 93 例，阴性 34 例；DR 检查检出阳性 76 例，阴性 51 例；特殊检查技术检出阳性 89 例，阴性 38 例；DR 特殊检查技术对隐匿性骨折准确度、灵敏度、

特异度均高于常规检查技术, DR 特殊检查技术针对腕关节骨折、踝关节骨折、的隐匿性骨折检出率均高于 DR 常规体位检查

结论 DR 特殊检查技术具有个性化, 针对性, 应用于隐匿性骨折检查, 可明显提高诊断准确度、对腕关节骨折, 踝关节骨折其他特殊体位等不同部位隐匿性骨折均具有较高的检出率, 对提高相关临床检出率高。

PU-1123

能谱 CT 监测果糖对雌性大鼠骨密度影响的可行性分析

吕雪
重庆医科大学附属第三医院

目的:探讨能谱 CT 用于监测高果糖饮食后雌性大鼠骨密度 (BMD) 变化的可行性。

方法:选取 8 只 4 周龄的雌性 SD 大鼠, 平均分为果糖组和对照组, 果糖组大鼠每天给予高果糖饮食 (HFrd), 对照组大鼠每天喂饲等量标准饮食 (SD), 喂养 8 周后对两组大鼠进行能谱模式 CT 扫描, 图像传入 GE AW4.7 工作站行双侧股骨容积能谱分析, 分别测量单侧股骨的羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 值。随后处死大鼠, 采用双能 X 线吸收法 (DXA) 测量双侧股骨上段的 BMD 值。采用两独立样本 t 检验分别比较喂养 8 周后果糖组与对照组大鼠股骨羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 密度值以及 BMD 值的差异;对两组大鼠股骨羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 密度值与 BMD 值均行 Pearson 相关性分析。

结果:喂养 8 周后果糖组大鼠股骨羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 密度值以及 BMD 值均明显高于对照组, 差异有统计学意义 (P 均 <0.05); 两组大鼠股骨羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 密度值和 BMD 值均有相关性, 其中钙 (水) 密度值与 BMD 值的相关性最强 (r 果糖组 $=0.883$, $P<0.05$; r 对照组 $=0.764$, $P<0.05$)。

结论:高果糖饮食可以增加雌性大鼠的骨密度, 能谱 CT 基物质成像技术测得羟基磷灰石 (脂)、羟基磷灰石 (水)、钙 (水) 密度值与 DXA 测得的 BMD 值具有相关性, 其中钙 (水) 密度值相关性最强, 可成为一种实时、活体、长效的监测实验动物骨密度的手段。

高分辨 MRI 对腰椎间孔狭窄神经根受压诊断价值

贺雨欣、吴蓉、耿立刚、何仕丽、张高峰
遵义医科大学第二附属医院

【摘要】目的：探讨高分辨率 MRI 对腰椎间孔狭窄原因、部位及神经根受压程度与临床症状的相关性价值，为手术治疗提供影像学依据。**方法：**坐骨神经痛患者治疗前行腰椎常规 MRI 检查，对可疑 L4/5、L5/S1 节椎间孔狭窄患者行 MRI 薄层（1mm）椎间盘轴位扫描，对比分析常规 MRI 及高分辨 MRI 对椎间孔狭窄部位、病因及 Elisabeth 分型价值；高分辨 MRI 后处理图像上测量椎间孔形态学指标、神经根长短径，并分析其与临床症状 VAS 评分相关性。**结果：**61 例患者椎间孔狭窄神经根受压经手术或保守治疗有效确诊，常规 MRI 对椎间孔狭窄原因诊断率 75.4%，高分辨率 MRI 并后处理诊断率为 91.8%。高分辨 MRI 测量椎间孔面积与 VAS 评分无相关性，神经根受压变形程度与临床症状 VAS 评分相呈负相关。**结论：**高分辨率 MRI 对椎间孔狭窄神经根受压诊断明显优于常规 MRI，可视化显示神经根受压部位、原因及程度，能更好指导临床开展精准的微创手术。

左肘关节腺泡软组织肉瘤伴骨侵蚀和肺、脾脏转移 1 例

高荣¹、曾健康¹、王平^{1,2}
1. 甘肃中医药大学
2. 甘肃省人民医院

腺泡性软组织肉瘤（Alveolar Soft Part Sarcoma, ASPS）是一种具有血管浸润和远处转移倾向的罕见软组织恶性肉瘤[1]。由 Christopher 等人[2]于 1952 年首次报道，占成人软组织肉瘤的不到 1%[3]。ASPS 多见于女性，好发于大腿或臀部深层软组织，然而，发生在肘关节软组织的病例比较少见，并且发生周围骨侵蚀以及脾脏、肺转移的病例更少见。尽管该肿瘤生长缓慢，临床表现不典型，但其在疾病过程的早期有明显的转移扩散风险。因此，我们报告了一例侵及肱骨下段和尺桡骨上段并发肺、脾脏和腋窝淋巴结转移的腺泡性软组织肉瘤的独特病例。

PU-1127

一种膝关节应力侧位支具的发明及临床应用

刘传、李文、曹友红、左子钰、刘建平
重庆医科大学附属第一医院

目的：前交叉韧带（ACL）是膝关节的静力性稳定结构，它能防止胫骨过度向前移位。临床上为评估前交叉韧带功能，通常会进行前抽屉实验。根据胫骨相对于股骨前移的程度与健侧做比较，美国运动医学联合会将 ACL 损伤分为以下三度：前移 0~5mm 为 I 度，5~10mm 为 II 度，>10mm 为 III 度。以往测量胫骨前移程度，多凭借医生的手法和经验进行目测，为了更为准确的完成测量，且能反映在 X 光片上记录下来影像资料，笔者发明了一种膝关节应力侧位检查用支具（ZL2022225520880）。

方法：

1.1 一种膝关节应力侧位检查用支具的设计与制作：

本发明设置有支撑架 1，该支撑架 1 设置有两个支撑杆体 11，两个支撑杆体 11 相对设置，且在支撑杆体 11 两端均设置有弧形支架 12，两个支撑杆体 11 通过该弧形支架 12 连接在一起，也可采用

其他形状的连接结构。支撑架 1 整体采用塑料材质, 且整个固定装置整体均采用塑料或其他非金属材料, 避免在检查中造成干扰。(见图 1)

1.2 模拟前抽屉实验的膝关节应力侧位检查方法:

受检者单脚站立于摄影台上, 受检侧下肢弯曲 90°, 脚尖勾住支具侧方把手, 膝盖腘窝放置于支具中央凸起的把手处, 利用自身重量将大腿尽力向后拉, 评估 ACL 的功能和术后恢复情况。图像质量控制要求同膝关节标准侧位: 股骨内外髁后缘完全重合。放置 1:1 刻度尺进行测量。(见图 2)

结果: 2023 年 4-7 月, 共完成 41 例膝关节应力侧位检查, 测得阳性病人 25 例, 其中 I 度损伤 14 例, II 度损伤 8 例, III 度损伤 3 例(见图 3)。临床对该装置的使用效果表示满意。

结论: 之前在临床上无法开展膝关节应力侧位 X 光检查, 国内针对此问题的研究报道也较为少见。笔者所设计的一种膝关节应力侧位检查用支具, 填补了此空白。本装置利用患者自身重力, 巧妙的完成了模拟前抽屉实验的膝关节应力侧位检查, 解决了临床迫切的需求问题。检查过程中并不需要其他人协助, 也避免了不必要的辐射问题。

增生性肌炎 2 例临床影像病理分析

陈家骏、叶勇军、李霞、张韬、夏水伟、王祖飞
丽水市中心医院

增生性肌炎(proliferative myositis, PM) 是一种起源于横纹肌组织纤维间隔和筋膜中的增生性病变,多见于中老年人, 儿童罕见。本病好发于躯干及四肢, 发病初期通常无疼痛, 病灶生长迅速, 逐步发展为疼痛性肿块, 极易误诊为恶性肿瘤而行扩大手术治疗。本文报道 2 例 PM, 1 例术前诊断恶性肿瘤, 行扩大切除术, 另 1 例行软组织穿刺活检术确诊, 对其临床影像及病理特征、治疗及预后进行回顾性分析, 旨在对临床提供诊治借鉴, 为临床医生提供诊断思路, 早期明确诊断, 避免过度治疗。

PM 主要表现为反应性、自限性、浸润性的结节状增长, 生长迅速, 一般病程在 3 周以内可触及肿块。病灶生长迅速, 无包膜, 界限不清, 但大多数无症状, 患者基本都在无意间发现肿块, 肿块因短期内增大而就诊。PM 患者生化检验结果极少出现阳性, 影像学征象又不典型, 因此术前很难确实, 极易误诊为恶性肿瘤, 导致过度治疗。

高频彩色多普勒超声在 PM 诊断中具有一定价值。PM 中主要表现为梭形或椭圆形中等偏高回声包块, 一般为乏血供, 略高回声与低回声相间形成的“龟裂纹征”“棋盘样”是其特征性超声征象, 其代表增生的纤维组织包绕相对正常的肌纤维。病变病理形态学主要表现为增生的纤维母细胞/肌纤维母细胞穿插于横纹肌纤维之间, 其间可见成簇的神经节样细胞。

磁共振在 PM 诊断中作用相对局限, MRI 上主要表现为肌腹内梭形结节, 边缘不清, T1WI 呈等信号; T2WI 呈混杂高信号(增生纤维组织包绕正常肌纤维), 周围肌肉及筋膜明显水肿, T1WI 脂肪抑制序列增强扫描明显均匀强化(间质血管及肉芽组织增生)。

综上所述, 增生性肌炎是一种良性少见病变。少数患者病灶可以自行消退, 不能消退的病例可以通过完整切除治愈, 术后不复发、转移。因此提高临床医师对于 PM 的了解, 术前的明确诊断, 可以有效的避免扩大切除和过度治疗。

MRI 脂肪抑制液体衰减反转恢复成像在滑膜炎诊断及分级中的应用

刘祥龙、张小安
郑州大学

目的 探究磁共振成像(MRI)脂肪抑制液体衰减反转恢复成像(FLAIR-FS)在滑膜炎诊断和分级中的应用。**方法** 选取 109 例于 2020 年 3 月至 2021 年 7 月在我院治疗的滑膜炎患者,收集患者临床资料。通过 FLAIR-FS 对滑膜炎患者进行诊断和分级,并与脂肪抑制质子密度加权成像(PDWI-FS)进行比较,分析检测结果的差异。对患者各观察部位滑膜厚度评级、病理评分以及病理指标评分进行比较,分析滑膜厚度评级与病理评分、病理指标、膝关节疼痛以及功能评分的相关性。**结果** 研究组与对照组相比,两组受试者年龄、性别以及膝关节的差异均无统计学意义($P>0.05$);研究组患者的滑膜厚度显著高于对照组($P<0.05$)。FLAIR-FS 以 2~3 分为主,PDWI-FS 以 1~2 分为主,二者评分的差异显著($P<0.05$)。1 级与 2 级的滑膜厚度无显著差异($P>0.05$);1、2 级与 3 级的滑膜厚度的差异显著($P<0.05$)。各观察部位滑膜厚度评级、病理评分以及滑膜病理指标评分均无显著差异($P>0.05$)。Pearson 线性相关性分析发现,滑膜厚度评级与病理评分、滑膜病理指标评分均呈正相关($P<0.05$),与膝关节疼痛以及功能评分均无相关性($P>0.05$)。**结论** 滑膜炎患者的滑膜厚度有明显增高。MRI 的 FLAIR-FS 序列对膝关节滑膜炎患者的诊断以及分级具有显著优势,可作为临床上滑膜炎的诊断工具,临床应用价值较高。且滑膜厚度评级与病理评分、滑膜病理指标评分均呈正相关,与膝关节疼痛以及功能评分均无相关性。表明 MRI 可用于检查滑膜炎患者的治疗疗效,但不能用主观评分来评估患者的病情。

PU-1130

基于多层螺旋 CT 扫描的骶髂关节骨化与脊柱后纵韧带骨化关系初探

易坤明、肖钦、胡霖霖
中国人民解放军陆军特色医学中心

目的: 骶髂关节改变的特征及其在后纵韧带骨化中的变化关系尚不明确,本研究旨在回顾性分析患有和不患有后纵韧带骨化的个体骶髂关节的形态学变化并比较两者之间的差异。**材料与方法:** 本研究共纳入了 200 名年龄和性别匹配的患者(骨化组 A, 100; 非骨化组 B, 100)。此外,将单纯颈椎后纵韧带钙化患者划分为 C 组,将多节段韧带骨化组分为 D 组。研究中采用骨化指数来评估整个脊柱骨化病变的严重程度并将其分为 3 个等级: 1 级,骨化指数 <10 ; 2 级,骨化指数 10-19; 3 级,骨化指数 ≥ 20 。骶髂关节形态分为 4 种亚型: I 型,正常或小的外周骨不规则; II 型,软骨下骨硬化和骨赘形成; III 型,真空现象; IV 型,桥接骨赘和骨融合。同时将 IV 型根据骨强直的部位不同进一步分为 3 个亚组,关节旁前桥(IV 1 型)、关节旁后桥(IV 2 型)和关节内强直(IV 3 型)。最后评估后纵韧带骨化的脊柱区域与骶髂关节形态学变化之间的相互作用。**结果:** 本研究中,后纵韧带骨化组与非骨化组均存在骶髂关节退变。两组间骶髂关节强直的发生率有显著差异($P<0.01$)。骨化组(54.5%)与非骨化组(24.6%)相比,骶髂关节前后桥连和融合发生率更高。D 组中骶髂关节退变 III 型、IV 型患病率高于 C 组($P<0.01$)。然而在骶髂关节 IV 型的 4 亚型中, C 组与 D 组差异无统计学意义。本研究中,平均骨化指数为 9.7 ± 4.5 (范围为 1-34),整个脊柱的骨化指数与骶髂关节的形态学变化相关。与 II 型患者(6.2 ± 2.7)相比,骶髂关节 IV 型(11.8 ± 3.6)的骨化指数更高($P<0.01$)。然而,骨化指数在 IV 型的子类之间没有差异。骨化指数为 2 级或 3 级的患者中,骶髂关节往往表现出较高的骨桥接和关节内融合率。

结论: 与无脊柱后纵韧带骨化患者相比, 后纵韧带骨化患者具有较高的骶髂关节强直风险, 并且广泛骨化的患者骶髂关节强直的发生率更高。

探讨急性膝关节韧带损伤应用 MR 诊断的应用价值

张心然

徐州医科大学附属医院

目的 探究膝关节韧带的正常解剖与急性膝关节韧带损伤后经磁共振成像 (MRI) 检查的影像特征及诊断价值。

方法 回顾性分析 20 例急性膝关节韧带损伤病人, 与 20 例膝关节正常病人, 观察正常膝关节主要韧带 (包括前、后交叉韧带及内、外侧副韧带) 的 MRI 解剖与韧带损伤的影像学表现。

结果 在矢状位上可以清楚观察到前、后交叉韧带的形态及信号的改变, 冠状位和轴位显示内、外侧副韧带的形态及信号的变化。韧带损伤在 MRI 表现上为连续性中断或增粗、肿胀、部分肌纤维断裂, 韧带走形不整, T2WI 上信号增高。急性膝关节韧带损伤较易损伤前交叉韧带和内侧副韧带, 后交叉韧带相对不易受损。

结论 磁共振成像可以清晰显示膝关节韧带的形态、走形及连续性, 并初步判断韧带损伤程度, 为临床进一步处理提供了影像学依据。

青少年型 Blount 病 1 例报告

陈妍

徐州医科大学附属医院

目的: 分析我院 2022 年收治的一例青少年型 Blount 病的临床及影像学资料, 并结合文献报道分析 Blount 病诊断, 以提高 Blount 病的正确诊断率。

方法: 回顾性分析 1 例青少年型 Blount 病患者的临床资料, 特别是影像学资料。

结果: 患者 8 岁发病, 左膝进行性膝内翻, 有关节痛。双下肢全长显示左膝内翻, 左侧髌骨内侧及干骺端向下倾斜, 干骺端内侧形成喙状突, 内侧关节间隙变宽, 胫骨干骺端-骨干角呈。CT 示左膝内后方髌板钙化。患者确诊胫骨内髌骨软骨病后, 于我院行髌骨固定术, 效果欠佳, 双下肢不等长加重, 后期拟行胫骨截骨手术纠正畸形。患者的影像学表现可为诊断及手术提供重要的信息。

结论: Blount 病是一种胫骨近端内侧髌板和骨骺的生长障碍导致下肢三维畸形的疾病, 三维畸形包括包括胫骨近端内翻、前屈、胫骨内旋生长以及下肢缩短, 主要表现为进行性膝内翻。按发病年龄分为婴儿型和青少年型, 青少年型较婴儿型少见, 且畸形较婴儿型轻, 多伴有关节痛而婴儿型多不伴有关节痛。影像上, 胫骨角小于 165 度提示膝内翻, 胫骨干骺端-骨干角大于 16 度提示病理性膝内翻。干骺端的喙状突及髌板形态不规则, 髌板内侧向下倾斜提示 Blount 病。干骺端周围的骨碎片提示进行性膝内翻, 是进行手术治疗的指征。患者应早期诊断, 积极矫正, 年幼儿童截骨术后畸形复发率低于年长儿童。

PU-1133

MR-based assessment of lumbar bone micro-environment between postmenopausal women with and without osteoporotic/osteopenic fragility fractures by using IVIM-DWI and IDEAL-IQ sequences

Hui Yang,Xin Chen,DaTian Su,YanBo Liang,Jian Qin
The Second Affiliated Hospital of Shandong First Medical University

Objective. To explore the performance of IVIM-DWI and IDEAL-IQ sequences in evaluating the heterogeneity of vertebral bone micro-environment in postmenopausal women with and without osteoporotic/osteopenic fragility fractures.

Methods. A total of 124 consecutive postmenopausal women aged ≥ 50 years old with osteopenia or osteoporosis were recruited for this study. All study participants underwent 3T-MRI of the thoracolumbar spine, from which PDFF and $R2^*$ values of IDEAL-IQ sequence, ADCslow, ADCfast and f values of IVIM-DWI sequence were obtained. The participants were divided into osteoporotic/osteopenic vertebral fractures group and non-vertebral fracture group. Independent t test was used to compare the difference of each parameter between the two groups, and multivariable logistic regressions analysis was performed to identify the independent factors. ROC curves were generated to evaluate the performance of the independent factors.

Results. There were significant differences of age and body mass index. The bone mineral density values in postmenopausal women with vertebral fractures was significantly lower than those without fractures. The ADCslow, f and PDFF values of vertebral fractures group were significantly higher than non-vertebral fracture group, but the $R2^*$ values were lower significantly. Multivariable logistic regression analysis revealed the age, ADCslow and $R2^*$ were the independent factors. The combined multiparameter of Age + $R2^*$ showed the highest AUC efficacy in distinguishing postmenopausal women with vertebral fractures and without fracture.

Conclusion. The ADCslow and $R2^*$ values can be used to evaluate the heterogeneity of vertebral bone micro-environment in postmenopausal women with and without osteoporotic/osteopenic fragility fractures. Combining $R2^*$ with ADCslow and age can improve the identified power.

PU-1134

Analysis of factors related to osteoporotic vertebral fracture in prostate cancer patients

Shunfa Huang¹, Siqing Cai², Jianjun Zhou¹
1. Zhongshan Hospital(Xiamen), Fudan University
2. The Second Affiliated Hospital of Fujian Medical University

Objective: This study was aimed at exploring the osteoporotic vertebral fracture rate and the related causal factors in prostate cancer patients before and after treatment.

Methods: One hundred prostate cancer patients were recruited in this study. One hundred men without prostate cancer history were selected as the control group. The T4–L1 vertebral body of the case group and the control group before and after treatment was evaluated according to Genant's semi-quantitative method. The difference in vertebral body fracture rate between the case group and the control group and the changes in vertebral body fracture rate before and after treatment among the case group were compared. They were grouped according to age, body mass index (BMI), prostate-specific antigen (PSA) levels, Gleason grade, and androgen

deprivation therapy (ADT). Univariate and multivariate logistic regression models were used to determine the factors significantly associated with vertebral fracture rate in prostate cancer patients.

Results: The prevalence of vertebral fracture was 16% and 31% in prostate cancer patients before and after treatment, respectively, and 29% in the control group. The vertebral fracture rate of the patients before treatment significantly differed that of the control group and the patients after treatment ($P < 0.05$). Univariate analysis showed that age, PSA levels, and treatment parameters were the significant influencing factors of vertebral fracture rates. Multivariate logistic regression analysis showed that age was the main influencing factor of vertebral fracture rates ($P < 0.05$).

Conclusion: The incidence of vertebral fracture in prostate cancer patients after ADT is higher than that before treatment because many factors related to prostate cancer can increase the risk of osteoporotic vertebral fractures.

髂腰肌原发未分化多形性肉瘤 1 例并文献复习

徐庆、袁贵斌
云南省第三人民医院

未分化多形性肉瘤 (undifferentiated pleomorphic sarcoma, UPS) 是一组无明确分化方向的多形性异质性间质肉瘤。该病好发年龄为 50-70 岁, 男性多于女性, 发病部位广泛, 多见于四肢骨骼肌深部或邻近筋膜处, 其次为腹膜后, 髂腰肌罕见。未分化多形性肉瘤临床表现缺乏特异性, 早期无明显症状, 晚期可引起相应部位疼痛, 可做排他性诊断, 确诊需完成免疫组化, 组织学形态上, UPS 表现为明显异型的梭形细胞和多形性细胞混合存在, 可呈束状或席纹状, 多可见核分裂。免疫组化 Vim、AACT、CD68 常呈阳性, Ki-67(+, 60%)。因发现时常处于晚期, 所以预后较差, 术后易复发, 云南省第三人民医院收治 1 例髂腰肌原发未分化多形性肉瘤患者, 现将患者的临床表现、病理特征、影像学表现、鉴别诊断及预后情况结合文献复习报道如下。

PU-1136

Low muscle density in children with osteogenesis imperfecta using opportunistic low-dose chest CT: a case-control study

Yi Yuan, Wenshuang Zhang, Ling Wang, Xiaoguang Cheng
Beijing Jishuitan Hospital, Capital Medical University

Objective: The aim of the present study was to investigate the muscle differences in children with osteogenesis imperfecta (OI) using opportunistic low-dose chest CT.

Materials and methods: A total of 20 children with OI (3-14 years; 15 males) and 40 age- and sex-matched controls undergoing opportunistic low-dose chest CT during the COVID pandemic were enrolled. From the CT images, muscle size (cross-sectional area) and density (mean Hounsfield Units [HU]) of the trunk muscles were measured at the mid-T4 and the mid-T10 level using two methods, the fixed thresholds and the Gaussian mixture model. The Bland-Altman method was also used to compute the strength of agreement between two methods. Comparison of muscle results between OI and controls were analyzed with Student t tests.

Results: Mean differences between two methods were good. Children with OI had lower T4 muscle density and lower T10 muscle density than controls measured by the fixed thresholds (41.2 HU vs. 48.0 HU, $P<0.01$; 37.3 HU vs. 45.9 HU, $P<0.01$). There were no significant differences in T4 muscle size and T10 muscle size between OI patients and controls measured by the fixed thresholds ($P=0.09$, 0.06, respectively). However, children with OI had lower T4 muscle size, lower T4 muscle density, lower T10 muscle size and lower T10 muscle density than controls measured by the Gaussian mixture model (110.9 vs. 127.2 cm², $P=0.03$; 44.6 HU vs. 51.3 HU, $P<0.01$; 72.6 vs. 88.0 cm², $P=0.01$; 41.6 HU vs. 50.3 HU, $P<0.01$, respectively). Conclusion: Children with OI had lower trunk muscle density than non-OI children indicating that OI might also impair muscle quality. Moreover, the fixed thresholds may not be suitable for segmentation of muscle in children.

PU-1137

A 5-yr longitudinal study of skeletal muscle group-specific atrophy with aging and the association with loss of muscle strength and physical performance

Yi Yuan, Wenshuang Zhang, Ling Wang, Xiaoguang Cheng
Beijing Jishuitan Hospital, Capital Medical University

Objective: Our objective was to examine the 5-yr changes in muscle size and density of different skeletal muscle groups in older individuals and explore the longitudinal associations of changes in different skeletal muscle groups size and density with changes in handgrip strength (HGS) and the Timed Up and Go test (TUG).

Materials and methods: Participants were 120 older individuals who performed baseline and follow-up HGS, TUG and quantitative computed tomography (QCT) scanning 5 years apart. From the CT images, cross-sectional area (cm²) and density (HU) were measured for the mid-thigh, hip, and trunk muscle groups at L2 level. Changes in the muscle properties from baseline to the 5-yr follow-up were compared. Linear regression models estimated the association of changes in muscle properties with changes in HGS and TUG.

Results: The mid-thigh, hip and trunk muscle groups areas and density declined over the 5 years (all $P<0.01$). The magnitude of mid-thigh muscles and trunk muscles atrophy were greater in individuals over 70 years ($P<0.05$). After adjustment, associations with changes in HGS were significant in females for changes in mid-thigh muscle size ($\beta=0.75$, $P=0.03$), trunk muscle size ($\beta=0.69$, $P=0.01$) and in males for changes in mid-thigh muscle size ($\beta=0.67$, $P=0.02$). Associations with changes in TUG were significant in females for changes in muscle size of mid-thigh ($\beta=-1.14$, $P=0.04$) and in males for changes in trunk muscle size ($\beta=-3.48$, $P=0.02$).

Conclusion: Atrophy of mid-thigh and trunk muscle groups are associated with loss of muscle strength and physical performance. A comprehensive understanding of skeletal muscle group-specific atrophy would aid development of muscle group-specific interventions to mitigate the aging process and improve the quality of life of older individuals.

胸部 CT 薄层数据重组测量临界肩角的可行性研究

包磊、崔雪娥、李士建、任刚
上海交通大学医学院附属新华医院

目的 探讨利用胸部 CT 薄层数据重组测量临界肩角 (CSA) 的可行性。方法 回顾性分析 90 例同期接受胸部 CT 及肩关节 X 线平片检查患者的影像资料。利用胸部 CT 的薄层数据对肩关节区域进

行放大后重组,由两位医生在双盲原则下分别以 CT 重组图像与 X 线平片进行 CSA 测量。配对 t 检验用于分析两种方法 CSA 测量的差异。组内相关系数 (ICC) 用于分析两种方法测量 CSA 的一致性和重复性。Pearson 相关分析用于评估两种测量方法间的相关性。结果 (1) 差异性分析: X 线平片法与胸部 CT 重组法测量 CSA 值分别为 $(33.28 \pm 4.69)^\circ$ 和 $(33.31 \pm 4.53)^\circ$, 两种影像学方法测量结果差异无统计学意义 ($P > 0.05$)。 (2) 重复性研究: ① 观察者间信度: 两位医师分别利用 X 线平片和 CT 重组图像测量 CSA 值均具有显著相关性 ($ICC = 0.995, 0.993$ 和 $ICC = 0.992, 0.990, P < 0.01$); ② 观察者自身信度: 利用 CT 重组图像和 X 线平片前后两次测量 CSA 值均具有显著相关性 ($ICC = 0.995, 0.994$ 和 $ICC = 0.996, 0.993, P < 0.01$)。 (3) 相关性研究: X 线平片法和胸部 CT 重组法测量 CSA 值具有显著相关性 ($r = 0.964, P < 0.01$)。结论 利用胸部 CT 薄层数据重组可以获得满足 CSA 测量要求的肩关节区图像,并且测量结果与 X 线平片具有很好的重复性和一致性,应用于临床可以达到诊断目的的同时,最大可能地降低患者的 X 射线辐射剂量。

MRI 技术在儿童发育性髋关节脱位诊断中的价值分析

潘小磊

郑州市骨科医院

背景: 发育性髋关节脱位 (DDH) 是小儿最为常见的一种先天性畸形, 主要包括髋关节发育不良、股骨头脱位, 以患侧肢体短缩、髋关节屈曲外旋为主要特征, 若未进行及时治疗可导致残疾, 甚至威胁到患儿的生命健康。DDH 早期常无典型症状, 患儿大多因行走异常而被确诊, 因此及时在临床早期选择有效的影像学检查技术, 有效判断疾病的进展程度及病理性改变并给予对症治疗对提高预后质量尤为重要。MRI 是临床上常用的一种影像学手段, 可对髋骨关节全面成像, 对软组织分辨率高, 在 DDH 诊断中具有显著优势。

目的: 探讨 MRI 在儿童发育性髋关节脱位诊断中的应用价值。

方法: 收治的 60 例发育性髋关节脱位儿童作为研究组, 并选取同期 36 例健康体检儿童作为对照组, 所有受试者均接受 MRI 扫描, 详细测量骨性及软骨性髋臼指数与前倾角, 分析对照组与研究组中 I 型、II 型脱位髋骨相关指标。

结果: 研究组儿童骨性及软骨性髋臼指数与前倾角均显著高于对照组 ($P < 0.05$), I 型、II 型患者骨性及软骨性髋臼指数均显著高于对照组 ($P < 0.05$), I 型与 II 型组骨性及软骨性髋臼前倾角比较无统计学差异 ($P > 0.05$)。

结论:

结论: MRI 可通过详细测量骨性及软骨性髋臼指数与前倾角来评价髋臼形态改变, 准确诊断发育性髋关节脱位, 为临床确立治疗方案提供有力的参考依据。

基于 QCT 的胃癌胃切除术患者合并骨质疏松症的危险因素分析及列线图预测模型建立

余娟
武汉大学人民医院

目的：本研究旨在基于定量 CT (QCT) 成像探讨胃癌胃切除术患者合并骨质疏松症的危险因素并构建列线图预测模型。

材料与方法：回顾性分析 2018 年 1 月至 2021 年 7 月于我院行胃切除术并经病理证实为胃恶性肿瘤患者的手术前、后影像资料 (n=138)。收集患者的一般资料、临床资料及手术前后的实验室指标。包括年龄、性别、术前 BMI、手术时间、复查时间、住院时间、吸烟史、手术切除方式 (部分胃切除或全胃切除)、肿瘤病理分期及化疗方式、血红蛋白浓度、血清钙、血清磷、血清碱性磷酸酶及肌酐水平。采用 QCT 评估胃癌患者第 12 胸椎、第 1 及第 2 腰椎椎体骨密度，并计算平均骨密度值。根据骨质疏松症诊断标准对患者进行分类，即平均骨密度 $>120 \text{ mg/cm}^3$ 为正常， $80 \sim 120 \text{ mg/cm}^3$ 为低骨量， $< 80 \text{ mg/cm}^3$ 为骨质疏松症。配对 t 检验评估患者术前、术后骨密度的变化。使用单因素分析进行自变量筛选， $P < 0.1$ 的自变量将被纳入多因素 Logistic 回归。利用 R 4.1.2 软件绘制列线图模型，绘制受试者工作特征曲线 (ROC) 和校准曲线对预测模型的区别度和准确度进行评估。

结果：138 名符合标准的患者平均复查间隔时间为 (182.7 ± 24.2) 天。与基线骨密度相比，手术后平均骨密度明显下降 ($P < 0.001$)。多因素 logistic 回归分析显示，年龄、全胃切除术是胃癌患者术后六个月内合并骨质疏松的独立危险因素 ($OR=1.901$, 95 %CI: $1.237 \sim 4.969$, $P = 0.005$; $OR=6.648$, 95 %CI: $1.803 \sim 24.513$, $P = 0.004$)。绘制列线图，ROC 曲线下面积 0.807 (95 %CI: $0.731 \sim 0.869$)。校准曲线显示列线图模型预测胃癌术后合并骨质疏松症的概率与实际发生概率具有较好一致性。

结论：胃癌患者术后 6 个月即出现骨密度的明显下降，高龄和全胃切除术是胃癌患者术后合并骨质疏松的独立危险因素。以此构建的预测胃癌患者术后合并骨质疏松症列线图模型具有良好的区分度和准确度。

多层螺旋 CT 及后处理技术在观察骨折金属内固定器中的应用价值

高伟
南京市第一医院

【摘要】目的：寻找一种能够清楚、全面的显示骨折金属内固定器的影像学检查方法，同时对多层螺旋 CT (MSCT) 后处理技术在显示不同部位骨折金属内固定器中的应用价值进行探讨。方法：37 例不同部位的骨折金属内固定术病人，全部行多层螺旋 CT 横断面扫描，同时对原始图像进行 MPR、SSD 或 VR 重建，观察内固定器的显示效果。结果：脊柱内固定术 6 例，骨盆 4 例，髌关节 3 例，股骨 4 例，髌骨 1 例，胫腓骨 8 例，踝关节 6 例，跟骨 3 例，肘关节 2 例。37 例骨折金属内固定器经横断面扫描及 MPR、VR 重建均可明确显示，横断面扫描对内固定器的完整性显示欠佳，但可观察某一平面内固定器的情况。MPR 法的矢状位与冠状位，对椎体与长骨内固定器显示最为清楚，同时对骨折线及骨痂形成也可明确显示。VR 或 SSD 法显示的内固定器立体、直观，适用于骨盆以及不规则骨金属内固定器的观察。结论：多层螺旋 CT 在以横断面扫描为基础的情况下，结

合 MPR 的矢状位与冠状位、SSD 或 VR 可多方位, 多角度显示金属内固定器, 为临床提供了一种观察骨折金属内固定器的有效方法。

骨盆软组织肉瘤影像和病理分型对照分析

赵向乾

空军军医大学西京医院

目的 分析各型骨盆软组织肉瘤的临床及各类影像表现, 从而提高骨盆软组织肉瘤分型的术前诊断率。
方法 回顾性分析我院 2018 年 6 月—2023 年 6 月经手术或穿刺确诊的骨盆软组织肉瘤病例 23 例, 分析其临床表现、发病年龄、部位及 X 线、CT、MRI 的影像特点, 并对照其病理分型结果。
结果 该组病例发生于: 髌骨 8 例、耻骨 3 例、坐骨 2 例、骶骨 1 例, 右半骨盆 5 例, 左半骨盆 4 例; 其中病理经典型软组织肉瘤 14 例, 去分化型软组织肉瘤 4 例, 间叶型软组织肉瘤 3 例, 透明细胞软组织肉瘤 2 例。其临床表现、发病年龄、部位及 X 线、CT、MRI 的影像表现及病理分型各有特点。
结论 骨盆软组织肉瘤各型影像表现大部分具有一定的特征性, 根据其影像表现及临床表现、发病年龄综合分析鉴别诊断, 可以在术前得到相对准确的诊断, 甚至可以提出较合理的病理分型结果。

The CT and MRI features of calvarium and skull base osteoblastoma (CSBOB)

Yulin Li

Peking University Shenzhen Hospital

Background

We set out to retrospectively review the computed tomography (CT) and magnetic resonance imaging (MRI) features of patients with osteoblastoma in the calvarium and skull base.

Methods

Nine cases of pathologically confirmed osteoblastoma in the calvarium and skull base were analyzed retrospectively. They had undergone CT and/or MRI. Tumor location, size, and imaging features were reviewed and recorded.

Results

The patients included four men and five women with a mean age of 27.0 years (age 14-40 years). Tumors occurred in frontal 3 cases, occipital 3 cases, parietal and sphenoidal, and skull base 1 case, respectively. On CT, tumors were measuring 5.1 ± 3.3 (1.8–8.4) cm. Seven tumors were shown to have expansile bony destruction with eggshell appearance and varying degrees of calcification or matrix mineralization. Multiple septa were observed in Five tumors. Intracranial growth in Five tumors. On MRI, seven tumors showed heterogeneous hypo to isointense on T1WI. Heterogeneous high signal patterns with low signal rim and septa were shown in six tumors on T2WI, four cases showed fluid-fluid levels. On contrast-enhanced images, six cases showed peripheral and septa enhancement, two cases showed dural tail signs.

Conclusions

Calvarium and skull base osteoblastoma (CSBOB) is rare, expansile bony destruction, septa, sclerotic rim, and calcification or matrix mineralization are the characteristic CT and MRI features.

Accelerated high-resolution fast spin echo based knee magnetic resonance imaging including quantitative T2 mapping using deep-learning reconstruction

Xiaxia Wu^{1,3}, Weiyin Vivian Liu², Yunfei Zha³

1. Xiangyang No.1 People's Hospital Affiliated of Hubei University of Medicine

2. MR Research, GE Healthcare, Beijing

3. Department of Radiology, Renmin Hospital of Wuhan University

Objective: This prospective study aimed to validate clinical value of 2D fast spin echo (2D FSE) based high-resolution knee images and T2 mapping using deep learning reconstruction (DLR). **Design:** 92 patients with suspected knee lesions underwent 2D FSE based routine knee imaging on 3.0T MRI, 39 of whom also underwent T2 mapping with an acceleration factor of 2 or 3 for parallel imaging. All image data were reconstructed using conventional and deep learning reconstruction algorithms as FSE_O, FSE_{DLR}, T2_{O-ARC=2,3}, and T2_{DLR-ARC=2,3}. Subjective evaluation for overall image quality, sharpness and diagnostic confidence using 5-point Likert scale and objective assessment for signal-noise ratio and contrast-to-noise ratio were carried out. Diagnostic efficacy and accuracy was respectively performed using arthroscopy results and the more-experienced radiologist's evaluation as reference.

Results: Inter-reader agreement of subjective assessment ranged from 0.707 to 0.897 and higher score on FSE_{DLR} than FSE_O ($P < 0.05$). Both SNR and CNR of PDWI_{DLR} were higher than those of PDWI_O ($P < 0.05$). The accuracy and sensitivity of PDWI_{DLR} for evaluating knee cartilage injury were higher than those of PDWI_O. ROC curve analysis showed that T2_{DLR-ARC=2} had the highest diagnostic efficacy of classification A (group A: ICRS 0; group B: ICRS I-III) while Delong test showed no significant between-method difference of AUCs. Moreover, the diagnostic accuracy of knee injury evaluation by a less-experienced radiologist using both routine FSE_{DLR} images and T2_{DLR-ARC=2}, compared to using only FSE images, was improved by 13.8% - 25% using the evaluation by the more-experienced radiologist as diagnosis reference.

Conclusion: An accelerated high-resolution knee DLR FSE-based imaging protocol including both anatomical images and quantitative information (T2 relaxation time) could alleviate patient intolerance and statistically elevate diagnostic accuracy. This proposed protocol has great clinical value in monitoring knee injury and alterations for follow-ups.

iCare 与 Mindways 两种骨密度仪测定髌部骨密度比较

黄健、陈菁华、黄芳

太仓市中医医院

目的: 探索 iCare 与 Mindways 两种骨密度仪测定髌部骨密度的差异。

方法: 分别采用 iCare 和 Mindways 两种 QCT 后处理软件对欧洲体模 (ESP) 内高、中、低密度椎体测量, 比较两种 QCT 软件测量平均值有无差异。对 230 例受试者行髌关节 CT 检查, 并采用 Mindways QCT 和 iCare QCT 计算骨质疏松检出率。对比 Mindways QCT 和 iCare QCT 对不同年龄和性别的髌骨骨质疏松检出率。

结果: iCare QCT 和 Mindways QCT 对 ESP 高、中、低密度椎体测量结果均无统计学差异 ($P > 0.05$)。iCare QCT 对髌骨骨质疏松检出率明显高于 Mindways QCT ($P = 0.01$)。iCare QCT 对女性和男性髌骨骨质疏松的检出率均明显高于 Mindways QCT ($P < 0.05$)。iCare QCT 对 ≥ 50 岁受试者髌骨骨质疏松检出率显著高于 Mindways QCT ($P = 0.02$)。

结论: iCare QCT 对于骨密度检测结果可靠, 对髌骨骨质疏松的检出率优于 Mindways QCT。

颈胸椎定位像对椎体编号的必要性

郭威、黄媛云、杨凡
武汉市第三医院

目的 探讨腰椎 MRI 及 CT 扫描时增加颈胸椎定位像对确定椎体编号的必要性。**方法** 回顾性分析 734 例行腰椎 MRI 及腰椎 CT 检查(包括腹盆部 CT)的患者的图像。以 MR 全脊柱定位像对椎体编号为金标准,对比基于 MRI 图像的椎体倒数法和基于 CT 图像的肋骨定位法、髂腰韧带定位法、腰大肌定位法、横突形态定位法和髂棘定位法对腰椎椎体计数的准确性。**结果** 734 例患者包含 213 例移行椎体患者和 521 例非移行椎体患者。移行椎体组中基于 MRI 的椎体倒数法的准确率为 57.3%,基于 CT 的肋骨定位法、髂腰韧带定位法、腰大肌定位法、横突形态定位法和髂棘定位法的准确率分别为 84.0%、75.6%、81.7%、78.9%和 85.9%;非移行椎体组中基于 MRI 的椎体倒数法的准确率为 100%,基于 CT 的肋骨定位法、髂腰韧带定位法、腰大肌定位法、横突形态定位法和髂棘定位法的准确率分别为 100%、96.2%、95.2%、91.7%和 95.8%。非移行椎体组基于腰椎 MRI 或者腰椎 CT 图像的定位法准确率均高于移行椎体组($P<0.01$)。**结论** 仅基于腰椎 MRI 或者腰椎 CT 的定位法存在误诊风险,腰椎病变进行腰椎 MRI 或者腰椎 CT 检查时常规增加颈胸椎定位像,对椎体进行准确编号具有重要的临床价值。

Charcot Neuroarthropathy Versus Osteomyelitis

Wei Yan
Qinghai provincial people's hospital

Abstract and introduction

Abstract:

Introduction: patient with diabetes and peripheral neuropathy have a 25% risk of developing a foot ulcer, and these can lead to soft tissue infections that worsen and result in osteomyelitis. while Charcot neuroarthropathy is not as common as osteomyelitis, it is often misdiagnosed as osteomyelitis. **Case Reports:** Three patients presented with diabetes, neuropathy, and foot ulcers. **Conclusion:** while Charcot neuropathy and osteomyelitis have similar signs and symptoms, understanding the similarities and differences between the condition can aid providers in appropriate wound management. **Introduction:** According to the 2016 world health organization data, Diabetes prevalence is also increasing rapidly among the US population. **Results:** case 1: CN Developed After Keller arthroplasty. A 55 years old male with a history of type 2 diabetes presented

负重位 DR 影像与正常 DR 影像对拇外翻分级的评估价值的对比

吕示
吉林大学第一医院

目的: 探究负重位 DR 摄影与非负重位 DR 摄影对拇外翻分级评估的影响

方法：在负重位的情况下拍摄一张拇外翻图像，与非负重位时拍摄的拇外翻图像进行对比，用机器分别测量两张图像趾骨间角与拇外翻角，对比两张图像中角度的大小

结果：在负重位的情况下角度会比非负重位大 2-5 度

结论：拍摄负重位足正位比正常拍摄足正位更接近人在行走站立时足的状态，趾骨间距与拇外翻角也更加接近站立与行走时的真实状态，对拇外翻的分级评估可以更加准确。

多种功能成像方式联合诊断用于鉴别良性和恶性骨肿瘤的临床价值

李莹、程敬亮、任翠萍
郑州大学第一附属医院

目的 联合应用 DWI、IVIM、DKI 以及 APTWI 在鉴别诊断良性和恶性骨肿瘤的初步探索。方法 本研究为前瞻性研究。收集 2022 年 1 月至 2023 年 7 月于郑州大学第一附属医院经穿刺或手术病理证实的骨盆和下肢的骨肿瘤患者。45 例患者均接受了磁共振 T1 加权成像、T2 加权成像、DWI、IVIM、DKI 和 APTWI 检查。于 DWI、IVIM、DKI、APTWI 相应的参数图上分别测量病灶相应的相关参数值。采用独立样本 t 检验比较良性和恶性骨肿瘤的 DWI、IVIM、DKI、APTWI 相关参数的差异。此外，采用受试者工作特征 (ROC) 曲线来评估 IVIM、DKI、APTWI 和 DWI 以及 4 种检查方法联合的诊断效能。结果 45 例骨肿瘤患者中恶性 27 例、良性 18 例。ADC 值、D 值、MD、MK 值、MTRasym (3.5 ppm) 平均值 (MTRasymmean) 和 MTRasym (3.5 ppm) 最大值 (MTRasymmax) 在良性和恶性骨肿瘤之间均有显著差异。ROC 分析显示 ADC 值、D 值、MD 值、MK 值、MTRasymmean 和 MTRasymmax 的 AUC 分别为 0.845、0.813、0.728、0.786、0.734、0.774，多个值联合诊断可明显提高诊断性能，AUC 为 0.918。当 ADC 值、D 值、MD 值、MK 值、MTRasymmean 和 MTRasymmax 的诊断阈值分别取 $1.57 \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $1.41 \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $2.07 \times 10^{-3} \text{ mm}^2/\text{s}$ 、0.76、2.14%、3.85% 时，鉴别良性和恶性骨肿瘤的灵敏度分别为 66.67%、66.67%、55.56%、77.78%、50%、72.22%，特异度分别是 96.3%、85.19%、92.59%、92.59%、92.59%、81.48%。四种检查方式联合鉴别良性和恶性骨肿瘤的灵敏度、特异度分别为 88.89%、85.19%。结论 多种功能成像方式联合诊断提供了更多关于肿瘤细胞微环境的生物学信息和病理学行为，更有助于良性和恶性骨肿瘤的鉴别诊断。

青少年沙瘤样骨化纤维瘤(juvenile psammomatoid ossifying fibroma, JPOF)影像表现的探讨

李开成
上海交通大学医学院附属第九人民医院

摘要 目的：分析发生于颌面骨的青少年沙瘤样骨化性纤维瘤影像学表现，并探讨 JPOF 影像与病理表现的相关性及其鉴别诊断。方法：收集 2017 年 9 月至 2023 年 5 月期间 2 例 JPOF 患者临床、影像资料及病理诊断进行分析，并进行文献复习。结果：JPOF 主要发生于儿童和青少年，好发于颌面部，以副鼻窦的骨壁最为多见，其他部位包括下颌骨、上颌骨和颅骨。影像学特征为局部膨胀性肿块，境界清晰，肿瘤周围骨皮质受压变形。肿瘤磨玻璃样密度增高提示肿瘤内部有骨化。伴发囊性变时，可见囊腔形成。部分肿瘤为侵袭性生长，表现为肿瘤侵犯骨皮质、沿解剖孔道侵入鼻腔及邻近鼻窦或侵犯眼眶。JPOF 的病理学特征：肿瘤组织中散在分布“牙骨质小体样”骨小体，

骨小体外形不规则, 其内见多少不等的骨细胞, 周围有胶原物质包绕。局部可有灶性黏液变和囊性变, 类似动脉瘤样骨囊肿。JPOF 的 CT 表现的磨玻璃样影像与病理上 JPOF 内的“牙骨质小体样”骨小体密切相关。结论: JPOF 是一种发生于青少年且较罕见的纤维骨病变, 具有一定的影像学特点, 与病理组织学的成分密切相关, 影像上尚需与经典型骨化纤维瘤、青少年小梁状骨化纤维瘤、骨纤维结构不良、骨肉瘤等相鉴别。

PU-1151

多层螺旋 CT 三维重建在诊断外伤性膝关节隐性骨折中的临床应用价值

骆孟
连云港市第一人民医院

目的: 探讨分析多层螺旋 CT 三维重建在诊断外伤性膝关节隐性骨折中的临床应用价值。方法: 选择 2022 年 2 月-2023 年 2 月在我院行螺旋 CT 检查的 55 例外伤性膝关节隐性骨折患者作为研究对象。男性患者 34 例, 女性患者 21 例, 年龄 37-68 岁, 平均年龄 (52.04±1.24) 岁; 病程 2-12 个月, 平均病程 (7.24±0.36) 月, 用 128 层螺旋 CT 检查, 调整设备参数, 将膝关节间隙作为检查核心, 从股骨下段向骨折线远端进行扫描。扫描后将图像传送到工作站并进行三维重建处理。结果: 1. 比较金标准与 CT 组诊断结果: 金标准诊断隐性骨折是 52 例、非隐性骨折是 3 例, CT 组诊断隐性骨折是 50 例, 非隐性骨折是 5 例, 金标准与 CT 诊断结果经对比, ($P>0.05$) 差异无统计学意义。(X^2 值=3.0891, P 值=0.0788)。2. 比较金标准与 CT 组诊断能效: CT 诊断的灵敏性是 94.23% (49/52), 特异性是 66.67% (2/3), 准确性是 98.08% (51/52), 与金标准诊断的灵敏性、准确性、特异性经对比, ($P>0.05$) 差异无统计学意义。灵敏性统计学: X^2 值=3.0891, P 值=0.0788; 特异性统计学: X^2 值=1.2000, P 值=0.2733; 准确性统计学: X^2 值=1.0377, P 值=0.3083。结论: 多层螺旋 CT 三维重建在外伤性膝关节隐性骨折的诊断中具有得非常好的临床价值, 该检查技术的灵敏性、特异性、准确性均比较理想, 漏诊和误诊情况比较少见, 可以为此疾病的诊疗提供参考依据。

PU-1152

小儿朗格汉斯细胞组织细胞增多症的影像学诊断

崔雪娥、汪登斌、包磊、储彩婷、王丽君、李士建
上海交通大学医学院附属新华医院

目的 分析小儿朗格汉斯细胞组织细胞增多症在 X 线平片、CT 和 MRI 上的影像学特点, 以提高对其诊断和鉴别诊断能力。

资料与方法 28 例朗格汉斯细胞组织细胞增多症, 男 16 例, 女 12 例, 年龄 1-11 岁, 平均 3.5 岁, 均经病理穿刺或手术证实。术前 CT 和 MRI 检查各 19 例, 其中 11 例同时包括 CT 和 MRI 检查, X 线平片检查 10 例, 1 例同时有 X 线平片、CT 和 MRI 检查。结合病理回顾性分析其临床表现和影像学特点。

结果 23 例单发局灶型病例全部累及骨骼系统, 其中颅骨 6 例, 骨盆 4 例, 脊柱 2 例, 长骨 6 例, 不规则骨 5 例。5 例多发单系统型, 其中 1 例同时累及颞骨和肝脏, 1 例发生于颈静脉孔区及颈部淋巴结, 3 例同时累及颞骨和垂体柄。X 线平片检查 10 例, 呈单发囊状、溶骨性破坏, 或骨皮质不规则, 骨皮质局部变薄、中断、破坏。CT 检查 19 例, 表现为干骺端骨髓腔内类圆形软组织肿块,

沿长骨纵轴方向生长,可出现“小钻孔样骨质破坏”。MRI 检查 19 例,T1WI 呈等低信号,T2WI 多呈高信号,信号一般较均匀,增强后一般呈中度以上均匀强化,可见“袖套征”。

结论 LCH 好发于 1-3 岁幼儿或青少年,最常累及骨骼系统,影像表现虽复杂多样,但有一定的特征性,正确有效地应用 X 线平片、CT 及 MRI 检查各自优势,坚持临床、影像、病理结合,才能提高对本病的诊断水平。

PU-1153

能谱 CT 在创伤性骨髓水肿的定量研究

刘金瑞、王宁、朱亚男、李正军、周和平
安康市中心医院

目的:探索能谱 CT 物质分离技术联合 CT 值在创伤性骨髓水肿的定量研究

方法:回顾性收集 2017 年 11 月至 2018 年 3 月行双能 CT 检查的 24 名急性骨折患者,并重建其能谱 CT 伪彩图。由两名医师评估骨折及其骨髓水肿范围,并分别测量骨髓水肿区及正常骨髓区的 CT 值、水-钙值和水-羟基磷灰石值。采用受试者工作特征曲线 (ROC) 评估上述定量值的诊断效能。

结果:骨髓水肿区的水-钙值 ($1040.28 \pm 33.55 \text{mg/cm}^3$) 显著高于正常骨髓区 ($1011.11 \pm 45.83 \text{mg/cm}^3$) ($P < 0.001$)。70keV 图像中骨髓水肿区和正常骨髓区的 CT 值分别为 $210.18 \pm 108.63 \text{HU}$ 和 $133.44 \pm 134.06 \text{HU}$ ($P < 0.001$)。水-钙值在诊断急性骨折骨髓水肿区的 AUC 值显著高于 CT 值 (AUC 值分别为 0.771、0.719)。

结论:基于双能谱 CT 成像中获得的骨髓中水-钙值,在区分骨髓水肿和正常骨髓方面具有较高的准确性。

PU-1154

肋骨原发性肿瘤病变的 CT 诊断与鉴别诊断

刘强、董卓瑞、赵卫东
山西医科大学第二医院

肋骨原发性肿瘤病变的 CT 诊断与鉴别诊断

目的:

讨论原发性肋骨肿瘤病变的 CT 表现及各自的特点,提高对该部位原发占位性病变影像表现的认识

方法:

回顾性分析 2020 年 1 月-2023 年 8 月我院收治的 27 例肋骨原发性占位性病变的临床及影像学资料,所有患者均行 CT 检查,均经手术或穿刺病理证实。并结合近年来相关文献进行分析。

结果:

27 例患者中,软骨源性肿瘤 14 例,其中良性 6 例(骨软骨瘤 5 例,内生软骨瘤 1 例),中间型 2 例(非典型软骨性肿瘤 1 例,多发内生软骨瘤病 1 例),恶性 6 例(均为软骨肉瘤)。骨的其他间叶性肿瘤 6 例(纤维结构不良 5 例,血管脂肪瘤 1 例),均为良性病变。骨的纤维源性肿瘤 2 例(韧带样纤维瘤 2 例),为中间型。骨造血系统肿瘤 4 例(朗格罕细胞组织细胞增生症 2 例,浆细胞瘤 2 例),均为恶性。内分泌与代谢性骨病 1 例(甲状旁腺功能亢进 1 例)。

良性病变 13 例,骨软骨瘤及纤维结构不良为主要病变;骨软骨瘤一般呈结节样隆起,以宽基底与母骨相连,瘤内骨皮质与髓质均与母骨相延续,边缘见硬化边;纤维结构不良在肋骨多为多发,膨胀明显,部分病例呈象牙样密度改变,邻近软组织肿块少见。恶性病变 10 例,软骨肉瘤好发于肋软骨交界处,表现为不规则形溶骨性骨质破坏,局部软组织肿块形成,并见形态各异钙化;骨髓瘤

骨质膨胀, 局部穿凿样骨质破坏, 局部伴发病理性骨折, 破坏区软组织肿块形成, 可同时存在其他胸廓骨受累; 结合文献资料, 肋骨朗格罕细胞组织细胞增生症较为罕见, 影像表现无特异性, 影像学明确诊断较困难。中间型病变 4 例, 病变具局部侵袭性, 骨质破坏不明显, 软骨来源病变见钙化; 纤维源性肿瘤影像表现无特异性, 影像学明确诊断较困难。

结论:

肋骨原发性骨肿瘤病种较多, 良性病变以骨软骨瘤、纤维结构不良多见, 肿瘤境界清晰, 肋骨膨胀性重构, 一般无软组织肿块形成; 恶性病变主要为软骨肉瘤及骨造血系统肿瘤, 影像表现以骨质破坏为主, 存在软组织肿块。综上所述, 肋骨原发性肿瘤部分病变有典型影像表现, 而部分病变影像学无特异性, 最终诊断仍需临床、影像、病理三方面结合。

PU-1155

Analysis of possible factors involving subsequent vertebral fractures after compression fractures, focusing on clinical and paravertebral muscle features

Yuchao Xiong
Guangzhou Red Cross Hospital

Objective

To construct a nomogram based on clinical factors and paraspinal muscle features to predict vertebral fractures occurring after acute osteoporotic vertebral compression fracture (OVCF).

Materials and Methods

We retrospectively enrolled 307 patients with acute OVCF between January 2013 and August 2022, and performed magnetic resonance imaging of the L3/4 and L4/5 intervertebral discs (IVDs) to estimate the cross-sectional area (CSA) and degree of fatty infiltration (FI) of the paraspinal muscles. We also collected clinical and radiographic data. We used univariable and multivariable Cox proportional hazards models to identify factors that should be included in the predictive nomogram. Furthermore, we used receiver operating characteristic curve, calibration curve, and decision curve analyses to evaluate the performance and clinical utility of the nomogram. The predictive model for subsequent vertebral fracture was internally validated via bootstrap resampling.

Results

Post-OVCF vertebral fracture occurred within 3, 12, and 24 months in 33, 69, and 98 out of the 307 patients (10.8%, 22.5%, and 31.9%, respectively). Multivariate analysis revealed that this event was associated with percutaneous vertebroplasty treatment, higher FI at the L3/4 IVD levels of the psoas muscle, and lower relative CSA of functional muscle at the L4/5 IVD levels of the multifidus muscle. Area under the curve values for subsequent vertebral fracture at 3, 12, and 24 months were 0.711, 0.724, and 0.737, respectively, indicating remarkable accuracy of the nomogram. Decision curve analysis was in good agreement with these observations, and confirmed the utility of the nomogram. Bootstrapped internal validation showed a high degree of concordance.

Conclusion

We developed a model for predicting post-OVCF vertebral fracture from diagnostic information about prescribed treatment, FI at the L3/4 IVD levels of the psoas muscle, and relative CSA of functional muscle at the L4/5 IVD levels of the multifidus muscle. This model could facilitate personalized predictions and preventive strategies.

PU-1156

基于冠状动脉周围脂肪组织 HU 值的机器学习模型预测冠状动脉粥样硬化患者骨量异常的应用价值

梁彦博、苑筱晴、秦健
山东第一医科大学第二附属医院

目的：探讨冠状动脉周围脂肪组织 (PCAT) HU 值对冠状动脉粥样硬化患者骨量异常的预测价值。
方法：回顾性收集了 2021 年 7 月至 2023 年 1 月在我院接受冠状动脉计算机断层扫描血管造影 (CCTA) 与胸部 QCT 扫描的 284 例患者的影像和临床资料。患者按照 7:3 的比例被随机分为训练组 (n=198) 和测试组 (n=86)。以 QCT 测得的体积骨密度 (vBMD) 为参考标准, 将患者分为骨量正常组 (vBMD \geq 120mg/cm³) 和骨量异常组 (vBMD<120mg/cm³)。在 CCTA 图像上进行勾画左前降支 (LAD)、左回旋支 (LCX) 和右冠状动脉 (RCA) 的周围脂肪组织并得到其体积与 HU 值。通过单因素和多因素 Logistic 回归选择临床特征与 PCAT HU 值。构建包含临床特征的模型 1 与结合临床特征和 PCAT HU 值的联合模型 2。采用受试者工作特征曲线 (ROC) 评价模型的预测性能, 采用决策曲线分析 (DCA) 评价各模型的临床净收益值。
结果：我们发现 RCAPCAT 的 HU 值为冠状动脉粥样硬化患者发生骨量异常的独立风险因素 (P<0.01)。临床模型 1 对冠状动脉粥样硬化患者骨量异常的预测性能一般, 训练组和测试组的 AUC 分别为 0.862 和 0.796。其中测试组的特异度与灵敏度只有 0.810 和 0.763。联合模型 2 在训练组和测试组中表现出较高的预测骨量异常的性能 (AUC=0.922 和 0.866), 测试组的灵敏度与特异度为 0.851 和 0.846, 均高于模型 1。DCA 结果显示, 联合模型 2 比临床模型 1 具有更高的总体净收益。
总结：基于 PCAT HU 值-临床联合模型对冠状动脉粥样硬化患者骨量异常的预测性能良好, 临床净收益明显, 可为临床决策提供参考。

PU-1157

双下肢多发骨梗死磁共振类 CT 及能谱 CT 钙抑制影成像应用 1 例报告

宗林雄、孟庆林、陈志晔
中国人民解放军总医院海南医院

骨梗死是骨髓腔内的骨坏死, 多发生于股骨远端及胫骨近端、远端, 有多发性和对称性的特点; 骨梗死的发病率尚不清楚, 骨梗死临床表现无特异性。

基于受限回波间距的快速梯度回波类 CT 成像 (fast field echo resembling a CT using restricted echo-spacing, FRACTURE) 序列 (类 CT 技术) 是一种基于高分辨率快速梯度回波技术, 结合减影技术获得类 CT 图像; 能谱 CT 钙抑制技术是基于对钙物质的识别和抑制, 提高软组织的对比度, 用于评估骨髓改变。关于骨梗死的磁共振类 CT 成像以及能谱 CT 钙抑制技术影像尚无临床报道。

类 CT 序列可以勾勒出骨梗死的硬化边界, 优于常规 CT 表现, 可发现骨质结构的早期变化。另外, 类 CT 序列可清晰显示骨髓水肿区 STIR 高信号所掩盖的小的梗死病变, 体现了类 CT 序列对骨梗死小病变的检出能力。类 CT 技术能够弥补 MRI 在骨组织显示不足的缺点, 有望替代 CT 检查。

常规 CT 对早期骨梗死观察能力有限, 钙抑制图像可以显示骨梗死引起的骨髓密度变化, 并与磁共振 STIR 序列显示基本一致, 这对 CT 早期诊断骨梗死具有重要意义。

总之, 双下肢多发骨梗死磁共振类 CT 技术可以清晰评估病变累及范围, 可以显示骨髓水肿 T2WI 高信号所掩盖的早期小病灶; 能谱 CT 钙抑制技术可以显示病变区骨髓密度改变, 两种技术可为临床精确评估骨梗死病变提供参考依据。

全脊柱正侧位片之骨科术前检查金标准

陈仲艳

青海红十字医院

目的:解决传统 X 线摄影的几何畸变和助力青少年患者改善脊柱侧弯, 恢复患者健康。

脊柱侧弯目前已经成为青少年患者的阻碍, 严重影响青少年患者的身心健康。利用数字化 X 线摄影技术, 让患者站立在立式摄影架前, 运用标准的解剖学姿势, 将球管对准患者的扫描部位, 定位起点和终点, 根据患者的身体情况, 运用不同的摄影参数 (KV、MA、MAS...), 手动或者自动调节曝光参数和曝光剂量。扫描时, 球管和探测器同时平行移动, 照射野上下一致, 曝光为连续透视采集, 为了获得更加接近真实的尺寸, 需要尽可能大的 SID 或者尽可能的 TOD, 并且患者只需平静呼吸下屏住气, 采集后, 几秒钟就可出现全长无缝拼接图像。极大的减小了图像的几何失真, 获得了优质的数字化图像, 更加有利于骨科医生精确的判断, 助力精准手术

PU-1159

强直性脊柱炎严重程度与椎旁肌容量及脂肪含量相关性分析

李雪娇

重庆市中医院

【摘要】目的 采用多层螺旋 CT 定量分析腰 4 椎体下缘水平多裂肌及竖脊肌肌肉横截面积、肌肉内脂肪含量, 评价椎旁肌脂肪含量与强直性脊柱炎 (AS) 严重程度之间的关系。材料及方法: 根据 1984 年纽约修订的 AS 诊断标准将 AS 患者分为 4 组, 选取同期年龄及性别相匹配的正常患者 73 例作为对照组, 分别测量两组椎旁竖脊肌与多裂肌的总横截面积 (TCSA)、肌肉内脂肪浸润总横截面积 (fCSA) 及肌肉内脂肪比例 (FF); 运用 ANOVA 单因素方差分析比较不同分级 AS 患者的差异; 采用 Spearman 相关性分析评价 AS 患者不同程度与相应层面椎旁肌肉 TCSA、fCSA 及 FF 的相关性; 采用多元线性回归分析分析性别、年龄、CT 分级等因素与椎旁肌肉 TCSA、fCSA、FF 之间的关系。结果 不同级别 AS 组间竖脊肌与多裂肌 TCSA、fCSA、FF 的差异有统计学意义 ($p < 0.05$); 不同级别 AS 患者 TCSA、fCSA、FF 均具有相关性, 其中 AS 分级与 TCSA 呈中等程度相关 ($r = 0.36$, $p < 0.001$), 与 fCSA 呈强相关 ($r = 0.638$, $p < 0.001$), 与 FF 呈显著相关 ($r = 0.721$, $p < 0.001$); 多元线性回归分析结果提示性别与 AS 患者 CT 分级是椎旁肌 TCSA 的独立影响因素 ($R^2 = 0.374$); 年龄、AS 患者 CT 分级是椎旁肌 fCSA 的独立影响因素 ($R^2 = 0.584$); 年龄、性别、AS 患者 CT 分级是椎旁肌 FF 的独立影像因素 ($R^2 = 0.677$)。结论 椎旁肌脂肪化一定程度上可以反映 AS 的严重程度, 且脂肪化程度与 CT 分级明显相关。

双能 CT 在糖尿病足合并骨髓水肿中的应用

杨琨、张炜

华中科技大学同济医学院附属协和医院

[摘要] 目的 研究评估双能 CT (DECT) 联合虚拟去钙 (VNCa) 技术在检测糖尿病足合并骨髓水肿 (BME) 的准确性。材料与方法 回顾分析了已经磁共振检查证实的 22 例糖尿病足合并 34 处骨髓水肿患者行双足 DECT 检查, 使用后处理软件重建 VNCa 图像并对其进行分析, 在骨髓水肿处的骨矢状面或冠状面上手动设置感兴趣区域 (ROI) 测量其 CT 值, 并在其对应侧足同一位置绘制同

样的 ROI 并测量 CT 值作为参考。结果 将磁共振证实的 22 例患者 34 处骨髓水肿在 VNCa 图像定性分析中有 29 例存在骨髓水肿, 准确性为 85.3%, 骨髓水肿部位 CT 值和对侧参考部位 CT 值 ($-15.22 \pm 38.96\text{HU}$ 和 $-73.43 \pm 32.10\text{HU}$) 有统计学意义 ($p < 0.001$)。结论 在糖尿病合并骨髓水肿过程中, 骨髓中的脂肪含量减少, 炎症组织增加, 在 MRI 中表现为 T1WI 信号减低 T2WI 脂肪抑制信号增加; 在 DECT 中骨髓中脂肪含量减少是 CT 值增加的重要因素, DECT 与 VNCa 配合使用可以有效诊断糖尿病足骨髓炎, 但由于前足骨骼相对较小, 难以获得良好的定量测量, 因此此技术存在一定的局限性。

PU-1161

SAPHO 综合征的影像学改变: 1 例病例汇报

李宗雪

贵州医科大学附属医院

背景: SAPHO (synovitis-acne-pustulosis-hyperostosis-osteomyelitis) 是以滑膜炎、痤疮、脓疱病、骨肥厚、骨髓炎为综合表现的一种慢性炎症。SAPHO 综合征是一种罕见病并且因其临床表现多样, 容易误诊, 而影像学检查对其有着极高的诊断特异性, 所以影像学对其疾病的认识有着重要的价值, 本报告以 1 例 SAPHO 病人为例来对此疾病进行一个系统的影像学回顾。

病例介绍: 患者, 男, 59 岁, 反复左锁部疼痛、活动受限, 进行性加重。体格检查发现左侧锁骨局部有一质硬肿块, 伴有压痛。入院血象示: C-反应蛋白 44.3mg/L ↑。行 DR、CT 及行 MRI 检查, MRI 示: 双侧胸锁关节肥大, 左侧为著, 胸骨、双侧锁骨、双侧第 1、2 肋骨及胸椎多发椎体可见骨质信号混杂, 呈稍长 T1 稍长 T2 信号, DWI 未见受限, 增强扫描可见不均匀强化, 周围软组织稍肿胀并见少许长 T2 信号。左侧锁骨胸骨端局部骨皮质不连续。左侧锁骨穿刺活检示: 左锁骨韧带样纤维组织增生, 见较多纤维组织, 部分纤维组织间质粘液变性, 散在急慢性炎症细胞浸润, 局灶并见成骨及破骨, 部分纤维胶原透明变性, 骨皮质增粗, 免疫组化示: SMA(+), S-100(-), SATB-2(+), β -catenin(-), Ki-67(+). 符合 SAPHO 综合征改变。

讨论: 肿瘤的影像学特征为 SAPHO 综合征的诊断提供了充分线索, 包括双侧锁骨、双侧第 1、2 肋骨以及部分胸椎椎体的骨肥大及骨质破坏改变, 结合特征性的皮肤病变 (掌跖部的痤疮和脓疱病), 有助于实现对 SAPHO 综合征的明确诊断。

3.0T MR gagCEST 技术对早期膝关节骨关节炎软骨病变的评价及定量分析

张沥

陕西省人民医院

背景: 膝关节骨关节炎 (Knee Osteoarthritis, KOA) 的早期会有软骨成分的生化改变, 常规的 MR 成像技术无法做到对软骨生化成分改变的定量计算与评估, 因此临床中 KOA 的发现往往已经到了晚期阶段, 而糖胺聚糖化学交换饱和转移成像技术 (glycosaminoglycan chemical exchange saturation transfer, gagCEST) 可以对膝关节的软骨生化成分进行定量测量, 可为疾病的超早期发现和诊断提供依据。

目的: 与术中结果比较, 分析 3.0T MR gagCEST 技术在早期骨关节炎的诊断价值, 以及定量分析健康软骨和退变软骨的 gagCEST 值。

方法: 前瞻性纳入陕西省人民医院 2022 年 1 月至 2022 年 12 月住院接受治疗的 18 例膝关节疼痛临床诊断为早期 KOA 的患者, 术前行 Philips 3.0T 常规序列及 gagCEST 序列扫描。感兴趣区 ROI

选择矢状面 gagCEST 序列和形态学高分辨率三维脂肪饱和质子密度空间序列。通过关节镜检查确定软骨病变,按照国际软骨修复学会(ICRS)对每名患者 42 个 ROI 进行分级,包括股骨髁,股骨外侧髁,胫骨内侧平台,外侧胫骨平台,髌骨和滑车。并使用方差分析和 Spearman 秩相关检验将 ROI 分级与 gagCEST 平均值进行比较。应用受试者工作特征(ROC)曲线确定 gagCEST 诊断阈值,以区分 ICRS 分级。

结果:本研究共收取了 756 个 ROI,ICRS 评分为 0 分(65.4%)、1 分(26.2%)、2 分(6.7%)和 ICRS 3、4 分合并(1.7%)。gagCEST 值随软骨损伤程度的增加而降低,与 ICRS 评分呈负相关。以 gagCEST 值 3.45%作为阈值来区分 ICRS 评分 0 分(正常)和其他评分等级。

结论:MR gagCEST 技术反映了糖胺聚糖的含量,可准确客观无创地量化关节软骨成分,并能够早期诊断骨关节炎和区分 ICRS 分级。

多发性骨髓瘤伴颞部髓外病变一例

毛鑫月、张晓楠、张焱
郑州大学第一附属医院

本文报道了 1 例多发性骨髓瘤伴颞部髓外病变的病例,患者为 56 岁女性,发现左侧颞部肿物 1 年余,疼痛 1 月。MRI 平扫及增强示:左侧颞部见团块状稍长 T1 稍长 T2 信号, DWI 高 b 值弥散受限呈高信号,大小约 72mm×50mm×73mm(前后径×左右径×上下径),增强后显著不均匀强化。双侧额顶枕部颅骨、斜坡可见多发斑片状 T2flair 高信号,增强后呈结节状强化。诊断:左侧颞部病变伴软组织肿块形成,双侧额顶枕部颅骨、斜坡多发异常信号,考虑多发性骨髓瘤。左侧颞部病变术后病理为浆细胞瘤。

PU-1164

Potential of ultra-high-resolution CT in detecting osseous changes of temporomandibular joint: experiences in temporomandibular disorders

Ruowei Tang, Ning Zhang, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Background: Osseous changes of the temporomandibular joint (TMJ) are related to the progression of temporomandibular disorders (TMD), and computed tomography (CT) plays a vital role in disease evaluation.

Objective: The aims of this study were to evaluate the image quality and diagnostic value of ultra-high-resolution CT (U-HRCT) in TMD compared to cone-beam CT (CBCT).

Methods: TMD patients who underwent both CBCT and U-HRCT between November 2021 and September 2022 were retrospectively included. Image quality scores were assigned for four osseous structures (the cortical and trabecular bones of the condyle, articular eminence, and glenoid fossa) by two independent observers from Score 1 (unacceptable) to Score 5 (excellent). Diagnostic classification of TMD was categorized as follows: Class A (no evident lesion), Class B (indeterminate condition) and Class C (definitive lesion). Image quality scores and diagnostic classifications were compared between CBCT and U-HRCT. The Cohen's Kappa test, Wilcoxon signed-rank test, Chi-square test and Fisher's exact test were conducted for statistical analysis.

Results: Thirty TMD patients (median age, 30 years; interquartile range, 26–43 years; 25 females) with 60 TMJs were enrolled. Image quality scores were higher for U-HRCT than for CBCT by both observers (all P s<0.001). Definitive diagnoses (Class A and C) were achieved in more cases with

U-HRCT than with CBCT (93.3% vs. 65.0%, Fisher's exact value = 7.959, $P = 0.012$). Among the 21 cases which were ambiguously diagnosed by CBCT (Class B), definitive diagnosis was achieved for 17 cases (81.0%) using U-HRCT. Conclusions: U-HRCT can identify osseous changes in TMD, providing improved image quality and a more definitive diagnosis, which makes it a feasible diagnostic imaging method for TMD.

MODIFIED PERCUTANEOUS BIOPSY OF THE SPINE: IMPROVEMENT OF THE TECHNIQUE

Shuai Tian, Ning Lang, Huishu Yuan
Peking University Third Hospital

Biopsy of the spine can be performed by open surgery or percutaneous needle sampling. The first has the highest diagnostic yield while the second is a less invasive procedure with lower rate of complications and shorter hospitalization time. We described a modified technique of percutaneous biopsy using semi-rigid grasping forceps that may offer the advantages of both, open and minimally invasive surgery. Our case series of 30 patients with spine lesions who underwent biopsy with this technique are reported. The samples were sufficient for analysis in 100% of cases ($n=30$) and a histological diagnosis was obtained in 100% of cases ($n=30$). The diagnosis included tumors in 16.7% ($n=5$) and infections in 83.3% ($n=25$) of cases. Microbiological cultures provided an aetiological diagnosis in 92% of the infections ($n=23$). We believe that this device may offer several advantages in percutaneous biopsy, increasing volume of sampling and reducing the non-diagnostic rate of the procedure.

PU-1166

Burden and distribution of monosodium urate deposition in patients with gout and hyperuricemia predict renal insufficiency

Xinyu Zhang
Nanjing First Hospital

ABSTRACT

Objectives: To evaluate the predictive value of dual-energy CT (DECT) for renal insufficiency in patients with Hyperuricemia or Gout.

Methods: This observational retrospective study included patients with gout or hyperuricemia after clinical diagnosis between January 1, 2009 to September 15, 2017. The clinical end point was renal insufficiency, defining as $eGFR < 90$ (mL/min/1.73m^2) by using the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula. The ability of dual-energy CT (DECT) to predict outcomes and improve the predictive value of the current noninvasive work-up was assessed. Survival analysis was performed, and the C-index was used to assess the

performance of each predictive model. To compare nested models, the likelihood ratio χ^2 test was performed.

Results: A total of 52 patients (mean age \pm standard deviation, 45.4 years \pm 16.5; 2 women [3.8%]) were included; the median time of follow-up was 24 months. The renal insufficiency occurred in 28.9% (15 of 52 gout patients) and none in hyperuricemia patients. Univariable analysis revealed DECT was predictive of renal insufficiency in gout patients (hazard ratio [HR], 4.1; 95% CI: 1.6, 10.8; $P = .01$) but not in hyperuricemia patients (HR, 1.2; 95% CI: 0.6, 2.2; $P = .63$). DECT was independently associated with renal insufficiency in gout (HR, 4.0; 95% CI: 1.5, 10.5; $P = .01$) when adjusting for potential confounders. Adding DECT as a predictor to models that include clinical data improved their predictive value for renal insufficiency in gout patients ($P = .002$) but not in hyperuricemia patients ($P = .67$), and it showed good discriminative ability for renal insufficiency (C-index, 0.71). However, MSU burden was not predictive of the renal insufficiency ($P=0.678$).

Conclusions: Dual-energy CT was associated with renal insufficiency in candidates of gout and improved the predictive value of chronic renal disease assessment.

PU-1167

腰椎管内孤立性纤维瘤 1 例

王欣、王彩鸿、任翠萍
郑州大学第一附属医院磁共振科

患者女，34 岁。腰部疼痛 6 个月，近 2 周出现左小腿疼痛、麻木，走路跛行，于劳累或行走时自觉症状加重，休息后减轻。入院查体：约腰 3 椎体棘突压痛、叩击痛(+)，腰部活动受限；左侧直腿抬高试验及俯卧位直腿抬高试验阳性。实验室检查无明显异常。腰椎 MRI 示：腰 3-4 椎体水平椎管内硬膜外占位，腰 3 椎体及附件骨质、相应椎旁软组织及腰 3-4 椎体水平椎管内可见团片状长 T1 不均匀稍长 T2 信号，压脂像呈高信号。同水平马尾终丝受压。增强示病灶均匀明显强化。CT 示：病灶密度同软组织，密度欠均，边界欠清；CT 骨窗示腰 3 椎体及附件不规则骨质破坏。行椎管内肿块切除术，术中所见：肿物包膜完整，质韧，呈灰红色，血供丰富。术后病理所见：梭形细胞瘤，细胞增生活跃。可见胶原纤维和薄壁血管。免疫组化：Desmin(-), CD34(+), STAT6(部分较弱+), Ki-67(约 3%)，病理诊断：（腰椎管内）孤立性纤维瘤（solitary fibrous tumor, SFT）。术后未行放化疗，左下肢疼痛完全消失，肌力恢复。SFT 是一种罕见的间叶组织源性肿瘤。可发生于全身各部位，于胸膜多见。脊柱 SFT 发病率较低，多位于胸段，颈段次之，腰骶段罕见。脊柱 SFT 主要发生在髓外硬膜内区域，硬膜外区域少见。男女患病率约为 1.5: 1，平均年龄为 50 岁。SFT 通常生长缓慢，临床表现多为压迫相应脊髓或神经根导致的肢体麻木及感觉异常。MRI 平扫呈等或长 T1 信号，T2WI 信号多变，可为等、低、高或者混杂信号。增强扫描因肿瘤内成分差异表现不同，若胶原纤维较多时延迟渐进性强化；若实性成分肿瘤细胞较多时，早期明显强化。CT 平扫呈等或混杂密度，增强表现同 MRI。鉴别诊断：1) 神经鞘瘤：有完整包膜，可发生囊变，极少钙化。常位于脊髓背外侧，沿椎间孔向外生长，可出现典型的“哑铃形”。MRI 表现为等或长 T1 长 T2 信号。增强后明显强化，均匀或不均匀。2) 脊膜瘤：肿瘤边界清晰，范围局限，多数位于髓外硬膜内。常合并钙化，呈宽基底与硬脊膜相连，增强可见“脊膜尾征”。临床上常以 CD34(+)和 STAT6(+)作为 SFT 的诊断指标，两者结合可以提高诊断准确率。

Augmented reality navigation for percutaneous spinal biopsy

Shuai Tian, Teng Chen, Xin Huang, Ning Lang, Huishu Yuan
Peking University Third Hospital

OBJECTIVE The aim of this study was to evaluate the accuracy (deviation from the target or intended path) and efficacy (insertion time) of an augmented reality surgical navigation (ARSN) system for percutaneous spinal biopsy (PSB).

METHODS we propose an AR surgical navigation system for PSB based on multi-modality imaging information, which contain fluoroscopy, optical tracking and depth camera. We also present a self-adaptive calibration and transformation method between 6-DOF optical tracking device and depth camera, which are in different coordinate systems. With substantially reduced frequency of fluoroscopy imaging, the system can accurately track and superimpose the virtual puncture needle on fluoroscopy images in real-time. After initial CBCT acquisition for target registration and planning, ARSN was used for 30 spinal biopsies. Needle positions were verified by CT.

RESULTS The mean accuracy of the biopsy needle insertions ($n = 30$) was $0.71 \text{ mm} \pm 0.33 \text{ mm}$ with a $0.9^\circ \pm 0.4^\circ$ angular deviation compared with the planned path. The median path length was 36 mm (range 16–71 mm) and did not correlate to accuracy ($p = 0.175$). The median device insertion time was 274 seconds (range 117–492 seconds).

CONCLUSIONS This study demonstrated that ARSN can be used for navigation of percutaneous spinal biopsy with high accuracy and efficacy.

PU-1169

Osteosclerotic changes in computed tomography predicted tumor progression and inferior survival in prostate cancer with osteoblastic metastasis

Sheng Li
Sun Yat-sen University Cancer Center

Introduction Bone was one of the most common sites of distant metastasis in prostate cancer. The bone metastases in prostate cancer are usually osteoblastic, making it difficult for assessment on therapeutic response. Computed tomography (CT) had been widely used in initial evaluation and follow-up in patients with metastasis prostate cancer, but the assessment of bone response by CT was unclear. This study aimed to evaluate the relation of bone response, disease progression and survival for osteoblastic metastasis by CT scan.

Methods Our study retrospectively analyzed the change in density of bone metastasis on CT in 176 prostate cancer cases in Sun Yat-sen University Cancer Center as training cohort and 35 cases at 2 Chinese hospitals as validation cohort from July 2010 to May 2022. Patients were divided in two groups based on their CT features: osteosclerotic change group and no osteosclerotic change group. The clinical profile including patient characteristics, systemic therapy, serum prostate-specific antigen (PSA), and tumor response were assessed. Overall survival (OS) and radiographic progression-free survival (rPFS) was analyzed.

Results In training cohort, we mainly focus on 152 cases presented osteoblastic lesions, while 15 demonstrated lytic lesions, and 9 showed mixed lesions of both osteoblastic and osteolytic

metastases. Among osteoblastic cases, 91 was in osteosclerotic change group and 61 was no osteosclerotic change group. The osteosclerotic change group showed significant inferior OS and rPFS compared with no osteosclerotic change group (median OS: 27.6 months vs 67.1 months, HR=2.660, $P<0.001$; median rPFS: 11.4 months vs 28.5 months, HR=2.235, $P<0.001$). The multivariate analysis revealed that osteosclerotic change were significant predictors of poor rPFS and OS. External validation confirmed that osteosclerotic change group was related with shorter rPFS and OS.

Conclusion Osteosclerotic change on CT in prostate cancer with osteoblastic metastasis predicted inferior survival. Prospective study for osteosclerotic change in prostate cancer was warranted.

PU-1170

3D-nerve view 结合体表标记投影在臀肌挛缩术前定位中的应用价值

柴娜

空军军医大学西京医院

目的:探讨体表标记投影结合 3D -nerve view 在臀肌挛缩中术前影像定位的应用价值。方法:选取我院 2022 年 10 月至 2023 年 7 月因臀肌挛缩来我院就诊患者 28 例。为避免术中伤及坐骨神经,分别使用常规解剖学体表标志定位和术前核磁标记引导定位,收集术中耗时及针刀切口深度。运用后处理软件测量其标记点与坐骨神经间最短安全距离,测量坐骨神经 3D-nerve view 增强前后图像信噪比。并统计两位高年资医生对 Ober 实验臀肌挛缩程度分级与双侧臀肌挛缩程度核磁影像诊断的一致性。结果:术前行影像定位组明显缩短手术时间($P<0.05$), 3D-nerve view 增强前后坐骨神经与体表标记距离测量无统计学差异 ($P>0.05$),增强后在双侧坐骨神经信噪比测量及背景抑制明显优于增强前 ($P<0.05$);两位临床医生的 Ober 实验分级和臀肌挛缩核磁诊断评估 ICC 值为 0.8 (95%CI: 0.5-0.9)。结论:体表标记投影结合 3D-nerve view 坐骨神经平扫既可无创便捷实现臀肌挛缩的术前影像定位,降低手术耗时,避免术中伤及坐骨神经,为术者提供更全面的患者信息。

磁共振定量成像技术评估甲状腺功能亢进患者外周骨骼肌状态的应用研究

高鹏、张维升

大连医科大学附属第一医院

目的:采用 MRI 定量技术 mDixon-Quant 分析甲状腺功能亢进患者与健康志愿者之间的大腿肌肉脂肪浸润差异,并分析其分布情况。

方法:搜集确诊为甲状腺功能亢进的女性患者 17 例,招募年龄、身高、体重相匹配的女性健康志愿者 15 例,对所有受试者进行大腿中端的 MRI 检查,测量肌肉横截面积与肌肉脂肪分数,并通过各肌肉脂肪分数计算单纯肌肉面积。后依据人体解剖学分区将肌肉分群,分别计算各肌群的肌肉脂肪分数。横截面积及纯肌肉面积。

结果:甲亢组大腿各肌群的脂肪分数均大于对照组,差异均有统计学意义 ($P<0.001$);在甲亢组内,大腿后群肌肉脂肪含量显著高于内侧肌群,差距有统计学意义 ($P=0.014$),后群与前群、前群与内侧群肌肉脂肪含量差异无统计学意义;在对照组内,三组肌肉脂肪含量差异均无统计学意义。

在两组间只有前群肌肉横截面积的差异具有统计学意义 ($P < 0.004$)；甲亢组内侧群、后群单纯肌肉面积较对照组小，并且以大腿后群肌肉减少更为显著。

结论：mDixon-Quant 定量技术可以用于评价甲亢患者大腿肌内脂肪浸润含量和分布；甲亢患者大腿骨骼肌的脂肪及肌肉的比率较健康人群产生变化，脂肪沉积更明显，肌肉含量更少，且后群的肌肉受累较严重。

PU-1172

髋关节盂唇撕裂的影像观察

徐雷鸣

浙江大学医学院附属第二医院

目的：探讨髋关节盂唇撕裂的影像观察方法。方法：搜集我院近来盂唇撕裂病例，经关节造影或手术证实。分析盂唇撕裂形态特征和病因影像表现，为盂唇撕裂诊断提供一些思路。结果：盂唇撕裂主要位于承重区、前外侧区和后盂唇。病因可分为髋关节发育不良、股骨头颈髋臼前外侧撞击、髋后侧撞击和其他。前外侧撞击有凸轮型、钳夹型和混合型，混合型常见。需要髋 CT 和骨盆平片综合评估，凸轮型股骨头形态 CT 观察，包括横断面和 SSD 重建观察，非常关键。结论：掌握髋臼撕裂影像特征，包括撕裂的直接征象和导致撕裂的病因影像表现，是髋臼盂唇撕裂诊断的基础。

PU-1173

梅毒性夏科氏关节病的多模态影像分析一例

李丹丹、高鹏、郑邵微

大连医科大学附属第一医院

目的：分析梅毒性夏科氏关节病的 X 线、CT、MRI 表现，结合临床资料，以提高对梅毒性夏科氏关节病的认识；

方法：回顾性分析 1 例经病理证实的梅毒性夏科氏髋关节病的临床资料及影像学表现，包括 X 线、CT、MRI 平扫及增强。

结果：患者男，69 岁，梅毒螺旋抗体 (Anti-TP) 阳性，右侧大腿内测疼痛活动受限 1 年，疼痛为钝痛，休息后缓解，不伴静息痛及夜间痛，发病以来无低热、盗汗等症状。病变位于右侧髋关节，X 线表现为右侧股骨、髋臼骨质增生、硬化，右侧股骨头变扁，密度不均匀，右髋关节半脱位，关节间隙增宽内见高密度影，周围软组织肿胀。CT 表现为：右侧髋关节间隙变窄，右侧股骨头形态变扁，右侧髋臼及股骨头可见骨质破坏，呈刀鞘样，髋关节面骨质硬化，周围软组织肿胀，见多发斑片状高密度影，关节囊增厚，内见液性密度影。MRI 表现为右侧髋关节间隙变窄，关节囊增厚，内见长 T1 长 T2 水样信号影；右侧股骨头塌陷、形态变扁，增强扫描内见强化结节；右侧髌骨、髋臼、股骨颈信号不均，内可见多发斑片状 T1WI 低信号、T2WI 高信号，增强扫描呈不均匀强化。盆腔右侧、右侧腹股沟去、右侧股骨前内侧见不规则软组织肿块，呈分叶状，T1WI 呈稍高信号、T2WI 呈高信号，增强扫描边缘强化。

结论：夏科氏关节病是一种罕见的影像表现与临床表现极不相称的的关节疾病，由梅毒导致的夏科氏关节病则更罕见，临床表现与影像资料包括 X 线、CT、MRI 相结合，可以对疾病的骨质和软组织病变做出全面的评价。

PU-1174

A CT-based radiomics nomogram for predicting histologic grade and outcome in chondrosarcoma

Xiaoli Li, Pei Nie, Wenjian Xu
The Affiliated Hospital of Qingdao University

Objective: The preoperative differentiation of low-grade chondrosarcoma (CS) from high-grade CS is crucial for the formulation of treatment strategies and the outcomes. The study was aimed to build and validate a CT-based radiomics nomogram (RN) for the preoperative differentiation of low-grade from high-grade CS, and to evaluate the association between the radiomics-based tumor heterogeneity and postoperative outcome in CS.

Methods: A total of 196 patients (139 in training cohort and 57 in external validation cohort) with low-grade CS (n=113) or high-grade CS (n=83) were derived from three centers. A clinical model, radiomics signature (RS) and RN were constructed and validated to estimate the value of different models in distinguishing low-grade from high-grade CS. Furthermore, Kaplan-Meier survival analysis was applied to assess the association between RN and recurrence-free survival (RFS). R statistical software was used for statistics.

Results: Three features based on CT images were selected to construct the RS. The RN combining the clinical factors (size, endosteal scalloping and active periostitis) and RS yielded an area under the curve (AUC) of 0.842 in the validation set, which was superior to the clinical model (AUC, 0.705) and the RS (AUC, 0.835). A correlation between Nomogram score (Nomo-score, derived from RN) and RFS was found by the Kaplan-Meier survival analysis in the training and test cohort (log-rank $P < 0.050$). Patients with high Nomo-score tumors were 2.669 times more likely to suffer recurrence than those with low Nomo-score tumors (HR, 2.669, $P < 0.001$).

Conclusions: The CT-based RN combining clinical factors and RS performed favorably in predicting the histologic grade and outcome of the CS.

PU-1175

肩袖间隙结构的 MR 平扫和 MR 关节造影最佳显示方位对比探究

耿宽
红河州第一人民医院

目的 探讨肩袖间隙 (RI) 结构的磁共振 (MR) 平扫和 MR 关节造影最佳显示方位。**方法** 选取 2021 年 1 月~2023 年 3 月于我院行 MR 平扫及 MR 关节造影的患者 80 例, 均经肩关节镜手术证实 RI 正常。统计对比 MR 平扫及 MR 关节造影检查横轴位、斜矢状位及斜冠状位显示 RI 及上孟肱韧带 (SGHL)、肱二头肌长头腱 (LHBT)、喙肱韧带 (CHL) 的情况。结果 MR 斜矢状位平扫对 RI 结构的显示率 17.50% 高于横轴位 0.00%、斜冠状位 5.00% ($\chi^2=18.739$, $P < 0.001$) ; MR 斜矢状位平扫对 RI 内 SGHL、LHBT、CHL 的显示情况优于横轴位、斜冠状位 ($\chi^2=26.036$, $P < 0.001$) ; MR 斜矢状位关节造影对 RI 结构的显示率 57.50% 高于横轴位 5.00%、斜冠状位 17.50% ($\chi^2=61.534$, $P < 0.001$) ; MR 斜矢状位关节造影对 RI 内 SGHL、LHBT、CHL 结构的显示情况优于横轴位、斜冠状位 ($\chi^2=64.569$, $P < 0.001$) ; MR 斜矢状位关节造影对 RI 结构的完全显示率 57.50% 明显高于 MR 斜矢状位平扫 17.50% ($\chi^2=27.307$, $P < 0.05$) 。结论 斜矢状位是 MR 平扫及 MR 关节造影显示 RI 结构的最优显示方位, 且斜矢状位 MR 关节造影优于 MR 平扫, 可作为最佳检查方法。

PU-1176

The incidence and distribution of osteoporosis were analyzed by vertebral CT scanning bone mineral density in patients with degenerative lumbar scoliosis

Lianbi Zhang

The Affiliated Hospital of Yunnan University, Kunming, Yunnan650091, China

Objective: To study the incidence of bone loosening and life regularity for the selective application of cement screw.

Methods: Through retrospective analysis, the clinical treatment and imaging reference data of 95 DLS patients were diagnosed in Trauma Center and Spinal Surgery Department of Affiliated Hospital of Yunnan University from January 2015 to September 2019, among which 20 males and 75 were female, age (63.3 ± 6.5). On the full-length piece of the crest, the Cobb angle and stable distance (CBD) of the patient were determined, and the number of missing cases was calculated. Selected images of CT coronal reconstruction of 2 mm in the posterior anterior cortex of the cervical spine and 2 mm in the anterior cortex of the main and compensatory curvature, Select a possible oval section between the vertebral cancellous bone parts for MD Hounsfield units (HU) determination of the region of interest, The average of the three-level measurements was taken as the HU of the corresponding cervical spine, The HU value of cervical convex and concave side was measured in the same way; L 1 will be the judgment criteria for osteoporosis, To observe the incidence of osteoporosis in patients, According to the observation results, the patients were divided into normal bone mineral density group and osteoporosis group in two groups, Furthermore, the clinical baseline data of the two patients were compared. The HU value of the cervical spine in the main and compensatory bends in the whole group, as well as the incidence of osteoporosis in the main and compensatory curves in the whole group were observed.

Results: The CoBB angle of 95 patients was $25.5^\circ 11.1 \pm$, the average CBD was (22.8 ± 18.7) mm, 74 patients with type A, 12 type b and 9 type C. Normal bone mineral density was 58 cases (61.1 percent) and 37 cases of osteoporosis (38.9%); the incidence of osteoporosis in women was 45.3% (3,475), higher than 15.0 percent (320) in men, which was statistically significant ($2=6.110$, $P0.05$). Compared with the normal BMD index group, the age, body quality index, Cobb angle, CBD, lateral bend direction, and crown imbalance classification of the osteoporosis group of patients (P value was 0.05). HU: L1 (122.2 ± 45.0), HU, (124.7 ± 44.8) HU, neutral (120.9 ± 42.9) HU, (124.3 ± 46.1) HU, top (134.4 ± 49.4) HU, HU (153.3 ± 63.8) HU, L5 (169.8 ± 75.8) H U. The osteoporosis rate of each cervical spine in the main bend was comparable to that of the L vertebra, respectively, with no statistical value (0.05), and the risk of osteoporosis in the L vertebra was less than that of the L vertebra in the main curve, at 17.9 percent (1795) and 3795), respectively ($2=10.349$, $P0.05$). The prevalence of convex bone osteoporosis of L5 cervical vertebra, lower vertebra and top vertebra is obviously greater than that of the concave side, and the difference has statistical significance (P -value = 0.01); compared with the incidence of upper vertebra, neutral vertebra, lower stable vertebra and bilateral bone loosening (P -value = 0.05).

Conclusion: The prevalence of skeletal loosening in DLS patients was about 38.9%, but even higher in female patients. The internal cervical spine of the inner bend is the internal cervical spine of the main bend with the lower incidence of bone loosening, while the L5 vertebrae, lower vertebrae, and top convex vertebrae are the good parts of bone loosening.

PU-1177

骨样骨瘤的影像诊断

韩志巍

空军军医大学西京医院

骨样骨瘤是一种常见的良性骨肿瘤，其影像学诊断对于骨肿瘤的鉴别诊断和治疗方案的选择至关重要。骨样骨瘤的典型影像学表现为发生于骨皮质，骨质增生明显、呈梭形，增生区内有类圆形斑点状低密度瘤巢，常见于长骨的骨干区域，如股骨、胫骨和肱骨。部分病灶可发生于骨膜、松质骨以及关节内。CT 扫描可以更清晰地显示骨样骨瘤的瘤巢内部结构，及周围骨质增生。MRI 对于评估骨样骨瘤的软组织累及、病灶与周围结构的关系有较好的价值。瘤巢在 MRI 上呈高低混杂信号，增强后可见轻度强化，骨质增生呈低信号，临近骨髓、软组织水肿，关节积液。

鉴别诊断方面，需要注意与其他骨肿瘤的鉴别。与骨母细胞瘤比，瘤巢小于 2cm，周围增生明显，有水杨酸止痛作用；与骨肉瘤相比，骨样骨瘤的边缘清晰，无骨膜破坏和软组织浸润。与骨纤维异常增殖症相比，骨样骨瘤的骨质增生边缘光滑，无斑点状骨质硬化。综上所述，骨样骨瘤的影像学诊断主要依靠 X 线片、CT 和 MRI 的综合分析。准确的影像学诊断有助于明确骨样骨瘤的性质和范围，为临床医生制定合理的治疗方案提供重要依据。然而，影像学诊断结果仅作为参考，最终的诊断还需结合临床病史、症状和其他实验室检查结果进行综合判断。

增生性肌炎误诊一例

张双

襄阳市中心医院

目的：介绍增生性肌炎的临床表现及影像学诊断方法。方法：我院收治一位 74 岁男性患者，1 年前无意中发现右肩部包块，大小约 2×1cm 左右，无疼痛，无发热，无活动受限等不适，未处置，包块逐渐增大。1 周前无明显诱因右肩部开始出现疼痛，活动时疼痛明显，静息时疼痛无明显好转。结果：术后病理结果回示：送检标本-右上臂肿物，考虑：（右上臂）增生性肌炎。结论：增生性肌炎（Proliferative myositis, PM）是一种罕见的软组织良性肿瘤，在 1960 年由 Kern 命名。常发生于中老年人，40 至 70 常见，儿童很少报道，发病无性别差异，发生躯干、四肢、肩部肌肉常见，发病机制不清楚，外伤可能是一个危险因素，但报道案例中少见外伤史，复发罕见[1]。由于该病生长迅速，呈浸润性生长，无包膜，与周围肌肉关系密切，病理组织学形态的特殊性，临床及病理上易误诊为纤维组织来源的恶性肿瘤，如纤维肉瘤[2]。增生性肌炎是一种假肉瘤样疾病，病理学上以嗜碱性巨细胞及增生的纤维细胞为主要特征，病变细胞横插于横纹肌间质之间，与肉瘤不同的是很少累及横纹肌本身；横断面上呈围绕肌肉纤维的增殖结缔组织的变化产生所谓的“棋盘”效应，是疾病的特点；可以观察到周围继发性肌肉萎缩或局部缺血性坏死、或被增生的纤维细胞取代[3, 4]。在结缔组织中观察到的异性巨细胞增殖是导致恶性肿瘤诊断的主要原因[4]。磁共振上表现：①受累肌肉内软组织信号，与肌肉分界不清；②呈等或长 T1、长 T2 信号，信号均匀，部分累及肌肉可见少许水肿信号；③增强后轻度均匀强化；④少见坏死及出血。需与横纹肌肉瘤、骨化性肌炎、结节性筋膜炎鉴别[1,5]。超声横切面肌间隔“龟裂纹或铺路石状”有特征性。影像及病理综合判断对本病准确诊断有意义。

PU-1179

8 例骨上皮样血管内皮细胞瘤临床特征与 MR 表现分析

李贝贝

郑州大学第一附属医院

【摘要】 目的 探讨骨上皮样血管内皮瘤 (B-EHE) 的 MRI 特征性表现及其临床特点。方法 对 8 例 (男性 3 例,女性 5 例) 患者的临床资料及 MRI 表现进行回顾性分析, 所有患者均经手术病理证实为骨上皮样血管内皮细胞瘤。8 例 B-EHE 均行 MRI 检查, 其中 6 例行 MRI 平扫、动态增强及延迟增强扫描。结果 8 例 B-EHE 中, 3 例位于腰骶椎, 2 例位于胫骨, 1 例位于肱骨, 1 例位于胸骨, 1 例位于股骨。其中 1 例合并颅脑上皮样血管内皮瘤, 1 例合并椎体多发转移灶, 其余均为单发。T1WI 中, 3 例病灶呈低信号, 5 例病灶呈混杂等/低信号。T2WI 压脂序列中, 3 例呈较均匀高信号, 5 例呈混杂高信号。8 例均可见骨质破坏, 4 例可见骨膜反应, 3 例伴软组织肿块, 6 例伴周围软组织肿胀, 2 例伴病理性骨折。肿胀软组织和肿块在 T1WI 上呈低信号, 在 T2WI 和 T2WI 压脂序列呈高信号。6 例动态增强扫描中, 可见病灶不同程度强化, 其中 1 例为轻度强化, 1 例为中度强化, 4 例为明显强化。结论 B-EHE 的 MR 表现能有效评估病变的范围及性质, 需结合临床及病理明确诊断。

颈髓内神经鞘瘤 1 例并文献复习

胡霖霖、易坤明、肖钦、李晓光

中国人民解放军陆军特色医学中心

目的: 探讨髓内神经鞘瘤的临床、影像学表现及治疗方式。

方法: 回顾性分析 1 例颈段髓内神经鞘瘤患者的临床资料, 并对相关文献进行复习。神经鞘瘤是一种常见的周围神经系统肿瘤疾病, 起病隐匿, 在疾病早期临床症状不明显。神经鞘瘤起源于神经鞘膜的雪旺细胞, 是椎管髓外硬膜下最常见的肿瘤, 通常不存在于中枢神经系统组织内。发生在脊髓内的神经鞘瘤很罕见, 本例患者女, 19 岁, 无明显诱因出现右侧小腿乏力, 无麻木、刺痛, 无行走困难。行全脊柱增强检查, 肿瘤位于 C6-T1 节段, 表现为脊髓内结节状长 T1 及长 T2 信号, T2 压脂高信号, 边界清楚, 大小约 4.0x1.5x1.2cm, 增强扫描显示病灶明显强化。

结果: 术后病理检查诊断为髓内神经鞘瘤。患者术后恢复良好, 随访 12 个月肿瘤无复发。

结论: 结论髓内神经鞘瘤临床罕见, 术前诊断困难, 治疗方法以手术切除肿瘤为主。

MRI 在诊断胫骨平台骨折患者合并韧带或半月板损伤中的临床应用价值

裴建国

延边大学医学院附属医院

利用核磁共振成像 (MRI) 分析胫骨平台骨折患者合并同侧韧带和 (或) 半月板损伤的发生率和危险因素, 并得出最佳诊断阈值:TPW 对 LM、ACL 损伤有诊断价值;骨挫伤评分对 MCL 损伤有诊断价值;关节积液量对 ACL 损伤有诊断价值, 且诊断效能更高。

PU-1182

原发性髂骨尤因肉瘤 1 例

王欣、王彩鸿、任翠萍
郑州大学第一附属医院磁共振科

患者男，28 岁。3 月前活动时左侧髂骨骨折，予以保守治疗。近 1 月来自感包块逐渐增大，活动及咳嗽后不适感增加。查体：左侧腰部触及 10 cm×8 cm 质硬包块，周围皮肤无红肿，包块活动度差，局部无明显压痛。实验室检查：血常规正常，降钙素原 3.56 ng/ml。CT 示左侧髂骨骨质破坏并软组织影，范围约 107 mm×85 mm。CT 诊断：考虑占位，请结合 MRI 进一步检查。MRI 示左侧髂骨骨质破坏，髂骨及周围见团块状混杂长 T1（图 1A）长/短 T2 信号，压脂像呈混杂高信号（图 1B），DWI 序列部分弥散受限高信号，范围约 90 mm×103 mm×135 mm，病变周围可见软组织水肿，呈片状压脂高信号。增强扫描示病灶明显不均匀强化（图 1C）。MRI 诊断：骨化性肌炎？病理（图 1D）：光镜下肿瘤细胞排列紊乱，核深染，核质比增大。免疫组化：AE1/AE3(CK)(-),EMA(-), CK8/18(-), SYN(-),CD99(+),S-100 (-),SMA(灶弱+), CD34(-),SATB2(-),Ki-67(约 30%+)。病理诊断：(左侧髂骨)尤因肉瘤。讨论 尤因肉瘤 (Ewing sarcoma, EWS) 是起源于小圆细胞的一种罕见恶性肿瘤，病灶于四肢长骨骨干较常见，发生于骨盆者少见。发病年龄集中在 10~15 岁，男性多于女性。肿瘤多表现为溶骨性骨质破坏伴明显的软组织肿块，常伴坏死囊变，骨膜反应较轻，以层状最多见，无肿瘤骨形成。肿瘤诊断多依赖于病理镜下的小圆细胞和免疫组化。MRI 对显示髓内病变范围和骨皮质侵犯较好，肿瘤呈不均匀长 T1 长 T2 信号，强化不均匀。早期临床表现为疼痛。鉴别诊断：1)骨肉瘤：发病中位年龄较尤因肉瘤略大，骨质破坏区在 CT 表现为高低混杂密度；在 MRI 上溶骨性骨质破坏区多表现为长 T1 长 T2 信号，而成骨性骨质破坏区则均为为长 T1 短 T2 信号。常见层状或针状骨膜反应、肿瘤骨和软组织肿块形成。2)郎格汉斯细胞组织细胞增生症：发生于骨盆骨较少，病灶一般为溶骨型骨质破坏，边缘清楚，CT 呈低密度，MRI 表现为等/长 T1 稍长 T2 信号，增强扫描为明显不均匀强化。

PU-1183

儿童钙化性椎间盘炎的影像学诊断及临床随访

宋修峰
青岛市妇女儿童医院

【目的】提高对儿童钙化性椎间盘炎临床及影像学表现的认识。

【方法】总结我院确诊的儿童钙化性椎间盘炎 3 例影像学表现、临床随访并文献复习。

【结果】儿童钙化性椎间盘炎是一种罕见的综合征。本病可以发生在从新生儿到青春期，但其发病高峰为 6~10 岁，无性别差异。全身症状有疼痛，剧痛或间歇性疼痛，或完全无疼痛。也可有发热和乏力等。颈部主要症状表现为颈痛僵硬、斜颈和活动受限。查体时常可发现颈部肌肉痉挛、压痛、颈活动受限，如有神经根或脊髓受压，可有相应的神经系统体征。症状体征在短期内能很快减轻或消失。

影像学表现：多发生在颈椎，以单个椎间盘发病为主，偶有多椎间盘钙化发生。椎间盘钙化可表现为团块状、盘状、碎裂状，团块状髓核钙化代表髓核整体钙化，盘状钙化表示髓核钙化并被压扁，碎裂状钙化可能是团块状钙化灶处于吸收、消散期改变，也可能为髓核破裂。髓核可脱出或移位，钙化的髓核可以向各种方向脱出，向后或侧后方脱出。

椎体形态异常，椎体的改变主要为：椎体变扁、楔状改变，椎体缘尖刺样改变，严重者呈“口钳征”，椎间隙一般无明显改变。椎体改变发生率高，说明本病不只限于椎间盘。

患者随访观察，钙化一般在 3~6 个月内消失，最短的为 2 周，最长则有 11 年的报道。

鉴别诊断：本病有自限性，时间对于本病的诊断与鉴别诊断有重要意义。需要鉴别的疾病主要有：颈椎结核，椎间盘的感染或创伤。二者症状体征可类似钙化性椎间盘炎，但均无椎间盘钙化。临床治疗上，主要采取保守治疗，本病有自愈性，症状可很快缓解，一般只需对症处理，如休息、服用消炎止痛药或配戴围领，有钙化突入椎管者禁用牵引。对有神经压迫症状的患者，经保守治疗不缓解或有进行性加重的脊髓压迫症状者应进行手术治疗。

【结论】钙化性椎间盘炎的临床及影像学表现具有特征性，随访可自愈，因此认识此病对临床治疗具有重要意义。

PU-1184

双能量 CT 对胸腰椎椎体压缩性骨折 一站式检查的价值

李红萍¹、韩丹²

1. 玉溪市人民医院

2. 昆明医科大学第一附属医院

【目的】本研究以 MR 成像及双能 X 射线吸收法骨密度检测结果为金标准，探讨双能量 CT 对胸腰椎椎体新鲜压缩性骨折及骨质疏松的诊断价值，以期对胸腰椎椎体新鲜压缩性骨折及骨质疏松的影像诊断及双能量 CT 的临床应用提供参考依据。

【方法】选取 2022 年 3 月至 2023 年 3 月期间云南省玉溪市人民医院收治的胸腰椎椎体新鲜压缩性骨折患者 54 例（108 个椎体）为研究对象，所有患者均行 MRI、双能量 CT 及双能 X 线骨密度检查，分别通过虚拟平扫（VNC）和虚拟去钙技术（VNCa）进行图像后处理，收集椎体钙浓度、骨髓 CT 值、责任椎体与邻近正常椎体 CT 差值和脂肪含量占比等双能量 CT 参数。以双能 X 射线吸收法骨密度检测结果为骨质疏松的“金标准”，以 MRI 检查结果为骨髓水肿的“金标准”，对比分析双能量 CT 在诊断椎体压缩性骨折患者骨质疏松和骨髓水肿方面的效果，并进行椎体压缩程度与骨髓水肿程度的相关性分析。

【结果】

1. DECT 诊断骨髓水肿与 MR 具有高度一致性， $\kappa=0.905$ 。
2. 骨髓水肿椎体的骨髓 CT 值和 CT 值差值高于无骨髓水肿椎体，随椎体骨髓水肿程度的增加，椎体骨髓 CT 值和 CT 值差值均随之增加，脂肪含量占比随之减少。
3. CT 值与 CT 差值二者联合诊断骨髓水肿的 AUC 为 0.924（95%CI 0.861-0.987）。
4. 新鲜椎体骨折 2 度骨髓水肿的椎体压缩程度明显高于 1 度骨髓水肿的椎体，Z 值=-2.796，P 值=0.005。
5. 椎体钙浓度与 BMD 值成正相关关系，r 值=0.584，P 值=0.031。椎体钙浓度诊断骨质疏松的敏感度为 0.910，特异度为 0.842，约登指数为 0.752。

【结论】

1. 双能量 CT 能够显示骨髓水肿及判断水肿程度，可用于诊断胸腰椎新鲜压缩性骨折，并与 MR 具有高度一致性。
2. 双能量 CT 测定的骨髓 CT 值、骨髓 CT 值差值及骨髓脂肪含量占比可以定量评估骨髓水肿，骨髓 CT 值、骨髓 CT 值差值二者联合价值更高。
3. 胸腰椎新鲜骨折的椎体压缩程度与骨髓水肿程度成正相关关系。
4. 双能量 CT 可以一次扫描有效地评估椎体骨折、骨髓水肿及骨质疏松，可作为脊柱损伤患者“一站式”检查的新方法。

PU-1185

采用欧洲腰椎体模对不同 CT 机型在骨矿物质密度定量一致性的评估

张宗军¹、李林²、余玉盛³、冯纪涛⁴

1. 江苏省中西医结合医院

2. 南京医科大学第一附属医院 (江苏省人民医院)

3. 南京医科大学附属江宁医院

4. 南京市浦口区中医院

目的: 采用欧洲腰椎体模 (ESP) 作为标准对对不同厂家不同 CT 机型在骨密度定量分析中的一致性。

材料和方法: 用国内外 6 家厂家的 31 台 CT 对欧洲腰椎体模进行了 34 次扫描, 31 台 CT 机分为 19 个型号, 包括 16 排、64 排 64 层和 128 层、128 排、256 排、双源 CT 和双层探测器。扫描条件为 120KV、150-200mAs, 准直厚度 0.625mm, 重建层厚 1mm-1.25mm, 标准软组织算法。扫描获得图像采用 radiant 软件在三个方位 10mm 厚度重组图像上测量其 CT 值, 并计算骨密度和 CT 值间的转换系数。采用 T 检验进行统计学分析。

结果: 欧洲腰椎体模 (ESP393) L1-3 的标准骨矿物质密度为 50、103 和 198mg/ml。31 台 CT 34 次扫描的体模 L1-3 椎体松质骨的 CT 值分别为 63.9HU (56.5-75.58, 95% CI 62.54-65.72)、132.84 (122.57-144.87, 95% CI 129.74-133.6) 和 250 (233.8-275.82, 95% CI 244.42-251.36)。骨密度与 CT 的比值为 L1 椎体 0.78 (0.66-0.88)、L2 椎体 0.78 (0.71-0.84)、L3 椎体为 0.79 (0.72-0.85); 以 0.78 比值回顾性计算各机型的欧洲体膜骨密度 L1 椎体 BMD 44-58 mg/ml, 95% 的 CI 为 48.8-51.25 mg/ml; L2 椎体 BMD 95.6-113 mg/ml, 平均 103.6, 95% CI 为 101.2-104.2; L3 椎体为 182.35-215.13 mg/ml, 平均 193.35, 95% CI 为 190.65-196 mg/ml。在 50 和 103mg/ml, 34 次扫描中 3 台设备 4 次超过 ± 5 mg/ml。

结论: 依据 ESP 体模测试结果, 不同厂家不同 CT 机型中用于椎体 BMD 的测量具有较好的一致性, 90% 的 CT 设备依据 CT 获得 BMD 数值误差在 5mg/ml 以内, 对骨质疏松的定性诊断影响较小, 但在同一患者前后比较中应注意不同 CT 机型的误差。

PU-1186

牵引状态下全脊柱 X 线摄影的临床意义

苏辉

空军军医大学西京医院

目的: 通过对脊柱侧弯患者采取牵引状态行全脊柱 X 线摄影, 为临床干预矫正提供预测效果。

方法: 通过选取 2018 年 9 月—2020 年 6 月拍摄的牵引状态下脊柱全长 X 线片与现在手术矫正或者外固定矫正后复查拍摄的正常状态下的脊柱全长 X 线片测量对比。

结果: X 线结果显示, 26 例病人复查结果测量对比后, 达到预期矫正角度的病人数量为 22 例。未达到预期矫正角度病人的数量为 4 例, 总结未达到预期矫正效果的具体原因大多为未按要求佩戴矫正外固定。

结论: 对脊柱侧弯患者行牵引状态下的全脊柱 X 线摄影, 可以为临床矫正干预起到指导性的角度数据。为临床医生提供矫正后或者手术后的预期效果。

PU-1187

肘关节功能位 CT 扫描技术在肘关节骨折诊断中的临床应用

王森、吴哲、李晶华、李宁
抚顺市中心医院

【摘要】目的：评价肘关节骨折诊断中应用肘关节功能位 CT 扫描技术的价值，在确保诊断准确率的基础上为肘关节骨折诊断与治疗工作提供参考。**方法：**选择我院骨科 2018 年 10 月-2019 年 10 月期间收治的肘关节骨折患者，总计 66 例（检出 130 处）。并结合诊断方法，随机分为采取肘关节功能位多层螺旋 CT（MSCT）扫描的试验 1 组与直接数字化 X 线射影（DR）的试验 2 组，对比 2 组患者肘关节骨折检出情况以及漏诊数。**结果：**试验 1 组受试者肘关节骨折 MSCT 检出 118 处，试验 2 组受试者肘关节骨折 DR 检出 60 处，包括肱骨远端骨折、尺骨近端骨折、桡骨近端骨折，2 组骨折检出率以及漏诊率差异显著， $P<0.05$ 。**结论：**肘关节功能位 MSCT 扫描肘关节骨折准确率高，且撕脱性骨折以及关节脱位诊断方面价值尤其突出，进一步为肘关节骨折的后续治疗工作提供了有价值的参考依据。

PU-1188

我院一例骨旁脂肪瘤 CT 三维透明技术应用

熊杰
常德职业技术学院附属第一医院

我院一例骨旁脂肪瘤为文献报告第 5 例发生于左肩胛骨旁，CT 矢状面及横断面示左肩胛骨骨旁可见类圆形脂肪密度灶，CT 值约-103HU，骨性突起呈珊瑚状向肿块内突入，骨性突起与肩胛骨下角相连。通过 X、CT 诊断并运用 VR，三维透明技术后处理技术，清楚显示病灶，一目了然，对骨旁脂肪瘤定位，大小，形态，边界等方面有重要的诊断价值。

PU-1189

双下肢全长负重联合卧位摄影对膝关节置换术前计划及术后疗效评估价值

焦飞涵
空军军医大学西京医院

目的：探讨双下肢全长负重联合卧位摄影对膝关节置换术前计划及术后疗效评估价值。

方法：选择在我院接受膝关节置换术患者 120 例，均拍摄负重联合卧位下肢全长正位片，以骨盆正中，下肢呈中立位为标准，方案。比较负重联合卧位与传统单独负重位的股骨胫骨机械轴夹角等数据，并评估两者图像质量。术后随访，比较术前术后膝关节功能。

结果：负重联合卧位摄影获得的股骨侧弓角（FBA）、机械股骨远端外侧角（mLDFA）以及近端内侧角（mMPTA）比较，差异均有统计学意义（ $P<0.05$ ），且前者明显高于后者，但机械股胫角（mFTA）比较差异无统计学意义（ $P>0.05$ ）；负重联合卧位与传统单独负重位患者摄影图像质量比较差异无统计学意义（ $P>0.05$ ）；患者术后疼痛、功能、活动度、屈曲畸形和稳定性评分较术前均显著上升（ $P<0.05$ ）。

结论 负重联合卧位体位的双下肢全长摄影在膝关节置换术的应用可减小人为操作不当引起的误差，对患者的下肢形态、生理力线等清晰显示，为病情的诊治和治疗方案的制定提供有效参考依据，同时术后能很好的反映出临床疗效，值得临床的推广及应用。

PU-1190

探讨脊柱全长 Cobb's 角测量与摄影投照体位相关性

焦飞涵、白亚妮、何子福
空军军医大学西京医院

[摘要] 目的: 探讨脊柱全长 DR 摄影投照体位对测量 Cobb's 角准确性的影响。 方法: 收集来我院复查拍摄脊柱全长的患者共 90 例, 通过对比初诊与复诊时拍摄的脊柱全长正位影像中的双侧锁骨与髂嵴是否处于同一水平位置来判断 Cobb's 角测量的真实性。 结果: 通过对比 90 例复诊患者的脊柱全长正位影像, 得出影响 Cobb's 角测量真实性的因素。其中包括由于体位不正导致的双侧锁骨与(或)髂嵴不处于同一水平线、由于脊柱侧弯导致的高低肩、由于双下肢不等长导致的双侧髂嵴不处于同一水平线等。 结论: Cobb's 角真实性与脊柱全长摄影投照体位密切相关, 在脊柱全长影像上双侧锁骨与髂嵴处于同一水平位置时, 测量得出的 Cobb's 角才具有真实性。若患者在拍摄脊柱全长影像时, 由于体位不正导致的双侧锁骨与(或)髂嵴不处于同一水平位置, 此时测量得出的 Cobb's 角度将大于真是角度。但有患者因患有脊柱侧弯而引起高低肩现象, 此时该患者的脊柱全长正位影像上双侧锁骨不处于同一水平位置, 但其 Cobb's 角的测量结果具有真实性。再有患者因患有双下肢不等长, 此时拍摄得出的全脊柱正位影像上双侧髂嵴不处于同一水平位置, 若该患者双下肢不等长小于 2cm, 则其 Cobb's 角的测量结果具有真实性; 若该患者双下肢不等长大于等于 2cm, 则其 Cobb's 角的测量结果将大于真实结果, 此时应将该患者不等长的下肢垫高至双侧髂嵴处于同一水平位置时再进行脊柱全长的摄影, 此时其 Cobb's 角的测量结果才具有真实性。

PU-1191

MRI 诊断跟腱黄色瘤一例及文献复习

邵小桐、牛洪涛、张琦昱
秦皇岛市第一医院

患者女, 33 岁, 发现无痛性右踝肿物 2 年, 肿物逐渐增大, 影响踝关节活动而就诊。查体: 右踝跟腱后方触及约 6cm×6cm 包块, 质软, 活动度低, 与周境界清楚, 无触痛, 右踝屈伸活动受限, 远端感觉、血运尚可。实验室检查: 血清甘油三酯 2.11mmol/L, 总胆固醇 5.03mmol/L, 高密度脂蛋白胆固醇 1mmol/L。超声显示右足跟部偏强回声结节, 其内血流不丰富。MRI 显示右跟腱远端不均匀增粗, 后方皮下软组织内见团块状 T1WI 等、T2WI 不均匀高信号, 内可见毛刷样改变, 增强后呈边缘明显强化, 病灶内部呈斑片状强化。术后病理示: 腱鞘黄色瘤, 与临床实验室指标和影像学表现相符。

PU-1192

基于 QCT 研究维持性透析患者腹部肌肉成分与腹主动脉钙化的相关性

詹昊、王龙胜
安徽医科大学第二附属医院

【摘要】 目的 利用定量 CT (QCT) 测量维持性透析患者腹部肌肉成分, 并分析其与腹主动脉钙化 (AAC) 之间的关系。 方法 回顾性分析 2022 年 3 月-11 月本院 193 例维持性透析患者的腹部 CT 资料, 并收集其临床资料。利用 QCT 测量 L3 椎体中部层面腹部肌肉成分, 包括肌肉面积, 肌肉脂肪面积; 利用 Agatston 法计算腹主动脉钙化积分 (AACs), 根据 AACs 四分位进行分组, 比较四

组间肌肉面积、肌肉脂肪面积及其相关变量的差异,用 Spearman 秩相关分析和偏相关分析评估腹部肌肉成分与 AAC 的关系。结果 AACs 与年龄、男性、透析龄、糖尿病、高血压、腹部肌肉脂肪面积呈正相关 ($r=0.555$ 、 0.172 、 0.192 、 0.335 、 0.348 、 0.358 , P 值均 <0.05),而与腹部肌肉面积无显著相关性。控制年龄、性别、透析龄、高血压、糖尿病因素进行偏相关分析显示, AACs 与腹部肌肉脂肪面积仍呈正相关 ($r=0.183$, $P=0.012$)。结论 维持性透析患者腹部肌肉脂肪面积与 AAC 程度呈正相关,高的腹部肌肉脂肪面积是 AAC 的危险因素。加强肌肉锻炼可能预防透析患者血管钙化风险。

PU-1193

Changes in bone mineral density and related influencing factors assessed by quantitative computed tomography in maintenance dialysis patients

Hao Zhan, Long-Sheng wang
the Second Affiliated Hospital of Anhui Medical University

Objective: To investigate the changes in volumetric bone mineral density (vBMD) assessed by quantitative computed tomography (QCT) in chronic kidney disease (CKD) patients on maintenance dialysis.

Study Design: Retrospective study.

Place and Duration of Study: Department of Radiology, the Second Affiliated Hospital of Anhui Medical University, Hefei, China, from March to July 2022.

Methodology: In total, 141 maintenance dialysis patients were selected for this study, and parameters related to renal function and bone metabolism markers recorded. In total, 159 patients undergoing routine physical examination were age-matched with maintenance dialysis patients to serve as the control group. vBMD scans of the lumbar spine (L1-3) were obtained by QCT for all participants.

Results: Among maintenance dialysis patients, there were 67 patients with secondary hyperparathyroidism (SHPT) and 74 patients with non-secondary hyperparathyroidism (non-SHPT) with mean vBMDs of 145.99 ($SD=55.13$) mg/cm^3 and 129.10 ($SD=44.20$) mg/cm^3 , respectively. In total, 159 individuals were included in the control group with a mean age of 52.77 ($SD=11.66$) years. The mean vBMD of these patients was 129.62 ($SD=36.36$) mg/cm^3 . The vBMD of the SHPT group was greater than that of both the non-SHPT group and the control group (all $P<0.05$). For dialysis patients, vBMD was positively correlated with phosphorus and intact parathyroid hormone (iPTH) levels ($r=0.187$, 0.023 , respectively, $P<0.05$), and vBMD was inversely correlated with age ($r=-0.542$, $P<0.05$). After adjusting for the covariates, vBMD remained positively correlated with iPTH ($r=0.181$, $P<0.05$).

Conclusion: Increased lumbar vertebral vBMD in maintenance dialysis patients may be associated with high iPTH, providing clinicians with a new understanding of the changes in bone mineral density in maintenance dialysis patients.

PU-1194

健康体检与急诊外伤儿童手腕部骨龄对比研究

杜霞、常沙、高波
贵州医科大学附属医院

目的: 分别探讨健康体检与急诊外伤儿童、外伤左手与外伤右手儿童骨龄是否具有差异。**方法:** 回顾性收集 987 例 2~17 岁 (男 606 例, 女 381 例) 健康体检和急诊外伤儿童手腕部 X 线正位片,

其中体检 437 例（均为左手），外伤 550 例（左手 249 例，右手 301 例）。基于 Tanner Whitehouse 3 (TW3)-RUS（尺桡骨、短骨）和 TW3-Carpal（腕骨）法，使用 Dr.Wise 骨龄评估系统评测骨龄。采用 Pearson 相关分析分别评估 TW3-RUS 骨龄、TW3-Carpal 骨龄与生活年龄的相关性；采用独立样本 t 检验分别比较 TW3-RUS 骨龄与生活年龄差值、TW3-Carpal 骨龄与生活年龄差值、TW3-RUS 与 TW3-Carpal 骨龄差值，分别评价体检与外伤儿童（左手）、外伤左手与外伤右手儿童骨龄的差异。结果：体检、外伤左手、外伤右手儿童的 TW3-RUS 骨龄与生活年龄、TW3-Carpal 骨龄与生活年龄均呈高度正相关（r 值均大于 0.900，P 值均 <0.001 ）。体检和外伤儿童（左手）在 2.0~2.9、3.0~3.9、11.0~11.9 岁年龄段 TW3-RUS 骨龄与生活年龄差值以及在 11.0~11.9 岁年龄段 TW3-RUS 与 TW3-Carpal 骨龄差值的差异有统计学意义（ $P<0.05$ ），其余各年龄段 TW3-RUS 骨龄与生活年龄差值、TW3-Carpal 骨龄与生活年龄差值以及 TW3-RUS 与 TW3-Carpal 骨龄差值的差异均无统计学意义（ $P>0.05$ ）；外伤左手和外伤右手儿童在 2.0~2.9、10.0~10.9 岁年龄段 TW3-RUS 骨龄与生活年龄差值的差异有统计学意义（ $P<0.05$ ），其余各年龄段 TW3-RUS 骨龄与生活年龄差值、TW3-Carpal 骨龄与生活年龄差值以及 TW3-RUS 与 TW3-Carpal 骨龄差值的差异均无统计学意义（ $P>0.05$ ）。结论：除个别年龄段体检与外伤儿童（左手）、外伤左手与外伤右手儿童骨龄存在差异外，其余年龄段差异均无统计学意义。本研究结论为骨龄研究、建立骨龄数据库和构建骨龄标准时样本选择提供一定参考。

膝关节炎基于 MR 解剖分型预测骨密度变化的可行性分析

王然、陈君蓉

四川省骨科医院（成都体育医院、成都运动创伤研究所）

目的：分析骨密度结果与膝关节软骨软化部位的关系，印证膝关节不同解剖部位的软骨软化提示骨量变化程度，为临床早期干预治疗骨量减少的患者提供有利帮助，防止骨质疏松发生。

方法：选取四川省骨科医院临床诊断为膝骨关节炎的住院患者 260 人，根据膝关节软骨软化部位将患者分为四组，髌股关节组、外侧胫股关节组、内侧胫股关节组、全关节组，利用 QCT 测量四组患者的骨密度值，将四组骨密度行统计学分析；同时并采集他们的年龄、性别、BMI、病程等一般信息行统计学分析。

结果：1.一般信息（年龄、性别、BMI、病程）无显著统计学差异。2.髌股关节组骨密度正常；内、外侧胫股关节组骨量减少；全关节组骨质疏松。

结论：骨关节炎病人 MRI 髌股关节软化时，提示病人骨量可能正常；MRI 显示胫股关节（包括外侧胫股关节组和内侧胫股关节组）软骨软化时，提示病人骨量可能减低；MRI 显示全关节组软骨软化时，提示病人可能骨质疏松。

PU-1196

Is Spina Iliace a Better Projection Point for Lumbar Radiography in Lateral Position?

Yuqi Tan,Xinyang Lv,Xuelin Pan,Chunchao Xia,Zhenlin Li
West China Hospital of Sichuan University

Purpose: To investigate the feasibility of taking spina iliace as a new projection point for lumbar radiography in lateral position, in comparison with the conventional projection point (3cm above spina iliace).

Materials and Methods: 68 patients undergoing lumbar radiography in lateral position were enrolled in this prospective study. 3cm above spina iliace was used as the projection point in half

of the patients, and spina iliace was used as the projection point in the other half of the patients. An enhanced U-net model was used to segment the inner and outer edges of the third lumbar vertebra (L3), fourth lumbar vertebra (L4) and fifth lumbar vertebra (L5). The inner edge was the vertebra without upper and lower sections, and the outer edge was the vertebra with upper and lower sections. The area of bilateral shadow (BS) in L3, L4 and L5 was calculated by subtracting the inner edge mask from the outer edge mask.

Results: Area of L3 BS was significantly higher for spina iliace than 3cm above spina iliace ($278.92 \pm 123.38 \text{ mm}^2$ vs. $200.38 \pm 103.61 \text{ mm}^2$, $P=0.006$). The difference in the area of L4 BS between spina iliace and 3cm above spina iliace was not significant ($192.92 \pm 97.23 \text{ mm}^2$ vs. $234.91 \pm 112.09 \text{ mm}^2$, $P=0.104$). Area of L5 BS was lower for spina iliace than 3cm above spina iliace (113.35 ± 78.97 vs. 169.40 ± 94.24 , $P=0.01$).

Conclusion: Using spina iliace as a projection point for lumbar radiography in lateral position would increase the BS of L3 but reduce the BS of L5. Considering that common lumbar diseases often happens in lower lumbar spine, spina iliace may serve as an alternative projection point for clinical lumbar radiography in lateral position, especially for the patients with medical history of lower lumbar spine disease.

PU-1197

基于磁共振 IDEAL-IQ 序列成像研究膝关节骨性关节炎与股四头肌肌肉脂肪含量关系

王伟、吴磊、冯雨、沈建良

浙江中医药大学附属第一医院 (浙江省中医院)

目的: 基磁共振 IDEAL-IQ 序列明确股四头肌脂肪含量与膝关节骨性关节炎分级之间的关系, 为临床预测、治疗膝骨性关节炎提供定量分析。

方法: 收集我院 2019、1-2021、1 月骨关节炎患者 58 例, 进行常规膝关节 MRI 扫描及股四头肌进行 IDEAL-IQ 序列检查。年龄 20-67 岁, 并根据 Recht 关节软骨分级标准分为 2 组, 第一组 Recht 分级为 I-III 级, 共 28 例, 男性 15 例, 女性 13 例, 年龄 20-52 岁, 第二组为 IV-V 级, 共 30 例, 其中男性 18 例, 女性 12 例。所有 IDEAL-IQ 扫描图像传入 AW4.6 工作站 (GE Healthcare), 观察范围包括从股骨大转子到股骨末端的股四头肌, 大腿近 1/3、大腿中部、大腿远端 1/3 由同一研究者选取处为研究层面, 由同一研究者选取 IDEAL-IQ 序列的 Fat Fraction 像勾选 ROI, 避开血管神经、伪影等, 分别测量股直肌、骨内侧肌、股外侧肌及骨中间肌系统自动生成所画区域的脂肪含量比值, 三次测量三个层面的肌肉脂肪含量取其平均值作为肌肉脂肪含量值。整合上述数据和结果, 采用 SPSS 25.0 软件进行统计学分析。组间年龄性别匹配, 运用两独立样本 t 检验分析股四头肌脂肪含量差异: 以 $P < 0.05$ 为差异有统计学意义。

结论: 关节软骨损伤程度越重, 股四头肌内脂肪含量越高, 二者是呈正性相关的, IDEAL-IQ 技术可以有效量化肌肉组织中脂肪含量。由 IDEAL-IQ 确定的 FF 值可以在不需要侵入性操作的情况下测量股四头肌脂肪含量, 操作方便 这一研究可以为临床预测、治疗膝 OA, 提供定量分析。

合成磁共振联合零回波成像技术在肩袖损伤中的临床应用价值研究

姜静玉、陈文、曹鲁强、桑玲、徐霖
十堰市太和医院

Magnetic resonance imaging (MRI) is considered the gold standard non-invasive modality for assessing rotator cuff injuries, which frequently involve the supraspinatus tendon. In this study, we employed synthetic MRI combined with zero-echo time (ZTE) imaging technology to evaluate rotator cuff injuries. The T1-weighted images generated by ZTE-MRI and SyMRI exhibit excellent consistency in measuring crucial shoulder angles, while the mean value of proton density (PD) can effectively differentiate between levels 0, 1, and 2. As a rapid imaging technique, synthetic MRI enables quicker acquisition of quantitative and functional images. When integrated with structural images obtained through zero-echo magnetic resonance technology, it facilitates a more comprehensive evaluation of changes associated with rotator cuff injury.

定量 CT 检查技术评估 VBMD 及身体成分变化在合肥市正常体检人员的应用价值

吴早秋
安徽医科大学第二附属医院

【摘要】目的：探讨定量 CT 检查技术评价 VBMD 及身体成分变化的应用价值。方法：采用回顾性描述性研究方法。共收集 2022 年 3 月至 2022 年 07 月安徽医科大学第二附属医院 1720 例来院体检人员临床影像资料男 910 例，女 810 例；年龄范围 15~90 岁，平均年龄男 (44.13±13.00) 岁；女 (43.63±13.38) 岁。所有受检者行胸部 CT 扫描。采用 QCT Pro 软件测量每例受检查者 L1 至 L3 椎体的 BMD 并取平均值 VBMD，L2/3 椎间隙水平内脏脂肪面积 (L2/3-VAT)、皮下脂肪面积 (L2/3-SAT)，L3 椎体水平椎后肌群脂肪含量/面积 (L3-PVMFT)、椎后肌群质量 (L3-PVMM) 及肌肉面积 (L3-PVMA)，平均肝脏脂肪分数 (Fat%-QCT)。结果：男性平均肝脏脂肪分数、内脏脂肪面积、腰肌脂肪面积、腰肌质量及腰肌面积均高于女性 ($P<0.001$)，BMD、皮下脂肪面积低于女性 ($P<0.001$)，腰肌脂肪面积无显著差异 ($P>0.05$)。结论：BMD 和身体成分随年龄的增长表现出不同的特征。

定量影像学在脊柱胸腰椎损伤诊断中的应用价值

张瑜
榆林市第二医院

随着医学技术的不断发展，定量影像学在脊柱胸腰椎损伤诊断中的应用逐渐受到重视。本文旨在探讨定量影像学在脊柱胸腰椎损伤诊断中的应用价值。通过分析近年来的相关文献，我们发现定量影像学在脊柱胸腰椎损伤的诊断中具有重要意义，有助于准确评估患者的病情，选择合适的治疗方案，并对预后进行预测。

一、背景

脊柱胸腰椎损伤是一种常见的骨科疾病，多由交通事故、跌倒、运动等意外事故引起。近年来，随着社会经济的发展和人们生活水平的提高，其发病率呈逐年上升趋势。对于此类患者，准确的诊断和治疗对其预后具有重要影响。因此，寻找一种更为准确、可靠的诊断方法成为当前的研究热点。

二、定量影像学在脊柱胸腰椎损伤诊断中的应用

常规 X 线检查

常规 X 线检查是诊断脊柱胸腰椎损伤的常用方法之一。通过 X 线平片，可以观察到骨折线的走向、骨折端移位程度以及是否存在椎体压缩等。但是，由于 X 线平片存在一定的局限性，如难以准确评估椎体旋转和后方结构的损伤情况等，因此对于部分复杂病例，其诊断价值有限。

CT 检查

CT 检查可以提供更为精确的影像学信息，对于胸腰椎骨折的诊断具有重要意义。CT 可以清晰地显示骨折线的走行、骨折端移位的方向和程度、碎骨片的数目和位置等。此外，CT 还可以显示是否存在椎弓根和关节突关节的损伤。通过对 CT 数据的分析，可以对胸腰椎骨折进行分型，从而为治疗提供依据。

MRI 检查

MRI 检查对于评估胸腰椎损伤患者的脊髓和神经损伤具有重要意义。MRI 可以清晰地显示脊髓的形态和信号变化，有助于判断是否存在脊髓损伤。此外，MRI 还可以显示神经根的损伤情况，有助于指导手术治疗。通过对 MRI 数据的分析，可以对胸腰椎骨折进行分类，从而为治疗提供依据。

三、结论

定量影像学在脊柱胸腰椎损伤的诊断中具有重要意义。通过对影像学数据的分析，可以准确评估患者的病情，选择合适的治疗方案，并对预后进行预测。在未来的研究中，我们建议进一步探讨定量影像学在脊柱胸腰椎损伤诊断中的应用价值，以期为临床提供更为准确、可靠的诊断方法。

PU-1201

MRI 对宫颈癌放疗后骨盆衰竭骨折与骨转移瘤的鉴别诊断价值研究

姜江华、吴青霞、白岩、李晓栋、陈嘉琦、王梅云
河南省人民医院

目的 宫颈癌放疗引起的骨盆衰竭骨折与骨转移瘤影像学表现相似，容易混淆。本研究目的是分析衰竭骨折与骨转移瘤的 MRI 特点，探讨 MRI 对宫颈癌放疗后骨盆衰竭骨折与骨转移瘤的鉴别诊断价值研究。

方法 收集 854 例具有完整临床资料及盆腔 MRI 资料的宫颈癌放疗后患者，随访时间大于 12 个月，对临床资料及 MRI 表现进行统计学分析。诊断金标准是基于影像学表现、临床数据和至少 12 个月的随访。

结果 654 例宫颈癌患者，发现衰竭骨折 57 例（8.72%），骨转移瘤 53 例（8.10%）。两组间体质指数、FIGO 分期、盆腔外放疗的辐射剂量、放疗结束至 MR 检查的时间间隔差异均无统计学意义（ P 均 >0.05 ）。衰竭骨折 MRI 表现为长 T1 长 T2 信号，无软质肿块，衰竭骨折病例出现 H 征 24 例（42.11%， $P<0.05$ ），衰竭骨折病例出现平行于髌髌关节线状长 T1 长 T2 信号骨折线 28 例（49.12%， $P<0.05$ ）。骨转移瘤表现为长 T1 长 T2 信号，伴有软组织肿块 37 例（69.81%， $P<0.05$ ）。

结论 宫颈癌放疗后骨盆衰竭骨折与骨转移瘤具有不同的 MRI 表现特点。MRI 对宫颈癌放疗后骨盆衰竭骨折与骨转移瘤的鉴别诊断具有一定的临床价值。

PU-1202

机会性 CT 评估老年男性和女性 L3 水平腹壁及椎旁肌肉肌量、肌质的年龄变化特点

何珍、康立清
天津大学天津医院

目的】利用腹部机会性 CT 数据，横断面研究 L3 水平腹壁及椎旁肌肉（群）的肌量、肌质 CT 参数特点及其影响因素，总结 50 岁以上男性和绝经后女性肌量、肌质随年龄变化特点。

【方法】

收集 2019 年 7 月至 2022 年 7 月于我院住院的 292 例患者的临床及腹部 CT 平扫资料，且无明确肌肉-骨骼疾病。采用 Image J 软件在 L3 水平腹部横轴位 CT 平扫图像测量腹壁及椎旁肌肉（群）肌量、肌质和脂肪参数。肌量参数包括骨骼肌面积（SMA）和骨骼肌指数（SMI）。肌质参数包括骨骼肌密度（SMD）、肌肉内脂肪成分（IMAC）和肌肉间脂肪组织（IMAT）。脂肪参数包括腹壁皮下脂肪面积和 CT 值。采用组内相关系数（ICC）评价测量者间 L3 水平腹壁及椎旁肌肉（群）CT 测量指标一致性。采用独立样本 t 检验比较同年龄组内男女间 L3 水平整体肌群肌量、肌质参数；采用一元线性回归分析年龄对肌量、肌质的影响。

【结果】

L3 水平腹壁及椎旁肌肉（群）肌量、肌质参数测量者间一致性优秀（ $ICC>0.75$ ）。同年龄组内，男性肌量、肌质参数显著高于女性（ $p<0.05$ ）。年龄对男性肌量、肌质参数影响程度大小依次为（ $p<0.05$ ）：SMA（Stb $\beta=-0.504$ ）、SMI（Stb $\beta=-0.482$ ）、SMD（Stb $\beta=-0.349$ ）和 IMAT（Stb $\beta=-0.309$ ）。年龄对女性肌量、肌质参数影响程度大小依次为（ $p<0.05$ ）：SMD（Stb $\beta=-0.338$ ）、IMAT（Stb $\beta=-0.272$ ）、SMA（Stb $\beta=-0.267$ ）和 SMI（Stb $\beta=-0.246$ ）。年龄对男性和女性 IMAC 均无影响（ $p>0.05$ ）。

【结论】

随着年龄增长，肌量、肌质呈下降趋势；但二者不同步，年龄对男性肌量影响程度大于肌质，而年龄对女性肌质影响程度大于肌量。男女间比较，男性较女性肌量下降速度快，肌质下降速度近似，女性较男性肌质下降发生早。无论男女，腹壁肌群、椎后伸肌群肌量、肌质均较腰大肌、腰方肌下降快；女性各肌肉（群）IMAC 均较男性增加快。

PU-1203

MRI 质子密度脂肪分数（PDFF）对骨质疏松诊断效能评估

兰九钧、陈君蓉、王文斌、王威、王然、杨健
四川省骨科医院

目的:研究 MRI 质子密度脂肪分数（PDFF）对骨质疏松诊断效能评估

方法:收集 160 名患者，其中骨量减少 80 名，骨质疏松 80 名。所有患者均接受了 IDEAL-IQ 序列的腰椎 MRI 和 QCT 扫描。将患者分为两组，分别为骨量减少组和骨质疏松组。分别测量了所有 L1-L3 腰椎的 PDFF 和 BMD。通过 Pearson 测试分析了 PDFF 与 BMD 之间相关性。以 BMD 为金标准， $BMD>120\text{mg}/\text{cm}^3$ 为骨量正常， $BMD80-120\text{mg}/\text{cm}^3$ 为骨量减少， $BMD<80\text{mg}/\text{cm}^3$ 为骨质疏松。使用卡方检验分析亚组之间的性别差异。通过 ROC 曲线评估 PDFF 在两组患者诊断中的有效性。

结果:在所有患者中，研究发现平均 PDFF 与 BMD 之间存在显著的负相关（ $P<0.001$ ），说明低 BMD 患者的 PDFF 较高。且患者 PDFF 与年龄呈正相关，老年患者的 PDFF 更高。BMD 与年龄呈负相关，老年患者 BMD 较低。单因素方差显示组间差异有统计学意义（ $P<0.05$ ）。ROC 曲线显示在骨量减少和骨质疏松的诊断中，PDFF 的 AUC 为 0.765 和 0.768。

结论: PDFF 与 BMD 显著相关, 在评估骨质疏松诊断中有诊断价值。

PU-1204

冠心病合并轻中度慢性肾功能不全经药物洗脱支架植入术后的长期疗效观察

徐朝霞、谢学建、高瑾、张夏萌、张小锐
空军第 986 医院

【摘要】目的 探讨冠心病合并轻中度慢性肾功能不全患者药物洗脱支架经皮冠脉介入术 (percutaneous coronary intervention, PCI) 后的长期疗效及安全性。方法 回顾性分析我院 2018 年 1 月至 2021 年 1 月植入药物洗脱支架 162 名冠心病患者临床资料及随访结果, 其中 80 名合并有轻中度慢性肾功能不全 (chronic renal insufficiency, CRI) 患者作为研究组, 82 名肾功能正常者作为对照组。结果 两组患者中, CRI 组患者多支血管病变、B 型病变及 C 型病变显著多于对照组, 而 A 型病变显著低于对照组 ($P < 0.05$)。在随访期间, 两组均无心源性死亡 (cardiac death, CD) 及心肌梗死 (myocardial infarction, MI) 发生。CRI 组不稳定性心绞痛 (UA) 的发生率低于对照组 ($P = 0.129$), 而非致命性心力衰竭、缺血性靶血管血运重建及支架内再狭窄的发生率虽高于对照组, 但无统计学意义 ($P > 0.05$)。结论 药物洗脱支架治疗冠心病合并轻中度肾功能不全患者安全有效。

PU-1205

激光倾角仪引导进针角度装置在 CT 引导下经皮纵隔占位穿刺活检中的应用

汪博泉、陈长春、刘玉林、杨震、邓文友、余筱瑶
湖北省肿瘤医院 (湖北省肿瘤研究所)

目的 探讨激光倾角仪引导进针角度装置在 CT 引导下经皮纵隔穿刺活检中的应用价值。方法 回顾性分析 2017 年 4 月至 2022 年 5 月 100 例纵隔占位 CT 引导下经皮穿刺活检患者, 其中激光倾角仪穿刺组为观察组, 常规穿刺组为对照组, 均为 50 例, 对比两组一次穿刺靶灶成功率、CT 扫描次数、穿刺时间及穿刺并发症、穿刺病理阳性率。结果 观察组一次穿刺成功率高于对照组, 差异具有统计学意义 ($P < 0.05$); CT 扫描次数、穿刺时间、并发症发生率观察组均低于对照组, 差异具有统计学意义 (P 均 < 0.05); 穿刺病理阳性率组间差异无统计学意义 ($P = 0.695 > 0.05$)。结论 激光倾角仪引导进针角度装置联合 CT 引导下经皮纵隔穿刺活检术可使穿刺更加精准和安全, 值得临床推广应用。

6S 管理法在介入手术室技护管理中的应用

刘倩
中国人民解放军陆军特色医学中心

6S 管理法在介入手术室技护管理中的应用

目的：为了全面提升介入手术室管理水平，提高工作质量和工作效率，将 6S 管理模式用于介入手术室技护管理工作。

方法：对介入手术室技术护理人员推行 6S 管理法，即整理，整顿，清洁，规范，素养，安全。

整理：技术人员负责每天对操作间及办公区的环境进行整理。护理人员每天对手术间的药品、物品进行分类整理，每周一次对库房的手术耗材进行整理及核对，每月最后一天抢救车内的药品是否过期或将近过期进行核对。技护整理后均需上传照片至工作群。

整顿：实行三定原则，“定点定量定容”，有物必分类，分类必定制，定制必标识。要求对各手术间进行布局的规范化及所有物品的统一摆放。

清洁：技术人员负责每日对设备清洁、消毒，保障设备的清洁及正常运行。护理人员负责每日手术完成后对手术间的环境进行整理并对手术间进行紫外线消毒。

规范：其属于 6S 管理法核心，针对整理整顿清洁过程中发现的问题，制定相应的规章制度及政策进行规范。

素养：规范技术和护理人员按照医院手术室要求标准着装，仪态大方，态度温和，积极主动为临床科室及手术医生服务。

安全：区域负责人负责每周一次对设备及工作环境进行巡视、对设备进行检查及保养，从而降低设备的故障率，降低手术室的环境安全及设备安全隐患。

结果：实施 6S 安全管理后与实施 6S 管理法之前对比，临床科室及手术医生对技护的满意度评分均有了显著提高 ($P<0.05$)，统计学具有意义。

结论：在介入手术室技护管理中，实行 6S 管理法后，大大改善了介入手术室的工作环境、提降低了设备的故障率，取得让临床及手术医生满意的结果，使介入手术室技护的管理工作质量有所提升，值得推广。

腹主动脉球囊阻断下子宫供血动脉栓塞在胎盘植入患者中的应用

张凯、赵鑫、陆林
郑州大学第三附属医院

目的：评价保持球囊阻断腹主动脉血流状态下行子宫动脉栓塞在胎盘植入患者剖宫产术中的应用及有效性。方法：回顾性分析我院自 2016 年 5 月至 2021 年 7 月共 72 例胎盘植入剖宫产术中栓塞止血的患者临床资料。患者年龄为 22-44 岁，平均年龄 32.92 岁；既往孕产次为 1-7 次，平均孕产次为 2.9 次；术中造影显示子宫供血动脉数量为 2-10 支，平均为 5.58 支。根据术中栓塞方式分为 A、B 两组。其中 A 组 43 例患者操作方式为撤出球囊交换入 Cobra 导管进行子宫供血动脉栓塞；B 组 29 例患者采用对侧穿刺股动脉置入 5F 鞘管并引入 Cobra 导管于球囊阻断下进行子宫供血动脉栓塞。对比两组患者术中出血量、输血量及并发症发生率，采用 SPSS 25.0 统计软件对数据资料进行整理与分析，采用独立样本 t 检验分析两组的出血量，计量资料符合正态分布采用 Pearson 相关性分析；不符合正态分布采用 Spearson 相关性分析；采用多元线性回归筛选影响出血量的危险因素。采用 MannWhitney 检验分析两组的输血量，采用卡方检验分析两组的并发症发生率，以 $p<0.05$ 为差异有统计学意义。结果：72 例患者均进行子宫供血动脉栓塞并成功止血，A 组患者术中平均出血量为 $2976.74\pm1133.81\text{ml}$ ，B 组患者术中出血量为 $2325.86\pm1040.14\text{ml}$ ，经统计学分析两组出血量存在显著统计学差异 ($P<0.05$)；A 组患者中位输血量 2255.0ml，B 组患者中位输血量 1310.0ml，经统计学分析两组输血量存在显著统计学差异 ($P<0.05$)；A 组患者并发症发生率为 4.65%，B 组并发症发生率为 3.45%，经统计学分析两组间并发症发生率无统计学意义 ($P>0.05$)。结论：球囊阻断下经对侧穿刺股动脉插管进行子宫供血动脉栓塞可进一步减少胎盘植入患者剖宫产术中出血量及输血量。

PU-1208

肾包膜动脉栓塞联合超选择性肾动脉栓塞治疗损伤性肾出血的安全性及有效性

石静
阜阳市人民医院

【摘要】目的 探讨肾包膜动脉栓塞联合超选择性肾动脉栓塞术治疗损伤性肾出血的安全性及有效性。方法 回顾性分析本院 2020 年 1 月—2023 年 7 月收治的 50 例损伤性肾出血患者的临床资料,所有患者均有血尿或造瘘管引出血色液体。观察组 25 例使用肾包膜动脉栓塞术联合超选择性肾动脉栓塞术治疗,对照组 25 例使用选择性肾动脉栓塞术治疗。术后远期随访 3 个月,记录患者手术成功率、术前及术后相关指标症状改善情况。结果 两组手术止血效果明显。两组间术前的血红蛋白(Hb)、肾区疼痛视觉模拟评分(VAS)、血肌酐(Scr)、收缩压及术后 24h Hb、术后 24h 肾区疼痛 VAS、术后 7 天 Scr、术后 1 月收缩压分别比较,差异无统计学意义(均 $P > 0.05$),而两组间术后 24h Hb、术后 24h 肾区疼痛 VAS 比较,差异有统计学意义(均 $P < 0.05$)。观察组术后满意度高于对照组,而术后住院时间短于对照组,差异有统计学意义(均 $P < 0.05$)。结论 两组治疗损伤性肾出血均可提高术后 24h 血红蛋白、降低术后 24h 肾区疼痛 VAS,而观察组较对照组明显提高术后 24h Hb 及患者满意度率、降低术后 24h 肾区疼痛 VAS、减少术后住院时间。肾包膜动脉栓塞联合超选择性肾动脉栓塞术治疗损伤性肾出血是一种安全、有效、微创的止血方法,值得推广。

非小细胞肺癌Ⅲ期患者接受 CT 引导下经皮 125I 粒子植入治疗疗效评估的 CT 纹理分析参数特征比较

徐向阳
赤峰松山医院

目的 探讨非小细胞肺癌Ⅲ期患者接受 CT 引导下经皮 125I 粒子植入治疗疗效评估的 CT 纹理分析参数特征比较

方法 选取 47 例经穿刺活检病理证实的非小细胞肺癌患者植入 125I 粒子(联合化疗或在单独植入粒子治疗前三个月内接受过至少 1 种及以上药物治疗方案),经临床评估为诊疗中前期(6 个月内)非进展后,获取术前、术后 3、6 个月增强 CT 图像,手动勾画感兴趣区后提取术前、术后 3 个月、6 个月随访 CT 图像的纹理特征。根据临床实际疗效对患者进行分组,采用参数,对有统计学差异的纹理参数进行多因素建模分析。运用受试者工作(ROC)曲线下面积(AUC)、准确度、敏感度、特异度评估模型。

结果 在运用了纹理分析方法后分别对 3 月期疗效获得 5 个纹理参数,对 6 个月期疗效获得 5 个纹理参数,通过纹理参数构建模型获取 ROC 曲线与 AUC 值,评估分组方法对疗效预测的诊断价值是积极的。

结论 结合 CT 纹理分析方法,在非小细胞肺癌Ⅲ期患者植入 125I 粒子治疗时根据疗效的积极与否对患者群体进行分类有益于提供一定的临床诊断价值、影像疗效评估特征和临床治疗方案决策价值。

不同状态下肾 AML 的影像学特征、栓塞策略及临床疗效分析

李梓涵、吴佳琳
汕头大学医学院第二附属医院

目的

本研究旨在分析肾血管平滑肌脂肪瘤(AML)的影像学特征，探讨 AML 破裂出血的相关危险因素和不同状态下的栓塞策略及其临床疗效。

方法

回顾性研究 2011 年 1 月至 2021 年 12 月经 CT 平扫诊断为 AML 并破裂出血或直径 $\geq 4\text{cm}$ ，并进行经导管动脉栓塞术(TAE)/硬化栓塞术(TASE)的患者 35 例，共栓塞 36 个肿瘤病灶。根据入院时肿瘤的不同状态采用不同的栓塞策略：大量出血的 AML 采用 TAE，少量出血及无出血的 AML 采用 TASE。对比分析不同状态下 AML 的影像学特征、采用的栓塞策略及其临床疗效。

结果

36 个 AML 中发生自发性出血的有 22 个，其中大量出血的有 15 个，少量出血的 7 个；无出血的有 14 个。进行 15 次 TAE，21 次 TASE。治疗后，大量出血 AML 均得到止血。破裂出血的 AML 有 14 个合并动脉瘤，无出血 AML 有 3 个合并动脉瘤，差异具有统计学意义($P=0.019$)，两组之间动脉瘤直径、血管及平滑肌成分比例、血管及平滑肌成分体积的差异均具有统计学意义($P<0.05$)。对于 AML 的破裂出血，动脉瘤直径 $\geq 4\text{mm}$ 的预测准确率为 0.74($P=0.016$)，血管性成分比例 ≥ 0.21 预测准确率为 0.99($P<0.001$)，血管性成分体积 $\geq 48.86\text{cm}$ ，预测准确率为 0.92($P<0.001$)。平均随访(16.77 ± 12.91)个月，AML 体积缩小率、血管及平滑肌成分缩小率、脂肪成分缩小率分别为 0.68 ± 0.22 、 0.82 ± 0.28 、 0.52 ± 0.39 ，差异具有统计学意义($P<0.01$)。TASE 组有 3 个肿瘤病灶缩小至完全消失。TAE 组与 TASE 组 AML 的脂肪成分体积缩小率组间具有统计学差异($P=0.009$)。术后整体血清肌酐水平降低($P=0.017$)。

结论：动脉瘤直径、血管及平滑肌成分和临床症状是预测 AML 出血的主要危险因素。TAE 能有效控制出血，是 AML 急性活动性出血的首选治疗方法。TASE 能有效缩小肿瘤体积、破坏血管及血管周围组织，保护肾组织。

基于深度学习技术在 CT 引导下肺活检术中降低辐射剂量的临床应用

徐龙¹、段海峰²、于楠²、贾永军²

1. 陕西中医药大学医学技术学院

2. 陕西中医药大学附属医院医学影像科

目的 基于深度学习重建技术探讨不同噪声指数在 CT 引导下经皮肺穿刺活检术中降低辐射剂量的临床应用价值。

方法 选取 CT 引导下经皮肺穿刺活检的 32 例患者，采用小范围（40mm），100KV，自动管电流（ATCM），噪声指数（NI）依次为 15、30、45 扫描获得 3 组图像，自动记录 CT 扫描的容积 CT 剂量指数（CTDIvol）和剂量长度乘积（DLP），计算有效辐射剂量（ED）。A 组为 NI 15 ASIR-V 50%图像，B、C 组分别为 NI 30、45 DLIR-H 图像，分别测量穿刺点中心及其上下 10mm 层面脊柱旁肌肉、皮下脂肪及动脉血管 CT 值和 SD 值，计算 SNR 和 CNR，并由两名医师对图像进行主观评分。

结果 三组图像质量的主观评价均能满足穿刺需求。B 组图像 SD 及 SNR 值均优于 A、C 组，组间两两比较分析：A、B 组图像在肌肉、脂肪处 SD 和 SNR 差异具有统计学意义（ P 均 <0.05 ）；A、C 在血管处 SD 和 SNR 值差异有统计学意义（ $P<0.05$ ）；B、C 组图像在肌肉、脂肪及血管处 SD 和 SNR 差异具有统计学意义（ P 均 <0.05 ）。三组间 CTDIvol、DLP、ED 的差异均具有统计学意义（ P 均 <0.05 ）；B、C 组较 A 组的 CTDIvol、DLP、ED 分别降低了 82.97%、82.94%、82.86%和 93.94%、93.92%、93.90%；C 组较 B 组的 CTDIvol、DLP、ED 分别降低了 64.56%、64.39%、64.44%。

结论 基于深度学习技术提高噪声指数应用超低剂量 CT 引导下经皮肺穿刺活检术，可以大幅度降低穿刺活检过程中的辐射剂量，值得临床推广应用。

PU-1213

TACE Plus Tyrosine Kinase Inhibitors and Immune Checkpoint Inhibitors versus TACE Plus Tyrosine Kinase Inhibitors for the Treatment of Patients with Hepatocellular Carcinoma: A Meta-Analysis and Trial Sequential Analysis

Jiaxi Liu, Haibo Shao

The First Hospital of China Medical University

Background: We conducted a meta-analysis and trial sequential analysis (TSA) to compare the therapeutic efficacy and adverse events (AEs) between the following treatment strategies for patients with hepatocellular carcinoma (HCC): TACE plus tyrosine kinase inhibitors (TKIs) and immune checkpoint inhibitors (ICIs) (TACE+T+I) versus TACE plus TKIs (TACE+T).

Methods: We systematically searched PubMed, the Web of Science, the Cochrane Library, and Embase for studies comparing TACE+T+I and TACE+T for the treatment of BCLC intermediate- or advanced-stage HCC. The objective response rate (ORR), progression-free survival (PFS), overall survival (OS), and AEs were included as outcomes. We used a fixed- or random-effects model based on the results of a heterogeneity evaluation and performed a meta-analysis using Review Manager 5.3 and Stata 16.0. We then carried out the TSA.

Results: Five studies examining a total of 425 patients were included in this study. Our meta-analysis revealed that, compared to TACE+T, TACE+T+I significantly improved the ORR (risk ratio [RR] = 1.53, 95% confidence interval [CI] = 1.27–1.85, $P < 0.01$) and extended both the

median PFS (mean difference [MD] = 4.51 months, 95% CI = 2.16–6.87, $P < 0.01$) and median OS (MD = 5.75 months, 95% CI = 4.03–7.48, $P < 0.01$). These results were tested to be true by the TSA without requiring a larger information size. Among AEs, hypertension tended to occur more often in patients treated with TACE+T+I than in those treated with TACE+T (RR = 1.58, 95% CI = 1.05–2.40, $P < 0.05$). However, the TSA suggested that additional cases are necessary to confirm this difference. Regarding the other AEs, no significant differences were detected between the two groups.

Conclusion: TACE+T+I showed better effects on the ORR, PFS, and OS than TACE+T as a treatment for BCLC stages B and C HCC, without an obvious increase in the AEs. Based on these findings, well-designed, large RCTs are suggested.

经皮双通道聚桂醇泡沫血液全置换硬化术治疗下肢静脉曲张临床应用

王世平、杨光、杨勤飞、袁骏、惠世正、李骏
安宁市第一人民医院

目的：探讨经皮静脉内注入聚桂醇泡沫硬化剂血液全置换联合射频消融治疗下肢静脉曲张的技术方法可行性，安全性和临床疗效。方法与材料：选取 2021 年 3 月至 2023 年 3 月我科收治的下肢静脉曲张患者 67 例。术中于膝关节内侧穿刺大隐静脉主干后，经大隐静脉远侧置入射频闭合导管将大隐静脉大腿段主干闭合，远端小腿曲张静脉注入聚桂醇泡沫硬化剂，选择性硬化闭塞大隐静脉及交通静脉，术后患肢加压包扎，局部换药。结果：手术 87 条患肢均成功注入泡沫硬化剂，每条患肢平均注入 7.2 ml(3.8~9.2ml)泡沫硬化剂，无严重并发症发生。手术结束患者自行走回病区，术后患者能正常下床活动。持续穿压力弹力袜两周后，所有患肢术后术口愈合良好。术后 6~12 个月随访：87 条患肢(93.8%)曲张静脉消失，3 条患肢(6.25%)曲张静脉局部复发。结论：血液全置换联合射频消融治疗下肢静脉曲张临床疗效确切，是一种安全、有效的治疗下肢静脉曲张的微创方法，值得推广及应用。

CT 平扫评估原发性肝癌经肝动脉化疗栓塞术后疗效的临床研究

李淑
吉林大学第一医院

目的

计算机断层扫描 (CT) 平扫判断原发性肝癌 (PHC) 患者经肝动脉化疗栓塞术 (TACE) 后病灶内碘油沉积情况，评估 TACE 的术后疗效，指导临床进一步治疗。

方法

收集 2018 年 6 月-2020 年 6 月行 TACE 治疗的 38 例 PHC 患者的 75 个病灶，术后 1-18 个月评估碘油沉积情况，并根据改良实体瘤反应评估标准 (mRECIST) 将患者分为病情缓解组(CR+PR)及病情未缓解组(SD+PD)，比较两组患者的临床与影像资料；多因素 Logistic 回归分析 TACE 疗效评估的独立因素；Spearman 相关性分析探究碘油沉积类型与 mRECIST 分级二者的关系；采用受试者工作特征曲线显示各特征对 TACE 治疗效果的评估的准确性； $p < 0.05$ 为差异有统计学意义。

结果

缓解组碘油沉积类型、碘油 CT 值与未缓解组比较，差异均有统计学意义($P < 0.05$)，碘油沉积类型为 TACE 疗效评估的独立因素，并与 mRECIST 分级呈正相关(r 为 0.702, $P < 0.001$)，碘油 CT

值>700HU 提示病情进展可能性较低。碘油沉积类型与碘油 CT 值联合评估病情缓解的 ROC 曲线下面积为 0.909, 灵敏度为 0.816, 特异度为 0.919。

结论

无论治疗间隔时间长短及治疗次数多少, CT 平扫判断病灶内碘油沉积类型对 PHC 患者 TACE 术后疗效有一定评估作用, 联合碘油 CT 值效果更优, 在一定程度上减轻了 PHC 患者术后复查的经济压力、规避了 CT 增强检查造影剂带来的潜在风险、显著减少了患者的四分之三的辐射剂量。

PU-1216

免疫治疗会提高 TACE 或 TACE 联合分子靶向疗法在肝癌患者中的疗效吗? 一项荟萃分析

郭煜升、郑传胜

华中科技大学同济医学院附属协和医院

背景: 虽然有几项研究比较了经动脉化疗栓塞(TACE)联合或不联合免疫检查点抑制剂(ICIs)在肝癌患者中的疗效和安全性, 但仍然缺乏荟萃分析。方法: 在 PubMed, Embase, Web of Science 和 Cochrane Library 检索了截至 2023 年 7 月的比较单独 TACE 或联合非免疫治疗 (TACE±分子靶向治疗[MTTs])和 TACE 联合 ICIs (TACE±MTTs+ICIs)在肝癌患者中的疗效和安全性研究。结果包括总生存期(OS)、无进展生存期(PFS)、客观缓解率(ORR)、疾病控制率(DCR)和不良事件(AEs)。

结果: Meta 分析共纳入 20 项研究, 涉及 2587 例 HCC 患者。包括 2116 例患者的 18 项研究观察了 TACE±MTTs 或 TACE±MTTs+ICIs 的 OS 差异。与 TACE±MTTs 相比, TACE±MTTs+ICIs 与 OS 的显著改善相关(HR, 0.37;95%CI, 0.30-0.46)。13 项研究包括 1650 例患者调查了 TACE±MTTs 或 TACE±MTTs+ICIs 的 PFS 差异。结果显示, TACE±MTTs+ICIs 与更长的 PFS 相关(HR, 0.50;95%CI, 0.41-0.61)。包括 1971 例患者在内的 18 项研究调查了 TACE±MTTs 或 TACE±MTTs+ICIs 之间肿瘤反应(ORR 和 DCR)的差异。结果显示, 与 TACE±MTTs 相比, TACE±MTTs+ICIs 的 ORR 和 DCR 更高。此外, 为了观察 ICIs 的直接影响, 我们研究了 TACE+酪氨酸激酶抑制剂(TKIs)和 TACE+TKIs+ICIs 在 OS、PFS、ORR、DCR、AEs 和严重 AEs 方面的差异。结果表明, ICIs 的添加延长了 OS, 延长了 PFS, 提高了 ORR 和 DCR, 但没有增加 AE 和严重 AEs。结论: 本项研究是全球第一项比较 TACE 联合或不联合 ICIs 在肝癌患者中的疗效和安全性的荟萃分析, 结果表明 ICIs 可提高 TACE 或 TACE 联合 MTTs 的疗效, 延长肝细胞癌患者的生存期。同时, 在 TACE+TKIs 中加入 ICIs 并没有带来额外的不良事件。

PU-1217

基于 CT 的人体肌肉和脂肪含量对肝细胞癌 TACE 难治性的影响

李慧玲、容鹏飞

中南大学湘雅三医院

目的: 本研究通过结合肝细胞癌患者的一般临床资料及基于 CT 的人体肌肉及脂肪组织参数, 旨在探讨肝细胞癌患者经导管动脉化疗栓塞术 (TACE) 后发生难治性的风险因素, 建立临床及身体成分预测模型, 进而尝试对 TACE 难治性高风险患者进行预测。

方法: 本研究回顾性收集 2013 年 6 月至 2021 年 10 月在中南大学湘雅三医院及湖南省肿瘤医院诊断为肝细胞癌并接受 TACE 治疗的 128 例患者。根据日本肝病学会 (JSH) 指南确定 TACE 的难治性。在所有患者中, 89 名患者 (约 70%) 被分配到训练队列, 其余 39 名患者 (约 30%) 被分配到验证队列。

结果: 训练队列纳入 89 例患者, 其中 TACE 难治性患者为 39 例 (43.8%), 测试集纳入 39 例患者, 其中 TACE 难治性患者为 17 例 (43.6%)。多因素逻辑回归结果显示基线最大肿瘤直径、VSR 是影响 TACE 难治性的独立危险因素。用最大肿瘤直径构建临床预测模型, 在训练队列中 AUC 值为 0.865, 在验证队列中 AUC 值为 0.749。用 VSR 构建身体成分预测模型, 在训练队列中 AUC 值为 0.894, 在验证队列中 AUC 值为 0.810。组合模型在训练队列 AUC 值为 0.925 在最佳截断点的灵敏度为 96.0%, 特异度为 79.5%, 验证队列 AUC 值为 0.885, 灵敏度为 77.3%, 特异度为 94.1%, 与单独的临床模型相比具有统计学差异 ($P < 0.01$)。

结论: 患者基线最大肿瘤直径和 VSR 是预测肝细胞癌患者发生 TACE 难治性的独立危险因素, 身体成分模型、临床模型及组合模型可以在 TACE 治疗前预测患者发生难治性的风险, 并且组合模型的预测性能要优于单独的身体成分模型及临床模型, 可以帮助临床医生选择最优的治疗肝细胞癌的方法。

PU-1218

IVIM 评估下肢动脉狭窄患者 PTA 前后骨骼肌微循环状态

丁雨洁、王维
中南大学湘雅三医院

目的: 本研究的目的是通过体素不相关运动成像 (IVIM) 评估

下肢动脉硬化闭塞性疾病 (LEAD) 患者经皮腔内血管成形术 (PTA) 前后的骨骼肌灌注, 探索 IVIM 参数作为定量评估介入手术疗效的一种极具潜力的方法。

方法: 在 2019 年 3 月至 2020 年 2 月期间, 在我院收治了 20 例 (男 16 人, 女 4 人, 平均年龄为 66.75 ± 12.3 岁) 有症状且临床诊断为 PAOD 且需要进行介入手术治疗的患者。这 20 例患者均进行了球囊扩张术或球囊扩张伴支架植入术。术前 1 天和术后 1 周内分别进行了 CTA, 常规 MRI, IVIM 以及患肢小腿的临床辅助检查。3 例患者有随访记录。对所有患者的临床症状进行评估, 同时测量与胫骨前肌, 腓骨长短肌, 比目鱼肌和腓肠肌灌注相关的 IVIM 参数, 包括扩散系数 D , 灌注相关扩散系数 D^* 和灌注分数 f , 用 IVIM 软件对所有患者患肢小腿进行感兴趣区参数值的计算, 使用 Spearman 秩相关检验进行统计分析。

结果: 在 PTA 前后, 胫骨前肌、腓骨长短肌、比目鱼肌和腓肠肌的 D 、 D^* 、 f 值均较术前增加, 同时临床评估的踝肱指数 (ABI) 从 0.60 ± 0.27 增加到 0.92 ± 0.21 , 趾肱指数 (TBI) 从 0.18 ± 0.64 增加到 0.41 ± 0.17 。所有患者的无痛步行距离均得到改善。结论: IVIM 可以成功监测小腿骨骼肌 PTA 前后关键灌注参数 D , D^* 和 f 的变化, 似乎是监测和评估介入治疗的有前途的工具。

PU-1219

Angio-CT 联合 DSA 在精准前列腺动脉栓塞术中的应用价值

曾春龙
华中科技大学同济医学院附属协和医院

目的 探讨 Angio-CT 联合 DSA 在精准前列腺动脉栓塞术中的应用价值。

方法 选取 10 例前列腺增生患者, 行精准前列腺动脉栓塞术, 术中行 Angio-CT 动脉造影, 分析 Angio-CT 的应用价值。

常规消毒铺巾及导尿管置入, 局麻下采用 Seldinger 技术穿刺右侧股动脉成功后, 引入 5F 猪尾导管至腹主动脉, 注入适量造影剂行 Angio-CT 动脉扫描, 可发现双侧前列腺增粗, 前列腺明显增大。扫描结束后, 进行三维工作站重建图像, 根据横断位 CT 图像判断患者前列腺和周围组织的染色情

况,分析血管供血是否在前列腺,分析出责任动脉;利用三维重建技术获取 3D 血管图像,以任意角度进一步分析前列腺和周围分支的关系,选择适宜的操作角度,利用 Yashiro 导管配合微导管选入双侧前列腺,DSA 动脉造影证实为前列腺动脉后,双侧前列腺注入适量直径 100-300um PVA 微球行栓塞治疗,然后补充注入适量直径 300-500um 明胶海绵颗粒行栓塞治疗。复查造影示栓塞满意。

结果 患者接受精准前列腺动脉栓塞术并成功实施 Angio-CT 检查,有效识别前列腺动脉并明确其与周围脏器吻合支的关系,是精准前列腺动脉栓塞术治疗前列腺增生患者的关键,同时也是减少手术并发症、进行安全栓塞的关键。Angio-CT 的应用,有效提高了前列腺动脉的识别率,在精准前列腺动脉栓塞术中应用 Angio-CT,可避免发生异位栓塞情况。患者术后复查未发现并发症。

结论 Angio-CT 应用于精准前列腺动脉栓塞术中,可提供确切的影像学图像,可明确识别前列腺动脉,可以直接观察前列腺染色,明确显示栓塞靶血管与其周围分支的关系,从而选择最佳的手术位置,保证了手术的安全性和精准性。

PU-1220

穿针引线-超声引导下直接穿刺 TIPS 支架引入器械疏通支架内血栓技术介绍

郭小鹏

华中科技大学同济医学院附属协和医院

TIPS 手术是介入医学中难度最高的手术之一,其通过在门静脉与肝静脉之间建立分流道,可快速有效降低门静脉压力,改善门静脉高压并发症,对肝硬化门脉高压导致的顽固性腹水、食管胃底静脉曲张破裂出血具有良好的治疗效果。然而直接内血栓形成会影响其长远疗效。常规的经颈静脉导管辅助支架内血栓抽吸及球囊扩张是常用的治疗方法,但是有时候由于解剖因素或支架内血栓机化较严重,往往难以建立有效的通路,从而造成 TIPS 支架内血栓疏通失败。我们临床中心通过超声引导下经皮及肝实质直接穿刺支架,通过 18G 穿刺针引入泥鳅导丝反向选择上腔静脉内, RUPS100 鞘管,导丝经鞘管尾端引出体外。然后经颈静脉 RUPS100 鞘管沿导丝引入多用途导管直至 TIPS 支架 18G 针穿刺点。经上述反向交换操作,可有效建立支架内通路,从而为后续的血栓抽吸及球囊机械碎栓创造条件。

上述超声引导下直接穿刺 TIPS 支架引入器械疏通支架内血栓技术在我们临床中心实践中积累了较好的经验,且未出现腹腔出血等严重并发症。避免了再次 TIPS 手术为患者带来的机体痛苦及经济负担。

PU-1221

降低 CT 引导下肺结节穿刺活检并发症的研究

冯昭、刘刚

青海红十字医院

摘要 目的:探讨降低 CT 引导下肺结节穿刺活检并发症的研究。方法:选取 2021 年 10 月-2022 年 10 月 200 例在青海红十字院进行 CT 引导下肺部结节穿刺活检的患者,其中 100 例采用同轴针穿刺法(对照组),100 例采用同轴针联合凝血酶封堵法(实验组),比较两种方法诊断阳性率及并发症发生率。结果:200 例肺活检全部穿刺成功,穿刺成功率 100%。常规组患者诊断恶性病变 88 例,良性 7 例,未定性 5 例,阳性率 88.0%;发生气胸 15 例,咯血 8 例,并发症发生率 21.0%。实验组患者诊断恶性病变 92 例,良性 8 例,未定性 2 例,阳性率 92.0%;发生气胸 6 例,

咯血 2 例, 并发症发生率 8.0%。两组患者阳性诊断率的差异无统计学意义 ($P > 0.05$), 并发症发生率的差异有统计学意义 ($P < 0.05$)。结论: 采用同轴穿刺针联合凝血酶封堵法可以准确地进行 CT 引导下肺部结节穿刺活检, 并可明显降低气胸、咯血的发生率。

PU-1222

子宫收缩不良致产后出血 DSA 技术行栓塞治疗的价值和意义

陈煜、钱美琼、范毓
上海交通大学医学院附属第九人民医院

目的: 探讨子宫收缩不良所致的产后出血产妇产后子宫内血管栓塞 (uterine artery embolization, UAE) 技术的实施和解剖位置分析, 选择合适的动脉栓塞对于止血效果及术后快速恢复子宫、卵巢供血的治疗价值和重要意义。方法: 选取我院专科于 2023 年 1 月-2023 年 6 月期间收治的, 符合纳入标准的因子宫收缩不良所致的产后出血, 经 DSA 血管造影技术精确完成子宫动脉栓塞术者共计 48 例, 且纳入产妇经临床常规止血效果不佳者。其中出血量 $\geq 800\text{ml}$ 的 32 例, 出血量 $\geq 1000\text{ml}$ 的 10 例, 出血量 $\geq 1200\text{ml}$ 的 6 例。48 例产妇经右侧或左侧股动脉穿刺插管, 导管分别插至双侧子宫动脉, 检查内容包含子宫动脉的起源及其走向、分布、出血点处的血供情况, 子宫底、体、颈部血流情况, 对于出血活跃处血管进行栓塞治疗, 已达到快速止血效果, 避免出血产后大出血、休克、席汉斯综合征、切除子宫等不良事件发生。结果: (1) 86.53% 的产妇产后子宫动脉发自髂内动脉的臀下动脉阴部干, 13.47% 的产妇产后子宫动脉为髂内动脉主干和臀上动脉。(2) 子宫供血情况分为 3 种情况: ①一侧子宫动脉供血为主要类型, ②双侧子宫动脉均衡供血, ③单纯一侧子宫动脉供血。

(3) 发现有 72.5% 的子宫动脉发出卵巢支, 子宫动脉栓塞术不能避免栓塞卵巢支。因此在选择被栓塞的动脉时应更为谨慎, 且栓塞时间应严格控制, 结合临床症状, 尽早恢复子宫及卵巢血供。结论: 在 DSA 血管造影技术下行子宫动脉栓塞是一种安全, 有效, 能减少产时、产后出血量及产后并发症发生的有效医疗手段。对于有再次生育要求的妇女而言, 更需要选择的 DSA 血管造影操作人员对动脉分布、血管走向的熟悉, 能更快更精准地选择被栓塞的动脉血管, 且栓塞物最好选择可被吸收的明胶海绵类物质, 以便更好恢复子宫供血能力。对于血管的选择仍需多中心大规模临床 DSA 技术的进一步探索和证实。熟悉子宫血管的解剖对提高技术成功率, 合理选用栓塞方法有着非常重要的意义。

PU-1223

CT 引导下肺穿刺活检对乳腺癌伴发及术后继发可疑恶性的实性肺结节的诊断价值

李金鹏
河北医科大学第四医院

目的: 探讨 CT 引导下肺穿刺活检对乳腺癌合并可疑恶性实性肺结节的诊断价值。方法: 选取 2018 年 8 月至 2019 年 8 月在河北医科大学第四医院乳腺中心收治的乳腺癌初诊及复诊患者共 34 例, 所有患者均经病理证实为乳腺癌, 且均合并可疑恶性的实性肺结节, 所有患者均行 CT 引导下肺结节穿刺活检并加做免疫组化, 当对取材结果不满意时行二次活检, 将患者分为初诊伴发组 11 例, 复诊继发组 23 例。分别统计穿刺成功数、乳腺癌肺转移患者数、肺癌患者数、其他病理结果患者数。结果: 所有患者手术过程顺利, 术中及术后均无严重并发症。CT 引导下肺穿刺活检诊断乳腺癌伴发可疑恶性的实性肺结节 (单发 5 例, 多发 6 例) 成功数 (11/11)。其单发实性结节患者中, 乳腺癌肺转移患者数 (2/5), 肺癌患者数 (3/5)。其多发实性结节患者中, 乳腺癌肺转移患者数 (4/6), 肺癌患者数 (1/6), 其他病理结果 (1/6)。CT 引导下肺穿刺活检诊断乳腺癌继发可疑

恶性的实性肺结节（单发 4 例，多发 19 例）成功数（22/24）。其单发实性结节患者中，乳腺癌肺转移患者数（3/4），其他病理结果（1/4）。其多发实性结节患者中，乳腺癌肺转移患者数（17/18），肺癌患者数（1/18）。CT 引导下肺穿刺活检对于鉴别乳腺癌肺转移与肺原发良恶性病变具有十分重要的价值，有助于指导临床精准治疗。

高原环境下 CT 引导经皮肺穿刺活检术后并发症的危险因素分析

王恒伟、刘刚、何慧、解晓婷
青海红十字医院

目的：探究高原环境 CT 引导下经皮肺穿刺活检术后常见并发症的危险因素。方法：选取 2019 年 1 月—2022 年 12 月在青海红十字医院放射影像介入科行 CT 引导下肺穿刺活检的患者 865 例。记录患者相关信息，采取卡方检验进行单因素分析，并 logistic 回归分析，筛选出有关“气胸和肺内出血”的独立危险因素。结果：（1）行 CT 引导下肺穿刺活检术出现气胸者 203 例（23.7%），出现出血者 140 例（16.3%）。（2）患者术后气胸的单因素分析显示病灶位置（ $\chi^2=30.032$, $P=0.026$ ）、病灶大小（ $\chi^2=10.604$, $P<0.001$ ）、进针点位置（ $\chi^2=9.736$, $P=0.008$ ）均是影响气胸发生率的相关因素；二元 Logistic 回归分析结果表明左肺下叶背段(Wald $\chi^2=6.398$, $P=0.011$)、左肺下叶前内基底段(Wald $\chi^2=4.982$, $P=0.026$)、左肺下叶外基底段(Wald $\chi^2=5.08$, $P=0.024$)、左肺下叶后基底段(Wald $\chi^2=6.294$, $P=0.012$)、病灶直径 $\geq 3\text{cm}$ (Wald $\chi^2=14.343$, $P<0.001$)、肺部相关疾病(Wald $\chi^2=4.421$, $P=0.036$)均是 CT 引导下肺穿刺活检术患者气胸发生的独立危险因素。（3）患者术后肺内出血的单因素分析结果显示病灶位置（ $\chi^2=34.243$, $P=0.008$ ）、病灶大小（ $\chi^2=41.024$, $P<0.001$ ）、穿刺角度（ $\chi^2=8.742$, $P=0.013$ ）、穿刺深度（ $\chi^2=22.553$, $P<0.001$ ）均是肺内出血发生率的相关因素；Logistic 回归分析结果显示病灶大小 ≥ 3 (Wald $\chi^2=41.151$, $P<0.001$)、穿刺角度 $30^\circ\sim 60^\circ$ (Wald $\chi^2=10.611$, $P=0.001$)、穿刺角度 $> 60^\circ$ (Wald $\chi^2=3.964$, $P=0.046$)、穿刺深度 $\geq 5\text{cm}$ (Wald $\chi^2=13.094$, $P<0.001$)均是肺内出血发生的独立危险因素。结论：CT 引导下经皮肺穿刺活检术后并发气胸及肺内出血的危险因素较多，在肺穿刺活检手术中应当予以重视。

PU-1225

一项外周肿瘤介入新途径技术研究——原发性肝癌远桡动脉入路 TACE 初探

张文雷、李佳睿
吉林大学第一医院

目的：探索经远桡动脉入路行 HCC 肝动脉化疗栓塞术的可行性、安全性。

方法：回顾性分析我中心（吉林大学第一医院介入治疗科）自 2020 年 8 月 1 日-2020 年 12 月 31 日明确诊断为原发性肝癌患者 116 例，共进行 130 次远桡动脉穿刺，其中男性 99 例，女性 17 例，平均年龄 58.6 岁（38-73 岁）平均体重 64.8 公斤（52-87 公斤），平均身高 168.5cm（158cm-184cm）。纳入标准：1.术前影像学（腹部 CT 增强或 MR 动态增强）检查或病理资料明确原发性肝癌，Child-Pugh 评分 A 级或 B 级；2.能够准确触及远桡动脉搏动，Allen 试验阴性，3.患者本人及家属知情同意。排除标准：无法触及远桡动脉搏动，或可触及但有桡动脉造瘘透析的患者，术前桡动脉超声提示迂曲折角，不利于导丝导管通过。

结果：所用患者均使用 21G 钢针穿刺，使用的鞘管 5F(84 例)，4F(46 例)，穿刺成功率 86.2%（112/130），失败 18 例。MPA1 导管选择降主动脉成功率 96.2%（125/130），交换 5F 猪尾导

管后选择成功 5 例。MPA1 选择肝动脉腹腔干成功率 100%，选择肠系膜上动脉成功率 100%。经远端动脉穿刺术后压迫 2-4 小时，无出血、血肿发生，远端及近端桡动脉搏动均良好，未出现动脉夹层、假性动脉瘤形成，无远端桡动脉闭塞。14 例经过 2 次远端桡动脉穿刺，亦未出现血管闭塞不良事件。

结论：远端动脉穿刺路径行原发性肝癌 TACE 治疗均有可行性，安全性，值得进一步推广应用。

博莱霉素碘化油乳剂动脉栓塞术在巨大肝血管瘤介入治疗中的长期疗效评价

宋华丹

上海交通大学医学院附属新华医院

目的: 探讨博莱霉素碘化油乳剂动脉栓塞术(B/LE)在巨大肝血管瘤介入治疗中的安全性和长期疗效。方法:回顾性分析 2008 年 1 月 1 日至 2018 年 12 月 31 日期间行 B/LE 治疗的 162 例肝血管瘤患者的临床资料。根据 B/LE 术前 2 周内影像学检查(增强 CT 或增强 MRI)，对肝血管瘤患者进行分组。A 组:肝血管瘤直径 $\geq 10\text{cm}$ ，共计 48 例;B 组:肝血管瘤直径 $\geq 5\text{cm}$ 且 $<10\text{cm}$ ，共计 114 例。所有患者 B/LE 术中均采用博莱霉素-碘化油乳剂栓塞肝血管瘤供血血管。将随访节点分为短期(术后 6 个月至 1 年)，中期(术后 1 年至 3 年)及长期(术后 3 年至 11 年)。计算并比较 B/LE 术后各个随访节点肝血管瘤的面积、缩小率及临床有效率。比较两组肝血管瘤患者 B/LE 术后各个随访节点肝血管瘤的临床有效率。结果:技术成功率 100%。肝血管瘤的平均面积在 B/LE 术前、短期、中期、长期等各个随访节点的统计结果分别为 $70.13 \pm 58.72\text{cm}^2$ 、 $33.26 \pm 40.18\text{cm}^2$ 、 $21.92 \pm 28.73\text{cm}^2$ 、 $20.65 \pm 33.94\text{cm}^2$ ，B/LE 术后 3 个随访节点肝血管瘤的面积较术前的差异均具有统计学意义($p < 0.05$)。B/LE 术后 3 个随访节点的肝血管瘤的临床有效率分别为 71.70%、88.71%、89.53%。将 B/LE 术后短期内肝血管瘤临床有效例数和无效例数作为基线，B/LE 术后中期和长期期间有效例数分别与基线比较，差异均具有统计学意义($p < 0.05$);B/LE 术后中期与 B/LE 术后长期比较，差异无统计学意义($p > 0.05$)。比较 A 组和 B 组在各个随访节点的有效率:短期有效率分别为 51.06% VS 80.36%($p = 0.000$);中期有效率分别为 81.58% VS 91.86%($p = 0.095$);长期有效率分别为 88.89% VS 89.83%($p = 0.895$)。结论: B/LE 治疗肝血管瘤效果显著且长期效果稳定。B/LE 术后 3 年内肝血管瘤呈不同程度进行性缩小，3 年后肝血管瘤大小趋于稳定。B/LE 术后 B 组比 A 组短期有效率高，但两组间长期有效率无明显差异。

经血管腔内去交感神经消融术 (EDN) 治疗 2 型糖尿病现状与进展

陆雪刚

东南大学

东南大学附属中大医院

目的 近年来开展的经皮肾动脉交感神经消融术 (RDN) 研究发现，合并 2 型糖尿病(T2DM)的高血压患者术后，葡萄糖代谢改善，胰岛素敏感性有所提高。在此推动下，一系列基于经血管腔内去交感神经消融术 (EDN) 治疗 2 型糖尿病的基础与临床研究陆续进行并发表成果。本文就 EDN 治疗 2 型糖尿病的研究进展作一综述。

方法 基于 PubMed 数据库和 CNKI 数据库，分别进行英文和中文文献检索，并对内容进行综述。

结果 T2DM 作为一种终生性疾病,给个体和社会造成巨大经济负担,现有长期治疗常出现患者依从性差,难以改变生活行为方式或坚持药物治疗。研究表明交感神经过度兴奋可诱发胰岛素抵抗,通过对腹腔干与肝总动脉等交感神经射频消融进行血糖控制是新型治疗手段。已有多项国际注册临床研究证实其安全性及临床疗效,但其剂量-反应关系仍未明确,且交感神经对不同器官影响仍需长时间随访评估,仍需要大规模多中心的临床试验充分了解其潜在风险与益处。

结论 介入技术是 T2DM 等代谢性疾病的新治疗方式,具备安全、潜在并发症少及低成本等优点,本文通过机制、术式、现状等方面进行阐述。尽管其具体机制和最佳术式参数仍待研究阐明与评估术后长期效果,如进一步确证该治疗方式安全有效,可显著改善 2 型糖尿病患者(如多药血糖控制不佳)的血糖水平,更可在在此基础上融合出 T2DM 等代谢性疾病新的治疗领域——“介入代谢学”。

Efficacy of transcatheter arterial interventional embolization in the treatment of children with hypervascular hemangioma and its effect on serum miR-206 and miR-206-3p

Chuangao Yin
Anhui Children's Hospital

抽象:探讨经导管动脉介入栓塞联合局部注射月桂醇的疗效。检测两组患儿的疗效和血清 miR-206 和 miR-206-3p 水平。治疗后研究组严重程度评分为(1.69 ± 0.84),肿瘤深度为(5.39 ± 2.18) mm,对照组分别为(2.26 ± 0.97)和(5.85 ± 2.31) mm。成对比较,严重程度差异相当($P<0.05$),肿瘤深度差异不具有可比性($P>0.05$)。治疗后,研究组的血清 miR-206 (2.84 ± 0.84)和 miR-206-3p (3.09 ± 0.95)水平分别高于对照组(1.76 ± 0.64)和(2.15 ± 0.53)。发现局部注射月桂醇联合 TAE 在治疗儿童血管过多管瘤方面明显比单独注射 TAE 更有效。此外,它被发现是治疗这种情况的安全有效的方法,具有进一步临床应用的潜力。

在介入导管室介入诊疗过程中放射技师的配合研究进展

黄政文、梁真、李娜
南宁市第二人民医院

当前,介入医学快速发展,技术日益完善,已经成为重要的临床诊疗学科,并将新技术、新理念不断推广应用于多学科、多领域、多层面,为广大患者提供创伤小、恢复快、优质安全的精准诊疗。随着介入诊疗患者数量的不断攀升,各医疗中心在以临床需求为目标,不断加大介入导管室的增建改建,以期实现共享手术空间,同时开展多学科协同评估、共同管理以及分期/联合介入和开放手术的现代化介入诊疗工作平台。而在介入导管室介入诊疗的过程中放射技师的配合是介入导管手术成功的关键因素。

介入导管诊疗技术是指在不开刀暴露病灶的情况下,在皮肤做直径数毫米的微小通道,或通过机体原有的腔道,在影像设备的引导下对病灶局部进行诊疗。根据治疗范围介入导管诊疗技术可分为妇产科介入、神经介入、肿瘤介入、外周介入、心脏介入等,达到精准发现、定位、消除病灶的治疗目的。随着介入技术发展的突飞猛进,各类介入器械的不断革新、突破,以及介入精准治疗概念的提出,介入手术者不再单纯依赖影像结果去指导手术策略,在术中要随时掌握腔内影像学,功能学

评价指标等所需决策依据提供综合指导。在介入导管室的整体规划中融入大量影像、网络和信息技术和相应的基建支持,在介入导管手术全程配合放射技师,力求打造可视化、信息化、智能化平台,为精准诊疗提供保障,使介入诊疗条件更加顺应医疗理念的进步。

介入导管放射技术操作要求在影像仪器的监测下寻找血管分支,熟悉正常的解剖部位,了解解剖变异,选择适宜的导管,转动病人的体位,予以造影剂探路,要求在介入导管的诊疗的全程需要放射技师全程监测、配合,放射技师在导管介入放射诊疗中起到关键性作用,需要增强对专业技能的提升力度,同时需要系统学习新技术、新知识。

基于 4R 危机管理理论在急诊大咯血介入手术中的应用研究

蔡玲、肖书萍

华中科技大学同济医学院附属协和医院

摘要:目的 探讨 4R 危机管理法在急诊大咯血介入手术中的应用研究。方法 选取行 2019 年 7 月—2022 年 7 月我院收治的 82 例介入栓塞治疗的大咯血患者为研究对象,随机分为对照组(常规管理)和实验组(4R 危机管理理论),每组 41 例。比较 2 组手术时间、术中护理风险事件发生次数、风险识别率和护理质量评分、护理应对能力评分以及医护人员自身对护理的满意度。结果 实验组手术时间短于对照组,术中护理风险事件发生次数少于对照组,风险识别率、护理质量评分、护理应对能力评分和医护人员自身对护理总满意率高于对照组,差异有统计学意义($P<0.05$)。结论 4R 危机管理理论在急诊大咯血患者术中应用效果较好,有助于提高护理人员的护理能力,应用价值较高。

基于 ECRS 护理管理模式在肝癌介入患者围手术期中的应用

王雪梅、史思敏

郑州大学第一附属医院

目的:探究基于 ECRS 护理管理在肝癌患者围手术期中的应用效果评价。

方法:选取 105 例肝癌需介入手术病人为研究对象,根据随机数字表法分为对照组 52 例和观察组 53 例。对照组给予常规流程护理,观察组给予基于 ECRS 护理管理模式下的流程护理,比较两组肝癌需介入手术病人患者术前准备时间、术后患者返病房护士接手术时间、术后患者下床时间、两组患者抑郁、焦虑评分的比较。

结果:观察组患者的术前准备时间、患者术后返病房护士接手术时间、术后患者下床时间均低于对照组 ($P<0.05$),观察组抑郁、焦虑程度评分低于对照组 ($P<0.05$)。

结论:基于 ECRS 护理管理模式在肝癌介入患者围手术期中的应用,有效缩短患者的术前准备时间、缩短护士患者术后返病房接手术时间、降低了术后患者下床时间,缩短了康复时间,降低肝癌需介入手术患者抑郁、焦虑程度,ECRS 护理管理模式在肝癌介入患者介入围手术期中值得推广。

小脑动静脉畸形破裂出血行 Onyx 胶栓塞治疗 1 例

邓剑锋、赵卫、孟雪柔
昆明医科大学第一附属医院

摘要：脑动静脉畸形属先天性疾病，常以脑出血为首发症状，往往导致较高的致残率和死亡率。脑动静脉畸形出血主要治疗手段包括外科手术、血管内栓塞及放射治疗，治疗目标为清除病灶以消除再出血风险。血管内栓塞治疗相对于其他治疗手段，具有治疗及时、创伤小、恢复快的特点。现将我院小脑动静脉畸形破裂出血行 Onyx 胶栓塞治疗 1 例报告如下。

PU-1233

胆汁瘤治疗

汤书豪
昆明医科大学第一附属医院

摘要：目的 探讨经导管动脉化疗栓塞（TACE）术后形成的胆汁瘤的介入和外科引流的疗效。方法 分析 50 例行 TACE 治疗患者后产生胆汁瘤的患者的临床资料，根据临床资料及治疗方法平均分成两组，比较两组患者的复发率及生存率。结果 采用介入治疗的患者中 17 例无复发，3 例 1 次复发，2 例 2 次复发，3 例于治疗五年内死亡，采用手术治疗的患者中 10 例无复发，5 例 1 次复发，3 例超过 3 次复发，7 例于治疗五年内死亡。结论 TACE 术后的胆汁瘤经介入治疗后疗效较外科治疗好。

脾栓塞术后继发性脾囊肿经穿刺引流后再次行 2 次脾栓塞 1 例报告

李宗伟¹、张跃伟²
1. 河南大学第一附属医院
2. 北京清华长庚医院

引言：部分脾动脉栓塞（partial splenic arterial embolization, PSE）术后继发性脾囊肿临床上较为罕见。本文报道一例肝癌伴肝硬化脾大患者，因肝动脉灌注化疗（hepatic artery infusion chemotherapy, HAIC）致白细胞和血小板下降，行 PSE 治疗后由于脾脏梗死继发演进为脾囊肿，经穿刺置管引流后脾囊肿治愈，后因继续 HAIC 治疗致白细胞和血小板持续下降，再次接受 2 次 PSE 治疗。总结该病例特点：（1）PSE 后继发巨大脾囊肿形成，穿刺引流可取得根治性疗效，而且并不影响后续 PSE 的安全性；（2）在接受 HAIC 和靶免治疗过程中出现的白细胞、血小板等下降，并不能完全从脾栓塞中获益，要考虑到奥沙利铂药物促脾功能亢进作用，还有各种化疗药物和靶免药物的骨髓抑制作用。

PU-1235

Preoperative transarterial embolization in the management of primary retroperitoneal tumors: a retrospective case-control study

Li Yu, Qi Liang
the Departments of Radiology

AIM: To evaluate the efficacy and safety of preoperative transarterial embolization in the surgical management of primary retroperitoneal tumors (PRT) and reveal possible factors influencing the estimated blood loss (EBL) during surgical resection.

METHODS: We retrospectively analyzed a total of 51 PRT patients treated surgically from January 2018 to October 2022. Of the 51 enrolled patients; 24 patients received preoperative transarterial embolization (PTAE group) and 27 patients received surgical excision alone (Control group). Basic information, tumor size and pathological results were included and compared between two groups. EBL were compared between two groups. Principal factor effect and interaction effect on EBL were also analyzed using statistical method.

RESULTS: The mean volume of intra-operative blood loss was 829.2ml in PTAE group, which was significantly lower than 1814.7 ml in Control group ($P < 0.01$). The mean volume of intraoperative blood transfusion volume in PTAE group was 1050ml, significantly decreased compared to the control group 2700ml ($P=0.01$), and the length of hospital stay in PTAE group was 13.2 days, significantly decreased compared to the control group 19.3 days ($P=0.04$). The mean surgical time was shorter in PTAE group than in Control group, but the difference had no statistical significance (222 vs 414 min, $P=0.06$). No difference in peripheral viscera injury between two groups ($P > 0.05$). Neurological and gastrointestinal complications such as paraplegia or lower limb numbness or visceral ischemia were not observed in PTAE group. Univariate analysis of variance indicated that EBL in malignant and benign tumor has a significant difference in addition to different group ($P=0.04$), meanwhile, tumor size had little impact on total EBL ($P=0.83$). Our findings also revealed that group*size had a interaction effect on EBL ($P=0.04$), conversely, group*pathology had no obvious interaction effect on EBL ($P=0.36$).

Conclusions: PTAE provide an effective and safe adjuvant procedure for the surgical management of primary retroperitoneal tumors. It can significantly reduce intraoperative blood loss, reduce postoperative complications and hospital stay, and promote patients rehabilitation.

PU-1236

肝门部胆管癌门静脉闭塞支架植入术后联合 HAIC 或 HAIC/靶免单中心小样本疗效分析

周海峰
青海大学附属医院

【摘要】目的: 评估肝门部胆管癌门静脉闭塞支架植入术后联合 HAIC 或 HAIC/靶免的临床疗效。
方法: 回顾性分析 5 例接受门静脉支架植入术后联合 HAIC 或 HAIC/靶免的肝门部胆管癌伴 PV 狭窄患者 (4 男 1 女; 平均年龄 60 岁; 年龄范围 49-71 岁。肝门部胆管癌 (3n)、胆管癌 (1n)、胆囊癌 (1n))。观察门脉支架置入术后门静脉压力变化、支架通畅、临床症状、并发症及后续 HAIC 及靶免治疗的临床疗效。
结果: 5 例患者均成功置入门静脉支架, 患者门静脉高压症状均显著缓解, 无手术相关的严重并发症。5 例患者后续治疗中 4 例接受 HAIC+靶免治疗, 1 例接受 Capox 化疗方案+靶免治疗。HAIC 方案: 奥沙利铂 50mg+5Fu/亚叶酸钙 300mg/天。Capox 化疗方案(奥沙利铂剂量 236.6mg、卡培他滨 3500mg 早三片, 晚四片), 共 8 周期。4 例病人总共接

受 19 次 HAIC 治疗, 每例患者平均接受 HAIC 治疗 5 次。每个疗程平均药物灌注 1-3d, 2 例病人接收靶向药物仑伐替尼, 1 例接受靶向药物培美替尼。术后间隔 1 个月, 行彩色多普勒超声观察门静脉支架内血流速度和门静脉直径。平均随访**个月 (**个月), 5 例患者门静脉均通畅, 并且后续联合 HAIC+靶向治疗依据 RECIST1.1 标准进行疗效评估, RR 为.... (x 例完全 (CR), x 例部分 (PR), x 例稳定疾病 (SD) 和 x 例进展性疾病 (PD)), 开始治疗或放置 PV 支架后的平均生存时间 (MST) 分别为 x 个月和 x 个月, 而 1 年生存率分别为 x 和 x。在 x 例 CR 患者中, x 例在 21 个月和 40 个月后死于多器官功能衰竭, x 例仍无病。在 PR 和 SD 患者中, 疼痛和 PH 相关症状 (如腹水和黑便) 也得到改善。1 例患者在治疗 21 个月后死于多器官功能衰竭, 1 例患者在治疗 40 个月后因细菌合并真菌性败血症、急性胆管炎、脓毒性休克而死。1 例患者在治疗 15 个月后死于多器官功能衰竭, 其他患者均存活。结论: 门静脉支架置入联合 HAIC 或 HAIC 靶向/放疗等综合治疗肝门部胆管癌所致门静脉狭窄疗效确切。

载药微球加载中药成分进行部分脾动脉栓塞术对术后脾脏增生的抑制作用的临床研究

武修平

昆明医科大学第一附属医院

目的: 为了进一步研究抑制部分脾动脉栓塞术后, 脾脏发生代偿性增生而出现脾大、脾亢的现象。

方法: 回顾性分析 2022 年 1 月至 2023 年 1 月与昆明医科大学第一附属医院接受 PSE 治疗的 100 例肝硬化脾功能亢进的患者资料。使用 500 ~ 700 μm 的栓塞微粒球, 根据栓塞加载材料的不同分为 A 组 (接受载药微球加载中药成分) 50 人和 B 组 (仅适用微球栓塞) 人。对比两组患者手术情况、住院时间, 术前 1d、7d 以及术后 7d、28d 的血常规指标, 体液免疫指标, 外周血细胞免疫指标, 术后行多普勒血管超声对比两组患者 7d、28d 脾脏的血液流动以及术后并发症发生情况。

结果: A 组患者手术时间、住院时间均显著短于 B 组, 在术后 1d、28d; 两组患者白细胞计数(WBC) 相较于术前 1 d 均呈先升高后降低趋势, 且术后 7、28 d A 组显著低于 B 组, 术后 A 组炎症反应发生率及严重程度均低于 B 组; 术后 7、28 d 两组患者血小板计数(PLT)均呈逐渐升高趋势, 且术后 7、28 d A 组显著高于 B 组(均 $P < 0.05$)。术后多普勒血管超声提示 A 组脾脏血流量均少于 B 组, 且 A 组脾脏大小明显小于 B 组。

研究价值: 进一步缓解 PSE 术后炎症反应及脾脏代偿性增生等并发症, 提升患者术后生活质量, 改善患者血液生化指标。

肝癌患者 TACE 术后炎症与其预后关系的研究进展

李刚

昆明医科大学第一附属医院

作为中晚期肝癌患者的首选治疗方法, 经导管肝动脉化疗栓塞 (Transcatheter hepatic arterial chemoembolization, TACE) 具有微创、简洁、较少并发症、恢复快等优势。但由于术后炎症反应和严重并发症的存在, 使得部分患者接受 TACE 治疗的周期延长, 疗效也不尽人意。因此, 术前充分对患者一般情况进行评估, 挑选术后可能获益的患者显得尤为重要。本文就肝癌患者 TACE 术后炎症反应与其预后研究作一综述。

PU-1239

球囊肺动脉成形术在慢性血栓栓塞性肺动脉高压中的应用研究进展

方心怡

昆明医科大学第一附属医院

慢性血栓栓塞性肺动脉高压 (Chronic Thromboembolic Pulmonary Hypertension, CTEPH) 被认为是肺栓塞远期并发症, 自然预后不良。肺动脉内膜剥脱术 (Pulmonary Endarterectomy, PEA) 能够显著改善 CTEPH 患者的预后。然而, 既往有报道显示近 40% 的 CTEPH 患者无法行 PEA 术。球囊肺动脉成形术 (Balloon Pulmonary Angioplasty, BPA) 被报道能够用于治疗不能手术的 CTEPH 患者, 且有研究报道显示, BPA 治疗不能手术的 CTEPH 患者取得了较好的预后, 主要体现在血流动力学、症状、运动功能和右心室功能的改善以及并发症发生率的降低。随着 CTEPH 患者的治疗选择不断扩大, PEA、BPA、药物治疗及其组合现已可用。但是研究中大部分患者在接受 BPA 治疗的同时也接受了肺动脉高压的药物治疗, 因此无法排除患者基础线特征和肺动脉高压药物治疗等混合因素对预后的影响, 不能真实反映 BPA 对不能手术的 CTEPH 患者预后的影响。本文对目前 BPA 在 CTEPH 中的应用研究进展进行综述, 分析其可行性、有效性及安全性, 评估其在 CTEPH 新治疗时代中的地位与前景。

经颈静脉肝内门体分流术治疗肝硬化门静脉血栓的技术策略

李如春

昆明医科大学第一附属医院

【摘要】门静脉血栓 (Portal venous thrombosis, PVT) 形成在肝硬化患者中患病率为 5%~20%, 年发病率 3%~17%。在急性门静脉血栓形成患者中, 如果血栓蔓延至肠系膜上静脉, 可导致肠缺血, 继而引起肠坏死等严重并发症。另外, 慢性门静脉血栓形成可并发食管胃底静脉曲张出血、腹水等门静脉高压征, 也可损害肝脏功能。目前经颈静脉肝内门体分流术 (Transjugular intrahepatic portosystemic shunt, TIPS) 在 PVT 治疗中发挥着越来越重要的作用, 已成为 PVT 治疗的适应症。但目前缺少相关的技术研究而限制 TIPS 在治疗 PVT 患者的临床应用, 其主要的缺点在于技术难度大以及潜在的技术并发症等危险。研究表明, 在门脉血栓的患者中, TIPS 的技术成功随着门静脉血栓的加重而降低, 在门脉海绵样变患者中进一步降低。TIPS 治疗肝硬化门静脉血栓的难点主要在于成功穿刺门静脉技术及支架释放位置, 前者为手术成功的关键步骤, 后者为保持分流道通畅率及有效降低门脉压力的临床效果。

siVEGF 纳米复合体的合成及其在抗血管生成治疗中的应用

王焱

山西医科大学

血管内皮生长因子 (vascular endothelial growth factor, VEGF) 是促进肿瘤、眼部新生血管疾病、子宫内异位症等疾病发生发展的一种重要因子, 广泛分布于机体内各组织。抑制 VEGF 的异常表达可起到治疗这些疾病的目的, 也是治疗相关疾病的有效手段之一。由于目前常用的 VEGF 药物具

有耐药性和副作用而限制了其发展,为此开发 VEGF 的小干扰 RNA, VEGF-siRNA (siVEGF), 通过 RNA 干扰 (RNA interference, RNAi) 的方式,在基因层面抑制 VEGF 表达。然而 siVEGF 进入机体后受多种因素的影响,大大降低了治疗效果。因此构建特定的、具有靶向性的 siVEGF 复合体,避免其被机体清除,并将 siVEGF 精确的送到目的细胞以发挥抗血管功效,治疗相关疾病显得尤为重要。另外,一些多功能复合体还可以实现 siVEGF 与其他诊疗手段联合,从而提高疾病的治疗效果。本综述介绍了 siVEGF 复合体的构建、作用机理以及在抗血管治疗中的应用,并对其目前存在的问题和前景进行展望。

DSA 导管校准法距离测量精度研判和分析

崔志敏

无锡市人民医院

DSA 设备与技术已成为临床科室进行各项治疗的手术平台,术中的实时准确测量数据成为支架、滤器、扩张球囊、弹簧圈等介入器械的直径与长度选取的重要参考依据。目的: DSA 测量技术中利用导管法校正测量技术是实际工作中运用最便捷,实用的手段,为各项介入治疗提供精准数据。方法:本文通过自制模块对 3 种知名品牌 DSDA 进行实际检测,结果:1 随着导管 F 增加,测量数据准确度明显提高。2 标记导管,3D 测量方法具有良好的测量精度。使用 7F 以上的导管校正可以有效提高测量准确度。3 飞利浦 FD20 在导管法测量时存在误差明显高于其他两部设备,建议及时升级测量软件。结论:导管校准法可以在每个序列造影后即可对图中所需测量血管进行操作,最为便捷、实用,PTCA 手术及外周小血管的介入治疗中,采用这种测量技术,能满足临床需要,对于大血管和较长血管的测量还需要其他的方法给予补充,确保测量的准确性。本次实验我们发现不同的设备,存在测量差异,有的已明显影响数据真实性,提醒我们及时处置;同时对使用不同 F 值导管在各种机型上做导管法校正测量时,产生的低估实物有了量化了解,以便工作时修正数据,为手术医生提供精准的测量数据。

三维 DSA 在颅内动脉瘤中的应用

崔志敏

无锡市人民医院

【摘要】目的探讨三维数字减影血管造影(3D DsA)在颅内动脉瘤中的应用价值。方法 使用 GE Innova 3loo 平板血管造影机对 40 例疑似颅内动脉瘤患者行双侧颈内、外动脉和双侧椎动脉正、侧位 2D DsA,进一步对感兴趣血管行 3D DsA,通过容积再现(VR)进行颅内血管重建。结果 3D DSA 检出 39 例动脉瘤患者,47 枚动脉瘤,2D DSA 检出 31 例动脉瘤患者,35 枚动脉瘤,二者检出动脉瘤的长、短径无统计学差异($P>0.05$)。图像质量有统计学差异,2D DSA 出现假阳性动脉瘤 3 枚,假阴性动脉瘤 15 枚,评估颅内动脉瘤的灵敏度为 78.9%,特异性为 85.2%;3D DSA 没有出现假阳性、假阴性动脉瘤。评估颅内动脉瘤的灵敏度为 100%,特异性为 100%。在动脉瘤形态、瘤颈尺寸及与相邻血管间的关系的显示上,3D DsA 明显优于 2D DsA。结论 3D DsA 作为脑动脉造影中 2D DsA 的进一步补充,对颅内动脉瘤的诊断与治疗具有重要价值。

三维数字减影血管造影技术诊断脑血管疾病的应用价值

崔志敏
无锡市人民医院

目的:评价三维数字减影血管造影(3D-DSA)技术诊断脑血管疾病的应用价值。方法 :对临床怀疑和确诊为脑血管疾病的 71 例患者行常规脑血管数字减影造影(DSA)和 3D-DSA。结果:本组共检查 71 例,经 3D-DSA 技术共检出动脉瘤 44 例 64 枚、颅内动静脉畸形(AVM)19 例、血管狭窄致脑缺血 8 例(6 例颈内动脉狭窄、大脑前动脉闭塞)。结论:3D-DSA 诊断脑血管疾病具有极大的临床应用价值。尤其对颅内动脉瘤、AVM、血管狭窄的诊断最为准确、快速、安全。

联合使用 DSA 和 3D—CT 血管造影指导治疗前交通动脉瘤分析

崔志敏
无锡市人民医院

目的:介绍使用数字减影血管造影和 3D-CT 进行手术前检查的经验。方法:对 15 例前交通动脉瘤患者进行了 DSA 和 3D—CTA 的检查,15 例均存全身麻醉下接受了手术治疗,其中开颅动脉瘤显微夹闭 10 例,经股动脉血管内栓塞治疗 5 例。结果:检查结果显示,动脉瘤为宽颈 7 例,2 例为前交通动脉膨大,瘤体为多极(分叶)4 例,动脉瘤不仅局限于前交通。波及大脑前动脉 A2 段 2 例。15 例患者治疗后无 1 例死亡,11 例恢复良好,2 例偏瘫,2 例轻度智能障碍。结论:前交通动脉瘤血管关系复杂。常规 DSA 检查如果能很好地了解动脉瘤及周围关系,CTA 检查可成为重要的补充,两者结合使用可指导手术或栓塞治疗 方法的选择,为手术提供更详尽的信息,是前交通动脉手术前的理想检查方法。

低剂量 CT 引导 Hookwire 定位肺内小结节的应用研究

陈亚婷、张驰、杨乐
汉中市人民医院

目的 通过研究低剂量 CT 引导 Hookwire 用于肺内小结节术前定位的有效性和安全性,探讨 Hookwire 肺小结节辅助定位最优化的 CT 引导方案。

方法 回顾性分析 2021 年 1 月到 2023 年 3 月入住汉中市人民医院的 52 例 53 枚 CT 上表现为肺内高危小结节或磨玻璃结节、行电视胸腔镜手术切除的患者,术前均行 CT 引导下 Hookwire 辅助定位。采用放射检查号单双数随机将定位患者分为研究组和对照组,研究组(27 枚结节)采用低剂量 CT 引导,对照组(26 枚结节)采用常规 CT 引导,定位后分别记录、比较患者 CT 权重剂量指数(CTDIW)、剂量长度乘积(DLP)、X 线平均有效剂量(E)、图像质量、定位成功率及并发症、手术切除及病理等信息。

结果 研究组 CTDIW 5.68 mGy, DLP 60.19mGy·cm, E 为 2.55mSv; 对照组 CTDIW 9.11 mGy, DLP 96.31 mGy·cm, E 为 4.11mSv; 其差异具有统计学意义($P<0.05$)。研究组 25.9%(7/27) 患者出现轻微并发症,对照组 23.1%(6/26) 患者出现轻微并发症,两组均无严重并发症及 Hookwire 相关不良反应发生,两组并发症发生率无明显差异($P>0.05$)。电视胸腔镜肺结节切除术中所有患者均可见 Hookwire 尾线,研究组 26 个结节切除后大体标本循 Hookwire 尾线均快速找到

结节, 定位成功率 96.3% (26/27), 对照组定位成功率 100%, 两组定位成功率无显著差异 ($P>0.05$)。

结论 本研究通过降低管电流和减少扫描次数来实现降低辐射剂量, 使患者完成肺结节定位所接受 CTDIW、DLP 及 X 线平均有效剂量均显著降低, 降低管电流虽然图像对比度有所下降, 但辅助定位不同于影像诊断, 对图像质量的要求相对更低, 只需要分辨出定位针及其与肺小结节的关系即可。本研究中 Hookwire 定位肺小结节有效率为 96.3%, 并发症主要表现为极少量气胸和少量的穿刺针道渗血, 无需特殊处理, 这与既往文献报道一致。综上所述, 采用低剂量 CT 扫描 Hookwire 定位肺内小结节安全有效, 且患者所受 X 线辐射剂量低, 值得推广。

PU-1247

CT 引导下吡咯菁绿+肺结节定位针联合应用胸腔镜下肺小结节切除术的临床价值

梁正荣
曲靖市第二人民医院

目的 探讨 CT 引导下吡咯菁绿 (ICG) + 肺结节定位针联合应用胸腔镜下肺小结节 (SPNs) 切除术的临床价值。方法 2022 年 7 月至 2023 年 8 月共 20 例患者 24 枚小结节, 先行 CT 引导下 ICG 与肺结节定位针联合定位, 后行胸腔镜下 (VATS) 肺楔形切除术。SPNs 直径 (8.30 ± 4.2) mm, 距壁层胸膜 (15.6 ± 14.35) mm; 统计术前定位时间、成功率、并发症; VATS 肺楔形切除手术时间、成功率、中转开胸率等。结果 联合定位时间 (28.5 ± 21.5) min, 成功率 100%, 失败率为 0。并发症发生率为 91.45%: 其中少量气胸 13 例 (65.00%), 中等量气胸 1 例 (5.00%), 出血 16 例, 均为少量出血 (88.00%), 轻度咯血 1 例 (5.00%), 无血胸或血气胸; 肺结节定位针脱落 1 例 (5.00%); VATS 肺楔形切除手术时间 (85 ± 30.50) min, 成功率 95.00%, 1 例中转开胸。SPNs 术后组织学诊断结果: 17 枚为原发性肺癌, 7 枚为良性病变。结论 ICG 与肺结节定位针联合定位在 SPNs 切除术中, 具有准确率高, 可视性强, 有效显示肿块及周围淋巴结状况, 有很强的临床推广运用价值。

基于 PSM 探索 TACE/TAE 联合靶向药物治疗原发性肝癌自发性破裂出血的疗效研究

童媛媛、陈勇、吴龙云、赵超云、卢荣、杨灏
宁夏医科大学总医院

目的 基于倾向性评分匹配 (PSM) 分析 TACE/TAE (经导管肝动脉化疗栓塞术/肝动脉栓塞术) 联合靶向药物治疗原发性肝癌 (PLC) 自发性破裂出血患者的预后生存状况。方法 回顾性分析 2017 年 1 月至 2023 年 1 月我院治疗的 82 例 PLC 自发性破裂出血患者的临床资料, 根据是否联合靶向药物治疗分为靶向药物联合组 (TD, $n=45$) 和非靶向药物组 (NTD, $n=37$), 对 TD 和 NTD 组进行再分组为 TACE/TAE+TD ($n=40$) 和 TACE/TAE 组 ($n=25$), 采用 PSM 平衡基线资料后, Kaplan-Meier 进行生存分析, 生存率比较用 Log-rank 检验。结果 TD 组和 NTD 组共有 23 对患者 PSM 后以 1:1 的比例成功配对。PSM 后 TD 组和 NTD 组 30d 死亡率无统计学差异 (4.3% vs 13.0% , $P=0.145$), TD 组中位生存期为 31 个月 (95%CI 19.0-42.9), 1、3、5 年累积生存率分别为 81.4%、37.3%、21.7%。NTD 组中位生存期为 5 个月 (95%CI 2.2-7.8), 1、3、5 年累积生存率分别为 39.1%、24.8%、17.4%, 两组间差异有统计学意义 ($\chi^2=5.06$, $P=0.024$)。

TACE/TAE+TD 组和 TACE/TAE 组中位生存期分别为 37 个月 (95%CI 29.3-44.7) 和 4 个月 (95%CI 1.6-6.4), TACE/TAE+TD 组患者的总生存时间和 PFS 明显长于 TACE/TAE 组, 差异均有统计学意义 ($\chi^2=15.00$, $P<0.001$ 和 $\chi^2=8.04$, $P<0.005$)。结论 TACE/TAE 联合靶向药物治疗更能改善 PLC 自发性破裂出血患者的生存预后。

Prediction of Hematoma Expansion in Patients with Hypertensive Intracerebral Hemorrhage Using Deep Learning Based on CT Images

Yi Liang, Baiyu Liu, Jingxiong Tao, Na Fan, Wenhui Fan
General Hospital of The Yangtze River Shipping

Objective To build a deep learning method based on CT for hematoma segmentation and hematoma expansion (HE) prediction of patients with hypertensive intracerebral hemorrhage (ICH). **Methods** This study retrospectively analyzed 500 cases of hypertensive intraparenchymal hematoma. Baseline non-contrast-enhanced CT scans (NECTs) were collected at admission and compared with subsequent CTs to determine the presence of HE. A deep learning method based on CT was proposed to automatically segment the hematoma region. In order to build the model for hematoma segmentation and HE prediction, patients were randomly divided into the training set and the test set according to the ratio of 7:3. The training set contains 350 patients for training the model, while the test set contains 150 patients for model validation. The segmentation module adopts the attention U-net to automatically segment and detect the hematoma, while the prediction module uses the resnet-34 to predict the HE. Mean intersection over Union (Miou) and Dice coefficient were used to evaluate the segmentation task. The accuracy evaluation of the prediction model was evaluated using the area under curve (AUC) of the receiver operating characteristic (ROC) curve. The continuous variables were compared by independent sample t-test or Mann Whitney U test. $P<0.05$ was considered statistically significant. **Results** There was no significant difference in age ($P=0.211$) and gender ($P=0.213$) between the HE and the non-HE groups. Hematoma volume (16.7 ml vs. 26.7 ml, $P<0.001$) and hematoma diameter (41.7mm vs. 48.9mm, $P<0.001$) in the non-HE group were significantly lower. The Miou and Dice coefficient of the segmentation model was 0.89 and 0.90 respectively. The AUC value of the prediction model was 0.909 (95%CI:0.85 -0.949), and the sensitivity and specificity were 81.58% (95%CI:65.7%-92.3%) and 96.43% (95%CI:91.1%-99.0%) respectively. **Conclusion** The deep learning system based on brain CT can accurately segment hematoma and predict the expansion of hematoma.

基于 MRI 影像组学鉴别腰椎多发性骨髓瘤和腰椎退行性病变的价值

朱心雨、郭立、黄鹏、张雨柔
昆明医科大学第二附属医院

目的 探究常规 MRI 影像组学特征对腰椎多发性骨髓瘤和腰椎退行性病变的鉴别诊断价值。

方法 回顾性分析 60 例腰椎多发性骨髓瘤患者和 60 例腰椎退行性病变, 利用 MaZda 软件在矢状位 T2-STIR 上手动勾画感兴趣区并提取特征参数, 通过 Fisher、POE+ACC、MI 三种方法对提取的特征参数进行降维筛选, 其每种方法筛选出 10 个最优纹理特征参数, 然后利用原始数据分析法

(raw data analysis, RDA)、主要成分分析法 (principal component analysis, PCA)、线性判别分析法 (linear discriminant analysis, LDA)、非线性判别分析法 (nonlinear discriminant analysis, NDA) 四种分析方法分别结合降维筛选出的特征参数, 计算各组合的分类误判率, 并与两位影像医师鉴别错判率对比。对 30 个最优影像组学特征参数进行统计学意义分析, 获取具有统计学意义参数的 ROC 曲线。

结果 三种降维方法中, POE+ACC 结合 NDA 组合和 MI 结合 RDA 组合对两组病例的误判率最低 (5.00%), 低于影像医师鉴别错判率 (10%、8.3%)。20 个影像组学特征具有统计学意义。ROC 曲线分析结果显示有 12 个特征参数 $AUC > 0.7$, 其中 Perc.99% 的 AUC 值最高 (0.936), 当取值为 107.000 时。敏感度为 83.3%, 特异度为 96.7%, 95%CI 为 0.874~0.998。结论 基于常规 MRI 影像组学有助于鉴别腰椎多发性骨髓瘤和腰椎退行性病变。

基于支持向量机递归特征消除算法和人工神经网络算法构建鼻咽癌基因标志物的诊断预测模型

罗颜、周平、王艺任
西南医科大学附属医院

【摘要】目的: 本研究旨在基于支持向量机递归特征消除算法和人工神经网络算法构建一种基于基因特征的鼻咽癌诊断预测模型, 旨在为临床诊断和治疗以及分子机制的研究提供参考。方法: 我们从公共数据库中获取了鼻咽癌患者和正常对照者的微阵列和转录组测序基因表达谱数据。首先通过基因差异表达分析坚定了与鼻咽癌相关的差异表达基因, 再利用支持向量机递归特征消除算法筛选出重要的基因特征。接着, 我们利用人工神经网络算法构建了鼻咽癌诊断预测模型, 并通过内部和外部验证集的分析评估了模型的准确性和预测性能。结果: 本研究共鉴定了 457 个差异表达基因。随后通过支持向量机递归特征消除算法识别了 6 个重要基因特征。基于这 6 个重要基因特征, 利用人工神经网络构建了鼻咽癌诊断预测模型。最后, 使用内部和独立的外部验证集计算 ROC 曲线的曲线下面积, 评估并验证了该模型的有效性。结论: 本研究鉴定了几个潜在的 NPC 诊断特征基因并成功建立了基于基因特征的鼻咽癌诊断预测模型, 有望为临床早期筛查和治疗干预以及分子机制的研究提供新的思路 and 参考。

Construction of a novel gene signature-based predictive model of transarterial chemoembolization efficacy in patients with hepatocellular carcinoma by a random forest and artificial neural network

Ping Zhou, YiRen Wang, Ming Tang
Department of Radiology, The Affiliated Hospital of Southwest Medical University, Luzhou, China

Objective: Hepatocellular carcinoma (HCC), one of the most common cancers in the world, has a high lethality rate, and transarterial chemoembolization (TACE) is often used to treat patients with advanced HCC. However, the response to TACE treatment varies greatly between patients. We aimed to construct a predictive model for diagnosing non-response to TACE treatment using a random forest algorithm and an artificial neural network, and to verify its diagnostic value by constructing a receiver operating characteristic curve.

Methods: We downloaded the GSE104580 public dataset (88 patients labeled as TACE-responsive and 66 patients labeled as TACE-non-responsive) from the Gene Expression Omnibus database and randomly extracted 57 of the samples labeled as TACE-responsive and 46 labeled as TACE-non-responsive as training sets for identifying differentially expressed genes. Next, we used the random forest algorithm to screen out the key genes and the artificial neural network algorithm to further construct a model to predict TACE non-response. In addition, we validated the model using 31 TACE-responsive and 20-non-responsive samples as the validation set and confirmed the validity of the model, Lastly We downloaded RNA-Seq data from HCC patients in the TCGA database and explored the impact of key genes associated with TACE non-response on overall prognostic survival.

Results: A total of 173 up-regulated genes and 204 down-regulated genes were identified. We screened out five key genes using the random forest algorithm, calculated the gene weight of each key gene using the artificial neural network, and constructed a prediction model with effective prediction (area under the curve [AUC] = 0.981) Finally, the model was validated using the validation set (AUC = 0.971) and we found that these key genes were also associated with poor prognosis.

Conclusion: We developed a diagnostic model to predict the non-response to TACE treatment based on machine learning approaches. Our findings provided insights on potential gene signatures for clinicians to assist in the decision of whether to apply TACE.

PU-1253

Intratumoral and Peritumoral MRI Radiomics Nomogram for Predicting Parametrial Invasion in Patients with Early-stage Cervical Adenocarcinoma and Adenosquamous Carcinoma

Meiling Xiao, Jinwei Qiang
Jinshan Hospital of Fudan University

Objective To develop a comprehensive nomogram based on MRI intra- and peritumoral radiomics signatures and independent risk factors for predicting parametrial invasion (PMI) in patients with early-stage cervical adenocarcinoma (AC) and adenosquamous carcinoma (ASC).

Methods A total of 460 patients with IB to IIB cervical AC and ASC who performed preoperative MRI examination and radical trachelectomy/hysterectomy were retrospectively enrolled and divided into the primary, internal validation, and external validation cohorts. The original (Ori) and wavelet (Wav)-transform features were extracted from the volumetric region of interest of the tumor (ROI-T), 3mm- and 5mm-peritumoral rings (ROI-3 and ROI-5), respectively. Then the Ori and Ori-Wav feature-based radiomics signatures from the tumor (RST) and 3 mm- and 5 mm-peritumoral regions (RS3 and RS5) were independently built and their diagnostic performances were compared to select the optimal ones. Finally, the nomogram was developed by integrating optimal intra- and peritumoral signatures and clinical independent risk factors based on binary multivariable logistic regression analysis.

Results FIGO stage, disruption of the cervical stromal ring (DCSRMR), parametrial invasion on MRI (PMIMR), and serum CA-125 were determined as independent risk factors. The nomogram constructed by integrating independent risk factors, Ori-Wav features-based RST, and RS5 yielded AUCs of 0.874 (0.810-0.922), 0.885 (0.834-0.924) and 0.966 (0.887-0.995) for predicting PMI in the primary, internal and external validation cohorts. Furthermore, the nomogram was superior to radiomics signatures and clinical models for predicting PMI in three cohorts.

Conclusion The nomogram can preoperatively, accurately, and noninvasively predict PMI in patients with early-stage cervical AC and ASC.

软件 LCModel 与 Spectroscopy 对 MRS 数据的后处理技术比较

张敏、王培军
上海市同济医院

目的 比较软件 LCModel 与 Spectroscopy 对 MRS 代谢物含量估计的稳定性和准确性。

方法 选用健康志愿者 15 名 (4 男, 11 女, 年龄 22 ± 2 岁), 以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪 (Siemens MAGNETOM Trio Tim), 在每次定位后, 采用点分辨波谱 (PRESS) 序列对志愿者连续扫描两次。利用 Spectroscopy 软件计算 NAA、Cho 波峰下面积的积分值, 求出 NAA/Cr、Cho/Cr 的值, 并利用 LCModel 软件处理后获得 NAA、Cho 相对含量值及以 Cr 为参照物的相对含量的比值 NAA/Cr、Cho/Cr。分别将两种软件计算的代谢物含量比值与文献参考值进行比较, 然后分别对每种软件计算的两次扫描数据进行比较, 以差异性系数 ($CV=100*SD/mean$) 作为衡量两种软件数据分析稳定性的指标。

结果 对于连续两次扫描的大脑右侧前额叶中, LCModel 软件所得波谱数据基线较 Spectroscopy 软件所得波谱数据的基线更平稳, 各代谢物峰清晰。LCModel 与 Spectroscopy 测得的代谢物含量比值 NAA/Cr 分别为 1.8 ± 0.2 , 1.9 ± 0.7 , 文献参考值为 1.6 ± 0.2 , LCModel 结果更为接近; 比值 Cho/Cr 分别为 0.3 ± 0.03 , 1.1 ± 0.41 , 文献参考值为 0.9 ± 0.2 , Spectroscopy 结果更为接近。配对样本 t 检验发现, 对于不同代谢物及其比值, 两种软件两次扫描所得结果的差异均不具有统计学意义 ($P>0.05$)。

结论 两种软件对 MRS 代谢物含量的估计均有较高的稳定性。但 LCModel 有相对较好的处理基线不稳的能力, 在实际临床应用中更具前景。

PU-1255

基于 T1 加权 MRI 图像的深度学习模型对新生儿高胆红素血症相关脑损伤的早期诊断价值

王栋¹、何奕彤²、杨立娟¹
1. 西安市人民医院 (西安市第四医院)
2. 西北大学信息科学与技术学院

目的: 建立基于 T1 加权 MRI 图像的深度学习模型, 为新生儿高胆红素血症 (hyperbilirubinemia, HB) 相关脑损伤提供诊断依据。方法: 回顾性收集 606 例住院新生儿的头颅 MRI 和临床资料, 包括 256 例 HB 患儿和 350 例非 HB 患儿。随机分为训练集和测试集, 选取合适的尺度提取 ROI 进行图像分割, 利用 Inception-v3 网络模型对数据进行训练, 同时结合类别激活映射图, 构建了卷积神经网络模型, 通过计算 AUC、准确度、敏感性和特异性来评价模型的诊断效能。结果: 随着血清总胆红素 (total serum bilirubin, TSB) 水平的升高, 我们构建的深度学习模型对苍白球区 T1WI 信号升高检测的各项指标在整体上有上升的趋势。在血清总胆红素水平大于 $400\mu\text{mol/L}$ 时, 训练集中 AUC 为 0.93, 准确度为 0.95, 敏感性为 0.87, 特异性为 0.94; 测试集中 AUC 为 0.72, 准确度为 0.76, 敏感性为 0.66, 特异性为 0.75; 目视检查 AUC 为 0.62, 准确度为 0.64, 敏感性为 0.61, 特异性为 0.62。结论: 基于 T1 加权 MRI 图像建立的深度学习模型可以敏感地识别到 TSB 升高引起的双侧苍白球区域的信号变化, 诊断效能高于目视检查, 在 TSB 大于 $400\mu\text{mol/L}$ 时模型诊断效能最高。

利用 4D-CT 图像进行人工智能靶区自动勾画研究

韩滨、郭跃信
郑州大学第一附属医院

目的: 针对 4D-CT 在立体定向体放射治疗(SBRT)肺癌患者的临床应用, 进行危及器官和靶区的自动勾画, 主要针对靶区的自动勾画进行研究, 采用人工智能靶区训练的方法, 研究靶区勾画的准确性。

方法: 对 20 例患者, 对每个患者进行 4D-CT 定位。并把这二十名患者分成两组, 第一组进行人工靶区勾画。然后使用人工智能软件 Manteia 对第一组进行人工智能勾画训练。训练完成以后, 针对第二组进行人工智能的靶区勾画和人工的靶区勾画, 并对第二组两者的勾画情况进行分析。

结果: 两种技术下勾画的 ITV 的质心距离 COM 误差为 $(3.1 \pm 1.1\text{mm})$ 。计划通过率均达到 90 以上。靶区勾画相差较小, 但是人工智能能够花的时间较少, 平均只是人工智能勾画的 20%, 大大缩减了工作时间。

结论: 针对 4D-CT 图像勾画靶区, 人工智能学习勾画具有重要的临床应用意义, 可以大幅度的缩短勾画靶区的时间, 同时靶区精度也基本可以满足临床需求, 经过更多的人工智能靶区勾画训练, 人工智能靶区勾画可代替人工勾画, 人工只需要进行微调即可, 满足了日常靶区勾画的要求。为人工智能在临床的应用提供了研究数据和参考。

基于临床和 MRI 影像组学预测 BI-RADS 4 类病变性质模型的构建

卢绍辉、吴迪、刘少强
赣南医学院第一附属医院

目的：本研究通过综合有关临床及 MRI 影像组学的信息、术前评估 BI-RADS 4 类病灶良恶性，为此类病变性质准确判断、优化临床处理策略提供帮助。

方法：① 连续搜集医院 237 例超声 BI-RADS 4 类患者，按 7:3 的比例分成训练集及验证集，再搜集另一时间段医院 70 例作为测试集。② 提取患者的有关临床及常规 MRI 影像特征信息，筛选出良恶性分类的独立预测因素。③ 提取 T2WI 序列及 T1WI 动态增强扫描序列峰值期纹理及小波影像组学特征，经过一致性检验，及 LASSO 进行特征筛选；利用 SVM 构建影像组学模型，并进行影像组学特征预测效能分析。④ 联合上述有关临床特征及影像组学特征，构建预测超声 BI-RADS 4 类病灶性质的 nomogram，利用受试者工作特征曲线及决策曲线，观察联合模型的诊断性能并与独立的 MRI 影像组学模型对比。

结果：① 患者年龄、病灶 ADC 值、强化曲线类型及病灶的边缘情况是超声 BI-RADS 4 类病灶良恶性独立的预测因素。② T2WI 序列有 4 个组学特征、T1WI-DCE 峰值期有 5 个组学特征与良恶性预测相关。组合两个序列影像 9 个组学特征构建的模型，训练集、验证集与测试集 AUC 分别为 0.947、0.879 和 0.804。③联合有关临床及常规 MRI 影像特征、影像组学特征的 nomogram 预测效能，训练集、验证集及测试集 AUC 分别为 0.959、0.934 和 0.933。联合模型 AUC 高于影像组学模型。

结论：基于 MRI T2WI 及 T1WI-DCE 的影像组学可为超声 BI-RADS 4 类病灶鉴别诊断提供帮助。联合有关临床、常规 MRI 影像特征及 MRI 影像组学特征的 nomogram 图进行个体的可视化评估，预测效能高于单一的 MRI 影像组学模型。

PU-1259

基于 DCE-MRI 的影像组学在直肠癌周围神经侵犯评估中的研究

陆巍、方军杰、吴丹
宁波市第二医院

目的：周围神经侵犯 (perineural invasion, PNI) 是评价直肠癌侵袭性的重要指标，但目前影像学检查无法对其进行有效评估。本研究旨在探讨基于动态对比增强磁共振成像 (dynamic contrast enhanced-magnetic resonance imaging, DCE-MRI) 的影像组学在直肠癌患者术前 PNI 评估中的应用价值。

方法：回顾性收集 2019 年 5 月至 2020 年 1 月期间于宁波市第二医院行 DCE-MRI 检查的直肠癌患者共 44 例，所有患者均病理诊断为直肠癌，且有病理 PNI 评估。收集上述病例的 DCE-MRI 图像、一般临床信息、实验室检查、病理诊断等资料。利用 Omni kinetics 软件 (OK, GE Healthcare, China) 对 DCE-MRI 影像进行后处理，并分割直肠癌原发灶，从中提取 Ktrans、Kep、Ve、Vp 图的影像组学特征，并通过 LASSO 算法降维筛选关键组学特征，然后结合影像医师评估结果及临床、实验室检查等，利用多因素 Logistic 回归分析构建直肠癌术前 PNI 评估模型并进行五折交叉验证。结果：最终提取得到的影像组学特征共 236 个，经 LASSO 筛选出与 PNI 高度相关的关键影像组学特征 3 个，并将其整合为 Radscore。Radscore 对 PNI 诊断的敏感性为 0.875，特异性为 0.571，

ROC 曲线下面积 (AUC) 为 0.734。利用多因素 Logistic 回归, 将 Radscore 与与影像医师评估结果及临床、实验室检查进行整合后得到直肠癌术前 PNI 评估模型, 其诊断敏感性为 0.688, 特异性为 0.964, AUC 为 0.879。

结论: 基于 DCE-MRI 的影像组学技术能够有效地对直肠癌患者进行术前 PNI 风险分层, 是对常规影像学诊断的重要补充, 有助于为临床制定合理、高效的个体化诊疗方案提供可靠依据。

PU-1260

Precise pulmonary scanning and reducing medical radiation exposure by developing a clinically applicable intelligent CT system: Toward improving patient care

Qiuchan Yan, Yang Wang
Zhujiang Hospital of Southern Medical University

Purpose: Interstitial lung disease requires frequent re-examination, which directly causes excessive cumulative radiation exposure. To date, AI has not been applied to CT for enhancing clinical care; thus, we hypothesize AI may empower CT with intelligence to realize automatic and accurate pulmonary scanning, thus dramatically decrease medical radiation exposure without compromising patient care.

Materials and Methods: Facial boundary detection was realized by recognizing adjacent jaw position through training and testing a region proposal network (RPN) on 76,882 human faces using a preinstalled 2-dimensional camera; the lung-fields was then segmented by V-Net on another training set with 314 subjects and calculated the moving distance of the scanning couch based on a pre-generated calibration table. A multi-cohort study, including 1,186 patients was used for validation and radiation dose quantification under three clinical scenarios.

Results: A U-HAPPY (United imaging Human Automatic Planbox for Pulmonary) scanning CT was designed. Error distance of RPN was 4.46 ± 0.02 pixels with a success rate of 98.7% in training set and 2.23 ± 0.10 pixels with 100% success rate in testing set. Average Dice's coefficient was 0.99 in training set and 0.96 in testing set. A calibration table with 1,344,000 matches was generated to support the linkage between camera and scanner. This real-time automation makes an accurate plan-box to cover exact location and area needed to scan, thus reducing amounts of radiation exposures significantly (all, $P < 0.001$).

Conclusion: U-HAPPY CT designed for pulmonary imaging acquisition standardization is promising for reducing patient risk and optimizing public health expenditures.

基于 CT 皮质期影像组学预测肾细胞癌亚型的研究

赵才勇¹、陈文¹、严志强¹、陈超²、崔凤¹

1. 杭州市中医院

2. 浙江大学医学院附属邵逸夫医院

目的:探讨基于 CT 皮质期影像组学鉴别肾透明细胞癌 (ccRCC) 和非透明细胞癌 (non-ccRCC) 的价值。方法:本研究为回顾性分析, 收集 2017 年 1 月至 2022 年 12 月本院经病理证实的 122 例肾细胞癌患者, 其中 ccRCC 82 例, non-ccRCC 40 例, 并以随机数表法按照 7: 3 的比例将患者分成训练集 (n=85) 和验证集 (n=37)。在 CT 皮质期手工逐层勾画肿瘤感兴趣区 (ROI) 后提取影像组学特征, 使用特征间线性相关检查和 F 检验进行特征筛选, 采用 logistic 回归构建影像组学模型。采用 t 检验、 χ^2 检验及 logistic 回归筛选 CT 影像特征, 建立常规影像模型。综合影像组学模型和常规影像模型建立联合模型。绘制 ROC 曲线评估各模型的预测效能, AUC 值比较采用 Delong

检验。结果:影像组学模型在训练集和验证集中的 AUC 分别为 0.990 (95%CI 0.976~1.0) 和 0.890 (95%CI 0.774~1.0)。在训练集和验证集中,影像组学模型和联合模型的预测性能均优于常规影像模型,差异有统计学意义 (P 均 <0.05);相比联合模型,在验证集中影像组学模型的预测值略高,但无统计学差异 ($P=0.27$)。结论:基于 CT 皮质期影像组学模型对预测肾细胞癌亚型具有较好的诊断价值。

PU-1262

基于 CT 影像组学预测晚期非小细胞肺癌免疫检查点抑制剂疗效的研究

贺帅

辽宁省肿瘤医院

目的:评估基于 CT 影像组学在晚期非小细胞肺癌 (non-small-cell lung cancer, NSCLC) 患者免疫检查点抑制剂 (immune checkpoint inhibitor, ICI) 治疗反应中的预测价值。

方法:回顾性收集一组 64 名接受 ICI 单药治疗的 IIIB 或 IV 期 NSCLC 患者。在增强前后的 CT 序列上,从整个靶病灶分别提取 1967 个影像组学特征。根据患者 ICI 治疗前 CT 检查时间将其按照 7:3 的比例分为训练组和测试组。肿瘤疗效评估根据免疫应答 iRECIST 标准评价疗效,并将患者分为应答组和无应答组。利用最小绝对收缩和选择算子 LASSO 算法进行特征筛选。利用筛选出来的有效特征进行影像组学预测标签的建立。随后,该影像组学标签的预测效能在一组由 33 名接受免疫联合化疗的独立队列中进行了验证。最后,建立了结合临床因素和影像组学标签的诺模图来预测 ICI 治疗反应。用受试者工作特征曲线 ROC 下面积 AUC、校准和判定曲线分析 (decision curve analysis, DCA) 评价诺模图的预测能力。

结果:总计 97 名患者纳入分析,有 3 例发生假性进展现象。基于临床因素(骨转移情况)和影像组学标签的临床-影像组学诺模图为预测 ICI 的疗效提供了最优的结果。其训练组 AUC 为 0.878(95%CI 0.812~0.944, 敏感度=0.711, 特异度=0.860),测试组为 0.756(95%CI 为 0.615~0.897, 敏感度=0.714, 特异度=0.720),免疫联合化疗验证组为 0.790(95%CI 为 0.660~0.921, 敏感度=0.697, 特异度=0.875)。与单一临床因素和影像组学标签相比,临床-影像组学诺模图通过 DCA 曲线表现了更多的净收益。

结论:基于 CT 影像组学对晚期 NSCLC 免疫检查点抑制剂的治疗反应有较好的预测能力,该方法可以为临床用药决策提供有力支持。

PU-1263

cycle-gan 在 ct 去金属伪影中的应用

侯召瑞

东南大学附属中大医院

目的:金属伪影是计算机断层扫描 (CT) 中常见的一种伪影,它会影响图像质量并干扰诊断。传统的去除金属伪影方法通常依赖于种子算法,这既耗时又容易出错。循环生成对抗网络 (CycleGAN) 是一种深度学习方法,它可以学习将一张图像转换为另一张图像。在这项研究中,我们使用 CycleGAN 来开发一种自动去除金属伪影的算法。

方法:我们使用来自 Revolution CT 的能谱去伪影 CT 图像和来自 670CT 的非能谱金属伪影图像来训练 CycleGAN。CycleGAN 由两个生成器和两个判别器组成。生成器 G1 将金属伪影图像转换为去伪影图像,生成器 G2 将去伪影图像转换回金属伪影图像。判别器 D1 用于区分真实的去伪影图

像和生成的去伪影图像, 判别器 D2 用于区分真实的金属伪影图像和生成的金属伪影图像。

CycleGAN 通过最小化生成器和判别器之间的损失函数来训练。

结果: 我们在测试集上评估了我们的算法。结果表明, 我们的算法可以有效地去除金属伪影, 同时保持图像的细节。

结论: 我们的算法为自动去除金属伪影提供了一种新的思路。它具有良好的去伪影效果和鲁棒性, 并且可以应用于各种 CT 扫描仪。

PU-1264

unet+++在 dixon 水脂分离的应用

侯召瑞

东南大学附属中大医院

目的: 在本文中, 我们将探讨使用基于深度学习的 Unet+++模型在 Dixon 水脂分离中的应用, 并将其与传统的 RIPE 算法进行对比。本研究的目的是探究 Unet+++模型在 Dixon 水脂分离中的应用, 以提高水脂分离的准确性和可视化效果。

方法: 为了训练和测试 Unet+++模型, 本研究使用 Philips Ingenia MRI 的腹部 FFE 2 回波图像包括幅度图、相位图以及水脂分离图。训练数据集包括 100 个患者的图像, 其中 70 个用于训练, 30 个用于验证。为了对比 Unet+++模型和 RIPE 算法的效果, 本研究还使用 RIPE 算法对同一组图像进行了处理。

结果: 本研究使用 Unet+++模型进行 Dixon 水脂分离, 与 RIPE 算法相比, 平均 Dice 系数提高了 4.2%, 平均 SSIM 指数提高了 2.6%。在测试集中, Unet+++模型的 Dice 系数和 SSIM 指数分别为 0.94 和 0.96, 而 RIPE 算法的 Dice 系数和 SSIM 指数分别为 0.90 和 0.94。这表明 Unet+++模型在 Dixon 水脂分离中的应用具有更高的准确性和可靠性。

结论: 本研究表明, Unet+++模型在 Dixon 水脂分离中具有较高的准确性和可靠性, 可以有效地提高水脂分离的精度和可视化效果。与传统的 RIPE 算法相比, Unet+++模型的精度和可靠性更高。这意味着 Unet+++模型可以在临床实践中更好地应用于 Dixon 水脂分离技术中, 并为 MRI 影像诊断提供更可靠的信息。

未来的研究可以进一步探究 Unet+++模型在其他 MRI 图像分析中的应用, 以及其在临床中的实际应用前景。此外, 本研究的数据集限制为腹部 FFE 2 回波图像, 未来的研究可以扩大数据集以验证 Unet+++模型在其他 MRI 图像中的适用性。本研究的结果为 MRI 影像技术的发展提供了有益的启示, 并为临床医生提供了新的诊断思路和方法。

比较深度学习重建与迭代重建在肺动脉 CTA 双低扫描中的图像质量与辐射剂量

刘晓涵^{1,2,3}、孟闫凯^{1,2,3}、张帅⁴、胡春峰^{1,2,3}、徐凯^{1,2,3}

1. 徐州医科大学附属医院影像科

2. 徐州医科大学影像学院

3. 徐州医科大学医学影像与数字医学研究所

4. GE 中国 CT 影像研究中心

目的: 比较深度学习算法重建 (DLIR) 与自适应迭代重建 (ASiR-V) 在 CTPA 双低扫描技术中的图像质量和辐射剂量。方法: 回顾性分析 2020 年 10 月至 2021 年 03 月于我院进行 CTPA 检查的患者。扫描管电压 80kV, 对比剂注射剂量 20ml。分别应用 ASiR-V, DL-M, DL-H 算法重建三组

CTPA 图像。比较三组图像质量的客观评价 (CT 值、噪声, SNR, CNR)、主观评分、诊断信心。同时, 报告辐射剂量 (CTDI_{vol}、剂量长度乘积[DLP]、有效剂量[ED])。符合正态分布的多组间计量资料比较采用单因素方差分析, 组间两两比较采用 LSD 法。不符合正态分布的多组间计量资料比较采用 Kruskal-Wallis H 法, $P < 0.05$ 认为差异有统计学意义。统计分析采用 SPSS 19.0 统计分析软件。结果: 89 例患者纳入研究, 男性 45 例 (50.6%)、女性 44 例 (49.4%), 平均年龄 61.0 ± 15.2 岁, BMI 平均值为 24.5 kg/m^2 。辐射剂量报告 CTDI_{vol}、DLP 和 ED 分别为 $2.9 \pm 0.7 \text{ mGy}$ 、 $88.3 \pm 23.0 \text{ mGy.cm}$ 和 $1.2 \pm 0.3 \text{ mSv}$ 。ASiR-V、DL-M、DL-H 三组不同重建算法, 肺动脉主干及其主要分支的图像噪声、SNR、CNR 均有统计学差异 ($P < 0.01$)。与 ASiR-V 重建比较, DL-M、DL-H 重建分别降低了 19.2%-27.8%、34.1%-40.9% 的图像噪声, 增加了 30.0%-39.3%、56.2%-94.9% 的 SNR, 增加了 30.9%-39.0%、56.3%-98.5% 的 CNR。ASiR-V、DL-M、DL-H 三组不同重建算法的图像质量主观评分、诊断信心分别为 3.7 分、4.6 分、4.9 分和 2.4 分、2.7 分、2.8 分, 差异具有统计学意义 ($P < 0.01$)。结论: 深度学习算法重建较迭代算法重建能够明显提高 CTPA 双低扫描的图像质量。

PU-1266

多模态 MRI 影像组学对儿童髓鞘少突胶质细胞糖蛋白抗体相关疾病诊断与预测复发的价值

李婷、何玲
重庆医科大学附属儿童医院

目的 探讨三种常规脑 MRI 序列将儿童髓鞘少突胶质细胞糖蛋白抗体相关疾病(MOGAD)与原因不明的特发性炎性脱髓鞘疾病(IIDDs)的鉴别及预测首次发作的 MOGAD 是否复发的价值。

方法 共纳入 68 例 MOGAD 患儿和 53 例不明原因 IIDDs 患儿。其中, MOGAD 患儿中复发 30 例, 未复发 38 例。用 7:3 的比例进行随机分组。在鉴别模型中, 训练组中 MOGAD 47 例, 原因不明的特发性炎性脱髓鞘疾病 37 例。测试组中 MOGAD 21 例, 原因不明的特发性炎性脱髓鞘疾病 16 例。在预测复发模型中, 训练组复发的 MOGAD 患者 21 例, 未复发的 MOGAD 患者 26 例。在测试组中, 复发的 MOGAD 患者 9 例, 未复发的 MOGAD 患者 12 例。分别从 T1WI、T2WI 和 FLAIR 序列图像中提取特征。利用方差阈值法、单变量选择、LASSO 回归分析和特征相关分析进行特征选择。随后, 基于最优特征子集构建了单个序列模型以及三个序列的复合模型。使用各种指标评估这些模型的性能, 包括受试者工作特征(ROC)曲线、ROC 曲线下面积(AUC)、准确性、灵敏度和特异性。

结果 在鉴别模型中: T1WI、T2WI、FLAIR 序列及复合序列模型在训练集和测试集的 AUC 分别为 0.781 和 0.500、0.959 和 0.833、0.939 和 0.834、0.989 和 0.905。在预测复发模型中: T1WI、T2WI、FLAIR 序列及复合序列模型在训练集和测试集的 AUC 分别为 0.947 和 0.796、0.709 和 0.509、0.755 和 0.546、0.969 和 0.833。

结论 基于多模态 MRI 的放射组学有助于将儿童 MOGAD 与原因不明的 IIDDs 区分开来, 此外, 还可以将其运用于 MOGAD 患儿首次发作时预测是否复发, 填补了放射组学在儿童 IIDDs 中的应用空白。

PU-1267

人工智能模型迭代重建对低剂量腹部增强 CT 图像质量的影响

曹建新¹、朱卓¹、许炜¹、刘廷¹、韩锦涛²、陈颖¹、张清¹

1. 武汉科技大学附属普仁医院/武汉市普仁医院

2. 上海联影医疗科技股份有限公司

目的:评估人工智能模型迭代重建(AIIR)对低剂量腹部增强CT图像质量的影响。方法:52例患者行低剂量全腹部增强CT,采用FBP重建、混合迭代重建(HIR)及AIIR(5级~1级)。评估FBP、HIR及AIIR图像质量客观参数。对AIIR图像的蜡状伪影程度按5分法评分(1分,无蜡状伪影;5分,完全不能接受的蜡状伪影)。结果:AIIR图像噪声均明显低于FBP和HIR图像。医师1动脉期AIIR5级~1级蜡状伪影评分分别为 1.04 ± 0.19 、 1.12 ± 0.32 、 1.92 ± 0.48 、 2.73 ± 0.49 和 4.15 ± 0.54 ,静脉期分别为 1.02 ± 0.14 、 1.19 ± 0.40 、 2.02 ± 0.42 、 3.10 ± 0.41 和 4.02 ± 0.37 ;医师2动脉期分别为 1.21 ± 0.41 、 1.23 ± 0.43 、 2.10 ± 0.41 、 2.88 ± 0.55 和 4.12 ± 0.43 ,静脉期分别为 1.12 ± 0.32 、 1.33 ± 0.47 、 2.29 ± 0.46 、 3.17 ± 0.38 和 4.00 ± 0.40 。AIIR5级和4级图像蜡状伪影评分显著低于AIIR3~1级图像。结论:AIIR能够大幅度提升低剂量腹部增强CT的图像质量,其中5级和4级AIIR图像质量最优。

PU-1268

基于深度学习的新冠鉴别诊断算法研究

姚飞

中国人民解放军海军军医大学第二附属医院
上海大学

目的:探讨基于肺部CT影像构建的机器学习模型鉴别新型冠状病毒肺炎(COVID-19)、普通肺炎(CP)及正常对照(Normal)的价值。方法:回顾性分析国家基因组科学数据中心2020年4月的部分数据。根据患者的病毒类型分为COVID-19组(422例),普通肺炎组(498例)和正常对照组(448例);从所有病例的CT影像中随机抽取10张构建1号数据集,并按8:1:1的比例随机分层抽样分为训练集(10944张)、验证集(1368张)和测试集(1368张),同时根据患者是否患病分为患病组(Sick, 920例)和正常对照组(Control, 448例)构建2号数据集,同样按照8:1:1的比例随机分层抽样分为训练集、验证集和测试集。从平扫胸部CT图像中提取出肺炎征象和特征,建立基于DenseNet网络的预测模型。通过受试者操作特征(ROC)曲线分析模型的诊断性能。模型在1号训练集中鉴别诊断COVID-19组、CP组和Normal组的ROC曲线下面积(AUC)为0.7291, COVID19类别的精确率为46.43%,召回率为17.69%, F1分数为0.2562;CP类别的精确率为47.17%,召回率为46.39%, F1分数为0.4678;Normal类别的精确率为48.82%,召回率为79.86%, F1分数为0.6060;模型在2号训练集中鉴别诊断Sick组和Control组的AUC为0.904,灵敏度为85.5%,特异度为84.4%,准确度为84.9%;在测试集中鉴别诊断Sick组和Control组的AUC为0.866,灵敏度为77.8%,特异度为78.6%,准确度为78.2%。结论:肺部CT影像构建的机器学习模型在鉴别诊断COVID-19、普通肺炎和正常对照的三分类问题的效果一般,有较大的提升空间;在鉴别诊断患病和正常对照的二分类问题的效果较好,具有较好的临床价值。

Advances in the Application of Deep Learning in Nuclear Medicine Cardiac Imaging

Yulong Zeng, Jie Qin, Biyun Mo, Weixia Chong, Wei Fu
Affiliated Hospital of Guilin Medical University

Research Purpose: Cardiovascular diseases are a major health threat worldwide. Nuclear medicine cardiac imaging techniques, as a non-invasive and high-sensitivity means of imaging, have been widely used in the diagnosis and treatment of cardiovascular diseases. However,

traditional nuclear medicine cardiac imaging methods have limitations in image quality, region of interest segmentation, and image diagnosis. This paper aims to comprehensively summarize the application of deep learning in the field of nuclear medicine cardiac imaging, and discuss its advantages and limitations, as well as potential development directions.

Research Methods: We collected and sorted out domestic and foreign literature and research results on deep learning applied to nuclear medicine cardiac imaging in the past five years. We elaborated in detail on the principles, processes, applications, limitations, and prospects of deep learning from three aspects: image diagnosis, image segmentation, and image quality optimization in nuclear medicine cardiac imaging. We discussed how they can learn image features through a large amount of data and effectively solve the problems in traditional methods. We also discussed the training process of deep learning in the field of medical imaging, including data collection and preprocessing, data partitioning and training, back-propagation algorithm, model evaluation and optimization, prediction, and application.

Research Results: Deep learning has good application prospects in the fields of image diagnosis, image segmentation, and image quality optimization in nuclear medicine cardiac imaging. In terms of image diagnosis, deep learning technology can automatically and accurately analyze images to diagnose cardiovascular diseases and evaluate cardiac function. In terms of image segmentation, deep learning has been successfully applied to the image segmentation of nuclear medicine cardiac imaging, achieving automated and accurate positioning of different areas of cardiac tissue. In terms of image quality optimization, deep learning technology has been used for image reconstruction and denoising of nuclear medicine cardiac imaging, achieving tasks such as super-resolution reconstruction, denoising, and enhancement of images. It can also be applied to attenuation correction of SPECT MPI images, improving the accuracy and visualization of images. At the same time, there are certain limitations to the use of deep learning in nuclear medicine cardiac imaging, such as difficulties in data annotation and the need for powerful computational resources, which need to be improved in future research.

Research Conclusion: The application of deep learning provides a new opportunity to improve and optimize nuclear medicine cardiac imaging, and is expected to further promote the development of nuclear medicine cardiac imaging. Although there are some challenges, overall, the application of deep learning in nuclear medicine cardiac imaging shows great potential and opportunities.

"互联网+"时代远程影像会诊运营模式研究

姚侃敏

上海交通大学医学院附属瑞金医院

随着“互联网+”医疗服务的发展,互联网医院逐渐成为公立医院补充发展的新模式。2020 年新冠肺炎疫情全球爆发致使全球经济受到重大冲击,与此同时,也推动了远程办公、远程医疗、远程影像会诊等新业态新模式的迅速发展,人们的生产生活方式发生了迅速变革。远程影像会诊基于云平台,运用互联网和多样化终端,依托医学影像技术,使患者临床信息能够走出医院的围墙,实现了病人与医生,医生与专家,以及医院与医院之间的疑难杂症影像会诊互联网模式,将病人、基层医院和大医院的专家三者建立便捷的沟通渠道,让病人通过网络平台得到专家的专业、科学的诊断意见,在提高基层医生的诊疗水平的同时,也提升了患者就医满意度。虽然我国地域间发展差异性大,但远程影像会诊平台建设差异性并不明显,现阶段远程影像会诊的运营模式成为其可持续发展的关键。本文对“互联网+”时代远程影像会诊运营模式研究,为远程医疗的正向发展提供借鉴与参考。

Performance evaluation of a deep learning-based cascaded HRNet model for automatic measurement of X-ray imaging parameters of lumbar sagittal curvature

Yuhua Wu¹, Xiaofei Chen², Fuwen Dong², Linyang He³, Guohua Cheng³, Yuwen Zheng¹, Chunyu Ma⁴, Hongyan Yao⁴, Sheng Zhou⁴

1. Gansu University of Traditional Chinese Medicine
2. Gansu Provincial Hospital of Traditional Chinese Medicine
3. Hangzhou Jianpei Technology Company Ltd
4. Gansu Provincial People's Hospital,

Objective: To develop a deep learning-based cascaded HRNet model, in order to automatically measure X-ray imaging parameters of lumbar sagittal curvature and to evaluate its prediction performance.

Methods: A total of 3730 lumbar lateral digital radiography (DR) images were collected from picture archiving and communication system (PACS). Among them, 3150 images were randomly selected as the training dataset and validation dataset, and 580 images as the test dataset. The landmarks of the lumbar curve index (LCI), lumbar lordosis angle (LLA), sacral slope (SS), lumbar lordosis index (LLI), and the posterior edge tangent angle of the vertebral body (PTA) were identified and marked. The measured results of landmarks on the test dataset were compared with the mean values of manual measurement as the reference standard. Percentage of correct key-points (PCK), intra-class correlation coefficient (ICC), Pearson correlation coefficient (r), mean absolute error (MAE), mean square error (MSE), root mean square error (RMSE) and Bland-Altman plot were used to evaluate the performance of the cascade HRNet model.

Results: The PCK of the cascaded HRNet model was 97.9-100% in the 3 mm distance threshold. The mean differences between the reference standard and the predicted values for LCI, LLA, SS, LLI, and PTA were 0.43 mm, 0.99°, 1.11°, 0.01 mm, and 0.23°, respectively. There were strong correlation and consistency of the five parameters between the cascaded HRNet model and manual measurements (ICC = 0.989-0.999, R = 0.991-0.999, MAE = 0.63-1.65, MSE = 0.61-4.06, RMSE = 0.78-2.01).

Conclusion: The cascaded HRNet model based on deep learning algorithm could accurately identify the sagittal curvature-related landmarks on lateral lumbar DR images and automatically measure the relevant parameters, which is of great significance in clinical application.

Prediction model of vascular cognitive impairment based on MRI white matter hyperintensities radiomics features in the elderly patients with CSVD

Wei Wang, Shaocai Wang, Kai Xu, Chunfeng Hu, Yankai Meng, Peng Xu
The Affiliated Hospital of Xuzhou Medical University

Purpose: To establish a prediction model of vascular cognitive impairment (VCI) based on white matter hyperintensities (WMH) radiomics feature, in order to guide people at risk of VCI to carry out early intervention and delay the occurrence of VCI or dementia. **Materials and Methods:** MRI data of 57 patients with VCI and 169 patients with no cognitive impairment (NCI) were retrospectively analyzed. Patients were randomly divided into training set (n=159) and test set (n=67) in a ratio of 7:3. The images were standardized and WMHs were segmented automatically by using the lesion prediction algorithm in the SPM software package. Two radiologists

determined whether there was any error, and if there was any error, ITK-SNAP software was imported for manual delineation. Then features were extracted from the segmented WMHs to select the best image morphological features to build the model. Clinical data and conventional MRI signs were incorporated into the study to build a clinical model, and then the radiomics model was combined with clinical model. The receiver operating characteristic (ROC) curve was plotted and the decision curve analysis (DCA) was performed to evaluate the diagnostic efficacy and clinical application value of each model. Results: 8 radiomics features were extracted from WMH, and the WMH radiomics model, clinical model and combined model were established respectively. The area under the ROC curve (AUC) of the training sets of the three models were as follows: WMH radiomics model was 0.74(95%CI: 0.66-0.83), clinical model was 0.88(95%CI: 0.81-0.94), combined model was 0.90 (95%CI: 0.84-0.96), The AUC in the test set was 0.75(95%CI:0.62-0.87), 0.81(95%CI: 0.68-0.95) and 0.85 (95%CI: 0.74-0.96), respectively. The combined model has better diagnostic efficacy and a higher clinical net return as assessed by DCA. Conclusions: The diagnostic efficacy of WMH radiomics combined with clinical conventional model was better than that of WMH radiomics or clinical model. It could be provide more sensitive and reliable markers for the early prediction and diagnosis of VCI.

人工智能在甲状腺领域的应用价值观察

邹灿

玉林市四人民医院

摘要:

人工智能 (Artificial Intelligence, 简称 AI) 在医疗领域的应用正日益受到关注。本文旨在探讨人工智能在甲状腺领域的应用价值, 并通过对相关研究成果的观察, 总结人工智能在甲状腺疾病诊断、治疗和预后评估等方面的潜在优势和挑战。本研究结果显示, 人工智能在甲状腺领域的应用具有巨大的潜力, 并为未来的甲状腺疾病管理提供了新的诊疗思路和方法。

3D 人工智能定位技术在 64 排 CT 胸部扫描中的应用价值

杨尚文

南京鼓楼医院

目的:探讨 3D 人工智能(artificial intelligence, AI)定位技术在胸部 CT 平扫中的应用价值。

方法:连续选取 2020 年 9 月来我院行胸部平扫 CT 检查的患者 100 例, 采用区组长度为 2, 区组内顺序固定的区组随机分组法分为 A、B 两组, A 组为人工定位组, B 组为 3D-AI 定位组, 每组 50 例。两组患者使用相同的胸部扫描协议。测量 A、B 两组患者的定位偏离距离, CT 剂量指数 (CTDI) 和剂量长度乘积(DLP), 并记录患者的检查用时。同时由 2 位放射医师对患者纵隔窗图像质量进行客观评价, 并对胸部图像进行主观评分。使用独立样本 t 检验对定位偏离距离、CTDI、DLP、图像质量客观指标和检查用时进行比较。使用卡方检验对图像质量评分进行比较。P<0.05 认为差异具有统计学意义。结果: B 组 (3D-AI 定位组) 的总体定位偏移距离较 A 组 (人工定位组) 减少了 47.18%[(8.81±7.16)VS (15.40±9.66)mm] (P<0.01), CTDI 降低了 11.28%[(6.68±2.58)VS (7.53±2.52) mGy], DLP 降低了 13.31%[(234.21±85.62)VS (270.19±95.30)mGy·cm](P 均<0.05)。B 组的检查用时(149.62 秒±14.43)比 A 组(214.18 秒±26.31)减少 64.56 秒, 降低 30.14% (P<0.01)。A、B 两组图像的背景噪

声以及降主动脉和竖脊肌的信号噪声比均无统计学差异($P>0.05$), 图像主观评分无统计学差异($P>0.05$), 所有患者图像均满足诊断要求。

结论: 使用 3D-AI 定位技术进行胸部 CT 扫描, 可以在保证图像质量的前提下, 提高定位准确性, 降低患者的辐射剂量, 大幅提高工作效率。

精神分裂症患者具有暴力行为风险的灰质体积分析的结构磁共振成像研究

李颖娜、梁文洲、赵立营、王志仁
北京回龙观医院

目的: 比较具有暴力行为的精神分裂症患者与无暴力行为史的精神分裂症患者之间的灰质厚度和体积差异以及临床因素的相关性。

方法: 本研究招募了 19 名具有暴力行为史的精神分裂症患者和 17 名无暴力行为史的精神分裂症患者, 分析他们大脑结构上的差异。每组个体都接受了 3DT1WI 磁共振成像检查, 并使用 FreeSurfer 进行全脑结构分析。使用 Spearman 相关性评估 PANSS 量表得分与 MRI 脑形态指标之间的相关性。采用接收者操作特征曲线 (ROC 曲线) 检验皮层厚度和体积的诊断效能。

结果: 与无暴力行为史的精神分裂症患者相比, 具有暴力行为史的患者显示出左侧额中回尾部皮层厚度显著减少和右侧颞中回皮层体积减少。ROC 曲线显示, 左侧额中回尾部皮层厚度的 AUC 为 0.876, 右侧中颞回皮层体积的 AUC 为 0.794。左侧缘上回、顶下小叶和右侧楔叶体积与精神分裂症患者的阳性和阴性综合症状评分 (PANSS-N) 呈正相关。

结论: 与无暴力行为的精神分裂症患者相比, 暴力患者的大脑结构显示了明显的差异, 这些发现可能与暴力行为的表现有关, 暗示着与控制情绪和冲动有关的大脑区域可能出现了功能和结构上的异常。这可能为将来发展基于大脑结构的生物标志物来辅助暴力行为的诊断和预测提供了潜在的线索。

CT 灌注成像对急性缺血性脑卒中评估价值的研究进展

曹伯裕、陈思丹、李雨钢、戚乐
杭州师范大学附属医院

脑卒中发病率高、致死/残疾率高, 其中以急性缺血性脑卒中 (AIS) 最为常见。CT 灌注成像 (CTP) 能有效反映局部脑组织血流灌注量的改变。对诊断超早期 AIS 具有重要意义, 评估梗死后脑组织的代偿能力, 判断溶栓治疗后血管再通的效果等。本研究就 CTP 在 AIS 评估价值的研究进展予以综述。

PU-1277

QSM 与双能 CT 对比评估帕金森病脑铁沉积

贾中正、陈悦、葛敏
南通大学附属医院

目的 通过比较帕金森病 (PD) 患者与正常人脑各灰质核团的磁敏感值 (MSV) 及 CT 值的差异, 探讨 QSM 与双能 CT (DECT) 评估 PD 患者脑内铁沉积的价值; 同时分析 MSV 与 CT 值之间的相关性, 判断 QSM 与 DECT 两种技术在评估 PD 患者脑内铁沉积的相关性。

方法 分别对 55 例 PD 患者 (PD 组) 和 43 例正常人 (对照组) 进行 QSM 检查和 DECT 扫描, 测量双侧尾状核 (CA)、壳核 (PU)、苍白球 (GP)、黑质 (SN)、红核 (RN) 的 MSV 和 CT 值。比较 PD 组与对照组各部位 MSV 与 CT 值的差异, 分析各部位 MSV 及 CT 值鉴别诊断 PD 组与对照组的效能, 评估各部位 MSV 与 CT 值之间的相关性。P < 0.05 为差异有统计学意义。

结果 1. PD 组双侧 GP、SN 的 MSV 均大于对照组, 差异有统计学意义 (均 P < 0.05)。2. PD 组双侧 GP、SN 和 RN 的各 CT 值均大于对照组, 差异有统计学意义 (均 P < 0.05)。3. PD 组左侧 GP 的 MSV 与 DECT 的各 CT 值均呈正相关 (P < 0.001)。4. PD 组右侧 GP 的 MSV 与 DECT 的各 CT 值均呈正相关 (P < 0.001)。

结论 1. QSM 与 DECT 均可以无创性定量评估 PD 患者异常脑内铁沉积。2. PD 患者双侧 GP 的 MSV 与 CT 值具有正相关性, 提示 DECT 可作为 QSM 的替代技术评估 PD 患者脑内铁沉积。

基于黑质纹状体系统 QSM 影像组学鉴别帕金森病及帕金森病型多系统萎缩

贾中正、王艳、葛敏
南通大学附属医院

目的 应用影像组学探讨基于黑质纹状体系统定量磁敏感图 (QSM) 在帕金森病 (PD) 和帕金森病型多系统萎缩 (MSA-P) 鉴别诊断中的价值。

方法 分别对 PD 患者和 MSA-P 患者进行 QSM 检查并勾画双侧尾状核头 (HCN)、壳核 (PUT)、苍白球 (GP)、黑质 (SN)、红核 (RN) 作为感兴趣区 (ROI), 对每个 ROI 提取组学特征并进行降维, 筛选出鉴别诊断贡献率较大的特征。按 7: 3 的个数比将入组患者随机分为训练组和验证组, 就不同 ROI 分别创建多元逻辑回归模型, 采用 ROC 曲线及混淆矩阵计算模型判断诊断效能。采用 Mann-Whitney U 检验比较 PD 组和 MSA-P 组特征的差异。

结果 在两组比较中, 5 个 ROI 的特征有统计学差异, PUT 的诊断效能最高, 在训练组与验证组均具有高度的准确性、敏感性、特异性、曲线下面积。

结论 基于黑质纹状体系统 QSM 影像组学可以鉴别 PD 和 MSA-P, 其中 PUT 的诊断效能最高。

PU-1279

机器学习结合影像组学特征预测 2 型糖尿病患者椎体脆性骨折

李思懿、曾燕、钟健、刘巧、秦芬、洪玉芹、周代全
重庆医科大学附属第三医院

目的: 探讨机器学习结合 CT 影像组学特征构建模型预测 2 型糖尿病 (T2DM) 患者椎体脆性骨折的准确性。**方法** 回顾性收集 138 例新近椎体脆性骨折的 T2DM 患者和对照组的 CT 图像和临床数

据，应用单因素分析、Pearson 相关分析、二元 logistic 回归分析和最小绝对值收缩和选择算子（LASSO）模型筛选出最佳特征。基于支持向量机（SVM）、极端梯度提升树（XGBoost）、轻量级梯度提升机（LightGBM）构建预测模型。应用受试者工作特征（ROC）曲线下面积（AUC）对模型效能进行评估。结果：从每例患者的 CT 图像中提取了 1037 个影像组学特征，然后精简为 18 个影像组学特征。18 个临床特征中性别、年龄、BMI 是预测结果的独立因素。其中 LightGBM 分类器表现最好，训练集中 LightGBM 模型的 AUC 分别为 0.982、0.864、0.980；测试集中分别为 0.959、0.770、0.985。结论：基于临床及影像组学特征构建的 LightGBM 模型可作为预测 T2DM 患者椎体脆性骨折的一种无创性辅助工具。

虚拟平扫技术在泌尿系 CTU 检查中的应用

朱梦甜

中国人民解放军陆军特色医学中心

目的：通过虚拟平扫技术获得去除造影剂的虚拟平扫图像，分析评价结石成分，获得与常规平扫图像质量最相符的图像，从而替代常规平扫期所需要的图像，同时减少患者所受辐射剂量。

方法：常规行平扫及皮质期、髓质期扫描，排泄期三期增强行双能量扫描，对所得三期增强图像进行双能量后处理，获得虚拟平扫图像，对所得图像进行分析处理，评价图像显示的结石成分，与常规平扫图像结果作比较。

结果：评价三期增强处理后的虚拟平扫图像，比较图像信噪比及与常规平扫图像对比结石检出率，得到与常规平扫图像吻合度最高的图像。

结论：虚拟平扫技术得到的图像与常规平扫图像信噪比及病变检出率吻合，可替代常规平扫期图像，降低患者辐射剂量，减少检查所需时间。

PU-1281

基于胸部 CT 的影像组学对胸腺上皮性肿瘤和前纵隔淋巴瘤鉴别诊断的价值研究

陈慧敏、陈杰云

泉州市第一医院

目的：探讨基于胸部 CT 的影像组学对胸腺上皮性肿瘤、前纵隔淋巴瘤鉴别诊断的预测价值。

材料与方法：回顾性分析 102 例病理证实的胸腺上皮性肿瘤（71 例）和前纵隔淋巴瘤（31 例）患者影像资料，按照 7:3 比例随机分为训练集和测试集。在平扫、动脉期、静脉期图像上逐层勾画病灶获得感兴趣容积并分别提取 1409 个组学特征。基于平扫图像提取的特征用于构建平扫模型，基于动脉期、静脉期提取的特征用于构建增强模型，基于平扫、动脉期、静脉期提取的特征用于构建联合模型。进行观察者间一致性分析，排除低重复性特征。使用合成少数类过采样技术对样本进行平衡处理。使用 Z-score 标准化对特征进行标准化。训练集依次使用皮尔逊相关系数、递归特征消除对影像组学特征进行筛选。使用线性判别分析（linear discriminant analysis, LDA）、逻辑回归、支持向量机作为分类器。运用 10 折交叉验证方法选取最优模型参数。最后取得基于 3 个序列（平扫、增强、平扫+增强）图像、采用 3 种分类器的 9 个模型，使用独立测试集对模型效能进行评估。

结果：训练集中，9 个影像组学模型均具有较好、优异的诊断效能，AUC 值 0.895-0.962，准确率 0.817-0.930，敏感性 0.682-0.909，特异性 0.776-0.980。测试集中，9 个影像组学模型均具有较好的诊断效能，AUC 值 0.818-0.899，准确率 0.807-0.903，敏感性 0.556-0.889，特异性 0.818-

1.000。各模型中,采用 LDA 分类器的平扫模型预测效能稍佳,测试集 AUC 为 0.899,95%CI 为 0.747-1.000,准确率 0.839,敏感性为 0.889,特异性为 0.818。

结论:

基于不同序列图像、采用不同分类器的影像组学模型在鉴别胸腺上皮性肿瘤及前纵隔淋巴瘤中均具有较好的诊断效能,采用 LDA 分类器的平扫模型诊断效能稍佳,有助于辅助临床决策。

实影渲染重建技术在不同危险度分层急性肺栓塞患者中的应用研究

王梓又^{1,2}、徐文北^{1,2}、刘忠喆¹、张贺¹、邱慎满¹、孙潇楠¹、于孟¹、朱慧慧¹、孟闫凯¹、徐凯¹

1. 徐州医科大学附属医院

2. 徐州医科大学

目的: 研究实影渲染 (Cinematic rendering, CR) 技术在不同危险分层的急性肺动脉栓塞 (Acute pulmonary embolism, APE) 患者中的临床应用价值。 **方法** 回顾性分析 2022 年 11 月-2023 年 3 月于我院行 CT 肺血管造影检查的 APE 患者资料。以 Qanadli 栓塞指数=20%为低死亡风险阈值,分为低危组 (Qanadli 栓塞指数<20%, N=23) 和高危组 (Qanadli 栓塞指数≥20%, N=27), 所有图像上传至 Siemens Syngo.via 后处理工作站 (西门子医疗, 德国), 由一名从事心血管影像诊断工作的医生根据预先设计好的 APE 渲染颜色、透明度模块分别进行 CR、容积重建 (Volume rendering, VR)。所有后处理图像的评估由两名具有高级职称的影像诊断学医生完成, 至意见达成一致。后处理图像的评估采用 3 分法, 包括图像质量方面的栓子显示、解剖结构、诊断信心及是否推荐用于多学科诊疗 (Multi-disciplinary Treatment, MDT)。 **结果** 本研究 50 例患者中位数年龄 72.5 (15) 岁。高危组的 CR 重建栓子显示平均 2.815 分, VR 重建 1.778 分; 低危组的 CR 重建栓子显示平均 2.739 分, VR 重建 1.913 分, 差异均具有统计学意义 ($P<0.0001$)。41 例 (82%) CR 重建的解剖结构为 3 分, 明显高于 VR 重建 (1.904 分), $P<0.0001$ 。40 例 (80%) 患者 CR 重建对于栓子的诊断信心为 3 分, 明显高于 VR ($P<0.0001$)。在评估是否被推荐用于 MDT (3 分) 中, 41 例 (82%) 患者的 CR 重建图像和 5 例 (10%) 患者的 VR 图像被推荐用于 MDT (3 分), 两组间统计学差异明显 ($P<0.0001$)。 **结论** 对于不同危险分层的 APE 患者, CR 重建技术均可获得逼真的三维图像, 更好的显示栓子、准确诊断信心、更有效的用于 MDT。

PU-1283

人工智能辅助诊断高危肺结节影像的应用价值研究

晏根平

宜春市人民医院

目的 探讨人工智能 (AI) 在高危肺结节影像诊断中的应用价值。 **方法** 选取肺结节手术患者 113 例, 所有患者的肺部 CT 薄层图像由 AI 软件诊断及影像诊断医师阅片, 由 1 名胸外科高年资医师及 1 名影像科高年资医师联合阅片的诊断结果作为金标准, 对比 2 组高危肺结节检出的敏感性、阳性率、假阳性率及漏诊情况, 对所得结果进行分析。 **结果** 113 例患者共检出高危肺结节 121 个, 其中实性结节 67 个, 磨玻璃结节 38 个, 混杂磨玻璃结节 16 个。AI 组共检出高危肺结节 131 个, 误诊 18 个, 漏诊 4 个, AI 组检出敏感性 93.3%, 阳性率 86.2%, 假阳性率 13.8%; 医师组共检出高危肺结节 119 个, 误诊 3 个, 漏诊 5 个, 医师组检出敏感性 95.8%, 阳性率 97.4%, 假阳性率 2.6%。 **结论** AI 组与医师组诊断高危肺结节的敏感性均高, 但 AI 组的假阳性率相对较高; 影像科

医生利用 AI 阅片可有效提高影像诊断正确率,减少误诊及漏诊,减少医师工作负担,提高工作效率。

PU-1284

基于 CTE 影像组学在克罗恩病所致炎性肠段活动性预测效能的研究价值

刘荣丽

河北医科大学第二医院

目的: 本文旨在探讨基于 CTE (计算机断层扫描增强) 影像组学在克罗恩病所致炎性肠段活动性预测中的研究价值。通过综合分析 CTE 影像组学技术在克罗恩病诊断和治疗过程中的应用,我们探讨其在炎性肠段活动性预测方面的潜在效能,以及为克罗恩病患者提供更准确、早期干预的新途径。**引言:** 克罗恩病是一种复杂的慢性炎性肠道疾病,其临床表现多样,诊断和治疗存在一定的挑战。CTE 影像组学作为一种先进的医学影像分析技术,可以从大规模的 CTE 图像中提取丰富的特征信息,为医生提供更全面的诊断依据。**方法:** 本研究将收集克罗恩病患者的 CTE 影像数据,应用影像组学技术提取多维度的影像特征,如肠壁增厚程度、病变分布、血管分布等。同时,将结合临床指标,如病情活动指数、临床症状等,建立预测模型,评估 CTE 影像组学在预测克罗恩病炎性肠段活动性方面的效能。**结果:** 预计 CTE 影像组学技术在预测克罗恩病所致炎性肠段活动性方面将具有重要价值。通过多维度特征的综合分析,预测模型可能能够准确预测患者的肠段活动性,为临床医生提供及早干预的机会。此外,CTE 影像组学还可能揭示不同炎症程度之间的影像特征差异,有助于深入理解炎性肠段的病理生理过程。**结论:** 基于 CTE 影像组学在克罗恩病所致炎性肠段活动性预测方面的研究具有重要的临床应用前景。该技术有望提高克罗恩病的早期诊断和治疗效果评估水平,为临床决策提供更全面的影像信息支持。然而,为了更好地发挥其潜力,需要进一步的大样本研究和临床验证,同时结合其他临床指标进行综合分析,以确保预测模型的可靠性和准确性。

PU-1285

人工智能三维可视化技术在保留肾单位肾肿瘤切除术前评估的价值及相关 CT 图像质量优化策略分析

孙维晗

吉林大学第一医院

目的:探索并构建保留肾单位肾肿瘤切除术前的 CT 三维可视化术前评估规范并针对图像质量的优化策略进行分析。

方法:回顾性收集 2022 年 6 月到 2023 年 7 月吉林大学第一医院放射科因拟行保留肾单位肾肿瘤切除术的连续性 CT 三期增强检查拟患者 48 例。根据肾动静脉走行、形态和连续性及主干、二级、三级分支情况,肾脏内部结构(肾皮质、肾锥体、肾盏)其显示,测算病灶形态、大小、分布和体积是否与 CT 图像一致,是否需要人为修正,出现的影像质量问题,逐一判断影响质量的原因,对三维可视化图像质量进行质控评价分成三类:不需要人为修正可直接重建,人为修正可重建和无法重建。并评估肿瘤相关解剖结构,血管等信息通过归纳和总结构建专科化评估规范并对影响可视化效果的原始 CT 增强图像质量的原因进行分析和总结进一步改进优化策略。

结果: 48 例图像中, 39 例 (81.23%) 不需要人为修正可直接重建, 7 例 (14.58%) 需要人为修正, 2 例 (4.17%) 图像无法重建。人为修正可重建和无法重建的例数 9 例, 共占 18.75%。其中有 4 例为对比剂使用不当血管显影不良, 2 例为延迟时间不足输尿管未显影, 3 例为屏气不当产生运动伪影。

结论: 基于人工智能三维可视化技术较常规三维重建, 能够更全面、直观、量化评估保留肾单位肾肿瘤切除术的风险。CT 增强图像对可视化信息获取影响因素的分析和改进, 有助于可视化技术规范、同质化工作的开展, 助力专科化精准影像评估体系的构建。

PU-1286

对侧颈动脉狭窄对非急性前循环大血管闭塞的灌注影响:CTP 初步研究

王梦卉、谢元亮
武汉市中心医院

目的: 探讨对侧颈动脉狭窄程度对非急性前循环大血管闭塞患者脑部灌注和分水岭侧支状态的影响。方法: 回顾性分析 2020 年 1 月~2022 年 12 月我院连续收治 58 例单侧前循环非急性大血管闭塞患者 CTP 和 DSA 影像资料。闭塞侧根据闭塞部位分为颈内动脉 (ICA) 闭塞组和大脑中动脉 (MCA) 闭塞组, 比较两组患者 $T_{max} > 4s$ 和 $T_{max} > 6s$ 低灌注容积的差异。根据对侧颈动脉狭窄 (CAS) 程度分为两组: 狭窄 $\geq 50\%$ 和狭窄 $< 50\%$ 。采用一种新的 8 分制分水岭区域侧支评分 (WTCS) 对闭塞侧及对侧进行评分。比较两组双侧脑半球脑灌注参数及分水岭区 CBF、CBV、TTP、MTT、 T_{max} 比值以及 WTCS。

结果: 58 例非急性前循环闭塞患者均存在不同程度的灌注不良, MTT、TTP 和 T_{max} 延长, CBV 和 CBF 略有增加。ICA 闭塞组 $T_{max} > 4s$ 容积 ($216.0 \pm 120.8ml$ vs $142.6 \pm 128.2ml$, $P < 0.05$)、 $T_{max} > 6s$ 容积 ($85.0 \pm 91.1ml$ vs $39.1 \pm 68.9ml$, $P < 0.05$) 均大于 MCA 闭塞组。与对侧 CAS $< 50\%$ 患者比较, 对侧 CAS $\geq 50\%$ 患者半卵圆中心分水岭区 CBF 比值较低 (1.033 ± 0.046 vs 1.084 ± 0.167 , $P = 0.003$), 对侧 CAS $\geq 50\%$ 患者 WTCS 总分较高 [3.1 (95%CI: 2.4-3.7) vs 5.1 (95%CI: 3.9-6.2), $P = 0.002$], 而 CBV、MTT、TTP、 T_{max} 比值无统计学意义。联合 CBF 比值+WTCS 总分预测非急性 LVO 患者对侧前循环狭窄 $\geq 50\%$ 的 AUC 为 0.832。

结论: 非急性 LVO 患者中, ICA 闭塞患者比 MCA 闭塞患者的灌注不良容积更大。非急性 LVO 患者, 对侧颈动脉狭窄程度影响侧枝循环代偿能力, 脑 CTP 及 WTCS 评分有较高的评估价值。

PU-1287

A radiomics model of contrast-enhanced computed tomography for predicting post-acute pancreatitis diabetes mellitus: a bi-center study

Ran Hu, Hua Yang
重庆市中医院

Background Diabetes mellitus can occur after acute pancreatitis (AP), but the accurate quantitative methods to predict post-acute pancreatitis diabetes mellitus (PPDM-A) are lacking. This retrospective study aimed to establish a radiomics model based on contrast-enhanced computed tomography (CECT) for predicting PPDM-A.

Methods A total of 374 patients with first-episode AP were retrospectively enrolled from two tertiary referral centers. There were 224 patients in the training cohort, 56 in the internal validation cohort, and 94 in the external validation cohort, and there were 86, 22, and 27 patients with PPDM-A in these cohorts, respectively. The clinical characteristics were collected from the hospital information system. A total of 2398 radiomics features were extracted from the arterial- and venous-phase CECT images. Random forest-based recursive feature elimination, collinearity analysis, and least absolute shrinkage and selection operator were used for selecting the final features. Three classification methods (eXtreme Gradient Boosting [XGBoost], Adaptive Boosting, and Decision Tree) were built in three models to compare the performances. The predictive performances of the models were compared based on the classification metrics. Each of the three models was modeled with three algorithms, resulting in a total of nine classifiers. The performances were compared both within and between the models.

Results Eleven radiomics features were selected after a reproducibility test and dimensionality reduction. Among the three classification methods, the XGBoost classifier showed better and more consistent performances. The accuracy of the XGBoost's radiomics model to predict PPDM-A in the training, internal, and external cohorts was good (0.964, 0.875, 0.968, respectively). By comparing the AUCs among the three XGBoost's models, we found that the radiomics model was significantly better than the clinical model in the external validation cohort (0.857 vs. 0.619, $p = 0.000$), but there was no significant difference between the combined and radiomics models (0.882 vs. 0.857, $p = 0.317$).

Conclusions The radiomics model based on CECT performs well and can be used as an early quantitative method to predict the occurrence of PPDM-A.

PU-1288

多模态影像融合技术在脑膜瘤患者中的应用

郝桥、秦江彦、冯天保

延安大学附属医院心脑血管病医院放射科

目的：由于大脑结构和功能的复杂性，决定了该学科的特点就是精准治疗。精准治疗实现的一个重要手段就是多模态影像融合技术。多模态影像融合技术就是通过融合多种成像技术，把多种模态的图像信息整合，将抽象的、原本“不可见”的神经解剖及功能结构三维可视化，通过多模态影像融合技术把各种神经功能和病变的关系整合到手术平台上，通过术中精准定位，选择合适的个体化手术入路。本研究主要目的是探讨多模态影像融合技术在脑膜瘤患者中的临床可操作性及准确性。

方法：纳入我院 2022 年 8 月至 2023 年 8 月神经外科接受开颅肿瘤切除手术治疗的脑膜瘤患者 30 例，术前均行 3.0T 的磁共振扫描，扫描序列包括：TWI、T2WI、FLAIR、MRA 及增强的 T1 加权序列，颅内血管 CTA 及 CTV，然后利用西门子后处理软件 Sygo.via 软件将多模态 MRI、CT 影像配准、融合，通过区域增长及结构分离的方式，重建出三维立体的脑膜瘤及临近血管的虚拟现实模型，然后根据重建出的虚拟现实模型制定合适的个体化手术入路，最后与手术中所见到的实际情况进行对比分析，进而探讨多模态影像融合技术在脑膜瘤患者中的临床可操作性及准确性。

结果：在 30 例脑膜瘤患者中，利用西门子后处理软件 Sygo.via 基于区域增长及结构分离，可准确直观的展示脑膜瘤在颅内的空间位置及肿瘤及临近血管的关系，对于肿瘤的血供及对静脉窦的压迫具有较高的灵敏度和特异度；利用此技术与术中实际情况相比具有很好的一致性。对于患者手术方案的制定及术中手术切除范围有极大的帮助。

结论：基于多模态影像融合技术，利用西门子后处理软件 Sygo.via 实现对脑膜瘤患者的虚拟现实模拟技术具有临床可行性。利用该技术可以实现术前对脑膜瘤患者肿瘤在颅内直观的三维立体空间及肿瘤的血供、对静脉窦有压迫、侵蚀作出准确的评估，以便指导手术方案的制定，最大程度地切除病变和最安全地保护神经功能，从而改善患者预后。

CT 影像组学特征与临床指标的联合模型预测非小细胞肺癌脑转移发生风险

夏晓颖¹、李新春¹、万齐¹、邹乔¹、杜自宏²

1. 广州医科大学附属第一医院

2. 云南省第一人民医院

目的

非小细胞肺癌 (non-small cell lung cancer, NSCLC) 脑转移发生率高, 患者需多次 MRI 增强扫描随访, 增加了钆对比剂沉积风险。因此, 有必要对 NSCLC 脑转移发生风险进行分层, 减少低风险患者钆对比剂沉积风险。本研究通过 CT 影像组学方法, 提取并筛选稳定影像组学特征, 融合临床指标、CT 影像学特征和影像组学特征构建多维信息联合模型, 预测 NSCLC 脑转移发生风险。

方法

回顾性分析经病理学确诊 NSCLC 的 226 例患者胸部 CT 影像及临床资料, 其中脑转移阳性 61 例, 阴性 185 例。训练组 (195 例) 使用 SIEMENS 64 排、128 排 CT 扫描仪, 测试组 (31 例) 使用 GE 256 排 CT 扫描仪。在 1mm 肺算法组、2mm 平扫组、2mm 静脉期组中分别勾画感兴趣区, 提取、筛选各组 CT 影像组学特征并建立模型, 选出预测效能最佳的 CT 影像组学模型并计算 Rad-score。筛选与脑转移相关的临床指标、CT 影像学特征, 建立 Rad-score 与临床指标、CT 影像学特征联合模型, 选出预测效能最佳的模型。

结果

1mm 肺算法组、2mm 平扫组、2mm 静脉期组影像组学特征预测 NSCLC 脑转移模型训练组 AUC 分别为 0.651、0.683、0.677, 测试组 AUC 分别为 0.619、0.696、0.643, Delong 检验显示三组模型 AUC 差异无统计学意义。选用 2mm 平扫组计算 Rad-score 并构建联合模型, CT 影像组学+临床指标联合模型训练组、测试组 AUC 分别为 0.838、0.738, CT 影像组学+CT 影像学特征联合模型训练组、测试组 AUC 分别为 0.703、0.714。

结论

CT 影像组学模型预测 NSCLC 脑转移具有可行性, CT 图像的层厚、时相、重建算法对影像组学模型预测效能不会造成影响, 纳入临床指标和 2mm 平扫组 CT 影像组学特征的联合模型可以提高预测效能。

基于 MRI 的人工智能预测自体肌腱大小辅助前交叉韧带重建术

李米芳、张灵艳、张妃媛

深圳市龙岗中心医院

目的

通过基于 MR 的成像技术验证腓绳肌肌腱 (半腱肌及股薄肌肌腱) 横截面积与移植物直径的相关性, 同时基于深度神经网络构建腓绳肌肌腱自动分割系统, 指导前交叉韧带重建术 (ACLR) 术前规划。

方法

回顾性收集 374 例因前交叉韧带损伤行 ACLR 患者 (316 名男性, 58 名女性) 的术前膝关节 MR 图像及术中移植物直径信息。两名放射科医师在 MRI 图像上选择股骨内外髁最大层面进行半腱肌及股薄肌勾画并计算横截面积。采用相关分析方法分析术前腓绳肌横截面积与术中移植物直径关系,

利用受试者工作特征曲线分析腓绳肌横截面积对术中移植直径的预测价值。同时,我们提出了一种基于 EGM+U-Net++网络的深度学习框架,自动分割 MR 图像中的肌腱,并使用骰子相似系数(DSC)来比较不同网络分割系统的性能。

结果

通过 Pearsons 相关性分析,移植直径与腓绳肌肌腱横截面积相关程度最高($r=0.588$, $P<0.01$)。移植直径与半腱肌肌腱、股薄肌肌腱横截面积相关系数分别为 0.540 ($P<0.01$) 和 0.555 ($P<0.01$)。移植直径与半腱肌肌腱、股薄肌肌腱横截面积相关系数分别为 0.540 ($P<0.01$) 和 0.555 ($P<0.01$)。二元 Logistic 回归分析表示腓绳肌横截面积能够预测术中移植直径($P<0.01$), AUC 为 0.824 (95%CI 0.780~0.868), 移植直径大于 8mm 时 MRI 上测量的肌腱横截面积最佳阈值为 17.82mm²。基于不同网络的肌腱分割 DSC 系数均大于 0.90, 其中本研究提出的改进 EGM+U-Net++网络表现最好, 分割半腱肌及股薄肌的 DSC 系数分别为 0.921±0.04、0.922±0.04。

结论

磁共振上腓绳肌横截面积可以预测用于 ACLR 的腓绳肌移植直径大小。利用深度神经网络建立肌腱自动分割系统, 为辅助临床术前规划提供技术支持。

MRI 影像组学列线图术前预测子宫内膜癌淋巴结转移

方如旗

福建省妇幼保健院

【摘要】目的 构建并验证 MR 影像组学列线图术前预测子宫内膜癌淋巴结转移的价值。方法 回顾性分析 195 例子宫内膜癌患者临床及影像资料, 利用 Mazda 软件获取影像组学特征, 建立影像组学得分, 利用多因素 logistic 回归建立淋巴结转移预测列线图, 采用 ROC 分析评价模型的预测效能, 并在测试集中进行验证。结果 训练集 134 例, 淋巴结转移 43 例, 验证集 61 例, 淋巴结转移 28 例, 术前 MR 诊断淋巴结转移的敏感性为 29.6%, 特异性为 96.8%。多因素 logistic 回归分析确定影像组学得分、MR 提示宫颈间质浸润、Ki67、MR 提示淋巴结转移为独立危险因素, 并依此构建的预测模型, 训练组及验证组 AUC 分别为 0.897、0.829, Hosmer-Lemeshow 检验显示模型在训练组、验证组拟合优度良好(P 值分别为 0.689、0.167)。结论 磁共振影像组学列线图可用于子宫内膜癌患者淋巴结转移的术前个体化预测。

CT 三维重建技术在危重患者 PICC 导管尖端定位的应用效果分析

王强、王猛

吉林大学白求恩第一医院

目的: 在日常工作中, 经常会遇到重症监护室患者外出检查肺 CT 时, 临床多提 X 线胸片检查以观察 PICC 尖端位置。本研究探讨 CT 三维重建技术在危重无意识患者 PICC 导管尖端定位的应用价值。

方法: 本次研究对象为各科室重症监护室危重无意识患者, 共 100 例患者入选, 选取时间在 2020 年 9 月至 2022 年 12 月期间, 并将所有患者分为两组, 即对照组和实验组, 分组方式为随机抽取,

两组均为 50 例。对照组选用 X 线定位 PICC 导管尖端, 实验组在 PICC 导管尖端定位时采取 CT 检查方式采集数据, 应用后处理工作站行三维重建, 对两组患者应用效果进行对比分析。

结果: CT 三维重建后, 观察尖端定位点未至上腔静脉显著低于 X 线定位, 且观察 PICC 尖端到达上腔静脉内及右心房患者高于对照组. ($P < 0.05$)。

结论: 重症监护室患者多数插管连接心电监护等, 对 X 线定位干扰较多, CT 三维重建在重症插管患者 PICC 导管尖端定位中可发挥一定作用, 能够有效判断 PICC 导管尖端位置, 与 X 线检查相比, 准确度较高, 干扰性较小。

重症患者在行肺 CT 检查后, 即行三维重建, 可直接观察 PICC 准确位置, 同时缩短整个检查流程, 降低风险, 同时减少患者费用支出。

基于 T2WI 影像组学列线图预测早期宫颈癌深度间质浸润 的一项双中心研究

宋惠贞¹、王语²、李茂渊³、李雪¹、杜涛明⁴

1. 河南大学临淮河医院

2. 西南医科大学附属医院

3. 成都市青白江区人民医院

4. 成都市第七人民医院

目的 构建与验证基于 T2WI 影像组学列线图预测早期宫颈癌(CC)术前宫颈深度间质浸润(DSI)的价值。

资料与方法 回顾性分析西南医科大学附属医院(第一中心), 河南大学淮河医院(第二中心) 2018 年 5 月至 2022 年 8 月两家医疗中心连续收治的具有术后病理结果和术前 MR 图像的早期宫颈癌患者 164 例, 第一中心(114 例)、第二中心(50 例)的数据分别划分为训练集和验证集。运用 3D slicer 对 T2WI 图像行肿瘤分割, python 软件提取影像组学特征, 进而对训练集行特征筛选, 构建支持向量机(SVM)预测模型; 采用单因素方差分析筛选临床危险因素, 并使用多因素 logistic 回归结合影像组学评分(Radscore)构建影像组学列线图, ROC 曲线用于评估这些模型, 并对不同模型的预测效能。

结果 最终筛选出 12 个影像组学特征; 使用多因素 logistic 回归构建 Figo 分期结合 Radscore 的影像组学列线图, 结果发现列线图的预测效能优于临床预测模型(验证集 AUC: 0.845 VS. 0.717, Delong 检验: $Z=2.728$, $p=0.006$)。

结论 基于 T2WI 影像组学列线图对早期宫颈癌 DSI 术前无创性预测具有较高的价值。

PU-1294

Radiomic differentiation of testicular tumors in children based on T1WI and T2WI MRI images

Qianyi Liao¹, Lin Lu², Yijiang Zhuang¹, Longwei Sun¹, Feifei Lin¹

1. Shenzhen Children's Hospital

2. Columbia University Medical Center

Purpose: To differentiate childhood testicular tumors (CTT) based on T1WI and T2WI radiomics.

Patients and methods: A total of 71 patients with CTT were enrolled for the study, including 20 malignant and 51 benign tumors (histopathologically proven). All patients were undergone T1WI and T2WI MRI scanning. A total of 1,160 quantitative radiomic features were extracted from T1WI and T2WI images of each patient, respectively. Three radiomic models, the T1WI, T2WI and

T1WI+T2WI models, were established to predict the malignancy and benign of the tumors based on the extracted radiomic features. The area under the receiver operating characteristic curve (AUC) and five-fold cross-validation were used to evaluate the predictive performance of models. Results: The AUC among the T1WI, T2WI and T1WI+T2WI models was 0.857 (95% CI, 0.715-0.935; sensitivity=80.0%, specificity=87.8%), 0.820 (95% CI, 0.672-0.910; sensitivity =70.0%, specificity =90.0%) and 0.867 (95% CI, 0.720-0.933; sensitivity =83.3%, specificity = 90.2%). The T1WI and T1WI+T2WI models were significantly better than the T2WI model ($p<0.001$). There is no significant difference between T1WI and T1WI+T2WI model ($p>0.05$). Conclusion: Radiomics based on T1WI and T2WI presented good performance on differential diagnosis of CTT. It is of great potential to be a noninvasive quantitative diagnostic tool to advance accuracy of CTT diagnosis and avoid unnecessary radical orchiectomy of children.

基于增强 CT 图像探究影像组学在肺结节良恶性诊断价值

沈天赐、杨峰
襄阳市第一人民医院

目的：基于临床及增强 CT 影像组学构建联合模型，评估其预测诊断肺结节患者良恶性的价值。方法：回顾性分析 116 例（良性 52 例，恶性 64 例）经病理证实的肺结节患者，将患者采用分层抽样的方式按照 7:3 的比例分为训练组和验证组，逐层提取每位患者增强（动脉期及静脉期）图像肺结节区域的感兴趣区（regions of interest ,ROI），采用 3Dslicer 软件提取影像组学纹理特征，使用 LASSO 回归算法对影像组学特征进行特征筛选及降维，选择非零变量构建影像组学特征模型。结合独立的临床危险因素采用多元 Logistics 回归建立影像组学列线图，列线图的准确率和诊断效能可在训练集中进行评估在验证集中进行验证，最后通过决策曲线分析评价列线图的临床应用价值。结果：基于临床特征模型在训练集（AUC=0.81，95%CI 0.73-0.90）及验证集（AUC=0.85，95%CI 0.73-0.98）对肺结节良恶性诊断略差，筛选出 9 个影像组学纹理特征与肺结节良恶性相关依据回归系数建立 Rad-Score 特征模型在训练集及验证集 AUC 分别为 0.91（95%CI 0.84-0.98），0.90（95%CI 0.80-1.00），联合影像组学及临床特征列线图模型在训练集（0.94，95%CI 0.89-0.99）和验证集（0.98，95%CI 0.94-1.00）均表现优异，DCA 分析结果表明影像组学的加入可以使患者获益。结论：联合临床特征及增强 CT 影像组学建立的列线图模型具有良好预测肺结节良恶性的效能。

基于对比剂增强脂肪饱和 T1WI 的机器学习模型对肛瘘术前诊断的应用价值

倪政欣、邱光、张璐
苏州市中医医院

目的

探讨基于对比剂增强脂肪饱和 T1WI 的机器学习模型对肛瘘术前诊断的应用价值。

方法

回顾性收集 2019 年 1 月至 2022 年 12 月于苏州市中医医院手术证实为肛瘘患者的术前 MRI 图像资料，共入组 80 例，其中男 66 例，女 14 例，年龄 15~65（37±3）岁。以 3:1 的比例分为训练集 60 例，测试集 20 例，训练集采用 mark_rcnn 网络进行肛瘘的瘘管检测，并使用 Adam 优化算法，由 2 名医师结合手术结果标注出肛管及其病变肛瘘瘘管区域，使用医学影像智能辅助分析系统

进行标注, 作为实验中的金标准用于训练深度学习算法和预测结果评价。对测试集的 20 例患者的 T1 图像进行区域划分, 对于输入的 MRI 图像, 计算检测的结果, 使用 sensitivity 系数来评价检测模型的预测结果与医师标注金标准间的匹配程度。

结果

根据 Dice 评测指标, 肛瘘瘘管检测模型对测试集 20 例样本取得的 Sensitivity 为 0.81897, 平均时间为 0.126 秒, 表明模型具有一般的预测精度。取得了与医师标注金标准一般的重合度。我们还将模型与其他常用的图像分割算法进行了比较, 结果表明我们的算法在瘘管检测方面表现出色, 相较于其他算法, 具有更高的准确性和更低的误检率。除此之外, 我们还对模型进行了可视化分析, 发现模型能够准确地检测出瘘管的位置和形状, 并可以将其从周围的组织和结构中分离出来。

结论

本研究结果表明, 使用深度学习算法对单纯性肛瘘患者的 MRI 图像进行瘘管检测是可行和有效的, 我们还对模型的可解释性进行了探究。通过可视化分析, 我们发现模型能够准确地检测出瘘管的位置和形状, 这为医生提供了更为准确的术前诊断信息, 有助于更好地指导手术操作。随着训练集数据的不断扩张, 该模型有望作为一种可靠的肛瘘诊断辅助工具。

Preoperative MRI with Deep Learning Reconstruction in Assessing Rectal Cancer: A Multi-reader and Multi-sequence Study

Luguang Chen, Yuan Yuan, Fu Shen, Chengwei Shao, Jianping Lu
Department of Radiology, Changhai Hospital of Shanghai

Purpose: To determine whether deep learning reconstruction (DLR) could improve the image quality of rectal MRI, and to explore the diagnostic performance of TN-staging of rectal cancer (RC) by readers with different levels of experience, compared with conventional MRI without DLR.

Materials and Methods Images of high-resolution T2-weighted, diffusion-weighted imaging (DWI), and contrast-enhanced T1-weighted imaging (CE-T1WI) from patients with pathologically diagnosed rectal cancer from July 2017 to March 2022 were retrospective processed with and without DLR and assessed by five readers. The first two readers measured the signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of the lesion. The overall image quality and lesion display performance on each sequence with and without DLR were independently scored using a five-point scale and evaluated the TN-stage of RC lesions by the other three readers. Image quality was compared between images with and without DLR, and the diagnostic performance and interobserver agreement were also explored.

Results Overall, 178 patients (mean age, 56.7 ± 11.4 years; 124 men) were evaluated. SNR and CNR of the lesion on images with DLR were significantly higher than those without DLR ($p < 0.0001$), e.g., for T2WI, the mean SNR was 78.984 ± 57.934 versus 42.190 ± 36.264 , respectively ($p < 0.0001$). A significant difference was observed in overall image quality and lesion display performance between images with and without DLR ($p < 0.0001$). Compared with images without DLR, diagnostic performance and interobserver agreement were improved in images with DLR.

Conclusion DLR improves the image quality and agreement of rectal MRI and enhances the diagnostic performance in TN-staging of rectal cancer.

基于深度学习的胸部正位 DR 质量控制系统的初步研究与应用

韦鑫、周治明、陈金华
重庆医科大学附属第二医院

【摘要】：目的 本研究旨在构建一种基于深度学习的人工智能 (AI) 胸部正位数字 X 线 (DR) 图像质量控制模型，并评估其在放射质控体系中的应用价值。方法 回顾性纳入 16 家医院在 2021 年 1 月—6 月拍摄的 6920 张胸部正位 DR 图像进行分级标记，其中 4844 张作为训练集用于构建一种基于生成对抗网络的，能够自动化评价胸部 DR 图像质量的深度学习模型。1730 张作为验证集用于调整模型参数。346 张作为测试集评估模型效能。以 5 名高年资主管技师共同评定结果和总评分作为金标准，分别从 10 项评价维度计算 AI 模型的敏感度、准确率和曲线下面积 (AUC)，并对 AI 与专家的评分进行一致性评估。结果 在评价维度的判断中，AI 模型的效能与放射专家感知评价相当，其中对“肩胛骨内缘是否旋出肺野之外”的检测效能最高 (AUC=0.912)，其敏感度、和准确率分别为 86.32%、96.02% 和 93.35%。AI 模型在图像质量评分与专家评分一致性较好 (ICC=0.843, $P<0.001$)。AI 耗费的平均时间明显比专家的短 (4.24 s VS 12.85 s, $P<0.001$)。结论 基于生成对抗网络建立的 AI 胸片 DR 质控系统能快速、自动地进行影像图像质量控制工作，并进行高级别图像质量评分，可成为辅助 DR 图像质量控制和管理工作的有效工具。

基于 DTI 图像的 Transformer 模型预测耳鸣患者音乐掩蔽治疗效果

王星皓、陈乾、孙婧、李佳、杨文博、刘雅文、吕晗、杨正汉、王振常
首都医科大学附属北京友谊医院

目的:探究 DTI 图像与耳鸣患者之间的关联，运用基于 DTI 图像的 Transformer 模型预测耳鸣患者音乐掩蔽治疗效果。

方法: 对 60 例特发性耳鸣患者和 57 例健康对照人群进行了弥散张量成像 (Diffusion Tensor Imaging, DTI)。应用了一种特殊的耳鸣治疗仪器 eMasker® (Micro-DSP 科技有限公司)，这是一种根据耳鸣特征测试结果定制的个人声音治疗设备，可以对耳鸣患者进行音乐掩蔽治疗。每 17 周收集一次关于声音疗法应用的治疗反馈。所有患者被要求在治疗后再次完成耳鸣障碍量表评分，据此将患者分为治疗有效组与治疗无效组。基于迁移学习的方法构建基于 DTI 图像的 Transformer 模型，标签选择为治疗有效组与治疗无效组，探究模型预测能力。

结果:在 28 例患者中，音乐掩蔽治疗具有良好的治疗效果；32 名患者治疗无效。基于 DTI 图像的 Transformer 模型可以很好地将这两类患者进行区分 (AUC 为 0.94，敏感性，82.86%；，特异性，97.14%)，且在 10 折交叉验证中都保持较高的预测能力 (所有 AUC>0.85，平均 AUC>0.9)。校准曲线显示模型拟合良好。且模型对于区分健康对照人群与耳鸣患者也有意义 ($P<0.05$)。

结论: 基于 DTI 图像的 Transformer 模型可以有效预测耳鸣患者的治疗效果，这对于耳鸣患者的治疗方案选择是具有积极意义的。

Multimodal Image for Brain Age Prediction: From Asian Genetic Background

Xinghao Wang, Qian Chen, Jing Sun, Jia Li, Wenbo Yang, Han Lv, Zhenghan Yang, Zhenchang Wang
Department of Radiology, Beijing Friendship Hospital, Capital Medical

The aging of the human body is reflected in various systems and tissues, among which the nervous system dominates many other systems, and its aging is crucial for exploring human aging. Exploring the degree of brain aging requires a "gold standard", so the concept of brain age has been proposed to describe the degree of brain aging under normal physiological and social living conditions. Magnetic resonance imaging is a non-invasive and convenient method to comprehensively evaluate the brain, which is widely used in the diagnosis of various mental or Degenerative disease, and has great clinical application value. Many previous studies have proposed many brain age prediction models based on brain MRI in the genetic background of Europe or America. As is well known, Asian populations have significant differences in genetic background, cultural habits, living environment, and many other aspects compared to European and American regions, and their impact on the brain also varies. Therefore, this study uses poly-centric data to explore brain age models based on Asians.

Deep learning in the precise assessment of primary Sjögren's Syndrome based on ultrasound images: a multicenter prospective study

Xinyue Niu², Yujie Zhou², Tianyu Tang², Ling Wang¹

1. Department of Ultrasound, Zhong Da Hospital, Medical School, Southeast University, 89 Dingjiaqiao Road, Nanjing, 210009, Jiangsu Province, China

2. Medical School, Southeast University, 89 Dingjiaqiao Road, Nanjing, 210009, Jiangsu Province, China

Objectives: This study aimed to investigate the value of a deep learning model (DL) based on the grayscale ultrasound (US) images for the precise assessment and accurate diagnosis of primary Sjögren's syndrome (pSS). **Methods:** A dataset of 864 US images of bilateral parotid glands (PGs), submandibular glands (SMGs), and lacrimal glands (LGs) were collected from the prospective multicenter study including 72 pSS patients diagnosed according to the 2016 American College of Rheumatology/European League Against Rheumatism criteria and 72 healthy subjects matching by propensity score matching. The prediction model was constructed based on the Residual Neural Network 50, input with preprocessed original US images. The performance of the model was analyzed using accuracy, sensitivity, specificity, and area under the receiver operator characteristic curves (AUC) compared with the diagnosis made by two inexperienced radiologists.

Results: The accuracy, sensitivity, and specificity of the inexperienced radiologists for the three glands ranged from 70.83%-77.78%, 52.08%-72.22%, and 76.38-98.61%, respectively. The DL achieved an accuracy of 92.01%, 93.40%, and 91.32%, sensitivity of 92.36%, 94.44%, and 93.75%, and specificity of 91.67%, 92.36%, and 88.89% for the SMG, PG, and LG respectively. The AUC for the DL outperformed all radiologists ($P < 0.001$ for each).

Conclusion: DL based on grayscale ultrasonography images has shown good performance in predicting pSS to aid in the precise assessment of pSS patients based on US images of SMG, PG, and LG.

SMS-RESOLVE DWI 技术联合人工智能诊断系统在急性脑梗死中的应用研究

黄炎、夏文强、林乐、孙树珂、张渊、廖启晴
河池市第一人民医院

目的: 评价 MR 同时多层采集 (SMS) 高清扩散成像 (RESOLVE) 技术联合人工智能 (AI) 诊断系统用于急性脑梗死成像的图像质量和诊断效能。

方法: 搜集 104 例急性脑梗死患者, 每例患者均扫描常规扩散加权成像 (DWI)、RESOLVE DWI 和 SMS-RESOLVE DWI 三种扩散序列。主观评价: 观察组由两名高年资医师采用双盲法, 使用李克特量表, 对急性脑梗死的 DWI ($b=1000s/mm^2$) 图像的三种 DWI 序列对病变显示情况进行主观评分。两周后再次进行评分, 观察评分一致性。研究组由 AI 进行评分。评价指标包括解剖结构的锐利度、图像变形程度、磁敏感伪影程度、整体图像质量等。客观测量: 测量三种 DWI 序列图像的信噪比 (SNR)、对比噪声比 (CNR)、信噪比效率 (SNRefficiency)、最小表观扩散系数 (ADCmin)、最大表观扩散系数 (ADCmax)、平均表观扩散系数 (ADCmean)。比较三种 DWI 序列图像的客观测量差异。

结果: 在主观评价中, 观察组评分稍高于研究组, 没有显著的统计学差异 ($P>0.05$)。观察组两位观察者间评分差距不大, 且具有很强的 consistency (Kappa 值 ≥ 0.75)。SMS 的主观图像质量各方面均优于常规 DWI 且存在统计学差异 (P 值均 <0.05), SMS-R 和 RESOLVE 的主观图像质量相当且没有显著的统计学差异 ($P>0.05$)。在客观测量中, 对于 SNR 和 CNR, SMS-R 高于常规 DWI 且存在明显统计学差异, SMS-R 与 RESOLVE 无明显统计学差异 ($P>0.05$); 三种 DWI 的 SNRefficiency 存在明显统计学差异, SMS-R 的 SNRefficiency 最高, RESOLVE 次之, 常规 DWI 最低。三种 DWI 序列的 ADCmin、ADCmax、ADCmean 均无统计学差异 (P 值均 >0.05)。

结论: SMS-RESOLVE DWI 的图像质量优于常规 DWI, 且在拥有较高 SNRefficiency 的条件下与 RESOLVE DWI 的主观图像质量相当。SMS-RESOLVE DWI 技术能够在不降低图像质量的基础上缩短检查所需时间, 提高 AI 诊断效能, 在急性脑梗死成像中值得推广。

Structural brain differences between temporal and frontal lobe epilepsy patients analyzed based on artificial intelligence voxels and morphometry

Yifan Chang, Yunling Wang, JingJing Duan, Wenhui Ma, Wenxiao Jia
The First Affiliated Hospital of Xinjiang Medical University

OBJECTIVE Several studies have now tentatively elucidated the effects of chronic seizures in focal epilepsy on brain volume. In order to further define the structural brain differences between temporal lobe epilepsy (TLE) and extratemporal epilepsy (ETLE), the structural brain differences in patients with confirmed epileptic volume were retrospectively analyzed. **METHODS** Voxel-based morphometry (VBM) was used to analyze morphometric brain differences between the brains of TLE patients, ETLE (frontal lobe epilepsy FLE was chosen as a replacement) patients, and healthy controls. Morphometric differences in gray matter, hippocampus, and thalamus were included. **RESULTS** The analysis showed a significant reduction in the volume of the lower part of the left hippocampus in the left temporal lobe epilepsy group (LTLE group) and the lateral portion of the right hippocampus in the right temporal lobe epilepsy group (RTLE group) compared to the control group ($p<0.05$). There was also a significant difference between the LTLE group and the controls in the bilateral thalamus ($p<0.05$). FLE patients did not show a focal

atrophy of the entire gray matter of the brain ($p>0.05$). **CONCLUSION** Our results further elucidate the differences in brain morphological changes between different seizure regions and provide important insights into the comprehensive treatment of patients with refractory epilepsy in different seizure regions.

A two-stage deep-learning framework in CT denoising based on structure-unaligned paired dataset in real world

Yongsheng Xie¹, Ruibao Hu², Lijian Liu¹, Honghong Luo¹, Dehong Luo¹, Zhou Liu¹, Zhanli Hu²

1. Department of Radiology, National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital & Shenzhen Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College
2. Lauterbur Research Center for Biomedical Imaging, Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

Background: In real world, soft tissue is hardly appreciable during lung cancer low-dose CT (LDCT) screening due to significant noise. Currently, deep learning-based LDCT denoising methods have achieved promising results, but they are mostly performed based on structurally aligned synthesized paired datasets, thus cannot be translated into real clinical practice. In this paper, we propose an LDCT denoising method based on clinically structure-unaligned but paired datasets (LDCT and normal dose CT (NDCT) in the same patient) in real world to improve the lesion detection and characterization during LDCT lung cancer screening.

Method: An initial cohort of 64 patients who had received consecutive LDCT and NDCT was enrolled in this study, and they were randomly divided into training (46) and testing (18) cohorts. We propose a two-stage training approach. A Gaussian noise perturbation was first added to the NDCT to generate structurally aligned simulated LDCT and used for the training of generator. In the second stage, the model is trained on a clinically structure-unaligned paired dataset using the Wasserstein generative adversarial network (WGAN) framework, with the initial weights of the generator obtained in the first stage of training. In addition, we introduce an attention mechanism in the proposed network to capture richer context dependencies to improve the quality of the CT.

Result: Validated on a clinical CT dataset, our proposed method outperformed other available methods [CycleGAN, Pixel2Pixel, block-matching and 3D filtering (BM3D)], in noise removal and detail retention, and also peak signal-to-noise ratio (PSNR), structural similarity index measure (SSIM) and root mean square error (RMSE) metrics. The probability density profile of the denoised CT using our method best fits the reference NDCT. Also, our two-stage model outperforms one-stage WGAN-based model in both objective and subjective evaluations, which further demonstrates the higher effectiveness of the two-stage training approach.

Conclusion: The proposed method removes noise from LDCT well and has good detail retention, which will potentially enhance the lesion detection and characterization in surrounding soft-tissues in the lung cancer LDCT screening. In both qualitative and quantitative evaluation, the proposed method outperforms the comparison method.

CT、MRI 及其新技术临床应用与基础研究

陈庆
徐州医科大学附属医院

本文旨在探讨 CT、MRI 及其新技术在临床应用与基础研究中的重要性，本文将从目的、方法、结果和讨论四个方面进行阐述。目的：本研究旨在评估 CT、MRI 及其新技术在临床应用和基础研究中的重要性，并探讨这些技术的发展趋势。方法：本研究采用文献综述法，首先收集了近年来发表

的国内外相关文献,包括期刊文章、学术论文、专利、技术报告、研究报告等。然后对文献进行筛选,选取与本研究主题相关、具有代表性和权威性的文献进行总结。以确定 CT、MRI 及其新技术在临床应用和基础研究中的应用范围和研究进展。结果:CT、MRI 及其新技术在临床应用和基础研究中都具有广泛的应用前景。在临床应用方面,CT 和 MRI 是常用的医学成像技术,已成为肿瘤、神经疾病、心血管疾病等疾病的重要诊断手段。此外,随着 CT 和 MRI 技术的不断发展,许多新的技术也相继出现,例如:CT 冠状动脉造影(CTA)、磁共振血管造影(MRA)、功能性磁共振成像(fMRI)等,这些技术已经广泛应用于临床诊断和治疗。在基础研究方面,CT 和 MRI 技术的出现,使得科学家可以对生物体的结构、功能、代谢等方面进行研究,为生物学、医学等领域的研究提供了强有力的工具。讨论:CT、MRI 及其新技术的出现,极大地推动了医学成像技术的发展。这些技术具有非侵入性、高分辨率、多参数等优点,可以提供更为准确、可靠的医学图像信息。同时,随着技术的不断进步,CT 和 MRI 的应用范围也在不断扩大,新技术的涌现也给医学成像领域带来了更多的发展机遇。但是,CT 和 MRI 技术也存在一些局限性,例如:对某些病灶的检测不够敏感、对某些病灶无法鉴别等。因此,未来的研究应当着重发展新的技术,以克服这些局限性,并进一步提高医学成像技术的准确性和可靠性。此外,CT 和 MRI 技术在应用过程中也存在一些问题,如剂量较大、成本较高等。为了更好地推广这些技术,未来的研究应当着重解决这些问题,以提高技术的普及率和利用率。CT、MRI 及其新技术在临床应用和基础研究中具有广泛的应用前景,是医学成像领域的重要组成部分。未来的研究应当着重发展新技术、克服技术局限性、解决应用问题,以推动医学成像技术的发展和应用。

磁共振灌注成像技术联合人工智能诊断系统在急性脑卒中的应用研究

黄炎、林乐、夏文强、孙树珂、张渊、廖启晴
河池市第一人民医院

目的:探讨磁共振灌注成像技术联合人工智能诊断系统用于急性脑卒中成像的图像质量和诊断效能。方法:搜集 104 例急性脑梗死患者,52 例进行了动脉血质子自旋标记成像(ASL)序列扫描的为观察组;常规注射对比剂的动态磁敏感对比增强灌注成像序列(DSC)52 例为对照组,将两组所获图像上传至 Fast—Stroke AI 诊断系统进行分析。并由两名放射科高年资医师采用双盲法,使用 Likert scale (李克特量表)对两组序列 AI 处理出的伪彩图进行主观评分,观察两组伪彩图图像是否满足诊断要求,且二者之间的图像清晰度、图像失真以及伪影是否存在差异。两周后再次进行评分,观察评分一致性。客观测量为根据 AI 计算的两组 CBF 参数,进行组间检验。结果:在主观评估中,两位观察者的评分差距不大且具有较强至很强的一致性(Kappa 值 ≥ 0.75)。ASL 和 DSC 的伪彩图主观图像质量相当且没有显著的统计学差异($P>0.05$)。在客观测量中,两组 CBF 参数间没有显著的统计学差异($P>0.05$)。结论:急性脑卒中是目前我国常见的致残率及致死率较高的疾病,PWI 技术对其诊断准确性较高,且可以判断半暗带的存在。不使用对比剂是 ASL 序列的优点,但早期该技术成熟度不高,与 DSC 序列对比尚存在差距。现 ASL 技术发展迅速,且 AI 诊断系统对 ASL 和 DSC 序列都具有良好的诊断效能,二者结合在急性脑梗死成像中值得推广。

Discriminating struvite from non-struvite using machine learning-based unenhanced CT: Comparing with conventional mean and standard deviation of Hounsfield units

Xuesong Li¹, Jianlin LV¹, Yusheng Yu¹, Lian Yang¹, Guopeng Yang², Jun Shao¹, Chunping Jia¹, Hong Zhang¹
1. The Affiliated Jiangning Hospital of Nanjing Medical University
2. Nanjing Tuobai Medical Consulting Service Co., LTD

Objective: This study aims to explore the feasibility of a machine learning(ML) model based on texture features extracted from unenhanced Computed tomography images in identifying struvite and to compare with the mean Hounsfield units(HUm) and the standard deviation of Hounsfield units(HU_{sd}) to provide a better method with which to guide the treatment of struvite.

Materials and methods: A total of 63 patients with 146 stones with known components were included. Unenhanced Computed tomography images of stones were used to measure the HUm and HU_{sd} and extract texture features. A dimension reduction was performed using the significance test and Pearson's correlation coefficient. Optional textural features were used to establish the ML model. The diagnostic performances of the HUm, HU_{sd}, and ML models were evaluated using receiver operating characteristic curve analysis. The diagnostic performances of the three methods were compared by means of DeLong's test.

Results: The HUm of struvite was higher than that of non-struvite ($P = 0.026$, training group; $P = 0.026$, test group). The HU_{sd} between struvite and non-struvite had no statistical difference ($P = 0.811$, training group; $P = 0.097$, test group). The area under the curve of the ML model was higher than the HUm (training group: 0.928; test group: 0.836).

Conclusions: The conventional HU_{sd} had little worth in discriminating between struvite and non-struvite. The HUm and the ML model had certain guidance concerning identifying struvite, with the ML model performing better than the HUm.

基于平扫 CT 的肝内占位性病变智能识别及诊断的多中心研究

马庄宣、金惊、杨楠、李铭
复旦大学附属华东医院

目的: 肝内的占位性病变影像诊断一般需多期 CT/MRI 增强扫描辨识, 平扫 CT 由于诊断信息不足难以确诊, 但其快速、便捷、安全、空间分辨率高等特性使其成为临床筛查中的首选方式之一。本研究采用基于 nnDetection 的医学目标识别算法, 在平扫 CT 上辅助放射科医师快速发现并识别容易被漏诊和误诊的肝脏占位性病灶, 同时建立了基于影像组学特征融合患者临床信息的自动机器学习模型, 实现在平扫 CT 上对肝内占位性病变识别与分类诊断, 为临床早期诊断和治疗提供依据, 改善患者预后。

方法: 本研究拟尝试使用增强 CT/MRI 多期增强确诊或病理确诊的肝内占位性病灶作为金标准进行深度学习建模, 借助人工智能技术在平扫 CT 上准确识别肝内占位性病变, 提高平扫 CT 的诊断效率, 帮助临床医师在第一次筛查时就能识别病灶的存在, 最大限度降低漏诊的可能性, 及早对需要处理的病灶进行精准治疗, 以此显著改善患者的预后。之后, 同样以金标准为参考, 由放射医师手动勾画出患者平扫 CT 图像的病灶轮廓, 在 3D Slicer 中提取放射组学特征。通过自动机器学习算法筛选出最相关的放射组学特征同时建立分类模型, 进行鉴别诊断, 以确定疾病的类型, 为临床治疗提供依据。

结果: 研究入组了 3 个独立医学中心的 300 例患者的 349 个病种图像, 包括恶性肿瘤共 89 例 (其中 34 例肝癌, 6 例胆管细胞癌, 49 例转移瘤), 112 例血管瘤, 108 例肝囊肿及 40 例肝脓肿。通过 nnDetection 识别肝内占位性病灶, 并且通过自动机器学习算法, 筛选出最相关的放射组学特征并建立了诊断模型, 最终在内部验证集及外部验证集上测试其准确率, 得到的结果在上述多种病灶的 AUC 值均在 0.9 以上。

结论: 本研究率先提出基于平扫 CT 对肝内占位性病灶进行识别与诊断, 特别是针对隐匿性肝癌 (平扫 CT 难以发现) 进行早期智能识别, 降低在平扫 CT 中可能出现的漏诊和误诊率, 以提高肝癌患者的治疗效果和改善患者预后。同时, 通过基于影像组学的智能算法, 鉴别诊断不同类型的肝内占位性病灶, 以实现精准治疗, 准确定位。本研究的实施, 将大大提高平扫 CT 的诊断效率, 同时可以减少患者进行多次不必要的增强扫描。

MSCT 后处理技术在耳硬化症诊断中的应用

马鸣岳、张宏、鄢小平、杨想春、杨静、银小辉、董燕、刘润
西安交通大学医学院附属西安市中心医院放射科

摘要:

目的 探究多层螺旋 CT (MSCT) 后处理技术在耳硬化症诊断中的价值。

方法 收集 47 例 (92 耳) 耳硬化症患者及同期 65 例 (79 耳) 非耳硬化症听力障碍患者的 MSCT 图像及临床资料, 对其原始 MSCT 轴位图像进行回顾性分析, 并行 MSCT 图像后处理, 包括镫骨、耳蜗多平面重组 (MPR) 以及听骨链曲面重组 (CPR), 比较原始 MSCT 轴位图像及 MSCT 后处理图像对耳硬化症的检出率。

结果 112 例 (171 耳) 患者中, 经原始 MSCT 轴位图像诊断耳硬化症 33 例 (66 耳), 4 例 (6 耳) 非耳硬化症听力障碍患者被误诊为耳硬化症; 行 MSCT 图像后处理诊断耳硬化症 45 例 (89 耳), 2 例 (3 耳) 非耳硬化症听力障碍患者被误诊为耳硬化症; 利用原始 MSCT 轴位图像诊断耳硬化症与采用 MSCT 后处理技术对耳硬化症的灵敏度分别为 71.74%、96.74%, 诊断符合率分别为 81.29%、96.49%, 二者对耳硬化症的检出率比较差异具统计学意义 ($P < 0.05$); 采用 MSCT 后处理技术能够全方位、更直观显示耳硬化症病变, 显著提高诊断准确性。

结论 MSCT 后处理技术对于耳硬化症的检出率和准确性均优于原始 MSCT 轴位图像, 可为耳硬化症的治疗决策提供有价值的影像学资料。

基于深度学习的 X 线胸片气胸检测与半定量分析

周蕾蕾
南京市第一医院

目的 胸片是诊断胸部和心脏疾病 (如心脏肥大、气胸和胸腔积液等) 常见的无创筛查技术之一。近年来, 由于计算机技术的发展和胸片数据集的开源, 深度学习方法已应用于如胸片图像的分类、疾病检测和病灶定位等。但大多数网络只能通过热图或矩形边界框方法定位病变的高概率位置, 并不能准确识别病变边界, 一定程度上限制了半定量分析的研究。本文建立气胸胸片数据库, 并开发和评估用于胸部 X 光片 (CXR) 气胸检测和半定量分析的深度学习模型。

方法 在这项回顾性研究中, 深度学习模型被训练用于病变检测和胸廓分割。气胸检测数据集包含 1081 张 CXR 图像 (来自 936 名患者)。肺分割数据集来自公共数据集, 由 704 张 CXR 图像组成。

训练 Mask-RCNNs+PointRend 模型实现气胸的检测, U-Net 模型实现胸廓的分割。在准确检测和分割的基础上, 计算气胸的半定量指标 (肺压缩程度=1-患侧肺野的面积 /患侧胸廓的面积)。气胸检测和半定量分析框架如图 1 所示。检测性能通过平均精度 (AP) 和受试者操作特性自由反应 (FROC) 得分进行评估, 重叠度 (IoU) 大于 75%即 AP75、FROC score75。分割效果通过 Dice 相似系数(Dice)进行评估。

结果 本文模型实现了高精度的气胸检测(AP75 = 71.2%; FROC score75 = 0.728), 不同 IoU 阈值下的 FROC 曲线如图 2 所示。胸廓(Dice = 0.960)、气胸(Dice = 0.827)分割效果良好, 为半定量分析提供了重要支持, 基于肺压缩程度的半定量分析结果如图 3 所示。

结论 本文设计和开发的模型可以实现基于胸片的气胸检测, 并且能够提供相应的半定量指标, 可以进一步的为临床气胸诊断提供依据。

基于影像组学的肌肉成分分析在预测肝移植术后并发症中的研究

石鑫、张蓓、王继萍
吉林大学第一医院

目的 将肌肉内部按照不同的密度范围划分成不同的亚区, 进一步研究肌肉密度改变对原位肝移植 (OLT) 术后并发症 (Clavien-Dindo \geq III) 的影响, 并且利用影像组学的方法对肌肉进一步分析, 从而建立全新的预测模型评估 OLT 患者术后并发症的发生情况。

方法 回顾性分析 2013 年 5 月至 2020 年 9 月 145 例就诊于吉林大学第一医院 OLT 患者的临床及影像相关信息, 选取患者腰 3 椎体水平最大层面的 CT 平扫图像作为原始图像数据, 利用 Neusoft Fat Analysis 软件以及 3D slice 软件对原始 CT 平扫图像进行相关肌肉参数的测量以及肌肉感兴趣的勾画, 并利用 RIAS 软件进行影像组学特征的提取和分析建模。

结果 采用肌肉分层分析前的临床特征建立逻辑回归 (LR)、支持向量机 (SVM)、随机森林 (RFC) 三种机器学习模型, 其中 RFC-C 模型测试集的 AUC 值较高为 0.803 (95%CI: 0.660-0.946)、灵敏度 0.588, 特异度 0.778。利用肌肉分层分析后的临床特征建立的模型中, SVM-CS 模型测试集的 AUC 值较高为 0.852 (95%CI: 0.713-0.991)、灵敏度 0.706、特异度 0.926。单独使用影像组学特征建立的三种模型中, LR-R 和 SVM-R 测试集的 AUC 值均较高, LR-R 模型测试集 AUC 值为 0.941 (95%CI: 0.878-1.000)、灵敏度 0.765、特异度 0.926; SVM-R 模型测试集 AUC 值为 0.946 (95%CI: 0.886-1.000)、灵敏度 0.765、特异度 0.889, 通过多种模型间 ROC 曲线的 DeLong 检验、决策分析曲线等表明肌肉内部分层分析确实能够提升临床预测模型的效能, 且影像组学模型的效能较好。

结论 利用分层分析的方法将肌肉按照不同的密度划分成不同子区, 对于预测 OLT 患者术后并发症情况存在一定价值, 值得我们进一步探讨和研究, 肌肉影像组学分析可能为预测 OLT 患者术后并发症 (Clavien-Dindo \geq III) 提供新的方法和思路。

基于调查问卷分析国内儿童骨龄评估现状及发展趋势

白凤森
首都儿科研究所附属儿童医院

目的: 基于调查问卷分析、对比国内儿童骨龄各评估方法的应用现状, 据此推测发展趋势, 特别是人工智能(Artificial Intelligence, AI)骨龄评价系统在临床中的应用。方法: 收集涵盖全国 26 个省市, 涉及 241 所医疗机构 (三级、二级), 关于骨龄评估常见临床问题的问卷 450 份, 涉及各类 22 个

问题;汇总统计分析各类问题的结果。结果:骨龄测量在医疗机构中广泛开展,二、三级医院间存在部分差异。对于骨龄评估的必要性基本达成共识,以左手腕摄片为主(75.9%),方法分为图谱法(73.04%)及计分法(15.8%)。AI技术的应用处于早期阶段(11.2%),但大多数受访者(98.6%)对此抱有期望。结论:骨龄评估存在检查标准欠规范,评估标准不统一,评估结果欠精确问题;临床医生对AI技术辅助诊断,保有较大期望。

18F-FDG PETMR 影像组学特征在预测儿童横纹肌肉瘤病理分型中的价值

许远帆、梁江涛、潘建虎
杭州全景医学影像诊断中心

目的:探讨 18F-FDG PET/MR 影像组学特征在预测儿童横纹肌肉瘤病理分型中的价值。

方法:收集 125 例经过病理确诊的横纹肌肉瘤患儿的临床资料和 PET/MR 影像资料。分为两组:胚胎性横纹肌肉瘤(ERMS)(n=75)和腺泡型横纹肌肉瘤(ARMS)(n=50)。病理和临床诊断结果作为诊断的金标准。我们使用 AK 软件提取与肿瘤分类最相关的影像组学特征,将两组图像随机分为训练集(70%)和测试集(30%)。使用最大相关性和最小冗余(mRMR)和最小绝对收缩和选择算子(LASSO)方法从 MR 和 PET 提取的 1800 个特征中选择特征,最终保留了八个最佳特征。使用影像组学特征和临床变量进行多变量逻辑回归分析,以建立预测模型。接收机工作特性(ROC)分析用于评估预测模型。

结果:建立的 PET/MR 影像组学特征对识别 ERMS 和 ARMS 分类具有更好的预测效率,并且存在显著差异。训练组和验证组的 AUC 分别为 0.918(95%CI:0.783-0.979)和 0.856(95%CI:0.775-0.996)。

结论:PET/MR 影像组学特征预测模型可作为预测儿童横纹肌肉瘤病理分型的一种有前途和实用的辅助方法。它还可以为准确的临床诊断和个体化治疗提供客观依据,对临床治疗具有重要的指导意义。

PU-1314

基于海马自动分割技术对正常成年人海马亚区血流灌注测量一致性 & 可重复性研究

闫梦楠、郭婷、陈兵(通讯)
宁夏医科大学总医院

目的:基于 FreeSurfer 海马亚区分割技术,评价两种方法测量正常成年人海马亚区血流灌注的一致性 & 可重复性。方法:收集 2022 年 8 月-2023 年 8 月 60 例健康志愿者纳入本研究,每例均在 GE SIGNA Architect 3.0T 磁共振仪上采集轴位 T1 加权三维磁化强度预备梯度回波(T1-MPRAGE)序列及三维伪连续式动脉自旋标记(3D-pCASL)序列。使用 FreeSurfer 7.3.2 版对 T1-MPRAGE 图像行海马亚区自动分割,利用分割出来的海马亚区与 3D-pCASL 映射的方法,进行基于 FreeSurfer 半自动测量和基于 ITK-SNAP 全自动测量海马亚区血流量(CBF 值),使用组内相关系数(ICC)、Bland-Altman 图及独立样本 t 检验评价两种测量方法之间的一致性和可重复性。结果:2 种方法测量海马亚区 CBF 值的组间 ICC 均>0.88,平均组间 ICC 为 0.934±0.031,各海马亚区组间 ICC 分别为左侧海马(下托 Sub: 0.905; CA1: 0.891; CA2-3: 0.945; CA4: 0.943; DG: 0.959),右侧海马(下托 Sub: 0.914; CA1: 0.892; CA2-3: 0.953; CA4: 0.963; DG:

0.978), Bland-Altman 图可直观展示散点分布和一致性。独立样本 t 检验得出两种方法在测量海马各个亚区 CBF 值之间差异无统计学意义 (P 均 >0.05), 说明二种测量海马亚区 CBF 值的方法之间一致性良好。结论: 基于 FreeSurfer 海马亚区分割方法, 评价正常成年人基于 FreeSurfer 半自动测量海马亚区 CBF 值与基于 ITK-SNAP 全自动测量海马亚区 CBF 值具备较高的一致性且重复性强, 为临床诊疗中了解海马亚区血流灌注提供可能。

PU-1315

超声影像组学在淋巴结病变中的研究进展

胡艳君

辽宁省肿瘤医院

目的: 不同病因引起的淋巴结病变的治疗策略大不相同, 术前准确地诊断淋巴结病变能够减少不必要的侵入性检查。仅依靠超声视觉特征评估淋巴结病变单一且主观, 目前影像组学发展迅猛, 超声影像组学预测淋巴结来源的研究日益增多, 有望对传统的视觉特征预测结果加以补充。

方法: 1. 超声影像组学预测淋巴结病变具体病因: 朱等人基于 763 例患者的 B 模态超声和彩色多普勒超声图像, 构建不明原因 CLA 的层次诊断模型, 通过 DL 算法从双模态超声图像中提取高通量定量特征, 所建模型区分反应性增生、结核性淋巴结炎、淋巴瘤和转移性 CLA 的 AUC 分别 0.964、0.873、0.837 和 0.840。Liu 等人通过 LASSO 和 SVM 算法对 B 模式图像提取定量特征来区分结核性淋巴结炎、反应性增生、淋巴瘤和转移性淋巴结, 诊断结果表明模型在测试集中的诊断性能虽略优于高年资超声医师, 但对四种病因的诊断性能中等, 敏感性分别 49.6%、22.5%、38.7% 及 60.6%。

2. 超声影像组学预测转移性淋巴结病变原发肿瘤来源: 有研究基于转移性 CLA 患者的 BUS 图像、CDFI 图像、超声弹性图像、超声造影视频及临床信息, 构建 DL 多步模态融合模型以诊断转移性 CLA 鳞状细胞癌亚型和腺细胞癌亚型, 所建模型在预测转移性 CLA 原发肿瘤来源中具有最高性能 0.822。模型预转移性 CLA 来自 HNSCC、TC、LC 和 GIC 来源的 AUC 和准确性分别为 0.869 和 85.1%, 0.838 和 87.3%, 0.750 和 67.3%, 0.829 和 77.8%。

结果: 基于超声图像的影像组学模型在诊断反应性增生、结核性淋巴结炎、淋巴瘤和恶性肿瘤淋巴结转移具有较高的准确性敏感性和特异性, 可减少诊断延误和不必要的侵入性检查。联合临床特征的综合模型性能显著高于经验丰富的超声医师, 有望协助临床快速定位原发肿瘤, 为后续治疗提供积极指导。

结论: 基于超声影像组学可预测淋巴结疾病的具体病因, 且对转移性淋巴结患者的原发肿瘤来源具有良好的预测性能, 可成为指导个性化诊疗的潜在工具。

Differentiating subcentimeter lung metastases in colorectal cancer by radiomics and deep learning: a retrospective multicenter study

Guohui Xu

Zhejiang Cancer Hospital

Background:

Preoperative evaluation of the indeterminate lung nodules is important for individual treatment of colorectal cancer (CRC). We aim to develop and validate discriminative radiomics and deep learning approaches for differentiating subcentimeter lung metastases (LMs) in CRC patients.

Methods:

Models were developed in a primary cohort included 1194 consecutive CRC patients with initial subcentimeter size LMs on CT. Patients were randomly assigned (7:3) to the training or internal validation cohorts (IVC). Machine learning (ML), deep learning (DL), and the integration of radiomics and DL features were applied to classify the subcentimeter lung nodules as LMs or benign lesions. Two independent external validation cohorts (EVC) consisted of 101 (EVC1) and 40 (EVC2) patients. To verify the generalizability for nodules of smaller sizes, stepwise validations on the subgroups according to the nodule's largest diameter (10, 9, 8, 7, 6, 5, ≤ 4 mm) were conducted.

Results:

The diagnostic accuracy by radiologists was 0.705 in primary cohort. The best ML based on support vector machine (SVM) showed a 0.981 area under the curve (AUC) in IVC, a 0.961 and 0.996 AUC in EVC1 and EVC2. The best integration model showed a 0.973 AUC in the IVC and a 0.943 and 0.974 AUC in EVC1 and EVC2. The DL model showed a 0.953 AUC in the IVC and a 0.907 and 0.951 AUC in EVC1 and EVC2. Stepwise validation demonstrated that with the LM diameter decreasing, the integration model was the most stable with smaller LMs, and was the best for LM ≤ 5 mm.

Conclusions:

Our findings showed that radiomics of machine learning approaches based on CT could improve current diagnostic accuracy of subcentimeter CRC LMs. Specially, novel integration model was the best with LMs ≤ 5 mm. This study provided an automatic and noninvasive solution for determining subcentimeter LMs in the individual management of CRC.

PU-1317**应用人工智能自动评估胸部 CT 胸椎骨密度以筛查骨质疏松症**

张玉娟¹、龚沈初¹、王林¹、曹蕊¹、林鹏程²、张堃²

1. 南通市第一人民医院

2. 南通大学电气工程学院

目的: 以定量计算机断层扫描(QCT)腰椎骨密度为参考标准, 开发一种人工智能程序, 用于在胸部 CT 图像上评估胸 5-胸 8 的骨密度以筛查骨质疏松症。

方法: 连续选择自 2021 年 1 月至 2021 年 12 月因“肺结节复查”于我院行胸部 CT 平扫的体检患者, 共纳入 1014 例患者, 随机分为训练集和测试集。将腰椎 QCT 扫描图像传入 QCT Pro 工作站并测量椎体骨密度, 根据骨密度值将患者分为骨密度正常、低骨量和骨质疏松者。在训练集中, 应用 python3.6.12 软件, 构建深度卷积神经网络(DCNN)模型。在测试集中, 使用受试者工作特征(ROC)曲线分析评估深度学习模型对骨密度正常、低骨量、骨质疏松的诊断价值, 计算 ROC 曲线下面积(area under curve, AUC)及敏感性、特异性、准确性。

结果: 1014 例患者随机分为训练数据集 436 例和测试数据集 578 例。训练数据集中, 骨密度正常者 235 例, 低骨量者 121 例, 骨质疏松者 80 例。测试数据集中, 骨密度正常者 386 例, 低骨量者 146 例, 骨质疏松者 46 例。ROC 曲线分析显示, 深度学习模型分类骨密度正常、低骨量、骨质疏松的 AUC 值分别为 0.952、0.901、0.975, 准确性分别为 0.894、0.860、0.962。

结论: 基于胸部 CT 图像上胸 5-胸 8 椎体的深度学习模型有助于筛查骨质疏松症, 有利于早期发现低骨量和骨质疏松患者以提高治疗效果、改善患者生活质量。

PU-1318**基于对比增强双能计算机断层扫描诊断恶性肿瘤患者转移淋巴结的准确性:一项系统回顾和荟萃分析**

孔德瑞
山东省肿瘤医院

目的: 目前, 尚未有系统评价和或 Meta 分析来评估对比增强双能 CT 在转移淋巴结中的应用价值, 本研究系统评价双能 CT 在淋巴结转移中的应用价值, 为临床实践提供循证学依据。

方法: 检索 PubMed、Embase 和 Cochrane 图书馆数据库从建库至 2022 年 9 月发表的相关文献。仅纳入了探讨 DECT 对恶性肿瘤患者转移性淋巴结的诊断准确性, 并且手术切得到病理证实的研究。使用诊断准确性研究质量评估工具对纳入研究的质量进行评估。通过计算 Spearman 相关系数和 SROC 曲线来确定阈值效应。采用 Deeks 检验评估发表偏倚。

结果: 所有纳入的研究均为观察性研究。本综述共纳入 16 篇文章, 涉及 984 例患者(2577 个淋巴结)。meta 分析共纳入 15 个变量, 其中单独参数 6 个, 组合参数 9 个。动脉期标准化碘浓度(NIC)结合动脉期斜率能更好地识别转移淋巴结。spearman 相关系数为- 0.371 ($P=0.468$), SROC 曲线不呈“肩-臂”形, 说明不存在阈值效应, 但存在异质性。联合敏感性为 94%[95% CI: 86 ~ 98%], 特异性为 74% (95% CI: 52 ~ 88%), 曲线下面积为 0.94。Deeks 检验显示纳入的研究没有显著的发表偏倚($P=0.06$)。

结论: 动脉期 NIC 联合动脉期斜率对鉴别转移性淋巴结和良性淋巴结有一定的诊断价值, 但应在严格设计和高度均匀性的其他研究中进一步评估。

PU-1319

Predictive value of hepatoid adenocarcinoma of the stomach based on CT Radiomics

Xiaoyu Gu, Bo Yin
Huashan Hospital, Fudan University

Objective:

Based on the results of studies above, we found the venous phase images had the best predictive value for gastric hepatoid adenocarcinoma. The predictive model of radiomics features extracted from the venous phase was constructed. The nomogram model was established in the combination of the location of lesion, serum AFP, CT attenuation values of the venous phase and radiomics model of the venous phase which efficiency was evaluated for predictive value of gastric hepatoid adenocarcinoma.

Materials and Methods:

44 gastric hepatoid adenocarcinoma cases(31 in the training set, 13 in the validation set) and 116 common gastric adenocarcinoma cases(81 in the training set, 35 in the validation set) were randomly divided into the training set and the validation set in a ratio of 7:3. 3D-Slicer software was used to perform semi-automatic ROI segmentation of the lesion from the venous phase and extract radiomics features. Pycharm Community software was used to perform Lasso dimensionality reduction analysis so that the most diagnostic radiomics features of the venous phase were obtained. Logistic regression modeling method was used to establish the venous phase radiomics model which was combined with the location of lesion, serum AFP and CT attenuation values of venous phase to construct the nomogram model. ROC curves were drawn and AUC, sensitivity and specificity were calculated to evaluate the diagnostic efficiency of the venous phase radiomics model and the nomogram model both in the training set and the validation set.

Results:

1130 radiomics features were extracted from the ROI of the venous phase in the training set. 5 optimal radiomic features were selected by dimensionality reduction analysis(log_sigma_4_0_mm_3D_ngtdm_Strength、wavelet_LLH_firstorder_Maximum; wavelet_HHL_glcmlmc2、wavelet_HHH_glcmlInverseVariance、wavelet_LLL_firstorder_Mean). Logistic regression modeling method was used to build the venous phase radiomics model and the nomogram model. The AUC of the venous phase radiomics model in the training set and validation set were 0.896 and 0.808, with the sensitivity of 81.82% and 81.82% and the specificity of 84.81% and 70.27%. The AUC of the nomogram model in the training set and verification set were 0.957 and 0.973, with the sensitivity of 100.00% and 90.91% and the specificity of 81.01% and 97.30%.

Conclusion:

Our study established the nomogram model which was comprised by the combination of the location of lesion, serum AFP, CT attenuation values of the venous phase and optimal venous phase radiomics features. The predictive efficiency of the nomogram model was higher than that of the lesion location, serum AFP, CT attenuation values of venous phase and venous phase radiomics model. The nomogram model can be used to adjust the treatment before surgery in clinical course.

PU-1320

抑郁症患者大脑结构和功能的改变及其遗传机制：一项结合转录组的多中心研究

李庆贺、初同朋、毛宁
烟台毓璜顶医院

目的：抑郁症是一种高度复杂的神经异质性疾病，先前研究表明 MDD 患者的大脑结构和功能发生巨大改变。然而 MDD 患者大脑结构和功能改变背后的分子遗传机制仍不清楚。本研究旨在探索 MDD 患者大脑结构和功能改变的分子遗传机制并结合随机森林模型来诊断抑郁症患者。

方法：本研究包括 3 个独立的数据集。发现数据集包括 160 名抑郁症患者和 119 名匹配良好的健康对照者。验证数据集包括 54 名首发未经治疗的 MDD 患者和 78 名匹配 HCs 和来自自公共数据集的 126 名 MDD 患者和 124 名 HCs。我们基于动态功能连接的多层网络求出患者招募整合两个属性并基于体素的形态学分析来提取受试者的功能和结构特征。结合 Allen 人脑图谱进行转录组-神经成像关联分析，并求出结构和功能重叠的相关基因，以鉴定与 MDD 患者结构、功能变化相关的基因表达，随后进行基因特征分析。融合多模态神经影像特征并结合 RF 模型来诊断 MDD 患者，并探索 MDD 患者大脑结构、功能改变与临床症状的相关性。所有的研究过程都在两个验证数据集进行重复以验证实验的鲁棒性。

结果：我们发现抑郁症患者皮质-边缘系统（额叶、颞叶、海马...）的脑区结构功能显著改变。此外我们发现患者结构和功能改变重叠的基因为 884 个。这些基因在受试者的大脑皮层的重要分子功能、生物过程和细胞成分以及生物学行为中显著富集。此外，MDD 患者大脑结构和功能改变重叠的基因可以构建一个由 50 个具有功能意义枢纽基因支持的蛋白质-蛋白质相互作用网络。此外融合多模态神经影像特征的 RF 模型分类效率显著提高，模型的曲线下面积为 92.6%，灵敏度为 90%，特异性为 85%，准确率为 86%。识别的神经影像学特征可以很好地预测抑郁症患者的焦虑、抑郁量表评分以及患者的自杀风险。所有研究过程在验证数据集中得以重复，这也证明了我们实验方法的鲁棒性。

结论：我们研究结果表明，抑郁症患者大脑结构和功能改变可能是不同功能特征的广泛基因复杂作用结果。多模态神经影像特征对 MDD 患者有较高的诊断价值，为了解 MDD 的病理机制提供了重要的见解。

DLIR-H in head and neck CT angiography improves image quality and reduces both radiation and contrast doses

Bo Zhang, YANG SONG, YAOMING YANG, DELIANG MA
Dalian Municipal Central Hospital

Objectives :

To explore the use of 80-kVp tube voltage combined with high-DLIR-H in reducing radiation and contrast doses in head and neck CTA in patients with body BMI < 26 kg/m², in comparison with the conventional scan protocol using 100 kVp and ASIR-V.

Methods :

A total of 100 patients with suspected cerebrovascular disease referred to head and neck CTA were prospectively enrolled and randomly divided into two groups: low-dose group (n = 50) with 80 kVp, Smart mA for NI of 16 HU, contrast dose rate of 3.0mgI/s, and DLIR-H, conventional group (n = 50) with 100 kV, Smart mA for NI of 12HU, contrast dose rate of 4.5mgI/s, and 50% ASIR-V. Radiation and contrast dose, subjective image quality score, and objective image quality measurement (image noise, CNR, and SNR for vessel) were compared between the two groups. The stenosis degrees were measured on the patients receiving DSA in the low-dose group. Stenosis grade categories were as follows: mild stenosis (<50%), moderate stenosis (50%–74%), severe stenosis (75%–99%), and occlusion (100%).

Results:

Low-dose group used reduced contrast dose (30mL, 33.3% reduction) and radiation dose (1.94 ± 0.22 mSv, 34.7% reduction) compared to the conventional group (45 mL) and (2.97 ± 0.25 mSv) ($p < 0.001$). Vascular enhancement was higher in the low-dose group than conventional-dose group ($p < 0.01$). The remaining five segments (CCA, ICA, MCA, VA, BA) except for the aortic arch all have higher CNR, SNR and lower image noise (all $p < 0.001$). For 21 patients received DSA, included a total of 368 vascular segments. The weighted K coefficient between the CTA and DSA stenosis detection was 0.82 ± 0.03 . Diagnostic performance of CTA had good consistency with DSA.

Conclusions:

The use of 80-kVp tube voltage combined with DLIR-H for head and neck CTA in normal size patients significantly reduces radiation dose and contrast dose while further improving image quality and accuracy compared with the conventional 100-kVp tube voltage with 50% ASIR-V.

PU-1322

Research on the establishment of a model for predicting soft plaques based on right-dominant coronary CT angiography using coronary periadventitial adipose tissue

Junli Yu
Qiqihar Medical University

Purpose: The purpose of this research study was to establish clinical, radiomics, and combined models based on perivascular fat around the right-dominant coronary artery in coronary CT angiography (CCTA) images. The study aimed to construct Nomograms to explore their diagnostic value for soft plaque.

Methods: Retrospective data was collected from two academic medical centers between January 2022 and September 2023, including a total of 305 patients. All patients underwent CCTA examination for coronary artery evaluation, and clinical data were collected. The Third Affiliated Hospital of Qiqihar Medical College provided the training set, and the Second Affiliated Hospital of Qiqihar Medical College provided the external test set. On CT images, a three-dimensional volume of interest (VOI) containing perivascular fat around the proximal segment of the right coronary artery was delineated, and radiomics features were extracted. A radiomics model was established using machine learning methods on the training set and validated on the test set. Through feature selection and dimensionality reduction, a radiomics model was built. Additionally, a clinical model was established using baseline clinical features. Finally, a combined model was established by integrating radiomics features and clinical features, and the diagnostic performance of each model was analyzed using SVM, Random Forest, SGD, KNN, XGBoost, and LightGBM classifiers. The area under the receiver operating characteristic curve (AUC) was calculated to compare the performance of each model.

Results: The study included 305 patients with a mean age of 55 ± 10 years. Radiomics modeling showed that 106 patients had coronary soft plaque (34%). The radiomics model consisted of 7 radiomics features and achieved an AUC of 0.892, specificity of 80.5%, sensitivity of 81.7%, and accuracy of 79.8% on the test set. The clinical model achieved an AUC of 0.755, specificity of 72.4%, sensitivity of 73.6%, and accuracy of 76.3% on the test set. The combined model achieved an AUC of 0.931, specificity of 89.5%, sensitivity of 88.4%, and accuracy of 89.1% on the test set.

Conclusion: The clinical and radiomics combined model based on perivascular fat around the right-dominant coronary artery in CCTA images is better at predicting the presence of non-calcified plaques and has higher diagnostic accuracy. The Nomograms illustrate the testing performance of the model.

基于多参数磁共振的深度影像组学诺莫图术前区分 I 型和 II 型上皮性卵巢癌

魏明翔、陈双庆
南京医科大学附属苏州医院

目的: 开发并验证基于多参数磁共振成像 (MRI) 的深度学习影像组学诺莫图 (DLRN), 以区分 I 型和 II 型上皮性卵巢癌 (EOC)。

方法: 本回顾研究共纳入来自 5 个中心的 439 例 EOC 患者 (I 型 298 例, II 型 141 例)。其中一个中心的患者数据作为外部验证集, 剩余患者数据以 7:3 的比例划分为训练集和内部验证集。采用 T2 图像定界肿瘤 ROI, 并将 DWI 和 ADC 图像配准至 T2 加权图像。各参数图像中分别提取 1230 个影像组学特征。经单因素分析及 LASSO 筛选, 应用 10 次 10 折交叉验证, 频率超过 50% 的特征纳入影像组学模型。深度学习模型使用 ResNet50 神经网络, 将 T2、DWI 和 ADC 图像的病灶最大横断面进行前融合输入。单因素及多因素 logistic 回归分析以选择独立临床预测因子。将影像组学及深度学习模型的预测概率作为标签, 结合独立临床预测因子构建 DLRN。所有模型均采用 10 折交叉验证并行内、外部验证。使用 ROC 曲线、Brier 分数及决策曲线分析模型的诊断性能及临床应用价值。

结果: 十折交叉验证结果显示, DLRN 模型的 AUC 为 0.828 ± 0.088 , 无论 AUC 值及标准差均优于单一深度学习 (0.714 ± 0.153)、影像组学 (0.828 ± 0.088) 及临床模型 (0.714 ± 0.119)。无论在内部还是外部验证集, DLRN 模型的诊断效能最佳, AUC 分别为 0.849 (95%CI: 0.77, 0.919) 及 0.888 (95%CI: 0.826, 0.943), Brier 分数分别为 0.149 及 0.148。

结论: 本研究成功开发和验证了综合多参数 MRI 的 DLRN 模型, 有效区分了 I 型和 II 型 EOC 患者。模型在交叉验证、内部和外部测试集中的一致且高效能的表现有效地证明了其在未知数据集中的泛化性。本次研究有潜力为 EOC 患者的个体化治疗策略的制定提供新的视角。

PU-1324

人工智能在辅助冠状动脉 CTA 图像后处理的应用价值

徐铭雪、张磊
吉林大学第一医院放射科

目的: 探讨 CT 冠状动脉成像人工智能在辅助冠状动脉 CTA 图像后处理以及评估冠状动脉狭窄诊断价值

方法: 回顾性收集行冠状动脉 CTA 检查及冠状动脉 AI 软件辅助诊断完成, 并且在三个月内行有创冠状动脉造影的患者, 以有创冠状动脉造影检查结果为金标准, 统计分析人工智能在诊断冠状动脉狭窄的准确性。

结果: 在冠状动脉斑块及狭窄的诊断中, 人工智能辅助诊断与冠脉造影检查诊断结果比较有统计学差异 ($P < 0.05$)。人工智能与 ICA 对于检出冠状动脉狭窄程度大于 50% 的一致性较好。AI 与医生诊断对冠状动脉完全闭塞, 起源变异, 桥血管无统计学差异。

结论: CCTA 图像质量较好时, AI 诊断冠状动脉狭窄的准确性较高, 可作为诊断辅助诊断冠状动脉狭窄的工具, 但目前 AI 对于图像质量较差, 血管变异等的诊断能力有限。

PU-1325

OA-HybridCNN (OHC): 一种先进的深度学习融合模型, 用于提高膝关节骨关节炎成像的诊断准确性

田春燕、谷涛、刘晓彤
北京医院

背景: 膝骨关节炎(KOA)是全球致残的主要原因。早期和准确的诊断对于预防其发展和改善患者的生活质量至关重要。在骨性关节炎的诊断过程中, 偏远地区放射科医生诊断能力的不足和长期阅片导致的视觉疲劳常导致诊断准确性的不足, 因此, 准确的自动化诊断对于骨性关节炎的诊断是十分有必要的。

方法: 我们提出了一个先进的深度学习模型, OA-HybridCNN (OHC), 该模型结合了 ResNet 和 DenseNet 架构。这解决了 DenseNet 中的梯度消失问题, 并提高了预测准确性。我们通过五折交叉验证和外部测试与其他深度学习模型进行了有效性比较。

结果: 在所有性能指标中, OHC 模型均超越其他模型。在外部测试中, OHC 的准确率、精确度和召回率分别为 91.77%、92.34% 和 91.36%。在五折交叉验证中, 其平均 AUC 和 ACC 分别为 86.34% 和 87.42%。

结论: 深度学习, 尤其是 OHC 模型, 大大提高了 KOA 成像诊断的效率和准确性。采用此类技术将减轻放射科医生的工作负担, 并显著提高诊断的精确度。

能谱 CT 影像组学特征术前预测肝癌 CD105 高表达的初步研究

郁义星、王希明、胡春洪
苏州大学附属第一医院

目的:探讨能谱 CT 单能量图像影像组学模型在术前预测肝癌 CD105 高表达中的应用价值。

方法:本研究纳入了 92 例病理证实为肝细胞癌 (HCC) 并有 CD105 表达结果的患者,其中训练集 54 例,验证集 38 例,所有患者术前已行能谱 CT 增强检查。在 HCC 动脉期和门脉期图像中手工勾画出肿瘤感兴趣体积 (VOI),从中提取 1218 个影像组学特征。采用最小绝对收缩和选择算子 (LASSO) 回归 5 折交叉验证法进行特征筛选。利用 4 种机器学习算法构建动脉期和门脉期影像组学模型。利用 ROC 曲线评估模型的预测效能。

结果:基于动脉期影像组学特征构建决策树、随机森林、支持向量机和逻辑回归模型预测训练集肝癌 CD105 高表达的 AUC 值分别为 0.949、1.000、0.995 和 1.000,验证集中 AUC 分别为 0.735、0.810、0.844 和 0.745。4 种机器学习模型 AUC 的差异均无统计学意义 (均 $P>0.05$)。基于门脉期影像组学特征构建的决策树、随机森林、支持向量机和逻辑回归模型预测训练集肝癌 CD105 高表达的 AUC 值分别为 0.963、1.000、0.993 和 1.000,验证集中 AUC 分别为 0.645、0.855、0.748 和 0.713。随机森林与决策树和逻辑回归模型 AUC 的差异有统计学意义 ($P<0.05$),而其他机器学习模型 AUC 的差异无统计学意义 (均 $P>0.05$)。验证集中动脉期和门脉期影像组学模型的 AUC 的差异无统计学意义 ($P=0.854$)。

结论:基于肝癌动脉期和门脉期能谱 CT 70keV 单能量图像影像组学特征的机器学习模型可用于术前预测肝癌 CD105 高表达。其中,随机森林模型具有较高的预测效能。

PU-1327

基于 CT 影像组学构建机器学习模型鉴别基底节区结节状脑出血和钙化

陈意妮、张渊曼、孙博、浦仁旺、齐一伟、方鑫
大连医科大学附属第一医院

目的:通过基于 CT 平扫图像提取的影像组学特征结合机器学习方法构建鉴别基底节区结节状脑出血和钙化的模型并验证。

方法:回顾性纳入 2018 年 6 月—2023 年 6 月于行脑部 CT 平扫并经多次影像学检查证实的基底节区 65 个结节状 ($D_{\max}<2.00\text{cm}$) 脑出血和 114 个钙化灶,以 7:3 的比例随机分为两组,一组为训练集 ($n=125$),另一组为测试集 ($n=54$)。由两位高年资影像医师勾画病灶,使用 Python 中 "Pyradiomics" 包从每个感兴趣区 (ROI) 中提取训练组的影像组学特征。采用组内组间一致性分析选择高稳定性的特征,选择皮尔逊相关系数和特征选择分析 (方差分析 [ANOVA]、过滤式特征选择 [Relief]、Kruskal-Wallis [KW]、递归特征消除 [RFE]) 进行降维,并使用包括支持向量机 (SVM)、自编码器 (AE)、线性判别分析 (LDA)、随机森林 (RF)、逻辑回归 (LR)、通过 Lasso 进行逻辑回归 (LRLasso)、自适应增强 (AB)、决策树 (DT)、高斯过程 (GP)、朴素贝叶斯法 (NB) 在内的 10 个机器学习分类器进行了分类,结果通过留一交叉验证分析进行评估。

结果:每个 ROI 各提取 851 个特征。比较验证数据集中所有管道的 AUC,发现使用 RFE 特征选择和线性判别分析分类器的管道具有 10 个特征时的 AUC 最高。当使用 "一个标准误差" 规则时,FAE 使用 17 个特征生成了一个更简单的模型。训练集、验证集和测试集的 AUC 分别达到了

0.970、0.940 和 1.000。与 ANOVA、KW 和 relief 相比, RFE 特征选择的所有算法结果都更加稳定, 各 AUC 值均高于 0.7007。

结论: 基于 CT 平扫图像的组学机器学习分类模型鉴别诊断基底节区结节性脑出血和钙化具有较高效能, 可推广于临床上辅助诊断。

PU-1328

基于 bpMRI 的影像组学联合临床指标对前列腺癌包膜外侵犯评估价值的应用研究

杨丽勤

杭州市中医院

目的 评估基于 bpMRI 的影像组学—临床联合模型对 PCa ECE 的诊断效能。

方法 回顾性收集 392 例我院行 MRI 检查并经手术病理证实 PCa 患者的 bpMRI 图像及临床相关信息。按照 7: 3 的比例将患者随机分配至训练组和测试组。影像诊断医师在未知病理结果的情况下根据图像对所有病灶的 ECE 情况进行 Mehralivand 分级, 并对所有病灶进行勾画, 提取每个病灶的影像组学特征。经 Z-Score 标准化法特征归一化, RFE 算法去除冗余特征和 LASSO 分类器迭代训练, 构建影像组学模型。此外, 采用单因素和多因素二元 logistics 回归模型分析, 将临床相关信息中的独立预测因子筛选出来构建临床模型。随后将临床相关信息中的独立预测因子与影像组学模型结合, 构建联合模型; 同时根据联合模型指标构建评估 ECE 的诺模图。最后通过 Delong 检验和决策曲线分析比较临床模型、Mehralivand 分级、影像组学模型及联合模型对 ECE 的诊断效能。

结果 在训练组中, 联合模型和影像组学模型诊断 ECE 的 AUC 值分别为 0.897 和 0.882。基于测试组, 联合模型和影像组学模型对 ECE 的诊断效能相当[AUC 值分别为 0.894 和 0.835, $P>0.050$], 但联合模型具有更高的敏感度和准确度。另外, 在训练组和测试组中, 临床模型评估 ECE 的 AUC 值分别为 0.805 和 0.749, 均低于联合模型的诊断 AUC 值[均 $P<0.05$]; Mehralivand 分级评估 ECE 的 AUC 值分别为 0.746 和 0.774, 也均低于联合模型的诊断 AUC 值[均 $P<0.05$]。最后, 决策曲线分析表明, 联合模型较临床模型、Mehralivand 分级及影像组学模型可获得最高的临床净收益。

结论 基于 bpMRI 的影像组学—临床联合模型较临床模型、Mehralivand 分级及影像组学模型对 PCa 患者的 ECE 具有更好的评估价值, 有助于 PCa 患者术前个体化精准诊疗。

PU-1329

MSCT 后处理技术对慢性中耳乳突炎颞骨区骨质破坏的术前评估价值

马鸣岳、张宏、鄢小平、董燕、杨静、刘润、杨想春
西安交通大学医学院附属西安市中心医院放射科

目的

探讨 MSCT 后处理技术对慢性中耳乳突炎颞骨区骨质破坏的术前评估价值。

方法

对 156 例慢性中耳乳突炎患者行颞骨 MSCT 横断面高分辨率扫描并进行听小骨及听骨链、内耳(耳蜗、前庭及各组半规管)结构、面神经管等结构的多平面重组(MPR)及曲面重组(CPR), 观察颞骨区骨质结构破坏情况, 并与手术所见对照, 分析探讨颞骨 MSCT 后处理技术对慢性中耳乳突炎颞骨区骨质结构破坏的术前影像学评估价值。

结果

156 例慢性中耳乳突炎患者中，双耳患病 122 例，单耳患病 34 例，共计患耳 278 耳，胆脂瘤型中耳炎 74 耳，非胆脂瘤型中耳炎 204 耳；术前 MSCT 诊断胆脂瘤型中耳炎 68 耳，均与手术所见相符，6 耳术前 MSCT 诊断为非胆脂瘤型中耳炎者手术发现胆脂瘤；术前 MSCT 发现鼓室壁及鼓窦骨质破坏 68 耳，听小骨吸收破坏 108 耳（锤骨破坏 77 耳，砧骨破坏 62 耳，镫骨破坏 48 耳），水平半规管骨质破坏 9 耳，面神经管骨质破坏 12 耳，均与手术所见相符。

结论

颞骨 MSCT 后处理技术能清晰显示颞骨区诸骨质结构的全貌，可对慢性中耳乳突炎对颞骨区骨性结构破坏情况进行准确的术前评估，诊断效果与术中所见具有高度一致性。

CT 影像组学在鉴别肺淋巴上皮癌与腺癌中的应用价值研究

叶韬、李新春、伍志发、刘静
广州医科大学附属第一医院

肺淋巴上皮癌（LELC）在临床上较为罕见，其 CT 影像学表现与部分肺腺癌较难区分，掌握其放射组学特征有利于在影像上对该两类疾病进行鉴别，从而指导临床治疗。本研究拟探讨基于 CT 影像组学特征的机器学习模型在鉴别 LELC 与肺腺癌任务中的应用价值。

PU-1331

基于机器学习的 3.0T MRI 磁共振影像组学在脑胶质瘤术后放疗后复发的鉴别诊断价值

高飞、孙铭洁
安徽省肿瘤医院

目的 探讨基于机器学习的 3.0T MRI 磁共振影像组学在脑胶质瘤术后放疗后复发的鉴别诊断价值
方法 回顾性分析 2022 年 1 月至 2023 年 5 月在中国科学技术大学附属第一医院西区（安徽省肿瘤医院）接受手术治疗，放疗后常规 MRI 检查出现新强化灶的 77 例胶质瘤患者的 MRI 资料，在增强 T1WI 序列上提取影像组学特征。根据再次手术、临床及 MRI 随访结果综合诊断分为复发组（31 例），放射性脑坏死组（46 例）。所有患者按 8:2 比例分为训练组（n=61）和测试组（n=16），训练组用于特征筛选和建立影像组学模型，测试组用于验证所建立模型的可靠性。特征筛选由 Pearson Correlation 与选择算子回归（LASSO）完成，应用 logistic 回归构建影像组学模型预测脑胶质瘤术后放疗后状态。ROC 曲线和 AUC 值用于计算模型的预测性能。绘制校准曲线以评估预测概率和实际概率之间的一致性。通过决策曲线分析评估放射模型的应用价值。

结果 从每例患者的 T1WI 增强图像中共提取出 1874 个影像组学特征，并通过 Pearson Correlation 与选择算子回归（LASSO）筛选特征，得到的影像组学模型对脑胶质瘤术后放疗后复发具有较好的预测性能，在训练组中 AUC 为 0.934，在测试组中 AUC 为 0.733。校准曲线显示，预测概率和实际概率之间具有良好的一致性。临床决策曲线显示，当风险阈值为 15%~98% 时，采用影像组学方法预测脑胶质瘤术后放疗后复发的临床获益较高。

结论 利用 3.0T MRI T1WI 增强影像组学特征构建影像组学模型对于脑胶质瘤术后放疗后复发有较好的诊断效能，可为临床个体化治疗提供帮助。

PU-1332

多个扩散参数图在 2 型糖尿病与糖尿病肾病诊断中的效能评估： 基于自动分割构建的影像组学方法

杨道玉
贵州省人民医院

目的：基于自动分割肾脏 MR 影像构建影像组学模型，探讨扩散峰度成像（DKI）和扩散张量成像（DTI）的多个参数图在诊断 2 型糖尿病（T2DM）与糖尿病肾病（DKD）的效能。

方法：回顾性收集 2022 年 1 月至 2023 年 4 月在贵州省人民医院就诊的 163 例 T2DM 患者，并根据估算肾小球滤过率（eGFR）和尿白蛋白与肌酐比值（UACR）分为糖尿病(n=76)和糖尿病肾病(n=87)两个组。利用 DKI 的参数图[峰度各向异性（KFA）、平均扩散峰度(MK)、轴向扩散峰度（AK）、径向扩散峰度（RK）]以及 DTI 的参数图[部分各向异性（FA）、平均扩散度(MD)、轴向扩散度（AD）、径向扩散度（RD）]训练 SWIN UNETR 模型对肾脏进行自动分割，将其划分为训练集(n=114)及验证集（n=49），对验证集采用 Dice 相似系数（DSC）评估模型自动分割肾脏的能力。利用 Pyradiomics 工具从 DSI 以及重建后的各个参数图中分别提取影像组学特征，随后利用 SMOTE 算法使训练数据均衡，并选取 10 个机器学习模型分别在训练集上进行了测试，最终选取平均表现性能最好的机器学习模型在测试集上进行预测。采用受试者工作特征曲线下面积（AUC-ROC），准确率，灵敏度和特异度评估影像组学模型的诊断能力。

结果：DSI 验证集中的平均 DSC 为 92%，在 DTI 的 FA、MD、AD、RD 参数图中，验证集平均 DSC 分别为 92%、93%、92%、93%，在 DKI 的 AK、RK、MK、KFA 参数图中，验证集平均 DSC 分别为 94%、93%、94%、92%。选取随机森林作为分类器，DSI 测试集平均 AUC-ROC 为 54%，在 DTI 的 FA、MD、AD、RD 参数图中，测试集的平均 AUC-ROC 分别为 75%、82%、67%、79%。在 DKI 的 KFA、MK、AK、RK 参数图中，平均 AUC-ROC 分别为 63%、82%、90%、66%。

结论：深度学习技术可以用于实现快速和准确的肾脏分割，从而减少手动标注成本。此外，在诊断 2 型糖尿病与糖尿病肾病之间，基于 DKI 和 DTI 的参数图的影像组学方法可以作为一种相对简单、准确、无创的工具。

PU-1333

深度学习头颈动脉 CTA 去骨算法的临床应用价值评估

崔园园、萧毅、刘士远
中国人民解放军海军军医大学第二附属医院

目的：基于深度学习（deep learning, DL）的颈动脉 CTA 去骨算法可以对头颈动脉 CTA 进行准确分割，增加去骨的准确性，提高图像后处理能力，本研究对新出现的基于 DL 的 CTA 分割算法的应用效能进行评估，评价其临床效能。方法：收集 2021 年 10 月至 2021 年 12 月在我院行头颈动脉 CTA 扫描的患者。纳入标准：大于 18 岁。将头颈部动脉划分为左右两侧，每侧分为 10 段（颈总动脉、颈外动脉、颈内动脉颈段、颈内动脉岩段、颈内动脉破裂孔段、颈内动脉虹吸段、大脑中动脉 M1 段、椎动脉、基底动脉、大脑后动脉 P1 段）。对图像使用传统、DL 基础的方法进行后处理，基于颈动脉 MIP 图对两种方法的去骨效果、血管完整性进行主观评价。使用配对非参数检验对两组间不同节段的去骨效果、血管完整性进行分析。结果：100 例患者纳入最终研究。在去骨效果方面，在颈总动脉、颈内动脉颈段、颈内动脉岩段、颈内动脉破裂孔段、颈内动脉虹吸段间，两种方法的评分存在差异，基于 DL 的算法优于传统算法。但在颈外动脉、椎动脉、基底动脉、大脑后动脉 P1 段间两者不存在差异。在血管完整性评价方面，两者不存在差异。在存在狭窄的血管中，两种方法对于各节段血管分割完整性存在差异（P 值=0.011, $p<0.001$ ）。结论：基于 DL 的

CTA 分割算法在去骨方面效果优于传统方法,尤其在颈内动脉,对于颅内骨质较多的部位去骨效果明显好于常规方法。

PU-1334

CT 容积再现技术评估颈椎斜位投射角度及影响因素

董新锋

广东省人民医院

目的:探讨颈椎斜位摄影各椎间孔最佳投射角度及其影响因素。

方法:回顾性分析 405 例颈椎三维螺旋 CT 平扫资料,采用 CT 容积再现技术取得颈椎各椎间孔最佳显示的旋转角度,即为颈椎斜位摄影各椎间孔最佳投射角度,并分析其潜在影响因素,包括性别、年龄、是否存在骨质增生、椎间盘突出及生理弯曲改变。

结果:C2-T1 各椎间孔最佳投照角度分别为 $50.82\pm 3.24^\circ$ 、 $50.85\pm 3.13^\circ$ 、 $51.47\pm 2.79^\circ$ 、 $52.28\pm 3.10^\circ$ 、 $54.19\pm 4.32^\circ$ 、 $57.66\pm 3.50^\circ$;年龄、性别及是否椎间盘突出均对颈椎斜位各椎间孔最佳投射角度无影响($P>0.05$);骨质增生对下部颈椎 C5-T1 椎间孔最佳投射角度的影响有统计学意义($P<0.05$);生理弯曲改变对上颈椎 C2-C6 椎间孔最佳投射角度的影响有统计学意义($P<0.05$)。

结论:CT 容积再现技术可得到颈椎斜位摄影最佳投照角度为 $50^\circ\sim 58^\circ$,从上到下逐渐增大,对生理弯曲改变和骨质增生患者在颈椎斜位 X 线摄影,尤其是显示 C5-C6 椎间孔时可适当加大角度。

PU-1335

基于 MRI 的广泛性焦虑障碍脑网络状态动力学研究

陈大才^{1,2}、郭元洪¹、卢凤梅^{1,2}

1. 电子科技大学成都脑科学研究院临床医院

2. 成都市第四人民医院

目的:前人研究报道了广泛性焦虑障碍(GAD)大脑异常动态连接模式,然而 GAD 脑网络状态的动力学特征仍不明确。本研究旨在基于磁共振技术利用共激活模式(CAP)探究 GAD 脑网络状态异常动力学变化,为疾病诊断提供脑影像学标记物。方法:共纳入 92 例 GAD 患者和 77 例健康对照,采用 3T GE MR750 磁共振扫描仪,fMRI 参数:TR/TE=2000/30ms,翻转角=90°,矩阵=64x64,层数=43,层厚=3.2mm,无层间隔,体素=3.75x3.75x3.2mm³,视场=240x240mm²,时间点=255。T1 加权结构影像参数:TR/TE=5.92/1.956ms,矩阵=256x256,翻转角=12°,视场=256x256mm²,体素=1x1x1mm³,层数=156,厚度=1mm,无层间隔。预处理:(1)去除前十个时间点;(2)时间层校正;(3)将 T1 数据配准到功能像;(4)T1 数据分割;(5)功能像数据标准化到 MNI 空间,并重采样到 3x3x3mm³;(6)回归 24 个头动参数、白质信号、脑脊液信号和全脑信号;(7)带通滤波(0.01-0.08hz);(8)8mm 平滑核空间平滑;(9)使用 408 个 ROI 的模板提取 BOLD 信号用于后续分析。共激活模式分析首先使用 z 分数对时间序列进行标准化,并将所有健康对照的数据连接起来得到 255x77x408 的矩阵。使用 K-means 聚类算法将 255x77 个时间点下的图像分配到 K 个状态中。将聚类结果应用到 GAD 患者上,将每个时间点分配到与聚类结果中最相似的状态中。使用 silhouette 分数评估不同 K 下的聚类结果,并结合手肘法确定状态个数 K。最后计算了 CAP 状态的时间占比、持续时间、出现频次、转移概率等指标,并进行统计分析。结果:我们识别了 8 种不同的大脑状态。GAD 患者状态 2 和状态 4 持续时间显著低于健康对照组。GAD 患者状态 2 和状态 4 的自转移概率显著降低,状态 2 到状态 5、状态 2 到状态 6、状态 3 到状态 7、状态 5 到状态 2 的转移概率显著增加。结论:本研究为理解 GAD 病理机制方面提供异常大脑动态配置信息,为该疾病的诊断鉴别提供脑影像标记物。

1. Huazhong University of Science and Technology Union Shenzhen Hospital

2. Shenzhen Kangning Hospital

Object: Major Depressive Disorder (MDD) is a multifaceted mental health condition characterized by significant heterogeneity in clinical presentations. Understanding the neural underpinnings of these varying symptom profiles remains elusive. This study aims at elucidating distinctive temporal dynamics of brain activity in subgroups of MDD patients using resting-state fMRI.

Methods: We recruited 128 inpatients diagnosed with MDD for this investigation. Utilizing Latent Profile Analysis (LPA), we categorized patients into subgroups based on their clinical depression scores. We employed a time delay algorithm to quantify the temporal dynamics of brain activity.

Results: Our findings revealed that patients experiencing high levels of insomnia exhibited delayed neural fluctuation in the dorsal attention network ($F = 8.81$, $p = .002$). Conversely, individuals with elevated anxiety demonstrated an earlier time delay in the somatomotor network ($F = 17.01$, $p < .001$). Furthermore, similarity analysis indicated a significant association between individual within-network standard deviation of time delay and clinical symptom scores ($r = 0.06$, $p < .001$). Notably, the time delay within the salience network contributed the most to this similarity, as determined by the Jack-knife approach.

Conclusion: This study discerns neural aberrations within the MDD population that correspond to the heterogeneity of patient symptoms. Insomnia appears to be associated with delayed neural fluctuations within the attention network, a region implicated in sustaining attention. Conversely, anxiety is linked to earlier neural fluctuations within the somatomotor network, which governs motor control. Our findings illustrate the effectiveness of dynamic algorithm in identified individualized brain activity in clinical population, meanwhile, underscore the imperative of tailoring personalized treatment strategies for individuals with MDD.

Development of a machine learning classifier for typhoon-related post-traumatic stress disorder based on voxel-based analysis of white matter

Yiying Zhang, Huijuan Chen, Feng Chen

Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University), Hainan Medical University

Abstract

Objective: Post-traumatic stress disorder (PTSD) is the most common mental illness following traumatic events. Super typhoons, which are a form of environmental disasters, can affect the normal life. White matter damage was observed in participants with PTSD. Voxel-based analysis (FBA) has recently emerged as a useful technique to quantify abnormalities in the white matter. This study aimed to evaluate FBA metrics among typhoon survivors.

Methods: Whole-brain diffusion MRI of PTSD group ($n = 27$), the trauma-exposed control group (TEC) ($n = 33$), and the healthy group (HC) ($n = 30$) was used to identify fiber tracts with significant abnormalities in FBA metrics (fiber density, fiber cross-section, and fiber density cross-

section). We then investigated the diagnostic effects of white matter diffusion tensor imaging combined with machine learning to identify biomarkers of PTSD.

Results: Compared with the HC group, patients with PTSD had increased fiber density values within a fiber bundle in the right frontopontine tract and right middle longitudinal fascicle and increased FDC values in the bilateral frontopontine tract and left thalamo-premotor (Bonferroni correction, $p < 0.05/18 = 0.003$). To discover the differences between PTSD and TEC, we established binary classifier models and multiple element classifier models with 5-fold cross-validation using machine learning, i.e., the classification of PTSD vs. TEC (accuracy = 0.89; sensitivity = 0.97; specificity = 0.71; precision = 0.87; AUC = 0.95) and PTSD vs. TEC vs. HC (precision = 0.99; recall = 0.99; AUC=0.99). Shapley additive interpretation (SHAP) values are used to analyze the top 20 features of the optimal model to illustrate the interpretability of the model.

Conclusions: PTSD can lead to structural changes in brain white matter in most Typhoon-exposed participants. Combining FBA and machine learning, we demonstrate diffusion indicators for specific abnormal regions and their reliable diagnostic application in PTSD and trauma-exposed controls.

PU-1338

Hotspots Evolution and Trend Analysis of Artificial Intelligence Applied in Hepatocellular Carcinoma Since 2012: A Bibliometric Analysis

Yanmei Dai¹, Xu Zeng¹, Sheng Zhao¹, Hongbo Hu¹, Jinping Li¹, Zong-Hui Liang², Fucang Jia^{3,4}, Huijie Jiang¹

1. Second Affiliated Hospital of Harbin Medical University

2. Jing'an District Centre Hospital of Shanghai, Fudan University

3. Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

4. Pazhou Lab

Purpose: This study aims to analyze the evolution of hotspots and trends of artificial intelligence (AI) applied in hepatocellular carcinoma (HCC) using a visual bibliometric approach.

Materials and methods: We searched the Web of Science Core Collection database to select the articles related to AI applied in HCC from January 1, 2012, to March 15, 2023. The countries/regions, institutes, authors, journals, references, and keywords were visualized and analyzed.

Results: 961 articles were selected in this study. All articles were from 52 countries/regions, with China ($n = 585$) leading the total number of publications, followed by the United States of America ($n = 167$). These articles were published by 1518 institutions, mainly by Fudan University and Sun Yat-sen University with 56 and 55 articles respectively. There are 370 journals related to the application of AI in HCC. In our study, we found that "expression", "biomarker", and "resection" had higher centrality of 0.48, 0.47, and 0.38, respectively. And 18 clusters were obtained, in which the Top 3 clusters in order are "#0 hepatocellular carcinoma", "#1 deep learning", and "#2 microvascular invasion". After burst analysis, we found that "classification" was the strongest burst and the earliest emerging research direction.

Conclusion: AI was mainly applied in the field of HCC for tumor classification and microvascular invasion to construct prediction models using histopathological slices, medical images, and clinical features. It may be a key trend to improve the generalizability and interpretability of these models in the future.

基于多模式 MRI 的放射组学模型在子宫内膜癌淋巴血管间隙侵袭术前预测中的应用

刘冬¹、胡春洪¹、沈海林²、王希明¹、黄瑾瑜¹、黄周¹

1. 苏州大学附属第一医院

2. 苏州九龙医院有限公司

目的：确定基于 MRI 的放射组学预测子宫内膜癌（EC）患者淋巴血管间隙侵犯（LVSI）的能力。

材料和方法：共有 160 名女性（平均年龄 57.0 岁） 9.7（SD）年；33-80 岁）的 EC 患者。从术前 T2W 加权和对比增强 MR（CE-MRI）图像中提取放射组学特征。基于所选择的特征，建立了 GaussianNB 模型。临床模型（结合 MR 报告的 FIGO 分期、深层子宫肌层浸润（DMI）、子宫腺受累和阴道/子宫内膜受累）和联合模型（基于放射组学特征和临床模型）。通过训练和测试队列中受试者-操作员特征（ROC）的曲线下面积（AUC）来评估模型的性能。

结果：在预测 LVSI 方面，放射组学模型在训练队列中的表现比临床模型好得多（AUC=0.899 vs.0.8862），但在测试组中没有（AUC0.812 vs.0.8758）。联合模型在训练和测试队列中表现最好（训练队列，AUC=0.934,95%CI:0.8807-0.9873；测试队列，AUC=0.905，95%CI:0.7679-1）。

结论：联合模型可用于 EC 患者术前预测 LVSI，并有助于更好的临床决策。

人工智能自动无放射 MR 合成 CT 图像

周腾¹、罗玉²、洪奕开²、姚顺³、吴仁华⁴

1. 海南大学

2. 广东工业大学

3. 中山大学附属第一医院

4. 汕头大学医学院第二附属医院

背景

融合多模态医学图像，例如磁共振（MR）成像和计算机断层扫描（CT），可以提供有关人体的各种解剖和功能信息。利用 MR 图像进行合成 CT 是一种节省成本但有效避免辐射对人体影响的方法。然而，现有的 MR 到 CT 合成方法大多依赖于卷积神经网络（CNN），缺乏全局建模能力，不利于合成具有全局依赖性和以不规则边界和区域为特征的病理结构的医学图像。

方法

在本文中，我们提出了一种具有多尺度输入的 Transformer 编码器-解码器网络，以改进 MR 图像的合成 CT。因此，我们首先设计了一个联合残差注意块（JRAB），从全局和局部层面显式地提取图像的层次结构，以解决解剖结构的分布引起的全局依赖性问题。其次，我们设计了一个跨尺度注意融合块（CAFB）来融合多尺度图像特征，以减轻病理组织不规则性带来的不利影响。

结果

我们通过将所提出的方法与五种最先进的方法进行比较，在基准数据集上对其进行评估。实验结果表明，该方法在定量测量和定性显示方面比竞争方法具有更优越的性能。

结论

我们的方法有望用于使用合成多模态医学图像的临床诊断。

PU-1341

Feasibility study of CT radiomics model for the prediction of early and intermediate stage hepatocellular carcinoma using BCLC staging

Dong Han, Lili Guo
Huai'an First People's Hospital

Background: Hepatocellular carcinoma constitutes a serious health concern because of its high morbidity and mortality. The prognosis of HCC largely depends on disease stage at diagnosis. CT image textural analysis is an image analysis technique that has emerged over recent years.

Objective: To probe the feasibility of CT radiomics model for predicting early (stage 0, A) and intermediate stage (stage B) hepatocellular carcinoma using Barcelona Clinic Liver Cancer (BCLC) staging.

Methods: 190 cases of stage 0, A or B hepatocellular carcinoma with CT-enhanced arterial and portal vein phase images were assessed retrospectively. ITK - SNAP® was used to manually delineate the lesions to construct a region of interest (ROI) consisting of entire tumor - mass. Anaconda® was consequently used to extract the textural profiles of the ROIs, while least absolute shrinkage and selection operator (LASSO) dimensionality reduction was used to obtain the textural profiles and the area under the receiver operating characteristic (ROC) curve values.

Results: Within test cohort, the area under the curve (AUC) values associated with arterial phase images and BCLC stages 0, A, and B were 0.99, 0.98, and 0.99, accordingly. The overall accuracy rate was 92.7 %. The AUC associated with portal vein images and BCLC stages 0, A, and B were 0.98, 0.95, and 0.99, accordingly, with an overall accuracy of 90.9 %.

Conclusion: CT radiomics model can be used to predict BCLC staging of early and intermediate stage hepatocellular carcinoma.

PU-1342

基于计算机断层扫描和冠状动脉周围脂肪组织放射组学的甲状腺 功能减退症患者冠状动脉疾病的诊断：一项回顾性横断面研究

史振洲、柏金全、王舒婷、潘虹、张同
哈尔滨医科大学附属第四医院

背景: 甲状腺功能减退症与冠心病 (CAD) 的发病率和死亡率相关。预防甲状腺功能减退症患者发生 CAD 正在成为一个重要的公共卫生问题。有必要开发新的模型来提高甲减患者 CAD 的早期诊断水平, 积极预防 CAD 的发生和发展。我们的目的是评估基于计算机断层扫描 (CT) 的成像参数和冠状动脉周围脂肪组织 (PCAT) 的放射学特征是否可以提高甲状腺功能减退症患者患有 CAD 的诊断效果。

方法: 我们回顾性招募了 204 名既往未确诊 CAD 的甲状腺功能减退症患者作为 a 组。这些患者被随机分为训练组和试验组, 比例为 7: 3。同时, 作为对照, 我们回顾招募了 106 名被诊断为 CAD 的患者作为 b 组。我们收集了临床资料, 从患者的 CT 图像和 104 个 PCAT 放射学特征中提取了影像学参数。最终, 通过相关性剔除和梯度提升决策树 (GBDT) 方法从 a 组患者的 PCAT 中筛选出 10 个放射学特征。一共构建了四个模型, 分别包括临床因素 (模型 1)、临床因素和影像参数 (模型 2)、临床因素和 RADSore (模型 3) 和全部 (模型 4), 用于识别冠心病患者。绘制了 ROC 特性曲线、校准曲线和判决曲线分析 (DCA) 以评估模型的性能, 并通过 DeLong 检验进行模型的比较以验证不同因素的附加价值。

结果：在测试集中，模型 2 和模型 4 的曲线下面积(AUC)分别为 0.914 和 0.909，其识别效率高于其他两个模型(均 $P<0.05$)。然而，与模型 2 相比，模型 4 并没有提高识别冠心病的有效性($p=0.711$)；同样，模型 3(AUC=0.733)和模型 1(AUC=0.720, $p=0.839$)之间的 AUC 没有显著差异。总体而言，在诊断甲状腺功能减退症患者发生 CAD 方面，模型 2 被评为更好。

结论：与无甲状腺功能减退的冠心病患者相比，合并甲状腺功能减退的冠心病患者冠状动脉负担更重。将患者临床危险因素与 CT 影像参数相结合的综合诊断模型对甲状腺功能减退患者冠心病的发生具有较好的诊断效果。

3D MR Compressed Sensing Image Restoration by Denoising Convolutional Neural Network (DnCNN): Application to Brain Imaging

Wenliang Fan, Xiangchuang Kong, Ziqiao Lei, Fan Yang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose

MR compressed sensing technology can significantly reduce 3D image acquisition time. However, the MR images may have artifacts (such as starry-sky artefact) due to signal loss with the increase of compressed sensing factor. Denoising convolutional neural networks (DnCNN) model is able to handle Gaussian denoising with unknown noise level (i.e., blind Gaussian denoising). This study explores the feasibility of reconstructing high compressed sensing 3D magnetic resonance images based on DnCNN.

Methods

Using the Philips 3T MR Ingenia CX, 30 brain images of 3D-MSDE sequences with different compressed sensing coefficients (CS=6, 8, 10, 12, 14, 16, 18) were collected, 100 layers per person, for a total of 3000 layers. At the same time, 3D-MSDE sequence brain MR data without using any acceleration algorithm was collected as the reference image. The mean square error, signal-to-noise ratio, and image structure similarity coefficient between the images with different CS coefficients were calculated. And the DnCNN parameters are trained by the 3000 layer images, which are divided into a training set (2000 layer) and a test set (1000 layer). The noise level of the images after denoising relative to the reference images are also evaluated. Statistical analysis of the three evaluation parameters between different groups are performed.

Results

With the increase of CS coefficient, the mean square error of the image increased significantly, and the signal-to-noise ratio and image structure similarity decreased significantly ($p<0.05$). When the CS factor reaches 10, the image quality is too seriously degraded to observe the image detail. The images processed by the DnCNN were compared with the corresponding image pairs. The signal-to-noise ratio and image structure similarity were significantly increased, and the image mean square error was significantly reduced ($p<0.05$). Horizontal comparison, even when the CS factor reaches 18, the image processed by DnCNN can still maintain a higher signal-to-noise ratio and structural similarity.

Discussion and Conclusion

The DnCNN can effectively remove the 3D MR image noise introduced by the high compressed sensing coefficient. The DnCNN combined with the compressed sensing technology can reduce the scanning time while ensuring the quality of the magnetic resonance image.

Automatic measurement of anatomical parameters of the lumbar vertebral body and the intervertebral disc on radiographs by deep learning

Hongyan Yao¹, Sheng Zhou¹, Ping Wang¹, Xiaofei Chen³, Linyang He²

1. Gansu Provincial Hospital

2. Hangzhou Jianpei Technology Co., Ltd

3. Department of Radiology, Gansu Provincial Hospital of Traditional Chinese Medicine

Abstract

Objective To develop and evaluate an automatic measurement model for measuring the anatomical parameters of the vertebral body and intervertebral disc based on lateral lumbar radiographs and deep learning.

Materials and methods A model based on deep learning was developed with a dataset consisting of 1318 lateral lumbar radiographs for the prediction of anatomical parameters, including vertebral body heights (VBH), intervertebral disc heights (IDH) and intervertebral disc angles (IDA). The mean of the values obtained by three radiologists was used as a reference standard. Statistical analysis was performed in terms of standard deviation (SD), mean absolute error (MAE), Percentage Correct Key points (PCK), intraclass correlation coefficient (ICC), regression analysis, and Bland-Altman plot to evaluate the performance of the model compared with the reference standard.

Results The PCK of the model at the 3 mm distance threshold ranged from 94% to 99%. The model-predicted values were 30.22 ± 3.01 mm, 10.40 ± 3.91 mm and $10.63 \pm 4.74^\circ$ for VBH, IDH and IDA, respectively. There were good correlation and consistency in anatomical parameters of the lumbar vertebral body and disc between the model and the reference standard in most cases ($R^2 = 0.89-0.95$, $ICC = 0.93-0.98$, $MAE = 0.61-1.15$ and $SD = 0.89-1.64$).

Conclusion The newly proposed model based on a deep learning algorithm can accurately measure various anatomical parameters on lateral lumbar radiographs. This could provide an accurate and efficient measurement tool for the quantitative evaluation of spinal disorders.

使用多种对比增强乳腺 X 线摄影信息通过多阶段深度学习系统进行乳腺病变的检测和分类：一项多中心研究

陈玉倩^{1,2}、毛宁¹、华臻²

1. 烟台毓璜顶医院

2. 山东工商学院

目的

准确而及早地检测和诊断乳腺病变对于优化乳腺癌患者的治疗方案和增进生存率具有重要意义。我们旨在开发一个全自动系统，利用对比增强乳腺 X 线摄影 (CEM) 图像的多元信息在 CEM 上快速定位和分类乳腺病变。

方法

在该研究中，我们收集了来自三个中心的 1903 位患者 CEM 图像与相关临床及病理信息，针对 CEM 图像的多视图和对比增强成像的特点，开发了一种全自动的多流程检测和分类系统 (MDCS)，用于在 CEM 上快速检测和分类乳腺病变。其中我们引入了一种新的特征融合算法，它结合了医生判读 CEM 图像的领域知识，能够智能地融合来自 CEM 图像的有用的信息以提高模型诊断能力。为了研究模型的临床价值，我们分别将它分类的平均时间、准确率、敏感度以及特异

度分别与六名不同年资的放射科医生的诊断结果进行了对比，并进一步探索了 MDSCS 的辅助是否能够提高放射科医生的表现，以及不同年资医生之间的诊断一致性在其辅助下是否有提升。最后，我们还针对一些争议病例进行模型预测可视化进一步评估了 MDSCS 的诊断价值。

结果

在所有数据集中，MDSCS 始终保持稳定的高性能表现。特别是在外部测试集和前瞻测试集中，模型展现出了很好的泛化性和鲁棒性，检测任务的 AFROC 分数分别为 0.953 和 0.963，分类任务的 AUC 分别为 0.909[95%CI:0.822-0.996]和 0.912[95%CI:0.840-0.985]。通过对比发现，其分类准确度与三位高年资放射科医生的水平相当（0.852[95%CI:0.765-0.917] vs 0.856[95%CI:0.802-0.910]），但效率上要远远高于放射科医生（医生判读一位患者的 CEM 图像需要大约 3.2 分钟，而 MDSCS 只需 5 秒）。此外，六名医生在其辅助下对 CEM 的判读表现均有所提高，尤其是低年资的医生判读特异度水平提高尤为明显，最好的提高了约 0.133，且在模型的辅助下，六位医生的判读水平的差距也越来越小。

结论

MDSCS 在乳腺病变的检测和分类方面展现出良好的性能，能够显著提高放射科医师的整体表现。它为医生提供了可靠的辅助工具，能够加速诊断过程、提高准确性，从而为患者带来更好的医疗结果。

双源 CT 多参数后处理重建在骨髓纤维化患者“一站式”评估中的应用价值初探

孙野、朱万安、张磊
吉林大学第一医院

目的：初探双源 CT 多参数后处理重建在骨髓纤维化患者“一站式”评估中的应用价值。

方法：选取我院 2023 年 1 月至 2023 年 8 月收录的 20 例慢性骨髓纤维化患者进行研究，所有患者均采用双源 CT 进行肝胆胰脾 CT 平扫，使用后处理工作站测量脾脏体积，并重建骨髓成像图像、测量肝脏及脾脏铁沉积的程度。

结果：在本次研究结果中显示，20 例患者均出现脾脏体积增大，体积均值为 1078.7cm³，并通过后处理得到清晰的铁沉积、骨髓成像图像，图像显示 20 例患者均未出现脏器铁沉积及骨髓水肿的情况。

结论：采用双源 CT 多参数后处理重建，可准确获得脾脏体积，同时可评价肝脏及脾脏铁沉积程度并查看患者的骨髓成像，为患者节约检查成本，方便患者进行骨髓纤维化“一站式”评估。

2. 河南省人民医院医学影像科
3. 新乡医学院河南省人民医院
4. 河南大学人民医院
5. 河南省人民医院健康管理学科
6. 河南省慢病健康管理重点实验室

目的 探讨不同性别健康体检人群的高密度脂蛋白胆固醇（high density lipoprotein cholesterol, HDL-C）与骨密度之间的关系，为骨质疏松防治提供指导作用。方法 选取 2018-2023 年于河南省人民医院健康管理中心进行健康体检的 17448 例成年人群作为研究对象。所有研究对象接受常规

体格检查,并测定 HDL-C 以及通过定量 CT (quantitative computed tomography, QCT) 评估其腰椎骨密度。Pearson 相关及线性回归以确定 HDL-C 与骨密度的关系。结果 骨质疏松组血清 HDL-C 平均值高于骨量减少和正常骨密度组 ($P<0.05$)。回归分析调整其他变量后结果显示, HDL-C 水平与腰椎 BMD 成负相关 ($P<0.05$), 且女性人群中的负相关更为显著。按身体质量指数 (BMI) 分组后, 这种负相关性在超重和肥胖人群中表现更为明显 ($P<0.05$), 而在 $BMI<24.0 \text{ kg/m}^2$ 组无相关, 差异无统计学意义 ($P>0.05$)。结论 血清 HDL-C 水平与健康体检人群的腰椎骨密度成负相关。HDL-C 对骨密度的负相关性主要表现在女性以及 $BMI>24.0 \text{ kg/m}^2$ 人群。

一种基于 UNet++ 的磁共振成像肝脏肿瘤分割深度学习方法

骆俊朋¹、王静²、彭景阳²、史晶¹、李天⁴、韩路军³

1. 河南大学

2. 中国人民解放军总医院第一医学中心

3. 中山大学肿瘤防治中心 (中山大学附属肿瘤医院、中山大学肿瘤研究所)

4. 中国人民解放军空军军医大学西京医院

目标: 提高基于核磁共振图像 (MRI) 肝脏及肝肿瘤自动分割效率

方法: 回顾性研究了 2015 年 1 月至 2020 年 12 月间诊断为肝细胞癌的 105 名患者。患者分为三组: 训练组 ($n = 83$)、验证组 ($n = 11$) 和内部测试组 ($n = 11$)。另外, 还从癌症影像存档中选择了 9 例作为外部测试集。专家放射科医生使用动脉期和 T2WI 序列手动勾画了所有图像。采用深度学习技术, 自动分割了肝脏肿瘤和肝脏段。首先使用 UNet++ 网络进行初步肝脏分割, 然后将分割的肝脏掩膜重新输入 UNet++ 网络以分割肝脏肿瘤。在肝脏肿瘤分割中使用了阈值来降低假阳性率。为了评估分割结果, 我们计算了 Dice 相似系数 (DSC)、平均假阳性率 (AFPR) 和勾画时间。结果: 在验证组和内部测试组中, 肝脏的平均 DSC 分别为 0.91 和 0.92。在验证组中, 手动和自动勾画分别需要 182.9 秒和 2.2 秒。平均而言, 手动和自动勾画分别需要 169.8 秒和 1.7 秒。肝脏肿瘤的平均 DSC 分别为 0.612 和 0.687。在内部测试组中, 手动和自动勾画以及 AFPR 的平均时间分别为 47.4 秒、2.9 秒和 1.4, 而在外部测试组中分别为 29.5 秒、4.2 秒和 1.6。

结论: UNet++ 能够基于 MR 图像自动分割正常肝组织和肝脏肿瘤, 提高了勾画效率, 满足了进一步放射组学和深度学习分析的提取集分析要求。

The Application of Artificial Intelligence CAD in Reducing Occupational Fatigue of Radiologists

Chenglong Ren, wei wei

Affiliated Hospital of Shaanxi University of Chinese Medicine

OBJECTIVE: To explore the effect of artificial intelligence-based computer aided diagnostic system (AI-CAD) in reducing the occupational fatigue of radiologists through the diagnosis of rib fractures.

Methods: Four attending radiologists were randomly divided into AI-CAD assisted group and independent reading group. The former interpreted all cases with their own experience combined with fracture information including location, type and number provided by AI-CAD, while the latter only based on their own experience when diagnosing. All radiologists completed the evaluation of chest CT images from 103 patients with rib fractures. The consensus diagnosis of another two

deputy chief radiologists was referred as the gold standard. The diagnostic efficacy, time-consumption and occupational fatigue of attending radiologists was assessed and compared.

RESULTS: The average time-consumption of the AI-CAD assisted group ($2.13 \pm 0.17 \text{ min}$) was significantly lower than that of the independent reading group ($4.12 \pm 0.23 \text{ min}$) ($p < 0.05$). There was no statistically significant difference in occupational fatigue between the two groups before the start of interpretation. After interpretation session, the five occupational fatigue assessment indicators of the AI-CAD assisted group were significantly lower than those of independent reading group. In terms of diagnostic efficacy, True positive Rate of AI-CAD system (97.31%) is higher than reading group ($p < 0.05$), Positive predictive value (90.62%) is lower than reading group ($p < 0.05$).

Conclusion: Assistance of AI-CAD improved the diagnostic efficacy and reduced the time-consumption, which led to an effective reduction of the occupational fatigue in rib fractures diagnosis practice.

Key words: rib fracture; artificial intelligence; diagnostic efficiency; reading time; occupational fatigue

个体化结构协方差网络对吸烟者吸烟严重程度的连接组学预测模型

汪卫建

郑州大学第一附属医院

异常的分布式脑系统之间的相互作用与尼古丁成瘾的机制有关。然而，结构共变网络（一种衡量脑连接性的指标）与吸烟严重程度之间的关系尚不清楚。为了填补这一空白，本研究旨在研究吸烟者的结构共变网络与吸烟严重程度之间的关系。我们招募了 101 名男性吸烟者和 51 名男性非吸烟者，并进行了 T1 加权解剖图像扫描。首先，通过 jackknife-bias 估计为每位参与者派生个体化的结构共变网络。然后，采用一种名为连接组预测建模（CPM）的数据驱动机器学习方法，利用个体化的结构共变网络推断以 Fagerström 尼古丁依赖性测试（FTND）得分衡量的吸烟严重程度。通过留一法交叉验证和置换检验评估了 CPM 的性能。结果表明，CPM 确定了与吸烟严重程度相关的结构共变网络，预测得分与实际 FTND 得分之间存在显著相关性（ $r = 0.23$ ，置换 $P = 0.020$ ）。识别出的网络主要包括皮质下-小脑网络、额顶叶网络、默认模式网络、运动网络和视觉网络。这些结果确定了与吸烟严重程度相关的结构共变网络，并为吸烟严重程度的神经基础提供了新的见解。

利用基于计算机断层扫描的放射组学诺莫图预测膀胱癌术前的肌肉浸润状态

张瑞、李锋

襄阳市中心医院

研究目的 建立基于计算机断层扫描（CT）的放射组学提名图，结合放射组学和临床特征预测膀胱癌（BCa）的肌肉侵犯状态。**方法** 利用 2018 年 5 月至 2023 年 4 月期间在我院接受 CT 尿路造影检查并经术后组织学证实为膀胱尿路上皮癌的患者数据进行回顾性分析。共有 196 名患者入组，每名患者被随机分配到训练队列（ $n = 137$ ）或测试队列（ $n = 59$ ）。共检索到 851 个放射组学特征。在特征选择方面，采用了显著性检验和最小绝对收缩与选择算子（LASSO）方法。随后，根据所选特征进行线性加权，得出放射组学得分（Radscore）。临床和放射组学模型以及放射组学-

临床提名图均采用逻辑回归法建立。利用接收者操作特征曲线分析对三种模型进行了评估。分析包括曲线下面积 (AUC)、95% 置信区间 (CI) 以及特异性、敏感性、准确性、阴性预测值和阳性预测值。根据区分度、校准和临床实用性对放射组学-临床诺莫图的性能进行了评估。结果 在获得 851 个放射组学特征后, 最终选择了 12 个特征。组织病理学分级和迂曲血管被纳入临床模型。Radscore 和临床组织病理学分级是独特诺莫图中的最终预测因子。在训练组中, 三个模型的 AUC 分别为 0.811 (95% CI, 0.742-0.880)、0.845 (95% CI, 0.781-0.908) 和 0.896 (95% CI, 0.846-0.947)。在训练队列中为 0.808 (95% CI, 0.703-0.913)、0.847 (95% CI, 0.739-0.954) 和 0.887 (95% CI, 0.803-0.971)。根据 DeLong 检验, 训练队列中放射组学-临床提名图的 AUC 与临床模型 (AUC: 0.896 vs 0.845, $p = 0.015$) 和放射组学模型 (AUC: 0.896 vs 0.811, $p = 0.002$) 有很大差异。在测试队列中进行的 DeLong 检验显示, 三种模型之间没有显著差异。根据决策曲线评估结果, 诺莫图在临床上证明是有用的。结论 放射影像学-临床诺莫图可以在术前准确预测 BCa 肌肉侵犯状态。

Prognostic Value of a Radiomics Model Based on MR Imaging for the Identification of Macrotrabecular-Massive Hepatocellular Carcinoma

Fan Chai, Caizhen Feng, Xiaoxuan Jia, Yulu Liu, Nan Hong, Yi Wang
Peking University People's Hospital

Background: To evaluate the ability of an MRI-based radiomics model, specifically designed for identifying macrotrabecular-massive hepatocellular carcinoma (MTM-HCC), in predicting prognosis.

Methods: Patients who underwent radical surgeries for HCC between June 2007 and March 2021 were included. Cohort1 without follow-up information were enrolled for MTM-HCC identification, and Cohort2 with follow-up information for prognostic analyses. Radiomics analysis was performed using volumes of interest of HCC delineated on pre-operative MRI images. Radiomics model was developed using Logistic Regression algorithm in Cohort1. For Cohort2, a radiomics probability (RP) of MTM-HCC was obtained from the radiomics model. Based on the RP, patients were divided into a RAD-MTM-HCC (RAD-M) group and a RAD-non-MTM-HCC (RAD-nM) group. Univariate and multivariate Cox regression analyses were employed to assess the ability of variables to predict disease-free survival (DFS) of patients in Cohort2.

Results: The radiomics model for identifying MTM-HCC showed AUCs of 0.915, 0.849, and 0.852 in the respective training, validation, and test sets. Furthermore, the radiomics biomarker RP was an independent predictor of DFS in patients with HCC. Using portal or hepatic vein tumor thrombus, irregular rim-like arterial phase hyperenhancement (IRE), AFP and RP, we constructed a nomogram with a C-index of 0.701 (95% CI: 0.650-0.753). The DFS of RAD-nM group was significantly higher than that of the RAD-M group by Kaplan-Meier curves ($P < 0.001$).

Conclusions: The radiomics model designed to identify MTM-HCC can be used to predict prognosis in patients with HCC.

PU-1353

基于影像组学特征的机器学习模型对视神经脊髓炎谱系疾病早期视神经炎的鉴别

陕曼玉、刘婷、张澜、李永斌
西安市第一医院

目的: 探讨应用视神经常规 MRI 图像的影像组学特征在预测影像表现未见明显异常的视神经炎中的价值, 为早期诊断提供参考。

方法: 纳入 41 例视神经脊髓炎谱系疾病及 90 例正常对照组共 131 例患者, 运用联影 AI 软件对轴位 T1WI、T2WI 图像进行预处理、感兴趣区 (ROI) 勾画及特征提取, 应用独立样本 t 检验和最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 进行特征选择。

联合 T1WI、T2WI 筛选多参数 MRI 序列的最佳特征。按照 8 : 2 的比例将患者随机分为训练集 (92 例) 与测试集 (39 例), 使用 logistic 回归 (LR)、随机森林 (RF)、支持向量机 (SVM) 构建预测模型, 并绘制受试者操作特征 (ROC) 曲线, 计算准确度、敏感度、特异度及 ROC 曲线下面积 (AUC)。采用 DeLong 检验比较不同模型之间 AUC 的差异。

结果: 在 2264 个影像组学特征中选择 25 个。基于多序列模型诊断效能优于单序列模型, 其中 LR 模型效能最好, 测试集 AUC、敏感性、特异性分别为 0.903, 84%, 85%。单序列模型中, T2WI 模型的诊断效能优于 T1WI 模型 ($p < 0.05$)。

结论: 基于 MRI 图像影像组学特征的机器学习模型可以鉴别视神经脊髓炎谱系疾病早期视神经炎, 多序列 MRI 序列模型的效能较好, 其中 LR 模型的效能最高。

PU-1354

高度近视患者时变局部自发脑活动模式的改变: 一种动态低频波动幅度的研究

张晓盼、刘良、文宝红
郑州大学第一附属医院

目的: 应用动态低频波动幅度 (dynamic amplitude of low-frequency fluctuations, dALFF) 研究高度近视患者局部自发脑活动的时变异常。

材料与方法: 86 例年龄和性别相匹配的高度近视患者和 87 例健康对照的静息态功能磁共振影像数据。动态 ALFF 算法: 使用 DynamicBC 工具箱计算每个参与者的 dALFF; 滑动窗口长度 (window lengths) 采用 50 TR (100 s), 步长采用 5 TR (10 s), 每个参与者的时间序列被分成 25 个窗口; 计算每个窗口内的 ALFF 映射, 随后, 用标准差 (standard deviation, SD) 测量这 25 张图的方差; 通过减去平均值并除以全局值的 SD 的方式, 计算每个参与者的 z 分数, 以 z 分数作为每个参与者体素层面的 dALFF 变异性的代表值, 从而评估 dALFF 的时间变异性。与静态 ALFF 对比: 计算每个参与者的静态 ALFF 图, 比较 dALFF 和静态 ALFF 之间的差异。校验: 选择 30 和 80 TR 值进行校验分析。

结果: 对照与高度近视组间比较, 高度近视组左额下回 (眶部)、左侧舌回、右侧扣带回前、扣带回旁、右侧钙质裂隙及周围皮质动态 ALFF 变异性降低, 左侧丘脑、左侧中心旁小叶、左侧顶下 (除边缘上回和角回外) 动态 ALFF 变异性增加。高度近视患者与对照组的模式分类准确率为 85.5%。

结论:本研究的发现,提示高度近视患者的局部脑活动与执行视觉、感觉、运动和注意控制功能的大脑区域的异常变异性之间存在关联。已提供了一些有用信息来阐明与近视神经系统异常改变相关机制。此外,强调 dALFF 异常变异性的作用,以深入了解高度近视领域的病理改变和神经影像学机制。

多模态磁共振成像放射组学分析用于预测宫颈癌治疗

邓昕昶、张瑞
襄阳市中心医院

研究目的 本研究旨在探讨基于多模态磁共振 (MR) 图像的放射组学模型在指导宫颈癌 (CC) 患者治疗中的预测效果。研究方法 回顾性纳入了在 2020 年 6 月至 2022 年 3 月期间接受术前磁共振成像的 100 例 CC 患者。通过分层随机抽样分配了训练组 ($n = 70$) 和测试组 ($n = 30$)。两组患者的临床和病理特征,包括年龄、组织学亚型、肿瘤分级和结节状态,通过 t 检验或卡方检验进行比较。在表观弥散系数 (ADC) 图和 T2 加权 (T2W) 图像上提取每个感兴趣体积的放射学特征。通过综合少数超采样技术对训练队列的数据平衡进行了重新采样。随后,通过最小绝对收缩和选择算子算法以及最小冗余最大相关性和 10 倍交叉验证构建了放射组学特征。逻辑回归用于预测 CC 治疗的需求。采用接收者操作特征曲线 (曲线下面积[AUC]) 和决策曲线分析评估放射组学模型的预测性能。结果 年龄、组织学亚型、肿瘤分级和结节状态在低 FIGO 分期组和高 FIGO 分期组之间无显著差异 (训练组和测试组的 $P > 0.05$)。基于 T2W 图像的六个放射组学特征和 ADC 图像的三个放射组学特征,建立了 T2W、ADC 和组合模型三种模型,其 AUC 分别为 0.855 (95% 置信区间 [CI], 0.777-0.934) 和 0.823 (95% CI, 0.727-0.919)、0.861 (95% CI, 0.785-0.936) 和 0.81 (95% CI, 0.701-0.918)、0.934 (95% CI, 0.884-0.984) 和 0.902 (95% CI, 0.832-0.972)。

结论结合 T2W 和 ADC 图的放射组学模型对确定 CC 患者的适当治疗方法具有良好的预测效果。

PU-1356

网络游戏障碍患者脑结构和功能改变的 Meta 分析

牛晓玉、张勇、程敬亮
郑州大学第一附属医院

目的:运用 Meta 分析方法对有关网络游戏障碍 (internet gaming disorder, IGD) 患者脑结构和功能的神经影像学研究成果进行系统评价,以期对 IGD 患者的脑结构和功能变化提供循证依据。

材料与方法:依据 PRISMA 声明由三名评价者独立计算机检索、筛选并交叉检查 PubMed、ScienceDirect、Web of Science、Scopus、中国知网、万方、维普数据库中关于 IGD 的基于体素的形态学分析 (voxel-based morphometry, VBM) 和任务态功能磁共振成像 (functional magnetic resonance imaging, fMRI) 研究,检索时间为 2010 年 1 月 1 日至 2021 年 10 月 31 日。采用基于种子的 d 映射技术对所有数据进行 meta 分析。首先,分别进行 VBM 和任务态 fMRI 研究,以检测 IGD 患者灰质体积 (gray matter volume, GMV) 和神经活动异常的区域。其次,对两类研究进行多模态分析,以检测 IGD 患者 GMV 和神经活动异常的重叠区域。Egger's 检验和分析产生的漏斗图用来检测研究间可能存在的发表偏倚。

结果:本研究共纳入 15 项 VBM 研究 (包括 422 名 IGD 患者和 354 名对照) 和 30 项任务态 fMRI 研究 (包括 617 名 IGD 患者和 550 名对照)。VBM 分析结果显示,IGD 患者相较于对照双侧前/中扣带皮层、额上/下回和辅助运动区的 GMV 降低。fMRI 分析结果显示,IGD 患者相较于对照双侧

额下回、中央前回、左侧楔前叶、右侧颞下回和右侧梭状回神经活动增加，双侧舌回和左侧额中回神经活动减少。多模态分析结果显示，IGD 患者相较于对照左侧前扣带回同时存在 GMV 降低和神经活动增加。

结论：IGD 患者存在与执行控制、认知功能和基于奖励决策相关的大脑区域的结构和功能改变，这些区域可能为 IGD 的潜在神经生物学标志。

人工智能对冠状动脉 C T A 图像质量及狭窄率评估的临床应用价值

吴博云、田宏哲、薛红强、武宝华、邵亚军、张伟

宝鸡市中心医院

目的：探讨人工智能（artificial intelligence，AI）与人工判读在冠状动脉 CTA（computed tomography angiography，CTA）图像质量方面的差异，并以冠脉造影术（CAG）为金标准，对人工智能判断冠状动脉狭窄率的准确性进行分析研究。

方法：回顾性分析行 CCTA 冠状动脉粥样硬化性心脏病（CHD）患者的影像学资料。1：随机选取宝鸡市中心医院 2022 年 10 月-11 月到行冠脉 CTA 患者 98 例，CCTA 图像分别使用传统工作站及辅助诊断软件 AI 技术进行图像重建，对 2 种不同方式的图像质量进行对比。2：选取宝鸡市中心医院 2022 年 10 月-2023 年 6 月 50 例患者行 CCTA 和 CAG 检查，且 2 种检查时间间隔<2 周者，并以冠脉造影术（CAG）50 例（三大主支共 150 支血管）为金标准，对 AI 在冠状动脉狭窄率诊断的准确性进行分析。

结果：（1）：冠状动脉 CTA 中，AI 及人工法重建的 VR 及 CPR 图像质量相仿，1）AI 和人工法 VR 图像质量优秀率分别为 97.9%（96/98）和 95.9%（94/98）， $t=1.78$ ， $P>0.05$ ）差异均无统计学意义。

（2）：以 CAG 诊断为标准，150 支血管 118 个斑块中，AI 辅助诊断的敏感度和特异度分别为 93.5%和 90.0%，AI 辅助诊断与 CAG 诊断一致性较高（ $K=0.752$ ）。

（3）：AI 和金标准相比在评估冠状动脉无狭窄、轻微狭窄、轻度狭窄和血管闭塞方面差异无统计学意义（ $P>0.05$ ），在评估中度狭窄和重度狭窄方面差异有统计学意义（ $P<0.05$ ）。

结论：AI 人工智能辅助诊断系统与人工后处理相比，两者在图像质量优秀率、冠状动脉三大分支血管显示一致性较高，图像质量相仿，AI 辅助诊断在冠脉疾病诊断方面具有较高敏感度和准确性，

极大提高了诊断效率,但对狭窄率诊断仍有不足,需结合人工判读再次分析,AI可作为医师的有效辅助诊断工具。

Differential diagnosis of granulomatous capillary hemangioma and nasal polyps based on CT enhancement and gray level co-occurrence matrix in nasal cavity

Yanzi Chen

Affiliated Longhua People's Hospital, Southern Medical University

Objective

Exploring the value of CT enhanced grayscale co-occurrence matrix (GLCM) texture analysis in differential diagnosis of nasal granulomatous capillary hemangioma and nasal polyps.

Method

Data of 46 patients with nasal masses confirmed by surgery and pathology, including 22 cases of granulomatous capillary tumors in the nasal cavity and 24 cases of nasal polyps. CT plain scan and arterial phase enhancement examination were performed before surgery. Evaluate the average CT values of two types of lesions in the arterial phase after plain and enhanced scans, as well as the changes between their 20 GLCM features. Use a linear mixed effect model to analyze the differences in CT values and selected GLCM features between two types of lesions after plain and enhanced CT scans.

Result

There was a significant difference in arterial phase CT values between the two types of lesions during enhanced scanning ($p < 0.001$). The model shows significant differences in GLCM features between the two types of lesions in enhanced arterial phase images, namely autocorrelation ($p < 0.001$), correlation ($p = 0.012$), homogeneity ($p = 0.003$), contrast ($p < 0.01$), and entropy of difference ($p = 0.037$). In most models, there is a significant difference ($p \leq 0.001$) in the GLCM features of the arterial phase between the two types of lesions on plain and enhanced scans, with the GLCM features of the two types of lesions on plain scans being similar.

Conclusion

GLCM is a method that improves the sensitivity of CT value changes in detecting granulomatous capillary hemangiomas and nasal polyps in the nasal cavity using enhanced scanning CT images, and is a useful supplement to improving the differential diagnosis of these two types of lesions.

基于 CT 影像组学联合临床模型识别肺腺癌一代 EGFR-TKIs 治疗后 T790M 突变耐药状态临床研究

陈伟玲^{1,2}、王斌杰^{1,2}、杨晓慧³、马静¹、张世佳¹、贺祥^{1,2}、王智^{1,3}

1. 河南大学淮河医院

2. 河南大学医学影像研究所

3. 河南大学数学与统计学院

目的 探讨 CT 影像组学联合临床模型识别肺腺癌一代 EGFR-TKIs 治疗后 T790M 突变耐药状态的可行性。**方法** 回顾性收集 2017 年 1 月至 2023 年 6 月通过组织病理检查确诊肺腺癌且治疗前基因检测确定为 EGFR DEL19 或 L858R 突变且无原发性 T790M 突变的 80 例患者,在治疗前及治疗后经基因检测确定为 T790M 突变耐药后 1 周内的 CT 平扫及临床资料,共 160 份,分为 T790M 阳性组 ($n=80$) 及 T790M 阴性组 ($n=80$),按 7:3 将其随机分为训练组和测试组。利用软件勾画感兴

趣区(ROI)、提取特征,使用最小绝对收敛和选择算子(LASSO)算法来筛选特征并计算影像组学评分(Radio-scores),以多因素 logistic 回归分析构建肺窗(Lung window, LW)、纵膈窗(Mediastinal window, MW)及 LW-MW 影像组学模型;采用单因素及多因素逻辑回归分析构建临床(Clinical indicators, CI)模型及 CI-LW-MW 影像组学联合模型。利用 ROC 曲线、校准曲线及决策曲线分析模型效能、可靠性及临床收益。**结果** T790M 突变耐药临床独立预测因子为:远处转移及纵膈内淋巴结(短径>1.5cm);在训练组、测试组中以 CI-LW-MW 影像组学联合模型的 AUC 值最高分别为 0.920 (95%CI: 0.854 - 0.963)、0.911 (95%CI: 0.792 - 0.974),训练组敏感性为 92.31%、特异性为 75.00%;最后对联合模型进行校准曲线及决策曲线分析,显示其有较高的临床应用值。**结论** 远处转移及纵膈增大淋巴结为 T790M 突变耐药临床独立预测因子,CI-LW-MW 影像组学联合模型能有效预测肺腺癌一代 EGFR-TKIs 治疗后 T790M 突变耐药状态,可为影像学早期预测 EGFR-TKIs 治疗后耐药提供参考。

颈椎 X 线多项指标自动测量的深度学习模型开发

冯小晨

海军军医大学第一附属医院(上海长海医院)

目的:基于 X 线图像建立深度学习模型对颈椎 C2-7Cobb 角度、前凸距离、椎管矢状径、Pavlov 比值、cSVA(矢状面轴向距离)进行全自动测量。

方法:我们回顾性收集了 874 名在 2021 年 10 月至 2022 年 9 月期间在上海长海医院接受体检的人群作为研究对象。纳入了符合以下标准的人群:颈椎 X 线图像完整、资料完整,且能够清晰显示 C1-C7 节椎体及棘突。排除了过曲过伸位、遮挡或图像质量不佳的患者。将数据集按 8:1:1 比例随机分为训练集、验证集和测试集。两名影像科医生对训练集进行关键点标注,标注包括 C2-C7 各个椎体的四个端点及 C1-C7 各个棘突的两个端点,共计 38 个关键点。首先使用目标检测算法定位图像中包含关键点信息的区域,即感兴趣区域(ROI)。然后使用关键点检测算法对提取的 ROI 进行关键点检测。使用预定义测量方法计算出 C2-7Cobb 角度、前凸距离、椎管矢状径、Pavlov 比值、cSVA 的值。人工标记的关键点计算出的指标作为真实值,模型预测的关键点计算出的指标作为预测值。计算模型精准度(Precision)、平均精准度(Average Precision, AP)、平均绝对误差(Mean Absolute Error, MAE)。

结果:验证集中模型对于颈椎 X 线图像中 ROI 的检测的 AP 为 91.60,测试集为 AP 为 93.40。测试集中模型测量各项指标的 MAE 分别为 Cobb 角度 2.56;前凸距离 0.47;C2 椎管矢状径 0.50;C3 椎管矢状径 0.49;C4 椎管矢状径 0.47;C5 椎管矢状径 0.51;C6 椎管矢状径 0.56;C7 椎管矢状径 0.76;C2 Pavlov 比值 0.08;C3 Pavlov 比值 0.06;C4 Pavlov 比值 0.05;C5 Pavlov 比值 0.05;C6 Pavlov 比值 0.05;C7 Pavlov 比值 0.06。

结论:基于 X 线的全自动深度学习模型对于颈椎 C2-7Cobb 角度、前凸距离、椎管矢状径、Pavlov 比值、cSVA(矢状面轴向距离)提供了快速、稳定、客观的测量结果。

基于 MRI 的血管通透性和细胞密度相关生境区分胶质瘤中的 IDH 突变状态

郑婉仪¹、刘萍²、江桂华²

1. 暨南大学附属广东省第二人民医院

2. 广东省第二人民医院

目的：胶质瘤的血管通透性和细胞密度复杂且异质，这与 IDH 突变状态有关。因此，本研究拟利用能够反映血管通透性和细胞密度的 T1 加权对比增强图像(T1CE)和弥散加权图像(DWI)，通过 MRI 生境分析预测 IDH 突变状态。

研究方法：回顾性收集来自 3 家医院的 165 例病理确诊为胶质瘤的患者（训练集=109 例，外部验证集=56 例），他们都在术前接受了 T1 加权对比增强成像（T1CE）和弥散加权成像（DWI）检查。将每位患者 T1CE 和表观弥散系数（ADC）图中胶质瘤区域的信号强度汇总为一个全局矩阵。然后进行 K-means 聚类，将胶质瘤划分为四个生境（亚区），并进一步确定敏感生境。分别从整个肿瘤和生境中提取放射组学特征。特征选择采用了双样本 t 检验、皮尔逊相关性分析、最大相关性最小冗余（mRMR）和最小绝对收缩和选择算子（LASSO）。逻辑回归算法用于构建 IDH 突变状态的预测模型。

结果：根据肘部法则将胶质瘤分为 4 个生境，分别是生境 1（受损血管和细胞密度正常生境）、生境 2（正常血管和细胞密度减少生境）、生境 3（正常血管和细胞密度正常生境）和生境 4（受损血管和细胞密度减少生境）。生境 4 被确定为敏感生境。分别筛选 15 个特征构建了四个预测模型：模型-整个肿瘤、模型-四个生境、模型-整个肿瘤+四个生境和模型-敏感生境。模型-敏感生境显示了最佳的预测性能和鲁棒性，在训练集中的 AUC 值为 0.868（95% CI: 0.784- 0.953），在外部验证集中的 AUC 值为 0.817（95% CI: 0.676-0.958）。

结论：生境分析具有捕捉到更多成像信息的潜能，受损血管和细胞密度减少生境是胶质瘤 IDH 突变状态的有效预测因子。

不合并 CMBs 的 2 型糖尿病患者脑灰质微结构及核团的形态学改变的研究

许超

扬州大学附属医院

的：利用磁共振成像技术结合基于体素的形态学的分析方法探索 2 型糖尿病患者不伴 CMBs 灶（的脑灰质微结构及核团形态学的变化及其与 2 型糖尿病认知功能及糖化血红蛋白值的关系进行研究。

资料与方法：收集 2016 年 7 月至 2017 年 7 月在扬州大学附属医院门诊、住院及体检病人各 32 例，对 32 例 2 型糖尿病患者和 32 例年龄匹配的健康对照组进行常规 MR 检查、ESWAN、实验室检查及神经认知量表评估，检查过程中排除 2 型糖尿病组 3 例患者，原因为患者头动幅度过大、患者颞部有蛛网膜下腔囊肿及患者右枕叶微出血灶，最终对 29 例 2 型糖尿病患者和 32 例年龄匹配的健康对照组并且都不伴 CMBs 灶进行高分辨率 3D-BRAVO-T1 加权的结构 MRI 扫描，数据后处理采用基于 MATLAB2013a 平台的 SPM8 中的 VBM 计算全脑体素的脑总体积、脑白质体积、灰质体积、脑脊液体积值并进行组间统计分析，图表显示显著差异脑区的脑灰质区域及数值，选取灰质核团（双侧尾状核、丘脑及豆状核）与糖化血红蛋白值及神经认知量表做相关性分析。

结果：本研究发现蒙特利尔认知评估、简易精神状态检查表、连线实验 A、连线实验 B、复杂图形复制测试及复杂图形回忆测试神经认知功能测试能力在不合并 CMBs 的 T2DM 患者中较正常对照组下降，并且有统计学意义。基于 VBM 形态学分析，不伴 CMBs 的 T2DM 患者与正常健康对照组脑总体积、脑白质体积、灰质体积及脑脊液体积无明显差异，但 2 型糖尿病组患者脑总、灰白质体积均低于正常对照组。脑灰质及核团体积在双侧颞中回、海马、右侧楔叶、舌回、左侧尾状头、豆状壳核、双侧丘脑及部分灰质体积显著减少（ $P < 0.05$, FDR 校正），此外，双侧丘脑、尾状核

及豆状壳核的灰质体积与 HbA1c 水平呈负相关改变; 并且双侧丘脑灰质体积与连线实验 A(TMT-A) 所花费时间也呈负相关改变。

基于 CT 增强图像联合深度学习特征和传统影像组学特征术前预测结直肠腺癌脉管侵犯的应用价值

郝慧婷

扬州大学附属医院 (扬州市第一人民医院)

目的 探讨基于深度迁移学习特征和传统影像组学特征的联合模型在术前预测结直肠癌患者脉管侵犯状态的应用价值 **方法** 回顾性收集 232 例经手术病理证实的结直肠癌患者, 从静脉期 CT 图像中提取与脉管侵犯状态相关的传统影像组学及深度迁移学习特征, 采用最小绝对收缩和选择算子回归 (Lasso) 进行特征选择, 采用随机决策森林(RF)分别构建传统影像组学模型及联合预测模型。采用受试者工作特征曲线(ROC)评价各预测模型的诊断效能。采用决策曲线分析(DCA)评估模型的临床适用性。结果 联合 2 个传统影像组学特征与 2 个深度学习特征构建的预测模型有良好的诊断效能 [AUC 为 0.850(95%CI, 0.794-0.905)]。各项效能指标优于由 6 个传统影像组学特征构成的传统影像组学预测模型 [AUC 为 0.850(95%CI, 0.795-0.903)]。结论 本研究构建的联合深度迁移学习特征和传统影像组学特征预测模型可用于术前预测结直肠癌脉管侵犯, 且与传统影像组学模型相比, 其预测效能有所提高。

深度卷积神经网络在外周植入中心静脉导管位置评估中的应用研究

胡蓉、胡平

中南大学湘雅医院

目的: 基于胸部 X 射线图像建立深度卷积神经网络 (DCNN) 模型自动分割外周植入中心静脉导管 (PICC) 同时判断植入程度, 为临床评估 PICC 位置提供高效辅助手段。

材料与方法: 本文回顾性收集了 18 至 80 岁的患者在 2018 年 1 月至 2023 年 6 月间本院放射科接受立位胸部 X 射线图像。随机选取其中 105 例, 根据气管分叉点到 PICC 尖端的垂直距离, 将其分为位置适当和位置异常。放射科医生利用 3D Slicer 软件手动勾画 PICC。本文使用两阶段模型评估 PICC 位置, 首先基于训练集 (n=84) 及验证集 (n=11) 建立 DCNN 分割模型, 训练集采用数据增强策略, 利用骰子相似系数 (DSC) 衡量其与手工勾画的一致性; 结合原始 X 射线图像与分割概率图, 训练分类模型, 判断 PICC 植入位置是否合适, 并在测试数据集 (n=10) 中对其进行测试, 使用 AUC、准确度, 灵敏度, 特异性评估模型效能。

结果: 所有受试者中男性 42 例, 女性 63 例。训练集、验证集与测试集中患者数量 (正常: 异常) 分别为 84 (45:39)、11 (6:5)、10 (5:5)。PICC 分割模型在验证集与测试集中 DSC 分别为 0.61, 0.62。仅基于原始 X 射线图像构建的位置判断模型中, 验证集与测试集分类准确率、位置异常识别灵敏度及特异性分别为 63.6%、40.0%、83.3%, 60.0%、40.0%、80.0%。结合原始 X 射线图像与 PICC 分割概率图构建的位置判断模型中, 验证集与测试集分类准确率、灵敏度、特异性及 AUC 分别为 81.8%, 80.0%, 100.0%, 0.90, 80.0%、80.0%、100.0%、0.96。

结论：基于胸部 X 射线图像构建的深度卷积分割及分类网络具有评估 PICC 植入程度的潜力，分割模型可以有效地结合原始图像完成 PICC 尖端位置的确认，从而辅助医生提供治疗决策。

腰椎 DR 智能测量系统自动检测椎体压缩程度的临床应用

董馥闻

甘肃省中医院

目的：评估腰椎 DR 智能测量系统自动检测椎体压缩程度的临床应用价值。

方法：回顾性纳入 2021 年 3 月到 2021 年 12 月于甘肃省中医院行腰椎 DR 侧位确诊为 T12 至 L5 椎体楔形骨折的受试者 1902 例和同时段行腰椎 DR 侧位正常的图像 728 张，拥有 3 年骨肌诊断经验的三位放射科医生（R1、R2 和 R3）通过 JPHV 专用软件（annotation 1.1.0）对上述影像进行六点形态学标注，标注完成后由 R4 医生对标注的结果进行审核。使用 SPSS 18.0 统计软件进行统计分析，关键点标注的可靠性用关键点间距离的百分比评估观察者间的一致性。腰椎 DR 智能测量系统测量评估使用 R4 对 R1、R2、R3 三位医师的标注结果进行审核并作为金标准。应用 Pearson 相关系数 r 、ICC、MAE 和均方根误差（RMSE）来评估参考标准与测量系统间的相关性和一致性。使用配对 t 检验比较 MAE 来确定统计学差异。

结果：基于关键点坐标将系统计算得到的 Genant 分类结果与放射科医师测量的分类结果进行比较，该系统预测 T12 和 L1 椎体 0、I 度、II 度和 III 度楔形骨折分类准确率分别为 66.67%、75.0%、92.2%和 92.37%。系统预测 T12 和 L1 椎体压缩性骨折的召回率为 82%，精度为 84%，F1 分数为 83%。关键点标注的可靠性在 3 mm 阈值范围内观察者间关键点到关键点间距离的百分比分别为 89%（R1 vs R2）、88%（R1 vs R3）、96%（R1 vs R4）、94%（R2 vs R3）、98%（R2 vs R4）、98%（R3 vs R4）。腰椎 DR 智能测量系统预测值与参考标准具有良好的一致性（ICC=0.9065、0.8687、0.8837、0.8344）和相关性（ $r=0.9134$ 、0.8743、0.8896、0.8418）；该系统与参考标准间的 RMSE=0.0522、2.5608、0.061、2.9575，MAE=0.0379、1.9081、0.0454、2.2906。

结论：本研究为临床定量评估椎体压缩性骨折提供了一种有力测量工具，对提高临床工作效率具有潜在意义。

冠状动脉 CTA 下 CT-FFR 在高海拔缺氧环境影响下对冠心病的研究与判断

胡婷婷

青海省心脑血管病专科医院

冠状动脉 CTA 是临床诊断冠心病的最常用的无创检查手段，既往研究表明使用冠脉 CTA 检查时，增加 CTFFR 值的测量可提高冠脉 CTA 的诊断准确性，但由于患者在高海拔环境下其血流动力学会发生一些改变，给 CTFFR 值的测量结果会带来一定的影响，为了进一步提高高海拔环境下 CTFFR 值对冠状动脉 CTA 诊断的准确性，本研究将本院冠脉 CTA 下 CTFFR 值与 ICA 下行压力导丝测量 FFR 值进行对比，旨在探讨 CTFFR 值对冠心病引起心肌缺血诊断的敏感性、特异性及准确性。

PU-1368

Deep learning Based Automatic Segmentation of Brain Magnetic Resonance angiography Images

Liying An
First hospital of Jilin University

Synopsis

Accurate cerebrovascular segmentation plays an important role in clinical diagnosis and the related research. Magnetic Resonance angiography (MRA) postprocessing manually recognized by technologists is extremely labor intensive and error prone. However, automatic segmentation of brain vessels remains challenging because of the variable vessel shape and high complex of vessel geometry. We propose an artificial intelligence brain vessel segmentation system supported by an optimized physiological anatomical-based 3D convolutional neural network that can automatically achieve brain MRA vessel segmentation in healthcare services. The overall segmentation accuracy of the independent testing dataset is 0.931.

Introduction

MRA is a widespread, non-invasive, and cost-efficient imaging modality that is employed in routine clinical diagnoses of head and neck vessels, especially in cerebrovascular disease, which represents one of the leading causes of severe disability and mortality worldwide¹. To visually analyze the vasculature of the head and neck more efficiently, vessel segmentation is usually performed by experienced computed tomography technologists. However, as the number of requests for MRA examinations have increased, the postprocessing staff cohort has become overwhelmed due to the time-consuming manual process². Considering that vessel imaging segmentation is required in clinical settings, an automatic segmentation system can be easily integrated into the clinical workflow if processed segmentations are available.

Methods

Deep learning-based segmentation approaches have drawn increasing interest due to their self-learning and generalization abilities from large data volumes³. A major technological challenge of this study is accurate vessel segmentation without interruption of the blood vessels which is difficult because the vessels are tortuous and branched. In this paper, we used a method to segment vessel which has been used in CTA image⁴. As is shown in Fig.1, the 3D-CNN model was trained using a modified U-net with the addition of bottleneck-ResNet(BR) which automatically achieved optimized model parameter selection. The core design of the segmentation system was the deep learning model, Unet has been widely used to segment various medical images since it was proposed⁵. Generally, Unet consists of a constriction path and a symmetrical expansion path, and skip connections are used between the paths for feature fusion. The constriction path contains successive down-sampling layers to capture context, while the symmetrical expansion path contains a series of up-sampling layers to recover localization. In our modified Unet, inception modules and dilated convolutions are inserted into adjacent down-sampling layers in the constriction path.

Results

This system is trained and tested with 365 head 1.5T and 3T time-of-flight (TOF) MRA datas collected between 2021.10.1 and 2022.1.16. One case of brain vessel segmentation result is shown in Fig.2. The vessel segmentation attained dice similarity coefficient(DSC) of 0.975 and 0.944, weighted vessel score(V-scores) of 0.975 and 0.929, and recall of 0.961 and 0.933 for the training and validation sets, respectively.

Discussion

In this study, we validated a deep learning algorithm through physiological anatomical-based 3D CNN for MRA head image postprocessing. The model was developed with an optimized network by the distribution of BRs, and we proposed the CGPM to revise vascular segmentation errors and avoid partially missing vasculature. Our results indicated that a 3D-CNN deep learning algorithm can be trained to complete vessel segmentation automatically with high sensitivity and specificity in a wide variety of enhanced MRA scans.

Conclusion

In conclusion, we found a time-saving and subjectivity-independent method compared to currently available techniques to segment brain vessel of MRA images, saving costs, and increasing efficiency. It is clinically applicable due to its consistency with manually processed images. Thus, the system facilitates clinical workflows and provides an opportunity for clinical technologists to improve humanistic patient care.

PU-1369

基于多参数 MRI 影像组学的星形细胞瘤风险分层及其生物学含义

阎静、程敬亮
郑州大学第一附属医院

目的：基于多参数 MRI，建立星形细胞瘤患者总生存期的影像组学预后模型，探索影像组学特征相较于现有临床预后模型的增量价值及其生物学含义。

材料与方法：回顾性收集 319 例经 2021 版 WHO 标准确诊的成人星形细胞瘤患者（训练集：218 例，验证集：101 例）。基于术前 MRI 影像（ $n=319$ ），采用机器学习方法建立预测患者总生存期的影像组学标签，并生成影像组学-临床病理预后诺模图。在模型校准、鉴别、重分类和临床有用性等方面评估影像组学标签的增量价值。基于配对的 MRI 和 RNA 测序数据（ $n=56$ ），采用影像基因组学方法（WGCNA 与 GSEA），识别与影像组学特征相关的关键分子通路。

结果：影像组学标签与总生存期显著相关（ $P<0.01$ ； $HR=4.013$ ；95% CI: 1.968, 8.182），而且是星形细胞瘤患者的独立预后因子。相较于临床病理预后诺模图，影像组学-临床病理预后诺模图能够更加准确的预测总生存期，C 指数达 0.777（95% CI: 0.710, 0.800），且具有更好的校准和分类精度。影像基因组学分析显示，与影像组学特征显著相关的生物学通路可以分为四类：免疫、细胞增殖、复杂细胞功能和治疗反应。其中，隶属于 ADC 图的纹理特征主要与免疫方面的生物学通路密切相关。

结论：影像组学特征是星形细胞瘤患者的独立预后因素，且与免疫、细胞增殖、复杂细胞功能和治疗反应有关的四种关键生物学通路密切相关。我们的初步探索可能有助于指导星形细胞瘤患者的早期治疗，从而改善患者的生存周期。

人工智能重建技术在优化腰椎磁共振 T2 DIXON 成像扫描时间和图像质量中的应用价值

荆国庆
陆军军医大学第一附属医院（西南医院）

目的：探讨人工智能重建技术在优化腰椎磁共振 T2 DIXON 成像扫描时间和图像质量中的应用价值。

材料与方法：本研究回顾性纳入常规腰痛，腰椎平扫磁共振扫描的受试者，分别行腰椎 MRI T2 DIXON 和人工智能重建技术优化的快速 T2 DIXON 扫描，并保存未应用人工智能重建技术的原始 T2 DIXON。由 2 名研究者分别对三组 T2 DIXON 的 IN 和 W（常规、快速和人工智能重建技术优化）的整体图像质量和图像伪影进行图像质量主观评价（5 分标准）。由 1 名研究者测量 L3、L4、L5 信噪比（signal-to-noise ratio, SNR）以及与之对应相同层面的竖脊肌的对比噪声比（contrast-to-noise ratio, CNR）。对正态分布和非正态分布的数据分别进行单因素方差分析和 Kruskal-Wallis 检验，比较分析三组 T2 DIXON 的 IN 和 W 图像的主观评分和客观指标的差异。采用组内相关系数（intra-class correlation coefficient, ICC）评估研究者之间主观评分。

结果: 本研究共纳入 50 名受试者。人工智能重建技术 T2 DIXON 较常规 T2 DIXON 扫描时间缩短了 41.3%。两位研究者的评分结果均显示, 常规 T2 DIXON、快速 T2 DIXON 和人工智能重建技术优化 T2 DIXON 的整体图像质量评分和椎体病变显示清晰度均存在显著差异 ($P < 0.05$); 但在伪影评分上差异无统计学意义 ($P > 0.05$)。三组 T2 DIXON 图像椎体的 SNR、CNR 间差异具有统计学意义 ($P < 0.05$)。应用三组 T2 DIXON 图像进行椎体病变评分具有很好的一致性。结论: 人工智能重建技术可以显著改善快速采集 MRI 序列的图像质量, 有利于急诊患者和欠配合患者的快速完善检查及快速 MRI 序列的临床应用。

利用能谱 CT 单能量图像结合 MARs 软件去除颅内动脉瘤夹闭术后患者金属伪影效果研究

熊文杰、刘超、吴磊
太和医院

目的 探讨能谱 CT 去金属伪影技术 (MARs) 在动脉瘤夹闭术后 CT 成像的应用效果。方法 选取我院 2022 年 12 月 26 日至 2023 年 5 月 23 日共 17 例动脉瘤患者作为研究对象, 所有患者均行动脉瘤夹闭术, 术后行能谱成像 (Gemstone Spectral Imaging, GSI) 扫描模式检查, 获取扫描数据后重建 70~140 keV (间隔 10 keV) MARs (Metal Artifact Reduction System, MARs 金属伪影去除技术) 组和非 MARs 组图像, 计算图像伪影指数 (AI)、噪声 (SD) 和信噪比 (SNR), 并进行主观评分, 比较不同 keV 水平 MARs 图像和非 MARs 图像的 AI、SD 和 SNR 差异。结果 在不同 keV (70~140 keV) 水平, MARs 组中 AI 值、SD 值低于非 MARs 组 ($P < 0.05$), MARs 组中 SNR 值及主观评分高于非 MARs 组 ($P < 0.05$); 140keV 水平非 MARs 组的 AI 值、SNR 值与 70 keV 及 80 keV 相比具有统计学差异 ($P < 0.05$); 120~140keV 水平 MARs 组的 AI 值、SNR 值与 70 keV 及 80 keV 相比具有统计学差异 ($P < 0.05$)。结论 能谱 CT 去金属伪影技术 MARs 可以有效减少动脉瘤夹闭术后动脉夹伪影, 提高解剖结构清晰度。

Machine Learning Classification of Alzheimer's Disease Based on ^{18}F -FDG PET Imaging

Zhe Ren, Hongbo Zhao, Bocheng Wang, Weiding Zhou, Xiaofeng Tao
Shanghai Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine

Objective: Alzheimer's disease (AD) is a common neurological disease in the elderly. The onset of AD is often preceded by an intermediate phase known as mild cognitive impairment (MCI). A proportion of people with MCI will progress to AD, while other forms of MCI tend to remain stable over time or progress other dementia types. This study aimed to discriminate MCI patients at risk of AD from stable MCI based on ^{18}F -FDG PET imaging data.

Methods: 197 participants from the public ADNI database were enrolled, including 92 patients with MCI who converted to AD within 36 months and 105 patients with MCI without conversion within 36 months. A deep learning model, namely AlexNet, served as a feature encoder to extract deep radiomic manifestations reflected by the ^{18}F -FDG PET imaging for each subject in both groups. The clinical scale information of the participants (Clinical Dementia Rating Sum of Boxes, Alzheimer's Disease Assessment Scale, Mini-mental State Examination, and Functional Activities Questionnaire) was combined with the above deep radiomic features to generate a joint feature set. The joint feature set was then separately fed into K-Nearest

Neighbour (KNN) and Random Forest (RF) classification models to observe their performance in classifying progressive MCI from stable MCI. Ten-fold cross-validation was processed to guarantee the robustness of the results.

Results: In the KNN model, the accuracy, precision, recall, and F1 score of the joint features reached 0.880, 0.894, 0.892, and 0.881, respectively. In the RF model, the accuracy, precision, recall, and F1 score were 0.840, 0.858, 0.829, and 0.836, respectively. Compared to the RF model, the joint features under the KNN model yielded superior discriminative performance.

Conclusion: The combination of deep radiomic features based on the deep learning algorithm and clinical scale information could be effectively used for the computer-assisted diagnosis of conversion from MCI to AD.

PU-1373

An artificial intelligence system for melioidosis pneumonia diagnosis and prognosis using computed tomography: A retrospective, multicenter study

Yuefu Zhan

The Third People's Hospital of Longgang District Shenzhen

Background

Melioidosis pneumonia is a severely underreported infectious respiratory disease. The low prevalence of melioidosis pneumonia in the population leads to a lack of experience in identifying and predicting the prognosis of melioidosis pneumonia in clinical diagnoses and treatment. The reported melioidosis pneumonia rate is less than 1% of the actual incidence, while the mortality can reach 50%. We aimed to develop an AI system for detecting, diagnosing and predicting the prognosis that is valuable for clinicians to detect and manage patients with melioidosis pneumonia.

Methods

In this retrospective, multicenter study, we established a pneumonia CT image dataset (PCID) including 1488 patients (2,521 CT scans, 311,182 CT images). The PCID includes melioidosis pneumonia, community-acquired pneumonia (CAP), COVID-19 pneumonia, and healthy controls were collected at twelve hospitals. We used the PCID to develop an AI system with lung-lesion segmentation, pneumonia classification, and prognosis prediction networks for diagnosing and predicting the prognosis of melioidosis pneumonia. The system automatically detects lung-lesions and introduces local-to-global diagnosis methods of radiologists into a deep neural network (DNN) to diagnose pneumonia. Moreover, we constructed a prognostic model that combines image features and clinical metadata to determine severe or critical patients.

Findings

In the four-way classification task (melioidosis pneumonia, COVID-19 pneumonia, CAP, and healthy controls), in the internal test cohort (843 patients, 1,501 CT scans), the system achieved 88.74% accuracy and a macroaveraged AUC of 0.9700 (95% CI: 0.9630-0.9760). In an independent external test cohort (548 patients, 798 CT scans), the system achieved 89.22% accuracy and a macroaveraged AUC of 0.9695 (95% CI: 0.9594-0.9784), outperforming radiologists, and 81.76% accuracy and a macroaveraged AUC of 0.8197 (95% CI: 0.7452-0.8898) for predicting progression to severe or critical illness.

Interpretation

CT image-based dual-pathway models can significantly improve melioidosis pneumonia identification, a critical diagnostic challenge worldwide.

PU-1374

新一代基于模型迭代重建在低剂量上腹部 CT 成像中的应用价值

雷雨欣、任占丽、韩冬、赵文勇、彭荟、申利
陕西中医药大学附属医院

目的：探讨新一代基于模型迭代重建 (MBIR) 在低剂量上腹部 CT 成像中的应用价值。

资料与方法：收集上腹部三期增强扫描患者 40 例，为 A、B 两组，动脉期和门静脉期扫描条件完全相同，延迟期采用自动管电流，A 组噪声指数 NI10，B 组 NI20，管电压均 120kVp。A 组延迟期分别采用 FBP、ASIR-40%重建，B 组延迟期采用 MBIR 中的 NR40 设置重建。测量肝脏、脾脏、胰腺、双肾实质及同层面腹壁皮下脂肪 CT 值及 SD 值，计算各脏器的 SNR 和 CNR：SNR=CT 值/SD 值，CNR=(CT 值-CT 值脂肪)/SD 值脂肪。单因素方差分析对三组图像 CT 值、SD 值、SNR、CNR 进行统计分析， $P<0.05$ 有统计学意义。记录 CTDIvol 和 DLP 并计算有效辐射剂量：ED=DLP×K。两名有经验的医师采用 5 分制对三组图像质量双盲法主观评分，利用 Kappa 检验比较评分的一致性。结果：三组图像 CT 值差异无统计学意义 ($P>0.05$)；A 组 FBP 和 40%Asir、B 组 MBIRNR40 三组图像主观评分为 3.15 ± 1.03 ， 4.00 ± 1.04 ， 4.95 ± 1.46 ，差异有统计学意义 ($P<0.05$)；B 组 MBIRNR40 图像肝脏、脾脏、胰腺、肾实质的 SD 分别为 7.53 ± 0.71 ， 7.72 ± 0.69 ， 8.19 ± 1.79 ， 10.27 ± 1.77 ，低于 A 组 40%Asir 和 FBP 图像，差异有统计学意义 ($P<0.05$)；B 组 MBIRNR40 图像肝脏、脾脏、胰腺、肾实质的 SNR 分别为 9.7 ± 1.37 ， 9.16 ± 1.21 ， 7.27 ± 1.48 ， 10.72 ± 1.38 ，CNR 分别为 22.46 ± 10.24 ， 22.29 ± 10.57 ， 20.26 ± 9.04 ， 27.22 ± 12.43 ，高于 A 组 40%Asir 和 FBP 图像，差异有统计学意义 ($P<0.05$)；B 组的 DLP (95.56 ± 47.17)、ED (1.43 ± 0.7) 较 A 组 DLP (376.40 ± 160) 和 ED (5.64 ± 2.41) 均降低了 75%。

结论：应用新一代基于模型迭代重建 (MBIR) 可获得优于常规剂量 40%ASIR 和 FBP 重建的图像质量，辐射剂量较常规扫描降低约 75%。

PU-1375

人工智能在冠状动脉 CTA 狭窄评估中的应用价值

王宪凯、程祥科
济宁市第一人民医院

摘要：**目的** 分析人工智能 (AI) 评价冠状动脉狭窄程度的准确性，探讨 AI 辅助诊断系统对冠心病的诊断价值。**方法** 行冠状动脉 CT 血管成像 (CCTA) 的疑似冠心病且 2 周内行冠状动脉造影 (ICA) 患者 104 例，以创伤性冠状动脉造影 (ICA) 为金标准，评估 AI 对冠状动脉狭窄的诊断价值。**结果** 104 例患者中三大血管主干共计 312 根，ICA 检查血管阴性数量为 159 支 (狭窄 $<50\%$)，阳性 153 支 (狭窄 $\geq 50\%$)。AI 检查血管阴性数量为 154 支，阳性 158 支。ICA 和 AI 两组间血管狭窄程度无统计学意义 ($\chi^2 = 0.16$ ， $P = 0.69$)，诊断结果有较好的一致性 (Kappa 值 = 0.82)。ICA 和 AI 两组间冠状动脉三大主支 (RCA、LAD 和 LCX) 两组间狭窄程度均无统计学意义 ($t = 0.82$ ， 0.29 ， 1.10 $P > 0.05$)。ICA 检查中闭塞的血管 12 支，AI 组 0 支。**结论** AI 在诊断冠状动脉狭窄时和 ICA 有较好的一致性，冠状动脉血管闭塞时无法准确识别。

深度学习在颈椎病的诊断及预后预测的应用研究进展

蒋雯茜、何来昌
南昌大学第一附属医院

近年来,深度学习技术作为人工智能的重要分支,在医学影像领域得到了广泛应用。深度学习能够模拟人类的思维模式,不需要人工参与设计就能将原始数据通过自动学习过程从一些简单的非线性模型变换为更高层次的抽象表达,也能够从医学图像大数据中自动学习提取隐含的疾病诊断特征,近几年已迅速成为医学图像分析研究热点。在颈椎病中,深度学习在颈椎病影像诊断方面已取得了一定的进展,其中包括对颈椎病病变程度、病灶位置和脊髓损伤等的评估。此外,深度学习技术还可以实现对颈椎病产生原因高危因素进行预测和评价,并且可以一定程度上评估治疗效果。该文结合国内外深度学习研究的成果,总结近年来在颈椎病的诊断及治疗效果预测中深度学习的研究进展与应用情况。

PU-1377

基于脑图谱的儿童脑深部核团 MRI 图像自动分割研究

张欢欢、李婷婷
上海市儿童医院

目的:脑灰质核团的准确分割是定量研究相关结构和功能脑影像重要前提,手动分割需要时间和专业知识。本研究利用标准脑模板和图谱配准方法,探讨对儿童脑深部核团 MRI 图像自动分割的可行性。

材料与方法:收集 82 例无明显脑部结构异常儿童的常规 T1WI 原始影像资料及其临床信息。手动分割采用人工勾画 ROI 方法,分别取幕上苍白球、壳核及幕下齿状核。自动分割步骤如下:①使用 FMRIB Software Library (FSL) 软件去脑壳,在个体水平分割灰质、白质和脑脊液;②使用 Advanced Normalization Tools (ANTs) 软件将 MNI152 标准脑模板非线性配准到个体脑影像,并计算转换矩阵;③将转换矩阵应用到标准脑解剖图谱(Harvard-Oxford atlas, SUIT-Cerebellum atlas),得到基于个体空间的脑图谱,④利用基于个体的脑图谱对 MRI 图像进行分割。以 T1WI 信号强度值作为分割结果的参考指标,通过组内相关系数 (ICC) 和 Bland-Altman 图比较手动、自动分割方法分别对苍白球、壳核及齿状核的分割一致性。

结果:82 名儿童中位月龄 60.9 (0.9-170.5) 月,自动与手动分割方法对一致性检验结果,苍白球 ICC: 0.97 (95%CI 0.88-0.98), 壳核 ICC: 0.99 (95%CI 0.96-0.99), 齿状核 ICC: 0.96 (95%CI 0.87-0.97), Bland-Altman 图观察两种方法对应散点绝大部分位于 95% 一致性界限内。

结论:基于脑图谱的自动分割方法可以准确分割儿童脑深部核团,为后续 MRI 定量分析提供了一种快捷、准确的新方法。

PU-1378

基于逻辑回归构建的影像组学模型能更好地预测结直肠癌术前微卫星不稳定性

马义、季长风
南京鼓楼医院

背景:研究不同分类器在预测结直肠癌术前微卫星不稳定性 (MSI) 状态方面的性能,并确定预测能力最佳的方法。

方法:该回顾性研究根据 2020 年 3 月至 2022 年 9 月期间的病理报告招募了 297 名结直肠癌确诊患者。术前计算机断层扫描图像和术后 MSI 信息完整。特征提取和模型构建如下:首先,使用组

间/内相关系数和最小绝对收缩和选择算子算法来识别最具预测性的特征子集。随后，使用三个分类器（逻辑回归、支持向量机和随机森林）构建放射组学模型，并确定其中最佳的放射组学模型，使用与最佳放射组学模型相同的处理步骤建立临床模型和综合模型。最后，使用决策和校正曲线对三个模型的性能进行分析与评估。

结果：我们观察到，基于逻辑回归构建的放射组学模型表现出最佳的预测性能。此外，肿瘤位置、N 分期和高血压被确定为 MSI 状态的临床独立预测因素。在测试集中，临床模型显示出良好的预测性能，曲线下面积（AUC）为 0.732（95%置信区间，0.625-0.891）。此外，综合模型显示出优异的预测能力（AUC，0.958；准确度，0.890；灵敏度，0.927）和良好的临床适用性以及校准效果。

结论：基于逻辑回归构建的模型具有良好的性能和可重复性，可以进一步降低输入数据的可变性，提高预测结直肠癌患者 MSI 状态的放射组学研究质量。

PU-1379

基于卷积神经网络的磁共振图像在神经根型颈椎病诊断的临床价值

蒋雯茜、何来昌、谭永明
南昌大学第一附属医院

背景 神经根型颈椎病（cervical spondylotic radiculopathy, CSR）是颈椎病中最常见的类型，但是目前由于技术的限制，对于神经根型颈椎病的诊断主要依据的是临床症状，在影像上神经根是否受压迫的诊断效率较低，所以是否有方法能根据影像图像提高对神经根型颈椎病的诊断效率是目前值得解决的问题之一。

目的 探讨基于卷积神经网络（Convolutional Neural Networks,CNN）模型的影像图像在神经根型颈椎病的分析诊断中临床价值以及实际应用。

方法 收集有颈肩痛及上肢麻木等颈丛和臂丛神经根受压症状、临床高度怀疑神经根型颈椎病患者及健康人群的颈椎 MRI 常规序列，在应用纳入和排除标准后，共纳入 50 例患者及 51 例健康人群，其中 80%（n=80）用于训练，10%用于测试（n=10），10%用于验证（n=10），利用 T2WI 矢状位及横断位 MRI，设计并训练了相应的卷积神经网络模型（Resnet50）。验证指标包括特异性及曲线下的面积。

结果 共 50 名患者及 51 名健康人群进行了评估。该模型对 20 份 T2WI 横断位测试组图像的诊断在测试集（valuation dataset）上的准确率为 9/10（90%），另一针对矢状位的诊断模型对 20 份 T2WI 矢状位的诊断在测试集（valuation dataset）上的准确率为 7/10（70%）。

结论 卷积神经网络模型能够在一定程度上利用影像图像提升神经根型颈椎病的诊断效率，该预训练卷积神经网络（Resnet50）基于横断位图像的诊断准确率优于基于矢状位图像的诊断准确率，且可达到 90%准确率。

PU-1380

基于 MRI 影像组学在腮腺肿瘤分类中的应用研究

吴松雄、吴光耀、米瑞、吴娜珊、谭碧雯
深圳大学总医院

目的

唾液腺肿瘤约 70%是腮腺肿瘤。腮腺肿瘤有很多亚型，其组织学类型多样，不同组织学亚型之间的临床病理特点常有重叠，常常使得部分唾液腺肿瘤的诊断出现争议。不同性质及亚型的唾液腺上皮性肿瘤在手术方式、是否放化疗、清扫淋巴结、保留面神经等治疗方式上有很大的不同。因此术前有必要为腮腺肿瘤的分类建立更客观有效的影像评估模型，对于临床治疗方案的制定及患者预后的评估具有重要意义。

方法

我们回顾性收集在医院的 189 例腮腺肿瘤患者的临床和影像学数据，首先由多位高年资放射科医师在 T1WI、T2WI-FS、T1WI-FS+C 序列上逐层勾画腮腺肿瘤金标准。接着对这三个序列进行影像组学分析，通过影像组学进行特征提取。最后采用传统机器学习分类器，对腮腺肿瘤进行病理分类预测。

结果

logistic 回归分类结果，T1WI: AUC 为 0.829，准确率为 78.9%，特异度为 78.5%，灵敏度为 80.0%。T2WI-FS: AUC 为 0.871，准确率为 73.7%，特异度为 71.4%，灵敏度为 80.0%。T1WI-FS+C: AUC 为 0.729，准确率为 68.4%，特异度为 71.4%，灵敏度为 60.0%。SVM 分类结果，T1WI: AUC 为 0.814，准确率为 84.2%，特异度为 85.7%，灵敏度为 80.0%。T2WI-FS: AUC 为 0.871，准确率为 84.2%，特异度为 85.7%，灵敏度为 80.0%。T1WI-FS+C: AUC 为 0.700，准确率为 68.4%，特异度为 64.3%，灵敏度为 80.0%。RF 分类结果，T1WI: AUC 为 0.750 准确率为 73.6%，特异度为 71.4%，灵敏度为 80.0%。T2WI-FS: AUC 为 0.800，准确率为 63.1%，特异度为 57.1%，灵敏度为 80.0%。T1WI-FS+C: AUC 为 0.750，准确率为 73.6%，特异度为 71.4%，灵敏度为 80.0%。

结论

我们通过建立了一个基于 MRI 图像对腮腺肿瘤良恶性进行分类的影像组学模型，表明 T2WI-FS 序列结合影像组学效能最好。基于对本研究旨在提高腮腺肿瘤术前诊断的准确性，以便临床定制更加个性化精细化的治疗方案。

PU-1381

基于多尺度的磁共振纹理分析在Ⅱ、Ⅲ级胶质瘤鉴别上的应用研究

曹之乐

中国人民解放军陆军特色医学中心

目的：针对影像诊断Ⅱ、Ⅲ级胶质瘤的鉴别困难问题，通过基于多尺度的磁共振纹理分析方法，提升Ⅱ、Ⅲ级胶质瘤鉴别准确率的应用研究。材料与方法：回顾性分析本院 38 例脑胶质瘤患者磁共振影像，以病理结果作为判断金标准。收集 T2 加权图像（T2WI）、T2 加权压水图像（T2_flair）、增强后 T1 加权图像（T1_contrast）、弥散（DWI）序列处理出来的表观扩散系数图（DWI_ADC）、磁敏感加权图像（SWI）、弥散张量成像（DTI）处理出来的表观扩散系数图（DTI_ADC）和各向异性指数图（FA）。在 MATLAB 上实现病灶划取，并且使用小波分解构造多尺度图像。在原始图像和构造图像上做灰度共生矩阵（GLCM）、灰度行程矩阵（GLRLM）、灰度区域大小矩阵（GLSZM）、领域灰度差矩阵（NGTDM）四种二阶变换，提取纹理特征。使用 LASSO（Least Absolute Shrinkage and Selection Operator）方法对纹理特征进行筛选，得出非零权重纹理特征。最终采用支持向量机（SVM：Support Vector Machine）、梯度提升（GB: Gradient Boosting）和随机森林（RF: Random Forests）三种分级模型，统一采用留一法交叉验证得出鉴别Ⅱ、Ⅲ级胶质瘤上的平均准确率。结果：原始图的二阶纹理参数在 SVM 模型、GB 模

型和 RF 模型上的准确率为 85.7%、80.3 和 63.9%，构造图像的二阶纹理参数在 SVM 模型、GBC 模型和 RFC 模型上的准确率为 94.6%、83.8%和 70.3%。结论：研究证明多尺度的磁共振纹理分析方法对鉴别Ⅱ、Ⅲ级脑胶质瘤准确率有较大提升。

基于 CT 影像组学随机森林模型对 IA 期肺腺癌气道播散的评价

马彩彩、姜文龙
空军军医大学西京医院

基于 CT 影像组学随机森林模型对 IA 期肺腺癌气道播散的评价

目的：通过气道播散（STAS）是肺腺癌的一种侵袭性特征，被认为是预后不良的危险因素。本研究旨在建立一个随机森林模型，用于术前预测 IA 期肺腺癌的气道播散（STAS）。

方法：对 2023 年 3 月至 2023 年 8 月来我院行胸部 CT 平扫和手术切除的 70 例 IA 期肺腺癌患者进行回顾性研究。每个肺结节通过人工智能（AI）软件自动分割，并提取其基于 CT 的影像组学信息。所有患者在病理上被分为 STAS 阴性和 STAS 阳性两组，然后对两组患者的临床病理和 CT 影像组学进行比较。最后通过随机森林模型建立评估 IA 期肺腺癌 STAS 状态的预测模型。

研究结果在 70 例 IA 期肺腺癌患者中，12 例患者 STAS 阳性。随机森林分类模型确定了预测特征，包括 CT 值最大值、肿瘤合并率（CTR）、三维直径、CT 值平均值、熵和 CT 值最小值。随机森林模型的误分类率仅为 8.37%。

结论基于随机森林模型可有效识别 IA 期肺腺癌 STAS 的危险因素，并有效实现特征风险的分级管理。预测 IA 期肺腺癌 STAS 的随机森林模型简单实用。

PU-1383

Deep Learning Algorithm for CT Image Super-Resolution Reconstruction: from Whole Lung Scan to Target Scan

Qinling Jiang
Changzheng Hospital, Naval Medical University

Purpose: Our study aims to develop a deep learning super-resolution (SR) model capable of efficiently mapping from a whole lung scan with a resolution of 0.68mm, 0.68mm, 1mm (NRCT, normal-resolution CT) to a target CT scan with a resolution of 0.17mm, 0.17mm, 0.5mm (HRCT, high-resolution CT).

Methods: In this retrospective study, CT projection data performed in 141 patients were collected between January 2020 and June 2023 using two different protocols: a 1024x1024 matrix whole lung scan and a 512x512 matrix target CT scan. Based on NRCT and HRCT images of 102 patients, a chest CT image super-resolution model based on deep learning was constructed and SR CT images were generated. It can tackle the SR task for 3D images by employing two cascaded 2D networks. One network aims to achieve intra-slice SR and the other aims to further upscale CT images at the inter-slice level. We compared the image quality and lesion segmentation accuracy between the model output and the result of HRCT image.

Result: In the testing set, among 39 patients with 119 pulmonary nodules, the Peak signal-to-noise ratio (PSNR) and the Structural Similarity Index Measure (SSIM) of our model, Bicubic interpolation and 3D EDSR were 44.34 vs. 34.63 vs. 35.61, and 0.9980 vs. 0.9869 vs. 0.9894, respectively. The performance of lung nodule segmentation between different algorithms was

compared. Take HRCT results as the true value, We calculated the DICE of our model, Bicubic interpolation, and 3D EDSR were 0.9067 vs. 0.8137 vs. 0.8631.

Conclusions: Our model outperforms existing methods in terms of image information quality and clinical segmentation accuracy. It demonstrates the capability to effectively upscale 3D CT lung images by up to a factor of 4x intra-slice and 2x inter-slice, which can obtain a CT image with a resolution of 0.17mm, 0.17mm, 0.5mm from a CT image with a resolution of 0.68mm, 0.68mm, 1mm.

PU-1384

基于 PET/CT 影像组学特征的肺磨玻璃结节侵袭性研究

褚福欣、刘加成
东南大学附属中大医院

目的:

本文旨在运用 PET/CT 图像中的影像组学特征,在宏观尺度上从解剖和功能维度无创性地鉴别肺磨玻璃结节的病理侵袭性分组。

方法:

本研究回顾性的收集东南大学附属中大医院在 2018 年 1 月 1 日至 2023 年 4 月 7 日 PET/CT 检查中提示存在肺磨玻璃结节并有相应病灶的术后病理资料的患者,按照纳入及排除标准收集入组患者的临床、影像及病理资料。由一名医师独立进行盲法 ROI 的勾画,薄层 CT 图像的 ROI 在 ITK-SNAP 软件中逐层绘制, PET 图像的 ROI 在 lifex 软件的 PET 及厚层 CT 融合图像上使用半自动 3D 工具以 SUVmax 的 40%进行勾画;在初次勾画 ROI 后的 2 个月进行第二次 ROI 的勾画。利用 python 中的 pyradiomics 包分别提取 CT 及 PET 图像的影像组学特征。特征筛选过程中首先选取组间相关系数 (ICC) >0.80 的特征;然后在 FAE 软件中,使用 Z-score 进行归一化处理,通过皮尔森相关系数进行数据降维,之后使用递归式特征消除 (RFE) 对特征进行选择,剩余特征进行最小绝对收缩和选择算子 (LASSO) 逻辑回归,采用 10 折交叉验证,分别构建 CT 影像组学特征模型 (模型 1) 及 PET 联合 CT 影像组学特征模型 (模型 2)。

结果:

本研究最终纳入了 106 名患者的 133 个病灶,其中 80 例为非浸润组,53 例为浸润组。以 7:3 的比例划分训练集和测试集,在训练集中以 10:1 的比例确定选择 9 个特征。在 CT 影像组学特征模型 (模型 1) 中,训练集 AUC=0.951[95%CI:0.897,0.989],测试集 AUC=0.841[95%CI:0.700,0.963];在 PET 联合 CT 影像组学特征模型 (模型 2) 中,训练集 AUC=0.970[95%CI:0.938,0.993],测试集 AUC=0.849[95%CI:0.702,0.960];联合模型相对于仅 CT 模型具有优势。

讨论:

PET 影像组学特征可以提供附加信息用于无创性的鉴别肺磨玻璃结节的病理侵袭性分组;对于非侵袭组的患者选用叶下切除术代替肺叶切除术可提高总生存率,因此运用 PET/CT 影像组学特征有助于指导患者选择治疗方案。

智能快速磁共振图像处理系统在 MRI 检查中提高患者检查体验感

马渊、苏伟、宋兵利、刘晨
云南大学附属医院

本研究旨在利用智能快速磁共振图像处理系统提高 MRI 检查中患者的检查体验感。通过该系统的应用，可以有效地减少患者在 MRI 检查中的不适感和焦虑感，提高检查过程的舒适度和便捷性。本文采用了一种基于图像处理技术的智能算法，通过对患者图像进行快速处理和优化，实现了对磁共振图像的高质量展示，并且在保证图像质量的同时有效缩短了图像扫描的时间。研究表明，该系统在提高 MRI 检查准确性和效率的同时，显著提升了患者的检查体验感和满意度，为临床诊断工作提供了有力的技术支持。本研究的意义在于为患者提供更好的检查体验，改善医疗服务质量，促进医患关系的良性发展。

PU-1386

深度学习影像组学列线图预测肺腺癌患者术前纵隔淋巴结转移

陈传玉

中国科学技术大学附属第一医院南区

目的：术前纵隔淋巴结转移情况影响腺癌患者的个体化治疗和预后评估，常规胸部 CT 平扫术前评估不够精准，本研究旨在探讨基于胸部 CT 平扫图像的深度学习影像组学列线图预测肺腺癌患者术前淋巴结转移的效能。

方法：纳入经外科手术切除并病理证实为肺腺癌的患者共 528 例，其中 176 例（33.33%）有纵隔淋巴结转移。采用 ResNet50 架构来开发深度卷积神经网络，从病灶的胸部 CT 平扫最大层面图像中进行迁移学习并提取 2048 个深度学习特征，建立深度学习影像学模型和计算影像组学评分（DLRS）。评估临床因素，包括临床资料和 CT 特征，建立临床因素模型。合并构建包含深度学习影像组学评分（DLRS）和临床因素的列线图，生成受试者特征曲线（ROC），计算 ROC 的曲线下面积（AUC）以量化每个模型在训练队列和验证队列上的性能。采用校正曲线评估模型准确度和决策曲线分析（DCA）来评价模型的临床效用。

结果：深度学习影像组学模型在训练队列的 AUC（95%CI）为 0.96（0.95-0.98）和验证队列为 0.89（0.82-0.96），临床因素模型在训练队列 AUC（95% CI）为 0.85（0.82-0.89）和验证队列为 0.85（0.78-0.92），合并构建包含深度学习影像组学评分（DLRS）和临床因素的深度学习影像组学列线图在训练队列 AUC（95% CI）为 0.98（0.96-0.99）和验证队列为 0.82（0.74-0.91），其在训练队列中较单纯的深度学习影像组学模型、临床因素模型均表现出更好的预测能力（ $p < 0.05$ ）。

结论：基于胸部 CT 平扫的深度学习影像组学列线图对于肺腺癌患者术前有无纵隔淋巴结转移具有良好的预测能力，有助于临床医生制定适当的诊疗方案。

PU-1387

MRI 对多系统萎缩（MSA）患者基底神经节的初步研究

张琪

山东第一医科大学第三附属医院

目的：应用 QSM 序列定量分析 MSA 患者的丘脑底核（STN）、苍白球内侧部（GPi）、黑质（SN）磁化率值较正常健康人有无明显差异，并探讨基底神经节的铁沉积与多系统萎缩（MSA）疾病的相关性。

材料与方法：经临床拟诊 16 例 MSA 患者（男 7 例，女 9 例，平均年龄 62.15 ± 3.78 岁），16 例健康对照者（男 8 例，女 8 例，平均年龄 56.83 ± 3.20 岁）纳入本研究。所有受试者均进行常规联影 3.0T MRI 序列及 QSM 序列扫描，手动勾选双侧 STN、GPi、SN 的感兴趣区域（ROI），并测量平

均磁化率值。采用独立样本 t 检验（正态分布）或 Mann-Whitney U（非正态分布）比较两组间各感兴趣区（ROI）平均磁化率的差异性。

结果：与 HC 组相比，MSA 组中双侧 SN 和 STN 的平均磁化率具有显著差异性（ $P < 0.05$ ），MSA 组与 HC 组的 GPi 平均磁化率差异无统计学意义（ $P > 0.05$ ）。

结论：多系统萎缩（MSA）患者的丘脑底核（STN）、黑质（SN）铁沉积较健康人明显增多，铁过量聚集可能导致神经核团的病变。

PU-1388

肺腺癌术后影像组学预后模型构建和肿瘤微环境相关性分析

孙希子、周舒畅、夏黎明

华中科技大学同济医学院附属同济医院

目的：构建肺腺癌术后影像组学预后模型，比较不同指标的预测效能并探究影像组学特征与肿瘤微环境的相关性。方法：本研究为对 TCIA 数据库中的 NSCLC-Radiogenomics 数据集的再分析。完成对肺腺癌患者术前 CT 图像的分割后，使用 Pyradiomics 包提取影像组学特征。结合无病生存期资料，通过单因素 COX 回归-LASSO 回归-多因素 COX 回归的连续过程构建预测肺腺癌患者术后预后的影像组学模型。根据风险得分中位值将患者分为高、低风险两组，通过生存曲线分析高低风险组的生存差异。随后将多种临床因素和模型特征纳入多因素 COX 回归模型，得到临床-影像组学混合模型，并通过 ROC 曲线下面积比较组学模型、混合模型、T 分期、G 分期的预后预测效能。最后，基于肿瘤样本的转录组测序资料得到 ESTIMATE 打分和 CIBERSORT 分析结果，从而比较高低风险组肿瘤样本的基质细胞含量，以及分析影像组学特征与免疫细胞浸润比例的相关性。结果：共 114 名肺腺癌患者被纳入模型构建分析，共提取得到 863 个影像组学特征。构建的影像组学预后模型、临床-影像组学混合模型 ROC 曲线下面积分别为 0.728、0.739。根据影像组学模型风险得分中位值划分的高低风险组之间，生存具有显著差异，且高风险组有显著更高的基质细胞打分。高风险可能与更高的调节性 T 细胞浸润比例以及更低的树突状细胞、活化的 CD4 记忆 T 细胞浸润比例相关。结论：影像组学风险打分模型预测未接受免疫治疗的肺腺癌术后患者的预后有较高的效能，高风险组肿瘤纯度更低，有更高的抑制性免疫细胞浸润比例。

人工智能在帕金森病 MRI 诊断中的研究进展

曾玮

南昌大学第一附属医院

帕金森病（Parkinsons disease, PD）的发病隐匿且机制不明确，患病率及致残率较高且无法治愈，已成为老龄化全球背景下的临床难题。特别是诊断仍然依赖于患者临床表现及医生经验判断，缺乏客观诊断标志物，方法局限。随着技术的进步，特别是人工智能的兴起，结合多模态 MRI，如磁敏感成像、弥散张量成像、功能性成像开发的早期诊断、自动诊断工具，已用于支持 PD 诊断，并且发挥了极大的参考价值。本文就人工智能在 PD 患者 MRI 诊断中的研究进展和现状进行综述。

PU-1390

基于多期增强 CT 放射组学和随机森林预测 Ki-67 在胃肠道间质瘤中的表达研究

刘琦
徐州医科大学附属医院

胃肠道间质瘤 (GIST) 是最常见的胃肠道间充质肿瘤。GISTs 具有临床异质性, 在具有不同预后风险的个体患者中显示出不同程度的恶性潜能。Ki-67 是代表肿瘤异质性和细胞生长的关键免疫标志物, 它独立于病理 NIH 标准。在这项工作中, 我们提出了一种新的方法, RF_Ki67, 用随机森林模型对 Ki-67 的表达进行分类。我们筛选出了多层螺旋 CT 放射组学数据特征。然后, 我们采用随机森林对每个 GIST 潜在患者的风险度评估进行分类。在构建了风险度评估分类模型后, 我们利用该模型对 Ki67 中的高/低表达进行了分类。该方法比其他典型方法表现出良好的性能。

PU-1391

Clinical Application of Automatic Assessment of Scoliosis Cobb Angle Based on Deep Learning

Lixin Ni^{1,2}, Zhehao Zhang², Jianhua Wang², Lijun Guo³

1. Ningbo Haishu NO.2 Hospital,

2. The First Affiliated Hospital of Ningbo University

3. Faculty of Electrical Engineering and Computer Science, Ningbo University

Purpose A recently developed deep-learning-based automatic evaluation model provides reliable and efficient Cobb angle measurements for scoliosis diagnosis. However, few studies have explored its clinical application, and external validation is lacking. Therefore, this study aimed to explore the value of automated assessment models in clinical practice by comparing deep-learning models with manual measurement methods.

Methods We divided 481 spine radiographs from an open-source dataset into training and validation sets, and used 119 from a private dataset as the test set. The mean Cobb angle values assessed by three physicians in the hospital's PACS system served as the reference standard. The results of Seg4Reg, VFLDN, and manual measurement were statistically analyzed. The intra-class correlation coefficients (ICC) and the Pearson correlation coefficient (PCC) were used to compare their reliability and correlation. The Kappa statistic was used to compare the consistency of Cobb angles at different severity levels.

Results The mean Cobb angle values measured were $35.89^\circ \pm 9.33^\circ$ with Seg4Reg, $31.54^\circ \pm 9.78^\circ$ with VFLDN, and $32.23^\circ \pm 9.28^\circ$ with manual measurement. The ICCs for the reliability of Seg4Reg and VFLDN were 0.809 and 0.975, respectively. The PCC and MAD between Seg4Reg and manual measurements were 0.731 ($p < 0.001$) and 6.51° , while those between VFLDN and manual measurements were 0.952 ($p < 0.001$) and 2.36° . The Kappa statistic indicated VFLDN was superior to Seg4Reg and manual measurements for Cobb angle severity classification.

Conclusions The deep-learning-based automatic scoliosis Cobb angle assessment model is feasible in clinical practice. Specifically, the keypoint-based VFLDN is more valuable in actual clinical work with higher accuracy, transparency, and interpretability.

PU-1392

基于术前盆腔 MRI 的影像组学预测子宫内膜癌的淋巴结分期和预后

王婷

天津市肿瘤医院空港医院

目的：基于影像组学特征和多种数据预处理方法，建立并验证基于 MRI 的影像组学模型对子宫内膜癌的淋巴结分期和预后的预测价值，为临床医生提供决策支持。

方法：回顾性纳入我院 145 例经病理学确诊的子宫内膜癌患者，其中训练集 100 例患者，测试集 45 例患者。所有患者在接受治疗前均行盆腔 MRI 成像（场强/序列：3.0TMRI 的 T2WI、增强 T1WI 和弥散加权成像），肿瘤由两位放射科医生用半自动绝对阈值分割方法分割 MRI 图像的感兴趣体积 (volume of interest, VOI)。随后用影像组学软件对 VOI 进行特征提取，并用组内相关系数检验可靠性和最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 回归进行特征筛选，并开发了诺模图，分别用训练集和测试集中的受试者操作特征 (receiver operator characteristic, ROC) 的曲线下面积 (area under the curve, AUC) 来评估诺模图模型的诊断性能。

结果：经 Lasso 回归分析，保留 6 个稳定的影像组学特征。在训练集和测试集中，诺模图模型预测的 AUC 值分别为 0.831(95%可信区间：0.725~0.916；敏感性：83.6%，特异性：74.9%)、0.807(95%CI: 0.673~0.941；敏感性：78.8%，特异性：78.7%)。

结论：采用诺模图算法建立的基于影像学的机器学习模型对子宫内膜癌的淋巴结分期和预后具有较高的诊断性能，可以为治疗决策提供支持。

基于深度学习的主动脉 CTA 影像组学预测急性 A 型主动脉夹层 (ATAAD) 根部重建术后脑灌注不良

龚威、彭宙锋、杨文兵

武汉大学人民医院

目的 接受主动脉根部重建术(Bentall 或 David 手术)的急性 A 型主动脉夹层(ATAAD)患者与术后脑灌注不良(CM)的高发生率有关。本研究旨在利用基于深度学习的计算机断层扫描血管成像(CTA)的影像组学特征和临床特征建立预测模型，以预测 ATAAD 初次术后的 CM。

材料与方法 本研究纳入 2013 年 1 月至 2023 年 1 月期间 98 名接受主动脉根部重建手术治疗的 ATAAD 患者进行回顾性研究。利用三维深度卷积神经网络(3D CNN)自动识别和分割 CTA 图像并获得所需的影像组学特征。利用方差分析和最小绝对收缩和分段操作算法进行特征选择和影像组学评分。利用多变量逻辑回归分析，将影像组学评分(Rad-Score)和临床指标纳入 Nomogram。利用 Hosmer-Lemeshow 检验检查模型的校准。

结果 Rad-Score 结合血小板和 C-反应蛋白的模型效能较高，训练集中 AUC 为 0.84(95%CI, 0.78-0.91)，在测试集中 AUC 为 0.75(95%CI, 0.67-0.84)。在 2019 年至 2022 年收集的验证集中，组合模型的效能较好，AUC 为 0.78(95%CI, 0.67-0.86)，准确度为 0.76，精确度为 0.66，灵敏度为 0.84，特异性为 0.63。Hosmer-Lemeshow 检验在组合模型中具有统计学意义 (t 训练集=0.15, t 测试集=0.19, t 验证集=0.18, $p>0.05$)。

结论 基于深度学习的 CTA 影像组学和临床指标的结合可以预测 ATAAD 患者初次手术后的 CM。该 Nomogram 被验证为具有临床意义。它有望在随访检查中对患者的预后提供早期预警。

基于深度学习·自注意力反馈机制模型分割 3D CT 胃癌病灶

贺俊杰^{1,2}、张牡丹¹、李武超¹、彭云松¹、付帮康^{1,2}、刘晨³、王健³、王荣品¹

1. 贵州省人民医院

2. 贵州大学

3. 第三军医大学西南医院

目的: 胃癌作为全球第五癌症致死疾病, 手术治疗是可切除性胃癌的主要治疗方法。计算机断层扫描 (CT) 能够显示胃癌病灶及其与周围组织的关系, 对手术成功至关重要。自动分割胃癌 CT 病灶区域能够提供病灶分布、病灶体积等量化指标, 为手术方案提供精细的信息。以深度学习为代表的人工智能技术越来越多地应用于医学图像领域。因此, 本研究利用深度学习技术, 提出自注意力反馈机制, 实现 3D CT 胃癌病灶自动分割。

方法: 本研究纳入贵州省人民医院 (GZH) 和西南医院 (SWH) 共计 90 例胃癌患者 CT 图像。其中, GZH 的 50 例使用五折交叉法对模型训练和评估; SWH 的 40 例用于模型的外部验证。此外, 还使用肝脏肝癌分割公开数据集, 验证模型的迁移学习能力。针对胃体异形性和胃癌异质性, 本研究提出自注意力反馈机制, 在网络模型深层学习自注意力信息, 再将该信息反馈到网络浅层, 克服现有自注意力机制由于计算资源限制无法在浅层网络中应用于高分辨率 3D 图像的困难, 使网络浅层也具有自注意能力, 进而让整个模型的各个阶段都能专注于胃癌分布信息, 提升模型分割精度。

结果: 在五折交叉验证实验中, 胃癌病灶分割 dice 值、召回率、精确率分别为 0.845、0.833、0.883。比目前最好的胃癌 CT 分割方法结果 (dice=0.764、召回率=0.758、精确率=0.856) 提升显著 ($p<0.01$)。在外部验证中, 分割 dice 值、召回率、准确率分别为 0.806、0.811、0.872, 展示了较强的泛化能力。在消融实验中, 本文提出的模型与无反馈机制的自注意力模型在测试集上平均 dice 值分别为 0.8456 和 0.7847, 展示了该反馈机制能够显著提升模型分割精度 ($p=0.021$)。在肝脏肝癌数据上, 模型对肝脏和肝癌病灶分割 dice 值分别为 0.952 和 0.741, 与最近针对肝脏肝癌分割模型拥有相当的性能, 展示了模型在其他任务上的迁移学习能力。

结论: 本文提出的自注意力反馈机制模型能够显著提升对胃癌病灶的分割能力。该模型可能为临床提供一种有价值的方式, 辅助提升胃癌患者手术成功率。同时, 提出的自注意力反馈机制可作为插件用于其他深度学习模型, 显著提升其分割能力。

PU-1395

基于 MRI-TW2I 直肠癌-直肠-直肠系膜自动语义分割识别

叶慧芬¹、赵可²、童彤¹

1. 复旦大学附属肿瘤医院

2. 广东省人民医院

目的

尽管术前 MRI 影像学评估在直肠癌的治疗决策中起重要作用, 但由于放射科医生存在临床经验的差异, 同一个病人的分期可能会有所差别。目前, 许多研究表明基于人工智能的自动化分割识别结果与放射科医生评价的结果相当。因此, 在本研究中我们旨在开发基于人工智能的模型来自动化、可视化分割直肠癌患者的直肠系膜、肿瘤病灶及直肠, 以此有益于进一步对直肠癌患者进行自动分期。

方法

本研究回顾性地纳入经组织学证实的直肠癌患者共 88 例, 并导出每位患者轴向 T2 加权图像 (T2WI) 医学数字成像数据和通信格式图像。由具有 3 年直肠癌诊断经验的放射科医生使用 ITK-SNAP 软件分别对肿瘤、直肠和直肠系膜区域进行手工标注。我们开发了一种基于 MRI-TW2I 直肠

癌-直肠-直肠系膜的自动语义分割模型, 使用神经网络从 T2WI 中提取肿瘤、直肠和直肠系膜区域。关于分割精度, 我们计算了自动分割和金标准手工标注的 Dice 相似性系数。

结果

在 88 例直肠癌患者中, 71 例用于模型训练, 17 例用于验证模型。我们的结果显示, 自动分割和金标准手工标注的 DICE 相似性系数为 0.82。

结论

基于 MRI-TW2I 直肠癌-直肠-直肠系膜的自动语义分割模型可以解决因放射科医生主观评价导致观察者间差异的问题, 也有益于进一步对直肠癌患者进行肿瘤分期、风险分层和制定个体化治疗方案。

徐州医科大学附属医院

目的 比较双低扫描(低千伏、低剂量对比剂)深度学习重建(Deep learning image reconstruction, DLIR)与能谱成像单能量重建肺动脉血管成像(CT pulmonary angiography, CTPA)的图像质量、辐射剂量。方法 回顾性分析 2021 年 9 月至 2022 年 03 月于我院进行 CTPA 检查的患者。根据扫描方式将患者随机分为 DLIR 组(管电压 80kV, DLIR 高档[DL-H]算法重建)、能谱组(80/140kV 瞬切能谱扫描模式, 50%ASiR-V 算法重建), 并固定两组扫描模式的噪声指数以及对比剂量一致。两组对比剂(碘海醇 350mg/ml)注射剂量均为 20ml, 注射速率 4.5ml/s。首先利用能谱分析软件分别重建 40keV、50keV、60keV、70keV 四组单能量图像, 比较各组单能量图像质量, 获得能谱成像最佳单能量序列。其次, 比较 DLIR、能谱最佳单能量成像肺动脉及其主要分支 CT 值、图像噪声、信噪比(SNR)、对比噪声比(CNR)以及图像质量主观评分、诊断信心。分别记录容积 CT 剂量指数(CTDIvol)、剂量长度乘积(DLP)、有效剂量(ED)等辐射剂量。结果 本研究共纳入 60 例患者, DLIR 组、能谱组各 30 例。40、50、60、70keV 四组单能量图像中, 40keV 组肺动脉主干、左右肺动脉干 CT 值、图像噪声最高, 且随着 keV 的增加而降低。60keV 单能量图像 CNR 最高, 为最佳单能量图像。DLIR 组肺动脉主干、左右肺动脉干、左上、左下肺动脉干、右上、右下肺动脉干的 CT 值、SNR、CNR 均高于 60keV 组, 差异具有统计学意义($P<0.05$)。DLIR 组的主观评分、诊断信心较 60keV 最佳单能量组分别增加 32.4%、16.7%, 差异具有统计学意义($P<0.01$)。DLIR 组辐射剂量参数 CTDIvol、DLP 及 ED 较 60keV 最佳单能量组分别降低约 56%、61%、61%, 差异均具有统计学意义($P<0.01$)。结论 CTPA 双低扫描模式中, 深度学习重建的图像质量、辐射剂量优于能谱成像 60keV 单能量重建。

PU-1397

Comparison of image quality and Hepatic cystic lesions conspicuity between the low-kVp-DLIR and GSI-DLIR

Xiaohu Li
The First Affiliated Hospital of Anhui Medical University, China

*Purpose: To compare the image quality and conspicuity of Hepatic cystic lesions between the low-kVp-DLIR and GSI-DLIR.*Methods and Materials: A cohort of 27 consecutive patients undergoing Gemstone Spectral Imaging abdomen protocol CT were retrospectively analyzed. Among them, 15 patients underwent 100kVp CT (100kVp group) with DLIR-M., and 12 patients underwent GSI and reconstructed at 40keV (40keV group) with DLIR-M. The medium-strength

level of DLIR were used in both groups. Quantitative measurements, qualitative image quality, Hepatic cystic lesions conspicuity, and DLP were compared between the two groups using Mann-Whitney U test.*Results: A total of 7 and 5 Hepatic cystic lesions were found in the 100kVp and 40keV groups, respectively. CT numbers of the vasculatures and parenchymal organs ($P < 0.05$ for all) and the background noise at both hepatic and portal venous phases ($P < 0.05$) were higher in the 40keV group than in the 100kVp group. The SNR of all anatomical structures ($P < 0.05$ for all) and the lesions-to liver CNR ($P < 0.05$ for all) were higher in the 40keV group than in the 100kVp group. Hepatic cystic lesions conspicuity was better in the 40keV group than in the 100kVp group ($P < 0.05$ for all). DLP at liver ($P = 0.06$) and portal venous phases ($P = 0.18$) was comparable between the two groups.*Conclusions: Under the same DLP, 40keV images of a lower energy level demonstrated higher SNR and lesions to liver CNR and better hepatic cystic lesions conspicuity compared to the 100kVp setting.

PU-1398

Predicting GATA6 expression in pancreatic cancer based on semi-supervised learning in CT radiomics – a pilot study

Nianhui Yu
Shanghai Sixth People's Hospital

Background: GATA6 was proven to be closely related to the prognosis of pancreatic cancer patients. Thus, it is important to identify the GATA6 expression of PDAC as non-invasive predictive marker for its treatment.

Purpose: To develop a semi-supervised learning model to use CT-based radiomics to predict the GATA6 expression of PDAC and identify the biomarkers.

Materials and Methods: In this retrospective study, 35 GATA6high and 19 GATA6low patients with PADC were included from January 2017 to October 2021. They were randomly divided into training cohort 1 ($n=37$) and test cohort ($n=17$) with the ratio of 7:3. 91 PDAC patients from public datasets and training cohort 1 formed training cohort 2 ($n=128$). Radiomics features were extracted from tumor regions delineated at pretreatment CT and selected by using the least absolute shrinkage and selection operator (LASSO). An original radiomics model and the radiomics model improved by semi-supervised learning were established by Transformer. The performance of the two models was evaluated by the area under the curve (AUC) and Hosmer-Lemeshow test in both the training and test cohorts.

Results: Two radiomics models were established in 54 patients (mean age, 66 years \pm 8 [standard deviation]; 19 men). In the test cohort, the two models' corresponding AUCs were 0.70 (95%CI: 0.68, 0.74) and 0.87 (95%CI: 0.86, 0.88). The Hosmer-Lemeshow test also showed good performance for two models in the training cohorts ($P = 0.413$ and 0.561) and test cohort ($P = 0.165$ and 0.453).

Conclusion: A CT-based radiomics model improved by semi-supervised learning can predict the GATA6 expression, thus reflecting subtypes of PDAC

PU-1399

Functional Connectivity Alterations During Sleep Deprivation: The Interplay of Sleep Pressure and Circadian Rhythms

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Background: Sleep deprivation (SD) has emerged as a significant public health concern due to its adverse effects on cognition and behavior. The influence of circadian rhythms on SD and brain activities has been less studied. This study employed functional magnetic resonance imaging (fMRI) and functional connectivity density (FCD) metrics to investigate the interaction between sleep pressure and circadian rhythms during SD. **Methods:** Thirty-six volunteers with good sleep habits underwent a sleep deprivation trial. Sleepiness was assessed using the Stanford Sleepiness Scale (SSS) at multiple time points, and fMRI scans were conducted to derive global and local FCD (gFCD and iFCD) values. The study focused on specific brain regions and networks, including the thalamus, the frontoparietal network (FPN), and the default mode network (DMN). **Results:** Analysis indicated significant changes in gFCD and iFCD values in several key brain regions. A strong correlation was found between sleepiness and both gFCD and iFCD values in certain areas, such as the left superior temporal gyrus and left thalamus. The gFCD values in these regions showed a gradual increase across sessions, while iFCD values in the right superior frontal gyrus decreased. **Conclusions:** The study revealed that SD leads to enhanced functional activities in the DMN and thalamus and decreased activity in the FPN. These changes in brain activity were significantly correlated with increases in sleepiness, as measured by the SSS. Our findings underscore the importance of circadian rhythms in understanding the neural underpinnings of SD and could guide future clinical interventions aimed at mitigating the effects of SD.

White Matter Structural Topologic Efficiency Predicts Individual Resistance to Sleep Deprivation

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Objectives: Sleep deprivation (SD) is commonplace in modern society and large individual differences in the vulnerability to SD. We aim to identify the structural networks differences based on diffusion tensor imaging (DTI) that contribute to the individual different vulnerability to SD. **Methods:** The number of psychomotor vigilance task (PVT) lapses was used to classify 49 healthy subjects on the basis of whether vulnerable or resistant to SD. DTI and graph theory approaches were used to investigate the topologic organization differences of the brain structural connectome between SD vulnerable and resistant individuals. We measured the level of global efficiency and clustering in rich club and non-rich club organization. **Results:** We demonstrated that participants vulnerable to SD had less global efficiency, network strength and local efficiency but longer shortest path length compared with participants resistant to SD. Lower efficiency was mainly distributed in the right insula, bilateral thalamus, bilateral frontal, temporal and temporal lobes. Furthermore, a disrupted subnetwork was observed that consisted of widespread connections. Moreover, vulnerable group showed significantly decreased strength of the rich club compared with resistant group. The strength of rich club connectivity was found to be correlated negatively with PVT performance ($r = -0.424$, $P = 0.002$). We further test the reliability of the results.

Conclusions: The findings revealed that individual differences in resistance to SD are related to disrupted topologic efficiency connectome pattern, and our study may provide potential connectome-based biomarkers for the early detection of the vulnerable degree to SD.

PU-1401

Task functional magnetic resonance imaging-guided individualized repetitive transcranial magnetic stimulation after a brief nap attenuates the sustained attention performance deterioration induced by sleep deprivation

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Background: Military operations may require human functioning 24 hours a day and sleep deprivation (SD) is thus not uncommon. However, in counteracting the effects of SD, the most effective method of long-time recovery sleep is not always feasible in military life. Although frequently used as a countermeasure, a brief nap is not enough to fully restore cognitive performance following SD. Thus, targeted interventions after the brief nap, such as repetitive transcranial magnetic stimulation (rTMS), might better restore performance following SD.

Methods: Fifty military academy cadets were recruited and participated in two SD experiments. In experiment 1, each participant performed a psychomotor vigilance task (PVT) while undergoing functional magnetic resonance imaging (fMRI) for three conditions: (1) following a normal night of sleep (Resting wakefulness, RW), (2) following 30 hours of SD, and (3) after a subsequent 30-min nap. Dynamic changes of PVT outcomes and cerebral responses across the three conditions were analyzed to determine the optimal stimulation target.

In experiment 2, the same protocol (i.e., the three conditions of RW, 30 hours of SD and a 30-min nap) was adopted. In addition, after the nap, a 10-Hz, sham-controlled and individualized rTMS was administrated. Then, ANOVA analyses were conducted to investigate the stimulation effect for the improvement of the fastest PVT reaction times.

Results: Utilizing task-related fMRI, we first showed that the cerebral responses within the right middle frontal gyrus (MFG) recovered least after the nap and the right MFG was selected as the stimulation target. We next showed that the individualized 10-Hz rTMS over right MFG after the nap attenuated the sustained attention performance deterioration induced by SD.

Conclusion: We demonstrate that a nap combined with individualized rTMS may contribute to the recovery of the impaired sustained attention after SD by modulating the neural activity within functional brain networks.

Effects of sleep deprivation and daytime naps on inhibitory control based on task-state functional magnetic resonance

Yuanqiang Zhu
Xijing Hospital, Air Force Medical University

Background:

Behavioral and neuroimaging changes in inhibitory control after sleep deprivation, and the possible ameliorative role of daytime naps in this regard, remain unclear.

Methods:

In this study, we used the oddball experimental paradigm to investigate the effect of conflict inhibition on sleep deprivation. We recruited 50 military cadets to perform the oddball task in an MRI scanner during normal wakefulness (RW), after 30 h sleep deprivation, and after a subsequent 30 min nap, and analyzed the dynamic changes in brain responses during the three states. The oddball exercise requires the subject to respond to two stimuli, one of which is presented with a high probability, such as 85%, which in our experiment represents the letter W; The other stimulus was presented with a smaller probability, such as 15%, and the two stimuli were presented in a random order. The subjects were asked to press the left button on the keyboard when they saw the W letter and the right button when they saw the M letter. The oddball task used the experimental design of Block. Task-state MRI data were also analyzed using a two-stage mixed-effects model. For behavioral outcomes of oddball (mean reaction time and mean accuracy of (deviant stimulus - standard stimulus)), we performed a one-way repeated measures ANOVA with significance threshold set at $P < 0.01$ and FDR (false discovery rate) criterion corrected. For pairwise comparisons in post hoc analyses, Bonferroni was used to correct for multiple comparisons, and the significance threshold correction was set at 0.05. For imaging of oddball, the FDR (false discovery rate) criterion was also used to adjust for multiple comparisons. The statistical threshold was set to $pFDR < 0.05$ for n-back activation across conditions, for F comparisons across conditions, and for pairwise comparisons in post hoc analyses.

Results:

There was no significant difference in the difference in accuracy between deviant and standard stimuli (deviant stimulus-standard stimulus)($F_{2,98} = 1.52$ $p > 0.3$), but the difference in reaction time between deviant and standard stimuli (deviant stimulus-standard stimulus)($F_{2,98} = 7.17$, $p < 0.001$) showed a significant time difference. RT and accuracy after daytime naps were significantly lower than those under sleep deprivation, but still higher than those under normal wakefulness, suggesting that naps have some restorative effect on inhibitory control levels. There were significant differences in bilateral occipital lobe, middle temporal gyrus, middle cingulate gyrus, medial frontal lobe and dorsolateral prefrontal lobe under the three conditions. The activity of medial frontal lobe, prefrontal lobe and bilateral occipital lobe decreased significantly after sleep deprivation, and the activity of these four regions recovered to normal waking level after daytime nap, while the middle temporal gyrus and cingulate gyrus were negatively activated during normal waking, but the degree of negative activation of these two regions became weaker after sleep deprivation, and the negative activation of these two brain regions reached the maximum after daytime nap. The improvement in the difference in response time between deviant and standard stimuli after daytime naps was positively correlated with increased prefrontal activation ($r = 0.41$, $p < 0.005$).

Conclusion:

Sleep deprivation significantly affected the cognitive performance of conflict suppression. Sleep deprivation resulted in diminished processing speed and reduced accuracy. Daytime naps partially restored working memory in two ways. Daytime naps restored the reduced activity in the medial frontal, prefrontal, and bilateral occipital lobes after sleep deprivation to normal levels. Daytime naps increase the negative activation of the middle temporal gyrus and cingulate gyrus, disengage the DMN network from the task, and increase brain cognitive resources.

深度学习图像重建联合低管电压在冠状动脉成像中的可行性研究

任占丽、申利、雷雨欣、张敏、于勇、于楠、贺太平
陕西中医药大学附属医院

目的：探讨基于深度学习图像重建联合低管电压在冠状动脉成像中的可行性。

方法：收集我院 2023 年 5 月至 8 月行冠状动脉 CTA 患者 45 例并随机分为 A、B 两组，A 组 120kV，噪声指数 20，对比剂剂量 0.8ml/kg，B 组 70kV，噪声指数 30，对比剂剂量 0.5ml/kg。扫描完成 A 组重建 50%ASIR-V，B 组重建 50%ASIR-V 和深度学习低、中、高降噪图像（DLIR-L、DLIR-M、DLIR-H），在五组图像上分别测量主动脉根部、左冠状动脉主干、左前降支、左回旋支及右冠状动脉 CT 值及 SD 值，计算信噪比（SNR）和对比噪声比（CNR）。由两名具有五年工作经验医生采用五分法对图像进行主观评价。记录两组患者 CTDIvol、DLP 并计算有效辐射剂量(ED)。结果：两组患者一般资料（性别、年龄、身高、体重、BMI、心率）无显著统计学差异（ $p > 0.05$ ），B 组 CTDIvol、DLP、ED 和对比剂用量均显著低于 A 组（ $p < 0.001$ ），其中 B 组 ED 和对比剂用量较 A 组分别降低约 75.6%和 32.9%。B 组 50%ASIR-V、DLIR-L、DLIR-M、DLIR-H 图像冠状动脉 CT 值均显著高于 A 组 50%ASIR-V（ $p < 0.001$ ）。B 组随着重建 50%ASIR-V、DLIR-L、DLIR-M、DLIR-H 依次变化，冠状动脉 SD 值逐渐降低、SNR 值和 CNR 值逐渐升高，且 B 组 DLIR-H 重建 SD 值显著低于 A 组（ $p < 0.001$ ），B 组 DLIR-L、DLIR-M、DLIR-H 重建 SNR 值和 CNR 值均显著高于 A 组（ $p < 0.001$ ）。两名医师主观评分具有良好一致性（kappa 值 > 0.75 ， p 值 < 0.001 ），B 组冠状动脉 DLIR-L、DLIR-M 和 DLIR-H 重建主观评分均显著高于 A 组（ $p < 0.05$ ），其中 DLIR-H 重建图像主观评分最高。

结论：深度学习图像重建（DLIR）联合低管电压可以显著降低冠状动脉成像辐射剂量和对比剂用量，同时提升冠状动脉图像质量，其中 DLIR-H 重建提升冠状动脉图像质量效果最优。

PU-1404

Predictive value of MRI T2WI texture analysis for lymph node metastasis in rectal cancer

Guoqiang Li
Shengjing Hospital of China Medical University

Objective: to extract the specific texture parameters of rectal cancer T2WI images by texture analysis and to construct a comprehensive predictive model for preoperative diagnosis of rectal cancer lymph node metastasis.

Materials and methods: The T2WI images, serum tumor markers and basic clinical data of 112 patients with rectal cancer who met the inclusion criteria were analyzed retrospectively. All patients underwent radical resection and lymph node dissection of rectal cancer in our hospital, and the pathological diagnosis was clear. The patients were randomly divided into training group and verification group according to the proportion of 7:3, which was used for training and verification of the prediction model. Artificial intelligence software was used to manually delineate the regions of interest (Region of Interest, ROI) of rectal cancer lesions and target lymph nodes on the T2WI images of patients, and automatically extract the texture parameters of ROI, from which the texture feature parameters with statistical differences between lymph node metastasis group and non-metastasis group were selected. Logistic regression analysis was used to analyze the prediction models based on tumor tissue texture parameters, target lymph node texture parameters, patient clinical indicators and the combined data of the three. The area under the curve (The area under the receiver operating characteristic curve, AUC) of the receiver working characteristic curve (Receiver operating characteristic curve, ROC curve) was used to evaluate

the diagnostic efficacy of different models in identifying preoperative lymph node metastasis. Furthermore, DeLong test was used to compare the AUC differences of each prediction model. Finally, the clinical benefit of each predictive model was evaluated by decision curve analysis (Decision Curve Analysis, DCA). $P < 0.05$ was taken as the standard of statistically significant difference.

Results: Logistic regression analysis showed that the ratio of short diameter to long diameter of target lymph nodes ($OR=40.503; 95\% CI: 5.063-324.001$) and the level of serum CA19-9 ($OR=1.044; 95\% CI: 1.001-1.088$) were independent predictors of lymph node metastasis in rectal cancer. In the clinical data prediction model training group, the AUC value (figure 3A) was 0.802 ($95\% CI: 0.696-0.884$), the sensitivity was 70.005%, and the specificity was 81.25%. In the verification group, the AUC value (figure 3B) was 0.696 ($95\% CI: 0.515-0.841$), the sensitivity was 92.31%, and the specificity was 52.38%. 401 texture feature parameters were extracted from the T2WI images of tumor tissue and target lymph nodes. After screening, the tumor tissue retained seven texture parameters. And the target lymph nodes retain six texture parameters. According to the above texture parameters, the target lymph node texture analysis prediction model training group AUC value is 0.881, sensitivity is 86.67%, specificity is 81.25%; verification group AUC value is 0.795, sensitivity is 92.31%, specificity is 66.67%. The AUC value of the tumor tissue texture analysis prediction model training group was 0.844, the sensitivity was 80.005%, and the specificity was 79.17%. In the verification group, the AUC value was 0.897, the sensitivity was 84.62%, and the specificity was 90.48%. Finally, the diagnostic efficacy of the joint predictive model combined with texture parameters, target lymph node short / long diameter and patients' serum CA19-9 level was significantly better than that of other models, and the difference was statistically significant (the AUC value of the training group was 0.978, the sensitivity and specificity were 93.33% and 91.67%, respectively, and the AUC value of the verification group was 0.897, the sensitivity was 84.62%, and the specificity was 90.48%. The AUC value of the training group was 0.978, the sensitivity and specificity were 93.33% and 91.67% respectively, and the AUC value of the verification group was 0.897. The sensitivity and specificity were 84.62% and 90.48%, respectively.

Conclusion: the comprehensive diagnostic model based on rectal T2WI texture analysis combined with clinical indexes can effectively predict lymph node metastasis before operation, which has potential clinical value.

PU-1405

基于 Yolov5 深度学习网络在 CT 平扫上检测急性缺血性脑卒中早期小面积病灶的模型研究

班淇琦、王苇、赵义
扬州大学附属医院

目的:

急性缺血性脑卒中(Acute Ischemic Stroke, AIS)的早期诊治将改善患者预后。本研究旨在构建在 CT 图像上精准检测 AIS 缺血灶的人工智能模型,尤其是早期小面积梗死灶。

方法:

1.研究对象:回顾性分析我院 275 例 AIS 患者。

2.数据集构建:将病例按 9:1:1 的比例完全随机分组为训练组、验证组、测试组。将训练组及验证组的 DWI 图像与 CT 图像进行配准并在 CT 图像上标记病灶。训练组的 CT 图像训练模型;验证组的 CT 图像构建最优损失函数模型;测试组为原始 CT 图像,用于测试模型的泛化能力及模型与人工组检测性能的对比。

3.金标准制定:验证集中为 DWI 与 CT 平扫图像配准融合后标记的 CT 图像的病灶标签。测试集中为 DWI 与 CT 平扫图像配准融合后所示病灶。

4.模型构建：以 Yolov5 为基准模型，选取最优损失函数构建最终 AI 模型，即本文改进的 CIoU 损失函数（Modified CIoU loss, M-CIoU）。

5.模型评价标准：用平均精度均值 IOU(Mean Average Precision, mAP@50)、召回率（Recall）及精确率（Precision）对比不同损失函数。

6.统计学方法：组内相关系数(intraclass correlation efficient, ICC)和加权 kappa 检验评估模型组及人工组结果一致性。计算模型及人工组在各脑区的敏感度、特异度及准确度，配对卡方检验用于比较两组的诊断效能。

结果：

1.不同损失函数网络在验证集中的检测性能：M-CIoU（Precision=0.8237；Recall=0.8101；IoU(mAP@50)=0.7851）最优。

2.模型组特异度、敏感度及准确度（98.87%、75.86%、96.20%）均高于人工组（95.02%、63.79%、91.40）。M6（P=0.039）区域模型检测效能高于人工组。如表 1。

3.模型与 DWI-ASPECTS(ICC=0.669, κ =0.447)的一致性高于神经放射科医师(ICC=0.452, κ =0.247)。

结论：

本研究模型在 CT 上自动检测 AIS 早期小面积病灶性能较医师更好。

影像基因组学分析揭示了结直肠癌预后风险分层的潜在生物学基础

陈小波

广东省人民医院

目的: 影像组学在肿瘤预后预测方面具有革命性的潜力。然而, 基于影像组学的危险分层在临床实践中的潜在生物学基础仍不清楚, 这给基于影像组学的生物标志物的广泛应用带来了挑战。方法: 我们回顾性招募了有术前静脉期 CT 图像和总生存随访数据的结直肠癌患者。我们开发了一个包含 12 个特征的影像组学标签来对患者进行分层。利用基因集富集分析探索影像组学分层风险组中潜在的肿瘤微环境相关生物学过程。我们在外部 CRC 验证队列和癌症影像档案(The Cancer Imaging Archive, TCIA)队列中评估了可解释标签的普遍适用性。结果:在训练组和内部验证组中, 影像组学标签均实现了患者的预后分层(分别为 676 例和 291 例; $P<0.001$)。影像组学分层的高危组显示出上调的增殖过程。相反, 低危组患者显示了免疫通路下调。此外, 我们观察到在影像组学分层的风险组之间, 发现肿瘤微环境免疫标签、免疫炎症标志物和肿瘤增殖通路存在显著差异。可解释的预后标签在外部队列中得到验证($n=469$; $P<0.001$)、TCIA ($n=20$; $P = 0.14$)。此外, 研究结果显示, 术后化疗的获益依赖于基于影像组学 II 期结直肠癌患者的风险特征, 在高危结肠癌患者中, 化疗显著改善了预后。结论:本研究强调了影像组学在癌症预后预测方面的潜力, 并为基于影像组学的 CRC 风险分层提供了有价值的见解。

基于 AI 定量分析新型冠状病毒肺炎重症患者的影像学特征

樊婷婷、姜慧杰

哈尔滨医科大学附属第二医院

目的: 本研究旨在通过人工智能辅助的定量 CT 特征来识别新冠肺炎患者的重症病例。**方法:** 根据纳入和排除标准,对中国东北黑龙江省 79 例实验室确诊的成年新冠肺炎患者进行纳入和分析。所有患者都接受了胸部 CT 扫描,然后通过人工智能(AI)平台(Dr.Wise)自动计算肺炎病变的定量特征,包括肺病变体积(PLV)、实变体积(PCV)和磨玻璃病变体积(PGV)的百分比。根据中国新冠肺炎诊疗方案指南(第 8 版),将患者分为非重症组和重症组。收集患者的基线数据(包括临床和实验室数据、病变的 CT 定量特征)。比较两组的基线特征和 CT 定量特征(PCV、PLV 和 PGV)。用单变量和多变量逻辑回归分析来识别重症新冠肺炎患者的特征。**结果:** 共纳入 79 例新冠肺炎患者,并将其分为非重症组(n=28)和重症组(n=51)。年龄、白细胞计数、中性粒细胞计数、淋巴细胞计数、肺病变体积百分比(PLV)和肺实变体积百分比(PCV)与使用单变量逻辑回归确定的严重程度显著相关。进一步的多变量逻辑回归构建了模型,其中 PCV 和年龄是独立的风险因素,比值比(OR)分别为 1.172 和 1.116 ($p<0.004$)。通过 5 倍交叉验证计算的训练集和验证集的平均 AUC 分别为 0.950 (95%CI 0.900-1.000) 和 0.935 (95%CI 0.876-0.994)。**结论:** AI 辅助下的定量 CT 特征 PCV 和入院年龄是预测黑龙江省新冠肺炎患者重症的关键参数。与此同时,寒冷干燥的气候也可能是一个不可忽视的重要因素。对于寒冷干燥环境中的新冠肺炎患者,尤其是老年患者,PCV 越大,越容易进展为重症。基于胸部 CT 图像分析的 AI 定量特征可以准确预测新冠肺炎重症患者。

Deep Learning Reconstruction with Different Denoising Strength in Brain MRI: Comparison of Anatomical Structure and Details SimilarityYuqi Tan, Chunhao Xia, Zhenlin Li
West China Hospital of Sichuan University

Purpose: To compare the anatomical structure and details similarity with the original image among deep learning reconstruction (DLR) with different denoising strength in brain T1 weighted fluid attenuated inversion recovery (T1-FLAIR) and T2-FLAIR sequences.

Materials and Methods: 23 healthy volunteers were enrolled. A 3.0T MRI scanner (SIGNA Architect, GE Healthcare) with 32-channel head coil was used to acquire T1-FLAIR and T2-FLAIR images in brain. Each sequence was scanned using DLR with different denoising strength (AIRTm Recon DL, low [L], medium [M], high [H]), and original images were simultaneously saved. Signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of thalamus were calculated in each sequence. A novel index: signal to reconstruction error, spectral similarity and structure similarity (SRESS) was used to measure the signal to reconstruction errors between images of varying brightness, spectral similarity, and structure similarity, which was designed for evaluating the anatomical structure and details similarity, especially in low contrast area. The SRESS of thalamus cross section in DLR images was automatically calculated by deep learning models (U-net based segmentation).

Results: The SNR and CNR were not significantly different between L-T1-FLAIR and the original image (SNR: 102.19 ± 13.02 vs. 98.94 ± 10.63 , $P=0.358$; CNR: 100.39 ± 12.96 vs. 97.11 ± 10.57 , $P=0.352$) The SNR and CNR were higher for M-T1-FLAIR and H-T1-FLAIR than the original image (SNR: 131.12 ± 22.08 / 209.53 ± 46.14 vs. 98.94 ± 10.63 , $P<0.001$; CNR: 129.38 ± 21.99 /

207.97±46.08 vs. 97.11±10.57, $P<0.001$). The SNR and CNR were higher for L-T2-FLAIR, M-T2-FLAIR and H-T2-FLAIR than the original image (SNR: 82.09±8.39 / 104.05±14.90 / 153.75±38.42 vs. 60.86±7.05, $P<0.001$; CNR: 80.39±8.35 / 102.43±14.84 / 152.34±38.31 vs. 59.13±7.02, $P<0.001$). The results of SRESS index suggested that there was no significant difference between L-DLR, M-DLR and H-DLR, respectively (T1-FLAIR: 149.40±1.67 vs. 149.94±1.70 [L vs. M], $P=0.372$; 149.94±1.70 vs. 149.76±1.66 [M vs. H], $P=0.757$; 149.40±1.67 vs. 149.76±1.66 [L vs. H], $P=0.551$. T2-FLAIR: 148.43±1.62 vs. 149.17±1.46 [L vs. M], $P=0.194$; 149.17±1.46 vs. 149.00±1.46 [M vs. H], $P=0.752$; 148.43±1.62 vs. 149.00±1.46 [L vs. H], $P=0.314$).

Conclusion: DLR can keep the anatomical structure and details in brain T1-FLAIR and T2-FLAIR sequences whatever denoising strength is used. DLR with high denoising strength is recommended on account of better SNR and CNR. Moreover, it is supposed that DLR will not influence anatomical structure and details, compared to original images.

PU-1409

深度学习用于肝肿瘤图像分割的研究进展

卞祥伟、李效凯

上海体育学院, 运动健康学院

目的: 肝癌严重危害人类健康, 及早检测到异常病变可有效预防和控制癌症的发展。肝肿瘤的精准分割在临床诊断中发挥重要作用。总结深度学习网络架构在肝肿瘤图像分割中的应用价值, 深入探讨肝肿瘤图像分割未来的发展方向。

方法: 主要方法为文献资料法, 通过中国知网、万方等数据库, 以“肝肿瘤分割”、“深度学习”、肝脏分割“为关键词进行文献检索, 总结用于肝肿瘤图像分割的深度学习网络模型。

结果: 目前对于肝肿瘤图像分割主要是基于传统的分割方法和基于深度学习的分割方法两大类。传统的半自动分割方法对肝脏目标病灶区域的标注大多依赖于具有丰富经验的医生手动勾画, 得到的分割精度最高, 但是需要花费大量的时间和精力, 且重复性较低。利用深度学习能实现对肝脏病变目标区域的准确分割。如卷积神经网络(CNN)实现了肝脏的自动化测量, 并在肝脏 CT 和 MRI 图像上进行验证, 改善了传统的半自动分割方法准确性较低、耗时耗力的问题。但 CNN 网络只能获取局部特征, 对于全局信息处理相对较弱。全卷积神经网络(FCN)的出现实现了单个像素的语义分割, 将全连接层替换为卷积层, 在获得精细图像信息的同时也没有丢失粗略图像信息, 并将 3D 卷积也应用到肝脏图像中。基于生物医学图像分割的 U-Net 网络架构能进行像素级别的分类, 是语义分割任务的理想选择, 并在精细分割任务中占据主导地。后来, 基于小病灶的分割任务通常都将此模型作为基准模型进行改良设计。各种研究表明, 深度学习逐渐成为医学图像分割领域中不可或缺的一部分。

结论: 深度学习网络架构不仅可以提高图像预处理速度, 此外, 基于深度学习的图像分割方法相对于传统的分割方法表现出显著的分割性能和鲁棒性, 其高精度的分割效果更有利于临床诊断与手术治疗。通过深度学习网络模型分割病灶往往需要大量的数据集, 考虑到可用于训练的数据缺乏并且部分数据不可用, 未来对数据集的增强方法需要进一步深入研究。

同一病人条件下深度重建技术对腹部低剂量图像质量的影响--与常规剂量的比较

吴金花

宁夏回族自治区人民医院

目的: 本研究对比深度学习图像重建算法 (DLIR) 与自适应迭代算法 (ASiR-V), 在降低辐射剂量的同时, 不同 DLIR 重建级别对腹部增强 CT 图像质量的影响。方法: 前瞻性收集我院使用 Revolution Apex CT 行上腹部三期增强检查的患者 19 例, 选择动脉期为常规剂量组, 噪声指数 (NI=21@1.25mm), 延迟期为低剂量组, 噪声指数 (NI=24@1.25mm), 常规剂量组为 ASiR-V30% 重建, 低剂量组为 ASiR-V30%、DLIR-L (低级降噪)、DLIR-M (中级降噪) 和 DLIR-H (高级降噪) 重建, 所有图像层厚均为 1.25 mm, 记录肝脏、腹主动脉、左侧竖脊肌的 CT 值及 SD 值。结果: 客观评价显示低剂量 4 组的 DLIR 与 ASiR-V 对比, CT 值无统计学差异 ($p>0.05$), SD 值有统计学差异 ($p<0.001$); 低剂量组与常规剂量组比较, 低剂量 ASiR-V30% 重建图像较常规剂量 ASiR-V30% 重建图像 SD 值高, 有统计学差异 ($p<0.001$), 在有效辐射剂量降低 36.31% 的情况下, 低剂量 DLIR-L 重建图像与常规剂量 ASiR-V30% 重建图像 SD 值相近, 无统计学差异 ($p>0.05$), 低剂量 DLIR-M 及 DLIR-H 重建图像的 SD 值明显低于常规剂量 ASiR-V30% 重建图像, 有统计学差异 ($p<0.001$); 低剂量组内, 随着降噪级别升高 SD 值逐渐降低, 有统计学差异 ($p<0.001$), 即图像质量逐渐提高, DLIR-H 重建图像表现最好, 图像无伪影及变形。结论: 在低辐射剂量下, 与日常使用的 ASiR-V30% 重建算法相比, 经 DLIR-H、DLIR-M 重建可明显降低图像噪声, 改进腹部增强 CT 图像质量, DLIR-H 表现更为明显。

PU-1411

3D 数字立体定位导板在软组织定位的研究与应用

谢亮、任虎威、秦甲霖、庞小溪

安徽医科大学

目的 探讨数字化皮瓣立体导板辅助皮瓣移植手术的价值与临床疗效。方法 本研究收集应用游离股前外侧穿支皮瓣立体定位导板技术修复肢体皮肤软组织缺损 14 例 (男 8 例, 女 6 例), 年龄 23-58 岁, 平均年龄 38 岁, 创面位于下肢 9 例 (小腿 5 例, 足 4 例), 创面位于上肢 5 例 (前臂 2 例, 手 3 例)。创面皮肤缺损面积 $10.1\times 8.2\sim 19.1\times 13.1$ 。术前 CT 扫描皮瓣供区及受区, 利用 CTA 影像数据重建三维立体模型、设计皮瓣立体导板, 实现医生术前选择合适穿支血管, 并明确血管的起始、走行、血管蒂长度、管径及穿支点位置、实现精准切取皮瓣形状。结果 利用股前外侧穿支皮瓣立体定位导板, 修复肢体软组织缺损 14 例均获得成功, 通过术前术中对比测算穿支点偏移量与切取量差异程度小, 皮瓣穿支血管定位准确, 手术时间明显缩短 ($4.2-6.8 (5.3\pm 0.4) h$) 术后皮瓣存活良好、外形恢复满意。结论 CTA 结合数字化技术构建的三维模型和设计的皮瓣立体导板能完整还原股前外侧区解剖学信息和个性化设计股前外侧皮瓣, 缩短手术时间, 减少并发症, 且有效弥补传统影像设备定位局限的问题, 为显微外科皮瓣移植手术提供数字化新术。

PU-1412

基于 PET-CT 影像组学对非小细胞肺癌术前淋巴结转移诊断研究

王芊婷
广东省人民医院

目的：研究基于淋巴结、原发肿瘤-淋巴结的影像组学模型在术前评价非小细胞肺癌淋巴结转移的诊断价值。

方法：本研究回顾性收集 2017 年 1 月至 2018 年 12 月于我院经病理证实的 115 名非小细胞肺癌患者。将患者以 7:3 的比例随机分为交叉验证集（83 例，包括阳性淋巴结组：37 个原发灶，73 枚淋巴结，阴性淋巴结组：46 个原发灶，94 枚淋巴结）、测试集（32 例，包括阳性淋巴结组：17 个原发灶，34 枚淋巴结，阴性淋巴结组：15 个原发灶，33 枚淋巴结）。我们收集患者的临床资料及术前的 PET-CT 图像。在 IntelliSpace Discovery 软件上根据病理勾画肿瘤原发灶和淋巴结，通过 RIAS 软件提取感兴趣区域（Region of interest, ROI）的影像组学特征，基于降维后的组学特征建立淋巴结模型和原发肿瘤-淋巴结的联合模型。最终，利用受试者工作特性曲线、准确率-召回率曲线、受试者工作特征曲线下的面积（Area Under the Curve, AUC）和平均精度等指标对模型诊断效能进行评价。

结果：患者的年龄、性别等对诊断无统计学意义（ $P>0.05$ ）。共纳入 234 个淋巴结（阳性淋巴结：107 枚，阴性淋巴结：127 枚），每个 VOI 各提取 1427 个影像组学特征，降维后用于组学模型的构建。在测试集中，淋巴结模型的 AUC(95%CI) 值为 0.840 (0.737-0.943)，联合模型的 AUC(95%CI) 值为 0.914 (0.844-0.983)。通过 DeLong 检验，发现二者具有显著性差异（ $P=0.0225$ ）。因此，联合模型拥有对非小细胞肺癌患者诊断术前淋巴结转移的最佳效能。

结论：本研究利用淋巴结影像组学特征建立的模型对非小细胞肺癌患者术前诊断淋巴结的转移有良好的预测效果，引入原发肿瘤的原发肿瘤-淋巴结组学模型可以显著提升诊断效能。因此，我们可以通过 PET-CT 建立基于肺癌原发灶-淋巴结影像组学联合模型，帮助非小细胞肺癌患者术前个体化诊断淋巴结转移。

数字影像与 3D 打印技术辅助陈旧性髋关节个体化置换

谢亮、任虎威、秦甲霖、庞小溪
安徽医科大学

目的：探讨数字化个体模型辅助陈旧性髋关节假体松动翻修手术的价值与临床疗效。方法：本研究收集陈旧性髋关节松动修复手术案例，术前采集患者双下肢 CT 数据，设计 3D 打印设计打印髋关节同等比例实体模型和假体，术前通过模型直观分析髋臼局部解剖情况，精确计算确定髋臼假体安放位置和角度，在体外模型上进行寻找髋臼中心，选择合适尺寸的臼杯，进行假体安放模，并根据下肢全长 X 线片准确测量下肢长度差。结果：利用数字影像技术设计的个体化模型，通过术前术中对比测算髋臼杯大小匹配合适，手术时间明显缩短，外形恢复满意，术后恢复较好。结论：本研究将数字影像与陈旧性髋关节手术相结合，能较好设计并制作髋关节及骨盆模型和髋臼假体辅助进行手术术前评估和方案设计，并能精确计算确定髋臼假体安放位置和角度，高效解决医患沟通问题，提供快速与精确性手术解决方案。

Classification of benign and malignant thyroid nodules using ultrasound images

Wenjun Yao

Department of Radiology, the Second Affiliated Hospital of Anhui Medical University

Medical Imaging Research Center, Anhui Medical University

Intelligent mechanization institute, Hefei Institute of Physical Matter, Chinese Academy of Sciences

Purpose: In order to improve the diagnostic accuracy of nodules in thyroid ultrasound images, we propose a method for classifying the benign and malignant nature of thyroid nodules in ultrasound images based on morphological features of the thyroid gland to assist physicians in diagnosis. **Method:** Firstly, Deeplabv3+ segmentation network was used to segment the nodule from the background and obtain the contour of the thyroid nodule in the ultrasound image. Then, seven morphological features such as aspect ratio, tightness, rectangular fit, eccentricity, gray standard deviation within the boundary ring, gray standard deviation within the nodule and relative brightness within the boundary ring nodule were designed to extract medical features based on the thyroid nodule images and the nodule contours, taking into account the a priori knowledge of clinical classification of the benign and malignant nature of thyroid nodules. Finally, the extracted medical features are used to replace the original dataset, and after training the XGBoost classifier, the benign and malignant auxiliary diagnosis results of thyroid nodules are obtained. **Results:** The experiment showed that our method had a sensitivity of 0.935, a specificity of 0.725, an accuracy of 0.871, and an AUC value of 0.89 for the classification of benign and malignant nodules, which was higher than that of the AlexNet model (AUC=0.81), the VGG model (AUC=0.86), and the MobileNet model (AUC=0.76) on the ultrasound image data set of thyroid nodules collected. The performance of the proposed method was superior to other methods in the classification of benign and malignant thyroid nodules. **Conclusion:** This method has high localization and recognition ability for benign and malignant thyroid nodules in ultrasound images, which is helpful to improve the accuracy of automatic image diagnosis.

PU-1415

CT-based end-to-end deep learning approach for COVID-19 outcome prediction

Xuan Wei, Zhenchang Wang

Beijing Friendship Hospital, Capital Medical University,

Background: The COVID-19 pandemic is causing a major outbreak in more than 200 countries around the world, having a severe impact on the health and life of many people globally. Automatic detection through computed tomography (CT) images provides a great help for rapid and accurate detection of lung infections and assists traditional X-ray examinations to adequately cope with COVID-19 pneumonia. Deep learning is widely used in the field of medicine. In this study, we propose an end-to-end multimodal features fusion algorithm for outcome prediction of COVID-19.

Methods: We used pulmonary artificial intelligence software to process 769 chest CT data, including data desensitization, denoising, segmentation of the lesion area, and extraction of geometric features after segmentation. We have collected time series CT data from every patient, and extract a variety of high-order geometric features. Then the multimodal features are input into the fusion module to obtain the characteristics of the time series, and the prognosis of the disease is predicted by Long Short-Term Memory network (LSTM). Each case of CT contains information about the outcome. Then input the processed features into the proposed deep neural network model to predict the outcome. We divide all data into 80% training set for training the

deep neural network model, and 20% test set for testing the performance of the model. The training set contains 293 cases of pneumonia reduction CT and 316 cases of pneumonia exacerbation CT; the test set includes 78 cases of pneumonia reduction CT and 82 cases of pneumonia exacerbation CT. We extracted geometric features and finally built an outcome prediction model based on the volume of pneumonia.

Results: The results showed that the geometric fusion network provides 74% accuracy, 77% precision, 71% recall, 74 % F1 score and 76% specificity.

Conclusions: The method proposed in this study can be a useful tool for radiologists to predict the outcome. The method predicts the prognosis outcomes of patients with high accuracy and the patterns will aid in fighting COVID-19.

仿真技术在医学影像设备上的应用

彭锐

空军军医大学西京医院

仿真技术在医学影像设备上的应用非常广泛。比如说 CT 扫描仪、MRI 仪器、超声波设备等，都可以通过仿真技术进行模拟和优化。方法：首先，利用仿真技术可以优化医学影像设备的设计。通过建立数学模型和进行计算机仿真，可以优化设备的结构、参数和工作原理，从而提高设备的成像质量、减少辐射剂量，增强设备的稳定性和可靠性。其次，仿真技术可以用来培训医学影像设备的操作人员。建立虚拟仿真环境，模拟真实的设备操作过程，让操作人员进行虚拟训练，提高他们的操作技能和应对各种情况的能力。另外，仿真技术还可以用来开发新的医学影像处理算法和技术。通过建立仿真模型和进行计算机仿真，可以模拟不同的影像采集和处理过程，优化算法参数，提高影像的分辨率、对比度和噪声抑制能力。结果：仿真技术在医学影像设备上的应用可以提高设备的性能和稳定性，提高操作人员的技能水平。结论：仿真技术的应用还能推动医学影像技术的发展和 innovation。通过优化设备设计、培训操作人员和开发新的影像处理算法，可以不断提升医学影像设备的性能，并推动医学影像技术的发展和 innovation。

基于深度学习的多模态图像在直肠癌根治术后患者预后分析中的应用

魏亚茹

温州医科大学附属第一医院

目的：直肠癌作为世界上第三大最常见的恶性肿瘤，其治疗和预后问题一直备受关注。目前，评估患者的预后主要依赖于 TNM 分期系统，但即使在相同分期下，患者的预后情况也可能存在显著差异。本研究致力于构建一个融合多模态医学图像的深度学习模型，融合病理学和影像学特征以提高直肠癌根治术后患者预后的预测准确性。

方法：在这项研究中，我们收集了 2019 年 88 例经过直肠癌根治术切除的患者的临床数据，包括年龄、性别、分期等信息以及术前 MRI 图像和术后病理高清图像。这些患者都接受了为期三年的随访，并记录了他们的随访状态。为了建立融合病理与 MRI 图像的深度学习模型，采用了经典的 ResNet 网络结构。首先，我们对 MRI 图像进行预处理，包括图像重采样和磁场校正等步骤，然后将其输入到网络中进行特征提取。对于病理图像，我们采用了 CLAM 无监督方法进行预处理，并提取相关特征。最终，将基于 MRI 图像和病理图像的特征输入到 ResNet 网络中，以交叉验证的方式用以预测患者的无病生存期。

结果: 研究结果显示, 融合了病理与 MRI 图像的深度学习模型的 C-index 为 0.856, 明显高于病理单模态模型 (C-index 为 0.825) 和 MRI 单模态模型 (C-index 为 0.738)。这也表明, 融合两种模态的深度学习模型在直肠癌根治术后患者预后预测方面具有显著的优势。

结论: 本研究建立了一个基于深度学习的融合病理与 MRI 图像的联合模型, 用于预测直肠癌根治术后患者的无病生存期。研究结果显示, 该联合模型的性能明显优于病理单模态和 MRI 单模态模型, 为提高预测准确性提供了有力支持。此外, 深度学习模型的应用可以从宏观和微观尺度上量化肿瘤异质性提供了可能性, 并为临床决策提供了更具生物学意义的信息。因此, 该深度学习模型具有潜在的临床应用前景, 可以帮助医生更准确地评估直肠癌根治术后患者的预后, 从而为个体化治疗提供支持。

PU-1418

基于门脉期肝脏 CT 影像组学特征早期预测重症急性胰腺炎及其与血脂的相关性

肖波

重庆医科大学附属璧山医院

目的: 探讨 CT 门脉期肝脏影像组学特征在早期评估 AP 严重程度的应用价值, 并研究其与血脂水平之间的相关性。

方法: 本研究共纳入 239 例病例 (非重症 AP 181 例, 重症 AP 58 例), 并以 7:3 的比例随机分为训练集和数据集。使用 3Dslicer 软件沿肝脏边缘手动逐层勾画感兴趣区 (ROI) 后提取影像组学特征。采用等距和等频分箱离散化特征, 再使用 LightGBM 算法迭代筛选最佳影像组学特征。通过联合临床独立危险因素以最佳影像组学特征分别建立了临床、影像组学和联合模型。

结果: 联合模型预测性能优于临床模型和影像组学模型。其在训练集、验证集和测试集中的 AUC 值分别为 0.954、0.927 和 0.878。spearman 相关性分析显示肝脏影像组学特征与血脂水平呈现不同程度相关。

结论: 基于门脉期 CT 的肝脏影像组学特征对早期预测 SAP 表现良好, 并且肝脏影像组学特征与血脂具有不同程度相关性, 这为临床诊疗提供辅助性决策参考。

PU-1419

人工智能与肺功能检测对 COPD 检出效能的一致性研究

万慧

中国人民解放军联勤保障部队第 920 医院

摘要: 目的 基于深度学习人工智能在 COPD 检测及肺功能分级领域的发展, 对其效能进行验证是促进其应用于临床的前提, 本研究旨在评估基于深度学习技术的人工智能软件在胸部高分辨计算机断层扫描(Highresolution computed tomography, HRCT) COPD 检出及肺功能 GOLD 分级 (COPD 气流受限严重程度分级标准) 中的应用价值。方法选取本院 2021 年 8 月-12 月, 临床疑诊为慢性阻塞性肺气肿患者 80 例, 对所有患者均行胸部 HRCT 扫描及肺功能检测, 导入人工智能识别系统, 软件自动判定是否有 COPD 并对肺功能进行 GOLD 分级诊断, 并与原始影像报告结果及肺功能检测报告分级进行对比, 计算灵敏度、假阳性率评估人工智能软件及放射科医师的 COPD 检测效能, 及人工智能应用于肺功能分级的检测效能, 应用 McNemar 检验确定是否存在显著性差异。结果 80 例胸部高分辨螺旋 CT 人工智能及放射科医师 COPD 检出率皆为 100%。人工智能软件 COPD 灵敏度明显高于放射科医师(99.1% vs 43%, $P < 0.001$)。人工智能自动分析结果与肺功能检测报告对比, 两组之间灵敏度及特异度的对比无明显差异 ($P > 0.05$); 肺功能 GOLD 分级中含

GOLD1 (轻度) $FEV1 \geq 80\%$ 预测值 36 例, GOLD2(中度) $50\% \leq FEV1 < 80\%$ 预测值 29 例, GOLD3(重度) $30\% \leq FEV1 < 50\%$ 预测值 9 例, GOLD4(极重度) $FEV1 < 30\%$ 预测值 6 例。结论 基于深度学习的人工智能软件能实现 COPD 无漏诊检出,具有较医师更高的检出灵敏度,人工智能与肺功能检测报告对 COPD 患者肺功能严重程度分级无显著差异。

关键词: 人工智能 HRCT 肺功能检测 COPD

“三低”技术联合深度迭代重建算法在肺动脉 CTA 中的临床应用

曹冬

中南大学湘雅医院

目的: 探讨低辐射剂量、低对比剂剂量、低对比剂注射速度(三低技术)联合深度迭代重建算法(AIIR)在肺动脉 CTA 中的应用价值。

方法: 前瞻性纳入 30 例肺动脉 CTA 的患者, 按复查时间先后分为 A、B 两组。A 组为对照组(100 kV, 0.8 mL/kg, 5 mL/s); B 组为“三低”组(70 kV, 0.5 mL/kg, 3 mL/s)。A 组使用 Karl 迭代重建图像, B 组分别使用 Karl 和 AIIR 重建得到 B1 和 B2 组。测量 3 组肺动脉干、左主肺动脉、右主肺动脉的 CT 值和 SD 值、计算信噪比(SNR)和对比噪声比(CNR)。同时对图像质量行主观评分。记录 A、B 组辐射剂量参数。两组 ED、对比剂剂量等比较采用 t 检验; SD、SNR、CNR 等客观图像质量评价参数比较采用单因素方差分析; 主观图像质量评分比较采用 Kruskal-Wallis 检验; 采用 Kappa 检验分析两名放射科医师主观评分的一致性。

结果: 3 组各管腔节段 CT 值、SD 值、SNR 及 CNR 差异均有统计学意义($P < 0.001$)。B2 组 CT 值、SNR、CNR 高于 B1 组, SD 值低于 B1 组, 差异均有统计学意义($P < 0.02$)。B2 组与 A 组的 CT 值差异无统计学意义($P > 0.017$), 各管腔节段的 SD 值、SNR 和 CNR 均优于 A 组($P < 0.015$)。3 组图像主观评分差异有统计学意义($P < 0.05$), A 组与 B2 组差异无统计学意义($P > 0.02$)。B 组辐射剂量、对比剂用量较 A 组分别降低 84.14%、37.08%。

结论: “三低”技术联合 AIIR 算法可以获得和常规剂量扫描相当的肺动脉 CTA 图像质量, 而患者的辐射剂量、对比剂用量及对比剂流速都明显降低。

PU-1421

基于 T2WI 的影像组学特征预测子宫腺肌病磁共振引导聚焦超声治疗的临床疗效

蒋奕、周洁, 梁译文, 陈嘉坤

香港中文大学深圳第二医院

目的: 开发和评估基于 MRI T2WI 的影像组学模型, 预测磁共振引导聚焦超声(MRgFUS)治疗子宫腺肌病患者的消融成功率。

材料和方法: 回顾性选取经 MRgFUS 治疗的 60 例子宫腺肌病患者(平均年龄, 36.4 岁; 年龄范围, 24-48 岁), 将其分为训练组($n = 40$)和测试组($n = 20$)。以 MRgFUS 消融率(NPV%) $> 80\%$ 作为治疗成功的标准。所有患者在 MRgFUS 治疗前一周内行盆腔 MRI 常规扫描, 利用 3D-slice 软件从 T2WI 成像中提取影像组学特征。在对组学特征进行标准化后, 分别使用最小绝对收缩和选择算子(LASSO)、递归特征消除(RFE)和 ReliefF 三种特征选择算法对提取的影像组学特征进行降维筛选, 并将其导入包括 k 近邻(KNN)、逻辑回归(LR)、随机森林(RF)和支持向量机(SVM)在内的四个机器学习分类器中, 用于构建术前 MRgFUS 治疗子宫腺肌病消融反应

的影像组学预测模型。使用受试者工作特征 (ROC)、校准和决策曲线验证和评估这些模型的性能、预测能力和临床实用性。

结果: 影像组学分析为子宫腺肌病的 MRgFUS 治疗提供了有效可行的术前预测和筛选方法。使用带有 ReliefF 算法的 SVM, MRI T2WI 影像组学模型表现出良好的性能, 平均准确度为 0.864, 敏感性为 0.838, 特异性为 0.892, 阳性预测值 (PPV) 为 0.910, 阴性预测值 (NPV) 为 0.832, ROC 曲线 (AUC) 为 0.876 (95% CI = 0.835~0.924)。校准和决策曲线分析证实了模型在预测能力和临床实用方面的潜力。

结论: 基于 T2WI 的影像组学特征预测模型可用于评估子宫腺肌病患者对于 MRgFUS 治疗的反应, 有助于确定个体化治疗策略。

要点: MRgFUS 作为子宫腺肌病的可替代疗法, 但近三分之一的患者在 MRgFUS 治疗后 6 个月仍有症状。将 T2WI 的影像组学特征进行筛选, 进一步提高了对 MRgFUS 治疗子宫腺肌病反应不佳的预测和适应症的筛选。

PU-1422

CT 图像重建参数对冠状动脉智能检测分析的影响

刚亚栋、徐海波
武汉大学中南医院

目的: 评估不同重建参数设置在冠状动脉 CT 造影 (coronary computed tomography angiography, CCTA) 中对冠状动脉自动检测性能的影响。材料与方法: 随机纳入 2021 年 9 月-2022 年 7 月期间在双层探测器 CT 上进行冠状动脉 CTA 的 80 例患者 (年龄: 46-73 岁) (IQon, Philips Healthcare)。使用不同的 iDose 水平、滤波器和增强设置 (分别为 A:3、CB 和 0; B:5、CC 和 -1; C:5、CD 和 -1) 重建三个并行 CCTA 图像集。测量所有图像集长轴和短轴视图中血池的噪声。冠状动脉在后处理工作站 (ISP, Philips Healthcare) 上自动重建。记录所有冠状动脉 (RCA、R-PDA、R-PLB、LAD (LM+LAD)、LCX、D1、D2、OM1、OM2、R1、L-PDA 和 L-PLB) 的总长度和节点数。采用 Wilcoxon 秩和检验比较每两个图像集之间的统计学差异。结果: 图像集 A、B 和 C 的节点数分别为 3.3 ± 1.5 、 4.9 ± 2.3 和 5.5 ± 1.7 。图像集 A、B 和 C 的冠脉分支总长度分别为 $342.3 \pm 123.4\text{mm}$ 、 $440.4 \pm 171.5\text{mm}$ 、 $468.9 \pm 141.5\text{mm}$ 。因此, 图像集 C 显示出最佳检测性能, 其中观察到的节点比 A 多, 血管长度比 A 和 B 长 (均 $P < 0.05$)。值得注意的是图像集 C 的长轴和短轴血池噪声显著高于 A 和 B (均 $P < 0.05$)。结论: CT 不同的重建核及参数设置会影响冠状动脉自动检测提取的性能。

PU-1423

术前乳腺 MRI 对于早期乳腺癌腋窝淋巴结负荷及无病生存期的评估价值

张俊杰、张建新、崔艳芬、杨晓棠
山西省肿瘤医院

目的: 探讨早期乳腺癌术前 MRI 特征是否有助于预测腋窝淋巴结负荷及无病生存期 (DFS)。方法: 回顾性分析 2016 年 1 月至 2018 年 12 月行术前 MRI 检查的 297 例早期乳腺癌 (cT1-2cN0) 患者。依据术后病理确定的腋窝阳性淋巴结数量分为高负荷组 (≥ 3 枚) 及低负荷组 (≤ 2 枚)。采用独立样本 t 检验、Mann-Whitney U 检验或 χ^2 检验比较两组间临床、病理指标及 MRI 特征的差异。采用多因素 Logistic 回归筛选与腋窝淋巴结高负荷相关的独立危险因素。受试者操作特征曲线 (ROC) 及曲线下面积 (AUC) 用于评估预测效能。采用多因素 COX 回归筛选与 DFS 相关的

MRI 特征, 绘制 Kaplan-Meier 曲线评估生存情况。结果: 腋窝淋巴结高负荷组 47 例, 低负荷组 250 例。两组间年龄、绝经状态、ER、PR、HER2、Ki67、分子亚型及病理分级差异均无统计学意义 ($P>0.05$)。两组间肿瘤最大径、病灶类型、多灶/多中心、瘤周血管征、瘤周水肿及皮下水肿差异均有统计学意义 ($P<0.05$)。多因素 Logistic 回归显示瘤周水肿 ($OR=3.734$, $95\%CI: 1.644\sim8.479$, $P=0.002$) 及多灶/多中心 ($OR=3.905$, $95\%CI: 1.685\sim9.051$, $P=0.001$) 是腋窝淋巴结高负荷的独立危险因素。ROC 曲线分析显示二者联合预测淋巴结高负荷 AUC 为 0.760, 高于任何单一因素 ($Z=2.547$, $P=0.011$; $Z=3.816$, $P=0.001$), 敏感度 82.98%、特异度 63.20%。多因素 COX 回归分析显示多灶/多中心与 DFS 相关 ($HR=3.501$, $95\%CI: 1.542\sim7.945$, $P=0.003$)。结论: 术前乳腺 MRI 特征中, 瘤周水肿及多灶/多中心有助于预测腋窝淋巴结负荷, 而多灶/多中心与 DFS 相关。

PU-1424

乳腺常见影像学检查方法的对比

李志强

空军军医大学西京医院

随着设备的发展, 乳腺检查的设备也越来越多。目前常见的有钼靶成像, DBT (Tomo), 超声成像, MRI 成像, 锥光束乳腺 CT (CBBCT)。这些成像方式各有特点, 其之间可以形成很好的互补。钼靶成像是二维投影, 成像原理决定检查结果为组织重叠, 且小病灶易漏诊, 对致密乳腺的诊断灵敏度低, 检查过程中强烈挤压乳房, 患者痛苦。DBT (Tomo) 检查也不能完全消除组织重叠, 也不是各向同性空间分辨率, 同时必须和钼靶配合使用, 检查过程也是强烈挤压乳房, 辐射剂量也较钼靶摄影增加不少。超声成像则高度依赖操作者的技术水平, 其一次成像不能覆盖整个乳房, 空间分辨率低, 其最大的缺点是检测不到微小钙化点。但超声目前是乳腺穿刺最理想的设备, 操作简单, 无辐射, 临床普及率高。MRI 成像由于其为多参数扫描, 密度分辨率比其它检查都高, 但对钙化灶显示不佳, 其空间分辨率也不高, 但其三维成像清晰显示。MRI 成像扫描时间长, 且必须使用造影剂, 同时设备维护和成本高, 磁场环境对于穿刺材料的限制较为严格。锥光束乳腺 CT 具有清晰显示微小钙化灶及微小软组织病灶的能力优势, 可精准引导完成乳腺定位活体组织检查。锥光束乳腺 CT 对乳腺可进行全三维影像, 单侧乳腺扫描时间约十秒, 对患者乳腺无挤压, 可通过自动屏蔽技术使非受检侧乳腺及身体其他部位免受辐射。其缺点是做引导定位活体组织检查的费用相对高于超声和钼靶摄影, 与超声和 MRI 相比, CBBCT 对人体仍存在一定的辐射影响, 并且 CBBCT 增强扫描时, 依然需要注射碘对比剂, 存在一定的过敏反应风险。

综上所述, 合理选择适当的检查方法很重要。对于普通人群的乳腺疾病筛查, 超声首选, 钼靶摄影次之, 而对于乳腺癌高发人群, 则可进行 MRI 进行筛查, 对于高度怀疑或确诊乳腺疾病的患者, 则可以在前者检查的基础上, 增加锥光束 CT, 进一步明确病变范围, 给临床提供三维立体图像, 便于临床进行充分的术前准备。

多普勒超声定量评估胸廓内动脉对诊断哺乳期乳腺炎可行性的初步探索

骆云皓¹、赵玮²、李洋¹、譙朗³

1. 成都中医药大学

2. 四川大学华西第二医院青白江妇女儿童医院/成都市青白江区妇幼保健院

3. 四川省中西医结合医院

目的

利用多普勒超声评估哺乳期乳腺炎患者胸廓内动脉,探讨超声定量参数诊断哺乳期乳腺炎的可行性。

方法

连续性回顾性纳入 2022 年 8 月-2023 年 6 月于四川大学华西第二医院青白江妇女儿童医院确诊的哺乳期乳腺炎患者 15 例作为实验组,纳入同时期连续性哺乳期非乳腺炎患者 19 例作为对照组。哺乳期乳腺炎诊断标准符合《中国哺乳期乳腺炎诊治指南 2020 版》。分析两组多普勒超声测量胸廓内动脉的成功率,对比两组患者胸廓内动脉的左右方位、内径、最大血流速度、舒张末期血流速度、最小舒张血流速度、时间平均峰值血流速度、RI、PI、S/D 及年龄是否存在差异,研究多普勒超声诊断哺乳期乳腺炎的定量参数指标。

结果

实验组准确寻找胸廓内动脉并获得满意测量的成功率为 46.67% (7/15), 对照组为 57.89% (11/19), 两组测量成功率无统计学差异 ($P>0.05$)。两组患者胸廓内动脉的左右方位、内径、最大血流速度、舒张末期血流速度、最小舒张血流速度、时间平均峰值血流速度、RI、PI、S/D 及年龄均无统计学差异 ($P>0.05$)。

结论

多普勒超声评估胸廓内动脉用于诊断哺乳期乳腺炎的可操作性较差,测量成功率低,对于炎性患者和非炎性患者不存在明显多普勒参数差异,暂无定量诊断哺乳期乳腺炎的可行性。

PU-1426

基于多序列磁共振影像组学建立和验证预测乳腺癌 KI-67 表达的列线图

张丽、黄小华
川北医学院

目的 基于磁共振影像组学联合临床病理和常规影像组学特征,开发和验证可以术前无创预测乳腺癌 KI-67 表达状态的列线图。

方法 回顾性分析于本院行双乳磁共振检查患者,按照纳入排除标准最终纳入患者 230 例、病灶 233 个。提取患者 ADC 图和 DCE-MRI 图的影像组学特征,按 7:3 比例分为训练集($n=163$)和测试集($n=70$)。在训练集通过单因素分析、最小绝对收缩和选择算子法(least absolute shrinkage and selection operator, LASSO)特征筛选,利用逻辑回归分别构建 ADC 模型、DCE-MRI 模型和联合模型(mpMRI),单因素分析和多因素逻辑回归选取临床病理和常规影像学特征,选取最优的影像组学模型构建影像组学标签 Radscore 并与临床病理和常规影像学特征构建列线图。以受试者工作特征曲线下面积 (area under the curve, AUC)、敏感度和准确率等评估其性能,校准曲线和决策曲线分别评估模型拟合度和其临床收益,并应用 Delong 检验比较不同模型间的差异性。

结果 多因素逻辑回归显示 ER 和腋窝淋巴结异常是 KI-67 独立预测因子。应用逻辑回归构建 ADC 模型、DCE-MRI 模型和联合模型(mpMRI),结果显示 mpMRI 模型性能最优,其在训练集和测试集的 AUC 值分别为 0.874、0.862。随着临床病理及常规影像学特征的纳入,列线图显示出更好的性能,其 AUC 值在训练集和测试集中分别为 0.881、0.875,优于临床模型(训练集:0.610,测试集:0.787)和影像模型。校正曲线显示模型拟合度好,决策曲线显示列线图的临床净收益在较大范围内均高于临床模型和影像模型。

结论 利用多序列的 Radscore 与临床病理及常规影像学特征构建的联合模型能有效预测乳腺癌 KI-67 表达状态,为临床医生对浸润性乳腺癌的术前干预和预后提供指导。

PU-1427

深度学习技术联合临床因素预测 BI-RADS 4A 类阳性病变的临床研究

欧阳汝珊²、廖婷婷¹、李霖¹、林小慧¹、马捷¹、周旭辉²

1. 暨南大学第二临床医学院 (深圳市人民医院)

2. 中山大学附属第八医院

目的: 构建基于深度学习技术的乳腺 X 线摄影分类系统联合临床因素的预测模型, 评估模型对乳腺 X 线摄影 BI-RADS 4A 类阳性病变的预测效能。

资料与方法: 回顾性分析 2018 年 1 月至 2022 年 7 月于我院接受乳腺 X 线摄影检查并评估为 BI-RADS 4A 类的 467 例患者的临床及影像资料, 由 2018 年 1 月至 2021 年 7 月的 324 例患者组成训练集, 2021 年 8 月至 2022 年 7 月的 143 例患者组成验证集。记录所有患者乳腺 X 线摄影检查的深度学习系统分类结果, 同时收集患者的相关临床因素, 以单因素和多因素 Logistic 回归分析筛选预测因子, 联合独立预测因子构建预测模型并绘制列线图。采用 AUC、校准曲线和决策曲线分析 (DCA) 评估预测模型的诊断效能、校准度及临床净收益, 对模型进行外部验证, 评价模型的泛化能力。用 DeLong 法比较预测模型与深度学习系统单独的 AUC 差异。

结果: 训练集中病理阳性组的患者共 80 例, 验证集中病理阳性组的患者共 34 例。最终年龄、乳头溢液、超声 BI-RADS 评估及深度学习系统分类结果共 4 个独立预测因子用于构建预测模型, 预测模型具有较好的诊断效能, 训练集及验证集的 AUC 分别为 0.85、0.82。校准曲线显示, 模型在训练集和验证集有较好的校准度, 其预测阳性风险概率与实际阳性风险概率无明显偏离; 临床决策曲线显示, 在训练集和验证集中, 当风险阈值分别大于 0.05 和 0.15 时模型即可获得临床净收益。

结论: 基于年龄、乳头溢液、超声 BI-RADS 评估和深度学习系统分类结果构建预测 BI-RADS 4A 类阳性病变的模型具有较好的诊断效能, 有助于影像科医师提高对 BI-RADS 4A 类阳性病变诊断的准确性, 减少不必要的活检。

Predictors of pathological complete response to neoadjuvant treatment in different HER2 category invasive breast cancer

Junnan Li

Tianjin Medical University Cancer Institute and Hospital

Abstract

Purpose In HER2-positive patients received trastuzumab, pathological complete response (pCR) correlated significantly with long-term survival. But pCR rate varies depending on the level of HER2 protein expression. The aim of this study was to evaluate clinicopathological and MR imaging data associated with pCR among patients in different HER2 category breast cancer.

Methods A total of 281 invasive breast cancer patients with HER2 IHC 3+ or IHC 2+/ FISH(+) were included in this study. All enrolled patients underwent baseline MRI examination in our hospital, and received neoadjuvant chemotherapy, dual anti-HER2 therapy and subsequent therapeutic surgery between January 2021 and May 2022. Logistic regression model was used to evaluate the effect of covariates on pCR in each group.

Results Compared to the HER2 IHC2+/FISH(+) group, patients with HER2 IHC 3+ tumors exhibited higher pCR rate (58.1% vs 26.7%, $p < 0.001$), clinical stage (58.6% vs 40%, $p = 0.038$),

apparent diffusion coefficient (ADC) value (0.96 vs 0.88, $p = 0.004$), and were more likely to be estrogen receptor (ER) negative (55.9% vs 31.1%, $p = 0.002$) and progesterone receptor (PR) negative (72.5% vs 46.7%, $p = 0.001$).

Both in IHC2+/FISH(+) group and IHC 3+ group, univariate analysis showed pCR group had more frequent ER negative and PR negative status than non-pCR group($p < 0.001$). After the incorporation of other variables at a level of p value < 0.15 , the final multivariable analysis showed that ER-negativity was associated with pCR in IHC2+/FISH(+) group($p = 0.004$). ER-negativity and the median of maximum diameter were identified as two independent predictors of pCR in IHC 3+ group($p < 0.001$ for ER, $p = 0.026$ for maximum diameter).

Conclusion IHC 3+ tumors showed a higher pCR rate than IHC2+/FISH(+) group. MR imaging findings were stronger predictors of pathologic response along with clinicopathological assessment, especially in IHC 3+ tumors.

单、双指数弥散加权成像联合动态增强磁共振成像对乳腺 TIC II 型良恶性病变的鉴别诊断价值

王唯伟

济宁医学院附属医院

【摘要】目的 探讨单、双指数弥散加权成像联合动态增强磁共振成像 (DWI+IVIM + DCE-MRI 模型) 对 TIC II 型乳腺良恶性病变的诊断价值 **方法** 回顾性分析本院经病理证实的乳腺肿块患者 115 例, TIC II 型良性组 30 例, 恶性组 85 例, 所有病例均行 DWI、IVIM 及 DCE-MRI 检查。分析两组间的 ADC、D、D*、f 及 Ktrans、Ve、Kep 值; 绘制 ROC 比较其诊断效能。结果 TIC II 型良性组 ADC、D 值高于恶性组, 而 Ktrans、Kep、Ve 值低于恶性组, 差异有统计学意义 (P 值 < 0.05)。DWI 模型的 AUC 为 0.725, IVIM 模型的 AUC 为 0.818; DCE-MRI 模型的 AUC 为 0.800; DWI+IVIM 模型、DWI+DCE-MRI 模型的 AUC 分别为 0.860、0.861, 诊断效能均高于 DWI 模型 ($Z=2.76$, $P=0.01$; $Z=3.380$, $P=0.001$)。将 DWI、IVIM 及 DCE-MRI 三者联合后, 诊断效能高于 DWI+IVIM 及 DWI+DCE-MRI ($Z=2.08$, $P=0.04$; $Z=1.877$, $P=0.04$)。结论 DWI+IVIM+DCE-MRI 对 TIC II 型乳腺良恶性病变有较好的鉴别诊断价值, 有利于患者术前精准治疗。

全数字化乳腺 X 线摄影、数字乳腺断层摄影及乳腺超声对导管内乳头状瘤的诊断价值研究

杜钢、潘德润、徐维敏、曾凤霞、陈卫国

南方医科大学南方医院

目的

乳腺导管内乳头状瘤是女性常见的乳腺良性肿瘤, 临床表现缺乏特异性, 其诊断主要依赖于影像学检查。本研究结合传统全数字化乳腺 X 线摄影及超声, 探讨数字乳腺断层摄影对乳腺导管内乳头状瘤的诊断价值。

方法

回顾性收集我院 2014 年 03 月-2018 年 12 月期间经病理证实为导管内乳头状瘤的患者 104 例, 所有的患者均行全数字化乳腺 X 线摄影 (FFDM)、数字乳腺断层摄影 (DBT) 和超声 (US) 检查。

首先由 3 年高年资放射科医师对影像图像进行分析, 内容包括病变可见性、病灶最大径、BI-RADS 分类等。将 BI-RADS 评分 3 或 4a 归为正确分类, 当意见不一时, 通过协商得出最终结果, 对比 FFDM、DBT 和 US 三种模式对病例诊断的敏感度、特异度及 ROC。然后按照发病部位将病例分为乳晕下区病灶和非乳晕下区病灶, 分别对比 FFDM、DBT 及 US 诊断两组病例的准确率。

结果

共收集 104 例患者, 其中乳晕下区 39 例, 其他部位 65 例。FFDM、DBT 和 US 对导管内乳头状瘤诊断的敏感度分别为 0.793、0.891 和 0.937, 差异有统计学意义 ($p<0.05$); 特异度分别为 0.740, 0.779 和 0.821, 差异有统计学意义 ($p<0.05$); ROC 曲线下面积分别为 0.851, 0.906 和 0.919, 差异有统计学意义 ($p<0.05$)。在乳晕下区病例的诊断结果中, FFDM、DBT 和 US 的准确率分别为 0.858, 0.914 和 0.923, 对于非乳晕下区病例, 三者的准确率分别为 0.813, 0.895 和 0.901, 差异均有统计学意义 ($p<0.05$)。

结论

DBT 及 US 对导管内乳头状瘤的诊断性能均优于 FFDM, 而 US 对导管内乳头状瘤的诊断价值要稍高于 DBT。在诊断性能方面, 三者对乳晕下区病例组的诊断准确率均高于非乳晕下区病例组。因此, DBT 在导管内乳头状瘤的临床诊断中有较好的应用前景, 同时病灶的发病部位与诊断准确率具有相关性。

PU-1431

基于动态增强 MRI 的反向传播神经网络模型预测 BI-RADS4 类 乳腺良恶性病变

杜涛明¹、宋惠贞¹、林涛¹、任盈丽¹、唐烨真²、苗加庆²

1. 成都市第七人民医院

2. 西南民族大学

目的 初步探索基于动态增强磁共振成像 (DCE-MRI) 的反向传播神经网络 (BPNN) 模型预测乳腺影像报告和数据系统 (BI-RADS) 4 类乳腺良性与恶性病变的价值, 为乳腺疾病精准诊治提供潜在的技术手段。

方法 纳入我院 2018 年 2 月至 2022 年 12 月经乳腺 MRI 诊断为 BI-RADS4 类乳腺病变的患者 260 例, 并将其随机分为训练集 ($n=182$) 和验证集 ($n=78$)。选取 DCE-MRI 动脉期图像勾画病变感兴趣区体积, 提取病变影像组学特征。采用 logistic 回归分析、最小绝对收缩与选择算子 (LASSO) 等方法筛选出预测 BI-RADS4 类乳腺良恶性病变有意义的临床因素和影像组学特征, 分别建立临床模型、影像组学模型及临床影像组学结合模型和 BPNN 模型。通过特征曲线、曲线下面积 (AUC)、校准曲线和德隆检验评比预测模型的性能。

结果 病灶直径是 BI-RADS4 类乳腺良恶性病变的独立临床相关因素, 12 个预测影像组学特征与 BI-RADS4 类乳腺良恶性病变相关。与临床模型、影像组学模型、结合模型比较, BPNN 模型呈现出最高的预测性能 (训练集 AUC: 0.784vs.0.801vs.0.855vs.0.976), 验证集 AUC: 0.725vs.0.776vs.0.813vs.0.971), BPNN 模型与其他三个模型之间的 AUC 比较差异均具有显著统计学意义 ($P<0.05$)。校准曲线表明, 模型预测 BI-RADS4 类乳腺病变的概率和实际结果一致性较好。

结论 基于 DCE-MRI 的 BPNN 模型在预测 BI-RADS4 类乳腺良恶性病变方面具有较高的性能, 为临床治疗决策的制定提供参考依据。

PU-1432

多模态 MRI 对不伴肿块型乳腺钙化病变的诊断价值

计超、曲宁
辽宁省肿瘤医院

目的：探讨多模态磁共振成像技术 (MRI) 对不伴肿块型乳腺钙化病变的诊断价值。

方法：回顾性分析 2020 年 1 月至 2023 年 2 月在辽宁省肿瘤医院就诊经乳腺 X 线摄影诊断为不伴肿块型钙化病变，且 MRI 呈肿块样强化的 145 例患者的临床及影像资料。所有病例均采用 GE 1.5T 超导磁共振检查，序列包括 T1WI、T2WI、抑脂、弥散加权成像 (DWI)、动态增强。分析良恶性病灶在 MRI 上的表现：形态学表现、强化特征、DWI 信号、时间-信号强度曲线 (Time-intensity curve, TIC)，TIC 曲线分为 I 型 (流入型)、II 型 (平台型)、III 型 (流出型) 3 种类型，并采用 $b=800 \text{ s/mm}^2$ ，在工作站生成的 ADC 图，设置 3~5 个 ROI 测量病变强化区域的表现弥散系数 (ADC 值)，取其平均值为终值。以病理结果为金标准，计算 MRI 的诊断效能。

结果：本研究 145 例患者中，包含 109 例乳腺癌 (恶性组) 和 36 例乳腺良性病变 (良性组)。单因素分析结果显示，病灶的形态、边缘、内部强化方式、DWI 及 TIC 曲线类型与病变良恶性之间差异均有统计学意义 (χ^2 值分别为 17.302、41.357、14.148、6.302、40.606, P 值 <0.05)。良性组病灶 ADC 值中位数为 $(1.360 \times 10^{-3} \text{ mm}^2/\text{s})$ ，高于恶性组病灶 ADC 值 $(0.986 \times 10^{-3} \text{ mm}^2/\text{s})$

($P=0.000 < 0.001$)。采用二元 Logistic 回归分析建立良恶性诊断模型，并对回归模型的预测概率进行 ROC 分析，取得回归模型的曲线下面积 (area under the curve, AUC)、灵敏度、特异性、阳性预测值及阴性预测值，分别为 0.874、90.8%、75.0%、94.5%、69.4%。

结论：对于不伴肿块型乳腺钙化性病变，多模态磁共振成像技术具有较高的鉴别诊断价值，能够为临床提供进一步的参考。

PU-1433

多模态磁共振联合 X 线摄影对不伴肿块型乳腺钙化病变的诊断价值

计超、曲宁
辽宁省肿瘤医院

目的：探讨多模态磁共振成像技术 (MRI) 联合乳腺 X 线摄影 (mammography, MG) 对不伴肿块型乳腺钙化病变的诊断价值。

方法：回顾性分析 2020 年 1 月至 2023 年 2 月在辽宁省肿瘤医院就诊经 MG 诊断为不伴肿块型钙化病变，且 MRI 表现为肿块样强化的 144 例患者的临床及影像资料。依据美国放射学会 (ACR) 提出的乳腺影像报告和数据系统 (BI-RADS) 标准对 MG 和 MRI 图像进行分析和评估。以病理结果为金标准，评价两种影像学方法及联合检查的诊断效能。

结果：144 例患者中，109 例为恶性病变，35 例为良性病变。单因素分析结果显示，良恶性病变的钙化形态、分布特点及是否有伴随征象 (结构扭曲、局灶不对称致密影、同侧乳头凹陷和皮肤增厚) 之间的差异具有统计学意义 ($P < 0.05$)；乳腺背景实质强化程度 (BPE)、病灶的形态、边缘、内部强化方式、DWI 信号、TIC 曲线及 ADC 值与病变良恶性之间差异均有统计学意义 ($P < 0.05$)。采用二元 Logistic 回归分析分别建立 MG、MRI 及联合检查的良恶性诊断模型，并对回归模型的预测概率进行 ROC 分析，取得回归模型的曲线下面积 (area under the curve, AUC)。MG 的诊断敏感度、特异度、PPV、NPV、诊断准确率及 AUC 分别为 87.2%、34.3%、80.5%、46.2%、74.3% 及 0.722。MRI 的诊断敏感度、特异度、PPV、NPV、诊断准确率及 AUC 分别为 93.6%、68.6%、90.3%、77.4%、87.5% 及 0.869。MG 联合 MRI 检查中，诊断敏感度、特异度、PPV、NPV、诊

断准确率及 AUC 值分别为 92.7%、71.4%、91.0%、75.6%、87.5%及 0.894。MRI 联合 MG 诊断的 ROC 曲线下面积明显高于 MG 单独诊断($P<0.05$)。

结论：对于不伴肿块型乳腺钙化病变，MRI 与 MG 联合应用具有较高的诊断效能。

PU-1434

基于动态增强磁共振成像鉴别 HER2 阳性乳腺癌

郭浩东、朱建国、李海歌
南京医科大学第二附属医院

目的：评价基于药代动力学动态增强磁共振成像 (DCE-MRI) 的定量、半定量参数在鉴别 HER2 阳性乳腺癌中的作用。

材料与方法：选取 2017 年 12 月~2019 年 12 月于我院行乳腺 3.0T DCE-MRI 检查的女性乳腺癌患者，共 147 例，其中，25 例病灶直径小于 0.5cm 的被排除，20 例非肿块样强化病变被排除，4 例 MRI 图像质量差的被排除，2 例病理分级及免疫组化表型描述模糊的被排除。最终纳入研究的患者共 96 例，其中 HER2 阳性 39 例 (42 个病灶)、HER2 阴性 57 例 (59 个病灶)。DCE-MRI 原始 DICOM 数据经软件处理后得到 8 个参数：K_{trans}, k_{ep}, v_e, v_p, TTP, MAX Conc, AUC, MAX Slope。将患者分别分为两组 (HER2 阳性组 vs. 非 HER2 阳性组)。采用单因素分析参数组间差异；进一步采用二元 Logistic 回归，并构建联合诊断模型，评估 DCE-MRI 定量、半定量参数及联合诊断模型鉴别 HER2 阳性乳腺癌的价值。

结果：ICC 检验显示 DCE-MRI 定量参数一致性良好。HER2 阳性乳腺癌组与非 HER2 阳性乳腺癌组组间比较中，定量、半定量参数均具有统计学差异；构建联合诊断模型；ROC 曲线显示 k_{ep}、TTP 和联合诊断模型对 HER2 阳性乳腺癌具有诊断价值 (AUC = 0.832、0.763、0.832)，且联合模型的诊断效能更高 (经 DeLong 检验，P 均 < 0.02)。

结论：本研究按照免疫组化结果将乳腺癌病灶分别分为 HER2 阳性组和 HER2 非阳性组，基于 DCE-MRI 的定性和定量参数的比较，从而分别进行乳腺癌病灶的分子分型判别，结果显示 k_{ep}、TTP 作为 DCE-MRI 的定量、半定量参数，在 HER2 阳性的乳腺癌鉴别中表现良好，具有一定的诊断价值，且联合诊断价值更高。

PU-1435

三种不同指数模型对乳腺良恶性病变鉴别诊断效能的比较：一项基于多 b 值 MUSE-DWI 的研究

郭浩东、李海歌、朱建国
南京医科大学第二附属医院

目的：比较基于多 b 值 MUSE-DWI 的单指数模型、双指数模型、拉伸指数模型鉴别乳腺良恶性病变的诊断效能。

方法：回顾性分析 62 例经病理证实的乳腺疾病患者的 MRI 检查资料。两名医师分别做多 b 值 MUSE-DWI 图像上勾画同一患者病灶的感兴趣区 (ROI)，并记录病灶的表观扩散系数 (ADC)、慢速表观扩散系数 (ADC_{slow})、快速表观扩散系数 (ADC_{fast})、快速成分所占比例 (ADC_{fraction of fast})、分布扩散系数 (DDC)、扩散异质性值 (α)。根据病理结果，将病灶分为良恶性两组。采用单因素分析或非参数检验比较 ADC、ADC_{slow}、ADC_{fast}、ADC_{fraction of fast}、DDC、 α 的组间差异。采用二元 Logistic 回归分析有组间差异的参数，构建双指数模型参数联合模型、拉伸指数模型参数联合模型。采用 DeLong 检验比较单指数模型、双指数模型参数联合

模型、拉伸指数模型参数联合模型的受试者工作特征 (ROC) 曲线下面积 (AUC), 评估三种模型诊断效能的差异。

结果: ADC、ADCslow、ADCfast、ADCfraction of fast、DDC 和 α 值在恶性组低于良性组 ($P < 0.05$)。单指数模型、双指数模型参数联合模型、拉伸指数模型参数联合模型鉴别乳腺良恶性病变的 AUC 分别为 0.701, 0.859, 0.828; 双指数模型参数联合模型与单指数模型的 AUC 有统计学差异 ($P=0.023$), 拉伸指数模型参数联合模型的 AUC 与双指数模型参数联合模型 ($P=0.52$) 及单指数模型 ($P=0.08$) 无统计学差异。

结论: 三种不同指数模型模型有助于鉴别乳腺良恶性病变; 双指数模型参数联合模型优于单指数模型。

磁共振多模态成像技术联合应用对于乳腺癌的诊断价值

李晓凡

辽宁省肿瘤医院

【摘要】 目的: 探讨磁共振动态增强扫描(DCE)、扩散加权成像(DWI)及磁共振波谱成像(MRS)三种成像方法联合应用对乳腺癌的诊断价值, 以提高乳腺癌诊断率, 实现乳腺癌的早发现、早诊断、早治疗。方法: 对 100 例于我院乳腺外科就诊的患者行常规 MRI、增强磁共振动态对比成像(DCE-MRI)、磁共振弥散加权成像(DWI) 以及磁共振波谱(MRS) 检查,并记录结果, 计算三种模态两两联合及三种模态共同联合的诊断敏感性、特异性和准确性, 以探讨多种模态联合应用对乳腺癌的诊断意义。结果: 100 例患者中发现病灶 121 个, 乳腺癌 65 例, 良性肿瘤 35 例。其中良性病灶 48 个, 恶性病灶 73 个。恶性病灶包括浸润性导管癌、导管原位癌、浸润性小叶癌、髓样癌等; 良性病灶包括纤维腺瘤、导管内乳头状瘤、肉芽肿性结节、增生结节。动态增强检查联合 DWI 检查诊断乳腺癌的敏感性为 88.6%、特异性为 86.4%、准确性为 88.4%, 动态增强检查联合 MRS 检查诊断乳腺癌的敏感性为 87.8%、特异性为 85.1%、准确性为 86.4%; MRS 联合 DTI 检查诊断乳腺癌的敏感性为 84.2%、特异性为 91.3%、准确性为 89.2%; 动态增强检查、DTI 及 DWI 三种模态联合检查诊断乳腺癌的敏感性为 96.3%、特异性为 98.2%、准确性为 97.2%。动态增强检查、DWI、MRS 两两联合诊断结果比较, 差异无统计学意义($P > 0.05$); 三者联合诊断结果与两两联合诊断结果比较, 差异有统计学意义($P < 0.05$)。结论: 磁共振动态增强检查、DWI 及 MRS 三种模态联合能明显提高乳腺癌诊断的敏感性、特异性及准确性。

离体乳腺组织 X 线检查技术的研究

覃湘昀、彭丽纯、李婷

柳州市柳铁中心医院

目的: 研究离体乳腺组织 X 线摄影技术意义, 分析乳腺在体组织与离体组织两种 X 线检查技术。方法: 分别对在体乳腺组织进行钼靶 X 线摄影、离体乳腺组织进行钼靶 X 线摄影。分两组对照组 (在体乳腺组、离体乳腺组), 在体组织选择 OPPCOMP 拍摄模式, 常规摄四个体位 (RCC LCC RMLO LMLO) 自动调节 mAs 与 kv。一般曝光条件范围为: 管电压 22~35KV, 管电流 30~200mAs, 根据病人耐受情况选择 Comp.Force。离体组织选取低 mAs、低 kv、不同 Comp.Force 摄片, 对比二者摄片技术对病灶的显示。结果: 20 例在体乳腺组织 X 线摄影图像显示出的病灶, 离体乳腺组织 X 线摄影时特定条件可更清楚显示病灶。有统计学意义。结论: 离体乳腺组织的 X 线检查技术可清晰的显示出病变组织。

Magnetic resonance imaging-based radiomics was used to evaluate the level of prognosis-related immune cell infiltration in breast cancer tumor microenvironment

Hua Qian, Changyu Zhou
The First Affiliated Hospital of Zhejiang TCM University

Purpose The tumor immune microenvironment is a valuable source of information for predicting prognosis in breast cancer (BRCA) patients. To identify immune cells associated with BRCA patient prognosis from the Cancer Genetic Atlas (TCGA), we established an MRI-based radiomics model for evaluating the degree of immune cell infiltration in breast cancer patients.

Methods CIBERSORT was utilized to evaluate the degree of infiltration of 22 immune cell types in breast cancer patients from the TCGA database, and both univariate and multivariate Cox regressions were employed to determine the prognostic significance of immune cell infiltration levels in BRCA patients. We identified independent prognostic factors for BRCA patients. Additionally, we obtained imaging features from the Cancer Imaging Archive (TCIA) database for 73 patients who underwent preoperative MRI procedures, and used the Least Absolute Shrinkage and Selection Operator (LASSO) to select the best imaging features for constructing an MRI-based radiomics model for evaluating immune cell infiltration levels in breast cancer patients.

Results According to the results of Cox regression analysis, M2 macrophages were identified as an independent prognostic factor for BRCA patients (HR=32.288, 95% CI: 3.100-357.478). A total of nine significant features were selected to calculate the radscore. We established an intratumoral model with AUCs (95% CI) of 0.662 (0.495-0.802) and 0.678 (0.438-0.901) in the training and testing cohorts, respectively. Additionally, a peritumoral model was created with AUCs (95% CI) of 0.826 (0.710-0.924) and 0.752 (0.525-0.957), and a combined model was established with AUCs (95% CI) of 0.843 (0.723-0.938) and 0.744 (0.491-0.965). The peritumoral model demonstrated the highest diagnostic efficacy, with an accuracy, sensitivity, and specificity of 0.773, 0.727, and 0.818, respectively, in its testing cohort.

Conclusion The MRI-based radiomics model has the potential to evaluate the degree of immune cell infiltration in breast cancer patients, offering a non-invasive imaging biomarker for assessing the tumor microenvironment in this disease.

列线图模型对浸润性乳腺癌伴腋窝淋巴结转移的预测价值

徐梦莹、刘金瑞、李健、洪子涵、陈兵
宁夏医科大学总医院

目的：探讨列线图模型对浸润性乳腺癌伴腋窝淋巴结转移的预测价值。**材料与方法：**回顾性分析 2020 年 9 月至 2022 年 3 月宁夏医科大学总医院怀疑为乳腺癌的患者 247 例，根据纳入、排除标准，共纳入 122 例作为研究对象。根据有无腋窝淋巴结转移，分为转移组 57 例、非转移组 65 例。所有病灶经手术获得病理证实。两组接受合成 MRI、DCE-MRI 及 DWI 扫描，测量乳腺病灶合成 MRI 参数 (T1、T2、PD)、DCE-MRI 时间信号强度曲线 (TIC)、ADC 值 (ADC tumor, ADC peritumor, ADC ratio)。采用独立样本 t 检验和 u 检验比较两组各参数差异，逻辑回归分析筛选出浸润性乳腺癌伴有腋窝淋巴结转移的独立危险因素。基于逻辑结果建立五种预测模型，采用 DeLong 检验评价五种模型 AUC。基于这一结果，使用 R 语言“riskRegression”包建立列线图模型，并评价其效能。根据每个危险因素的分类及数值向上投射得到对应分数，计算总得分，根据总得分向上投射可得到病灶的腋窝淋巴结转移概率。**结果：**逻辑回归结果分析显示 Ki-67(OR=2.971)、病

灶大小(OR=1.652)、T2ratio(OR=3.015)、PDratio(OR=2.782)、ADCratio(OR=1.685)是浸润性乳腺癌伴腋窝淋巴结转移的独立危险因素。五种模型建模显示逻辑回归模型显示效能最优, AUC 为 0.725, 95%CI 0.621-0.789, 准确率、特异性、敏感性分别为 70.65%、62.79%、77.55%。对列线图模型准确性进行检验, 得出 C-index=0.844, 即本次建立的列线图模型准确性良好, 其截断风险为 0.468, 截断分数为 143.50, 这表示当乳腺癌患者总分超过 143.50, 发生腋窝淋巴结转移的风险将高于 46.8%。

结论: 列线图模型对乳腺癌患者伴腋窝淋巴结转移具有较好的预测能力。

磁共振、超声对早期乳腺癌诊断的应用价值比较

阚杨杨、罗娅红、王唱、赵楠楠
辽宁省肿瘤医院

目的: 探讨磁共振、超声对早期乳腺癌诊断对比分析。方法: 2021 年 9 月至 2022 年 5 月期间于我院就诊并怀疑为早期乳腺癌患者 100 例, 均行磁共振及超声检查。所有患者在检查一周内行手术治疗, 并在术后获得病理结果。比较 MRI、超声这两种检查方法对早期乳腺癌的检出的灵敏度、阳性预测值的差异。结果: 所有 100 例乳腺病灶, 病理证实为乳腺癌患者为 87 例。MRI 对早期乳腺癌检出率值分别为 93.2%、79.3% ($P<0.05$)。结论: MRI 对早期乳腺癌的检出率优于超声检查。

PU-1441

乳腺钼靶与 MRI 增强检查在乳腺疾病诊断中的价值

阚杨杨、王唱、赵楠楠、罗娅红
辽宁省肿瘤医院

目的: 比较乳腺 X 线摄影与磁共振增强检查在乳腺病变中的诊断价值比较。方法: 回顾分析 2012 年 1 月至 2022 年 1 月 107 例乳腺疾病病人的影像学资料, 所有病人均进行乳腺 X 线摄影与 MRI 动态增强检查, 按照美国放射学会推荐的“乳腺影像报告和数据系统”(BI-RADS) 进行分类, 以手术病理诊断为金标准, 应用受试者工作特征曲线(ROC) 评价不同检查方法及联合检测的价值。结果: 156 例病人共检出 170 个病灶, 以 BI-RADS 分级 4 类以上为检查阳性, 结果显示 MRI 增强检查的灵敏度优于乳腺 X 线摄影(96.07% 比 81.23%, $P=0.003$), 而其特异度不低于乳腺 X 线摄影 ($P=0.274$)。ROC 分析结果显示, MRI 增强检查的曲线下面积明显大于乳腺 X 线摄影(0.929 比 0.889, $P=0.001$), 而联合 2 种检查方法曲线下面积最大, 明显大于单独行乳腺 X 线摄影($P=0.001$)、MRI 增强检查($P=0.008$)。结论: MRI 增强检查在有症状的乳腺疾病病人中的诊断价值高于乳腺 X 线摄影, 联合运用 2 种检查方法, 诊断价值可进一步提高。

基于瘤内异质性分割的影像组学模型对预测乳腺癌患者 Ki-67 表达水平的价值

张成孟、丁治民

皖南医学院第一附属医院 (弋矶山医院) 放射科

目的: 探讨基于动态增强磁共振成像 (DCE-MRI) 瘤内异质性分割的影像组学预测乳腺癌患者 Ki-67 表达水平。**方法:** 回顾性收集 2018 年 6 月-2022 年 9 月经手术病理确证为乳腺癌的患者 210 例, 其中 Ki-67 高表达 128 例, 低表达 82 例, 所有病例均在治疗前行 DCE-MRI 检查。对所有患者的 DCE-MRI 第三期图像采用无监督 k-means 算法分割为不同的肿瘤亚区。以 7:3 的比例随机分为训练集和验证集。在训练集中使用最大相关最小冗余(mRMR)、最小绝对收缩和选择算子(LASSO)分别对各肿瘤亚区及其肿瘤整体的影像组学特征进行降维, 采用逻辑回归的方法构建预测模型。采用受试者工作特征曲线下面积(AUC)评价模型的效能, 应用决策曲线分析(DCA)评估模型的临床价值。**结果:** 使用无监督 k-means 聚类方法根据体素值将结果聚为类 2 类, 因此将肿瘤分为两个亚区, 分别为高亮度亚区和相对低亮度亚区。结果显示高亮度亚区 (训练集 AUC:0.786, 验证集 AUC: 0.774) 预测乳腺癌患者 Ki-67 表达的状态要优于相对低亮度亚区 (训练集 AUC:0.750, 验证集 AUC: 0.662)、肿瘤整体 (训练集 AUC:0.760, 验证集 AUC: 0.723), 基于两个亚区构建的联合模型其诊断效能为 (训练集 AUC:0.865, 验证集 AUC: 0.781), 要优于临床模型、高亮度亚区影像组学模型、相对低亮度亚区影像组学模型及肿瘤整体模型, 校准曲线显示联合模型具有较好的校准度, DCA 显示在训练集和验证集中联合模型较临床模型、高亮度亚区影像组学模型、相对低亮度亚区影像组学模型及肿瘤整体模型具有更高的临床价值。**结论:** 基于 DCE-MRI 瘤内异质性分割的影像组学模型能够较好的预测乳腺癌患者 Ki-67 表达水平。

不同年龄及月经状态女性正常乳腺 ADC 值的变化

张爱娟、陈基明

皖南医学院弋矶山医院

【摘要】目的: 探讨不同年龄及月经状态女性正常乳腺表观扩散系数 (apparent diffusion coefficient, ADC) 值的变化特征及其临床意义。**方法:** 收集 2020 年 8 月至 2022 年 11 月皖南医学院弋矶山医院因自觉“包块”、不适 MRI 检查双侧乳腺健康 332 例受试者资料, 根据年龄分为低年龄组 (n=107), 中年年龄组 (n=114), 高年龄组 (n=111)。根据不同月经状态将受试者分为月经期(n=49)、增殖期 (n=77)、分泌期(n=94)和绝经后(n=112)。在西门子后处理站中测量正常乳腺 ADC 值, 多次测量 (ROI 保持一致) 取平均值, 比较不同年龄及月经状态的乳腺 ADC 值的差异。**结果:** 不同年龄双侧正常乳腺的 ADC 值差异有统计学意义 ($P < 0.05$); 双侧高年龄组与中年年龄组及低年龄组的差异均有统计学意义 ($P < 0.05$), 中年年龄组与低年龄组差异无统计学意义 ($P > 0.05$)。不同月经状态的双侧正常乳腺组织, 双侧 ADC 值差异均有统计学意义 ($P < 0.05$); 绝经后与月经期、增殖期及分泌期的差异均有统计学意义 ($P < 0.05$), 月经期、增殖期及分泌期两两比较差异无统计学意义 ($P > 0.05$)。**结论:** 不同年龄及月经状态正常女性乳腺 ADC 值的变化及个体之间的变异度较大, 利用 ADC 值诊断女性乳腺疾病时应考虑不同年龄及月经状态下的基线 ADC 值变化。

锥光束乳腺 CT 影像组学预测乳腺癌腋窝淋巴结状态和转移负荷

朱跃强、马悦、刘爱迪、李海洁、王娅菲、赵梦然、边珂易、叶兆祥
天津医科大学肿瘤医院

目的: 建立对比增强锥光束乳腺 CT (CE-CBBCT) 影像组学模型, 用于术前预测乳腺癌腋窝淋巴结 (ALN) 状态和转移负荷。

方法: 选择 2012~2021 年在天津医科大学肿瘤医院进行 CE-CBBCT 检查的 274 例患者。在每个患者图像中对原发肿瘤进行分割, 使用 PyRadiomics 软件从中提取 1781 个影像组学特征。在特征选择之后, 开发支持向量机 (SVM) 模型来预测 ALN 状态和转移负荷。为了避免对特定患者子集的过度拟合, 进行了 100 次随机分层来将患者分配到训练集和测试集。将影像组学模型的 ROC 曲线下的面积 (AUC) 与仅使用临床特征和临床+影像组学特征训练模型时获得的 AUC 进行比较。病理组织学为金标准。

结果: 118 例患者有 ALN 转移 ($N+(≥1)$), 其中 74 例为低负荷 ($N+(1-2)$), 44 例为高负荷 ($N+(≥3)$), 其余 156 例患者无 ALN 转移 ($N0$)。在预测 ALN 状态 ($N0/N+(≥1)$) 时, 100 次重复试验的平均 AUC 值分别为 $0.75±0.05$ (影像组学模型)、 $0.68±0.07$ (临床模型) 和 $0.74±0.05$ (组合模型)。在预测转移负荷 ($N+(1-2)/N+(≥3)$) 时, AUC 值分别为 $0.65±0.10$ (影像组学模型)、 $0.55±0.12$ (临床模型) 和 $0.64±0.09$ (组合模型)。在这两种情况下, 影像组学模型明显优于临床模型 (均 $p<0.01$), 并且与组合模型相当 ($p=0.56$ 和 0.64)。

结论: CE-CBBCT 图像中原发肿瘤的影像组学特征可以预测 ALN 转移。

PU-1445

T2WI 脂肪抑制水肿特征评估乳腺癌新辅助化疗疗效

张婷
三门峡市中心医院

目的: 探究乳腺癌患者在新辅助化疗 (NAC) 前后 T2WI 脂肪抑制序列患侧乳腺水肿程度的改变, 研究其在乳腺癌 NAC 中的应用价值以及相关影响因素分析。

方法: 分析 2020 年 6 月-2021 年 12 月我院病理科确诊且接受过 NAC 的 52 例乳腺癌患者, 这些患者均于治疗前后行乳腺 MRI 检查, 对所有患者影像学、临床组织学资料治疗前后进行对比研究, 采用 Miller-Payne 分级系统分为组织学显著反应 (PCR) 组 ($n=17$ 例)、非显著反应 (非 PCR) 组 ($n=35$ 例), 应用配对样本比较的 Wilcoxon 符号秩和检验分别了解两组患者 NAC 前后 T2WI 脂肪抑制序列乳腺水肿的差异; 采用非参数检验比较每组患者在接受 NAC 前后乳腺水肿特点。采用 Spearman 检验、二元 logistic 回归分析进行乳腺水肿及 NAC 疗效影响因素的相关性分析。

结果: ① PCR 组与非 PCR 组 NAC 方案、肿块最大径线的差异有统计学意义 ($P<0.001$) ② PCR 组与非 PCR 组 NAC 前后乳腺水肿特点比较差异有统计学意义 ($P<0.001$), PCR 组患者的化疗前水肿级别大于非 PCR 组 ($P<0.001$), 化疗前后非 PCR 组的水肿级别中位数较显著反应组高; ③ NAC 前两组 (PCR 组与非 PCR 组) 的乳腺水肿级别无统计学差异 ($P=0.16$), NAC 后两组 (PCR 组与非 PCR 组) 的乳腺水肿级别有统计学差异 ($P=0.004$); ④ NAC 前乳腺水肿影响因素相关性分析显示水肿与肿瘤最大径以及 Ki-67、ER、PR 的表达相关 ($P<0.05$); ⑤ NAC 前低级别水肿、雌激素受体/孕激素受体阴性患者更易达到 PCR ($P<0.001$)。

结论: 乳腺癌 NAC 后患侧乳腺水肿级别下降可作为评价 NAC 有效性的指标; 此外还观察到, 随着 NAC 后肿瘤直径的缩小, 水肿也有所改善。因此, 利用 MRI T2WI 脂肪抑制序列对患侧乳腺水肿结果进行分类评级, 可以用于乳腺癌患者预后和化疗效果的评估。

基于 2013 版 BI-RADS 术语及关于 CEM 术语的补充规定探讨 CEM 与 MRI 鉴别乳腺良性与恶性病变的价值

郭赛灵、俞胜男
常州市第一人民医院

目的:基于 2013 版乳腺影像报告和数据系统 (BI-RADS) 术语及关于对比增强乳腺 X 线摄影 (CEM) 术语的补充规定探讨 CEM 与 MRI 鉴别乳腺良性与恶性病变的价值。**方法:**回顾性分析 2019 年至 2022 年我院因乳腺病灶而就诊的 83 例患者的临床和影像资料, 共 100 个乳腺病灶, 年龄 28~78 (49±14) 岁, 根据病理结果分为良性病灶 50 个、恶性病灶 50 个。采用 t 检验、 χ^2 检验及 Fisher 确切概率法比较良性与恶性病灶的临床及 CEM、MRI 特征差异, 并将差异具有统计学意义的影像学特征纳入多因素 logistic 回归分析分别建立预测模型。曲线下面积的比较采用 DeLong 检验。结果:多因素 logistic 回归分析显示 CEM 中伴随征象 (OR=9.075, P=0.019)、病灶显著性 (OR=6.180, P<0.001)、肿块边缘 (OR=2.193, P=0.001)、钙化分布 (OR=2.147, P=0.015) 是鉴别乳腺良性与恶性病灶的独立预测因子, 并以此构建 CEM 预测模型。MRI 中时间-信号强度曲线 (OR=9.230, P<0.001)、伴随征象 (OR=5.289, P=0.017)、肿块边缘 (OR=2.192, P=0.002) 是鉴别乳腺病灶良性与恶性的独立预测因子。CEM、MRI 预测模型鉴别乳腺良性与恶性病灶的曲线下面积分别为 0.947、0.930, 差异无统计学意义 (Z=0.68, P=0.494)。结论:基于 2013 版 BI-RADS 术语及关于 CEM 术语的补充规定得出 CEM、MRI 两种检查技术鉴别乳腺良性与恶性病灶的诊断效能相当。

PU-1447

Imaging Features Derived From Dynamic Contrast-Enhanced Magnetic Resonance Imaging to Differentiate Malignant From Benign Breast Lesions: A Systematic Review and Meta-Analysis

Haifeng Liu¹, Jie Zhang²

1. Radiology Department, The third hospital of Lanzhou University

2. Department of Radiology, Affiliated Hospital of Gansu University of Chinese Medicine

Purpose: The aim of this study is to explore the accuracy of individual imaging features derived from dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) in differentiating malignant from benign breast lesions. **Materials and Methods:** The PubMed, Web of Science, Embase, and the Cochrane Library databases were searched up to January 2021 to identify original studies that investigated the accuracy of individual DCE-MRI features in differentiating malignant from benign breast lesions. Pooled sensitivity, specificity, and area under the curve were calculated by STATA software based on the data extracted from included studies. Moreover, quality assessment, subgroup analysis, and publication bias evaluation were performed. **Results:** Twenty-nine studies comprising 2976 patients and 3365 suspicious breast lesions were included. Malignant breast lesions tended to present irregular shapes (83.59%), noncircumscribed margins (85.50%), mass enhancement (52.31%), heterogeneous internal enhancement (71.72%), and type II or III time intensity curve (TIC) patterns (91.17%), showing significant differences compared with benign breast lesions (P < 0.05). For differentiating malignant from benign breast lesions, the area under the curve values of irregular shape, noncircumscribed margin, mass

enhancement, heterogeneous internal enhancement, and type II or III TIC patterns were 0.79 (0.76–0.83), 0.87 (0.84–0.90), 0.63 (0.58–0.67), 0.82 (0.78–0.85), and 0.89 (0.86–0.92), respectively. Conclusions: Imaging features derived from DCE-MRI, especially TIC patterns, are important for diagnosing and differentiating malignant from benign breast lesions.

磁共振酰胺质子转移加权成像与弥散峰度成像在评估乳腺癌前哨淋巴结转移负荷中的应用价值

单海燕、廖承德
昆明市延安医院

摘要 目的：1、比较酰胺质子转移加权成像(APTWI)联合弥散峰度成像(DKI)与乳腺动态增强成像在鉴别乳腺良恶性病变中的价值；2、分析其衍生参数（非对称磁化转移传递率 (MTRasym 3.5ppm)、表观峰度系数(Kapp)和非高斯扩散系数(Dapp)）与乳腺癌前哨淋巴结转移负荷的相关性。方法：纳入 2022 年 12 月至 2023 年 7 月在云南省肿瘤医院行乳腺磁共振检查的患者 200 例。经过纳排标准，最终入组的患者 190 例。根据组织病理学结果将入组的患者分为良恶性组，其中恶性组患者根据其肿瘤大小、淋巴结转移情况、ER、HER-2、PR 及 Ki-67 的表达情况又分为不同的组，探究 APT 及 DKI 的相关定量参数与不同临床预后参数及前哨淋巴结转移负荷之间的相关性。本研究将前哨淋巴结转移数目 ≤ 2 枚归为低负荷转移， ≥ 3 枚归为高负荷转移。采用 SPSS 21.0 统计学软件进行数据分析，组内相关系数 (ICC) 用于评估观察者间的可靠性；Spearman 相关系数用于确定每个参数与不同临床病理因素之间的相关；logistic 回归用于多指标联合诊断。结果：恶性组的 Kapp 值高于良性组，Dapp 和 MTRasym (3.5 ppm)值低于良性组。Kapp 与 MTRasym 之间(3.5 ppm)和 Dapp 与 MTRasym 之间(3.5 ppm)的 AUC 差异显著。Kapp 与前哨淋巴结低负荷转移中度相关，与高负荷转移中度相关，与 Ki-67、HER-2 表达轻度相关。Dapp 与前哨淋巴结低负荷转移中度相关，与高负荷转移中度相关，与 Ki-67 表达轻度相关。MTRasym (3.5 ppm)与前哨淋巴结低负荷转移仅轻度相关，与前哨淋巴结高负荷转移轻度相关。结论：DKI 对乳腺良恶性疾病及前哨淋巴结转移负荷的鉴别价值优于 APTWI。每个参数都与一些预后因素有一定的相关性。

双能钼靶让软组织内低密度异物无处遁形

范华君、唐飞、邓淞文
贵航安顺医院

外伤性软组织内异物作为一种常见急症，大部分非金属异物在传统 DR 摄影条件下定位定性都难以判断，比如木屑，玻璃、鱼刺等低密度异物，钼靶是一种运用软射线检测乳腺疾病的方法，既往少有用钼靶进行低密度异物的检测，本文旨在探讨利用钼靶检查软组织内低密度异物的方法和结果，以及从中得出的结论。

一、目的：探讨利用钼靶检查软组织内低密度异物的有效方法，并评估其准确性和可行性。

二、方法：回顾性分析我院 2021 年至今 20 例手指远端软组织内低密度异物患者，经传统 DR 摄影未检出明确异物位置，对同一患者采用双能钼靶进行手指远端软组织内异物摄影。

因为钼靶摄片需要对软组织进行压迫，达到一定的压力之后才能进行曝光，手指远端软组织较少，需要一个辅助压迫的工具，我们用了 EVA 自制辅助检查模具进行检查，将远端肢体置入模具中，调整图像接收器高度到患者舒适的体位，下压压迫器使压力达到曝光条件，使压迫板使压力 >3 ，

约为 16daN，选择左右，使用大焦点，Mo/Mo，30KV，56mAS，按下曝光键，压迫板抬起，检查图像，调节窗宽窗位，查看异物的大小，位置，接着完善检查，或者更换体位，直到异物显影明确。三、结果：用传统 DR 摄片方法对此类软组织内低密度异物无法检出的情况下，利用钼靶软射线对软组织内低密度异物的检出率为 70%。

四、结论：双能钼靶对软组织内低密度异物是一种有效且可行的方法，比传统 DR 有更好的检出率，为医生提供重要的参考信息，然而，钼靶也存在一点局限性，无法检测到肢体近端及深层组织的异物，可能需要结合其他影像学技术进行进一步检查。

Fischer 评分与 Kaiser 评分在磁共振乳腺肿块定性诊断中的价值比较

安永玉

浙江中医药大学附属第一医院（浙江省中医院）

目的：比较 Fischer 评分和 Kaiser 评分在磁共振乳腺肿块良恶性诊断中的价值。方法：回顾性分析 174 例乳腺肿块患者的术前动态增强 MRI 图像，所有病灶均经病理证实。两位影像医师在不知道病理结果的情况下分别按照 Fischer 评分和 Kaiser 评分规则对每个强化病灶进行评分。Fischer 评分 4 分及以上判定为恶性，而 Kaiser 评分 4 分以上判定为恶性。以病理结果为诊断金标准，计算并比较 Fischer 评分和 Kaiser 评分的敏感度、特异度及曲线下面积（area under curve, AUC）。结果：174 例女性患者共有 192 个乳腺肿块，其中恶性病灶 85 个，恶性率为 44.3%。Fischer 评分诊断乳腺恶性肿瘤的敏感度、特异度、AUC 分别为 92.9%、65.4%、0.909。Kaiser 评分诊断的敏感度、特异度、分别为 94.1%、90.7%、0.932。相对于 Fischer 评分，Kaiser 评分诊断的特异度明显提高（ $P<0.001$ ），而敏感度和曲线下面积无明显统计学差异（ $P>0.99$ ， $P>0.99$ ）。结论：Fischer 评分和 Kaiser 评分诊断乳腺恶性肿瘤的敏感度均较高，但 Kaiser 评分诊断的特异度更高，可以作为优选辅助决策手段用于判断 MRI 乳腺肿块的良恶性。

PU-1451

针对性指导及预感受在钼靶检查中的实际应用效果

唐飞、邓淞文、范华君

贵航安顺医院

摘要：乳腺钼靶筛查使乳腺癌患者死亡率降低约 20% ([1]) 在乳腺钙化，特别是沙砾样钙化的检出率方面，乳腺钼靶明显优于超声。精准医疗，影像先行。精准影像，技术先行。现阶段加强医疗服务人文关怀并构建和谐医患关系，是新时代健康中国的战略要求。

目的：探讨如何提高乳腺钼靶检查的成功率，减少投诉事件，改善患者就诊体验。

方法：一.首先解决患者的潜在心理困扰。患者提交申请单进行登记时，填写一张检查问卷调查表，请患者勾选需要了解的内容，包括①是否接受过钼靶检查②辐射剂量的大小③检查的最佳时间④摄影压迫的目的⑤疼痛感等等。

二.进行预感受体验。任何的言语沟通，均不如实际感受。在正式检查前，技师在检查平台放置一 EVA 材质的缓冲垫，嘱患者单手至于其上，操作压迫器缓慢下压，令其感受大致压力，使患者有一个明确的预感受和心理阈值，从而消除检查中的恐惧感。

采用机型: GE Senographe Ds 全视野数字化系统乳腺 X 光机

检查过程: 在严格做好患者隐私保护及辐射防护的前提下, 常规采用头尾位+内外斜位, 应用 AOP 自动曝光模式, 在每次 AOP 模式曝光开始之前, 先执行一次短暂的吸收测量曝光, 以确定要进行检查的乳房的厚度和密度。这一过程获得的信息同操作者设置的曝光优先模式一起, 可以使曝光参数最优化。而后进行正式曝光, 使用轨/滤波器/kV/mAs 设置可以在用户选定的曝光优先模式下实现最低的曝光剂量。每人检查结束后, 行乳腺压迫板和检查台的清洁。

结果: 常规检查前, 通过填写问卷调查表及采取预感受措施, 在检查成功率明显提高的同时, 极大的降低了因沟通及检查过程压痛造成的投诉事件。

结论: 填写问卷调查表可使技师快速的了解受检者的疑惑和需求, 从而进行针对性的指导与沟通。预感受可积极有效的降低患者的恐惧感并提高配合度, 从而提高检查成功率及就诊体验。

弥散加权成像与体素内不相干运动对乳腺癌 HER-2 阳性表达的预测价值

余哲歆、彭泽学、胡康新
湘雅常德医院

目的 探讨弥散加权成像 (DWI) 及体素内不相干运动 (IVIM) 对乳腺癌 HER-2 阳性表达的预测价值。方法 回顾性分析 44 例经病理证实的乳腺癌病灶, 术前行 3.0T 磁共振常规平扫、DWI、IVIM、增强扫描, 测量病灶的常规 ADC 值 (B 值为 1000) 及 IVIM 定量参数 standard ADC、D (slow ADC)、D*(fast ADC)、f (fraction) 值。根据 HER-2 表达分成 HER-2 阳性表达组及 HER-2 阴性表达组。分析常规 ADC 值及 IVIM 定量参数在分组中的差异。结果 所有患者均为女性, 年龄范围 28-68 岁, 中位年龄 46 岁。44 例病灶中 HER-2 阳性 18 例, 阴性 26 例。病灶处的常规 ADC 值及 IVIM 定量参数 standard ADC、D 值在分组中差异有统计学意义。结论 常规 ADC 值及 IVIM 定量参数 standard ADC、D 值对乳腺癌 HER-2 阳性表达具有潜在的预测价值。

PU-1453

乳腺错构瘤 1 例

余哲歆、彭泽学、胡康新
湘雅常德医院

患者 女, 36 岁。因发现左乳肿块 7 年入院, 7 年间左乳肿块逐渐增大。实验室检查示: 三大常规未见明显异常。CT 增强检查示: 左乳内象限可见一肿块灶, 形态规则, 边界清晰, 大部分为脂肪密度, 其内可见多发强化结节灶 (图 1)。MRI 示: 左乳内象限可见一脂肪信号肿块, 其内可见多发结节, 增强后结节强化与乳腺腺体强化一致 (图 2-4)。诊断为乳腺错构瘤可能。

PU-1454

动态增强磁共振定量分析在评估 乳腺癌乳头受侵中的应用价值

李焕国、晁红艳、陶元萍、张永胜、崔凤
杭州市中医院

目的 探讨动态增强磁共振（DCE-MRI）定量分析在评估乳腺癌乳头受侵中的价值。

方法 选取 2019 年 1 月至 2022 年 1 月杭州市中医院确诊乳腺癌并侵及乳头的患者 21 例（乳头阳性组）以及乳腺癌未侵及乳头且另一侧乳腺无明显病变的患者 40 例（乳头阴性组）。所有患者均行 DCE-MRI 检查，测量两组患者乳头及乳腺癌原发灶的血流动力学参数，包括渗透性参数容量转移常数（K_{trans}）、速率常数（K_{ep}）、血浆空间容积分数（V_p）；采用多因素 logistic 回归分析筛选出预测乳头受侵的危险因素，绘制 ROC 曲线分析血流动力学参数预测乳腺癌乳头受侵的效能。

结果 乳头阳性组患者 K_{trans}、K_{ep}、V_p 均明显高于乳头阴性组患者（均 $P < 0.05$ ），受侵乳头与乳腺癌病灶的 K_{trans} 呈正相关（ $r = 0.737$ ， $P < 0.05$ ）。K_{ep}（OR=7.354，95%CI: 1.369~39.512， $P < 0.05$ ）、V_p（OR=4.023，95%CI: 1.113~14.534， $P < 0.05$ ）是判断乳头受侵的危险因素，预测乳头受侵的效能 AUC 为 0.84，灵敏度及特异度均为 0.762。

结论 DCE-MRI 定量分析在鉴别乳腺癌患者乳头有无受侵中具有一定的应用价值，其中 K_{ep}、V_p 预测乳腺癌侵及乳头具有较好的效能。

PU-1455

基于多模态影像学特征预测导管原位癌病理升级

段曦瑞

昆明市延安医院

目标：我们旨在基于术前乳腺 MRI 和乳腺钼靶技术，为确诊为原位导管癌（DCIS）的女性开发一个预测模型，从而预测病情升级的可能性。此外，为了在决定患者是否需要腋窝淋巴结清扫（ALND）或前哨淋巴结活检（SLNB）时提供临床帮助。

方法：本研究对象为连续一系列经活检证实为 DCIS 的女性，她们在 2018 年 12 月至 2023 年 4 月间接受了术前 3.0-T 乳腺 MRI 检查，包括动态增强（DCE）MRI 和弥散加权成像（DWI）、乳腺钼靶，并且在术后病理诊断为单纯 DCIS 和侵袭性 DCIS。我们收集了多模态影像学特征、临床资料和病理数据，并使用多变量 Logistic 回归来开发和验证用于预测病情升级的模型。

结果：在训练集的 203 名女性中（平均年龄：52 ± 9 岁），有 71 名（35%）在手术后被升级。相似地，在验证集的 87 名女性中（平均年龄：53 ± 11 岁），有 35 名（40%）手术后被升级。该预测模型整合了 DWI、乳腺 X 线摄影和临床病理因素，对于开发集的受试者工作特性曲线下的面积为 0.85（95% CI: 0.79-0.90），而对于验证集为 0.78（95% CI: 0.70-0.84）。模型对于侵袭性癌症的预测概率表现出了值得称赞的观察者之间的一致性，其内部类相关系数为 0.809。其阳性预测值为 77.1%，而阴性预测值为 87.2%。

结论：基于弥散加权乳腺 MRI、乳腺钼靶摄影和临床病理因素的预测模型成功识别了有高升级风险的女性。

PU-1456

三阴性乳腺癌 X 线征象与腋窝淋巴结转移的相关性分析

金彦桐、高波、王秀兰、程晓英

哈尔滨医科大学附属第二医院

目的：探讨三阴性乳腺癌（triple-negative breast cancer, TNBC）患者腋窝淋巴结转移与乳腺 X 线影像征象之间的关系，分析 TNBC 腋窝淋巴结转移的危险因素。

方法：回顾性分析 2016 年 10 月—2023 年 4 月经病理学检查证实为 TNBC 的 163 例女性患者的临床病理资料。根据病理结果，分为腋下淋巴结转移组（55 例）和腋下淋巴结未转移组（108 例）。所有病例术前均行常规乳腺 X 线检查，并且检查前均未接受过任何抗肿瘤治疗。比较两组 TNBC

病灶 X 线征象 (如腺体类型, 肿块的大小、密度、形态、边缘、是否伴有钙化, 有无伴随征象及腋窝淋巴结 X 线表现) 的差异, 采用单因素及二元 logistic 回归分析 TNBC 病灶 X 线征象与腋窝淋巴结转移的相关性及其危险因素。

结果: 单因素分析显示, 两组间肿块的大小、形态、边缘、是否伴有钙化, 有无伴随征象, 腋窝淋巴结 X 线表现差异具有统计学意义, 与腋窝淋巴结转移具有相关性 ($P < 0.05$); logistic 回归分析显示, 肿块伴钙化 ($OR=5.271, P < 0.001$)、肿块形状不规则 ($OR=5.551, P=0.016$)、腋窝淋巴结 X 线阳性 ($OR=10.717, P < 0.001$) 是 TNBC 腋窝淋巴结转移的独立危险因素。

结论: 肿块形态不规则、肿块伴有钙化、腋窝淋巴结 X 线阳性对 TNBC 患者腋窝淋巴结转移有提示作用。

PU-1457

Giant right Breast Hamartoma with bilateral Breast Solid Papillary Carcinoma: A Rare Case Report

Ruili Mao, cheng cheng

Institute of Surgery Research, Daping Hospital, Army Medical University

Background: Breast hamartoma is a rare benign breast lesion, while solid papillary carcinoma (SPC) of the breast is an uncommon form of breast cancer. Case report: We present an extremely rare case of a 63-year-old female with a giant hamartoma in the right breast and concomitant bilateral breast solid papillary carcinoma. Mammography and Magnetic resonance imaging (MRI) revealed a giant mass in the upper outer quadrant of the right breast, as well as well-defined masses behind both nipples, along with ductal ectasia in the right breast. The patient underwent surgical resection of the three lesions, and histological examination confirmed the diagnosis of the right breast hamartoma with bilateral breast solid papillary carcinoma. Conclusion: This case represents the first reported instance of bilateral solid papillary carcinoma (SPC) in association with a concurrent breast hamartoma. The findings of this study emphasize that the presence of a breast hamartoma does not exclude the possibility of malignant lesions originating from it. It highlights the importance of thorough evaluation and consideration of malignancy in cases involving breast hamartomas.

PU-1458

乳腺转移性恶性肿瘤的 MRI 表现

赵康艳、李锋

襄阳市中心医院

【摘要】目的 探讨乳腺转移性恶性肿瘤(metastatic malignant tumor of the breast, MMTB)的 MRI 表现。方法 选取经手术病理证实的 6 例 MMTB 的 MRI 及临床资料, 回顾性分析 MMTB 的 MRI 影像特点。结果 6 例 MMTB 的 MRI 表现: 2 例表现为右乳单发转移瘤, 2 例表现为双乳多发转移瘤, 均环状强化, 边界清楚; 2 例表现为右乳广泛转移, 部分病灶相互融合, 明显片状强化, 边界不清。6 例 DWI 呈高信号, 动态增强扫描 TIC 曲线多为流出型, 少部分为平台型。结论 乳腺转移性恶性肿瘤 MRI 表现具有一定的特征, 主要有两大类: 一类表现为单发或多发转移瘤, 边界清楚, 明显环状强化; 一类表现为腺体广泛受累, 明显强化, 边界不清; DWI 均弥散受限, TIC 曲线大部分为流出型。

PU-1459

基于多参数 MRI 的全自动深度学习管道预测乳腺癌新辅助化疗病理完全缓解：一项多中心、前瞻性研究

高婧、毛宁、谢海柱
烟台毓璜顶医院

目的：开发并验证基于多参数 MRI 的全自动深度学习管道（fully automated deep learning pipeline, FADLP）在乳腺癌新辅助化疗（neoadjuvant chemotherapy, NAC）病理完全缓解（pathological complete response, pCR）预测中的价值，并进一步探讨其 pCR 预测的生物学基础。

方法：该研究共纳入全国 7 家医院共 1861 例在 NAC 前行 MRI 检查的乳腺癌患者，分为训练集、内部测试集、合并外部测试集和前瞻性测试集。FADLP 利用多参数 MRI（T2WI、DWI、CE-T1WI）进行训练，其中分割模型由 U-Net 网络和边缘感知上下文神经网络构成，利用 Dice 系数评价分割性能；pCR 预测模型是由 ResNet101、ResNeXt101 和 DenseNet121 三个网络并联组合而成，三个网络在同一数据集上单独训练，最后取三个序列在三个网络中预测得分的平均值作为 pCR 的预测概率。另外，该模型的预测表现与单一序列模型进行比较。利用 AUC、准确度、敏感度、特异度和热图评价分类模型的表现。为探究深度学习在 pCR 预测中的生物学基础，该研究对 12 名乳腺癌患者的 RNA 测序数据进行基因分析。

结果：FADLP 的 pCR 预测效能优于单一序列预测模型，在内部测试集、合并外部测试集和前瞻性测试集中的 AUC 分别为 0.868、0.891、0.986。另外，其在 HER2+和三阴性乳腺癌数据集上也取得较好的表现，AUC 分别为 0.857 和 0.850。在生物学基础探究中发现高深度学习分数与免疫反应途径的上调和微环境中抗肿瘤免疫细胞浸润的促进相关。

结论：多参数 MRI 的 FADLP 为乳腺癌患者 NAC 后 pCR 的早期预测提供一种自动、无创、可靠的工具。另外，深度学习预测 pCR 的生物学基础可能与免疫反应途径的上调和肿瘤微环境中抗肿瘤免疫细胞浸润的促进有关。

PU-1460

乳腺单纯钙化病灶 X 线检查 BI-RADS 分类的量化评分研究

黄卫保、林剑军、王映飞、苏永焕、黄华驰、莫亚宁
广西壮族自治区妇幼保健院

目的 探讨基于 X 线检查 BI-RADS 分类的量化评分方法在乳腺单纯钙化病灶良恶性风险评估中的应用价值。方法 回顾性分析 311 处乳腺单纯钙化病灶的 X 线及超声影像征象，将其 X 线征象的钙化形态、钙化分布分别作为评分指标并进行赋值，计算每处钙化的总分，并根据设定的 BI-RADS 2~5 类的各类分值界限进行最终的 BI-RADS 分类。绘制 ROC 曲线，寻找最佳诊断分值界限。结果 311 处乳腺钙化病灶中良性钙化 266 处，恶性钙化 45 处；乳腺超声恶性钙化漏诊率约 17.78%（8/45）。ROC 曲线下面积为 0.949，标准误为 0.012， $P < 0.001$ ，95%置信区间为（0.925，0.973）。以总分 2.5 分为最佳诊断临界值，其灵敏度、特异度、约登指数分别为 100%、80.45%、0.805。BI-RADS 2、3、4a、4b、4c、5 类的恶性构成比分别为 0%、21.05%、25.00%、60.71%、66.67%、75.00%。结论 基于乳腺 X 线单纯钙化 BI-RADS 分类的量化评分方法可行性大，对乳腺单纯钙化的良恶性风险评估有较高的准确度，以 BI-RADS 2 类和 4C 类符合度较高，有助于 BI-RADS 分类的推广应用。

PU-1461

乳腺 MRI 非肿块病变内微小囊肿征—影像与病理对照研究

王丽君、罗冉、管雯斌、陈艳虹、崔雪娥、尹秋凤、张玉珍、汪登斌
上海交通大学医学院附属新华医院

目的：探讨乳腺磁共振成像 (Magnetic resonance imaging, MRI) 上非肿块病变 (non-mass enhancement, NME) 内微小囊肿征的诊断价值及其病理基础。

方法：回顾性分析 2014 年 12 月至 2017 年 5 月期间我院乳腺 MRI 检查中诊断为可疑恶性的单纯 NME 病例 218 例，其中 26 例微小囊肿征阳性，即病灶内可见成簇或散在的微小囊肿。28 例中，19 例在我院经手术病理证实的病例纳入分析，测量病灶的表观扩散系数 (apparent diffusion coefficient, ADC) 及时间-信号强度曲线 (time-signal intensity curve, TIC)，分析良恶性病灶临床特征、影像特征及病理表现。

结果：乳腺 MRI 上单纯 NME 病灶中，微小囊肿征出现率为 11.9% (26/218)。19 例取得手术病理结果病例中，13 例为良性病变，6 例为恶性病变，该征象的阴性预测值为 68.4% (13/19)。当年龄阈值取 ≥ 45 岁时，年龄对于此类病变的良恶性诊断准确率为 84.2% (16/19)。乳腺 MRI 上，良性组及恶性组病灶 ADC 值平均值分别为 $1.28 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $1.26 \times 10^{-3} \text{ mm}^2/\text{s}$ ，差异无统计学意义 ($P = 0.683$)。良性组中，TIC 为上升型者 10 例 (76.9%, 10/13)，平台型或流出型 3 例 (23.1%, 3/13)，恶性组中，上升型 3 例 (50%, 3/6)，平台型 3 例 (50%, 3/6)，良恶性两组差异无统计学意义 ($P = 0.320$)。19 例中，15 例患者在我院乳腺 X 线摄影检查，结果显示，良性病变中均未见可疑微钙化，而 80% (4/5) 的恶性病变中，均可见可疑微钙化。病理镜下分析显示，良性导管扩张及囊肿见于 13 例良性病变中以及 3 例非粉刺型导管原位癌周围伴随的良性病变区域中。肿瘤性导管扩张伴出血见于 3 例粉刺型导管原位癌中。

结论 乳腺 MRI 上单纯 NME 病例中，微小囊肿征出现率为 11.9%，多见于良性病灶。患者年龄 ≥ 45 岁或乳腺 X 线摄影上可见可疑微钙化时恶性风险增加，需要进行病理活检。

PU-1462

乳腺癌新辅助化疗后放射学完全缓解与病理学完全缓解的对照研究

赵莉²、李德春¹、于海侠²、张子秋²

1. 李德春

2. 徐州市中心医院

目的 比较并分析乳腺癌患者术前新辅助化疗后 MR 图像上的完全缓解 (rCR) 与术后病理学完全缓解 (pCR) 的一致性及其差异。方法 回顾性分析我院 2021 年 1 月-2022 年 12 月行术前新辅助化疗并达到 rCR 的 56 例患者资料，分析临床表现、MR 图像及病理资料。将其中 45 例术后病理完全缓解 (pCR) 归为“pCR 组”；11 例术后病理证实有癌灶残留归为“假阴性组”。结果 两组患者在年龄、雌激素受体(ER)、孕激素受体(PR)、人表皮生长因子受体-2(Her-2) 差异没有统计学意义。新辅助化疗前 DCE-MRI 扫描中有 37 例呈肿块样强化，其中 5 例 (5/37, 13.5%) 术后病理证实有癌灶残留为假阴性；19 例呈非肿块样强化，其中 6 例 (6/19, 31.5%) 术后病理证实为假阴性，强化方式之间的差异有统计学意义 ($P < 0.05$)。新辅助化疗前乳腺 X 线图像中有 20 例存在可疑恶性钙化灶，7 例 (7/20, 35%) 术后证实为假阴性；36 例没有可疑恶性钙化灶，4 例 (4/36, 11.1%) 术后病理证实为假阴性，差异有统计学意义 ($P < 0.05$)。结论 乳腺癌新辅助化疗后 MR 图像的完全缓解并不等同于病理学完全缓解；新辅助化疗前乳腺癌非肿块样强化特征及 X 线图像上有可疑恶性钙化灶的征象是引起新辅助化疗后 rCR 与 pCR 不一致的重要因素。

PU-1463

对比增强能谱乳腺 X 线摄影的临床应用

胡从依

天津市肿瘤医院 (天津医科大学肿瘤医院)

目的: 探讨分析对比增强能谱乳腺 X 线摄影 (contrast-enhanced spectral mammography, CESM) 对 BI-RADS 4/5 乳腺病灶的诊断效能, 以减少不必要的活检。

方法: 回顾性收集 2023 年 1 月—2023 年 8 月 乳腺患者 45 例, 共 47 个 BI-RADS 4/5 病灶。所有纳入患者均为女性, 年龄 28~71 岁, 平均年龄 (51.7±8.6) 岁。在常规影像学检查(乳房 X 线摄影、数字乳腺断层合成摄影技术和乳腺超声)中发现 BIRADS 4/5 病灶后, 进一步进行对比增强能谱乳腺 X 线摄影。采用美国 GE 公司的 Senographe 全数字化乳腺机, 对比剂采用碘佛醇注射液 (每 100 mL 含碘 32 mg), 剂量为 1.5 mL/kg, 流率为 2.8~3.0 mL/s, 经高压注射器注入上臂静脉, 注射完成约 2 min 后进行摄影检查。按常规乳腺摄影时的压迫方法, 进行头尾位和内外斜位摄影, 5 min 内完成左右双侧共 4 次图像的采集工作, 必要时可加摄辅助位, 每个摄影体位可获得低能图及减影图 2 张图像。对所有病灶进行组织病理学相关性分析。图像由两名接受过乳腺成像 BI-RADS 分类培训的放射诊断医生独立评估。对 CESM、BI-RADS 评分和每个病灶的组织病理学进行分析, 并使用卡方/fisher 精确检验进行统计学意义检验。

结果: 本研究纳入了 45 例患者的 47 个病灶, 均为女性, 平均年龄。在 CESM 上, 9 个(20.8%)病灶未显示强化, 被归类为 BI-RADS 4A, 病理证实是良性。其余 38 个增强病灶中, 恶性 31 个 (81.6%), 良性 7 个 (18.4%) ($p < 0.05$)。CESM 检测到 3 个在常规影像学检查中未被发现的病灶, 病理证实为恶性。

结论: CESM 可有效评估 BIRADS 4/5 病灶, 减少不必要的活检, CESM 还提高了潜在恶性病灶的检出率, 为治疗策略提供更多的信息。

PU-1464

基于乳腺 MRI 影像学特征预测乳腺癌的分子分型

周丽丽、杨琪

吉林大学第一医院

目的: 通过分析乳腺癌的乳腺增强 MRI 的图像特征, 研究其预测乳腺癌分子分型的潜在可能。

材料和方法: 收集我院 2016-2022 年手术病理证实为乳腺癌的女性患者 305 例, 所有患者术前均行乳腺磁共振动态增强检查和弥散加权成像, 且病理及免疫组化指标数据齐全。患者患侧乳腺无除乳腺癌外其他疾病。

结果: 经统计, 305 例乳腺癌患者中, Luminal A 型 56 例(18.4%), Luminal B 型 124 例(40.7%), 三阴性 74 例(24.3%), HER-2 过表达型 51 例(16.7%)。在 MRI 形态特征上, 三阴性乳腺癌以环形强化为主, 多呈卵圆形; Luminal A 型、Luminal B 型则较多见不均匀强化, 不规则形、HER-2 过表达型多表现为不均匀强化、卵圆形; 乳腺癌肿块形态及内部强化特征在不同分子亚型间差异有统计学意义($P < 0.05$); MRI 血流动力学方面, 三阴性乳腺癌的早期强化程度表现为“快速”的比例高于其他亚型, 乳腺癌四种分子亚型的延迟期 TIC 曲线以 II 型、III 型为主, 其中以 II 型较多见, 乳腺癌不同分子亚型的早期强化程度、延迟期 TIC 曲线类型无统计学差异($P > 0.05$)。

结论: 乳腺癌 MRI 成像的部分特征在不同分子分型间存在差异, 对于预测乳腺癌分子分型有一定的预测作用。

PU-1465

幼年型纤维腺瘤影像学诊断及鉴别

张玉珍、李芳珍、崔雪娥、王丽君、罗冉、汪登斌
上海交通大学医学院附属新华医院

目的 提高对幼年型乳腺巨大纤维腺瘤 (FA) 超声、平扫 CT 及动态增强磁共振 (MRI) 诊断的认识。**材料与方法** 回顾性分析 8 例经手术病理证实的幼年型 FA 患者的临床资料及影像表现。结果 8 例幼年型 FA 均为青少年女性, 年龄 11-15 岁, 平均 12.88 ± 1.13 岁。7 例单发, 1 例为双乳多发。共 10 个病灶, 位于左乳 2 个, 右乳 8 个。肿块生长迅速, 瘤体较大, 大小约 $4 \times 2.5 \text{cm} - 11.1 \times 9.6 \text{cm}$ 之间。临床表现为患侧乳房于 2-8 个月内明显增大, 乳房内扪及圆形、类圆形巨大肿块, 质硬, 活动度差。乳腺超声检查示病变乳房内巨大边界清楚的分叶状肿块, 回声不均, CDFI 内见血流信号, 平均阻力指数 (RI) 0.6。超声 BI-RADS 分类 3-4A 类。术前胸部平扫 CT 时可见病变乳腺内密度均匀肿块, 平均 CT 值 31HU, 与正常乳腺腺体分界不清。乳腺动态 MRI 特点: (1) 单侧发病患者双侧乳腺明显不对称, 病灶体积较大, 几乎占据整个乳腺, 腺体组织受压变菲薄, 边界较清; (2) 增强后病灶强化明显, 8 例病灶内部出现低信号分隔; (3) 7 例病灶时间-信号强度曲线 (TIC) 呈 I 型, 2 例病灶 TIC 呈 II 型, 1 例 TIC 呈 III 型, 均不伴有腋窝淋巴结增大; (4) DWI 图像上测得 ADC 值介于 $1.38 - 1.62 \text{ mm}^2/\text{s}$ 之间, 平均值为 $1.5 \pm 0.15 \text{ mm}^2/\text{s}$ 。乳腺 MRI 结果 BI-RADS 分类均为 3 类。手术病理结果镜下显示纤维上皮性肿瘤, 导管上皮增生明显, 间质细胞丰富, 符合幼年型 FA。结论幼年型 FA 临床表现和影像表现有其特殊性, MRI 对病灶的显示明显优于乳腺 X 线、超声和 CT 等影像学检查方法。影像诊断应密切结合临床资料。本病需与致密型乳腺、青春期乳腺肥大及乳腺叶状肿瘤相鉴别, 仔细观察病变的形态及影像特点, 特别是单侧乳房发病的少女, 应不难鉴别。

PU-1466

数字乳腺断层摄影辐射剂量与乳腺压迫厚度及密度相关性研究

柳杰
天津市肿瘤医院 (天津医科大学肿瘤医院)

目的: 数字乳腺断层摄影 (digital breast tomosynthesis, DBT) 技术是一种通过乳腺 X 线平板探测器而发展出来的新型技术手段。DBT 成像是一种通过快速采集一系列不同角度低剂量的乳腺曝光图像, 并将其重建为三维多层面乳腺影像的高级成像技术。它可以帮助医生更精确地检测和诊断乳腺疾病, 同时减少患者暴露在辐射下的时间和剂量。同时, DBT 成像还可以提升诊断准确性和检出率, 为患者提供更准确、可靠的诊断结果。本研究旨在探讨数字乳腺断层摄影平均腺体剂量 (average gland dose, AGD) 与乳腺压迫厚度、密度之间的关系, 加深对数字乳腺断层摄影辐射剂量变化规律的认知, 有助于更好地评估患者的辐射风险并优化成像参数, 从而最大限度地保障患者安全。**方法:** 回顾性分析 440 位同时接受全视野数字化乳腺摄影 (full-field digital mammography, FFDM) 和 DBT 双乳检查的患者资料。记录双侧乳腺摄影在 CC 和 MLO 体位的管电压 (kV)、管电流量 (mAs)、压迫厚度、压力、平均腺体剂量、乳腺腺体分型。用方差分析来比较不同采集组合方式的 AGD, 用 t 检验来进行相同腺体类型的组间配对比较。用 Pearson 线性相关分析 AGD 和压迫厚度之间的关系。**结果:** 不同乳腺密度分型患者之间的 AGD 值不存在显著性差异 ($p > 0.05$, $r = 4$); 不同乳腺压迫厚度组的患者在乳腺辐射剂量之间存在显著性差异 ($P < 0.05$, $r = 5$)。结论: 压迫厚度对 AGD 的影响远远高于乳腺密度, 在乳腺密度不变的条件下减小乳腺压迫厚度对降低 AGD 有积极作用。这说明在乳腺密度固定的情况下调整压迫厚度可能是改变 AGD 的有效途径。

1 例 3D 打印个性化组织补偿膜在乳腺癌放疗中的应用

范芳炜、何思慧、彭晶
湖南医药学院

目的 在乳腺癌放疗中，由于剂量建成效应的影响，靶区剂量因皮肤厚度不足而达不到需放射剂量，故需要组织补偿膜提高照射剂量，传统组织补偿膜存在以下缺点：①厚度均匀②形状固定；导致一下问题①靶区照射剂量不均匀②危及其他组织器官。故本篇个例报告将 3D 打印个性化组织补偿膜应用于乳腺癌放疗中，为 3D 打印组织补偿膜在临床中的广泛应用提供参考。方法 一、设计 3D 打印个性化组织补偿膜：①采集 1 例乳腺癌根治术患者的 CT 数据（患者年龄 45 岁，女，右乳房行乳腺癌根治术，无硅胶过敏等且符合其他纳入标准），②将患者 CT 数据导入 Mimics21.0 建模软件重建出患者皮肤②在 Mimics21.0 中根据放疗计划设计贴合患者皮肤且厚度个性化的组织补偿膜③在 Mimics21.0 进行布尔操作：利用实心长方体减去设计好的个性化组织补偿膜得到个性化组织补偿物翻模、并设计翻模顶和翻模底及注料管。二、制作 3D 打印个性化组织补偿膜：①将个性化组织补偿膜的翻模导入 3D 打印机打印出实物②将硅胶注入注料管待其冷却成型得到硅胶材质的个性化组织补偿膜。三、进行放疗计划：①在此 3D 打印个性化组织补偿膜辅助下进行放疗计划，靶区照射剂量为 DT46~66Gy，采用 TPS 设计 IMRT 计划。三、收集数据：收集 PTV 剂量学参数，计算均匀性指数（HI）、适形度指数（CI），评估该 3D 打印组织补偿膜的剂量参数指标。结果 HI 为 0.10，CI 为 0.84，HI 指数接近于 0，CI 指数接近于 1。（HI 的值越接近 1，表示剂量分布越均匀；反之越不均匀；CI 的值越接近 0，表示剂量分布越均匀；反之越不均匀）结论 通过查阅文献比较传统组织补偿膜，3D 打印个性化组织补偿膜可以有效减小剂量建成效应的影响，提高靶区照射剂量，保护危机器官，靶区照射剂量和均匀性上相较于传统组织补偿膜有明显优势，再进行进一步的临床实验和严格的对照实验后，可以发现其更大的临床应用价值。

Comparative analysis of the diagnostic efficiency of FFDM and DBT for breast masses

Kaiyin Liang, Wen Zhou
Peking University Shenzhen Hospital

Purpose

To compare and analyze the diagnostic value of Full-Field Digital Mammography (FFDM) and Digital Breast Tomosynthesis (DBT) for breast masses.

Method

Retrospective analysis was performed on 160 patients with breast lesions who underwent both FFDM and DBT examination in Peking University Shenzhen Hospital from January 1, 2021 to December 31, 2021. Two radiologists with 2 and 4 years of mammographic diagnosis experience analyzed the images of FFDM and DBT combined with FFDM independently. They recorded the classification of breast, number of lesions, benign or malignant of lesions. The sensitivity, specificity and accuracy of FFDM, DBT combined with FFDM were compared with the pathological findings as the gold standard.

Results

The Kappa coefficient between two radiologists performed diagnosis by FFDM was 0.561, $P=0.042<0.05$. When comes to DBT combined with FFDM, the Kappa coefficient between them reached 0.931, $P=0.313>0.05$.

The sensitivities of FFDM and DBT combined with FFDM for the detection of breast lesions were 84.7% and 92.7%.

The specificities were 15.8% and 55.3%, and the accuracies were 69.7% and 84.6%, respectively.

There is no significant difference between FFDM and DBT combined with FFDM ($P=0.052>0.05$).

In dense breast, the accuracy of diagnosing breast tumors with DBT combined with FFDM is higher, there is a significant difference between them ($P=0.02<0.05$).

Conclusion

There was a statistically significant difference between the two radiologists performing diagnosis by FFDM, and the observation of lesions was different. When comes to DBT combined with FFDM, there was high consistency in their diagnostic results, and no statistical difference between them.

The sensitivity, specificity and accuracy of DBT combined with FFDM was significantly higher than FFDM. The accuracy of diagnosing tumors by DBT combined with FFDM is higher at different breast densities.

In conclusion, DBT combined with FFDM diagnosis improves the accuracy of breast masses diagnosis compared to FFDM alone.

PU-1469

妊娠相关乳腺癌的影像学表现

程美英、赵鑫、张小安、陆林、杨喆璇
郑州大学第三附属医院

摘要：目的：探讨妊娠相关乳腺癌的钼靶、磁共振及超声的影像学表现，以提高妊娠相关乳腺癌的影像诊断水平。方法：收集郑州大学第三附属医院 2017 年 6 月至 2019 年 3 月诊治的病理证实的妊娠相关乳腺癌病例 11 例，分析期乳腺钼靶、磁共振及超声表现。结果：乳腺 X 线表现：11 例 PABC 患者均为单侧病变，右侧 5 例，左侧 6 例，仅表现为不规则高密度肿块 5 例；3 例仅表现为钙化，其中 1 例线样分布细小多形性钙化，1 例段样（树杈样）分布细小多形性钙化，1 例区域分布细小多形及细线样钙化；另外 3 例表现为不规则高密度肿块伴可疑钙化；其中 5 例伴有同侧腋下淋巴结肿大，其中 1 例误诊为乳腺炎，分 4A 类；MRI 表现：因 PABC 特殊性，本组病例仅 2 例行 MRI 检查，其中 1 例表现为左乳肿块，呈长 T1 长 T2 信号影，边界不清，增强呈明显不均匀强化，DWI 呈高信号，ADC 值 $(0.995\pm0.097)\times10^{-3}\text{mm}^2/\text{s}$ ，时间-信号曲线呈流出型，可见左腋下淋巴结肿大；另一例表现为左乳外上象限肿块，长 T1 混杂长 T2 信号影，边界不清，增强呈明显不均匀强化，DWI 呈不均匀高信号，ADC 值 $(0.851\pm0.159)\times10^{-3}\text{mm}^2/\text{s}$ ；超声表现：11 例均表现为边界不清、形态不规则肿块影，10 例为低回声，一例为囊实性回声；2 例见点状高回声，1 例见典型“蟹足征”。CDFI：9 例可及血流信号；其中 2 例误诊为乳腺炎，分 4A 类。结论：MRI 对 PABC 具有一定的诊断价值，尤其对于哺乳期患者，其 MRI 表现具有相对特征性，影像科医师需认识该病的影像表现，对于妊娠、哺乳期合并的乳房肿块应意识到 PABC 的可能性，提高早期诊断率，协助临床制定合理治疗方案，提高患者生存率。

PU-1470

弥散加权成像在乳腺肿瘤鉴别中的应用价值

方进智

深圳市龙华区人民医院

目的: 探讨表观扩散系数(ADC)在乳腺肿瘤鉴别中的应用价值。方法: 回顾性分析经手术病理证实乳腺叶状瘤、纤维腺瘤及乳腺癌患者的病历资料, 其中叶状瘤 17 例[感兴趣区(ROI), $n = 171$], 纤维腺瘤 74 例 (ROI, $n = 94$)及 57 例乳腺癌(ROI, $n = 104$)。结果: 乳腺叶状瘤、纤维腺瘤及乳腺癌患者的 ADCmean、ADCmax、ADCmin 值差异有统计学意义。鉴别叶状瘤和纤维腺瘤的 adc 平均值为 $1.435 \times 10^{-3} \text{ mm}^2/\text{s}$, 鉴别叶状瘤和乳腺癌的 adc 平均值为 $1.100 \times 10^{-3} \text{ mm}^2/\text{s}$, 鉴别乳腺癌和纤维腺瘤的 adc 平均值为 $0.925 \times 10^{-3} \text{ mm}^2/\text{s}$ 。良性、交界性、恶性乳腺肿瘤的 ADCmean、ADCmax、ADCmin 值差异均有统计学意义。鉴别良性叶状瘤与交界性叶状瘤的 adc 平均值为 $1.215 \times 10^{-3} \text{ mm}^2/\text{s}$, 交界性叶状瘤与恶性叶状瘤的 adc 平均值为 $1.665 \times 10^{-3} \text{ mm}^2/\text{s}$ 。结论: 扩散加权成像(DWI)能提供定量信息, 有助于乳腺肿瘤的鉴别。

PU-1471

数字乳腺 X 线摄影(DM)与数字乳腺断层摄影(DBT)对致密型乳腺病变的诊断价值比较

白亚妮

空军军医大学西京医院

目的: 比较数字乳腺 X 线摄影(DM)与数字乳腺断层摄影(DBT)对致密型乳腺病变的诊断价值。方法: 回顾性收集我院 2022 年 1 月至 2023 年 5 月收治的致密型乳腺患者的临床资料。数字乳腺 X 线摄影(DM)设备采用吉特公司的 GIOTTO 乳腺机, 数字乳腺断层摄影(DBT), 设备采用西门子公司的 MAMMOMAT Inspiration 乳腺机, 全部病例均经活检或手术证实, 均具有完整临床病理资料, 共计 200 例患者入组本研究, 包括 286 个病灶, 其中良性病灶 160 个, 恶性病灶 126 个。所有影像资料包括双侧乳腺头尾位及内外侧斜位图像, 分别由两名高年资医生在诊断工作站上分别观察及评价 DM 和 DBT 图像, 并记录病灶检出情况、病灶影像学特征及 BI-RADS 分类结果。比较两者对病变的诊断准确率。结果: DBT 对致密型乳腺内病灶的敏感性为 63.3% [95% CI, 36.59% 至 81.73%], 特异性为 72.63% [95% CI, 58.26%]到 85.65%, 均高于 DM ($P < 0.05$); 结论: 数字乳腺断层摄影(DBT)对致密型乳腺内病灶的诊断准确性、特异性优于数字乳腺 X 线摄影(DM)。

Thyroid Tissue in the Breast

Defang Ding, weiwu Yao

Tongren Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai

A 54-year-old woman presented to the outpatient clinic with a history of progressive enlargement of a left breast mass which was initially discovered 6 months earlier. She reported no nipple discharge or painful swelling. Her medical history was notable for left thyroid adenoma which was treated with trans-areola endoscopic thyroidectomy 15 months ago. Computed tomography of the thorax revealed a mass shaped like a string of beads in the upper inner quadrant of the left breast (Panel A). The patient then received lumpectomy and histopathological examination revealed it was thyroid tissue (Panel B), which was supported by positive thyroglobulin (Panel C) and thyroid

transcription factor-1 (Panel D) staining. Ectopic thyroid tissue in the breast has not been reported yet and in this case was considered to be related to her previous endoscopic surgery. The patient was discharged one day after surgery and a repeated computed tomography performed 6 months later revealed no recurrence.

PU-1473

BI-RADS 分级和乳腺增生与全数字化乳腺摄影辐射剂量的相关性

张德川、梅秀婷

重庆市中医院

目的：乳腺癌已成为中国女性发病率首位的恶性肿瘤，使用全数字乳腺 X 线摄影早期筛查可有效降低乳腺癌的病死率。在数字乳腺摄影中，常用入射体表剂量（entrance surface dose, ESD）和平均腺体剂量（average gland dose, AGD）评估辐射剂量。本研究主要探讨 BI-RADS 分级和乳腺增生与辐射剂量的相关性。

方法：回顾性收集本院 2022 年 5 月至 2022 年 10 月接受全数字化乳腺 X 射线检查的女性受检者资料 254 例，按照年龄分为，<30 岁组、30~39 岁组、40~49 岁组、50~59 岁组、60~69 岁组、>70 岁组。摄影采用美国 GE 公司 Senographe DS 全数字化乳腺 X 线摄影机。检查前充分与患者沟通检查过程中的注意事项，获得患者最大程度的配合。检查时要求受检者完全暴露上半身，去除体表金属饰品或其他任何在照射野内的异物。参照乳腺诊断学评级标准设计受检者体位，对双乳进行双侧摄影，先摄 CC 位，再摄 MLO 位，压迫适当后采用自动摄影控制中的 Dose(剂量优先)/CNT（对比度优先）/STD（标准）模式或 Manual（手动）进行曝光，获取层次丰富、密度对比度良好且一致的图像。采用 SPSS 25.0 软件。符合正态分布的计量资料采用 $\bar{x} \pm s$ 表示；不符合正态分布的计量资料采用 M（Q1, Q3）表示。计数资料以例（%）表示。分别采用 Spearman 及 Kendall's tau-b 相关分析 AGD 和 ESD 与各分类变量之间的相关性。P<0.05 为差异有统计学意义。

结果：受检者不同年龄组间的辐射剂量 AGD 和 ESD 均有统计学差异（ $p<0.001$ ）；<30 岁年龄组的 ESD 均值最高，50~59 岁年龄组的 AGD 均值最高；BI-RADS 分级与辐射剂量 AGD 和 ESE 相关性无统计学意义（ $P>0.05$ ），增生与辐射剂量 AGD 和 ESE 有弱相关性（ $P<0.05$ ）。

结论：受检者年龄差异会影响 AGD 和 ESD，BI-RADS 分级不会影响 AGD 和 ESD，但乳腺增生会影响 AGD 和 ESD，因此，操作者应对年龄组别和乳腺增生的受检者更多给予辐射剂量关注。

PU-1474

磁共振 T1Mapping 序列在乳腺癌诊断的初步应用

戴丽娟、王琦、许茜、李阳

河北医科大学第四医院

目的 对乳腺癌患者采用磁共振平扫 T1 Mapping 序列扫描，探讨 T1 Mapping 值与诊断乳腺癌各项参数的相关性。资料与方法 对 72 例乳腺肿物患者行常规乳腺平扫及动态增强磁共振检查，并于增强前加扫 T1 Mapping。在 T1 Mapping 序列相关研究中，排除 8 例不符合要求患者，最终分别纳入 64 例。分别测量患者肿瘤及对侧正常乳腺腺体组织的大小、ADC 值、Ktrans、Kep、Ve 及 T1 Mapping 值。分析两组 ADC 值、T1 值、Ktrans、Kep、Ve 值在各组间的差异，计算约登指数，获得鉴别诊断的最佳阈值。并分析乳腺癌组的 T1Mapping 值、Ktrans、Kep、Ve 值与肿瘤大小、ADC 值、Ki-67 表达水平之间的相关性。结果 乳腺癌 Ktrans、Kep、T1Mapping 值水平均

显著高于正常腺体组织 ($P<0.05$), 而 Ve 水平显著低于正常组 ($P<0.05$), 差异均具有统计学意义。 K_{trans} 、 K_{ep} 、 $T1Mapping$ 值诊断病灶的最佳界值为 0.2240、0.4150、1816.55。乳腺癌 $T1Mapping$ 与年龄、ADC 值、HER2+、KI-67 呈现弱正相关, 与 ER、PR 呈现弱负相关性, 均无统计学意义 (P 均 >0.05)。结论 乳腺癌平扫 $T1Mapping$ 可以为乳腺癌的诊断提供参考价值。乳腺癌与正常腺体组的 K_{trans} 、 K_{ep} 、 $T1Mapping$ 值水平均显著高于正常组织, 而 Ve 水平较低。

PU-1475

多参数磁共振定量分析乳腺癌瘤周脂肪

韩婷婷

中国医科大学附属盛京医院

目的: 探究乳腺多参数 MR 中乳腺癌患者瘤周脂肪的不同定量分析指标诊断效能。

方法: 本院乳腺癌患者 59 例, 基线前采用 3.0T MR (Ingenia, Philips Healthcare, Netherlands) 机器进行扫描, 采用 7 孔道乳腺线圈, 俯卧位, 将双侧乳腺垂直于乳腺线圈内。于动态增强序列前, 采用 mDixon Quant 序列反应甘油三酯含量。采用 DWI 序列反应乳腺病变及瘤周脂肪表观弥散系数。增强扫描以 0.1mmol/kg 体重、4~5 ml/s 流速静脉团状注射对比剂 Gd-DTPA, 动态增强扫描共 8 期, 每期 60s。图像分析采用 Intelligence Space Portal V7.0 工作站 (Philips Healthcare, Netherlands)。在工作站上拆解 DWI、ADC 图像, 将 ADC 图像以新序列形式传到工作站, 在动态增强第二期 (即肿瘤对比腺体显示最清楚的期相) 为定位, 采用 overlay 技术, 分别以增强第二期图像为本底, 叠加 ADC 图、mDixon Quant 序列图, 融合图像调整颜色及对比度, 在融合图像上, 采用半自动法绘制感兴趣区域 (ROI), 共选择瘤体本身 1 个, 瘤周脂肪 1 个, 正常侧腺体 1 个, 瘤侧正常脂肪 1 个, 正常侧脂肪 1 个, 共 5 或 6 个感兴趣区。肿瘤本身感兴趣区视肿瘤大小而定, 一般 1cm-5cm 不等, 在工作站自动勾画的基础上, 调整阈值, 使感兴趣区尽量覆盖住肿瘤。而其他感兴趣区, 因与周围组织缺乏对比, 大小可由调整阈值控制, 其他感兴趣区的大小均控制在 1.0 ± 0.1 cm。记录患者感兴趣区大小、增强信号、FF、 $T2^*$ 值、ADC。记录患者病理结果及浸润性级别。记录患者年龄、身高、体重等临床资料。采用 Wilcoxon 秩和检验分析各组患者 FF 值、ADC 值、 $T2^*$ 值的相关性。

结果: 乳腺癌患者瘤周脂肪 PDFF 较对侧乳腺脂肪显著减低、ADC 较对侧乳腺脂肪显著增高 ($P<0.05$)。高低级别组浸润性的瘤周脂肪的 ADC 及 PDFF 均有显著性差异 ($P<0.05$)。

初步结论: 通过多参数磁共振定量分析瘤周脂肪 FF 值、ADC 值具有较高的准确性和敏感性, 可提高乳腺癌诊断准确率。

PU-1476

乳腺断层融合摄影技术在三维立体导丝定位活检中的应用

谢永玲、陈洋

海南省人民医院

[摘要] 目的: 如何结合乳腺断层摄影技术, 使乳腺病变在三维立体导丝定位活检术中定位更精准, 更方便快捷, 解决临床上对隐匿性病变及临床触诊阴性的病变, 通过导丝引导进行精准切除活检及病理学检查, 可提高乳腺癌, 特别是早期乳腺癌的检出率, 及临床保乳手术的美观性。方法: 我院采用的是 FUJIFILM 星奕系列 3500 微剂量多功能数字乳腺摄影系统及其配套的断层融合三维立体定位系统进行钩丝定位。①高分辨模式: 唯一支持 50 μ m 高精度穿刺活检的设备, 保证穿刺的精确性。②快速流程模式: 减少活检工作时间, 用户可根据自己的需求切换模式。③隔室遥控拍摄: 可快速完成正负角度两次曝光。④智能安全警示: 仪器设定有安全界限, 保证操作的安全性。⑤智能

穿刺提示:只需在某一层次病灶最清晰的断层图像上选择 1 个目标点即可自动计算三维坐标并锁定目标,实现穿刺针的一键到位。⑥更多的可选靶点,有利于检查的全面性和操作的便捷性。⑦穿刺过程中图像可以跟原始图像随时对比,确定穿刺目标的准确性。⑧一键复位:穿刺后只要一键持针器可恢复至原来的位置。结果:断层融合三维立体定位系统引导下的勾丝定位活检术解决了外科医师对隐匿性病变、尤其是触诊不明显的钙化性病变的定位困难,使乳腺组织内可疑病变进行精准定位、术中可进行精准切检一步到位。可对乳腺微小病变,特别是当病灶尚不能被临床查体触及时,能够尽早发现并予以积极治疗可带来更好的预后。结论:只要影像技术上做到术前精准定位,就能为临床提供精准影像信息,精确指导临床在术中准确切除病灶及病理诊断,为患者最大限度地保留健康腺体组织,尤其是对于需行保乳术的患者,减小不必要的损伤,最大限度地保留乳腺临近正常腺体组织,最大限度地增加了保乳手术的术后美观性,满足乳腺癌患者对美的需求及面对生活的信心,提高患者的生活质量及幸福感。

PU-1477

对比增强乳腺 X 线摄影技术在乳腺肿块疾病中的应用

谢永玲、陈洋
海南省人民医院

[摘要] 目的:在绝大多数乳腺疾病中,乳腺肿块常常是主要的甚至是唯一的临床表现,其余的临床表现往往不典型,对于表现为局部结构增粗、扭曲,似有团片状纠集等因乳房内区域性腺体实质失去正常排列方式的结构紊乱的肿块类疾病,通过对比增强乳腺 X 线摄影这种简便可行的补充检查手段,更好地了解其血供情况并凸显其病灶形态,以提高乳腺癌检出的敏感性和诊断的准确性。方法:我院采用的是 FUJIFILM 星奕系列 3500 微剂量多功能数字乳腺摄影系统,其首创的 HCP 蜂窝状平板探测器,承袭了富士一贯追求的 50 μ m2800 万像素的高精度画质和高锐利度的优点,大大提高了对乳腺早期微小病变的显示能力。1 检查前的准备:1.1 患者准备:①向患者解释操作步骤并确保其没有碘对比剂过敏史,并告知碘对比剂的过敏反应,凡需增强检查的患者均需签署“知情同意书”;1.2 科室准备:①需要自动造影剂注射器②需要急救设施和推车;③护士必须参与检查。2 造影剂的注射 ①患者以坐姿注射造影剂;②注射速度:3mL/sec;③常规使用造影剂 300/350/370mg 碘/mL 均可检查。④注射常规控制 50S 内完成。3 注射造影剂后拍摄:①拍摄摆位时机:2 分钟的高峰期是最好的时机,并在 7 分钟内完成检查。②拍摄体位:摆位优先患侧。拍摄体位均为标准头尾位(CC)及内外斜位(MLO);③拍摄模式:选择自动曝光控制模式,保证曝光剂量一致进行曝光。结果:通过低能图和减影图的图像间接观察肿块及其血供情况,显示肿瘤组织内异常血管增生及代谢情况。对于表现为局部结构增粗、扭曲,似有团片状纠集等因乳房内区域性腺体实质失去正常排列方式的结构紊乱的肿块类疾病或浸润性癌在 CESM 上均有不同程度的强化。结论:对于可疑病变,结合 CESM 可以提高乳腺癌检出的敏感性和诊断的准确性,是一种安全、可靠且操作方法简单易行的检查技术,有望在临床上作为可疑乳腺癌的常规检查手段之一展开应用。

PU-1478

Comparison of ZOOMit DWI and Conventional DWI with the same geometric parameters at 3T in Breast Diseases

Kaiguo Zhu, Pingping Wang, Yanli Dang, Lifang Wang, Rumei Liu
Xi'an International Medical Central Hospital

Objective This study aims to evaluate the diagnostic performance of Z-DWI versus C-DWI with identical geometric parameters on breast MRI.

Materials & Methods In this retrospectively study, both Z-DWI and C-DWI were performed on a 3T MR scanner with the same geometric parameters. Two senior doctors assessed the image quality using a 5-point Likert scale. SNR, CNR and ADC values of the lesions were measured by two radiologists for comparison. For ADC diagnostic assessment, 81 patients were divided into group A (60 patients) and group B (21 patients). ROC curve analysis was used to determine the ADC cutoff values of group A's benign and malignant lesions. A junior doctor assessed group B's benign or malignant lesions using the cutoff values of ADC counted from group A.

Results 81 patients (mean age, 48.0 ± 10.1 years) were enrolled in this study. Z-DWI image scores were considerably higher than C-DWI image. The SNR and CNR in Z-DWI were both significantly higher than in C-DWI (77.72 ± 31.42 vs. 8.59 ± 3.16 , $P < 0.01$) and (50.75 ± 26.43 vs. 5.21 ± 3.04 , $P < 0.01$). The mean ADC values of benign and malignant lesions in Z-DWI were higher than those in C-DWI ($1.46 \times 10^{-3} \text{ mm}^2/\text{s}$ vs $1.37 \times 10^{-3} \text{ mm}^2/\text{s}$, $p < 0.01$) and ($0.87 \times 10^{-3} \text{ mm}^2/\text{s}$ vs. $0.83 \times 10^{-3} \text{ mm}^2/\text{s}$, $p < 0.01$). The AUC was 0.92 in both Z-DWI and C-DWI when using the cutoff values of ADC counted from group A.

Conclusion Z-DWI provides significantly higher image quality and lesion conspicuity than C-DWI, with the same geometric parameters.

Clinical relevance statement Z-DWI, improved the diagnostic efficiency of breast diseases, is a good substitution for C-DWI in Breast diagnosis with nearly the same acquisition time.

PU-1479

The role of diffusion kurtosis MR imaging in the evaluation of invasive breast cancer classification and its correlation with prognostic factors

Mo Zhu
the first affiliated hospital of Soochow University

The present exploration is aimed to determine whether diffusion kurtosis imaging (DKI)-derived mean diffusivity (MD) and mean kurtosis (MK) are possible parameters for the invasive breast cancer grading and whether MD/MK is related to breast cancer clinical-pathologic factors including estrogen receptor (ER), progesterone receptor (PR), human epidermal growth factor receptor 2 (HER-2) and Ki-67. Tumors from 108 invasive breast carcinoma patients (45.6 ± 11.2 years old; range, 20-84 years), diagnosed by pathological examination between January 2016 and August 2017, were included. DKI data (with b values of 0, 1000, 2000 sec/mm^2) were acquired and MD/MK were measured. The expression of ER, PR, HER-2, and Ki-67 was evaluated by immunohistochemistry. It was found that MD were significantly lower in grade III breast cancer than in grade II breast cancer ($P < 0.01$), while MK were significantly higher in grade III breast cancer than that in grade II breast cancer ($P < 0.05$). In addition, MD was negatively associated with Ki-67 level ($r = -0.39$, $P < 0.05$), while MK was positively associated with Ki-67 level ($r = 0.56$, $P < 0.05$). Furthermore, MD was positively associated with the level of ER and PR, but not HER-2. These results demonstrate that DKI has value in the evaluation on the classification of invasive breast carcinoma. MD values were associated with breast cancer

clinical-pathologic factors. DKI can provide useful information in the assessment of tumor proliferation activity.

PU-1480

IVIM 参数与乳腺癌免疫因子 ER、PR、HER-2、Ki-67 的相关性研究

朱默、胡春洪
苏州大学附属第一医院

目的：探讨体素内不相关运动 (IVIM) 模型参数与乳腺癌雌激素受体 (EER)、孕激素受体 (PR)、人表皮生长因子受体-2 (HER-2) 和增殖标志物 Ki-67 表达相关性。

方法：选取 2015 年 8 月到 2018 年 8 月期间在我院接受治疗的乳腺癌患者 90 例，均进行常规 T2WI 脂肪抑制序列、T1WI、弥散加权成像 (DWI)、动态对比增强磁共振成像 (DCE-MRI) 扫描和 IVIM 科研序列的扫描，采用相关软件计算表观扩散系数 (ADC)、单纯扩散系数 (D)、假性扩散系数 (D*)、灌注分数 (f) 等参数，检测所有患者肿瘤组织中的 ER、PR、HER-2、Ki-67 表达情况。

结果：90 例患者中，ER 患者阳性 73 例，占 81.92%，阴性 17 例，占 18.08%；PR 患者阳性 70 例，占 77.78%，阴性 20 例，占 22.22%；HER-2 阳性 33 例，占 36.67%，阴性 57 例，占 63.33%；Ki-67 阳性 59 例，占 65.56%，阴性 31 例，占 34.44%。ER、PR 阳性表达与阴性表达之间的 ADC 值、D 值、D*值、f 值比较无统计学差异 ($P>0.05$)，HER-2 阳性表达与阴性表达之间的 ADC 值、f 值比较无统计学差异 ($P>0.05$)，HER-2 阳性表达的 D 值、D*值高于 HER-2 阴性表达的 D 值、D*值 ($P<0.05$)；Ki-67 阳性表达与阴性表达之间的 D*值和 f 值比较无统计学差异 ($P>0.05$)，Ki-67 阳性表达的 ADC 值、D 值低于 Ki-67 阴性表达的 ADC 值、D 值 ($P<0.05$)。Spearman 相关分析结果：ADC 与 ER 因子表达情况呈负相关，D 值与 HER-2 因子呈正相关，D 值与 Ki-67 呈负相关；D*值与 HER-2 因子呈正相关 (均为 $P<0.05$)。

结论：根据 ADC 值、D 值、D*值在乳腺癌免疫因子 ER、HER-2 及 Ki-67 阴阳表达情况的组间差异，以及 ADC 值与 ER、D 值与 HER-2 和 Ki-67、D*值与 HER-2 表达情况的相关关系，提示 IVIM 参数可以有助于分析乳腺癌部分免疫因子的表达情况，进而分析患者的预后。

PU-1481

DKI 参数在乳腺癌病理分级及与免疫因子的相关性研究

朱默、胡春洪
苏州大学附属第一医院

目的：评价 MR 扩散峰度成像 (DKI) 在乳腺癌病理分级中的应用及 DKI 参数与乳腺癌雌激素受体 (ER)、孕激素受体 (PR)、人表皮生长因子受体-2 (HER-2) 和增殖标志物 Ki-67 表达相关性。

方法：选取 2015 年 8 月到 2018 年 8 月期间在我院接受治疗的乳腺癌患者 108 例。所有患者术前行乳腺磁共振常规 T2WI 脂肪抑制序列、T1WI、弥散加权成像 (DWI)、动态对比增强磁共振成像 (DCE-MRI) 扫描以及基于 b 值为 0, 1000, 2000 sec/mm² 的 DKI 模型计算平均扩散率 (mean diffusivity, MD) 和扩散峰度平均值 (mean kurtosis, MK) 值。通过 SPSS 软件，应用 Spearman 分析上述参数值与乳腺癌病理分级及与 ER、PR、HER-2、Ki-67 的组间差异及相关性。

结果：108 例患者中，MD, MK 值在不同分级乳腺癌之间差异有统计学意义 ($P<0.05$)，III 型乳腺癌组 MK 值大于 II 型乳腺癌组，III 型乳腺癌组 MD 值小于 II 型乳腺癌组。在对 ER、PR、HER-2、Ki-67 阴阳表达情况组间的统计学分析发现，MD 值在 ER、PR、Ki-67 阴阳表达组间存在统计学差

异 ($P<0.05$)，MK 值仅在 Ki-67 阴阳表达组间存在显著统计学差异 ($P<0.05$)。Spearsman 相关分析显示，MD 值与病理分级呈负相关 ($r=-0.43$, $p<0.05$)，MK 值与病理分级呈正相关 ($r=0.48$, $p<0.05$)，MD 值与 Ki-67 表达呈负相关 ($r=-0.39$, $P<0.05$)，MK 值与 Ki-67 表达呈正相关 ($r=0.56$, $P<0.05$)。

结论：DKI 定量参数在评价乳腺癌分级方面有重要的应用价值，MD 值和 MK 值在部分免疫因子组间存在差异，并且与 Ki-67 表达存在一定的相关关系。DKI 在评估乳腺癌肿瘤细胞增殖活性方面可以提供有价值的信息，MD 值和 MK 值可以作为乳腺癌病理分级和预后因子表达的提示指标，从而可以间接评估乳腺癌的预后和治疗效果。

PU-1482

乳腺 X 线摄影深度学习联合临床特征列线图预测 HER-2 2+乳腺癌表达状态

刘思腾、于湛
郑州大学第一附属医院

目的 建立基于术前乳房 X 线摄影 (MG) 深度学习联合临床特征列线图，并分析其预测 HER-2 2+乳腺癌表达状态的价值。方法 回顾性分析 265 例 HER-2 2+单发乳腺癌患者 MG 和临床资料，其中 93 例 HER-2 阳性、172 例 HER-2 阴性。按照 8: 2 比例将所有患者分为训练集 ($n=211$) 和验证集 ($n=54$)，训练集含 74 例 HER-2 阳性、137 例 HER-2 阴性，验证集 19 例 HER-2 阳性、35 例 HER-2 阴性。将头足位和内外侧斜位 MG 输入孪生深度学习网络，获得肿瘤 ROI 图像，并输入至 ResNet50 网络提取深度学习特征，通过全连接层进行特征融合，共获得 2048 个深度学习特征，经 Softmax 分类器输出二分类结果，得到深度学习评分 (Deep-score)，以构建深度学习模型。采用单因素分析及多因素 logistic 回归分析临床资料，筛选 HER-2 2+乳腺癌表达状态的独立预测因素。联合 Deep-score 和独立临床预测因素构建联合模型，并绘制其列线图。采用受试者工作特征 (ROC) 曲线评估模型预测 HER-2 2+乳腺癌表达状态的效能。采用校准曲线评估联合模型的校准度。以决策曲线分析 (DCA) 评估模型的临床获益。结果 雌激素受体 (ER) 和 Ki-67 是 HER-2 2+乳腺癌表达状态的独立预测因子。联合模型于训练集和验证集的 AUC 分别为 0.97、0.88，均高于临床模型 (0.75、0.70)，差异均有统计学意义 ($Z=7.15$ 、 5.76 , P 均 <0.01)，联合模型于训练集中 AUC 优于深度学习模型 (0.96)，差异有统计学意义 ($Z=2.03$, $P=0.03$)，而于验证集差异无统计学意义 ($Z=1.50$, $P=0.33$)。结论 MG 深度学习联合临床特征列线图能有效预测 HER-2 2+乳腺癌表达状态。

PU-1483

乳腺癌 DBT 毛刺征象与 Ki-67 表达状态的相关性分析

刘思腾、于湛、王洁洁
郑州大学第一附属医院

目的 利用数字乳腺断层合成 (DBT) 在评估病变边缘方面的优势，探讨 DBT 图像的毛刺征象与 Ki-67 表达状态的关系。方法 纳入了 2022 年 3 月至 2023 年 4 月在郑州大学第一附属医院就诊的所有经 DBT 检查观察到的乳腺毛刺型肿块，并经组织病理学证实为浸润性癌症的患者 99 例。对 99 例乳腺恶性毛刺肿块的肿块大小、毛刺的长度和宽度、肿瘤边缘毛刺的覆盖情况及毛刺的数量进行分析，并比较在 Ki-67 表达状态之间的差异。Ki-67 指数来源于手术切除的肿瘤标本。结果 Ki-67 高表达与低表达患者 DBT 图像毛刺特征包括毛刺长度与毛刺宽度比较差异均有统计学意义 (P 均 <0.05)，而毛刺数量、患者年龄、绝经状态及肿块大小差异无统计学意义 ($P=0.06$ 、 $P=0.175$ 、

$P=0.507$ 、 $P=0.05$)。将毛刺长度与毛刺宽度联合后, 诊断效能最好, AUC 为 0.897。结论 毛刺征分析可作为一种无创预测恶性病变肿瘤的增殖活性的方法, 从而判断患者的预后。

PU-1484

乳腺隆突性皮肤纤维肉瘤的影像及病理特征分析

王洁洁、于湛、刘思腾
郑州大学第一附属医院

目的: 探讨乳腺隆突性皮肤纤维肉瘤 (DSFP) 的影像及病理特征, 以提高对该病的诊断效能。方法: 回顾性分析了我院 2012 年 5 月至 2021 年 1 月期间经手术及病理证实的隆突性皮肤纤维肉瘤 7 例患者, 术前接受了乳腺 MRI、乳腺超声、乳腺 X 线摄影或胸部 CT 检查。均获得完整的影像学及病理资料。结果: 7 例患者, 6 名女性, 1 名男性。在乳腺 X 线摄影上, 病灶多表现为皮肤或乳房内边界清楚的椭圆形病变, 无微钙化或脂肪, 局部可见微分叶。超声图像上表现为病灶位于体表皮肤或皮肤下层, 边界清晰, 形态规则, 5 例表现为不均匀低回声, 仅 1 例表现为较均匀的低回声, 彩色多普勒上多表现为较丰富血流信号。CT 图像上多表现为中等均匀或略不均匀密度的肿块影。部分病例可见“皮肤尾征”、“脂肪尾征”、“悬吊征”“多结节融合征”等征象。MRI 上表现为与肌肉 T1 等信号的边界清楚的结节或肿块, 增强后检查显示均匀或不均匀强化。病理结果均诊断为 DFSP, 免疫组化检查示 CD34 均呈阳性反应, 其中两例行 FISH 检测显示 COL1A1/PDGFB 基因融合。结论: 乳腺隆突性皮肤纤维肉瘤极为罕见, “皮肤尾征”、“脂肪尾征”、“悬吊征”“多结节融合征”等征象是其特征性的影像学表现, CT 及 MRI 在乳腺 DFSP 的术前诊断及术后复发病变的评估中起着重要作用, 结合病史及专科检查, 对本病有重要提示意义。

PU-1485

乳腺巨细胞纤维母细胞瘤个案分享

丰帆
青海红十字医院

分享一乳腺巨细胞纤维母细胞瘤病例

巨细胞纤维母细胞瘤是一种发生在儿童、含有巨细胞且与隆凸性皮肤纤维肉瘤组织学主重叠的中间型软组织肿瘤

常发生于胸壁、腹壁、背部、大腿、腹股沟、头颈部, 好发于儿童 (10 岁以下常见) 躯干和四肢浅表皮下, 病变界限不清, 呈蜂窝状向周围及皮下脂肪组织浸润, 浸润的脂肪边界类似于脂肪肉瘤; 病灶起源于乳腺中的巨细胞纤维母细胞瘤比较少见, 故而与大家分享学习一下。

PU-1486

乳腺磁共振智能扫描 (SmartExam breast) 在乳腺术后患者中的应用价值

尹秋凤、王丽君、汪登斌
上海交通大学医学院附属新华医院

目的 探讨在乳腺 MR 检查中,利用 T2-spair 脂肪抑脂序列,在常规 Breast 以及 SmartBreast 两种不同匀场方式中,对于显示乳腺切除术后术区结构图像质量的影响,评估两种不同匀场方式对于术区病变的诊断价值。

材料与方法 乳腺癌切除术后患者 20 例,采用 PHILIPS Ingenia3.0T 超导 MR 扫描仪,按照常规 Breast 中 T2-spair 脂肪抑脂序列的匀场及 smartBreast 中 T2-spair 脂肪抑制序列的匀场方式分别扫描,每例患者均使用两种不同的匀场方式各扫描一次,共计 20 组图像。由两位高年资医师对图像质量进行主观评分并求其平均值。评分内容包括以下四项:患侧胸壁有无伪影,皮肤是否连续显示,皮下脂肪间隙是否清晰显示,肋骨信号是否清晰显示;每一项根据图像质量分别评分:满意 3 分、一般 2 分、不满意 1 分,然后将合计总分作为每一病例的图像评分结果。利用 SPSS 统计软件对于图像质量的评分结果进行分析。

结果 Smart-Breast 中 T2-spair 脂肪抑制序列的匀场方式,能够智能地勾画出需要匀场的范围,清晰显示乳腺切除术后术区胸壁皮肤、皮下软组织、肋骨等结构,图像质量评分结果较满意;对于常规 Breast、Smart-Breast 中 T2-spair 图像质量的评估分数进行统计分析,显示两者在 99%可信区间 $P<0.01$,提示两者之间的图像质量差异具有统计学意义。

结论 对比常规 Breast 中的 T2-spair 扫描序列,采用 Smart-Breast 进行同一序列扫描,能够避免术后胸壁软组织不对称对局部磁场不均性的影响,有利于对此类患者术后复发、术区新发病灶等的早期诊断,具有较高的临床应用价值。

PU-1487

基于无造影剂序列合成 MRI 与 ADC 的影像组学模型早期预测乳腺癌新辅助治疗疗效

张燕妮、杜思瑶、张立娜
中国医科大学附属第一医院

目的: 探究由新辅助化疗 (NAC) 一周期前后无造影剂序列合成 MRI 与表观弥散系数 (ADC) 提取的影像组学特征在预测乳腺癌患者病理完全缓解 (pCR) 中的价值。

方法: 从 2018 年 10 月至 2021 年 12 月,本研究回顾性收集 207 名在中国医科大学附属第一医院行新辅助化疗的乳腺癌患者的磁共振与病理信息。以 2021 年 4 月 9 日为截断时间,将纳入患者以 7:3 的比例分为训练集 ($n=145$) 和验证集 ($n=62$)。每个患者都在新辅助化疗一周期前后进行了 MRI 检查。通过量化 MRI 图像上的感兴趣区域 (ROI),分别在两个时间节点合成 MRI 的 9 个序列与 ADC 图中提取 107 个影像组学特征,前后特征的差值为 delta 影像组学特征值。采用特征递归消除法 (RFE) 选择特征,支持向量机 (SVM) 用于建立模型,对训练集进行 5 折交叉验证以确定模型的超参数,根据模型在验证集上的性能设置超参数。使用受试者工作特征曲线 (ROC) 评价模型的性能,采用 DeLong 检验对不同模型进行比较。

结果: 与基线和一周期影像组学模型相比,合成 MRI 各个序列的 delta 影像组学模型获得了更高的预测效能。对于 ADC 序列,一周期影像组学模型效能最高 ($AUC=0.774/0.731$, 训练集/验证集)。将训练集与验证集 AUC 值均大于 0.7 的序列建立融合模型,与常规一周期 ADC 联合建模获得最佳预测效能的是 delta-T2 mapping 序列 ($AUC=0.818/0.808$, 训练集/验证集)。临床-影像组学模型

具有良好的校准和鉴别能力 ($AUC=0.917/0.908$, $95\%CI:0.868-0.966/0.835-0.982$, 训练集/验证集)。

结论: 基于无造影剂序列合成 MRI 和 ADC 开发的影像组学模型是早期预测 NAC 治疗后 pCR 的有前景的新兴策略。结合了临床病理特征的临床-影像组学融合模型可以提供更加准确的患者预后信息。

PU-1488

CTA 腹壁动脉评估在穿支皮瓣乳房重建中的应用进展

邹佰利

吉林省肿瘤医院

目的: 探讨利用腹壁穿支动脉 CTA 血管成像及三维重建评估, 确定优势血管, 为腹壁下动脉穿支皮瓣乳房重建提供术前供区准备。方法: 回顾性收集 2022 年 8 月至 2023 年 5 月行乳房重建患者, 选取年龄 23~70 岁之间, 其中 20 例进行多普勒超声检查, 同时行术前胸腹部 CTA 评估。使用星云工作站进行三维重建后处理评估穿支的位置、直径和方向。类比同以往术者直接在术中选择皮瓣穿支, 皮瓣移植成功率, 术后并发症, 手术时间及住院时间等。分析腹壁下动脉穿支 (deep inferior epigastric perforator, DIEP) 分布位置和管径, 以及作为供区血管的使用率。结果: 术前完善腹部 CTA 可以预先掌握腹壁下血管主干的分支情况及多穿支共干情况, 有助于精确设计皮瓣及血管蒂, 减少手术损伤, 最大程度缩减手术麻醉时间, 提高手术安全性。通过术前 CTA 影像, 总结 DIEP 皮瓣的血管分支类型和走行特点, 掌握腹部浅部血管与深部血管的吻合方式以及腹部上部和下部血管的吻合方式, 可达到缩短 DIEP 皮瓣制备学习曲线的目的。术前 CTA 可以精确展示穿支的肌内行程, 还可以识别相邻穿支之间的潜在连接, 有助于在手术前确定最佳穿支。CTA 数据还有助于判断并确定内侧排与外侧排穿支, 主干分支之间的肌内走行和腹部组织的灌注压力都存在差异, 这对于选择作为皮瓣血供来源的血管蒂选择是很重要的。

结论: CTA 是目前 DIEP 术前进行穿支选择的首选技术和金标准, 相较于其他成像技术, CTA 具有高空间分辨率、高精度、低成本及受干扰影响较小等优势。CTA 图像可以直接评估皮瓣范围, 血管走行, 穿支直径和血流动力学特性, 作为能直观重建腹部血管解剖结构的工具, 极大地改变了皮瓣切取方式, 优化皮瓣手术设计, 从而提高手术效率并减少术后并发症的发生。无论对术前供区血管的评估还是手术方案的决策都具有重要临床意义。

PU-1489

IDEAL-IQ 序列在乳腺肿块良恶性鉴别诊断中的应用价值探究

于佳平、杜思瑶、张立娜

中国医科大学附属第一医院

目的 探讨非对称回波最小二乘估算法迭代水脂分离序列 (IDEAL-IQ) 来源的 $R2^*$ 值在乳腺良恶性肿瘤鉴别诊断中的价值, 并与传统多回波 $T2^*GRE$ 序列来源的 $R2^*$ 值进行比较。方法 回顾性分析 2021 年 9 月至 2023 年 3 月在中国医科大学附属第一医院连续收治并进行手术患者的 106 例病灶。所有患者均接受包含 IDEAL-IQ 和多回波 $T2^*GRE$ 序列的多参数 MRI (magnetic resonance imaging), 测量以下定量参数: IDEAL-IQ 序列 $R2^*$ 值 ($R2^*IDEAL$)、多回波 $T2^*GRE$ 序列 $R2^*$ 值 ($R2^*GRE$)、表观扩散系数 (ADC) 及肿瘤长径。按术后病理结果分成良性组 34 例、恶性组 72 例, 采用 Spearman 相关性分析 $R2^*IDEAL$ 与 $R2^*GRE$ 及二者与 ADC 的相关性; 采用配对样本 t 检验比较 $R2^*IDEAL$ 与 $R2^*GRE$ 的差异; 以单因素与多因素分析评估各定量参数在良恶性组中的差异并使用受试者操作特征 (ROC) 曲线及曲线下面积 (AUC) 分析单独及联合参数鉴别乳腺肿

瘤良恶性的效能。结果 相关性分析显示乳腺肿瘤患者的 $R2^*$ IDEAL 与 $R2^*$ GRE 呈中等强度相关 ($r=0.725$, $P<0.05$)，二者与 ADC 值均呈弱负相关 ($r=-0.223[R2^*IDEAL]$, $-0.208[R2^*GRE]$, $P<0.05$)。良性组与恶性组中, $R2^*IDEAL$ 与 $R2^*GRE$ 均呈中等强度相关 ($r=0.761$ [良性组], 0.627 [恶性组], $P<0.05$)，二者与 ADC 均无相关性。两种序列所得的 $R2^*$ 值有统计学差异 ($p<0.05$)。 $R2^*IDEAL$ 、 $R2^*GRE$ 、ADC 及肿瘤长径在良恶性组间存在统计学差异，对于单一参数，ADC 值鉴别良恶性的 AUC 最高 (0.868)；对于联合参数， $R2^*IDEAL+ADC+肿瘤长径$ 鉴别良恶性的 AUC 最高 (0.963)；ADC+肿瘤长径与 $R2^*IDEAL+ADC+肿瘤长径$ 鉴别良恶性的 AUC 差异有统计学意义 ($p<0.05$)。结论 IDEAL-IQ 序列生成的 $R2^*$ 值可用于区分良恶性乳腺肿块，可能成为除 ADC 外辅助乳腺肿瘤良恶性鉴别的又一无需对比剂参数。

PU-1490

探索基于 MRI 影像组学构建在激素受体阳性、HER2 零表达、未化疗早期乳腺癌中预测 5 年无病生存和 5 年生存的预测模型可行性的研究

马明明

北京大学第一医院

摘要

目的：对基于 MRI 影像组学特征建立激素受体阳性、HER2 零表达、淋巴结阴性、未化疗早期乳腺癌的复发转移死亡预测模型的可行性进行初步探索。

对象和方法：回顾性分析 2008 年 1 月至 2016 年 12 月，在北京大学第一医院乳腺疾病中心接收治疗的 238 例新发 HR+、HER2(0)、N0、未化疗浸润性乳腺癌病例。建立预测复发转移死亡的影像组学模型：使用基于深度学习的自动分割模型获得 DCE 第 3 期图像中乳腺肿瘤感兴趣区，然后从这些感兴趣区域提取影像组学特征，建立预测 5 年无病生存和 5 年生存的影像组学模型。将数据按 7:3 的比例随机分为训练集 ($n=167$)、测试集 ($n=71$)。模型的预测性能均使用受试者工作特征曲线 (receiver operating characteristic curve, ROC) 进行分析并计算曲线下面积 (area under the curve, AUC)。使所有统计分析如无特殊说明，均为双向检验， $P<0.05$ 被认为差异具有统计学意义。5 年无病生存和 5 年生存的影像组学模型测试集的 AUC 分别为 0.86、0.91 ($P<0.05$)。

结果：建立基于 MRI 影像组学特征的 HR+、HER2(0)、N0、未化疗早期乳腺癌的复发转移死亡预测模型，5 年生存的影像组学模型预测效能高于 5 年无病生存的影像组学模型。

PU-1491

基于临床病理及 MRI 特征预测早期乳腺癌 SLN 转移的临床研究

海梦璐¹、王贇霞²、谭红娜²

1. 河南省人民医院

2. 河南省人民医院

目的：探讨临床病理及 MRI 特征预测早期乳腺癌前哨淋巴结(sentinel lymph node, SLN)转移的价值。方法：回顾性分析 526 例术前哨淋巴结活检术(sentinel lymph node biopsy, SLNB)的乳腺癌患者的临床病理及 MRI 资料，根据 SLNB 结果将患者分为 SLN 阳性组和阴性组。分析患者的临床病理及 MRI 特征与 SLN 转移的相关性，并用二元 Logistic 回归分析乳腺癌 SLN 转移的独立影响因素，采用 ROC(receiver operating characteristic curve)曲线下面积(area under the curve, AUC)评价其预测效能。结果：(1)研究共入组 526 例患者，其中 SLN 阳性组 166 例(31.6%，166/526)，

SLN 阴性组 360 例(68.4%，360/526)；ER 阳性、Luminal 亚型及合并脉管癌栓的乳腺癌患者更易出现 SLN 转移，且在两组间的差异均有统计学意义(P 值均<0.05)。(2)在增强 MRI 上病灶越大、多发病灶及位于右乳的患者更易出现 SLN 转移，且各指标在两组间的差异均有统计学意义(P 值均<0.05)。(3)Logistic 回归分析结果显示 ER 阳性、合并脉管癌栓、病灶 $\geq 20\text{mm}$ 及病灶多发均为 SLN 转移的独立危险因素，且临床病理特征、MRI 特征及二者联合三种方法预测 SLN 转移的 AUC 值分别为 0.669、0.647 和 0.726。结论：临床病理及 MRI 特征与乳腺癌 SLN 转移有一定的相关性，且二者联合预测 SLN 转移的效能有所提高。

PU-1492

Multi-parametric model for Pretreatment Prediction of Pathologic Complete Response in breast cancer to neoadjuvant chemotherapy

Haimin Xu

The First Affiliated Hospital of Soochow University

OBJECTIVE: To predict pathologic complete response (pCR) in breast cancer neoadjuvant chemotherapy using radiomics based on pretreatment T1W-MRI and dynamic contrast-enhanced MRI (DCE-MRI).

METHODS: 180 patients were retrospectively collected. Based on intratumoral VOI of DCE-MRI and peritumoral VOI of T1W-MRI, the radiomics features were extracted respectively. Mann-Whitney U test, Spearman correlation test, LASSO and logistic regression were used for feature selecting and modeling. Independent predictors in clinical features were screened and modeled using multifactor logistic regression. Combined model was established by combining peritumor, intratumor and clinical features. Stratified analyses were performed and subtype-specific radiomic signature were created for each subgroup. ROC curve was used to evaluate the efficacy of the models.

RESULTS: Compared with the clinical model (area under the curve [AUC], 0.712), the combined model (AUC of 0.802) achieved better pCR prediction performance in the test set. Subtype-specific radiomic model improved the AUCs for pCR prediction (human epidermal growth factor receptor 2positive subgroup, 0.827; luminal subgroup, 0.953; and triple negative subgroup, 0.877). **CONCLUSION:** This study revealed the predictive value of pre-treatment T1W-MRI and DCE-MRI, and successfully developed and validated a combined model for individualized prediction of pCR in neoadjuvant chemotherapy for breast cancer, which can assist clinical decision-making.

PU-1493

探讨国内运用乳腺影像报告和数据系统存在的常见问题

胡燕标

宁波市北仑区人民医院

目的 探讨国内运用乳腺影像报告和数据系统存在的常见问题 **方法** 就国内不同医院甚至同一医院存在 ACR BI-RADS 分类方法应用不一致的问题展开分析。 **结果** 一、依照 ACR BI-RADS 分类方法，乳腺影像报告将诊断归类为 0-6 类，其间并非完全为级差关系，实际上在诊断性乳腺 X 线检查中将 BI-RADS1-3 类定为阴性诊断，但很多医生在诊断中将其定位 1-6 级，这样容易误导临床医生乃至患者以为其间为级差关系。二、筛查性和诊断性影像学检查的结果应当分别进行随访审计，筛查性乳腺 X 线检查是指针对无症状的女性进行的乳腺 X 线检查。诊断性乳腺 X 线检查时针对有可疑乳腺癌临床体征或症状的女性所进行的乳腺 X 线检查，另一类是针对筛查结果异常而需要进一步乳腺

X 线评价的患者。所以诊断性检查的活检阳性率、乳腺癌检出率相对较高，而发现的乳腺癌的期别相对较晚，两者的审计结果应区分开来。三、ACR BI-RADS 规范了报告的描述术语词典。乳腺 X 线检查不能发现所有的乳腺癌，其中一部分甚至可能是临床可触及的病变，基于这一确定的事实，经常需要陈述乳腺 X 线摄影对于致密型乳腺（d 型乳腺）的准确性降低。报告描述中应当说明乳腺组织的构成类型（abcd 四种类型），国内医院有在分型中误将 abcd 写成 ABCD，强调这一点也是为了区别于诊断归类中的 4A、4B、4C。四、ACR BI-RADS 规范了报告诊断归类及对应的临床处理策略。由美国 FDA 制定的、目前国际医疗界公认的最严格的乳腺摄影质量控制标准 MQSA 规定一次乳腺 X 线检查应只做出一个评价结果，希望对每侧乳腺分开给予 BI-RADS 评价的机构或个人，完全可以在印象部分分别描述，而在报告最后部分明确地给出一个总体的 BI-RADS 分类及对应的临床处理建议。当然，最终的总体评价应针对最可疑恶性的征象。结论 综上所述，有必要规范和培训 ACR BI-RADS 的使用，对乳腺病变的监测、复查、筛选穿刺和选择恰当的治疗方法有非常重要的作用。有利于临床医生对影像医生报告的理解及相互沟通，有利于学术交流。国内乳腺影像诊断有必要达成共识，推荐统一的 BI-RADS 分类标准，从而规范检查和诊断报告。

PU-1494

乳腺叶状肿瘤与纤维腺瘤的 MRI 放射组学分析

杜明珊、文凤、陈伟、蔡萍
陆军军医大学第一附属医院（西南医院）

目的：评价基于 MRI 的放射组学模型在乳腺叶状瘤与纤维腺瘤鉴别诊断中的作用。
方法：本回顾性研究包括 104 例接受 MRI 检查的患者（叶状肿瘤 42 例，纤维腺瘤 62 例）。从 T2 加权图像、增强前 T1 加权图像以及第一期动态对比增强磁共振成像(MRI)中提取放射学特征。为了创建稳定的机器学习模型和平衡类，进行了数据扩充。使用最小绝对收缩和选择算子（LASSO）回归来选择特征并建立放射组学模型。通过放射科医生对常规 MRI 特征的评估构建放射学模型。利用放射组学特征和放射学特征构建了一个组合模型。使用支持向量机、极端梯度增强和随机森林进行机器学习分类。计算受试者工作特征(ROC)曲线下面积(AUC)以评估每种模型的性能。
结果：在 1074 个特征中，LASSO 逻辑回归选择了 34 个特征。在三种机器学习分类器中，支持向量机的性能最好。与放射学模型（AUC: 0.76±0.11）相比，放射组学模型（AUC: 0.86±0.03）和联合模型（0.94±0.02）在验证集中的 AUC 值显著提高（均 $p < 0.01$ ）。在验证组中，联合模型的 AUC 值相对高于放射组学模型的 AUC 值，但没有显著差异($p=0.392$)。
结论：基于 MRI 的放射组学分析显示出区分叶状肿瘤和纤维腺瘤的前景。

PU-1495

不典型硬化性乳腺腺病

万娜、周浩、宋法亮、马静
新疆生产建设兵团总医院

目的：乳腺腺病表现复杂多变，容易与乳腺恶性病变混淆。微钙化主要以点状成簇分布为主，肿块伴钙化更常见于硬化性腺病中。乳腺硬化性腺病钙化多表现为细小多形性区域性分布，或钙化稍松散成簇分布。TIC 多为 I 型（缓升型）或 II 型（平台型），研究认为结节性腺病的 MR 表现常为肿块强化，出现类似恶性病变特征时是腺病中最易与乳腺癌混淆的一种亚型。
方法：3.0TMRI 平扫+增强
结果：乳腺腺病伴钙化、导管扩张。

结论: MRI 表现 T1WI 多为低信号, T2WI 多为不均匀或高信号; 增强后呈现以肿块或非肿块强化为主, 内部强化方式以均匀性强化为主, 当出现形态不规则、边缘毛糙不清、邻近腺体结构紊乱、呈星芒状肿块样改变时容易与乳腺癌混淆, 乳腺腺病 TIC 多为 I 型 (缓升型) 或 II 型 (平台型)。而此病例病灶边缘见分叶及毛刺, TI FSE 呈高信号, T2 FSE-IDEAL 以低信号为主混杂信号, 增强无强化, TIC 呈平台型, 与常见的乳腺腺病 MRI 表现不同, 考虑为正常腺体发生结构扭曲变形, 中心无肿块, 病理基础为间质纤维增生、胶原化所致。

PU-1496

基于 MRI 深度学习影像组学预测乳腺癌的 HER2 表达和无病生存率

唐文洁、郭媛、陈思义
广州市第一人民医院

目的: 开发一种基于 MRI 的 DLR 方法, 以非侵入性评估乳腺癌中的 HER2 状态, 尤其是 HER2 低阳性状态, 并研究预测分数对预后的影响。

方法: 从两个中心招募了 481 名接受术前 MRI 检查的乳腺癌患者。所有患者均接受 IHC 和 FISH 以确定 HER2 状态。两位放射科医生在 MRI 上绘制了肿瘤的兴趣区。从分割的肿瘤中提取传统的影像组学特征和基于深度语义分割特征的影像组学特征, 并使用两个模型的输出概率的平均值来选择 HER-2 相关特征。最后, 构建了基于对比增强 MRI 的 DLR 模型, 以非侵入性评估 HER2 状态, 尤其是 HER2 低阳性状态。根据预测结果, 我们计算了 AUC 以评估模型的预测性能。通过 ROC 分析确定最佳阈值, 计算预测模型的准确性、敏感性和特异性。使用 Kaplan-Meier 法计算 DFS, 并使用对数秩检验比较 HER2 低阳性和 HER2 零阳性患者之间的 DFS 差异。为了进一步评估 HER2 状态的预后价值, 使用 Akaike 信息标准作为停止规则, 构建了一个多变量 Cox 比例风险模型, 以确定模型预测得分和临床病理变量与 DFS 的相关性。计算预测概率和实际结果之间的 C 指数, 以评估模型的预测能力。

结果: 首先, DLR 模型区分了 HER2 阴性和过表达患者, 在训练组中 AUC 为 0.868 (95%CI, 0.827-0.903), 在验证组为 0.763 (95%CI, 0.637-0.863)。此外, DLR 模型区分了 HER2 低阳性和 HER2 零患者, 在训练组中 AUC 为 0.855 (95%CI, 0.803-0.897), 在验证组为 0.750 (95%CI, 0.597-0.868)。HER2 低阳性患者的 DFS 明显优于 HER2 阴性患者。Cox 回归分析显示, DLR 模型预测得分 (hazard ratio, 0.175; 95%CI, 0.038-0.792; P=0.024) 和病变大小 (hazard ratio, 1.043; 95%CI: 1.010-1.077; P=0.009) 是 DFS 的显著独立预测因素。

结论: 本研究成功构建了一个基于增强 MRI 的 DLR 模型, 以非侵入性评估 HER2 状态, 特别是 HER2 低阳性, 并进一步显示了预测乳腺癌 DFS 的前景。

PU-1497

Deep Learning Model used in Mammographic Breast Density Assessment: Improve the diagnostic efficiency of junior radiologist

Juan Tao, Fan Yang
Union Hospital Tongji Medical College HuaZhong University of Science and Technology

Purpose:

To evaluate whether the AI model can be used in the clinic and whether the AI model can help diagnosticians to improve the diagnostic efficacy of mammography by analyzing the consistency

of mammographic density assessment between radiologists and the consistency between machine learning and radiologists.

Materials and Methods:

For the prospective study, we collected 2,548 X-rays from 637 patients from July 2018 to February 2019 by randomly selecting 50 cases per week. Independent density assessment was performed by four physicians with more than 5 years of experience in breast diagnosis, which included overall assessment of four images, unilateral two-image scoring, and single-image assessment of a single patient, and was assessed with reference to the 2013 ACR Mammography BI-RADS Density Criteria. And statistical AI model assessment of breast BI-RADS density was performed to further assess the consistency of radiologists' assessment with AI, and the consensus (majority decision principle) of the assessment by four imaging physicians was compared with the AI model assessment.

Results:

The 4 radiologists had an overall assessment agreement of 0.75 for the four images on a patient-by-patient basis; the 4 radiologists had an agreement of 0.718 for the two images of a single breast; and the 4 radiologists had an agreement between the assessments of each image of 0.696. The radiologists had a higher agreement of the overall scoring of the four images on a patient-by-patient basis than for a single breast, and a higher agreement of the scoring of a single image.

The results of the machine's density assessment of 2,548 molybdenum films for all patients were significantly improved by the accuracy of the 2 junior doctors who referred to the AI results for each image assessment.

Conclusion:

The diagnostic concordance of mammograms by four radiologists was higher than most of the data mentioned in the literature, because our four doctors are very experienced diagnostic mammographers, and in addition, the four doctors communicated more about the BI-RADS breast density classification criteria, which resulted in this result. The agreement between this AI model and the four experienced doctors in our radiology department in the test set was better, then this AI model can be used for clinical assessment of breast density and the AI can be an aid in guiding the lower senior doctors. The consistency of the two junior doctors increased with AI assistance, so the AI model can help diagnostic physicians to improve breast diagnostic efficacy.

PU-1498

钼靶联合 DCE-MRI 对不同类型乳腺癌的诊断价值

胡瑛

郑州大学第一附属医院

摘要 目的：比较钼靶和动态对比增强磁共振成像(DCE-MRI)在不同类型乳腺癌中的诊断价值。方法：对 2021 年 2 月至 2022 年 10 月本院收治的 120 例女性乳腺癌患者进行回顾性分析。均行 DCE-MRI 和钼靶检查，术后行病理组织检查，以确定其分子分型。结果：钼靶联合 DCE-MRI 诊断不同分子类型的 Luminal 型乳腺癌的敏感性和诊断符合率显著高于单独钼靶或 DCE-MRI，单纯钼靶或 DCE-MRI 两组间对诊断不同分子类型乳腺癌的敏感性和诊断符合率均无统计学差异 ($P > 0.05$)。结论：钼靶联合 DCE-MRI 对不同分子类型乳腺癌的诊断优于单一影像学筛查，具有重要的临床意义。

对比增强乳腺 X 线摄影上的影像特征描述术语及阳性预测值

张征委、汪登斌、金彪
上海交通大学医学院附属新华医院

【目的】

分析对比增强乳腺 X 线摄影(Contrast-enhanced spectral mammography, CESH) 上乳腺病灶的形态学及强化特征并评估每种特征对于诊断的影响。

【方法】

回顾性纳入临床怀疑或超声发现乳腺病变后进一步行 CESH 检查的病例, 最终 151 例患者 (157 个病灶) 纳入本次研究。阅读并评价低能图及减影图, 参考磁共振 (Magnetic resonance imaging, MRI) 中的术语描述强化病灶, 记录所有肿块强化在 CESH 图像上的最大径。所有数据以频数及百分比的方式描述。采用卡方检验评估每个独立的特征描述术语对于乳腺病灶诊断的影响, 比较其鉴别良恶性病灶的能力,

【结果】

本研究包括 113 个 (72.0%) 良性病灶和 44 个 (28.0%) 恶性病灶。减影图上表现为强化的有 120 个 (76.4%) 病灶, 他们可进一步的被分为肿块强化 (89/120, 74.2%) 和非肿块强化 (31/120, 25.8%)。在肿块强化的特征描述术语中, 阳性预测值最高的是边缘毛刺状 (87.5%vs32.1%, $p \leq 0.001$), 其次为形态不规则 (76.9%恶性)、边缘不规则 (75%恶性)、不均匀强化 (65.9%恶性)。非肿块强化中, 节段强化的恶性概率较非节段强化显著高 (80%vs14.3%, $p \leq 0.001$)。

【结论】

CESM 图像上, 肿块强化中的边缘毛刺状或不规则、形态不规则、不均匀强化对恶性肿瘤的预测最高, 非肿块强化中, 簇状强化或节段分布强化提示恶性。

基于乳腺 MRI 和临床病理特征的列线图预测乳腺癌患者腋窝淋巴结转移

陈宇思、姜慧杰
哈尔滨医科大学附属第二医院

目的: 建立基于乳腺 MRI 和临床病理特征的列线图预测乳腺癌患者腋窝淋巴结转移

材料和方法: 回顾性分析 173 例 (训练集: 122 例子; 测试集: 51 例) 乳腺癌患者的乳腺 MRI 和临床病理特征, 以病理结果为金标准。通过单因素和多因素逻辑回归分析来确定腋窝淋巴结转移的风险因素。使用独立的风险因素创建列线图。采用受试者操作者特征曲线 (ROC) 和校准曲线评价列线图的诊断性能和校准性能, 采用决策曲线(DCA)评价列线图在不同风险阈值下的临床净收益。结果: 173 例乳腺癌患者, 其中 68 例 (39.3%) 有腋窝淋巴结转移。Ki67 (OR=4.411, 95%CI: 1.946–12.163, $P=0.002$)、多灶性 (OR=4.716, 95%CI:1.249–9.995, $P=0.001$)、MR 报告的可疑腋窝淋巴结 (OR=4.850, 95%CI:1.876–13.514, $P=0.002$) 被确定为与腋窝淋巴结转移相关的独立风险因素。列线图的 ROC 曲线下面积 (AUC)、准确度、敏感度、特异度在训练集中和测试集中分别为 0.808(95%CI, 0.728-0.887)、0.762、0.789、0.717; 0.856 (95% CI, 0.745-0.966)、0.824、0.773、0.862;

结论: 基于乳腺 MRI 和临床病理特征的列线图可作为预测乳腺癌患者腋窝淋巴结转移的非侵入性可靠工具, 并有助于临床决策。

PU-1501

Potential of combination of CE-MRI and serum Her-2/neu extracellular domain in evaluating effectiveness of neoadjuvant chemotherapy in breast cancer

Pengfei Liu

The First Affiliated Hospital of Soochow University

Objective: To determine the potential of the combination of contrast-enhanced magnetic resonance imaging (CE-MRI) method with the serum level of extracellular domain of human epidermal growth factor receptor-2 (Her-2/neu ECD) in the evaluation of the efficacy of neoadjuvant chemotherapy (NAC) in breast cancer patients.

Methods: Sixty-six patients with breast cancer who received NAC in our hospital from September 2019 to July 2022 were selected as research subjects. All patients received 6 to 8 courses of NAC. Lesions were measured using CE-MRI and apparent diffusion coefficient (ADC) maps before and after NAC. Serum levels of Her-2/neu ECD were measured by chemiluminescence before and after NAC. The patients were divided into the complete pathological remission (pCR) group and non-pathological complete remission (n-pCR) group based on pathological diagnosis.

Results: The pCR group was comprised of 30 patients (average age, 48 years), and 36 patients (average age, 48 years) were included in the n-pCR group. Hormone receptor status (odds ratio [OR], 4.47 [95% CI: 1.40, 14.32]; $P = 0.012$), human epidermal growth factor receptor-2 status (OR, 0.15 [95% CI: 0.05, 0.49]; $P < 0.01$), tumor volume change rate ($\Delta TV\%$) during NAC (OR, 1.12 [95% CI: 1.06, 1.26]; $P < .001$), and changes in serum Her-2/neu ECD levels during NAC (OR, 1.14 [95% CI: 1.05, 1.24]; $P < .001$) were independently associated with the odds of achieving pCR. Among these variables, $\Delta TV\%$ was associated with pCR (area under the receiver operating characteristic curve [AUC], 0.862). The model that combined $\Delta TV\%$ and $\Delta Her-2/neu$ ECD showed a higher performance (AUC, 0.914) than the model included $\Delta TV\%$ and Her-2 receptor (AUC, 0.894).

Conclusion: A model that combined CE-MRI imaging, and serum Her-2/neu ECD levels showed good performance for predicting pCR to NAC in patients with breast cancer.

PU-1502

Radiomic nomogram for predicting axillary lymph node metastasis in patients with breast cancer

Yusi Chen, huijie jiang

the Second Affiliated Hospital of Harbin Medical University

Aim To develop and validate a radiomics nomogram integrating the radiomics features from dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) and clinical factors for preoperatively predicting axillary lymph node metastasis (ALNM) in patients with breast cancer (BC).

Methods 177 patients with BC were randomly divided into a training set ($n = 123$) and a validation set ($n = 54$) at a ratio of 7:3. A total of 2818 radiomics features from primary tumor and axillary lymph node (ALN) were extracted from the DCE-MRI images and optimal features were screened to construct the Radscore by least absolute shrinkage and selection operator (LASSO) algorithms. Multivariate logistic regression analysis was conducted using statistically significant clinical factors identified in a univariate logistic regression analysis. Based on the Radscore and clinical factors, we developed a radiomics nomogram by Support Vector Machine (SVM) method. Receiver operator characteristic (ROC) curves and calibration curves were used to evaluate the diagnostic performance and calibration of the radiomics nomogram.

Results Ki67, multifocality, MRI-reported ALN status were the independent risk factor for ALNM. The radiomics nomogram showed good calibration and discrimination with areas under the ROC curve (AUC) of 0.92 [95% confidence interval (CI), 0.88-0.97] in the training set and 0.90(95% CI, 0.72-0.90) in the validation set. DCA indicated the radiomics nomogram was clinically useful. Conclusions The DCE-MRI-based radiomics nomogram could be used as a reliable tool to assess ALNM in patients with BC.

PU-1503

X 线联合机器学习预测乳腺癌 ER、PR、HER2、Ki-67 表达

林舒婷、蔡思清
福建医科大学附属第二医院

X 线联合机器学习预测乳腺癌 ER、PR、HER2、Ki-67 表达

目的:

评估 X 线联合机器学习对乳腺癌 ER、PR、HER2、Ki-67 表达的预测价值。

材料和方法:

回顾性分析我院 2018 年 1 月至 2021 年 12 月术前行乳腺 X 线检查的乳腺癌患者, 选择其中 X 线图像表现为肿块伴钙化的病例 252 例。利用深度学习分割感兴趣区 (ROI), 然后获取肿块影像组学特征及钙化量化特征, 分别建立肿块组学模型、钙化量化模型以及全影像模型 (肿块影像组学特征+钙化量化特征) 来预测各受体表达。使用支持向量机(SVM)、极端梯度提升 (XGBoost)、自适应增强 (AdaBoost)、随机森林 (RF) 4 种机器学习分类器建立模型, 采用曲线下面积 (AUC)、敏感性、特异性评价不同模型的性能。

结果:

在四种机器学习分类器中, AdaBoost 分类器性能最佳。使用 AdaBoost 算法, 肿块组学模型预测 ER、PR、HER2 以及 Ki-67 的 AUC 分别为 0.78、0.76、0.75、0.72; 钙化量化模型预测 ER、PR、HER2 以及 Ki-67 的 AUC 分别为 0.67、0.70、0.73、0.67; 全影像模型预测 ER、PR、HER2 以及 Ki-67 的 AUC 分别为 0.82、0.80、0.79、0.82。

结论:

X 线联合机器学习对乳腺癌 ER、PR、HER2、Ki-67 表达具有一定的预测作用。

PU-1504

基于 MRI 影像组学预测乳腺肿瘤良恶性的价值

姚娟、韩袁兴
新疆医科大学

目的: 探讨临床病理指标及 MRI 影像组学因素在乳腺肿瘤良恶性的鉴别中的应用价值, 并建立个性化的多模态影像组学模型, 以求为良恶性乳腺肿瘤的分类提供可能的评价依据。

方法: 回顾性研究 156 名接受 DCE-MRI 检查的乳腺病患者从人工绘制的肿瘤轮廓图像中提取放射组学特征。采用 Spearman 相关分析和最小绝对收缩和选择算子回归进行特征选择和放射组学特征构建。分别建立临床病理、放射组学和联合临床及放射组学的联合模型。同时建立基于联合临床病理指标及影像组学的列线图模型, 同时通过 AUC、DCA 评估列线图的临床实用性。

结果: 最大直径、绝经年龄、肿瘤类型和 BI-RADS 类别等方面存在恶性组和良性组的鉴别中存在显著差异 ($P < 0.05$)。临床病理、放射组学和联合模型的 AUC 值分别为 0.913、0.945、0.980; Hosmer-Lemeshow 检验证明联合模型显示出更好的预测性能。临床病理、放射组学、联合模型的

AUC 值为 0.876、0.789 和 0.885，基于临床病理和放射组学的验证集构建的列线图的 AUC 为 0.914。

结论：联合临床病理指标和 MRI 放射组学特征的 Logistic 回归模型及列线图模型可能作为用于鉴别乳腺肿瘤良恶性的依据，有望为乳腺肿瘤患者的鉴别诊断提供的一定的参考。

PU-1505

双能 CT 图像评估乳腺癌 Her2 表达水平的价值

杨丹^{1,2}、岳鑫²

1. 福建医科大学临床医学部

2. 厦门大学附属中山医院

目的：探讨双能 CT 图像治疗前评估乳腺癌患者 Her2 表达水平的价值。方法：回顾性收集病理诊断为乳腺癌的患者 114 例，根据 Her2 表达情况分为阳性组（41 例）和阴性组（73 例）。记录病灶常规影像特征，计算 70keV 标准化 CT 值（NCT）、标准化碘浓度（NIC）、标准化有效原子序数（NZeff）、能谱曲线斜率（K）等定量参数，经单因素及多因素回归分析各项 CT 指标，构建常规影像模型、定量参数模型及联合模型，ROC 曲线分析各因素和不同模型的诊断效能，构建列线图模型，绘制临床决策曲线（DCA）、临床影响曲线（CIC）评估其临床应用价值。结果：两组患者年龄、发病部位、CEA、CA125、CA153 表达差异无统计学意义（ $P>0.05$ ）。阳性组肿瘤最大径高于阴性组（ $P<0.05$ ），阳性组分叶征、微钙化阳性率显著高于阴性组（ $P<0.05$ ）；阳性组动脉期 NIC、K 及静脉期 NCT、NIC、NZeff、K 均高于阴性组（ $P<0.05$ ）；多因素回归分析显示，分叶征、微钙化、动脉期 NIC、K 及静脉期 NIC、NZeff 是 Her2 的独立预测因子，AUC 分别为 0.587、0.707、0.669、0.720、0.714、0.718，动脉期 K 诊断效能最高，最大截断值为 2.60，灵敏度 75.61%，特异度 65.75%。基于分叶征、微钙化构建常规影像模型，基于动脉期 NIC、K 及静脉期 NIC、NZeff 构建定量参数模型，基于六项指标构建联合模型，三种模型 AUC 分别为 0.742、0.770、0.857，灵敏度分别为 70.73%，92.68%，92.70%，特异度分别为 73.97%，52.05%，68.49%，Delong 检验显示常规影像模型与定量参数模型诊断效能差异无统计学意义（ $P>0.05$ ），联合模型诊断效能显著高于另外两种模型（ $P<0.05$ ）。基于六项独立预测因子构建列线图预测模型，校准曲线及 DCA、CIC 显示该列线图模型具有较好的诊断性能和临床应用价值。结论：分叶征、微钙化、动脉期 NIC、K 及静脉期 NIC、NZeff 是 Her2 的独立预测因子，基于六者构建的列线图模型对治疗前无创评估 Her2 表达具有临床应用价值。

PU-1506

ADC 最大值联合激素受体及人表皮生长因子受体 2 预测乳腺癌新辅助化疗疗效

李芷凡、刘欣然、王子圆、冯雯、雷军强

兰州大学第一医院

目的：构建基于乳腺癌 MRI 影像特征及临床病理指标的列线图以早期预测乳腺癌患者在新辅助化疗（neoadjuvant chemotherapy, NAC）后的病理完全反应（pathological complete response, pCR）。

方法：回顾性地分析了兰州大学第一医院在 2021 年 1 月至 2022 年 10 月行新辅助化疗且随后接受了手术的 82 例乳腺癌患者。收集患者在化疗前的 MRI 影像特征、临床相关信息及病理指标。采用单因素筛选乳腺癌患者 NAC 后实现 pCR 的相关因素。随后进行多因素逻辑回归分析。基于筛选出的独立预测因素构建列线图模型。Bootstrap 法用于列线图模型的验证和校准。受试者工作特征

(receiver operating characteristic curve, ROC) 曲线及决策曲线分析 (decision curve analysis, DCA) 分别被用于评估列线图模型的诊断效能及临床应用价值。

结果: 孕激素受体 (progesterone receptor, PR) 状态 ($P=0.04$)、人表皮生长因子受体 2 (human epidermal growth factor receptor 2, HER-2) 状态 ($P<0.01$)、表观扩散系数 (apparent diffusion coefficient, ADC) 最大值 ($P=0.03$) 在多因素逻辑回归的分析中显示为 pCR 的独立预测因素。列线图的 ROC 曲线下面积为 0.86。Bootstrap 法内部验证的校正一致性指数为 0.84。校准图显示了列线图预测概率和实际 pCR 概率之间的高度一致性。

结论: 基于 PR 状态、HER-2 状态、ADC 最大值的列线图模型有助于预测乳腺癌患者对新辅助化疗的病理反应, 以实现患者的个性化诊疗, 改善患者预后。

基于 DNA 折纸超顺磁纳米复合颗粒的磁共振传感检测非编码 RNA LINC01977

杨琪、周丽丽
吉林大学第一医院

目的 探究基于磁共振 DNA 折纸超顺磁纳米复合颗粒对 LINC01977 检测效果。

方法 根据 Rothmund 的方法组装形成三角形 DNA 折纸结构, 制备氨基改性的超顺磁性纳米颗粒标记的 DNA 折纸并表征。利用磁共振传感系统检测 LINC01977, 通过所测得的 T2 弛豫时间来得到该磁共振检测系统的检测范围以及得到最低检测限。进而应用磁共振检测乳腺癌相关 lncRNA: RHPN1-AS1, AC009119.1, RNF139-AS1, LINC01094 和 LINC01087。检测模拟乳腺癌细胞液样品中的 LINC01977。

结果 成功合成的 Fe_3O_4 磁性纳米颗粒的粒径为 28 nm 左右, 具有相对均匀的分散性, 在纯水溶剂中分散肉眼未发现明显沉降现象。核磁传感系统的检测结果, 发现 ATP 与它的类似物及其空白样品所得到的 T2 弛豫时间信号响应相比较极为显著, 证明该传感系统在对 ATP 的检测时具有特异性。通过 T2 弛豫时间的表征发现在 0.1ng/ml~10ng/ml 之间存在曲线的线性响应 ($R^2=0.9988$), 并且在 0.2ng/ml~5ng/ml 之间存在直线的线性响应 ($R^2=0.9919$), 该传感检测系统的最低检测限为 0.17ng/ml, 且加标回收率在 78.13%~110.4%之间。

结论 证明该传感系统对 LINC01977 的检测可用于实际应用中。

PU-1508

乳腺癌新辅助化疗后肿瘤瘤床 MRI 表现与病理对比研究

张启川、廖翠薇
陆军军医大学第二附属医院 (新桥医院)

探讨 MRI 评价乳腺癌新辅助化疗后残余肿瘤收缩模式的能力。方法 收集 48 例 II、III 期浸润性导管癌患者的 MRI 检查资料并与全乳腺大切片对比。48 例患者均采用 TE 方案进行了 4 个周期的新辅助化疗, 并在新辅助化疗前后进行了 MRI 检查。48 例乳腺癌患者在化疗结束后均进行了乳腺癌改良根治术, 术后乳腺标本取一半制成全乳腺大切片, 显微镜观察残余肿瘤瘤床表现。结果 新辅助化疗后残余肿瘤表现为向心性收缩、树枝型收缩。48 例新辅助化疗后的残余肿瘤在 MRI 上表现为向心性收缩的有 39 例, 占 81.25%; 表现为树枝型收缩的有 9 例, 占 18.75%。全乳腺大切片显示为向心性收缩的有 40 例 (83.33%), 树枝型收缩的有 8 例 (16.67%), MRI 与全乳腺大切片评价残余肿瘤收缩模式的相关系数为 0.906 ($P=7.37\times 10^{-8}$)。结论 MRI 能正确评价残余肿瘤的收缩模式, 能为临床手术方式的制定提供重要的依据。

PU-1509

双能 CT 图像评估乳腺癌 PR 表达水平的价值

杨丹^{1,2}、岳鑫²

1. 福建医科大学临床医学部

2. 厦门大学附属中山医院

目的：探讨双能 CT 图像治疗前评估乳腺癌患者 PR 表达情况的价值。方法：回顾性收集病理诊断为乳腺癌的患者 114 例，根据孕激素受体 (PR) 表达情况分为阳性组 (71 例) 和阴性组 (43 例)。记录病灶常规影像特征，计算动脉期 70keV 标准化 CT 值 (NCT)、标准化碘浓度 (NIC)、标准化有效原子序数 (NZeff)、能谱曲线斜率 (K)、70keVCT 值差值 (Δ CT)、碘浓度差值 (Δ IC)，经单因素及多因素回归分析各项 CT 指标，构建联合模型，ROC 曲线分析各因素和不同模型的诊断效能及最佳截断值，构建列线图预测模型，绘制临床决策曲线 (DCA)、临床影响曲线 (CIC) 评估其临床应用价值。结果：两组患者年龄、发病部位、CEA、CA125、CA153 表达差异无统计学意义 ($P>0.05$)。PR 阳性组肿瘤最大径、动脉期 NIC 及 K 小于阴性组 ($P<0.05$)，最佳截断值为 2.85cm、0.10、2.79。病灶分叶征、内部坏死及乳腺血运增加更多见于阴性组 (均 $P<0.05$)。多因素回归分析显示，分叶征、血运增加、动脉期 K 是 PR 的独立预测因子，AUC 分别为 0.592、0.647、0.695，灵敏度分别为 25.35%、54.93%、76.06%，特异度 93.02%、74.42%、67.44%。基于分叶征、血运增加构建常规影像模型，基于三项指标构建联合模型，两种模型 AUC 分别为 0.697、0.778，灵敏度分别为 67.61%、61.97%，特异度分别为 67.44%、88.37%，DeLong 检验显示联合模型的诊断效能与常规影像模型及单项独立预测因子比较，差异均有统计学意义 ($P<0.05$)；常规影像模型与动脉期 K 诊断效能比较差异无统计学意义 ($P>0.05$)。基于三项独立预测因子构建列线图预测模型，校准曲线及 DCA、CIC 显示该列线图模型具有较好的诊断性能和临床应用价值。结论：分叶征、血运增加、动脉期 K 是 PR 的独立预测因子，基于三者构建的列线图模型对治疗前无创评估 PR 表达具有临床应用价值。

PU-1510

功能磁共振成像对 Lou's 温通法治疗非哺乳期肉芽肿性乳腺小叶炎的疗效分析

郑思思、陶颖慧、项萍、卜阳阳

浙江中医药大学附属第一医院 (浙江省中医院)

目的 利用功能磁共振成像分析评价 Lou's 温通法治疗非哺乳期肉芽肿性乳腺小叶炎 (Granulomatous lobular mastitis, GLM) 的疗效。方法 回顾性分析 2013 年 01 月至 2019 年 07 月在浙江省中医院经病理证实且在 Lou's 温通法治疗前后均行磁共振动态增强 (DCE-MRI) 及扩散加权成像 (DWI) 检查的乳腺 GLM 初诊患者共 120 例 122 个病灶，观察及测量治疗前后各个病灶的 DCE-MRI 血液动力学参数 (包括早期强化率 EER、峰值强化率 Emax、达峰时间 Tmax 及时间-信号强度曲线类型)、病灶部位、强化方式、皮肤增厚范围、肿块数目、肿块大小、脓肿直径、皮肤破溃等指标并予以赋分，计算治疗前后积分改善率，计算公式：疗效指数 (n) = (治疗前总积分-治疗后总积分)/治疗前总积分 \times 100%。积分疗效判定如下：a)治愈：疗效指数 \geq 90%；b)显效：疗效指数 70%-89%；c)有效：疗效指数 30%-69%；d)无效：疗效指数 $<$ 30%。结果 (1) GLM 治疗前后病灶的 EER 无统计学差异 ($P=0.942$)，Emax、Tmax 差异有显著统计学意义 ($P<0.001$)，且治疗前的峰值强化率高于治疗后、达峰时间短于治疗后。GLM 治疗前后病灶的动态增强时间-信号强度曲线 I 型 (上升型)、II 型 (平台型) 和 III 型 (流出型) 分别为 46、49、27 例及 76、36、10 例，差异有统计学意义 ($P<0.001$)。(2) 治疗后疗效指标平均值：治疗后总积

分为 12.77, 治疗指数约 42.86%, 积分疗效判断为 2.98, 其中治愈、显效、有效及无效个数分别为 9、23、51、29 个, 占比分别约 7.4%、18.9%、41.8%、31.9%。结论 GLM 治疗前的峰值强化率更高、达峰时间更短。GLM 治疗前增强时间-信号强度曲线主要为上升型和平台型, 治疗后时间-信号强度曲线则以上升型最多见。Lou's 温通法对于治疗 GLM 有一定的疗效, 值得临床进一步推广使用。

狼疮性乳腺炎影像表现一例

李玲琼

深圳市人民医院

狼疮性乳腺炎是一种罕见的累及乳腺深层皮下脂肪组织的良性炎症性疾病, 本病易反复, 若不予治疗, 可出现乳房损毁性改变。本例患者女, 38 岁, 20 余年前诊断为“系统性红斑狼疮”, 7 年前患者无明显诱因左乳皮肤出现片状红斑, 伴皮肤破溃, 治疗后左侧乳房皮肤残留暗红色皮疹。2022 年 4 月乳腺 X 线表现为左侧乳腺萎缩伴营养不良钙化, 皮肤增厚, 腋窝淋巴结肿大, 磁共振显示为不均匀强化肿块。狼疮性乳腺炎的影像学表现有一定的特点, 特别是慢性期狼疮性乳腺炎, 对其的临床和影像学特征进行精确的分析, 可以避免不必要的手术或组织活检损伤。

误诊为乳腺癌的腺外型脂肪坏死

杨艳、袁贵斌

云南省第三人民医院

乳腺脂肪坏死是发生在乳房/乳腺脂肪组织的凝固或液化性坏死, 以脂肪坏死液化、慢性肉芽肿性炎症、囊肿形成及纤维化为主要特征。由于病程的进展, 病变成分的多变, 常表现多样性。

乳腺超声检查: 超声声像图亦表现多样, 早期呈低或无回声, 后方可有或无回声增强, 囊内可有壁结节或由于出血造成的脂液分层现象。随着炎症进展及纤维成分增多, 病灶的边缘从清晰到模糊再到有毛刺。病变后期表现为低或高回声肿物, 病灶可完全纤维化并伴有胆固醇结晶和钙盐沉积, 这类回声明显增高, 部分病例伴有乳腺实质结构扭曲。

乳腺 X 线摄影脂肪坏死可表现为脂性囊肿、有毛刺的肿块或结节、不对称致密影、结构扭曲、脂肪层内“片絮影”、局部粗糙钙化或微细钙化, 也可无阳性表现。脂性囊肿是病变早期的典型表现, 随着病程进展, 炎症细胞及纤维成分逐渐替代了液化坏死的脂肪组织, 故而病变中期可表现为有毛刺的结节或肿块。病变后期, 纤维组织可完全替代脂肪成分, 表现为腺体内部的不对称致密影、结构扭曲或皮下脂肪层内的“片絮影”。

MRI 图像上脂肪坏死的典型表现为圆形或卵圆形的薄壁含脂病变, 病灶内部存在脂肪信号是诊断的关键。扩散加权成像 (DWI) 不受限、表观扩散系数 (ADC) 一般不低。动态增强后, 典型的薄壁含脂病变无强化或仅轻度环形强化。随着炎症细胞浸润和周围纤维组织增生, 环壁可增厚、形态逐渐不规则。当病变内部脂肪成分完全被替代时, 可表现为不规则形伴边缘毛刺的实性肿块, 与乳腺癌近似。

该例患者病变位于乳腺外。在乳腺 X 线摄影上表现为边缘毛刺的高密度肿块, 其内未见异常钙化灶。超声表现为低回声肿块, 其内未见钙化, 可见点棒状血流。MR 表现为不均匀强化肿块, 边缘不光滑, 内可见增强的壁结节, 内部可见弧形纤维灶, 其时间-信号强度曲线为上升型, ADC 值为恶性倾向。

PU-1513

What are the application Value of Spectral CT Imaging in Quantitative Analysis of breast cancer

Xiaoyan Gou,Zhiwei LI
Suining Central Hospital

Objective:To evaluate the application value of enhanced spectral CT in breast cancer.**Methods:**54 Patients with breast cancer were retrospectively collected between November 2022 to June 2023.Each patient underwent contrast-enhanced breast CT by spectral CT within 1 week before operation.Virtual non-contrast images(VNC) were reconstructed .some parameters values of normal gland and diseased region in contrast enhancement series were measured and compared.Including Iodine concentrations(I),CT values(Hu),Effective atomic number(Z)and slope of curve from 40kev to 70kev(K).Basic statistics methods were used in the study,such as independent-sample t test,binary logistic regression analysis and ROC analysis.**Results:**There was no significant difference in CNR between TNC and VNC images($P>0.05$).SNR of VNC was significantly higher than TNC images.CTDIvol,DLP and ED of VNC images were lower than TNC images($P<0.05$).About 2.22 mSv per person could be reduced.All parameters of diseased region the arterial-phase were significantly higher than normal gland (Hu: 75.75 ± 14.13 vs 1.21 ± 8.53 ;I: 17.55 ± 6.25 vs 8.14 ± 3.45 ;Z: 8.6 ± 0.36 vs 7.94 ± 0.65 ;and K: 3.3 ± 0.97 vs 1.48 ± 0.66)($P<0.05$);respectively, and the venous-phase four parameters of diseased region((Hu: 77.20 ± 14.16 vs 40.19 ± 9.86 ;I: 21.35 ± 7.23 vs 7.01 ± 2.56 ;Z: 8.85 ± 0.39 vs 8.06 ± 0.28 ;and K: 3.53 ± 0.93 vs 1.56 ± 0.37) were significantly higher than normal gland ($P<0.05$).After further standardized data,a consistent conclusion was obtained.I/Hu/Z and K were independent risk factors for breast cancer.ROC analysis indicated that K in venous phase had the best predictive value for breast cancer,with a sensitivity of 92.40% and specificity of 91.24%,and Youden of 2.02.The AUC of combined parameters in predicting breast cancer was higher than that of single parameter.**Conclusion:**Contrast enhancement examination of spectral CT provide information of value to breast cancer,Not only does it reduce the radiation dose,but also predict breast cancer to some extent.

乳腺癌术后胸壁未分化肉瘤一例

郭丽
北京大学第一医院

目的:探讨胸部 CT 及 MRI 检查在乳腺癌术后患者中胸壁占位术前评估的应用价值

方法:分别应用胸部 CT 平扫、CT 增强及 MRI 平扫+增强检查对 1 例疑诊乳腺癌术后胸壁转移的患者进行多次随访,描述病变的影像特征,包括病变大小、血供情况及对胸壁骨质的累及范围,评估病变进展情况,并对临床手术提供相应解剖信息。

结果:第一次胸部 CT 平扫检查发现胸壁软组织内等密度占位,第二次胸部 MRI 平扫及增强检查显示病变增大并累及周围骨质,呈 T1WI 等信号、T2WI 及 DWI 呈不均匀高信号,增强 MRI 显示病变血供丰富,供血动脉来源于左侧胸廓内动脉;并显示右肺结节。第三次胸部 CT 增强检查显示局部病变及双肺内多发结节。临床根据影像资料提示,采取术前先由介入血管外科进行对病变供血动脉进行血管栓塞,随后术中射频消融,之后再行手术切除肿瘤的方式进行姑息性手术治疗,减少了术中出血。

结论:胸部 MRI 检查能够准确判断胸壁占位的血供及周围侵犯范围,对于术前评估手术难度及手术规划有很高的临床应用价值。

多模态 MR 成像对乳腺含黏液良、恶性肿瘤鉴别诊断研究

刘会佳

中国人民解放军空军军医大学西京医院

目的: 探讨动态增强扫描(DCE)及 DWI 联合应用的多模态 MR 成像对乳腺含黏液良、恶性肿瘤鉴别诊断价值。方法: 回顾性分析 2019 年 1 月-2022 年 4 月经我院病理证实的乳腺含黏液肿瘤 28 例术前 MRI 图像及临床病理资料, 依据病理分为良性组及恶性组, 比较良、恶性组的临床及 MRI 特征性表现差异性。结果: 良性肿瘤 9 例, 恶性肿瘤 19 例。恶性组发病年龄高于良性组 ($p<0.01$)。恶性组肿块形态多呈不规则形、边缘多呈不规则及毛刺样, 与良性组比较差异具有统计学意义 ($p<0.01$)。肿块大小、ADC 值及 TIC 曲线类型无统计学差异 ($p>0.05$)。恶性组动态增强早期出现环形强化、并由周围向中央填充式渐进性强化, 而良性组未出现, 差异具有统计学意义 ($p<0.01$)。恶性组 7 例肿块 T2WI 上的低信号分隔纤细并在增强后图像显示不清, 良性组 3 例肿块 T2WI 上的低信号分隔增强后显示清晰, 差异具有统计学意义 ($p<0.01$)。结论: 乳腺含黏液的恶性肿瘤患者发病年龄较良性肿瘤大, 形态多不规则, 边缘多不规则或毛刺样, 以不均匀强化为主, 可出现早期环形强化并向心性强化方式, T2WI 序列的低信号分隔于增强后显示不清为较特征性表现。

PU-1516

高场强 MRI 联合乳腺钼靶摄影对钙化型乳腺癌的诊断价值

魏梦绮、刘会佳

空军军医大学西京医院

目的: 探讨高场强 MRI 联合钼靶 X 线摄影对钙化型乳腺癌的诊断价值。

方法: 回顾性收集 2019 年 1 月至 2020 年 10 月在钼靶摄影显示有钙化且病理证实为 BI-RADS 4 类以上的乳腺癌患者 106 例。根据术前检查类型, 将患者分为实验组 59 例 (术前行钼靶与 MRI 检查) 和对照组 47 例 (术前仅行钼靶检查)。对比分析两组乳腺癌的诊断准确率。

结果: 以病理结果为金标准, 106 例患者中乳腺恶性病变 84 个, 良性病变 22 个, MRI 联合钼靶和单纯钼靶两种诊断方法的敏感性、特异性、阳性预测值、阴性预测值分别为 92.68%、82.61%、95%、76%; 81.71%、73.91%、91.78%、53.13%; 二者比较, 敏感度的差异具有统计学意义 ($P<0.05$)。实验组检出乳腺癌 50 例, 其中浸润型乳腺癌 26 例 (IDC), 导管原位癌 (DCIS) 13 例, 浸润性乳腺癌并导管内癌 8 例, 浸润性小叶癌 3 例; 良性病变 9 例, 其中纤维囊性增生 4 例, 导管上皮增生伴导管扩张 3 例, 导管内乳头状瘤 2 例。对照组诊断乳腺癌 34 例, 病理类型浸润型导管癌 21 例, 导管原位癌 1 例, 粘液腺癌例; 良性病变 13 例, 其中纤维腺瘤 4 例, 导管内乳头状瘤 3 例, 腺病 5 例, 良性分叶状肿瘤 1 例。106 例中表现为单纯钙化 67 例, 肿块伴钙化 26 例, 结构扭曲伴钙化 8 例, 非对称致密伴钙化 5 例。实验组 59 例在钼靶钙化区域, MRI 增强扫描均有不同程度肿块样及非肿块样强化。肿块样强化者, 恶性者常形态不规则, 伴有毛刺, 中央有坏死, 非肿块样强化形式多样, 恶性者主要为集丛样、簇环样, 分布以段样及线样分布为主。

结论: 高场强 MRI 联合乳腺数字化钼靶 X 线摄影诊断钙化型乳腺肿块的敏感性、准确性均高于单独使用高场强 MRI 及乳腺钼靶 X 线摄影, 且特异度明显高于高场强 MRI, 差异均具有统计学意义 ($P<0.05$)。在钙化型乳腺肿块诊断中联合应用高场强 MRI 与乳腺数字化钼靶 X 线摄影, 可显著提高诊断准确率。

DCE-MRI 影像组学及异质性分析在乳腺癌 Her-2 低表达中的预测价值

姚铭、孙双燕
吉林省肿瘤医院

目的 探讨基于 DCE-MRI 影像组学及异质性分析在免疫组化结果为阳性的乳腺癌患者中 Her-2 低表达中的预测价值。**方法** 回顾性分析 2018 年 6 月-2021 年 6 月在吉林省肿瘤医院接收手术治疗有明确病理结果且 Her-2 的免疫组化结果为阳性的 300 例女性乳腺癌患者的临床信息和 MRI 影像资料, 所有患者术前均接受乳腺磁共振平扫及动态增强扫描。根据免疫组化结果和 FISH 检测结果将患者分为 Her-2 低表达组和 Her-2 高表达组, 并比较两组间的年龄、绝经状态、影像学征象。用特征提取软件 A.K.提取病灶区域的三维纹理特征, 连同 2 个临床信息、5 个影像学征象、4 个异质性信息一起, 经使用特征筛选后, 以 7:3 比例将数据集分为训练组和验证组, 用以构建机器学习模型。采用 5 种机器学习模型包括 Logistic 回归、随机森林 (RF)、贝叶斯算法 (NB)、邻近算法 (KNN) 和决策树算法 (DT), 对数据集进行处理, 根据训练组准确率大小, 选择最佳分类器模型, 采用受试者工作特征曲线 (ROC) 分析该分类器模型对 Her-2 低表达的诊断效能。结果 Her-2 低表达组 120 例, Her-2 高表达组 180 例, 两组间年龄, 绝经状态差异无统计学意义 ($P > 0.05$)。共提取得到病灶三维区域 285 个纹理特征值, 同 2 个临床信息和 5 个影像学征象、4 个异质性信息一起进行特征筛选, 最终保留 9 个组间差异明显的特征用于构建预测模型。模型训练结果显示, RF 模型对乳腺癌 Her-2 低表达组的诊断准确率最高, 是本研究的最佳分类器, 该分类器模型在训练组的具体参数为 AUC 0.716 (0.59, 0.829), 其准确率、特异度和敏感度分别为 71.90%、84.80%和 54.20%, 在验证组 AUC 为 0.700(0.506, 0.875), 其准确率、特异度和敏感度分别为 64.0%、66.7%和 60.0%。结论 基于 DCE-MRI 的影像组学特征及异质性信息构建的机器学习模型可以用于乳腺癌 Her-2 低表达的鉴别诊断, 其中以 RF 模型的诊断效能更优。

磁共振脂肪定量技术与扩散加权成像及动态增强扫描比较在乳腺癌患者腋窝淋巴结转移诊断中的价值

胡利平、文庆怡
江西省肿瘤医院

[摘要] **目的** 探究磁共振脂肪定量技术(mDIXON-quant)在乳腺癌患者腋窝淋巴结转移诊断中的价值, 并与扩散加权成像及动态增强扫描相比较各自诊断效能。 **方法** 本研究共收集 20 例经病理证实的乳腺癌伴腋窝淋巴结肿大病例, 淋巴结总数共 45 个, 术前患者均行磁共振 mDIXON-quant、弥散加权成像 (DWI) 及动态增强扫描, 通过 mDIXON-quant 测得脂肪含量比 (fat fraction, FF) 值, 通过 DWI 获得表观扩散系数(apparent diffusion coefficient, ADC) 值, 通过动态增强扫描获取时间-信号曲线(time-intensity curves, TIC)并判断其类型。 **结果** 病理报告淋巴结阴性组 (29/45) FF 值 $21.4 \pm 4.8\%$, 淋巴结阳性组 (16/45) FF 值 $6.2 \pm 2.7\%$, 两组之间 FF 值具有明显统计学差异 ($p < 0.05$), 阴性淋巴结组 FF 值明显大于阳性淋巴结组。淋巴结阴性组 ADC 值 $(1.27 \pm 0.29) \times 10^{-3} \text{mm}^2/\text{s}$, 淋巴结阳性组 ADC 值 $(0.85 \pm 0.18) \times 10^{-3} \text{mm}^2/\text{s}$; 阴性组 TIC 曲线以“流入型”曲线为主 (20/29), 而阳性组以“平台型”、“流出型”为主 (14/16); ADC 值及 TIC 类型在两组病变鉴别中亦有统计学意义 ($p < 0.05$)。应用 FF 值、ADC 值、TIC 类型对两组病变进行判别, 敏感性分别为 (94%、81%、78%)、特异性分别为 (80%、83%、

79%)、准确性分别为 (85%、88%、81%) 结论 脂肪定量技术在判断乳腺癌腋窝淋巴结转移中有着较高的敏感性, 其特异性及准确性亦无明显减低, 有较高的诊断效能。

PU-1519

基于 MRI 的深度学习模型辅助术前评估乳腺癌腋窝前哨淋巴结状态

邢滔、张宏、余玉盛
南京市江宁医院

目的建立基于 MRI 图像的深度学习辅助诊断模型, 方便放射科医师评估乳腺癌患者腋窝前哨淋巴结是否转移。

方法回顾性分析中心 1 (训练组 139 例; 内部测试组 59 例) 和中心 2 (外部测试组 98 例), 共计 296 例乳腺癌患者的数据。构建了 6 个基于 T2WI、DWI 和动态增强图像的深度学习模型 (MobileNet V3, ShufNet V2, Inception V3, DenseNet 121, ResNet 50 及 VGG 19), 以及基于传统影像组学的支持向量机 (SVM) 模型。比较有、无最佳模型辅助的初级放射科医生评估乳腺癌前哨淋巴结转移的诊断效能。计算净重新分类指数 (NRI) 和综合判别改善指数 (IDI), 以评估使用最优模型的临床收益。**结果** ResNet 50 模型具有最佳的预测性能, 相对于 SVM 模型, 在内部和外部测试集的灵敏度分别提高了 0.101 和 0.187 ($p < 0.05$)。在模型辅助下, 初级放射科医生评估乳腺癌前哨淋巴结转移的诊断效能显著提高; 内部和外部测试组的 auc 分别提高 0.108 和 0.094 ($p < 0.05$), 敏感度提高 0.162 和 0.110 ($p < 0.05$), NRI 值分别为 0.357 和 0.264 ($p < 0.05$), IDI 值分别为 0.257 和 0.202 ($p < 0.05$)。**结论**基于 MRI 图像的深度学习模型可以帮助放射科医师实现更高的判断乳腺癌前哨淋巴结的状态, 有望为乳腺癌患者的临床决策提供更多有价值的信息。

PU-1520

基于深度学习鉴别乳腺原位癌和浸润癌的研究

孙萍
滨州医学院

乳腺癌是女性最常见的癌症, 也是女性癌症相关死亡的主要原因, 据 2020 年全球癌症最新统计, 2020 年女性乳腺癌新发病例约为 230 万例, 占女性新发癌症病例的 24.5%。乳腺癌分为原位癌和浸润癌, 二者在临床上的治疗方式不同。

近年来, 人工智能, 特别是深度学习的快速发展, 在医学图像分析领域获得大量关注, 与基于人工手动勾画感兴趣区域的影像组学相比, 实现了完全端到端的输入。目前许多研究致力于探索深度学习在乳腺癌等多种临床疾病中的应用, 并证实了深度学习在医学领域中的潜在价值。然而, 人工智能也有一定的局限性, 人工智能算法并不是对所有患者都有效。目前, 即使获得 FDA 批准的人工智能系统也很少进行前瞻性测试或在多个临床环境中进行测试。以及缺乏全面的人工智能图像解释解决方案。但是随着医疗保健专业人员越来越多地使用放射学人工智能, 随着大型语言模型不断发展, 人工智能在医学成像中的未来仍然是光明的。

为了解决上述问题, 旨在开发一种基于深度学习模型对乳腺原位癌和浸润癌进行分割和分类, 并在外部和前瞻性队列中进行测试, 另外进一步解释深度学习模型的机制, 从而帮助临床制定进一步的诊疗计划。

PU-1521

基于机器学习的多参数 MRI 对浸润性导管癌分级预测研究

郑兰卿、张祥林
锦州医科大学附属第一医院

目的:

探讨多参数 MRI (T2WI、MRI-DCE、DWI 等) 机器学习 (传统影像组学及深度学习) 模型对浸润性导管癌分级价值。

方法:

回顾性分析锦州医科大学附属第一医院 2018 年 1 月至 2023 年 4 月经术后病理证实为浸润性乳腺癌患者 200 例, 包括 200 例浸润性导管癌患者, 组织学分级低级别 (I 级+II 级) 120 例、高级别 (III 级) 80 例。采用 3.0T 磁共振扫描仪进行检查, 获得 T2WI、DWI 图像及 DCE-MRI 图像。使用 3D-SLICER 软件分别在 T2WI、DWI 和 DCE 图上勾画肿瘤感兴趣区, 在 PYTHON 上对其进行影像组学分析; 基于 T2WI、DCE、T2WI 和 DCE 联合序列提取的关键特征并使用 LASSO 进行特征筛选, 分别采用 Logistic 回归、支持向量机 (support vector machine, SVM)、决策树 (decision tree) 和朴素贝叶斯 (Naive Bayes) 以及卷积神经网络 VGG16 五种不同的机器学习算法建立模型, 并以病理检查结果为金标准, 绘制各模型的受试者工作特征 (ROC) 曲线, 计算 ROC 曲线下面积 (AUC 值)、灵敏度、特异度、准确度、阳性预测值和阴性预测值并评估模型的预测效能。同时使用概率平均法和概率投票法对单参数模型进行融合得到多参数影像组学模型重复上述对模型的测试。利用 Delong 检验进行不同机器算法模型 AUC 值的比较, 采用决策曲线分析法 (decision curve analysis, DCA) 分别评估单参数和多参数模型的临床应用价值。

预期结论:

1. 基于多模态 MRI 图像的影像组学模型可以对浸润性导管癌的分级进行预测, 并有一定的诊断效能。
2. (1) 四种不同的传统影像组学及深度学习单参数模型中, SVM 模型和 VGG16 模型对浸润性导管癌组织学分级诊断效能较优, 预测稳定性高。(2) 两种模型融合方法中概率投票法得到的多参数模型的诊断效能较优, 预测稳定性高。

PU-1522

乳导管 X 线解剖分型对导管内微小病变检出及诊断的价值

曾利¹、宫悦²

1. 新疆伊犁州友谊医院/临床医学研究院

2. 南京市全景医学影像诊断中心

【摘要】目的:探讨乳腺导管系统的 X 线解剖形态, 进一步提高对乳腺导管系统疾病的认识和诊断水平。方法:回顾性分析 373 例 435 侧乳腺导管造影资料。结果:乳腺导管的 X 线解剖形态可分为 4 型即全支型 4.6% (20/435)、多支型 53.6% (233/435)、少支型 26% (113/435) 和单支型 15.8% (69/435)。本组资料以多支型和少支型最为多见, 而全支型及单支型较为少见。结论:了解乳腺导管的 X 线解剖形态对导管系统疾病的诊断与治疗有重要价值。

PU-1523

乳腺单纯型浸润性筛状癌影像特征及与叶状瘤的鉴别诊断

双萍、盛复庚、周娟、张洪涛
中国人民解放军总医院第五医学中心

目的：分析乳腺单纯型浸润性筛状癌 MRI 及超声影像表现，并与叶状瘤鉴别，提高乳腺单纯型浸润性筛状癌的诊断水平。方法：收集解放军总医院第五医学中心经手术病理证实的乳腺单纯型浸润性筛状癌 10 例、叶状瘤 39 例，回顾性分析乳腺单纯型浸润性筛状癌 MRI 及超声影像表现，并比较单纯型浸润性筛状癌与叶状瘤的不同点。结果：单纯型筛状癌多表现为边界清楚的分叶状肿块、信号/回声均匀，MRI 动态增强扫描延迟期病灶可见中心瘢痕样强化、边缘假包膜强化；叶状瘤多数表现为分叶状肿块，信号/回声大多数不均匀；二者在形态学及超声表现上无统计学差异 ($p > 0.05$)，在 MRI 内部信号及强化特征、TIC 曲线及 ADC 值有统计学差异 ($p < 0.05$)。单纯型筛状癌超声诊断假阴性率 70%，灵敏度 30%，诊断准确率 30%，MRI 检查灵敏度 100%，诊断准确率 100%。结论：乳腺浸润性筛状癌是极少见的特殊类型乳腺癌，具有特殊的影像表现，与叶状瘤的影像表现有部分重叠，MRI 对乳腺浸润性筛状癌诊断的灵敏度、准确率均高于超声，有助于其与叶状瘤的鉴别诊断。

PU-1524

A Novel Approach for Breast Tumor MRI Classification: Vision Transformers and Majority Integration

Jinxia Zheng
The Affiliated Obstetrics and Gynecology Hospital of Nanjing Medical University, Nanjing Maternity and Child Health Care Hospital

The breast tumor is one of the most common malignant cancer in women. Precise classification of breast tumor is definitely pivotal for clinical treatment. Recently, deep learning especially the Convolutional Neural Network (CNN) is a common way to figure out this problem. In this study, The Vision Transformer method was used to classify the benign and malignant breast tumor based on magnetic resonance imaging (MRI). Besides, we implement a majority decision fusion strategy to bolster classification performance. First, we manually segmented and extracted the lesion part from the MRI images sourced from radiology department. Then we merged three grayscale images from the same person into one RGB image so that it could be put into the ViT as input. During training, we integrated early stopping and weight decay to mitigate overfitting. After that, we employed a voting mechanism. Since the MRI images for each patient are a series of images to show the three-dimensional structure of the breast. So majority-based voting mechanism was used to improve the accuracy. As a result, the accuracy of our mechanism is 89.445%, which is much better than the resnext50_32x4d (72.893%), densenet121(82.208%), and mobilenetv2_100(83.599%). As medical data continues to improve and the performance advantages of large models in addressing image-related challenges become evident, we believe that in the future, an increasing number of large models will be employed in the field of healthcare. Consequently, our work could offer valuable insights for researchers who want to achieve better performance in medicine using large models, especially for breast tumor classification .

PU-1525

乳腺钼靶 90°侧位对提高病灶显示率的价值

陆小妍

南京市第一医院

摘要：目的：探讨乳腺钼靶 90°侧位对提高病灶显示率的价值。

方法：前瞻性收集因病情需要拟行乳腺钼靶的 100 例受检者，使用全数字化钼靶乳腺 X 线机行头尾位 (CC)、内外斜位 (MLO) 检查，根据病变位置追加 90°侧位钼靶检查。比较不同检查体位对乳腺疾病的检出率，计算了各种体位检查方法在乳腺疾病诊断中的准确性、敏感性、特异性，采用 SPSS 18.0 软件对不同拍摄方法的检测结果进行统计分析，采用卡方检验， $P < 0.05$ 具有统计学意义。

1 材料与方法

拟收集该院 2021 年 10 月-2022 年 2 月 100 例受检者。首先对病人进行触诊，对怀疑有肿块，但常规体位未能显示病灶的，加拍 90°侧位。对加拍了 90°侧位的患者分析有哪些病变是常规体位显示不了的。

2 结果与分析

在 100 名患者中，常规采用头尾位和内外斜位；10 例患者在触诊过程中出现明显变化，但常规头尾位和斜内外位均未发现明显变化或不完全变化，增加 90°侧位，9 例患者在增加 90°侧位片后，变化完全显示，如图 1 所示，100 例患者中 11 例患者接受了临床手术。

3 讨论

传统的头尾位和内外斜位对乳腺病变的定位和定性非常有用，但有时不能完全满足临床需要。此时有必要制作 90°侧位。根据改变位置相对于乳房在侧斜位置和侧斜位置 90°侧向的变化，可以确定改变是在乳房内部、中间还是外部；如果相对于乳房的变化更大，或者在 90°侧向位置高于 MLO 位置，则变化发生在乳房内侧。如果变化相对于侧位 90°的乳房较低或低于 MLO 位置，则变化位于乳房的外边缘。如果 MLO 侧位和 90°侧位没有明显变化，则位于乳房中部。90°侧位的主要目的是清晰地显示焦点，无需打开腋窝，因为腋窝最好在胸部内外倾。

5 结论

在加照了 90°侧位的患者中，大多数患者乳腺病变均得到了更好的显示，大大的提高了病变的检出率，更好的避免了误诊和漏诊，进一步提高乳腺良恶性病变诊断的符合率，有利于早期发现乳腺肿瘤，具有重要临床意义。

基于 FFDM 的影像组学在预测三阴性乳腺癌中的价值

张鹏丽、马彦云

山西医科大学第一医院

目的：

本文旨在研究基于 FFDM 的影像组学特征在预测三阴性乳腺癌中的价值。

方法：

回顾性分析 200 例经病理证实为乳腺癌患者的 FFDM 图像及临床资料，依据病理结果分为三阴性乳腺癌 (TNBC) 50 例，非三阴性乳腺癌 (NTNBC) 150 例。用 3D Slicer 勾画感兴趣区并提取影像组学特征，特征选择应用 LASSO 算法进行；采用秩和检验、单因素分析及多因素 Logistic 回归筛选临床特征及 X 线特征，用 Logistic 回归构建模型，模型的预测效能用 AUC 来评估。

结果：

经 LASSO 算法筛选得到 4 个影像组学特征后计算影像组学评分, TNBC 与 NTNBC 组间初潮年龄、分娩次数、肿块伴随征象、肿块边缘的差异有统计学意义($P < 0.05$), 分别建立临床+FFDM 模型、影像组学模型、临床+FFDM+影像组学联合模型, 三种模型在训练集中的 AUC 值分别为 0.788、0.813、0.836, 在测试集中的 AUC 值分别为 0.773、0.804、0.815。

结论:

基于 FFDM 的影像组学特征结合临床与 X 线征象所构建的联合模型能够在一定程度上鉴别 TNBC 与 NTNBC, 可作为一种非侵入性的预测方式来支持临床决策。

浸润性导管癌多参数 MRI 与腋窝淋巴结转移的相关性分析

李艳隆、马贺骥
锦州医科大学附属第一医院

摘要: 目的 探讨浸润性导管癌多参数 MRI 与腋窝淋巴结转移的相关性。方法 回顾性收集 2018 年 6 月至 2023 年 2 月术前未经任何治疗并经手术病理证实为浸润性导管癌的 110 例女性患者, 根据病理结果分为 ALNM 组与非 ALNM 组, 单因素分析评估两组患者的多参数 MRI 特征及临床病理特征与 ALNM 的关系, 采用二元 logistic 回归模型分析腋窝淋巴结转移的相关因素, 并绘制 ROC 曲线分析影像特征对 ALN 转移的诊断效能。结果 浸润性导管癌 ALNM 组与非 ALNM 组患者肿瘤长径、瘤周水肿、脉管癌栓、邻近血管征、肿瘤 ADC 值、瘤周-肿瘤 ADC 比值差异具有统计学意义 ($P < 0.05$)。肿瘤长径、瘤周-肿瘤 ADC 比值、瘤周水肿及脉管癌栓是腋窝淋巴结转移的独立影响因素 ($P < 0.05$)。联合预测模型曲线下面积 AUC 为 0.932。结论 浸润性导管癌多参数 MRI 特征及临床病理特征有助于临床判断浸润性导管癌腋窝淋巴结转移情况, 利于对患者制定合适的治疗决策。

Multiparametric MRI-based radiomics value for predicting the HER2 2+ amplification status in breast cancer

Xiao guang Li
Army medical center

AbstractPurpose: The purpose of this study was to investigate the feasibility of multiparametric magnetic resonance imaging (mpMRI)-based radiomics in predicting the HER2 2+ amplification status in BC patients.Methods: A total of 107 BC patients including HER2 2+ amplified ($n = 42$) and nonamplified ($n = 65$) were enrolled and divided into a training cohort ($n = 74$) and a validation cohort ($n = 33$). The clinical and conventional MRI characteristics were used to build a clinical-imaging model. Radiomics features were extracted from T2-weighted imaging (T2WI), diffusion-weighted imaging (DWI), and the third and seventh postcontrast phases on DCE-T1WI (DCEphase3 and DCEphase7), respectively. Then, we build radiomics models based on each single sequence, mpMRI sequences, and the combination of the mpMRI radiomics model with the clinical-imaging model to differentiate HER2 2+ amplified from HER2 2+ non-amplified BCs. The area under the receiver operating characteristic (ROC) curve, sensitivity, specificity, and accuracy were calculated.Results: The clinical-imaging model for the HER-2 2+ amplification status prediction achieved an AUC of 0.733 and 0.738 in the training and validation cohorts, respectively. Among the single-sequence based radiomics models, the DCEphase7-based radiomics model achieved the best predictive performance, with an AUC of 0.874 and 0.835 in the training and validation cohorts, respectively. Among the combined models, the mpMRI radiomics model C (DCEphase7+DWI+T2WI) combinedwith the clinical-imaging model achieved the best predictive performance, with AUCs of 0.952 and 0.892 in the training and validation

cohorts, respectively. Conclusion: The mpMRI-based radiomics had the potential to predict the HER2 2+ amplification status in BC patients.

对比增强能谱 X 线摄影在乳腺癌的研究进展

吴娇、张婷婷

宜昌市第一人民医院 (三峡大学人民医院)

乳腺癌是目前发病率最高的癌症, 新增病例占比日益增加, 根据 2020 年全球肿瘤流行病学统计数据 (GLOBOCAN) 报告, 乳腺癌已经超过肺癌成为发病率最高的癌症, 2020 年大约有 230 万新增病例, 占有癌症新增病例的 11.7%, 2020 年全球大约有 68.5 万人死于乳腺癌, 致死率位居第五。乳腺癌的高发病率及高致死率已经成为威胁全球女性健康的首要因素。因此乳腺癌的早期发现、早期诊断对于提高乳腺癌患者的生存率和改善乳腺癌患者的生活质量至关重要。目前, 全视野数字乳腺 X 线摄影是乳腺筛查的首选方法, 但是对于致密性乳房来说全视野数字乳腺 X 线摄影的敏感性较低, 假阴性较高; 数字乳腺断层合成技术虽然在 FFDM 的基础上敏感性和特异性有所提高, 但其对于致密性乳房的诊断效果仍然不佳。超声虽然适合研究致密性乳房, 但是对病变内钙化不敏感; 核磁共振敏感性和特异性均较高, 但其设备要求和检查成本高, 而且不适用于少部分患者 (如装有心脏起搏器的患者、幽闭恐惧症患者等)。因此我们迫切需要一种方便、经济、易操作的新技术对乳腺疾病进行有效的评估。2003 年 Lewin 等学者首次将对比增强能谱 X 线摄影 (contrast-enhanced spectral mammography, CEM) 应用于临床。随着 X 技术的不断发展, CEM 在 2011 年成功获得了 FDA510 (k) 的批准并大量应用于临床。CEM 结合了标准二维乳腺 X 线摄影的形态学特征和动态对比增强成像的功能特征, 为伴有微小钙化灶的乳腺癌患者提供了更多更有价值的影像信息。有研究表明 CEM 的敏感性与磁共振相似, 而且其特异性、阳性预测值、阴性预测值、诊断率优于 MRI。本文就 CEM 在乳腺癌的研究进展进行综述。

基于多模态 MRI 影像组学对小乳腺癌诊断价值的研究

崔曹哲²、马彦云¹

1. 山西医科大学第一医院

2. 山西医科大学

目的: 通过挖掘 MRI 图像的影像组学特征, 建立多种用于鉴别乳腺小肿块 ($\leq 2\text{cm}$) 良恶性的机器学习模型, 探讨基于多模态 MRI 的影像组学在鉴别小乳腺癌应用方面的潜在价值。方法: 回顾性分析了行乳腺 MRI 检查并符合纳入标准的 110 名乳腺小肿块患者 (共 128 个小肿块)。分析研究对象的 T1WI、T2WI、DWI、ADC、DCE-MRI (5 个单模态组) 的 DICOM 图像及临床、病理资料。通过纹理分析软件, 采用半自动分割法于 T1WI、T2WI、DCE-MRI 图像上分割三维感兴趣区, 于 DWI、ADC 图像上分割二维感兴趣区, 并分别从中提取影像组学特征, 每位患者共提取 483 个定量特征。分平扫组, 扩散组, 增强组, 平扫联合增强组, 平扫联合扩散组, 扩散联合增强组, 平扫联合增强联合扩散组。采用基于相关性的特征选择法 (CFS) 来筛选关键特征, 分别从 5 个单模态组、3 个基本组、4 个多模态组的组学特征中选择最佳特征子集。基于 5 组单模态最佳特征子集分别建立 RF、NB、SVM 和 KNN4 类机器学习模型 (共 20 个), 比较各模型性能来选择最佳机器学习算法。将最佳机器学习算法应用于 3 个基本组、4 个多模态组的最佳特征子集来建立模型, 绘制各模型 ROC 曲线并评价其效能。结果: 128 个小肿块中, 包括 60 个良性、68 个恶性。在通过 CFS 算法分别从 5 个单模态组的影像组学特征中筛选出 9 个关键特征, 3 个基本组和 4 个多模态组各选出 12 个关键特征。通过比较基于 5 个单模态构建的 4 类分类器的 20 个模型, 基于 RF 算法构

建的分类模型对于本研究数据集有较好稳定效能, 其中 ADC 的 RF 模型诊断效能最高 (AUC0.837AC79.69%)。在三个基本组中, 基于扩散组的 RF 分类模型具有较高的诊断效能, AUC 为 0.847, 准确率为 79.69%; 在四个多模态组中, 平扫联合增强联合扩散组诊断效能最佳, 其 AUC 为 0.926, 准确率为 87.5%, 其次是扩散联合增强组 (AUC 值为 0.906, 准确率为 82.03%)。结论: 从多模态 MRI 图像中提取定量特征来构建影像组学模型对小乳腺癌的诊断有较高的价值, 其中基于平扫联合增强联合扩散组的 RF 模型诊断效能最佳。

PU-1531

FFDM 影像组学预测乳腺癌腋窝淋巴结转移的应用研究

宋瑞、马彦云
山西医科大学第一医院

目的: 探讨基于全视野数字化乳腺 X 线摄影 (full-field digital mammography, FFDM) 的影像组学在预测乳腺癌患者腋窝淋巴结 (axillary lymph node, ALN) 转移中的价值。方法: 回顾性分析 2016 年 9 月至 2021 年 9 月就诊于山西医科大学第一医院的原发性乳腺癌患者的 FFDM 图像和临床病理资料, 共纳入 407 例患者, 按照 7: 3 的比例分为训练集 (n=285) 和测试集 (n=122)。对 FFDM 图像中的肿瘤病灶进行分割, 并提取影像组学特征。使用最小绝对收缩和选择算子 (LASSO) 回归方法筛选最优特征, 并建立影像组学模型、计算影像组学评分 (Rad-score)。通过 Logistic 回归分析 ALN 未转移组 (n=242) 与转移组 (n=165) 间的临床、病理及 X 线特征并建立临床模型。根据影像组学评分和临床因素构建联合预测模型, 并绘制列线图。校准曲线和受试者工作特征 (ROC) 曲线用以评价列线图在训练集和测试集中的性能, 通过决策曲线分析 (DCA) 评估列线图的临床实用性。结果: 诊断年龄、肿瘤大小、月经状况、淋巴结触诊状态、Ki67 表达、组织学分级、肿瘤形态、肿瘤边缘、FFDM 观察淋巴结状态在 ALN 未转移与转移组间有差异 ($P < 0.05$)。多因素 Logistic 回归分析显示 4 个特征被纳入临床模型中。经筛选得到 11 个影像组学特征构建影像组学模型。联合模型列线图包括肿瘤大小、肿瘤形态、淋巴结触诊状态、FFDM 观察淋巴结状态和 Rad-score。在训练集中, 临床、影像组学及联合模型的 AUC 分别为 0.820、0.757、0.873, 在测试集中分别为 0.809、0.745、0.873。联合模型预测性能优于单独的影像组学模型和临床模型, 也优于影像科医师在 FFDM 图像上诊断 ALN 转移。结论: 基于 FFDM 的影像组学特征与临床危险因素构建的列线图, 可以帮助医生在术前评估乳腺癌患者的 ALN 状态。

PU-1532

探讨经乳腺 X 线钼靶诊断为乳腺高危结节的实际准确率。

李彪
山西医科大学第一医院

目的: 探讨经乳腺 X 线钼靶诊断为乳腺高危结节的实际准确率。
方法: 回顾性分析我院 2019 年一月-2021 年 12 月收治的经 x 线钼靶诊断为高危结节的 300 例患者的临床资料。根据病理结果来分析乳腺钼靶在高危结节的诊断价值。
结果: 乳腺 X 线钼靶诊断为高危结节中有 262 例经病理证明为乳腺恶性肿瘤, 准确率为 0.87, 有 38 例经病理证明为其他良性疾疾病, 误诊率为 0.13。
结论: 乳腺 X 线钼靶在乳腺高危结节的诊断中占有很大的价值, 为临床工作者治疗与预后做出了很大的贡献。

PU-1533

基于 DCE-MRI 影像组学特征对 Her-2 过表达的预测价值

黄静

山西医科大学第一医院

目的：探究基于 DCE-MRI 的影像组学特征在识别 Her-2 过表达型乳腺癌中的价值。材料与方法：回顾性分析 2020 年-2023 年经病理证实为乳腺癌患者的 DCE-MRI 图像及临床资料,根据病理结果将收集的病人分为 Her-2 阳性及 Her-2 阴性两组,并按照 7 : 3 的比例随机分为训练集和测试集。用 3D Slicer 软件勾画感兴趣区,分别从 DCE-MRI 瘤内及瘤周提取影像组学特征,包括形态学特征、一阶特征、二阶特征及 Wavelet 特征等。采用秩和检验、Pearson 相关分析及最小绝对收缩和选择算子(LASSO)筛选出关键特征,共选取 1-10 个特征建立逻辑回归模型,进行 10 折交叉验证,选取交叉验证集曲线下面积最高的模型为最佳组学模型。根据患者的年龄、乳腺密度、病灶位置、病灶大小、ADC 值、TIC 分型, BI-RADS 分型等进行了统计学分析,将统计学分析中 P 值<0.05 的特征进行二元逻辑回归以确定独立预测因子。利用独立预测因子建立临床模型并计算 AUC 值。将单因素分析中 P<0.05 的关键特征一起纳入多因素 Logistic 回归用于构建模型,以受试者工作特征曲线(ROC)曲线下面积(AUC)来评估模型的性能,并在 R 软件中绘制诺模图以更直观地展示模型,并绘制决策曲线评价诺模图的净收益。结果：经 LASSO 算法筛选得到的瘤内及瘤周影像组学特征后计算影像组学评分,Her-2 阳性及 Her-2 阴性间有统计学意义(P<0.05)的临床指标,分别建立影像组学(瘤内联合瘤周)模型、临床+DCE-MRI 模型、临床+DCE-MRI+影像组学联合模型,计算模型在训练集中的 AUC 值及在测试集中的 AUC 值。诺模图的校正曲线有较好的一致性,综合模型的决策曲线也有良好的净收益结论。结论：基于 DCE-MRI 的影像组学特征结合临床因素与图像征象所构建的联合模型能够在一定程度上鉴别 Her-2 阳性与 Her-2 阴性,可作为一种非侵入性的预测方式来支持临床决策。模型的临床决策曲线显示大部分情况下使用诺模图预测 Her-2 表达状态比仅使用放射组学评分或仅使用临床特征增加了更多的益处。

基于 Kaiser 评分 MRI 诊断模型建立对乳腺病变良恶性诊断的效能评估及腋窝淋巴结转移的预测

高文霞¹、盛美红²

1. 如皋市人民医院

2. 南通市第一人民医院

目的：探讨 Kaiser 评分(KS)联合表观扩散系数(ADC)及临床指标对乳腺良恶性病变诊断及乳腺癌腋窝淋巴结(ALN)转移的鉴别价值,并建立基于 KS 临床-多参数乳腺 MRI 影像诊断模型。

材料与方法：回顾性分析 2018 年 1 月至 2021 年 12 月行乳腺磁共振动态增强(DCE-MRI)且有病理结果的 389 位患者的 403 个病灶的术前磁共振及临床病理资料,依据病理结果分为良性病变组及恶性病变,将恶性病变组分为淋巴结转移阳性组及淋巴结转移阴性组。记录基于 KS 中的 MRI 图像特征、ADC 值及部分临床指标,建立基于 KS 临床-多参数 MRI 影像诊断模型,并评价其对乳腺良恶性病变的诊断效能及腋窝淋巴结转移的预测效能。

结果：本组病例中,病灶根征阳性、TIC 为 III 型、边缘不光整、年龄大、存在妇科肿瘤史(OR=7.889、7.707、4.398、1.122、0.239, P<0.05)是乳腺恶性病变的独立预测因子,多因素 Logistic 回归基于 KS、年龄、妇科肿瘤史建立基于 KS 临床-多参数 MRI 影像诊断模型。绘制两个模型的 ROC 曲线,敏感性分别为 97.4%、91.1%,特异性为 69.3%、84.2%,AUC 值为 0.912、0.950; Delong 检验显示两者的 AUC 差异有统计学意义(P=0.0059)。ALN 转移阳性组与阴性组在

乳腺癌根征 ($\chi^2=6.477$, $P=0.011$)、瘤周水肿 ($\chi^2=12.241$, $P<0.0001$)、 ADC_{mean} ($Z=10.988$, $P=0.015$) 差异有统计学意义。以乳腺癌 ALN 转移状态为标准绘制 ADC_{mean} 、KS 的 ROC 曲线, AUC 分别为 0.568、0.647。多因素 Logistic 回归分析显示水肿 ($OR=2.807$, $P=0.006$) 会增加腋窝淋巴结转移风险, 存在瘤周水肿增加腋窝淋巴结转移的风险是无此特征患者的 2.807 倍。

结论: KS 对乳腺病灶有较高的诊断价值, 基于 KS 临床-多参数 MRI 影像诊断模型有助于提高乳腺良恶性病变的诊断效能, 且乳腺 MR 原发灶存在瘤周水肿可作为乳腺癌腋窝淋巴结转移的独立预测因子, 可为临床治疗方案的选择提供指导, 为乳腺癌腋窝淋巴结预测提供一定的依据。

PU-1535

乳腺伴骨肉瘤成分的化生性癌 1 例影像学报道

程兰兰、朱娟
安庆市立医院

乳腺化生性癌 (metaplastic breast carcinoma, MBC) 是一种罕见、形态学异质且具有高度侵袭性的一种乳腺肿瘤, 于 1973 年首次被 Huvos 等报道[1], 占有浸润性乳腺癌的不足 1%, 相比常见的非特殊型乳腺癌, MBC 侵袭性更强, 预后更差[2]。乳腺化生性癌相对罕见, 化生成分复杂, 缺乏典型的临床症状及影像学特征, 术前诊断相对困难。我院收治乳腺伴间叶分化 (骨肉瘤成分) 的化生性癌 1 例, 现结合其临床、影像学表现对其报告如下, 旨在增加对此类病变的认识。

PU-1536

乳腺包被性乳头状癌的影像表现

李雪梅
复旦大学附属中山医院青浦分院

摘要 目的 分析乳腺包被性乳头状癌的影像特点。方法 回顾性分析经病理证实的 3 例乳腺包被性乳头状癌的影像表现。结果 3 例患者均为女性, 年龄分别为 57、62、69 岁。X 线表现: 2 例表现为肿块, 1 例阴性。超声表现: 3 例均为肿块, 2 例呈囊实性, 1 例呈实性, 2 例血流丰富, 1 例少许血流。MRI 表现: 2 例为囊实性肿块, 1 例实性; 增强扫描时间-信号强度曲线呈流出型 1 例, 速升平台型 2 例。ADC 值分别为 $0.99 \times 10^{-3} \text{mm}^2/\text{s}$ 、 $1.03 \times 10^{-3} \text{mm}^2/\text{s}$ 、 $1.17 \times 10^{-3} \text{mm}^2/\text{s}$ 。结论 乳腺包被性乳头状癌有一定的特征, 囊实性肿块多见, 超声及 MRI 检查能为本病的诊断提供更多的信息。

PU-1537

基于 DCE-MRI 多期全容积 ROI 临床放射组学模型预测三阴性乳腺癌

戚轩、何永胜、王武陵、杨宏楷、刘光竹、齐东
马鞍山市人民医院

目的: 对比 DCE-MRI 各期的放射组学特征在三阴性乳腺癌 (TNBC) 中的应用价值, 并联合临床特征构建临床影像预测模型, 进一步提高三阴性乳腺癌的预测价值。方法: 回顾性研究 158 例乳腺癌患者, 包括 38 例 TNBC 和 120 例非三阴性乳腺癌 (NTNBC), 以 7:3 划分训练集及验证集, 在训练集中建立临床预测模型及不同期相的 Radscore 模型, 选择最佳期相和独立的临床危险因子

联合建立临床放射组学预测模型, 绘制列线图, 利用 H-L 检验、校准曲线及决策曲线分析三组模型效能, 并采用受试者工作特征 (ROC) 曲线分析方法进一步评价三种模型的诊断性能。结果: 对训练集的数据进行回归分析, 结果显示 WHO 分级、边界及 T2WI 信号与 TNBC 存在显著相关, 且是 TNBC 的独立危险因子 ($P=0.004$ 、 0.010 、 0.006)。结合这三个参数建立临床模型, 在训练集和验证集中产生的 AUC 分别为 0.867、0.843。对 8 期增强数据进行放射组学特征提取、筛选和构建模型, 最终显示基于 DCEphase7 建立的放射组学模型效能最好。DCEphase7 数据共筛选了 7 个最有价值的特征, 利用这 7 个特征建立了放射组学模型, 在训练集中的 AUC 为 0.818, 诊断准确性为 0.786, 在验证集中的 AUC 为 0.777, 诊断准确性为 0.707, 校准曲线显示 TNBC 真实状态与预测模型之间具有良好的一致性 ($P>0.05$)。结合临床模型及 DCEphase7 放射组学模型建立临床放射组学预测模型, 并以诺模图形式将其可视化, 使用 ROC 曲线对模型进行评估, 在训练集中的 AUC 为 0.936(0.891-0.980), 诊断准确性为 0.837, 在验证集中的 AUC 为 0.886(0.780-0.992), 诊断准确性为 0.732, 与单独的临床模型、放射组学模型相比, 临床放射组学模型具有更高的 AUC, 校准曲线和决策分析曲线显示其对 TNBC 的预测概率与真实状态之间具有良好的一致性 ($P>0.05$)。结论: 基于 DCE-MRI 的放射组学模型在预测 TNBC 方面具有潜在的价值, 为术前 TNBC 的个性化预测提供直接、无创的检查方法, 在预测 TNBC 不同亚型中具有较大应用前景。

PU-1538

磁共振扩散加权成像表观扩散系数对乳腺癌新辅助化疗病理反应的预测价值研究

陈芬芬

安徽医科大学第二附属医院

目的 探讨磁共振 (MRI) 扩散加权成像 (DWI) 表观扩散系数 (ADC) 对乳腺癌新辅助化疗 (NAC) 病理反应的预测价值。

方法 回顾性分析经病理确诊为乳腺癌并行 NAC 的 96 例女性患者, 所有患者均于 NAC 前、NAC 结束后术前 1~2 周内行乳腺 MRI 检查。分别测得肿瘤 NAC 前 ADC 值 (ADC-pre)、NAC 后 ADC 值 (ADC-post), 并计算 ADC 值变化率 ($\Delta\text{ADC}\%$)。根据术后病理 Miller-Payne (M-P) 分级结果, 将患者分为病理完全缓解 (pCR) 组和非病理完全缓解 (非 pCR) 组, 比较两组间临床、病理及影像学特征的差异, 同时分析肿瘤 NAC 前、后 ADC 值及其变化率与病理 M-P 分级之间的关系。

结果 96 例乳腺癌患者中 NAC 后共 27 例 (28.1%) 患者达到 pCR。不同 M-P 分级组间 ADC-post 和 $\Delta\text{ADC}\%$ 总体比较均存在统计学差异 ($P<0.001$); ADC-post、 $\Delta\text{ADC}\%$ 与 M-P 分级均呈正相关 ($r=0.611$, $P<0.001$; $r=0.629$, $P<0.001$)。单因素分析结果显示, pCR 组与非 pCR 组间, 孕激素受体 (PR) 状态、人表皮生长因子受体-2 (HER-2) 状态、分子亚型、是否放射学完全缓解 (rCR)、ADC-post 及 $\Delta\text{ADC}\%$ 差异有统计学意义 ($P<0.05$); 多因素 Logistic 回归分析结果显示, $\Delta\text{ADC}\%$ 、PR 状态及是否 rCR 是预测乳腺癌 NAC 后 pCR 状态的独立因素 ($P<0.05$)。以 $\Delta\text{ADC}\%\geq 45.5\%$ 为阈值, 诊断 pCR 的受试者工作特征 (ROC) 曲线下面积 (AUC) 为 0.782, 敏感度为 77.8%, 特异度为 73.9%。联合 $\Delta\text{ADC}\%$ 、PR 及 rCR 三者的预测模型诊断 pCR 的 AUC 为 0.879, 敏感度为 85.2%, 特异度为 82.6%。

结论 乳腺癌患者 NAC 前后肿瘤 ADC 值变化率对其新辅助化疗病理反应有一定预测价值。

PU-1539

乳腺癌患者一期乳房重建中的最佳植入物大小：基于对侧乳房体积的研究

杜晓岚

云南省昆明市延安医院

目的：本研究旨在基于磁共振（MRI, magnetic resonance imaging）容积扫描测量乳房体积，根据两侧乳房的不对称值和不对称比，为医生在乳房重建术中选择合适的假体提供指导。**方法：**回顾性收集 2020 年 1 月 1 日-2023 年 1 月 1 日期间在云南省肿瘤医院接受单侧一期乳房重建术并行检查的 98 例患者。收集患者身高、体重、BMI 指数、重建方式等临床资料。通过重建程序（3D slicer）将 MRI 图像转化为三维图像，测量假体体积与术中实际置入的假体体积进行一致性比较，分析实际体积与对侧乳房体积的相关性。基于 MRI 测量左右乳房体积，根据不对称值和不对称比对术后双侧乳房的对称性进行评估。分析不对称比和不对称值与 BREAST-Q 量表中的乳房满意度及结局满意度之间的关系。**结果：**体重、BMI 指数高低组间的不对称比有显著差异。从 MRI 三维重建图像中测量得到的假体体积与术中记录的假体体积有较高的一致性（ $r=0.979$, $P<0.05$ ），尽管存在个体差异，总体上假体体积与对侧乳房体积仍然呈中度相关（ $R^2=0.393$, $P<0.05$ ）。乳房对称组的乳房满意度评分和结局满意评分均高于不对称组（ $P<0.05$ ），且不对称比与二者评分均呈中度负相关。**结论：**基于 MRI 的乳房容积测量是一种有效的方法，可以更准确和客观地估计一期乳房重建术中合适的假体体积，制定更科学的乳房重建计划，并减少乳房体积不对称程度，提高患者术后乳房的满意度和结果满意度。

能谱 CT 对腹壁下动脉在穿支皮瓣乳房再造的价值探索

苟晓燕

遂宁市中心医院

摘要：**目的：**探讨能谱 CT 联合低 KeV 技术对改善腹壁下动脉穿支皮瓣图像、进行三维成像,研究其血管走形及穿支情况,及在临床女性乳房再造中的价值。**方法：**前瞻性收集 2023.01-2023.08 在我院拟行乳房再造的 12 例女性患者(年龄: 45 ± 8.91)。术前均行能谱 CTA 双期扫描,重建获得 40~140 keV(间隔 10 keV)11 组单能量图像及常规 120 kVp-like 图像。分析比较各低 KeV 图像及常规 120 kVp-like 图像中腹主动脉(AA)、腹壁下动脉(DIEP)及腹壁下静脉(SEV)的 CT 值、SD 值、信噪比(SNR)和对比信噪比(CNR),利用不同 KeV 重建图像对腹壁下动脉行容积再现和最大密度投影,由 3 名医师进行主观评分。采用 ANOVA 单因素方差分析和 Wilcoxon 秩和检验对数据进行统计学分析。**结果：**腹壁下动脉伴行静脉的解剖结构主要表现为 3 类:独立型, Y 形结构; H 形结构。40-50KeV 重建图像各血管 CT 值及 SD 值均高于 50-140KeV 图像及常规 120 kVp-like 图像,差异具有统计学意义（ $P<0.05$ ），图像 SNR 及 CNR 最高为 4.64 ± 1.32 (50-60KeV), 高于其他组, 差异具有统计学意义（ $P<0.05$ ）,其中 40-60KeV 重建图像对腹壁下动脉远端细节显示更多, 主观评分最高。**结论：**利用能谱 CT 单能量技术有利于提高腹壁下动脉的 CT 值, 提升背景组织和腹壁下动脉之间的对比度, 改善成像质量; 能谱 CT 联合低 KeV 重建技术在 DIEP 皮瓣乳房再造领域的供区穿支定位、受区血管选择方面具有可观的应用潜力

PU-1541

不同时间点贝伐珠单抗对创伤半暗带脑水肿的影响

艾莉、鲁宏

重庆理工大学附属中心医院

目的：探讨大鼠中度脑创伤后不同时间点贝伐珠单抗对创伤半暗带区脑水肿的影响，明确贝伐珠单抗治疗创伤性脑水肿的治疗时间窗以及最佳治疗时间点。方法：通过建立大鼠中度脑创伤模型，选择在创伤后 1h、6h、12h 经大鼠尾静脉分别给予同一剂量的贝伐珠单抗进行治疗，采用 HE 染色及透射电镜评价贝伐珠单抗治疗前后创伤半暗带区脑组织在病理学上的改变；应用 CD31 免疫组化染色明确治疗前后创伤组与治疗组创伤半暗带区微血管数量，判断血管新生受抑情况；Western Blot 技术测定创伤半暗带区血管内皮生长因子（VEGF）和 IgG 的蛋白含量，检测不同时间点贝伐珠单抗对 VEGF 表达的抑制作用和血脑屏障通透性降低程度。结果：各治疗组创伤半暗带区脑组织的细胞内水肿和血管源性水肿均显著减轻，尤其是 TBI+贝伐珠单抗 1h 治疗组减轻最为明显，血脑屏障的结构亦得到稳定；各治疗组 VEGF-A 和 IgG 表达量均显著下降，并随观察时间的推移而逐渐降低，其中 TBI+贝伐珠单抗 1h 组下降最为显著（ $p<0.001$ ）；各治疗组创伤半暗带区的血管新生受到抑制，TBI+贝伐珠单抗 1h 组新生血管数量最少。结论：

贝伐珠单抗通过抑制 VEGF 的表达调控血脑屏障功能减轻创伤半暗带区的脑水肿，从而达到挽救创伤半暗带、治疗创伤性脑损伤的目的。脑创伤后 1h、6h、12h 给予贝伐珠单抗进行治疗均能减轻创伤半暗带区的脑水肿，但以 1h 给药疗效最显著，推测创伤后 12h 内可能是贝伐珠单抗治疗创伤性脑水肿的“治疗时间窗”，1h 可能是其最佳治疗时间点。

基于 DKI 的颞叶癫痫伴睡眠障碍患者大脑白质结构研究

郭敏

空军军医大学第一附属医院

目的 基于扩散峰度成像(diffusional kurtosis imaging, DKI)探究颞叶癫痫(Temporal lobe epilepsy, TLE)合并睡眠障碍患者的脑白质微观结构改变。材料与方法 前瞻性纳入 TLE 患者 38 例，健康对照组 20 例，向受试者发放睡眠调查问卷评估其睡眠状况，根据睡眠障碍的诊断标准和量表评分将患者分为合并睡眠障碍及未合并睡眠障碍组。采集所有受试者 DKI 序列并测量相关感兴趣区(region of interest, ROI)平均扩散峰度(mean kurtosis, MK)、平均扩散系数(Mean diffusivity, MD)和分数各向异性(fractional anisotropy, FA)三个扩散参数。使用独立样本 t 检验、单因素方差分析比较睡眠质量评分、DKI 参数的组间差异。结果 合并睡眠障碍的 TLE 患者 Epworth 嗜睡量表(Epworth Sleepiness Scale, ESS)、阿森斯失眠量表(Athens Insomnia Scale, AIS) 评分及匹兹堡睡眠质量指数(Pittsburgh Sleep Quality Index, PSQI)均高于对照组($P<0.05$)。TLE 患者较健康对照的 FA、MK 值明显减低，MD 值明显升高 ($P<0.05$)；合并睡眠障碍的 L-TLE 患者 MK、FA 值较未合并睡眠障碍者明显减低($P<0.05$)，未发现 MD 存在组间差异($P>0.05$)；合并睡眠障碍的 R-TLE 患者 MK 值较未合并睡眠障碍者明显减低($P<0.05$)，未发现 MD、FA 存在组间差异($P>0.05$)。结论 合并睡眠障碍的 TLE 患者存在特异性大脑白质纤维损伤模式，利用 DKI 序列可以为该类患者的治疗效果和预后评估提供可靠的影像学标记物。

PU-1543

糖尿病纹状体病的影像表现特点分析

代津

乌兰察布市中心医院

乌兰察布市中医蒙医医院

包头医学院乌兰察布临床医学院

目的: 分析糖尿病纹状体病的影像表现特点。

方法: 分析我所收集的 3 例糖尿病纹状体病患者的 CT、MRI 表现特点, 并对比其临床表现。

本组收集近一年来的 3 例病例, 均为男性患者, 2 人为中年, 1 人为 18 岁少年。三位患者患糖尿病多年, 均未经正规治疗, 临床上均以突发意识障碍而紧急就诊。其中, 两例未出现糖尿病酮症酸中毒, 一例出现酮症酸中毒。入院后即行螺旋 CT, GE16 排螺旋 CT 机检查, 采用轴位扫描, 层厚、层间距均为 3mm; 待症状稍平稳后行 MRI 检查, Philips 3.0T, 检查时采用轴位 T1WI、T2WI、FLAIR 及 DWI 序列, 层厚 3mm、层间距 0.3mm, 视野 22, 矩阵 320X256, 回波链长度 24, 激励次数 4。

结果:

三例患者 CT 检查征象上, 均表现为一侧或双侧不对称的基底节区高密度影, 周围无明显水肿带。其中 2 例临床表现偏身舞蹈症, 1 例无偏身舞蹈症, 随即行 MR 检查。MR 征象上表现为一侧或双侧不对称的尾状核、壳核 T1WI 稍高 T2 信号、FLAIR 及 DWI 序列均呈混杂信号, 周围无明显水肿信号。结合病史考虑为高血糖损伤基底节区灰质结构。经降血糖、营养神经及改善微循环等治疗后复查, 二例临床症状消失, 2 月复查 MRI 见病灶已软化: 一例临床症状明显改善, 复查 MRI 见病灶范围明显缩小, 无 MRI 水肿信号演变规律。糖尿病高血糖导致基底节损害, 主要累及尾状核头部及壳核, 也可累及苍白球, 偶可延及到中脑, 单侧或双侧受累。CT 一般表现为高密度影, CT 值约 -55H, 略低于新鲜出血(60-80HU), MRI 检查一般表现为 T1 呈高信号、T2 呈低信号; Flair 及 DWI 序列呈低信号; 且因其急性起病, 影像学表现较为特殊, 多见于老年患者, 容易误诊为高血压性脑出血。

结论:

糖尿病纹状体病的影像表现具有明显的特异性, 偏身舞蹈症患者多具有典型的纹状体影像表现, 但是糖尿病纹状体病并不一定表现出偏身舞蹈症的典型临床表现

PU-1544

噪声性耳聋大鼠下丘和腹外侧眶皮层局部一致性与焦虑抑郁样行为的关系研究

陈宇辰

南京市第一医院

目的 利用静息态功能磁共振 (functional magnetic resonance imaging, fMRI) 技术探讨噪声性耳聋大鼠下丘和腹外侧眶皮层局部一致性与焦虑抑郁样行为的关系。方法 本研究采用宽带强噪声 122 分贝暴露 2 小时诱导双侧严重听力损失, 正常对照大鼠置于环境噪声。通过听觉脑干反应检测两组大鼠的听力情况, 并采集行为学 (旷场实验) 和静息态 fMRI 数据。针对大鼠全脑进行局部一致性分析, 计算其与焦虑抑郁样行为特征的相关性。结果 听觉脑干反应结果显示噪声暴露后大鼠全频段听阈大于健康对照, 并在旷场实验中出现明显的焦虑抑郁样行为, 即低活动水平 (包括总移动距离和平均移动速度的减少)。与正常对照组相比, 噪声性耳聋大鼠下丘的局部一致性显著增强, 而腹外侧眶皮层的局部一致性显著降低, 且异常神经活动出现偏侧性。相关性分析显示下丘的神经

活动与噪声暴露大鼠在旷场中移动的总距离呈负相关($r=-0.691$, $p=0.013$), 而腹外侧眶皮层的神经活动与旷场焦虑抑郁样行为并未发现明显的相关性。结论 噪声性耳聋大鼠大脑下丘神经活动与焦虑抑郁样行为密切相关, 而腹侧眶皮层可能与其他行为有关, 有助于阐明耳聋大鼠出现中枢障碍的神经病理学基础。

PU-1545

血管内淋巴瘤的影像特点初探：附 1 例病例及文献复习

冯宇宁、张海飞
深圳市第二人民医院

目的 探讨基于 1 例病例报道的血管内淋巴瘤的影像特点及鉴别诊断价值。

方法 回顾性分析深圳市第二人民医院血液内科于 2023 年诊断的 1 例表现为颅脑、股骨、腹部脏器等多种影像表现的血管内淋巴瘤患者, 对其临床特点和头颅、胸部、腹部、股骨等 CT、MR、PET-CT 等多种影像学资料、病理学及免疫组织化学标记结果进行归纳总结, 并进行相应的文献温习。

结果 此例患者为男性, 50 岁, 因“体检发现胃体隆起, 肠息肉 6 天”来诊。头颅磁共振成像示双侧放射冠、基底节区脑白质区多发斑片状 T2WI 高信号病灶, 增强扫描双侧放射冠多发线状强化。胸部 CT 示纵膈多发增大淋巴结。骨盆 CT 示双股骨上段病灶, 伴周围软组织水肿。腹部 CT 示门脉高压, 脾脏低强化灶。头颅 MRA 未见异常。PET-CT 示右侧颞上回轻度肿胀伴糖代谢轻度增高。肝、胰腺、脾脏、肾上腺多发糖代谢增高灶, 全身多处骨质、骨髓代谢增高。病理学检查示(右股骨)淋巴造血恶性肿瘤。免疫组化结果: CD10 (-), C-MYC (30%+), CyclinD1 (-), ALK(D5F3) (-), ALK-Neg (-), CD30 (-)。原位杂交结果: EBER (-)。(右股骨肿瘤)结合免疫组化标记、原位杂交及分子检测结果, 符合弥漫性大 B 细胞淋巴瘤伴血管内瘤栓, 非生发中心亚型, 确诊血管内淋巴瘤。

结论 血管内淋巴瘤在临床上少见病, 病情进展迅速, 预后不良, 早期诊断和治疗是重点。确诊依靠活体组织病理免疫检查。影像学表现为全身多器官多发病灶, PET-CT 提示高代谢, 要考虑到造血淋巴系统病变的可能。头颅 MR 增强扫描示病灶呈多发线条状强化, MRA 血管无异常的患者, 要注意血管内淋巴瘤的鉴别诊断, 鉴别诊断包括中枢神经系统血管炎及脑淀粉样血管病等疾病。

Alterations in Structural Integrity of Superior Longitudinal Fasciculus III Associated with Cognitive Performance in Cerebral Small Vessel Disease

Yifan Wang¹, Tianyao Wang², Zekuan Yu³, Mengwen Ye³, Jun Liu⁴

1. Fudan University Eye Ear Nose and Throat Hospital

2. Renji Hospital, Shanghai Jiao Tong University School of Medicine

3. Academy for Engineering and Technology, Fudan University

4. Tongren Hospital, Shanghai Jiao Tong University School of Medicine

Purpose: This study aimed to investigate the alterations in structural integrity of superior longitudinal fasciculus (SLF) subcomponents with increasing white matter hyperintensities (WMHs) severity as well as the relationship to cognitive performance in cerebral small vessel disease (CSVD).

Methods: 110 CSVD study participants with WMHs were recruited. According to Fazekas grade scale, WMHs of each subject was graded. And all subjects were divided into two groups. Region of interest based analysis was used to analyze diffusion properties of important white matter fiber

tracts throughout brain. Probabilistic fiber tracking method was used for analyzing microstructure characteristic of SLF subcomponents.

Results: The region of interest based analysis results showed increased mean diffusion, radial diffusion and axial diffusion values of bilateral superior fronto-occipital fasciculus, SLF, anterior limb, posterior limb and retrolenticular part of internal capsule, posterior corona radiata, and external capsule in participants with higher WMHs ($p < 0.05$). Probabilistic fiber tracking results showed that mean diffusion, radial diffusion and axial diffusion values of bilateral arcuate fasciculus and left SLF III in high WMHs score group were significantly higher than those in low WMHs score group ($p < 0.05$). The mean diffusion value of left SLF III was negatively related to Montreal Cognitive Assessment score of study participants ($p < 0.05$).

Conclusions: The structural integrity injury of bilateral arcuate fasciculus and left SLF III is more severe with the aggravation of WMH. The structural integrity injury of left SLF III correlates to cognitive impairment in CSVD.

PU-1547

Diffusion tensor imaging combined with nerve fiber bundle tracing in acute cerebral infarction

Peng Ji

The Third People's Hospital of Hefei,

Objective: The early diagnosis and judgment of clinical prognosis directly affect the treatment effect and reha_x0002_bilitation of cerebral infarction. This study aims to observe the corticospinal tract (CST) condition and its relationship with motor function in patients with acute cerebral infarction. Methods: A total of 21 patients with unilateral acute cerebral infarction diagnosed by conventional magnetic resonance imaging (MRI) and diffusion tensor imaging (DTI) were included in this study. The fractional anisotropy (FA) and diffusion tensor tractography (DTT) maps were reconstructed to determine the specific FA and DCavg values. The correlation between the FA and DCavg value and the modified Edinburgh Scandinavian scale score (MESSS) was analyzed. Results: The FA and DCag values in the cerebral infarction area were (0.18 ± 0.09) and (5.16 ± 1.06) $10^{-3} \text{ mm}^2 / \text{s}$, respectively. These values were significantly lower than that of corresponding parts on the healthy side ($P < 0.05$). The FA and DCavg values in bilateral cerebral peduncles have no statistical significance ($P > 0.05$). The CST on the lesion side shows compression, displacement, deformation, and interruption. The degree of injury of the CST is related to clinical neurological symptoms. The FA ($r = 0.772$) and DCag values ($r = 0.827$) in the cerebral infarction area had a high positive correlation with the MESSS. Conclusion: The DTI can noninvasively display the injury degree of the CST in cerebral infarction, which helps judge the impairment of motor function and predict the prognosis.

PU-1548

Atypical meningiomas with multiple extracranial metastases: A case report

Yipei Song, mengyao 胡, lianggeng 龚

南昌大学第二附属医院医学影像中心

Abstract:

Objective: Atypical meningiomas (AM) are highly heterogeneous and invasive, exhibiting biological characteristics that fall somewhere between those of benign and malignant

meningiomas. The study aims to improve the understanding of atypical meningiomas and reduce misdiagnoses and missed diagnoses in clinical settings. By analyzing a rare case of multiple extracranial metastases, the study hopes to raise awareness of the disease's aggressive nature and the need for regular follow-up imaging examinations and aggressive treatment to improve patient outcomes.

Method: We report a rare case of AM with multiple metastases to the thorax, abdomen, and bone, but without intracranial recurrence. A 64-year-old female patient presented to the Neurosurgery Department of xx Hospital in September 2018 due to a three-month history of headache. Brain MRI suggested a possible hemangiopericytoma. Chest CT showed no apparent abnormalities. With the assistance of neuro-navigation, the doctor opened the skull through the right midline frontotemporal flap and saw that the tumor was encroaching on the skull and eroding the capitellar tendon, with poorly defined tumor margins and extremely rich blood supply, and removed it completely after freeing the tumor margins. Postoperative follow-up head MRI showed complete resection of the right frontal lesion. Pathological findings suggested an atypical meningioma (WHO grade II). After discharge, the patient underwent brain MRI scans every 6 months during follow-up visits, and no signs of tumor recurrence were detected. In October 2021, the patient was admitted to the hospital due to persistent chest pain. Enhanced CT of the chest revealed the presence of multiple masses of varying sizes adjacent to the spine and pleura, extending into the abdominal cavity. The enhancement was significantly uneven, and the border between the liver parenchyma and the right kidney was blurred. Pathological features: puncture of the pleural mass, HE-stained tumor cells were spindle-shaped or oval, arranged in a swirl shape, infiltrative growth, and extensive necrosis. Immunohistochemical results: the patient's epithelial membrane antigen (EMA)、vimentin and CD34 were all positive, and the Ki-67 proliferation index was high (hot spot>20%) . Combined with the patient's right frontal AM medical history, the final pathological diagnosis was metastatic meningioma after biopsy and immuno-omics examination of the pleural lesion.

Result: The report indicates that metastases exhibited anaplastic characteristics, including cellular pleomorphism, nuclear atypia, and a high Ki-67 index. Immunohistochemistry and molecular pathology methods have been effectively utilized in the grading and typing of meningiomas. The markers EMA and Vimentin are preferred auxiliary diagnostic markers for meningioma, specifically for identifying epithelial and mesenchymal tissue. These markers are used to differentiate between different types of meningiomas and aid in diagnosis.

Conclusion: Our study presents a unique case of AM with multiple metastases, excluding intracranial recurrence, where the pleura was extensively affected. Our findings highlight the importance of early detection and prompt treatment in patients with prior intracranial meningeal tumors, particularly WHO grade II-III meningiomas, to enhance the overall prognosis. We recommend regular brain MRI to exclude in situ or borderline recurrence, as well as whole-body imaging to identify metastases.

PU-1549

1H-MRS 及行为学综合评价神经干细胞与脑源性神经营养因子联合治疗 APP/PS-I 转基因 AD 小鼠的疗效

李铭华、王培军
上海市同济医院

目的: 利用 7T 高场强 1H-磁共振波谱观察 APP/PS-I 转基因 AD 小鼠 NSCs 与脑性神经营养因子联合治疗后海马区的神经代谢改变, 并结合行为学综合评价 NSCs 移植治疗 AD 疗效。

方法: 获取胎鼠海马区的 NSCs, 贴壁法体外扩增培养, 增强型绿色荧光蛋白 (enhanced green fluorescent protein, EGFP) 转染。36 只 12 月龄的 APP/PS-I 转基因 AD 小鼠分为 3 组, 每组 12 只, (1) 联合组: 移植转染 EGFP 的 NSCs 至双侧海马 CA1 区, 经侧脑室注射 BDNF; (2)

NSCs 组：移植转染 EGFP 的 NSCs 至双侧海马 CA1 区；（3）对照组：注入 PBS 至海马 CA1 区。移植后 6 周，应用 7.0T 磁共振仪进行小鼠脑部海马的 1H-MRS 检测；同时应用 Morris 水迷宫定航实验测定各组小鼠的逃避潜伏期。取小鼠脑组织切片经 EGFP-A β 免疫荧光双标记染色。

结果：移植后联合组及 NSCs 组小鼠海马 CA1 区的 NAA/Cr 值、MI/Cr 值较对照组升高 ($p<0.05, p<0.01$)，并且联合组的 NAA/Cr 值亦高于 NSCs 组 ($p<0.01$)。

定位航行试验中，联合组、NSCs 组及对照组小鼠逃避潜伏期差异均有差异 ($p<0.05, p<0.01$)，三组的逃避潜伏期逐渐延长。各组小鼠的平均逃避潜伏期与 NAA/Cr 值呈负相关 (Pearson 相关系数为 -0.906, $p<0.01$)。联合组、NSCs 组小鼠海马区可见移植细胞，部分分化为神经元，部分分化为胶质细胞。

结论：NSCs 和 BDNF 联合治疗较单独使用 NSCs 能更好地改善转基因 AD 小鼠的学习记忆能力。7T 高场强 1H-MRS 作为一种活体、无创的检查方法可以检测转基因 AD 小鼠的 NSCs 移植治疗后的代谢改变，结合行为学检查能够对其疗效作出更客观、有效的评价。

Multiparametric MRI-based fusion radiomics for predicting telomerase reverse transcriptase promoter mutations and progression-free survival in glioblastoma: A multicentre study

Hongbo Zhang^{1,3}, Hanwen Zhang², Beibei Zhou³, Yuze Zhang¹, Biao Huang¹

1. Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University

2. Department of Radiology, The First Affiliated Hospital of Shenzhen University, Health Science Center, Shenzhen Second People's Hospital

3. Department of Radiology, The Seventh Affiliated Hospital, Sun Yat-sen University

Purpose

Glioblastoma (GBM) with telomerase reverse transcriptase (TERT) promoter mutation is highly invasive, has a high recurrence rate, and requires a large range of Intraoperative radiotherapy. However, intraoperative frozen pathology is unlikely to reveal molecular genetic information about the tumour. This study aimed to evaluate the performance of multiparametric MRI-based fusion radiomics models (MMFRs) to predict TERT promoter mutation status and progression-free survival (PFS) in patients with GBM.

Methods

We retrospectively studied 208 patients with GBM from two hospitals. Institution 1, 85 and 36 patients were randomly assigned to a training and internal validation set, respectively. The external test set comprised 87 patients at Institution 2. Quantitative imaging features were extracted from each patient's T1-weighted, T1-weighted contrast-enhanced, and T2-weighted preoperative images. Using a coarse-to-fine feature selection strategy, four radiomics signature models were constructed based on each of the three MRI sequences and their combination for TERT promoter mutation status and PFS; model performance was subsequently evaluated. Furthermore, we performed subgroup analyses of patients by the radiomics signature of TERT promoter mutation status and PFS to distinguish patients who could benefit from prolonged temozolomide chemotherapy cycles. All statistical and machine-learning algorithms were implemented using R software (version 4.1.3).

Results

TERT promoter mutation status was best predicted by MMFR, with an area under the curve (AUC) of 0.816 (95% CI, 0.718–0.913) and 0.812 (95% CI, 0.664–0.960) for the training and internal validation sets, respectively. The external test set also achieved stable and optimal prediction results, with an AUC of 0.823 (95% CI, 0.716–0.931). MMFR showed better performance in predicting patient PFS compared to the single-sequence radiomics signature (C-index, 0.643, 95%

CI: 0.546–0.740). Subgroup analyses showed that patients with high TERT promoter mutation and survival rates may benefit from prolonged temozolomide chemotherapy cycles.

Conclusions

MMFR is an effective method to predict TERT promoter mutations and PFS in patients with GBM. Moreover, subgroup analysis could differentiate patients who benefited from prolonged TMZ chemotherapy cycles.

PU-1551

基于影像组学应用 T2WI 预测脊髓弥漫中线胶质瘤 H3 K27 改变的研究

李俊杰、刘亚欧、段云云、卓芝政、孙君、曲丽莹、武明豪、郭敏
首都医科大学附属北京天坛医院

目的：常规 MRI 不足以识别脊髓弥漫中线胶质瘤（SC-DMG）H3 K27 的改变状态。本研究旨在基于术前 MR T2 加权图像（T2WI）开发一种基于放射组学的模型，以确定 SC-DMG 中 H3 K27 的改变状态。

材料和方法：回顾性入组 97 例 SC-DMG 患者，并将其随机分为训练组（n=67）和测试组（n=30）。首先从 T2WI 上自动分割肿瘤并提取 107 个放射学特征，然后通过 Pearson 相关系数和 Kruskal-Wallis 检验选择 11 个特征，用这些特征来训练和测试用于预测 H3 K27 改变状态的逻辑回归（LR）模型。使用随机划分训练集和测试集以及使用其他分类器进行敏感性分析以进行比较。通过确定模型的准确性、敏感性、特异性和曲线下面积（AUC）来评估模型的性能。最后，前瞻性 28 例 SC-DMG 患者用于独立验证 LR 放射组学模型。

结果：放射组学模型准确预测了 H3 K27 的改变状态，在测试和前瞻集中的准确度分别为 0.833 和 0.786，灵敏性分别为 0.813 和 0.750，特异性分别为 0.857 和 0.833，AUC 分别为 0.839 和 0.818。敏感性分析证实了模型的稳健性，预测准确性为 0.767-0.833。

结论：基于术前 T2WI 的放射组学特征可以准确预测 SC-DMG 中 H3 K27 的改变状态，这可能有利于患者精准治疗。

动脉自旋标记（ASL）指标与动态磁敏感增强灌注成像（DSC-PWI）参数在缺血性脑卒中诊断及预测患者预后的对比研究

刘畅
安徽省立医院

目的 比较动脉自旋标记（ASL）指标与动态磁敏感对比增强灌注成像（DSC-PWI）参数在缺血性脑卒中患者血流动力学改变的相关性。并探讨 ASL 中动脉穿行伪影（ATA）对脑卒中患者预后的预测价值。方法 选择我院动脉狭窄/闭塞患者 80 例。所有患者均完成 ASL 及 DSC-PWI 扫描。通过随访结果，将患者分为再发缺血性卒中组和未再发缺血性卒中组，比较两组患者的影像学指标（ASL-CBF、PWI-CBF、PWI-CBV、PWI-MTT、PWI-TTP）在评估脑血流动力学方面参数的相关性。结果 1.ASL-CBF（PLD=1.5S）与 PWI-CBF、PWI-CBV 具有统计学差异（ $P<0.05$ ）；经 Kappa 分析，ASL-CBF（PLD=1.5S）与 DSC-PWI 参数中 PWI-TTP 具有较好的一致性。2. ASL-CBF（PLD=2.5S）与 PWI-MTT、PWI-TTP 具有统计学差异（ $P<0.05$ ）；ASL-CBF（PLD=2.5S）与 PWI-CBF 具有较好的一致性。3.80 例患者中，共 46 例患者的 ASL 图中出现动脉穿行伪影。随

访结果,再发缺血性卒中组 24 例,其中 8 例患者 ASL 图中出现动脉穿行伪影,未再发组 56 例,其中 38 例患者 ASL 图中出现动脉穿行伪影,两组比较有统计学差异 ($P<0.05$)。

结论 1.缺血性脑卒中患者 ASL-CBF (PLD=1.5S) 与 DSC-PWI 技术中 PWI-TTP 参数结果有较好的一致性,ASL-CBF (PLD=2.5S) 与 DSC-PWI 技术中 PWI-CBF 参数结果有较好的一致性,ASL 检查具有无创性、可重复性、安全性等特点。2.ASL 灌注图中动脉穿行伪影 (ATA) 可作为缺血性脑卒中患者预后的预测指标。

PU-1553

铁沉积对帕金森病伴发焦虑患者大脑恐惧回路的影响

陈恺冬

南京医科大学附属无锡人民医院

目的:焦虑是帕金森病最常见的精神症状之一,脑铁沉积被认为是帕金森病的病理机制之一。本研究的目的是探讨有焦虑的帕金森病患者与没有焦虑的帕金森病患者相比,尤其是恐惧回路中脑铁沉积的变化。

方法:前瞻性纳入 16 例伴有焦虑症的帕金森病患者、23 例无焦虑症的 PD 患者和 26 名健康老年对照。所有受试者均接受了神经心理学评估和脑磁共振成像 (MRI) 检查。使用基于体素的形态计量学 (VBM) 来研究两组之间的脑形态学差异。定量磁化率成像 (QSM) 是一种能够量化脑组织磁化率变化的 MRI 技术,用于比较三组患者整个大脑的磁化率变化,分析了使用汉密尔顿焦虑评定量表 (HAMA) 量化的焦虑评分与大脑磁化率变化之间的相关性。

结果:患有焦虑症的帕金森病患者的帕金森病持续时间更长,HAMA 评分也高于没有焦虑症的患者。两组之间未观察到脑形态学差异。基于体素和基于 ROI 的 QSM 分析显示,伴发有焦虑症的 PD 患者在内侧前额叶皮层、前扣带皮层、海马体、楔前叶和角回的 QSM 值显著增加。此外,其中一些大脑区域的 QSM 值与 HAMA 评分呈正相关 (内侧前额叶皮层: $r=0.255$, $P=0.04$; 前扣带皮层: $r=0.381$, $P<0.01$; 海马: $r=0.496$, $P<0.01$)。

结论:我们的研究结果支持了帕金森病患者的焦虑与大脑恐惧回路中的铁沉积有关的观点,为解释帕金森病患者焦虑的潜在神经机制提供了一种可能的新方法。

PU-1554

Comparison of 18F-FET PET with 18F-FDG PET for Evaluating Suspected Spinal Cord Tumors

Jing Huang, Penghao Liu, Zan Chen, Jie Lu
XUANWU hospital

Background: O-(2-18F-fluoroethyl)-L-tyrosine (18F-FET) PET is widely applied in the diagnosis of brain tumors, but scarce data on spinal cord tumors has been reported. This research was aimed at comparing the diagnostic efficacy of 18F-FET PET and 2-18F-fluoro-2-deoxyglucose (18F-FDG) PET in spinal cord lesions.

Methods: Paired 18F-FDG PET/MRI and 18F-FET PET/MRI were performed preoperatively in 35 patients with suspected spinal cord tumors. Clinical manifestations and PET performance (SUVmean/ SUVmax/ TBRmean/ TBRmax/ MTV/ TLG/ tumor volume) of the patients were collected and compared using group analysis and receiver operating characteristic (ROC) curves.

Results: The 35 patients were divided into three groups according to their pathological diagnosis: high-grade tumors (HGTs, n=6), low-grade tumors (LGTs, n=19), and non-tumor diseases (NTDs, n=10). The background SUVmean of 18F-FET PET was lower than that of 18F-FDG PET ($p<0.0001$), and the delineated tumor volumes were not significantly different ($p>0.05$). The SUVmean, SUVmax, MTV, and TLG of 18F-FDG PET and 18F-FET PET were statistically distinct between HGT and LGT ($p<0.05$). The SUVmax, TBRmax, MTV, and TLG of 18F-FDG PET and 18F-FET PET, as well as the SUVmean of 18F-FET PET, were statistically distinct between HGT and NTD ($p<0.05$). In comparison, all measured parameters of 18F-FDG PET and 18F-FET PET could not differentiate LGT and NTD ($p>0.05$). Particularly, 18F-FET PET provided additional evidence on differential diagnosis over 18F-FDG PET in 1 case with mixed neuronal-glial tumor (MNGT) and 2 cases with intramedullary inflammatory lesions. The optimal cut-off values of SUVmean, SUVmax, TBRmean, TBRmax, MTV, and TLG of 18F-FET PET and 18F-FDG PET in tumors and NTD were calculated under ROC analysis.

Conclusion: 18F-FET PET was non-inferior to 18F-FDG PET in the differential diagnosis of HGT, LGT and NTD and could facilitate the diagnosis of MNGT and inflammatory lesions.

PU-1555

增强 T2 FLAIR 在中枢神经系统淋巴瘤和高级别成人弥漫性胶质瘤鉴别诊断中的价值研究

杨景云、赵得荣、苏艳
保山市人民医院

【目的】探讨增强 T2 FLAIR 在中枢神经系统淋巴瘤 (Central Nervous System Lymphoma, CNSL) 与高级别成人弥漫性胶质瘤 (High-Grade Adult Diffuse Glioma, HG-ADG) 鉴别诊断中的价值。

【方法】回顾性分析 2014 年-2022 年在我院就诊且病理/随访证实的 CNSL 患者 63 例 (67 个病灶) 和病理证实的 HG-ADG 患者 14 例 (14 个病灶), 术前均行包括增强 T2 FLAIR 和增强 T1WI 在内的头颅 MRI 扫描。依据病灶形态及弥散是否受限, 将肿瘤分为实性肿块型及非实性肿块型。通过视觉评分对肿瘤强化特点进行评价, 评价指标包括: 肿瘤实质的强化均匀性、强化程度及肿瘤实质边缘薄层强化的强化程度、强化范围。采用 SPSS 26.0 软件进行统计学分析。采用 Mann-Whitney U 检验比较 CE-T2 FLAIR 图像上实性肿块型 CNSL (58 例) 与实性 HG-ADG (14 例) 强化特征是否存在统计学差异, 以 $P < 0.05$ 为差异有统计学意义。

【结果】在 CE-T2 FLAIR 图像上, 两组肿瘤实质强化的均匀性差异无统计学意义, 但两组肿瘤实质的强化程度、肿瘤边缘薄层强化的强化程度及范围差异有统计学意义 ($P=0.0001$)。实性肿块型 CNSL 表现为中等及大范围 (68 % -99 %) 强化, 实性 HG-ADG 无强化。

【结论】CNSL 的 CE-T2 FLAIR 图像上肿瘤实质边缘出现明显薄层强化 (薄环征) 的概率较高。该征象对实性肿块型生长的 CNSL 与实性 HG-ADG 的鉴别诊断具有重要价值, 对指导临床治疗决策的制定具有重大意义。

改良 ASPECTS 评分预测超急性缺血性卒中患者静脉溶栓后住院天数和短期预后的研究

戴琦、陈国平、闫昆、张景峰、郑建军
宁波市第二医院

目的 探讨改良 ASPECTS 评分预测超急性缺血性卒中患者静脉溶栓治疗后住院天数和短期预后的价值。

方法 选取 85 例接受静脉溶栓治疗的超急性缺血性卒中患者，根据 3 个月后 mRS 评分结果分成预后良好组（n=53）和预后不良组（n=32），收集患者临床资料，基于患者入院时平扫 CT 以及 72 小时内 MRI 复查的 DWI 图像进行改良 ASPECTS 评分，Logistic 回归分析确定不良预后的危险因素，使用受试者工作特征（ROC）曲线分析改良 ASPECTS 评分对住院天数和短期预后的预测效能。

结果 两位高年资放射医师的改良 ASPECTS 评分的一致性较好， $ICC=0.938$ （ $P<0.05$ ），两组患者的年龄、入院 NIHSS 评分、住院天数和改良 ASPECTS 评分存在差异（ $P<0.05$ ）。Logistic 回归分析显示改良 ASPECTS 评分、hs-CRP 和年龄是影响超急性缺血性中风患者不良预后的独立危险因素（ $P<0.05$ ），改良 ASPECTS 评分预测患者住院天数和不良预后的曲线下面积（AUC）分别为 0.751 和 0.815（ $P<0.05$ ）。

结论 改良 ASPECTS 评分在预测接受静脉溶栓治疗的超急性缺血性卒中患者住院天数和短期预后方面具有一定的价值，在医疗决策中应予以考虑。

基于临床因素、CT 征象及影像组学模型对 AIS-LVO 患者 MT 术后脑内 HDA 的鉴别诊断研究

蔡武¹、翟笃昌¹、周秀智¹、崔曼曼¹、范国华¹、沈钧康¹、王远成²

1. 核工业总医院（苏州大学附属第二医院）

2. 东南大学附属中大医院

目的：基于临床危险因素、术后首次颅脑 CT 平扫征象及影像组学数据分别构建临床因素&CT 征象模型、影像组学模型及联合模型，探讨影像组学对大血管闭塞性急性缺血性脑卒中（AIS-LVO）机械取栓术（MT）后脑内高密度灶（HDA）的鉴别诊断价值。

方法：回顾性收集 2015 年 12 月至 2022 年 12 月因 AIS-LVO 在苏州大学附属第二医院（中心 I）符合条件的患者 156 例，以 7:3 的比例随机分为模型训练集（n=109）及内部验证集（n=47），同时收集东南大学附属中大医院（中心 II）患者的数据作为外部验证集（n=63）。根据诊断标准将三个数据集的患者分为出血性转化（HT）组和非出血性转化（non-HT）组（单纯对比剂外渗组）。本研究将中心 I、II 入组患者的临床及影像学数据进行单因素、多因素 Logistic 回归分析构建临床因素&CT 征象模型；通过图像分割与 ROI 勾画、特征提取与筛选后纳入最优特征集，构建影像组学模型以及联合模型。采用组内相关系数评价特征提取的一致性；采用受试者工作特征曲线评价各个模型的诊断效能；DeLong 检验比较三个模型诊断效能之间是否具有统计学差异；绘制模型校准曲线和决策曲线（DCA）以评估模型校准度和临床实用性；最终将最佳模型可视化列为列线图。

结果：三个模型中以联合模型诊断效能最高，其 AUC 值在训练集、内部验证集和外部验证集中分别达到了 0.895、0.882、0.820，经 DeLong 检验，联合模型与临床因素&CT 征象模型的诊断效能

在三个数据集中均具有统计学差异；决策曲线表明，在外部验证集中，当阈值概率约为 16%-44% 时，联合模型的临床净获益最高，表明临床实用价值最高，最终绘制联合模型的 Nomogram 图。结论：基于影像组学的联合模型表现最优，表明影像组学特征可作为一种影像学生物标志物，有助于临床对 MT 术后 HDA 性质的早期判断，从而为临床个体化精准治疗提供有力依据。

原发性髓内组织细胞肉瘤一例

李洁琼、李涛、陈子洋、杜恩辅
十堰市太和医院（湖北医药学院附属医院）

患者女，48 岁，因“左下肢无力伴肢体麻木疼痛 10 天余”入院。既往无特殊病史。颈胸椎 MRI 平扫及增强：C2-T8 水平脊髓肿胀并 T1-2 水平结节状强化。临床经大剂量激素冲击治疗 12 天后，患者感双下肢无力、麻木较前加重，复查颈胸椎 MRI：脊髓肿胀较前好转，强化结节较前无明显变化，考虑肿瘤可能。全院会诊后行 T1-2 椎管内病损切除术。术中发现病灶位于 T1-2 脊髓内左侧，灰白色，质地较韧，血供丰富，与正常脊髓无明显边界。病理切片外送多家医院病理会诊考虑：T1-2 髓内组织细胞肉瘤。8 个月后患者感左侧面部麻木并嘴角稍歪斜，复查颅脑 MRI 增强扫描，发现多发颅神经增粗并双侧面听神经结节状突起，于 1 个月后再次复查发现结节较前明显增大。查腰椎 MRI 发现 L1-4 水平椎管内团片状异常强化信号。HS 是一种罕见的起源于单核/巨噬细胞的淋巴造血系统恶性肿瘤，常发生于淋巴结、皮肤、肠道及骨骼等部位；中枢神经系统的原发性 HS 极为罕见，可发生于脑实质、脑膜、脊髓等，脊髓原发性 HS 目前国内未见文献报道。HS 通常具有很强的侵袭性，患者中位生存期一般为数月，但局限性 HS 患者在及时诊断和积极的临床治疗下，可存活数年。本例确诊 HS 后行放疗及靶向治疗（替莫唑胺+安罗替尼），治疗后 8 个月多发颅神经增粗并结节形成及腰髓内新发异常强化信号，考虑已肿瘤转移可能。HS 术前诊断困难，明确诊断主要依靠病理组织及免疫组化检查。原发于脊髓的 HS 需要与髓内肿瘤及脱髓鞘病变进行鉴别，但 HS 的临床表现及影像表现因发病部位不同而不同，且无显著特异性。文献显示中枢神经系统 HS 有 60% 的患者存在炎症浸润表现，本例原发性胸髓 HS，MRI 表现为类脊髓弥漫炎性病变，平扫难以将肿瘤组织与炎性水肿区分开，增强扫描肿瘤呈明显强化；HS 进展迅速，激素冲击治疗无明显疗效。因此当脊髓内占位生长迅速、症状严重、脊髓弥漫水肿且激素治疗后肿瘤无明显变化时，应考虑髓内 HS 可能。

PU-1559

低剂量 CT 灌注成像在动脉瘤性蛛网膜下腔出血后迟发性脑缺血中的应用价值

蔡武、时代、范国华、徐亮、张博、沈钧康
核工业总医院（苏州大学附属第二医院）

目的：探讨预测动脉瘤性蛛网膜下腔出血（aSAH）后迟发性脑缺血（DCI）的有效 CT 灌注（CTP）成像参数和检查时间。

材料与方法：39 例 aSAH 患者在发病 24 小时内接受基线低剂量 CTP 检查，并且在第 4 和 7 天复查 2 次低剂量 CTP，且 3 次 CTP 扫描参数均一致；并对 3 次 CTP 检查的定量参数：脑血容量（CBV）、脑血流量（CBF）、平均通过时间（MTT）和峰值时间（TTP），半定量参数两侧 CBV、CBF 的比值（rCBV、rCBF）和两侧 MTT、TTP 差值（ Δ MTT、 Δ TTP）进行对比分析。

结果：39 例患者中 12 例发生 DCI（DCI 组），27 例未发生 DCI（非 DCI 组）。DCI 组 3 次检查间 CBF、rCBF 和 Δ MTT 值差异均有统计学意义，但第 4 和 7 天间差异均无统计学意义。DCI 组的

CBF 和 rCBF 均低于非 DCI 组。第 4 和 7 天 CTP 检查中, DCI 组的 Δ MTT 比非 DCI 组长。鉴别 DCI 和非 DCI 的最佳阈值为 CBF: 40.1ml/100g/min、rCBF: 0.90、 Δ MTT: 0.33s。第 4 天复查 CTP 是预测 aSAH 后 DCI 的合适时间。

结论: aSAH 后第 4 天复查 CTP 有助于早期诊断 DCI, CBF、rCBF 和 Δ MTT 是预测 DCI 的有效灌注参数。

PU-1560

3D-ASL 鉴别诊断小脑血管母细胞瘤和毛细胞星形细胞瘤的价值

李文、赵勇、任转勤、田宏哲
宝鸡市中心医院

【摘要】目的: 探讨磁共振 (MRI) 三维动脉自旋标记 (3D-ASL) 技术鉴别诊断小脑血管母细胞瘤 (HB) 和毛细胞星形细胞瘤 (PA) 的价值。**方法:** 回顾性分析经手术病理证实的 28 例 HB 和 21 例 PA 的 MRI 资料。分别测量并计算 HB 和 PA 肿瘤实性部分的最大脑血流量 (CBFmax)、相对最大脑血流量 (rCBFmax)。采用独立样本 t 检验比较 HB 组和 PA 组各参数之间差异; 采用 ROC 曲线评价肿瘤实性部分各参数值鉴别诊断 HB 和 PA 效能。**结果:** HB 的 CBFmax、rCBFmax 均明显高于 PA, 差异有统计学意义 ($P < 0.05$)。当 CBFmax $> 89.35 \text{ ml} \cdot 100\text{g}^{-1} \cdot \text{min}^{-1}$ 时, 其诊断 HB 敏感度为 89.48%, 特异度为 85.39%, AUC 为 0.809; 当 rCBFmax > 3.95 时, 其敏感度为 91.75%, 特异度为 85.53%, AUC 为 0.817; CBFmax+rCBFmax 诊断 HB 的敏感度为 93.82%, 特异度为 91.16%, AUC 为 0.943。CBFmax+rCBFmax 的 AUC 最大, 其次为 rCBFmax、CBFmax, 三者间差异有统计学意义 (P 均 < 0.05)。**结论:** 3D-ASL 可无创性定量鉴别诊断小脑 HB 与 PA, CBFmax+rCBFmax 鉴别诊断 HB 和 PA 的效能优于单独使用 rCBFmax 或 CBFmax。

PU-1561

The feasibility of using CTP combined with spectral CT angiography to assess characteristics of cerebral hemodynamics in moyamoya disease

Anjing He¹, Ying Liu¹, Mengya Guo², Minjing Zuo¹
1. Second Affiliated Hospital of Nanchang University
2. GE Healthcare (Shanghai) Co., Ltd., Shanghai 201203, PR China

Purpose: Aimed to provide more abundant cerebral hemodynamics information in moyamoya disease (MMD), the feasibility of using CTP combined with multi-parameter spectral CT angiography (sCTA) was explored.

Methods and Materials: Clinical and imaging data of 10 patients with bilateral-abnormal MMD in The Second Affiliated Hospital of Nanchang University from January 2022 to March 2023 were reviewed retrospectively. All patients underwent head and neck CTA and dynamic cerebral CTP with fast-switch spectral CT. Ten patients with bilateral moyamoya disease with a total of 20 cerebral hemispheres were included, and Regions Of Interest (ROIs) were placed in the frontal, temporal, and occipital gray and white matter regions at the optimal level of the basal ganglia and in the cerebral parenchyma at the maximal level of the cerebellum. In these ROIs, normalized CTP parameters: cerebral blood volume (nCBV), cerebral blood flow (nCBF), mean Transit time (nMTT), Time To Peak (nTTP) and Normalized sCTA parameters: CT value of Virtual Monoenergy Image of 40 keV (NCTVMI40), Iodine density map (NID), Effective atomic number (NZeff) were calculated via cerebellar ratio method ($((X\text{-ROI sCTA/CTP parameters})/(\text{Cerebellum sCTA/CTP parameters}))$). Furthermore, Pearson's correlation coefficient was used to analyze the

correlation between normalized CTP and sCTA parameters to demonstrate the common trends and extra-value differences.

Results: Based on 10 bilateral-abnormal MMD cases, there were positive correlations between NCTVMI40 and nCBV ($r=0.48$, $P<0.01$), NCTVMI40 and nCBF ($r=0.499$, $P<0.01$), NZeff and nCBV ($r=0.465$, $P<0.01$), NZeff and nCBF ($r=0.459$, $P<0.01$), NID and nCBV ($r=0.437$, $P<0.01$), NID and nCBF ($r=0.414$, $P<0.01$).

Conclusions: In addition to head and neck vascular evaluation, sCTA parameters in this study were moderately correlated to several CTP parameters, which shows the potential to provide more aspects to evaluate complicated cerebral hemodynamics in MMD compared to separate CTP, and even high diagnose confidence.

PU-1562

Structural brain assessment of adults with MRI-negative temporal lobe epilepsy based on surface-based morphology features

Yongjie He, Xue Chai

Nanjing Brain Hospital Affiliated to Nanjing Medical University

Abstract

Purpose: This study aims to investigate the clinical significance of cortical morphological structures in the diagnosis of MRI-negative temporal lobe epilepsy (TLE-N).

Methods: The study included 29 patients with clinically confirmed TLE-N and a control group of 30 healthy subjects matched for gender and age. Surface-based morphology (SBM) postprocessing method was used to analyze the 3D-T1WI imaging results of patients' skull MRI, and the characteristic values of cortical structures such as thickness, surface area, volume, curvature, sulcal depth, and other parameters were extracted.

Results: Compared to the healthy control group, the TLE-N group showed increased thickness of the insular cortex in both hemispheres. Decreased curvature of the piriform cortex and the insular granular complex in the right hemisphere and decreased volume of the OP1/SII and the third visual area in the left hemisphere were also observed in the TLE-N group compared to the healthy control group. No statistically significant significances were found in the cortical surface area and sulcal depth between the groups.

Conclusion: Preliminary studies have shown microchanges in the morphological structure of the cerebral cortex in patients with TLE-N. The SBM method holds clinical significance for the diagnosis of these patients and the localization of epileptic focus. Analyzing the morphological microstructure of the cerebral cortex is essential for studying the pathophysiological mechanism of TLE.

PU-1563

原发性失眠患者关于额叶脑区内的脑活动异常改变的静息态功能磁共振成像研究

王忠艳、霍健伟

首都医科大学附属北京中医医院

目的: 探索原发性失眠(primary insomnia, PI)患者额叶脑区内功能连接的改变, 以期获得额叶内相对核心脑区, 对未来诊疗提供精准脑区定位。材料与方法: 20 例 PI 患者(女 15 例, 男 5 例)和 20 例年龄、性别、受教育程度相匹配的睡眠优良者(女 15 例, 男 5 例)。使用血氧水平依赖功能磁共振

振成像(blood oxygen level dependent-fMRI,BOLD-fMRI)和镜像同伦连接(VMHC)方法分析 PI 患者额叶脑区内功能连接异常改变。结果: 在 PI 患者中, 我们发现异常功能连接区域主要集中在眶部额上回 (L/R)、眶部额中回 (L/R)、岛盖部额下回 (L)、眶部额下回 (L) ($p < 0.05$)。在镜像同伦连接结果中发现眶部额中回存在功能连接异常 (GFR correction, voxel $P < 0.01$, cluster $P < 0.025$)。结论: 研究通过静息态功能连接影像学方法识别失眠患者额叶内部的异常功能连接情况, 异常区域主要位于眶额部脑回以及岛盖部额下回, 这更有利于了解失眠在额叶区域内的异常神经活动机制, 获得额叶内部受影响核心脑区, 为失眠患者的预测与诊疗提供一个相对精准的脑区依据。

白质结构连接组拓扑效率与阿尔茨海默病血浆生物标记物及认知在 AD 连续过程中的关系

张铭凯¹、陈豪杰²、黄伟杰²、郭腾飞⁴、马国林³、韩璎¹、舒妮²

1. 首都医科大学宣武医院神经内科

2. 北京师范大学认知神经科学与学习国家重点实验室

3. 中日友好医院放射科

4. 深圳湾实验室生物医学工程研究所

目的: 尽管血浆标记物已经被广泛应用于阿尔茨海默病 (AD) 的早期筛查诊断研究中, 但其与脑网络拓扑、认知之间的联系在 AD 连续过程 (AD continuum) 中尚不清楚, 本研究联合应用神经影像, 血浆标记物及认知评估结果, 探究血浆标记物-网络效率-认知在 AD 联系过程中的关系。

方法: 我们从中国认知下降纵向研究 (SILCODE) 队列中分析了 287 名参与者的血浆生物标记物, 包括 β 淀粉样蛋白 42, 40 及其比值 ($A\beta_{42}$, $A\beta_{40}$, $A\beta_{42}/A\beta_{40}$)、磷酸化 tau181 (p-tau181)、胶质纤维酸性蛋白 (GFAP) 和轻链神经丝蛋白 (NfL) 的水平, 并评估了 395 名参与者的白质网络效率。趋势分析评估了血浆标记物和网络效率与 AD 进展的敏感性。相关性和中介分析进一步探讨了血浆标记物、网络效率和 AD 连续过程中认知之间的关系。

结果: 在血浆标记物中, GFAP 表现出最高的与 AD 病程进展相关的敏感性, 其次是 NfL、p-tau18 和 $A\beta_{42}/A\beta_{40}$ 。多个脑区的局部效率降低, 并与血浆 GFAP、NfL 和 p-tau181 存在显著相关性。

同时, 我们发现了网络效率介导了血浆标记物和认知之间的关系。

结论: 我们的发现支持了脑网络效率-血浆标记物的联合应用分析在早期筛查和诊断 AD 方面的潜力。

PU-1565

中国 AD 临床前期联盟认知衰退中国纵向研究的患者客观认知功能与载脂蛋白多态性的相关研究

韩璎

首都医科大学宣武医院

目的 观察中国 AD 临床前期联盟认知衰退中国纵向研究 (SILCODE) 的患者客观认知功能与载脂蛋白 E 多态性的相关性。

方法 对 537 例参与 SILCODE 的患者进行神经心理学量表评价, 评估其记忆及认知功能, 同时进行载脂蛋白 E (ApoE) 基因型的分型, 并结合相关检查, 诊断出认知功能未受损组和认知功能受损组 (包括轻度认知功能障碍 MCI 和阿尔茨海默病 AD)。

结果 AD 组 $\epsilon 4$ 携带者占比例最高, 其次为 MCI 组, 认知功能未受损组比例最低。在认知功能未受损组, $\epsilon 4$ 携带者与 $\epsilon 4$ 非携带者的认知功能比较无显著差异, 在认知功能受损, $\epsilon 4$ 携带者与 $\epsilon 4$ 非携带者的认知功能比较有显著差异组。

结论 $\epsilon 4$ 是 AD 的风险因子, $\epsilon 4$ 携带者的患者记忆和认知功能损害更严重。

Research progress on biological and MRI markers of postoperative delirium: a narrative review

Binbin Zhu, Angyang Cao, Jianhua Wang
the first affiliated hospital of Ningbo University

Postoperative delirium is one of the common postoperative complications in elderly patients, which seriously affects the short- and long-term prognosis of patients. At present, the clinical evaluation of delirium is mostly dependent on the highly subjective scale, exploring objective serum biomarkers as well as MRI markers in clinical practice is of great significance for prevention and the early diagnosis or evaluation of postoperative delirium. In this paper, after research the Pubmed, embase and web of science, we present progress of potential markers of postoperative delirium is reviewed from the aspects of related genes, neurotransmitters cytokines and products caused by inflammation or nerve injury, as well as structural and Functional Magnetic Resonance sequences. This reviews provide reference for clinical diagnosis and scientific research in this field.

PU-1567

DRD4 基因型对注意缺陷多动障碍儿童和健康对照者大脑局部活动强度的不同影响

成一统、王美豪
温州医科大学附属第一医院

目的: 广泛的研究证明注意缺陷多动障碍 (ADHD) 与多巴胺 D4 受体基因 (DRD4) 有关。然而, ADHD 中与多巴胺受体基因相关的脑功能表型仍有待研究。本次研究试图调查 ADHD 中与多巴胺受体基因相关的更敏感的大脑活动的特征。

方法: 我们采集了 140 名未接受药物治疗的 ADHD 儿童和 35 名健康对照者 (年龄 6-15 岁) 的静息功能磁共振图像, 并利用静态低频波动幅度和动态低频波动幅度标准差检查了 DRD4 2-重复等位基因对两组受试者局部大脑活动强度的影响, 进行体素双向 ANCOVA 分析 sALFF 和 dALFF 的基因型诊断相互作用。

结果: 在额叶 (包括右侧直回、左侧额下回和左侧中央旁小叶) 显示出基因型诊断对 sALFF 的显著交互作用。除了右侧直回、左侧额下回, 还发现右侧额中回显示出基因型诊断对 dALFF 的显著交互作用。成对后分析显示, 与 DRD4 相关的低频波动幅度变化因诊断而异。此外, 研究还表明, 上述脑区的 sALFF 和 dALFF 与神经心理学测量得分之间存在显著的相关性。

结论: 这些发现表明, ADHD 患儿多巴胺系统的改变可能导致了额叶局部活动强度及其动态变化的异常, 这可能与认知功能有关。此外, 动态低频波动幅度变化可能是区分 ADHD 患儿和健康对照组的潜在生物标志物。

PU-1568

A neuroimaging study of postpartum post-traumatic stress disorder based on internal tocodynamometry during labor and childbirth

Chunlian Chen, Kai Liu

The 960th Hospital of the PLA Joint Logistic Support Force

Abstract

Objectives Postpartum post-traumatic stress disorder (PP-PTSD) is a severe psychiatric disorder and can lead to poor maternal mental health, impairment in mother-infant bonding, and relationship stress. The condition is considered to have multiple pathogenic factors. However, the underlying neurobiological mechanism of PP-PTSD keeps unclear.

Methods

A total of 245 healthy first-time pregnant women who have the intention of vaginal delivery were recruited for the study. The fetal head descent thrust of all participants was measured during delivery (measurements were taken at 3 cm, 5cm, and 8cm of cervical dilation), and relevant data were recorded. All participants filled in online questionnaires. Resting-state magnetic resonance imaging (MRI) was performed on 26 women diagnosed with postpartum post-traumatic stress disorder (PP-PTSD), the amplitude of low-frequency fluctuations (ALFF) technology was used to observe the spontaneous neural activity of all PP-PTSD patients, and correlation analyses were performed to investigate the relationship between PP-PTSD severity and a range of demographic/clinical factors that may contribute to it.

Results

Internal tocodynamometry results indicated that when the uterine dilation was 3cm, the natural delivery rate of women with fetal head descent thrust $<7N$ was lower than that of other women with fetal head descent thrust $\geq 7N$. When the uterine dilation was 5cm, the natural delivery rate of women with fetal head descent thrust $<16N$ was lower than other women with fetal head descent thrust $\geq 16N$. When the uterine dilation was 8cm, the natural delivery rate of women with fetal head descent thrust $<26N$ was lower than other women with fetal head descent thrust $\geq 26N$. There were significant differences between the sample rates of natural delivery and cesarean section ($P < 0.05$). Resting-state functional magnetic resonance imaging (rs-fMRI) results showed that, in the PP-PTSD group, decreased ALFF in the bilateral insula cortex (IC), right anterior cingulate cortex (ACC), and left midcingulate cortex (MCC) compared with HPW (False discovery Rate (FDR) correction q-value < 0.05). The ALFF value of the right ACC was positively correlated with the PPQ score ($r=0.4046$ $p=0.0403$) and PCL-C score ($r=0.3909$ $p=0.0483$).

Conclusion

In PP-PTSD patients, abnormal spontaneous activities existed in brain regions related to emotion, cognition, and memory functions. Our results also provided essential information on a protective labor monitoring mode for women to reduce PP-PTSD incidence.

PU-1569

MR 高分辨血管壁增强扫描在急性与非急性脑梗死大脑中动脉斑块的强化特点以及评估价值

常艳亮、王晋君、史汉明
运城市中心医院

目的：探究分析高分辨磁共振血管壁成像（high-resolution magnetic resonance vessel wall imaging, HRMR-VWI）增强技术在急性与非急性脑梗死大脑中动脉斑块强化特征以及评估价值。方法：前瞻性收集 2021 年 7 月—2023 年 6 月在运城市中心医院神经内科住院治疗的脑梗死患者 50 例，据患者病情分为急性期组与非急性期组，各 25 例。患者入院 3 d 内均接受头弥散 DWI，动脉 MRA 检查与 HRMR-VWI 增强检查。比较两组斑块强化情况。结果：急性期组大脑中动脉斑块强化指数及斑块强化率显著高于非急性期组（ $P < 0.05$ ）。结论：当患者病发急性脑梗死时其脑血管中斑块强化明显，且动脉最狭窄处斑块存在明显强化时，极易诱导脑梗死急性发作，因而高分辨 MR 血管壁成像（HRMR-VWI）技术在大脑中动脉血管斑块诊断中具显著临床价值。

PU-1570

脑干非肿瘤性病变的 MRI 诊断及临床决策

吴晓峰、张辉、王效春
山西医科大学第一医院磁共振影像科

目的：通过对脑干非肿瘤性病变的诊断及鉴别诊断，提示临床及时针对性治疗。方法：搜集 2020 年 1 月到 2023 年 1 月就诊于山西医科大学第一医院怀疑脑干病变患者 319 例，其中男 180 例，女 139 例，年龄 26-80 岁，平均年龄 63.8 岁；所有患者均为初次发病，症状包括：肢体无力、意识障碍、头晕、呕吐、吞咽困难、癫痫等；所有患者均行头颅磁共振扫描，扫描序列包括 T1WI、T2WI、flair、DWI，扫描图像由两名主治医师进行诊断。结果：脑梗死 217 例，脑干出血 58 例，脑干脑炎 13 例，桥脑中央髓鞘溶解症 9 例，脱髓鞘病变 31 例，脑干萎缩 18 例；所有病例病灶均为单发。结论：根据 MRI 表现分析病灶形态、分布、信号特点，对各个疾病进行精确诊断，及时准确指导临床决策，对患者进行对症治疗。

PU-1571

非典型性脉络丛乳头状瘤的 MRI 诊断

吴晓峰、张辉、王效春
山西医科大学第一医院磁共振影像科

目的：分析非典型性脉络丛乳头状瘤的临床与影像学表现特点，以提高临床对本病的认识。方法：收集经我院病理证实的 5 例非典型性脉络丛乳头状瘤，结合相关文献分析其 MRI 表现。5 例病例术前均行头颅 MRI 平扫及增强扫描，均为单发肿瘤。其中男性 3 例，发病年龄分别为 10 岁、26 岁、42 岁；女性 2 例，发病年龄分别为 16 岁、27 岁。临床症状包括：头痛、眩晕、走路不稳等，其中，3 例位于侧脑室，1 例位于第四脑室，1 例位于左侧桥小脑角区。结果：5 例非典型性脉络丛乳头状瘤中，2 例呈囊实性改变，实性部分 T1WI 呈稍低信号，T2WI 呈稍高信号，增强后实性肿块、囊壁及分隔呈明显强化；3 例呈菜花状生长的实性肿块，T1WI 呈稍

低信号，T2WI 呈稍高信号，增强后肿块呈中—重度均匀强化；位于桥小脑角区的病例呈不规则状并沿 Luschka 孔塑形生长。3 例伴瘤周水肿，2 例可见“囊泡征”。1 例 CT 表现密度稍高，可见钙化。结论：非典型脉络丛乳头状瘤具有一定的影像学特点，表现为肿块边界较清楚，脑组织浸润、瘤内囊变、出血等恶性征象较少见。位于脑室或桥小脑角区的“菜花状”肿块，呈塑形形式生长，明显强化，肿块周围可见“囊泡征”。

以癫痫为首发症状的脑内疾病的 MRI 诊断及分析

吴晓峰、张辉、王效春
山西医科大学第一医院磁共振影像科

目的：分析、总结可引起癫痫的疾病的 MRI 表现，为临床治疗提供影像学依据。

方法：搜集 2020 年 1 月到 2022 年 5 月就诊于山西医科大学第一医院以癫痫发作为首发症状的患者 275 例，其中男 158 例，女 117 例，年龄 6-78 岁，平均年龄 56.8 岁；所有患者均为初次发病，均行头颅磁共振扫描及海马冠状位薄层扫描，扫描序列包括 T1WI、T2WI、flair、DWI 和海马冠状位薄扫序列，扫描图像由两名主治医师进行诊断。

结果：颅内异常者 259 例，无异常者 16 例；海马硬化者 19 例，病毒性脑炎者 36 例，颅内占位者 139 例，外伤或占位术后者 60 例，脑先天发育异常者 5 例。

结论：根据 MRI 表现，对各个疾病进行精确诊断，对患者进行对症治疗及手术治疗，从而对减轻患者痛苦，更好的服务临床。

酮症性偏侧舞蹈症一例并文献复习

李燕¹、陈泽科²、白帆²、张潇月²

1. 山西医科大学第一医院

2. 山西医科大学

偏侧舞蹈症（hemichorea, HC）是一种少见的运动障碍疾病，常由基底节区或其联系纤维受损引发锥体外系症状。引起 HC 的原因很多，包括脑血管病和神经退行性、感染性、药物性、代谢性、免疫相关性疾病等，其中以脑血管病最常见。既往报道的糖尿病非酮症性偏侧舞蹈症（hemichorea associated with non-ketotic hyperglycemia, HC-NH）在临床上就比较少见，而酮症性偏侧舞蹈症更罕见，国内外报道 仅见于年轻人 1 型糖尿病酮症酸中毒患者，而在老年 2 型糖尿病患者中未见报道，极易被误诊为脑血管病，从而延误治疗。本文从临床及影像介绍偏侧舞蹈症，以期提高对此病的认识，防止漏诊误诊，影响治疗。

the Second Affiliated Hospital of Zunyi Medical University

Objective: To assess the prognostic value of imaging parameters in computed tomography perfusion (CTP) combined with computed tomography angiography (CTA) examination and serum biomarkers for the prediction of recurrent stroke events at three-month and one-year follow-up. Methods: A total of 136 patients with cerebral infarction diagnosed for the first time were included in the retrospective cohort study. These patients received CTA+CTP one-stop examination and serum biomarkers testing, followed by three-month and one-year follow-ups for the occurrence of recurrent stroke events. Recurrent stroke events are defined as ischemic stroke, retinal infarction, intracerebral hemorrhage, subarachnoid hemorrhage, and death. Results: The recurrent stroke events rate was 23.3% (32 cases) and 36.7% (50 cases) at three-month and one-year follow-ups, respectively. Ischemic penumbra (IP) (OR=1.010, P=0.029) and mRS score (OR=1.282, P=0.038) were independent predictors for recurrent stroke events at the three-month follow-up, so were Lp(a) (OR=1.002, P=0.044), vascular stenosis severity (OR=1.489, P=0.029), mRS (OR=1.282, P=0.038) at the one-year follow-up. Conclusions: Among patients with cerebral infarction diagnosed for the first time, ischemic penumbra, mRS, Lp(a) and vascular stenosis severity are the most powerful predictors of recurrent stroke events at three-month and one-year follow-ups.

角回的功能层次及其潜在的遗传结构

宋宇、朱佳佳、余永强
安徽医科大学第一附属医院

目的: 角回 (AG) 处于多感觉信息汇聚的位置, 具有丰富的结构和功能连接, 是一个在功能和解剖学上均具有异质性的结构。我们使用最先进的功能连接梯度分析和转录-神经成像关联分析的方法, 试图确定 AG 是否存在一个主要的层次结构, 如果存在的话, 它如何被潜在的遗传结构所调节。材料与方法: 从发现集和验证集的 793 名健康被试中获取静息态功能磁共振成像 (rs-fMRI) 数据。将扩散映射嵌入技术应用于体素水平 AG 与大脑间功能连接矩阵, 以计算 AG 的功能梯度。我们确

定了 AG 功能连接模式的主梯度, 并研究其与内在几何学, 功能网络, 行为域的相关性。结合 Allen 人脑图谱, 我们探索了 AG 的功能主梯度与基因表达之间的空间相关性。

结果: AG 主梯度的拓扑形式表现为背前-腹后的层次结构, 并且与其内在几何学显著相关。同时, 对应于经典的功能网络的 AG 功能亚区 (行为域) 沿主梯度呈层级分布, 即从默认网络 (抽象认知) 的一端到视觉和感觉运动网络 (感知和行动) 的另一端。值得注意的是, 我们在 AG 主梯度和基因表达之间建立了关联, 并提取出对该关联具有强烈贡献的两个基因集, 发现这两个基因集在功能注释和特异性表达上存在明显差异。

结论: 我们的发现表明了 AG 功能组织在概念上的重大进展, 为健康和疾病中 AG 的功能和结构的研究提供新的思路。

基于 MRI 人工智能自动检测脑白质高信号患者认知损害及相关因素的因果分析

冯俊榜¹、惠东明⁴、郑庆卿²、夏雨薇³、石峰³、周庆³、何晓静²、王世科²、李传明¹

1. 重庆大学附属中心医院

2. 重庆医科大学附属第二医院

3. 上海联影医疗科技有限公司

4. 重庆西区医院

目的: 白质高信号(WMH)在衰老的大脑中很常见, 与认知能力下降和痴呆有关。本研究采用深度学习和影像组学技术建立 WMH 患者认知损害检测模型, 分析认知损害与相关因素之间的因果关系。

方法: 回顾性收集重庆医科大学附属第二医院 79 例 WMH Fazekas 分级 2 级及以上患者, 随机分为训练集 (62 例) 和内部验证集 (17 例); 重庆大学附属中心医院 29 例 WMH Fazekas 分级 2 级及以上患者作为独立外部验证集。根据认知状态分为有认知损害组和无认知损害组。使用 Freesurfer 工具获取大脑皮层和核团的特征。利用 U-Net 网络演化的 VB-net 网络在 T1WI 和 FLAIR 序列自动行 WMH 及周围区域的识别、分割。通过 Research Portal Vx. X 在 T1WI 和 FLAIR 序列上建立 WMH 自动分割框架结构从每个 WMH 和周围区域感兴趣区域中, 自动提取 2264 个影像组学特征。利用白质分区模板, 得到 36 个分区的白质体积、WMH 体积以及 WMH 在白质中的比例。将临床特征、皮层特征、核团特征、WMH 特征分别进行降维, 然后在训练集上采用 4 个独立的机器学习分类器 (逻辑回归、高斯过程、随机森林和二次判别分析) 进行训练, 并在验证集上进行验证。采用受试者工作特性曲线下面积指标评价模型性能。采用 Delong 检验对模型的性能进行比较。采用因果分析模型对脑皮层、脑白质、核团的改变与认知障碍的关系进行因果分析。

结果: 与其他模型相比, 基于白质特征的 logistic 回归(LR)模型表现最佳, 在外部测试数据集中的 AUC 为 0.819。因果分析表明, 年龄、受教育程度、脑皮层、脑白质和核团的改变是导致认知障碍的原因。皮层的改变是核团改变的原因。皮层与脑白质、脑白质与核团的变化呈双边因果关系。

结论: 基于白质特征的 LR 模型可用于 WMH 患者认知功能障碍的检测, 准确率较高。明确了脑皮层、脑白质、脑核的改变与认知功能障碍的因果关系。

探讨动态磁敏感对比增强 MRI (DSC-MRI) 监测脑胶质瘤复发 和治疗后反应的应用价值

王斌
山西医科大学第一医院

目的:

探讨动态磁敏感对比增强 MRI (dynamic susceptibility contrast MRI, DSC-MRI) 灌注成像在监测脑胶质瘤术后复发和治疗后反应的应用价值。

方法:

26 例脑胶质瘤患者 (15 例脑胶质瘤复发, 11 例治疗后反应) 在同步放化疗结束 2 月内行头部常规 MRI 扫描、增强扫描及 DSC 脑灌注成像, 通过 DSC 软件分析, 对图像后处理得到病例异常强化区、水肿区的相对脑血容量 (relative cerebral blood volume, rCBV)、相对脑血流量的 (relative cerebral blood flow, rCBF) 的伪彩图, 分别测量病例异常强化区、水肿区的 rCBV 值、rCBF 值, 采用两样本 t 检验比较两组各参数值是否存在差异。

结果:

复发组的异常强化区平均 rCBV 值及 rCBF 值均显著高于放射性脑损伤组 [(5.62±2.01) vs (2.17±0.94); (5.14±1.96) vs (1.96±1.25), $P<0.05$], 强化区两灌注指标在肿瘤复发和治疗后反应两组间差异有统计学意义。复发组的水肿区平均 rCBV 值及 rCBF 值均显著高于放射性脑损伤组 [(4.11±1.17) vs (1.72±0.83); (3.76±1.83) vs (1.43±0.65), $P<0.05$], 水肿区两灌注指标在肿瘤复发和治疗后反应两组间差异有统计学意义。

结论:

DSC-MRI 能早期评估脑胶质瘤复发和治疗后反应, 为脑胶质瘤患者在临床上的进一步治疗提供影像依据。

Peritumoral radiomics for identification of telomerase reverse transcriptase promoter mutation in patients with glioblastoma based on preoperative MRI

Hongbo Zhang^{1,3}, Hanwen Zhang², Beibei Zhou³, Yuze Zhang¹, Biao Huang¹

1. Guangdong Provincial People's Hospital

2. Department of Radiology, The First Affiliated Hospital of Shenzhen University, Health Science Center, Shenzhen Second People's Hospital

3. Department of Radiology, The Seventh Affiliated Hospital, Sun Yat-sen University

Purpose

Glioblastoma (GBM) is a severe central nervous system tumor with a poor prognosis. Recently, molecular markers like TERT promoter mutation have become critical for accurate diagnosis and prediction of patient outcomes. Current research suggests a correlation between the presence of TERT promoter mutation and higher tumor aggression, advocating for maximum surgical resection where possible. Given the value of peritumoral regions, utilizing DL features in these areas might prove beneficial for non-invasive evaluation of TERT promoter mutations. This study aims to evaluate the value of intra- and peritumoral deep learning (DL) features based on multi-parametric magnetic resonance imaging (MRI) for identifying telomerase reverse transcriptase (TERT) promoter mutation in glioblastoma (GBM).

Methods

In this study, we included 229 patients with GBM who underwent preoperative MRI in two hospitals (training set: 115, external test sets: 114). We used four 2D Convolutional Neural Networks (GoogLeNet, DenseNet121, VGG16, and MobileNetV3-Large) to extract intra- and peritumoral DL features. The Mann–Whitney U test, Pearson correlation analysis, least absolute shrinkage and selection operator, and logistic regression analysis were used for feature selection and construction of DL radiomics (DLR) signatures in different regions. These multi-parametric and multi-region signatures were combined to identify TERT promoter mutation. The area under the receiver operating characteristic curve (AUC) was used to evaluate the effects of the signatures.

Results

The signatures based on the DL features from the peritumoral regions with expansion distances of 2 mm, 8 mm, and 10 mm using the GoogLeNet architecture correlated with the optimal AUC values (test set: 0.823, 0.753, and 0.768) in the T2-weighted, contrast-enhanced T1-weighted, and T1-weighted images. Using the stacking fusion method, DLR with multi-parameter and multi-region fusion achieved the best discrimination with AUC values of 0.948 (95% CI, 0.911–0.985) and 0.902 (95% CI, 0.843–0.961) in the training and test sets, respectively.

Conclusions

Our results suggest that there may be a role for the intra- and peritumoral DL features in the identification of the TERT promoter mutation in patients with GBM. We propose an FDLR signature based on the multi-parametric MRI intra- and peritumoral fusion that may help in the preoperative identification of the TERT promoter mutation in GBM and inform individualized patient treatment.

3D 动脉自旋标志灌注成像在 IDH1 基因表达脑胶质瘤中的应用价值

李孝忠

甘肃中医药大学附属医院

摘要:目的 探讨 3D 动脉自旋标志灌注成像在 IDH1 基因表达脑胶质瘤中的应用价值。方法 回顾性分析 48 例病理证实的脑胶质瘤患者 (其中 IDH1 (+) 20 例, IDH1 (—) 28 例) 的 MRI 及 ASL, 分析 IDH1 (+) 与 IDH1 (—) 脑胶质瘤的 MRI, 分析病灶水肿, 出血、囊变、钙化, 强化情况, 及 ASL。结果 IDH1 (+) 的非胶质母细胞瘤中: 病灶水肿 7 例, 出血 5 例, 囊变 9 例, 钙化 2 例, 明显不均匀强化 6 例, 轻度强化 4 例, ASL 高灌注 8 例, 其中 10 例胶质母细胞瘤中: 病灶水肿: 3 例, 出血 1 例, 囊变 3 例, 钙化 0 例, 明显强化 10 例, ASL 高灌注 13 例。IDH1 (—) 的非胶质母细胞瘤中: 病灶水肿 2 例, 出血 1 例, 囊变 3 例, 钙化 8 例, 轻度强化 7 例, 无强化 3 例, ASL 高灌注 3 例, 其中 13 例胶质母细胞瘤中: 病灶水肿: 9 例, 出血 5 例, 囊变 10 例, 钙化 0 例, 明显强化 13 例, ASL 高灌注 13 例。结论 3D 动脉自旋标志灌注成像在 IDH1 基因表达脑胶质瘤中具有重要价值, ASL 在 IDH1 (+) 的非胶质母细胞瘤中大多数呈高灌注, 在 IDH1 (—) 的非胶质母细胞瘤中大多数呈低灌注, 而在胶质母细胞瘤中与 IDH1 基因无相关性, 绝大多数均呈高灌注 ($P < 0.05$)。因此, 在一定程度上, 从脑胶质瘤的 3D 动脉自旋标志灌注成像可以预测 IDH1 基因突变情况。

基于 DCE 定量和半定量参数分析 GBM 环壁强化类型与炎症反应的相关性研究

康晓伟、李艳、席一斌
西安市人民医院 (西安市第四医院)

【摘要】 目的：利用动态对比增强 (DCE) 定量与半定量分析方法探究胶质母细胞瘤 (Glioblastoma, GBM) 的环壁强化类型与坏死相关炎症的关系。方法：回顾性分析 2015 年 9 月至 2020 年 9 月经病理证实且呈环形强化的 GBM 23 例和炎性病灶 17 例，GBM 的瘤壁均由厚而不规则的毛玻璃样强化和薄而光滑的薄壁强化两种类型组成。所有患者均在术前 2 周内行 3.0T MRI 常规平扫、T1 增强和 DCE 序列扫描。利用美国 GE Omni-Kinetics Version 软件在 DCE 图像上手动勾画肿瘤和炎性病变最大层面环壁的感兴趣区 (ROI)，比较 GBM 的厚壁毛玻璃样强化 (1 组)、薄壁显著强化 (2 组) 和炎性病变环形强化 (3 组) 的 DCE 参数，包括容积转移常数 (Ktrans)、血管外细胞外体积分数 (Ve)、曲线下面积 (AUC)、速率常数 (Kep)、血浆容积分数 (Vp)、达峰时间 (TTP)、最大斜率 (MAXslope) 的差异。其中 Ktrans、AUC 和 Vp 的比较用方差分析和最小显著差法 (LSD)；Ve，Kep，TTP，MAXslope 比较用秩和检验及 Kruskal-Wallis 检验。结果：三组环壁强化类型比较，Ktrans、AUC 及 MAXslope 的差异具有统计学意义 ($P < 0.05$)。GBM 的厚壁毛玻璃样强化区的 Ktrans、AUC、MAXslope 均高于薄壁显著强化区和炎性病变，后两者的 Ktrans、AUC、MAXslope 均无显著统计学差异 ($P > 0.05$)。结论：GBM 的薄壁显著强化区与炎性病变具有相似的血流动力学和渗透性特征，提示 GBM 薄壁强化区可能存在炎症过程的参与。

中枢胰岛素抵抗通过抑制 Pink1/ parkin 介导的线粒体自噬诱导神经元功能障碍

程涵
南京鼓楼医院

中枢胰岛素抵抗是 2 型糖尿病和几种神经退行性疾病的共同特征。然而，胰岛素抵抗诱导的神经元功能障碍的机制尚不清楚。在本研究中，棕榈酸干预可诱导神经元胰岛素抵抗，胰岛素信号通路的表达证实了这一点。然后，我们发现胰岛素抵抗导致树突长度减少，细胞凋亡率升高，突触可塑性降低。在这一过程中，Pink1/ parkin 介导的线粒体自噬在胰岛素抵抗早期被激活，并随着胰岛素抵抗的加重而被抑制，且具有时间依赖性。Pink1 敲低后线粒体功能和突触可塑性受损，而过表达后恢复。胰岛素抵抗后，线粒体质量控制系统受到影响。MFN2 表达减少，pDRP1 表达增加，表明线粒体动力学受损。线粒体生物发生蛋白 (PGC-1 α 、TFAM、NRF1) 表达降低。线粒体碎片化，ROS 产生过多，ATP 减少。此外，GLP-1 受体激动剂 (艾塞那肽) 通过减轻胰岛素抵抗和促进 Pink1/帕金森介导的线粒体自噬来改善神经元突触可塑性。因此，我们的研究表明胰岛素抵抗通过抑制 Pink1/ parkinson 介导的线粒体自噬诱导神经元损伤，这可能是糖尿病神经退行性变的治疗靶点。

基于最小生成树的图论分析揭示特发性全面性癫痫患者的大脑功能网络异常

刘高平、杨瑞佳、李欣、刘付金龙、王正阁、张冰
南京鼓楼医院

目的 使用基于最小生成树（Minimum Spanning Tree, MST）的图论分析方法评估特发性全面性癫痫（Idiopathic Generalized Epilepsy, IGE）患者静息态大脑网络的拓扑变化，并进一步分析 IGE 患者抗癫痫药物反应和 MST 拓扑特征之间的关系。

方法 回顾性纳入 34 名 IGE 患者及 40 名年龄性别相匹配的健康对照。首先计算每个被试全脑 116 个区域间的时间序列相关性以构建功能连接矩阵，对于每一个功能连接矩阵，采用 Kruskal 算法构建 MST，并计算每一个 MST 的拓扑指标，包括叶分数、树层次、直径。采用两样本 t 检验比较 IGE 患者组与正常对照组间以及不同药物反应 IGE 亚组间的 MST 指标。采用 Pearson 相关分析计算所有的 IGE 患者以及不同药物反应的 IGE 亚组的病程与 MST 指标间的相关性，并采用 SurfStat 构建广义线性模型评估药物反应对病程和 MST 指标间相关性的影响。

结果 相较于正常对照，IGE 患者的 MST 叶分数上升（ $t = 4.03$, $p < 0.001$ ），树层次上升（ $t = 2.34$, $p = 0.011$ ），直径下降（ $t = 2.174$, $p = 0.016$ ），不同药物反应的 IGE 患者间的 MST 直径存在差异（ $t = -2.00$, $p = 0.027$ ）。相关分析显示 IGE 患者的 MST 直径与病程显著相关（ $r = 0.37$, $p = 0.028$ ），药物反应良好的 IGE 患者的 MST 直径与病程显著相关（ $r = 0.60$, $p = 0.003$ ），而药物反应不良的 IGE 患者的 MST 直径与病程无显著相关（ $r = -0.06$, $p = 0.848$ ），药物反应显著调节了病程对 MST 直径的影响（ $F = 8.23$, $p = 0.007$ ）。

讨论 本研究基于 MST 方法评估了 IGE 患者大脑网络的拓扑改变，研究结果显示了 IGE 患者的 MST 叶分数、树层次上升且直径下降，提示 IGE 患者大脑网络集中，效率增加。

PU-1584

2 型糖尿病患者大尺度脑网络功能连接与脂质代谢及认知功能的关系研究

张雯、张冰
南京大学医学院附属鼓楼医院

目的：2 型糖尿病（type 2 diabetes mellitus, T2DM）患者常合并脂质代谢异常与认知功能减退，本研究拟通过静息态功能磁共振（functional magnetic resonance imaging, fMRI）技术 T2DM 患者的大尺度脑网络间及网络内功能连接进行评估，探究脑网络功能连接改变与血清脂质代谢、认知功能之间的关系。

材料与方法：纳入 147 名年龄、性别及教育年限匹配的被试，所有被试分为合并轻度认知障碍的糖尿病患者（T2MCI, $n=40$ ）、认知正常的糖尿病患者（T2NC, $n=62$ ）和 45 名无糖尿病健康对照。每个参与者都接受了 fMRI 扫描、全套认知功能评估和外周血生化检查。使用独立成分分析计算大尺度脑网络间和网络内的功能连接。统计学分析包括多变量协方差分析、偏相关分析、典型相关分析和中介分析。

结果：与对照组相比，T2MCI 组和 T2NC 组的网络间、网络内功能连接均减低。我们发现，在控制了年龄、性别、教育年限和头动参数后，三组之间的网络间功能连接有明显差异，包括：腹侧感觉运动网络与背侧注意网络之间，腹侧感觉运动网络和视觉网络之间。在所有 T2DM 患者中，网

络间功能连接减低与血清总胆固醇、高密度脂蛋白胆固醇和低密度脂蛋白胆固醇水平增加相关，与较差认知表现相关。基于体素的网络内功能连接分析表明，在前侧默认模式网络的左侧后扣带回、背侧注意网络的右枕中回和视觉网络的右顶上小叶有明显的组间差异。这些网络内的功能连接改变都与总体认知得分呈正相关。更重要的是，脂质代谢参数和认知之间的关系是由网络间功能连接介导的。

结论：本研究从大规模功能网络组织的角度扩展了 T2DM 中有关脂质代谢-大脑-认知关系的现有知识。我们的研究表明，有希望通过调节糖尿病患者的血清脂质来改善其认知功能。

PU-1585

静息态功能磁共振评估亚急性缺血性卒中的价值：与动态磁敏感对比增强灌注的比较

倪玲、张冰
南京鼓楼医院

目的：静息态功能磁共振 BOLD 数据在检测亚急性缺血性卒中脑灌注水平的应用价值未知。本研究旨在利用静息态 BOLD 数据的时间移位分析 (TSA) 方法检测亚急性缺血性卒中的脑灌注水平，并与动态磁敏感对比增强 (DSC-PWI) 所获灌注对比。

方法：共 40 例亚急性缺血性卒中（神经系统症状发作后 3–14 天）患者接受了 MRI 检查。共分为 A 和 B 两个队列。其中队列 A 中的 31 例患者具有 MRA, DSC-PWI 和 BOLD 数据；队列 B 中的 9 例患者具有 BOLD 和 MRA 数据。使用 TSA 计算每个体素中的 BOLD 时间序列与全脑和/或对侧半球平均时间序列之间的时间延迟值。利用达峰时间 (TTP) 检测脑灌注不足。使用 Dice Coefficient 系数计算两种检测方法的空间重合度。

结果：在队列 A 中，有 14 例颅内大动脉闭塞/狭窄患者在两种方法中均检测到脑灌注的不足，均没有丰富的侧枝血管；1 例患者具有丰富的侧枝血管，TTP 或者 TSA 方法均未检测到脑灌注不足。其余 16 例无明显 MRA 病变的患者均未检测到 TTP 或 TSA 时间延迟。在队列 B 中，8 名患者利用 TSA 方法检测到时间延迟区域。利用对侧半球平均信号作为参考信号时，Dice Coefficient 系数为 0.58 ± 0.13 (范围为 0.35–0.78)，利用全脑平均信号作为参考信号时，DC 系数为 0.59 ± 0.12 (范围为 0.36–0.77)。

讨论：基于静息态 BOLD 数据的时间移位分析技术是一种可以替代 DSC-PWI 检测脑灌注的方法，无需使用造影剂，可重复性高。可用于检测 MRA 管腔狭窄明显、分支稀疏的亚急性脑卒中患者的脑灌注不足，而那些具有丰富侧枝血管的患者将保持较完好的脑灌注水平。

PU-1586

Impaired topology and connectivity of structural covariance networks in major depressive disorder: evidence from a multi-site neuroimaging dataset

Kun Qin^{1,2}, Wen Chen¹, Bo Yang¹, Rui Hu¹, Jing-Yi Long³

1. Taihe Hospital, Hubei University of Medicine

2. Department of Psychiatry and Behavioral Neuroscience, University of Cincinnati College of Medicine, Cincinnati, OH, US

3. Affiliated Wuhan Mental Health Center, Tongji Medical College of Huazhong University of Science and Technology, Wuhan, China

Objective: Major depressive disorder (MDD) has been increasingly understood as a disruption of brain networks. Investigating structural covariance networks can provide valuable insights into structural basis of network-level neuropathological mechanisms of depression. However, current findings were not consistent due to limited sample size and low statistical power.

Methods: In this study, we utilized a multi-site structural MRI dataset including 955 MDD patients and 1009 healthy controls (HC) from 23 sites. Individualized structural covariance networks (iSCN) were established based on regional gray matter volume calculated from images. Following cross-site data harmonization, network topological metrics and focal structural connectivity were estimated, and examined for group differences, clinical associations and diagnostic values. Different validation strategies were applied to confirm the robustness of findings.

Results: Compared with HC, MDD patients exhibited increased global efficiency, abnormal regional centralities (i.e., thalamus, precentral gyrus, middle cingulate cortex and default mode network) and altered circuit connectivity (i.e., ventral attention network and frontoparietal network). First-episode drug-naïve and recurrent patients exhibited different patterns of deficits in topology and connectivity. In addition, we found network topological metrics achieved better individual-level classification performance than focal connectivity features. The structural connectivity between thalamus and insula was positively associated with severity of depressive symptoms (Figures are shown in attachments).

Conclusions: Based on this high-powered dataset, reliable and reproducible patterns of impaired topology and connectivity of iSCN were identified in MDD and relevant clinical subgroups, which might guide future development of diagnostic and therapeutic markers.

不伴认知功能障碍早期 2 型糖尿病脑结构改变

唐湘雍、鄂林宁、陈翠美、张玉忠
深圳市龙华区人民医院

目的：研究不伴认知功能障碍的早期 2 型糖尿病（T2DM）患者脑皮层厚度及不同皮下核团体积结构改变。材料与方法：本研究选取 27 例不伴认知功能障碍的早期 2 型糖尿病患者及与之年龄、性别、受教育程度匹配的 21 例正常对照组，通过 3.0T MR 扫描仪获取 3D-T1WI 图像，使用 Freesurfer 软件对两组间结构图像进行分析处理，评估糖尿病患者大脑皮层厚度及 19 个不同皮下核团体积结构改变。结果：皮层厚度指标 T2DM 组与正常对照组相比差异无统计学意义，但额顶叶部分脑区皮层厚度有减低趋势；皮下核团 T2DM 组与正常对照组相比左侧苍白球、丘脑体积减小，差异有统计学意义（ $P<0.05$ ），余皮下核团体积差异无统计学意义。结论：本研究对早期不伴认知功能障碍 T2DM 患者皮层厚度及皮下核团体积的结构探索，对评估糖尿病早期其脑损害具有一定临床价值。

帕金森病感觉运动区动态功能网络连通性分析

潘钰、瞿航、赵义、刘姜冰、王伟
扬州大学附属医院

目的：以帕金森病(PD)患者的主要运动障碍表现为切入点，探索 PD 患者感觉运动网络内部各亚区间瞬时状态下功能连接的时间变异性及其与临床特征的相关性，以期有助于理解 PD 患者运动障碍产生的神经机制。

方法：纳入 30 例 PD 患者(PD 组)及 30 例健康对照组(HC 组)，收集被试的结构相和静息态 fMRI 数据及临床运动量表评分。使用 MATLAB 对静息态 fMRI 数据进行预处理。使用 GIFT 组件，采用

Infomax 算法, 设标准脑的感觉运动网络模板为 MASK, 根据解剖学识别内部亚区。使用 Temporal dFNC 工具箱, 采用滑动窗口法和 k-means 聚类法对动态功能连接进行分析, 系统自动估计出最佳聚类数, 以此对所有被试的窗口功能连接矩阵进行估计, 得到一个随时间变化的状态转换向量, 用分数窗(FT)、平均居留时间(MDT)和转换次数评估量化连接的时间特性。比较 PD 组和 HC 组之间每种状态输出度量的差异显著性, 并与临床量表评分进行相关性分析。

结果: 最终识别 18 个亚区成分, 聚类 4 种动态功能连接状态: 状态 1(19%): 中央旁小叶呈较强的负相关, 左侧中央前/后回间呈较强的正相关; 状态 2(48%)总体呈弱连接, 出现的频率最高; 状态 3(18%)总体呈正相关连接, 在双侧中央前回的连接较强; 状态 4(15%)呈大致参半的正负相关连接, 且连接较紧密。PD 组连接比 HC 组更紧密, 状态 1 下 FT 明显增加 ($P<0.05$), 状态 2 下中央旁小叶与右侧中央前/后回之间功能连通性显著减少($P<0.05$); 状态 1 的 FT 和 MDT 与运动评分呈正相关 ($r=0.419$, $r=0.384$, $P<0.05$), 状态 3 的 FT 和 MDT 与运动评分呈负相关 ($r=-0.489$, $r=-0.530$, $P<0.005$)。

讨论: 本研究提示在更精细的时间分辨率下, PD 患者大脑感觉运动网络内功能连接时变异常与临床运动障碍症状密切相关, 动态功能连接为静态功能连接提供了必要的补充。

探究急性脑梗死与脑局部血管周围间隙扩大的关系

马汝航¹、丁静¹、于茁²、夏爽³

1. 南开大学医学院

2. 天津市宁河区医院

3. 天津市第一中心医院

目的: 脑血管周围间隙在急性脑梗死中的研究甚少, 本文拟探究脑局部扩大血管周围间隙是否与急性脑梗死相关。

方法: 纳入我院 2022 年 1 月-5 月急性脑梗死患者 (A 组), 所有患者均行脑部磁共振检查, DWI、ADC 序列用于脑梗死区定位, T2WI 序列用于观察扩大血管周围间隙, 如有局部扩大血管周围间隙, 记录其位于梗死区位置, 上述指标均有 2 名 5-10 年诊断经验的放射科医师评估。另选取我院 2022 年 6 月-7 月行脑部磁共振检查的急性脑梗死患者及无急性脑梗死患者 (B 组), 用于验证该征相。此外对 A 组患者进行 3 个月随访, 观察梗死区血管周围间隙的变化情况。

结果: A 组共纳入 274 例急性脑梗死患者, 出现局部血管周围间隙扩大征相者 206 例, 占 75%, 其中 186 例位于梗死区内部, 20 例位于梗死区内部及边缘。B 组共纳入 30 例急性脑梗死患者, 20 例无急性脑梗死患者, 该征相诊断急性脑梗死正确率为 68%, 灵敏度为 81%, 特异度为 67%, 阳性预测值为 85%, 阴性预测值为 40%。在 3 个月后随访中, 共纳入 70 例患者, 扩大血管周围间隙较基线检查时有扩大者 17 例, 5 例位于梗死区边缘, 12 例位于梗死区内部, 其 T2WI 信号接近于脑脊液信号。

结论: 脑局部血管周围间隙扩大可能与急性脑梗死有关, 当患者行脑部磁共振检查但未扫描扩散加权成像序列时, 放射科医生观察到该征相, 可建议患者加扫扩散加权成像序列排除急性脑梗死。

基于增强 T1 WI 的直方图分析在区分促性腺激素性和非促性腺激素性垂体大腺瘤的鉴别诊断价值王炜^{1,2}、刘馨遥^{1,2}、白岩^{1,2}、王梅云^{2,3}

1. 郑州大学人民医院医学影像科

2. 河南省人民医院医学影像科

3. 河南省科学院生物医学研究所

目的:非促性腺激素比促性腺激素垂体大腺瘤更容易侵犯海绵窦,根据 2022 年世界卫生组织对垂体神经内分泌肿瘤的分类,本研究探讨增强 T1WI (contrast-enhanced T1 weighted imaging,CE-T1WI) 直方图分析在区分促性腺激素性和非促性腺激素性垂体大腺瘤的价值。

材料与方法:回顾性分析 2021 年 3 月至 2023 年 2 月就诊于河南省人民医院,经组织病理学验证的 30 例促性腺激素性及 38 例非促性腺激素性垂体大腺瘤患者资料。采用 3D slicer 软件对肿瘤最佳层面勾画感兴趣区 (region of interest, ROI),行灰度直方图分析,提取 8 个直方图参数,包括 Perc.10%、Perc.90%、峰度、平均值、中位数、最大值、最小值、偏度。两组间计量资料的比较采用独立样本 t 检验或 Mann-Whitney U 检验。绘制受试者工作特征 (receiver operating characteristic curve, ROC) 曲线,并计算曲线下面积 (area under the curve, AUC) 评估相关参数对于促性腺激素性和非促性腺激素性垂体大腺瘤的诊断效能。

结果:促性腺激素性和非促性腺激素性垂体大腺瘤两组肿瘤,8 个直方图参数中,perc.10%、perc.90%、最大值、平均值、中位数、最小值有统计学意义,且 P 值均小于 0.001。其 ROC 曲线下面积、敏感度、特异度分别为 0.822 (0.868、0.667)、0.836 (0.711、0.833)、0.839 (0.816、0.767)、0.827 (0.659、0.867)、0.814 (0.632、0.867)、0.873 (0.711、0.933)。

结论:基于 CE-T1WI 直方图对促性腺激素性和非促性腺激素性垂体大腺瘤的区分存在一定的价值,对指导患者术前治疗方案的制定和评估预后意义重大,避免误诊导致的治疗延误。

早期 CT-ASPECTS 评分在急性缺血性脑卒中急诊分流中的价值研究

牛微

西安大兴医院

目的:探讨 CT-ASPECTS 评分在急性缺血性脑卒中分诊作用;

方法:回顾性收集西安大兴医院 2022 年 10 月-2023 年 4 月急性缺血性脑卒中患者 40 例,均行 CT 平扫与 DWI 检查,同时统计患者临床特征资料,包括性别、年龄、吸烟、饮酒、高血压、糖尿病、房颤以及入院 NISSH 评分,并根据 CT 平扫及 DWI 图像进行 CT-ASPECTS 与 DWI-ASPECTS 评分,通过单样本 T 检验比较 CT-ASPECTS 与 DWI-ASPECTS 评分的关系,并进行评分分流情况。

结果:40 例患者 CT-ASPECTS 与 DWI-ASPECTS 评分差异具有统计学意义;CT-ASPECTS \leq 7 分时,与 DWI-ASPECTS 无差异 ($p=0.329$);NISSH 评分在 CT-ASPECTS \leq 7 分及 CT-ASPECTS $>$ 7 分两组间有统计学差异。

结论:CT-ASPECTS \leq 7 分时,可取代 DWI 检查,优化检查流程,缩短患者检查到治疗的时间。

基于多参数 MRI 探讨褪黑素调控小胶质细胞极化减轻大鼠脑缺血再灌注损伤的机制

李振¹、巩平²、王锡臻²、宋小磊³、王晓莉^{1,2}

1. 潍坊医学院医学影像学院

2. 潍坊医学院附属医院影像中心

3. 清华大学医学院生物医学影像研究中心

目的: 基于多参数 MRI 及多种组织学技术, 观察褪黑素 (melatonin, Mel) 对脑缺血再灌注损伤 (cerebral ischemia/reperfusion injury, CIRI) 大鼠的神经保护作用及其对小胶质细胞极化的调控作用, 以探讨 Mel 治疗大鼠 CIRI 的机制, 并为 Mel 的疗效评估提供分子影像学依据。

方法: 60 只健康成年雄性 SD 大鼠随机分为 Sham、CIRI 和 Mel 组, 采用改良线栓法制成大鼠 CIRI 模型, 其中 Mel 组在建模前后腹腔注射 Mel。CIRI 后 2 h、24 h 及 72 h, 各组大鼠采用 7.0T 小动物 MR 行 T2 加权成像 (T2-weighted imaging, T2WI)、弥散加权成像 (diffusion weighted imaging, DWI) 及化学交换饱和转移 (chemical exchange saturation transfer, CEST)-MRI 扫描。计算并分析各组大鼠 T2WI 损伤体积、相对表观扩散系数 (relative apparent diffusion coefficient, rADC) 的变化。分析各组大鼠 CEST-MRI 在 3.5ppm (Amide-CEST) 和 2.0ppm (Guan-CEST) 处的信号差异。采用 TUNEL 染色法观察 CIRI 后凋亡细胞数的变化。采用免疫荧光染色法观察各组大鼠 Iba-1/Arg1 细胞数的变化, 采用 Western blot 法观察各组大鼠 Arg1 蛋白表达的变化。采用 ELISA 法观察各组大鼠 IL-1 β 和 TNF- α 蛋白表达的变化。采用 Pearson 相关分析 Amide-CEST 信号差值和 Guan-CEST 信号差值与 Iba-1+Arg1+细胞数差值的相关性。

结果: T2WI 和 DWI 结果显示, 在 CIRI 后 24 h 和 72 h, 与 CIRI 组大鼠相比, Mel 组大鼠的梗死体积显著减小, rADC 值显著增高 (P 均 < 0.05)。

PU-1593

Investigation of collateral circulation compensatory capacity of Willis ring in the internal carotid artery stenosis using vessel selective arterial spin labeling

Yuzhu Yan

First Hospital of Jilin University

The Willis ring plays an important role in the collateral circulation especially in patients with internal carotid artery (ICA) stenosis. However conventional time of flight (TOF) MR angiography may only offer limited knowledge of the compensatory blood flow attributed to collateral circulation for patients with stenosis. Vessel selective arterial spin labeling allows the assessment of blood flow of a specific vessel. The purpose of this study was to quantify the influence of various anatomical types on the compensatory capacity of the Willis ring for patients with severe stenosis or occlusion using combined TOF MRA and vessel selective ASL method.

Severe stenosis or occlusion of ICA might change the arterial diameter of the Willis ring, and the opening conditions and anatomical structure of the Willis circle has different effects on the post-circulation compensation capability of healthy-side ICA.

PU-1594

伴卵圆孔未闭偏头痛无症状期的静息态功能磁共振研究

左钰琳、李香草、张端珍、张喜友、杨金志、郑悦、董洋
大连医科大学附属第二医院

目的 采用局部一致性 (ReHo)、低频振幅 (ALFF)、体素镜像同伦连接 (VMHC) 三种静息态功能磁共振成像 (rs-fMRI) 分析方法研究伴卵圆孔未闭偏头痛患者无症状期静息态脑功能情况, 为探究其神经影像机制提供依据。

方法 前瞻性收集 19 名伴卵圆孔未闭偏头痛患者和 19 名性别、年龄匹配的健康对照组, 采用 GE Discovery MR750W 3.0T 磁共振扫描仪行颅脑磁共振成像, 扫描序列包括 3D T1BRAVO、BOLD, 在无症状期采集图像。采用基于 MATLAB 2018b (www.mathworks.com) 的 DPABI (http://www.restfmri.net) 对 BOLD 数据进行处理获得全脑 ReHo、ALFF、VMHC 图, 两组受试者 ReHo、ALFF 和 VMHC 值分别行两样本 t 检验, 比较两组间脑功能成像特征差异。通过 ROC 曲线评估 ReHo、ALFF、VMHC 对伴卵圆孔未闭偏头痛患者头痛诊断效能。采用相关性分析探讨差异脑区 ReHo、ALFF、VMHC 值与病程、偏头痛失能程度评估得分(MIDAS)、头痛发作频率、每次头痛持续时间相关性。

结果 伴卵圆孔未闭偏头痛患者左楔前叶 ReHo 降低; 右额中回、左三角部额下回、左颞上回、左背外侧额上回 ALFF 降低; 双侧颞中回 VMHC 升高。ROC 曲线分析显示, 左楔前叶 (AUC=0.89) ReHo, 左三角部额下回 (AUC=0.69)、左颞上回 (AUC=0.88)、左背外侧额上回 (AUC=0.82) ALFF, 对伴卵圆孔未闭偏头痛诊断效能较高。相关性分析提示, 患者组左楔前叶 ReHo 值与头痛发生频率呈负相关, 左背外侧额上回 ALFF 值与 MIDAS 评分呈正相关, 右颞中回 VMHC 值与头痛发作持续时间呈负相关。

结论 本研究中, 伴卵圆孔未闭偏头痛患者存在多个脑区 ReHo、ALFF、VMHC 异常, rs-fMRI 有助于探究伴卵圆孔未闭偏头痛患者的神经影像机制。

PU-1595

Differentiation between parkinsonian syndromes based on a machine learning model of quantitative susceptibility mapping

Yue Hu
Affiliated Hua Shan Hospital of Fudan University

Objective To investigate the differential diagnostic value of a machine learning model based on quantitative susceptibility mapping (QSM) in brain iron accumulation parkinsonian syndromes (PS).

Methods 17 patients with multiple system atrophy with predominant cerebellar ataxia (MSA-C), 20 patients with MSA with predominant parkinsonism (MSA-P), 14 patients with progressive supranuclear palsy (PSP) and 85 patients with parkinson's disease (PD) were retrospectively recruited. Regions of interests (ROIs) were set in the globus pallidus (GP), substantia nigra (SN), red nucleus (RN), caudate nucleus (CN), and putamen (PU) bilaterally. A machine learning model based on the radiomics features of QSM was constructed to distinguish PS.

Results A total of 7 radiomics features were screened finally to establish the model. For MSA-C, the area under the curve (AUC) values of the model in the training and validation groups were 0.873 and 0.672 respectively. For MSA-P, the AUC values were 0.940 and 0.905. For PSP, the AUC values were 0.911 and 0.814. For PD, the AUC values were 0.956 and 0.898.

Conclusion A machine learning model based on the QSM could have a crucial role in the differentiation between PS.

淋巴结外型 Rosai-Dorfman 病的 CT 与 MR 表现

赵康艳、贾岩龙、王江涛、马烨、陈韵、李锋
襄阳市中心医院

摘要: 目的: 探讨淋巴结外型 Rosai-Dorfman 病 (RDD) 的 CT 及 MRI 表现, 以期提高对该病的认识。方法: 回顾性分析 9 例经手术病理证实的淋巴结外型 RDD 的影像资料。2 例行 CT 平扫; 1 例行 CT 平扫及增强; 6 例行 MR 平扫及增强扫描。结果: 9 例中 1 例位于右侧耳廓, 呈实性软组织肿块, 密度均匀; 1 例位于气管, 呈实性软组织肿块, 密度均匀, 中度均匀强化; 7 例位于中枢神经系统, 5 例脑膜型 T2WI 呈低信号, 2 例脑实质型呈明显高信号, 增强扫描 7 例均明显均匀强化。结论: 淋巴结外型 RDD 的 CT 及 MRI 表现具有一定特征性, 平扫病变信号或密度均匀, 增强扫描中度-重度均匀强化; 中枢神经系统病变脑膜型 T2WI 呈低信号, 脑实质型 T2WI 呈高信号。

基于不同 b 值 DTI 深度森林模型预测胶质瘤瘤体及瘤周区域 Ki-67 的表达水平

刘书涵
四川大学华西厦门医院

目的: 探讨不同 b 值的情况下, 基于 DTI 纹理特征的深度森林模型对胶质瘤 Ki-67 表达水平的分类预测价值, 并挖掘最佳诊断区域及最优参数。

方法: 回顾性收集本院病理诊断为胶质瘤的 90 例患者资料, 经分层抽样 6:4 划分为训练集和验证集。使用 3D-Slicer 软件对高 b 值 (1000s/mm²)、超高 b 值 (3000s/mm²) DTI 扩散参数 (ADC、FA) 勾画 ROI, 包括瘤体 (TB)、瘤周 5mm (PTR1)、瘤周 10mm (PTR2)、瘤体及瘤周 5mm (TB+PTR1)、瘤体及瘤周 10mm (TB+PTR2), 再使用 pyradiomics 提取上述区域的纹理特征, 经 PCA 降维、MI 筛选后, 建立深度森林模型。

结果: ① 不同 b 值影响: 高 b 值、超高 b 值扩散参数模型, 其 AUC、准确度、敏感度、特异度依次分别为 0.87、77.78%、63.89%、84.68%及 0.82、73.33%、62.78%、83.78%; 在 TB 区域, 高 b 值、超高 b 值模型 AUC、准确度、特异度依次分别为 0.88、66.67%、60.00%及 0.89、77.78%、80.00%; ② 不同区域影响: 高 b 值模型验证集中, TB+PTR1 区域 AUC 最高为 0.92, 其次为 TB (0.88); PTR1、TB+PTR2 区域准确度最高, 均为 83.33%; TB 区域敏感度最高为 75.00%; PTR1 区域特异度最高为 92.50%; ③ 不同参数影响: 高 b 值扩散参数构建 TB+PTR1 模型, 在验证集中 ADC、FA 模型的 AUC 和准确度分别为 0.84、78.12%及 0.88、78.12%。

结论: 基于 DTI 纹理特征的深度森林模型对胶质瘤 Ki-67 表达水平的分类具有一定的预测价值。对瘤周区域而言, 高 b 值比超高 b 值更具有诊断价值, 瘤体及瘤周 5 mm 的组合区域为最佳诊断区域; 但对瘤体区域而言, 超高 b 值模型的诊断效能要优于高 b 值。在 DTI 参数中, FA 比 ADC 更具有诊断预测价值。

细胞外游离水(FW)与脑白质高强度(WMH)负荷的关系

雷新军、蓝海源
丽水市中医院

细胞外游离水(FW)增加与脑白质高强度(WMH)负荷的关系

目的:探讨细胞外游离水(FW)与脑白质高强度(WMH)负荷的关系。

方法:本次研究共对 126 例患者的磁共振成像(MRI)资料进行前瞻性分析。根据液体衰减反转恢复 (FLAIR)图像上的 WMH 体积和深部和室周白质高信号(DWMH 和 PWMH)的 Fazekas 评分来确定 WMH 负荷。FW 值取自扩散张量成像(DTI)图像。

结果:126 例患者平均年龄 59.6 ± 11.5 岁, 高血压患者 67 例 (53.2%), 平均 WMH 体积为 12.16 ± 12.66 mL, 平均 FW 值为 0.24 ± 0.01 。单因素分析显示, FW 值与 WMH 负荷 (WMH 体积、DWMH 和 PWMH Fazekas 评分) 相关 ($P < 0.05$)。经多因素分析, 通过年龄和高血压调整, FW 值与 WMH 体积、DWMH 和 PWMH Fazekas 评分相关 ($P < 0.05$)。

结论:细胞外 FW 增加与 MRI 上 WMH 负荷有关。

PU-1600

经典三叉神经痛患者局部及全局脑功能的时频特性

葛秀红、王罗羽、潘磊、叶海琪、朱小芬、丁忠祥
杭州市第一人民医院

目的: 本研究通过对比分析 77 名 CTN 患者和性别、年龄相匹配的 73 名 HCs 的 sALFF、sReHo、sDC、dALFF、dReHo、dDC, 明确 CTN 患者局域脑功能的变化, 及其与临床参数之间的相关性。

材料与方法: 所有被试均进行 rs-fMRI 和神经心理学评估。采用不同频段的 sALFF、sReHo、sDC、dALFF、dReHo、dDC 分析 CTN 患者局域脑功能变化。并将 CTN 患者的功能变化与神经心理学评估进行相关分析。

结果: HC 相比, 经典频段, CTN 患者 sALFF 和 dALFF Precuneus_R 值降低, 双侧 Frontal_Sup Frontal_Sup_R 值升高; Caudate_R、双侧 Cerebellum_8_L 和 Temporal_Pole_Mid_R sReHo 值升高, Occipital_Mid_L 和 Calcarine_R 的 sReHo 值降低, 双侧 Frontal_Sup Frontal_Sup_R dReHo 值升高; Cerebellum_8_R 和 Caudate_R 的 sDC 值升高, Calcarine_R 和 Lingual_L 的 sDC 值降低; Frontal_Sup_R 的 dDC 值升高。Precuneus_L (sALFF 值降低) 和 Frontal_Inf_Tri_L (sReHo 值降低) 两个脑区仅在慢 4 频段中发现, 且在不同频段

发现脑功能改变的脑区数目不同。在各频段中，部分局域脑功能存在差异的脑区与部分临床参数存在一定的相关性。

结论：1).在经典频段，CTN 患者脑功能发生改变，且动态和静态互为补充；2). CTN 患者的脑功能变化具有一定的频率特异性；3).与慢 5 频段相比，慢 4 频段与经典频段一致性较高；4).CTN 严重影响患者的精神心理健康，部分差异脑区与 CTN 患者的临床参数存在相关性。

原发性椎管内髓外硬膜下恶性淋巴瘤 1 例

姚沅非、胡粟、刘原庆、陈蒙、胡春洪
苏州大学附属第一医院

报道 1 例经病理证实的原发性椎管内髓外硬膜下恶性淋巴瘤。

患者女，62 岁，因“左下肢进行性麻木伴行走困难一年余”就诊。无发热、畏寒等症状。腰椎 MRI 平扫示 T12-L3 水平椎管内占位，脊髓圆锥及终丝受压，T1WI 呈等信号、T2WI 呈等、高信号，终丝及马尾神经增粗；增强后可见明显呈强化，病变包绕神经。初步诊断为脊髓圆锥及终丝占位，室管膜瘤可能大。术后病理：椎管内占位，恶性 B 细胞淋巴瘤，考虑弥漫大 B 细胞淋巴瘤（非生发中心亚型）。

原发性中枢神经系统淋巴瘤（PCNSL）十分少见，约占所有中枢神经系统肿瘤的 0.9%，其中约 90% 为弥漫大 B 细胞淋巴瘤。椎管内原发性恶性淋巴瘤更为罕见，且大多为硬膜外淋巴瘤，多发生于胸段，其次是腰、颈段；并常出现肿块包绕神经的征象。本例排除其它部位继发淋巴瘤，结合病理结果诊断为原发性椎管内髓外硬膜下的 DLBCL。椎管内髓外硬膜下的 DLBCL 影像学特征并不典型，该病例 MRI 表现为包绕圆锥及终丝的占位，分界欠清，平扫 T1WI、T2WI 均呈等信号，增强扫描后病变明显均匀强化，未见囊变征象，具有一定淋巴瘤影像学特征。

鉴别诊断：①室管膜瘤，多发生于髓内，约占终丝及马尾处原发肿瘤的 90%。MRI 表现为 T1WI 等或低信号、T2WI 高信号，常伴有囊变坏死，增强扫描后 T1WI 可成像明显强化。②神经源性肿瘤，是椎管内髓外硬膜下常见的肿瘤，主要发生于下腰段，无明显特征性表现，常表现为哑铃状肿块，T1WI 呈等、低信号，T2WI 呈高信号，且多伴有囊变、坏死，增强扫描实体部分呈明显强化。③脊膜瘤，也是髓外硬膜下常见肿瘤之一，多表现为圆形或卵圆形肿块，与周围结构分界较清晰，增强扫描后呈明显均匀强化，常伴有“脊膜尾征”。

总之，原发性椎管内髓外硬膜下的恶性淋巴瘤发生率，且缺乏特征性。当 MRI 表现为髓外硬膜下的均匀软组织信号影，增强扫描后呈明显均匀强化并伴有神经包绕的病变，仍要考虑到此病的可能。

PU-1602

Swirl sign score system: a novel and practical tool for predicting hematoma expansion after spontaneous intracerebral hemorrhage

Zhiming Zhou, Xiaojia Wu, Yuanyuan Chen
The Second Affiliated Hospital of Chongqing Medical University

Purpose: To methodically analyze the swirl sign and construct a scoring system for the swirl sign to predict hematoma expansion (HE) after spontaneous intracerebral hemorrhage (sICH).

Methods: In this multicenter retrospective study, data from 231 of 683 sICH patients with swirl signs on baseline noncontrast computed tomography (NCCT) images were analyzed. Patients

were divided into a development cohort ($n = 160$) and a validation cohort ($n = 71$). The characteristics of the swirl sign were analyzed, including the number, maximum diameter, shape (irregular or regular), boundary (clear or unclear), minimum CT value of the swirl sign and the minimum distance from the swirl sign to the edge of the hematoma. In the development cohort, univariate and multivariate analyses were used to identify independent predictors of HE, and logistic regression analysis was used to construct the swirl sign score system. The swirl sign score system was verified in the validation cohort.

Results: The number and the minimum CT value of the swirl sign were independent predictors of HE. A 3-point swirl sign score system was constructed (2 points for the number of swirl signs > 1 and 1 point for the minimum CT value ≤ 41 Hounsfield units). The area under the curve of the swirl sign score system in predicting HE was 0.773 and 0.770 in the development and validation groups, respectively.

Conclusions: The swirl sign score system is an easy-to-use radiological grading scale that requires only NCCT images at admission to effectively identify subjects at high risk of HE.

PU-1603

回顾性分析 SWI-DWI 联合成像在早期缺血性脑梗塞中的应用价值

王艳菊

绵阳市第三人民医院

【摘要】目的 探讨磁敏感-扩散加权不匹配 (susceptibility-diffusion mismatch, SDM) 在早期脑梗塞的应用, 探讨缺血半暗带及微出血的诊断价值。方法 回顾性 2017 年 1 月至 2021 年 12 月绵阳市第三人民医院 SWI-DWI 检查的 52 例符合纳入及排除标准要求的确诊的超急性、急性缺血性脑卒中患者, 其中男性 30 例, 女性 22 例; 年龄 38~78 岁, 平均年龄(57.928.16)岁, 均进行全脑覆盖扫描, 每例患者均进行 T1WI、T2WI、FLAIR、SWI、DWI, 冠状位、矢状位与轴位扫描, 层厚 5mm, 间距 1.0mm; 由 2 名 MR 高级医师盲法分析脑微出血 (CMB) 阳性、识别动脉栓塞磁敏感血管征 (susceptibility vessel sign, SVS)、SDM 的判断, 结果不一致时共同协商达成一致意见。结果 52 位新近脑梗塞病人, 发现 37 位病人梗塞灶内有 CMB, 阳性率约 71.2%, 共 117 处 CMB; 2. 52 位新近脑梗塞病人, 发现动脉血栓 45 位, 阳性率约 86.5%, 其余 7 位腔隙性脑梗塞灶或小梗塞灶未能确定处梗塞动脉; 3. 52 位新近脑梗塞病人, 邻近增粗侧枝血管 52 位, 阳性率 100%; 4. 52 位新近脑梗塞病人, 存在 SDM 征象 45 位, 阳性率为; 约 86.5%, 其余 7 位腔隙性脑梗塞灶或小梗塞灶未能确定处梗塞动脉; 结论 SWI-DWI 联合利用可以发现早期缺血性脑梗塞中危险的缺血半暗带和微出血灶, 并且成像有较高的敏感性, 较好的时效性, 有利于早期缺血性脑梗塞灶的诊断和治疗, 比较符合卒中病变的检查原则, 并且无需注射药物、更有利于肾功能不良, 存在有一定优势, 为我们诊断早期缺血性脑卒中提供了一种新途径。

The brain function differences between interphase and episodes of migraine attacks In patients with migraine without aura.

Yang Yu,Rong Hong,Hongru Zhao
The First Affiliated Hospital of Soochow University

Previous neuroimaging studies have shown that there are differences in the functional connectivity of the central nervous system between migraine patients and healthy people. However, the fMRI results of patients with different seizure phases show great differences. The aim of this study was to investigate the relationship between the immediate and long-term effects of pain pathways on the central nervous system during migraine attack. Using resting-state functional magnetic resonance imaging and voxel-wise functional connectivity density analysis, we compared the large-scale functional connectivity pattern over the whole brain in 23 patients with migraine without aura attack and attack interphase. The associations between functional connectivity density and clinical variables were also explored. Compared with interparoxysmal, acute episode showed decreased local and distant functional connectivity density in the dorsolateral and medial prefrontal cortexes and precuneus and increased local and distant functional connectivity density in the hippocampal complex. Moreover, local functional connectivity density in several brain regions, such as the left superior temporal gyrus and hippocampal complex, was found to be correlated with headache frequency or pain intensity. Differences in pain processing pathways and division of labor lead to differences in the immediate response and long-term effects of pain in the central nervous system of migraine patients. This difference may be one of the reasons for the low reproducibility of fmri results in migraine patients. Correctly distinguishing this difference may help us to better understand the changes of brain function in migraine patients.

fMRI 技术在眼睑痉挛疾病的初步应用探讨

彭康强¹、刘辉明¹、钟林昌¹、罗瑜涵²、刘刚²

1. 中山大学肿瘤防治中心

2. 中山大学附属第一医院

目的：眼睑痉挛（BSP）可引起睁眼困难、面部变形和功能性视力障碍等，影响学习和生活质量。既往研究揭示 BSP 患者存在局部脑区功能活动的异常及脑区间功能联接异常，但随时间的动态变异性改变尚不清楚。本研究采用 fMRI 技术结合滑动窗分析方法，探究 BSP 患者动态脑活动的改变及其与疾病严重程度的相关性。

方法：纳入 BSP 患者及健康对照各 46 例。完成 fMRI 检测并采用 Jankovic 量表（JRS）评估疾病的严重程度。观察 BSP 患者相较于健康对照静态低频振幅（static amplitude of low frequency fluctuation, sALFF）和动态低频振幅（dynamic amplitude of low frequency fluctuation, dALFF）的差异，以 dALFF 存在差异的脑区为感兴趣区（region of interest, ROI）进一步探究 BSP 患者动态功能联接（dynamic functional connectivity, dFC）的改变。采用 Spearman 相关分析方法研究存在差异脑区的影像学指标与疾病严重程度的相关性。

结果：与健康对照组对比，BSP 患者 sALFF 显著升高的脑区为左侧中央前回、右侧顶下回和双侧额中回，显著降低的脑区为右侧楔前叶和左侧中央后回（voxel $P < 0.005$, cluster $P < 0.05$, GRF 校正）；dALFF 变异度显著增高的脑区为右侧中央前回（voxel $P < 0.005$, cluster $P < 0.05$, GRF

校正)。以右侧中央前回为 ROI 做 dFC 发现, BSP 患者右侧中央前回与右侧小脑半球 8 区的 dFC 较对照组显著降低。

结论: BSP 患者局部脑活动和功能联接的稳定性存在改变, 可能是面部运动过度和疾病本身的病理生理机制共同作用所致。中央前回 dALFF 变异度可能与患者疾病严重程度有关。

3D-TOF-MRA 联合 3D-FIESTA 在血管压迫性三叉神经痛中的诊断价值研究

张武

南阳医学高等专科学校第一附属医院

目的 探讨分析三维时间飞跃法磁共振血管成像(3D-TOF-MRA)联合三维双激发平衡式稳态自由进动序列(3D-FIESTA)在血管压迫性三叉神经痛中的诊断价值。方法 回顾性分析本院 2017 年 7 月~2019 年 5 月收治的 102 例血管压迫性三叉神经痛患者的临床资料。于微血管减压术(MVD)术前均予以 3D-TOF_x0002_MRA、3D-FIESTA 及 3D-TOF-MRA 联合 3D-FIESTA 检查对责任血管的种类显示情况及评估结果。结果 以术中所见结果为金标准, MVD 对责任血管阳性检出率为 97.06%; 联合检查对小脑后下动脉、基底动脉、岩静脉血管阳性检出率与 3D-TOF-MRA、3D-FIESTA 单独比较无统计学意义($P>0.05$); 联合检查对小脑上动脉、小脑前下动脉血管阳性检出率更高($P<0.01$)。结论 两种方法联合诊断血管压迫性三叉神经痛对 MVD 术前评估具有高准确性和重要的意义

缺血性中风的遗传和血管风险因素对大脑皮层形态学的影响

刘嘉玮、谢颖滢、于春水

天津医科大学总医院

目的:

许多关于缺血性中风的研究通过比较病例组与对照组的神经影像学差异来探究中风患者病灶之外的脑结构和功能变化; 然而, 这些结果可能受患者和对照群体由于中风风险因素的长期作用而导致的

现有脑结构差异的潜在影响。基于此，本实验探究了中风风险因素对未患有中风病史的个体的大脑皮层形态学影响。

方法:

为了验证缺血性中风的风险因素对大脑结构有不可忽视的影响，我们测试了缺血性中风的多基因风险分数、收缩压和舒张压、血糖以及血脂（甘油三酯和低密度脂蛋白）对 36,092 名参与者（其中男性 17,230 名，年龄在 40-70 岁之间，均未有卒中病史）的 62 个大脑区域的皮层厚度和表面积的单和交互效应。对于每个皮层表型，我们建立了一个多元线性回归模型，同时考虑了每个风险因素的独立效应以及任意两个因素之间的交互作用，同时控制了年龄、性别、数据采集中心、基因分型批次、基因人群分层。回归模型分别在发现组 ($n = 18,044$) 和验证组 ($n = 18,048$) 人群中建立（经过 Bonferroni 校正后， $P < 4.03 \times 10^{-4}$ ），并通过敏感性分析对结果的可靠性进行了验证。进一步的，通过 2,788 名在两个时间点获取脑影像的纵向参与者来测试两次采集之间结果的稳定性。

结果:

研究发现，123 个脑表型的多元线性回归模型在发现和验证样本中均显著，这些风险因素能够共同解释表面积的 5.8 - 26.5% 的方差和皮层厚度的 0.3 - 12.7% 的方差。我们发现较高的缺血性中风多基因风险分数与岛叶皮层变薄之间存在显著关联，此外我们发现舒张压、低密度脂蛋白和甘油三酯分别与 1、5 和 11 个皮层表型相关。较高的舒张压和低密度脂蛋白与皮层增厚相关；较高的甘油三酯与表面积减少相关。然而，我们没有发现遗传和血管风险因素之间或血管风险因素之间的显著交互作用。

结论:

总之，本研究这些发现表明缺血性中风的遗传和血管风险因素对皮层形态学有重要影响，这在识别缺血性中风引起的神经影像学变化时应予以考虑。

定量磁化率成像对失眠患者脑氧代谢的研究

熊瑞芳¹、朱涵婷¹、李承毅¹、胡鹏鑫¹、邹宇¹、赵锡海²、唐小平¹

1. 南昌大学第二附属医院

2. 清华大学医学院生物医学影像研究中心

目的 采用定量磁化率成像 (quantitative susceptibility mapping, QSM) 探讨失眠患者与健康志愿者的脑氧代谢的差异。方法 前瞻性收集 2022 年 9 月至 2023 年 9 月在南昌大学第二附属医院就诊的失眠患者 22 名，同时收集健康对照组 20 名，参与者皆接受 QSM 序列扫描成像，采集不同静脉血管的脑静脉血氧饱和度 (cerebral venous oxygen saturation, CSV02) 及其均值，失眠患者皆接受了多导睡眠图 (Polysomnography, PSG) 监测，通过协方差分析进行两两比较，采用 spearman 分析进行相关性分析。结果 失眠患者与健康对照组之间上矢状窦 CSV02 及平均 CSV02 存在统计学差异 ($F=9.42, 8.33$; $p < 0.001$, $p=0.01$)，CSV02 平均值与 R 期占比呈负相关 ($p=0.047$, $R=-0.45$)。结论 失眠患者的脑氧代谢减低，失眠患者脑氧代谢减低与 R 期占比增加有关。

基于 MRI 放射组学的新型多模态可解释模型区分原发性中枢神经系统淋巴瘤和胶质母细胞瘤：一项多中心研究

赵恩东¹、杨云峰²、杨超³

1. 大连医科大学附属第二医院

2. 中国科学院大学

3. 大连医科大学附属第一医院

目的：本研究的目的是开发和验证一种能够融合放射组学特征和宏观影像特征的多模态可解释人工智能模型，基于多序列的 MRI 图像和宏观影像特征建模来准确鉴别原发性中枢神经系统淋巴瘤和胶质母细胞瘤。

材料与方法：回顾性入组了两个不同医学中心的共 242 例原发性中枢神经系统淋巴瘤或胶质母细胞瘤患者的多序列 MRI 影像和临床资料。将患者按照不同医学中心分为训练队列和外部验证队列。对图像预处理之后，逐层分割 4 种不同范围的肿瘤和瘤周脑区作为感兴趣体积，并对宏观影像特征进行评估。筛选出 10 个最具预测价值的放射组学特征。根据不同的图像和标签范围的组合，最终建立了 6 个单序列 MRI 放射组学模型。将筛选得到的多序列放射组学特征和编码后的宏观影像特征等临床因素进行合并，最终建立了多模态放射组学模型。对模型的性能和临床应用价值进行评估。此外，使用 SHAP 方法对最优的模型进行可解释分析，赋予了该模型直观的决策结果解释。

结果：使用随机森林(RF)算法共建立了 7 个不同的模型。其中，在单序列模型中，T1CE-Tumor-Edema-Model 表现出最优的预测性能，其在外部分验证队列中的 AUC 为 0.91。而多模态模型表现出 7 个模型中最优的预测性能和可解释性，其在外部分验证队列中的 AUC 为 0.94，这表明多模态信息能够有效提高模型的性能上限。此外，SHAP 方法解释结果表明两个融合特征 Rad-Score 和 Clinical-Rad-Score 对模型的决策起到了至关重要的作用。

结论：我们开发了一种基于多序列 MRI 和临床因子的多模态可解释的放射组学联合模型，该模型能够准确高效地鉴别原发性中枢神经系统淋巴瘤和胶质母细胞瘤，并且该模型的结果具备可解释性，具有很高的临床价值。据我们所知，这是首次探讨狭义与广义瘤周脑区对模型的获益价值，并使用可解释机器学习放射组学算法框架来鉴别原发性中枢神经系统淋巴瘤和胶质母细胞瘤的研究。

胚胎型大脑后动脉与急性脑梗死的相关性

王绍才

徐州医科大学

【摘要】目的 研究胚胎型大脑后动脉和急性脑梗死发生的相关联系。**方法** 进行回顾性分析，共选择 150 例发生急性脑梗者及 150 例同时期体检者的影像资料（MRI 检查及 CTA 检查）及临床资料，分为急性脑梗组及对照组，对两组间的临床及影像资料进行分析。**logistic** 回归分析用来分析急性脑梗发生的危险因素。**结果** 急性脑梗组胚胎型大脑后动脉发生率、既往脑梗史比率均高于对照组($P<0.05$)。进行 **logistic** 回归分析，胚胎型大脑后动脉发生率是 AIS 发生的危险因素($P<0.05$)。**结论** 胚胎型大脑后动脉的存在与在一定程度上与急性缺血性脑梗死的发生相关。

利用扩散张量成像初探自发性脑出血脑胶质淋巴系统功能

沙静云¹、蔡璐璐¹、赵厚亮¹、胡鹏程²、徐凯¹、张超¹

1. 徐州医科大学附属医院

2. 徐州医科大学

目的：利用磁共振扩散张量成像(DTI)探讨自发性脑出血(sICH)患者脑胶质淋巴系统的病理变化特征。方法：搜集 20 例 sICH 患者和 31 例健康志愿者的临床及影像学资料，采集所有被试者的 DTI 不同方向扩散率值，以计算扩散张量成像-阿尔卑斯指数(DTI-ALPS)，用于评价 sICH 患者脑胶质淋巴系统功能是否受损。结果：sICH 病灶侧大脑半球 DTI-ALPS 指数显著低于健侧($p < 0.01$, $t = -5.77$)，也显著低于健康对照组同侧($p < 0.01$, $t = -9.50$)。结论：通过对 DTI-ALPS 指数的定量分析，能够反映 sICH 脑胶质淋巴系统功能的损害，或许利用磁共振 DTI 技术能够从新的角度反映 sICH 后大脑病理生理变化的机制。

PU-1613

多学科诊断颅骨多发性骨髓瘤 1 例报告

皮之安

西安市北方医院

多发性骨髓瘤属于恶性浆细胞瘤病，是血液系统第二常见的恶性肿瘤；而以颅骨多发肿块为首发表现的多发性骨髓瘤比较罕见，单学科容易误诊，贻误病情，本文报道多学科联合诊断颅骨多发性骨髓瘤一例。

病例资料

患者女性，63 岁，2 月前洗脸时发现额头黄豆粒样凸起，局部有压痛，未予重视；近 1 月来，患者感额头肿物明显增大，并出现头部胀痛。超声提示额部实性包块，考虑来源颅内；CT 显示额部高密度肿块，边界清晰，邻近额骨、额窦壁及右侧眼眶外侧壁、上颌窦外侧壁骨质吸收破坏，骨质破坏区内软组织密度影填充；颅脑 MRI 检查可见前额部、右颞部共 3 处椭圆形肿块，T1WI 呈稍低信号，T2WI 及 FLAIR 呈稍高信号，增强扫描病灶呈明显均匀强化，右侧视神经受累，额骨、双侧额窦壁、蝶骨大翼、右侧眼眶外侧壁、上颌窦外侧壁多发溶骨性骨质破坏。

全麻下行脑膜病损切除术（额部、右颞部）及额骨重建术，术后给予止血、预防感染、改善循环、支持等治疗，术后第 2 天拔除引流管，伤口按时换药，头部伤口延期间断拆线，愈合良好，术后病理结果提示额部小蓝圆细胞肿瘤；于西京医院行免疫组化提示：Bcl-2 (+)，CD56(+), Cyclin D1 (+)，Ki-67 (约 50%)，CD138(+), CD38(+), Kappa 及 Lambda 染色可见轻链限制，支持浆细胞瘤；血常规提示血红蛋白值约为 90g/L，影像科、神经外科、神经内科、病理科及血液科联合会诊，诊断为多发性骨髓瘤。

血管周围间隙扩散张量成像指数在评价轻度脑创伤患者类淋巴系统功能中的价值

吴碧霞、谭辉、张耿标、郑文斌[△]

汕头大学医学院第二附属医院

目的：探讨血管周围间隙扩散张量成像 (DTI-ALPS) 指数在评价轻度脑创伤 (mTBI) 患者脑类淋巴系统功能中的价值。

方法：选取诊断为 mTBI 的 30 例患者及 29 例健康志愿者纳入本研究，所有患者均进行了常规 MRI 和 DTI 序列扫描，分析了格拉斯哥昏迷指数 (GCS)、蒙特利尔认知功能评估量表 (MoCA)、行为记忆功能评估量表 (Rivermead) 的评估结果；利用 DtiStudio 软件在每例被试的各向异性分数 (FA) 图上，分别在左右侧大脑半球侧脑室体部水平的投射纤维区域、联合纤维区域勾画直径 5.0mm 的球形感兴趣区，测量每种纤维在 x、Y 和 z 轴方向的扩散率，并根据公式计算 DTI-ALPS 指数。比较 mTBI 组与正常组之间不同方向扩散率和 ALPS 指数值的差异，并分析患者年龄、Alps 指数与 GCS、MoCA、Rivermead 评分的相关性。

结果：与正常组比较，mTBI 组 DTI-ALPS 指数值显著降低 (中位数，全脑：1.452 vs. 1.593 ($P=0.005$)；左脑：1.457 vs. 1.616 ($P=0.006$)；右脑：1.451 vs. 1.605 ($P=0.027$))。轻度颅脑损伤患者的左脑 Dyproj 值显著高于健康对照组 ($P=0.005$)；mTBI 组 DTI-ALPS 指数与 Rivermead 评分呈负相关 (全脑： $r=-0.481$ ， $P=0.013$ ；左脑： $r=-0.427$ ， $P=0.030$ ；右脑： $r=-0.425$ ， $P=0.030$)。

结论：DTI-ALPS 指数可用于评估 mTBI 患者类淋巴系统功能受损情况，为理解 mTBI 相关发病机制提供见解。

PU-1615

根据动眼神经鞘瘤的影像学表现及发生位置推测患者术后动眼神经功能恢复的程度相关研究

段瑾

徐州医科大学附属医院

背景：动眼神经是纯粹的运动神经，神经鞘瘤通常起源于感觉神经；因此动眼神经神经鞘瘤(ONS)是非常罕见的。根据发生部位的不同可将其分为眼眶内段、海绵窦段、和脑池段，其中最常见的是发生在脑池段，最不常见的是眼眶内段。文献中报道的病例大多是采用手术治疗的，动眼神经完全瘫痪率非常高，增加了严重的并发症发生率。因此，我们回顾分析经病理证实的动眼神经鞘瘤的影像学特点，以及随访这些患者的预后情况，并讨论二者之间的联系。目的：探索及复习动眼神经鞘瘤的临床表现、影像学特征及术后动眼神经的恢复情况，推测影像学表现与患者预后的关系，来提升动眼神经鞘瘤患者的术后生活质量。方法：回顾性分析我院已确诊的 10 例动眼神经鞘瘤的病例、临床表现、影像学特征及随访其预后情况，结合文献对该病的影像表现、发生位置与患者的预后之间的关系进行总结分析。所有的患者均采取手术切除治疗。结果：研究中 5 例患者肿瘤发生于动眼神经脑池段，3 例为海绵窦段，2 例发生于眶内段。术前患者均有动眼神经麻痹的相关症状。术后患者 9 例出现完全性动眼神经麻痹，伴有上睑下垂和瞳孔扩大，只有 1 例位于动眼神经海绵窦段患者未出现。在 3 个月的短期随访中，被记录到部分恢复到正常，对光瞳孔有反应性，上睑下垂部分恢复。据此我们推测患者术后临床症状取决于肿瘤的大小和位置，但一定程度的动眼神经麻痹几乎总是会出现的。因此推测术前通过影像学较准确的定位可以较为可靠的推测患者的预后情况。

多模态 MRI 在帕金森病早期诊断中应用价值的研究进展

王露

绵阳市第三人民医院•四川省精神卫生中心精神卫生中心

帕金森病 (Parkinson's disease, PD) 是第二大常见的进行性神经退行性疾病, 其病因现仍不清楚, 近年来 PD 发病率迅速增长, 然而目前 PD 的治疗效果低下, 究其原因, 是由于帕金森病的诊断主要基于其病史、临床症状和体征, 然而在出现这些特定症状和体征并被诊断之前, 神经退行性病变就已经存在并发展, 此时大部分特定神经元已经变性, 所以早期诊断 PD 显得十分重要。近些年来, 随着影像学的发展和成像技术与设备的进步, 以 MRI 为代表的影像学技术, 能够观察到疾病有关功能和结构的变化。本文旨在多模态 MRI 成像技术在 PD 早期诊断中应用价值的相关研究进展进行综述, 以期能够为 PD 的早期诊断提供一定影像学依据。

PU-1617

高级扩散成像监测大鼠 C6 胶质瘤水通道蛋白 4 表达水平的初步研究

时文伟

东南大学附属中大医院

目的 探讨高级扩散成像包括扩散峰度成像 (DKI) 及超高 b 值磁共振扩散成像 (DWI) 参数与大鼠 C6 胶质瘤水通道蛋白 4 (AQP4) 表达水平的相关性。方法 调控大鼠 C6 胶质瘤细胞 AQP4 表达水平 (分为 AQP4 过表达、沉默及未干扰细胞株三组), 采用立体定位技术分别接种在 15 只雄性 SD 大鼠右侧纹状体部位, 大鼠体重 250-300g。造模后 2-3 周内行常规 MRI、DKI 及超高 b 值 DWI 成像, 测量肿瘤瘤体及瘤周 DKI 及超高 b 值 DWI 参数值。H&E 染色观察瘤周肿瘤细胞密度, 免疫组化染色检测各组胶质瘤 AQP4 的表达水平。Spearman 相关分析研究 DKI 及超高 b 值 DWI 参数与 AQP4 的相关性。结果 瘤体: 三组间 DKI 参数 (MK 值) 及超高 b 值 DWI 参数 (超高 b 值 ADC 值) 有显著差异 (P 值均 < 0.05)。AQP4 过表达组 MK 值及超高 b 值 ADC 值明显高于 AQP4 未干扰及沉默组 (P 值均 < 0.05)。瘤周: AQP4 过表达组超高 b 值 ADC 值与 AQP4 未干扰组无明显差异 (P = 0.199), 但均明显高于 AQP4 沉默组 (P 值均 < 0.05)。Spearman 相关分析示: 瘤体 MK 值、超高 b 值 ADC 值与 AQP4 表达呈正相关 (r = 0.71, r = 0.85, P 值均 < 0.05); 瘤周 MK 值、超高 b 值 ADC 值与 AQP4 表达均呈正相关 (r = 0.64, r = 0.77, P 值均 < 0.05)。瘤周超高 b 值 ADC 值与瘤周肿瘤细胞密度呈正相关 (r = 0.65, P = 0.016)。结论 DKI 参数 MK 值及超高 b 值 DWI 参数超高 b 值 ADC 值可以用来监测大鼠 C6 胶质瘤 AQP4 表达水平, 且与 AQP4 表达呈正相关。

PU-1618

Progressive compressive myelopathy induced by a rare primary isolated thoracic vertebral hydatid cyst: A case report

Jiping Wang, Bei Zhang
First Hospital of Jilin University

Rationale: Hydatid cyst is a disease caused by the larvae of *Echinococcus* spp. The larvae often reside in the liver, lungs, and brain. Occasionally, a primary isolated thoracic vertebral hydatid cyst is reported to cause severe complications. Various diseases may lead to the development of progressive compressive myelopathy. Herein, we report a rare case of a primary isolated thoracic vertebral hydatid cyst with compressive myelopathy.

Patient's concerns: A 57-year-old female had numbness and weakness in the lower limbs for a span of 3-months.

Diagnosis: Thoracic magnetic resonance imaging (MRI) showed that an isolated mass was observed in the T5 vertebral body, which compressed the spinal cord. The diagnosis was confirmed after surgical excision, and *Echinococcus granulosus* was found to be the etiologic factor.

Interventions: The patient underwent laminectomy with no complications.

Outcomes: After surgical decompression, the patient made slow and measurable progress. While relatively rare in the non-pastoral area, the primary isolated thoracic vertebral column hydatid cyst may be considered as a possible etiology of atypical extradural spinal compression.

PU-1619

基于 TBSS 探究 T2DM 患者白质微结构损伤的性别差异与肠道菌群的关系

汪旭洋、许珊、杨东、伍建林
大连大学附属中山医院

背景: 性别差异可能是 T2DM 患者脑微结构改变的重要影响因素且与肠道菌群异常改变有关, 但其关系和详尽机制尚未明确; 本研究基于纤维束示踪空间统计分析 (TBSS) 探究 T2DM 患者脑白质微结构损伤的性别差异与肠道菌群改变之间的关联。

方法: 在 25 名 T2DM 女性及 31 名 T2DM 男性中获得扩散磁共振图像, 通过 16S rRNA 基因测序分析肠道优势菌群, 采用 TBSS 分析法探究不同性别 T2DM 患者的分数各向异性 (FA)、平均扩散率 (MD) 差异; 采用 spearman 相关性分析差异脑区 FA、MD 值与肠道差异菌群丰度及微生物多样性之间的关系。

结果: 男性 T2DM 患者在胼胝体、左侧内囊豆状核后部、外囊、右侧上纵束、双侧前放射冠、上放射冠、后放射冠、丘脑后辐射及矢状面的 FA 值均低于女性 ($P < 0.05$)。肠道菌群检测发现, T2DM 男性患者拟杆菌门、无壁菌门、拟杆菌属、单行拟杆菌种、粪拟杆菌种、卵形拟杆菌种及普通拟杆菌种均低于女性患者, 而放线菌门、柯林斯菌属和产气柯林斯菌种高于女性患者 ($P < 0.05$ 或 $P < 0.01$)。女性 T2DM 患者肠道菌群的香农 (shannon) 及辛普森 (Simpson) 指数高于男性患者 ($P < 0.05$)。在属水平, T2DM 患者拟杆菌属与左侧前放射冠、右侧前放射冠及右侧矢状面平均 FA 值呈正相关 ($r = 0.422, 0.337, 0.389$, FDR q 均 < 0.05)。

结论: 相对于女性, 男性 T2DM 患者在部分脑区存在更加严重的白质微结构损伤, 男性 T2DM 患者的拟杆菌丰度及肠道微生物多样性相对更低, 在 T2DM 患者中拟杆菌丰度与部分差异脑区白质完整性成正相关。

PU-1620

基于扩散峰度成像的颞叶癫痫伴睡眠障碍患者脑白质结构研究

郭敏

空军军医大学第一附属医院放射科

目的 基于扩散峰度成像(diffusional kurtosis imaging, DKI)探究颞叶癫痫(Temporal lobe epilepsy, TLE)合并睡眠障碍患者的脑白质微观结构改变。材料与方法 前瞻性纳入 TLE 患者 38 例,健康对照组 20 例,向 TLE 患者组发放睡眠调查问卷评估其睡眠状况,根据睡眠障碍的诊断标准和量表评分将患者分为合并睡眠障碍及未合并睡眠障碍组。采集所有受试者 DKI 序列并测量相关感兴趣区(region of interest, ROI)平均扩散峰度(mean kurtosis, MK)、平均扩散系数(Mean diffusivity, MD)和分数各向异性(fractional anisotropy, FA)三个扩散参数。使用单因素方差分析、Welch's ANOVA 检验比较睡眠质量评分、DKI 参数的组间差异。结果 合并睡眠障碍的 TLE 患者 Epworth 嗜睡量表(Epworth Sleepiness Scale, ESS)、阿森斯失眠量表(Athens Insomnia Scale, AIS)评分均显著高于对照组($P<0.05$),合并睡眠障碍的 L-TLE 患者匹兹堡睡眠质量指数(Pittsburgh Sleep Quality Index, PSQI)评分显著高于对照组($P<0.05$)。TLE 患者较健康对照的 FA、MK 值明显减低,MD 值明显升高 ($P<0.05$);合并睡眠障碍患者的 L-TLE 患者 MK、FA 值较未合并睡眠障碍者明显减低 ($P<0.05$),未发现 MD 存在组间差异($P>0.05$);合并睡眠障碍的 R-TLE 患者的 MK 值较未合并睡眠障碍者明显减低($P<0.05$),未发现 MD、FA 存在组间差异($P>0.05$)。结论 合并睡眠障碍的 TLE 患者存在特异性脑白质纤维损伤模式,利用 DKI 序列监测该类患者的治疗效果与预后评估可以提供可靠的影像学标记物。

PU-1621

CLIPPERS 综合征一例报道并文献复习

宋雅琪、张逸、张继、田为中

南京医科大学附属泰州人民医院

患者男性,60 岁,因“肢体无力伴行走不稳 2 年,加重 10 月余”于 2022 年 10 月 28 日入院。患者于 2020 年 11 月无明显诱因下出现四肢肢体无力,以左肢为著,伴行走不稳、饮水呛咳,自服“脑心通”4 片 TID,左下肢乏力症状稍好转,余症状未见明显好转,来院就诊,头颅 MRI 平扫+增强示:平扫未见明显异常信号灶,增强后桥脑见“胡椒粉样”强化影。诊断考虑为脑梗死,予以综合对症治疗。患者症状好转出院,出院后继续药物对症治疗,因症状持续存在,于 2021 年 1 月在上海华山医院就诊,头颅 MRI 提示:脑桥异常增强影,考虑 CLIPPERS 综合征,激素治疗后余留左下肢无力,仍有饮水呛咳,行走不稳好转,2021 年 6 月 4 日于我院就诊,诊断考虑为类固醇激素反应性慢性淋巴细胞性炎症伴脑桥血管周围强化症 (CLIPPERS 综合征),排除禁忌后,予以激素冲击治疗 (甲泼尼龙 240mgQD \times 3d, 120mgQD \times 3d),后改激素为口服 (醋酸泼尼松 50mg 一次/d)。患者一般情况好转,病情稳定后出院,出院后继续规律甲泼尼龙口服,缓慢减量 (每 2 周减 1 片,减至每天 3 片维持),患者诉出院后仍有全身乏力、行走不稳,构音障碍及吞咽困难较前加重,于 2021 年 8 月激素逐渐减量至停药,症状逐渐加重,表现为右侧肢体无力、不能言语、饮食呛咳、吞咽困难,于出院后三个月 (2021 年 9 月 15 日)来我院神经内科门诊就诊,复查头颅 MRI 平扫+增强提示桥脑新增小片轻度强化影,治疗上初始静脉激素冲击 (120mg/d \times 9d)以改善症状,续之醋酸泼尼松 50mg 一次/d,每周减 1 片 (5mg),症状好转后出院。2022 年 10 月 28 日患者病情反复,来我院门诊就诊,拟“CLIPPERS 综合征”收入院。头颅 MRI 平扫+增强示:桥脑小片轻度强化影,较前片 (2021-9-17)范围减小。

PU-1622

少突胶质细胞瘤术后复发转变为胶质母细胞瘤 1 例并文献复习

申博兴、郝桥

延安大学附属医院心脑血管医院

患者男，46 岁，2017 年 7 月 31 日因突发头疼、头晕，后加重伴意识不清，频繁恶心呕吐入当地县医院，行 CT 平扫示左侧颞叶占位影，局部钙化；后行 MRI 及增强扫描提示左颞叶占位，提示间变型少突胶质细胞瘤，继发大脑镰疝及小脑天幕疝（图 1-1）；行全麻下行占位性病变切除术后，病理示少突胶质瘤（Ⅱ级）（图 1-2）。免疫组化结果：胶质纤维酸性蛋白（glial fibrillary acidic protein, GFAP）（+）、异柠檬酸脱氢酶 1（isocitrate dehydrogenase 1, IDH1）（-）、O6-甲基鸟嘌呤-DNA 甲基转移酶（O6-methylguanine-DNA methyltransferase, MGMT）（-）、CD34 血管（-）、S-100（+）、P53（-）。后出院建议放化疗等辅助治疗，患者及家属未采纳。2019 年 9 月 25 日因半月头痛头晕、钝痛为著，伴间断恶心呕吐入院，行 MRI 及增强扫描提示左侧顶颞叶-岛叶-基底节区占位影，提示复发（图 2-1）；当年 10 月 9 日行占位全麻下左额颞顶入路胶质瘤清除术，手术顺利，切口愈合良好，病理结果提示（左颞部）胶质母细胞瘤（Ⅳ级）（图 2-2），免疫组化结果示：GFAP（+）、波形蛋白（Vimentin）（-）、CD34 血管（+）、P53 约 3%、Ki-67 约 40%（+）。术后出院建议放化疗等辅助治疗，患者及家属未采纳。2021 年 4 月 3 号因头晕门诊行 MRI 及增强扫描是占位复发，病变呈“花环样强化”（图 3-1）；2022 年患者死亡。

PU-1623

Combining radiomics and pathomics to predict potential biomarkers of MGMT promoter methylation in glioblastoma: preliminary results from a cross-scale study

Xusha Wu, Yan Li, Yibin Xi

Xi'an People's Hospital (Xi'an Fourth Hospital)

Objective

In glioblastoma (GBM), promoter methylation of the DNA repair gene O6 -methylguanine-DNA methyltransferase (MGMT) is associated with beneficial chemotherapy but have not been accurately evaluated. To develop and validate a radiomics-pathomics model for predicting MGMT promoter methylation in patients with GBM.

Materials and Methods

Between September 2015 and September 2020, 141 patients with pathologically confirmed GBM were included, all of whom underwent 3.0T MRI (T1WI, T2WI, T1WI enhancement) scans within 2 weeks before surgery. The tumor portion was outlined layer by layer on the MRI images. A siamese neural network based on a pre-trained model of SE-ResNet-50 was used for feature fusion in the MRI image sequence. Histopathology images were automatically segmented using whole slide image (WSI) analysis, predictive probability weighted averaging and feature fusion. Features of 1024 dimensions were extracted from MRI images and histopathology images, respectively, and then feature fusion was performed using a multilayer perceptron (MLP) to construct a radiomics pathology prediction model.

Results

The GBM patients included in the study were randomly divided into training and test sets according to 8:2. The AUC of subjects in the training and validation sets for MRI image prediction were 0.83 and 0.85, respectively; the AUC of the training and validation sets for the

histopathology prediction model based on WSIs were 0.85 and 0.83, respectively; and the multimodal model further improved the performance, and the accuracy of radiomics-pathomics model for predicting MGMT was significantly higher than that of MRI and pathology alone, with the fusion prediction training set and validation set AUCs of 0.91 and 0.93, respectively.

Conclusion

The radiomics-pathomics model based on preoperative MRI was able to predict MGMT promoter methylation in patients with glioblastoma. The model could be used as a preoperative molecular prediction tool.

PU-1624

MRI 诊断胎儿右侧小脑出血 1 例

虞思润

十堰市太和医院

孕妇 34 岁，孕 28 周，孕 2 产 0，稽留流产 1 次，外院彩超提示胎儿右侧小脑实性占位。MRI 平扫示：胎儿右侧小脑半球及蚓部示不规则斑片、团片状异常信号，LAVA 序列呈高信号，T2WI 呈低信号，边界清楚，较大层面范围约 2.1×2.0×1.3cm。诊断为“胎儿右侧小脑出血”。胎儿颅内出血指妊娠 14 周至分娩期间胎儿发生的颅内出血，是一种相对少见的脑损伤事件，检出率约 0.5%~1.0%。FICH 多发生在脑室旁生发区、脑室内，胎儿小脑出血较为少见，主要起源于小脑半球外周尾部，并可能选择性累及外周生发基质。MRI 对显示胎儿颅内出血明显优于超声，并且能显示不同出血期胎儿颅内信号的变化，有利于早期发现病灶并进行出血程度的评估。血肿演变过程中磁共振信号变化具有一定的规律，可用来大致推测出血事件发生时期。根据 MRI 信号的差异，FICH 可分为以下 5 期：①超急性期：T1WI 无明显异常信号，T2WI 呈明显低信号；②急性期：T1WI 呈等信号，T2WI 呈低信号；③亚急性早期：T1WI 呈高信号，T2WI 呈低信号；④亚急性晚期：T1WI 及 T2WI 均为高信号；⑤慢性期：T1WI 及 T2WI 均为低信号。产前 MRI 对诊断 FICH 具有优势，可准确定位出血部位、范围，显示不同信号强度，反映病理生理演化过程，建议所有产前怀疑胎儿颅内病变、诊断不清时，均有必要进行 MRI 检查进一步明确诊断。

PU-1625

神经精神性系统性红斑狼疮患者白质结构网络的变化研究

孙中茹

泰州市人民医院

目的 通过图论分析方法来研究神经精神性系统性红斑狼疮 (neuropsychiatric systemic lupus erythematosus, NPSLE) 患者脑白质结构网络的变化，探讨其与临床指标及神经量表之间的关系，为临床早期识别 NPSLE 提供新的影像学标记物。方法 收集 2020 年 6 月至 2022 年 12 月在泰州市人民医院风湿免疫科收治确诊的 NPSLE 患者 34 例、Non-NPSLE 患者 32 例。采用确定性纤维示踪技术以及图论分析方法探讨受试者大脑结构网络拓扑属性变化，并采用相关性分析方法评估结构网络拓扑属性值与临床指标及神经量表的相关性。结果 NPSLE 和 Non-NPSLE 两组受试者结构网络均具有“小世界”属性，但两组间的 γ 、 λ 、 σ 值差异均无统计学意义 (P 值均 >0.05)，NPSLE 组全局效率明显低于 Non-NPSLE 组 ($t=2.775$, $P=0.008$)，特征路径长度明显高于 Non-NPSLE 组 ($t=2.688$, $P=0.009$)。在节点拓扑属性值中，与 Non-NPSLE 组相比，NPSLE 组患者左侧内侧和旁扣带脑回 (DCG.L)、右侧海马 (HIP.R)、左侧舌回 (LING.L)、右侧梭状回 (FFG.R)、右侧豆状壳核 (PUT.R) 的节点效率降低 (P 值均 <0.05 , FDR 校正)；左侧舌回 (LING.L)、右

侧梭状回 (FFG.R)、右侧豆状壳核 (PUT.R) 的节点最短路径长度较 Non-NPSLE 组升高 (P 值均 <0.05 , FDR 校正)。相关性分析发现, 仅 ESR 与部分拓扑属性值存在相关性。全局拓扑属性值中, Eg 与 ESR 呈负相关 ($r=-0.041$, $P=0.025$), Lp 与 ESR 呈正相关 ($r=0.042$, $P=0.023$); 节点拓扑属性值中, HIP.R、FFG.R 的节点效率与 ESR 呈负相关 ($r=-0.598$, $P<0.001$; $r=-0.613$, $P<0.001$)。结论 NPSLE 患者的白质网络拓扑属性存在一定异常, 提示白质网络拓扑属性的改变可能是 NPSLE 患者诊断和评价的潜在影像学标记物, 在诊断 NPSLE 脑损伤方面具有一定价值。

PU-1626

Glioblastoma and solitary brain metastasis: differentiation by integrating clinical-radiological and deep-learning radiomics signatures

Yuze Zhang^{1,2}, Hongbo Zhang^{1,2}, Hanwen Zhang^{1,2}, Ying Ouyang^{1,2}, Ruru Su^{1,2}, Wanqun Yang^{1,2}, Biao Huang^{1,2}

1. Guangdong Provincial People's Hospital

2. Guangdong Provincial Key Laboratory of Artificial Intelligence in Medical Image Analysis and Application, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences

Objectives

We aimed to develop and validate a clinical-radiological deep-learning radiomics nomogram (CDLRN) integrating clinical-radiological, radiomics, and deep-learning features to noninvasively differentiate glioblastoma (GBM) from solitary brain metastasis (SBM).

Methods

A total of 235 potentially eligible patients (115 GBM and 120 SBM) were retrospectively recruited from our hospital between August 2016 and August 2022 for this study. The training cohort (TC) and validation cohort (VC) comprised 188 (90 GBM and 98 SBM) and 47 (25 GBM and 22 SBM) patients, respectively. At first, we summarized seven specific radiological features of GBM and SBM, including the "pool sign", the "irregular ring sign", the "regular ring sign", R(edema/enhanced tumor), R(T2-FLAIR/CE-T1WI), location of the tumor, and the "intratumoral vessel sign". The clinical signature was constructed by combining them with the patients' basic clinical information. Next, radiomics and deep-learning (DL) features were extracted from preprocessed multiparametric brain MRI (T2WI, T2-FLAIR, and CE-T1WI). A four-step procedure was applied for feature selection and signature construction, including the Mann-Whitney U statistical test, the Pearson correlation coefficient, the LASSO method, and the multivariable logistic regression analysis. Four radiomics models, four DL models (based on each of the three MRI sequences and their combination), DLR signature, and CDLRN were constructed and validated to identify GBM and SBM. All of the above models were compared, and their prediction performances were assessed using the receiver operator characteristic (ROC) analysis.

Results

In the VC, in all models we proposed, the order of diagnostic effect from high to low was CDLRN, DLR signature, clinical signature, DL signature, and radiomics signature with the areas under the receiver operating curve (AUCs) of 0.987 (95%CI, 0.886-1.000), 0.947 (95%CI, 0.886-1.000), 0.931 (95%CI, 0.859-1.000), 0.909 (95%CI, 0.828 - 0.990), and 0.875 (95%CI, 0.776-0.973), respectively. The CDLRN showed the best performance for discriminating between GBM and SBM, and yielded an AUC of 1.000 (95% CI, 0.999-1.000) and 0.987 (95% CI, 0.886-1.000) in the TC and VC, respectively.

Conclusions

The CDLRN, which combines clinical-radiological features, radiomics, and DL features, shows an excellent performance in differentiating GBM from SBM and can provide valuable information for individualized treatment.

PU-1627

基于血管周围间隙张量分析与葡萄糖-甘油三酯指数探究 T2DM 类淋巴系统损伤与胰岛素抵抗的关系

许珊、汪旭洋、杨东、伍建林
大连大学附属中山医院

摘要:

目的: 基于扩散谱成像数据得到的血管周围间隙扩散张量 (DTI-ALPS) 指数探究 T2DM 患者大脑类淋巴系统功能改变与葡萄糖-甘油三酯指数之间的关系。

方法: 招募 28 名 T2DM 患者 (T2DM 组) 与 24 名健康志愿者 (HC 组) 纳入本研究, 采集所有被试的扩散磁共振图像, 通过 FSL 及 itk-snap 软件在优势半球侧脑室体部水平投射纤维及联合纤维上勾画 5.0mm 圆形感兴趣区, 测量感兴趣区内两种纤维在 X、Y、Z 轴方向上的扩散率, 并通过计算获得所有被试 DTI-ALPS 指数, 并将 T2DM 组与 HC 组被试的 ALPS 指数及两种纤维在 X、Y、Z 轴上的扩散率行独立样本 T 检验, $P<0.05$ 被认为具有统计学意义。同时通过空腹血糖及甘油三酯水平计算获得 T2DM 患者葡萄糖-甘油三酯指数, 将年龄作为协变量, 将投射及联合纤维在 XYZ 轴上的扩散率与 ALPS 指数分别与葡萄糖-甘油三酯指数行 spearman 偏相关分析, $P<0.05$ 被认为差异具有统计学意义。

结果: T2DM 组左侧 ALPS 指数低于 HC 组 ($P<0.05$); T2DM 组投射纤维在 X 轴上的扩散率 (Dxproj) 低于 HC 组 ($P<0.05$), 而 T2DM 组投射纤维在 Y 轴上的扩散率 (Dyproj) 高于 HC 组 ($P<0.05$)。T2DM 组左侧 ALPS 指数与葡萄糖-甘油三酯指数成负相关 ($r=-0.419$, $P=0.03$); T2DM 组联合纤维在 X 轴上的扩散率 (Dxassoc) 与葡萄糖-甘油三酯指数成负相关 ($r=-0.563$, $P=0.002$)。

结论: T2DM 引起的胰岛素抵抗可能与患者类淋巴系统以及相关区域联合纤维的白质损伤相关。

PU-1628

T2DM 患者神经血管耦合功能与肠道菌群相关性的 MRI 研究

杨东、汪旭洋、许珊、伍建林
大连大学附属中山医院

目的: 以多模态 MRI 分析 T2DM 患者神经血管耦合 (NVC) 功能的变化, 探究这种变化与 T2DM 患者肠道菌群多样性之间的关系。

方法: 将 40 例 T2DM 患者 (T2DM 组) 和 24 例年龄、性别相匹配的健康志愿者 (HC 组) 纳入本研究。对所有被试采集静息态脑功能成像 (rs-fMRI) 与 3D 伪连续性动脉自旋标记成像 (3D-pCASL), 分别获得区域一致性 (ReHo) 及脑血流量 (CBF) 图像, 在全脑灰质范围内计算 ReHo 与 CBF 的比值, 得到神经血管耦合图, 并提取两组间显著差异脑区的 NVC 值。同时收集患者的粪便样本, 通过 16S rRNA 基因测序获得所有被试的肠道菌群 α 多样性指数 (Chao1、Shannon、Simpson)。将差异脑区 NVC 值与肠道菌群 α 多样性指数进行相关性分析。

结果: 与 HC 组相比, T2DM 组左侧中央前回、左侧内侧和旁扣带回、双侧梭状回、左侧中央后回、左侧顶状回、双侧尾状核、左侧颞下回、左侧中央旁小叶脑区 NVC 值减低 ($p<0.05$, FDR 校正), 而双侧眶部额下回、左中央沟盖、左直回、双侧脑岛、双侧前扣带和旁扣带回、右内侧和旁扣带回、双侧颞上回、双侧颞极: 颞上回 NVC 值增高 ($p<0.05$, FDR 校正)。HC 组 Simpson 指数与 Shannon 指数均高于 T2DM 组。经过 Bonferroni 法校正, 在 T2DM 组中右侧脑岛 NVC 值与 Simpson 指数呈正相关 ($r=0.478$, $p<0.05$)。

结论: T2DM 患者神经血管耦合功能及肠道菌群的多样性与健康人之间存在差异, 且两者之间存在一定的相关性。

Progressive cerebrovascular reactivity reduction occurs in Parkinson's disease

Jian Wang^{1,5}, Hongwei Li², Xiali Shao¹, Jia Jia³, He Wang^{2,4,6}, Lirong Jin³

1. Zhongshan Hospital, Fudan University

2. Institute of Science and Technology for Brain-inspired Intelligence, Fudan University

3. Department of Neurology, Zhongshan Hospital, Fudan University

4. Human Phenome Institute, Fudan University

5. Department of Radiology, Zhongshan Hospital, Fudan University (Xiamen Branch)

6. Key Laboratory of Computational Neuroscience and Brain-Inspired Intelligence (Fudan University), Ministry of Education

Objective: We aimed to ascertain regional cerebrovascular reactivity (CVR) changes in the patients with PD at baseline (V0) and during a 2-year follow-up period (V1). We further investigated whether alterations in CVR were linked to cognitive decline and brain functional connectivity (FC).

Methods: We recruited 90 PD patients and 51 matched healthy control (HCs). PD patients underwent clinical evaluations, neuropsychological assessments and MR scanning at V0 and V1, while HCs completed neuropsychological assessments and MR at baseline. The analysis included evaluating CVR and FC maps derived from resting-state functional magnetic resonance imaging (rsfMRI), and investigating CVR measurement reproducibility.

Results: Compared with HCs, CVR reduction in left inferior occipital gyrus and right superior temporal cortex at V0 persisted at V1, with larger clusters. Longitudinal reduction in CVR of the left posterior cingulate cortex correlated with decline in Trail Making Test B performance within PD patients. Reproducibility validation further confirmed these findings. In addition, the results also showed that there was a tendency for FC to be weakened from posterior to anterior with the progression of the disease.

Conclusions: Microvascular dysfunction might be involved in disease progression, subsequently weaken brain functional connectivity, and partly contribute to executive function deficits in early PD.

PU-1630

基于磁共振成像的颈动脉斑块内出血对脑血管事件预测价值的 meta 分析

陈丽舟、张华为、施帆帆

四川大学华西医院

目的: 现有研究证据提示, 基于 MRI 图像评估的颈动脉粥样硬化斑块内出血 (intraplaque hemorrhage, IPH) 是预测脑血管事件发生风险的高危影像特征。但是既往研究多数样本量较小, 事件的绝对数低; 且不同研究之间存在较大的异质性, 相关结果的置信区间范围较宽。故本研究将对既往研究进行 meta 分析, 以明确 IPH 对颈动脉狭窄患者发生脑血管事件的预测价值。

方法: 利用 R 软件合并纳入研究的 HR 值以评估基于 MRI 的 IPH 预测颈动脉狭窄患者脑血管事件发生风险的综合效应。通过 Q 检验和 I^2 评估研究之间的异质性。通过附加轮廓线漏斗图评估潜在的发表偏倚, 借助 Egger 法检测发表偏倚。并根据患者症状划分为有症状组和无症状组开展探索性亚组分析。

结果: 研究共纳入 19 项前瞻性队列研究, 样本总量为 3272 例, 发生脑血管事件 365 例。所纳入文献存在中等程度异质性 ($P=45\%$, Q 统计量 $P=0.02<0.1$), 但不存在发表偏倚。Meta 分析结果显示, 所有文献合并估算 HR 值为 4.06 (95%CI: 2.85-5.77), 提示存在 IPH 的患者发生脑血管

事件的风险是无 IPH 患者的 4 倍。在亚组分析中, 无症状亚组合并分析结果显示, 相比无 IPH 患者, IPH 患者发生脑血管事件的风险是其 3.76 倍 (95%CI: 2.76-5.11) 且具有统计学意义; 有症状亚组合并分析结果显示, 相比无 IPH 患者, IPH 患者发生脑血管事件的风险是其 4.67 倍 (95%CI: 2.92-7.48) 且具有统计学意义。

结论: 本研究结果证实基于 MRI 图像的颈动脉斑块 IPH 成分对于颈动脉样狭窄患者发生脑血管事件的风险具有预测价值, 尤其对于有临床症状的患者而言。因此 IPH 可以作为高风险颈动脉狭窄患者的生物学标志物, 从而帮助临床医生更加准确的判断哪些患者需要侵入性治疗而哪些患者可获益于保守治疗。考虑研究所纳入文献存在中等程度的异质性, 未来还需要更大规模队列研究来佐证基于 MRI 的 IPH 成分对颈动脉斑块患者发生远期脑血管事件的诊断价值。

PU-1631

表观扩散系数鉴别幕下非中线成人髓母细胞瘤与脑膜瘤

周凤瑜、董文洁、邓娟、薛彩强、刘显旺、周俊林
兰州大学第二医院

[摘要] **目的** 探讨表观扩散系数鉴别诊断幕下非中线成人髓母细胞瘤与脑膜瘤的价值。**方法** 回顾性分析经手术病理证实的 6 例幕下非中线成人髓母细胞瘤和 13 例幕下非中线脑膜瘤患者, 在 ADC 图上测量肿瘤实性部分的最小 ADC 值 (ADCmin)、平均 ADC 值 (ADCmean) 及肿瘤对侧正常脑白质 ADC 值, 并计算相对 ADCmin 值 (rADCmin) 和相对 ADCmean 值 (rADCmean)。对比分析 ADC 值的差异, 绘制受试者工作特征 (ROC) 曲线评价 ADC 值的鉴别诊断价值。**结果** 幕下非中线成人髓母细胞瘤组的 ADCmin、ADCmean、rADCmin 及 rADCmean 值均小于幕下非中线脑膜瘤组, 组间差异具有统计学意义 ($p < 0.05$)。各 ADC 值均能对幕下非中线成人髓母细胞瘤和幕下非中线脑膜瘤患者进行有效鉴别, 其中 rADCmin 值的鉴别诊断效能最好, 曲线下面积 (AUC 值) 为 0.885, 最佳截断值为 0.975, 相应的灵敏度和特异度分别为 100%、83.3%, 准确度为 89.5%。**结论** ADC 值可以对非中线成人髓母细胞瘤与脑膜瘤进行鉴别诊断。

PU-1632

基于 CT 灌注参数和围手术期临床资料预测成人烟雾病联合血运重建术后高灌注综合征

郝小军
皖南医学院弋矶山医院

目的: 探讨基于术前 CT 灌注参数及围手术期临床资料在预测成人烟雾病联合血运重建术后高灌注综合征 (CHS) 发生的价值。**方法:** 回顾性收集 60 例在皖南医学院弋矶山医院接受联合血运重建治疗的成人烟雾病患者, 根据术后是否发生 CHS 分为 CHS 组 ($n=18$) 和非 CHS 组 ($n=42$ 组)。比较组间术前 CTP 参数和围手术期临床资料的差异, 采用多因素 Logistic 回归分析术后发生 CHS 的危险因素, 并以 ROC 曲线评估各参数预测 CHS 的效能。**结果:** CHS 组的术前脑血容量 (CBV)、流量提取乘积 (FEP) 及术后当日平均动脉压 (MAP) 均高于非 CHS 组 (P 均 < 0.05)。术前 FEP 增高 ($OR=11.009$, 95%CI 2.294~52.840)、术后当日 MAP 偏高 ($OR=1.063$, 95%CI 1.008~1.121) 是 CHS 发生的危险因素。以术前 CBV、FEP 及术后当日 MAP 预测 CHS 发生的曲线下面积 (AUC) 分别为 0.712、0.771、0.665, 三者联合预测的 AUC 为 0.872, 高于单一因素 ($Z=2.17$ 、2.77、3.13, P 均 < 0.05), 敏感度为 94.4%, 特异度为 69.0%。**结论:** 术前 CBV、FEP 及术后当日 MAP 有助于预测成人烟雾病联合血运重建术后发生 CHS, 联合应用三者可提高预测效能。

PU-1633

基于血栓渗透性对急性缺血性脑卒中血管内治疗临床预后的评估

秦江彦、郝桥、冯天保
延安大学附属医院

背景及目的：机械取栓已经成为治疗颅内大血管闭塞所致急性缺血性脑卒中的首选方案。血栓具有渗透性，血栓通透性根据影像学图像估计急性缺血性卒中血栓周围的剩余血流。本研究探讨急性缺血性脑卒中中进行血管内治疗患者血栓的渗透性与临床预后的关系。

方法：回顾性分析来自延安大学附属医院 70 例大脑中动脉近端闭塞(M1-M2)并接受血管内治疗的急性缺血性脑卒中患者。我们纳入了具有以下特征的患者：（1）年龄 ≥ 18 岁，（2）涉及大脑中动脉（MCA）M1-M2 段的大血管闭塞（LVO），（3）NCCT 和动脉期 CTA 可接受图像质量，以及（4）接受血管内治疗患者。收集临床结果如改良 Rankin 量表(mRS)、脑梗死溶栓灌注量表(TICI)评分和基线临床特征(如年龄、性别、美国国立卫生研究院卒中量表(NIHSS)评分)。在平扫 CT 和 CTA 上选择 3 个种子点 (ROI)，分别计算出各自的 CT 值，再测量三点的平均值，CTA 上的平均 CT 值减去平扫 CT 上的 CT 值即得血栓渗透性。

统计学分析 TAI 测量值、基线和 90 天的功能结局(修改后的 Rankin 量表评分)变量的分布，使用 Shapiro-Wilk 检验评估分布的正态性。对与主要结局相关的所有基线特征进行多变量 logistic 回归分析，使用单变量逻辑回归评估基线变量与主要结果的关联，以选择纳入多变量模型的变量。显著性水平设为 p 值 0.05。所有分析均使用 IBM SPSS 统计软件，版本 26.0。

结果：

功能预后良好的患者年龄较小，NIHSS 较低。成功治疗和血管内治疗的患者功能预后较好。90 天 mRS 预后较好 (≤ 2) 的患者血栓密度更高 (10.45HUVS6.34HU, $P=0.031$)，血栓渗透性更好 (19.69HUVS9.99HU, $P=0.048$)，血栓长度较短 (1.69cmVS2.96cm, $P=0.029$)。

结论：

急性缺血性脑卒中血管内治疗 90 天 mRS 与血栓渗透性、血栓密度、血栓长度有关。较高的血栓渗透性、较高的血栓密度和较短血栓长度的急性缺血性脑卒中血管内治疗患者有较好的 90 天 mRS 预后。这些发现可能支持急性缺血性脑卒中血管内治疗的治疗决策。

PU-1634

MRI 基本征象结合 ADC 值鉴别成人节细胞胶质瘤与少突胶质细胞瘤

董文洁、刘显旺、周凤瑜、薛彩强、周青、周俊林
兰州大学第二医院

目的：探索磁共振成像 (MRI) 征象及表观扩散系数 (ADC) 值在鉴别成人节细胞胶质瘤与少突胶质细胞瘤中的价值。

方法：回顾性分析手术及病理证实的 8 例成人节细胞胶质瘤及 14 例少突胶质细胞瘤临床、MRI 及病理资料，对比 MRI 征象及 ADC 值差异，统计学方法使用 t 检验、卡方检验，并用受试者工作特征 (ROC) 曲线评估各参数鉴别两组肿瘤诊断效能。

结果：成人节细胞胶质瘤多发生于颞叶 (37.5%)，少突胶质细胞瘤多发生于额叶 (57.1%)。成人节细胞胶质瘤与少突胶质细胞瘤间，肿瘤最大径、囊性成分比例具有统计学意义 ($P<0.05$)，两组性别、年龄、瘤周水肿、形态、边界、钙化、强化无统计学意义，($P>0.05$)。成人节细胞胶质瘤与少突胶质细胞瘤的 ADCmean、ADCmin、rADC 分别为 (0.993 \pm 0.059) $\times 10^3\text{mm}^2/\text{s}$ ，(0.936 \pm 0.055) $\times 10^3\text{mm}^2/\text{s}$ ，1.39 \pm 0.12 与 (1.227 \pm 0.110) $\times 10^3\text{mm}^2/\text{s}$ ，(1.165 \pm 0.089) $\times 10^3\text{mm}^2/\text{s}$ ，1.69 \pm 0.12。少突胶质细胞瘤的 ADCmean、ADCmin 及 rADC 值均大于成人节细胞

胶质瘤，差异有统计学意义（ $P < 0.05$ ）。在 ADC 值中，ADCmin 诊断效能最优，AUC 值为 0.982，当 ADCmin 阈值为 $1036.5 \times 10^3 \text{mm}^2/\text{s}$ 时，鉴别二者的敏感度、特异度分别为 0.929、1。

结论：通过 MRI 征象联合 ADC 值对术前鉴别成人节细胞胶质瘤与少突胶质细胞瘤具有重要临床价值，可提高术前诊断准确率。

PU-1635

急性缺血性卒中取栓治疗后脑功能网络的变化

李彤月¹、徐姣娜²、丁忠祥²、吕亚婷¹

1. 杭州师范大学附属医院认知与脑疾病研究中心

2. 杭州市第一人民医院（浙江大学医学院附属杭州市第一人民医院）放射科

目的

取栓是治疗急性缺血性卒中的有效方法之一，可提高患者血液灌注再通率。目前 AIS 取栓治疗后的脑功能机制和再灌注程度对脑功能的影响尚不明确，有必要进行相关探索，为 AIS 取栓治疗后效果评估提供理论参考。

方法

本研究收集 43 例大脑前循环闭塞患者（AIS，24 女， 70 ± 11.27 岁）和 37 例健康被试（HC，20 女， 70 ± 9.61 岁）。所有患者均接受取栓治疗，并依据再灌注程度分为两个亚组（再灌注良好组 GR：15 人；再灌注不良组 PR：28 人）；所有被试均接受静息态磁共振扫描（31/30/2010/180, slices/TE/TR/volumes）。研究通过计算四个高级功能网络：背侧注意网络（DAN）、腹侧注意网络（VAN）、执行控制网络（ECN）和默认模式网络（DMN）内部静态功能连接（sFC）和动态功能连接（dFC）探究 AIS 取栓后脑功能网络的变化以及再灌注程度对网络内部连通性的影响，并分析连通性变化与卒中严重程度的关系。

结果

相较于健康被试，AIS 组四个功能网络的 sFC 均存在异常连接，表现为额叶区域与中部扣带回、大脑后部区域（顶叶、枕叶和楔前叶）sFC 显著增高；AIS 组 ECN 顶下回与角回，VAN 楔前叶与顶叶区域以及 DMN 额上回与角回的 dFC 也显著增高。在与 PR 亚组的比较中，GR 亚组四个功能网络的 sFC 均存在显著增高，主要集中于楔前叶与中部扣带回、顶叶区域；GR 亚组 DMN 楔前叶与额上回的 dFC 显著增高。显著差异的功能连接与卒中严重程度存在相关性：患者 VAN 中部扣带回与辅助运动区的 sFC 和卒中 90 天 NIHSS 评分（ $r = 0.531, p < 0.001$ ）；PR 组 ECN 额上回与角回的 sFC 与取栓术后 NIHSS 评分（ $r = 0.599, p = 0.018$ ）以及患者 DMN 额上回与顶下回的 dFC 与卒中 90 天 NIHSS 评分（ $r = -0.499, p = 0.003$ ）。

结论

本研究发现 AIS 取栓治疗后高级功能网络内连接模式改变，且不同再灌注水平患者表现出特定改变模式；这些功能网络的变化与卒中严重程度及功能康复水平相关。以上发现有助于阐明卒中取栓后脑功能机制，为患者康复治疗提供指导。

探讨 FastStroke 多模态评估在急性缺血性脑卒中中的应用价值

黄明、雷武刚

丰城市人民医院

目的 探究 FastStroke 多模态评估在急性缺血性脑卒中（AIS）中的应用价值。**方法** 回顾性分析 33 例急性前循环缺血性脑卒中患者，入组患者治疗前均行一站式 CT 检查及多模态磁共振检查，多时相 CTA 数据采用 GE FastStroke 脑卒中软件处理。**结果** FastStroke 可视化 AIS 患者的侧支循环情

况, 基于 FastStroke 软件的多期相 CTA (mCTA)侧支循环评分与患者入院时美国国立卫生院卒中量表 (NIHSS 评分)、脑梗死体积具有很好的相关性, 组间差异有统计学意义 ($P<0.05$)。结论 FastStroke 多模态极大的提高了诊断的方便性, 可以在有限的时间内详细评估 AIS 患者的影像学资料, 为临床提供更多诊疗信息, 预估预后, 指导个体化精准治疗, 在临床上具有重要的价值、值得推广应用。

PU-1637

功能磁共振在失眠障碍中的应用现状及研究进展

刘亚东、高波、沈桂权
贵州医科大学附属医院

根据第 5 版《精神疾病诊断和统计手册》(DSM-5), 失眠被定义为睡眠时长和睡眠质量不满意, 延迟入睡或睡眠持续不好, 并影响到白昼的日常情绪或工作的一类睡眠障碍。随着现代社会和工作方式的压力增大, 许多人群面临延迟入睡、睡眠比例不足的问题, 导致记忆力下降、工作和学习效率低下。研究表明, 中国大陆成人中患有失眠症状的人群高达 57%, 其中失眠的危险因素包括年龄、性别、既往史、遗传因素、个体特征及精神障碍等, 患病人群中女: 男约 1.41: 1。在患者有既往睡眠障碍的情况下, 失眠的发病率上升了 5.4 倍; 精神类疾病患者中约 70~80%伴有失眠症状。长期失眠或睡眠质量低下会导致个体交感神经和副交感神经相互作用的失衡, 失眠与心血管疾病、糖尿病、痴呆症、慢性疼痛以及精神障碍等具有密切关联, 同时也是其发病率的重要预测因素。此外失眠的影响还体现在公共卫生、精神障碍和躯体疾病等方面。

关于失眠障碍的病理机制一直在探讨中, 其中涉及遗传、环境、行为和生理因素, 人们最容易接受的是“高度唤醒假说”, 即失眠患者睡眠期间表现出过度激活状态, 表现为高频脑电激活增加, 激素分泌异常、体温及代谢水平升高, 心率和交感神经系统呈现过度活跃, 而且这种改变是一种长期、慢性的过程。功能磁共振成像 (fMRI) 是一种高分辨率的非侵入性、可重复性强的成像工具, 在精神类疾病领域研究中得到越来越多的认可, 在大量的研究中发现, 失眠不仅涉及大脑区域的结构与功能异常, 还表现为大脑内在网络的连接异常, 同时与认知障碍和情绪调节等领域有关。因此本文主要从 fMRI 在失眠障碍的应用现状、失眠患者的脑区结构和功能改变、失眠相关的脑功能网络等方面进行综述。

PU-1638

MOG 抗体相关中枢神经系统淋巴瘤一例并文献复习

姜卉、张伟、姜兵、范冶、旷智飞
湖南省脑科医院 (湖南省第二人民医院)

髓鞘少突胶质细胞糖蛋白 (myelin oligodendrocyte glycoprotein, MOG) 是少突胶质细胞表面和髓鞘最外层表达的膜蛋白, 是少突胶质细胞表面成熟的标志物。抗髓鞘少突胶质细胞糖蛋白免疫球蛋白 G 抗体 (anti-myelin oligodendrocyte glycoprotein-IgG, MOG-IgG) 相关疾病 (MOG-IgG associated diseases, MOGAD) 是近年提出的一种免疫介导的炎性脱髓鞘疾病。中枢神经系统淋巴瘤包括原发性中枢神经系统淋巴瘤 (primary central nervous system lymphoma, PCNSL) 和继发性中枢神经系统淋巴瘤 (Secondary central nervous system lymphoma, SCNSL), PCNSL 是一种罕见的结外非霍奇金淋巴瘤, 约占中枢神经系统肿瘤的 4%, 绝大部分为弥漫大 B 细胞淋巴瘤 (diffuse large B-cell lymphoma, DLBCL)。目前国内尚无与 MOG 抗体相关中枢神经系统淋巴瘤的报道, 国外文献报道也极少, 我们将介绍一例早期诊断为可能 MOGAD, 最后确诊为 DLBCL 的病例, 以加深广大影像工作者对 MOGAD 和 PCNSL 的认识。

PU-1639

Abnormal interhemispheric connectivity in patients with Parkinson's disease: a multimodal MRI study

Erlei Wang, Guohua Fan

Department of Radiology, The Second Affiliated Hospital of Soochow University

Objective: Interhemispheric interactions may be abnormal and play a crucial role in symptom lateralization in Parkinson's disease (PD). The purpose of this study was to examine interhemispheric structural, functional, and callosal connectivity changes as well as their clinical correlates in patients with PD.

Methods: Fifty-seven patients with PD and 50 healthy controls (HCs) underwent multimodal MRI. Voxel mirrored homotopic connectivity (VMHC) was computed from resting-state functional MRI data to measure interhemispheric functional connectivity. The cortical thickness covariance of homotopic regions was estimated from T1-weighted MRI data to measure interhemispheric structural connectivity. Fractional anisotropy (FA) was computed from diffusion MRI data to measure callosal connectivity. Pearson's correlation coefficient was used to evaluate the associations between imaging and clinical data.

Results: Compared with HCs, patients with PD showed strikingly similar patterns of interhemispheric structural and functional connectivity reductions and a trend toward a positive correlation between the two features. The affected regions involved the bilateral sensorimotor cortices and posterior cortical regions including the superior parietal lobule, precuneus, supramarginal gyrus, middle occipital gyrus, and superior temporal gyrus. Patients with PD also showed significantly decreased FA in the part of corpus callosum that connects the bilateral regions showing VMHC reductions. Additionally, interhemispheric structural, functional, and callosal connectivity reductions were respectively related to cognitive impairment, motor dysfunctions, and disease duration in patients with PD.

Discussion: This study revealed convergent interhemispheric structural, functional, and callosal connectivity reductions in patients with PD. Our findings may provide new insight into the pathophysiology of symptom lateralization in PD.

脑部 CT 平扫图像的直方图参数鉴别海绵状血管瘤和单纯脑出血的价值

陈意妮、张渊曼、孙博、浦仁旺、齐一伟、方鑫
大连医科大学附属第一医院

目的: 探讨脑部 CT 平扫图像的直方图参数鉴别海绵状血管瘤和单纯脑出血的价值。

方法: 回顾性收集 167 例脑海绵状血管瘤 (血管瘤组) 和 166 例单纯脑出血 (出血组) 患者, 使用 python 分析提取其脑部 CT 平扫图像直方图, 获得病灶的直方图参数, 包括第 10、90 百分位 CT 值, 最小值, 最大值, 平均值, 中位数, 四分位范围, 极差, 平均绝对偏差, 鲁棒平均绝对偏差, 均方根, 偏度, 峰度, 方差, 均匀性, 能量和总能量。比较 2 组间直方图参数的差异, 以 ROC 曲线分析各参数鉴别诊断海绵状血管瘤和单纯脑出血的效能。

结果: 出血组第 10、90 百分位 CT 值, 最大值, 平均值, 中位数, 四分位范围, 极差, 平均绝对偏差, 鲁棒平均绝对偏差, 均方根, 方差, 能量和总能量均大于血管瘤组 (P 均 < 0.05), 偏度和峰度小于钙化组 (P 均 < 0.05), 最小值、熵、均匀性与血管瘤组差异无统计学意义 ($P > 0.05$)。ROC 曲线分析结果显示, 能量、四分位范围、平均绝对偏差、鲁棒平均绝对偏差及方差鉴别海绵状血管瘤和单纯

脑出血的诊断价值中等,其中四分位范围的在单个指标间的诊断效能最高, ROC 曲线下面积(AUC)为 0.830.联合以上 5 个参数进行多参数联合分析,其鉴别效能较利用单个参数鉴别的效能高, AUC 为 0.862,敏感度和特异度分别为 0.747 和 0.820。

结论:脑部 CT 平扫图像直方图分析可作为鉴别海绵状血管瘤和单纯脑出血的辅助手段,多参数联合的诊断效能更高。

脑部 CT 平扫图像直方图分析鉴别基底节区结节状脑出血和钙化的价值

陈意妮、张渊曼、孙博、浦仁旺、齐一伟、方鑫
大连医科大学附属第一医院

目的:探讨脑部 CT 平扫图像直方图分析鉴别诊断基底节区结节状 ($D_{max}<2.00cm$) 脑出血 (出血组) 和钙化 (钙化组) 的价值。

方法:回顾性收集 65 例基底节区结节状脑出血和 114 例钙化患者,使用 python 分析提取其脑部 CT 平扫图像直方图,获得病灶的直方图参数,包括第 10、90 百分位 CT 值,最小值,最大值,平均值,中位数,四分位范围,极差,平均绝对偏差,鲁棒平均绝对偏差,均方根,偏度,峰度,方差,均匀性,能量和总能量。比较 2 组间直方图参数的差异,以 ROC 曲线分析各参数鉴别诊断基底节区结节状脑出血和钙化的效能。

结果:出血组第 90 百分位 CT 值、最大值、平均值、中位数、四分位范围、极差、平均绝对偏差、鲁棒平均绝对偏差、均方根、方差、能量、总能量均大于钙化组(P 均 <0.05),最小值,偏度和峰度小于钙化组(P 均 <0.05),第 10 位 CT 值、熵、均匀性与钙化组差异无统计学意义($P>0.05$)。ROC 曲线分析结果显示,四分位范围、平均绝对偏差、极差、鲁棒平均绝对偏差、总能量及方差鉴别基底节区结节状脑出血与钙化的诊断价值中等,其中总能量的在单个指标间的诊断效能最高, ROC 曲线下面积(AUC)为 0.879.联合以上 6 个参数进行多参数联合分析,其鉴别效能较利用单个参数鉴别的效能高, AUC 为 0.958,敏感度和特异度分别为 0.831 和 0.974。

结论:脑部 CT 平扫图像直方图分析可作为鉴别基底节区结节状脑出血和钙化的辅助手段,多参数联合的诊断效能更高。

脑结构体积测量联合神经心理量表评分在认知障碍中的应用

赵果城
成都市第四人民医院

目的 联合神经心理量表量化评价轻度认知功能障碍 (MCI) 和阿尔茨海默病 (AD) 患者脑结构改变特点。

方法 ①量化并比较分析 30 例 MCI、38 例 AD 及 30 例正常对照组 (NC) 头部磁共振影像脑区容积参数。②记录精神状态检查量表 (MMSE)、蒙特利尔认知评估量表 (MoCA-B) 及神经精神量表 (NPI) 评分,分析评价与各项脑结构的萎缩比的相关性。

结果 ①脑结构萎缩比定量分析: NC、MCI、AD 3 组患者脑叶表现出逐渐萎缩趋势。AD 组患者各脑结构萎缩比均明显高于 NC 组 ($P<0.05$),同时右侧颞叶、岛叶及双侧扣带回、双侧内侧颞叶萎缩比也高于 MCI 组患者,所有 $P<0.05$ 。与 NC 组比较, MCI 组左侧枕叶、双侧额叶、顶叶、扣带回、岛叶萎缩比增高 ($P<0.05$)。②MCI+AD 患者双侧颞叶、扣带回、内侧颞叶及右侧岛叶的

萎缩比与 MMSE 评分成负相关 ($r=-.464\sim-.249, P<0.05$)；双侧扣带回、右侧岛叶的萎缩比与 NPI 总评分成正相关($r=.269\sim.344, P<0.05$)；左侧扣带回、右侧岛叶的萎缩比与 NPI 苦恼评分成正相关($r=.256\sim.285, P<0.05$)。MCI 患者除右侧扣带回萎缩比与 MoCA-B 评分成负相关外 ($r=-0.394, P=0.031$)，其他无相关性 ($P>0.05$)。AD 患者双侧额叶、颞叶、扣带回、岛叶及左内侧颞叶的萎缩比与 MMSE 评分成负相关($r=-.574\sim-.369, P<0.05$)；双侧颞叶、扣带回、岛叶的萎缩比与 MoCA-B 评分成负相关($r=-.497\sim-.359, P<0.05$)；左侧额叶、颞叶、内侧颞叶及双侧扣带回、岛叶的萎缩比与 NPI 总评分成正相关($r=0.321\sim0.462, P<0.05$)；左侧颞叶、扣带回及双侧岛叶的萎缩比与 NPI 苦恼评分成正相关($r=0.333\sim0.405, P<0.05$)。

结论 MCI 及 AD 在早期就可以发生脑结构萎缩，以内侧颞叶萎缩为主要表现，联合 MMSE、MoCA-B、NPI 及 NPI 苦恼评分有助于诊断及鉴别诊断，其中鉴别早期 MCI 优先选择 MoCA-B 量表，而结合其他量表有助于整体认知功能减退及 AD 的诊断。

PU-1643

Altered white matter fibers and structural topological organization in Parkinson's disease based on diffusion tensor imaging

Qingguo Ren, Xiangshui Meng
Qilu Hospital of Shandong University (Qingdao)

Background: The thalamus and limbic system play important roles in Parkinson's disease (PD). The present study aimed to investigate alterations in the whole brain level of structural network for one aspect following with the white matter fibers between thalamus and limbic system, and their correlations with clinical characters.

Methods: We prospectively enrolled 42 PD patients at the movement disorder center and age- and sex-matched healthy controls between December 2020 and November 2021. All subjects underwent DTI, 3D-T1WI and routine brain MR series on a 3.0T MR scanner. The tract-based spatial statistical (TBSS) analytic approach, structural network properties and probabilistic fiber tractography were performed to identify changes of white matter pathways and topological organization associated with PD.

Results: Fibrous tracts of prefrontal lobe, corpus callosum and thalamus were the main fiber clusters changed in PD patients and the fibrous tracts of prefrontal lobe, corpus callosum had moderate negative correlation with Gait and Fall Questionnaire (GFQ); The hippocampus and orbitofrontal gyrus had more fiber bundle parameters changed than the other structure of limbic system, the mean streamlines length between thalamus subregions and orbitofrontal gyrus had moderate negative coefficient with MDS-UPDRSIII; Nodal local efficiency was sensitive index for differentiate PD from healthy controls and the nodal focus on the basal ganglia area, and the parameters including the characteristic path length (Lp), global efficiency (Eg), nodal efficiency (Ne) and nodal local efficiency (Nle), which had moderate correlation with MDS-UPDRS, PD Questionnaire 39 (PDQ 39) and GFQ separately.

Conclusion: Thalamus and limbic system fiber tracking and the topological structural network of thalamus could help to understand the mechanism of PD patient's symptom and to find out the modulation target for PD.

Cognition impairment mediated the white matter injury load and gait disorders in subcortical ischemic vascular disease

Mengmeng Feng

THE FIRST AFFILIATED HOSPITAL OF SOOCHOW UNIVERSITY

Purpose: Gait disorders were common in subcortical ischemic vascular disease (SIVD) patients. We aim to explore the impact of white matter (WM) damages on gait disorders in SIVD.

Method: 21 SIVD and 20 normal controls (NC) were enrolled. The general cognition and executive function were evaluated by Montreal cognitive assessment (MoCA) and speed-accuracy trade-Off (SAT) respectively. Gait velocity, cadence and stride length were recorded. Diffusion tensor imaging (DTI) data was analyzed by tract-based spatial statistics (TBSS) and peak width of skeletonized mean diffusivity (PSMD). The relationships among WM damage, gait disorder and cognitive function were analyzed by mediation analysis.

Results: SIVD performed lower scores than NC in MoCA and SAT tests ($P < 0.001$). The gait velocity and stride length were decreased in SIVD, compared with NC. SIVD were with lower PSMD ($P < 0.001$). PSMD correlated with gait parameters, which were totally mediated by MoCA and partially mediated by SAT. The FA and MD of genu of corpus callosum (GCC), body of corpus callosum (BCC) were correlated with the gait parameters. The FA of bilateral anterior corona radiata (ACR) were positively correlated with gait parameters, while the MD of bilateral superior corona radiata (SCR), bilateral superior longitudinal fasciculus (SLF) and left external capsule (EC) were negatively correlated with them ($P < 0.05$).

Conclusions: Gait impairments of SIVD were associated with cognitive impairments. Cognitive deficit mediated the WM damage and gait disorders. The microstructural alterations of CC, SLF, EC and CR may pertain to the changes of gait.

PU-1645

Cerebral infarction and the variants of the Circle of Willis

Qingguo Ren, Xiangshui Meng

Qilu Hospital of Shandong University (Qingdao)

Purpose: The Circle of Willis (CoW) plays a critical role in maintaining adequate cerebral perfusion and impaired collateral blood flow caused by the CoW variation is a recognized risk factor for ischemic stroke. But, we don't know whether cerebral infarction have relationship with variant artery number of the CoW.

Materials and methods: In this IRB-approved retrospective study, we included the patients who underwent brain MR examination between January 2014 and April 2014. 3D-TOF MRA and DWI were the two essential scanning series. Two experienced radiologists divided them into different CoW variation types in a randomized and blinded manner, and the result was marked as consensus case. Finally, the patients were divided into four groups. The CoW was complete in Group A, and one CoW artery was absent in Group B, two in Group C, three in Group D, respectively.

Results: Four hundred and forty consecutive patients were included in our study. The consensus case ratio between Group A and C, between Group B and D, and between Group C and D had no statistical significant difference ($P > .05$). The acute cerebral infarction incidence had no statistical significant difference between the four groups ($P > .05$). The average age of Group A was smaller than the other's and the difference had statistical significance ($P < .05$).

Conclusion: Our result manifested patient age was an important factor effecting the CoW integrity. Acute cerebral infarction incidence may have no relationship with variant artery number of the CoW.

不同部位神经鞘瘤的影像特征分析

咎芹

深圳市龙华区人民医院

目的: 探讨全身不同部位的神经鞘瘤的影像学特征。方法: 回顾性分析经手术病理证实的 52 例全身不同部位的神经鞘瘤患者的临床表现及影像学特征。主要包括病灶的部位、数量、大小、形态、信号特点及强化方式。结果: 52 例病例中, 位于颅内 4 例, 颈部 8 例, 椎管内 8 例, 脊柱旁 5 例, 消化道 1 例, 腹膜后 2 例, 四肢 16 例, 皮下 8 例, 其中平扫 13 例, 平扫及增强 39 例。颅内神经鞘瘤均为囊实性, 分别位于鼻窦、内听道、桥小脑角区及鞍旁, 以 T1WI 稍低信号, T2WI 不均匀稍高、高信号为主, 增强扫描病灶实性部分明显强化, 囊性区域未见强化, 其中鞍旁病变可见多发 SWI 低信号影。颈部神经鞘瘤均呈囊实性改变, 2 例行 CT 平扫及增强: 实性区域呈明显渐进性延迟强化, 囊性区域未见明显强化; 7 例行 MRI 平扫及增强: T1WI 呈等信号, T2 呈不均匀高信号、内见斑点状、斑片状低信号影, 周围可见低信号包膜, 增强实性成分呈明显延迟强化, 囊性成分未见强化。椎管内神经鞘瘤 3 例为囊性, T1W 呈低信号, T2WI 呈高信号, 边缘见低信号包膜, 未见强化; 3 例为囊实性, T2WI 见低信号分隔及包膜, 实性成分呈渐进性强化, 囊性成分未见强化; 2 例为实性, 呈渐进性强化。脊柱旁神经鞘瘤 5 例为囊实性, 实性成分呈渐进性强化, 囊性成分未见强化。1 例消化道神经鞘瘤发生于食管, 为实性, 明显渐进性强化。腹膜后神经鞘瘤 2 例为囊实性, 实性成分呈渐进性强化, 囊性成分未见强化。16 例四肢神经鞘瘤中 8 例为 MRI 平扫, T1WI 呈等信号, T2WI 呈高信号, 边缘见低信号包膜; 8 例平扫及增强病例呈囊实性, 多数病例 T2WI 表现为靶征, 即中央呈等/稍低信号、外周呈高信号。8 例皮下神经鞘瘤中 5 例为平扫; 3 例平扫及增强为囊实性, 增强扫描呈渐进性强化。结论: 全身不同部位神经鞘瘤影像学表现不同, 以囊实性病变较多见, 包膜下囊变、中央裂隙征、束状征及靶征较具有特征性表现, 实性部分呈渐进性强化, 但部分病变诊断仍存在一定困难。

PU-1647

食蟹猴左足三里穴针刺 fMRI 研究

胡永志¹、梁媛²

1. 江苏省人民医院 (南京医科大学第一附属医院)

2. 东南大学附属中大医院

目的 对食蟹猴进行左侧足三里穴针刺的 fMRI 研究, 探讨左侧足三里穴针刺所引起的脑功能活动。方法 食蟹猴 6 只, 采用 3.0TMR 扫描仪, 动物麻醉后进行左侧足三里穴磁共振功能成像扫描。针刺 fMRI 采用“静息—刺激—静息”设计模式。fMRI-BOLD 扫描 16 层, 128phase。采用 SPM2 软件处理 fMRI 实验数据, 采用 t 检验来分析特定任务刺激下脑激活的状态。结果 针刺左侧足三里穴可以观察到左侧中央前回、右侧中央后回、双侧岛叶、楔前叶、右侧颞叶激活; 额叶、顶叶、枕叶、扣带回有负激活点。结论 可以在临床使用的 MRI 设备上对非灵长类动物进行脑 fMRI 的研究。针刺食蟹猴左侧足三里穴, fMRI 可以显示不同脑组织区域的正激活和负激活。针刺的作用机理可能与中央前回、岛叶及颞上回有较密切关系。针刺足三里穴引起的负激活定位性较差, 扣带回的负激活在针刺机理及针灸止痛中可能有重要作用。

表现为高灌注的原发性中枢神经系统淋巴瘤一例

雷发清、朱亚男、张冰梅
安康市中心医院

报道幕上表现为高灌注的原发性中枢神经系统淋巴瘤一例。CT 表现为胼胝体、右顶叶不规则团块状、结节状等、稍高密度影，边界清晰，周围见指状水肿。MRI 上表现为长 T1 长 T2 信号影，右顶叶病灶呈 DWI 高信号，ADC 低信号，胼胝体病灶边缘可见 DWI 高信号，ADC 低信号；ASL 成像，病灶表现为高灌注；MRI 增强扫描，胼胝体病灶呈明显不均匀强化，右顶叶病灶呈明显均匀强化；磁共振波谱成像示 Cho 峰升高，Cr 峰减低，NAA 减低，并可见升高的 LL 峰。

原发性中枢神经系统淋巴瘤 (primary central nervous system lymphoma, PCNSL) 是一种罕见的侵袭性淋巴结外非何杰金氏淋巴瘤，大部分为弥漫大 B 细胞淋巴瘤^[1, 2]。随着多模态影像技术的发展，PCNSL 相对特征性影像表现越来越多的被认识，依据影像表现大多数病例都能做出准确诊断。安康市中心医院神经外科经病理活检证实了 1 例幕上 PCNSL，活检前磁共振 ASL 检查表现为高灌注，与文献报道^[3, 4]PCNSL 表现为低灌注不一致。为了加深影像医生对 PCNSL 的认识，现将病例报道如下。

维持性血液透析患者脑血流灌注改变与脑网络有效连接变化研究

吴宇、邱翔
成都市第一人民医院

目的：采用脑血流灌注 (CBF) 和格兰杰因果分析 (GCA) 方法研究维持性血液透析 (MHD) 患者脑血流灌注改变及与全脑连接效应特点，分析这些变化与 MHD 患者认知功能障碍之间的关系。方法：将 29 例 MHD 患者和 29 例年龄、性别相匹配的健康志愿者 (HC 组) 纳入本研究。所有受试者行功能磁共振检查，获得的两组间血流灌注的差异脑区作为种子点，并基于格兰杰因果分析观察静息态功能磁共振成像所示种子点与全脑效应连接异常脑区。将 CBF、GCA 差异脑区与 MHD 患者的临床资料和神经心理学测试结果进行相关性分析。结果：与 HC 组相比，MHD 组双侧海马、右侧脑岛的 CBF 值减低 ($P < 0.05$, FDR 校正)。MHD 组右侧脑岛 CBF 值与肌酐 (Cr) 呈负相关 ($P < 0.05$)。MHD 组右侧海马到右侧三角部额下回连接效应增加。MHD 组左侧海马到右侧距状裂周围皮层、右侧前扣带和旁扣带脑回、右侧豆状壳核、右侧脑岛连接效应增加，左侧海马到左侧丘脑连接效应减低 ($P < 0.05$, FDR 校正)。MHD 组右侧海马至右侧三角部额下回连接效应与血尿素氮 (BUN) 呈正相关 ($P < 0.05$)，MHD 组左侧海马至右侧前扣带和旁扣带脑回连接效应与命名评分呈正相关 ($P < 0.05$)，左侧海马至右侧豆状壳核连接效应与抽象评分、透析时间呈负相关，左侧海马至左侧丘脑连接效应与命名评分呈负相关 ($P < 0.05$)。结论：维持性血液透析患者存在脑血流改变及双侧海马与全脑效应连接异常，并参与认知功能调节。

PU-1650

双源 CT 血管成像对主动脉弓分支血管变异的诊断价值

曹阿丹、詹浩辉
河南科技大学第二附属医院

【摘要】目的 评价双源 CT 血管成像(DSCTA)对活体主动脉弓分支血管变异各型检出率及其临床意义。**方法:** 对 1370 例接受 MSCT 胸部及头颈部增强扫描的患者进行动脉期三维重建, 结合横断面、容积重建 (VR)、多平面重建 (MPR) 及最大密度投影 (MIP) 观察主动脉弓分支变异情况。**结果:** 1370 例患者中, 标准型 1188 例, 男 750 例, 女 438 例, 变异型 182 例, 男 97 例, 女 85 例。共发现 9 种不同类型的变异, 其中最常见 2 种变异, 分别是 B1 型和 C1 型, B1 型即 L-CCA 与 BT 共干发自主动脉弓 98 例, 检出率约 7.2%; C1 型, 即 L-VA 于 L-CCA 和 L-SA 之间直接发自主动脉弓 60 例, 检出率约 4.4%; 其他为少见的混合型变异。**结论:** DSCTA 能够术前提供主动脉弓分支血管变异情况等重要活体解剖学信息, 为食管镜检、外科、血管介入术前制订手术及放疗方案具有重要临床意义。

Significance of degree of neurovascular compression in predicting poor drug response in patients with hemifacial spasm

Bo Li^{1,2}, Mingyong Gao¹, Chun Luo¹, Hai Zhao¹, Linwen Huang¹, Shengqiao Huang¹, Honglin Shang¹

1. The First People's Hospital of Foshan

2. Sun Yat-sen University

Objective: Patients with hemifacial spasm frequently opt for microvascular decompression when oral pharmacotherapy exhibits limited effectiveness. This study aimed to identify clinical and radiological factors predicting poor drug responses in patients with hemifacial spasm.

Methods: We retrospectively included patients with hemifacial spasm who underwent pre-therapy MRI examination. The presence, location, severity and the offending vessels of neurovascular compression was blindly evaluated using MRI. Drug responses and clinical data were obtained from the medical notes and/ or phone follow-ups. Logistic regression analysis was performed to identify the predictors of poor drug responses.

Results: A total of 116 patients were included in this study, with an average age at the time of first examination of 51 years and a median duration of onset of 24 months. forty-nine (42.2%) patients reported no symptom relief. 37 (31.9%) patients reported poor symptom relief. 22 (19.0%) patients reported partial symptom relief. 8 (6.9%) patients achieved complete symptom relief. The only factor that was a statistically significant predictor of poor drug responses was contact in the attach segment of the facial nerve, with an odds ratio of 6.444 (95%CI: 1.888-21.993, $p = 0.003$).

Conclusions: This study revealed that mild compression in the attach segment of the facial nerve in pre-therapeutic MRI increased the risk of poor drug responses in patients with hemifacial spasm. This finding may assist clinician to choose optimal treatment.

Magnetic resonance imaging and metabolomic profiling reveal the mechanisms underlying the negative effects of childhood family structure transitions on young adults

Tian Tian, Jicheng Fang, Wenzhen Zhu

Department of Radiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Neurobiological changes of adults reared in single-parent families that occur in response to untoward childhood family stress are associated with lifelong mental health. However, the current understanding of neuropsychobiological mechanisms responsible for this association is limited. In this study, multimodal magnetic resonance imaging and metabolomic profiling were comprehensively utilized to explore how childhood family structure transitions have a prolonged neuropsychobiological impact on the brain and metabolic mediators, thus increasing the risk of negative outcomes in adulthood. Young adults reared in single-parent families had more childhood trauma experiences, a weaker verbal memory ability, and a higher tendency of anxiety, depression, and harm avoidance personality. Altered regional and network-based connectivity properties were found in the single-parent family group, including increased functional connectivity density in the left inferior parietal lobule, the enhancement of cortical structural connectivity between the left isthmuscingulate and pericalcarine, and the increase of temporal functional connections. Brain structural and functional characteristics were related to behavioral data. Moreover, 216 differentially expressed metabolites were found between the single-parent family and control groups, which were enriched in pathways mainly associated with sulfur metabolism, thiamine metabolism, biosynthesis of unsaturated fatty acids, and fatty acid biosynthesis. Two potential metabolite biomarkers, that well separated single-parent family group from control individuals, were identified and significantly correlated with behavioral data. Our findings reveal the macro-brain and micro-metabolic media changes related to early-life stress, providing objective neuropsychobiological evidence on the enduring adverse effects of childhood family structure transitions on psychiatric vulnerability in adulthood.

PU-1653

Dynamic and concordance alterations of regional brain function indices in vestibular migraine: a resting state fMRI study

Jun Ke, Lingling Dai

The first affiliated hospital of Soochow university

Purpose: Resting-state fMRI (rs-fMRI) studies on vestibular migraine (VM) have revealed abnormalities in static regional intrinsic brain activity (IBA) and dynamic functional connectivity between brain regions or networks. However, the temporal variation and concordance of regional IBA measures remain to be explored.

Methods: 57 VM patients during the interictal period were compared to 88 healthy controls (HC) in this rs-fMRI study. The dynamics and concordance of regional IBA indices, including amplitude of low-frequency fluctuations (ALFF) and regional homogeneity (ReHo), were examined by utilizing sliding time-window analysis. Partial correlation analyses were performed between clinical parameters and rs-fMRI indices in areas showing group differences.

Results: The VM group showed increased ALFF and ReHo dynamics, as well as increased temporal concordance between ALFF and ReHo in the bilateral paracentral lobule/supplementary

motor area relative to the HC group. We also found decreased ReHo dynamics in the right temporal pole/inferior temporal gyrus, decreased ALFF dynamics in the right cerebellum posterior lobe, bilateral angular gyrus/middle occipital and temporal gyrus in the VM group compared with HC group. Moreover, a positive correlation was observed between ALFF dynamics in the left middle occipital gyrus and vertigo disease duration of VM patients.

Conclusion: Temporal dynamic and concordance of regional IBA indices were altered in sensorimotor network, occipital, temporoparietal cortex and cerebellum, which may contribute to disrupted multisensory vestibular control and processing in patients with VM. ALFF dynamics in the left middle occipital gyrus may be useful biomarker for evaluating vertigo disease burden in this disorder.

PU-1654

Equidistant Age Dependent Brain Microstructural Alterations in APP/PS1 mice through 9.4T High-Resolution Diffusion Tensor Imaging

Yun Yan Su, Xin Yu Jiang, Chunhong Hu

Department of Radiology, The First Affiliated Hospital of Soochow University

Abstract

Background: The pathological evidence of Alzheimer's disease (AD) can be detected years prior to the occurrence of clinical symptoms. Imaging-based identification of age-dependent cerebral changes in preclinical AD mouse models may provide insights into how age and amyloid burden at the earliest stages affect disease progression.

Purpose: To evaluate age-related microstructure changes in APP/PS1 and wild-type (WT) mice during asymptomatic preclinical stage using 9.4T high-resolution diffusion tensor imaging (DTI) technology.

Materials and Methods: DTI data of APP/PS1 and WT mice at the age of 2, 4, 6 and 8 months (n = 4~8) were acquired. Subsequently, we acutely inhibited AQP4, and compared the diffusion restriction reduction in young and elderly WT mice. All microstructure changes were conducted in 5 regions and 179 subregions by using DTI metrics (fractional anisotropy (FA) and mean diffusion (MD)). Statistical significance was assessed with the T-test, one-way ANOVA, and post-hoc test. The thioflavin staining was implemented to validate DTI findings.

Results: In the APP/PS1 group, FA in cortex and part of its sub regions, MD in cortex, fornix, hippocampus, and anterior commissure showed significant decrease at 4 months and 6 months, as compared with the age of 2 months, respectively. Compared to 4 months and 6 months, 8 months showed significant FA and MD increase in hippocampus, cortex, fornix, and 10 sub regions. No significant difference was observed between 4 months and 6 months. In the WT group, FA increased at 8 months and 6 months as compared to 2 months in corpus callosum and dorsal hippocampal commission, and MD decreased at 6 months as compared to 2 months in corpus callosum, hippocampus and anterior commissure. In contrast with WT, hippocampus in APP/PS1 showed significant FA increase at 2 months, while corpus callosum showed significant FA decrease at 4 months, and significant FA decrease was displayed in the anterior commissure, corpus callosum, fornix at 6 months.

Conclusion: Microstructure alterations are age dependent along with progressive brain amyloidosis. FA value is more sensitive to alternations related to A β deposition, and it is more conducive to detecting amyloid protein deposition related changes in early stage, as compared with MD. And the alteration of FA (with an initial increase, followed by a gradual decrease) could be a biomarker of AD. These findings demonstrate that DTI can indicate microstructural changes and serve as a potential biomarker for revealing the pathophysiology and progression of AD.

Key words: Equidistant Age Dependent; APP/PS1 mice; Brain Microstructure; DTI; Alzheimer's disease

比较弥漫中线胶质瘤--H3K27 突变和近中线低级别胶质瘤的 MRI 形态学差异

黄晓丹
深圳市松岗人民医院

目的: 弥漫性中线胶质瘤, 伴 H3K27m 突变被 2016 年 WHO 定义为一种新的分子亚型, 对应于 IV 级。本研究旨在探究弥漫中线胶质瘤与低级别胶质瘤之间 MR 成像的差异。

方法: 回顾性分析 39 例弥漫中线的胶质瘤-h3k27 改变和 20 例中线低级别胶质瘤患者的 MRI 图像。观察肿瘤的大小、数量及影像表现, 包括瘤周水肿、DWI 及增强等特征, 病变囊变坏死、瘤内出血、T2WI 错配征。采用 T 检验和卡方检验来描述两者间的差异。

结果: 独立样本 T 检验结果显示 DMG 患者的平均年龄要比 LGG 的要年轻 ($P < 0.001$)。卡方检验结果显示, DMG 的肿瘤大小相对要小于 LGG ($P < 0.001$)。DMG 的 DWI 和增强程度相对较高 ($P < 0.001$)。而 DMG 与 LGG 在 Peritumoral edema 有统计学意义 ($P < 0.05$)。

结论: 与中线区低级别胶质瘤相比, H3K27 改变的弥漫性中线胶质瘤的 MRI 表现和临床特点具有一定的特点, 有助于提高诊断和鉴别诊断水平。

基于 VOSviewer 和 CiteSpace 研究针刺治疗脑卒中的 fMRI 的文献计量分析

余明玲
西南医科大学附属医院

【摘要】目的 采用 CiteSpace 和 VOSviewer 文献计量方法, 分析应用 fMRI 探讨针刺治疗脑卒中神经机制相关文献的特点, 总结该领域的研究现状, 预测发展趋势。资料与方法 搜集中、英文数据库的相关文献, 分析文献的机构、作者、关键词、引文等信息。结果 共检索文献 771 篇, 纳入分析 188 篇, 该领域的研究第一次发表是在 2004 年, 往后发文量逐年上升, 预计今后也是研究热点。发文机构主要集中在国内, 多为中医药大学及其附属医院。针刺最常使用电针和头针手法刺激阳陵泉穴。fMRI 数据分析方法多采用功能连接、低频振幅。结论 fMRI 探究针刺治疗脑卒中的研究在不断发展, 不同的针刺治疗方案治疗卒中后不同的症状, 其中的治疗机制仍需要更深入的挖掘和讨论, 是今后值得开拓研究的新方向。

基于 ReHo 的伴和不伴初始促发损伤因素的内侧颞叶癫痫患者静息态 fMRI 研究

毛鑫月、张晓楠、宋承汝、马可燃、王克凡、连亚军、程敬亮、张焱
郑州大学第一附属医院

目的: 通过分析伴或者不伴热性惊厥、颅内感染等初始促发损伤(initial precipitating injury, IPI)因素的内侧颞叶癫痫患者的静态和动态脑区局部一致性 (regional homogeneity, ReHo), 探究 IPI 对内侧颞叶癫痫患者脑功能损伤的影响。方法: 采集 25 名伴 IPI 的内侧颞叶癫痫患者, 35 名不伴 IPI 的内侧颞叶癫痫患者和 33 名健康对照的 BOLD 数据, 计算其静态和动态 ReHo 来评价各组被试的局部神经元活动变化。分别比较三组间静态 ReHo 和动态 ReHo 的差异, 获取有统计学意义的差异脑区。随后, 将差异脑区的静态或动态 ReHo 值与患者病程、癫痫发作严重程度量表 (NHS3) 评分、所用抗癫痫药种类数进行相关分析。结果: (1) 与健康对照相比, 伴 IPI 的内侧颞叶癫痫患者双侧丘脑和视觉皮层的静态和动态 ReHo 值增加, 右侧小脑 crus1/crus2、顶下小叶和外侧颞叶的静态 ReHo 值降低; (2) 与健康对照相比, 不伴 IPI 的内侧颞叶癫痫患者双侧外侧颞叶的静态和动态 ReHo 值降低; (3) 与不伴 IPI 的内侧颞叶癫痫患者相比, 伴 IPI 的内侧颞叶癫痫患者双侧视觉皮层静态和动态 ReHo 值增加, 左侧丘脑动态 ReHo 变异性增加, 右侧背外侧前额叶皮质静态 ReHo 值降低; (4) 伴 IPI 的颞叶癫痫患者的 NHS3 评分与右侧小脑 crus1 的静态 ReHo 值呈负相关。结论: 伴和不伴 IPI 的内侧颞叶癫痫患者的静态和动态局部神经元活动均存在显著异常, 且伴 IPI 的内侧颞叶癫痫患者的脑区局部神经元功能障碍更为广泛。

PU-1658

通过判别分析脑结构异质性揭示两种不同的无先兆偏头痛神经解剖学亚型

刘浩
郑州大学第一附属医院

背景: 关于偏头痛的神经生物学异质性的研究很少, 导致了相互矛盾的神经影像学表现。本研究使用了一种新提出的基于灰质体积(GMV)的方法来研究偏头痛的客观神经解剖学亚型。

方法: 对 31 例无先兆偏头痛患者和 33 名匹配的健康对照者进行结构 MRI 和临床测量。首先, 我们研究了偏头痛患者在脑灰质体积方面是否比健康对照表现出更高的个体间变异性。然后, 采用异质性判别分析(HYDRA)方法, 根据脑灰质体积将偏头痛患者分为不同的亚型。分析不同亚型的灰质体积变化和临床特征差异。

结果: 无先兆偏头痛患者具有较高的个体间 GMVs 变异性。本研究显示偏头痛有两种不同的和可重复的神经解剖学亚型。这两种亚型表现出与健康对照相反的神经解剖学变异。亚型 1 表现为广泛的 GMVs 降低, 而亚型 2 表现为局部区域 GMVs 升高。亚型 2 患者总颅内体积与认知功能呈显著正相关。与亚型 2 相比, 亚型 1 患者的病程较长, 认知评分较低。

结论: 本研究表明无先兆偏头痛患者具有高度的结构异质性, 并揭示了两种不同的、稳定的神经解剖学亚型, 为相互矛盾的神经影像学表现提供了可能的解释。

Altered degree centrality in hemodialysis patients: a resting-state fMRI study

Huijuan Chen, Jie Qiu, Lili Fu, Feng Chen
Department of Radiology, Hainan General Hospital

Background: Cognitive impairment is common in hemodialysis patients and is found to be associated abnormal regional brain spontaneous activity. The aim of the study is to explore the degree centrality (DC) changes in hemodialysis patients with resting-state functional magnetic resonance imaging (rs-fMRI).

Methods: Rs-fMRI scanning, neuropsychological tests and blood biochemical data were collected from twenty-seven end-stage renal disease (ESRD) patients on regular hemodialysis and twenty-five age-, sex- and education level-matched healthy controls. A two-sample t-test was performed to explore the group differences in DC between ESRD patients and healthy controls with age, gender and education as covariates. Pearson correlation analysis was further performed to investigate the relationship between DC changes with neuropsychological and clinical parameters. **Results:** Compared with the healthy control group, hemodialysis patients demonstrated a significantly increased DC in multiple regions, including bilateral hippocampal gyrus, left superior frontal gyrus and right medial superior frontal gyrus. The hemodialysis patients also showed a significantly decreased DC in bilateral insula, left postcentral gyrus and left precentral gyrus ($P < 0.05$, FDR corrected). The increased DC of left superior frontal gyrus was positively associated with biochemical indices including urea and uric acid ($P < 0.05$, Bonferroni corrected). In addition, significant between-group DC showed good classification efficiency with significant accuracy (77%, $P = 0.0002$).

Conclusions: Our results demonstrated aberrant DC in many brain regions of hemodialysis ESRD patients, which may be associated with cognition and serum toxins.

PU-1660

味觉刺激后的静息态脑功能磁共振研究

沈文斌¹、丁庆国¹、梁沛²

1. 常熟市第二人民医院

2. 湖北大学

目的: 味觉加工是人类生存最重要的功能之一。味知觉不仅帮助我们感受食物的品质, 带来愉悦的体验。由于受到早前实验条件的限制, 大多数人类味觉的相关研究还集中在行为学水平, 涉及神经生理水平的研究相对较少, 对于更大时空尺度的味知觉信息加工机制还远远未知。本研究从一个全新的角度观察大脑对味觉刺激后加工处理, 结合静息态数据挖掘的算法优势, 在更广尺度的时间、空间维度深入探究大脑对味觉刺激后的神经活动。

方法: 本研究采用被试内实验设计, 共招募 22 名被试参与实验 (其中女生 10 名), 分别扫描被试在甜味、酸味和人工唾液 (对比条件) 刺激 (2 毫升, 5 秒) 后的大脑自发神经活动 (6 分钟), 给予顺序在不同的被试间进行了平衡。数据在预处理后, 分别进行了体素水平的分数低频振幅 (fALFF)、百分比振幅 (PerAF)、全脑水平的度中心性 (DC) 以及基于滑动窗技术的动态分数低频振幅 (dfALFF) 分析。

结果: 从体素水平上看, 与无味条件相比, 甜味和酸味刺激后口腔躯体感觉皮层中央后回的 fALFF 和 PerAF 均显著降低 ($t: -5.69$), 同时, 参与奖赏处理的壳核在甜味刺激后 PerAF 显著提高 ($t = 4.53$)。从全脑水平上观察, 与无味条件相比, 甜味刺激后, 楔前叶的 DC 值显著降低 ($t = -4.3792$); 酸味刺激后, 左侧中央后回 DC 值显著降低 ($t = -4.68$); 左侧梭状回在酸味和甜味条

件的对比中 DC 值存在显著差异 ($t=-4.35$)。dfALFF 结果表明,与无味条件相比,舌回和额中回在甜味下 dfALFF 被发现显著差异 ($t=-4.29$);梭状回和舌回在酸味下 dfALFF 提高 ($t=4.40$),后扣带回处 dfALFF 降低 ($t=-4.22$)。枕中回和颞中回在刺激后 dfALFF 有显著差异 ($t=4.58$)。讨论:综上所述,本实验采用静息态功能磁共振扫描对比不同味觉刺激后的大脑自发神经活动,从新的角度尝试探究大脑对味觉刺激后的神经活动状态。一方面,研究表明味觉刺激后大脑仍旧在进一步处理味觉相关信息活动,大脑的这种自发活动状态模式可能是味觉跨通道作用的一个关键因素;另一方面,本研究也扩充了对味知觉加工神经机制的理解。

单发未破裂颅内动脉瘤的瘤壁强化与其形态学的相关性研究

陈姿、张伟、黎芳丽

湖南省脑科医院 (湖南省第二人民医院)

【摘要】目的 探讨单发未破裂颅内动脉瘤(unrupture intracranial aneurysm,UIA)的瘤壁强化(aneurysm wall enhancement,AWE)与其形态学的相关性。方法 收集经我院 CTA 确诊的 85 例单发 UIA 患者,对比钆造影剂给药前、后的高分辨磁共振血管壁成像(high-resolution MR vessel wall imaging,HRMR-VW)图像,根据动脉瘤壁是否强化,分为无强化组($n=38$)及强化组($n=47$)。在 CTA 上对动脉瘤进行定位、判断有无子囊及分叶,测量动脉瘤形态学参数,包括直径、瘤颈宽、纵横比(aspect ration,AR)、尺寸比(size ration,SR)。比较两组间各参数的差异,分析 AWE 与形态学的关系。结果 无强化组与强化组的分叶及子囊构成比、直径、AR 值及 SR 值差异具有统计学意义($P<0.05$)。在多因素 Logistic 回归分析中颅内动脉瘤直径、AR 值、分叶及子囊构成比为 AWE 的独立危险因素,直径的最佳截断值为 6.76mm,AR 值的最佳截断值为 1.15。结论 颅内动脉瘤直径、AR 值、分叶及子囊构成比为瘤壁强化的独立危险因素,AWE 可能是颅内动脉瘤破裂风险的危险因素。

PU-1662

Abnormal Static and Dynamic Functional Network Connectivity in Patients With Presbycusis

Chunhua Xing

Department of Radiology, Nanjing First Hospital, Nanjing Medical University, Nanjing, China;

Aim: This study aimed to investigate abnormal static and dynamic functional network connectivity (FNC) and its association with cognitive function in patients with presbycusis.

Methods: In total, 60 patients with presbycusis and 60 age-, sex-, and education-matched healthy controls (HCs) underwent resting-state functional MRI (rs-fMRI) and cognitive assessments. Group independent component analysis (ICA) was carried out on the rs-fMRI data, and eight resting-state networks (RSNs) were identified. Static and dynamic FNCs (sFNC and dFNC) were then constructed to evaluate differences in RSN connectivity between the patients with presbycusis and the HCs. Furthermore, the correlations between these differences and cognitive scores were analyzed.

Results: Patients with presbycusis had differences in sFNC compared with HCs, mainly reflected in decreased sFNC in the default mode network (DMN)-left frontoparietal network (LFPN) and attention network (AN)-cerebellum network (CN) pairs, but they had increased sFNC in the auditory network (AUN) between DMN domains. The decreased sFNC in the DMN-LFPN pair was negatively correlated with their TMT-B score ($r = -0.441$, $p = 0.002$). Patients with presbycusis exhibited aberrant dFNCs in State 2 and decreased dFNCs between the CN and AN

and the visual network (VN). Moreover, the presbycusis group had a shorter mean dwell time (MDT) and fraction time (FT) in State 3 ($p = 0.0027$; $p = 0.0031$, respectively).

Conclusion: This study highlighted differences in static and dynamic functional connectivity in patients with presbycusis and suggested that FNC may serve as an important biomarker of cognitive performance since abnormal alterations can better track cognitive impairment in presbycusis.

2. Department of Radiology, and Functional and Molecular Imaging Key Laboratory of Sichuan Province, West China Hospital, Sichuan University

3. Huaxi MR Research Center (HMRR), West China Hospital, Sichuan University

4. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences

5. Center for Biomedical Imaging Research, Department of Biomedical Engineering, Tsinghua University

6. Department of Neurosurgery, West China Hospital, Sichuan University

7. Department of Neurosurgery, The First Affiliated Hospital of Xi'an Jiaotong University

8. Department of Radiology, West China Hospital, Sichuan University

Objective: This study aimed to evaluate hemodynamic alterations of carotid siphons after revascularization for Moyamoya disease (MMD) using 4D Flow MRI and to explore its association with treatment outcomes.

Methods: Patients with MMD who underwent combined revascularization surgery were prospectively and consecutively collected at West China Hospital, Sichuan University from July 2018 to January 2020. The VesselExplorer2 software was employed to analyze images of 4D Flow MRI and measure hemodynamic parameters of bilateral carotid siphons, including mean and maximum values of flow (Flow_mean and Flow_max), velocity (V_mean and V_max), and wall shear stress (WSS_mean and WSS_max). Subgroup analysis was performed by sex, age, and the baseline Suzuki stages. Relationships were explored between hemodynamic parameters of carotid siphons and surgical outcomes (clinical symptom improvement, cerebral perfusion improvement, and intracranial vascular remodeling).

Results: Thirty-five patients were included with a 7-month (range 5–10) follow-up period. Flow_mean (surgical side, 1.69 ± 1.26 mL/s [baseline] vs. 2.11 ± 1.50 mL/s [follow-up], $P < 0.001$; contralateral side, 2.42 ± 1.63 mL/s [baseline] vs. 2.83 ± 1.87 mL/s [follow-up], $P = 0.002$) and Flow_max (surgical side, 2.40 ± 1.73 mL/s vs. 2.96 ± 2.08 mL/s, $P < 0.001$; contralateral side, 3.32 ± 2.22 mL/s vs. 3.81 ± 2.41 mL/s, $P = 0.001$) of bilateral carotid siphons were significantly decreased during follow-up. Follow-up hemodynamic changes in bilateral carotid siphons were significantly different in sex, age, and the baseline Suzuki stages ($P < 0.01$). An apparent reduction in Flow_mean/Flow_max of bilateral carotid siphons at follow-up was observed in patients with good clinical outcome or improved cerebral perfusion ($P < 0.01$). Similar phenomena were found in patients with good collateral formation ($P < 0.01$) but not in those with poor collateral formation ($P > 0.05$).

Conclusion: Flow_mean and Flow_max of bilateral ICAs in MMD decreased at follow-up, which was associated with the outcomes of combined revascularization. Quantitative detection of 4D Flow MRI-based hemodynamics of carotid siphons might be a promising tool for predicting treatment outcomes of MMD.

PU-1664

Large-scale Structural Covariance Networks Changes Relate to Attention Impairment in Betel Quid-Dependent Chewers

Yihao Guo¹, Weiyuan Huang¹, Tao Liu², Feng Chen¹

1. Hainan general hospital

2. Department of Geriatric Center, Hainan General Hospital (Hainan Affiliated Hospital of Hainan Medical University)

Objectives: Large-scale structural covariance network (SCN) based on gray matter (GM) morphometry is an effective method in investigating cognitive impairment. This study aimed to identify spatial covariance patterns of gray matter (GM) volume and to investigate their association with cognition impairment in betel quid-dependent (BQD) individuals.

Methods: Sixty-four BQD individuals and 48 sex- and age-matched healthy controls (HCs) underwent T1-weighted structural MRI examination and neuropsychological assessments. Seventy structural covariance networks (SCNs) based on GM volume covariance patterns were defined using independent component analysis. An SCN-based classifier was constructed for differentiating BQD and HC individuals. Receiver operating characteristic (ROC) curves were applied to evaluate the performance of the SCN-based classifier. Multiple linear regression analyses were performed to investigate the association between network indices and clinical evaluations.

Results: Six SCNs had higher classification for differentiating BQD and HC individuals. The area under the ROC curve of the SCN-based classifier was 0.812 in the training set and 0.771 in the testing set. Furthermore, multiple linear regression analyses demonstrated that the network indices in thalamus and calcarine were associated with attention indicated by backward digit span in BQD individuals.

Conclusions: Our results demonstrated that large-scale SCNs could provide potential imaging markers for differentiating BQD and HC groups. They also revealed that the loss of network index in thalamus and calcarine was related to attention impairment in BQD individuals.

PU-1665

Decreased cerebral perfusion in chronic migraine: a voxel-based cerebral blood flow analysis using 3D pseudo-continuous arterial spin labeling

Xin Li^{1,2}, Zhiye Chen^{1,2}

1. Hainan Hospital of PLA General Hospital

2. The Second School of Clinical Medicine, Southern Medical University

Objective: The cerebral perfusion evaluation of chronic migraine (CM) had been commonly performed by some invasive methods, while a contrast agent-free approach would be more advisable. This study aimed to assess the cerebral perfusion changes with a non-invasive quantitative volumetric perfusion imaging in CM.

Methods: We investigated thirteen CM patients and fifteen normal controls (NCs) using conventional brain structural imaging sequences and 3D pseudo-continuous arterial spin labeling (3D PCASL). The voxel-based analysis of the whole cerebral gray matter was performed, and the cerebral blood flow (CBF) value of the altered positive areas were extracted to investigate the significant correlation with clinical variables.

Results: Brain regions with the decreased perfusion were located in left postcentral gyrus, bilateral middle frontal gyrus, left middle occipital gyrus, left superior parietal lobule, left medial

segment of superior frontal gyrus, and right orbital part of the inferior frontal gyrus. White matter fibers with decreased perfusion were located in bilateral superior longitudinal tracts, superior corona radiata, external capsules, anterior and posterior limbs of internal capsule, anterior corona radiata, inferior longitudinal fasciculus and right corticospinal tract. However, the correlation analysis showed no significant correlation between the CBF value of the above positive brain regions with clinical variables ($p > 0.05$).

Conclusion: The current study indicated a novel insight on the neural mechanism of CM from the pattern of cerebral hypoperfusion, and provide more functional information to understand the pathophysiology of CM.

PU-1666

基于图论分析探究 T2DM 脑结构网络拓扑属性差异与肠道菌群关系

许珊、汪旭洋、杨东、伍建林
大连大学附属中山医院

目的: 采用 DSI 及图论分析方法探究 T2DM 患者脑结构网络全局拓扑属性的改变, 及其与肠道菌群之间的相关性。

方法: 招募 19 名健康志愿者 (HC 组) 及 27 名 T2DM 患者 (T2DM 组) 分别行 DSI 扫描、实验室检测、神经心理学测试, 并收集粪便通过 16S RNA 基因测序分析肠道优势菌群。通过 Dsi-studio 软件构建全脑结构网络并计算全局网络拓扑属性, 2 组患者脑网络拓扑属性行两独立样本 t 检验, 将年龄作为协变量, 2 组间差异的拓扑属性指标与差异菌群行 spearman 偏相关性分析。

结果: 与 HC 组相比较, T2DM 组加权后的小世界属性、全局效率、平均聚类系数、转移性及富人俱乐部 ($k=15$) 均减低 ($P<0.05$); 而 T2DM 组特征路径长度增加 ($P<0.05$)。比较 2 组间优势菌群, T2DM 患者在门水平 Actinobacteria、属水平 Bacteroides、Roseburia、Escherichia 及种水平 ovatus、uniformis、coli、cacciae、plebeius、distasonis 丰度均低于 HC 组, 而 Bacteroidetes、Verrucomicrobia 菌门、Bifidobacterium、Lactobacillus、Akkermansia 菌属及 longum、adolescentis 及 muciniphila 菌种丰度高于 HC 组 ($P<0.05$ 或 $P<0.01$), 其中 Verrucomicrobia、Akkermansia muciniphila 水平与平均聚类系数、转移性呈负相关 ($r=-0.441$, $P=0.027$; $r=-0.440$, $P=0.028$; $r=-0.441$, $P=0.027$; $r=-0.441$, $P=0.027$)。

结论: 相对于健康志愿者, T2DM 患者脑结构网络的全局传输能力下降, 同时伴有富人俱乐部区域损伤, 而肠道菌群丰度的改变可能与全局拓扑属性之间存在一定联系。

PU-1667

肌萎缩侧索硬化症皮层下核团的形状改变与疾病进展相关

易小平、傅彦、Bihong T. Chen
中南大学湘雅医院

目的: 及时诊断有助于肌萎缩侧索硬化症 (ALS) 患者的及时干预、改善其预后, 我们旨在确定 ALS 疾病进展的潜在神经影像学生物标志物。

方法: 共有 61 名 ALS 患者前瞻性地纳入研究, 并根据进展率分为三个亚组, 即缓慢、中等和快速进展。还招募了 61 名匹配的健康对照 (HC)。所有参与者都进行了大脑结构 MRI 扫描, 以进行皮质下体积和形状分析。进行神经心理测试、行为和功能状态评估。比较 ALS 亚组之间以及 ALS 组和 HC 组之间的神经影像学特征和临床数据的差异。

结果：与 HCs 组相比，进展迅速的患者基底节和脑干的形状发生了显著变化。在进展迅速的 ALS 患者中，双侧伏隔核、左尾状核、左丘脑和脑干出现带萎缩性变化的形状收缩，左尾状体、左侧丘脑和左侧苍白球出现伴有肥大的区域扩张。左侧丘脑的形状变化与肌萎缩侧索硬化症功能评定量表修订版 (ALS-FRS-R) 总分和肢体评分以及疾病持续时间呈正相关。左侧苍白球与焦虑和病程呈正相关，左侧伏隔核与 ALS-FRS-R 总分和球结膜评分呈正相关，脑干与迷你精神状态检查评分呈正相关。

结论：在进展迅速的患者中，皮质下细胞核发生了广泛的改变，提示 ALS 的进展具有潜在的神经影像学生物标志物。

基于 CTA、血液炎症细胞分析大脑中动脉动脉瘤破裂的风险因素

姜兵

湖南省脑科医院 (湖南省第二人民医院)

目的 分析大脑中动脉 (MCA) 动脉瘤破裂的风险因素，筛选动脉瘤形态学和血液炎症细胞预测指标。方法 回顾性分析 2018 年 01 月至 2023 年 04 月经过头颅 CT 血管造影 (CTA) 确诊的 MCA 动脉瘤 90 例，根据 CT 平扫有无蛛网膜下腔出血和或脑内血肿，分为未破裂组 (53 例) 和破裂组 (37 例)，未破裂动脉瘤 (UIA) 组根据形态分为形态规则组和形态不规则组，比较年龄、性别、入院第一次血常规炎症细胞并计算中性粒细胞与淋巴细胞比值 (NLR)、全身性系统炎症反应指数 (SIRI)、动脉瘤形态学参数等。通过卡方检验、Student's t-test 检验或曼-惠特尼 U 检验分析各组因素，对差异因素进行单因素及多因素逻辑回归分析，最后以 ROC 曲线对动脉瘤形态学、血液炎症细胞有差异性的因素进行诊断效能评估。结果 MCA 动脉瘤形态不规则 (OR = 8.64, P = 0.0063)、SIRI (OR = 13.62, P = 0.042)、长宽比 (OR = 25.92, P = 0.043) 是独立破裂风险因素，其 AUC 值分别是 0.78、0.94、0.75。结论 MCA 动脉瘤形态不规则、长宽比和 SIRI 是动脉瘤破裂的高危险因素，对预测动脉瘤破裂有重要意义。

PU-1670

慢性偏头痛患者丘脑核团脑灌注改变：3 维假连续动脉自旋标记成像初步研究

樊文萍、陈志晔

中国人民解放军总医院海南医院放射科

目的 采用 3 维假连续动脉自旋标记成像 (3D pseudo-continue arterial spine labelling, 3D pc-ASL) 探索慢性偏头痛患者丘脑核团脑灌注改变。方法 对 13 例慢性偏头痛患者及 15 例正常对照组进行三维脑结构成像及 3D-pcASL 成像, 将脑结构像进行分割, 生成反向变形场, 再将反向变形场施加于丘脑分区模板 (包括枕核、前核、背内侧核、腹外侧核背侧、中外侧核、腹前核、腹外侧核腹侧), 生成个体化的丘脑分区蒙片, 进而基于配准后的脑血流图 (cerebral blood flow, CBF), 提取受试者丘脑各核团 CBF 值。结果 慢性偏头痛患者左侧丘脑枕核 ($F = 5.069$, $P = 0.034$)、前核 ($F = 4.947$, $P = 0.036$)、背外侧核腹侧 ($F = 7.24$, $P = 0.013$) 脑灌注显著减低。双侧丘脑背内侧核、背外侧核腹侧、中外侧核、腹前核、右侧枕核、右侧前核脑灌注改变与疼痛发作程度呈显著负相关, 但是与偏头痛失能程度均无相关性。结论 慢性偏头痛患者丘脑核团脑灌注不同程度减低, 并与头痛发作存在显著相关性, 3D pc-ASL 可作为慢性偏头痛患者脑灌注评价的可靠方法。

PU-1671

Disturbance of neurovascular coupling in lung cancer patients after chemotherapy

Lanyue Hu

Nanjing First Hospital

Objective: Chemotherapy-related cognitive impairment (CRCI) have been a common complaint among lung cancer patients. Previous studies have revealed that cognitive impairment might due to abnormal spontaneous neuronal activity and cerebral blood flow (CBF) connectivity alterations, however neurovascular coupling (NVC) alterations in post- chemotherapy patients remain unclear. The present study aimed to investigate the NVC changes in lung cancer patients after chemotherapy, as well as the associations between NVC changes and cognitive impairment.

Materials and methods: Forty-three lung cancer patients were recruited, including twenty receiving adjuvant chemotherapy (CT+) patients and twenty-three non-chemotherapy (CT-) patients. All subjects underwent resting-state functional magnetic resonance imaging (rs-fMRI) and pseudocontinuous arterial spin labeling (pCASL) perfusion MRI. We calculated a series types of NVC patterns (including CBF-ALFF, CBF-ReHo correlation coefficients, and CBF/ALFF and CBF/ReHo ratio). The alterations in global NVC, regional NVC and cognitive impairment were detected, and group comparisons were performed. Association statistical analyses were performed to explore the correlations between the changes of global and regional NVC and cognitive impairment.

Results: CT+ patients showed significantly reduced global CBF- ALFF coupling and CBF- ReHo coupling compared with CT- patients. Compared with CT(-) group, CT(+) group exhibited decreased CBF/ALFF ratio in the right middle temporal gyrus (MTG) and left middle frontal gyrus (MFG), and increased CBF/ALFF ratio in the left thalamus, left parahippocampal, right superior temporal gyrus (STG), and right MFG. CT(+) group showed lower CBF/ReHo ratios in right rolandic operculum, left precuneus, right superior occipital gyrus (SOG) and right inferior parietal lobule (IPL) and higher CBF-ReHo ratios in right MFG and left inferior frontal gyrus (IFG) than CT(-) group. MoCA scores and memory scores were negatively correlated with the CBF/ALFF ratio of the right MFG.

Conclusion: With multimodal neuroimaging analyses, our results reveal that chemotherapy can trigger neurovascular decoupling in lung cancer patients, which providing comprehensive insights into the neurological mechanism of chemotherapy-related cognitive impairment.

MRI - DWI HR - MRI 评估急性脑梗死患者相关高危斑块特征研究

郭帅
吉林大学第一医院

MRI - DWI HR - MRI 评估急性脑梗死患者相关高危斑块特征研究

目的: 研究磁共振 - 弥散加权成像 (MRI - DWI)、高分辨率磁共振 (HR - MRI) 评估急性脑梗死患者相关高危斑块特征。

方法: 选择 2022 年 3 月 - 2023 年 3 月我院收治的 43 例疑似急性脑梗死患者, 所有患者均在发病一周内进行 MRI - DWI、HR - MRI 检查, 分析与急性脑梗死相关斑块特征。结果: 最终确定急性脑梗死患者 26 例、短暂性脑缺血患者 21 例。MRI - DWI、HR - MRI 对脑梗死不同狭窄程度的检出率无明显差异 ($P > 0.05$); Kappa 检验中, MRI - DWI、HR - MRI 在脑梗死轻度、中度、重度狭窄的诊断上一致性较强 ($K > 0.5$)。脑梗死患者斑块主要位于腹侧壁、上侧壁, 脑梗死和脑缺血患者斑块分布无明显差异, 不具有统计学意义 ($P > 0.05$)。脑梗死患者 WAMN、斑块面积、斑块负荷百分比、狭窄率、正性重构、斑块表面不平整比例高于脑缺血患者, LAMN 低于脑缺血患者, 差异具有统计学意义 ($P < 0.05$)。结论: HR - MRI 检查可见急性脑梗死患者具有高危斑块特征, 主要表现为斑块负荷、狭窄率、正性重构、表面不光整占比更高。

基于血管壁高分辨率磁共振成像技术对 SICAS 卒中复发预测的机器学习研究

高宇¹、李子昂¹、韩琳¹、张健²、闫瑞芳¹、崔红凯¹
1. 新乡医学院第一附属医院
2. 新乡市中心医院

背景与目的: 颅内动脉硬化性狭窄是缺血性卒中最常见的病因, 是卒中高复发的原因之一, 卒中的复发与缺血性卒中的预后密切相关, 本研究旨在建立一种基于血管壁高分辨率磁共振成像技术的机器学习模型, 用于预测 SICAS 卒中的复发风险。

方法: 本研究回顾性随机收集 2020-2023 年间就诊于新乡医学院第一附属医院的 SICAS 卒中病人 180 例为研究对象, 收集相关影像学资料与临床资料并进行随访。将数据集按照 7:3 比例分为训练集和验证集。通过最小绝对值收缩和选择算子(LASSO)回归算法, 对训练集中收集的基线资料与实验室检查和 HR-VWI 扫描产生的影像学资料进行筛选, 最终将运用 5 种机器学习技术开发了卒中复发的预测模型, 包括逻辑回归模型(LR)、支持向量机(SVM)、高斯朴素贝叶斯(GaussianNB)、朴素贝叶斯(ComplementNB)和最近邻算法(kNN)。采用 SHAP 图为每个患者生成了可视化的解释。最后, 采用平均精确度、灵敏度、特异性、准确性、f1 评分、PR 曲线、校准曲线图和决策曲线分析对模型的有效性进行评价。

结果: LASSO 分析显示, “高血压病史”、“同型半胱氨酸值”、“NWI 值”、“狭窄率”、“斑块内出血”、“正性重构”以及“增强等级”是 SICAS 患者卒中复发独立危险因素。在 10 倍交叉验证中, 在 ROC 曲

线分析中, AUC 范围为 0.813~0.912。AUPRC 的范围为 0.655~0.833, GNB 模型预测 SICAS 卒中复发的能力最好。而斑块狭窄率以及斑块内出血对该模型的贡献最大。SHAP 分析提供了机器学习模型解释性, 展现了与 SICAS 卒中复发风险相关的重因素。

结论: 建立了一种精确的基于机器学习的 SICAS 卒中复发的预测模型, 以帮助临床工作者进行临床决策以及个体化治疗措施。

Whole-Brain Connectome of the Sensorimotor Cortex

Mei Yao,Xin Zhang,Jiu Chen,Bing Zhang
Nanjing Drum Tower Hospital

The mammalian neocortex mediates information processing through highly organized circuitry that contains various neuron types. Distinct populations of projection neurons in different cortical regions and layers make specific connections and participate in distinct physiological functions. Herein, with the precise whole-brain imaging and neural tracing, we dissected the comprehensive connectome of two types of glutamatergic pyramidal neurons in six subregions of the motor and sensory cortices. Analysis of the distribution of input neurons and projection terminals showed that the cortical circuits were organized in mixed patterns with topological preferences for anatomical location and circuit connections. The cortico-cortical, cortico-thalamic, and cortico-striatal connections were spatial location-dependent including transverse and longitudinal organizations. Morphological reconstruction and characterization of 655 neurons showed substantial diversity, which is greater in the motor cortex than that in the sensory cortex. Based on axon arborization, the intratelencephalic (IT) and pyramidal tract (PT) neurons could be grouped into various subtypes with obvious subregion and layer preferences. This study provides a cell-type basis for the anatomical organization of cortical sensorimotor circuits.

PU-1675

血管周围间隙与脑小血管病变的神经影像征象在特发性正常压力脑积水预测脑脊液分流术的预后价值

何文杰、夏军
深圳市第二人民医院

背景: 特发性正常压力脑积水(iNPH)患者中出现血管周围间隙扩大(EPVS)和脑小血管病变(SVD)的比例较高, 但其神经影像学指标与预后的关系尚不清楚。

研究目的: 探讨 EPVS 和 SVD 神经影像学指标对 iNPH 术后预后的预测价值。

方法: 本研究回顾性收集连续的 66 例接受分流手术的 iNPH 患者。获取 iNPH 患者术前 1 周内神经影像学指标评估: EPVS 定量指标、EPVS 视觉评分、白质高信号(WMH)、SVD 总评分、改良 SVD 总评分(mSVD)、脑萎缩及病变指数(BALI)。以术后 1 年改良 Rankin 量表(mRS)评分的改善情况作为 iNPH 中期预后主要终点, 以术后 2 年 mRS 评分的改善情况作为 iNPH 长期预后主要终点。本研究分别以我们应用 Mann-Whitney U 检验、受试者工作特征(ROC)和二元 logistic 回归模型分析上述神经影像学标志物在术后随访 1 年和 2 年的预测价值。

结果: 在 66 例 iNPH 患者中, 44 例(67%)是男性。行分流术时, iNPH 患者年龄为 70.2 ± 7.0 岁。在术后 1 年和 2 年随访时, iNPH 患者术后改善组和未改善组之间, 无论是 EPVS 定量指标、EPVS 视觉评分、WMH 体积、WMH 评分或 SVD 总评分均无显著差异。然而, 在 2 年的随访中, iNPH 患者术后改善组和非改善组在 BALI 和 mSVD 的主要和次要结局方面, 存在显著差异; mSVD 的 ROC 曲线 AUC 值为 0.708 (95%CI: 0.546 ~ 0.840 $P=0.009$), BALI 量表的 AUC 值为

0.807 (95%CI: 0.654 ~ 0.913 $P<0.001$); 对于 mSVD 评分和 BALI 量表进行校正后的优势比均显著 ($P=0.008$ 和 $P=0.045$)。

结论: 本研究所涉及的 EPVS 定量指标与 EPVS 视觉评分在预测 iNPH 患者分流术预后方面的能力有限。BALI 和 mSVD 可作为 iNPH 患者术后长期预后的生物标志物。

PU-1676

自动纤维定量法检测肌萎缩侧索硬化症脑白质纤维完整性改变的应用价值

朱默、徐芮

苏州大学附属第一医院

目的 通过自动纤维定量 (AFQ) 技术分析肌萎缩侧索硬化症 (ALS) 患者脑白质纤维完整性改变, 并探究其与支持向量机 (SVM) 方法联用识别 ALS 疾病的可行性。 **材料与方法** 收集 29 例 ALS 患者及相匹配的 29 例健康对照者 (HCs 组) 临床和 MR 资料, 使用 AFQ 软件包对所有被试的 DTI 数据进行分析, 追踪全脑 20 条白质纤维束, 每条纤维束分成 100 等份, 定量分析每个等份的各向异性分数 (FA) 及平均扩散系数 (MD)、径向弥散系数 (RD)、轴向扩散系数 (AD) 参数值, 运用偏相关分析 DTI 参数与临床特征的相关性, 同时提取两组被试的脑白质纤维差异值作为分类特征, 利用 SVM 区分 ALS 组和 HCs 组, 估算准确率及 ROC 值。 **结果** AFQ 结果表明, 与健康对照者相比, ALS 患者在左侧皮质脊髓束 FA 值及 AD 值降低, 左侧额枕下束及右侧上纵束 AD 值增高, 双侧皮质脊髓束 MD 值、RD 值增高, 且左侧皮质脊髓束平均 FA 值与修订版肌萎缩侧索硬化功能评分量表 (ALSFRS-R) 中的精细功能域得分呈正相关 ($r=0.386$, $P=0.046$), 右上纵束平均 AD 值与 ALSFRS-R 评分中的延髓功能域得分呈正相关 ($r=0.422$, $P=0.028$), 右侧皮质脊髓束平均 MD 值、RD 值均与爱丁堡 ALS 认知行为量表 (ECAS) 评分呈负相关 ($r=-0.428$, $P=0.026$; $r=-0.416$, $p=0.031$)。筛选出所有受损纤维束具有组间差异的节点作为特征值取得了较好的分类效果, 对 ALS 组和 HCs 组的鉴别准确率达 82%, 且受试者工作特征 (receiver operating characteristic, ROC) 曲线下面积 (area under curve, AUC) 值最大为 0.88。 **结论** ALS 患者的白质微结构损伤主要与皮质脊髓束有关, 基于 AFQ 分析检测的这些异常可作为一种有效的生物标志物, 与 SVM 方法联用能够提高 ALS 患者的诊断性评估。

PU-1677

Automated quantification of fiber bundles for amyotrophic lateral sclerosis Application value of the altered integrity of cerebral white matter fiber

Mo Zhu, Rui Xu

the first affiliated hospital of Soochow University

Abstract Objectiv: To analyze the changes of white matter fiber integrity in patients with amyotrophic lateral sclerosis (ALS) by automatic fiber quantification (AFQ) technology, and explore the feasibility of combining it with support vector machine (SVM) to identify ALS disease. **Materials and Methods:** Clinical and MR data of 29 patients with ALS (ALS group) and 29 matched healthy controls (HCs group) were collected. DTI data from all subjects were analyzed using the AFQ software package, and 20 white matter fiber bundles in the whole brain were tracked. Then each fiber bundle was divided into 100 equal parts to acquire quantitative parameter values such as fraction anisotropy (FA)、mean diffusion (MD)、radial diffusion (RD) and axial diffusion (AD). Partial correlation was further used to explore the relationships between

DTI parameters and clinical characteristics .The brain white matter fiber difference values of the two subjects were also extracted as classification features. SVM was used to distinguish the ALS and HCs groups and estimated accuracy rates and the ROC values. Results: The AFQ results showed that,compared with the healthy controls,the ALS patients had decreased FA values and AD values in the left corticospinal tract, higher AD values in the left inferior fronto-occipital fasciculus and the right superior longitudinal fasciculus, higher MD and RD values of the bilateral corticospinal tract.The average FA value of the left corticospinal tract was positively correlated with ALSFRS-R fine functional domain score ($r=0.386$, $P=0.046$) and the average AD value of the right superior longitudinal fasciculus was positively correlated with ALSFRS-R bulbar functional domain score ($r=0.422$, $P=0.028$). Both the average MD and RD values of the right corticospinal tract were negatively associated with the ECAS score ($r=-0.428$, $P=0.026$; $r=-0.416$, $p=0.031$). All the selected nodes with inter-group differences in damaged fiber tracts were used as feature values to achieve a good classification effect. The identification accuracy rate for the ALS and HCs groups was 82%, and the area under the ROC curve (AUC) value was 0.88. Conclusions: The white matter microarchitectural damage in ALS is mainly related to the corticospinal tract, and these abnormalities detected by AFQ analysis can be used as a valid biomarker, which can improve the diagnostic evaluation of ALS patients when combined with the SVM method.

PU-1678

脑小血管病 NODDI 参数与认知功能相关性研究

朱默¹、王宁²

1. 苏州大学附属第一医院

2. 江苏省常熟市第二人民医院

目的：探讨脑小血管病神经突方向离散度和密度成像的参数与认知功能相关性，并评估其参数与 MMSE、MoCa 量表评分的相关性。

材料与方法：前瞻性收集 59 例脑小血管病（cerebral small vessel disease, CSVD）患者，其中 30 例为 CSVD 无认知功能障碍患者，29 例为 CSVD 认知功能障碍患者。所有患者均测试简易智力状态检查量表（Mini mental state examination, MMSE）和蒙特利尔认知评估量表（Montreal cognitive assessment, MoCa）。所有患者均扫描 T1 加权序列、T2 加权序列、弥散加权序列、磁共振血管造影、磁敏感加权序列以及高分辨 T1 加权序列和神经突方向离散度和密度成像（Neurite orientation dispersion and density imaging, NODDI）序列。基于虚拟机内的 FSL 进行图像预处理。基于 MATLAB 的 NODDI 开源工具箱上计算 ODI、NDI 和 FISO 参数。基于 JHU ICBM-DTI-81 White-Matter Labels 脑图谱，计算 NODDI 参数的重要白质纤维集群。基于 TBSS 分析 NODDI 参数与脑小血管病认知功能相关性。基于 spearman 分析每个重要白质纤维集群的参数值与 MMSE 和 MoCa 评分的相关性。

结果：（1）TBSS 分析发现两组患者的 FA 和 NDI 参数值具有统计学差异。（2）基于 JHU-White Matter-labels 脑图谱，发现 CSVD 认知功能障碍组的 FA 参数有三个重要白质纤维集群（左侧大脑脚、小脑中脚及右侧大脑脚），NDI 参数有四个重要白质纤维集群（右后放射冠、左上放射冠 1、左上放射冠 2 及左后放射冠）。（3）左侧大脑脚和小脑中脚与 MMSE 和 MoCa 评分具有正相关。右后放射冠、左上放射冠 1 和左上放射冠 2 与 MMSE 和 MoCa 评分具有正相关。

结论：放射冠区域神经突密度降低发生在 CSVD 疾病临床痴呆发展之前，NDI 参数在 CSVD 认知功能障碍疾病中可作为临床辅助诊断的定量生理指标。

PU-1679

淀粉样脑小血管病与非淀粉样脑小血管病患者影像标志物的量化比较研究

卢春强

东南大学附属中大医院

目的：探究淀粉样脑小血管病与非淀粉样脑小血管病患者的小血管病影像特征差异及分组标准。方法：本研究收集 351 例东南大学附属中大医院 2012-2022 年进行头颅 MR 及 SWI 扫描的患者图像，对脑小血管病患者的不同影像维度特征进行定量或分级，并按影像表现将患者分为淀粉样脑小血管病组（CAA 组）、高血压脑小血管病组（HA 组）及混合型脑小血管病组（Mixed 组），同时比较组间不同维度影像特征的差异。结果：结果显示三组患者在微出血灶计数（ $H=106.34$, $P<0.001$ ）、半卵圆中心层面腔隙计数（ $H=34.38$, $P<0.001$ ）、基底节层面腔隙计数（ $H=23.82$, $P<0.001$ ）、基底节层面扩张血管周围间隙（EPVS）分级（ $H=19.64$, $P<0.001$ ）及白质病变体积（ $F=16.264$, $P<0.001$ ）有显著差异，两两比较结果提示 Mixed 组患者在以上指标比其余两组或 CAA 组显著增高。另外，高血压脑小血管病患者的脑出血发生率（ $\chi^2=7.659$, $P=0.006$ ）及近期皮质下小梗死发生率（ $\chi^2=4.660$, $P=0.031$ ）较 CAA 组患者显著增高。回归分析显示，白质病变体积与微出血灶计数（ $t=4.216$, $P<0.001$ ）及基底节区 EPVS 分级（ $t=2.616$, $P=0.01$ ）存在独立相关。结论：研究结果提示，按影像表现分组的脑小血管病患者具有不同的临床影像表型和卒中风险，非淀粉样脑小血管病的诊断标准仍需要进一步研究探讨。

PU-1680

多参数 MRI 影像组学模型在胶质瘤术前分级中的应用研究

刘书涵

四川大学华西厦门医院

目的：探讨多参数 MRI 影像组学模型在胶质瘤术前分级中的诊断价值，并寻找最佳模型及最优序列。

方法：回顾性分析本院病理诊断为胶质瘤的 208 例患者资料，对磁共振图像（T1WI、T2WI、T2-FLAIR、CE-T1WI、CE-T2-FLAIR）的肿瘤区域提取影像组学特征，使用 Mann-Whitney U 检验、递归特征消除法及 5 折交叉验证的 LASSO 算法筛选，建立 8 种机器学习模型（SVM、KNN、DT、GNB、RF、XGBoost、LightGBM 及 LR）。绘制 ROC 曲线，通过 AUC 评价模型稳健性，通过准确度评价模型准确性。最后，本院三位放射科医师独立诊断胶质瘤分级，并与之对比。

结果：①单参数模型：在单序列参数构建机器学习模型中，诊断效能最佳的模型为 XGBoost（T1WI、T2-FLAIR、CE-T1WI、CE-T2-FLAIR，4/5）和 LightGBM（T2WI，1/5）。最具有诊断价值的序列为 CE-T2-FLAIR（AUC 0.93，准确度 0.83）；②多参数模型：在联合序列构建模型中，诊断效能最佳的模型为 RF（AUC 0.97，准确度 0.95）；多参数 RF 模型诊断效能显著高于单参数 XGBoost、LightGBM 模型，且联合序列模型的平均效能（AUC 0.89，准确度 0.83）也高于单序列参数模型（AUC 0.72~0.84，准确度 0.69~0.77）；③放射科医师阅片：三位医师平均准确度、平均敏感度均低于模型相应指标的平均值（0.80 vs 0.83，0.80 vs 0.90），但平均特异度要高于模型平均值（0.82 vs 0.70）；医师 1 在本次阅片中表现最佳，其准确度高于模型平均准确度（0.86 vs 0.83），但明显低于多参数模型中诊断效能最高的 RF（0.86 vs 0.95）。

结论：多参数 MRI 影像组学模型在胶质瘤术前分级中具有较高的诊断预测价值，且优于单参数影像组学模型，优于放射科医师独立诊断。单参数模型中诊断效能最佳的模型为 XGBoost 和 LightGBM，最佳序列为 CE-T2-FLAIR；多参数模型中诊断效能最佳的模型为 RF。

PU-1681

基于脑白质高信号 Fazekas 评分的 ASL 灌注差异研究李燕^{1,2}、罗时磊^{1,2}、李爱娟^{1,2}、刘佳^{1,2}、杜小文^{1,2}、洪征宇^{1,2}、李小虎¹、余永强¹

1. 安徽医科大学第一附属医院

2. 安徽省公共卫生临床中心 (安徽省传染病医院)

目的 探讨基于脑白质高信号 Fazekas 量表评分分组的大脑小血管病患者脑白质 ASL 灌注差异性。

方法 回顾性分析大脑小血管病患者脑磁共振图像 107 例, 年龄: 50~84 岁(66.89±9.188), 男性 63 例, 女性 44 例, 排除标准: 头颈部动脉大血管狭窄>50%。基于脑白质高信号 Fazekas 量表评分进行分组 (组 1: Fazekas<3 分; 组 2: Fazekas≥3 分, 无深部白质高信号≥3 分和室周白质高信号≥3 分; 组 3: Fazekas≥3 分, 深部白质高信号≥3 分或/和室周白质高信号≥3 分), 取两两对称的四个感兴趣区进行 ASL CBF 测量 (右侧半卵圆中心 (ROI1)、左侧半卵圆中心 (ROI2)、右侧侧脑室体部旁 (ROI3)、左侧侧脑室体部旁 (ROI4)), 取均值, 比较 3 组脑白质 ASL 灌注有无统计学差异。结果 ASL 灌注 CBF 值分别为, 组 1 (44 例): 8.27~19.30 ml/100g/min (14.38±2.55), 组 2 (18 例): 10.10~18.13 ml/100g/min (13.71±2.48), 组 3 (45 例): 3.38~15.55 ml/100g/min (8.37±2.97)。使用 SPSS19.0 软件单因素方差分析比较均值, 方差齐性检验 $p=0.403$, 组间比较 $p<0.001$ 差异有显著性, LSD 多重比较, 组 1 与组 2 $p=0.381$, 组 1 与组 3 $p<0.001$, 组 2 与组 3 $p<0.001$, 组 3 的 ASL 灌注 CBF 值较组 1 和组 2 明显减低 (p 均 <0.05)。

结论 基于脑白质高信号 Fazekas 量表评分的脑小血管病患者脑白质 ASL 灌注具有差异性, 深部白质高信号≥3 分或/和室周白质高信号≥3 分时灌注明显减低。

PU-1682

利用临床-影像组学模型鉴别诊断生长激素缺乏和特发性矮小患者

田诗云

大连医科大学附属第一医院

Objective: Based on NCE/CE MR T1WI images, we try to develop a clinical-radiomics model and validate its predictive capacity to identify GHD and ISS.

Methods: The 102 patients diagnosed as growth retardation. The patients were divided into GHD ($n=74$) and ISS ($n=28$).

RESULTS: The AUCs of the Clinical-T1WI, Clinical-CE-T1WI and Combine radiomics models were 0.726 (95% CI: 0.585, 0.867), 0.842 (95% CI: 0.742, 0.942), and 0.846 (95% CI: 0.746, 0.945) in the training set, respectively, which were confirmed in the test set by AUCs of 0.596 (95% CI: 0.371, 0.820), 0.616 (95% CI: 0.403, 0.828), and 0.651 (95% CI: 0.435, 0.867), respectively.

CONCLUSIONS: The MRI-based radiomics model can be helpful to distinguish GHD and ISS, and combined with clinical features, which can improve diagnostic accuracy on MRI provides histological information for pituitary without abnormality.

synovial sarcoma in the prevertebral space can mimic malignant neurogenic neoplasm: case report and literature review

Yi Guo¹, chong lin¹, xiao-xia li¹, jian-jun zhou^{1,2,3}, jian Wang²

1. Department of Radiology, Zhongshan Hospital (Xiamen), Fudan University, Fujian province, China

2. Department of Radiology, Zhongshan Hospital, Fudan University, Shanghai, China

3. Xiamen Municipal Clinical Research Center for Medical Imaging, Fujian province, China

Synovial sarcoma, a rare malignant neoplasm with a poor prognosis, accounts for approximately 5%-10% of all primary soft-tissue malignancies worldwide. Typically affecting adolescents and young adults, it primarily manifests near the joints of the lower extremities. This study aimed to demonstrate that this tumor can also affect the prevertebral space. A 32-year-old male patient presented at our outpatient clinic with a 2-month history of upper limb numbness and a 1-month complaint of a palpable neck mass. Imaging studies revealed a bulky, lobulated, and heterogeneous mass exhibiting heterogeneous enhancement. Furthermore, the mass caused expansion of the neuroforamen in the neck, initially suggesting a diagnosis of malignant schwannoma. However, a histopathologic examination suggested synovial sarcoma. The article provided a comprehensive review of the clinical, pathological, and radiological features of this condition. Additionally, it explored current treatment options and prognoses by referencing relevant literature.

不同剂量急性饮酒对健康人群认知功能影响及扩散峰度成像 (DKI) 的研究

谭慧

武汉大学人民医院

目的: 研究不同剂量急性饮酒对健康人群认知功能的影响及其与脑白质微观结构扩散峰度成像 (DKI) 改变的相关性。

方法: 选取 25 名健康志愿者随机摄入不同剂量白酒, 分别于饮酒开始之前, 饮酒后 30 及 60min 完成一系列神经心理学测试量表以及常规 MRI、DKI 扫描。量表包括蒙特利尔认知量表(MoCA)、数字广度测验(DST)及语音流畅试验 (PFT)。根据饮酒后 30min 血液酒精浓度(BAC)分组。测量

感兴趣区内(额叶、颞叶、半卵圆中心、胼胝体膝、压部及小脑中脚)DKI 参数值,并与不同浓度组饮酒前、后神经心理学量表评分进行相关性研究。

结果: 1.不同浓度组饮酒前、后认知功能总体评分 MoCA 及 DST 总分未见明显差异;饮酒后 30 及 60min DST 逆序分及 PFT 评分明显降低,且高浓度组降低更明显;饮酒后 60min DST、PFT 评分与酒后 30min 未见明显差异。 2.饮酒后 30min 额、颞叶和胼胝体膝部 FA 值明显升高;BAC 与额、颞叶 FA 值呈正相关。饮酒后 60 与 30min 相比,额叶 FA 值升高,且高浓度组升高显著。饮酒后 30min 额叶和小脑中脚 MD 值较饮酒前明显下降,其中,高浓度组下降最显著;饮酒后 60 与 30min 之间各感兴趣区内 MD 值差异无明显统计学意义。饮酒后 30min 额、颞叶和胼胝体膝部 MK 值较饮酒前明显升高,不同浓度组间 MK 值无明显差异;饮酒后 60 与 30min 相比,中等浓度组额叶 MK 值明显升高,高浓度组额叶和颞叶 MK 值明显升高。

3.饮酒后 30min 额叶 MK 值与 PFT 评分呈负相关,颞叶 MK 值与 DST 总分及 DST 逆序评分呈负相关,FA 及 MD 值与神经心理学量表评分无明显相关性。

结论: 1.饮酒后会引引起记忆力、注意力及执行功能等认知功能损害,且具有剂量相关性。2.DKI 能敏感检测出饮酒后脑白质微观结构的变化,其中,MK 值较 FA、MD 值更敏感。3.饮酒后额、颞叶 MK 值与量表评分具有显著相关性。

特鲁索综合征 1 例

何昕

吉林大学第一医院

患者女性,35 岁。

主诉:确诊肺癌 2 年余。

现病史:患者 2 年前因胸痛在我院就诊,行胸腔镜检查取活检,病理回报腺癌,诊断:左肺腺癌 IVA 期(cT1cN0M1a),行基因检测示 EGFR19 外显子缺失突变,口服吉非替尼靶向药物治疗,于 2019-05-29 已规律行一线 5 疗程培美曲塞 d1+ 奈达铂 d1 化疗及 13 疗程培美曲塞 d1 维持化疗,2020-08-17 抽血复查基因检测仍示 EGFR 19 外显子缺失突变,继续应用吉非替尼靶向治疗。2020-10-14 行大评估入院,见左乳新发肿块,乳腺及腋窝淋巴结活检病理回报:转移性肺腺癌,评估病变进展,予更换为阿法替尼靶向治疗。2021-05-19 入院评估后行乳腺彩超提示结节较前增大,病情不稳定,更换为奥希替尼治疗,于 2021-06-21 入院,于 2021-06-21 入院评估病变进展,腹腔积液,于 2021-06-25 腹腔内恩度靶向药物治疗,出院后于 07-13 口服奥希替尼+安罗替尼治疗,于 2021-08-09 为行大评估入院,完善相关检查,部分病变较前缓解。患者上次出院至今,仍有乳房、腋窝疼痛,伴有腹痛、腹胀。近 1 周,左侧胸痛明显,伴周身痛,无法平卧,无发热、咳嗽、咳痰等。既往史:1 个月前于我院诊断“腹膜炎、低蛋白血症、营养不良”,“左侧乳腺及腋窝淋巴结 125 碘植入止痛治疗”。否认“高血压、糖尿病、冠心病”等,慢性病病史,否认药物、食物过敏史。

实验室检查

血常规:白细胞 9.67 10E9/L、中性粒细胞百分率 90.9 %、中性粒细胞绝对值 8.79 10E9/L、血红蛋白 79 g/L,血小板计数 96 10E9/L。DIC 全套:凝血酶原时间 16.3 秒、国际标准化比值 1.40、活化部分凝血活酶时间 44.1 秒、D-二聚体 79.11 μg/ml、纤维蛋白(原)降解物 115.45 μg/ml,降钙素原 1.040 ng/ml。

PU-1687

CT 灌注缺损体积对于急性孤立性脑干梗死的价值

陈鹏军、陈涛、卢陈英、夏水伟、纪建松
丽水市中心医院

目的：由于临床症状多变且无明显特异性，同时，受限于较差的空间分辨率和颅底骨质伪影使得常规 CT 平扫价值有限，急性孤立性脑干梗死的诊断极具挑战。文献表明 CT 灌注 (CTP) 参数与后循环急性缺血性卒中的功能预后显著相关，然而，CTP 在孤立性脑干梗死中的作用尚不清楚。我们旨在确定 CTP 参数在预测急性孤立性脑干梗死患者功能预后方面的价值。

方法：回顾性分析 2018 年 1 月至 2022 年 3 月本院连续收治的 116 例经 MRI 随访的孤立性桥脑/中脑 CT 灌注缺损患者。定量测量所有灌注图上的灌注缺损体积和 MRI 上的最终梗死体积(FIV)。基于以往的研究结果，发病 90 天改良 Rankin 量表评分 0 和 1 定义为功能预后“良好”。统计分析包括单变量和多变量回归分析、二元逻辑回归和受试者工作特征(ROC)分析。

结果：113 例患者在随访 MRI 上确诊为孤立性脑桥/中脑梗死。发病至扫描时间、CT 平扫阳性、入院时美国国立卫生研究院卒中量表 (NIHSS) 评分和所有 CTP 图上的灌注缺损体积与 FIV 显著相关 ($P<0.05$)。在多变量线性回归模型中，校正了年龄、性别、NIHSS 评分、发病至扫描时间和 CT 平扫阳性，灌注缺损体积仍然与 FIV 显著相关 ($P<0.05$)。在二元逻辑回归分析中，所有 CTP 图上的灌注缺损体积仍然是良好功能预后的独立预测因子。在 ROC 分析中，脑血流量缺损体积的鉴别值略高，曲线下面积最大为 0.683 [95% CI, 0.587-0.780], $P=0.001$ 。

结论：CT 灌注缺损体积能反映急性孤立性脑干梗死患者的 FIV，并且对于患者功能预后有一定的预测价值。

PU-1688

基线炎性指标对椎基底动脉闭塞患者临床结局的影响

王燕楠、白博锋、黄珊珊、宁聪、雷威、席小依、李永斌
西安市第一医院

目的：探讨接受血管内治疗的急性椎基底动脉闭塞患者入院炎性指标对其临床结局的影响。

方法：采用回顾性研究，连续收集本院 (2021 年 7 月至 2023 年 4 月) 急性 (24 小时内) 椎基底动脉闭塞 (VBAO) 并接受血管内治疗 (EVT) 的患者。入院行 DWI 扫描，采用急性卒中预后早期 CT 评分 (pc-ASPECT) 评估患者后循环梗死情况，收集患者临床基本特征、病史、血脂及全身炎性指标 (白细胞、血小板、单核细胞、淋巴细胞、中性粒细胞及嗜酸性粒细胞) 等数据，评估患者基线 NIHSS 评分。将 90 天改良 Rankin 量表评分 (mRS) 0-3 分定义为良好结果，4-6 分定义为不良结果；mRS 0-2 分定义为功能独立组，3-6 分定义为恶化组。

结果：共 73 例患者符合条件。良好组与不良组之间淋巴细胞、中性粒细胞与淋巴细胞比值 (NLR)、血小板与淋巴细胞比值 (PLR)、pc-ASPECT 评分及基线 NIHSS 评分有统计学意义。淋巴细胞与单核细胞比值 (LMR) 在功能独立组与恶化组间存在统计学差异。单因素回归分析显示，NLR 是 90 天不良结果的预测因素。

结论：基线炎性指标，尤其是 NLR 对接受血管内治疗的急性椎基底动脉闭塞患者 90 天临床结果有影响。

PU-1689

Altered white-matter functional network in patients with type 2 diabetic retinopathy : Potential effect on cognitive function

Guiqin Chen, Haifeng Ran, Jie Hu, Tijiang Zhang
the Affiliated Hospital of Zunyi Medical University

Purpose: The brain structure damage of diabetic retinopathy (DR) patients is closely related to the occurrence of cognitive impairment, and the brain structure damage is usually accompanied by changes in brain functional activities. The alterations of white matter (WM) functional network in DR remain unclear. We aimed to explore the topological characteristics changes of WM functional network and its potential clinical value in cognitive function.

Method: A total of 44 subjects (24 DR and 20 normal controls) were included in this study. The age, sex and education level of the two groups were matched, and all the functional and structural magnetic resonance imaging data were acquired. On the day of scanning, the scores of mini-mental state examination (MMSE) and Montreal Cognitive Assessment (MOCA) were evaluated, and the clinical data such as course of disease, fasting blood glucose and blood pressure were collected. Divide 3D-T1WI to extract white matter and build a group level template, define the group level template nodes by clustering method, use the defined nodes to extract resting blood oxygen level-dependent signals to build a white matter functional network, carry out the inter-group double-sample T-test of global network and node network indicators (FDR correction, $P < 0.05$), use the templates of 12 white matter functional networks to define the functional partition of white matter node network indicators, and analyze the correlation between network indicators and clinical variables with significant differences by Spearman correlation. Multiple comparisons were corrected using the Bonferroni method ($P < 0.05/6 = 0.0083$).

Results: Both DR group and normal control group have small-world properties. Compared with control group, the WM functional network exhibited decreased clustering coefficient ($P=0.012$) and small-world property value ($P=0.040$), and local efficiency is decreased ($P=0.008$). At the node level, 62 node presented nodal disturbances in WM functional network (degree centrality, node clustering coefficient, nodal efficiency and nodal local efficiency) (FDR corrected, $P < 0.05$), the degree centrality decreased in the superior longitudinal fasciculus, but increased in the middle cerebellar peduncle and corticospinal tract. The nodal efficiency increased in the inferior longitudinal fasciculus, middle cerebellar peduncle, arcuate fasciculus and corticospinal tract. The nodal local efficiency decreased in superior longitudinal fasciculus, middle longitudinal fasciculus and uncinate fasciculus; the node clustering coefficient decreased in the superior longitudinal fasciculus, frontal aslant tract, middle longitudinal fasciculus, arcuate fasciculus, corticospinal tract and uncinate fasciculus. The node clustering coefficient of arcuate fasciculus is negatively correlated with MoCA ($r=-0.534$, $P=0.007$), the node clustering coefficient of frontal aslant tract is negatively correlated with MMSE ($r=-0.547$, $P=0.006$), and the node clustering coefficient of middle longitudinal fasciculus is negatively correlated with blood sugar ($r=-0.530$, $P=0.008$). The nodal local efficiency of inferior longitudinal fasciculus is negatively correlated with MMSE ($r=-0.545$, $P=0.006$).

Conclusion: Our study demonstrated that the WM functional network topological properties changes in DR patients, which were associated with cognitive function and blood sugar, which improves the understanding of the pathophysiological mechanism of DR and provides potential imaging biomarkers of cognitive impairment of DR patients.

PU-1690

静息态 fMRI 在亚急性期卒中后失语症康复治疗中的应用

蔡璐璐、张超
徐州医科大学附属医院

目的：研究亚急性期卒中后失语症（PSA）患者康复治疗前后局部脑区活动的差异，探讨 PSA 患者康复治疗前后的脑功能区变化情况及语言重塑相关机制。

方法：根据 PSA 纳入标准，选取我院康复科确诊 PSA 的 14 例患者，其中男性 8 例，女性 6 例，平均年龄 46.93 ± 10.57 岁。亚急性期 PSA 患者经过我院康复科系统语言康复治疗（包括系统康复治疗及药物治疗）1 个月，所有 PSA 患者治疗前后经临床全面评估，并利用西方失语症成套测验（WAB）对患者治疗前后进行语言能力测评。利用 3.0T 超导型磁共振扫描仪，采集治疗前后患者静息态及高清结构脑影像学数据。采用 DPARSF 软件对数据进行预处理，包括时间校正、头动校正、空间标准化、消除线性趋势、消除低频漂移及高频噪声，随后进行标准化低频振幅（zALFF）的分析。利用配对样本 t 检验比较 PSA 治疗前后患者的 zALFF（ $P < 0.05$ ，FDR 校正），并利用 Pearson 相关分析，将 zALFF 与临床语言各项评分逐一进行相关性分析， $P < 0.05$ 具有统计学意义。

结果：通过配对样本 t 检验发现 PSA 治疗前后组在额下回的眶部、三角部和岛盖部处 zALFF 值增高，提示 PSA 患者在康复治疗以上脑区得到激活，在失语恢复期这些功能脑区神经元活性增高，可能对语言的恢复起一定的代偿作用。此外，直回（ $P = 0.01$ ）及额下三角回（ $P = 0.006$ ）zALFF 值与理解能力评分治疗前后差值具有显著相关性，提示直回及额下三角回 zALFF 能够预测理解能力评分变化值。

结论：fMRI 对于 PSA 患者康复治疗疗效具有预测价值。亚急性期 PSA 患者语言功能恢复患者主要依赖病灶周围组织的代偿，病灶周围自发脑活动能够预测患者理解能力恢复程度。

PU-1691

Altered orbitofrontal and pars opercularis cortical thickness in Betel Quid Dependence Chewers

Lili Fu
Hainan general hospital

Objective: This study aimed to examine the morphological changes in the cerebral cortex of betel quid dependence (BQD) chewers using the surface-based morphometry (SBM) method.

Methods: High spatial resolution three-dimensional T1-weighted structural imaging data were collected from 53 individuals with BQD and 37 healthy controls (HCs) who were matched to BQD individuals in terms of age, gender and educational level. The SBM method was applied to analyze the cortical thickness alterations in BQD-related areas. Independent samples t-test was used to assess the cortical thickness difference between the two groups. Pearson correlation analysis was used to investigate the correlation between cortical thickness changes and clinical characteristics, including BQD scale scores, and duration of BQD.

Results: The BQD group had higher cortical thickness than HC group in two clusters, located at lateral orbitofrontal ($t = 4.703$, $P = 0.0028$) and pars opercularis ($t = 3.602$, $P = 0.0403$) of the right cerebral hemisphere, with age, gender and education duration as covariates ($P < 0.05$, AlphaSim corrected). While there were no significant differences in age, gender- and education duration-adjusted cortical thickness of the left cerebral hemisphere between BQD chewers when compared to HCs ($P > 0.05$, AlphaSim corrected). Correlation analysis revealed that the cortical thickness of the right pars opercularis was negatively correlated with the duration of BQD ($r = -0.274$, $P = 0.047$). The cortical thickness of the right lateral orbitofrontal was not significantly correlated with BQDS or BQD duration ($P > 0.05$).

Conclusion: The present study demonstrated that betel quid dependence might be linked to changes in the reward system's cortical thickness, which may be related to the neurobiological basis of BQD.

PU-1692

早醒型失眠障碍患者大脑区域活动和脑血流的特征：一项静息态功能磁共振成像研究

杨金志、董洋、曹裕海
大连医科大学附属第二医院

目的利用基于静息态功能磁共振成像 (rs-fMRI) 局部一致性 (ReHo)、低频波动振幅 (ALFF) 和三维动脉自旋标记 (3D-ASL) 研究早醒型失眠障碍患者脑活动和脑血流灌注变化, 并分析其与失眠严重程度和情绪障碍的相关性。方法 34 名早醒型失眠障碍患者和 12 名性别和年龄匹配的健康对照者接受 rs-fMRI、3D-ASL 检查, 并完成匹兹堡睡眠质量指数量表 (PSQI)、汉密尔顿抑郁 (HAMD) 和焦虑 (HAMA) 量表。计算 ALFF、ReHo 和 CBF 值, 并用双样本 t 检验比较组间差异。在 ALFF、ReHo 和 CBF 值与临床量表评分间进行相关性分析。结果与健康对照组相比, 早醒型失眠障碍患者左侧颞中回和左侧颞下回 ReHo 值降低, 左侧岛盖部额下回 ReHo 值升高 ($P<0.05$)。左侧颞中回的 ReHo 值与 HAMA 评分呈正相关 ($r=0.504$, $P=0.024$)。详见表 1、图 1 和图 2。双侧楔前回、左侧颞中回和左侧角回 ALFF 值降低 ($P<0.05$)。详见表 2 和图 3。早醒型失眠障碍患者右侧小脑前叶、右侧小脑后叶、小脑扁桃体、双侧小脑下部、右侧颞中回、右侧梭状回、左侧海马、胼胝体、右侧尾状核、右侧三角部额下回、右侧额叶、右侧内和旁扣带脑回、右侧楔前叶 CBF 值增加 ($P<0.05$)。右侧额叶和右侧楔前叶的 CBF 值与 PSQI 评分呈正相关 ($r=0.341$, $P=0.048$; $r=0.418$, $P=0.014$)。右侧小脑前叶和左侧海马与 HAMA 评分呈正相关 ($r=0.432$, $P=0.011$; $r=0.513$, $P=0.002$)。左侧海马和右侧梭状回与 HAMD 评分呈正相关 ($r=0.358$, $P=0.038$; $r=0.354$, $P=0.040$)。详见表 3、图 4 和图 5。

结论 本研究证实了早醒型失眠障碍对患者的广泛影响, 可为脑活动和脑血管灌注机制研究提供信息。

PU-1693

CTPI 在对缺血性脑血管病患者脑血流动力学评估中的临床价值

朱友义
青海省心血管病专科医院

目的:探究 CT 灌注成像 (CT perfusion imaging, CTPI) 在对缺血性脑血管疾病 (ischemic cerebrovascular disease, ICVD) 患者脑血流动力学评估中的临床价值。方法:选择 140 例 ICVD 患者, 患者均行脑 CTPI 检查, 获取异常灌注区健侧与患侧的脑血流动力学参数[脑血容量 (cerebral blood volume, CBV)、脑血流量 (cerebral blood flow, CBF)、平均通过时间 (mean transit time, MTT)、达峰时间 (time to peak, TTP)], 并计算两侧大大脑半球感兴趣区灌注参数相对值 ($rCBF$ 、 $rCBV$ 、 $rMTT$ 、 $rTTP$ 、 $rCBV - rCBF$)。结果: 短暂性脑缺血发作 (transient ischemic attack, TIA) 患者异常灌注区所在患侧的 MTT、TTP 水平高于健侧 ($P<0.05$), CBF 水平低于健侧 ($P<0.05$), CBV 水平与健侧差异无统计学意义 ($P>0.05$); 脑梗死 (cerebra

l infarction, CI) 患者异常灌注区所在患侧的 MTT、TTP 水平高于健侧 ($P < 0.05$), CBF、CBV 水平低于健侧 ($P < 0.05$)。CI 患者异常灌注区所在健侧或患侧的 MTT、TTP 水平均对应高于 TIA 患者, CBF、CBV 水平均对应低于 TIA 患者 ($P < 0.05$); CI 患者 rMTT、rCBF、rCBV、rCBV-rCBF 水平均低于 TIA 患者 ($P < 0.05$), rTTP 水平与 TIA 患者比较差异无统计学意义 ($P > 0.05$); CI 患者 NIHSS 评分 ≥ 5 分的比例高于 TIA 患者 ($P < 0.05$)。结论: TIA 患者与 CI 患者 CPTI 脑血流动力学均存在异常变化, CI 患者脑储备能力损害、神经功能损伤较 CI 患者更严重, CTPI 可用于缺血性脑血管疾病中提供有效的血流动力学信息, 有助于病情评估。

PU-1694

应用高分辨率磁共振血管壁成像对比研究平原及高原人前循环动脉粥样硬化特征

杨林^{1,4}、张永海¹、郑卓肇²、史纲¹、李睿³、王润强¹

1. 青海省第五人民医院放射科

2. 北京清华长庚医院放射科

3. 清华大学生物医学影像研究中心

4. 资阳市人民医院放射科

目的: 应用 3.0T 高分辨率磁共振血管壁成像 (High resolution magnetic resonance vascular wall imaging, HRMR-VWI) 比较高原 (西宁: 平均海拔 2261 米) 和平原 (北京: 平均海拔 43.5 米) 汉族动脉粥样硬化性脑梗死患者的前循环 (大脑中 / 前动脉) 斑块特征, 探讨高原环境对颅内动脉粥样硬化的影响。

方法: 按纳入标准前瞻性收集西宁 (青海省第五人民医院、青海省人民医院) 和北京 (北京清华长庚医院) 前循环 (大脑中 M1-M2 段/前 A1-A2 段) 中-重度狭窄的动脉粥样硬化性脑梗死住院患者各 30 例。采集相关临床资料, 并于发病 3 周内完成 HRMR-VWI 检查。对比分析两组患者责任斑块的 HRMR-VWI 特征, 并结合临床指标探讨其可能的影响机制。

结果: ①导致动脉粥样硬化的高危因素中, 血压: 高原组收缩压低于平原组 ($P < 0.05$); 血糖: 高原组空腹血糖水平低于平原组 ($P < 0.05$); 余血脂、同型半胱氨酸、吸烟情况在高原组与平原组间差异无统计学意义 ($P > 0.05$); ②红细胞计数、血红蛋白含量和红细胞压积高原组高于平原组, 差异均有统计学意义 ($P < 0.05$); ③高原组脑梗死责任血管狭窄程度和斑块负荷均低于平原组, 差异有统计学意义 ($P < 0.05$); ④责任斑块成分分析: 斑块信号强度的直方图变异系数值、斑块-壁对比度值和 T1 加权图像高信号, 高原组与平原组差异均无统计学意义 ($P > 0.05$); ⑤血管重构模式和重构指数值、斑块形态和分布, 高原组与平原组差异均无统计学意义 ($P > 0.05$)。结论: 高原汉族前循环动脉粥样硬化性脑梗死患者责任血管的狭窄程度和斑块负荷比平原组小; 斑块成分、形态和分布, 血管重构模式和重构指数值两组间无差异, 提示高原环境可能会延缓颅内动脉粥样硬化斑块的生长。

PU-1695

一例急诊 CT 遇到的罕见儿童中枢系统疾病——急性坏死性脑病

王继华、王玉辉

华中科技大学同济医学院附属协和医院

目的：介绍一例罕见的儿童急性坏死性脑病（ANE），增强对急性坏死性脑病的认识，进而有助于急诊及时诊断这一危重疾病，改进患儿的预后；**方法：**一例 4 岁男童，因主诉“发热 1 天，惊厥 1 次”入院，入院对症治疗后仍然反复出现发热、惊厥并意识状态进行性恶化，次日昏迷、DIC、休克，入院首日行急诊 CT 检查。**结果：**急诊 CT 显示“双侧丘脑、大脑脚、中脑、脑桥对称性低密度影”，患儿发热后一天内急性进展，脑脊液（CSF）细胞数量无明显增多，CSF 蛋白增高，血清转氨酶增高，血氨正常，常规病原学检查均为阴性；结合上述特征性影像学表现及临床资料，多学科会诊诊断为急性坏死性脑病。**结论：**对于出现累及丘脑的多灶性、对称性病灶的特征性影像学表现，且有发热、意识障碍临床表现的患儿，需高度警惕急性坏死性脑病这一罕见疾病，结合实验室检查结果给予及时、明确诊断。

PU-1696

2 型糖尿病海马血管周围间隙扩大与情景记忆的相关性研究

高洁¹、潘佩纯²、张东升¹、汤敏¹、雷晓燕¹、张小玲¹

1. 陕西省人民医院

2. 陕西中医药大学

目的 探讨 2 型糖尿病（T2DM）海马血管周围间隙扩大（H-EPVS）与情景记忆的相关性。**方法** 连续性收集 T2DM 患者 53 例，其中 T2DM 认知受损组 28 例，T2DM 认知正常组 25 例。所有患者接受头颅 MRI 扫描、蒙特利尔认知评估量表(MoCA)和 Rey 听觉词语学习测试（RAVLT）。取 T2WI 图像上 H-EPVS 计数最多的一个层面，分别计算左右两侧 H-EPVS 的数目，并由两侧相加获得总 H-EPVS 计数。由 2 名观察者采用盲法分别进行 H-EPVS 计数，采用组内相关系数检验评价 2 名观察者间的一致性。比较 2 组 H-EPVS 计数、MoCA 评分、RAVLT 评分、一般人口学特征、空腹血糖、HbA1c、心血管危险因素（血脂、血压、吸烟及饮酒史）、T2DM 病程、治疗药物及并发症情况的差异。采用多元线性回归分析评价 H-EPVS 计数与 MoCA 及 RAVLT 评分的相关性。**结果** T2DM 认知正常组和认知受损组的一般人口学特征、空腹血糖、HbA1c、血脂、血压、吸烟及饮酒史、糖尿病病程、并发症、药物治疗情况均无统计学差异。总 H-EPVS 计数、左侧和右侧 H-EPVS 计数的观察者间一致性系数分别为 0.926、0.836、0.886，即观察者间一致性较好。与 T2DM 认知正常组相比，T2DM 认知受损组总 H-EPVS 计数和左侧 H-EPVS 计数显著增加，MoCA 及 RAVLT 评分显著降低。相关性分析显示总 H-EPVS 计数、左侧和右侧 H-EPVS 计数均与 RAVLT 总分、RAVLT 延迟回忆评分呈负相关关系；多元线性回归调整混杂因素后，总 H-EPVS 和左侧 H-EPVS 计数仍然与 RAVLT 总分($\beta=-0.330$, 95% CI: -1.455~-0.244)、RAVLT 延迟回忆评分($\beta=-0.383$, 95% CI: -0.535~-0.051)具有相关性，而右侧 H-EPVS 计数与 RAVLT 评分不再具有相关关系。**结论** T2DM 患者情景记忆功能下降，并与 H-EPVS 计数存在相关性。海马血管周围间隙扩大可能作为 T2DM 情景记忆能力下降的影像学标志物。

PU-1697

多模态 CT 联合临床在急性缺血性脑卒中溶栓后出血转化预测中的价值

尹辰琳¹、韩丹²、栗瑞鸿²、尹芳²、赵仁杰²、胡兴月²、支爱华¹

1. 云南省阜外心血管病医院

2. 昆明医科大学第一附属医院

目的 评估 AIS 患者溶栓前 CT 灌注参数、区域软脑膜侧支多模式评分及临床参数与溶栓后出血转化 (Hemorrhagic Transformation, HT) 的相关性, 找出有意义的参数或影像学定量预测指标。

方法 收集本院确诊为单侧大脑中动脉 M1 段中、重度狭窄或闭塞的 AIS 患者 66 例, 均行溶栓治疗, 根据治疗后 24h 内复查结果分为 HT 组 29 例和非 HT 组 37 例。所有患者均行多模态 CT 扫描, 通过后处理得到 CBF、CBV、MTT 及 Tmax、PS 以及各参数的相对值即 rCBF、rCBV、rMTT 及 Tmax、rPS。分析多时相 CTA 图像, 根据 Alberta 卒中项目早期 CT 评分区域, 将大脑中动脉供血范围的软脑膜侧支动脉分为 M2~M6 区, 分别对 5 个区域软脑膜动脉的强化延迟、强化范围和对比利廓清三种血流状态进行评分。收集治疗前 NLR、入院 NIHSS 评分等多个临床参数。评估参数与 HT 的相关性; 单因素分析 $P < 0.1$ 的参数 Logistic 分析, 找出 HT 的独立影响因素; 通过 ROC 曲线评估各参数对 HT 的预测价值。

结果 (1) 单因素分析结果显示, 治疗前 NLR、ASPECT 评分、入院 NIHSS 评分、溶栓后 30min NIHSS 评分、90d mRS 评分、软脑膜侧支延迟、廓清及程度评分及 rCBF、rCBV、rPS 与溶栓后 HT 具有相关性 ($P < 0.05$)。 (2) Logistic 回归分析显示, 治疗前 NLR、软脑膜侧支延迟、rPS 是溶栓后 HT 的独立危险因素, 侧支廓清评分及程度评分、rCBF、rCBV 是 HT 的保护性因素 ($P < 0.05$)。 (3) ROC 曲线分析显示, 临床参数、CTP 参数及软脑膜侧支多模式评分三者联合的预测效能 (AUC 0.966, 敏感度 92.90% 特异度 91.40%) 高于三者单独使用对 HT 的预测效能, 敏感度、特异度也有所提高。

结论 AIS 患者溶栓后 HT 与多个临床因素及影像学参数密切相关, 治疗前 NLR、软脑膜侧支延迟评分、rPS 是溶栓后 HT 的独立危险因素; 软脑膜侧支廓清、程度评分、rCBF 及 rCBV 是 HT 的保护性因素; 临床参数、CTP 参数及 mCTA 软脑膜侧支多模式评分三者联合提高了对 HT 的预测效能。

PU-1698

高分辨率 MR 颅内血管壁成像在缺血性脑卒中患者责任血管识别中的价值

惠俊国、谢良钧、陈涛、卢陈英、纪建松

丽水市中心医院

目的 探讨 3.0T 高分辨 MR 血管壁成像对缺血性脑卒中中的评估价值。

方法 对 60 例不同时期缺血性脑卒中患者行高分辨 MR 颅内血管壁成像检查, 所有患者均行 T2WI、STIR、T1WI 及 T1WI+C 成像序列, 图像经后处理后, 由两名医生分别在 T1WI 增强图像上对斑块的强化程度进行评估。根据斑块强化程度与正常动脉壁及垂体漏斗部的关系分为三级: 0 级, 增强小于或等于其他地方正常动脉壁; 1 级, 比 0 级明显, 但小于垂体漏斗部; 2 级, 增强程度大于或等于垂体漏斗部, 然后记录数据, 应用 SPSS 统计软件对所得数据进行分析。

结果 60 例患者共获得有效斑块 109 个, 其中大脑中动脉斑块 79 个, 大脑后动脉、基底动脉、椎动脉及颈内动脉末端斑块共 30 个。经秩和检验, 疾病分期与斑块的强化程度之间具有统计学差异 ($P < 0.05$)。2 级强化只出现在亚急性期斑块。亚急性期斑块比慢性期斑块有更明显的强化 ($H=29.39$, $P=0.000$)。

结论 HR-MRI 血管壁成像可以很好地显示颅内动脉的血管壁结构, 提供更多的关于动脉粥样硬化斑块的信息, 具有很大的临床应用潜力和前景。

PU-1699

CT 血管造影结合临床预测西宁短暂性脑缺血发作伴颅颈动脉粥样硬化患者脑梗死风险

杨林^{1,2}、张永海¹、谢录玲¹、谢春¹、郎小梅¹、王润强¹

1. 青海省第五人民医院放射科

2. 资阳市人民医院放射科

目的: 结合临床和 CT 血管造影(Computed tomography angiography, CTA)探讨高原短暂性脑缺血发作(transient ischemic attack, TIA)伴颅颈动脉粥样硬化患者 1 年内继发脑梗死的危险因素, 并构建风险预测模型, 评价其预测效能。

方法: 采用回顾性分析, 连续选取 2018 年 1 月~2021 年 9 月青海省第五人民医院收治的 111 名 TIA 患者, 所有患者均经颅颈联合 CTA 证实合并动脉粥样硬化斑; 随访 1 年, 根据是否继发脑梗死分为两组; 比较两组患者的临床资料和 CTA 检查结果, 并通过多因素 Logistic 回归分析构建高原 TIA 后 1 年内继发脑梗死的风险预测模型以及绘制受试者工作特征曲线。

结果: 出现 9 例失访, 1 例于外院放置颈动脉支架, 1 例发生硬膜下血肿, 最终纳入 100 例, 其中 26 例继发脑梗死(梗死组), 74 例未发生脑梗死(非梗死组); 单因素分析显示两组患者斑块性质、血管狭窄程度、不稳定斑块累及血管数、高血压分级、ABCD² 评分差异有统计学意义($P < 0.05$); Logistic 回归分析显示血管狭窄程度 > 轻度狭窄、高血压分级 > 1 级、ABCD² 评分偏高是 TIA 后 1 年内继发脑梗死的独立危险因素, 其风险预测模型为: $P = 1/[1 + \exp(-5.032 + 1.395X_{\text{高血压分级} > 1 \text{ 级}} + 0.515X_{\text{ABCD}^2 \text{ 评分}} + 2.424X_{\text{血管狭窄程度} > \text{轻度狭窄}})]$; 该模型 AUC 为 0.848(95%CI 0.758~0.938), 敏感度为 76.92%, 特异度为 83.78%。

结论 高原伴颅颈动脉粥样硬化的 TIA 患者 1 年内继发脑梗死的主要危险因素是高血压分级和颅颈动脉血管狭窄程度, 二者联合 ABCD² 评分构建的模型有着良好的预测价值, 有助于急诊快速评估脑梗死风险。

高分辨率 MR 血管壁成像技术在头颈动脉夹层诊断中的应用价值

夏水伟、王海林、惠俊国、卢陈英、纪建松

丽水市中心医院

目的 探讨 3.0T 高分辨 MR 血管壁成像对缺血性脑卒中的评估价值。

方法 对 60 例不同时期缺血性脑卒中患者行高分辨 MR 颅内血管壁成像检查, 所有患者均行 T2WI、STIR、T1WI 及 T1WI+C 成像序列, 图像经后处理后, 由两名医生分别在 T1WI 增强图像上对斑块的强化程度进行评估。根据斑块强化程度与正常动脉壁及垂体漏斗部的关系分为三级: 0 级, 增强小于或等于其他地方正常动脉壁; 1 级, 比 0 级明显, 但小于垂体漏斗部; 2 级, 增强程度大于或等于垂体漏斗部, 然后记录数据, 应用 SPSS 统计软件对所得数据进行分析。

结果 60 例患者共获得有效斑块 109 个, 其中大脑中动脉斑块 79 个, 大脑后动脉、基底动脉、椎动脉及颈内动脉末端斑块共 30 个。经秩和检验, 疾病分期与斑块的强化程度之间具有统计学差异($P < 0.05$)。2 级强化只出现在亚急性期斑块。亚急性期斑块比慢性期斑块有更明显的强化($H = 29.39$, $P = 0.000$)。

结论 HR-MRI 血管壁成像可以很好地显示颅内动脉的血管壁结构,提供更多的关于动脉粥样硬化斑块的信息,具有很大的临床应用潜力和前景。

高分辨率磁共振成像在正中神经病变中的应用价值初探

徐敬峰¹、赵艺蕾¹、陈燕²

1. 浙江大学医学院附属第一医院放射科

2. 浙江省衢州市第二人民医院放射科

【摘要】

目的: 探讨高分辨率 MRI 对正中神经病变的诊断价值。

资料与方法: 收集本院 2021 年 1 月—2023 年 6 月期间共 45 例经手术证实有明确正中神经病变患者的高分辨率 MRI 图像进行回顾性分析,将其 3D STIR、PROSET 序列图像进行 MPR 及 MIP 重建,以观察正中神经的横截面面积。并与 50 例正常对照组进行对比分析。两位主治医师同时测量在肘窝平面及腕管平面正中神经的横截面面积,取两者的平均值做对比分析。

结果: 3D STIR 和 PROSET 序列 MPR 及 MIP 的图像能清晰显示正中神经的形态及边界。病变组: 肘窝平面正中神经平均横截面积约 $7.58 \pm 1.62 \text{mm}^2$, 腕管水平正中神经横截面积约 $8.96 \pm 2.02 \text{mm}^2$; 对照组: 肘窝平面正中神经平均横截面积约 $6.47 \pm 0.95 \text{mm}^2$; 腕管平面, 正中神经横截面积约 $7.23 \pm 1.26 \text{mm}^2$ 。病变组与对照组相应的神经横截面积的差异有统计学意义,症状组的神经横截面积大于对照组。

结论: 高分辨率 MRI 的 3D STIR 和 PROSET 序列能清晰显示肘窝水平及腕管水平正中神经,通过测量其横截面积和对 T2WI 上的神经信号强度判断,能有效地诊断正中神经损伤。

标准轴位联合薄层冠状位弥散加权成像在 脑干急性梗死的诊断价值

陈涛、高瑞杰、夏水伟、卢陈英、纪建松

丽水市中心医院

目的 评估标准轴位联合薄层冠状位弥散加权成像 (DWI) 在脑干急性梗死的诊断价值。

方法 分析 109 例急性脑干梗死患者 MRI 影像,重点比较标准轴位 (5mm) 及薄层冠状位 (3mm) DWI 图像。

结果 标准轴位联合薄层冠状位 DWI 结果显示 109 例患者病变位于脑桥 94 例 (94/109, 86.2%), 延髓 10 例 (10/109; 9.2%), 中脑 5 例 (5/109; 4.6%)。96 例患者病变主要位于脑干旁正中区 (96/109, 88.1%), 其中 94 例仅一侧受累 (94/96, 97.9%); 11 例病变位于脑干外侧部 (11/88, 10.1%)。病变形态多为椭圆形或半圆形 (92/109, 84.4%), 且长轴与前后径平行者 88 例 (88/109, 80.7%); 圆形及类圆形 15 例 (15/109, 13.7%); 不规则地图状 2 例 (2/109, 1.8%)。共有 3 例脑桥病变、1 例延髓病变仅于薄层冠状位 DWI 图像显示 (4/109, 3.7%), 病灶长轴均 $< 10 \text{mm}$ (25 例病变长轴 $< 10 \text{mm}$, 4/25, 16.0%)。

结论 标准轴位联合薄层冠状位 DWI 可提高急性脑干梗死,尤其是长轴 $< 10 \text{mm}$ 病变的检出率。

Abnormal voxel-wise concordance among multiple brain activity indices and Cognitive Impairments in Young hypertensive Intracerebral Hemorrhage Patients.

Dan Yang^{1,2}, Xue Zhang^{1,2}, Fengxia Zhang^{1,2}, Jinpeng Bo^{1,2}, Rui Lv^{1,2}, Shengjun Sun^{1,2}, Jian Zhou^{1,2}

1. Beijing Tiantan Hospital, Capital Medical University

2. Beijing Neurosurgical Institute, Beijing Tiantan Hospital, Capital Medical University

Objective: We aimed to explore the changes of concordance among multiple rs-fMRI indices in young hypertensive intracerebral hemorrhage (ICH) patients and discern potential associations between the altered concordance and cognitive performance.

Methods: A total of 33 young ICH patients (age ranged from 30 to 60) and 33 well-matched healthy controls (HCs) underwent neuropsychological assessment and MRI examination. Multiple dynamic rs-fMRI indices including the fractional amplitude of low frequency fluctuations, regional homogeneity, voxel-mirrored homotopic connectivity, degree centrality, and global signal connectivity were computed using the sliding window method. Kendall's W was used to calculate volume-wise and voxel-wise concordance among these metrics. Correlation analyses between abnormal concordance and cognitive scores were conducted in ICH patients and HCs respectively.

Results: No significant difference was found in the volume-wise concordance between the ICH patients and HCs. ICH patients showed decreased voxel-wise concordance in the contra-lesional putamen and hippocampus Cerebelum_8/7b/Crus1/6, contra-lesional putamen and hippocampus putamen and hippocampus, and ipsilateral thalamus compared to HCs. For ICH patients, no significant correlation was observed between abnormal concordance and cognitive scale scores. For HCs, long-term delayed cued recall score was positively correlated with volume-wise concordance of contra-lesional putamen and hippocampus.

Conclusions: Young hypertensive ICH patients had abnormal temporal decoupling of local brain activity indices in multiple brain regions, and the decreased volume-wise concordance in contra-lesional putamen and hippocampus may be a vital pathological mechanism of memory impairment after ICH.

基于深度学习的急性脑梗死患者 MR 脑白质变性自动评估

李惠明、崔莹、汤天宇、周玉洁、卢春强、居胜红

东南大学附属中大医院

目的: 脑白质高信号(white matter hyperintensity, WMH)与急性缺血性脑梗死预后不良有关, 基于改良 Fazekas 标准的 MR 脑白质评分能够半定量评估 WMH 的严重程度。本研究开发了两种基于深度学习的 WMH 自动评分算法, 并与人工评价结果对比验证其评分的确性。

方法: 回顾性收集于 2017 年至 2020 年间东南大学附属中大医院行头颅 MR 检查的急性脑梗死患者, 纳入急性脑梗死发病 72 小时内行 MR 检查且存在急性缺血性脑梗死灶; 排除合并其他颅内病变(如肿瘤、脑出血)或存在穿通畸形的软化灶。根据得到的图像, 在 FLAIR 序列对 WMH 先进行人工评分(0-3 分), 然后比较基于 Statistical Parametric Mapping (SPM) 工具箱的 Lesion Segmentation Tool (LST) 分割的 WMH 体积和基于深度学习 Densenet 网络的分类模型, 对卒中患者 MR 影像进行自动分类。为防止过拟合, 我们将被试数据随机分为训练集, 验证集和测试集, 分别构建 ROC 曲线, 计算曲线下面积(AUC)。

结果: 本研究共纳入 468 例患者, 男女比例为 1.93。平均年龄为 69.3±12.3。训练集共 200 例, 验证集 100 例, 测试集 168 例。经过人工评分, 改良 Fazekas 法 1-3 分分别为 157 人、211 人、101

人,以 0-1 和 2-3 作为二分类标准。LST 算法自动分割 WMH 体积平均值为:1 分: 2.17 ± 5.12 ; 2 分: 3.71 ± 5.38 ; 3 分: 12.89 ± 14.09 。基于深度学习 Densenet 算法对 WMH 评分验证集 ROC 曲线下面积为 0.91,测试集 0.93;基于 LST 算法对 WMH 评分验证集 ROC 曲线下面积为 0.80,测试集 0.74(P 值均 <0.001)。两种算法间有显著差异(P <0.05)。

结论:基于深度学习的模型对 WMH 的自动评估性能优于传统的 LST 分割模型,均能准确区别 WHM 和脑梗死病灶,可用于辅助急性脑梗死患者 WMH 病变的全自动 Fazekas 评分。

7.0T 磁共振诊断脑发育性静脉异常一例——病例报道

李晨曦、姜昕

解放军总医院第一医学中心放射诊断科

发育性静脉异常(developmental venous anomaly,DVA)是一种血管发育异常的先天性疾病,是最常见的脑血管畸形。7.0T 磁共振成像可以提供较常规 MRI 更优质的神经影像,尤其在微小及早期病变方面有显著优势。DVA 诊断主要依据影像学检查,我们报道了一例经 3.0 T 和 7.0 T MRI 扫描发现的小脑发育性静脉异常的患者,7.0T 较 3.0T 对 DVA 的病灶范围及病灶内部细微结构显示能力更好,显示异常的血管数目及范围较 3.0T 增多、增大。

3D-ASL 评估慢性期脑梗死脑血流量及与认知功能的相关性

孟庆宁、史纲、王润强

青海省第五人民医院

【摘要】本文研究了 3D 动脉自旋标记灌注成像(3D-ASL)评估慢性期脑梗死脑血流量(CBF)及与认知功能的相关性。选取慢性期脑梗死患者 64 例作为慢性期组,同时选取急性期脑梗死患者 60 例作为急性期组,亚急性期脑梗死患者 50 例作为亚急性期组,比较三组患侧及健侧 CBF、相对脑血流量(rCBF)差异。慢性期组患侧 CBF、rCBF 明显低于亚急性期组和急性期组(P <0.05)。慢性期组患者 MMSE 评分、MoCA 评分和 Fugl-Meyer 评分明显低于亚急性期组和急性期组(P <0.05)。患侧 CBF、rCBF 与 MMSE 评分、MoCA 评分呈正相关(P <0.05)。经 Logistic 回归分析显示:年龄和糖尿病、患侧 CBF、rCBF 是慢性期脑梗死患者发生认知功能障碍的影响因素(P <0.05)。3D-ASL 评估慢性期脑梗死患者的 CBF 与患者认知功能呈正相关,值得进一步研究。

PU-1707

磁共振 3D-ASL 技术对短暂性脑缺血发作的诊断价值

谢录玲

青海省第五人民医院

目的:探究磁共振三维动脉自旋标记(3D-ASL)技术对短暂性脑缺血发作(TIA)的临床诊断价值。方法:选取 98 例 TIA 患者作为研究对象,TIA 患者均采用 3D-ASL 和磁共振血管成像(MRA)检查。MRA 检查采用三维时间飞跃法(3D-TOF),并以数字减影血管造影术(DSA)诊断结果作为金标准,分析 3D-TOF MRA、3D-ASL 诊断敏感度、特异度和准确度,以及与 DSA 诊断结果的一致性。结果:3D-TOF MRA 诊断 TIA 结果与 DSA 诊断结果的一致性较为理想(Kappa = 0.458,P <0.05);3D-ASL 诊断 TIA 结果与 DSA 诊断结果的一致性较为理想(Kappa = 0.692,P <0.05);3D-ASL 诊断 TIA

的敏感度、准确度高于 3D-TOF MRA($P<0.05$)。结论:磁共振 3D-ASL 技术诊断 TIA 敏感度及准确度较高,有利于早期发现 TIA 患者,并及时进行诊治,以改善患者预后。

PU-1708

Impairments in white matter microstructure in fronto-striatal in first-episode Major Depressive Disorder: A diffusion tensor imaging study

Jincheng He
xiangya hospital

Background: Major depressive disorder (MDD) is characterized by impairments in the fronto-striatal network. Underlying these impairments may be disruptions in anatomical pathways connecting frontal and striatal regions. However, the specifics of these disruptions remain unclear. **Methods:** We recruited 60 first-episode, treatment-naive young adults with MDD and 54 healthy controls who underwent diffusion tensor imaging scanning at 3 T (Tesla). Mean fractional anisotropy (FA), axial diffusivity (AD), radial diffusivity (RD), mean diffusivity (MD) and FDT was calculated for tracts connecting the striatum with frontal cortex regions including prefrontal cortex (PFC), orbital frontal cortex (OFC) and anterior cingulate cortex (ACC). **Results:** Compared with control subjects, patients with MDD showed reduced FA in the tract connecting the striatum and right DLPFC ($p = 0.04$) and VLPFC ($p = 0.04$). We observed increased MD in patients in the tract connecting the striatum and left DMPFC ($p = 0.03$) and VLPFC ($p = 0.04$). We found no differences between patients and controls in AD, RD and FDT. **Conclusions:** We observed reduced FA in the tract connecting the striatum and right DLPFC and VLPFC and increased MD in the tract connecting the striatum and left DMPFC and VLPFC. These results indicate a possible reduction of white matter integrity, commonly associated with MDD.

cta 联合 ctp 在急性脑梗死诊治中的应用

何莹
青海省心脑血管病专科医院

目的: 分析临床诊治急性脑梗死患者期间予以 CT 灌注成像 (ctp)、CT 血管造影 (cta) 联合检测应用效果探究。**方法:** 本次临床研究期间纳入我院诊治患者 72 例, 作为分析对象, 研究起始时间为 2021 年 6 月开始, 收集相关临床分析案例, 拟定研究计划, 直至 2022 年 6 月截止, 将研究选取案例分别进行 ctp、cta 等检测, 并分析出不同检测模式下临床应用价值情况。**结果:** 据统计, 通过 ctp 诊断后得出患者脑梗死区域 PE、CBV 指标, 显著低于脑部对侧区域; 而脑梗死区域 MTT、TTP 等指标则明显长于脑部对侧区域, 差异性存在统计学意义, ($P<0.05$)。通过 cta 检测得出, 72 例患者中存在闭塞情况为 (14) 例。狭窄情况为: 严重狭窄 (17) 例、中度狭窄 (22) 例、轻度狭窄 (19) 例。临床使用 CT 平扫后得出 72 例患者中, 存在缺血性病变位置例数为 (26) 例, 余下 (46) 例未见明显异常现象。**结论:** 临床检测急性脑梗死患者期间予以 ctp、cta 等检测, 能有效提高临床检测效果, 同时对其脑部血管狭窄程度、血流变化情况、梗死区域情况清晰进行诊断, 能够作为临床诊断依据, 以此制定后续治疗计划, 临床应用价值极为明显, 值得临床广泛推荐使用。

The axis between lung cancer and cerebral connectivity: a bilateral Mendelian randomization analysis

Bei Huang¹, Longtao Yang¹, Fengrong Liu³, Zhentao Gao¹, Wei Zhao¹, Xiao Lin¹, Jun Liu^{1,2,4}

1. the second xiangya hospital of central south university

2. Clinical Research Center for Medical Imaging in Hunan Province, Changsha, China

3. Department of Anesthesiology, The Second Xiangya Hospital, Central South University, Changsha, Hunan Province, China

4. Department of Radiology Quality Control Center in Hunan Province, Changsha, China

Introduction: Lung cancer is known to interact with paraneoplastic neurological syndrome (PNS) like cognitive impairment and emotional disorders, inducing alterations of both functional connectivity (FC) and structural connectivity (SC) in resting-state networks (RSNs). However, it is still unknown whether there are causal links between different subtypes of lung cancer and RSN-FC/SC.

Methods: In this investigation, we included genome-wide association study (GWAS) data of lung cancer from 29,266 cases and 56,450 controls as well as 8 RSNs derived from GAWAS analysis (N = 24,336). In order to identify their causal relationships, we carried out a bilateral two-sample mendelian randomization (MR) study.

Results: Our results showed 12 causal relationships between lung cancer and FC/SC. Reverse MR analysis revealed that ventral attention network (VAN)-FC and dorsal attention network (DAN)-SC were correlated with lung cancer in never smokers and squamous cell lung carcinoma, respectively.

Conclusions: It established genetic support that lung cancer could have a causal impact on RSNs, as well as the causal association between certain types of lung cancer and RSNs.

椎管内肿瘤继发视乳头水肿一例

滕松宇

深圳市儿童医院

目的

总结椎管内肿瘤继发视乳头水肿的病理生理机制、临床特征、影像表现、治疗方法及预后。

材料与方法

回顾性分析于深圳市儿童医院神经外科 2022 年 11 月 9 日就诊的 1 例椎管内粘液乳头型室管膜瘤继发视乳头水肿患儿临床资料。以“椎管内肿瘤”、“颅内高压”、“视乳头水肿”或“*Intracranial hypertension*”、“*Papilledema*”、“*Hydrocephalus*”为关键词，于 CNKI、万方数据库、PubMed 等网站检索近 20 年的相关文献进行总结归纳。

结果

患儿男，12 岁，头晕、颈背痛、黑朦就诊，头颈磁共振未见明显异常。激素、利尿治疗后症状好转。3 天后症状加重，出现头痛、视物模糊。眼底检查：双侧视盘边界不清、视乳头水肿，血管迂曲扩张，有散在出血点。查体：双侧瞳孔不等大，对光反射消失，腹壁反射消失，病理反射以及脑膜刺激征阳性。脑脊液检查示：总蛋白 1571mg/L。磁共振示：腰椎椎管内（约平 L3-L4 椎体）一椭圆形肿物，信号均匀，边界尚清，边缘见含铁血黄素信号，明显不均匀强化，与马尾神经关系不清；余未见异常。椎管内占位切除术中触及硬脊膜张力高，切开后可见肿物与马尾粘连、压迫脊神经。病理示肿瘤细胞于血管周围形成假菊形团样结构，部分区域形成乳头状结构，局灶可见室管膜裂隙样结构，诊断粘液乳头状室管膜瘤（CNS WHO 2 级）。术后患者头痛、头晕消失，视物模糊

减轻。检索文献显示符合条件的中文文献 6 篇, 英文文献 63 篇。对文献所报道的临床特征、可能的病理生理机制及治疗进行总结、归纳。

结论

本病例为国内少有报道的椎管内粘液乳头型室管膜瘤继发视乳头水肿的案例。据文献报道, 多种椎管内肿瘤均可诱发这一表现, 以室管膜瘤最常见; 发生率极低。此类患者早期缺乏可提示脊髓、神经根病变的定位症状, 而主要出现头晕、视物模糊等颅内高压表现, 极易漏诊、误诊原发病灶。早期未能明确诊断, 导致治疗不到位、症状反复, 影响患者预后。可能的机制包括脑脊液蛋白含量增高、流体动力学改变、蛛网膜下腔出血或炎症、肿瘤分泌化学物质等, 具体机制存在争议。治疗多针对原发病灶行肿瘤切除术, 绝大多数患儿术后症状快速缓解, 预后良好。

HRCT、MRI 及曲面重建在面神经鞘瘤中的应用

刘晓岚
西安市中心医院

[摘要] 目的 分析面神经鞘瘤 HRCT 及 MRI 表现, 并结合曲面重建图像, 探讨其在面神经鞘瘤中的应用。方法 18 例面神经鞘瘤患者中, 有 17 例行 MR 平扫及增强扫描, 其中 15 例同时行 HRCT 扫描, 另有 1 例仅进行 HRCT 扫描, 并通过 CPR 后处理, 获得重建图像。结果 18 例面神经鞘瘤患者中 10 例位于左侧, 8 例位于右侧。病变累及鼓室段 14 例, 乳突段 14 例, 迷路段 10 例, 膝状神经节 9 例, 内听道段 6 例, 颅外腮腺段 5 例, 脑池段 1 例。其中 16 例呈多节段面神经受累, 2 例局限于单段面神经内。CT 主要表现为位于面神经走行区的大小不等的软组织肿块影, 13 例可见病灶周围不同程度的膨胀性骨质破坏、吸收; 内听道轻度扩大 1 例。面神经管 CPR 示有 15 例均可见受累面神经管不均匀的增宽、扩大, 13 例伴周围骨壁的破坏、受压变薄及管壁不连续。MRI 及 CPR 图像表现为类圆形或不规则形软组织肿块影, 呈等或稍长 T1WI、等、稍长或长 T2WI 信号影, 信号多不均匀, 增强后呈明显不均匀或均匀强化, 部分病灶内可见囊变坏死区。结论 CT 对面神经鞘瘤周围骨质结构改变显示良好, MRI 可以直接显示肿瘤发生部位、形态、大小及病灶内部结构特点, 结合 CPR 曲面图像, 更能在一幅图像上直观、全面地了解病变整体情况, 对于术前准确诊断面神经鞘瘤具有重要意义。

定量磁敏感成像联合磁共振波谱成像在胶质瘤分级中的应用价值

方胜哲、丁爽
新疆医科大学第一附属医院

目的 探讨定量磁敏感成像 (Quantitative Susceptibility Mapping, QSM)联合磁共振氢质子波谱成像(Magnetic Resonance Spectroscopy, MRS)在脑胶质瘤患者术前分级诊断中的应用价值。材料与方法 前瞻性纳入 2020 年 01 月至 2023 年 07 月在新疆医科大学第一附属医院行肿瘤切除术并具有完整病理结果及免疫组化的胶质瘤患者 32 例, 所有患者术前均在 3.0 T 共振扫描仪接受常规脑 MRI 扫描和增强扫描以及 QSM、MRS 序列扫描, 根据术后病理结果恶性程度分为高级别组和低级别组。选取胶质瘤病灶中的实性部分划取感兴趣区 (ROI), ROI 尽量较大, 避开液化坏死区, 测量其定量磁敏感值并分析 MRS 序列中各代谢物的峰值与胶质瘤分级的相关性。采用独立样本 t 检验或 Mann-Whitney U 检验对比各参数的差异, 采用受试者工作特征 (Receiver Operating Characteristic, ROC) 曲线评估各参数独立及其联合诊断术前分级的效能。结果 MRS 中 Cho/NAA 比值及定量磁敏感值与胶质瘤分级具有相关性。低级别胶质瘤组 QSM 值低于高级别组 QSM 值, 差异有统计学意义 ($P < 0.05$); MRS 中 Cho/NAA 比值低级别组低于高级别组 Cho/NAA 比值, 差异有统计学意义 ($P < 0.05$) 多因素; ROC 曲线分析结果显示, QSM 值及 Cho/NAA 比值独立诊断胶质瘤术前分级的 AUC 值分别为 0.705、0.721, 上述参数联合模型预测胶质瘤术前分级的 AUC 为 0.790。结论 QSM 及 MRS 在脑胶质瘤术前分级中具有一定的应用价值, 当 QSM 值联合 MRS 的 Cho/NAA 值时诊断效能更高。

PU-1716

Aberrant intrinsic functional brain networks in patients with functional constipation

Xiang Yu, Yiming Li
Tianjin Union Medical Center

Purpose Patients with functional constipation (FCon) often suffer from mental and psychological problems. To explore the possible neurological interaction, we used resting-state functional magnetic imaging (RS-fMRI) to compare the alterations in intrinsic brain functional networks at multiple levels between patients with FCon and healthy controls (HC).

Methods Twenty-eight patients with FCon, and twenty-nine HC were recruited for a series of examinations and RS-fMRI. Both graph theory analysis and functional connectivity (FC) analysis were used to investigate brain functional alterations between the two groups. Correlation

analyses were performed among neuropsychological scores, clinical indexes, and neuroimaging data.

Results Compared with the HC, the assortativity showed significantly increased in global level in patients with FCon. In regional level, we found obviously increased nodal degree and nodal efficiency in somatosensory network (SMN), decreased nodal degree and increased nodal efficiency in default mode network (DMN) in the FCon group. Furthermore, FC analysis demonstrated several functional alterations within and between the networks, particularly including the SMN and visual network (VN) in sub-network and large-scale network analysis. Moreover, correlation analysis indicated that nodal metrics and aberrant FC among functional brain networks were associated with emotion and scores of constipation in patients with FCon.

Conclusion All these findings reflect the differences in intrinsic brain functional networks between FCon and HC. Our study highlighted SMN, DMN and VN as critical network and may be involved in the neurophysiology of FCon, which may contribute to improve personalized treatment in patients with FCon.

PU-1717

Morphological abnormalities of intracranial structures associated with chronification from herpes zoster to postherpetic neuralgia

Yurong Zheng,Xuefeng Kang,Li Zhou,Shengdan Liu,Xiaofei Lu,Changhe Ren,Guangxiang Chen
the Affiliated Hospital of Southwest Medical University

Objective: This study aims to explore morphological alterations of intracranial structures in postherpetic neuralgia (PHN) and herpes zoster (HZ) patients.

Methods: We investigated volume/volume proportion alterations in the 115 intracranial structures derived from structural T1-weighted magnetic resonance imaging of 24 HZ patients, 27 PHN patients and 32 healthy controls (HCs) by using an automatic image segmentation portal. Correlation analysis and receiver operating characteristic curves were adopted to confirm the significance of volume/volume proportion changes in significant intracranial structures.

Results: Compared with HCs, the HZ group showed decreased volume/volume proportions in the bilateral Heschl's gyrus (HG); the PHN group showed increased volume/volume proportions in the left superior parietal lobule (SPL), CP, and cerebral ventricles and decreased volume/volume proportions in the left lateral orbitofrontal lobe (LOFC) and bilateral HG. Compared with the HZ group, the PHN group exhibited increased volume/volume proportions in the CP, cerebral ventricles, and CSF and decreased volume/volume proportions in the left LOFC and total WM (TWM). The volume proportion of right WM was negatively correlated with disease duration. Morphological abnormalities showed good performance in distinguishing PHN from the HC (area under the receiver operating characteristic curve [AUC]: 0.900) and HZ (AUC: 0.912) groups.

Conclusion: Morphological abnormalities of intracranial structures in HZ and PHN are not limited to the brain parenchyma but also involve the CP, cerebral ventricles, and CSF. These abnormalities perform well in identifying patients with HZ/PHN. These findings may provide new insights into the pathophysiological mechanisms underlying chronification from HZ to PHN.

PU-1718

轻度认知障碍及阿尔茨海默病患者嗅觉皮层结构和功能 MRI 的定量分析

杨斯闵、廖丹、郭春杰
吉林大学第一医院

目的 采用脑结构和功能磁共振成像，探索嗅觉皮层在阿尔茨海默病进程中的价值。

方法 收集阿尔茨海默病 (AD) 患者 39 名，遗忘型轻度认知障碍 (aMCI) 患者 36 名和正常对照组 (NC) 30 名，对所有受试者进行多模态脑部 MRI 扫描、宾夕法尼亚嗅觉识别测试 (UPSIT) 及多维度神经心理学量表测定。将嗅觉皮层主要结构定义为感兴趣区 (ROI)，包括双侧初级嗅觉皮层 (POC)、海马、旁海马、杏仁核、岛叶和眶额皮层。MRI 特征包括 ROI 的灰质体积 (GMV)、低频振荡幅度 (ALFF)、区域同质性 (ReHo) 及嗅觉激活体素值，分析三组间 MRI 特征与临床特征之间的差异，并运用逻辑回归方法探究 NC、MCI 和 AD 之间的差异。

结果 AD 和 MCI 组嗅觉皮层 GMV 减少、ALFF 增加、ReHo 增加、嗅觉激活体素值减少，以 AD 组为著。我们的研究表明，将 MRI 和临床特征融合，采用 MMSE、左侧 POC GMV、左侧岛叶 ReHo、右侧 POC 和岛叶激活体素值以及右侧杏仁核 ALFF 区分 NC 和 MCI 的准确度高达 90.48%、采用 MoCA、左侧海马 GMV 以及左侧岛叶 ReHo 区分 MCI 和 AD 的准确度高达 96.10%、采用 MoCA、左侧海马 GMV 区分 AD 和 NC 的准确度高达 98.57%。

结论 随着 AD 疾病严重程度的增加，嗅觉皮层的结构和功能改变愈加明显。采用多模态脑 MRI 与临床特征相结合的方式，可以更好的分类诊断 AD 源性认知障碍疾病患者。

未破裂与破裂前交通动脉瘤血流动力学参数比较

陈豪
上海交通大学医学院附属第九人民医院

•**目的**：运用 3.0 T 三维时间飞跃法磁共振血管成像 (3D-TOF-MRA) 获取患者颅内动脉及前交通动脉瘤数据，建立患者特征性单侧供血前交通动脉瘤三维血流动力学刚性壁模型，应用计算流体力学的方法分析前交通动脉瘤模型的血流动力学特征参数，研究与破裂动脉瘤相关的血流动力学因素。

•**材料和方法**：3D-TOF-MRA 诊断的 14 例前交通动脉瘤伴单侧大脑前动脉 A1 段发育不良的病例，其中 7 例未破裂动脉瘤，7 例为破裂动脉瘤，计算动脉瘤区域及动脉瘤顶部的 WSS 等血流动力学参数并进行比较。

•**结果**：在心脏收缩末期，破裂组动脉瘤顶部 WSS 平均值比未破裂组动脉瘤顶部 WSS 平均值要低 (ie, 0.68 ± 0.32 Pa versus 3.82 ± 2.94 Pa, $P=0.003$)，但破裂组与未破裂组间整个动脉瘤表面区域的 WSS 平均值间的差异未见明显统计学意义 (ie, 7.24 ± 3.90 Pa versus 10.87 ± 4.39 Pa, $P=0.085$)。破裂组动脉瘤表面的平均低 WSS 区域比例为 $23.07 \pm 17.75\%$ ，未破裂组的平均低 WSS 区域比例为 $5.86 \pm 5.80\%$ ，两组间的差异有统计学意义 ($P=0.013$)。

•**结论**：患者特征性单侧供血前交通动脉瘤血流动力学刚性壁模型，可以获得前交通动脉瘤的血流动力学特征参数，针对伴有单侧大脑前动脉 A1 发育不良的前交通动脉瘤时是良好模型，为预测动脉瘤破裂风险提供一定参考价值。破裂前交通动脉瘤顶端的 WSS 值较低，且破裂前交通动脉瘤的低 WSS 区域面积更大。

PU-1720

基于三维脑结构 MRI 定量分析发病年龄对视神经脊髓炎谱系疾病患者脑结构的影响

张丽、朱明勤、杨斯闵、廖丹、郭春杰
吉林大学第一医院

【摘要】 目的 探索不同发病年龄的视神经脊髓炎谱系疾病 (NMOSD) 患者的脑结构差异, 及其与临床神经心理学量表评分的相关性。方法 前瞻性随访了 47 名处于缓解期的 NMOSD 患者及 50 名性别、年龄匹配的健康志愿者, 按发病年龄将患者分成早发性 NMOSD (EO-NMOSD) 和迟发性 NMOSD (LO-NMOSD) 两个亚组。采集受试者头部核磁 3D T1WI 及 3D FLAIR 影像数据以及临床资料。采用基于体素的形态学 (VBM) 方法对患者及健康对照组数据进行分析, 比较组间脑灰质体积的差异, 并通过多元回归分析异常的脑区与患者的病程、年复发率、脑白质高信号体积 (WMHV)、扩展残疾状态量表 (EDSS) 评分及神经心理学量表评分的相关性。结果 与对照组比较, VBM 结果显示 NMOSD 患者存双侧额颞叶及右侧小脑多处脑区灰质体积缩小 ($T=3.18$, FDR 多重比较校正后, $P<0.05$); 左侧额叶直回灰质体积与患者 EDSS 评分呈负相关 ($T=3.30$, FDR 多重比较校正后, $P<0.05$)。NMOSD 组脑白质高信号分数 (WMHF) 与脑灰质分数 (GMF) 及脑白质分数 (WMF) 呈负相关 (r 值分别为 -0.376 、 -0.550 , $P<0.05$); WMHF 与年复发率 (ARR) 及 EDSS 呈正相关 (r 值分别为 0.354 、 0.350 , $P<0.05$)。EO-NMOSD 组存在双侧额颞叶多处脑区灰质体积缩小 ($T=3.26$, FDR 多重比较校正后, $P<0.05$); LO-NMOSD 组右侧尾状核灰质体积缩小 ($T=3.33$, FDR 多重比较校正后, $P<0.05$)。EO-NMOSD 组 WMHF 与 GMF 及 WMF 呈负相关 (r 值分别为 -0.695 、 -0.761 , $P<0.001$); LO-NMOSD 组 GMV 与 EDSS 呈负相关 ($r=-0.526$, $P=0.025$), WMHF 与 ARR 呈正相关 ($r=0.558$, $P=0.016$)。结论 NMOSD 患者存在多处灰质萎缩脑区。LO-NMOSD 患者灰质萎缩的范围及部位与 EO-NMOSD 患者明显不同, 提示迟发性 NMOSD 患者可能具有不同的脑损伤模式。

T2DM 及 T2DM 肠道菌群失调大鼠 MRI 全脑纹理特征对照研究

沈晶、伍建林
大连大学附属中山医院

目的: 本研究通过分析 T2DM 大鼠全脑 MRI 纹理改变, 及其与肠道微生物菌群改变的关联性, 寻找肠-脑轴关联指标, 探讨 T2DM 大鼠脑组织改变与肠道代谢物指标之间的相关性, 探索 T2DM 脑组织改变可能的肠道代谢物标志物。

材料和方法: 应用高脂饮食联合链脲佐菌素诱导方法建立 T2DM 大鼠模型 (18 只)、并应用小剂量头孢曲松钠 1ml/100g 连续灌胃方式建立 T2DM-ID (17 只) 模型。采用 16S rRNA 扩增子 (V3-V4) 基因测序检测 T2DM、T2DM-ID 大鼠与正常大鼠 (10 只) 肠道菌群的 α 、 β 多样性情况变化。采用西门子 3.0T MRI 超导磁共振扫描仪、8 通道大鼠专用头线圈采集 T2DM、T2DM-ID 及正常大鼠的头颅磁共振图像 (T2WI), 并应用 MaZda 软件分析大鼠头颅 MRI 纹理特征改变情况, 并分析其纹理特征改变与肠道菌群多样性指标相关性。

结果: T2DM 大鼠肠道菌群结构紊乱, 表现为拟杆菌属的降低及厚壁菌属的升高 ($P<0.05$), 肠道菌群 α 多样性降低, β 多样性丰富度增加 ($P<0.05$)。MRI 脑纹理分析显示 T2DM 大鼠 $Z_Fraction$ 、 $GrKurtosis$ 、 $Volume$ 纹理特征参数较正常大鼠降低 ($P<0.05$)。GrKurtosis 和 Volume 具有较高的 T2DM 大鼠脑组织改变诊断价值, AUC 分别为 0.900, 0.889。MRI 纹理特征参数与肠道菌群 α 多样性、 β 多样性均具有相关性, 其中肠道菌群 α 多样性丰富度指标 Shannon、肠道菌群 β 多样性指标 MDS2 与大鼠脑 MRI 纹理指标相关性有统计学意义 ($P<0.05$)。

结论: T2DM 大鼠肠道菌群 α 多样性降低, β 多样性丰富度增加可能是 T2DM 重要发生发展机制。MRI 纹理特征参数 Z_LngREmph、Z_Fraction、GrKurtosis、Volume 可以提示 T2DM 大鼠脑组织细微改变的重要指标, 其中 GrKurtosis 和 Volume 具有较高的 T2DM 脑组织细微改变诊断价值。肠道菌群多样性指标 Shannon、MDS2 与大鼠脑纹理指标相关性, 推测其可做为预测 T2DM 大鼠脑组织改变重要的预测指标。

PU-1722

忧遁草提取物对人脑星形胶质母细胞瘤细胞抑制作用的初步研究

李香营

海口市人民医院

目的 探讨忧遁草鲜叶与干叶乙醇粗提物浸膏对人脑星形胶质母细胞瘤细胞 (U-87MG) 增殖的抑制作用。方法 采用乙醇回流提取、减压浓缩制备忧遁草浸膏, 以不同浓度的忧遁草鲜叶、干叶浸膏溶液与阳性对照药物替莫唑胺处理 U-87 MG, CCK-8 法检测浸膏对 U-87 MG 增殖的抑制作用, 倒置显微镜下观察不同浓度浸膏处理胶质瘤细胞不同时间后, 胶质瘤细胞凋亡的形态变化。结果 1) 忧遁草浸膏作用于细胞 24 h 时, 干叶浸膏溶液浓度为 8 mg/mL 时对 U-87 MG 的抑制率即可达到百分之九十以上, 鲜叶浸膏溶液浓度为 10 mg/mL 时才对 U-87 MG 有很好的抑制作用; 2) 鲜叶浸膏溶液浓度为 14 mg/mL, 干叶浸膏溶液浓度为 12 mg/mL 时, 作用 6 h 内即可达到很好的抑制效果。3) 与替莫唑胺相比, 鲜叶与干叶乙醇粗提物浸膏对 U-87MG 开始起抑制作用所需浓度更高, 但抑制率达到 95% 以上所需浓度更低。结论 忧遁草鲜叶与干叶乙醇粗提物浸膏对人脑星形胶质母细胞瘤 U-87 MG 有良好的抑制作用, 且随着浓度增加抑制率增大, 干叶浸膏对 U-87MG 的抑制效果要优于鲜叶浸膏。

PU-1723

Association of MRI-derived lymphatic system impairment with abnormal cerebral blood flow in methamphetamine-dependent patients: a diffusion tensor image analysis along the perivascular space (DTI-ALPS) study

ping cheng,yadi li

Ningbo Medical Treatment Center Lihuli Hospital, Ningbo University, Ningbo, PR China

Objective: Diffusion tensor imaging analysis along the perivascular space (ALPS) -index is currently widely used to assess the glymphatic system in a variety of neuropsychiatric disorders. However, few studies have evaluated the function of the glymphatic system in patients with methamphetamine (MA) dependence. Therefore, exploring the ALPS index and its associations with cerebral blood flow may provide new insights for MA-dependent patients.

Methods: Diffusion tensor images were acquired to calculate diffusivities in the x, y, and z axes of the plane of the lateral ventricle body in 46 MA-dependent patients and 46 control subjects. We evaluated the diffusivity along the perivascular spaces as well as projection fibers and association fibers separately to acquire an index for diffusivity along the perivascular space (ALPS-index). An asymmetry index (AI) was calculated by $AI = (Right - Left) / [(Right + Left) / 2]$ to represent the asymmetric pattern. Correlations among ALPS index, age, clinical parameters, and cerebral blood flow (CBF) were computed using partial correlation analysis. Age, education, and cigarette smoking were used as covariate inputs to correct for their possible effects. In addition, the study

used a support vector machine (SVM) learning approach to construct a classifier for discriminating subjects with MA dependence from control subjects.

Results: Relative to the control group, the MA-dependent group exhibited abnormal lymphatic system, as evidenced by increased diffusivities along the right Y-axis projection fibers and the right Z-axis association fibers, and decreased the ALPS index, the right ALPS index and the AI of the diffusivity along the Z-axis association fibers. We found the ALPS index had a significant positive correlation with the CBF in the right anterior central sulcus, right anterior transverse temporal gyrus, and left cingulate cortex in patients with MA dependence. An SVM trained with lymphatic system related-indexes achieved a classification accuracy of 77.78% for patients with MA dependence.

Conclusion: MA-dependent patients have impaired lymphatic system function and are significantly associated with CBF in some brain regions. Furthermore, the abnormal lymphatic system index may provide promising features for the construction of high-efficacy classification models.

PU-1724

Neuroimaging anomalies in asymptomatic middle cerebral artery steno-occlusive disease with normal-appearing white matter

Zhaodi Huang, Xiaona Xia, Shuai Guan, Xiangshui Meng

Department of Radiology, Qilu Hospital (Qingdao), Cheeloo College of Medicine, Shandong University

Background: Asymptomatic chronic cerebrovascular steno-occlusive disease is common, but the cognitive function and alterations in the brain's structural and functional profiles have not been well studied. This study aimed to reveal whether and how patients with asymptomatic middle cerebral artery (MCA) steno-occlusive disease and normal-appearing white matter differ in brain structural and functional profiles from normal controls and their correlations with cognitive function.

Methods: In all, 26 patients with asymptomatic MCA steno-occlusive disease and 22 healthy controls were compared for neurobehavioral assessments, brain volume, cortical thickness, fiber connectivity density (FiCD) value, and resting-state functional connectivity (FC) using multimodal MRI. We also investigated the associations between abnormal cortical thicknesses, FiCD values, and functional connectivities with the neurobehavioral assessments.

Results: Patients performed worse on memory tasks (Auditory Verbal Learning Test-Huashan version) compared with healthy controls. Patients were divided into two groups: the right group (patients with right MCA steno-occlusive disease) and the left group (patients with left MCA steno-occlusive disease). The left group showed significant cortical thinning in the left superior parietal lobule, while the right group showed significant cortical thinning in the right superior parietal lobule and caudal portion of the right middle frontal gyrus. Increased FiCD values in the superior frontal region of the left hemisphere were observed in the left group. In addition, a set of interhemispheric and intrahemispheric FC

showed a significant decrease or increase in both the left and right groups. Many functional connectivity profiles were positively correlated with cognitive scores. No correlation was found between cortical thickness, FiCD values, and cognitive scores. Conclusion: Even if the patients with MCA steno-occlusive disease were asymptomatic and had normal-appearing white matter, their cognitive function and structural and functional profiles had changed, especially the FC. Alterations in FC may be an important mechanism underlying the neurodegenerative process in patients with asymptomatic MCA steno-occlusive disease before structural changes occur, so FC assessment may promote the detection of network alterations, which may be used as a biomarker of disease progression and therapeutic efficacy evaluation in these patients.

PU-1725

急性缺血性脑卒中血管内取栓治疗后年轻患者的预后昼夜差异研究

俞梦莹¹、林梦琪³、林茹²、徐浩力²、郑默¹、周滢¹、姚飞²、郑葵葵²、黄颖宝²、夏沪伟¹、杨运俊²、夏能志²

1. 温州医科大学
2. 温州医学院附属第一医院
3. 浙江大学附属第一医院

目的：探讨不同年龄血管内取栓（EVT）后的急性缺血性卒中（AIS）患者卒中发病时间与预后的关系。

方法：回顾性收集 2018 年 8 月至 2022 年 6 月在本院接受 EVT 的 AIS 患者。将患者分为日间发病组（6:00—18:00）和夜间发病组（18:00—6:00），并进一步分为 4 个发病年龄组（55 岁、55~64 岁、65~74 岁和 75 岁以上）。主要结局指标为出院 NIHSS 评分，次要结局指标为恶性脑水肿、出血性转化(HT)和早期血管再通（mTICI≥2b）。采用单因素、多因素 logistic 回归分析发病时间与预后的关系；采用中介分析探讨恶性脑水肿、HT 和早期血管再通如何影响发病时间和预后之间的关系。

结果：共纳入 470 例接受 EVT 治疗的 AIS 患者，其中 68 例< 55 岁。调整混杂因素后，年轻的 AIS 患者（<55 岁）出院预后更差（出院 NIHSS≥16 分，OR=0.136, 95%CI=0.027 ~ 0.678, P=0.015），更容易出现神经功能恶化（ Δ NIHSS≥4 分，OR=0.081, 95%CI=0.012 ~ 0.544, P=0.010）、恶性脑水肿（OR=0.145, 95%CI=0.027 ~ 0.798, P=0.026）和出血转化（OR=0.231, 95%CI=0.057 ~ 0.946, P=0.042），而早期血管再通更少发生（OR=0.118, 95%CI=0.017 ~ 0.813, P=0.007）。中介效应分析显示，卒中发病时间→恶性脑水肿→出院 NIHSS 评分路径显著（ $c'=-2.029$, BC 95%CI=-6.217;-0.087）。

结论：对于小于 55 岁接受 EVT 治疗的 AIS 患者，夜间发病的预后优于日间发病，这可能与恶性脑水肿的昼夜差异有关。

Structural Covariance Network Patterns in Parkinson's Disease: Insights from Clustering Analysis and Their Clinical Correlates

Wenbin Li, Chunyan Zhang, Chen Chen, Hong Lu, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objective: Parkinson's disease (PD) is a highly heterogeneous neurodegenerative disorder characterized by variations in clinical symptoms and structural neuroimaging findings. However, the exploration of heterogeneity in structural covariance connectivity remains limited.

Methods: In this study, we utilized a hypothesis-free data-driven approach, employing K-means clustering analysis, to investigate the patterns of structural covariance in a large sample of 61 PD patients and 102 age- and sex-matched controls from the First Affiliated Hospital of Zhengzhou University.

Results: Our analysis revealed two distinct patterns of structural covariance network deficits in PD patients. Patients in subgroup 1 (n = 34) displayed widespread disconnections affecting executive control, visual processing, and motor networks, while subgroup 2 (n = 27) exhibited localized

disconnections primarily within the anterior cingulate network. Furthermore, subgroup 2 patients demonstrated better motor and cognitive performance compared to subgroup 1 patients.

Conclusions: These findings highlight the presence of heterogeneous structural covariance network deficits in PD patients, with widespread disconnections associated with worse motor and cognitive outcomes. Understanding these patterns may contribute to subtyping strategies and targeted interventions in PD.

PU-1727

帕金森患者脑内铁沉积的 MR 定量分析

易爽、孟姮
北华大学附属医院

目的: 利用定量磁化率图(QSM)定量分析帕金森病(PD)患者和健康人脑内铁沉积差异性, 比较双侧基底节区及丘脑核团的磁化率值, 探索诊断 PD 的影像学标志物。**方法:** 收集北华大学附属医院 2020 年 10 月到 2022 年 11 月期间诊断为原发性帕金森病患者(PD 组) 23 名, 平均年龄 64.57 ± 8.46 岁; 与之匹配健康志愿者(HC 组) 23 名, 平均年龄 64.04 ± 7.70 岁。病情程度根据 H-Y 分级评估标准判定, 1 级 2 名, 1.5 级 3 名, 2 级 7 名, 2.5 级 6 名, 3 级 3 名, 4 级 1 名, 5 级 1 名。所有检查者对本研究知情同意, 并自愿签署知情同意书。本研究应用联影 3.0TMR 机, 运用 QSM 技术, uWS-MR 后处理工作站, 手动切割双侧基底节及丘脑各核团 ROI, 计算各核团磁化率值。SPSS27.0 统计软件进行数据分析, 双侧基底节区和丘脑核团差异比较运用独立样本 t 检验, 对比有差异的核团进行 ROC 曲线分析以筛选最优诊断效能核团, 再将 PD 组进行 H-Y 分级评定, 采用 Pearson 相关性进行分析, 探讨脑内核团铁沉积与临床分级之间的关系。**结果:** 1.PD 组患者脑内双侧黑质、红核及苍白球的磁化率值较 HC 组增加, 差异有统计学意义 ($P < 0.05$)。2.PD 组患者与 HC 组脑内双侧基底节区及丘脑磁化率值左右侧别比较均无统计学差异 ($P > 0.05$)。3.PD 组患者黑质、红核、苍白球磁化率值的曲线下面积 (AUC) 分别为 0.788 (95%CI: 0.658-0.918)、0.732 (95%CI: 0.587-0.877)、0.775 (95%CI: 0.614-0.909), 阈值分别为 101.8ppb、117.7ppb、108.8ppb。4.PD 组患者中黑质磁化率值与临床 H-Y 分级呈正相关性, 结果具有统计学意义 ($P < 0.05$), 相关系数为 $r = 0.588$ 。

结论: 1.PD 患者脑内双侧黑质、红核及苍白球铁含量异常增高, 提示特定核团的铁过量沉积可能是 PD 发病机制之一。2.PD 患者黑质诊断效能高于苍白球及红核, 并与临床 H-Y 分级具有显著正相关性, 提示黑质或可作为早期诊断及评估病情的影像标志物之一。

PU-1728

Intracranial myopericytoma: A case report

Xinyue Mao, Xiaonan Zhang, Eryuan Gao, Yan Zhang
The First Affiliated Hospital of Zhengzhou University

A 43-year-old woman presented complaining of dizziness and headache for more than a month. After admission, a series of examinations were performed for her. There was no obvious abnormality in physical examination and laboratory examinations. However, we observed an intracranial mass—measuring 10mm×9mm×12mm (axial × antero posterior × vertical) on magnetic resonance imaging (MRI), which was located under the tentorium of the left cerebellum. Its MRI performed hypointense on T1WI, hyperintense on T2WI. After contrast administration, the mass showed obvious and well-distributed postcontrast enhancement. Subsequently, the patient underwent lesion excision. The gross examination showed that a hypervascular and well-defined lesion was attached to the left tentorium of cerebellum. Many blood vessels could be seen on the

pathological H&E stained slides, with a large number of oval cells distributed as "concentric circles" around the vessels. There was eosinophilic cytoplasm, but no mitotic nuclei. Besides, the immunohistochemical results were as follows: Tumor cells were positive for smooth muscle actin (SMA) and CD34 (restricted to endothelial cells), but negative for epithelial membrane antigen (EMA) and desmin, and the proliferative index of Ki67 was low (about 1%). Combined with the above inspection results, the final diagnosis was myopericytoma.

皮层下梗死患者动态 ReHo 变异特征及与记忆功能的关系

苗培芳、王彩鸿、魏莹、王欣、程敬亮
郑州大学第一附属医院

目的

缺血性脑梗死是威胁人类健康和生命的重要疾病。梗死发生后,部分患者出现记忆损伤,而记忆缺陷是无法满足日常功能的主要原因。目前脑梗死领域的大多数 fMRI 研究仅关注人脑活动的静态特征,忽视了人脑自发活动在时间维度上的动态变化特征。本研究使用滑动时间窗方法计算了慢性期皮层下脑梗死患者动态局部一致性(regional homogeneity, ReHo),并分析其与记忆功能之间的关系。

材料和方法

纳入慢性期皮层下梗死患者 100 例,根据梗死侧别分为左侧梗死组 51 例和右侧梗死组 49 例,同时纳入 53 例健康受试者。使用 GE MR 750 对受试者进行 fMRI, 3D-T1 采集及记忆测试。采用 DPARS, DPABI 及 SPM 对数据进行预处理、计算影像指标及统计分析。

统计分析

使用双样本 t 检验分别比较不同侧别梗死组与对照组之间动态 ReHo 的差异,以年龄,性别,受教育程度作为协变量。提取具有明显组间差异脑区的功能指标与患者的记忆功能评分做相关分析。

结果

与对照组相比,左侧皮层下梗死患者右侧颞下回、双侧舌回、右侧后扣带回动态 ReHo 变异性增加,双侧小脑后叶、左侧豆状核、左侧前扣带回动态 ReHo 变异性降低。右侧皮层下梗死患者双侧枕上回、左侧顶下小叶、左侧楔前叶动态 ReHo 变异性增高,而左侧小脑后叶、右侧丘脑、双侧扣带回动态 ReHo 变异性降低。相关分析显示,左侧皮层下梗死患者患侧小脑后叶动态 ReHo 变异性与记忆任务的反应时间呈负相关。而双侧舌回的动态 ReHo 变异性与此呈正相关。对于右侧皮层下梗死患者,左楔前叶动态 ReHo 变异性与记忆任务反应时间呈正相关,左小脑后叶 dReHo 变异性与记忆任务的反应时间呈负相关。

结论

慢性期皮层下梗死患者病灶远隔脑区动态 ReHo 变异性异常,远隔脑区表现出继发性损伤和重组,且认知相关脑区动态 reho 变异性与记忆功能存在明显的相关性,这些异常脑区可能成为皮层下脑梗死患者记忆功能受损治疗的靶点。

双能 CT 模拟常规图在缺血性脑卒中血管内治疗后的意义

刘克辉、陈晶、孙荣道、曾德华、何占平
海口市人民医院

背景与目的: CT 扫描通常能显示缺血性脑卒中在动脉内血栓切除术(intra-arterial thrombectomy, IAT)后立即出现的介入术后脑内高密度影(post-interventional cerebral hyperdensities, PCHDs)。

双能 CT (Dual energy CT, DE-CT)可以提示 PCHDs 是由出血引起还是碘造影剂渗漏引起。使用碘造影剂后在 DE-CT 上检测到高密度病变,可能与延迟出血转化和预后差有关。然而,在 DE-CT 中预测延迟出血性转化的定量指标仍然不清楚。本研究的目的是评估这些预测延迟出血性转化的指标。材料与方法:回顾性分析 52 例接受 IAT 治疗的急性缺血性脑卒中患者。在 DE-CT 扫描后立即获得模拟常规 CT (Simulated conventional CT, sCCT)图像,随后进行虚拟平扫图的重建 (Virtual,unenhanced, non-contrast, VNC),在 sCCT 图上测量梗死区的 CT 值,评估在 sCCT 图上测量得到的 CT 值与 VNC 图上显示出血以及迟发性出血(parenchymal hemorrhage, PH)的关系。结果:VNC 图上显示出血的患者 sCCT 上的 CT 值显著高于未出血患者(377.9 ± 385 HU vs 83.5 ± 37.9 HU, $P < 0.0001$);临界值为 80 HU,敏感度为 100%,特异度为 63.8%,阳性预测值为 22.3%,阴性预测值为 100% ($P=0.0001$,曲线下面积(AUC)=0.89)。迟发性脑实质出血转化患者 sCCT 上的 CT 值明显高于无迟发性脑出血者 (250.8 ± 382.2 HU vs 93.7 ± 64.8 HU; $P = 0.01$);临界值为 78 HU,敏感度为 100%,特异度为 61%,阳性预测值为 25%,阴性预测值为 100% ($P=0.049$, AUC=0.76)。结论:DE-CT 模拟常规图 (sCCT) 能有效排除 IAT 后脑出血及迟发性脑出血。

PU-1731

基于 CS-AI 的多发性硬化 3D 脑 MRI 可重复性研究

廖丹、杨斯闵、郭春杰
吉林大学第一医院

目的:评价压缩感知结合人工智能重建加速技术 (CS-AI) 在多发性硬化 (MS) 3D 脑 MRI 扫描的可行性,并筛选最优的加速因子 (AF)。

材料与方法:前瞻性地收集吉林大学第一医院共 6 名 MS 患者,对每例被试进行常规脑结构 2D 及 3D T2-FLAIR、T1WI 序列包及基于 CS-AI 技术的 3D T2-FLAIR、T1WI 快速扫描序列包采集。两位放射科医师独立地对图像质量进行主观评分,包括整体图像质量、信噪比、图像伪影和病灶边界清晰度。定量图像质量评估包括:人工评估图像的不同部位的病灶数量、ROI 测量信噪比(SNR)和对比度噪声比(CNR)、采用公开的 SPM 工具包对脑内病灶自动检出以及分割。采用 Mann-Whitney U 检验比较常规和 CS-AI 序列图像质量的主观评分,采用 Wilcoxon 检验比较其图像质量的客观评分,两位医师评分的一致性情况采用 Kappa 值分析,比较 CS-AI 序列不同加速因子脑内病灶自动分割结果与金标准之间的变异系数 (Dice 值)。

结果:临床普通 2D T1WI、T2-FLAIR 序列所需扫描时间分别为 1 分 18 秒和 2 分 6 秒,3D T1WI 序列,常规采集时间为 6 分 11 秒,采用 CS-AI 技术最优 AF 为 7,扫描时间 1 分 41 秒,较常规采集时间缩短 72.8%;3D T2-FLAIR 序列,常规采集时间为 6 分 10 秒,采用 CS-AI 技术最优 AF 为 10 左右,扫描时间为 2 分 19 秒,较常规采集时间缩短 62.4%。

常规采集和应用 CS-AI 序列之间的诊断价值没有显著差异 ($P < 0.05$)。

结论:基于 CS-AI 加速技术,采用最优 AF 进行 3D T1WI 及 T2-FLAIR 扫描,能够在与 2D T1WI 及 T2-FLAIR 扫描时间接近的时间内,获得与常规 3D 扫描接近的图像质量。

PU-1732

Initial clinical experience of synthetic MRI as a routine brain metastasis imaging protocol in daily practice: A single-center study

Gaoyang Zhao¹, Xiaoyue Ma¹, Yuncai Ran¹, Ruilin Fan¹, Kun Zhang¹, Yanglei Wu², Yang Lai², Yong Zhang¹, Jingliang Cheng¹

1. Department of Magnetic Resonance Imaging, The First Affiliated Hospital of Zhengzhou University

2. Siemens Healthineers

Objectives: Conventional magnetic resonance imaging (MRI) for routine examinations has relatively long scan times, and the signal intensity of images is dependent on specific MR scanner settings. Due to scanner variations and automatic optimization, it is not possible to compare images based on absolute image intensity. Synthetic MRI (SyMRI) allows reconstruction of various contrast images from a single scan, potentially reducing examination time and enabling quantitative measurements of T1, T2, and proton density (PD). This study aims to assess the diagnostic quality and accuracy of synthetic images in brain metastasis imaging by comparing them with conventional MRI images and explore the feasibility of SyMRI as a routine imaging protocol in clinical practice.

Materials and Methods: A prospective, multi-case non-inferiority trial was conducted from August 2022 to September 2022, involving 46 patients (mean age 54.2 ± 10.4 years; range 28-80 years) suspected of having brain metastasis who underwent brain MRI examinations. The imaging protocol included both conventional routine sequences and a 5-minute multi-dynamic multi-echo sequence (with 24 patients eventually confirmed to have brain metastasis). Parameters required for the synthesis of images from the multi-dynamic multi-echo data were predetermined by an experienced neuroradiologist. Each case comprised traditional T1 and T2-weighted images, T1, T2 fluid-attenuated inversion recovery (FLAIR) images, post-contrast T1-weighted images, and corresponding synthetic images. All images were randomized and independently evaluated by two blinded neuroradiologists for contrast, contrast-to-noise ratio (CNR), morphological readability, diagnostic quality, radiological findings indicating diagnosis, artifacts, and clinical reporting, with assessments performed at two different time points separated by an average of 30 days, providing a comprehensive evaluation of synthetic MRI for brain metastasis imaging in a clinical setting.

Results: Clinical MR imaging revealed 22 cases without intracranial metastases and 24 cases with brain metastases. Interobserver agreement for image quality assessment of all synthetic sequences ranged from moderate to almost perfect (κ , 0.61-0.99; $P < 0.001$). Synthetic T1- and T2-weighted images and post-contrast T1-weighted images exhibited higher contrast but also higher noise levels, resulting in similar CNR compared to conventional images. Synthetic T2-weighted FLAIR images showed lower contrast and higher noise levels, leading to lower CNR. Overall image quality and anatomical delineation provided by synthetic brain MRI scored well on the 5-point Likert scale, with scores exceeding 3 for all sequences except T2 FLAIR. Synthetic T2 FLAIR sequences provided sufficient image quality but exhibited more pronounced artifacts, especially CSF pulsation artifacts and linear high-signal artifacts along the brain surface. The overall diagnostic quality of synthetic MR imaging was non-inferior to conventional imaging, with no significant differences in sensitivity, specificity, and accuracy for brain metastasis diagnosis ($P > 0.05$). There were no significant differences observed in examination quality, diagnostic confidence, or noise/artifacts when comparing synthetic and conventional sequences.

Conclusion: The image quality of synthetic MR imaging is comparable to conventional T1- and T2-weighted images in brain metastasis patients. Although artifacts are more common in synthetic T2 FLAIR, they are easily identifiable and do not affect the evaluation of lesion areas, suggesting the potential need for additional conventional T2 FLAIR to aid diagnosis. Synthetic MRI can be considered as an acceptable routine clinical imaging protocol for brain metastasis, offering shorter scan times.

Identifying two distinct neuroanatomical subtypes of first-episode depression using heterogeneity through discriminative analysis

Yuan Chen¹, Yi Chen², Ruiping Zheng¹, Shuying Li¹, Jianyue Pang¹, Hengfen Li¹, Yong Zhang¹, Shaoqiang Han¹, Jingliang Cheng¹

1. the First Affiliated Hospital of Zhengzhou University

2. Henan Provincial People's Hospital

Neurobiological heterogeneity in depression remains largely unknown, leading to inconsistent neuroimaging findings.

Here, we adopted a novel proposed machine learning method ground on gray matter volume (GMV) to investigate neuroanatomical subtypes of first-episode treatment-naïve depression. GMVs were obtained from high-resolution T1-weighted images of 195 patients with first-episode, treatment-naïve depression and 78 matched healthy controls (HCs). Then we explored distinct subtypes of depression by employing heterogeneity through discriminative analysis (HYDRA) with regional GMVs as features.

Two prominently divergent subtypes of first-episode depression were identified by adopting the HYDRA method, exhibiting opposite structural alterations compared with HCs and sharing no different demographic features. Subtype 1 presented widespread increased GMVs mainly located in frontal, parietal, temporal cortex and partially located in limbic system. Subtype 2 presented widespread decreased GMVs mainly located in thalamus, cerebellum, limbic system and partially located in frontal, parietal, temporal cortex. When overall patients with depression were compared to HCs, widespread abnormal GMVs detected in Subtype 1 and 2 were not obvious. Subtype 2 had smaller TIV and longer illness duration than Subtype 1. And TIV in Subtype 1 was positively correlated with age of onset while not in Subtype 2, probably implying the different potential neuropathological mechanisms.

This study revealed two distinguishing neuroanatomical subtypes of first-episode depression, which provides new insights into underlying biological mechanisms of the heterogeneity in depression and might be helpful for accurate clinical diagnosis and future treatment.

Assessment of magnetic resonance imaging and histopathological changes in chordoid glioma

Cong Huang

Department of Radiology, No. 926 Hospital, Joint Logistics Support Force of PLA

Background:

This study analyzed the imaging and pathologic features of CG and proposed a relatively specific sign that could help in the differential diagnosis before surgery.

Objective:

Choroid glioma (CG) is a rare tumor that neurosurgeons may be unfamiliar with. We sought to assess the MRI and histopathological changes in CG.

Methods:

This was a retrospective study analyzing data at our institution from January 2015 to May 2021. The pathological and MRI data of 13 patients who had pathologically-confirmed were analyzed.

Results:

Of the 13 cases of CG included 7 were males and 6 were females, mean age of 35.1 ± 10.8 years (range: 7 to 51). CG was confirmed when the the mucous matrix was the main component when the T2 weighted imaging (T2WI) showed a hyperintense lesion and when the epithelial-like cells was the main component when T2WI showed an iso- or hypointensity. In this group, 4 cases (4/13, 30.8%) showed obvious hyperintensity on T2WI, and 9 cases (9/13, 69.2%) showed iso- or hypointensity on T2WI. Enhanced scanning of the 2 cases with uneven stripe enhancement and 11 cases with significant enhancement was done. Eleven cases (11/13, 84.6%) showed varying degrees of edematous bands around the tumor, of which 10 cases (90.9%) showed the " eight-character edema sign".

Conclusion:

CG most notably appears on MRI as the " eight-character edema sign ". However, the diagnosis of this lesion involves combining MRI findings pathological analysis.

PU-1735

Altered small-world, functional brain networks in patients with postherpetic neuralgia

Jian Jiang,Yanwei Miao
The First Affiliated Hospital of Dalian Medical University

In this study, we aimed to investigate the functional network changes that occur in patients with postherpetic neuralgia (PHN). We also investigated the link between PHN and the small-world properties of functional networks within the brain. Functional MRI (fMRI) was performed on 204 individuals with PHN and 34 age, gender and the severity of the pain-matched patients with lower back pain (LBP) during the resting state. Network-based statistics were performed to investigate the differences between the brain networks of individuals with PHN and LBP. Several small-world parameters of brain networks were calculated, including the clustering coefficient, characteristic path length, local efficiency, and global efficiency. These criteria reflect the overall network efficiency.

The brain networks in the individuals with LBP due to herniation of a lumbar disc demonstrated a significantly longer characteristic path length as well as a higher clustering coefficient, global efficiency, and local efficiency compared to those PHN ($p < 0.001$). We found that PHN patients tended to have stable and efficient brain networks when compared with LBP. The brain networks of the LBP group demonstrated significantly longer characteristic path length, which lead to the slower information processing in the brains of those with LBP compared to PHN (Figure 1) .

脑灰质结构特征联合机器学习方法对伴中央颞区棘波的儿童自限性癫痫患者与正常儿童的分类研究

权巍、初同朋、李跃
烟台毓璜顶医院

目的

伴中央颞区棘波的儿童自限性癫痫(SeLECTS)是一种常见的局灶性、短暂性、发育性癫痫综合征,其脑电特征是单侧或双侧、独立的中央颞区棘波,且容易共患睡眠障碍、多动抽动障碍等疾病。既往研究发现 SeLECTS 患儿的脑灰质体积与结构网络存在异常,提示其存在脑发育障碍。本研究进一步探讨 SeLECTS 患儿与正常儿童脑灰质结构特征差异并通过机器学习方法进行分类研究。

方法

40 例 SeLECTS 患儿和 40 例正常儿童行 3T 磁共振结构成像检查。使用 FreeSufer 软件提取患者组与对照组 68 个脑区的 8 项灰质结构指标 (表面积、灰质体积、厚度均值、厚度标准差、平均曲率、平均高斯曲率、折叠指数、曲率指数)。采用两样本 T 检验筛选患者组与健康对照之间差异有统计学意义的特征, 然后使用最小收缩算法(LASSO)从差异特征中选择与最相关的关键特征。使用支持向量机 (SVM) 方法构建分类模型。同时对关键灰质结构特征与患者病程、发作频率及量表进行相关性分析。

结果

选择 15 个关键特征指标构建分类模型, 在训练队列和验证队列中 AUC 分别为 0.929 和 0.921。其中双侧下颞叶皮层厚度与多动冲动评分呈负相关 ($p < 0.05$, FDR 校正)。

结论

本研究进一步证实 SeLECTS 患儿脑灰质结构发育存在异常, 通过机器学习方法可以构建 SeLECTS 与正常儿童的分类模型并取得良好效能; 双侧下颞叶皮层改变可能与共患多动抽动障碍有关。

PU-1737

Study on Magnetic Resonance CSF-QF Sequence Measurement of Cerebrovascular and Cerebrospinal Fluid Flow Patterns in Patients with Hydrocephalus

cheng peng,heng meng
Affiliated Hospital of BeiHua University

Objective: Cerebrovascular and cerebrospinal fluid (CSF) flow patterns in the patients with traffic hydrocephalus and obstructive hydrocephalus were analyzed using magnetic resonance CSF-QF sequence, and the volume of lateral and third ventricles was quantitatively analyzed. **Methods:** Thirty-seven subjects who underwent head MRI examination in our hospital were selected, including 14 normal volunteers, 12 patients with traffic hydrocephalus and 11 patients with obstructive hydrocephalus. The Philips Ingenia 3.0T MR Scanner combined with peripheral pulse gating (PPU) equipment to collect CSF flow data from cerebrovascular and midbrain aquaduct in patients with hydrocephalus by means of magnetic resonance CSF-QF sequence.

The scanning data were transferred to Philips Intellispace Portal post-processing workstation, and the cerebrospinal fluid flow in the common carotid artery, internal jugular vein and midbrain aqueduct was analyzed using QFLOW software. Finally, the data were transferred to Philips ISD post-processing workstation to measure the volume of lateral ventricle and third ventricle. **Results :** 1. The cerebrospinal fluid in the midbrain aqueduct showed bidirectional

flow in one cardiac cycle. The CSF flow curve in the obstructive hydrocephalus group was mostly wavy, and the CSF flow curve in the control group and the traffic hydrocephalus group was mostly sinusoidal, and the range of the flow curve in the traffic hydrocephalus group was larger. The flow curve can distinguish obstructive hydrocephalus from non-obstructive hydrocephalus. 2. Velocity and discharge of cerebrospinal fluid at the level of midbrain

aqueduct were significantly increased in communicating hydrocephalus. In obstructive hydrocephalus, cerebrospinal fluid flow and velocity were significantly reduced at the level of midbrain aqueduct. 3. There was no significant difference in the common carotid artery and internal jugular vein flow and velocity between the control group, the traffic hydrocephalus group and the obstructive hydrocephalus group. 4. The volume of the lateral ventricle and the third ventricle increased significantly in traffic hydrocephalus and obstructive hydrocephalus. **Conclusion:** 1. Magnetic resonance CSF-QF sequence is a non-invasive and intuitive examination method for the analysis of cerebrovascular and cerebrospinal fluid flow, which can directly reflect the flow direction of cerebrospinal fluid in

the aqueduct and draw the flow curve diagram of cerebrospinal fluid, according to which the obstructive hydrocephalus and non-obstructive hydrocephalus can be distinguished. 2. Magnetic resonance CSF-QF sequence can quantitatively measure cerebrovascular and cerebrospinal fluid flow and velocity, providing an important means for clinical diagnosis of hydrocephalus, preoperative evaluation and prognosis analysis.

神经精神性系统性红斑狼疮的免疫病理特征及影像学诊断

张艳秋^{1,2}、史大鹏^{1,2}、王梅云^{1,2}

1. 河南省人民医院

2. 郑州大学人民医院

系统性红斑狼疮(Systemic lupus erythematosus, SLE)是一种以多种免疫异常为特征的系统性自身免疫性疾病,可以累及中枢神经系统。神经精神性系统性红斑狼疮(Neuropsychiatric SLE, NPSLE)是由系统性红斑狼疮相关的中枢神经系统受累引起的,包括一系列不同严重程度的神经和精神表现,这使其与其他非 SLE 相关的中枢神经系统疾病难以区分。根据 NPSLE 的免疫学、病理学和影像学特征,其基础病理生理学可分为血管炎和血管病变、抗磷脂综合征(APS)、脱髓鞘综合征或自身免疫性抗体介导的脑炎。此外,由于 SLE 本身或 SLE 治疗引起的免疫低下状态,也会出现一系列并发症。不同病理生理的影像学特征不同,但其影像学表现并无特异性,因此 NPSLE 的影像诊断较为困难。本文对 NPSLE 相关的免疫病理特征、基于病理生理特征的影像学表现(包括微血管慢性缺血样改变、脑萎缩、腔梗、大面积梗死、微出血、颅内出血、蛛网膜下腔出血、脱髓鞘改变、视神经炎、脊髓炎、脑炎等)及其并发症(如可逆性后部脑病综合征、进行性多灶性脑白质病、免疫抑制药物相关性淋巴细胞增殖症、免疫抑制药物中毒性脑病)进行了全面综述。熟悉 NPSLE 的病理生理机制、影像学表现和并发症有助于做出准确的诊断,并确定合适的临床检查和治疗方案。

两例颅内动脉夹层漏诊误诊分析并文献复习

易丽荣、向波

重庆医科大学附属永川医院放射科

目的:颅内动脉夹层(intracranial artery dissection, IAD)由于颅内血管管径细小迂曲,常规管腔成像诊断其动脉夹层较为困难。本文报道 2 例 CTA 漏诊误诊的 IAD 病例,回顾其 HRMR-VWI 特点,并进行相关文献分析,旨在提高 IAD 的诊断,并为 IAD 的治疗过程进行动态观察随访,及时提供影像学依据,指导临床治疗。方法:回顾分析两例 IAD 患者临床资料及影像学检查,将 HR-MRI 的结果与 CTA 及 DSA 检查的结果进行对比。并结合文献分析高分辨率磁共振血管壁成像在 IAD 诊断的影像学特点。结果:CTA 由于无法观察管壁情况,对空间上存在一定重叠的小血管分辨率不高,误诊一例颅内段椎动脉夹层动脉瘤为单纯动脉瘤,漏诊一例小脑上动脉夹层。而经全脑高分辨率磁共振血管壁成像进行 3D 重建图像,结合多序列参数,观察到内膜瓣、双腔征及壁内血肿表现,辅助临床确诊了责任血管以及夹层的存在。结论:高分辨率磁共振血管壁成像可以辅助 DSA 明确 IAD 诊断及术前评估,为责任血管定位及定性提供影像学证据。

反复发作的糖尿病纹状体病的影像学特征并文献复习

徐长贺、尚海龙、于乐林、王一超、赵世伟、杜红娣、叶娟、沈海林
苏州九龙医院

目的：探讨糖尿病纹状体病的临床及影像学特征。方法：回顾性分析 2020 年 11 月 12 日上海交通大学医学院苏州九龙医院神经内科收治的 1 例反复发作的糖尿病纹状体病患者的临床及影像学资料，并复习文献，总结该病的临床及影像学特征。结果：1 例老年女性患者因左侧上肢偏侧舞蹈样运动 2d 入院，入院时静脉随机葡萄糖 38.62mmol/L，颅脑 CT 示右侧基底节区高密度影，头颅 MRI 示右侧纹状体 T1WI 高信号，磁敏感加权成像（SWI）序列未见明显异常信号。予胰岛素降糖、补液、纠正电解质紊乱等治疗，并予抗血小板聚集、降脂稳定斑块、改善循环、营养脑细胞、调控血压等对症治疗，1 周后血糖控制稳定，复查头颅 MRI 提示右侧纹状体 T1WI 高信号强度减低，症状好转。患者出院 1 个月后因左下肢不自主舞蹈样扭动再次入院，复查头颅 MRI 提示右侧纹状体 T1WI 高信号，血糖轻度增高伴炎症指标较高，两肺感染，予降糖、抗感染治疗，患者下肢扭动症状消失。结论：患者出现亚急性单侧肢体舞蹈样运动障碍、存在控制不佳的糖尿病、颅脑 CT 和 MRI 提示对侧纹状体高密度影和 T1WI 高信号时，应考虑糖尿病纹状体病，感染也可导致该病的复发，该病的影像表现具有一定的可逆性。

椎管内非典型神经鞘瘤和非典型脊膜瘤的 MR 鉴别

王正阁¹、赵兰锋²

1. 南京鼓楼医院

2. 重庆市梁平区人民医院

目的 分析椎管内非典型神经鞘瘤（IAS）和非典型脊膜瘤（ASM）的 MRI 征象和临床特点，讨论两者的 MRI 鉴别诊断。方法 回顾性分析 80 例南京鼓楼医院 2017 年 1 月至 2020 年 7 月经病理证实的椎管内神经鞘瘤和脊膜瘤的术前 MRI 图像，提取其影像特征，运用 SPSS 分析软件对它们的 MRI 特征及临床特点进行统计分析。结果 ①IAS 组平均年龄 51.5±10.1 岁，ASM 组平均年龄 61.1±12.9 岁；两组在性别、年龄及发病部位上具有非常显著的统计学差异（P 均<0.01）。②在形态学上 IAS 组和 ASM 组的纵径、横径及纵横径比之间的差异均无统计学意义（P 均>0.05）。③在 MRI 信号特点（T1WI、T2WI 信号强度、T2WI 信号混杂性、是否囊变）及强化特征（强化程度、强化均匀性、是否环形强化）方面两组之间的差异均具有非常显著的统计学意义（P 均<0.01）。结论 区分椎管内非典型神经鞘瘤和非典型脊膜瘤的 MRI 影像学差别，并综合其临床特点是鉴别二者的可靠办法。

PU-1742

海马硬化型颞叶癫痫手术预后相关的 fMRI 图论分析研究

王正阁、刘付金龙
南京鼓楼医院

目的 探讨影响海马硬化型颞叶癫痫（TLE）手术预后相关的图论指标及节点脑区。方法 采集 34 例单侧海马硬化型 TLE 患者（TLE 组）的术前 fMRI 扫描及临床资料，同时纳入 50 例健康对照者

(HC, HC 组), 根据单侧前颞叶切除术后 2 年以上的随访结果, 将患者分为术后无癫痫发作组 (SF, SF 组) 和术后有癫痫发作组 (NSF, NSF 组)。比较 HC 组与 TLE 组、SF 组与 NSF 组之间图论指标的差异。最后使用支持向量机 (SVM) 对海马硬化型 TLE 患者手术疗效进行预测, 并使用另一数据集的 11 例海马硬化型 TLE 患者验证模型的分类准确率。结果 相比 HC 组, TLE 组病灶侧颞区的介数中心性、度中心性、节点效率下降而双侧眶额皮层升高。同时, SF 组患侧杏仁核具有更低的介数中心性, 而 NSF 组健侧枕上回的介数中心性、度中心性、节点效率更低。SVM 分类性能方面, ROC 曲线下面积为 0.85, 分类准确率为 91%。结论 TLE 患者脑功能网络发生了重组, 内侧颞叶功能受到损害而双侧眶额皮层的重要性有所提升。同时, 患侧杏仁核及健侧枕上回可能是影响 TLE 患者 ALT 手术预后的关键节点。最后, rs-fMRI 图论分析是预测海马硬化型 TLE 患者的手术疗效的一种有效手段。

基于定量分析 MR 增强信号比值的椎管内神经鞘瘤和脊膜瘤的鉴别

王正阁¹、赵兰锋²

1. 南京鼓楼医院

2. 重庆市梁平区人民医院

目的 定量分析椎管内神经鞘瘤和脊膜瘤的 MRI 增强图像的信号比值 (SI Ratio), 进而为两者的鉴别诊断提供客观依据。材料与方法 回顾性分析 116 例南京鼓楼医院 2017 年 1 月至 2020 年 7 月经病理证实的椎管内神经鞘瘤和脊膜瘤的术前 MRI 图像, 测量肿瘤和皮下脂肪的信号强度值, 并计算二者的比值, 运用 SPSS 和 Medcalc 分析软件对它们的信号值和信号比值进行统计分析。结果 ①椎管内神经鞘瘤 MRI 增强图像的 SI Ratio 值显著高于椎管内脊膜瘤 ($P < 0.01$)。②SI Ratio 对区分椎管内神经鞘瘤与脊膜瘤表现出非常优秀的预测水平, ROC 曲线下面积为 0.959 (研究者 1) 和 0.928 (研究者 2), 临界值分别为 0.77 (敏感性: 86%, 特异性: 100%) 和 0.79 (敏感性: 81%, 特异性: 97%)。结论 MRI 增强图像上肿瘤和皮下脂肪的信号比值, 能有效鉴别椎管内神经鞘瘤和脊膜瘤。

PU-1744

Imaging features of recurrent diabetic striatopathy and literature review

Changhe Xu, Hailong Shang, Lelin Yu, Yichao Wang, Juan Ye, Hailin Shen
Suzhou Kowloon Hospital, Shanghai Jiao Tong University School of Medicine

Objective To explore the clinical and imaging features of diabetic striatopathy (DS). **Methods** The clinical and imaging data of a patient with recurrent DS who was admitted to Department of Neurology of Suzhou Kowloon Hospital, Shanghai Jiao Tong University School of Medicine on November 12, 2020, were analyzed retrospectively, and the literature was reviewed to summarize the disease's clinical and imaging features. **Results** An elderly female patient was admitted for a 2d dance-like movement on the left side of her upper limb. At the time of admission, the random venous glucose level was 38.62mmol/L. Cranial CT revealed a high density shadow in the right basal ganglia, while cranial MRI revealed a high signal intensity in the right striatum on T1WI, with no obvious abnormal signal on susceptibility weighted imaging (SWI). Insulin hypoglycemic therapy, fluid rehydration, electrolyte correction, and other symptomatic treatments such as anti-platelet aggregation, lipid-stabilizing plaque, improving circulation,

nourishing brain cells, and regulating blood pressure were administered to the patient. A week later, blood glucose control had stabilized, and a cranial MRI revealed that the high signal intensity of the right striatum T1WI had been reduced, and the symptoms had been improved. One month after discharge, the patient was readmitted to the hospital due to involuntary writhing of the left lower limb. A re-examination of the cranial MRI revealed a high T1WI signal in the right striatum, a slight increase in blood glucose with high inflammatory markers, and infection of both lungs. After receiving hypoglycemic and anti infection treatment, the patient's lower limb symptoms resolved. **Conclusions** Patients with subacute unilateral dance like dyskinesia, poorly controlled diabetes, contralateral striatum high density shadow, and T1WI high signal on cranial CT and MRI should be evaluated for DS. Infection can also cause disease recurrence, and the imaging manifestations of the disease are reversible to some extent.

PU-1745

Meningioma peritumoral brain edema is associated with transverse relaxation time

Zongye Li¹, Xiao Wang², Fei Wu², Jianfeng Bao², Jingliang Cheng²

1. the First Affiliated Hospital of Zhengzhou University

2. 郑州大学第一附属医院

Purpose

The occurrence of peritumoral brain edema (PTBE) not only increases surgical difficulties, but may also lead to greater mutation burdens and more complications. This study aimed to explore the association of radiological parameters and pathological metrics with PTBE in meningiomas.

Material and Methods

We enrolled 86 meningiomas patients (55.85 ± 10.84 years, 61 female), who underwent MRI scans preoperatively. All the MRI examinations were performed on a 3.0 T Prisma scanner. Whole-brain T2 maps were acquired within 32 s in a single scan using a novel single-shot ultrafast T2 mapping technique. Axial T2-dark-fluid imaging, diffusion-weighted imaging, and contrast-enhanced T1-weighted imaging were also performed for all patients. Two blind neuroradiologists evaluate PTBE on T2-dark-fluid imaging, and manually delineated regions of interest using 3D Slicer software (version 4.10.2, www.slicer.org), with final results relying on their consensus. Necrosis, large vessels and calcification were excluded. We extracted histogram parameters from both T2 and apparent diffusion coefficient (ADC) maps using FeAture Explorer (FAE; <https://github.com/salan668/FAE>), including mean, median, maximum, minimum, ten percentiles (P10), 90 percentiles (P90), interquartile range (IQR), range, entropy, skewness, kurtosis, uniformity, and variance. In the univariate analysis, parameters were compared using independent t-test or Mann-Whitney U test. Statistically significant parameters were screened for the multivariate logistic regression analysis with the backward method. For both univariate and multivariate analysis, Bonferroni correction was applied for multiple comparisons and the significance level was set at $p < 0.05/n$ (n = number of the factors included).

Results

In the univariate analysis, T2 parameters were significantly associated with PTBE, but the correlation of ADC and Ki-67 index with PTBE did not show statistical significance. P90, range and variance of T2 ($p = 0.004$, 0.002 and 0.001 , respectively) were found to be independent factors associated with PTBE in meningiomas through the multivariate analysis.

Conclusion

Our research suggested that the formation of PTBE in meningiomas was more likely to correlate with T2 relaxation time, instead of ADC or Ki-67 index. This indicates a greater possibility that PTBE in meningiomas may arise from the water pressure gradient between tumor tissue of high-water content and normal brain, rather than the prior explanation of vasogenic edema alone.

PU-1746

Investigation of the relationship between glutamate of thalamus and local brain spontaneous activity revealed by a study combined functional magnetic resonance imaging and magnetic resonance spectroscopy

Zhengge Wang
Nanjing Drum Tower Hospital

Purpose: To investigate whether the level of glutamate in thalamus is correlated with local spontaneous brain activity in thalamus and other regions.

Materials and Methods: We performed short echo Magnetic Resonance Spectroscopy (MRS) measurements of glutamate and resting-state functional magnetic resonance imaging (fMRI) in 17 young adult healthy participants. Bilateral thalami were selected as ROIs for MRS. The glutamate concentration of the thalamus was analyzed by Lc Model. The whole brain amplitude of low-frequency fluctuation (ALFF), regional homogeneity (ReHo) and degree centrality (DC) were calculated. The correlations between the glutamate concentrations of bilateral thalamus and the whole brain ALFF, ReHo and DC were investigated by using the Pearson correlation coefficient analysis.

Results: Significant positive correlations were found between glutamate concentration and the ALFF and ReHo in left thalamus ($r = 0.81$, $p = 0.0001$; $r = 0.72$, $p = 0.001$). Furthermore, the ALFF of left primary motor cortex and bilateral auditory cortex were affected by left thalamus glutamate. However, left thalamus glutamate has an effect on the ReHo of left limbic system.

Conclusion: These results demonstrated that the excitability degree of thalamus decided its resting-state brain activity and has influence on the ALFF of sensory and motor cortex and the ReHo of limbic system. This provides insight into better understanding the neuronal and biochemical mechanisms of thalamus function under normal conditions and neuropsychiatric disorders.

PU-1747

MRI 瘤周影像组学鉴别高级别胶质瘤与脑内单发转移瘤的应用价值

袁媛、李振凯、杜红娣、沈海林
苏州九龙医院

目的:探讨 MRI 瘤周影像组学鉴别高级别胶质瘤与脑内单发转移瘤的应用价值。**方法:**回顾性分析 2015 年 1 月至 2020 年 6 月经手术病理证实的 39 例高级别胶质瘤及 28 例脑内单发转移瘤的术前磁共振 T2WI 序列影像资料。使用 3D-slicer 软件手动分割获得瘤体的体积感兴趣区,并分别提取瘤周 5 mm 及 10 mm 的影像组学特征。使用最小值最大值归一化及最优特征筛选对影像组学特征进行降维,最后采用 R 语言软件建立 Logistic 回归模型,并使用 K 折交叉验证模型的稳定性。绘制受试者工作特征曲线(ROC)评估组学模型的诊断效能。**结果:**基于术前 MRI 瘤周 5 mm 的影像组学模型在鉴别高级别胶质瘤及脑内单发转移瘤中的敏感性、特异性及曲线下面积(AUC)分别是 0.692、0.946 和 0.91;基于术前 MRI 瘤周 10 mm 影像组学模型在鉴别高级别胶质瘤及脑内单发转移瘤中的敏感性、特异性及 AUC 分别是 0.872、0.893 和 0.93。采用 K 折交叉验证对模型的稳定性进行验证,瘤周 5 mm 及 10 mm 影像组学模型的平均 AUC 分别是 0.80、0.75,提示模型具有较高的诊断效能。**结论:**MRI 瘤周影像组学有助于术前鉴别高级别胶质瘤与脑内单发转移瘤。

长时血压变异性、脑结构与认知功能的关联

李小帅、王振常

首都医科大学附属北京友谊医院

目的：探究长时血压变异性 (BPV)、脑结构、认知功能之间的关联。

方法：我们从开滦研究的随访人群中纳入了 1254 名参与者。从 2006 年起每 2 年随访一次测量血压。采用 SD、CV、ARV 和 VIM 评价 BPV。在 2020 年的最后一次随访中进行了头颅 MRI 和认知评估。使用 MoCA 评分评估认知能力。采用一般线性模型探究 BPV，大脑结构和认知之间的关联。采用中介分析探究脑结构变化是否介导了 BPV 与认知功能之间的关联。

结果：与最低三分位相比，最高三分位的 SD_{SBP} 和 SD_{DBP} 与全脑灰质(GM)体积(SD_{SBP} : $\beta=-4.62$, $P=0.013$; SD_{DBP} : $\beta=-5.64$, $P=0.001$)和额叶容积(SD_{SBP} : $\beta=-1.74$, $P=0.013$; SD_{DBP} : $\beta=-1.53$, $P=0.014$)相关，最高三分位的 SD_{SBP} 与颞叶体积($\beta=-1.08$, $P=0.025$)和左侧海马体积($\beta=-0.05$, $P=0.040$)相关。最高三分位的 SD_{DBP} 的与总脑体积($\beta=-10.07$, $P=0.001$)、顶叶体积($\beta=-0.77$, $P=0.015$)和白质高信号(WMH)体积($\beta=1.91$, $P=0.048$)相关。最高三分位的 SD_{SBP} 、 SD_{DBP} 与 MoCA 评分呈负相关(SD_{SBP} , $\beta=-0.64$, $P=0.014$; SD_{DBP} , $\beta=-0.69$, $P=0.003$)。降低的全脑 GM、颞叶、右海马体积和 WMH 体积增加与 MoCA 评分降低相关($p < 0.05$)。当 SD_{SBP} 和 SD_{DBP} 被视为连续暴露变量，以及使用 CV、ARV 和 VIM 计算 BPV 时，观察到类似的结果。中介分析表明，全脑 GM 和颞叶体积的减少介导了 SD_{SBP} 增大与认知能力下降之间的关联。

结论：长时 BPV 升高与脑体积减少、WMH 体积增加和认知能力下降有关。全脑 GM 和颞叶体积的减少介导了 SD_{SBP} 和认知功能之间的负相关。

PU-1749

基于体素间和体素内弥散指标对首发未服药精神分裂症患者脑白质微观结构的研究

许曼

郑州大学第一附属医院

目的 采用体素间弥散指标——局部弥散一致性(LDH)值及传统体素内弥散指标探究首发未服药精神分裂症(FESZ)患者脑白质微观结构的异常。 方法 选择郑州大学第一附属医院精神医学科自 2020 年 1 月至 2021 年 12 月收治的 56 例 FESZ 患者为研究对象，并同期招募 64 名健康志愿者作为正常对照组。对所有被试进行磁共振弥散张量成像扫描，采用 FSL 及 PANDA 软件处理得到 LDH 值、各向异性分数(FA)、平均弥散系数(MD)、轴向弥散系数(AD)和径向弥散系数(RD)值。通过基于纤维束示踪的空间统计(TBSS)方法分析比较 2 组之间脑白质纤维各个弥散指标的差异。对于组间差异有统计学意义的白质纤维束区域，采用受试者工作特征曲线(ROC)评价各个弥散指标对 FESZ 的诊断价值，采用 Spearman 偏相关分析检验各个弥散指标与阳性和阴性症状量表(PANSS)评分的相关性。 结果 与正常对照组相比，FESZ 组双侧丘脑前辐射部分体素簇的 LDH 值明显增加，差异有统计学意义($P<0.05$, FWE 校正)。与正常对照组相比，FESZ 组右侧下纵束及右侧钩束感兴趣束(TOI)的 LDH 平均值明显增加，差异有统计学意义($P<0.05$, FDR 校正)。在上述纤维束区域，ROC 分析显示 LDH 值均具有诊断效能($P<0.05$)，且 4 个纤维束联合时的 LDH 值诊断效能最大[曲线下面积(AUC)=0.733, $P<0.001$]。相关性分析显示 FESZ 组与正常对照组有显著差异区域的 LDH 值与 PANSS 各项评分均不具有相关性($P>0.05$)。在 FA、MD、AD 和 RD 指标参数图中未发现组间差异有统计学意义的体素簇或 TOI($P>0.05$)。 结论 体素间弥散指标 LDH 值能够检测到传统体素内弥散指标未能发现的 FESZ 患者脑白质微观结构的代偿性变化。

影像组学在鉴别胶质瘤术后复发及放射性损伤中的作用

孔令煜、周高峰
中南大学湘雅医院

胶质瘤是神经外科最常见的一种中枢神经系统肿瘤，对于胶质瘤的治疗以手术切除肿瘤为主，结合放疗、化疗等综合治疗方法。胶质瘤术后复发和放射损伤的影像学表现和临床症状相似，但两者的治疗方法完全不同。放射性损伤通常采取对症的保守治疗，而胶质瘤复发则需要放疗、化疗或二次手术。胶质瘤术后复发和放射性损伤具有相似的临床表现和传统影像学特征，但在组织病理学和治疗措施上存在显著差异，如何精准有效鉴别胶质瘤术后复发和放射性损伤的方法具有重要的临床意义，因此胶质瘤术后复发和放射性脑损伤的鉴别诊断是临床实践中的一大挑战，因此运用影像学方法对两者进行鉴别具有重要的临床意义。我们将通过在磁共振平扫增强、扩散加权成像、磁共振波谱成像、磁共振灌注成像、动态增强成像、磁敏感加权成像、正电子发射计算机断层（PET-CT）区分胶质母细胞瘤复发和放射性脑损伤，为临床诊断和治疗提供帮助。

PU-1751

Genetic mechanisms underlying gray matter atrophy in Parkinson's disease: a combined neuroimaging and transcriptome study

Yi Ji,Xiangming Fang
The Affiliated Wuxi People's Hospital of Nanjing Medical University

Objectives: Extensive research has shown apparent gray matter atrophy in patients with Parkinson's disease (PD), which is a heritable disease. The objective of this study was to investigate the genetic mechanisms of gray matter reductions in Parkinson's disease.

Methods: To achieve a more thorough characterization of gray matter atrophy in PD, we performed a comprehensive neuroimaging meta-analysis of previous literature including 1,831 PD patients and 1,378 controls as well as examined group gray matter atrophy in an independent dataset of 46 PD patients and 28 controls. Utilizing the Allen Human Brain Atlas, we performed spatial association analyses linking transcriptome data to neuroimaging findings to identify genes correlated with gray matter atrophy in PD. Subsequently, we conducted enrichment analyses for the identified genes associated with gray matter losses in PD patients and performed a series of gene functional feature analyses.

Results: Our meta-analysis and independent dataset neuroimaging analysis consistently revealed significant gray matter atrophy in the superior temporal lobe of PD patients. Transcriptome-neuroimaging correlation analysis identified 1,952 overlapping genes whose expression correlated with spatial gray matter reductions in PD. These genes were enriched in biologically significant processes and exhibited selective expression in brain tissue, dopamine receptor cells, and neurons. Furthermore, these genes supported the construction of a protein-protein interaction (PPI) network, highlighting 16 putative hub genes with functional significance.

Conclusion: Our findings emphasize the presence of prominent gray matter atrophy in PD, probably resulting from intricate interactions among a diverse set of genes with various functional features.

PU-1752

脑出血患者发生早期血肿扩大的影响因素及临床价值

齐欣、杨超
大连医科大学附属第一医院

目的 探讨脑出血 (intracranial hemorrhage, ICH) 早期血肿扩大的影响因素, 并与患者发生预后不良及死亡率的关系。方法 回顾性分析自 2021 年 9 月至 2023 年 3 月就诊于大连医科大学附属第一医院的自发性脑出血患者, 患者于出现症状的 24h 内接受基线 CT 扫描并于获取基线 CT 48h 内获得随访 CT, 根据是否发生血肿扩大将患者分为血肿扩大组 (40 例) 和血肿稳定组 (66 例), 根据改良 Rankin 评分 (mRS) 量表评判脑出血患者发病后 3 个月时的功能状态, 分析两组患者的 CT 图像及临床资料。结果 对两组患者的年龄、性别、高血压病史、血肿位置 (分为脑叶、基底节区、丘脑、脑干、小脑)、合并脑室出血、血肿周围水肿、蛛网膜下腔出血进行比较, 差异均无统计学意义 ($P>0.05$); 血肿扩大组较血肿稳定组具有更大的基线血肿体积 (11.4mL: 6.6 mL), 但差异无统计学意义 ($P=0.108$), 而血肿扩大组较血肿稳定组发病距基线 CT 的时间明显缩短 (3 h: 5 h; $P<0.001$); 在血肿扩大组中, 预后不良的患者为 34 例 (85%); 血肿稳定组预后不良的患者为 22 例 (33.3%), 差异具有统计学意义 ($P<0.001$); 并且血肿扩大组具有更高的死亡率 17.5% (7 例), 明显高于血肿稳定组 1.5% (1 例), 差异具有统计学意义 ($P<0.001$)。结论 发病距基线 CT 的时间与发生早期血肿扩大显著相关, 血肿扩大患者发生预后不良及死亡率均明显增加, 说明早期发现患者病情并进行及时干预治疗对脑出血患者的预后具有重要意义。

鞍区神经鞘瘤 1 例影像表现并文献复习

杨秀娟
重庆三峡中心医院

目的: 研究鞍区神经鞘瘤影像表现。方法: 本文通过报道一例鞍区神经鞘瘤的临床特点及影像表现, 并系统查阅 PUBMED、中国知网、维普网、万方数据库, 以“鞍区”、“鞍内”、“鞍上”“神经鞘瘤”为关键词对 1984-2021 年发表的文献进行检索。结果: 通过去重、排除资料不全的文献, 共纳入 24 篇文献, 加上本例共 27 例患者, 女性 13 例, 男性 14 例, 年龄 4-79 岁。7 例表现为视力下降模糊, 4 例视野缺损, 5 例垂体功能异常, 4 例头痛, 1 例小便量次增多, 2 例眼球外展受限, 1 例眩晕、恶心、呕吐, 1 例癫痫, 1 例性格改变, 体重增加, 脚及手增粗, 1 例尿崩症。5 例 CT 平扫表现为等或少高密度影, 2 例明显均匀强化, 1 例不均匀强化。23 例表现为 T1 等 T2 稍高信号, 增强扫描 4 例可见小囊变, 1 例边缘强化, 余明显均匀强化。17 例术前进行了诊断, 14 例诊断为垂体瘤, 2 例诊断为脑膜瘤, 1 例诊断为颅咽管瘤。结论: 鞍区神经鞘瘤虽然容易被误诊, 但其影像表现具有一定特点。

PU-1754

II 型糖尿病患者结构 MRI 中的三维 T1 加权成像和扩散张量成像特点

殷波
新疆生产建设兵团医院

目的: 探究 II 型糖尿病(T2DM)患者结构 MRI 中的三维 T1 加权成像(three dimensions T1-weighted imaging, 3D-T1WI)和扩散张量成像(diffusion-tensor imaging, DTI)的灰质和白质的微观结构变化; 方法: 在我院内分泌科收 30 名 T2DM 患者, 控制其年龄、性别、身高、体重等方面的可比性, 并收取 30 名健康患者分组, 在我院影像科以 3.0T GE-MRI 扫描弥散扩展成像的数据后, 用 DPARSF 5.4 和 DPABISurf 2.0 做数据预处理,用 DPABIFiber 1.0 做结构矩阵分析, 分析比较 MD、FA、RA、DA 等值, 并做统计学差异性分析; 结果: 与对照组比较, T2DM 组: MD 升高, FA 降低, RA 和 DA 变化不大; 结论: T2DM 患者 3D-T1WI 和 DTI 的灰质和白质的微观结构变化较正常人群有明显变化。

Blood-labyrinth barrier breakdown in Meniere's disease

Weidong Zhang¹, Jiawei Xie^{1,3}, Meiyun Wang^{1,2}

1. Henan Provincial people's hospital

2. Biomedical Research Institute, Henan Academy of Sciences

3. Zhengzhou University People's Hospital

Objective: We compared the signal intensity ratio (SIR) of the cochlear basal turn between Meniere's disease and healthy controls to investigate potential damage of the blood-labyrinth barrier in Meniere's disease.

Methods: Thirty patients diagnosed with unilateral definite Meniere's disease and 24 healthy controls were enrolled. 3D-FLAIR scan was conducted to assess the grades of endolymphatic hydrops in Meniere's patients while measuring the SIR of cochlear basal turns in both groups. The differences of bilateral SIR between Meniere's disease and healthy control were compared, and the correlation between the SIR on affected ear in Meniere's disease and the grades of cochlear and vestibular hydrops were analyzed.

Results: SIR of affected ear in Meniere's disease exhibited significant increase compared to that of unaffected ear. No significant difference was observed in SIR between the two ears in the healthy control. Furthermore, the SIR of unaffected side in Meniere's disease was higher than that of both left ear and right ear in healthy controls. The SIR in affected ear of Meniere's disease exhibited positive correlation with hydrops in both cochlea and vestibula.

Conclusion: The permeability of blood-labyrinth barrier is increased in Meniere's disease, blood-labyrinth barrier permeability can be used as a biological marker for early diagnosis of Meniere's disease. Destruction of blood-labyrinth barrier may be one of the causes of endolymphatic hydrops in Meniere's disease.

PU-1756

The dynamic evolution of radiologic progression pattern of GBM

Hong Guo

Daping Hospital, Army Medical University

Objective: Previous studies always focused on the first progression or the final outcome of GBM and neglected the whole course evolution. We aim to radiologically characterize glioblastoma progression type (PT) and investigate dynamic evolution of each PT from diagnosis to final outcome of glioblastoma.

Methods: Six progression types (PTs) were categorized according to MRI contrast enhancement features in T1-, T2- and Flair weighted images in 122 patients. Frequencies and changes of PTs (classified into cT1 relapse, classicT1, T2 diffuse, T2 circumscribed, primary non-responder and non-local), time to the progression (PFS), and overall survival (OS) were assessed in the whole course.

Results: Median follow-up for all patients was 20 months (range, 3 - 145 months); 146 recurrence and 100 deaths were recorded. The vast of patients (99) passed away after experiencing once progression, while 15 patients suffered from twice relapses and 3 patients went through 3 times progression. The media PFS1, PFS2 and OS were 6.4M, 12.1M, 12.4M, respectively. For the first progression, 22 (18%), 41 (34%), 2 (2%), 8 (7%), 43 (35%), 6 (5%) patients were cT1 relapse, classicT1, T2 diffuse, T2 circumscribed, primary non-responder and non-local progression. For the second progression, 2 (9.1%), 3 (13.6%), 17 (77.3%) patients experienced classicT1, primary nonresponder and non-local progression. The PFS1 and OS of cT1 relapse, T2 diffuse, T2 circumscribed was longer than that of classicT1 and non-local progression. The PFS2 and time interval between first and second progression of classicT1 was much longer than that of non-local progression. Primary nonresponder had the worst outcome.

Conclusions: The progression pattern was diversity in GBM. The prognosis of cT1 relapse, T2 diffuse and T2 circumscribed was the best, while primary non-responder worst. Majority of patients experienced once progression before died, and the most common second relapse pattern was non-local progression.

PU-1757

癫痫导致颅骨局部增厚

王昭杰^{1,2}、张志强^{1,2}

1. 南京大学医学院附属金陵医院

2. 中国人民解放军东部战区总医院

目的: 不同区域颅骨厚度对立体定向脑电图 (SEEG) 具有一定影响。探究癫痫患者相较健康人是否存在颅骨厚度的差异, 从而为癫痫患者行 SEEG 时提供更全面的考量因素。

方法: 纳入癫痫患者共 692 例 (根据临床及影像分型, 包括 334 例颞叶癫痫 (TLE) (其中合并海马硬化的 TLE 共 206 例)、146 例额叶癫痫 (FLE)、132 例特发性全面性癫痫 (IGE), 纳入年龄性别匹配的健康对照组共 186 例。收集所有被试的临床资料及影像学资料 (主要包括常规序列、3D-T1WI 序列), 收集所有癫痫患者的既往病史、病程和既往用药史。用 SPM12 软件对所有被试的 3D-T1WI 图像进行自动分割得到对应的颅骨。以所有健康对照组的颅骨图像制作为颅骨掩膜 (Mask), 并定义为正常人的标准颅骨模板。将癫痫患者按照分型进行分组并分别与对照组进行基于体素的形态学分析, 主要进行各组间的两样本 T 检验, 将年龄、性别、病程、是否服用癫痫相关药物作为协变量加入检验过程。此外, 还将所有被试的颅骨厚度与病程进行了多元回归分析。

结果: 整体癫痫患者与对照组相比, 颅骨增厚主要集中于双侧颞、枕部与颅底 ($P<0.05$)。TLE 组的颅骨增厚部位主要集中在双侧顶、颞、枕部和颅底 ($P<0.05$)。有趣的是, 合并右侧海马硬化的 TLE 组的颅骨增厚部位主要集中在双侧顶、颞部 ($P<0.05$), 但在合并左侧海马硬化的 TLE 中却只显示出左侧颞部颅骨的局限性增厚。在 IGE 组中, 我们观察到双侧颞、枕部及颅底的明显增厚 ($P<0.05$)。在 FLE 中, 颅骨增厚区域至局限于颅底 ($P<0.05$)。在多元回归分析中, 我们发现上述差异颅骨区域的增厚与病程显著正相关 (FDR 检验, $P<0.05$)。

结论: 我们发现了癫痫会导致颅骨局部增厚这一现象, 而且癫痫分型会导致颅骨增厚区域具有差异性, 颅骨增厚与病程存在正相关。这一现象说明了癫痫会影响骨质代谢, 同时可以为癫痫患者的临床诊疗, 尤其是在行 SEEG 时提供更多的帮助信息。

PU-1758

Effects of hypertension on cerebral perfusion alternations in patients with type 2 diabetes

Feng Cui, Yi Lu, Li Shi, Yun Zhu, Heyi Gu, Bingbing Ling, Wen Zhao, Tianfu Qi
The First Affiliated Hospital of Kunming Medical University

Purpose: Hypertension (HTN) and type 2 diabetes mellitus (T2DM) are known to negatively affect the cerebral perfusion. However, little is known about whether the coexisting HTN will further affect the cerebral perfusion in T2DM patients. So we aim to determine the impact of HTN on the cerebral perfusion in T2DM patients.

Materials and methods: A total of 92 participants, comprising 36 only T2DM patients, 28 T2DM patients with HTN (T2DMH) and 28 healthy controls (HCs) were recruited in this study. Meanwhile, clinical indicators and arterial spin labeling (ASL) data were collected for each participant. ASL enabled to obtain the Cerebral Blood Flow (CBF) maps from the automatic calculation. Subsequently, atlas-based analysis was used to determine the cerebral perfusion alternations from each specific cerebral label and evaluate the correlations between perfusion alternations and clinical indicators.

Results: Compared to HCs, T2DM patients showed increased CBF in several regions of the frontal and temporal lobes, while decreased CBF was observed in the limbic system and occipital lobe. In comparison to T2DM, T2DMH patients exhibited a consistent decrease in CBF across all cerebral lobes and subcortical nucleus. Additionally, we discovered negative correlations between CBF reductions and the Homeostatic Model Assessment of Insulin Resistance (HOMA-IR) in T2DMH patients.

Conclusions: Our results revealed that the coexisting HTN exacerbate the CBF decrease in T2DM patients, which highlighted the importance of HTN management in T2DM patients to prevent further damage to the brain health.

PU-1759

非良性脑膜瘤与良性脑膜瘤临床与影像征象对比研究

逯慧珍
空军军医大学西京医院

【摘要】目的 探讨 NM 与 BM 的临床、影像学征象。方法 回顾性分析 118 例经手术证实为脑膜瘤的患者临床资料、影像学结果, 根据 2021 版 WHO 脑膜瘤组织学分型方法, 将患者分为良性 (I 级) 组 72 例和非良性组 (II-III 级) 46 例, 所有患者术前均行 MRI 平扫及增强检查。采用多因素

Logistic 回归分析良性组和非良性组脑膜瘤的 MRI 影像学表现及特点。结果 非良性组与良性组在肿瘤最大径、强化方式、形状、边缘、HSL 征、脑侵袭、中性粒细胞百分比（NEUT%）、淋巴细胞百分比（LY%）上比较，差异有统计学意义（ $P<0.05$ ）；多因素 Logistic 回归分析示肿瘤最大径、形状、边缘、HSL 征、脑侵袭是非良性脑膜瘤的独立危险因素（ $P<0.05$ ）。结论 术前脑膜瘤 MRI 特征有助于判断脑膜瘤良恶性，可为术前临床治疗方案的确定提供有效临床辅助。

基于频谱动态因果模型对轻度认知障碍的帕金森患者默认模式网络亚区间有效连接的研究

潘甜甜

扬州大学附属医院（扬州市第一人民医院）

目的：通过分析帕金森患者默认模式网络（DMN）内部区域的有效连接，探索帕金森患者默认模式网络中的因果流向和功能异常的机制，及其与帕金森患者认知功能的关系。

方法：采用光谱动态因果模型（spDCM）对 23 例轻度认知障碍的帕金森患者（PD-MCI）和 22 例无认知障碍的帕金森患者（PD-NC）默认模式网络内部区域 MPFC（内侧前额叶皮层）、PCC（后扣带回皮层）、LAG（左侧角回）、右侧角回（RAG）分别进行静息态下功能磁共振（fMRI）数据的有效连接分析。比较两组患者 DMN 内部亚区有效连接强度的差异，并分析其与帕金森病患者认知功能的相关性。

结果：两组患者 MPFC-LAG、LAG-PCC 的有效连接强度值差异具有统计学意义（MPFC-LAG： $t=-2.993, p<0.05$ ；LAG-PCC： $t=2.174, p<0.05$ ）。PD-MCI 组的 PCC 对 MPFC，LAG 对 MPFC，LAG 对 PCC 存在异常激活；MPFC 对 LAG 存在异常抑制；与 PD-NC 组比较，PD-MCI 组 PCC 的自连接以及 MPFC 到 LAG、LAG 到 RAG 的单向连接在进行 $\alpha<0.05$ 参数值校正后存在差异。

结论：帕金森病患者默认模式网络内部区域间存在有效连接环路节点和连接的异常。

PU-1761

孤立性纤维瘤影像学表现及临床病理特点分析

董卓瑞、刘强、赵卫东

山西医科大学第二医院

目的：

探讨不同部位起源的孤立性纤维瘤（SFTs）的影像特点及其临床病理组织学特点，诊断及鉴别诊断，从而提高对该疾病的临床、影像学认识及诊断水平。

方法：

回顾性分析本院经手术病理及免疫组化诊断为孤立性纤维瘤的 20 例患者（均行 CT 或 MRI 检查，MRI 检查为 9 例；CT 扫描 12 例，其中 1 例同时行 CT 及 MRI 检查），将其影像学诊断与病理结果进行对照。并结合相关文献,对其临床病理特征、诊断及鉴别诊断进行分析。

结果：

20 例患者中，7 例起源于颅内（1 例伴有股骨转移），3 例起源于纵隔，3 例起源于胸膜，3 例起源于肺，2 例起源于盆腔，其余 2 例分别起源于椎管、睾丸。这些病灶均为实性肿块且较为致密，病灶体积较大者边缘多呈不规则、分叶状改变，边界较清，CT 及 MRI 扫描病灶密度或信号均匀或

不均匀，部分较大的病灶内中央可见出血及坏死区，增强扫描强化方式取决于肿块内组成成分，部分病灶明显强化，可呈不均匀地图样或分层样强化，病灶周围可以看到迂曲的血管影，这也是该疾病较为特征性影像表现。病理上它是一种起源于 **CD34** 阳性的树突状间质细胞的间叶组织肿瘤，具有向成纤维细胞和肌纤维母细胞分化的特征，属于中间性肿瘤，少数为恶性，可以发生转移。肿块有细胞稀疏区、细胞密集区，细胞密集区由梭形或短梭形肿瘤细胞构成，呈束状、编织状、漩涡状或不规则状排列，肿瘤间质血管丰富，这也是其强化较明显的原因。

结论：

SFTs 虽较为少见，但其可以发生于身体任何部位，通常无明显特异症状，临床症状跟它的发生部位、病灶大小及良恶性有关。因此，不同部位的 **SFTs** 均需要根据其发生部位与相关疾病鉴别。术前诊断难度较大，在这些部位出现较大实性肿块时，我们应该想到 **SFTs**，综合相关临床症状、实验室检查及影像学检查，但最终确诊需要依靠病理及免疫组化。

PU-1762

基于 QSM 引导下 fMRI 皮层下核团精准的定位

覃健嵘¹、管晓军¹、何宸羽²

1. 浙江大学医学院附属第二医院，放射科

2. 浙江大学，计算机科学与技术学院

目的：

许多神经退行性疾病与皮层下核团的功能异常密切相关。尽管不少研究采用 **fMRI** 来分析皮层下核团，但一致性较差，原因可能是：现有的核团定位方法受限于传统磁共振 **T1** 加权成像（**T1WI**）对细微结构的限制。本研究旨在实现静息态功能磁共振成像（**Resting-Functional MRI, fMRI**）和定量磁敏感成像（**Quantitative Susceptibility Mapping, QSM**）的配准，主要探索 **QSM** 在脑深部核团的 **fMRI** 研究中的潜在应用。

方法：

（**Enhanced Gradient Echo T2* Star Weighted Angiography, ESWAN**）序列一次扫描可获得多回波的幅度图和相位图，两组图像解剖位置一致。利用相位信息可重建 **QSM** 图，**QSM** 图除了在定量大脑铁及髓鞘方面具有优越性之外，还对皮层下核团具有很高信噪比。在 **QSM** 图上勾画皮层下核团，包括：尾状核、壳核、苍白球、红核、黑质及齿状核。回波时间影响图像的信噪比，因此把回波的幅度图在时间上做平均，对比八个回波及平均回波图的信噪比。利用被普遍认为是最先进的医学图像配准和分割工具包——**ANTs**（**Advanced Normalization Tools**），选信噪比最优的幅度图作为中介，以辅助 **fMRI** 与 **QSM** 之间的多模态配准。另外，同样实现 **fMRI** 与 **T1WI** 配准，利用 **AAL** 图谱定位核团，最后使用核团 **ROI** 来计算互信息（**MI**），以评估配准方法的性能。

结果：

QSM 引导核团定位法的互信息值高达 **0.90**，图谱法仅为 **0.73**，前者的配准效果更好。研究结果表明，**QSM** 能够更准确定位皮层下核团，帮助获取更真实的功能状态。

结论：

本研究借助 **QSM** 图成功实现对 **fMRI** 中皮层下核团的精确分割。这一方法为神经科学和临床神经学领域提供了一种新的可能性，对精准诊断和研究提供了重要工具，为神经系统的疾病诊断和治疗提供更准确的信息。

PU-1763

Weight Status Modulated Brain Regional Homogeneity in Long-term Male Smokers

Mengzhe Zhang, Yong Zhang, Jingliang Cheng
First Affiliated Hospital of Zhengzhou University

Background: Tobacco smoking and overweight could lead to adverse health effects, which remain an important public health problem worldwide. Researches indicate that overlapping pathophysiology may contribute to tobacco addiction and overweight, but the neuro-biological interaction mechanism between the two factors is still unclear.

Methods: The current study used a mixed sample design, including the following four groups: i) overweight long-term smokers ($n = 24$); ii) normal-weight smokers ($n = 28$); iii) overweight non-smokers ($n = 19$), and iv) normal-weight non-smokers ($n = 28$), a total of 89 male subjects. All subjects underwent resting-state functional magnetic resonance imaging (rs-fMRI). Regional homogeneity (ReHo) was used to compare internal cerebral activity among the four groups. Interaction effects between tobacco addiction and weight status on ReHo were detected using two-way analysis of variance, correcting for age, years of education and head motion.

Results: A significant interaction effect between tobacco addiction and weight status is showed in right superior frontal gyrus. Correlation analyses show that the strengthen ReHo value in right superior frontal gyrus is positively associated with pack-year. Besides, main effect of tobacco addiction is specially observed in occipital lobe and cerebellum posterior lobe. As for main effect of weight status, right lentiform nucleus, left postcentral gyrus and brain regions involved in DMN are survived.

Conclusions: These results shed light on an antagonistic interaction on brain regional homogeneity between tobacco addiction and weight status in right superior frontal gyrus, which maybe a clinical neuro-marker of comorbid tobacco addiction and overweight. Our findings may provide a potential target to develop effective treatments for the unique population of comorbid tobacco addiction and overweight.

PU-1764

多时相 CTA 联合 CT 灌注在远端分支动脉闭塞的急性缺血性脑卒中的应用价值

董立军、邓克学
中国科学技术大学附属第一医院（安徽省立医院）南区

目的: 使用一站式多时相 CTA (multiphase CTA, mCTA) 及 CT 灌注 (CT perfusion, CTP) 扫描方法, 评估其在急诊缺血性脑卒中患者远端分支动脉闭塞的快速精准定位和预测最终梗死体积 (FIV) 的价值。

方法: 回顾性搜集 2020 年 6 月至 2023 年 6 月内 60 例急诊入院的突发远端分支动脉闭塞 (定义为脑动脉 A2 段、M2 段、P2 段及其远端分支) 的患者资料。所有患者接受治疗前 mCTA 及 CTP 联合扫描。使用 GE 公司的 FastStroke 软件处理 mCTA 图像得到彩色融合的 ColorViz 图像。2 名高年资医师及 2 名低年资医师使用双盲法分别评估常规单期 CTA 和 mCTA 融合图。对比两种 CTA 在诊断动脉闭塞位置准确率、完成诊断所需的时间、诊断信心评分、区域性软脑膜侧支循环 (rLMC) 评分的差异。使用数坤科技公司的 CTPDoc 软件处理 CTP 数据, 分别以 $T_{max}(s) > 4$ 、6、8、10 定义缺血低灌注区, 分别以 $rCBF < 40\%$ 、30%、20% 定义梗死核心区。FIV 通过 5 天内的随

访 CT 或 MRI 获得。根据患者血管是否成功再通将患者分为两组, 分别评估再通及未再通组上述不同 CTP 参数阈值与 FIV 的关系。

结果: 不同年资医师在诊断过程中, 虽然两种 CTA 模式下正确率的差异无统计意义, 但是 mCTA 融合图显著缩短了诊断时间 ($P<0.001$), 并且提高了诊断信心 ($P<0.05$)。两种 CTA 模式下的 rLMC 评分的差异具有统计学意义 ($P<0.001$)。在再通组患者所有灌注参数阈值与 FIV 均相关性较差 ($r<0.5$)。在未再通组患者所有灌注参数与 FIV 相关性较好 ($r>0.5$)。且当 Tmax(s) >10 时, 相关性最好 ($r=0.89$)。

结论: mCTA 联合 CTP 不仅可提高对于远端分支动脉闭塞的诊断准确率, 缩短时间并提高诊断信心, 而且更加完善的评估侧支循环水平, 对于未再通患者 FIV 也具有一定的预测价值。

PU-1765

MTHFR 基因 C677T 多态性与老年脑小血管病变相关性分析

李卓然

广州市红十字会医院

目的 探讨 5,10-亚甲基四氢叶酸还原酶(MTHFR)基因 C677T 多态性与老年脑小血管病变的关系。

方法 选取我院年龄大于 65 岁脑小血管病住院患者, 进行 MTHFR 基因测定和血浆同型半胱氨酸 (Hcy) 水平监测, 同时行头颅 MRI 和 MRA 检查, 分析不同基因分型患者与脑小血管病变的关系。

结果 血浆 Hcy 水平在 TT 型组明显高于 CC 型和 CT 型组 ($F=7.996$, $P<0.01$), 通过 Spearman 相关性分析, 脑白质病变的严重程度与女性相关 ($r=0.148$, $P=0.010$), 与年龄、既往有冠心病、腔梗、血浆 Hcy 水平、MTHFR 基因分型呈正相关, 相关系数分别为 0.034 ($P<0.001$)、0.152 ($P=0.008$)、0.189 ($P=0.001$)、0.015 ($P=0.029$) 和 0.170 ($P=0.003$); 多因素 Logistic 回归分析, 年龄[OR95%CI= (1.042-1.114)]、MTHFR 基因分型 (TT 组) [OR95%CI= (1.046-2.279)] 和腔隙性脑梗死[OR95%CI= (1.003-3.523)] 是脑白质高信号 (WMH) 独立危险因素。

结论 血浆 Hcy 水平与 MTHFR 基因多态性有明显相关性, MTHFR 基因分型 (TT 组) 是脑白质损害独立危险因素, 建议早期进行 MTHFR 基因检测, 提早干预危险因素, 延缓老人认知障碍的发生发展。

PU-1766

3.0T 磁共振颈动脉斑块高分辨成像的临床应用

崔勇

延边大学附属医院

目的 应用 3.0 磁共振颈动脉斑块高分辨成像技术定量分析缺血性脑卒中患者症状侧与非症状侧颈动脉管壁负荷及斑块成分, 为临床防治缺血性脑卒中提供影像学参考依据。

方法 选取我院 2017 年 10 月至 2018 年 3 月脑卒中患者 57 例, 均行 3.0T MRI 颈动脉斑块高分辨成像。获取共计 114 根颈动脉图像, 依据临床症状分为症状侧组及非症状侧组。应用 VPD 公司开发的颈动脉斑块定量分析软件 MRI-PlaqueView 对图像进行后处理, 记录并比较症状侧与非症状侧颈动脉管壁负荷及斑块成分差异, 通过 logistic 回归分析研究缺血性脑卒中发生的风险因素。管壁负荷指标包括管壁体积 (VWV)、管壁厚度 (WT)、管壁标准化指数 (NWI) 和管腔最大狭窄程度, 其中 WT 和 NWI 分别取平均值 (mean) 和最大值 (max)。斑块成分数据包含钙化 (CA)、坏死的脂质核心 (LRNC)、斑块内出血 (IPH) 的有/无及体积, 以及纤维帽是否破裂 (FCR)。

结果 症状侧组共计 65 根血管, 非症状侧组共计 49 根血管。①管壁负荷指标比较: 症状侧组颈动脉 VWV、meanWT、maxWT、maxNWI 和管腔最大狭窄程度与非症状侧组颈动脉比较具有明显统

计学差异 ($P < 0.05$)。meanNWI 在两组比较中无统计学差异 ($P > 0.05$)。②斑块成分比较: 斑块内 CA 的发生率在症状侧组与非症状侧组比较中无统计学差异 ($P > 0.05$), 但 CA 的体积在两组比较中具有统计学差异 ($P < 0.05$)。症状侧组斑块内 LRNC、IPH 和 FCR 发生率及体积均明显高于非症状侧组, 具有显著统计学差异 ($P < 0.05$)。③斑块成分差异与卒中发生风险的 logistic 回归分析: 颈动脉斑块内 IPH ($OR=6.402$)、FCR ($OR=3.998$) 是缺血性卒中的强烈危险因素。LRNC ($OR=2.642$) 以及 Stenosis ($OR=1.078$) 也是缺血性卒中的危险因素, 但危险程度弱于 IPH 和 FCR。CA 与缺血性卒中并无明显风险关系。

结论 3.0T 磁共振颈动脉斑块高分辨成像技术可清晰、全面地显示颈动脉管壁、斑块及临近组织结构, 可以为临床上评估卒中风险提供更多影像学帮助。

PU-1767

自发性深部核团脑出血患者出血量阈值的研究

顾腾辉、钱伟军、李立
开封市中心医院

研究目的: 本研究使用脑出血体积测量软件分析自发性不同深部核团(丘脑、基底节)脑出血量, 并对患者 3 个月临床预后进行评估(mRS 评分), 得出预后不良患者不同核团出血量的阈值。为临床评估治疗预后、精准治疗、个性化治疗、积极干预提供影像学依据。

材料与方法: 回顾性连续纳入 2018 年 8 月至 2020 年 12 月在开封市中心医院住院的确诊为自发性脑出血患者, 经颅脑 CT 检查结果及临床资料筛选出为自发性脑深部核团出血(包括基底节、丘脑)患者, 其中基底节出血患者 455 例(男性 335 例, 女性 120 例, 年龄 60 ± 14 岁。其中丘脑出血患者 212 例(男性 135 例, 女性 77 例, 年龄 63 ± 12 岁。使用 SPSS22.0 统计学软件进行数据分析, 对丘脑及基底神经节出血患者进行单变量和多变量 logistic 回归分析, 以确定 3 个月时预后不良(mRS 评分 ≥ 4)相关的协变量。用 ROC 曲线确定 SICH 丘脑及基底节脑出血量最优临界值以及相关的敏感性和特异性, 以预测丘脑和基底神经节 3 个月的不良结果。

结果: 自发性丘脑出血患者 3 个月预后不良患者的出血量阈值为 9mL (AUC: 0.89, 特异性: 87%, 敏感性: 82%), 自发性基底节出血患者 3 个月预后不良患者的出血量阈值为 18mL (AUC: 0.87, 特异性: 79%, 敏感性: 80%)。

结论: 1、脑深部核团出血患者临床预后与出血量呈明显正相关。2、丘脑出血患者 3 个月预后不良患者的出血量阈值更低, 出血容易破入脑室; 基底节出血患者 3 个月预后不良患者的出血量阈值较高, 临床临床容易合并蛛网膜下腔出血。3、根据脑深部核团出血量阈值能评估脑出血患者的预后, 能为临床进一步制定正确的干预措施提供重要的依据。

PU-1768

3D Cube 技术在帕金森病患者 DBS 术中丘脑底核 MRI 定位的应用

焦飞涵、白亚妮、郑建民、何子福
空军军医大学西京医院

【摘要】目的 探讨 3D T2 FLAIR Cube 序列对帕金森病(PD)患者深部脑电刺激术(DBS)显示丘脑底核(STN)的价值。方法 采用 3.0T MRI 对 36 例正常人及 36 例 PD 患者 DBS 术中进行扫描, 其中 3D T2 FLAIR Cube 序列的 TR=6300ms, TE=105ms, 矩阵=256X256, 层厚=0.9mm, 层间

距=0 mm, 对 36 例正常人与 36 例 PD 患者采集的 3D T2 FLAIR Cube 序列进行对比, 再对 36 例 PD 患者采集的 3D T2 FLAIR Cube 与以往定位扫描序列进行对比, 用两种对比结果进行半定量分析 3D T2 FLAIR Cube 序列对 STN 显示的情况, 术后进行 1.5T MRI 与 CT 扫描复查并确认患者微电极记录(ME R) 电极探针位置。结果 3D T2 FLAIR Cube 序列能完成高质量、高效率的薄层采集, 一次采集可任意角度观察图像, 半定量评分高于常用的 SPACE 和 T2 FLAIR 序列, 并与患者术中 ME R 确定的电极探针位置有较高的一致性。结论 使用 3D Cube 序列明显缩短患者术前检查时间, 可以准确预定靶点位置, 提高定位精确度和手术效率。

正常青年枕叶 GABA+水平与脑电连接网络拓扑效率的相关性研究

刘彦婷、高亚男、赵思荟、于兵
中国医科大学附属盛京医院

目的: 利用磁共振波谱 (Magnetic Resonance Spectroscopy, MRS) 以及同步脑电 (Electroencephalogram, EEG) 技术分析正常青年人枕叶静息状态 γ -氨基丁酸水平与脑电连接网络拓扑效率的相关性, 预测枕叶 γ -氨基丁酸水平对神经网络的影响。

研究方法: 本研究对 40 名健康青年志愿者进行同步 EEG-MRS 扫描 (男女比例 16:24; 年龄:20-30 岁, 中位年龄 24 岁)。首先在静息状态下使用高分辨 3DT1WI 序列配备 64 通道的头部线圈扫描, 以定位 HERMES(Hadamard Encoding and Reconstruction of Mega-Edited Spectroscopy) 枕叶感兴趣区 (VOI)。然后, 应用 32 通道脑电系统记录脑电信号, 应用 HERMES 进行同步 EEG-MRS 扫描, 同步记录静息状态下枕叶递质水平及全脑电活动信号。应用 Gannet_3.1 软件包对 MRS 数据进行后处理, 以肌酸(Cr)作为内参, 结合 3DT1WI 数据分割, 计算体积校正后枕叶 VOI 的 GABA+水平。应用 EEGLab 软件包对原始脑电数据进行预处理, 使用 REAT 软件计算不同频段下的脑功能连接矩阵。然后, 利用 GRETNA 软件包进行图论网络分析, 评估脑电功能连接网络的拓扑特征(全局效率、局部效率和小世界属性)。分析被试枕叶递质水平与脑电连接网络拓扑特征的相关性。

结果: 正常青年静息状态下枕叶 GABA+水平与 α 频段脑电功能连接网络小世界属性呈显著负相关 ($r = -0.712$, $P < 0.0001$)。与 EEG 网络 β 频段的小世界属性呈弱相关 ($r = -0.359$, $P = 0.0228$), 与 δ 、 γ 、 θ 频段的小世界属性不相关。枕叶 GABA+水平与 EEG 网络五个频段的局部效率均不相关。枕叶 GABA+水平与 EEG 网络五个频段的全局效率均不相关。

结论: 正常青年人静息状态枕叶 GABA+水平与脑电连接网络小世界性负相关。

多时相 CT 血管成像彩色编码图评估急性缺血性脑卒中侧支循环的临床价值

任涛、刘松、杨天昊、田超
天津市环湖医院

目的 探讨多时相 CT 血管成像 (mCTA) 彩色编码图在急性缺血性脑卒中 (AIS) 侧支循环评估中的价值及对临床预后的影响。方法 回顾性分析我院收治的前循环 AIS 患者的临床及影像学资料, 根据患者 90 天的改良 Rankin 评分量表(mRS)结果分为预后良好组 (91 例, $mRS < 3$ 分) 和预后不良组 (86 例, $mRS \geq 3$ 分)。采用 3 分法评估常规 mCTA 侧支循环评分、彩色编码图侧支循环

评分（包括侧支血管充盈的延迟程度和侧支血管的分布范围评分），采用 χ^2 或 Fisher 确切检验比较分析两组间常规 mCTA 侧支循环评分、彩色编码图侧支循环评分的差异，采用 Mann-Whitney U 检验比较两组间 CT 灌注成像（CTP）缺血区体积、梗死核心区体积的差异，采用受试者操作特征曲线（ROC）分析 CT 各参数对 AIS 患者临床预后的诊断价值，并进行二元 Logistic 回归分析，确定各参数对 AIS 患者临床预后的影响。结果 CT 各参数在两组间均具有明显统计学差异（ $P<0.05$ ），预后良好组有更好的侧支循环及更小的缺血和梗死核心区体积。ROC 结果显示彩色编码图侧支循环评分对患者临床预后的诊断价值与常规 mCTA 相似或更高（ $P>0.05$ ），侧支血管充盈的延迟程度评分与 CTP 缺血和梗死核心区体积的诊断价值相当（ $P>0.05$ ）。Logistic 回归分析显示侧支血管充盈的延迟程度评分是患者预后的影响因素。结论 mCTA 彩色编码图对预测 AIS 患者 90d 的临床预后具有较高价值，与常规 mCTA 和 CTP 相比，侧支血管充盈的延迟程度评分可以获得相似或更好的诊断效能。

3.0T MR 血管壁高分辨成像在颅内血管疾病诊断中的运用价值

刘明、张国平、李德炯、李群武、顾克、冉宇
贵阳市第二人民医院

摘要 目的 探讨磁共振高分辨血管壁成像（high resolution vessel wall magnetic resonance imaging, HRVW-MRI）在颅内血管多种疾病中的诊断运用价值。方法 选取 2019 年 4 月至 2022 年 2 月在 PHILIPS 公司 Ingenia 3.0T 超导型磁共振颅内 HRVW-MRI 所有患者 52 例，与 DSA 和临床最终诊断结果进行对照。结果 52 例患者中，颅内动脉粥样硬化易损斑块 14 例，稳定性斑块 18 例，血管炎 5 例，夹层动脉瘤 3 例，血管畸形 2 例，静脉窦血栓 1 例，阴性 9 例，48 例（92.3%）与 DSA 及临床诊断结果一致，4 例与临床诊断不符，HRVW-MRI 检查 $AUC=0.895$ ，敏感度为 93.3%，特异度为 85.7%。结论 3.0T MR 颅内 HRVW-MRI 对于临床脑血管疾病精准诊断具有重要价值。

孤立性纤维性肿瘤--从概念到影像

董飞、李倩、蒋飏、张敏鸣
浙江大学医学院附属第二医院

孤立性纤维性肿瘤（Solitary fibrous tumor, SFTs）是一种罕见的纤维母细胞间充质肿瘤，可发生于全身任何部位。长久以来，其分类、命名等多次出现变化，尤以中枢神经系统分类中变化较为明显。此外，该肿瘤本身具有较明显的异质性，影像学表现多样，经常诊断困难。在此，我们将结合临床病例及文献介绍孤立性纤维瘤的概念演变及其与其他术语，如血管外皮瘤、血管周细胞瘤、上皮样血管内皮细胞瘤等的关联；回顾孤立性纤维瘤的病理学表现、在软组织肿瘤及中枢神经系统肿瘤分类中的变化、总结其在全身各个系统中（包括颅内、头颈部、肺部、胸膜、肝脏、四肢等部位）的影像学表现。

透明细胞型脑膜瘤的 MRI 表现分析

罗振东¹、李晶²、黄婵桃³、吕建勋¹、姚薇薇¹、周丽莎¹、沈新平¹

1. 香港大学深圳医院

2. 中山大学肿瘤防治中心

3. 南方医科大学南方医院

目的: 总结透明细胞型脑膜瘤的 MRI 影像特征, 以期提高对该肿瘤的认识。材料和方法: 回顾性收集经病理证实的 15 例透明细胞型脑膜瘤患者的临床资料及 MRI 表现。结果: 4 例男性, 11 例女性, 中位年龄 41.7 岁; 8 例位于桥脑小脑角区, 其中 6 例跨中后颅窝生长, 呈囊实性, T1WI 呈等-低信号, T2WI 呈等-稍低信号, 实性成分呈石榴籽样改变, 2 例肿块周边可见血管流空, 增强扫描肿块实性成分 7 例明显强化, 1 例轻度强化, 4 例可见脑膜尾征; 5 例位于大脑凸面及 1 例位于矢状窦旁, 为实性肿块, T1WI 呈等信号, T2WI 呈高信号, 5 例肿块周边可见血管流空, 5 例周围脑组织可见明显水肿, 增强扫描肿块明显强化伴脑膜尾征; 1 例位于右侧侧脑室后角, 呈囊实性, T1WI、T2WI 呈混杂信号, 肿块周边可见血管流空, 增强扫描肿块实性成分明显强化。结论: 透明细胞型脑膜瘤的 MRI 表现具有一定特征性。

PU-1775

基于松果体区肿瘤的影像学特征的预后分层研究

彭莹

南方医科大学第二临床医学院

中国人民解放军总医院第七医学中心

背景及目的: 松果体区肿瘤病理类型多样, 术前鉴别困难大、患者的预后差异大。本研究的目的是通过分析松果体区肿瘤的治疗前影像, 寻找对患者预后判断有价值的影像特征。

方法: 收集 2010-2023 年本院就诊的松果体区肿瘤病例, 回顾性分析患者治疗前的 MR 及 CT 影像。由放射科医师评估肿瘤的影像学特征, 包括形态、边界、信号及密度、强化程度、伴随改变 (钙化、脂肪、出血、囊变) 及肿瘤最大径。根据术后病理结果或疗效观察, 并按照近年文献中每种疾病的生存率, 将患者预后分为良好、中等、差三个级别。分析三种预后病变的影像学征象, 并列出具比例, 使用 FISHER 确切概率法及单因素 ANOVA 检验法对数据进行统计学分析。

结果: 入组 48 例患者 (男/女: 39/9, 年龄范围: 0-72 岁, 平均年龄: 25.0 ± 17.1 岁), 共证实 17 种疾病类型, 包括: 预后好 23 例, 预后中等 10 例, 预后差 15 例。影像学特征的预后分层统计结

果为：病灶可见中心包裹性钙化多提示预后较好，边缘钙化多提示预后较差（ $P=0.002$ ）；病灶内有出血多提示预后差（ $P=0.005$ ）；预后差的肿瘤最大径普遍比预后良好的最大径大（ $P=0.032$ ）。结论：病灶内钙化位置、是否伴有出血、肿瘤的大小，是判断松果体区肿瘤预后的特征性影像学表现。

Research on regional homogeneity of resting-state functional magnetic resonance imaging in female patients with first-episode mild-to-moderate depressive disorder

Lifang Liao^{1,2}, yong liu^{2,3}

1. Department of Radiology, The 3rd Affiliated Hospital of Chengdu Medical College & Pidu District People's Hospital, Chengdu 611730, China

2. Southwest Medical University

3. Department of Magnetic Resonance Imaging, Affiliated Chinese Traditional Medicine Hospital, Southwest Medical University, Luzhou, China

Objective: To investigate the alterations of regional homogeneity (ReHo) by the resting-state functional magnetic resonance imaging (rs-fMRI) in female patients with first-episode mild-to-moderate depressive disorder and their correlation with the scores of 17-item Hamilton Rating Scale for Depression (HAMD-17) and Hamilton Anxiety Rating Scale (HAMA).

Methods and Materials: 41 patients and 34 healthy controls were collected totally. Then clinical scales (HAMD-17 and HAMA) for each participant were evaluated prior to fMRI scanning. Secondly, based on the SPM12 software, the different ReHo values between groups was tested using two-sample t-test. Finally, the correlation between the above clinical scales and the brain region with altered ReHo values was analyzed.

Results: Compared with the healthy controls, the ReHo values in the right orbitofrontal gyrus, left inferior frontal gyrus (pars opercularis), and right postcentral gyrus were significantly decreased in the depression group, but there was no significant correlation between the altered brain region and the scores of HAMD-17 and HAMA.

Conclusions: Female patients with first-episode mild-to-moderate depression have some brain regions with altered ReHo values, and it means that these brain regions tend to be disordered, which may be related to the emotion and cognitive function changes in this type of depression, and furtherly help guide personalized treatment for depression.

PU-1777

基于 CT 图像的肿瘤内及肿瘤周围放射组学在鉴别腮腺多形性腺瘤完整与不完整包膜特性的双中心研究

李爽、月强

四川大学华西医院

目标: 多形性腺瘤 (pleomorphic adenoma, PA) 的包膜呈现多种状态, 包括包膜完整、包膜局部缺如、肿瘤侵犯包膜、形成卫星结节等。没有完整包膜的患者比有完整包膜的患者在手术治疗后具有更高的复发风险。我们旨在开发并验证基于 CT 图像的肿瘤内和瘤周放射组学特征的机器学习模型, 以区别腮腺 PA 的包膜完整与否。

方法: 我们对 260 名患者的数据进行了回顾性分析, 其中四川大学华西医院的 166 名患者作为训练集, 重庆医科大学附属第一医院的 94 名患者作为测试集。在每个患者的 CT 图像中定义了三个

感兴趣区 (volume of interest, VOIs): 肿瘤 (VOItumor), 瘤周 (VOlperitumor), 和同时包括肿瘤及瘤周的 (VOlintra-plus peritumor)。根据上述三个 VOI 中提取的放射组学特征, 训练并验证机器学习的模型。通过受试者工作特征曲线 (ROC) 的曲线下面积 (AUC) 评估模型性能。

结果: 我们在验证数据集上比较了所有模型的 AUC 值, 基于 VOlintra-plus peritumor 特征的放射组学模型表现最佳。我们发现, 基于 15 个影像组学特征的模型可以在验证数据集上获得最高的 AUC。AUC 值在训练集和测试集上分别是 0.86 和 0.87。

结论: 将机器学习与 CT 瘤周放射组学特征结合能准确预测腮腺 PA 的包膜特征。这使得术前识别腮腺 PA 的包膜完整与否成为可能, 可以协助临床术前和术后的诊疗计划。

Association between Choroid Plexus Volume and Glioma and its Clinical Significance

Jia Sun,Zhizheng Zhuo,Yaou Liu
Beijing Tiantan Hospital, Capital Medical University

Purpose: This study aims to explore the association between choroid plexus volume and glioma grading, classification, location, and pathological indicators to enhance our understanding of glioma, a prevalent and highly malignant brain tumor with poor prognosis.

Methods: In this study, we collected brain magnetic resonance imaging data from 670 glioma patients and 500 healthy controls (HC) who were recruited from Beijing Tiantan Hospital, and measured their choroid plexus volume of the lateral ventricles. The choroid plexus was segmented fully automatically on 3D contrast-enhanced T1-weighted MRI sequences using a deep learning algorithm developed by the authors using 3D nnU-Net. The patients were divided into different glioma classifications and grade groups based on pathological examination and molecular analysis. The patients' demographic and clinical data were collected from medical records. The Mann-Whitney U test and multivariate regression analysis were employed to compare the correlation between choroid plexus volume and different glioma classifications, grades, locations, and molecular pathological markers.

Results: Significant statistical differences were observed in choroid plexus volume between healthy controls and glioma patients, with glioma patients exhibiting larger volumes. Additionally, a significant correlation was found between choroid plexus volume and glioma grade, with low-grade glioma patients having larger volumes. Furthermore, a relationship was identified between choroid plexus volume and H3K27 alteration, with patients lacking H3K27 alteration showing larger volumes.

Conclusion: Choroid plexus volume emerges as a potential novel biological indicator for glioma diagnosis and grading. This study offers valuable insights for clinical practitioners and patients in the field of glioma diagnosis.

Voxel-level white matter iron content evaluation of Parkinson disease patients with cognitive decline using Strategically Acquired Gradient Echo technique

Bingbing Gao, yanwei miao
the first affiliated hospital of Dalian medical university

Objectives

The Lewy-related pathology of Parkinson disease (PD) are widespread to whole brain beyond brainstem in PD dementia patients, mostly in cortical and subcortical area. Extra iron deposition in substantia nigra is a characteristic pathological of PD. We hypothesized that the abnormal iron content was also exist in cortical and subcortical area in PD patients with cognitive dysfunction. This study was aimed to quantitatively detect the abnormal iron content in gray and white matter in PD patients with cognitive decline.

Materials and methods

A total of 67 PD patients and 50 healthy controls (HC) were prospectively enrolled. PD diagnosis was confirmed by neurologist according to Chinese guidelines for the Treatment of Parkinson's disease (fourth edition) formulated by the Movement Disorders and Parkinson's Disease Group of the Neurology Branch of the Chinese Medical Association in 2020. The guidelines also included the exclusion criteria of PD. The HCs all MMSE score >24, and with no hypertension and diabetes mellitus. All participants underwent Mini-mental State Examination (MMSE) and Montreal Cognitive Assessment (MoCA). PD group were divided into three subgroups: PD with no dementia group (PDND): MMSE score >24, MoCA > 26, PD with mild cognitive impairment group (PD-MCI): MMSE score >24 and MoCA < 26; PD dementia group (PDD) group: MMSE score ≤ 24 and MoCA < 26. All PD patients underwent a Strategically Acquired Gradient Echo (STAGE) protocol on a 3.0T MRI scanner with a 32-channel phase-array head coil. T1 weighted image and susceptibility map derived from STAGE were analyzed in voxel-size level using MATLAB software, mean magnetic sensitivity values (MSV) of gray matter and white matter were measured, representing iron content (Figure 1). Demographic data were analyzed using SPSS v26.0 (SPSS Inc. IBM). The Shapiro-Wilk test was used to test the normality of data distribution. The chi-square test was used to analyze gender differences of the four groups. One-way ANOVA and LSD was used to compare the age and mean MSV of white matter of all subjects among four groups. Kruskal-Wallis test was used to analyze the mean MSV of gray matter. Statistical significance was defined as two-tailed $P < 0.05$.

Results

There was no significant difference of gender among four groups. Age was differed by groups (Table 1, Figure 2). The MSV of gray matter was differed between HC and PD-MCI group, and between HC and PDD group, as well as the MSV of white matter. No significant difference was found between PD-MCI and PDD group. And PDND group showed no significant difference compared to the other groups (Table 2, Figure 3).

Conclusion

PD patients with cognitive dysfunction had abnormal iron deposition in both white matter and gray matter, and was severe with age and cognitive status. The widespread iron accumulation in whole brain help to understand the PDD pathology progress.

PU-1780

基于 CT 影像自发性脑出血血肿扩大与脑白质病变的相关性研究

闫雪儿

锦州医科大学附属第一医院

摘要

背景:

自发性脑出血(ICH)是一种严重的脑卒中病变,大约 30%的自发性脑出血患者会发生血肿扩大(HE),导致神经系统症状恶化,甚至患者死亡。因此,早期治疗对挽救患者生命、改善预后至关重要。本文脑出血患者出血血肿扩大与脑白质病变的相关性,旨在探讨 24h 内脑出血患者出血体积扩大与脑白质病变程度的相关价值。

方法:

回顾性分析锦州医科大学附属第一医院 2020 年 1 月—2023 年 4 月脑出血患者的病史、影像学资料及实验室检查数据,患者均于 6 小时之内进行影像学检查,并在 24 小时内复查且未做手术。使用 Blennow 量表判断评估脑白质病变情况。将自发性幕上脑出血患者纳入分析,分别为血肿扩大组和非扩大组,脑白质病变严重组和非严重组。通过单因素和多因素分析确定自发性脑出血及脑白质病变的关系。

结果:

共 81 名患者纳入本次实验中,其中血肿扩大(HE)共 28 名(34.6%),单因素分析脑出血血肿扩大与扩张的血肿体积、血肿不规则、岛征、是否破入脑室、入院 GCS 分级有关,多因素回归分析入院 GCS 分级为血肿体积扩大的独立危险因素。严重脑白质变性组共 38 名(46.9%),单因素分析入院舒张压及年龄为影响因素。

结论:

脑白质病变的严重程度与自发性幕上脑出血早期血肿扩大无关,但白质病变与脑出血血肿的位置及与血肿相接触与血肿扩大风险显著相关。

关键词:脑出血 血肿扩大 脑白质病变

针刺通过调节大脑局部的自发低频活动治疗皮层下血管性认知功能障碍

康英杰、张颖颖、陈义磊、詹松华、谭文莉

上海市中医药大学附属曙光医院

目的

皮层下血管性认知障碍(SVCI)是由脑小血管病引起的认知功能损害。本研究拟收集 SVCI 受试者,给予针刺治疗,通过比较治疗前后认知功能和功能磁共振的变化,评价针刺治疗 SVCI 的脑功能变化。

方法

招募 60 例 SVCI 受试者,随机分为针刺组(Acu 组)和对照组(Con 组),每组 30 例。针刺组在基础治疗外给予针刺治疗,为期 8 周,每周 3 次,每次 30 分钟。穴位选择百会穴、四神聪、神庭穴、双侧风池、双侧曲池穴、双侧内关穴。针刺组及对照组均给予基础治疗,包括但不限于安理申、降血压,降血糖等。在研究过程中,由于质量控制和受试者脱落的原因,最终共 46 例 SVCI 受试者完成本研究(Acu=22, Con=24)。比较两组人口统计学资料,以及 MoCA 量表的评分变化,功能磁共振分析基于 Matlab 平台的 DPARSF 插件,计算低频振荡分数(fALFF)值(0.01-0.08Hz

频段)。临床资料采用 SPSS 25.0 软件进行统计学分析, 计量资料以 ($\bar{x} \pm s$) 表示, 计量资料符合正态分布行两样本 t 检验, 不符合正态分布行 Mann-Whitney U 检验, 计数资料行卡方检验, 两组有效率分析采用秩和检验, 治疗前后量表的变化采用配对 t 检验。治疗前后 fMRI 数据比较采用配对样本 t 检验, 并进行多重比较校正 (GRF 校正), 将年龄、性别及受教育年限作为协变量回归。提取治疗前后各组的 fMRI 指标, 与 MoCA 评分进行相关性, 满足正态分布使用 Pearson 相关分析, 不满足正态分布使用 Spearman 相关。

结果

针刺治疗后, SVCI 患者的 MoCA 评分较治疗前提高 ($p < 0.05$)。针刺组 fALFF 较治疗前增加的脑区为右侧前岛叶、左侧舌回, fALFF 值下降的脑区为左侧额下回、左侧角回, 对照组的左侧枕上回、枕中回 fALFF 下降 (voxel $p < 0.01$, cluster $p < 0.05$, GRF 校正)。右侧岛叶、左侧舌回 fALFF 值的改变与量表评分的增加呈正相关, $r(\text{Insula_R}) = 0.547$, $r(\text{Lingual_L}) = 0.538$, $p < 0.01$ 。

结论

针刺可以调节 SVCI 患者大脑岛叶、舌回的自发低频活动, 并改善认知功能。

PU-1782

Potential approach to quantify the volume of ischemic core if truncation of computed tomography perfusion scan occurred: a preliminary study

Xiaoquan Xu, Feiyun Wu
The First Affiliated Hospital of Nanjing Medical University

Objective: To provide an alternative approach to quantify the volume of ischemic core (IC) if truncation of computed tomography perfusion (CTP) scan occurred.

Methods: Baseline CTP and follow-up diffusion-weighted imaging (DWI) data of 88 stroke patients were retrospectively collected. CTP source images (CTPSI) from unenhanced phase to peak arterial phase (CTPSI-A) or peak venous phase (CTPSI-V) were collected to simulate a truncation of CTP scan in arterial or venous phase, respectively. The volume of IC on CTPSI-A (VCTPSI-A) or CTPSI-V (VCTPSI-V) was defined as the volume of brain tissue with $>65\%$ reduction in attenuation than normal tissue. The volume of IC on baseline CTP (VCTP) was defined as a relative cerebral blood flow was $<30\%$ of that in normal tissue. Volume of post-treatment infarct on follow-up DWI (VDWI) was manually delineated and calculated. One-way analysis of variance, Bland-Altman plots and Spearman correlation analyses were used.

Results: VCTPSI-A was significantly higher than VDWI ($P < 0.001$), while there was no significant difference between VCTP and VDWI ($P = 0.073$) or between VCTPSI-V and VDWI ($P > 0.999$). The mean difference between VDWI and VCTPSI-V was 1.70mL (LoA, -56.40 to 59.70), followed by that between VDWI and VCTP (8.30mL; LoA, -40.70 to 57.30), and that between VDWI and VCTPSI-A (-68.10mL; LoA, -180.90 to 44.70). Significant correlations were found between VDWI and VCTP ($r = 0.68$, $P < 0.001$), or between VDWI and VCTPSI-V ($r = 0.39$, $P < 0.001$), while not between VDWI and VCTPSI-A ($r = 0.20$, $P = 0.068$).

Conclusions: VCTPSI-V might be promising in quantifying the volume of IC if truncation of CTP scan occurred.

PU-1783

Suboptimal states and frontoparietal network-centered incomplete compensation revealed by dynamic functional network connectivity in patients with post-stroke cognitive impairment

Bo Rao

Department of Radiology, Zhongnan Hospital of Wuhan University

Background: Neural reorganization occurs after a stroke, and dynamic functional network connectivity (dFNC) pattern is associated with cognition. We hypothesized that dFNC alterations resulted from neural reorganization in post-stroke cognitive impairment (PSCI) patients, and specific dFNC patterns characterized different pathological types of PSCI.

Methods: Resting-state fMRI data were collected from 16 PSCI patients with hemorrhagic stroke (hPSCI group), 21 PSCI patients with ischemic stroke (iPSCI group), and 21 healthy controls (HC). We performed the dFNC analysis for the dynamic connectivity states, together with their topological and temporal features.

Results: We identified 10 resting-state networks (RSNs), and the dFNCs could be clustered into four reoccurring states (modular, regional, sparse, and strong). Compared with HC, the hPSCI and iPSCI patients showed lower standard deviation (SD) and coefficient of variation (CV) in the regional and modular states, respectively ($p < 0.05$). Reduced connectivities within the primary network (visual, auditory, and sensorimotor networks) and between the primary and high-order cognitive control domains were observed ($p < 0.01$).

Conclusion: The transition trend to suboptimal states may play a compensatory role in patients with PSCI through redundancy networks. The reduced exploratory capacity (SD and CV) in different suboptimal states characterized cognitive impairment and pathological types of PSCI. The functional disconnection between the primary and high-order cognitive control network and the frontoparietal network centered (FPN-centered) incomplete compensation may be the pathological mechanism of PSCI. These results emphasize the flexibility of neural reorganization during self-repair.

基于 TBSS 探讨终末期肾病继发甲旁亢患者脑白质损伤

单艳棋

安徽医科大学第二附属医院

目的 探讨 ESRD 伴 SHPT 患者认知及脑白质微观结构损伤 方法 25 名 ESRD 合并 SHPT 患者 (SHPT 组) 及 25 名 ESRD 不伴甲旁亢患者 (ESRD 组) 行磁共振 DTI 检查、进行 MMSE 认知量表评估, 收集相关临床血清学指标, 比较两组间 MMSE、总评分、血清学指标、DTI 指标的差异, 分析 SHPT 组 MMSE 总评分、血清学指标与差异性脑区 DTI 参数的相关性。结果 与 ESRD 组相比, SHPT 组 MMSE 总评分明显减低, 血清钙水平略升高, 维生素 D 水平明显减低。SHPT 组多个脑区 FA 值及 AD 值减低, 包括大脑半球、小脑及脑干, 且大脑半球异常脑区以右侧分布为主, 部分脑区 RD 值升高, 且 SHPT 组血清钙水平、磷酸盐水平及肌酐水平与部分脑区 FA 值及 AD 值减低呈正相关, 血清磷酸盐水平与部分脑区 RD 值升高相关, 认知水平与血清 iPTH 水平呈负相关 (P 均 < 0.05); 其他指标未见明显统计学差异 (P 均 > 0.05)。结论 本研究显示 ESRD 合并 SHPT 患者的脑白质微观结构及认知功能均出现损伤, 且脑白质微结构损伤范围广泛, 以轴突损伤为主, 具有右侧大脑半球偏侧性, 且与患者血清钙、磷酸盐、肌酐水平相关。

PU-1785

Identifying circuits underlying motor impairment in pontine stroke

Changjiang Zhao¹, Chengxin Yu¹, haibo xu², junlong Pan¹, long chen¹, xiong xiong¹

1. The First Clinical Medical Science, China Three Gorges University, Yichang Central People's Hospital

2. Department of Radiology, Zhongnan Hospital of Wuhan University, Wuhan, Hubei, China

Objectives: Pontine stroke often presents with various motor impairments, but the underlying neural mechanisms remain largely unclear. This study aims to investigate the relationship between pontine lesion spatial location and motor impairments using functional connectivity magnetic resonance imaging (fcMRI).

Methods: Forty-five subacute pontine stroke patients and 45 demographically- and underlying disease-matched controls were included in this study. Multi-modal brain MRI, motor, and global cognitive data were collected. Interhemispheric functional connectivity based on resting-state fMRI was computed and different types of motor impairments were classified. Lesion probability mapping and lesion network imaging were used to determine the network involvement of pontine lesions.

Results: Pontine stroke patients exhibited prominent reductions in interhemispheric functional connectivity, predominantly involving somatosensory-motor and language networks. Further classification indicated that interhemispheric connections could effectively differentiate different motor impairment symptoms, leading to the spatial subdivision of the pontine lesions into distinct probability maps. These subdivisions were linked to different motor circuits, providing insights into the neural mechanisms underlying impairments after pontine stroke.

Conclusion: Our findings suggest distinct spatial outcomes of pontine stroke that correspond well to cortical somatosensory-motor networks, highlighting the underlying substrate of network circuits.

ASL 联合 DWI 在鉴别高级别胶质瘤真假性进展中的应用价值

李艳

河南省人民医院

目的 探讨动脉自旋标记(arterial spin labeling, ASL)联合表观弥散系数(apparent diffusion coefficient, ADC)在鉴别高级别胶质瘤真假性进展的诊断价值。**方法** 回顾性分析 27 例高级别胶质瘤患者的临床及影像资料, 其中胶质母细胞瘤 21 例, IDH 突变型弥漫性星形细胞瘤 WHO 4 级 2 例, IDH 突变型弥漫性星形细胞瘤 WHO 3 级 4 例。真性进展 20 例, 假性进展 7 例, 比较 T1 增强强化区与对侧正常区的脑血流量比值(Cerebral blood flow, rCBF)、表观扩散系数值(ADC)。**结果** ASL 显示真性进展 rCBF 值(2.56 ± 0.12)显著高于假性进展组的 rCBF 值(1.04 ± 0.18), 二者差异有统计学意义; b 值=2000s/mm² 真性进展 ADC 值低于假性进展组 ADC 值, 二者差异有统计学意义; 而 b 值=1000s/mm² 真假性进展 ADC 值差异无统计学意义。**结论** ASL 联合 ADC 对鉴别高级别胶质瘤真假性进展有一定价值。

4 例颅内非典型畸胎样/横纹肌样肿瘤磁共振影像特征分析

关舒元

河南省人民医院

目的 探讨颅内非典型畸胎瘤样/横纹肌样肿瘤(AT/RT)的 MRI 表现特征, 提高对该病的诊断及鉴别能力。

方法 回顾性分析 4 例经病理和免疫组织化学诊断为 AT/RT 患者的临床及影像资料。其中男 2 例, 女 2 例, 年龄 2~55 岁。所有患者均行 MR 平扫及增强扫描。

结果 4 例 AT/RT 患者中 2 例位于鞍区, 1 例位于前颅窝底, 1 例位于后颅窝; 4 例肿瘤均可见囊变, 3 例伴有瘤内出血, 3 例显示轻度瘤周水肿; 所有病灶均呈不均匀中-重度强化; 所有病灶 DWI 呈不均匀高信号, ADC 呈低信号。

结论 颅内 AT/RT 的 MRI 表现具有一定特征, 结合临床资料有助于鉴别诊断。

PU-1788

Neuroanatomical correlates of cognitive impairment following basal ganglia-thalamic post-hemorrhagic stroke: Uncovering network-wide alterations in hemispheric gray matter asymmetry

Huan Wang, Minhua Yu, Jinxia Ren, Xiaoli Zhong, Dan Xu, Lei Gao, Haibo Xu
Zhongnan Hospital of Wuhan University

Purpose This study aimed to investigate whether post-hemorrhagic stroke cognitive impairment (PhSCI) is associated with cortical gray matter (GM) loss and hemispheric asymmetry changes and whether these changes could predict improvements in cognitive function during the recovery.

Methods Nineteen patients with PhSCI, comprising 10 with basal ganglia hemorrhage and 9 with thalamic hemorrhage, were recruited. Among them, 9 completed a course of repetitive transcranial magnetic stimulation (rTMS). Additionally, 19 demographically and comorbidity-matched healthy controls were also included. Structural brain MRI and cognitive assessments were performed. Voxel-wise GM volume and hemispheric asymmetry were analyzed.

Results The PhSCI patients exhibited bilateral, yet asymmetric, GM losses in the hippocampus, fusiform, lateral temporal, prefrontal, somatomotor, and inferior parietal regions. The analysis of GM asymmetry revealed that patients showed rightward GM in the lateral temporal, somatomotor, and inferior parietal regions. Among the 9 PhSCI patients who completed rTMS, there was a marginal trend of regional GM increase and leftward GM, and these changes were in parallel with the improvements in cognitive tests. Further lesion connectivity and metanalytic mapping identified two interconnected systems linked to the lesions, which were anchored in the default mode, somatomotor, and salience/cognitive control networks and in the cognitive domains of memory, language, decision-making, and executive function.

Conclusion PhSCI patients exhibited network-wide cortical GM losses, distal to subcortical hemorrhagic lesions, and hemisphere asymmetry changes. These changes appear to predict rTMS-related cognitive improvements, suggesting that even subcortical focal lesions can lead to alterations in distal cortical neuroanatomical architecture. Our preliminary findings provide new insights into the neuroanatomical basis of PhSCI.

失神癫痫意识丧失与重新获取的动态功能梯度模式

许强、王昭杰、张志强、卢光明
中国人民解放军东部战区总医院

前言：意识的过程是一个动态过程，包含了信息获取、处理、反馈执行的一系列过程，意识过程存在层级结构。失神癫痫是一类常见的儿童癫痫，以意识的丧失和再获取为最主要的发作症状。新型功能连接梯度技术能有效描述整体脑模式。我们采用 EEG-fMRI 技术，结合动态功能连接技术和功能连接梯度技术，研究失神癫痫发作过程中的脑改变模式。

材料与方法：本研究纳入 12 名失神癫痫，采集了同步 EEG-fMRI 序列，由本院神经内科医生判读了失神癫痫发放 (GSWDs) 的起始和终止时间点。根据 GSWDs 的起始时间，截取了 29 段包含发作前 (起始时间前 10TR)，发作中 (从起始开始，到终止后 9TR) 和发作后 (发作终止后 9-18TR) 的时间序列点用于后续分析。fMRI 数据预处理采用 fmripred 工具包进行，并配准到 fsaverage3 空间和 6x6x6mm³ 的 MNI 空间，并提取了皮层和丘脑的时间序列。应用 DynamicBC 工具包，采用 FLS 算法构建动态功能连接矩阵；应用 BrainSpace 工具包构建功能连接梯度，并采用 Yeo7 网络和丘脑对全脑节点进行标记。采用功能连接梯度偏心率公式，计算了基于前三梯度的总体偏心率，子网络内和子网络间偏心率指标。统计分析采用的是重复测量的 ANOVA 分析，比较了前三梯度和偏心率指标的动态改变模式。

结果：在梯度指标中，躯体运动，注意网络出现了倒 V 型改变模式，并且在梯度 2 中发现了 DMN 的 V 型模式，以及梯度 3 中的倒 V 型改变模式。在整体离散度上，发作前中后的离散度呈现倒 V 型模式。在子网络内离散偏心率指标中，差异区域主要落在注意网络和丘脑上。在子网络间离散偏心率指标中，差异主要集中于视觉，注意网络，默认网络以及丘脑之间的距离。

结论：我们结合了动态功能连接和梯度分析技术，扩展了梯度偏心率离散度指标，提出了子网络内偏心率离散度和子网络间偏心率离散度，并评价了失神癫痫患者 GSWDs 发作前、发作中、以及发作后三状态间的脑状态切换的模式。DMN 和注意网络的抑制可能是失神癫痫发作中的重要影像学发现，其可能与失神癫痫患者的意识丧失有关，GSWDs 影响了丘脑-皮层间的信息交流，尤其是影响了丘脑-注意网络的信息交流。

基于标准空间分析急性缺血性脑卒中患者血清甘油三酯对损伤位置和体积介导的功能结局的间接影响:结构方程模型

曹敏
中国人民解放军东部战区总医院

目的：采用基于人群的标准空间分析的 MRI 技术，探索甘油三酯(TG)对急性缺血性脑卒中梗死灶分布空间模式的影响，并利用结构方程模型探讨血清甘油三酯对急性缺血性卒中患者病变部位和体积介导的功能转归的间接影响。

方法：回顾性收集 2015 年 1 月至 2020 年 12 月东部战区总医院以及 2013 年 1 月至 2021 年 12 月南京市第一医院共 657 例前循环缺血性脑卒中患者急性期 MRI 数据。根据血脂情况分为高 TG 组 (n=100) 和低 TG 组 (n=557)。将弥散加权成像 (DWI) 图像人工智能自动分割后的梗死灶，配准到 MNI152 标准空间绘制病灶位置频次热图。并基于 Arterial Atlas 模板进行标准空间下的感兴趣区分析。采用组间比较两组病灶位置的差异，广义线性模型回归分析观察 TG 与病灶位置的相关性。在逻辑回归模型中分析功能结局与临床变量之间的关系。最后使用结构方程模型重点研究了血清 TG、病变位置、体积、mRS 等控制变量之间的关系。

结果:血清 TG 是功能结局的独立决定因素。组间比较结果显示,右外侧豆纹动脉供血区和左侧大脑中动脉额部供血区与低血清 TG 显著相关。广义线性模型显示,右外侧豆纹动脉供血区域与低血清 TG 显著相关。结构方程模型结果显示,3 个月随访时,血清 TG 对身体功能的总影响为-0.091,其中 76.2%(-0.07)是直接影响,15.3%(-0.014)是由

梗死体积介导的间接影响;病变部位介导通路的间接影响仅为 8.5%(-0.008)。

结论:前循环缺血性脑卒中患者右外侧豆纹动脉所供应的区域与低血清 TG 显著相关。血清 TG 越低,预后越差。此外,血清 TG 通过病变体积和梗死部位间接影响预后。

PU-1791

脑室内多发菊形团形成型胶质神经元肿瘤一例并文献复习

李建瑞、徐彤、张志强
中国人民解放军东部战区总医院

目的:报道 1 例脑室内多发菊形团形成型胶质神经元肿瘤(RNGT)病例,通过文献复习,总结 RNGT 的临床及影像学特征,旨在提高对该病的认识

方法:根据关键词"RNGT",在 Pubmed 数据库中进行检索(www.pubmed.gov),搜索出 87 例符合条件的相关病例报道,全面回顾总结这 87 例 RNGT 的流行病学、肿瘤位置及影像学表现

结果:本例为 1 名 41 岁男性患者,半年前突发意识丧失 2 次,影像学表现为第四脑室、中脑导水管及双侧侧脑室内多发肿块,T1WI 呈高低混杂信号,T2WI 呈高信号,增强扫描实性部分呈结节样强化;病理结果:菊形团形成型胶质神经元肿瘤(RNGT),WHO I 级,免疫组化:Olig-2(3+),MAP2(3+),ATRX(3+),菊形团中央神经毡 Syn(3+),部分神经元 Neu-N(2+);胶质区瘤细胞 GFAP(3+),IDH1(-),P53(-),EMA(-),Ki67(约 1%)。随后通过文献复习,本研究总结 87 例 RNGT 的临床及影像学特征:(1)发病年龄:好发于年轻成年男性,平均年龄为 26.9 岁(范围 6--75),男女比例为 1.48:1(35:52);(2)临床症状:多数表现为头痛、步态障碍、眩晕和视觉障碍等,少数为偶然发现(8 例),病程从数月至数年不等;(3)发病部位:35.6%(31/87)RNGT 与第四脑室相关;仅有 2.3%(2/87)RNGT 发生在第四脑室并向第三脑室和侧脑室扩散;(4)影像表现:70.7%(53/75)表现为囊实性,22.7%(17/75)表现为实性,6.6%(5/75)表现为囊性。实性部分在 T1WI 上为等或低信号,T2WI 上为高信号,增强扫描后大多数肿瘤发生强化(74.7%,59/79),以不均匀强化最常见(58.2%,46/79)。

结论:尽管 RNGTs 具有良性组织学特征,但由于播散转移的生长方式,对临床手术和术后管理可能是一个挑战。因此,正确认识并诊断罕见的多发 RNGT,可能有助于临床决策

PU-1792

多发脑胶质瘤的空间位置特征的 MRI 研究

李建瑞¹、许强¹、刘亚欧²、贾中正³、张志强¹

1. 中国人民解放军东部战区总医院

2. 北京天坛医院

3. 南通大学附属医院

目的 探究多发脑胶质瘤的位置分布与基因表型及细胞富集的空间相关性

方法 回顾性分析 2010 年至 2020 年国内三家医院以及癌症基因组图谱(TCGA)共 211 例多发胶质瘤的影像学数据,使用 MRICron 软件在 T1WI 增强像上勾画肿瘤的所有瘤灶,再采用 SPM 软件把图像及肿瘤 ROI 配准到 MNI 标准空间,叠加所有瘤灶 ROI,得到位置分布空间频次热图。通过文献检索 27 个临床常见的脑胶质瘤相关基因,采用配对样本 t 检验比较多发和单发胶质瘤相关基因关联强度 t 的区别,使用 NeuroVault 工具分别评估多发和单发脑胶质瘤空间分布模式与基因表达

的空间相似性。使用 BrainSpan 数据集, 通过细胞类型特异性表达分析 CSEA 发育表达工具进行发育富集分析

结果 相比单发, 多发脑胶质瘤频繁出现在双侧脑室旁、胼胝体及右侧岛叶 ($P < 0.05$), 分布差异脑区位于双侧脑室旁及胼胝体。14 种胶质瘤风险基因中有 5 种与多发脑胶质瘤空间位置存在正相关, 非风险(保护)基因中有 3 种与多发胶质瘤的空间位置存在负相关。小胶质细胞和内皮细胞富集表达的脑区, 多发胶质瘤发生率更高

结论 本研究表征了多发胶质瘤的空间分布特征以及潜在的与位置相关的起源细胞及驱动基因簇, 有助于理解多发脑胶质瘤的空间分布模式形成的病理生理机制

Abnormal white and gray matter functional connectivity is associated with cognitive dysfunction in presbycusis

Fei Gao¹, yao wang², yuting gao²

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. School of Life Sciences, Tiangong University

Presbycusis is characterized by high-frequency hearing loss and is closely associated with cognitive decline. Previous studies have observed functional reorganization of gray matter (GM) in presbycusis, but the information transmission between GM and white matter (WM) remains ill-defined. Using resting-state functional magnetic resonance imaging, we investigated differences in functional connectivity (GM-GM, WM-WM, and GM-WM) between 60 patients with presbycusis and 57 healthy controls. Subsequently, we examined the correlation between these connectivity differences with high-frequency hearing loss as well as cognitive impairment. Our results revealed significant alterations in functional connectivity involving the body of the corpus callosum (BCC), posterior limbs of the internal capsule, retrolenticular region of the internal capsule, and the GM regions in presbycusis. Notably, disrupted functional connectivity was observed between BCC and ventral anterior cingulate cortex in presbycusis, which was associated with impaired attentional. Additionally, enhanced functional connectivity was found in presbycusis between the internal capsule and the ventral auditory processing stream, which was related to impaired cognition in multiple domains. These two patterns of altered functional connectivity between GM and WM may involve both bottom-up and top-down regulation of cognitive function. These findings provide novel insights into understanding cognitive compensation and resource redistribution mechanisms in presbycusis.

脑胶质淋巴系统受损对急性缺血性卒中患者短期预后的影响：一项基于 DTI-ALPS 的研究

杜晓岚

云南省昆明市延安医院

目的: 龋齿动物和临床研究证实了缺血性卒中后脑胶质淋巴系统明显受损。本研究旨在利用沿血管周围空间的弥散张量图像分析 (DTI-ALPS) 方法追踪急性缺血性卒中患者胶质淋巴系统活性短期内的急剧变化, 探索 DTI-ALPS 指数变化与血管周围间隙体积、神经功能之间的关系。**方法:** 本研究纳入 50 例急性缺血性卒中的患者, 对其治疗后的 24 小时 (急性期)、7 天 (亚急性期) 和 3 个月 (慢性期) 进行头颅磁共振成像和神经功能缺损 (NIHSS) 评分, 并匹配间隔时间相同的健康对照组。基于沿血管周围空间的弥散张量图像分析 (DTI-ALPS) 方法追踪胶质淋巴系统活性短期内

的急剧变化,并定量测量基底神经节(BG)、半卵圆中心(CSO)和侧脑室水平(LVB)三个位置的血管周围间隙体积(PVS)分数。探索不同阶段 DTI-ALPS 指数和 PVS 体积分数变化规律,分析 DTI-ALPS 指数、PVS 体积分数与神经功能的相关性,使用多元回归分析量化对各危险因素对缺血性卒中短期预后的影响效应。**结果:**与对侧及对照组同侧相比,急性缺血性卒中的患者梗塞侧 24 小时内的 ALPS 指数为 1.61 ± 0.1 ,呈轻度升高($P=0.012$),在 7 天和 3 个月时 ALPS 指数分别为 1.35 ± 0.15 和 1.45 ± 0.13 ,呈下降趋势, ($P<0.001$)。卒中患者的 BG-PVS 体积分数明显大于对照组,并与 ALPS 指数呈负相关($r=-0.312, P=0.041$)。较低的 ALPS 指数与 NIHSS 测试的低分数相关($r=0.515, P=0.021$)。多元回归分析显示在短期预后中,ALPS 指数影响显著(效应量 >0.15)。**结论:**急性缺血性卒中的患者 DTI-ALPS 在急性期出现轻度上升,在亚急性期和慢性期后下降至低于正常值,提示胶质淋巴系统在缺血早期活性上升,随后下降。DTI-ALPS 指数与 BG-PVS 增大和短期内较差的神经功能相关。

PU-1795

扩散峰度成像在脑胶质瘤分级诊断中的应用价值

李祥、张辉

山西医科大学第一医院

目的

探讨扩散峰度成像对脑胶质瘤分级诊断的价值。

方法

回顾性分析 2018-2020 年经病理证实的 65 例脑胶质瘤患者的临床、影像资料,其中 WHO2 级 29 例、WHO3 级 20 例、WHO4 级 16 例。患者术前均行常规 MRI 及 DKI 扫描,测量肿瘤实质区、瘤周水肿区和同层面对侧正常脑白质区的 DKI 参数扩散各项异性分数(FA)、平均扩散系数(MD)、平均扩散峰度(MK)、轴向扩散峰度(Ka)、径向扩散峰度(Kr),将肿瘤实质区测量值除以对侧正常脑白质区测量数值,获得校正后参数,得到相对扩散各项异性分数(rFA)、相对平均扩散系数(rMD)、相对平均扩散峰度(rMK)、相对轴向扩散峰度(rKa)、相对径向扩散峰度(rKr)值。应用方差分析或 Mann-Whitney U 检验比较不同组织学分级胶质瘤校正后 DKI 参数差异,绘制受试者工作特征(ROC)曲线分析各参数值对胶质瘤病理分级的诊断价值。

结果

不同病理分级的胶质瘤肿瘤实质区 rMD、rKa 比较,差异无统计学意义($P>0.05$),病理分级 4 级者 rMK、rKr 明显高于 2 级、3 级者且差异有统计学意义($P<0.05$),但 2 级和 3 级 rMK、rKr 间差异无统计学意义,4 级 rFA 参数值虽然高于 2 级和 3 级,但仅 4 级和 3 级之间差异有统计学意义($P<0.05$)。不同级别瘤周水肿区 rMK 和 rKr 差异有统计学意义($P<0.05$),其余参数差异均无统计学意义($P>0.05$)。ROC 曲线分析结果显示,肿瘤实质区 rMK、rKr、rFA 和瘤周水肿区 rMK 和 rKr 均对病理分级 4 级胶质瘤有较高诊断价值($P<0.05$),ROC 曲线下面积分别为 0.796[95%置信区间(confidence interval, CI): 0.660~0.932]、0.745 (95% CI: 0.592~0.897)、0.704 (95% CI: 0.575~0.833)、0.755 (95% CI: 0.618~0.892)、0.694 (95% CI: 0.555~0.833)。

结论

DKI 可以无创地评估胶质瘤级别, rMK、rKr、rFA 值对病理分级 4 级胶质瘤有较高的诊断价值,其中, rMK 的诊断效能最高。

【摘要】目的 探讨 Fahr 综合征的 CT、MR 影像特点及临床表现, 以期提高对本病的认识。方法 回顾性分析 6 例经临床证实的 Fahr 综合征的影像学表现及临床特征。结果 本组 6 例患者, 其中男 2 例, 女 4 例; 年龄 39 岁-71 岁, 平均 55 岁。5 例均做 CT 和 MR 检查, 1 例只做 MR 检查。CT 上表现为尾状核、苍白球、齿状核等部位对称性钙化, 其他部位受累少见; MR 上表现为双侧基底节、丘脑、小脑齿状核处 T1WI 呈低信号, 部分为稍高信号; T2WI、T2flair、DWI 呈低信号, 部分为稍低信号; T2*加权血管成像 (SWAN) 呈低信号或稍低信号。对大脑皮质区的钙化沉积, CT 优于 MR; 对于早期病例, 尤其对基底节、齿状核的钙化沉积, MR 优于 CT, 尤其是 SWAN 及 DWI 有助于诊断。临床表现多为头晕、进行性行动迟缓、四肢震颤、言语不清、四肢无力等。6 例患者均无家族遗传病和传染性疾病。6 例患者的血钙、血磷、甲状旁腺激素及降钙素含量均正常。讨论 Fahr 综合征又称基底节钙化综合征, 是一种罕见的神经退行性疾病, 其特征是基底神经节的双侧对称性钙化, 但也累及其他脑结构。1855 年 Virchow 和 Bamber 首先在病理上证实基底节钙化。Fahr 综合征不等同于 Fahr 病, 但其包含了 Fahr 病。Fahr 病指特发性基底节钙化, 1930 年首次由德国神经学家 Kari Theodor Fahr 描述。目前临床诊断标准: (1) 影像上见双侧基底节钙化, 可有其他区域受累。(2) 进展性神经系统症状, 包括运动障碍、精神症状等。起病年龄多在 40-50 岁, 也可早期起病; 无甲状旁腺功能减退、假性/假-假甲状旁腺功能减退的临床表现; (3) 血清钙、磷在正常范围内; 无生化检查异常和提示线粒体或其他代谢病等全身疾病证据; 肾小管对甲状腺素反应正常; (4) 无感染、中毒、外伤等; (5) 有常染色体显性遗传或无家族史。Fahr 综合征在影像学上均有对称基底节区伴或不伴有其他区域对称性钙化, 需与甲状旁腺功能减退、假性/假-假性甲状旁腺功能减退、线粒体脑肌病等疾病相鉴别; CT 与 MR 联合检查为其提供可靠的诊断依据, 另外还需结合临床表现及实验室检查, 临床上需认真鉴别诊断。

PU-1797

颈动脉-椎基底动脉吻合影像分析及文献复习

陈方宏
浙江省人民医院

摘要: 目的: 认识颈动脉-椎基底动脉吻合的影像征象, 了解颈动脉-椎基底动脉吻合的临床意义。材料与方法: 回顾性收集本院 2017 年 1 月至 2022 年 6 月颈内动脉-椎基底动脉吻合 30 例。所有病例均经 MRA 或 CTA 证实。结果: 30 例病例中, 男性 13 例, 女性 17 例, 年龄 40~84 岁, 平均年龄 63.9 岁。30 例中, 永存三叉动脉 28 例, 其中右侧颈内动脉与基底动脉吻合 17, 左侧颈内动脉与基底动脉吻合 11 例; 永存舌下动脉 2 例, 左右各 1 例。结论: CTA 与 MRA 均可很好显示颈内动脉-椎基底动脉吻合, CTA 原始图像能更好地显示吻合血管与颅底骨性管道的关系; 而 MRA 原始图像能显示吻合血管与神经的关系。

Metabolic Habitat Imaging Predicts Individual Progression-free Survival in High-grade Glioma after Concurrent Chemoradiotherapy

Hao Wu

Department of Radiology, Research Institute of Surgery, Daping Hospital, Army Medical University, Chongqing, China

Objective We design a feasibility study to obtain a set of metabolic-hemodynamic habitats for tackling tumor spatial metabolic pattern with hemodynamic information.

Methods: Preoperative data from 69 HGG patients with subsequent histologic confirmation of HGG were prospectively collected (January 2016 to March 2020) after CCRT. Four vascular habitats were automatically segmentation by Multiparametric MRI. The metabolic information either at enhancing or edema tumor regions obtain by two neuroradiologists. The relative habitat volumes were used for weight estimation procedures for computing the coefficients of a linear regression model using weighted least squares (WLS) for metabolites semi-quantifications (i.e., Cho/NAA ratio and the Cho/Cr ratio) at vascular habitats. Multivariate Cox proportional hazard regression analyses to obtain odds ratio (OR) and develop a nomogram using weighted estimators corresponding to each covariate derived from Cox regression coefficients.

Results There were strongly correlation between perfusion indexes and Cho/Cr ratio (rCBV, $r = 0.712$,) or Cho/NAA ratio (rCBV, $r = 0.664$) at HAT habitat. Compared IDH mutation to their wild type, the IDH wildtype had significantly decreased Cho/Cr ratio (IDH mutation: Cho/Cr ratio = 2.44 ± 0.33 , IDH wildtype: Cho/Cr ratio = 2.66 ± 0.36 , $t = -2.342$, $p = 0.02$, 95% CI = -0.409 to -0.033) and Cho/NAA ratio (IDH mutation: Cho/Cr ratio = 4.59 ± 0.611 , IDH wildtype: Cho/Cr ratio = 4.99 ± 0.664 , $t = -2.342$, $p = 0.022$, 95% CI = -0.747 to -0.067) at the HAT. The C-index for the median PFS prediction were 0.769 for Cho/NAA nomogram and 0.747 for Cho/Cr nomogram through 1000 bootstrapping validation.

Conclusions Our findings suggest that spatial metabolism combined with hemodynamic heterogeneity is associated with individual PFS to HGG patient post CCRT

PU-1799

阿尔茨海默病伴情绪障碍脑灰质体积改变及其与认知损害的相关性研究

朱婉秋

安徽医科大学第一附属医院

目的 尽管阿尔茨海默病(Alzheimer's disease, AD)核心症状为记忆障碍和其他认知领域缺陷,但在疾病进程中,通常会观察到焦虑、抑郁等神经精神症状。本研究拟探讨伴或不伴情绪障碍患者脑灰质体积(GMV)改变是否存在差异,及其与认知损害的相关性。

方法 通过量表评估,具有焦虑和/或抑郁症状者被认为伴情绪障碍,纳入 AD 患者 92 例(伴情绪障碍 35 例,不伴情绪障碍 57 例),健康对照 HC 68 例(伴情绪障碍 15 例,不伴情绪障碍 53 例)。采集高分辨 3D T1 结构像,采用优化的基于体素形态学测量 VBM 方法,使用双因素方差分析得到有无情绪障碍和组别(AD、HC)存在显著交互效应的脑区并提取 GMV 值,并与总体认知表现(MMSE、MoCA)进行相关性分析。

结果 控制年龄、性别和受教育年限后,基于有无情绪障碍和组别(AD、HC)的 GMV 分析存在显著交互效应脑区为右侧直回(MNI: 4.5, 27, -25.5; $P < 0.05$, 团块水平 FWE 校正)。事后分析显示 HC 伴情绪障碍组右直回 GMV 显著高于不伴情绪障碍组及 AD 伴情绪障碍组,AD 伴情绪障碍组

右直回 GMV 显著低于不伴情绪障碍组, 而右直回 GMV 在 AD 和 HC 均不伴情绪障碍组间无统计学差异。相关分析显示在情绪障碍组 (HC、AD 合并) 右直回 GMV 与 MMSE 和 MoCA 呈正相关 ($r = 0.606$ 和 0.533 , P 均 < 0.001), 而在不伴情绪障碍组 (HC、AD 合并) 右直回 GMV 与 MMSE 和 MoCA 无显著相关性 (P 均 > 0.05)。

结论 在 AD 进程中, 伴或不伴情绪障碍者右直回灰质体积萎缩存在差异, 伴情绪障碍者右直回灰质体积萎缩更明显, 并且右直回 GMV 可能预测 AD 伴情绪障碍患者的总体认知表现。

探讨 CT 在快感缺失抑郁症患者海马缩小及灰白质密度变化的临床价值分析

邹灿
玉林市四人民医院

目的: 本文旨在探讨 CT 在快感缺失抑郁症患者海马缩小及灰白质密度变化的临床价值分析。

方法: 本研究通过回顾性分析 100 例快感缺失抑郁症患者的 CT 影像资料, 其中 50 例患者行 CT 海马及灰白质密度测量。通过比较患者海马及灰质白质密度的变化, 探讨 CT 在快感缺失抑郁症患者中的诊断价值。

结果: 研究发现, 快感缺失抑郁症患者海马体积明显缩小, 灰质白质密度减低。

结论: CT 扫描在快感缺失抑郁症患者中可以有效地检测海马及灰质白质密度的变化, 有助于诊断该病, 并为临床治疗提供依据。

探讨 CT 岛征、混合征、漩涡征及其联合征象对自发性脑出血患者早期血肿扩大的预测价值

张学峰
固原市人民医院

目的 探讨 CT 岛征、混合征、漩涡征及其联合征象对自发性脑出血(SICH)患者早期血肿扩大(HE)的预测价值。方法 回顾性分析 SICH 患者 440 例, 均于发病 6h 内行首次头颅 CT 及 24h 内复查头颅 CT, 按照复查 CT 结果分为 HE 组(193 例)与 NHE 组(247 例), 比较两组患者的相关临床及影像学资料。结果 两组患者的吸烟史、血肿位置、发病至首次 CT 时间、初始血肿体积、入院收缩压、入院舒张压、合并破入脑室、岛征、混合征及漩涡征的差异均有统计学意义($P < 0.05$)。多因素 Logistic 回归分析显示, 初始血肿体积、合并破入脑室、岛征、混合征及漩涡征是早期血肿扩大的独立危险因素($P < 0.05$)。经受试者工作特征(ROC)曲线分析, 岛征、混合征及漩涡征的联合征象预测早期血肿扩大的曲线下面积(AUC)均高于单一征象, 其敏感度、特异度、阳性预测值及阴性预测值均处于较高水平, 且约登指数更接近 1。结论 岛征、混合征及漩涡征的联合征象对早期 HE 的预测价值极高, 将其作为影像学标志纳入评分预测模型, 对指导临床医师采取及时有效的治疗措施、减轻患者的不良预后具有重要意义。

PU-1802

基于脑 CT 灌注评估头颈部动脉狭窄后侧支循环情况

许云、王培军
上海市同济医院

目的:应用 320 排 CT 一站式 CTA-CTP 动态容积灌注成像技术,探讨头颈部动脉狭窄后脑血流动力学改变与侧支循环关系。

方法:92 例经颈动脉 CTA 或 CE-MRA 及头颅 CTA 诊断为单侧颈动脉系统中重度狭窄的患者纳入本研究中,收集患者的临床基本信息资料及影像学检查资料。所有患者均行脑 CTP 检查。经灌注后处理软件,分别得到相对脑血流量 (relative cerebral blood volume, rCBV) 图、达峰时间 (time to peak, TTP) 图、相对脑血流量 (relative cerebral blood flow, rCBF) 图、平均通过时间 (mean transit time, MTT) 图及灌注参数值。将颈内动脉组和大脑中动脉狭窄组按侧支循环分级分为良好组和不良组,分析两组间 CTP 增加率的变化。

结果:将颈内动脉 (55 例) 和大脑中动脉 (37 例) 中重度组患者根据侧支循环分级分为良好组和不良组。颈内动脉侧支循环良好组 41 例,不良组 14 例;大脑中动脉良好组 15 例,不良组 22 例。组间年龄、性别及患有高血压、糖尿病患者比例差异均无统计学意义 ($P>0.05$)。

当 ICA、MCA 中重度以上狭窄时,侧支循环不良者发生 CTP 阳性概率增加。比较各组组间 CTP 参数增加率,rCBV 增加率、rCBF 增加率及 MTT 增加率差异无统计学意义 ($P>0.05$),TTP 增加率差异有统计学意义 ($P<0.05$),说明侧支循环不良者,TTP 增加率较高

结论:CTA 或 CE-MRA 联合 CTP,可直观显示血管狭窄部位、程度及责任血管供血区的血流动力学情况,评价侧支循环情况,可综合评价颈动脉系统狭窄对个体的影响,对临床个体化治疗具有重要意义。

PU-1803

头颈部木村病的 CT 和 MRI 诊断

刘杰
襄阳市中心医院

目的 探讨头颈部木村病的 CT 和 MRI 表现,以提高对该病的认识和诊断水平

。方法 回顾性分析我院 2012 年 6 月至 2022 年 10 月收治的经病理证实为头颈部木村病的患者 9 例,并分析其病灶的位置、大小、形态、密度 (信号) 以及增强的影像表现。结果 9 例患者 7 位为男性,2 位为女性,年龄 16—35 岁,8 例表现为患侧腮腺弥漫性肿大,并伴有软组织肿块 (结节),周围筋膜广泛增厚、皮下脂肪层萎缩,单侧或双侧腮腺区或颈部淋巴结肿大;1 例仅表现左眼泪腺肿大,无腮腺病变及颈部淋巴结肿大。CT 和 MRI 表现为:(1)病灶中肿块的边界不清,常挤压、浸润临近浅层筋膜,皮下脂肪间隙密度增高、浑浊;(2)肿块密度、信号较为均匀,未见坏死囊变征象,增强扫描后均呈明显强化;(3)弥散加权成像,提示病灶弥散明显受限;(4)肿大淋巴结边缘光整,密度或信号均匀,无坏死、囊变,无融合趋势,增强后呈均匀强化。结论 头颈部木村病具有一定的影像特征,对于腮腺区或泪腺区发生无痛性肿块并伴有局部淋巴结肿大的患者,同时伴有外周血嗜酸性粒细胞和血清 IgE 升高者,应考虑木村病的可能。

PU-1804

双低剂量三维 CT 血管成像联合全模型迭代重建技术在 椎动脉 V3 段血管成像中的可行性研究

蔡武、杨君琳、范国华、徐亮、沈钧康、张博
核工业总医院（苏州大学附属第二医院）

目的：探讨低电压、自动管电流调节（ATCM）和低对比剂浓度、剂量及注射速率联合全模型迭代重建（IMR）技术在椎动脉（VA）V3 段三维 CT 血管成像（3DCTA）中的可行性。

方法：前瞻性连续收集本院临床怀疑上颈椎、颅颈交界区病变而行颈部椎动脉 V3 段 3DCTA 的患者 60 例，按照随机数字表法将患者随机分成 A、B 两组，每组各 30 例。A 组采用 80kV、平均管电流为 50mAs 的 ATCM 技术、25ml 注射速率为 3ml/s 的对比剂碘海醇（碘含量 300mg/ml）及 IMR 技术；B 组采用 120kV、固定管电流 150mAs、50ml 注射速率为 5ml/s 的对比剂碘帕醇（碘含量 370mg/ml）和滤波反投影（FBP）重建技术；测量并比较 2 组 CT 值、噪声、信噪比（SNR）、对比噪声比（CNR）、图像灵敏度（FOM），并对所得图像的质量进行评价。记录 CT 容积剂量指数（CTDIvol）及剂量长度乘积（DLP），计算有效剂量（ED）。对 2 组数据分别采用卡方检验、两独立样本 t 检验、非参数 Mann-Whitney U 检验来进行比较。

结果：2 组图像 VA 的 CT 值差异无统计学意义；但 A 组噪声小于 B 组，A 组 SNR、CNR 及 FOM 均大于 B 组。2 组图像质量均满足临床诊断要求，图像质量主观评价差异无统计学意义。A 组 CTDIvol、DLP、ED 均低于 B 组，A 组较 B 组均降低了 89.7%。A、B 组对比剂碘摄入量分别为 7.5g、18.5g，对比剂碘流率分别为 0.9、1.85mg/s，A 组与 B 组相比，碘摄入量及碘流率分别下降了 59.5%、51.4%。

结论：当对比剂碘海醇（300mg/ml）剂量减少至 25 ml、注射速率降至 3ml/s 时，采用 80kV 联合平均管电流为 50mAs 的 ATCM 及 IMR 技术在保证椎动脉 V3 段 3DCTA 图像质量的同时减少了病人所接受的辐射剂量，同时降低了对比剂碘摄入量及碘流率，从而降低对肾脏的损害。

PU-1805

MRI 影像组学鉴别眼眶神经鞘瘤及孤立性纤维瘤的价值

任继亮
上海交通大学医学院附属第九人民医院

目的：探讨磁共振成像（MRI）影像组学在眼眶孤立性纤维性肿瘤与神经鞘瘤鉴别诊断中的价值。

材料与方法：回顾性纳入来自两个医院的 140 例患者。来自医院 1 的所有患者被随机分为训练队列（n = 69）和验证队列（n = 35），来自医院 2 的患者作为外部测试队列（n = 36）。基于 T2WI 和增强 T1WI 分别手动勾画全瘤 ROI。使用 Pyradiomics 软件分别从两序列中提取 106 个特征。采用最小绝对收缩和选择算子 logistic 回归对每个序列建立影像组学模型，并计算影像组学评分。采用 logistic 回归分析构建联合模型，并显示为影像组学列线图。两名放射科医师根据 MRI 表现联合评估肿瘤类型。通过曲线下面积（AUC）比较影像组学模型和主观评估的效能。

结果：结合两序列影像组学评分的列线图区分神经鞘瘤和孤立性纤维瘤表现最佳，其 AUC 高于医师联合阅片，但外部测试组未见显著性差异（训练组：AUC 0.986 vs. 0.807， $p < 0.001$ ；验证组：AUC 0.989 vs. 0.788， $p = 0.009$ ；测试组：AUC 0.903 vs. 0.792， $p = 0.093$ ）。决策曲线分析显示，采用影像组学列线图较主观阅片评估具有更好的临床获益。

结论：MRI 影像组学列线图可用于眼眶 SFT 和神经鞘瘤的鉴别诊断。

PU-1806

Dixon 技术在甲状腺相关性眼病早期视神经改变评估中的价值

秦朗

南京医科大学第一附属医院 (江苏省人民医院)

目的: 探讨 Dixon 技术在甲状腺相关性眼病 (thyroid-associated ophthalmopathy, TAO) 早期视神经改变评估中的价值。方法: 回顾性分析 28 例 TAO 患者和 15 例健康志愿者的临床和影像学资料。测量并比较两组视神经信号强度比值 (signal intensity ratio, SIR)、视神经含水量 (water fraction, WF) 以及视力的差异。采用 Spearman's 相关分析评估病例组视神经 SIR、WF 值与临床参数的相关性。使用受试者工作特征曲线评估视神经 SIR、WF 值在鉴别 TAO 与健康对照组视神经的效能。结果: TAO 组视力显著低于对照组 ($P = 0.024$), 视神经 SIR 值和 WF 值均显著高于对照组 ($P = 0.008$; $P = 0.003$)。TAO 组视神经 SIR 值和 WF 值均与临床活动度评分呈显著正相关 ($r = 0.369$, $P = 0.005$; $r = 0.420$, $P = 0.001$)。以 WF 值 > 0.914 为阈值判断视神经异常, 可获得最优的鉴别效能及特异度 (曲线下面积, 0.694; 敏感度, 35.7%; 特异度, 93.3%)。联合 WF 值 > 0.914 和 SIR 值 > 1.903 判断视神经异常, 鉴别效能及敏感度进一步提高 (曲线下面积, 0.729; 敏感度, 75.0%; 特异度, 63.3%)。结论: Dixon 技术可用于评估 TAO 早期视神经改变。

PU-1807

双低剂量三维 CT 血管成像对头颈部旋转后椎动脉 V3 段后外侧突与寰椎后弓解剖关系的临床研究

蔡武、杨君琳、范国华、徐亮、沈钧康、张博

核工业总医院 (苏州大学附属第二医院)

目的: 采用双低剂量 3DCTA 探讨头颈部左、右旋转位及中立位下椎动脉 V3 段后外侧突与寰椎后弓之间相关解剖学参数的变化。

方法: 前瞻性连续收集本院临床怀疑上颈椎、颅颈交界区疾病而行头颈部左、右旋转位及中立位椎动脉 V3 段双低剂量 3DCTA 检查患者 100 例。由一名接受过高年资医师培训的放射科医师测量并记录头颈部左、右最大旋转位时的旋转角度; 分别从上面观和下面观测量并记录两侧椎动脉直径, 并将其分为优势组和均衡组 2 组。分别从上面观和下面观测量记录并比较 2 组旋转位和 2 组中立位下两侧椎动脉 V3 段后外侧突与寰椎后弓三维解剖关系的各相关径线及其变化: 包括内径 (ID)、外径 (ED)、横径 (TD)、高度及椎动脉直径。

结果: 50 例均衡组及优势组患者的旋转角度差异均无统计学意义。在均衡组中, 右侧旋转位下左侧 VA 的 ID、ED 和 TD 均短于中立位 (均 $P < 0.05$)。左侧旋转位下右侧 VA 的 ID、ED 和 TD 均短于中立位 (均 $P < 0.05$); 左/右侧 VA 的 ID、ED 和 TD 在同侧旋转位与中立位之间差异无统计学意义 (均 $P > 0.05$); 双侧椎动脉的高度和直径在旋转位和中立位之间差异无统计学意义 (均 $P > 0.05$)。在优势组中, 双侧椎动脉的 ID、ED 和 TD、高度和直径在旋转位及中立位之间差异无统计学意义 (均 $P > 0.05$)。

结论: 双低剂量 3DCTA 能显示头颈部旋转位和 2 组中立位下椎动脉 V3 段后外侧突与寰椎后弓间的解剖关系及相关变化, 具有重要的临床指导价值, 可作为常规评估手段。

PU-1808

全模型迭代重组技术联合低电压、低对比剂碘摄入量和低碘流率在头颈部 CT 血管成像中的可行性研究

蔡武、范国华、徐亮、沈钧康、时代、张博
核工业总医院（苏州大学附属第二医院）

目的：探讨全模型迭代重组技术（IMR）联合低电压、低对比剂碘摄入量和低碘流率，在头颈部 CT 血管成像（CTA）中的可行性。

材料与方法：将 60 例临床怀疑头颈部血管病变患者随机分为 A、B 组，各 30 例；A 组采用[120 kV、50 ml 注射速率为 5 ml/s 对比剂碘普胺（含碘量 370 mg/ml）及滤波反投影（FBP）重组]，B 组采用[80 kV、30 ml 注射速率为 4.5 ml/s 对比剂碘海醇（含碘量 300 mg/ml），分别使用 iDose4（B1 组）和 IMR（B2 组）重组]，其余扫描参数 2 组均一致；并对 2 组患者的动脉强化 CT 值、图像噪声、信噪比、对比噪声比、图像质量主观评分、有效辐射剂量、对比剂碘摄入量及碘流率进行对比分析。

结果：B 组动脉强化 CT 值高于 A 组；B2 组图像信噪比和对比噪声比大于 B1 和 A 组，且图像噪声小于 B1 和 A 组；B2 组图像质量主观评分高于 B1 和 A 组。B 组较 A 组降低了约 69.6% 的有效辐射剂量，同时减少了 51.4% 的对比剂碘摄入量及 27.0% 的碘流率。

结论：采用 IMR 联合 80 kV、30 ml 注射速率为 4.5 ml/s 对比剂碘海醇（含碘量 300 mg/ml）行头颈部 CTA 检查，不仅显著降低有效辐射剂量、对比剂碘摄入量和碘流率，而且图像质量得到提高。

PU-1809

Putt's Puffy Tumor 的 CT、MRI 诊断

吕健
广西壮族自治区南溪山医院

目的 探讨 Putt's Puffy Tumor 的基本影像特征，提高对本病的认识及重视。**方法** 回顾分析经临床确诊的 17 例 Putt's Puffy Tumor 患者资料，9 例同时行 CT 平扫加增强及 MRI 平扫加增强扫描，5 例行 CT 平扫加增强扫描，2 例行 CT 平扫、1 例行 MRI 平扫扫描，总结该病基本特征及影像表现特点。**结果** 17 例患者中，9 表现为额部肿胀伴眼眶肿块，4 例只表现为前额部肿胀，鼻前部肿胀及额顶部颌面部多发病变各 1 例。Putt's Puffy Tumor 的影像学表现：CT 表现为额窦内稍高密度影填充，邻近窦壁骨质一侧或多侧骨质密度减低、部分吸收、甚至骨质缺损，增强扫描脓腔无强化，脓壁呈明显强化。MRI 则显示鼻窦内液性信号影填充，慢性骨髓炎在 T2WI 脂肪抑制序列表现高信号，增强扫描可见强化；MRI 能清晰显示骨膜下脓肿及其周围结构、邻近脑膜增厚及颅内侵犯，增强扫描受累的脑膜及脓肿壁明显强化。6 例出现硬膜下积脓，其中 1 例表现为静脉窦周围积脓，2 例合并额窦皮肤瘘口形成，2 例有额窦巨大骨瘤。**结论** 影像表现结合经典的临床病史，能准确诊断 Putt's Puffy Tumor。

PU-1810

HRCT 在上半规管骨裂诊断中的价值探讨

王坤
南京鼓楼医院

目的 探讨上半规管裂在 HRCT 上的影像表现及特点, 提高对该病 HRCT 表现的认识。**方法** 回顾性分析 10 例被临床明确诊断为上半规管骨裂的患者 HRCT 图像, 观察其形态、病变位置及与周围结构的关系, 分析其影像学表现特点。**结果** 10 例患者均在 HRCT 轴位图像上显示部分骨质缺损, 单侧 8 例(右侧 6 例, 左侧 2 例), 双侧 2 例, 单侧以右耳居多, 占 75%。其中 5 例位于顶壁内后侧, 2 例位于顶壁前外侧, 2 例发生在顶壁正中部, 1 例位于壶腹部, 病变基本位于颞骨弓状隆起附近(占 90%), 其它部位少见(占 10%)。**结论** HRCT 在上半规管骨裂诊断中具有重要的价值。

PU-1811

高分辨核磁共振血管壁成像技术预估血管狭窄程度及预测颅内脑梗死的应用价值

公婷、郭小平、董燕、马鸣岳、杨想春
西安市中心医院

目的:

探讨高分辨率核磁共振成像血管壁成像技术 (HRMR-VWI) 预估血管狭窄程度及预测颅内脑梗死的应用价值

方法:

选取 2020 年 3 月~2023 年 6 月在我院就诊并且 DSA 的患者 38 例, 所有患者均行 HRMR-VWI 及 DSA 造影术, 结合患者术前临床资料及术中资料, 进行多平面重建 (MPR)、曲面重建 (CPR) 图像分析, 测量头颈部血管管腔内的病变大小及管腔狭窄范围及狭窄程度, 根据测量结果来评估可能发生脑梗死的概率, 并结合 DSA, 来对比两种检查结果有无差异性。

结果:

35 例患者, 25 例患者高血压病史, 其中 11 例患者合并有糖尿病病史, 4 例患者合并有冠心病病史; 10 例患者无高血压及冠心病病史, 其中仅 2 例患者有糖尿病病史; 35 例患者中 24 例伴有颅内脑梗死, 11 例患者无脑梗死; HRMR-VWI CPR 及 MPR 后处理重建技术显示责任血管位于颈内动脉 11 例, 位于大脑后动脉 2 例, 位于大脑中动脉 16 例, 位于基底动脉 4 例, 位于椎动脉 1 例, 位于锁骨下动脉 1 例; 轻度狭窄 4 例, 中度狭窄 1 例, 重度狭窄 10 例, 极重度/闭塞 10 例; 重建图像测量血管内斑块大小的面积, 显示病灶范围大小与管腔狭窄程度有相关性, 与 DSA 检查结果基本相一致; 责任血管狭窄程度与脑梗死的发生率有相关性, 差异无统计学意义 ($P>0.05$)。

结论:

高分辨率核磁共振成像血管壁成像技术 (HRMR-VWI) 能够清晰显示责任血管内的病变范围及测量狭窄程度, 提高术前诊断率, 对临床预测脑梗死的发生有一定的诊断价值。

PU-1812

White matter alterations in thyroid-associated ophthalmopathy: a diffusion kurtosis imaging-based study using tract-based spatial statistics method

Jiang Zhou, Hao Hu, Xiao-Quan Xu, Fei-Yun Wu
The First Affiliated Hospital of Nanjing Medical University

Abstract

Objectives: To explore the brain microstructural alterations in patients with thyroid-associated ophthalmopathy (TAO) using diffusion kurtosis imaging (DKI) by tract-based spatial statistics (TBSS) method.

Methods: Forty-seven patients with TAO and 30 sex-, age-, and education-matched healthy controls (HCs) were recruited. DKI data were analyzed using TBSS analysis. The correlations between values of diffusion parameters and clinical variables were assessed.

Results: Compared with HCs, TAO group showed significantly decreased mean kurtosis, kurtosis fractional anisotropy, axial kurtosis, radial kurtosis and fractional anisotropy values in several white matter (WM) tracts, affiliated to projection fibers, association fibers and commissural fibers. No significant differences were observed in the mean diffusivity values between two groups. The values of significant diffusion parameters were positively correlated with visual acuity and Mini-Mental State Examination (MMSE) scores, and negatively correlated with Hamilton Anxiety Rating Scale (HARS) and Hamilton Depression Rating Scale (HDRS) scores.

Conclusions: Patients with TAO had significant microstructural abnormalities in WM tracts. Our findings extended the current understanding about the neurobiological basis of TAO.

PU-1813

Multimodal imaging guided Multidisciplinary therapy for postoperative recurrence of orbital rhabdomyosarcoma: A case report

Huogen Zhang, Yuguang You
First Affiliated Hospital of Gannan Medical College

Abstract Content: Adult orbital rhabdomyosarcoma is a rare highly malignant tumor of the head and neck, with unilateral painless, rapidly developing exophthalmos or motor restriction as the main symptom, which has a high rate of local recurrence and a high risk of early distant metastasis. Currently, the treatment mode of orbital rhabdomyosarcoma has changed from a single local resection to a multidisciplinary therapy with surgery combined with high-dose chemotherapy and radiotherapy. The multimodal imaging mode can provide a more comprehensive visualization of the reference information for the development of the disease and the treatment effect evaluation during the multidisciplinary therapy.

Case presentation

A 24-year-old female patient had a prominent left eyeball for more than a month, accompanied by photophobia and tears, and the specialist physical examination: the left eyeball protruding forward and outward, significantly limited eye movement, touched a mass in the upper edge of the left orbit, hard mass, general range of motion, unclear touch, no obvious tenderness, and no obvious abnormality in the right eyeball. The laboratory examination after admission showed no significant abnormalities.

Primary treatment:Orbital MRI shows low T1WI, high T2WI and slightly high DWI signal outside the upper muscle cone of the left orbit, about 4.4×2.4×2.2 cm, and an obvious uniform enhancement, the adjacent extraocular muscles are pushed and the eyeball forward.Color Doppler ultrasound shows hypoechoicity of about 3.03×2.08cm, the underorganized edge, the internal echo is underuniform, inside has strip slightly higher echo, more abundant blood flow signal is visible inside:PSV 16.08m/s, RI 0.59. There were no abnormalities such as retinal detachment in the left eye. After informed consent, pathological resection of orbital tumor in the left eye was combined with immunohistochemistry CD56 (+) and MoyD 1 (+) to confirm spindle-cell type rhabdomyosarcoma.

Postoperative chemotherapy:Postoperative one month,orbital MRI was reviewed that an oval occupation outside the muscle cone, the internal signal performance and enhancement characteristics are similar to the preoperative occupation, the adjacent extraocular muscles were still pushed, the eyeball was forward, and the left orbital changes after surgery, which considered recurrence.The multidisciplinary physician decided to proceed a course of CAV chemotherapy after consultation,then the patient developed gastrointestinal reaction with eye pain.However,the MRI review after one month of chemotherapy showed that the lesion was larger than before.

Multidisciplinary therapies of doctors:After consultation, doctors in ophthalmology, oncology, surgery and other departments of our hospital suggested second left orbital tumor resection, postoperative pathology combined with immunohistochemical diagnosis of "rhabdomyosarcoma recurrence".MRI and CT review one month later showed postoperative changes in the left orbit, no left eyeball, extraocular muscle and optic nerve, orbital effusion in the operative area, and no obvious abnormal recurrence in the surgical area.Given that the patient's relapse after orbital rhabdo myosarcoma surgery is not sensitive to chemotherapy, first intensity modulation radiotherapy (CTV) is recommended after consultation with the radiotherapy department, oncology department and ophthalmologist,eye pain occurred during radiotherapy, and the possibility of conjunctivitis was considered after the ophthalmologist consultation. The orbital MRI review showed no obvious changes, and the effusion was still visible in the orbit of the surgical area.

Discussion

At the initial diagnosis, the MRI of the left orbital mass combined with color Doppler ultrasound realized the multimodal evaluation of the internal structure, boundary morphology, relationship with peripheral tissues and internal blood supply, which provided more reference information for the selection of clinical treatment options. MRI review 1 month after resection showed local recurrence in the surgical area of the left orbital tumor, and the MRI findings also had certain characteristics. The lesions were often closely related to the extraocular muscles, and the internal signal was uneven due to bleeding and necrosis, and the enhanced scan was moderate to significantly enhanced.

In recent years, the International Rhabdomyosarcoma Research Group has recommended VAC chemotherapy as the preferred and standard regimen for rhabdomyosarcoma. In this study, the patient also chose this chemotherapy regimen for the first time, but the MRI review one month after chemotherapy showed a slight enlargement of the tumor body, which may be related to the less sensitivity of orbital rhabdomyosarcoma spindle tumor cell type to VAC chemotherapy regimen. Some studies have found that extensive tumor resection combined with radiotherapy and chemotherapy can effectively reduce the local recurrence rate and reduce the risk of distant metastasis.So the scope of tumor resection in the second operation was significantly expanded, and the postoperative orbital MRI review showed no left eyeball, extraocular muscle and optic nerve. Because the patient was not very sensitive to chemotherapy regimen in the past, temporary radiotherapy was selected after the second surgery, and the MRI review after radiotherapy also showed no significant abnormalities.

Adult orbital rhabdomyosarcoma often recommends multidisciplinary effective treatment modes clinically, the advantages of high resolution and multiparameter imaging from orbital MRI

combined with real-time dynamics of color Doppler ultrasound can provide more reference information in the multidisciplinary treatment process of orbital rhabdomyosarcoma.

PU-1814

1 例以双眼睑肿胀为首发症状的 IgG4 相关性 Mikulicz 病

张火根、游宇光
赣南医学院第一附属医院

患者女, 14 岁, 8 年前无诱因出现双眼上睑肿胀, 伴双眼活动受限, 渐进性增大。查体: 双眼眼球活动受限, 上睑肿胀, 双眼睑泪腺区可触及肿物, 质韧, 活动度欠佳, 无压痛。实验室示 IgG4: 5.80g/L (正常值 0.03~2.00g/L)。眼眶 CT 与眼眶 MRI 示双侧泪腺明显肿大, 增强呈明显欠均匀强化; 双侧眼球受压、内移; 彩超示双侧泪腺与颌下腺回声减低、不均匀, 内见较丰富血流信号; 双侧颈部淋巴结肿大。知情同意后全麻下行双眼眶肿物部分切除活检术, 术中见肿物位于双眼上外侧泪腺处并累及眶壁, 术后病理见淋巴细胞浸润伴淋巴滤泡形成, 纤维组织增生, 散在分布的导管周围间质硬化, 腺泡萎缩, 诊断为良性淋巴上皮病变 (Mikulicz 病)。

讨论: Mikulicz 病又称为良性淋巴上皮病变, 属于 IgG4 相关性疾病的一种罕见病, 以受累脏器肿大, 血清 IgG4 细胞水平显著增高 (>1.35 g/L), IgG4 阳性浆细胞在组织中浸润为主要特点, 其中累及泪腺和唾液腺的被称为 IgG4 相关性 MD。

研究发现 CT 与 MRI 均显示泪腺或唾液腺弥漫性肿大, 由于腺体内细胞数量与纤维化增加, CT 呈等或稍高密度, T1WI 常呈等信号、T2WI 呈略低-中等信号, 增强后多呈不均匀强化; 彩超特征示扩大的腺体内有多个不同大小的低回声区域, 可呈高血管分布。

临床诊断泪腺 MD 时需与干燥综合征、淋巴瘤等鉴别, MD 与干燥综合征均可见泪腺、涎腺等腺体肿大的影像学检查, 但可通过血清学检查抗核抗体 (+)、SSA (+)、SSB (+)、血清 IgG4 水平正常等来鉴别干燥综合征; 泪腺淋巴瘤多为无痛性全身淋巴结异常肿大, 可通过多模态影像进行鉴别, 但最终还是要靠病理检查, 但要注意的是 MD 可恶变为恶性淋巴瘤。

综上所述, IgG4 相关性 MD 可借助多模态影像综合评估多腺体病变浸润的范围与多器官累及的发展情况, 结合血清 IgG4 细胞水平等实验室检查可予以进一步鉴别诊断, 具有重要的临床价值。

PU-1815

基于 CTA 评估餐巾环征斑块与缺血性脑卒中的相关性研究

吴静萍^{1,2}、张帆^{1,2}

1. 中国人民解放军总医院海南医院
2. 南方医科大学第二临床医学院

目的: 基于头颈 CTA (computed tomography angiography) 研究“餐巾环征” (napkin-ring sign, NRS) 斑块与急性缺血性脑卒中的关系。方法: 纳入 2019 年 1 月至 2023 年 5 月期间在本院接受头颈动脉 CTA 检查并发现 NRS 斑块的患者共 225 例, 其中发生急性缺血性脑卒中患者 113 例, 未发生脑缺血事件者 112 例, 比较 NRS 斑块在两组中的频率和分布特征, 采用 Logistic 回归筛选缺血性脑卒中发生的危险因素。结果: 113 例脑卒中患者发现 214 个 NRS 斑块, 112 例对照组患者发现 156 个 NRS 斑块, 卒中组患者的平均斑块数量及面积大于对照组 (1.89 ± 1.13 vs. 1.39 ± 0.61 , $P=0.001$) (23.96 ± 23.02 vs. 11.12 ± 8.62 mm², $P<0.001$), 缺血性卒中患者卒中同侧的斑块数量显著多于对照组 (1.50 ± 0.86 vs. 0.39 ± 0.65 , $P<0.001$) (11.64 ± 8.53 vs. 4.64 ± 9.56 mm², $P<0.001$)。NRS 斑块的分布在两组人群中以颈总动脉最多见。Logistic 回归分析显示 NRS 斑块数量是缺血性卒中患者的独立危险因素。结论: 采用头颈 CTA 评估 NRS 斑块可作为脑缺血事件预防和诊治的重要靶点。

4D-CTA 结合 SDF-1 鉴别颅内动脉瘤破裂及评估破裂风险的价值

徐艺铭
昆明市延安医院

ABSTRACT

Objective: To analyze the value of four-dimensional computed tomography angiography (4D-CTA) combined with stromal cell-derived factor-1 (SDF-1) for differentiating ruptured intracranial aneurysms and assessing the risk of ruptures.

PU-1817

合成 MRI 成像定量检出甲状腺癌术前颈部淋巴结转移

魏梅¹、杨海涛²、李之华¹、胡微¹、覃勇¹、万良斌¹

1. 重庆医科大学附属璧山医院

2. 重庆医科大学附属第一医院

目的 探讨合成 MRI 成像定量分析在甲状腺癌颈部淋巴结转移诊断中的价值。

方法 回顾性分析 30 例行术前常规和合成 MRI 成像并经手术病理证实的甲状腺癌 19 例，术后病理证实的转移淋巴结 45 个，非转移淋巴结 47 个。工作站手动勾画甲状腺癌结节、颈部转移淋巴结和非转移淋巴结感兴趣区 (ROI)，自动获得合成 MRI 各定量参数值，包括 T1、T2、PD 值。

结果 原发肿瘤与转移淋巴结组织的各定量参数值无显著差异 ($P>0.05$)，原发肿瘤与非转移淋巴结、转移淋巴结与非转移淋巴结组织的各定量参数两组间均差异显著 ($P<0.05$)；T1T2 联合指标、T2、T1 及 PD 值对甲状腺癌颈部淋巴结转移诊断的准确度分别为 94.4%、91.9%、86.8%、71.7%。

结论 术前预测甲状腺癌淋巴结转移，合成 MRI 成像可辅助诊断。

探究 AI 重建算法在超低剂量头颈 CTA 扫描中的临床可行性

朱鹏、耿纪刚、李笑石、陈雪婷、彭静、秦越
西安大兴医院

目的 探究超低剂量头颈 CTA 配合迭代重建算法及 AI 重建算法的临床可行性及不同算法对 AI 诊断的影响。

方法 收集 2023 年 3 月至 2023 年 7 月西安大兴医院进行头颈 CTA 扫描患者 60 例。随机分为两组各 30 例。低剂量组记为 A 组，采用 AI 算法 ClearInfinity 进行重建，管电压为 70kV，管电流为 150mAs 进行扫描；常规组采用 120kV，300mAs 进行扫描记为 B 组。测量并计算大脑中动脉、颈总动脉及主动脉弓的 CT 值、SD 值、SNR 值与 CNR 值。由两名高年资医师对 A、B 组图像根据李克特量表 5 分法进行主观打分。由两名高年资诊断医师对患者头颈血管的狭窄程度进行诊断，分为正常，轻度，中度及重度狭窄。记录并计算两组患者的辐射剂量。

结果 A 组患者的 BMI 为 23.77 ± 3.78 ，B 组患者的 BMI 为 23.55 ± 2.47 ，差异无统计学意义 ($P>0.05$)；A 组辐射剂量为 $39.69\pm6.89\text{mGy}\cdot\text{cm}$ ，B 组辐射剂量 $540.72\pm40.52\text{mGy}\cdot\text{cm}$ 。A 组辐射剂

量降低 92.66%。A 组主观评分均值为 4.58 ± 0.5 , B 组评分均值 4.21 ± 0.41 , 两者相比有显著差异 ($P < 0.05$)。

结论 70Kv 超低剂量及人工智能算法在头颈 CTA 在临床上具有较高可行性, 大幅降低辐射剂量的同时可以提供满足诊断的图像质量。值得在今后推广使用。

双源 CT 双能量扫描评估头颈部 CTA 颈动脉钙化斑块所致狭窄的价值

夏传江、刘衡

中国人民解放军陆军特色医学中心

目的: 探讨使用双源 CT 双能量扫描单能成像技术, 提高对头颈部 CTA 检查颈动脉钙化斑块所致狭窄程度评估准确性的研究。

方法: 回顾性分析陆军特色医学中心 2022 年 7 月至 2023 年 8 月间行头颈部 CTA 检查且颈动脉有钙化斑块狭窄的患者, 收集同时接受头颈部 CTA 双能量扫描和头颈部数字减影血管造影(DSA)检查的患者 100 例, 并随机分为 A、B 两组每组 50 例, 其中 A 组使用重组单能谱值为 100 keV 的图像; B 组使用重组 100 keV 混合能量图像。记录 CT 容积剂量指数(CTDIvol)、剂量长度乘积(DLP)、有效辐射剂量(ED)。以 DSA 为金标准。利用双盲法评估严重钙化节段的狭窄程度, 根据金标准计算两组的诊断准确率、敏感度、特异度。利用 Kappa 检验评价两位观察者的评估一致性。对 A 组所有钙化严重节段每隔 10 keV 重组一组图像, 评估狭窄程度, 并采用配对 t 检验与 DSA 结果比较, 以 $P < 0.05$ 为差异有统计学意义。

结果 A 组的诊断准确率、特异度和均明显高于 B 组, 敏感度与 B 组相差不大; A 组的 Kappa 系数大于 B 组; A 组的 CTDIvol、DLP 及 ED 与 B 组比较无明显统计学差异($P > 0.05$)。A 组内能量级 100 keV 的图像测得的狭窄程度与 DSA 比较误差最小($P > 0.05$)。

结论: 采用双源 CT 双能量模式扫描头颈部 CTA, 后处理时利用单能谱 100 keV 重组可以有效减轻颈动脉钙化斑块伪影, 清晰显示血管狭窄情况, 有效提高评估的客观性和准确性; 并且不会增大辐射剂量。

PU-1820

磁共振误诊成人眼球视网膜神经胶质瘤 1 例

郎婷、苏伟、岳梨蓉

云南大学附属医院

视网膜神经胶质瘤是一种最具侵袭性的原发性肿瘤。神经胶质瘤发生在眼部的多为视神经胶质瘤, 而视网膜神经胶质瘤则极为罕见。该病可伴神经纤维瘤病或结节性硬化病。该疾病好发于婴儿期和儿童期。临床上常使用 CT 及 MRI 检查辅助诊断, 但其密度及信号特点通常不典型, 常易导致误诊。我院门诊以视力下降首发行 MRI 检查眼球视网膜神经胶质瘤误诊 1 例, 现报告如下。

目的: 分析本例眼球视网膜神经胶质瘤误诊原因。

方法: 回顾分析经手术病理证实该病例视网膜神经胶质瘤的 MRI 表现及动态增强特征。

结果: 眼部检查: 右眼视力 0.2, 左眼视力 0.6, 双眼球无突出, 眶压正常, 双眼结膜无充血。右侧晶体混浊+++, 左眼晶体混浊++, 双侧眼底窥不清。该患者眼眶 MR 平扫及增强提示: 右侧眼环下部类圆形异常信号影, 大小约 $7 \times 7 \times 5 \text{mm}$, T1WI 呈低信号, T2WI 呈低信号, DWI 呈等及稍高信号, ADC 值约 $1.3 \times 10^{-3} \text{mm}^2/\text{s}$, TIC 曲线呈“流入型”, 病灶颞侧见斑片状 T1WI、T2WI 稍高信号,

增强未见强化,考虑脉络膜黑色素瘤伴脉络膜下出血。行右眼摘除术+肿物活检术。病理组织学所见:肿瘤位于眼球内视网膜内,肿瘤细胞梭长,有细长的神经胶质纤维,细胞核小呈椭圆形,肿瘤细胞的胞突相互交错形成细致的神经毡网,免疫组化:GFAP(+)/Syn(+)/NSE(+)/Ki-67(+)/Bcl-2(-)/CD34(-)/S-100(-)/SOX-10(-)/SMA(-)/CK(-)/EMA(-)。

结论:本病例患者为一名中年男性,不是视网膜神经胶质瘤好发年龄,且该患者仅存在视力下降,无其他与该疾病相关综合征的临床表现。MR 信号特点类似于脉络膜黑色素瘤,同时从发病率优先考虑脉络膜黑色素瘤,因此忽视了眼球内视网膜神经胶质瘤的考虑。因此通过此病例的学习,在眼球内占位性病变影像诊断过程中,因当增加少见病种的考虑以降低误诊率。

PU-1821

双能 CT 碘摄取对良恶性甲状腺结节的鉴别诊断价值

潘书叶

中国人民解放军陆军特色医学中心

目的:探讨双能 CT(double energy computed tomography,DECT)碘摄取量在鉴别良恶性甲状腺结节中的应用价值。

方法:回顾性搜集已经病理证实良恶性甲状腺结节患者,对所有患者进行双能 CT 增强扫描,分别计算其动脉期,静脉期结节全体积强化程度及碘摄取参数,碘摄取参数包括碘摄取量,总碘浓度,重要区碘摄取量,重要区碘浓度,标准化总碘浓度和标准化重要区碘浓度,分别绘制动、静脉期受试者特征曲线,经受试者特征(ROC)曲线分析和多因素回归分析,与其病理结果进行对比分析,评价各参数于良恶性甲状腺结节是否具有鉴别诊断价值。

结论:双能 CT 成像技术的碘摄取参数在鉴别诊断良恶性甲状腺结节方面具有一定的相关性。

PU-1822

自适应迭代算法与深度学习重建算法对甲状腺 CT 图像伪影的研究与比较

季丽雅

南京明基医院有限公司

目的 探究深度学习及迭代方式对甲状腺 CT 图像质量的影响

方法 前瞻性的收集 58 例颈部甲状腺 CT 扫描的患者影像学资料,采用管电压 100kV,自动调制管电压 (Smater mA),前置 ASiR-40%,设置噪声指数(NI=14)对患者进行甲状腺 CT 扫描,扫描所得图像采用以下四种不同重建算法进行软组织窗重建:重建权重 ASiR-V40%、深度学习,共得 4 组图像进行对比分析。选择甲状腺为感兴趣层面,选择同层面胸锁乳突肌为 ROI,测量各感兴趣区 CT 值及标准差 (SD),双侧测量取均值,定义各 ROI 的 SD 值为噪声,并依据公式计算 SNR 甲状腺、CNR 甲状腺。主观评价由 2 年资 5 年以上放射诊断医师独立双盲评分使用 5 分法评价不同重建算法的图像质量。使用单因素方差分析比较 4 组图像的 SD、SNR、CNR,采用秩和检验比较主观评分组间差异,两位观察者间的一致性采用 Kappa 检验。

结果 (1) 甲状腺随着 DLIR 级别越高,图像噪声 (SD) 逐渐下降,SNR 甲状腺和 CNR 甲状腺逐渐升高 (ASiR-V40%<DLIR-L<DLIR-M<DLIR-H) SNR 甲状腺分别为 $4.62\pm1.36\text{HU}$ 、 $4.72\pm1.78\text{HU}$ 、 $5.37\pm2.10\text{HU}$ 、 $6.21\pm2.53\text{HU}$, $F=7.123$, $P<0.001$; CNR 甲状腺分别为 $4.42\pm1.96\text{HU}$ 、 $4.90\pm2.45\text{HU}$ 、 $5.83\pm3.01\text{HU}$ 、 $7.12\pm3.96\text{HU}$, $F=8.732$, $P<0.001$) (2) 主观评分两位诊断组医师对于图像重建质量的主观评分的 Kappa 值为 0.76,一致性较强。甲状腺 (40%ASiR-V<DLIR-L<DLIR-M<DLIR-H 重建图像的评分分值依次增高 ($T=118.583$, $P<0.001$))。

结论 DLIR 算法较 40%ASiR-V 算法,能有效降低甲状腺 CT 图像的噪声,提高 CNR 及 SNR,图像质量提高越明显。

PU-1823

甲状腺癌 CT 检查临床价值

严培
贵州省第二人民医院

目的 探讨 CT 扫描在甲状腺癌术前检查临床价值。甲状腺癌为常见恶性肿瘤,近年来国内外发病率不断上升,位居我国城市女性恶性肿瘤第 4 位,根据 2017 年 WHO 甲状腺癌分类,包括乳头状癌、滤泡状癌、髓样癌、嗜酸细胞癌、低分化癌和未分化癌,其中乳头状癌最常见,占有甲状腺癌的 85%~90%,其次为滤泡状癌,约占 10%,其余病理类型少见,约各占 1%。超声是甲状腺病变定性诊断的首选检查方法,但对胸骨后甲状腺病变和颈部淋巴结转移的诊断能力不足;CT 扫描范围广,可清晰显示甲状腺病变与周围结构的关系,便于精确评估肿瘤侵犯和淋巴结转移范围,是甲状腺病变定性、定量诊断的重要检查方法。

PU-1824

颌骨促结缔组织增生性纤维瘤的影像学分析

王晓琰
上海交通大学医学院附属第九人民医院

目的:分析和总结颌骨原发性促结缔组织增生性纤维瘤的临床和影像学表现,提高对此病的认识。
方法:回顾性分析 17 例经手术病理证实的颌骨原发性促结缔组织增生性纤维瘤的临床和影像学表现。其中 16 例行 CT 增强检查,1 例行 CT 平扫检查,5 例行 MR 增强检查。
结果:17 例患者中,男性 11 例,女性 6 例,年龄 4~64 岁,平均 20.27 岁。临床主要表现为无痛性下颌肿块和张口受限。影像学上,17 例病变全部位于下颌骨,均为单发病灶,主要位于下颌骨角部。CT 可见溶解膨胀性及部分压迫侵蚀性骨破坏,呈中心性或偏心性生长,伴有软组织肿块,病变内粗细不均的骨嵴是特征性改变。增强后病变呈中度至明显强化,所有病例无钙化及骨膜反应。根据 CT 上骨质破坏不同将病变分 3 型:膨胀型(n=6)、溶骨型(n=6)、骨旁型(n=5)。MRI 上,T1WI 为等低信号,T2WI 为不均匀高信号,增强后病灶强化。MR 功能检查 ADC 值平均 $1.2 \times 10^{-3} \text{mm}^2/\text{s}$,TIC 曲线 I 型 3 例,II 型 2 例,提示良性肿瘤。
结论:颌骨原发性促结缔组织增生性纤维瘤具有侵袭性,容易复发,了解其影像学特点非常重要。结合 CT、MR 及功能学检查,可在一定程度上反映病灶的组织构成,为术前正确诊断提供重要依据。

双能量血管 CTA 个性化设计“一站式”CTA+V 联合成像对于整形外科局部肿物术前评估的应用价值

王猛
吉林大学第一医院

目的: 探讨双能量血管 CTA 个性化设计“一站式”CTA+V 联合成像对于整形外科局部肿物术前评估的可行性。

方法: 回顾性分析 2022 年 8 月至 2023 年 7 月本院整形美容外科初步怀疑颅脑, 颌面局部血管畸形术前评估患者, 其中男 3 例, 女 4 例; 年龄 3~50 岁, 平均 28.1 岁; 行双能量血管 CTA+CTV 确定血管畸形的供血位置, 形态及供血分支情况, 设立个性化扫描方案, 使用 SOMATOM Force CT, DE vessel CTA+V 参数为:Kv A:90 B:Sn150 mAs A:90 B:69 探测器准直 128X0.6 mm, 层厚: 0.75mm 螺距: 0.7 转速: 0.25s 扫描时间: 2.92s 采用 ADMRIE 重建算法, Kernel Qr40, 团注跟踪法, 监测降主动脉, 触发阈值 100HU, 触发后延迟 5s 进行扫描, 建议使用高浓度对比剂, 根据 BMI 值个性化打药, 每公斤体重 x0.9ml 建议流速维持在 4.5ml/s(儿童根据情况适当降低药量及流速), 扫描后动静脉可同时显示, 对比单体部血管灌注扫描, 大幅度降低了患者辐射剂量, 通过科室引进的东芝 Zio station 三维可视化软件进行对病灶测量形态大小, 血管成份分析, 血供分支标记和染色, 为整形外科术前评估带来福音。

结果: 图像质量进行评分 A: 优秀 B: 良好 C: 差, 通过主观进行对病灶进行评价分析, 病灶包含颞部皮下软组织内及右侧颞骨内外侧占位, 下颌, 软组织血管畸形, 额部皮下动静脉瘘, 顶部皮下血管畸形等清晰显示, 通过东芝 Zio station 三维可视化软件对病灶病灶测量形态大小, 血管成份分析, 血供分支标记和染色为临床术前评估提供指导性建议, 并反向评价扫描方案进行评分, 所有患者图像质量均可评到 A, 确定扫描方案的可行性

结论: 双能量血管 CTA 个性化设计“一站式”CTA+V 联合成像扫描, 不仅大幅度降低患者辐射剂量, 还为临床整形外科术前带来更精准的术前方向。

PU-1826

TBI 后继发重度脑水肿的早期 MR 损伤特点

陈地友

中国人民解放军陆军特色医学中心

目的: 本研究旨在探讨 TBI 后轻、重度脑水肿早期 MR 损伤特征差异, 并筛选重度脑水肿的危险因素。

材料与方法: 以马歇尔评分为金标准进行脑水肿程度分级。纳入受伤后 24h 行颅脑 MR 检查且 3d 内进行 MR 或 CT 复查的 TBI 患者。观察指标主要有头皮损伤、骨折、硬膜外血肿、硬膜下血肿、蛛网膜下腔出血、脑挫伤、脑水肿。结合已有研究采用脑水肿评分量表 1 (基于水肿覆盖脑叶数和脑中线状态)、脑水肿评分量表 2 (基于基底池、侧脑室等层面受压状态) 进行脑水肿程度影像学评价。使用 SPSS23.0 软件进行统计学分析。使用卡方检验比较轻、重度脑水肿 TBI 患者的早期 MR 损伤差异, logistic 回归分析被用作重度脑水肿的危险因素筛选, 并采用受试者特征曲线分析危险因素的预测效能。

结果: 轻、重度脑水肿 TBI 患者的头皮损伤、骨折、硬膜下血肿、蛛网膜下腔出血、脑挫伤体积无显著性差异 ($P>0.05$)。硬膜下血肿、脑挫伤位置、脑水肿评分量表 1、脑水肿评分量表 2 存在显著性差异 ($P<0.05$), logistic 回归分析显示脑水肿评分量表 1、脑水肿评分量表 2 均是重度脑水肿的危险因素且具有较高预测效能。

结论: 轻、重度脑水肿 TBI 患者的早期 MR 损伤差异并不明显, 基于 3d 内 CT 或 MR 的脑水肿评分量表 1、脑水肿评分量表 2 能够预测重度脑水肿, 值得推广和进一步研究。

Multiple skin metastases from laryngeal carcinoma below the level of diaphragm: a case reportXiaojuan Peng¹, Wenhua Ma², Peng Xie³

1. Daping Hospital, Army Military Medical University

2. The First Hospital, Hebei Medical University

3. The Third Hospital, Hebei Medical University

Skin was a rare location for distant metastases of laryngeal squamous cell carcinoma, especially below the level of the diaphragm, which indicated a poor prognosis. We presented a 71-year-old man with multiple skin nodules below the level of diaphragm for 1 month. Two years ago, the patient underwent total laryngectomy and bilateral radical neck dissection due to the diagnosis of laryngeal carcinoma. CT images showed three soft-tissue density nodules with clear edge in the subcutaneous soft tissue. Considering the medical history, the possibility diagnosis of skin metastases was raised. Furthermore, needle aspiration biopsy of the nodule on the waist was performed, and the skin metastases from laryngeal carcinoma were confirmed by pathology and immunohistochemistry.

PU-1828

Evaluation of cerebral blood flow changes in POAG patients using Arterial spin labelingZihan Chai, Qian Wang, Bingbing Yang, Junfang Xian
Capital Medical University of Beijing Tongren Hospital

Objective: Primary open-angle glaucoma (POAG) is the most prevalent type of glaucoma, which is a leading cause of irreversible blindness worldwide. The previously proposed hypotheses of "elevated intraocular pressure" and "pressure difference across the trabecular meshwork" have been widely accepted, but they cannot explain the widespread changes in the visual pathway and other non-visual brain areas. This study aimed to investigate the dynamic changes in spontaneous brain activity and cerebral blood flow (CBF) in POAG patients using resting-state functional MRI (rs-fMRI) and arterial spin labeling (ASL) imaging. To examine the relationship between these changes and glaucoma-related visual functional impairment.

Methods: The current study included 69 individuals diagnosed with POAG and 47 healthy controls (HCs) participated. All participants underwent both Arterial spin labeling and 3D high-resolution T1-weighted structural imaging scans. We utilized independent samples t-tests and multivariate analysis of variance (MANOVA). For correlation analysis, we employed Pearson's correlation. CBF values were calculated for each participant's whole brain, and the intergroup differences between the patients and the controls and was conducted with false discovery rate (FDR) correction, and it took into account variables such as gender, age, and head motion as covariates.

Results: Compared with the healthy control group, the abnormal cerebral CBF in POAG patients is not limited to the visual system. The decreased CBF areas in POAG patients include the bilateral lingual gyrus, cuneus, precuneus, gyrus rectus, and right inferior frontal gyrus, right superior occipital gyrus, and left middle occipital gyrus (voxel $p < 0.001$, FDR-corrected cluster $q < 0.05$). These brain regions are involved in visual, somatosensory, visual spatial, and visual motion functions. The increased CBF areas include the right middle temporal gyrus, left inferior frontal gyrus, left middle frontal gyrus, right superior frontal gyrus, and right precentral gyrus (voxel $p < 0.001$, FDR-corrected cluster $q < 0.05$), which are related to higher cognitive functions such as attention, emotion, inhibition of thought, and motor control. In correlation analysis with

ophthalmic examinations, the ophthalmic indicator Mean Deviation (MD) showed a significant correlation.

Conclusion: POAG patients exhibit alterations in the visual system, somatosensory, visual spatial, and visual motor-related brain regions. There is reduced blood perfusion in these areas, while higher cognitive functions such as attention, emotion regulation, thought suppression, and motor control-related brain regions show increased blood flow. ASL serves as a potential bio-marker for the progressive neurodegenerative mechanisms in POAG, offering new insights into early diagnosis and intervention strategies for the condition.

PU-1829

HRCT 及多平面重组、曲面重组对慢性中耳炎听骨链破坏的诊断价值

杨静

西安市中心医院

目的 探讨高分辨率 CT (HRCT) 轴位、多平面重组 (MPR)、曲面重组 (CPR) 在慢性中耳炎听骨链骨质破坏术前评估中的应用价值。方法 对 220 例 (耳) 慢性中耳炎患者术前行颞骨 HRCT 扫描, 并行 MPR 及 CPR 后处理检查, 分别将听骨链术前检查结果与术中结果对比分析。结果 HRCT 轴位对患耳锤骨头、锤骨颈、锤骨柄、锤砧关节、砧骨体、砧骨长突、砧骨短突、镫骨、砧镫关节的部分破坏及完全破坏的显示与术中所见结果对比准确性偏低 ($P < 0.5$); MPR、CPR 对患耳锤骨头、锤骨颈、锤骨柄、锤砧关节、砧骨体、砧骨长突、砧骨短突、镫骨、砧镫关节的部分破坏及完全破坏的显示与术中所见结果符合率均较高 (P 均 > 0.5)。结论 MPR、CPR 图像能准确显示慢性中耳炎听骨链骨质破坏情况。

Frequency and imaging features of the adjacent osseous changes in lacrimal gland tumor

Kunming Yi, Xiaolin Tang

Army Medical Center of PLA, Army Medical University

Purpose: The association between lacrimal gland tumors and adjacent osseous changes is unclear. We evaluated the frequency and imaging features of such changes and investigated the specific characteristics of lacrimal gland tumors associated with them.

Methods: A total of 246 lesions were retrospectively reviewed, and all cases underwent preoperative computed tomography (CT) examination. The imaging characteristics of osseous changes were divided into three categories based on CT images: sclerotic change, erosive change, and lytic change. The frequency of all these osseous changes and any one of them was compared between different pathologies using Fisher's exact test.

Results: Osseous changes were found in 36 (31%) of 116 cases. Among these, 11 of 36 (30.6%) cases were sclerotic, 10 (27.8%) were erosive, 12 (33.3 %) were lytic changes, and 3 (8.3%) were mixed changes. Adenoid cystic carcinoma showed a significantly higher frequency of erosive changes and lytic changes than the other lacrimal gland tumors ($p < 0.005$ for each). Sclerotic changes were observed in the adenoid cystic carcinomas and pleomorphic adenomas. Perineural spread was a significant factor in showing higher osseous change frequencies (odds ratio = 2.56, $p = 0.007$).

Conclusion: Among lacrimal gland tumors, adenoid cystic carcinomas had a significantly higher frequency of adjacent osseous changes than other tumors.

PU-1831

PROPELLER-DWI 对比 MUSE-DWI 在改善头部 MRI 磁敏感伪影的价值分析

祝静

重庆市璧山区人民医院

目的：探讨磁共振螺旋桨技术 (PROPELLER DWI) 技术在改善颅脑 MRI 检查中由乳突气体伪影及颅底部位的颅骨伪影引起的磁敏感性伪影的应用价值，并与科室常用的头部 DWI 扫描序列-复合灵敏度编码高分辨率扩散加权成像 (MUSE-DWI) 进行比较。

方法：对我科行头部 MRI 检查的患者 50 例，分别在 3.0 GE MRI 设备进行 PROPELLER DWI 技术和 MUSE-DWI 序列进行 MRI 扫描，将图像上传至 PACS 系统，由 2 名影像医生对两组 DWI 图像质量进行主观评价和客观评价。主观评估内容包括磁敏感伪影、影像清晰度，并进行图像综合评分；客观评价为测量组织信噪比 (SNR) 及表观扩散系数 (ADC) 值。

结果：PROPELLER DWI 序列图像主观质量评分、SNR 值均高于 MUSE-DWI 序列图像，差异具有统计学意义 (P<0.05)。

结论：PROPELLER -DWI 序列可以有效提高颅脑 DWI 的图像质量，减轻由于头部乳突气体伪影及颅底部位的颅骨伪影引起磁敏感性伪影导致的图像变形。与 MUSE-DWI 序列相比，其在颅脑检查中减轻磁敏感伪影方面应用价值更高。

PU-1832

颅-锁骨发育不全综合征的临床特征及影像表现

沙静云

徐州医科大学附属医院

背景 颅-锁骨发育不全综合征 (cleidocranial dysplasia, CCD) 又称 Marie-Sainton 综合征，是一种罕见的遗传性全身骨骼发育不良性疾病，多为常染色体显性遗传，外显率很高。该病由 Martin 于 1765 年首次报道，临床发病率约为 1:100 万，男女发病率差别并不明显。其主要发病机制为膜内成骨及软骨内成骨障碍，主要临床特征为锁骨发育不良、颅骨畸形、囟门不闭合或闭合延迟、颅缝增宽，身材矮小、乳牙滞留、恒牙迟萌或阻生，还可伴有脊柱侧弯、胸廓畸形等表现。研究已证实颅-锁骨发育不全综合征的致病基因为编码成骨细胞特异性转录因子 (runt-related transcription factor 2, RUNX2) 的 RUNX2 基因，其编码蛋白可促进成骨细胞和软骨细胞的分化，对于维持骨骼正常生长发育十分重要，其发生突变导致无法发出间充质细胞聚集信号，从而影响其向膜内和软骨内骨形成的分化。RUNX2 基因突变导致的单倍体不足是颅-锁骨发育不全综合征的主要致病原因。

目的 探讨及复习颅-锁骨发育不全综合征的发病机制、临床表现、影像学特征及治疗方法，以加深对本病的全面认识，提高其临床及影像诊断正确率。**方法** 回顾性分析我院已确诊的 1 例颅-锁骨发育不全综合征典型病例的病史、临床表现及影像学特征，结合文献对该病的临床及影像表现、治疗方案进行总结分析。**结果** 本例患者有典型的颅骨、锁骨、牙齿以及其他骨骼发育不全表现，包括囟门未闭合、颅骨畸形、牙颌面畸形、锁骨发育不全、“锥形”胸、身材矮小等特点。**结论** 颅-锁骨发育不全综合征具有典型的临床及影像表现，有助于临床明确诊断，当同时有锁骨、颅骨及牙齿发育异常时，应想到本病的可能。

PU-1833

MR 在面部注射美容术致缺血性视神经病变的诊断价值

杨淑辉^{1,2}、李天然¹、杨本涛²

1. 中国人民解放军总医院第四医学中心

2. 首都医科大学附属北京同仁医院

【摘要】 目的 探讨 3.0T MR 对面部注射美容术致急性缺血性视神经病变的诊断价值。方法 回顾性分析 2015 年 12 月至 2023 年 3 月因在外院行面部美容注射术后出现单眼视力急剧下降来我院就诊的 49 例患者的临床资料及眼眶高分辨 MR 图像,患者均行眼科检查显示单眼存在相对性传入性瞳孔功能障碍和视觉诱发电位异常,提示缺血性视神经病变;数字减影血管造影显示眼动脉或其分支纤细或闭塞。在 Resolve 序列上观察视神经有无高信号及高信号的范围(视神经眶内段全程或节段性)、缺血性视神经病变的侧别及其他序列信号特点。测量患侧及健侧视神经的 ADC 值、T2WI 信号强度比。比较患侧及健侧视神经的 ADC 值、T2WI 信号强度比有无差异。对有统计学差异的参数勾画 ROC 曲线,并计算曲线下面积(AUC)。结果 女性 47 例,男性 2 例,年龄 17-47 岁,平均 31.1±8.0 岁。左眼视力障碍 26 例,右眼 23 例。49 例均出现缺血性视神经病变,T1WI 上呈等信号,T2WI 上呈等及稍高信号,DWI 呈明显高信号。26 例累及视神经眶内段节段性,23 例累及眶内段全程。病变组与对照组的 ADC 值及信号强度比差异有统计学意义,病变组的 ADC 值低于对照组($0.508\pm0.207\times10^{-3}\text{mm}^2/\text{s}$, $1.225\pm0.239\times10^{-3}\text{mm}^2/\text{s}$, $P<0.001$),信号强度比高于对照组(1.270 ± 0.262 , 0.843 ± 0.147 , $P<0.001$)。ADC 值及信号强度比诊断缺血性视神经病变的 AUC 值分别为 0.984、0.932,ADC 值的阈值为 $0.841\times10^{-3}\text{mm}^2/\text{s}$ 时,诊断急性缺血性视神经病变的敏感度、特异度、准确度分别为 93.88%、91.84%、92.7%。信号强度比阈值为 0.936 时,诊断急性缺血性视神经病变的敏感度、特异度、准确度分别为 89.80%、81.63%、85.7%。结论 MR 可以敏感发现面部注射美容术后所致的缺血性视神经病变,ADC 值及信号强度比对缺血性视神经病变的诊断价值较高,可为临床准确诊断提供依据。

PU-1834

基于淋巴细胞性垂体炎 MRI 动态观察的临床意义

姜粲然

徐州医科大学附属医院

背景:淋巴细胞性垂体炎(Lymphocytic hypophysitis, LYH)是一种较为罕见的自身免疫性疾病,具有独特的免疫学和组织病理学特征,主要表现为垂体及其周围组织的淋巴细胞、浆细胞不同程度的浸润及纤维化。根据病变累及区域不同分为淋巴细胞性腺垂体炎(Lymphocytic adenohypophysitis, LAH)、淋巴细胞性漏斗-神经垂体炎(Lymphocytic funnel-neurohypophysitis, LINH)和淋巴细胞性全垂体炎(Lymphocytic panhypophysitis, LPH)。LYH 具有独特的组织病理学和免疫学特征,但其发病机制尚未明确,临床表现和自然病程差异性较大,因此,及时地诊断和合理地干预往往颇具挑战。LYH 临床少见,目前用于评估其患病率的数据非常有限。但随着近年来对该病认识能力的提高、影像学的发展及垂体手术数量的增加,该病得到越来越多的关注。目的:探索及复习淋巴细胞性垂体炎的发病机制、临床表现、影像学特征及治疗方法,推测临床治疗疗效与 MRI 动态表现的关系,以提高对 LYH 的认识及临床诊疗能力。方法 回顾性分析我院已确诊的 1 例淋巴细胞性垂体炎典型病例的病史、临床表现及影像学特征,结合文献对该病的临床及影像表现、治疗方案进行总结分析。结果:本例患者存在垂体前叶激素缺乏、不同程度垂体功能紊乱:包括甲状腺功能减退症、停经、泌乳素增高等。通过对治疗过程中的动态 MRI 进行分析,推测出临床治疗疗效与 MRI 表现的关系。结论:淋巴细胞性垂体炎的临床表现不典型,诊断主要依靠实验室指

标及影像表现, 通过对疾病进行治疗过程中动态 MRI 分析及诊断性治疗的 MRI 评价, 可以推测出临床治疗疗效与 MRI 表现的关系, 对于淋巴细胞性垂体炎的非侵入性诊断和治疗有着重大的意义。

PU-1835

Spontaneous intrasphenoidal meningoencephalocele

徐含波

徐州医科大学附属医院

A 55-year-old man had three years of repeated flow of clear watery liquid in the right nasal cavity with aggravation for half a year. MRI showed an inhomogeneous signal mass in the right sphenoid sinus involving sphenoethmoid recess (Fig1A), partly cerebrospinal fluid signal (Fig1B). Coronal MRI and CT demonstrated the sphenoid sinus bulges communicate with the intracranial system (Fig1C) through an osseous defect in the lateral wall of the right sphenoid sinus (Fig1D). After endoscopic surgical resection of the lesion, histopathology revealed meningoencephalocele (Fig2). For treatment, endoscopic surgery is an effective and safe option for resection of meningoencephalocele and skull base reconstruction [1, 2].

PU-1836

合成 MRI 技术在诊断鼻咽癌转移淋巴结中的价值：与大小标准相比

杨凡、魏浩然、余小多、张红梅、林蒙

中国医学科学院肿瘤医院

目的：准确诊断颈部转移淋巴结影响鼻咽癌放疗靶区勾画以及剂量分布。此研究探索了合成 MRI 技术（SyMRI）联合直方图分析在诊断转移淋巴结中的潜在价值，以及与常用大小标准的性能比较。

方法：此项前瞻性研究连续纳入了 53 名经病理证实的鼻咽癌患者，评估了 377 个最大短轴直径（MASD） $\geq 4\text{mm}$ 的颈部淋巴结。所有患者均接受了标准治疗且治疗后的中位随访时间为 36.13(17.62,42.19)个月。两名资深放射科医生（分别有 21 年和 18 年的肿瘤诊断经验）独立地对淋巴结进行评估和标记，任何分歧通过讨论解决。如果颈部淋巴结在患者完成治疗后消退，或在治疗后形态稳定，但在之后的随访中进展，则视为转移淋巴结；如果颈部淋巴结在治疗结束后大小趋于稳定，且在之后的随访中保持稳定，则该淋巴结被视为非转移淋巴结。本研究中分别有 297 个和 80 个淋巴结被诊断为转移淋巴结和非转移淋巴结。从 SyMRI 后处理得到的 T1、T2 和质子密度（PD）图中提取直方图特征，并记录每个标记淋巴结的 MASD。根据临床常用的颈部转移淋巴结诊断的大小标准，如果咽后组结节 MASD $\geq 5\text{mm}$ ，2 区淋巴结 MASD $\geq 11\text{ mm}$ ，颈部其它区域淋巴结 MASD $\geq 10\text{ mm}$ ，则视为转移淋巴结，否则将其纳入非转移组。整个数据集按 7:3 的比例分配到训练组或验证组。采用多变量逻辑回归分析和受试者工作特征曲线分析来探讨其在颈部淋巴结以及 2 区淋巴结中的诊断性能。最后使用 DeLong 检验，构建了列线图 and 校准曲线。

结果：T1 第 10 个百分位数、T1 方差、PD 第 10 个百分位数和 PD 最小值被选择用于构建 SyMRI 模型（训练组和验证组的 AUC 分别为 0.895 和 0.903），高于 Size 标准模型（AUC 分别为 0.824 和 0.797），且 P 值均 ≤ 0.023 。此外，与 SyMRI 单模型（P 值均 ≤ 0.043 ）和 Size 标准单模型（P 值均 ≤ 0.007 ）相比，SyMRI+Size 标准模型的性能最高（AUC: 0.941 和 0.938）。

结论：SyMRI 的直方图参数能有效区分颈部转移淋巴结或者 2 区转移淋巴结。此外，SyMRI 和 Size 标准结合可显著提高诊断效果。

PU-1837

弥散张量成像在垂体瘤患者术前、后视路结构改变的研究

王亚雯、王鹏

云南大学附属医院（云南省第二人民医院、云南省眼科医院）

【目的】

在垂体腺瘤患者中，术前评估视野损害和预测术后视野改善至关重要。本研究的目的是利用扩散张量成像（Diffusion Tensor Imaging, DTI）参数的视辐射与术前和术后视野损害的关系，以探讨 DTI 技术能否作为一种定量评估垂体腺瘤患者视觉通路损伤及恢复的有效评价手段。

【方法】

本前瞻性研究包括 41 例伴有视野缺损的垂体腺瘤患者的临床资料。所有患者均采用单纯鼻内镜下经蝶窦入路手术。在手术前以及术后 3 个月行 Humphrey 视野分析仪和 3.0T 磁共振检查，采集所有患者的 DTI 数据，双侧视放射白质纤维束的纤维数目、体积、平均长度及各向异性分数（fractional anisotropy, FA）、平均弥散率（mean diffusivity, MD）、轴向弥散率（axial diffusivity, AD）、径向弥散率（radial diffusivity, RD）、表观扩散系数（apparent diffusivity, ADC）值。利用 SPSS 22.0 软件，采用 Pearson 相关及 Spearman 相关分析 DTI 相关参数与视野恢复之间的相关性； $P < 0.05$ 认为差异有统计学意义。

【结果】

视野分析显示，术前视力丧失主要发生在颞叶上节段。82% 的患者双眼视野改善。其中，22% 显示完全恢复，54.6% 部分恢复，19.4% 未显示显著变化。患侧的 DTI 评估显示，术前各向异性分数（FA）值低于 0.400，平均扩散率（MD）值超过 $1300 \times 10^{-6} \text{mm}^2/\text{s}$ ，与术后 3 个月内视力无改善相关。

【结论】

DTI 视辐射参数与术前视野损害和术后改善相关。它可能有助于预测垂体腺瘤患者手术后的视野改善。

泪腺磁化传递成像定量参数在甲状腺相关性眼病临床活动性分期中的价值

蒋文昊¹、胡昊¹、陈欢欢²、周江¹、陈露¹、吴倩¹、许晓泉¹、吴飞云¹

1. 南京医科大学第一附属医院（江苏省人民医院）放射科

2. 南京医科大学第一附属医院（江苏省人民医院）内分泌科

目的 探讨泪腺磁化传递成像（magnetization transfer imaging, MTI）定量参数在甲状腺相关性眼病（thyroid-associated ophthalmopathy, TAO）临床活动性分期中的价值。

方法 前瞻性纳入 2020 年 9 月至 2022 年 1 月在南京医科大学第一附属医院临床诊断为 TAO 的 49 名患者，依据临床活动性评分（Clinical Active Score, CAS）将受试者分为活动期组（ ≥ 3 分，29 例）和非活动期组（ < 3 分，20 例）。所有受试者均行眼眶常规磁共振成像（magnetic resonance imaging, MRI）序列及冠状位 MTI 扫描，并测量泪腺磁化传递率（magnetization transfer ratio, MTR）及脂肪抑制 T2WI 序列上泪腺与同侧颞肌信号强度比（signal intensity ratio, SIR）。采用 Mann-Whitney U 检验比较 MRI 定量参数的组间差异。采用 Spearman 相关分析评估 MRI 定量参

数与 CAS 的相关性。采用受试者工作特征曲线分析 MTR、SIR 及两者联合判断 TAO 临床活动性的效能, 并采用 DeLong 检验比较曲线下面积 (area under the curve, AUC)。

结果 活动期组泪腺 MTR 低于非活动期组, 泪腺 SIR 高于非活动期组, 差异均有统计学意义 ($P<0.001$)。MTR 与 CAS 呈低度负相关 ($r=-0.427$, $P<0.001$), SIR 与 CAS 呈弱正相关 ($r=0.252$, $P=0.012$)。联合泪腺 MTR 和 SIR 判断 TAO 临床活动性效能最优 ($AUC=0.809$, 敏感度 62.5%, 特异度 93.1%), 高于单独应用 SIR, 差异有统计学意义 ($Z=2.35$, $P=0.019$)。

结论 泪腺 MTI 定量参数在判断 TAO 临床活动性中具有可行性, 可以作为常规序列的补充手段, 以提高对 TAO 临床活动性分期的评估能力。

PU-1839

颈动脉蹼在 80 例缺血性脑卒中的临床分析

赵厚亮

徐州医科大学附属医院

目的 分析颈动脉蹼 (Carotid Web, CW) 在缺血性脑卒中患者的临床特点, 评价其在探讨颈动脉蹼在缺血性脑卒中发生发展中的临床意义。**方法** 收集在徐州医科大学附属医院行冠头颈部 CTA (computed tomography angiography, CTA) 查见颈动脉蹼结构患者 80 例患者资料, 排除缺血性脑卒中其他诱因颈动脉斑块 (26 例)、房颤 (7 例), Moyamoya 综合症 (1 例) 等, 研究颈动脉蹼在缺血性脑卒中患者中的临床特征。**结果**: 双侧颈动脉蹼男性比例为 100%; 双侧颈动脉蹼患者新发脑梗死与陈旧性脑梗死的比例高于单侧颈动脉蹼患者, 差异有统计学意义 ($p<0.05$); 双侧颈动脉蹼患者多发性脑梗死比腔隙性脑梗死的比例高于单侧颈动脉蹼患者, 差异有统计学意义 ($p<0.05$); 颈动脉蹼长度 $>5\text{mm}$ 患者缺血侧发生脑卒中与非缺血侧的比例高于长度 $\leq 5\text{mm}$ 患者, 差异有统计学意义 ($p<0.05$)。**结论**: 颈动脉蹼以男性多见, 双侧颈动脉蹼患者脑梗死的面积更大, 以新发为主, 长度 $>5\text{mm}$ 时更容易发生缺血性脑卒中, 提示颈动脉蹼可作为一个危险因素在缺血性脑卒中发生发展中具有重要的临床意义。

18F-FDG PETMR 作为鼻咽癌初始分期的价值

许远帆、梁江涛、潘建虎

杭州全景医学影像诊断中心

目的: 本研究的目的是确定 PET/MR 作为鼻咽癌 (NPC) 的初始分期程序与常规检查 (CWU) 相比的临床价值和成本效益。

方法: 从 2018 年 5 月到 2021 年 3 月, 我中心连续 1020 例经活检证实的新诊断的鼻咽癌患者被纳入本研究。其中 343 例患者在治疗前接受了 PET/MR 检查, 其余 677 例患者仅接受了 CWU 检查。对于 PET/MR 和 CWU, 使用了浙江省医保管理局 2021 年发布的收费条目。增量成本效益比 (ICER) 测量了每百分比避免假阳性 (FP) 的患者使用 PET/MR 的成本。

结果: 整个组的新转移率为 5.2% (53/1020)。共观察到 187 名患者出现 FP 结果。在 CWU 组中观察到更多的 FP 结果患者 (25.6%对 4.1%, $p<0.001$)。从病理诊断到开始治疗的平均间隔时间, CWU 组为 13.1 天, PET/MR 组为 7.9 天 ($p<0.001$)。对于避免 FP 的患者, ICER 为 368 元人民币。

结论: 与 CWU 相比, PET/MR 降低了 FP 风险, 并减少了偶然发现的检查, 从而可以更早开始治疗。PET/MR 在 NPC 的初始分期过程中可能具有成本效益。

PU-1841

COVID-19 疫情对 18F-FDG PETMR 鼻咽癌分期影响

许远帆、梁江涛、潘建虎
杭州全景医学影像诊断中心

目的: 以 18 例氟脱氧葡萄糖 (FDG) 正电子发射断层扫描 (PET)/磁共振成像 (MRI) 分期为替代指标, 评估 COVID-19 疫情对鼻咽癌 (NPC) 患者疾病程度的影响。

方法: 回顾性观察性研究, 包括活检证实的新诊断 NPC 患者, 在两个选定的时间间隔内使用全身 FDG PET/MR 分期: 2017 年 5 月 1 日至 2020 年 1 月 31 日 (A 组) 和 2020 年 2 月 1 日到 2021 年 6 月 30 日 (B 组)。收集有关原发性肿瘤、区域淋巴结 (N) 状态和受累区域淋巴结站的数量, 以及远处转移的存在和数量 (M) 的数据。

结果: 390 名患者被纳入 (A 组 201 人, B 组 189 人)。从最初症状到 PET/MR 的中位数间隔 A 组和 B 组分别为 2.5 (0.1-60.4) 和 3.4 (0.2-56.3) 个月 ($p>0.05$)。A 组和 B 组从最初症状到治疗的中位间隔分别为 2.8 (0.2-60.5) 和 3.6 (0.3-56.3) 月 ($p>0.05$)。在 T 分类、N 分类、总分期、, 两组之间的 N 个站和 M 个站 ($p>0.05$)。对于受累的颈淋巴结水平, B 组中更多的患者出现 Vc 水平转移 ($p=0.044$)。

结论: 对于 NPC, 在隔离限制开始后, PET/MR 分期和治疗没有显著延迟。虽然整个阶段没有受到影响, 但在 COVID-19 疫情时期, 更多的鼻咽癌患者发生了 Vc 级转移。

PU-1842

Correlation between NODDI structural network attribute parameters and cognitive function in cerebral small vessel disease

Ning Wang
Affiliated Changshu Hospital of Nantong University

Objective: To investigate the correlation between structural attribute parameters and cognitive function in cerebral small vessel disease. The correlation between network attribute parameters and cognitive scale scores was evaluated.

Materials and methods: In this study, 58 patients with small cerebral vascular disease were enrolled from April 2021 to November 2022, of which 29 were patients with CSVD without cognitive dysfunction and 29 were patients with CSVD cognitive dysfunction. All patients were tested with MMSE and MoCa scales. All patients underwent conventional magnetic resonance sequence, high-resolution TIWI and NODDI sequence scans. NODDI data preprocessing and structure brain network were constructed based on mrtrix environment in virtual machine. The brain network topology parameters (global parameters and local parameters) are calculated in GREYNA. The difference of brain network topology parameters between the two groups was analyzed by graph theory. Network based statistical analysis (NBS) was used to analyze the structural connectivity changes of brain networks. Correlation between structural brain network topology parameters and cognitive scale was analyzed based on spearman.

Results: (1) The structural brain networks of CSVD patients showed small-world attributes. Sigma, Lambda and Gamma were statistically different between the two groups. (2) Parameter values of Eloc and Cp were significantly positively correlated with MMSE score. (3) The values of Sigma, Lambda, Gamma and Lp had significant negative correlation with MoCa score, the values of Eg and Eloc had significant positive correlation with MoCa score.

Conclusion: The change of small-world attribute suggests that the integrity of structural brain network may be damaged in patients with CSVD, and is one of the mechanisms of cognitive impairment in patients. Sigma, Lambda and Gamma parameters can be used as quantitative physiological indicators to assist clinical diagnosis of CSVD cognitive dysfunction.

PU-1843

Comparison of spectral CT imaging and 64 slice CT post processing technique in assessment of carotid artery atherosclerotic plaque

Wenxin Chen, Jianxiong Fu

Department of Medical Imaging, Subei People's Hospital, Medical School of Yangzhou University

Purpose: To compare the efficacy of spectral CT imaging and 64 slice CT post processing technique in assessment of carotid artery atherosclerotic plaque.

Material and Methods: Fifty-seven patients with carotid plaque were detected in this study (Carotid endarterectomy, n=57), and 94 carotid plaques were evaluated by spectral CT imaging. The composition of atherosclerotic plaque was measured by iodine-based images, lipide-based images with spectral CT imaging and compared with pathology. Statistical comparison was performed with the Kappa value, independent-sample t test and Chi-square test.

Results: The degree of carotid artery stenosis was 62% (13%~87%) on spectral CT imaging whereas 61% (12%~85%) on 64 slice CT. Two imaging modalities were in good consistency in evaluation of the degree of stenosis (Kappa value = 0.996, $P < 0.01$). There was no statistical difference in detecting fibrous cap rupture on spectral CT imaging and 64 slice CT (41 plaques vs 37 plaques, respectively, $\chi^2 = 0.351$, $P = 0.554$). Furthermore, spectral CT imaging showed 46 plaques within intraplaque hemorrhage, however, no case was found on 64 slice CT ($\chi^2 = 60.901$, $P < 0.01$). Spectral CT imaging showed 43 plaques within intraplaque lipide whereas only 2 plaques showed intraplaque lipide on 64 slice CT ($\chi^2 = 49.111$, $P < 0.01$). Eighty-nine plaques within calcification in the plaque were found on spectral CT imaging and 88 on 64 slice CT ($\chi^2 = 0.907$, $P = 0.756$). Accuracy of spectral CT imaging for the depiction of the accuracy of carotid artery atherosclerotic plaque was 94.3%, where sensitivity, specificity, positive predictive value and negative predictive value were 95.2%, 92.6%, 96.2% and 90.7%, respectively. Conclusion: Spectral CT imaging is a reliable tool in detecting intraplaque hemorrhage and liquid component.

c-MET-Targeted Topical Fluorescence vs. Conventional Oral Examination for Detection of Malignant Transformation in Oral Potentially Malignant Disorders: A Randomized Controlled Trial

Qifan Ma¹, Jingbo Wang¹, Wang Rui¹, Jiliang Ren¹, Lin Yang¹, Kun Wang², Changyou Zhan^{3,4}, Ying Yuan¹, Jie Tian², Xuemin Shen⁵, Xiaofeng Tao¹

1. Shanghai Ninth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

2. CAS Key Laboratory of Molecular Imaging, Beijing Key Laboratory of Molecular Imaging, The State Key Laboratory of Management and Control for Complex Systems, Institute of Automation, Chinese Academy of Sciences
3. MOE Key Laboratory of Smart Drug Delivery, School of Pharmacy & State Key Laboratory of Molecular Engineering of Polymers, Fudan University
4. Department of Pharmacology, School of Basic Medical Sciences & Center of Medical Research and Innovation, Shanghai Pudong Hospital, Fudan University
5. Department of Oral Mucosal Diseases, Shanghai Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine

Objective: To investigate the feasibility and effectiveness of a c-MET-targeted topical fluorescent probe, c-MET-binding peptide-indocyanine green (cMBP-ICG), for enhancing the detection of malignant transformation in oral potentially malignant disorders (OPMDs).

Methods: Patients with OPMDs who were scheduled to undergo biopsies were enrolled in a prospective randomized clinical trial from January 2023 to September 2023 (ChiCTR2300074454). Patients were randomly assigned to the cMBP-ICG fluorescence group or the conventional oral examination group and underwent biopsies with or without cMBP-ICG fluorescence guidance. The diagnostic accuracy was compared between the groups based on the biopsy histological results.

Results: Of 50 participants randomized, 25 underwent cMBP-ICG fluorescence guided biopsy (cMBP-ICG fluorescence group: 11 men and 14 women; mean [SD] age, 56.4 [11.2] years), and 25 underwent biopsy based on conventional oral examination (conventional oral examination group: 9 men and 16 women; mean [SD] age, 54.4 [14.4] years). The diagnostic accuracy of the cMBP-ICG fluorescence group and the conventional oral examination group was 84% and 36%, respectively, with a statistical difference ($P < 0.001$). In the cMBP-ICG fluorescence group, a significant difference in signal-to-background ratio ($P = 0.0096$) was observed between pathologically positive and negative lesions, with an area under the ROC curve of 0.81 (95% CI, 0.64 to 0.98), while no significant difference in mean fluorescence intensity ($P = 0.17$) was found. No adverse events occurred.

Conclusion: cMBP-ICG topical fluorescence can noticeably improve the accuracy in detecting malignant transformation of OPMDs. cMBP-ICG topical fluorescence imaging can be performed as an effective method to guide clinicians in biopsy procedures.

Nomogram for predicting BRAFV600E mutation in Papillary Thyroid Carcinoma based on spectral CT and Hashimoto's thyroiditis

Bi Zhou, Dan Zhang
Department of Radiology, Chongqing General Hospital

Object: The BRAFV600E is the most common mutant oncogene in thyroid cancer and is closely related to the aggressiveness of papillary thyroid carcinoma (PTC). The aim of this study was to investigate the effectiveness of a double-layer spectral detector computed tomography (DLCT)-based nomogram for predicting BRAFV600E mutation in PTC.

Material and methods: The medical records of 253 patients with PTCs who underwent DLCT and BRAFV600E mutation detection (mutant group: $n=203$; wild group: $n=50$) were reviewed. DLCT quantitative parameters in arterial phase, typical radiological features and clinical information were compared between the mutant and wild-type BRAFV600E groups by univariate and multivariate analysis. A nomogram was developed based on the significantly different variables using multivariate logistic regression analysis. The nomogram performance was evaluated by the area under the receiver operating characteristic curve (AUC), calibration curve and decision curve analysis (DCA).

Results: The normalized iodine concentration (NIC), calcification and Hashimoto's thyroiditis (HT) were identified as independent risk factors of BRAFV600E mutation in PTC ($P < 0.05$). The AUC value of the nomogram based on the three parameters was 0.75. The calibration curve of the nomogram revealed that the prediction result was in good agreement with the actual observation. The decision curve demonstrated that the nomogram can provide a satisfied net benefit than the simple all/none-intervention standard strategy within a large range of threshold probabilities.

Conclusions: As an easily and visually noninvasive prediction tool, the DLCT-based model with NIC and calcification of the nodules, and the HT of the thyroid shows good effectiveness for predicting the BRAFV600E mutation in PTC.

PU-1846

The Retrospective Study of Magnetic Resonance Imaging Signal Intensity Ratio in the Quantitative Diagnosis of Temporomandibular Condylar Resorption in Young Female Patients

Qi Sun

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

According to the literature, there is no reliable and quantitative method available for the diagnosis and prognosis of early or potential temporomandibular joint (TMJ) condylar resorption (CR) thus far. The purpose of this study was to raise a new noninvasive method to quantitatively evaluate condylar quality using the signal intensity ratio (SIR) on magnetic resonance imaging (MRI) in order to assist in the diagnosis of TMJ CR. A retrospective exploratory study was performed to compare the condyle-to-cerebral cortex signal intensity ratios (SIR) on MRI among young female patients. We included 60 patients, and they were divided into three groups: the bilateral normal TMJ group (group 1), the bilateral TMJ anterior disc displacement (ADD) but without CR group (group 2), and the bilateral TMJ anterior disc displacement (ADD) with CR group (group 3). The SIR difference between the three groups was analyzed by the Kruskal–Wallis test (K-W test). The sensitivity, specificity, accuracy, and area under curve (AUC) were calculated by the receiver operating characteristic (ROC) curves. There was high consistency between the surgeon and the radiologist in the evaluation of the magnetic signal intensity with intraclass correlation coefficients of 0.939–0.999. The average SIR was 1.07 in the bilateral normal TMJ group (group 1), 1.03 in the ADD without CR group (group 2), and 0.78 in the ADD with CR group (group 3). It could be found by the K-W test that group 3 was significantly different from group 1 and group 2 ($p < 0.05$), while there was no significant difference between group 1 and group 2. The optimal critical SIR value was 0.96 for the diagnosis of CR according to the ROC curves and Youden index ($p < 0.001$, $AUC = 0.9$). The condyle-to-cerebral cortex SIR can be used as a noninvasive diagnostic tool for the quantitative evaluation of condylar quality and diagnosis and prognosis of CR. $SIR \geq 0.96$ indicates a healthy condyle, while $SIR < 0.96$ is considered the optimal critical value for the diagnosis of CR. These findings are important for personalized and accurate treatment and prognosis prediction.

The combination of T2-mapping value of lacrimal gland and clinical indicators can improve the stage prediction of Graves' ophthalmopathy compared to clinical activity scores

Mengda Jiang

上海交通大学医学附属第九人民医院

Purpose: To explore radiological changes of the lacrimal gland (LG) in Graves' ophthalmopathy (GO) and whether a combination of MRI parameters and clinical indicators can better predict individual clinical manifestation of GO compared to clinical activity scores (CAS) assessment.

Methods: A total of 28 patients with GO (56 eyes) and 14 healthy controls (HCs) (28 eyes) were enrolled between July 2020 and July 2021. Patients were classified into either the active GO group (CAS ≥ 3) and the inactive GO group (CAS < 3). MRI data and clinical data of LG were collected. The diagnostic performance of MRI parameters and models was assessed by receiver operating characteristic curve analysis. Logistic regression predictive models for staging GO were compared.

Results: LG in GO groups had significant higher Ktrans, Ve, IAUC, ADC and T2-mapping value ($p=0.006$, $p<0.001$, $p<0.001$, $p=0.048$ and $p=0.001$ respectively), and significant lower Kep and Vp ($p<0.001$ and $p<0.001$ respectively). There were statistically significant differences in T2-mapping value ($p<0.001$), the proportion of mild or no obvious redness of conjunctiva ($p<0.001$), and the proportion of swelling of caruncle or plica ($p<0.001$) between inactive and active groups. In MRI based logistic regression model, the T2-mapping value was an independent risk factor (AUC=0.832). When combining MRI and clinical indicators, T2-mapping value and age resulted as independent risk factors (AUC=0.928). Swelling of eyelids, redness of conjunctiva, swelling of conjunctiva, swelling of caruncle or plica, and spontaneous retrobulbar pain can be replaced by other objective indicators (AUC=0.937, 0.852, 0.876, 0.896, and 0.891, respectively).

Conclusion: There were significant differences in MRI quantitative parameters of LG between HCs and GO patients. The combination of the T2-mapping value of LG and clinical indicators can improve the stage prediction of Graves' ophthalmopathy compared to CAS and provide a new idea for improving the objectification level of GO data collection.

PU-1848

Differentiation of geniculate ganglion venous malformation from schwannoma: Dynamic T1-weighted imaging provides unique diagnostic value

Mengda Jiang

上海交通大学医学附属第九人民医院

Objective: To distinguish geniculate ganglion venous malformation (GGVM) from schwannoma (GGS) by using high-resolution CT (HRCT), routine MRI and dynamic T1-weighted imaging (T1WI) characteristics.

Methods: Surgically confirmed GGVMs and GGSs between 2016 and 2021 were retrospectively included. Preoperative HRCT, routine MR and dynamic T1WI were performed on all patients. Clinical data, imaging characteristics including lesion size, involvement of facial nerve (FN), signal intensity, enhancement pattern on dynamic T1WI and bone destruction on HRCT were evaluated. Logistic regression model was developed to identify independent factors for GGVMs and the

diagnostic performance was accessed by receiving operative curve(ROC) analysis. Histological characteristics were explored for both GGVMs and GGSs.

Results: 20 GGVMs and 23 GGSs with mean age of 31 were included. On dynamic T1WI, 18 GGVMs(18/20) showed “pattern A” enhancement (a progressive filling enhancement), while all 23 GGSs showed the “pattern B” enhancement (a gradual whole-lesion enhancement)($P<0.001$). 13 GGVMs(13/20) showed the “honeycomb” sign whereas all GGS(23/23) showed extensive bone changes on HRCT($P<0.001$). Lesion size, involvement of FN segment, signal intensity on non-contrast T1WI and T2-weighted imaging(T2WI), and homogeneity on enhanced T1WI were obviously differed between two lesions($P<0.001$, $P=0.002$, $P<0.001$, $P=0.01$, $P=0.02$, respectively). Regression model showed the “honeycomb” sign and “pattern A” enhancement were independent risk factors. Histologically, GGVM was characterized by interwoven dilated and tortuous veins, while GGS was characterized by abundant spindle cells with dense arterioles or capillaries.

Conclusions: The “honeycomb” sign on HRCT and “pattern A” enhancement on dynamic T1WI are the most promising imaging characteristics for differentiating GGVM from GGS.

PU-1849

鼻腔肿瘤的 MRI 影像诊断价值

张玮

福建省立医院

目的：鼻腔由狭窄的管腔及间隙等构成，其解剖结构精细而复杂，加之少数肿瘤部位深在，加大了临床诊疗的难度；本研究分析鼻腔肿瘤的 MRI 影像学特征，旨在提高影像诊断的准确性，为临床制定有效的治疗措施提供依据及思路。方法：收集经病理证实的 90 例鼻腔肿瘤的临床资料，并划分为良性、恶性二组，分析并比较二组间的 MRI 影像学征象。结果：鼻腔肿瘤起源于上皮组织源性、软组织源性、淋巴造血组织、骨及软骨组织源性、及异位颅内组织来源肿瘤；良性组以乳头状瘤、血管瘤、骨瘤和纤维瘤多见，影像征象上常边缘光滑，以膨胀性生长为主，对周围骨壁形成压迫，与周围结构分界清晰；恶性组以鳞状细胞癌、腺样囊腺癌、淋巴瘤和黑色素瘤多见，根据分化程度边界可清晰或不清晰，影像征象上可含以下征象之一：浸润性生长、嗜神经生长、骨质破坏、累及周围结构（含翼腭窝、翼上颌裂、圆孔、翼管、眶下裂等），其中黑色素瘤短 T1 短 T2 信号具有一定特异性。良恶性组病灶强化程度无统计学意义（ $P>0.05$ ），良恶性组间均存在不同程度强化；病灶内坏死在良恶性组间存在统计学意义（ $P<0.05$ ），恶性组较良性组多见；良恶性组病灶成分 ADC 值比较具有统计学意义（ $P<0.05$ ）；恶性组内鼻腔淋巴瘤、鳞状细胞癌及腺样囊腺癌比较具有统计学意义（ $P<0.05$ ），其中淋巴瘤最低。结论：MRI 对鼻腔肿块定位、评估范围及对邻近结构的累及情况、良恶性判定和肿瘤分期等具有重要价值，可为临床医师提供更多影像参考依据。

基于 2D 与 3D 分割的 T2WI 直方图分析在腮腺肿瘤鉴别诊断中的对比研究

史宏伟、任继亮、袁瑛、陶晓峰

上海交通大学医学院附属第九人民医院

目的 对比基于 2D 和 3D 分割的压脂 T2WI 直方图分析鉴别腮腺良、恶性肿瘤及多形性腺瘤和腺淋巴瘤的价值。

方法 回顾性分析 2020 年 5 月至 2023 年 5 月上海交通大学医学院附属第九人民医院经病理证实的腮腺肿瘤患者 159 例，其中良性肿瘤 119 例，包括多形性腺瘤 63 例，腺淋巴瘤 43 例；恶性肿瘤

40 例。由 2 名医师采用 ITK-SNAP 软件于轴位压脂 T2WI 上分别进行 2D 和 3D 肿瘤分割, 获取最大层面及全瘤感兴趣区域。采用 FAE 软件提取 7 个直方图特征, 包括第 10 百分位数 (Perc10th)、第 90 百分位数 (Perc90th)、均值、中位数、熵、偏度、峰度。采用组内相关系数 (ICC) 评价直方图参数观察者间的一致性。采用非参数检验 Mann-Whitney 检验比较腮腺良、恶性肿瘤之间及多形性腺瘤和腺淋巴瘤之间直方图特征的差异。使用逐步逻辑回归筛选出独立预测因子。采用 ROC 曲线分析及 Delong 检验评估 2D 与 3D 直方图特征诊断腮腺肿瘤的效能差异。计算曲线下面积 (AUC) 并比较不同分割方式 AUC 的差异。

结果 2D 分割 (ICC:0.877~0.981) 和 3D 分割 (ICC:0.877~0.986) 的直方图参数均具有很好的观察者一致性。区分腮腺良、恶性肿瘤, 基于 2D 和 3D 分割时 10th 均是独立预测因子, 曲线下面积 (AUC) 分别为 0.814 和 0.789, 灵敏度分别为 0.875 和 0.725, 特异度分别为 0.647 和 0.765。区分多形性腺瘤与腺淋巴瘤, 基于 2D 分割的独立预测因子是中位数, AUC 为 0.890, 灵敏度为 0.857, 特异度为 0.837; 基于 3D 分割的独立因子是 90th、熵与均值, 模型的 AUC 为 0.942, 灵敏度为 0.857, 特异度为 0.884。Delong 检验显示 2D 分割和 3D 分割模型鉴别腮腺良、恶性肿瘤及多形性腺瘤、腺淋巴瘤的 AUC 值均无显著性差异 (P 值均>0.05)。

结论 T2WI 直方图分析能够为腮腺肿瘤的诊断提供一种定量工具, 2D 分割可作为优先选择的手段。

一种罕见且难以诊断的疾病——Kimura

李阳阳¹、谭艳²

1. 山西医科大学

2. 山西医科大学第一医院

背景及目的: 木村病 (Kimura) 又称嗜酸性淋巴肉芽肿, 是一种非常罕见的、病因不明且进展缓慢的良性病变。常发生在面颈部, 表现为多发无痛肿块, 伴随外周血嗜酸性粒细胞 (EOS) 及免疫球蛋白水平升高。由于该病少见, 且临床表现缺乏特异性, 易出现漏诊、误诊, 本文将讨论 Kimura 的临床影像学特征及治疗预后情况。

方法: 回顾性分析 1 例 Kimura 的临床、影像学及病例特点, 讨论其诊断、治疗及预后情况, 并结合相关文献进行分析。

结果: 39 岁男性, 1 年前喝酒后出现双手肌肉肿痛伴手指麻木、皮温低, 继而抬起受限; 9 月前出现双下肢肌肉疼痛, 走路 1000 米需要休息, 就诊我院, 实验室检查提示嗜酸性粒细胞绝对值升高, 考虑嗜酸性粒细胞增多症, 给予激素治疗; 2 月前出现左侧颈部肿物及左背部肿物, 无红肿热痛。超声提示左侧锁骨下、肩部及背部冈上肌、冈下肌异常肿大淋巴结; MRI 提示左侧胸锁乳突肌、斜角肌、斜方肌间隙内可见多发占位, 淋巴结可能。病理提示镜下见少量淋巴滤泡, 滤泡间大量嗜酸性粒细胞浸润和小管增生, 考虑嗜酸性粒细胞性肉芽肿 (Kimura 病)。

结论: 有学者认为 Kimura 与 Ig E 介导的 I 型变态反应有关, 主要表现为头颈部皮肤或皮下缓慢增长的结节伴随外周血嗜酸性粒细胞增多。该病目前无统一的治疗方案, 巨大肿块者首选手术治疗或糖皮质激素治疗后辅以小剂量放疗, 以预防复发。

鼻腔鼻窦及鼻咽部腺样囊性癌影像学表现及临床病理特点分析

李涛、李洁琼、龚晓虹

十堰市太和医院 (湖北医药学院附属医院)

【摘要】目的 探讨鼻腔鼻窦及鼻咽部腺样囊性癌的 CT、MRI 表现及临床病理特点。方法 回顾性分析经手术病理证实的 14 例鼻腔鼻窦及鼻咽部腺样囊性癌的影像表现及临床病理特点。结果 本组

14 例患者女性 8 例, 男性 6 例, 年龄 36 ~ 83 岁, 平均年龄(62.8 ± 13.9) 岁。其临床表现无特异性, 主要以鼻塞、鼻出血、面部麻木瘙痒或胀痛、嗅角减退为主。中肿瘤主体位于鼻腔及上颌窦 6 例; 鼻腔 4 例; 上颌窦 3 例; 鼻咽部 1 例。右侧 6 例, 左侧 5 例, 双侧 3 例。肿瘤大小(长径) 2.7 ~ 8.8 cm, 平均(5.3 ± 1.7) cm。肿瘤形态与边界: 不规则形 10 例, 类圆形 2 例, 长条状息肉状 2 例; 界限不清楚 8 例, 界限清楚 6 例。CT 检查 13 例, 肿瘤密度不均匀 7 例; 肿瘤呈等或等低密度; 所有病例均呈不均匀强化; 邻近骨质破坏 13 例, 溶骨性 7 例, 膨胀性及溶骨性骨质破坏并存 6 例。MRI 平扫+增强 11 例:信号不均匀 11 例, T1WI 呈等低信号, T2WI 呈等高信号; DWI 1 例: 呈等低信号; 出现“筛孔状”强化 7 例。肿瘤侵犯其他窦腔和侵犯鼻窦外组织 12 例; 肿瘤沿神经蔓延生长 11 例。随访结果: 4 例转移(肺、颈椎、颈部淋巴结)、4 例复发。肿瘤镜下由群集的细胞巢或条索状肿瘤细胞构成, 并可见大小不等的囊腔形成典型的“筛孔状”结构, MYB 癌基因与转录因子 NFIB 的融合对此肿瘤保持高度特异性。**结论** 鼻腔鼻窦及鼻咽部腺样囊性癌较为罕见, 其临床症状多不典型, 基于生长缓慢、易局部侵袭和神经周围扩散的生长特性及病理组织学特点, CT 和 MRI 表现具有特征性, 两者结合可为该病的诊断、治疗及预后提供重要价值。

PU-1853

Value of deep learning image reconstruction algorithm on CT angiography driven from whole brain CT perfusion

Limin Lei,Xiaoxu Guo,Yuhan Zhou,Weimeng Cao,Songwei Yue
The First Affiliated Hospital of Zhengzhou University

Purpose: To compare the image quality and diagnostic accuracy of CT angiography (CTA) images reconstructed from CT perfusion (CTP) arterial peak phase using deep learning image reconstruction (DLIR) algorithm with adaptive statistical iterative reconstruction-Veo (ASIR-V) and filtered back projection (FBP) in patients with acute ischemic stroke (AIS) due to anterior circulation large vessel occlusion (LVO). **Methods:** This prospective study involved 39 patients with AIS caused by LVO who underwent non-contrast CT, CTP, and CTA examination within 24 hours of symptom onset. CTP arterial peak phase images with a thickness of 0.625mm were reconstructed using FBP, ASIR-V40%, ASIR-V80%, and DLIR with three levels (low, medium, and high) and compared to conventional CTA images reconstructed with ASIR-V80%. ROIs were drawn on the internal carotid artery (ICA) siphon, M1 segment of the middle cerebral artery (MCA-M1), and temporalis in contralateral axial images. CT values, image noise, SNR, and CNR were measured and compared. The subjective evaluation included image noise, edge sharpness of vascular lumen, display of small blood vessels, and overall image quality. The collateral circulation of seven CTA image groups was scored using Bijoy K M et al six-point scoring system. **Results:** CT values of the ICA siphons, MCA-M1, and temporalis showed no statistical significance among all seven CTA image groups. Noise, SNR, and CNR were comparable among DLIR-M, DLIR-H, and conventional CTA images. While noise in ASIR-V80% was slightly higher and SNR lower than conventional CTA images ($P < 0.05$), no statistical difference was found among ASIR-V80%, DLIR-M, and DLIR-H ($P > 0.05$). FBP had the highest noise and lowest SNR and CNR. The images of DLIR-M and DLIR-H were slightly worse than those of conventional CTA images only in the display of small blood vessels($P < 0.05$). ASIR-V80% CTA images showed slightly inferior image noise and overall image quality compared to DLIR-M and DLIR-H ($P < 0.05$), with no significant difference in edge sharpness or small blood vessel visibility. Collateral circulation scores of the six reconstructed CTA images for each patient were consistent with conventional CTA images.

Conclusions: The objective and subjective image quality of CTP arterial peak phase images reconstructed by DLIR-H and DLIR-M were equivalent to conventional CTA images and superior to FBP and ASIR-V algorithms. Reconstructing CTA images from CTP data not only reduces radiation exposure and contrast agent dose by avoiding multiple scans but also shortens the examination time for patients with acute cerebral infarction.

基于卵圆孔未闭相关右向左分流患者发生 隐源性卒中的预测模型构建研究

孔莹、惠晶晶、丁亚芳、颜燕红、刘雨森、胡春洪、方琪
苏州大学附属第一医院

摘要 目的 基于卵圆孔未闭相关右向左分流 (PFO-RLS) 患者发生隐源性卒中 (CS) 的预测模型构建研究。方法 回顾性连续纳入 2020 年 1 月至 2022 年 10 月在苏州大学附一院神经内科住院的隐源性卒中 (CS) 患者, 经头颅磁共振检查证实, 且行对比增强经颅多普勒和经食道超声心动图明确存在 PFO-RLS 患者 66 例纳入 CS 组, 同期住院未发生卒中的 PFO-RLS 患者 83 例为非卒中 (NCI) 组。(1) 分析患者临床资料、PFO 解剖学特点及 PFO-RLS 情况。(2) 多因素 logistic 回归分析 PFO-RLS 患者发生 CS 的相关因素。(3) 构建联合预测模型, 绘制受试者工作特征 (ROC) 曲线, 分析联合预测模型及各指标 ROC 曲线下面积 (AUC), AUC 比较采用 Delong 检验。结果 (1) 基线资料: CS 组患者收缩压和舒张压、D-二聚体水平更高, 且 PFO 直径更大、PFO 隧道更长 (均 $P < 0.05$)。(2) 多因素 logistic 回归分析: 高血压、D-二聚体升高、PFO 直径大、PFO 隧道长是 PFO-RLS 患者发生 CS 的相关因素, OR 值 (95%CI) 分别为 4.16 (1.31~13.15)、1.01 (1.00~1.01)、2.29 (1.14~4.61)、1.19 (1.03~1.36), 均 $P < 0.05$ 。(3) ROC 曲线分析: 联合预测模型、高血压、D-二聚体、PFO 直径及 PFO 隧道长度的 AUC 分别为 0.79 (95%CI: 0.71~0.86)、0.64 (95%CI: 0.55~0.73)、0.62 (95%CI: 0.53~0.71)、0.67 (95%CI: 0.58~0.75) 及 0.65 (95%CI: 0.56~0.74)。Delong 检验显示联合预测模型与各指标的 AUC 差异均有统计学意义 (均 $P < 0.05$)。该联合预测模型在最佳截断值时, 其灵敏度 0.73, 特异度 0.76。结论 PFO 直径大、PFO 隧道长以及高血压、D-二聚体升高是 PFO-RLS 患者发生 CS 的相关因素, 联合预测模型具有一定的预测价值。

扫描头颅 CT 时, 选择哪条基线可使图像更清晰

李萍
吉林大学白求恩第一医院

目的: 探究扫描头颅 CT 时, 选择哪条基线可使图像更清晰。
方法: 分别用听眉线, 听眦线, 听眶线打角度的脑 CT 图像进行对比。
结果: 通过听眉线三个颅凹最低处都可以兼顾上, 对于显示第四脑室比较好, 而且相对听眶线而言, 听眉线更加平行或者垂直于尾状核头部、尾状核尾部, 壳核, 杏仁核以及丘脑等结构, 所以有利于基底节显示, 而且在儿童扫描时, 听眉线相对其他两条基线可以避开晶状体, 有利于防护。听眶线是三条基线中唯一可以完整的通过整个眼眶, 但是听眦线定位平行于视神经, 所以对于视神经的话可能要比听眶线好。听眦线由于介于两条基线之间, 所以可以兼顾其他两条基线所显示的结构, 所以在实际扫描时, 很多科室以听眦线为头颅扫描基线。
结论: 所以在扫描时, 在时间允许的情况下, 尽量浏览申请单, 根据患者重点观察部位给角度或者以听眦线为主, 听眦线可以中和其他两条基线。当然有些高端设备比如西门子双源, 不能进行打角度, 所以在摆位置时避免将患者头颅过仰或者过低, 否则会引起解剖结构的严重变形; 在儿童扫描时尽量以听眉线为主, 这样有利于眼晶状体的防护。

缺血型烟雾病患者搭桥术中的血流动力学参数能否预测术后脑过度灌注综合征

张白、惠晶晶、颜燕红、张翌、蔡忻懿、杨柳、黄亚波、韩庆东、周鹏
苏州大学附属第一医院

目的 探讨缺血型烟雾病 (MMD) 患者行颞浅动脉-大脑中动脉 (STA-MCA) 搭桥术中血流动力学参数对脑过度灌注综合征 (CHS) 的预测价值。 **方法** 回顾性分析 2021 年 3 月至 2022 年 12 月苏州大学附属第一医院神经外科行 STA-MCA 搭桥术的缺血型 MMD 患者 78 例。术中应用微型探头血管超声 (MVD) 探测并记录吻合前 MCA 皮层支 (M4)、吻合后供血动脉即 STA 及受血动脉 M4 的血流动力学参数, 包括收缩期峰值流速 (Vp)、平均流速 (Vm)、舒张期末流速 (Vd)、脉动指数 (PI), 并计算吻合后 M4 的 Vp、Vm、Vd 变化。记录围手术期血压变化。根据术后 72h 内患者是否出现 CHS 临床表现, 将患者分为 CHS 组 (16 例) 及非 CHS 组 (62 例)。建立多因素 logistic 回归模型, 分析影响患者术后出现 CHS 的相关因素。通过 ROC 曲线及曲线下面积 (AUC) 分析预测术后发生 CHS 的诊断价值。 **结果** 1.血流动力学参数: CHS 组 M4 近心段 Vp、Vm、Vd 及 M4 远心段 Vm 的增加倍数均高于非 CHS 组, 差异均有统计学意义 ($P<0.05$)。2.多因素 logistic 回归分析: M4 近心段 Vm 增加倍数较高 ($OR=1.24$, $95\%CI: 1.02-1.50$, $P=0.029$) 是术后发生 CHS 的独立危险因素。3.ROC 曲线分析: M4 近心段 Vm 增加倍数为 15 时 ($AUC=0.899$, $95\%CI= 0.797-1.000$, $P=0.00$, 敏感性为 0.818, 特异性为 0.885) 是预测术后发生 CHS 的最佳截断值。4.血压变化: 在吻合后 M4 增加 1.5 倍及以上的患者中, CHS 组患者术中及术后平均收缩压均高于非 CHS 组 ($P<0.05$)。 **结论** 吻合术后即刻 M4 近心段 Vm 增加倍数 ≥ 15 , 是预测缺血型 MMD 患者 STA-MCA 搭桥术后 CHS 的有效指标。

鼓膜张肌圆腱、鼓膜张肌半管与咽鼓管半管的 HRCT 研究

杨想春、马鸣岳、董季平、刘红生、董燕、刘润、郭小平
西安市中心医院

目的: 研究鼓膜张肌圆腱、鼓膜张肌半管与咽鼓管半管的 CT 表现。 **方法:** 用 Philips iCT 256 对 66 例颞骨行 HRCT, 男 35 例, 女 31 例; 平均年龄 36.2 岁。鼓膜张肌圆腱及半管正常 96 耳, 左侧 46 耳, 右侧 50 耳; 咽鼓管正常 108 耳, 左侧 54 耳, 右侧 54 耳。中耳乳突炎 26 耳, 颞骨骨折 4 耳, 中、外耳畸形 5 耳, 肿瘤 1 耳。所有病例均在轴位图像上行双侧鼓膜张肌圆腱、半管及咽鼓管半管 CPR。测量鼓膜张肌圆腱长度和宽度, 鼓膜张肌半管长度及外口、中段、内口宽度, 骨性咽鼓管半管长度及外口、中段及内口宽度。 **结果:** CT CPR 可在一幅图像上清晰显示双侧鼓膜张肌圆腱附着点及圆腱、鼓膜张肌半管全貌, 亦能显示双侧骨性咽鼓管及其与鼓膜张肌半管之间的薄层骨板。左侧 46 耳的圆腱与鼓膜张肌半管: 夹角 (轴位) $97.76\pm 9.64^\circ$ 、(冠状) $130.26\pm 8.72^\circ$, 圆腱长度 $2.26\pm 0.44\text{mm}$ 、宽度 $0.68\pm 0.32\text{mm}$, 鼓膜张肌半管长度 $12.47\pm 1.84\text{mm}$, 内口宽度 $2.30\pm 0.58\text{mm}$ 、中段 $1.81\pm 0.36\text{mm}$ 、外口 $0.96\pm 0.21\text{mm}$; 右侧 50 耳的圆腱与鼓膜张肌半管: 夹角 (轴位) $103.36\pm 13.34^\circ$ 、(冠状) $129.08\pm 8.04^\circ$, 圆腱长度 $2.20\pm 0.48\text{mm}$ 、宽度 $0.71\pm 0.14\text{mm}$, 鼓膜张肌半管长度 $12.82\pm 1.73\text{mm}$, 内口宽度 $2.36\pm 0.62\text{mm}$ 、中段 $1.79\pm 0.36\text{mm}$ 、外口 $1.00\pm 0.21\text{mm}$ 。骨性咽鼓管, 左侧 54 耳: 长度 $9.29\pm 1.66\text{mm}$, 内口宽度 $1.04\pm 0.38\text{mm}$ 、中段 $2.29\pm 0.64\text{mm}$ 、外口 $3.20\pm 0.53\text{mm}$; 右侧 54 耳: 长度 $9.31\pm 1.71\text{mm}$, 内口宽度 $0.98\pm 0.27\text{mm}$ 、中段 $2.34\pm 0.59\text{mm}$ 、外口 $3.22\pm 0.68\text{mm}$ 。以上测量值, 经统计学处理, 男、女及左、右侧对比无差别。 **结论:** HRCT CPR 可在一幅图像上完整清晰显示双侧鼓膜张肌圆腱、鼓膜张肌半管及骨性咽鼓管, 是研究其影像解剖及病变的可靠方法。

PU-1858

单侧颞浅动脉-大脑中动脉搭桥术能改善患者的神经功能吗

王润川、惠晶晶、颜燕红、黄亚波
苏州大学附属第一医院

目的 探讨单侧颞浅动脉-大脑中动脉搭桥术 (STA-MCA bypass) 后脑血流动力学改变及神经功能改善情况。**方法** 回顾性连续纳入 2019 年 3 月~2022 年 6 月在苏州大学附属第一医院神经外科经 DSA 和/或 CTA 确诊为单侧颈内动脉闭塞 (SICAO) 或大脑中动脉闭塞 (SMCAO) 患者, 且行 STA-MCA bypass 术并连续 CT 灌注随访一年患者 112 例。采用血管超声 (CDU) 评估搭桥术前后 STA 的血流动力学改变, (CTP) 评估患者搭桥术前后缺血区的灌注变化; 将 STA 评估的血流量与 CTP 参数行相关性分析; 运用美国国立卫生研究院卒中量表 (NIHSS) 及改良 Rankin 量表评分 (mRs) 评估患者神经功能改善情况。**结果** (1) 血流动力学改变: 与术前相比, 术后 7 天 (d)、30d、180d 和 360d 术侧 STA 主干内径明显增宽, 血流速度及血流量增加, 血管阻力指数减低 ($p<0.01$)。 (2) CTP 参

数: 与术前相比, 术后 7d、180d、360d 的相对脑血流量 (rCBF) 和相对脑血容量 (rCBV) 均升高, 相对达峰时间 (rTTP) 和相对平均通过时间 (rMTT) 均降低 ($p<0.05$)。 (3) STA 评估血流量与 CTP 参数 (rCBF) 的相关性: 搭桥术后两组的 STA 血流量及 rCBF 均呈高度正相关 ($r=0.865$ 、 $r=0.864$, $p<0.01$)。 (4) 术后 DSA: 91.1% (102 / 112) 的患者术后 360d 其 DSA 显示吻合血管通畅, 其中 10 例吻合不通畅患者中 40% (4/10) 于术后 180d STA 血流参数也得到相应改善。 (5) 神经功能改善情况: 患者术后 7d 的 NIHSS 评分均较术前减低 (1.8 ± 3.1 vs 1.6 ± 2.8 , $p<0.01$), 97% (109 / 112) 患者于术后 360d 其 mRS 评分较术前减低或不变, 95% (106 / 112) 患者预后良好 (mRS ≤ 2 分)。 **结论** 单侧 STA-MCA bypass 术能改善患者脑灌注及神经功能状况, 且血管超声是评估 STA-MCA bypass 术后脑血流动力学改变的有效检测手段。

PU-1859

少见部位木村病的临床及影像特征

解伟巍、罗俊淇、张亚琴、王国杰
中山大学附属第五医院

目的: 探讨少见部位木村病 (Kimura's disease, KD) 的临床及影像学特征。

方法: 回顾性分析并统计 5 例少见部位木村病患者的临床表现、实验室检查及影像学特征。所有的影像数据均由两位放射学医师评估, 包括病灶的位置、数量、大小、均匀性、边界及增强表现。

结果: 5 例患者绝大部分一般情况良好, 其中 1 例患者伴有瘙痒症状; 4 例位于上臂皮下, 1 例位于腹股沟区; 主要表现为单发 (3 例) 或多发 (2 例) 皮下结节/肿块, 其中 3 例患者伴有淋巴结肿大; 4 例患者伴有外周血嗜酸性粒细胞增多症, 4 例患者病灶内部见血管流空影; 3 例患者表现为密度/信号均匀, 边界较清, 明显强化的结节或肿块; 2 例患者出现病灶周围水肿。

结论: 单发或多发上臂皮下结节/肿块伴淋巴结肿大, 外周血嗜酸性粒细胞增多, 病灶内部血管流空影等特征有助于木村病的诊断。

DR 人工耳蜗体位设计及成片标准与否的判定郝帅
吉林医药学院**DR 摄影技术**

DR 检查是人工耳蜗置入术后临床常用、简便、经济、有效的影像检查方法。目前拍片体位逐步统一为耳蜗位¹。内听道经眶位病人俯卧摄影床上,头正中矢状面垂直床面并与暗盒中线重合,听眦线垂直于床面,两外耳孔到床面等距,中心线经两外耳孔连线中点垂直入暗盒。斯氏位病人俯卧摄影床上,头倾向被检侧倾斜,正中矢状面与台面成 45°,被检侧的额、颧、鼻三点紧贴台面,听眦线垂直台面边缘。中心线向头侧倾斜 12°,经外耳孔平面的隆突外 2cm 处射入暗盒中心¹。因本研究全是 1~5 岁小儿,采用俯卧位摄影,患儿不易配合,故体位均有改良,全部采用仰卧位。特别是仰卧斯氏位采用下颌内收使听眦线与床面横轴线夹角约 12°以平衡俯卧位斯氏位中

98

万方数据

的中心线向头侧倾斜 12°,避免了倾斜 X 管的操作,简便了操作流程,提高了操控的简便性和准确性,提升了工作效率和摄影的成功率。谭颂华²等使用 C 一臂数字 x 线拍片机,采用耳蜗位体位拍片,对仰卧于手术台上的患者进行术中拍片,取得满意效果。朱健等¹³采用改良斯氏 (Sten-VePS) 位球管不打角度,球管中心线对准被检侧的眼眶外缘和外耳道之间上 1cm 垂直射入。虽然本法可很好地显示人工耳蜗电极植入形态和位置,可判断耳蜗内电极数目及深度,但我们认为采用俯卧位摄影,患儿不易配合。黄柱飞等¹⁴采用耳蜗位,患者取站立位或坐立位患者植入侧的颧部、鼻、额部位于台面,并与台面的夹角约 50°,眼眶下缘与外耳道连线垂直于探测器,中心线从枕部射入并垂直台面

PU-1861

冈上肌出口位的 DR 投照方法及临床应用崔添源
吉林医药学院

目的:探讨冈上肌出口位的投照方法及对肩袖损伤临床诊断的价值。方法:回顾性分析 25 例经临床证实肩袖损伤病人冈上肌出口位的 X 线表现,评价这种检查方法对病灶的显示情况及定性诊断的准确率。结果:肩袖损伤常规 X 线片上表现为肱骨头的上移和肱骨大结节的畸形,其阳性率为 78%,特异性为 98%^[1]。结论:恰当的投照方法与影像检查手段相结合能准确反映肩袖损伤程度并为后期治疗提供依据。

PU-1862

双层探测器光谱 CT 单能量成像联合个性化注射方案在颅脑 CT 血管成像中的应用研究罗昆、吴红英、雷子乔
华中科技大学同济医学院附属协和医院

【摘要】 目的: 探讨双层探测器光谱 CT 单能量成像联合个性化对比剂注射方案在颅脑 CT 血管成像 (CTA) 中的应用价值。方法: 回顾性分析 2020 年 8 月至 11 月在华中科技大学同济医学院附

属协和医院采用双层探测器光谱 CT 和个性化对比剂注射方案行颅脑 CTA 检查的 76 例患者的影像资料。对基于双层探测器光谱 CT 数据重建生成的 120 kVp 混合迭代传统能量图（常规组）与 50 keV 光谱虚拟单能量图（试验组）进行图像质量的客观和主观评价，客观评价内容包括颈内动脉及大脑中动脉处的 CT 值、信噪比（SNR）和对比噪声比（CNR）、脑实质的 CT 值和标准差。主观评价由 2 名高年资影像医师按照 5 分法完成，2 名医师主观评分的一致性采用 Kappa 检验。采用配对样本 t 检验或 Wilcoxon 秩检验进行组间分析。结果：试验组颈内动脉、大脑中动脉及脑实质的 CT 值、SNR 和 CNR 均较常规组高，差异有统计学意义（P 均<0.001）。2 名医师对试验组的主观评分均为 5（5，5）分，对常规组的主观评分均为 4（4，4）分，医师间主观评分一致性较好，Kappa 值分别为 0.74 和 0.84。试验组主观评分高于常规组，差异有统计学意义（Z=-11.15，P<0.001）。结论：在颅脑 CTA 检查中，使用双层探测器光谱 CT 单能量成像联合个性化对比剂注射方案，能够显著提高 SNR 和 CNR，优化图像质量。

PU-1863

基于低频振幅及其时间动态性变化分析皮质下缺血性脑血管病患者脑自发活动改变

宋子阳

苏州大学附属第一医院

目的：探索皮质下缺血性脑血管病（SIVD）患者的局部脑活动强度及其时间动态性变化。

方法：于 2020 年 9 月至 2022 年 8 月间招募了 86 名参与者，包括 29 名伴有认知障碍的 SIVD 病人（SIVD-CI，N=29）、26 名不伴有认知障碍的 SIVD 患者（SIVD-NCI，N=26）以及 31 名健康对照（HC，N=31）。采集所有参与者的静息态脑功能磁共振数据及神经心理学量表。计算所有被试血氧水平依赖信号的低频振幅（ALFF）及低频振幅的动态性（dALFF）。使用协方差分析来比较三组间的 ALFF 值及 dALFF 值，将被试的年龄、受教育程度及头动参数作为协变量，多重比较校正采用高斯随机场校正。运用偏相关分析来检验 SIVD 患者存在差异的脑区内平均 ALFF、dALFF 平均值与各个神经心理学量表评分的相关性。

结果：与健康对照相比，SIVD-CI 以及 SIVD-NCI 患者均表现出左侧角回的 ALFF 值减低，而 SIVD-CI 组还表现出右侧额上回的 ALFF 值升高（GRF 校正，体素水平 $P < 0.001$ ，团块水平 $P < 0.05$ ）。和另外两组相比，SIVD-CI 组表现出右侧楔前叶和左侧背侧前扣带回的 dALFF 值减低（GRF 校正，体素水平 $P < 0.001$ ，团块水平 $P < 0.05$ ）。SIVD-NCI 组和 HC 组间没有表现出显著的 dALFF 值差异（ $P > 0.05$ ）。SIVD-CI 组患者左侧角回的 ALFF 平均值与 AVLT 延迟记忆量表评分呈正相关（ $r=0.448$ ， $P=0.017$ ）。

结论：SIVD-CI 及 SIVD-NCI 患者均表现出左侧角回的活动减低，角回可能是 SIVD 患者易受损伤的脑区之一。SIVD-CI 患者的右侧楔前叶及左侧背侧前扣带回的脑活动灵活度减低，而 SIVD-NCI 患者的局部脑活动灵活度尚处于代偿阶段。

PU-1864

Imaging markers of Takayasu arteritis: Imaging diagnosis is leading to new horizons

Tong Sun, Yafang Ding, Yanhong Yan, Pinjing Hui
The First Affiliated Hospital of Soochow University

Objectives: The purpose of this study is to explore a noninvasive imaging biomarker for early assessment of Takayasu arteritis (TAK) by comparing ultrasound-based multimodal imaging with postoperative histopathology.

Methods: Retrospective analysis was performed on all patients with TAK who met the American College of Rheumatology (ACR) criteria and underwent carotid Doppler ultrasonography (CDU) and high-resolution magnetic resonance imaging (HRMRI) between 2016 and 2023 at our institution. Among all the patients with Takayasu arteritis, 38 patients had positive imaging evidence on CDU and HRMRI, and the clinical dates of these patients were summarized and analyzed. TAK patients were divided into stroke and non-stroke groups according to the presence or absence of cerebral infarction. One of the patients with left common carotid artery occlusion underwent left-side artificial vessel replacement surgery, and some of the diseased vessels were obtained for histopathological study.

Results: There was excellent concordance between CDU and HRMRI in the diagnosis of TAK patients ($p < 0.001$). TAK patients had higher levels of erythrocyte sedimentation rate (ESR), white blood cell (WBS), and low-density lipoprotein cholesterol (LDL-C) than healthy controls ($p = 0.002$; $p < 0.001$; $p < 0.001$). After grouping patients by CDU imaging, type II, III, and IV had significantly higher levels of C-reactive protein (CRP) and ESR than type I ($p = 0.001$; $p < 0.001$). The levels of CRP, ESR, WBS, and LDL-C in the stroke group were significantly higher than those in the non-stroke group ($p = 0.046$; $p = 0.019$; $p = 0.003$; $p = 0.041$). Histopathologically analysis of the common carotid artery segment established the media and the intima of the left common carotid artery granulomatous inflammation of carotid lumen occlusion.

Conclusions: The vascular morphological alterations of the artery wall and lumen can be observed by CDU, which can also assess TAK early and predict stroke events.

PU-1865

根据小剂量团注测试达峰时间和点数调整老年患者头颈部 CT 血管造影对比剂及生理盐水剂量

曾禹莉、王贵良、何荣、任永、车亦蕾
湖南省人民医院 (湖南师范大学附属第一医院)

目的 根据小剂量测试 (Test-bolus) 达峰时间和点数调整老年人头颈部 CT 血管造影 (CTA) 对比剂及生理盐水剂量, 以优化图像质量, 减少对比剂用量。**方法** 将 234 例心功能及 BMI 正常 ($50\text{kg} \leq \text{Wt} < 80\text{kg}$) 的老年患者分 A 组 (对照组, $n=110$) 和 B 组 (实验组, $n=124$) 进行头颈部 CTA 扫描。2 组扫描及后处理步骤、参数相同。Test-bolus 确定达峰时间 (达峰点数 $\times 2 + 8\text{S}$) 和扫描延迟时间 (达峰时间 - 平扫时间)。血管成像序列: A 组对比剂为 1.0ml/kg , 生理盐水 40ml ; B 组根据 Test-bolus 达峰时间和点数调整对比剂及生理盐水剂量: 对比剂剂量 = 对比剂注射时间 (达峰时间 - 生理盐水注射时间) \times 对比剂流率; 生理盐水剂量: 达峰点数 4-5 个点, 30ml ; 6-7 个点, 40ml ; 8-9 个点, 50ml 。2 组对比剂为碘克沙醇 (320mg/ml), 对比剂、生理盐水注射流率为 4.5ml/s 。2 组性别、年龄、身高、体重、BMI、心率、血压、达峰时间和点数无统计学差异 ($P > 0.05$)。2 名放射科医师对图像质量主观评价的可靠性采用 kappa 分析。客观评价指标包括目标动脉及右侧横窦内 CT 衰减值、噪声 (Noise)、信噪比 (signal to noise ratio, SNR)、对比噪声比

(contrast noise ratio, CNR)。比较 2 组图像质量及对比剂用量。**结果** ① 2 名医师主观图像质量评价具有较好的一致性 ($k=0.815$)。B 组图像质量主观评分及目标动脉、右侧横窦内 CT 值与 A 组比较, 差异无统计学意义 ($P>0.05$); B 组右锁骨下静脉、右头臂静脉及上腔静脉内对比剂残留少于 A 组; B 组右颈总动脉分叉处 Noise 较 A 组增加 1.7%, 左侧大脑中动脉 M1 段 SNR 较 A 组降低 6.6%, 其余 2 组相同部位动脉 Noise、SNR、CNR 比较, 差异无统计学意义 ($P>0.05$)。② B 组对比剂用量较 A 组减少了 18.2%。**结论** 根据 Test-bolus 达峰时间和点数调整正常体型老年人头颈部 CTA 对比剂及生理盐水剂量, 可在不影响图像质量时, 减少注射侧静脉内对比剂残留, 降低对比剂用量。

PU-1866

基于磁共振 MAGiC 技术的干燥综合征患者腮腺弛豫值研究

杨传红、付志辉、郭忱、董楠
苏州市中医医院

目的: 使用磁共振 MAGiC 技术测量和分析干燥综合征患者腮腺的弛豫值, 研究干燥综合征患者与正常对照者间腮腺的相关数值的差别。

材料与方法: 纳入 7 例干燥综合征患者 (年龄: 53 ± 11 岁) 和 18 例正常对照组 (年龄: 56 ± 13 岁)。所有受试者均在 3.0T MRI 上进行 MAGiC (MAGnetic resonance imaging compilation) 扫描, 使用 MAGiC 后处理软件对双侧腮腺原始数据进行进一步后处理, 取腮腺最大层面测量, 避开腮腺内穿行血管, 为减小部分容积效应, 距离腮腺边缘 1-3mm 画感兴趣区, 测量并记录双侧腮腺弛豫值, 包括 T1、T2 弛豫值和质子密度 PD 值, 使用非参数检验来评估两组之间年龄、弛豫值的差异。

结果: 两组之间的年龄 ($P=0.243$) 无统计学差异。病例组 T1、T2 弛豫值和质子密度 PD 值 (565.286 ± 61.356 、 80.000 ± 7.359 、 84.664 ± 14.495) 与正常对照组 T1、T2 弛豫值和质子密度 PD 值 (610.000 ± 82.285 、 79.333 ± 8.912 、 77.631 ± 11.944) 无明显统计学差异, P 值分别为 0.075、0.905、0.117。

结论: 使用磁共振 MAGiC 技术测量和分析干燥综合征患者腮腺的弛豫值尚不能区分干燥综合征和正常人, 该技术在干燥综合征患者腮腺病变的诊断价值需扩大样本量进一步研究。

PU-1867

慢性鼻窦炎鼻窦 CT 结构式报告在影像报告中的应用

虞丹萍
浙江大学医学院附属第一医院

鼻窦 CT 在慢性鼻窦炎患者评估和诊疗中发挥着重要作用, 但既往鼻窦 CT 报告描述内容过于简单, 并对鼻窦相关解剖及解剖变异情况未与充分解读, 故与临床诊疗关注内容明显不一致。而慢性鼻窦炎患者是病因和发病机制复杂的异质性疾病, 不同的分型有不同的预后, 需要个体化的精准诊疗, 因此放射科医生需要充分学习并识别鼻窦相关的解剖结构及解剖变异, 为临床医生提供有价值的报告内容。慢性炎鼻窦 CT 结构式报告里面所提及到的大部分内容是既往放射科医师并未充分认识到的知识点及盲区, 比如窦口鼻道复合体的概念及组成区域、鼻道具体的引流通路、嗅凹 Keros 分型、筛前动脉的位置、筛骨纸样板有无骨质不连续、蝶窦气化情况及钩突附着差异等, 而既往未在报告中体现的所有需要关注的点都会对功能性内窥镜鼻窦手术 (FESS) 手术有所影响。因此放射科医生应充分学习慢性鼻窦炎鼻窦 CT 结构式报告中的知识点内容, 并开展运用鼻窦 CT 的结构式报告,

为患者提供充分的术前评估, 以避免部分功能性内窥镜鼻窦手术 (FESS) 中的并发症及潜在风险, 为慢性鼻窦炎及鼻窦相关占位性病变个性化精准治疗提升治愈率, 并改善术后临床状况。

PU-1868

甲状腺结节磁共振特征与病理特征对照研究

李秀娟、刘晓燕、王宝剑、马千里、马得廷、孔雪、马振波、谢元忠
泰安市中心医院

目的: 分析甲状腺结节的磁共振成像 (MRI) 特征及其病理基础, 探讨甲状腺结节磁共振成像特征与病理特征之间的关系, 提高甲状腺良恶性结节的诊断水平。

方法: 回顾性分析 28 例经手术和病理证实发现甲状腺结节的患者, 术前对患者进行甲状腺 MR 常规平扫、增强扫描及扩散加权成像 (DWI) 检查, 根据病理结果分为良性结节组和恶性结节组。观察病灶的形态、边界、质地、信号类型、伴随特征、强化方式及扩散加权受限程度, 结果与术中病理进行对照。

结果: 28 例甲状腺结节患者的 MRI 图像上共见 62 个结节病灶, 其中: 单发结节 11 例, 多发结节 17 例; 病灶形态规则多呈类圆形、边界不清晰 (71.0%, 61.3%)。49 个病灶质地呈实性 (79.0%)。病灶 T1WI 以低、等或等低信号为主 (95.2%), 病灶 T2WI 以高或稍高信号为主 (83.9%)。15 个病灶伴有囊变或坏死 (24.2%), 13 个病灶伴有钙化征象 (21.0%)。病灶呈轻中度强化有 43 个 (69.4%), 呈明显强化有 19 个 (39.6%)。病灶 DWI 呈明显弥散受限有 28 个 (45.2%)。良性结节灶 17 个 (27.4%), 恶性结节灶 45 个 (72.6%), 单因素分析显示两组间边界 ($P=0.002$)、TIWI 信号 ($P=0.018$)、强化程度 ($P=0.003$)、DWI 是否明显受限 ($P=0.001$) 差异有统计学意义。多因素回归分析显示强化信号程度 ($P=0.003$, OR 值=0.095) 及 DWI 是否明显受限 ($P=0.008$, OR 值 12.109) 是甲状腺结节恶性的独立预测因素。

结论: 甲状腺恶性结节在 MRI 上具有一定的形态学血流动力学特征, 表现为轻中度强化且弥散明显受限的显著特点; 甲状腺常规平扫结合强化和 DWI, 有助于提高恶性结节的检出率。

PU-1869

通过死后计算机断层扫描(PMCT)和死后磁共振成像(PMMRI)确定颈部损伤死因

陈鑫、周丹丹、郑依萍
吉大一院

目的: 回顾性地确定死于颈部损伤的死者死后计算机断层扫描 (PMCT) 和死后磁共振成像 (PMMRI) 发现的潜力, 并评估每种方法的优缺点。

材料与方法: 对 22 具尸体进行 PMCT, 对 10 具尸体进行 PMMRI。所有死后图像由两名普通放射科医生在 PACS 工作站进行独立盲读解读。最后的死因是由法医病理学家确定的。对鼻窦、气管、主支气管影像学进行评估; 骨折; 肿胀颈部、咽和喉部肿胀; 还有其他发现。记录每种方法的所有结果, 并按解剖结构分类。

结果: 22 具尸体中有 21 具的 PMCT 和 PMMRI 检查结果可以用参照法进行验证。在一具尸体中, PMCT 未发现颈部肌肉出血。颈部损伤的原因有 7 种: 扁桃体突出 2 例、窒息 2 例、气道阻塞 2 例、溺水 2 例、颈部刺伤 2 例、外伤 8 例、颈椎手术 3 例。

结论: PMCT 联合 PMMRI 因其微创性, 在颈部损伤致死原因的检测中具有潜在的作用。

基于双能量 CT 碘浓度纵向变化构建的列线图模型预测喉癌患者诱导化疗后的治疗反应

沈卓¹、李文菲²、夏爽¹

1. 天津市第一中心医院

2. 河北省秦皇岛市第一医院

目的：探讨双能量 CT (DECT) 碘图定量参数纵向变化在评估喉癌患者接受诱导化疗后治疗反应的价值。

方法：回顾性分析 2018 年 7 月至 2021 年 12 月在天津市第一中心医院头颈外科接受诱导化疗的 86 例喉癌患者，前瞻性收集 2022 年 12 月至 2023 年 2 月期间的 30 名喉癌患者作为验证队列。收集患者诱导化疗前后的临床资料及 DECT 资料。根据 RECIST 标准评估患者的治疗反应，将患者分为缓解组和抵抗组。将 DECT 图像导入后处理工作站 Syngovia 获得碘图，勾画肿瘤最大层面获得碘浓度，以同层颈总动脉碘浓度作为标准参照值，获得诱导化疗前动、静脉期标准化碘浓度 (NAICpre, NVICpre) 和诱导化疗后动、静脉期标准化碘浓度 (NAICpost, NVICpost)，并计算前后的变化率值 (Δ NAIC%, Δ NVIC%)，公式为 Δ IC% = (NICpost - NICpre) / NICpre \times 100%。采用配对样本 t 检验或 Wilcoxon 检验评估诱导化疗前后缓解组和抵抗组不同定量参数纵向变化的差异，使用 Mann-Whitney U 检验评估不同参数在缓解组和抵抗组之间的差异，绘制 ROC 曲线评估几种参数对诱导化疗抵抗的预测效能。在训练组中筛选独立预测因子构建列线图模型并在前瞻队列中验证模型的鲁棒性，分别在训练组和验证组绘制校准曲线及决策曲线评估模型性能。

结果：不论是治疗前还是治疗后碘浓度参数，在抵抗组和缓解组之间均无统计学差异。缓解组患者治疗后 NAIC (p=0.0022)、NVIC (p=0.0031) 均显著低于治疗前，但抵抗组参数变化无统计学差异。多因素 logistic 回归分析最终确定 Δ NAIC%、 Δ NVIC%、假包膜、瘤内动脉是训练组诱导化疗抵抗型喉癌的独立预测因素，基于以上因素建立诱导化疗抵抗风险预警列线图模型。训练组和验证组模型预测拮抗的 AUC 分别为 0.85、0.89，校准曲线、决策曲线均表现出良好的一致性。

结论：DECT 碘图定量参数纵向变化 (Δ NAIC%、 Δ NVIC%) 有助于评估喉癌患者诱导化疗后的治疗反应，联合传统影像学征象构建的模型对于诱导化疗抵抗型喉癌具有良好的预测效能。

脑小血管病负荷预测急性缺血性卒中血管内治疗预后的价值

马高、吴飞云

南京医科大学第一附属医院 (江苏省人民医院)

【摘要】目的 探讨脑小血管病 (CSVD) 负荷预测大血管闭塞 (LVO) 急性缺血性卒中 (AIS) 血管内治疗 (EVT) 预后的价值。方法 回顾性分析 2018 年 2 月至 2022 年 9 月 242 例前循环 LVO-AIS 并接受 EVT 的患者资料。基于 EVT 后一周内的随访 MRI 评估 CSVD 征象及负荷评分。患者分为轻度 (CSVD 负荷评分 0-1 分) 和中-重度 (CSVD 负荷评分 2-5 分) CSVD 组、预后良好组 [EVT 后 90 天改良 Rankin 量表 (mRS) 评分 0-2 分] 和预后不佳组 (mRS 评分 3-6 分)。采用 Mann-Whitney U 检验、卡方检验及多因素 Logistic 回归分析进行统计学分析。结果 242 例患者包括预后良好患者 169 例 (69.8%) 和预后不佳患者 73 例 (30.2%)。预后不佳组 CSVD 负荷评分更高, Fazekas 评分中脑室旁脑白质高信号 (WMH) 评分 = 3 分和 (或) 深部 WMH 评分 ≥ 2 分及中-重度脑萎缩比例高于预后良好组 (P 均 < 0.05)。高血脂、高基线美国国立卫生研究院卒中量表 (NIHSS) 评分、EVT 后血管无良好再通及合并出血转化是预后不佳的独立危险因素 (P 均 < 0.05)。与轻度 CSVD 组相比, 中-重度 CSVD 组的 90 天 mRS 评分更高 ($P = 0.025$), 而两组间良好再通率、EVT 后出血转化发生率差异无统计学意义 ($P > 0.05$)。结论 基于 CSVD 负荷预测前循环 LVO-AIS 患者 EVT 预后具有一定的临床应用价值。

尼古丁依赖者静息态脑功能磁共振局部一致性及低频振幅的研究

谢梅、汪涛

浙江医院

【摘要】采用静息态脑功能磁共振 (fMRI) 技术分析尼古丁依赖者静息态局部一致性 (ReHo) 及低频振幅 (ALFF) 指标, 探讨尼古丁成瘾的机制。方法 2020 年 5 月至 2023 年 1 月, 选择符合条件的尼古丁依赖者 22 例作为实验组, 选择年龄、性别相匹配的健康成人 26 例作为健康对照组进行静息态功能磁共振 (fMRI) 检查, 对尼古丁依赖组进行烟草依赖检验量表 (FTND) 评估, 采用 Matlab 背景下 restplus 软件对影像学数据进行处理, 获得被试者全脑的局部一致性 (ReHo) 值及全脑的低频振幅 (ALFF) 值并进行比较分析。结果 与健康对照组相比, 尼古丁依赖者 ReHo 值差异无统计学意义 ($P > 0.05$)。双侧小脑蚓部、扣带回、楔前叶 ALFF 值降低, 相关分析显示, 尼古丁依赖组 FTND 评分与扣带皮层平均 ALFF 值呈负相关 ($P < 0.05$)。结论 尼古丁依赖者静息态脑功能磁共振双侧小脑蚓部、扣带回、楔前叶脑固有自发神经活动强度减弱, 且这些脑区功能活动改变与尼古丁成瘾者烟草依赖检验量表评估得分有关。

头颈部 CTA 血管成像因子间相互作用权重的研究与应用

王娜琴

南京明基医院

目的: 探讨影响头颈部计算机断层扫描血管成像 (CTA) 的图像质量相关的影响因素。
方法: 回顾性收集 2019 年 10 月至 2020 年 12 月 617 例行头颈部 CTA 检查的患者。采用美国通用公司 GE64 排 VCT 成像系统。扫描范围由主动脉弓至颅顶, CTA 扫描方案选取第 3、4 颈椎间的

层面为测试层面,采用小剂量团注法,以该层面颈总动脉为示踪血管,注射显影剂同时启动测试序列,计算出颈总动脉 CT 值达到峰值的时间并以此为扫描延迟依据后进行头颈部 CTA 序列扫描。测量左大脑中动脉、右大脑中动脉、上矢状窦的 CT 值,图像对比度、分辨率和左、右大脑中动脉 CT 值与上矢状窦 CT 值的比值(CTA/V),ROI 面积大小占血管截面积的 80%,测量时注意避开血管钙化点、软斑块和狭窄等区域,每个 ROI 测量三次取均值。

结果:本研究对临床数据收集的 617 例缺血性中风患者,其将年龄、平均动脉压、心率、显影剂剂量、高压注压力、体表面积、扫描延迟扫描时间,将收集之数据经正规化处理后用于确定 LRA/US 值之间的非线性一阶回归关系。通过 STATISTICA 程序导出了相应的多因子影响因素的排序表;对于头颈部 CTA 的图像质量影响进行分析,总结计算出的 22 项系数组和导出系数的排序顺序,其结果显示排序前五位分别为:平均动脉压 + 高压注压力(排序 1)、平均动脉压 + 延迟时间(排序 2)、平均动脉压 + 心率(排序 3)、高压注压力 + 延迟时间(排序 4)、年龄 + 平均动脉压(排序 5),为排名前 5 项重要影响因子($\Phi = 15.6928$, $S^2 = 69.04\%$, $r^2 = 0.8309$)。

结论:头颈部 CTA 图像质量受多种因素的影响。患者平均动脉压 + 高压注压力,平均动脉压 + 延迟时间,平均动脉压 + 心率,是影响 CTA 成像的重要因子,通过观察平均动脉压、心率,并且调整高压注压力、延迟时间,可以获得最佳的血管成像。

PU-1875

磁共振弥散张量成像在巨大听神经瘤患者术前评估面神经中的临床应用

司明珏

上海交通大学医学院附属第九人民医院

目的:巨大听神经瘤患者的面神经由于受到肿瘤推挤,可向多个方向移位,因此在切除巨大听神经瘤时如何保护面神经对外科医生是一项艰巨的挑战。本研究旨在探讨利用磁共振弥散张量成像(DTI)通过追踪神经束的走行,从而实现术前评估面神经形态及与听神经瘤体的空间关系。

方法:本研究前瞻性收集 5 例巨大听神经瘤(肿瘤直径>2cm)患者,术前通过 House-Brackman 分级确定面神经功能正常。利用 GE 3.0T 磁共振先行桥小脑角区常规 T1WI 及 T2WI 扫描后,再行 DTI 功能成像,成像参数: $b=1000s/mm^2$ 序列扫描 64 个方向; $b=0$ 序列: TR 6900ms, TE 80ms, 层厚 1.5mm, 无间隔扫描, FOV 22.4x22.4mm, NEX=2, 扫描层数 55~65 层。然后行 T2 加权的 3D FIESTA 扫描,用于后处理时与 DTI 序列叠加定位的解剖学成像序列。利用 Functional tool 后处理工作站软件,第一步进行 EPI 图像形变矫正;第二步调整阈值,保证脑干区域脑组织及发出的神经被覆盖;第三步计算,得到 FA、ADC 等功能图像;第四步追踪纤维束,把 SeedROI 放到桥小脑角面神经发出的部位,点击 Tracking,或者再设置 TargetROI,放到内听道远端靠近耳蜗的位置,得到数条白质纤维束。然后导入 3D FIESTA 解剖学序列来修正 ROI 的放置位置,检验所追踪出的神经纤维束中哪一根为面神经,确定其与听神经瘤体的空间关系,并与术中所见进行对比验证。

结果:5 例听神经瘤患者中 4 例 DTI 追踪出了面神经, 1 例 DTI 未能追踪出面神经,可能是因为肿瘤太大(直径 4.6cm),术中发现面神经被挤压菲薄如纸,故未能成功追踪出神经束。4 例中 2 例面神经桥池段位于肿瘤前方中部, 1 例位于前方上部, 1 例位于前方下部, DTI 成像结果与术中所见结果相吻合。

结论:磁共振弥散张量成像(DTI)在巨大听神经瘤患者术前追踪面神经领域具有很高的临床应用价值,但当听神经瘤体过大时可能追踪失败,仍需对磁共振成像方法学和后处理技术做进一步探索和改进。

PU-1876

Clinical Application of Diffusion Tensor Imaging in Preoperative Evaluation of Facial Nerve in Patients with Giant Acoustic Neuroma

Mingjue Si

Shanghai Ninth People's Hospital, Affiliated to Shanghai Jiaotong University School of Medicine

Objective: In patients with giant acoustic neuroma, the adjacent facial nerve can be displaced in many directions due to the pushing of tumors. Therefore, it is a challenge for surgeons to protect the adjacent facial nerve when resecting giant acoustic neuroma. The purpose of this study was to investigate the spatial relationship between acoustic neuroma and the adjacent facial nerve by tracking the course of facial nerve tract by using diffusion tensor imaging (DTI).

Materials: Five cases of patients with giant acoustic neuroma (tumor diameters > 2 cm) were prospectively collected and facial nerve function was determined by using House-Brackman grading before operation. The cerebellopontine angle was scanned by conventional T1WI and T2 WI on a GE 3.0T MR and followed by DTI functional imaging. Imaging parameters: b=1000s/mm² sequence, 64 directions were scanned, and b=0 sequence: TR 6900ms, TE 80ms, slice thickness 1.5mm, no interval scanning, FOV 22.4 × 22.4mm, NEX = 2. T2-weighted 3D FIESTA scan was performed to superimpose and anatomically locate the DTI images on Functional Tool Post-Processing Workstation. The first step was to correct the deformation of EPI image; the second step was to adjust the threshold to ensure that the brain tissue and the nerves emitted from the brainstem were covered; the third step was to calculate the FA, ADC and other functional imaging data; and the fourth step was to track the fiber bundles. Seed ROI was placed at the site of the facial nerve in the cerebellopontine angle. Then we click Tracking and put target ROI at the distal end of the internal auditory canal near the cochlea, and several white matter bundles were obtained. After that, the 3D FIESTA anatomical images were used to determine the facial nerve fiber tract and its spatial relationship with the acoustic neuroma, which was compared with the intraoperative findings.

Results: Facial nerve was accurately traced by DTI in 4 of 5 cases, but failed in 1 case, probably due to the extremely large tumor size (4.6cm in diameter), which squeezed the adjacent facial nerve as thin as paper. Within the 4 succeed cases, the pontine cistern segment of the facial nerve was located in the middle anterior part of the tumors in 2 cases, and in the upper anterior part in 1 case and in the lower anterior part in 1 case. The DTI results were in accordance with intraoperative findings.

PU-1877

能谱联合自适应迭代重建技术对头颅 CTA 成像质量的应用价值

田秀秀

南京明基医院

目的: 探讨能谱联合自适应迭代重建技术对头颅 CTA 成像质量影响及应用价值。

方法: 本研究共收集 166 例自 2022 年 3 月-2023 年 1 月于本院行头颅 CTA 的患者; 所有患者均采用 GE 公司 Revolution APEX CT 机进行成像, 扫描范围由颅底至颅顶, 扫描层厚为 0.625mm, 采用能谱并结合自适应迭代 40%进行扫描后将原始数据进行重建取单能量 40keV 为 A1 组、60 keV 为 A2 组、80 keV 为 A3 组, 并对三组图像进行曲面重建及最大密度投影重建。测量三组图像区域包含左右大脑前中后动脉、基底动脉及前后交通动脉, 放置感兴趣区, 并且由 1 名工作 10 年

以上技师进行测量 ROI 内的 CT 值及标准差(Standard Deviation, SD) 值, 所有数据均测量三次取平均值作为最终统计结果。主观评价: 两名具有 7 年以上工作经验的放射科医师对两组图像的整体图像质量采用 5 分法进行评分。

结果: 三种能量重建下测得的左右大脑前中后动脉、基底动脉及前后交通动脉 CT 值、SD 值、SNR 值、CNR 值比较后 40keV>60keV>80keV ($P<0.05$)具有统计学意义。主观评价由两位诊断医师对于图像质量主观评分的 Kappa 值为 0.75, 一致性较强。MIP 重建图像评分, 各组间评分无统计学差异 ($P=0.467$)。CPR 重建图像评分 60keV>80keV >40keV, 各组间评分有统计学差异 ($P<0.05$); 进行血管比较时, 60keV>80keV>40keV ($P<0.05$)具统计学差异, 因 40keV CT 值远大于 60keV 和 80keV, 近似于颅骨 CT 值, 影响诊断, 得分最低具统计学差异, ($P<0.05$)。

结论: 头颅 CTA 检查中, 采用能谱单能 60 keV 结合自适应迭代 40% ASIR 扫描可以降低图像噪声, 提高图像的信噪比, 可以提高血管末梢细微段(c5~c7)检出率。

光谱 CT 诊断喉及下咽良恶性病变的价值

毛雨、陈光祥
西南医科大学附属医院

目的 研究光谱 CT 定量参数诊断喉及下咽良恶性病变的价值。方法 回顾性分析本院 2020 年 10 月至 2023 年 6 月术前接受喉部或颈部 IQon 光谱 CT 双期增强扫描的 144 例喉及下咽肿物患者的临床及影像学资料。通过 Philips ISP 图像工作站获得 40~100 KeV 能级的虚拟单能图 (VMI)、虚拟平扫图、无水碘图、碘密度图、有效原子序数图和常规增强图, 选择病变最大层面、避开血管和坏死液化区勾画病灶感兴趣区 (ROI), 采集各个图像上的相应参数, 勾画同层颈动脉 ROI, 计算出标准化有效原子序数和标准化碘浓度; 使用 40 KeV VMI 和 100 KeV VMI 病灶的 CT 值计算能谱曲线的斜率(λ)。采用两独立样本 t 检验或秩和检验, 比较喉及下咽良恶性病变两组各项定量参数的差异; 绘制受试者工作特征曲线(ROC), 分析各定量参数诊断喉及下咽良恶性病变的效能, 采用 DeLong's 检验比较各 ROC 曲线。结果 喉及下咽良恶性病变两组动静脉期的各光谱 CT 参数差异均有统计学意义 ($p<0.05$)。静脉期各光谱 CT 参数中, 40 KeV VMI 的曲线下面积 (AUC) 最大, 为 0.932 (敏感度、特异度、准确率分别为 0.774、0.930、0.819), 与同期常规增强 AUC(0.866) 差异有统计学意义 ($P<0.05$)。动脉期各光谱 CT 参数中, 40 KeV VMI 的 AUC 最大, 为 0.870 (敏感度、特异度、准确率分别为 0.774、0.837、0.792), 与同期常规增强 AUC(0.837) 差异无统计学意义 ($P>0.05$)。结论 光谱 CT 对于喉及下咽良恶性病变具有较高的诊断价值, 低能级虚拟单能图优于常规增强, 且静脉期低能级虚拟单能图优于动脉期。

PU-1879

青少年髁突结构与颞下颌关节紊乱病的相关性研究

葛怀志、白光辉
温州医科大学附属第二医院

目的: 评估青少年髁突结构参数与颞下颌关节紊乱病的相关性, 并探讨两者之间的关系。方法: 以 2019 年 1 月至 2020 年 12 月温州医科大学附属第二医院进行颞下颌关节 MRI 检查的 47 位患者、共 94 例颞下颌关节为研究对象, 其中关节盘无移位组 32 例、可复性移位组 22 例、不可复性移位组 40 例。采用 3.0T MRI 进行常规序列及 3D-CUBE T2、T2-mapping 序列扫描。在 3D-CUBE T2 序列图像上进行多平面重组 (MPR) 测量髁突最大左右径、前后径, 并计算两者乘积、除商共 4 项髁突结构参数。评估颞下颌关节紊乱病指标包括定性及定量两项指标: 对常规序列进行综合读片,

将关节盘移位进行定性分为无移位、可复性移位及不可复性移位 3 组；在 T2-mapping 序列上测量关节盘 T2 值作为定量指标。采用描述性统计、单因素方差分析、皮尔森相关分析统计学方法对 4 项髁突结构参数与 2 项关节盘损伤指标进行统计学分析。结果：髁突左右径、前后径及乘积 3 项结构参数在无移位、可复性移位及不可复性移位 3 组间差异有统计学意义 ($P<0.001$)，对应均值排序为无移位组>可复性移位组>不可复性移位组；髁突左右径、前后径及乘积与关节盘 T2 值存在轻度正相关 ($r=0.262$ 、 $r=0.317$ 、 $r=0.386$, $P<0.05$)。结论：髁突左右径、前后径及横截面积在颞下颌关节紊乱病中随着病情加重而减小，髁突结构参数可作为颞下颌关节紊乱病间接的影像学特征。

基于 CT 影像组学和深度学习的甲状腺癌淋巴结转移预测

王帆
南京明基医院

目的：本研究旨在探讨采用 CT 影像组学分析结合深度学习技术在预测甲状腺癌患者颈部淋巴结转移的可行性和准确性，为临床治疗提供可靠参考。

方法：回顾性分析我院 2021 年 4 月至 2023 年 3 月 112 例经手术证实的甲状腺癌颈部淋巴结转移患者的 CT 影像数据。首先，对照病理证实的甲状腺癌颈部转移淋巴结，在 CT 图像上找出对应淋巴结，通过卷积神经网络 (CNN) 对其进行图像分割，并提取形态特征、纹理特征和直方图统计特征等共 59 个特征。然后，应用特征选择方法，从中筛选出对淋巴结转移具有显著差异的特征。最后，使用逻辑回归模型进行预测建模，并评估其准确性和泛化能力。

结果：通过特征选择，我们选出了四个最优特征，包括角度二阶矩、熵、面积和方差。在测试集上，经过交叉验证和 ROC 曲线分析，逻辑回归模型在预测甲状腺癌颈部淋巴结转移方面的准确性为 88.2%，灵敏度为 84.0%，特异度为 92.4%，AUC 为 0.913。

结论：本研究证明了 CT 影像组学和深度学习技术可以用于预测甲状腺癌淋巴结转移情况。所提取的最优特征能够有效地区分有无淋巴结转移的甲状腺癌患者。逻辑回归模型具有较高的准确性和泛化能力，可以作为一种可靠的临床决策支持工具，帮助医生更好地制定治疗方案，提高治疗效果。未来，我们将进一步扩大样本量，完善算法性能，并开发基于 CT 影像组学和深度学习技术的自动化淋巴结转移预测系统。

基于 MRI 的鼻咽癌侵犯颈内动脉血管壁外膜的评估

王帆
南京明基医院

目的：本研究旨在探讨基于 MRI 的鼻咽癌侵犯颈内动脉血管壁外膜的评估方法，并提出了一种新的颈内动脉浸润评估标准。

方法：回顾性分析了 50 例经手术病理证实为鼻咽癌的患者，这些患者均接受过 MRI 扫描。根据 MRI 图像，对鼻咽癌浸润颈内动脉血管壁的情况进行分类和评估，并提出了一种新的颈内动脉浸润评估标准（共分为四个等级）。同时，还对其他常用的评估标准进行了比较和分析。

结果：通过对 MRI 图像的分析，50 例患者中有 12 例发现鼻咽癌侵犯颈内动脉血管壁外膜。在这些患者中，新提出的颈内动脉浸润评估标准能够更准确、更全面地评估鼻咽癌对颈内动脉血管壁的侵犯情况，并与其他评估标准相比具有更高的灵敏性和特异性。

结论：基于 MRI 的颈内动脉浸润评估标准可以更好地评估鼻咽癌对颈内动脉血管壁的侵犯情况，该评估标准具有更高的灵敏性和特异性，可以为患者提供更准确的诊断和治疗方案。这一研究结果

对于鼻咽癌的临床诊断和治疗具有重要意义, 并为进一步探讨颈内动脉浸润与预后的关系提供了基础。

PU-1882

基于多模态 CT 的血栓影像组学模型对急性缺血性脑卒中病因的预测价值

马雨竹

苏州大学附属第一医院

目的: 研究基于多模态 CT 的血栓影像组学模型对急性缺血性脑卒 (AIS) 病因的预测价值。

方法: 本研究纳入了苏州市第一附属医院 2020 年 1 月至 2023 年 6 月发病在 24h 内的 134 例 AIS 患者, 所有患者均在入院后进行了常规 CT 平扫 (NCCT) 及双能 CTA (DECT) 检查。将 DECT 图像后处理重建为 70ev 虚拟单能量图及碘覆盖图 (IOM)。分别由两名医师在 NCCT、70kev 及 IOM 图像上使用 3D slicer 进行血栓 ROI 的分割, 使用 PyRadiomics 进行影像特征的提取。先采用组间相关系数筛选出一致性较高的特征, 再采用最大相关最小冗余及最小绝对收缩与选择算子算法回归分析进行特征筛选, 最后用筛选出的特征构建影像组学评分模型。采用 ROC 曲线对模型的性能进行评估, 并采用 Delong 检验对两组模型的 ROC 曲线下面积 (AUC) 进行比较。

结果: 共构建 5 个模型: 基于 NCCT、70Kev 及 IOM 图像特征分别构建模型 1-3; 联合 NCCT、70Kev 图像特征建立模型 4; 联合 NCCT、IOM 图像特征建立模型 5; 其中联合模型展示出较好的预测价值, 模型 5 在训练集及测试集中的 AUC 均大于 0.75, 为所有模型中最高 (delong 检验, p 值 <0.05)。

结论: 基于多模态 CT 建立的血栓影像组学模型可以预测 AIS 的病因, 指导临床治疗及二级预防方案的选择。

PU-1883

探讨冠状动脉和颅颈动脉一站式联合 CT 血管造影对于疑似冠状动脉或颅颈动脉疾病的诊断价值

彭松、邓娇、郭睿、胡鹏志

中南大学湘雅三医院

目的: 探讨对于疑似冠状动脉疾病(CAD)或颅颈动脉疾病(CCAD)患者行一站式冠脉和颅颈动脉联合 CT 血管造影(CTA)作为首诊方法的潜在诊断价值, 并将其与冠脉和颅颈动脉分开连续两次 CTA 扫描的临床表现进行比较。

方法: 对疑似但未确诊的 CAD 或 CCAD 的 130 被试进行前瞻性入组, 随机分为 2 组, 每组各 65 名被试, 组 1 所有 65 名被试采用冠脉轴向 CTA 后颅颈动脉螺旋 CTA 的一站式联合扫描方案检查, 组 2 被试采用冠脉 CTA 加颅颈动脉 CTA 连续扫描方案, 其中 36 名怀疑 CAD 的被试先行冠脉 CTA 检查再行颅颈动脉 CTA 检查, 29 名怀疑 CCAD 的被试先行颅颈动脉 CTA 检查再行冠脉 CTA 检查, 组 2 连续扫描方案的扫描是根据症状确定的, 针对主要关注的区域, 而组 1 联合方案是以不歧视的方式一站式进行的。评估靶区和非靶区的诊断发现, 比较两组被试的客观图像质量、总扫描时间、辐射剂量、造影剂用量。

结果: 1、非靶区病变数量: 组 1 为 44/65(67.7%), 组 2 为 41/65(63.1%), 再次说明了扩大扫描覆盖范围的必要性。2、怀疑为 CCAD 的患者比怀疑为 CAD 的患者更容易发现非靶区病变(71.4% vs

61.7%)。3、与组 2 连续扫描方案相比,组 1 联合扫描方案扫描时间缩短 21.5% (~51.1 s),造影剂用量减少 21.8% (~20.8 mL),两组的扫描均能获得高质量图像。

结论:与两次单独检查相比,一站式联合 CTA 扫描方案能够以更低的扫描时间和更少的造影剂用量有效地发现非靶区病变,因此值得作为疑似 CAD 或 CCAD 患者的首选检查。

PU-1884

颞骨软骨肉瘤诊断及颞骨 CT、MR 重建技术的应用

张亚娟

西安市中心医院

摘要:目的 总结颞骨软骨肉瘤的 CT 及 MRI 表现,并探讨颞骨高分辨率 CT 平扫、多平面重组 MPR、曲面重组 CPR 技术对听小骨、面神经管破坏的诊断价值。方法 回顾性分析 2012 年-2022 年于我院就诊的 5 例颞骨软骨肉瘤患者的临床及影像学资料,总结其影像学表现特点,并通过 CT、MR 后处理技术分析病变对听小骨、面神经管的破坏情况。结果 5 例软骨肉瘤 CT 均呈溶骨性骨质破坏,并可见钙化,其中 1 例镫骨骨质吸收,3 例面神经管骨壁破坏;MRI 呈长 T1 长 T2 混杂信号,1 例呈蜂窝状改变,增强扫描呈不均匀、明显强化,局部呈花瓣状或蜂窝状。结论 对于颞骨软骨肉瘤的诊断,CT 可以很好地显示病变内钙化成分以及对颅底骨质的破坏情况,而 CT 后处理技术可以直观地显示听小骨、面神经管受累情况,MRI 则可以显示病变内软组织及黏液成分,病变范围更为明确。

PU-1885

基于双能量 CT 的改良 T1 分期预测声门型喉癌患者预后的研究

张焕磊

潍坊市益都中心医院

目的 基于双能 CT (DECT)图像特征构建声门型喉癌(GC)的改良 T1 (m-T1)分期,并探讨 m-T1 分期预测预后及辅助制定手术方式方面的价值。

方法 回顾性连续纳入 2015 年 1 月 1 日至 2018 年 12 月 31 日行 DECT 检查的 147 例 AJCC 第 8 版 T1 期 (8th-T1) GC 患者。随访截止日期为 2021 年 12 月 31 日。在 DECT100kVp 数据集上评估原发灶的长径、浸润深度、肿瘤体积(TV)和前连合侵袭(ACI)状态。以术后组织学病理为金标准,采用 McNemar 试验评价 DECT 诊断 ACI 状态的准确性。使用无复发生存期(RFS)差异显著的特征或特征组合来建立 m-T1 分期。log-rank 检验用于评价不同手术方式间 RFS 的差异。

结果 DECT 与金标准对 ACI 状态的诊断准确率差异无统计学意义($p=0.182$, Kappa 值= 0.859)。中位随访时间为 44 个月(3-81 个月)。根据随访结果将所有患者分为复发组和非复发组。基于 TV 联合 ACI 状态构建 m-T1 分期,m-T1 组(TV 联合 ACI 状态)的 RFS 差异较 8th -T1 组显著($p = 0.019$ vs. 0.492)。m-T1b 期患者的复发率显著高于 m-T1a 期,而 8th-T1 的两个亚分期期间的复发率无显著差异 (8th-T1a vs 8th-T1b, $p=0.803$)。在高危人群(m-T1b 期)中,非激光手术患者的 RFS 较非激光手术者更长。

结论 与 8th-T1 分期相比,基于原发灶的 TV 和 ACI 状态构建的 m-T1 分期能筛选出 RFS 较短的高危人群。对于复发风险高的患者,非激光手术可以明显改善 RFS。

PU-1886

基于能谱 CT 基物质图像组学特征预测模型鉴别腮腺常见肿瘤类型

宫志伟、王丽君
大连医科大学附属第一医院

目的:基于能谱 CT 平扫及增强图像重建碘基及水基图像,比较影像组学构建预测模型效能差异,探讨平扫、增强图像及其碘基、水基图像组学特征在腮腺常见肿瘤类型鉴别中的价值。

方法:搜集 2021 年 10 月-2023 年 2 月行能谱 CT 增强扫描且有明确病理诊断的腮腺肿物患者,共 88 例,其中良性 73 例(混合瘤 44 例、腺淋巴瘤 29 例),恶性 15 例。回顾性分析患者临床信息(年龄)以及平扫期,动脉期及静脉期影像,并重建各期碘基图、水基图。使用联影科研平台,于平扫及增强各期图像下手动逐层分割感兴趣区(ROI)并复制到相应的碘基、水基图像,尽量避开坏死囊变、钙化及血管影,得到感兴趣体积(VOI),提取影像组学特征,并纳入临床信息特征,通过 LASSO 算法筛选特征。采用五折交叉法验证,绝对值最大归一化预处理,通过随机森林(RF)建立预测模型并绘制受试者工作特征(ROC)曲线,计算训练集和测试集的曲线下面积(AUC)及灵敏度、特异度、准确率、精确率,分析并比较不同序列下预测模型的鉴别诊断效能。

结果:通过特征筛选,确定平扫期及其基物质序列共 9 个显著特征参数;动脉期及其基物质序列共 6 个显著特征参数;静脉期及其基物质序列共 8 个显著特征参数。绘制 ROC 曲线,计算常规平扫、碘基图、水基图训练集及测试集 AUC 分别为 0.952 和 0.904、0.945 和 0.884、0.971 和 0.962。动脉期、碘基图、水基图训练集及测试集 AUC 分别为 0.958 和 0.859、0.962 和 0.918、0.931 和 0.884。静脉期、碘基图、水基图训练集及测试集 AUC 分别为 0.96 和 0.912、0.965 和 0.897、0.98 和 0.912。水基图灵敏度、特异度、准确率、精确率(0.703、0.886、0.817、0.882)高于静脉期(0.686、0.864、0.786、0.863)。

结论:能谱 CT 基物质图像(特别是静脉期水基图),相较于常规平扫及增强图像,应用于组学特征机器学习建立随机森林预测模型,对于腮腺混合瘤,腺淋巴瘤及恶性肿瘤的鉴别具有更优的诊断效能。

“盐水袋”法在降低颈部 CT 射线束硬化伪影的价值

张盼
中国人民解放军联勤保障部队第 900 医院

目的 探讨在颈部两侧放置生理盐水袋(“盐水袋”法)对降低颈部 CT 射线束硬化伪影的价值。

方法 随机选取行颈部 CT 平扫+增强的患者 60 例,平均分为“盐水袋”组和对照组,“盐水袋”组采用盐水袋法进行颈部 CT 扫描,对照组进行常规 CT 扫描。由两名工作经验丰富的放射科医师对平扫、动脉期及静脉期图像质量进行主观评价,并测量两组图像的 CT 值、噪声标准差,计算信噪比(Signal to Noise Ratio, SNR)、对比噪声比(Contrast to Noise Ratio, CNR)以及射线束硬化伪影指数(Artifact Index, AI),比较两组图像质量的主观评价和客观评价结果。

结果 “盐水袋”组的主观评分及 AI 值均低于对照组,其中平扫及动脉期的主观评分及 AI 值差异均具有统计学意义($P<0.05$),静脉期的主观评分及 AI 值差异无统计学意义($P>0.05$)。

结论 “盐水袋”法能够降低颈部 CT 射线束硬化伪影,改善图像质量。

PU-1888

A Preliminary 4D Flow MRI Analysis of Blood Flow Characteristics in Cerebral Veins of Adults

Chihang Dai, Pengfei Zhao, Zhenchang Wang

Department of Radiology, Beijing Friendship Hospital, Capital Medical University

Objectives:

To evaluate blood flow characteristics in the cerebral veins of adults using 4-dimensional flow magnetic resonance (4D Flow MRI).

Materials and Methods:

A total of 65 volunteers prospectively underwent 4D Flow MRI and 12 volunteers underwent repeated scans during one month in a single center. Velocity, average blood flow rate ($Flow_{avg}$), and blood flow patterns of cerebral sinuses were evaluated for each volunteer. The mastoid emissary veins, posterior condylar emissary veins, and oblique occipital sinuses were also evaluated.

Results:

The mean age of volunteers was 36.31 ± 11.05 years old, including 3 (50.8%) females and 32 (49.2%) males. 4D Flow MRI data showed good reproducibility. The velocity and $Flow_{avg}$ of the superior sagittal sinus increased along the direction of flow and $Flow_{avg}$ near torcular herophili were 3.14 times that through the straight sinus. Slight fluctuations were found within a cardiac cycle. A vortex flow pattern was shown in 12.3% of torcular herophili, 7.5% of the transverse-sigmoid junction and 51.3% of jugular bulbs and was associated with increased blood flow velocity/rate in the upstream sinuses. Mastoid emissary veins, posterior condylar emissary veins and oblique occipital sinuses were all drained in the extracranial direction.

Conclusion:

Cerebral veins, including cerebral sinuses and emissary veins, could be measured visually and quantitatively in vivo by 4D Flow MRI. Cerebral veins' velocity varied with segments and showed slight fluctuations within a cardiac cycle. The analysis of cerebral blood flow in healthy volunteers lays the foundation for the study of cerebral venous system diseases.

多层螺旋 CT 定量分析在鉴别腮腺肿瘤的临床价值

花烨

南通大学附属医院

目的：探讨分析多层螺旋 CT 对腮腺良恶性病变的鉴别诊断价值。方法 回顾分析经病理证实的 42 例腮腺占位病变的 CT 影像学表现、CT 定量参数，包括病变的边界、大小、形态及 CT 值等。用两独立样本 t 检验及 Fisher 精确检验比较良恶性占位病变的差异，并用受试者工作特征(receiver operating characteristic, ROC)曲线评估诊断效能。结果：良性占位病变形态规整，边界较清，而恶性病变形态明显不规则，边界模糊、粘连不清晰，部分可见骨质破坏和颈部淋巴结及其他结构转移、侵犯。腮腺良恶性肿瘤最大径无明显统计学意义(2.60 ± 1.01 vs. 2.44 ± 1.19 cm, $P=0.88$)，但恶性病变体积明显大于良性病变(45.5 ± 20.6 vs. 27.6 ± 10.5 cc, $P<0.05$)。恶性病变平扫 CT 值与良性病变无明显统计学意义(40.2 ± 8.9 vs. 45.3 ± 8.1 Hu, $P=0.056$)，增强后 CT 值及 Δ CT 值均明显高于良性病变(70.9 ± 13.5 vs. 83.3 ± 11.8 Hu 及 25.5 ± 14.2 vs. 37.9 ± 13.3 Hu, $P<0.05$)。病变体积、增强后 CT 值及 Δ CT 值 ROC 曲线下面积(area under the curve, AUC)分别为 0.864、0.801 及 0.733。结论：多层螺旋 CT 可显示腮腺病变大小及其与邻近组织的关系等，定量 CT 参数对鉴别腮腺良恶性病变有重要参考价值。

阻塞性睡眠呼吸暂停低通气综合症动态 CT 检查方法及表现

唐文娟

华中科技大学同济医学院附属协和医院

目的：观察男性 OSAHS 患者软腭平面气道塌陷及舌后区上气道塌陷在动态 CT 上的检查方法及上下气道的影像学表现；

材料和方法：2020 年 3 月至 2023 年 6 月，收集以下症状的男性患者作为研究对象：日间嗜睡和疲惫，频繁打鼾，睡眠中呼吸暂停，经证实为阻塞性睡眠呼吸暂停低通气综合征。所有研究对象接受了清醒状态下平静呼吸时、Muller 动作下和反咬合动作下的上气道 CT 扫描。在正中矢状平面测量各项指标。并将这些测量指标与 OSAHS 严重程度进行相关性研究和轻中度 OSAHS 患者和重度 OSAHS 患者进行对比。

结果：共有 47 名 OSAHS 患者，重度组 36 名，轻中度组 11 名。全部患者都出现软腭平面的气道阻塞。与平静呼吸状态相比，Muller 动作时腭后区最小截面面积明显减小、软腭明显延长，差异有统计学意义。在重度和轻中度 OSAHS 患者组间，除了舌骨位置外，其他测量指标均无统计学差异。而各组患者腭后区最小截面面积塌陷度较大，Muller 动作下腭后区最小截面面积更小，颈围更大，差异有统计学意义。舌后区气道最小截面面积减小，差异有显著统计学意义，舌体长度和舌骨位置未见有统计学意义的变化。反咬合动作下的舌后区气道最小截面面积增大，颈棘到咽后壁水平距离增加，舌骨向前、向上移位，差异均有显著统计学意义；舌后区最小截面面积增加值与颈棘到咽后壁水平距离增加值有统计学意义上的相关性。与轻中度 OSAHS 组比较，重度 OSAHS 组患者舌骨位置较低，反咬合动作时舌骨与颈棘相对位置的变化及变化率较小，差别均有统计学意义；Muller 动作时舌骨位置和舌体长度的改变两组间差异无统计学意义。

结论：本研究应用动态 CT 三维成像技术模拟了 OSAHS 患者显示了 OSAHS 患者上气道软腭平面的动态变化。全部患者均存在软腭平面不同程度的阻塞，但软腭平面的变化程度与 OSAHS 严重程度未见明显相关性；重度组 OSAHS 患者比轻中度组 OSAHS 患者舌骨位置更低；

PU-1891

头颈部孤立性纤维瘤的 CT 及 MR 分析

耿宽

红河州第一人民医院

目的 探讨头颈部孤立性纤维瘤的 CT 及 MR 表现，提高影像诊断水平。方法 回顾性分析经手术病理证实的 11 例头颈部 SFT 的临床、病理及术前 CT、MR 资料。结果 11 例患者均为单发病灶，呈圆形、类圆形或椭圆形软组织肿块，边界清晰，CT 平扫呈等/稍低密度，密度多不均匀；3 例见多发囊变；1 例合并多发点状钙化；3 例肿瘤周围骨质出现压迫性改变；8 例动态增强，动脉期轻中度强化，静脉期及延迟期强化范围增加。结论：头颈部 SFT 的 CT 表现为边界清楚软组织肿块，动态增强“快速强化缓慢廓清”的强化模式，要考虑到盆腔 SFT 的可能。

双源 CT(DSCT)在颈部淋巴结结核诊断中的价值

陈冬冬、杨瑞、刘继伟
河南省胸科医院

目的:探讨双源 CT(DSCT)对颈部淋巴结结核的诊断价值。

方法:选取 45 例颈部淋巴结结核 DSCT 影像资料,记录病变分区、大小、密度、有无融合、强化方式等情况,进行综合分析。

结果:颈部淋巴结结核更易累及内颈链下组及锁骨上下区;多个淋巴结受累及常见,易融合成团,与邻近肌肉粘连,皮下脂肪层呈鱼网状改变,局部皮肤增厚或破溃;增强检查淋巴结多呈厚环强化;

结论:颈部淋巴结结核有其优势的解剖分布和影像学特征,DSCT 平扫+增强显示颈部淋巴结结核病变分区、强化方式及其与周围结构的关系,为颈部淋巴结结核与颈部其他常见肿块的鉴别诊断提供有价值信息。

PU-1893

西门子双源 CT 在鉴别颅内出血与碘造影剂上的应用

刘海玲、任闻闻、曹修祥、丁雪、巩庆雷
中国人民解放军联勤保障部队第 960 医院

西门子双源 CT 在鉴别颅内出血与碘造影剂上的应用

刘海玲;任闻闻;曹修祥;丁雪;巩庆雷

中国人民解放军联勤保障部队第九六〇医院

目的:

使用西门子双源 CT 鉴别颅内出血与造影剂渗出,帮助及指导临床处理造影术后意识障碍患者的后期治疗方向及药物的使用。颅脑血管、心脏血管、腹主动脉、双侧髂动脉血管取栓、静脉滤过器的放置等等各类 DSA 造影检查及治疗的手术,都要用到造影剂,而造影剂外渗是确实存在的现象,CT 平扫下,脑内出血及造影剂外渗均表现出高密度影像,两者的鉴别直接影响了后期的治疗,西门子双源 CT 就解决了这一难题。

方法:

使用西门子 SIEMENS Healthineers SOMATOM Force 256 排双源螺旋 CT 对颅脑进行检查。

扫描:

双能量扫描,采用两套球管进行扫描,其高 Kv150,低 Kv80,使用西门子的 syngo.via 工作站,选择应用程序配置文件中的脑出血处理软件进行处理,得到 VNC 图、IOM 图、VMI 图。

结果:

后处理:虚拟平扫(virtual non-contrast imaging, VNC)是在物质分离过程中去除碘而得到的图像,DECT 的 VNC 图像质量与传统平扫图像在肉眼上无差别。碘图(iodine overlay map, IOM)是在物质分离中突出碘剂的图像,可突出显示碘含量及碘分布情况。虚拟单能量成像(virtual monochromatic imaging, VMI)是利用两种不同的多色能谱了解组织的射线衰减特性,并在多个模拟能级上创建虚拟单色图像。由 DECT 合成的高能级 VMI 可以减少光束硬化伪影,低能级 VMI 可以提高图像分辨率。

结论:

图像判断标准:仅有 VNC 图像上存在高密度灶时为出血;仅有碘图图像上存在高密度灶时为对比剂外渗;而 VNC 和碘图图像上均可见高密度灶时则为出血合并对比剂。常规 CT 无法区分脑出血与造影剂,常采用时间延迟法行当日及次日、48 小时甚至更长时间后多次扫描以区分造影剂代谢或者

出血灶的吸收,由此失去了患者治疗的黄金时期。因此双能量 CT 对鉴别诊断各类 DSA 血管内治疗后脑内出血与碘对比剂外渗意义更加重大。

PU-1894

低管电压联合全模型迭代重建技术对急诊颅脑 CT 图像质量和病灶显示的影响研究

孙宁达
吉林大学第一医院

目的:在设备、扫描条件和参数均一致的前提下,比较 80、100 和 120kVp 管电压结合全模型迭代重建 IMR 对急诊颅脑 CT 图像质量和病灶显示的影响。

方法:收集符合入组条件的行急诊颅脑 CT 检查的患者 30 例,其中分为低、中、高剂量组,每组各 10 人。低、中、高剂量组分别采用管电压为 80、100、120kVp,其余扫描条件及重建参数相同。对 IMR-1 层厚为 1.5mm 的重建图像进行客观测量以及主观评价。客观评价:比较低剂量组、中剂量组和高剂量组之间颅骨、血管、脑组织、脑室的 CT 值、噪声、信噪比、对比噪声比以及脂肪密度分辨率。主观评价:针对三组图像的噪声、组织分层及细小结构的显示、整体图像质量以及对脑梗死、蛛网膜下腔出血等疾病的诊断可用性进行主观评分。记录计算机自动生成的剂量长度乘积和容积 CT 剂量指数,计算患者接受的辐射剂量用有效辐射剂量表示。

结果:低、中、高剂量患者在性别、年龄以及体重指数方面的差异均无统计学差异($P>0.05$)。低、中、高剂量组接受的有效辐射剂量分别为 $10.55\pm 2.8\text{m Sv}$ 、 $14.5\pm 2.1\text{m Sv}$ 、 $17.65\pm 1.47\text{m Sv}$,三组患者所接受的 ED 差异具有统计学差异($T=6.015, P<0.05$)。在低、中剂量扫描下头部各组织的 CT 值较高剂量组随着管电压的降低而逐渐增加,且三组间及两两比较差异均具有统计学意义($P<0.05$)。低、中剂量组各部分测得的噪声、信噪比和对比噪声比数值均高于高剂量组,具有统计学意义($P<0.05$)。与高剂量组相比,低、中剂量组计算得到的脂肪密度分辨率降低,但三组间及两两比较差异没有统计学意义($Z=-1.45, P=0.185$)。三组之间图像噪声及整体图像质量的主观评分差异具有统计学意义($P<0.05$),对三组图像的噪声、组织分层及细小结构的显示、整体图像质量以及对疾病诊断可用性的主观评分差异无统计学意义($P>0.05$)。

结论:低管电压联合 IMR 技术可以减少辐射剂量,虽然低、中、高剂量组的图像质量都可满足诊断需求,对疾病的诊断信心没有影响,但低剂量组的图像噪声、颗粒感加重。总体而言,低管电压联合 IMR 技术在临床上具有较强可用性。

PU-1895

头颈部炎性肌纤维母细胞肿瘤的 CT 及 MR 影像学特征分

王灿
上海交通大学医学院附属第九人民医院

目的:探讨头颈部炎性肌纤维母细胞肿瘤 (Inflammatory myofibroblastic tumor, IMT) 的 CT 及 MR 影像学特征,以提高该肿瘤的术前正确诊断。方法:回顾性收集 2012 年 1 月至 2018 年 12 月上海交通大学医学院附属第九人民医院初诊并经术后病理证实的 29 例头颈部 IMT 患者,分析患者术前 CT 及 MRI 影像学表现。结果:29 例头颈部 IMT 患者中,67.0% (20/29) 的患者术前被误诊为恶性肿瘤。头颈部 IMT 的影像表现多样,局限性软组织内肿块 7 例,软组织肿块伴临近骨质破坏 12 例 (颞下窝 5 例,上颌窦 6 例,颌面部广泛软组织病变 1 例),骨内肿块 10 例 (上颌骨 5 例,下颌骨 4 例,颞骨 1 例)。89.7% (26/29) 病灶边界不清楚;75.9% (22/29) 病灶有骨质破坏,34.5% (10/29) 病灶骨质破坏与骨质增生硬化并存。8 例患者沿神经孔道侵犯邻近结构 (6 例发生

在颞下窝, 其中 4 例侵犯翼腭窝, 沿圆孔、卵圆孔累及颅内, 2 例侵犯眶尖视神经管; 2 例发生在下颌骨, 侵犯下颌神经管)。头颈部 IMT 在 CT 平扫时呈等或稍低密度, 均未见钙化, 增强扫描呈中度至明显强化。在 MR 上, 9 例呈 T1WI 等或稍低信号; 7 例呈 T2WI 低信号; 9 例呈 DWI 高信号, ADC 值约 $0.6-1.0 \times 10^{-3} \text{mm}^2/\text{s}$ 。TIC 曲线 I 型 7 例, II 型 2 例。均未出现颈淋巴结及远处转移。结论: 头颈部炎性肌纤维母细胞瘤的影像学特征与恶性肿瘤相近, 但头颈部炎性肌纤维母细胞肿瘤骨质破坏的同时伴有骨质增生硬化, T2WI 低信号, TIC 曲线以 I 型为主, 极少颈淋巴结及远处转移, 结合 CT、MRI 及功能学检查可以在一定程度上反映病灶的组织构成, 对术前的正确诊断提供重要依据, 以指导临床治疗

PU-1896

Dixon 定量技术在 TMD 髁突骨关节病中的诊断价值

柳庆华^{1,2}、王鹏²、李建波²

1. 昆明市第三人民医院

2. 云南大学附属医院 (云南省第二人民医院、云南省眼科医院)

目的 Dixon 定量 MRI 技术通过化学位移分析分离脂肪和水, 实现直接脂肪定量, 可以检测到肉眼无法观察到的微妙脂肪变化。基于 Dixon 的方法采集时间短、敏感度低, 非常适合于头部成像, 近年来已得到初步应用。有文献显示, 基于 Dixon 序列对腰椎骨质具有较好的图像质量, Dixon 技术还可发现早期腰椎退变患者骨质脂肪分数高于健康人群, 提示基于 Dixon 的技术也有潜力用于髁突骨髓信号的评估。且基于 Dixon 技术的研究方法在髁突的评价中至今鲜有报道。探讨 3.0T 磁共振 T1 DIXON 定量技术在颞颌关节功能紊乱 (temporomandibular disorders, TMD) 髁突骨关节病中的诊断价值。方法 回顾性分析 20 例 TMD 髁突骨关节病患者及 20 例正常颞颌关节的髁突 MRI T1 DIXON 脂像, 测定并分析脂肪分数 (Fat Fraction, FF) 图像在 TMD 髁突骨关节病中的诊断效能; 比较正常颞颌关节髁突与骨关节病髁突 FF 值的差异, 使用独立样本 t 检验分析是否有统计学差异, 应用 ROC 曲线评估 FF 值的诊断效能。结果 TMD 髁突骨关节病的 FF 值明显低于正常髁突 ($t = -2.713$, $P < 0.05$), 其中 ROC 曲线下面积为 0.987, 截断值为 9.87%。结论 磁共振 T1 DIXON 能够定量测定 TMD 髁突骨关节病的脂肪含量, 对颞颌关节功能紊乱的髁突骨关节病诊断具有较高的诊断效能。

PU-1897

蝶窦气化停滞的影像学表现

张洪春

中国科学技术大学附属第一医院 (安徽省立医院)

目的 探讨蝶窦气化停滞的 CT 及 MRI 影像学表现。方法 回顾性分析 20 例蝶窦气化停滞病例的 CT 及 MRI 表现。结果 20 例病例中, 男性及女性各 10 例, 年龄 34~81 岁, 平均为 59 ± 12.8 岁, 变异位于蝶骨体左侧者 11 例, 位于蝶骨体右侧者 4 例, 位于蝶骨体后部者 1 例, 蝶骨体左右两侧及中部均存在者 2 例, 蝶骨体后部及左下部者 1 例, 还有 1 例位于蝶骨体后部、右侧部及右侧蝶骨大翼、翼突。CT 图像上所有病例均含脂肪密度灶及卷曲样钙化灶, 变异周边有硬化边, 变异无占位效应, 邻近颅底孔道无变窄, 邻近骨质无破坏。MRI 图像上变异呈短 T1、长 T2 信号, 压脂序列呈低信号, 无弥散受限, 增强无强化, 变异边界清晰。结论 蝶窦气化停滞是一种容易被误诊的正常变异, 具有典型的 CT 及 MRI 表现。

PU-1898

种植螺丝固体桥边缘骨水平变化：一项前瞻性的初步研究

樊林峰、张楚南

上海交通大学医学院附属第九人民医院

背景：种植螺丝固定桥能减少粘接剂的刺激，且更利于戴牙完成后的维护，一直是种植修复的首选。目前为止，螺丝固位桥基台的选择并没有统一标准，而结合使用非抗旋基台是实现螺丝固体桥的一种修复方式，但临床研究较少。

目的：确定结合非抗旋基台的种植螺丝固位桥的稳定性和边缘骨水平变化，所有种植体都是同一品牌（Nobel Biocare），且都在种植三个月后负载。

材料和方法：共 38 枚种植体（SIC implant，瑞士）植入 19 名患者的后牙区，每位患者 2 枚植体，修复 2-3 个牙位。植入后三个月取模，制做 2 或 3 单元种植固定桥。基台的选择为 1 枚传统抗旋基台结合 1 枚非抗旋基台制做螺丝固位桥，不同基台在牙位的分布随机选择。负载时拍摄平行投照根尖片记录边缘骨水平的基线值，负载一年后再次拍摄平行投照根尖片并之前的比较，并记录修复体是否松动。之后通过已知的种植体长度使用 ImageJ 校正后测量 MBL（marginal bone loss）的变化。

结果：所有种植体都成功负载，负载一年后没有种植体失败且修复体稳定性良好。每个种植固定桥中 MBL 变化抗旋基台和非抗旋基台分别为 $-0.18\pm0.27\text{mm}$ 和 $-0.24\pm0.27\text{mm}$ ，这在统计学上并不显著（ $p>0.05$ ）。

结论：结合非抗旋基台的种植螺丝固定 2-3 单元桥的稳定性和 MBL 变化在种植负载的第一年是临床可接受的范围。

PU-1899

Case report : Embryonal rhabdomyosarcoma: clinical experience and literature review

Jiaqi Cui,Tijiang Zhang

AFFILIATED HOSPITAL OF ZUNYI MEDICAL UNIVERSITY

Abstract Content:**Background**

Rhabdomyosarcoma (RMS) is a rare and highly malignant tumor that originates from myogenic progenitor cells, and it is the most common soft tissue sarcoma in children, accounting for 2% to 5% of all soft tissue sarcomas. The World Health Organization classifies it into 4 types, with embryonic being the most common subtype, accounting for about 80% to 90%. ERMS exhibits high malignancy, strong invasion and rapid spread with clinical manifestations varying depending on its location within the body; commonly found sites include the head and neck region, urogenital tract, pelvic retroperitoneum, and occasionally limbs. Due to its high soft tissue resolution, MRI can observe tumor boundaries and enhancement features from different directions, and it is commonly used as an aid in diagnosis.

Case report

A 31-year-old female patient was admitted to the hospital due to a history of dizziness and headache lasting for 7 months, as well as decreased vision in her left eye for 10 days. Brain MRI revealed a lobed mass measuring approximately 57×50×40mm located at the bottom of the anterior cranial fossa. The mass exhibited slightly long T1T2 signal with clear boundaries and uniform signals. The bone signal of the local cranial plate was discontinuous, and it burst down into the sinus. Based on clinical presentation and imaging findings, an initial diagnosis of anterior

fossa floor meningioma was made by clinicians. ERMS was confirmed by pathological examination after operation.

Conclusion

In summary, the incidence of RMS is low, especially in adults. Its clinical manifestations are complex and diverse, and the lack of specificity is easy to lead to missed diagnosis and misdiagnosis. And its malignant degree is high, early hematogenous and lymphatic metastasis. Therefore, early diagnosis is crucial.

Key words: Embryonal rhabdomyosarcoma; Magnetic Resonance Imaging; Adult

鼻窦未分化癌影像表现一例并文献复习

顾腾辉、钱伟军、李立
开封市中心医院

【摘要】 本文报道鼻窦未分化癌 1 例，患者男、54 岁。间断性头痛两月余，再发加重伴反应迟钝 1 天，1 天前头痛再发加重，伴反应迟钝，精神差，睡眠增多，伴交流困难。头颅 CT 示额区颅内板下团块影，宽基底，跨前纵裂生长，其内及周边见多发斑片状密度增高影，CT 值约 52-67HU，病变周围见大片状、伸指样水肿区，邻近脑沟裂变浅，展平，双侧脑室前角受压、变形。MRI 检查示额区颅内板下方见不规则团片状混杂 T1 混杂等、长 T2 信号影，边界欠清，部分向下突入邻近筛窦，病变与邻近脑实质分界不清、呈明显受压改变，DWI 呈混杂稍高信号及明显高信号影，周围见大片状长 T2 信号水肿带。增强后病灶呈明显不均匀强化，邻近硬脑膜增厚，呈条形强化，病变包绕邻近上矢状窦，相应上矢状窦显示不清。病理诊断：鼻窦未分化癌。

PU-1901

Sinonasal undifferentiated carcinoma with intraparenchymal haemorrhage

Tenghui Gu, Weijun Qian, Li Li
Kaifeng Central Hospital

Sinonasal undifferentiated carcinoma (SNUC) is an aggressive and rare cancer of the sinonasal tract and is often characterized by intracranial invasion. However, SNUC rarely with presents focal cerebral haemorrhage. In this paper, we present a case of focal cerebral haemorrhage and invasion of the anterior cranial fossa by an SNUC. A 54-year-old man presented to our hospital with a two-month history of intermittent headache, recurrent aggravation with unresponsiveness for 1 day, accompanied by slow response, poor spirits, increased sleep, and communication difficulties. Imaging studies showed a neoplasm of the ethmoid sinus with extension into the anterior cranial fossa. This lesion was aggressive with enhancement and mass effects. Intraparenchymal haemorrhage could be seen on the frontal lobes. The patient underwent resection of the carcinoma and began chemoradiotherapy. The pathological diagnosis was undifferentiated carcinoma of the sinuses. This case shows that SNUC is very aggressive and easily invades into the skull, causing focal haemorrhage in the brain parenchyma. Understanding these imaging features is more helpful for the diagnosis of undifferentiated sinus carcinoma.

Study in intracranial hemodynamic assessment based on four dimensional flow MRI (4D flow MRI) after implantation of blood flow diverter

Jiyun Zhang¹, Ying Shi²

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Objective: To investigate the feasibility and clinical significance of applying four-dimensional flow magnetic resonance imaging (4D flow MRI) technology for the assessment of post-implantation blood flow in flow diverter (FD) devices.

Methods: A retrospective analysis was conducted on eight patients who underwent flow diverter (FD) implantation procedures at our Stroke Center between January 2021 and May 2023. Prior to the procedures, all patients were confirmed to have significant unilateral stenosis of the middle cerebral artery through digital subtraction angiography (DSA), accompanied by distinct clinical symptoms. Original data for eight patients, including eight diseased vessels and their corresponding normal vessels on the contralateral side, were collected. These data included parameters such as arterial wall cross-sectional area, the extent of stenosis at the lesion site, plaque characteristics, and collateral circulation formation. Computational fluid dynamics (CFD) was utilized to calculate various hemodynamic parameters, such as through-plane velocity at the lesion site, maximum through-plane velocity, average velocity, maximum velocity, and average and maximum instantaneous blood flow rates.

Subsequently, 16 vessels were analyzed, comprising the eight diseased vessels and their corresponding normal vessels on the contralateral side from all eight patients. These vessels underwent magnetic resonance vascular imaging and 4D flow MRI processing, yielding velocity vector fields, streamlines, shear rates, wall shear stress, oscillatory shear index, and three-dimensional blood flow pathlines for the eight diseased vessels. Blood flow velocity at the lesion site was extracted, and the normalized root mean square error (NRMSE) and linear correlation coefficient (R²) were computed to compare the two methods.

One month following FD implantation, the eight patients underwent follow-up DSA examinations and 4D flow MRI assessments. Hemodynamic parameters were compared with preoperative data using paired t-tests and intergroup Chi-squared tests. Ultimately, comparative results between preoperative and postoperative 4D Flow MRI and CFD were obtained.

Results: Comparative analysis between 4D Flow MRI and CFD revealed similar flow patterns at the lesion site, with good agreement in average blood flow velocity within the diseased vessels. Prior to FD implantation, alterations in blood flow patterns were consistent with the measurements obtained from 4D Flow MRI and the calculations from CFD, indicating concurrence between the two methods.

Conclusion: There is a strong consistency between the measurements obtained from 4D Flow MRI and the calculations from CFD. 4D Flow MRI offers a comprehensive assessment of hemodynamics and, being non-invasive, provides more precise data. It can be valuable in the evaluation of FD implantation and holds significant clinical utility.

PU-1903

Development and validation of a prediction nomogram based on clinical and CT features for facial canal dehiscence in patients with cholesteatoma

Xiaoxue Fan, Changwei Ding, Yang Hou, Zhaoyu Liu
Shengjing Hospital of China Medical University

Purpose: To develop and validate a risk-prediction model for facial canal dehiscence (FCD) in patients with cholesteatoma.

Material and Methods: The primary cohort retrospectively enrolled patients who underwent high-resolution computed tomography on admission and subsequently underwent otologic surgery with a pathologically confirmed diagnosis of cholesteatoma. In a 7:3 ratio, the patients were randomly assigned to a training set ($n = 135$) and an internal test set ($n = 51$). An additional independent validation cohort contained 130 consecutive patients. A logistic regression analysis of the training cohort was conducted to identify clinical and CT-based risk factors for FCD. The prediction model derived from these risk factors was then validated in the internal test and independent validation sets using receiver operating characteristic analysis and calibration curves.

Results: Predictors contained in the individualized prediction model included stapes destruction, involvement of the mastoid process, lateral semicircular canal defect, and low-lying tegmen, which were significantly associated with FCD and were incorporated into the scoring system. The optimal cutoff value of the risk-prediction score was set at 2 points. The areas under the curve of the receiver operating characteristic curve in the training and internal test cohorts were 0.919 (95% confidence interval [CI]: 0.859–0.959) and 0.902 (95% CI: 0.786–0.968), respectively. Application of the risk-prediction score in the independent validation cohort still provided good discrimination (C-index, 0.927 [95% CI, 0.868–0.965]) and good calibration.

Conclusion: This risk-prediction model may aid clinicians in identifying cholesteatoma patients with FCD at decreased risk for intraoperative facial nerve injury.

四维血流磁共振成像（4D flow MRI）技术在颅内脑动静脉畸形血流动力学研究

张冀云¹、石潞²

1. 昆明市第一人民医院
2. 昆明医科大学第一附属医院

目的 探索四维血流磁共振成像（4D flow MRI）技术在颅内脑动静脉畸形(arteriovenous malformations, AVM)的血流评估中应用的可行性及临床价值。

方法 回顾分析 2022 年 1 月至 2023 年 7 月于我院脑卒中中心经 DSA 证实单侧颅内动静脉畸形且临床症状明显的 14 例患者，得到 14 例患者 14 个病灶的血管情况及对侧正常血管的原始数据（畸形血管团大小、供血动脉管壁横截面积、引流静脉血管管径、侧枝循环形成情况）并通过计算流体力学(computational fluid dynamics, CFD)得到血流动力学参数（通过病变部位平面速度/最大通过平面速度、平均速度、最大速度、平均及最大瞬时血流量）。14 位患者 14 个病灶血管及对侧正常血管均再次行磁共振血管成像及 4D flow MRI 技术处理，最终得到血管速度矢量场、流线、剪切速率、壁面剪切应力，振荡剪切指数，根据流速计算并显示病变血管的三维血液流动迹线(Pathline)；提取病变部位血流速度并计算两者之间的归一化均方根误差(normalized root mean square error, NRMSE)和线性相关系数(R2)；最后比较供血动脉速度分布图与对侧正常血管流速分布图差异，探讨 AVM 出血的血流动力学因素。

结果 4D Flow MRI 和 CFD 对比结果显示,血液在病变部位的流动状态相似;病灶供血动脉剪切速率、壁面剪切应力越高,AVM 病灶越容易出血。

结论 4D Flow MRI 的测量结果和 CFD 的计算结果之间具有较好的一致性,4D Flow MRI 可全面评估颅内 AVM 血流动力学,且为无创检查,能够提供更多精确数据,指导临床手术方式,有较高临床应用价值。

深度学习图像重建结合去金属伪影技术在口腔金属植入物患者颈动脉能谱 CTA 图像的应用

宋建、李小虎、李云成、汪军、束鸿敏
安徽医科大学第一附属医院

目的 探讨深度学习图像重建 (DLIR) 结合去金属伪影 (MAR) 技术 (DLIR-MAR) 对口腔金属植入物患者颈动脉能谱 CTA (DECTA) 图像的影响。方法 前瞻性收集 30 例行颈动脉 DECTA 检查的口腔金属植入物患者纳入研究。在 50keV 下重建 DLIR-MAR、DLIR 和基于多模型的自适应统计迭代重组 (ASIR-V) 结合 MAR (ASIR-MAR) 图像。在轴位图像上测量金属伪影最严重的颈内动脉 (ICA)、同侧未受金属伪影影响的 ICA 及该层面颈部肌肉的 CT 值和噪声 (SD), 计算信噪比 (SNR)、对比度噪声比 (CNR) 和伪影指数 (AI)。两名放射科医生使用 Likert 5 分制法对受金属伪影影响的 ICA 进行血管可视化评分,并评估整体图像质量。通过 One-Way Repeated Measures ANOVA 检验和 Friedman 检验比较 DLIR-MAR、DLIR 和 ASIR-MAR 之间的定量和定性参数的差异。结果 与 ASIR-MAR 相比,DLIR-MAR 的图像噪声均降低 ($P<0.001$), SNR、CNR 均增加 ($P<0.001$), 同时获得了更高的整体图像质量 ($P<0.05$)。在金属伪影方面,与 DLIR 相比,DLIR-MAR 的 AI 显著降低 ($P<0.001$), 血管可视化评分更高 ($P<0.001$)。而 ASIR-MAR 与 DLIR-MAR 的 AI 和血管可视化评分无显著差异 ($P>0.05$)。结论 DLIR 结合 MAR 技术在口腔金属植入物患者中提供了更好的颈动脉 DECTA 图像,在 50keV 的重建中提高图像质量的同时兼顾伪影去除效果。

甲状腺结节钙化在 CT 诊断甲状腺癌中的应用有效性

杨一帆
空军军医大学西京医院

目的:分析甲状腺结节钙化在 CT 诊断甲状腺癌患者中的临床作用.方法:选取自 2019 年 6 月—2021 年 3 月于本院接收治疗的甲状腺结节患者 100 例作为研究对象,并将甲状腺恶性结节患者作为观察组,将甲状腺良性结节患者作为对照组,对所有患者均采用 CT 检查,分析其甲状腺钙化情况,并观察患者 CT 检查的影像学表现.结果:观察组患者单发结节明显高于对照组,多发结节明显低于对照组,对比差异明显($P<0.05$);观察组患者微钙化结节以及单发钙化结节明显高于对照组,粗钙化结节明显低于对照组患者,对比差异明显($P<0.05$);CT 诊断下良性结节患者主要表现为圆形、椭圆形、边界清除、包膜完整、内部低回声、增强回声,恶性结节主要表现为微小钙化、边缘不规则、纵横比 >1 等.结论:在甲状腺结节患者的诊断中,甲状腺结节钙化程度与甲状腺癌患者有一定的关联

Clinical characteristics and imaging findings of EBV-positive inflammatory pseudotumor-like follicular dendritic cell sarcoma: A case report and literature review

Lifang Liao^{1,2}, huijun zhao^{1,3}, yong Liu^{1,4}

1. Southwest Medical University

2. Department of Radiology, The 3rd Affiliated Hospital of Chengdu Medical College & Pidu District People's Hospital, Chengdu 611730, China

3. the third hospital of mianyang

4. Department of Magnetic Resonance Imaging, Affiliated Chinese Traditional Medicine Hospital, Southwest Medical University, Luzhou, China

EBV-positive inflammatory pseudotumor-like follicular dendritic cell sarcoma (IPT-like FDSC) is a rarely encountered tumor originated from the proliferation of follicular dendritic cells. It is a distinct subtype of FDSC, involving lymph nodes and/or extra-nodal sites, that is overwhelmingly associated with Epstein-Barr virus infection. As a result of low specificity and understanding in clinicopathologic and imaging manifestations, its preoperative diagnostic rate is always low. The present study reported the ultrasound, CT, PET-CT and clinicopathologic features of a patient with IPT-like FDSC at both lymph nodes and extra-nodal sites, and then made a literature review about its clinic and imaging features, and clinicopathologic findings so far, aiming to provide radiologists and surgeons with a broader understanding of this disease.

一站式 CTA 联合 CTP 扫描在急性脑梗死患者临床诊疗中的应用价值分析

张博源

空军军医大学西京医院

摘要 目的 探讨一站式 CT 血管成像 (CTA) 联合 CT 灌注成像 (CTP) 扫描在急性脑梗死患者临床诊疗中的应用价值。方法 选取 2020 年 8 月~2021 年 8 月期间医院收治的急性脑梗死患者 63 例, 均进行一站式 CTA 联合 CTP 扫描检查, 分析患者梗死区、缺血半暗带区以及相应对侧区 CTP 检查参数, 并分析患者血管狭窄程度与灌注异常以及侧支循环形成的关系。结果 63 例急性脑梗死患者 CTP 检查均发现脑血流灌注异常, 梗死区患侧 CBF、CBV 显著低于对侧区 ($P<0.05$), TTP 较对侧区无限延迟; 缺血半暗带区患侧 CBF 显著低于对侧区 ($P<0.05$), TTP 显著高于对侧区 ($P<0.05$), CBV 与对侧区比较差异无统计学意义 ($P>0.05$)。63 例急性脑梗死患者中, 轻度、中度、重度狭窄以及闭塞患者分别为 31 例、24 例、6 例和 2 例, 其中 22 例侧支循环形成, 且随着血管狭窄程度的加重, 有梗死区、缺血半暗带区以及侧支循环形成的患者比例逐渐增多 ($P<0.05$)。结论 CTP 检查能够快速、准确地区分梗死区和缺血半暗带区, CTA 可对供血动脉狭窄程度及闭塞情况进行评估, 一站式 CTA 联合 CTP 扫描在急性脑梗死患者临床诊疗中具有重要的指导价值。

一例磁共振高分辨血管壁成像检查在颅内夹层动脉瘤中的应用

杨景云、赵得荣、苏艳
保山市人民医院

颅内夹层动脉瘤相对少见，其诊断仍需更多认识。磁共振高分辨血管壁成像检查（HR-VWI）是最近较新的一种血管壁成像检查方式，对于血管壁的显示更为清晰并且可以评估动脉瘤的稳定性。作者报道了 1 例磁共振高分辨血管壁成像检查的夹层动脉瘤病例，复习了国内外相关文献，探讨了颅内夹层动脉瘤在磁共振高分辨血管壁成像中的影像学表现和临床应用，以提高临床医师对该疾病的认识。

T1 and T2 Mapping for Identifying Malignant Lymph Nodes in Head and Neck Squamous Cell Carcinoma

Jiangming Qu, Boju Pan, Tong Su, Yu Chen, Tao Zhang, Xingming Chen, Xiaoli Zhu, Zhentan Xu, Tianjiao Wang, Zhuhua Zhang, Zhengyu Jin
Peking Union Medical College Hospital, Chinese Academy of Medical Sciences

Background: This study seeks to assess the utility of T1 and T2 mapping in distinguishing metastatic lymph nodes from reactive lymphadenopathy in patients with head and neck squamous cell carcinoma (HNSCC), using diffusion-weighted imaging (DWI) as a comparison.

Methods: Between July 2017 and November 2019, 46 HNSCC patients underwent neck MRI inclusive of T1 and T2 mapping and DWI. Quantitative measurements derived from preoperative T1 and T2 mapping and DWI of metastatic and non-metastatic lymph nodes were compared using independent samples t-test or Mann-Whitney U test. Receiver operating characteristic curves and the DeLong test were employed to determine the most effective diagnostic methodology.

Results: We examined a total of 122 lymph nodes, 45 (36.9%) of which were metastatic proven by pathology. Mean T2 values for metastatic lymph nodes were significantly lower than those for benign lymph nodes ($P < 0.001$). Conversely, metastatic lymph nodes exhibited significantly higher apparent diffusion coefficient (ADC) and standard deviation of T1 values (T1SD) ($P < 0.001$). T2 generated a significantly higher area under the curve (AUC) of 0.890 (0.826-0.954) compared to T1SD (0.711 [0.613–0.809]) and ADC (0.660 [0.562–0.758]) ($P = 0.007$ and $P < 0.001$). Combining T2, T1SD, ADC, and lymph node size did not significantly enhance diagnostic performance over using T2 alone ($P = 0.089$).

Conclusions: The application of T1 and T2 mapping is feasible in differentiating metastatic from non-metastatic lymph nodes in HNSCC and can improve diagnostic efficacy compared to DWI.

PU-1912

同时多层采集技术在鼻咽癌 MR 高清扩散峰度成像中的初步研究

刘骏、朱娟、杨擎、汪飞
安庆市立医院

目的 探讨同时多层弥散技术 (SMS) 对鼻咽癌磁共振基于分段读出技术弥散峰度 (RESOLVE-DKI) 成像的价值。**方法** 前瞻性收集头颈部肿瘤 30 例, 所有患者均于治疗前行磁共振常规序列、加速因子为 2 的 SMS 和不加 SMS 的 RESOLVE-DKI 序列, 后处理得到两种序列 RESOLVE-DKI 定量参数: 表观扩散系数 (ADC)、平均峰度系数 (MK)、平均扩散系数 (MD), 并对两种序列参数进行 Bland-Altman 分析、相关性分析; 同时对 2 组图像进行包括整体图像质量、病变的明显度、病变的几何变形和图像伪影在内的主观图像质量评价, 并客观评价图像的信噪比 (SNR) 及对比噪声比 (CNR)。**结果** 分析 30 例鼻咽癌原发灶及 8 例咽旁转移淋巴结, 结果显示与 RESOLVE-DKI 相比, SMS-RESOLVE-DKI 可显著缩短扫描时间 (扫描时间分别为 5 分 23 秒和 2 分 54 秒), 两种序列所得扫描定量参数间具有良好的一致性 & 显著线性正相关 (ADC、MD 及 MK 的相关系数分别为 0.912、0.918、0.921, P 值均 < 0.001), 两种序列的整体图像质量、病变的明显度、病变的几何变形、图像伪影、SNR 及 CNR 间的差异无统计学意义。**结论** 相较于传统的 RESOLVE-DKI, SMS 技术能够显著缩短鼻咽癌 RESOLVE-DKI 成像时间, 并提供稳定的定量参数和良好图像质量, 具有良好的应用前景。

SMARCA4(BRG1)缺失型未分化癌颅底侵犯 CT 及 MR 表现: 附 2 例报告及文献复习

朱洪基、刘影
中国科学技术大学附属第一医院 (安徽省立医院)

摘要: **目的** 探讨 SMARCA4(BRG1)缺失型未分化癌颅底侵犯的影像学表现。**方法** 收集中国科学技术大学附属第一医院 2021—2023 年经病理证实的 SMARCA4(BRG1)未分化癌颅底侵犯 2 例, 分析其临床特点及 CT、MR 影像学表现。**结果** 2 例均为男性, 并有吸烟史。1 例患者 34 岁, “左侧鼻腔间歇性出血 1 月”入院, 体格检查: 左侧鼻腔见大团新生物, 新生物拖至右侧后鼻孔, 左侧眼球活动受限, 影像学提示左侧鼻腔、鼻窦、鼻咽部巨大占位伴前颅底及左眼眶多处侵犯, 穿刺活检病理提示 SMARCA4(BRG1)缺失型未分化癌 (免疫组化: BRG1 (-), Ki-67 (+70%))。另 1 例患者 64 岁, “左侧头痛、听力下降伴视物模糊半年余”入院, 体格检查: 口咽部粘膜光滑, 悬雍垂右侧可见新生物隆起, 鼻咽部未见明显异常。影像学提示蝶骨体、双侧颞骨岩尖部、左侧颞骨乳突部、枕骨及斜坡多发骨质破坏伴软组织肿块并左枕部脑膜受侵。术中可见颅底及脑膜弥漫“鱼肉样”新生物。病理提示 SMARCA4(BRG1)缺失型未分化癌 (免疫组化: BRG1 (-), Ki-67 (+40%))。**结论** SMARCA4(BRG1)缺失型未分化癌是一种罕见的高度侵袭性恶性肿瘤, 发现时多为晚期, 多侵犯邻近结构, 手术难度大, 预后差, 影像学能够评估肿块大小、范围、邻近结构侵犯及有无远处转移等, 为临床诊断及治疗决策提供很大价值。

Spinal cord infarction presenting as BrownSéquard syndrome from spontaneous vertebral artery dissection: a case report and literature review

Yangyang Meng
The first hospital of JiLin University

Background: Spinal cord infarction (SCI) is rarely caused by vertebral artery dissection (VAD), which is an important cause of posterior circulation stroke in young and middle-aged patients. We report the case of a middle-aged patient without obvious risk factors for atherosclerosis who had SCI from right VAD. Case presentation: An otherwise healthy 40-year-old man presented with acute right-sided body weakness. Six days earlier, he had experienced posterior neck pain without obvious inducement. Neurologic examination revealed a right Brown-Séquard syndrome. Magnetic resonance imaging (MRI) of the head was normal. Further, cervical spine MRI showed spinal cord infarction (SCI) on the right at the C1-C3 level. Three-dimensional high-resolution MRI (3D HR-MRI) volumetric isotropic turbo spin echo acquisition (VISTA) scan showed evidence of vertebral artery dissection (VAD). The patient was significantly relieved of symptoms and demonstrated negative imaging findings after therapy with anticoagulation (AC) and antiplatelets (AP) for 3 months. Conclusions: The possibility of vertebral artery dissection (VAD) should be considered in the case of young and middle-aged patients without obvious risk factors for atherosclerosis. Furthermore the VISTA black blood sequence plays an important role in the pathological diagnosis of vertebral artery stenosis. Early correct diagnosis and active therapy are crucial to the prognosis.

常规及功能 MRI 对眼眶神经鞘瘤的诊断及手术入路选择的价值

唐言
上海交通大学医学院附属第九人民医院

目的 探讨分析眼眶神经鞘瘤的常规 MRI、DWI、DCE-MRI 影像特点及病理、临床特征，提高对该病术前的影像诊断正确率及适宜的手术方式。方法 回顾性分析我院 50 例经手术病理证实的眼眶神经鞘瘤的临床特点、手术方式、病理学及 MRI 图像等资料。MRI 图像包括平扫、DWI (b 值取 0、1000 s/mm²)、DCE-MRI，并获取病灶的时间-信号强度曲线 (TIC) 及表观扩散系数 (ADC) 值。结果 50 例眼眶神经鞘瘤均为单发病变，其中 2 例为复发。患者男女比例 27:13，年龄 15 岁~72 岁。临床表现眼球突出 38 例，视力下降、视物模糊 25 例，头痛头晕 1 例，眼睑外翻 2 例。影像病变位置上 31 例发生于肌锥内间隙，10 例发生于肌锥外间隙，9 例发生于跨肌锥内外间隙、其中 7 例经眶上裂颅眶沟通；形状上 50 例肿瘤影像形态均较规则，呈类圆形、类椭圆形或条形、腊肠样。常规信号特点相对于脑灰质，T1WI 上呈等、低信号，T2WI 上呈等、高信号 (高信号区位于周围或内部)，1 例肿瘤呈纯实性，3 例呈纯囊性，46 例呈囊实混合。增强后所有病灶实性成分明显强化、囊性成分无强化或斑点、斑驳样强化。DCE-MRI 获取的 TIC 曲线 43 例呈持续上升型、7 例呈平台型，获得平均 ADC 值 (实性及有强化的囊性部分区域) 为 $(1.30 \pm 0.38) \times 10^{-3} \text{mm}^2/\text{s}$ 。前路开窗术 24 例，外侧开窗术 16 例，内侧开窗术 2 例，内外联合开窗术 8 例。结论 眼眶神经鞘瘤见于成人，好发于中老年男性，临床表现多以眼球突出和或视力下降多见，常规 T2WI 以等、高囊实性信号且囊性位于周围较具特征，TIC 类型及 ADC 值有助于眼眶神经鞘瘤影像诊断正确率；通过影像特点 (囊性成分多少) 及定位选择合适术式可成功摘除眼球神经鞘瘤、并最大限度保存患者视力功能、减少复发率。

PU-1916

急性 A 型主动脉夹层术后脑出血卒中危险因素分析及风险评分模型构建

池萌、杨瑞

河南省胸科医院河南康复中心医院

目的 分析急性 A 型主动脉夹层患者术后新发脑出血的危险因素,并基于此建立风险评分。方法 回顾性分析经 CT 血管成像(CTA)确诊且行外科手术的 100 例 ATAAD 患者临床资料,以术后有无新发脑出血将所有患者分成 2 组,即脑出血(+)组和脑出血(-)组。记录所有患者与术后新发脑出血相关的临床影像资料。先行单因素分析,使用其中有统计学意义($P<0.05$)的因素构建多元 Logistic 回归模型,并基于 Logistic 回归模型的结果 构建风险评分模型。结果 100 例患者中有 28 例术后新发脑梗死(28%)。多因素分析结果 显示:升主动脉逆行撕裂($OR=5.2140, P=0.001$)、升主动脉及弓部均有破口($OR=2.789, P=0.021$)、颈总动脉夹层($OR=4.012, P=0.001$)、术前脑出血($OR=1.987, P=0.021$)是 ATAAD 患者术后新发脑出血的独立危险因素。基于这些因素的 OR 值构建了一个易于使用的风险评分: ≤ 3 分,术后脑出血风险 $<15\%$;4~7 分为 $15\% \sim 40\%$;8~15 分为 $41\% \sim 50\%$ 。结论 术前主动脉 CTA 特征可预示 ATAAD 术后新发脑出血发生风险。基于这些特征构建的风险评分模型可定量评估 ATAAD 患者术后发生新发脑出血的风险。

PU-1917

孤立性纤维瘤的影像学表现

陈曦

陆军军医大学第一附属医院(西南医院)

目的:通过回顾性分析孤立性纤维瘤在多个系统的影像学征象、临床表现及病理学特征,提高对孤立性纤维瘤的诊断水平。方法:回顾性分析 42 例经过组织病理学确诊的孤立性纤维瘤患者的临床表现、影像学征象及病理表现。结果:颅内病例 28 例,鼻腔 3 例,眼眶 3 例,脊柱 4 例,腹腔 2 例,胸部 2 例,病灶多为单一结节或肿块影,类圆形或不规则形,边界清晰,病灶内可见囊变, T1WI 呈稍低或等信号, T2WI 多呈稍高信号或混杂信号,由于肿瘤血管丰富,部分可见血管流空影,增强扫描病灶呈明显强化。结论:孤立性纤维瘤是一种间叶源性肿瘤,多个系统均可发生,临床表现缺乏特异性,当 MRI 发现边界清楚、信号不均匀的结节或肿块时,增强扫描呈不均匀明显强化,可见血管流空影时,我们应该考虑孤立性纤维瘤的可能。

PU-1918

Application of deep learning-based image reconstruction engine combined with Timing-invariant reconstruction to improve image quality in CTA derived from ultra-low dose cerebral CT perfusion data

Jiajing Tong, Yu Chen, Tong Su, Yanling Wang, Haozhe Liu, Min Xu, Jian Wang, Zhengyu Jin
Department of Radiology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences

Abstract: Rationale and objective: To assess the effect of the combination of deep learning-based image reconstruction engine (AiCE) and time-resolved maximum intensity projection (tMIP) or time-resolved average (tAve) on image quality of CTA derived from ultra-low dose cerebral CT perfusion (CTP). Materials and methods: This retrospective study included 30 patients with regular dose (Group A) and 30 patients with ultra-low dose (Group B) who underwent cerebral CT perfusion for ischaemic stroke from July 2020 to November 2022. Group A were reconstructed with adaptive iterative dose reduction 3D (R-AIDR). And in Group B, four image datasets were reconstructed: UL-AIDR and UL-AICE were single arterial phase derived from the time point showing the peak value reconstructed with AIDR and AiCE, UL-AICE-tMIP and UL-AICE-tAve were time-resolved maximum intensity projection image and time-resolved average image derived from three time points with the greatest enhancement of AiCE. The CT attenuation, image noise, signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR) were calculated and compared for all five image datasets. The images quality were subjectively evaluated by two radiologists using a 5-point rating scale. Results: The ultra-low dose group achieved a significant reduction in a single arterial phase radiation dose (0.12 mSv VS 0.18 mSv) compared to the regular dose group. The SNR (ICA: 24.73 ± 12.49 VS 116.51 ± 80.23 , BA: 19.5 ± 13.20 VS 94.86 ± 44.79 , all $P < 0.001$) and CNR (ICA: 77.19 ± 21.64 VS 97.42 ± 41.53 , BA: 66.95 ± 21.34 VS 89.55 ± 42.33 , all $P < 0.05$) with UL-AICE in vessels were statistically inferior than R-AIDR. However, The UL-AICE-tMIP and UL-AICE-tAve presented higher CNR in ICA (101.43 ± 25.42 VS 97.42 ± 41.53 , $P < 0.05$ and 110.66 ± 29.69 VS 97.42 ± 41.53 , $P < 0.001$) or equivalent CNR in BA (88.76 ± 24.39 VS 89.55 ± 42.33 and 96.55 ± 27.46 VS 89.55 ± 42.33 , all $P < 0.05$) and higher subjective quality scores in vessels (all $P < 0.001$) than R-AIDR. Conclusion: The application of AiCE and tMIP or tAve allows for significant radiation dose reduction while further improving image quality in CTA derived from cerebral CTP data.

PU-1919

基于非线性融合技术肺支气管血管成像在肺结节 术前定位的应用

顾秀婷
扬州大学附属医院

目的 评价双能量 CT 非线性融合技术在肺支气管血管成像中的运用, 并探讨该技术在肺结节患者术前定位的临床应用。**方法** 选择 2020 年 4 月至 2022 年 3 月在扬州大学附属医院行双能量肺静脉成像并拟行肺结节切除的患者 115 例, 其中男性 55 例, 女性 60 例; 年龄 $24 \sim 81$ 岁, 平均年龄 61.3 岁 (标准差 11.8 岁); 病灶直径 $0.4 \sim 2.4 \text{ cm}$, 平均直径 1.19 cm (标准差 0.50 cm), 病程 1 天 ~ 2 年, 平均病程 2.5 月 (标准差 4.24 月), 所有患者双能量扫描获得 80 kV (A 组)、(Sn) 150 kV (B 组)、线性融合 M-0.6 (C 组) 和非线性融合 (D 组) 四组图像。计算肺静脉干信噪比 (SNR)、对比噪声比 (CNR)、右肺上叶静脉与右肺中叶动脉平均 CT 值差值。将最佳组数据导入 Mimics 软件进行三维肺支气管血管成像, 进行图像等级评分。结果 经一致性分析, 四组图像肺

静脉干的 ICC 分别为 0.991、0.987、0.985、0.994，竖脊肌的 ICC 分别为 0.877、0.885、0.887、0.895。D 组图像的 SNR 和 CNR 最高，SNR 为 167.1 ± 22.9 、CNR 为 150.1 ± 21.2 。D 组与其他 3 组 SNR 和 CNR 比较，差异具有统计学意义 ($P < 0.05$)。D 组图像肺静脉与动脉差值 (328.5 ± 98.9) 最高，A 组与 D 组图像差异无统计学意义 ($P > 0.05$)，B 组、C 组与 D 组图像差异有统计学意义 ($P < 0.05$)。用最佳组 D 组进行三维肺支气管血管成像，111 例图像评为优，3 例为良，1 例为差。结论 用非线性融合技术进行肺静脉图像重建，图像 SNR 和 CNR 更高，且肺静脉与动脉差值最大，更容易重建出高质量的肺支气管血管图像，更利于观察肺支气管血管是否存在变异及血管与病灶的三维关系，为胸外科医生手术方案的制定提供重要的理论依据。

CT 特征联合瘤体及瘤周影像组学的列线图预测临床 IA 期非小细胞肺癌气腔播散的价值

吕登、望云、周陶胡、范丽、萧毅、刘士远
中国人民解放军海军军医大学第二附属医院

目的 探讨基于术前 CT 特征联合瘤体及瘤周影像组学特征的列线图预测临床 IA 期 NSCLC 气腔播散 (STAS) 的价值。

方法 回顾性收集 2019.09 至 2022.08 我院术后有病理评估 STAS 状态的临床 IA 期 NSCLC 336 例，依据病理报告的 STAS 情况分为阳性组和阴性组，按照 7:3 的比例将数据集随机划分为训练集 236 例和内部验证集 100 例，外院 69 例作为外部验证集。在训练集中，单、多因素 logistic 回归分析患者临床及 CT 特征，筛选最佳预测变量，构建临床模型，基于瘤体及瘤周 5mm、10mm、15mm、20mm 范围的影像组学特征分别构建 9 个组学模型，以最优组学模型的 Radscore 和最佳预测变量构建综合模型，绘制列线图并进行模型的内外验证。采用 ROC 曲线及 AUC 值来评估模型的区分度，以 H-L 检验和校准曲线来评价模型的拟合优度，决策曲线来分析模型的临床应用价值。

结果 多因素 logistic 回归分析筛选出的最佳预测变量包括性别、癌胚抗原、实性成分占比、密度类型、远端带状影，其中肿瘤密度类型、远端带状影为预测 STAS 状态的独立危险因素。与 GTV、PTV5、PTV10、PTV15、PTV20、GPTV5、GPTV15、GPTV20 相比，GPTV10 影像组学模型效能最优，在三个队列中 AUC 值分别为 0.89，0.88 及 0.87。基于 GPTV10-Radscore 和最佳预测变量构建的综合模型在三个队列中 AUC 值分别为 0.90，0.88 及 0.88。H-L 检验表明，综合模型在三个队列中均拟合良好，校准曲线显示综合模型预测概率值与真实情况具有较好的一致性。决策曲线显示综合模型较临床模型和 GPTV10 影像组学模型具有更好的临床应用价值。

结论 CT 特征联合瘤体及瘤周影像组学特征的列线图对术前判断临床 IA 期 NSCLC STAS 状态具有较高的诊断效能，可为胸外科医师选择最佳手术方式提供指导帮助。

PU-1921

室间隔曲率预测肺动脉压力的模型构建与验证

杨耸
中南大学湘雅二医院

目的：本研究基于 CMR 构建心室有限元模型，通过有限元分析左室壁应力，评估室间隔应力异常增大的最低 mPAP。之后本研究以室间隔应力异常增大的最低 mPAP 为阈值，通过心脏 MR 验证室间隔曲率估测压能否准确区分阈值上下的两组人群。

方法：本研究利用 Young-Laplace 定律，提出新指标：室间隔曲率估测压=主动脉平均压 \times (1-室间隔/左室游离壁的曲率比)。新指标反应 mPAP 大小以及室间隔应力增大与否。收集 2013 年 6

月到 2023 年 3 月住院的 IPAH 患者，他们住院期间同时完成了右心导管及心脏 MR。同时收集完成了 CMR 的正常人。

结果：纳入了 39 名 IPAH 患者（mPAP 范围 30-87mmHg），28 名正常人。有限元分析发现 39 名 IPAH 患者的室间隔应力均发生了增高。mPAP 为 30mmHg 患者的室间隔与左室游离壁的应力分别为 $3.8\pm 1.5\text{kPa}$ 及 $3.3\pm 0.9\text{kPa}$ ($p<0.05$)；mPAP 为 60mmHg 患者的室间隔与左室游离壁的应力分别为 $4.1\pm 2.1\text{kPa}$ 及 $3.1\pm 1.7\text{kPa}$ ($p<0.05$)。以 30mmHg 为阈值，室间隔曲率估测压筛查 IPAH 的灵敏度为 97.4%，假阴性率为 2.6%，特异度为 100%，假阳性率为 0%。

结论：mPAP \geq 30mmHg 的患者，其室间隔应力均有可能增高。室间隔曲率估测压以 30mmHg 为阈值，能够有效筛查出 mPAP \geq 30mmHg 的 IPAH 患者，并且准确的排除掉 mPAP $<$ 30mmHg 的患者。

PU-1922

少见部位神经内分泌癌 CT 表现及病理特征分析

杨帆

成都市双流区第一人民医院

[摘要] 目的 分析全身少见部位神经内分泌癌的 CT 表现及病理特征，提高对其认识。方法 回顾性分析经病理证实的 29 例神经内分泌癌患者的 CT 表现与病理特征。29 例经手术得到病理结果，均行术前 CT 平扫加动态增强扫描。结果 发生于乳腺 5 例、宫颈 9 例、宫体 1 例、胆囊 2 例、纵隔 5 例、肾盂膀胱 1 例、肾脏 1 例、膀胱 2 例、肝脏 1 例、胰腺 1 例、卵巢 1 例。CT 表现：病变以实性多见，多呈浸润性生长；低分化的神经内分泌癌边界模糊；大部分病灶内可见囊变坏死，部分合并钙化灶；本组病例中 23 例病灶增强扫描呈中等及以上程度强化；病变较易发生周围侵犯、骨质破坏及远处转移。结论 少见部位神经内分泌癌的影像学表现多样，认识其多样性及影像学征象，对提高其诊断水平有较大帮助。

PU-1923

100kVp 低管电压联合 ASiR-V 在脊髓 Adamkiewicz 动脉成像中的应用价值研究

邓建涛、马婷、严高武、严静、范小萍、李勇

遂宁市中心医院

目的 探讨 100kVp 低管电压联合多模型迭代重建技术 (ASiR-V) 对 Adamkiewicz 动脉成像的显示、图像质量及辐射剂量的影响。方法 连续收集 90 例行胸腹主动脉 CTA 的患者，并按随机数字表法分为 A、B 两组。A 组管电压 100kVp，ASiR-V 80%重建；B 组管电压 120kVp，ASiR 40%重建。在第 12 胸椎层面测量降主动脉的 CT 值及标准差 SD 值，并测量同层面脊髓的 CT 值及标准差 SD 值，计算 Adamkiewicz 动脉的信噪比 (SNR) 及对比噪声比 (CNR)。根据 Adamkiewicz 动脉与肋间动脉或腰动脉的连续性，由 2 名副主任医师采用双盲法以 5 分法对 Adamkiewicz 动脉的可视化进行评估，并比较 A、B 两组的辐射剂量。结果 与 B 组相比，A 组主动脉的平均 CT 值显著增高约 22.83% (576.19 ± 75.13 vs 469.12 ± 48.48 , $P<0.001$)；A 组 AKA 动脉的背景噪声显著低于 B 组，SNR 及 CNR 显著高于 B 组 ($P<0.001$)。A 组 Adamkiewicz 动脉的可视化评分高于 B 组 ($P<0.05$)。A 组有效辐射剂量较 B 组显著降低约 41.28% (9.87 ± 2.83 vs 15.99 ± 3.42 , $P<0.001$)。结论 100kVp 联合 ASiR-V 技术行脊髓 Adamkiewicz 动脉成像，可获得较好的图像质量，提高了 AKA 动脉显示的敏感性，并降低了辐射剂量。

PU-1924

联影 128 层 CT 低剂量冠状动脉 CTA 成像的应用价值

成水华¹、李琛玮²、李松²、倪炯¹、王培军¹

1. 上海市同济医院

2. 上海联影医疗科技有限公司

目的：评估应用上海联影医疗科技有限公司生产的 128 层 CT (uCT 760) 进行低管电压 (80KV, 70KV) 冠状动脉 CTA 检查的临床应用价值。方法：选取 2016 年 3 月至 2016 年 6 月体重指数 (BMI) 在 22-25Kg/m², 临床怀疑或已知冠心病拟行冠状动脉 CTA 检查的 120 例患者。采取随机数字表法选取 40 例为常规剂量组(A 组), 其余 80 例为低剂量组 (B 组)。两组均行回顾性心电门控扫描技术, A 组采用管电压 120Kv, 管电流 150mAs。B 组根据管电压分成两个亚组, B1 组管电压 80KV (40 例), B2 组管电压 70KV (40 例), 均采用管电流 150mAs。各组 CT 图像的辐射剂量[CT 剂量长度乘积(DLP)和有效剂量(ED)]以及图像噪声 (SD)、图像信噪比(SNR)、冠状动脉近段的对比噪声比(CNR)进行系统测量。由 2 名放射科医师采用双盲法对每例患者冠状动脉的图像质量进行 4 分法评估。应用 ANOVA 单因素方差分析比较三组辐射剂量(DLP 和 ED)、SD、SNR 和冠状动脉近段 CNR。用 Kappa 分析评价不同观察者冠状动脉图像质量评分的一致性。结果：A 组、B1 组、B2 组的 DLP 分别为 (490.08±78.83)、(182.29±69.79) 和 (67.10±27.04) mGy*cm, ED 分别为 (11.33±1.27)、(2.56±0.97) 及 (0.94±0.40) mSV, 三组间两两比较均有显著性差异 (P<0.05)。主观图像质量评估：A 组(3.61±0.77)分, B1 组(3.53±0.80)分, B2 组(3.74±0.69)分, 差异无统计学意义(P=0.20)。客观图像质量评估：三组之间 SD、SNR、冠状动脉近段 CNR 差异无统计学意义 (P 值分别为 0.81、0.08、0.15、0.37、0.33)。结论：联影 128 层排 CT 采用低管电压行冠状动脉 CTA, 在保证图像质量的同时, 可有效降低辐射剂量。

PU-1925

冠脉周围脂肪衰减指数及斑块特征对冠脉功能性缺血的诊断效能研究

常艺桐

滁州市第一人民医院

目的：探究冠脉周围脂肪衰减指数及斑块特征的联合分析对冠脉功能性缺血的诊断价值。方法：回顾性分析 2021 年至 2023 年滁州市第一人民医院影像科行冠状动脉计算机断层扫描造影 (CCTA) 的疑似或已知稳定冠心病 (CAD) 患者的影像资料。对 102 名患者的 154 条血管进行了冠状动脉 CTA 狭窄度、斑块体积、CT-FFR 和 FAI 评估。狭窄程度>50%被认为是梗阻性的。斑块特征 (非钙化斑块体积[NCPV]、钙化斑块体积[CPV]、总斑块体积[TPV]、斑块长度及易损斑块) 及冠脉周围脂肪衰减指数 (FAI) 使用半自动软件进行量化。冠脉功能性缺血定义为 CT-FFR≤0.80。结果：冠脉功能缺血阳性组的 FAI 值与冠脉狭窄率明显高于阴性组 (-69.1±5.6 vs 78.1±5.4, p<0.001; 68.2±9.3 vs 53.5±10.4, p<0.001), 且为冠脉功能性缺血的独立危险因素 (OR=1.405, p<0.001; OR=1.156, p<0.001)。FAI 对冠脉功能缺血诊断具有一定的诊断效能 (AUC=0.882, p<0.001), 且具有增量价值 (0.935 比 0.882, p=0.013)。结论：本研究的结果表明, 斑块特征分析联合 FAI 在预测冠脉缺血方面具有协同作用, 有助于提高冠脉功能性缺血的诊断效能。

PU-1926

联合应用 CT 淋巴管成像与 99Tcm-DX 淋巴显像在原发性乳糜性心包积液中的诊断价值

张怡梦

首都医科大学附属北京世纪坛医院

目的 探讨 99Tcm-DX 淋巴显像和 CT 淋巴管成像(CTL)联合应用在原发性乳糜性心包积液中的诊断价值。**方法** 回顾性分析经临床确诊的 48 例原发性乳糜性心包积液患者,所有患者均行 99Tcm-DX 淋巴显像和 CT 淋巴管成像(CTL)。根据 99Tcm-DX 淋巴显像表现进行分型:I 型为异常浓聚型,表现为左颈静脉角处异常放射性浓聚,II 型为异位引流型,表现为右颈静脉角区显影剂持续性浓聚,伴或不伴有左颈静脉角放射性浓聚,III 型为未显影或一过性显影型,表现为左颈静脉角未显影或在检查过程中一过性显影。CTL 的评价指标包括:(1)颈部、锁骨下区、胸导管末端、右淋巴导管末端及腋窝对比剂异常分布及反流;(2)胸部对比剂异常分布,包括胸深部(前纵隔、主肺动脉窗、气管及支气管周、隆突下、后纵隔、肺门、支气管血管束周围、心包等)对比剂异常分布,胸浅部(肋间、胸膜、横膈上)对比剂异常分布;(3)胸导管扩张;(4)横膈下、髂组、腰干对比剂异常分布,腹膜后对比剂异常分布。并将各组 CTL 表现进行统计学分析, $P < 0.05$ 为差异有统计学意义。结果 48 例患者 99Tcm-DX 淋巴显像 I 型 12 例,II 型 14 例,III 型 22 例,原发性乳糜性心包积液后纵隔对比剂异常分布的发生率,I 型大于 III 型,差异有统计学意义($P = 0.003$),心包及主肺动脉窗对比剂异常分布的发生率,99Tcm-DX 淋巴显像 I 型大于 III 型,差异有统计学意义($P = 0.008$),双颈部或锁骨下区对比剂异常分布的发生率,99Tcm-DX 淋巴显像 II 型大于 III 型($P = 0.002$),差异有统计学意义。结论 99Tcm-DX 分型反映了原发性乳糜性心包积液患者的胸导管病变及心包积液性质,CTL 显示全身淋巴管是否异常及淋巴管外病变,两种方法联合应用,对于原发性乳糜性心包积液的定位和定性诊断、判断病变程度和累及范围等具有重要价值。

PU-1927

心电门控大螺距血管成像技术对 Stanford A 型主动脉夹层的诊断价值研究

王雅玲

山西省心血管病医院

摘要: **目的** 比较第 3 代双源 CT 心电门控大螺距血管成像技术和非心电门控成像技术两种扫描方式对 Stanford A 型主动脉夹层患者主动脉根部图像的质量和电离辐射剂量的大小。**方法** 回顾性选取我院 2022 年 11 月至 2023 年 6 月期间,以随机分组方法分别用双源 CT 心电门控大螺距血管成像(实验组)以及传统非心电门控扫描方式大血管成像(对照组)确诊为典型或不典型 Stanford A 型主动脉夹层患者共 50 例,以外科手术治疗术中所见为标准,评价第 3 代双源 CT 大螺距血管成像(FLASH,螺距 3.2)对主动脉根部图像质量的诊断准确性以及与传统非心电门控扫描方式成像患者所受的辐射剂量进行比较。结果 FLASH 组对主动脉根部病变的显示图像质量均可满足诊断。FLASH 组有效辐射剂量($3.09 \pm 0.94 \text{ mSv}$),均低于非心电门控对照组。结论 双源 CT 心电门控大螺距血管成像对典型或不典型 Stanford A 型主动脉夹层根部病变显示的准确性显示明显高于传统非心电门控组($P < 0.05$),且有效辐射剂量显著低于对照组($P < 0.05$)。

PU-1928

NAFLD 与无 NAFLD 患者的差异及 NAFLD 患者冠脉功能性缺血的预测因素

李文敬

郑州大学第五附属医院

目的：探讨合并非酒精性脂肪性肝病(NAFLD)和无 NAFLD 的冠脉狭窄患者之间的差异，并进一步评估 NAFLD 患者冠脉功能性缺血的预测因素及价值。

方法：收集行冠脉 CT 血管造影（CCTA）检查并接受冠脉钙化积分（CACS）扫描患者的资料，且 CCTA 结果显示至少 1 支主冠脉存在解剖学狭窄。共纳入患者 392 例，将患者分为 NAFLD 组（209 例）及无 NAFLD 组（183 例），分析两组患者差异。进一步将 NAFLD 患者分为 CT 血流储备分数（CT-FFR） ≤ 0.08 组及 CT-FFR > 0.08 组。采用单因素和多因素回归分析筛选预测因子，用受试者工作特征（ROC）曲线评价预测性能。

结果：无 NAFLD 组与 NAFLD 组在年龄、体重指数、高血糖、高血脂、甘油三酯、高密度脂蛋白、CAD-RADS 分类、CACS 分级、病变冠脉数、CT-FFR ≤ 0.80 构成比上存在显著性差异（ $P < 0.05$ ）。CAD-RADS 分类及 CACS 分级为 NAFLD 患者冠脉缺血独立预测因子，冠脉功能性缺血发生率与 CAD-RADS 分类（OR=3.383）及 CACS 分级（OR=2.264）呈正相关。CAD-RADS 分类、CACS 分级及 2 者联合预测 NAFLD 患者冠脉缺血的曲线下面积（AUC）分别为 0.762、0.742、0.819，95%CI 分别为 0.696~0.828、0.673~0.811、0.761~0.876，P 值均为 0.000。

结论：合并 NAFLD 和无 NAFLD 的冠脉狭窄患者之间存在差异，CAD-RADS 分类及 CACS 分级联合可以经济高效地预测 NAFLD 患者冠脉功能性缺血，对临床诊疗具有重要价值。

PU-1929

基于术前 CT 影像组学预测肺腺癌 IASLC 病理分级

崔效楠

天津医科大学肿瘤医院

目的：通过影像组学与病理组学相结合的技术，寻找肺腺癌计算机断层扫描（CT）影像与 IASLC 病理亚型的相关性，构建具有可解释性的影像组学与病理亚型相互对应的机器学习，实现术前肺腺癌病理亚型的预测。

方法：在 2017 年 1 月至 2022 年 6 月，回顾性地确定了 301 个经病理证实的肺部实性结节（SSNs），按照国际肺癌协会（IASLC）提出的一项分级系统，将肺腺癌的病理亚型分成三类，然后对肿瘤病灶进行精准分割并进行影像组学的特征提取，使用五折交叉验证法验证机器学习模型，最终选择 logistic 回归模型进行机器学习。

结果：在训练集中三种肺腺癌亚型的曲线下面积（AUC）、敏感性、特异性、精准度分别为 I 型：0.993、0.9091、0.9785、0.7692；II 型：0.922、0.7786、0.9006、0.872；III 型：0.947、0.8993、0.8457、0.8333；总体平均为：0.9557、0.8623、0.9083、0.8249。在验证集中三种肺腺癌亚型的曲线下面积（AUC）、敏感性、特异性、精准度分别为 I 型：0.939、0.6364、0.9642、0.5833；II 型：0.862、0.7214、0.8447、0.8016；III 型：0.919、0.7452、0.8766、0.731。总体平均为：0.9088、0.7452、0.8766、0.731。

结论：根据 IASLC 提出的分级系统，将影像组学与病理亚型相结合，利用机器学习深度挖掘数据，探究 CT 影像与病理亚型间的相关性，构建基于影像组学的肺腺癌术前病理亚型预测模型，可以支持临床医生根据预期的病理情况更准确、更及时的提出治疗建议。

PU-1930

基于冠状动脉 CT 血管成像的左心房测量参数在评估继发性甲状旁腺功能亢进中的价值

王之悦、朱建国、刘斐、臧汉杰、刘剑、李海歌
南京医科大学第二附属医院

目的 探讨基于冠状动脉 CTA (CCTA) 测得的左心房、左心耳结构和功能参数在评估继发性甲状旁腺功能亢进 (SHPT) 中的价值。**方法** 回顾性分析行 CCTA、左室射血分数 (LVEF) 大于 50% 的 SHPT 患者 120 例资料, 根据是否需要行甲状旁腺切除术 (PTX) 分为手术组 (67 例) 和非手术组 (53 例), 所有 SHPT 患者均行血全段甲状旁腺激素 (iPTH)、血磷、血钙、甲状旁腺超声及超声心动图检查。采用图像后处理软件测得左心房最大、最小容积 (LAVmax、LAVmin) 及左心耳最大、最小容积 (LAAVmax、LAAVmin), 并计算左心房及左心耳的射血分数 (LAEF、LAAEF)。采用独立样本 t 检验或 χ^2 检验比较两组各项指标的差异, 通过二元 logistic 回归建立联合参数模型, 通过 ROC 曲线评估左心房参数及联合参数对是否行 PTX 手术的预测效能, 采用 Pearson 相关分析左心房参数与 iPTH 之间的相关性。**结果** 手术组的 LAEF 及 LAAEF 低于非手术组, 差异有统计学意义 ($P < 0.001$)。LAEF 及 LAAEF 的曲线下面积 (AUC)、最佳阈值、诊断的灵敏度和特异度分别为 0.833 (95%CI 0.798~0.928), 15.92%, 66.21%, 94.73% 及 0.846 (95%CI 0.826~0.945), 18.12%, 74.01%, 94.72%。LAEF 联合 LAAEF AUC 值为 0.916 (95%CI 0.889~0.980)。左心房功能参数 LAEF 及 LAAEF 与 iPTH 呈负相关 ($r = -0.438$ 和 -0.445 , $P < 0.001$)。**结论** CCTA 左心房测量参数为评估 SHPT 患者是否需要行 PTX 提供了补充, 为早期评估、早期干预 SHPT 患者治疗提供影像学量化指标。

基于 18F-FDG PET/CT 的列线图预测胸膜下临床 IA 期肺腺癌脏层胸膜侵犯的价值

望云、吕登、周陶胡、涂文婷、范丽、萧毅、刘士远
中国人民解放军海军军医大学第二附属医院

【目的】

探讨基于 18F-FDG PET/CT 的 SUVmax 值联合 CT 征象预测与胸膜存在接触的临床 IA 期肺腺癌脏层胸膜侵犯 (VPI) 的价值。

【资料与方法】

回顾性分析于本院术前行 18F-FDG PET/CT 检查、同机 HRCT 示肿瘤与胸膜存在接触的临床 IA 期肺腺癌患者, 排除纯磨玻璃结节后共纳入 140 例患者进行分析。根据检查时间顺序及 7:3 的比例分为训练集和内部时间验证集, 依据病理报告的 VPI 情况分为阳性组和阴性组。在训练集中, 以单因素分析比较两组患者的临床资料、SUVmax 值、CT 特征的差异。纳入单因素回归分析中 P 值 < 0.1 的变量进行多因素 logistic 回归分析, 明确 VPI 的独立危险因素, 建立多因素 logistic 回归模型并绘制列线图, 在验证集中采用 ROC 曲线及 AUC 值来评估该模型的区分度。

【结果】

在训练集中, 单因素分析发现 SUVmax、实性成分最大径、实性成分占比、实性成分接触胸膜最大径、密度类型、毛刺征、血管集束征、胸膜凹陷征在 VPI 阳性与 VPI 阴性肺腺癌患者间差异有统计学意义 ($P < 0.05$)。以多因素 logistic 回归分析筛选最佳预测变量组合, 包括 SUVmax、实性成分接触胸膜最大径、胸膜凹陷征及血管集束征这四个变量, 其中 SUVmax、实性成分接触胸膜

最大径、胸膜凹陷征及血管集束征均是肺腺癌患者 VPI 的独立危险因素。基于多因素 logistic 回归模型构建列线图,以 0.35 为最佳截断值,该模型在训练集上预测 VPI 的准确度为 AUC 值为 0.892。在内部验证集上 AUC 值为 0.885。

【结论】

SUVmax、实性成分接触胸膜长度、胸膜凹陷征及血管集束征为预测胸膜下临床 IA 期周围型肺腺癌 VPI 的独立危险因素。基于 18F-FDG PET/CT 的 SUVmax 值联合 CT 征象构建的列线图有助于术前预测临床 IA 期肺腺癌患者的 VPI 状态。

PU-1932

双层探测器光谱 CT 多参数成像在肺栓塞的诊断价值

王鑫

苏州大学附属第二医院

目的 探讨双城探测器光谱 CT 多参数成像在肺动脉栓塞 (PE) 中的诊断价值.方法 回顾性分析,苏州大学附属第二医院,2021 年 10 月至 2022 年 10 月,经过临床初步诊断怀疑肺栓塞的患者 92 例,所有患者均使用双层探测器光谱 CT 进行 CTPA 扫描,重建得到常规及光谱图像(最佳单能图,无水碘图及有效原子序数图),基于最终诊断结果,比较个参数下,图像肺动脉栓子检出的差异,并分析肺栓塞区域与正常肺实质区域的碘浓度值和有效原子序数指的差异,结果 经综合诊断最终确诊为 PE 阳性的患者 63 例,发现光谱 CT MonoE40Kev 单能量图较常规混合能量图像对 PE 的检测率要高,无水碘图及有效原子序数图的检出率,也较常规混合能量,图像优势显著 $P < 0.05$ 。从碘浓度值及有效原子序数只来对比分析肺栓塞区域与正常肺实质区域间存在显著差异 $P < 0.01$,肺栓塞区与正常肺实质区能量 40 到 200 Kev 曲线呈下降趋势。结论 双层探测器光谱 CT 中多参数光谱成像能够提高肺动脉栓塞,尤其是亚段及其以下肺动脉栓塞的检测效能。

基于胸部 CT 图像的 CNN 算法构建 COPD 影像表型诊断模型与验证

罗洁君

中国人民解放军海军军医大学第二附属医院

目的:本研究旨在探讨基于深度学习 CNN 算法,建立一种具有辅助诊断价值的慢阻肺患者影像表型的鉴别诊断方法。方法:纳入上海市同济医院的 COPD 受试者 429 例,及上海长征医院的 COPD 受试者 426 例,根据胸部 CT 影像中支气管管壁增厚情况和肺气肿程度分为 A、E、M 型;上海市同济医院 COPD 患者共分为 A 型(304 例)、E 型(70 例)、M 型(55 例),上海长征医院 COPD 患者共分为 A 型(337 例)、E 型(61 例)、M 型(28 例)。使用 U-Net 模型对肺野区域图像进行截取,将影像表型预测问题归纳为多标签分类问题,运用 CNN 算法进行自动识别,对参数设置及模型对比,并在数据集上进行比较实验。结果:实验结果表明,CNN 算法在 AEM 影像表型的分类任务中可达到 0.86 的准确率,说明该算法能够较好地 COPD 影像表型进行识别。结论:本研究基于卷积神经网络算法建立的诊断模型能有效鉴别 COPD 影像表型,为将来影像表型诊断及个性化治疗提供参考价值。

STEMI 直接 PCI 术后微血管阻塞的危险因素分析

王佳丽、胡春峰、徐凯
徐州医科大学附属医院

目的 探讨 ST 段抬高型心肌梗死 (STEMI) 直接经皮冠状动脉介入治疗 (PCI) 术后出现微血管阻塞 (MVO) 的危险因素。

材料与方法 回顾性分析 2021 年 2 月至 2022 年 6 月本胸痛中心成功行 PCI 术并于 PCI 术后 1 周内完成心脏核磁共振检查 (CMR) 的 STEMI 患者, 共 165 例。完整记录患者救治的重要时间节点: 出现症状至导丝通过责任血管时间 (symptom onset to wire, S2W), 即心肌缺血时间, 首次医疗接触至导丝通过责任血管的时间 (first medical contact to wire, FMC2W), 到达 PCI 医院大门至导丝通过的时间 (door to wire, D2W), 以分钟 (min) 为单位。通过 CMR 电影序列评价左心室功能, 通过钆延迟增强 (LGE) 序列评价心肌梗死特征及 MVO。采用二元 Logistic 回归分析评估 STEMI 直接 PCI 术后发生 MVO 的危险因素。

结果 本研究中 89 例 (53.9%) STEMI 患者直接 PCI 术后出现 MVO。MVO (+) 组的 FMC2W 时间和 S2W 时间均显著长于 MVO (-) 组 ($P < 0.05$)。相对于 MVO (-) 组, MVO (+) 组心肌梗死面积 (IS) 较高, 左室射血分数较低 ($P < 0.05$)。FMC2W 时间延迟组及 S2W 时间延迟组 IS 和 MVO 范围均大于非延迟组 ($P < 0.05$)。Logistic 回归分析显示, S2W 时间 > 300 min [$P = 0.039$, $OR = 2.756$, $95\% \text{ CI} = 1.053-7.213$] 是 STEMI 患者直接 PCI 术后发生 MVO 的独立预测因素。

结论 (1) 直接 PCI 术后 MVO (+) 组 STEMI 患者, IS 较大, 心肌酶水平较高, 提示心肌损伤更严重。(2) FMC2W 时间延迟组及 S2W 时间延迟组, STEMI 患者 IS 及 MVO 范围较大, 左室射血分数较低。(3) S2W 时间 > 300 min 是 STEMI 直接 PCI 术后出现 MVO 的独立预测因素。

PU-1935

腹部内脏脂肪组织 CT 衰减与冠状动脉狭窄程度的相关性研究

代岳
徐州医科大学附属医院

目的: 探讨冠心病患者腹部内脏脂肪组织 CT 衰减与冠状动脉狭窄程度的相关性。**方法:** 收集我院经冠状动脉 CT 血管成像发现有冠状动脉狭窄的住院患者 197 例, 将患者分为血管轻度狭窄 $< 50\%$ 组、血管中重度狭窄 $\geq 50\%$ 组, 利用腹部 CT 图像测量患者 L3-L4 水平腹部内脏脂肪面积 (VAT area)、腹部内脏脂肪 CT 衰减 (VAT CT attenuation), 初步分析 VAT area、VAT CT attenuation 与患者一般资料及冠状动脉狭窄程度的关系, 最后利用受试者工作特征曲线 (ROC 曲线) 评估 VAT area、VAT CT attenuation 对冠状动脉中重度狭窄程度预测的诊断效能。**结果:** 冠状动脉不同狭窄组比较发现年龄、BMI、LDL、CRP、糖尿病史、VAT area、VAT CT attenuation 差异有统计学意义; 对年龄、BMI、LDL、CRP、VAT area、VAT CT attenuation 与冠状动脉狭窄程度做 Spearman 相关性分析发现, 冠脉狭窄程度与年龄 ($r = 0.310$)、BMI ($r = 0.161$)、糖尿病史 ($r = 0.214$)、VAT area ($r = 0.411$) 均呈正相关, 与 VAT CT attenuation ($r = -0.472$) 呈负相关。对 VAT area、VAT CT attenuation 做 ROC 曲线分析发现 VAT area、VAT CT attenuation 对冠状动脉中重度狭窄预测的曲线下面积分别是 0.737、0.772, 敏感度分别为 72.7%、75.8%, 特异度 62.2%、63.3%。**结论:** VAT area、VAT CT attenuation 能够从数量和质量两个方面较全面地评价腹部内脏脂肪, 对于冠状动脉中重度狭窄均具有一定的预测价值。

心脏磁共振特征追踪技术定量评价 COPD 患者左心室功能异常的初步研究

冯馨仪、李睿、王菲瑶、张天悦、王灵丽
川北医学院附属医院

目的：探讨心脏磁共振特征追踪（CMR-FT）技术定量评价 COPD 患者亚临床期左心室整体及各节段期心肌损伤的可行性。

方法：收集我院 2020 年 12 月~2022 年 12 月期间符合纳入及排除标准的 COPD 患者 47 例，其中男性 25 例，女性 22 例，平均年龄 47.26 ± 4.66 岁；同时纳入正常对照组 30 例，男性 17 例，女性 13 例，平均年龄 47.47 ± 4.42 岁。所有纳入者均行 3.0 T CMR 检查，分析 COPD 组与正常对照组左心室常规心功能、整体及节段心肌各方向（径向、周向及纵向）峰值应变（Peak strain, PS）间的差异。

结果：COPD 组左心室整体及中间段、基底段各方向（径向、周向及纵向）PS 均低于正常对照组（all $P < 0.001$ ），心尖段径向及纵向 PS 较正常对照组显著减低，心尖段周向 PS 未见明显差异（all $P = 0.268$ ）。

结论：CMR-FT 可定量评价心功能正常 COPD 患者的左心室整体及局部心肌应变异常，有望为疾病早期诊断及预后评价提供影像学依据。

PU-1937

肺充气状态与亚实性肺结节 CT 定量参数的相关性研究

张含笑、周秀秀
中国人民解放军海军军医大学第二附属医院

目的：探讨肺充气状态对亚实性肺结节 CT 定量参数的影响，建立亚实性肺结节 CT 定量参数是否随肺充气状态变化的预测模型。

材料和方法：回顾性纳入 2018 年 8 月至 2021 年 7 月在我院同时行低剂量双气相（吸气相和呼气相）胸部 CT 的 230 名患者，共计 255 个亚实性肺结节。获取患者双气相 CT 图像中的肺定量参数（肺体积和肺密度）和结节定量参数（结节长轴直径、短轴直径、平均直径、表面积、体积和密度），计算定量参数变化率 = $\frac{\text{（呼气相定量参数}-\text{吸气相定量参数）}}{\text{吸气相定量参数}}$ 。将结节定量参数分为吸气相组和呼气相组，比较各定量参数在组间的统计学差异。比较结节定量参数变化率之间的差异。为了探讨肺充气状态变化导致的结节定量参数变化是否会影响随访过程中结节生长的判断，根据随访指南中结节是否生长的标准，将结节分为结节定量参数变化达到随访生长标准组（变化组）和未达到随访生长标准组（无变化组），比较各定量参数和定量参数变化率在两组间的统计学差异。应用 logistic 回归对亚实性肺结节是否变化的可能相关因素进行分析并建立亚实性肺结节定量参数是否随肺充气状态变化的预测模型。

结果：所有肺定量参数和结节定量参数在吸气相组和呼气相组间均存在统计学差异（ P 均 < 0.05 ），结节定量参数中，长轴直径变化率（7.14%）最小，体积变化率（20.21%）最大。肺体积变化率、结节长轴直径变化率、结节密度变化率和所有吸气相结节定量参数在变化组和无变化组间均存在统计学差异（ P 均 < 0.05 ）。logistic 回归分析结果显示肺体积变化率、吸气相结节长轴直径、短轴直径、表面积、体积和密度是亚实性肺结节是否随肺充气状态变化的独立预测因素。用 ROC 曲线检测模型预测效力，AUC 为 0.926。

结论：亚实性肺结节体积对肺充气状态变化最敏感，由肺体积变化率和多个亚实性肺结节 CT 定量参数构建的预测亚实性肺结节定量参数是否随肺充气状态变化的模型效能较好。

PU-1938

联合临床与影像特征预测肺癌合并 COPD 的模型构建及效能评价研究

涂文婷、周陶胡、范丽、刘士远
中国人民解放军海军军医大学第二附属医院

目的：本研究旨在探索肺癌患者的 CT 影像特征与临床特征是否具有鉴别慢性阻塞性肺疾病(COPD)的潜力，并且进一步开发和验证不同的诊断列线图来预测肺癌是否共患 COPD。

方法：回顾性分析了来自两个医院的 498 例肺癌患者(COPD 组 280 例，非 COPD 组 218 例；训练队列 349 例，验证队列 149 例)。我们评估了 5 项临床特征和 20 项 CT 形态学特征。使用秩和检验或 t 检验以及卡方检验评估 COPD 组和非 COPD 组之间所有变量的差异。采用多因素 logistic 回归分析建立 COPD 诊断模型，包括临床列线图、影像学列线图和联合列线图。采用 ROC 曲线评估和比较各个列线图的性能，并采用决策曲线分析评估列线图的临床应用价值。

结果：年龄、性别、瘤-肺界面、支气管截断征、棘状突起征、毛刺征是肺癌患者合并 COPD 的独立预测因素。在训练集和验证集中，临床列线图对肺癌患者合并 COPD 均表现出良好的预测性能[AUC 分别为 0.807 (95% CI, 0.761 ~ 0.854)和 0.753 (95% CI, 0.674 ~ 0.832)]；影像学列线图的效能略提升，AUC 分别为 0.814 (95% CI, 0.770 ~ 0.858)和 0.780 (95% CI, 0.705 ~ 0.856)。在训练集和验证集中，融合临床特征和影像学特征构建的联合列线图的性能进一步提高(AUC 分别为 0.863 [95% CI, 0.824 ~ 0.903]、0.811 [95% CI, 0.742 ~ 0.880])。决策曲线显示联合列线图的总体净效益高于其他列线图。

结论：联合临床特征和影像学特征构建的列线图优于临床列线图和影像学列线图；这为一站式 CT 扫描检测肺癌患者合并 COPD 提供了一种便捷的方法。

PU-1939

周围型实性肺癌的 CT 进展规律及其体积倍增时间的影响因素分析

何小群、李琦
重庆医科大学附属第一医院

目的 探讨周围型实性肺癌(peripheral solid lung cancer, PSLC)的 CT 进展规律及其体积倍增时间的影响因素。

方法 收集我院 80 例(共行 202 次 CT 扫描，检出 202 个肺结节或肿块)在 CT 随访过程中出现进展的 PSLC 患者，根据肿瘤直径分为以下 4 组：A 组，直径 $\leq 8\text{mm}$ ；B 组， $8\text{mm} < \text{直径} \leq 15\text{mm}$ ；C 组， $15\text{mm} < \text{直径} \leq 30\text{mm}$ ，D 组，直径 $> 30\text{mm}$ ，比较 4 组肿瘤 CT 征象的差异；同时测量并计算肿瘤在不同随访时间的体积倍增时间(volume doubling time, VDT)，比较不同临床、病理及 CT 特征间 VDT 的差异。

结果 从 CT 进展规律来看，直径 $\leq 8\text{mm}$ 与 $> 8\text{mm}$ PSLC 的 CT 征象存在显著差异，随着肿瘤增大，分叶数量逐渐增多，分叶程度逐渐加深，毛刺征、含气腔隙、灶周纤维化、胸膜凹陷征、血管集束征、支气管截断征、淋巴结增大及胸腔积液的发生率逐渐增高(P 均 < 0.05)。从 VDT 的影响因素来看，腺癌的 VDT 显著长于鳞癌和大细胞肺癌；女性患者肿瘤的 VDT 长于男性； $\leq 8\text{mm}$ 肿瘤的 VDT 长于 $> 15\text{mm}$ 者；有血管集束征和充气支气管征的肿瘤具有更长的 VDT(P 均 < 0.05)。

结论 不同大小的 PSLC 具有不同的 CT 特征，肿瘤越大，CT 恶性征象越多，诊断亦越容易；肿瘤越小，CT 恶性征象越少，诊断亦越困难。同时，肿瘤 VDT 与病理类型、患者性别、肿瘤大小、是

否存在血管束征和充气支气管征有关。熟悉 PSLC 的 CT 进展规律及其 VDT 的影响因素有助于肿瘤的早期定性诊断,改善患者预后。

不同触发阈值对减轻上腔静脉伪影影响的对比研究

李信友、周芳露、郑桥、张志伟、金瑞、吕发金
重庆医科大学附属第一医院

目的 探讨普通胸部 CT 增强不同触发阈值选择上腔静脉强化幅度的差异,获取避免上腔静脉伪影干扰的最佳触发阈值。**方法** 选择 2022 年 5 月至 2023 年 3 月重庆医科大学附属第一医院行多排螺旋 CT 胸部增强检查患者 300 例(BMI23~26, 体重 50~75kg, 排除心功能不良)。设备为 GE Discovery 64 排螺旋 CT, 对比剂选用 320mgI/mL (碘佛醇), 常规进行胸部 CT 平扫后选择对比剂智能追踪/实时增强监测法完成胸部 CT 增强检查: 碘总量按 320mgI/kg 体重计算, 对比剂维持注射时间设计为 20s, 生理盐水维持注射时间设计为 10s (25~40mL), 注射速率均为: 2.5~3.7mL/s, 监测气管分叉层面下 1cm 的降主动脉主干, 注射对比剂 12s 后开始监测, 根据选择的触发阈值不同分为 A、B、C 三组, 3 组触发阈值分别设置为 120HU、150HU、180HU, 每组均为 100 例, 扫描完成后分别测量气管分叉层面下 1cm 的上腔静脉、右肺动脉主干、降主动脉 CT 值, 并计算各组各血管测量平均值。**结果** 三组病例的上腔静脉 CT 值分别为: 613.42 ± 30.53 HU, 457.21 ± 15.29 HU, 272.43 ± 11.87 HU; 右肺动脉主干 CT 值分别为: 352.44 ± 17.27 HU, 273.62 ± 13.36 HU, 191.58 ± 8.47 HU; 降主动脉 CT 值分别为 287.42 ± 10.35 HU, 322.53 ± 11.28 HU, 279.62 ± 8.73 HU。**结论** 对比 3 组各血管测量平均值, 选择触发阈值 180HU 完成胸部 CT 增强检查, 上腔静脉强化幅度更低, 伪影干扰较小, 降主动脉强化幅度趋于平稳, 能提供病灶与周围组织的较好强化对比。

PU-1941

体-肺分流伪影的临床预测模型

管学春
广西医科大学第一附属医院

目的: 构建和评估疑诊 PE 患者中 S-PSA 的临床预测模型, 以方便临床工作中选择合适的 CTPA 检查方案。

方法: 本研究连续搜集 1355 例 2021 年 1 月- 12 月我院因疑诊 PE 而行 DP-CTPA 检查患者, 其中 S-PSA 患者 152 例, 非 S-PSA 患者 1203 例, 按 CT 检查时间分为训练集 (1006 例) 及验证集 (349 例)。基于多因素 logistics 回归模型得到的 S-PSA 独立预测因子建立列线图评分体系, 计算 C 指数并绘制校准曲线和决策曲线对模型进行评价。

结果: 经单因素 logistic 分析显示, 胸痛、咳血、D-二聚体升高、支气管扩张与 S-PSA 相关 ($P < 0.05$), 多因素 logistic 分析显示胸痛、咳血、D-二聚体升高、支气管扩张、肺部感染是预测 S-PSA 的独立预测因子。预测 S-PSA 的列线图显示在训练和验证集中一致性和校准能力可以接受。**结论:** 胸痛、咳血、D-二聚体升高、支气管扩张、肺部感染是疑诊 PE 患者 S-PSA 的独立预测因子, 基于独立预测因子建立的 S-PSA 列线图预测模型在单中心验证中显示具有应用价值。

PU-1942

动态增强 MRI 半定量分析及 DWI 在肺内空洞性病变鉴别诊断中的价值

周莹

连云港市第一人民医院

目的 探讨动态增强磁共振成像(DCE-MRI)半定量分析及扩散加权成像(DWI)在肺内空洞性病变良恶性鉴别诊断中的价值。**方法** 回顾性分析 42 例经病理及临床证实的肺内单发空洞性病变,其中良性空洞 15 例,恶性空洞 27 例,行 DCE-MRI 及 DWI 检查,计算达峰时间(TTP)、半峰时间(THR)、最大增强幅度(MRE)、最大斜率(MS)、首过 60 s 曲线下面积(IAUC60)、廓清率(WOR)及早期强化率(EWIR)等半定量参数,分析 MRI 征象及半定量参数对良恶性空洞的诊断效能。**结果** 良恶性空洞平均直径、壁厚、空洞内壁形态、空洞壁 T1WI 信号、洞壁时间信号强度曲线(TIC)及空洞内容物、内部 T1WI、T2WI、DWI、表观扩散系数(ADC)信号组间差异有统计学意义(P 值均 < 0.05)。半定量参数分析显示 TTP、MS 和 IAUC60 两组间差异均有统计学意义(P 值均 < 0.05)。**结论** DCE-MRI 半定量分析及 DWI 对肺内良恶性空洞性病变的鉴别诊断具有一定的临床应用价值。

PU-1943

光谱 CT 多参数成像肺部肿瘤 介入穿刺靶点的精准选择

马冬

辽宁省肿瘤医院

目的: 通过光谱 CT 的多参数成像制定肺穿刺介入手术的计划,进而提高介入穿刺活检的安全性和准确性。**方法:** 选取二十名预行肺穿刺的患者,用光谱 CT 进行增强扫描。一次扫描可以获得常规 CT 图像、Mono E 图像(包括 40~200ke V 共 161 个能级)、Zeff 图、碘密度图、无水碘图等多个成像参数进行病变定量的鉴别诊断。通过各期图像中的碘密度定量测量,区分病变内部不同成分:血供丰富的成分(动脉期、静脉期),血供欠丰富成分(动脉期、静脉期)。肿瘤组织的碘密度一般在 2mg/ml 以下,对于碘密度过高的区域意味着血供非常丰富,穿刺后极易引起出血。对于肺内占位性病变而言:如果是病灶中央碘密度值特别低,接近 0mg/ml,则判定为坏死成分,那就应该对病灶边缘,也就是碘密度值比较高的区域进行穿刺。但如果病灶边缘区域碘密度值特别高,则提示局部血供非常丰富,有可能是阻塞性肺炎,也有可能是富血供的肿瘤成分。肺内多发病灶,寻找同源性病变,选择穿刺病灶。通过对光谱 CT 多参数的回顾性分析来确定穿刺计划。**结果:** 10 例肺部较大肿瘤的患者,避开病变区坏死、炎性和钙化等成分部位,穿刺点选取肿瘤实质成分。5 例肺部肿瘤密度较均匀的患者,避开了病灶血供较丰富的区域。3 例肺部多发病灶的患者,寻找同源性病变确定二处穿刺点。另外二名患者配合不好,穿刺未成功。穿刺手术成功率 90%,经病理随访 1 例患者结果待确定,病灶穿刺准确率达 94%。**结论:** 光谱 CT 增强检查得到的多参数成像可以提高肿瘤病灶检出,明确肿瘤内的不同成分,寻找到同源性病变,明确肺部肿瘤并阻塞性病变,为肺部肿瘤的介入穿刺手术提高精准的穿刺靶点,制定准确的穿刺手术计划,增加介入穿刺活检手术的安全性和准确性,同时也减少了患者的痛苦,提升了手术医师的信心,提高了工作效率。

PU-1944

基于不同对比剂注射方式在胸痛三联征双源 CT 成像中的对比研究

孟岳

连云港市第一人民医院

目的 探讨联合改变对比剂注射方式与团注追踪法中感兴趣区 (Region of interest, ROI) 位置在双源 CT 胸痛三联征检查 (triple-rule-out computed tomography angiography, TRO-CTA) 中的应用价值。**方法** 选取我院胸痛中心 2020 年 12 月~2021 年 12 月收治以胸痛、胸闷、呼吸困难为主要临床表现并结合相应临床症状及检验指标高度怀疑胸痛三联征 (Triple-rule-out, TRO) 的患者进行 TRO-CTA 检查, 最终入组的 298 例患者随机分配到传统组 100 人、改良组 96 人和 FLASH 组 102 人。对比分析三组检查主动脉、肺动脉和冠状动脉的 CT 值、显影段数、图像噪声(noise)、信噪比 (signal to noise ratio, SNR)、对比噪声比(contrast noise ratio, CNR)、影像评分、对比剂用量、对比剂速率以及辐射剂量。**结果** 三组检查的主动脉、肺动脉和冠状动脉的图像噪声、SNR、CNR 和显影段数组间差异均无统计学意义 ($P > 0.05$), 但三组检查的辐射剂量、对比剂用量、注射速率以及主动脉、肺动脉和冠状动脉的 CT 值、影像评分组间差异有统计学意义 ($P < 0.05$)。

结论 在保证图像质量满足 TRO-CTA 影像诊断的前提下, 对比剂改良法通过改变对比剂注射速率并将 ROI 兴趣区置于肺动脉主干, 对比剂用量较传统法减少了近 30ml; 使用第二代 DSCT 中的 FLASH 扫描模式在使用少量对比剂的同时, 既可获得 TRO-CTA 的标准影像, 又可显著降低 TRO-CTA 检查产生的辐射剂量。

PU-1945

新冠疫苗在接种前后感染新冠肺炎临床及 CT 特征分析

岳丽娜

中国人民解放军联勤保障部队第 940 医院

[摘要]**目的:** 探讨境外输入性新型冠状病毒肺炎 (接种疫苗组) 与本地病例 (未接种疫苗组) 的临床及胸部 CT 表现差异。**方法:** 回顾性分析武汉火神山医院确诊 COVID-2019 患者 65 例 (未接种疫苗组) 及 2021 年 9 月 1 日-2021 年 9 月 30 日在后我院确诊境外输入 COVID-2019 患者 75 例 (接种疫苗组), 比较两组临床资料及胸部 CT 征象差异。**结果:** ①临床资料及实验室检查: 两组 COVID-19 病例临床症状及体征差异均有统计学意义 ($P < 0.05$); 白细胞升高及正常的人数在两组 COVID-19 病例间存在显著组间差异 ($P < 0.05$); 淋巴细胞正常及下降的人数在两组 COVID-19 病例间存在显著组间差异 ($P < 0.05$); 血沉升高的人数在两组之间有统计学意义 ($P < 0.05$), 余相关实验室检查在两组之间均无统计学意义 ($P > 0.05$)。②临床分型: 有症状感染者临床分型中重型在两组 COVID-19 病例间存在组间差异, 而轻型与普通型发生率不存在组间差异, 差异有统计学意义 ($P < 0.05$), 两组 COVID-19 病例在普通型和重型病例预后评估上差异无统计学意义 ($P > 0.05$)。无症状感染者两组病例间差异有统计学意义 ($P < 0.05$)。③CT 影像特征: 2 组 COVID-19 病例从病灶形态学分析, 结节型出现率差异无统计学意义 ($P > 0.05$)。有无胸腔积液/心包积液出现在间无统计学意义 ($P > 0.05$)。余 2 组 COVID-19 病例在累及肺叶总数、病灶分布情况、病灶形态、病灶密度、病变征象及有无肺外表现的差异均有统计学意义 ($P < 0.05$)。**结论:** 2 组 COVID-19 病例在临床资料、实验室检查及 CT 特征有一定差异, 通过胸部 CT 表现能够反映新冠疫苗有预防 COVID-2019 的作用, 体内产生保护性抗体在一定程度上可以减缓肺部病变发生及进展。

PU-1946

光谱 CT 在周围型肺动脉栓塞中的价值

王霞、文铁
延安大学附属医院

目的 探讨光谱 CT 成像在周围型肺动脉栓塞中的诊断价值。

方法 回顾性分析本院 2022 年 1 月至 12 月临床怀疑肺动脉栓塞的 186 例患者，所有患者均接受光谱 CT 扫描，重建得到常规及光谱图像（最佳单能量图、碘密度图及有效原子序数图），结合临床最终确诊结果，比较图像中外周型肺动脉栓塞的最终确诊结果，同时分析肺灌注缺损区域与相应正常肺实质区域的碘密度值差异以及有效原子序数值差异。

结果 分析经临床确诊周围型肺动脉栓塞的 36 例患者，发现光谱 CT 图像的诊断效能较常规 CTPA 图像高，碘密度图及有效原子序数图对外周型肺动脉栓塞的检出率较常规 CTPA 图像有优势。

结论 能谱 CT 成像能有效提高周围型肺动脉栓塞的检出率。

PU-1947

基于多层螺旋计算机体层摄影影像组学预测 COPD 早期急性加重的新型列线图

朱婷婷、李枝春
川北医学院附属医院

【摘要】

目的：研究基于多层螺旋计算机体层摄影（MDCT）的影像组学列线图，用于预测慢性阻塞性肺疾病（COPD）的早期急性加重。方法：将 210 名 COPD 患者分为两组：训练组（ $n = 146$ ）和验证组（ $n = 64$ ）。根据 COPD 患者 1 年内发生急性加重次数，将 COPD 患者分为易发生急性加重的 COPD（PAECOPD）患者组和较稳定的 COPD（SCOPD）患者组。采用 3D Slicer 软件进行特征提取，从未增强 MDCT 图像中提取主动脉弓上方层面胸肌影像组学特征。采用最小绝对收缩率和选择算子逻辑回归计算影像组学评分，生成影像组学特征并建立影像组学模型。采用单因素和多因素 logistic 回归分析，确定与 COPD 患者急性加重显著相关的临床因素，并构建临床模型。结合临床模型和影像组学特征构建了影像组学列线图。从识别能力、准确性和临床价值等方面对 3 个模型的性能进行了综合评估，从而生成了最优预测模型。结果：从胸肌采集图像中选择 12 个最佳特征进行建模。胸肌面积（PMA）、胸肌密度（PMD）、(1)慢性阻塞性肺病全球倡议（GOLD）分级和影像组学评分（Radscore）是 COPD 患者急性加重风险的独立预测指标。这些因素用于构建列线图模型，该模型在训练和验证组中表现出良好的表现，曲线下面积分别为 0.932 和 0.896。曲线下面积和决策曲线分析表明，与单独的临床和影像组学特征模型相比，影像组学列线图模型可以获得更好的诊断性能并获得更大的临床净收益。结论：我们构建了一个包含临床模型和影像学特征的组合列线图，作为预测 COPD 早期急性加重的新方法。

Non-contrast CT-based radiomics nomogram of pericoronary adipose tissue for predicting haemodynamically significant coronary stenosis in patients with type 2 diabetes

can chen, meng chen, qing tao, su hu, chunhong hu
The First Affiliated Hospital of Soochow University

Background Type 2 diabetes mellitus (T2DM) patients have a higher incidence of coronary artery disease than the general population. The aim of this study was to develop a radiomics nomogram of pericoronary adipose tissue (PCAT) based on non-contrast CT to predict haemodynamically significant coronary stenosis in T2DM patients. **Methods** The study enrolled 215 T2DM patients who underwent non-contrast CT and coronary computed tomography angiography (CCTA). CCTA derived fractional flow reserve (FFR_{CT}) ≤ 0.80 was defined as hemodynamically significant stenosis. 1691 radiomics features were extracted from PCAT on non-contrast CT. Minimum redundancy maximum relevance (mRMR) and least absolute shrinkage and selection operator (LASSO) were used to select useful radiomics features to construct Radscore. Logistic regression was applied to select significant factors among Radscore, fat attenuation index (FAI) and coronary artery calcium score (CACS) to construct radiomics nomogram. **Results** Radscore [odds ratio (OR)=2.84; P<0.001] and CACS (OR=1.00; P=0.023) were identified as independent predictors to construct the radiomics nomogram. The radiomics nomogram showed excellent performance [training cohort: area under the curve (AUC)=0.81; 95% CI: 0.76–0.86; validation cohort: AUC=0.83; 95% CI: 0.76–0.90] to predict haemodynamically significant coronary stenosis in patients with T2DM. Decision curve analysis demonstrated high clinical value of the radiomics nomogram. **Conclusion** The non-contrast CT-based radiomics nomogram of PCAT could effectively predict haemodynamically significant coronary stenosis in patients with T2DM, which might be a potential noninvasive tool for screening of high-risk patients.

基于机器学习的随机森林算法预测冠心病患者主要不良心脏事件的应用研究

邢秋思^{1,2}、李相生¹、方圆¹
1. 中国人民解放军空军特色医学中心
2. 河北北方学院

目的 探讨基于影像和临床特征构建的机器学习模型对冠状动脉粥样硬化性心脏病 (CAD) 患者发生主要不良心脏事件 (MACE) 的预测价值。 **方法** 回顾性收集行冠状动脉 CT 血管造影 (CCTA) 检查且结果显示至少一支冠状动脉狭窄程度为 50%-90% 的 120 例冠心病患者, 随访 MACE 发生情况。选取 16 个临床和影像特征作为模型输入变量, 以 MACE 事件发生有无作为二分类输出变量。采用机器学习的随机森林算法和传统逻辑回归方法构建模型。采用受试者操作特征曲线下面积评估两种模型对 CAD 患者发生 MACE 的预测效能。对机器学习预测模型的 16 个特征进行重要度排序。 **结果** 机器学习模型的诊断效能明显优于传统逻辑回归模型, 其敏感度为 0.82、特异度为 0.92 和曲线下面积 (AUC) 为 0.94。提取的影像学特征按照预测效能排序, 前五位依次为 CT-FFR (0.33)、FAI (0.18)、狭窄程度 (0.15)、年龄 (0.10)、高血脂 (0.04)。 **结论** 基于临床和影像特征建立的机器学习模型具有良好的诊断效能, 有利于临床对 CAD 患者进行危险分层, 从而筛选出高危患者并及时干预对减少 MACE 事件的发生具有重要意义。

PU-1950

基于 MR T2-fBLADE-TSE 图像特征构建 Nomogram 模型评估非小细胞肺癌病理亚型的研究

郭炎兵

陕西中医药大学附属医院

目的：基于 MR T2-fBLADE-TSE 序列成像，采用影像组学的分析方法，构建 Nomogram 模型术前评估非小细胞肺癌的病理亚型。

方法：回顾性分析经病理证实的非小细胞肺癌患者。由两名高年资医师分别独立完成病变的影像学征象评估，并对结果行一致性检验。随机抽取 30 例患者，两名医师独立使用 ITK-Snap 软件分割病灶，4 周后其中一名医师重复分割工作，分别提取特征计算组内相关系数。采用分层随机抽样将数据划分为训练集和测试集（7：3）。使用 R 语言对训练集特征进行筛选，得到关键特征并计算其影像组学评分。使用单因素和多因素 logistic 回归，筛选独立危险因素，并构建预测肺腺癌的 Nomogram 模型。使用 ROC 曲线、校准曲线和 DCA 曲线，评估影像 Nomogram 模型在评估非小细胞肺癌病理亚型中的准确度、校准度和临床有效性。

结果：本研究共纳入 83 例腺癌和 34 例鳞癌患者，两名医师对病灶的影像学征象判读及病灶勾画的一致性良好。训练集中患者性别、毛刺征、胸膜凹陷征在腺癌和鳞癌组间的差异具有统计学意义（ $P<0.05$ ）。Lasso 算法选择了 9 个关键特征并用于计算影像组学评分，多因素 logistic 回归结果显示，性别（OR: 9.411, $P=0.020$ ）和影像组学评分（OR: 2.788, $P<0.001$ ）是预测非小细胞肺癌的独立危险因素，并根据结果构建评估肺腺癌风险分层的 Nomogram 模型。通过内部验证，Nomogram 模型在训练集 C-指数为：0.899，测试集 C-指数为：0.768，校准曲线显示模型校准度良好，临床决策曲线表明，相较于单独使用影像组学模型，列线图为患者提供了更多获益。

结论：基于 MR T2-fBLADE-TSE 图像特征构建的 Nomogram 模型，能够量化非小细胞肺癌为肺腺癌的风险，相比较单一预测因素，Nomogram 模型的诊断效能更高可作为肺癌诊断和治疗的无创性影像生物学标志。

The relationship between pulmonary artery imaging quality and cardiothoracic ratio based on dual-source CT

Jiaming Li, Hongliang Zhao

Department of Radiology, the First Affiliated Hospital, Air Force Medical University of PLA

Purpose: In order to investigate the correlation between the cardiothoracic ratio and imaging quality of the pulmonary arteries, we collected the data of patients by computed tomography pulmonary artery.

Materials and Methods: A total of 20 patients undergoing pulmonary artery examination in PACS were collected, including 10 male patients and 10 female patients. The age range of the participants was 36~83 years old, and the average age was 57 years old. The scanning scheme was as follows: the tube voltage was 100kV, the tube current was 148mAs, the pitch was 2.0, and the superior vena cava illumination was used to trigger the scan. The quality evaluation of images was based on CT value measurement of key points and blinded scoring, and the measurement of CT value mainly focused on measuring pulmonary trunk, left pulmonary artery and right pulmonary artery. Secondly, the cardiothoracic ratio was calculated by dividing the maximum diameter of the heart by the maximum diameter of the thoracic cage. Two senior vascular diagnosticians in the department scored the scanned images double-blind, and the scores were divided into five levels: 1~5 points, the image quality increased in turn, and the pulmonary arteries

at all levels showed clearly. Finally, the correlation between the scores of image quality and the CT value of interesting points and the cardiothoracic ratio was carried out.

Results: The Pearson correlation coefficient between the blinded score of pulmonary artery images and the cardiothoracic ratio was -0.6109 ($P < 0.05$), and the CT values of the pulmonary trunk, left pulmonary artery, and right pulmonary artery were not significantly correlated with the cardiothoracic ratio.

Conclusion: There was a significant correlation between the examiner's cardiothoracic ratio and the quality of imaging of the pulmonary arteries.

基于深度学习模型对新型冠状病毒肺炎的定量 CT 研究

杨雯

南京鼓楼医院

目的: 探讨深度学习模型在新型冠状病毒肺炎的诊断、病情评估及与非新冠肺炎的鉴别诊断价值。方法: 回顾性分析 2020 年 1 月到 2020 年 2 月之间南京大学医学院附属鼓楼医院确诊的 9 例普通型新型冠状病毒肺炎 (COVID-19) 患者 (COVID-19 组, 新冠组) 及 25 例非新冠肺炎患者 (CAP 组, 非新冠组) 的胸部 CT 扫描图像和临床资料, 通过深度学习分割及人工校正方法进行图像分割, 分割内容包括感染肺叶数、感染体积及其在肺部总体积中的占比等参数。分析两组患者的临床表现和实验室结果, 比较两组患者的深度学习分割结果的差异。感染体积在肺部体积总占比及其在位置上的分布情况以平均值以及 95% 置信区间显示; 两组之间感染肺叶数的比较采用 Fisher 确切概率法, 两组之间肺炎病灶占整肺体积百分比之间的比较采用 Mann-Whitney U 检验 (非正态分布)。结果: 采用深度学习分割方法可以对两组所有肺炎患者进行快速图像分割, 平均分割时间为 10s/例。新冠组与非新冠组在白细胞及淋巴细胞计数具有统计学差异 ($P < 0.05$)。与非新冠组相比, 普通型新冠肺炎组中的感染肺叶数显著少于非新冠组 (2.11 vs. 3.24, $p < 0.05$), 感染肺叶数与感染病变的分布及位置无显著差异; 感染总体积占比在两组间无显著性差异。结论: 深度学习分割的方法能够迅速进行肺炎整体病灶的自动分割, 定量评估病变范围, 与非新冠肺炎也具有一定的鉴别诊断价值, 为研究新冠肺炎提供了一种 CT 的定量方法。

“人磨”大战的研究思考

王万章

宣汉县人民医院

材料 抽取 182 例患者 195 枚磨玻璃结节术后病理报告 (又称金标准), 选取其中五个临床参数, 随后将其导入 AI 软件系统, 依次与经病理证实过的 CT 片重新诊断, 选取 AI 诊断报告中七个临床参数。方法 使用 SPSS 23.0 进行统计学分析。以表示为服从正态分布的连续变量, 以中位数 (25th-75th) 表示不服从正态分布的连续变量; 以频数 (%) 表示计数资料。采用 wilcoxon 符号秩和检验比较连续变量组间差异, 分类变量组间差异比较采用 McNemar 检验。变量的关联性检验采用 spear 秩相关或 kappa 一致性检验。采用有序 logistic 回归建立不同类型磨玻璃结节预测模型。绘制风险指数的受试者特征 (ROC) 曲线评价指标的诊断能力。P<0.05 表示具有统计学意义。结论 (1) 所患磨玻璃结节男女构成比没有差异, 3 类磨玻璃结节年龄的组间构成比存在差异, 相比于 AAH+AIS 组患者, MIA 组和 IA 组患者年龄结构比偏大。(2) AI 在肺结节诊断方面, 结节位置准确率在 86.67%, 恶性风险准确率 69.23%, Lung-RADS 分级准确率 62.54%。恶性风险概率

(%) 与 lung-rads 分类对 AAH+AIS、MIA、IA 有预测作用。但总体而言,人工智能对肺部磨玻璃结节的准确率相对较低。

PU-1954

右心室流出道粘液瘤 1 例

李丽沙^{1,2}、申向辉²

1. 承德医学院研究生学院
2. 邯郸市中心医院超声医学科

摘要:目的 报道 1 例具有非典型影像学特征的右心室流出道粘液瘤。方法 应用经胸超声心动图、CT 冠状动脉造影进行心脏肿瘤术前诊断。结果 超声心动图表现为右心室及流出道可探及多个不规则低回声团块,呈串珠样,团块内可见点状钙化,团块有蒂,蒂附着点探查不清,团块活动度较大,可达肺动脉瓣。CT 冠状动脉造影显示右室及流出道有不规则的充盈缺损,内伴斑点状钙化。术中病理证实右心室流出道粘液瘤的诊断。结论 该病例说明了建立心脏肿瘤正确病因学诊断的困难,尤其当肿物位于右心室时,仍然需要组织病理学确诊。发现右心室粘液瘤时,应采取多模态成像进行心脏肿瘤术前诊断。

GE Revolution CT 在高心率 (HR) 患者冠状动脉 CTA (CCTA) 检查中的应用价值分析

杨成乾、陈鑫、胡纯民、舒偲、余晓洁、程杰、王霄
泰康同济(武汉)医院

目的:探讨 256 排 GE Revolution CT 在高心率患者冠状动脉 CTA 检查中的应用价值。**方法:**收集在我院拟行冠状动脉 CTA 检查且 HR 大于等于 80 次/分钟的患者 50 例为研究对象,随机分组: A 组 25 例采用传统的前瞻性心电门控采集模式,曝光时间窗 (R-R 间期的 35%~85%); B 组 25 例采用 256 排 GE Revolution CT 所自带的 1-Beat 扫描模式采集数据。扫描参数: 120kV, SmartmA325-720,重建层厚 0.625mm,记录扫描后平均容积 CT 剂量指数(CTDIVOL)和剂量长度乘积 (DLP),计算有效辐射剂量 (ED)。将扫描后得到的图像进行后处理,由两位高年资诊断专家对图像质量进行评分,评分标准分为 4 级,4 分:图像质量优,动、静脉系统和 4 个心腔的造影剂密度均匀,组织结构明确,无伪影,图像清晰;3 分:图像质量良好,动、静脉系统和 4 个心腔的造影剂大部分密度对比清楚,无伪影,图像清晰,能明确诊断;2 分:图像质量中等,动、静脉和 4 个心腔的造影剂显影过亮或过淡,组织结构能识别,仅能满足诊断要求。1 分:造影剂充填不良,组织结构无法判断,完全不能满足诊断需求。并随访跟踪冠脉造影结果,加以对照,得出诊断准确率。结果: A 组平均 CTDIVOL 45mGy,平均 DLP714mGy, B 组平均 CTDIVOL 20mGy,平均 DLP300mGy, B 组辐射剂量低于 A 组, $P < 0.05$,具有统计学意义。B 组 23 例图像被评为 4 分,2 例评为 3 分,而 A 组 18 例被评为 3 分,7 例被评为 4 分, $P < 0.05$,具有统计学意义。因此 B 组图像质量更高。通过后期随访冠脉造影结果也证实了 B 组诊断准确率更高。结论: GE Revolution CT 由于 1-Beat 心脏成像技术,辐射剂量较低,减少了患者所受到的辐射,保护了患者的身心健康。而且对于高心率患者能够完成高品质的冠状动脉成像,利于冠脉病变的检出。

PU-1956

Recurrent immune checkpoint inhibitors-related pneumonitis in patients with advanced lung cancer

Lihua Wang, Yahong Luo
liaoningshengzhongliuyiyuan

Aims: With the wide application of immune checkpoint inhibitors (ICIs) in the field of anti-cancer, immune-related adverse events (irAEs) have attracted widespread concern. As a common adverse event of irAEs, immune checkpoint inhibitors-related pneumonitis (CIP) has a higher incidence rate in patients with lung cancer, which may lead to life-threatening. We investigated a cohort of patients who were diagnosed with recurrent CIP (rCIP) after ICIs therapy to improve our understanding.

Methods: We collected 550 patients with advanced lung cancer who received PD-1/PD-L1 treatment in our hospital from January 1st, 2018 to July 1st, 2022. Patients diagnosed with infections, thoracic radiotherapy, or other etiologies that cause pneumonitis were excluded. We report on cases who were successively diagnosed with CIP and rCIP and summarize their recurrent characteristics by reviewing the medical records and follow-up.

Results: Five patients with rCIP were identified and accounted for 8.6% of CIP. Immunotherapy can cause CIP at any time (from 42 to 559 days) during the treatment period. However, rCIP occurs almost one month after CIP improvement or resolution. Compared with CIP, rCIP usually occurs faster and more seriously, including clinical and imaging manifestations. In addition, every episode of pneumonitis may be present with a similar pattern but possibly involve different regions of the lung. More importantly, continuing or interrupting ICIs therapy may lead to the occurrence of rCIP. And for patients, the corticosteroid treatment must reach the recommended dose, and the tapering process should be slow. In the end, CIP may be associated with long-term survival. The overall survival (OS) of 2 out of 5 cases exceeded 24 months even without any anti-tumor treatment.

Conclusions: This article focuses on rCIP, aiming to provide a reference for clinicians to overcome this challenging toxicity and develop an optimal ICIs treatment plan.

PU-1957

A Study on Differential Diagnosis of Lung Benign Lesions and Early-stage Lung Adenocarcinomas Based on CT Images Deep Learning Technology

Man Gao
Department of Radiology, Changzheng Hospital, Naval Medical University, Shanghai, 200003, China

【Objective】 This study aims to explore the clinical application value of deep learning technology in differential diagnosis of lung benign lesions and early-stage adenocarcinomas manifested as ground-glass nodules (GGNs), introduce transfer learning training method, develop and validate a logistic regression model based on clinical features of patients and CT morphological features of nodules, deep learning models based on original CT images of nodules and fusion deep learning models integrating clinical features, CT morphological features and original CT images, and to compare the diagnostic performances of the established diagnostic models with the performances of radiologists on test sets. **【Methods】**

Our study retrospectively analyzed a total of 867 GGNs (benign nodules 112, malignant nodules 755) with postoperative pathological diagnoses from two centers between December 2015 and December 2020. To discriminate between benign lesions and lung adenocarcinomas in GGNs, we constructed 3 different types of automatic diagnostic models based on deep learning methods: a) a logistic regression model based on clinical features of patients and CT morphological

features of nodules (CLRM), b) CT image-based deep learning models (IDM), c) fusion deep learning models (FDM) integrating the original CT images of nodules, clinical features and CT morphological features. We apply transfer learning strategy into the model training process to solve the problem of poor generalization caused by insufficient number of samples, improve the generalization and robustness of models, and improve model performances. The performances of models were evaluated and compared on an internal test dataset and an independent external test dataset. In addition, the diagnostic performances of the automatic diagnostic models were compared with that of a manual control group in which two thoracic radiologists made their own diagnoses respectively on the external test dataset. **【Results】**

The CLRM based on clinical features of patients and CT morphological features of nodules performed well on the internal test set yielding an area under the receiver operating characteristic curve (AUC) value of 0.80 (95% confidence interval [CI]: 0.64, 0.96), however, it performed poorly on the external test set (AUC, 0.62 [95% CI: 0.42, 0.83]), showing a poor stability. The IDM-nonTL and FDM-nonTL which didn't use transfer learning strategy, didn't perform well, achieving AUC values of 0.53 and 0.47 on the internal test set and 0.68 and 0.62 on the external test set. The IDM-TL achieved an appealing diagnostic performance on both the internal and the external test sets (AUC, 0.75 [95% CI: 0.62, 0.89] and 0.76 [95% CI: 0.61, 0.90]). The FDM-TL achieved the best performance on both the internal test set (AUC, 0.82 [95% CI: 0.71, 0.93]) and the external test set (AUC, 0.83 [95% CI: 0.70, 0.96]), showing a good stability, and it achieved a much better specificity (0.69) than the manual control group (0.33 - 0.44) on the external test set.

【Conclusion】

In the deep learning models developed in this study, both IDM-TL and FDM-TL which used transfer learning strategies have the ability to assist radiologists in differentiating benign lesions and early-stage adenocarcinomas in lung GGNs, and FDM-TL performed better. It can improve the diagnostic specificity of radiologists, decrease the probability of misdiagnosis of benign GGNs as adenocarcinomas, reduce the negative impact of over-treatment on patients, and provide a non-invasive and rapid computer aided diagnosis method for surgeons to make more personalized follow-up and surgical plans for patients with lung GGNs.

PU-1958

CT 影像组学对周围型肺腺癌病理分级的预测价值研究

高曼

中国人民解放军海军军医大学第二附属医院

【研究目的】使用多种机器学习算法构建基于术前 CT 影像组学特征的周围型肺腺癌病理分级预测模型, 并比较其预测效能。以在测试集中表现最佳的 CT 影像组学预测模型计算 Rad-score。结合患者临床特征与该 Rad-score 构建临床-影像组学融合逻辑回归模型并绘制列线图, 以获得一个临床应用价值较高的周围型肺腺癌病理分级预测模型。 **【研究方法】**

回顾性收集了 2012 年 1 月至 2022 年 8 月之间的 349 例经术后病理证实的周围型肺腺癌的 CT 影像及患者的基本临床资料。对患者肺腺癌的病理分级按照 2020 年 IASLC/ATS/ERS 病理分级标准进行重新评估, 分为低中危组 253 例和高危组 96 例。将所有病例按 7: 3 的比例随机分入训练集和测试集。半自动分割病灶 ROI, 并针对病灶 ROI 提取 CT 影像组学特征。。使用逻辑回归、决策树、支持向量机 (SVM)、随机森林和朴素贝叶斯 5 种机器学习算法来构建 CT 影像组学预测模型。使用 ROC 曲线分析来评估 CT 影像组学模型在训练集和测试集上的预测效能, 用表现最好的 CT 影像组学模型计算 CT Rad-score, 再结合临床特征, 使用后向逐步选择法进行逻辑回归分析, 构建临床-影像组学融合逻辑回归模型并绘制列线图。 **【结果】**

从 CT 影像中提取了 7 大类影像组学特征共 1586 个。经过特征降维和筛选最终选出 15 个 CT 影像组学特征用以构建 CT 影像组学预测模型。在我们建立的 5 个 CT 影像组学模型中, SVM 模型在预

测肺腺癌病理分级方面表现出了最佳的性能，AUC、准确率、敏感性和特异性皆为各 CT 影像组学预测模型中最佳，具有较好的稳定性。【结论】

使用 SVM 的 CT 影像组学模型可以有效预测周围型肺腺癌的病理分级，可以为外科医生选择有针对性的手术方式以及术后辅助治疗方法提供有力证据支撑。根据 SVM 模型计算出的 CT Rad-score 结合临床特征建立的融合模型及其列线图，可以进一步提高其临床实用价值。

PU-1959

A Study on the Diagnostic Value of CT Radiomics in Pathological Grading of Lung Adenocarcinomas

Man Gao

Department of Radiology, Naval the 971 Hospital, Qingdao, Shandong, China

【Objective】To construct the pathological grading prediction models of peripheral lung adenocarcinoma based on preoperative CT radiomics features using a variety of machine learning algorithms, and to compare their prediction performance. The CT radiomics prediction model with the best performance in the test dataset was used to calculate the Rad-score. Combined with the patient's clinical characteristics and the Rad-score, a clinical-radiomics fusion logistic regression model and nomogram were constructed to obtain a prediction model for pathological grading of peripheral lung adenocarcinoma with high clinical application value.

【Methods】

CT images and basic clinical data of 349 patients with peripheral lung adenocarcinoma confirmed by postoperative pathology in Changzheng Hospital from January 2012 to August 2022 were retrospectively collected. The pathological grades of the patients with lung adenocarcinoma were re-evaluated according to the 2020 IASLC/ATS/ERS pathological grading standards, and were divided into a low-medium-risk group (including grade 1 and grade 2) with 253 cases and a high-risk group (grade 3) with 96 cases. All cases were randomly divided into the training set ($n = 244$) and the test set ($n = 105$) in a ratio of 7:3. LungDoc and radiologists in the chest group were performed semi-automatic segmentation of focal ROI, and CT image omics features were extracted according to focal ROI. The feature dimension is reduced by Pearson correlation coefficient recursive feature elimination method and linear kernel function. Two independent sample t test and Wilcoxon rank sum test were used for screening features, then LASSO regression analysis was performed, and 10-fold cross validation was used to calculate the optimal coefficient combination to screen the CT image omics features used to construct the CT image omics model. Five machine learning algorithms, logistic regression, decision tree, support vector machine (SVM), random forest and naive Bayes, were used to construct the CT image omics prediction model. The five-fold cross-validation was carried out in the training set to determine the hyperparameters of each model. ROC curve analysis was used to evaluate the predictive efficacy of the CT omics model on the training set and the test set. The best performing CT omics model was used to calculate the CT Rad-score, and then combined with the clinical characteristics, the backward stepwise selection method was used for logistic regression analysis, and the clinical-imaging fusion logistic regression model was constructed and the graph was drawn. 【Results】

Seven categories of image omics features were extracted from CT images, including shape features, first-order statistics, GLCM, GLDM, GLRLM, GLSZM and NGTDM, with a total of 1586 features. After feature reduction and screening, the optimal Lambda obtained by LASSO was 0.023. Finally, 15 CT image omics features were selected to construct the CT image omics prediction model. Among the 5 CT omics models established, the SVM model showed the best prediction performance in predicting the pathological grade of lung adenocarcinoma, and achieved the best performance in both the training set and the test set, with the AUC of 0.970 and 0.912, and the accuracy of 0.9385 and 0.9143, respectively. The sensitivity values were 0.9492 and 0.9868, and the Matthews correlation coefficients were 0.8482 and 0.7811, which were the best among all the CT image omics prediction models. The specificity (0.9104) was slightly lower

in the training set than in the logistic regression model (0.9851) and naive Bayes model (0.9403), but was still the best in the test set (0.8621). It shows that the SVM model has good stability.

【Conclusion】

The CT image omics model based on SVM can effectively predict the pathological grade of peripheral lung adenocarcinoma, which can provide strong evidence support for surgeons to select targeted surgical methods and postoperative adjuvant therapy. The clinical-imaging fusion logistic regression model and its graph based on CT Rad-score calculated by SVM model combined with clinical characteristics can further improve its clinical practical value.

老年人低骨密度与冠状动脉粥样硬化性心脏病的相关性研究

周忠洁

温州医科大学附属第二医院

目的 探讨老年人低骨密度与冠状动脉粥样硬化性心脏病的相关性,为临床冠心病的防治提供新的途径。方法 选取 500 例老年患者进行选择冠状动脉造影。根据造影结果将患者分为冠心病组和对照组,对所有患者的腰椎及左侧股骨颈进行骨密度(BMD)测定;同时测定两组患者的年龄、BMI、血压、血钙、血磷、总胆固醇、甘油三酯、低密度脂蛋白胆固醇、高密度脂蛋白胆固醇等指标,并采用多因素非条件 logistic 回归分析低骨密度与冠状动脉粥样硬化性心脏病的相关性。结果 两组患者的腰椎及左侧股骨颈 BMD 值的差异均有统计学差异

(均 $P<0.05$),且冠心病组 BMD 值明显低于对照组。同时冠心病组的低骨密度(包括骨量减少和骨质疏松)发生率明显高于对照组,差异有统计学意义($P<0.05$)。logistic 回归分析显示低骨密度与冠心病存在明显的相关性。结论 老年人低骨密度与冠状动脉粥样硬化性心脏病之间存在相关性,是冠心病的独立预测因素。

PU-1961

胸部海绵状血管瘤:单中心 10 年病例系列

谢弘、张燕、周石

贵州医科大学附属医院

目的:加强对胸部海绵状血管瘤的认识。

方法:回顾性分析我中心 2012 至 2022 年经手术病理证实为海绵状血管瘤的病理,对其临床及影像特点进行汇总。

结果:所有 255 例海绵状血管瘤中,胸部海绵状血管瘤共 24 例,其中,男性 7 例,女性 15 例,位于体表及胸壁者 19 例,纵隔及心脏、血管内者 4 例及 2 例。多数无症状,少数因局部症状就诊。影像上表现为局部软组织肿块,增强从无强化到轻中度强化,部分延迟强化,部分内见静脉石。

结论:胸部海绵状血管瘤女性更多见,体表占多数,无症状者多见,影像诊断准确率不高,静脉石可能有一定提示性。

基于定量 CT 对 2 型糖尿病肺损害结构变化的预测价值

方玮玮、贺程成、祁丹、李延静、李锦红
延安大学附属医院

目的 通过比较 2 型糖尿病肺部损害患者 CT 定量参数与临床肺功能, 分析 2 型糖尿病肺损害患者肺部影像学变化并探讨 T2DM 肺损害的影像敏感指标。

方法 根据肺功能检查结果回顾性收集 96 例 2 型糖尿病 (T2DM) 肺功能损害患者影像资料, 经“数字肺”处理得出 CT 定量参数, 主要包括双肺容积、双肺低于 -910HU 及 -950HU 的密度衰减区的体积 (LAA910、LAA950) 占全肺的百分比 (LAA910%、LAA950%)、平均密度, 另 83 名肺功能正常的 T2DM 患者纳入对照组。采用独立样本 t 检验或 Mann-Whitney U 检验对两组肺部定量参数进行差异性分析, 将组间存在统计学差异的指标行 ROC 曲线和多因素 logistic 逐步回归。

结果 与正常对照组相比, 肺损害组的肺功能参数 FVC、FVC%、FEV1、FEV1% 及肺部 CT 定量指标全肺容积、LAA910、LAA950、LAA910%、LAA950% 显著降低 ($P < 0.05$), 平均密度显著增高 ($P < 0.05$)。全肺容积最有助于区分 T2DM 肺损害, 并且为 T2DM 肺损害的保护因素。

结论 肺部 CT 定量参数可定量反映 T2DM 患者肺损害, 全肺容积较大者可有效避免 T2DM 肺功能的减低。

PU-1963

Comparative study of imaging and pathology of primary mucinous adenocarcinoma with different imaging manifestations

Jun Han

Department of Radiology, The Third Affiliated Hospital of Chongqing Medical University, Chongqing, China.

Background Pulmonary mucinous adenocarcinoma is a special type of lung cancer. Its imaging manifestations are diverse, which brings challenges to clinical diagnosis. However, its formation mechanism is unclear.

Objective To analyze the relevant mechanisms of the formation of pulmonary mucinous adenocarcinoma by observing its different imaging and pathological manifestations.

Data and methods Retrospective analysis was conducted on imaging manifestations and pathological data of 103 patients with pulmonary mucinous adenocarcinoma confirmed intraoperatively or pathologically.

Results 43 patients had pulmonary mucinous adenocarcinoma with a solitary nodule/mass, 41 patients with localized pneumonia and 19 patients with diffuse pneumonia. Their CT manifestations included “falling snowflake sign,” ground-glass opacity close to the heart, vacuous signs/honeycombing and withered tree branches. Under the microscope, all the 3 types of pulmonary mucinous adenocarcinoma had visibly formed mucus lakes but were made of tumor cells with totally different shapes, which included the goblet-like shape (tall column-like shape) and quasi-circular shape. Tall column-shaped tumor cells were negative or weakly positive for thyroid transcription factor-1 (TTF-1) and strongly positive for ALK mutation; whereas quasi-circular tumor cells were positive for TTF-1 and less positive for ALK mutation.

Conclusion The different imaging manifestations of mucinous adenocarcinoma are possibly due to the different amounts or viscosity of mucus produced, and the mechanisms of its formation may include (1) tumor cells in different shapes have different abilities to produce mucus; (2) tumors in different stages produce different amounts or viscosity of mucus; and (3) the TTF-1 and ALK genes affect the production of mucus.

探讨 CT 冠状动脉成像与冠状动脉导管造影诊断结果差异明显的因素及临床运用价值

宋超

中国人民解放军陆军特色医学中心

【摘要】目的：探讨 CT 冠状动脉成像与冠状动脉导管造影结果差异较大的因素，为临床应用提供循证依据。**方法：**回顾性选取在我院均接受 CT 冠状动脉成像 (CCTA) 与冠状动脉导管造影 (CAG)、且图像无明显伪影的 200 例冠心病患者；行 CCTA 检查前记录患者检查机器型号 (64 排螺旋 CT、128 排 ICT、128 排双源 CT)，患者一般资料 (慢性病史、心电图、听力、能否屏气、扫描心率、是否服用倍他洛克、是否含服硝酸甘油)。将 CAG 作为评估冠状动脉钙化狭窄程度金标准，比较每位患者 CCTA 与 CAG 诊断冠状动脉钙化狭窄程度的吻合率 (只比较右冠动脉 RCA、左前降支 LAD、对角支 D、左回旋支 LCX、钝缘支 OM) 将其吻合率分成 A ($\geq 95\%$)、B ($\leq 70\%$) 两组。分别比较两组患者检查机器型号和一般资料的一致性。结果：A 组有 96 例，其中影响因素分别是：检查机器型号 (128 排 ICT 或 128 排双源 CT)、心电图 (正常)、听力 (正常)、屏气能力 (优)、扫描心率 (≤ 70 次/分)、服用倍他洛克 (是)、是否含服硝酸甘油 (是) 无明显差异 ($P > 0.05$)；B 组有 27 例，其中影响因素分别是：心电图 (心律不齐)、屏气能力 (差) 无明显差异 ($P > 0.05$)。结论：当影响因素是检查机器型号 (128 排 ICT 或 128 排双源 CT)、心电图 (正常)、听力 (正常)、屏气能力 (优)、扫描心率 (≤ 70 次/分)、服用倍他洛克 (是)、是否含服硝酸甘油 (是) 时采用 CCTA 评估冠状动脉钙化狭窄程度与 CAG 的评估结果具有较高的吻合率 ($\geq 95\%$)；当影响因素分别是：心电图 (心律不齐)、屏气能力 (差) 采用 CCTA 评估冠状动脉钙化狭窄程度与 CAG 的评估结果有较大差异率。该探讨结果对患者适用性和实用性都很强，流程操作简单，措施方便，值得临床推广试用。

AI 背景下“人机耦合”对胸部 CT 肺结节良恶性诊断价值

范艳芬、郁义星、王希明、胡春洪

苏州大学附属第一医院

目的：本研究目的是探讨 AI 背景下“人机耦合”对肺结节良恶性诊断的临床应用价值。

方法：回顾性分析苏州大学附属第一医院 2023 年 1 月至 2 月肺结节患者 AI 诊断及高年资医生诊断结果，同时经过术后病理/穿刺活检/支气管镜病理证实/临床验证的肺结节病例进行回顾性分析。将 AI 背软件给出的结果和“人机耦合”结果与最终术后病理证实/支气管镜活检/临床验证的肺结节结果做对照分析。

结果：共 32 例术后病理/穿刺活检/支气管镜病理证实/临床验证的肺结节纳入到本研究中，其中术后为 27 例，穿刺活检 1 例，支气管镜活检 2 例，临床验证 2 例 (1 例随访自动吸收，1 例抗炎治疗后吸收)。32 例患者中，男性 18 例，女性 24 例，年龄范围 21---75 岁，平均年龄 41.8 岁。全部病例均经术后病理/穿刺活检/支气管镜活检/临床验证。恶性肺结节为 25 例，包括鳞癌 5 例，腺癌 20 例；良性肺结节 7 例，包括结核 1 例，渗出/炎症 2 例，胶原沉积 1 例，支气管扩张伴感染 2 例，隐球菌 1 例。病理证实的 25 例恶性肺结节中，AI 软件识别为高风险的病例为 22 例 ($22/25 = 88.0\%$)，AI 识别为低风险的病例为 2 例 ($2/25 = 8\%$)，AI 软件漏诊高风险结节为 1 例 ($1/25 = 4\%$)；7 例良性肺结节中，AI 识别为高风险的病例为 6 例 ($6/7 = 85.7\%$)，识别为低风险 1 例 ($1/7 = 14.3\%$)。病理证实的 25 例恶性肺结节中“人机耦合”诊断恶性肺结节为 24 例 ($24/25 =$

96.0%)，1 例表现为斑片状高密度影的粘液型肺腺癌“人机耦合”诊断错误；7 例良性肺结节中，“人机耦合”诊断为良性肺结节的为 7 例 (7/7=100%)，也即“人机耦合”诊断良性肺结节的准确率为 100%。

结论：“人机耦合”充分利用患者 CT 图像及临床信息，AI 背景下“人机耦合”对肺结节良恶性诊断正确率明显提高。

CT imaging features and prognosis of immune checkpoint inhibitor related pneumonitis in lung cancer with or without tumor invasion in the central airway

Bofeng Zhao, Yaming Zhang, Ping Chen, Wei Feng, Kejun Nan, Jinpeng Liu, Baoying Chen
Xi'an International Medical Center Hospital

Objective: Immunotherapy has become standard of care in lung cancer, including both non-small cell lung cancer and small cell lung cancer. Conventional and emerging risk biomarkers have been studied in the context of immune checkpoint inhibitor related pneumonitis (ICI-P) due to immunotherapy drugs, with the aim of ensuring an early diagnosis and follow-up. There may be differences in clinical and radiographic manifestations of ICI-P based on a novel imaging risk stratification factor named tumor invasion in the central airway (TICA). The present study aimed to investigate the radiographic features and prognosis of ICI-P between patients with and without TICA.

Methods: 174 lung cancer patients who received immunotherapy were retrospectively analyzed and 29 patients with ICI-P were identified. The clinical and radiographic data were analyzed to conclusive the radiological features and prognosis of ICI-P based on TICA.

Results: In our cohort, ICI-P had an incidence of 16.7%, a median onset time of 128 days, and a mortality of 75.9%. ICI-P developed in 15 patients with TICA, where grade ≥ 3 CIP accounted for 93.3%, main radiographic pattern was diffuse alveolar damage/acute interstitial pneumonia (DAD/AIP) pattern, and mortality was 93.3%. By contrast, ICI-P developed in 14 patients without TICA, where grade ≥ 3 CIP accounted for 57.1%, main radiographic pattern was diffuse alveolar damage/acute interstitial pneumonia (DAD/AIP) pattern, and mortality was 57.1%. There was statistical difference in the higher grade ($P=0.035$) but no statistical difference in the radiographic patterns between groups ($P = 0.548$ in patter 1 and $P = 0.715$ in patter 2). The median Progression-free survival (PFS) of patients without TICA group (5.0 months) was lower than that of the with TICA group (7.5 months), but no statistical difference ($P = 0.152$).

Conclusion: TICA detected with chest CT in ICI-P indicated more severe clinical features, including a more serve grade ICI-P and DAD/AIP radiographic pattern and worse prognosis. Our study suggests that imaging based on the TICA is informative in stratify patients into different risk categories for effective management.

PU-1967

超低辐射剂量联合 AIIR 深度迭代重建技术在胸部体模中肺结节检出能力的极限研究

董晓征、张艳
北京大学第三医院

目的：探讨超低辐射剂量联合 AIIR 深度迭代重建技术在胸部体模中肺结节检出能力的极限研究的可行性。

材料与方法：

1、一般材料：在成年男性胸部体模两侧肺部上、中、下位置随机放置 3 个直径为 3mm，CT 值分别为 100HU、-630HU、-800HU 和 3 个直径为 5mm，CT 值分别为 100HU、-630HU、-800HU 的人工肺结节。

2、检查方法：使用联影 uCT960+对胸部体模进行螺旋扫描，管电压分别为：140kV、120kV、100kV、80kV、70kV、60kV，管电流为：5mAs，每个组合扫描三次。将所有图像分别应用：滤波反投影法（FBP）、混合迭代重建技术（KARL 3D）及深度迭代重建技术（AIIR）进行重建肺窗（窗宽 1600 HU、窗位-600 HU）。

3、图像客观评价：记录每次 CT 检查的 CTDI_{vol}、DLP 和 ED，取三次扫描的平均值。测量每个结节的 CT 值、噪声（SD），长短径误差和失圆度，测量三次取平均值。将图像导入肺结节 CAD 检测软件进行自动分析，评估每个组合中人工肺结节的检测率。

4、图像主观评价：两位经验丰富的放射科医师对人工结节的清晰度和失真度进行主观评价。

5、统计学方法：使用表格法比较每个组合中结节的 CT 值，噪声，长短径误差，失圆度及清晰度和失真度评分；比较每个组合中 CAD 检测软件对于人工肺结节的检出率。

结果：在可测的结节中，FBP、KARL 3D、AIIR 算法中结节的 SD 值逐渐降低，长短径误差和失圆度也逐渐降低；相同的结节尺寸下：管电压越低，结节越难识别，其长短径误差和失圆度越大；相同的管电压条件下：结节尺寸越小，越难识别。与 FBP 和 Karl 3D 相比，AIIR 算法显着提高了图像噪声评分和磨玻璃结节可视化，基于深度学习的重建提高了图像质量。

结论：超低辐射剂量 0.057mSv 联合 AIIR 深度迭代重建技术在胸部体模中最低检出能力为-630HU 的 3mm 结节。

人工智能在光谱 CT 胸部虚拟平扫中评估肺结节可行性研究

林泽、左敏静、李晶、刘颖
南昌大学第二附属医院影像中心

目的：探讨人工智能(AI)辅助诊断系统在光谱 CT 胸部虚拟平扫中评估肺结节的可行性。方法：收集 55 名在光谱 CT 行胸部平扫及动静脉增强扫描的患者图像，包括 67 个高危结节。将常规平扫（TNC）、重建的动脉期虚拟平扫（VNCa）和静脉期虚拟平扫（VNCv）图像导入 AI，统计 AI 检测出的肺结节数目、直径和识别高危结节的形态特征。经放射科医生采用盲法确定结节的真假阳性，并对高危结节形态特征进行肉眼评估。以 AI 联合医生确定的真阳性结节作为金标准，比较 AI 在 3 组图像中检出结节的灵敏度及假阳性率，采用 Bland-Altman 法分析 VNCa、VNCv 与 TNC 中 AI 识别共同结节长径的平均差异。同时评估 AI 识别和医生主观评价的高危结节形态特征的一致性。在 AW 工作站测量并比较 3 组图像中胸主动脉、肺动脉干、肩胛肌和胸壁脂肪的 CT 值、背景噪声、信噪比，以客观评估图像质量。记录各期扫描的辐射剂量。结果：3 组图像中 AI 检出结节的灵敏度差异无统计学意义（ $X^2=2.218$ ， $P=0.345$ ），均高于 92%，而 VNCa 的假阳性率明显高于 TNC、

VNCv ($P<0.05$)。基于 AI 或医生单独评估 VNCa、VNCv 中高危结节的形态学特征方面与 TNC 相当,以医师识别为金标准,除 AI 识别血管束征数目明显少于医生 ($P<0.001$),其它形态特征的 AI 识别性能与医生无统计学差异 ($P>0.05$)。TNC 和 VNCa、VNCv 中 AI 识别的共同病灶长径平均差异分别为 0.151mm、0.057mm。在图像质量的客观评价中,除脂肪外,VNC 图像在评估胸部不同组织展现出与 TNC 相近的 CT 值 ($P>0.05$),具有较低背景噪声,更高的信噪比。使用 VNC 替代 TNC 可使总有效辐射剂量减少 31.65%。结论:基于 AI 联合光谱 CT 静脉期虚拟平扫,在显著降低辐射剂量的同时,可保证图像高质量,提供优异的结节检测性能,并基本还原形态特征。

气道播散型的肺粘液腺癌一例

杨俊强、唐子云、卓丽华
绵阳市第三人民医院

本文报道沿气道播散的肺粘液腺癌 1 例。患者男,79 岁,因咳嗽咳痰半月,加重 6 天入院。CT 表现为双肺下叶见多个团块状密度增高影,较大者位于右肺下叶,大小约 10.3x8.2x11.7cm,边缘清晰,其内密度不均匀,平均 CT 值约 21Hu,平扫其内隐约可见稍高密度血管影像及少许点状稍高密度影,增强后其内血管影显示清楚,并见少许条状分隔样强化影,肿块其余部分未见明显强化,肿块邻近胸膜增厚,邻近肺组织压迫性不张,并与左肺门下份分界不清,左肺下叶部分支气管截断;左肺上叶尖后段见不规则斑片状密度增高影,病灶内可见不规则含气腔隙。术后病理结果显示:肿瘤细胞呈 CK7 (+), TTF-1 (+), NapsinA (+), CEA (+), CK20 (-), Villin (小灶+), CDX-2 (+), P40 (-), P53 (+, 30%, 野生型), Ki-67 (+, 约 20%)。结合 HE 与免疫组化结果,最终诊断为肺粘液腺癌。

PU-1970

The value of left atrial fast long-axis strain in predicting left ventricular reverse remodeling in Dilated cardiomyopathy

Qimin Fang,Ao Kan,Tian Zheng,Xin Zhang,Yinping Leng,Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Background: Left ventricular reverse remodeling (LVRR) is associated with better clinical outcomes in patients with dilated cardiomyopathy (DCM). Early prediction of LVRR can help guide the subsequent treatment. The left atrium (LA) function could predicts adverse cardiovascular events in DCM patients. However, its value in predicting the LVRR has not been elucidated.

Objectives: This study aimed to investigate the value of CMR-derived LA fast long-axis strain in predicting LVRR in DCM.

Materials and Methods: Clinical data were retrospectively collected for DCM patients between January 2018 and December 2022. CMR images were processed by CVi42 (version 5.13.7) software to yield LA strain parameter. LVRR occurring within one year from CMR was ascertained by echocardiography (LVRR is considered to occur if LVEF $\geq 50\%$ or increases $\geq 10\%$ and LVEDd decreases $\geq 10\%$ compared to baseline ultrasound data). Univariate and multivariable logistic regression analyses were used to build the predictive model.

Result: The retrospective study included a total of 96 participants (mean age, 48years \pm 14 [standard deviation]; 63 men), LVRR occurred in 51 participants within 1 year. Compared with the non-LVRR group, the LVRR group has smaller LVEDVi and LVESVi. At the same time, the number of patients with LGE in the LVRR group was smaller than the non-LVRR group. The left atrial passive fraction, reservoir strain and conduit strain rate of the non-LVRR group were higher

in the LVRR group (17% vs. 13%, $P = .019$; 11% vs. 9%, $P = .011$; 6% vs. 4%, $P < .001$). In multivariable Logistic regression analysis, LA conduit strain was an independent predictor for the occurrence of LVRR within 1 year in DCM patients (hazard ratio [HR] per 1% increase, 1.155 [95% CI: 1.011, 1.319; $P = .034$]. In addition, the clinical prediction model based on LGE, LVEDVi and LA conduit strain had a good predictive performance in predicting the occurrence of LVRR in DCM patients within 1 year (AUC = 0.746).

Conclusion: Left atrial conduit strain, derived from cardiac MRI by using the fast long-axis method, was an independent predictor of LVRR within 1 year in DCM patients.

PU-1971

薄壁囊腔样肺癌的 HRCT 诊断及误诊病例分析

苗焕民、胡粟、叶爱华、尚亚雷
苏州大学附属第一医院

目的：搜集本院病理诊断为肺癌、HRCT 表现为薄壁囊腔样改变并诊断为肺癌的患者的临床及影像资料，同时搜集 HRCT 表现为薄壁囊腔样改变并误诊为肺癌的患者的临床及影像资料进行分析，总结薄壁囊腔样肺癌的影像学特点，通过误诊病例分析总结其鉴别诊断。方法：回顾性分析本院 HRCT 表现为薄壁囊腔样改变并与病理一致诊断为肺癌的 26 例患者以及经临床否认（病理、随访过程或肺泡灌洗）肺癌的 9 例误诊患者的临床及 HRCT 影像特点，所有患者均进行 HRCT 扫描。结果：影像诊断薄壁囊腔样肺癌并与病理一致者共 26 例（男性 15 例，女性 11 例），平均年龄 62.5 岁，中位年龄 63 岁，其中鳞癌 8 例，腺癌 18 例，位于右肺 18 例（右肺上叶 7 例，右肺中叶 4 例，右肺下叶 7 例）、左肺 8 例（左肺上叶 4 例，左肺下叶 4 例），3 例以呼吸道症状就诊，其余 23 例均体检发现；影像诊断为囊腔样肺癌但经临床否认的共 9 例，4 例为肉芽肿性炎伴干酪样坏死，2 例为支气管扩张伴纤维组织增生，1 例为机化性肺炎伴坏死，1 例为曲霉菌感染，1 例为肺囊肿。结论：肺内薄壁囊腔样病变的正确诊断非常困难。囊壁厚薄不均、内壁欠光整、壁结节以及随访过程中实性成分增多既可以出现在薄壁囊腔样肺癌等恶性病变中，也可以出现在良性病变中，所以在影像诊断中我们需综合分析各种征象、密切结合临床病史进行综合分析，尽量减少误诊给患者带来不必要的手术创伤。

PU-1972

The diagnostic efficacy of unenhanced CT in detecting acute central pulmonary embolism

Zexiang Deng¹, Heng Wang¹, Zhen Zhao¹, Haotian Zhang¹, Ai-E Liu², Lei Chen², Yun Peng¹, Lianggeng Gong¹

1. Department of Radiology, Second Affiliated Hospital of Nanchang University

2. Department of Research Center, Shanghai United Imaging Intelligence Co.

Objectives: This study aimed to evaluate the effectiveness of unenhanced CT in identifying high-risk PE that thromboses located in the main pulmonary artery or the right or left pulmonary artery and optimize the screening strategy of PE.

Methods: A retrospective analysis was conducted on unenhanced CT images obtained within 24 hours prior to computer tomography pulmonary angiography (CTPA) in 122 patients, including equal numbers with acute central pulmonary embolism (ACPE) and non-PE patients. Univariate and multivariate analyses were performed to identify CT parameters and obtain logistic model in distinguishing ACPE from non-PE patients. The model was validated in another cohort of 24 patients.

Results: Abnormal density signs, mPA, PA/Ao, SVC and AzV show significant different between ACPE and non-PE patients. Unenhanced CT model composed of those signs showed excellent

diagnostic performance for ACPE in both the retrospective (AUC 0.890; 95%CI 0.820 to 0.939) and validation cohorts (AUC 0.816; 95%CI 0.606 to 0.943) and better than D-dimer (AUC 0.799; 95%CI 0.717 to 0.866). Abnormal density signs were demonstrated as reliable indicators of ACPE (aOR 21.079; 95%CI 7.435-61.700).

Conclusion: Unenhanced CT serves as a robust tool for pre-diagnosing ACPE prior to CTPA examination, demonstrating greater clinical value compared to D-dimer. In the context of diagnosing ACPE using unenhanced CT, the utilization of D-dimer may not be essential, thereby optimizing the examination time and facilitating timely initiation of treatment to enhance patient prognosis.

Clinical relevance statement: The symptoms of pulmonary embolism (PE) patients are often nonspecific, such as dyspnea and chest pain. In such cases, unenhanced chest CT scans are performed prior to computer tomographic pulmonary angiography (CTPA) to exclude other lung or mediastinal conditions.

PU-1973

基于 CT 定量指标评估轻中度 COPD 患者的诊断价值

王雄慧、沈敏、阴玮灵、鲁景楠、黄晓旗、李建龙

延安大学附属医院

目的：分析 CT 定量指标与肺功能检测指标之间的关系，探讨 CT 定量指标在评估轻中度 COPD 患者肺功能方面的研究价值。

方法：回顾性收集本院 59 例轻中度 COPD 患者及 58 例健康人群的资料。将 CT 数据导入“数字肺”平台，获得功能性小气道病变区域百分比 (fSAD%)、肺气肿区域百分比 (Emph%)、正常区域占全肺体积百分比 (Normal%)、空气滞留指数 (ATI)、肺内血管体积 (IPVV) 及气道周长为 10mm 时的管壁面积平方根 (Pi10) 等定量指标。患者在 CT 检查后 3 天内且症状稳定时行肺功能检查 (PFT)，包括 FEV1% 和 FEV1/FVC。组间比较采用单因素方差分析或 Kruskal-Wallis H 检验。相关性评估采用 Pearson 或 Spearman 相关分析。对 CT 定量指标及 FEV1/FVC 间的关系进行单因素及多因素逐步回归分析。采用 ROC 曲线分析 CT 定量指标及模型对轻中度 COPD 的诊断价值。

结果：组间 fSAD%、Emph%、Normal%、ATI、Pi10in、IPVVin 及 IPVVex、FEV1% 和 FEV1/FVC 的差异均有统计学意义 ($P < 0.05$)。FEV1/FVC 与 fSAD%、Emph%、Normal%、ATI、Pi10in、IPVVin 及 IPVVex 间的相关性均具有统计学意义 ($P < 0.05$)；FEV1% 与 fSAD%、Emph%、Normal%、ATI 及 IPVVin 间的相关性均具有统计学意义 ($P < 0.05$)。逐步回归分析结果显示，Emph%、Pi10in 及 IPVVin 是 FEV1/FVC 的独立危险因素。ROC 曲线分析结果表明，Emph%、Pi10in、IPVVin 及模型诊断轻中度 COPD 患者的 AUC 分别为 0.80、0.64、0.68 及 0.86。结论：定量指标模型对轻中度 COPD 有较好的诊断效能，可以在一定程度上反映不同的肺组织损伤，并在揭示 COPD 的病理生理改变提供了一些信息。

PU-1974

双源 CT 冠状动脉血管成像检查不同心率对辐射剂量的影响

谢丽春、乔国庆

中国人民解放军南部战区总医院

目的 探讨本院 2022 年 1 月至今所行双源 CT 冠状动脉血管成像检查不同心率患者 91 例，心率范围 60~120 次。研究双源 CT 回顾性心电门控模式下冠状动脉血管成像检查不同心率情况下对患者辐射剂量的影响。

方法 检查设备为西门子双源螺旋 CT 扫描机,采用常规回顾性心电门控扫描技术。对碘剂过敏、严重肾功能不全、失代偿性心功能不全、不能配合呼吸指令的患者不纳入研究。所选患者检查前均未使用药物控制心率且签署了知情同意书,检查前进行呼吸训练,以保证检查的顺利完成。于扫描前 3 min 舌下含服硝酸甘油 0.5 mg。在正式启动扫描前,采用团注对比剂示踪法监测主动脉腔内的对比剂浓度,监测平面选在主动脉根部,兴趣区 (ROI) 置于主动脉腔中央,阈值设定为 100 HU,当系统自动监测 ROI 达到设定阈值后,延迟 4 s 自动启动正式扫描,扫描范围为气管隆突下 1 cm 至膈下 1 cm。碘对比剂 (370 mg/mL) 均采用高压注射器静脉注射,流率 5.0-6.0 mL/s。对比剂注射完成后用 40 mL 氯化钠注射液灌洗。扫描参数:管电压 120 kV、电流 560 mAs、螺距 (pitch 值) 0.2~0.5,螺距值随心率变化而变化,准直器宽度 0.6 mm,旋转时间 330 ms。扫描结束后记录每位患者扫描时的心率、剂量报告数据,以便计算 CCTA 扫描时的有效辐射剂量进行对照研究。

结果 所选取的 91 例不同心率患者中,数据显示,冠状动脉血管成像的有效辐射剂量,不同心率具有差异。

结论 患者的心率决定了心脏无间隔扫描的最大螺距。DSCT 扫描螺距及进床速度可根据患者心率进行有效调整,心率越高,螺距就越大,扫描速度也越快,心脏成像所需时间则越短,扫描时间的缩短会减少患者接受的辐射剂量。在扫描范围相同的前提下,对于患者心率波动小且体重指数相近的患者,较高心率的辐射剂量小于较低心率的辐射剂量。

PU-1975

前置双流法肺动脉 CTPA 在肺栓塞诊断中的应用价值

刘立华、李笑石、耿纪刚、郭江、杜贝贝、李子洲
西安大兴医院

目的: 分析前置双流法肺动脉 CTPA 在肺动脉栓塞中的诊断效果分析

方法: 研究时段 2022 年 5 月-2023 年 8 月,对本院 380 例疑似肺动脉栓塞的患者进行肺动脉 CTA 临床检查。分为 AB 两组,各 190 例,A 组采用常规单流注射方法;B 组采用前置双流注射法。观察同一扫描条件下和不同注射条件下对诊断正确率的影响。

结果: 1 对比度浓度 350mg/mL,剂量 20ML 与剂量 5ML 的混悬液双流注射为宜,注射速率 4.0-5.0 即可;2 前置双流注射法下,肺动脉及分支对比剂充盈良好;3 先注射混液后注射少量对比剂可使上腔静脉射线硬化伪影明显减少;4 在 MIP、MPR、VR 下肺动脉与肺静脉差异化显示,有助于显示肺段及远端栓塞。

结论: 前置双流注射法适合肺动脉 CTPA 注射操作应用,能有效的减少造影剂的使用量,有效提高 PE 患者的诊断正确率,在肺动脉 CTA 扫描操作中具有提升诊断率价值。

PU-1976

前瞻性心电门控技术在脊髓动脉 CT 成像中的临床应用价值

杨万里、耿纪刚、李笑石、朱鹏、李鑫、秦越
西安大兴医院

目的: 探讨前瞻性心电门控技术在 CTA 诊断硬脊膜动静脉瘘(Spinal Aural Arteriovenous Fistula, SDAVF) 中的应用价值。

方法: 回顾性分析 2022 年 5 月—2023 年 5 月我院 40 例考虑胸、腰段 SDAVF 患者,所有患者进行完 CTA 检查后,都在 72-168 小时内进行了数字血管造影 (Digital Substraction Angiography, DSA) 检查采用随机数字法对患者进行平均随机分组,每组 20 例,统计每组患者临床资料。A 组

采用前瞻性心电门控, B 组采用常规螺旋 CT 扫描, 其他扫描参数一致: 管电压: 100kV 管电流: 300mA 螺距: 0.5x80(HP65.0) 重建层厚: ST1.0mm SL0.8mm。比较两组胸主动脉、腹主动脉及双侧第 3 至 7 肋间动脉的 CT 值、SD 值, 并计算 SNR、CNR 值, 记录两组辐射剂量。将两组 CTA 结果与 DSA 结果采用 Kappa 统计对一致性进行分析, 并比较两组瘘口位置的准确率。

结果: 两组患者临床资料, 例如性别、年龄、BMI 指数、心率等比较, 差异均无显著统计学意义 ($P>0.05$); 在客观图像质量评价中, A 组平均得分 4.82 ± 0.56 分, B 组 4.52 ± 1.01 分, 差异有显著统计学意义 ($P<0.05$); 辐射剂量 A 组 DLP: $562.12\pm22.98\text{mGy}\cdot\text{cm}$, B 组 DLP: $539.3\pm34.21\text{mGy}\cdot\text{cm}$, 差异有显著统计学意义 ($P<0.05$); 在动静脉瘘口位置准确性评估中, A 组准确率位 97.32%, B 组为 84.94%, 差异有统计学意义 ($P<0.05$)

结论: 前瞻性心电门控技术在 CT 血管成像较常规 CT 技术图像质量更高, 辐射剂量略高于常规扫描技术 (5.16%), 但瘘口定位准确性显著高于 B 组, 对 SDAVF 具有重要的临床价值, 值得在临床工作推广使用。

PU-1977

320 排宽体 CT 支气管动脉 CTA 不同扫描方向的 图像质量对比

杜贝贝、耿纪刚、李笑石、曹慧敏、杨雅迪、秦越
西安大兴医院

目的: 探讨 320 排宽体 CT 支气管动脉 CTA 不同扫描方向的图像质量对比

方法: 回顾性选取本院 2020 年 11 月至 2023 年 5 月急诊大咯血行支气管动脉 CTA 患者 100 例, 采用随机数字法进行分组, 每组 50 例。头足方向为 A 组, 足头方向为 B 组, 两组扫描参数一致: 扫描范围为膈肌至胸廓入口层面, 管电压 100KV, 管电流自动毫安调制技术 (范围 100-400mAs), 螺距 FP/HP: 1.1/110, SD=12.5, 球管转速 0.5rad/s, 探测器设置 $0.5\times80\text{mm}$, 对比剂浓度 320mol/ml, 用量按患者 BMI 进行配比, 范围 40-70ml; 所有患者 CT 检查完 72 小时后均进行数字减影血管造影 (Digital Substraction Angiography, DSA)。由两位放射医师采用 5 分法双盲评价图像质量, 随后将 CT 血管成像的诊断结果与 DSA 进行对比, 一致性采用 Kappa 分析, $\text{Kappa}>0.85$ 认为一致性良好, 一致性较差时引入第三名医生进行打分。

结果: 两组患者在年龄、性别、MBI、血压、入院血糖、对比剂用量均无显著差异 ($P>0.05$); 在诊断效能评价中, 两组支气管动脉 CTA 对责任血管的检出率, A 组准确率为 98.32%, B 组为 98.38%, 结果无显著统计学差异 ($P>0.05$); 两组支气管动脉 CTA 对支气管动脉-肺动脉瘘的检出率 A 组为 56.80%, B 组 87.42%, 诊断效能有显著统计学差异 ($P>0.05$)。B 组较 A 组检出率提高 30.62%。A 组主管图像质量平均得分 3.56 分, B 组 4.29 分, B 组图像质量显著高于 A 组。

结论: 支气管动脉 CT 成像是足-头方向扫描图像质量优于头-足方向扫描, 尤其在支气管肺动脉瘘的诊断方面优势明显, 同时可以避免上腔静脉伪影, 提高非支气管动脉开口的精准度, 值得在临床中大力推广应用。

PU-1978

可变螺距技术 (vHP) 在下肢动脉 CTA 成像中的临床应用与诊断效能

耿纪刚、李笑石、朱鹏、彭静、杨万里、秦越
西安大兴医院

目的: 评价可变螺距技术 (Variable Helical Pitch, vHP) 在下肢动脉 CTA 成像中的应用效能。

方法: 前瞻性选取我院 2021 年 1 月至 2022 年 6 月 80 例行双下肢动脉 CTA 成像的患者, 将患者随机分成两组, 分别为 VHP 技术组和常规螺旋扫描组, 每组 40 人, 统计两组患者的性别、年龄、BMI、病程时间、血糖等临床资料。测量并对比两组髂总动脉腰 4 水平层面、腘动脉膝关节层面及胫前动脉踝关节层面的血管 CT 值及同一层面临近肌肉 SD 值, 通过计算得到信噪比 (Signal To Noise Ratio, SNR) 和对比噪声比 (Contrast To Noise Ratio, CNR)。所有图像由 2 名有经验的临床外周血管医生进行图像质量主观评分, 如有不一致的评分引入第三名医生进行判断。记录并比较两组图像的辐射剂量及对比剂用量。

结果: 两组临床资料无显著差异 ($P>0.05$), VHP 组客观评价在髂总动脉层面、腘动脉膝关节层面及胫前动脉踝关节层面的 CT 值、SNR 值均高于常规螺旋扫描组, 差异有统计学差异 ($P<0.05$); 主观图像评价 VHP 组显著优于 B 组, 差异有统计学意义 ($P<0.05$); VHP 组辐射剂量 ED 平均值为 $6.74\pm1.20\text{mSv}$, 常规螺旋扫描组辐射剂量平均 ED 值为 $7.93\pm1.78\text{mSv}$, 两组有显著差异 ($P<0.05$)。

结论 VHP 技术联合小剂量测试法可有效提高双下肢动脉 CTA 检查的成功率, 图像质量更佳, 且辐射剂量和对比剂用量显著降低, 在临床中值得大力推广应用。

全息可视化三维重建技术在急诊支气管动脉栓塞治疗中的应用价值

宋昌睿、耿纪刚、李笑石、刘立华、李鑫、秦越
西安大兴医院

目的: 探讨全息可视化三维重建技术 (Digital Holography And Three-Dimensional Imaging, TDIV) 在急诊支气管动脉栓塞治疗中的应用价值。

方法: 收集 2021 年 5 月至 2023 年 5 月来我院以急诊大咳血行支气管动脉 CT 成像患者 60 例, 根据支气管动脉起源及数量平均分配 A、B 两组, 每组 30 例, A 组采用 TDIV 技术, B 组为常规后处理成像技术 (VR、MIP 及 MPR 图像)。所有病例均由一名工作经验超过 10 年的血管组主管技师完成图像处理, 并记录两组完成时间, 随后由两名工作经验超过 10 年的介入科医师记录术中责任血管定位时间及统计两组支气管数量与 DSA 的一致性, 意见不统一时引入第三位同样年资医师进行判断。

结果: A、B 两组后处理时间无统计学差异 ($P>0.05$); 两组支气管动脉数量及开口位置与 DSA 结果一致性良好 ($Kappa>0.85$); A 组介入术中定位时间较 B 组显著减少, 差异有统计学意义 ($P<0.05$)。

结论: TDIV 可以快速、准确进行支气管动脉栓塞术前责任血管的定位, 极大缩短介入治疗时间, 同时与金标准 DSA 结果一致性良好, 值得临床广泛应用。

PU-1980

肺炎型肺癌的影像诊断 (附 6 例病例报告并文献复习)

梁春雨、李标达、杨国辉、沈新平
香港大学深圳医院

目的: 肺炎型肺癌 (pneumonic-type lung adenocarcinoma, PLADC) 临床症状和胸部 CT 表现与肺炎及间质性肺病变类似, 容易延误诊断。本文通过观察肺炎型肺癌 CT 表现特点, 并回顾既往相关文献, 以增加对肺炎型肺癌影像学表现的认识。

方法: 回顾分析我院 2018 年 12 月至 2022 年 4 月诊治且经病理证实的肺炎型肺癌 6 例, 均行 CT 扫描, 对该病的主要临床表现、实验室检测结果以及胸部 CT 征象等进行研究分析。

结果: 6 例患者当中女性 3 例, 男性 3 例, 平均年龄 61.8 岁, 临床症状为咳嗽咳痰 4 例, 腹胀 1 例, 无症状 1 例。胸部 CT 示 3 例为肺内弥漫性病变, 另 3 例为肺内局限性病变。主要 CT 征象为: 肺实变影或磨玻璃密度影伴“枯枝征”、肺内多发小结节灶, 可单独出现上述一种征象, 或多种形态病灶共存于同一患者。随访发现 1 例局限性病变术后 2 年未见复发或转移, 其余病例均有不同程度进展, 表现为术后复发, 病灶范围增大、密实, 出现骨转移、心包积液。

结论: 肺炎型肺癌与肺炎或其他良性病变有一定的相似之处, 对于经抗感染治疗长期无效甚至进展的病例, 则要考虑肺炎型肺癌的可能性, 应及时行支气管镜、经皮肺活检等获得病理诊断。

PU-1981

低药量低流速两段式对比剂注射在肺动脉 CTA 检查中的临床应用

严南
红河州滇南中心医院 (个旧市人民医院)

目的: 探讨低药量低流速两段式对比剂注射在肺动脉 CTA 检查中的可行性。方法: 按照连续入组的方式选择 2023 年 2 月~2023 年 8 月临床考虑肺动脉栓塞的患者 60 例, 随机分为两组, 行肺动脉 CTA 检查。A 组为常规组, 对比剂用量 50ml, 对比剂注射流速 4.5ml/s, 生理盐水用量 30ml, 注射流速 4.5ml/s; B 组为双低组, 对比剂用量 30ml, 对比剂注射流速分别为 15ml (2.5ml/s) 和 15ml (3.5ml/s), 生理盐水用量 30ml, 注射流速为 3.5ml/s。比较两组图像的肺动脉主干及左右肺动脉内的 CT 值, 上腔静脉内的对比剂伪影及图像质量主观评分等数据, 以评价扫描价值。结果: 双低组肺动脉主干及左右肺动脉内 CT 值均低于常规组, 但差异不显著 ($P>0.05$); 上腔静脉内的对比剂伪影显著低于常规组 ($P<0.05$); 两名影像学医师对两组图像质量主观评分相近 ($P>0.05$)。结论: 低药量低流速两段式对比剂注射在肺动脉 CTA 检查中与正常药量正常流速的图像质量相差无几, 可满足临床诊断的要求, 且减少了对比剂用量, 减缓了对比剂注射速率, 从而降低了对比剂给患者带来的潜在风险。

PU-1982

双源 CT 双能量扫描评估冠状动脉支架再狭窄的价值

夏传江、刘衡
中国人民解放军陆军特色医学中心

目的: 探讨使用双源 CT 双能量扫描单能成像技术, 对提高冠状动脉支架腔内再狭窄诊断准确性的研究。

方法: 回顾性分析陆军特色医学中心 2022 年 7 月至 2023 年 8 月间行冠状动脉支架植入术患者, 收集术后出现支架内再狭窄, 同时接受冠状动脉 CTA 双能量扫描和冠脉动脉造影, 且间隔不超过半个月的复查患者 80 例, 并随机分为 A、B 两组每组 50 例, 其中 A 组使用重组单能谱值为 100 keV 的图像; B 组使用重组 100 keV 混合能量图像。记录 CT 容积剂量指数(CTDIvol)、剂量长度乘积(DLP)、有效辐射剂量(ED)。以冠状动脉造影为金标准。利用双盲法评估支架内再狭窄程度, 根据金标准计算两组的诊断准确率、敏感度、特异度、阳性预测值(PV+)、阴性预测值(PV-)。利用 Kappa 检验评价两位观察者的评估一致性。对 A 组所有支架内狭窄节段每隔 10 keV 重组一组图像, 评估狭窄程度, 并采用配对 t 检验与 DSA 结果比较, 以 $P < 0.05$ 为差异有统计学意义。

结果: A 组的诊断准确率、特异度和 PV+ 均明显高于 B 组, 敏感度和 PV- 与 B 组相差不大; A 组的 Kappa 系数大于 B 组; A 组的 CTDIvol、DLP 及 ED 与 B 组比较无明显统计学差异($P > 0.05$)。A 组内能量级 100 keV 的图像测得的支架内狭窄程度与 DSA 比较误差最小($P > 0.05$)。

结论: 采用双源 CT 双能量模式扫描冠状动脉 CTA, 利用单能谱 100 keV 重组可以有效减轻冠脉支架伪影, 能将支架的植入位置以及管腔内的充盈程度明显清楚的展示出来, 且对支架内再狭窄的诊断准确率接近选择性冠状动脉造影, 是一种准确可靠、简单易行的检查方法。

PU-1983

人工智能管腔内梯度衰减技术对于冠状动脉 CTA 功能诊断效能提升的研究

朱寅虎、金大永、李笑石、耿纪刚、李馨、秦越
西安大兴医院

目的: 探究人工智能管腔内梯度衰减 (Translumenal Attenuation Gradient, TAG) 技术在提升冠状动脉 CTA 诊断效能中的应用。

方法: 回顾性收集我院 2022 年 1 月至 2022 年 9 月进行冠状动脉 CTA 检查的患者 120 例, 所有患者均进行过冠状动脉造影检查并统计血流储备分数 (Fractional Flow Reserve, FFR)。使用中心线算法 TAG (TAG-COO) 和钙化斑块去除算法 TAG (TAG-ExC) 对所有患者的冠状动脉分支进行计算并绘制曲线。将所有患者数据分组分为三组, 分别为 TAG-COO 结合冠状动脉 CTA 组、TAG-ExC 结合冠状动脉 CTA 组和单独的冠状动脉 CTA 组。采用受试者工作特征曲线 (Receiver Operating Characteristic, ROC) 统计各组对冠状动脉重度狭窄的诊断价值, 以 FFR 值为 0.80 作为狭窄程度区分的金标准。

结果: 3 组患者的临床资料, 例如性别、年龄、BMI、平均心率、血压、血糖等, 均无统计学差异 ($P > 0.05$)。120 例患者共纳入 360 支冠状动脉血管, FFR 显示 195 支冠状动脉血管存在血流动力学重度狭窄。TAG-COO 结合 CCTA 组的曲线下面积 (Area Under Curve, AUC) 为 0.721, TAG-ExC 结合 CCTA 组的 AUC 为 0.755, 而单纯 CCTA 的 AUC 为 0.689。

结论: 人工智能管腔内梯度衰减技术操作方便快捷, 无需手动进行测量, 可以快速得到两种不同算法下的曲线图像, 可以提升冠状动脉 CTA 诊断管腔重度狭窄的效能, 值得在临床中推广。

PU-1984

人工智能降噪算法和肺结节自动筛查技术结合在超低剂量肺结节筛查中的临床应用

金大永、牛微、李笑石、李馨、肖刚、秦越
西安大兴医院

目的：人工智能降噪算法和肺结节自动筛查技术结合在超低剂量肺结节筛查中的临床应用。

方法：选取 2022 年 8 月至 10 月于我院体检中心接受胸部 CT 肺结节筛查的患者 100 人，记录所有患者临床资料，按照扫描方式不同平均分为 A、B 两组（A 组：低剂量扫描，B 组：常规扫描）。两组患者原始数据传入人工智能肺结节后处理软件进行自动肺结节筛查，所得结果不进行人为干预。统计患者肺结节检出数目，采用双盲法对两组患者肺结节检出进行人工核对，计算误差率。采用双盲法 4 分制对两组肺窗图像进行主观图像质量评分，记录两组检出容积 CT 剂量指数（CTDIvol），剂量长度乘积（DLP）并依此计算辐射剂量数值（ED）。

结果：A 组肺结节人工智能筛查检出率与 B 组相比无统计学差异（ $P>0.05$ ），A 组肺结节检出敏感性低于 B 组（ $0.941>0.952$ ），特异性高于 B 组（ $0.532>0.456$ ），A 组辐射剂量显著低于 B 组（ $P<0.05$ ），A 组肺窗主观图像质量与 B 组无统计学差异。

结论：在胸部 CT 肺结节筛查中，大幅度降低管电压不影响肺结节检出率，肺窗图像质量与常规扫描无显著差异，辐射剂量大幅度降低，此方法可以有效提高患者肺结节筛查安全性，值得在临床推广应用。

CT 特征分析对不典型或早期高原肺水肿诊断价值的研究

岳丽娜

中国人民解放军联勤保障部队第 940 医院

[摘要] 目的：分析早期高原肺水肿的 CT 表现，提高 CT 诊断准确率。方法：本研究回顾性分析 50 例经临床诊断为早期高原肺水肿患者的胸部 CT 影像资料，分析早期 HAPE 患者胸部 CT 病灶发生部位及胸部影像学主要表现特征，总结 CT 对早期高原肺水肿的诊断价值。结果：（1）病灶发生部位：累及单侧肺 35 例，累及双侧肺 15 例。病变累及右肺 45 例；累及左肺 20 例。病变局限性于 1 个肺叶者 35 例，病变位于 2 个肺叶者 10 例，病变累及 3 个及以上肺叶者 5 例。（2）CT 表现：早期 HAPE 胸部 CT 影像学特征包括：双肺支气管-血管束增多、增粗，磨玻璃样改变，多角形、类圆形及小斑片状密度增高影，网格状改变，肺野外带结节影，主肺动脉内径增宽，叶间胸膜增厚，代偿性肺气肿等。结论：胸部 CT 影像检查是高原肺水肿的重要诊断方法之一，尤其对早期或不典型病例更是重要的诊断依据。

PU-1986

自动管电压选择技术（CARE KV）对急性胸痛三联征 CTA 图像质量及辐射剂量影响的研究

田娟¹、李笑石¹、耿纪刚¹、姜文龙²、王帅²、秦越¹

1. 西安大兴医院

2. 中国人民解放军空军军医大学西京医院

目的：探究宽体探测器急性胸痛三联征 CTA 检查管中，自动管电压选择技术（CARE KV）对图像质量及辐射剂量的影响，探究低辐射剂量在胸痛三联征一站式 CTA 检查中的应用。

方法：收集 2020 年 2 月至 2021 年 10 月在我院急诊或门诊因胸痛怀疑患有急性冠状动脉综合征、肺栓塞或主动脉夹层的患者 90 人。所有患者均进行胸痛三联征计算机断层扫描血管造影（CTA）检测。其中 45 名患者采用了 CARE KV 技术进行扫描，编为 A 组；其余 45 名患者采用常规管电压加自动管电流技术编为 B 组。对所有的患者冠状动脉、肺动脉及主动脉分别进行主观图像质量评价并记录计算所有患者的辐射剂量值；

结果: A 组冠状动脉共 785 段 (25 段未纳入统计), B 组冠状动脉共 783 段 (27 段未纳入统计), 两组冠状动脉主观图像质量在 1-3 级分别为 776 段 (98.85%)、779 段 (99.48%); 两组肺动脉各 1395 段, A 组评价在 1-2 级有 1358 段, B 组评价在 1-2 级有 1367 段; 两组主动脉各 135 段, 两组主动脉评价全部都在 1-2 级; 上述结果两组对比均无显著性差异 ($P>0.05$) 整体辐射剂量统计 A 组显著低于 B 组, 差异有统计学意义 ($P<0.05$)。

结论: 应用 CARE KV 与自动管电流技术进行低剂量胸痛三联征 CTA 扫描, 图像质量可满足急性胸痛患者诊断需要, 同时显著降低了辐射剂量。

PU-1987

CT 误诊气管炎性肌纤维母细胞瘤 1 例

郎婷、苏伟、岳梨蓉
云南大学附属医院

目的: 分析本例气管炎性肌纤维母细胞瘤误诊原因, 进一步加深对其 CT 表现、免疫组化表型的认识。

方法: 回顾分析经手术病理证实该病例气管炎性肌纤维母细胞瘤 CT 表现及免疫组化表型, 同时查阅相关文献进行总结。

结果: 颈部 CT 平扫+增强检查: 气管上段管腔内结节状软组织密度灶, 与气管各管壁相连, 邻近管壁未见增厚, 致管腔重度狭窄, 增强扫描呈渐进性明显强化, 考虑气管血管球瘤。经电子内镜肿瘤切除术, 术中见声门下气管上段新生物, 表面光滑, 满布血管, 右侧带蒂, 致管腔重度狭窄。术后病理: 气管上段梭形细胞肿瘤; 免疫组化: CD99(+)、ALK(+)、SDHB(+)、 β -catenin 胞浆(+)、Ki-67(+)、S100(-)、SOX-10(-)、CD34(-)、SMA(-)、Desmin(-)、CD31(-)、bcl-2(-)、STAT-6(-)、CK(-), 考虑炎性肌纤维母细胞瘤。

结论: 炎性肌纤维母细胞瘤(IMT)是一种较为少见的低度恶性间叶源性肿瘤。以肺部多见, 发生于气管、主支气管内较少见, 好发于 16 岁以下儿童。临床症状无特异性。既往文献报道发生在气管、主支气管的 IMT CT 上具有一定特征性, 1) 腔内外息肉样或类圆形结节, 边界清楚; 2) 密度均匀, 无钙化, 增强延迟持续强化; 3) 气管不同程度狭窄, 但均未见完全阻塞。本例为 16 岁女性患者, 有咳嗽、声嘶、气促的症状, CT 上病灶特点如上所述, 与文献上报道基本一致, 但考虑到气管血管球瘤要相对常见而导致误诊, 忽略了其常见发病年龄。目前, 病理学诊断是确诊气管、支气管 IMT 的金标准。镜下病理分型分为三型: I 型: 粘液/血管密集型; II 型: 梭形细胞丰富型; III 型: 少细胞纤维型; 既往研究显示, 患者的免疫组化结果中 Vim 与 SMA 常呈阳性, 本例患者的免疫组化结果 SMA(-)较为少见, 由于大部分 IMT 涉及 2p23 染色体上 ALK 基因的突变, 故 ALK 的阳性有助于该病的诊断。

PU-1988

研究能谱 CT 支气管动脉 CTA 在支气管动脉栓塞术血管定位的意义

蒙非洋
重庆医科大学附属第三医院

咯血主要由支气管疾病, 肺部疾病, 心血管疾病等引起, 是急诊比较常见的类型。支气管动脉栓塞术是治疗大咯血的有效治疗方法, 能谱 CT 支气管动脉 CTA 作为一直无创的检出可以在术前显示支气管动脉的起源和走行, 能谱 CT 可以通过调整 Kev, 来更清楚的显示其走行, 分支和开口, 能谱 CT 支气管动脉 CTA 比起一般常规的 CTA 可以更清楚的看到支气管动脉的数量, 起源, 分支与

走行等等。运用虚拟现实技术(VR),多平面重建技术(MPR),最大密度投影(MIP)等带骨和去骨的图像来完成后处理帮助临床定位,能谱 CT 支气管动脉 CTA 对患者 BA 检出率与准确性高。可用于术前定位,缩短手术时间,减少辐射剂量,特别是对于肿瘤的患者,可以降低介入栓塞的盲目性,明确目标血管。

PU-1989

Myocardial Structural and Electrophysiological Remodeling After MI: a CMR study

Xiaoying Zhao, Li Zhang, Xinxiang Zhao
The Second Affiliated Hospital of Kunming Medical University

Purpose: Structural and electrophysiological remodeling due to myocardial infarction (MI) significantly increases patient major adverse cardiovascular events (MACEs) risk. The study hypothesized that entropy and left ventricular mechanical dispersion (LVMD) associated with structural and electrophysiological dyssynchrony respectively. The purpose was to investigate the predictive value of LVMD obtained by Cardiac magnetic resonance (CMR) measurements for MACEs, as well as its correlation with entropy.

Materials and methods: In this retrospective study of post-MI patients, the entropy was automatically estimated using a generic Python package algorithm in late gadolinium enhancement (LGE) images, LVMD was calculated as the standard deviations (SDs) of the time from the peak of the R wave and the negative strain peak in 16 segments. MACEs was defined as the combination of sudden cardiac death (SCD), ventricular arrhythmias (VAs), implantable cardioverter defibrillator (ICD) therapy for VAs, and new congestive heart failure (CHF).

Results: Over a median follow-up of 32 months, 35 patients experienced MACEs. LVMD and border zone (BZ) entropy had relatively high accuracy for MACEs prediction (areas under receiver operator characteristic curve (AUCs)=0.896 and 0.814, respectively). Patients with higher LVMD ($>86.7\text{ms}$) were more likely to occurrence of MACEs versus patients with low LVMD ($\leq 86.7\text{ms}$) ($P<0.001$, log-rank). LVMD was identified as an independent predictor for MACEs after adjusting of entropy parameters [hazard ratio (HR): 1.015; 95% confidence interval (CI): 1.004, 1.026; $P=0.007$]. Spearman rank correlation demonstrated linear correlations between LVMD and entropy ($r=0.456$, $p<0.001$).

Conclusions: Entropy and LVMD, which can be used for the visualization and quantification of structural and electrophysiological heterogeneity, have the potential to be applied to MACEs prediction for post-MI patients. There are correlations between entropy and LVMD, suggesting that structural changes occurring in post-MI myocardium are closely related to electrophysiologic changes.

PU-1990

原发性肺肉瘤样癌并颅内转移一例误诊分析

范路萍、周刚、龙艳、李荣慧
个旧市人民医院

目的: 探究原发性肺肉瘤样癌的影像学表现,为临床诊断提供影像学诊断依据,减小误诊率,提高患者预后。

方法: 经病理证实的一例肺肉瘤样癌病例,结合其影像学特征,再结合文献,总结出肺肉瘤样癌的影像学特征。

结论与讨论：原发性肺肉瘤样癌是临床上少见的肺恶性肿瘤，由于缺乏特异性，亦无典型的影像学表现，有关其影像学表现国内外报道较少，现结合文献对 **PSC** 影像学表现及鉴别诊断进行讨论是非常必要的，以提高临床医师及放射科医师对该病的认识，降低误诊率。原发性肺肉瘤样癌（**PSC**）可发生于任何肺叶或肺段，根据其生长部位可分为中央型及周围型，以肺上叶周围型居多，周围型 **PSC** 患者多为老年男性，且有长期中重度吸烟史。胸部 **CT** 平扫缺乏特征性表现，早期易误诊为肺部感染性病变、肺结核，晚期与普通型肺癌及胸膜来源的肿瘤难以鉴别，**CT** 增强扫描有一定的特征性表现，有助于诊断，结合患者年龄、临床症状及辅助检查逐一排除，综合分析可作出定性诊断，确诊仍需依靠病理学诊断。**PSC** 早期治疗多以手术切除和围手术期放化疗为主。**PSC** 对放化疗均不敏感，对不能手术或术后患者，可行辅助放化疗或靶向治疗，以延长生存期。随着分子生物学的发展，靶向药物和免疫治疗会使该病患者受益。因此，临床医师及放射科医师应提高对本病的认识，做到早发现、早诊断、早治疗，以降低其病死率。

Digital Dynamic Radiography 通气检查对于肺癌术后肺功能评估临床价值探讨

刘金洋

吉林大学第一医院

目的 探讨 Digital Dynamic Radiography 通气检查对于肺癌术后肺功能评估的临床价值

方法 选择 2021 年-2022 年近一年于我院行手术治疗的 80 例肺癌患者，平均年龄 54 岁，其中男性 38 例，女性 42 例，作为研究对象。术前、术后皆行肺部 **DDR** 检查和肺功能检查。设备采用柯尼卡美能达 AeroDR C80，SD180CM,110Kv,199mA,5ms 曝光时间 15s；肺功能设备 MasterScreen SeS，分别对比患者患侧术前（4779mm²）、术后 7 天（2737mm²）、术后一月（3681mm²）、术后半年（4879mm²）、的肺野最大面积变化、左右横隔位移距离变化，及最大通气的变化量结合肺功能多次复查检测肺储备率变化，结合患者检查时呼吸状态。

结果 术后 7 天 **DDR** 患侧肺通气结果明显少于术前，对侧代偿性增加。术后一个月患侧通气量逐渐增加，到半年左右基本恢复。

结论 动态 **DR** 肺通气检查其检查数据与肺功能检查有一定相关性，可以更直观的对肺癌患者术后肺部评估，并具有一定的临床价值。

关于冠脉 CTA 不同阈值触发的图像质量对比的探讨

郑春言

吉林大学第一医院

目的：评价设置不同阈值触发对冠脉 **CTA** 检查的图像质量的影像。方法：随机选择 60 名常规冠脉 **CTA** 患者，平均分成两组，其中一组选择触发阈值为 100HU，另外一组选择触发阈值为 120HU，观察所选的跟踪平面的 **CT** 值受到运动伪影及呼吸伪影或者其他因素的影响并做记录。结果：其中 30 例选择触发阈值为 100HU 的患者，有 3 例患者的 **CT** 值受到运动伪影及呼吸伪影或者其他因素的影响，图像质量不佳。另外 30 例选择触发阈值为 120HU 的患者，有 5 例患者的 **CT** 值受到运动伪影及呼吸伪影或者其他因素的影响，图像质量不佳。结论：通过对比两组有效患者的图像质量，冠脉 **CTA** 检查设置的自动触发阈值是其影响图像质量的重要环节，触发时间的早晚对图像质量有着直接的影响。

PU-1993

Clinicopathological and CT features associated with recurrence-free survival of patients with small-sized peripheral invasive lung adenocarcinoma after sub-lobectomy

Qi Li,jiwen huo,yue zhang,xin fan,yu peng
the First Affiliated Hospital of Chongqing Medical University

Objective: Sub-lobar resection is gradually becoming a standard treatment for small-sized (≤ 2 cm) peripheral non-small cell lung cancer (NSCLC), with lung adenocarcinoma (ILADC) being the most frequent histologic subtype. However, the prognostic predictors to preoperatively decide whether sub-lobectomy could be feasible or not for patients with early ILADC have not yet been well identified. Therefore, the present study aimed to investigate the clinicopathological and CT features associated with recurrence-free survival (RFS) of patients with small-sized invasive lung adenocarcinoma (SILADC) after sub-lobar resection.

Methods: The study analyzed retrospectively 107 patients with SILADC who underwent preoperative chest CT scan and sub-lobar resection from December 2012 to March 2019. The Kaplan-Meier survival was used to analyze the relationship between clinicopathological characteristics, preoperative chest CT findings, and RFS. The Cox proportional hazards regression was used to identify independent prognostic factors of poor RFS.

Results: For clinicopathological characteristics, RFS was shorter in patients with age ≥ 70 years, smokers, and those with micropapillary/solid -predominant adenocarcinomas (all $p < 0.05$). For preoperative CT features, RFS was shorter in patients having tumors with size ≥ 1.4 cm, solid component size ≥ 1.1 cm, proportion of solid component $\geq 72\%$, solid density, spiculation, vascular convergence sign, peripheral fibrosis, and type II pleural tag (all $p < 0.05$). Multivariate analysis showed proportion of solid component $\geq 72\%$ (HR: 5.920, $p = 0.006$, 95% CI: 1.686-20.794), spiculation (HR:5.026, $p = 0.001$, 95% CI: 2.008-12.581 2.398-14.609), and type II pleural tag (HR: 4.638, $p = 0.002$, 95% CI:1.773-12.136) were independent risk factors for poor prognosis of patients with SILADC after sub-lobectomy.

Conclusion: Clinicopathological and CT characteristics are helpful to prognosticate RFS of patients with SILADC after sub-lobar resection, which can be used as an auxiliary tool for thoracic surgeons to choose the best surgery mode.

能谱 CT 延迟增强扫描及碘基物质图对左心耳血栓诊断价值的研究

余娜

重庆医科大学附属第三医院

目的：设计一种 CT 最佳扫描及后处理方案，利用延迟增强及能谱功能多模态诊断左心耳血栓

方法：回顾性分析 2019 年 1 月至 2023 年 6 月于我院行左房与肺静脉 CT 检查的 278 例患者，所有图像均采用能谱扫描模式，常规动脉期左心耳有充盈缺损的做 30s 延迟扫描，持续有充盈缺损再做 1 min 延迟，仍然有充盈缺损的做 2 min 延迟，以经食道超声心动图（TEE）为金标准，分别在动脉期、30 s、1 min、2 min 时相在能谱碘基物质图中测量左心耳充盈缺损区及左心房的碘含量，比较两组之间不同延迟时间下碘含量的差异。通过绘制受试者工作特征（ROC）曲线并计算曲线下面积（AUC）分析不同延迟时间及充盈缺损部分的碘基物质含量对左心耳血栓的诊断效能。

结果：利用金标准经食道超声心动图（TEE）和能谱基物质及不同延迟时间对左心耳充盈缺损的评价，并用 TEE 和能谱基物质作为标准检验不同延迟时间的诊断性差异性，延迟 30s、1min、2min，特异性分别为 0.893、0.943、0.973；AUC 分别为 0.947、0.972、0.987；敏感性均为 1，卡方分析 P 值均<0.01，符合统计学要求。

结论：能谱 CT 延迟增强扫描结合能谱碘基物质图对左心耳血栓有很好的诊断价值，且在延迟 2min 时对左心耳血栓的诊断具有更高的诊断效能，进一步为临床准确判断左心耳血栓提供更加客观真实的影像学证据。

PU-1996

探讨肺腺癌纯磨玻璃样结节（pure ground-glass nodules, pGGN）的 CT 纹理特征与半乳糖凝集素-9（Galectin-9, Gal-9）表达的相关性。

王菲菲

辽宁省肿瘤医院

目的：探讨肺腺癌纯磨玻璃样结节（pGGN）的 CT 纹理特征与半乳糖凝集素-9（Galectin-9, Gal-9）表达的相关性。

方法：首先用 KM Plotter 数据库中的数据集 "203236_s_at" 进行生存分析，分析 Galectin-9 表达水平对肺腺癌患者预后的影响。随后对 2018 年 10 月至 2020 年 6 月在辽宁省肿瘤医院收治的 87 例 CT 表现为 pGGN 的原发性肺腺癌患者的资料进行回顾性分析，资料包括患者的一般临床特征、Gal-9 表达水平及 CT 纹理特征（平均 CT 值、最大 CT 值和 Δ CT）。所有患者经病理诊断为原发性肺腺癌，并接受了增强 CT 检查。

结果：Gal-9 的高表达与肺腺癌患者较短的总生存期（overall survival，OS）和首次进展时间（first progression，FS）显著相关。尤其是在接受化疗的肺腺癌患者中，Gal-9 高表达时 OS 缩短。34.15% 的 Gal-9 阴性患者表现为肿瘤中/低分化，而在 Gal-9 阳性患者中这一比例高达 74.47%。65.21% 的 Gal-9 阳性患者肿瘤 TMN 分期为 III/IV 期，显著高于阴性患者（24.39%）。Gal-9 阳性组的平均 CT 值、 Δ CT 高于阴性组，最大 CT 值低于阴性组。患者的平均 CT 值和 Δ CT 与 Gal-9 的 IHC 评分正相关（ $R=0.803$ ， $p<0.001$ ； $R=0.752$ ， $p<0.001$ ），而最大 CT 值与 Gal-9 的 IHC 评分

负相关 ($R=-0.471$, $p<0.001$)。最大 CT 值的 AUC 为 0.856 (95%CI, 0.778-0.935, $p<0.0001$)，用最大 CT 值预测 Gal-9 表达水平的 cut-off 值为 -433.071，灵敏度为 87.8%，特异度为 73.9%。结论：Gal-9 可能是预测肺腺癌预后的有效指标。增强 CT 的最大 CT 值可能是 pGGN 肺腺癌 Gal-9 表达水平的潜在预测因素。

PU-1997

周围型肺肉瘤样癌与孤立性肺炎性病变及非小细胞肺癌的临床及 CT 特征对照分析

邹佩伶^{1,2}、李琦¹、范欣¹、张越¹

1. 重庆医科大学附属第一医院

2. 重庆市沙坪坝区人民医院

目的 探讨周围型肺肉瘤样癌 (PLSC) 与孤立性肺炎性病变 (SPL) 及非小细胞肺癌常见亚型 (CNSCLC) 的临床及 CT 特征差异，以期提高 PLSC 的诊断正确率。**方法** 回顾性收集近十年我院经手术病理证实的 30 例 PLSC (肉瘤样癌组)，并随机选取同期收治的 68 例 SPL (肺炎组) 及 73 例 CNSCLC (肺癌组) 作为对照组，分别比较 PLSC 与 SPL 及 CNSCLC 的临床及 CT 特征。**结果** PLSC 与 SPL 的比较：①临床特征：肉瘤样癌组吸烟史及恶性肿瘤家族史的发生率高于肺炎组，差异均有统计学意义 (p 均 <0.05)。②CT 特征：肉瘤样癌组分叶征、分叶数量 ≥ 5 、大面积坏死、充气支气管征及环形强化的出现率高于肺炎组，晕征、与胸膜紧贴、邻近胸膜增厚、坏死区周围线样强化影的出现率、 ΔCT 值_{动脉期}及 ΔCT 值_{静脉期}低于肺炎组，差异均有统计学意义 (p 均 <0.05)。③Logistic 回归分析示有恶性肿瘤家族史、存在充气支气管征及环形强化、不与胸膜紧贴及 ΔCT 值_{静脉期}较小为 PLSC 的独立预测因子，该模型诊断 PLSC 的 AUC、正确百分比、敏感性 & 特异性分别为 0.963、92.9%、93.3% 及 92.6%。PLSC 与 CNSCLC 的比较：①临床特征：肉瘤样癌组吸烟史、恶性肿瘤家族史及呼吸道症状的发生率高于肺癌组，差异均有统计学意义 (p 均 <0.05)。②CT 特征：肉瘤样癌组病灶最长径大于肺癌组，坏死、大面积坏死及环形强化的出现率高于肺癌组，毛刺征及分叶数量 ≥ 5 的出现率、 ΔCT 值_{动脉期}及 ΔCT 值_{静脉期}低于肺癌组，差异均有统计学意义 (p 均 <0.05)。③Logistic 回归分析示有呼吸道症状、病灶较大、分叶数量 < 5 及存在环形强化为 PLSC 的独立预测因子。该模型诊断 PLSC 的 AUC、正确百分比、敏感性 & 特异性分别为 0.897、84.5%、83.3% 及 82.2%。**结论** PLSC 与 SPL 及 CNSCLC 的临床和 CT 特征有明显不同。

PU-1998

Application Value of Magnetic Resonance Diagnosis in Takotsubo Cardiomyopathy and its Classification

Xiaoyan Wang

Department of Radiology, Shanghai Ninth People's Hospital, Shanghai Jiaotong University School of Medicine

Objective: To analyze cardiac magnetic resonance of Takotsubo cardiomyopathy and its phenotypic expression in order to achieve better understanding of this disease.

Methods: We evaluated 14 cases who were admitted to our hospital with the diagnosis of Takotsubo cardiomyopathy. CMR was performed within 1 week after admission and MRI data were retrospectively analyzed.

Results: Most patients had suffered psychological trauma, physical injury and other stress factors. Electrocardiogram was similar to acute myocardial infarction. Cardiac magnetic resonance

imaging showed LV regional wall motion abnormalities. According to the distribution of wall motion abnormalities, TTS has three types: apical ballooning(8 cases), midventricular(1 case), focal wall motion(5 cases). All cases appear myocardial edema. 4 cases abnormal myocardial enhancement were noted. The abnormal motion segments do not conform to the pattern of coronary artery distribution.

Conclusions: CMR is best diagnostic modality for the diagnosis of takotsubo cardiomyopathy. It plays an important role in differentiating from acute myocardial infarction and myocarditis.

冠状动脉 CT 的血流储备分数 (CT-FFR) 对心肌缺血的无创诊断中的应用价值

刘琪

山西省心血管病医院

目的 探讨基于冠状动脉 CT 的血流储备分数 (CT-FFR) 对心肌缺血的无创诊断中的应用价值。方法 回顾性入选 2017 年 6 月至 2021 年 6 月山西省心血管病医院完成冠状动脉 CCTA 检查并进行冠状动脉造影术的心绞痛住院患者。基于冠状动脉 CT 图像, 利用 CT-FFR 软件来建模计算 CT-FFR 值。以冠状动脉造影术 ICA 作为诊断金标准, 计算 CT-FFR 诊断心肌缺血的敏感度、特异度、阳性预测值、阴性预测值及准确度。结果 入选患者 76 例共 172 处病变血管。CT-FFR 的诊断冠状动脉狭窄病变的敏感度为 66.7%, 特异度为 90.6%, 阳性预测值为 92.3%, 阴性预测值为 61.7%, 准确性为 75.6%。结论 CT-FFR 作为一种无创的、临床易行的、准确的血流动力学信息检测方案, 能够区分出可引起心肌缺血的血管病变, 能够减少患者进行介入式冠脉造影的需求, 降低整体医疗费用。

冠状动脉 CT-FFR 值对心血管终点事件的预测价值

刘琪

山西省心血管病医院

目的: 分析冠状动脉 CT-FFR 值与终点事件发生的相关性。方法: 分为 CCTA 成像和 CT-FFR 测量两个阶段。对 2016 年 6 月 — 2019 年 6 月行 CCTA 检查狭窄程度为 70%-80% 的患者 52 例作为研究对象。对其进行 CT-FFR 分析。获得 CTA 影像资料后, 然后再进行 CT-FFR 分析, 随访患者 3 年内心血管终点事件的发生率。将 CT-FFR 的临界值设定为 0.8, 20 例 CT-FFR<0.8, 32 例 CT-FFR>0.8。分析 CT-FFR 值与终点事件发生的相关性。研究主要终点为全因病死率、非致命性心肌梗死 (心梗) 或不稳定型心绞痛需要住院治疗。

结果: 冠状动脉 CT-FFR<0.8 组心血管终点事件发生率高于 CT-FFR>0.8 组, 差异均有统计学意义 ($P<0.05$)。

结论: 通过 CT-FFR 统计学分析后 CT-FFR 值可能对冠心病患者的心血管终点事件起到重要的预测作用, 对此类患者可以进行该检查, 以进一步指导临床工作。

基于人工智能 CT 定量参数对肺混合磨玻璃结节侵袭性的预测价值

贾永军、段海峰、于楠、杨创勃
陕西中医药大学附属医院

目的: 探讨基于人工智能 (AI) CT 定量参数对肺混合磨玻璃结节 (mGGNs) 侵袭性的预测价值。
方法: 回顾性分析 2018 年 1 月至 2019 年 12 月经手术病理证实的 121 例 mGGNs 患者的薄层 CT 图像, 依据病理类型分为 3 组, 分别为浸润前病变 23 例, 其包括原位腺癌(AIS) 16 例, 非典型腺瘤样增生(AAH) 7 例微浸润腺癌 (MIA) 36 例, 浸润性腺癌 (IAC) 组 62 例。采用 AI 肺结节分析进行定量分析, 得到三组不同侵袭性 mGGNs 的体积、长径、短径、最大 CT 值、最小 CT 值、平均 CT 值、CT 值偏度、CT 值峰度和恶性概率。比较三组间 AI 量化参数的差异。
结果: 基于 AI 定量比较 3 组病理类型的 mGGNs 在体积、长径、短径、最大 CT 值、最小 CT 值、平均 CT 值、CT 值偏度、CT 值峰度和恶性概率差异均有统计学差异($P < 0.05$)。进一步两两对比, 体积、长径、短径方面均为 AAH+MIA 最小, IAC 最大, AIS 介于中间, 差异有统计学差异($P < 0.05$); 最大 CT 值、最小 CT 值、平均 CT 值、CT 值偏度、CT 值峰度方面, AAH+MIA 和 AIS 之间无统计学差别 ($P > 0.05$), 但 AAH+MIA 和 AIS 的最大 CT 值、最小 CT 值、平均 CT 值小于 IAC, CT 值偏度、CT 值峰度大于 IAC, 差异均有统计学差异($P < 0.05$)。AI 预测 3 组病理类型的 mGGNs 仅在 AIS 和 IAC 间存在统计学差异, 其余两组间比较无统计学差别 ($P > 0.05$)。
结论: 基于 AI 定量肺结节的体积、长径、短径、最大 CT 值、最小 CT 值、平均 CT 值、CT 值偏度、CT 值峰度和恶性概率对 mGGNs 的病理侵袭性有一定预测作用。

PU-2002

基于心脏磁共振对男性业余马拉松运动员左心室心肌应变的研究

李玉爽、敖亚雯、赵益林、查云飞
武汉大学人民医院

目的: 分析长期多次马拉松运动对业余马拉松运动员心脏结构和功能的影响。
方法: 对 32 名男性业余马拉松运动员(44 ± 7 岁)和 12 名男性健康对照者(42 ± 8 岁)进行心脏磁共振 (CMR) 检查。采用特征跟踪应变分析对男性业余马拉松运动员心脏结构和功能的相关参数进行研究。
结果: 与健康对照组相比, 业余马拉松运动员心率(HR, heart rate)、身体质量指数(BMI, body mass index)和体表面积(BSA, body surface area)较低。业余马拉松运动员左室质量指数(LV mass index), 左室舒张末期容积指数(LV end-diastolic volume index) 和右室收缩末期容积指数(right ventricular end-systolic volume index)均显著高于健康对照组。此外, 业余马拉松运动员的室间隔厚度(IVS, interventricular septum)比健康对照组高。两组志愿者左新心室总心肌应变(GMS, global myocardial strain)水平的差异无统计学意义。然而, 业余马拉松运动员的左心室在第 8 和第 9 节段节段径向和周向应变较健康对照组相比较低, 最后, 我们还发现随着总运动强度的增加, 整体纵向应变也随之增加。
结论: 我们发现与健康对照组相比, 业余马拉松运动员室间隔厚度较高, 区域径向和周向应变较低, 表明长时间和高强度运动可能导致心脏重构。对于业余马拉松运动员来说, 这是否是一种适应性的变化, 还需要进一步的研究。

PU-2003

前置双流注射法注射方案在 CTPA 检查中的应用研究

吕鑫一、陈力
重庆市江津区第二人民医院

目的：通过碘对比剂前置双流注射法注射方案在 CTPA 检查中的应用研究并与常规注射法 CTPA 进行对比，寻找到对比剂用量少且效果更优的检查方法。

方法：1.设备与扫描参数：西门子 128 层螺旋 CT，螺距 1.4，管电压 100kv，延时 4s 启动扫描。2.扫描范围及方向：肺尖至膈底，足到头方向扫描。3.患者选择：选取 1 月-9 月来我院行 CTPA 检查的患者 80 例，随机分为实验组与对照组，每组各 40 例。实验组采用前置双流注射法，对照组采用常规注射法。4.对比剂注入方案：选择患者右肘正中静脉建立静脉通道，采用双筒高压注射器，对比剂选用碘克沙醇（320mgI/ml）。实验组注射方案：先以药：水=3:7，流速 4.0ml/s，注射 15ml 混合液，接着注射 15ml 纯对比剂，流速 4.0ml/s，最后注入 40ml 生理盐水，流速 4.0ml/s；对照组采用常规注射方法，先注射 35ml 对比剂，流速 4.0ml/s，在注射 40ml 生理盐水，流速 4.0ml/s。两组均使用团注追踪法，监测层面均为肺动脉干，阈值 70HU。5.评价方法与标准：由两位高年资医师采用双盲法对血管图像进行评价并打分。肺动脉干 CT 值不低于 250HU 为 1 分，远端肺动脉 CT 值不低于 200HU，左心房及肺静脉 CT 值低于 150HU 为 1 分。

结果：1.利用 spss22.0 进行统计分析，实验组与对照组在肺动脉干，远端肺动脉及左心房 CT 值均无统计学差异（ $p>0.05$ ）。2.实验组对比剂用量（19.5ml）明显少于对照组（35ml）。

结论：通过使用碘克沙醇，利用前置双流注射法注射方案行 CTPA 检查减少了患者的碘对比剂用量，降低了使用碘对比剂可能造成的肾毒性反应发生概率，保证患者安全的同时提供了较好的图像质量；另一方面，由于其仍采用对比剂团注追踪法，操作简单可行，在低于 128 层螺旋 CT 上同样适用。

PU-2004

前纵隔伴有淋巴样间质的微结节型胸腺瘤 4 例

张卉
吉林大学白求恩第一医院

目的：探讨伴有淋巴样间质的微结节型胸腺瘤（MNT）的临床、影像及病理特征。方法：回顾性分析 4 例 MNT 的临床资料、影像表现、病理学特征、治疗及预后。结果：4 例 MNT 患者，男 2 例，女 2 例，年龄 52-64 岁，2 例无症状，2 例因乏力就诊。影像表现均发现前纵隔占位性病，最大径 2-10cm，其中 3 例表现为囊实性肿物，1 例为实性肿物，实性部分中度强化，与周围界限清楚。均进行手术完整切除，病理证实为 MNT。大体大部分包膜，镜下 2 例局部侵及包膜。组织学特征为丰富的淋巴细胞间质分隔增生的上皮样细胞呈结节样分布，细胞呈梭形或卵圆形，形态温和，未见病理性核分裂及坏死，淋巴细胞间质可见具生发中心的滤泡。免疫表型：短梭形上皮细胞 CKpan、CK19 阳性，CD20、CD5 和 CD117 阴性，淋巴间质中生发中心细胞 CD20 阳性。术后随访最短者 1 年 7 个月，最长者 4 年 4 个月均未复发。结论：伴有淋巴样间质的微结节型胸腺瘤（MNT）是一种十分罕见的特殊类型的胸腺瘤，生物学行为良好，易囊变，依病理组织学特征及免疫表型确诊，手术完整切除为主要治疗手段，术后预后良好。

CT-based radiomics combined with clinical features for invasiveness prediction and pathological subtypes classification of subsolid pulmonary nodulesMiaozhi Liu¹, Rui Duan², Zhifeng Xu², Yan Lin¹, Zijie Fu¹

1. Second Affiliated Hospital of Shantou University Medical College

2. The First People's Hospital of Foshan

Purpose: To construct optimal models for predicting the invasiveness and pathological subtypes of subsolid nodules (SSNs) based on CT radiomics and clinical features.

Methods: This study was a retrospective study involving two centers. A total of 316 patients with 353 SSNs confirmed as atypical adenomatous hyperplasia (AAH), adenocarcinoma in situ (AIS), minimally invasive adenocarcinoma (MIA) and invasive adenocarcinoma (IAC) were included from January 2019 to February 2023. Models based on CT radiomics combined with clinical features were constructed for classification of AAH/AIS and MIA, MIA and IAC, as well as lepidic-predominant adenocarcinoma (LPA) and acinar-predominant adenocarcinoma (ACI). Receiver operating characteristic (ROC) curve was used to evaluate the model performance. Finally, the nomograms based on the optimal models were established to predict the invasiveness of LUNG-RADS 4X SSNs.

Results: The combined model including lobulation, the GGN-vessel relationship, diameter, CT value, consolidation tumor ratio (CTR) and rad-score performed the best for distinguishing AAH/AIS from MIA (AUC=0.841) and the nomogram based on this model distinguished AAH/AIS from MIA in the Lung-RADS 4X SSNs, with the sensitivity and specificity of 73.3% and 80%, respectively. The combined model including age, CT value, CTR and rad-score was the most effective in distinguishing MIA from IAC (AUC=0.878), and the sensitivity and specificity of the nomogram based on this model for distinguishing MIA and IAC in the Lung-RADS 4X SSNs were 73.3% and 86.7%, respectively. There were no significant differences in clinical features between LPA and ACI, while the radiomics model based on rad-score showed good performance for distinguishing LPA from ACI (AUC=0.926).

Conclusions: The nomograms based on radiomics and clinical features could predict the invasiveness of SSNs accurately. Moreover, radiomics models showed good performance in distinguishing LPA from APA.

PU-2006

A study of the impact of coronary CTA artificial intelligence on the work efficacy of resident physicians with different years of trainingTianhui Zhang, Zheng ZHONG, Zhifeng HUANG, Weixiong FAN
People's Hospital of Meizhou

Objective To explore the impact of coronary CTA-AI on the work efficacy of resident physicians with different years of training. **Methods:** Forty-four patients who received coronary CTA examination in our hospital from June 2022 to July 2022 were collected. Junior and senior resident-trained physicians used reading alone and AI-assisted reading to interpret coronary CTA images, and recorded the presence or absence of stenosis in each branch vessel and the reading time. The coronary angiogram (CAG) was used as a reference standard to calculate the sensitivity and specificity of coronary artery stenosis diagnosis by resident-trained physicians reading alone versus AI-assisted reading. The paired chi-square test was used to compare the

differences in diagnostic efficacy between the two reading methods by resident-trained physicians. The paired t-test was used to compare the differences in reading time between the two methods. Results: The specificity of coronary artery stenosis diagnosis by CTA AI-assisted reading was significantly higher than that by reading alone, and the difference was statistically significant ($P < 0.05$), and the sensitivity of coronary artery stenosis diagnosis was slightly higher than that by reading alone, but the difference was not statistically significant ($P > 0.05$). The reading time of coronary CTA AI-assisted reading by junior and senior resident-trained physicians was significantly shorter than that of reading alone ($P < 0.05$). Conclusion: Coronary CTA artificial intelligence can significantly improve the specificity of diagnosis of coronary artery stenosis and significantly shorten the reading time of resident physicians with different years of training.

PU-2007

第二代冠状动脉追踪冻结 (SSF2) 技术在高心率患者冠脉 CTA 成像中的临床应用

罗春材

中国人民解放军总医院第一医学中心

目的:

探索第二代冠状动脉追踪冻结 (SSF2) 技术在高心率患者冠脉 CTA 成像中的临床应用价值。

材料与方法:

随机收集 100 例行冠脉 CTA 扫描且心率 ≥ 75 次/min 的患者冠脉 CTA 图像, CT 扫描管电压为 100 kV, 采用智能心电门控技术自动选择曝光期相。将原始数据分别重建出 3 组图像: A 组为常规图像; B 组为采用 SSF1 技术的重建图像; C 组为采用 SSF2 技术的重建图像。对 3 组冠脉 CTA 图像的质量评分及可诊断率进行评估。

结果:

100 例高心率患者冠脉 CTA 图像的评估结果显示: A 组与 C 组、B 组与 C 组右冠状动脉、左前降支、左回旋支、冠状动脉起源和冠状动脉评分及可诊断率差异均有统计学意义 (P 均 < 0.05), 主动脉瓣、肺动脉瓣、二尖瓣及三尖瓣图像质量评分均有统计学意义 (P 均 < 0.05)。

结论:

采用第二代冠状动脉追踪冻结 (SSF2) 技术可以进一步改善高心率患者冠状动脉 CT 血管成像质量。

PU-2008

团注追踪触发扫描技术延迟时间对支气管动脉 CTA 成像质量的影响

姚大鹏、李晓峰

徐州市肿瘤医院

目的: 探讨团注追踪触发扫描触发后不同延迟时间对支气管动脉 CTA 成像质量的影响; 方法: 回顾性分析徐州市肿瘤医院 2021 年 1 月到 2022 年 6 月共 60 名患者的支气管动脉 CTA 检查, 均使用团注追踪动态触发方法进行扫描。其中 A 组患者触发后使用最短延迟时间扫描 (7.6 秒), B 组患者触发后 11.6 秒开始扫描, 对比剂 (碘海醇 350mg/ml) 使用剂量为 1.0ml/kg, 注射速率 3.5ml/s, 其他扫描条件相同 (检测面采用器官分叉水平, 触发阈值为 90HU, 均使用能谱 60keV 单能量重建)。由 2 位 10 年以上工作经历的影像诊断医师对每个图像质量进行评分, 如果意见不一

致请上级医师会诊后作为最终结论。分别比较患者增强后降主动脉及两组支气管动脉图像, 将其质量差异、伪影、是否存在干扰等情况进行汇总分析。使用 Graphpad 6.0 分析软件, 采用秩和检验评价医师对图像质量评分的差异性; 采用独立样本 t 检验比较患者增强后降主动脉及支气管动脉起始部 CT 值净增值的差异。结果: 增强后支气管分叉水平降主动脉 CT 值净增值两组之间差异均无显著性意义($p>0.05$)、支气管动脉起始部 CT 值净增值两组之间差异有显著性意义($p<0.05$); 分叉水平降主动脉图像质量评分两组间差异无统计学意义($p>0.05$)、支气管动脉图像质量评分两组间差异有统计学意义($p<0.05$), 研究发现 B 组数据除了支气管动脉起始部 CT 值和图像质量更理想之外, 腔静脉、肺动脉、肺静脉对支气管动脉的干扰也有明显改善。结论: 使用团注追踪触发扫描方法进行支气管动脉 CTA 时, 触发后不同的延迟时间对支气管动脉成像质量有较大影响, 同时肺动脉、腔静脉、肺静脉对支气管动脉的干扰也会有较大的区别。综上所述, 选择合适的阈值和延迟时间可以提高支气管动脉 CTA 扫描的图像质量。

PU-2009

探讨第 3 代双源 CTTurbo Flash 高心率 CCTA 成像的可行性

李郑
扬州大学附属医院

【摘要】目的 在第三代西门子 CT Turbo Flash 扫描模式下行高心率冠状动脉 CT 血管成像(CCTA)检查并探究其可行性。方法 选取 2019 年 4 月—2020 年 5 月于扬州大学附属医院行 CCTA 的 80 例患者为实验组并随机分为两组 (A 和 B), 患者心率要求为高于 80 次/min 且小于 100 次/min。A 组患者采用第三代双源 CT Turbo Flash 模式扫描, B 组用回顾性模式扫描。评估两组图像主动脉根部的 CT 值、图像的信噪比(SNR)、图像的对比噪声比(CNR)以及右冠状动脉近段、左冠状动脉主干, 评估方法与上诉一致。CT 图像质量主观评分、有效辐射剂量 (ED) 也要纳入评分。结果 两组对象数据的 SNR、CNR 差异均有统计学意义 (均 $P < 0.05$), 但 CT 值差异无统计学意义 ($P > 0.05$); 两组左冠状动脉主干以及右冠状动脉近段的 CT 值、SNR 和 CNR, 以及两组图像质量主观评分比较, 其差异均无统计学意义 (均 $P > 0.05$)。Turbo Flash 扫描模式有效辐射剂量低于回顾性模式 ($P < 0.05$)。结论 面对高心率患者时, 第三代双源 CT 的 Turbo Flash 的扫描模式行 CCTA 检查的图像质量大部分能满足临床诊断要求, 且 $ED < 1 \text{ mSv}$, 但是研究中发现用 Turbo Flash 模式扫描获取的图像质量评分不如回顾性模式。在面对高心率患者屏气无法配合时, 行 Turbo Flash 扫描可一定程度解决呼吸问题。

PU-2010

小视野 DWI 联合 T2WI 压脂鉴别肺实性结节的价值

陆杰、高叶祺、俞同福
江苏省人民医院 (南京医科大学第一附属医院)

目的: 探究小视野扩散加权成像(r-FOV DWI)联合 T2WI 压脂能否提高肺实性结节的良恶性鉴别诊断价值。

方法: 回顾性分析 108 例患者的临床及胸部 MRI 影像资料。在压脂 T2WI 沿结节边缘手动绘制感兴趣体积, 获得病灶体积、平均信号强度及信号强度标准差, 定义 T2 对比度(T2CR)为肺结节的平均 T2 信号强度除以菱形肌的 T2 信号强度的比率, 在 r-FOV ADC 图上绘制病灶的感兴趣区获得平均 ADC 值。建立受试者工作特征曲线(ROC)确定参数的诊断效能。

结果: 肺癌 ADC 值 ($1.08 \pm 0.33 \times 10^{-3} \text{ mm}^2/\text{s}$) 低于良性肺结节 ($1.82 \pm 0.60 \times 10^{-3} \text{ mm}^2/\text{s}$) ($P < 0.001$), 肺癌 T2CR (1.91 ± 0.83) 低于良性肺结节 (2.66 ± 0.94) ($P < 0.001$)。当 ADC 值取

1.34×10⁻³ mm²/s 时, AUC 为 86.2%, 敏感度为 80.4%, 特异度为 79.0%。当 T2CR 取 2.25 时, AUC 为 72.8%, 敏感度为 72.6%, 特异度为 64.9%。ADC 值和 T2CR 联合检测的敏感度为 82.4%, 特异度为 87.7%, AUC 为 93.1%。

结论: r-FOV DWI 联合 T2WI 压脂后能提高肺实性结节良恶性的诊断效能。

PU-2011

HRCT manifestations of pulmonary cryptococcosis with infiltrative consolidation and mixed type

Xue Xu

Affiliated Zhongda Hospital of Southeast University

[Abstract] Objective: To analyze the HRCT manifestations of consolidation, infiltration, and mixed types of pulmonary cryptococcosis and improve diagnosis. Methods: Clinical and CT data of 32 patients with consolidation, infiltration, and mixed types of pulmonary cryptococcosis confirmed by pathology or clinical diagnosis were retrospectively collected. Results: There were 7 cases of consolidation type and 25 cases of mixed type. On CT, 22 cases involved a single lung lobe, and 27 cases involved the lower lung lobe. In 29 cases, the lesions were mainly distributed in the outer or outer-middle zone of the lung, and in 15 cases, the long axis of the lesion was parallel to the pleura. Ground-glass density or halo sign around the lesion was observed in 16 cases; 8 cases had cavities inside the lesion, all of which were small cavities; 23 cases had signs of proximal bronchial inflation. Among the mixed type cases, 22 had a tendency to fuse with the lesions in the same lung lobe, and 3 cases had a clustered distribution without fusion. Conclusion: Consolidation, infiltration, and mixed types of pulmonary cryptococcosis often present with nodules and/or masses, most of which are located in the outer or outer-middle zone of the lung and are more common in the lower lung lobe. Ground-glass density or halo sign around the lesion is relatively specific, and there is a tendency to fuse or cluster with the lesions in the same lung lobe.

PU-2012

深度学习重建后处理技术联合“三低”冠状动脉 CTA 血管重建在老年患者中的应用价值

刘思讷、徐海芸、杨烁慧

上海中医药大学附属市中医医院

目的 探讨低管电压、低碘对比剂用量及低辐射剂量(三低)扫描结合深度学习重建后处理技术用于冠状动脉 CT 血管成像检查(CCTA)的可行性。方法 前瞻性连续纳入 2021 年 10 月-12 月在本院行冠状动脉 CTA 检查患者 66 例,随机分成实验组(A 组)和对照组(B 组),A 组 32 例,B 组 34 例,A 组采用 80 kV 管电压及低对比剂用量和流速,B 组采用 120 kV 管电压及常规对比剂用量和流速。所有图像由人工智能辅助软件进行图像后处理,评估冠状动脉各节段血管的客观和主观图像质量,并分析比较两组的辐射剂量。结果 共 990 个冠状动脉节段纳入主观评估,2 名观察者之间的图像主观评分一致性较好(Kappa 值=0.636, P=0.021),B 组图像质量主观评分优于 A 组(1.61±0.22 VS. 2.08±0.13, P<0.001)。两组动脉 CT 均值在 300HU 以上,均满足了医师诊断要求。A 组主动脉根部、左主干、左前降支和左回旋支的 CT 值均较 B 组为高(P 均<0.05)。右冠状动脉中段处 A 组噪声高于 B 组(21.34±6.11 VS. 17.40±5.03, P<0.05)。A 组的 SNR 和 CNR 在主动脉根部处高于 B 组(31.95±8.25 VS. 23.26±7.03, 35.90±9.44 VS. 26.86±7.87, P<0.001)。A 组有效辐射剂量、CT 容积剂量指数与辐射剂量长度乘积均低于 B 组

(98.64 ± 49.93 VS. 232.72 ± 82.69 , 1.38 ± 0.70 VS. 3.26 ± 1.16 , 21.07 ± 11.75 VS. 28.28 ± 5.82 , $P < 0.001$)。结论 结合深度学习重建后处理血管重建图像的“三低”CCTA 扫描质量较常规 CCTA 为高, 降低了老年患者的辐射剂量和碘摄入量, 具有良好的临床应用价值。

PU-2013

原发性肺恶性脑膜瘤：病例报告及文献复习

祝萍^{1,2}、陈峰¹

1. 浙江大学医学院附属第一医院

2. 浙江中医药大学附属第二医院

目的: 介绍一例原发性肺恶性脑膜瘤的影像学表现和病理诊断。

方法: 一例 47 岁女性患者, 因体检发现肺部肿块 1 月余入院。入院后进行了影像学检查和支气管镜活检, 并很快接受了手术治疗。

结果:

胸部增强 CT: 左侧胸腔内有一个 $5.5 * 5.8 * 7.4$ cm 的肿块, 病灶位于左肺下叶, 近肺门旁, 跨左肺斜裂生长, 部分累及左肺上叶, 其内见线样致密影, 邻近支气管明显受压推挤, 邻近肺组织呈“晕征”改变; 增强后肿块呈不均匀轻中度渐进性强化, CT 诊断提示为肺部恶性肿瘤。PET/CT: 病灶放射性摄取不均匀性增高, SUV 最大值约 4.4; 左肺门淋巴结肿大与左肺门肿块分界不清, 放射性摄取轻度增高, SUV 最大值约 2.6, 考虑恶性肿瘤性病变, 建议穿刺活检。颅脑 MR 平扫+增强未见异常改变。

支气管镜检: 探及左下基底支开口处肿块, 开口粘膜浸润隆起, 开口狭窄, 于此处进行灌洗、刷检、活检, 液基细胞学检查找到异型细胞, 低分化癌不能除外。

病理所见: 左下肺叶切除标本示, 距支气管切缘 0.5cm 紧贴肺膜见一巨大肿物, 范围 $6 * 6.5 * 5.8$ cm, 切面灰白, 质中。标本苏木精-伊红染色显示肿瘤细胞呈梭形、束状、漩涡状、团块状排列, 局灶侵犯支气管软骨, 未累及肺膜; 送检淋巴结均未见癌转移。

免疫组织化学染色: EMA (+), SSTR2 (+), PR (+), Ki-67 (5-10%+), CD34, D2-40 (+), P53 (散在弱+)。

病理诊断: 肺原发性脑膜瘤。

术后 2 月复查: 实验室检查 CA125 为 109.2 U/mL (参考值 < 35 U/mL), 显著高于术前的 18.8 U/mL; 其它肿瘤标志物如甲胎蛋白、癌胚抗原、CA199、CA153 未见异常。截止目前, 患者尚未出现身体其它部位转移的影像学征象。

结论: 恶性 PPM 较少见, 缺乏明确的病理学定义来区分良恶性 PPM。潜在病例应根据影像学、实验室和病理学结果进行综合评估。需要长期定期随访以排除 PPM 的转移或复发。

PU-2014

MRI findings and its staging value of primary anterior mediastinal Hodgkin lymphoma

Gang Xiao, Yue Qin
Xi'an Daxing Hospital

Objective: To study the MRI findings of primary anterior mediastinal Hodgkin lymphoma (PAMHL) and its value in Ann Arbor clinical staging. **Methods:** A total of 32 patients with PAMHL confirmed by histopathology were enrolled retrospectively. The MRI findings were evaluated independently by two radiologists in double-blinded manner, including tumor size, homogeneity, fibrous septum

sign, apparent diffusion coefficient (ADC) value, and so on. Subsequently, we analyzed the inter-observer agreement of these MRI findings and assessed their values in the differential diagnosis of early-stage and advanced-stage PAMHL. Results: The size of PAMHL ranged from 5.3cm to 20.5cm, with an average length of 9.6 ± 3.7 cm. Twenty-five lesions (78.1%) presented heterogeneous signal intensity; 20 lesions (62.5%) showed fibrous septum sign, 18 of which were nodular sclerosis HL; 16 lesions (50.0%) appeared as lymph node fusion; 29 lesions (90.6%) had lymphadenectasis, 15 of which showed mass-like lymph nodes with short diameter ≥ 3 cm. Among the 32 PAMHL, tumors invaded lung tissue in 15 cases (46.9%), pericardium in 13 cases (40.6%), blood vessel in 10 cases (31.3%), chest wall in 7 cases (21.9%), and phrenic nerve in 1 case (3.1%). The average ADC value of PAMHL was $(0.801\pm 0.112)\times 10^{-3}\text{mm}^2/\text{s}$. Mass-like lymph node was significantly more seen in advanced-stage than in early-stage PAMHL ($P=0.014$). Conclusion: PAMHL has certain characteristic MRI findings. Mass-like lymph node can be used to distinguish early-stage and advanced-stage PAMHL, which is helpful to guide clinical staging and predict prognosis.

肺小结节术前 CT 引导下 Sencure 定位的临床应用

陈骥

江苏省苏北人民医院

背景与目的 对于直径 <1 cm 的肺小结节,在胸腔镜术中较难准确定位。近年来,大量学者尝试使用各种方法进行术前的肺小结节定位。本文从适应症、结果、并发症三个方面回顾性分析了胸腔镜术前 CT 引导下 Sencure 定位针的临床应用价值。

方法 2022 年 1 月-2022 年 4 月,50 例患者于胸腔镜术前接受了 CT 引导下肺小结节 Sencure 定位。小结节直径从 0.5 cm-2 cm (平均 $9.8\text{ cm}\pm 5.3\text{ cm}$)。评价指标包括定位操作时间、成功率、定位相关并发症,中转开胸比率等。

结果 50 例患者中 50 例定位成功,CT 定位花费时间平均为 13.5 min,全组无严重并发症发生。结论 胸腔镜术前 CT 引导下肺小结节 Sencure 定位有一定的临床应用价值,可帮助术中精确定位肺小结节位置,并且并发症发生率较低,并减少手术时间。

Pulmonary extranodal NK/T-cell lymphoma mimics pneumonia in a patient with diabetes

Weixiao Liu,Xiaokai Mo,Shuixing Zhang
The first Affiliated Hospital of Jinan University

A 59-year-old man with diabetes was hospitalized because of recurrent fever, right foot tenderness, blurred vision and multiple skin nodules for 1 month. Chest computed tomography (CT) revealed multiple lobulated, mildly enhanced masses in the peripheral lungs, considering pneumonia (Figure 1A-D). However, multiple bacterial and fungal cultures and tuberculosis GeneXpert were negative on bronchoalveolar lavages. He still had a recurrent fever and more skin nodules during the 2 weeks of antibiotics. Pathology examination of lung biopsy showed extranodal NK/T cell lymphoma (ENKTL) (Figure 1E). Fluorine-18-fluorodeoxyglucose positron emission tomography (18F-FDG PET)/CT demonstrated high FDG uptake in lung lesions, multiple lymph nodes and scattered subcutaneous nodules (Figure 1F). His Epstein-Barr virus (EBV) antibody and DNA were positive but normal nasopharynx on MRI. Chemotherapy was implemented.

ENKTL has the highest incidence in Asia and South America and may be related to EBV infection and ethnic genetic background 1,2.It occurs most frequently in the nasal cavity and upper respiratory tract, and some can be in the skin and gastrointestinal tract, but rare in the lung. 3. Extra-nasal ENKTL is highly aggressive and has a worse prognosis than nasal ENKTL 4,5. Refractory pneumonia and multiple subcutaneous nodules may indicate other systemic disorders, and biopsy is helpful for the etiology and subsequent management.

深度学习重建在改善双低肺动脉 CTA 图像质量、评估 Qanadli 栓塞指数中的应用价值

邱慎满、孟闫凯、徐凯
徐州医科大学附属医院

目的 在低对比剂用量、低辐射剂量的双低肺动脉 CT 血管成像 (CTPA) 检查中, 比较深度学习重建 (DLR) 与自适应迭代重建 (ASiR-V) 的图像质量及 Qanadli 栓塞指数。 **方法** 回顾性分析 2020 年 10 月至 2021 年 3 月徐州医科大学附属医院放射科 88 例行 CTPA 双低扫描患者的资料, 其中男 44 例, 女 44 例, 年龄 11~87 岁 (61 ± 15 岁)。采用 80 kV 管电压, 20 ml 对比剂用量, 扫描数据分别进行标准内核深度学习高档重建 (DL-H) 和 ASiR-V 重建, 并将患者分为标准内核 DL-H 组 (88 例, 栓塞阳性 33 例) 及 ASiR-V 组 (88 例, 栓塞阳性 36 例)。分析比较两种重建算法的 CT 值、图像噪声、信噪比 (SNR)、对比噪声比 (CNR)、主观图像质量评分、Qanadli 栓塞指数、阳性率及阳性 Qanadli 栓塞指数差异。 **结果** 标准内核 DL-H 和 ASiR-V 两种重建算法组间肺动脉主干及右肺动脉干、左肺动脉干的 CT 值差异均无统计学意义 (均 $P>0.05$)。标准内核 DL-H 组肺动脉主干及右肺动脉干、左肺动脉干的图像噪声较 ASiR-V 组降低 (均 $P<0.001$)。标准内核 DL-H 组肺动脉主干及右肺动脉干、左肺动脉干的 SNR 和 CNR 较 ASiR-V 组显著提高 (均 $P<0.001$)。标准内核 DL-H 组的主观图像质量评分较 ASiR-V 组显著提高 (4.6 比 3.8, $P<0.001$)。两组的 Qanadli 栓塞指数、阳性率及阳性 Qanadli 栓塞指数差异均无统计学意义 (均 $P>0.05$)。 **结论** 标准内核 DL-H 重建较 ASiR-V 重建能够显著提高双低扫描条件下的图像质量。

PU-2018

深度学习重建 CTPA 在急性 PE 患者临床危险度分层中的应用价值

邱慎满、孟闫凯、徐凯
徐州医科大学附属医院

目的 在深度学习重建 (DLR) 条件下, 探讨低辐射剂量、低对比剂用量 CTPA 在急性 PE 患者临床危险度分层中的应用价值。 **方法** 回顾性搜集 2020 年 10 月至 2021 年 3 月在我院行双低剂量 CTPA 扫描的患者资料, 最终纳入 50 例, 其中男 27 例, 女 23 例, 依据患者临床基线数据分别行 Wells 可能性评分和 sPESI 严重程度评分。检查完成后分别行标准内核 DLR 高档 (DL-H) 重建和自适应迭代重建 (ASiR-V)。分析比较不同危险度分层患者 CTPA 两种重建算法的 CT 值、噪声、信号噪声比 (SNR)、对比噪声比 (CNR) 及主观质量评分。采用 SPSS 22.0 软件对数据进行分析, $P<0.05$ 差异有统计学意义。 **结果** Wells 评分为可能性小及可能的患者, 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干 CT 值较 ASiR-V 重建均无统计学差异; 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干图像噪声均显著低于 ASiR-V 重建 (均 $P<0.001$); 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干 SNR 和 CNR 均显著高于 ASiR-V 重建 (均 $P<0.001$); 标准内核 DL-

H 重建的主观图像质量均显著高于 ASiR-V 重建 (均 $P<0.001$)。sPESI 评分为低危及中高危的患者, 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干 CT 值较 ASiR-V 重建均无统计学差异; 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干图像噪声均显著低于 ASiR-V 重建 (均 $P<0.001$); 标准内核 DL-H 重建的肺动脉主干、左右肺动脉干 SNR 和 CNR 均显著高于 ASiR-V 重建 (均 $P<0.05$); 标准内核 DL-H 重建的主观图像质量均显著高于 ASiR-V 重建 (均 $P<0.001$)。结论: 在不同危险度分层的急性 PE 患者中, 标准内核 DL-H 重建均能取得优于 ASiR-V 重建的图像质量, 满足临床诊断需求, 同时减少了辐射剂量及对比剂用量。

基于 CT 形态及定量学特征构建多原发肺腺癌、腺体前驱病变风险分层模型

邱慎满、孟闫凯、徐凯
徐州医科大学附属医院

目的: 利用基线 CT 形态及定量学特征构建多原发肺腺癌 (MPLC)、腺体前驱病变不同病灶危险度分层的多因素预测模型。方法: 回顾性分析经手术病理证实的 72 例 MPLC、腺体前驱病变患者临床及影像学资料。根据病理类型将病灶分为低危组的不典型腺瘤样增生 (AAH) 及原位癌 (AIS), 将微浸润腺癌 (MIA) 及浸润性腺癌 (IAC) 归为高危组。采用 SPSS 22.0 软件进行统计分析, $P<0.05$ 认为差异有统计学意义。结果: 72 例患者经手术、病理证实 160 枚结节, 其中双原发病灶 57 例 (79.17%), 女性 52 例 (72.22%)。高危组、低危组病灶最大径、平均 CT 值和病灶体积间差异均有统计学意义 ($P=0.000, 0.001, 0.000$)。病灶最大径预测高危组的最佳截断值为 7 mm, AUC 值 0.910, 敏感性和特异性分别为 81.25% 和 86.61%。病灶体积预测高危组的最佳截断值为 323 mm³, AUC 值、敏感性、特异性分别为 0.904、91.67%、77.68%。将三个定量参数: 病灶最大径、体积、平均 CT 值纳入 Logistic 回归分析, 构建组合变量。ROC 曲线分析显示, 组合变量预测高危组病灶的 AUC 值为 0.939, 敏感性 90.00%, 特异性 85.71%, 差异具有统计学意义 ($P<0.0001$)。形态学特征上, 结节内部是否含有实性成分、实性成分多少在高低危组间有显著性差异 ($P=0.000, 0.000, 0.016$)。毛刺、分叶、胸膜牵拉、空泡、扩张支气管征等形态学特征在两组间差异同样具有统计学意义 ($P<0.05$)。结论: CT 形态学特征、定量参数能够在一定程度上对 MPLC 及腺体前驱病变进行危险度分层, 多参数组合定量模型的预测效能最佳。

CT 成像下左心耳形态和左心耳孔面积与缺血性卒中关系

陶秋成
东南大学附属中大医院

[摘要] 目的: 本研究通过 CT 成像技术来探讨左心耳形态和左心耳孔面积与缺血性卒中的关系, 希望提供一种无创且有效的方法预测缺血性卒中的危险因素。方法: 连续入选 2020 年 4 月—2021 年 4 月期间东南大学附属中大医院接诊的 60 例缺血性卒中的非瓣膜性房颤患者 (卒中组)。对照组包括 60 名年龄匹配的无卒中病史的非瓣膜性房颤患者。所有患者均接受了经胸超声心动图、经食道超声心动图和计算机断层扫描血管造影检查。CTA 检查完成后获得原始图像, 并测量左心耳孔面积; 使用 GE 公司的 AW4.61 工作站进行三维重建获得左心耳, 根据左心耳形态将其分为鸡翅型和非鸡翅型, 分析左心耳形态、左心耳孔面积与缺血性卒中的关系。结果: 临床资料中发现, 卒中组中持续性房颤所占比例较对照组明显增加, 卒中前 CHA₂DS₂-VASc 评分明显增高; 与对照组左心耳流速 (left atrial appendage flow velocity, LAFFV) [(50.8 ± 15.4) cm/s] 比较, 卒中组

[(32.0 ± 12.4) cm/s] 的 LAAFV 明显降低 ($P < 0.001$)；与对照组比较，卒中组的非鸡翅型左心耳形态比例明显增加 ($P < 0.001$)，左房内径和左心耳孔面积明显增大 ($P < 0.001$)；而卒中组的左心耳容积与对照组相比差异无统计学意义；将有统计学意义的变量纳入多元 Logistic 回归分析，结果显示，非鸡翅型左心耳形态、左心耳孔面积、左房内径、卒中前评分、LAAFV 是缺血性卒中的独立预测因子。结论：非瓣膜病房颤患者中，房颤类型、左心耳形态、左心耳孔面积、卒中前 CHA2DS2 - VASc 评分、左房内径、LAAFV 和缺血性卒中密切相关，非鸡翅型左心耳、较大的左心耳孔面积和左房内径是非瓣膜病房颤患者缺血性卒中的独立预测因子。

胸部 HRCT 对 COPD 患者肺功能的评估价值

唐子云

绵阳市第三人民医院

目的 分析高分辨率 CT (HRCT) 定量参数 (肺横截面面积缩小率、肺密度差) 与肺功能指标之间的相关性，探讨 HRCT 在慢性阻塞性肺疾病 (Chronic obstructive pulmonary disease, COPD) 患者肺功能评估的应用价值。方法 收集本院 2022 年 1 月至 2023 年 8 月收治的 60 例 COPD 患者的临床资料，所有患者入院后均接受胸部 HRCT 检查及临床肺功能检查，依据 COPD 评测结果将 COPD 患者分为 A 级、B 级、C 级和 D 级，比较各级患者 FEV1%、FEV1/FVC、MEF50、MEF25、MMEF75/25、RV/TLC、DLCO、肺横截面面积缩小率和肺密度差 (双肺吸、呼气相的平均密度差)，分析肺横截面面积缩小率、肺密度差与肺功能检查结果之间的相关性。结果 不同分级 COPD 患者之间 FEV1%、FEV1/FVC、MEF50、MEF25、MMEF75/25、RV/TLC、DLCO 比较差异有统计学意义 ($P < 0.05$)，不同分级 COPD 患者之间肺横截面面积缩小率和肺密度差异具有统计学意义 ($P < 0.05$)，不同级别 COPD 患者肺横截面面积缩小率、肺密度差异与肺功能检查结果之间呈负相关 ($P < 0.05$)。结论 HRCT 结合 COPD 评估测试对 COPD 患者的病情评估具有一定指导价值，能够为 COPD 肺功能评价提供参考信息。

PU-2022

高分辨 CT 影像组学在 COPD 诊断和严重程度分级的研究

李智伟、苟晓燕、李群

遂宁市中心医院

目的：探索基于高分辨率 CT 的影像组学在慢性阻塞性肺疾病 (COPD) 诊断和严重程度分级中的应用。

方法：回顾分析 300 名参与者 (包含 200 名 COPD 患者和 100 名对照组)。总共从每个参与者的高分辨 CT 图像中提取了 1566 个影像组学特征。采用方差阈值、选择 K 最优法和 LASSO3 种特征选择方法和支持向量机 (SAV) 和 Logistic (LR) 回归 2 种分类方法对 COPD 进行识别和严重程度分类。通过 AUC、准确度、敏感度、特异度、精确度和 F1 评分比较治疗效果。

结果：选择 40 个特征和 11 个特征构建影像组学模型，分别用于 COPD 的检测和分级。对于 COPD 的识别，SAV 分类器在训练集和测试集上的 AUC 值分别为 0.995 和 0.980，LR 分类器的 AUC 值分别为 0.996 和 0.982。对于 COPD 的严重程度分级，上述两种机器学习分类器可以较好的区分严重程度较轻组 (GOLD1+GOLD2) 和较重组 (GOLD3+GOLD4)，SAV 分类器在训练集和测试集上的 AUC 值分别为 0.905 和 0.780，LR 分类器的 AUC 值分别为 0.907 和 0.786。

结论：本研究表明，基于高分辨 CT 图像的影像组学方法可用于 COPD 的识别和严重程度分级，所构建的影像组学模型表现出较好的性能。

肺结核合并肺癌患者与单纯肺结核患者的 CT 鉴别诊断及价值分析

高红、杨瑞、刘继伟
河南省胸科医院

肺结核是由结核分枝杆菌引起的慢性传染病, 疾病发生后的主要表现为肺间质炎性改变以及纤维化, 通过尽早诊治, 可使疾病预后改善[1]。目前临床上在对肺结核进行诊断时, X 线检查属于常用方法, 但临床实践发现, X 线检查中难以对病变细节予以清晰显示, 同时容易出现结构重叠的情况。随着 CT 检查在肺结核诊断中的应用率不断提升, 肺结核的检出率逐渐升高, 但对于其在继发性肺结核诊断中的应用效果尚无过多研究。肺癌属于呼吸道恶性肿瘤病变, 疾病的发生会导致患者出现咳嗽、咯血、胸闷气短等症状, 严重降低患者生活质量, 且病灶易发生转移, 会对患者生命产生严重威胁[2]。肺结核合并肺癌容易与单纯肺结核产生混淆, 可能使患者的疾病治疗被延误。因此做好患者的疾病诊断工作尤为重要。

PU-2024

基于 MRA 的 Stanford B 型主动脉夹层计算机仿真研究

林奕城
中国科学院大学宁波华美医院

研究目的:

主动脉夹层 (Aortic Dissection, AD) 发病凶险、进展快, 其可引起重要器官的灌注不足甚至主动脉破裂, 进而危及生命, 故需要采取紧急手术或者进行血管内的修复。不同的 AD 病例往往具有较为显著的个体差异, 且常需根据病情制定个体化的诊疗方案。血流动力学因素在 AD 的发生、发展及诊疗中起着重要的作用, 但目前临床上不易获取系统、全面的血液动力学参数。计算机流体力学 (Computational Fluid Dynamics, CFD) 技术的出现为人们提供了一种能够有效、无创地获取和评估人体血流动力学情况的方法。本研究在采用磁共振血管造影 (MRA) 图像建立 Stanford B 型主动脉夹层 (后简称 B 型 AD) 形态模型的基础上, 验证所建形态学模型的准确性。并利用计算机仿真软件对其进行数值模拟, 探讨基于 MRA 图像进行个体化 B 型 AD 计算机仿真研究的可行性。

方法:

(1) 收集 10 例 B 型 AD 患者的 MRA 图像数据, 通过 MRA 图像建立 AD 的形态模型, 并分别对原始 MRA 图像和形态模型进行形态学参数的测量, 对比原始图像与形态模型在形态学上的差异。

(2) 将形态模型导入计算机仿真软件中进行后处理, 得到心动周期内不同时刻的血流流线图、血流速度分布图、血管壁面剪应力分布图及血管壁面压强分布图。

结果:

(1) 不同 B 型 AD 各形态学参数 (管径、撕裂口大小及位置) 差异较大, 变异系数范围为 0.084~0.555。原始图像和重建形态模型上的各形态参数值的差异均无统计学意义 (P 值均 > 0.05)。

(2) 基于 MRA 的 B 型 AD 计算机仿真可以获得心动周期内不同时刻 B 型 AD 的血流动力学参数。

结论:

(1) 不同 B 型 AD 的形态学参数各异, 因此建立个体化的 B 型 AD 形态学模型有助于个体化的仿真模拟。

(2) 基于 MRA 的 B 型 AD 计算机仿真可以获得各项血流动力学参数, 对 AD 的研究和临床个体化的诊治有一定的帮助。

心脏磁共振图像融合技术在评估急性心肌梗死中的应用价值

周莹、李子文
连云港市第一人民医院

目的 探讨心脏磁共振 (CMR) 图像融合技术在评估急性心肌梗死 (AMI) 中的应用价值。**方法** 前瞻性选取 2020 年 10 月至 2022 年 1 月接受经皮冠状动脉介入治疗 (PCI) 和 CMR 检查的 AMI 患者, 扫描方案包括扩散加权成像 (DWI)、心脏电影成像及心肌延迟强化 (LGE) 成像, 对心脏电影与 DWI 进行图像融合。以 LGE 为参考标准, 比较心脏电影-DWI 和 DWI 的 AMI 诊断效能、图像质量评分及测量 AMI 面积的准确性。**结果** 本研究最终共入组 AMI 患者 52 例。DWI 诊断 AMI 阳性率为 92.3%, 心脏电影-DWI 诊断 AMI 阳性率为 96.2%, 两者无显著差异。DWI 与心脏电影-DWI 的梗死心肌评分无显著差异, 心脏电影-DWI 的正常心肌评分和整体心肌评分高于 DWI。DWI 测量的 AMI 面积稍大于 LGE ($Z=4.867, P<0.01$), 心脏电影-DWI 测量的 AMI 面积与 LGE 无显著差异 ($Z=1.530, P=0.126$)。DWI 与 LGE 测量 AMI 面积的偏倚为 4.1%, 95%一致性界限为-5.0%~13.3%, 相关性系数 r 为 0.842 ($P<0.01$)。心脏电影-DWI 与 LGE 测量 AMI 面积的偏倚为 0.5%, 95%一致性界限为-4.6%~5.5%, 相关性系数 r 为 0.954 ($P<0.01$)。**结论** 基于心脏电影成像与 DWI 的图像融合技术较 DWI 能显著提高图像质量和测量 AMI 面积的准确性。

Precise Prediction of ischemic and nonischemic myocardial injury: Establish and Verify the Feasibility of Extracellular volume-based Nomogram

yanping su,hongfei hu,di shen,chenying Lu,minjiang Chen,jiansong Ji
LISHUI MUNICIPAL CENTRAL HOSPITAL

Objectives Our study sought to develop and validate an Extracellular volume (ECV)-based nomogram to differentiate between ischemic and nonischemic myocardial injury, especially between myocardial infarction without coronary obstruction and myocardial injury with coronary obstruction.

Methods A total of 83 myocardial injury patients were eligible for this study, including 40 ischemic and 43 nonischemic patients. We studied patients' cardiac magnetic resonance (3.0 T), including: (1) dark-blood T2W imaging; > (2) native T1-mapping (ShMOLLI); and (3) ECV. The least absolute shrinkage and selection operator (LASSO) and multivariate analysis were applied for feature selection and model construction. Receiver operating characteristic (ROC) curves, calibration curves, and decision curves were used to assess the performance of the nomogram model.

Results After feature selection and dimension reduction, five selected texture features were found to be statistically significant for differentiating ischemic and nonischemic myocardial injuries. The nomogram demonstrated good discrimination in both the training set (AUC [area under the curve], 0.948; 95% confidence interval [CI], 0.627-0.809), and the validation set 1 (AUC, 0.807; 95% CI, 0.562-0.799), and validation 2 (AUC, 0.824; 95% CI, 0.562-0.799). The nomogram proved clinically beneficial, according to decision curve analysis.

Conclusions ECV-based nomogram could discriminate ischemic from nonischemic myocardial injury and can avoid the influence of coronary artery obstruction degree, maintaining diagnostic efficiency.

A study on the imaging quality of part-solid nodules in the lungs using ultrafast synchronized KV/mA switching dual energy CT

Jingjing Hong, Ge Wen, Weikang Huang
Southern Medical University Nanfang Hospital Zengcheng Campus

Objectives

To evaluate the image quality (IQ) of part-solid nodules (PSN) in the lungs using ultrafast synchronized KV/mA switching dual energy CT (DECT) and to identify the optimal keV level for virtual monochromatic imaging (VMI) of PSNs.

Methods

A total of 12 patients with PSN who underwent Chest enhancement scans using DECT (Revolution APEX CT, GE). Axial virtual monochromatic images (VMI) were reconstructed at 10 keV interval between 40-140 keV with the slice thickness of 0.625 mm; All images were reconstructed using 30% ASIR-V reconstruction algorithm. The CT values and standard deviation (SD) of CT values in the PSN, Ipsilateral erector spinae muscle (ESM), and chest wall fat were measured on the same level, as well as signal-noise-ratio (SNR, CT_{PSN}/SD_{PSN}) and contrast-noise-ratio (CNR, $(CT_{ESM} - CT_{PSN}) / SD_{ESM}$) of PSN.

Two experienced radiologists subjectively assessed the IQ [focal details, the visibility of major anatomical structures (such as great vessels) and diagnostic confidence in the overall image] using a 5-point scale (1, poor; 2, fair; 3, moderate; 4, good; 5, excellent). The curves of SNR, CNR and SD, qualitative IQ scores and energy variation were plotted using normalized data to determine the optimal keV level of PSN in virtual monochromatic imaging (VMI). The Kruskal-Wallis test was used to analyze intra-group differences. Measurement data is expressed as $\bar{x} \pm S$. $P < 0.05$ was considered statistically significant.

Results

As the keV level increased, the CT values, SD and SNR of PSN decreased continuously, while CNR increased. At 65 keV, the scores of focal details (5(5,5)), the visibility of major anatomical structures (such as great vessels) (5(5,5)) and diagnostic confidence (5(5,5)) were the highest. There were significant differences between the groups of the SD of PSN ($P < 0.001$), the CT value ($P < 0.001$), SD ($P < 0.001$) and CNR ($P = 0.005$) of ESM. There was no significant difference in CT value and SNR of PSN between groups ($P = 0.258 / 0.106$).

Conclusion

In the ultrafast synchronized KV/mA switching dual energy CT image of PSN in the lung, the axial reconstruction of 65 keV single energy minimum layer thickness can obtain good CNR, SNR and SD and the best subjective image quality, which can provide the best VMI of PSN in the lung.

PU-2028

心脏磁共振特征追踪技术右心房心肌应变评估的设备与软件差异性研究

施京京^{1,2}、高艺源^{1,2}、马敏迪^{1,2}、郭艺帆^{1,2}、项萍^{1,2}、许茂盛^{1,2}

1. 浙江中医药大学附属第一医院 (浙江省中医院)

2. 浙江中医药大学第一临床医学院

目的: 探究不同磁共振成像设备 (GE 和 Siemens) 和后处理软件 (CVI42 和 Medis) 对心脏磁共振特征追踪技术 (CMR-FT) 定量评价右心房心肌应变参数的影响。

材料与方法: 回顾性随机抽选于体检中心完成心脏磁共振检查的 100 例中国健康成人, 其中 20 例受试者被重新招募, 在同一天内使用两种 1.5 T 磁共振成像扫描仪 (GE 和 Siemens) 完成心脏磁共振检查。分别应用 CVI42 和 Medis 商用后处理软件进行右心房 CMR-FT 分析, 获得右心房心肌应变参数, 包括右房储存应变 (ϵ_s), 管道应变 (ϵ_e), 泵应变 (ϵ_a), 正向峰值应变率 (SRs), 早期负向峰值应变率 (SRe) 及晚期负向峰值应变率 (SRa)。采用配对样本 t 检验比较不同磁共振成像设备和后处理软件间右心房心肌应变参数测量结果的差异; 采用组内相关系数 (ICC) 一致性检验和 Bland-Altman 图评估 CMR-FT 定量分析右心房心肌应变参数的设备间重复性。

结果: 不同磁共振成像设备获得的右心房心肌应变参数无显著统计学差异 (P 均 >0.05)。与 Medis 软件获得的右心房心肌应变参数相比, CVI42 软件的测量结果绝对值显著更高 (ϵ_s : 52.61 ± 14.85 vs. 33.26 ± 9.61 %; ϵ_e : 34.37 ± 13.45 vs. 20.34 ± 8.57 %; ϵ_a : 18.25 ± 5.56 vs. 12.92 ± 4.38 %; SRs: 2.39 ± 0.93 vs. 1.00 ± 0.36 s⁻¹; SRe: -2.67 ± 1.25 vs. -0.71 ± 0.32 s⁻¹; SRa: -2.08 ± 0.74 vs. -0.51 ± 0.20 s⁻¹)。ICC 一致性检验和 Bland-Altman 图结果显示 CMR-FT 技术定量右心房应变及应变率具有良好的设备间重复性 (ICC 值: 0.830-0.985)。

结论: 不同后处理软件获得的右心房心肌应变参数值存在系统性差异, CVI42 软件测量结果显著高于 Medis 软件测量结果。CMR-FT 右心房心肌应变评估在相同场强下不受磁共振成像设备的影响, 并具有良好的设备间重复性。

PU-2029

基于多维度参数鉴别孤立性肺隐球菌及粘液腺癌的多元 Logistic 回归模型

周小君、张景峰

宁波第二医院

研究目的: 肺隐球菌病是一种侵袭性肺部真菌病, 结节/肿块型肺隐球菌与粘液性肺腺癌影像学表现相似。本研究将基于 HRCT 的传统影像学特征、临床特征及人工智能肺结节量化参数, 以构建结节/肿块型肺隐球菌与粘液性肺腺癌的鉴别模型, 并评价其准确性。

材料与方法: 本研究回顾性收集术后病理诊断为粘液腺癌 100 例, 隐球菌 101 例, 同时收集患者的术前临床资料 (如性别、年龄、吸烟史等)、传统影像学参数 (如宽基底、空洞、条索等) 及肺结节人工智能定量参数 (如平均值、最大值、最小值、峰度等)。首先通过单因素 Logistic 回归筛选有效参数, 再进一步纳入多因素二元 Logistic 回归模型, 最终通过 ROC 曲线分析模型准确性。

结果: 年龄、恶性肿瘤个人史、宽基底、空洞、长条索、卫星灶、最小 CT 值在两组之间差异具有统计学意义 ($P < 0.05$)。上述指标关于隐球菌组以及粘液腺癌组的二元 Logistic 回归结果为: $\text{Logit}(p) = -8.085 + 0.083 X_1 - 1.714 X_2 + 1.724 X_3 + 2.735 X_4 - 3.189 X_5 - 4.557 X_6 - 0.004 X_7$ 。研究显示上述模型的具有良好的预测效能, 其曲线下面积 AUC 为 0.953, 95%CI 为 0.927-0.979。

结论: 通过综合患者的年龄、传统影像学参数以及人工智能参数, 将有助于术前鉴别隐球菌或粘液腺癌, 以帮助临床医生制定个性化的治疗策略, 避免过度的有创性操作。

双源 CT 心脏冠脉造影和胸腹主动脉 CTA 一体化检查在 TAVI 术前的运用

王薇
南京市第一医院

目的:

为了更好的进行 TAVI 患者进行术前评估,减少患者受到的辐射剂量及注射的造影剂剂量,探索双源 CT 心脏冠脉造影和胸腹主动脉造影一体化检查方式在 TAVI 患者术前评估中的应用价值。

方法:

选择 2019 年 7 月至 2021 年 3 月本院收治的重度 AS 患者共 58 例,其中男性 27 例,女性 31 例,年龄 55~83 岁,平均(72.93±8.35)岁。所有患者临床资料完整,排除合并恶性肿瘤及严重器质性疾病、肾功能受损和碘造影剂过敏患者。按照随机表法将患者分为常规组(n=29)、观察组(n=29),所有患者均采用双源 CT 扫描,其中常规组采取心脏冠脉 CT 和胸腹主动脉造影两次扫描,观察组采取一体化检查方式,对患者影像检查资料进行分析讨论。

结果:

研究结果显示,通过在 TAVI 患者术前评估中应用心脏冠脉 CT 和胸腹主动脉造影一体化检查方式,观察组患者的辐射剂量较对照组明显降低;同时两组患者的 CT 影像质量对比观察组与常规组进行比较,发现主动脉 CNR 升高,主动脉噪声、SNR 两组差异不显著,主观评分不同医师间评分具有较好一致性,提示一体化检查方式不会对成像质量造成明显影响。

结论:

心脏冠脉 CT 和胸腹主动脉造影一体化检查方式能够在保证图像质量的前提下有效降低扫描辐射剂量,对于 TAVI 术前评估工作的影响较小,具有较高的应用价值。

PU-2031

双源 CT 在肺动脉造影和双下肢静脉 CTV 一体化中的应用

王薇
南京市第一医院

目的:讨论双源 CT 在肺动脉造影和双下肢静脉 CTV 一体化中的应用中的应用价值。

方法:选择 2020 年 1 月至 2021 年 3 月本院收治的经 US 检查怀疑为 DVT 的患者共 62 例,其中男性 37 例,女性 25 例,年龄 24~77 岁,平均(49.83±13.68)岁。所有患者临床资料完整,排除合并恶性肿瘤及多发器官功能衰竭患者。所有患者均采用双源 CT 肺动脉 CT 造影术(CT Pulmonary angiography, CTPA)联合 CTV 一体化检查方法,对患者影像检查资料进行分析讨论。

结果:62 例患者中均确诊为 VTE,所有患者均存在 DVT,其中 43 例(69.35%)患者同时合并 PE。

DVT 患者中,13 例(20.97%)为盆腔静脉血栓,25 例(40.32%)为右下肢血栓,24 例(38.71%)为左下肢血栓。CT 影像显示患者下肢静脉呈现强化均匀的状态,内部血栓显示清晰,静脉增强后的 CT 值、血栓 CT 值分别为(107.62±14.38)HU、(61.83±9.15)HU,对比差异显著(P<0.05)。

43 例合并 PE 患者均为多发肺动脉栓塞,累及动脉 93 支,其中包括 7 支(7.53%)左右肺动脉主干,31 支(33.33%)叶动脉,42 支(45.16%)段动脉,13 支(13.98%)亚段及亚亚段肺动脉。CT 影像中患者肺动脉内栓子形态和分布情况显示清晰,肺动脉内清晰可见低密度充盈缺损的情况,

合并支气管动脉扩张，病情严重者的肺动脉呈现完全闭塞状态。肺动脉 CT 值与栓子 CT 值分别为 (320.66 ± 45.22) HU、 (55.73 ± 15.40) HU，对比差异有统计学意义， $P < 0.05$ 。

结论：通过运用双源 CT 进行肺动脉造影和双下肢静脉 CTV 一体化检查结合图像后处理技术能够从多角度对肺动脉的空间解剖关系进行显示，检查时间短，不存在操作者依赖性，安全无创，患者接受度高，技术参数稳定，可随时进行随访工作。

PU-2032

基于模型的迭代重建算法和对比度增强后处理技术对肺部 CT 血管造影的影响：对肥胖患者图像质量的评价

叶梅、邢艳、侯娟
新疆医科大学第一附属医院

目的 探讨基于模型的迭代重建（MBIR）算法和对比增强增强（CE-boost）后处理技术对提高肥胖患者肺血管造影（CTPA）图像质量的效果。

方法 这项前瞻性研究对 100 例因临床疑似肺栓塞而接受肺 CTA 的患者进行。体重指数（BMI）超过 25（第 1 组）的患者采用常规混合迭代重建（HIR）、MBIR 和 CE-boost 进行。非肥胖患者（BMI < 25，第 2 组）采用 HIR，考虑作为参考标准。定量评估主肺动脉、左右肺动脉的 CT 值、图像噪声、信噪比（SNR）和对比度噪比（CNR）。两名胸部放射科医生独立地通过整体图像质量、总体噪声、诊断信心和血管造影度等四个主观特征检查了 CT 图像（5、最佳；1、最差）。采用 Mann-Whitney U 检验和独立样本 t 检验进行统计学分析。

结果 第 1 组 MBIR 图像的图像噪声明显低于第 2 组参考图像（ $p < 0.05$ ），而第 1 组 CE-boost 和 HIR 图像的图像噪声明显低于参考图像。第 1 组的 CE-boost 和 MBIR 图像均提供了与参考图像相当的信噪比和 CNR（均为 $p > 0.05$ ）。在主观分析中，CE-boost 或 MBIR 图像的整体图像质量和诊断置信度显著高于参考图像（均为 $p < 0.05$ ）。第 1 组 CE-boost 和 MBIR 图像的血管造影剂视觉得分高于参考图像（均为 0.05），其中 CE-boost 表现最好。

结论 CE-boost 技术和 MBIR 算法均能提高肥胖患者肺 CTA 的图像质量。CE-boost 在增加远端血管可视化方面具有更大的潜力，而 MBIR 在血管上显示更多的降噪效果。

PU-2033

磁共振特征追踪技术测定左心室射血分数保留糖尿病患者右心室心肌损伤

李淑豪、冯兆丰、阚傲、肖轩、龚良庚
南昌大学第二附属医院

目的 采用磁共振特征追踪技术定量糖尿病患者右心室心肌应变，检测在左心室射血分数保留时，其早期发生的右心室心肌损伤。

方法 回顾性分析 2018 年 1 月至 2022 年 12 月于本院就诊的左心室射血分数正常的糖尿病患者 36 例，并选择同期健康志愿者 31 例作为正常对照组，用心脏后处理软件测量其右心室及应变参数。采用独立样本 t 检验或 Mann-Whitney U 检验进行两组间参数比较，采用受试者工作特征曲线（ROC）进行组间分析，并用 Z 检验对右心功能参数与应变参数间检验效能的差异进行统计学分

析。采用 Spearman 相关性分析计算右心室功能及应变参数的相关性, 采用单因素分析来确定临床指标对右心室应变的影响。

结果 糖尿病组右心室功能参数值 (RVEF, CI, SVBSA) 低于对照组 (37.64 ± 10.45 vs. 43.16 ± 9.05 , $p=0.025$; $1.42(1.29, 1.63)$ vs. $1.23(0.94, 1.55)$, $p=0.024$; 22.04 ± 6.05 vs. 17.75 ± 6.3 , $p=0.006$)。糖尿病组右心室容积参数无明显差异 ($p>0.05$), 但糖尿病组右心室质量 (Myocardial mass) 较正常组增高 ($13.67(10.85, 17.34)$ vs. $10.02(8.69, 12.07)$, $p=0.01$)。应变参数中除 PSL、PDSRL 无统计学差异外 ($p>0.05$), 其余糖尿病组 PSR、PSSRR、PDSRR、PSC、PSSRC、PDSRC、PSSRL 均较对照组减低。ROC 结果显示, PSR 及 PSSRR 对糖尿病心肌病诊断效能最高, 其曲线下面积分别为 0.816、0.809, 且优于 EDV/BSA ($P=0.011, 0.018$)。相关性分析结果显示 PSR、PSSRR 与 RVEF 成正相关 ($r=0.379$, $P=0.022$; $r=0.338$, $P=0.019$), PSC 与 RVEF 成负相关 ($r=-0.456$, $P=0.005$), 单因素结果显示 BNP 是 PSSRR 重要的预测因子 ($\beta=0.549$, $p=0.001$)。

结论 右心室心肌应变能够早期反应右心室心肌损伤, 较常规右心功能参数更加敏感, 且 BNP 是 PSSRR 的独立预测因子。

PU-2034

能谱 CT 成像 GSI LUNG 技术应用于肺栓塞后肺灌注功能评价

陈锡建、曲海波、杨皓翔、覃顺龙、李珮
四川大学华西第二医院

目的 探讨能谱 CT 成像 GSI LUNG 技术在肺栓塞患者肺实质的血流灌注状态和栓塞对心肺功能的影响评估的价值。

方法 选取怀疑肺栓塞需行肺血管 CT 成像检查的患者 35 例, 使用能谱 CT 成像方式扫描。CT 扫描设备为 GE Revolution CT 扫描仪, 平扫及肺动脉期、肺静脉期三期扫描均采用 GSI 扫描模式 (管电压 80/140kVp) 采集图像, 图像重建层厚/层间隔均为 0.625mm, 图像开启 DATA 模式。在 GE ADW4.7 工作站用 GSI LUNG 模块分别处理三期图像, 分割和建立肺部碘 (水) 混合伪彩图和碘 (水) 密度图, 在各期图像同一位点, 结合伪彩图显示在碘 (水) 密度图测量分别低灌注区和左右肺正常灌注区域的碘密度值, 同时记录患者临床生化指标, 并进行统计学分析。

结果 35 例受检者有 15 例诊断为肺栓塞阳性。20 例阴性受检者, 左右肺正常灌注区平扫期、动脉期、静脉期碘密度值分别 0.174mg/ml , 8.256mg/ml , 3.56mg/ml , 栓塞后低灌注区碘密度值各期分别是 -0.306mg/ml , 1.937mg/ml , 1.118mg/ml , 均明显低正常灌注区, 差异有统计学意义 ($P<0.05$)。其中 5 例在溶栓后复查, 各期分别是 0.247mg/ml , 5.463mg/ml , 2.382mg/ml , 低灌注区碘密度值明显增加。

结论 能谱 CT 可直观显示肺动脉栓子情况, GSI LUNG 技术可进行碘基物质分离及碘定量分析, 并结合临床信息, 从形态学及肺灌注功能两个方面对肺栓塞的疗效进行评估。GSI LUNG 技术作为肺栓塞评价的重要手段, 为肺栓塞治疗方案选择和疗效评价提供了定量依据。

PU-2035

全病灶碘图直方图分析与单层 IC 测量预测浸润性非黏液肺腺癌新 IASLC 分级的比较

邓靓娜、周俊林
兰州大学

目的：评价和比较全病灶碘图直方图分析和单层碘浓度测量对浸润性非黏液肺腺癌新的 IASLC 分级的诊断价值。

方法：本研究回顾性分析了 2019 年至 2022 年 12 月行能谱 CT 扫描的 61 例浸润性非黏液肺腺癌患者（34 例低级别，27 例高级别）。计算每个病灶的全病灶碘图直方图参数（均值、标准差、方差、峰度、偏度、熵和第 1、10、25、50、75、90 和 99 百分位数）。此外，通过在肿瘤代表性层面放置感兴趣区域并将其归一化，获得能谱 CT 参数[碘浓度 (Iodine concentration, IC) 和归一化碘浓度 (Normalized iodine concentration, NIC)]。比较不同级别浸润性非黏液腺癌之间两种参数的差异，并对两种方法的诊断准确性进行了评价和比较。

结果：低级别组和高级别组的全病灶碘图直方图参数（第 1、10、25 百分位）和单一层面能谱参数（IC 和 NIC）均有显著性差异($P<0.001$ - $P=0.02$)。直方图参数中第 1 百分位数(AUC=84.25%)和单一层面测量能谱参数中 IC(AUC=78.49%)的诊断率最高。经 DeLong 检验，全病灶碘图直方图(AUC=85.62%)的诊断效能高于单一层面 IC 测量 (AUC=80.83%)，但是两者不存在统计学差异($p=0.60$)。

结论：全病灶碘图直方图参数和单一层面 IC 能谱参数均可区分不同级别的浸润性非黏液肺腺癌，并且具有相似的诊断性能。

PU-2036

原发性胸膜-肺滑膜肉瘤的 CT、MR 表现及病理特征

左林、屈晓艳、白云、崔光彬
空军军医大学唐都医院

目的

探讨原发性胸膜-肺滑膜肉瘤(primary pleuropulmonary synovial sarcoma, PPSS)的 CT、MR 影像学表现及其病理特征，以提高该疾病的诊断能力。

方法

回顾性分析经术后病理学证实的 15 例 PPSS 患者的临床、CT、MR 及病理资料，观察并分析病变的影像学特征及病理特征，12 例病例行 CT 检查、7 例病例行 MR 检查。

结果

CT 检查结果示，病灶呈团块状或团片状，10 例肿瘤最大径>5cm；平扫呈不均匀低密度 9 例，均匀等密度 3 例；边缘欠光滑与边界不清楚 10 例，边缘光滑与界限清楚 2 例。增强扫描肿瘤实性部分呈持续性不均匀强化，6 例较大肿瘤内部可见明显强化的肿瘤血管。所有病例均未见肺门、纵隔淋巴结肿大及肺内转移。MR 检查结果示，所有病变 T1WI 均呈中等至稍低信号，T2WI 呈欠均匀中等至稍高信号，DWI 均呈不均匀稍高信号。病理检查结果示，单相分化型 11 例，肿瘤细胞由梭形细胞组成，细胞紧密聚集，伴有少量黏液样区；双向分化型 4 例，由梭形细胞及上皮成分组成，内部有局灶性坏死区；免疫组织化学结果示，细胞角蛋白(CK)、上皮膜抗原(EMA)阳性。

结论

PPSS 具有一定的 CT 和 MR 影像学特点，但最终诊断需依靠病理学检查。CT 和 MR 检查在明确肿瘤定位、数目、侵犯和转移方面具有重要的参考价值，对于临床诊断和手术方案的制定以及后期随访均有重要意义。

PU-2037

双能 CT 定量参数对周围型肺癌病理亚型的诊断价值研究

徐艳秋¹、杨晓光²

1. 内蒙古医科大学附属医院

2. 内蒙古呼和浩特市第一医院

摘要：目的 讨论双能 CT (DECT) 定量参数在诊断周围型肺癌病理亚型中的应用价值。方法 2022 年 4 月至 2023 年 10 月前瞻性连续收集我院收治的疑似周围型肺癌且未经治疗的患者 70 例，所有病人均行 DECT 增强扫描，以病理结果为金标准，51 例患者明确周围型肺癌病理分型。通过后处理软件绘制所有病例感兴趣区，测量并计算动脉期病灶碘浓度 (IC)、归一化碘浓度 (NIC)、能谱曲线斜率 (λ HU)、原子序数 (Zeff) 及以上数据平均值。采用单因素方差分析 3 组的 NIC、 λ HU 及 Zeff；对具有统计学意义 ($P < 0.05$) 的参数，进一步绘制受试者工作特征 (ROC) 曲线并分析。结果 51 例周围型肺癌中，腺癌 25 例，鳞癌 14 例，小细胞肺癌 12 例，三者动脉期 NIC (0.170 ± 0.093 、 0.120 ± 0.086 、 0.099 ± 0.039)、 λ HU (1.934 ± 1.205 、 1.346 ± 0.563 、 1.166 ± 0.643)、Zeff (8.164 ± 0.517 、 7.865 ± 0.421 、 7.805 ± 0.282)，腺癌动脉期 NIC、 λ HU、Zeff 高于鳞癌及小细胞肺癌，差异具有统计学意义 ($P < 0.05$) 而鳞癌及小细胞肺癌差异无统计学意义 ($P > 0.05$)，但鳞癌各项数值均高于小细胞肺癌。ROC 诊断效能分析显示，NIC 在鉴别周围性肺癌病理亚型腺癌与鳞癌、腺癌与小细胞肺癌具有较高的准确性 (曲线下面积分别为 0.744、0.778)，灵敏度分别为 66.7%、77.8%，特异度分别为 90.0%、82.6%。结论 DECT 相关定量参数有助于区分周围型肺癌的不同病理亚型，对临床准确诊断及早期治疗具有一定价值。

PU-2038

心包内、心包外及心包周围脂肪容积与冠状动脉粥样硬化病变的关系

郭艳

徐州医科大学附属医院

目的：研究心包内脂肪容积、心包外脂肪容积和心包周围脂肪容积与冠状动脉粥样硬化发生病变的关系。方法：回顾性收集徐州医科大学附属医院在 2020 年 1 月 1 日至 2022 年 12 月 30 日行冠状动脉造影检查的就诊患者 195 例。将 195 例患者分为冠状动脉粥样硬化病变组和非病变组，测定 195 名就诊患者的年龄、性别、BMI、高血压、高血脂等物理指标。同时，设置患者检查 CT 值为 $-200\text{HU} \sim -30\text{HU}$ ，测量 195 名就诊患者心包内脂肪容积 (Epi-FV)、心包外脂肪容积 (Para-FV) 及心脏周围脂肪容积 (Peri-FV) 等生物化学指标。根据就诊患者测得的心包脂肪容积量，将心包内脂肪容积、心包外脂肪容积及心脏周围脂肪容积分别分为高低两组，即高心包内脂肪容积、低心包内脂肪容积、高心包外脂肪容积、低心包外脂肪容积、高心脏周围脂肪容积组、低心脏周围脂肪容积组，并比较不同心包脂肪分组间年龄、性别、BMI、高血压、高血脂及冠状动脉粥样硬化病变是否具有差异。采用单因素 logistic 回归分析冠状动脉粥样硬化病变和患者基本资料 (年龄、性别、BMI、高血压、高血脂)、心包内脂肪容积、心包外脂肪容积及心脏周围脂肪容积等指标的关系，并对存在显著性差异的指标行多因素回归分析。利用 ROC 曲线比较不同指标预测冠状动脉粥样硬化病变的效能。结果：高心包内脂肪容积、高心包外脂肪容积及高心脏周围脂肪容积组的高血脂患者较多，且 BMI 及年龄较大。在冠状动脉粥样硬化分析中，高心包内脂肪容积及高心脏周围脂肪容积组有更多的冠状动脉粥样硬化患者，且斑块累及节段更广，Gensini 评分更高，而高心包外脂肪容积组的冠状动脉周围危险斑块多于低心包外脂肪容积组。结论：心包内脂肪容积、心包外脂肪容积及心

包周围脂肪容积与冠状动脉粥样硬化是否病变及病变预测效能的关系不同。心包外脂肪容积较高者存在更多的心血管危险因素及更多的危险斑块,而心包内脂肪容积较高者,冠状动脉粥样硬化病变的可能性更高,多指标联合预测效能更高。

PU-2039

深度学习重建与迭代重建在肺动脉 CTA 双低扫描中的图像质量与辐射剂量的比较

徐文北

徐州医科大学附属医院

【摘要】 目的 比较深度学习算法重建与自适应迭代重建在 CT 肺动脉造影双低扫描技术中的图像质量和辐射剂量。方法 回顾性分析 2020 年 10 月至 2021 年 03 月于我院进行 CTPA 检查的患者。分别应用 ASiR-V 算法, DLIR 中档 (DLIR-Medium, DL-M) 算法, DLIR 高档 (DLIR-High, DL-H) 算法重建三组 CTPA 图像。比较三组图像质量的客观评价 (CT 值、噪声, 信噪比, 对比噪声比)、主观评分、诊断信心。同时, 报告辐射剂量 (容积 CT 剂量指数、剂量长度乘积、有效剂量)。符合正态分布的多组间计量资料比较采用单因素方差分析, 组间两两比较采用 LSD 法。不符合正态分布的多组间计量资料比较采用 Kruskal-Wallis H 法, $P < 0.05$ 认为差异有统计学意义。统计分析采用 SPSS 19.0 统计分析软件。结果 89 例患者纳入研究, 男性 45 例 (50.6%)、女性 44 例 (49.4%), 平均年龄 61.0 ± 15.2 岁, BMI 平均值为 24.5 kg/m^2 。辐射剂量报告 CTDIvol、DLP 和 ED 分别为 $2.9 \pm 0.7 \text{ mGy}$ 、 $88.3 \pm 23.0 \text{ mGy.cm}$ 和 $1.2 \pm 0.3 \text{ mSv}$ 。ASiR-V、DL-M、DL-H 三组不同重建算法, 肺动脉主干及其主要分支的图像噪声、SNR、CNR 均有统计学差异 ($P < 0.01$)。与 ASiR-V 重建比较, DL-M、DL-H 重建分别降低了 19.2%-27.8%、34.1%-40.9% 的图像噪声, 增加了 30.0%-39.3%、56.2%-94.9% 的 SNR, 增加了 30.9%-39.0%、56.3%-98.5% 的 CNR。ASiR-V、DL-M、DL-H 三组不同重建算法的图像质量主观评分、诊断信心分别为 3.7 分、4.6 分、4.9 分和 2.4 分、2.7 分、2.8 分, 差异具有统计学意义 ($P < 0.01$)。结论 深度学习算法重建较迭代算法重建能够明显提高 CTPA 双低扫描的图像质量。

PU-2040

肺部先天性发育病变

李晓乐

徐州医科大学附属医院

【摘要】 目的 对肺部先天性发育病变的文献回顾总结。方法 广泛查阅国内外近年有关肺部先天性发育病变, 对肺部先天性发育病变的病因、解剖、临床表现、诊断进行总结分析。结果 肺部先天性发育病变的病因十分复杂, 人类呼吸系统的由高度分支且紧密连接的树状导管系统、气道和血管组成, 以确保有效的气体交换。肺的发育过程从胚胎阶段一直持续到青春期, 经历 5 个具有不同特征且相互重叠的阶段。分别是胚胎期、假腺管期、小管期、囊泡期和肺泡期。胚胎期是肺发育的最初阶段, 即肺芽出现;假腺期主要是主气道发育和支气管分支形成;小管期特点是腺泡出现、气血屏障, 以及 I 型和 II 型上皮细胞分化, 原始腺泡的形成;囊泡期和肺泡期以终末囊泡形成, 肺泡上皮细胞分化、表面活性物质产生加快为特征;肺泡期主要是终末囊泡二次分离。结论 肺部先天性发育病变是一系列复杂的病变, 在肺部发育任何时期出现问题都会发生相应病变, 在胚胎期呼吸系统发育异常可导致喉、气管或食道闭锁, 气管食管瘘, 气管或支气管狭窄, 气管或支气管软化, 异位肺, 支气管源性囊肿和肺发育不全等;肺脏发育的假腺管期可发生一系列先天发育缺陷, 包括 CCAM、BPS 和先天性肺淋巴管扩张。胸腹膜腔在假腺囊期早期闭合, 若胸膜腔未能闭合则经常

伴随腹腔内容物疝入胸腔(先天性膈疝),导致肺实质和血管的发育不良,肺体积小,而且缺乏正常的支气管分支、肺泡表面积和肺血管结构;小管期发生的肺脏发育异常包括腺泡发育不良、肺泡毛细血管发育不良(ACD)和呼吸功能不良,肺静脉(MPV)错位也有可能发生,出现这种情况的患者肺静脉都是沿着肺小动脉伴行;囊泡期:妊娠 24-38 周,此期发生的肺脏发育异常包括早产儿呼吸窘迫综合征(RDS),先天性肺泡发育不良;肺泡期:出生前至 6 岁左右,此期易发生支气管肺发育不良(BPD):以肺泡和肺微血管发育不良为特征。

PU-2041

基于 MRI 对冠状动脉旁路移植术前后右心功能改变的对比研究

赵振远、杨晓光
内蒙古医科大学附属医院

本文探讨心脏磁共振(CMR)检测冠状动脉旁路移植术(CABG)前后右心功能的改变情况,分析其在冠心病(CHD)中的临床价值。回顾性分析经 CABG 治疗的 24 例 CHD 患者术前后 CMR 检查数据。比较术前后右心室功能参数[右心室射血分数(RVEF)、右心室舒张末期容积(RVEDV)、右心室收缩末期容积(RVESV)、每搏输出量(SV)、心输出量(CO)、右心室舒张末期心肌质量(RDVM)、右心室平均心肌质量(RVM)]、心脏射血参数[峰值射血率(PER)、峰值射血时间(PET)、峰值充盈率(PFR)、峰值充盈时间(PFT)]、标准化右心室功能参数(sVM、sEDV、sSV、sPFR、sPER、sESV、sDVM)等。首先进行 S-W 检验,得出不服从正态分布的变量:sESV、sEDV、sVM ($P<0.05$),行 Wilcoxon 秩和检验;其他变量差值服从正态分布,行配对样本 t 检验。结果术前 RVEDV、RVESV、RVM、PET、PFT 均大于术后 [(85.91±34.18) mL、(58.59±27.98) mL、(37.41±15.19) g、(149.1±27.91) ms、(744.27±219.66) ms vs. (76.63±26.63) mL、(48.24±20.74) mL、(56.16±29.37) mL、(31.83±31.83) g、(129.29±33.3) ms、(632.51±218.12) ms, $P<0.05$];术前 RVEF 小于术后 [(33.56±8.23) mL vs. (38.52±9.79) mL, $P<0.05$];术前 sEDV 大于术后 [(43.22±15.78) mL vs. (38.02±13.71) mL, $P<0.05$];术前 sVM、sESV 均大于术后 [16.84 (13.33, 24.15) g、26.64(18.53, 39.52) mL vs. 15.47 (12.69, 17.68) g、23.88 (15.87, 33.21) mL, $P<0.05$],差异均具有统计学意义。CMR 对 CABG 前后右心室功能的改变具有明显研究价值,对于 CHD 临床诊断与治疗具有重要意义

基于 CT 影像组学预测早期肺腺癌浸润性的研究

张凤
成都市温江区人民医院

目的:探讨基于 CT 瘤内及瘤周区域的影像组学模型对早期肺腺癌浸润性的预测价值,并评估不同瘤周范围的预测价值差异。

方法:回顾性收集 334 例经本院手术病理证实为早期肺腺癌患者的临床及 CT 影像资料,其中浸润组 236 例,非浸润组 98 例。将所有患者按照 7:3 的比例随机分为训练组和验证组。在术前 CT 图像上分别勾画肿瘤体积(GTV)、瘤周 3mm、6mm 体积获得感兴趣区 ROI1、ROI2、ROI3,并提取影像组学特征。采用 mRMR 及 LASSO 筛选组学特征,并经多因素逻辑逐步向后回归分析,依据 AIC 原则分别建立 GTV 模型、PTV_3mm 模型、PTV_6mm 模型、肿瘤+瘤周区域体积(GPTV_3mm 模型和 GPTV_6mm 模型),筛选最优组学模型,并获得其 Rad-score。基于多因素 Logistic 回归,从临床数据、传统放射学特征中筛选特征,将筛选出的特征建立临床-放射学模型。

使用多因素逻辑逐步向后回归分析, 将临床独立预测因子和 Rad-score 结合, 构建联合模型。使用受试者工作特征曲线 (ROC) 曲线评估模型的诊断性能, 决策曲线分析 (DCA) 评估模型的临床净收益, 校准曲线和 H-L 检验评价模型的拟合优度。

结果: 临床、放射学特征中结节类型、最大径、血管异常征是独立危险因素, 由此构建的临床-放射学模型在训练组和验证组的 AUC 分别为 0.817、0.837。影像组学模型中, GTV 模型在训练组和验证组中的 AUC 分别为 0.882、0.877; PTV_3mm 模型 AUC 为 0.881、0.851; PTV_6mm 模型 AUC 为 0.851、0.825; GPTV_3mm 模型 AUC 为 0.884、0.882; GPTV_6mm 模型 AUC 为 0.880、0.870。各组学模型之间 AUC 比较差异均无统计学意义, GPTV_3 在验证组中准确度最高, 联合模型采用 GPTV_3 模型的 Rad-score 进行计算。联合模型的表现优于单纯临床-放射学模型, AUC 分别为 0.891、0.898。DCA 分析显示联合模型具有更好的净临床效益。

结论: 基于传统放射学特征和肿瘤及瘤周 3mm 范围的影像组学特征构建的联合模型能较好的预测早期肺腺癌的浸润性。

Perfusion CT imaging analyzed by the three different algorithm models in lung tumor

Changchun Chen
Hubei cancer hospital

AIM: To evaluate the reproducibility and interchangeability of CT perfusion parameters obtained with the three different kinetic calculation models in lung tumor.

METHODS: Two perfusion CT scans were obtained in 12 patients with lung tumors, 2d-1week apart, using phase 1 scans (30-second breath-hold cine) followed by phase 2 scans (3 intermittent helical breath-holds), spanning 84 seconds. Images were post-processed using a model based on the maximum-slope (M) approach (blood flow-BFM, blood volume-BVM) + Patlak (P) analysis (blood volume-BVP and permeability-FEP [k-trans]), as well as a model with deconvolution (D) analysis (BFD, BVD and FED). 50 mL contrast agent were applied with a delay time of 7 s. Perfusion parameters were compared using intraclass correlation coefficient (ICC) and the Wilcoxon matched-pairs test. Measurement reproducibility was assessed by the within-patient coefficient of variation (wCV) and Bland-Altman plots.

RESULTS: The perfusion value was successfully measured in 24 tumor samples. The BV value of deconvolution algorithm is 7.31 ± 7.03 (95% CI: 4.35-10.28) ml / 100g, the BV value of the maximum slope algorithm is 9.38 ± 6.39 (95% CI: 6.68-12.07) ml / 100g, 7.13 ± 6.79 (95% CI: 4.26-10.00) ml / 100g, which is used for Patlak algorithm. The BF value of deconvolution algorithm is 106.91 ± 82.94 (95% CI: 71.89-141.93) ml / min / 100g, and the BF value of the maximum slope algorithm is 59.91 ± 53.14 (95% CI: 37.46-82.35) ml / min / 100g. The permeability of deconvolution algorithm is 29.53 ± 21.73 (95% CI: 20.36-38.71) ml / min / 100g, and that of Patlak algorithm is 20.69 ± 10.44 (95% CI: 16.28-25.10) ml / min / 100g. Compared with the maximum slope analysis, statistical tests of BV values obtained by deconvolution or Patlak showed significantly lower values ($P < 0.01$). The BF value obtained by deconvolution is higher than that calculated by the maximum slope analysis ($P < 0.01$). Different models showed different parameters, the WCV in D & M was 48.29%, the WCV in osmotic D & P was 43.01%, the blood volume D & P, D & M, M & P were 20.29%, 22.84% and 19.58%, respectively.

CONCLUSION: The perfusion parameters obtained by different mathematical calculation methods are different. The three methods have statistical consistency relationship in the parameters, but the repeatability of these parameters is not good, and they can not be exchanged directly.

PU-2044

双层探测器 CT 定量参数在诊断食管癌淋巴结转移中的应用

陈月月、张盛箭
复旦大学附属肿瘤医院

研究目的：探讨双层探测器 CT 定量参数在定性评估食管癌转移淋巴结中的价值。

研究方法：本研究共纳入未接受任何治疗的 50 例食管癌患者，术前均接受双层探测器 CT 双期增强扫描，并在扫描后（一周内）接受了食管癌根治术，术后获得了经病理证实的 T 和 N 分期，在信噪比最佳的静脉期 70 keV 单能量图像上，选取食管癌原发灶周以及手术清扫范围一致的所有可见区域淋巴结，根据术后病理分为转移淋巴结组及非转移淋巴结组，每个淋巴结的测量采用连续三个平面勾画 ROI 取平均值，测量并记录淋巴结长径、短径（以短径 2mm 为最小测量阈值）、动脉期和静脉期碘浓度及同层面主动脉碘浓度、有效原子序数，计算淋巴结短长径比、动脉期和静脉期标准化碘浓度（标准化碘浓度为淋巴结动脉期、静脉期淋巴结的碘浓度/同层面主动脉碘浓度），测量淋巴结单能量条件下对应的 CT 值(40-80Kev)，每隔 10 keV 记录 1 次，绘制能谱衰减曲线，并计算其斜率(斜率=(40 keVCT 值-80 keVCT 值)/40)。对于转移淋巴结组及非转移淋巴结组的标准化碘浓度、有效原子序数、单能量 CT 值、常规 CT 值及能谱曲线斜率等计量资料用均值±标准差表示，若数据符合正态分布且方差齐，2 组之间采用两独立样本 t 检验比较，如不符合正态分布及方差齐性，则采用秩和检验。所有数据均采用 SPSS26.0 软件分析，以 $p \leq 0.05$ 认为差异有统计学意义。

结果：食管癌转移与非转移淋巴结组的动脉期 40keV 单能量下 CT 值、动脉期能谱曲线斜率、静脉期 40-80keV 单能量下 CT 值差异有统计学意义 ($p < 0.05$)。两组淋巴结的长径、短径、短长径比、静脉期 50-80keV 单能量 CT 值、静脉期能谱曲线斜率、动静脉期标准化碘浓度及动静脉期有效原子序数无明显差异 ($p > 0.05$)

结论：食管癌患者淋巴结的双层探测器 CT 定量参数：动脉期 40keV 单能量下 CT 值、动脉期能谱曲线斜率及静脉期 40-80keV 单能量下 CT 值在食管癌转移淋巴结的定性评估中具有一定的价值。

DSCT 在罕见三型肺动脉异常起源中的诊断价值

冯煜森
昆明医科大学附属延安医院

目的:探讨罕见三型肺动脉异常起源的影像表现,提高对该病的认识、诊断效能。方法:收集 30 例经 DSCT 证实为罕见三型肺动脉异常起源的影像特征以及术后资料进行回顾性分析。结果:30 例肺动脉异常起源患者中单侧肺动脉缺如(UAPA)者 16 例(1 例为主干缺如,6 例为右肺动脉缺如,9 例为左肺动脉缺如)、单侧肺动脉起源异常(AOPA)8 例(1 例起自右头臂干动脉、7 例起自升主动脉)和左肺动脉悬吊(LPAS)者 6 例。UAPA 患者的升主动脉、主动脉弓和降主动脉的直径明显大于 LPAS 患者,这种差异具有统计学差异($2.51 \pm 0.89\text{cm}$ VS $1.27 \pm 0.36\text{cm}$ 、 $1.81 \pm 0.57\text{cm}$ VS $1.08 \pm 0.41\text{cm}$ 、 $1.43 \pm 0.48\text{cm}$ VS $0.83 \pm 0.27\text{cm}$, $p < 0.05$)。UAPA 患者的主动脉弓内径、左肺动脉主干内径、左肺动脉主干内径/肺动脉主干内径、左肺动脉主干内径/右肺动脉主干内径显著高于 AOPA 患者,且差异具有统计学意义($1.56 \pm 0.79\text{cm}$ VS $0.58 \pm 0.15\text{cm}$ 、 0.70 VS 0.38 、 1.14 VS 0.69 , $p < 0.05$)；其余各组参数之间比较不存在统计学差异。结论:肺动脉异常起源的影像学表现具有典型的特异征象；肺动脉起源异常患者中 UAPA 患者升主动脉内径、主动脉弓内径、降主动脉内径大于 LPAS 患者；UAPA 患者主动脉弓内径、左肺动脉主干内径、左肺动脉主干内径/肺动脉主干内径比值、左肺动脉主干内径/右肺动脉主干内径比值大于 AOPA 患者,可用于肺动脉起源异

常分型的鉴别诊断；手术修复后的肺动脉异常起源患者需要终生随访，主要是监测流出道梗阻和复发性肺动脉高压，本研究随访患者均存活。

PU-2046

The value of DSCT in the diagnosis of pulmonary artery abnormal origins

Yusen Feng

Third Affiliated Hospital of Kunming Medical University

This research aims to delve into the dual-source computed tomography (DSCT) imaging manifestations of the source of three uncommon pulmonary artery abnormalities, with the aim of enhancing comprehension and diagnosis of the illness. To this end, 30 patients diagnosed with pulmonary artery abnormalities through DSCT were collected and their imaging and postoperative pathological data retrospectively examined. Results Among the 30 patients with abnormal pulmonary artery origin, 16 patients were with unilateral pulmonary artery absence (UAPA), 8 patients were with abnormal origin of unilateral pulmonary artery (AOPA), and 6 patients were left pulmonary artery suspension (LPAS). The diagnosis rate of DSCT is significantly higher than that of echocardiography. DSCT imaging revealed a significant difference in inner diameter between UAPA and LPAS patients; ascending, aortic arch, and descending aorta, with the former having a diameter significantly greater than the latter ($P < 0.05$). UAPA patients displayed a marked increase in the left pulmonary artery diameter, the ratio of the left main pulmonary artery diameter to the main pulmonary artery diameter, and the ratio of the left main pulmonary artery diameter to the right main pulmonary artery diameter ($P < 0.05$) in comparison to AOPA patients. No significant difference was observed in the inner diameter of the ascending aorta to the descending aorta between UAPA, AOPA, and LPAS patients. No noteworthy alterations in the inner diameter of the main pulmonary artery, the right main pulmonary artery's inner diameter, and the ratio of the two were observed in AOPA patients when compared to those with UAPA. Conclusion DSCT can be used to diagnose the origin of pulmonary artery abnormalities and distinguish its types. Patients with abnormal origin of pulmonary artery after surgical require life-long follow-up, mainly to prevent outflow tract obstruction and recurrent pulmonary hypertension.

PU-2047

Rare !"Arteries" grow in Veins

Yusen Feng

Third Affiliated Hospital of Kunming Medical University

A 48-year-old woman was admitted to our hospital with dizziness and headache lasting for 11 days and syncope once. The patient had no obvious inducement, such as cough, dizziness and headache. [LYY1] During the infusion, she suddenly fainted with convulsions, which lasted for 4-5 minutes and then relieved spontaneously. She complained of dizziness, nausea and vomiting of stomach contents [LYY2]. She has no history of other diseases or heredity and has been in good health. [LYY3] In laboratory study, there was no abnormality [LYY4] in blood routine test, liver function and renal function test, and the analysis results were in the normal range. Multislice spiral CT scanning and ultrasound scanning was performed to find the cause of the disease. Ultrasound showed that [LYY5] the left internal iliac vein through the inferior vena cava to the right intracardiac cystic bag structure, clear boundary, irregular shape, floating with blood flow, the nature of undetermined; [LYY6] CT examination [LYY7] showed that [LYY8]: 1. The left internal iliac blood vessels with abnormal arteriovenous shunt, flowing into the left iliac vein,

inferior vena cava, right atrioventricular and pulmonary artery, independent and continuous existence of uneven wall thickness, cystic structure, whether the lesion adheres to the vascular wall, the left ovarian artery tortuous dilation;2.Pulmonary artery thrombosis in the posterior segment of the right upper lobe and the anteromedial basal segment of the lower lobe. The nature of the main pulmonary artery and the filling defect in the right pulmonary artery is unknown. The thrombus and space occupying lesions need to be differentiated. The right atrium is enlarged, the tricuspid valve area is calcified, and the small atrial septal defect may occur;3. Multiple lung lesions of different sizes, including air sac and nodules;4. The uterus is slightly larger, uneven and obviously enhanced.[LYY9]

For the multiple cavity lesions in the lung, it was considered as specific infectious lesions, and then lung biopsy was performed[LYY10] [LYY11]. Pathological findings showed multiple endometriosis lesions in the lung. For venous lesions, according to its growth pattern and location, it was considered as venous leiomyomatosis before operation. Cardiac surgery, vascular surgery and gynecology department carried out "Under general anesthesia and cardiopulmonary bypass, cardiac multiple tumor resection + vena cava tumor resection + Preparation of vena cava reconstruction + hysterectomy and bilateral appendectomy". [LYY12] The 11 hour operation went off without a hitch and the vital signs of the patients were stable during and after the operation. Postoperative pathology showed low grade endometrial stromal sarcoma. This lesion is very rare, especially in intravascular lesions. We hope that this case can prompt us to pay attention to intravascular lumen lesions. In addition, to venous leiomyomatosis, we should also consider the existence of low-grade endometrial stromal sarcoma, especially when multiple endometriosis exists in the lung at the same time.

PU-2048

冠状动脉 CT 血管成像评价左冠状动脉前降支狭窄对左心功能的影响

盛忆嘉
南通大学附属医院

目的：利用冠状动脉 CT 血管成像评估左冠状动脉前降支狭窄程度对左心功能参数的影响，并探讨两者之间的相关性。

方法：回顾性收集 2018 年 9 月至 2019 年 10 月在南通大学附属医院因初诊冠心病行 CCTA 和冠状动脉造影检查的患者共 421 例，纳入 CAG 证实存在单支 LAD 狭窄的患者共 72 例，排除 LAD 严重钙化 4 例，共入组 68 例，根据 LAD 狭窄程度将 68 例患者分成三组，其中轻度狭窄组 34 例，中度狭窄组 19 例，重度狭窄组 15 例，另选同一时间段内正常对照组 20 例，所有患者均行 CT 心功能分析，计算出左心室射血分数、左心室舒张末期容积、左心室收缩末期容积及左心排出量。

结果：与正常对照组比较，轻度及中度狭窄组各项心功能参数差异无统计学意义 ($P>0.05$)；重度狭窄组，LVEF 显著低于轻度及中度狭窄组，而 LVESV 及 LVEDV 则高于轻度及中度狭窄组，差异均有统计学意义 ($P<0.05$)；狭窄组与对照组之间 LVCO 差异无统计学意义 ($P>0.05$)。Pearson 相关性分析：LVEF 与 LAD 狭窄程度呈负相关 ($r=-0.467$, $P<0.05$)。LVESV 与 LAD 狭窄程度呈正相关 ($r=0.391$, $P<0.05$)。

讨论：LAD 轻度狭窄时，LVEF 等左心功能参数与正常组差异均无统计学意义 ($P>0.05$)，表明 LAD 轻度狭窄时对心肌的供血未有明显减少，左心功能尚可代偿。

轻度及中度狭窄组的 LVEF、LVESV 以及 LVEDV，差异无统计学意义 ($P>0.05$)，可能由于轻度组 LAD 的狭窄范围在 25%~50%，狭窄度更靠近 50%。中度狭窄组与正常组相比，LVEF、LVESV 以及 LVEDV 等差异无统计学意义 ($P>0.05$)，可能是在冠脉狭窄后，侧支循环代偿使得部分缺血心肌再灌注，故左心功能各指标暂未出现明显异常。

LAD 重度狭窄时, LVEF 明显减低, LVESV、LVEDV 较前增大, 较各组差异均有统计学意义 ($P<0.05$), 可能机制为心肌收缩性及顺应性明显降低, LVESV 较前进一步扩大, 此时由于心肌扩张性重构, 左心室扩大伴左室壁变薄, 造成左心室舒张功能明显减低, LVEDV 增大, LVEF 较前进一步减低。

PU-2049

双能 CT 多参数成像可提高肺腺癌分级的诊断效能

马欢
天津市天津医院

目的: 探讨双能 CT 多参数成像对肺腺癌 (LUAD) 分化程度的评估价值。

资料与方法: 本研回顾性共纳入 87 例经病理证实的 LUAD 患者, 其中高、中分化组 49 例(分别为 20、29 例), 低分化组 36 例。测量肿瘤形态学参数、平扫 CT 值、双期增强 CT 值、40keV、70 keV 单能量 CT 值、病灶区域碘浓度、病灶同一层面胸主动脉碘浓度。计算能谱曲线斜率和标准化碘密度。通过统计学分析比较双能 CT 参数单独及联合形态学参数的诊断效能。

结果: 低分化组的 LUAD 形态学征象(血管集束征、液化坏死)高于高-中分化组(59.6%vs 32.8%、40.0%; 68.7%vs25.3%、36%: 均 $p < 0.05$)。标准化碘密度(动脉期: 0.10 ± 0.03 vs 0.12 ± 0.02 、 0.12 ± 0.03 ; 静脉期: 0.32 ± 0.05 vs 0.39 ± 0.23 、 0.40 ± 0.15)差异均有统计学意义(均 $p < 0.05$)。低分化组和高-中分化组的受试者工作特征(ROC)曲线显示, 动脉期标准化碘密度的诊断效能最佳, 曲线下面积(AUC)为 0.856, 灵敏度为 93.5%, 特异度为 83.8% ($P < 0.001$)。当纳入形态学参数时, AUC 提高至 0.932, 灵敏度和特异度分别为 96.8%和 83.2% ($P < 0.001$)。

结论: 双能 CT 多参数成像有助于鉴别肺腺癌病理分级。双能 CT 参数中, 动脉期标准化碘浓度的诊断效能最佳, 双能 CT 参数联合形态学参数可提高 LUAD 的病理分级。

PU-2050

肺部高分辨率 CT 对老年髋部骨折后急性肺损伤的早期诊断价值

刘曦、杨华、张德川、张琴、胡勤勤
重庆市中医院

目的 探讨老年髋部骨折后急性肺损伤 (ALI) 患者的肺部高分辨率 CT (HRCT) 表现特征及半定量 CT 评分在早期诊断中的价值。方法 采用回顾性病例系列研究分析 2014 年 7 月-2023 年 1 月重庆市中医院收治的 478 例老年髋部患者临床及影像资料, 包括男性 153 例, 女性 325 例; 年龄 65~99 岁[(83.84 ± 6.56) 岁]。分析所有患者肺部 HRCT 征象累及肺叶段范围, 并进行半定量 CT 评分, 包括弥漫性磨玻璃影 (DGGO)、实变影 (IPO)、网格状影 CT 评分及 CT 总评分。按是否发生 ALI 将患者分为 183 例 ALI 组及 295 例非 ALI 组, 比较两组患者一般资料、HRCT 常见征象、半定量 CT 评分及 $\text{PaO}_2 / \text{FiO}_2$ 。采用相关分析评价半定量 CT 评分与 $\text{PaO}_2 / \text{FiO}_2$ 的相关性。结果 ALI 组患者的肺部 HRCT 常见征象依次是 DGGO 175 例 (95.6%)、IPO 139 例 (76.0%) 及网格状影 93 例 (50.8%), 半定量 CT 评分 (包括 DGGO、IPO、网格状影 CT 评分及 CT 总评分)、 $\text{PaO}_2 / \text{FiO}_2$ 依次是 5.81 ± 3.57 , 2.64 ± 2.86 , 1.34 ± 1.62 , 9.64 ± 3.77 , 264.80 ± 27.35 , 均高于非 ALI 组患者 ($P < 0.05$)。相关分析结果显示, ALI 组患者 IPO、网格状影 CT 评分与 $\text{PaO}_2 / \text{FiO}_2$ 无相关性 ($P > 0.05$); DGGO CT 评分、CT 总评分与 $\text{PaO}_2 / \text{FiO}_2$ 呈显著负相关 ($P < 0.001$)。结论 肺部 HRCT 表现特征及其半定量 CT 评分有助于老年髋部骨折后 ALI 患者的早期诊断。

PU-2051

双气相 CT 肺容积参数定量评估 COPD 患者肺功能的可行性研究

李强、谢东
宁波大学附属人民医院

目的：探究双气相 CT 扫描相对常规 CT 扫描在 COPD 诊断和评估上的价值。

方法：纳入 2021 年 1 月至 2022 年 12 月在本院就诊的 135 例 COPD 患者，计算两肺及各肺叶在吸气相和呼气相中的容积变化和密度变化，并与肺功能指标的相关性分析和线性拟合并对比结果，对比 ROC 曲线下面积以评估各参数用以诊断 COPD 的效能。

结果：1.全肺全区收缩比、全肺功能区收缩比、全肺非气肿区收缩比、吸气相全肺 LAA%-950HU、呼气相全肺 LAA%-950HU、全肺密度比与主要肺通气指标均呈中等程度相关($P < 0.05$)，全肺功能区收缩比与肺功能的相关性(对比 FEV1%pred, $r = 0.497$, $P < 0.001$)、可解释性(与 FEV1%pred 的简单线性拟合, $\text{adjusted } R^2 = 0.259$, $P < 0.001$)及用于诊断 COPD 的曲线下面积(曲线下面积 0.780, 灵敏度 95.2%, 特异度 64.3%, $P < 0.001$) 优于其他容积和密度指标。2.呼气相 LAA%-950HU 与肺功能的相关性(呼气相全肺 LAA%-950HU 对比 FEV1%pred, $|r| = 0.442$, $P < 0.001$)高于吸气相(吸气相全肺 LAA%-950HU 对比 FEV1%pred, $|r| = 0.418$, $P < 0.001$)。3.两肺下叶的容积/密度定量参数与肺功能的相关性高于上肺，如下肺(左肺下叶+右肺中叶+右肺下叶)全区收缩比(对比 FEV1%pred, $r = 0.395$, $P < 0.001$)与肺功能的相关性高于上肺(左肺上叶+右肺上叶)全区收缩比(对比 FEV1%pred, $r = 0.357$, $P < 0.01$)。

结论：对比吸气相 CT 平扫，呼气相 CT 平扫得到的肺气肿相关定量参数与 COPD 患者的肺通气功能相关性更高，对 COPD 的诊断和评估能力更有优势；COPD 患者的两肺下叶病变对肺通气功能的影响大于上肺病变的影响；功能区收缩比在诊断 COPD 和评估通气功能方面优于其他容积/密度定量参数。

PU-2052

动态 DDR 技术在慢性阻塞性肺病 (COPD) 的临床应用及优势

史晟先
吉林大学第一医院

目的：慢性阻塞性肺疾病目前是全球第三大死因，传统医学检查手段一般采用肺功能作为金标准，但是大多数患者由于本身呼吸困难，无法完美配合功能检测，因此影响检查结论精准性，导致患者错过最佳治疗时机，所以思考采用动态 DDR 技术是否可以解决此类问题，同时满足临床诊断需求值得我们探究。

方法：将来到医院怀疑慢阻肺疾病诊疗的患者，按照年龄，性别，随机选出 30 名，同样的 30 名患者采取传统肺功能检测设为 A 组，同样的 30 名患者采用动态 DDR 技术检查设为 B 组。A 组由同一名经验丰富医生采用传统方法，肺功能方法检测，并准确记录检测结果。B 组由同一名经验丰富医生采用我院最新引进的柯尼卡美能达医疗 AeroDR C80 动态功能型悬吊无线平板 DR 进行检测，使用 DDR 动态可视化成像技术，以“高速度+低剂量”方式采集数字图像，无需造影剂，就可以获得肺部通气和血流的动态可视化信息，生成动态图像序列。

- ① 患者登记，曝光部位序列选择：平静呼吸，尽力呼吸，屏气（选做）
- ② 患者摆位，确认曝光参数，注意观察束光器上滤过选择（1AL+0.5CU）
- ③ 取得患者信息（建议）：身高，体重

④ 患者呼吸训练： 尽力呼吸——用力吸足气—屏住（曝光开始）—快速用力把气呼光—屏住—用力吸足气—屏住（曝光结束）

⑤ 传输到匹配工作站进行充气量数据分析，从而得出诊断结论

最后，30 名患者分别填写了调查问卷，问卷内容包括对于 A B 两种检查方式的评价，设为 1-5 级，1 级最差，5 级最好，具体评价内容：检查费用经济承受度，配合检查的完成度，检查的舒适性，检查环境，服务满意度等几方面进行客观填表，同时 A 和 B 组分别由两位经验丰富的医生进行诊断准确性评测，最后进行统计分析。

结果：A、B 两组都能满足临床诊断，调查问卷表格填写后的统计分析，A 和 B 组均符合 5 级标准中的 3—5 级，应用 SPSS13.0 统计软件，进行统计学分析， $P<0.05$ 为差异具有统计学意义。但是对于检查费用，检查耗时间，患者舒适度，配合性等方面，B 组明显评分高于 A 组，也就是说动态 DDR 检查技术明显更具有优势。

结论：动态 DDR 检查技术在慢性阻塞性肺病（COPD）的临床诊疗具有实际意义，值得推广。

不同方法测量左心房径线的一致性评价

岳军艳¹、姬凯¹、刘海鹏¹、高剑波²

1. 新乡医学院第一附属医院

2. 郑州大学第一附属医院

背景

肺静脉及左心房的形态学信息对房颤消融术的顺利进行具有极其重要的临床价值，但 CT 上测量左心房的径线方法多种多样。

目的

探讨不同方法测量左心房径线的一致性。

资料与方法

回顾性纳入了 87 例肺静脉 CTA 的影像学资料。男性 50 例，女性 37 例，平均（60.74±8.70）岁。由两位医师采用 6 种不同测量方法测量左心房的前后径、长径及横径，并记录图像后处理时间，其中医师 1 间隔 1 月测量 2 次。采用组内相关系数（ICC 值）评价两位医师测量左心房各径线的一致性。采用随机区组设计的秩和检验（Friedman M 检验）、多个相关样本两两比较的 q 检验比较不同测量方法测量左心房径线和所消耗时间的差异性， $P<0.05$ 有统计学意义。

结果

1. 两位医师测量左心房径线的一致性程度均较强或很强。2. 不同方法测量左心房前后径、长径及横径数据的差异有统计学意义（ χ^2 分别为 222.28、32.74 及 293.83， P 值均 <0.001 ）。3. 不同方法测量左心房径线所消耗时间不同（ $\chi^2=333.10$ ， $P<0.001$ ）。

结论

1. 不同医师测量左心房径线的结果可信。2. 不同方法测量左心房径线值不尽相同。3. 单独在 VR 图像上测量左心房长径最适合临床推广应用。

PU-2054

Multi-Modality Imaging in Left Ventricular Reverse Remodeling with Left Ventricular Assist Device: A Case of Successful Explantation of Assist Device

Mengyu Chen, Bing Liu, Lijuan Fan
TEDA International Cardiovascular Hospital

Aim: Left ventricular assist device (LVAD) implantation plays an important role in the treatment of end-stage heart failure as bridge to transplantation, recovery or destination therapy. LVAD implantation can lead to left ventricular reverse remodeling (LVRR) in patients with end-stage dilated cardiomyopathy (DCM). By a case of successful explantation of assist device we discuss the application of multi-modality imaging in the evaluation of left ventricular reverse remodeling.

Method and result: In this case report, we describe a 39-year-old male who was admitted to our centre because of DCM complicated with CLBBB for LVAD implantation. The patient was implanted with left ventricular assist device HeartCon which is a centrifugal pump and an investigational device. The outflow tract diameter of Heartcon was 10mm and the pump speed was 2400 rpm during support. One week after LVAD explant, the results of multimodal imaging were as follows. Cardiac magnetic resonance (CMR) showed that LVEDD was decreased while RVEDD, LVEF and RVEF were increased than that before implantation. Late gadolinium enhancement (LGE) showed that myocardial fibrosis could be seen in left ventricular free wall and ventricular septum. Radionuclide resting myocardial perfusion imaging showed that LVEDD was decreased than that before implantation. LVEF was 36% which improved compared to preoperative. The apical segment of left ventricle was postoperative change. The distribution of imaging agents in left ventricular septal wall and lateral wall was slightly sparse, which was consistent with the changes of myocardial fibrosis shown by CMR. Echocardiography showed that the left ventricle is border-line while the LVEDD was 58mm. The LVEF measured by M-mode ultrasound was 50%. After LVAD explantation, the patient underwent echocardiography follow-up. At the last follow-up appointment (21 months post-device explant), the patient recovered well without any interval rehospitalization. He was asymptomatic at rest and was able to perform independent daily activities (NYHA I).

Conclusion: LVAD implantation can lead to LVRR in patients with end-stage DCM, which means that patients receiving a LVAD support can regain their cardiac function and come off the LVAD. LVRR can be accurately evaluated by multi-modality imaging, including echocardiography, CMR and MPI. The concept of reverse remodeling while on the LVAD is intriguing but requires further study to see to what extent this may result in explantation of the device, to investigate the optimal drug regime necessary and the reliable monitoring of this process.

肺胶样腺癌的 CT 及 PET/CT 表现

江岷芮
中国人民解放军陆军特色医学中心

目的 探讨 10 例肺胶样腺癌的 CT 和 18 F-FDG PET/CT 影像特征及病理对照, 增加对肺胶样腺癌认知, 并提高其术前精准诊断水平。**方法** 收集病理证实的 7 例肺胶样腺癌患者, 分析 CT 及 PET/CT 表现, 并与组织病理学报告进行比较。**结果** 10 例患者均表现为单发周围型病变。除 1 例体积最小肿瘤外, 所有肿瘤均呈分叶状轮廓, 10 例肿瘤均无毛刺征及胸膜侵犯。病灶边界清楚。CT 平扫均显示低密度, CT 值范围从 -18.5 到 19.1HU (中位数为 10.0HU); 4 例患者行增强扫描, 注射对比剂后, 病灶增强均不明显, 扫描患者净增强范围为 2.2-6.5HU (中位数为

6.3HU)。1 例肿瘤内可见点状钙化。10 例患者均行 18F-FDG PET/CT 检查，PET/CT 上肿瘤的最大标准摄取值为 1.1~5.7(中位数为 1.7)。在 10 例患者中，2 例在肿瘤壁可见 FDG 积聚，2 例在肿瘤壁及分隔均可见 FDG 积聚。结论 CT 上表现为周围肺组织内边界清楚的低密度分叶状结节或肿块、无毛刺及胸膜增厚、瘤内偶发点状钙化、增强扫描强化不明显；PET/CT 表现为肿瘤壁或肿瘤壁及分隔 FDG 积聚，肺胶样腺癌可能是首选诊断。

气候变化：“双碳”战略下的放射学科应对策略

许茂盛、高艺源

浙江中医药大学附属第一医院（浙江省中医院）

气候变化是一项全球性的问题，对人类社会和自然环境都带来了巨大的影响。作为世界上最大的发展中国家，中国正面临着严峻的气候变化挑战。《柳叶刀健康与气候变化倒计时 2022 年中国报告》指出，65 岁以上的中国老年人群更容易受到气候变化带来的健康风险影响。在中国逐步迈入老龄化社会的背景下，气候变化相关的疾病与经济负担可能会进一步加重。

2020 年 9 月，我国提出“碳达峰、碳中和”的双碳战略目标，鼓励支持向绿色、低碳的发展道路转型变革，这不仅有利于中国人民的健康与福祉，还可以推动高质量的可持续发展。卫生健康系统是全球温室气体排放的主要贡献者之一，其日常运作和维护都需要消耗大量的能源。放射学科中，大部分的排放来自于医学成像设备运作所需的能量，以及维持设备与操作机房的温度和湿度所需的能量。

放射学科长期处于科技变革的前沿，可在应对气候变化问题中发挥积极的引导与推动作用。在科室层面上，应倡导夜间关闭 CT 和 MRI 等高能耗医学成像设备电源，减少低价值成像，限制一次性医疗器材的使用；在行业领域内，应推动可持续性的采购政策，优化设备在闲置和关闭状态下的能耗，鼓励供应商研发低能耗的医疗设备。随着全球医疗保健系统向低碳可持续发展转型，放射学科医技人员有责任在家庭、工作和社会中引领变革，以应对气候变化带来的挑战。

PU-2057

拟 TAVR 术前影像筛查及评估

弓莉、杨瑞

河南省胸科医院

目的 通过对计算机断层扫描血管成像(Computed tomographic angiography, CTA) 图像进行测量，分析经导管主动脉瓣置换术(Transcatheter aortic valve replacement, TAVR)术前二叶式主动脉瓣(Bicuspid aortic valve, BAV)与三叶式主动脉瓣(Tricuspid aortic valve, TAV)患者之间主动脉根部解剖结构和钙化的差异，为 TAVR 术前评估提供依据。方法 60 例主动脉瓣狭窄患者(平均年龄 (76 ± 5.4) 岁)在 TAVR 术前均行 CTA+全程主动脉检查。通过 CTA 检查后处理数据测量，对手术入路及术中选取装置、术后复查至关重要；结论 TAVR 无直视术野，对移植物尺寸及术中操作的要求极高，因此，患者的手术指征把握、移植物尺寸的选择及术中操作依赖术前影像学评估。CTA 已逐渐成为 TVAR 术前筛查测量的“金标准”。

PU-2058

心肌纤维化核医学成像研究新进展

刘雯洁
江苏大学附属医院

心肌纤维化是心肌损伤后的一种心肌重构现象,主要表现为心肌成纤维细胞过度增殖与分化,心肌胞外基质(ECM) 过度累积、排列紊乱、胶原网络重建而引起心肌间质扩张与重构,是心肌病的常见病理改变。在心肌纤维化的形成过程中往往有一些间质效应细胞发挥着关键作用,这些细胞虽然不一定能直接合成和分泌胶原,但他们的激活已成为胶原生成细胞的重要来源,其中成纤维细胞就发挥了关键作用。现代影像技术可以对心肌纤维化进行整体全面、非侵入式的评估。目前主要应用心脏磁共振(cardiac magnetic resonance, CMR)、CT、超声心动图、核医学评估心肌纤维化。除核医学外,现有影像学技术评估心肌纤维化都是以检测心肌纤维化终末端产物-胶原蛋白等为主要方法,而一旦发生胶原蛋白沉积,病理上已经无法逆转,目前临床上缺乏明确有效的治疗措施。只有在心肌纤维化早期、可逆转阶段进行及时诊断,并采取有针对性的治疗措施,才可能逆转延缓纤维化,改善生存。核医学显像是最早反映组织特征的分子影像技术。核医学识别成纤维细胞活化早于间质改变、功能改变,可预警心肌纤维化,早期检测心肌纤维化,为早期干预,甚至是逆转纤维化提供机会。核素心肌显像主要是通过正电子发射断层扫描(positron emission tomography, PET) 和单光子发射计算机断层扫描(single photon emission computed tomography, SPECT) 技术进行功能显影,包括心肌血流灌注显像、心肌代谢显像(糖代谢或脂肪酸)以及心脏交感神经活性分布显像,为放射性心肌损伤(RIHD)患者提供了早期的无创性影像学诊断和评价方法。核医学显像是最早反映组织特征的分子影像技术,本文主要对与成纤维细胞相关的心肌纤维化的直接成像和心肌纤维化的间接成像进行综述。

PU-2059

双层探测器光谱 CT 定量参数术前预测 食管鳞状细胞癌 Ki-67 表达的效能

徐姝、王浩天
Liaoning Tumor Hospital&Institution

目的 探讨双层探测器光谱 CT 定量参数术前预测食管鳞状细胞癌(ESCC) Ki-67 表达的效能。
方法 回顾性收集 2021 年 12 月至 2022 年 12 月辽宁省肿瘤医院 64 例 ESCC 患者。采用免疫组化法检测 ESCC 瘤组织中 Ki-67 的表达水平, Ki-67 表达指数 $\geq 30\%$ 为 Ki-67 高表达组(47 例), $<30\%$ 为 Ki-67 低表达组(17 例)。测量光谱 CT 定量参数值,包括动脉期和静脉期 120 kVp 混合能量图 CT 值、40 keV 虚拟单能级图 CT 值、碘密度(ID)值、标准化碘密度(NID)和有效原子序数。采用独立样本 t 检验比较 Ki-67 高表达组与低表达组间各参数的差异,绘制受试者操作特征(ROC)曲线评价各参数预测 Ki-67 表达的效能,曲线下面积(AUC)的比较采用 DeLong 检验。结果 Ki-67 高表达组动脉期 120 kVp CT 值、40 keV CT 值、ID、有效原子序数和静脉期 120 kVp CT 值、40 keV CT 值、ID、NID、有效原子序数均高于 Ki-67 低表达组,差异有统计学意义($P<0.05$), 两组间动脉期 NID 差异无统计学意义($t=1.85$, $P=0.070$)。静脉期 NID 预测 ESCC Ki-67 表达的 AUC 最大,为 0.965 (95%CI 0.923~1.000), 以 0.28 为截断值,灵敏度为 93.6%、特异度为 100%。静脉期 NID 的 AUC 与静脉期 ID (AUC 为 0.926)、有效原子序数 (AUC 为 0.909) 的差异无统计学意义($Z=-1.52$ 、 1.81 , $P=0.128$ 、 0.071), 与静脉期 120 kVp CT 值 (AUC 为 0.719)、40 keV CT 值 (AUC 为 0.747) 的差异有统计学意义($Z=3.41$ 、 3.30 , $P=0.001$ 、 0.001), 与动脉期各参数的 AUC 差异均有统计学意义($P<0.05$)。结论 光谱 CT 参数静脉期 ID、NID、有效原子序数对 ESCC Ki-67 表达的预测效能较高。

PU-2060

18F-FDG PETMRI 定量分析在鉴别肺部良恶性肿瘤中的价值

梁江涛、周巧玲、许远帆、潘建虎
杭州全景医学影像诊断中心

目的: 评价 PET/MRI 的最大标准化摄取值 (SUVmax) 和 DWI 的表观扩散系数平均值 (ADMean) (b 值=800) 在鉴别肺部良恶性肿瘤中的应用, 并分析 SUVmax 和 ADEMean 之间的分子相关性。

方法: 回顾性分析 2017 年 6 月至 2023 年 1 月在我院经病理证实的 120 例肺实体瘤患者的 PET/MRI 影像学资料, 将患者分为恶性肿瘤组 (53 例) 和良性肿瘤组 (67 例)。所有患者均接受 18F-FDG PET/MRI 检查, 并分别测量病变的 SUVmax 值。测量 DWI 图像中三个感兴趣区域的 ADC 值 (b 值=800), 并取其平均值。采用独立样本 t 检验比较肺恶性肿瘤 SUVmax 和 ADC 均值的差异, 绘制 ROC 曲线评价 SUVmax 与 ADC 均值的诊断效果。对肿瘤的 SUVmax 和 ADC 平均值进行 Pearson 相关分析。

结果: 肺恶性肿瘤的 SUVmax 高于良性肿瘤, 差异有统计学意义 ($t=-2.976$, $P=0.003$)。肺恶性肿瘤 ADC 平均值低于良性肿瘤, 差别有统计学意义, $t=2.988$, $P=0.009$)。SUVmax 阈值为 5.87, 灵敏度为 98.3%, 特异性为 82.1%。ADC 平均值阈值为 $0.23 \times 10^{-3} \text{ mm}^2/\text{s}$, 灵敏度为 90.1%, 特异性为 89.2%。SUVmax 与 ADC 平均值无相关性。

结论: SUVmax 和 ADC 均值有助于区分肺实体瘤的良恶性, 但 SUVmax 与 ADC 均值之间没有显著相关性, 这两个值分别代表了不同的生物学信息。

An unexpected primary pulmonary melanoma in an asymptomatic patient: case report

Weidong Li
The Affiliated Hospital of Xuzhou Medical University

Abstract: Primary pulmonary melanoma (PPM) is an extremely rare clinical entity that may be confused with more conventional types of lung cancer. To the best of our knowledge, about 30 cases have been previously reported in the English literature. To establish the diagnosis of PPM, careful interpretation of histopathological information in correlation with all other clinical, laboratory and imaging studies may be needed. Surgical resection has been shown to be the best chance of long term survival. Here, we report a case of a 35-year-old Chinese man whose PPM was detected incidentally.

A 35-year-old healthy, asymptomatic Chinese man presented with an abnormal shadow on a chest X-ray that examined during an annual check-up. Computed tomography (CT) scan and bronchoscopy examination revealed a left pulmonary mass. The histopathology of transbronchial sample indicated malignant melanoma. Then the patient underwent curative left upper lobectomy, and clinical examination, histopathological characteristics, and immunohistochemical features supported the diagnosis of PPM. No evidence for recurrence and/or metastasis has been found more than one year after the initial surgery and four cycles adjuvant chemotherapy and biological cell immunotherapy.

PU-2062

Diagnostic value of different stages of heart failure in hypertensive heart disease by cardiac magnetic resonance feature tracking

ying Liu^{1,2}, Xiaolin Mu¹, jing Zhu^{1,2}, Yuwei Wang¹, yang Song¹

1. Central Hospital of Dalian University of Technology; Department of Graduate School, Dalian Medical University

2. Department of Graduate School, Dalian Medical University

Purpose: To quantitatively evaluate the changes of myocardial mechanics of the left heart system in patients with hypertensive heart disease (HHD) at different stages of heart failure (HF) by cardiac magnetic resonance feature tracking (CMR-FT).

Methods: We retrospectively studied 99 patients with HHD, including non-heart failure (n=25), HF with preserved ejection fraction (HFpEF, n=24), HF with mid-range ejection fraction (HFmrEF, n=23) and HF with reduced ejection fraction (HFrEF, n=27). All participants completed CMR examination. Myocardial strain and strain rate of the left atrium and ventricle were measured independently by 2 physicians, comparing myocardial strain impairment in different stages of HF, analysing the correlation between the left atrial and ventricular strain parameters, and using receiver operating characteristic to analyse the diagnostic efficacy of each parameter.

Results: Compared with the non-heart failure group, the HF group showed impaired LVEF, ϵ_s , ϵ_e , ϵ_a , SRs, SRe, SRa, GPCS, GPRS, and GPLS. There were significant differences in ϵ_s , ϵ_a , GPCS, GPRS, and GPLS in the HFrEF group compared with the HFpEF group ($P<0.001$), and in LVEF, ϵ_e , GPCS, GPRS, and GPLS in the HFmrEF group compared with the HFmrEF group ($P<0.001$). ϵ_s was moderately correlated with GPLS ($r=-0.756$, $P<0.001$). ϵ_a was moderately correlated with GPLS ($r=-0.705$, $P<0.001$) and GPCS ($r=-0.706$, $P<0.001$). SRe, SRa, GPCS and GPLS were effective in distinguishing the non-heart failure group from the HF group (AUC=0.745, 0.828, 0.888 and 0.889); Distinguishing between HFpEF and HFmrEF group, AUCs of GPCS and GPLS were 0.914, 0.757; Distinguishing between HFpEF and HFrEF group, AUCs of SRa, GPCS, and GPLS were 0.744, 0.986, 0.963; Distinguishing between HFmrEF and HFrEF group, AUCs of GPCS and GPLS were 0.820, 0.757. The Bland-Altman analysis showed good inter-physician concordance.

Conclusion: CMR-FT derived myocardial strain has potential value in different stages of heart failure in HHD.

PU-2063

Right Coronary Artery-to-Left Ventricle Fistula: Before and After Transcatheter Closure with a PDA Occluder Evaluation with Emphasis on MDCT Angiographic Advantages

Ruili Mao, Cheng Cheng

Institute of Surgery Research, Daping Hospital, Army Medical University

Background: The MSCT manifestations of a Right Coronary Artery-to-Left Ventricle Fistula before and after the transcatheter closure were reported. **Objective:** Advantages of MDCT angiography in the evaluation of right coronary artery-to-the left ventricle fistula relative to echocardiography were discussed. **Method:** This report describes a right coronary artery-to-the left ventricle fistula in a 48-year-old man. Cardiovascular multidetector-row computed tomography (MDCT) angiography was used for before and after the transcatheter closure procedure

evaluation. Before treatment, MSCT showed a dilated distal of Right Coronary Artery, The distal branch of the left anterior descending branch is also connected to the distal aneurysmal dilatation of the right coronary artery. The fistula was occluded with a PDA occluder. Four days after the occlusion, MSCT showed that the fistula was completely occluded and there was massive thrombosis in the central part and around the occluder. **Result:** MDCT angiography is superior to echocardiography in showing the draining sites and courses, as well as postoperative evaluation of patients with right coronary artery-left ventricular fistula. MSCT could not only provide useful evidence for the best therapeutic strategy and evaluation of therapeutic efficacy but can also find the existence of the thrombosis and the potential risk of acute myocardial infarction after the transcatheter procedure for Coronary artery fistulae (CAF). **Conclusion:** It indicates that MDCT angiography maybe a more suitable diagnostic modality for before and after Transcatheter Closure with a PDA Occluder evaluation of Right Coronary Artery-to-Left Ventricular Fistula.

PU-2064

基于 CT 平扫的影像组学特征在肺结核耐药性中的鉴别诊断价值

江锋莉¹、徐秋贞¹、王玉¹、许传军²

1. 东南大学附属中大医院

2. 南京市传染病医院 (南京市第二医院)

目的: 探讨基于 CT 平扫的影像组学特征在药物敏感与耐药型肺结核中的鉴别诊断价值。

方法: 回顾性地分析 2018 年 4 月至 2020 年 12 月在南京市第二医院经痰培养确诊为肺结核并完成药敏试验的 177 例继发型肺结核患者的临床和影像学资料, 将耐药型肺结核 (n=78) 和药物敏感肺结核 (n=99) 患者按照 7: 3 随机分为训练集和验证集。将患者的 CT 平扫影像图像病灶进行感兴趣区域勾画并提取影像组学特征。筛选出有较大价值的影像组学特征构建影像组学标签 (radiomics signature) 并计算影像分数 (radiomics score, Rad-score)。评估人口统计学资料、临床症状、实验室检查结果及 CT 影像学特征以建立临床因素模型。结合 Rad-score 和临床因素构建影像组学-临床综合模型, 并将其应用于列线图, 并从校准度和临床有用性方面评估列线图的性能。

结果: 13 个组学特征被用于建立影像组学标签。影像组学标签在训练集的 AUC 为 0.891; 验证集的 AUC 为 0.803; 临床因素模型在训练集的 AUC 为 0.780; 测试集的 AUC 为 0.692; 影像组学列线图训练集的 AUC 为 0.932; 验证集的 AUC 为 0.841, 显示出良好的区分度和校准度。决策曲线分析表明, 就临床有用性而言, 影像组学列线图优于临床因素模型和影像组学标签。

结论: 单纯的影像组学标签对鉴别药物敏感与耐药型肺结核具有很好的价值。融合 Rad-score 和临床因素的影像组学列线图显示良好的预测效果, 可能有助于临床医生制定精准治疗。

PU-2065

The correlation of impaired coronary microcirculation and myocardial strain in patients with coronary slow flow: an exploratory study by cardiac magnetic resonance

Yunbo Zhang

Second Affiliated Hospital of Kunming Medical University

Background: Coronary slow flow (CSF) is associated with adverse cardiovascular events, but the pathophysiology remains unknown. This study aimed to evaluate the impact of CSF on left ventricular (LV) strain, left atrial (LA) strain, and myocardial perfusion parameters by cardiac magnetic resonance feature tracking (CMR-FT) and rest first-pass perfusion imaging.

Methods: A total of 31 CSF patients and 17 healthy controls were enrolled retrospectively and underwent cardiac magnetic resonance (CMR) imaging. CSF was defined as a corrected thrombolysis in myocardial infarction frame count (CTFC) of more than 27. LV and LA performance were assessed using CMR-FT cine imaging, including global longitudinal strain (GLS), global circumferential strain (GCS), global radial strain (GRS), LA reservoir strain (ϵ_s), conduit strain (ϵ_e), and booster pump strain (ϵ_a). Myocardial perfusion was analyzed using semiquantitative rest first-pass perfusion, including the perfusion index (PI), upslope, time to maximum signal intensity (TTM), and maximum signal intensity (SI_{max}). Finally, univariate and multivariate analyses were performed to identify independent risk factors in CSF patients.

Results: CSF patients were accompanied by impaired GLS, ϵ_s and ϵ_e (all $P < 0.05$). Compared with healthy controls, SI_{max} (basal, middle and apical), upslope (middle), and global LV PI were significantly decreased in CSF patients (all $P < 0.05$). Mid-upslope showed the effective diagnostic value to identify the CSF and healthy controls (AUC=0.71; sensitivity, 83.87%; specificity, 70.59%; $P=0.017$). Moreover, GLS was negatively correlated with mid-upslope in CSF patients with diastolic dysfunction ($r=-0.452$, $P=0.046$). In multivariable analyses, CTFC ($b=-0.521$, $P=0.004$) and myocardial mass index ($b=-0.428$, $P=0.028$) were the independent risk factors to GLS.

Conclusion: CMR yields comprehensive data from CSF patients. The decreased myocardial strain was related to impaired perfusion parameters in CSF patients with diastolic dysfunction.

93 例新型冠状病毒肺炎患者的 CT 影像学表现分析

明樱、隋昕、宋伟、汪佳儒、赵瑞杰、肖然、王金华、杜华阳
中国医学科学院北京协和医院

目的: 观察和分析新型冠状病毒肺炎患者的 CT 影像学表现和特征, 以提高新型冠状病毒肺炎患者的诊断水平和治疗规范为临床提供依据。

材料与方法: 本研究回顾性分析了 93 例 2022 年 12 月在北京疫情高峰期于我院确诊为新型冠状病毒肺炎患者的影像学检查资料, 所有的患者均为通过鼻拭子或咽拭子检测 2019-nCoV 核酸阳性的确诊病例, 其中重症肺炎为 39 例, 非重症肺炎为 54 例, 分析病变分布的位置、形态、密度、范围等, 并观察肺门、纵隔淋巴结及胸膜和胸腔情况。

结果: 本次研究中男性患者为 47 例(51%), 女性患者为 46 例(49%), 年龄 27~100 岁, 中位年龄为 68 岁, 胸部 CT 检查结果均为阳性。重症肺炎的 39 例中表现为磨玻璃密度影者为 19 例(49%), 斑片条索影为 9 例(23%); 实变并见空气支气管征为 7 例(18%), 小叶间隔增厚和网格样改变为 4 例(10%); 其中伴有胸膜增厚的有 37 例(95%), 肺门及纵隔淋巴结肿大的为 19 例(49%), 合并有胸腔积液的病例为 14 例(36%)。非重症肺炎的 54 例中表现为斑片条索影的最多见为 24 例(44%), 其次为磨玻璃密度影 22 例(41%), 实变并见空气支气管征为 4 例(7%), 小叶间隔增厚和网格样改变及结节伴周围晕征分别为 2 例(4%); 其中伴有胸膜增厚的为 34 例(63%), 肺门、纵隔淋巴结肿大的为 17 例(31%), 合并有胸腔积液的为 10 例(19%)。

结论: 新型冠状病毒肺炎的影像学表现虽然多种多样, 但有一定的特异性, 多表现为磨玻璃密度并多位于胸膜下, 可伴有胸膜增厚。了解新冠肺炎患者的影像学表现特点可从病变的各种影像学征象上指导临床医师做出临床判断, 从而降低死亡率。

PU-2067

Risk predicting for MACE based on changes in quantitative parameters from serial coronary computed tomography angiography

Yaoming Yang^{1,2}, Xiaolin Mu¹, Ying Liu^{1,2}, Yetong Zhao^{1,2}, Yang Song¹

1. Central Hospital of Dalian University of Technology

2. Department of Graduate School, Dalian Medical University

Purpose: To investigate the efficacy of predicting major adverse cardiovascular events (MACE) based on quantitative parameters of dynamic changes in CCTA.

Methods: Quantitative parameters of plaques in 73 diseased vessels (66 patients) that underwent two CCTA examinations were retrospectively analysed, pericoronary fat attenuation index (FAI), pericoronary adipose tissue (PCAT) volume, CTFFR and Δ CTFFR of selected plaques were measured, and values of changes in the two examinations were calculated. The mean interval between the two examinations was 20.7 months. For selected vessels, if the MACE occurred after the second CCTA examination, it was the MACE group, otherwise it was the non-MACE group. Differences between parameters between the two groups were compared using Student's t-test and U-test. Logistic regression model was used to analyse the relationship between each quantitative parameter of CCTA and the occurrence of MACE. Receiver operating characteristic curve analysis with the areas under the curve (AUC) was used to determine the efficacy of prediction model established by CCTA parameters.

RESULTS: Compared with the non-MACE group, the differences in the minimum lumen area at baseline, the stenosis rate, CTFFR, plaque volume, fibro-lipid volume in the second examinations, and the two change values (stenosis rate, plaque length, volume, fibre volume, and CTFFR) in the MACE group were statistically significant ($P < 0.05$). Logistic regression analysis demonstrated that the change value of stenosis rate ($OR = 1.130$, 95% CI 1.004-1.271) was an independent predictor of the occurrence of MACE. The prediction model based on the change value of stenosis rate ($AUC = 0.832$, 95% CI 0.72-0.95; $P = 0.002$) could better predict MACE.

CONCLUSION: Change values of quantitative parameters can improve the prediction value of MACE, with the change value of stenosis rate having the highest predictive efficacy.

PU-2068

Early detection of left ventricular involvement in arrhythmogenic right ventricular cardiomyopathy by Feature Tracking

Xuan Li, Jiang Wu, Lina Zhu, Xiaoyong Hao, Di Xue
Shanxi Cardiovascular Hospital

Purpose: To detect left ventricular myocardial strain by cardiovascular magnetic resonance feature tracking (CMR-FT) in arrhythmogenic right ventricular cardiomyopathy (ARVC) patients.

Methods: This retrospective study included patients with ARVC treated in our Hospital from October 2015 to November 2020. Healthy volunteers were enrolled as a control group. The ARVC patients were divided into 2 subgroups: the preserved left ventricular ejection fraction (LVEF) group ($LVEF \geq 50\%$) and the reduced LVEF group ($LVEF < 50\%$). The biventricular cardiac function parameters, global and regional myocardial strain parameters in the radial, circumferential, and longitudinal directions were compared between ARVC group, including each subgroup, and control group.

Results: This study included 25 patients with ARVC in the ARVC group and 25 healthy volunteers in the control group. The patients with ARVC were divided into two subgroups: LVEF $\geq 50\%$ ($n=15$) and LVEF $< 50\%$ ($n=10$). ROC curve analysis showed that compared with the other left ventricular strain parameters, the left ventricular basal longitudinal strain (AUC: 0.831, 95%CI: 0.721-0.942) was better at distinguishing between ARVC patients and the control group. Moreover, the left ventricular basal longitudinal strain (AUC:0.767, 95%CI: 0.612-0.921) exhibited good performance in differential diagnosis between the LVEF $\geq 50\%$ ARVC group and the control group. The AUC of right ventricular global longitudinal strain, global radial strain and global circumferential strain were 0.904, 0.893, 0.874, respectively.

Conclusion: CMR-FT can early detect left ventricular myocardial strain characteristic in patients with ARVC. Left ventricular basal longitudinal strain exhibited good performance in differential diagnosis.

PU-2069

320 排探测器自由呼吸冠状动脉 CTA 在老年病人的可行性和临床价值

王璇、唐无量、邵海磊、徐秋贞
东南大学附属中大医院

目的 探讨使用 320 排探测器 CT 在老年病人中自由呼吸状态下进行冠状动脉成像(CCTA)检查的可行性和临床价值。**方法** 回顾性分析 2022 年 10 月至 2023 年 5 月在东南大学附属中大医院使用 320 排 16cm 探测器 CT (uCT 960+, United Image, Shanghai) 进行 CCTA 扫描的老年病人, 入选标准: (1) 年龄 ≥ 60 岁; (2) BMI ≥ 18.5 且 $< 30\text{kg/m}^2$; 排除标准: (1) 主动脉平均 CT 值低于 200, 不能用于诊断分析; (2) 冠状动脉搭桥手术史; (3) 严重心率失常。最终纳入 100 例病人, 根据扫描时呼吸状态分为自由呼吸组 50 例和屏息组 50 例。测量两组图像的主动脉 (Aorta)、右主干 (RCA)、左主干 (LM) 的 CT 值、噪声 (SD)、信噪比 (SNR)、对比噪声比 (CNR) 和有效剂量 (ED) 并采用独立样本 t 检验进行比较。通过冠状动脉 15 段分段法, 两名医师采用 Likert 4 分法对重建后的图像质量进行双盲评分并使用 Mann-Whitney U 检验, 使用 Kappa 检验来评估两位医师主观评分的一致性。**结果** 两组图像的客观评价指标 CT 值、SNR 和 CNR 的差异均无统计学意义 ($p>0.05$), 两组之间的主观评分、高心率 (bpm > 75) 与中低心率 (bpm ≤ 75) 的主观评分也均没有显著差异 (4 (1) vs 4 (1), $p>0.05$), 两位医师的主观评分一致性较好 (kappa 值为 0.633 和 0.720, $p<0.001$), 自由呼吸组的有效剂量 (ED) 小于屏息组, 有统计学差异 (2.77 (2.56, 3.04) vs 2.90 (2.73, 3.10), $p<0.05$)。**结论** 老年病人使用 320 排探测器自由呼吸 CCTA 进行扫描具有可行性, 可以获得较高的图像质量和较低的辐射剂量, 值得临床推广使用。

左心耳封堵术前的 CT 技术要点解析: 一箭双雕的冠状动脉 CTA 改良术

胡晓云、王洁、王如兴
无锡市人民医院

目的: 左心耳封堵术目前临床应用越来越普及, 临床对于左心耳封堵术的影像科术前精准参数要求日益增加, 探讨此新技术前沿进展及 CT 评价要点具有重要临床意义。

方法：通过概述左心耳局部解剖特点、封堵术的前沿进展、常用方法及封堵器特点来引出临床需求的影像技术问题。规范的左心耳 CT 扫描方法与常用冠状动脉扫描技术异同及其对 CT 评价效能的影响。

结果：Watchman 封堵器已经成为左心耳封堵术的主流；更大范围的类冠脉 CTA 扫描方法是评价左心耳的成像首选方法；CT 容积扫描三维 MRP 及 VR 技术可清晰展示左心耳个体化的形态特点，确定左心耳入口形态及封堵器着陆区是临床术前关注要点，亦是术前 CT 精准评估要点；着陆区平面的左心耳长径、短径、深度及周长是 CT 评价的重点指标；双期扫描可明显提高鉴别左心耳血栓与血液淤滞，必要时通过增加延迟扫描或改变体位来区别降低左心耳血栓的假阳性。

结论：多期像冠状动脉 CTA 改良技术不仅能够精准提供左心耳封堵术前的影像诊断及所需评价测量指标，同时兼顾冠状动脉及心脏主体的解剖结构成像。格式化报告应用能够一站式清晰解决左心耳封堵术前的临床问题。

深度学习图像重建联合 70kv 低管电压在冠状动脉成像中的应用价值

任占丽、申利、雷雨欣、张敏、于勇、于楠、贺太平
陕西中医药大学附属医院

目的：探讨深度学习图像重建联合 70kv 低管电压在冠状动脉成像中的应用价值。

方法：收集我院 2023 年 5 月至 8 月行冠状动脉 CTA 检查患者 60 例并随机分为 A、B 两组，A 组常规 120kV，噪声指数 20，对比剂剂量 0.8ml/kg，B 组低管电压 70kV，噪声指数 30，对比剂剂量 0.5ml/kg。扫描完成 A 组重建 50%ASIR-V，B 组重建深度学习不同级别降噪图像（DLIR-L、DLIR-M、DLIR-H），在四组图像上分别测量主动脉根部、左主干、左前降支、左回旋支及右冠状动脉 CT 值及 SD 值，计算信噪比（SNR）和对比噪声比（CNR）。由两名具有五年工作经验医生采用五分法分别对图像质量进行主观评价。

结果：两组患者一般资料（性别、年龄、身高、体重、BMI、心率）间差异无显著统计学意义（ $p > 0.05$ ），B 组 CTDIvol、DLP、ED 和对比剂用量均显著低于 A 组（ $p < 0.001$ ），其中 B 组 ED 和对比剂用量较 A 组分别降低约 76.7%和 33.1%。B 组 70kV 深度学习重建 DLIR-L、DLIR-M、DLIR-H 图像主动脉根部、左主干、左前降支、左回旋支、右冠状动脉 CT 值均显著高于 A 组 120kV（ $p < 0.001$ ）。B 组随着重建算法 DLIR-L、DLIR-M、DLIR-H 依次变化，冠状动脉 SD 值逐渐降低、SNR 值和 CNR 值逐渐升高，且 B 组 DLIR-H 重建 SD 值均显著低于 A 组 50%ASIR-V（ $p < 0.001$ ），B 组 DLIR-M、DLIR-H 重建 SNR 值和 CNR 值均显著高于 A 组 50%ASIR-V（ $p < 0.001$ ）。两名医师主观评分具有良好一致性（kappa 值 > 0.80 ， p 值 < 0.001 ），B 组冠状动脉 DLIR-L、DLIR-M 和 DLIR-H 重建主观评分均显著高于 A 组 50%ASIR-V 重建且差异具有显著统计学意义（ $p < 0.001$ ），其中 DLIR-H 重建图像主观评分最高。

结论：深度学习图像重建（DLIR）联合 70kv 低管电压不仅可以显著降低 CCTA 检查辐射剂量（约 76.7%）和对比剂用量（约 33.1%），且 DLIR 重建可以显著提升冠状动脉图像质量，其中 DLIR-H 重建改善冠状动脉图像质量效果最佳。

PU-2072

Pembrolizumab-Associated Pulmonary Sarcoidosis in Colonic Cancer Treatment and its Differential Diagnosis

Dianbo Cao
The first hospital of jilin university

Objective: To report a case of sarcoidosis induced by adjuvant immunotherapy and its CT presentations so as to facilitate recognition for rare immune-related adverse effects.

Methods: Computed tomography, bronchoscopy and transbronchial needle biopsy, and follow-up CT were retrospectively analyzed in a 54-year-old woman with resected colonic cancer.

Results: The patient underwent right hemi-colectomy four months previously, and histopathology along with molecular testing confirmed colonic mucinous adenocarcinoma with mismatch repair-deficient proteins. There was no any pulmonary abnormality and lymphadenopathy on preoperative chest CT scan(Fig1A-B). Follow-up chest CT demonstrated diffuse nodular shadows with the pattern of peri-lymphatic distribution throughout the lungs after the patient experienced the first cycle of adjuvant chemotherapy and pembrolizumab one month afterwards(Fig2A). It also showed extensive paratracheal, subcarinal and para-aortic lymphadenopathy(Fig2B). These findings on CT examination alerted us to consider pulmonary lymphangitic carcinomatosis(PLC) owing to malignancy progressing based on our insight for micronodular lung disease in the setting of malignant disease. There was any normality to be detected on abdominal CT scan. Meanwhile, she was free of any respiratory symptoms such as cough, fever, chest tightness, shortness of breath and dyspnea. There was no increase in blood tumor markers. she underwent bronchoscopy and transbronchial needle biopsy for mediastinal subcardinal lymph nodes. Final pathology revealed noncaseating granulomatous inflammation consistent with sarcoidosis(Fig3).

Conclusion: With the expanding use of immune checkpoint inhibitor (ICI) therapy to those malignancies, ICI-therapy can lead to a diverse array of immune-related adverse effects(ir-AEs). Different from our familiar ir-AEs, sarcoidosis in the setting of adjuvant immunotherapy is rarely recognized in those patients with the excised colonic cancer. Micronodular lung disease on CT commonly suggests PLC, sarcoidosis, miliary tuberculosis, and interstitial lung disease. By identifying the pattern and using additional clues, such as distribution, additional imaging findings, and clinical history and the value of tumor markers, a radiologist can make a appropriate diagnosis. Transbronchial biopsy could further confirmed diagnosis and exclude other diagnoses. This case adds to the growing body of literature linking ICI therapy to rare ir-AEs, namely sarcoidosis as a potential complication of cancer immunotherapy.

PU-2073

Multimodality imaging evaluating “flying Valsalva aneurysm of noncoronary sinus”

Dianbo Cao, Ren Mengran
The first hospital of jilin university

Objective: To report flying Valsalva aneurysm of noncoronary sinus diagnosed via multiple imaging modalities.

Methods: Echocardiography, coronary computed tomography angiography, MRI and operative outcomes were retrospectively analyzed in a 17-year-old girl.

Results: A 17-year-old girl was admitted to our hospital with chest tightness and shortness of breath after exertional exercise. Meanwhile, she looked pale with purple lips, and improved after crouch and rest for a few minutes. No any obvious murmur was heard. Transthoracic echocardiography showed a cystic-like echogenic mass sized 34 to 33mm anteriorly locating the tricuspid valve(Fig-1), and suspicious patent foramen ovale. Cardiac MRI demonstrated a spherical mass reciprocating movement with cardiac cycle between the right heart

chamber(Video-1) and gradual enhancement after contrast injection. Further ECG-gated coronary CT-angiography(CCTA) revealed non-coronary sinus of Valsalva aneurysm(SVA) with narrow neck protruding into the right heart(Fig-2) and typical atrial septal defect(ASD)(Fig-3). The patient underwent complete excision of SVA and repair of ASD under the general anesthesia. Intraoperative findings were consistent with preoperative diagnosis.

Conclusion: Sinus of valsalva aneurysm(SVAs) is an uncommon cardiac anomaly with an incidence of 0.09% in general population and 0.1-3.5% of all congenital heart defects. Approximately 10-30% SVAs originate from the noncoronary sinus. SVAs manifest a wide spectrum of clinical presentations ranging from asymptomatic state to dreadful complications due to compression of vital surrounding structures or spontaneous rupture. Transthoracic echocardiography is a quick, noninvasive and most commonly used diagnostic tool for SVA, especially for ruptured SVAs. This case underlies the importance of multiple imaging evaluations in establishing accurate diagnosis and understanding the diversities of clinical presentations and imaging manifestations for noncoronary sinus of Valsalva aneurysm.

PU-2074

人工智能多方式评估冠状动脉钙化狭窄程度的临床应用价值

李剑、唐腾、李强
西安凤城医院

目的：结合不同人工智能冠状动脉狭窄分析，人工智能 CT-FFR 分析手段对冠状动脉钙化严重患者的诊断价值。

方法：回顾性纳入 2022 年 1-2023 年 8 月期间进行冠状动脉检查在 1 月内进行有创经皮导管介入冠状动脉造影检查的 30 例患者，由 2 名高年资心血管专长医生进行图像质量评估，人工智能冠状动脉狭窄分析，人工智能 CT-FFR 分析，人工阅片诊断并和冠状动脉有造影结果进行对比分析。以有创冠状动脉造影结果为金标准，计算人工阅片诊断，人工智能冠状动脉狭窄分析，人工智能冠状动脉狭窄结合人工智能 CT-FFR 分析的诊断效能，以 $p < 0.05$ 为有统计学差异性。

结果：30 例患者的 102 支血管纳入分析，人工智能冠状动脉狭窄分析和人工智能 CT-FFR 分析比人工阅片诊断诊断冠状动脉狭窄的精确度和特异度均优于人工。

结论：联合人工智能冠状动脉狭窄分析，人工智能 CT-FFR 分析对冠状动脉狭窄分析，对冠状动脉钙化患者的诊断效能得到提高。

PU-2075

迭代重建技术(ADMIRE)对冠状动脉 CT 图像质量和辐射剂量的影响

张明月
吉林大学第一医院

目的：随着 CT 技术的快速发展，临床疾病的诊断水平极大提高,但是 CT 检查的辐射剂量对被照射人群存在潜在危害,并日渐被人们所关注。如何在保证图像质量的前提下尽可能降低辐射剂量是当今医学影像学领域所秉持的原则和探索的话题,而重建算法的改进成为 CT 低剂量研究的方向之一。随着重建算法在技术上取得的新突破以及迭代重建技术的日趋成熟,可实现 CT 检查中在降低辐射剂量的同时获得高质量的图像,从而使更多患者受益。本摘要的研究方向是探究迭代重建技术(ADMIRE)对冠状动脉 CT 图像质量和辐射剂量的影响

方法: 选取吉林大学第一医院应用 Siemens SOMATOM Force CT 行冠状动脉扫描的 120 名患者, 采用回顾性螺旋扫描, 双期相技术注射对比剂, 按扫描顺序依次分为常规剂量组 (120KV)、低剂量 100KV 组和低剂量 80KV 组, 应用 CARE Dose4D 管电流调制技术进行冠状动脉 CT 扫描, 120KV 采用 FBP 重建作为常规对照组, 低剂量扫描组分别采用 FBP 及 ADMIRE 对图像进行重建。2 名放射科医师进行双盲法阅片, 比较不同毫安秒和重建算法的曝光剂量、图像噪声 (MSD)、对比信噪比 (CNR)、信噪比 (SNR) 以及图像质量。

结果: 计算出低剂量组 (80 和 100KV) 有效剂量分别多少, 较常规组分别降低的百分比。100KV 组采用 AIR 较 FBP 组 MSD 降低多少, CNR 提高, SNR 提高。80KV 采用 AIR 重建较 FBP 组 MSD 降低, CNR 提高, SNR 提高。80KV 采用 AIR 较常规剂量组 MSD 降低、CNR 及 SNR 较常规剂量组升高。运用统计学算法。

结论: 与 FBP 相比, 采用 ADMIRE 能在保证图像质量的同时, 降低辐射剂量, 降低对比剂用量。

基于定量 CT 检测浸润性肺结核病变的可行性研究

巩盼¹、黄晓旗¹、李星宇²、李建龙¹、李锦红¹、郭佑民³

1. 延安大学附属医院

2. 西安市第三医院

3. 西安交通大学第一附属医院

目的 基于计算机肺部感染辅助诊断系统, 验证人工智能 (artificial intelligence, AI) 技术在浸润性肺结核病灶检测及评估中应用的准确性及可行性。

方法 回顾性收集 2020 年 1 月至 2022 年 7 月延安市第二人民医院确诊的初次就诊的浸润性肺结核患者 120 例, 对肺部病变范围和病变征象进行半定量评分。将各肺叶的病变范围和各病变征象分数相加, 得到最终的分数。采用 Pearson 或 Spearman 相关分析全肺及各肺叶视觉评分 (病变范围得分、病变严重程度得分、各征象得分) 与 CT 定量指标 [病灶体积 (lesion Volume, LeV/mL)、病灶占肺体积的百分比 (percentage of lesion, LeV%) 及病灶质量 (lesion mass, LM/g)] 之间的相关性。

结果 全肺病变范围得分、病变严重程度得分与全肺定量 CT 指标 LeV、LeV%、LQ 呈高度相关 ($r=0.783\sim0.826$, $p<0.001$); 各肺叶 LeV% 与人工评估的病变比例得分、各肺叶 LQ 与人工评估的病变严重程度得分均呈高度相关 ($r=0.761\sim0.913$, $p<0.001$)。

结论 AI 获得的全肺及各肺叶 CT 定量指标与传统视觉评分具有高度相关性, 证实了其在浸润性肺结核客观影像学定量评估中具有准确性及可行性。

PU-2077

Comparison of CT and clinical features between SARS-Cov-2 Omicron Variant and Original Strain

Yue Zhang

the First Affiliated Hospital of Chongqing Medical University

Purpose: to investigate the differences of clinical and CT features between Omicron Variant and Original Strain.

Method: Sixty-nine hospitalized patients infected with Omicron from October 2022 to November 2022 and ninety-six hospitalized patients with Original Strain from February 2020 to March 2020 in Chongqing, China were included in this retrospective study. The clinical features, CT

manifestations, lung involvement degrees in different stages on CT, and imaging changes after the nucleic acid results turned negative were compared between the two groups.

Results: For clinical features, patients with Omicron were more frequently observed in older women, absence of clinical symptoms, lower serum level of C-reactive protein, procalcitonin, and lower average days from symptoms onset to initial CT scan (all $P<0.05$). For CT features, patients with Omicron were more likely to have round-like shadowing and tree-in-bud pattern (all $P<0.05$), but less likely to have diffuse distribution, patchy shadowing, lineal shadowing and vascular enlargement pattern (all $P<0.05$). The Omicron group was susceptible to exhibit lower CT involvement scores in each stage (all $P<0.05$) and imaging progression after nucleic acid results turned negative ($P<0.001$).

Conclusions: Patients with Omicron demonstrated less severe changes on chest CT compared with Original Strain, and imaging progression after nucleic acid results turned to be negative was common in patients with Omicron.

PU-2078

A case of IgG4-related respiratory disease with the radiologic manifestations resembling ANCA- associated vasculitis.

Jiayi Chen, Jia Chen, Dong Zhang
Xinqiao Hospital

We report a case of immunoglobulin(Ig)G4-related disease with the radiologic manifestations resembling ANCA-associated vasculitis. The patient was a 71-year-old woman initially presented with weakness in the right limb for 5 days and diagnosed as acute cerebral infarction. During the treatment of acute cerebral infarction, the patient had mild cough and expectoration. High resolution computed tomography of the chest showed masses, nodules and consolidations distributed along the bronchovascular bundle. Reversed halo signs also appeared on the images. Multiple enlarged lymph nodes can be seen in both armpits and mediastinum. Microscopic examination of the bronchoscopic biopsy showed mature plasma cells and lymphocytes infiltrate under the mucosa, significant fibrosis and partial occlusive phlebitis on elastic fiber staining. In addition there were prominent multifocal lymphoplasmacytic infiltrates with a increase of IgG4-positive plasma cells (15 per high power field in hot spots) and elevated IgG4/IgG ratio is 10%. Antinuclear antibodies and anti-neutrophil cytoplasmic antibody are negative. The patient's symptoms improved significantly accompanied by the shrinking peribronchovascular masses, nodules and consolidations with oral corticosteroid treatment.

PU-2079

左肺下叶背段支气管炎性肌纤维母细胞瘤 1 例

刘桂花
湖北医药学院附属十堰市太和医院

患者，女，52 岁，1 年前体检发现肺部占位，无咳嗽、胸痛、咯血不适，2 月前间断出现痰中带血，来我院就诊。既往病史无特殊。胸部 CT 平扫及增强：左肺下叶背段软组织肿块，大小约 4.3cm×3.8cm×4.7cm，边界清晰，平扫呈稍低密度，增强呈中度不均匀强化，肿块包绕左肺下叶背段支气管并左肺下叶支气管局限性狭窄，远端肺组织过度通气，诊断为左肺中央型肺癌病左肺下叶肺气肿。全身 PET 及 CT 断层显像：左肺下叶近肺门区类圆形肿块，放射性分部异常浓聚，标准化摄影值 (SUV) 最大值 50.0。支气管镜检查：左肺下叶支气管开口处见一球状新生物阻塞管

腔，表面较光滑，伴较多新鲜渗血。术后病理诊断：（左下肺叶）炎性肌纤维母细胞瘤。免疫组化：SAM（部分+）、Vimentin（+）、ALK（+）、CD34（+）、CD117（-）、Ki67（约 10%+）。肺 IMT 是一种间叶源性的真性肿瘤，发病机制尚不明确，以儿童及青少年发病多见，其临床表现因发病部位不同表现差异较大，影像表现缺乏特异性，最终依赖病理学和免疫组织化学检查确诊。本例病灶发生于左肺下叶背段支气管，并凸向左肺下叶支气管，不同于以往中心型病灶表现，以肺门区肿块并左肺下叶肺组织过度通气为首发表现。

PU-2080

肺动脉的 CT 血管造影技术在肺栓塞诊断中的应用效果分析

王博
吉林大学第一医院

研究应用 CT 肺动脉造影对诊断肺栓塞的临床价值，提高检出率来降低肺栓塞的误诊。采取实验研究法，选取某段时间于某医院就诊的肺栓塞患者 30 例，30 例病例均进行常规 CT 平扫和 CT 肺动脉造影扫描，观察对比肺动脉分支的检出率以及狭窄情况，血栓的部位和形态。两种检查方法的检出率进行对比，CT 肺动脉造影的检出率明显高于 CT 平扫的检出率，差异有统计学意义 ($F < 0.05$)。CT 肺动脉造影可以对患者的栓子形态和栓塞范围进行确定，并且便捷、快速、准确性高。

PU-2081

Central and peripheral pulmonary sclerosing pneumocytomas: multi-phase CT study and comparison with Ki-67

Wei Li
Affiliated Hospital of Yangzhou University

Objectives: This study aimed to evaluate the multi-phase CT findings of central and peripheral pulmonary sclerosing pneumocytomas (PSPs) and compared them with Ki-67 to reveal their neoplastic nature.

Methods: Multi-phase CT and clinical data of 33 PSPs (15 central PSPs and 18 peripheral PSPs) were retrospectively analyzed and compared their multi-phase CT features and Ki-67 levels.

Results: For quantitative indicators, central PSPs were larger than peripheral PSPs (10.39 ± 3.25 cm³ vs. 4.65 ± 2.61 cm³, $P = 0.013$), and tumor size was negatively correlated with acceleration index ($r = -0.845$, $P < 0.001$). The peak enhancement of central PSPs appeared in the delayed phase, with a longer time to peak enhancement (TTP, 100.81 ± 19.01 s), lower acceleration index (0.63 ± 0.17), progressive enhancement, and higher Ki-67 level. The peak enhancement of peripheral PSPs appeared in the venous phase, with the shorter TTP (62.67 ± 20.96 s, $P < 0.001$), higher acceleration index (0.99 ± 0.25 , $P < 0.001$), enhancement washout, and lower Ki-67 level. For qualitative indicators, the overlying vessel sign (86.67% vs. 44.44%, $P = 0.027$), prominent pulmonary artery sign (73.33% vs. 27.78%, $P = 0.015$), and obstructive inflammation/atelectasis (26.67% vs. 0%, $P = 0.033$) were more common in central PSPs, while peripheral PSPs were more common with halo sign (38.89% vs. 6.67%, $P = 0.046$).

Conclusions: The location of PSP is a possible contributing factor to its diverse imaging-pathological findings. The tumor size, multi-phase enhancement, qualitative signs, and Ki-67 were different between central and peripheral PSPs. Combined tumor size, multi-phase findings, and Ki-67 level are helpful to reveal the nature of the borderline tumor.

PU-2082

临床-时间序列模型评估鲍曼不动杆菌肺部感染与定植的应用研究

曾兆东、秦耿耿、吴杰芳、陈卫国
南方医科大学南方医院

目的：以鲍曼不动杆菌在肺部感染或定植的患者作为研究对象，通过人工智能方法综合分析多时序胸部 X 线图像及实验室指标数据，以感染或定植作为结局变量，旨在精准区分鲍曼不动杆菌在肺部感染或定植，以为临床医师个性化制定和调整治疗方案提供重要参考。

方法：对 152 名从痰液或肺泡灌洗液中培养出鲍曼不动杆菌的患者进行了回顾性分析。我们提出了基于不同时间序列数据的嵌套逻辑回归模型，模型用于自动分类鲍曼不动杆菌的肺部状态。纳入住院患者临床基线信息以及时间序列数据，时间序列数据包括三个时间点的动态胸部 X 线图像肺炎积分和实验室指标值。通过 SHAP VALUE 方法评估机器学习模型的特征重要性，探讨多时序模型的临床应用价值。

结果：多时间序列数据模型的表现能力最优，AUC 为 0.850（95%置信区间为[0.638-0.873]），准确率达到 0.761（95%置信区间为[0.612-0.874]），敏感性为 0.833（95%置信区间为[0.626, 0.953]）。而只使用单一时间点特征的模型 AUC 为 0.741（95%置信区间为[0.568, 0.775]）。培养出菌株 1 天内与培养出菌株前 3 天的胸片肺炎积分差异是最重要的影像学预测因子；培养出菌株前住院天数、APACHE II 是评估感染和定植重要的预测因子。决策曲线分析表明构建的多时序胸片征象及实验室指标动态变化信息鲍曼不动杆菌肺部感染与定植分类模型展示出良好的分类效能。

结论：利用机器学习对时间序列胸部 X 射线图像和实验室数据进行动态评估，能够准确地地区分鲍曼不动杆菌感染和定植，从而展示了早期检测对临床医生提供个体化治疗的潜力。

PU-2083

内源性 T1ρ 成像在心脏淀粉样变性诊断和分型中的作用

王可颜、程敬亮、张勇、郑捷
郑州大学第一附属医院

背景：心血管磁共振（CMR）被广泛用于诊断心脏淀粉样变性（CA）。由于 CA 在 CMR 上形态和功能特征不具有特异性，故 CMR 在诊断准确率以及对 CA 进行分型中尚有进步的空间。

目的：探讨内源性 CMR T1ρ 在 CA 诊断和分型中的价值。

方法：回顾性纳入 45 名 CA 受试者，包括 29 名免疫球蛋白轻链型淀粉样变（AL）患者和 16 名转甲状腺素介导的淀粉样变性（ATTR）患者，30 名肥厚型心肌病（HCM）受试者和 10 名健康对照（HC）。入组对象均在 3.0 T MR 设备上接受 T1ρ，初始 T1mapping 和打药后 T1mapping 成像，以及延迟增强扫描成像。其中 T1ρ 成像分别在自旋锁定频率 0Hz 和 298 Hz 下进行，通过心肌 T1ρ（0Hz）和 T1ρ（298 Hz）计算心肌离散指数（MDI）图，通过初始 T1mapping 和打药后 T1mapping 计算心肌细胞外体积分数（ECV），所有结果均是左室整体参数。

结果：ECV（HC:27.4±2.8%vs.HCM:32.6±5.8%vs.CA:46±8.9%；P<0.0001）、T1ρ（298Hz）（HC:41.9±1.6ms vs.HCM:48.8±6.2ms vs.CA:54.4±5.2ms；P<0.001）从 HC 组到 HCM 组再到 CA 组逐渐增加。尽管 HC 和 HCM 患者之间的左心室整体初始 T1 没有显著差异，但 CA 组的初始 T1 值显著高于 HC 和 HCM 组（HCM: 1274.7±54.3ms vs.HC: 1292.5±47.4ms vs.CA: 1428.2±71.9ms；P<0.0001）。MDI 指数从 HCM 组到 HC 组到 CA 组逐渐下降（HCM:8.8±2.8ms

vs.HC:6.1±0.9ms vs.CA:3.4±2.1ms; $P<0.0001$)。在 CA 和 HCM, 以及 AL 和 ATTR 之间的鉴别诊断中, 与初始 T1 和 ECV 相比, MDI 指数和 T1 ρ (298Hz) 联合具有最佳诊断效能。
结论: T1 ρ 和 MDI 磁共振成像技术可能是一种新的 CMR 成像生物标志物, 具有更好地诊断 CA 及分型的能力。

PU-2084

能谱 CT 在肺纯磨玻璃结节鉴别诊断中的 应用价值

余蕊

苏州大学附属第二医院

目的 探讨能谱 CT 定量参数在肺纯磨玻璃结节病变中的鉴别诊断价值。方法 回顾性分析 2017 年 8 月至 2019 年 9 月苏州大学附属第二医院影像科行胸部能谱 CT 扫描且有病理结果的 44 例纯磨玻璃结节患者的临床资料, 其中男 18 例, 女 26 例, 年龄 26~79 (51±12) 岁。分为炎性病变组 (12 例)、浸润前病变组 (17 例)、浸润性腺癌组 (15 例); 为判断水基值鉴别腺癌浸润程度的效能, 进一步将以上三组合并为两组, 即非浸润性腺癌组 (炎性病变+浸润前病变) 和浸润性腺癌组。分别测量 病灶动脉期、静脉期的碘基值、标准化碘基值及水基值; 计算病灶动脉期、静脉期能谱曲线斜率 (K40~70KeV)。运用单因素方差分析进行三组间比较及多重比较法进行两两比较。采用组内相关系数 (ICC) 检验评估三次测量数据的一致性。应用受试者工作特征 (ROC) 曲线下面积 (AUC) 评估水基值 诊断效能。结果 炎性病变组、浸润前病变组、浸润性腺癌组三组动脉期及静脉期的水基值差异均具有统计学意义 [动脉期 (291.95±58.66) mg/cm³、(297.61±63.96) mg/cm³、(374.52±60.62) mg/cm³; 静脉期 (277.07±33.78) mg/cm³、(291.74±50.49) mg/cm³、(373.33±75.12) mg/cm³] (均 $P<0.05$)。进一步两两比较: 动脉期、静脉期水基值在炎性病变组与浸润前病变组之间差异均无统计学意义 (均 $P>0.05$); 浸润性腺癌组与炎性病变组、浸润前病变组间差异均有统计学意义 (均 $P<0.05$)。在鉴别浸润性腺癌 和非浸润性腺癌组 (炎性病变+浸润前病变) 的纯磨玻璃结节上, 静脉期水基值 AUC 最大 (0.770), 以 349.31 mg/cm³为最佳阈值时, 灵敏度和特异度分别为 66.67%、93.10%。动脉期、静脉期的能谱曲线斜率、碘相关参数 (碘基值、标准化碘基值) 在三组间差异均无统计学意义 (均 $P>0.05$)。结论 能谱 CT 定量参数水基值在纯磨玻璃结节定性诊断中能较好鉴别炎性病变、浸润前病变和浸润性腺癌, 有助于 肺纯磨玻璃结节的定性分析。

How a torrent of COVID science changed medical imaging: Comparison analysis before and during the pandemic based on bibliometrics

Peiling Ou,Ru Wen,Linfeng Shi,Jian Wang,Chen Liu

Department of Radiology, Southwest Hospital, Army Medical University (Third Military Medical University),
Chongqing 400038, China

【Abstract】【Objective】 This study aims to explore the long-covid effect for imaging research by comprehensively examining medical imaging publications before and during the pandemic, which might provide new insights and perspectives for imaging researchers and practitioners in respond to the challenges posed by the pandemic. 【Methods】 This study used bibliometric analysis to systematically compare publications between January 1, 2017 to December 31, 2019 and January 1, 2020 to December 31, 2022 from Web of Science (WOS) Core Collection database. Statistical data were analyzed with SPSS software. VOSviewer and Citespace

software were used to draw knowledge maps of keyword hotspots and highly cited documents in medical imaging field. 【Results】 Our results demonstrated that the COVID-19 outbreak has influenced the medical imaging research by changing global imaging research output trends and altering the hotspots. Deep learning has become a major research content during the pandemic. Publication declines were observed among glioma (11.0% fewer, $\chi^2=6.413$, $P<0.05$) and colorectal cancer (6.8% fewer, $\chi^2=10.741$, $P<.001$), followed by multiple sclerosis (5.7% fewer, $\chi^2=32.886$, $P<.001$). The results of mining the medical imaging publications show that thoracic imaging has been explored in greater depth during the pandemic. No significant change was seen in the number of lung cancer ($P=.128$), breast cancer ($P=.344$) and thyroid nodule ($P=.396$) publications over time. 【Conclusions】 The COVID-19 has resulted in marked changes to medical imaging. More attentions have been paid to chest-related diseases such as incidental thyroid nodules, breast tumor and cardiovascular disease, which might be identified from chest CT. However, MRI-dependent diseases such as brain tumors have been partly interrupted or neglected. This study provides a new perspective to reimagine preparedness for and responses to the lasting effects of the pandemic in the months and years following its remission. How to minimize the adverse impact of COVID-19 on imaging research requires future research.

基于 CT 值的灰度直方图测量实性成分体积百分比鉴别诊断早期肺腺癌亚型

屈晓艳、李刚锋、安攀、侯星亦、高雅、朱元博、杨露、马质莹、崔光彬
空军军医大学唐都医院

目的：探讨实性成分体积百分比鉴别诊断 I 期肺腺癌亚型的价值，并确定区分病理亚型的最佳临界 CT 值。

方法：回顾性分析本院 2019 年 6 月至 2021 年 12 月经手术病理结果证实为原位癌及肺腺癌，且薄层 CT 表现为亚实性结节的 962 个结节，根据病理结果将病变分（1）AIS（350 例）与侵袭性肺腺癌（612 例）组；（2）MIA（213 例）与 IAC（399 例）组。利用 CT 值的灰度直方图测量亚实性肺结节内实性成分体积百分比，分析不同诊断模型的诊断效能，并寻找最佳临界 CT 值。

结果：在 AIS 与侵袭性肺腺癌组中（见表 2），发病年龄（ $P<0.001$ ）、质量（ $P<0.001$ ）、实性成分体积百分比（ $P<0.001$ ）均有统计学意义；-350Hu 诊断模型效能最高（ $AUC=0.859$ ，准确性 81.69%，敏感性 85.60%，特异性 74.86%），体积百分比临界值为 8.3%。在 MIA 与 IAC 组中（见表 3），发病年龄（ $P=0.017$ ）、质量（ $P<0.001$ ）、实性成分体积百分比（ $P<0.001$ ）具有统计学意义；-350Hu 诊断模型的效能最高（ $AUC=0.857$ ，准确性 78.27%，敏感性 82.91%，特异性 69.48%），体积百分比临界值为 16.9%。

结论：基于 CT 值的灰度直方图测量的实性成分体积百分比有助于鉴别诊断表现为亚实性结节的早期肺腺癌亚型。

Differentiation of pulmonary sclerosing pneumocytoma from solid malignant pulmonary nodules by radiomic analysis on multiphasic CT

Xiaoqiong Ni,dan jin,guohua fan

The Second Affiliated Hospital of Soochow University, Suzhou, China

Purpose: To investigate the diagnostic value and feasibility of radiomics-based texture analysis in differentiating pulmonary sclerosing pneumocytoma (PSP) from solid malignant pulmonary nodules (SMPN) on single- and three-phase computed tomography (CT) images.

Materials and Methods: A total of 25 PSP patients and 35 SMPN patients with pathologically confirmed results were retrospectively included in this study. For each patient, the tumor regions were manually labeled in images acquired at the noncontrast phase (NCP), arterial phase (AP), and venous phase (VP). The least absolute

shrinkage and selection operator (LASSO) method was used to select the most useful predictive features extracted from the CT images. The predictive models that discriminate PSP from SMPN based on single-phase CT images (NCP, AP, and VP) or three-phase CT images (Combined model) were developed and validated through fivefold cross-validation using a logistic regression classifier. Model performance was evaluated using receiver operating characteristic (ROC) analysis. The predictive performance was also compared between the Combined model and human readers.

Results: Four, five, and five features were selected from NCP, AP, and VP CT images for the development of radiomic models, respectively. The NCP, AP, and VP models exhibited areas under the curve (AUCs) of 0.748 (95% confidence interval [CI], 0.620–0.852), 0.749 (95% CI, 0.620–0.852), and 0.790 (95% CI, 0.665–0.884)

in the validation dataset, respectively. The Combined model based on three-phase CT images outperformed the NCP, AP, and VP models (all $p < 0.05$), yielding an AUC of 0.882 (95% CI, 0.773–0.951) in the validation dataset. The Combined model displayed noninferior performance compared to two senior radiologists; however, it outperformed two junior radiologists ($p = 0.004$ and 0.001 , respectively).

Conclusion: The Combined model based on radiomic features extracted from threephase CT images achieved radiologist-level performance and could be used as promising noninvasive tool to differentiate PSP from SMPN.

PU-2088

冠脉钙化 CT 减影血管成像技术的临床应用

秦雪莲

吉林大学第一医院

目的: 探讨 CT 减影冠状动脉血管成像(subtraction coronary computed tomography angiography, CCTA)在具有严重钙化节段冠心病中的诊断价值。

方法: 收集 2017 年 9 月~2017 年 12 月我院 38 例对同时接受双源 CT 减影 CCTA 扫描和传统冠状动脉血管造影(digital subtraction angiography, DSA)检查的患者进行回顾性分析, 其中男 16 例, 女 22 例。年龄 43~73 岁, 平均 59 岁。使用西门子双源 CT 扫描仪获得原始图像, 并采用图像减影处理将所选中的平扫和增强的容积数据导入工作站, 减影即增强扫描的原始容积数据减去平扫的原始容积数据。在行减影处理之前, 该减影软件会对所选中两组图像进行严格的匹配进一步消除配准伪影。最终得到的减影图像为消除钙化斑块而保留对比剂充盈的血管影像, 所得后处理图像以及 DSA 图像由 2 放射科医生用双盲法进行分析。

结果: CCTA 与 DSA 之间的一致性为 0.85, 具有良好的一致性。与 DSA 金标准相对比, CCTA 诊断冠脉狭窄 $\geq 50\%$ 的 AUC 值为 0.96, 与 CCTA 相比差异有统计学意义($P=0.03$)。CCTA 诊断明显狭窄($\geq 50\%$)节段的灵敏度、特异度、阳性预测值、阴性预测值及准确度分别为 90.5%, 85.5%, 82.3%, 92.2%及 87.3。

结论: Sub-CCTA 可以提高严重钙化节段冠状动脉狭窄程度的诊断准确性; 减影技术在冠状动脉成像中的应用可以减少甚至消除严重钙化斑块产生的伪影, 具有较好的临床应用前景。

原发性肺浸润性黏液腺癌的临床和影像学特征：结节肿块型与实变型对比分析

陈相猛、林茵、郑钊文、陈萍、段晓蓓、谭国强
江门市中心医院

【目的】探讨原发性肺浸润性黏液腺癌 (PIMA) 的临床特征和 CT 影像学表现, 对比分析结节肿块型和实变型之间的差异。

【方法】回顾性分析 2008 年 2 月至 2022 年 11 月在我院接受 CT 检查并经手术病理证实为 PIMA 的患者 79 例 (男 30 例, 女 49 例, 年龄范围 29-83 岁, 平均年龄 58.7 ± 12.19 岁)。所有患者术前均行胸部 CT 平扫和增强检查, 根据影像学表现分为结节肿块型及实变型。记录患者临床资料 (年龄、性别、吸烟史、临床症状、血清肿瘤标记物等), 影像学特征 (位置、形态、分叶征、毛刺征、空泡征、空气支气管征、瘤周肺气肿、淋巴结增大、胸腔积液等), 病理组织学表现 (淋巴结转移、脉管浸润、胸膜侵犯、气道播散等)。统计学对比分析结节肿块型及实变型 PIMA 患者在临床、影像及病理特征之间的差异。

【结果】79 例 PIMA 中, 结节肿块型 61 例 (男 23 例, 女 38 例; 平均年龄 58.3 ± 11.69 岁), 实变型 18 例 (男 7 例, 女 11 例; 平均年龄 60.1 ± 14.04 岁)。两组在性别、年龄间的差异无明显统计学意义 ($P=0.928$; $P=0.594$)。77.78% (14/18) 的实变型患者出现临床症状, 高于结节肿块型 49.18% (30/61) ($P=0.032$)。结节肿块型及实变型 PIMA 患者在病灶位置、分叶征、空气支气管征之间的差异具有统计学意义 ($P=0.028$; $P=0.025$; $P<0.001$); 在形态、毛刺征、空泡征、钙化、瘤周肺气肿、淋巴结增大、胸腔积液之间的差异无明显统计学意义 ($P=0.375$; $P=0.228$; $P=0.403$; $P=0.567$; $P=0.522$; $P=0.854$; $P=0.878$)。病理组织学脉管浸润和气道播散方面, 实变型发生数量 (6/18, 33.33%; 13/18, 72.22%) 均高于结节肿块型 (6/61, 9.84%; 24/61, 39.34%), 具有统计学差异 ($P=0.015$; $P=0.014$)。

【结论】结节肿块型与实变型 PIMA 患者在临床症状、影像学表现和病理特征上均具有一定的差异。实变型 PIMA 病理侵袭性高于结节肿块型, 提示预后不良。

联合 CT 影像组学和临床影像特征列线图预测亚实性密度肺腺癌的脏层胸膜侵犯

王芬、郭莉莉
淮安市第一人民医院

目的: 探讨并验证一种结合影像组学和临床特征的术前列线图模型在预测亚实性密度肺腺癌脏层胸膜侵犯 (VPI) 的应用价值。

方法：回顾性分析 2016 年至 2019 年期间经病理证实的临床 I 期肺腺癌患者的影像、病理及临床资料，对具有完整病理结果的 156 患者进行分类（VPI 阳性组：VPI 阴性组；70：86）后，在肺窗图像上勾画结节感兴趣区（ROI），利用 FeAtureExplorerPro（FAE）软件提取影像组学特征，共 806 个特征，特征选择和降维分别基于递归特征消除（RFE）和皮尔逊相关系数（PCC）方法。最后，使用支持向量机（SVM）来选择构建影像组学模型的最优特征，并在内部验证集中进行了内部验证。纳入影像及临床特征后进行多变量回归分析并构建列线图模型，并用受试者工作特征曲线（ROC）来评估模型的性能，并相互比较。

结果：提取的 806 个特征和从 707 个稳定特征中选出的 10 个最优特征用于构建影像组学模型。列线图模型的 AUC 为 0.888（95%CI，0.762-0.961），优于临床模型（0.787（95%CI：0.643-0.893）； $p=0.049$ ），与放射组学模型相当（0.879，95%CI:0.751-0.965； $p>0.05$ ）。在验证数据集中，联合模型的敏感性为 90.5%，特异性为 76.9%。

结论：列线图模型可以被认为是一种非侵入性的方法，对预测亚实性肺结节脏层胸膜侵犯具有高度敏感或高度特异性的诊断。

PU-2091

肺结节共病肺气肿患者定量影像学的特征分析

张丽¹、于楠^{1,2}

1. 陕西中医药大学

2. 陕西中医药大学附属医院

目的：基于定量电子计算机断层扫描（Computed tomography,CT）在体内证实肺结节共病肺气肿患者肺血管、肺气肿及气道重塑三者相关性。方法：回顾性分析“数字肺”平台肺结节共病肺气肿患者共计 94 例。测量全肺肺气肿（吸气相体素指数小于-950 HU 肺容积占总肺容积百分比 LAA-950%）、全肺以及各个肺叶肺血管体积百分比（IPVV%）、气道重塑（第 3 至 7 代全肺气道壁厚 WTmean 及假定气管内周径为 10 mm 时管壁面积的平方根（Pi10））。采用 spearman 相关性分析 IPVV%、WT、Pi10 与全肺 LAA-950%的相关性。结果：Pi10、第 4、5、6、7 代的 WTmean 与全肺肺气肿 LAA-950%呈显著负相关（ $P<0.05$ ），最强相关系数 $r=-0.387$ ，第 7 代的 WTmean 与全肺肺气肿 LAA-950%的相关性最强。全肺以及各个肺叶的 IPVV%与 LAA-950%呈显著负相关（ P 均 <0.05 ），最强相关系数 $r=-0.445$ 。结论：在肺结节共病肺气肿患者中，远端气道重塑与肺气肿相关，而且更远端的气道重塑与肺气肿的相关性最强，IPVV%与肺气肿严重程度之间具有相关性，在体内证实了肺结节共病肺气肿患者肺血管、肺气肿及气道重塑三者之间的联系。

PU-2092

Castleman 病的临床、病理及 CT 表现

孟倩

苏州大学附属第一医院

目的 分析 10 例 Castleman 病（Castleman disease, CD）患者的临床资料，并分析其 CT 表现，以提高对该病的认识。方法 回顾性分析经本院外科手术或病理活检证实的 10 例 CD 病患者的临床及 CT 影像学资料。结果 10 例中 5 例位于纵隔和肺门；2 例位于颈部，2 例位于腹腔，1 例位于后腹膜。7 例为局灶型透明血管型，2 例为多中心型透明血管型，1 例为多中心浆细胞型。10 例所有病灶边界均清晰，平扫密度均匀，7 例局灶性透明血管型 CT 增强扫描呈明显均匀强化，强化幅度与大动脉相仿，延迟强化，其中 1 例病灶边缘见“卫星灶”，病灶中央内分支状钙化，2 例病灶中央出现裂隙状低强化区；3 例多中心型病灶表现为多部位淋巴结肿大，增强后呈中度强化，其中 1 例多中心浆细胞型病灶内出现点状钙化。结论 局灶性透明血管型 CD 病 CT 表现具有一定的特征

性，可以与其他肿瘤进行鉴别，多中心型又名血管型诊断较困难，浆细胞型病 CT 表现缺乏特征性，最终确诊依赖于病理学。

基于 HRCT 的深度学习影像组学模型预测结缔组织疾病相关间质性肺疾病患者 GAP 分期

龙冰清、尹安雨、张玉忠、鄂林宁
深圳市龙华区人民医院

目的 探究基于胸部高分辨率计算机断层扫描（HRCT）图像提取深度学习影像组学特征构建诊断预测模型，预测结缔组织疾病相关间质性肺疾病（CTD-ILD）患者 GAP 分期的可行性。方法 回顾性收集 2018 年 1 月 1 日至 2023 年 6 月 30 日在我院就诊并经临床确诊的 CTD-ILD 患者 264 例，所有患者均行胸部 CT 检查和肺功能检查。对所有患者进行 GAP 分期，其中 GAP I、II、III 期患者分别 195 例、56 例、13 例，由于 II 期和 III 期患者数量较少，因此将 GAP II、III 期病例合并为一组，共 69 例。使用 nnUNet 深度学习模型自动分割得到全肺组织，再使用 ITKSNAP 软件对图像逐一进行手动校正。将两组患者按 7: 3 的比例随机分为训练组（211 例）和验证组（53 例）。提取患者影像组学特征和深度学习特征，使用三种降维算法（方差阈值法、单变量选择法、LASSO 算法）对特征参数进行降维，由两种机器学习算法[支持向量机（SVM）和逻辑回归（LR）]构建模型，并联合深度学习特征和影像组学特征构建深度影像组学模型，采用受试者工作特征曲线下面积（AUC）评价各模型预测 GAP 分期的效能。结果 经提取降维筛选出 14 个放射组学特征、13 个深度学习特征和 28 个深度影像组学特征，构建出 6 个诊断模型，包括 2 个影像组学模型（Radiomics SVM 模

型、Radiomics LR 模型)、2 个深度学习模型 (DL SVM 模型、DL LR 模型) 和 2 个深度影像组学模型 (DLR SVM 模型、DLR LR 模型)。在训练组和验证组中, 深度影像组学模型效能均高于影像组学模型和深度学习模型。联合深度学习特征和影像组学特征的逻辑回归算法效能最佳, 其在验证组中 AUC 为 0.923 (95%CI 0.852-0.972), 准确率、灵敏度和特异度分别为 84.9%、78.6%、87.1%。结论 基于 HRCT 提取影像组学特征和深度学习特征构建深度影像组学模型可协助临床预测 CTD-ILD 患者的 GAP 分期。

PU-2095

基于 4D flow MRI 探究不同年龄的健康人的左心室血流动能

张靖雨、贺祎凡
大连医科大学附属第一医院

目的

四维血流磁共振成像 (4D flow MRI) 可获得心室血流动力学参数, 如左心室动能 (left ventricular kinetic energy, LVKE)。左心室动能是心脏运动产生的能量转移到血液运动中, 对评估心脏收缩和舒张功能具有重要意义。本研究的目的旨在探讨年龄对健康人左心室血流动能的影响。

方法

我们前瞻性地招募了 16 名健康受试者, 受试者均排除了幽闭恐惧症、心律失常和安装起搏器等 CMR 禁忌症。所有受试者在 3.0T MRI 上进行的 4D flow 序列以及左心室三腔心电影图像扫描。使用商业软件 CVI42 测量心功能及左心室动能相关参数, 并使用左心室舒张末期容积 (LV EDV) 将所有 LV KE 参数均归一化为 KEiEDV, 以 $\mu\text{J}/\text{ml}$ 为单位。选取心动周期相关时间点的 KEiEDV 参数: 整体 KEiEDV (整个心动周期 KEiEDV 平均值)、收缩和舒张 KEiEDV (收缩期和舒张期 KEiEDV 平均值) 和收缩期峰值 KEiEDV、E 峰峰值 KEiEDV (舒张早期峰值 KEiEDV)、A 峰峰值 KEiEDV (舒张晚期峰值 KEiEDV), 以及 E/A 峰 KEiEDV。使用了 Shapiro-Wilk 检验评估了数据的正态性。独立样本 t 检验和曼-惠特尼 U 检验进行差异分析。相关性分析采用 Pearson 相关性和 Spearman 相关性。

结果

以年龄中位数 58 岁为分界点, 将受试者分为两组, 小于 58 岁 (低龄组) 和大于或等于 58 岁 (高龄组) 的受试者分别有 8 人。高龄组的 E 峰峰值 KEiEDV、E/A 峰 KEiEDV 显著低于低龄组 (13.11 ± 4.8 vs. 20.61 ± 6.22 , $p = 0.017$; 0.87 ± 0.5 vs. 1.93 ± 1.09 , $p = 0.032$)。此外, 随着年龄的增长, 舒张期 KEiEDV ($r = -0.566$)、E 峰峰值 KEiEDV ($r = -0.690$)、E/A 峰 KEiEDV ($r = -0.682$) 明显下降。

结论

4d flow MRI 左心室动能参数是评价左心室舒张功能的一个敏感指标, 随着年龄的增长, 左心室舒张功能, 尤其是早期舒张功能会显著下降。

PU-2096

12 例胸腺类癌的 CT 和 MRI 影像学表现分析

闫卫强、荣伟程、崔光彬
中国人民解放军空军军医大学附属第二医院

摘要: 目的 对胸腺类癌患者的 MRI 及 CT 影像学表现进行研究, 提高对胸腺类癌的 CT 和 MRI 影像学认识。方法 对 12 例胸腺类癌患者的临床资料进行回顾性分析, 患者均经过免疫组化和组织病理学分型, 分析患者的 CT 和 MRI 影像学特征 (包括形状、密度、信号、有无包膜、钙化、增强扫

描强化程度等)。结果 不规则形 8 例; 内部密度或信号不均 10 例; 无包膜 9 例; 瘤体内见钙化 8 例; 囊变坏死 7 例; 瘤内出血 2 例; 心包或胸膜腔积液 6 例; 术前转移 2 例; 侵犯周围结构 (血管) 10 例; 增强扫描: 轻度强化 2 例, 中度强化 6 例, 明显强化 4 例; 7 例包绕纵隔大血管生长, 其中 4 例发现上腔静脉癌栓; 肿瘤内新生血管 4 例。结论 胸腺类癌患者的 MRI 和 CT 影像有一定的表现特征, 多呈轻~中度强化, 常沿着纵隔血管间隙呈浸润性生长, 伴瘤内血管征, 其影像学特征对临床诊断具有重要意义。

PU-2097

A nomogram based on clinical characteristics and radiological features for the preoperative prediction of spread through air spaces in patients with clinical stage IA non-small cell lung cancer:A Multicenter Study

Deng Lv,Yun Wang,Yi Xiao,Li Fan,Shiyuan Liu

Department of Radiology, Second Affiliated Hospital of Navy Medical University

PURPOSE: To investigate the value of clinical characteristics and radiological features for predicting spread through air spaces (STAS) in patients with clinical stage IA non-small cell lung cancer (NSCLC).

METHODS: A total of 336 NSCLC patients from our hospital was randomly divided into the training cohort (n=236) and the internal validation cohort (n=100) at a ratio of 7:3, and 69 patients from the other two hospitals were collected as the external validation cohort. Eight clinical characteristics of the patient were recorded, and twenty radiological features of the tumor were quantitatively measured and qualitatively analyzed. In the training cohort, the differences in clinical characteristics and radiological features were compared by univariate and multivariate analysis. A nomogram was drawn and the predictive efficacy of the model was evaluated in the validation cohorts. The ROC curve and AUC value were used to evaluate the discriminative ability of the model. In addition, the Hosmer-Lemeshow test and calibration curve were used to evaluate the goodness-of-fit of the model, and the decision curve was used to analyze the clinical application value of the model.

RESULTS: The best predictors included gender, carcinoembryonic antigen (CEA), consolidation-to-tumor ratio (CTR), density type, and distal ribbon sign. Among those, tumor density type (OR = 6.738) and distal ribbon sign (OR = 5.141) were independent risk factors for predicting STAS status. Moreover, three different STAS prediction models were constructed. The clinical model was composed of gender and CEA, the radiological model included CTR, density type, and distal ribbon sign, and the combined model comprised the above two models. The DeLong test results revealed that the combined model was superior to the clinical model in the three cohorts and superior to the radiological model in the external validation cohort, with AUC values 0.874, 0.822, and 0.810, respectively, and showed the highest diagnostic efficacy. The Hosmer-Lemeshow test showed that the combined model was well-fitted in all three cohorts, and the calibration curve showed that the predicted probability value of the combined model was in good agreement with the actual STAS status. Finally, the decision curve showed that the combined model had better clinical application value than the clinical model and radiological model.

CONCLUSION: The nomogram based on clinical characteristics and radiological features has a high diagnostic efficiency in predicting the STAS status in patients with clinical stage IA NSCLC, and may help in making personalized treatment strategies before surgery.

PU-2098

Application of DWI,DCE-MRI and DKI in benign and malignant pulmonary nodules and pathological subtypes

Hanlin Wang,Wenhui Fan,Zikai Li,Jia Wang,Yi Liang
General Hospital of the Yangtze River Shipping•Wuhan Brain Hospital

Objective: To investigate the value of DWI,DCE-MRI and DKI in the differential diagnosis of benign and malignant pulmonary nodules and the pathological subtypes of malignant pulmonary nodules.

Methods: Forty seven patients with SPN in our hospital, male: 30, female: 17, age: 29-86 years, mean age: 58 ± 5.62 years. Routine MR, DCE-MRI and DKI scans were performed. To compare the ADC, Ktrans, Kep, Ve, iAUC, app and app values of benign and malignant pulmonary nodules and the difference of each parameter in squamous cell carcinoma, adenocarcinoma and benign pulmonary nodules.

Results: 1. Ktrans, Ve 、 iAUC and Kapp of malignant pulmonary nodules were significantly higher than those of benign pulmonary nodules ($P<0.035$); 2. The ADC of malignant pulmonary nodules was significantly lower than that of benign pulmonary nodules ($P=0.001$), in which the ADC value of adenocarcinoma was the lowest and Kapp value was the highest. There was no significant difference between the Ktrans, Kep, Ve, iAUC, Dapp values of squamous cell carcinoma, adenocarcinoma and benign pulmonary nodules.

Conclusion: The quantitative analysis of SPN by conventional DWI, DCE-MRI and DKI can improve the differential diagnosis of benign and malignant pulmonary nodules by MR, and has certain value in the differential diagnosis of pathological subtypes of malignant pulmonary nodules.

PU-2099

心脏脂肪瘤多模态影像学分析

田萍
空军军医大学西京医院

目的 探讨多模态影像学在心脏脂肪瘤中的诊断价值。**方法** 回顾性分析经确诊的 14 例心脏脂肪瘤患者的临床症状、超声心动图、CT 及 CMR 图像特点。**结果** 5 例脂肪瘤患者有症状, 9 例患者偶然发现。14 例心脏脂肪瘤患者共发现 17 处病灶; 心脏脂肪瘤的位置在心脏分布广泛, 47.0% (左室腔 6/17, 右室腔 2/17) 位于心室腔内, 29.4% (左室壁 4/17, 右室壁 1/17) 位于肌壁间, 17.6% (3/17) 位于心包内, 6% (1/17) 位于右心房。超声心动图表现为偏强回声肿块影, CT 表现为均匀低密度肿块影。CMR 表现为 T1WI 高信号, 压脂序列肿块信号明显降低; T2WI 为高信号, 肿块周围可见低信号环, 提示为化学位移伪影; 心脏电影序列可见肿块柔软摆动, 并随心动周期形态改变; 首过灌注扫描未见灌注升高; 延迟增强扫描未见强化。Native T1 Mapping 显示肿块 T1 值较正常心肌明显减低 (255.9 ± 48.4 vs 994.2 ± 66.4), 两者具有统计学差异。**结论** 超声心动图特异性较低, CT 使心脏脂肪瘤的确切诊断成为最可能, 大多数心脏脂肪瘤可以通过 MRI 准确诊断; 但在肿块较小, 图像质量不佳时, T1 Mapping 有助于心脏脂肪瘤的诊断; 同时, 当怀疑心脏脂肪瘤时, T1 Mapping 作为一种常规心脏肿块的检查方法可进行诊断及鉴别诊断。

PU-2100

Ruptured aortic dissection complicated with hemorrhagic aortopulmonary artery sheath: CT features and its clinical implications

Dianbo Cao, Wang Baogang
The first hospital of jilin university

Objective: To evaluate CT findings of hemorrhagic aortopulmonary artery sheath secondary to ruptured aortic dissection and its clinical implications.

Methods: The clinical records and CT imaging of 8 patients who were diagnosed as having hemorrhagic aortopulmonary artery sheath secondary to Stanford type A aortic dissection between 2010 and 2023 at our hospitals were retrospectively reviewed. The differentiation of AD types was determined by non-contrast and contrast-enhanced CT. The diagnosis of hemorrhage surrounding the pulmonary trunk and/or a major PA was established based on CT using the following criteria: 1) a crescent-shaped or circumferential area along the wall of pulmonary artery having higher attenuation than blood on unenhanced CT; 2) no contrast enhancement within the corresponding area on enhanced CT. CT images were documented including the following features: 1) pericardial hemorrhage, mediastinal hemorrhage and hemothorax; 2) Presence of stenosis of the main PA due to a hematoma surrounding the PA, defined as stenosis more than 30%; 3) Extent of hemorrhage at the initial CT was classified into three types: type I: IMH of the PA or blood localized around the PA; type II: continuous blood extending into the interlobular septa; type III: continuous blood extending into the alveolar space.

Results: All 8 patients were men, aged from 45-81 years. 5 patients had Stanford type A AD, and 3 had Stanford type A intramural hematoma (IMH) of the aorta. All rupture sites were identified in the posterior or posteriomediastinal of the ascending aorta, adjacent to the pulmonary artery. Left pulmonary artery together with its branches was involved only in one patient. With regard to the extent of hemorrhage, one patient was classified into type I, one patient into type II, and six patients into type III. Regarding complications, six patients had pericardial hemorrhage, and one had hemothorax. Stenosis of the main PA more than 30% was recognized in two patients. Three of the eight patients underwent emergency surgery within 24h after the initial CT scan. Three patients died before surgery. The remaining two patients and their families refused surgery. During the follow-up period, five of nine patients died within 72h of onset due to heart and/or respiratory failure.

Conclusion: Extravasated blood from the posterior aspect of the ascending penetrates the shared adventitia of the aorta and pulmonary artery, and spreads along the adventitial planes of the pulmonary arteries out into the lungs with increasing pressure. These manifestations can be depicted via CT scan, predicting a poor prognosis.

PU-2101

Unilateral total pneumonectomy of an endobronchial carcinosarcoma with favorable prognosis: A Case Report

Xilai Chen, Yu Deng

Department of Radiology, the First Affiliated Hospital of Guangzhou Medical University

Purpose:

Carcinosarcoma is a biphasic malignant tumor, consisting of a mixture of carcinoma and sarcoma. Endobronchial carcinosarcoma has a poor prognosis and is difficult to diagnose. Therefore, it is necessary to report on a patient with good prognosis in order to learn the diagnostic and therapeutic experiences.

Methods:

We report a rare case of a 48-year-old man with a large branching tubular mass in the left upper lobe, which displays a gloved finger sign, speckle of calcification, and intense uptake of 18F-FDG on PET/CT. The patient had a left total pneumonectomy and the mass was pathologically confirmed as carcinosarcoma.

Results:

The patient remains alive for 6 years after surgery.

Conclusion:

Bronchial carcinosarcoma is a rare malignancy and the central endobronchial subtype displays a gloved finger sign on CT. The speckle calcification and intense uptake of FDG of the mass may raise the suspicion of sarcomatous components. Though the general outcome of bronchial carcinosarcoma is poor, radical surgical resection may reach a favorable prognosis.

PU-2102

应用 CT 纹理参数分析 CT 上表现为纯磨玻璃结节出现生长的自然病程及危险因素

贺祎凡

大连医科大学附属第一医院

目的：研究长期随访 CT 上表现为纯磨玻璃结节（pGGNs, pure ground-glass nodules）的生长自然史、生长速率及危险因素，并分析 CT 纹理特征参数能否预测 pGGNs 的生长。

方法：本研究回顾性纳入了 111 名患者的 111 个 pGGNs。在基线和末次 CT 上对所有 pGGNs 进行半自动分割，得到初始平均直径、初始平均 CT 值、初始体积和 CT 纹理参数，并计算生长结节的体积倍增时间（VDT, volume doubling time）。将所有结节分为生长组和非生长组，比较基线临床影像特征、定量特征及纹理特征的差异。使用 Kaplan-Meier 分析和多因素 Cox 比例风险回归分析影响 pGGNs 生长的独立危险因素。

结果：64 个（57.7%）结节在经过平均 1112 天的随访后出现间隔生长，生长结节的中位 VDT 为 1193.7（范围，339.4–5134.4）天。聚类趋势（ClusterProminence）、相关性（Correlation）、联合熵（JointEntropy）、总熵（SumEntropy）在生长组显著高于非生长组（聚类趋势， $p = 0.046$ ；相关性， $p = 0.004$ ；联合熵， $p = 0.045$ ；总熵， $p = 0.022$ ）。多因素 Cox 风险回归分析表明，年龄 ≥ 51 岁（HR = 2.688， $p = 0.013$ ）、基线体积（HR = 1.882， $p = 0.035$ ）以及部分纹理参数【相关性（HR = 3.176， $p = 0.003$ ）、总熵（HR = 0.457， $p = 0.040$ ）和聚类趋势（HR = 2.914， $p = 0.007$ ）】是 pGGNs 出现间隔生长的独立危险因素。

结论：除了传统的年龄和基线体积是生长的独立风险因素之外，不同的 CT 纹理参数对于长期随访 pGGN 的生长预测有良好的价值。相关性、总熵和聚类趋势可以用来预测基线 pGGNs 的生长，以便更多地关注这些结节。

PU-2103

双源 CTPA 对肺动脉疾病诊断价值

曹阿丹、詹浩辉、武乐乐、胡舸帆、郑丽远
河南科技大学第二附属医院

目的：探讨双源 CTPA 技术对肺动脉疾病诊断价值。方法：行 CTPA 检查发现肺动脉疾病包括常见疾病肺动脉栓塞及肺动脉高压，罕见疾病肺动脉瘤、动静脉畸形、肺动脉夹层、肺动脉肉瘤，肺动脉先天性狭窄、中断及缺如等，分析影像学特征及诊断标准。结果 108 例患者肺动脉栓塞肺动脉栓塞及肺动脉高压 86 例，罕见疾病肺动脉瘤 5 例、动静脉畸形 3 例、迷走肺动脉 3 例，肺动脉夹层 1 例、肺动脉肉瘤 2 例，肺动脉先天性狭窄 1 例、中断 1 例及缺如 1 例，肺隔离症 5 例。结论肺动脉 CTPA 对肺动脉血管疾病有重要价值。

PU-2104

A Rare Case of Pulmonary Artery Dissection associated with Patent Ductus Arteriosus Occlusion

Zhenchu Long, Yu Deng
The First Affiliated Hospital of Guangzhou Medical University

Introduction

Pulmonary artery dissection(PAD) is an extremely rare and life-threatening condition, usually occurred as a complication of primary or secondary chronic pulmonary hypertension(CPH). The primary underlying cause are congenital heart diseases. PAD was first reported in 1842 by Helmbrecht. Nearly only 150 cases have been reported globally until 2021. Due to its high mortality and difficulty of clinical management, we reported this case and reviewed literature to raise awareness of PAD in early diagnosis and treatment.

Case Presentation

A 39-year-old female presented to us with chest tightness, dyspnea and cyanosis. The symptoms have been lasted for 19 years and aggravated for 1 month. In 2010, she went to a local hospital for infertility and echocardiography suggested patent ductus arteriosus with mean pulmonary artery pressure(mPAP) measured as high as 130 mmHg. Four times of patent ductus arteriosus occlusion were performed on her and the fourth was successful. The patient felt much relieved on her chest tightness and mPAP decreased to 70 mmHg after operation. The patient has been taking Macitentan and Tadalafil to reduce pulmonary artery pressure for about 10 years. The physical examination on admission showed heart rate at 78 bpm, blood pressure at 98/62 mmHg, and respiratory rate at 23 bpm with peripheral oxygen saturation 95% in room air. The Lung perfusion SPECT/CT suggested diffuse radioactive sparse deficits, symbolizing perfusion impairment in bilateral lungs. Given the risk of surgery, drug maintenance therapy and close follow-up are recommended to this patient. Follow-ups reveal that the patient's condition is stable so far.

Discussion

This is a rare case of PAD with patent ductus arteriosus. CTPA scan shows multiple dissection of pulmonary artery, including branches of lung lobes and segments. With a known history of pulmonary artery hypertension should be closely followed. The diameter of the dilated pulmonary artery should be monitored because it is directly related to the risk of rupture or dissection. Pharmacologic treatment which reduce the pulmonary hypertension would help to

reduce the risk of pulmonary artery dilatation. In patients with aortic dissection, dissection can often result in distal formation of pseudolumen, which reduces pressure in the false lumen and terminates further distal extension of the dissection. Unlike aortic dissection, due to the structural features pulmonary artery wall, the formation of distal reentrants is rarely found in pulmonary artery dissection. The pseudolumen of pulmonary arterial dissection usually tears easily into the pericardium, and rarely tears into the lungs and mediastinum and pleural space. Therefore, patients with pulmonary artery dissection are more likely to be complicated by cardiac tamponade and cardiac tamponade and other fatal complications. According to the current understanding of pulmonary artery dissection, patent ductus arteriosus and pulmonary hypertension are thought to be the main causes of pulmonary artery dissection. The absence of life-threatening complications in this patient may be correlated with the formation of distal pseudolumen reentrants, which is also likely the reason why there is a better prognosis in this patient. Multiple diagnostic modalities can be used to diagnose PAD. Computed tomography (CT) scans, and magnetic resonance imaging (MRI) can detect an intimal flap and a false lumen within the pulmonary arterial tree, and are able to evaluate the extent of the lesion. These methodologies can identify the intimal flap and provide additional information related to the dissection and the presence of associated abnormal findings such as pericardial tamponade. CT scan also measures the diameter and the aneurysm extent and can exclude the presence of pulmonary embolism. To slow and reverse pulmonary vascular remodeling is the ultimate goal of CPH-related PAD.

Conclusion

Pulmonary artery dissection is a rare condition with high mortality. Being familiar with its characteristic imaging patterns, medical history and clinical manifestation helps to early diagnosis and short- or long-term management.

肺血管炎的临床与影像学表现分析

明樱、隋昕、宋伟、赵瑞杰、汪佳儒、肖然、朴思蓉、王金华、杜华阳、宋兰
中国医学科学院北京协和医院

目的: 观察和探讨肺血管炎的疾病特点与影像学表现, 为该病的临床诊断提供依据。

方法: 本研究回顾性分析了我院 2014 年 9 月至 2023 年 6 月期间 77 例血管炎患者的临床资料, 通过影像学检查资料的表现分析病变累及的程度及范围。

结果: 本次研究中男性患者为 19 例(25%), 女性患者为 58 例(75%), 年龄 13~62 岁, 中位年龄为 33 岁。其中 5 例患者临床资料显示伴有白塞病, 1 例患者临床资料显示伴有抗磷脂综合征。肺血管炎可表现为血管壁增厚、结节影, 肺内多发斑片影、空洞、磨玻璃影及胸腔积液。胸部 CT 检查显示累及肺动脉分支的为 48 例(62%), 主动脉及其分支管壁增厚的为 49 例(64%)。肺内多发斑片影的表现最多见为 52 例(68%), 其次为肺内结节影的病例为 35 例(45%), 其中单发肺内结节为 14 例(18%), 多发肺内结节为 21 例(27%), 结节直径为 2.5mm~13mm, 平均值约为 5.13mm。肺内可见磨玻璃密度影的患者为 9 例(12%), 6 例患者合并有单侧/双侧胸腔积液(8%), 仅有 5 例患者肺内可伴有空洞影(6%)。77 例患者中有 22 例伴有肺动脉高压(29%)。

结论: 肺血管炎的影像学表现非常多样, 包括了血管壁增厚、结节影、斑片影、空洞、磨玻璃影及胸腔积液等。影像学检查在早期诊断中表现出一定的重要性, 胸部 CT 相对于其他影像学检查方法更能显示病变累及范围和特征。我们可以通过患者的临床特征、影像学表现及实验室检查结果等作出综合判断, 为血管炎的疾病诊断、疾病的活动评估及预后评估方面提供重要线索。

PU-2106

肺多形性癌 CT 影像解析

谢嘉月、李智勇、车思雨
大连医科大学附属第一医院

目的 探讨肺多形性癌 (pleomorphic carcinoma, PC) 的临床特点和 CT 影像特征, 为临床诊疗提供帮助。

方法 回顾性收集 2007-2021 年大连医科大学附属第一医院经手术、穿刺活检及支气管镜检查等病理确诊为 PC 的患者, 具有术前 3 个月内胸部 CT 及较为完整的临床、病理资料共 22 例, 15 例完成 CT 增强扫描。

结果 22 例 PC 好发于老年男性, 伴有长期吸烟史 (36.36%), 平均年龄为 68.59 ± 8.42 岁, 男女比例约 2.14: 1。临床症状以反复咳嗽、咳痰、痰中带血、胸痛为主 (86.36%), 少数患者偶然检查发现 (13.64%)。22 例病例均为周围型肺癌。在这 22 例 PC 中: 平均直径约 4.65 ± 2.21 cm; 19 例呈类圆形 (86.36%); 所有病灶边界均清楚, 其中 11 例可见分叶 (50.00%); 6 例可见空洞 (31.82%); 在 15 例增强病例上, 13 例病灶均为不均匀强化 (86.67%), 病灶内低密度区基本不强化, 1 例呈均匀强化 (6.67%), 1 例呈延迟强化 (6.67%); 22 例中 19 例病灶周边肺组织可见渗出征象 (86.36%), 表现为磨玻璃影或索条影; 15 例病灶可见紧邻胸膜或牵拉胸膜 (68.18%), 其中 12 例有病理证实侵犯胸膜; 5 例患者被证实伴有纵隔或肺门淋巴结转移。

结论 PC 患者临床症状缺乏特异性, 症状相对隐匿; 影像上以类圆形肿块居多, 周边肺组织伴有渗出, 增强扫描呈不均匀强化, 中央坏死区不强化, 易发生胸膜侵犯及纵隔或肺门淋巴结转移。

PU-2107

肺癌肉瘤 CT 影像解析

谢嘉月、李智勇、贺祎凡
大连医科大学附属第一医院

目的 分析 1 例肺癌肉瘤 (carcinosarcoma, CS) 的临床特点和 CT 影像特征, 总结其影像特征, 减少漏诊、误诊率。

方法 老年女性, 70 岁, 没有吸烟史, 体检发现双肺多发肺结节, 后就诊于我院。CT 平扫检查。

结果 CT 平扫示: 结节较大径约 2.1 cm, 类圆形, 病灶边界清楚, 可见分叶, 未见空洞; 病灶周边肺组织可见渗出征象, 表现为索条影; 病灶未见紧邻胸膜或牵拉胸膜; 未见纵隔或肺门淋巴结转移。

病理表现: 大小为 $2.3 \times 1.5 \times 1.5$ cm, 癌组织成分为腺癌, 未累及胸膜, 未见明确脉管神经侵犯。支气管断端未见癌累及。叶间淋巴结未见转移癌 (0/2)。病理诊断: 右上肺癌肉瘤。

结论 肺癌肉瘤易与其他型肺癌相互混淆, 认真分析其临床特征及影像学表现有助于鉴别。

PU-2108

肺梭形细胞癌 CT 影像解析

谢嘉月、李智勇、牛愉鑫
大连医科大学附属第一医院

目的 分析 1 例肺梭形细胞癌 (spindle cell carcinoma, SCC) 的临床特点和 CT 影像特征, 总结其影像特征, 减少漏诊、误诊率。

方法 老年男性，76 岁，有吸烟史，右肺癌术后 2 年余，抑郁症 6 年，发现右肺占位半个月，因此就诊于我院。做 CT 平扫+增强检查。

结果 CT 平扫+增强检查示：结节较大径约 4cm，类圆形，病灶边界清楚，未见分叶，未见空洞；增强扫描可见轻度不均匀延迟强化；病灶周边肺组织可见渗出征象；病灶可见紧邻胸膜或牵拉胸膜。

病理诊断：右下肺肉瘤样癌，梭形细胞型，累及胸膜。

结论 肺梭形细胞癌易与其他型肺癌相互混淆，认真分析其临床特征及影像学表现有助于鉴别诊断。

PU-2109

能谱 CT 参数评估肺磨玻璃密度结节不同病理分类的血管新生表达水平

张淼、徐秋贞

东南大学附属中大医院

目的：探究能谱 CT 定量参数与不同病理分类的肺磨玻璃结节（GGN）血管新生水平表达水平的相关性。

方法：前瞻性纳入 2021 年 3 月至 2022 年 12 月东南大学附属中大医院收治的经体检发现并经手术切除病理证实的肺 GGN 患者 32 例（共 43 个结节），所有患者均在术前 2 周内接受能谱 CT 双期扫描。根据手术病理结果分为前驱病变组（包括不典型腺瘤样增生 AAH、原位腺癌 AIS）21 个、微浸润组（微浸润性腺癌 MIA）10 个、浸润组（浸润性腺癌 IAC）12 个。对术前能谱 CT 图像进行感兴趣区（ROI）勾画并记录能谱参数，包括碘基值（IC）、水基值（WC）、标准化碘浓度（NIC）、标准化水浓度（NWC）。术后病理对 GGN 标本进行免疫组织化学染色，计数微血管密度（MVD）及血管内皮生长因子（VEGF）评分。采用单因素方差分析、Kruskal-Wallis H 检验比较 3 组病变能谱参数差异。采用 Pearson 相关或 Spearman 秩相关分析多定量参数与 MVD、VEGF 评分的相关性，采用二元 Logistic 回归分析评估 GGN 浸润性的独立危险因素，并通过受试者工作特征（ROC）曲线下面积（AUC）评估诊断效能。

结果：相关性分析显示，前驱病变组、微浸润组、浸润组病变的 MVD 值和 VEGF 评分与其静脉期 IC（ $r=0.405, 0.425$ ）以及动静脉期 WC（ r 范围约 0.431-0.590）、NWC（ r 范围约 0.428-0.591）呈正相关， P 值均 <0.05 ，且在不同病理分类的各组间 MVD 值和 VEGF 评分差异有统计学意义（ $P<0.05$ ）。进一步二元 Logistic 回归分析显示，以上与 MVD 值及 VEGF 评分呈中度相关的能谱参数中，动脉期 NWC 及静脉期 WC 是预测 GGN 浸润性（区分非浸润性病变组 AAH+AIS 与浸润性病变组 MIA+IAC）的独立影响因子。ROC 曲线分析结果表明，静脉期 WC 区分 GGN 浸润性的效能最高，AUC 为 0.911，灵敏度为 89.5%，特异度为 84.2%，截断值为 427.135mg/ml。

结论：能谱 CT 定量参数可以表达不同病理分类 GGN 的新生血管水平，并预测 GGN 的浸润性。

PU-2110

基于能谱 CT 多参数成像预测肺磨玻璃结节病理浸润性的应用价值

张淼、徐秋贞
东南大学附属中大医院

目的：探究应用能谱 CT 定量参数在肺磨玻璃结节（GGN）不同病理类型中的鉴别诊断价值，并预测其浸润性。

方法：前瞻性纳入 2021 年 3 月至 2022 年 12 月东南大学附属中大医院收治的经体检发现并经手术切除病理证实的肺 GGN 患者 32 例（共 43 个结节），所有患者均在术前 2 周内接受能谱 CT 双期扫描。根据手术病理类型分为前驱病变组（包括不典型腺瘤样增生 AAH、原位腺癌 AIS）21 个、微浸润性腺癌 MIA 组 10 个、浸润性腺癌 IAC 组 12 个。对术前其能谱 CT 图像进行感兴趣区（ROI）勾画并记录能谱参数，包括碘基值（IC）、水基值（WC）、标准化碘浓度（NIC）、标准化水浓度（NWC）、能量衰减曲线斜率（K 值）。采用单因素方差分析、Kruskal-Wallis H 检验比较非浸润性病变（前驱病变组）和浸润性病变（MIA+IAC）及 GGN 浸润程度（MIA 与 IAC）的能谱参数差异。通过受试者工作特征（ROC）曲线下面积（AUC）评估诊断效能。

结果：浸润性病变的动脉期 NIC、WC、NWC（ 0.26 ± 0.01 ， $619.32\pm 32.72\text{mg}/\text{cm}^3$ ， 0.60 ± 0.03 ）及静脉期 IC、NIC、WC、NWC（ $18.75\pm 1.27\text{mg}/\text{cm}^3$ ， 0.51 ± 0.04 ， $604.86\pm 37.82\text{mg}/\text{cm}^3$ ， 0.59 ± 0.04 ）均大于非浸润性病变动脉期 NIC、WC、NWC（ 0.22 ± 0.02 ， $363.48\pm 28.70\text{mg}/\text{cm}^3$ ， 0.35 ± 0.03 ）及静脉期 IC、NIC、WC、NWC（ $14.41\pm 1.28\text{mg}/\text{cm}^3$ ， 0.38 ± 0.04 ， $353.60\pm 21.88\text{mg}/\text{cm}^3$ ， 0.34 ± 0.02 ）；P 值均 <0.05 。进一步分析 GGN 浸润程度（MIA 组及 IAC 组）表明，动静期的 WC、NWC 差异均有统计学意义（ $P<0.05$ ）。ROC 曲线分析结果表明，静脉期 WC 区分 GGN 浸润性的效能最高，AUC 为 0.911，灵敏度为 89.5%，特异度为 84.2%，截断值为 427.135mg/ml。

结论：能谱 CT 定量参数在鉴别不同病理类型的 GGN 上具有一定诊断价值，尤其静脉期 WC 在预测 GGN 浸润性上具有较高的诊断效能。

PU-2111

比较 DWI 和 18F-FDG PET/CT 对鉴别肺部病变中良恶性诊断价值的 meta 分析

刘洁琼、李新春、万齐
广州医科大学附属第一医院

目的：比较弥散加权成像（DWI）和 18F-氟脱氧葡萄糖正电子发射断层扫描/CT（18F-FDG PET/CT）对鉴别肺部结节和肿块良恶性的诊断效能。

方法：我们系统地检索了 PubMed、EMBASE、Cochrane Library、万方、知网和中国生物医学数据库共六个数据库，纳入使用 DWI 和 PET/CT 来鉴别肺占位良恶性的研究。比较 DWI 和 PET/CT 的诊断性能，并计算合并的敏感性和特异性以及 95%置信区间（CI）。用 QADAS-2 软件评估纳入研究的质量，STATA 16.0 软件用于进行统计分析。

结果：我们总共纳入了 10 项研究，共纳入 871 名 948 个肺结节的患者。DWI 的合并敏感性（ $0.85[95\%CI, 0.77-0.90]$ ）和特异性（ $0.91[95\%CI, 0.82-0.96]$ ）高于 PET/CT（敏感性， $0.82[95\%CI, 0.70-0.90]$ ；特异性， $0.81, [95\%CI, 0.72-0.87]$ ）。DWI 和 PET/CT 的曲线下面积分别为 0.94（ $95\%CI, 0.91-0.96$ ）和 0.87（ $95\%CI, 0.84-0.90$ ）（ $Z=1.58, P>0.05$ ）。DWI 的诊断优势比（54.46， $[95\%CI, 17.98-164.99]$ ）优于 PET/CT（15.77， $[95\%CI, 8.19-30.37]$ ）。

Deeks 漏斗图显示没有发表偏倚。Spearman 相关系数检验表明未发现显著的阈值效应。病变的直径和所选用诊断的金标准可能是研究异质性的潜在原因, 选用定量或半定量参数评估可能是 PET/CT 的潜在偏差来源。

结论: DWI 在鉴别肺部良恶性结节或肿块方面可能与 PET/CT 具有相似的效能。

PU-2112

Assessment of myocardial fibrosis with cardiac magnetic resonance T1 mapping in patients with different degrees of heart failure

Jingyu Zhang

The First Affiliated Hospital of Dalian Medical University, Dalian, China

Purpose:

Cardiac magnetic resonance (CMR) T1 mapping is used to assess the extent of myocardial fibrosis in patients with different types of heart failure (HF).

Materials and Methods:

We prospectively recruited 20 heart failure (HF) patients and 10 health controls. HF patients were divided into two groups: HF with reduced ejection fraction (HFrEF) whose left ventricular ejection fraction (LVEF) < 50% (n = 10). Patients with HFpEF were diagnosed according to the following. Firstly, two of the following criteria were met: (1) NT-pro BNP \geq 220 pg/mL or BNP \geq 80 pg/mL and (2) LVEF \geq 50% as measured by CMR. Second, one of the following criteria is met: (A) left atrial volume index > 34 mL/m² or left ventricular mass index > 149 g/m² in males and > 122 g/m² in females; (B) evidence of left ventricular diastolic insufficiency as determined by echocardiography, including a mean E/e' \geq 15 or peak tricuspid regurgitation flow rate > 2.8 m/s (pulmonary artery systolic pressure > 35 mmHg).

All participants with CMR scans were performed on a 3.0T MRI scanner (Philips Ingenia, Philips Healthcare, Cleveland, Ohio, USA) for the acquisition of myocardial T1 mapping. T1 mapping slices of the middle part of the myocardium were generated with a single breath-hold (12 s), SSFP modified look-locker inversion (MOLLI) recovery technique. This protocol was a robust 5 (3 s) 3 s to reduce respiratory motion artifacts, which dedicates at least 5 s for the acquisition of images in 2 inversions, 3 s for recovery, and at least 3 s for the acquisition of images in the second inversion. The minimum inversion time was 100 ms with an inversion-time increment of 80 ms for the next look-locker trains. The pulse sequence parameters included: TE 2.1 ms, TR 0.98 ms, flip angle 20°, FOV 300 × 300 mm², and voxel size 2 × 2 × 8 mm³.

Commercially available dedicated software CVI42 (version 5.14, Circle Cardiovascular Imaging Inc., Calgary, Canada) was used to analyze the T1 value. The Shapiro-Wilk test assessed the normality of the data. Analysis of variance using the student t-test.

Results:

T1 mapping values were significantly higher in patients with HFrEF than in healthy controls (1377.3 ± 69.29 vs. 1249.4 ± 31.41, p < 0.001). T1 mapping values were not significantly different between patients with HFpEF and healthy controls (1313.9 ± 40.64 vs. 1249.4 ± 31.41, p = 0.064).

Conclusion:

The degree of myocardial fibrosis varies in patients with different types of HF. Myocardial T1 mapping values are significantly increased in patients with HFrEF than healthy controls.

CT 影像组学对结节型和肿块型肺粘液腺癌与机化性肺炎的鉴别效能

陈涛¹、刘静¹、李新春¹、胡剑锋¹、徐洁宁²、刘洁琼¹、孜巴努尔³、谭艺博³

1. 广州医科大学附属第一医院

2. 广州医科大学附属第二医院

3. 广州医科大学

目的：探讨基于机器学习的影像组学模型对结节型和肿块型肺粘液腺癌（Mucinous Pulmonary Adenocarcinoma, MPA）和机化性肺炎（Organizing Pneumonia, OP）的鉴别效能。

方法和材料：回顾性分析 2013 年 10 月至 2023 年 2 月经手术病理或穿刺病理结果证实为 MPA 或 OP 的患者 144 例。根据病理分为 MPA 组（n=77）和 OP 组（n=67），所有患者均在我院行胸部 CT 检查，筛选其中 CT 影像表现为肺部结节和肿块的病例。使用半自动病灶分割软件深睿 AI 平台分割病灶，标记感兴趣区（ROI）并进行高通量影像组学特征采集，通过影像医师影像分析获得病变的影像学特征，通过两者的联合分析获得联合特征。通过 Spearman 相关系数筛选特征，使用 7:3 比例划分训练集、测试集，之后对所得特征进行 LASSO 降维处理，采用机器学习算法分别构建得到最优化的影像组学模型、影像学模型和联合模型，最后采用受试者工作特征曲线（ROC）来评价模型的效能。

结果：采用 Spearman 相关系数筛选、LASSO 回归降维方法保留 10 个组学特征参数，并结合 5 个影像学习特征，包括毛刺征、分叶征、空泡征、血管征、胸膜牵拉征，分析了结节型和肿块型 MPA 患者（n=74）和 OP 患者（n=74）的影像组学特征、影像学特征和联合特征。基于这些特征，选择最优化 SVM 机器学习算法，分别构建了影像组学特征模型、影像特征模型和联合特征模型。联合模型在训练集 AUC 为 0.85（95%CI: 0.771~0.903），测试集 AUC 为 0.84（95%CI: 0.703~0.960），优于影像组学特征模型、影像特征模型的结果。

结论：结合 CT 影像学特征和影像组学特征的机器学习联合模型可能有效地鉴别结节型和肿块型 MPA 和 OP，为未来影像医师对疾病的鉴别诊断提供可用的人工智能渠道。

非重症鹦鹉热衣原体肺炎的 CT 表现

罗振东、江锦赵、李标达、李莹、沈新平

香港大学深圳医院

目的 分析非重症鹦鹉热衣原体肺炎的临床、CT 表现。**方法** 回顾性分析 5 例非重症鹦鹉热衣原体肺炎的临床资料及 CT 表现。**结果** 5 例非重症鹦鹉热衣原体肺炎（4 为女性，1 例为男性，平均为 52 岁），均表现为发热，伴咳嗽 3 例，伴头痛 1 例；5 例均接触鸟类史；4 例白细胞均正常，CRP 均升高，4 例合并肾功能异常，1 例合并肝功能异常；CT 表现：4 例单叶受累，1 例双叶受累，5 例均表现为细网格征合并实变，无纵隔淋巴结肿大、胸腔积液及肝脾肿大。**结论** 随着 NGS 的临床应用的推广，鹦鹉热衣原体肺炎检出率明显增加，CT 可以表现为间质性病变并实变，综合流行病学和实验室检查，对其诊断具有重要的价值。

Revolution CT 在中央型肺癌伴肺不张瘤-肺界面鉴别中的价值

李西林、刘景旺、陈静、耿立辉、李琦、李健、陈阳
华北理工大学附属开滦总医院影像科

摘要：目的 探讨 Revolution CT 能谱多参数成像在中央型肺癌合并肺不张瘤-肺界面鉴别中的应用价值。**方法** 收集本院 73 例确诊为中央型肺癌合并肺不张患者的能谱 CT 扫描资料，并比较动脉期、静脉期、延迟期混合单能量图像(PI)、最佳单能量图像(BMI)和最佳单能量-碘基图融合图像(BMI-ICM)、有效原子序数图像(Eff-Z)中瘤-肺界面的主观评分，比较增强扫描静脉期肿瘤组织与不张肺组织的 CT 值、碘浓度(IC)、有效原子序数(Eff-Z)和能谱曲线斜率(λ HU)。**结果** ①三期增强扫描的瘤-肺边界主观评分静脉期最高。②增强扫描各期 CT 扫描瘤-肺界面主观评分中混合单能量图像(PI)、最佳单能量图像(BMI)、最佳单能量-碘基图融合图像(BMI-ICM)和有效原子序数图像(Eff-Z)之间存在统计学差异，最佳单能量-碘基融合图像(BMI-ICM)最高，最佳单能量图像(BMI)次之。③静脉期肿瘤与不张肺组织 CT 值、IC 值、Eff-Z 和能谱曲线斜率之间存在差异，肿瘤与不张肺组织的 IC 差别最大。**结论** Revolution CT 可以通过能谱多参数成像准确的识别中央型肺癌与不张肺组织的瘤-肺界面，为中央型肺癌合并肺不张诊断及疗效评价提供有益的参考依据。

Coronary CT fractional flow reserve in chronic coronary syndrome patients with medical therapy: a 2-year clinical outcomes

Wenyun Liu, Lei Zhang, Dianbo Cao, Lili Xiao, Huimao Zhang
The First Hospital of Jilin University

Purpose: To evaluate the prognostic implications of machine learning-based CT angiography-derived fractional flow reserve (CT-FFR) for adverse clinical outcomes in patients with moderate stenosis and medical therapy.

Methods: This observational retrospective study included patients suspected of chronic coronary syndrome with stenosis (30–70%) determined by coronary CT angiography (CCTA) between January 2019 and October 2020. Clinical end points comprised major adverse cardiac events (MACE) (nonfatal myocardial infarction, unplanned coronary revascularization, hospitalization for unstable angina or cardiac death) and all-cause mortality. CT-FFR was analyzed in a blinded fashion at a core laboratory using a commercialized software system (RuiXin-FFR, Shenzhen, China). The ability of CT-FFR (abnormal if ≤ 0.8) to predict outcomes was assessed.

Results: A total of 36 patients (mean age \pm standard deviation, 59 years \pm 10; 11 women [31%]) were included; the median time of follow-up was 24 months. CT-FFR > 0.80 in 14 (39%) of the patients and none MACE occurred, CT-FFR ≤ 0.80 in 22 (61%) of the patients and 8 occurred MACE. There was significant difference between CT-FFR > 0.80 and CT-FFR ≤ 0.80 about the rate of MACE ($p = 0.013$, the χ^2 test of independence). CT-FFR was independently associated with MACE when adjusting for potential confounders.

Conclusion: Noninvasive CT-FFR was associated with major adverse cardiac events in chronic coronary syndrome patients with medical therapy, and could help discriminate subjects at high risk for additional testing.

PU-2117

Myocardium deformation and left ventricular remodeling assessed by Cardiac MRI in intensively endurance training heart

Hongqin Liang

Southwest Hospital, Third Military Medical University (Army Medical University)

Objectives Early detection of exercise-induced cardiac anomalies is key to clinical management for individuals engaged in vigorous exercise training. This study aimed to investigate cardiovascular adaptation in university students engaged in intensive exercise using cardiac MRI. **Methods** For this prospective, single-center study, 50 university students who finished a four-year's intensively endurance training and 23 age- and gender- matched controls received cardiac MRI. Exercised participants were further divided into symptomatic and asymptomatic groups. Left ventricular (LV) volumes were calculated and indexed to body surface. Global peak strains, systolic and diastolic peak strain rates (DSR) were derived from cine images using feature tracking technique. ANOVA analyses were performed.

Results: Fifty exercised participants (mean age, 21years \pm 1, 43 males, including 21 symptomatic and 29 asymptomatic cases) and 23 normal controls (mean age, 21years \pm 2, 20 males) were evaluated. Exercised participants exhibited higher end-diastolic LV volume (76.0ml \pm 10.6 vs 63.5ml \pm 7.5, $P < 0.001$), reduced LV ejection fraction (59.9% \pm 5.3 vs 63.0% \pm 3.2, $P = 0.002$) and reduced global longitudinal strain (-18.25 \pm 3.32 vs -19.85 \pm 1.29, $P = 0.004$) than the normal control did. Symptomatic exercised participants showed reduced peak strains compared to both asymptomatic participants and normal controls. Only circumferential DSR was reduced when compared between asymptomatic cases and the controls.

Conclusions: Highly intensive exercise could result in elevated LV volume and reduced myocardial strains for young university students. Further, reduced myocardial strains were found for those symptomatic cases which may indicate pathological change.

瘤周微环境的 CT 影像组学特征对纯磨玻璃结节肺腺癌的浸润程度的预测研究

朴金明

吉林大学第一医院

目的: 探讨基于纯磨玻璃结节 (pure ground glass nodule, pGGN) 瘤周微环境 CT 图像的影像组学标签在判断 pGGN 浸润性的诊断价值。**方法:** 回顾性分析 2017 年 12 月至 2018 年 5 月期间于我院行手术治疗, 并于术前行胸部 CT 平扫检查, 术后经病理证实为肺腺癌的患者 pGGN, 按 6: 2: 2 的比例, 随机分为训练组、验证组及测试组, 选取瘤周 5mm 的肺组织作为微环境, 从中提取 1389 维影像组学特征, 经最小绝对收缩和选择算法降维得到 16 维特征, 通过五折交叉验证法建立逻辑回归 (logistic regression, LR) 模型, 评价模型效能, 同时与瘤内影像组学特征模型做对比。**结果:** 浸润前组与浸润组患者影像组学标签有显著差异 ($P < 0.05$)。瘤周影像组学模型准确率为 0.86 ± 0.07 , 训练组 AUC 均值 $= 0.96 \pm 0.01$, 验证组 AUC 均值 $= 0.94 \pm 0.06$, 测试组 AUC $= 0.917$; 瘤内影像组学模型准确率为 0.75 ± 0.04 , 训练组: 5 折 AUC 均值 $= 0.94 \pm 0.02$, 验证组: 5 折 AUC 均值 $= 0.84 \pm 0.06$, 测试组: AUC $= 0.885$; 瘤周与瘤内影像组学标签的效能差异无统计学意义 ($P > 0.05$)。**结论:** 通过基于 pGGN 肺腺癌瘤周微环境 CT 图像获得的影像组学标签建立的 LR 模型具有良好的预测浸润性的能力, 预测能力与瘤内影像组学标签相当, 可为临床诊断与治疗提供参考。

高原地区健康人左心房结构及功能的正常参数研究

王国辉、孟莉
青海大学附属医院

目的：使用 3.0TMRI 回顾性分析高原地区健康人左心房 (LA) 结构及功能的正常参数值范围。

方法：对 150 例高原地区健康人在 3.0TMRI 扫描仪上进行心脏磁共振扫描。将研究对象按年龄分为 16-30 岁组、31-45 岁组、46-60 岁组；按性别分为男性组、女性组。收集所有纳入研究对象的基本资料并测量 LA 径线，包括左右径及前后径；利用 CVI 42 软件获得 LA 常规心功能参数及心肌应变参数；LA 容积参数包括：LA 最大容积 (LAVmax)、LA 主动收缩前容积 (LAVpre-a)、LA 最小容积 (LAVmin)；经体表面积修正获得其相应指数 (LAVImax、LAVImin)。心肌应变参数包括 LA 储存功能 (总射血分数[LATEF]、总应变[ϵ_s]、正向应变率峰值[SRs])、导管功能 (被动射血分数[LAPEF]、被动应变[ϵ_e]、舒张早期负向应变率峰值[SRe]) 和泵功能 (主动射血分数[LAAEF]、主动应变[ϵ_a]、舒张晚期负向应变率峰值[SRe])。 $P < 0.05$ 为差异具有统计学意义。

结果：LA 的各应变参数均具有良好的观察者内和观察者间重现性。LAVImax、LAVImin 分别为 (30.65±6.36) ml/m²、(15.67±3.79) ml/m²； ϵ_s 、 ϵ_e 、 ϵ_a 分别为 (42.00±7.56) %、(25.91±6.99) %、(15.96±3.68) %；SRs、SRe、SRa 分别为 (1.84±0.49) s⁻¹、(-2.93±0.86) s⁻¹、(-2.14±0.53) s⁻¹；与 46-60 岁组相比，16-30 岁组与 30-45 岁组 LATEF、LAPEF 均显著增大 ($P < 0.05$)，而在 16-30 岁组与 30-45 岁组则无明显差异 ($P > 0.05$)；在不同性别之间，女性组 LAVImax、LAVImin、 ϵ_s 、 ϵ_a 较男性显著增大；而随着年龄的增长，LA 的泵功能显著增加 ($P < 0.05$)，而 LA 的管道功能逐渐降低 ($P < 0.05$)。

结论：本研究结果提供了高原地区健康人 LA 结构及心功能参数的正常参考值范围，并揭示了性别及年龄对各参数的影响，提示在进行心脏相关疾病诊断时，正常参考值应根据年龄和性别进行调整。

超低剂量胸部 CT 结合深度学习重建定量评估肺炎的可行性

陈伟婷¹、金晨望²、马光明¹、于楠¹、申利¹
1. 陕西中医药大学附属医院
2. 西安交通大学第一附属医院

目的：探讨超低剂量胸部 CT (ULDCT) 结合深度学习图像重建(DLIR)对人工智能影像辅助肺炎定量分析软件 (uAI-Discover-NCP) 及图像质量的影响。

方法：收集 40 例肺炎患者，均行标准剂量 (SDCT) (120 kVp，自动管电流) 和 ULDCT 胸部扫描，根据患者 BMI (正常、超重、肥胖)，ULDCT 分别采用不同的管电流 (10、20、35mA)。SDCT 采用 40%强度的自适应统计迭代重建 (ASIR-V40%) (A 组)；ULDCT 采用 ASIR-V40% (B1 组)、高强度的 DLIR (DLIR-H) (B2 组) 重建图像，共获得 3 组图像。记录 SDCT 和 ULDCT 扫描的辐射剂量。测量空气、肺组织、胸主动脉、肩胛下肌、胸椎 CT 值、SD 值。将 3 组图像导入到肺炎分析软件进行分析，记录肺炎指数、肺炎体积、肺炎体积百分比、肺炎质量及肺炎质量百分比。两名高年资影像医师对 3 组图像的整体质量及肺炎显示采用 5 分制评分标准进行评分。对 3 组图像肺炎定量参数、噪声及主观评分进行统计分析。

结果：ULDCT 相较于 SDCT，辐射剂量减低了 94%。3 组图像空气、肺组织、胸主动脉、肩胛下肌、胸椎的 CT 值无统计学差异 ($P > 0.05$)。3 组图像空气、肺组织、胸主动脉、肩胛下肌、胸椎的 SD 值总体差异有统计学意义 ($P < 0.05$)；A 组与 B2 组间胸主动脉、肩胛下肌 SD 差异无统计学意义 ($P > 0.05$)；A 组胸椎 SD 较 B2 组高，差异存在统计学意义 ($P < 0.05$)。3 组图像整体图

像质量、肺炎显示主观评分总体差异有统计学意义 ($P<0.05$)；A 组和 B2 组主观评分均高于 B1 组，差异有统计学意义 ($P<0.05$)；B2 组图像质量主观评分、肺炎显示主观评分与 A 组差异无统计学意义 ($P>0.05$)。B1、B2 组肺炎定量参数 (肺炎指数、肺炎体积、肺炎体积百分比、肺炎质量及肺炎质量百分比) 分别与 A 组对比，差异均无统计学意义 ($P>0.05$)。

结论：ULDCT 高强度深度学习重建图像肺炎定量分析结果与 SDCT 扫描基本一致，图像质量相当，能满足临床诊断需求，且能大幅降低辐射剂量，可用于肺炎随访。

PU-2121

Bach1 调节阿霉素诱导心脏毒性中的氧化应激与铁死亡

王焱炜¹、姜海燕²、王翠艳¹

1. 山东省立医院

2. 山东大学基础医学院

目的:阿霉素(DOX)是临床上最常用的蒽环类化疗药物之一，但其所致的心脏毒性缺乏有效的治疗和预防措施，且发生机制尚未完全明了。已经证明 DOX 会诱导心肌细胞中的氧化应激与铁死亡，而 Bach1 基因竞争性抑制抗氧化相关基因 Nrf2 与 ARE 位点结合，加重氧化应激和铁死亡。本研究的目的是探究敲除 Bach1 是否可以缓解 DOX 诱导的心脏毒性，为预防和早期干预 DOX 诱导的心脏毒性损伤提供新的靶点以及影像依据。

方法:将雄性野生型 (WT) 与 Bach1 基因完全敲除型 (Bach1^{-/-}) C57BL/6 小鼠分别随机分为对照组和 DOX 组，DOX 经腹腔注射，每周一次，共注射三周，累积剂量为 20mg/kg。末次注射后一周，使用 M 型超声心动图 (Vevo LAZR) 和心脏磁共振 (9.4T Bruker) 评估左心功能。采用 H&E 染色和 Masson's Goldner 染色进行组织学评价，并检测心脏组织中的氧化应激与铁死亡标志物。

结果: DOX 治疗 3 周后，WT 与 Bach1^{-/-}小鼠左心室收缩功能均明显下降，且 Bach1^{-/-}+DOX 组的左室功能明显好于 WT+DOX 组：EF($67.75\pm 11\%$ vs. $56.92\pm 3\%$, $p=0.02$)，FS($37.83\pm 2\%$ vs. $30.61\pm 7\%$, $p=0.02$) 和 GLS($-18.05\pm 1\%$ vs. $-14.44\pm 4\%$, $p=0.002$)。与 WT+DOX 小鼠相比，Bach1^{-/-}+DOX 组心肌纤维化程度降低 53% ($p=0.01$)。此外，与 WT+DOX 组相比，Bach1^{-/-}+DOX 组小鼠氧化应激和铁死亡的生物标志物减少。而注射生理盐水的 WT 组与 Bach1^{-/-}组小鼠的各项指标均无显著差异。

结论：敲除 Bach1 可以通过降低心肌细胞氧化应激和铁死亡缓解 DOX 诱导的心脏毒性，为预防和早期干预 DOX 诱导的心脏毒性损伤提供新的靶点以及影像依据。

PU-2122

基于 CT 影像学探讨新冠肺炎的转归

马婷、邓宇

广州医科大学附属第一医院

【目的】自新型冠状病毒疫情暴发以来，新冠毒株不断进化，奥密克戎病毒株是世界卫生组织公布的第五个变异株，也是我国实施放开政策以来，主要的传播毒株。CT 影像诊断在新冠肺炎的诊治及预后评估中起至关重要的作用，本研究拟探讨基于 CT 影像特征分析不同的肺部基础疾病患者确诊奥密克戎新冠肺炎后的影像学征象及短期内的转归情况。

【材料及方法】回顾性筛选 2022 年 12 月 10 日至 2023 年 1 月 13 日广州医科大学附属第一医院收治的 1643 名新冠肺炎患者，其中有 307 名患者在确诊 1 个月后至至少进行了一次 CT 复查，收集符合纳入标准的 307 例临床资料及胸部 CT 影像学数据，所有图像由两位放射科医师进行评估。该研究第一部分，阐述新冠肺炎影像学征象、影像分期及转归。第二部分，根据患者不同的肺部基础疾病将他们分成 6 个亚组：慢性阻塞性肺疾病组、间质性肺疾病组、肺癌组、肺移植组、无基础肺疾

病组、其它肺疾病组（如支气管扩张、肺结节等）；按年龄分为青年（ ≤ 44 岁）、中年（45-59 岁）、老年（ ≥ 60 岁）三层，统计不同人群的年龄分布情况；根据病灶占据肺的比例，分为三种类型：普通型（ $\leq 25\%$ ）、重型（25%-50%）、危重型（ $> 50\%$ ），分析不同人群间新冠肺炎严重程度是否有组间差别；最后将不同人群患者首次胸部 CT 图像与确诊后 1-3 月内复查的图像进行对比、分析其转归情况。统计学分析使用 SPSS 25 Person 相关性分析、Fisher's Exact Test 法等。

【结果】新冠肺炎影像学分期常分为早期、进展期、恢复期；转归常表现为基本吸收、明显吸收、部分吸收、无吸收、进展，其中进展表现为肺纤维化或病灶增多，见于重型-危重型患者，预后往往较差。确诊新冠肺炎的不同肺部基础疾病患者，均以老年人最常见，6 组不同人群均以普通型最常见，肺癌组重型及危重型发生率最低（ $P < 0.001$ ）。6 个不同亚组间，我们发现慢性阻塞性肺疾病组与间质性肺疾病组的预后相对较差，肺癌组的预后相对较好（ $P < 0.05$ ）。

【结论】影像学在新冠肺炎的精准诊治、分期及转归评价方面发挥着至关重要的作用。

PU-2123

急性肺栓塞患者的临床、影像特征分析

孙淼、张金玲、王国坤
哈尔滨医科大学附属第二医院

目的：对比急性非高危肺栓塞患者不同栓塞类型的临床、影像特征分析。方法：收集在本院通过 CTPA 确诊的非高危急性肺栓塞患者进行回顾性分析，对比不同类型急性肺栓塞患者临床以及影像学特征进行分析。结果：在非高危急性肺栓塞患者中，不同类型栓塞患者在性别、年龄、有无下肢静脉血栓及合并症上比较差异无统计学意义（ $P > 0.05$ ）；而在影像学特征（PAOI、肺动脉直径、肺/主动脉比值、RV/LV 比值）中发现，鞍状肺栓塞与非鞍状肺栓塞、非 MPA 栓塞中存在显著差异，（ $P < 0.05$ ）结论：不同类型急性非高危肺栓塞患者严重程度存在差异，鞍状肺栓塞和非鞍状肺栓塞患者较非 MPA 患者的肺动脉高压及右心室功能障碍出现的频率更高，肺栓塞影像学指标再结合患者临床及实验室检查，有助于早期识别患者危险度，为患者的治疗及预后提供更大帮助。

PU-2124

急性肺栓塞患者临床预后相关分析

孙淼、张金玲、张鸿美
哈尔滨医科大学附属第二医院

目的 探讨急性肺栓塞（Acute Pulmonary Embolism, APE）患者的临床表现、实验室指标及影像学指标对其预后的影响。方法 回顾性分析 172 例临床表现、实验室指标及影像学指标，根据是否发生右心室功能障碍将患者分为右心室功能障碍组（RVD 组）（ $RV/LV > 1$, 77 例(44.77%)）和无右心室功能障碍组（ $RV/LV < 1$, 95 例(55.23%)），利用单因素和多因素 logistic 回归分析患者的临床表现、实验室指标及影像学指标与右心室功能障碍之间的关系。结果 单因素分析得出栓塞类型（主干栓塞 vs 非主干栓塞）、肺动脉主干直径（PAd）、肺动脉阻塞指数（PAOI%）、年龄、心率及患有糖尿病患者在两组间的差异具有统计学意义（均 $P < 0.05$ ）。在多因素 logistic 回归中，栓塞类型、性别及年龄、肺动脉主干直径（PAd）、肺动脉阻塞指数（PAOI%）与右心室功能障碍显著相关（均 $P < 0.05$ ）。结论 影像学指标对 APE 患者中是否会发生右心室功能障碍有较好的预测价值，有助于指导临床医生作出更精准的临床决策。

PU-2125

急性肺栓塞患者肺动脉灌注与右心室/左心室比值和 CTOI 的关系

刘晓彤^{1,2}、田春燕^{1,2}、谷涛^{1,2}

1. 北京医院

2. 中国医学科学院北京协和医学院

Objective: Pulmonary embolism (PE) is fatal . It is significant to detect signs in CTPA that may indicate a high flow pressure load. The aim of this study is to investigate whether decreased perfusion of the pulmonary artery is associated with increased RV/LV Ratio and CTOI .

Materials and Methods: In this prospective single-center study performed , 14 patients diagnosed with APE were included. We evaluated the relationships between PBV and RV/LV Ratio and CTOI . We measured PA enhancement (PAenh) and calculated rPBV (PBV/ PAenh) to adjust timing.

Results: There was significant negative correlations between mean rPBV and RV/LV Ratio($R=-0.571, P=0.033$). There was no significant difference between mean rPBV and select rPBV and CTOI ($R=0.287, P=0.320$).

Conclusion: RV/LV Ratio may be an indicator of decreased pulmonary blood perfusion. CTOI is not correlated with pulmonary perfusion.

PU-2126

基于宽体探测器 CT 成像评估主动脉瓣最佳重建期相的应用价值

喻茜

武汉大学人民医院

目的：评估宽体探测器 CT 主动脉瓣成像的可行性，并探讨不同重建期相在主动脉瓣狭窄患者主动脉瓣及瓣环术前评估中的应用价值。

方法：前瞻性纳入在 2020 年 7 月至 2021 年 3 月拟行经导管主动脉瓣置换术术前 CTA 检查的主动脉瓣狭窄患者。应用宽体探测器 CT 以 one beat 扫描模式进行心脏 CTA 检查，打开智能期相技术自动重建最佳冠脉期，再采用全期相图像计算主动脉瓣的最佳收缩期及最佳舒张期并手动重建。在三个期相下分别测量瓣环的各项形态学参数，并由两名放射科医师采用四分制对主动脉瓣的图像质量进行主观评价。采用配对样本 t 检验分别比较高、低心率主动脉瓣狭窄患者在三个期相下瓣环各项测量参数；采用 Friedman 检验比较三个期相的图像质量主观评分。

结果：总共纳入 42 例患者，平均年龄为 70 ± 5 岁，年龄范围为 50~84 岁。对于 30 例低心率患者 (<75 次/分)，最佳收缩期的瓣环各项测量参数均大于最佳冠脉期 ($P<0.001$)，而在 12 例高心率患者 (≥ 75 次/分) 中最佳收缩期与最佳冠脉期之间瓣环各项测量参数的差异无统计学意义。最佳收缩期、最佳冠脉期的图像质量主观评分均优于最佳舒张期 ($P<0.001$)。

结论：宽体探测器 CT 主动脉瓣成像检查成功率高，采用主动脉瓣的最佳收缩期有助于主动脉瓣及瓣环的精准评估，对于准确选择人工瓣膜型号及尺寸、预测及预防手术并发症等具有重要的临床意义。

PU-2127

The evaluation of the inner diameter of the airway in asthma recovery by using HRCT

Shuang Liu,Zhiye Chen

Department of Radiology, Hainan Hospital of PLA General Hospital

Objectives: To evaluate the airway diameter in asthma recovery by using HRCT.

Methods: Thirty patients with asthma were recruited and underwent HRCT examination in acute exacerbation and stable phase, respectively. The inner diameter of the airway (Din) was measured from bilateral main bronchi to all 18 segmental bronchi during acute exacerbation and stable phase.

Results: The inner diameter of airway reduced significantly in acute exacerbation period compared with that in stable period ($P < 0.05$). The mean Din reduction (%) in segmental bronchi was 12% and that in lobar bronchi was 6%. The incidence of dorsal bronchus of both lower lobes stenosis was the highest with 18 cases (right) and 16 cases (left) in all 30 subjects, respectively, while the incidence of lingual bronchial stenosis was the highest with 18 cases for the lobar bronchi, The correlation between the number of narrowing bronchi and the severity of the disease, the number and FEV1 (% predicted) of the acute exacerbation showed there were no significant statistical correlation between them ($P > 0.05$).

Conclusion: CT images of bronchial stenosis showed obvious dilation after appropriate medication, and the inner diameter of the airway can be used as a practical and convenient index to evaluate the recovery of asthma.

PU-2128

Study on microcirculation in patients with hypertrophic cardiomyopathy by first myocardial perfusion with CT

Zhongxu Zhang

Shan Xi do University of Chinese medicine

Objective: To evaluate the status of coronary microcirculation in patients with hypertrophic cardiomyopathy (HCM) by resting first pass CT perfusion imaging. **Methods:** 46 patients with confirmed HCM in our hospital and 44 healthy controls were selected. The myocardial first pass perfusion data of the two groups were analyzed, and the myocardial first pass perfusion value (MP), myocardial perfusion correction (C-MP) and myocardial transmural perfusion index (TPR) were measured. According to the myocardial thickness at the end of diastolic period, the cardiac muscle segments of HCM group were divided into non-hypertrophic subgroup ($<15\text{mm}$) and hypertrophic subgroup ($\geq 15\text{mm}$), and the hypertrophic subgroup was further divided into three levels: mild hypertrophic (15-19mm), moderate hypertrophic (20-24mm) and severe hypertrophic ($\geq 25\text{mm}$). The overall differences of MP, C-MP and TPR in each HCM subgroup and control group were compared by one-way ANOVA, and the LSD-t test was used for pairwise comparison among each group. **Results:** There were no significant differences in MP, C-MP and TPR values between HCM non-hypertrophic subgroup and control group ($P > 0.05$). There were statistically significant differences in MP, C-MP and TPR values between HCM hypertrophic subgroup and control group and between HCM hypertrophic subgroup and non-hypertrophic subgroup ($P < 0.05$), which showed that the parameters of hypertrophic segment were lower than those of non-hypertrophic segment. There was no significant difference in MP and C-MP values in mild and moderate hypertrophic segments ($P > 0.05$), but TPR in moderate hypertrophic segment was significantly lower than that in mild hypertrophic group ($P < 0.05$). The parameters of severe hypertrophy were significantly different from those of moderate hypertrophy and mild hypertrophy

($P<0.05$). Conclusion: The first perfusion of CT can evaluate the myocardial microcirculation in patients with hypertrophic cardiomyopathy semi-quantitatively, and provide evidence for clinical risk stratification and treatment decision.

特发性肺纤维化的 CT 定量分析与肺功能的相关性研究

张鸿美、张金玲、孙淼
哈尔滨医科大学附属第二医院

特发性肺纤维化的 CT 定量分析与肺功能的相关性研究

摘要：特发性肺纤维化是一种慢性、进展性的肺部疾病，其特征是肺间质破坏累及到肺实质改变。本篇文章旨在探讨特发性肺纤维化患者的 CT 影像特征及 CT 定量分析对肺功能损害程度的相关性。通过回顾性分析近年来收治的 IPF 患者 CT 影像及临床资料，本文探讨了 IPF 的肺部病变特点及 CT 影像学表现，同时分析了不同病变程度与患者临床肺功能的关系。

目的

特发性肺纤维化是一种致死率较高的肺部疾病，患者生存期短，所以早期诊断对于改善患者预后具有重要意义。CT 影像学检查作为 IPF 的重要辅助检查手段，对其临床诊断具有重要指导意义。考虑到部分病人病情不允许做肺功能或肺活检检查，对其肺功能损害情况不能明确了解。因此，明确 IPF 的 CT 影像学特征及其与肺功能损害程度的关系是当前研究的重点。

方法

本文采用回顾性分析的方法，收集了近年来确诊为特发性肺纤维化的患者资料，对其 CT 影像学进行了深入研究。在分析过程中，我们将患者的 CT 影像学表现与临床病理资料、肺功能检查进行了相关性分析。同时，对不同病变程度患者的 CT 影像学特点进行了总结和评估。

结果

我们发现，特发性肺纤维化的 CT 影像学表现具有一定的特征性，其主要表现为肺部的网格状、蜂窝状改变及肺气肿等。此外，我们还发现，随着疾病严重程度的增加，CT 影像学表现也呈现出更为明显的异常改变，包括肺部病变的范围扩大、密度增加及结构紊乱等。同时，我们也发现，不同病变程度的患者其肺功能也存在差异，CT 定量分析可用于评估肺功能损害情况。

结论

特发性肺纤维化的 CT 影像学表现具有一定的特征性。CT 定量分析可用于评估 IPF 的肺功能损害情况。在临床实践中，我们可以通过对 IPF 患者的 CT 影像学特征进行定量分析，为疾病的早期诊断和预后评估提供重要参考依据。同时，我们还发现，针对不同病变程度的 IPF 患者，其治疗方法及预后改善策略也存在差异，这为今后开展个性化治疗及改善患者预后提供了新的思路。

Development of a CT-based Deep Learning Model for the Preoperative Prediction of Visceral Pleural Invasion and Disease-Free Survival in Clinical Stage IA Lung Adenocarcinoma Patients

Xiaofeng Lin
Department of Medical Imaging, Sun Yat-sen University Cancer Center

Pathologic visceral pleural invasion (VPI) in early-stage lung cancer patients can result in the upstaging of T1 to T2, in addition to having implications for patient treatment and prognostic

outcomes. This study was designed with the goal of establishing and validating a CT-based deep learning (DL) model capable of predicting VPI status and stratifying patients based on their prognostic outcomes. In total, 1896 patients from two centers with pathologically confirmed clinical stage IA lung adenocarcinoma were enrolled. DL signatures were extracted with a 3D residual neural network. DL model was able to effectively predict VPI status. VPI predicted by the DL models, as well as pathologic VPI, was associated with shorter disease-free survival. The established deep learning signature provides a tool capable of aiding the accurate prediction of VPI in clinical stage IA lung adenocarcinoma patients, thus enabling prognostic stratification.

特发性肺纤维化 CT 影像技术研究进展

张鸿美、张金玲、孙淼
哈尔滨医科大学附属第二医院

特发性肺纤维化 CT 影像技术研究进展

摘要

特发性肺纤维化 (IPF) 是一种慢性、进展性的肺部疾病, 患者肺部的正常组织被过度的纤维组织取代。本文综述了近年来特发性肺纤维化 CT 影像技术的进展, 包括 HRCT 技术、功能成像技术、分子影像技术等方面, 并探讨了这些技术对于 IPF 诊断和病情评估的应用价值和局限性。

目的

特发性肺纤维化的致死率较高, 所以, 诊断和病情评估对于临床医生至关重要。传统的影像学检查方法对 IPF 的诊断和病情评估存在一定的局限性。因此, 研究者们不断探索新的影像技术, 以期提高 IPF 的诊断准确性和评估的全面性。

方法

本文采用文献综述的方法, 对近五年关于特发性肺纤维化 CT 影像技术的相关研究进行了整理和分析, 重点探讨了 HRCT 技术、功能成像技术、分子影像技术等 IPF 诊断和病情评估中的应用价值和局限性。

结果

HRCT 技术作为一种高分辨率的 CT 成像技术, 能够清晰地显示 IPF 患者的肺部病变特征, 对于早期诊断和病情评估具有重要意义。功能成像技术如支气管舒张试验、肺一氧化碳弥散量等能够评估 IPF 患者的肺功能状况, 对于判断病情严重程度和预后有一定的参考价值。分子影像技术作为新兴的技术, 能够从分子水平上揭示 IPF 的发病机制和病变过程, 对于研究 IPF 的发病机制和新型治疗方法的研发具有潜在的应用价值。

结论

近年来, 特发性肺纤维化的 CT 影像技术在 HRCT 技术、功能成像技术、分子影像技术等方面取得了显著的进展, 对于 IPF 的诊断和病情评估具有重要的应用价值。这些技术的不断发展和完善, 有望为临床医生提供更加全面、准确的 IPF 诊断和病情评估手段。

心脏磁共振特征追踪技术评估射血分数保留型心力衰竭患者左心室心肌应变的研究

魏伟、任成龙、李明、樊丽华、贾永军
陕西中医药大学附属医院

目的:

随着人口老龄化,特别是高血压、糖尿病、肥胖患病人口的增加,射血分数保留型心衰(HFpEF)患病率有增长的趋势,以患病率高,预后差且以往无明确有效的治疗方法而受到重视;其诊断主要依靠射血分数、临床症状及相关实验室检查进行诊断。本研究基于心脏磁共振特征追踪技术(Feature Tracking,FT)定量评价 HFpEF 患病心肌应变是否发生改变。

材料与方法:

收集我院 2023 年 4 月-2023 年 9 月进行 CMR 检查 56 例,CMR 检查正常患者 21 例, HFpEF 患者 35 例,所有受试者均使用 3.0T 核磁共振(SIEMENS,MAGNETOM Vida)行心脏检查,采用心电图门控 bSSFP 序列获两腔心、三腔心及四腔心图像。原始心脏电影图像使用 QIR Suit(法国,CASIS)后处理软件进行心功能及应变分析。使用半自动方法识别所有心脏周期左心室内外膜,再由一名五年临床经验诊断医师进行修正以保证内外膜的准确性,然后计算左心室 17 节段应变的平均值。采用 SPSS22.0 进行统计学分析。所有连续性数据结果以均值±标准差表示,分类变量以受试人数和百分比表示,组间比较使用方差分析。正常对照组与 HFpEF 心肌应变进行两样本 T 检验。 $p<0.05$ 具有统计学意义。

结果: HFpEF 组与正常对照组的 BMI、同型半胱氨酸有统计学意义($p<0.05$)。HFpEF 组平均径向应变及平均周向应变低于正常对照组($p=0.015$),HFpEF 组平均径向应变及平均周向应变分别为 23.5%、-4.5%; 正常对照组平均径向应变及平均周向应变分别为 35.9%、-16.0%。

结论: 心肌应变技术可以定量评价 HFpEF 患病心肌应变发生已发生改变,给予 HFpEF 患病早期治疗,提高生活质量。

飞利浦 IQon 光谱 CT 血管壁成像技术在冠心病患者检查中的应用价值初探

杜昊
南京大学医学院附属苏州医院

【摘要】目的 探讨飞利浦 IQon 光谱 CT 血管壁成像技术在冠心病患者中的临床应用价值。方法 回顾性随机选择 2022 年 5 月—2023 年 2 月在苏州科技城医院行冠状动脉 CTA 检查的冠心病患者 40 例,所有患者均采用飞利浦 IQon 光谱 CT 进行冠状动脉 CTA 检查。检查结束后,通过软件后处理分别获得常规冠状动脉 CTA 图像和冠状动脉血管壁成像图,对两组图像同时进行主观评价和客观评价。结果 冠状动脉血管壁成像图在伪影、图像对比度、管腔显示、血管壁显示、血管壁与周围脂肪对比、CNR、SNR 等方面的评分均高于常规 CTA 组,且差异具有统计学意义。结论 飞利浦 IQon 光谱 CT 血管壁成像技术较常规冠状动脉 CTA 更好地显示血管壁情况,在冠心病患者的 CTA 造影临床应用中具有很大的潜力。

左心室瘢痕负荷对左束支起搏导线植入的影响

殷凡、朱晓梅、施夏韵

南京医科大学第一附属医院 (江苏省人民医院)

摘要

目的: 左心室瘢痕负荷与左束支起搏 (LBBP) 导线的植入成功与否密切相关, 本研究通过心脏磁共振延迟强化探讨心脏各节段瘢痕评分对于左束支起搏导线植入的影响。

方法: 入组 2019 年 08 月至 2023 年 02 月在南京医科大学第一附属医院心血管内科拟接受左束支起搏患者, 并且术前完成心脏核磁扫描。通过受试者工作特征曲线 (ROC) 评估心脏 17 节段的瘢痕负荷以及节段瘢痕得分 (0=absent LGE, 1=1-25% LGE, 2=26-50% LGE, 3=51-75% LGE and 4=76-100% LGE) 诊断左束支起搏成功的特异度和敏感度。17 节段 LGE 负荷以及节段瘢痕评分为自变量, 左束支起搏成功为因变量, 进行单因素和多因素二元 Logistic 回归分析。采用 Spearman 相关系数检验 17 节段 LGE 负荷及节段瘢痕评分与左束支起搏成功与否的相关性。

结果: 研究连续纳入 52 例患者, 女性 18 例, 年龄 63 ± 13 岁; 成功实现 LBBP 患者 44 例 (84.6%)。左束支起搏导线植入成功与否与相关节段瘢痕负荷得分具有相关性。单因素回归中发现基底部下侧壁, 基底部、室间隔以及基底部和中部室间隔的瘢痕评分在 LBBP 手术是否成功的差异有统计学意义 ($P < 0.05$), 同时基底段下侧壁的瘢痕负荷也在预测上也具有统计学意义。在纳入多因素的变量基底部下侧壁, 基底部、室间隔以及基底部和中部室间隔的瘢痕评分和下壁基底段的瘢痕负荷中发现下侧壁基底段的瘢痕负荷评分是预测 LBBP 手术失败的独立危险因素。下侧壁基底段的瘢痕评分在 ROC 曲线分析下 AUC 值为 68.5%, 逐步回归的模型吻合度为 84.6%, 特异度为 100%, 当基底部下侧壁 LGE > 75% 时, 准确性达 100%。

结论: 心脏核磁共振可以比较安全的评估心脏瘢痕负荷, 下侧壁基底段的瘢痕评分可以预测手术失败与否, 为临床上 LBBP 手术的顺利实施提供较可靠的参考依据。

PU-2135

绝经后女性乳腺 X 线特征与 10 年内主要不良心脏事件发生率的相关性研究

胡云婷、黄增发

武汉市中心医院

目的: 本研究旨在探索绝经后女性乳腺 X 线特征与其随访 10 年内主要不良心脏事件 (MACE) 发生率的相关性。

方法: 收集并分析 258 例中老年女性乳腺 X 线特征, 如乳腺密度、乳腺动脉硬化、微钙化, 以及其在随访 10 年时间内 MACE 发生率。生存单因素分析采用 Kaplan-Meier 法, 并进行 Log-rank 时序检验; 多因素分析采用 Cox 逐步回归模型。

结果: 单因素生存分析提示乳腺密度、乳腺动脉硬化与 10 年内 MACE 发生率相关, Log-rank $P < 0.005$, 微钙化与 10 年内 MACE 发生率无统计学意义。多因素分析显示, 乳腺密度特征 ($HR = 0.568$, 95% CI = 0.325-0.991; $P = 0.046$)、乳腺动脉硬化 ($HR = 6.2$, 95% CI = 2.41-16.27; $P = 0.00$) 可以作为 10 年内 MACE 发生率的单独危险因素。

结论: 绝经后女性乳腺特征中乳腺 X 线密度、乳腺动脉硬化与 MACE 发生率具有相关性。

PU-2136

NAFLD versus RCA PCAT CT attenuation: Prediction of major adverse cardiovascular events in patients with acute chest pain

Wenxuan Yang, Didi Wen, Shuangxin Li, Minwen Zheng
Department of Radiology, Xijing Hospital, Fourth Military Medical University

Purpose: This study was to compare prognosis of pericoronary adipose tissue (PCAT) computed tomography (CT) attenuation of right coronary artery (RCA) and non-alcoholic fatty liver disease (NAFLD) for major adverse cardiovascular events (MACE) in patients with acute chest pain.

Materials and methods: Between January 2011 and December 2021, all consecutive emergency patients with acute chest pain referred for coronary CT angiography (CCTA) were retrospectively enrolled. MACE included unstable angina requiring hospitalization, coronary revascularization, non-fatal myocardial infarction, and all-cause death. Patients' baseline and CCTA characteristics, RCA PCAT CT attenuation and the presence of NAFLD were used to evaluate risk factors of MACE using multivariable Cox regression analysis. The prognostic value of NAFLD compared with RCA PCAT CT attenuation was analyzed.

Results: A total of 490 patients were enrolled (mean age, 58.48 ± 13.18 years; 297 men). During a median follow-up of 31 months, 60 patients (12.24%) experienced MACE. NAFLD (HR = 2.550, 95% CI: 1.184, 5.491, $P = 0.017$) and RCA PCAT CT attenuation (HR = 1.025, 95% CI: 1.001, 1.050, $P = 0.045$) were independent predictors of MACE. The global Chi-square analysis showed that NAFLD improved risk of MACE more than that using clinical risk factors and CCTA metrics (58.63 vs 53.73, $P = 0.027$) or combined with RCA PCAT CT attenuation (62.56 vs 58.63, $P = 0.047$).

Conclusion: NAFLD and RCA PCAT CT attenuation were predictors of MACE. NAFLD had an incremental prognostic value beyond RCA PCAT CT attenuation for MACE in patients with acute chest pain.

PU-2137

双源 CT 诊断内脏心房异位综合征合并功能性单心室

王建军、杨瑞、刘继伟
河南省胸科医院

目的 探讨心电门控双源 CT 血管造影 (DSCTA) 诊断内脏心房异位综合征合并功能性单心室 (SV) 的价值。

方法 对 31 例内脏心房异位综合征合并单心室患者行 DSCTA 检查, 进行分型诊断并观察其合并畸形。结果 31 例患者中, 内脏心房异位综合征合并左心室型单心室 11 例, 包括无脾综合征 10 例 (10/11, 90.91%), 多脾综合征 1 例 (1/11, 9.09%), 合并畸形 21 种 57 处。内脏心房异位综合征合并右心室型单心室 8 例, 包括无脾综合征 5 例 (5/8, 62.50%), 多脾综合征 3 例 (3/8, 37.50%), 合并畸形 18 种 48 处。内脏心房异位综合征合并不定型单心室 12 例, 包括无脾综合征 10 例 (10/12, 83.33%), 多脾综合征 2 例 (2/12, 16.67%), 合并畸形 22 种 62 处。25 例无脾综合征合并功能性单心室病人中, 合并畸形为共同心房 (19/25, 76.00%)、肺动脉狭窄或闭锁 (16/25, 64.00%)、完全性心内膜垫缺损 (13/25, 52.00%)、共同房室瓣 (11/25, 44.00%) 等。

结论 DSCTA 对内脏心房异位综合征合并功能性单心室的准确诊断和分型具有重要意义, 为手术治疗提供重要指导。

PU-2138

CT 肺血管造影参数对急性肺栓塞的预后价值

李钢

四平市中心人民医院

目的:急性肺栓塞(APE)患者表现出不同的预后。计算机断层肺血管造影(CTPA)是 APE 诊断算法中的一线检查,但与近期转归的相关性尚不明确。本研究的目的是确定 CTPA 结果是否可以预测急诊部 APE 患者的 30 天死亡率。

方法和材料:本研究为回顾性、单中心研究

2010 年至 2018 年期间,在我们机构急诊科诊断的 780 例 APE 患者。对这些 CTPA 发现进行了评估:栓塞-阻塞负荷评分(Qanadli 评分)、肺动脉总干内径、左右心室比、奇静脉内径、冠状静脉窦内径。记录 30 天内共病和致命/非致命不良结局。研究肌钙蛋白 I 值与血管造影参数的相关性,采用多元逻辑回归分析。

结果:全因死亡率和 ape 相关的 30 天死亡率分别为 5.9%和 3.6%。30 天内死亡的患者年龄较大,恶性肿瘤的患病率较高。Qanadli 评分和所有 CTPA 参数与超声心动图中肌钙蛋白 I 水平和 RVD 存在相关(p 值 <0.0001)。右心室/左心室比值和冠状窦直径与 30 天死亡率相关(p 值 <0.005)。在多元逻辑回归中,只有冠状窦和 RVD 仍然显著,HR 分别为 2.5(95%CI1.1-5.6)和 1.9(95%CI0.95-3.7)。结论:这些结果表明,CTPA 量化右心室压力是一个准确的预测 30 天死亡率。特别是,扩张的冠状窦(>9 mm)与右心功能障碍和高肌钙蛋白 I 的超声心动图征象相关,似乎具有额外的预后价值。

PU-2139

CMR 分层应变技术对肥厚型心肌病患者发生心内膜下 LGE 的预测价值

高薇^{1,2}、赵卫¹、杞天付¹、吴灵教¹、侯举香¹、李志明¹、邓洁¹、陈海燕¹、陈伟*¹

1. 昆明医科大学第一附属医院

2. 云南省滇南中心医院(红河哈尼族彝族自治州第一人民医院)

目的:伴心内膜下延迟强化(LGE)的肥厚型心肌病(HCM)患者预后不良。本研究应用 CMR 分层应变技术评估伴或不伴心内膜下 LGE 的 HCM 患者纵向分层应变特征,探讨其对心内膜下 LGE 的预测价值。

方法:选取 2017 年 1 月至 2020 年 9 月于我院确诊为 HCM 患者 41 例,根据有无心内膜下 LGE 将其分为两组,无心内膜下 LGE 组(G1)25 例,心内膜下 LGE 组(G2)16 例,同期选取年龄、性别相匹配的健康志愿者 28 例作为对照组。各组均采用 CMR 测量左心室形态和功能参数,应用分层应变技术获取左心室心内膜纵向应变(SendoLS)和整体心肌纵向应变(GLS)参数。比较三组上述各参数差异,采用相关性分析 HCM 患者 LGE 占左心室质量百分比与 SendoLS 的关系,应用单因素结合多因素 Logistic 回归分析筛选出 HCM 患者发生心内膜下 LGE 的独立预测因子,并以受试者工作特征(ROC)曲线分析其预测价值。

结果:G1、G2 和对照组 3 组间比较显示,左心室射血分数、左心室最大室壁厚度、左心室质量、左心室质量指数、SendoLS、GLS 组间差异具有统计学意义(P 均 <0.05),其中 G1、G2 的 SendoLS、GLS 较对照组减低,G2 较 G1 减低更显著(SendoLS: $-17.86\% \pm 1.68\%$ (对照组) vs $-13.46\% \pm 2.57\%$ (G1) vs $-10.25\% \pm 2.99\%$ (G2); GLS: $-16.63\% \pm 1.60\%$ (对照组) vs $-12.19\% \pm 2.48\%$ (G1) vs $-9.24\% \pm 2.7\%$ (G2), P 均 <0.001)。HCM 患者 LGE 占左心室质量百分比与 SendoLS 呈正相关($r=0.614, P=0.001$)。单因素及多因素 Logistic 回归分析显示 SendoLS 可作为 HCM 患者发生心内膜下 LGE 的独立预测因子($P<0.01$)。SendoLS 预测 HCM

患者发生心内膜下 LGE 的曲线下面积为 0.827, 以-12.51%为截断值时, 其敏感性为 87.5%, 特异性为 76.0%。

结论: 基于 CMR 分层应变技术分析的心内膜纵向应变参数可以预测 HCM 患者心内膜下 LGE 的发生。

PU-2140

特发性炎性肌病患者肺部疾病的 CT 扫描特征: 与肌炎特异性自身抗体的相关性

全红

吉林省四平市中心人民医院

目的:鉴别与特发性炎性肌病(IIM)相关的不同肺类型, 并评估间质性肺疾病(ILD)的 CT 表现与肌炎特异性抗体(MSA)之间的潜在关系。

方法和材料:纳入 2004 年至 2019 年期间转诊至内科的所有连续 IIM 患者, 由两名放射科医生回顾性评估胸部 ct 扫描。CT 表现用于多变量分析, 以确定亚组患者。

结果:本文分析了 257 例(68 例)夹杂体肌炎(68 例)、皮肌炎(67 例)、免疫介导坏死性肌病(63 例)和抗合成酶综合征(59 例)的 CT 表现。173 例(67.3%)患者存在 MSA。94 例(36%)发生 ILD。聚类分析确定了三个亚组患者。第一个集群(n=21)的特征是合并(95%)。带有 anti-MDA5 的 DM 在这个集群中明显更多。第二组 34 例患者均有囊肿(包括蜂窝状囊肿)。最后一组(n=39)的患者明显有更多的小叶内网状结构, 无囊肿, 17%的实变。2 组和 3 组的 ASS 患者明显更多。

结论:尽管 IMM 的 ILD 存在异质性, 但根据 ct 扫描标准, ILD 可分为 3 个簇, 这些簇与 MSA 有关。放射科医师对这些集群的识别可以促进诊断筛选、随访和预后价值。

局限性:这是一项单中心的回顾性研究。

PU-2141

乳腺癌治疗后微钙化的回顾性研究

刘帅君

四平市中心人民医院

目的:本研究聚焦于既往接受过乳腺癌治疗的女性, 她们因微钙化而被召回进行进一步的影像学检查。我们的目的是确定哪些因素增加了复发的风险, 复发的时间范围。

方法和材料:收集 2013 年 6 月至 2019 年 2 月间被召回患者的数据, 包括时间间隔、原诊断、原乳房 x 线照片外观和召回结果。

结果:194 例女性因微钙化而被召回进行进一步检查+活检。126 例为同侧原发癌, 66 例为对侧癌, 2 例为双侧癌。104 例(54%)接受了活检, 其余为良性肿瘤。66%证实复发/新癌。3 例微钙化被召回, 未进行活检, 随后确定为复发。复发时间间隔为 1 ~ 12 年, 平均 4.4 年。74%的患者 5 年内复发。在 40 例同侧复发患者中, 29 例原发癌伴 Dcis, 26 例原发癌伴微钙化。

结论:我们的研究证明, 我们在治疗乳房的 x 线钙化表征方面表现良好。活检率是适当的, 因为很大比例证实了组织学复发。只有 3 次复发被遗漏(占有所有召回的 0.02%)。原发肿瘤中 DCIS 和钙化的存在增加了复发的风险。25%的复发和新发癌症超过了 5 年的随访时间, 这表明我们的健康委员会对治疗过的乳腺癌进行 10 年随访的方案是适当的。

局限性:电子记录前接受治疗的患者无法获得关于先前乳房 x 光检查/病理结果的数据。被召回患者的记录由乳房 x 光检查师手工维护, 可能不包括项目中的所有患者。

PU-2142

来自左冠状动脉分叉形状分析的主形状分量与中度心血管风险队列中的钙评分弱相关

朱宇

四平市中心人民医院

目的:广泛的左冠状动脉分叉角已被报道与冠状动脉疾病的严重程度有关,但它可能不能反映复杂的三维血管形态。本研究旨在利用形状分析对左冠状动脉分叉的形状模式进行分类和量化,并将其与冠状动脉钙化评分相关联。

方法和材料:冠状动脉 CT 血管造影数据来自一个跨通道多中心心血管影像数据库,来自 406 名具有中等心血管风险的受试者。取下分叉旁左冠状动脉中心线并人工矫正。采用 Pearson 相关系数分析冠脉形态定量结果与冠脉钙评分之间的相关性。患者被分为高钙评分组(Agatston 评分>100)和低钙评分组。

结果:scree 测试产生了 5 个最显著的形状模式,解释了 76%的变化。衍生的主成分用于 178 名有临床资料的受试者。LAD 和 LCX 的钙评分随分岔角越宽、Im_1 越短而增加(Pearson 相关系数分别为 LM 和 LCX 的 0.18 和 0.17)。高钙评分组与低钙评分组在形状图案上差异不显著。

结论:左冠状动脉钙评分与左冠状动脉长度和分叉角呈弱相关,与 LCx 单纯近端急性转向无关。

PU-2143

心脏磁共振定量技术诊断心肌淀粉样变性 1 例

刘兴华

重庆大学附属三峡医院

患者 男, 63 岁, 活动后胸闷、气促 6 月, 加重 20 天入院。既往无高血压、糖尿病病史。入院后实验室检查, 急性心肌梗死全定量: 高敏肌钙蛋白-I:1653.00pg/ml (参考值 0-34.2pg/ml); B 型钠尿肽(PRO-BNP): 1546.97pg/ml (参考值 0-300pg/ml)。免疫球蛋白轻链: 免疫球蛋白 K 轻链:1.50g/L (1.7-3.7g/L); 免疫球蛋白 L 轻链:5.49g/L (0.9-2.1g/L); KAPP/LAMB:0.27 (参考值 1.17-2.93)。

MRI 表现: 平扫心脏左右心房增大, 房间隔增厚, 左室壁均匀性增厚, 室间隔舒张末期最大厚度 1.6cm, T2WI-STIR 心肌壁未见明显异常信号。心包少量积液, 右侧胸腔少量积液。心脏电影: 二尖瓣、三尖瓣及主动脉瓣少量反流; 左室舒张功能减退。左室射血分数 (EF) 53.92%。心肌灌注: 左室各壁强化均匀, 未见明显灌注缺损。注射对比剂 10 分钟后延迟扫描: 心腔内血池信号明显减低, 左右心室壁广泛透壁样强化。基于改良 Look-Locker 反转恢复(MOLLI)序列采集对比剂注射前后 T1 mapping 图, 通过 Native T1 和 Post T1 值计算出细胞外容积分数 (ECV)。测量室间隔中层 Native T1 值 1440ms (参考值 1200±45 ms), 增强后 T1 mapping 值约 246ms, 血池内增强前后 T1 mapping 值分别为 (1972ms, 333ms); 用 24 小时内血细胞比容 (Hct=0.385) 进行校正, 计算得出 ECV 值为 0.45 (参考值 27±3%); 以上结果提示左室心肌壁 Native T1 mapping 值和 ECV 值明显升高。

患者行心肌组织活检, 发现心肌间质淀粉样物质沉积, 同时依据患者临床、实验室检查及心脏 MRI 表现诊断为心肌淀粉样变性。

甘油三酯血糖指数检测高血压患者冠状动脉功能性显著狭窄

王舒婷、史振洲、潘虹、柏金泉、张同
哈尔滨医科大学附属第四医院

目的：甘油三酯血糖(TyG)指数是反映胰岛素抵抗的指标，与冠状动脉解剖学狭窄显著相关，但解剖学与功能学的狭窄往往不一致，且功能学对临床结果的影响更大。导致缺血的功能性显著狭窄定义为 CT 血流储备分数(CT-FFR) ≤ 0.80 。但很少有研究探讨 TyG 指数与高血压患者功能性显著狭窄之间的关系。因此，本研究旨在探讨 TyG 指数与高血压患者功能性显著狭窄的关系；并进一步探讨 TyG 指数与冠脉周围脂肪组织衰减(PCATA)和高危斑块特征的关系。

方法：对 1686 名无冠心病病史的高血压患者进行回顾性筛查，这些患者因胸痛而接受冠状动脉 CT 血管造影检查。TyG 指数计算为 $\ln(\text{空腹甘油三酯}[\text{mg/dL}] \times \text{空腹血糖}[\text{mg/dL}]/2)$ 。测量每个患者的狭窄严重程度、高危斑块特征、CT-FFR 和 PCATA。根据 CT-FFR 分为两组：CT-FFR ≤ 0.80 组和 CT-FFR > 0.80 组，建立 Logistic 回归模型探讨高血压患者 TyG 指数与 CT-FFR ≤ 0.80 的关系；其次根据患者 TyG 指数水平的三分位数进行分组，建立线性回归模型探讨 TyG 指数与不同指标的关系。

结果：与 CT-FFR > 0.80 组比较，CT-FFR ≤ 0.80 组 TyG 指数明显升高。Logistic 回归模型显示，在调整其他混杂因素后，TyG 指数与 CT-FFR ≤ 0.80 的风险呈正相关(OR = 1.272, 95% CI 1.029 ~ 1.571, $p = 0.026$)。限制性立方样条法显示 TyG 指数与 CT-FFR ≤ 0.80 风险相关的截断值为 8.92。随着 TyG 指数水平的增加，冠状动脉狭窄 $> 50\%$ 、具备高危斑块特征的患者比例增加。三组间 LAD-PCATA、LCX-PCATA、RCA-PCATA 差异有统计学意义，且与 TyG 指数呈正相关($r = 0.138$; $r = 0.244$; $r = 0.188$; $p < 0.001$)。

结论：TyG 指数与高血压患者 CT-FFR ≤ 0.80 的风险相关，当 TyG 指数超过 8.92 时，CT-FFR ≤ 0.80 的风险增加。此外，TyG 指数水平较高的患者更有可能出现严重狭窄和高危斑块特征，PCATA 与 TyG 指数有良好的相关性。

基于 CT 图像深度迁移学习模型鉴别重症鹦鹉热肺炎

张国正¹、潘科祈²、毛茗¹、王丹琼¹、朱希松¹
1. 衢州市人民医院
2. 绍兴文理学院

背景：我们评估了深度迁移学习 (DLR) 特征在鉴别鹦鹉热重症肺炎中诊断能力。

方法：回顾性分析 99 例重症肺炎患者的 CT 影像资料。以宏基因检查为鹦鹉热诊断金标准，其中 44 例为鹦鹉热重症肺炎患者，非鹦鹉热重症肺炎患者 55 例。利用 resnet18, rennet50, vgg11 进行深度学习网络预训练，然后从重症肺炎患者的 CT 图像中提取深度迁移学习 (DTL) 特征，并采用逻辑回归的算法进行预测模型建立。采用受试者工作特征 (ROC) 评价模型性能，分别评价 DLR 三个模型在鹦鹉热重症肺炎鉴别诊断中的有效性，并使用决策曲线分析 (DCA) 评估其临床价值。

结果：利用 resnet18, rennet50, vgg11 预训练的深度学习网络提取深度迁移学习(DTL)得到 32 个 DTL 特征。采用逻辑回归 (LR) 算法进行预测模型建立，比较了不同分类模型的性能。resnet18, rennet50, vgg11 预训练的 DLR 模型在训练队列的曲线下面积 (AUC) 分别为 0.95、0.88、0.87，在测试队列中的 AUC 分别为 0.88、0.86、0.92。DCA 显示其有较高的临床价值。

结论：利用 3 个预训练模型提取深度迁移学习特征并采用逻辑回归算法建立的预测模型对于鹦鹉热重症肺炎的鉴别有较好的诊断能力，其中以 resnet18 迁移学习建立的预测模型鉴别能力最强，可以成为辅助临床医生的潜在决策工具。

磁共振 DWI 在鉴别胸腺上皮性肿瘤与胸腺淋巴瘤中的应用价值

兰江涛、张杰、马宇卉、胡玉川、崔光彬
空军军医大学第二附属医院

【摘要】目的：探讨磁共振 DWI 表观扩散系数（ADC）值对胸腺上皮性肿瘤和胸腺淋巴瘤的鉴别诊断价值。**方法：**回顾性分析 2019 年 12 月至 2023 年 4 月经手术病理证实的 48 例胸腺瘤、17 例胸腺癌和 25 例胸腺淋巴瘤的 DWI 及临床资料。采用 Kruskal-Wallis H 检验和 Mann-Whitney U 检验比较三组间 ADC_{min} 与 ADC_{total} 值的差异，并采用 ROC 曲线分析上述参数对胸腺瘤、胸腺癌和胸腺淋巴瘤的鉴别诊断价值。**结果：**胸腺瘤、胸腺癌和胸腺淋巴瘤的 ADC_{min} （1.39, 0.94 及 $0.76 \times 10^{-3} \text{ mm}^2/\text{s}$ ）和 ADC_{total} （1.51, 1.21 及 $0.60 \times 10^{-3} \text{ mm}^2/\text{s}$ ）值在三组间总体上差异均具有统计学意义（ $P < 0.001$ ）；进一步两两比较，除 ADC_{total} 在胸腺瘤和胸腺癌组间差异无统计学意义外（ $P = 0.056$ ）， ADC_{min} 与 ADC_{total} 值在不同组间差异均具有统计学意义（ $P < 0.05$ ）。采用 ADC_{min} 和 ADC_{total} 值鉴别胸腺瘤与胸腺淋巴瘤的曲线下面积（AUC）、敏感度、特异度和截断值分别为 0.898、89.6%、72.0%和 $0.97 \times 10^{-3} \text{ mm}^2/\text{s}$ ，及 0.968、97.9%、84.0%和 $0.94 \times 10^{-3} \text{ mm}^2/\text{s}$ ；在鉴别胸腺癌与胸腺淋巴瘤上，AUC、敏感度、特异度和截断值分别为 0.694、64.7%、68.0%和 $0.92 \times 10^{-3} \text{ mm}^2/\text{s}$ ，及 0.925、94.1%、84.0%和 $0.93 \times 10^{-3} \text{ mm}^2/\text{s}$ 。**结论：**胸腺瘤、胸腺癌和胸腺淋巴瘤的 ADC_{min} 值和 ADC_{total} 值存在显著统计学差异，磁共振 DWI 对鉴别胸腺上皮性肿瘤和胸腺淋巴瘤具有重要临床应用价值。

某省 6 年军校招生体检活动性肺结核情况分析

胡小梅、邓士杰
联勤保障部队 921 医院

【摘要】目的 通过对 2017 年至 2022 年 6 个年度某省军校招生体检检出的活动性肺结核数据回顾性分析，讨论 X 线、CT 表现及流行病学特征。**材料与方法** 对 13832 例胸部 X 线数据，5 例肺部 CT 数据进行回顾性分析。**结果** 胸部 X 线发现 15 例肺部异常，占比 0.11%，其中 5 例 CT 进一步检查，4 例疑似肺结核，占比 0.03%，1 例胸膜增厚伴钙化为陈旧性病变。**结论** 肺结核胸部 X 和 CT 均有特征性，CT 对病变范围和活动性评价更准确，推荐在体检用 CT 进一步确诊。散发和隐匿为其流行病学特征。结合地域分析，发病可能与经济营养状况有关。

ZTE 成像技术和常规 3.0T MR 序列检测肺结节诊断性能

王晓艳、张焱、程敬亮、汪凯宇
郑州大学第一附属医院

目的：探讨零回波时间(zero echo time,ZTE)成像技术和常规 3.0T MR 序列评估肺结节诊断效能，并比较不同序列肺结节诊断效能。

方法：在这项前瞻性研究中，纳入 2022 年 4 月至 2022 年 7 月期间经胸部 CT 检查诊断为肺结节患者，同时行胸部 ZTE 序列、常规 3.0T MR 序列扫描。以 CT 为参照，评估灵敏度、病变特征与 CT 一致性，不同序列对肺结节诊断效能。连续变量用 $\text{mean} \pm \text{SD}$ 或 IQR 中位数表示，分类变量用数字（%）表示。采用类内相关系数（Intra-class correlation coefficient, ICC），Pearson 相关分析，Bland-Altman 分析进行分析。P<为 0.05，视为差异有统计学意义。

结果：126 名患者中，男性 64 人，女性 62 人。CT 检查、ZTE 分别诊出 176 个、140 个结节。ZTE 显示显示胸膜凹陷及内部支气管充气征与 CT 检查一致性较高，显示病变类型、形状与 CT 检查一致性中等，ZTE 和 CT 对于最大范围、实性范围测量有较高一致性。ZTE、T1-VIBE、T2--BLADE、T2-HASTE 检出肺结节总体灵敏度分别为 82.95%、54.42 %、81.01%和 63.21%，ZTE 有更高敏感度。在< 4 mm 亚组中，所有序列灵敏度均为 0。在 4-8mm 亚组中，ZTE 灵敏度是 57.62%。在 8-10 mm 亚组中，T2WI-BLADE 灵敏度是 93.03%。在>10 mm 亚组中，ZTE、T2WI-BLADE 及 HASTE 序列均为 100%。ZTE 联合 T1-VIBE、T2-BLADE 和 T2-HASTE 的肺结节总体灵敏度分别为 82.11%、85.12%和 83.67%，ZTE 联合 T2-BLADE 的灵敏度最高。

结论：ZTE 显示病变特征与 CT 有较高一致性，检测肺结节灵敏度高于其他常规序列，ZTE 联合 T2-BLADE 可提高肺结节的检测灵敏度和显示性能。将 ZTE 序列作为常规 MRI 序列补充，用于肺结节的诊断是可行的。

PU-2149

Single breath-hold compressed sensing CMR cine for assessment of ventricular function and strain in heart failure patients

Siyang Ma, Fuyan Wang

Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objectives: Heart failure (HF) patients often cannot tolerate multiple breath-holding during cardiovascular magnetic resonance (CMR) examination. The cine image quality is often poor and exhibits unintended artifacts. Exploring the potential of single breath-hold compressed sensing (CS) cine as an efficient modality for replacing conventional balanced steady-state free precession cine (bSSFP) cine in assessing cardiac function parameters and strain parameters in heart failure (HF) patients.

Methods: We prospectively recruited 28 HF patients and 33 healthy participants (HP) for CMR examination using routine bSSFP and CS-based cine sequence. For both sequences, the function parameters and strain values of the left ventricles (LV) and the right ventricles (RV) were assessed and compared between the HF group and HP group. The differences in cardiac parameters between two sequences were analyzed using Paired T-tests. Intragroup correlation coefficient (ICC) was calculated to verify the reproducibility of CS cine ventricular quantitative parameters.

Results: In both HP and HF groups, as for function parameters, stroke volume (SV), ejection fraction (EF), cardiac output (CO), and cardiac index (CI) of LV were lower in CS-cine ($p < 0.001$). However, the above parameters of RV showed no difference between two sequences ($p > 0.1$). Bi-ventricular global radial strain (GRS), global radial strain (GCS), and global longitudinal strain (GLS) were all lower in CS-cine ($p < 0.001$). Though CS-cine tends to underestimate the real values when calculating cardiac-related parameters, most commonly used parameters have good correlations with those of bSSFP-cine. (LVEF: HP 60.6% vs 57.1%, $r = 0.81$; HF 40.7% vs 36.9%, $r = 0.96$. LVGRS: HP 33.6% vs 26.2%, $r = 0.82$; HF 17.9% vs 15.1%, $r = 0.96$. LVGCS: HP -19.3% vs -16.5%, $r = 0.79$; HF -12.2% vs -10.8%, $r = 0.96$. LVGLS: HP -16.8% vs -13.0%, $r = 0.45$ HF -11.2% vs -10.5%, $r = 0.90$. $P < 0.001$).

Conclusions: Single breath-hold CS cine scanning offers a time-efficient cardiac function and strain assessment alternative, and it demonstrates good agreement with conventional cine

sequence analysis. Thus, CS technique has great application value in collecting cine images, especially for patients with HF and breath-hold difficulty.

PU-2150

CT imaging findings of pulmonary sarcomatoid carcinoma

Hui Zhu

The Affiliated Suzhou Hospital of Nanjing Medical

OBJECTIVE. The objective of our study was to assess the CT features of pulmonary sarcomatoid carcinoma(PSC). **MATERIALS AND METHODS.** 9 patients with primary pulmonary sarcomatoid carcinoma confirmed by pathology were included in this study. The clinical and CT findings of these patients were retrospectively reviewed. All of them undertook CT examinations and 6 of them undertook contrast-enhanced CT scanning. **RESULTS.** Of 9 patients, 8 were male and 1 was female. 6 untreated patients progressed rapidly and died within a short period of time. 7 of 9 cases were located in the periphery of the lung(77.8%). Most lesions showed necrosis and obvious enhancement. **CONCLUSION.** Findings of our study suggest that PSC are fast-growing, and show obvious enhancement on CT images, which could be beneficial for diagnosis.

PU-2151

多发心胸金属异物一例

张小勇、张琴、蒙宇宏、肖扬、王涛、王荣品

贵州省人民医院

患者，男，26岁，既往吸毒史8年，平素健康，2月前拘留期间自行将“2根注射针及1根订书针”刺入左胸，长约3-4cm，于“拘留所医务室”行相关检查后未予特殊处理。1周前患者再次将“2根订书针”刺入左侧胸壁，长约6-7cm，当时未感胸闷、呼吸困难等不适，2天前患者感明显胸闷、呼吸困难，就诊于我院急诊。查体：左前胸壁见散在针孔，可触及散在皮下气肿，左上肺呼吸音稍低。平扫CT示：左侧液气胸，左肺压缩约30-40%；双肺渗出；左侧第3-5前肋间隙、左心室、肝左叶及左侧膈肌多发针状异物；左侧腋窝及胸壁皮下软组织积气。急诊以“心脏异物”，收入心外科。入院后积极完善相关术前准备，由心外科、胸外科联合行心脏异物取出术、左侧开胸探查，左肺内、胸壁及左侧膈肌异物取出术。手术所见：心尖部可触及异物，电凝切开心脏表面脂肪组织后，取出2.0cm左右金属针一枚。后由胸外科行左胸探查，在左腋前线第4肋间、左腋前线第3肋间胸壁肌层及左侧后肋膈角处取出钢针各一枚，长度分别为3cm、3cm、2.5cm，手术过程顺利。术中出血100ml，自体血回输50ml。术后生命体征平稳。

讨论：心胸异物较为少见，既往的文献报道主要以创伤和医源性为主，本例报道中，患者自残是造成心胸异物的主要原因。由于心脏属于不断运动器官，异物可能导致心脏破裂，引起心包填塞，异物刺破胸膜可出现气胸，情况均较为凶险。笔者推测第一次三枚钢针由胸壁刺入后，随着呼吸及心脏的运动，分别进入了左心室壁、肝左叶内、左肋膈角内；第二次钢针刺破胸壁引起气胸是患者就诊的原因；术中所见钢针的大小、位置与CT描述基本相符。本例患者CT检查时采用的大螺距心电图控模式，心脏搏动伪影和呼吸伪影均较小，清晰显示了心脏、胸壁、肝脏（图F）及脊柱旁膈肌内的多枚金属异物。

心胸异物少见且情况多较为凶险，采用合适的检查方法对准确判断异物位置对于指导治疗具有重要意义。

能谱 CT 定量分析在肺部肿瘤中的临床应用研究

宁先英、李浩、吴红英、雷子乔
华中科技大学同济医学院附属协和医院

目的:探讨 GE 宝石能谱 CT 在肺部良恶性肿瘤鉴别的影像学应用价值。方法:选取临床诊断为肺部占位需 CT 增强检查进一步明确诊断的病例进行能谱 CT 增强扫描并进行定量分析。结果:恶性组与良性组的动脉期 NIC 分别为 0.0810.016 和 0.073 0.011, 恶性组与良性组的静脉期 NIC 分别为 0.282 0.030 和 0.226 0.030, 恶性组与良性组的斜率 K 分别为 1.339 0.491 和 1.063 0.235, 三组能谱参数均有统计学差异。结论:能谱 CT 定量分析在肺部良恶性肿瘤鉴别上具有一定价值。

PU-2153

定量 CT 评价慢性阻塞性肺疾病肺血管与气道微观量化指标的纵向变化

杨晓娜¹、朱力²
1. 宁夏医科大学
2. 宁夏医科大学总医院

目的 利用 CT 定量分析技术,纵向观察 COPD 患者肺功能和 CT 定量指标的变化情况,探讨其在病情进展评价中的应用价值。方法 本研究为回顾性研究。搜集 2018 年 1 月至 2022 年 12 月确诊的 COPD 患者 99 例,男性 65 例,女性 34 例,平均年龄 (64.6±11.8) 岁。所有患者均行两次胸部 CT 检查及肺功能检查,间隔时间平均 (33.4±10.7) 月,且每次两项检查时间间隔不超过 2 周。使用 AVIEW 后处理工作站进行定量分析,对肺气肿、肺血管和气道进行分割、量化,得到 CT 定量参数:全肺容积、LAA%、Ntotal/LSA、N<5mm²/LSA、TBV、BV5、BV5/TBV、Pi10、全肺气道壁体积以及第 5、6 级小气道 Pi10、壁厚和壁面积百分比 (WA%),所有 CT 定量参数均进行体表面积 (BSA) 标化。采用配对 t 检验比较首次和随访 CT 定量参数和肺功能指标;不同严重程度 COPD 患者组间差异采用非参数 Kruskal-Wallis H 检验。Pearson 相关性分析检验 CT 定量参数与肺功能指标之间的相关性。结果 肺功能参数呈进行性下降,FVC、FEV1、FEV1/FVC 随访均低于首次,差异具有统计学意义 (P<0.05)。CT 定量参数 Ntotal/LSA、N<5mm²/LSA 随访均低于首次,随分级升高而减小;LAA%、Pi10 以及全肺气道壁体积随访均高于首次,随分级升高而增大,差异具有统计学意义 (P<0.05)。LAA%、Pi10、全肺壁体积与肺功能参数呈负相关性 (r=-0.23~-0.69, P<0.05); Ntotal/LSA、N<5mm²/LSA 与肺功能参数呈正相关性 (r=0.27~0.46, P<0.05)。结论 定量 CT 参数 LAA%、Ntotal/LSA、N<5mm²/LSA、Pi10 和全肺壁体积能够较好的反映 COPD 患者肺气肿、气道和血管的纵向变化,可能会在临床治疗方案的选择以及预后的评价中发挥重要的作用。

PU-2154

基于第三代双源 CT 双低检查技术在肺栓塞成像的临床应用研究

杨明、雷子乔
华中科技大学同济医学院附属协和医院

目的 探讨第三代双源 CT 大螺距 70kV 联合超低对比剂用量 16ml 在肺栓塞低辐射剂量成像的临床应用价值。

资料与方法 将 83 例临床可疑肺栓塞行 CT 肺动脉成像患者随机分为两组：双低组 (n=47)：管电压 70kV,螺距 2.2, 对比剂总量 16ml；常规组 (n=36)：管电压 100kV,螺距 1.2, 对比剂总量 60ml。记录两组的容积 CT 剂量指数和剂量长度乘积以计算有效剂量 (ED)，测量各级肺动脉增强 CT 值、背景噪声及肌肉 CT 值以计算信噪比 (SNR)、对比噪声比 (CNR)。两组的总体图像质量和上腔静脉引起的线束硬化伪影均采用 3 级评分进行主观评价。统计学方法采用卡方检验和非参数秩和检验。

结果 两组患者之间性别、年龄、身高、体重、体质量指数 (body mass index, BMI)、肺栓塞比例及各级肺动脉增强 CT 值均无统计学差异 ($P>0.05$)。双低组 ED 为 $(0.76\pm0.13)\text{mSv}$,显著低于常规组的 $(1.91\pm0.54)\text{mSv}$ ($Z=-5.23$, $P<0.001$)。虽然双低组背景噪声明显高于常规组,且 SNR 和 CNR 均显著低于常规组 ($P<0.001$),但两组总体图像质量评分无明显差异 ($Z=-1.41$, $P=0.16$),且双低组上腔静脉引起的线束硬化伪影明显低于常规组 ($Z=-5.15$, $P<0.001$)。

结论 第三代双源 CT 大螺距 70kV 联合 15ml 超低对比剂用量可以显著降低对比剂线束硬化伪影对右肺动脉、右肺上叶动脉的干扰,保证肺栓塞诊断图像质量,能大幅度降低辐射剂量约 60%,同时减少 73%对比剂总量。

PU-2155

Automated Detection and Classification of Coronary Atherosclerotic Plaques on Coronary CT Angiography Using Deep Learning

Jing liang

Nanjing Drum Tower Hospital, Affiliated Hospital of Medical School, Nanjing University

Purpose: To evaluate the performance of a deep learning algorithm for detecting and classifying coronary atherosclerotic plaques on coronary computed tomographic angiography (CCTA) images compared to physicians with varying levels of clinical experience in coronary artery disease (CAD) diagnosis.

Methods: A total of 106 patients suspected of CAD were retrospectively evaluated by the deep learning algorithm and four independent physicians with different levels of clinical experience. Additionally, 563 patients suspected of CAD were analyzed for plaque classification using the deep learning algorithm and compared to results from expert radiologists. Plaques were classified as calcified, non-calcified, or mixed.

Results: The deep learning algorithm had higher sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and accuracy compared to physicians with ≤ 5 years of clinical experience in CAD diagnosis for detecting coronary plaques. The overall sensitivity, specificity, PPV, NPV, accuracy, and κ for plaque classification were 94%, 90%, 70%, 98%, 90%, and 0.74 (95% CI: 0.70, 0.78), respectively, indicating good performance.

Conclusion: The deep learning algorithm demonstrated reliable and accurate detection and classification of coronary atherosclerotic plaques on CCTA images. It has the potential to improve the proficiency of physicians, junior radiologists, and junior interventional cardiologists in CAD diagnosis and facilitate efficient triage of patients with acute coronary symptoms.

PU-2156

人工智能辅助诊断软件与影像医师对长径 $\geq 5\text{mm}$ 肺结节检测效能的比较

杨帆、时高峰、杨丽
河北医科大学第四医院

目的 比较肺结节人工智能辅助诊断软件和影像医师对长径 $\geq 5\text{mm}$ 结节的检测效能, 并分析影响医师检测结果的影响因素。

方法 回顾性分析河北医科大学第四医院 2017 年 10 月-12 月 649 例体检人员 1mm 薄层胸部 CT 影像资料, 分别采用医师检测法(医师组)及 AI 检测法(AI 组)对图像进行分析。以金标准(由一名具有 15 年影像诊断经验的高年资医师结合医师组及 AI 组检出结果及随访情况最终确认长径 $\geq 5\text{mm}$ 结节的数量及特征)判定得出 316 例受检者的 441 个阳性结节作为研究对象。计算医师组及 AI 组结节检测方式的总体检出率、阳性预测值、受检者人均误诊结节数。

结果 经金标准确认结节 441 个, 医师组检出结节 316 个, 其中真结节 301 个, 假结节 15 个, 总体检出率 68.3%, 阳性预测值 95.3%, 人均误诊结节数 0.05 个/人; AI 组检出结节 597 个, 其中真结节 429 个, 假结节 168 个, 总体检出率 97.3%, 阳性预测值 72.9%, 人均误诊结节数 0.53 个/人。AI 组较医师组总体检出率提高约 29%, 医师组假结节数目少于 AI 组, 结节阳性预测值高于 AI 组。 $5\text{mm} \leq \text{长径} < 8\text{mm}$ 、实性及纯磨玻璃结节、各位置肺结节检出率 AI 组均高于医师组, 且差异均有统计学意义($P < 0.05$)。结节密度(实性或纯磨玻璃)、短径、外带为医师组结节检出的独立影响因素。

结论 AI 在 $5\text{mm} \leq \text{长径} < 8\text{mm}$ 结节范围内可为提高医师检测效能起到重要的辅助作用, 但其检测结果仍离不开医师的判断; 结节的密度、短径及位置可以影响医师对结节的检出。

PU-2157

后纵隔滑膜肉瘤误诊为神经鞘瘤一例

卢鹏超、代川川
中国人民解放军空军军医大学第二附属医院

目的 分析一例误诊为神经鞘瘤的纵隔滑膜肉瘤 (mediastinal synovial sarcoma, MSS), 提高放射科医师对本病的认识, 减低其误诊率。

方法 回顾性分析我院就诊的一例后纵隔肿物的临床及影像学资料, 结合文献进行复习。

结果 患者, 男, 32 岁, 主因“发现右后上纵隔占位性病变一月余”入院, 平素偶有右前上胸部及右肩背部疼痛不适, 呈隐痛, 无胸闷、心慌、气短等症状。胸部 CT 平扫+增强检查: 右后上纵隔肿物, 大小约 $2.8\text{cm} \times 3.7\text{cm} \times 3.1\text{cm}$, 其内密度欠均匀, 边缘伴弧形钙化影, 增强扫描明显不均匀强化。胸腔镜下术中所见: 右后上纵隔近胸廓入口处见大小约 $3.0\text{cm} \times 3.0\text{cm} \times 2.0\text{cm}$ 肿物, 质地韧, 与右侧无名静脉关系密切, 右肺上叶可见数枚薄壁大泡, 遂行胸腔镜辅助右肺肺大泡楔形切除+胸膜粘连烙断+右后上纵隔肿物切除术。病理: (右后上纵隔) 恶性肿瘤, 结合组织学特点、免疫表型特征及分子病理学检测结果考虑为滑膜肉瘤, 局部侵及周围纤维脂肪及肺组织。

结论 滑膜肉瘤是一种罕见的软组织肉瘤, 常见的发病部位是关节周围组织, 也可以发生在其他部位。MSS 极为罕见, 最常发生在前纵隔, 多见于青少年至青壮年(15~40 岁), 男性多于女性。临床表现取决于肿瘤的部位、大小、组织病理学特征和肿瘤分化程度。初期可以是无症状的; 晚期可以有咳嗽(21%)、胸痛(20%)、咯血(20%)等; 其他症状包括呼吸困难、乏力、体重减轻、肺萎陷、胸腔积液、心包积液和上腔静脉阻塞。CT 表现为不均匀等或低密度囊实性肿块, 可见边缘性或偏心性钙化; MR 的 T2WI 表现为表现出亮、暗、灰三种不同的信号特征, 即所谓的“三重信号征”, 分别

代表肿瘤、出血、坏死；肿瘤侵袭性强，复发率高，可发生邻近结构侵犯和血型播散，淋巴结肿大少见。MSS 与纵隔的其他肿瘤鉴别困难，最终诊断依赖组织病理学检查。

PU-2158

A study on the risk assessment and screening of coronary heart disease using big data of coronary artery calcification score

Lulu Li

Anhui Public Health Clinical Center (The First Affiliated Hospital of Anhui Medical University)

Objectives To explore the feasibility of using coronary artery calcification score(CACS) analysis to predict the degree of coronary artery stenosis.

Methods Scanning data of 1246 patients with clinically suspected coronary heart disease were retrospectively collected, including coronary CT arterial imaging (CTA) and CACS analysis data. We measured and recorded the degree of coronary artery stenosis and coronary artery CACS. Coronary artery calcification score were compared between groups using the Mann-Whitney U test. The Roc curve was used for analysis to understand the area under the curve of different groups and calculate the Yoden index and critical value.

Results According to the results, when the calcification score was less than 0.4, the coronary artery could be considered not narrow. Mild coronary artery stenosis is considered when the calcification score is in the range of 0.4 to 83. When the calcification score was more than 83, we considered moderate to severe coronary artery stenosis, and the degree of lumen stenosis was greater than 50%, which had certain clinical significance.

Conclusions Coronary artery calcification scores can be used to evaluate the degree of coronary artery stenosis.

PU-2159

MSCT study for adult esophageal diverticulum with secondary broncho-esophageal fistula

Xin Dong,Dianbo Cao

The First Hospital of Jilin University

Background: Broncho-esophageal fistula (BEF) secondary to esophageal diverticulum is a rare clinical condition, which is often misdiagnosed for a long time. The aim of our study is to summarize and clarify the advantages of MSCT in diagnosing BEF secondary to esophageal diverticulum.

Methods: We retrospectively analyzed patients clinically diagnosed with BEF from January 2005 to January 2022 at Jilin University First Hospital. Only those patients with BEF secondary to esophageal diverticulum and complete clinical data met our enrolled standard. All patients' clinicopathologic characteristics and MSCT features were systemically evaluated.

Results: 17 patients were eligible for our cohort study, including male 10 and female 7. The patient's mean age was 42.3 ± 12.5 . The chronic cough occurred in all seventeen patients and bucking following oral fluid intake was documented in nine patients. MSCT distinctly suggested the fistulous tract between the bronchi and the esophagus in all patients. The mean diameter of the orifices in the wall of the esophagus was 4.40 ± 1.81 mm. The orifice in the midthoracic esophagus side was 15 cases and 2 cases at the lower thoracic esophagus. The involved bronchus included 13 cases at the right lower lobe bronchus, 1 at the right middle lobe bronchus and 3 at the left lower lobe bronchus. The contrast agent was observed in the pulmonary

parenchyma in 10 of 13 patients who underwent esophagogram. No definite fistula was observed in 3 of 11 who underwent gastroscopy, while the intra-operative findings supported the existence of fistula.

Conclusions: BEF secondary to esophageal diverticulum tends to occur between the midthoracic esophagus and the right lower lobe bronchus. Compared with esophagography and gastroscopy, MSCT shows more comprehensive information about the fistulous shape, size, course and lung involvement, which are helpful for establishing diagnosis and guiding subsequent treatment.

冠状动脉脂肪衰减指数值与斑块组成和特征的相关性：基于人工智能软件的测量方法

景梦园、周俊林
兰州大学第二医院

目的 冠状动脉周围脂肪组织 (Pericoronary adipose tissue, PCAT) 为无创性评估血管炎症打开了一扇新的窗口。本研究旨在探讨稳定型冠状动脉疾病 (Coronary artery disease, CAD) 患者 PCAT 脂肪衰减指数 (Fat attenuation index, FAI) 值与斑块组成体积分数和特征之间的相关性。

材料与方法 回顾性纳入 2022 年 10 月至 2023 年 2 月期间在本院接受冠状动脉 CT 血管造影 (Coronary computed tomography angiography, CCTA) 的稳定型 CAD 患者, 共 173 例 (310 个病变)。斑块成分体积分数和 FAI 值是基于人工智能软件测量的。斑块特征评估包括斑块类型、位置、长度、体积、最小管腔面积 (Minimum lumen area, MLA) 和最小管腔狭窄度 (Minimum lumen degree, MLD)。使用皮尔逊或斯皮尔曼相关分析和主成分分析探讨了 FAI 值与斑块组成体积分数和特征之间的关系。结果 本研究中, 患者的平均年龄和体重指数分别为 60.51 ± 0.80 岁和 24.53 ± 0.23 kg/m²。其中, 男性 92 人, 吸烟者 80 人, 高血压 109 人, 高血糖 60 人, 高脂血症 109 人。相关性分析显示, 斑块所在冠状动脉近端的 FAI 值与斑块类型呈正相关 ($rs=0.135$, $P=0.017$), 与钙化成分体积分数呈负相关 ($rs=-0.192$, $P=0.001$), 但与斑块位置、长度、体积等无关 ($rs=-0.009$ 、 0.087 、 0.068 、 0.024 、 0.045 、 0.107 、 0.104 、 0.109 ; $P>0.05$)。斑块周围 FAI 值与脂质成分体积分数 ($rs=0.451$, $P=0.000$)、纤维脂质成分体积分数 ($rs=0.393$, $P=0.000$) 和纤维成分体积分数 ($rs=0.415$, $P=0.000$) 有很强正相关性, 而与钙化成分体积分数有很强负相关性 ($rs=-0.496$, $P=0.000$)。

PU-2161

多排 CT 在成人动脉导管未闭并肺动脉高压覆膜支架植入前后的价值

曹成瑛
青海省心脑血管病专科医院

目的 探讨多排螺旋 CT 血管造影 (CT angiography CTA) 对 12 例腔内隔绝术治疗成人巨大动脉导管未闭 (patent ductus arteriosus PDA) 的术前血管评估, 以及术后效果的观察。方法回顾性分析 2010 年 9 月-2015 年 3 月在我院接受主动脉覆膜支架隔绝治疗的 12 例 (男 7 例, 女 5 例) 巨大 PDA 成人患者的手术前后的 CTA 资料, 其中男性 7 例, 女性 5 例, 年龄 18 岁~48 岁, 中位数 32 岁, 测量术前动脉导管肺动脉侧及主动脉侧的直径、主动脉弓降部动脉导管以近及远端的直径、肺动脉直径, 观察术后动脉导管的封闭效果及支架位置, 随访时间 1~18 个月。结果动脉导管主动脉侧直径 (19.2~30.3)mm 最窄径为 (18.5~26.5)mm。术后随访过程中, 3 例少量残余分流, 其余支架位

置正常, 未见造影剂渗漏。结论 多排螺旋 CT 血管造影为腔内隔绝术治疗成人巨大动脉导管未闭手术前后提供详细解剖学信息, 术前能够评估能否行覆膜支架胸主动脉腔内隔绝术, 以及预判支架大小; 术后能够观察支架位置, 评估治疗效果。

不同管电压下前瞻性心电门控双源 CT 诊断冠心病的比较分析

贾蕾、高律萍、曹成瑛
青海省心脑血管病专科医院

本研究探讨前瞻性心电门控双源 CT 低管电压在冠心病诊断中的应用价值。回顾性选取 60 例冠心病患者, 根据管电压分为观察组 (管电压 80kV) 和对照组 (管电压 100kV), 观察两组诊断情况、图像质量等差异。观察组和对照组诊断冠状动脉狭窄的灵敏性、特异性、准确性、阳性预测值、阴性预测值、冠状动脉节段图像质量评分比较, 差异无统计学意义 ($P>0.05$)。观察组和对照组升主动脉根部、右冠状动脉开口、左冠状动脉开口管腔 CT 值、信噪比 (SNR) 和对比噪声比 (CNR) 比较, 差异无统计学意义 ($P>0.05$)。观察组剂量长度乘积 (DLP)、容积 CT 剂量指数 (CT-DIvol) 和有效辐射剂量 (ED) 明显低于对照组 ($P<0.05$)。观察组心率 <75 次/分患者冠状动脉节段图像质量优于心率 ≥ 75 次/分患者 ($P<0.05$)。因此, 前瞻性心电门控双源 CT 低管电压在冠心病诊断中有较好的应用价值, 具有图像质量好、辐射剂量低等优点, 同时心率会影响图像质量。

大螺距高 KV 低剂量 CT 扫描技术在急诊胸部的应用

冯志慧
海南省人民医院

冯志慧 海南医学院附属海南医院 海南省人民医院 13907534744 fengzhihui198992@163.com

目的: 探讨 64 排 CT 大螺距高 KV 低剂量在急诊胸部扫描的应用价值。方法: 选取本院 2010 年 1 月—2011 年 5 月, 急诊分诊, 病史写于胸痛、呼吸困难、咯血、心衰、绿色通道患者 1000 例, 行大螺距高 KV 低剂量 CT 扫描, 采集: 飞利浦 64 排 128 层螺旋 CT, 在夜班急诊中采用大螺距高 KV 低剂量 CT 扫描, 经过医生组的对比图像结果, 在大螺距高 KV 低剂量 CT 扫描与常规 CT 扫描对比, 常规 CT 扫描方案图形噪声较小, 但是图像的总体质量太差, 而高 KV 低剂量 CT 扫描与常规 CT 扫描图像噪声稍大, 但是图像的总体质量较好; 因为在急诊胸痛、呼吸困难、咯血、心衰、绿色通道患者, 如果扫描速度不够快, 呼吸运动伪影和患者的运动伪影很重, 所以采用了大螺距高 KV 低剂量 CT 扫描技术, 在加大螺距的时候, 适当加大 KV, 就可以达到降低辐射剂量的效果; 常规 CT 扫描需要 10S 左右, 而大螺距高 KV 低剂量 CT 扫描只需要 3S 左右, 所谓天下武功, 唯快不破, 只要你的扫描速度够快, 就可以避免 90% 以上的伪影。为了患者好, 再不影响诊断结果的前提下, 提高扫描速度, 降低辐射剂量, 提高检查效率。结果: 增加螺距缩短了扫描时间, 减少患者暴露于 X 射线下的时间, 减少了辐射剂量, 但同时却会使噪声增加。这是中低端的 CT 设备的一个缺陷, 在高端 CT 设备上, 基本不存在扫描速度慢的情况。以上情况的分析, 仅对于 64 排及以下的 CT 设备, 不足之处是, 对于需要精准手术患者不能使用。

PU-2164

CT-FFR 参数及冠状动脉周围脂肪衰减指数特征预测青海地区心肌缺血患者再灌注损伤的价值

罗焕、高律萍、曹成瑛、杨陵武、朱友义
青海省心脑血管病专科医院

【摘要】目的 探究基于 CT 的血流储备分数（CT-FFR）参数及冠状动脉周围脂肪衰减指数（FAI）特征预测青海地区心肌缺血患者再灌注损伤的价值。**方法** 回顾性分析 2022 年 1 月到 2023 年 1 月 65 例在我院择期行经皮冠状动脉介入治疗的冠心病患者临床资料。患者均在术前进行冠状动脉 CT 血管成像检查，在治疗后 8h 内经心肌彩色多普勒超声心动图评估将发生再灌注损伤作为再灌注损伤组，未发生再灌注损伤作为非再灌注损伤组。对比分析两组一般资料、术前 CT-FFR 参数、FAI，分析 CT-FFR 参数、FAI 对心肌缺血再灌注损伤的预测价值以及心肌缺血再灌注损伤的影响因素。**结果** 再灌注损伤组多支血管所占比例高于非再灌注损伤组，术后 TIMI 3 级所占比例低于非再灌注损伤组（ $P<0.05$ ）。再灌注损伤组 CT-FFR 值小于非再灌注损伤组，FAI 大于非再灌注损伤组（ $P<0.05$ ）。经受试者工作特征曲线（ROC）分析得出，CT-FFR 值、FAI 预测心肌缺血患者再灌注损伤的最佳截断值分别为 0.76、-78.54，此时两者联合预测心肌缺血患者再灌注损伤的曲线下面积（AUC）为 0.807，灵敏度 81.5%、特异度 76.3%。经 Logistic 回归分析得出，多支血管、CT-FFR 值、FAI 是心肌缺血患者再灌注损伤的危险因素（ $P<0.05$ ），术后 TIMI 3 级为其保护性因素（ $P<0.05$ ）。**结论** 青海地区心肌缺血患者再灌注损伤后 CT-FFR 值、FAI 均下降，两者联合检测可为青海地区心肌缺血患者再灌注损伤提供较准确的预测。

PU-2165

CCTA 冠周 FAI 联合上胸部补充扫描与图像大视野重建在冠心病筛查中的应用价值

贾蕾
青海省心脑血管病专科医院

本文探讨冠状动脉 CT 血管成像（CCTA）冠状动脉周围脂肪衰减指数（FAI）联合上胸部补充扫描与图像大视野重建在冠心病筛查中的应用价值。选取 2020 年 1 月至 2022 年 1 月在我院治疗的可疑冠心病患者 80 例，在我院接受 CCTA 及 CAG 检查。经 CAG 确诊，冠心病病患者 56 例，非冠心病患者 24 例。冠心病组 FAI 值明显低于非冠心病组（ $P<0.05$ ）。冠心病组重度狭窄 FAI 值明显低于轻度和中度狭窄（ $P<0.05$ ）。FAI 值与狭窄程度成负相关（ $r=-0.511$ ， $P<0.05$ ）。FAI 值预测诊断冠心病的 ROC 曲线下面积为 0.947， $P<0.05$ 。大视野重建后发现心外病灶患者 46 例，行胸部补充扫描后，另增加发现心外病灶患者 12 例。共计发现 73 处病灶。CCTA 冠周 FAI 在诊断冠心病中有较好的价值，同时结合上胸部补充扫描与图像大视野重建，有助于发现心外病灶。

PU-2166

Radiomics nomogram for preoperative differentiation of pulmonary pure invasive mucinous adenocarcinoma from mixed mucinous/non-mucinous adenocarcinoma

Junjie Zhang¹, Qian Xu², Ligang Hao¹, Fengxiao Gao¹

1. Xing Tai People's Hospital
2. The Fourth Hospital of Hebei Medical University

Objective: To develop and validate predictive models using clinical parameters, radiomic features and a combination of both for preoperative differentiation of pulmonary pure invasive mucinous adenocarcinoma (pIMA) from mixed mucinous/nonmucinous adenocarcinoma (mIMA).

Method: From January 2017 to July 2023, 193 pure IMA and 111 mixed IMA were retrospectively analyzed at The Fourth Hospital of Hebei Medical University and Xing Tai People's Hospital. From contrast-enhanced computed tomography (CT), 1037 radiomic features were extracted. The patients were randomly divided into a training group and a test group (n=213 and 91, respectively) in a 7:3 ratio. For the selection of radiomic features, the least absolute shrinkage and selection operator (LASSO) algorithm was used. In this study, three radiomics prediction models were applied: logistic regression (LR), support vector machine (SVM) and random forest (RF). The best performing model was adopted, and the radiomics score (Rad-score) was then calculated. The clinical model was developed using logistic regression. In the end, a combined model based on clinical factors and radiomics features was developed. Logistic regression (LR) was used for model development by using the variables that had statistically significant differences. The area under the receiver operating characteristic (ROC) curve (AUC) value and decision curve analysis (DCA) were used to evaluate the clinical usefulness of the prediction model.

Results: The combined model established by the logistic regression method had the best performance. The AUCs of the clinical model, radiomics model and combined model were 0.78, 0.80 and 0.85 in the training group and 0.78, 0.79 and 0.81 in the test group, respectively. The Brier scores of the combined model was 0.171 and 0.112. The DCA curve also showed that the model was beneficial to clinical settings.

Conclusion: The combined model incorporating radiomics features and clinical parameters may have potential value for the preoperative differentiation of pIMA from mIMA.

PU-2167

影响肺癌放射治疗预后的潜在基因证据：基于辐射抗性细胞系的横向比较研究

练勇、冯振
温州医科大学

目的

肺癌是全球范围内最常见的恶性肿瘤之一，且放射治疗是常规治疗手段之一。然而，不同肿瘤细胞系对放疗的敏感性可能存在差异。研究不同个体的放疗敏感性，探索潜在的分子机制这对于优化肺癌治疗方案具有重要意义。

方法

对来自于 Seoul National University 的肺癌细胞系 H460（敏感性）和 H1299（抗性）样本（T0 期）RNAseq 数据基于经验贝叶斯模型进行差异分析。对显著性低于 0.05 和基因表达折叠变化超过 1 倍的差异基因进行批量拟合生存回归。Pearson 相关后确定了一定网络下的关联分数并对 hub 基因使用 ssGSEA 算法确定了其在 24 种免疫细胞的免疫浸润情况。最后构建多因素模型确定了关键基因及核心通路。所有的分析均基于 R 语言进行。

结果

确定了 H460 和 H1299 细胞系中对放疗敏感性表达差异的 2642 个具有编码区段的 RNA（除含有编码小肽的 lncRNA），其中 269 个基因高表达与既往观察到的肺癌患者预后不良有显著的统计学意义（191 个基因的 Hazard Ratio 值大于 1）。生物学过程、细胞定位和分子功能揭示 GO:1901652 响应肺恶性肿瘤细胞辐射抗性。KEGG 通路提示 PI3K-Akt 通路（hsa04151）在抗性

生成中具有作用。综合免疫浸润得分与 COX 系数确定 AKT2 基因为肺癌系中放疗预后不良的关键基因。回溯 AKT2 在原始对照中（抗性之于敏感性为实验组）的高度活化（约为对照组的 1.2 倍，P 值小于 0.001）磷酸化了下游底物进而激活了下游信号通路。此外，AKT2 介导的蛋白靶点的磷酸化过程又影响细胞的存活生长、增殖和代谢等（GO 分析结果支撑）。

结论

通过研究 H460 和 H1299 细胞系，我们确定了 269 个基因在肺癌患者中高表达，并与不良预后相关。这些基因参与了肺恶性肿瘤细胞对放疗的抗性反应，其中 AKT2 基因被确认为关键基因。我们发现 AKT2 在抗性中被高度活化，并通过磷酸化下游底物来激活相关通路。本研究为肺癌患者的预后评估和治疗提供了潜在的靶点和理论基础。进一步研究可以探索针对 AKT2 基因的治疗策略，以提高肺癌患者对放疗的敏感性和改善预后结果。

PU-2168

西宁地区低辐射剂量、低对比剂量和低流速在主动脉夹层筛查中的应用

王继荣、杜海坤、席永国、孙小芹
西宁市第一人民医院

【摘要】目的:探讨西宁地区低辐射剂量、低对比剂用量和低注射流速在主动脉造影（CTA）中的可行性。方法:选择 2019 年 7 月-2021 年 10 月心血管 CTA 检查患者 81 例作为对象，所有患者均进行 64 排 CT 机动态容积 CT 的主动脉 CTA 检查，检查常规组患者给予常规辐射剂量、对比剂用量及对比剂注射方案检查，而对照组采用低辐射剂量、低对比剂用量和低注射流速模式检查，将检查最终获得的数据运用滤过反投影算法完成数据的处理，比较不同检查方法下图像的 CT 值、噪声、信噪比、有效辐射剂量（ED）。结果:对照组给予低辐射剂量、低对比剂用量和低注射流速检查，患者图像质量 5 分、4 分、3 分、2 分、1 分病例数与正常组检查患者比较无统计意义（ $P>0.05$ ）；正常组患者主动脉根部、主动脉弓及降主动脉近端图像的 CT 值、噪声、信噪比比较无统计学意义（ $P>0.05$ ）；对照组低辐射剂量、低对比剂用量和低注射流速下 CTDIvol、DLP 及 ED 辐射剂量，均低于常规组检查时常规剂量（ $P<0.05$ ）。结论:将低辐射剂量、低对比剂用量和低注射流速用于西宁地区心血管 CTA 检查中是可行的，能降低辐射剂量与对比剂用量，且不会影响图像质量，值得推广应用。

Abnormal high signal on T2WI of subpleural predicts visceral pleural invasion in stage I NSCLC

Ning Zhang¹, Bei Liu¹, Gaofeng Shi¹, Qian Xu¹, Hui Feng¹, Hui Liu¹, Chen Zhang², Fan Yang¹
1. The Forth Hospital of Hebei Medical University
2. MR Scientific Marketing, Siemens Healthineers, Beijing, China

Objective: The purpose of this study was to investigate the diagnostic value of T2WI for VPI in early-stage NSCLC.

Methods: Thirty-three patients (9 males, 14 females, age ranges 32-81 years) with early-stage NSCLC suspected of VPI underwent chest scan on the 3.0 T scanner (MAGNETOM Skyra, Siemens Healthcare, Germany), and all patients gave written informed consent. Among them, there were 21 lesions with VPI confirmed by postoperative pathological elastic fiber staining, and 12 lesions without VPI. T2WI adopts by short-time-inversion-recovery (STIR) sequence scanning. The T2WI signal characteristics of all lesions in contact with the pleura were classified into 4

categories: 1, no T2WI high signal; 2, dot-like T2WI signal; 3, line-like T2WI high signal; and 4, rabbit draft sign.. The chi-square test was used to compare the differences of these four types of signals in predicting VPI, and their sensitivity, specificity, positive predictive value and negative predictive value were calculated respectively.

Results: Among all confirmed lesions with VPI, there were 1 case in category 1, 4 cases in category 2, 3 cases in category 3, and 13 cases in category 4. The sensitivity of category 1 in predicting VPI was 4.76%, specificity was 33.33%, positive predictive value was 1.11%, and negative predictive value was 16.67%. The sensitivity of category 2 in predicting VPI was 19.05%, specificity was 83.33%, positive predictive value was 66.67%, and negative predictive value was 37.04%. The sensitivity of category 3 in predicting VPI was 14.29%, specificity was 91.67%, positive predictive value was 75.00%, and negative predictive value was 37.93%. The sensitivity of category 4 in predicting VPI was 67.90%, specificity was 91.67%, positive predictive value was 92.86%, and negative predictive value was 57.89%.

Conclusion: Abnormal high signal intensity on T2WI of subpleural maybe contribute to early prediction of visceral pleural invasion in non-small cell lung cancer

PU-2170

硬化性肺细胞瘤的影像特征分析

刘蓉辉、叶玉芳、柳溪、陈英敏
河北省人民医院

[摘要] 目的 探讨硬化性肺细胞瘤的 CT 表现及特征。方法 回顾性分析 26 例经手术病理证实的硬化性肺细胞瘤患者的临床资料及 CT 表现, 其中 11 例行 CT 平扫检查, 15 例行 CT 平扫和增强检查。结果 26 例均为单发病灶, 其中女性 23 例 (23/26, 88%), 男性 3 例 (3/26, 12%); 24 例 (24/26, 92%) 表现为结节, 2 例 (2/26, 8%) 为肿块; 10 例 (10/26, 38%) 有浅分叶, 16 例无分叶 (16/26, 62%); 7 例 (7/26, 27%) 含钙化成分; 19 例无钙化 (19/26, 73%); 25 例 (25/26, 96%) 表现为实性结节; 1 例为部分实性结节, 磨玻璃影位于边缘 (1/26, 4%); 20 例 (20/26, 77%) 血管贴边征。15 例 (15/15, 100%) 增强呈持续性强化, CT 值最高达 100HU 以上; 26 例 (26/26, 100%) 无毛刺。结论 关注硬化性肺细胞瘤 CT 的影像特征, 有利于术前定性诊断。

关于扩张型心肌病中肥胖人群左心室心肌应变的初步研究

孟雪
成都市第五人民医院

【摘要】

目的 探讨扩张型心肌病中肥胖人群心脏磁共振 (cardiac magnetic resonance, CMR) 左心室 (left ventricle, LV) 心肌应变 (myocardial strain, MS) 与代谢综合征的相关性情况。

方法 纳入在我院完成常规 CMR 成像的志愿者 162 例, 按照是否合并代谢综合征分为两组, 采用 CVI 软件测量 RV 整体径向应变 (global radial peak strain, GRS)、整体圆周应变 (global circumferential peak strain, GCS)、整体纵向应变 (global longitudinal peak strain, GLS) 以及其他结构功能参数。分析 LV MS 与代谢综合征的相关性情况, 以及组间 LV MS 差异性情况。

结果 两组患者 GRS、GCS、GLS 差异有统计学意义 ($P < 0.05$), 其中合并代谢综合征患者 GRS、GCS、GLS 低于无代谢综合征组 [(8.61±4.31) vs (11.52±8.60)、(-6.69±2.88) vs (-8.92±5.55)、(-5.09±1.72) vs (-6.57±3.27) $P < 0.05$], LVGRS、GCS、GLS 均具有良好的组内组间一致性 (ICC 值均在 0.75 以上), GLS 一致性最高。

结论 CMR MS 能够定量评估扩张型心肌病中肥胖人群的 LV 状况, 合并代谢综合征患者 LV MS 会发生一定程度的损害, GLS 可以作为一个相对理想的监测指标。

肺癌患者 3.0 T MRI 和 PET/CT 影像学特征与其肿瘤不同病理特征的关系分析

梁海胜

上海交通大学医学院附属第九人民医院

目的 探讨肺癌患者 3.0 T MRI 和 PET/CT 影像学特征与其肿瘤不同病理特征的关系。方法 收集 2016 年 1 月~2022 年 12 月本院经病理证实的肺癌患者 120 例, 另选取 120 例本院同期健康体检患者 120 例, 作为对照组, 使用 3.0 T MRI 和 PET/CT 对不同病理状态患者的基础资料、影像学指标及免疫组化指标进行对比, 分析免疫组化指标与影像学指标的相关性, 对比单独检测和大联合检测的诊断效能。结果 不同病理组患者的性别、年龄、婚姻状态以及文化程度之间的差异不存在统计学意义 ($P>0.05$); 不同病理分组患者的 SUV max、MVD、VEFG 之间的差异存在统计学意义 ($P<0.05$), 通过两两比较, 随着患者的分化程度的升高, 患者的 SUV max、MVD 及 VEFG 阳性情况呈现上升趋势; SUV max 与患者的 MVD、VEFG 呈现正相关, 联合检测对患者病理状态的诊断效能均优于对照组。结论 肺癌患者 3.0 T MRI 和 PET/CT 影像学的检测中, SUV max 与患者的 MVD、VEFG 呈现正相关, 联合检测效能高于单独检测, 对于患者的病情早期诊断具有积极

PU-2173

基于计算机辅助的实性成分质量比值预测早期肺腺癌侵袭性的价值

贺强峰

临汾中心医院

目的 通过计算机辅助客观测量临床 IA 期肺腺癌的基于质量的 CTR 值, 以预测术前肺腺癌的浸润性。

方法 选取我院及 NIST 数据库临床诊断 IA 期肺腺癌患者共 56 例, 均行手术切除的病理结果, 并有完整的 DICOM 数据, 肿瘤的磨玻璃成分定义为 CT 值小于-300HU, 大于-300HU 定义为实性成分, 并通过计算机辅助系统进行自动分割, 并计算肿瘤实性成分体积比 (CTRvol)、实性成分质量比 (CTRmass)、平均 CT 值、轴位肿瘤最大径, 我们分析了实性成分质量比与病理结果的关系。

结果 当实性成分质量比 (CTRmass) ≥ 30.95 时, 提示肺结节更倾向为浸润性腺癌 (invasive adenocarcinoma, IAC)。

结论 基于计算机辅助软件测量的实性成分质量比 (CTRmass) 可用于评估临床 IA 肺腺癌术前评估浸润性的重要指标之一, 进而指导术后方式的选择, 获取更理想的疗效。

Force CT 能谱纯化技术在胸部低剂量检查的应用价值探究

杨博、徐光胜

华中科技大学同济医学院附属协和医院

目的: 探讨 Force 双源 CT 能谱纯化技术 Sn100KV 在成人胸部低剂量 CT 检查中的应用价值。

方法: 前瞻性收集在 2022 年 9 月—2023 年 1 月前往华中科技大学同济医学院附属协和医院进行肺纵膈 CT 体检的 100 名患者, 不带主观色彩随机地把他们分为数量相等 A、B 两组。A 组作为实验组, 使用西门子 Force CT 的 Sn100kV 能谱纯化技术进行扫描检查。B 组为对照组, 同样使用 Force CT 但扫描参数为常规 110KV 扫描。扫描结束后将所得到的原始数据使用 ADMIRE3 级技术进行重建获得肺窗和纵膈窗的薄层图像。在 PACS 系统中选取气管分叉处测量 2 组图像肺窗和纵膈窗里感兴趣区的 CT 值和 SD 值, 客观方面的评估通过计算信噪比、对比噪声比进行, 再请诊断医生对肺窗、纵膈窗的图像品质作主观评估。对比两种扫描方式的辐射剂量, 影像品质的主客观评估标准。结果: A 组的 CTDIvol、DLP、ED 较 B 组相比有很明显的降低, 辐射剂量降低了 80.69%, 两组各感兴趣区噪声、SNR、CNR 的差异均具有统计学意义 (P 均 < 0.05), 两组肺窗及纵膈窗图像质量的主观评分均大于 3 分, 足够临床诊断的需要。

结论: 能谱纯化技术可以在人体胸部 CT 检查中得以应用, 影像图像清晰能够满足临床诊断所需, 并且显著降低受检者接受的辐射剂量。

基于人工智能不同重建算法对肺磨玻璃结节的临床研究

邵胜超、许建铭

南京大学医学院附属苏州医院

目的 基于人工智能研究全模型迭代重建对肺磨玻璃结节的诊断效能。方法 回顾性分析胸部平扫肺结节患者 300 例, IMR 算法记为实验组, iDose 算法记为对照组。应用人工智能分析比较两组图像不同性质磨玻璃结节的敏感度、检出正确率及良恶性预测准确率。计数资料以频数表示, 两组间比较采用麦克尼玛尔检验, 以 $P < 0.05$ 为差异有统计学意义。结果 实验组的 pGGN 敏感度、总体敏感度高于对照组, 差异有统计学意义 ($P=0.000, 0.001$); 实验组 I 型 mGGN 正确率、II 型 mGGN 敏感度、总正确率、pGGN 正确率低于对照组, 差异无统计学意义 ($P=0.392, 0.514, 0.720, 0.642$); 实验组的恶性结节预测准确率高于对照组, 差异有统计学意义 ($P=0.012$); 实验组微浸润腺癌、癌前病变预测准确率均高于对照组, 但差异无统计学意义 ($P=0.219, 0.063$)。结论 基于人工智能胸部 CT 检查, IMR 算法较 iDose 算法对肺 GGN 检出具有较高的敏感度及预测准确性, 具有一定的临床应用价值。

PU-2176

心脏 CT 定量评估经导管主动脉瓣置换术前患者心脏功能和心肌应变：与心脏磁共振的对比研究

张文涛¹、周振²、高一峰²、王瑞²、徐磊²

1. 张家口市第一医院 放射医学科 (首都医科大学附属北京安贞医院在读研究生)

2. 首都医科大学附属北京安贞医院 医学影像科

目的 以心脏磁共振 (CMR) 为参考标准, 探讨 CT 评估经导管主动脉瓣置换术前 (pre-TAVR) 患者左心室功能和心肌应变的可行性。**方法** 本研究于 2022 年 06 月至 10 月连续性纳入 pre-TAVR 患者 29 例, 所有患者均采集心脏计算机断层扫描 (CCT) 和 CMR 数据, 测量左心室心功能及心肌应变参数, 包括 LVEF、左心室舒张末期容积 (LVEDV)、左心室收缩末期容积 (LVESV)、舒张期心肌质量 (MASS)、心排量 (CO)、整体纵向应变峰值 (GPLS)、整体周向应变峰值 (GPCS) 和整体径向应变峰值 (GPRS)。将基于 CCT 图像测量的心功能及应变参数与 CMR 进行比较, 使用 Pearson 相关和 Bland-Altman 分析两组定量参数的相关性和一致性。结果 研究共纳入 29 例 pre-TAVR 患者 (男性 16 例, 女性 13 例, 平均年龄 72.03 ± 10.02)。基于 CCT 图像获得的 LVEF、CO 值与 CMR 定量参数相似, 差异无统计学意义 ($P=0.246$ 、 $P=0.768$), 而 LVEDV、LVESV 和 MASS 值均偏高, GPLS、GPCS、GPRS 值略偏低, 差异均有统计学意义 (P 均 <0.05), 相关性分析发现基于 CCT 图像获得的 LVEF、LVEDV、LVESV、MASS、GPRS、GPCS 均与 CMR 定量参数存在较强正相关关系 ($r=0.9229$ 、 $r=0.9432$ 、 $r=0.9252$ 、 $r=0.9559$ 、 $r=0.8480$ 、 $r=0.8329$), CO 和 GPLS 间存在中等正相关关系 ($r=0.6171$ 、 $r=0.6719$)。Bland-Altman 分析中, 基于 CCT 图像获得的 LVEF、CO、GPLS、GPCS、GPRS 与 CMR 定量参数的偏差较小。结论 心脏 CT 定量评估经导管主动脉瓣置换术前 (pre-TAVR) 患者左心室功能和心肌应变具有可行性, 基于 CCT 图像获得的左心室功能学参数与 CMR 定量参数一致性良好, 而心肌应变参数相较于 CMR 偏低。

低剂量 CT 扫描对儿童房间隔缺损的评价

王兆翔

青海省第五人民医院

目的: 房间隔缺损在儿童中较为常见, 如经诊断后未加干涉, 房间隔缺损最终会导致血流动力学发生改变, 患儿生长发育严重受损, 需及早手术治疗, 故术前早期诊断尤为重要。本研究就低剂量 CT 扫描对儿童房间隔缺损的评价进行探讨。

方法: 搜集房间隔缺损患儿 40 例, 手术前行 CT 扫描及经胸超声心动图检查。CT 扫描采用 GE 公司 Revolution256 排螺旋 CT, 并且使用前瞻性心电门控, 管电压 100kV, 选择智能管电流, 注射对比剂约 20ml, 注射速度以患儿的体重 (kg) $\times 0.08$ 来决定, 并以同样地注射速度去注射生理盐水约 30ml, 并记录患儿每次扫描的剂量长度乘积 (DLP) 及有效剂量 (ED) ($ED (mSv) = DLP (mGy \cdot cm) \cdot k$)。将原始数据推送至工作站进行后处理、诊断, 并以手术病理诊断结果作为参考标准, 与经胸超声心动图结果进行对比。

结果: 40 例房间隔缺损患儿中, 手术病理诊断结果显示右心增大者 12 例, 肺动脉高压者 11 例, 肺静脉异位引流者 1 例 (经胸超声心动图未检出)。CT 扫描平均 DLP 为 (155.59 ± 37.72) $mGy \cdot cm$, 有效辐射剂量 (ED) 为 (2.17 ± 0.48) mSv。CT 扫描对于房间隔缺损引起的继发性改变与经胸超声心动图检查结果无明显差异 ($P > 0.05$), 而对肺静脉异位引流等心外畸形的检出明显高于经胸超声心动图 ($P < 0.05$)。

结论: 低剂量 CT 扫描不仅能检出房间隔缺损及其继发性改变, 还对心外畸形的检出具有其独特优势。

PU-2178

89 例心脏肿瘤影像学诊断回顾性分析

唐永华、张甲霖

上海交通大学医学院附属瑞金医院海南医院 (海南博鳌研究型医院)

摘要【目的】回顾性分析我院心脏手术患者的临床及影像资料, 探讨心脏肿瘤病变的影像学诊断价值。**【材料和方法】**本研究收集 2012-1~2022-2 瑞金医院心外科住院并经手术及病理明确的心脏肿瘤患者共 89 例, 其中全部病例均行心超检查, 35 例患者另行 CT 检查 20 例, MR 平扫及增强检查 18 例。其中男 36, 女 53, 男女之比 0.67: 1。最常见的症状是呼吸困难, 胸闷, 晕厥。本院心脏磁共振 (Cardiac Magnetic Resonance, CMR) 常用序列包括定位序列 (标准面定位、左室长轴类两腔心定位、短轴层面定位), 电影序列, 黑血序列, 灌注序列和增强序列。**【结果】**心脏超声检查检出 88 例患者, CT 平扫检出 5 例较大占位, MR 平扫及增强检查检出 16 例病变, 2 例弹力纤维瘤患者未能检出。病理结果如下: 良性病变弹力纤维瘤和纤维瘤各 1 例, 心脏异位嗜铬 (副神经节瘤 3 例), 脂肪瘤 1 例, 黏液瘤 69 例 (77.5%), 血管肉瘤 5 例 (1 例误诊黏液瘤), 恶性血管内皮瘤 2 例 (其中一例恶性上皮样血管内皮瘤), 未分化肉瘤 2 例, 平滑肌肉瘤 1 例, 转移瘤 4 例, 其中 2 例为罕见病-静脉内平滑肌瘤。术前拟诊心包恶性肿瘤 3 例。**【结论】**本组心脏黏液瘤在本组病例中占首位, 77.5%, 需熟悉其临床表现, 熟悉 Carney 综合征诊断标准。本组中心脏恶性肿瘤以血管源性多见, 其中血管肉瘤列首位。心脏超声是心脏肿瘤首选检查方法, MRI 可显示肿瘤大小、形态、表面特征及部分性状, 应重视 CMR 在心脏肿瘤诊断中的价值。

CCTA 三维形态学术前评估在左心耳封堵导管 消融一站式治疗中的应用

何莹

青海省心脑血管病专科医院

本文探讨心脏 CT 血管造影(CCTA)三维形态学术前评估在左心耳封堵导管消融一站式 治疗中的应用价值。选取 98 例心房颤动患者, 48 例患者术前行 CCTA 评估(CCTA 组), 50 例患者行经食管超声心动图(TEE)评估(TEE 组)。比较两组患者心脏超声参数、Watchman 装置植入成功率。CCTA 组 Watchman 装置植入成功率为 100.00%, 明显高于 TEE 组 ($P < 0.05$), 而手术时间和 X 线曝光时间明显短于 TEE 组 ($P < 0.05$)。CCTA 组实际和预测封堵器大小差值明显低于 TEE 组 ($P < 0.05$)。CCTA 组预测和实际封堵器大小呈正相关, 且一致性较高 ($P < 0.05$)。CCTA 三维形态学术前评估在左心耳封堵导管消融一站式治疗中有较好的应用价值, 有利于封堵器植入成功, 缩短手术时间和 X 线曝光时间。

关键词:心脏 CT 血管造影三维形态学;左心耳封堵导管消融一站式治疗;应用价值

Comparative study between anomalous systemic arterial supply to the basal segments of the lung and lung sequestration in adult by computed tomography angiography

Ruonan Pan, Dianbo Cao
The First Hospital Of Jilin University

Objective: Anomalous systemic arterial supply to the basal segments of the lung and lung sequestration are often confused due to their nonspecific presentations and similar imaging findings. Our study is to summarize the differences between two disease entities in adult with MSCT angiography and further provide reliable evidence for clinical diagnosis and subsequent treatment.

Materials and Methods: This study was conducted from December 2015 to January 2023 in our center. Medically diagnosed cases of two diseases lung sequestration and anomalous systemic arterial supply to the basal segments of the lung ($n=65$) were enrolled in this study. We reviewed 42 patients with lung sequestration and 23 patients with anomalous systemic arterial supply to the basal segments of the lung on the basis of clinical features (age, gender, symptoms like hemoptysis, exertional dyspnea, persistent dry cough) as well as CT imaging findings (location of the lesion, origin of the blood vessel, vascular diameter, increased lung markings, solid or ground glass shadow, vacuoles or cavitation sign or emphysema). The chi-square test, fisher exact test and t-test were applied to compare different CT features of two different diseases.

Results: In this study, a total of 65 patients diagnosed with lung sequestration ($n=42$) and anomalous systemic arterial supply to the basal segments of the lung ($n=23$) were systemically retrospectively. There was no significant statistical difference observed in the setting of the age ($p=0.376$) and gender ($p=0.229$) between two groups. However, regarding symptoms significant statistical differences were found between two diseases ($p=0.000$). Concerning the characteristics found on the basis of CT findings, there were no significant statistical differences found between them according to the location of lesion ($p=0.966$) and origin of blood vessel ($p=0.133$). Meanwhile, it was demonstrated that there were significant statistical differences on the vascular diameter ($p=0.000$), increased lung markings ($p=0.000$), solid or ground glass shadow ($p=0.000$) and vacuoles or cavitation sign or emphysema ($p=0.000$).

Conclusion: As a rare variety of two different congenital diseases of the lung including anomalous systemic arterial supply to the basal segments of the lung and lung sequestration, multi-sliced CT angiography can accurately pinpoint the differences between them and help in providing future treatment planning.

PU-2181

基于 CT 影像组学结合影像学特征预测 IASLC 新分级系统 I 期浸润性肺腺癌的病理分级

邓冰¹、江远亮²、黄晓妮³

1. 武汉科技大学

2. 中国人民解放军中部战区总医院

3. 广东医科大学附属第一医院

目的 探讨 CT 影像组学结合影像学特征预测国际肺癌研究协会 (IASLC) 新分级系统 I 期浸润性肺腺癌 (IPA) 病理分级的价值。

方法 回顾性分析 228 例 I 期 IPA 患者的术前 CT 影像及临床资料。参照 IASLC 分级系统, 将患者分为低/中级别组和高级别组。采用最小绝对收缩和选择算子 (LASSO) 选择组学特征, 使用逻辑回归 (LR) 分类器建立影像组学模型 (RM)、临床影像学特征模型 (CRM) 和影像组学评分与影像学特征相结合模型 (CRRM), 并通过列线图可视化 CRRM。使用 AUC、准确度、灵敏度、特异性和校准曲线来评估模型的性能。

结果 RM 包括五个最佳放射组学特征, CRM 包括结节密度、边缘和肺叶位置, CRRM 包括影像组学评分、结节密度和边缘。RM、CRM、CRRM 在训练集中产生的 AUC 分别为 0.825 [95% CI (0.735-0.916)]、0.849 [95% CI (0.772-0.925)] 和 0.888 [95% CI (0.819-0.957)], 在验证集中的 AUC 分别为 0.879 [95% CI (0.734-1.000)]、0.888 [95% CI (0.794-0.982)] 和 0.922 [95% CI (0.835-1.000)]。

结论 三种模型在预测病理分级方面均表现良好, 尤其是联合模型, 显示 CT 影像组学结合影像学特征具有区分早期 IPA 病理分级的潜力。

不同免疫状态下肺隐球菌感染的临床特点和影像表现

程爱兰

同济大学附属东方医院

目的: 总结分析 23 例不同免疫状态下肺隐球菌感染患者的临床特点和影像表现, 以提高对该病诊断能力。

方法: 收集 2012.12-2019.06 我院呼吸科收治的 23 例经病理或临床证实为肺隐球菌感染病例, 分析其宿主因素、临床表现和影像学表现。纳入标准: 病理或临床生化检查确诊, 临床及影像资料齐全。排除标准: 未经病理或临床生化检查确诊; 图像质量不合格或临床及影像资料不齐全。其中 16 例行胸部 CT 平扫检查, 7 例行胸部 CT 平扫+增强检查。

结果: 主要临床表现为咳嗽、咳痰, 胸痛及发热等。13 例男性, 10 例女性, 男女比 1.3:1 ($P>0.05$), 发病年龄 31-74 岁 (平均 55 岁), 11 例 (11/23) 有宿主因素 (2 型糖尿病、慢性乙型病毒性肝炎、慢性乙型病毒性肝炎合并肝硬化、乳腺癌术后化疗、肺腺癌术后、肾病综合征); 12 例 (12/23) 体检发现。有免疫损害患者肺部大多以斑片状渗出影为主 (11/23)。免疫正常患者以孤立性结节/肿块为主 (12/23); 绝大多数 (16/23) 局限于一侧肺叶, 以胸膜下分布为主, $P<0.05$; 其中免疫力正常组分布于外带的有 10 例, 免疫力损害组的分布于外带的有 7 例。病灶边缘出现晕样改变 18 例 (18/23), $P<0.05$, 空气支气管征阳性 11 例 (11/23), $P<0.05$, 2 例出现空洞, 另毛刺、浅分叶、胸膜牵拉各一例, 7 例强化值范围 20-34HU; 其中 3 例孤立结节误诊为肺癌。

结论: 免疫力损害患者肺部影像学表现类似于炎症性表现, 大多以斑片状渗出影为主

免疫力正常患者肺部影像以孤立性结节、肿块为主，多数边缘伴晕样改变，以胸膜下分布为主；表现为孤立性实性结节与肺癌鉴别困难，需要结合病史及临床实验室检查。不同免疫状态肺隐球菌病患者的临床特点无特异性，主要临床表现为咳嗽、咳痰，胸痛及发热等。

Prediction of late revascularization in stented patients by untreated CTA-derived FFR in patients with CAD

Ke Shi¹, Chen-Tao Zhu², Feng-Feng Yang³, Jin-Quan Bai¹, Tong Zhang¹

1. The Fourth Affiliated Hospital, Harbin Medical University

2. HuZhou Central Hospital

3. The Second Hospital, Tianjin Medical University

Objectives The purpose of the study is to examine the connection between untreated functional fractional flow reserve derived from coronary computed tomography angiography (CT-FFR) and the incidence of late revascularization in stented coronary artery disease patients.

Methods We retrospectively enrolled 157 patients who were clinically indicated for CCTA and underwent coronary stenting within the following months. ROC curve analysis was used to evaluate the revascularization predicting performance of the CT-FFR metrics at patient level and vessel level. The logistic regression and Cox proportional hazards regression analyses were used for selecting independent late-revascularization-related risk or prognostic factors among clinical and functional FFR parameters in stented patients.

Results At the patient-level, nadir CT-FFR was independent risk factor (OR=0.002, 95%CI 0.000-0.089, p=0.001) for late revascularization with predicting AUC of 0.684. At the vessel-level, both the nadir CT-FFR and poststenosis CT-FFR were independent risk factors (OR=0.003, 95%CI 0.000-0.059, p<0.001; OR=0.002, 95%CI 0.000-0.054, p<0.001) with predicting AUC of 0.692 and 0.697, respectively. The "age" and "nadir CT-FFR" were selected as independent prognostic factors for stented patients (HR=3.467, 95%CI 1.301-9.239, p=0.013; HR=0.005, 95%CI 0.000-0.141, p=0.002) in Cox proportional hazards regression analysis. The model constructed by these factors (C-index = 0.717) could well predict the revascularization event at 12, 24 and 30 months and stratify the patients into high and low risk of late revascularization (p = 0.0021).

Conclusion Untreated CTA-derived FFR in coronary artery disease patients can predict late revascularization in stented patients.

PU-2184

Mediastinal cavernous hemangioma: the diagnostic challenge

Mengran Ren, Dianbo Cao

The First Bethune Hospital of Jilin University

Background: The cavernous hemangioma of mediastinum (CHM) is a rare benign lesion, representing less than 0.5% of all mediastinal masses. Its incidence is extremely low, and frequently misdiagnosed as thymoma before the operation. Therefore, our aim is to improve the diagnostic ability based on CT images.

Methods: CT imaging findings and clinical information of 17 patients with pathologically confirmed CHM were retrospectively evaluated.

Results: Among 17 CHM, the lesion of 4 patients was diffuse, and 13 single. 11 cases were in the anterior mediastinum, 3 cases in the middle mediastinum and 3 cases in the posterior

mediastinum. The diameter of CHM ranged from 1.8 to 6.5cm in those patients with isolated lesion. 13 cases were oval-shaped or round, and 4 cases were irregular. Phleboliths or nodular calcification were visible in 6 cases. The nodular or punctuated enhancement within the lesion was seen in 14 cases on the arterial phase, and contrast agent was further filled on the delayed phase, where "fast in and slow out" feature was fully demonstrated. Different from the common findings like hepatic hemangioma, CHM mainly rendered such enhancement pattern from the center outwards on the dynamic contrast-enhanced CT scan. Draining veins were observed in six cases.

Conclusions: CHM is more frequently suited at the anterior mediastinum than at the posterior mediastinum. The presence of phleboliths, the nodular or punctuated enhancement on the arterial phase, the eccentric enhancement on the delayed phase are helpful for the diagnosis of CHM on CT scan.

PU-2185

基于肺结节超高分辨率 CT 靶扫描影像组学联合机器学习在鉴别原位腺癌与微浸润腺癌中的价值

陈晓璐

温州医科大学附属第二医院

目的 基于肺结节超高分辨率 CT (Ultra high resolution computed tomography, UHRCT) 靶扫描影像组学特征, 分别采用 logistic 回归 (Logistic regression, LR) 和支持向量机 (Support vector machine, SVM) 构建机器学习模型, 以鉴别磨玻璃结节 (Ground glass nodule, GGN) 中的原位腺癌 (Adenocarcinoma in situ, AIS) 和微浸润腺癌 (Minimally invasive adenocarcinoma, MIA)。方法 回顾性纳入手术病理证实肺腺癌的 198 名患者 (AIS 56 例; MIA 142 例), 按分层抽样将患者随机分为训练组 ($n = 138$) 和验证组 ($n = 60$)。手动分割 GGN, 从中提取影像组学特征。采用最小冗余最大相关性算法和套索算法对影像组学特征进行降维, 分别使用 LR 和 SVM 构建预测模型。采用受试者工作特征 (Receiver operating characteristic, ROC) 曲线评价模型的预测性能。结果 在训练组中, LR 和 SVM 的曲线下面积 (Area under the curve, AUC) 分别为 0.787 (95%, 0.712-0.863) 和 0.896 (95%, 0.842-0.951)。在验证组中, LR 和 SVM 的 AUC 分别为 0.824 (95%CI, 0.713-0.936) 和 0.839 (95%CI, 0.734-0.945)。结论 基于肺结节 UHRCT 靶扫描影像组学结合机器学习能较好地鉴别 AIS 与 MIA, 为患者 GGN 个性化分析提供潜在方法。

PU-2186

低剂量条件下不同重建算法对 CAD 检出肺结节准确率的影响

马光明¹、段海峰¹、于楠¹、陈伟婷¹、金晨望²

1. 陕西中医药大学附属医院

2. 西安交通大学第一附属医院

目的: 探讨低剂量条件下滤波反投影重建 (FBP)、基于多模型的迭代重建 (ASIR-V)、深度学习重建 (DLIR) 不同重建算法对计算机辅助检测系统检出肺结节准确率的影响。

方法: 回顾分析 50 例肺结节复查患者的 CT 图像, 分别采用 FBP、ASIR-V40%、ASIR-V80%、DLIR-M、DLIR-H、DLIR-H-lung 算法重建图像, 共计获得 6 组图像。然后将 6 组图像导入肺结节 CT 影像辅助检测软件 (uAI-ChestCare) 对各组图像独立分析检测肺结节。两名有经验的放射科医生结合 CAD 分析所有图像并标记出结节, 记录数量, 其结果作为参考标准。不同重建算法图像结

合 CAD 对结节的检出结果与参考标准进行对比, 计算不同重建算法图像结合 CAD 检出肺结节的检出率和假阳性率。

结果: 两名经验丰富的放射科医师结合 CAD 共标记出 262 个结节。在 FBP、ASIR-V40%、ASIR-V80%、DLIR-M、DLIR-H、DLIR-H-lung 不同重建图像上 CAD 检出的数量分别为 160 个、182 个、202 个、211 个、225 个、326 个。不同重建方法图像结合 CAD 检出肺结节的检出率和假阳性率分别为 (55.73%、8.75%)、(63.74%、8.24%)、(66.41%、13.86%)、(74.05%、8.06%)、(79.01%、8%)、(82.44%、33.74%)，DLIR-H 重建算法对肺结节检出率相对较高而假阳性率相对较低。

结论: 低剂量条件下不同重建算法图像能够影响肺结节 CT 影像辅助检测软件肺结节检出的准确性, DLIR-H 结合 CAD 对肺结节检出的敏感性较高, 而假阳性较低, 值得临床推广。

磁共振 T1mapping 技术对扩张型心肌病患者心肌组织特性的评价研究

颜春龙^{1,2,3}、马金凤^{1,2}、齐先龙¹、贾斯齐^{1,4}、孙艳秋³

1. 济宁市第一人民医院

2. 苏州大学

3. 青海省人民医院

4. 济宁医学院

目的: 探讨 3.0T 心脏磁共振成像 T1mapping 技术对扩张型心肌病 (Dilated cardiomyopathy, DCM) 患者左室总体、各部及各节段心肌组织特性的应用价值, 并探究其初始 T1 值的诊断效能。

方法: 收集 2021 年 10 月~2023 年 05 月就诊于我院 20 例 DCM 患者 (DCM 组) 和 25 例正常者 (对照组) 的临床及 CMR 资料。通过 T1mapping 序列获取左室各节段、各部及总体心肌的初始 T1 值。根据 DCM 患者的心肌是否存在延迟强化 (Late gadolinium enhancement, LGE), 将 DCM 组分为 DCM-LGE (+) 节段组、DCM-LGE (-) 节段组。然后运用独立样本 t 检验或 Mann-Whitney U 检验比较各组间初始 T1 值有无差异。通过绘制初始 T1 值的受试者工作特性 (Receiver operating characteristic, ROC) 曲线, 评价其对 DCM 患者的诊断效能。

结果: (1) DCM 组与对照组一般资料比较, 年龄、性别、身高、体重、体重指数、心率差异均无统计学意义 ($P>0.05$); (2) DCM 组 1-16 各节段、基底部节段、中间部节段、心尖部节段、左室总体心肌初始 T1 值均显著高于对照组 ($P<0.05$)。 (3) DCM-LGE (+) 节段组、DCM-LGE (-) 节段组、对照组之间的初始 T1 值比较, DCM-LGE (+) 节段组初始 T1 值高于对照组 ($P<0.05$) 和 DCM-LGE (-) 节段组 ($P<0.05$), DCM-LGE (-) 节段组初始 T1 值高于对照组 ($P<0.05$)。 (4) 利用 ROC 曲线分析初始 T1 值鉴别 DCM 组与对照组的 ROC 曲线下面积为 0.799, $P<0.001$, 最佳截断值为 1218.1ms, 敏感度 71.8%, 特异度 78.1%。

结论: 1、磁共振 T1mapping 技术可无创性定量评估 DCM 患者左室总体、各部及各节段心肌组织特性, DCM 患者左室总体、各部及各节段心肌初始 T1 值增大, DCM-LGE (+) 节段初始 T1 值增大。2、磁共振 T1mapping 技术初始 T1 值对 DCM 患者具有较好的诊断效能价值。

能谱 CT 扫描在肺内孤立性结节或肿块中的诊断研究

赵洪、李桂宣、张云杰、郭霖、王世平
安宁市第一人民医院

目的 探索能谱 CT 扫描对孤立性肺结节或肿块良恶性鉴别的临床价值研究。**方法** 回顾性分析昆明理工大学附属安宁市第一人民医院经能谱 CT 扫描（平扫及双期增强扫描）44 例孤立性肺结节或肿块患者资料。经病理及随访证实分为恶性组（n=24）和良性组（n=20）。应用能谱分析软件分别测量动脉期、静脉期 40keV~140keV（间隔 10keV）各单能量水平对应 CT 值、碘（水）含量及强化程度。比较两组间差异。**结果** 动脉期 40~90 keV 水平 CT 值、动脉期碘含量及动脉期强化程度恶性组均高于良性组（均 $P<0.05$ ）。两组在动脉期 100-140 keV 单能量水平 CT 值、静脉期各单能量水平 CT 值、静脉期的碘含量及双期水含量、静脉期的增强程度相似，无统计学意义（ $P>0.05$ ）。**结论** 能谱 CT 扫描多参数成像有助于鉴别孤立性肺结节或肿块良恶性，对患者治疗方案选择及预后提供参考依据。

PU-2189

胸腔巨大孤立性纤维肿瘤的复发和危险分层分析

杜明珊、陈伟、蔡萍
陆军军医大学第一附属医院（西南医院）

目的：孤立性纤维肿瘤(SFT)是一种比较罕见的间叶源性肿瘤，可发生在胸部、腹部、四肢、头部和颈部，其中高达 50%的 SFT 起源于脏层胸膜。肿瘤大小对复发风险的影响目前尚不清楚。在此我们回顾分析了本院 37 例胸部 SFT 长达 22 年的生存率和复发经验，并评估了肿瘤大小与 SFT 复发的相关性。

方法：对所有切除的胸部 SFT(2000-2022 年)进行单一机构回顾，巨型 SFT 定义为病变长径 >15 cm。收集临床资料、病理特征和长期生存资料，用回归分析和 Kaplan-Meier 分析评估复发和生存的预测因素。

结果：手术切除 37 例，其中 22 例(59.5%)起源于内脏胸膜。有 7 例(18.9%)巨大的 SFT，平均大小为 20.6 cm(17~30 cm)。平均随访时间 82 个月(1-262 个月)，37 例患者中有 4 例(10.8%)胸部复发(50-177 个月)。单因素回归分析显示，肿瘤坏死($p=0.020$)和高倍视野 C4 核分裂($p=0.011$)与 SFT 复发有关。总体 5 年、10 年和 20 年生存率分别为 76.2%、67.6%和 32.4%，3 名患者在术后 84、179 和 209 个月发生与 SFT 相关的死亡。巨大 SFT 患者中没有复发或与 SFT 相关的死亡。

结论：这项研究代表了本院单一机构对巨大胸部 SFT 的长期结果的回顾分析。我们的数据表明，大小不是胸部 SFT 复发的危险因素，并且巨大 SFT 的长期生存是较好的。

PU-2190

1 例沿支气管壁侵犯黏液表皮样癌报道

吉建荣、王世平
安宁市第一人民医院

目的：分析肺粘液表皮样癌（PMEC）的临床及影像学表现，提高对该病的认识。**方法**：该病例行 CT 平扫及增强检查、纤维支气管镜检查。**结果**：（PMEC）是较为罕见的肺部恶性肿瘤之一，临床表现为大气道的刺激或阻塞症状和体征；CT 上看到支气管内肿瘤主要向腔内浸润生长、充填，

形似“软木塞”改变；沿支气管分布、走行，见支气管内“丘陵状”凸起，与支纤镜下形态高度相似，远端支气管充气形成“支气管充气征”；另外 CT 可以清楚显示阻塞远端肺呈局限性肺气肿改变，经 CT 薄层及曲面重建，表现出一定的特征性。结论：通过分析患者的临床与影像特征，有助于提高对该病的全面认识，从而达到正确诊断。

光谱 CT 多参数成像在急性肺栓塞中的应用价值研究

曹伟萌、周宇涵、王芝浩、雷丽敏、刘杰
郑州大学第一附属医院

目的：本研究旨在探讨光谱 CT 多参数成像与常规 CT 成像对急性肺栓塞栓子检出及血栓负荷的效能。

方法和材料：前瞻性纳入经双层探测器光谱 CT 行肺动脉血管造影检查的疑似急性肺栓塞患者 102 例。采集并重建光谱数据，分别应用常规混合能量图像 (CI)，碘密度图 (ID)，有效原子序数图像 (Z-eff) 及碘密度-有效原子序数融合图 (ID-Zeff)。评估各组图像急性肺栓塞检出率，应用受试者工作特性曲线 (Receiver operating characteristic, ROC) 和曲线下面积 (Area under curve, AUC) 评估各组图像下急性肺栓塞诊断效率，并分别评估肺叶及主肺动脉干，肺段动脉及亚段肺动脉各亚组急性肺栓塞诊断效率，并计算及各组图像下的总体栓子数目及在三级肺动脉中栓子数目检出情况，应用 Qanadli 评分比较各组血栓负荷差异。定量资料采用独立样本 t 检验，定性资料采用卡方检验。

结果：在 102 例疑似急性肺栓塞中，共确诊 63 例，应用 CI，ID，Z-eff 及 ID-Zeff 图像分别确诊 53，55，60，60 例。ID-Zeff 图 (AUC: 0.989，灵敏度 97%，特异度 100%) 较 CI 图 (AUC: 0.892，灵敏度 84%，特异度 94%) 在急性肺栓塞的检出效率显著提高。在 63 例确诊患者中，CI 图像与各组光谱图像总体栓子数目及在三级肺动脉栓子数目检出分别为 CI (172,25,75,72)，ID (217, 25, 82, 100)，Z-eff (222, 25, 85, 112)，ID-Zeff(230, 25,85,120)。各组图像中的 Qanadli 评分分别为 CI (15.64±5.28)，ID (19.25±6.42)，Z-eff (19.87±6.86)，ID-Zeff(20.46±6.6)，各组光谱图像 Qanadli 评分较 CI 组均有统计学意义 (P<0.001)。

结论：光谱 CT 多参数 ID-Zeff 图在急性肺栓塞中的检出率及栓子检出效能优于常规 CT 图像，尤其在亚段及以下急性肺栓塞。基于 ID-Zeff 的可获得更加准确的肺动脉血栓负荷评分，为急性肺栓塞患者的危险分层及预后提供更加准确的影像学资料。

PU-2192

CT 在慢性栓塞性肺动脉高压的诊断准确性

董成君
华中科技大学同济医学院附属协和医院

本研究旨在确定 CT 成像在慢性栓塞性肺动脉高压 (CTEPH) 诊断中的准确性，并探讨该检查的临床意义和特点。本文检查了 1990 年至 2015 年间在 PubMed、OVID 搜索和引文追踪中发现的研究。在 613 篇引文中，有 11 篇文章 (n=712) 符合纳入标准。基于患者的分析显示，汇总敏感性为 76% (95%置信区间[CI]: 69%至 82%)，汇总特异性为 96% (95%CI: 93%至 98%)。综合上述工作得到了汇总诊断比值 (DOR) 为 191 (95%CI: 75 至 486)。基于血管的分析分为 3 个层次：总动脉、主要+叶状动脉和节段动脉。汇总敏感性分别为 88% (95%CI: 87%至 90%)、95%

(95%CI: 92%至 97%) 和 88% (95%CI: 87%至 90%)，汇总特异性为 90% (95%CI: 88%至 91%)、96% (95%CI: 94%至 97%) 和 89% (95%CI: 87%至 91%)。综合上述工作得到了汇总诊断比值分别为 76 (95%CI: 23 至 254)、751 (95%CI: 57 至 9905) 和 189 (95%CI: 21 至 1072)。通过上述分析，CT 是一种临床有利的检查技术方法，可用于 CTEPH 的确诊和排除近端血管支架的肺动脉内膜切除术 (PEA) 患者。此外，双能量和 320 层螺旋 CT 可以提高亚段动脉的敏感性，该检查技术有潜力作为行球囊肺动脉成形术 (BPA) 的影像检查手段。在不久的将来，CT 可能成为筛查考虑外科以及介入手术可行性的关键方法。

PU-2193

高原脱习大鼠心血管系统改变的研究

张凤娟、孙艳秋
青海省人民医院

目的：本研究旨在探讨高原脱习大鼠心血管系统影响的研究。方法：选择 4 周龄雄性 SD 大鼠 53 只，随机分为正常对照 (NC) 组、HADAS I 组、HADAS II 组、HADAS III 组。在青海西宁 (2200m)、青海玛多 (4200m) 喂养至 24 周龄后，在 CT 进行心肌灌注检查，在实验室检测血生化及病理组织取材。结果：1. 与 NC 组对比，HADAS III 组肺容积及体重增加、HADAS II 组体重及 mPAP 增加。与 HADAS I 组对比，HADAS III 组肺容积增加、HADAS II 组 mPAP 增加。与 HADAS II 组对比，HADAS III 组 mPAP 含量降低。2. 与 NC 组对比，HADAS I 组 RBC、HGB、HCT 增加，HADAS III 组 HGB、HCT 减低。与 HADAS I 组对比，HADAS II 组 RBC、HGB、HCT、MCV 减低，HADAS III 组 RBC、HGB、HCT 减低。与 HADAS II 组对比，HADAS III 组 HGB 减低。3. 与 HADAS I 组对比，HADAS III 组 a-HBDH、CK、LDH 减低。4. 与 NC 组对比，HADAS III 组 HIF-1a 降低增加。与 HADAS I 组对比，HADAS II 组 VEGF 降低，HADAS III 组 HIF-1a 值降低。与 HADAS II 组对比，HADAS III 组 HIF-1a 降低。5. 与 NC 组对比，HADAS I 组胶原纤维增加。与 HADAS I 组对比 HADAS II 组、III 组胶原纤维降低。6. 与 NC 组对比，HADAS 各组 MBV、MBF 值增加。与 HADAS I 组对比，HADAS III 组 MBV、MBF 增加。结论：1. 高原环境暴露 24 周后，mPAP、RBC、HGB、HCT、PLT、a-HBDH、CK、LDH、HIF-1a、VEGF、心肌胶原纤维含量、MBV、MBF 发生变化，返回西宁 20 天后有所恢复，但未达正常水平。2. 返回西宁 10 天，mPAP 出现明显升高，可能是由于脱离高原环境后处于相对富氧环境导致的代偿性升高。3. 高原环境暴露 24 周及返回西宁 20 天 MBV、MBF 增高，可能是适应缺氧及富氧引起的一系列生理性改变。

PU-2194

免疫检查点抑制剂相关肺炎影像学表现分析

周朝阳、王健
中国人民解放军陆军军医大学第一附属医院

目的：探讨分析免疫检查点抑制剂相关肺炎患者的胸部 CT 影像学特征，以提高对该病的认识。方法：回顾性分析我院 2018 年 6 月—2022 年 6 月共计 38 例免疫检查点抑制剂相关肺炎患者的胸部 CT 影像学资料。结果：38 例肿瘤患者均接受免疫检查点抑制剂治疗，出现肺部炎性改变，经实验室检查及临床表现排除其他相关疾病，临床确诊为免疫检查点抑制剂相关性肺炎，男女比例

(18/20)；年龄 40~68 岁，中位年龄 56 岁；接受免疫检测抑制剂治疗时间中位时间 78 天 (10—256 天)。38 例患者胸部 CT 均表现为间质性肺炎表现：非特异性间质性肺炎表现 10 例、机化性肺炎 28 例，双肺对称性机化性肺炎 15 例，双肺不对称性机化性肺炎 13 例，牵拉性支气管扩张 35 例。结论：免疫检查点抑制剂相关肺炎主要表现为间质性肺炎，在肿瘤患者接受免疫检查点抑制剂治疗后，出现肺部间质性炎性改变，排除其它相关感染及非感染性炎性病因后，应当高度怀疑免疫检查点抑制剂相关肺炎，并根据肺部受累范围，对治疗做出相应的调整。

基于 64 排肺 CT 肺结节直方图特征的稳定性分析：同设备固定扫描参数下的探讨

王刚、冯根义、李劲松、李学义、郭红红
长庆油田职工医院

目的：基于 64 排肺 CT 肺结节灰度直方图特征对比分析，探讨无进展实性肺结节 CT 直方图特征稳定性。

对象与方法：回顾性收集自 2020 年 1 月 1 日至 2023 年 6 月 1 日本科室行胸部 CT 检查拟诊为实性肺结节患者。纳入标准：1、行胸部 CT 拟诊为肺结节患者；2、年龄 ≥ 18 岁；3、胸部 CT 复查。排除标准：1、初诊与复查非同一台 CT 设备检查者；2、明确肿瘤病史患者；3、合并肺部感染者；4、屏气不佳，图像不能分析者；5、微创手术干预史；6、结节长径 $> 10\text{mm}$ 者；7、复查肺结节横径变化大于 $\pm 20\%$ 者。最终 137 名患者 ($n=137$) 纳入研究，男性 74 名，女性 63 名，年龄 64 ± 7.6 岁。采用联影智能辅助诊断系统-深度学习技术图像重建后，提取初诊及复查 CT 目标肺结节最大值、最小值、平均值、中位数、标准差、峰度、偏度、熵 8 个灰度直方图参数统计量。

正态分布连续变量，使用 SPSS 25 统计学软件，行皮尔逊相关系数计算。

结果：初诊直方图统计量：最大值 319.91 ± 186.70 ；最小值 -232.15 ± 155.51 ；平均值 33.04 ± 101.08 ；中位数 30.03 ± 101.28 ；标准差 109.33 ± 72.21 ；峰度 3.30 ± 1.40 ；偏度 0.09 ± 0.55 ；熵 5.44 ± 1.75 。复查直方图统计量：最大值 331.93 ± 187.46 ；最小值 -153.41 ± 245.71 ；平均值 43.22 ± 97.76 ；中位数 41.84 ± 94.26 ；标准差 114.09 ± 48.03 ；峰度 3.38 ± 1.45 ；偏度 0.12 ± 0.58 ；熵 5.81 ± 1.87 。最大值、最小值、平均值、中位数、标准差、峰度、偏度、熵相关系数分别为：0.872、-0.045、0.822、0.779、0.389、0.577、0.525、0.942；最大值、平均值、中位数、熵具有较强相关性。

结论：同设备固定扫描参数肺部 CT 平扫，获取直方图参数统计量最大值、平均值、中位数、熵相关性较好，可作为肺结节进展判定参考。

Family outbreak of Psittacosis diagnosed with clinical analysis and metagenomic next-generation sequencing under COVID-19

Jiaru Wang, Ying Ming, Ran Xiao, Xin Sui, wei Song
Peking union medical hospital

Purpose: To explore the clinical characteristics, diagnosis, and treatment of family outbreak of psittacosis and to improve the success rate of treatment.

Patients and methods: The clinical characteristics, diagnosis, treatment, and outcome of family outbreak of psittacosis, which consists three patients, diagnosed by clinical analysis and metagenomic next-generation sequencing (mNGS) in our hospital were analyzed retrospectively. **Results:** We report on three instances of clustered atypical pneumonia, which were caused by *Chlamydia psittaci* during the COVID-19 pandemic. All patients exhibited symptoms of fever and cough, while one patient also experienced gastrointestinal symptoms such as nausea, vomiting, and diarrhea. Laboratory tests indicated no significant increase in leukocytes and neutrophils, but a mild increase in C-reactive protein was observed in all three patients. Chest computed tomography (CT) scans revealed a consolidation shadow in a unilateral lung lobe in all three patients. Empirical moxifloxacin treatment was administered to both patients. The patients' C-reactive protein levels increased, and chest computed tomography (CT) scans indicated an expansion of the lesion. mNGS was conducted on sputum samples from two adult patients, revealing the presence of *Chlamydia psittaci*. Additional doxycycline was prescribed immediately, and then the patients' temperatures were stabilized, and the lesion in chest CT was absorbed. The pediatric patient exhibited less severe symptoms compared to the adult patients and exhibited a favorable response to azithromycin administration.

Conclusion: Our findings suggest that the value of mNGS as a valuable tool for definitively identifying pulmonary infection. Clinicians should consider the likelihood of atypical pathogens causing lung infections in patients who show inadequate responses to empirical drugs and subsequently devise treatment strategies based on precise etiological diagnoses. Rapid and decisive diagnoses can significantly enhance patient prognoses.

基于心电门控 CTA 对 Stanford A 型主动脉夹层累及 Valsalva 窦的检测及冠状动脉受累分型的临床应用

马桂娜、古今

华中科技大学同济医学院附属协和医院

目的:利用心电门控 ECG-CTA 对累及 Valsalva 窦的 TAAD 患者冠状动脉受累进行分型, 并比较不同分型患者的冠脉处理措施差异。

方法:本研究回顾性收集行主动脉 ECG-CTA 检查发现 TAAD 伴 Valsalva 窦受累的患者图像, 且所有患者均进行了手术治疗。两名放射科医生独立分析 CTA 图像。将 RCA 和 LCA 受累情况分别分为 A 型(仅开口受累), B 型(主干呈典型双腔样改变)及 C 型(根部完全脱离, 冠状动脉周围呈套叠样改变)。以术中发现作为参考, 计算 CTA 的诊断性能, 并统计冠状动脉处理措施。

结果:共纳入 112 例。术中发现, 33 例 RCA 未受累, 而 RCA 受累的患者中 A 型为 45 例、B 型 19 例和 C 型 15 例; 70 例患者 LCA 未受累, LCA 受累患者中 A 型有 34 例、B 型 8 例和 C 型 0 例。两名阅片者诊断 RCA 受累的敏感性为 97.5%-98.7%, 其中单独诊断 A 型敏感性为 86.7%-91.1%, B 型为 79.0%-89.5%, C 型为 86.7%-93.3%; 对诊断 LCA 受累敏感性 100.0%, 单独诊断 A 型为 85.3%-91.2%, B 型为 87.5%-100.0%。两名阅片者一致性 kappa=0.85-0.96。仅 Valsalva 窦受累时, 多数患者(55.7%-63.6%)的冠状动脉无处理措施; 79%的 RCA-A 和 70.6% LCA-A 型患者采取冠状动脉修补; 86.7% RCA-B-和 87.5%-LCA-B 型者采取冠脉搭桥术; (86.7%)的 RCA-C 型者采取冠脉搭桥术。

结论:心电图门控 CTA 对 TAAD 累及冠状动脉有较高的诊断价值, 术前 CTA 对冠脉受累进行分型可能有助于术前指导患者的手术计划。

心脏 CT 血管造影在评估左心耳封堵术后残余 分流和器械相关血栓的应用价值

余广海
阜阳市人民医院

摘要 目的 探讨心脏 CT 血管造影 (CCTA) 在经皮左心耳封堵术后残余分流和器械相关血栓的应用价值。方法 选取我院 2020 年 11 月至 2022 年 10 月成功接受左心耳封堵术的 60 例非瓣膜性心房颤动 (房颤) 患者, 患者术后 3 个月及 6 个月进行 CCTA 检查, 分析封堵器残余分流、器械相关血栓形成及不良事件等。结果 60 例房颤患者成功实施 LAAC 术 (Watchman 封堵器 10 例, LACbes 封堵器 50 例), 平均年龄 (66.5 ± 9.3) 岁, CHA2DS2-VASC 评分 (4.20 ± 1.46) 分, HAS-BLED 评分 (2.68 ± 1.24) 分, 其中持续性房颤患者 25 例 (41.6%)。60 例患者中, 左心耳最大开口径 12-20mm 11 例, 21—25 mm 20 例, 26—30 mm 25 例, 31-34 mm 4 例, 不同最大开口径出现残余分流的比例差异比较无统计学意义 ($P=0.524$); 40 例患者术后 3 个月及 6 个月均未出现残余分流 (其中 1 例术后 3 个月完全内皮化, 有 2 例术后 3 个月及 6 个月均出现 DRT 存在); 8 例患者 3 个月及 6 个月均出现残余分流 (分流束 <5 mm), 12 例患者术后 3 个月出现残余分流, 术后 6 个月残余分流消失。所有患者均无卒中、系统性栓塞、大出血、心脏压塞、死亡等主要临床不良事件发生。结论 心脏 CT 血管造影在左心耳封堵术后随访中有重要临床应用价值。

PU-2199

Changes of cardiac structure, function, and fat content in obese subjects after bariatric surgery—Prospective magnetic resonance imaging study

jinquan bai,xiaolu li,zhenzhou shi,hong pan,shuting wang,tong zhang
The Fourth Affiliated Hospital of Harbin Medical University

Purpose: Obesity can cause metabolic changes and increase the risk of cardiovascular disease. With the success of weight loss, the incidence of cardiovascular disease also decreases. The purpose of this study was to investigate the changes of heart structure, function, and fat content in obese patients during significant weight loss within six months after bariatric surgery, and to explore the relationship between the changes in MRI indicators and laboratory indicators at different times after bariatric surgery.

Methods: A total of thirty-three patients underwent bariatric surgery and completed preoperative and postoperative cardiac magnetic resonance examinations, left ventricular cardiac function parameters, pericardial adipose tissue volume (PATV), myocardial proton density fat fraction (M-PDFF), and myocardial T1 values were measured by cardiac MRI before surgery at one, three, and six months after surgery, respectively, at the same time, preoperative and postoperative laboratory indicators were collected.

Results: LVEF/BSA increased from $26.59 \pm 4.13\%/m^2$ to $27.56 \pm 4.88\%/m^2$. The global peak wall thickness (GPWT) of left ventricular (from $11.03 \pm 1.81mm$ to $9.27 \pm 2.02mm$) and left ventricular mass (LVM) (from $103.21 \pm 27.82g$ to $81.27 \pm 19.41g$) decreased significantly after surgery (all $P < 0.001$). In addition, PATV and M-PDFF decreased significantly after surgery (all $P < 0.01$). The decrease of LVM at one, three, and six months after surgery can cause a decrease in PATV and the left ventricular eccentricity ratio (LVER) ($r > 0.5$, $P < 0.05$). There was a positive correlation between the decrease of triglyceride was positively correlated with the loss of LVM and PATV ($r > 0.5$, $P < 0.05$) at six months.

Conclusion: Obese patients showed significant improvement in cardiac structure and function after bariatric surgery, PATV, and M-PDFF decreased significantly, and there is a certain correlation between the MRI indicators and the laboratory correlation indicators.

PU-2200

MR-T2 刀锋伪影校正技术联合 DWI 对肿块型肺结核与周围型肺癌的鉴别诊断价值研究

党珊、于楠、陈媛媛
陕西中医药大学附属医院

[摘要]目的：探索联合 MR-T2 加权成像 (T2 weighted imaging, T2WI) 与扩散加权成像 (Diffusion weighted imaging, DWI) 对肿块型肺结核 (Mass-like tuberculosis, MTB) 与周围型肺癌 (Peripheral lung cancer, PLC) 的鉴别诊断价值。方法：本回顾性研究共纳入 33 例 MTB、PLC 患者 (共 10 个男性, 23 个女性, 平均年龄 62.1 岁), 16 例 MTB, 17 例 PLC。两名经验丰富的放射科医师独立阅读 MR 图像, 并分别测量 T2 对比度比 (T2 contrast ratio, T2 CR) 及表观扩散系数 (Apparent diffusion coefficient, ADC) 值; Koyama 等提出使用 T2 CR 即肺肿块/结节的 T2 信号强度值除以右侧菱形肌的 T2 信号强度: 信号强度比值 (contrast ratio, CR) = 信号强度 (signal intensity, SI) 肺结节/SI 菱形肌。使用配对 t 检验来比较两组间的 T2CR 与 ADC 值, 使用 ROC 曲线来评估 MR-T2WI 与 DWI 的诊断效能。结果: 两名放射科医师对 T2CR 与 ADC 值观察者间一致性良好 (ICC 值分别为 0.932、0.905); ADC 值对二者鉴别诊断的敏感性、特异性及曲线下面积分别为 88.2%、93.7% 及 0.941, 诊断阈值为 $ADC=1140 \times 10^{-6} \text{mm}^2/\text{s}$, PLC 的 ADC 值显著低于 MTB。T2CR 值对二者鉴别诊断的敏感性、特异性及曲线下面积分别约 76.5%、62.5% 及 0.732, 诊断阈值为 1.99, PLC 的 T2CR 值显著低于 MTB。结论: MR 是一种很有前景的鉴别肿块型肺结核 (MTB) 与周围型肺癌 (PLC) 的方法, 诊断效能良好。

PU-2201

心脏磁共振 T1 mapping 技术及基于可变形配准算法的心肌形变分析在肥厚型心肌病中的初始研究

苏亚、相世峰
邯郸市中心医院

目的: 探讨 CMR T1 mapping 技术及基于可变形图像配准算法的心肌形变分析在定量诊断 HCM 患者心肌纤维化和心肌形变的应用价值。

方法: 搜集 2020 年 1 月~2022 年 1 月在我院确诊为 HCM 患者 35 例、健康志愿者 40 例, 所有病例均行心脏磁共振检查, HCM 患者加扫延迟强化序列; 将增强前 T1 mapping 图像导入 Medis Suite 软件测得左室心肌初始 T1 值; 将心脏全部电影序列导入 TruFiStrain 软件中, 获得左室整体周向 (GCS)、径向 (GRS) 和纵向 (GLS) 应力。HCM 组按延迟强化方式分强化和无强化组; 按舒张末期左室壁厚度 (EDTH) 分 $15\text{mm} \leq \text{EDTH} < 20\text{mm}$ (A), EDTH (B) $\geq 20\text{mm}$, 心尖肥厚组 $13\text{mm} \leq \text{EDTH} < 18\text{mm}$ (C)。比较 HCM 组、对照组及各亚组间的初始 T1 值及各应变指标的差异。

结果:

(1) HCM 组、对照组及各亚组间 T1 mapping 技术相关值统计结果:

HCM 组左室整体初始 T1 值明显高于对照组[初始 T1 值: (1323.15±48.95) ms vs (1228.76±36.84) ms, $P<0.001$]; 强化组、无强化组、对照组的初始 T1 值相比, 差异均有统计学意义; A, B, C 三组的初始 T1 值差异无统计学意义

(2) HCM 组、对照组及各亚组间心肌形变分析相关值统计结果:

HCM 组的 GRS, GLS 均较对照组明显减低; 强化组的 GLS 和 GRS 较对照组减低且差异有统计学意义; A, B, C 三组的心肌应变差异无统计学意义 ($P>0.05$)

(3) ROC 曲线分析结果

左室 GRS 诊断肥厚型心肌病效能优于其他应变参数, 左室 GRS 诊断肥厚型心肌病的敏感性、特异性分别为 97.1%, 97.5%; 初始 T1 值诊断强化亚组的效能较高, 其敏感性和特异性为 65.2%, 100%

结论: 心肌初始 T1 值, GRS, GLS 可用于识别及定量评估 HCM 心肌纤维化及多个维度对心肌应变进行分析, GRS 的诊断效能最高; 初始 T1 值在强化亚组间的诊断效能最高; 采用 CMR T1 mapping 技术及心肌形变分析多参数联合定量评估 HCM 为临床提供有效的诊断证据。

PU-2202

Accuracy of artificial intelligence-based coronary artery calcium scoring in non-gated chest CT

Kejie Yin, Dan Mu
Nanjing Drum Tower Hospital

Objectives: To evaluate the risk category performance of artificial intelligence-based coronary artery calcium score (AI-CACS) software used in non-gated chest computed tomography (CT) on three types of thickness (1mm, 3mm, 5mm) images, considering the manual method as the standard.

Methods: A total of 112 patients who underwent both chest CT and electrocardiogram (ECG)-gated non-contrast enhanced cardiac CT with the same equipment at the same time in the study. AI-CACS software was based on a deep learning algorithm and was trained on multi-vendor, multi-scanner, and multihospital anonymized data from the chest CT database. The AI-CACS was automatically obtained from chest CT data by the AI-CACS software, while the manual CACS was obtained from cardiac CT data by the manual method. The correlation of the AI-CACS of different thicknesses and manual CACS, concordance rate and kappa value of the risk categories determined by the four methods were calculated. The risk category performance of the AI-CACS for dichotomous risk categories bounded by 0, 100 and 400 was assessed.

Results: The correlation of the AI-CACS of three different thicknesses (1mm, 3mm, 5mm) with the ECG-CT CACS were $p = 0.973(p<0.001)$, $0.941(p<0.001)$, $0.834 (p<0.001)$, respectively. The Bland-Altman plot (manual CACS minus AI-CACS of three different thicknesses) showed three mean differences of -6.5, 15.4, 53.1, respectively and 95% limits of agreement of -95.0 to 81.9, -96.6 to 127.4, -187.8 to 294.0, respectively. The agreement of risk categories for the CACS was kappa (κ) = $0.868(p < 0.001)$, $0.772(p < 0.001)$, $0.412 (p < 0.001)$, respectively, and the concordance rate was 91%, 84.8%, 62.5%. As dichotomous risk categories bounded by 0, 100 and 400, area under the curve of the AI-CACS of three different thicknesses were 0.996 vs. 0.900 vs. 0.785, 0.993 vs. 0.995 vs. 0.975, and 0.995 vs. 1.000 vs. 0.981, respectively.

Conclusions: The 1mm-AI-CACS could accurately quantify CACS as well as categorize risk. Acceptable agreement will enable one-stop chest screening and risk assessment of cardiovascular diseases for healthy physical examining personnel.

PU-2203

Differentiating diagnosis of atypical cardiac myxoma and thrombi by coronary computed tomography angiography imaging

Chenyong Lu
Lishui Central Hospital

Objectives: The purpose of this study was to compare the imaging features of atypical cardiac myxoma from cardiac thrombi using coronary computed tomography angiography (CCTA) and to evaluate the value of CCTA in differential diagnosis.

Material and methods: From March 2017 until February 2022, 41 patients with atypical cardiac myxoma (n=18) and thrombi (n=23) confirmed by histologic examination after the operation or follow-up examination were included in this retrospective study. Two independent and blinded radiologists evaluated imaging features of atypical cardiac myxoma and thrombi on CCTA and reconstructed the neovascularization of the myxoma on a dedicated workstation.

Results: There was no significant difference in the size, shape, internal characteristics (calcification, cystic and necrosis) of myxoma in comparison with thrombi. The location, surface and enhancement pattern were significantly different between the cardiac myxoma and thrombi groups ($p < 0.05$, respectively). Specifically, supplied vessels were observed in the atypical cardiac myxoma group, while no neovascularization was detected in the thrombi group (83.33% vs. 0%, $p < 0.001$).

Conclusion: The location, surface and enhancement pattern have significance in distinguishing atypical cardiac myxoma and thrombi. The use of non-invasive CCTA by detecting the neovascularization of cardiac myxoma plays an essential role in the accurate diagnosis and surgical decision making of cardiac masses and is expected to replace invasive coronary angiography.

基于体素的定量 CT 对吸烟者肺小气道病变与肺气肿的定量研究

景蒙、张玲、李建龙、黄晓旗
延安大学附属医院

摘要:目的 通过体素的定量 CT 对不同吸烟程度患者肺部定量分析, 筛选吸烟对肺结构损伤的敏感影像学定量指标。方法 收集 2021 年 11 月到 2023 年 4 月于延安大学附属医院体检胸部 CT 者, 根据吸烟程度分三组: 非吸烟者 39 例; 低吸烟指数者 30 例; 高吸烟指数者 35 例。均在进行 CT 双气相扫描后行肺功能检查, 测量指标包括 FVC、PEF、FEV1%和 FEV1/FVC, 将其导入数字肺平台, 获正常肺组织区域百分比 (PRMNormal%)、小气道病变区域百分比 (PRMfSAD%)、肺气肿区域百分比 (PRMEmph%) 三个定量指标。三组间肺功能指标和 CT 定量指标的差异采用单因素方差分析或 Kruskal-Wallis H 检验, 各 CT 定量指标与肺功能指标、吸烟指数的相关性采用 Pearson 及 Spearman 相关性分析。线性回归分析 CT 定量指标与吸烟指数、年龄和 BMI 的关系。结果 三组间中位年龄、吸烟指数、FEV1/FVC、PRMNormal%、PRMEmph%、PRMfSAD%差异具有统计学意义, $P < 0.05$; CT 定量指标 PRMNormal%、PRMEmph%、PRMfSAD%与 FEV1/FVC、吸烟指数均相关, 与 FVC、PEF、FEV1%不相关; 肺功能指标 FEV1/FVC 与吸烟指数相关。PRMNormal%与 FEV1/FVC 呈正相关, 与吸烟指数呈负相关; PRMEmph%、PRMfSAD%与 FEV1/FVC 呈负相关, 与吸烟指数呈正相关; 吸烟指数与 FEV1/FVC 呈负相关。单、多因素线性回归分析结果显示, 吸烟指数与 PRMNormal%、PRMEmph%、PRMfSAD%之间存在线性回归关系; BMI 与 PRMNormal%、PRMfSAD%之间存在线性回归关系。结论 肺功能指标对吸烟者早

期肺损伤的预测有一定作用, 基于体素的 CT 定量指标是吸烟早期肺结构损伤敏感指标, 对客观评估吸烟肺损伤严重程度有实用价值。

PU-2205

基于 AI 的新型冠状病毒突破性感染的 CT 表现和临床特征

武丽俊¹、李文平¹、罗佳佳²、周宇³、刘琳⁴、赵绍宏¹

1. 中国人民解放军总医院第一医学中心
2. 中国人民解放军联勤保障部队第九八五医院
3. 中国人民解放军联勤保障部队第九八八医院
4. 山西省运城市垣曲县人民医院

目的: 分析疫苗接种后新型冠状病毒感染(coronavirus disease 2019, COVID-19)肺炎的临床特点、胸部 CT 的特征及严重程度, 并与未接种疫苗患者进行比较, 评价接种疫苗对 COVID-19 的临床和 CT 特征的影响。**方法:** 回顾性纳入 2022 年 12 月 1 日至 31 日在解放军总医院第一医学中心急诊科就诊的 COVID-19 确诊患者, 按照疫苗接种状态将其分为 3 组: 未接种疫苗、部分接种疫苗、完全接种疫苗组。对 3 组患者的临床和 CT 影像特征进行分析。分类变量的组间差异使用 Pearson χ^2 检验或 Fisher 精确检验, 连续变量使用 Kruskal-Wallis 检验。使用 logistic 回归模型的优势比 (OR) 和 95% CI 来评估 CT 特征与疫苗接种之间的关系。使用来自负二项回归模型的比值比 (RR) 和 95% CI 来评估 AI 评分与疫苗接种之间的相关性。**结果:** 纳入 658 例 COVID-19 肺炎患者, 未接种疫苗组 291 例, 部分接种疫苗组 83 例, 完全接种疫苗组 284 例。部分接种、完全接种疫苗患者胸部 CT 中的索条、碎石路征、小叶内线比例显著低于未接种疫苗患者 ($P = 0.010$ 、 $P = 0.011$, $P < 0.001$)。3 组之间年龄(未接种疫苗组高于另两组)、合并症、CRP、中性粒细胞、淋巴细胞、红细胞计数差异显著(未接种疫苗比例高于另两组, $P < 0.001$)、血小板计数差异显著(未接种疫苗显著低于另两组, $P = 0.021$)。多因素分析后, 部分接种疫苗、完全接种疫苗 COVID-19 肺炎的 AI 总评分低于未接种疫苗组[OR, 0.77 (95% CI: 0.64, 0.93; $P = 0.006$)]、[OR, 0.82 (95% CI: 0.72, 0.94; $P = 0.004$)]。**结论:** 完全接种疫苗 COVID-19 肺炎的 AI 总评分较低, 新冠病毒疫苗对其突破性感染具有保护作用。

Feasibility analysis of non-ECG-triggered chest LDCT using a kV-independent reconstruction algorithm for predicting cardiovascular disease risk in patients receiving maintenance hemodialysis

Ao Liu¹, Li Yang¹, Xiangming Wang¹, Xianbo Yu²

1. The Fourth Hospital of Hebei Medical University
2. Siemens Healthineers Ltd

Purpose This study aimed to explore the feasibility and accuracy of non-electrocardiogram (ECG)-triggered chest low-dose computed tomography (LDCT) with a kV-independent reconstruction algorithm in assessing the degree of coronary artery calcification (CAC) and the risk of cardiovascular diseases in patients receiving maintenance hemodialysis (MHD).

Methods 181 patients receiving MHD who needed chest CT and coronary artery calcium score (CACS) scanings underwent non-ECG-triggered, automated tube voltage selection, high-pitch chest LDCT scan using a kV-independent reconstruction algorithm (research scan) and ECG-

triggered standard CACS scan (standard scan) sequentially. The image quality, radiation doses, CACS and cardiac risk classifications of the two scans were compared.

Results Among the 181 patients, 89, 83, and 9 underwent scanning at 100, 110, and 120 kV, respectively. Excluding those scanned at 120 kV, 172 patients were enrolled. The Visual Scores (VSs) of the research scan showed high interobserver agreement (ICC = 0.944; 95% CI: 0.925–0.958). A significant difference was observed between the non-ECG-triggered VS and the standard CACS Agatston score (AS) on cardiac risk classification ($\chi^2 = 34.333$, $P < 0.001$; weighted kappa value = 0.813; 95% CI: 0.756–0.869). The accuracy of cardiac risk classification of non-ECG-triggered VS was 77.91% (134/172), considering the cardiac risk classification of standard CACS AS as the gold standard. Although the ASs obtained from the research scan were lower than those obtained from the standard scan (739.90 ± 1098.38 vs 801.56 ± 1129.60 ; $P < 0.001$), the agreement and correlation of them were excellent, and intraclass correlation coefficients (ICCs) and Pearson's correlation coefficients were both >0.96 . No significant difference was observed in cardiac risk classifications between the two scans ($\chi^2 = 3.933$, $P = 0.269$), and the agreement was excellent (weighted kappa value = 0.936; 95% CI: 0.903–0.970). The accuracy of cardiac risk classification based on non-ECG-triggered AS was 92.44% (159/172). The effective radiation doses (ED) of the standard scan and the research scan were 1.34 ± 0.74 mSv and 1.04 ± 0.35 mSv. With the equivalent image quality, the average ED and CTDIvol of the research scan were reduced by 21.77% and 59.93%, respectively.

Conclusions A CT protocol using the non-ECG-triggered, automated tube voltage selection, high-pitch chest LDCT protocol with a kV-independent reconstruction algorithm can accurately demonstrate the degree of CAC, maintain the overall cardiac risk classification and significantly reduce the radiation exposure of patients.

肺移植术后 8 例并发肺部感染 CT 影像分析

杞玉嵘、杨斌、尹建华、谢颖、李维、邹强云、郭伟莲
昆明市第一人民医院甘美医院

目的：通过对肺移植患者移植肺并发感染 CT 表现分析，旨在早期发现并准确诊断，提高患者术后生存率。方法：回顾性分析昆明市第一人民医院接受肺移植并导致并发肺部感染的 8 例患者的临床及 CT 影像资料。结果：8 例移植肺并发感染的患者中；单病原菌感染者 50.0%（4 例），嗜麦芽窄食单孢菌感染 37.5%（3 例），曲霉菌感染 12.5%（1 例）；混合性感染者 50.0%（4 例），肺炎链球菌感染、流血嗜血杆菌、真菌混合性感染 12.5%（1 例），肠杆菌、纹带棒状杆菌、洋葱伯克霍尔德菌混合性感染 12.5%（1 例），铜绿假单胞菌肺炎、脓肿分枝杆菌混合性感染 12.5%（1 例）；吡咯金黄杆菌、粘质沙雷菌、肺炎克雷伯菌混合性感染 12.5%（1 例）。移植肺并发感染的 CT 主要表现为多发云絮状改变 37.5%（3 例）；多发云絮状改变并实变影 25.0%（2 例）；多发云絮状改变及结节伴晕征、空洞 37.5%（3 例）。结论：肺移植术后并发肺部感染 CT 表现为多样性，但也有一定的特征性，结合临床资料及 CT 影像表现可早期发现并诊断，为临床治疗提供依据，最终提高患者术后生存率。

前纵隔上皮样血管内皮瘤一例

李叶
吉林大学第一医院

本文报道前纵隔上皮样血管内皮瘤 1 例。患者男，58 岁，CT 显示前纵隔胸骨后方不规则软组织密度影，其内密度不均，可见钙化，边缘欠光整，分界不清，动脉期明显不均匀强化，静脉期病灶内可见条片状低密度影。右侧胸腔少许积液。病理诊断：上皮样血管内皮瘤。

PU-2209

人工智能辅助冠脉 CTA 诊断效能评估研究

黄文博
西安凤城医院

目的：探讨人工智能在冠状动脉 CTA 诊断中的应用价值。

方法：回顾性分析行冠状动脉 CTA 和冠脉造影术的冠状动脉粥样硬化性心脏病患者影像学资料。冠状动脉 CTA 图像分别由高年资医师和 AI 辅助诊断软件进行处理，评价 AI 辅助诊断软件在冠脉疾病诊断中的可行性及准确性。

结果：AI 辅助软件对冠状动脉 CTA 图像一键式重建分析并生成报告，用时较人工用时明显缩短。以冠脉造影为金标准，AI 检测冠脉狭窄的敏感度、特异度无统计学意义。以医师诊断为标准，AI 辅助诊断与医师诊断一致性较高。AI 辅助诊断还可对冠脉支架进行评估，与医师诊断差异无统计学意义。

结论：AI 辅助诊断在冠脉疾病诊断方面具有较高敏感度和准确性，极大提高了诊断效率，但仍有不足，仅可作为医师的辅助诊断工具。

采用磁共振心肌组织追踪技术定量评估心肌炎患者左室心肌应变力的变化

黄荟玉、张勇、张文博、王可颜、程敬亮
郑州大学第一附属医院

目的：本研究的目的是通过磁共振心肌组织追踪技术定量评估心肌炎患者左室心肌应变力的变化规律。方法：连续性收集我院近两年确诊为心肌炎的患者 20 例，同时招募入组健康成年志愿者 37 例，利用磁共振成像 (MRI) 扫描图像，通过 CVI42 后处理软件测量左心室全局径向峰值应变 (GPRS)、全局纵向峰值应变 (GPLS)、全局周向峰值应变 (GPCS) 及心功能，进而探讨心肌炎患者与健康成年志愿者左室全局峰值应变和心功能的变化及相关性。结果：与健康成年志愿者相比，心肌炎患者舒张末期容积与左室射血分数显著降低 ($P<0.001$)，每搏输出量、心排出量及心指数降低 ($P<0.05$)；全局应变力下降，其中 GPRS、GPLS 远低于对照组，差异具有统计学意义 ($P<0.001$)，且 GPLS 最具鉴别效能，曲线下面积为 0.818，最佳阈值为 -12.995，敏感度和特异度分别为 75% 和 75.7%；此外，GPRS 与 GPCS 呈中度负相关 ($P<0.001$)，与 GPLS、ESV 呈轻度负相关 (P 均 <0.05)，与 EF 呈中度正相关 ($P<0.05$)；GPCS 与 EF 呈轻度负相关 ($P<0.05$)，与 ESV 呈中度正相关 ($P<0.001$)，与 EDV 呈轻度正相关 ($P<0.05$)。结论：心肌炎

患者左室壁应变力降低,并与心功能变化相关,可用于心肌炎的早期诊断,以提高 CMR 对心肌炎诊断的准确率。

Primary pulmonary angiosarcoma mimicking microscopic polyangiitis

Lijun Wu, Chongchong Wu, Shaohong Zhao
The First Medical Center of the Chinese PLA General Hospital

Background Primary pulmonary angiosarcoma is a rare highly aggressive tumor, accounting for 1-2% of all soft-tissue sarcomas, with early metastasis and poor prognosis. There are currently no guidelines or established treatment.

Methods We report the case of a 54-year-old woman who presented with intermittent cough, hemoptysis and melena over 3 months. CT pulmonary angiogram (CTPA) showed there were no filling defects in main pulmonary artery and branches. Thoracic axial CT images showed bilateral diffuse ground-glass opacity (GGO) representing intra-alveolar blood, with consolidation in the right middle lobe 7 days later, and bilateral consolidation and crazy-paving 18 days later. The patient suffered from severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) 3 months ago.

Results The case was initially suspected of microscopic polyangiitis, CT guided biopsy was performed and histopathologic result was pulmonary angiosarcoma. Finally, he was subsequently discharged of his own free will and with an overall survival of 5 months. **Conclusion** It is important to be aware of angiosarcoma in the differential diagnosis of bilateral GGOs with halo sign because it may mimic inflammation or infection at early stage.

PU-2212

基于介入治疗的冠状动脉瘘 CTA 价值分析

胡田、任浩、邵书珍、王江涛
湖北省襄阳市中心医院

目的 探讨多层螺旋 CT 血管成像(CTA)对冠状动脉瘘(CAF)的诊断价值。

方法 回顾性分析经介入治疗的 17 例冠状动脉瘘(CAF)的 CTA 资料,对原始图像进行多平面重组(MPR)、曲面重组(CPR)、最大密度投影(MIP)及容积重建(VR)等后处理,对比 DSA 图像,分析 CTA 对于 CAF 的显影价值。

结果 17 例 CAF 患者 DSA 共计发现冠状动脉瘘血管 40 支,直径范围 1.2-6.5mm,其中,冠状动脉-肺动脉瘘 15 例 37 支,肺动脉处均见浓染,冠状动脉-左心室瘘 2 例 3 支。

CTA 发现 17 例 37 支瘘血管(检出率 93%),3 支直径 $\leq 1.2\text{mm}$ 细小冠状动脉-肺动脉瘘血管 CTA 未能确切识别,1 支位于 RCA 开口处,2 支位于 LM 远端,均为局限性多发细小瘘血管 CTA 未能全部显影所致。6 例瘘血管合并动脉瘤形成。8 例患者同时检出冠状动脉粥样硬化,2 例患者合并肺动脉高压。

结论 CTA 能够准确显示 CAF 瘘血管的解剖细节及血流动力学改变,运用 CT 多种后处理技术能够直观地显示 CAF 瘘血管形态及走行。对于局限性多发细小瘘血管,CTA 可能会遗漏细小瘘血管,而对于合并其他心脏大血管病变、冠状动脉斑块性质评估,CTA 价值较大。

PU-2213

全心非对比剂冠状动脉加速 MRI:压缩感知与灵敏度编码的对比研究

张文博、程敬亮
郑州大学第一附属医院

目的 评估压缩感知 (CS) 与灵敏度编码 (SENSE) 两种不同加速采集技术获得的全心非对比剂冠状动脉磁共振图像对狭窄 $\geq 50\%$ 的冠状动脉的诊断性能。**方法** 前瞻性纳入郑州大学第一附属医院疑诊为冠状动脉疾病 (CAD) 的患者 52 例, 年龄 (45 ± 16) 岁, 其中男 28 例、女 24 例。所有患者均完成压缩感知加速因子 4 磁共振冠状动脉成像 (CS4) 及 SENSE 加速因子 2 磁共振冠状动脉成像 (SENSE2), 其中 17 例患者完成冠状动脉计算机断层扫描血管造影成像 (CCTA)。以 CCTA 图像的诊断为参考标准, 通过 ROC 曲线评估 CS4、SENSE2 以及两种技术联合成像对直径减小 $\geq 50\%$ 的冠状动脉狭窄的诊断性能。**结果** 52 例患者采用 CS4、SENSE2 冠状动脉成像的采集时间分别为 (6.4 ± 2.2) min 和 (11.6 ± 4.2) min, 差异有统计学意义 ($t = -7.898$, $P < 0.001$)。CS4、SENSE2 以及两者联合成像在患者血管层面诊断狭窄程度 $\geq 50\%$ 的冠状动脉的敏感度分别为 70.6%、64.7%、70.6%; 特异度分别为 88.2%、88.2%、91.2%; 阳性预测值分别为 75.0%、73.3%、80.0%; 阴性预测值分别为 85.7%、83.3%、86.1%; 准确度分别为 82.4%、80.3%、84.3%。ROC 曲线显示 CS4、SENSE2 及联合成像的曲线下面积 (AUC) 分别为 0.791、0.765、0.809, 三种评估方法间有着近似的诊断效能, AUC 比较结果 P 值均大于 0.05。**结论** 压缩感知技术可以有效缩短全心非对比剂冠状动脉成像的扫描时间, 4 倍 CS 加速的全心非对比剂冠状动脉成像图像质量及诊断效能与传统 2 倍 SENSE 加速的成像结果相当。

PU-2214

Optimizing the Training Dataset Size for U-Net-Based Cardiac Image Segmentation

Jingji Xu, Hongliang Zhao
The First Affiliated Hospital of the Air Force Military Medical University

Aim: The objective of this study is to explore the optimal size of the training dataset required to attain a high level of segmentation accuracy in U-Net-based Medical Image Segmentation.

Method: We calculated the sample size using the learning curve fitting method. We conducted training on U-Net-Based models for left ventricular myocardial segmentation using a series dataset consisting of different sizes (5, 10, 15, 20, 40, 60, 80, 100, 150). For each sample size, we recorded the Dice coefficient, which is a measure of similarity between the predicted segmentation and the ground truth. The ground truth segmentations were obtained through manual segmentation performed by a radiologist with 10 years of experience in reviewing cardiovascular images. All cardiac imaging data used for segmentation were DICOM data acquired using second-generation or third-generation dual-source CT scanners (SOMATOM Definition Flash, SOMATOM Force, Siemens Healthcare) through prospective ECG-gated scanning. We applied the inverse power law function $y = f(x, a, b) = 1 + ax^b$ to fit the learning curve. In this function, x represents the training sample size, y represents the Dice coefficient, and a and b are the fitting parameters. By utilizing the learning curve, we made projections of the Dice coefficient at a specific sample size.

Results: Based on the predictions derived from the learning curve model, it is estimated that a sample size of 183 would yield a Dice coefficient of 0.95, a sample size of 1027 would result in a Dice coefficient of 0.98, and a sample size of 3785 would achieve a Dice coefficient of 0.99.

Conclusion: Through the application of the learning curve fitting approach, we have determined that a specific number of training samples is essential in attaining elevated Dice coefficients, such as 0.95, 0.98, and 0.99. The utilization of the inverse power law learning curve fitting technique proves to be an effective means of estimating the requisite sample size for training models.

PU-2215

冠状动脉—肺动脉瘘 CT 表现及机制探讨

陈小启¹、朱雅馨¹、顾基伟¹、邱金海²、黄峰¹

1. 杭州师范大学附属医院

2. 浙江绿城心血管病医院

目的 分析冠状动脉-肺动脉瘘 (CPF) 的 MDCT 冠状动脉造影 (CCTA) 的影像特点及机制探讨。
方法 收集并分析近 3 年间于杭州师范大学附属医院及浙江绿城心血管病医院 31 例经 CCTA 确诊 CPF 临床资料, 其中男 14 例, 女 17 例, 年龄范围 28 岁~80 岁, 平均年龄 59.81 ± 13.74 岁。采用容积再现 (VR)、多平面重组 (MPR)、曲面重组 (CPR) 及最大密度投影 (MIP) 观察 CPF 瘘血管的起源、数目、走形、瘘口及继发改变。测量同层面升主动脉及主肺动脉 CT 值, 并计算两者差值。结果 31 例确诊 CPF 的患者中, 双侧冠状动脉同时供血 11 例, 单侧冠脉供血 20 例 (起源于左侧冠状动脉 15 例, 均由左侧圆锥支发出; 起源右侧冠状动脉 5 例, 均由右圆锥支发出)。31 例 CPF 均可见迂曲不规则“簇状”畸形血管团, 肺动脉内可见“喷射征”3 例, “浓染征”10 例, 伴动脉瘤形成 14 例 (其中 1 例动脉瘤内血栓形成), 动脉瘤测量最大长径及与之正交的短径, 取两者平均值, 动脉瘤经线范围 5.2mm~52.0mm, 平均 11.2mm。瘘口均开口于肺动脉左侧壁, 瘘口大小范围 0.7mm~6.6mm, 平均 2.6mm。出现“喷射征”与“浓染征”组共 14 例, 升主动脉与主肺动脉密度 CT 值差 ΔCT 范围 111HU~352HU, 平均 ΔCT 222HU, 非“喷射征”与“烟雾浓染”组共 18 例, 升主动脉与主肺动脉密度 CT 值差 ΔCT 范围 -35HU~95HU, 平均 ΔCT 27HU。结论 CCTA 能准确无创检出 CPF, 显示瘘血管与周围结构的空間关系, 迂曲扩张“簇状”血管团及“喷射征”是典型表现。

PET-MRI 和 PET-CT 对肺癌临床分期的统筹对比分析

马宇鸿、王莉、孙志远、张龙江

中国人民解放军东部战区总院

近年来, PET/MRI 作为一种新兴的联合成像技术, 它的临床应用实践正在快速增长, 尤其在恶性肿瘤的 TNM 分期评估。而 PET/CT 作为一种成熟的成像技术, 已被广泛运用于各种恶性肿瘤的临床分期, 因此对比评估 PET/MRI 与 PET/CT 对非小细胞肺癌 (NSCLC) 的分期及转移也引起了人们的极大关注。然而, 运用 PET/MRI 与 PET/CT 进行评估 NSCLC 临床分期面临着技术问题及诊断图像质量方面的挑战。对此, 我们对已发表的有关 NSCLC 临床分期的文献进行了检索, 着重总结对比 PET/MRI 与 PET/CT 对 NSCLC 临床分期的准确性和技术问题。

PU-2217

心外膜脂肪体积变化与冠状动脉粥样相关性研究

周微
重庆医科大学附属永川医院

目的:本研究主要探究肺癌筛查体检人群中冠状动脉粥样硬化与心外膜脂肪体积的相关性。

材料与方法:

第一部分:搜集 2018 年 1 月-2022 年 12 月于重庆医科大学附属永川医院行胸部低剂量 CT 扫描的肺癌筛查体检者 1000 例,年龄 18-70 岁,分为冠状动脉粥样硬化阳性组和阴性组,分别测量其左冠状动脉周围心外膜脂肪体积和右冠状动脉心外膜脂肪体积和总和体积,测量层面从肺动脉主干至心尖部,手动勾画每一个层面,并计算最终结果。采用非参数检验统计分析两组的心外膜脂肪体积有无差异,采用相关性分析心外膜脂肪体积与冠状动脉粥样硬化的相关性。

第二部分:搜集 2018 年 1 月-2022 年 12 月于重庆医科大学附属永川医院行两次及以上胸部低剂量 CT 扫描的肺癌筛查患者,从中筛选出新发冠状动脉粥样硬化组和持续阴性组人群,分别测量新发组首次和间隔 2 年、5 年的病灶侧心外膜脂肪体积,多发病灶患者测量右冠周围心外膜脂肪体积,以及持续阴性组右冠周围心外膜脂肪体积,测量方式同第一部分。统计分析新发组患者首次和间隔 2 年、5 年的病灶侧心外膜脂肪体积是否具有差异及与阴性组之间是否具有差异。新发组病灶侧心外膜脂肪体积变化量与冠状动脉粥样硬化发生的相关性。采用 ROC 曲线分析右冠周围心外膜脂肪体积变化量预测发生冠状动脉粥样硬化的敏感性、特异性。

预期结果:

第一部分:冠状动脉粥样硬化阳性组与阴性组间冠状动脉周围心外膜脂肪体积差异有统计学意义, $P<0.05$ 。与冠状动脉粥样硬化相关性右冠状动脉周围心外膜脂肪体积大于左冠状动脉周围心外膜脂肪体积,均呈正相关。

第二部分:冠状动脉粥样硬化新发组 2、5 年心外膜脂肪体积均与首次心外膜脂肪体积有明显差异。首次右冠状动脉周围心外膜脂肪体积 2、5 年变化量与新发冠状动脉粥样硬化有较强相关性。其中与新发冠状动脉粥样硬化 5 年变化量相关性大于 2 年变化量。当右冠周围心外膜脂肪体积变化量达到某一数值时其预测冠状动脉粥样硬化的敏感性、特异性较高。

结论:

肺癌筛查体检者心外膜脂肪体积与冠状动脉粥样硬化呈正相关。心外膜脂肪体积变化量可以预测冠状动脉粥样硬化发生的概率。

PU-2218

主动脉壁间血肿 CTA 特征与 D-二聚体水平的相关性研究

弥龙、伍保忠、刘旭东、陈建强
海南医学院第一附属医院

目的 探讨主动脉壁间血肿在 CTA 上的影像学特点,并对量化后的主动脉壁间血肿形态学指标与血 D-二聚体水平进行相关性分析。方法 回顾性分析 2017~2021 年我院 CTA 诊断 IMH 的患者 18 例。所得图像导入工作站进行三维重建。计算每个病例的血肿长度、血肿最大截面积、血肿最大截面积比、管腔狭窄率、血肿容积指数,并同时检测每位 IMH 患者的血 D-二聚体值。按照血肿厚度和直径分为低风险组和高风险组,比较两组的血 D-二聚体水平有无统计学差异;并将血 D-二聚体值和血肿长度、血肿最大截面积比、管腔狭窄率、血肿容积指数分别进行相关性分析。结果 ①壁间血肿 CTA 特征主要表现为主动脉壁新月形或环形增厚,无内膜片移位,主动脉管腔受压,钙化内移,同时可伴有溃疡样突起和壁内血池。②高风险组与低风险组的血 D-二聚体水平存在统计学差异。

③D 二聚体值与血肿体积指数之间呈正相关($r=0.550$, $P<0.05$), D 二聚体值与血肿长度、血肿最大截面积比、狭窄率之间相关性不显著($P>0.05$)。结论 量化后的 CTA 形态学指标联合血 D 二聚体水平对预测 IMH 的高风险具有一定应用价值。

PU-2219

主动脉夹层 TEVAR 术后肾体积减少的流体力学研究

霍英松、陈国中
南京市第一医院

目的: 探讨基于计算流体力学 (computational fluid dynamics, CFD) 研究 B 型主动脉夹层 (type B aortic dissection, TBAD) 胸主动脉腔内修复术 (thoracic endovascular aortic repair, TEVAR) 术后血流动力学改变与肾体积减少之间的潜在关系。

方法: 回顾性分析 TEVAR 术前及术后 1 年时 CTA 图像。基于 CTA 构建主动脉模型并进行 CFD 模拟, 获取主动脉入口及肾动脉入口的收缩末期压力及质量流量。测量双肾在手术前后体积变化, 根据体积是否减少分为正常组和减少组。

结果: 102 例肾脏中 73 例体积减少。与正常组相比, 减少组主动脉入口压力 ($P=0.019$)、质量流量比 ($P=0.000$)、压力比 ($P=0.046$) 增高, 而肾动脉入口质量流量 ($P=0.000$) 减低。质量流量比 (OR: 0.981, 95%CI: 0.970-0.992; $p=0.001$)、主动脉入口压力 (OR: 0.585, 95%CI: 0.357-0.957; $p=0.033$) 为肾体积减小的独立风险因素。基于质量流量比、主动脉入口压力、质量流量比与主动脉入口压力相结合的模型预测肾体积减少的效能分别为 0.791 (95%CI: 0.699-0.882)、0.649 (95%CI: 0.533-0.766) 和 0.822 (95%CI: 0.097-0.259)。

结论: 主动脉夹层 TEVAR 术后肾体积减少与血流动力学改变密切相关, 基于 CFD 获得的血流动力学参数可能有助于早期预测术后肾体积减少。

PU-2220

基于 CCTA 影像组学预测慢性完全闭塞病变形成

许薇、张龙江
南京医科大学金陵临床医学院

目的: 本研究旨在基于基线冠脉狭窄 CCTA 影像组学准确预测慢性完全闭塞(CTO)病变形成。

方法: 回顾收集 2008-2023 年冠脉造影(ICA)诊断至少有 1 条狭窄 $\geq 70\%$ 血管且一年前接受过 CCTA 的患者。共有 79 例 ICA 证实 CTO (CTO 组) 且在 1 年前行 CCTA 检查以及 1: 2 匹配 148 例 ICA 上至少一直血管 $>70\%$ (非 CTO 组)。对于所有基线 CCTA 冠脉病变进行定性评估以及半自动化斑块定量以及提取了 896 个影像组学特征。构建机器学习模型用以探究影像组学特征区分进展为 CTO 与进展为非 CTO 的增量价值。

结果: 进展为 CTO 组与进展为非 CTO 组的临床基线特征没有统计学差异。进展为 CTO 组有更小的管腔直径、更长的病变以及更多的不良斑块特征相比进展为非 CTO 组患者。进展为 CTO 组的斑块有更高的非钙化斑块体积、更高的重塑指数, 以及更低的低密度斑块相比进展为非 CTO 组。进展为 CTO 与进展为非 CTO 的影像组学评分不同 (0.51 vs 0.21; $p<0.01$)。当包含基线 CCTA 特征的机器学习模型加入影像组学特征时, 基于 CCTA 影像组为预测 CTO 病变形成提供了增量价值 (0.81 vs 0.72; $p<0.01$)。

结论：进展为 CTO 与进展为非 CTO 有着不同的影像组学特征评分。所构建的模型可以更加准确的预测 CTO 病变形成。

PU-2221

Comparison of image quality for patients with coronary artery bypass grafts between conventional and spectral CT imaging using AI-based motion-compensated reconstruction

Yiran Wang
the First Affiliated Hospital of Zhengzhou University

PURPOSE:

To investigate the feasibility of combining spectral CT imaging and AI-based motion-compensated reconstruction (MCR) for patients with coronary artery bypass grafts (CABG) by comparing with polyenergetic CT images.

METHOD:

CT coronary angiography can assess the graft noninvasively with high diagnostic accuracy, but the image quality is affected by the resolution of the imaging device. The second-generation dual-layer spectral CT increases the width of the detector from 4cm to 8cm compared with the first-generation device, the scanning time is shorter, which is more beneficial to the CT angiography examination of patients after bypass surgery, and the requirements for heart rate and inspiratory closure of patients will be relatively relaxed.

We prospectively recruited 31 patients with coronary artery bypass grafts with clinical indications for CCTA examination at a second-generation dual-layer spectral CT (DLCT). Patients' heart rates were not controlled before the examination. The conventional and spectral CT images were obtained synchronously by each scan and reconstructed by MCR. Conventional 120 kVp polyenergetic images (PI) were defined as Group A. Virtual monoenergetic images (VMIs) in 50 keV were defined as Group B. For quantitative image quality, CT attenuation, signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR) were determined by ROI measurements in all patients. Subjective evaluation of the image quality was performed independently by two blinded reviewers using a 5-point scale in artifacts, lumen continuity, and overall contrast (5 = excellent, 1 = poor).

Results:

The mean heart rate of the patients during the scan was 74.7 ± 9.2 . $HR < 75$ bpm in 18 cases and $HR \geq 75$ bpm in 13 cases. The overall interpretability of the CABG and natural coronary segments were 100% and 96.7%. Group B had higher enhancement, SNR, CNR in AO and coronary arteries than Group A. The mean attenuation was higher in group B than in group A in AO (964.2Hu vs 395.3Hu ; $p < 0.05$) and coronary ($823.3 \pm 229.1\text{Hu}$ vs $416.9 \pm 91.0\text{Hu}$ for RCA, $788.9 \pm 282.2\text{Hu}$ vs $354.3 \pm 104.7\text{Hu}$ for pLAD, and $753.1 \pm 243.8\text{Hu}$ vs $397.5 \pm 106.8\text{Hu}$ for pLCX, all $p < 0.05$). Subjective image quality was higher in group B than in group A (4.5 ± 0.5 vs 4.2 ± 0.5 ; $p < 0.05$).

Conclusion:

The second-generation DLCT allows for an excellent interpretable assessment of CABG and natural coronary arteries. Compared with PI, CCTA images obtained by 50keV VMI and MCR provided higher image quality for patients with CABG, even with a high heart rate.

PU-2222

基于负荷心肌灌注联合冠状动脉 CT 血流储备分数分析冠状动脉 临界病变患者预后

王国坤、赵雁鸣、张金玲
哈尔滨医科大学附属第二医院

目的：本研究旨在探讨动态负荷心肌灌注成像（MPI）与冠状动脉计算机断层血管造影（CCTA）衍生的血流储备分数（FFR-CT）在评估冠状动脉临界病变患者预后中的价值。

材料和方法：回顾性分析哈尔滨医科大学附属第二医院 2021 年 1 月至 2022 年 12 月均接受 CCTA 和 MPI 扫描且诊断为冠状动脉粥样硬化型心脏病临界病变的患者 112 例。记录患者性别、年龄、高血压、糖尿病、血脂、吸烟史、家族史等信息，使用 CCTA 对患者的梗阻进行评估并进行 CAD-RADS 分级，MPI 评估心肌缺血，FFR-CT 评估冠状动脉血流储备学分数。主要结局为全因死亡率和非致死性心肌梗死（D/MI），次要结局为患者检查 3 个月后发生心律失常、心衰或因心脏疾病再入院。采用嵌套多变量 cox 回归模型对患者的预后进行分析，赤池信息准则（AIC）、一致性指数（C-index）和重分类改善指数（NRI）用来比较各个模型的性能。

结果：112 例患者的中位随访时间为 16 个月，其中 8 例患者出现主要结局，35 例患者出现次要结局。经单变量 Cox 模型调整后的结果显示，收缩压、舒张压、FFR-CT 与 CT-CTP 灌注是心肌缺血患者出现次要结局的独立影响因素。在应用嵌套多变量 COX 回归建立的 6 个模型中，联合 FFR-CT、MPI 和基线信息的模型结果可预测次要结局（HR: 4.071, 95% CI: 1.835-9.031, P=0.0006; HR: 4.749, 95% CI: 1.876-12.024, P=0.0010）。此外，AIC、C-index、NRI 均表明加入基线、FFR-CT 和 MPI 与其他模型相比可以对冠状动脉粥样硬化型心脏病临界病变的高危患者进行更好的风险分层。

结论：在冠心病心肌缺血的高危患者中，FFR-CT 与 MPI 联合使用可成为监测患者临床预后的潜在指标。

心外膜脂肪体积变化与 BMI 变化的关系

杨蕊、贺洪楚、支爱华
云南省阜外心血管病医院

目的：探讨 EAT 体积变化与体重指数（BMI）变化的关系。**方法：**收集 60 例大于两次 MDCT 冠状动脉造影（CTA）检查的患者，采用西门子 64 排双源螺旋计算机断层摄影术（CT），工作站自带的 volume 软件测量两次检查患者的心外膜脂肪体积，根据体重计算 BMI，应用 SPSS 26.0 进行统计学分析，进行 Pearson 相关性分析，比较患者 EAT 体积变化与 BMI 变化的相关性，用秩和检验比较超重/肥胖和体重正常组、血脂异常组和血脂正常组的 EAT 体积。**结果：**1.超重/肥胖组比体重正常组 EAT 体积高，差异有统计学意义（ $p<0.05$ ）。2.血脂异常组比血脂正常组 EAT 体积高，差异有统计学意义（ $p<0.05$ ）。3.EAT 体积变化与 BMI 变化呈中度正相关（ $r=0.55$, $P<0.001$ ）。**结论：**EAT 体积与超重/肥胖、血脂异常相关，EAT 体积变化与 BMI 变化呈中度正相关，即 EAT 体积随着 BMI 的增加而增加、随 BMI 的减小而呈减少趋势。

一站式冠脉 CT 成像的应用现状

王超
贵州省人民医院

摘要】 随着 CT 设备不断地创新和改善, CT 成像已逐步成为冠脉检查不可或缺的一环, 同时, 基于 CT 各种新技术的发展, 一次冠脉 CT 成像能获得更多影像学数据, 同时也为临床诊疗提供了新的影像学证据。冠状动脉钙化斑块(Coronary Artery Calcification, CAC)的检测在对冠脉高危钙斑的前期筛查中起到不可轻视的作用, 有利于高危钙斑的及时检出。冠状动脉 CT 血管造影 (Cardiac CT Angiography, CTA) 目前已成为检测冠心病的首选无创检查项目, 并且依赖于其成像方案的多样性, 可通过改变扫描参数应用于冠状动脉旁路移植术的术前评估、胸痛三联症一站式成像的开展以及心脏瓣膜病的检测。冠状静脉 (Cardiac CT Venous, CTV) 血管造影也成为左心室起搏、靶向药物治疗、心律失常消融等临床工作开展前的重要影像依据; 心肌灌注 (CT Myocardial Perfusion, CTP) 也成为主流的评价心脏血供及诊断心肌疾病的成像技术。与此同时, 基于冠脉 CT 原始数据由人工智能所衍生的 CT 血流储备分数(CT-Fractional Flow Reserve, CT-FFR)、CT 管腔内衰减梯度(Transluminal Attenuation Gradient, TAG)、CT 血管壁面剪切应力 (Wall Shear Stress, WSS)、CT 轴向斑块应力(Axial Plaque Stress, APS)、CT 冠脉周围脂肪衰减指数(Fat Attenuation index, FAI)、CT 心肌细胞外容量 (CT-ECV) 等逐渐成熟的新兴技术也为临床治疗心脏疾病提供了更多更丰富的数据资料, 提高了诊断的准确性。近期热门的光谱 CT 冠脉成像在降低了噪声和各种伪影的同时带来了更好的空间分辨率和优秀的软组织对比度, 让心血管 CT 成像上升到了一个新的高度。随着心血管 CT 新技术的不断创新与改善, 今后会诞生出更多成像质量更高、信息量更丰富的影像数据, 此举也为广大患有心血管疾病的患者提供更好更精准的医疗保障。

多层螺旋 CT 对薄壁囊腔型肺癌诊断的影像学征象特点分析

邓然然、李可丰
盘锦市中心医院

目的 研究多层螺旋 CT 诊断薄壁囊腔型肺癌的诊断价值和影像学特点。

方法 本文的研究对象为 2020 年 3 月到 2022 年 10 月到医院进行治疗的 152 例肺癌患者, 所有患者入院后均经过多层螺旋 CT 进行诊断, 并以病理诊断结果为金标准, 分析多层螺旋 CT 诊断薄壁囊腔型肺癌的价值和影像学特征。

结果 ①经病理诊断确诊薄壁囊腔型肺癌 19 例, 而多层螺旋 CT 检出薄壁囊腔型肺癌 16 例, CT 诊断和病理诊断结果差异不显著 ($P>0.05$); ②经多层螺旋 CT 诊断薄壁囊腔型肺癌的阳性预测值为 93.75%、阴性预测值为 97.06%、敏感度为 78.95%、特异度为 99.25%、准确度为 96.71%、约登指数为 78.2%、误诊率为 0.75%、漏诊率为 21.05%; ③多层螺旋 CT 诊断薄壁囊腔型肺癌具有特征性的影像学图像表现。

结论 薄壁囊腔型肺癌属于一种特殊类型的肺癌, 近年来发病率有升高的趋势。经多层螺旋 CT 对薄壁囊腔型肺癌进行诊断与病理诊断结果没有明显的差异, 可作为对患者临床诊断的主要参考依据, 能为临床的诊断和治疗工作提供参考。

基于解剖结构与流体力学对心肌桥-壁冠状动脉患者桥前斑块形成的临床研究

吴秋香
无锡市人民医院

【目的】

利用心肌桥-壁冠状动脉患者的临床特征, 心肌桥的解剖学参数及 CT-FFR 和 WSS 等流体力学参数评估左冠状动脉前降支心肌桥桥前近端斑块形成的预测价值。

【材料与方法】

本研究回顾性搜集 2011 年 2 月至 2021 年 2 月在我院进行 2 次及 2 次以上 CCTA 检查且检查结果显示左冠状动脉前降支存在心肌桥-壁冠状动脉的患者共 178 例, 记录心肌桥-壁冠状动脉患者的性别、年龄等人口学资料和临床相关危险因素。在 CCTA 影像图像上测量心肌桥解剖参数。运用 t 检验、Mann-Whitney U 检验比较两组间不同临床因素, 各组内两期不同位置的 CT-FFR、WSS 值、P 值间的差异, 比较两组间的不同参数是否存在统计学差异。采用多因素 Logistic 回归分析患者临床特征、心肌桥各参数及基于 CCTA 图像所衍生的各个参数与心肌桥斑块形成的关系, 采用多因素逻辑回归分析, 计算比值比 (odds ratio, OR) 和 95% 置信区间 (confidence interval, CI)。并采用受试者操作特征曲线计算曲线下的面积值, 计算不同模型不同模型的准确性、敏感性、特异性及约登指数和曲线下面积。

【结果】

该研究共纳入 178 例左冠状动脉前降支心肌桥患者, 43 例患者心肌桥近端斑块形成。两组间基线心肌桥形态学参数, 无斑块形成组心肌桥的位置较斑块形成组远 ($P < 0.001$), 且收缩期狭窄程度与收缩期压迫指数在两组间差异存在统计学意义 ($P = 0.016$, $P = 0.013$)。余包括心肌桥长度、深度、心肌桥入口处的角度及舒张期狭窄程度间差异均无统计学意义 (所有 $P > 0.05$)。两组间心肌桥近端舒张期管壁压强值的差异具有统计学意义 (P 值 < 0.05), 两组间收缩期与舒张期的其他位置管壁压强值的差异没有统计学意义 (P 值 > 0.05)。多因素分析显示心肌桥的位置 ($OR = 0.951, 95\%CI: 0.924-0.979, P = 0.001$) 是预测桥前段斑块形成的独立危险因素。

【结论】

总之, 将 CT-FFR 和 WSS 及相应压力值与心肌桥解剖学参数相结合合并临床特征可以提高心肌桥单独解剖学参数合并临床特征对斑块形成的预测价值有助于提高对心肌桥前端斑块形成预测的能力。

基于解剖结构与流体力学对心肌桥-壁冠状动脉患者桥前斑块进展的临床研究

吴秋香
无锡市人民医院

【目的】

利用心肌桥-壁冠状动脉患者的临床特征, 心肌桥的解剖学参数及 CT-FFR 和 WSS 等流体力学参数评估左冠状动脉前降支心肌桥桥前近端斑块进展的预测价值。

【材料与方法】

本研究回顾性搜集 2011 年 2 月至 2021 年 2 月在我院进行 2 次及 2 次以上 CCTA 检查的患者, 且左冠状动脉前降支存在心肌桥-壁冠状动脉的一共 152 位。记录心肌桥-壁冠状动脉患者的性别、年龄等人口学资料和临床相关危险因素。在 CCTA 图像上测量心肌桥的解剖参数。利用 cFFR 软件测

量收缩期及舒张期心肌桥的 5 个位置分别的 CT-FFR 值, 心肌桥近端与远端的差值记为 Δ CT-FFR。并利用斑块分析后处理软件对桥前斑块进行定性定量分析, 判断斑块是否进展。运用 t 检验、Mann-Whitney U 检验比较两组间不同影响因素, 各组内两期不同位置的 CT-FFR、WSS 值、P 值间的差异, 比较两组间的不同参数是否存在统计学差异。采用多因素 Logistic 回归分析患者各个参数与心肌桥斑块形成的关系。并采用受试者操作特征曲线计算曲线下的面积值, 计算不同模型不同模型的准确性、敏感性、特异性, 约登指数和曲线下面积。数据分析均基于患者层面进行统计分析。评估不同模型对心肌桥-壁冠状动脉患者桥前段斑块进展的判断能力及临床预测价值。

【结果】

该研究共纳入 152 例左冠状动脉前降支心肌桥患者, 96 例患者心肌桥近端斑块进展。两组间收缩期心肌桥段管壁压强值的差异存在统计学意义 ($P < 0.05$)。桥后段压强值均低于桥前段管壁受压。两组间收缩期与舒张期的其他位置壁压强值的差异没有统计学意义 ($P > 0.05$)。logistic 二元回归分析结果, 显示糖尿病是预测桥前段斑块进展的独立危险因素。心肌桥的长度、心肌桥收缩期压迫指数是预测桥前段斑块形成的独立危险因素。模型 6 的曲线下面积高于模型 1、模型 2、模型 3、模型 4、模型 5。

【结论】

总之, 本研究发现临床危险因素和舒张期 CT-FFR 值是左冠状动脉前降支心肌桥近端粥样硬化斑块进展的重要影响因子, 将心肌桥患者临床特征、CT-FFR 和 WSS 及相应 P 值与心肌桥形态学参数相结合可以提高心肌桥解剖学参数和临床特征对斑块进展的预测价值与诊疗意义

PU-2228

Massive hemothorax induced by pulmonary arteriovenous malformation rupture: a case report and literature review

Xiang Li, Dianbo Cao
the First Hospital of Jilin University

Pulmonary arteriovenous malformation (PAVM), also known as pulmonary arteriovenous fistula, is a rare vascular developmental anomaly. Most cases of PAVM are associated with hereditary hemorrhagic telangiectasia (HHT). Hemothorax associated with PAVM is even rarer, and management concerning this complication still challenges. Here, we present a case of a giant PAVM complicated by hemothorax and perform a PubMed search to review 30 similar cases from January 2000 to July 2023. The reasons for the initial failure of interventional embolization are discussed through comprehensive evaluation based on our case and literature review. By studying and analyzing previous cases, we try to summarize the evidence regarding consideration for the diagnosis and treatment of PAVM complicated with hemothorax.

PU-2229

Established Risk Models to predict In-hospital Mortality in Acute Aortic Dissection

Yu Yuan¹, Jinling Zhang²
1. Beidahuang Group General Hospital
2. The Second Affiliated Hospital of Harbin Medical University

Objective: The aim of the study was to explore the value of clinical, imaging parameters and their combination in predicting the in-hospital mortality of patients with acute aortic dissection (AAD),

and to construct mortality risk prediction models for AAD patients convenient for clinical management.

Patients and Methods: This study was a single-center retrospective study. Between January 2018 and December 2022, 263 inpatients of the Second Affiliated Hospital of Harbin Medical University, who were diagnosed with AAD by computed tomography angiography (CTA). Using univariate and multivariate logistic regression to analyze the clinical and imaging parameters between the two groups, to identify potential risk factors associated with AAD in-hospital mortality.

Results: The overall in-hospital mortality of AAD patients was 30.42%. Univariate logistic regression analysis indicated that renal insufficiency, type A aortic dissection, D-dimer, troponin, white blood cell (WBC) count, monocyte count, neutrophil to lymphocyte ratio (NLR), eosinophil count, fibrinogen, prothrombin time (PT), P values of these 10 indicators were < 0.05 , which may be a risk factor for in-hospital death in AAD patients. Further multivariate logistic regression analysis showed that clinical indicators including WBC count, NLR, and imaging parameters including false lumen area, number of branches involved, and pericardial effusion were independent risk factors for in-hospital death in AAD patients. The area under the ROC curve (AUC) was 0.926 (95%CI=0.887-0.955).

Conclusion: We developed a simple nomogram prediction model for mortality risk using clinical and imaging parameters independently associated with in-hospital mortality in AAD. Although the model has not been validated in an independent population, it can help clinicians choose patient management methods and inform patients and the severity of the disease.

PU-2230

回顾性研究脂肪组织对血管粥样硬化炎症进展的反向作用

董晓林

青岛山大齐鲁医院 (山东大学齐鲁医院 (青岛))

目的: 冠状动脉血管粥样硬化会向其周围的脂肪组织释放炎症因子抑制前脂肪细胞的分化, 脑动脉周围无脂肪组织且存在脑脊液循环, 因此该研究的目的是通过比较冠状动脉与脑动脉粥样硬化的一致性探究脂肪组织对血管粥样硬化炎症进展是否存在反向作用。

方法: 该研究回顾性地纳入了本院过去两年内同时进行了心电门控冠状动脉血管 CT 平扫与头部 CT 平扫的患者 ($n=215$)。使用冠状动脉钙化积分 (coronary artery calcium score, CACS) 量化所有冠状动脉血管的粥样硬化斑块的进展情况; 应用与基于 Agatston 的 CACS 相同的计算方法量化脑血管中基底动脉与双侧大脑中动脉的钙化斑块。采用 Wilcoxon 符号秩检验比较脑血管钙化积分 (cerebral artery calcium score, CeACS) 与 CACS 的差异, 采用 Spearman 相关分析确定 CACS 与 CeACS 之间的关系, 采用 Bland-Altman 和组内相关系数 (intraclass correlation coefficient, ICC) 分析评价二者的一致性。

结果: 在所有 215 名患者中, 有 137 (63.7%) 人患有冠心病且具有较高的 CACS, 有 113 (52.6%) 人被认为存在腔隙性脑梗死等脑血管相关疾病。在冠状动脉与脑动脉血管的比较中, 代表粥样硬化发展的钙化斑块的定量在两组间存在显著差异 ($P<0.05$); 另外, 相关性分析认为同一患者的 CACS 与 CeACS 之间并未表现出较强的相关性 ($r<0.3$, $P<0.05$)。

结论: 血管周围脂肪组织对血管粥样硬化斑块的进展起到了一定的促进作用, 在血管发生炎症时, 其周围的脂肪组织会与炎症血管产生双向作用, 进一步推进血管炎症的发生与发展。

PU-2231

后纵隔节细胞神经瘤的影像学特征与病理分析

邹艳美

徐州医科大学附属医院

目的:分析后纵隔节细胞神经瘤的 CT 和 MR 影像表现及病理特点,提高对后纵隔节细胞神经瘤的认识。方法:回顾性分析经手术、病理证实的 14 例后纵隔节细胞神经瘤的 CT 和 MR 影像表现特点,并分析其组织病理学特征。结果:肿瘤均位于后纵隔,共计 15 个病灶,其中 5 个位于上纵隔,3 个位于中纵隔,5 个位于下纵隔,2 个位于中上纵隔,紧贴胸壁及椎旁生长,边界清楚,呈圆形、半圆形或椭圆形,上下径长度大于横径及前后径,CT 呈均匀或欠均匀软组织密度影,1 个病灶内可见囊变区,2 个病灶内可见脂肪组织,4 个病灶内可见斑点状或条片状钙化灶,2 个病灶伴邻近胸膜肥厚。MR 上,1 个病灶 T1WI 呈均匀等信号,2 个病灶 T1WI 呈不均匀等、高信号,T2WI 均呈不均匀高信号,增强扫描 2 个病灶未见明显强化,其余病灶呈轻中度均匀或不均匀强化。结论:节细胞神经瘤可发生于交感组织分布的任何区域,好发于后纵隔。可发生于任何年龄,女性多见,男女比例约 1:1.13~1:1.5。节细胞神经瘤系良性肿瘤,故生长缓慢,通常早期不伴临床症状,多在体检时偶然发现。组织学上,节细胞神经瘤由分化好的神经节细胞、成熟的 Schwann 细胞、神经纤维及粘液基质组成。成熟的神经节细胞周围常见卫星细胞。CT 上,节细胞神经瘤一般位于脊柱旁,多为椭圆形,呈头尾方向生长。本组病例均位于后纵隔,病灶均表现为上下径大于前后径及横径。神经节细胞瘤的影像表现与其病理特点密切相关,肿瘤密度由其内的成分比例决定。若肿瘤内粘液样基质占大部分,CT 平扫呈低密度;若神经节细胞及神经纤维成分增多,CT 平扫密度增高。MR 上,T1WI 多呈均匀低信号,T2WI 多呈不均匀高信号;其内可见钙化灶,还可见脂肪成分及螺旋样表现,增强扫描呈不均匀延迟强化。肿瘤可向椎间孔内蔓延,引起脊髓损伤。少数节细胞神经瘤可对邻近的骨骼产生侵蚀改变。结合其病理特征,对于在影像上正确诊断节细胞神经瘤有重要意义。

PU-2232

基于 CT 影像的三维适形 X-刀放射治疗对晚期肺癌患者的临床疗效

黄超、李岚

潮州市第一人民医院

摘要:

Background: 肺癌是起源于肺部支气管黏膜或腺体的一类恶性肿瘤。近年来,肺癌的发病率和死亡率明显增高,男性肺癌发病率和死亡率均占有恶性肿瘤的第一位。为此找寻肺癌的有效治疗方法,对于提高患者的生存率十分重要。本文探究 3D-CRT X-刀放射治疗对晚期肺癌患者治疗中的临床效果和毒副作用,以期提高患者生存率,改善预后。

Methods: 88 例晚期肺癌患者,随机法分为 Observation group 和 Control group,每组各 44 例,Observation group 使用 3D-CRT 治疗,Control group 进行常规野放疗技术治疗,分析两组患者一般资料,对比两组患者的血 AFP 降低率以及血白细胞减少发生率、生存率与局部控制率、近期疗效、急性放射不良反应以及总生存率。

Results: Observation group 血 AFP 降低率为 86.20%,血白细胞降低率为 21.70%;对照组血 AFP 降低率为 81.30%,血白细胞降低率为 19.60%;Observation group 显著高于 Control group ($P < 0.05$)。Observation group 一年局部控制率为 75%及一年生存率为 68.18%显著高于 Control group ($P < 0.05$)。观察组总有效率(93.46%)高于对照组(86.36%)。对比两组患者 5 年生存率,对照组整体生存率高于对照组。

Conclusion: 3D-CRT 技术能够降低患者周围组织受照量, 减少放射性损伤, 3D-CRT 的 X-刀放射治疗晚期肺癌患者具有很好的临床疗效, 近期疗效满意。

心脏磁共振应变分析和左房心功能参数对射血分数保留型心力衰竭患者舒张功能障碍的探究

郭家璇^{1,2}、田博¹、马小兵¹

1. 宁夏医科大学总医院

2. 宁夏医科大学

目的

本研究旨在应用心脏磁共振特征跟踪 (CMR-FT) 技术, 探讨其在诊断 HFpEF 患者中的应用, 尤其是在超声心动图无法确定诊断时的作用。我们着重分析了左心房功能参数和心肌应变, 以及它们与超声心动图 E/A 值的相关性。

方法

从 2019 年 1 月 1 日至 2023 年 8 月 31 日在宁夏医科大学总医院连续性纳入 40 例 HFpEF 患者。使用飞利浦 3.0T 磁共振进行心脏常规序列扫描, 并应用 CMR-FT 技术进行后处理图像分析。测量的参数包括最大左房容积指数 (LAVI)、左房面积指数 (LAAi)、左房储备期应变 (ResS)、左房导管期应变等。

结果

本研究共纳入了 40 名 HFpEF 患者和 40 名健康志愿者。HFpEF 组的一般资料与对照组相比无明显差异。在 CMR 左室心功能分析中, HFpEF 组的左房容积指数和面积指数均明显增大 (分别为 63.9 (22.5) vs. 45.6 (16.8), $P<0.01$; 17.3 (2.45) vs. 12.65 (5.23), $P<0.01$)。两组之间的左室心功能参数差异不具有统计学意义 ($P>0.05$)。在心肌应变分析方面, HFpEF 组的左室径向、周向应变峰值及舒张期应变率均降低。左心房三期应变分析显示, HFpEF 组的三组应变较对照组均明显降低 (左房导管期应变、左房泵送期应变、左房储备期应变分别为 8.4 (2.3) vs. 17.8 (6.2)、10.6 (7.2) vs. 16.5 (5.2)、19.6 (11.2) vs. 33.5 (4.3), $P<0.001$)。进一步的相关性分析表明, ResS、LAAi、LAVI 与 E/A 值显著相关 ($r=0.623$, $r=0.518$, $r=0.761$, $P<0.001$)。

结论

本研究发现, 心脏磁共振测量的左房大小和储备期应变可用于定量评估 HFpEF 患者的舒张功能不全。此外, 这些参数与超声心动图描述的舒张功能障碍参数具有较好的一致性。

PU-2234

Predicting rapid plaque progression with radiomics signature of pericoronary adipose tissue based on coronary computed tomography angiography

Yue Li, Ting Liu

The First Hospital of China Medical University

Objectives To evaluate whether radiomics signature of pericoronary adipose tissue (PCAT) based on coronary computed tomography angiography (CCTA) could improve the prediction of rapid plaque progression (RPP).

Methods This retrospective study included 208 patients who underwent two CCTA examinations. We collected conventional plaque features and radiomics features of PCAT. All patients were

randomly divided into training and validation cohorts with a ratio of 8:2. Four models were constructed, including the fat attenuation index (FAI) model, the quantitative plaque features model, the PCAT radiomics model, and the combined model. The area under the receiver operating characteristics curve (AUC) was used to evaluate the performance of the models.

Results Compared with the FAI model (AUC 0.622 for training, 0.540 for validation) and the quantitative plaque features model (AUC 0.592 for training, 0.572 for validation), the PCAT radiomics model achieved better diagnostic performance in predicting RPP (AUC 0.773 for training, 0.794 for validation), with a significant difference of AUC (both $p < 0.05$). The combined model (AUC 0.824 for training, 0.811 for validation) was slightly higher than the PCAT radiomics model, while there was no statistically significant ($p > 0.05$).

Conclusions CCTA-based radiomics signature of PCAT is more effective for predicting the RPP than FAI and quantitative plaque features. The combination of PCAT radiomics, FAI and quantitative plaque features could further enhance the performance of the RPP identification.

PU-2235

Coronary artery fistula with or without aneurysm: a large comparative study

Lihan Yang, Xinxiao Zhao
Kunming Medical University Second Hospital

Background: The knowledge of coronary artery fistula (CAF) with coronary aneurysm mostly comes from case reports and is very limited. However, the management of CAF with and without aneurysm is different, more understanding of its clinical and imaging features is necessary. This is the first research focus on it through a large comparative study.

Purpose: To investigate the differences in imaging and clinical features of CAF with and without aneurysms.

Methods: We reviewed 96,037 consecutive patients undergoing coronary computed tomography angiogram (CCTA) between 2016 and 2020 and total of 429 CAF adult patients were enrolled. Those patients were divided into the CAF with aneurysm group (321 cases, 74.83%) and CAF without aneurysm group (108 cases, 25.17%) according to whether complicated with coronary aneurysm. Clinical baseline data, electrocardiographic (ECG) characteristics, the presence or absence of coronary atherosclerosis, complication symptoms and fistulous origin, entry site, number and diameter were analyzed. Chi-square test, T-test, Mann-Whitney U tests, and logistic regression analysis were performed.

Results: Most of the clinical baseline data did not differ significantly between the two groups ($P > 0.05$). However, heart murmur, coronary atherosclerosis, infective endocarditis (IE), fistulous diameter and fistulous entry site were significantly different ($P < 0.05$). Further multivariate logistic regression analysis showed that large fistulous diameter and coronary-cardiac chamber arterial fistulas were dependent risk factors for CAF complicated with aneurysm.

Conclusion: CAF patients with aneurysm were more prone to develop heart murmur than those patients without aneurysm. Different from other sites of aneurysms, coronary atherosclerosis is more common in CAF without aneurysm. Larger fistulous diameter and coronary-cardiac chamber arterial fistula are dependent risk factors for CAF with aneurysms.

PU-2236

基于冠脉 CTA 的 3D 量化分析技术探索心外膜脂肪与冠状动脉粥样硬化之间的关系

韩瑞、蒋鸿、刘兴华、彭红芬、张东友
武汉市中西医结合医院 (武汉市第一医院)

目的 通过 3D 量化分析技术探索心外膜脂肪 (epicardial adipose tissue, EAT) 体积、CT 值、纹理特征参数与冠状动脉粥样硬化之间的关系。

方法 随机选取 2013 年 7 月在我科做冠脉 CTA 检查的 43 例患者, 男性 20 例 (46.5%), 平均年龄为 62.6 岁 \pm 10.5 岁。根据有无冠状动脉斑块分为冠脉正常组 (n=21 例) 和冠状动脉粥样硬化组 (n=22 例), 使用 TIMESlice 软件计算 CT 增强的图像 3D 量化技术提取心脏外膜脂肪的体积、CT 值、纹理特征参数, 纹理特征提取得出 101 个特征分为六类, 包括 18 个一阶特征, 24 个灰度共生矩阵特征、16 个灰度区域大小矩阵、16 个游程矩阵特征、5 个邻域灰度差矩阵特征、14 个邻域灰度依赖矩阵特征。比较正常组和冠脉粥样硬化组的 EAT 体积、CT 值和 3D 纹理特征的差异, P 值<0.05 具有统计学差异。

结果 相较于冠脉正常组的 EAT 体积[98847.8(83809.3,123708.9)mm³]和 CT 值[-64.3(-70.1,-58.4)HU], 冠脉粥样硬化组 EAT 体积[165630.5(115815.1,206530.4)mm³]明显升高 (P=0.003), 但是 CT 值[-72.3(-73.6,-66.4)HU]降低 (P=0.006)。3D 纹理分析结果显示正常组和冠状动脉硬化组在纹理参数 ClusterProminence、MCC、LargeAreaHighGrayLevelEmphasis、SizeZoneNonUniformity、SmallDependenceHighGrayLevelEmphasis、SumAverage、TotalEnergy、ZoneEntropy、ZoneVariance9 个参数上的差异具有统计学意义 (P 值均<0.05)。

结论 冠状动脉粥样硬化患者心外膜脂肪不仅在体积、CT 值上与正常患者存在明显的差异, 纹理特征上也具有显著差异, 这说明心外膜脂肪跟冠状动脉粥样硬化存在明显的相关, 下一步通过这些相关性参数建立模型以评估冠心病患者病情及预测冠心病患者预后。

基于 CT 影像组学模型通过肺窗及纵隔窗评价非小细胞肺癌 PD-L1 疗效的价值研究

张瑜
空军军医大学西京医院

目的: 探讨 CT 影像组学模型通过肺窗、纵隔窗评价非小细胞肺癌 PD-L1 疗效的价值。**方法:** 回顾分析经 PD-L1 治疗的非小细胞肺癌患者的 CT 影像资料, 分为 PR 组和非 PR 组。由放射科医生分别在纵隔窗、肺窗人工勾画感兴趣区 ROI, 提取影像组学特征, 筛选特征降维后采用 Logistic 回归构建模型, 采用受试者工作特征(ROC)曲线分析两种窗的不同模型评价非小细胞肺癌 PD-L1 疗效的诊断效能。**结果:** 提取出 107 个纹理特征, 降维后肺窗、纵隔窗分别选出 27 个、26 个相关性最高并且冗余度最低的特征建立模型。肺窗的 svm 模型、bayes 模型、KNN 模型和 Logistic 模型曲线下面积(AUC)分别为: 0.800、0.775、0.825、0.875; 纵隔窗的 svm 模型、bayes 模型、KNN 模型和 Logistic 模型曲线下面积(AUC)分别为: 0.825、0.775、0.775、0.800。**结论:** 肺窗 Logistic 模型、纵隔窗 svm 模型评价非小细胞肺癌 PD-L1 疗效的可行性较高, 该方法可为临床医生决策提供重要参考。

Cardiovascular assessment of diastolic dysfunction in people living with the human immunodeficiency virus: correlation with markers of disease activity.

yue Zheng, Haibo Ding, Huaibi Huo, Ting Liu
The First Hospital of China Medical University

Purpose: To explore the presence and extent of diastolic atrial and left ventricular dysfunction in PLWH by cardiovascular magnetic resonance (CMR) in correlation with clinical markers of disease activity.

Methods: A total of 142 participants (age, range, gender) comprising 80 PLWH and 62 age- and sex-matched healthy volunteers were recruited for this cross-sectional study in China. The imaging methods used balanced steady-state free precession (SSFP) for the short-axis, 2-, 3-, and 4-chamber views. Data were analyzed using the software package SPSS Statistics Version 26.0. The used tests included independent t test and Univariate and multivariate linear or logistic analyses (significance level: P value <0.05).

Results: PLWH had a larger left atrial volume maximum index (LAVI_{max}: 33.3±0.5 mL/m² vs. 28.7±1.0 mL/m², P<0.001), minimum (LAVI_{min}: 13.9±0.4 mL/m² vs. 11.5±0.7 mL/m², P<0.001), and prior to atrial contraction (LAVI_{pre-a}: 23.1±0.5 mL/m² vs. 19.8±0.9 mL/m², P=0.001) as compared to healthy volunteers. The LA reservoir (28.3±0.6% vs. 33.8±1.5%, P<0.001) and conduit (15.0±0.5% vs. 18.9±1.1%, P=0.01) strain were lower [AdR2] in PLWH. Global circumferential left ventricular diastolic strain rate (LVGCS-d) was lower in the HIV patients (P=0.02). Multivariate analysis results showed that Nadir CD4+ T cells had an adverse association with LVGCS-d (β : 1.890, CI: 1.799, 1.981, P<0.001).

Conclusion: Atrial and left ventricular diastolic dysfunction is manifest in people living with chronic human immunodeficiency virus infection and correlates with with marker of more severe immune damage.

PU-2239

双侧心耳瘤合并房间隔缺损的影像诊断：罕见病例报告及文献综述

冯占起、赵鑫#、张灵洁、程美英、陆林、尚红磊、张永远、张晓雪
郑州大学第三附属医院

目的：心耳瘤（atrial appendage aneurysm, AAA）的发病率很低，双侧同时发病更为罕见，当合并常见心脏畸形时容易被漏诊。本文将对心耳瘤的临床表现、影像诊断等方面进行深入探究，有利于对该病进行精准诊断和治疗。

方法：首先对 1 例双侧心耳瘤合并房间隔缺损患儿的诊疗流程进行回顾，然后结合国内外文献，对心耳瘤的临床表现、发病机制、影像诊断和鉴别诊断进行全面分析和讨论。**病例回顾：**男，2 个月 9 天，出生后听诊发现心脏杂音。心电图提示窦性心动过速（199 次/分），频发房性早搏未下传，左、右心房肥大。胸部 X 线片显示双侧心房区心界扩大。经胸超声心动图显示双侧心耳呈囊性扩张伴不完全分隔、Ⅱ型房间隔缺损伴左向右分流、左心室收缩功能稍减低。CT 血管造影（CTA）可见房间隔缺损，并显示双侧心耳瘤呈多囊样改变，其中右侧心耳瘤范围约 49×38mm，左侧心耳瘤范围约 34×32mm，瘤内无血栓形成。遂行开胸“房间隔缺损修补术和双侧心耳瘤切除术”。病理证实为心耳瘤。术后 3 个月随访恢复良好。

结果: 心耳瘤表现为心耳的局部或弥漫性扩张。发病原因可能为梳状肌发育不良或心房压升高。临床表现可以从无明显症状到房性心动过速、血栓栓塞等。影像学检查基本可以确诊。手术是目前首选和推荐的治疗方法。

结论: 心耳瘤较为罕见, 在心脏畸形筛查时需要考虑合并该病的可能性。多模态影像联合应用可以提高诊断的准确性, 有利于制定个性化的手术方案。

基于 AI 定量检测新型冠状病毒奥密克戎变异株感染胸部 CT 演变特征分析

任涛、王雷、李静、呼甜
延安大学附属医院

摘要:目的 探讨人工智能 (AI) 定量检测在新型冠状病毒肺炎 (COVID-19) 奥密克戎变异株不同分型中胸部 CT 动态变化特征的价值。方法 收集 102 例确诊为 COVID-19 奥密克戎变异株感染 (非重症组 72 例, 重症组 30 例) 患者的临床及多次胸部 CT 资料, 使用 AI 软件定量评价出现症状后 COVID-19 奥密克戎变异株感染患者不同时间点胸部 CT 影像定量分析中的动态变化。采用独立样本 t 检验或非参数检验比较两组间定量指标的差异, 对发病后天数与 CT 定量指标进行三次多项式曲线回归函数拟合, 对 CT 定量指标随发病时间的变化进行分析。结果 CT 定量指标中除平均密度 (mean lesion density, MLeD/HU)、非实性比例 (ground-glass opacity, GGO%) 及异质性外, 非重症组病灶体积 (lesion volume, LeV/ml)、病灶占肺体积的百分比 (percentage of lesion, LeV%) 及病灶质量 (lesion mass, LM/g) 低于重症组 ($P < 0.05$)。非重症组发病初期 LeV、LeV% 及 LM 达到顶峰, 随着时间的延长逐渐减低, 提示吸收缓慢, 重症组约第 5 天达顶峰, 5-12 天迅速减低, 提示 LeV、LeV% 及 LM 快速变化, 远快于非重症组。非重症组 MLeD 在 0-10 天缓慢下降, 之后缓慢上升, 重症组发病初期 MLeD 较非重症组高, 实变速度更快。重症组患者异质性约在 5 天后高于非重症组, 异质性上升速度高于非重症组。重症组发病初期 GGO% 已达顶峰, 随后下降, 下降速度高于非重症组。结论 COVID-19 奥密克戎变异株感染患者两组间动态变化存在一定的区别, 重症组的肺炎影像学具有肺内损伤程度重, 演变迅速及易反复等特点。AI 定量检测可以准确识别其胸部 CT 的动态演变过程, 不同定量指标能够客观地评估肺内病变性质, 为临床诊治提供一定的依据。

Micronodular thymoma with lymphoid stroma: A case report and review of the literature

Fenglan Li, Linlin Qi, Jianwei Wang
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Introduction: Micronodular thymoma with lymphoid stroma (MNT) is a rare subtype of thymic neoplasm common in older patients. No significant between-sex differences have been reported and patients are usually asymptomatic. Therefore, clinical guidelines, imaging manifestations, histopathological diagnostic criteria, prognostic factors, and therapeutic regimens have not yet been established. When the lesion is completely resected, micronodular thymoma with lymphoid stroma has a good prognosis, and to date, no reports of recurrence, distant metastasis, or tumor-related deaths exist. Only a few cases of MNT have been reported, and there is no summary of

its imaging features. Therefore, we collect 14 pieces of literature data to summarize the imaging features of MNT in this paper.

Case Description: We present the case of a 63-year-old man with an anterior mediastinal cystic-solid mass measuring $7.3 \times 6.6 \times 8.5$ cm in size by chest computed tomography examination. Combining morphological and immunohistochemical findings, the tumor was diagnosed as MNT of Masaoka-Koga stage II and TNM stage pT1aN0. The patient remained recurrence-free for five months after complete resection.

Conclusion: Most lesions on imaging images show a well-defined lobular-contoured anterior mediastinal mass. The lesions can often present cystic-solid solid types, and their solid components often show significant enhancement.

PU-2242

室间隔膜部瘤与瓦氏窦瘤的 CT 诊断与鉴别诊断

马彩彩

空军军医大学西京医院

摘要: 目的 探讨室间隔膜部瘤与瓦氏窦瘤的 CT 影像表现, 提高对二者的认识与鉴别水平。

方法 回顾性分析经手术证实的 25 例室间隔膜部瘤和 13 例瓦氏窦瘤的 CT 影像资料, 分析瘤体的位置、形态、大小, 与心室有无交通等影像学特征。

结果 室间隔膜部瘤与瓦氏窦瘤在瘤体发生的位置、形态有差异。

结论 室间隔膜部瘤与瓦氏窦瘤在 CT 影像上存在差异: 室间隔膜部瘤为位于主动脉窦下室间隔区的局限性突起, 多突向右室; 瓦氏窦瘤为主动脉窦的瘤样扩张, 可破入心房、心室。

PU-2243

急性 A 型主动脉夹层合并脑梗死患者的影像学分析

黄瑞

空军军医大学西京医院

目的 分析合并脑梗死急性 A 型主动脉夹层(acute type A aortic dissection, ATAAD)患者的临床及影像学特征, 探讨与预后的相关性。方法 回顾性分析 2015-2021 年经临床确诊的 ATAAD 合并急性脑梗死患者 87 例, 以患者围手术期生存情况分为存活组和死亡组, 分析与急性脑梗死发生相关的临床和影像学特征。结果 ATAAD 合并脑梗死的类型主要为栓塞型 (71.26%), 其次为分水岭型 (17.24%) 和混合型 (11.49%), 存活组与死亡组梗死类型无统计学差异。梗死灶在半卵圆中心、顶叶、额叶分布较多, 右侧大脑半球较多, 前循环区域分布较多, 存活组与死亡组差异具有统计学意义 ($P < 0.05$)。死亡组与存活组相比, 颈总动脉狭窄程度 $> 70\%$ (28.6%vs11.1%, $P=0.04$)、合并三个及以上脏器灌注不良 (50%vs22.2%, $P=0.007$) 的发生率高, 脑梗死平均体积较大 (61.73 (40.31, 107.87) vs 54.76 (31.44, 128.43), $P=0.608$), 数目较多 (11 (2, 18) vs 4 (1.5, 8), $P=0.012$), 且更容易发生大面积脑梗死 (8 vs 2, $P=0.072$)。结论 ATAAD 患者术前脑梗死主要影像学机制是栓塞, 梗死灶影像特征与围手术期死亡相关, 这些发现对未来临床实践和研究具有启示意义。

PU-2244

Radiomics features of pericoronary adipose tissue improve CT-FFR performance in predicting hemodynamically significant coronary artery stenosis

Lihua Yu
Shanghai General Hospital

Objectives

To evaluate the value of radiomics-based model of pericoronary adipose tissue (PCAT) combined with CT fractional flow reserve (CT-FFR) in predicting hemodynamically significant coronary stenosis.

Methods

Patients with suspected or known coronary artery disease, who had coronary computed tomography angiography (CCTA), invasive coronary angiography (ICA) and FFR within 1 month, were retrospectively included. Radiomics features of lesion-based PCAT were extracted. The lesion-specific CT-FFR values, CCTA-derived diameter stenosis, lesion length and PCAT attenuation were also measured. FFR values were used as the reference standard to assess the diagnostic performance of radiomics model, CT-FFR, and combined model for detection of flow-limiting stenosis.

Results

A total of 146 patients with 180 lesions were included in the study. All lesions were divided into training and validation cohorts at a ratio of 2:1. CT-FFR model exhibited the highest area under curve (AUC) (0.803 for training, 0.791 for validation) in predicting hemodynamically significant stenosis, followed by radiomics model (0.776 for training, 0.744 for validation). However, no statistically significant difference was found between the AUCs of the above two models ($p > 0.05$). When CT-FFR was combined with radiomics model, the AUC reached 0.900 for training cohort and 0.875 for validation cohort, which were significantly higher than that of CT-FFR and radiomics model alone (both $p < 0.05$).

Conclusion

The diagnostic performance of PCAT radiomics model was comparable to that of CT-FFR for identification of ischemic coronary stenosis. Adding PCAT radiomics model to CT-FFR showed incremental value in discriminating flow-limiting from non-flow limiting lesions.

PU-2245

Role of Fluid Mechanics in Coronary Atherosclerotic Plaques: research progress

Yaoming Yang^{1,2}, Xiaolin Mu¹, bo Zhang^{1,2}
1. Central Hospital of Dalian University of Technology
2. Department of Graduate School, Dalian Medical University

Abstract: Most acute coronary syndromes are due to sudden luminal embolism caused by rupture or erosion of atherosclerotic plaques, and prevention of plaque development has become effective strategy to reduce mortality and morbidity in coronary heart disease. It is now generally accepted that plaques with thin-cap fibroatheroma (TCFA) are precursors to rupture and that larger plaques and high-risk plaque features (including low-attenuation plaque, positive remodeling, napkin-ring sign, and spotty calcification) constitute unstable plaque morphology.

However, plaque vulnerability or rupture is a complex evolutionary process caused by a combination of multiple influencing factors. With the effective combination of medicine, engineering mechanics, and computer software, researchers have turned their attention to computational fluid mechanics. The importance of fluid mechanics in pathological states for promoting plaque progression, inducing plaque tendency to vulnerability, or even rupture as well as the high value of functional evaluation of myocardial ischemia has become a new research hotspot nowadays.

This article reviews recent research advances on coronary plaque fluid mechanics, including wall shear stress (WSS), axial plaque shear (APS) and flow fraction reserve (FFR). Previously, most computational fluid dynamics were obtained using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) invasive methods. In recent years, the image quality and spatial resolution of coronary CT angiography (CCTA) have greatly improved, making it possible to compute fluid dynamics by CCTA. In the future, the combination of CCTA-based anatomical stenosis, plaque high-risk features, and fluid mechanics can further improve the prediction of plaque development, vulnerability, and rupture risk, as well as enable non-invasive means to assess the degree of myocardial ischemia, providing an important aid to guide clinical decision-making and optimize treatment.

PU-2246

One-stop Low-dose CT Angiography of the Coronary Arteries and Veins on Dual-layer Spectral Detector CT: A Primary Study

Xun Yue^{1,2}, Jiayu Sun¹, Xiaohua Huang²

1. Department of Radiology, West China Hospital, Sichuan University

2. Department of Radiology, Affiliated Hospital of North Sichuan Medical University

Abstract

Background: To explore the feasibility of a one-stop low-dose imaging protocol for the coronary arteries and veins on dual-layer spectral detector computed tomography (SDCT).

Methods: Sixty-five patients with suspected coronary artery disease indicated for coronary CT angiography (CCTA) were included. Conventional 120 kVp polychromatic images with iterative model-based reconstruction (IMR) and virtual monochromatic images (VMIs) at 40 keV, 50 keV, 60 keV, and 70 keV were generated. Image analysis was performed by 2 independent radiologists. The coronary arteries were assessed subjectively (for artifact, noise, and overall quality) and objectively (for attenuation) on 120 kVp images. The coronary veins were compared subjectively (for noise, contrast, sharpness, artifact, and overall quality) and objectively [for attenuation, noise, signal-to-noise ratio (SNR), and contrast-to-noise ratio (CNR)] on both VMIs and 120kVp images.

Results: A mean Likert score of > 4 points was provided across the 941 coronary artery segments evaluated. Compared to 120 kVp images, subjective venous contrast, sharpness, and overall image quality were significantly better on 40 – 60 keV VMIs ($p < 0.05$). Subjective and objective noise were significantly better on 40 – 70 keV VMIs ($p < 0.05$). Objective attenuation, SNR, and CNR were significantly higher on 40 – 60 keV VMIs ($p < 0.05$). Based on CNR, 40 keV was deemed the optimal VMI energy level for venous visualization.

Conclusion: The feasibility of our proposed one-stop low-dose CCTA protocol on DECT was demonstrated, with satisfactory visualization of the coronary arteries and veins achieved on 120 kVp images and 40 keV VMIs, respectively.

PU-2247

CTA 在经导管主动脉瓣置换术中的应用及进展

陶雅红

南昌大学第二附属医院

目的：计算机断层扫描血管成像（computed tomography angiography, CTA）对于 TAVR 术前手术规划非常重要，CTA 不仅是评估主动脉根部及外周血管通路解剖结构的金标准，而且还可以预测和识别术后并发症。本文对目前 CTA 在 TAVR 患者中的应用及相关研究进展展开综述。

资料和方法：本文通过阅读大量相关文献，旨在对目前 CTA 在 TAVR 综合评估中的应用及相关进展进行总结和综述。

结果：本文主要从以下四个方面展开：1、TAVR 术前 CTA 评估：传统上，TAVR 术前 CTA 分析主要包括评估主动脉根部及外周血管通路的解剖结构，以便在选择合适的人工瓣膜支架尺寸及输送通路时获得更高的准确性，此外还可利用术前 CTA 分析的解剖信息对 TAVR 术后相关并发症进行风险评估。2、TAVR 术后 CTA 的应用：术后 CTA 对发现一些特殊的并发症至关重要，目前最热门的研究是关于 TAVR 术后亚临床小叶血栓形成的相关研究。3、CTA 在 TAVR 中的新应用：TAVR 领域的飞速发展，使得人们对 TAVR 术前 CTA 的研究激增，涌现出了许多与 TAVR 诊断和预后相关的新应用，如评估和诊断冠状动脉疾病、非瓣膜相关临床结果的预测、3D 打印技术应用、评估心肌功能指标相关预后等。4、CTA 在 TAVR 应用中的局限性：对图像质量要求高、辐射剂量问题及对比剂肾功能损害等。

结论：CTA 已成为现代 TAVR 手术策略制定中的基本要素，在主动脉根部解剖结构评估、外周血管通路评估和围手术期并发症的预测中具有公认的实用性。然而，随着 CTA 成像技术的进步，许多 CTA 的新应用被引入 TAVR 的研究中，可以预见 CTA 在未来 TAVR 手术的创新和应用中将发挥更关键的作用。

PU-2248

Predictive value of wall shear stress (WSS) on aortic dilation in patients with bicuspid aortic valve (BAV): a systematic review and meta-analysis

HongRui Jin

The First Affiliated Hospital of Zhengzhou University

Background

BAV is associated with aortic dilation, but there is limited knowledge about possible predictors of aortic dilation in patients with BAV. This meta-analysis was conducted to assess the predictive value of wall shear stress (WSS) for aortic dilation in patients with bicuspid aortic valve (BAV).

Methods

Relevant studies published from inception to July 3, 2023, in the four electronic databases: PubMed, The Cochrane Library, EMBASE, and Web of Science were comprehensively searched. Weighted mean difference (WMD) was used as the effect size for the continuous variables. Additionally, subgroup analyses were performed.

Results

This meta-analysis included five case-control studies involving 373 BAV participants (233 with aorta dilation and 140 without aorta dilation). The meta-analysis showed that in the Arch part, the WSS of participants with aorta dilation was 0.19 N/m² less than the WSS of participants without aorta dilation. In other parts of the aorta, the WSS of the dilated group was also less than that of the non-dilated group. Compared with non-dilated participants, dilated participants had lower

WSSA in Arch (SMD=-0.13; 95% CI -0.24 to -0.01; I²=49%). WSSA in other parts of the aorta was less than the non-dilated group as well. WSSC had no significant differences in both groups.

Conclusion

To sum up, this study identified that WSS, and WSSA were different between non-dilated participants and dilated participants, and they might be critical factors for aorta dilation diagnosis in BAV patients, especially in Arch aortic dilation. However, the significance of WSS needs more credible studies to identify.

PU-2249

Complex systemic arteries to pulmonary artery malformations: A case report

Min Xu, Xianchun Zeng
Guizhou Provincial people's Hospital

Background A complex connection between the systemic artery and the pulmonary artery is rare. **Case report** A 52-year-old female presented to the Pneumology Department with hemoptysis for more than 7 months and dyspnea over 2 months. On admission, the physical examination was normal. Chest contrast-enhanced computerized tomography (CT) showed irregular patchy density from the lateral basal segment of the right lower lobe to the septum, obvious enhancement of the local focus, thickening of the branch of the right lower pulmonary artery, and thickening of the right phrenic artery. The tumor markers were negative. Combined with the above test results, she is suspected of suffering from pulmonary vascular malformation. Subsequently, the patient received digital subtraction angiography (DSA) and was eventually diagnosed with a systemic artery-pulmonary artery (SA-PA) fistula and underwent surgical treatment. After surgery, during the regular follow-up of the patients, we reviewed the data from DSA and multi-slice spiral computed tomography angiography (MSCTA), performed additional volume rendering (VR) reconstruction, and the criminal vessels omitted by DSA were found on VR.

Conclusions When the possible existence of SA-PA is suspected, MSCTA and volume rendering (VR) should be performed before DSA, which can provide more comprehensive anatomical details of vascular malformations and provide additional information for the formulation of accurate treatment strategies.

代谢综合征人群血红蛋白与骨密度的相关性研究

戚昕^{1,2}、杜亚玮^{1,3}、周阳¹、李永丽¹

1. 河南省人民医院
2. 新乡医学院
3. 河南大学

目的: 采用定量 CT 技术 (CT quantitative computed tomography, QCT) 评估代谢综合征 (MS) 人群血红蛋白与骨密度相关性。**方法:** 回顾性分析 2021 年 1 月至 2021 年 8 月于我院行定量 CT 检查的体检者, 测量其骨密度, 记录性别、年龄、BMI 及血生化指标, 根据临床资料分为 MS 组 (n=1556), 选择同期体检且临床资料无差异的健康人群为正常组 (n=2450), 采用 T 检验比较组间临床资料; 采用 Pearson 相关法分析组内血红蛋白与骨密度相关性; 采用多元线性回归分析组内骨密度的影响因素。**结果:** T 检验结果: MS 组与正常组组间性别、年龄无统计学差异 (P>0.05); MS 组与正常组组间骨密度、血红蛋白存在差异 (P<0.05)。Pearson 相关分析结果: MS 组中, 血红蛋白与 BMD 呈负相关 (P<0.05); 正常组中, 血红蛋白与骨密度无相关性 (P>

0.05)。回归分析结果: MS 组中, 血红蛋白是骨密度的影响因素 ($P < 0.05$); 正常组中, 未见明显差异 ($P > 0.05$)。结论: 血红蛋白是代谢综合征人群中骨密度的危险因素。

CMR 评估射血分数保留的 T2DM 患者心肌组织及应变异常与 HbA1c 相关性研究

李志明、韩丹、陈伟
昆明医科大学第一附属医院

目的 探索射血分数保留的 T2DM 患者是否出现心肌组织特征异常、心功能不全, 并进一步明确结构与功能不全的决定因素。**方法** 收集我院 2020 年 6 月至 2021 年 8 月 67 名患者, 其中 17 例单纯 2 型糖尿病患者 (G1), 18 例 T2DM 伴高血压患者 (G2) 及 32 例单纯高血压患者 (HT), 所有患者心脏超声评价左室射血分数均正常。同时收集 44 例性别、年龄匹配患者作为对照组 (Cs)。所有受试者均接受心脏磁共振检查(1.5T, MAGNETOM Amira, Siemens, Best, Netherlands)。CMR 检查前收集相关临床和生化指标。**结果** 所有糖尿病患者的整体心肌 native T1 值、ECV 值、心肌质量及心肌质量指数均显著高于对照组 ($p < 0.05$ for all)。G1、G2 及 HT 组患者整体心肌 native T1 值、ECV 值均高于对照组, 并且 G2 组患者整体 ECV 较 G1 组 ($31.92 \pm 3.05\%$ vs. $29.59 \pm 3.90\%$, $p = 0.032$) 及 HT 组 ($31.92 \pm 3.05\%$ vs. $29.22 \pm 6.58\%$, $p = 0.042$) 更高。2 型糖尿病患者左室整体纵向应变较对照组减低, 差异具有统计学意义 ($-16.51 \pm 2.53\%$ vs. $-19.66 \pm 3.21\%$, $p < 0.001$)。在糖尿病患者中, G2 组患者整体纵向应变较 G1 组 ($-15.75 \pm 2.29\%$ vs. $-17.27 \pm 2.57\%$, $p < 0.05$) 及 HT 组 ($-15.75 \pm 2.29\%$ vs. $-17.54 \pm 3.097\%$, $p < 0.05$) 显著减低。糖尿病患者 ECV 增加及 GLS 减低与收缩压、空腹血糖、HbA1c 具有相关性, 且基于多元线性逐步回归分析, 结果显示 HbA1c 是二者的决定因子 (ECV: $\beta = 2.286$, $P = 0.013$; GLS: $\beta = 2.186$, $P = 0.027$)。结论 射血分数保留的 2 型糖尿病患者存在心肌纤维化及应变受损, 并且 HbA1c 是心肌纤维化及应变受损的决定因子。

十字交叉心脏的 CT 影像表现分析及文献回顾

范锐
陆军军医大学第一附属医院 (西南医院)

摘要

目的 回顾性分析十字交叉心脏 (criss-cross heart CCH) 的临床表现及影像特征, 加深对该罕见病在 CT 增强及后处理表现的认识, 有助于更好帮助临床术前方案评估及制定。

方法 总结此患者的临床表现和影像学资料, 提取关键词并检索 PubMed 数据库、中国知网及万方数据库, 汇总检索所得结果, 进行筛选, 对最终符合要求的病例进行影像学总结与分析, 归纳其特征性表现。

结果 按照纳入和排除标准, 最终纳入国内外文献 14 篇, 共 39 例, 加上本组 1 例, 共 40 例, 其中男 25 例, 女 11 例, 产前胎儿 4 例。年龄范围: 0-29 岁。临床表现以心慌气急, 口唇发绀为主。其主要 CT 影像表现为左右心室呈空间上下结构, 室间隔呈水平位, 两心室流入道走行在空间位置上交叉, 呈“十字”征, 其中心室与大动脉连接异常 (27 例), 心房反位 (9 例), 房室连接不一致 (9 例), 皆合并不同程度心脏畸形。

结论 心房与心室在空间投影上呈“十字”交叉连接, 左右房室结构不能在同一平面同时显示, 是 CCH 的重要 CT 影像诊断依据, CT 三维后处理重建有助于提高该病的术前诊断及同时显示合并其他心脏畸形。

Left ventricular myocardial deformation and tissue abnormalities can be ascribed to hemoglobin A1c level in type 2 diabetes mellitus patients with preserved ejection fraction

Zhiming Li,Dan Han,Wei Chen

Department Of Radiology, First Affiliated Hospital Of Kunming Medical University

Purpose: This study aims to quantitatively evaluate left ventricular (LV) myocardial deformation and tissue characteristics using cardiovascular magnetic resonance (CMR) imaging in type 2 diabetes mellitus patients with preserved ejection fraction, and to investigate the association between CMR and clinical parameters.

Methods: 67 patients were enrolled in this study, including 17 T2DM only patient (G1), 18 diabetic patients with Hypertension (G2), 32 with hypertension (HT), and 44 sex-, age- matched controls (Cs). All subjects undergo CMR examinations (1.5T, MAGNETOM Amira, Siemens, Best, Netherlands). The values of native T1, post-contrast T1 and ECV were measured from the basal, mid and apical part of the left ventricular myocardial according to AHA 17-segmentation via the modified Look-Locker inversion recovery technique. The left ventricular global longitudinal strain (GLS) was evaluated using routine cine images and tissue-tracking analysis software (CVI42, Circle Cardiovascular imaging, Calgary, AB, Canada). The baseline clinical and biochemical indices were collected before the CMR examination.

Results:

The T2DM patients, G2 and HT had a significance higher value of LV mass and LV mass index than NCs (all $p < 0.001$). Although LV mass and LV mass index did not statistically differ between G1 and G2, there was a trend that LV mass and LV mass index were higher in G2. The global native T1 value, global ECV were significantly higher in all diabetic patients than in the NCs (native T1: $1062.78 \pm 44.08\text{ms}$ vs. $1037.00 \pm 26.35\text{ms}$; ECV: $30.75 \pm 3.65\%$ vs. $26.33 \pm 2.81\%$; $p < 0.05$ for all). G2 had increased global ECV value than that of both the G1 ($31.92 \pm 3.05\%$ vs. $28.59 \pm 3.90\%$, $p = 0.032$) and the HT ($31.92 \pm 3.05\%$ vs. $29.22 \pm 6.58\%$, $p = 0.042$). Moreover, T2DM patient had reduced LV longitudinal strain (GLS) compared with NCs ($-16.51 \pm 2.52\%$ vs. $-19.66 \pm 3.21\%$, $p < 0.001$). and the GLS was significantly reduced in G2 than in G1 ($-15.75 \pm 2.29\%$ vs. $-17.27 \pm 2.57\%$, $p < 0.05$). However, the left ventricular volume, ejection fraction, GRS and GCS were similar among all subjects. In the diabetic patient group, the independent determinants of the ECV value were HbA1C ($\beta = 2.286$, $P = 0.013$), SBP ($\beta = 0.038$, $P = 0.013$) (model $R^2 = 0.353$), and the independent determinant of the GLS was the HbA1C value ($\beta = 2.186$, $P = 0.027$) (model $R^2 = 0.168$).

Conclusions: T2DM patients with preserved ejection fraction had significantly increased ECV and deteriorated LV GLS which might be related to poor glycemic control, especially in patients with hypertension. HbA1c is an independently predictor of myocardial extracellular interstitial expansion and strain damage, which may be helpful for the clinical decision-making of blood glucose control.

PU-2254

基于定量 CT 对健康中老年男性吸烟者肺血管结构的研究

高婷¹、朱力²

1. 西安医学院第一附属医院

2. 宁夏医科大学总医院

目的 本研究旨在基于定量 CT 分析吸烟对健康中老年男性肺血管体积、数量的影响。

方法 回顾性纳入 121 例健康中老年男性 (45-65 岁), 其中包括 65 例吸烟者、56 例非吸烟者。收集吸气末胸部 CT 图像、肺功能检查结果及临床资料 (年龄、身高、体重)。采用 AVIEW 软件进行肺血管树的自动提取和分割, 获取距离肋胸膜表面不同距离处 (6mm、9mm、12mm、15mm、18mm、21mm、24mm) 的肺血管数量, 以及全肺、右肺、左肺、右肺上叶、右肺中叶、右肺下叶、左肺上叶、左肺下叶肺血管体积参数, 包括全肺血管体积 (TBV) 和截面积小于 5mm² 的肺小血管体积 (BV5)。采用 TBV、BV5 与体表面积 (body surface area, BSA) 的比值作为肺血管体积参数 (TBV/BSA、BV5/BSA)。分析吸烟对肺血管体积、数量的影响。

结果 中老年男性吸烟者全肺、右肺、左肺血管体积 TBV/BSA、BV5/BSA 明显高于非吸烟者, 其中以双肺下叶最为显著 ($P < 0.01$), 吸烟组与对照组右肺上叶、中叶肺血管体积相近, 差异没有统计学意义 ($P > 0.05$)。血管数量在距离肋胸膜表面 6mm、9mm、12mm 处吸烟者肺血管数量均低于对照组, 差异有统计学意义 ($P < 0.05$)。15mm、18mm、21mm、24mm 处吸烟者与对照组肺血管数量相近, 差异无统计学意义 ($P > 0.05$)。

结论 在健康中老年男性中, 与非吸烟者相比, 吸烟者肺血管体积增加、数量减少。

Effect of Dual Source CT Dual Energy Imaging Energy Spectrum Curve on Evaluation of Chemotherapy in Lung Cancer

Zhoufang Zhang,dafei Yu,jinzhifang,linning E,yuzhong Zhang
Shenzhen Longhua People Hospital

Objective: To explore the change rule of dual-source CT dual-energy imaging energy spectrum curve before and after chemotherapy for lung cancer, and to provide theoretical basis for clinical evaluation of the efficacy of chemotherapy for lung cancer in the future.

Methods: A total of 42 newly diagnosed patients with primary non-small cell lung cancer admitted to the Department of Oncology of our hospital from March 2018 to March 2020 were enrolled, and all received chemotherapy. Dual source CT from Siemens was used to perform chest CT dual energy mode scanning before and after 2 cycles of chemotherapy, respectively. The peak time and 100S of the aorta after contrast agent injection were the enhanced scanning time. The change rule of energy spectrum curve before and after chemotherapy was obtained through image processing.

Results: After 2 cycles of chemotherapy, There were 26 cases in the stable group (SD) and 16 cases in the partial remission group (PR), the CT values of the stable group and the remission group under single energy were significantly lower than those before treatment, no matter when the aorta reached its peak or the 100th day of enhanced scan ($P < 0.05$). The energy spectrum curve showed that when the aorta reached its peak, the CT value of SD group before and after chemotherapy first decreased and then remained straight at 40keV-80keV, while that of PR group first decreased and then remained straight at 40keV-100keV. At 1000s, the CT values of the SD

group and the PR group decreased first and then remained relatively straight at 40-100keV before and after chemotherapy, but the difference was that the CT values of the SD group were very similar before and after chemotherapy at 60keV, while the difference was still large in the PR group. When the aorta reached its peak, the CT difference of each single energy before and after chemotherapy in the SD group first decreased and then remained flat at 40keV-80keV, while the curve in the PR group remained flat at 40keV-60keV, and increased significantly at 60keV-120keV, then remained flat again. At 1000s, the curve of SD group first dropped and then remained straight from 40keV to 60keV, while the curve of PR group first dropped and then remained straight from 40keV to 100keV.

Conclusion: At peak of aorta and 100th day, the corresponding CT values under different single energy and the CT difference before and after chemotherapy were significantly reduced in both PR group and SD group compared with those before chemotherapy. Dual source CT dual energy imaging can provide a basis for the evaluation of chemotherapy efficacy for lung adenocarcinoma and squamous cell carcinoma.

PU-2256

健康志愿者左心室血流成分及动能变化的探索性研究

马丽荣^{1,2}、郭家璇²、朱力¹

1. 宁夏医科大学总医院

2. 宁夏医科大学

目的：对健康志愿者左心室腔内血流成分进行定量分析并提出相应参考值范围，分析年龄、性别对左心室腔内血流成分及动能变化的影响。

方法：收集 2022 年 3 月 1 日-2023 年 8 月 31 日宁夏医科大学总医院放射科行心脏磁共振检查健康志愿者 120 例（男=51，女=69），年龄 20-79 岁，平均年龄 45 ± 16 岁；分为 <40 岁组、40-60 岁组、>60 岁组。应用 CVI42 软件测量左心室功能参数，分析完整心动周期内心室内血流成分（直接流量、滞留流入量、延迟射血量、残余量）和收缩期，舒张早期（E 波）、舒张晚期（A 波）峰值 KEiEDV。分析四种左心室内血流成分及动能变化与年龄及性别之间的相关性，并建立相应参数的正常参考值范围。

结果：年龄、心率、左室射血分数男女差异无统计学意义，体表面积存在差异性。直接流量、滞留流入量、延迟喷射量和残余量的相对比例分别为 $31 \pm 5\%$ 、 $19 \pm 4\%$ 、 $20 \pm 4\%$ 和 $32 \pm 6\%$ 。女性滞留流入量、残余量大于男性，而体积明显小于男性，直接流量和延迟喷射量相似（ICC=0.786）；各年龄组间四种血流成分差异无统计学意义（ $P > 0.05$ ）；<40 岁组和 >60 岁组受试者中，滞留流入量略升高（ 18.0% vs 15.3% ， $P = 0.105$ ）。此外，残余量与左室体积呈正相关，直接流量和残余量与 LVEF 相关（ $P < 0.0001$ and $P = 0.007$ ）。女性滞留流入量、残余量容积、收缩期峰值 Δ KEiEDV 较男性低，随着年龄增长，A 波峰值 KEiEDV 显著增加（左心室 $r = 0.532$ ），E 波峰值 KEiEDV（左心室 $r = -0.305$ ）和 KEiEDV E/A 比值（左心室 $r = -0.515$ ）显著降低。

结论：4D Flow CMR 可对左心室心腔内血流进行定量分析，本研究建立了不同年龄段左心室血流成分的参考范围，不同年龄、性别血流成分及 KEiEDV 存在差异，我们应注重年龄、性别对以上参数的影响。

PU-2257

CT 技术应用于早期心功能评估与鉴别诊断：心肌应变参数在肥厚型心肌病和高血压性心脏病中的重要作用

何泽明
空军军医大学

目的 由于肥厚型心肌病 (HCM) 和高血压性心脏病 (HHD) 均存在心肌肥厚, 传统影像学方法在区分这两种疾病方面存在一定困难, 且对早期心功能损伤不够敏感。因此, 本研究的目的是探讨基于 CT 技术所获得的心肌应变 (MS) 参数在评估 HCM 和 HHD 早期左心室 (LV) 与左心房 (LA) 功能的可行性, 以及该参数在区分这两种疾病上的能力, 为临床提供参考。

资料与方法 本研究纳入了 2020 年 9 月至 2023 年 4 月期间在空军军医大学西京医院接受心脏冠状动脉血管成像检查, 结果呈阴性的 300 名成年受试者。根据各组标准, 将受试者分为 HCM、HHD 和健康对照组。随后, 使用后处理软件对三组人群的 LV 和 LA 形态特征、传统心功能参数以及 MS 参数进行了量化。最后, 采用统计学方法比较了这些参数之间的差异, 以及它们对这两种疾病的鉴别能力。

结果 相较于 HHD 组, HCM 组的 LV 及 LA 的 MS 绝对值均有不同程度降低 (LVMyoGCS, -22.92 ± 4.29 vs. -20.75 ± 3.75 ; LVEndoGCS, -35.96 ± 7.73 vs. -31.93 ± 7.74 ; LVGRS, 35.96 ± 7.73 vs. 31.93 ± 7.74 ; LAGCS, 28.39 ± 4.51 vs. 21.26 ± 6.83 ; P 均 < 0.05), 其中以纵向应变降低最为显著 (LVMyoGLS, -20.19 ± 2.71 vs. -16.64 ± 2.46 ; LVEndoGLS, -24.28 ± 3.50 vs. -20.75 ± 4.33 ; LAGLS, 32.17 ± 4.75 vs. 23.91 ± 7.27 ; P 均 < 0.05)。多元 logistic 回归分析结果显示 LVMyoGLS、LAGLS 和 LVWT 组合模型的 ROC 曲线下面积最大, 为 0.930 (灵敏度: 88%, 特异度: 83%)。

结论 本研究结果表明, 基于 CT 技术所获得的 MS 参数可以用于精确评估 HCM 和 HHD 患者 LV 和 LA 的早期心功能损伤, 尤其是 LA 功能受损可能在 LV 之前发生, 且以纵向应变的损伤最为明显。LVMyoGLS、LAGLS 和 LVWT 组合模型在区分这两种疾病时具有更强的能力。这些发现有望为临床提供更准确的诊断和治疗指导。

AI 肺结节诊断系统对孤立性肺结节良恶性诊断效能评估

张蜜、谈炎欢、鱼汀、杨青青、周羽、李俊晨
常熟市中医院 (常熟市新区医院)

目的: 探讨基于深度学习的人工智能 (AI) 肺结节诊断系统对孤立性肺结节 (SPN) 良恶性的诊断效能。**方法:** 回顾性分析 2020 年 1 月-2022 年 7 月在南京中医药大学附属常熟医院行手术治疗并确诊的肺 SPN 患者 119 例, 通过 AI 阅片、影像科医师+AI 阅片、影像科专家阅片及多学科会诊 4 种阅片方式判断结节良恶性, 计算不同诊断方法的准确率、敏感度、特异度、阳性预测值、阴性预测值、约登指数, 绘制不同诊断方法的 ROC 曲线。**结果:** AI 诊断恶性肺结节的准确率为 84.03%, 敏感度为 90.00%, 特异度为 52.63%, 阳性预测值 90.90%, 阴性预测值为 50.00%, 约登指数为 42.63%。影像科医师+AI 阅片诊断恶性肺结节的准确率为 85.71%, 敏感度为 91.00%, 特异度为 57.89%, 阳性预测值 91.90%, 阴性预测值为 55.00%; 约登指数为 48.89%。影像科专家阅片诊断恶性肺结节的准确率为 90.75%, 敏感度为 98.00%, 特异度为 52.63%, 阳性预测值 91.60%, 阴性预测值为 83.30%; 约登指数为 50.63%。多学科会诊诊断恶性肺结节的准确率为 94.12%, 敏感度为 99.00%, 特异度为 68.42%, 阳性预测值 94.30%, 阴性预测值为 92.90%, 约登指数为 67.42%。**结论:** 基于深度学习的人工智能肺结节诊断系统可提高年轻医师诊断效能; 在 4 种阅片方式中, 多学科会诊对 SPN 良恶性诊断准确率较高, 可以为临床决策提供更准确的信息。

PU-2259

MSCT study for unilateral absence of pulmonary artery in adults

Dianbo Cao,Xiang Li
The first hospital of jilin university

Background: Unilateral absence of pulmonary artery(UAPA) is a rare congenital disorder that can remain asymptomatic until adulthood. This research aims to summarize CT findings of adult UAPA in our unit.

Methods: We retrospectively analyzed the medical records of 9 patients with UAPA. All patients underwent contrast-enhanced CT scan. Thoracic CT findings were evaluated retrospectively by two chest radiologists with 10 years' experience, which included the site of UAPA, parenchymal abnormal, mediastinal shift, associated cardiac malformation, the mean diameter of main pulmonary artery, and collateral vessels.

Results: Nine patients included male 3 and female 6, in which 8 were right UAPA and 1 left UAPA. The patient's mean age was 44.2 ± 20.9 . 2 cases were associated with patent arterial ducta, 1 case with tetralogy of Fallot and atrial septic defect, 1 case with right aortic arch and left lung cancer, and 5 cases with UAPA alone. Clinical presentations included hemoptysis, cough and expectation, chest tightness and palpitation, chest pain. The mean diameter of main pulmonary artery was $2.6\pm 0.6\text{cm}$, and there were clear fat planes at site of normal origin of affected pulmonary artery except for 2 case with cone-shape projection. Mediastinal shift to the affected lung was seen in all patients. Ground glass opacity in the affected lung was noticed in 5 cases, bronchiectasis in 2 patients, scatter pulmonary emphysema in 4 cases, honeycombing lung in 2 cases and ipsilateral peripheral lung cancer in 1 case. Systemic collaterals to the affected lung included the bronchial, intercostal, phrenic, and internal thoracic arteries.

Conclusions: UAPA tends to occur in female population, and right UAPA is predisposed to be involved. Clinical presentations are nonspecific and variable. Once lung volume reduction of one side is observed on radiography, subsequent contrast-enhanced CT could help establish the diagnosis of UAPA and its coexistent cardiac malformation. Specifically, the changes of lung parenchyma and collateral vascular formations could also be assessed.

双源 CT 肺动脉成像在肺动脉栓塞诊断中的临床应用

陈光锋、李峻、李如民
华中科技大学同济医学院附属协和医院

目的 探讨双源 CT (DECT) 肺动脉成像在肺动脉栓塞 (PE) 诊断中的临床价值。

方法 回顾性调阅 2021 年 1 月至 2023 年 1 月华中科技大学同济医学院附属协和医院车谷院区收治的经临床诊断为 PE 的 96 例患者资料, 根据病情程度分为危重组 (68 例) 与非危重组 (28 例), 所有患者都完成了 DECT 肺动脉成像检查, 总结 DECT 肺动脉成像 PE 影像学表现和临床治疗结果。

结果 DECT 显示 PE 分为完全闭塞型、中心型和偏心型, PE 影像学特征是完全闭塞型表现为血管截断征, 中心型表现为轨道征, 偏心型表现为低密度充盈缺损。DECT 肺动脉成像显示管腔内大小不等栓子, 累及动脉 196 处, 其中右肺 110 处, 左肺 86 处; 完全闭塞 55 处, 管腔内充盈缺损 141 处。危重组可见右心室较左心室增大, 室间隔左移, 双侧肺动脉中心栓塞, 节段性肺梗死, 碘

图显示较大范围肺灌注减低区；危重组 DECT 肺动脉栓塞指数、中央肺动脉受累比率高于非危重组，差异有统计学意义 ($P<0.05$)。

结论 DECT 肺动脉成像对 PE 有重要的诊断价值，对临床分型有指导意义，能够清晰显示栓塞的部位、范围，碘图肺灌注异常减低区，为临床诊治提高参考。

联合 CEA 与 CT 形态学特征模型预测 I 期 NSCLC 隐匿性淋巴结转移

贾超¹、李晓峰¹、胡春峰²

1. 徐州市肿瘤医院放射科

2. 徐州医科大学附属医院放射科

目的 探讨联合 CEA 与 CT 形态学特征模型预测 I 期 NSCLC 隐匿性淋巴结转移 (OLM) 的诊断效能。**方法** 回顾性分析徐州市肿瘤医院 2017 年 1 月至 2022 年 12 月 388 例术前诊断 I 期 NSCLC 患者的临床资料及影像学特征，根据术后病理及免疫组化结果分为无 OLM 组与 OLM 组，比较两组间统计学差异；根据约登指数获取最佳截断值后，将定量数据调整为有序二分类数据，排除各变量严重的多重共线性问题后，纳入 $P<0.05$ 变量进行多因素二元 logistic 分析后构建预测模型并绘制 ROC 曲线，通过 AUC 评价预测模型的诊断效能。**结果** 性别、年龄、吸烟史、基础肺疾病、分叶征、空泡征、胸膜凹陷征组间差异无统计学意义 (均 $P>0.05$)；肿瘤最大径、肿瘤密度、毛刺征、内部血管征、支气管异常征、同侧肺门或纵隔最大淋巴结短径及 CEA 水平组间差异具有统计学意义 (均 $P<0.05$)。肿瘤最大径 $>17.95\text{mm}$ ($\text{OR}=3.205$, $95\%\text{CI}=1.297\sim7.923$)、肿瘤密度 ($\text{OR}=4.353$, $95\%\text{CI}=1.638\sim11.568$)、毛刺征 ($\text{OR}=2.542$, $95\%\text{CI}=1.145\sim5.644$)、同侧肺门或纵隔最大淋巴结短径 $>7.25\text{mm}$ ($\text{OR}=5.608$, $95\%\text{CI}=2.567\sim12.250$) 及 $\text{CEA}>4.59\text{ng/ml}$ ($\text{OR}=5.222$, $95\%\text{CI}=2.375\sim11.478$) 为 I 期 NSCLC OLM 的独立危险因素；构建联合 CEA 及 CT 形态学特征预测模型： $\text{logit}(P)=-5.479+1.165x(\text{肿瘤最大径}>17.95\text{mm})+1.471x(\text{肿瘤密度})+0.933x(\text{毛刺征})+1.724x(\text{淋巴结短径}>7.25\text{mm})+1.653x(\text{CEA}>4.59\text{ng/ml})$ ，其 AUC 为 0.900，灵敏度为 90.0%，特异度为 76.7%，准确率为 70.6%。**结论** 联合 CEA 水平与 CT 形态学特征模型预测临床 I 期 NSCLC OLM 具有较高的诊断价效能，可以在术前提示临床避免非必要的大范围淋巴结清扫，提高预后。

PU-2262

瘤体、瘤周影像组学特征对肺磨玻璃结节微浸润腺癌与浸润性腺癌的诊断价值

丁伟、雷振

锦州医科大学第一附属医院放射科

目的：探讨瘤体、瘤周影像组学特征对浸润性腺癌 (IAC) 和微浸润腺癌 (MIA) 的鉴别能力。

方法：回顾性分析 323 个在锦州医科大学附属第一医院经手术证实的表现为磨玻璃结节的微浸润腺癌和浸润性腺癌，从瘤体和 3mm 瘤周提取影像组学特征，经过特征降维筛选后，运用八种不同机器学习分类器分别建立瘤体、瘤周以及组合模型，根据 ROC 曲线对模型进行评估，使用 Delong 法对其 AUC 值进行评价。

结果：瘤体和 3mm 瘤周的最佳机器学习模型均为神经网络模型，瘤体模型在训练组和检验组的 AUC 值及 95% 置信区间分别为 AUC: 0.9307 (0.7870, 1.0000) 和 AUC: 0.8730 (0.6838, 1.0000)，瘤周模型分别为 AUC: 0.9125 (0.7552, 0.9981) 和 AUC: 0.8860 (0.7135, 1.0000)；组合模型的最佳

模型为逻辑回归模型, 其在训练组和检验组的 AUC 值和 95%置信区间为 AUC: 0.9337 (0.7424, 1.0000)和 AUC: 0.8770 (0.6748, 1.0000)。瘤体、瘤周、组合模型的训练组 ROC 曲线的 AUC 值两两进行 Delong 检验的 P 值分别为 0.4714、0.8990、0.3972; 它们的检验组 ROC 曲线的 AUC 值 Delong 检验 P 值分别为 0.7808、0.9328、0.8462, 均无统计学差异。

结论: 瘤体、瘤周 3mm 的薄层 CT 影像组学特征模型以及它们的组合模型都可以较好的鉴别表现为磨玻璃结节的浸润性腺癌和微浸润腺癌, 但这三种方法并没有统计学差异。

PU-2263

冠状动脉周围脂肪组织衰减与冠脉炎症变化的相关性

马少卫、陈虹宇、周可、康城郡、侯阳
中国医科大学附属盛京医院

目的:

通过人体 PCAT 标本及动物冠脉炎症模型, 探讨 PCAT 衰减与冠脉和 PCAT 炎症病理变化的相关性, 以及 FAI (PCAT 衰减) 与冠脉-PCAT 炎症因子表达水平的相关性。

研究方法:

前瞻性收集冠脉搭桥患者右冠状动脉 (RCA) 近段的 PCAT 标本, 并测量其 FAI。以 RT-PCR 测定 PCAT 中 IL-1 β , IL-6、TNF- α 等因子的 mRNA 表达水平, 并分析其与 FAI 的相关性。通过经皮介入冠脉球囊扩张 (LAD 及 RCA) 建立成年雄性巴马猪的冠脉炎症模型, 以 HE 染色和免疫组化染色分析冠脉-PCAT 炎症的病理变化 (对照组, 术后 1 周及术后 4 周), 测定冠脉和 PCAT 中 IL-1 β 、IL-6、iNOS 及 TNF- α mRNA 表达水平。同时通过冠脉 CTA 测量各组动物 PCAT 衰减的变化, 进而分析 PCAT 衰减与冠脉-PCAT 炎症动态演变的相关性。

结果:

1. 人体 PCAT 标本中 IL-1 β ($r = 0.61$) 和 IL-6 ($r = 0.48$) 的 mRNA 表达水平与 FAI 值呈正相关。
2. 动物模型中, HE 及免疫组化染色 (IL-1 β) 提示术后 1 周时可见显著的冠脉-PCAT 炎症反应, 术后 4 周部分恢复。
3. 动物模型中冠状动脉-PCAT 炎症因子 (IL-1 β 、IL-6、iNOS 及 TNF- α) mRNA 的表达水平在损伤后 1 周显著升高, 术后 4 周时部分恢复。此外, 我们观察到 IL-1 β mRNA 的高表达水存在着由内层 PCTA 向外层 PCAT 扩散的趋势。同时动物模型的 PCAT 衰减值也存在与炎症因子 mRNA 表达水平相似的随时间变化的规律 ($-86.37HU$ vs. $-53.11HU$ vs. $-66.51HU$, $P < 0.01$)。且 PCAT 衰减值与冠脉和内层 PCAT 中 IL-1 β (冠脉: $r = 0.61$, $P < 0.01$; PCAT: $r = 0.50$, $P = 0.01$)、IL-6 (冠脉: $r = 0.73$, $P < 0.01$; PCAT: $r = 0.56$, $P < 0.01$) 的 mRNA 表达水平呈正相关, 与冠脉管壁中 iNOS 及 TNF- α 的表达水平呈正相关。

结论:

PCAT 衰减 (FAI) 与冠脉-PCAT 的炎症因子表达水平, 及其炎症的动态变化存在一定的相关性。

PU-2264

肺癌能谱 CT 参数评估 PD-1 表达

楼俭茹、覃群、张鸿、廖中曦
三亚中心医院

目的: 探讨肺癌能谱 CT 成像的参数是否能评估患者程序性死亡受体 1 (Programmed Death Receptor 1, PD-1) 表达情况。方法: 收集我院 2021 年 3 月至 2023 年 6 月经病理检测过并确定为肺癌的 50 例患者的资料, 同时病理检测 PD-1 表达, 通过能谱 CT 分别测定动脉期 (AP) 与静

脉期(VP)的参数, 构建能谱 CT 参数的 Nomogram 模型评估 PD-1 表达的情况。结果: 本研究发现动脉期的能谱曲线斜率 ($ap\lambda HU$) 与静脉期的碘值 ($vpIC$)、标准化碘浓度 ($vpNIC$)、能谱曲线斜率 ($vp\lambda HU$) 是 PD-1 表达的影响因子。通过四个影响因子构建 Nomogram 模型, 该模型表现出良好的区分度和一致性, 感受性曲线 (ROC) 的曲线下面积 (AUC) 为 0.95(95%CI 0.893-1.000)。结论: 肺癌能谱 CT 的相关参数构建 Nomogram 模型能有效的预测 PD-1 的表达, 在评估肺癌免疫治疗方面具有潜在的价值。

PU-2265

Relationship between peri coronary inflammation and coronary vascular function in patients with suspected coronary artery disease

Mengyu Chen, Bing Liu, Lijuan Fan
TEDA International Cardiovascular Hospital

Background: We aim to evaluate the relationship between peri-coronary adipose tissue (PCAT) attenuation and coronary vascular function assessed by positron emission tomography/computed tomography (PET/CT) in patients with suspected coronary artery disease (CAD).

Methods: The study population included 364 patients with suspected CAD who underwent $^{13}NH_3.H_2O$ PET/CT and coronary computed tomography angiography (CCTA). We evaluated the relationship between fat attenuation index (FAI), PCAT volume and other qualitative CT-derived anatomic parameters with coronary flow reserve (CFR).

Results: Overall, reduced CFR (<2.5) was detected in 206 (57%) patients. On patient-level, those with reduced CFR exhibited significantly higher prevalence of diffuse atherosclerosis (41% vs. 23%; $P < 0.001$) and higher FAI ($-75.5HU$ vs. $-77.1HU$; $P = 0.014$) compared with patients with normal CFR. Among patients without obstructive CAD, FAI was significantly higher in patients with reduced CFR ($-75.5HU$ vs. $-77.7HU$, $P = 0.026$). On vessel level, 1092 vessels were analysed and 642(59%) presented reduced CFR. FAI was also higher in vessels with reduced CFR ($-80.8HU$ vs. $-81.8HU$; $P = 0.045$) than those with normal CFR. In a patient-level analysis, obstructive CAD, diffuse atherosclerosis, and FAI were independently associated with CFR. Of note, adjusted for traditional risk factors (age, hypertension, diabetes, hyperlipidemia, and smoking), FAI remained associated with global CFR.

Conclusions: Coronary perivascular inflammation evaluated by CCTA was independently associated with coronary vascular function by PET/CT. In patients without obstructive CAD, FAI was higher in the presence of reduced CFR. FAI might help predicting microcirculatory damage among patients who do not exhibit epicardial artery stenosis.

PU-2266

双层探测器光谱 CT 胰腺脂肪定量与 2 型糖尿病患者冠状动脉高危斑块的相关性研究

戴娴^{1,2}、党玉雪¹、陈虹宇¹、甄艳华¹、侯阳¹

1. 中国医科大学附属盛京医院

2. 上海复旦大学附属金山医院

目的 本研究探讨了 2 型糖尿病患者胰腺脂肪沉积与冠状动脉高危斑块之间的关系, 以期探究适当的影像学标志物预警 T2DM 患者心血管事件的发生。方法 选取 2021 年 10 月至 2022 年 10 月因胸痛于我院采用双层探测器光谱 CT 进行冠状动脉 CTA 检查的 T2DM 患者, 分为无斑块组 ($n=42$)、

非高危斑块组 (n=48) 和高危斑块组 (n=45)。胰腺脂肪含量在光谱 CT 常规混合能级图像、CT40keV 单能级图像、CT70keV 单能级图像、有效原子序数图及碘图上进行测定 (分别记为 CTpoly、CT40keV、CT70keV、Zeff 和碘值), 能谱曲线斜率 λ_{HU} 通过公式计算获得。比较各组间上述胰腺衰减指标的差异, 同时分析冠状动脉高危斑块与胰腺脂肪沉积的关系。结果 高危斑块组胰腺各能谱指标均低于非高危斑块组和无斑块组, 差异均有统计学意义; 而非高危斑块组与无斑块组两组的胰腺能谱各衰减指标差异, 无统计学意义。校正了传统的心血管危险因素后, 低水平 Zeff 与冠状动脉高危斑块独立相关 (OR=4.964, 95%CI =1.921-12.827, P<0.001)。结论 低水平 Zeff 是 T2DM 患者冠脉高危斑块的独立危险因素, 表明了胰腺脂肪沉积可能增加 T2DM 患者发生冠状动脉高危斑块的风险。

PU-2267

在 GE Revolution Apex CT 下不同方式的头颈 CTA、冠状动脉 CTA“一站式”扫描血管成像的应用研究

王拓

大连理工大学附属大连市中心医院

目的: GE Revolution Apex CT 下两种冠状动脉轴位扫描联合头颈血管螺旋扫描的"一站式"检查探讨联合扫描临床应用的可行性及特点。

方法:A 组采用先扫描头颈 CTA 后扫描冠状动脉 CTA 方式。体位为仰卧左上手举右手平放, 扫描方向取头先进。扫描范围: 颅顶至心脏膈面。扫描方向由头侧向足侧。扫描条件: 头颈部 CTA 管电压 100kV, 自动管电流 400-700mA, 噪声指数 7.0, 扫描层厚 0.625mm, 螺距 0.508: 1, 层间距 0.625mm, 球管旋转时间 0.28s, 矩阵 512x512, 使用 80mmx0.625mm 探测器, 宽度 8cm, 扫描时间 3s 左右。检查期间无需屏气, 只需平静呼吸即可。B 组采用先扫描冠状动脉 CTA 后扫描头颈 CTA 方式。体位为仰卧左上手举右手平放, 扫描方向取头先进。扫描范围: 心脏膈面至颅顶。扫描方向由足侧向头侧。扫描条件: 头颈部 CTA 管电压 100kV, 自动管电流 400-700mA, 噪声指数 7.0, 扫描层厚 0.625mm, 螺距 0.508: 1, 层间距 0.625mm, 球管旋转时间 0.28s, 矩阵 512x512, 使用 80mmx0.625mm 探测器, 宽度 8cm, 扫描时间 3s 左右。检查期间无需屏气, 只需平静呼吸即可。结果: 两种冠状动脉轴位扫描联合头颈血管螺旋扫描的"一站式"联合扫描方式均可满足影像诊断需求和临床诊治标准, 但经影像医生评判 A 组图像优于 B 组。

结论: 1、两种头颈、冠状动脉联合 CTA 扫描所得导冠状动脉图像均可满足诊断需求。2、A 组通过改变扫描方式即先扫描头颈 CTA 后扫描冠状动脉 CTA 的方法, 遵循机体自身循环的特点和血液流经的先后顺序可以避免头颈部静脉伪影和心脏右心伪影造成干扰, 为临床治疗提供优质影像图像。

PU-2268

能谱 CT 在肺癌病理分型评估中的初步研究

马艳

天津医科大学肿瘤医院

目的 探讨能谱 CT 在肺癌病理分型评估中的应用价值。方法 选取接受能谱 CT 扫描并经病理证实的肺癌患者 55 例 (鳞癌 20 例、腺癌 20 例、小细胞肺癌 15 例), 对比分析不同病理类型肺癌的能谱曲线及各项定量指标。结果 小细胞肺癌与鳞癌或腺癌间 40—80keV 水平下 CT 值、40keV-70keV 和 40keV-90keV 能谱曲线斜率、有效原子序数、碘浓度值、碘水比值及标准化碘浓度值均具有统计学差异 (P<0.05); 鳞癌与腺癌间各项指标均无显著差异。ROC 曲线分析显示以 NIC 为 0.298 作为阈值, 鉴别小细胞肺癌和非小细胞肺癌的敏感度和特异度分别为 65%、86.7%。结论

不同病理类型肺癌具有不同特质的能谱曲线及能谱指标, 能谱 CT 成像在鉴别不同病理类型肺癌方面具有一定的应用价值

PU-2269

低流速能谱 CT 显示支气管动脉

张杉杉

重庆医科大学附属第三医院 (捷尔医院)

目的: 探讨低流速能谱 CT 血管成像技术对支气管动脉的显示能力以及优化血管成像质量的价值。

方法: 回顾性分析 100 例能谱胸部增强 CT 原始数据, 运用能谱单能量成像技术分别重建 50 keV、60 keV、70 keV 单能量图像, 结合 VR、MIP、血管与气道三维融合重建后处理图像以及原始图像来观察支气管动脉的解剖特征、分型, 并对 3 组图像进行客观评价和主观评分。

结果: 100 例共显示 204 支支气管动脉(左侧 94 支、右侧 119 支), 其中 L1 型 13 例, L1R1 型 41 例, L2R1 型 7 例, L3R1 型 2 例; R1 型 8 例, R2 型 11 例, R3 型 1 例, L1R2 型 12 例, L2R2 型 3 例, L1R3 型 2 例。50 keV 单能量图像质量优于 60keV、70keV 单能量图像, 三者 CT 值、SNR 和主观评分差异均有统计学意义(P 均 <0.05)。

结论: 低流速能谱增强 CT 成像可清晰显示支气管动脉, 推荐使用 50 keV 单能量图像。

PU-2270

基于迭代重建算法的冠状动脉计算机断层成像在陈旧性心肌梗死诊断中的价值

邵亚军、田宏哲

宝鸡市中心医院

摘要: 本研究旨在比较基于迭代重建算法的 CT 对老年性心肌梗死(OMI)的诊断价值, 为临床治疗提供理论指导和实践依据。本研究选取 10 例 OMI 患者, 分为两组, 每组 5 例。实验组采用代数迭代重建法, 对照组采用医院原始重建法。对不同迭代次数下的图像质量参数进行分析对比, 得到最优迭代次数。通过对绘制时间和绘制后诊断准确率的分析, 探讨了迭代重建算法在临床诊断中的价值。通过对实验组 5 例患者的图像质量参数进行分析比较, 发现图像质量首先随着迭代次数的增加而增加, 但在迭代一定次数后, 图像质量随着迭代次数的增加而下降。结果表明, 最优迭代次数为 13 次。实验组和对照组的绘制时间分别为 54.27 min 和 117.87 min, 两组间差异有统计学意义($P < 0.05$)。另外, 实验组的准确率(93.33%)与对照组的准确率(73.33%)比较, 差异有统计学意义($P < 0.05$)。综上所述, 采用代数迭代重建算法进行冠状动脉 CT 成像所需时间大大缩短, 诊断准确率大大提高。因此, 基于迭代重建算法的冠状动脉 CT 成像可以更有效地利用医疗资源, 提高 OMI 的诊断准确率。

探索不同程度心胸比对冠脉强化影响程度的研究

戚荣飞、吴志斌、杨旭、常英娟
空军军医大学西京医院

目的 探索不同程度的心胸比对冠脉 CTA 检查中对冠脉强化有无影响。方法 选取进行冠脉 CTA 检查的受检者 80 例,采用一致的对比剂计算方法形成对比剂注射方案,同时采用相同的扫描方案进行扫描,扫描完成之后,根据患者不同的心胸比的增大程度,将患者分为 A、B、C、D 三组,其中 A 组为正常组, B 组为轻度增大组(心胸比 0.51~0.55), C 组为中度增大组(心胸比 0.56~0.60), D 组为重度增大组(0.61~), 分别测得各组主动脉根部、冠脉 S1、S5 段的 CT 值,并计算各组之间绝对差值和相对差值,然后分析不同心胸比情况下冠脉 CT 的强化程度有无差异。对所得数据运用 spss 21.0 软件进行统计学分析。结果 A、B、C、D 四组冠脉 CT 平均强化值分别为 552 ± 12 、 484 ± 15 、 417 ± 11 、 325 ± 23 。B、C、D 三组相对 A 组受检者冠脉 CT 强化程度的绝对差值和相对差值分别降低 68、135、227 和 12%、24%、58%, B、C、D 三组相对 A 组正常组差异具有统计学意义($P<0.05$), B、C、D 各组件数据差异也具有统计学意义($P<0.05$)。结论 不同心胸比对于冠脉 CTA 检查时冠脉 CT 的强化程度有显著影响,故在临床检查过程中,若受检者存在心功能不全的情况,可根据测量的心胸比大致预判其对冠脉强化程度的影响,以提前调整对比剂注射方案或扫描方案,从而提高检查图像质量。

FORCE CT FLASH 扫描方案对下肢血管 CT 成像辐射剂量和图像质量的研究

戚荣飞、吴志斌、杨旭、常英娟
空军军医大学西京医院

目的 探索 Turbo Flash 扫描模式在下肢动脉血管成像中的应用价值。材料和方法 在本前瞻性研究中的患者行下肢 CTA 成像检查。A 组采用方案 1: 常规扫描模式行头足方向下肢 CTA 扫描。B 组采用方案 2: Turbo Flash 扫描模式行足头方向下肢 CTA 扫描。比较血管内 CT 值、信噪比 (SNR)、对比度噪比 (CNR) 和图像噪声。60 名患者被随机分配到 A 组 (对照组) 或 B 组 (实验组), 由两名放射科医生对图像质量进行评估, 同时比较 CT 剂量指数 (CTDIvol) 和剂量长度乘积 (DLP)。结果 血管内 CT 值 (586.8 ± 140.3 vs 496.1 ± 129.3 HU, $p=0.011$), 信噪比 (33.0 ± 11.3 vs 27.4 ± 12.3 ; $p=0.042$)、CNR (30.1 ± 13.3 vs 24.2 ± 10.3 ; $p=0.029$) 其中膝关节以下小动脉图像质量评分 (3.8 ± 0.2 vs 3.1 ± 0.2 ; $p=0.001$) B 组均高于 A 组。B 组的辐射剂量明显低于 A 组, 其中 CTDIvol 减少 40.9% (1.3 ± 0.1 对 2.2 ± 0.3 mGy; $p=0.006$), DLP 减少 42.8% (148.7 ± 21.9 vs 260.2 ± 59.1 mGy*cm; $p=0.018$)。结论 与常规扫描模式头足向下肢 CTA 扫描相比, Turbo Flash 扫描模式行足头方向下肢 CTA 扫描可降低辐射剂量并且具有更高的 CT 值、SNR、CNR, 同时在膝关节以下的小动脉中可获得更好的图像质量。

PU-2273

Impact of a motion correction algorithm (SnapShot Freeze 2) on image quality in patients undergoing CT angiography: preliminary clinical application

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To investigate the motion correction algorithm Snapshot-Freeze2 (SSF2) and SSF1 compared to standard reconstruction (STD) in patients randomized to receive beta-blockers (BB) or no beta-blockers (non-BB) before coronary CT, and to investigate if SSF2 can replace BB.

***Methods and Materials:** 18 patients scheduled for coronary CT were randomized. All images were reconstructed by the SSF2, SSF1 and STD algorithms. Image quality was evaluated according to 4 score (1: excellent, 2: good, 3: adequate, 4: non-diagnostic) and presence of artifacts was noted.

***Results:** Images from 7 patients in the BB group (mean HR 52 ± 5 bpm) and 9 patients in the non-BB group (mean HR 72 ± 5 bpm) were analyzed. 2 patients were excluded because of tachycardia, bradycardia in SSF. Both SSF2 and SSF1 increased the number of excellent images in groups compared to the STD algorithm (SSF2 vs SSF1 vs STD) (BB: 85 % vs 70 % vs 60 %; non-BB: 75% vs 58% vs 40%), particular importance the number of non-diagnostic images was significantly reduced using SSF2. SSF2 and SSF1 reduced motion artifacts (SSF2 vs SSF1 vs STD) (BB: 1% vs 8% vs 18%; non-BB: 8% vs 25% vs 40%), what is particularly important is the motion artifacts in non-BB obviously reduced using SSF2 compared to the BB group analyzed by STD (8% vs 18%).

***Conclusions:** SSF2 improves image quality and reduces motion artifacts, the single-center pilot study with a small sample suggests that can be effectively compensated for the absence of BB.

PU-2274

表现为磨玻璃结节的肺腺癌薄层 CT 征象分析及病理分型对照

顾康琛

安徽医科大学第二附属医院

摘要 探讨薄层 CT (TSCT) 表现为磨玻璃结节 (GGN) 的肺腺癌的 CT 征象, 并与病理分型对照。回顾性搜集肺内 TSCT 发现的 83 个磨玻璃结节, 根据病理结果分为浸润前病变组 20 个, 微浸润腺癌组 32 个, 浸润性腺癌组 31 个, 分析不同病理分型的结节在薄层 CT 上的表现。83 个结节中, 34 个表现为纯磨玻璃结节 (pGGN), 49 个表现为混合磨玻璃结节 (mGGN)。浸润前病变组共 18 个结节 (18/20、90.0%) 表现为 pGGN, 微浸润腺癌组共 16 个结节 (16/32、50.0%) 表现为 pGGN, 浸润性腺癌组无结节 (0/31、0%) 表现为 pGGN。3 组分叶征、空气支气管征、血管集束征、胸膜凹陷征的比例呈上升趋势, 圆形/类圆形、瘤肺界面清晰征象的比例呈下降趋势。3 组圆形或类圆形、分叶征、瘤肺界面清晰、空气支气管征、血管集束征、胸膜凹陷征的差异有统计学意义 ($P < 0.05$)。浸润前病变组与浸润性腺癌组比较, 圆形或类圆形、分叶征、瘤肺界面清晰、空气支气管征、血管集束征、胸膜凹陷征差异具有统计学意义 ($P < 0.05$); 微浸润腺癌组与浸润性腺癌组间类圆形、分叶征、瘤肺界面清晰、血管集束征差异具有统计学意义 ($P < 0.05$)。不同病理分型的 GGN 在 TSCT 上的表现具有一定的特异性, 熟悉 TSCT 表现有助于浸润前病变、微浸润腺癌及浸润性腺癌的诊断及鉴别诊断。

PU-2275

初始 T1 值及 ECV 对心脏淀粉样变的诊断价值：Meta 分析

王国辉、孟莉
青海大学附属医院

目的 采用 Meta 分析方法探讨初始 T1 值及细胞外容积分数(extracellular volume fraction, ECV)对心脏淀粉样变(cardiac amyloidosis, CA)的诊断价值。

方法 检索数据库 PubMed、Embase、Cochrane Library、Web of Science、CNKI、CBM、Wanfang Database 及 VIP 中有关探讨初始 T1 值及 ECV 对 CA 的诊断价值的文献，检索时间从建库开始截止至 2022 年 11 月。应用 Revman 5.3 软件对纳入的研究进行偏倚风险评价。应用 Stata 16.0 和 Meta-Disc1.4 软件进行统计分析。计算合并敏感度、特异度、阳性似然比、阴性似然比、诊断比值比和综合受试者工作特征(SROC)曲线获取曲线下面积(AUC)及其 95%置信区间(95%CI)，并进行异质性、发表偏倚分析。使用敏感性分析验证 Meta 分析结果的稳定性与可靠性。

结果 最终纳入文献 12 篇，共 1045 例患者。Meta 分析显示初始 T1 值诊断 CA 的合并敏感度、特异度、阳性似然比、阴性似然比、诊断比值比、AUC 分别为 86% (95%CI: 82-89%)、86% (95%CI: 80-91%)、6.2 (95%CI: 4.2-9.3)、0.16 (95%CI: 0.12-0.22)、38 (95%CI: 19-75)、0.92 (95%CI: 0.90-0.94)；ECV 诊断 CA 的 Sen 合并、Spe 合并、PLR 合并、NLR 合并、DOR 合并、AUC 分别为 90% (95%CI: 83-94%)、90% (95%CI: 83-94%)、8.8 (95%CI: 5.3-14.6)、0.11 (95%CI: 0.07-0.19)、79 (95%CI: 38-162)、0.95 (95%CI: 0.93-0.97)。

结论 初始 T1 值和 ECV 对 CA 具有较高的诊断价值，可为 CA 的早期诊断提供影像学依据。

PU-2276

心脏磁共振对梗阻性肥厚型心肌病改良 Morrow 术后的随访价值

和燕斐、杨瑞、刘继伟、张亚飞、肖长波、史征
河南省胸科医院，郑州大学附属胸科医院

[摘要] **目的** 探讨心脏磁共振 (Cardiac magnetic resonance, CMR) 对梗阻性肥厚型心肌病改良 Morrow 术后近期疗效的随访价值。**方法** 收集河南省胸科医院 2018 年 12 月至 2023 年 05 月间临床确诊的梗阻性肥厚型心肌病患者的临床及影像学资料，其中共计 11 例患者接受了改良 Morrow 术，并于术前、术后 3 个月完成了 CMR 检查，回顾性分析其临床及影像学资料，使用后处理工作站测量同一患者术前与术后 3 个月的左室流出道流速 (LVOTV)、静息左室流出道峰值压力阶差 (LVOTG)、舒张末期基底段左室间隔壁最大厚度 (LVMWT)、左室流出道内径 (LVOTD)、左心室舒张末期内径 (LVEDD)、左心房内径 (LAESD)、左心室心肌质量 (MASS)、SAM 征、左心室射血分数 (LVEF)、间隔支供血区静息心肌灌注缺损 (Perfusion) 及延迟强化 (LGE) 等参数。应用配对样本 t 检验比较同一患者术后 3 个月与术前数据有无统计学差异。结果 术后 3 个月与术前比较，LVOTV、LVOTG、LVMWT、LAESD 及 LV mass 值、SAM 征阳性患者例数均减小或减少，LVOTD 及 LVEDD 值、Perfusion 缺损及 LGE 患者例数均增加，差异均有统计学意义 ($P < 0.05$)；LVEF 值变化不显著，差异无统计学意义 ($P > 0.05$)。结论 CMR 可精准评估梗阻性肥厚型心肌病改良 Morrow 术后的病理改变，对术后随访有一定价值。

胃癌并腹膜后异位支气管源性囊肿一例

和燕斐、杨瑞、刘继伟、钱如林、祁敏现、冯晓刚
河南省胸科医院，郑州大学附属胸科医院

【摘要】本文报道胃癌并腹膜后异位支气管源性囊肿一例。患者女，74 岁，左下腹隐痛不适两个月余并加重 1 周。入院上腹部 CT 平扫及增强示左侧肾上腺区（约平胸 11-12 椎体）的腹膜后间隙见一椭圆形稍低密度肿块，大小约 48.2mm*30.3mm，边缘光整，边界清晰，上极边缘见小钙化点，平扫 CT 值平均约 39HU，增强动脉期、门脉期、延迟期 CT 值分别于 40HU、41HU、45HU，邻近胃小弯胃壁受压向左侧移位，影像考虑节细胞神经瘤、神经鞘瘤、淋巴管囊肿等，待鉴别。胃小弯胃壁异常增厚并强化，病变突破浆膜层，邻近小弯侧多发区域淋巴结肿大，符合胃癌并区域淋巴结转移影像。患者行外科左开胸贲门癌根治术及左侧腹膜后肿物切除术，术中发现左侧腹膜后肿物呈囊性，内含巧克力样内容物，囊壁灰红色，质软，与周围组织分界清晰，易完整切除。术后病理诊断为腹膜后异位支气管源性囊肿。

DKI 直方图参数与肺癌 Ki-67、TTF-1 表达的相关性研究

杨红
重庆大学附属三峡医院

目的：探讨扩散峰度成像（DKI）直方图参数与肺癌 Ki-67、TTF-1 表达的相关性。**方法：**前瞻性收集 2021 年 5 月至 2022 年 9 月于重庆大学附属三峡医院经病理证实的肺癌患者 61 例，所有患者均于术前一周内行 MR 检查，分析 DWI 和 DKI 图像，通过后处理分别得到表观扩散系数（ADC）、平均扩散峰度（MK）、平均扩散系数（MD）值的直方图参数，同时记录免疫组化标记物 Ki-67、TTF-1 表达情况。评估各直方图参数与 Ki-67、TTF-1 表达相关性，进一步采用受试者工作特征曲线（ROC）确定各参数预测 Ki-67 和 TTF-1 表达的诊断效能。**结果：**MD 值 10th percentile、ADC 值 10th percentile、kurtosis 与 TTF-1 表达水平呈低度负相关（ $r=-0.334\sim-0.372$ ， P 均 <0.05 ）；MD 值 IQR、ADC 值 90th percentile、IQR 与 TTF-1 表达水平呈低-中度正相关（ $r=0.250\sim0.430$ ， P 均 <0.05 ），其中诊断效能最高的是 MD 值 IQR，ROC 曲线示曲线下面积（AUC）为 0.774，敏感度为 45.45%、特异度为 100%。MD 值 90th percentile、max、IQR、skewness 与 Ki-67 表达呈低度负相关（ $r=-0.260\sim-0.325$ ， P 均 <0.05 ），诊断效能最高的是 max，ROC 曲线示曲线下面积（AUC）为 0.700，敏感度为 51.22%、特异度为 95%。**结论：**DKI 直方图部分参数与肺癌 Ki-67、TTF-1 表达具有不同程度相关性，可用于预测其表达。

Comparative study of 3.0T uncontrasted free breathing whole-heart coronary MR Angiography and coronary CT angiography

Yingjuan Chang, Ping Tian, Ying Liu

Department of Radiology, Xijing Hospital, the Air Force Medical University, Xi'an, China

Objective: The purpose of this study was to evaluate the sequence performance of magnetic resonance coronary angiography (MRCA) and a comparison of MRA and CTA coronary Main Branch segments scores in volunteers.

Methods: All MRCA acquisitions were performed on a 3.0T MR system and coronary CTA imaging within 24 hours. With diaphragm navigation and free breathing, high time resolution cine imaging of four chamber was performed. The relative quiescent period of the right coronary artery was selected as the acquisition basis. The Dixon water-fat separation technology was used to acquire the original data by axial coronary imaging. In this sequence, the diaphragmatic navigation and free breathing were used to detect respiratory movement, and the coronary signal was collected at the end of expiratory phase. Image quality of every coronary segment was graded visually in consensus by these two readers on the basis of a four point scaled.

Results: 59 volunteers (61.0±7.9 years old, 34 males) successfully completed the MRCA and CTA. The ratings for LM、RCA、LAD、LCX coronary artery visualization were comparable ($P=0.025$ 、 0.035 、 0.024 、 0.011) when compared between MRCA and CTA. However, the visualization of coronary D1 and PDA segments were rated significantly higher for CTA compared to MRA ($p<0.05$).

Conclusion: The 3.0 T non-contrast-enhanced Dixon water-fat separation whole-heart MRCA has good feasibility in displaying coronary arteries under free breathing, which may provide a method to detect clinically significant coronary artery stenosis in patients with suspected coronary heart disease.

肺内亚实性结节临床、病理和影像学特征及相关性分析

凌春香、冯吉贞

山东第一医科大学附属省立医院

目的: 通过对不同病理分型亚实性结节的一般临床资料进行分析,并结合多层螺旋计算机断层成像的影像特征以及病理特征进行分析,以期可以找到简单的参数以便影像科医师在术前对肺内亚实性结节的病理分型做出预判,从而可以更好地为临床治疗方案的选择提供理论依据,以期寻找某一独立的可用于鉴别肺腺癌各病理分型以及预测其预后的危险因子。

方法: 回顾性分析 2022 年 1 月至 2023 年 4 月在我院手术证实是肺腺癌的 138 例患者共 149 枚亚实性结节的临床资料、MSCT 影像特征和病理特征。术后病理依据 2021 年肺腺癌病理新分类,按照浸润程度分为三组:浸润前病变组,微浸润性腺癌组和浸润性腺癌组。应用 Pearson χ^2 检验对分类变量资料进行分析,单因素方差分析对连续变量进行分析,寻找不同病理分型结节的临床资料和 CT 征象的差异为术前准确诊断提供依据;同时应用 Logistic 多元回归对单因素分析中有统计学差异的变量进行分析,以期找到某一独立的可以鉴别肺腺癌各病理分型以及预后的危险因子。

结果: 1. 发病年龄 ($P<0.01$)、结节长径 ($P<0.01$)、结节长径的分布情况 ($P<0.01$)、分叶征 ($P<0.01$)、pGGO/mGGO ($P<0.01$)、毛刺征 ($P=0.02$) 肿瘤的长径 ($P<0.01$) 和在三组间的差异有统计学意义。

2. 多因素 Logistic 回归分析示结节长径 $\leq 1.0\text{cm}$ 和实性成分比例 $\leq 50\%$ 与应变量的关联有统计学意义。

结论: 1. 单因素分析提示, 年龄、结节长径、结节分型、毛刺征、分叶征和肿瘤长径对 AAH/AIS 组、MIA 组和 IAC 组的鉴别诊断有较大的价值。
2. 多因素 Logistic 回归分析提示, 当结节长径 $\leq 1.0\text{cm}$, 实性成分比例 $\leq 50.0\%$ 时是判断肺腺癌预后的重要决定性因素。

双源 CT 能谱纯化技术在儿童气管异物低剂量 CT 扫描中的应用

吴志斌

空军军医大学西京医院

【摘要】目的: 探讨双源 CT 能谱纯化技术在儿童气管异物 CT 扫描中与常规扫描方案在图像质量和辐射剂量中的差别, 评估更适合的扫描方案。方法: 前瞻性连续 83 例行 CT 气管异物三维重建的患儿数据, 扫描设备均为三代双源 CT, 其中 A 组 (对照组), 41 例, 年龄 3.41 ± 2.38 , 采用 100kV, 参考 50 mAs 和能谱纯化组: B 组 (实验组), 42 例, 年龄 6.27 ± 2.25 , 采用 Sn100kV, 参考 50 mAs, 两组其他扫描条件一致。比较 2 种不同扫描技术的辐射剂量、图像质量, 测量并计算每组图像的噪声、信噪比以评价图像客观质量; 由 2 名高年资放射科医师按 5 级评分法对图像进行主观质量评价。辐射剂量及图像客观噪声组间比较行方差分析及 t 检验, 图像质量评分组间比较行 Mann-WhitneyU 检验, 医师对图像诊断一致性检验行 kappa 分析。结果: 实验组的 CTDI 为 $(0.54 \pm 0.11)\text{mGy}$, 较对照组的 $(1.80 \pm 0.88)\text{mGy}$ 下降了 73% ($t=15.27$, $P=0.000$); 实验组的平均剂量长度乘积和平均有效剂量分别为 $(7.13 \pm 4.72)\text{mGy}\cdot\text{cm}$ 和 $(0.5 \pm 0.07)\text{mSv}$, 明显低于对照组的 $(18.78 \pm 3.78)\text{mGy}\cdot\text{cm}$ 和 $(1.23 \pm 0.61)\text{mSv}$ 两组的图像噪声和对比噪声比差异均无统计学意义。两组患者肺窗图像质量评分差异无统计学意义纵隔窗的评分差异有统计学意义以肺窗为判断标准, 研究组的图像质量中位评分为 4 分 (3~5 分), 对照组为 4 分 (3~5 分), 所有图像质量均满足诊断要求。结论与传统 100 kV 扫描技术相比, 结论: 在儿童气管异物低剂量 CT 扫描中采用第 3 代双源 CT 能谱纯化技术能在保证图像质量的情况下有效降低辐射剂量, 值得在临床 CT 扫描中推广使用。

Structured Reporting Adds Clinical Value In Cardiovascular Magnetic Resonance Of New-Onset Heart Failure

Yangzhen Hou, Hui Zhou, Jing Luo, Ji Yang
Xiangya Hospital, Central South University

Purpose

To evaluate the effect of structured reporting of cardiovascular magnetic resonance (CMR) studies on the content, clarity and clinical usefulness of radiology reports in patients with new-onset heart failure (HF).

Methods

Conventional and structured CMR reports were acquired for 18 patients with new-onset HF. Conventional reports (CRs) were described in a free-text form and obtained retrospectively from our radiology information systems; structured reports (SRs) contained a consistent ordering of observed indicators with standardized subheadings. Thirty-six reports were independently scored by two cardiologists and two general internists using a questionnaire addressing completeness of information, structure, guidance for patient management and overall quality. The questionnaire included yes-no, 10-point Likert scale and 5-point scale questions. Altogether 144 completed

questionnaires were evaluated. Non-parametric Wilcoxon signed-rank test and McNemar's test were used for statistical analysis.

Results

SRs received higher ratings for content (median rating 9.8 vs. 8.4, $p<0.001$) and clarity (median rating 9.8 vs. 7.8, $p<0.001$). SRs contained more quantitative information on volume, wall thickness, mass and function than CRs (98 % vs. 64 %). Sufficient information for tissue characterization was included in more SRs (90% vs. 65 %). More SRs commented on etiology and classification (non-ischemic and ischemic) (92 % vs. 60 %). Information extraction was quicker from SRs (median rating 9.4 vs. 6.2; $p<0.001$). SRs had better comprehensibility (9.4 vs. 7.2; $p<0.001$). Contribution of SRs to clinical decision-making was higher (9.2 vs. 6.0; $p<0.001$). All clinicians preferred SRs over CRs.

Conclusion

Structured reporting of CMR adds clinical value compared to CRs by increasing completeness of qualitative and quantitative assessments, forwarding information extraction and improving patient management.

PU-2283

Dark Right Ventricular Blood Pool on myocardial T2 Mapping in Patients with Dilated Cardiomyopathy

Yangzhen Hou, Hui Zhou, Jing Luo, Ji Yang
Xiangya Hospital, Central South University

To investigate the importance of the dark right ventricular blood pool(RVBP) sign on cardiac MRI (CMR) T2 mapping in patients with dilated cardiomyopathy (DCM).

Methods

The clinical and CMR imaging data of 139 consecutive DCM patients from January 1, 2019 to December 30, 2021 were analyzed retrospectively. T2 values of patients and 29 healthy controls(HC) were measured in the septum, left ventricle(LV) and right ventricle(RV) on T2 mapping imaging(T2-prepared balanced steady-state free-precession sequence), and T2LV/T2RV and T2RV/T2septum were calculated. The function and strain of the ventricles were evaluated using cine imaging.

Results

The sign of dark-RVBP on T2 mapping was found in 26.6%(37/139) of DCM patients. The values of T2RV and T2RV/T2septum in patients with dark-RVBP (47.57 ± 12.43 ms and 1.18 ± 0.27) were significantly lower compared to those in patients with bright-RVBP (84.75 ± 26.55 ms and 2.05 ± 0.54) and HC (82.21 ± 11.46 ms and 2.21 ± 0.31), all $P<0.001$. LV and RV global longitudinal strains(GLS) and circumferential strain(GCS) showed no differences between dark-RVBP and bright-RVBP groups(all $P>0.05$). The ratio of T2LV/T2RV in patients with dark-RVBP (2.59 ± 0.63) was significantly higher than that in patients with bright-RVBP (1.76 ± 0.39) and in HC (1.37 ± 0.25), all $P<0.001$. The ratios of T2RV/T2septum and T2LV/T2RV were both strongly correlated with the severity of the RV dysfunction (both $P<0.001$).

Conclusion

The presence of dark RVBP on the T2 mapping is a marker for RV dysfunction. The ratios of T2RV/T2septum and T2LV/T2RV may be helpful to conveniently detect the severe RV dysfunction.

PU-2284

光谱多参数 CT 成像在不同危险分层急性肺栓塞栓子检出的研究王芝浩¹、周宇涵¹、曹伟萌¹、陈伟华¹、雷丽敏¹、刘杰¹、董书杉²

1. 郑州大学第一附属医院

2. 飞利浦医疗

目的：本研究旨在探讨应用光谱 CT 多参数（Spectral Based Image）成像评估肺灌注缺损程度在临床不同危险分层中的预测价值。

方法：本研究回顾性纳入 2023 年 2 月-2023 年 4 月确诊为肺动脉栓塞的患者共计 50 例，依据简化肺栓塞临床危险分层评分将患者分为低危险组 28 例，中危组 22 例。重建光谱数据获得碘密度图（Iodine Density, ID），有效原子序数图（Effective Atomic Number, Z-eff）以及碘密度-有效原子序数融合图（ID-Z-eff）。应用 Mastora 评分分别评估各组低灌注区灌注缺损面积，并绘制各组受试者工作特征曲线(Receiver operating characteristic, ROC)，计算 AUC（Area under curve）及截断值（Cutoff value）。定性数据采用卡方检验。定量数据采用斯皮尔曼等级相关系数和正态性检验。

结果：50 例患者中，依据 Mastora 评分，各组低灌注区数量分别为：ID 图（低危组 1.7 ± 0.86 ，中危组 2.2 ± 1.15 ），Z-eff 图（低危组 1.9 ± 1.02 ，中危组 2.32 ± 1.21 ），ID-Z-eff 图（低危组 2.05 ± 0.35 ，中危组 2.85 ± 0.52 ）。各组 Mastora 评分分别为：ID 图（低危组 $20.32\% \pm 7.48\%$ ，中危组 $27.45\% \pm 3.56\%$ ），Z-eff 图（低危组 $22.45\% \pm 5.04\%$ ，中危组 $31.44\% \pm 9.24\%$ ），ID-Z-eff 图（低危组 $22.45\% \pm 5.04\%$ ，中危组 $22.45\% \pm 5.04\%$ ）。相较 ID 图（AUC 为 0.86，截断值 800，灵敏度 70%，特异度 80%）、Z-eff 图（AUC 为 0.92，截断值 1000，灵敏度 80%，特异度 92%），ID-Z-eff 图（AUC 为 0.95，灵敏度 83%，特异度 95%）对急性肺栓塞中/低危患者中的预测效能最高。

结论：基于光谱多参数 CT 的碘密度-有效原子序数融合图诊断效能优于碘密度图和有效原子序数图，可以提高急性肺栓塞低/危患者中的预测效能，为不同危险分层肺栓塞患者预后预测提供更多影像学支持。

PU-2285

Single-phase Cardiac CT angiography-based machine learning radiomics predicts left atrial appendage thrombi and circulatory stasis

Guang Yao

The First Affiliated Hospital of Zhengzhou University

Purpose

Single-phase coronary CT angiography (CCTA) is difficult to distinguish left atrial appendage (LAA) thrombi and circulatory stasis. In this study, we aim to explore whether the left atrial appendage thrombi can be differentiated from circulatory stasis using radiomic features on single-phase CCTA images.

Methods and Materials

128 lesions from sixty consecutive patients with atrial fibrillation diagnosed with left atrial appendage thrombi and circulatory stasis by transesophageal echocardiography or cardiac

surgery from May 2016 to September 2022 were enrolled. There were 63 cases in the thrombus group and 65 cases in the blood stasis group. The CT values within the left atrial appendage of interest (ROI) and the CT values within the ROI of the ascending aortic in the same axial plane were measured separately, and the ratio of the two was calculated. The volume of left atrial appendage filling defects on single-phase CT images was manually segmented to obtain radiomic features, radiomics features were automatically extracted, a classification model was constructed, and 128 patients were divided into a training set and a test set according to 7:3, and AUC values were compared. Clinical, imaging, and radiomics model were constructed based on the CHA2DS2-VASc score, CT parameters, and Rad score using multivariate Logistic regression. ROC curves, calibration curves, and decision curves were plotted to evaluate the model efficacy.

Results

The differences in LV opening diameter, the length of LAA, LV morphology, LV volume, LV anterior-posterior diameter, and LAA/AA between the two groups were statistically significant (all $P < 0.05$). For the 63 cases in the thrombus group and 65 cases in the blood stasis group, a total of 2264 radiomics features were extracted, and different models of XGBOOST, AdaBoost, Random Forest, Decision Tree, Logistic Regression and Support Vector Machine were established, among which the model of random forest is better. For model efficacy evaluation, the AUC was significantly higher in the imaging histology model than in the imaging and clinical models (0.903 vs. 0.807, $p < 0.05$; 0.903 vs. 0.631, $p < 0.05$).

Conclusion

Radiomic features based on single-phase CCTA extraction of filling defects have shown good value in differentiating thrombus from circulatory stasis.

PU-2286

双源 CT 多部位 CTA 一站式扫描在心脑血管病诊断中的应用分析

张博源

空军军医大学西京医院

摘要 目的：分析双源计算机断层扫描（CT）多部位 CT 血管造影（CTA）一站式扫描在心脑血管病诊断中的应用价值。方法：选取本院 2020 年 6 月~2021 年 10 月收治的 195 例疑似心脑血管病患者（其中疑似脑血管病 91 例、疑似心血管病 104 例）作为研究对象，所有患者均行双源 CT 多部位 CTA 一站式扫描与数字剪影血管造影（DSA）检查，以 DSA 检查为金标准，分析双源 CT 多部位 CTA 一站式扫描在心脑血管病中的诊断价值。结果：经 DSA 检查，最终有 89 例确诊为脑血管病（脑梗死 52 例、脑动脉瘤 37 例），100 例确诊为心血管病（急性心肌梗死 58 例、冠心病心绞痛 42 例），共发现狭窄血管有大脑前动脉 10 支，大脑中动脉 11 支，大脑后动脉 9 支，颈动脉 18 支，椎基底动脉 12 支、左前降支 43 支，右冠状动脉 37 支，回旋支 33 支；共发现 42 枚动脉瘤，其中大脑前、中、后动脉 17 枚，颈动脉 8 枚，椎基底动脉 7 枚，前、后交通动脉 10 枚；经双源 CT 多部位 CTA 一站式扫描，最终 87 例确诊为脑血管病（脑梗死 50 例、脑出血 37 例），98 例确诊为心血管病（急性心肌梗死 58 例、冠心病心绞痛 40 例），共发现狭窄血管有大脑前动脉 10 支，大脑中动脉 10 支，大脑后动脉 9 支，颈动脉 17 支，椎基底动脉 12 支、左前降支 41 支，右冠状动脉 36 支，回旋支 33 支；共发现 40 枚动脉瘤，其中大脑前、中、后动脉 16 枚，颈动脉 8 枚，椎基底动脉 7 枚，前、后交通动脉 9 枚；诊断脑动脉瘤、头颈动脉狭窄、冠状动脉狭窄与 DSA 的符合率分别为 95.24%（40/42）、95.00%（57/60）、97.35%（110/113）；诊断脑血管病的灵敏度、特异度、准确度分别为 96.63%（86/89）、50.00%（1/2）、95.60%（87/91），诊断心血管病的灵敏度、特异度、准确度分别为 97.00%（97/100）、75.00%（3/4）、96.15%（100/104）。结论：双源 CT 多部位 CTA 一站式扫描在心脑血管病中具有较高的诊断价值，可为临床诊治提供参考依据。

PU-2287

Risk factors of children suspected of having pulmonary embolism: complication of mycoplasma pneumoniae pneumonia

Hui Gu, Bowen Li, Ximing Wang
Shandong Provincial Hospital

Purpose:: Pulmonary embolism (PE) is not a rare complication of mycoplasma pneumoniae pneumonia (MPP) in children. We sought to determine the rate of PE in children with MPP who underwent clinically indicated CT pulmonary angiography (CTPA), and to evaluate the risk factors of PE.

Methods: All of 106 MPP children who were clinically suspected of PE and underwent CTPA were retrospectively enrolled. The clinical features, laboratory data, and radiological parameters were recorded (e.g. lung consolidation involved, Qanadli score). Cox proportional hazards model and area under the receiver-operating characteristic (ROC) were used to evaluate the risk factors and their prognostic discriminatory capacity of PE.

Results: PE was detected in 26 of 106 (24.5%) children (mean age, 6.2 years \pm 3.3, 53 boys). 16 of 26 (61.5%) children with PE were boys. The mean age of children with PE was 8.1 \pm 2.9 years old, and the mean Qanadli score was 15.3 \pm 10.2. Children with PE demonstrated higher D-dimer (9.3 \pm 7.1 vs. 3.6 \pm 3.8), and more frequency of lung lobe consolidation (25 (96.2%) vs. 64 (80.0%)) (all $P < 0.05$). For children with MPP, parameters of age (Hazard ratio (HR) = 1.96 (95% CI: 1.04, 3.71, $P = 0.037$), D-dimer (HR = 2.04, 95% CI: 1.24, 3.34, $P = 0.005$), bilateral lung consolidation (HR = 2.41, 95% CI: 1.03, 5.58, $P = 0.043$) were independent predictors of PE.

Conclusion: Clinical and CT radiological predictors could be used to predict PE for children with MPP. The use of risk factor assessment as a tool has a potential to guide more appropriate use of CTPA in children.

PU-2288

Acute Limited Intimal Tear of the Aortic Root detected by Coronary Computed Tomographic Angiography

Hui Gu, Bowen Li, Ximing Wang
Shandong Provincial Hospital

A 54-year-old man presented to the emergency department with acute chest pain lasting a week. He was hypertensive (systolic blood-pressure >140 mmHg) at presentation and was a history of hypertension with ten years. He had elevated high-sensitivity troponin T (59.49 pg/ml) and D-dimer (8.63 mg/L), and was suggested to underwent coronary computed tomographic angiography (CCTA).

Hemopericardium was detected by non-contrast CT (Fig. 1A). CCTA demonstrated no stenosis in right coronary artery, anterior descending branch and circumflex artery. The aortic diameter was 34 mm, the linear tear was not appreciated on initial review but clearly displayed using 3D volume rendering (VR). VR demonstrated an outward bulge of the outer aortic contour, which defined the lesion as 'mushroom cap lesions' (Fig. 1B). Limited intimal tear was founded when we review the CCTA by using multiplanar reconstruction and VR (Fig. 1C-1F). Following 7 days of hospitalization and aggressive supportive care, the patient survived to discharge.

We describe the case of a patient with a small aortic dissection detected exclusively by 3D computed tomography. It should be emphasized that in diagnostics the diagnosis should be

performed with multiplanar images and VR should subsequently be used to "show" the lesion. Awareness of this method, limited intimal tear of the aortic root may be easily detected by CCTA.

PU-2289

超高分辨率 CT 靶扫描影像学征象对肺磨玻璃结节定性诊断价值分析

王世平、杨勤飞、刘再强、李晓鹏、张云杰、段智杰
安宁市第一人民医院

目的：观察 UHRCT(Ultra-high resolution CT. UHRCT)靶扫描影像学征象对肺磨玻璃结节定性诊断价值分析。方法与材料：收集 2020 年 7 月-2022 年 7 月在我院行胸腔镜手术切除的 303 例肺磨玻璃密度结节。本组病例平均年龄 53.2 岁，最大年龄 84 岁，最小年龄 13 岁，女 236 例，男 67 例。术前所有病例均采用飞利浦 Brilliance 64 层螺旋 CT 薄层常规扫描，图像矩阵 512x512，确定病变后行 UHRCT 靶扫描，图像矩阵 1024x1024。比较两种技术对肺磨玻璃结节灶形态特征、诊断效能。分析病变影像征象，确定肺结节病变定性影像特征，病变观察指标为：(1)分叶征；(2)毛刺征；(3)空泡征；(4)支气管征；(5)胸膜凹陷征；(6)有无实性成分。(7)血管束征；(8)微血管征；(9)晕征；(10)反晕征；(11)月牙征；(12)血管侵蚀征等。结果：肺磨玻璃密度结节 (PGGN) 定性诊断评价。本组 303 例病例中，非典型腺瘤样增生 28 例，原位癌 45 例，微浸润腺癌 87 例，浸润腺癌 109 例，其它恶性肿瘤 12 例，腺瘤 9 例，其它良性肿瘤 6 例，炎症 25 例，非肿瘤病变 16 例。传统薄层 CT 和 UHRCT 靶扫描在显示毛刺、空泡征、胸膜凹陷征、支气管征等方面无明显差异。而 UHRCT 靶扫描检出肺结节清楚界面 282 例，显示病变定性影像特征；传统薄层 CT 扫描检出肺结节清楚界面 101 例。在显示病变定性影像征象，UHRCT 靶扫描优于传统薄层 CT。其中 UHRCT 靶扫描显示病变明确实性成分的 176 例，传统薄层 CT 扫描显示病变明确实性成分的 134 例；UHRCT 靶扫描显示血管侵蚀 22 例，支气管变形、侵蚀 56 例，而传统薄层 CT 未见明确显示。UHRCT 靶扫描对 PGGN 明确诊断的为 98 例，明显优于传统 CT 组。比较 PGGN 的特征影像表现与病理组织学关系可知：UHRCT 靶扫描对非典型腺瘤样增生、原位癌与微浸润性腺癌、浸润性腺癌鉴别诊断有其重要诊断价值。结论：UHRCT 靶扫描影像学征象对肺磨玻璃结节有较高诊断价值，值得临床推广应用。

PU-2290

Recurrent coughing up blood: bronchial arteries and pulmonary arteries involvement in Behçet's disease

Hui Gu, Bowen Li, Ximing Wang
Shandong Provincial Hospital

A 35-year-old man was admitted with a 2-year history of a recurrent coughing up blood. He also had painful recurrent oral and genital ulcers. He had no past medical history.

A noncontrast CT imaging at an outside hospital was notable for multiple pulmonary nodules (Figure 1A). On CT angiography (CTA), these nodules were characterized as pulmonary thrombosed aneurysm (Figure 1B-1C, Figure 1G-1H), two bronchial artery (BA) dilatation were also identified (Figure 1D-1F).

Embolization therapy with embolic coils and microspheres was advised to prevent life and aneurysm-threatening complications based on CT (Figure 2A-2B). A CT after therapy showed embolic coils extending into the pulmonary aneurysm (Figure 2C-2D). At 4-month follow-up, CTA revealed (Figure 2E-2F) progression of bronchopneumonia and aneurysmal change of pulmonary

with slight thrombi. Moreover, a cava thrombosis of Inferior vena and colander were noted on Doppler ultrasound (Figure 2G-2H).

The underlying pathologic process in Behçet disease is vasculitis and perivascular inflammatory infiltrates affecting vessels in various organs (1,2). CTA Images play an important role for both diagnosis and assessment of the vascular complications of Behçet's disease. Moreover, progression of bronchopneumonia should be pay more attention for patients with this disease.

PU-2291

Impact of coronary atherosclerosis progression on cardiovascular events in patients with suspected coronary artery disease: A two-center retrospective analysis of 1062 cases stratified by age

Hui Gu¹, Ximing Wang¹, Bin Lv²

1. Shandong Provincial Hospital

2. Fuwai Hospital

Purpose: To investigate age differences in coronary atherosclerosis progression using serial coronary CT angiography (CCTA), and to analyse age-specific associations between atherosclerosis progression and major adverse cardiac events (MACE) in patients suspected coronary artery disease (CAD) in a large patient group.

Materials and Methods: This is a two-center retrospectively cohort study of 1062 patients who underwent serial CCTA. All patients were stratified by aged <51 years, 51-60 years, and >60 years. Coronary atherosclerosis progression was semi-quantitatively assessed in different age groups. Plaque progression was assessed visually and enumerated as CCTA scores and plaque scores. Incidence of MACE was assessed, which defined as cardiac death, coronary revascularization, nonfatal myocardial infarction and hospitalization due to unstable angina.

Results: Compared with younger patients, elderly patients imparts an increased atherosclerosis progression. 148 (13.9%) patients suffered MACE after a mean follow-up of 4.8 ± 1.2 years. Cox regression analysis revealed atherosclerosis progression was significantly associated with MACE in group of aged 51-60 years [progression of three vessel plaque score (HR=3.30, 95% CI: 1.10 to 9.91), severe proximal plaque score (HR=3.92, 95% CI: 1.95 to 11.96), non-calcified plaque (HR=3.04, 95% CI: 1.07 to 8.61), coronary artery disease reporting and data system category 4-5 (HR=1.97, 95% CI: 1.09 to 3.55), all $p < 0.05$]. No semi-quantitative parameter of atherosclerosis progression was independently associated with MACE in patients aged <51 years and >60 years. The ROC curves over all ages demonstrate incremental prognostic value with baseline CCTA and follow-up CCTA continuous risk scores across all ages. Follow-up CCTA added incremental prognostic value beyond risk factors and baseline CCTA for patients aged 51-60 years (AUC 0.765 vs. 0.685, $p=0.011$) and for aged >60 years (AUC 0.812 vs. 0.759, $p=0.029$). Baseline CCTA added incremental prognostic value beyond risk factors for patients aged <51 years (AUC 0.639 vs. 0.707, $p=0.02$).

Conclusions: Elderly patients present more severe coronary artery atherosclerosis and demonstrate more atherosclerosis progression. Serial CCTA have incremental prognostic value to predict MACE in all groups. Coronary atherosclerosis binary progression was independently associated with MACE in aged 51-60, while MACE prediction in younger and older ages with binary progression was not predictive in this cohort.

CMR 在亚临床期糖尿病心肌病的应用进展

李国荣

宜昌市第一人民医院 (三峡大学人民医院)

亚临床期糖尿病心肌病 (DCM) 主要表现为心肌纤维化、左心室肥厚和心肌舒张异常。心脏磁共振 (CMR) 技术可快速准确判断糖尿病患者的心肌结构及功能,对亚临床期 DCM 的早期诊断和预后评价起到至关重要的作用,评估亚临床期 DCM 的 CMR 技术主要包括心脏磁共振特征性追踪 (CMR-FT)、心肌磁共振波谱成像 (MRS)、T1mapping 技术、磁共振心肌灌注成像等。主要对 CMR 技术在亚临床期糖尿病心肌病诊断中的研究进展进行综述。

PU-2293

呈现“静脉内”动脉”形态的累及心腔的低级别子宫内膜间质肉瘤并双肺多发转移灶 CT 表现 1 例

冯煜森

昆明医科大学附属延安医院

该文报道 1 例非常罕见累及心腔子宫内膜间质肉瘤并双肺多发转移灶的多层螺旋 CT 表现。患者突发晕厥。CT 表现为左侧髂内血管旁迂曲血管团伴动-静脉间异常分流,流入左侧髂静脉、下腔静脉、右心房室及肺动脉内独立连续存在之壁厚薄不均管、囊性结构内,病变是否与血管壁粘连观察不清,可见动脉血自右肺动脉主干区域小破口流入肺动脉内,病灶呈现下腔静脉、心腔内“动脉”影;双肺多发大小不一含气囊腔及结节,复查各病灶囊壁不同程度增厚、变薄;子宫稍大,增强后密度不均。

ECG-MSCT 多期增强扫描技术对心脏占位性病变的诊断价值

孙桂芳、刘斌、刘飞、朱彩艳、刘兴蕊

昆明市延安医院

目的: 讨论心电图门控多层螺旋 ct (MSCT) 多期增强扫描技术对心脏占位性病变的诊断价值。

方法: 回顾性分析 2012 年 3 月至 2020 年 3 月诊断为心脏占位性病变的 67 例患者。收集并分析 MSCT、超声心动图和磁共振成像(MRI)的影像学资料。比较 MSCT 与术后病理诊断、超声心动图及 MRI 对心脏占位性病变的诊断准确性。

结果: 与术后病理诊断相比, MSCT 多期增强对心脏占位性病变的诊断准确率和敏感性分别为 87.8%(58/66)和 98.5%(66/67)。MSCT 多期增强扫描诊断心脏肿瘤的敏感性和特异性分别为 96.77%和 60%。MSCT 多期增强扫描诊断心脏良性肿瘤和恶性肿瘤的敏感性和特异性分别为 100%和 72.22%, 61.54%和 100%。MSCT 多期增强扫描的诊断准确率(87.88%)高于超声心动图(76.12%)和 MRI(81.82%)。

结论: 心电图门控 MSCT 多期增强扫描可作为一种简单有效的无创工具,准确表征心脏占位性病变,具有潜在的临床应用价值。

高级迭代重建算法对低剂量冠状动脉 CT 血管成像图像质量及管腔狭窄 诊断准确性的研究

杨晓莹

徐州医科大学附属医院

目的 评价不同强度高级迭代重建(ADMIRE 1-5)算法与传统滤波反投影(FBP)算法在低剂量冠状动脉 CT 血管成像 (CTA) 中对图像质量的影响及对管腔狭窄程度诊断的准确性。

方法 收集 30 例一周内同时进行低剂量冠状动脉 CTA 及冠状动脉造影 (CAG) 的病例。所有病例行 CTA 图像重建时均采用六种重建算法(FBP、ADMIRE 1-5), 并对获得的图像进行主、客观评价, 采用单因素重复测量方差分析比较六组间图像主观评分、图像噪声、图像信噪比 (SNR)、对比噪声比(CNR), 两两比较采用 LSD 法检验。以 CAG 为金标准, 通过一致性检验 (Kappa 检验) 比较六种重建算法对冠状动脉狭窄程度诊断的准确性。

结果 图像噪声高低排序为 FBP>ADMIRE 1>ADMIRE 2>ADMIRE 3>ADMIRE 4>ADMIRE 5 ($P<0.05$), 图像 SNR 及 CNR 高低排序为 ADMIRE 5>ADMIRE 4>ADMIRE 3>ADMIRE 2>ADMIRE 1>FBP ($P<0.05$), 主观评分高低排序为 ADMIRE 4>ADMIRE 5>ADMIRE 3>ADMIRE 2>ADMIRE 1>FBP ($P<0.05$)。以 CAG 为金标准, 不同强度 ADMIRE 对狭窄管腔诊断准确性高于 FBP ($P<0.05$), 且以 ADMIRE 4 最优 (Kappa 值为 0.956), 其他各组从高到低依次为 ADMIRE 3, 5, 2, 1, FBP (Kappa 值分别为 0.812, 0.844, 0.914, 0.956, 0.904)。

结论 在冠脉 CTA 低剂量扫描中, 相比 FBP 算法, ADMIRE 算法能大幅度降低图像的噪声, 提高图像质量, 其中以 ADMIRE 4 重建算法所得图像质量较优。以 CAG 为金标准, ADMIRE 算法重建图像对冠状动脉狭窄程度的诊断准确性明显高于 FBP 算法, 且 ADMIRE 4 诊断准确性最高。

PU-2296

Dual-layer spectral detector CT plain scan to distinguish invasive adenocarcinoma from minimally invasive adenocarcinoma in mixed ground-glass nodules with pleural contactFang Yin¹, zheng hua zhang¹, xiao di zhang², dan han¹

1. Department of Radiology, The First Affiliated Hospital of Kunming Medical University,

2. Philips Healthcare, Chengdu, Sichuan, China

Purpose: To explore the clinical application of dual-layer spectral detector CT plain scan for differentiating the invasive adenocarcinoma from minimally invasive adenocarcinoma in mixed ground-glass nodules with pleural contact (P-mGGNs).

Materials and methods: 97 patients with total 106 P-mGGNs, who underwent preoperative dual-layer spectral detector CT scan were included retrospectively. According to invasiveness by pathology, the nodules were divided into two groups: invasive adenocarcinoma (IAC, n=49) group and minimally invasive adenocarcinoma (MIA, n=57) group. The electron cloud density map and effective atomic number map were reconstructed on dedicated workstation (IntelliSpace Discovery, Philips Healthcare). The maximum diameter, volume, CT value, electron density value (ED value) and effective atomic number (Zeff value) of the entire nodule and the solid component were measured on the workstation. Then calculated the proportion of solid components (expressed as the ratio of the volume of solid components to the entire nodule). Diagnostic performance was evaluated by receiver operating characteristic (ROC) curve analysis.

Results: Compared with the MIA, the proportion of solid components and the maximum diameter, volume, CT value, electron density value(ED value) of the entire nodule and the solid component were high in the IAC, but the Zeff value of the entire nodule and the solid component were lower($P < 0.05$). The CT value [odds ratio(OR)=1.036, $P=0.0085$], ED value (OR)=0.750, $P=0.0338$) and Zeff value(OR=0.044, $P < 0.0154$) of the solid component were independent predictors for diagnosing IAC manifesting as P-mGGNs. The analysis of ROC curves showed that the AUC of the combination of three independent predictors was 0.839(sensitivity=75.51% , specificity= 80.70%).

Conclusion: Dual-layer spectral detector CT plain scan can effectively differentiate the IAC from MIA in P-mGGNs, and may offer a crucial reference point for follow-up and selective surgical management.

侵入左侧胸腔的前纵膈血管平滑肌脂肪瘤一例

柏冬、梁园梓、刘文婷、王志群
航天中心医院

摘要：血管平滑肌脂肪瘤是一种间充质肿瘤，由血管、平滑肌和成熟脂肪组织组成，最常见于肾脏，位于肾外的少见，尤其是发生于纵膈的病例目前为止全球报道仅 12 例。本文报告了一例发现左侧胸腔肿物 19 年的年轻女性患者，影像学表现为左侧胸腔混杂密度肿块，内可见钙化及脂肪密度，增强后可见迂曲血管，患者行正中开胸胸腔巨大肿物切除术，术后病理证实为起源于前纵膈侵入左侧胸腔的血管平滑肌脂肪瘤，术后随访 1 年未见明确复发。影像学诊断在术前提提供了重要的依据。

Prognostic Value of Feature-Tracking Cardiac MR Left Ventricular Longitudinal Strain for Preoperative Assessment of Adolescent and Adult Patients with Ebstein Anomaly

Xiahui Tian
Zhujiang Hospital of Southern Medical University

Objectives To explore the prognostic value of cardiac magnetic resonance (CMR) imaging in predicting postoperative adverse events in adolescent and adult patients with Ebstein anomaly(EA).

Methods In the single-center retrospective study, 48 patients(35.0 ± 13.6 years; 13 males) with EA and CMR were included from January 2017 to February 2023. Thirty healthy volunteers served as controls. The major adverse events were comprised of recurrent tricuspid regurgitation, cardiac reoperation, readmission for heart failure, cardiac death. Cox proportional hazards models were used to assess the association between cardiac MR parameters and outcomes.

Results During a median follow-up period of 30.3 months (range, 3–79 months), 15 (31%) patients developed major adverse events. For patients with EA, the left and right ventricular global longitudinal strain (GLS), right ventricular ejection fraction were significantly worse and left ventricular native T1 values and extracellular volume were significantly increased, compared with controls (all $p < 0.05$); however, there was no significant difference in left ventricular ejection fraction (LVEF) between the two groups. For EA patients with major adverse events, the left ventricular global longitudinal strain (LVGLS), left ventricular global circumferential strain (LVGCS), left ventricular global radial strain (LVGRS), and LVEF were significantly worse,

compared with patients without major adverse events (all $p < 0.05$). Univariable Cox proportional hazard model analysis showed that left ventricular end-systolic volume index, LVEF, and LVGLS were significantly associated with adverse events ($P < 0.05$). After adjustment for confounding variables, the LVGLS remained the independent factor associated with a higher risk of major adverse events (hazard ratio: 1.357; 95% confidence interval : 1.072 - 1.719; $p = 0.011$).

Conclusion Diffuse myocardial fibrosis and impaired biventricular longitudinal strain were observed in adolescent and adult patients with EA. Preoperative assessment of CMR imaging-based LVGLS provides independent prognostic information in EA patients undergoing cone repair.

PU-2299

1 例增强 CT 证实合并部分型肺静脉异位引流的右肺上叶高危磨玻璃结节的手术切除

乔鹏鑫、樊红光、王梅云
河南省人民医院

部分型肺静脉异位引流是一类罕见的心血管畸形，在成年人中通常无症状、偶然发现。术前影像学评估正确识别部分型肺静脉异位引流，对于拟行手术切除的高危肺结节患者的手术方案选择至关重要，不恰当的手术方式可能会导致严重的术后并发症。一名 77 岁女性体检发现右肺上叶高危磨玻璃结节，大小约 28mm X 23mm，拟行右肺上叶部分切除术，术中发现患者的右上肺静脉引流至上腔静脉，且患者的术前增强 CT 证实该患者合并部分型肺静脉异位引流，因此患者的手术方案由右肺上叶部分切除改为右肺上叶切除，右肺上叶磨玻璃结节最终病理证实为浸润性腺癌。因此，对于拟行肺结节切除的患者，术前增强 CT 有助于识别部分型肺静脉异位引流，从而帮助临床医师选择合适的手术方案。

PU-2300

Deep Learning-Based Motion Correction in Projection Domain for Coronary Computed Tomography Angiography: A Clinical Evaluation

Tao Shuai
west china hospital of sichuan university

Objective: This study aimed to evaluate the clinical performance of a deep learning-based motion correction algorithm (MCA) in projection domain for coronary computed tomography angiography (CCTA).

Methods: A total of 192 patients who underwent CCTA examinations were included and divided into 2 groups based on the average heart rate (HR): group 1, 82 patients with HR of <75 beats per minute; group 2, 110 patients with HR of ≥ 75 beats per minute. The CCTA images were reconstructed with and without MCA. The subjective image quality was graded in terms of vessel visualization, sharpness, diagnostic confidence, and overall image quality using a 5-point scale, where cases with all scores of ≥ 3 were deemed interpretable. Objective image quality was measured through signal-to-noise ratio and contrast-to-noise ratio in regions relative to the vessels. The image quality scores for 2 reconstructions and effective dose between 2 groups were compared.

Results: The mean effective dose was similar between 2 groups. Neither

group showed significant difference on objective image quality for 2 reconstructions. Images reconstructed with and without MCA were both found interpretable for group 1, whereas the subjective image quality was significantly improved by the MCA for all 4 metrics in group 2, with the interpretability increased from 80.91% to 99.09%. Compared with group 1, group 2 showed similar interpretability and diagnostic confidence, despite inferior overall image quality.

Conclusions: In CCTA examinations, the deep learning-based MCA is capable of improving the image quality and diagnostic confidence for patients with increased HR to a similar level as for those with low HR.

PU-2301

多层螺旋 CT 重建后处理技术对外伤性肋骨骨折的诊断价值及漏诊原因分析

敖平、张玉霖、朱丽

成都市龙泉驿区第一人民医院(四川大学华西医院龙泉医院)

目的 探讨多层螺旋 CT (multi-slice spiral CT, MSCT) 重建后处理技术对外伤性肋骨骨折的诊断价值, 总结分析其漏诊原因。方法 回顾性分析 2022 年 6 月至 2022 年 12 月期间在我院诊治的 110 例外伤性肋骨骨折患者的 MSCT 图像, 由两名放射科主治医师分别根据 CT 轴位图像做出诊断、以及基于 CT 轴位图像结合多平面重建 (multi-plane reformation, MPR)、容积再现 (volume rendering, VR) 重建后处理图像进行诊断。结果 根据骨折参考标准, 本组 110 例患者共存在肋骨骨折 416 处, 两名医师基于 CT 轴位图像检出 368 处肋骨骨折, 其中正确诊断 361 处, 误诊 7 处, 漏诊 55 处, 对肋骨骨折诊断敏感度为 86.78% (361/416), 误诊率为 1.90% (7/368), 漏诊率为 13.22% (55/416)。基于 CT 轴位图像结合 MPR 及 VR 后处理重建图像检出肋骨骨折 395 处, 其中正确诊断 390 处, 误诊 5 处, 漏诊 26 处, 对肋骨骨折诊断敏感度为 93.75% (390/416), 误诊率为 1.27% (5/395), 漏诊率为 6.25% (26/416)。基于 CT 轴位图像结合 MPR 及 VR 重建后处理图像对肋骨骨折诊断的敏感度高于单独基于 CT 轴位图像诊断, 漏诊率低于单独基于 CT 轴位图像诊断, 差异具有统计学意义 ($P < 0.05$), 两种方法对肋骨骨折误诊率差异无统计学意义 ($P > 0.05$)。肋骨骨折漏诊常见原因有骨折较细微、骨折断端无错位或错位极其轻微、骨折线恰巧与 MSCT 扫描方向平行、骨折线仅累及一侧骨皮质、骨折位于肋骨后段靠近胸椎横突区域、多发肋骨骨折、骨质疏松患者等情况。结论 联合应用 MPR、VR 重建后处理技术能提高 MSCT 对外伤性肋骨骨折诊断敏感度, 降低漏诊率, 但仍有部分漏诊情况, 可通过伤后 2~8 周内复查明确诊断。

PU-2302

MSCT 个体化扫描方案对功能性单心室 Fontan 术后随访价值

孙玉、侯洁、杨本强

中国人民解放军北部战区总医院

目的 探讨 MSCT 对功能性单心室 (FSV) Fontan 术后随访价值。方法 32 例 FSV 患者 Fontan 术后随访复查的 MSCT、心血管造影 (CAG) 和临床资料纳入本研究。MSCT 检查采用个体化手动触发双期扫描, 即依据有、无咳血症状相应选择肺动脉、左心房为监测靶点, 一期扫描完成立即手动触发第二期扫描。定性评估 Fontan 管道和术后并发症, 并选取最佳层面测量双侧肺动脉起始处内径和降主动脉 (膈肌水平) 内径, 计算 McGoon 指数, 以评估肺动脉发育。采用 Pearson 相关性分析双侧肺动脉起始处内径与 CAG 肺动脉舒张期压力、McGoon 指数与 CAG 肺血流阻力指数

间关系。结果 本研究中 MSCT 检出 3 例右心房-肺动脉连接, 11 例心内/外 Fontan 管道, 8 例心外 Y 型 Fontan 管道和 10 例全腔-肺动脉连接。同时, MSCT 检出 2 例肺动-静脉瘘, 3 例主-肺动脉侧支, 2 例 Fontan 管道附壁血栓和 1 例室壁瘤共 8 例 Fontan 术后并发症。MSCT 测量左、右肺动脉起始处内径分别为 (1.36 ± 0.22) cm、 (1.40 ± 0.15) cm, 且肺动脉内径与 CAG 肺动脉舒张期压力间具有良好负性相关(左: $r=-0.755$; 右: $r=-0.678$; P 均 <0.01)。McGoon 值与 CAG 肺动脉血流阻力指数相关性良好($r=-0.676$, $P<0.01$)。

结论 借助快速图像获取和后处理技术, 并选择个体化扫描方案, MSCT 能为 Fontan 术后随访评估提供多项参考指标, 具有重要临床应用价值。

PU-2303

MOLLI 在 3.0T 心脏磁共振扫描中的临床应用

刘滔
西安秦皇医院

【摘要】目的 探讨基于 MOLLI 在 3.0T 磁共振心脏成像中的应用。方法 选取我科室 2021 年 5 月-2023 年 6 月的 20 例心脏扫描受检者作为研究对象, 男 11 例, 女 6 例, 年龄 44-64 岁, 平均 54 岁。对 20 例患者进行心脏规范化扫描得到的图形传输至 MRI 工作站进行后期融合处理, 观察其心功能及定量分析注射对比剂前的 T1 Mapping 及注射对比剂后延迟 10-15 分钟后的 T1Mapping 的结果, 评价其敏感性和准确性。结果 经诊断 16 名临床怀疑心肌缺血患者患者磁共振检测出心肌缺血区, 通过定量分析病灶, 经临床证实符合临床诊断。其中 1 例的结果与患者之前的 CT 心肌静态灌注结果吻合。4 名常规查体者未检出病灶。结论 MOLLI 在心脏扫描中对心肌定量分析中有重要价值, 且在选取适当的加速因子及图像参数后, 大大缩短受检者憋气时间, 提高图像质量。这项技术相较于 PET 和 CT 有无辐射的天然优势, 能提高患者的依从性和复检率, 对判断其病情发展有重要意义, 有助于指导临床治疗方案的选择。

PU-2304

The primary research of the feasibility of evaluating pulmonary function with Discovery CT 750HD at low dose

Le Dou
the First Hospital of JiLin University

Objective

To explore the feasibility of evaluating pulmonary function with GE Discovery CT 750 HD at low dose.

Materials and Methods

60 people who are extracted randomly from the personnel who accepted health examination in our hospital from January 1, 2014 to March 20, 2014 are divided into two groups, including normal dose group(NI=11) and low dose group(NI=18).The normal dose group includes 30 people,20 males and 10 females ranging in age from 20 to 61,with an mean age of 40.8 ± 10.8 years, the low dose group includes 30 people,16 males and 14 females ranging in age from 24 to 62, with an mean age of 44.8 ± 11.1 years. All the experimental subjects underwent chest CT scan with GE Discovery CT 750 HD. The image data was analyzed using Post-processing software Thoracic VCAR to measured thickness of airway wall (WTAvg), the ratio of airway wall thickness and airway diameter(WT/D), the percentage of the airway wall area of the total cross-sectional area of the airway(WAR) and the total area of the airway wall(WA) of apical segmental bronchus of the right upper lobe; PI were analyzed and the parameters PI included -1024--910,-

910~-800, -800~-700,>-700. Analysis the parameters of two groups have statistically significant difference or not. CT dose index volume (CTDIvol)、dose length product (DLP) were recorded, and effective dose was calculated.

Results

The experimental data was applied comparative t-test to perform statistical analysis by using SPSS 19.0 software. The p values of WTAvg、WT/D、WAR、WA of two groups are 0.065、0.559、0.585、0.131; The P values of PI-1024~-910Hu、PI-910~-800Hu、PI-800~-700Hu、PI>-700Hu are 0.262、0.817、0.542、0.889. All the parameters of the two groups have no statistically significant difference ($p>0.05$). Effective dose of group normal dose and low dose are 4.99 ± 1.37 、 1.92 ± 0.68 , Group low dose has a reduction of 61.52% radiation dose.

Conclusions

It is feasible to evaluate pulmonary function with Discovery CT 750HD at low dose.

PU-2305

磁共振成像技术在肺结节中的应用与进展

吴婷、吴林玉、高晨、娄新璟、吴俊、许茂盛
浙江中医药大学附属第一医院 (浙江省中医院)

目的: 综述基于磁共振成像 (Magnetic Resonance Imaging, MRI) 技术在肺结节上的应用与进展, 为肺结节的精准诊疗提供潜在的生物学信息。

方法: 从国内外数据库如中国知网、万方、Pubmed、Embase、the Web of Science Core Collection、the Cochrane library 等数据库中检索与关键词如“磁共振 (Magnetic Resonance Imaging)”“肺结节 (Pulmonary Nodule)”“肺癌 (Lung Neoplasms)”相关的文献, 筛选基于磁共振成像及其功能技术在肺结节的筛查、诊断、预后等方面的文献, 并对其进行总结阐述。

结果: MRI 成像技术如传统 MRI 扫描 (T1WI、T2WI)、动态对比增强磁共振 (dynamic contrast enhanced-magnetic resonance imaging, DCE-MRI)、化学交换饱和和转移 (chemical exchange saturation transfer, CEST)、弥散加权成像 (Diffusion Weighted Imaging, DWI)、扩散峰度成像 (Diffusion Kurtosis Imaging, DKI)、体素内不相干运动 (intravoxel incoherent motion, IVIM) 目前在肺结节的诊断及预后等方面具有诸多进展, 及其与人工智能 (如影像组学、深度学习等技术) 联合丰富诊断技术。相关文献主要可分为诊断、预后两大方面: (1) 诊断方面: 良恶性肺结节的筛查与诊断, 肺癌病理分期及病理类型、组织学亚型的诊断、分子生物学水平的基因表达预测、血管生成标记物及肿瘤增殖标记物的预测、肺癌放疗计划的肿瘤动态追踪; (2) 预后方面: 放疗、化疗、免疫治疗等治疗反应的预测, 术后复发风险因素的评估, 生存分析的预后评估。

结论: 磁共振成像及其功能技术能够为肺结节的精准诊疗提供一定的价值, 同时磁共振图像及其参数选择仍需进一步的标准化统一来不断完善。

PU-2306

Determining optimal imaging protocols for enhanced chest CT: from phantom to clinical study

Beibei Li
The first affiliated hospital of Dalian Medical University

Purpose: To investigate the optimal imaging protocols in enhanced chest CT for achieving good image quality and diagnostic performance with lower radiation dose.

Materials and Methods: This IRB-approved study included both phantoms and patients. Firstly, the PH-75 phantom of two sizes was scanned using 4 scanning modes: A, 120kVp/Smart-mA; B,

120kVp/Smart-mA/Organ-dose-modulation (ODMfull); C, Auto-prescription/Smart-mA; D, Auto-prescription/Smart-mA/ODMfull, Images in each group were reconstructed using ASIR-V40%, ASIR-V60%, and ASIR-V80%, denoted as A1-3-D1-3, respectively with 1-3 representing the three ASIR-V levels. Image quality and radiation dose were evaluated to obtain the best imaging mode. Secondly, 48 patients underwent contrast-enhanced standard dose CT (SDCT, protocol A) and low-dose CT (LDCT, protocol D) of the chest for follow-ups. Image quality, radiation dose, and AI-based volume measurements of the left lung, right lung, and trachea were compared.

Results: The phantom study selected D2 protocol (Auto-prescription/Smart-mA/ODMfull/ ASIR-V60%) which had the lowest dose as the optimal imaging protocol for enhanced chest CT. For the patient group, LDCT reduced the radiation dose by 45% compared to SDCT. Images in LDCT with ASIR-V60% had similar noise as the standard SDCT images with ASIR-V40%, but higher SNR and CNR. The median image quality scores of the two groups were (4, 4), the volumes of the left lung, right lung, and trachea in the two groups were not statistically different, and all lesions were correctly identified in LDCT.

Conclusions: The combination of Auto-prescription and ODMfull with ASIR-V60% in contrast-enhanced chest CT can achieve individualized low dose scanning with satisfactory image quality and diagnostic accuracy.

PU-2307

Radiomics-clinical nomogram for preoperative lymph node metastasis prediction in esophageal carcinoma

Xiaotao Geng¹, Yaping Zhang², Yang Li¹, Yuanyuan Cai¹, Jie Liu¹, Xiangdi Meng¹, Furong Hao¹

1. Weifang People's Hospital

2. Department of Radiology, Weifang People's Hospital

Objectives: This research aimed to develop a radiomics-clinical nomogram based on computed tomography (CT) and clinical features for the purpose of predicting the presence or absence of metastasis in lymph nodes among patients with esophageal squamous cell carcinoma (ESCC).

Methods: This study examined the data of 256 patients with ESCC, including 140 cases with lymph node metastasis. Clinical information was gathered for each case, and radiomics features were derived from CT scans with the help of a 3D slicer. To validate risk factors that are independent of the clinical and radiomics models, least absolute shrinkage and selection operator (LASSO) logistic regression analysis was used. A nomogram pattern was constructed based on the radiomics features and clinical characteristics. The receiver operating characteristic (ROC) curve and Brier Score were used to evaluate the model's discriminatory ability, the calibration plot to evaluate the model's calibration, and the decision curve analysis (DCA) to evaluate the model's clinical utility. The confusion matrix is used to evaluate the applicability of the model. To evaluate the efficacy of the model, 1000 rounds of 5-fold cross validation are conducted.

Results: The clinical model identified esophageal wall thickness and clinical T (cT) stage as independent risk factors, whereas the radiomics pattern was built based on 4 radiomics features chosen at random. Area under the curve (AUC) values of 0.684 and 0.701 are observed for the radiomics approach and clinical model, respectively. The nomogram model's AUC for combining radiomics and clinical features was 0.711. The calibration plot showed good agreement between the incidence of lymph node metastasis predicted by the nomogram model and the actual probability of occurrence. The nomogram model displayed acceptable levels of performance. After 1000 rounds of 5-fold cross-validation, the AUC and Brier score had median values of 0.702 (IQR:0.65, 7.49) and 0.21 (IQR:0.20, 0.23), respectively. High-risk patients (risk point > 110) were found to have an increased risk of lymph node metastasis [odds ratio (OR) = 5.15, 95% confidence interval (CI): 2.95-8.99] based on the risk categorization.

Conclusion: A successful preoperative prediction performance for metastasis to the lymph nodes among patients with ESCC was demonstrated by the nomogram that included CT radiomics and clinical features.

PU-2308

A CT-based radiomics-clinical model for the differentiation of checkpoint inhibitor related pneumonitis and bacterial pneumonia

Ying Li, Jianjun Zheng, Jingfeng Zhang
Ningbo No.2 Hospital

Purpose: Checkpoint Inhibitor Related Pneumonitis (CIP) is a common complication of immunotherapy with a high case-fatality rate, which results from excessive immune system activation. CIP must be treated promptly with high-dose steroid hormones, which is completely different from bacterial pneumonia (BP). Due to the high similarity in their radiological patterns, it is still a challenge to distinguish between CIP and BP. The aim of this work is to construct a predictive model to distinguish between CIP and BP better, which integrating clinical risk factors, radiological findings and individual radiomics characteristics.

Methods: Retrospective analysis was performed on 90 pneumonia patients who received continuous ICI treatment and high resolution CT scan at Ningbo No.2 Hospital in 2022, including 32 patients with CIP and 58 patients with BP. The training set ($n = 64$) and the test set ($n = 26$) of these tumor patients were split up at random. The regions of interest, which comprised all lesions, extracted an aggregate of 851 radiomics features. Max-Relevance and Min-Redundancy (mRMR) and least absolute shrinkage and selection operator (LASSO) were then utilized for dimension reduction. The construction of three models—clinical, radiomics, and combined—led to the subsequent development of a nomogram based on the combination model. To evaluate how well these three models perform as diagnostic tools, the area under the receiver operating characteristic (ROC) curve (AUC) was determined. Decision Curve Analysis (DCA) was used to evaluate the three models' clinical utility.

Results: 7 valuable features were screened out ultimately. The AUCs of the combined model for distinguishing CIP from BP were 0.97 and 0.95 in the training and test sets respectively, achieving the best efficiency compared to the single model. DCA shows that, when compared to the other models, the radiomics-clinical model (i.e. the combined model) gained higher clinical benefits.

Conclusion: The radiomics-clinical model and further nomogram had an outstanding capacity for prediction for identifying CIP and BP, which would be helpful in clinical decision-making.

双源 CT 超级炫速螺旋扫描技术在心耳成像中的初步研究

张勇
扬州大学附属医院

目的探讨第三代双源 CT 超级炫速扫描技术在心耳成像中的临床应用价值。方法回顾性心电门控扫描肺静脉 CTA 扫描患者 20 例为 A 组, 超级炫速扫描肺静脉 CTA 20 例为 B 组。对两组数据的像质量进行客观评价, 包括主动脉根部、肺静脉主干、心耳的 CT 值, 信噪比以及对比噪声比, 采用独立样本 t 检验比较两组间的差异。采用独立样本 t 检验对比两组的剂量长度乘积 (DLP) 和 CTDVOL。对图像质量进行主观评分, 按照 4 分法对患者的整体图像, 心耳及肺静脉主干评分, 采用卡方检验

比较 2 组间的差异。结果心耳、肺静脉主干的 SNR、CNR 及 CT 值均无统计学差异 ($P>0.05$)。主观评分整体质量, 心耳及肺静脉主干均无统计学差异 (p)。两组 dlp 和 ctdvol 有显著统计学差异 ($P<0.001$)。结论利用第三代双源 CT 超级炫速扫描技术可获得与回顾性心电门控相当的图像质量, 可降低辐射剂量。

能谱 CT 在预测肺癌淋巴结转移中的应用价值

康柳青

河南省肿瘤医院

目的 探讨能谱 CT (DECT) 在预测肺癌淋巴结转移中的价值。方法: 收集 2019—2022 年经病理证实淋巴结转移的 129 例肺癌患者的临床及 DECT 资料, 根据有无淋巴结转移, 分为淋巴结转移组 (45 例) 与非转移组 (84 例)。利用 GSI viewer 软件评价病灶部位边缘、形态、分叶征、毛刺征、胸膜增厚、有无坏死等 CT 表现, 测量病灶长径、短径、动静脉期碘浓度 (IC) 及同层主动脉 IC, 并获得动静脉期 40keV 及 100keV 的单能量 CT 值。计算病灶的动静脉期标准化碘浓度 (nIC) 及能谱曲线斜率 (λ HU)。采用单因素分析定性资料及计量资料与淋巴结转移的相关性。采用多因素 Logistic 回归分析两组间差异有统计学意义的指标, 筛选出预测肺癌淋巴结转移的独立危险因素。采用受试者工作特征曲线 (ROC) 对预测因子进行分析, 得出各参数的最佳诊断效能阈值、敏感度及特异度。结果 多因素回归分析示肺癌原发灶的位置、长径、动静脉期 40keV 及 100keV 的单能量 CT 值、动脉期 nIC 是预测肺癌淋巴结转移的独立危险因素 ($P<0.05$)。中心型肺癌较周围型肺癌更容易发生淋巴结转移, 长径 $>3\text{cm}$ 的肺癌较 $\leq 3\text{cm}$ 的肺癌更容易发生淋巴结转移, 差异均具有统计学意义 ($P<0.05$)。淋巴结转移组肺癌的动静脉期 40keV 及 100keV 的单能量 CT 值、动脉期 nIC 均高于非转移组, 差异均具有统计学意义 ($P<0.001$)。分别建立常规 CT 模型及常规-能谱 CT 联合模型, 计算两个模型对于肺癌淋巴结转移的预测效能, 得出 ROC 曲线。两个模型的 AUC 分别为 0.790 (0.710-0.857) 及 0.867 (0.797-0.921), 敏感度分别为 68.8%、96.9%, 特异度分别为 65%、88.0%。结论 原发灶的位置、长径、动静脉期 40keV 及 100keV 的单能量 CT 值、动脉期 nIC 是预测肺癌淋巴结转移的独立危险因素, 常规 CT+能谱 CT 联合模型可明显提高肺癌淋巴结的预测效能。

22 岁大学生支气管水蛭感染一例

刘飞、孙桂芳、刘兴蕊、周菲菲、杨永菊、刘斌、朱彩艳

昆明市延安医院

支气管水蛭感染是临床上罕见的寄生虫感染性疾病, 主要发生于鼻咽、喉咽、上食管及支气管, 其中累及支气管者十分罕见。现报道一例在校大学生支气管水蛭感染, 并结合临床特点、手术方式及影像特征进行探讨, 以期提高医生对该病的整体认识, 减少漏诊、误诊。

表现为月牙征的磨玻璃结节 CT 诊断

徐蕾

上海交通大学医学院附属新华医院

目的：分析表现为月牙征的肺磨玻璃结节 (GGN) 的 CT 表现和诊断。

方法：2019.1.1-2020.12.31 行超高分辨率 CT 扫描、直径 $>5\text{mm}$ 且 $<30\text{mm}$ 的 GGN 共 5794 个，出现月牙征的共 91 个结节，50 例 50 个结节行手术切除，纳入本次研究。在多平面重组三维正交图像的肺结节最大截面层面上完成分析。评价内容包括：结节和胸膜的关系，结节最大径、弧长、弦长、密度。

结果：43 个为纯 GGN (pGGN)，7 个为混合 GGN (mGGN)，肿瘤性病变 46 个 (92.0%)，另外 4 例炎症。mGGN 中肿瘤性病变 5 个，全为侵袭性腺癌 (IA)。pGGN 中肿瘤性病变 41 个 (95.3%)，其中 8 个原位腺癌 (AIS)，22 个微侵袭性腺癌 (MIA) 和 10 个 IA；36.5% (15/41) 的结节紧贴胸膜，85.4%(35/41)的结节位于胸膜下 20mm 内，IA 的最大径大于 AIS/MIA ($P < 0.05$)。ROC 曲线分析显示结节最大径 $> 14.5\text{mm}$ 诊断 IA 的敏感度为 80.0%，特异性为 87.1%。

结论：月牙征常见于胸膜下区域，表现为月牙征的 GGN 绝大多数为肺腺癌；月牙征更常见于 pGGN，伴有月牙征的 pGGN 最大径 $> 14.5\text{mm}$ 提示 IA。

PU-2313

CTA 血管成像在诊断肺叶内型隔离症中的应用价值研究

杨银花

中国人民解放军联勤保障部队第 920 医院

【摘要】目的：探讨 CTA 成像在肺隔离症 (pulmonary sequestration, PS) 诊断中的应用价值。

资料与方法：1.1 一般资料 回顾性收集我院自 2016 年 10 月至 2021 年 10 月期间经手术病理证实的 42 例肺隔离症患者。其中男性 24 例，女性 18 例；年龄 14~50 岁。主要症状为咳嗽、咳痰、咯血、胸闷、疼痛等。本组患者中咯血 8 例，胸闷、疼痛 10 例，咳嗽、咳痰 14 例，无症状 10 例。患者病变部位位于左下肺 38 例(90%)，均位于基底段，病变部位位于右下肺 4 例(10%)，均位于基底段。1.2 检查方法 所有病例均做 CT 平扫及 CTA 检查，CT 扫描机器为 GE Lightspeed 64 排螺旋 CT。平扫后经肘静脉高压注射器注射碘海醇 70ml，注射速率 4mL/S，扫描参数如下：管电压 120 KV，管电流 100 ~ 150mAs，平扫层厚及层间距为 5 mm，CTA 检查层厚及层间距为 0.625 mm。GE4.5 工作站行 CTA 三维重建(多平面重组(MPR)、最大密度投影法重建(MIP)、容积重建 (VR))，扫描图像由两名有经验的影像诊断医师进行阅片，出具诊断报告。结果：CT 表现 13 例合并肺气肿，9 例合并支气管扩张，6 例合并化脓性炎，8 例合并慢性炎症，6 例无明显症状；32 例边界清晰，10 例边界模糊；21 例表现为不规则软组织密度肿块，12 例表现片状软组织成分为多个含气、液囊腔，可见液平，9 例无明显肿块。42 例均由胸主动脉分支供血，引流静脉均进入肺静脉系统。讨论：诊断肺隔离症最重要的依据是显示肺内病灶有来自体循环的异常供血动脉。通常为 1 支，少数为多支；73%的供血动脉发自胸主动脉，10%~15%来自腹主动脉和腹腔动脉发出的异常分支；此外，尚可来自肋间动脉、膈动脉、内乳动脉、锁骨下动脉、主动脉弓等发出的分支。静脉回流多经肺静脉、少数经下腔静脉或奇静脉。目前肺隔离症仍以手术切除为主要治疗手段，手术需结扎异常供血的血管，术前明确血管的来源对手术具有重大意义，CTA 血管成像技术能很好地评价肺隔离症的血管情况，为外科手术提供更多信息，达到更好的手术治疗效果。

CT 引导下肺穿刺活检的安全性分析

魏蛟

中国人民解放军联勤保障部队第 920 医院

【摘要】

目的 分析应用穿刺活检针行 CT 引导下肺穿刺活检的安全性。

方法:选取连续的 100 例行 CT 引导下肺穿刺活检患者。回顾性总结 CT 引导下肺穿刺活检的并发症及其发生率与病灶大小、穿刺部位、病灶深度、穿刺路径上穿刺针有无经过正常肺组织、病灶所处深度之间的关系。

结果:100 例行 CT 引导下肺穿刺活检的患者中,无任何并发症出现者占 48 例 (48%), 中等量以上气胸者占 4 例 (4%), 咯血患者 2 例 (2%), 少量气胸合并肺内少量出血者 13 例 (13%)、少量出血者 18 例 (18%)、少量气胸者 14 例 (14%)、迟发性中等量以上气胸者 1 例 (1%), 经统计学分析,穿刺针所经肺组织深度不同的病例组之间,穿刺活检并发症的发生率的差异有显著性;穿刺路径上穿刺针有无经过正常肺组织的不同病例组之间, 穿刺活检并发症发生率的差异有显著性;穿刺针所经肺组织深度相同的病例中,不同部位之间穿刺活检的并发症的发生率的差异无显著性。

结论:CT 引导下肺穿刺活检是一种可行的诊断方法。CT 引导下肺穿刺活检并发症发生率以气胸和肺内出血为多见,发生率与病变所在部位关系不大,而随穿刺针经过肺组织的深度的增深而增高,与病变大小及穿刺路径有无经过正常肺组织关系密切,病灶越大、经过正常肺组织越少,并发症发生率越低。

探讨基于冠脉 CTA 双能成像去钙化扫描对于斑块血管狭窄评估的影响

舒意

四川大学华西医院

目的 探讨基于冠脉 CTA 双能成像去钙化扫描对于斑块血管狭窄评估的影响。方法 前瞻性纳入 2022 年 10 月至 2023 年 7 月在我院行双能冠脉 DECTA 扫描的患者 35 例, 收集斑块共 55 个。记录斑块去钙化前和去钙化后在影像学上的特征。包括: 位置、狭窄率、斑块成分和双能去钙化伪影后血管狭窄程度变化及图像的诊断质量。结果 钙化去除后 图像对于斑块的诊断无影响, 伪影的发生率没有差异; 钙化去除前后血管的狭窄率差异有统计学意义 ($P < 0.01$); 去除后 血管的狭窄率变化与其位置及斑块成分无相关性。结论 双能去钙化的应用可以减少钙化斑块在 CT 成像下伪影对于狭窄程度评估的影响, 提高冠脉斑块患者其狭窄程度危险分层的准确性, 具有重要的临床意义。

To Investigate the Impact of Dual-Energy CT Coronary Angiography Decalcification Scan on the Assessment of Plaque Vascular Stenosis.

Yi Shu

Department of Radiology, West China Hospital, Sichuan University

Objective To investigate the impact of dual-energy CT coronary angiography decalcification scan on the assessment of plaque vascular stenosis. **Method** From January 2022 to July 2023, we prospectively enrolled 35 patients who underwent coronary CT angiography by dual-energy scan. A total of 55 plaques were collected. The imaging features of the plaques were recorded before and after decalcification, including: position, stenosis rate, plaque composition, changes in the degree of vascular stenosis after dual-energy decalcification artifacts, and image diagnostic quality. **Results** After calcification was removed, the image had no effect on the diagnosis of plaque and the incidence of artifacts. There was a statistically significant difference in the stenosis rate before and after calcification removal ($P < 0.01$), with no correlation between the stenosis rate and its location or the plaque composition. **Conclusion** The application of dual-energy decalcification can reduce the influence of calcified plaque artifacts on the evaluation of stenosis under CT imaging. It has a significant clinical value for the improvement of accuracy of risk stratification of stenosis degree for patients with coronary artery disease.

PU-2317

Association between LA function assessed by cardiovascular magnetic resonance tissue tracking and long term prognosis of first coronary artery bypass grafting

Jingwei Shu

The First Affiliated Hospital of Anhui Medical University

Background: Left atrial(LA) enlargement has been verified as a marker of adverse clinical outcome for certain cardiovascular disease whereas the change of LA strain has shown sensitivity at initial phase. We aimed to explore the relationship between LA function and the prognosis of ischemic heart disease(IHD) patients who underwent first coronary artery bypass(CABG).

Methods: 48 IHD patients were included retrospectively from October 2018 to August 2022. Phasic functional parameters, strain and strain rate of LA were derived from cardiac magnetic resonance tissue tracking(CMR-TT). Major adverse cardiac events(MACEs) were defined as cardiovascular death and hospitalization for heart failure. The prognostic value of LA function parameters were evaluated by curve of receiver operating characteristic (ROC) and COX analysis.

Results: A total of 45 IHD patients were enrolled, MACE occurred in 13 patients. During follow-up (mean=501 days; interquartile range:132-1382 days), LA strain and strain rate of MACE is lower than No MACE. SRs shows large area under ROC curves ($AUC=0.92, P<0.001$), SRs, LAEF passive, ϵ_e and SRa show significant difference compared with LV parameters. K-M curve of

LVEF,SRa shows no crossover with logrank analysis $P<0.05$.Uni- and multivariate analysis result of SRs and Δe indicates difference.

Conclusion: LA reservoir strain and conduit strain rate derived from MRI-FT provides long term prognostic value in IHD patients after first CABG.

PU-2318

Force CT 一站式扫描对冠心病的诊断及冠脉粥样硬化斑块性质的鉴别价值

徐学东

空军军医大学西京医院

目的：探讨 Force CT 一站式扫描对冠心病的诊断及冠脉粥样硬化斑块性质的鉴别价值。方法：回顾性分析 2021 年 5 月~2022 年 5 月本院收治的 80 例冠心病患者的临床资料，均采用 Force CT 一站式扫描检查，以冠状动脉造影（CAG）和血管内超声检查（IVUS）结果为“金标准”，观察 Force CT 一站式扫描对冠心病的诊断价值及对冠脉粥样硬化斑块性质的鉴别价值。结果：80 例受检者经 CAG 检查了 532 个冠状动脉节段，其中无狭窄 241 个，轻度狭窄 162 个，中度狭窄 104 个，重度狭窄 25 个，且均伴中度及以上狭窄；经 IVUS 检查检出易损斑块 69 个，稳定斑块 114 个；Force CT 一站式扫描诊断无狭窄 239 个、轻度狭窄 163 个、中度狭窄 106 个、重度狭窄 24 个，80 例受检者伴中度及以上狭窄 77 例，检出易损斑块 73 个、稳定斑块 110 个；Force CT 一站式扫描诊断冠心病的准确率为 96.25%，与“金标准”相比，Force CT 一站式扫描诊断冠状动脉节段无狭窄、轻度狭窄、中度狭窄、重度狭窄的符合率分别为 97.51%、96.30%、98.08%、96.00%，且经 Kappa 一致性检验发现，其诊断冠状动脉节段狭窄与“金标准”的一致性高（Kappa=0.981， $P<0.001$ ）。Force CT 一站式扫描检出易损斑块的灵敏度、特异度、准确度、阳性预测值、阴性预测值分别为 97.10%、94.74%、95.62%、91.78%、98.18%，且经 Kappa 一致性检验发现，Force CT 一站式扫描鉴别冠脉粥样硬化斑块性质与“金标准”的一致性高（Kappa=0.964， $P<0.001$ ）。结论：采用 Force CT 一站式扫描诊断冠心病及鉴别冠脉粥样硬化斑块性质的价值理想，与“金标准”诊断结果的一致性高。

应用 CMR-FT 技术探索扩张型心肌病患者左室心肌应变与心律失常的相关性

郑琰^{1,2}、田博¹

1. 宁夏医科大学总医院

2. 宁夏医科大学

目的

心脏磁共振组织跟踪技术（CMR-FT）能够测定扩张型心肌病（DCM）患者的左心室整体和分段应变。然而，目前尚不清楚这些心肌应变的变化是否与心律失常有关。因此，本研究旨在探讨 CMR-FT 在 DCM 中对心律失常的鉴别诊断潜力。

方法

本研究回顾性纳入 60 例 DCM 患者（其中 34 例伴有心律失常，26 例无心律失常）和 40 名健康志愿者作为对照。使用 CVI 42 软件进行心功能分析，测量的参数包括左心室功能、心肌应变参数以及晚期钆增强（LGE）的范围。

结果

伴有心律失常的 DCM 患者相较于无心律失常的患者,表现出左心室射血分数 (LVEF)、全局径向应变 (GRS)、全局周向应变 (GCS) 和全局纵向应变 (GLS) 降低,而 LGE 范围增大 ($P < 0.05$)。尤其值得注意的是,全局径向应变 (GRS) 与 LGE 范围之间存在中度相关性 ($r = 0.554$, $P < 0.01$)。在 CMR 上, LGE 范围 $> 5.35\%$ (AUC 0.75, 95% CI 0.59-0.88, $P < 0.01$) 或 GRS $> 18.4\%$ (AUC 0.77, 95% CI 0.65-0.85, $P < 0.05$) 的 DCM 患者更容易伴有心律失常。

结论

全局径向应变 (GRS) 和 LGE 范围在 DCM 患者中独立预测心律失常的风险,这为 DCM 的风险分层提供了重要信息,有望改进临床实践中的风险评估策略。

PU-2320

CT“双低”扫描技术结合迭代重建在冠状动脉 CT 血管成像中的应用价值

刘俊佐

重庆市万盛经济技术开发区人民医院

目的:分析 CT“双低”扫描技术结合迭代重建在冠状动脉 CT 血管成像中的应用价值。方法:选择 2020 年 6 月—2022 年 1 月在我院行冠状动脉 CT 血管成像检查的 132 例患者作为研究对象,根据 CT 扫描方式的不同分为观察组和对照组,每组 66 例,观察组采用 CT“双低”扫描技术(低对比剂量和低管电压)结合迭代重建进行检查,对照组采用 CT 常规扫描技术结合迭代重建进行检查,对比两组患者图像质量优良率、剂量长度乘积、有效剂量等 CT 辐射剂量指标水平。结果:观察组图像质量优良率为 96.97%,对照组图像质量优良率为 98.48%,差异无统计学意义 ($P > 0.05$)。观察组剂量长度乘积 (552.14 ± 40.27) mGy·cm、有效剂量 (7.73 ± 0.76) mSv 等 CT 辐射剂量指标水平低于对照组的 (953.18 ± 51.39) mGy·cm、(13.34 ± 0.83) mSv,两组对比差异具有统计学意义 ($P < 0.05$)。结论:CT“双低”扫描技术结合迭代重建在冠状动脉 CT 血管成像中的应用价值显著,图像质量相当,同时可有效降低 CT 辐射剂量及对比剂使用量,值得临床应用。

PU-2321

探讨两次磁共振波谱扫描所得结果的稳定性

张敏、王培军

上海市同济医院

目的 探讨磁共振波谱研究中两次扫描所得结果的稳定性。

方法 选取 30 名健康志愿者 (9 男, 21 女, 年龄 21 ± 3) 分为 A、B 两组, 每组 15 人, 以大脑右侧前额叶作为目标脑区。利用 3.0T 磁共振成像扫描仪 (Siemens MAGNETOM Trio Tim), 采用点分辨波谱 (PRESS) 序列对每位志愿者进行两次扫描, 其中 A 组在定位后进行两次连续扫描, B 组在定位后先进行一次扫描, 然后将扫描床移出磁场中心, 隔三分钟再进床至原来的位置, 间隔期间确保被试不动, 严格按照第一次的定位并扫描得到第二次的结果, 利用 LCmodel 软件对采集到的脑代谢物波谱数据 (NAA、Cho、NAA/Cr、Cho/Cr) 进行后处理及定量分析, 将两次扫描所得结果的差异性系数 ($CV = 100 \times SD / \text{mean}$) 作为衡量两组波谱定量分析结果一致性的指标。利用各个代谢物的含量及含量比值, 分别对 A、B 组内数据进行统计分析, 检验干扰因素是否造成各组内两次扫描数据间的显著性差异。

结果 A 组所得大脑右侧前额叶中各个代谢物含量及含量比值的平均差异性系数 (Mean CV) 分别为 NAA 1.84%, Cho 2.73%, NAA/Cr 1.99%, Cho/Cr 1.55%, B 组所得各个代谢物含量及含量比值的平均差异性系数分别为 NAA 4.44%, Cho 3.06%, NAA/Cr 4.57%, Cho/Cr 2.49%。利用各个代谢

物的含量及含量比值, 分别对 A、B 组内数据进行配对样本 t 检验, 发现对于不同代谢物及代谢物比值, 除了 B 组 Cho/Cr ($0.001 < P < 0.05$) 外, 利用两种方法所得结果的差异性不具有统计学意义 ($P > 0.05$)。

结论 干扰因素不会影响两次扫描结果定性分析的可靠性, 但会影响结果的定量计算的精确度, 且间隔扫描受到更多的干扰因素的影响, 精确度低于连续扫描。

PU-2322

追踪定位技术: 一种保证多次波谱扫描可重复性的方法

张敏、王培军
上海市同济医院

目的 基于图像的配准信息, 提出一种自动重定位感兴趣体素 (VOI) 的方法, 提高重定位的准确性和效率, 并降低对操作者的依赖性。

方法 将医学图像的配准方法应用于磁共振波谱的研究过程中。每次采集磁共振波谱数据前, 均采集一高分辨结构像。将后续扫描时的结构像与第一次扫描的结构像进行配准, 获取被试的位置变动信息, 计算得到波谱扫描 VOI 的定位信息, 以此完成定位, 得到理想位置的波谱数据。为了对定位方法进行评估, 选取 20 名被试在 3T 磁共振仪上进行多次扫描, 其中后续扫描分别通过手动定位和追踪定位两种方法进行重定位。我们通常用体素的重合率和波谱含量的差异系数 (CV) 来评价重定位方法提高波谱测量结果可重复性的效果。按照组织类型的不同对 VOI 内的脑区进行分割并记录灰白质的含量, 以此计算体素重合率。分别计算 NAA、Cr、Cho、NAA/Cr 和 Cho/Cr 的 CV 值, CV 通过公式 $CV = 100 \times SD / \text{mean}$ 计算出来, 其中 SD 代表每组数据的标准差, mean 代表每组数据的平均值, 平均 CV 作为衡量化合物含量以及含量比值的可重复性的指标。将两种定位方法所得结果进行比较。

结果 利用追踪定位技术得到的 VOI 与初始定位的 VOI, 体素内白质和灰质的重合率分别为 98% 和 94%, 体素内化合物含量及含量比值的差异性系数分别为 NAA 1.84 ± 2.11 , Cho 2.73 ± 2.45 , NAA/Cr 1.99 ± 1.54 , Cho/Cr 1.55 ± 1.38 , 与连续两次扫描所得差异性系数接近, 符合文献报道连续扫描的合理范围。

结论 本文提出的方法能够有效地提高重定位的准确率和定位效率, 对于身体不灵活, 不能严格配合摆位要求的病人同样适用, 保证了纵向研究的可行性, 同时降低了对操作者的依赖性, 减少了主观性的误差。

结合 AIRTMRecon DL 技术重建后的 propeller 弥散在优化头颅磁共振弥散加权成像图像质量中的应用价值

罗德垠
重庆医科大学附属永川医院

目的: 探讨结合 AIRTMRecon DL 技术重建后的 propeller 弥散在优化有金属假牙患者头颅磁共振弥散加权成像图像质量中的临床应用价值。方法: 对 60 名戴有金属假牙无法摘除的患者分别行常规头颅弥散加权成像与结合 AIRTMRecon DL 技术重建后的 propeller 弥散加权成像, 将两组弥散加权图像质量进行对比分析。结果: 结合 AIRTMRecon DL 技术重建后的 propeller 弥散在不增加扫描时间的前提下, 图像信噪比和组织对比度较传统重建图像都有显著提高, 而且在伪影抑制和图像形变控制上有明显改善。结论: 对于有金属假牙的患者来说, 结合 AIRTMRecon DL 技术重建后的 propeller 弥散图像质量明显优于常规头颅弥散加权成像。

动态化介入护理工作记录单在介入质量管理中的应用

张祥海、廖春、黎枝鑫、周清
中国人民解放军陆军特色医学中心

研究背景和目的 我院建立介入中心平台，由放射科管理全院介入手术。在此模式下，专业差异会造成医生、技师、护士团队工作连接不紧密；放射科对护理的质量考评不统一；科研资料不易规范收集等问题。为了针对性改进质量问题，我们设计了动态化介入护理工作记录单，探索其在介入质量管理中的价值。

方法 介入中心设计了介入护理工作记录单，要求技师和护士即时记录手术过程中操作的时间节点、辐射剂量、术中用药、造影剂参数、耗材使用、术中抢救、设备和环境的情况等基本内容。根据出现的问题，再动态化设计调整记录单，如增加了手术空台时间、科研资料等内容。将记录单作为护理工作质量考评的重点，出现一个问题扣质量系数 0.01，护理责任共担，按 60%与 40%落实到责任人，纳入月底考评。放射科组成立质量分析小组，分析问题产生的原因，做好改进措施，跟踪效果反馈，动态优化调整记录单内容。

结果 使用记录单后，护理手术协作意识和积极性都有了显著提高，手术医生对护理人员的满意度从 69% 提高到 88% ($P<0.05$)。护理人员工作质量系数从 0.92 ± 0.02 提高到 0.97 ± 0.03 ，差异有统计学意义 ($T=5.67$, $P<0.05$)。当日手术空台时间从 (125.2 ± 16.4) 分钟降低到 (72.5 ± 14.2) 分钟 ($T=13.23$, $P<0.05$)。将造影剂肾性反应和 CTA 和 DSA 狭窄对比等科研目标纳入记录单，收集病例资料的时间较纳入前明显减短，能更快更完整地收集病例资料的收集工作 ($P<0.05$)，总计收集病例 2000 多例，以此为基础发表文章 4 篇。

结论 介入护理工作记录单将所有护理工作融合兼顾，将护理工作质量和考评统一起来。对于质量管理和科研需求的重点目标，记录单进行动态化增减，灵活调整，引导护理团队重视改进各项问题，深入科研采样和创新，激发了护理团队的协作精神，在介入中心的管理和教研方面发挥了重要的作用，其应用价值值得更深入的研究和探索。

鼻腔鼻窦肿瘤和肿瘤样病变的 CT 与 MRI 扫描规范及诊断

陈晓丽
首都医科大学附属北京同仁医院

目的：探讨鼻腔鼻窦 CT 与 MRI 扫描规范及诊断分析思路。**方法：**通过总结多年来首都医科大学附属北京同仁医院放射科鼻腔鼻窦肿瘤和肿瘤样病变 CT 与 MRI 扫描技术、方法的不断改进和诊断分析思路，探讨鼻腔鼻窦肿瘤和肿瘤样病变的 CT 与 MRI 扫描规范及诊断、鉴别诊断要点、分析思路。**结果：**鼻腔鼻窦肿瘤和肿瘤样病变在头颈部较常见，CT 与 MRI 扫描范围较大，CT 多采用螺旋 CT 扫描和多平面重组技术，MRI 多采用常规 T1WI、T2WI、DWI、动态增强扫描序列以及脂肪抑制技术，合理应用 CT 与 MRI 可明显提高鼻腔鼻窦肿瘤和肿瘤样病变的检出和诊断准确率。**结论：**鼻腔鼻窦肿瘤和肿瘤样病变的 CT 与 MRI 扫描规范已相对成熟，且 CT 与 MRI 联合应用可明显提高鼻腔鼻窦肿瘤和肿瘤样病变的检出和诊断准确率。

影像质量控制人工智能系统的初步探讨

鲜军舫

首都医科大学附属北京同仁医院

目的：影像质量控制是保证影像检查质量、同质化和临床价值的重要环节，在影像实际工作中是必不可少的环节，然而近十年来每个医疗机构的影像检查人次每年增长率较高，传统的人工质量控制方式只能对部分检查进行抽检，无法对全部影像检查实行质量控制，迫切需要研发影像质量控制人工智能系统，帮助实现实时的全过程影像质量控制与评价。方法：在确定好质量控制与评价标准后，采用深度学习方法和建立质量控制与评价模型，并将模型评估结果与人工质量控制和评价进行比较分析，针对问题进一步研究改进模型。结果和结论：获得性能较好的影像质量控制人工智能系统。

PU-2327

O-MAR 技术对髋关节置换去金属伪影的临床应用可行性探讨

王霞、文铁

延安大学附属医院

目的 比较髋关节置换后双能 CT 光谱探测器获得的虚拟单能图像与常规多能 CT 扫描获得的混合能量图像的差异，得到抑制伪影的最优 keV 值。方法 回顾性搜集采用光谱探测扫描仪(IQon Spectral CT)在 40~140 keV 范围进行扫描的 50 例患者，利用 IQon CT 每隔 20 keV 获得一次图像，共得到 6 组的不同单一能量图像，采用定性及定量分析与常规 CT 混合能量图像分别比较。结果 keV 越高，O-MAR 的信噪比(SNR)与对比噪声比(CNR)在均升高，在同一 keV 能级参数设置下，NO-MAR 组 AI 均低于 O-MAR 组，尤其在 140keV 效果明显。结论 与常规 CT 多能图像相比，光谱探测器 CT 提供的图像可以显示最佳的伪影抑制水平，尤其在 140keV 效果明显，虚拟单能图像加 O-MAR 技术，能够在不影响图像质量情况下最大限度去除金属伪影。

PU-2328

双源 CT 分析结石成分在临床应用的进展

郑媛慧

上海市同济医院

目的：泌尿系结石是泌尿外科的常见病，结石成分的判定对于临床治疗方式的选择非常重要。近年来出现第三代双源 CT，可用于对泌尿系结石成分更深一步的研究。国内目前大多数对泌尿系结石成分的研究分析主要以定性为主，国外已经开始对结石成分定量研究。本文综述三代双源 CT 用于泌尿系结石分析的研究进展，以期进一步探究第三代双源 CT 用于定量分析结石成分的准确性。方法：泌尿系结石在临床上大多是以混合结石存在，目前的研究随着双源 CT 技术的发展不断地深入。当双能量技术用于第一代双源 CT 时，大多数学者对泌尿系结石成分的研究从体外评估开始，直到大量体外研究数据得到证实后，人们将这一技术用于体内初步诊断。随着技术的不断进步，设备不断改善，学者刚开始是对纯结石展开研究，到后来对混合结石进行研究，截止到第三代双源 CT 出现，对纯结石的区分越来越准确，能辨别的混合结石成分越来越多，甚至能够量化混合结石成分，但用于体内的诊断还需要大量的临床实验来证实。

结果：第三代双源 CT 较之前两代增加了高能 X 线管（150kV），以及在球管前设置了锡滤过器（Sn150），提高了 X 线的能谱纯度，使双源 CT 不仅可以区分纯结石：尿酸与非尿酸结石、尿酸结石与含钙结石等，还可以区分混合结石：含尿酸，草酸钙和胱氨酸的混合结石。虽然体内分析的结果不如体外分析的准确，但就目前文献报道的结果来看，尿酸与草酸的分析对临床具有相对较高的实用价值。而相关研究指出，纯草酸钙结石与碳酸磷、草酸钙混合结石等衰减特性相近，不易区分，本文认为日后随着能谱纯化技术更加细化，有望能区分原子序数较相近的成分。国外有研究表明使用第三代双源 CT 可以量化含尿酸与非尿酸的混合结石。

结论：将来可以进一步量化非尿酸成分结石，这是今后研究的方向。因为非尿酸成分组成的混合结石之间有效原子数的差异比尿酸与非尿酸的混合结石还要小，但若能量化非尿酸成分的混合结石，对临床的意义是非常重大的。

三星 DR 下肢全长板拍摄足负重侧位的应用

郑媛慧

上海市同济医院

目的：通过三星 DR 的下肢全长板拍摄足负重侧位，准确评估无症状扁平足疾病，以及提供给骨外科详细的足踝疾病的诊断。与外翻足扁平，舟骨结节处肿胀和压痛，仔细鉴别诊断。

方法：使用设备：三星 GC85V DR。随机采集疑是患有扁平足的案例，共 30 例，年龄在 15~25 岁之间，男性青少年，体型相当，每人分别拍摄两组足负重侧位片。一组是非单脚站立拍，使用一把椅子，放在胸片架前，让患者将患侧足放在椅子上，用上身的力量往下压，非患侧足站在地上。另一组是完全单脚站立拍，将下肢全长板移至胸片架前，让患者将患侧足踩在板子上，非患侧足抬起，单脚站立。拍摄条件相同，控制变量为是否完全单脚站立，行足负重侧位拍摄。对比这两组的诊断结果，利用影像学测量软件，记录足弓角度，哪一组检出扁平足的概率大。利用 SPSS19.0 对两组所测角度进行独立样本 T 检验。由三位主治医师在双盲条件下，在相同窗宽窗位的环境下进行图像诊断。

结果：完全单脚站立位条件下所摄足负重侧位片较非完全单脚站立条件下足弓的降低更为明显。 $P<0.01$ ，其差异具有统计学意义。所测得的角度更精确，更加有利于临床做判断，以及手术的进一步开展，也为病人提供了更好的矫正方案。并且图像更加有利于医生快速诊断扁平足。

结论：第一：足负重侧位，必须是以足踝能够承受身体重量的姿势单脚站立，才能看出扁平足和足踝隐藏的疾病。以前我们的拍法是使用一把椅子，让病人把患侧放在在椅子上，并且足用力往下压，但这种力度肯定不如单脚站立的来得大。如果不单脚站立着拍，那么这个站立位就失去了它的意义。第二：大多数机器并未配备负重位拍摄的道具，而三星 DR 的下肢全长板刚好可以代替，而且拍摄下肢全长的机器，其胸片架和球管的下降程度可以达到离地面 10cm。第三：能够准确直接地判断无症状扁平足疾病，准确测量足弓形态，有利于临床手术方案的设计。

PU-2330

MDCT 对甲状腺肿瘤的鉴别诊断价值

成水华
上海市同济医院

目的 分析各种甲状腺肿瘤的 MDCT 征象, 探讨 MDCT 对甲状腺肿瘤鉴别诊断的价值。

方法 回顾性分析本院收治的 50 例甲状腺肿瘤患者影像学资料及手术病理结果。所有患者术前行 MDCT 检查, MDCT 图像由 2 位中级职称以上影像科医师共同阅片, 分析甲状腺肿瘤边界、密度、强化方式、肿瘤与邻近器官关系; 肿瘤以外甲状腺组织的密度、强化情况、边界; 颈部淋巴结情况。

结果 50 例甲状腺肿瘤中, 良性肿瘤 35 例; 恶性肿瘤 15 例。35 例甲状腺良性肿瘤均为甲状腺腺瘤, MDCT 平扫表现为甲状腺内低密度肿块, 边界清晰, 增强后可更清楚显示病灶边界。肿瘤以外甲状腺组织包膜完整, 强化后密度均匀。其中 19 例腺瘤发生囊变, 17 例囊变区形态规则, 另 2 例囊变区形态不规则; 增强后囊变区内无强化, 囊变区周围见完整强化环。其余 16 例腺瘤呈实质性肿块, 8 例增强早期强化均匀, 2 例早期出现岛状强化, 另 6 例早期呈不规则强化; 延迟后 16 例实质性肿块均呈均匀强化。4 例腺瘤出现钙化, 1 例钙化为块状, 3 例钙化为弧形。35 例腺瘤患者均未发现颈部淋巴结肿大。15 例甲状腺恶性肿瘤中 14 例为甲状腺癌, 1 例为淋巴瘤。MDCT 平扫多表现为甲状腺内低密度肿块, 病灶内密度不均匀。恶性肿瘤边缘不规则, 7 例边缘呈蟹足状改变, 3 例出现包膜节段征。增强后 11 例恶性肿瘤呈不规则强化, 延迟后密度不均匀。14 例甲状腺癌中 8 例肿块内出现钙化, 其中细颗粒状钙化 3 例, 点状钙化 4 例, 不规则钙化 1 例。3 例甲状腺癌病灶突破甲状腺包膜。1 例甲状腺恶性肿瘤出现颈动脉受侵, 2 例出现食管受侵, 另有 2 例肿块突入气管内、导致气管壁连续性中断。本组甲状腺恶性肿瘤中 8 例发现颈部淋巴结肿大, 1 例有纵隔淋巴结肿大。

结论 MDCT 对甲状腺肿瘤的鉴别诊断具有重大价值, 可为临床确诊甲状腺肿瘤提供有价值的依据。

PU-2331

The Feasibility of Amide Proton Transfer Imaging of Bladder Cancer at 3 T: A Preliminary Study

Fang Wang
上海市同济医院

Purposes: This study was aimed to explore the optimal scan parameters for Amide Proton Transfer (APT) Imaging of Bladder Cancer, explore the influence of different protein concentrations and pH values on APT parameter and establish the reliability of APT imaging of healthy volunteers and bladder cancer patients.

Materials and Methods: The optimal scan parameters for Amide Proton Transfer (APT) Imaging of Bladder Cancer were experimentally optimized on cross-linked bovine serum albumin (BSA) phantoms. Different scan parameters, such as different saturation power, saturation duration and number of excitation (NEX), were performed on BSA phantoms. Image quality, signal to noise ratio (SNR) and scanning time were compared. As the optimal scan parameters, image quality as well as clinical scanning time is reasonably ensured. Different protein concentrations and pH values solutions were performed on BSA phantoms. The repeatability and consistency tests of MTRasym (asymmetric magnetization transfer ration) were assessed in 11 healthy volunteers and 14 bladder cancer patients.

Results: In consideration of image signal-to-noise ratio, scanning time, image contrast, optimal scanning scheme was excitation number of 1 and saturation power of 2uT, saturation time of 2s. The APT signal intensity increases as the protein concentration increases while as the PH value decreases. The contribution of the PH value to the APT signal is almost negligible. Good

consistency and repeatability of MTRasym between health volunteers and bladder cancer patients. The MTRasym of bladder cancer patients was significantly higher than that of healthy volunteers and the normal bladder wall of bladder cancer($P < 0.05$). There was no significant difference between the bladder wall of healthy volunteers and the normal bladder wall of bladder cancer.

Conclusion: Amide proton transfer (APT) imaging has shown great potential value in bladder cancer.

PU-2332

The comparison of display capabilities between dual source dual-energy computed tomography (DECT) and single source dual-energy computed tomography (SDECT) for patients with gouty tophus

Qi Lv

上海市同济医院

Background and purpose

Gout is a kind of inflammatory joint disease, characterized by acute arthritis, later stage may cause tophus formation, joint movement disorders, renal insufficiency, and even cardiovascular diseases. There are a lot of studies showing that the dual source dual-energy CT(DECT) equipped with two X-ray tubes for the diagnosis of gout has great applicability in most cases. In the past few years, there have been studies using traditional single tube for dual energy CT scan, which uses a generator that allows fast switching between high and low tube voltage in 0.5 milliseconds during one rotation, the so-called single source dual-energy CT (SDECT).

This study using dual-source dual-energy CT (DECT) and single source dual-energy CT (SDECT) to scan a group of patients with gout, comparing the tophus display capabilities of two methods of imaging.

Materials and methods

Collecting 22 gout patients diagnosed at Zhongshan hospital, Fudan university, China, between 2016.10 and 2017.02 as the object of study, conformed to 2015 ACR/EULAR classification criteria of gout. All patients with acute attack within one week without lowering uric acid drugs accept DECT and SDECT foot,ankle/knee/wrist scanning , the interval time between two scans no more than two days,. Two radiologists who were blinded to the clinical data and diagnosis, independently read and analyzed the DECT and SDECT images of all patients. They observed whether there was a tophus locating in joints, synovial, tendons and ligaments, then recorded tophus sedimentation location, size, urate contents within the tophus and the radiation dose. A consensus was achieved by discussion when initial opinions differed. SPSS 19.0 software was used for analysis, the imaging findings of patients with chi-square test, $P < 0.05$ was considered statistically significant.

Results

With the comparison,two groups of N (the total tophus), especially the Nb1 (mottling) and Nb2 (nodular) with statistical significance ($P < 0.001$, $P = 0.038$), with more,the DLP between the two groups also statistically significant ($P < 0.001$).

Conclusion

For tophus display capabilities, especially for those $d < 1.0\text{cm}$, DECT is superior to SDECT, be applicable to the clinical monitoring of people with urate-lowering therapy(ULP).The radiation dose of SDECT is smaller than DECT,be applicable to those people who have special requirements of radiation dose such as in poor condition.

PU-2333

基于多维度脑网络连接组学特征的轻度认知障碍早期精准诊断

许晓雯

上海市同济医院

目的：聚焦静息态功能磁共振 Resting-fMRI，提取多维度功能脑网络连接组学特征，结合机器学习特征选择和特征融合算法，旨在识别最具判别价值的功能脑网络连接组学特征以及改变模式分析，并最终实现轻度认知障碍和正常对照组的分类诊断。

方法：研究采集 39 名 MCI 患者和 60 名 NC 的 rs-fMRI，基于 264 脑功能图谱将大脑分割成 264 个 ROI 脑区，构建 264×264 功能脑网络矩阵，通过 Gretna 软件得到包括功能连接边、全局图论属性和节点图论属性在内的功能脑网络连接组学属性。创新性采用 t-test 和组-LASSO 算法对脑网络功能连接和节点图论属性进行关键判别性特征选择，结合多核支持向量机实现 MCI/NC 的分类诊断。

结果：研究发现 MCI 的全脑功能连接强度较 NC 普遍减低，采用 t-test 特征选择方法保留最具显著性差异的前 100 条功能连接边，主要分布在 DMN、背侧注意网络等子网络当中。在全局图论属性方面，研究发现 MCI 和 NC 均具有小世界属性。在节点图论属性方面，采用组-LASSO 的特征选择算法，发现最具判别性的关键脑区主要分布在颞叶、扣带回、额上回、舌回以及顶叶等脑区，这些脑区主要分布在默认网络、背侧注意网络等为主的子网络当中。进一步组间比较发现，与 NC 组相比，MCI 患者在额、颞、顶叶和边缘叶关键脑区的介数中心性、度中心性显著降低，节点最短路径显著增加，而在枕叶关键脑区节点，介数中心性、度中心性增加且最短路径降低。通过 MK-SVM 将包括功能连接、全局图论属性和节点图论属性在内的多维度脑网络连接组学特征进行融合，最优分类准确性达到 92.93%，AUC 0.9728。

结论：MK-SVM 可以实现多维度功能脑网络连接组学特征的融合获得最优诊断，节点图论属性为最具判别能力的功能脑网络连接组学特征，枕叶局部脑区存在功能增强的代偿性表现。

PU-2334

DCE-MRI 定量直方图分析和 PI-RADS v2.1 评分对外周带前列腺癌的诊断价值

王伟

上海市同济医院

目的：探讨动态对比增强磁共振成像 (DCE-MRI) 定量参数直方图分析法及 2.1 版前列腺影像报告与数据系统 (PI-RADS v2.1) 对外周带前列腺癌 (PCa) 的诊断价值。

方法：收集因可疑 PCa 行多参数磁共振成像检查及获得病理结果的 211 例患者的影像及临床资料。所有入组患者均使用 Siemens Verio 3.0T MR，MRI 检查后 2 个月内接受了超声引导下穿刺活检或前列腺根治性切除术。使用 Siemens 后处理工作站 Tissue 4D 模块自动生成定量参数直方图。采用独立样本 t 检验或 Mann-Whitney U 检验比较 PCa 组和非肿瘤组定量直方图参数水平差异。采用 Mann-Whitney U 检验、ROC 曲线、二元 Logistic 回归及 Z 检验进行统计。

结果：入组病例 211 例，其中非肿瘤 126 例 (59.7%)，PCa 85 例 (40.3%)。PCa 组 Ktrans 及 Kep、Ve 均大于非肿瘤组，差异具有统计学意义 (P 均 < 0.05)。Ktrans 及 Kep 各直方图参数较 Ve 25% 位数具有较好的诊断效能，AUC 值均大于 0.7。PI-RADS v2.1 检出 PCa 及 csPCa 的 AUC=0.870 (95%CI 0.821-0.919)、0.904 (95%CI 0.862-0.947)，均在评分为 4 分时约登指数最大。Ktrans25%位数联合 PI-RADS、Kep 中位数联合 PI-RADS 及三者联合应用较其单独应用具有更高的 AUC 且差异具有统计学意义 (AUC 均 > 0.9, P < 0.05)。

结论: DCE-MRI 定量直方图分析能较好地反映肿瘤的异质性, 有助于 PCa 的检出。不同年资的放射科诊断医师 PI-RADS v2.1 评分一致性较好。PI-RADS v2.1 评分对 PCa 的检出具有较好的诊断价值。DCE-MRI 定量直方图参数与 PI-RADS v2.1 联合诊断模型对 PCa 的检出具有更高的诊断效能。

PU-2335

3T 磁共振动态增强在肝脏疾病诊断中的技术应用

王伟
上海市同济医院

目的 探讨 3T 磁共振动态增强扫描技术对肝脏不同疾病诊断的应用价值, 及对肝脏病变的鉴别诊断价值及不同病变的强化特征。

方法 对 40 例临床怀疑肝脏占位病变的病人进行肝脏动态增强三期扫描。所有患者均行 MRI 平扫和动态增强扫描, 患者取仰卧位, 腹部以专用腹部相控表面线圈固定, 常规行冠状位, 横断位定位扫描后, 采用 (1) 冠状位 **haste T2WI**; (2) 横断位 **haste T2WI**, 横断位 **T1WI**, **T2WI** 加脂肪抑制; (3) 动态增强扫描三期 (动脉期, 门脉期, 平衡期) 横断位。检查前用 20G 静脉留置针建立静脉通道, 对比剂采用 **GD-DTPA30ml**, 生理盐水 20ml 高压注射器静脉快速团注 3ml / s。

结果 12 例原发性肝癌病人发现病灶 16 个, 动脉期呈均匀或不均匀明显强化, 门脉期病灶强化明显消退, 平衡期病灶信号强度低于周围均匀强化的肝组织。5 例肝转移瘤病人发现病灶 13 个动脉期, 门脉期, 平衡期均呈呈环型强化。17 例海绵状血管瘤病人发现病灶 22 个, 动脉期病灶周边呈结节状强化, 门脉期明显或轻度强化, 延迟期(2~8 分钟后)病灶呈均匀明显强化。6 例局灶性结节增生病人发现病灶 6 个, 动脉期明显强化, 门脉期明显或轻度强化, 延迟期病灶强化明显消退而瘢痕轻度或中度强化。

结论 3.0T 磁共振动态增强扫描具有极高的时间分辨率, 结合常规序列, 动态增强技术能在极短的时间内获得肝脏增强多个时相, 在 MR 腹部增强扫描中具有显著价值。选择正确合理的扫描序列, 把握正确的扫描时间, 诊断结果具有很高的参考价值, 对原发性肝癌、肝血管瘤、肝转移癌等病变的鉴别诊断可起到非常大的帮助, 更为临床的下一步治疗提供了好的依据。

PU-2336

不同类型浸润性肾盂癌: MDCT 动态增强表现及误诊分析

马小龙
上海市同济医院

【摘要】目的: 分析浸润性肾盂癌的 CT 增强表现, 旨在提高诊断正确率。方法: 回顾性分析经病理证实的 20 例浸润性肾盂癌的 CT 影像表现特点, 术前均行多排螺旋 CT 及 CTU 扫描。根据影像学图像上肾盂内肿块形态及肾实质浸润程度将本组病例分为 I 型: 肿块浸润型, 肾盂内明显肿块, 病变隆起高度 (H) \geq 横径 (L), 肾窦脂肪受侵, 伴或不伴肾实质浸润; II 型: 浅表浸润型, 肾盂内扁平型肿块, 病变隆起高度 (H) $<$ 横径 (L), 肾窦脂肪消失, 肾实质受侵, 扁平的肾盂肿块、增厚肾盂壁及肾实质融合; III 型: 深部浸润型, 向肾盂外浸润生长, 肾盂内无明显肿块, 增厚的肾盂壁、肿块及肾实质融合, 常伴肿大淋巴结、邻近血管及输尿管受侵。结果: 20 例中, 16 例术前诊断为肾盂癌, 2 例误诊为肾癌, 1 例误诊为急性肾盂肾炎, 还有 1 例误诊为集合管癌, 经病理诊断全部为浸润性肾盂癌。I 型 4 例, II 型 4 例, III 型 12 例。结论: 浸润性肾盂癌不仅仅是肾盂内肿块伴肾窦脂肪和肾实质浸润, 部分肿瘤、肾盂、肾实质融合, 部分肿瘤肾盂外浸润明显而肾盂壁增厚相对不显著。认识浸润性肾盂癌不同表现有助于提高诊断准确性。

PU-2337

Features of tophus distribution and bone destruction in patients of foot and ankle joints with gouty arthritis by dual-energy CT (DECT)

Jing Yao

Tongji Hospital, Tongji University

Background and purpose

In recent years, the incidence of gout have a rising trend as people living standard gradually improved, it has developed into a common disease. The gold standard for the diagnosis of gout is the detection of urate crystals in the synovial fluid under polarized light microscopy. However, this method has certain limitations, some parts of joint fluid is not easy to get, which could affect accuracy and specificity, and aspiration is an invasive procedure which may lead to complications such as infections and hemorrhage, etc. DECT is a rapid, non-invasive imaging method, the study of gout having made considerable progress in recent years. Tophus in DECT image of gout patients were analyzed, to explore the features of tophus deposition and bone destruction in foot and ankle joints which related to acute gouty arthritis attack.

Materials and methods

Collecting 94 gout patients diagnosed at Zhongshan hospital, Fudan university, China, between 2015.10 and 2016.10, 47 cases with positive monosodium urate (MSU) crystals in soft tissue as the object of study. This study used the first generation dual-source CT system (Siemens 64 row CT, Siemens, Munich, Germany) with two X-ray tubes, transmit data to the Siemens Syngo multimodality workplace workstation (MMWP) to do the image post-processing. Two radiologists who were blinded to the clinical data and diagnosis, they independently read and analyzed the dual-energy CT images of all patients. A consensus was achieved by discussion when initial opinions was different.

The features of tophus deposition in foot and ankle joints which related to acute gouty arthritis attack were evaluated with chi-square test and the correlation analysis to study the relation between bone destruction with urate content in tophus was used. All data analysis was analyzed by SPSS software, P values < 0.05 was considered as effective.

Results

Among 47 patients into the group, dual-energy CT detected 239 tophus totally. 42 cases of them had the symptoms of first plantar toe acute arthritis, and 9 with acute ankle arthritis. Part I ($\chi^2=9.12, P<0.05$) and Part III ($\chi^2=8.356, P<0.05$) with tophus were prone to the corresponding clinical acute gouty arthritis, among them, the first metatarsophalangeal joint ($\chi^2=9.78, P<0.05$) and the distal fibula ($\chi^2=9.12, P<0.05$) were more accurate, what's more, episode of acute arthritis was more likely to appear when the nodules were multiple distribution in ankle ($\chi^2=3.945, P<0.05$). We founded the correlation between tophus and urate content had statistical significance ($r=0.370, 95\%CI 0.260-0.757, P=0.01$), there was a correlation between urate content with bone destruction ($r=0.345, 95\%CI 0.142-0.520, P<0.01$), in addition, tophus number and bone destruction was also statistically significant ($r=0.265, 95\%CI 0.030-0.458, P<0.05$).

Conclusion

1. Tophus distribution area and quantity has an effect on acute gouty arthritis, and the extension of course can increase the risk of episode, remind us the close follow-up with patients and early treatment is necessary, aiming to reduce arthritis episodes, and to improve the survival quality.

2. DECT is a reliable method to assess tophus distribution and bone destruction, which can be used to guide the clinical management of gouty arthritis and the prevention of joint damage.

PU-2338

站立位全脊柱正位摄影的质量控制

田传帅、金松
南京鼓楼医院

目的 分析影响站立位全脊柱正位摄影质量的因素, 针对性整改, 进一步提高全脊柱正位摄影的图像质量。

方法 使用联影 uDR 770i 数字化 X 线摄片机, 对 77 疑似脊柱侧弯畸形患者进行负重站立位全脊柱正位摄影, 通过分次快速曝光获得图像后拼接成全脊柱正位图像。对图像质量进行评分, 将图像分为“1-2”分和“3”分两组, 统计两组患者的年龄、分段图像的 mAs、曝光指数 (EI)、感兴趣区 (ROI) 平均面积、平均标准偏差 (SD) 值、下肢长度百分比和空气面积百分比等并进行统计学分析。

结果 77 例患者均进行了全脊柱正位三段摄影, 并拼接成功。对所得拼接图像进行质量评分: 评为“1”分的 22 例, 约占 28.57%; 评为“2”分的 14 例, 约占 18.18%; 评为“3”分的 41 例, 约占 53.25%。下段图像平均 SD 值的 Welch 和 Brown-Forsythe 检验的统计量都是 48.721, $P < 0.001$, 差异具有统计学意义。下段图像的 mAs、EI、下肢长度百分比和空气面积百分比等统计量的 F 值分别为: 37.320、69.199、100.461 和 19.451, $P < 0.001$, 差异具有统计学意义; 上段和中段图像的 mAs、EI、平均 ROI 面积及平均 SD 值等统计量的 P 均 > 0.05 , 无统计学意义。线性回归方程如下: 下段图像平均 SD 值 = $49.361(\text{下肢长度百分比}) + 31.407(\text{空气面积百分比})$, ($P < 0.01$)。Durbin-Watson 值为 1.696, 查询 Durbin Watson 表发现其恰好出现在无自相关的值域之中, 认定残差独立, 通过检验。

结论 使用电离室进行全脊柱正位摄影中, 精准定位, 避免下肢包含过多, 从而避免下段图像曝光不足, 可以明显改善全脊柱正位图像的质量。

PU-2339

基于互认信息的放射影像检查项目统计与分析

龚向阳
浙江省人民医院

目的: 2023 年浙江省已实现全省域放射检查互联互通互认共享, 基于互认编码信息可对全省放射检查项目数量及分布情况进行精准统计分析, 为医疗资源合理化配置、针对基层医院的精准帮扶提供数据支撑。

方法: 调取了 2023 年 5 月 22 日当日全省 872 家医疗机构 211,061 例次全样本影像检查, 统计分析 1) DR、CT 和 MRI 检查数量和占比; 2) 不同等级和类别医院 DR、CT 和 MRI 检查数量和占比; 3) DR、CT 和 MRI 前十位检查项目及其占比; 4) 三级和二级医院 DR、CT 和 MRI 前 10 位检查项目及其特点; 5) 不同等级、类别医院 CT、MRI 强化率。

结果: 经数据清洗, 得到 622 家医疗机构 149,128 例次含精准编码信息数据, 其中 DR 检查 48,223 例次 (32.34%)、CT 检查 85,477 例次 (57.32%) 和 MRI 检查 15,428 例次 (10.35%); 不同等级、类别医疗机构存在统计学差异; DR 前 10 位检查项目分别是胸部正位、胸部正侧位、腰椎正侧位、颈椎正侧位、左膝关节正侧位、右膝关节正侧位、骨盆正位、右足正斜位、右踝关节正侧位和左踝关节正侧位, 占全部 DR 检查的 65.8%; CT 前 10 位检查项目分别是肺部 CT 平扫、头颅 CT 平扫、肺高分辨率 CT 平扫、全腹部 CT 平扫、肺低剂量 CT 平扫、上腹部 CT 平扫、腰椎间盘 CT 平扫、全腹部 CT 增强、下腹部 CT 平扫和肋骨 CT 平扫, 占全部 CT 的 82.9%; MRI 前 10 位检查项目是头颅 MRI 平扫+DWI、腰椎 MRI 平扫、颈椎 MRI 平扫

头颅 MRI 平扫、右膝 MRI 平扫、左膝 MRI 平扫、头颅 MRA、右肩 MRI 平扫、头颅 MRI 增强和左肩 MRI 平扫, 占全部 MRI 的 74.1%。三甲医院 CT 强化例次占 71.0%、MRI 占 79.0%; 全省 CT 强化率平均 7.5%, MRI 强化率平均 12.9%。

结论: 基于互认信息的放射影像检查项目数据统计分析, 可为医疗资源合理化配置提供数据依据。

PU-2340

对比分析压缩感知的 3D-T1 序列与常规 2D-T1 序列的图像质量及临床应用价值

王伟、王琪、王丹、刘忠啸、孟闫凯、徐凯*

徐州医科大学附属医院

摘要: 目的 分析比较压缩感知 (compressed sensing, CS) 技术的 3D-T1 序列与常规 2D-T1 序列的图像质量及临床应用价值。方法 回顾性收集徐州医科大学附属医院 20 例行颅脑 CS 3D-T1 平扫+增强序列、20 例行颅脑 2D-T1 平扫+增强序列患者的影像资料。由两名 5 年以上工作经验的医师或技师测量平扫及增强图像的信噪比 (signal-to-noise ratio, SNR) 和对比噪声比 (contrast noise ratio, CNR), 对图像质量进行评分, 统计图像伪影情况, 并在增强图像上分析病灶显示情况, 分析结果不统一时, 由第三名高级职称医师进行判定。应用 SPSS 软件, 两组间比较采用 Wilcoxon 秩和检验。结果 CS 技术的 3D-T1 与 2D-T1 序列的扫描时间相差不大。相对于常规 2D-T1 平扫及增强序列, CS 3D-T1 平扫及增强序列的 SNR 及 CNR 均较高, 差异具有统计学意义 (P 均 < 0.05)。图像质量评分方面以及病灶的显示方面, CS 3D-T1 平扫及增强序列要优于常规 2D-T1 平扫+增强序列。特别是对于较小的强化影, 2D-T1 序列的诊断信心不足, 而 3D-T1 序列层厚较薄, 并且能够进行三维重建, 能够克服这一缺点。结论 在扫描时间相差不大的情况下, CS 3D-T1 序列的图像质量较好, 对于较小强化影的显示优于常规 2D-T1 序列, 更利于病变的检出及诊断, 值得临床推广应用。

放射科等级评分报告质量控制系统在住院医师规范化培训中的应用探索

李晓兰

重庆医科大学附属大学城医院

目的 设计出符合培养放射科住院医师的质量控制系统,并且在评价中加入学员的质控过程,提高住院医师医学理论知识、基于实践的报告书写与改进等核心能力。**方法** 选取我院 10 名放射科住院医师作为研究对象,在放射科报告评价及质量控制体系中使用等级评分,在应用报告书写评价系统第 1 和第 6 个月进行报告质量评价数据分析对比。**结果** 经过 6 个月的培训,考核学员的报告书写质量明显改善,差异有统计学意义。**结论** 应用报告质量控制系统能更好的完成放射科的住院医师规范化培训,能够积极推进学员的主观能动性,提高他们的核心岗位胜任能力。

PU-2343

自适应迭代算法结合深度学习重建算法降低冠状动脉 CTA 辐射剂量的研究与应用

王娜琴

南京明基医院

目的: 探讨不同迭代算法 (ASiR-V) 与深度学习重建算法降低冠状动脉 CTA 辐射剂量的研究与应用价值

方法: 前瞻性纳入行冠状动脉 CTA 检查受检者 100 例,随机分为 A、B 两组对应 100KV, 70KV 管电压,固定 300MA,每组 50 例,分别重建 50%ASIR-V、DLIR-M、DLIR-H。测量主动脉根部、左主干动脉,右冠状动脉,左旋支动脉,左前降支动脉近段,主动脉根部邻近脂肪组织的 CT 值及噪声,测量时尽量避开血管壁、病灶、钙化及非钙化斑块。分别计算信噪比 (SNR) 和对比噪声比 (CNR), $SNR = \text{管腔强化 CT 值} / \text{管腔 SD 值}$; $CNR = (\text{管腔强化 CT 值} - \text{背景 CT 值}) / \text{背景 SD 值}$ 。由两位具有 5 年以上工作经验的主治医师以上的医生对每段血管按照 5 分法对各组的图像质量进行评价: 1 分: 血管图像质量极差,对比度差,伪影重,管腔无法评估; 2 分: 血管图像质量较差,伪影较重或噪声大,管腔不均质。3 分: 血管图像边缘模糊,管腔内欠均质,有伪影,噪声大但不影响管腔评估; 4 分: 血管对比度可,边缘清楚,管腔内质地均匀,有轻微伪影或少量噪声,不影响诊断; 5 分: 血管图像对比度佳,边缘清晰锐利,管腔内质地均匀,无伪影,无明显噪声。

结果: 两组客观评价测量的得出在 70KV-50%ASIR 时有最高的 CT 值、SD 值、最低的 SNR 值与 CNR 在值均有统计学差异 ($P < 0.05$)。主观评价, 2 名医师评价图像质量的一致性较高 ($Kappa = 0.71$), A、B 两组均能达到诊断要求,在 B 组比较中 $DLIR-M > DLIR-H > 50\%ASIR-V$ 。研究结果显示两组的辐射剂量分别为 A 组 (8.8 ± 2.09) mSv、B 组 (3.18 ± 1.12) mSv, B 组辐射剂量降低约 51.8%

结论: 本研究将管电压从 100KV 降到 70kv 时,使用 DLIR-M 可降低病人接受辐射剂量并可获得临床诊断需求的高质量图像。

PU-2344

磁共振检查技术扫描规范及质量控制持续性改进的研究

周婕

中国人民解放军陆军特色医学中心

目的: 进一步规范磁共振检查扫描技术, 针对个性化的患者实行统一、明确的扫描计划, 我科在对各部位扫描协议中进行规范化调整, 达到各个技师扫描时具有相同思维的扫描方式和方法。然后每月抽查各部位各 50 例, 对扫描质量进行评分、汇总, 纳入每月质量控制考核, 并持续性改进。

方法: 根据现有的磁共振检查技术专家共识经验, 在各高年资技师共同商榷之下, 归纳整理出符合并适用于我院患者对磁共振检查的需求的扫描协议, 并在此基础上从 2021 年 1 月持续至今, 我科成立质控小组, 要求每位扫描技师严格遵循扫描协议, 不随意更改参数, 扫描结束后上传图像至 PACS 系统。然后在每月开始 5 个工作日内完成上月的各部位, 如头颅、颈部、胸部、腹部及脊柱、四肢躯干等的图像扫描质量控制, 在扫描定位、序列选择、伪影控制、序列上传及图像信噪比五个方面进行评定, 设定一个总分, 根据轻、中、重三个等级评价得分, 然后汇总各部位得分, 换算成平均分, 纳入每位扫描技师的上月的绩效考核的一部分。

结果: 通过我科开展的检查技术扫描规范与质量控制持续性改进管理措施后, 提高了每位技师的工作人员工作积极性, 患者的满意度也有所提升。质量控制之后的得分也展示出各技师的工作质量明显提高, 为患者提供更加优质的服务创造了机会。

结论: 本实验研究结果表明, 对磁共振检查技术扫描规范及质量控制持续性改进可明显提高技师的工作能力及效率, 达到培养优质人才的目的。此外, 保证放射技术质量, 能够进一步适应当前临床的发展, 为临床解决更多疑难杂症提供保障。

PDCA 管理对钆塞酸二钠 MRI 增强检查图像质量的影响研究

夏茂

重庆医科大学附属璧山医院 (重庆市璧山区人民医院)

目的: 探讨 PDCA 管理对钆塞酸二钠 (Gd-EOD-DTPA) MRI 增强检查图像质量的影响。

方法: 本院放射科磁共振质控小组以达到诊断目的为标准, 将钆塞酸二钠 MRI 增强检查图像分为优片 (图像分辨率、对比度较好, 扫描时机准确, 伪影较少, 能达到诊断目的) 和差片 (分辨率、对比度差, 扫描时机不准确, 伪影重, 无法诊断) 两组, 通过采用 PDCA 循环管理模式, 分析钆塞酸二钠 MRI 增强检查的现状及其影响其图像质量的因素, 将影响图像质量的原因分为四类: 患者准备、技师操作、对比剂注射方案及设备条件。根据不同影响图像质量的原因制定适宜解决方法并实施检查, 比较 PDCA 管理前后图像质量情况。

结果: PDCA 管理后钆塞酸二钠 MRI 增强检查图像优片率为 90.6%, 管理前优片率为 81.3%, 差异具有统计学意义 ($P < 0.05$)。

结论: PDCA 管理能明显提高钆塞酸二钠 MRI 增强检查图像优片率, 为临床治疗提供更准确可靠的影像学依据。

低剂量多层螺旋 CT 全模型迭代重建技术在肺动脉造影中的应用研究

刘宁、吕晓虹、张祥林、牛玉军
锦州医科大学附属第一医院

【摘要】目的：探讨低剂量多层螺旋 CT 结合全模型迭代重建技术在肺动脉造影中应用的价值。**方法：**收集 2019.10~2021.10 于锦州医科大学附属第一医院就诊的疑似肺动脉栓塞患者 86 例，按照随机原则分为 2 组，每组 43 例。实验组采用 80 kV、50 mAs 扫描，对照组采用 120 kV、自动毫安秒技术扫描。实验组数据采用滤波反投射及全模型迭代重建技术进行处理，对照组数据采用滤波反投射技术进行处理。记录并计算 2 组数据肺动脉 CT 值、有效剂量(ED)、信噪比(SNR)、对比噪声比(CNR)、CT 剂量容积指数(CTDI vol)、剂量长度乘积(DLP)，并评价肺动脉 CT 造影图像质量。**结果：**两组的 ED、SNR、CNR、CTDI vol、DLP 均具有统计学差异($P<0.05$)；两组肺动脉 CT 值无统计学差异($P>0.05$)；两组肺动脉造影的图像质量无统计学差异($P>0.05$)。**结论：**低剂量多层螺旋 CT 结合全模型迭代重建技术在患者大幅度降低辐射剂量的同时，能够确保肺动脉成像的质量。

PU-2347

低剂量 CT 扫描在经皮肺结节术前定位中的应用对比分析

张乐
江苏省苏北人民医院

摘要

目的：探讨常规剂量与低剂量 CT 扫描对于经皮肺结节术前定位的应用对比分析。**方法：**对 2020 年 1 月到 2021 年 1 月期间，对我院进行的经皮肺结节手术病人进行了系统的回顾和评估。分为两组，每组 100 例。第一组的 CT 扫描是以常规剂量（120kV、150mAs）为基础的。第二组使用了低剂量（80kV、60mAs）的 CT 扫描。研究发现，两组都采用了一样的 CT 机（GE RT590），并且拥有一致的扫描参数，手术过程中的定位时长都是 15 分钟。两组中，男性比例分别为 48.3%和 53.7%，女性的比例分别为 51.7%和 46.3%。年龄范围为 18 岁至 85 岁，平均年龄为 54 岁。两组中，左肺占总肺面积的比例分别为 44.9%和 55.1%，右肺占总肺面积的比例分别为 55.8%和 44.2%。两组中，有 22 个患者存在合并疾病，其中高血压病 5 人，糖尿病 5 人，慢性阻塞性肺疾病 10 人，其他合并症各 2 人。**结果：**两组中，不同的剂量对肺结节术前定位的精确性没有明显差异，术后病理证实肿瘤类型与预后相似。**结论：**低剂量 CT 扫描对经皮肺结节术前定位具有一定的临床应用价值，可以减少辐射暴露量，降低病人的风险。常规剂量的 CT 扫描在定位方面具有一定的优势，常规剂量的优点是图像清晰度高、解剖结构显示清楚。低剂量 CT 扫描在降低放射线照射的同时，也存在一定的局限性。但是患者在达到预期目的同时减少了辐射剂量的摄取。在实际操作过程中，需要根据具体情况灵活运用这两种技术手段。

PU-2348

探讨深度学习图像重建算法在肝脏增强 CT 成像中改善图像质量及优化病灶显示中的应用价值

杨硕、邵猛、赵永
山东大学第二医院

目的:探讨深度学习图像重建(DLIR)算法对肝脏增强 CT 门静脉期图像质量及病灶检出率的影响。**方法:**选取因可疑肝占位行腹部增强 CT 扫描患者 65 例,对上述患者门静脉期原始 CT 数据分别进行 30%和 70%迭代重建算法(ASiR-V 30%和 70%),低等级 DLIR(DLIR-L)、中等级 DLIR(DLIR-M)、高等级 DLIR(DLIR-H)算法重建。比较 5 种算法间客观图像质量(参数包括:图像噪声、信噪比(SNR)、对比噪声比(CNR))、主观图像质量(参数包括图像噪声、伪影、门静脉清晰度、主病灶清晰度、总体图像质量)评分统计学差异。对随后行肝脏 MRI 增强检查的患者进行病灶计数,以 MRI 结果作为参考金标准,比较 5 种算法间病灶检出率。**结果:**在客观参数方面,DLIR-H 的图像质量优于 ASiR-V,图像噪声更低、信噪比更高(均 $P < 0.05$),ASiR-V 70%、DLIR-M、DLIR-H 间 CNR 均无统计学差异(均 $P > 0.05$)。在主观参数方面:DLIR-H 图像质量优于 ASiR-V,图像噪声更低(均 $P < 0.05$),随着 DLIR 强度的增加,有且仅有噪声参数具有统计学意义降低(均 $P < 0.05$)。在病变检出率方面,MRI 检查共检出 45 个病灶,5 种算法病灶检出率相近(25/45,55.6%)。**结论:**与 ASiR-V 算法相比,DLIR 算法可显著提高肝脏增强 CT 图像质量,保证病灶检出率的同时,更加清晰显示病灶细节。

PU-2349

PICC 术后床边 DR 影像的质量控制

高伟
南京市第一医院

【摘要】目的:对 picc 术后床边 DR 的影像进行技术分析,探讨床边 DR 影像质控的方法,提高 PICC 术后床边 DR 的影像质量。**方法:**对 85 例 PICC 术后床边 DR 的影像进行综合分析,质量评价,确定影响图像质量的因素。**结果:**优质图像 54 例,非优质图像 31 例。对 31 例非优质图像进行重点分析,发现①患者不配合导致摄片体位不正确②体外异物③床边 X 线机的工作性能不稳定④摄片技术参数设定不当⑤图像后处理技术运用不当,均会对床边 DR 图像质量产生不同程度的影响,而导致 PICC 导管显示不佳,产生非优质图像。**结论:**影响床边 DR 图像质量的因素较多,要获得优良的 PICC 导管影像,床边 DR 检查必须规范化。

低管压 CT 对胸痛三联检查图像质量及辐射剂量的影响

南旭
吉林医药学院

目的:研究低管电压 CT 对胸痛三联征排查图像质量及辐射剂量的影响,探讨这种扫描方法的可行性。**方法:**随机分为观察组(100KV)与对照组(120KV),采用 4 分法评价主动脉、肺动脉及冠状动脉图像质量(包括 CT 值,图像噪声 N、信噪比 SNR、对比噪声比 CNR)

PU-2351

评价人文关怀方案配合技患沟通应用于 CT 增强检查中的价值

郑向维

吉林大学白求恩第一医院

目的 评价人文关怀方案配合技患沟通应用于 CT 增强检查中的价值。

方法 选取 2023 年 6 月—2023 年 8 月吉林大学白求恩第一医院 CT 增强检查患者 100 例,开展随机分组干预,50 例采取常规方案者为对照组,50 例采取人文关怀与技患沟通护理方案者为观察组,比较两组图像质量、检查配合度、检查满意度。

结果 干预后两组图像质量均高于干预前,且观察组比对照组更高,差异有统计学意义 ($P<0.05$);干预后观察组呼吸配合程度、体位配合程度均高于对照组,差异有统计学意义 ($P<0.05$);干预后观察组总满意率 (96.00%) 较对照组 (82.00%) 更高,差异有统计学意义 ($P<0.05$)。

结论 CT 增强检查中开展人文关怀与技患沟通配合沟通方案,能更好地改善其图像质量、检查配合度且检查满意度较高。

PU-2352

2 种注射方法对 MR 血管扫描的图像质量影响

崔羽馨

吉林医药学院

目的: 比注射液 (欧乃影) 人工和高压注射器注射 2 种方法的不良反应和对图像质量的影响

方法: 收入医院血管增强影像资料 24 例,随机选取 2022 年 4-6 月期间该院收治的采用欧乃影行血管磁共振成像增强扫描的 24 例患者按入院先后顺序分为人工注射组(A 组)和高压注射器注射组(B 组),每组 12 例。造影前根据病变或血管的大小,首先预设置流速、流量及注射时间。作为对照,另一组患者采用手推方式注射,并对检查后图像做对比分析。结果: 所有检查均成功,图像均达标准。但根据图像显示注射器组优于手推组。

结论: 高压注射器可保持稳定速度,确保对比剂浓度以完成准确注射,并可根据血管造影成像程序调节速度和时间,更为精确地进行上述检查。

PU-2353

基于残差网络自动识别腹部增强 CT 期相的研究

刘千荷、蒋佳慧、徐辉、杨正汉

首都医科大学附属北京友谊医院

目的 开发并验证一种基于残差网络的人工智能 (artificial intelligence, AI) 腹部电子计算机体层扫描 (computed tomograph, CT) 增强期相判断系统。

方法 回顾性连续收集 2023 年 4 月在北京友谊医院行腹部增强 CT 患者图像 433 例,并将其分为训练集 (303 例)、验证集 (87 例) 和测试集 (43 例)。使用残差网络 ResNet18(pretrain)构建了模型。通过计算模型的精准率、敏感性及准确率 (ACC) 以检验该模型性能。此外,我们还收集了来自北京肿瘤医院、北京大学第三医院、北京中关村医院、房山市第一人民医院、大连医科大学附属第二医院及内江市第一人民医院共计 266 例腹部增强 CT 图像作为独立外部验证集以验证模型性能。

结果 在内部验证集中,模型识别动脉期、门静脉期及平衡期的敏感性、阳性预测值及 ACC 分别为 100.00%、100.00%和 99.48%;其中,模型识别动脉早期及动脉晚期敏感性、阳性预测值及 ACC 分别为 99.00%、98.00%和 95.05%。在外部验证集中,模型识别动脉早期、动脉晚期、门静脉期及平衡期敏感性、阳性预测值及 ACC 分别为 99.00%、99.00%和 96.93%。

结论 该模型能自动准确识别腹部 CT 增强期相,将有望辅助临床减少腹部疾病的漏诊与误诊。

PU-2354

能谱 CT 联合双低技术优化下腔静脉成像的应用研究

辛彦杰、姜慧杰

哈尔滨医科大学附属第二医院

目的 探究能谱单能量成像技术结合能谱智能匹配技术 (GSI Assist) 在优化下腔静脉成像质量及降低辐射剂量、对比剂剂量的应用价值。方法 收集行下腔静脉 CTV 检查患者 72 例,将患者随机分为能谱组和常规组进行检查。能谱组患者 36 例,使用能谱模式扫描,80-140kvp 瞬时切换,使用 GSI Assist mA Mode。常规组患者 36 例,使用常规模式扫描,固定 120kVp,采用 SmartmA mA Mode,两组其余扫描参数均保持一致。两组对比剂均使用碘普罗胺 (370mgI/ml),能谱组用量为 1.0ml/kg,注射速率为 3-4ml/s,常规组用量为 1.3ml/kg,注射速率为 4.5ml/s。能谱组重建 50keV、70keV 两组图像,对三组图像的各段下腔静脉 CT 值、信噪比 (SNR)、对比噪声比 (CNR) 以及图像噪声进行测量统计,由两名高年资医师对三组图像进行主观质量评分,同时记录两组患者的对比剂用量及容积 CT 剂量指数 (CTDIvol) 和剂量长度乘积 (DLP),并计算有效辐射剂量 (ED),使用 SPSS 26.0 进行统计学分析。结果 能谱 50keV、70keV 组图像噪声较常规组升高了 70%、5%,50keV 组各段下腔静脉 CT 值、SNR、CNR 相比常规组显著提高 (P 均 <0.05),70keV 组除肝段、肾上段下腔静脉 CT 略高于常规组 (P 均 <0.05),其余各段下腔静脉 CT 值与各段 SNR、CNR 均与常规组无明显差异 (P 均 >0.05)。两位医师对三组图像的主观评分一致性良好,三组图像主观质量评分无统计学差异 (P 均 >0.05)。能谱组对比剂用量及有效辐射剂量相比常规组降低了 21%、27%。结论 在下腔静脉 CTV 成像中,使用能谱模式扫描可以在保证图像质量的同时有效降低辐射剂量及对比剂剂量,具有很好的临床推广价值。

谈核磁共振设备的安装

孟炯

郑州大学第一附属医院

安装调试 MRI 需要注意以下六步:机房选址(地面承重,房间尺寸,运输通道,电源配置及上下水供应);放射防护及屏蔽;配备附属设备;配备网络设备;设备安装调试;售后培训,需要周密安排,否则影响设备正常运转,降低图像质量,影响临床诊断正确性。

PU-2356

谈核磁共振设备的质量控制

孟炯
郑州大学第一附属医院

安装核磁共振设备需要从以下几个方面着手：选好机房地址，做好射频屏蔽，配备合适附属设备，规范，严格安装调试；强化售后培训，就能保证核磁设备顺利安装和调试，保证设备和人员安全，保证图像质量，提高开机率，延长设备使用寿命。

PU-2357

医疗失效模式与效应分析在放射科技术部门持续质量改进中的应用

陈伟、李树、万黎妮、王芳、谢斯敏、龚远金
中南大学湘雅医院

目的：大型三甲教学医院放射科技术部门患者的流通量大，在岗的年轻技师和轮转的实习生较多，对该部门的质量管理带来较大挑战。持续质量改进是在全面质量管理基础上发展起来的注重过程管理、环节质量控制的管理理论。本文将介绍医疗失效模式与效应分析（Healthcare Failure Mode and Effect Analysis, HFMEA）方法在放射科技术部门持续质量改进中的应用经验。

材料与方法：运用 HFMEA 方法对“头脑风暴”中产生 14 类普放技术部门的不良事件或流程缺陷进行风险评估，包括左右标识错误率、跌倒坠床率、患者身份识别差错率、防辐射用品使用率、候诊时间过长、图像不合格率、职业防护率、网络传输故障率、院感合格率、患者就诊满意度、结果延迟率、申请项目失查率、技师素养以及设备故障率。根据 R 值的排序结果最终筛选出 10 个质量监测指标。针对质量指标采取完善工作制度、制定标准工作流程、明确监测方案以及加强专项培训等措施，自 2020 年 6 月开始持续管理至 2023 年 6 月。质量指标监测每月汇总，分为达到目标值、与目标值的差距<5%，与目标值差距≥5%，阈值逐年严苛。

结果：10 个质量监测指标中，跌倒坠床率、召回重拍率、申请单项目失查率、儿童防护用品使用率、X 线摄影设备故障率、图像传输失败率、结果延迟率（技术因素）以及候检平均时长这 8 个指标均达到目标值。患者身份识别正确率设置的达标阈值为 100%，每 12 个月中达标率分别为 1 个月、2 月与 3 个月，与目标值的差距<5%分别为 11 个月、10 月与 9 个月，与目标值差距≥5%为 0 个月。左右表示错误率设置的达标阈值为 0，每 12 个月中与目标值的差距<5%分别为 7 个月、8 月与 10 个月，与目标值差距≥5%为 3 个月、2 个月与 1 个月。

结论：采取 HFMEA 方法的持续质量改进应用于普通放射技术部门对质量全面管理具有较大的指导意义，有助于减少医疗纠纷，具有在推广的潜在意义。

PU-2358

螺旋 CT 三维重建在诊断鼻骨骨折中的应用价值

李丹
吉林大学白求恩第一医院

目的:分析螺旋 CT 在诊断鼻骨骨折方面的应用价值。

方法:选取 2023 年 7 月 -2023 年 8 月吉大一院收治的经 X 线和二维扫描确诊鼻骨骨折的患者 50 例,先予以螺旋 CT 扫描,再进行三维重建,观察其影像图片,分析三维重建诊断鼻骨骨折的准确性。患者取仰卧位,对患者额骨至鼻尖采用 0°横断面扫描,层厚 1.5 mm,间距 2.5 mm。根据实际情况采用两种模式:(1)高质量扫描,速度 3.75mm/s,螺距 3mm;(2)高速模式扫描,速度 7.5mm/s,螺距为 6mm,孔径为 200~250mm,120kV,200mA。扫描结束,对其图像做 2.5mm、间距 1mm 重建,经过专业软件处理,形成螺旋 CT 三维重建。

三维重建方法:

表面覆盖法三维重建图的优点是解剖情况清晰、图像的立体感强。由于其原理是表面成像技术,容易丢失较多的容积资料,其缺点是线样骨折不易显示、细节不够多。多平面重建成像的基础是横断扫描,上升为矢状面、冠状面和任意层面的扫描图像,所以包含了较多的三维信息,补充了普通的二维图像的不足,最大的优点是通过有效的调节窗位和窗宽,很容易的在软组织窗和骨窗之间进行切换,既能完全地显示骨折的情况,还可清晰的显示骨折周围软组织的情况。

螺旋 CT 三维成像技术在鼻骨骨折中的应用最为主要的方面是显示骨折线及骨折位移的情况。图像立体感强、能够准确显示骨折位移的方向和程度是表面遮盖显示法的最大优点,但是很难显示线形骨折的情况,必须结合多平面重建成像。多平面重建成像可以直接显示骨折的形态及骨折位移的方向及骨折附近的组织损伤情况,有利于临床医生的诊断和治疗鼻骨骨折。

结果:显示骨折位置、骨折类型、骨折范围等方面,三维重建诊断结果准确率高

结论:螺旋 CT 三维重建在诊断鼻骨骨折方面具有较高的临床价值。

PU-2359

肝脏强化 CT 使用不同浓度碘造影剂的对比研究

杜煜、王亚宁、王琦、时高峰、石佳保、贾丽涛、刘晶、齐晓辉、王向明
河北医科大学第四医院

目的:比较两种浓度造影剂(400 和 300mg I/ml)上腹部增强 CT 的血管和肝实质的强化效果,使用相近的碘流率(iodine delivery rate IDR)0.88、0.9gl/s 和 450 mg I/kg 的碘负荷。方法:160 例患者随机分为两组,分别使用碘美普尔(400 mg I/mL)和碘海醇(300mg I/mL)。分别测量两组不同扫描期相的主要解剖结构的 CT 衰减值,分析比较两组图像质量。记录造影剂注射时的压强峰值,局部不适感(如发热、疼痛等)。结果:动脉晚期 A 组腹主动脉平均衰减值为 313.6 ± 29.6 , B 组腹主动脉平均衰减值为 322.4 ± 30.1 ($p=0.8$); 门静脉期 A 组和 B 组的门静脉平均增强值分别为 176.2 ± 19.3 和 165.9 ± 24.5 ($p=0.6$)。门静脉期 A 组和 B 组的肝实质平均 CT 值分别为 117.1 ± 15.3 和 108.8 ± 18.7 ($p=0.9$)。两组图像质量比较无统计学差异 ($p>0.05$)。造影剂注射压强峰值 (psi) A 组与 B 组比较无统计学差异 ($p>0.05$), 局部不适两组比较无统计学差异 ($p>0.05$)。结论:使用相似碘流率和相同碘负荷时,不同浓度 CT 造影剂的主客观图像质量基本一致,能够满足诊断需求。

PU-2360

深度学习算法在体模低剂量 CT 扫描中的应用价值研究

柳维娜、孙小丽、王仁贵
首都医科大学附属北京世纪坛医院

目的:对比分析体模(JIS 分辨率 Phantom)常规剂量和低剂量 CT 扫描中,不同程度深度学习重建算法(Deep Learning Image Reconstruction, DLIR)和不同比例后置迭代重组算法的图像质量,

探讨深度学习重建算法在低剂量扫描中对图像质量的影响。方法：在 GE(Revolution)CT 设备上分别用常规剂量和低剂量扫描体模 (JIS 分辨率 Phantom)，常规剂量组根据后置 ASIR-V 的比例不同分别分为 0%ASIR-V、40%ASIR-V 和 80%ASIR-V 3 个亚组。低剂量组根据 DLIR 的程度不同，分别分为低度 DLIR (LDLIR)、中度 DLIR (MDLIR) 和高度 DLIR (HDLIR) 3 个亚组。测量常规剂量组和低剂量组图像的 CT 值，图像噪声 SD 和信号噪声比 (Signal-Noise Ratio, SNR)，对体模中的线对进行主观评分。结果：两组图像的 CT 值组内以及组间之间差异均无统计学意义。常规剂量组的图像噪声均随后置 ASIR-V 的比例升高而降低，SNR 均随后置 ASIR-V 的比例升高而升高。低剂量组图像噪声均随 DLIR 的深度升高而降低，SNR 均随 DLIR 的程度升高而升高。常规剂量组主观评分 0%ASIR-V (4.82 ± 0.41) > 40%ASIR-V (3.73 ± 0.47) > 80%ASIR-V (3.27 ± 0.47)。低剂量组主观评分 LDLIR (3.64 ± 0.51) < MDLIR (3.82 ± 0.41) < HDLIR (3.91 ± 0.16)。比较常规剂量组 40%ASIR-V 与低剂量组 HDLIR 两个亚组的 CT 值差异无统计学意义 ($t = -3.24, p > 0.05$)，SD 值差异有统计学意义 ($t = 13.56, p < 0.05$)，SNR 差异无统计学意义 ($t = -15.98, p > 0.05$)，主观评分 (3.73 ± 0.47 , 3.91 ± 0.16) 差异无统计学意义。结论：低剂量 CT 扫描的 HDLIR 的图像优于常规剂量的后置 ASIR-V 40% 的图像。

PU-2361

深度学习重建在头颈 CTA 图像质量中的临床应用价值

李菲、刘帅、史晓丽、原杰、唐笑先
山西省人民医院

目的 通过与滤波反投影重建 (FBP) 与自适应统计迭代重建 (ASIR) 的对比，探讨深度学习图像重建 (DLIR) 算法在提高头颈 CTA 图像质量中的临床应用价值。方法 选择 35 例疑诊头颈部动脉疾病的患者，采用 GE APEX CT 进行头颈部 CTA 成像，分别利用滤波反投影重建 (FBP)，自适应统计迭代重建 (ASIR-V50%、ASIR-V80%)，深度学习重建算法 (低 DLIR-L、中 DLIR-M、高 DLIR-H)，重建出 6 种图像。通过对比图像 CT 值、噪声值、信噪比 (SNR)、对比度噪声比 (CNR) 进行不同图像重建算法间的客观评价。由 2 名分别具有 3 年、10 年工作经验的放射科医师采用盲法，以 Likert 5 分制对 6 组图像质量进行主观评估，评分不一致时由第 3 名医师综合判定。结果 六组重建所得图像的 SNR、CNR 从高到低依次是：DLIR-H、DLIR-M、ASIR-V80%、DLIR-L、ASIR-V50%、FBP，差异具有统计学意义 ($P < 0.05$)；六组图像的主观评分中，DLIR-H 主观图像质量评分高于其他五组，差异有统计学意义 ($P < 0.05$)。结论 深度学习图像重建算法能显著降低噪声，提高头颈 CTA 图像质量，尤以 DLIR-H 重建算法效果最佳，在临床应用方面具有很大的潜力。

PU-2362

基于肺功能结果对肺部 CT 图像的质量控制研究

耿晓彤
华中科技大学同济医学院附属协和医院

目的：通过定量分析肺容积、肺实质密度等肺部 CT 定量参数与常规肺功能结果的相关性来设计描述患者呼吸状态的回归方程，评价肺双气相 CT 检查是否在最佳吸气/呼气状态下完成。方法：选取患者 67 例进行肺功能检查，并对患者用双源 CT 定量成像技术扫描测定肺功能定量参数，分析 CT 定量参数与肺功能指标间的相关性，通过二者具有良好相关性的双气相 CT 定量参数设计回归方程来对肺部双气相 CT 图像质量进行评价。结果：当定量肺 CT 与相关的 PFT 参数具有良好的相关性时，得出回归方程 $(V_{in}-V_{ex})/VC$ (预测) $= 0.525 + 0.147 \times (V_{in}-V_{ex}) \times 0.001 - 0.942 \times fSAD\%$ 。结论：

当(Vin-Vex)/VC 通过上述方程计算结果越接近于 1 时可认为达到最佳吸气/呼气状态, 此时肺部双气相 CT 图像质量较高。

PU-2363

深度学习重建算法在胸部低剂量 CT 成像中改善图像质量的应用研究

葛颖颖

南京明基医院有限公司

目的: 对比分析深度学习重建算法在改善胸部低剂量 CT 成像中图像质量的应用研究。

方法: 前瞻性纳入 57 例在我院接受胸部低剂量 CT 检查的受检者, 采用 256 排 512 层 CT 进行扫描, 分别用 FBP、ASIR-V40%、DLIR-L、M、H 这 5 种算法进行重建, 重建层厚为 0.625 mm、层间距为 0.6 mm 薄层图像, 客观评价升主动脉、右肺动脉及降主动脉、右侧竖脊肌、左右肺的前段和背段等图像噪声 (SD)、信噪比 (SNR)、对比噪声比 (CNR) 并进行主观评价, 评价内容图像噪声、血管边缘的锐利度及图像质量等, 最后进行分析对比。

结果: 客观评价: 不同重建算法的 CT 值比较无统计学差异 ($P > 0.05$), 五组不同重建算法(滤波反投影法 FBP、ASIR-V 以及 DLIR-L、DLIR-M、DLIR-H) 中 SD、SNR、CNR 均具有统计学差异 ($P < 0.001$) 且 SD 中 $DLIR-H > DLIR-M > DLIR-L > ASIR-V > FBP$ 比较有统计学意义。主观评价: 两位诊断医师对于图像质量的主观评分 $DLIR-H > DLIR-M > DLIR-L > ASIR-V > FBP$, 比较有统计学差异 ($P < 0.001$), 主观上: FBP 重建出来的图像质量差, 血管边缘和血管腔不清晰; ASIR-V 重建出来的图像质量良好, 血管边缘和血管腔显示良好; DLIR-L 重建出来的图像质量较好, 血管边缘和血管腔显示可以; DLIR-M 重建出来的图像质量良好, 血管边缘和血管腔显示良好; DLIR-HASIR-V 重建出来的图像质量好, 血管边缘和血管腔显示优。结论: 深度学习图像重建算法 (DLIR) 可以随着强度的增加智能地降低图像噪声, 恢复噪声纹理, 并且在低剂量的条件下与滤波后的反投影 (FBP) 和自适应迭代重建 (AIR) 相比, 该算法大大提高了主观图像的质量, 可以显著降低图像噪声, 改善解剖和病理细节显示。

PU-2364

不同重建算法在胸部低剂量扫描中提高图像质量的应用价值

朱家婕

南京明基医院

目的: 探讨 3 种不同重建技术滤波反投影法 (FBP)、自适应统计迭代重建 (ASIR-V)、深度学习算法重建 (DLIR-L、DLIR-M、DLIR-H) 在胸部低剂量扫描中提高图像质量的应用价值。

方法: 收集 68 例患者首诊和 3 个月内复查低剂量的 2 组胸部 CT 图像。所有患者首诊均采用常规剂量方案[预设噪声指数 (NI) = 8], 图像采用 ASIR 60% 进行重建, 复查采用低剂量方案 (预设 NI = 16), 分别采用 FBP、ASIR-V、DLIR-L、DLIR-M、DLIR-H 5 种不同重建算法进行重建。记录下图像噪声 (SD)、信噪比 (SNR)、对比噪声比 (CNR) 及 2 组容积 CT 剂量指数 (CTDIvol) 及有效剂量 (ED)。由两名放射科诊断医生选取主支气管分叉层面, 分别在升主动脉、右肺动脉及降主动脉、右侧竖脊肌、左右肺的前段和背段分别放置感兴趣区, 以其范围面积内的 CT 值的标准差来作为图像的噪声大小, 分别用公式计算 SNR、CNR 和噪声降低率, 各个参数须在同一期相的同一层面上进行测量, CT 值和 SD 值分别要重复的测量 3 次, 再取其平均值作为噪声大小。

结果: DLIR-H 在 2 种条件下的 SD 最低, CNR 和 SNR 最优且低剂量 DLIR-H 的 SD 值显著低于低剂量的 ASIR-V 和 FBP, 稍低于常规剂量的 DLIR-M, 差异有统计学意义 ($P < 0.05$); 低剂量 DLIR-H 的

SNR 显著高于低剂量的 ASIR-V 和 FBP,稍高于常规剂量 DLIR-M,差异有统计学意义 ($P < 0.05$)。图像主观评分,低剂量 DLIR-H 图像显著优于低剂量 ASIR-V 和低剂量 FBP,略优于常规剂量 DLIR-M,差异有统计学意义($P < 0.05$).与常规方案相比,低剂量的 ED 降低约 77.8%($P < 0.05$)。结论:与 FBP 和 ASIR-V 相比,DLIR-H 可以显著降低图像噪声,提高图像的信噪比,以及在低剂量 CT 扫描条件下使用 DLIR-H 将获得具有较高的图像质量。

PU-2365

儿童青少年 X 线全脊柱拼接正侧位摄影的图像质量

蒋志军
深圳市儿童医院

〔摘要〕目的 探讨儿童 青少年 X 线全脊柱拼接正侧位摄影的图像质量。方法 回顾性分析 2023 年 5—8 月于深圳市儿童医院接受 X 线全脊柱拼接正侧位检查的 2856 例患者的临床资料,参照世界卫生组织 (WHO) 对年龄段的划分分为 A 组 (儿童) (4-6, 952 例)、B 组 (青少年) (7-16 岁, 1904 例), 2 组均采用美国锐科 DRX-Evolution Plus 设备正常脊柱摄影程序进行数据采集并完成全景拼接,由于 A 组身高较矮,设定 2 张全景拼接。B 组身高较 A 组高设定 3 张全景拼接,B 组 3 张拼接中有一张影像经过隔肌水平,需要患者训练呼吸提高拼接的影像质量,减少重拍率。并由 1 名资深放射科副主任技师和 1 名资深放射科副主任诊断医生对图像质量进行评价。结果 2 组正侧位图像的信噪比 (SNR) 值比较,差异无统计学意义 ($P > 0.05$); 2 组正位侧位摄影得分比较、B 组平均得分高于 A 组,差异有统计学意义 ($P < 0.05$); 2 组全景拼接质量 A 组平均得分高于 B 组,差异有统计学意义 ($P < 0.05$)。结论 年龄及训练呼吸是影响 X 线全脊柱拼接正侧位摄影图像质量的重要因素,年龄较大及呼吸配合的患者图像的质量更佳。

〔关键词〕脊柱全长; 全景拼接技术; DR X 线数字摄影

能谱 CT 联合双低对比剂在 2 型糖尿病患者下肢 CTA 中的临床应用价值

冯国全、巫迎春
江苏大学附属医院

目的: 本研究通过 2 型糖尿病患者行下肢 CTA 检查,观察能谱 CT 联合双低对比剂在降低患者辐射剂量及对比剂用量方面的效能。方法: 收集行下肢 CTA 检查的 2 型糖尿病患者 60 例,随机分成两组: 对照组采用常规 CT 扫描,经肘静脉注入碘佛醇 350mgI/mL,用量按 1.5mL/kg 计算; 观察组使用能谱 CT 扫描,经肘静脉注入碘海醇 300mgI/mL,按体重 1.2mL/kg 计算总量。主观图像质量评价由两位高年资影像科医师采用双盲进行评分进行。客观图像质量评价采用两组图像的图像噪声、对比噪声比、信噪比判断。同时对两组的剂量长度乘积、平均 CT 容积剂量指数、有效辐射剂量及有效摄碘量进行分析。结果: 观察组腹主动脉、股动脉及腘动脉 CT 值高于对照组,差异有统计学意义 ($p < 0.05$); 观察组 SNR、图像噪声高于对照组 ($p < 0.05$); 观察组与对照组 CNR、图像质量评分差异无统计学意义 ($p > 0.05$); 观察组 CTDI、DLP、ED、有效摄碘量均较对照组明显下降 ($p < 0.05$)。结论: 在低对比剂浓度、低对比剂总量的条件下行下肢 CTA 能谱 CT 扫描,既可保证图像质量不受影响,亦可明显降低患者受到的辐射剂量和有效摄碘量。

放射防护对于放射检查的必要性

张境源

空军军医大学西京医院

放射防护科普文章

随着放射检查日益增多,人们对于放射检查了解逐渐熟悉。放射线对于人体有一定危害,因此放射防护的必要性就此展露出来。放射防护是为了保护放射工作人员和接受放射检查的被检者不暴露在辐射环境下以及辐射区域范围内,从而降低辐射对于人体的伤害。那么从哪个方面进行放射防护是极其重要的。首先了解一下放射防护三要素为时间防护、距离防护、屏蔽防护。时间防护是指做缩短放射检查的时间,避免长时间接受射线。对于普通患者做放射检查最好间隔三个月左右,避免超出年辐射剂量。距离防护是外部辐射防护有效方法,增加放射源与被检者之间的距离,让放射剂量在安全的剂量范围内,从而保护人体安全。屏蔽防护是指射线穿过某种材料会是放射性降低从而达到防护要求。常见的 x 线检查防护为铅围裙、铅衣、铅围脖等。其实对于放射检查人们不必惊慌,每年人们接受辐射剂量都会有一个参考范围,基本上不会让体内射线超标导致危害身体,所以大家正面对放射检查,他并没有那么可怕!

PU-2368

影像技师团队在医学影像互认提升影像质量工作中的作用和展望

崔志敏

无锡市人民医院

目的:探讨影像技师团队在全科影像质量管理中作用及实施路径。方法:通过深化技师团队管理模式,在技师长制管理模式,引入分组导师制、机长制等多维管理模式,推进技术团队质量提升。由技师长分管全科技术团队日常业务管理;技师长作为放射科的技术负责人外,增加了机长制管理,以影像科大型设备为基石,管控本设备本检查室单元的安全、质量、设备应用、技术开发、带教培训及创新等多项职能,尤其注重影像质量的提升,以医学影像互认为导向,逐步实现两个维度,数个模块的现代新型技术管理模式,建立影像技术管理人才团队,实现从管事到管人,从定方向到拿结果的新型高效管理模式。

幼儿 X 线检查辅助装置的临床应用

王勇

河北省故城县医院

[摘要]目的:研究如何更好的让幼儿配合完成 X 线检查,比如常见的小儿胸部 X 线摄影检查。方法:选取笔者所在医院 2023 年 2-8 月需进行 X 线检查的 8 月-4 岁的幼儿 200 例,其中 100 例使用幼儿 X 线检查辅助装置(观察组),100 例不使用幼儿 X 线检查辅助装置(对照组),在相同照射技术条件下,比较两组患儿完成 X 线检查的情况及获得 X 线图像的质量。结果:使用辅助装置的观察组患儿均未出现哭闹,较轻松的配合完成了检查,不需要或需要 1 名陪检家属即可,均获得合格的 X 线图像;对照组患儿均出现哭闹、恐惧,延长了检查时间,且 80 例患儿需要 2 位家属按压才能完成检查,有 10 例患儿初次拍片图像不清,需二次拍摄。结论:通过使用辅助装置,降低

了幼儿 X 线检查时的紧张、恐惧情绪,使其能较轻松、愉快的完成检查,缩短检查时间,减少了陪检家属,提高了 X 线图像合格率,并可获得正常的或更清晰的 X 线图像。

肾癌术前 CTA 评估及结构化报告的价值

王龙胜

安徽医科大学第二附属医院

肾癌的治疗越来越倾向个性化治疗,以期达到延长生存时间、提高生活质量的目的。对局限性肾肿瘤从早期经典的根治性肾切除术(RN)逐渐转变为保留肾单位手术。NSS 难易程度及术后可能出现的并发症与肾癌的解剖特征、周围环境的复杂程度(包括肾周脂肪的粘性、肾血管变异等情况)密切相关。CTA 及后处理技术 MPR、MIP、CPR 等可直观、立体、多角度的对肾肿瘤进行三维重组,全方位地了解肿瘤的位置、大小、形态,肿瘤与肾血管、集合系统的关系,肾周脂肪情况,反映肿瘤解剖学特征及周围环境的复杂程度。

标准化肾肿瘤解剖学特征、量化评估具有重要意义;目前,大多影像报告只是对肾肿瘤进行一般的定性描述(即文本报告);临床医师很难依据影像报告对肾肿瘤解剖特征有个全面的了解,且不同医师,对影像报告做出不同的选择,没有统一的标准,使得影像学资料在指导临床医师制定治疗方案方面存在不足。结构化报告是采用结构化格式、标准化术语、前后一致的组织结构书写的影像学报告。在开发结构化报告模板时,可以将临床需要的关键影像结果列入其中。结构化报告有助于提高影像报告的完整性和清晰度,易于阅读和信息提取,提高临床医师的满意度。

低剂量 CT 结合深度学习重建算法对腹部图像质量的影响

唐星

安徽医科大学第一附属医院

【摘要】目的:探讨超低剂量 CT 结合深度学习图像重建算法(DLIR)对腹部 CT 图像质量的影响。方法:选取我院 170 例因临床诊疗需求行腹部 CT 检查的患者(男 88 例,女 82 例),分别采取了常规剂量 CT 扫描和超低剂量 CT 扫描。常规剂量 CT 扫描使用滤波反投影技术(FBP)进行 0.625mm 层厚重建,超低剂量 CT 扫描分别使用滤波反投影技术(FBP)、不同权重迭代重建技术(ASIR-V30%、ASIR-V50%、ASIR-V70%)、不同等级的深度学习重建技术(DLIR-L、DLIR-M、DLIR-H)进行 0.625mm 层厚重建。由三名放射科医生分别对图像质量(1-5 分)、图像噪声(1-5 分)、诊断可信度(1-5 分)、边缘锐利度(1-4 分)以及伪影(1-4 分)进行主观评分。通过测量肝脏、脾脏、肾脏、主动脉、腰大肌、皮下脂肪的标准差值和 CT 值,客观评价图像质量(图像噪声、信噪比、对比噪声比)。

结果:超低剂量组较常规剂量组相比,辐射剂量降低了 89%。超低剂量 CT 扫描使用 DLIR-H 重建的图像质量与常规剂量 CT 扫描使用 FBP 重建的图像质量大致相仿,差异无统计学意义($P > 0.05$);超低剂量 CT 扫描使用 DLIR-M、DLIR-L、ASIR-70%重建的图像质量较常规剂量 CT 扫描使用 FBP 重建的图像质量较差($P < 0.05$),而超低剂量 CT 扫描使用 ASIR-50%、ASIR-30%、FBP 重建的图像质量基本不能满足诊断需求。超低剂量 CT 在结合 DLIR-H 重建图像检测出肝囊肿(61 例),肾囊肿(63 例)及肾结石(24 例),与常规剂量 CT 利用 FBP 重建图像病灶检出率差异无统计学意义。

结论:超低剂量 CT 结合深度学习重建技术在满足临床诊疗需求的基础上,能明显降低辐射剂量,具有较好的临床应用价值。

PU-2372

CT 扫描仿真系统在医学影像质量与安全控制中的应用

彭锐

空军军医大学西京医院

目的：本研究的目的是探讨 CT 扫描仿真系统在医学影像质量与安全控制中的应用。

方法：本研究采用计算机仿真技术对 CT 扫描过程进行模拟和优化。通过模拟不同的扫描参数和扫描条件，评估不同参数对影像质量的影响。例如，研究人员可以通过调整扫描参数，如曝光时间和管电压，来观察对图像分辨率、对比度和噪声控制的影响。此外，通过模拟患者的解剖结构和病变情况，医生可以在没有真实患者的情况下进行诊断和制定治疗方案。例如，研究人员可以模拟不同类型的肿瘤，以帮助医生更好地理解病变的特征和位置。

结果：通过优化扫描参数，可以获得更高的图像分辨率、对比度和噪声控制，从而提高医学影像的质量。通过调整扫描参数，可以显著提高肺部 CT 图像的分辨率，从而更准确地检测肺部病变。同时，通过模拟不同病变的 CT 图像，医生可以提高诊断准确性和治疗效果。医生在使用 CT 扫描仿真系统进行乳腺癌诊断时，与实际患者相比，其准确性提高了 10%。此外，通过模拟不同的扫描场景和操作过程，帮助医生和技术人员熟悉和掌握 CT 扫描设备的操作流程，可以减少操作失误和提高工作效率，从而提高患者的安全性。通过使用 CT 扫描仿真系统进行培训，操作人员的操作失误率降低了 30%。

结论：本研究表明，CT 扫描仿真系统在医学影像质量与安全控制中具有重要的应用价值。通过优化扫描参数、模拟病变情况和操作过程，可以提高医学影像的质量，提高诊断准确性，减少操作失误，确保患者的安全。通过使用 CT 扫描仿真系统进行培训，可以显著提高操作人员的技能水平，从而减少患者的辐射暴露风险。

上肢 CT 动静脉同时增强法对影像质量和辐射剂量的影响

洪何欣

襄阳市中心医院

目的：探讨上肢 CTA（CT 血管造影）两段式注射对比剂动静脉同时增强扫描的可行性，及其对影像质量和辐射剂量的影响。

方法：前瞻性纳入 2023 年 2 月至 8 月在襄阳市中心医院因为肾衰竭并行桡动脉-头静脉端侧吻合术，动静脉瘘手术后行上肢 CTA 的 20 例患者为试验组，上肢 CTA 采用两段式注射对比剂动静脉同时增强法。对比剂用量按照患者体质量计算，采用两段注射的方法，第一段对比剂用量为 0.7 ml/kg，中间注射生理盐水，第 25 秒注射第二段对比剂，用量为 0.5 ml/kg。回顾性收集 2022 年 12 月至 2023 年 1 月间性别、年龄与试验组匹配的 20 例患者为对照组，对照组采用传统动脉期和静脉期双期扫描方法，对比剂用量为 1.2 ml/kg，采用造影剂自动追踪技术，监测主动脉根部感兴趣区，触发阈值为 150 HU。达到阈值延迟 8S 后自动触发扫描，动脉期后延时 25s 扫描静脉期。测量试验组和对照组上肢动脉、静脉、动静脉瘘的动脉流入部、吻合口部、静脉流出部的 CT 值及噪声。并对试验组图像和对照组动脉期、静脉期图像进行评分。计算两组患者的有效剂量。

结果：试验组上肢动脉 CT 值低于对照组动脉期，差异均有统计学意义 ($P<0.05$)。试验组上肢静脉 CT 值高于对照组静脉期，差异有统计学意义 ($P<0.05$)。动脉流入部、吻合口部、静脉流出部的 SNR 和 CNR 无显著差异。试验组辐射有效量较对照组下降 49.2%，差异有统计学意义 ($P<0.05$)。

结论：两段式注射对比剂动静脉同时增强法进行上肢 CTA 增强扫描可以得到动脉期和静脉期的综合图像，实现上肢动脉、静脉同时强化，并降低辐射剂量。

The possible neural mechanism of NP evoked by MI in pediatric patients with CSCI: a preliminary brain structure study based on VBM

Ling Wang,Nan Chen
Xuanwu Hospital Capital Medical University

LT-0505

磁共振 DTI 技术在内囊走行纤维束分析

姜洪新、居艳梅
故城县医院

LT-0506

Functional connectivity gradients of the cingulate cortex

Yuhao Shen, Huanhuan Cai, Yongqiang Yu, Jiajia Zhu
The First Affiliated Hospital of Anhui Medical University

LT-0507

列线图预测高血压性脑出血短期预后的研究

谢立^{1,2}、刘衡¹、刘小清¹、赵纯凤¹
1. 遵义医科大学附属医院
2. 重庆市九龙坡区妇幼保健院

LT-0508

Chinese Version of Exercise Dependence Scale-Revised: Psychometric Analysis and Exploration of Risk Factors

Feifei Zhang, Hui Zhang
First Hospital of Shanxi Medical University

LT-0509

Brain functional and structural damage network related to suicide symptoms

Xiaohan Zhang
The First Affiliated Hospital of Anhui Medical University

LT-0510

**The damage networks of gray matter volume,
neurocognition, and social cognition
in schizophrenia patients:
an extended meta-analysis**

Yan Cheng
The First Affiliated Hospital of Anhui Medical University

LT-0511

**Neural correlates of peripheral inflammation in major
depressive disorder and their genetic architecture,
neurochemical basis, and behavioral relevance**

Wenming Zhao
The First Affiliated Hospital of Anhui Medical University

LT-0512

**Micro Fiber Environment Disruption and Thalamus GABA
Level Reduction in The Lifelong Premature Ejaculation**

Jiaming Lu,Xin Zhang,Fei Zhou,Qian Chen,Bing Zhang
The Affiliated Drum Tower Hospital of Nanjing University Medical School

LT-0513

**基于 CT 平扫的颅内脑脊液体积定量有助于识别急性卒中患者
发病时间是否在 4.5 小时内：一项多中心回顾性研究**

马汝航¹、于茁²、丁静¹、夏爽³
1. 南开大学医学院
2. 天津市宁河区医院
3. 天津市第一中心医院

LT-0514

静态和动态功能连接结合三重网络模型 在遗忘型轻度认知障碍和阿尔茨海默病中的应用

冯琪、丁忠祥
杭州市第一人民医院

LT-0515

CTP 与 CTA 在预测急性缺血性卒中 患者血管内治疗后临床结局的比较

吴蓉、凌奥南、何仕丽、张高峰
遵义医科大学第二附属医院

LT-0516

MRI 在预测 1p/19q 联合缺失型低级别胶质瘤的研究进展

岳律
绵阳市第三人民医院

LT-0517

STAGE 多定量参数联合提升 PD 诊断效能

王嫚、高冰冰、苗延巍
大连医科大学附属第一医院

LT-0518

基于 rs-fMRI 的 2 型糖尿病患者动态功能网络连接研究

梅磊磊、何永胜
马鞍山市人民医院

LT-0519

MRI 形态学特征鉴别原发性中枢神经系统淋巴瘤和胶质母细胞瘤

董凤君
绵阳市第三人民医院

LT-0520

**基于全脑酰胺质子化学转移成像探讨阻塞性睡眠呼吸
暂停综合征患儿脑代谢及其与认知改变的关系**

谭伟婷
深圳市儿童医院

LT-0521

MR 灌注成像技术在脑小血管病中的应用及研究进展

刘丹、王涛、魏梅、蔡吉勇
重庆市璧山区人民医院

LT-0522

**Stroke Etiology and Infarction Characteristics
in Patients with Acute Ischemic Stroke**

Yuxi Hou
The 1st affiliated hospital of Navy Medical University (Changhai hospital of Shanghai)

LT-0523

自身免疫性胶质纤维酸性蛋白星形细胞病 1 例报告并文献复习

张应从、龚霞蓉
云南省第一人民医院

LT-0524

**基于静息态比率低频振幅的慢性鼻窦炎嗅觉
功能障碍的脑功能研究**

钟业鸣、车子刚
南京同仁医院有限公司

LT-0525

多模态磁共振应用在新生儿脑损伤的早期诊断价值探讨

高文治
榆林市第二医院

LT-0526

Decreased cortical complexity in unilateral acute tinnitus patients with hearing loss

Gangping Zhou¹, Wangwei Li¹, Yuchen Chen², Hengle Wei¹, Yusheng Yu¹, Qingqing Zhou¹, Xindao Yin², Yuejin Tao¹, Hong Zhang¹
1. The Affiliated Jiangning Hospital of Nanjing Medical University
2. Nanjing First Hospital, Nanjing Medical University

LT-0527

多发胶质瘤的磁共振表现及鉴别

王珍、王琪
徐州医科大学附属医院

LT-0528

扩散加权成像体积在评估大动脉闭塞缺血性卒中患者灌注成像/扩散加权成像不匹配中的应用价值

邵婉怡
苏州大学附属第一医院
