Methods: The retrospective study enrolled a total of 103 TA patients, of whom 51 were TA non-PAI patients and 52 were TA-PAI patients (34 without PH and 18 with PH). We also included 58 sex- and age-matched healthy volunteers (HVs). Magnetic resonance (MR)-feature tracking derived deformation indices from steady-state free precession rest cine at 3.0 T, including the RVGLS, RVGCS and global strain rate, were measured.

Student's t test, intra- and inter-observer variabilities, one-way ANOVA followed by Games-Howell post hoc method, Pearson correlation analysis, and univariable and multivariable linear regression analysis were performed properly.

Results: Compared with the healthy volunteers, the TA-PAI patients had similar RVGCS but impaired RVGLS. Although the TA-PAI patients without PH had a similar RV ejection fraction (RVEF) with HV (non-PH $45.1 \pm 5.3\%$ vs. HV $44.5 \pm 3.5\%$, $p = 0.799$), RVGLS (non-PH $19.6 \pm 1.9\%$ vs. HV $25.6 \pm 3.1\%$, $p < 0.001$) was significantly decreased and RVGCS (non-PH $14.8 \pm 2.5\%$ vs. HV $13.0 \pm 2.6\%$, $p = 0.004$) increased. The TA-PAI patients with PH had significantly poorer RVGLS (PH $14.8 \pm 3.4\%$ vs. non-PH $19.6 \pm 1.9\%$, $p < 0.001$) and RVGCS (PH $10.0 \pm 2.4\%$ vs. non-PH $14.8 \pm 2.5\%$, $p < 0.001$) than did those without PH.

Conclusions: Right ventricular myocardial injury was detected in the TA-PAI patients without PH. MR-feature tracking may be an effective method for detecting early cardiac damage in the TA-PAI patients without PH.

PO-0922

Differentiation of mass-like thymic hyperplasia from thymic tumors using MR quantitative fat fraction technique in adulthood

Jie Zhang, Yu Hui Ma, Xiu Long Feng, Jiang Tao Lan, Yu Chuan Hu, Guang Bin Cui
Tangdu Hospital, Air Force Medical University

Purpose: To evaluate the efficacy of MRI proton density fat fraction (MRI-PDFF) for distinguishing mass-like thymic hyperplasia from low-risk thymomas and thymic lymphomas in adulthood.

Materials and Methods: Seventy-one subjects with thymic hyperplasia or thymic tumors underwent conventional thorax MRI and IDEAL-IQ (iterative decomposition of water and fat with echo asymmetry and least-squares estimation quantization) sequence at our institution before biopsy or surgery. Mean fat fraction (FF) values were measured and compared for the differences among thymic hyperplasia, low-risk thymomas, and thymic lymphomas groups using one-way ANOVA, and further post hoc multiple comparisons were performed with the Bonferroni test (equal variances

assumed) and Dunnett's T3 test (equal variances not assumed). Receiver operating characteristic (ROC) curve analysis was used to distinguish thymic hyperplasia from thymic epithelial tumors and thymic lymphoma, and compared the AUCs of the two methods using the Delong test.

Results: The study group consisted of 22 men and 49 women with a mean age of 39.68 ± 15.72 years (range, 18–78 years), including 30 cases of mass-like thymic hyperplasia, 28 cases of low-risk thymomas, and 13 cases of thymic lymphomas. The FFhotspot in patients with mass-like thymic hyperplasia is significantly higher than that in patients with low-risk thymomas and thymic lymphomas (26.41 (15.66-37.66) % vs. 1.78 (1.06-2.67) % vs. 1.93 (1.35-2.30) %, $p < 0.001$). The FFtotal in patients with thymic hyperplasia is significantly higher than that in patients with low-risk thymomas and thymic lymphomas (27.67 (14.19-37.67) % vs. 2.21 (1.37-3.11) % vs. 2.44 (1.85-4.57) %, $p < 0.001$). However, there was no significant difference in FFhotspot ($P=0.830$) or FFtotal ($P=0.832$) between low-risk thymomas and thymic

lymphomas. ROC curve analysis showed that FFhotspot had an AUC of 0.998 ($P<0.001$), with a cutoff of $\leq 9.51\%$ fat fraction yielding 100% sensitivity and 95.10% specificity, and FFtotal had an AUC of 0.994 ($P<0.001$), with a cutoff of $\leq 9.42\%$ fat fraction yielding 96.70% sensitivity and 97.60% specificity. There was no significant difference between two methods to distinguish thymic hyperplasia from thymic tumor with AUC ($P < 0.001$).

Conclusions: MRI-PDFF technique provide accurate fat quantitative parameters and can be used to differentiate mass-like thymic hyperplasia from low-risk thymomas and thymic lymphomas.

PO-0923

Dynamic changes in aortic dimension during the cardiac cycle analyzed by ECG gated computed tomography

Wenyong Zhu, Fan Yang, Weifan Zhu, Jie Liu, Juan Tao

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology.

Purpose: To characterize the difference in aortic dimensions between systole and diastole phases with ECG-gated computed tomography angiography (CTA), and to determine whether other parameters such as area or perimeter in comparison to diameter could potentially provide more accurate size reference for stent selection.

Methods: The ECG-gated CTA imaging of 90 patients during the cardiac cycle were reviewed. We measured the maximum diameter, the minimum diameter, the lumen area, the lumen perimeter, and the diameter derived from the lumen area at three anatomical locations (level A: 1 cm proximal to the innominate artery; Level B: 1 cm distal to the left common carotid artery; Level C: 1 cm distal to the left subclavian artery). The changes of each parameter between systole and diastole phases at each level were compared.

Results: The mean age of the patients was 60.9 ± 12.4 years. There was a considerable difference in the aortic dimensions of each measurement parameter between the systolic and diastolic phases ($P < .001$). The maximum aortic diameter in the diastole phase is greater than that in the systole phase in 2.2%-7.8% of patients at the three levels. The maximum changes between the cardiac cycle in the maximum aortic diameter, minimum aortic diameter, area, perimeter and diameter derived from lumen area at the three locations were as follows: level A (18.8%, 16.2%, 8.1%, 3.8%, 4.4%), level B (6.4%, 14.6%, 7.3%, 8.4%, 7.7%), level C (4.9%, 7.1%, 8.4%, 6.8%, 6.0%). The mean change in percentage is the smallest in the diameter derived from lumen area at all the three levels compared to the area, perimeter, and the maximum aortic diameter (1.4% vs 2.6% vs 1.5% vs 1.9 at level A, $P < .01$; 1.4% vs 2.6% vs 1.7% vs 1.8% at level B, $P < .01$; 1.6% vs 3.5% vs 1.9% vs 1.7 at level C, $P < .01$).

Conclusion: The aortic dimensions change during the cardiac cycle are significant. The aortic diameter based on the lumen area over other measurement parameters may provide a better evaluation for selecting the size of the stent.

PO-0924

Feasibility study of free breathing ultrashort echo time for lung MRI at 1.5T

Qing Fu, Jiawei Wu, Xueni Meng, Xin Sun, Aodong Xiao, Ziqiao Lei

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430022, China

***Purpose:**

To investigate the clinical feasibility of free breathing ultrashort echo time (Spiral-UTE) lung MRI compared to routine enhanced-volumetric interpolated breath-hold examination (VIBE) for follow-up patients at 1.5T.

***Methods and Materials:**

This study was approved by local ethics committee, and all subjects provided written informed consent. A total of 17 oncology patients completed MRI and CT with a maximum of 7 days between the two studies. Gd-DOTA enhanced and unenhanced spiral-UTE sequence during free-breathing (research application) and enhanced VIBE sequence during breath-holding were scanned at 1.5T for lung follow-ups. Enhanced spiral-UTE was scanned 3~4 minutes after contrast injection following the completion of routine clinical examination. Two experienced radiologists evaluated image quality in consensus with a 5-point scale (4, excellent; 0, poor) regarding CT as the reference standard. Quantitative comparison of image quality was performed using SNR and CNR.

***Results:**

Spiral-UTE outperformed VIBE with a statistically significant difference ($p < 0.05$). Notably, there was no statistical difference in vessel visualization between unenhanced and enhanced spiral-UTE. Enhanced spiral-UTE was found to be the best for depicting pulmonary vessels, outperforming unenhanced spiral-UTE and enhanced VIBE. Regarding apparent SNR and CNR, there were significant difference among enhanced and unenhanced UTE and VIBE ($p < 0.001$). Enhanced spiral-UTE provided the best SNR, while spiral-UTE obtained the highest CNR, with no statistical difference between enhanced and unenhanced spiral-UTE methods ($p = 0.498$).

***Conclusions:**

Spiral-UTE provides a free-breathing technique with superior image quality compared to routine enhanced-VIBE with high quality visualization of the pulmonary anatomy.

PO-0925

Predicting lymph node metastasis in non-small cell lung cancer based on peritumoral radiomics model

Yuxin Niu, Yifan He, Zhiyong Li

Department of Radiology, the First Affiliated Hospital of Dalian Medical University, Dalian, China.

Purpose: To investigate the incremental value of predicting lymph node metastasis in non-small cell lung cancer (NSCLC) lung cancer based on peritumoral volume (PTV) radiomics model.

Materials and methods: A retrospective analysis of 167 patients who underwent CT thin-section scans within 2 weeks before surgery and had pathologically confirmed purely solid nodular or mass-like NSCLC from April 2012 to May 2022 and were randomized in a 7:3 ratio into training and test data sets. Two regions of interest (ROI) of 3 mm PTV and gross tumor volume (GTV) were outlined for 167 lesions in 167 cancer patients using 3D Slicer (version 5.0.3) under a lung window (window

width, 1500 HU; window level, -500 HU) of non-enhanced computed tomography (NCECT). The voxel size was adjusted to 1mm×1mm×1mm, and the original images were resampled. The Radiomics software package that comes with the software was used to extract radiomics features, and intra-group and inter-group correlation coefficient assessment (ICC), correlation analysis, gradient boosting decision tree (GBDT) and logistic regression were used for radiomics feature screening and construction of PTV and GTV radiomics models.

Results: Radiomics model created by 3mm PTV (training: AUC = 0.651; test: AUC = 0.607) has better diagnostic performance than radiomics model of GTV (training: AUC = 0.630; test: AUC = 0.596).

DISCUSSION: This study shows that the radiomics model of 3mm PTV in NCECT is better to the GTV radiomics model in predicting lymph node metastasis in patients with pure solid nodules or mass-like NSCLC. In NSCLC, it is critical to determine preoperatively whether lymph node metastasis is present or not, which determines the surgical approach and subsequent clinical treatment decisions. There are related studies claiming that the peritumor microenvironment provides value for clinical assessment of the aggressive biological behavior of tumors, and there are also studies showing that PTV radiomics can improve the classification of adenocarcinomas and benign granulomas on CT images. Our study also confirms this idea that the diagnostic efficacy of a 3mm PTV radiomics model is superior to that of a GTV radiomics model, and therefore preoperative diagnostic aid for NSCLC lymph node metastasis by PTV radiomics.

PO-0926

Factors associated with underestimation of left ventricular strain obtained from single-shot compressed sensing cine imaging using cardiac magnetic resonance

Wen Qian,xiaomei zhu

Department of Radiology, The First Affiliated Hospital of Nanjing Medical University

Purpose: Left ventricular (LV) global strain values from compressed sensing (CS) cine imaging of cardiovascular magnetic resonance (CMR) are significantly underestimated compared with those from conventional segmented cine imaging (regarded as gold standard). This study aimed at exploring the associated factors of underestimation of LV strain from CS cine CMR.

Methods: Patients underwent echocardiography and 3T CMR using single-shot CS cine and a standard segmented cine. The patients were divided into different groups in terms of wall thickness (thinned <6mm, normal 8-12mm and thickened >15mm) and ejection fraction (EF) using echocardiography. We calculated the absolute and relative differences in LV global peak strains (GPSs) between CS and segmented cines, and assessed the associated factors of reduced GPSs on CS cine.

Results: Among 62 patients (mean age, 50±16 years; heart rate, 71±13 beats/min), 19 had normal wall thickness, 22 had thinned myocardium, 21 had thickened myocardium. LV systolic dysfunction (EF <50%) was found in 31 patients. Absolute differences of LV GPSs between two cines were significantly different among wall thickness groups and EF groups (all P <0.05), while relative differences in GPSs were not related to LV wall thickness or EF. In stepwise multivariable analysis, EF and heart rate remained associated with absolute decline in GPSs from CS cine (adjusted β -coefficient: from 0.262 to 0.503, P<0.05), however, only heart rate was connected with relative underestimation in global circumferential and longitudinal strains from CS cine (circumferential: β = 0.302, P = 0.017 and longitudinal β = 0.322, P=0.011). Increasing EF and heart rate augment underestimation in GPSs on CS cine as compared with GPSs on segmented cine.

Conclusion: Absolute reduced GPSs from CS cine are associated with EF and heart rate, and only heart rate is connected with relative decline in GPSs which is easier to correct the model.

PO-0927

CTPA in the assessment of right heart dysfunction and adverse prognosis in pulmonary embolism.

Xinyang Zhang¹, Jinling Zhang²

1. Harbin Medical University Cancer Hospital

2. The Second Affiliated Hospital of Harbin Medical University

Background and purpose

CTPA is the non-invasive gold standard test for diagnosing PE which is widely used in clinical practice. This study is dedicated to exploring the application value of CTPA parameters in PE patients with RVD and adverse prognoses. Combined with clinical indicators, a prognostic model was constructed to provide valuable prognostic information while making a qualitative diagnosis.

Methods

The 172 patients diagnosed with PE were enrolled, including 77 and 95 in the RVD and non-RVD groups, respectively; 60 and 112 in the SAEs and control groups, respectively, within 30 days of occurrence. Univariate and multivariate regression analyses were performed, respectively. Build prediction models, and compare and evaluate prediction effectiveness.

Results

Model 1, which includes RV/LV>1 ($P=0.031$), PAD>29mm ($P=0.053$), NT-Pro BNP>971pg/ml ($P<0.001$), to predict the occurrence of RVD in PE patients. The sensitivity and specificity were 94.81% and 74.74% respectively (AUC=0.890, 95% CI: 0.834-0.933); model 2, including four factors which of RV/LV>1 ($P<0.001$), NT-Pro BNP>1443pg/ml ($P=0.001$) and sPESI>1' ($P=0.006$), to predict the occurrence of SAEs. The sensitivity and specificity were 86.00% and 75.00% respectively (AUC=0.830, 95% CI: 0.765-0.883).

Conclusions

Model 1 and Model 2 have significant clinical significance in predicting RVD within 48h and SAEs in PE patients within 30 days.

PO-0928

Baseline chest CT based radiomics to predict short-term growth of incidental pulmonary nodules: a multicenter study: a multicenter study

Guangyao Wu

Affiliated Zhongshan Hospital of Dalian University

Purpose: Chest low-dose CT (LDCT) screening has proven its utility in the early detection and reduction of the mortality risk of lung cancer, and the short-term follow-up CT decides further management of pulmonary nodules. This study aims to develop and externally-validate a baseline CT-based radiomics signature and compare its performance with clinical-radiological features for predicting the short-term growth of incidental pulmonary nodules.

Materials and Methods: This retrospective study consecutively included 460 (growing: 60; non-growing: 400) PNs from three centers (training, $n = 272$, test1, $n = 92$, and test2, $n = 96$). A 30% increase in mass (volume \times CT-value) on short-term follow-up CT was used as the ground-truth (growth). Radiomic features were extracted from semi-automated contours on baseline CTs. Balanced sub-cohorts were created over 100 iterations for feature selection by random undersampling, and random oversampling was used for modeling. The performance of the logistic-regression model was evaluated using the area under the receiver-operating-characteristic curve (AUC), confusion matrix, calibration, and decision curve analysis (DCA).

Results: A radiomics signature based on 'glszm_ZoneEntropy' and 'shape_Sphericity' yields an AUC of 0.95 (95% confidence interval: 0.87, 1.00) in test1 and 0.89 (0.83, 0.96) in test2. The

prediction of the radiomics signature was significantly different with diameter ($p = .014$ and $p < .001$) and volume ($p = .003$ and $p < .001$) on the test1 and test2 datasets, while no significant differences with mass on two datasets ($p = .109$ and $p = .108$). DCA showed radiomics had higher clinical benefit on the threshold range (0.01 to 0.92) than using diameter, volume, and mass alone.

Conclusion: We indicate that the mass has better predictive performance than the diameter and volume for predicting the short-term growth of the pulmonary nodules. Furthermore, our radiomic signature outperformed than the diameter, volume, and mass and provided more clinical-benefits for patients with incidental pulmonary nodules.

PO-0929

Combined anatomical MRI differentiates pulmonary invasive adenocarcinoma from tuberculoma in noncalcified nodule: a retrospective comparison of CT with MRI

Shuyi Yang, Zhiyong Zhang
Zhongshan Hospital, Fudan University

Purpose: Magnetic resonance imaging (MRI), as a non-ionizing modality, can be a complementary tool for nodules assessment. This study is aimed to evaluate the potential of the combined conventional and modified anatomical MRI sequences for differential diagnosis of invasive adenocarcinoma (IAC) and tuberculoma.

Materials and methods: Sixty-seven patients (median 54 years, range 18-82 years) with 82 noncalcified nodules (mean 19.56 ± 6.85 mm, range 7-30 mm) underwent non-contrast enhanced CT and MRI (T1WI-starVIBE, T1WI-VIBE, T2WI-TSE-fBLADE). Two radiologists independently assessed nodule dimensions and morphologic features (including margin, morphology, lobulation, spiculation, cavity, air bronchogram, pleural indentation). Comparison of categorical variables was performed using Chi-square test. The inter-method agreement of morphologic features assessment by CT and MRI sequences were compared using Kappa test. Multivariate logistic regression analyses were applied to identify independent predictors to IAC. ROC analysis was performed to investigate the differential diagnosis capability. The AUC values for the models conducted by CT and MRI were compared using ROC curve analysis.

Results: A total of 38 IACs and 44 tuberculomas were identified. Readers 1 and 2 underestimated the nodules mean diameter with T1WI-starVIBE (T1WI-VIBE, T2WI-TSE-fBLADE) by 0.86 ± 1.71 mm (1.19 ± 2.06 mm, 0.15 ± 1.96 mm) and 0.99 ± 1.75 mm (1.27 ± 2.04 mm, 0.19 ± 1.91 mm). The inter-method agreements between MRI and CT were "fair" to "excellent" in the evaluation of morphological features except for spiculation ($0.318 \leq \text{Kappa} \leq 0.895$). Compared with the tuberculoma group, the IAC group was significant with unclear margin (T1WI-starVIBE and T1WI-VIBE), irregular morphology (CT and MRI), lobulation (CT and MRI), spiculation (T1WI-starVIBE and T2WI-TSE-fBLADE) and air bronchogram (CT, T1WI-starVIBE and T1WI-VIBE) ($P < 0.05$). The AUC value for the logistic model by the combination of CT and MRI was 0.867 (sensitivity 73.68%, specificity 86.36%; reader 1) and 0.877 (sensitivity 76.32%, specificity 86.36%; reader 2) and was significantly higher than that by T1WI-starVIBE ($P=0.002$) and T1WI-TSE-fBLADE ($P=0.027$) (reader 1), as well as higher than that by CT ($P=0.045$) and T1WI-starVIBE ($P=0.003$) (reader 2).

Conclusion: The combined conventional and modified anatomical MRI sequences has diagnostic potential in distinguishing pulmonary IAC from tuberculoma.

PO-0930

Association of Coronary CT Angiography-derived Plaque Parameters and White Matter Hyperintensity

Jie Qin, Yi Xu

The First Affiliated Hospital of Nanjing Medical University

Objective To explore the correlation between plaque parameters based on coronary artery CT angiography (CCTA) and overall white matter hyperintensity (WMH) and different regions.

Methods A retrospective analysis was conducted on the data of 392 patients who underwent CCTA and cranial MRI examinations. Fazekas score was recorded to assess the WMH degree, and coronary artery stenosis was also assessed and coronary artery disease (CAD) was defined to be present when stenosis was more than 50%. The clinical model (model 1) and radiology model (model 2) were developed with logistic regression. The combine model (model 3) was based on clinical characteristics and CCTA-derived parameters. The performance of these models was evaluated with area under the receiver operating characteristic curve (AUC) and compared using DeLong's test internally and externally.

Results Compared with the patients with mild WMH, the patients with severe WMH showed older age (64.1 ± 10.5 vs 70.6 ± 8.2 , $p < 0.001$), larger plaque burden (0.68 ± 0.15 vs 0.28 ± 0.31 , $p < 0.001$), higher Agatston Score (369.50 [IQR, $132.50 - 775.40$] vs 0.00 [IQR, $0.00 - 25.10$], $p < 0.001$), and CAD (80.90% vs 8.60% , $p < 0.001$). The performance of model 1, model 2, model 3 was supported by AUCs of 0.785 , 0.896 , 0.948 , 0.953 , respectively. These models existed statistical significance in WMH (model 1 vs model 2, $p < 0.001$, model 1 vs model 3, $p < 0.001$, model 2 vs model 3, $p = 0.183$, respectively).

Conclusions Our study indicated that individuals with older age, larger plaque burden, higher Agatston Score, and CAD are more likely to have severe white matter hyperintensity. The influencing factors of high matter hyperintensity in periventricular and deep location were not exactly the same, possibly due to different potential mechanisms that lead to cerebral lesions in two regions. This finding supports the thing that many similarities in the pathological processes involved in the heart and the brain vascular dysfunction.

PO-0931

The alterations and significance of computed tomography pulmonary angiography derived parameters in elderly patients with acute pulmonary embolism

Yuli Zeng, peng Liu, Jianbin Liu, Guiliang Wang, an Xie, Wenjie Sun, Yilei Che, Si Liu, xi Yi

Hunan Provincial People's Hospital (The First Affiliated Hospital of Hunan Normal University)

[Abstract] Objective To explore the alterations and significance of computed tomography pulmonary angiography (CTPA)-derived parameters in elderly patients with acute pulmonary embolism (APE). **Methods** According to the pulmonary artery obstruction index (PAOI), patients with APE were divided into A1 (PAOI $\geq 30\%$, $n = 57$) and A2 (PAOI $< 30\%$, $n = 40$) groups. Participants without APE were placed into B group ($n = 170$). The left atrial (LA) and left ventricular (LV) parameters among the three groups were compared and the parameter changes in 44 patients with APE were analyzed before and after treatment. The correlation between APE severity and parameters was analyzed by correlation analysis. **Results** The left to right diameters (LR) of LA, and LR \times anteroposterior diameters (AP) of LA and LV: A1 $<$ A2 $<$ B; LR of LV: A1 $<$ A2, B; AP of LA and LV: A1, A2 $<$ B. After treatment, the LR and LR \times AP of LA and LV were significantly enlarged in the A1 group, and the LR of the LV and the LR \times AP of the LA and LV were enlarged in the A2 group. APE severity had closer association with the LR \times AP ($r = -0.557$) and LR ($r = -0.477$) of LA. **Conclusion** With the increase in obstruction degree, elderly patients had smaller

LA and LV, and the LR and LR × AP of LA were significantly decreased, which contributes to in-time risk stratification.

PO-0932

Diffuse Myocardial Fibrosis in Inflammatory bowel disease - Insights from ECV derived from dual-energy contrast-enhanced Computed Tomography

Jin Gu, Wei Chen, Jun Li, Xiang Ma

Department of Radiology, Union hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: Inflammatory bowel diseases (IBD) not only affects the gastrointestinal (GI) tract but also may involve many other organs of the body, including cardiovascular complications. Diffuse myocardial fibrosis can be detected noninvasively by using ECV quantification on contrast-enhanced Computed Tomography (CT).

Objectives: The goal of this study was to assess the diffuse myocardial fibrosis in IBD using dual-energy contrast-enhanced CT and the association of extracellular volume (ECV) with disease duration.

Methods: 42 IBD patients (20 women; mean age 25 ± 8 years) and 42 matched control subjects (20 women; mean age 26 ± 7 years) underwent dual-energy contrast-enhanced CT and ECV was measured. ECV values were evaluated at the middle of left ventricular septum on venous phase images.

Results: The mean ECV was $32.6 \pm 4.6\%$ in IBD group, and significantly higher than ECV ($27.5 \pm 3.8\%$) in control subjects ($P < 0.001$). ECV was correlated with the disease duration.

Conclusions: Subclinical cardiovascular disease is frequent in IBD, especially myocardial fibrosis. ECV derived from contrast-enhanced CT can provide potential added value as a biomarker for disease monitoring and study of therapies aimed at reducing myocardial fibrosis in IBD.

PO-0933

Diagnostic value of texture analysis based on native T1 mapping of cardiovascular magnetic resonance in differentiating hypertrophic cardiomyopathy subtypes and hypertensive heart disease

Jia Liu, Heshui Shi

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To assess the use of texture analysis (TA) based on native T1 mapping from cardiovascular magnetic resonance (CMR) in the diagnosis of patients with non-apical hypertrophic cardiomyopathy (HCM), apical HCM and hypertensive heart disease (HHD) compared with left ventricular cardiac function and strain analysis.

Methods: In this study, 184 patients were retrospectively collected, including 61 patients with HHD, 74 patients with non-apical HCM, and 49 patients with apical HCM. All patients were subjected to a standardized clinical scan protocol using a 1.5-T scanner. Dedicated commercial software (version 5.13.5, CVI42, Circle, Calgary, Canada) was used to semi-automatically generate the left ventricular intracardial and epicardial contours from cine imaging. Left ventricular cardiac function and strain parameters were calculated after manual correction. The left ventricular endocardial and epicardial contours of the native T1 maps were automatically generated by open-source software

(3D Slicer, version 4.11), which imported into commercial software (Artificial Intelligence Kit, version V3.2.0.R, GE Healthcare) for texture feature extraction, selection and diagnostic models building after manual correction.

Results: For differentiating between patients with non-apical HCM and HHD, combining five texture features from native T1 mapping (Gray-level co-occurrence matrix_Cluster Shade, First Order_Kurtosis, First Order_Skewness, First Order_90Percentile, Gray-level co-occurrence matrix_Difference Variance) provided accuracy of 74.4% in the feature selection group and 61.5% in the test validation group. Compared with the TA combination model or the combination model with left ventricular cardiac function and strain parameters, the combination of selected texture features, cardiac function and strain parameters showed a greater area under the curve (AUC) (feature selection group: 0.907, test validation group: 0.826, $P < 0.05$). For differentiating between patients with apical HCM and HHD, the combination of selected texture features, cardiac function and strain parameters showed a greater AUC compared with using texture features alone or the combination of left ventricular cardiac function and strain parameters in the feature selection group (0.931 vs. 0.788 vs. 0.882, $P < 0.05$). And the combination of selected texture features, cardiac function and strain parameters showed a greater AUC compared with the combination of left ventricular cardiac function and strain parameters in the test validation group (0.811 vs. 0.712, $P < 0.05$).

Conclusion: TA based on native T1 mapping can help differentiate between patients with non-apical HCM, apical HCM and HHD with high diagnostic accuracy. Combining TA based on native T1 mapping with left ventricular cardiac function and strain analysis may provide incremental value in differentiating between patients with non-apical HCM and HHD.

PO-0934

Comprehensive analysis of the effects of altitude on the structure and function of the rat heart

Huaqing Tan¹, Shihan Fu²

1. Affiliated Hospital of Qinghai University

2. Qinghai Provincial People's Hospital

Purpose: To investigate the effects of different altitude environments on cardiac structure, function, and microcirculatory perfusion in rats. In addition, the expression of myocardial hypoxia-inducible factor 2 α (HIF-2 α) and vascular endothelial growth factor (VEGF) was analyzed to understand the underlying molecular mechanisms. Methods: Thirty 4-week-old male SD rats were randomly divided into a plain group (Chengdu, 500 m above sea level), a medium-altitude group (Xining, 2,200 m above sea level), and a high-altitude group (Mado, 4,200 m above sea level), and were transported to laboratories within the corresponding regions to be housed for 24 weeks. After 24 weeks, rats were incubated for 24 weeks in the laboratories of the corresponding regions using blood parameters (erythrocyte count RBC, hemoglobin HGB, hematocrit HCT, and mean corpuscular volume MCV), myocardial perfusion parameters (mean blood volume MBV, mean blood flow MBF, time to peak TTP, and mean time to passage MTT), pulmonary artery pressure (PA), cardiac histopathology (HE staining), and immunohistochemistry of HIF-2 α and VEGF expression were used to assess the effects of altitude on cardiac structure and function.

Results: Blood parameters (RBC, HGB, HCT, MCV) increased significantly with altitude exposure compared with the plains group ($P < 0.001$). Myocardial perfusion parameters (MBV, MBF, TTP, MTT) and PA also showed highly dependent changes. Scatterplot analysis showed a negative correlation between WBC count and MCV, and a positive correlation between MBF and MTT. Histopathologic analysis showed a disturbed arrangement of cardiomyocytes and vacuolar degeneration with significant pathological changes. The expression of immunohistochemical HIF-2 α and VEGF also showed a significant upward trend with increasing altitude ($P < 0.05$).

Conclusion: Exposure to different altitudes significantly affected cardiac structure, function, and microcirculatory perfusion in rats. The increase in altitude led to significant changes in blood

parameters, including increases in RBC, HGB, HCT, and MCV. These changes suggest an adaptive response of the organism to hypoxic conditions.

PO-0935

Using CMR-based tissue tracking strain to study the effects of prolonged exposure of aged male rats to a hypobaric and hypoxic environment at high altitude

Dongyong Zhu¹, Jing Wang¹, Fabao Gao²

1. Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Sichuan University West China Hospital

Aims: This study was intended to evaluate the feasibility and reproducibility of using CMR-based tissue tracking strain for analysis of bi-ventricular function in aged rats under prolonged exposure to plateau hypoxia.

Methods and results: Male Sprague-Dawley rats aged 18-month-old were divided into the experimental group and the control group. The former was raised on the Qinghai-Tibet Plateau, China, at an altitude of 4250 m while the latter was housed in the plain at an altitude of 500 m, hence the names “the plateau rats” and “the plain rats”, respectively. Cardiovascular magnetic resonance (CMR) was performed to acquire short-axis images of the left ventricle (LV) and the right ventricular (RV) at a 7.0 T preclinical MR scanner (Bruker, Ettlingen, Germany) using the cardiac coil and cine sequence for the plateau rats at the baseline and after 2 months in either a plateau or a plain environment. CMR tissue tracking (CMR-TT) metrics of biventricular global and segmental strain were derived using a cardiac analysis software (cvi42 version 5; Circle Cardiovascular Imaging). Biochemical detection and histological tests were later performed to evaluate myocardial changes.

Results: Group analysis of the baseline and exposed CMR parameters revealed significant increase in RV end-systolic and end-diastolic volumes, RV end-diastolic mass and a decrease in RV ejection fraction (RVEF). The plateau group showed preserved LVEF, which, however, was lower than that showed by controls ($57.14\% \pm 1.20\%$ vs. $60.35\% \pm 1.06\%$, $P = 0.0588$). Left ventricle radial strain (LRSSAX), left ventricle circumferential strain (LCSSAX), right ventricle radial strain (RRSSAX) and right ventricle circumferential strain (RCSSAX) of the plateau group were all significantly lower than that of the control group, and regional strains of the interventricular septum and right ventricle were also true ($P < 0.05$, respectively). Biochemical analysis revealed that compared with controls, the plateau rats had higher levels of cardiac oxidative stress, inflammatory factors and cTn-I but a lower level of serum testosterone. Histologically, there was a significant difference in myocardial damage and fibrosis between the plateau rats and controls in RV but none in LV. Additionally, Pearson analysis showed that RVEF was moderately correlated with RRSSAX and RCSSAX ($r = 0.6126$, $P = 0.0342$; $r = -0.6384$, $P = 0.0255$) whereas RRSSAX and RCSSAX were positively correlated with LRSSAX and LCSSAX ($r = 0.7685$, $P = 0.0035$; $r = 0.7913$, $P = 0.0022$), respectively.

Conclusion: The decreased interventricular septum strain and ventricular interdependence may be a mechanism for LV dysfunction in the plateau rats. CMR-TT identifies bi-ventricular dysfunction in aged hearts exposed to high altitude hypoxia.

PO-0936

Serum uric acid is associated with impaired right atrial strain derived from cardiovascular magnetic resonance feature tracking in connective tissue disease

Yuanyuan Tang, Jingyang Wen, Zhaoxia Yang, Lu Huang, Liming Xia
Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose:

Serum uric acid (SUA) is considered a marker of inflammation as well as a potential independent risk factor for cardiovascular disease. This study investigates the association of SUA and the right atrial (RA) phasic function derived by cardiac magnetic resonance feature-tracking (CMR-FT) in CTD patients.

Methods:

We consecutive and retrospective enrolled 104 CTD patients, including 31 with hyperuricemia and 73 with normouricemia, and were compared with 52 age- and sex-matched healthy controls. All individuals underwent CMR imaging and measured SUA levels. Hyperuricemia was defined as SUA of females $\geq 340 \mu\text{mol/L}$ and males $\geq 420 \mu\text{mol/L}$. RA longitudinal strain and strain rate parameters corresponding to reservoir, passive, and booster phases derived by CMR-FT were evaluated for each subject. The association of SUA with RA phasic function was explored by Spearman's rank correlation and multiple linear regression analyses with adjustment for clinical risk factors.

Results:

CTD patients had significantly higher SUA levels as well as a lower RA reservoir strain (ϵ_s), conduit strain (ϵ_e) and conduit strain rate (SRe) (all $p < 0.05$) than healthy controls. Among CTD groups, patients with hyperuricemia had significantly impaired RA conduit function compared with patients with normouricemia (RA passive ejection fraction: 18.40 ± 9.34 vs. 25.52 ± 11.34 , $P = 0.004$, ϵ_e : $21.48 [11.80, 31.02]$ vs. $27.54 [18.44, 37.99]$, $P = 0.028$, SRe: -1.66 vs. -2.50 , $P = 0.003$). The elevated SUA levels were correlated with impaired RA reservoir and conduit strain parameters (absolute value of $R = 0.284-0.350$, all $P < 0.05$). In adjusted multiple linear regression analyses, the SUA levels also had independent determinants with ϵ_s ($\beta = -0.205$, $P = 0.035$), ϵ_e ($\beta = -0.220$, $P = 0.025$), and SRe ($\beta = 0.210$, $P = 0.030$), respectively.

Conclusions:

Serum uric acid may be a potential risk factor of subclinical RA dysfunction and is independently associated with impaired RA strain in CTD patients.

PO-0937

Application Value of Spectral CT Multi-Parameter Imaging in the Detection of Emboli and Assessment of Thrombus Burden in Acute Pulmonary Embolism

Weimeng Cao, Yuhan Zhou, Limin Lei, Zhihao Wang
The first affiliated hospital of Zhengzhou university

Objective: This study aims to investigate the efficacy of spectral CT multi-parameter (Spectral Based Image) imaging compared to regular CT (rCT) imaging in the detection of emboli and assessment of thrombus burden in acute pulmonary embolism (PE).

Methods: 102 suspected pulmonary embolism (PE) patients who underwent dual-layer spectral CT (DLCT) pulmonary angiography (CTPA) were prospectively enrolled. Spectral data

were reconstructed into conventional images (CI), iodine density maps (ID), effective atomic number (Z-eff) maps, and ID-Zeff fusion maps (ID-Zeff). The detection rate of acute PE in each group was evaluated, and the diagnostic efficiency for PE was assessed using receiver operating characteristic (ROC) curves and area under the curve (AUC) for each type of image. The diagnostic efficiency for PE was evaluated separately in pulmonary lobes and main left and right pulmonary arteries, pulmonary segmental arteries, and subsegmental pulmonary arteries. In diagnosed acute PE patients, the total number of thrombi and the number of thrombi detected in three level of pulmonary artery were counted, and the thrombus burden was compared among groups using the Qanadli (Q) score. Independent sample t-tests and chi-square tests were used for quantitative and qualitative data, respectively.

Results: Among the 102 suspected PE patients, a total of 63 cases were diagnosed based on imaging, laboratory tests, and clinical data. Among them, the CI, ID, Z-eff, and ID-Zeff respectively diagnosed 53, 55, 60, and 60 cases. The ID-Zeff image (AUC: 0.989, sensitivity: 97%, specificity: 100%) significantly improved the detection rate of PE compared to the CI image (AUC: 0.892, sensitivity: 84%, specificity: 94%). The total number of thrombi detected by the CI image and each spectral image group in each three level of pulmonary artery were as follows: CI (172, 25, 75, 72), ID (217, 25, 82, 100), Z-eff (222, 25, 85, 112), and ID-Z-eff (230, 25, 85, 120). The Q scores for each spectral image group were as follows: CI (15.64±5.28), ID (19.25±6.42), Z-eff (19.87±6.86), and ID-Zeff (20.46±6.6). The Q scores in each spectral image group were statistically significant compared to the CI group ($p < 0.001$).

Conclusion: DLCT multi-parameter ID-Zeff maps exhibit better detection rates and thrombus detecting efficacy in PE compared to CI images, especially in subsegmental PE. Additionally, the ID-Zeff map provides more accurate Q scores.

Clinical significance: ID-Zeff imaging can use the wedge-shaped perfusion defect region to detect subsegmental and micro thrombi, significantly improving the detection efficacy of peripheral micro emboli in PE. This provides more accurate imaging data for the precise assessment of thrombus burden, risk stratification, and prognosis prediction.

PO-0938

The value of MR BLADE T2WI contrast ratio combined with DWI in evaluating the pathological grade of solid lung adenocarcinoma

Shan Dang, nan Yu

Affiliated Hospital of Shaanxi University of Chinese Medicine

[Abstract] Objective To investigate the value of MR T2WI combined with diffusion weighted imaging (DWI) in predicting the pathological grading of solid lung adenocarcinoma. Methods The clinical and imaging data of 153 cases of solid lung adenocarcinoma (82 males, 71 females, mean age 63.2 years) confirmed by pathology in our hospital from January 2017 to May 2022 were retrospectively analyzed. According to the pathological grading system proposed by the International Association for the Study of Lung Cancer in 2020, adenocarcinoma was divided into low-grade group and high-grade group (the low-grade group was G1 and G2, and the high-grade group was G3). Koyama et al. proposed to use T2CR, that is, the T2 signal intensity of lung mass/nodule, by T2 signal intensity of the right rhomboid muscle: contrast ratio (CR) = signal intensity (SI) of lung nodule / SI rhomboid muscle. Two experienced radiologists independently read the MR images and measured the T2 contrast ratio (T2CR) and apparent diffusion coefficient (ADC) values. Mann-Whitney U test were used to compare the general characteristics (sex, age, maximum diameter), T2CR and ADC values between the two groups, and non-parametric Kruskal-

Wallis test was used to calculate whether there were differences in T2CR and ADC values between the five adenocarcinoma subtypes. Receiver characteristic curve (ROC) and area under curve (AUC) were used to analyze the efficacy of each parameter in differentiating the pathological grade of lung adenocarcinoma. Z-test was used for comparison between AUC. Results Among 153 patients with adenocarcinoma, 103 were low-grade adenocarcinoma and 50 were high-grade adenocarcinoma. There was good agreement between T2CR and ADC observers between two radiologists (0.948, 0.929). All the parameters did not conform to normal distribution ($p < 0.05$). The ADC value of the high-grade adenocarcinoma group was lower than that of the low-grade adenocarcinoma group ($p=0.004$), and the T2CR value was higher than that of the low-grade adenocarcinoma group ($p=0.011$). There were statistically significant differences in maximum diameter and gender between the two groups ($p < 0.001$, $=0.005$), and no statistically significant differences in age between the two groups ($p=0.980$). Among the five types of adenocarcinoma subtypes, only the lepidic and the micropapillary had statistical differences in ADC values ($p=0.047$), and the rest had no statistical differences ($p > 0.05$). The AUC of ADC and T2CR values for distinguishing high-grade adenocarcinoma from low grade adenocarcinoma were 0.645 and 0.627, respectively. The AUC, sensitivity, and specificity of combined T2CR, ADC, sex and maximum diameter were 0.778, 70% and 75%, respectively, compared with T2CR and ADC alone, the diagnostic efficiency was improved ($p=0.008$, $z=2.624$; $p=0.007$, $z=2.679$). Conclusion non-enhanced MR can predict the pathological grade of solid lung adenocarcinoma non-invasively, and provide imaging basis for accurate treatment of lung cancer.

PO-0939

Risk Stratification by chest pain symptoms in patients with zero coronary artery calcium (CAC) Score Results From the CREATION-CHINA Study

Ninglang Yuan, Bin Lu, Zhihui Hou, Jianan Zheng, Yanan Ma, Yitong Yu
Fu Wai Hospital, Peking Union Medical College & Chinese Academy of Medical Sciences

BACKGROUND: Coronary artery calcium (CAC) is an established predictor of future major adverse cardiovascular events (MACE), and 0 CAC score patients have a favorable prognosis. The usage has been proven in asymptomatic individuals but is rarely used in symptomatic patients.

OBJECTIVES: Our study aimed to assess the prognostic value of chest pain symptoms in patients with 0 CAC score. **METHODS:** This study recruited consecutive patients suspected of CAD who underwent both a CAC scan and coronary computed tomography angiography (CCTA). Kaplan-Meier and Multivariable Cox proportional hazards models were used to assess the risk of MACE according to chest pain symptoms.

RESULTS: There were 13,145 patients with 0 CAC score (57.0% men; mean age 54.6 ± 10.3 years). During a median follow-up of 3.5 years, MACE was reported in 69 (0.9%) patients without chest pain and 81 (1.4%) with chest pain ($P=0.008$). Chest pain symptom is an independent risk factor for the prognosis of 0 CAC score people (adjusted HR=1.750, 95% CI: 1.264-2.422, $P<0.001$). Chest pain symptoms can increase the risk of MACE events in patients with plaque (adjusted HR=2.078, 95% CI: 1.447-2.984, $P<0.001$) and obstructive CAD (adjusted HR=2.505, 95% CI: 1.622-3.870, $P<0.001$) in CCTA. The median MACE time is shorter in patients with typical angina than in those who only have chest pain symptoms (790.5 vs 1319 days, $p<0.001$).

CONCLUSIONS: Chest pain symptoms can reclassify MACE risk in 0 CAC score patients, especially in those with plaques and obstructive CAD in CCTA. The median MACE time is shorter in those patients with typical angina.

Incremental impact of coronary obstruction on right ventricular systolic and diastolic dysfunction in type 2 diabetes mellitus patients: assessed by CMR feature tracking

Jin Wang¹, Zhi-Gang Yang¹, Yuan Li¹, Ying-Kun Guo², Yu Jiang¹, Rui Shi¹, Yue Gao¹, Yi-Lin Jiang¹

1. West China Hospital, Sichuan University

2. Department of Radiology, West China Second University Hospital, Sichuan University

Background: Obstructive coronary artery disease is a prevalent macrovascular complication in patients with type 2 diabetes mellitus (T2DM), which are at increased risk for cardiovascular morbidity and mortality. This study aimed to investigate the impact of coronary obstruction on right ventricle (RV) systolic and diastolic function in T2DM patients, and explore independent predictors of reduced RV function.

Methods: Cardiac magnetic resonance (CMR) scanning was performed on 274 T2DM patients {161 patients without OCAD [T2DM(OCAD-)] and 113 with [T2DM(OCAD+)]} and 83 control subjects. CMR-derived parameters, including RV structure, function, global strains [including systolic peak strain (PS), peak systolic (PSSR) and diastolic strain rate (PDSR) in radial, circumferential and longitudinal directions] were measured and compared among observed groups. Univariable and multivariable linear regression analyses were performed to identify independent predictors of RV dysfunction.

Results: Compared to the control subjects, T2DM (OCAD-) patients exhibited reduced RV systolic and diastolic function, as evidenced by a decrease in all RV global strains except for radial PS, PSSR, and PDSR (all $P < 0.05$). T2DM(OCAD+) patients showed a significantly more severe impairment of RV systolic and diastolic function than T2DM(OCAD-) patients and control subjects (all $P < 0.05$). The presence of OCAD was independently correlated with reduced GCPS ($\beta = -0.149$, $P < 0.05$), the radial ($\beta = -0.204$, $P < 0.001$) and the longitudinal PS ($\beta = -0.155$, $P < 0.05$) in the context of T2DM. Among T2DM(OCAD+) patients, Gensini score was associated with decreased GCPS ($\beta = -0.388$, $P < 0.001$).

Conclusions: Coronary artery obstruction in the context of T2DM exacerbated RV systolic and diastolic dysfunction. The presence of OCAD and Gensini score were independent predictors of decreased RV function.

PO-0941

Predictive value of imaging and clinical feature models for Chest CT severity of severe acute respiratory syndrome coronavirus 2 breakthrough infection

Lijun Wu¹, Wenping Li¹, Jiajia Luo², Yu Zhou³, Lin Llu⁴, Shaohong Zhao¹

1. The First Medical Center of the Chinese PLA General Hospital

2. The 985th Hospital of the Joint Logistics Support Force

3. The 988th Hospital of the Joint Logistics Support Force

4. Shanxi Province Yuncheng City Yuanqu County People's Hospital

Objective We aim to analyze the chest CT severity of novel coronavirus disease 2019 (COVID-19) pneumonia, and to establish and validate a predictive model of COVID-19 pneumonia severity based on radiological and clinical information. **Methods** A consecutive cohort of 787 confirmed COVID-19 patients were retrospectively recruited from the emergency department of the First Medical Center of the People's Liberation Army General Hospital. People were randomly divided into training ($n = 551$) and test ($n = 236$) cohorts. Clinical and imaging information of patients in the training and validation cohorts were analyzed. We used two feature selection method, Max-

Relevance and Min-Redundancy (mRMR) and Least absolute shrinkage and selection operator (LASSO) to select the feature. and three models of clinical information, radiological score (radscore), and nomogram were developed by multivariate logistic regression, combining radiological and clinical information. Clinical usage was evaluated by receiver operating characteristic (ROC) curves. **Results** Three radiologic characteristics (band, consolidation, crazy paving) and 1 clinical feature (platelet count) were identified to be significantly different. Three diagnostic models achieved an area under the curve value as high as 0.55 (95% CI 0.43-0.67). The nomogram model yielded a maximum AUC of 0.64 (95% CI 0.56-0.71) in the training cohort with the highest accuracy and specificity. **Conclusions** A model composed of radiologic and clinical features has an excellent performance for prediction of COVID-19 pneumonia. It provides a reference for evaluating patients; prognosis and selecting treatment programs.

PO-0942

Radiomics-Based Myocardial Fibrosis Prediction in Patients with Hypertrophic Cardiomyopathy Using Cardiac Magnetic Resonance Cine Imaging

Zhuofan Li, Ziliang Xu, DiDi Wen, Yuanqiang Zhu, Minwen Zheng
Xijing Hospital, Fourth Military Medical University

OBJECTIVE Myocardial fibrosis is an independent risk factor for major adverse cardiac events (MACE) in patients with Hypertrophic Cardiomyopathy (HCM). As the gold standard non-invasive modality, cardiac magnetic resonance (CMR) late gadolinium enhancement (LGE) scanning is one of the conventional CMR sequences for myocardial fibrosis screening of HCM patients. However, nearly 50% HCM patients are estimated to have no fibrosis during their lifetime, unnecessarily LGE scanning may cause serious MACE events due to the gadolinium accumulation. Moreover, nearly half an hour scanning time of LGE sequence may also make uncomfortable for HCM patients. Thus, this study will construct a myocardial fibrosis prediction model based on another conventional CMR sequences, CMR cine sequence, for HCM patients.

METHOD From January 2009 to December 2022, 723 HCM patients who underwent LGE and CMR cine scanning were retrospectively recruited. Patients were divided into LGE(+) and LGE(-) groups according to whether they had myocardial enhancement in least one segment (632/91). Radiomics features were extracted from entire LV myocardium across all timepoints in short-axis cine views. Prediction Model was constructed using support vector machine method with 5-folds cross validation.

RESULTS After feature selection and model construction, the radiomics model exhibited a better myocardial fibrosis prediction performance with accuracy, sensitivity, specificity, and area under curve of 0.77, 0.78, 0.76 and 0.77, respectively. After adding clinical CMR features, the performance of combined model was further improved, with accuracy, sensitivity, specificity, and area under curve of 0.81, 0.81, 0.80 and 0.80, respectively. Four features were finally remained.

CONCLUSION Results suggested that by using radiomics-based model, CMR cine sequence had the potential for myocardial fibrosis detection. The four selected features may be involved in pathogenesis of myocardial fibrosis in patients with HCM.

PO-0943

Deep Learning in Interstitial Lung Disease: Classification and Prognostic Insights

Yisong Wang, Jun Liu
The Second Xiangya Hospital of Central South University

Interstitial lung disease (ILD) comprises a broad and diverse range of parenchymal lung disorders, contributing significantly to morbidity and mortality. There is a frequent disagreement between radiologic read, pathologic interpretation, and multidisciplinary discussion consensus. Therefore, establishing a definitive diagnosis of ILD using current techniques and criteria poses a considerable challenge. High-resolution computed tomography (HRCT) plays a vital role in characterizing the imaging patterns and predicting the prognosis of ILD. However, the substantial overlap radiographic findings make accurately diagnosing ILD in HRCTs difficult, even for seasoned radiologists. Recently, deep learning (DL), a strategy which can automatically learn important characteristic features and patterns hiding behind the CT images, has shown great potential in identifying and predicting the prognosis of ILD. In this review, we aimed to summarize the latest DL applications in the ILD classification and prognosis evaluation. Additionally, we addressed the challenges to clinical implementation and presented our insights on advancing this field forward.

PO-0944

Financial and clinical outcomes of CT-MPI+CCTA versus CCTA-guided strategy in patients suspected of CCS

Xu Dai
Shanghai General Hospital

Objectives: To compare the financial and clinical outcomes of CT myocardial perfusion imaging (CT-MPI) + coronary CT angiography (CCTA)-guided versus CCTA-guided strategy in patients suspected of chronic coronary syndrome (CCS).

Materials and Methods: This study retrospectively included consecutive patients suspected of CCS and referred for CT-MPI+CCTA-guided and CCTA-guided treatment. The details of medical costs of downstream invasive procedures, hospitalization, and medications were recorded. All patients were followed up for major adverse cardiac events (MACE) at a median time of 22 months.

Results: A total of 1335 patients (559 in the CT-MPI+CCTA group and 776 in the CCTA group) were finally included. In the CT-MPI+CCTA group 129 patients (23.1%) underwent ICA and 95 patients (17.0%) received revascularization. In the CCTA group 325 patients (41.9%) underwent ICA whereas 194 patients (25.0%) received revascularization. An addition of CT-MPI in the evaluation strategy markedly reduced the healthcare expenditure, compared with the CCTA guided strategy (USD 1441.36 vs. USD 232.91, $p < 0.001$). After adjustment for potential cofounders after inverse probability weighting, the CT-MPI+CCTA strategy was significantly associated with lower medical expenditure [adjusted cost ratio (95% CI) for total costs: 0.77 (0.65-0.91), $p < 0.001$]. In addition, there was no significant difference regarding the clinical outcome between the two groups (adjusted HR= 0.97; $p = 0.878$).

Conclusions: CT-MPI combined with CCTA considerably reduced medical expenditures in patients suspected of CCS, compared to the CCTA strategy. Moreover, this functional + anatomical imaging modality led to a lower rate of invasive procedures with a similar long-term prognosis.

PO-0945

Microvascular myocardial ischemia in diabetic patients without obstructive coronary stenosis and its association with angina

Yarong Yu
Shanghai General Hospital

Objectives: To investigate the incidence of microvascular myocardial ischemia in diabetic patients without obstructive coronary artery disease (CAD) and its relationship with angina.

Materials: Diabetic patients with intermediate-to-high pretest probability of CAD were prospectively enrolled. Non-diabetic patients with intermediate-to-high pretest probability of CAD were retrospectively included as controls. Patients underwent dynamic computed tomography myocardial perfusion imaging (CT-MPI) and coronary computed tomography angiography (CCTA) for quantification of coronary stenosis, myocardial blood flow (MBF), and extracellular volume (ECV). The rate of patients with microvascular myocardial ischemia, defined as any myocardial segments with mean MBF ≤ 100 mL/min/100mL, in patients without obstructive CAD (i.e., CAD-RADS grade 0-2 at CCTA) was obtained. Various quantitative parameters were compared between the diabetic and non-diabetic patients without obstructive CAD. Multivariable analysis was used to determine the association between microvascular myocardial ischemia and angina symptom in diabetic patients without obstructive CAD.

Results: One hundred and fifty-two diabetic patients (mean age: 59.7 ± 10.7 ; 77 males) and 266 non-diabetic patients (62.0 ± 12.3 ; 167 males) were enrolled, in whom CCTA revealed 113 and 155 patients without obstructive CAD, respectively. For patients without obstructive CAD, the mean global MBF was significantly lower in diabetic patients (152.8 mL/min/100mL vs. 170.4 mL/min/100mL, $p < 0.001$) whereas the mean ECV was significantly higher in diabetic patients (27.2% vs. 25.8%, $p = 0.009$). Among patients without obstructive CAD, the incidence of microvascular myocardial ischemia (36.3% [41/113] vs. 10.3% [16/155], $p < 0.001$) and interstitial fibrosis (69.9% [79/113] vs. 33.3% [8/24], $p < 0.001$) were significantly higher in diabetic patients than in non-diabetic controls. The presence of microvascular myocardial ischemia was independently associated with angina symptom (adjusted odds ratio=3.439, $p = 0.037$) in diabetic patients without obstructive CAD.

Conclusion: Dynamic CT-MPI + CCTA revealed a high incidence of microvascular myocardial ischemia in diabetic patients without obstructive CAD. The presence of microvascular myocardial ischemia was strongly associated with angina in those patients.

PO-0946

Long-term prognostic value of CT-based high-risk coronary lesion attributes and radiomic features of pericoronary adipose tissue in diabetic patients

Wenli Yang
Shanghai General Hospital

Aims: To investigate the long-term prognostic value of coronary computed tomography angiography (CCTA)-derived high-risk attributes and radiomic features of pericoronary adipose tissue (PCAT) in diabetic patients for predicting major adverse cardiac event (MACE).

Methods and results: Diabetic patients with intermediate pre-test probability of coronary artery disease were prospectively enrolled and referred for CCTA. Three models (model-1 with clinical parameters; model-2 with clinical factors+CCTA imaging parameters; model-3 with the above parameters and PCAT radiomic features) were developed in the training cohort (835 patients) and tested in the independent validation cohort (557 patients) with a median follow-up of 39.7

months. 1392 patients (mean age: 61.4 ± 11.1 years, 791 males) were included and MACEs occurred in 108 patients (7.8%). Multivariable Cox regression analysis revealed that HbA1c (HR=1.13, $p=0.043$), coronary calcium Agatston score (HR=1.01, $p=0.037$), obstructive stenosis (HR=3.75, $p<0.001$) and high-risk plaque (HR=1.86, $p=0.043$) were the independent predictors for MACE whereas none of PCAT radiomic features showed predictive value. In the training cohort, model-2 demonstrated higher predictive performance over model-1 according to time-dependent AUC whereas model-3 did not show incremental value over model-2. The C-index of model-2 was significantly larger than that of model-1 (C-index = 0.80 vs. 0.68, $p<0.001$) while the C-index of model-3 was equivalent to that of model-2 (C-index = 0.81 vs. 0.80, $p=0.32$). Similar findings were found in the validation cohort.

Conclusion: The combined model (clinical and CCTA high-risk anatomical features) demonstrated high efficacy in predicting MACE in diabetes. PCAT radiomic features failed to show incremental value for risk stratification.

PO-0947

Application of deep learning reconstruction in chest prone position scanning

Ruijie Zhao, Ruijie Zhao, Jiaru Wang, Ran Xiao, Sirong Piao, Jinhua Wang, Lan Song, Ruiyao Qin, Yun Wang, Wei Song, Zhengyu Jin
Peking Union Medical College Hospital

Aim To explore whether deep learning reconstruction (DLR) could maintain image quality and reduce radiation dose in prone position scanning, when compared with hybrid iterative reconstruction (hybrid-IR) in early interstitial lung disease (ILD) patients.

Methods 21 early ILD patients were prospectively enrolled. All patients accepted two scans: high resolution CT (HRCT), and low dose CT (LDCT). HRCT images were reconstructed with hybrid-IR (Adaptive Iterative Dose Reduction 3-Dimensional [AIDR3D], standard setting), and LDCT images were reconstructed with DLR (Advanced Intelligence Clear-IQ Engine [AiCE], lung/bone, mild/standard/strong setting). Image noise, streak artifact, overall image quality, visualization of normal and abnormal features of ILD were evaluated.

Results Radiation dose of LDCT was reduced 65.1% compared with HRCT. Objective image noise of reconstructed LDCT images was 33.0% to 111.8 % of HRCT, and signal-to-noise ratio (SNR) was 0.88 to 3.12 times of the latter ($p<0.001$). LDCT-AiCE was not significantly different from HRCT in overall image quality and normal lung structures assessment. LDCT-AiCE (bone, strong) showed significantly weaker recognition of bronchiectasis and/or bronchiolectasis than HRCT-AIDR3D ($p<0.05$). No significant difference was found in visulation of GGO, architectural distortion, reticulation and honeycombing between LDCT-AiCE (all settings) and HRCT-AIDR3D.

Conclusion DLR was promising to keep image quality and reduce radiation dose in prone scanning in early ILD.

PO-0948

The value of coronary computed tomography angiography for suspected acute coronary syndrome patients with intermediate concentration hs-cTnI and ruled out myocardial infarction in emergency

Jingwen Ma, Wei-Hua Yin, Bin Lu
Fuwai Hospital

Background: The updated 2023 European Society of Cardiology (ESC) guidelines indicate that coronary computed tomography angiography (CCTA) in patients with suspected acute coronary syndrome (ACS) did not improve one-year clinical outcomes. However, the application value of CCTA for suspected ACS stratified based on high sensitivity cardiac troponin I (hs-cTnI) value is uncertain.

Objectives: To explore the value of CCTA on rates of 30 days' invasive coronary angiography (ICA) and one-year major adverse cardiovascular events (MACEs) including all-caused death, myocardial infarction, unplanned revascularization in suspected ACS patients who had hs-cTnI within intermediate concentration (5 ng/L to 99th percentile) and ruled out myocardial infarction presenting to emergency department (ED).

Methods: Between November 2017 to January 2019, suspected ACS patients who had intermediate hs-cTnI concentrations and ruled out an acute heart attack were included in ED. Patients were categorized into CCTA group and no CCTA group according to whether they underwent CCTA testing. Patients in both groups were propensity score matched at a ratio of 1:3. Matching variables used were sex, age, hs-cTnI values, body mass index, smoking history, hypertension, hyperlipidemia, diabetes, peripheral artery disease, cerebrovascular disease and family history of coronary artery disease. Survival curves were generated using the Kaplan-Meier method and compared using the log-rank test.

Results: After propensity score matching (PSM) for confounder adjustment, 136 patients (62.0 [53.0, 71.0] years, 75.7% men) underwent CCTA and 404 did not (62.0 [55.0, 68.0] years, 75.5% men). Patients in CCTA group had less likely to have ICA in 30 days than no CCTA group (91 [66.9%] vs 368 [91.1%]; $P < 0.001$), and CCTA provide a clear diagnosis (acute aortic dissection, cardiomyopathy, pulmonary embolism, valvular heart disease, deep cardiac muscle bridge) for 22 patients who had a nonobstructive etiology in the CCTA group. No statistical difference in matched two group was found in MACEs rate at one year ($n = 12$ [8.9%] in CCTA group vs $n = 35$ [8.6%] in no CCTA group; $P = 0.97$).

Conclusions: In suspected ACS patients ruled-out myocardial infarction and with intermediate troponin concentration, CCTA examination not only reduced the rates of invasive angiography, but also provided the clear diagnoses of intermediate raised levels of hs-cTnI in non-obstructive patients. Although CCTA did not alter one-year clinical outcomes, the application of CCTA for this specific population is safe and reliable.

PO-0949

Can deep learning improve image quality of low dose CT: a prospective study in interstitial lung disease

Ruijie Zhao,Xin Sui,Ruiyao Qin,Huayang Du,Lan Song,Duxue Tian,Jinhua Wang,Xiaoping Lu,Yun Wang,Wei Song,Zhengyu Jin
Peking Union Medical College Hospital

Objectives To investigate whether deep learning reconstruction(DLR) could keep image quality and reduce radiation dose in interstitial lung disease(ILD) patients compared with HRCT reconstructed with hybrid iterative reconstruction(hybrid-IR).

Methods 70 ILD patients were prospectively enrolled and underwent HRCT (120kVp, automatic tube current), and LDCT (120kVp, 30mAs) scans. HRCT images were reconstructed with hybrid-IR (Adaptive Iterative Dose Reduction 3-Dimensional[AIDR3D], standard-setting); LDCT images were reconstructed with DLR (Advanced Intelligence Clear-IQ Engine[AiCE], lung/bone, mild/standard/strong setting). Image noise, streak artifact, overall image quality, visualization of normal and abnormal features of ILD were evaluated.

Results The mean radiation dose of LDCT was 38% of HRCT. Objective image noise of reconstructed LDCT images was 33.6% to 111.3% of HRCT, and signal-to-noise ratio (SNR) was 0.9 to 3.1 times of the latter ($p<0.001$). LDCT-AiCE was not significantly different from or even better than HRCT in overall image quality and visualization of normal lung structures. LDCT-AiCE (lung, mild/standard/strong) showed progressively better recognition of ground glass opacity than HRCT-AIDR3D($p<0.05$, $p<0.01$, $p<0.001$), and LDCT-AiCE (lung, mild/standard/strong; bone, mild) was superior to HRCT-AIDR3D in visualization of architectural distortion ($p<0.01$, $p<0.01$, $p<0.01$; $p<0.05$).

Conclusion Deep learning reconstruction could effectively reduce radiation dose and keep image quality in ILD patients compared to HRCT with hybrid-IR.

PO-0950

Radiomic model based on Coronary CT Angiography to assess myocardial perfusion function in patients with Chronic Total Occlusion

Lichen Ren,Jun li,Yonggao Zhang
The First Affiliated Hospital of Zhengzhou University

Purpose

Accurate assessment of myocardial perfusion function and survival in chronic total occlusion(CTO) patients can help clinicians more objectively evaluate the benefit of percutaneous coronary intervention in CTO patients. Nuclear myocardial imaging and cardiac magnetic resonance are often used to assess the degree of myocardial ischemia. However, both of them are much less clinically applicable than coronary CT angiography(CCTA). Therefore, we aimed to investigate the significance of the radiomics features of CCTA to assess myocardial activity in patients with CTO.

Materials and methods

Fifty-six patients with CTO confirmed by invasive coronary angiography (ICA) and examined by Single Photon Emission Computed Tomography, (SPECT) from 2020-2021 were retrospectively included. Myocardial perfusion function was divided into approximately normal and abnormal myocardial perfusion group, non-infarction group and myocardial infarction group according to the degree of ischemia, using SPECT as the reference standard. Myocardial segments were divided

according to the AHA17 segmentation method, and the radiomic information of each myocardial segment was automatically outlined and extracted. The mRMR method was applied to screen the radiomic features and establish a random forest model. The area under the subject operating characteristic (ROC) curve (AUC) and sensitivity, specificity, and precision-recall curves were used to evaluate the classification efficacy of the model.

Result

The most relevant radiological features differed between groups with approximately normal and abnormal myocardial perfusion and between groups with non-infarcted myocardial perfusion and infarcted myocardium. The random forest model had high diagnostic accuracy in discriminating both abnormal myocardial perfusion and myocardial infarction (AUC:0.719,0.849).

Conclusion

CCTA radiomics features have a good stratified diagnostic value for myocardial perfusion function in patients with CTO.

PO-0951

Effect of lesion characteristics on diagnostic accuracy of CT-FFR: exploring indications for CT-FFR

Yutao Zhou¹, Na Zhao¹, Yang Gao¹, Weixian Yang¹, Lei Song¹, Tao Jiang², Li Xu², Hongjie Hu³, Lin Li³, Wenqiang Chen⁴, Duming Li⁴, Feng Zhang⁵, Lijuan Fan⁵, Bin Lu¹

1. Fuwai Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College / National Center for Cardiovascular Diseases
2. Beijing Chao-Yang Hospital, Capital Medical University
3. Sir Run Run Shaw Hospital, Zhejiang University School of Medicine
4. Qilu Hospital of Shandong University
5. Teda International Cardiovascular Hospital

Objectives: To investigate the effect of lesion-related factors on the diagnostic performance of fractional flow reserve (FFR) derived from coronary computed tomography angiography (CCTA; CT-FFR).

Materials and Methods: This clinical trial analyzed 306 patients with 30% – 90% stenosis undergoing CCTA and invasive FFR from 5 centers. The target lesions were assigned into different lesion characteristics (target vessel, lesion location, lesion length, bifurcation lesion, and coronary calcification) subgroups. Diagnostic performance (accuracy, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and area under receiver operating characteristics curve (AUC)) of CT-FFR identifying ischemia were calculated and compared in all sub-groups.

Results: A total of 306 patients (68% male; mean age: 59.3 ± 9.7 years) with 353 target vessels were included. The overall vessel-based diagnostic accuracy, sensitivity, specificity, PPV, NPV, and AUC of CT-FFR were 87.3%, 87.5%, 87.0%, 84.8%, 89.4%, 0.87. Absence of bifurcation lesion group possessed the higher NPV of CT-FFR than presence of bifurcation lesion group (92.5% vs. 81.8%, $p = 0.031$). Whereas there was no statistically significant difference in diagnostic performance of CT-FFR among different target vessel, lesion location, lesion length, and coronary calcification sub-groups (all $p > 0.05$).

Conclusion: This prospective multicenter clinical trial supported CT-FFR as a powerful noninvasive functional assessment tool for coronary lesions with different lesion characteristics, involving target vessel, lesion location, lesion length, and coronary calcification. While the diagnostic performance of CT-FFR was negatively affected by the presence of bifurcation lesions.

PO-0952

CT radiomics-based models in the differential diagnosis of inflammatory and malignant pulmonary nodules with typical or atypical signs

Shaohong Wu¹, Wenli Shan¹, Jiao Ren¹, Xiaoyan Wang¹, Shaofeng Duan², Lili Guo¹

1. The First Affiliated Huai'an Hospital of Nanjing Medical University

2. GE Healthcare, Precision Health Institution, China

Background: When pulmonary inflammatory lesions grow locally and appear as nodules on imaging, they must be differentiated from malignant nodules. Inflammatory and malignant nodules with atypical signs are difficult to diagnose clinically.

Purpose: To evaluate radiomics models based on CT images for distinguishing inflammatory and malignant pulmonary nodules with typical or atypical signs.

Patients and Methods: This retrospective study included 333 patients with malignant pulmonary nodules (Mn) and 161 patients with inflammatory pulmonary nodules (In) who were pathologically diagnosed between January 2017 and February 2022. According to whether the CT signs of pulmonary nodules were typical (typical: A or atypical: B), they were further divided into typical malignant pulmonary nodules (MnA), atypical malignant pulmonary nodules (MnB), typical inflammatory pulmonary nodules (InA) and atypical inflammatory pulmonary nodules (InB). Group 1 (MnA/InA), group 2 (InA/MnB), group 3 (MnA/InB) and group 4 (MnB/InB) were obtained by pairwise comparison. Clinical models, radiomics models and nomogram models were established for each group. The model performance was evaluated by the area under the curve (AUC), accuracy, sensitivity and specificity. The AUCs of the models were compared by using the DeLong test.

Results: In group 1, five radiomics features and three clinical independent predictors (sex, eccentricity, HU mean) were selected. In group 2, five radiomics features and three clinical independent predictors (sex, age, HU mean) were selected. In group 3, three radiomics features and three clinical independent predictors (sex, RECIST diameter, HU mean) were selected. In group 4, ten radiomics features and three clinical independent predictors (sex, age, HU mean) were selected. In the training set, the AUC values of all models in the four groups ranged from 0.77 to 0.89. In the test set, the AUC values ranged from 0.63 to 0.82. In each group, the nomogram model had the highest diagnostic efficiency (training set: AUCs ranged from 0.83 to 0.89, test set: AUCs ranged from 0.69 to 0.82) and had high accuracy, sensitivity and specificity. For group 3, the nomogram model had the best diagnostic ability (training set: AUC, 0.83; 95% CI [0.75-0.90]; accuracy, 0.72; sensitivity, 0.70; specificity, 0.84. test set: AUC, 0.82; 95% CI [0.70-0.94]; accuracy, 0.65; sensitivity, 0.96).

Conclusion: The nomogram model was useful in diagnosing inflammatory and malignant nodules with typical or atypical signs, especially those with malignant signs, yielding a better classification performance than the radiomics and clinical model.

PO-0953

Effect of nitroglycerin administration on the diagnostic performance of machine-learning fractional flow reserve derived from computed tomography angiography

Yutao Zhou, Na Zhao, Yang Gao, Weixian Yang, Lei Song, Bin Lu

Fuwai Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College / National Center for Cardiovascular Diseases

Objectives: Nitroglycerin administration prior to examination improves stenosis assessment of coronary CT. However, whether nitroglycerin influences CT-derived fractional flow reserve (CT-FFR; FFR) evaluation remains unclear. We aimed to investigate the effect of nitroglycerin on diagnostic performance of CT-FFR.

Methods: In this retrospective study, 107 consecutive patients suspected of coronary artery disease with nitroglycerin administration prior to CT in 2019 were matched to 107 patients without nitroglycerin in 2016. All patients underwent coronary CT and invasive FFR in a month. Vessel-based and patient-based accuracy and diagnostic performance of CT-FFR were compared between the two groups, as well as image quality and coronary evaluability.

Results: A total of 214 patients (56 ± 9 years, 155 men) with 237 target vessels were analyzed, including 120 vessels in nitroglycerin and 117 in non-nitroglycerin group. Per-vessel based accuracy of CT-FFR was higher in nitroglycerin group (80.0% vs. 68.4%, $p = 0.041$). On a per-patient basis, nitroglycerin administration improved the accuracy (83.2% vs. 68.2%, $p = 0.011$), specificity (82.7% vs. 61.9%, $p = 0.014$), PPV (83.6% vs. 58.6%, $p = 0.004$), and AUC (0.83 vs. 0.71, $p = 0.03$) of CT-FFR. Vessel diameters (LADs: 3.1 mm vs. 2.9 mm; LCXs: 2.9 mm vs. 2.7 mm; RCAs: 3.7 mm vs. 3.4 mm) and number of evaluable coronary arteries (11.0 vs. 8.0) were larger in nitroglycerin group (all $p < 0.05$).

Conclusions: Nitroglycerin administration prior to coronary CT has positive effects on diagnostic performance of CT-FFR.

PO-0954

Arrhythmogenic right ventricular cardiomyopathy: distribution of late gadolinium enhancement and prognostic assessment by cardiac magnetic resonance

Kailu Zhang^{1,2}, Yukun Cao^{1,2}, Qinyue Luo^{1,2}, Yuting Zheng^{1,2}, Xiaoyu Han^{1,2}, Heshui Shi^{1,2}

1. Wuhan Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Hubei Province Key Laboratory of Molecular Imaging, Wuhan 430022, P.R. China

Abstract

Background: Arrhythmogenic right ventricular cardiomyopathy (ARVC) is an inherited cardiomyopathy with multiple phenotypes. It can lead to ventricular arrhythmias and sudden cardiac death. The segmental distributing characteristics of late gadolinium enhancement (LGE) in ARVC patients remain unknown. Additionally, the prognostic value of cardiac magnetic resonance (CMR) in ARVC patients is not yet fully understood.

Methods: This study retrospectively analyzed 124 patients with ARVC who underwent a CMR scan (period 2016–2021). They were divided into two groups based on whether the left ventricular free wall was affected: the right dominant variants (Group 1, $n=75$) and the biventricular dominant variants (Group 2, $n=49$). Imaging features and the distribution of LGE were collected as well as their clinical and laboratory data. Patients were followed up for a median of 22 months (range 1–82) for the composite endpoint of a heart transplant and all-cause death. The purpose of our study

is to explore the distribution pattern of late gadolinium enhancement (LGE) in ARVC patients as well as the predictive value of multiple CMR parameters on adverse cardiovascular outcomes.

Results: 75 right dominant subjects (age 30.3 ± 10.6 y, 33% female) and 49 biventricular dominant controls (age 30 ± 14 y, 31% female) were included. LV global circumferential strain (GCS) and global longitudinal strain (GLS), RV global radial strain (GRS) and GLS were lower in rTOF patients ($p < 0.01$ for all). LVEF and LVESVi were significantly associated with all LV global (2D and 3D) systolic strain parameters and RV global 2D radial and circumferential strain. After a median follow-up of 1.7 years (range 0.3-4.6 years), there were 3 deaths and 3 heart transplants. By Cox-regression analysis, LVGCS and LVGLS were both independent predictors of the composite endpoint.

Conclusion: CMR shows high diagnostic value for ARVC patients in different phenotypes. Multiple CMR parameters show predictive value on adverse clinical events. LVEF, LV-GCS and left atrial GLS are independent predictors of the composite endpoint of death and heart transplant.

PO-0955

The combined effects of diabetes and its comorbidities on lower extremity peripheral artery disease: A computed tomography angiography study

Li Jiang, Zhi-Gang Yang, Yuan Li
west china hospital of sichuan university

Background and aims: The underlying combined effect of diabetes mellitus (DM) and its comorbidities on peripheral artery disease (PAD) is unclear. This study aimed to determine the effect of DM and its comorbidities on the burden of lower extremity PAD based on the global limb anatomic staging system (GLASS) stage using computed tomography angiography (CTA).

Methods: Data from 166 consecutive patients with DM and 166 matched controls who had undergone lower extremity CTA examination were analyzed. Arterial calcification (ACal), femoropopliteal grade, infrapopliteal grade, and overall GLASS stage were evaluated and compared at per-patient and per-artery levels.

Results: On the per-patient level, the DM group had a number higher of patients with ACal $> 0\%$ (117/166 vs. 49/166, $p < 0.001$), and lower extremity vascular GLASS stage $\geq I$ (141/166 vs. 104/166, $p < 0.001$) and were more likely to have bilateral lower extremity involvement (110/141 vs. 45/104, $p < 0.001$) than controls. On the per-artery level, age, DM, diabetic foot, dyslipidemia, hypertension, and renal insufficiency were associated with severe ACal (all $p < 0.05$). Smoking (odds ratio [OR] = 2.68, $p = 0.001$), hypertension (OR = 2.66, $p = 0.001$), and renal insufficiency (OR = 4.33, $p < 0.001$) were associated with an increased risk of stage $\geq I$, and dyslipidemia (OR = 1.76, $p = 0.022$; OR = 1.67, $p = 0.047$) and renal insufficiency (OR = 4.25, $p < 0.001$; OR = 3.83, $p < 0.001$) were associated with an increased risk of stage $\geq II$ and stage III, respectively.

Conclusions: DM is related more frequently to lower extremity ACal, PAD, and bilateral lower extremity involvement, and its comorbidities increase the burden of lower extremity PAD, among which dyslipidemia and renal insufficiency significantly increase the risk of severe PAD in the context of DM.

PO-0956

Machine learning prediction of obstructive coronary artery disease in PLWH: a new model based on HIV-specific factors.

Hui Liu, Ting Liu

The First Hospital of China Medical University

Objectives: The traditional models for evaluating the pretest probability of obstructive coronary artery disease (CAD) are only applicable to the general population. However, people living with HIV (PLWH) experience a higher CAD risk. We aim to develop a machine learning (ML) model to predict obstructive CAD ($\geq 50\%$ stenosis) on coronary CT angiography (CCTA) in the subclinical PLWH.

Methods: We compared the RF model established by random forests with traditional models (CAD consortium basic, CAD consortium clinical, CONFIRM score, and Genders clinical model) in a retrospective cohort of PLWH who underwent CCTA. In addition, we used logistic regression to build the LR model for comparison with the RF model. Predictive performance of the above models was evaluated according to DeLong et al.

Results: Overall 304 PLWH (age 48 ± 11 years, 91.1% males) were analyzed, of whom 64 (21.1%) had obstructive CAD. The RF model (AUC of 0.914) had the highest discrimination for obstructive CAD compared with the LR model, CAD consortium basic, CAD consortium clinical, CONFIRM score, and Genders clinical model (AUC of 0.827, 0.772, 0.754, 0.753 and 0.753, respectively). $P < 0.05$ for all comparisons.

Conclusion: The RF model incorporating cardiovascular risk factors and HIV-specific factors can more accurately estimate the pretest likelihood of obstructive CAD in PLWH than traditional models. In clinical practice, the use of such a model can improve risk stratification in HIV populations and help guide downstream management.

PO-0957

The relationship between quantitative parameters of pericoronary adipose tissue and coronary artery plaque types based on spectral CT

Yulin Jia, Lei Zou, Xigang Xiao

The First Affiliated Hospital of Harbin Medical University

Purpose: Dual-layer spectral detector computed tomography (SDCT) can derive multiple parameter images, which can be used for multiple quantitative parameter measurement. This study aimed to assess the relationship between quantitative parameters of pericoronary adipose tissue (PCAT) and coronary artery plaque types based on spectral CT.

Methods: Patients with coronary atherosclerosis disease were collected and underwent coronary CT angiography (CCTA) with SDCT. They were divided into three groups based on the plaque type at the most stenotic lumen: calcified plaque (CP), non-calcified plaque (NCP) and low-density non-calcified plaque (LD-NCP). Peri-plaque fat attenuation index (FAI) of the most stenotic lumen were measured on conventional image (120kVp), virtual mono-energetic images (VMI) from 40 keV to 100 keV and virtual non-contrast image (VNC). The slope of spectral attenuation curve (λ) at 40-70 keV interval, 40-100 keV interval and 70-100 keV interval were calculated, respectively. Effective atomic number (ZEFF) of peri-plaque PCAT was measured meanwhile.

Results: 231 coronary arteries with plaques and lumen stenosis were finally enrolled, of which 66 vessels with CP, 92 vessels with NCP and 73 vessels with LD-NCP. Peri-plaque FAI_{120kVp}, FAI_{VMI}, FAI_{VNC}, λ and ZEFF_{PCAT} were significantly different in the three groups ($P < 0.05$).

Among the multiple quantitative parameters of PCAT, LD-NCP group was higher than NCP group, and NCP group was higher than CP group.

Conclusion: Quantitative parameters of peri-plaque PCAT derived from spectral CT is closely related to plaque types of coronary. It is a potential non-invasive examination method in assessing the high-risk plaque and plaque vulnerability, especially on non-contrast images.

PO-0958

Evaluation of peri-plaque pericoronary adipose tissue attenuation in coronary atherosclerosis using spectral CT

Yulin Jia, Lei Zou, Xigang Xiao
The First Affiliate Hospital of Harbin Medical University

Purpose: Pericoronary adipose tissue (PCAT) is a biomarker of coronary inflammation. This study aimed to evaluate which of the fat attenuation index (FAI) at proximal part of the most stenosis lumen or peri-plaque PCAT is more valuable in evaluating coronary atherosclerosis.

Methods: Patients with coronary atherosclerosis were enrolled and underwent coronary CT angiography (CCTA) with dual-layer spectral detector CT (SDCT). Plaque type was classified as calcified plaque (CP), non-calcified plaque (NCP) and low-density non-calcified plaque (LD-NCP). Lumen stenosis was classified as mild stenosis, moderate stenosis and severe stenosis. Proximal and peri-plaque fat attenuation index (FAI) of the most stenotic lumen were measured both on conventional image (120kVp) and virtual mono-energetic images (VMI) from 40 keV to 100 keV. The slope of spectral attenuation curve (λ) at 40-70 keV interval, 40-100 keV interval and 70-100 keV interval were calculated, respectively.

Results: 231 coronary arteries with plaques and lumen stenosis were finally enrolled. Proximal and peri-plaque FAI increased with the stenotic degree of coronary artery. Peri-plaque FAI_{120kVp} and FAI_{VMI} were significantly higher in severe stenotic vessels than in mild and moderate stenotic vessels ($P < 0.05$), while λ of proximal and peri-plaque PCAT attenuation were not statistically different ($P > 0.05$), neither was the proximal FAI of vessels with different degrees of stenosis ($P > 0.05$). Peri-plaque FAI_{120kVp}, FAI_{VMI}, and λ were significantly higher in LD-NCP and NCP than in CP ($P < 0.01$). The values were the highest in LD-NCP group. Proximal FAI_{120kVp} and FAI_{VMI} were also significantly different in different plaque types ($P < 0.05$), but the highest FAI values were in NCP group. λ of proximal PCAT attenuation were not statistically different in different plaque types ($P > 0.05$).

Conclusion: Peri-plaque PCAT has much value in assessing coronary atherosclerosis than proximal PCAT. Peri-plaque PCAT attenuation is expected to be used for evaluation of plaque vulnerability and hemodynamic characteristics.

PO-0959

Cardiac MRI-based study of characteristic quantitative parameters in uremic cardiomyopathy patients

Zhaoxin Tian, Shiqi Jin, Ting Liu
The First Hospital of China Medical University

AIMS: Left ventricular hypertrophy is the most common manifestation of cardiomyopathy caused by chronic kidney disease (CKD). This study aimed to find out the characteristic cardiac magnetic resonance imaging (CMR) signatures in uremic cardiomyopathy (UC) patients compared with hypertensive, hypertrophic cardiomyopathy patients and healthy controls.

METHODS: This retrospective study included 53 patients with UC, 39 patients with essential hypertension (HTN), 30 patients with hypertrophic cardiomyopathy (HCM) and 30 healthy controls who underwent routine CMR at the First Hospital of China Medical University from June 2016 to March 2023.

RESULTS: UC patients demonstrated significantly higher native myocardial T1 and T2 values compared with the other three groups. UC patients revealed significantly higher GCS, RLSR and CLSR compared with HCM and HTN patients, whereas all these three parameters were lower in the patient groups than controls. According to Pearson correlation coefficient, there was a significant correlation between T1 and T2 values in UC patients ($r=0.511$, $p<0.001$) while no correlations were shown in other three groups. T1, RLSR and GCS (AUC 0.711, 95% CI: 0.604-0.819; AUC 0.706, 95% CI: 0.597-0.815; AUC 0.706, 95% CI: 0.591-0.821; respectively, $P<0.01$ for all) were discriminators for UC and HTN patients. T1, T2, RLSR and CLSR (area under ROC curve (AUC) 0.719, 95% confidence interval (CI): 0.598-0.841; AUC 0.730, 95% CI: 0.617-0.843; AUC 0.774, 95% CI: 0.663-0.885; AUC 0.718, 95% CI: 0.600-0.836; respectively, $P<0.01$ for all) were discriminators for UC and HCM patients.

CONCLUSIONS: Our findings revealed several characteristic CMR signatures in UC patients. Native T1 and T2 was significantly raised and had a significant correlation in UC patients compared with other groups. They enable clinicians to further distinguish the causes of cardiac hypertrophy in CKD patients so that the patients will be treated more appropriately.

PO-0960

Quantitative evaluation of diffuse myocardial fibrosis in patients with hypertension by late iodine enhancement quantified extracellular volume fraction based on Dual-layer Spectral Detector CT

Xihan Fan, Jie Deng, Yirui Yang, Wei Chen*
The First Affiliated Hospital of Kunming Medical University

Purpose: To quantify the severity of diffuse myocardial fibrosis in patients with hypertension by extracellular volume fraction (ECV) derived from late iodine enhancement (LIE) via Dual-layer Spectral Detector CT (SDCT).

Materials and methods: The validation group consisted of 1 patient with aortic stenosis, 3 with hypertension and 6 healthy subjects. All subjects completed cardiac magnetic resonance (CMR) and SDCT examination, and CMR-ECV and CT-ECV were calculated by T1 mapping and LIE images, respectively, and were compared. Then, 25 subjects with hypertension were included as the case group, which were divided into two subgroups based on left ventricular ejection fraction (LVEF), hypertensive patients with preserved LVEF ($LVEF \geq 50\%$, $n=14$, Gp) and patients with reduced LVEF ($40\% < LVEF < 50\%$, $n=11$, Gr). 20 subjects without heart disease and hypertension were enrolled as the control group (Gc). Patients and controls underwent LIE to calculate CT-ECV according to the American Heart Association 16-segment models. Statistical analysis included paired t-test, Bland-Altman analysis, intra-class correlation coefficients (ICC), independent samples t test, Welch ANOVA test and Kruskal-Wallis test.

Results: In the validation group, there were no significant difference between CT-ECV and CMR-ECV (29.66 ± 4.17 vs 29.38 ± 4.57 , $P>0.05$) and CT-ECV correlated with CMR-ECV ($r=0.946$, $P<0.001$). CT-ECV matched well with CMR-ECV with insignificant bias (0.3%; 95% CI: -2.4% to 2.9%). The inter- and intra-observer agreement for CT-ECV were 0.902 and 0.946, respectively. Compared with the control group, the CT-ECV were increased in patients with hypertension 28.72 (1.97) vs. 27.00 ± 1.32 , $P<0.05$. Based on subgroup analysis, compared with the control group, the CT-ECV were only increased in the patients with reduced LVEF 29.97 (1.68) vs. 27.00 ± 1.32 , $P<0.05$, but not in the patients with preserved LVEF 28.37 (2.51) vs. 27.00 ± 1.32 , $P>0.05$.

Conclusions: CT-ECV derived from LIE via SDCT is a reliable imaging marker with good repeatability for quantifying diffuse myocardial fibrosis. Furthermore, CT-ECV was found to be increased in hypertensive patients with reduced LVEF.

PO-0961

Artificial intelligence for segmentation and classification of lobar, lobular, and interstitial pneumonia using case-specific CT information

Qiao Zhu, Xiaohua Wang
Peking University Third Hospital

Objective: Pneumonia can be anatomically classified into lobar, lobular, and interstitial types, each associated with different pathogens. Utilizing artificial intelligence to determine the anatomical classifications of pneumonia and assist in refining the differential diagnosis may offer a more viable and clinically relevant solution. This study aimed to develop a multi-classification model capable of identifying the occurrence of pneumonia in patients by utilizing case-specific CT information, categorizing the pneumonia type (lobar, lobular, and interstitial pneumonia), and performing segmentation of the associated lesions.

Methods: Sixty-one lobar pneumonia patients, 60 lobular pneumonia patients, and 60 interstitial pneumonia patients were consecutively enrolled at our local hospital from June 2020 and May 2022. All selected cases were divided into a training cohort (n=135) and an independent testing cohort (n=46). To generate the ground truth labels for the training process, manual segmentation and labeling were performed by three junior radiologists. Subsequently, the segmentations were manually reviewed and edited by a senior radiologist. Artificial intelligence models were developed to automatically segment the infected lung regions and classify the pneumonia. The accuracy of pneumonia lesion segmentation was analyzed and evaluated using the Dice coefficient. Receiver operating characteristic curves were plotted, and the AUC (Area Under the Curve), accuracy, precision, sensitivity, and specificity were calculated to assess the efficacy of pneumonia classification.

Results: Our artificial intelligence model achieved a Dice coefficient of 0.743(95%CI: 0.657-0.826) for lesion segmentation in the training set and 0.723(95%CI: 0.602-0.845) in the test set. In the test set, our model achieved an accuracy of 0.927(95%CI: 0.876-0.978), precision of 0.889(95%CI: 0.827-0.951), sensitivity of 0.889(95%CI: 0.827-0.951), specificity of 0.946(95%CI: 0.902-0.990), and AUC of 0.989 for pneumonia classification. We trained the model using labels annotated by senior physicians and compared it to a model trained using labels annotated by junior physicians. The Dice coefficient of the model's segmentation improved by 0.014, increasing from 0.709(95%CI: 0.589-0.830) to 0.723(95%CI: 0.602-0.845), and the AUC improved by 0.042, rising from 0.947 to 0.989.

Conclusions: In conclusion, our study presents a robust multi-task learning model with substantial promise in enhancing the segmentation and classification of pneumonia in medical imaging.

PO-0962

Development and validation of a Nomograph based on CAC and clinical features for diagnosis of obstructive coronary artery disease in Military Personnel

Rui Zuo

General Hospital of Eastern Theater Command

Objective: Objective To explore the associations between military cardiovascular risk factors, coronary artery calcium score (CACS), and obstructive coronary artery disease (CAD), as well as the incremental value of CAC, and whether intuitive and accurate models for the diagnosis and prediction of obstructive coronary artery disease (OCD) can be developed and validated.

Methods: The 4498 military personnel who were undergoing coronary CT angiography (CCTA) excluded patients with poor image quality and a history of percutaneous coronary intervention (PCI) or coronary artery bypass grafting (CABG), resulting in the inclusion of 3859 military personnel. For all patients, the degree of luminal stenosis and CACS are measured. Obstructive coronary artery disease is defined as $\geq 50\%$ stenosis on CCTA. According to CACS, patients are divided into four groups: CACS=0, $0 < \text{CACS} \leq 100$, $101 < \text{CACS} \leq 400$, and $\text{CACS} > 400$. Mann-Whitney U test, Kruskal-Wallis H test, logistic regression model and ROC curve are used for statistical analysis. The model built on CAC was compared with a cardiovascular risk factor model, and then the CAC model was compared with a CAC+ cardiovascular risk factor model to assess the continuity and classification of the model for net reclassification improvement (NRI) and integrated discrimination improvement (IDI). A nomogram is generated based on the multivariate logistic regression analysis, to identify potential predictors associated with obstructive coronary artery disease. The performance of the nomogram is evaluated for discrimination, calibration, and clinical utility.

Results: Age, gender, diabetes mellitus, dyslipidemia, hypertension, current smoking, and drinking are all risk factors for the development of obstructive CAD (OR=1.083, $P < 0.0001$; OR=1.582, $P = 0.001$; OR=3.308, $P < 0.0001$; OR=5.496, $P < 0.0001$; OR=4.789, $P < 0.0001$; OR=2.021, $P < 0.0001$; OR=2.330, $P < 0.0001$). Compared with CAC=0, $0 < \text{CACS} \leq 100$, $101 < \text{CACS} \leq 400$, and $\text{CACS} > 400$ are risk factors for obstructive CAD (OR=8.739, $P < 0.0001$; OR=45.193, $P < 0.0001$; OR=199.752, $P < 0.0001$). CACS has incremental value for cardiovascular risk factors (NRI=0.191, $P < 0.001$). Military data from 2927 training set are analyzed to build the nomogram. Obstructive CAD is associated with 7 factors: age, gender, hypertension, Diabetes mellitus, $0 < \text{CAC} \leq 100$, $101 < \text{CAC} \leq 400$, and $\text{CAC} > 400$. The model achieves a concordance index of 0.899 and has a well-fitted calibration curve and good clinical application value.

Conclusion: In the military population, age, gender, diabetes and hyperlipidemia are all risk factors for coronary artery obstruction disease. CACS has incremental value for cardiovascular risk factors. Nomograms incorporating CACS have high accuracy in predicting obstructive CAD.

PO-0963

Myocardial Extracellular Volume Fraction from Late Iodine Enhancement with Spectral Detector Computed Tomography for Risk Stratification in Non-ischemic Heart Failure

Jie Deng, Dan Han, Xihan Fan, Hongen Zheng, Zhiming Li, Wei Gao, Wenfeng Jin, Wei Chen*
The First Affiliated Hospital of Kunming Medical University

Purpose:

Our previous study demonstrated that CT-ECV derived from LIE can serve as an excellent alternative to CMR-ECV in noninvasively quantifying diffused myocardial fibrosis. We will further explore the potential of CT-ECV derived from late iodine enhancement (LIE) via using dual-layer spectral detector computed tomography (SDCT) for disease risk stratification in patients with non-ischemic heart failure (NIHF).

Methods and Materials:

Eighty-two NIHF patients (52±13 years, 21 female) underwent SDCT. CT-ECV was calculated based on LIE images according to AHA's 16-segmentation. Clinical data of NIHF patients were reviewed and patients were followed up for primary clinical endpoints, the primary clinical endpoint was the first occurrence of a major adverse cardiovascular event (MACE), which included hospital admission for heart failure and all-cause mortality. Receiver operating curve (ROC curve) and area under curve (AUC) were used to evaluate the prediction model. ROC curve and Yoden index determine the optimal cut-off value of CT-ECV. Kaplan-Meier curve and log-rank test were used to analyze the relationship between MACE and CT-ECV of patients with NIHF.

Results:

Clinical outcome data were collected from 82 patients with NIHF after a median follow up of 10 months (interquartile range: 5 to 13). Final status check was performed during March 2023, and 7 patients lost follow-up. 31 (41.3%) of the 75 patients with MACE, including 28 (37.3%) patients were hospitalized for heart failure, and all-cause mortality occurred in 3 (4%) patients. The ROC curves demonstrated CT-ECV ≥ 31.28 % to be the optimal cut-off point for MACE with 83.9% sensitivity, 75% specificity and the area under the ROC curve = 0.863 (95% CI 0.782 to 0.944). Kaplan-Meier survival curves and Log-rank test demonstrate that NIHF patients with CT-ECV ≥ 31.28% had higher probability of MACE than NIHF patients with CT-ECV < 31.28%.

Conclusions:

CT-ECV derived from Late Iodine enhancement can assist in risk stratification in patients with non-ischemic heart failure.

PO-0964

Incremental prognostic value of myocardial radiomics derived from coronary CTA over clinical and CTA findings in patients with stable angina: a multicenter study

Pei Nie¹, Xinxin Yu², Yan Deng³, Kaiyue Zhi¹, Guangjie Yang¹, Ximing Wang²

1. The Affiliated Hospital of Qingdao University

2. Shandong Provincial Hospital Affiliated to Shandong First Medical University

3. Qilu Hospital of Shandong University

Objective To investigate additional risk stratification benefits of myocardial radiomics derived from coronary CTA (CCTA) over clinical and CTA findings in patients with stable angina.

Methods A total of 977 patients (mean age 64.2±10.3 years; 45% male; training/test cohort, 683/294) with stable angina who underwent CCTA were retrospectively included from three hospitals. The endpoints of this study were major adverse cardiovascular events (MACE). Clinical features (baseline demographics, cardiovascular risk factors, and medications) and CTA findings (segment stenosis score [SSS], segment involvement score [SIS], three-vessel plaque score [TVPS], and severe proximal plaque score [SPPS]) were analyzed to identify the independent predictors. The left ventricular myocardium was segmented from CCTA images, and the radiomics features were extracted and assessed to build a radiomics signature (RS). A radiomics nomogram was constructed by combining the independent clinical and CTA predictors with the RS. The performance of the models was evaluated with concordance index (C-index), hazard ratio (HR), time-dependent area under the receiver operating characteristics curve (time-AUC), and clinical usefulness.

Results During a median follow-up of 3.6 years, MACE was observed in 122 (12.5%) patients. Age, body mass index, dyslipidemia, and SPPS were proven as independent predictors for MACE (C-index, 0.677, test cohort). The RS was significantly associated with MACE (C-index, 0.718; HR, 4.154, test cohort). By adding the RS to the clinical and CTA predictors, the radiomics nomogram provided a higher C-index (0.768, test cohort), higher time-AUCs, and higher clinical net benefit. In subgroup analyses in patients with diabetes mellitus and hypertension, the RS had additive predictive value for MACE over the clinical and CTA findings.

Conclusion In patients with stable angina, evaluation of CCTA-derived myocardial radiomics enables more accurate prediction of patients at higher risk of MACE.

PO-0965

Predicting Lymphovascular Invasion in Non-Small Cell Lung Cancer Using Deep Convolutional Neural Networks on Preoperative Chest CT

Jian Wang, Maosheng Xu

The First School of Clinical Medicine of Zhejiang Chinese Medical University

Purpose: To investigate the predictive capability of various models within a deep neural network framework for identifying lymphovascular invasion (LVI) in chest CT images of non-small cell lung cancer (NSCLC).

Materials and Methods: This retrospective observational study included a series of consecutive patients who underwent surgical resection for NSCLC and received pathologically confirmed diagnoses. The cohort was randomly divided into a training group comprising 70% of the patients and a validation group comprising the remaining 30%. Four distinct deep convolutional neural network (DCNN) prediction models were developed, incorporating different combination of two-dimensional (2D) and three-dimensional (3D) CT imaging features as well as clinical-radiological data. The predictive capabilities of the models were evaluated by receiver operating characteristic curves (AUC) values and confusion matrices. The Delong test was utilized to compare the predictive performance among the different models.

Results: A total of 3,034 patients with NSCLC were recruited in this study including 2,832 adenocarcinomas, 138 squamous cell carcinoma, 46 adenosquamous carcinoma, and 18 other subtypes. In the validation cohort, the Dual-head Res2Net_3D_23F model achieved the highest AUC of 0.869, closely followed by the models of Dual-head Res2Net_3D_3F (AUC, 0.868), Dual-head Res2Net_3D (AUC, 0.867), and EfficientNet-B0_2D (AUC, 0.857). There was no significant difference observed in the performance of the EfficientNet-B0_2D model when compared to the Dual-head Res2Net_3D_3F and Dual-head Res2Net_3D_23F.

Conclusion: Findings of this study suggest that utilizing deep convolutional neural network is a feasible approach for predicting pathological lymphovascular invasion in patients with NSCLC.

PO-0966

Left Ventricular Entropy is a novel predictor of major adverse cardiac events (MACE) in patients with coronary atherosclerosis: A multi-center study

Wenxian Wang,Ximing Wang,Yan Gao
Shandong Provincial Hospital Affiliated to Shandong First Medical University

AbstractObjectives: To investigate the incremental prognostic value of left ventricular (LV) entropy in a large multi-center population with coronary atherosclerotic heart disease (CAD).

Background: Current risk stratification of patients with CAD is imprecise and not accurate enough.

Methods: A total of 314 CAD patients who underwent cardiovascular magnetic resonance (CMR) late gadolinium enhancement (LGE) at two medical centers in China between October 2015 and July 2022 were included in this study. Additionally, the 193 patients under 3.0T field also underwent CMR T1 mapping. LV entropy and extracellular volume (ECV) were calculated from the LGE image of LV myocardium, and major adverse cardiac events (MACE) were analyzed.

Results: Among 314 patients, 110 experienced MACE during a median follow-up of 13 months. The risk of MACE was significantly increased in the high entropy group (log-rank $P < 0.001$). Entropy maintained an independent association with MACE in a multivariable model including left ventricular ejection fraction (LVEF) and LGE (HR=1.78; $P = 0.001$). In addition, the primary endpoint events prognostic value was significantly improved by adding LV entropy to the baseline multivariable model (C-statistic improvement: 0.785-0.818, Delong test: $P = 0.001$). Similarly, among 193 3.0T field patients, adding LV entropy to the multivariable baseline model significantly improved the prognostic value of the model for MACE (C-statistic improvement: 0.820-0.898, Delong test: $P = 0.004$).

Conclusion: CMR-assessed LV entropy is a powerful independent predictor of MACE in patients with CAD, incremental to common clinical and CMR risk factors, including LVEF, LGE, Native T1 and ECV.

PO-0967

Entropy for the Assessment of Myocardial Fibrosis in Non-ischemic Cardiomyopathy

Yan Gao,Ximing Wang,Wenxian Wang
Shandong Provincial Hospital Affiliated to Shandong First Medical University

Abstract

Background: Entropy of left ventricular (LV) wall can predict cardiac adverse events. However, its mechanistic insights and the underlying link of entropy with markers of myocardial fibrosis were unclear.

Objectives: This study aimed to explore the correlation between entropy of LV wall derived from late gadolinium enhancement (LGE) and imaging markers of myocardial fibrosis, including native T1 and extracellular volume (ECV) fraction in non-ischemic cardiomyopathy (NICM).

Methods: A total of 602 subjects with NICM and 106 age and gender-matched healthy controls who underwent cardiac magnetic resonance (CMR) were retrospectively enrolled. The correlation between native T1/ECV and LV entropy was measured in NICM patients and the ability of LV entropy for detecting myocardial fibrosis was estimated.

Results: LV wall entropy was positively correlated with both native T1 and ECV ($r = 0.430$ and $r = 0.533$, respectively; $p < 0.001$) in all NICM patients. In subgroups of dilated cardiomyopathy (DCM), hypertrophic cardiomyopathy (HCM), left ventricular noncompaction (LVNC) and hypertensive heart disease (HHD) patients, LV entropy also showed moderate to strong positive correlation with

native T1 and ECV ($p < 0.05$). Furthermore, the diagnostic performance of entropy between low ECV in LGE-negative patients and healthy controls were considerable ($AUC = 0.95$, $p < 0.001$). Conclusion: LV entropy exhibited comparable ability as native T1/ECV in the display of myocardial fibrosis, and therefore diffuse myocardial fibrosis in NICM may be reliably assessed by LV entropy. In addition, LV entropy could detect diffuse myocardial fibrosis earlier than native T1 and ECV in NICM.

Coronary computed tomography angiography compared with standard of care for evaluation of NSTEMI-ACS: a meta-analysis of randomised controlled trials

Huihui Kong, Yi He
Beijing Friendship Hospital

Purpose: 2020 ESC guidelines for non-ST-segment elevation acute coronary syndrome (NSTEMI-ACS) updates that coronary CT angiography (CCTA) is the class I recommendation to exclude ACS when there is a low-to-intermediate likelihood of coronary artery disease (CAD) and when cardiac troponin and/or ECG are normal or inconclusive. The aim is to perform a meta-analysis comparing CCTA with standard-of-care (SOC) approach on management and clinical outcomes in evaluation of patients suspected of NSTEMI-ACS.

Method: We systematically search Pubmed, Embase, and Cochrane for randomized controlled trials (RCT) that compared CCTA vs SOC in patients with acute chest pain to the emergency department (ED) and suspected/confirmed NSTEMI-ACS. End points evaluated are incidence of hospital readmissions, repeat ED visits, referral to invasive coronary angiography (ICA), revascularization, and major adverse cardiac events (MACE). Pooled odds ratio (OR) and their 95% confidence intervals (CI) are calculated using random-effects models.

Result: Seventeen RCTs with 9210 patients (CCTA: 4872, SOC: 4338) were included. No statistically significant difference was noted between two arms with regards to hospital readmissions (OR 0.80, 95%CI 0.55–1.16, $P=0.24$, $I^2=51\%$), repeat ED visits (OR 0.99, 95%CI 0.78–1.26, $P=0.96$, $I^2=49$), MACE (OR 1.02, 95%CI 0.77–1.36, $P=0.88$, $I^2=31$) and referral to ICA (OR 1.25, 95%CI 0.95–1.65, $P=0.11$, $I^2=73$). However, significantly higher rates of revascularization (OR 1.42, 95%CI 1.09 - 1.85, $p=0.009$) were observed in the CCTA arm (Figure). Conclusion: In patients suspected of NSTEMI-ACS, CCTA increases revascularization rate and does not improve clinically relevant patient outcomes compared with SOC.

PO-0969

Myocardial viability under various ischemic burdens in chronic total occlusions: a stress-cardiac magnetic resonance study

Kang Li
The Second Xiangya Hospital Of Central South University

Objectives: This study aimed to analyze each myocardial segment's ischemic burden, scarring, function, and viability by late gadolinium enhancement (LGE) imaging and stress perfusion CMR using adenosine, and provide a basis for assessing myocardial viability before revascularization in patients with CTO.

Methods: This study prospectively recruited 80 patients from our hospital between August 2021 and August 2022. All patients had scanning prior to revascularization. Two experienced radiologists evaluated the volume of perfusion defects at rest and pressure for each segment as a percentage of the total volume of that corresponding segment. Moreover, segments without perfusion defect were defined as the no ischemic group, segments with a perfusion defect of $\leq 50\%$ were defined as a low ischemic burden group, and segments with a perfusion defect of $> 50\%$ were defined as a high ischemic burden group. "Segmental wall thickening (SWT)" was defined as the absolute difference between the end-diastolic and end-systolic wall thickness. Finally, viability was defined by dysfunctional myocardium (< 3 mm segmental wall thickening [SWT]) and $\leq 50\%$ late gadolinium enhancement (LGE).

Results: A total of 445 segments in the CTO territory were analyzed, scar tissue was found in the CTO territory, with LGE evident in 18.2% of CTO segments totaling $> 50\%$. Among the different ischemic burden groups, there were significant differences in LGE volume ($p < 0.01$), and the trend of SWT was consistent with the degree of myocardial ischemia. The incidence of $\leq 50\%$ LGE and viable myocardium was higher in segments of the no ischemia and low ischemic burden groups. However, there was no significant difference in the incidence of dysfunctional myocardial segments among the three groups ($P > 0.05$).

Conclusions: Stress MRI parameters can accurately and in detail assess myocardial viability and function, so multi-parameter joint assessment of CTO patients by stress MRI will help in treatment decisions.

PO-0970

Right Ventricular Function Predicts Outcome in Heart Failure with Preserved Ejection Fraction: Strain Analysis Derived from MR Feature-Tracking

Leyi Zhu, Shihua Zhao, Minjie Lu
Fuwai Hospital

Background: Left ventricular (LV) strain derived from cardiac magnetic resonance feature tracking (CMR-FT) has emerged as a powerful predictor of poor prognosis in patients with heart failure with preserved ejection fraction (HFpEF). Right ventricular (RV) function is an independent determinant of patient clinical status and prognosis in cardiovascular diseases; however, limited data are available on the prognostic value of RV function assessed by strain analysis in patients with HFpEF. The purpose of this study is to evaluate the association between RV strain parameters derived from CMR-FT and primary composite outcomes (all-cause death or heart failure hospitalization) in patients with HFpEF.

Methods: Patients with HFpEF who underwent CMR examination between January 2010 and September 2012 were retrospectively enrolled. FT strain analysis was performed to measure LV, left atrial (LA), and RV strain parameters (strain and strain rate). The correlations between strain parameters and other CMR-derived variables were analyzed by linear regression. The association between variables and clinical outcomes was assessed by Cox proportional regression and Kaplan-Meier survival analysis. Receiver operating characteristic (ROC) analysis was performed to determine the best cut-off value for strain parameters.

Results: A total of 299 consecutive patients with HFpEF (59 ± 11 years; 97 women) were enrolled in this study. The LV and RV strain parameters of all patients were analyzed. RV global circumferential strain (RV-GCS) was weakly but significantly correlated with LV ejection fraction ($r = -0.303$, $P < 0.001$), LA ejection fraction ($r = -0.193$, $P < 0.001$), RV ejection fraction ($r = -0.267$, $P < 0.001$), and RV end-systolic volume ($r = 0.242$, $P < 0.001$). During a median follow-up of 11.0 years (interquartile range, 10.5-11.7 years), 153 patients reached the primary composite outcomes. In multivariable Cox regression analysis, impaired RV-GCS ($> -16.6\%$) was the only strain

parameter associated with a greater rate of all-cause death or heart failure hospitalization (hazard ratio, 2.0 [95% CI: 1.3, 3.1]; $P = .003$) after adjusting for multiple clinical and CMR-derived variables.

Conclusion: RV-GCS derived from CMR-FT was an independent predictor of adverse clinical outcomes in patients with HFpEF, and it provided incremental prognostic value over traditional clinical and CMR-derived risk markers.

PO-0971

急性心梗 PCI 术后心脏 MRI 室壁运动分析

Lihua Wang, Qian Li, Qiyuan Wang, Jianzhong Sun

The Second Affiliated Hospital of the Medical College of ZheJiang University, China

目的: 研究急性心梗 PCI 术后心脏 MRI 节段性室壁运动变化及其对预后的预测价值。**材料和方法:** 本研究获得医院伦理委员会批准, 患者书面知情同意。18 例急性心梗患者接受 PCI 及常规内科治疗, 对所有患者行基线、6 个月、12 个月随访心脏增强 MRI 检查, 其中 12 例患者完成 12 个月随访检查。扫描采用 GE Signal HDXT 1.5T MRI 机, 序列采用左室短轴位电影序列, 2D 延迟增强序列。造影剂采用 Gd-DTPA, 0.2mmol/kg, 流率: 4.0ml/s, 10-15 分钟延迟。所得图像在 report CARD4.0 中行左室射血分数及左室舒张末期容积及梗死区域治疗 ROI, 总体 ROI 及 ROI% 计算。

在 SEGMENT 软件中左室壁内外边界被自动描记, 经过人工微调后, 自动计算室壁运动数据并生成 17 段牛眼图, 节段性室壁运动参数包括: 最大膨胀速度 (瞬时最大速度)、最大收缩速度 (瞬时最大速度)、峰值充盈率时膨胀速度、峰值射血率时收缩速度、最大壁厚、平均收缩末期壁厚, 平均舒张末期壁厚, 壁厚分数及心肌容积等。统计分析在 SPSS13.0 中采用 T 检验和相关分析。

结果: 18 例患者中, 男 14 例, 女 4 例, 年龄中位数 59 岁。全部梗死区域隶属左冠状动脉供血区, 分布于 AHA 第 7-15 节段。统计分析发现基线和 6 月比较, 最大收缩速度 (瞬时最大速度) 和峰值充盈率时膨胀速度于梗死段和非梗死段均存在显著性差异。梗死区基线最大收缩速度 (瞬时最大速度) 和充盈率时膨胀速度均减低, 6 月后恢复最好, 12 月随访二者均减低, 但未出现显著性差异。6 月梗死段较非梗死段最大壁厚存在显著性差异; 梗死段最大壁厚增加。在随访中心肌容积持续下降, 这一趋势于梗死段心肌更为显著。基线与 6 个月左室舒张末期容积与左室射血分数负相关:

($p=0.001$, $r=-0.632$, $r=-0.750$), 与 ROI、总体 ROI 正相关 ($p=0.001$, $r=0.650$, 0.615 ; $r=0.652, 0.492$)。基线与 6 个月比较, 左室射血分数与 ROI、ROI% 负相关 ($p=0.001$, $r=-0.590$, -0.624 , $r=-0.617, -0.661$)。12 月左室舒张末期容积与总体 ROI 正相关 ($p=0.001$, $r=0.870$), 左室射血分数与 ROI 负相关 ($p=0.011$, $r=-0.790$)。

结论: 利用 CMR 对急性心梗 PCI 术后进行节段性室壁运动定量评价是可行的。最大收缩速度和峰值充盈率时膨胀速度可能成为评价心脏泵血功能损害的敏感指标。

Purpose: To find out changes in segmental ventricular wall motion and value of prognostic predication with cardiac MRI in acute myocardial infarction after PCI.

Material and method: Institutional ethics committee approval and written informed consent were obtained. 18 consecutive patients with acute myocardial infarction underwent routine medical and PCI therapy. All 18 patients were performed baseline, 6 months follow-up with cardiac MRI. 12 patients fulfilled 12 months follow-up. Examination was performed in GE Signal HDXT 1.5T. Scan sequences used short-axis left ventricular view in FIESTA. The derived images were processed with SEGMENT in workstation. The ventricular wall motion was described by maximal expansion velocity (temporal max), maximal contraction velocity (temporal max), expansion velocity at peak filling rate (PFR), contraction velocity at peak ejection rate (PER), maximal wall-thickness (temporal max), mean end diastole wall-thickness, mean end systole wall-thickness, wall-thickening, fractional wall-thickening and myocardial volume. Statistics procedure used SPSS 13.0, including T-test and correlation analysis.

Result: 18 patients were studied including 14 male and 4 female, media age was 59yr. All infarction zones belong to left coronary artery supply and located in 7-15 segments. In SEGMENT the margin

of myocardium were depicted automatically and revised manually. The motion data were calculated. Statistics analysis revealed Baseline compared with 6 months follow-up the maximal contraction velocity (temporal max) showed significant differences. The two indicators in infarct segments of baseline all decrease then recovered in 6 months follow up and decreased again in 12 months but no significant differences. Maximal wall thickness (temporal max) between infarct and non infarct segments existed significant difference in 6 months follow-up and infarct segments had larger wall-thickness. Myocardial volume decreased continuously in follow-up duration, the trend was more obvious in infarct than non infarct segments. Correlation analysis revealed in baseline and 6 months follow up, LVEDV showed negative correlation with LVEF ($P=0.001$, $r=-0.632$, $r=-0.750$); LVEDV showed positive correlation with ROI and total ROI ($P=0.001$, $r=0.650$, 0.615 ; $r=0.652, 0.492$). LVEF showed negative correlation with ROI% ($P=0.001$, $r=-0.590$). 12 months follow up LVEDV showed positive correlation with total ROI ($P=0.001$, $r=0.870$); LVEF showed negative correlation with ROI ($P=0.011$, $r=-0.790$).

Conclusion: Quantitative evaluation of ventricular wall motion with cardiac MRI in acute myocardial infarction after PCI is available. Contraction and expansion velocity may be sensitive indicators for pump function impairment evaluation.

PO-0972

Association between thoracic skeletal muscle size and adverse outcomes in diabetes patients with heart failure and reduced ejection fraction: Quantitative analysis of sarcopenia by using cardiac MRI

Ke Shi¹, Ge Zhang¹, Hang Fu², Hua-Yan Xu², Ying-Kun Guo², Zhi-Gang Yang¹

1. West China Hospital

2. West China Second University Hospital

Background: Sarcopenia is associated with poor quality of life and adverse outcomes. Recent evidence suggests that axial thoracic skeletal muscle size could be used as a surrogate to assess sarcopenia in heart failure with reduced ejection fraction (HFrEF). Since diabetes mellitus (DM) is one of the most common comorbidities with HFrEF, we aimed to explore the potential association of axial thoracic skeletal muscle size with left ventricular (LV) remodeling and determine its prognostic significance in this condition.

Methods: A total of 243 diabetes patients with HFrEF were included in this study. Bilateral axial thoracic skeletal muscle size was obtained using cardiac MRI. Patients were stratified by the tertiles of axial thoracic skeletal muscle index (SMI). LV structural and functional indices, as well as amino-terminal pro-B-type natriuretic peptide (NT-proBNP), were measured.

Results: Patients in the lowest tertile of thoracic SMI displayed a deterioration in LV systolic strain in three components, together with an increase in LV mass and a heavier burden of myocardial fibrosis (all $P < 0.05$). Moreover, thoracic SMI ($\beta = -0.26$; $P < 0.001$), rather than body mass index ($\beta = -0.04$; $P = 0.55$), was independently associated with the level of NT-proBNP. The median follow-up duration was 33.6 months (IQR, 20.4-52.8 months). Patients with composite endpoint events showed a lower thoracic SMI (40.1 [34.3, 47.9] cm^2/m^2 vs. 45.3 [37.3, 55.0] cm^2/m^2 ; $P < 0.05$) but a similar BMI ($P = 0.76$) compared with those without composite endpoint events. Reduced thoracic SMI indicated a higher risk of adverse clinical outcomes (hazard ratio: 0.95; 95% confidence interval: 0.92-0.99; $P = 0.01$).

Conclusions: With respect to diabetes patients with HFrEF, thoracic SMI is a novel alternative for evaluating sarcopenia that can be obtained by a readily available routine cardiac MRI protocol. A reduction in thoracic skeletal muscle size predicts poor outcomes in the context of DM with HFrEF.

PO-0973

Comparative analysis of coronary atherosclerosis score based on coronary CT angiography between hypertension patients with and without type 2 diabetes mellitus

Yu Jiang,Zhigang Yang,Jin Wang,Li Jiang,Peilun Han,Rui Shi,Yuan Li
West China Hospital, Sichuan University

Purpose:

This study compares CT-based Leaman score (LeSc) and Leiden score in addition to common coronary computed tomography angiography (CCTA) characteristics between type 2 diabetes mellitus (T2DM) and non-diabetic individuals with hypertension.

Methods and Materials:

From January 2018 to December 2022, a total of 1954 patients, including 1000 T2DM and 954 non-diabetic individuals with hypertension found to have coronary plaques on CCTA were retrospectively enrolled. Coronary plaque types, lumen stenosis (score 1: stenosis < 25%; score 2: 25%~49% stenosis; score 3: 50%~69% stenosis; score 4: 70%~99% stenosis; score 5: total occluded; obstructive stenosis: >50%), and diseased vessels (range: 1-4) and segment (range: 1-17) were assessed; any presence of obstructive stenosis was defined as obstructive disease; segment stenosis score (SSS, sum of stenosis score), CT-based Leaman score, and Leiden score were calculated for each patient. Any presence of each plaque type, obstructive stenosis, involved vessel >2, segment involvement score (SIS) >4, SSS>6, CT-LeSc >5 and Leiden score >5 were compared between T2DM and non-diabetic patients. Univariate and multivariate analysis were used for analysing.

Results:

Overall, strong positive correlations between any two of SSS, CT-LeSc and Leiden score was found in all hypertension patients ($r=0.888-0.988$). In this study, hypertension patients with T2DM had more calcified plaques (2.14 ± 2.24 vs 1.52 ± 2.01), partially calcified plaques (2.86 ± 2.84 vs 2.42 ± 2.60), nonobstructive (4.21 ± 2.43 vs 3.65 ± 2.40) and obstructive stenosis (1.24 ± 2.21 vs 0.78 ± 1.50), and obstructive disease (39.6% vs 34.2%), and had higher SIS (5.5 ± 3.1 vs 4.4 ± 3.0), SSS (10.4 ± 8.6 vs 7.7 ± 7.1), CT-LeSc (9.4 ± 5.6 vs 7.9 ± 5.1) and Leiden score (13.8 ± 7.6 vs 11.5 ± 7.1) (all P values <0.05). When adjusted for confounding factors, hypertension patients with T2DM had higher risks of calcified coronary plaques [odds ratio (OR) =2.127; P <0.001], obstructive disease (OR=1.299; P=0.031), involved vessel >2 (OR=1.511; P=0.001), SIS >4 (OR=1.651; P<0.001), SSS >6 (OR=1.478; P=0.001), CT-LeSc >5 (OR=1.638; P<0.001) and Leiden score >5 (OR=2.115; P<0.001). Whether in male or female and ≤ 70 or >70 years old, T2DM was an independent risk factor for calcified plaques, involved vessel >2, SIS >4, SSS >6, CT-LeSc >5 and Leiden score >5 (all P values <0.05) in hypertension patients. Only in male or >70 years old, T2DM was an independent risk factor for obstructive disease (both P values <0.05).

Conclusions:

CT-LeSc and Leiden score might be useful for coronary atherosclerosis assessment for hypertension patients. T2DM is related to the presence of calcified plaques, obstructive disease, and more extensive coronary artery atherosclerosis plaques.

PO-0974

Protective Effects of High-Altitude Hypobaric Hypoxia on Myocardial Infarction: A 7.0T Cardiovascular Magnetic Resonance Study in a Rat Model

Xin Fang, Fabao Gao
West China Hospital of Sichuan University

Purpose: The impact of high-altitude hypobaric hypoxia on myocardial infarction (MI) cardioprotection is a subject of ongoing research in cardiovascular studies. This investigation aimed to assess the potential protective effects of high-altitude hypobaric hypoxia in a rat model of MI using 7.0T cardiovascular magnetic resonance (CMR) strain analysis.

Materials and Methods: A cohort of 40 rats were randomly distributed into four groups (10 rats per group): plain sham operation control (PSO), plain myocardial infarction operation control (PMO), high-altitude sham operation control (HSO), and high-altitude myocardial infarction operation group (HMO). Rats assigned to high-altitude groups were transported to institution 1 (altitude: 4,250 m), while those in the plain group were sent to institution 2 (altitude: 500 m). The rats underwent acclimatization to their specific environments under standard animal laboratory conditions for three months before initiating the experimental procedures. Four weeks into the modeling process, CMR was employed to assess cardiac function and left ventricular (LV) structural alterations following interventions. Strain analysis was performed to evaluate myocardial wall motion, thereby assessing the protective effects of high-altitude hypobaric hypoxia on MI.

Results: The HMO group displayed a marked improvement in LV function compared to the PMO group (LVEF, HMO vs. PMO = $45.80 \pm 7.53\%$ vs. $33.51 \pm 5.80\%$, $P = 0.021$). Regional strain measurements, such as anterior segmental circumferential strain (ACS, HMO vs. PMO = $-17.07 \pm 2.12\%$ vs. $-8.90 \pm 3.94\%$, $P = 0.038$), anterior segmental longitudinal strain (ALS, HMO vs. PMO = $-12.22 \pm 1.96\%$ vs. $-8.05 \pm 1.24\%$, $P = 0.041$), and anterior segmental radial strain (ARS, HMO vs. PMO = $24.08 \pm 1.74\%$ vs. $16.17 \pm 2.14\%$, $P = 0.003$), exhibited significant differences between the HMO and PMO groups. Additionally, histological evaluations showed a decrease in myocardial injury and fibrosis in the HMO group compared to the PMO group.

Conclusion: The findings of this investigation suggest that high-altitude hypobaric hypoxia provides a protective effect on MI in a rat model. These results enhance our understanding of the potential therapeutic benefits of high-altitude settings for patients at risk of MI and encourage further exploration into the underlying mechanisms and prospective clinical applications.

PO-0975

Paeoniflorin Alleviates Myocardial Infarction-Induced Ventricular Remodeling in High-Altitude Hypobaric Hypoxia: Insights from a 7.0T Cardiovascular Magnetic Resonance Strain Analysis Rat Model

Xin Fang, Fabao Gao
West China Hospital of Sichuan University

Purpose: Investigating the cardioprotective effects of paeoniflorin on myocardial infarction (MI)-induced ventricular remodeling in high-altitude hypobaric hypoxia environments is of great interest in cardiovascular research. This study aimed to evaluate the potential protective role of paeoniflorin in a rat model of MI-induced ventricular remodeling under high-altitude hypobaric hypoxia using 7.0T cardiovascular magnetic resonance (CMR) strain analysis.

Materials and Methods: Sixty rats were randomly allocated to six groups (10 rats per group): plain sham operation control (PSO), high-altitude sham operation control (HSO), high-altitude myocardial infarction operation group (HMO), and low-dose, middle-dose, and high-dose paeoniflorin treatment groups. Rats in the high-altitude groups were transported to institution 1 (altitude: 4,250 m), while the plain group rats were transported to institution 2 (altitude: 500 m). The rats acclimatized to their respective environments under standard animal laboratory conditions for three months before undergoing experimental procedures. After four weeks of modeling, CMR was employed to assess cardiac function and left ventricular (LV) structural changes post-interventions. Strain analysis was performed to determine the protective effects of paeoniflorin on MI-induced ventricular remodeling in the high-altitude hypobaric hypoxia rat model.

Results: Paeoniflorin treatment groups (low-dose, middle-dose, and high-dose) demonstrated a dose-dependent enhancement in LV function compared to the HMO group. Regional strains, encompassing circumferential, longitudinal, and radial strains, showed significant differences between the paeoniflorin treatment groups and the HMO group. Additionally, histological analyses revealed reduced myocardial injury and fibrosis in the paeoniflorin treatment groups relative to the HMO group.

Conclusion: This study's findings indicate that paeoniflorin exerts a protective effect on MI-induced ventricular remodeling in a high-altitude hypobaric hypoxia rat model. These results contribute to understanding the potential therapeutic advantages of paeoniflorin for patients at risk of MI in high-altitude environments, promoting further research into the underlying mechanisms and possible clinical applications.

PO-0976

Comparison of the T2 effects of three T1 mapping sequences of the myocardium at 3T and 1.5T

Yangzhen Hou, Hui Zhou, Jing Luo, Ji Yang
Xiangya Hospital, Central South University

Purpose

To compare the T2 effects of three T1 mapping sequences of the myocardium at 3T and 1.5T.

Materials and Methods

We measured native T1 values by three T1 mapping sequences (FFM, MPI and LONG) and T2 values of 630 consecutive subjects (patients and healthy volunteers) in a mid-ventricular short axis slice by regions of interest (ROIs) placed conservatively within the septal myocardium. Correlations between myocardial T1 and T2 values were analyzed.

Results

Native T1 values differed significantly depending on the sequence, with MPI providing consistently higher mean values than FFM and LONG, LONG providing higher mean values than FFM (all $p < 0.001$). T1 by FFM, MPI and LONG in the total population, disease group, non-ischaemic cardiomyopathy group were all weakly related to T2 at 3T. The correlation coefficient of MPI were the highest in the total population and disease group, but there is no significant difference in correlation coefficients (all $p > 0.05$). Similarly, T1 by FFM, LONG in the total population, disease group, NICM group were all weakly-moderately related to T2 at 1.5T. In the control group, only T1 by MPI was moderately and positively related to T2 ($r=0.469$, $p=0.037$). In the ischaemic cardiomyopathy group, only T1 by MPI was weakly and positively related to T2 ($r=0.334$, $p=0.011$). In the stress condition, T1 by FFM and MPI was weakly and positively related to T2 ($r=0.280, 0.210$, $p=0.001, 0.012$, respectively).

Conclusion

The T2 effects existed in three T1 mapping sequences of the myocardium in varying degrees, we should consider the potential bias from T2 when analyzing the abnormal T1 values of myocardium.

PO-0977

Artificial intelligence software for coronary CT angiography can significantly underestimate the extent and amount of coronary stenosis: A preliminary study.

Yangzhen Hou, Hui Zhou, Jing Luo, Ji Yang
Xiangya Hospital, Central South University

Purpose

To compare the automated diagnostic results of coronary stenosis provided by artificial intelligence (AI) software for coronary CT angiography (CCTA) with those of coronary angiography (CAG).

Materials and Methods

This retrospective study included 123 consecutive patients with CAG-confirmed severe stenosis or occlusion (stenosis $\geq 70\%$) in at least one vessel. The same set of CCTA raw images of the patients were simultaneously sent to two commercial AI software (K-software and M-software) servers for analysis. The maximum degree of stenosis of the left main (LM), left anterior descending (LAD), left circumflex (LCX) and right coronary artery (RCA), number of stenosed vessels, number of vessels with stenosis $\geq 70\%$ were recorded and compared.

Results

The maximum degree of stenosis of LAD, LCX and RCA calculated by both software are lower than that of CAG (all $p < 0.001$), with the measurements in M-software being lower than those of K-software (all $p < 0.001$). The number of vessels with stenosis and vessels with stenosis $\geq 70\%$ provided by both software are significantly less than that shown by CAG (all $p < 0.001$). On Spearman correlation analyses analysis, the degree of stenosis measured by two software is significantly correlated in LM, LAD, LCX and RCA ($r=0.431, 0.350, 0.618, 0.522$, respectively; $p < 0.001$). On Bland-Altman analysis, the mean difference (95% limits of agreement) between CAG and K-software in LM, LAD, LCX and RCA is 9%(5%-13%), 23%(19%-27%), 34%(29%-39%), 18%(13%-22%), respectively. The mean difference (95% limits of agreement) between CAG and M-software in LM, LAD, LCX and RCA is 14%(10%-19%), 51%(47%-55%), 56%(51%-60%), 51%(47%-56%), respectively.

Conclusion

The degree of coronary artery stenosis automatically measured by AI software was significantly lower than the results of CAG, and AI software identified significantly fewer stenosed vessels than CAG.

PO-0978

Differential Diagnosis of Pulmonary Embolism Embolism Detection in Different Risk Stratification Using Spectral Multiparameter CT Imaging

Zhihao Wang¹, Yuhan Zhou¹, Weimeng Cao¹, Limin Lei¹, Jie Liu¹, Weihua Chen¹, Shushan Dong²

1. The First Affiliated Hospital of Zhengzhou University

2. Philips Medical

Purpose: This study aims to explore the differential diagnostic value of spectral based imaging in detecting pulmonary embolism emboli in different risk stratification using spectral CT.

Method: This study retrospectively included 50 patients diagnosed with pulmonary embolism from February 2023 to April 2023. Spectral CT pulmonary angiography (CTPA) was performed, and pulmonary embolism burden was evaluated based on pulmonary embolism risk stratification

combined with pulmonary embolism index Qanadli and Mastora scores. The patients were divided into a low-risk group of 10, a medium risk group of 20, and a high-risk group of 20. Invite two imaging doctors with ten years of work experience to screen and record the number of emboli in three groups of patients. Apply the Philips post-processing platform to reconstruct spectral data and compare the differences in the number of emboli in conventional CT images (CI), iodine density and effective atomic number fusion images. Draw Receiver Operating Characteristic (ROC) and Area Under Curve (AUC) to determine the diagnostic efficiency of Qanadli and Mastora scores in clinical risk stratification. Qualitative data adopts chi square test, while quantitative data adopts Spearman rank correlation coefficient and t-test.

Result: Among the 50 patients, the number of emboli observed by CI was 50 in the low-risk group, 60 in the medium risk group, and 70 in the high-risk group. The number of emboli observed by ID-Zeff images was 55 in the low-risk group, 65 in the medium risk group, and 75 in the high-risk group. The ID-Z off plot (100% specificity/97% sensitivity) has a better detection ability for thrombus than the CI plot (94% specificity/84% sensitivity, $p < 0.01$), indicating better detection ability for thrombus. There was a significant difference in the pulmonary embolism index between the low-risk group and the high-risk group (Qanadli: 15.6%, 38.8%, 40.1%, $p < 0.001$,

Mastora: 10.44%, 30.68%, 45%, $p < 0.001$). The Qanadli and Mastora scores can effectively differentiate the risk stratification of pulmonary embolism.

Conclusion: Compared to conventional CT, the application of spectral multi parameter CT can improve the detection rate of pulmonary embolism emboli. To provide more imaging support for the clinical early diagnosis, treatment strategy formulation, and prognosis prediction of pulmonary embolism patients with different risk stratification.

PO-0979

CT-derived global longitudinal strain as a novel predictor of cardiovascular events in patients with stable angina

Hui Gu, Hongtao Yuan, Bowen Li, Ximing Wang
Shandong Provincial Hospital

Background: CT-derived evaluation of strain, based on CT feature tracking (CT-FT), has appeared as a novel technique that enables coronary CT angiography (CCTA) to provide additional information regarding cardiac function. While CT-derived strain on coronary artery disease (CAD) has rarely been reported.

Objective: To assess CT-derived left ventricular strain in patients with stable angina and its relationship with the incidence of major adverse cardiac events (MACE).

Methods: A total of 303 individuals who underwent CCTA due to stable angina with a median follow-up period of 428 days were prospectively included in this cohort. CT-derived left ventricular strain was quantitatively analyzed for all the patients. The following strain parameters were obtained: global longitudinal strain (GLS), global radial strain (GRS), global circumferential strain (GCS), and ejection fraction (EF). Coronary stenosis and risk factors were also obtained. In addition, the incidence of MACE was defined as a myocardial infarction, hospitalization for unstable angina, unplanned coronary revascularization, and all-cause death.

Results: Thirty-three patients (10.9%) suffered a MACE during follow-up time. Multivariate analysis identified that GLS was different in MACE group and no MACE group (-17.49 ± 2.37 vs. -19.22 ± 2.79 , $p < 0.001$). Patients with severe coronary stenosis, diabetes mellitus and higher GLS had a significantly higher incidence of MACE (all $p < 0.05$). Coronary stenosis (hazard ratio [HR] = 8.48, $p = 0.01$), diabetes mellitus (HR = 3.07, $p = 0.02$), and GLS (HR = 4.91, $p = 0.02$) were independent predictors of MACE. A conjunctive model comprising GLS, coronary stenosis, and risk factors results in the higher predictive efficacy than risk factors alone ((AUC: 0.86 vs. 0.75, $p = 0.01$)).

Conclusions: Among patients with stable angina, those with MACE had higher GLS than those without. Also, patients with higher GLS had an increased risk of MACE.

PO-0980

Densely calcification and total luminal occlusion in both lower limbs

Hui Gu, Bowen Li, Ximing Wang
Shandong Provincial Hospital

A 71-year-old woman presented with paresthesia and weakness in both legs and with a 2-month history of gangrene in the left leg. This patient have none history of diabetes, dyslipidemia and increased pulse pressure, and have normal mineral metabolism and renal function.

Volume rendering of non-contrast enhanced computed tomography showed marked calcification of the wall of the common iliac arteries, the both femoral arteries (Panels A, yellow arrows) and the both dorsal arteries (Panels B, yellow arrows). These findings were confirmed on computed tomography angiography (CTA), which showed femoral arteries calcification (Panel C, yellow arrows) and collateral circulation of the lower limbs (Panel C, red arrows). Evidence of a densely calcification of dorsal arteries (Panel D, yellow arrows) and arterial occlusion of lower extremity (Panel D, green arrows) was noted on CTA, and the patient successfully underwent the treatment of left femoral-posterior tibial artery bypass, left femoral-deep artery bypass and deulceration of left foot.

At 6-month follow-up, the bypass of femoral-posterior tibial artery was occluded of this patient, and surgical procedures of drug-eluting stent implantation was implanted. Aside from attention to mineral metabolism and cardiovascular risk factors, the etiology of vascular calcification in this patient remains uncertain.

PO-0981

The qualitative and quantitative parameters of dual-layer spectral detector CT plain scan predicting the invasiveness of ground-glass adenocarcinoma

Fang Yin¹, zheng hua zhang¹, xiao nan tang¹, xiao di zhang², dan han¹
1. Department of Radiology, The First Affiliated Hospital of Kunming Medical University,
2. Philips Healthcare, Chengdu, Sichuan, China

Purpose: To explore the predictive value of qualitative and quantitative parameters of dual-layer spectral detector CT plain scan on the invasiveness of ground-glass nodules (GGNs).

Materials and methods: 557 patients with total 778 GGNs, who underwent preoperative dual-layer spectral detector CT scan were included retrospectively. According to invasiveness by pathology, the nodules were divided into two groups: non-invasive adenocarcinoma (non-IA, n=202) group, which included atypical adenomatous hyperplasia and adenocarcinoma in situ and invasive adenocarcinoma (IA, n=576) group which included minimally invasive adenocarcinoma and invasive adenocarcinoma. The qualitative parameters included GGN interface, lobulation, spiculation, pleural retraction, bubble-like lucency, air bronchogram and vascular abnormality. The quantitative parameters included nodule size, effective atomic number (Zeff) value, CT value and electron density value (ED value). The nodule size, Zeff, and ED value of the lesion were measured on dedicated workstation (IntelliSpace Discovery). Diagnostic performance was evaluated by receiver operating characteristic (ROC) curve analysis.

Results: Significant differences were found in nodule shape, interface, lobulation, spiculation, pleural retraction, bubble-like lucency, air bronchogram, vascular abnormality, size, CT value, Zeff and ED value between non-IA and IA groups ($P < 0.05$). The nodule ED value [odds ratio(OR)=1.157, $P < 0.001$], interface (OR=0.196, $P < 0.001$), bubblelike lucency (OR=0.293, $P < 0.001$), pleural retraction (OR=0.354, $P=0.009$) and vascular abnormality (OR=0.371, $P < 0.001$) were independent predictors for diagnosing invasive adenocarcinoma. The analysis of ROC curves showed that the AUC of the combination of five independent predictors was 0.862, the sensitivity and specificity for predicting GGN invasion were 71.35% and 85.64%.

Conclusion: The combination of qualitative and quantitative parameters of dual-layer spectral detector CT plain scan can effectively evaluate the invasiveness of GGNs.

PO-0982

Prediction and Discrimination of Pre-Invasive Lesions and Minimally Invasive Adenocarcinoma from Invasive Adenocarcinoma Utilizing Advanced Ultra-HRCT Radiomic Features of Ground-Glass Nodules

Yueyue Chen, shengping wang, shengjian zhang
Fudan univeriy Shanghai Cancer Center

Objective: The objective of this study was to utilize advanced Ultra-HRCT radiomic features to predict and differentiate pre-invasive lesions and minimally invasive adenocarcinoma (MIA) from invasive adenocarcinoma (IAC) presenting as ground-glass nodules (GGNs). The application of Ultra-HRCT, with its superior anatomical depiction surpassing conventional CT by providing a spatial resolution of 0.5mm and a thickness of 0.5mm with a 512×512 matrix, has been well-documented in the literature. Its diagnostic potential offers more detailed information, enabling better follow-up recommendations and treatment decisions. Moreover, studies have extensively explored the utility of Ultra-HRCT in distinguishing different pathological types of lung cancer. Therefore, our study aimed to harness the power of Ultra-HRCT radiomic features to achieve our objectives.

Materials and Methods: This retrospective study included 102 GGNs, which were divided into training ($n=61$) and test ($n=41$) datasets. All GGNs were pathologically confirmed as pre-invasive lesions, minimally invasive adenocarcinoma (MIA), or invasive adenocarcinoma (IA). Radiomic features were extracted from automatically annotated regions of interest. Features were selected using a filtering algorithm to construct the radiomics model. Three classifiers, namely, Support Vector Machine, Logistic Regression, and Random Forest, were tested for the model's performance. Accuracy, sensitivity, specificity, and the area under the receiver operating characteristic curve (AUC) were used to evaluate the model's performance on both the training and test datasets.

Results: The radiomics model consisted of two features selected from a pool of 1781 extracted features. The support vector machine classifier achieved an AUC of 0.983 (training) and 0.981 (test). The logistic classifier yielded AUCs of 0.987 (training) and 0.984 (test). The random forest classifier demonstrated AUCs of 1.000 (training) and 0.974 (test), indicating the best performance among the classifiers. Remarkably, the model exhibited excellent calibration when validated with the test dataset by the logistic regression classifier.

Conclusion: By leveraging Ultra-HRCT radiomic features of ground-glass nodules, our study successfully demonstrated the potential to predict and differentiate invasive adenocarcinoma (IAC) from pre-invasive lesions and minimally invasive adenocarcinoma (MIA) before surgery. The logistic regression classifier provided reliable calibration, thereby offering valuable recommendations for follow-up or treatment in clinical practice.

PO-0983

Relationship between epicardial fat volume on cardiac CT and atherosclerosis severity in three-vessel coronary artery disease: a single-center cross-sectional study

Yu Sun, Jie Hou, Benqiang Yang
General Hospital of Northern Theater Command

Background: The ideal treatment strategy for stable three-vessel coronary artery disease (CAD) patients are difficult to determine and for patients undergoing conservative treatment, imaging evidence of coronary atherosclerotic severity progression remains limited. Epicardial fat volume (EFV) on coronary CT angiography (CCTA) has been considered to be associated with coronary atherosclerosis. Therefore, this study aims to evaluate the relationship between EFV level and coronary atherosclerosis severity in three-vessel CAD.

Methods: This retrospective study enrolled 252 consecutive patients with three-vessel CAD and 252 normal control group participants who underwent CCTA between January 2018 and December 2019. A semi-automatic method was developed for EFV quantification on CCTA images, standardized by body surface area. Coronary atherosclerosis severity was evaluated and scored by the number of coronary arteries with $\geq 50\%$ stenosis on coronary angiography. Patients were subdivided into groups on the basis of lesion severity: mild (score = 3 vessels, $n = 85$), moderate (3.5 vessels \leq score < 4 vessels, $n = 82$), and severe (4 vessels \leq score ≤ 7 vessels, $n = 85$). The independent sample t-test, analysis of variance, and logistic regression analysis were used to evaluate the associations between EFV level and severity of coronary atherosclerosis.

Results: Compared with normal controls, three-vessel CAD patients had significantly higher EFV level (65 ± 22 mL/m² vs. 48 ± 19 mL/m²; $P < 0.001$). In patients with three-vessel CAD, there was a progressive decline in EFV level as the score of coronary atherosclerosis severity increased, especially in those patients with a body mass index (BMI) ≥ 25 kg/m² (75 ± 21 mL/m² vs. 72 ± 22 mL/m² vs. 62 ± 17 mL/m²; $P < 0.05$). Multivariable regression analysis showed that both BMI (OR: 3.40, 95%CI: 2.00 - 5.78, $P < 0.001$) and the score of coronary atherosclerosis severity (OR: 0.49, 95% CI: 0.26 - 0.93, $P < 0.05$) were independently related to the change of EFV level.

Conclusion: Three-vessel CAD patients do have higher EFV level than the normal controls. While, there may be an inverse relationship between EFV level and the severity of coronary atherosclerosis in patients with three-vessel CAD.

PO-0984

Prognostic value of left atrial longitudinal strain by cardiac magnetic resonance feature tracking in atrial fibrillation patients with mitral valve disease

Yu Sun, Jie Hou, Benqiang Yang
General Hospital of Northern Theater Command

AIM: To evaluate the prognostic value of left atrial global longitudinal strain (LAGLS) in atrial fibrillation (AF) patients with mitral valve disease (MVD).

MATERIALS AND METHODS: In this single-center retrospective study, 48 consecutive AF patients with MVD who underwent cardiac magnetic resonance (CMR) before surgery were enrolled. The LAGLS was assessed by cine-CMR images and feature tracking (CMR-FT) technique. Logistic

regression and receiver operating characteristic analysis were performed to identify the value of LAGLS in predicting atrial tachyarrhythmias recurrence after surgery.

RESULTS: The LAGLS level of the total patients was 4.4 (interquartile range: 2.7 to 9.2)%. The LAGLS was significantly associated with many evaluation parameters of severity of disease, including biventricular volumetric function, LA ejection fraction, and the European System for Cardiac Operative Risk Evaluation II score (all $P < 0.05$). Multivariate Cox analysis showed that LAGLS (hazard ratio = 0.52, 95% confidence interval[CI]: 0.31, 0.87; $P = 0.013$) was an independent predictor of atrial tachyarrhythmias recurrence after adjustment for LA diameter, LA and biventricular ejection fraction, etiology of MVD (rheumatic or degenerative), and surgical procedure (valve surgery alone or valve surgery combined with Maze IV). The optimal cutoff value of LAGLS was 4.1% for predicting recurrent atrial tachyarrhythmias (sensitivity 81.8%, specificity 78.4%) and the area under the curve was 0.854 (95%CI: 0.711, 0.996, $P < 0.001$).

CONCLUSION: CMR-FT-derived LAGLS may act as a novel noninvasive imaging biomarker with which to evaluate the severity of disease and offer independent prognostic information for atrial tachyarrhythmias recurrence after surgery in AF patients with MVD.

PO-0985

New Whole-Heart Motion Correction Algorithm Enables Diagnostic CT of Aortic Valve and Coronary Arteries in Systolic Phase for Transcatheter Aortic Valve Implantation Candidates

Yu Zhang, Tao Shuai
West China Hospital, Sichuan University

Objectives: To investigate the ability of new generation snapshot freeze (NGSSF) algorithm in improving diagnostic image quality of both aortic valve and coronary arteries for transcatheter aortic valve implantation (TAVI) candidates in TAVI planning CT.

Methods: Sixty-four TAVI candidates underwent TAVI planning CT were enrolled. Scans from coronary CT angiography were reconstructed at 20%, 30%, 40%, and 75% R-R cardiac phases with NGSSF and standard (STD) algorithm. In each phase, following parameters were compared: aortic valve measurements and their reproducibility; image quality of aortic valve and coronary arteries. The diagnostic accuracies of TAVI planning CT for coronary artery stenosis in 30% R-R phase with NGSSF and STD algorithms were calculated in 47 out of 64 patients with invasive coronary angiography as reference standard.

Results: For subjective image quality evaluation, the excellent rate for aortic valve improved from 25.0% to 93.8% and the interpretable rate for coronary arteries increased from 20.3% to 95.3% in the 30% phase images with NGSSF compared with images with STD. For the detection of $>50\%$ coronary artery stenosis, the 30% phase images with NGSSF provided a sensitivity of 90%, specificity of 81.48%, negative predictive value of 91.7%, and positive predictive value of 78.3% on a per-patient basis; While images with STD, had a corresponding results of 95.0%, 33.33%, 90.0%, and 51.4%, respectively.

Conclusions: NGSSF significantly improves image quality for both aortic valve and coronary arteries compared with STD for TAVI patients of all heart rates. NGSSF enables the accurate measurement for aortic valve and satisfactory diagnostic performance for coronary arteries stenosis in the same systolic phase for TAVI planning.

PO-0986

Deep Learning Image Reconstruction for Transcatheter Aortic Valve Implantation Planning Computed Tomography using Low-kVp and Low-Contrast-Medium Protocol: Image Quality, Diagnostic Performance and Radiation Dose Assessment

Yu Zhang, Tao Shuai
West China Hospital, Sichuan University

Objective: To assess the image quality, dose reduction potential and diagnostic performance of low tube voltage with high-strength deep learning image reconstruction (DLIR-H) for transcatheter aortic valve implantation (TAVI)-planning CT in comparison with conventional imaging protocols.

Methods: We prospectively enrolled 128 patients who were referred to TAVI-planning CT. Patients were randomly divided into two groups: DLIR-H group (n=64) with contrast injection rate of 28mgI/kg/s, and conventional group (n=64) with contrast injection rate of 40mgI/kg/s. Radiation dose, contrast volume, contrast injection rate, and image quality were compared between the two groups. The diagnostic performance of TAVI planning CT for coronary artery stenosis was calculated using invasive coronary angiography as the gold standard.

Results: There was a significant reduction in radiation dose ($4.94 \pm 0.39 \text{ mSv}$ vs. $7.93 \pm 1.20 \text{ mSv}$), contrast volume ($45.28 \pm 5.38 \text{ mL}$ vs. $63.26 \pm 9.88 \text{ mL}$) and contrast injection rate ($3.1 \pm 0.31 \text{ mL/s}$ vs. $4.9 \pm 0.2 \text{ mL/s}$) in DLIR-H group compared to the conventional group (all $p < 0.010$). For diagnostic performance, TAVI planning CT in the DLIR-H group provided 100% sensitivity, 92.1% specificity, 100% negative predictive value (NPV), and 84.2% positive predictive value (PPV) on a per-patient basis for the detection of $> 50\%$ stenosis. In the conventional group, for the detection of $> 50\%$ stenosis, TAVI planning CT provided 94.7% sensitivity, 95.3% specificity, 97.6% NPV, and 90.0% PPV on a per-patient basis.

Conclusion: The combination of low tube voltage and DLIR-H in TAVI-planning CT provides improved image quality while significantly reducing radiation and contrast volume with no influence on the diagnostic performance of coronary artery stenosis in comparison with the conventional protocol.

PO-0987

Role of quantitative DCE-MRI parameters and ECV in differentiating non-small cell lung cancer subtypes and predicting lymph node metastasis

Peng Zhao¹, Wenxiu Guo², Binglin Lv⁴, Mimi Tian¹, Xiangtao Lin³

1. Shandong Provincial Hospital

2. Shandong First Medical University

3. Shandong Provincial Hospital, Shandong University

4. Department of Radiology, QiLu Hospital of Shandong University

Objective To investigate the value of dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) parameters and extracellular volume fraction (ECV) in the diagnosis of non-small cell lung cancer (NSCLC) subtypes and prediction of lymph node metastasis.

Methods Retrospective study. Clinical and MRI data of 70 patients diagnosed with NSCLC by pathological examination from September 2020 to December 2022 at the Provincial Hospital of Shandong First Medical University were included. Among them, there were 55 males and 15 females, aged 45-74 years. Patients all underwent DCE-MRI and enhanced T1 mapping within 1 week prior to treatment. The quantitative parameters transfer constant (K_{trans}), flux rate constant (K_{ep}), extravascular volume fraction (V_e) were measured. Venous blood was collected from the patient within 3 days of the MRI scan, and the patient's hematocrit was then measured. Detection of T1 values based on T1 mapping is used to calculate ECV. Patients were divided into adenocarcinoma group (41 cases) and squamous carcinoma group (29 cases) according to their NSCLC pathological typing. The patients were divided into the group with metastasis (28 cases) and the group without metastasis (42 cases) according to the presence or absence of lymph node metastasis. Observation indexes: (1) Comparison of clinical baseline information such as gender, age, degree of tumor differentiation, and maximum diameter of lesions in different groups of patients; (2) To compare the consistency between observers in detecting quantitative DCE-MRI parameters and ECV results; (3) Comparison of quantitative DCE-MRI parameters and ECV between different groups of patients; (4) To analyze the diagnostic efficacy of parameters that differ between subgroups for the typing of NSCLC and the predictive efficacy for the metastatic status of NSCLC lymph nodes; (5) To analyze the correlation between the quantitative parameter V_e of DCE-MRI and ECV.

Results (1) There was no statistically significant difference in age, degree of tumor differentiation, and maximum tumor diameter between the adenocarcinoma group and the squamous carcinoma group (all P values > 0.05), and the difference in gender between the two groups was statistically significant (P < 0.05). The differences in gender, age, degree of tumor differentiation, and maximum tumor diameter between the lymph node metastasis group and the patients without metastasis group were not statistically significant (all P values > 0.05). (2) Inter-observer agreement in detecting quantitative DCE-MRI parameters and ECV: ICC_{K_{trans}}=0.815, ICC_{K_{ep}}=0.835, ICC_{V_e}=0.871, ICC_{ECV}=0.853. Good agreement was identified between observers. (3) The quantitative DCE-MRI parameters K_{trans}, K_{ep} and V_e in the adenocarcinoma group were 0.23 (0.19, 0.29), 0.79 (0.60, 0.90) and 0.32 (0.24, 0.45), respectively, which were higher than those in the squamous carcinoma group (0.14 (0.12, 0.20), 0.61 (0.52, 0.78) and 0.25 (0.20, 0.38), all with statistically significant differences (Z=-4.763, -2.212, -2.438, all P values < 0.05), and no statistically significant differences in ECV between the two groups (P > 0.05). The ECV of the group with metastasis was 0.33±0.07, which was higher than that of the group without metastasis, which was 0.26±0.06, and the difference was statistically significant (t=-4.436, P<0.001). The differences in the quantitative parameters K_{trans}, K_{ep} and V_e of DCE-MRI between the two groups were not statistically significant (all P values > 0.05). (4) In the adenocarcinoma and squamous carcinoma groups, K_{trans}, K_{ep}, and V_e were selected with statistically significant differences to analyze the diagnostic efficacy of NSCLC subtypes, and K_{trans} had the best diagnostic efficacy, with an AUC of 0.836 (95%CI 0.743-0.929) and a sensitivity of 68.3% and specificity of 86.2% for the

diagnosis of adenocarcinoma and squamous carcinoma when the cut-off value was 0.208. In the group with and without lymph node metastasis, the difference in ECV between the two groups was statistically significant, and thus its predictive performance for the lymph node metastasis status of NSCLC was analyzed. The AUC of ECV was 0.764 (95% CI 0.652-0.877). When the cutoff value was 0.293, the sensitivity of ECV in predicting lymph node metastasis was 64.3% and the specificity was 81.0%. (5) There was no correlation between ECV and V_e in NSCLC ($r_s=0.071$, $P=0.558$).

Conclusion The differences of DCE-MRI parameters K_{trans} , K_{ep} , and V_e in adenocarcinoma and squamous carcinoma were statistically significant. K_{trans} was helpful in diagnosing the subtype of NSCLC, and ECV was valuable in predicting lymph node metastasis in NSCLC.

PO-0988

Evaluation of the effect of bariatric surgery on left ventricular function in obese subjects using cardiac magnetic resonance feature tracking

Lu Tang, Jiayu Sun

Department of Radiology, West China Hospital, Sichuan University

Objective: Obesity is one of the major cardiovascular risk factors and increases the risk of cardiovascular disease. Bariatric surgery is not only an effective treatment for obesity, but also may improve obesity-caused cardiac structural and functional abnormalities. At present, there were few studies on structural and functional longitudinal changes in obese subjects after weight loss, and the effect of bariatric surgery on cardiovascular in obese subjects still needed to be further explored. The purpose of this study was to investigate the longitudinal changes of left ventricular function in obese subjects after weight loss by laparoscopic sleeve gastrectomy using cardiac magnetic resonance feature tracking (CMR-FT).

Materials and Methods: Obese subjects who underwent laparoscopic sleeve gastrectomy for weight loss in West China Hospital of Sichuan University from December 2020 to July 2022 were prospectively enrolled. Preoperative cardiac magnetic resonance (CMR) examination was performed on obese subjects and clinical data were collected. CMR and clinical follow-up were performed at 1 month and 6 months after bariatric surgery for weight loss. CVI 42 software was used to analyze CMR cine images, and conventional cardiac function parameters and myocardial strain parameters were obtained. Conventional cardiac function parameters included left ventricular end-diastolic volume (LVEDV), left ventricular end-systolic volume (LVESV), left ventricular mass (LVmass), left ventricular ejection fraction (LVEF). Myocardial strain parameters included global peak circumferential strain (GCS), global peak radial strain (GRS) and global peak longitudinal strain (GLS). One-way repeated measures ANOVA or Friedman test was used for the comparison of obesity subjects at baseline, and at 1 month and 6 months after bariatric surgery. $P < 0.05$ was considered to be statistically significant.

Results: A total of 58 obese subjects [body mass index (BMI) $36.25 (9.47) \text{ kg/m}^2$] were included in this study, among which 43 obese subjects were followed up at 1 and 6 months after bariatric surgery. At 1 and 6 months after bariatric surgery, compared with baseline, the blood pressure, blood lipid level, blood glucose level of obese subjects were significantly improved (all $P < 0.05$). Comparing with baseline, the LVEDV, LVmass were decreased at 1 month and 6 months (all $P < 0.05$). At 1 month after bariatric surgery, LVEF and strain parameters showed no significant changes (all $P > 0.05$). At 6 months after bariatric surgery, although LVEF showed no significant changes ($P > 0.05$), GCS ($-18.71 \pm 1.92\%$ vs. $-17.84 \pm 2.04\%$, $P = 0.046$) and GLS ($-18.28 \pm 1.68\%$ vs. $-17.19 \pm 1.93\%$, $P = 0.039$) in obese subjects have significantly improved from baseline.

Conclusion: After bariatric surgery, although LVEF showed no significant change, the left ventricular subclinical function in obese subjects has improved. Cardiac magnetic resonance feature tracking is helpful to observe the improvement of subclinical myocardial function in obese subjects after bariatric surgery.

PO-0989

A preliminary study of accelerated mDIXON for segmented coronary adipose tissue evaluation in patients with suspected coronary artery disease

Pengfei Peng, Jiayu Sun
West China Hospital, Sichuan University

Purpose: Pericoronary adipose tissue (PCAT) has been suggested to contribute to the development of coronary artery disease (CAD). Dysfunctional PCAT can secrete pro-inflammatory adipokines and inflammatory cytokines which is closely associated with the development of coronary intima inflammation and the formation of coronary plaque, and also positively correlated with coronary artery stenosis, degree of calcification and plaque progression. Meanwhile, plaque composition and degree of stenosis in CAD can be valuable for risk stratification and prognosis of CAD. The evaluation of PCAT should be translated to novel clinical diagnostic tools for coronary heart disease.

The current preferred method for quantitative assessment of pericoronary adipose tissue (PCAT) is computed tomography (CT), but it is not suitable for follow-up examination because of its radiation. A coronary magnetic resonance angiography (MRA) method, recently, using a three-dimensional modified Dixon-sequence (3D-mDixon) was introduced and validated, to separate water from fat signals by the chemical shift of protons, which allows for more accurate volumetric quantification of PCAT volume. Meanwhile, to speed up scanning without compromising image quality, we used the compressed sensing artificial intelligence (CSAI) framework which combines deep learning (DL) and CS techniques to optimize the CS reconstruction algorithm while performing denoising and shortening the scanning time.

We sought to quantitatively analyze segmented pericoronary adipose tissue (PCAT), including PCAT volume and fat-fraction, in patients with known or suspected coronary artery disease (CAD) using a deep learning-based compressed sensing (CS) accelerated modified Dixon (mDIXON) sequence, as well as determine their relation with coronary plaque characters assessed by coronary computed tomography angiography (CCTA).

***Methods and Materials:** We included 35 symptomatic patients with CAD (111 arteries with plaque, 169 without plaque). They underwent cardiac magnetic resonance (CMR) to evaluate segmented PCAT volume and fat-fraction of 8 coronary segments. We manually traced the segmented PCAT volume, and calculated the fat fraction of the segmented PCAT by formula. We compared the segmented PCAT volume and fat-fraction across 8 coronary segments with different plaque types and degrees of stenosis defined with CCTA and explored the relationship between them using Kruskal - Wallis H test and One-way analysis of variance (ANOVA) testing.

***Results:** The coronary segments with plaques had a higher segmented PCAT volume and fat-fraction than those without plaques. Meanwhile, segmented PCAT volume around mixed plaques was larger than non-calcified or calcified plaques ($p = 0.014$ and $p < 0.001$). There was a moderate correlation between the segmented PCAT volume and plaque type ($r = 0.493$, $p < 0.001$). The fat-fraction had similar results ($r = 0.480$, $p < 0.001$).

***Conclusions:** The non-contrast-enhanced, whole-heart coronary MRA framework with CSAI is able to measure segmented PCAT volume and fat-fraction. The segmented PCAT volume is more significantly associated with the coronary plaque characters than fat-fraction.

PO-0990

Intranodular and Perinodular Radiomic Features on Lung CT Images Distinguish Pulmonary Cryptococcosis from Lung Adenocarcinoma.

Danni Dong,Xiaojun Zhou,Qi Di,Hai Chen,Jianjun Zheng,Jingfeng Zhang
Ningbo NO.2 Hospital

Objective To investigate the value of a radiomics prediction model based on intranodal and perinodal CT images of CT radiomic features in distinguishing pulmonary cryptococcosis from lung adenocarcinoma. **Methods** A total of 194 patients (94 cases of pulmonary cryptococcosis and 100 cases of pulmonary adenocarcinoma) confirmed by surgical or puncture pathology in Ningbo No. 2 Hospital between January 2019 and February 2023 were retrospectively analysed and randomly divided into a training set and a test set in a ratio of 7:3. Three-dimensional volumetric areas of interest (VOIs) within and 5 mm around the nodule were outlined by 3D Slicer, and their radiomic features were extracted separately. The minimum redundancy maximum relevance (mRMR) and least absolute shrinkage and selection operator (LASSO) methods were used to downscale and select features. Statistically significant indicators were screened by one-way logistic regression and further incorporated into the multifactor logistic regression model. Support Vector Machine (SVM) was used to construct the clinical model, the intranodal image-based radiomics model, the perinodal image-based model, the intranodal-and-perinodal-image-based radiomics model, and the combined model (i.e., a model based clinical images and the radiomic features extracted from both intranodal and perinodal images). The diagnostic efficacy of each model was evaluated by receiver operating characteristic (ROC) curve. **Results** In the test set, the areas under the ROC curves (AUC) of the clinical model, the intranodal image-based radiomics model, the perinodal image-based model, the intranodal-and-perinodal-image-based radiomics model, and the combined model were 0.84, 0.88, 0.85, 0.90, and 0.94, respectively. **Conclusion** The combined model based on clinical imaging features, intranodal and perinodal radiomics features can improve the ability of differentiating pulmonary cryptococcosis from adenocarcinoma of the lung.

PO-0991

Differentiating subcentimeter pulmonary metastases in differentiated thyroid cancer patients by integration of machine learning and deep learning: A retrospective, multicenter study

Xinyi Gao
Zhejiang Cancer Hospital

Background: Diagnosing subcentimeter pulmonary metastases in indeterminate pulmonary nodules is crucial for patients with differentiated thyroid cancer. We aim to develop and validate novel integration models combining machine learning and deep learning for diagnosing subcentimeter pulmonary metastases in differentiated thyroid cancer patients.

Methods: Models were developed in a primary center included 1244 subcentimeter pulmonary metastases on CT. Lesions were randomly assigned (7:3) to training or internal validation. Integration models based on machine learning were built with selected radiomics features and deep learning features and compared with classic machine learning models or deep learning models to classify the indeterminate subcentimeter lung nodules as pulmonary metastases or benign nodules. External validation contained 161 subcentimeter differentiated thyroid cancer pulmonary metastases in two independent centers. Stepwise validation was further performed according to

the nodule's largest diameter in order to test models' generalization ability for subcentimeter nodules of different sizes.

Results: Among all the machine learning models, the support vector machine showed the best discrimination in external validation, with a 0.910 AUC and a 0.935 AUC in internal validation. The deep learning model also showed good discrimination, with a 0.952 AUC in internal validation and a 0.893 AUC in external validation. All the integration models were significantly better than machine learning or deep learning alone, with the best AUC of 0.969 and 0.967 in internal validation and external validation, respectively. Stepwise validation demonstrated that with the PM diameter decreasing from 9mm to 2mm, the AUC initially remained stable and gradually decreased in all models and the integration models were the most stable.

Conclusions: The novel integration models combining traditional radiomics and deep learning features provided noninvasive discrimination of subcentimeter pulmonary metastases from benign pulmonary nodules, even with minimal sizes, and was more effective than machine learning or deep learning alone.

PO-0992

Differentiation of inflammatory pseudotumor and malignant pulmonary nodules using first-pass enhanced time to peak (TTP) with dual-input volume CT perfusion

Chengwei Guo

Department of Radiology, The 252 Hospital of PLA

AbstractObjectives To investigate whether the parameter of first-pass enhanced time to peak (TTP) can be used to distinguish single inflammatory pseudotumor from malignant solitary pulmonary nodules (SPNs) with dual-input body volume CT perfusion (DI-CTP).

Methods Ninety-eight consecutive patients with pathological proved were enrolled: twenty-five patients with inflammatory pseudotumor and seventy-three patients with malignant SPNs (30 patients with adenocarcinoma, 27 with squamous cell carcinoma, and 16 with pulmonary metastases). Pulmonary artery flow (PF), bronchial artery flow (BF), the perfusion index (PI, $PI=PF/PF+BF$), and time-density curve (TDC) were obtained by the DI-CTP analysis, and total perfusion (TLP, $TLP=PF+BF$) were calculated. The first-pass TTP was derived from TDC and was measured. Intraobserver and interobserver agreement for DI-CTP parameters were calculated using intraclass correlation coefficients (ICC); The perfusion parameters were analyzed among squamous cell carcinoma, adenocarcinoma, pulmonary metastases, and inflammatory pseudotumor. Their values in diagnosing malignant SPNs and inflammatory pseudotumors were evaluated by receiver operating characteristic (ROC) curves analysis.

Results Intraobserver and interobserver agreement measures with ICC showed high agreement between the measurements ($ICC=0.92-0.98$, all $P<0.01$) and both different observers ($ICC=0.92-0.97$, all $P<0.01$). The parameters (PF, TLP, PI, TTP) between squamous cell carcinoma, adenocarcinoma, pulmonary metastases, and inflammatory pseudotumors had significant differences (all $P<0.01$). Significant differences existed between inflammatory pseudotumors and malignant SPNs in parameters (PF, TLP, TTP, all $P<0.01$). The AUC of TTP was 0.987, more significant than that of the other perfusion parameters. When $TTP=18.10$ s was used as the cutoff value for predicting benign and malignant nodules, the sensitivity and specificity were 92% and 97.3%, respectively.

Conclusions The parameters (TTP) in inflammatory pseudotumors are significantly lower than that of malignant nodules, which enables better differentiation of inflammatory pseudotumors and malignant SPNs.

量化 LDCT 肺癌筛查方案并探寻筛查年龄的边界

胡艳军¹、尹红霞¹、徐岩¹、田心¹、贺毅¹、杨正汉¹、陈卉²

1. 首都医科大学附属北京友谊医院

2. 首都医科大学生物医学工程学院

目的 鉴于肺癌筛查的专家共识未提及普通人群，本文定义决策指数用于量化 LDCT 肺癌筛查方案，基于量化数值对普通人群筛查肺癌的行为进行评估并探寻筛查年龄的边界。

方法 将 LDCT 检出肺癌并完成手术治疗看作收益，并将 LDCT 诱发癌症看作减益，其他情况忽略不计，则 LDCT 筛查过程可以抽象为特定的投资或博弈（赌博）游戏。LDCT 筛查肺癌的过程中涉及两个重要参数：年龄别发病率 p_1 和终身可归因的患癌风险（the lifetime attributable risk, LAR），即癌症 LAR 发病概率 p_2 。参考凯利公式建立数学模型，推导并定义筛查决策指数（decision index, DI） $DI=(p_1-p_2)/(p_1+p_2)$ ，用于量化 LDCT 筛查肺癌的行为或方案。在各年龄分别计算人群行单次或规律性 LDCT 筛查的决策指数，根据指数大小划分等级并给出筛查建议。

根据模型原理，只有 DI 大于 0.5 的方案才值的进行肺癌筛查，并且越接近 1 越稳妥，因此根据 DI 数值将筛查建议划分为四个等级：小于等于 0.5，则不推荐；在 0.5 至 0.6 之间，勉强可以；0.6 至 0.8 之间，可以筛查；大于等于 0.8，则推荐筛查。

结果 普通人群单纯因筛查肺癌而接受 LDCT 检查时，建议男性筛查开始年龄不小于 46 岁，女性不小于 51 岁。普通人群 58 岁以前不宜行每年一次 LDCT 筛查肺癌；如果有规律性筛查肺癌的意愿，建议两年一次，对于有强烈筛查意愿的人群建议男性从 50 岁，女性从 60 岁开始筛查，对于中等筛查意愿的人群男性从 60 岁，女性从 70 岁开始筛查。

结论 本研究定义的决策指数可以用于量化 LDCT 筛查肺癌的行为、根据筛查频率和筛查年龄制定筛查方案。不建议普通人群过早实施规律性 LDCT 筛查。

静息和负荷磁共振心肌应变在缺血性心脏病 中诊断价值的动物实验研究

徐晶、崔辰、赵世华、陆敏杰

中国医学科学院阜外医院

目的：心脏磁共振特征追踪技术是一种无创、定量评估心肌整体、局部形态改变及运动异常的新兴技术，被认为可以比左室射血分数更早期的识别心肌异常。本研究拟通过构建缺血性心脏病猪模型，以冠状动脉造影和病理作为参照，探究静息和负荷心肌应变对缺血性心脏病的诊断评估价值，预期结果有望实现无需对比剂即可无创筛查缺血及梗死心肌。

材料与方法：采用美国肌缩窄法建立猪缺血性心脏病模型。对实验动物进行静息、负荷 CMR 成像（包括电影序列和心肌灌注成像）及晚期钆对比剂增强扫描。以冠状动脉造影和病理为参照，分别定义正常、远端、缺血和梗死心肌节段，并通过受试者工作特征（receiver operating characteristic, ROC）曲线评估静息和负荷心肌应变对心肌梗死和缺血的诊断准确性。

结果：共纳入 11 头缺血性心脏病猪模型和 5 头健康假手术组猪。即使在静息状态下，应变参数也与心肌缺血和心肌梗死有关（所有 $P<0.05$ ）。所有检测梗死心肌的应变参数的 ROC 曲线下面积（AUC）均大于 0.900（ $P<0.05$ ）。应变检测缺血心肌的 AUC 值分别为：静息和负荷纵向应变（LS）：0.906（95%CI：0.850，0.946）和 0.847（95%CI：0.782，0.899）；静息和负荷周向应变（CS）：0.763（95%CI：0.690，0.826）和 0.716（95%CI：0.639，0.784）；静息和负荷径向应变（RS）：0.758（95%CI：0.683，0.822）和 0.663（95%CI：0.583）。热图显示所有静息和负荷应变与负荷心肌血流量和心肌灌注储备均呈轻至中度相关（所有 $P<0.05$ ）。

结论: 左室心肌应变对缺血心肌和梗死心肌都具有较高的诊断评估价值, 有望在无需负荷药物及对对比剂的条件下, 成为疑诊缺血性心脏病患者进行侵入性检查、输注造影剂的“守门人”。

PO-0995

CT 联合临床特征的列线图预测临床 IA 期非小细胞肺癌气腔播散的价值

吕登、望云、周陶胡、范丽、萧毅、刘士远
中国人民解放军海军军医大学第二附属医院

目的 探讨基于术前 CT 及临床特征的列线图预测临床 IA 期 NSCLC 气腔播散 (STAS) 的价值。

方法 回顾性收集 2019.09 至 2022.08 我院术后有病理评估 STAS 状态的临床 IA 期 NSCLC 336 例, 依据病理报告的 STAS 情况分为阳性组和阴性组, 按照 7:3 的比例将数据集随机划分为训练集 236 例和内部验证集 100 例, 外院 69 例作为外部验证集。记录患者年龄、性别、癌胚抗原等 8 项临床资料; 定量测量肿瘤最大径、实性成分最大径、计算实性成分占比; 定性分析包括肿瘤的密度类型、形态、边缘、边界、内部结构及邻近结构等 17 项 CT 特征。在训练集中, 以单因素分析比较两组患者的临床及 CT 特征的差异, 将 P 值 < 0.1 的变量进行多因素 logistic 回归分析, 筛选最佳预测变量, 构建预测模型, 绘制列线图并进行模型内外部验证。采用 ROC 曲线及 AUC 值来评估模型的区分度, 以 H-L 检验和校准曲线来评价模型的拟合优度, 决策曲线来分析模型的临床应用价值。

结果 多因素 logistic 回归分析筛选出的最佳预测变量包括性别、癌胚抗原、实性成分占比、密度类型、远端带状影, 其中肿瘤密度类型、远端带状影为预测 STAS 状态的独立危险因素。基于上述变量, 分别构建由性别、癌胚抗原组成的临床模型, 由实性成分占比、密度类型、远端带状影组成的 CT 模型以及综合模型来预测 STAS。DeLong 检验结果表明综合模型在三个队列优于临床模型, 在外部验证集优于 CT 模型, 其在三个队列中的 AUC 值为 0.874、0.822、0.810。H-L 检验表明, 综合模型在三个队列中均拟合良好, 校准曲线显示综合模型预测概率值与真实情况具有较好的一致性。决策曲线显示综合模型较临床模型和 CT 模型具有更好的临床应用价值。

结论 CT 及临床特征构建的列线图对术前判断临床 IA 期 NSCLC STAS 状态具有较高的诊断效能, 可为胸外科医师选择最佳手术方式提供指导帮助。

PO-0996

CT 在高原慢性阻塞性肺疾病患者中的评估价值

邹兴雄
绵阳市第三人民医院

摘要: 目的 探讨 CT 指标在高原稳定期慢性阻塞性肺疾病患者中的诊断价值以及与肺功能、症状相关性。方法: 采用随机抽样法抽取四川省阿坝州红原县 ≥ 40 岁常驻人群 456 人, 通过纳排标准从中筛选出稳定期 COPD 患者 53 名及健康人群 53 名。收集受试者基线资料并完善肺功能检查、胸部高分辨率 CT 扫描、采集 CAT、mMRC 评分。比较两组患者 CT 指标, 使用 ROC 曲线评估 CT 指标对慢阻肺的诊断价值, 采用 Spearman 检验了解 CT 指标与肺功能、症状评分、急性加重次数的相关分析。采用多元线性回归分析肺功能的影响因素。结果: 慢阻肺组 %LAA-950、WA%、TDR 均较正常对照组高, 且差异有统计学意义。ROC 显示, %LAA-950、WA%、TDR 三个指标在高原慢阻肺中均有诊断价值 (P 均 < 0.05)。三个指标均与舒张前 FEV1% pred、MEF25、MMF、MEF50 呈负相关, 与 1 年急性加重次数、CAT 评分、MMRC 评分及 COPD 分级呈正相关。多元线性回归分析显示影响 FEV1% pred 的主要因素包括 %LAA-950 ($\beta = -1.427$, $P = 0.000$)、WA%

($\beta=-0.863$, $P=0.000$)。结论: CT 指标与高原稳定期慢阻肺患者肺功能、一年急性加重次数、症状评分、COPD 相关性良好,具有一定的诊断价值。

基于定量 CT 诺模图对支气管扩张咯血风险的预测研究

阴玮灵¹、黄晓旗²、王明全²、郭佑民²

1. 延安大学

2. 延安大学附属医院

目的: 本研究旨在建立和验证基于定量 CT 建立的诺模图以预测支气管扩张咯血发生的风险。**方法:** 回顾性收集 233 例支气管扩张患者的一般资料及定量 CT 指标,采用分层随机抽样方式按照 6:4 比例分为训练集 ($n=133$) 和验证集 ($n=100$),根据 2 年内随访有无发生咯血分为两组。在训练集中通过多因素逐步 Logistic 回归以确定支气管扩张咯血发生的独立危险因素,构建诺模图。并使用校准曲线评价模型的拟合优度,采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评价模型的预测效能,并采用决策曲线分析 (decision curve analysis, DCA) 评价模型的临床应用价值。**结果:** 多因素 Logistic 回归结果显示吸烟史、累及支气管总支数、最大扩张支气管横截面积、最大扩张支气管扩张程度是支气管扩张咯血发生的独立危险因素。诺模图在训练集和验证集中均显示出良好的校准和区分能力,ROC 曲线下面积 (AUC) 在训练集中为 0.951 (95%CI: 0.914~0.989),在验证集中为 0.956 (95%CI: 0.918~0.994)。决策曲线分析表明其具有临床实用价值。**结论:** 基于定量 CT 构建的诺模图对支气管扩张咯血风险具有良好的临床预测效能,并得到了可靠验证。

PO-0998

基于脂肪衰减指数对冠状动脉非钙化斑块的风险分层预测

刘晓滢^{1,2}、江杰¹、李俊¹、段慧¹、胡加耀²、韩丹^{*1}

1. 昆明医科大学第一附属医院

2. 保山市人民医院

目的 探讨冠状动脉非钙化斑块形态学参数与周围脂肪衰减指数 (FAI) 的相关性研究。**方法** 回顾 269 例拟诊冠心病住院患者的 CCTA 图像及临床资料,按管腔狭窄程度分正常组 60 例,病变组 (轻度组 103 例、中度组 63 例和重度组 43 例),其中有意义狭窄组 106 例 (狭窄程度 $\geq 50\%$) 和无意义狭窄组 103 例 (狭窄程度 $< 50\%$),病变组仅选取单支及单发性非钙化斑块。按斑块 CT 值分为低衰减组 21 例 (CT 值 ≤ 30 HU)、中等衰减组 84 例 ($30 < \text{CT 值} \leq 50$ HU)、高衰减组 104 例 ($50 < \text{CT 值} \leq 120$ HU)。以 FAI 是否 ≥ -70.1 HU,分为 FAI 高危组 (FAI ≥ -70.1 HU) 86 例、FAI 低危组 (FAI < -70.1 HU) 183 例。探讨冠状动脉非钙化斑块部分形态学参数与 FAI 相关性;分析 FAI 高危组与 FAI 低危组各参数间的差异。**结果** 冠状动脉狭窄程度与斑块短径 ($R_s=0.543$, $P<0.05$)、FAI ($R_s=0.534$, $P<0.05$)、收缩压 ($R_s=0.156$, $P<0.05$) 呈正相关,与斑块 CT 值 ($R_s=-0.430$, $P<0.05$) 呈负相关。轻度狭窄组与中、重度狭窄组 FAI 差异有统计学意义 ($P<0.05$),但中度组与重度组 FAI 差异无统计学意义 ($P>0.05$)。斑块低衰减组与中、高衰减组 FAI 差异具有统计学意义 ($P<0.05$),但中等衰减组与高衰减组 FAI 差异无统计学意义 ($P>0.05$)。有意义狭窄组与无意义狭窄组在斑块短径、斑块 CT 值及 FAI 差异有统计学意义 ($P<0.05$),两组间 FAI 临界值为 -69.5HU。冠状动脉 FAI 高危组较低危组男性占比高、斑块 CT 值低、斑块短径较大 ($P<0.05$),两组间斑块 CT 值、斑块短径的临界值分别为 21.5HU、1.95mm。**结论** 基于 FAI 能对冠状动脉非钙化斑块进行功能学水平风险分层评估,有望对冠心病严重程度及急性冠状动脉综合征的发生进行预测。

PO-0999

肺部 HRCT3D 重建联合 LDH 和 CRP 诊断难治性支原体肺炎的早期识别

邹灿
玉林市四人民医院

目的:

探讨肺部高分辨率 CT 三维重建 (HRCT3D) 联合血清乳酸脱氢酶 (LDH) 和 C 反应蛋白 (CRP) 对难治性支原体肺炎的早期诊断价值。

方法:

选择 2020 年 1 月至 2022 年 12 月期间收治的 100 例确诊为难治性支原体肺炎患者作为研究对象, 采用 HRCT3D 技术对其肺部进行三维重建, 并分析其影像学表现。同时, 检测患者血清 LDH 和 CRP 水平, 并与 50 例健康对照组进行比较。通过统计学方法分析 HRCT3D 重建结果与 LDH、CRP 水平之间的相关性, 并评估其在难治性支原体肺炎早期诊断中的应用价值。

结果:

HRCT3D 重建结果显示, 难治性支原体肺炎患者肺部出现多发斑片状高密度影像, 呈现为散在、局灶性或弥漫性分布。与健康对照组相比, 难治性支原体肺炎患者血清 LDH 和 CRP 水平明显升高 ($P<0.05$)。此外, HRCT3D 重建结果与 LDH、CRP 水平呈正相关 ($P<0.01$)。结合 HRCT3D 重建结果和 LDH、CRP 水平, 对难治性支原体肺炎的诊断敏感性和特异性分别为 92% 和 86%。

结论:

肺部 HRCT3D 重建技术联合血清 LDH 和 CRP 水平具有较高的难治性支原体肺炎早期诊断价值, 可提高该疾病的诊断准确性和早期干预的能力。

基于深度学习量化 CT 图像评估 COVID-19 患者严重程度及病情转归预测研究

张文钊、余建群
四川大学华西医院

目的: COVID-19 自 2019 年 12 月首次出现以来, 席卷全国, 对世界医疗和经济造成巨大影响, 这也使得许多地方医疗资源出现急剧短缺甚至不堪重负, 为最大化挽救患者生命提出了严峻挑战。因此, 在入院初期快速高效地评估重症患者的不良进展并预测危重患者的死亡风险, 有助于实现患者的早期监测、分级治疗, 对节省医务人员时间和合理配置资源意义重大。本研究旨在利用深度学习对 CT 图像进行量化分析, 以评估 COVID-19 肺炎患者的疾病严重程度及对患者病情转归的预测。

方法: 纳入 115 例在 2022 年 12 月至 2023 年 1 月期间因感染 COVID-19 病毒发生新冠肺炎的患者, 使用深度学习软件 (Siemens Healthineers, German) 对薄层 CT 图像进行处理, 以获得定量数据, 包括严重程度 (双肺分数相加, 严重: >15 ; 非严重: ≤ 15)、肺体积、病灶体积及百分比、高密度病灶 (≥ 200 HU) 体积及百分比, 病灶平均 HU 和标准差。并记录患者年龄、性别、吸烟史、是否合并基础疾病 (包括慢性肾病、糖尿病、高血压、COPD 等)。采用多变量方差分析和多元逻辑回归对数据进行分析处理, 以评估对患者病情影响的利/不利因素。

结果: 本研究共计纳入 115 例患者, 其中初诊重症患者 8 例 (双肺评分 >15)、非重症患者 107 例 (双肺评分 ≤ 15); 不合并基础疾病患者 15 例, 合并基础疾病患者 100 例。利用多变量方差分析

(MANOVA) 和多元逻辑回归对数据进行分析, 结果显示定量特征 (如不透明度评分、肺不透明度体积和百分比等) 在预测初患者预后情况方面具有统计学差异 ($P<0.001$)。

结论: 基于深度学习的 CT 肺炎分析实现了对新冠肺炎肺炎患者进行精准的肺部分割, 并确定患者结局和 ICU 入院需求。其可以为当前的放射学报告提供额外的定量信息, 为放射科医生对患者疾病严重程度的定性评估, 及预测患者的疾病预后情况提供了更多可参考信息。

PO-1001

基于 CT 影像组学的集成学习模型对 非小细胞肺癌脑转移预测研究

龚敬
复旦大学附属肿瘤医院

目的:

脑转移 (BM) 是非小细胞肺癌 (NSCLC) 患者最常见的并发症。本研究旨在利用胸部 CT 影像组学和临床特征, 开发一个集成学习模型, 预测晚期 NSCLC 患者 3 年内发生 BM 的概率。

方法:

这项回顾性研究纳入了 537 例 IIIA-IVB 期 NSCLC 患者, 其中 290 例发生了 BM, 247 例未发生 BM。将患者随机分为训练队列和验证队列, 比例为 7: 3。通过使用术前胸部 CT 图像计算了 1106 个影像组学特征, 以解码原发性肺癌的成像表型。为了降低影像组学特征的维度, 采用基于 Lasso 正则化方法的递归特征消除方法, 在去除低方差特征后选择最佳图像特征。使用 XGBoost 分类器的集成学习算法通过融合影像组学特征和临床特征进行模型训练和建立预测模型。最后, 采用 Kaplan-Meier (KM) 生存分析评估影像组学-临床模型生成的预测得分的预后价值。

结果:

融合模型在训练队列和验证队列中的受试者工作特征曲线下面积分别为 0.91 ± 0.01 和 0.89 ± 0.02 , 高于影像组学模型和临床模型。通过 KM 生存分析发现, 我们模型生成的风险评分在两个队列中对 BM 无转移生存 (BMFS) 和总生存期 (OS) 具有显著的预后价值 ($P<0.05$)。

结论:

我们的结果表明: (1) 融合影像组学和临床特征可以提高预测 BM 风险的性能, (2) 影像组学模型比临床模型具有更高的性能, (3) 影像组学-临床融合模型对预测 NSCLC 患者的 BMFS 和 OS 具有预后价值。

PO-1002

基于 3D 多任务深度影像组学的非小细胞肺癌 EGFR 基因突变状态预测

龚敬
复旦大学附属肿瘤医院

目的:

EGFR 基因突变状态预测对于非小细胞肺癌的治疗方案和预后具有重要的价值。本研究开发了基于 CT 影像的 3D 多任务深度影像组学模型, 预测非小细胞肺癌的 EGFR 基因突变状态。

方法:

从本中心回顾性收集了 818 名经过手术病理确认的非小细胞肺癌患者,按照 8:2 的比例分为训练集和测试集,并从 TCIA 公共数据集中手机 131 名符合要求的患者作为外部测试。首先,对每个肺肿瘤的中心点坐标进行标记,并手动勾画肿瘤的边界;然后,运用一系列图像预处理技术对原始 CT 影像进行预处理,主要包括图像重采样,灰度值标准化等,根据肿瘤的中心点坐标从 CT 影像中剪切出 96×96×96 像素大小的三维肿瘤区域。其次,运用三维残差网络构建多任务深度学习预测模型,采用 Focal 损失函数降低不同样本数量不平衡对模型的影响。其中,深度学习模型包括肺肿瘤分割和 EGFR 基因突变预测两个任务。最后,在提取肺肿瘤传统影像组学特征的基础上,融合深度图像特征和影像组学特征构建多任务深度影像组学预测模型。

结果:

3D 多任务深度影像组学模型在两个测试集上的曲线下面积 (AUC) 为 0.86 和 0.80,显著高于单任务深度学习模型和传统影像组学模型 ($P<0.05$)。预测评分在 DFS 和 OS 预测方面具有显著效能 ($P<0.005$)。

结论:

基于 CT 影像的多任务深度学习模型能够快速无创性的预测非小细胞肺癌 EGFR 基因突变状态,未来可以辅助临床提供更为准确的 EGFR 基因检测结果。

PO-1003

基于冠状动脉 CT 血管成像的左心房测量参数对慢性肾病患者肾功能的评价

王之悦、朱建国、臧汉杰、刘斐、李海歌
南京医科大学第二附属医院

目的 评价基于冠状动脉 CTA (CCTA) 测得的左心房、左心耳形态和功能参数与慢性肾病 (CKD) 患者肾功能的相关性。方法 回顾性分析行 CCTA 的 CKD2~4 级组及 CKD5 级组患者各 75 例,并选取肾功能正常的对照组 75 例,收集临床资料及常规超声心动图参数左室射血分数 (LVEF) 和二尖瓣口舒张期 E 峰与室间隔 e 峰的比值 (E/e')。采用图像后处理软件测得左心房最大、最小容积 (LAVmax、LAVmin) 及左心耳最大、最小容积 (LAAVmax、LAAVmin),并计算左心房及左心耳的射血分数 (LAEF、LAAEF)。采用单因素方差分析、秩和检验或 χ^2 检验比较组间各项指标的差异,采用 Pearson 相关分析及多元线性回归分析左心房参数与 eGFR 之间的相关性。结果 CKD5 级组较 CKD2~4 级组及对照组、CKD2~4 级组较对照组间的左心房功能参数 LAEF 及 LAAEF 显著减低 ($P<0.001$),CKD5 级组的左心房形态参数 LAVmax、LAVmin、LAAVmax 及 LAAVmin 较对照组显著增大 ($P<0.01$),但较 CKD2~4 级组增大不显著。左心房功能参数 LAEF 及 LAAEF 与 eGFR 呈正相关 ($r=0.395$ 和 0.414 , $P<0.001$),且为独立相关 ($P<0.01$)。结论 CCTA 左心房测量功能参数 LAEF 及 LAAEF 与 CKD 患者的肾功能独立相关,为早期评估、早期干预 CKD 患者诊治提供影像学量化指标。

PO-1004

基于增强 CT 深度学习影像组学术前预测胸腺瘤风险分类

吴树剑、俞咏梅
皖南医学院弋矶山医院

目的 探讨基于增强 CT 深度学习影像组学术前预测胸腺瘤风险分类的价值。**方法** 回顾性纳入弋矶山医院 139 例胸腺瘤患者为训练集, 池州市人民医院与芜湖市第二人民医院 81 例患者为验证集。根据 WHO 简化病理分型分为低风险组 (A、AB、B1 型胸腺瘤) 137 例及高风险组 (B2、B3 型胸腺瘤) 83 例。基于增强 CT 静脉期图像提取手工影像组学特征与深度学习影像组学特征, 降维筛选最优特征构建影像组学标签评分。单因素与多因素 logistic 回归分析筛选预测胸腺瘤高风险的影像学独立危险因素, 利用逻辑回归 (LR)、随机森林 (RF)、决策树 (DT) 及支持向量机 (SVM) 分别建模, 选择最佳模型为输出模型, 通过受试者工作特征 (ROC) 曲线下面积 (AUC) 及净重新分类指数 (NRI) 评估模型的效能。构建列线图将模型可视化, 校准曲线及临床决策曲线评价模型的校准度与临床适用性。**结果** 四种机器学习构建模型的 AUC 分别为训练集 LR: 0.899、RF: 0.835、DT: 0.897、SVM: 0.860; 验证集 LR: 0.889、RF: 0.830、DT: 0.905、SVM: 0.858。训练集及验证集 RF 与 LR 及 DT 比较差异有统计学意义 ($P < 0.05$), 余模型比较差异无统计学意义 ($P > 0.05$)。校准曲线表明模型的预测概率与观测概率具有较高一致性, DCA 显示当阈值概率为 0~0.93 (训练集)、0~0.82 (验证集) 时临床均有获益。训练集与外部验证集列线图与影像学模型比较差异均有统计学意义 ($P < 0.05$), 与 Radscore 比较差异无统计学意义 ($P > 0.05$)。列线图相较于 Radscore 模型效能均有改善, 训练集 NRI 为 7.5% ($P = 0.007$), 外部验证集 NRI 为 5.3% ($P = 0.020$)。**结论** 基于增强 CT 深度学习影像组学术前实现了胸腺瘤的准确风险分类。

PO-1005

影像组学联合 CT 特征预测胸膜下 临床 IA 期肺腺癌脏层胸膜侵犯的价值

望云¹、吕登¹、胡粟²、马燕青³、段绍峰⁴、耿亚媛⁵、周陶胡¹、涂文婷¹、范丽¹、萧毅¹、刘士远¹

1. 中国人民解放军海军军医大学第二附属医院

2. 苏州大学医学院第一附属医院

3. 浙江省人民医院

4. 上海 GE 医疗公司

5. 数坤 (北京) 网络科技有限公司

【目的】

评估基于瘤体及瘤周肿瘤全体积影像组学特征及 CT 特征构建的列线图预测临床 IA 期肺腺癌脏层胸膜侵犯 (VPI) 的价值。

【资料与方法】

回顾性收集本院诊断为临床 IA 期肺腺癌 404 例病例作为内部数据集, 依据病理报告的 VPI 情况分为阳性组和阴性组, 以 7: 3 的比例随机划分为训练集和内部验证集。于外院诊断为临床 IA 期肺腺癌 80 例患者作为外部验证集。以多因素 logistic 回归分析筛选与 VPI 相关的 CT 特征中最佳预测变量组合构建临床模型。基于平扫 CT 图像中瘤体全体积、瘤体外扩 5 mm, 10 mm, 15 mm 范围的瘤体+瘤周全体积的 VOI 各提取 1218 个影像组学特征以构建影像组学模型, 命名为 GTV, GPTV5, GPTV10 和 GPTV15 影像组学模型, 以最优组学模型的 Radscore 和相关 CT 特征采用多因素 logistic 回归构建综合模型并绘制列线图。在验证集中采用 ROC 曲线及 AUC 值来评估该模型的区分度。

【结果】

临床模型中的实性成分最大径、胸膜凹陷征、有无实性成分接触胸膜及血管集束征是临床 IA 期肺腺癌患者 VPI 的 CT 特征独立危险因素。在训练集、内部验证集和外部验证集中 GPTV10 影像组学模型的 AUC 值分别为 0.855、0.842、0.842，以 GPTV10 影像组学模型效能最优。基于 GPTV10-Radscore 和 CT 特征构建的综合模型在训练集、内部验证集和外部验证集中 AUC 值分别为 0.894、0.828 及 0.876。在训练集上综合模型预测效能优于 GPTV10 影像组学模型 ($P<0.05$)，在外部验证集中综合模型预测效能优于临床模型 ($P<0.05$)，在内部验证集中三个模型的 AUC 值差异无统计学意义 ($P>0.05$)。

【结论】

基于 GPTV10 影像组学特征及相关 CT 特征（实性成分最大径、胸膜凹陷征、有无实性成分接触胸膜及血管集束征）的列线图可有效术前预测临床 IA 期肺腺癌患者的 VPI 状态。

PO-1006

影像组学联合 CT 特征预测胸膜下实性成分占比 $\leq 50\%$ 的磨玻璃结节型肺腺癌浸润性的价值

望云¹、吕登¹、胡粟²、马燕青³、黄文君⁴、段绍峰⁵、涂文婷¹、周陶胡¹、范丽¹、萧毅¹、刘士远¹

1. 中国人民解放军海军军医大学第二附属医院

2. 苏州大学医学院第一附属医院

3. 浙江省人民医院

4. 潍坊医学院附属医院

5. 上海 GE 医疗公司

【目的】

评估基于瘤体及瘤周肿瘤全体积影像组学特征及 CT 特征构建的列线图预测胸膜下实性成分占比 (CTR) $\leq 50\%$ 的磨玻璃结节型肺腺癌浸润性的价值。

【资料与方法】

回顾性收集本院诊断为临床 IA 期肺腺癌、与胸膜存在接触且 CTR $\leq 50\%$ 的磨玻璃结节患者 247 例作为内部数据集，按病理类型分为微浸润型肺腺癌 (MIA) 和浸润型肺腺癌 (IAC)，以 7: 3 的比例随机划分为训练集和内部验证集。收集外部三家医院共 47 例患者作为外部验证集 ($n=47$)。以多因素 logistic 回归分析筛选与 VPI 相关的 CT 特征中最佳预测变量组合构建临床模型。基于平扫 CT 图像中瘤体全体积、瘤体外扩 5 mm, 10 mm, 15 mm 范围的瘤体+瘤周全体积的 VOI 各提取 1218 个影像组学特征以构建影像组学模型，命名为 GTV, GPTV5, GPTV10 和 GPTV15 影像组学模型，以最优组学模型的 Radscore 和相关 CT 特征采用多因素 logistic 回归构建综合模型并绘制列线图。在验证集中采用 ROC 曲线及 AUC 值来评估该模型的区分度。

【结果】

临床模型中的肿瘤最大径、实性成分占比是预测胸膜下 CTR $\leq 50\%$ 的磨玻璃结节型肺腺癌患者浸润性的 CT 特征独立危险因素 (P 均 <0.05)。以 GPTV10 影像组学模型效能最优。基于 GPTV10-Radscore 和相关 CT 特征构建的综合模型在训练集、内部验证集和外部验证集中 AUC 值分别为 0.912, 0.874 及 0.892。在训练集上综合模型预测效能优于临床模型 ($P<0.05$)，在内部验证集中三个模型的 AUC 值差异无统计学意义 ($P>0.05$)，在外部验证集中综合模型及 GPTV10 组学模型的预测效能均优于临床模型 ($P<0.05$)。

【结论】

基于 GPTV10 影像组学特征、肿瘤最大径和实性成分占比构建的综合模型可有效术前预测胸膜下 CTR $\leq 50\%$ 的磨玻璃结节型肺腺癌的浸润性。

PO-1007

CT 肺血管定量参数对 COPD 高危人群判定和诊断价值的研究

罗洁君

中国人民解放军海军军医大学第二附属医院

目的：本研究旨在探讨 CT 肺血管定量参数诊断 COPD 及判断高危人群的价值，并分析肺血管重塑参数与肺功能间的相关性。方法：回顾性分析上海市同济医院接受胸部 CT 检查和肺功能检测的 1126 例受试者的临床及影像资料，根据肺功能指标进行分组。定量测量所有受试者的胸部 CT 肺血管参数。分析①3 组人群的基本资料和 4 个肺功能参数间的差异；②分析 3 组人群的 18 个肺血管定量参数间的差异；③分析 CT 肺血管参数与肺功能参数的相关性。结果：①性别及各项肺功能参数在 3 组间均有统计学差异，年龄在组间有统计学差异，3 组间 BMI 差异无统计学意义。②距胸膜 9、15mm 的 Ntotal/LSA 在 3 组间均有统计学差异；距胸膜 9、15、21mm 的 NCSA<5、Ntotal、LSA 和距胸膜 15、21mm 的 VAtotal，距胸膜 21mm 的 Ntotal/LSA 以及 TBV、BV5 和 BV10 在组间有统计学差异，距胸膜 9mm 的 VAtotal 在 3 组间差异无统计学意义。③高危组中，距胸膜 9mm 的 Ntotal/LSA、VAtotal 与部分肺功能参数呈正相关；各胸膜距离下的 NCSA < 5、Ntotal、LSA、Ntotal/LSA 和 TBV、BV5、BV10 与部分肺功能参数呈负相关。COPD 组中，距胸膜 9mm 的 NCSA<5、Ntotal 与 DLCO SB、DLCO/VA 呈正相关，除了 Ntotal/LSA 与肺功能各参数均存呈正相关外，余肺血管参数与部分肺功能参数呈负相关。结论：胸部 CT 定量成像可有效评价 COPD 患者及高危人群的肺血管变化，且肺血管 CT 定量参数有可能区分 COPD 及高危人群，为 COPD 早期诊断提供新的途径。

PO-1008

CT 肺血管定量参数对 COPD 影像表型的鉴别诊断价值

罗洁君

中国人民解放军海军军医大学第二附属医院

目的：本研究旨在分析 COPD 患者不同影像表型的 CT 肺血管定量参数差异。方法：回顾性分析接受胸部 CT 检查和肺功能检测的 372 例 COPD 患者的临床资料及胸部 CT 图像，根据 AEM 视觉分型法分为 A 型 272 例，E 型 60 例，M 型 40 例，分析①3 种表型患者的所有受试者的胸部 CT 肺血管参数，基本资料和 4 个肺功能参数间的差异；②分析 3 种表型患者的 18 个肺血管定量参数间的差异。结果：（1）①3 组表型受试者的性别、年龄、BMI 及肺功能参数在组间有统计学差异；②3 组表型受试者在距胸膜 9mm、15mm 及 21mm 的 LSA 和 Ntotal/LSA 在 A 型和 E 型、A 型和 M 型之间差异有统计学意义；距胸膜 15mm 和 21mm 的 NCSA<5 在总体及两两比较之间差异均有统计学意义。距胸膜 15mm 的 Ntotal 在 A 型和 E 型之间差异有统计学意义，VAtotal 在 E 型和 M 型之间差异有统计学意义。距胸膜 21mm 的 Ntotal、VAtotal 在 A 型和 E 型、A 型和 M 型之间差异有统计学意义。TBV 在 A 型和 E 型、A 型和 M 型之间差异有统计学意义；BV10 在 A 型和 E 型间差异有统计学意义。距胸膜 9mm 的 NCSA<5、Ntotal、VAtotal 以及 BV5 在三组间差异均无统计学意义。结论：不同影像表型 COPD 患者肺血管定量参数存在差异，肺小血管数量在影像表型的区分中具有重要意义。胸部 CT 肺血管定量参数有助于 COPD 患者影像表型评估，为疾病精准诊疗和病人预后评估提供有益的补充。

PO-1009

不同严重程度的新型冠状病毒感染患者在肺血容量分布上的差异

胡歌、朱振宸、宋兰、金征宇
中国医学科学院北京协和医院

目的：基于 2022 年底我国 Omicron 流行期间北京市地区的 COVID-19 患者影像数据，探究不同严重程度的新型冠状病毒感染患者在肺血容量分布上的差异。

方法：本研究回顾性收集了 2022 年 11 月至 2023 年 1 月到本院就诊的 Omicron 感染患者的临床数据和 CT 影像。根据《新型冠状病毒感染诊疗方案（试行第十版）》将患者分为轻型、中型、重型和危重型，其中轻型和中型记为 MM 组（Mild/Moderate），重型和危重型记为 SC 组（Severe/Critical）。一名具有 20 年胸部影像诊断经验的放射科医生对患者 CT 图像中的肺炎程度进行了定性评分，同时采用深度学习模型分割图像中的肺叶、肺炎和肺血管等区域，分析并提取肺血容量分布等定量指标。采用 T 检验、U 检验、卡方检验和 Fisher 检验对两组患者的定性 CT 评分及定量 CT 指标进行统计学检验，采用 Pearson 相关性分析探究肺炎程度与肺血管容量分布之间的关系。

结果：本研究共入组 921 名经过 PCR 或抗原检测确诊的 Omicron 感染患者，其中 MM 组 755 人，平均年龄 58 岁，男性 348 人；SC 组 166 人，平均年龄 74 岁，男性 112 人。与 MM 组相比，SC 组肺炎严重程度的定性评分更高（MM vs. SC, 2.1 vs. 5.4, $P<0.001$ ），且 BV5%（MM vs. SC, 44% vs. 32%, $P<0.001$ ）和 BV10%（MM vs. SC, 61% vs. 49%, $P<0.001$ ）等反应肺部微血管血容量的指标显著低于 MM 组。同时两组患者均呈现下肺区域微血管损失>上肺区域的倾向，对于 SC 组患者来说，右肺上叶、中叶和下叶的 BV5%分别为 37%、32%和 24%，左肺上叶和下叶的 BV5%分别为 38%和 27%，存在显著性差异（ $P<0.001$ ）。肺炎程度定性评分与肺血容量分布指标的 Pearson 相关性系数为 0.71。

结论：与轻型和中型患者相比，重型和危重型的新冠病毒感染患者的肺部微血管血容量损失更加严重，且下肺区域血容量损失程度大于上肺区域，同时肺血容量损失与肺炎严重程度相关。

PO-1010

食管鳞状细胞癌胸椎骨折与放射治疗的相关性研究

王灵丽、李睿
川北医学院附属医院

【摘要】目的 探讨食管鳞状细胞癌(esophageal squamous cell carcinoma, ESCC)患者发生胸椎骨折与接受放射治疗(radiotherapy, RT)的相关性。**方法** 回顾性分析经病理证实为 ESCC 的 602 例患者的临床和 RT 相关参数。根据术后随访期间胸椎是否发生骨折，将患者分为骨折组与非骨折组。用单因素及多因素 Cox 模型分析发生胸椎骨折的危险预测因素。**结果** 经中位随访 24 个月后，有 54 例患者发生胸椎骨折。单变量分析表明，单个椎体的椎体受射剂量每增加 5 Gy 以及 RT 次数每增加 1 倍是椎体骨折的危险因素。多因素 Cox 回归分析显示，在调整临床危险因素后，RT 仍是胸椎骨折的独立的危险因素。在常规临床危险因素 Cox 模型中加入 RT 相关参数(椎体受射剂量和 RT 次数)及平均椎体 HU 值，显著提高了预测椎体骨折的 c2 值(均 $P<0.001$)。**结论** 本研究结果表明，ESCC 行 RT 过程中椎体受射剂量和 RT 次数的增加是发生椎体骨折显著预测因子。联合椎体剂量、RT 分数和椎体 HU 值可以为 ESCC 患者提供最佳的风险分层依据。

PO-1011

肺充气状态对亚实性肺结节影像组学特征稳定性的影响

张含笑、涂文婷

中国人民解放军海军军医大学第二附属医院

目的：探讨肺充气状态对亚实性肺结节 CT 影像组学特征稳定性的影响。

材料和方法：回顾性纳入 2018 年 8 月至 2021 年 7 月在我院同时行低剂量双气相（吸气相和呼气相）胸部 CT 的 230 名患者，共计 255 个亚实性肺结节。放射科医生 1 对 230 名患者的双气相图像中的亚实性肺结节进行手动勾画；另外，从 230 名患者中随机选取 30 名患者，由放射科医生 2 对这 30 名患者的亚实性肺结节进行手动勾画；间隔 1 个月时间，由放射科医生 1 对这 30 名患者的亚实性肺结节进行二次手动勾画。使用组学软件提取影像组学特征，通过组内相关系数（Intraclass correlation coefficient, ICC）对勾画结果进行一致性检验，将观察者间一致性和观察者内一致性较好（ $ICC > 0.75$ ）的特征纳入进一步分析。通过 ICC 对吸气相图像和呼气相图像上亚实性肺结节的影像组学特征进行一致性检验，统计改变肺充气状态导致一致性由较好降级为中等（ $0.4 < ICC \leq 0.75$ ）或较差（ $ICC \leq 0.4$ ）的特征数量，比较不同类别影像组学特征间发生 ICC 降级的数量差异。

结果：观察者间一致性平均值和观察者内一致性平均值均达到较好，分别为 0.854 和 0.849。在 1218 个特征中保留一致性较好的 997 个特征。吸气相和呼气相图像的亚实性肺结节影像组学特征一致性平均值达到中等，为 0.683。一致性较差的组学特征中纹理特征占比最多。改变肺充气状态使亚实性肺结节发生一致性降级的组学特征百分比达到 45.44%（453/997），发生一致性降级的纹理特征多于一阶特征。

结论：改变肺充气状态会影响亚实性肺结节 CT 影像组学特征的稳定性，纹理特征是受影响最明显的特征，进行结节纹理特征研究时，应充分考虑肺充气状态的影响。

PO-1012

肺充气状态对不同类别亚实性肺结节 CT 定量参数的影响

张含笑

中国人民解放军海军军医大学第二附属医院

目的：探讨肺充气状态对不同类别亚实性肺结节常规计算机断层成像（Computed tomography, CT）定量参数的影响。

材料和方法：回顾性纳入 2018 年 8 月至 2021 年 7 月在我院同时行低剂量双气相（吸气相和呼气相）胸部 CT 筛查的 230 名受试者，共计 255 个亚实性肺结节，获取患者双气相 CT 图像中的结节定量参数（结节长轴直径、短轴直径、平均直径、表面积、体积和密度），计算呼气相定量参数与吸气相定量参数变化之比，标记为定量参数变化率【（定量参数呼气相-定量参数吸气相）/定量参数吸气相】。将结节按照不同密度分为部分实性结节组和纯磨玻璃密度结节组、按照不同直径分为直径 $\leq 10\text{mm}$ 组和直径 $> 10\text{mm}$ 组以及按照不同肺叶分为上叶结节组（左肺上叶和右肺上叶）和下叶结节组（左肺下叶、右肺中叶和右肺下叶），比较不同密度、直径和肺叶间结节定量参数变化率的统计学差异。

结果：部分实性结节组和纯磨玻璃密度结节组间的结节长轴直径变化率不存在统计学差异，其余结节定量参数变化率均存在统计学差异（ P 均 < 0.05 ）。直径 $\leq 10\text{mm}$ 结节组和直径 $> 10\text{mm}$ 结节组间的所有结节定量参数变化率均不存在统计学差异（ P 均 > 0.05 ）。下叶结节组的结节密度变化率大于上叶结节组（ $P < 0.001$ ），其余结节定量参数变化率均不存在统计学差异（ P 均 > 0.05 ）。

结论：纯磨玻璃密度结节的大部分 CT 定量参数较部分实性结节更易受肺充气状态的影响；改变肺充气状态对不同直径亚实性肺结节影响相同；下肺叶亚实性肺结节的结节密度较上肺叶亚实性肺结节更易受肺充气状态的影响。

PO-1013

社区筛查人群低剂量 CT 参数反应图的定量分析及其与吸烟的关系：一项横断面研究

周秀秀、范丽

中国人民解放军海军军医大学第二附属医院

目的：基于不同肺功能分组的参数反应图 (PRM) CT 定量参数探讨社区筛查吸烟人群肺体积、密度和小气道的变化。

方法：纳入 2018 年至 2021 年完成了吸气和呼气胸部计算机断层扫描 (CT) 并匹配成功的参加胸部三大疾病筛查的社区吸烟者 1995 例。受试者被分为正常组 ($FEV_1/FVC \geq 0.70$, 预测 $FEV_1\% \geq 72\%$)、高危 COPD 组 ($FEV_1/FVC \geq 0.7$, 预测 $FEV_1\% < 72\%$) 和 COPD 组 ($FEV_1/FVC \leq 0.70$, 预计 $FEV_1\% < 22\%$)，三组根据吸烟史进一步分为从不吸烟者、现吸烟者和既往吸烟者。用计算机软件自动提取 PRM 定量参数。使用单因素方差分析或 Kruskal-Wallis 检验比较两组之间 PRM 定量参数的差异。

结果：COPD 高危组 PRMLV 和 PRMNormalV% 均低于正常组 ($P < 0.05$)，COPD 高危组与正常组中 PRMEmphV、PRMEmphV%、PRMfSADV 和 PRMfSADV% 差异无统计学意义 ($P > 0.05$)。在高危 COPD 人群中现在吸烟者的 PRMLV、PRMEmphV、PRMEmphV%、PRMfSADV 和 PRMfSADV% 高于从不吸烟者 ($P < 0.05$)。现在吸烟者的 PRMNormalV% 低于从不吸烟者 ($P < 0.05$)。先前吸烟者的 PRMfSADV% 高于不吸烟者 ($P > 0.05$)，目前吸烟者的 PRMEmphV% 和 PRMfSADV% 高于从不吸烟者 ($P < 0.05$)。

结论：COPD 高危人群正常肺组织容量和肺容量的百分比降低。吸烟对肺小气道的损害可能是不可逆转的。

PO-1014

HRCT 定量参数对 COPD 早期诊断价值研究

刘明珠

中国人民解放军海军军医大学第二附属医院

【目的】探讨利用胸部高分辨率计算机断层扫描 (HRCT) 测量的定量参数在慢性阻塞性肺疾病 (COPD) 的早期诊断以及 COPD 高危人群识别方面的价值。【资料与方法】回顾性纳入 2015 年 1 月至 2020 年 08 月上海市同济医院和长征医院 670 名同时具有肺功能检查和胸部 HRCT 图像的患者。根据 GOLD 指南定义的肺功能指标进行分组：正常组 ($FEV_1/FVC > 70\%$, $FEV_1\% \geq 95\%$)、高危组 ($FEV_1/FVC > 70\%$, $80\% < FEV_1\% < 95\%$) 及 COPD 组 ($FEV_1/FVC < 70\%$)；正常组 150 例、高危组 156 例、COPD 组 363 例 (GOLD I 105 例、GOLD II 131 例、GOLD III+IV 128 例)。用 COPD 专用分析软件测量肺气肿及小气道共计 13 个参数，探究 HRCT 定量参数与肺功能参数的相关性。【结果】第 6-8 代支气管气道参数与正常组 $FEV_1\%pred$ 显著相关 (均 $P < 0.05$, $rL/A-6=0.168$, $rL/A-7=0.203$, $rL/A-8=0.208$)。高危组内仅第 5、8 级支气管参数与 $FEV_1\%pred$ 显著相关 (均 $P < 0.05$, $rL/A-5=0.184$, $rL/A-8=0.212$)。GOLD III+IV 组所有气道参数均与 $FEV_1\%pred$ 显著相关 (均 $P < 0.05$)。且第 5-8 级支气管参数与 $FEV_1\%$ 相关系数依次递减，说明 GOLD III+IV 组内，较大的气道较小气道影响 $FEV_1\%$ 程度更加显著。【结论】以 FEV_1 为基础的 COPD 分期与患者的气道病变及肺气肿程度相关。在 COPD 临床前期，小气道重塑显著影响 $FEV_1\%$ 水平，而在 COPD 中晚期，中型呼吸道 (而不是小气道) 重塑及肺气肿程度影响 $FEV_1\%$ 水平。

PO-1015

光谱 CT 不同扫描方案及重建算法对体模肺结节图像质量的影响

张金、张含笑、周秀秀、刘士远、范丽
中国人民解放军海军军医大学第二附属医院

目的：评估光谱 CT 不同扫描方案及重建算法对体模肺结节图像质量的影响。

方法：应用西门子光谱 CT 对胸部体模进行不同 kv/mAs 扫描方案，体模中包含 12 个不同直径、密度的肺结节，扫描包括 14 种单能、8 种双能方案，重建算法包括滤波反投影(FBP)、高级迭代重建算法(ADMIRE) 3 级及 5 级。由两名医师分别独立测量不同扫描方案及重建算法下图像质量指标：对比噪声比 (CNR)、剂量校正后噪声 (FOM)、空气噪声 (空气 SD)。固定扫描方案，比较不同重建方法下图像质量的差异；固定重建算法，分别比较单能和双能不同扫描方案下图像质量的差异。

结果：观察者间一致性较好。所有扫描方案之间 CNR 比较有统计学差异 ($P<0.05$)，两两比较发现 Flash Sn100kV-10mAs 和 120kV-150mAs 之间存在差异。在 120kV/10mAs 的扫描方案下，CNR 和空气 SD 在 FBP、ADMIRE-3 及 ADMIRE-5 三种重建算法间无统计学差异 ($P>0.05$)；在重建 ADMIRE 3，单能扫描方案 (120kV-150mAs、120kV-30mAs、Sn100kV-20mAs、Flash Sn100kV-20mAs) 及双能 (90/Sn150kV-40mAs)、90/Sn150kV-20mAs、70/Sn150kV-90mAs、70/Sn150kV-60mAs) CNR、FOM 更高。

结论：光谱 CT 不同扫描方案中，Flash Sn100kV-10mAs 扫描方案的图像质量最佳，同时辐射剂量明显降低；此外，在固定重建方法 ADMIRE 3 时，最佳推荐扫描方案为 70/Sn150kV-60mAs。

PO-1016

基于深度学习技术的早期 COPD 诊断模型研究

刘明珠
中国人民解放军海军军医大学第二附属医院

【目的】利用胸部 HRCT 图像进行特征提取和分析，建立深度学习模型，识别 COPD 的高危人群以及对 COPD 患者进行智能化诊断和 GOLD 分级。

【资料与方法】回顾性纳入 2015 年 1 月至 2020 年 08 月上海市同济医院和长征医院 2142 名同时具有肺功能检查和胸部 CT 平扫的患者。本部分共纳入人群 2142 例。训练集有 1499 例，其中正常组 182 例、高危组 461 例、COPD 组 856 例 (GOLDI=167, GOLDII=459, GOLDIII=169, GOLDIV=61)。验证集有 214 例，其中正常组 28 例、高危组 78 例、COPD 组 108 例 (GOLDI=15, GOLDII=59, GOLDIII=26, GOLDIV=8)。测试集有 429 例，其中正常组 61 例、高危组 127 例、COPD 组 241 例 (GOLDI=41, GOLDII=135, GOLDIII=47, GOLDIV=18)。本研究建立利用 HRCT 图像早期 COPD 的 3D-CNN 深度学习诊断模型。

【结果】基于高分辨率 CT (HRCT) 图像的深度学习结果显示，模型对正常组及高危组进行分类的精确率为 0.72，召回率为 0.73，F1 分数为 0.73，AUC 为 0.75；对非 COPD 组及 COPD 组进行分类的精确率为 0.87，召回率为 0.84，F1 分数为 0.85，AUC 为 0.85；而对 COPD 组内 (GOLDI、GOLD II、GOLD III+IV) 进行分类的准确率和 AUC 分别仅为 0.61 和 0.68。

【结论】CNN 可以根据 CT 图像识别 COPD 肺实质结构变化，从而推断肺功能，确定 COPD 的存在 (AUC=85%) 和严重程度。肺功能正常的人群中，高危人群被 CNN 预测的正确率达到 73%。本研究表明，卷积神经网络 (CNN) 可以通过临床常用的吸气相 CT 进行图像分析实现 COPD 早期诊断，从而提供一种有效的替代方法。

PO-1017

基于光谱及双源 CT 的扫描参数及重建算法肺结节测量的对比：体模研究

张金、张含笑、周秀秀、刘士远、范丽
中国人民解放军海军军医大学第二附属医院

目的：探讨光谱及双源 CT 设备不同的扫描参数及重建算法的辐射剂量及对体模肺结节测量准确性的影响。

方法：对体模肺结节进行 CT 扫描，分为 A 组（飞利浦 128 层光谱 CT）、B 组（西门子 128 层双源 CT），测量、计算对比噪声比（CNR）、剂量校正后噪声（FOM）及空气噪声（AN），每次扫描的辐射剂量。对比光谱及双源 CT 设备的扫描参数、重建算法，比较两组之间图像质量的差异。在图像质量无差异的前提下，固定辐射剂量为 1mSv、0.5mSv、0.3mSv 左右亚组，测量计算以上参数；同时，记录肺结节位置、性质、计算长径的测量误差百分比(APE)。

结果：A、B 组不同扫描方案及重建算法均不影响肺结节的测量结果（ $P>0.05$ ）。在图像质量无差异的前提下，辐射剂量为 1mSv 左右，A 组 120 keV -30mAs (60,70,100keV)使用 IR(R2)重建算法，肺组织 SD、CNR、FOM 较高；当辐射剂量固定在 0.5mSv 左右，A 组 120 keV -10mAs 使用 IR(R2)重建算法 CNR、FOM 显较高；辐射剂量固定在 0.3mSv 左右，A 组 100 keV -10mAs 使用 IR(R2)重建算法 CN、FOM 较高。在图像质量无差异的前提下，辐射剂量为 1mSv 左右，A 组使用 120 keV -30mAs (80-90keV)联合 FBP,Idose4/5,iRR2 重建算法下直径 APE 较低；0.5mSv 左右，A 组 120 keV -10mAs 所有重建算法下直径 APE 较低；0.3mSv 左右，A 组 100 keV -10mAs 使用 Idose4/5,FBP 重建算法下直径 APE 较低。

结论：在不影响肺结节的测量准确性的前提下，飞利浦 128 层光谱 CT 的 100 keV -10mAs 扫描参数，使用 IR(R2)、Idose4/5 重建算法，辐射剂量最低，有望建议作为常规肺结节 CT 筛查的优化方案。

PO-1018

对比剂分段注射法对胸部增强 CT 减轻上腔静脉伪影的价值

李信友、郑桥、金瑞、张志伟、周芳露、吕发金
重庆医科大学附属第一医院

目的 探讨胸部 CT 增强采用对比剂分段注射法对减轻上腔静脉伪影的价值。方法 选择 2022 年 5 月至 2023 年 3 月重庆医科大学附属第一医院行多排螺旋 CT 胸部增强检查患者 200 例(BMI23~26，体重 50~75kg，排除心功能不良)。设备为 GE Discovery 64 排螺旋 CT，对比剂选用 320mgI/mL，常规进行胸部 CT 平扫后选择对比剂智能追踪/实时增强监测法完成胸部 CT 增强检查：碘总量按 320mgI/kg 体重计算，按是否采用对比剂分段注射法分为 A、B 两组，每组均为 100 例：A 组为对照组，采用对比剂+生理盐水推注模式，对比剂维持注射时间设计为 20s，生理盐水维持注射时间设计为 10s（25~40mL），注射速率均为：2.5~3.7mL/s；B 组采用对比剂分段注射法，第一段推注纯对比剂，总量按体重计算出的剂量减 10mL，注射速率按基于体重算出的对比剂总量除 20s 得出，第二段推注 25mL40%混合对比剂（含 10mL 纯对比剂），第三段推注 25~30mL 生理盐水，均使用第一段相同的注射速率；监测气管分叉层面下 1cm 的降主动脉主干，注射对比剂 12s 后开始监测，触发阈值设置为 150HU，扫描完成后分别测量气管分叉层面下 1cm 的上腔静脉、右肺动脉主干、降主动脉 CT 值，并计算各组各血管测量平均值。结果 三组病例的上腔静脉 CT 值分别为：457.21±15.29HU，316.55±12.69HU；右肺动脉主干 CT 值分别为：273.62±13.36HU，226.72±9.33HU；降主动脉 CT 值分别为 322.53±11.28HU，291.46±7.63HU。结论 对比 2 组各血管测量平均值，采用对比剂分段注射法完成胸部 CT 增强检查，上腔静脉强化幅度有相当程度降低

(141HU 左右), 有利于减轻上腔静脉伪影干扰, 肺动脉强化幅度略有增高, 降主动脉强化幅度趋于平稳, 能提供病灶与周围组织的较好对比。

PO-1019

小剂量团注测试多兴趣区选择对确定 CTPA 扫描延迟时间的价值

李信友、汪星宇、周芳露、李王佳、张志伟、吕发金
重庆医科大学附属第一医院

目的 探讨小剂量团注测试多兴趣区选择对确定 CTPA 扫描延迟时间的价值。**方法** 选择院行多排螺旋 CT 肺动脉成像 (CTPA) 检查患者 2 我 87 例 (BMI23~26, 排除心功能不良)。设备为 GE 64 排螺旋 CT, 对比剂选用 400mgI/ml, 常规完成胸部平扫后行小剂量对比剂团注测试获取肺动脉达峰时间: 对比剂 4ml+生理盐水 20ml, 注射速率: 4~4.5ml/s, 监测气管分叉层面下 1cm 的右肺动脉主干, 注射对比剂 4s 后开始监测, 分别选择右肺动脉及降主动脉作为兴趣区, 获取肺动脉及降主动脉达峰时间, 据此计算主动脉、肺动脉达峰时间差值, 选择差值为 4.5s、6s 各 80 例入组。CTPA 正式扫描: 根据体重使用对比剂 15~25ml+生理盐水 45~50ml, 注射速率: 4~4.5ml/s, 扫描延迟时间: 达峰时间+经验值, 根据主、肺动脉达峰时间差值及所加的经验值不同将 160 例患者分为 A、B 两组, 2 组经验值分别设置为 1s、2s, 扫描完成后测量气管分叉层面下 1cm 的上腔静脉、右肺动脉主干、升主动脉、降主动脉 CT 值, 并计算各组各血管测量平均值。结果 2 组病例的上腔静脉 CT 值分别为: $419.53 \pm 17.22\text{HU}$, $302.65 \pm 11.32\text{HU}$; 右肺动脉主干 CT 值分别为: $243.61 \pm 10.46\text{HU}$, $279.35 \pm 16.51\text{HU}$; 升主动脉 CT 值分别为: $45.76 \pm 5.28\text{HU}$, $53.27 \pm 8.62\text{HU}$; 降主动脉 CT 值分别为 $41.52 \pm 2.47\text{HU}$, $46.29 \pm 3.23\text{HU}$ 。结论 对比 2 组各血管测量平均值, 根据小剂量测试获取的主、肺动脉达峰时间差值, 确定 CTPA 扫描延迟时间时应适当变化, 差值为 4.5s, 选择肺动脉达峰时间加 1.5s 经验值, 差值为 6s, 选择肺动脉达峰时间加 2s 经验值, 据此完成 CTPA 检查, 肺动脉强化幅度更高, 上腔静脉伪影干扰更小, 升主动脉及降主动脉强化幅度更低, 后处理图像上肺动脉显示更佳。

PO-1020

基于 DL 的 T2 黑血成像(ACS T2-DB)在心脏磁共振中的应用价值

罗毅、黄璐、夏黎明
华中科技大学同济医学院附属同济医院

目的: 评估基于 DL 的 T2 黑血成像 (ACS T2-DB) 在心脏磁共振中的应用价值。**方法:** 本研究前瞻性的搜集了 9 名心力衰竭患者接受心脏磁共振成像。临床指征包括扩张型心肌病 (n=8) 和高血压性心脏病 (n=1)。所有 CMR 扫描均在配有专用心脏线圈的 3T 扫描仪上进行。所有患者在呼气后屏气状态下接受常规 T2WI-DB 和 ACS T2W-DB 短轴扫描。图像评估: 两名放射技师分别在短轴图像的室间隔上和左心室中池上独立划定感兴趣区域 (ROI), 以获得相应的平均值和标准差 (SD) 值并计算 SNR 和 CNR。一位具有 10 年 CMR 诊断经验的放射科医生盲目评估了常规 T2W-DB 和 ACS T2W-DB 的图像质量, 并记录了运动伪影, 包括左心室信号丢失和运动伪影。统计分析均使用 SPSS V23.0 进行。分析前对两名观察者的 SNR 和 CNR 进行平均, 并使用配对 t 检验评估传统 T2W-DB 和 ACS T2W-DB 的差异。ICC 用于评估 SNR 和 CNR 的观察者间一致性。P<0.05 被认为具有统计学意义。结果: ACS T2W-DB 的总屏气时间 ($50.0 \pm 9.1\text{s}$) 比常规 T2W-DB ($79.6 \pm 13.5\text{s}$, $P<0.001$) 缩短了 36%。与常规 T2W-DB 相比, ACS T2W-DB 显示出更好的 SNR (常规 vs ACS 50.0 ± 19.0 vs 67.6 ± 33.3 , $P=0.038$) 和 CNR (常规 vs ACS 47.8 ± 19.0 vs 77.9 ± 29.2 ,

$P=0.038$)。在伪影评估中,9 名患者中有 4 名在常规 T2W-DB 上显示出明显的伪影,而 9 名患者只有 1 名在 ACS T2W-DB 中显示出明显伪影。两名放射技师在常规 T2W-DB 和 ACS T2W-DB 中测量的 SNR 和 CNR 结果均具有良好的一致性(所有放射技师的 ICC 均大于 0.6)。结论:ACS T2-DB 序列不仅可以显著缩短屏气时间,而且可以通过减少心力衰竭患者的运动伪影来提高图像质量。

PO-1021

心脏磁共振钆延迟增强灰血技术提高心肌梗死检出能力的应用

罗毅、黄璐、夏黎明

华中科技大学同济医学院附属同济医院

【目的】评估心脏磁共振钆延迟增强(LGE)灰血技术对心肌梗死的检出能力。【资料与方法】前瞻性收集 2021 年 1 月至 2022 年 1 月在华中科技大学同济医学院附属同济医院确诊为心肌梗死或心肌梗死复查患者 50 例,所有患者均行心脏磁共振 LGE 亮血和灰血技术扫描,所有图像纳入本次评估范围。使用 4 点量表法对 2 种技术的图像质量和心肌梗死检出可信度进行评分,并比较 2 种技术的整体图像质量和心肌梗死检出可信度。分别比较 LGE 亮血和灰血技术图像的梗死心肌与左心室血池、梗死心肌与正常心肌、正常心肌和左心室血池的对比率(CR)和对比噪声比(CNR)。2 名观察者对 LGE 灰血和亮血技术图像质量的评价以及 CR 和 CNR 的评价均进行一致性分析。

【结果】LGE 灰血与亮血技术图像质量评分差异无统计学意义($t=1.895$, $P=0.058$),但是 LGE 灰血技术在心肌梗死检出可信度优于亮血技术($t=5.281$, $P<0.001$)。图像客观定量分析中,与 LGE 亮血技术比较, LGE 灰血技术的梗死心肌/血池的 CNR 和 CR 均较高($Z=3.113$ 、 3.606 , $P<0.01$),而梗死心肌/正常心肌的 CNR 较低($Z=3.06$, $P=0.002$)。2 名观察者对 LGE 灰血和亮血技术的图像质量和心肌梗死检出可信度评分具有良好的一致性(Kendall's τ_b 均 >0.7)。2 名技师所测值计算得到的 CR 和 CNR 具有较好的一致性(组内相关系数均 >0.7)。【结论】LGE 灰血技术在保证高质量 CMR 图像的前提下,明显提高了梗死心肌与血池的对比,从而提高心肌梗死特别是心内膜下心肌梗死的检出能力,为临床心梗随访提供可靠依据。

PO-1022

人工智能在非门控胸部 LDCT 平扫冠脉钙化积分危险分层的预测价值探讨

樊荣荣

中国人民解放军海军军医大学第二附属医院

目的 探讨深度学习在非门控胸部低剂量 CT (Low-dose Computer Tomography, LDCT) 平扫冠脉钙化积分 (Coronary artery calcium score, CACS) 危险分层的预测价值。方法 由推想医疗科技有限公司搭建深度学习平台并训练非门控胸部低剂量 LDCT 平扫 CACS 模型,模型训练集由上海长征医院 102 例非门控胸部 CT 平扫纵隔窗有冠脉钙化者组成,其中高危者 32 例、中危者 41 例、低危者 29 例。训练集中所有病例均进行非门控胸部 LDCT 平扫和门控 CT 平扫,以心电门控 CT 平扫评估的 CACS 危险分层为金标准,对非门控胸部 CT 平扫纵隔窗冠脉钙化进行标记,输入标记后采用交替训练方法进行深度学习训练。模型测试集由武汉同济医院 50 例非门控胸部 CT 平扫组成,同时将深度学习法中的非门控胸部 CT 扫描所评估的 CACS 与心电门控 CT 扫描所评估的 CACS 进行比较,并采用分类准确率、组内相关系数值、kappa 系数和时间来评估模型的性能。结果 采用深度学习模型确定了 26 例高危组,14 例中危组和 7 例低危组,模型平均正确率为 94%,与心电门控 CT

平扫评估的 CACS 一致性 kappa 值为 0.899。结论 深度学习模型能够较为准确地评估非门控胸部 CT 平扫的 CACS 及其危险分层,具有一定的临床应用价值。

PO-1023

基于人工智能的肺磨玻璃结节内血管定量特征与肺腺癌侵袭性之间的相关性研究

赵宝连、王祥、孙柯、亢寒、张凯、印宏坤、刘凯、萧毅、刘士远
中国人民解放军海军军医大学第二附属医院

目的:探讨基于深度学习(DL)的结节内血管定量特征在鉴别肺腺癌侵袭性中的作用。

材料和方法:本回顾性研究包括 474 例确诊的 512 例磨玻璃结节,其中 241 例为前驱腺体病变,126 例为微浸润腺癌,145 例为侵袭性腺癌。采用基于深度学习的区域分割和区域生长技术,在胸部 CT 平扫图像上重建肺血管并自动计算结节内血管发生率、血管种类和血管体积百分比。采用 Mantel-Haenszel 卡方检验、卡方检验和方差分析比较两组间的差异, $P < 0.05$ 定义为有统计学意义。结果:前驱腺体病变内血管发生率(33.2%)明显低于微浸润腺癌(46.8%, $p = 0.011$)和浸润性腺癌(55.2%, $p < 0.001$),而不同浸润程度的肺结节内血管种类相似(均 $p > 0.05$)。与前驱腺体病变相比,浸润性腺癌和微浸润腺癌内的血管改变更为常见,主要表现为血管体积百分比增加($12.4 \pm 19.0\%$ vs $6.3 \pm 13.1\%$ vs $3.9 \pm 9.4\%$, $p < 0.001$)。浸润性腺癌的结节内动、静脉体积百分比($7.5 \pm 14.0\%$ 和 $5.0 \pm 10.1\%$)高于前驱腺体病变($2.1 \pm 6.9\%$ 和 $1.7 \pm 5.8\%$)和微浸润腺癌($3.2 \pm 9.1\%$ 和 $3.1 \pm 8.7\%$),差异均有统计学意义($p < 0.05$)。

结论:基于深度学习的肺磨玻璃结节内血管的定量分析表明,结节内血管发生率和体积百分比增加的磨玻璃结节可能具有更高的肿瘤侵袭性。

PO-1024

探讨肺腺癌纯磨玻璃样结节(pGGN)的 CT 纹理特征与半乳糖凝集素-9(Gal-9)表达的相关性

王菲菲
辽宁省肿瘤医院

目的:探讨肺腺癌纯磨玻璃样结节(pGGN)的 CT 纹理特征与半乳糖凝集素-9(Gal-9)表达的相关性。

方法:首先用 KM Plotter 数据库中的数据集 "203236_s_at" 进行生存分析,分析 Galectin-9 表达水平对肺腺癌患者预后的影响。随后对 2018 年 10 月至 2020 年 6 月在辽宁省肿瘤医院收治的 87 例 CT 表现为 pGGN 的原发性肺腺癌患者的资料进行回顾性分析,资料包括患者的一般临床特征、Gal-9 表达水平及 CT 纹理特征(平均 CT 值、最大 CT 值和 Δ CT)。所有患者经病理诊断为原发性肺腺癌,并接受了增强 CT 检查。

结果:Gal-9 的高表达与肺腺癌患者较短的总生存期(overall survival, OS)和首次进展时间(first progression, FS)显著相关。尤其是在接受化疗的肺腺癌患者中,Gal-9 高表达时 OS 缩短。34.15%的 Gal-9 阴性患者表现为肿瘤中/低分化,而在 Gal-9 阳性患者中这一比例高达 74.47%。65.21%的 Gal-9 阳性患者肿瘤 TMN 分期为 III/IV 期,显著高于阴性患者(24.39%)。Gal-9 阳性组的平均 CT 值、 Δ CT 高于阴性组,最大 CT 值低于阴性组。患者的平均 CT 值和 Δ CT 与 Gal-9 的 IHC 评分正相关($R=0.803$, $p < 0.001$; $R=0.752$, $p < 0.001$),而最大 CT 值与 Gal-9 的 IHC 评分

负相关 ($R=-0.471$, <0.001)。最大 CT 值的 AUC 为 0.856 (95%CI, 0.778-0.935, $p<0.0001$)，用最大 CT 值预测 Gal-9 表达水平的 cut-off 值为 -433.071，灵敏度为 87.8%，特异度为 73.9%。结论：Gal-9 可能是预测肺腺癌预后的有效指标。增强 CT 的最大 CT 值可能是 pGGN 肺腺癌 Gal-9 表达水平的潜在预测因素。

PO-1025

心脏占位诊断与鉴别

李燕

山西医科大学第一医院

心脏占位发生率较低，但是一旦发生，需要我们影像科医生进行精准诊断与鉴别，心脏占位可以按照病理类型分类，也可以按照累及的心房心室分类。本次汇报通过我科一例病例，系统回顾心脏占位的类型及影像表现，帮助临床医生更好地进行鉴别。

PO-1026

基于 Delta 影像组学模型预测 NSCLC 新辅助免疫治疗疗效

韩小雨、史河水、郑传胜、郑雨婷

武汉协和医院

目标：目前尚无可靠的预测可切除（II-III 期）非小细胞癌（NSCLC）新辅助免疫治疗病理反应的标志物。本研究旨在探究影像组学特征变化，即 Delta 影像组学特征是否有潜力预测 NSCLC 患者新辅助免疫治疗的显著病理缓解（MPR）。

方法：纳入全国三家医院的 206 例 IIA-IIIIB 期 NSCLC 患者（武汉协和医院=164 例；湖北省宜昌中心医院=21 例；河南省安阳肿瘤医院=21 例），这些患者接受了新辅助化疗免疫治疗和手术治疗。武汉协和医院的病例被随机分为训练数据集和测试数据集，比例为 0.7:0.3。湖北省宜昌中心医院和河南省安阳肿瘤医院数据被用作两个独立的外部验证数据集。获取治疗前（基线）和手术前两次增强 CT 扫描图像。Delta 影像组学特征被定义为基线和术前影像组学特征之间的相对净变化。进而建立了 Delta 影像组学模型和治疗前 CT 影像组学模型，同时评估免疫相关反应评估实体瘤标准（iRECIST）对预测 MPR 的性能，结合 Delta 影像组学特征和 iRECIST 建立混合模型。

结果：超过一半患者（51.5%）在新辅助免疫治疗后出现 MPR。在预测 MPR 上，Delta 影像组学模型在训练、测试和两个外部验证数据库中的曲线下面积（AUC）分别为 0.768、0.732、0.833 和 0.716，显示出比术前治疗影像组学模型（0.644、0.616、0.475 和 0.608）更好的预测性能。与 iRECIST 标准（0.624、0.572、0.650 和 0.466）相比，结合 Delta 影像组学特征和 iRECIST 的混合模型在四组中对 MPR 的预测具有更高的 AUC 值，分别为 0.777、0.761、0.850 和 0.670。

结论：与治疗前 CT 影像组学模型和 iRECIST 标准相比，Delta 影像组学模型在可切除的 II-III 期 NSCLC 新辅助化疗免疫治疗术前预测 MPR 方面显示出最佳的诊断性能。

PO-1027

T2 mapping 识别肥厚型心肌病患者心肌损伤的可行性研究

杨淑娟、赵世华
中国医学科学院阜外医院

目的 既往研究报道 T2 mapping 技术可识别肥厚型心肌病的心肌水肿。本研究拟针对 HCM，探讨 T2 mapping 测量的 T2 值与心肌损伤之间的相关性。

方法 本研究前瞻性纳入了 50 名无冠心病和炎症性心肌病史的 HCM 患者。所有患者均接受了 3T CMR 检查，包括电影、钆对比剂延迟强化 (LGE)、T1 mapping 以及 T2 mapping 序列，测量每个患者的全心 T2 值、ConSept T2 值(中段室间隔 ROI)、最大及最小节段 T2 值。同时，每位患者均接受超敏心肌肌钙蛋白 I (hs-cTnI) 检测，hs-cTnI>0.016pg/ml 定义为心肌存在活动性损伤。此外，20 名基线分布与患者组相似的健康志愿者作为对照组。

结果 HCM 患者组中，25 例 (20 名男性，50±13 岁) hs-cTnI 升高，25 例 (17 名男性，49±14 岁) hs-cTnI 处于正常范围。相较于 hs-cTnI 正常组，hs-cTnI 升高组的最大 T2 值、最小 T2 值、全心 T2 值、ConSept T2 值、全心 T1 值以及 ConSept T1 值更高 (P 均<0.05)。ConSept T2 值 (r = 0.52, P <0.001)、LGE 范围 (r = 0.52, P <0.001) 均与 hs-cTnI 呈弱相关。在所有 T1 及 T2 参数中，ConSept T2 值识别肥厚型心肌病心肌损伤的效能最高 (AUV=0.83)。在多因素 logistic 回归分析中，在 7 个校正模型中分别纳入了左室射血分数、左室舒张末容积指数、最大室壁厚度、左室心肌质量指数、LGE 范围、T1 全心值以及 ConSept T1 值，ConSept T2 值仍然与升高的 hs-cTnI 即心肌损伤相关 (P<0.01)。

结论 本研究证实了 T2 mapping 在检测 HCM 活动性心肌损伤的可行性。ConSept T2 值与升高的 hs-cTnI 密切相关，这在体识别 HCM 患者的心肌损伤提供了影像学证据。

PO-1028

**非小细胞肺癌患者术后脑转移的风险：
影像组学及临床病理特征分析**

杨露、杨军
云南省肿瘤医院

目的：回顾性收集 IIB-IIIIB 期非小细胞肺癌患者病例，构建患者影像组学特征和临床病理特征的联合模型，预测非小细胞肺癌患者术后脑转移的风险。

资料和方法：本研究回顾性收集 2015 年 10 月至 2019 年 12 月在我院行肺癌手术切除，术后病理分期为 IIB-IIIIB 期的非小细胞肺癌患者 333 例 (脑转移患者 97 例，无脑转移患者 236 例)，按 7:3 的比例将患者随机分为训练集和验证集。从每个患者术前胸部 CT 图像中提取原发肿瘤及瘤灶周围的影像组学特征，使用最小绝对收缩选择算子 (least absolute shrinkage and selection operator, LASSO) 进行影像组学特征选择，利用单变量及多变量 COX 回归分析筛选临床病理特征，利用五种机器学习分类器分别构建影像组学模型、临床病理特征模型及两者联合的模型。最后构建整合影像组学特征、临床病理特征的诺谟图。通过受试者工作特征曲线 (receiver operating characteristic curve, ROC) 下面积 (area under curve, AUC)、校准曲线和决策曲线分析来评价模型的性能。AUC 的比较采用 DeLong 试验。

结果：影像组学联合临床病理特征的模型效能显著优于单一的模型，校准曲线显示联合模型的预测概率与脑转移的实际观测概率吻合较好。联合模型比临床模型和影像组学模型获得更高的净效益。联合模型中，所构建的机器学习模型中以 Ida 模型的效能最高 (AUC 为 0.95)。在影像组学模型中，增加瘤周影像组学特征，预测模型的效能得到显著提高，且差异具有统计学意义。

结论: 结合原发病灶和瘤灶周围的影像组学特征及临床病理特征的机器学习模型可以帮助早期预测 IIB-IIIIB 期 NSCLC 患者术后脑转移的发生风险, 筛选出脑转移的高风险人群, 为辅助临床医生为患者进行治疗及制定随访计划提供帮助。

PO-1029

肺动脉鞘血肿与急性 Stanford A 型 主动脉夹层近期预后相关性研究

和燕斐、杨瑞、刘继伟、王平凡、高夏、张亚飞
河南省胸科医院

目的 探讨 CTA 发现肺动脉鞘血肿 (HPS) 与急性 Stanford A 型主动脉夹层 (ATAAD) 近期预后的相关性。方法 回顾性分析河南省胸科医院 2019 年 1 月至 2022 年 10 月间共计 288 例经 CTA 及临床诊断 ATAAD 患者的影像学及病例资料, 将肺动脉鞘血肿、心包积液、灌注不良综合征等 14 个可能与死亡相关的因素逐个进行单因素分析, 单因素分析有意义的变量纳入多因素 Logistic 回归分析, 对其中有统计学差异的参数进一步做 ROC 曲线分析。结果 单因素分析发现 HPS 等 7 个因素有统计学意义 ($P < 0.05$), 进一步多因素分析提示 HPS 致肺动脉直径受压程度 $\geq 50\%$ ($OR = 6.88$, $P = 0.04$)、年龄 ($OR = 1.12$, $P < 0.01$)、术前伴灌注不良综合征 ($OR = 6.16$, $P < 0.01$)、心包积液 ($OR = 4.39$, $P = 0.04$) 是患者院内死亡的独立危险因素, 手术或介入治疗为保护因素 ($OR = 0.17$, $P < 0.01$), ROC 曲线显示联合预测概率的曲线下面积 (AUC) 为 0.96, HPS 致肺动脉受压程度 AUC 为 0.84, 差异有统计学意义 ($P < 0.01$)

PO-1030

探究心肌灌注储备与氧化应激及病理学指标之间的相关性: 一项针对 2 型糖尿病兔的心血管磁共振研究

马培松¹、张志伟¹、吕发金¹、王健²
1. 重庆医科大学附属第一医院
2. 陆军军医大学第一附属医院 (西南医院)

目的: 探讨基于负荷心脏磁共振 (CMR) 成像的心肌灌注储备指数 (MPRI) 评估 2 型糖尿病 (T2DM) 兔心肌微循环障碍的价值及其与氧化应激及病理学指标之间的联系。

方法: 本研究随机将新西兰大白兔分为对照组 ($n = 7$)、T2DM 5 周组 ($n = 6$)、10 周组 ($n = 7$) 以及 15 周组 ($n = 7$)。所有兔均接受 3.0T CMR 灌注成像, 分别获得静息及三磷酸腺苷 (ATP) 负荷下短轴位中间层面图像, 在室间隔处绘制感兴趣区域并测量 MPRI 值。随即处死家兔, 行 Masson 染色得到胶原体积分数 (CVF), 免疫组化 CD31 染色得到微血管密度 (MVD)。测定心肌室间隔组织氧化应激标志物水平。采用 Pearson 或 Spearman 探究 MPRI 与病理及氧化应激指标的相关性, 并构建多元线性回归模型评估 MPRI 的影响因素。以 MVD、CVF 中位数为阈值分为两组, 采用 ROC 曲线评估 MPRI 在鉴别不同病理学指标水平 (高于中位数与低于中位数) 的效能。

结果: MPRI 与 MVD ($r = 0.562$, $p < 0.01$), SOD ($r = 0.402$, $p = 0.041$), CVF ($r = -0.492$, $p < 0.01$) 呈显著相关性。多元回归分析发现 MVD 是预测心肌 MPRI 下降的独立影响因素 ($\beta = 0.562$, $p = 0.002$, $R^2 = 0.288$)。此外, MVD 小于中位数水平 ($t = 3.202$, $p = 0.004$) 与 CVF 高于中位数水平 ($t = 3.074$, $p = 0.005$) 组的 MPRI 值显著减小, MPRI 鉴别不同 MVD、CVF 水平 (高于中位数与低于中位数) 的曲线下面积 (AUC) 分别为 0.799 (95%CI 0.629~0.969) 和 0.783 (95%CI 0.609~0.957)。

结论: 基于 CMR 的 MPRI 可有效评估 T2DM 兔心肌微循环障碍, 且是鉴别 T2DM 个体低中危和高危病理状态的一个有价值的指标, 该研究为揭示 T2DM 心肌灌注障碍的发病机制和影响因素提供了科学依据。

PO-1031

基于冠状动脉 CT 血流储备分数预测老年冠心病患者远期结局的研究

江京洲、郭翔、左蕊、陈谦、乔红艳、郭邦俊、许棚棚、刘通源、张龙江
中国人民解放军东部战区总医院

【摘要】目的 评估冠状动脉 CT 血流储备分数 (CT-FFR) 在预测老年冠心病患者远期结局中的价值。**方法** 回顾性分析 2018 年 4 月至 2019 年 3 月在东部战区总医院的一项基于冠状动脉 CT 血管成像 (CCTA) 和 CT-FFR 的前瞻性观察性研究, 基于患者 CCTA 数据分析所有病变血管的斑块特征并测量 CT-FFR 值。通过 Cox 比例风险回归模型、Kaplan-Meier 生存曲线及受试者工作特征曲线分析斑块特征及 CT-FFR 与主要不良心血管事件 (MACE, 定义为全因死亡、非致死性心肌梗死以及紧急血运重建) 之间的关系。**结果** 330 例老年冠心病患者 (中位年龄 67 岁; 年龄范围, 60-90 岁; 62.7% 为男性) 纳入本研究, 中位随访时间为 2.9 年, 共 35 例 (10.6%) 患者发生 MACE。冠状动脉狭窄程度 $\geq 50\%$ 或 CT-FFR ≤ 0.8 的患者发生 MACE 风险明显增高 ($P < 0.05$)。无 MACE 组和 MACE 组之间病变血管斑块特征均无显著统计学差异 (P 值均 > 0.05)。单因素 Cox 分析显示糖尿病、吸烟、狭窄程度 $\geq 50\%$ 及 CT-FFR ≤ 0.8 是发生 MACE 的危险因素 (P 值均 < 0.1), 经多因素 Cox 分析校正后, 仅 CT-FFR ≤ 0.8 是发生 MACE 的独立危险因素 ($HR = 17.037$; $95\%CI [5.060-57.358]$; $P < 0.001$)。此外, 基于 CT-FFR 的风险预测模型显著优于基于 CCTA 的风险预测模型 (C 指数为 0.820 vs 0.696 ; $P < 0.001$)。结论 CT-FFR ≤ 0.8 是预测老年冠心病患者远期 MACE 的重要独立危险因素。根据 CT-FFR 值进行临床风险分层, 可能优化老年冠心病患者的预后管理策略。

PO-1032

计算机断层扫描心肌灌注成像与心理应激检测焦虑和阻塞性冠心病患者心肌缺血

孙伟航、曲晓峰、梅灵俊、赖声远
大连医科大学附属第二医院

目的: 心理应激可导致焦虑和阻塞性冠心病患者心肌缺血。动态计算机断层扫描心肌灌注 (CT-MPI) 可用于定量测量心肌血流动力学的变化。本研究的目的是使用动态 CT-MPI 结合精神压力源测量患有阻塞性冠状动脉疾病 (AOCAD) 的焦虑症患者和患有焦虑症但没有阻塞性冠状动脉疾病 (ANOCAD) 的患者的患者的心肌血流量 (MBF)。

方法: 对 30 例 AOCAD 患者和 30 例 ANOCAD 患者进行分析。使用 17 段模型, 分别记录 ANOCAD 患者主要冠状动脉 (包括左前降支、左主干冠状动脉、左旋支和右冠状动脉) 的静息期 MBF 和应力期 MBF。对于 AOCAD 患者, 根据冠状动脉 CT 血管造影术, 将至少一条活动血管中管腔狭窄超过 50% 的心肌节段定义为靶区。其余心肌节段被定义为非靶区。分别记录靶区和非靶区的静息期 MBF 和应力期 MBF。

结果: 与 ANOCAD 患者相比, AOCAD 患者更有可能出现局部 MBF 降低 ($p < 0.05$)。ANOCAD 的患者在应激期的总 MBF 和主干冠状动脉 MBF 均低于休息期 (均 $p < 0.05$), 但在静息期或应力期各主要冠状动脉的 MBF 无显著差异 ($p = 0.25$, $p = 0.15$)。AOCAD 患者在静息期和应力期靶区的

MBF 均低于非靶区, 应力期目标区 MBF 低于静息期 (均 $p<0.05$), 在非目标区域, 休息期和压力期的 MBF 没有显著差异 ($p=0.73$)。AOCAD 是精神压力后焦虑患者 MBF 有限降低的独立预测因素 (优势比: 4.03, 95%置信区间: 1.04-15.56, $p<0.05$)。

结论: ANOCAD 患者在精神压力下 MBF 的下降是弥漫性的, 而 AOCAD 患者的 MBF 下降是局部的。AOCAD 是精神压力下局部 MBF 降低的独立预测因子。动态 CT-MPI 结合精神压力源可用于检测焦虑患者的 MBF 变化。

PO-1033

肺 NUT 癌 CT 影像诊断及鉴别诊断 (附 1 例肺 NUT 癌报道)

肖艳、彭正伟、王文霞
重庆医科大学附属璧山医院

目的: 探讨肺 NUT 癌的临床表现、CT 诊断及鉴别诊断, 总结其影像学特征, 提高临床医生对该病的认识。方法: 回顾性分析我院 1 例罕见肺 NUT 癌的临床特征, 并结合相关文献讨论。结果: 患者为女性, 年龄 32 岁, 间断咯血 3 月。胸部 CT 增强示左肺上叶舌段肿块, 肿瘤最大直径为 6.3cm, 边界清晰, 密度不均, 增强中度不均匀强化, 伴纵膈及左肺门淋巴结转移, 初步考虑左肺上叶中央型肺癌。支气管镜病理活检: 左肺上叶小圆细胞恶性肿瘤伴出血及片状坏死, NUT (+), Ki67 (60%+)。分子检测: 肺 NUT 癌, 存在 BRD4-NUTM1 融合基因断裂。随访 1 月肿块增大, 密度不均较前更明显, 6 月后肿块持续性增大并出现胸膜广泛转移。结论: 肺 NUT 癌是一种罕见且分化程度极低的高度恶性肿瘤, 好发于年轻人, 以右肺多见, CT 表现有一定特征性, 影像需与其他原发病理类型肺癌 (鳞癌、腺癌及小细胞癌等) 相鉴别, 确诊依赖于组织病理学、免疫及和基因检测。

PO-1034

异基因造血干细胞移植术后慢性移植抗宿主病患者肺部影像评估

曹旭阳、洪楠
北京大学人民医院

【摘要】目的 分析成人慢性移植抗宿主病 (cGVHD) 患者肺部 CT 异常影像学表现并结合临床资料, 对 cGVHD 肺部的异常得到有助于诊断及鉴别的信息。资料与方法 收集*院 2018 年 10 月至 2020 年 10 月行异基因造血干细胞移植 (allo-HSCT) [51] 术后出现 cGVHD 临床表现的患者 162 例, 对其胸部 CT 图像征象[病变位置、分布、磨玻璃密度 (GGO)、实变、网格影、结节影、支气管扩张、胸腔积液、气体潴留、气胸或纵膈积液]进行总结并比较肺 GVHD 与肺部感染的影像差异。结果[52] 162 例患者中胸部 CT 影像表现正常 6 例, 异常 156 例, 其中感染性肺部并发症 153 例, 非感染肺部并发症 3 例, 感染性肺部并发症患者中病毒感染 7 例, 细菌感染 5 例, 真菌感染 50 例, 混合感染 34 例, 病原学不明 57 例。肺部细菌感染常见局限实变, 病毒感染多见 GGO 与弥漫分布网格, 真菌感染多散发结节, 肺 GVHD 常见气体潴留、支气管扩张、支气管壁增厚, 合并闭塞性细支气管炎的相关征象者 36 例。结论 临床确诊成人 cGVHD 患者, 绝大多数均有肺部影像异常, 以感染为主要病因, 有部分比例的患者同时具有肺部 cGVHD 的影像表现, 影像结合临床有助于肺部并发症的诊断与鉴别。

PO-1035

基于人工智能定量评估结缔组织病相关间质性肺疾病严重度的研究

储晨
南京鼓楼医院

目的：结缔组织病相关间质性肺疾病（CTD-ILD）是间质性肺疾病的主要类型，也是结缔组织病常见且严重的并发症。本研究试图通过人工智能肺炎分割系统分别评估左右肺感染体积和百分比、以及对感染成份进行分析比较，从而建立一个系统评价 CTD-ILD 的定量分析方法。

材料与方法：本研究共入组患者 128 例，其中男 28 例，女 100 例，年龄为 58.6 ± 11.2 岁。本研究入组患者均测量了 FVC% 和 DLCO% 预测值，并分为轻、中及重度。结合 TEI 和肺功能结果，将 CTD-ILD 分为轻度组和重度组。人工智能得到的参数有：全肺、左肺及右肺体积、感染体积和百分比、感染成份 ≤ -750 Hu 体积和百分比、感染成份 $-750 \sim -300$ Hu 体积和百分比、感染成份 $-300 \sim -49$ Hu 体积和百分比以及感染成份 ≥ 50 Hu 体积和百分比。独立样本 t 检验和 ROC 分析鉴别两组肺炎参数。方差分析和 LSD 检验比较感染成份。Spearman 秩和检验比较参数与肺功能等级的相关性。

结果：根据主观评估结合肺功能检查，分为轻度组 52 名和重度组 76 名。重度组体积均显著小于轻度组（ $P \leq 0.001$ ）。重度组感染体积和百分比均显著大于轻度组（ $P \leq 0.001$ ）。ROC 曲线示全肺、左肺及右肺感染体积和百分比指标具有较高诊断价值（AUC 值均 > 0.700 ）。感染成份 $-750 \sim -300$ Hu 体积及百分比显著大于 ≤ -750 Hu、 $-300 \sim -49$ Hu 和 ≥ 50 Hu 体积和百分比（P 值均 < 0.001 ）， ≤ -750 Hu 和 $-300 \sim -49$ Hu 体积和百分比显著大于 ≥ 50 Hu 体积和百分比（P 值均 < 0.001 ）。全肺、左肺及右肺体积与肺功能指标呈显著负相关，全肺、左肺及右肺感染体积和百分比、各感染成份体积和百分比均与肺功能等级呈显著正相关。

结论：本研究提供了一个系统定量评估 CTD-ILD 患者的新方法，可用于患者的严重度评估。

PO-1036

基于 CT 纹理分析及血常规指标联合预测模型在浸润性肺腺癌病理亚型鉴别中的应用

陈文萍
南京大学医学院附属鼓楼医院

目的：探讨浸润性肺腺癌病理亚型与 CT 影像学特征的关系，评估 CT 影像学特征、纹理参数及血常规指标联合预测模型对病理亚型的鉴别诊断价值。

方法：回顾性分析我院 2017 年 2 月至 2019 年 4 月经手术病理证实为浸润性肺腺癌的 222 例患者 CT 特征、纹理参数及血常规检查资料。按照第四版世界卫生组织（WHO）胸部肿瘤分类标准，将病理亚型分为贴壁生长为主型（lepidic predominant adenocarcinoma, LPA）组和非 LPA（non-LPA, n-LPA）组。采用 Mann-Whitney U 检验分析连续变量在 LPA 组和 n-LPA 组间的差异。采用受试者操作特征（receiver operating characteristic, ROC）曲线评价鉴别效能。采用回归分析和机器学习算法建立多参数模型。

结果：共纳入 222 例患者，LPA 组 49 例，n-LPA 组 173 例。训练集单因素分析中，6 个 CT 定性参数、5 个 CT 定量参数、23 个 CT 纹理参数和 2 个血常规检查参数在 LPA 组和 n-LPA 组间均存在显著性差异（ P 均 < 0.05 ）。多参数 logistic 回归分析中，结节型/肿块型、空泡征、Mean、SD (CT 纹理)、Mode、Min、Percentile 25th、Entropy GLCM 10 和白细胞是预测 n-LPA 的独立影响因子（ P 均 < 0.05 ）。基于回归模型建立的区分 LPA 组和 n-LPA 组间的曲线下面积（area under the

curve, AUC) 为 0.881, 在验证集中 AUC 值为 0.954。训练集中, 采用随机森林法 (random forest, RF) 的多参数模型鉴别诊断效能优于其他机器学习算法, AUC 值为 0.793。

结论: 本研究建立并验证了区分 LPA 及 n-LPA 的多参数模型, 该多参数模型联合了 CT 影像学特征、纹理参数及血常规指标, 并取得了较好的诊断效能。

PO-1037

VHP 技术在颈动脉、冠脉 CTA“一站式”扫描中的应用与价值

邢俊、孙炎冰
上海市胸科医院

目的: 探讨 320 排 CT 在颈动脉 CTA 和冠脉 CTA 检查中使用可变螺距法 (VHP) “一站式”扫描与常规方法扫描相比图像质量和辐射剂量上的差异。方法: 收集我院临床怀疑颈动脉疾病、冠心病史行颈动脉、冠脉 CTA 检查患者 50 例, 随机分成 A、B 两组。A 组使用 VHP 法, 从足往头侧扫描, 先经心脏处开启心电监护模式, 至气管分叉处后自动切换大螺距扫描 (Fast)。B 组患者分两天行常规冠脉 CTA 容积扫描及颈动脉螺旋扫描。测量两组图像主动脉根部、冠脉开口 (右冠)、颈动脉 (包括颈动脉开口、颈动脉分叉)、基底动脉及颈静脉层面的 CT 值。由两名有经验的放射科医生对图像质量评价并进行统计学分析, 同时比较两组图像的质量、对比剂用量及辐射剂量。结果: 两组颈静脉 SNR、CNR、CT 值及 SD 值均有统计学差异 ($P < 0.001$), 其中 B 组颈动脉的主观评分 (3.65 ± 0.49) 相较于 A 组 (2.73 ± 0.45) 高 33.7%, 其余两组图像质量评价无统计学差异 ($P > 0.05$)。在患者辐射剂量、对比剂用量上, A 组 ($992.94 \pm 177.43 \text{ mGy.cm}$)、($60.06 \pm 11.22 \text{ ml}$) 相较于 B 组 ($1077.35 \pm 117.36 \text{ mGy.cm}$)、($100.50 \pm 9.79 \text{ ml}$) 降低了 7.8%、40.2% 有统计学差异 ($P < 0.001$)。结论: VHP 技术下的颈动脉、冠脉 CTA “一站式”扫描可以在不影响临床诊断且保证图像质量的前提下一次完成所需检查, 大幅度降低患者对比剂用量及辐射剂量, 具有较高的临床应用价值。

PO-1038

基于 CTA 及临床资料预测急性主脉夹层患者围手术期死亡风险

邓铁¹、冯俊榜¹、王忠睿¹、李邦国²、余洪²
1. 重庆大学附属中心医院、重庆市急救医疗中心
2. 遵义医科大学附属医院

目的: 利用急性主动脉夹层 (acute aortic dissection, AAD) 患者围手术期死亡的风险因素建立一个有效的死亡风险预测评分模型。

方法: 回顾性收集 2013 年 2 月-2021 年 7 月经遵义医科大学附属医院诊治且围手术期死亡的 AAD 患者 60 例纳入死亡组; 随机收集同时期治疗好转的 AAD 患者 210 例纳入未死亡组。分析两组患者围手术期内首次计算机断层血管造影 (computed tomographic angiography, CTA) 成像数据、临床基线资料以及入院第一次的血清生物标志物资料, 筛选出患者围手术期死亡的独立预测因素, 建立死亡风险预测模型并对模型效能进行评价。

结果: 经单因素差异性比较分析、多因素 Logistic 回归分析后得出 AAD 围手术期死亡的七个独立危险因素: A 型主动脉夹层、夹层破口形态不规则、假腔增强-平扫 CT 差值减小、血红蛋白降低、尿酸升高、门冬氨酸转氨酶升高及主动脉夹层未进行手术治疗。利用上述独立危险因素建立列线图预测模型, 且该预测模型受试者工作特征曲线 (receiver operating characteristic, ROC) 曲线下面积为 0.882, 具有优秀的预测效能。

结论: 本研究成功地建立了一种简单、有效、快捷的 AAD 患者围手术期死亡风险评估模型。利用上述独立危险因素建立的列线图预测模型有助于评估 AAD 患者围手术期的死亡风险,具有一定的临床应用价值。

PO-1039

基于 CT 影像组学的计算机辅助鉴别周围型肺癌与肿块/结节型肺结核的研究

蔡久嫩、于韬
辽宁省肿瘤医院

目的: 通过影像组学方法对周围型肺癌和肿块/结节型肺结核 CT 影像进行辅助鉴别。

研究与方法: 回顾性收集辽宁省肿瘤医院 2017 年 8 月到 2018 年 12 月及沈阳市胸科医院 2017 年 9 月到 2018 年 10 月经病理证实为周围型肺癌的患者 206 例,肺结核的患者 277 例,共 483 例患者。对肺窗 CT 影像通过 ITK-SNAP 软件进行病灶区域人工分割,然后通过 Pyradiomics 软件对得到的 ROI 提取影像组学特征,训练构建四种分类器模型,即支持向量机 (SVM)、随机森林 (RF)、logistic 回归分析 (LR) 及朴素贝叶斯 (NB) 模型,并绘制 ROC 曲线,以评估模型对周围型肺癌和肿块/结节型结核的辅助鉴别能力。采用基于 Inception v3、VGG 16 和 VGG 19 框架的卷积神经网络 (CNN) 对数据进行自动学习和分析,鉴别周围型肺癌和肿块/结节型肺结核,绘制 ROC 曲线。

结果:

从图像中提取特征,并用双样本 t 检验选出具有显著统计学差异的特征,最终得到 20 个特征。建立 SVM、RF、LR 及 NB 四种预测模型,鉴别。SVM、RF、LR 及 NB 模型在测试集的 AUC 曲线下方的面积大小分别为 0.96、0.96、0.97 及 0.92;敏感度分别为 0.78、0.76、0.79 及 0.69。通过 CNN 建立的 inception v3、VGG 16、VGG 19 三种模型,得出测试集的 AUC 分别为 0.92、0.94、0.94,敏感度分别为 0.89、0.83、0.86。

结论: 基于胸部 CT 平扫提取的影像组学特征在鉴别周围型肺癌、肿块/结节型肺结核两种疾病具有一定价值。卷积神经网络对于鉴别周围型肺癌、肿块/结节型肺结核也有较高的应用价值。这两种方法均可以实现对周围型肺癌与肿块/结节型肺结核快速无创性的鉴别诊断,对临床医生的诊断和治疗提供了很大的帮助,为患者减轻病痛及经济负担,提高生活质量。

PO-1040

晚期肺癌患者免疫相关肺炎的临床及影像学表现

王利华、罗娅红
辽宁省肿瘤医院

目的:

本研究对使用免疫检查点抑制剂 (immune checkpoint inhibitors, ICIs) 治疗并发生免疫相关肺炎 (checkpoint inhibitor pneumonitis, CIP) 的晚期肺癌患者的临床及影像学表现进行回顾性分析。

方法:

收集 2018 年 1 月至 2022 年 10 月本院接受 ICIs 治疗 (PD-1/PD-L1) 的晚期肺癌患者 564 例,其中 61 名患者诊断为 CIP。分析 CIP 患者的临床表现、影像学表现及治疗疗效情况。

结果:

本研究中,肺癌患者接受 ICIs 并发生 CIP 的发生率为 10.82%。CIP 的发病时间为 3 天至 15 个月不等,中位时间 3.0 个月。发生 CIP 的患者中,腺癌 (32 例)、TNM 分期 IV 期 (47 例)、老年

(中位年龄 62 岁)、吸烟(42 例)、男性(48 例)、联合治疗(43 例)患者多见。肿瘤细胞阳性比例评分结果中,表达阳性患者更多见(16 例)。CTCAE 分级 1-2 级患者约占 2/3,5 级患者(6 例),死亡率 9.84%。随分级越高影像学表现加重。CIP 以多病灶(32 例)、周围(41 例)分布为主,累及双肺、多个肺叶,病灶多边界模糊(占比 58 例)。发生 CIP 患者影像学表现大多为隐源性机化性肺炎模式,过敏性肺炎模式少见。疗效评估中,肿瘤缓解、稳定及进展患者病例数分别为 19 例、22 例及 18 例,疾病控制率达 67.21%(41/61),发生 CIP 的多数患者仍在 ICIs 治疗中获益。

结论:

CIP 具有复杂的临床及影像学表现,甚至导致患者生命危险,但晚期肺癌患者发生 CIP 也可能与 ICIs 治疗的疗效呈正相关。本文对接受 ICIs 治疗的晚期肺癌患者发生 CIP 进行探讨,希望为临床医生制定 ICIs 治疗计划和 CIP 的及时发现、及早治疗提供指导和帮助。

PO-1041

基于 CT 影像深度学习技术的肺部良性病变 与早期肺腺癌的鉴别诊断研究

高曼

中国人民解放军海军军医大学第二附属医院

【研究目的】本研究旨在探索深度学习技术在 CT 上表现为磨玻璃结节的肺部良性病变与早期肺腺癌的鉴别诊断中的应用价值,引入迁移学习的训练方法,建立并验证基于受试者临床特征与结节 CT 形态学特征的逻辑回归模型、基于受试者肺结节原始 CT 影像的深度学习模型以及整合二者的融合深度学习模型,并比较各鉴别诊断模型的诊断效能。【研究方法】

本研究回顾性分析了来自两个中心的,有明确病理诊断的 867 例肺 GGN,其中良性病变 112 例、肺腺癌 755 例。我们建立了 3 种自动诊断模型:1) 基于受试者临床特征和结节 CT 形态学特征的逻辑回归模型(CLRM);2) 仅基于肺结节原始 CT 影像的深度学习模型(IDM);3) 联合原始 CT 影像、临床特征和 CT 形态学特征的融合模型(FDM)。我们使用了迁移学习策略进行模型训练以解决样本数量不足的问题,提高模型的泛化性。在内部和外部测试集中分别分析比较各模型的诊断效能。此外,本研究使用外部测试集病例设立了人工对照组。【结果】

基于患者临床特征和结节 CT 形态学特征的 CLRM 在内部测试集中表现良好,其受试者工作特性曲线下面积为 0.80,然而其在外部测试集中表现不佳,AUC 仅为 0.62,稳定性不佳。不使用迁移学习策略的模型表现都不理想。IDM-TL 取得了不错的诊断效能,而 FDM-TL 在内部测试集和外部测试集中表现稳定,都显示出了最好的诊断效能,且其在外部验证集中获得的特异性显著优于人工对照组。【结论】

本研究建立的基于肺结节 CT 影像的深度学习诊断模型中,使用迁移学习策略的 IDM-TL 和 FDM-TL 都具有帮助放射科医生更好地鉴别肺 GGN 中的良性病变与早期腺癌的能力。其中 FDM-TL 的诊断效能更好,能提高放射科医生诊断特异性,降低肺部良性病变被误诊为肺腺癌的概率,降低过度治疗带给患者的负面影响,为外科医生制定更个性化的肺 GGN 患者后续随访和手术方案提供了一种无创、快速的计算机辅助诊断方法。

PO-1042

心血管磁共振特征追踪技术预测糖尿病性射血分数保留型心力衰竭的不良结局

杨文静、陆敏杰
中国医学科学院阜外医院

目的:心脏 MRI 的特征跟踪技术 (CMR-FT) 可以预测射血分数保留型心力衰竭 (HFpEF) 的不良结局。HFpEF 中合并糖尿病(DM)的患病率约为 45%。糖尿病作为心血管重要危险因素之一, 已被证实与死亡率增加和心衰入院有关, 但 CMR-FT 应变分析在糖尿病性 HFpEF 患者中的预后价值的数值有限。本研究旨在通过 CMR-FT 评价糖尿病性 HFpEF 的心肌功能障碍, 并探讨其预后价值, 分析是否存在可独立预测糖尿病性 HFpEF 的应变参数。

方法:这项回顾性研究纳入 2010 年 1 月至 2016 年 12 月期间接受心脏 MRI 检查的 HFpEF 患者, 并且分为糖尿病性 HFpEF 和非糖尿病性 HFpEF。主要结局包括随访期间全因死亡或心力衰竭住院治疗, 比较糖尿病患者和非糖尿病患者的特征和结局, Cox 比例风险回归模型确定 MRI-FT 应变分析与糖尿病性 HFpEF 主要结局之间的相关性。

结果:共纳入 335 例 HFpEF 患者, 其中糖尿病型 HFpEF 患者 191 例(58.7 岁 \pm 10.8 岁; 男性, 137 人)。应变分析显示糖尿病性 HFpEF 患者左心室功能不全较非糖尿病性 HFpEF 更为严重。中位随访时间为 10.2 年(四分位数范围:8.0~11.3 年), 91 例糖尿病性 HFpEF 患者和 56 例非糖尿病型 HFpEF 患者发生了主要结局。糖尿病是 HFpEF 患者不良预后的显著独立预测因子。在糖尿病性 HFpEF 中, 单变量 Cox 回归分析显示 MRI-FT 衍生的应变参数(整体纵向、径向、周向应变和整体收缩、舒张纵向应率)与主要结局显著相关。多变量 Cox 回归分析中, 在调整多个临床和影像学变量后, 整体纵向应变每降低 1%, 不良事件风险增加 9.1%($P=0.008$)。

结论:在 HFpEF 中, 糖尿病亚型患者心肌功能障碍更为严重。在糖尿病性 HFpEF 中, 通过 CMR-FT 得到的整体纵向应变与不良结局相关, 在临床指标和常规影像指标的基础上提供附加的预后价值。

PO-1043

基于迁移学习构建鉴别活动性肺结核及社区获得性肺炎胸片的卷积神经网络模型

韩冬^{1,2}、于楠¹、段小艺²、于勇¹、党珊^{1,2}
1. 陕西中医药大学附属医院
2. 西安交通大学第一附属医院

目的 基于迁移学习构建鉴别活动性肺结核(APTB)及社区获得性肺炎(CAP)胸片的卷积神经网络(CNN)模型并验证。

方法 回顾性收集 715 例 APTB 及 513 例 CAP 患者的胸片, 按照 5: 3: 2 比例随机分为训练集(614 例)、验证集(369 例)及测试集(245 例)。采用 VGG16、Xception、ResNet50 及 MobileNet 四种预训练网络进行迁移学习。训练完成后分别选择四个预训练网络在验证集准确率最高的模型作为最优模型, 评价四个最优模型在测试集的区分度、校准度及使患者的净获益情况。

结果 训练完成后, VGG16 和 ResNet50 拟合较好, Xception 和 MobileNet 出现了过拟合。分别将上述四种网络在验证集准确性最高的模型应用于测试集, 结果表明 VGG16 最优模型的 AUC(0.983)均高于其他网络, 差异均有统计学意义($P<0.05$)。校准曲线表明该模型的校准度较好。决策曲线分

析表明四种网络的最优模型均在较大概率阈值范围内可使患者净获益, 其中 VGG16 的最优模型使患者的净获益程度最大。

结论 迁移学习技术对于鉴别 APTB 及 CAP 胸片有较高的分类性能, 其中 VGG16 的性能在四种预训练网络中性能最高, 有在大规模体检中发挥作用的潜力。

PO-1044

鉴别活动性肺结核及社区获得性肺炎 3D 卷积神经网络模型的开发和验证: 基于胸部 CT

韩冬^{1,2}、于楠¹、段小艺²、党珊^{1,2}、于勇¹

1. 陕西中医药大学附属医院

2. 西安交通大学第一附属医院

目的 基于胸部 CT 训练用于鉴别活动性肺结核(APTB)及社区获得性肺炎(CAP)的 3D 卷积神经网络(3D-CNN)模型, 并在内部及外部测试集验证。

方法 回顾性收集影像中心 A(n=432)及影像中心 B(n=61)的 APTB 及 CAP 患者的胸部 CT 图像, 将影像中心 A 的数据分为训练集、验证集及内测试集, 来自影像中心 B 的数据作为外部测试集。3D-CNN 构建采用 Keras(版本:2.7.0)深度学习框架。3D-CNN 在训练完成后选择在验证集准确率最高的模型作为最优模型, 分别应用于两个测试集。另由两名影像科医师对两个测试数据集进行了独立诊断。比较 3D-CNN 最优模型与两名影像科医生鉴别 APTB 及 CAP 胸部 CT 图像的区分度、校准度以及使患者的净获益情况。

结果 3D-CNN 最优模型在内部测试集的准确率为 0.989, 外部测试集为 0.934。在两个测试集的 AUC 均高于两名影像科医生, 差异均有统计学意义(all $p < 0.05$), 且有很高的校准度。决策曲线分析结果表明 3D-CNN 最优模型使患者的净获益程度均明显高于两名影像科医生。

结论 3D-CNN 鉴别 APTB 及 CAP 胸部 CT 图像有较高的分类性能, 从影像学视角为鉴别此类患者提供了新的自动化快速诊断方法。临床相关性/应用 3D-CNN 的应用, 从影像学视角为鉴别 APTB 及 CAP 患者提供了新的自动化快速诊断方法。

PO-1045

基于双气相配准定量 CT 评估 COPD 患者空气潴留

王雄慧、牛媛、沈敏、鲁景楠、黄晓旗、李建龙

延安大学附属医院

目的: 分析配准指标与肺功能检测指标和呼吸双气相平均肺密度比 (MLDex/in) 之间的关系, 探讨配准指标在评估 COPD 患者肺功能方面的价值。

方法: 回顾性收集 87 例 COPD 患者的资料。将 CT 双气相数据导入“数字肺”平台, 获得功能性小气道病变区域百分比 (fSAD%)、肺气肿区域百分比 (Emph%)、正常区域占全肺体积百分比 (Normal%)、空气潴留指数 (ATI) 和 MLDex/in 五个定量指标。患者在 CT 检查后 3 天内且症状稳定时行肺功能检查 (PFT), 包括 FVC、FEV1%和 FEV1/FVC。组间比较采用单因素方差分析或 Kruskal-Wallis H 检验。评估采用 Spearman 相关分析。对 MLDex/in 与 fSAD%、Emph%及 ATI 的关系进行多元逐步回归分析。采用 ROC 曲线分析 ATI 对 COPD3/4 级的诊断价值。

结果：组间 fSAD%、Emph%、Normal%、ATI 和 MLDex/in 的差异均有统计学意义。ATI 与 FVC、FEV1%和 FEV1/FVC 间的相关性均具有统计学意义；fSAD%与 FVC、FEV1%和 FEV1/FVC 间的相关性均具有统计学意义；Emph%与 FEV1%和 FEV1/FVC 间的相关性均具有统计学意义。ATI、fSAD%及 Emph%与 MLDex/in 呈正相关（ r 分别为 0.96、0.86、0.53）。多元逐步回归分析结果显示，MLDex/in 与 ATI、fSAD%之间均存在线性回归关系， β 值分别为 0.64 和 0.36。GOLD1/2 级的 ATI 与 FEV1%呈负相关（ $r=-0.45$ ），与 MLDex/in 呈正相关（ $r=0.94$ ）。ROC 曲线分析结果表明，ATI 预测 COPD3/4 级的 AUC 为 0.81（临界值为 0.54）。

结论：ATI 与 MLDex/in 之间具有良好相关性，可以在一定程度上反映肺功能，是评估 COPD 的相对敏感指标，有望成为评估 COPD 严重程度的辅助指标。

PO-1046

基于患者临床指标构建列线图来预测 A 型夹层患者在院死亡风险

夏元豪、孙泽华、郭浩、马恒
烟台毓璜顶医院

目标

本研究旨在通过基于临床指标构建的列线图来筛选 A 型夹层患者在院死亡的危险因子。

方法

患者与方法：回顾性选取了 2015 年 1 月到 2020 年 12 月烟台毓璜顶医院收治的 287 例斯坦福 A 型主动脉夹层患者的临床资料，按 7:3 的比例分为建模组(203 例)和验证组(84 例)。采用单因素及多因素 logistic 回归分析危险因素并构建列线图。利用受试者工作特征 (ROC) 曲线、校准曲线、Hosmer-Lemeshow 检验和决策曲线分析 (DCA) 评估了列线图在预测 A 型夹层患者在院死亡风险方面的预测性能。

结果

个体化预测列线图中包含的预测因子包括 BMI、治疗方式、血小板总数、白细胞总数、总胆固醇。该列线图具有良好的鉴别能力，AUC 指数为 0.904（训练集 H-L 检验值为 0.956），校准效果良好。在验证队列中应用列线图仍然具有良好的鉴别能力（AUC 指数为 0.807，H-L 检验值为 0.601）和良好的校准能力。决策曲线分析表明，放射组学列线图具有临床价值。

结论

本文介绍的基于临床指标的列线图可筛选斯坦福 A 型主动脉夹层患者在院死亡的危险因素，预测发生在院死亡的风险。因此，它可能有助于临床决策。

PO-1047

基于增强 CT 影像组学列线图预测胸腺上皮性肿瘤侵袭性

刘雪成
皖南医学院第一附属医院

【摘要】目的：探讨基于增强 CT 影像组学列线图预测胸腺上皮性肿瘤侵袭性的价值。方法：回顾性分析 155 例经病理证实为胸腺上皮性肿瘤患者的临床及影像学资料，按照 7:3 随机分训练组（ $n=108$ ）及验证组（ $n=47$ ）。使用 ITK-SNAP 软件基于增强 CT 静脉期图像提取影像组学特征；采用最小绝对收缩和选择算子算法 (LASSO) 回归对特征进行降维，筛选最优特征建立影像组学标签，并计算标签得分 (Rad-score)；单因素及多因素 logistic 回归分析筛选独立危险因素，分别构建影像特征模型、Rad-score 和影像组学联合模型，并绘制影像组学联合模型列线图；使用受试

者工作特征 (ROC) 曲线下面积 (AUC) 分别评价 3 种模型的诊断效能; DeLong 检验比较各模型间诊断效能; 校正曲线评价列线图的拟合优度; 决策曲线 (DCA) 评价列线图的临床净收益。结果: LASSO 回归筛选出 16 个最优组学特征。单因素及多因素 logistic 回归分析发现肿瘤形态、周围组织侵犯及 Rad-score 为独立危险因素。列线图的 AUC 在训练组及验证组分别为 0.852、0.831, 与影像特征模型比较差异具有统计学意义 ($P < 0.05$); 与 Rad-score 比较训练组差异具有统计学意义 ($P < 0.05$), 验证组差异无统计学意义 ($P > 0.05$)。DCA 显示列线图模型训练组的阈值概率在 0.08~0.88 时临床均有获益。结论: 基于增强 CT 影像组学列线图能够有效预测胸腺上皮性肿瘤侵袭性。

PO-1048

非小细胞肺癌 CT 征象与 ROS1 重排的相关性研究

夏玲凤、钟志林
武汉亚心总医院

目的: 探究非小细胞肺癌 CT 征象与 ROS 原癌基因 1 (ROS1) 重排状态的相关性, 目的是寻找 ROS1 基因重排的预测因素, 为肺腺癌的靶向治疗提供参考。

材料和方法: 回顾性分析 2014 年 11 月至 2019 年 4 月经病理证实的 92 例肺腺癌患者 (95 个病灶) 的术前胸部 CT 表现。所有病灶均接受 ROS1 状态检测, 并在治疗前进行了胸部 CT 检查。根据 ROS1 重排状态, 将患者分为两组, 即 ROS1 重排组 (33 例) 和 ROS1 野生型组 (59 例, 63 个病灶)。两个放射科诊断医生独立的评估患者特征和影像学特征。采用方差分析 (ANOVA)、卡方检验或 Fisher 精确检验来区分两组患者的临床和 CT 特征。结果: ROS1 重排患者和 ROS1 野生型患者之间在 3 个 CT 特征, 即癌性淋巴管炎 ($P=0.018$)、N1 区淋巴结 ($P=0.021$) 和 N2 区淋巴结 ($P=0.027$) 中有显著差异。ROS1 重排患者明显比 ROS1 野生型患者年轻。两组在性别、吸烟史方面无统计学差异。

结论: 虽然 ROS1 重排肿瘤与 ROS1 野生型肿瘤存在很大的重叠, 但是我们发现 ROS1 重排肿瘤表现出独特的影像学特征, 可以帮助临床医生选择患者进行基因检测和随后的靶向治疗。

PO-1049

急性主动脉夹层合并无菌性胆囊炎的影响因素探讨

夏玲凤、钟志林
武汉亚心总医院

目的: 探讨急性主动脉夹层合并无菌性胆囊炎的临床特征及危险因素。

方法: 急性主动脉夹层患者 461 例, 依据是否发生无菌性胆囊炎分为并发无菌性胆囊炎组和未并发无菌性胆囊炎组。统计记录所有患者一般资料、影像学资料, 分析急性主动脉夹层合并无菌性胆囊炎患者的临床特征及无菌性胆囊炎的危险因素。

结果: 461 例中有 46 例合并无菌性胆囊炎, 发生率为 10.0% (其中 A 型 36/262, B 型 10/199); 单因素分析结果显示, A 型主动脉夹层组中两组年龄、性别相比, 差异有统计学意义 ($P < 0.05$); 是否累及左或/和右冠状动脉开口相比, 差异有统计学意义 ($P < 0.05$), 是否累及腹腔干开口相比, 差异无统计学意义 ($P < 0.05$)。

结论: 未累及冠状动脉的 A 型夹层更易诱发胆囊炎, 临床需重点关注并予以相应治疗, 以控制疾病进展。

PO-1050

可变螺距技术在肿胀手综合症 CT 血管成像中的应用价值

耿纪刚、李笑石、牛微、肖刚、朱鹏、秦越
西安大兴医院

目的：探讨可变螺距 (Variable Helical Pitch, VHP) 技术在肿胀手综合症 CT 静脉血管成像中的应用价值。

方法：回顾性选取本院 2020 年 5 月至 2023 年 5 月 80 例行双上肢静脉 CT 成像患者，其中单、双侧病变各 40 例。将上述患者按照单、双侧位置进行平均分组，VHP 技术为 A 组，常规技术为 B 组，单侧病变采用间接法注射对比剂，双侧病变采用直接法注射对比剂，所有患者 CT 检查完均接受经皮腔内血管成形术 (Percutaneous Transluminal Angioplasty, PTA)，随后将 CT 血管成像的诊断结果与数字减影血管造影 (Digital Subtraction Angiography, DSA) 进行对比，由 2 名有经验的外周血管医生进行诊断，一致性采用 Kappa 分析， $Kappa > 0.85$ 认为一致性良好。记录并分析两组辐射剂量。

结果：在诊断效能评价中，中心静脉病变方面，A 组正确率为 98.32%，B 组为 82.08%，结果有统计学差异 ($P < 0.05$)；在非中心静脉病变方面，A 组为 96.80%，B 组 96.42%，诊断效能无统计学差异 ($P > 0.05$)。A 组与 B 组辐射剂量无显著差异 ($P > 0.05$)。

结论：VHP 技术在上肢静脉 CT 成像中，可以在不增加辐射剂量的前提下，诊断效能较常规技术明显提升，值得在临床中大力推广应用。

PO-1051

应用增强 CT 评估瘤内血管特征对胸腺上皮性肿瘤亚型的诊断价值

马宇卉、闫卫强、张杰、兰江涛、冯秀龙、胡玉川、崔光彬
空军军医大学唐都医院

目的：基于增强 CT 探讨不同病理亚型胸腺上皮性肿瘤 (thymic epithelial tumor, TET) 的瘤内血管分布及增强特征，以提高对 TET 亚型的鉴别诊断能力。

方法：回顾性分析经病理证实的 124 例 TET 患者的临床及 CT 特征，CT 特征包括肿瘤大小、位置、轮廓、强化均质性、程度及高峰期、有无内部多结节状强化及低密度分隔带、有无瘤内血管、瘤内血管形态、血管数、血管位置、有无内乳动脉包绕，对各亚型 CT 特征进行组间比较，并将各亚型临床及 CT 特征行单因素及多因素分析，构建 Logistic 回归模型，采用 ROC 曲线评估各模型及单因素特征对各亚型 TETs 的诊断效能。

结果：在各亚型间，瘤内血管发生率、血管形态、血管数、血管位置、内乳动脉包绕率、瘤内多结节状强化、低密度分隔带、强化程度及最大强化值的差异具有统计学意义 ($P < 0.05$)。强化均质性、强化高峰期的差异无统计学意义 ($P < 0.05$)。多因素分析提示，A 型胸腺瘤的独立预测因素为：最大强化值 $> 34\text{HU}$ 、无瘤内血管、轮廓光整；AB 型胸腺瘤的独立预测因素为：内部多结节状强化、最大强化值 $> 24\text{HU}$ 、轮廓光整、有瘤内血管；B 型胸腺瘤独立预测因素为：最大强化值 $\leq 21\text{HU}$ 、无瘤内血管、分叶状轮廓、重症肌无力症状、年龄。胸腺鳞状细胞癌的独立预测因素包括内乳动脉包绕、不均匀强化方式。多因素分析未发现对诊断胸腺神经内分泌肿瘤 (thymic neuroendocrine tumor, TNET) 有统计学意义的独立预测因子，但瘤内分支状血管对 TNET 有较高预测效能 (AUC, 0.841)。除 TNET 外，Logistic 回归模型对各亚型均有较高诊断效能 (AUC 值均 > 0.85)。

结论：TET 各亚型瘤内血管特征及强化特征不同，联合临床、CT 增强及血管特征的 Logistic 回归模型比单因素特征对各亚型具有更高诊断效能。

PO-1052

阿里海拔 4500 米高原肺水肿计算机断层扫描特征分析

岳丽娜

中国人民解放军联勤保障部队第 940 医院

[摘要]目的：分析高原肺水肿的 CT 表现，提高 CT 诊断准确率。方法：本研究回顾性分析 200 例经临床诊断为高原肺水肿患者的胸部 CT 影像资料，分析不同病情阶段肺内病灶的数量、位置、分布、密度及形态，总结 CT 对高原肺水肿的诊断价值。结果：（1）病变分期：早期 26 例（13%）、进展期 105 例（52.5%）、重症期 32 例（16%）及转归吸收期 37 例（18.5%）四期。（2）病变部位：早期累及单侧肺 20 例（76.9%），累及双侧肺 6 例（23%）；早期累及右肺 21 例（80.7%），累及左肺 5 例（19.2%）；进展期累及单侧肺 19 例（18%），累及双侧肺 86 例（81.9%）；进展期累及右肺 79 例（75.2%），累及左肺 26 例（24.7%）；重症期累及单侧肺 2 例（6.2%），累及双侧肺 30 例（93.7%）；重症期累及右肺 32 例（100%），累及左肺 30 例（93.7%）；转归吸收期累及单侧肺 30 例（81%），累及双侧肺 7 例（18.9%）；转归吸收期累及右肺 30 例（81%），累及左肺 14 例（37.8%）。（3）CT 表现：研究发现早期 HAPE 胸部 CT 表现为局限斑片状磨玻璃影。进展期 HAPE CT 多表现为磨玻璃影向云絮状密度增高影转变。重症爆发期 CT 影像可见“白肺”表现，右肺多重于左肺。转归吸收期此期病变 CT 表现与早期表现类似，经过治疗后可完全吸收。结论：胸部 CT 影像检查是高原肺水肿的重要诊断方法之一，尤其对早期或不典型病例更是重要的诊断依据。

PO-1053

开发和验证基于增强 CT 的深度迁移学习及临床-影像组学联合模型来鉴别胸腺瘤与胸腺囊肿：一项多中心研究

杨雨桦

南昌大学第二附属医院

目的：本研究旨在评估深度迁移学习及临床-影像组学在鉴别胸腺瘤与胸腺囊肿中的可行性及有效性。

材料与方法：从中心 1 回顾性收集经病理证实为胸腺瘤的 105 例和 91 例胸腺囊肿患者的临床和影像资料（训练队列：n=137；内部验证队列：n=59），来自中心 2 的 68 例胸腺瘤及胸腺囊肿患者构成独立外部验证队列。基于静脉期胸部增强 CT 进行感兴趣区勾画，并构建 8 种深度迁移学习模型。从患者的静脉期 CT 感兴趣区中提取影像组学特征并通过最小绝对收缩与选择算子等方法进行特征筛选。使用单因素分析、多因素逻辑回归筛选临床-常规影像学特征。6 种机器学习分类器被用于构建影像组学模型、临床-常规影像学模型。将上述模型中所纳入的特征进行前融合以构建联合模型，并绘制列线图。使用受试者工作特征曲线的曲线下面积（AUC）、校准曲线和决策曲线分析分别评估模型的区分度、校准度和临床收益。采用德隆检验比较各模型之间的 AUC。使用 K-means 聚类方法对患者病灶进行亚区划分，采用传统组学方法提取特征并筛选，通过相关性分析比较影像组学模型及深度迁移学习模型对病灶内部异质性反映能力。

结果：基于深度迁移学习模型的 Densenet 169 性能表现最佳，在内外验证集中 AUC 分别为 0.933 和 0.962。分类器在影像组学模型的内外验证集中 AUC 分别为 0.965 和 0.959。分类器 LightGBM 在临床-常规影像学模型中 AUC 分别为 0.805 和 0.839。联合模型在内外验证集中 AUC 分别为 0.933 与 0.945。德隆检验的结果显示，在内外验证队列中，影像组学模型、深度迁移学习模型及联合模型性能均优于临床-常规影像学模型。相关性分析结果表明影像组学比深度迁移学习能够更好量化胸腺瘤与胸腺囊肿内部异质性差异。

结论: 所开发的深度迁移学习模型及联合模型在鉴别胸腺囊肿与胸腺瘤时可达到良好的诊断效果, 可作为一种潜在的工具辅助临床医生决策。

PO-1054

有无隐球菌脑膜炎的隐球菌肺炎的临床及 CT 特征比较

邹佩伶^{1,2}、李琦¹、范欣¹、张越¹

1. 重庆医科大学附属第一医院

2. 重庆市沙坪坝区人民医院

目的 探讨有无隐球菌脑膜炎 (cryptococcal meningitis, CM) 的隐球菌肺炎 (pulmonary cryptococcosis, PC) 患者的临床及 CT 特征差异, 以期为 CM 的早期诊断提供更多的预警指标。

方法 回顾性分析 2014 年 1 月至 2022 年 6 月于我院经肺部穿刺活检或手术病理证实的 87 例 PC 患者的临床及 CT 资料, 其中 38 例合并 CM (脑膜炎组), 49 例不合并 CM (对照组), 比较两组临床及 CT 特征的差异。

结果 ①临床特征比较: 脑膜炎组免疫功能受损病史、CD4 细胞比例降低及 CD4/CD8 比值降低的发生率均显著高于对照组, 差异均有统计学意义 (p 均 <0.05); 两组患者的年龄、性别构成比、吸烟史、CD3 及 CD8 细胞比例降低的发生率差异均无统计学意义 (p 均 >0.05)。②CT 征象比较: 脑膜炎组空洞、胸内淋巴结肿大的出现率均显著高于对照组, 而晕征、充气支气管征的出现率显著低于对照组, 两组差异均有统计学意义 (p 均 <0.05); 两组病灶分布、CT 分型、病灶数目、毛刺征、分叶征、胸膜牵拉征及胸腔积液的出现率差异均无统计学意义 (p 均 >0.05)。③结论 有无合并 CM 的 PC 患者的临床及 CT 特征存在差异, 当 PC 患者有免疫功能受损病史、细胞免疫功能异常、肺内病灶出现空洞且无晕征及充气支气管征、伴胸内淋巴结肿大时需高度警惕 CM 的发生, 尽早筛查并及时调整治疗方案, 从而改善患者预后。

PO-1055

磁共振心肌初始 T1 值和细胞外容积分数对 心肌淀粉样变性患者的预后评估价值

刘雨蒙、朱静芬、陈蒙、汪灵杰、朱默、胡春洪

苏州大学附属第一医院

目的: 探讨心脏磁共振心肌初始 T1 值和细胞外容积分数 (ECV) 在心肌淀粉样变性 (CA) 患者中的预后评估价值。

方法: 连续收集 2017 年 7 月至 2021 年 10 月 CA 患者 38 例 (平均年龄 59 ± 11 岁), 所有患者均接受了 3.0T-CMR 检查, 扫描序列包括心脏电影、T1 mapping、LGE 成像。将 T1 mapping 图像导入后处理软件 (CVI42 v5.11.3), 获取左室整体心肌初始 T1 值和 ECV。此外, 收集所有患者的一般临床资料及实验室检查资料, 并对纳入研究的患者本人或家属每隔 3 个月进行定期电话随访, 随访起点为明确病理诊断的时间, 主要观察终点事件为全因死亡。利用 Kaplan-Meier 分析和 Cox 比例风险模型评估心肌初始 T1 值和 ECV 与 CA 患者死亡的相关性。

结果: 在中位随访 27 (16、37) 个月后, 有 12 例 CA 患者死亡。Kaplan-Meier 分析结果显示, 心肌初始 T1 值和 ECV 升高与 CA 患者预后不良密切相关, $ECV > 44\%$ 和心肌初始 T1 值 $> 1389ms$ 的 CA 患者的生存率显著低于 $ECV \leq 44\%$ 和心肌初始 T1 值 $\leq 1389ms$ 的患者 (Log-rank $P < 0.001$), 且与 LGE 的存在无关。在逐步多变量 Cox 回归模型中, 调整了年龄、性别、NT-proBNP、肌钙蛋白 T、梅奥分期、LGE、左室射血分数 (LVEF)、左室舒张末期容积指数 (LVEDVi)、左室收缩末期容积指数 (LVESVi)、左室心肌质量指数 (LVMI) 及左室每搏输出量 (LVSV) 后, ECV[风险

比 (HR) = 1.37, 95%CI: 1.09-1.73, P=0.008]和心肌初始 T1 值 (HR=1.01, 95%CI: 1.00-1.02, P=0.037) 仍然是 CA 患者全因死亡率的独立预测因子。

结论: 心肌初始 T1 值和 ECV 升高会增加 CA 患者的死亡风险, 两者是 CA 患者死亡率独立预测因子, 可作为 CA 患者预后评估的重要指标。

PO-1056

肺血栓栓塞症 CTPA 假阳性诊断常见原因分析及影像表现

范欣、李琦、张越、邹佩伶
重庆医科大学附属第一医院

目的: 分析肺血栓栓塞症 CT 肺动脉造影 (computed tomography pulmonary angiography, CTPA) 假阳性诊断的常见原因, 以降低 PTE 的误诊率。**方法:** 收集我院 62 例 PTE 假阳性诊断病例的 CTPA 资料, 观察肺动脉 CTPA 表现, 分析误诊原因并对其进行分型。**结果:** 肺血栓栓塞 CTPA 假阳性诊断的常见原因包括: (1) 呼吸运动及心脏传导搏动伪影引起的假阳性诊断 (17.74%, 11/62): 假性栓子表现为紧贴肺动脉管壁一侧的窄带状稍低密度影, 常累及多支血管。(2) 上腔静脉内高浓度对比剂引起的硬射线伪影导致假阳性诊断 (8.06%, 5/62): 表现为上腔静脉内对比剂浓度较高, 周围见放射状分布的条纹状低密度影, 累及邻近右肺动脉或右肺上叶肺动脉。(3) 把肺门淋巴结误诊为栓子 (12.90%, 8/62): 假性栓子常位于肺动脉分叉处, 邻近肺动脉管壁轮廓光整, 未见明显充盈缺损。(4) 肺血管阻力局限性增高所致假阳性诊断 (27.42%, 17/62): 表现为肺动脉期肺动脉腔内条片状低密度影, 主动脉期扫描该条片状低密度影消失, 邻近肺组织内常见慢性炎症或伴有同侧胸腔积液。(5) 心血管功能差、肺循环减慢所致假阳性诊断 (16.13%, 10/62): CTPA 表现为肺动脉远端分支强化程度减低, 腔内对比剂充盈不良。(6) 纵隔及肺门淋巴结肿大压迫邻近肺动脉所致假阳性诊断 (9.68%, 6/62): CTPA 表现为肺门及纵隔多发淋巴结增大、钙化, 邻近肺动脉管腔受压狭窄, 多见于尘肺及肺结核患者。(7) 将支气管黏液栓误诊为肺动脉血栓 (8.06%, 5/62): 表现为肺动脉走行区条状无强化低密度影, 近端与支气管相连, 周围见肺动脉分支伴行。**结论:** 肺栓塞 CTPA 假阳性诊断的类型多样, 正确识别各型误诊病例的图像特点, 规范扫描方案, 优化扫描策略, 掌握正确的分析方法, 有助于降低 PTE 的假阳性诊断率。

PO-1057

双能量肺部扫描技术“一站式”评估急性肺栓塞及肺灌注对于临床的应用价值

王猛
吉林大学第一医院

目的: 研究双能量 CT 一站式扫描对于急性肺栓塞及肺缺血性灌注分析对于临床的应用价值体现。**方法:** 收集 30 例 D-二聚体高并临床高度怀疑为急性肺栓塞患者进行双能量肺灌注成像, 采用 SOMATOM Force CT 进行双能扫描, 通过 Syngo VIA 工作站中双能量+血管及 DE Lung PBV (双能量肺血容量灌注分析) 得到 CT 肺血管成像 (CTPA) 及双能量肺血容量灌注分析 (DE Lung PBV) 融合图像, 以叶为单位观察肺动脉内有无栓子, 并进行记录栓子的位置及数目并分析栓子栓塞后各肺叶血流灌注情况进行分析记录其灌注异常位置。**结果:** 对 30 例患者溶栓一周后复查再行肺栓塞及肺灌注情况进行对比分析, 并观察栓子情况及肺血流灌注情况进行愈后评估其中 23 名患者基本恢复正常肺动脉干及远端分枝未见明显栓子, 血容量灌注基本恢复正常, 其于 7 名患者因个体差异较大未能完全恢复, 统计结果具有统计学意义, 与

此同时发现此方法可以消除上腔静脉伪影并可观察胸主动脉区域是否有夹层为患者其它病情消除隐患。

结论：一站式双能量肺血容量灌注分析不但可以解决肺动脉成像还可以定量评估肺组织的血流灌注情况，这是一种功能成像，肺部组织血流灌注的减低，可以间接证明责任血管的栓塞情况，对肺动脉栓塞的检出有及高的敏感度，并且可对治疗效果和愈后进行评估。

PO-1058

肺部恶性肿瘤经支气管镜下射频消融术后 CT 影像表现及疗效评价

陈莹莹¹、陈淮²

1. 广州医科大学附属第一医院

2. 广州医科大学附属第二医院

目的 描述肺部恶性肿瘤经支气管镜下射频消融（RFA）术后 CT 影像学特征及其随时间的演变，探讨不同影像特征与 RFA 术后疗效之间的相关性，以早期准确评估局部疗效，提高肿瘤局部控制率。
方法 收集 2021 年 1 月至 2021 年 12 月于广州医科大学附属第一医院对肺部病灶行支气管镜下射频消融（RFA）治疗的 41 例患者（44 个病灶）的临床及影像资料，于病灶水平定性评估 RFA 术后不同时间点消融区的影像表现，消融区形态学表现分为八种类型：实变、磨玻璃影、反晕征、空洞、结节/肿块、纤维条索、胸膜增厚、肺气肿。根据《影像引导下热消融治疗原发性和转移性肺部肿瘤临床实践指南-2021 年版》评估局部疗效。采用卡方检验或 Fisher 精确检验分析治疗前后影像学特征与术后疗效之间的相关性，以 $P < 0.05$ 为差异有统计学意义。

结果 44 个病灶中，3 个鳞癌，31 个腺癌，10 个无病理分型；肿瘤最大直径平均 (2.07 ± 0.79) cm。RFA 术后 24 小时，消融区最常见的影像表现是实变（97.7%，42/43）、磨玻璃影（95.3%，41/43）、反晕征（60.5%，26/43）；术后 1 个月，消融区表现为实变、磨玻璃影及反晕征的频率有所减低，可出现胸膜增厚（65.1%，28/43）及空洞（32.6%，14/43），而结节/肿块、纤维条索、肺气肿较少见；术后 3-12 个月内，最常见表现为不规则结节/肿块影，其次是纤维条索。31 个病灶评估为完全消融，13 个病灶为不完全消融/局部进展。术前病灶最大直径、胸膜凹陷征、病灶与血管接触、术后 GGO 最小宽度与术后疗效差异具有统计学意义（ $P < 0.05$ ）。

结论 肺部经支气管镜下 RFA 术后 CT 影像表现复杂多变，定期 CT 随访有助于识别典型的消融后影像表现与肿瘤残留或复发，以指导临床后续治疗。术前病灶最大直径 ≥ 2 cm、胸膜凹陷征、病灶与血管接触、术后 GGO 最小宽度 < 5 mm 与不完全消融/局部进展相关。

PO-1059

MRI 影像组学对非小细胞肺癌纵隔淋巴结转移的预测价值

曹瑕尹¹、李蕊¹、薛颖²、王婉琼¹、崔磊¹

1. 南通市第一人民医院

2. 南通市中医院

目的 建立基于常规 MRI 序列的影像组学模型，比较不同模型预测非小细胞肺癌（NSCLC）纵隔淋巴结（MLN）转移的效能。

方法 回顾性收集 2012 年 10 月至 2022 年 5 月南通市第一人民医院 90 例 NSCLC 患者的术前 MRI 数据，根据手术病理结果分为 MLN 阳性（52 例）和阴性组（38 例），采用完全随机法按照 7: 3 比例将患者分为训练集和内部验证集，盐城第一人民医院的 31 例患者数据作为外部验证（阳性 9 例，阴性 22 例），放射科医师采用半自动逐层勾画原发病灶，提取基于 T1WI、T2WI、高 b 值扩

散加权成像 (DWI) 及表观扩散系统 (ADC) 图像的组学特征, 由超参数搜索在 F Test、L1 Based (L1 正则)、Tree Based (树模型) 等特征筛选法中选择最佳方法用于降维, 分别建立逻辑斯特回归模型、朴素贝叶斯、随机森林、随机梯度下降法等 11 种模型, 计算受试者操作特征曲线 (ROC) 和曲线下面积 (AUC)、准确度、敏感度和特异度来评估模型的性能, 识别出最优模型。结果 在不同序列中决策树、逻辑斯特回归、支持向量机模型的预测性能都表现良好, 其中基于 T2WI 图像构建的 SVM 模型效能最佳, 训练集、内部验证集及外部验证集 AUC 分别达 0.98、0.73、0.72。

结论 MRI 影像组学对 NSCLC 纵隔淋巴结转移鉴别存在一定价值, 以基于 T2WI 模型表现最优。

PO-1060

探讨分别基于肺活量测定与参数响应图定义的小气道功能性障碍人群的肺结构差异

陈斌、高盼、齐琳、李铭
复旦大学附属华东医院

目的: 肺活量测定和参数响应图 (parametric response mapping, PRM) 虽然都已有相关的病理证据支持其在评估小气道功能性障碍 (small airway dysfunction, SAD) 的有用性, 但由于原理不同, 两者定义的 SAD 人群间肺结构是否存在差异尚未被报道过。本研究旨在分析两种方法定义的 SAD 人群的肺结构差异, 并建立相应的预测模型。

方法: 前瞻性纳入了 388 名符合条件的参与者, 均进行了肺活量测定和吸气-呼气胸部 CT 扫描。用力呼气流量低于预期值的 65% 为肺活量测定定义的 SAD, 而 PRM 中功能性小气道疾病的体积百分比 (PRMfSAD) 大于 20% 为 PRM 定义的 SAD。比较两种方法定义的 SAD 的临床资料及影像学特征, 并基于逻辑回归模型的结果构建预测模型。

结果: 通过肺活量测定定义了 122 名 SAD, 通过 PRM 定义了 158 名。CT 视觉评估中, 肺气肿、炎症性 SAD 和支气管壁增厚分别在两种方法所定义的 SAD 病人中都有较高的出现频率 ($P < 0.001$)。定量 CT 显示, 肺活量测定诊断的 SAD 具有更厚的气道壁 ($P < 0.001$), 更小的管腔 ($P = 0.011$) 及更少的气管分支 ($P < 0.001$), 而 PRM 定义的 SAD 在血管横截面积和直径上更小, 不过小血管数量却更多。逻辑回归分析显示年龄、男性、肺气肿、支气管壁增厚和分支数量是肺活量测定定义的 SAD 的预测因素, 而年龄、男性性别、BMI、炎症性 SAD、肺气肿和横截面积小于 1mm^2 的血管体积百分比 (BV1/TBV) 是 PRM 定义的 SAD 的预测因素, 各自拟合的预测模型曲线下面积 (area under curve, AUC) 值分别为 0.839、0.808。

结论: 由肺活量测定定义的 SAD 与气管关系紧密, 由 PRM 定义的与肺小血管关系紧密。基于临床资料和影像学特征的模型对于两种方法所定义的 SAD 均有较好的预测价值, 为 SAD 的筛查提供了另外途径。

PO-1061

基于低剂量呼-吸双相胸部 CT 对肺结节定量参数测量的研究

刘俊七^{1,2}、李宏伟¹、卓丽华¹、兰永树²
1. 绵阳市第三人民医院
2. 西南医科大学附属医院

目的: 评价肺组织、不同性质肺结节在呼吸双相 CT 上各定量参数及变化率的差异, 探讨肺充气程度对肺及肺结节各参数的影响。

方法: 收集 133 例在术前行低剂量呼吸双相胸部 CT 的肺结节患者, 共 138 个肺结节。分别测量深吸气末和深呼气末全肺、双侧肺及各肺叶的肺功能参数 (肺容积和肺密度)。吸气相与呼气相参数的变化率记为 $(E-I)/I$ 。评估肺上部、肺下部间肺参数变化的肺充气敏感度, 分析肺结节在不同肺充气状态下的变化趋势。各定量参数采用 t 检验或秩和检验进行比较。采用 Pearson 相关或 Spearman 等级相关分析各参数之间的相关性。

结果: 呼吸双相中肺下部容积、密度的变化大于肺上部 ($p < 0.01$), 肺下部容积 $(E-I)/I$ 、密度 $(E-I)/I$ 分别为 47.2%、18.1%。呼气相 CT 显示实性结节、非实性结节体积分别减少 2.0%、14.4%, 密度增加 19.5%、14.4%。呼吸双相中肺下部实性结节的密度大于肺上部 ($p < 0.01$), 肺下部非实性结节的密度 $(E-I)/I$ 、体积 $(E-I)/I$ 以及长径 $(E-I)/I$ 大于肺上部 ($p < 0.01$)。非实性结节密度 $(E-I)/I$ 在良、恶性结节间具有统计学差异 ($p = 0.038$), 结节体积 $(E-I)/I$ 、长径 $(E-I)/I$ 及短径 $(E-I)/I$ 无统计学差异 ($p > 0.05$)。非实性结节中原位腺癌、微浸润性腺癌和浸润性腺癌的结节长径 $(E-I)/I$ 存在相关性 ($p = 0.009$, $r = 0.290$), 结节体积 $(E-I)/I$ 、密度 $(E-I)/I$ 及短径 $(E-I)/I$ 不存在相关性 ($p > 0.05$)。结论: 呼吸双相非实性结节体积和密度同步变化, 而实性结节体积和密度不同步变化。肺下部实性结节的密度和非实性的结节密度、体积、长径更容易受到呼吸的影响。密度 $(E-I)/I$ 可能有助于非实性结节良、恶性鉴别, 长径 $(E-I)/I$ 对评价非实性结节的恶性程度有一定的参考价值。

PO-1062

CMR 参数定量技术在心肌梗死中的临床应用价值探索

阿巴斯江·阿地力¹、邢艳²

1. 新疆医科大学附属肿瘤医院

2. 新疆医科大学第一附属医院

目的: 探讨心脏磁共振弛豫定量技术在诊断心肌梗死患者中的临床应用价值。方法: 收集经冠脉造影诊断为心肌梗死的患者 23 名, 纳入梗死组; 以及年龄匹配的健康志愿者 29 名, 纳入对照组。采用 3.0 T 磁共振仪结合心脏线圈进行扫描, 扫描序列包括电影成像、T2WI、延迟强化、增强前 T1 mapping (Native T1)、T2 mapping (Native T2) 及增强后 T1 mapping (Post T1) 序列。扫描完成后, 先经 CVI42 后处理软件分析获得左心室心功能参数; 再通过延迟增强图像的异常强化区域, 勾画感兴趣区域并测量 T1、T2 值, 带入血细胞比容计算 ECV; 对上述数据进行统计学分析, 比较两组间的差异, $P < 0.05$ 差异有统计学意义。结果: 梗死组的左室舒张末容积、左室收缩末期容积、左室射血分数与对照组对比均降低, 差异有统计学意义 ($P < 0.001$); 梗死组的心脏每搏输出量、心输出量与对照组对比无明显差异, 差别无统计学意义 ($P > 0.05$); 另外, 梗死组的 Native T1 (1265.91 ± 60.86 ms), Native T2 (69.69 ± 12.71 ms), ECV ($35.16 \pm 2.59\%$), 较对照组 Native T1 (1071.75 ± 43.77 ms), Native T2 (52.06 ± 5.93 ms), ECV ($30.39 \pm 3.18\%$) 均升高, 差异有统计学意义 ($P < 0.05$); 梗死组 Post T1 (439.82 ± 24.86 ms) 较对照组 Post T1 降低 (505.82 ± 62.069 ms), 差异有统计学意义 ($P < 0.05$)。通过延迟强化确定梗死区, 用定量参数的 ROC 结果分析得出, Native T1 的诊断价值最高 ($AUC = 0.939$)。结论: CMR 弛豫定量技术可以帮助准确诊断梗死区域并量化其参数, 为早期、精确诊断心肌梗死提供影像学依据。

PO-1063

CT 影像特征在预测非小细胞肺癌免疫联合化疗治疗疗效中的价值

王福南¹、王立²、林冲¹、朱柳红¹

1. 复旦大学复大中山医院厦门医院

2. 镇江市中西医结合医院

目的: 本研究旨在免疫联合化疗治疗前分析 CT 图像特征, 预测其在非小细胞肺癌治疗的疗效评价。
方法: 收集患者经免疫联合化疗治疗后, 分为有效组及非有效组, 分析治疗前影像图像特征, 定性和定量的 CT 图像由两位放射学家独立评估, 主要评估以下影像特征: 长径、短径、CT 值、形态(“分叶征”、团块、不规则形、类圆形)、清晰度(清晰、欠清、模糊)、磨玻璃影、阻塞性改变、“毛刺征”)、血管征、坏死、钙化、血管穿行、支气管征、空洞、血管、“胸膜凹陷征”、淋巴结肿大、肺内转移、远处转移等。

结果: 共有 50 例患者最终纳入研究, 中位随访时间为 13 个月, 有效组有 31 例(有效率达 62%), 非有效组有 19 例。肿瘤的大小(长、短径), 以及是否淋巴结、肺内、远处转移, 对于疗效无显著差异。肿瘤内部的特征分析(CT 值、坏死、钙化、瘤内血管穿行、支气管充气征)等征象, 其差异亦无统计学意义。仅只有肿瘤周边的影像特征中“血管征”在无效组病例中较有效组出现的更多, 且两者间具有统计学差异。肿瘤周边其他特征(形态、毛刺、胸膜凹陷、阻塞性肺炎等)亦没有存在显著差异。

结论: 免疫联合治疗在进展期肺癌中具有较好预后效果, CT 检查的随访作为最常规的检查方法, 通过肿瘤的影像特征, 尤其是血管征可较好预测其治疗疗效, 对于临床的提示及方案的制定具有较好的便携的参考价值。

PO-1064

右心畸形为主先心病术后左心房功能的 CMR 研究

马岩岩、钟玉敏

上海交通大学医学院附属上海儿童医学中心

目的 探讨心脏 MRI(CMR)评估常见右心畸形先心病术后患儿左心房功能的价值。

方法 回顾性分析 2019 年 1 月至 2021 年 10 月于我院接受 CMR 的左心室射血分数(EF)保留的先心病术后患者 162 例(TOF 术后组 94 例、PS 术后组 32 例、PA/VSD 术后组 36 例)。对照组为 30 例患儿性别、年龄匹配的正常志愿者。基于 CMR 图像, 采用后处理软件使用双平面面积长度法测量左心房容积指数, 包括最大、最小及收缩前容积指数(LAVI_{max}、LAVI_{min} 及 LAVI_{preA}); 获得左心房功能参数包括储存期、管道期、收缩期的 EF、应变、应变率。

结果 与对照组比较, 先心病组的 LAVI_{max} 均下降, LAVI_{min}、LAVI_{preA} 无统计学差异。功能参数中, 管道期和收缩期应变率在 4 组间无统计学差异。TOF 术后组所有储存功能参数、管道期 EF 和应变均下降, 收缩期 EF 升高, 收缩期应变下降($P < 0.05$); PS 术后组仅储存期应变率下降($P < 0.05$); PA/VSD 术后组所有储存功能参数、管道期 EF 和应变均下降, 收缩功能未见明显异常。PS 术后组的储存期 EF、应变和管道期 EF、应变均高于 TOF 术后组和 PA/VSD 术后组($P < 0.05$)。先心病术后组的储存期 EF 均与储存期应变及应变率和管道应变呈中度相关。RVEF 较低($< 50\%$, $n=61$)的患者与 RVEF 较高($\geq 50\%$, $n=101$)的患者相比, 储存期和管道期功能参数均显著降低。

结论 在左心室 EF 保留的 TOF、PS 和 PA/VSD 术后患儿中, 左心房功能已发生异常, 可能可以早期提示左心室舒张功能不全, 且与右心室功能密切相关。TOF 和 PA/VSD 术后患儿的左心房储存功能和管道功能均下降, 收缩功能表现不同; PS 术后患儿的左心房储存和管道功能优于 TOF 和 PA/VSD 术后患儿。CMR 可以在左心房结构扩大之前, 早期发现左心房的功能异常。

PO-1065

基于心脏 MR 组织特征成像的 2 型糖尿病早期心肌损伤定量评价 及其与心外膜脂肪厚度关系的研究

黄璐、杨朝霞、夏黎明
华中科技大学同济医学院附属同济医院

目的：应用心脏 MR T1 mapping 技术及特征追踪心肌应变成像研究左心室射血分数 (left ventricular eject fraction, LVEF) 保留型 2 型糖尿病 (Type 2 diabetes mellitus, T2DM) 患者是否存在早期心肌损伤, 同时研究其与心外膜脂肪 (epicardial adipose tissue, EAT) 厚度的关系。材料与方法：回顾性纳入 T2DM 患者 (T2DM 组) 10 例和健康志愿者 (正常对照组) 10 例, 所有研究对象均进行 3.0 T CMR 检查, 扫描序列包括心脏电影及 T1 mapping。通过 CVI42 后处理软件测量 LV 心功能参数、心肌应变及 LV 心肌 T1 值, 及细胞外容积 (extracellular volume, ECV)。分析 T2DM 组与正常对照组的临床参数、心脏 MR 参数的差异。同时, 在四腔心电影和基底段短轴面电影的舒张末期对 EAT 的厚度进行测量, 包括右侧房室沟 (RAVG)、左侧房室沟 (LAVG)、前室间沟 (AIVG)、上室间沟 (SIVG)、下室间沟 (IIVG) 和右心室游离壁外 EAT, 并且分析 T2DM 组和正常对照组之间 EAT 厚度的差异, 并与血糖、左心室心肌 T1 值和 ECV 值进行相关性分析。结果：发现与正常对照组比较, T2DM 组的初始 T1 值及 ECV 值均较高, 左室心肌整体径向、环向应变均明显减低 (所有 $P < 0.05$) ; T2DM 组的 RAVG、LAVG、SIVG 和 RVFW 的 EAT 厚度明显高于对照组, 且 RAVG、LAVG 和 RVFW 的 EAT 厚度与血糖浓度呈中度正相关 (所有 $P < 0.05$) , RVFW 的 EAT 厚度与左心室整体初始 T1 值中度正相关 ($P = 0.022$) 。结论：心脏 MR 测量的 LV 心肌 T1 值、ECV 及心肌应变可作为评价 T2DM 患者早期心肌损伤的影像学参数。房室间沟 EAT 的厚度与血糖水平相关, 且 RVFW 的 EAT 有可能与左心室心肌纤维化有关。

PO-1066

左心房应变在 II 期轻链型心脏淀粉样变中的预后价值

郭玉博、李潇、李剑、王怡宁
中国医学科学院北京协和医院

目的：左心房 (left atrial, LA) 功能障碍在心脏淀粉样变发生发展中的作用逐渐受到重视。然而, LA 功能在梅奥 II 期轻链型心脏淀粉样变 (light-chain cardiac amyloidosis, AL-CA) 中的预后价值仍然未知。本研究旨在评估 LA 应变在梅奥 II 期 AL-CA 患者中的预后价值。方法：前瞻性地纳入进行心脏磁共振检查的梅奥 II 期 AL-CA 患者。终点是全因死亡, 进行 Cox 回归分析和 Kaplan-Meier 生存分析以确定变量与结局间的关系。结果：本研究共纳入 131 名梅奥 II 期 AL-CA 患者, 37 名患者 (28%) 达到终点 (中位随访: 28 [IQR: 10-50] 月)。血清生物标志物、细胞外体积 (extracellular volume, ECV)、左心室射血分数、左心室应变和 LA 应变均可预测结局 ($P \leq 0.02$)。在多因素模型中, 左心房储存应变仍然与结局显著相关 (HR: 0.910 [95% CI: 0.868, 0.954; $P < 0.001$])。在已知的预后因素基础上加入 LA 储存应变, 可显著改善模型的区分度 (Harrell's C-index: NT-proBNP + ECV = 0.392; Harrell's C-index: NT-proBNP + ECV + LA 储存应变 = 0.403) 和重新分类 (net reclassification index: 0.106; $P < 0.001$)。结论：LA 储层应变是梅奥 II 期 AL-CA 患者预后的独立预测因素, 优于左心室射血分数和左心室纵向应变, 并且对 ECV 具有增量预后价值。LA 应变评估应纳入到梅奥 II 期 AL-CA 患者的风险分层中。

PO-1067

基于共识聚类分析非小细胞肺癌的术后无复发生存期

田琪、冯峰
南通市肿瘤医院

目的：本研究旨在评估基于瘤内联合瘤周的 CT 影像组学共识聚类是否能对非小细胞肺癌 (NSCLC) 患者进行有效风险分层并预测术后无复发生存期 (RFS)。

材料与方法：回顾性分析了自 2014 年 12 月至 2020 年 4 月经病理确诊的 NSCLC 外科手术患者的数据。对 CT 图像进行预处理后，提取瘤内联合瘤周 9mm 区域的 CT 影像组学特征。应用主成分分析 (PCA) 对患者的影像组学特征进行降维处理并采用共识聚类对影像组学特征进行聚类分析。比较簇群之间的人口统计学特征、常规影像学特征、病理组织学特征、基因蛋白和免疫生物标志物表达状态。Cox 比例风险回归分析用于评估临床危险因素与术后 3 年 RFS 之间的相关性。采用 Kaplan-Meier 生存分析探索簇群之间的生存差异。

结果：共 266 名患者被纳入本研究，共识聚类确定了 3 个簇群 (簇 1: n=111, 簇 2: n=61, 簇 3: n=94)。病理 TNM 分期、病理 T 分期、病理类型、细胞程序性死亡-配体 1 (PD-L1) 和细胞程序性死亡-受体 1 (PD-1) 的表达状态、淋巴血管侵犯 (LVI) 等在 3 个簇群之间存在明显差异 (所有 $P < 0.05$)。Kaplan-Meier 生存分析显示，不同簇群之间的 RFS 存在显著统计学差异 ($P < 0.001$)，簇 1、簇 2 和簇 3 的术后 3 年无复发生存率分别为 76.4%，45.6% 和 41.5%。当在多变量 COX 回归分析中纳入与 NSCLC 患者预后相关的临床危险因素时，影像组学簇群是重要预后因素，与来自簇 1 的患者相比，簇 2 ($P=0.002$, HR: 2.533, 95%CI: 1.395-4.599) 和簇 3 患者 ($P < 0.001$, HR: 3.745, 95%CI: 2.231-6.286) 的术后 3 年 RFS 更低。

结论：基于瘤内联合瘤周的 CT 影像组学共识聚类可对 NSCLC 患者进行术后复发风险分层，可作为一种能有效评估 NSCLC 患者预后的手段。

PO-1068

基于 CT 纹理分析预测急性肺栓塞短期预后的研究

陈蓉¹、杨越¹、于雅茜¹、杨飞²、崔书君²

1. 河北北方学院

2. 河北北方学院附属第一医院

目的 探讨基于 CT 纹理分析定量预测急性肺栓塞 (APE) 患者短期预后的价值。**方法** 回顾性收集我院行 CT 肺动脉成像 (CTPA) 的 79 例 APE 患者 CTPA 图像及临床资料。依据临床结局分为预后良好组 (n=56) 和预后不良组 (n=23)，记录患者的影像学参数 RV/LV 比值、Qanadli 指数，提取血栓纹理特征，使用 R 软件对数据进行 Logistic 回归分析，并绘制 ROC 曲线、校准曲线和临床决策曲线评估纹理特征参数、RV/LV 比值、Qanadli 指数等在预测 APE 患者预后不良中的效能。

结果 RV/LV ≥ 1.0 、Qanadli 指数和纹理特征参数 GLSZM-GLN 是 APE 患者短期预后不良的独立预测因素。RV/LV ≥ 1.0 、Qanadli 指数、GLSZM-GLN 预测 APE 不良预后的 AUC 值分别为 0.826 (0.725-0.902)，0.922 (0.839-0.970)，0.867 (0.772-0.933)。**结论** 基于 CT 血栓纹理分析、RV/LV ≥ 1.0 和 Qanadli 指数能够评估 APE 患者短期预后不良，并有一定的临床应用价值。

基于瘤内及瘤周影像组学模型对肺癌淋巴结转移、Ki-67 表达水平的预测研究

邹孟宏、卓丽华、李宏伟、姚洪超、张婕、徐红霞
绵阳市第三人民医院

目的 探究肿瘤及肿瘤周围的影像组学模型对肺癌淋巴结转移、Ki-67 表达水平的预测效能。**方法** 本研究为回顾性研究，收集绵阳市第三人民医院及遂宁市中心医院的肺癌患者共计 157 例，依据患者术中取得淋巴结病理标本进行淋巴结转移的病理判断，依据患者肿瘤 Ki-67 表达水平的高低将患者分为 Ki-67 高表达 (Ki-67 \geq 25%)、Ki-67 低表达 (Ki-67 $<$ 25%)；同时收集所有患者的胸部 CT 平扫、动脉期、静脉期图像，由两名不同年资的放射科医师利用 3D-slicer 软件依据瘤体、距离肿瘤 2mm、4mm、6mm、8mm、10mm 进行逐层手动勾画，生成感兴趣区 (ROI)，并进行影像特征的提取采用 Lasso 回归分析的方法对特征进行降维，将筛选出来的特征采用机器学习方法分别建立基于瘤体、瘤周 2mm、4mm、6mm、8mm、10mm 的影像组学模型，各模型预测效能使用受试者工作特征曲线 (ROC) 来评价。结果 在对 Ki-67 表达水平预测的各个模型中，动脉期瘤体图像所构建出的影像组学模型对 Ki-67 表达水平的预测效能最高，AUC 为 0.817 (特异度为 0.820、灵敏度为 0.745)，高于动脉期各个距离的瘤周图像、平扫及静脉期的瘤体、瘤周模型的预测效能；在对淋巴结转移预测的各个模型中，静脉期瘤周 4mm 模型所构建出的影像组学模型对有无淋巴结转移的预测效能最高，AUC 为 0.887 (特异度为 0.780、灵敏度为 0.958)，高于静脉期瘤体及其余瘤周、动脉期、平扫瘤体及瘤周模型的预测效能。结论 对于肺癌 Ki-67 的表达，瘤周影像组学模型并不能提高其预测效能；而对淋巴结转移的预测，静脉期瘤周 4mm 影像组学模型能够提高其预测效能。

冠脉 CTA 评估的不同斑块类型及其与冠状动脉周围脂肪组织的体积和衰减的关系

景梦园、周俊林
兰州大学第二医院

目的 基于冠状动脉计算机断层扫描 (Coronary computed tomography angiography, CCTA) 探讨稳定型冠状动脉疾病 (Coronary artery disease, CAD) 患者中不同斑块类型与冠状动脉周围脂肪组织 (Pericoronary adipose tissue, PCAT) 体积和衰减之间的关系。**材料与方法** 共收集了 321 名接受过 CCTA 检查的稳定型 CAD 患者。斑块类型由两位分别具有 10 年和 8 年心血管诊断经验的放射科医生通过对 CCTA 图像的视觉分析进行评估。使用半自动软件分别测量了斑块周围、斑块所在节段和近端冠状动脉的 PCAT 体积和 CT 衰减值。比较不同类型斑块在冠状动脉近端、斑块所在节段和斑块周围的 PCAT 体积和衰减值是否存在统计学差异。结果 在本研究中，包含 218 名男性，103 名女性。共纳入 552 个病变，其中包括 299 个钙化斑块 (Calcified plaques, CP)、174 个非钙化斑块 (Non-calcified plaques, NCP) 和 79 个混合斑块 (Mixed plaques, MP)。两位放射科医生对 PCAT 体积和衰减值的测量结果一致性较好 (所有 ICC 值均大于 0.80)。不同斑块类型的斑块周围 PCAT 体积差异有统计学意义 ($P<0.001$)，而冠状动脉近端和斑块所在节段的 PCAT 体积无明显差异 ($P>0.05$)。此外，斑块周围和斑块所在节段的 PCAT 衰减值在不同斑块类型之间有显著统计学差异 ($P<0.001$)，而冠状动脉近端 PCAT 衰减值无显著差异 ($P>0.05$)。

PO-1071

融合 CT 图像和临床变量的深度残差网络预测肺腺癌的侵袭性

彭佳^{1,2}、钟文强¹、刘小彬¹、唐秉航²

1. 中山大学附属第五医院

2. 中山市人民医院

目的

开发一种基于 ResNet50 架构的深度残差学习网络 (DRLN)，用于区分浸润性腺癌 (IA) 和显示磨玻璃结节 (GGN) 的原位浸润性腺癌 (AIS) 或微小浸润性腺癌 (MIA)。

研究方法

回顾性地从四个中心获得了 430 名患者的常规 CT 图像、临床数据和血清肿瘤标记物数据，共发现 431 个 GGN。采用一系列预处理技术，如图像重采样、重新缩放和裁剪、数据增强等，对原始 CT 图像进行处理，生成新的训练图像和测试图像。DRLN 是基于 ResNet50 架构和支持向量机 (SVM) 分类器构建的。ResNet50 是一种深度神经网络，由 49 个卷积层和 1 个全连接层组成。输出层由 3 个节点组成，用于识别 3 个腺癌病例。最后，将 DRLN 的预测性能与两位放射科医生的预测性能进行了比较。

结果

所提出的模型获得了最高的准确率 (72.2%)、精确率 (95.6%)、召回率 (72.2%)、加权平均 F1 分数 (40%)、净现值 (96%)、MCC 值 (73.1%) 和宏观平均接收者操作特征曲线下面积 (AUC) 值 (87%)。这优于无临床信息模型的准确率 (64.9%) 和放射科医生的准确率 (分别为 49.7% 和 52.5%)。即使与资深放射科医生相比，建议的模型和不带临床信息的模型在所有指标上都取得了更好的分类性能，这表明 ResNet50 的有效性。

结论

DRLN 在判断 GGN 的侵袭性方面取得了良好的分类效果。

PO-1072

基于冠状动脉 CTA 的冠周脂肪影像组学特征结合机器学习对冠状动脉支架内再狭窄的诊断性能研究

梁硕、崔可艺、张洪

天津市胸科医院

目的：基于冠脉 CT 血管造影 (CCTA) 提取冠周脂肪 (PCAT) 的影像组学特征，评估其对冠脉支架内再狭窄 (ISR) 的诊断价值。

方法：回顾性纳入接受过冠脉支架植入后复查 CCTA 并同期接受冠脉造影术 (ICA) 的患者。根据 ICA 结果，将病例分为 ISR 组和非 ISR 组。计算支架周围脂肪衰减指数 (FAI) 及支架周围 PCAT 容积并提取影像组学特征。将所有样本按 7:3 的比例随机分为训练集和验证集进行机器学习模型的开发和验证。使用五种不同的机器学习算法：包括逻辑回归 (LR)、随机森林 (RF)、随机梯度下降 (SGD)、支持向量机 (SVM) 和 XG-Boost 构建影像组学模型、临床模型以及临床-影像组学相结合的综合模型。使用受试者工作特征曲线 (ROC) 评价各模型的诊断性能。对于支架直径 $\leq 3\text{mm}$ 的病例进行亚组分析。

结果：本研究最终共纳入 165 例患者的 214 支血管，其中 ISR 组 79 支血管，非 ISR 组 135 支血管。ISR 组支架周围 FAI 高于非 ISR 组 (-79.8 ± 10.7 Vs. -82.1 ± 8.3 , $P=0.107$)，ISR 组支架周围 PCAT 容积低于非 ISR 组 (1189.7 ± 639.8 Vs. 1271.1 ± 653.4 , $P=0.376$)。支架置入时长与 ISR 显著相关 ($OR=1.02$, $P<0.001$)。SGD 算法在影像组学模型中表现最佳，曲线下面积 (AUC) 在训练集和验证集分别为 0.73 和 0.69。RF 算法在综合模型中表现最佳，训练集和验证集的 AUC 分别

为 0.85 和 0.79。在支架直径为 ≤ 3 mm 的亚组分析中,表现最佳的影像组学模型的 AUC 在训练集和验证集分别为 0.93 和 0.82,表现最佳的综合模型在训练集和验证集分别为 0.93 和 0.85。

结论:基于 CCTA 的 PCAT 影像组学特征结合机器学习方法具有识别冠状动脉 ISR 的潜力,尤其是对于支架直径 ≤ 3 mm 的支架具有更好的诊断性能。

PO-1073

cT1N0M0 期肺癌的影像学表现和分子生物标记物相关性分析

彭佳¹、钟文强¹、唐秉航²

1. 中山大学附属第五医院

2. 中山市人民医院

目的 研究 T1N0M0 期肺磨玻璃结节的影像学表现和分子生物标志物。材料与方法: 选取 2013 年 3 月至 2019 年 12 月期间 221 例 T1N0M0 肺腺癌患者中 CT 显示 GGO 的 237 个病灶,包括 52 例原位腺癌(AIS)、42 例微创腺癌(MIA)和 141 例浸润性腺癌(IAC)。对 AIS-MIA-IAC 组之间或 AIS&MIA 组与 IAC 组之间的临床人口学数据、影像学特征和生物标志物进行了分析。统计分析采用单变量逻辑回归、多变量线性回归和相关分析。结果: 共纳入 221 名患者(中位年龄 59 岁;四分位数范围 51-67 岁;88 名男性)。在 AIS-MIA-IAC 比较中,CT 值、磨玻璃密度结节直径(DGGN)、部分实性结节直径(Dsolid)、合并肿瘤比率(CTR)、结节类型、形状、边缘、气泡、邻近结构、TTF-1 和表皮生长因子受体(EGFR)均有显著差异(均 $P < 0.05$)。在 AIS&MIA 和 IAC 比较中,性别、吸烟和 CEA 也有显著差异(均为 $P < 0.05$)。单变量逻辑回归分析显示,性别、CT 值、DGGN、Dsolid、CTR、类型、形状、边缘、气泡、TTF-1 和表皮生长因子受体(EGFR)特征是显著的危险因素(均 $P < 0.05$)。多变量逻辑回归分析显示,CT 值、DGGN 和气泡是独立的危险因素。该模型的 AUC、灵敏度、特异性和准确性分别为 0.880、0.787、0.854 和 0.814。TTF-1 与 CT 值、DGGN、Dsolid 和 CTR 呈中度相关。表皮生长因子受体与 CT 值、DGGN 和 Dsolid 呈中度相关。结论 CT 值、DGGN、气泡等 CT 特征和表皮生长因子受体(EGFR)、TTF-1 等生物标记物有助于确定肺腺癌的浸润范围,从而支持早期肺腺癌患者的及时诊断和个体化治疗。

PO-1074

“双低”技术联合不同重建算法在超重患者 CCTA 成像中优化图像质量的应用价值

申利、彭荟、于勇、于楠、陈晓侠、韩冬

陕西中医药大学附属医院

目的: 探讨深度学习重建算法(DLIR)、基于多模型迭代重建(ASIR-V)和滤波反投影法(FBP)在超重患者“双低”冠状动脉 CT 血管成像中优化图像质量的应用价值。

方法: 前瞻性收集我院 52 例行 CCTA 扫描的超重患者,体质量指数(BMI)为 25.1 kg/m²-28 kg/m²,采用 80 kVp 管电压,智能管电流,噪声指数为 30,对比剂用量 0.5mL/Kg,注射平台期 9s,监测肺动脉和降主动脉,降主动脉阈值 250HU,两点相交手动出发,进行图像采集。扫描完成后,每例患者重建 FBP、50%ASIR-V、DLIR-M、DLIR-H 四组图像,并测量主动脉根部、右冠状动脉近端、左冠脉回旋支近端、前降支近端及心包脂肪的 CT 值和噪声(SD 值),计算冠状动脉信噪比(SNR)和对比噪声比(CNR),由两名具有五年以上工作经验的影像科医生采用 5 分法对图像质量进行双盲法主观评分。

结果：在客观图像质量评价中，4 组重建图像 AO、LCX、RCA、心包脂肪 CT 值间差异无统计学意义 ($P>0.05$)。四组重建图像 SD 值、SNR 值和 CNR 值间差异存在显著统计学意义 ($P<0.05$)，随着四组重建算法 FBP、50%ASIR-V、DLIR-M、DLIR-H 依次变化，图像 SD 值逐渐降低，SNR 值和 CNR 逐渐升高，其中 DLIR-H 组 SD 值最低、SNR 值和 CNR 值最高。在主观图像质量评价中，两名医师对图像质量主观评分一致性很好 (κ 值=0.900, $p<0.001$)，其中 DLIR-M 组与 DLIR-H 组主观评分高。

结论：“双低”技术联合 DLIR-H、DLIR-M 重建可以显著提升超重患者 CCTA 图像质量且优于 ASIR-V 50% 和 FBP。

PO-1075

比较冠状动脉 CT 血管成像和临床风险评分在疑诊冠心病患者他汀类药物决策中的作用

郑嘉男、吕滨、侯志辉
中国医学科学院阜外医院

背景：目前指南推荐在一级预防中使用临床风险评分作为他汀类药物决策的证据，而冠状动脉 CT 血管成像 (CCTA) 在他汀类药物分配中的作用仍未知。

目的：本研究旨在比较 CCTA 和临床风险评分对疑诊冠心病 (CAD) 患者他汀类药物分配的影响。

方法：在接受了 CCTA 检查的 8040 名疑诊冠心病患者中，我们评估了按汇总队列方程 (PCE) 和 CCTA 解剖结果 (无斑块、非阻塞性 CAD 和阻塞性 CAD) 分层的主要不良心血管事件 (MACE) 风险。MACE 定义为全因死亡、急性心肌梗死、血运重建和卒中的复合事件。

结果：在 3.8 年的中位随访期内，316 名入组患者发生了 MACE。根据 CCTA 结果进行分层后，不同 PCE 分层的事件发生率无明显差异 ($P>0.05$)。与 PCE 所识别的人群相比，CCTA 发现了风险较低的人群 (0.3% 对 1.8%) 和风险较高的人群 (21.8% 对 9.0%)。在被推荐使用他汀类药物的人群中 (PCE 风险 $\geq 7.5\%$)，32.5% (1025/3151) 的患者事件风险很低 (0.3%)，且没有斑块。而在未被推荐使用他汀类药物 (PCE 风险 $< 5\%$) 的患者中，4.8% (179/3718) 的患者具有阻塞性 CAD，事件风险高 (17.3%)。

结论：在接受 CCTA 检查的疑诊 CAD 患者中，与 PCE 相比，CCTA 获得的解剖学结果在指导他汀类药物决策方面起着更重要的作用。

PO-1076

基于能谱 CT 单能量图像影像组学模型预测 NSCLC 患者 EGFR 突变状态

张旭阳、于楠、贺太平
Affiliated Hospital of Shaanxi University of Chinese Medicine

目的：本研究旨在探讨基于能谱 CT 单能量图像的影像组学特征对非小细胞肺癌患者表皮生长因子受体基因突变状态的预测价值，比较是否存在最佳单能量水平，并建立基于最佳单能量水平的 NSCLC 患者 EGFR 突变预测模型。

方法：本研究回顾性分析了经临床病理证实的 95 例 NSCLC 患者的影像学资料。通过能谱 CT 后处理 workstation 在 40-140keV 下每隔 10keV 重建一组单能量图像，共重建了 11 组单能量图像。使用 ITK-snap 软件在 70keV 水平主动脉期轴位图像上逐层勾画感兴趣区 (ROI)，完成后将 ROI 同步到其余 10 组单能量水平图像上。利用 Radiomics Feature Extractor 软件对 11 组单能量图像进行影像组学定量特征提取。使用 R 软件对特征进行最小绝对收缩和选择算子 (The least absolute shrinkage

and selection operator, LASSO) 筛选, 基于所选特征, 构建预测 NSCLC 患者 EGFR 基因突变的影像组学模型。使用受试者工作特征曲线 (Receiver operating characteristic, ROC) 来评价 11 组单能量图像影像组学模型预测 EGFR 基因突变的效能, 选择最佳单能量水平。

结果: 基于 11 组单能量图像, ROC 曲线下面积分别为 0.711、0.521、0.721、0.733、0.698、0.781、0.724、0.754、0.713、0.760、0.715, 除 50keV 外, 基于其余 10 组单能图建立的影像组学模型均具有良好的预测效能, 在 90keV 水平上预测效能较高。

结论: 在本研究中, 90keV 是预测 NSCLC 患者 EGFR 突变状态的最佳单能量水平, 可以为 NSCLC 患者的 EGFR 基因突变状态检测提供一种高效、无创、准确的成像方法, 实现对肿瘤生物学行为的评估。

PO-1077

复杂肺动脉闭锁伴室间隔缺损合并肺动脉起自冠状动脉一例

黄瑞良、孙琦婷、窦勇、刘冬冬
山西省心血管病医院 (山西省心血管病研究所)

目的

探讨复杂肺动脉闭锁合并肺动脉起源异常的影像表现。

方法

回顾性分析 1 例肺动脉闭锁患者的临床资料及影像特征, 并复习相关文献。

结果

患者, 女, 36 岁, 体弱, 平时面色略呈青色, 劳累时面色加深, 严重时呈紫色。体检: 口唇青紫, 双肺无干湿啰音。门诊心脏彩超: 先天性心脏病, 法乐氏四联症, 室间隔缺损, 主动脉骑跨, 肺动脉闭锁不排除, 右房右室增大, 右室壁增厚, 二尖瓣关闭不全 (轻度), 主动脉瓣关闭不全, 舒张功能减低。门诊先心病 CT 增强成像: 室间隔缺损, 主动脉骑跨, 左冠状动脉扩张, 肺动脉闭锁, 肺动脉起源异常。

PO-1078

基于临床、增强 CT 影像组学构建影像组学列线图模型预测胸腺瘤危险分类

杜梦颖、宋鑫洋、沈天赐、郭建峰、杨峰
襄阳市第一人民医院

目的: 基于临床、增强 CT 影像组学构建影像组学列线图, 评估其在预测胸腺瘤危险分类中的价值。

方法: 回顾性分析 133 例经病理证实的胸腺瘤患者, 男 63 例, 女 70 例; 其中低危组胸腺瘤 (LRT) 42 例, 高危组胸腺瘤 (HRT) 55 例, 胸腺癌 (TC) 36 例, 将患者分为研究组 1 (LRT 和 HRT, $n=97$) 和研究组 2 (HRT 和 TC, $n=91$), 每个研究组按 7: 3 比例随机分为训练集和测试集。利用 3Dslicer 软件逐层勾画每位患者 CT (平扫、动脉期及静脉期) 图像中胸腺瘤区域的感兴趣区, 从中提取并筛选最佳影像组学特征, 构建影像组学模型; 以单因素及多因素 logistic 回归分析筛选胸腺瘤组织学分型相关的临床及 CT 特征, 构建临床模型; 最后构建联合影像组学特征及临床、CT 特征的影像组学列线图 (联合模型)。绘制受试者工作特征曲线, 计算曲线下面积 AUC, 评价各模型预测胸腺瘤危险分类的效能, 以决策曲线 DCA 对比其临床获益。结果: 研究组 1, 筛选出性别及动脉期 CT 值构建临床模型, 其训练集 ($AUC=0.80$, $95\%CI$ 0.69-0.91) 和测试集 ($AUC=0.66$, $95\%CI$ 0.45-0.88) 对低危组和高危组胸腺瘤的预测效能较低, 影像组学模型及联合模型训练集和测试集的 AUC 值分别为 0.92、0.91 及 0.92、0.92, 均高于临床模型 (P 均 <0.05), DCA 显示联

合模型的临床获益高于临床模型；研究组 2，筛选出 5 个有意义的临床特征及 9 个最佳影像组学特征，以此构建的临床模型训练集和测试集的 AUC 值分别为 0.89、0.84，影像组学模型训练集和测试集的 AUC 值分别为 0.94、0.94，联合模型在训练集（0.97，95%CI 0.94-1）和验证集（0.98，95%CI 0.94-1.00）中均表现优异，联合模型、组学模型与临床模型的 AUC 值均无统计学差异（ P 均 >0.05 ），DCA 显示联合模型的临床获益高于临床模型。结论：联合临床、增强 CT 影像组学构建的影像组学列线图模型能很好的区分低危组胸腺瘤、高危组胸腺瘤和胸腺癌，且联合模型临床获益较高，尤其在高危组胸腺瘤和胸腺癌的鉴别诊断中具有较好的预测潜力。

PO-1079

精准调控斑块微环境的碳酸钙基纳米递药平台的 抗动脉粥样硬化研究

苏燕萍、沈霖、虞俊超、陈敏江、纪建松
丽水市中心医院

目的 现有临床治疗策略缺乏对动脉粥样硬化（AS）斑块微环境的调控可能是近十多年来心血管疾病（CVD）死亡率不降反升的重要原因。本研究旨在研发一种新型的、能对 AS 斑块微环境进行多重调控的纳米治疗体系，优化 AS 治疗策略，降低 CVD 死亡率。

方法与结果 将胆固醇（COD）氧化酶和 CaCO_3 纳米粒负载于双分子层脂质体之中，并用 VHPK 多肽对其进行表面修饰。通过 CaCO_3 纳米粒的 pH 响应性改善 AS 斑块内的微酸微环境，除了防止泡沫细胞表面的 ABCA1 蛋白在酸性环境下被降解之外，也为序贯的 COD 定向催化胆固醇提供了有利的微碱性微环境。COD 对 AS 斑块内的胆固醇进行定向分解后产生代谢产物 4-胆甾烯-3-酮，可介导泡沫细胞表面 ABCA1、ABCG1 的上调、促进胆固醇外排，对巨噬细胞炎症表型进行重编辑，使其向 M2 型巨噬细胞极化，实现 AS 斑块微环境的全面、多重调控。此外，VHPK 靶头的修饰增加了药物对 AS 斑块的靶向性和亲和性，从而进一步提升此碳酸钙基纳米递药系统的效能。

结论 本碳酸钙基纳米递药平台安全、高效、具有临床转化潜力，为动脉粥样硬化综合治疗策略提供了新的思路。

PO-1080

亚实性肺小结节浸润性腺癌相关危险因素 研究及临床预测模型建立

景瑞
山东大学第二医院

研究目的：

明确 CT 上表现为 $\leq 1\text{cm}$ 亚实性结节的浸润性肺腺癌的相关危险因素，并应用机器学习的方法建立预测模型以辅助早期肺癌的临床决策。

研究方法：

收集自 CT 上表现为 $\leq 1\text{cm}$ 亚实性结节的腺体前驱病变及肺腺癌患者共 169 例（200 个肺结节），分析其临床资料（包括年龄、性别、吸烟史、肿瘤史、家族史），CT 征象（包括位置、大小、密度、病灶边缘、瘤肺界面、病变内部及周围）及病理（腺体前驱病变，MIA 及 IAC）资料，将结节按病理分为 IAC 及非 IAC 两组。对两组患者的临床资料及结节 CT 征象进行对照分析，并进行单因素和多因素分析，筛选出 IAC 的独立危险因素。将结节按 0.7:0.3 的比例随机拆分为训练集和验证集，选择随机森林算法，利用递归式特征消除法筛选出的预测因子建立模型。使用 ROC 曲线分析

确定模型训练集及验证集的准确性。定性资料采用卡方检验，正态分布的连续型变量用 t 检验，非正态分布的连续型变量采用 Wilcoxon 检验。预测模型构建中的数据分析使用 R 语言。

结果：

在 200 个平均直径 $\leq 1\text{cm}$ 的肺腺癌 SSNs 中，有 25.5% 结节的病理为 IAC，149 个结节病理为非 IAC，包括 66 个腺体前驱病变及 83 个 MIA。两组患者在吸烟，结节大小，结节为混杂磨玻璃结节，实性成分占比，真实实性成分结节及结节出现分叶、毛刺、异常血管、空气支气管征、胸膜凹陷的差异有统计学意义 ($P < 0.05$)。通过单因素和多因素回归分析确定为 IAC 的独立危险因素为吸烟，结节大小，mGGN，实性成分占比 >0.5 及结节出现分叶。RFE 法筛选的预测因子为患者年龄，性别，肿瘤史，结节平均直径，结节密度分类，实性成分占比，实性密度分级，结节位置，结节出现胸膜凹陷、空泡、毛刺、空气支气管征、血管穿行。基于随机森林算法对 IAC 的预测因子建立预测模型，训练集和验证集曲线下面积分别为 0.9899 和 0.84。

结论：

1. $\leq 1\text{cm}$ 的亚实性肺小结节中存在部分 IAC；
2. 患者吸烟，结节大小，mGGN，CTR >0.5 及分叶征是 $\leq 1\text{cm}$ 的 IAC 的独立危险因素；
3. 使用临床资料和 CT 征象作为预测因子构建的随机森林模型能较好的对 $\leq 1\text{cm}$ 的 IAC 进行预测。

PO-1081

基于机器学习算法建立对体检发现的 亚实性肺小结节生长模式的临床预测模型研究

景瑞
山东大学第二医院

研究目的：

探讨体检胸部 CT 上首次发现 $\leq 1\text{cm}$ 亚实性结节 (SSN) 的动态随访并确定与结节生长相关的临床及影像学危险因素，制定预测模型以辅助肺结节个体化管理。

研究方法：

收集我院体检患者中行胸部 CT 检查时，首次发现直径小于 1cm 的亚实性肺结节 (SSN) 并随访 24 个月，结节持续存在的患者共 151 人 (166 个结节)。分析其临床 (年龄、性别、吸烟史、肿瘤史、家族史) 及影像 (位置、大小、密度、病灶边缘、瘤肺界面、病变内部及周围) 资料，按结节的生长情况分为生长组及非生长组。生长组分为两个亚组，结节增大和实性成分增加，分别进行对照分析。然后进行单因素和多因素分析，确定出与结节生长相关的独立危险因素。将结节按 0.7:0.3 的比例随机拆分为训练集和验证集，选择随机森林算法，利用递归式特征消除 (RFE) 法筛选出的预测因子建立模型。并用 ROC 曲线评估预测模型的准确性。定性资料采用卡方检验，正态分布的连续型变量用 t 检验，非正态分布的连续型变量采用 Wilcoxon 检验。临床预测模型构建中的数据分析使用 R 语言。

结果：

166 个 SSNs 中生长组共 36 个结节 (21.68%)。生长组与非生长组中患者的年龄、性别和既往有吸烟史存在统计学差异 ($P < 0.05$)。结节大小，密度分类，结节有无分叶、空气支气管征、血管穿行和异常血管改变的差异在两组中具有统计学意义 ($P < 0.05$)。通过单因素与多因素回归分析确定与结节生长相关的独立危险因素为患者年龄，吸烟，结节为 mGGN，结节出现血管穿行及异常血管改变。RFE 法筛选的预测因子为患者年龄、性别、吸烟、结节平均直径、结节密度分类、结节出现胸膜凹陷、空泡、毛刺、空气支气管征及异常血管，基于随机森林模型对预测因子建立预测模型，其 AUC 在训练集和验证集分别为 0.9944 和 0.7393。

结论：

1. 患者年龄，吸烟，结节为 mGGN，结节出现血管穿行及异常血管是 $\leq 1\text{cm}$ 亚实性结节生长的独立危险因素；

2. 使用临床资料和 CT 征象作为预测因子构建的随机森林模型能较好的对 $\leq 1\text{cm}$ 亚实性结节生长情况进行预测;
3. 以体检人群作为目标人群设立预测模型可以对肺结节的个体化、精准化诊疗提供帮助。

PO-1082

基于双瞬切能谱 CT 虚拟平扫与常规平扫在肺内部分实性结节图像质量的对照研究

洪静静、文戈、黄伟康
南方医科大学南方医院增城院区

目标

探讨使用双瞬切能谱 CT 重建得到的虚拟平扫评估肺内部分实性结节的可行性, 并将其性能与真实平扫图像进行比较。

方法

前瞻性搜集我院 46 例孤立性肺内部分实性结节 (PSN) 患者, 进行肺部常规平扫和能谱 CT 双期增强检查, 采用双瞬切能谱后处理技术重建得到双期 (动脉期、静脉期) 虚拟平扫图像。在常规真实平扫 (TNC) 和虚拟平扫图像中测量 PSN 和同侧竖脊肌 (ESM) 的 CT 值和噪声 (SD) 以及病变直径。计算了 PSN 的信噪比 (SNR, $\text{CTPSN} / \text{SDPSN}$) 和对比度噪声比 (CNR, $(\text{CT ESM} - \text{CTPSN}) / \text{SDESM}$)。记录 TNC 和 VNC 模式下的有效辐射剂量。两位经验丰富的放射科医生使用 5-point 量表 (1, 差; 2, 一般; 3, 适中; 4, 良好; 5, 优秀)。采用非参数检验比较不同扫描阶段图像的主观、客观参数和有效辐射剂量。Kappa 检验用于评估组间主观评分的一致性。

结果

动/静脉期 VNC 图像的客观评价指标直径、CT 值、SD、SNR 及 CNR 与 TNC 直径、CT 值、SD、SNR 及 CNR 图像比较, 无统计学差异 ($P=0.926/0.948/0.87/0.88/0.656$)。主观评分方面, 两名观察者主观评分在动脉期 VNC 与静脉期 VNC/TNC 之间比较, 组间差异有统计学意义 (P 观察者 1 值 $=0.004 / <0.001$; P 观察者 2 值 $=0.003 / <0.001$)。TNC 图像主观评分均值最高; 静脉期 VNC 图像主观评分高于动脉期主观评分; 三组图像 Kappa 值分别为 73%; 63%, 72%。主观评分一致性较强。VNC 模式有效辐射剂量小于常规模式 ($P<0.001$), 约降低了 30%。

结论

双瞬切能谱增强静脉期虚拟平扫技术可提供与 TNC 相似的图像质量, 且能明显减少患者辐射剂量。

PO-1083

基于 CCTA 的冠状动脉周围脂肪影像组学模型预测主要心血管不良事件: 前瞻性队列研究

张新伟、吴月、张瑜、刘俊诗、邢艳 (通讯作者)
新疆医科大学第一附属医院影像中心

目的: 探究基于冠状动脉周围脂肪 (PCAT) 的影像组学模型对于主要心血管不良事件 (MACE) 的风险预测能力。**方法:** 前期研究回顾性收集 2016 年 1 月至 2020 年 12 月发生 MACE 事件的 205 例患者进行病例对照研究, 建立 PCAT 影像组学模型。本研究进一步连续性纳入 440 例确诊冠心病或疑似冠心病患者进行外部验证。根据 PCAT 影像组学分析结果将患者划分为高风险组 (214 例) 和低风险组 (226 例), 其中高风险组男性 146 例, 平均 (62.01 ± 10.75) 岁, 低风险组男性 162 例, 平均 (58.85 ± 11.30) 岁, 通过电话、调阅病例等方式随访 MACE 事件。**结果:** 随访平均时间

15.68 个月, 共发生 MACE79 例, 其中高危组 54 例, 低危组 25 例, 在校正了性别、高血压病史、糖尿病病史、总胆固醇、甘油三酯等指标后, 多因素 Logitic 回归分析显示高龄为 MACE 发生的危险因素 (OR=1.07, 95%CI:1.02~1.13, P=0.008), Cox 回归生存分析显示 PCAT 高风险组发生 MACE 风险明显增高 (HR=2.40, 95%CI:1.46~3.85,P<0.001)。FAI 高风险组则没有统计学差异 (P=0.879), PCAT 影像组学模型对于 MACE 的发生有良好的预测及危险分层能力。**结论:** 基于 PCAT 的影像模型对 MACE 的预测和危险分层有较高的应用价值, 在回顾性研究和前瞻性研究中均得到了验证, 且明显优于基于 PCAT 密度建立的模型。

PO-1084

嗜酸性肉芽肿性多血管炎肺部受累 CT 影像征象

刘韵¹、陈淮²

1. 广州医科大学附属第一医院

2. 广州医科大学附属第二医院

目的 回顾性分析嗜酸性肉芽肿性多血管炎 (EGPA) 肺部受累的 CT 影像征象, 以提高 EGPA 患者的诊断水平为临床提供依据。

材料与方法 本研究回顾性分析了 58 例 2015 年 9 月至 2023 年 4 月于广州医科大学附属第一医院确诊为 EGPA 患者的影像学检查资料, 从气道改变 (广泛的支气管壁增厚、树芽征、空气潴留、支气管痰栓)、肺实质改变 (小结节、斑片状磨玻璃影、实变影)、肺间质改变 (肺小血管纹理增粗、小叶间隔增厚)、肺外病变 (纵隔淋巴结肿大、胸腔积液、胸膜增厚、鼻窦炎症) 四个方面, 总结 EGPA 的影像征象。

结果 男性患者为 27 例 (47%), 女性患者为 31 例 (53%), 年龄 19~72 岁, 中位年龄为 46.5 岁。气道改变方面, 其中表现为广泛支气管壁增厚为 51 例 (88%), 支气管痰栓为 42 例 (72%), 树芽征为 35 例 (60%), 空气潴留为 21 例 (36%)。肺实质改变方面, 其中表现为斑片状磨玻璃影为 36 例 (62%), 小结节为 21 例 (36%), 实变影为 17 例 (29%)。肺间质改变方面, 其中表现为肺小血管纹理增粗 49 例 (84%), 小叶间隔增厚为 5 例 (9%)。肺外病变方面, 其中表现为纵隔淋巴结肿大 25 例 (43%), 胸腔积液为 5 例 (9%), 仅有 2 例 (3%) 伴有胸膜增厚。其中 54 例患者在胸部 CT 检查的前后 3 天内进行鼻窦 CT 检查, 52 例 (96%) 表现为鼻窦炎, 其中 23 例 (44%) 为全组副鼻窦受累。

结论 EGPA 的影像学表现虽然多种多样, 但也有一定的特异性。EGPA 患者肺部受累时, 常表现为广泛支气管壁增厚、支气管痰栓形成、树芽征、斑片状磨玻璃影、肺小血管纹理增粗、纵隔淋巴结肿大, 并同时伴有鼻窦受累。

PO-1085

自身免疫病相关免疫抑制宿主肺部机会性感染临床特点分析

金聿嘉

常熟市第二人民医院

目的: 自身免疫病患者使用糖皮质激素、免疫抑制剂等药物后易发生免疫抑制, 继发肺部机会性感染。本研究分析自身免疫病患者继发肺部机会性感染的临床特征, 探讨影响患者 28 天预后的危险因素。

方法: 本研究纳入 2015 年 9 月 1 日至 2022 年 12 月 31 日期间入住苏州大学附属第一医院呼吸与危重症医学科, 诊断自身免疫病继发肺部机会性感染的患者共 119 例。回顾性分析两组患者临床特征、实验室检查及影像学检查结果, 探讨影响患者 28 天疾病预后的危险因素。

结果: 研究纳入 119 例患者, 分为存活组和死亡组。两组患者在性别、年龄上均无统计学差异。引起免疫抑制的基础疾病、其他基础疾病(糖尿病、高血压) 和烟酒史构成上无统计学差异。在入院临床表现如呼吸困难, 死亡组患者占比较存活组更高($P<0.05$), 死亡组患者入院 PSI 评分高于存活组 ($P<0.05$)。死亡组患者较存活组入院时实验室检查相关指标变化较为显著($P<0.05$)。本研究共 36 例患者入院后完善了肺泡灌洗液宏基因组二代测序, 结果提示两组患者在各种病原体占比上无统计学差异。在影像学分布及特点方面, 组间比较无统计学差异。死亡组较存活组入院后使用无创呼吸机、有创机械通气及住院期间呼吸治疗升级比例显著增加 ($P<0.05$)。在抗微生物治疗方面, 入院后患者初次使用抗菌药物组间比较无明显差异。在使用广覆盖机会性感染药物方面, 死亡组应用比例较存活组显著升高($P<0.05$)。住院期间死亡组患者较存活组糖皮质激素平均每日使用剂量显著增加 ($P=0.004$)。将入院 24h 抗曲霉菌治疗、入院 PSI 评分和糖皮质激素每日使用剂量这三个因素纳入多因素 Logistic 分析, 提示入院 PSI 评分和糖皮质激素平均每日使用剂量是影响 28 天预后的危险因素, 入院 24h 抗曲霉菌治疗为保护性因素。

结论: 自身免疫病相关免疫抑制宿主机会性感染后 28 天内死亡的患者入院呼吸困难更明显, 实验室检查相关指标变化更为显著。入院 24h 使用抗曲霉治疗为影响 28 天预后的保护性因素, 入院 PSI 评分、糖皮质激素平均每日使用剂量是危险因素。

PO-1086

临床与能谱 CT 参数联合预测 N0 期非小细胞肺癌淋巴血管侵犯

邓靓娜、周俊林
兰州大学第二医院

目的:探讨能谱 CT 定量参数对 N0 期非小细胞肺癌淋巴血管侵犯的预测价值, 建立预测模型并绘制诺莫图, 辅助临床术前治疗决策。

方法: 本研究回顾性分析了 2019 年至 2022 年 12 月术前行能谱 CT 扫描的 107 例 N0 期非小细胞肺癌患者。临床特征包括年龄、性别、生化指标、血清肿瘤指标和免疫组织化学指标。影像学特征包括肿瘤位置、肿瘤边界、分叶征、毛刺征、空泡征、支气管充气征、血管集束征和胸膜凹陷征。能谱 CT 参数包括单能量 CT 值、有效原子序数(Eff-Z)、碘浓度(IC), 计算归一化碘浓度(NIC)。组间计算差异采用 χ^2 检验、t 检验和 U 检验。然后, 使用最小绝对收缩和选择算子(LASSO)和多元 logistic 回归选择独立预测因子, 建立预测模型并绘制诺莫图。采用 ROC 曲线、校正曲线和决策曲线分析评价预测效果和临床应用价值。

结果: 107 例 N0 期非小细胞肺癌患者中有 41 例存在淋巴血管侵犯。两组患者性别、TIF-1、淋巴细胞计数差异有统计学意义($P<0.05$)。动、静脉期能谱 CT 参数 40-90keV、Eff-Z、IC 和 NIC 等影像学指标在两组之间存在显著差异($P<0.05$)。其中动脉期 70keV 的 AUC 值最高 (0.71)。经 LASSO 回归选择动、静脉期的 70keV、90keV 和 Eff-Z 6 个变量构建模态图。临床-能谱 CT 模型的 AUC 为 0.93 (95%CI: 0.88~0.98)。敏感性和特异性分别为 0.89 和 0.88。模型具有良好的校正效果, DCA 结果表明该模型比最佳单变量模型具有更高的净效益。

结论: 性别、TIF-1、淋巴细胞计数及能谱 CT 参数 (动、静脉期 40-90keV、Eff-Z、IC 和 NIC) 在淋巴血管侵犯状态上存在差异。基于临床特征和双期 70keV、90keV、Eff-Z 的诺莫图有助于术前确定非小细胞肺癌的淋巴血管侵犯状态。

PO-1087

高原慢性低氧环境下大鼠心指数和右心室肥厚指数的研究

颜春龙^{1,2,3}、马金凤^{1,2}、孙艳秋³、田登峰³、张晨红³、赵毓春^{3,4}、张凤娟^{3,4}、付诗晗^{3,4}、夏梦雪^{3,4}、李玥^{3,4}

1. 济宁市第一人民医院

2. 苏州大学

3. 青海省人民医院

4. 青海大学

目的: 探究不同海拔地区大鼠心指数、右心与体重占比和右心与全心质量占比的改变情况。方法: 选取雄性 Sprague-Dawley (SD) 大鼠 (4 周龄) 21 只, 随机分三组, 一组运送至成都地区 (海拔高度约 450m, 7 只), 定义为平原组, 一组运送至西宁地区 (海拔高度约 2200m, 7 只), 定义为中度海拔组, 一组运送至玛多地区 (海拔高度约 4300m, 7 只), 分别饲养至 28 周龄, 之后运送至高原医学实验室, 测量体重, 分离心脏器官并称重, 获得心指数、右心与体重占比 (定义为右心室肥厚指数-1)、右心与全心质量占比 (定义为右心室肥厚指数-2), 对分组数据进行统计学分析。结果: 1、与平原组比较, 中度海拔组体重明显减低 ($P < 0.05$), 心指数、右心与体重占比、右心与全心质量占比明显增加 ($P < 0.05$); 高海拔组体重、全心质量、右心质量明显减低 ($P < 0.05$), 右心与体重占比、右心与全心占比明显增加 ($P < 0.05$); 2、与中度海拔组比较, 高海拔组体重、全心质量、右心质量明显减低 ($P < 0.05$), 右心与体重占比、右心与全心占比明显增加 ($P < 0.05$)。结论: 随着海拔高度的增加, 大鼠体重减轻, 全心质量趋向减低, 右心结构已发生改变, 右心与体重占比增大, 右心与全心占比增大。

PO-1088

基于治疗前 CT 的放射组学模型预测非小细胞肺癌新辅助化疗联合免疫治疗的主要病理反应

黄定品¹、林晨²、辛恩慧³、许方怡¹、甘艺⁴、石磊²、胡红杰¹

1. 浙江大学医学院附属邵逸夫医院放射科

2. 浙江省肿瘤医院放射科

3. 上海联影医疗科技股份有限公司

4. 浙江大学医学院附属邵逸夫医院病理科

目的: 本研究旨在建立基于治疗前 CT 提取的瘤内和瘤周特征的放射组学模型, 以预测非小细胞肺癌 (NSCLC) 患者接受新辅助化疗联合免疫治疗的主要病理反应 (MPR)。

方法: 回顾性分析来自两个中心 (SRRSH 和 ZCH) 接受新辅助化疗联合免疫治疗的非小细胞肺癌患者 148 例。使用 SRRSH 数据集 ($n=105$) 作为训练组和内部验证组。从治疗前的 CT 中提取瘤内 (T) 和瘤周区域 ($P1=0-5\text{mm}$, $P2=5-10\text{mm}$, $P3=10-15\text{mm}$) 的放射组学特征, 并通过组内和组间相关系数 (ICC) 和最小绝对收缩和选择算子 (LASSO) 进行特征选择。然后利用机器学习算法建立了上述四个单一 ROI 模型和一个联合放射组学 (CR: $T+P1+P2+P3$) 模型。采用 logistic 回归分析选择临床因素, 构建放射组学-临床 (CRC) 联合模型, 随后在外部中心 ZCH ($n=43$) 进行验证。通过德隆检验、校正曲线和决策曲线分析对模型的性能进行评价。

结果: 所有患者中, 98 例 (66.2%) 患者达到 MPR。组织病理类型是唯一的临床独立危险因素。单一 ROI 模型 T、P1、P2 和 P3 在内部验证组预测 MPR 的 auc 分别为: 0.619、0.712、0.662 和 0.741。CR 模型在内部验证集中表现出较好的预测性能 ($AUC=0.810$), 优于 4 个单一 ROI 模型, 且明显优于模型 T ($AUC=0.810$ vs 0.619 , $p < 0.05$)。通过在 CR 模型中加入临床独立危险因素, 构建 CRC 模型, 其预测能力最佳 ($AUC=0.814$)。此外, CRC 模型在独立的外部测试集中获得了令人满意的性能 ($AUC=0.768$, 95% CI: 0.62-0.91)。

结论:我们建立了一种结合瘤内、瘤周特征和组织病理类型的联合模型, 为选择适合新辅助化疗联合免疫治疗的 NSCLC 患者提供了一种有效的方法。

PO-1089

基于心脏磁共振右心室-肺动脉耦联参数在评估 CTD-PH 危险分层中的研究

马珂凡¹、刘王琰¹、王婧²、孙晓萱²、祝因苏³、徐怡¹

1. 南京医科大学第一附属医院 (江苏省人民医院) 放射科

2. 南京医科大学第一附属医院 (江苏省人民医院) 风湿科

3. 南京医科大学附属肿瘤医院 (江苏省肿瘤医院, 江苏省肿瘤防治研究所)

目的: 探讨基于心脏磁共振 (CMR) 右心室-肺动脉耦联 (VAC) 参数在评估结缔组织疾病相关肺动脉高压 (CTD-PH) 危险分层中的应用价值。方法: 回顾性分析 2018 年 6 月至 2022 年 4 月期间 62 例 CTD-PH 患者临床及 CMR 资料, 根据危险分层将其分为组 1 (低危及中低危患者) (n=39 例) 和组 2 (中高危及高危患者) (n=23 例), 并对患者的左右心室容积、功能参数、左心室心肌组织学参数及 VAC 进行分析, 寻找用于预测 CTD-PH 危险分层的最佳模型。结果: 右心室容积功能参数和右心室插入部的组织学参数在两组 PH 患者的差异有统计学意义 ($P<0.05$)。右心室舒张末期容积指数 (RVEDVI) 和 VAC 具有独立预测效能, 联合 RVEDVI 和 VAC 具有最高的预测准确性 ($AUC=0.839$, $95\%CI: 0.735-0.944$, $P<0.001$)。结论: 右心室相关的容积、功能参数和右心室插入部的组织学参数可用于评估 CTD-PH 危险分层, 联合 RVEDVI 和 VAC 可提高评估危险分层的准确性。

PO-1090

应用影像组学技术预测结缔组织病相关间质性肺病的可逆性

张莹

上海交通大学医学院附属仁济医院

目的: 采用影像组学技术从基线 CT 图像预测结缔组织病相关间质性肺病 (connective tissue disease-associated interstitial lung disease, CTD-ILD) 的可逆性。

方法: 在这项回顾性研究中, 选取 2016 年 1 月至 2022 年 6 月于我院行多次 (≥ 2 次) 胸部 HRCT 检查的 CTD-ILD 确诊病例, 且 CT 图像上可见高密度区域 (high attenuation area, HAA)。将入选病例按照 7:3 的比例随机分为训练集及验证集。将两肺分为 6 个肺区, 根据 HAA 范围变化情况的主观评价结果将基线 CT 图像的 HAA 分为可逆组及稳定组。对基线 HAA 分别采用视觉评价及组学分析来进行可逆性分组评价。组学分析的步骤如下: (1) 阈值法 ($-600 \sim -250$ HU) 分割图像; (2) 软件提取特征; (3) Boruta 及随机森林算法筛选特征并建立组学模型; (4) 输出组学分数 (Rad-score)。采用多因素逻辑回归分析选取 HAA 可逆性的独立预测因素。

结果: 本研究共纳入 164 例 CTD-ILD 患者, 随机分为训练集 115 例、验证集 49 例。共有 608 个肺区发现 HAA, 其中 288 个肺区为可逆组 (训练集 198、验证集 90)、320 个肺区为稳定组 (训练集 223、验证集 97)。采用影像组学技术筛选得到 7 个与 HAA 可逆性相关性最为显著的特征。多因素逻辑回归分析发现 Rad-score 及部分形态学参数为 HAA 可逆性的独立预测因素, 并分别建立形态学模型、组学-形态学联合模型。对于基线 HAA 可逆性的预测效能, Rad-score 的曲线下面积 (area under the curve, AUC) 分别为训练集 0.749、验证集 0.728, 形态学参数模型 AUC 分别为训练集 0.883、验证集 0.838。与形态学模型相比, 组学-形态学联合模型可提高预测效能, AUC 分

别为训练集 0.908, 验证集 0.864。形态学模型及组学-形态学联合模型两个模型之间的差异显著 (训练集及验证集均 $P<0.001$)。

结论: 形态学参数和影像组学特征均可有效预测 CTD-ILD 的可逆性, 两组参数联合模型可提高预测效能。

PO-1091

基于 HRCT 影像组学预测早期肺腺癌高级别亚型的研究

张凤

成都市温江区人民医院

目的: 探讨基于 CT 的瘤内及瘤周影像组学模型对早期浸润性肺腺癌中高级别亚型的预测价值。

方法: 回顾性收集经手术病理证实为早期浸润性肺腺癌的 236 例患者为研究对象, 根据病理结果是否含有微乳头/实体成分, 将其分为高危组 (112 例), 低危组 (124 例), 将所有患者按照 7:3 的比例随机分为训练组和验证组。在术前 CT 图像上分别勾画 GTV、PTV_3mm、PTV_6mm 获得 ROI1、ROI2、ROI3, 并提取影像组学特征。采用 MRMR 及 LASSO 筛选影像组学特征, 并分别建立 GTV 模型、PTV_3mm 模型、PTV_6mm 模型、瘤内+瘤周模型 (GPTV_3mm 模型、GPTV_6mm 模型), 筛选最优组学模型, 并获得其 Rads-core。基于多因素 Logistic 回归, 从临床数据、传统放射学特征中筛选特征, 建立最优临床-放射学模型。使用多因素逻辑逐步向后回归分析, 依据 AIC 原则将临床独立预测因子和 Rad-score 结合, 构建联合模型。使用受试者工作特征曲线 (ROC) 曲线评估模型的诊断性能, 决策曲线分析 (DCA) 评估模型的临床净收益, 校准曲线和 H-L 检验评价模型的拟合优度。

结果: 临床、放射学特征中结节类型、病灶最大径、空泡征及性别与高级别成分显著相关, 由此构建的临床-放射学模型在训练组和验证组的 AUC 分别为 0.833、0.761。影像组学模型中, GTV 模型的 AUC 分别为 0.934、0.929; PTV_3mm 模型的 AUC 分别为 0.900、0.882; PTV_6mm 模型的 AUC 分别为 0.879、0.864; GPTV_3mm 模型的 AUC 分别为 0.926、0.922; GPTV_6mm 模型的 AUC 分别为 0.930、0.900。各组学模型之间 AUC 比较差异无统计学意义, 由于 GTV 模型在验证组中准确度最高, 联合模型采用 GTV-Rad score 进行计算。联合模型的表现优于单纯临床-放射学模型, 训练组和验证组 AUC 分别为 0.945、0.943。DCA 分析显示联合模型具有更好的净临床效益。

结论: 基于 CT 放射学特征结合影像组学特征的联合模型在预测早期肺腺癌的高级别成分中具有较好的诊断效能, 可能为临床诊治提供参考。

PO-1092

CT 引导下经皮纵隔肿块穿刺活检中胸骨通路的临床应用

陈长春

湖北省肿瘤医院

目的: 评价 CT 引导下经皮纵隔肿块穿刺活检术中胸骨通路的可行性和安全性

方法: 回顾分析 2021 年 1 月到 2022 年 12 月间在我科行 CT 引导下经皮经胸骨纵隔穿刺活检术的 34 例病例。穿刺术由两名 5 年以上临床经验的放射医师共同完成, 参照术前 CT 或 MR 增强图像制定穿刺方案, 采用 CT 引导徒手穿刺方法, 局部浸润麻醉, 穿刺使用 18g 半自动软组织活检针和相应 17g 同轴针, 均切割取材 2~3 次送病检。收集患者基本信息、临床病史, 术中术后并发症情况以及穿刺一次成功率、样本充足率。

结果: 33 例 (97.06%) 一次穿刺成功, 患者术中未诉任何不适; 无需要临床干预的并发症 (0%) 发生, 胸骨后或肋间少量积血 2 例 (5.88%), 纵隔微量气肿 1 例 (2.94%), 无咳血无气胸出现。结论: CT 引导下经皮经胸骨纵隔肿块穿刺活检技术可行, 并发症风险可控而且创伤小, 可以克服既往穿刺盲区, 扩大穿刺适应症, 使更多患者受益。

PO-1093

基于冠状动脉 CT 血管成像左冠脉前降支斑块定量参数与左心功能的相关性研究

盛忆嘉
南通大学附属医院

目的: 利用冠状动脉 CT 血管成像及斑块定量分析技术对左冠状动脉前降支斑块主要成分进行定量分析, 并探讨其与左心功能指标之间的相关性。

方法: 回顾性分析 2018 年 9 月至 2019 年 10 月在南通大学附属医院因初诊冠心病行 CCTA 和冠状动脉造影检查的患者共 421 例, 纳入 CAG 证实存在单支 LAD 狭窄的患者 72 例, 所有患者均行斑块成分定量分析及左心功能参数评估, 测量斑块的特征参数, 包括斑块总体积 (TPV)、脂质斑块体积 (LPV)、脂质斑块占比 (LPR)、纤维斑块体积 (FPV)、纤维斑块占比 (FPR)、钙化斑块体积 (CPV) 及钙化斑块占比 (CPR), 并与左心功能参数如左心室射血分数 (LVEF)、左心室舒张末期容积 (LVEDV)、左心室收缩末期容积 (LVESV) 及左心排出量 (LVCO) 行 Pearson 相关性分析。

结果: Pearson 相关性分析显示: LVEF 与 LPV、FPV、LPR 及 FPR 之间存在负相关。LVESV 与 LPV、FPV 之间存在正相关, 与 LPR 及 FPR 之间存在正相关。LVEDV 同样与 LPV、FPV、LPR 及 FPR 之间存在正相关。CPR 与 LVEF 呈正相关, 与 LVESV 及 LVEDV 之间均为负相关。LVCO 与各成分斑块体积及比例均无相关性, 差异无统计学意义 ($P>0.05$)。CPV 与左心功能参数均无相关性, 差异无统计学意义 ($P>0.05$)。

讨论: 研究显示, 冠脉斑块成分与心肌缺血之间存在相关性, 根据本研究数据可得, LVEF 与 LPV、FPV、LPR 与 FPR 之间存在负相关, 可能机制为脂质坏死核心的氧化及局部炎症反应, 引起血管内皮功能障碍, 从而抑制冠状动脉血管舒张并加重心肌低灌注。

LVESV 及 LVEDV 均与 LPV 及 LPR 之间正相关, 可能是在心肌缺血代偿期首先表现为心肌肥厚型重构, 此时心室肌收缩能力减弱, LVESV 增大, 而随着心肌缺血的加重, 心室肌舒张能力亦开始减退, 心腔扩张, LVEDV 增加。

CPR 与 LVEF 呈正相关, 与 LVESV 及 LVEDV 呈负相关, 可能机制是由于陈旧性斑块通常表现为钙化斑块, 它的存在可能为斑块表面维持了一定的机械稳定性, 对维持区域心肌的血流灌注起到了一定的作用。

PO-1094

CMR 定量评估非梗阻性肥厚型心肌病左房功能的应用研究

薛迪、吴江、李璇、梁秀琴
山西省心血管病医院 (山西省心血管病研究所)

目的: 应用心脏磁共振特征追踪技术对非梗阻性肥厚型心肌病 (NOHCM) 患者进行左房应变分析来评估左房功能, 并探究 NOHCM 对左房、左室结构与功能的影响。

方法: 回顾性分析我院 2020 年 1 月至 2022 年 12 月 58 例非梗阻性肥厚型心肌病患者 (NOHCM 组)、30 名健康对照者 (NC 组) 临床资料, 应用 CVI42 软件测量左房的整体功能参数包括储备功

能参数 (总应变[ϵ_s]、峰值正向应变率[SRs]、左房总射血分数[LATEF])、导管功能参数 (被动应变[ϵ_e]、早期峰值负向应变率[SRe]、左房被动射血分数[LAPEF]) 和收缩功能参数 (主动应变[ϵ_a]、晚期峰值负向应变率[SRe]、左房主动射血分数[LAAEF])；左房大小参数包括左房容积指数 (LAVI)；左室功能参数包括左室射血分数、左室心输出量和左室心脏指数；左室大小参数包括左室最大室壁厚度、左室心肌质量指数 (LVMI)、左室舒张末期容积指数和左室收缩末期容积指数。比较二组间上述参数的差异、NOHCM 组左室心肌不同肥厚部位的患者上述参数的差异、左房大小正常的 NOHCM 患者与健康对照者左房功能参数的差异，以及左房应变参数与其他左房、左室结构和功能参数之间的相关性。

结果：NOHCM 组的左室最大室壁厚度、LVMI、LAVI 均明显高于 NC 组 ($P < 0.05$)，NOHCM 组的左房功能参数均明显低于 NC 组 ($P < 0.05$)。左室心肌不同肥厚部位的 NOHCM 患者的左室最大室壁厚度存在统计学差异 ($P < 0.05$)，其他的左房、左室结构和功能参数均无统计学差异 ($P > 0.05$)。左房大小正常的 NOHCM 患者的 LATEF、LAPEF、 ϵ_s 、 ϵ_e 、SRs、SRe 明显低于 NC 组 ($P < 0.05$)，而 LAAEF、 ϵ_a 和 SRa 之间无统计学差异 ($P > 0.05$)。

所有受试对象左房各时相的应变参数和射血分数相关性强 ($r > 0.7$)。

结论：与健康对照组相比，NOHCM 患者的左房各时相功能均下降。在左房增大之前，NOHCM 患者的左房储备和导管功能下降，而收缩功能正常。左房各时相功能的受损与左室的肥厚部位无关。左房各时相的应变参数与射血分数相关性强。

PO-1095

心脏磁共振特征追踪技术定量右心房功能对扩张型心肌病患者预后后的预测价值

高艺源¹、蒲彩玲^{2,3}、施京京¹、余日胜⁴、胡红杰²、许茂盛¹

1. 浙江中医药大学附属第一医院 (浙江省中医院)

2. 浙江大学医学院附属邵逸夫医院

3. 电子科技大学附属四川省人民医院

4. 浙江大学医学院附属第二医院

目的：应用心脏磁共振特征追踪技术 (CMR-FT) 定量评价扩张型心肌病 (DCM) 患者右心房功能，探讨右心房心肌应变参数对该类人群不良预后的预测价值。

材料与方法：多中心回顾性纳入 2010 年 6 月至 2022 年 5 月于浙江中医药大学附属第一医院、浙江大学医学院附属第二医院和浙江大学医学院附属邵逸夫医院完成心脏磁共振 (CMR) 检查的 526 例 DCM 患者。应用 CVI42 后处理软件获得右房储存应变 (ϵ_s)，右房管道应变 (ϵ_e) 和右房泵应变 (ϵ_a)。主要临床终点定义为心源性死亡或猝死和心脏移植，次要临床终点包括主要临床终点、心衰住院和危及生命的心率失常。采用限制性立方条样图、Kaplan-Meier 生存曲线和 Cox 比例风险回归模型评估右心房心肌应变参数的预后价值，并通过 Harrell's-C 指数、似然比检验和净重分类指数比较不同 Cox 回归模型以确定右心房心肌应变的增量预后价值。

结果：在 41 个月的中位随访时间内，分别有 79 名和 214 名 DCM 患者达到主要临床终点和次要临床终点。限制性立方条样图结果显示 ϵ_s 和 ϵ_e 均与主要临床终点和次要临床终点密切相关，而 ϵ_a 与其无关。Kaplan-Meier 生存曲线表明无论 $\epsilon_s >$ 或 $< 19.05\%$ (基于中位数)， $\epsilon_e < 7.85\%$ (基于中位数) 均增加患者发生不良终点事件的风险。在多变量 Cox 回归模型中， ϵ_e 是主要临床终点 (风险比 [HR], 0.82 [95%CI: 0.77-0.88], $P < 0.001$) 和次要临床终点 (HR, 0.88 [95%CI: 0.86-0.91], $P < 0.001$) 的独立预测因素。将 ϵ_e 加入其他独立预测因素 (NYHA 心功能分级、延迟钆增强和左室射血分数等) 建立的预后模型，可显著提高模型对不良终点事件的预测能力。

结论：CMR-FT 获得的右心房 ϵ_e 是 DCM 患者不良预后的独立预测因素，可为传统临床和 CMR 危险因素提供增量预后价值。

PO-1096

心肌梗死患者基于 CMR-FT 评价的三维机械离散与心电参数的相关性研究

张莉、赵新湘
昆明医科大学第二附属医院

目的: 探讨心肌梗死(MI)患者基于心脏磁共振组织特征跟踪技术(CMR-FT)评价的机械离散 (LVMD) 与心电参数的相关性。

方法: 纳入 2015 年 01 月-2022 年 10 月经我院临床及 CMR 确诊的 MI 患者, 根据随访结果分为室性心律失常 (VA) 组和无 VA 组。左室功能参数包括 LVEF、LVEDV、LVESV、应变参数衍生参数 LVMD-C、LVMD-L。统计学采用独立样本 t 检验、Mann-Whitney U 秩和检验及卡方检验比较两组患者的基线资料、左室功能、应变参数及心电参数, 运用 Spearman 相关性分析两组 LVMD-C、LVMD-L 与 QTc 间期、QRS 间期、JTp 间期、TPe 间期及 iCEB 的相关性。

结果: 最终纳入 167 例 MI 患者, VA 组 37 例, 无 VA 组 130 例, 中位数随访时间为 25 (15-40) 个月。两组患者的 Spearman 相关性分析显示, LVMD-C 与 QTc 间期 (VA,rs=0.552; 无 VA,rs=0.443)、QRS 间期 (VA,rs=0.558; 无 VA,rs=0.379)、TPe 间期 (VA,rs=0.520 无 VA,rs=0.288)呈正相关; LVMD-L 与 QTc 间期、QRS 间期、TPe 间期呈正相关。LVMD-C 与 JTp 间期 (VA,rs=-0.535; 无 VA,rs=-0.342)、iCEB (VA,rs=-0.586; 无 VA,rs=-0.449)呈负相关; LVMD-L 与 JTp 间期、呈负相关; LVMD-C、LVMD-L 与 iCEB 相关性最强。VA 组患者 LVMD-C、LVMD-L 与心电参数的相关性均高于无 VA 组患者。

结论: 在 MI 患者中, CMR-FT 评价的 LVMD-C、LVMD-L 与心电参数 QTc 间期、QRS 间期、及 TPe 间期均呈正相关, 且这种相关性在 VA 患者中更为明显, 这表明 LVMD-C、LVMD-L 随着 QTc 间期、QRS 间期、TPe 间期的延长而延长。LVMD-C、LVMD-L 与 JTp 间期和 iCEB 呈负相关, 且这种相关性在 VA 患者中更为明显, 这表明 LVMD-C、LVMD-L 随着 JTp 间期的延长、iCEB 的增加而减小。本研究揭示了机械离散参数与心肌的电生理改变具有相关性。

PO-1097

不同类型 ANCA 相关性血管炎胸部影像特征及其免疫抑制治疗 后预后探究

左津铭
吉林大学第一医院

目的: 探讨 MPO、PR3ANCA 相关性血管炎的胸部影像特征, 以及经过治疗后胸部影像特征的改变, 并

分析影像与预后之间的关系。

方法: 回顾性分析 2019 年 1 月至 2022 年 12 月期间在我院首次明确诊断为 ANCA 相关血管炎并有肺部受累患者的临床资料及胸部 CT 影像表现。将 84 例患者分为 MPO、PR3 两组。所有患者于本院行胸部 CT 检查, 对患者的一般临床资料、胸部 CT 图像进行收集统计, 分组对比分析。将患者按照有无合并肾功能不全分为两组, 对两组间的胸部 CT 图像进行比较分析。除合并伴有重度肾功能不全 (肾功能不全 4 期、5 期/eGFR<30ml/min) 的患者外, 余 67 例患者均于本院接受免疫抑制治疗 (诱导期: 激素+环磷酰胺; 缓解期: 激素+免疫抑制剂), 收集患者治疗后 6 个月内的末次胸部 CT 图像, 与首次 CT 图像进行比较分析。记录患者一年内复发、死亡情况, 建立电子数据库, 用多因素 Logistic 回归分析法分析复发的相关危险因素。

结果:

1、本研究共纳入患者 84 例, 其中 MPO-ANCA 阳性组 58 例, PR3-ANCA 阳性组 26 例。MPO-ANCA 阳性组起病时较 PR3-ANCA 阳性组更易有关节、肌肉痛的临床表现 ($P<0.05$)。

2、MPO-ANCA 阳性组胸部 CT 更易表现为间质性肺疾病、支气管扩张, PR3-ANCA 阳性组患者胸部 CT 更易表现为结节、肿块 ($P<0.05$)。合并伴有肾功能不全的患者 43 例, 相对于肾功能正常组患者胸部 CT 表现为胸腔积液的比例高 ($P<0.05$)。

3、行免疫抑制治疗患者 67 例, 治疗后胸部 CT 表现为结节、肿块及磨玻璃影多减轻或消失, 而表现为间质性肺疾病及支气管扩张多无显著变化。复发患者 49 例, PR3-ANCA 阳性组较 MPO-ANCA 阳性组更易复发 ($P<0.05$), 胸部 CT 表现为胸腔积液的比例较为复发组高 ($P<0.05$)。

结论:

MPO-ANCA 阳性组、PR3-ANCA 阳性组之间临床首发症状及影像表现有差异, 合并伴有肾功能不全的患者胸部 CT 表现较特异。不同影像表现病例经免疫抑制治疗后反应不同, 应用胸部 CT 影像可为其预后提供参考。

PO-1098

心脏 MR 在冠状动脉慢血流患者中的初步研究

张耘博

昆明医科大学第二附属医院

目的 探讨冠状动脉慢血流(CSF)患者心脏 MR(CMR)评价的左室结构功能、心肌静息灌注及心肌应变的改变。方法 回顾性收集我院经冠脉血流帧数(TFC)诊断为 CSF 且一周内行 CMR 检查的患者 35 例(CSF 组), 同期纳入健康对照组 21 例。比较两组间基线资料、左室结构功能参数、静息灌注参数及心肌应变参数的差异, 左室结构功能参数包括左室收缩末容积(ESV)、左室舒张末容积(EDV)、左室收缩末容积指数(LVESVi)、心肌质量指数(LVMi)、左室射血分数(LVEF)等; 静息灌注参数包括最大上升斜率(upslope)、最大信号强度达峰时间(TTM)、信号强度最大值(SImax); 左室心肌应变参数包括径向应变(GRS)、周向应变(GCS)和纵向应变(GLS)。进一步明确 TFC 与心肌应变参数的相关性。结果 与对照组相比, CSF 患者体重指数、低密度脂蛋白胆固醇和甘油三酯水平及高血压患病率增高 ($P<0.05$)。CMR 评价的 ESV、EDV、LVM、LVESVi、LVMi 均较对照组增高, LVEF 减低 (63.92 ± 7.10 vs 57.37 ± 9.03 , $P<0.05$)。静息心肌灌注显示 CSF 组 SImax、upslope 较对照组减低。左室心肌应变参数 GRS、GCS 和 GLS 均较对照组明显减低 ($P<0.05$)。进一步相关分析前降支(LAD)和回旋支(LCX)的 TFC 和 GLS 呈负相关 ($P<0.05$)。结论 CSF 虽然 LVEF 正常, 但已存在结构功能改变, 包括心肌质量增加、舒张功能减退、静息灌注和心肌应变减低, 且心肌应变与 TFC 呈负相关。因此, CMR 有助于对 CSF 患者早期心脏结构功能改变的评价。

PO-1099

胸膜气囊型孤立性纤维瘤的 CT 诊断

邱平定

浙江大学医学院附属第二医院

【摘要】目的 分析胸膜气囊型孤立性纤维瘤(SFT)的 CT 表现, 总结其 CT 征象, 提高胸膜气囊型孤立性纤维瘤的 CT 诊断准确率。方法 回顾性分析 71 例经手术病理证实的胸膜孤立性纤维瘤的 CT 表现, 其中肿瘤边缘或中央坏死囊变形成气囊型孤立性纤维瘤 13 例 (18.3%), 分析病灶的大小、形态、密度、与胸膜及肺实质的关系、肿瘤内血管及强化特征。结果 71 例胸膜孤立性纤维瘤中男性 35 例、女性 36 例; 年龄 24~75 岁, 中位年龄 56 岁, 良性 64 例, 恶性 6 例 (8.5%); 位于左下胸腔胸膜 22 例, 右下胸腔胸膜 13 例, 两下胸腔胸膜占 49.3% (35/71), 均可见肋膈角

塑形征；前胸壁胸膜 6 例，侧胸壁胸膜 9 例，后胸壁胸膜 8 例，肺尖胸膜 3 例，叶间裂胸膜 10 例；病灶长径约 1cm~25cm 不等。13 例胸膜气囊型孤立性纤维瘤中男性 7 例、女性 6 例；年龄 45~68 岁，中位年龄 58 岁，良性 12 例，恶性 1 例；肿瘤边缘破溃不规则小气囊者 7 例，肿瘤边缘溃疡伴较大类圆形气囊者 3 例，肿瘤外侧多发肺气肿者 2 例，肿瘤内气囊伴壁结节者 1 例；CT 增强后肿瘤呈不均匀轻中度强化，较大肿块内可见增粗迂曲血管影。结论 胸膜孤立性纤维瘤以两下胸腔多见、均见肋膈角塑形征，肿瘤内可见不规则的粗大迂曲血管，但肿瘤实质强化多不明显；部分肿瘤边缘或肿瘤内可见坏死囊变形成部分气囊样病灶；胸膜气囊型孤立性纤维瘤比较少见，易误诊，但多具有胸膜孤立性纤维瘤的其他影像特征，结合其他 CT 征象可提高胸膜气囊型孤立性纤维瘤的诊断准确率。

PO-1100

心肌应变对肥厚型心肌病患者左心室舒张功能评估的应用价值

刘宇豪^{1,2}、李薇^{1,2}、郭家璇²、王一帆³、朱力³

1. 宝鸡市中心医院

2. 宁夏医科大学

3. 宁夏医科大学总医院

目的 探讨心脏磁共振特征追踪技术评价肥厚型心肌病 (HCM) 患者左心室舒张功能的价值。方法 该研究为回顾性分析，筛选 2018 年 1 月 1 日至 2021 年 11 月 31 日在宁夏医科大学总医院放射科行心脏磁共振检查的 HCM 患者及健康对照组，共纳入 51 例 HCM 患者及 37 例健康对照者。两组人群均进行了 3.0T 磁共振常规电影序列扫描。采用 CVI42 后处理软件测量 HCM 组及对照组左心室基本功能参数、整体各向峰值应变及舒张期应变率；采用独立样本 t 检验或 Mann-Whitney U 检验对两组人群影像学参数进行比较，并对左心室整体峰值应变及舒张期应变率进行 ROC 分析。结果 HCM 组年龄范围 21~75 岁，平均年龄 43.3 岁，其中男性 39 例；健康对照组年龄范围 23~61 岁，平均年龄 40.0 岁，其中男性 22 例。对于左心室整体峰值应变，HCM 组径向、周向、纵向均显著小于对照组，差异均有统计学意义[径向：26.6 (15.4) 比 32.5 (18.9)，周向：-17.1±4.0 比 -20.0±3.1，纵向：-8.1±3.0 比 -11.8±3.5，单位：%，P≤0.01]；对于整体舒张期峰值应变率，HCM 组径向、周向、纵向均显著小于对照组，差异均有统计学意义[径向：-1.6 (1.2) 比 -2.3 (1.5)，周向：0.8 (0.4) 比 1.2 (0.4)，纵向：0.5 (0.3) 比 0.7 (0.3)，单位：1/s，P≤0.01]；ROC 分析显示，整体纵向峰值应变阈值≥-9.53 时，对舒张功能不全的诊断敏感性为 74.51%，特异性为 72.97%。结论 左心室整体峰值应变及舒张期应变率的降低对评价肥厚型心肌病患者舒张功能障碍存在一定价值，其中整体纵向峰值应变对舒张功能障碍具有较高的诊断效能。

PO-1101

肺动脉铸型技术结合显微 CT 成像定量评价慢性黏液阻塞性肺病小鼠肺血管重塑的功能-影像研究

李赛¹、Zhe Zhou-Suckow²、Stephanie Hirtz²、Jolante Schatterny²、韩萍¹、郑传胜¹

1. 华中科技大学同济医学院附属协和医院

2. Translational Lung Research Center Heidelberg (TLRC), Germany

目的：黏液阻塞性气道疾病会导致肺灌注异常，但在显微成像水平下对血管重塑的研究却很少。我们的目的是优化血管铸型技术，在 Scnn1b-Tg (TG) 囊性纤维化 (cystic fibrosis, CF) 样肺病小鼠模型中生成肺血管树的显微 CT 成像 (Micro-CT) 高分辨率图像，并进行三维 (3D) 量化分析。

方法: 选取 2 周、6 周及 10 周龄的 CF 样 TG 小鼠及其同窝野生型 (WT) 阴性对照鼠, 对其进行肺动脉插管, 通过微注射泵 (Harvard Apparatus) 以既定流速 (2 周龄为 10 $\mu\text{l}/\text{min}$, 6 周及 10 周龄为 30 $\mu\text{l}/\text{min}$) 注射 Microfil MV-120 聚合物 (Flowtech Inc, Carver, MA) 对肺血管进行铸造, 随后对取出的肺标本进行完全硬化后, 以 9 微米体素大小的高分辨率采集 Micro-CT 图像 (SykScan1176, Bruker)。使用 VGSTUDIO MAX (Volume Graphics GmbH, Germany) 对图像进行 3D 血管树整体定量评估, 并在每个肺标本中选取 30 个末端分支样本, 计算血管体积分数 (fractional vessel volume, FVV) 和血管表面密度 (vascular surface density, VSD)。

结果: 共对 83 只 WT 小鼠和 55 只 Scnn1b-Tg 小鼠采用改良肺动脉铸造技术, 成功率约为 70%。共有 42 只小鼠 (每个年龄组的 TG 和同窝 WT 均为 7 只) 被选中进行图像评估。在 6 周和 10 周龄组, TG 的 FVV 较 WT 明显减低 ($P<0.001$)。与 WT 组相比, TG 小鼠的 VSD 在 2、6 和 10 周龄组均显著减低 ($p<0.001$)。

结论: 初步研究结果表明在小鼠黏液阻塞性肺部疾病模型中, 血管重塑在发病早期即已开始发生, 以外周肺血管床减少为特征表现。

PO-1102

基于 CT 形态和能谱定量指标预测非小细胞肺癌 新辅助免疫治疗反应的研究

孟繁杨、孙超、安俐莹、王春美、马克威、张惠茅
吉林大学第一医院

目的: 开发和验证一种基于 CT 形态和能谱定量指标, 以预测非小细胞肺癌 (NSCLC) 新辅助免疫治疗的反应。

方法: 20 名患者从临床试验中接受新辅助免疫治疗 (西妥昔单抗+帕博利珠单抗+卡铂对 IIIA/IIIB NSCLC, ClinicalTrials.gov, #NCT04326153)。在治疗期间进行 2-4 次 CT 扫描, 然后接受根治性肺癌切除+纵隔淋巴结清扫手术。使用 IntelliSpace Portal (版本 10, 飞利浦医疗系统, 荷兰 Best) 的多模式肿瘤跟踪模块 (MMTT) 计算基线和术前末次 CT 检查的形态定量指标 (长轴、短轴、长 X 短轴、体积、最大三维直径和最大面积), 这些形态定量成像指标缓解率按 (末次-基线) / 基线计算。其中 2 例患者行能谱 CT 扫描, 可获得能谱定量指标 (病灶内碘浓度, 标准化碘浓度 (NIC), $\text{NIC} = \text{IC}_{\text{病灶}} / \text{IC}_{\text{胸主}}$)。根据病理缓解是否达到 100% 作为金标准, 将患者分为完全缓解 (PCR) 组和非 PCR 组。统计分析基于 MedCalc 软件 (版本 20.115)。

结果: PCR 组有 9 名患者 (56 ± 9 岁, 8 男), 病理缓解率为 100%。相比之下, 非 PCR 组有 11 名患者 (57 ± 9 岁, 11 男), 病理缓解率在 30%–95% 之间。两组间的所有 CT 形态定量指标缓解率均存在统计学差异 (Mann-Whitney U 检验, $p<0.0001$)。但单因素和多因素分析未发现统计学显著差异的形态定量指标 ($P>0.05$)。与其他指标相比, 体积预测病变缓解的 AUC 为 0.576, 敏感性为 88.9%, 特异性为 44.5%, 表现较好。通过将所有形态定量成像指标缓解率纳入逻辑回归分析, AUC 达到 0.636。在新辅助免疫治疗后, 能谱扫描病灶的平均碘值及 NIC 均减低, 与术后病理完全缓解相符。

结论: 尽管 CT 形态定量指标在预测 NSCLC 新辅助免疫治疗反应方面不够理想, 但体积是一个相对有价值的指标。CT 能谱定量指标可能在 NSCLC 新辅助免疫治疗的术前评估中具有潜在应用价值。

PO-1103

肺黏膜相关淋巴组织淋巴瘤 CT 诊断

潘月影、管汉雄

华中科技大学同济医学院附属同济医院

目的: 探讨原发性肺黏膜相关淋巴组织(mucosa-associated lymphoid tissue, MALT)淋巴瘤的临床及多排螺旋 CT(multi-detector CT, MDCT)影像学表现。

方法: 回顾性分析华中科技大学同济医学院附属同济医院自 2015 年 1 月至 2023 年 6 月确诊的 43 例肺黏膜相关淋巴组织淋巴瘤的临床表现及影像学特点。

结果: 43 例 MALT 淋巴瘤患者中男 23 例、女 20 例, 年龄(61.28 ± 10.68)岁, 年龄范围为 36~80 岁。27 例患者无特异性临床症状, 为体检发现, 8 例患者胸闷, 7 例患者咳嗽, 4 例患者咳痰, 1 例患者发热, 1 例患者呕血, 1 例患者咯血, 1 例患者胸痛。MDCT 影像示 20 例患者双肺受累, 23 例患者单肺受累; 5 例患者为肺炎实变型, 27 例 MDCT 表现为结节/肿块, 11 例 MDCT 表现为混合型; 19 例病灶可见支气管充气征, 2 例病灶可见钙化, 2 例病灶可见空洞, 9 例患者可见胸腔积液, 4 例患者可见淋巴结肿大。

结论: 原发性肺 MALT 淋巴瘤患者临床表现缺乏特异性, MDCT 影像表现多样化, 但以肺内实变影及结节、肿块型多见。若患者为中老年男性, 肺内病灶以实变影、结节、肿块影合并空气支气管征、血管造影征时, 特别是抗感染治疗无效, 且未找到肺癌、肺结核等依据时, 应考虑到原发性肺 MALT 淋巴瘤的可能性, 但其最终确诊需要依靠病理组织学。

PO-1104

伴空洞的非结核分枝杆菌肺病与继发性肺结核的 CT 表现对比分析

李春华、刘雪艳、唐光孝、吕圣秀

重庆市公共卫生医疗救治中心

目的 探讨伴空洞的非结核分枝杆菌肺病与继发性肺结核的 CT 表现差异。方法 回顾性分析 2019 年 6 月至 2022 年 3 月重庆市公共卫生医疗救治中心经临床及实验室检查确诊伴空洞的非结核分枝杆菌肺病患者 26 例(观察组)及继发性肺结核患者 40 例(对照组)的 CT 表现, 并进行统计学分析。结果 观察组发生支气管扩张、静脉曲张型及囊状支气管扩张、肺部病灶钙化, 肺体积缩小、肺气肿、薄壁空洞、空洞邻近胸膜增厚均多于对照组, 差异有统计学意义(χ^2 分别为 6.226、18.284、13.239、20.027、17.483、14.786、11.899, P 均 <0.05); 观察组大结节影(直径 $\geq 10\text{mm}$), 结节周围浸润、单发空洞、厚壁空洞、纵隔淋巴结肿大、心包积液均少于对照组, 差异有统计学意义(χ^2 分别为 9.448、9.259、7.321、14.786、3.994、4.692, P 均 <0.05)。观察组支气管扩张 ≤ 2 叶的发生率低于对照组, 差异有统计学意义($\chi^2=6.340, P<0.05$), 支气管扩张 ≥ 3 叶的发生率高于对照组, 差异有统计学意义(χ^2 分别为 8.139、11.860, $P<0.05$); 观察组静脉曲张型及囊状支气管扩张 ≥ 3 叶的发生率高于对照组, 差异有统计学意义(χ^2 分别为 6.431、4.835, $P<0.05$)。结论 伴有空洞的非结核分枝杆菌肺病患者薄壁空洞、肺体积缩小、肺气肿、双肺广泛静脉曲张型及囊状支气管扩张多于继发性肺结核, 有助于二者的鉴别。

PO-1105

能谱 CT 成像评价食管静脉曲张破裂出血 TIPSS 术后的食管微循环情况

包如意

大连医科大学附属第一医院

目的通过能谱 CT 成像测量有效碘含量 (eIC)，定量评价经颈静脉肝内门体分流术 (TIPSS) 治疗食管静脉曲张破裂出血 (EVB) 的疗效。方法和材料 18 名接受 TIPSS 治疗的食管静脉曲张出血患者，排除心肺相关疾病，在 EVB 前和治疗 2 周和 6 个月后，接受 GSI 扫描。测量食管下部食管壁 eIC 值，通过 t 检验定量评估了 EVB 治疗前后 eIC 值的差异。结果 EVB 前、治疗 2 周后和 6 个月后，下食管食管壁的平均 eIC 值分别为 $38.00 \pm 11.7 \text{ mg/ml}$ 、 20.64 ± 9.60 和 $22.18 \pm 4.62 \text{ mg/ml}$ 。EVB 前的平均 eIC 值显著高于治疗 2 周后 ($t=2.13$, $p=0.04$) 和治疗 6 个月后 ($t=3.14$, $p=0.03$)。治疗后 2 周和 6 个月之间没有统计学差异。结论本研究的结果表明，食管壁的有效碘含量可能反映食管血流灌注，这有助于在 TIPSS 术后评估和食管静脉曲张出血患者的随访中定量评估食管血流变化。食管静脉曲张破裂出血是肝硬化患者的重要并发症。TIPSS 是治疗危及生命的胃食管静脉曲张出血的有效方法。更好地定量评估潜在肝硬化的变化有助于指导其预后评估和随访。

PO-1106

基于心脏磁共振组织追踪技术定量分析糖尿病对高血压患者左心房及左心室心肌应变的叠加影响

白苗苗、曲晓峰

大连医科大学附属第二医院

目的：基于心脏磁共振组织追踪技术 (CMR-FT) 分析高血压合并糖尿病患者左心房及左心室心肌应变，探讨糖尿病对高血压患者心肌应变的叠加影响。

方法：回顾性纳入 2019 年 9 月至 2022 年 5 月经大连医科大学附属第二医院心内科诊断为高血压的患者 50 例及高血压合并糖尿病的患者 79 例，分为高血压组、高血压合并糖尿病组，另纳入同期 93 名健康志愿者作为对照组。所有入组患者及志愿者左心室射血分数均正常 ($\text{LVEF} > 50\%$)。获取各组心脏磁共振图像，使用 cvi42 图像后处理软件进行分析，比较三组之间左心房及左心室结构、功能及心肌应变参数间的差异。统计学方法采用单因素方差分析、单变量和多变量线性回归， $p < 0.05$ 为差异有统计学意义。

结果：高血压合并糖尿病组左心房管道功能应变 (LA-Ee)、储备功能应变率 (LA-SRs) 及管道功能应变率 (LA-SRe) 显著低于对照组，差异有统计学意义 ($p < 0.05$)。高血压合并糖尿病组左心室整体纵向应变 (GLS)、整体周向应变 (GCS)、心尖段纵向应变 (GLS-apical) 显著低于对照组及高血压组，差异有统计学意义 ($p < 0.05$)。高血压合并糖尿病组左心室中间段纵向应变 (GLS-mid)、基底段周向应变 (GCS-basal) 显著低于对照组 ($p < 0.05$)。此外，高血压合并糖尿病组左心室舒张期径向 (PDSR-R) 及周向 (PDSR-C) 峰值应变率显著低于对照组及高血压组，差异有统计学意义 ($p < 0.05$)。高血压组与对照组左心房及左心室心肌应变参数均无统计学意义 ($p > 0.05$)。多因素线性回归分析显示：高血压合并糖尿病 ($b = -0.816$, $p < 0.001$)、甘油三酯 (TG) ($b = -0.352$, $p < 0.001$) 及性别 ($b = -0.798$, $p = 0.003$) 对 GLS 的影响有统计学差异；高血压合并糖尿病 ($b = -1.732$, $p = 0.024$)、性别 ($b = -4.646$, $p < 0.001$) 及高密度脂蛋白 (HDL) ($b = 5.372$, $p = 0.014$) 对 LAEs 的影响有统计学差异。

结论：CMR-FT 测量的心肌应变可定量反映糖尿病对高血压患者左心功能的叠加影响。

PO-1107

基于双能 CT 影像组学预测非小细胞肺癌靶向治疗疗效

耿立刚

遵义医科大学第二附属医院

摘要：目的 基于双能量计算机断层扫描(DECT)图像,开发并验证一种结合影像组学特征、临床参数、CT 影像学特征、碘相关参数的列线图预测非小细胞肺癌 (NSCLC) 靶向治疗疗效。j 方法 收集 2020 年 1 月至 2023 年 6 月遵义医科大学第二附属医院胸部肿瘤科接受靶向治疗非小细胞肺癌患者 104 名,患者随机分为 7:3 的训练组 (n=73) 和验证组 (n=31),收集患者治疗前临床参数,从两组动脉期和静脉期的单能量影像(100KV 和 140KV)中提取原发灶的影像组学特征,从混合 120KVCT 图像分析每个病灶影像学特征(毛刺征、空泡征等),通过 Liver VNC 获取碘图记录病灶相关参数如碘浓度 (IC)、归一化碘浓度 (NIC)、能谱衰减曲线斜率等。基于提取及筛选最优影像组学特征,计算影像组学评分。以单因素分析及多因素 logistic 回归分析筛选 NSCLC 靶向治疗疗效的独立预测因素,建立预测模型;基于独立预测因素构建联合列线图模型。采用受试者工作特征曲线评估模型预测效能,DeLong 检验各模型 AUC 差异,以校准曲线分析模型的拟合度,以决策曲线分析评估模型的临床获益。结果 本研究共有 65 名腺癌患者和 39 名鳞癌患者纳入研究。在 7 个构建模型中,结合临床参数、影像特征及影像组学特征的综合模型(AUC:模型 7=0.87)比单个临床模型或影像学特征模型(AUC:模型 1=0.76,模型 2=0.72,模型 3=0.68, p 均<0.05)具有更高的 AUC。将临床特征、影像学特征、影像组学特征分别两两组合建立模型(AUC:模型 4=0.81、模型 5=0.79、模型 6=0.83, p 均<0.05),联合列线图模型预测结果与实际结果的一致性较好,且其临床获益较高。结论 基于 DECT 影像组学构建的联合列线图模型可有效预测 NSCLC 靶向治疗疗效。

PO-1108

叶内型肺隔离症合并曲霉感染 1 例

李洪敏

个旧市人民医院

【摘要】回顾性分析 1 例肺隔离症合并肺曲霉病的临床表现、诊治过程,并复习相关文献,总结两者的关系及影像诊断依据、鉴别诊断。中老年男性,发现肺部阴影 1 年余、咳嗽 2 天,行胸部 CT 发现左肺下叶空洞性病变,增强扫描呈轻中度强化,并发现来源于降主动脉的异常供血血管,考虑叶内型肺隔离症,后经手术及疏忽病理证实为叶内型肺隔离症合并曲霉菌感染;通过复习分析相关文献,本列患者临床及影像表现与文献报道基本符合。胸部 CT 平扫加增强扫描并图像后处理重建作为首选的简单、经济且创伤小的确诊方法,同时需要与肺炎、肺不张及肺肿瘤等相鉴别。结论:肺隔离症合并肺曲霉病比较少见,临床工作中容易漏诊、误诊,积极、准确的影像学及病理学检查有助于疾病的诊断,手术治疗效果确切。

PO-1109

肺部良恶性混合磨玻璃结节实性成分的 CT 特征比较

张越

重庆医科大学附属第一医院

目的 探讨良恶性混合磨玻璃结节 (mGGO) 及恶性 mGGO 中微浸润腺癌 (MIA) 和浸润性腺癌 (IAC) 实性成分 CT 特征的差异。方法 将我院 313 例 mGGO 分为良性组 (95 例) 和恶性组 (218 例), 比较两组临床及实性成分的 CT 特征, 另将恶性组分为 MIA 组 (118 例) 和 IAC 组 (100 例), 比较两组实性成分的 CT 特征。将上述有统计学差异的 CT 特征构建 Logistic 回归模型, 利用 AUC 评估其效能。结果 ①良、恶性组临床特征比较: 与良性组相比, 恶性组以老年女性及不吸烟患者多见, 两组差异有统计学意义 (P 均 <0.001)。②良、恶性组实性成分 CT 特征比较: 良性组单发者占比较高, 而恶性组多发者占比较高, 两组差异有统计学意义 ($P < 0.001$)。对于单发者, 恶性组实性成分形态不规则、偏心分布、与血管及胸膜相连的发生率高于良性组, 两组差异均有统计学意义 (P 均 <0.05); 同时, 恶性组实性成分 CT 值高于良性组, 而相对 CT 值低于良性组, 两组差异均有统计学意义 (P 均 <0.001)。Logistic 回归分析示实性成分形态不规则、CT 值较高为恶性 mGGO 的独立预测因子, 该模型诊断恶性 mGGO 的 AUC、准确度、敏感度和特异度分别为 0.772、70.65%、74.40% 及 65.00%。③恶性组中 MIA 与 IAC 实性成分 CT 特征比较: MIA 单发者占比较高, 而 IAC 多发者占比较高, 两组差异有统计学意义 ($P < 0.001$)。对于单发者, IAC 组实性成分偏心分布的出现率显著高于 MIA 组, 其面积、比例及 CT 值较 MIA 组更高, 而相对 CT 值更低, 两组差异有统计学意义 ($P < 0.05$)。Logistic 回归分析示实性成分偏心分布、面积较大为 IAC 的独立预测因子, 该模型预测 IAC 的 AUC、准确度、敏感度和特异度分别为 0.865、83.47%、87.90%、68.20%。结论 良恶性 mGGO、MIA 和 IAC 实性成分 CT 特征不同。

PO-1110

双能 CT 定量参数在预测实性肺腺癌气道播散状态的性能研究

尹柯

重庆医科大学附属璧山医院

目的: 确定实性肺腺癌气道播散状态与 DECT 定量参数关系。方法和材料: 回顾性收集 2021 年 1 月至 2021 年 6 月接受手术治疗的 52 名实性肺腺癌患者, 并对气道播散状态进行评估。采用二元 Logistic 回归分析和受试者工作特征曲线来分析 DECT 定量参数 (IC_A 、 IC_V 、 NIC_A 、 NIC_V 、 Z_A 、 Z_V 、 λ_A 、 λ_V) 和 CT 特征 (最大直径、周围不透明影、空气支气管影、胸膜凹陷)。结果: 共有 52 例患者 (平均年龄: 57.0 岁, 年龄范围: 38-78 岁), 包括 35 名男性 (平均年龄: 58.7 岁, 年龄范围: 45-58 岁) 和 17 名女性 (平均年龄: 55.0 岁, 年龄范围: 38-67 岁) 纳入研究, 其中 25 例患者气道播散阳性, 27 例患者气道播散阴性。气道播散与 CT 特征之间没有关联, 而与 IC_A 、 NIC_A 和 IC_V 有关。且 IC_A 和 NIC_A 是预测气道播散的独立危险因素, 二者联合预测 AUC 值为 0.89, 敏感性为 0.84, 特异性为 0.89。结论: DECT 定量参数 (IC_A 和 NIC_A) 是预测气道播散的独立危险因素, 两者联合预测性能最佳。

PO-1111

3 例肺部血管内大 B 细胞淋巴瘤的病例报道及影像回顾

苟心怡、张银丽、程瑾、洪楠
北京大学人民医院

目的: 血管内大 B 细胞淋巴瘤是非霍奇金淋巴瘤的一种罕见亚型, 临床表现及实验室检查无特异性, 且预后极差。本研究旨在对肺部血管内大 B 细胞淋巴瘤患者的胸部 CT 影像表现进行探讨和回顾。

方法: 收集本院 2010 年 1 月~2023 年 7 月, 肺穿刺活检病理确诊为肺部血管内大 B 细胞淋巴瘤, 且临床资料及影像检查完整的患者, 共 3 例。回顾性分析了 3 例患者的胸部影像学表现及其临床资料, 并结合既往文献报道中的肺部血管内大 B 细胞淋巴瘤的胸部 CT 影像进行了影像回顾。

结果: 3 例患者 (男性 2 例, 女性 1 例, 年龄 51~65 岁), 2 例有咳嗽等呼吸系统症状, 1 例主要以腹泻等消化道症状为主要表现。实验室检查显示 3 例均出现乳酸脱氢酶升高。胸部 CT 显示 3 例均表现为双肺磨玻璃影。其中 2 例为双肺多发边界清晰的磨玻璃结节, 伴实性结节; 另 1 例表现为双肺膜玻璃密度片状影; 胸腔积液者 1 例; 肺门及纵隔区域淋巴结均未见肿大。其中 2 例行 ^{18}F FDG-PET 检查, 均表现为肺部病灶 FDG 摄取升高 (SUVmax 分别为 1.9 和 1.7)。1 例患者在接受 R-CHOP 治疗后, 规律复查胸部 CT, 磨玻璃影明显改善, 逐渐消失。进一步对既往肺部血管内大 B 细胞淋巴瘤的文献报告及本院 3 例患者, 共 26 例 (男 15 例, 女性 11 例, 年龄: 35~84 岁), 进行胸部 CT 影像学回顾, 其中 14 例患者表现为双肺多发或弥漫磨玻璃浸润影 (53.8%); 5 例为双肺多发边界清晰的磨玻璃密度结节影 (19.2%), 7 例患者的胸部 CT 影像无明显异常表现 (26.9%)。

结论: 肺部血管内大 B 细胞淋巴瘤患者胸部 CT 影像主要表现为双肺磨玻璃影, 且以边界不清的磨玻璃浸润多见。而 ^{18}F FDG-PET 对该病的诊断敏感性高。因此, 对于临床高度怀疑肺部血管内大 B 细胞淋巴瘤的患者, 结合 ^{18}F FDG-PET 检查, 能够为肺部血管内大 B 细胞淋巴瘤的早期诊断及鉴别提供关键的信息, 极大改善患者的预后。

PO-1112

基于非阈值法测量冠状动脉周围脂肪组织平均密度在冠状动脉粥样硬化斑块评估中的应用

林梦^{1,2}、李文佳²
1. 昆明理工大学
2. 云南省第一人民医院

目的: 探讨非阈值法测量冠状动脉周围脂肪组织平均密度 (PCAT_{MA}) 的可行性, 并进一步探讨 PCAT_{MA}、脂肪衰减指数 (FAI) 与冠状动脉粥样硬化斑块之间的相关性。

方法: 前瞻性纳入 138 名行冠状动脉 CT 血管成像 (CCTA) 的患者, 无斑块组患者 63 例 98 个节段, 斑块组患者 75 例 95 个节段, 并依据斑块类型分为钙化斑块、非钙化斑块和混合斑块亚组。采用非阈值法在无斑块节段周围测量与血管壁不同距离 (0.50mm、0.75 mm、1.00 mm、1.25 mm、1.50 mm、1.75 mm、2.00 mm) 的冠状动脉周围脂肪组织 (PCAT) 密度, 同时测量所有可评估节段的 PCAT_{MA} 和 FAI。

结果: 在最靠近冠状动脉管壁的区域, PCAT 密度较高 ($P < 0.001$), 随着与管壁距离的增加, PCAT 密度逐渐降低, 距管壁 0.75mm 范围以外的 PCAT_{MA} 差异无统计学意义 ($P > 0.05$)。在无斑块组中, 冠状动脉不同分支间的 PCAT_{MA} 和 FAI 差异均无统计学意义 ($P > 0.05$); 右冠状动脉近段 (pRCA) 的 FAI 较右冠状动脉中段 (mRCA) 更高, 且差异有统计学意义 ($p = 0.03$); 近端节段的 PCAT_{MA} 和 FAI 均高于远端节段, 但差异无统计学意义 ($P > 0.05$)。与无斑块组相比, 非钙化斑

块 (NCP) 和混合斑块 (MP) 节段的 $PCAT_{MA}$ 更高, 且差异有统计学意义 ($P<0.05$), 但 FAI 无显著差异 ($P>0.05$)。此外, 在不同类型斑块中 $PCAT_{MA}$ 和 FAI 差异均无统计学意义 ($P>0.05$)。结论: 距离血管壁 0.75mm 范围以外的 $PCAT$ 密度趋于稳定, 不易受血管壁的影响。基于非阈值法测量 $PCAT_{MA}$ 具有良好的可行性及可重复性。与无斑块的冠状动脉节段相比, 非钙化斑块和混合斑块节段显示出更高的 $PCAT_{MA}$ 值, 表明 $PCAT_{MA}$ 检测冠状动脉轻度狭窄性病变周围脂肪密度的变化可能比 FAI 更为敏感。

PO-1113

双气相配准 CT 在异基因造血干细胞移植后闭塞性细支气管炎综合征的初步研究

伊慧明¹、唐智贤²、陈欣¹、周宁³、杨栋林¹、冯四洲¹

1. 中国医学科学院血液病医院 (中国医学科学院血液学研究所)

2. 上海交通大学

3. 天津医科大学总医院

[目的]采用吸气和呼气 CT 图像配准定量指标评估异基因造血干细胞移植后合并闭塞性细支气管炎综合征 (BOS) 患者的肺病变, 探讨双气相配准 CT 定量分析在 BOS 诊断中的价值。

[方法]提出一种结合角点特征和互信息的肺部双相 CT 影像配准方法。首先对 CT 影像进行预处理, 包括去噪和灰度标准%化; 随后利用 FAST 角点检测器算法在两个相位的图像中检测出角点特征, 提取图像的关键结构信息; 最后, 通过配准算法将吸气相与呼气相 CT 影像进行空间对齐, 将空间和几何结构信息与强度信息相结合, 完成图像配准。配准后的图像进行肺实质分割, 然后中计算功能参数, 包括 PRMfSAD、PRMEmph、PRMNormal。采用 Spearman 相关检验做相关分析。最后采用受试者工作特征(ROC)曲线分析 CT 参数的诊断效能。

[结果]CT 图像分析显示, 与基于互信息的局部最大值寻找 (LMI) 方法相比, 我们的方法在配准中的平均配准误差为 1.43, 而 LMI 的平均配准误差分别为 1.56, 表明该方法能够准确有效地实现双相 CT 影像的配准。研究纳入 190 例患者, 其中肺功能数据完整者 70 例, PRMfSAD 和 FEV1%、FEV1/FVC 的相关系数分别为 -0.452、-0.493, $p<0.001$ 。确诊 BOS 者 42 例, 对 BOS 组和 NonBOS 组患者的 CT 参数和肺功能参数进一步分析显示, BOS 患者 PRMfSAD 与 FEV1/FVC 的相关系数有统计学意义 ($P<0.01$), PRMfSAD 与 FEV1%的相关系数并无有统计学意义 ($p>0.05$); 而 NonBO 患者的 PRMfSAD 与 FEV1%和 FEV1/FVC 的相关系数均无统计学意义 ($p>0.05$)。对 PRMfSAD 的在 BOS 诊断中的诊断效能采用 ROC 曲线分析, 结果显示, PRMfSAD 诊断 BOS 的最佳临界值 cutoff=0.2048 (AUC=0.771, 敏感度 86.0%, 特异度 66.7%)。

[结论]本文提出的方法能够准确对双气相 CT 图像进行配准, 基于该算法的 CT 定量参数 PRMfSAD 与 PFTs 指标 FEV1/FVC%之间具有良好的相关性, 能够反映肺功能状态, 是评估 BOS 小气道病变的相对敏感的指标。

PO-1114

心脏磁共振评估健康女性超重和肥胖人群 左心房心肌应变及应变率的初步研究

贺祎凡¹、田迪²、李智勇¹

1. 大连医科大学附属第一医院

2. 武汉市第一医院

目的：本研究旨在使用心脏磁共振（cardiac magnetic resonance, CMR）衍生的左心房（Left atrium, LA）心肌应变(myocardial strain, MS)及应变率（strain rate, SR）参数评估超重和肥胖女性，以及女性人群身体质量指数 BMI(body mass index)与 LA MS、SR 相关性。

方法：对 40 例成人女性的 CMR 数据进行了回顾性分析。根据 BMI 分为两组：正常组 BMI < 24 kg/m²，超重和肥胖组 BMI ≥ 24 kg/m²。在标准二腔、四腔长轴视图中，使用软件 Medis 对 LA MS、SR 进行分析。LA MS 包括：整体纵向应变（global longitudinal peak strain, GLS）、整体圆周应变（global circumferential peak strain, GCS）。其中 LA GLS 包括储存功能[储存应变 GLS Reservoir, 峰值正 SR（SR Reservoir）]、管道功能[管道应变（GLS Conduit），峰值早期负 SR（SR Conduit）]和泵血功能[泵血应变（GLS Booster），峰值晚期负 SR（SR Booster）]。结果：所有女性进行 CMR 分析是可行的。LA MS 及 SR 可重复性良好。与 BMI 正常组相比，超重和肥胖组 GLS Reservoir、GLS Conduit、SR Conduit 显著降低（均 P < 0.05）。BMI 与 SR Conduit 呈显著负相关（r = -0.409, P = 0.009）。

结论：肥胖和超重组表现出 LA 储能和导管功能受损，且随着 BMI 增加，LA SR conduit 逐渐下降，这表明女性超重和肥胖可能导致 LA 早期舒张功能受损。

PO-1115

基于定量 CT 评估慢性阻塞性肺疾病患者肺气肿严重程度 与骨质疏松的相关性研究

毕玉瑜、赵娓娓、杨勇、周舒玲、刘冰

西安市中医医院（西安市中医药研究院）

目的：既往研究发现 COPD 患者肺气肿程度与 OP 存在密切相关。故本研究基于胸部定量 CT、双能 X 线骨密度测量，以及 COPD 患者主要临床特征分析：1) COPD 组与对照组间的临床特征、肺气肿程度、OP 程度的差异性；2) 探讨肺气肿严重程度与 OP 之间关联性，通过 ROC 曲线建立预测肺气肿患者合并 OP 的临界值，为临床综合诊疗 COPD 提供依据。

方法：第一部分：120 例 COPD 患者为观察组，60 例健康者为对照组。实验一阐明两组间临床特征、肺气肿及 OP 程度是否有差异。严格汇总两组年龄、性别、体重指数、LAA%及骨密度值。第二部分：在实验一基础上，探讨 COPD 患者肺气肿严重程度与 OP 之间是否存在相关性。通过肺气肿 CT 定量参数 LAA%评估 COPD 患者严重程度。采用 S-W 或 K-S 检测数据的正态性。采用 Spearman 秩相关分析法分析骨密度值与 LAA%的相关性，根据多因素 Logistic 回归分析评估定量 CT 参数 LAA%是否具有诊断 COPD 患者合并 OP 的价值，并通过 ROC 曲线下面积评估其诊断效能，最后探寻 LAA%预测 OP 的最佳临界值。

结果：

第一部分：年龄、LAA%及骨密度值在两组间差异有统计学意义(P < 0.05)。性别、BMI 在两组间差异无统计学意义(P > 0.05)。

第二部分：年龄在 COPD 亚组间均无统计学意义(P > 0.05)。性别仅在重度与轻度组间有统计学意义(P < 0.05)。吸烟仅在与轻度组相比较，中、重度组有统计学意义(P < 0.05)。糖皮质激素、骨

密度值在 COPD 亚组间比较均有统计学意义 ($P < 0.05$)。COPD 患者肺气肿严重程度与骨密度值呈负相关 ($r = -0.867$, $P < 0.05$)。通过 Logistic 回归分析, 仅 LAA% 是诊断 COPD 患者是否合并 OP 的独立预测因子。ROC 曲线结果: LAA% 预测 OP 的 AUC 为 0.950 ($P < 0.001$), 最佳临界值为 19.7%。

结论:

- 1) COPD 患者骨密度值低于健康人, OP 发生率较健康人高。
- 2) COPD 患者 OP 发生率与肺气肿严重程度呈正相关。当 LAA% 大于 19.7%, 提示 COPD 患者可能合并 OP。

PO-1116

骨肉瘤合并自发性气胸肺转移灶的 CT 表现

彭林

中山大学附属第一医院

目的:探讨骨肉瘤合并自发性气胸肺转移灶的 CT 表现, 寻找可能导致自发性气胸发生的影像学特征。

方法:本研究纳入 2016 年 1 月至 2021 年 12 月在我院经病理证实的肺转移性骨肉瘤患者 123 例。记录患者的人口统计数据, 以及原发骨肉瘤的位置和大小。此外, 肺转移性骨肉瘤的 CT 表现, 如单发或多发结节/肿块、钙化、累及胸膜和空洞, 也被记录在案。从确诊为骨肉瘤到随后发生肺转移的时间也被记录下来。

结果:自发性气胸 30 例, 单侧气胸 18 例, 双侧气胸 12 例。出现气胸的骨肉瘤肺转移组与未出现气胸组相比, 从确诊为骨肉瘤到随后发生肺转移的中位时间缩短 (6 个月 vs. 9 个月, $p = 0.031$)。合并气胸的肺转移瘤表现为多发结节或肿块 (39/42 vs. 123/178, $p < 0.001$), 更多的空洞和胸膜受累 (23/42 vs. 19/178, $p < 0.001$; 38/42 vs. 63/178, $P < 0.001$)。钙化/骨化在肺转移瘤中很常见 (123/220, 55.9%), 但在合并气胸与否中无显著差异。多因素 logistic 回归分析显示, 肺转移灶空化和胸膜累及与自发性气胸显著相关, 优势比为 9.786 (95% CI: 2.597, 36.883; $P = 0.001$) 和 18.182 (95% CI: 4.992, 66.225; $P < 0.001$)。

结论:自发性气胸可能发生在肺转移灶靠近胸膜的位置, 随空洞的发生和破裂而发生。此外, 合并气胸的患者, 肺转移灶往往进展。建议这些患者定期进行胸部 x 线摄影以进行监测。

PO-1117

新型冠状病毒肺炎患者发病早期胸部影像学表现

黄明、雷武刚

丰城市人民医院

目的 探究新型冠状病毒肺炎(COVID-19)患者发病早期胸部影像学征象。方法 回顾性分析丰城市人民医院 2022 年 12 月 10 日-2 月 1 日 50 例确诊 COVID-19 患者胸部 HRCT 影像资料。结果 50 例确诊患者中, 49 例出现不同程度影像学改变, HRCT 上大部分病灶呈早期改变 (78%), 部分呈进展期 (20%); 病灶分布以两肺下叶为主 (58%), 多累及多个肺叶、肺段, 以胸膜下分布为甚 (92%), 少数沿支气管血管束分布 (6%); 病变形态以斑片状多见 (84%), 部分呈结节状 (24%); 病灶主要呈磨玻璃样密度 (84%), 部分伴实变 (28%), 纯实变未见; 病灶内可见细小血管增粗, 支气管壁增厚, 可见“空气支气管征” (50%)、“铺路石征” (60%)、“晕征” (24%)。结论 新型冠状病毒肺炎发病早期胸部 HRCT 表现具有一定特征性, 病灶多位于两肺下叶外带且以胸膜下分布为主, 多表现为斑片状磨玻璃样密度, 少数呈晕结样改变, 部分伴有实变, 病变内细小血管增粗、支气管壁增厚, 可见“空气支气管征”、“铺路石征”、“晕征”。

PO-1118

探索单次屏气压缩感知心脏磁共振电影序列在
评估左右心室应变中的可行性

王付言、马鋈莹、胡红杰
浙江大学医学院附属邵逸夫医院

研究目的:

压缩感知 (compressed sensing, CS) 电影可提供与常规平衡稳态进动 (balanced steady-state free precession, bSSFP) 心脏磁共振 (cardiovascular magnetic resonance, CMR) 电影类似的 心脏容积指标。基于 CMR 特征追踪 (feature tracking, FT) 技术, 电影序列还可用于心肌应变评估, 但扫描参数及造影剂对 CS 电影应变分析的影响仍不明确。本研究旨在探索单次屏气 CS 电影序列左右心室应变结果的影响因素。

材料与方法:

本研究共纳入 102 名患有不同心血管疾病患者 (男性 75 人, 女性 27 人, 平均年龄 46.5 ± 17.1 岁)。每位患者均接受四组 CMR 电影序列扫描, 包括作为参考的常规多次屏气 bSSFP_{ref} 电影序列、增强前后具有相同翻转角的单次屏气 CS 电影序列 (CS₄₅ 和 eCS₄₅) 和增强后 70° 翻转角的单次屏气 CS 电影序列 (eCS₇₀)。采用双侧配对 t 检验和 Wilcoxon 符号秩检验进行数据统计。

研究结果:

CS 电影序列获得的左右心室全局径向应变 (global radial strain, GRS)、全局周向应变 (global circumferential strain, GCS) 和全局纵向应变 (global longitudinal strain, GLS) 值均低于常规 bSSFP_{ref} 电影序列 ($p < 0.001$)。基于 CS₄₅ 和 eCS₇₀ 电影序列的左心室 GRS 和 GCS 值无显著差异, 同时 eCS₄₅ 和 eCS₇₀ 电影序列评估的右心室 GRS、GCS 和 GLS 值也未见差异。CS₄₅ 和 eCS₄₅ 电影序列的应变评估结果表明, 使用对比剂会导致右心室和左心室的 GRS 和 GCS 值降低 ($p < 0.001$), 对 GLS 值无影响。

结论:

CS 电影序列评估的左右心室 GRS、GCS 和 GLS 值始终比常规 bSSFP 电影序列低。右心室 CS 电影的 GRS、GCS 和 GLS 值不受翻转角和钆对比剂影响, 钆对比剂对左心室 GRS 和 GCS 值的影响可通过增加翻转角来补偿。CS 电影评估心肌应变的临床应用仍需进一步探索。

PO-1119

特发性肺纤维化的大螺距高分辨 CT 扫描优势

史征、杨瑞、刘继伟、和燕斐、弓莉、冯晓刚
河南省胸科医院

目的: 特发性肺纤维化 (IPF) 是一种以慢性、进行性、不可逆性肺纤维化为特征的弥漫性间质性肺疾病, 是特发性间质性肺炎最常见的亚型。患者多表现为干咳、呼吸困难、发绀、杵状指等非特异性临床表现, 双肺底闻及 Velcro 啰音, 肺功能呈限制性通气功能障碍伴不同程度的弥散障碍。导致患者在扫描时不能很好的配合吸气闭气口令, 故采用大螺距 Flash 扫描模式, 提高图像质量。

方法: 前瞻性连续纳入 2022 年 1 月-5 月于河南省胸科医院采用西门子 Drive 双源 CT 扫描特发性肺纤维化患者 80 例, 随机分为 A、B 两组, 每组 40 例。A 组为 Flash 模式下的胸部 CT 平扫, B 组为常规 CT 平扫。A、B 两组共同扫描参数 (采用自动管电压和自动管电流技术, 采集层厚: 128×0.6mm, 重建层厚: 5mm 和 1mm, 间距: 0, 扫描方向: 头-足, 迭代重建强度 3, 肺窗算法: I70f 非常锐利 ASA, 肺窗窗宽窗位: Lung, 纵隔窗算法: I30f 中等平滑, 纵隔窗窗宽窗位: Mediastinum。A 组特殊扫描参数 (螺距: 3.0, 球管旋转时间: 0.28s); B 组特殊扫描参数 (螺距:

1.2, 球馆旋转时间: 0.5s)。扫描后图像传至西门子 syngo.via 后处理工作站, 分别做主观与客观评价。主观评价有三名高年资诊断医生对图像质量进行主观评价, 按照纵隔、大血管、胸膜、胸壁软组织、肺段及亚段支气管显示的清晰度、解剖结构细节清楚、颗粒均匀、无伪影评价等级为优; 反之解剖结构细节不清晰、颗粒不均匀、有伪影评价等级为差; 若介于二者之间评价等级为中等。客观评价采用测量标准差 (SD) 与 CT 值统计分析评价。

结果: A、B 两组间标准差 (SD) 与 CT 值差异无统计学意义, 但在主观评价中 A 组图像质量明显高于 B 组图像质量。

结论: 特发性肺纤维化患者大多不能良好的配合吸气闭气口令, 导致常规 CT 胸部平扫呼吸运动伪影较大。Flash 模式下的胸部 CT 平扫, 即使患者不能配合吸气闭气口令, 亦可良好显示双下肺解剖结构, 左心缘无心脏搏动伪影。由此可见, 西门子 Drive 双源 CT 的 Flash 模式下胸部 CT 扫描, 更加适合特发性肺纤维化患者的胸部检查, 具有较高的临床价值。

CMR 联合心肌应变技术在房颤患者左房纤维化评估中的初步研究

种欢欢¹、立克拉虎¹、刘方韬¹、吴鹏²、董海鹏¹、严福华¹、杨文洁¹

1. 上海交通大学医学院附属瑞金医院

2. 飞利浦 (中国) 投资有限公司

目的: 探讨 3D 延迟增强心脏磁共振 (CMR) 联合心肌应变技术在房颤患者左房纤维化评估中的价值

材料与方法: 前瞻性收集分析我院 2022 年 1 月至 2023 年 5 月, 80 例拟行消融术及术前 CMR 检查阵发或持续性房颤患者 (PaAF, PeAF) 的左房储存功能、管道功能、升压泵功能、总应变 ϵ_s 、被动应变 ϵ_e 、主动应变 ϵ_a 及相应应变率 (SRs、SRe、SRa)。以房壁与血池的信号程度之比 (IIR) 为参考, 定量分析左房壁强化范围及程度。应用独立 t 检验、曼-惠特尼 U 检验及多因素逻辑回归分层房颤类型并建模。

结果: PeAF 与 PaAF 相比, 总容积、球形率、舒张末期容积、收缩末期容积明显增加 ($P<0.05$), 左房储存功能、管道功能、升压泵功能、 ϵ_s 、 ϵ_e 、 ϵ_a 、SRs、SRe、SRa 均显著降低 ($P<0.001$); 在延迟增强 20min 及 30min 后, PeAF 组强化心肌 (IIR>1.2)、瘢痕心肌 (IIR>1.32)、间质纤维化 (IIR 1.2~1.32) 的面积及占比均高于 PaAF 组。多因素逻辑回归显示, 在临床指标亚组中, BMI (OR 1.195, $P=0.012$) 和 CHA2DS2-VASC 评分系统 (OR 1.471, $P=0.008$) 是 PeAF 的独立危险因素, 其预测效能 AUC 为 0.753 ($P<0.001$); 在心肌应变亚组中, ϵ_s (OR 0.749, $P<0.001$) 及左房管道功能 (OR 1.079, $P=0.038$) 是房颤分类的独立预测因素, 其 AUC 可达 0.927 ($P<0.001$); 在延迟扫描亚组中, 20min 左房强化总面积 (OR 1.080, $P<0.001$) 及间质纤维化百分比 (OR 1.377, $P<0.001$) 是分层 PeAF 及 PaAF 的独立危险因素, 其 AUC 可达 0.933 ($P<0.001$); 而综合上述参数后的模型 AUC 高达 0.957 ($P<0.001$), 其独立预测因素分别为 ϵ_a (OR 0.709, $P=0.024$) 和 30min 左房强化总面积 (OR 1.060, $P=0.005$)。

结论: 术前无创 CMR 联合心肌应变技术可定量并可视化左房纤维化, 为手术规划及术中电生理导航的融合提供重要的影像学依据。

2 型糖尿病患者肺小血管重构的 CT 定量研究

张丽¹、于楠^{1,2}

1. 陕西中医药大学

2. 陕西中医药大学附属医院

糖尿病作为最常见的代谢性疾病与肺小血管重构关系显著，其机制可能包括内皮细胞功能紊乱、平滑肌细胞增殖、成纤维细胞活化和胶原沉积等。而这种复杂过程是否可以通过影像学手段进行监测尚不清楚。本研究使用 CT 定量分析方法分析 2 型糖尿病患者肺小动脉的结构改变，旨在为疾病肺小动脉监测提供监测手段，早期发现肺动脉高压。回顾性收集 2 型糖尿病患者胸部 CT 50 例，符合临床诊断标准。排除标准①肺内感染，肿瘤，胸腔积液，肺间质纤维化；②年龄小于 20 岁或大于 60 岁。③合并 COPD，哮喘，心血管疾病。根据患者年龄性别匹配影像未见明显异常的对照组 43 例。收集两组患者胸部 CT 并进行 CT 定量分析。包括全肺（-200--700）密度百分比，肺气肿定量，全肺血管、支气管、肺体积分割定量，小气道（ $\leq 2\text{mm}$ ）周围肺小动脉的数量及平均横截面积。对比两组之间差异。结果发现糖尿病患者组小气道周围血管平均横截面积/数量显著低于对照组（ $P < 0.05$ ）；全肺（-200--700）密度百分比及肺血管体积大于对照组。而支气管体积及肺容积在糖尿病组与对照组之间无差别。结论：2 型糖尿病的肺部损伤可用 CT 定量分析发现，CT 图像上表现为（-200--700）密度区域增多，可类似肺间质性改变。肺小动脉损伤可能是监测此类变化的敏感指标。

PO-1122

瘤周结节 CT 定量特征预测胸腺上皮肿瘤危险度

郭炜、王晓华

北京大学第三医院

目的 探讨瘤周结节的 CT 定量特征对预测胸腺上皮肿瘤危险度的价值。资料与方法 回顾性分析 108 例经病理诊断为胸腺上皮肿瘤的患者。根据 WHO 胸腺肿瘤分类，将患者分为高危组和低危组。定量 CT 特征包括瘤周结节的长径、体积、质量、瘤周结节及与主瘤灶距离。使用 Mann-Whitney U 检验评估这些特征的价值，并使用受试者操作特征曲线确定阈值。结果 108 例胸腺上皮肿瘤中有 45 例 CT 可见瘤周结节，高危组 30 例和低危组 15 例。不同观察者间一致性较好（相关系数 $\text{ICC}=0.886-0.907$ ）。高危组瘤周结节的长径、体积和质量均大于低危组（ $P < 0.05$ ），与主瘤灶距离组间差异无统计学意义（ $P > 0.05$ ）。CT 定量特征中，瘤周结节的质量在预测胸腺上皮肿瘤危险度方面具有最佳的诊断效能，对应的阈值为 27.84 mg（曲线下面积 $\text{AUC}=0.89$ ，敏感性 83.3%，特异性 87.5%，准确性 85.3%）。结论 瘤周结节的 CT 定量特征对预测胸腺上皮肿瘤的危险度有一定价值，尤以质量最佳。

PO-1123

心脏磁共振组织追踪技术及容积-时间曲线评估无明显并发症肥胖成人的舒张功能障碍:一项前瞻性研究

刘静、彭礼清、何文章、李雪、王银秋
四川大学华西医院

目的: 采用心脏磁共振组织追踪技术及容积-时间曲线测量左心室 (left ventricular, LV) 和左心房 (left atrial, LA) 功能来全面评估无明显并发症肥胖成人的舒张功能以及评估这些功能指标与体脂分布的关系。

方法: 前瞻性纳入 49 例无明显并发症的轻到中度肥胖受试者 (体重指数: $29.8 \pm 1.8 \text{ kg/m}^2$) 和 43 例健康对照 (体重指数: $20.2 \pm 1.6 \text{ kg/m}^2$)。测量两组的 LV 应变指标 (峰值收缩期及舒张期应变率)、LV 容积-时间曲线指标 (峰值充盈率及射血率指数) 和 LA 应变指标 (总应变及应变率、被动应变及应变率和主动应变及应变率) 并进行比较。采用双能 X 射线吸收测定仪测量体脂分布。多变量线性回归评价体脂分布与左室舒张功能指标的相关性。

结果: 比起健康对照, 肥胖受试者的舒张功能指数, 包括 LV 周向及纵向峰值舒张期应变率 ($1.3 \pm 0.2 \text{ s}^{-1}$ vs. $1.5 \pm 0.3 \text{ s}^{-1}$, $0.8 \pm 0.2 \text{ s}^{-1}$ vs. $1.1 \pm 0.2 \text{ s}^{-1}$, 所有 $P < 0.05$)、峰值充盈率指数 ($3.5 \pm 0.6 \text{ s}^{-1}$ vs. $3.9 \pm 0.7 \text{ s}^{-1}$, $P = 0.012$) 以及 LA 总应变及应变率 ($46.4 \pm 8.4\%$ vs. $51 \pm 12\%$, $1.9 \pm 0.5 \text{ s}^{-1}$ vs. $2.3 \pm 0.5 \text{ s}^{-1}$; 所有 $P < 0.05$) 和被动应变及应变率 ($30.8 \pm 8.0\%$ vs. $35.5 \pm 9.8\%$, $3.1 \pm 0.8 \text{ s}^{-1}$ vs. $3.5 \pm 1.0 \text{ s}^{-1}$; 所有 $P < 0.05$) 下降。肥胖组与对照组 LA 主动应变及应变率的差异无统计学意义。多变量线性回归分析表明, 躯干脂肪与 LA 被动应变 ($\beta = -0.520$) 和 LV 周向峰值舒张期应变率 ($\beta = -0.417$) 独立相关; 内脏脂肪和外周脂肪与 LV 纵向峰值舒张期应变率独立相关 ($\beta = -0.342$, $\beta = 0.376$); gynoid 区域脂肪与 LA 总应变 ($\beta = 0.384$) 和 LV 峰值充盈率 ($\beta = 0.285$) 独立相关。结论: 无明显并发症的肥胖成人出现亚临床舒张功能障碍而不是收缩功能障碍。中心脂肪分布 (躯干脂肪及内脏脂肪) 与舒张功能呈负相关, 而周围脂肪分布 (外周脂肪及 gynoid 区域脂肪) 与舒张功能呈正相关。

PO-1124

肺气肿、气道及肺血管与肺癌风险相关的定量 CT 评估

张丽¹、于楠^{1,2}
1. 陕西中医药大学
2. 陕西中医药大学附属医院

目的: 在肺癌筛查人群中确定肺气肿、气道壁增厚、肺血管的定量 CT 测量是否与肺癌风险相关。

方法: 回顾性分析 132 例经病理确诊的肺癌筛查患者的 CT 图像, 其中 83 名被诊断为恶性肺结节, 49 名为良性结节。测量两组全肺及肺结节所在肺叶的肺气肿 (吸气相体素指数小于 -950 HU 肺容积占总肺容积百分比 LAA-950%)、气道壁增厚 (第 3 至 7 代管壁面积百分比 (WA%)) 及假定气管内周径为 10 mm 时管壁面积的平方根 (Pi10))、全肺及各个肺叶的肺血管体积百分比 (IPVV%), 比较良性肺结节组和恶性肺结节组这些测量值的差异。结果: 肺气肿、气道及肺血管的定量 CT 测量值与肺癌发生的风险无关。结论: 肺气肿、气道及肺血管的定量 CT 测量与肺癌发生的风险无关, 表明其对临床风险分层没有潜在的实用价值。

PO-1125

基于胸部增强 CT 的影像组学模型在鉴别周围型肺癌和肺炎性假瘤中的研究价值

郝继元
太和县人民医院

【摘要】目的：探讨基于 CT 影像组学模型在肺炎性假瘤和周围型肺癌鉴别诊断中的应用价值。**方法：**回顾性分析本院 2018-2022 年经穿刺活检病理证实为肺炎性假瘤和周围型肺癌的患者，收集 81 例患者治疗前的 CT 影像资料，其中良性组 27 例，恶性组 54 例，随机分为训练集 54 例和测试集 27 例，运用 3D-Slicer 软件采用手动分割提取影像组学特征并使用 LASSO 方法降维，建立影像组学标签。经过多因素逻辑回归筛选，对有意义的影像特征及影像组学标签等相关变量建立影像组学诺模图诊断模型，使用受试者工作特征曲线 (ROC) 及其曲线下面积 (AUC) 对其诊断效能进行评价。**结果：**经过降维，17 种最具相关性的影像组学特征被用于建立影像组学标签，在训练集和测试集 AUC 分别为 0.728、0.767；影像组学诊断模型在训练集和测试集中 AUC(0.788, 0.922) 均大于非影像组学模型(0.682, 0.718, $P<0.05$)，且同时具有较高的校准度和临床应用价值。**结论：**基于 CT 平扫影像组学模型对肺炎性假瘤和周围型肺癌的诊断效能良好，具有简便、可靠的临床实用价值。

PO-1126

改良后左心房 CTA 检查在左心耳封堵术前的评估

景晓萍¹、邢俊²、张茸¹
1. 中国人民解放军海军军医大学第二附属医院
2. 上海胸科医院

摘要：**目的：**探讨西门子 Force 双源 CT 使用改良后技术行左心房 CTA 检查在左心耳封堵术 (PCLAA) 前的评估价值。**方法：**前瞻性收集我院 2022 年 1 月—2023 年 7 月 72 例拟行左心耳封堵术，采用改良后技术行左心房 CTA 患者。改良型技术：在常规动脉期扫描后 (对比剂：0.7ml/kg，流速 4.0ml/s) 延迟 30 秒行低剂量容积扫描；注射方案：在常规注射完后延迟 6-8 秒 (BMI 越小时间越短) 遵循低速、长时间原则，持续注射对比剂：0.2ml/kg，流速 1.0ml/s。观察左心耳形态分型、血栓情况及评估与植入封堵器选择的相关性。**结果：**经后处理工作站将左心耳形态分型：鸡翅型 (37 例，51.4%)、菜花型 (16 例，22.2%)、风向标型 (14 例，19.4%)、仙人掌型 (5 例，6.9%)；外侧法测量左心耳开口长径与封堵器最终选择有显著相关性 ($r=0.968$)，差异无统计学意义 ($P>0.05$)。动脉期显示左心耳血栓 23 例 (占 31.9%)，延迟期显示左心耳血栓 7 例 (占 9.7%)，两者有统计学意义 ($P<0.05$)。**结论：**改良后左心房 CTA 可以更好的观察左心耳的解剖信息、鉴别左心耳的血栓情况，为 PCLAA 术前提提供封堵器植入重要数据，具有较高的临床可行性和应用价值。

PO-1127

CT 影像组学在转移性 EGFR 突变型非小细胞肺癌患者靶向治疗 前预测 T790M 耐药发生的应用价值及风险评估

李晔、吕欣娜、侯代伦
首都医科大学附属北京胸科医院

目的 评估 CT 影像组学在预测转移性非小细胞肺癌患者一线表皮生长因子受体 (epidermal growth factor receptor, EGFR) 酪氨酸激酶抑制剂治疗前发生 T790M 耐药突变的风险预测的价值。

材料和方法 回顾性收集 162 名转移性非小细胞肺癌患者的临床和 CT 影像资料, 训练集共纳入 113 例病例, 测试集纳入 49 例病例。在平扫 CT 和增强 CT 上对肺癌层面进行逐层手动标注并提取影像组学特征。本研究先通过最大信息系数筛选出前 200 个特征, 之后通过 LASSO 算法进行进一步特征筛选, 并计算影像组学特征得分, 同时结合两期得分构建诺莫图, 以预测患者 14 个月内发生 T790M 耐药的可能, 并在独立测试集上测试。同时延长随访时间, 记录每位患者 T790M 耐药的发生时间, 评估诺莫图对耐药风险分层的能力。模型效能通过 ROC、DCA 和校准曲线进行评价, 并通过 Kaplan-Meier 生存分析评估诺莫图与 T790M 发生时间的相关性。

结果 患者基线临床病理资料在两组中并无明显统计学差异。分别从平扫 CT 和增强 CT 筛选出 4 个和 10 个影像组学特征。平扫 CT 模型在训练集和测试集上 AUC 值分别为 0.730 (95% CI: 0.643–0.818) 和 0.622 (95% CI: 0.415–0.829), 增强 CT 模型在训练集和测试集上 AUC 值分别为 0.803 (95% CI: 0.693–0.913) 和 0.752 (95% CI: 0.570–0.935), 诺莫图表现最佳, AUC 值分别为 0.828 (95% CI: 0.717–0.937) 和 0.853 (95% CI: 0.727–0.979)。独立测试集上的患者再根据诺莫图的最佳阈值分为耐药高危组和低危组。Kaplan-Meier 曲线表明, 根据诺莫图的影像组学得分的高危和低危组之间的 T790M 发生时间存在明显差异 ($p=0.00029$)。

结论 基于转移性 EGFR 突变型非小细胞肺癌患者靶向治疗前的 CT 影像组学特征可有效提供预后信息, 并对患者耐药风险实现精准预测, 多模态放射组学诺莫图具有成为临床潜在预测工具的能力。

PO-1128

耐多药肺结核影像组学研究进展

侯代伦、李晔、吕欣娜、王冰
首都医科大学附属北京胸科医院

目的: 耐多药结核病 (multidrug-resistant tuberculosis, MDR-TB) 是全球卫生安全面临的重大挑战。早期的识别耐多药结核病患者增加了治疗成功的可能性并可有效地阻断传播。因此, 本研究旨在探讨 CT 影像组学在 MDR-TB 中的诊断价值。

材料和方法 本课题前期回顾性收集来自两家医院的 454 例活动性肺结核患者的资料, 根据征象不同, 将其主要分为三个队列: 树芽征队列 (训练集: 295 例, 测试集: 102 例)、结节队列 (训练集: 302 例, 测试集: 97 例) 和联合队列 (训练集: 261 例, 测试集 81 例)。基于树芽征和结节层面进行手动标注, 包括病灶周围的卫星灶, 由对胸部影像诊断丰富的医生进行勾画并由另一名具有 10 年以上胸部 CT 诊断经验的医生进行确认, 两位医生并不知最终对结核病的诊断。通过 PyRadiomics 软件从医学影像数据中提取标准化的影像组学特征进行特征提取。本研究先通过最大信息系数分别在树芽征和结节队列进行特征筛选, 筛选出前 200 个特征, 之后通过递归特征消除算法进行进一步特征筛选。将在结节和树芽征中筛选出的特征分别通过随机森林算法在联合队列中构建影像组学模型, 并在测试集上进行测试。最后将两者影像组学特征联合, 构建联合预测模型。通过 SPSS 和 Python 进行统计学分析。定性资料分析通过卡方检验进行, 定量资料通过 Mann-Whitney U 检验分析, 模型效能通过 ROC 曲线进行评价。

结果 在训练集上,MDR-TB 和 DS-TB 患者在年龄上具有明显的统计学差异 ($P<0.05$),但在测试集上无明显统计学差异,其余特征均无明显统计学差异。我们最终分别从树芽征、结节队列筛选出 16、15 个影像组学特征以构建模型。三个模型均表现优异,树芽征影像组学模型在训练集和测试集上表现良好,AUC 值分别为 0.877 和 0.786,结节影像组学模型表现最佳,AUC 值分别为 0.933 和 0.855,联合模型 AUC 值分别为 0.911 和 0.820。

结论 综上所述,基于树芽征和结节的影像组学模型可有效鉴别 DS-TB 和 MDR-TB,因此该模型有望成为一种 MDR-TB 的初筛诊断方法。

PO-1129

淋巴管肌瘤病患者囊性病变的定量分析和基于 CT 成像预测气胸的影像组学方法

杨敏、立克拉虎、杨文洁
上海交通大学医学院附属瑞金医院

目的:

淋巴管肌瘤病 (LAM) 是一种罕见的转移性肿瘤,根据病变的严重程度,LAM 患者肺内的囊肿分布呈散在或累及整个肺,导致进行性呼吸困难,有时会出现气胸,大约三分之二的患者会在其临床病程中发生气胸,70%的女性会发生同侧或对侧复发性气胸。因此,气胸的复发是 LAM 预后的重要因素。本研究旨在评价淋巴管平滑肌瘤病患者的临床特征和影像学特征,并使用基于胸部计算机断层扫描 (CT) 图像的影像组学模型评估气胸复发的预后价值。

方法:

共入组 2015 年 8 月至 2021 年 5 月在我院行胸部 CT 检查的 101 例 LAM 患者。在患者接受 CT 平扫后,测量患者的肺囊肿体积。所有患者均通过电话随访至 2021 年 10 月,随后影像学检查出现气胸被定义为复发。对于气胸复发预测,我们首先使用预先训练的 U-net 深度学习模型,然后,我们使用 Python 包 pyradiomics v3.0.1 提取影像组学特征。我们首先将数据集分为两部分:70%组成训练集,30%组成测试集。使用 Pycaret 软件包中的去除多重共线性方法进行特征选择。使用 10 倍交叉验证对 70%的训练集进行训练,并选择具有最高平均交叉验证准确度评分的模型。对于影像组学特征,选择的模型是 adaboost 分类器,对于临床特征,选择的模型是随机森林分类器。然后将所选分类器拟合到所有训练数据上。最后,我们将影像组学和临床模型纳入 30%的测试集。

结果:

无气胸复发患者的双肺下叶肺囊肿体积比例 (23.50 ± 15.17 vs. 16.90 ± 11.31 , $P = 0.025$) 显著高于气胸复发患者。此外,气胸复发组和无复发组之间的胸腔积液存在统计学显著差异 ($P = 0.004$)。使用 ROC 曲线分析两种模型预测气胸复发的性能。影像组学模型 (AUC, 0.752;95%可信区间分别为 0.580 和 0.924; $P = 0.004$) 显示出比临床模型更好的预测效果 (AUC, 0.527;95%可信区间分别为 0.286 和 0.769; $P = 0.825$)。

结论:

双肺下叶囊性病变和胸腔积液的出现是 LAM 患者气胸复发的重要原因。肺部影像组学特征是预测 LAM 患者气胸复发的一种有前途的工具。

基于冠状动脉 CT 血管造影的冠状动脉钙化评分预测 脑白质高信号的进展--可行性和准确性

晋慧^{1,2}、侯婕^{1,3}、龚向阳¹

1. 浙江省人民医院

2. 蚌埠医学院

3. 锦州医科大学

摘要

背景 冠状动脉钙化 (Coronary artery calcification, CAC) 是动脉粥样硬化的一项可靠的衡量指标,也是中风和痴呆的预测因素。由于动脉粥样硬化在全身具有系统性特点,冠状动脉疾病 (Coronary artery disease, CAD) 通常与亚临床脑血管疾病共存。冠状动脉钙化评分 (CAC score) 可能是预测 CAD 患者脑白质高信号进展的有前途的工具。

目的 本研究旨在利用冠状动脉钙化评分预测 CAD 患者脑白质高信号的进展,并探究冠状动脉钙化评分与不同脑区脑白质高信号体积进展之间的关联。

材料和方法 在本研究中,我们评估了 2018 年 3 月至 2023 年 2 月期间接受冠状动脉计算机断层扫描血管造影 (CCTA) 和两次 MRI 扫描的 137 例 CAD 合并 WMH 患者。患者分为进展组 (n = 66) 和非进展组 (n = 71)。我们收集了人口统计、临床和影像数据进行分析。使用逻辑回归确定 WMH 进展的独立危险因素。开发并评估了三个预测 WMH 进展的模型。最后,根据患者的 CAC 总分 (0 ≤ 至 100 分、100 ≤ 至 400 分和 ≥ 400 分) 将患者分组,比较 9 个脑区的 WMH 变化。

结论 酒精滥用、最大 pFAI、CT-FFR 和 CAC 风险等级独立预测 WMH 进展 (p < 0.05)。联合模型具有较好的性能 (训练:AUC = 0.878, 95% CI: 0.790, 0.938; 验证:AUC = 0.845, 95% CI: 0.734, 0.953)。增加的 CAC 风险等级显著改变了全脑、胼胝体、额叶、顶叶和枕叶的 WMH 体积 (p < 0.05)。

总结: 基于冠状动脉 CT 血管造影获取的 CAC 评分,结合特定的危险因素,可以准确预测 CAD 患者脑白质高信号的进展。并且患者的总体脑白质、胼胝体、额叶、顶叶以及枕叶区域的脑白质高信号的体积进展与 CAC 风险等级相关联。

PO-1131

冠脉 CTA-FFR 与 CAD-RADS 评分相关性分析

王敏、张庭源、徐璟蓉

东南大学附属中大医院

研究目的: 探讨冠脉 CTA 血流储备分数 (FFR) 与 CAD-RADS 评分的相关性。方法: 选取 2023.2.14~2023.4.14 在东南大学附属中大医院行冠脉 CTA 检查的患者 397 例,根据 FFR_{CT} 值分为 FFR_{CT} ≤ 0.8 组和 FFR_{CT} > 0.8 组; 冠状动脉狭窄程度按照 CAD-RADS 评分分为 (0~4) 共计 5 个亚组, CAD-RADS0: 冠脉未见异常; CAD-RADS1, 轻微狭窄 1%~24%; CAD-RADS2, 轻度狭窄 25%~49%; CAD-RADS3: 中度狭窄 50%~74%; CAD-RADS4: 重度狭窄 75%~99%。结果: FFR_{CT} 值 ≤ 0.8 组 (133 例), 其中未见狭窄 7 例 (7/133), 轻度狭窄 0 例, 轻度狭窄 9 例 (9/133), 中度狭窄 49 例 (49/133), 重度狭窄 68 例 (68/133)。FFR_{CT} 值 > 0.8 组 (264 例); 其中, 未见狭窄 114 例 (114/264), 轻度狭窄 34 例 (34/264), 轻度狭窄 72 例 (72/264), 中度狭窄 42 例 (42/264), 重度狭窄 2 例 (2/264)。CAD-RADS0: FFR_{CT} 值 = 0.90 ± 0.04; CAD-RADS1, FFR_{CT} 值 = 0.93 ± 0.04; CAD-RADS2, FFR_{CT} 值 = 0.89 ± 0.06; CAD-RADS3, FFR_{CT} 值 = 0.81 ± 0.09; CAD-RADS4 FFR_{CT} 值 = 0.66 ± 0.08, CAD-RADS1、2、3、4 组间 FFR_{CT} 值差异具有统计学意义 (P < 0.001)。FFR_{CT} 值与 CAD-RADS 评分呈明显负相关, Pearson 相关系数为 -0.666, p < 0.001。结论: 冠脉 CTA-FFR 与 CAD-RADS 评分呈明显负相关, CAD-RADS 评分越高, 管腔狭窄程度越

明显，冠脉血流储备分数越低，CTA-FFR 联合 CAD-RADS 评分可用于冠脉中重度狭窄 3-4 分患者心肌缺血的辅助诊断。

PO-1132

基于常规肺部 CT 应用深度学习评估肺功能

王楠
吉林大学第一医院

研究背景：肺部 CT 检查广泛应用于肺癌筛查及肺部疾病诊断，但肺功能检查相对繁琐耗时，有大量肺功能受损人群未能早期发现。

研究目的：基于常规肺部 CT 应用深度学习评估肺功能。

研究方法：回顾性纳入 500 例同时行肺部 CT 及肺功能检查患者（两项检查间隔时间 <1 周），以肺功能为参照标准，分为肺功能正常组 210 例，肺功能异常组 290 例，应用深度学习构建肺功能异常筛查模型。以肺功能吸入支气管舒张剂后 $FEV1/FVC < 70\%$ 为参照标准，分为 COPD 组 130 例，非 COPD 肺功能异常组 160 例，构建 COPD 筛查模型。

另外纳入 150 例同时行肺部 CT 及肺功能检查患者，作为外部测试集（肺功能正常组 50 例，异常组 100 例，COPD 组 30 例，非 COPD 肺功能异常组 70 例），验证模型诊断效能。

研究结果：肺功能异常筛查模型 $AUC=0.917$ ，COPD 筛查模型 $AUC=0.735$ 。

研究结论：基于常规肺部 CT 应用深度学习构建的肺功能评估模型能够快速准确的筛查出肺功能受损患者，COPD 筛查模型效能较高，可用于大规模人群筛查。在不增加患者任何负担的前提下，提供功能信息的定性诊断。

PO-1133

基于胸部平扫和临床参数的主动脉夹层预测模型的建立与初步验证

张亚楠、崔磊、刘佳、明佳蕾
南通市第一人民医院

目的 建立并验证一种基于胸部 CT 平扫征象结合临床参数的主动脉夹层（AD）预测模型。

方法 回顾性收集行胸部 CT 平扫并短期内行胸主动脉 CTA 的胸痛病人 322 例，其中男 222 例、女 100 例，平均年龄（ 60.6 ± 13.2 ）岁。按 7 颐 3 的比例采用完全随机法将病人分为训练集（225 例，其中 AD 105 例）与验证集（97 例，其中 AD 45 例）。采用单因素分析和多因素 Logistic 回归分析筛选 CT 平扫征象及临床参数中 AD 的危险因素，并建立临床模型、影像模型及联合的 Logistic 回归预测模型，采用受试者操作特征（ROC）曲线、特异度、敏感度评估模型的预测效能，以筛选最佳预测模型。采用 Delong 检验比较各模型的曲线下面积（AUC），通过一致性指数（C 指数）评估预测模型的区分度。采用 Hosmer-Lemeshow 检验评价模型的校准度。

结果 Logistic 回归分析显示男性、D-二聚体升高、管腔内线样高密度和钙化斑块内移为 AD 的独立危险因素（均 $P < 0.05$ ）。联合的 Logistic 回归预测模型的 AUC 高于临床模型、影像模型（均 $P < 0.05$ ），联合模型的诊断效能最佳；在训练集中模型的 AUC 为 0.937，敏感度 91.4%，特异度 82.5%；在验证集中模型的 AUC 为 0.933，敏感度 95.6%，特异度 82.7%。联合预测模型具有较好的区分度（训练集：C 指数=0.937，验证集：C 指数=0.933）和较好的拟合效果（训练集： $X^2=3.081$ ， $P=0.687$ ；验证集： $X^2=2.199$ ， $P=0.821$ ；均 $P > 0.05$ ）。校准曲线显示联合模型预测的 AD 发生风险与胸主动脉 CTA 得到的结果有较好的一致性。

结论 建立基于胸部 CT 平扫征象结合临床参数的 AD 个体化 Logistic 回归预测模型, 有助于快速筛查和早期识别 AD 病人

PO-1134

基于能谱 CT 定量参数预测肺不张病因

杨晶晶、周俊林
兰州大学第二医院

目的 探讨能谱 CT 定量参数鉴别诊断结核相关纵隔纤维化致肺不张与肺癌肺不张的价值。材料与方法 回顾性分析 109 例肺不张患者的胸部能谱 CT 增强扫描图像, 经支气管镜活检病理结果将其分为结核相关纵隔纤维化组 (n=77) 和肺癌组 (n=32), 测量中央气道阻塞处及隆突下淋巴结平扫及增强双期 (肺动脉期与主动期) CT 值 (CT40keV、CT70keV)、有效原子序数 (Z_{eff})、5 对基物质 (碘-水、钙-水、碘-钙、HAP-水、碘-HAP) 浓度, 计算能谱曲线斜率 (λ 70keV) 和双期基物质浓度比、CT40keV 比值、CT70keV 比值。首先将测量得到的 87 个能谱定量参数, 使用 LASSO 回归分析筛选最优能谱参数, 应用 logistic 回归分析建立能谱参数预测模型。其次, 最优能谱定量参数联合常规影像特征及临床特征建立综合预测模型。结果 最优能谱参数分别是: 中央气道阻塞处双期 CT40keV 比值 (OR=39.88, 95%CI: 5.64-425.31, P=0.001)、淋巴结双期标准化碘浓度比值 (OR=252.1, 95%CI: 15.2-813.1, P<0.001) 和淋巴结肺动脉期 HAP (碘) 浓度 (OR=1.082, 95%CI: 1.02-1.15, P=0.01), 最优能谱参数预测肺不张病因的 AUC 值为 0.863(95%CI: 0.784-0.922), 敏感性 67.53%, 特异性 90.62%。综合预测模型由上述最优能谱参数、中央气道阻塞处淋巴结平扫 CT 值、纵隔淋巴结肿大融合评分和肺内结核后遗灶组成, 其预测肺不张病因的 AUC 为 0.965(95%CI: 0.911 - 0.991), 敏感性 98.71%, 特异性 84.32%。结论 能谱 CT 定量参数联合平扫常规影像学特征可有效鉴别结核相关纵隔纤维化与肺癌所致肺不张。

PO-1135

深度学习图像重建在提高肺部 CT 图像质量的临床应用研究

马光明、陈伟婷、贾永军、于楠、韩冬
陕西中医药大学附属医院

目的: 深度学习图像重建(Deep Learning Image Reconstruction, DLIR)是一种基于深度神经网络的图像重建新技术, 该方法有望在图像质量上优于现有的迭代重建技术。本研究的目的是评价 DLIR 重建的图像的图像质量和噪声, 并与 FBP、ASIR-V40%重建的图像进行比较。

方法: 回顾性选取本院 60 例 COPD 筛查患者胸部 CT 原始数据, 采用 FBP 重建 (A 组)、ASIR-V40%重建 (B 组)、DLIR-M 重建 (C 组)、DLIR-H 重建 (D 组), 共计获得 4 组图像。测量 4 组图像肺组织、主动脉、肌肉、胸椎、空气的 CT 值和 SD 值, 并计算各组织的信噪比 (SNR) 和对比噪声比 (CNR)。两名有工作经验的医师采用双盲法对图像噪声、伪影和诊断信心、整体图像质量进行 5 分制主观评分, 两名医师的评分结果一致性行 Kappa 检验。对 4 组图像的指标进行统计学分析。

结果: 4 组图像肺组织、主动脉、肌肉、胸椎、空气的 CT 值无显著性差异 (P>0.05), 但噪声值有统计学差异 (P<0.05), 不同重建算法对图像噪声有明显影响。4 组图像各组织的 SNR 和 CNR 均有统计学差异 (P<0.05), 其中 D 组的 SNR 和 CNR 最高, A 组的最低。两名医师的主观评分一致性较好 Kappa 值范围为 0.781-0.884。4 组图像的图像噪声、伪影和诊断信心、整体图像质量评分存在显著差异 (P<0.05), C、D 组的主观评分高于 A、B 组的, C 组与 D 组之间主观评分对比无差异 (P>0.05)。

结论: 深度学习重建算法可以降低胸部 CT 图像噪声, 提供更高的图像质量, 增强医生的诊断信心, 具有较大的降低辐射剂量潜能。

PO-1136

基于冠状动脉 CTA 的血流储备分数 对 2 型糖尿病合并冠心病患者预后的预测价值

陈蒙、胡春洪
苏州大学附属第一医院

目的 探究基于冠状动脉 CT 血管成像 (CCTA) 的血流储备分数 (CT-FFR) 对 2 型糖尿病 (T2DM) 合并冠心病 (CAD) 患者预后的预测价值。方法 回顾性收集 2014 年 1 月~2018 年 12 月确诊为 T2DM 且 CCTA 斑块直径狭窄率 $\geq 25\%$ 的患者。采用全自动化方法测量斑块远端 2-4 cm 的 CT-FFR 值。以主要心血管不良事件 (MACE) 作为研究终点。采用 Cox 风险比例回归筛选有统计学意义的因素, 并计算风险比 (HR) 和 95% 可信区间 (CI), 进一步构建传统模型和传统+CT-FFR 模型。用 C 指数和时间依赖受试者工作特征曲线 (ROC) 评价模型的预后表现。结果 共 170 例患者被纳入研究, 其中 52 人出现 MACE。性别 (HR=2.27, 95% CI 1.00-5.17, $P=0.050$)、不稳定型心绞痛 (HR=2.09, 95% CI 1.17-3.75, $P=0.013$) 和 CT-FFR (HR=0.02, 95% CI 0.00-0.15, $P<0.001$) 是 T2DM 合并 CAD 发生 MACE 的独立预测因子。CT-FFR ≤ 0.8 的患者发生 MACE 风险是 CT-FFR >0.8 患者的 3.86 倍 (调整后 HR, 95% CI 2.00-7.42, $P<0.001$)。在传统模型上加入 CT-FFR, C 指数从 0.70 提高至 0.74 (ΔC 指数=0.05, 95% CI 0.00-0.09)。传统+CT-FFR 模型 1-5 年的 ROC 曲线下面积 (AUC) 均高于传统模型。结论 CT-FFR 可提高 2 型糖尿病合并冠心病患者 MACE 的预测能力。

PO-1137

胸部 SMARCA4 缺失的未分化肿瘤的 CT 及 18F-FDG PET/CT 表现

龙振楚、邓宇
广州医科大学附属第一医院

目的

探讨胸部 SMARCA4 缺失的未分化肿瘤 (SMARCA4-deficient undifferentiated tumor, SMARCA4-UT) 的 CT 及 ^{18}F -FDG PET/CT 表现。

方法

回顾性分析经手术或穿刺活检病理证实的 25 例胸部 SMARCA4-UT 的影像资料, 25 例患者均行胸部 CT 平扫, 其中 22 例行胸部 CT 增强扫描; 14 例行 ^{18}F -FDG PET/CT 检查。观察病灶的分布部位、病灶最大径、形态、边缘情况 (边界是否清晰, 有无分叶、毛刺、胸膜牵拉)、病灶内部情况 (有无钙化、空洞、坏死)、强化表现 (平扫、动脉期、静脉期 CT 值、强化程度、病灶内是否有强化血管影)、有无合并阻塞性炎症、支气管包埋受累情况、肺门和/或纵隔淋巴结肿大情况、最大标准化摄取值 (SUVmax)。

结果

25 例 SMARCA4-UT 中, 中央型 11 例, 周围型 14 例。病灶最大径 0.6~11.7cm, 平均 $5.30\pm 2.83\text{cm}$ 。25 例均表现为边界清晰的单发结节或肿块, 25 例边缘分叶, 25 例毛刺征, 24 例胸膜牵拉。5 例平扫密度较均匀, 坏死 20 例, 钙化 2 例。增强扫描后无明显强化 7 例, 轻度强化 9

例, 中度强化 4 例, 明显强化 2 例。25 例出现瘤内血管影。22 例可见支气管包埋或受累。17 例合并肺门和/或纵隔淋巴结肿大。20 例合并阻塞性炎症。14 例 PET/CT 检查病灶内 SUVmax 范围 3.2~27.5, 平均 15.4±6.2。

结论

胸部 SMARCA4-UT 多表现为边界清晰、边缘分叶伴毛刺的单发结节或肿块, 体积较大, 增强扫描多呈无明显强化或轻度强化, 瘤体内出现血管影及坏死, 支气管多受累、包埋, 氟代脱氧葡萄糖 (^{18}F -FDG) 呈明显高摄取。

PO-1138

评估磨玻璃结节样肺腺癌在随访 CT 过程中的生长速率和相关性分析

贺祎凡

大连医科大学附属第一医院

目的: 本研究旨在分析纯磨玻璃结节样肺腺癌出现生长后的生长速率, 以及基线定量特征与生长速率之间的相关性。

方法: 这项研究回顾性纳入了 CT 随访超过 1 年并且出现间隔生长的 pGGN (pure ground-glass nodule) 样肺腺癌。最终纳入 29 名患者 (31 个 pGGNs), 手术病理证实为 17 个浸润性非粘液腺癌 (invasive non-mucinous adenocarcinoma, IA) 和 14 个微浸润腺癌 (minimally invasive adenocarcinoma, MIA)。在所有结节的初始和末次 CT 上进行三维半自动分割, 获得直径、CT 值、体积和质量, 并计算体积、质量的增长率 (体积增长率, VGR; 质量增长率, MGR)、体积倍增时间 (VDT) 和质量倍增时间 (MDT)。比较 IA 和 MIA 之间的生长速率及增长率。将所有结节根据 VDT=1000 天的阈值分为生长快 (VDT<1000 天, n=18) 组和生长慢组 (VDT>1000 天, n=13), 比较两组间的基线临床特征及影像特征的差异。

结果: 31 个生长肺腺癌的中位 VDT 和 MDT 是 923.7 (范围, 351.2-4004.5) 天和 960.6 (范围, 337.9-4092.5) 天, 对应的中位 VGR 和 MGR 均为 1.4。IA 的平均 VDT 和 MDT 是 746.2 天和 783.9 天, 均显著快于 MIA (平均 VDT, 1739.7 天; 平均 MDT, 1748.9 天) (p 均 = 0.001)。31 名患者年龄与 MDT 之间存在显著负相关 ($r = -0.432$, $p = 0.015$)。在 MIA 亚组中, VDT 和 MDT 与初始平均 CT 值之间存在显著正相关 (VDT, $r = 0.684$, $p = 0.007$; MDT, $r = 0.763$, $p = 0.002$)。生长快组和生长慢组之间只有年龄在两组之间存在显著差异 ($p = 0.028$), 其余临床及影像特征均无统计学意义。

结论: 表现为 pGGN 的 IA 生长速率显著快于 MIA。患者年龄与肺腺癌的 MDT 存在显著负相关, 并且在生长快慢组之间存在显著差异。初始平均 CT 值与 MIA 的 VDT、MDT 都存在显著正相关。

PO-1139

多参数 CMR 对缩窄性心包炎诊断及预后的增量价值

邵国柱

华中科技大学同济医学院附属协和医院

目的: 本研究旨在探讨多参数心脏磁共振成像 (CMR) 对缩窄性心包炎 (CP) 的诊断及影响预后的因素。方法: 回顾性分析 34 例连续性 CP 患者和 32 例对照组。CMR 获得了心脏形态、功能和组织特征的信息。

结果: 与对照组相比, CP 患者心脏结构和功能明显受损。与对照组相比, CP 患者左心房 (LA) 整体周向应变、LA 整体纵向应变、左室 (LV) 整体纵向应变、左室整体周向应变、左室整体径向应变、

右室纵向应变、右心房(RA)整体周向应变和 RA 整体纵向应变均降低($p < 0.001$)。CP 患者的心外膜脂肪组织(EAT)体积显著高于对照组(57.6 ± 13.0 vs 45.2 ± 9.2 , $p < 0.001$)。在中位随访 19 个月(四分位数间距:4-24 个月)期间, 3 例患者行心包切除术, 10 例患者因心力衰竭住院。在 Cox 比例风险模型分析中, EAT 是随访期间主要事件的唯一独立预测因子(HR, 1.189;95% CI, 1.096-1.2902; $P < 0.001$)。

结论:CP 患者表现为心脏结构和功能受损, 以及双房和双室心肌应力受损。CMR 量化的 EAT 是唯一具有预后价值的独立预测因子。定量 CMR 是一种有价值的诊断和预后的影像学方法。

PO-1140

应用临床及 CT 影像学特征预测肺粘液腺癌 Ki-67 增殖指数的研究

贺祎凡¹、蒋依宁²

1. 大连医科大学附属第一医院

2. 四川大学华西医院

目的 本研究基于 CT 平扫图像对肺粘液腺癌 (Lung mucinous adenocarcinoma, LMAC) 进行临床参数及影像特征分析, 探索这些参数对 LMAC 中 Ki-67 指数的预测性能, 以期术前用无创方式评估肿瘤的增殖与预后。

方法 回顾性收集经胸外科手术病理证实为 LMAC 患者共计 119 例。记录所有病例的临床特征 (年龄、性别等), 并由放射科医生记录影像学特征, 包括分布、形态、肿瘤-肺界面、空气支气管征、分页征、空泡征、毛刺征及胸膜牵拉征象。随后, 手动测量 LMAC 的定量特征, 包括直径和 CT 值。将 LMAC 分为 Ki-67 低表达组 (Ki-67 增殖指数 $< 20\%$) 和 Ki-67 高表达组 (Ki-67 增殖指数 $\geq 20\%$)。具有显著统计学差异的计量资料进行受试者工作特征曲线 (Receiver operating characteristic curve, ROC) 分析并评估其敏感性、特异性和曲线下面积 (Area under ROC curve, AUC)。

结果 119 例 LMAC 包括 Ki-67 低表达组有 80 例 (67.23%), Ki-67 高表达组有 39 例 (32.77%)。Ki-67 高表达组的男性患者占比高于 Ki-67 低表达组 (53.85% vs. 37.50%, $P = 0.029$)。Ki-67 高表达组的直径明显长于 Ki-67 低表达组 (2.08cm, 1.44~3.09cm vs. 1.49cm, 1.07~2.04cm), Ki-67 高表达组的 CT 值也高于 Ki-67 低表达组 (-105.67HU, -228.29~-39.95HU vs. -213.09HU, -320.33~-92.73HU) (p 均 < 0.05)。在 ROC 曲线分析中, 直径的 AUC 值最大, AUC 值 (95%CI) 和截断值分别为 0.677 (0.576~0.778), 1.92cm, 敏感性和约登指数分别为 0.615, 0.725 和 0.340。Spearman 相关性分析显示直径与 Ki-67 表达具有正相关性 ($r = 0.209$, $p = 0.023$)。结论 直径相比 CT 值对预测 LMAC 中 Ki-67 的表达程度具有相对较高的潜力, 并且与 Ki-67 表达存在显著正相关。

PO-1141

首诊肺结节病 CT 影像学征象的聚类分析

王策、谢晟

中日友好医院

目的: 本研究的目的是根据肺结节病的 CT 影像学表现对肺结节病进行分型, 并探讨各个表现型的结节病患者的肺功能是否存在差异。

方法: 本研究纳入了 146 名临床确诊的结节病患者。所有患者均进行了胸部 CT 检查, 并且在检查前未进行激素治疗。根据 CT 的影像学表现, 提取出以下表现: 支气管血管束增粗 (0 无, 1 存在)、结节 (单个肺叶内: 0 无结节, 1 结节稀疏 (0~20 个), 2 结节多发 (20~100 个), 3 结节弥漫分

布 (大于 100 个), 并将 6 个肺叶 (左肺上叶舌段算一个肺叶) 的评分相加)、实变 (肺内实变: 0 无, 1 以磨玻璃斑片影为主, 2 以大于一个次级肺小叶为主, 3 以大片实变为主)、总体肺实变 (将各个肺叶内实变的评分相加)、支气管壁增厚 (0 无, 1 存在)、支气管狭窄 (0 无, 1 存在)、胸腔积液 (0 存在、1 单侧、2 双侧)、淋巴结肿大 (0 无, 1 存在, 2 淋巴结肿大并相互融合)、淋巴结直径 (纵隔或肺门最大淋巴结的短径)、小叶间隔增厚 (单个肺叶内: 0 不存在, 1 占比 0~25%, 2 占比 25~50%, 3 占比 50~75%, 4 占比 75~100%, 将各个肺叶的得分相加)。对这些患者的评分进行 K-means 聚类分析, 并对各个类型的患者的肺功能 (FVC、FEV1、FEV1/FVC、DLCO) 进行比较, 判断组间是否存在差异。

结果: 根据聚类分析结果将结节病的 CT 影像学表现分为四型。I 型: 以淋巴结轻度肿大为主, 占 25.3% (37 例)。II 型: 以淋巴结肿大并相互融合为主, 占 30.1% (44 例)。III 型: 双肺改变以弥漫分布结节为主, 占 35.6% (52 例)。IV 型: 双肺改变以实变为主, 占 8.9% (13 例)。这四种类型的患者肺一氧化碳弥散量 (DLCO) 差异具有统计学意义 ($P=0.001\leq 0.05$), 其中 I 型与 II 型 ($P=0.031\leq 0.05$)、I 型与 III 型 ($P=0.02\leq 0.05$)、I 型与 IV 型 ($P=0.000\leq 0.05$) 及 II 型与 IV 型 ($P=0.018\leq 0.05$) 的 DLCO 有统计学意义。

结论: 根据肺结节病患者的 CT 表现可以将肺结节病分为 4 型, 这四种类型的患者的弥散功能差异具有统计学意义, 考虑可以根据肺结节病的影像学分型来指导临床的后续治疗。

PO-1142

基于 CT 组学预测表现为纯磨玻璃结节肺腺癌的 Ki-67 表达

贺祎凡

大连医科大学附属第一医院

目的 探讨表现为纯磨玻璃结节 (pure ground-glass nodules, pGGNs) 的浸润性腺癌中, CT 放射组学征象预测 Ki-67 表达的可行性和有效性。

方法 共 120 例组织病理学证实的浸润性腺癌 (invasive non-mucinous adenocarcinoma, IA) 患者接受了 CT 扫描。CT 扫描后 2 周内测定 Ki-67 增殖指数 (Ki-67 proliferation indices, PI)。两位经验丰富的胸部放射科医生评估了主观 CT 影像特征, 并测量了定量 CT 特征。手动勾画感兴趣区域的体积, 并通过 3D-slicer 软件从 CT 图像中提取放射组学特征。采用 Spearman 相关分析剔除冗余数据。采用梯度增强决策树 (Gradient Boosting Decision Tree, GBDT) 算法确定最佳放射组学特征。结合 GBDT 算法选择的候选变量建立多元 Logistic 回归模型, 预测 Ki-67 的表达水平。ROC 曲线用于确定预测模型的性能。

结果 Ki-67 低表达组与高表达组的临床特征、主观及定量 CT 表现差异均无统计学意义 (P 均 >0.05)。基于 CT 的放射组学特征显示了中等的诊断性能。训练集和测试集的 AUC 分别为 0.705 (敏感性 0.640, 特异性 0.640) 和 0.680 (敏感性 0.545, 特异性 0.682)。

结论 如果不能根据临床和传统 CT 影像特征预测 Ki-67 PI, 放射组学标记可以成为一种无创性和个性化的辅助诊断工具, 用于术前预测表现为 pGGNs 的 IAC 的 Ki-67 PI。

PO-1143

基于 CT 影像组学联合营养成分参数预测食管鳞癌患者术后 3 年无进展生存期和总生存期：一项多中心研究

贾建业、柏根基
淮安市第一人民医院

背景：营养成分参数是与食管癌的预后有关的临床危险因素，并且可以预测各种癌症的总生存期（OS）和无进展生存期（PFS），从而可以进行早期干预。本研究旨在探讨 CT 衍生的身体营养成分参数与食管鳞状细胞癌患者术后 3 年 OS 和 PFS 之间的关联，并最终结合 CT 影像组学特征构建联合模型以提高模型的预测价值。

材料与方法：回顾性收集来自 3 个机构的 662 例经术后病理证实的食管鳞癌患者。其中机构 1 与 2 中患者以 7:3 的比例随机分为训练队列(n=402) 和内部验证队列 (n=172)，机构 3 的患者被用作外部验证队列 (n=88)。勾画第三腰椎层面骨骼肌、皮下脂肪和内脏脂肪，并计算相应的骨骼肌指数、骨骼肌密度、皮下脂肪面积和内脏脂肪面积。使用单、多因素 Cox 回归分析预后的独立危险因素。最小绝对收缩和选择算子算法和 COX 回归用于构建影像组学模型。使用校准曲线和一致性指数评估各模型的预测效能。Kaplan-Meier 曲线分析高、低风险组的生存情况。

结果：多因素 COX 回归分析显示，肌肉减少症为 PFS (HR=1.60, 95%CI: 1.18-2.17, P<0.001) 和 OS (HR=1.61, 95%CI: 1.13-2.30, P<0.001) 的独立预后因素。结合临床独立危险因素和放射组学特征的联合模型获得了最佳的预测效能。该模型对于 PFS 的一致性指数在内、外部测试队列中分别为 0.758 (95%CI: 0.702-0.814)，0.738 (95%CI: 0.652-0.824)；对于 OS 的一致性指数在内、外部测试队列中分别为 0.746 (95%CI: 0.690-0.802)，0.728 (95%CI: 0.616-0.841)。联合模型的 Kaplan-Meier 曲线分析显示，预测高、低风险患者的 PFS 和 OS 中，高风险患者生存期均明显短于低风险患者。

结论：肌肉减少症与食管鳞癌患者的 PFS 与 OS 均显著相关。通过结合肌肉减少症与 CT 影像组学特征构建的联合模型，可以进一步提高对食管鳞癌患者术后 3 年 PFS 和 OS 的预测准确性，同时有助于更精确地进行患者术后风险分层。

PO-1144

珠海地区经外周静脉置入中心静脉置管头端位置异常原因分析

王国杰^{1,2}、黄兰芳¹、陈燕妮¹、龙凤娇¹

1. 中山大学附属第五医院
2. 喀什地区第一人民医院

目的 调查珠海地区经外周静脉置入中心静脉导管尖端位置异常的发生率并分析可能的原因。

方法 回顾分析 2020 年 1 月至 2022 年 4 月间进行经外周静脉置入中心静脉导管（PICC）的临床资料，主要包括置管的原因、置管的路径、导管尖端位置异常的发生率等。

结果 共入组 2481 例患者，以肿瘤患者为主，占比约 95.45% (2368/2481)，大部分穿刺贵要静脉置管 (89.36%，2217/2481)，以左上肢置管为主 (80.77%，2004/2481)，其次为右上肢 (18.02%，447/2481)，下肢占 1.21% (30/2481)。导管尖端位置异常（异位+过深）的发生率为 12.21% (303/2481)，其中导管尖端过深入右心 276 例，导管尖端异位 27 例（折曲 6 例，尖端位于颈内静脉、头臂静脉、锁骨下静脉分别为 8 例、8 例、5 例）。经左上肢置管导管尖端异位的发生率为 1.05% (21/2004)，右上肢为 1.12% (5/447)，差异无统计学意义 (P=0.8021)，另外一例异位病例为经下肢置管。左上肢置管导管尖端过深的发生率为 10.52% (211/2004)，右上肢置管的发生率为 14.54% (65/447)，差异有统计学意义 (P=0.0295)。过深病例中导管尖端与上腔静脉与右心房交界点的距离约 5mm-95mm（平均约 26.6±14.8mm）。导管头端异位在培训

导师、学员的发生率分别为 0.95% (18/1898)、1.54% (9/583)，差异无统计学意义 ($P=0.2256$)，而导管尖端过深在导师、学员组的发生率分别为 9.54%、16.30%，差异有统计学意义 ($P=0.000$)。

结论 珠海地区 PICC 以上肢置管为主，导管尖端位置异常主要为尖端过深入右心房，左上肢置管导管尖端位置异常的发生率低于右上肢。导管尖端位置异常的发生率与操作者的技术和经验相关。

PO-1145

建立 CT 影像组学列线图模型在孤立性肺结节型肺隐球菌病和肺癌鉴别诊断中的应用

李婷

广州医科大学附属第一医院

目的 建立基于 CT 的影像组学列线图模型用于鉴别诊断孤立性肺结节型肺隐球菌病(PC)和肺癌(LC)的可行性。**方法** 回顾性分析 2015 年 1 月-2023 年 8 月我院确诊表现为孤立性肺结节型肺隐球菌患者 86 例和肺癌患者 145 例，评估其临床特征和影像学特征。根据患者的薄层 CT 轴位平扫图像资料，提取病灶纹理特征，对其进行特征选择，获得 PC 组与 LC 组之间存在显著差异的特征参数。按 7:3 比例将所有样本分为训练集和测试集，采用 LASSO 算法以较优特征参数建立预测模型，对训练集数据进行评估，之后于测试集数据进行验证。经过多变量 Logistic 回归分析，构建了具有临床特征、CT 形态学征像、影像组学特征的影像组学列线图模型。我们计算了各种模型中的性能评估参数，如敏感性、特异性、准确性、阴性预测值(NPV)和阳性预测值(PPV)。采用受试者工作特征(ROC)曲线分析，评估模型的鉴别诊断效能。**结果** 我们从每张 CT 图像中提取了 1316 个影像组学特征。经 LASSO 算法降维后筛选出 4 个具有鉴别意义的影像组学特征。收集临床特征共计 13 个，经单因素分析及多因素 Logistic 回归分析后，发现性别、年龄、结节位置、患者免疫状态、分叶征、毛刺征、胸膜牵拉征、支气管充气征是区分 PC 和 LC 方面的 8 个因素 ($P < 0.05$)。影像组学模型、临床模型及混合模型预测效能：训练集中 AUC 分别为 0.839、0.807 和 0.857，测试集中 AUC 分别为 0.746、0.723 和 0.824。DeLong 检验显示，与临床模型和列线图相比的 AUC 之间存在显著性差异($p < 0.0001$)。**结论** 基于 CT 影像组学特征和临床危险因素的临床-影像组学列线图，可用于鉴别诊断孤立性肺结节型肺隐球菌病和肺癌。

PO-1146

自身免疫性 IgG4 相关肺疾病的 CT 表现及文献复习

罗振东、吕建勋、姚薇薇、周丽莎、沈新平

香港大学深圳医院

目的 分析 IgG4 相关肺疾病的临床、CT 表现。**方法** 回顾性分析 3 例 IgG4 相关肺疾病的临床资料，并复习相关文献，观察其临床、CT 表现。**结果** 3 例 IgG4 相关肺疾病 (3 例均为男性，年龄分别为 50、63、63 岁)，1 例表现为发热伴咯血 1 月，1 例表现为干咳、气喘 2 周、1 例表现为头痛、腹痛 10 天，无呼吸相关症状；2 例血清 IgG4 升高，3 例均接受 CT 平扫及增强扫描，3 例表现为结节及肿块，3 例存在肺内间质性病变 (2 例网格影，1 例磨玻璃密度影)，2 例纵隔及双肺门区淋巴结肿大，1 例合并多系统受累 (胰腺、双肾)。 **结论** IgG4 相关疾病累及肺组织少见，CT 可以表现为间质性病变、结节或肿块，可合并纵隔及双肺门淋巴结肿大，综合临床 IgG4 升高，对其诊断具有重要的价值。

PO-1147

成人肺朗格汉斯细胞组织细胞增生症高分辨率 CT 视觉评分及定量分析与常规肺功能的相关性研究

王金华、隋昕、宋兰、赵瑞杰、杜华阳、汪佳儒、肖然、明樱、宋伟
中国医学科学院北京协和医院

目的 探讨胸部高分辨率 CT (HRCT) 视觉评分及定量分析评估成人肺朗格汉斯细胞组织细胞增生症 (PLCH) 的价值。

方法 回顾性分析 2014 年 8 月至 2021 年 12 月北京协和医院经病理组织学证实确诊的 51 例成人 PLCH 患者的胸部 HRCT 及肺功能检查资料。由 2 名影像医师采用主观视觉评分法评估患者 HRCT 图像中结节、囊腔病变累及范围, 并根据不同评分将结节病变分为 3 组, 囊腔病变分为 4 组。应用全自动后处理软件, 三维定量分析肺部低衰减区容积占全肺总容积比例 (LAA%)。记录肺功能通气、容量、弥散等指标。采用 Spearman 秩相关性分析病变视觉评分、LAA% 与肺功能检查各指标的相关性。采用 Kruskal-Wallis 非参数检验对结节和囊腔病变不同评分组的肺功能指标进行分析。

结果 51 例患者 HRCT 图像均可见结节和囊腔病变。HRCT 结节病变视觉评分与肺功能指标无相关性 ($P>0.05$), 不同结节评分组间比较肺功能指标差异均无统计学意义 ($P>0.05$)。囊腔病变视觉评分与 FEV₁%pred、FEV₁/FVC、D_LCO%pred、D_LCO/V_A%pred、D_LCOc%pred、D_LCOc/V_A%pred 存在负相关 ($r=-0.393$ 、 -0.491 、 -0.347 、 -0.330 、 -0.373 、 -0.346 , $P<0.05$), 且不同囊腔评分亚组肺功能指标差异均有统计学意义 ($P<0.05$)。LAA% 与 FEV₁/FVC、D_LCO%pred、D_LCO/V_A%pred、D_LCOc%pred、D_LCOc/V_A%pred 存在负相关 ($r=-0.278$ 、 -0.378 、 -0.418 、 -0.395 、 -0.451 , $P<0.05$)。

结论 PLCH 患者 HRCT 结节病变视觉评分与肺功能无相关性, HRCT 囊腔病变视觉评分及定量分析可一定程度评估患者肺通气及弥散功能的损害程度。

PO-1148

基于冠脉 CTA 的冠状动脉周围脂肪组织 CT 衰减预测冠脉搭桥术后桥血管闭塞

涂永波
重庆市人民医院

目的: 计算机断层扫描血管造影术对冠状动脉周围脂肪组织的衰减是一种新的冠状动脉炎症的非侵入性成像生物标志物。我们观察了术前和术后冠状动脉周围脂肪组织的衰减 (PCATa) 的变化, 并评估了冠状动脉搭桥术后 1 年内桥血管闭塞的 PCATa 的预测值。

方法: 研究人群包括在 2018 年 2 月至 2023 年 4 月期间接受选择性冠状动脉搭桥术的 121 名连续患者。在术前 (1-10 天)、术后 (4-25 天) 和术后 6 个月、12 个月的随访时间进行计算机冠状动脉断层摄影血管造影术。右冠状动脉 (RCA)、左前降支 (LAD) 和左旋支 (LCx) 的 PCATa 在四个时间点使用半自动化软件对每位患者进行评估。单因素方差分析用于比较每个时间点的多组 PCATa 值及三支冠状动脉之间的 PCATa 值。根据随访 12 个月结果分为闭塞组及非闭塞组, 闭塞组与非闭塞组之间 PCATa 值比较采用独立样本 t 检验。计算受试者操作特征曲线、敏感性和特异性曲线、曲线下面积和 95% 置信区间。

结果: 共有 78 例患者在术前和术后四个时间点接受了计算机断层冠状动脉血管造影检查。PCATa RCA、PCATa LAD 和 PCATa LCx 在术后 (4-25 天) 最高 (PCATa LAD: -73.48 ± 5.84 ; PCATa LCx: -71.86 ± 6.17 ; PCATa RCA: -70.71 ± 6.49)。三支冠状动脉之间 PCATa 值差别无统计学意义。闭塞组和非闭塞组术后 (4-25 天) 的 PCATa 值具有统计学意义, 闭塞组更高 (PCATa LAD: -69.53

± 4.73 ; PCATa LCx: -68.09 ± 6.77 ; PCATa RCA: -65.69 ± 5.65)。ROC 曲线显示, 术后 (4-25 天) PCATa 值具有很强的预测闭塞的能力 (LAD AUC=0.727, LCx AUC=0.734, RCA AUC=0.793)。结论: 显示冠状动脉搭桥术前后的 PCATa 值呈动态变化。术后高 PCATa (4-25 天) 可以预测一年内桥血管闭塞。未来的研究应该评估这种成像生物标志物是否可以预测长期桥血管闭塞, 以便通过调节药物治疗来预防桥血管闭塞。

PO-1149

CT-FFR 和冠状动脉钙化评分对经导管主动脉瓣置换术后临床事件的预测价值

李爽昕、文娣娣、杨文轩、郑敏文
中国人民解放军空军军医大学西京医院

背景: CT 血流储备分数 (CT-FFR) 和冠状动脉钙化评分 (CACS) 对主动脉瓣疾病患者接受经导管主动脉瓣置换术 (TAVR) 后的临床结局具有预测价值。然而, CT-FFR 和 CACS 之间的增量预后价值尚不清楚。

目的: 比较 CT-FFR 和 CACS 对 TAVR 术后不良临床事件的预测价值。

方法: 回顾性纳入 TAVR 术前接受冠状动脉 CT 检查的重度主动脉瓣疾病患者。采用单变量和多变量 Cox 回归分析不良临床事件的危险因素, 包括临床危险因素、CT-FFR 和 CACS。还分析了 CT-FFR 与 CACS 相比的增量预后价值。

结果: 共纳入 290 例患者 (平均年龄 68 岁 ± 10 岁; 204 名男性)。在平均 43 ± 12 个月的随访期间, 80 例患者 (27.59%) 发生了不良临床事件。CACS > 100 (HR: 0.302-0.667, P 均 < 0.05) 和 CT-FFR ≤ 0.75 (HR: 2.436, P < 0.001) 是不良临床事件的独立预测因子。当出现 CT-FFR ≤ 0.75 和 CACS > 100 时, 出现不良临床事件的风险显着增加。CT-FFR (C-index: 0.665) 而非 CACS (C-index: 0.654, P = 0.021) 对预测不良临床事件有增量预后价值。

结论: CT-FFR 和 CACS 是 TAVR 术后不良临床事件的预测指标, CT-FFR 在预测不良临床事件中有增量预后价值。

PO-1150

CCTA 定量的冠状动脉周围炎症与不同运动状况之间的关系

席华泽、周俊林
兰州大学第二医院

背景: 稳定型冠状动脉疾病 (CAD) 患者的运动类型和强度与冠状动脉炎症之间的关系尚不清楚。因此, 本研究评估了冠状动脉计算机断层扫描血管造影 (CCTA) 量化的冠状动脉炎症与 CAD 患者的运动强度和模式之间的关系。

方法: 对 2020 年至 2023 年期间接受 CCTA 的患者进行回顾性研究。我们计算了右冠状动脉 (RCA) 的冠状动脉周围脂肪衰减指数 (FAI), 作为冠状动脉炎症的标志物。我们比较了两组患者的 FAI 值升高的危险因素, 并使用方差分析和限制性三次样条描述了不同运动持续时间与 RCA-FAI 之间的关系, 进一步随访后比较了不同运动时间患者的运动强度及冠脉炎症情况。

结果: 本研究共纳入了 1222 例患者, 其中 774 例冠心病患者为冠心病组, 448 例冠脉正常患者为健康对照组。冠心病组患者高血压、吸烟、家庭收入、体重指数 (BMI) 高密度脂蛋白 (HDL)、低密度脂蛋白 (LDL)、空腹血糖是 RCA-FAI 值升高的危险因素。冠心病患者运动量不同之间的 RCA-FAI 有明显差异。在校正相关因素后, RCA-FAI 与跑步和有氧运动的运动时间呈 “U” 型关系。同时短时间高强度运动对降低冠心病冠状动脉炎症更有价值。

结论: RCA-FAI 与预测 CAD 的运动密切相关。适当的体育锻炼可降低冠状动脉周围炎症和冠状动脉粥样硬化风险。然而, 过长时间或强度过大的运动可能会加剧冠状动脉炎症反应, 增加患 CAD 的可能性或导致猝死。

PO-1151

基于 MRI 随访扫描预测 COPD 患者偶发肺结节的长期转归—— 一项多中心临床试验

朱琳¹、Mark O. Wielpütz²、Hans-Ulrich Kauczor²、于红¹

1. 上海交通大学医学院附属上海胸科医院

2. Heidelberg University

研究目的: 通过多中心同时开展对 COPD 患者的两轮胸部磁共振成像 (MRI), 研究 MR 对检测和管理 COPD 患者偶发肺结节的能力, 建立 COPD 患者肺结节转归预测模型。

研究方法: 大于 40 岁的 COPD 患者在同一天接受胸部增强 MRI、非增强低剂量计算机断层扫描 (LDCT) 以及肺功能检测和一系列临床生活质量调查问卷, 并于至少 3 年后进行相同随访扫描。两位影像医师独立阅读两轮 CT 及 MRI 随访数据, 提取 MRI 和 LDCT 中结节影像学指标, 并以一致的 CT 结果作为结节转归的参考标准。根据结节转归及临床资料, 将差异指标纳入多因素 Logistic 回归分析, 获得结节转归的独立相关因素, 构建严格 ($P < 0.05$) 和宽松 ($P < 0.25$) 结节转归预测模型。

研究结果: 共 567 名 COPD 患者 (525 个结节) 纳入第一轮筛查和 241 名患者 (共 255 个结节) 参与第二轮随访。MRI 对实性结节的识别能力明显优于亚实性和磨玻璃, 敏感性和阳性预测值 (PPV%) 达 61.6% 和 67.5%。T1WI、T2WI、增强 T1WI 序列的敏感性及其 PPV% 均随着结节直径增加而增大 (65.78%-100%), 并且 MRI 增强扫描识别结节的敏感性明显高于平扫 (81.98% vs. 65.8%)。MRI 对结节的 RADS 评级与 LDCT 间一致性基本达到完美 ($\kappa = 0.70-1.00$ 和 $0.69-1.00$)。RADS 评级、结节个数、分叶征、CTA 评分纳入严格 MRI 预测模型 (AUC=0.88, 95%CI: 0.81-0.95), 进一步纳入年龄、结节位置、SGRQ、EQ5D 生成宽松模型 (AUC=0.96, 95%CI: 0.92-0.99)。两模型间比较: AUC 面积不存在差异 ($P = 0.05$), 净重新分类指数 (NRI) = 37.8%, $P = 0.07$, 综合判别改善指数 (IDI) = 0.15, $P < 0.01$ 。宽松 MRI 模型与 CT 模型间不存在差异 ($P > 0.05$)。

结论: 由增强 MRI 提取的影像特征及临床指标构建的宽松 Logist 模型可以对 COPD 患者偶发结节的转归起到较好的预测作用, 值得临床推广应用。

PO-1152

基于肺 CT 平扫的心外膜下脂肪与冠心病合并心力衰竭患者预后的相关性分析

张惠茅、刘文蕴、金晶玉、李明洋、李程
吉林大学第一医院

目的：探讨心外膜下脂肪（epicardial adipose tissue, EAT）相关参数对冠心病合并心力衰竭患者预后的预测价值。

方法：连续性纳入 2021.01.01 至 2021.05.31 就诊于我院，临床诊断为冠心病合并心力衰竭，并在我院进行了肺部平扫 CT 检查的患者，根据其左室射血分数（Ejection fraction, EF）分为射血分数降低型心力衰竭（HFrEF）组、射血分数轻度降低型心力衰竭（HFmrEF）组及射血分数保留型心力衰竭（HFpEF）组，收集临床资料及实验室检查信息。应用 Riaseg 医学图像分割软件，由 1 名具有 5 年工作经验的心内科医师在肺平扫 CT 图像上手动分割心包壁层轮廓，上缘为肺动脉干分叉水平，下缘为心脏底部，然后由一名具有 10 年心血管影像诊断经验的放射科医师对分割图像进行审核，最后根据脂肪组织的阈值-190~-30Hu，分割出 EAT，并获得其体积及平均密度值。使用 SPSS 26.0 进行统计分析。随访患者 1 年的主要不良心血管事件，评价各亚组 EAT 体积与平均密度绝对值对预后的预测价值。P<0.05 被认为差异具有统计学意义。

结果：本研究共纳入 441 名患者，其中 HFrEF 组 83 人，HFmrEF 组 88 人，HFpEF 组 270 人。年龄、高血压、甘油三酯水平是 EAT 体积和平均密度的独立影响因素（P<0.05），EAT 平均密度绝对值与 EF 值呈正相关（P<0.001），与左房前后径和左室舒末径呈负相关（P<0.001；P<0.001）；EAT 体积与 EF 呈负相关（P=0.011），与左房前后径和左室舒末径呈正相关（P<0.001；P<0.001）。共随访到 385 名患者，三个心衰亚组预后存在显著差异（P<0.001）。EAT 体积对 HFrEF 组和 HFmrEF 组预后存在预测价值（P=0.023；P=0.028）。

结论：年龄、高血压、甘油三酯水平为冠心病合并心力衰竭患者心外膜下脂肪的独立影响因素。EAT 体积可以有效评价冠心病合并心力衰竭患者中非 HFpEF 患者发生 MACE 事件的风险，EAT 体积越大，MACE 事件发生率越高。

PO-1153

基于定量 CT 分析吸烟与年龄对无症状健康男性小气道病变的交互影响

袁宇宇、黄晓旗、李建龙
延安大学附属医院

目的：采用参数效应图(PRM)分析无症状健康男性的胸部 CT 图像，探讨小气道病变是否受到吸烟和衰老交互作用的影响。

材料与方法：回顾性纳入无症状健康男性 93 例，其中包括吸烟者 62 人，不吸烟受试者 31 人。所有患者均接受深吸气末和呼气末胸部 CT 检查与肺功能测定。通过 PRM 方法得出小气道病变区域百分比（PRM^{fSAD}%）。根据不同年龄阶段及是/否吸烟进行分组。采用单因素方差分析或 Kruskal-Wallis H 检验比较各组差异，组间比较采用独立样本 t 检验或 Kruskal-Wallis H 检验。采用 Spearman 秩相关检验分析 CT 定量指标与肺功能参数的相关性。采用多元线性回归分析探究小气道病变的影响因素，运用简单效应分析探讨年龄与是/否吸烟的交互作用。

结果: 三组间吸烟指数、FVC 及 PEF 差异具有统计学意义。随着年龄组增大, $PRM^{fSAD\%}$ 逐渐增大 ($p < 0.05$)。在不同年龄分组中, 吸烟能够增加 50 至 59 岁组与 60 至 69 岁组中的 $PRM^{fSAD\%}$ ($P < 0.05$)。小于 50 岁组中是/否吸烟均不能改变 CT 定量结果 ($P > 0.05$)。 $PRM^{fSAD\%}$ 与 FEV1/FVC 相关, 与 FEV1% 不相关。在不同年龄分组中, 60 至 69 岁组年龄是 $PRM^{fSAD\%}$ 的正向影响因素 ($P < 0.05$)。在是/否吸烟分组中, 吸烟是 $PRM^{fSAD\%}$ 的正向影响因素。在不同年龄组下是/否吸烟亚组中, 50 至 59 岁组吸烟是 $PRM^{fSAD\%}$ 的正向影响因素 ($P < 0.05$)。年龄和是/否吸烟在 $PRM^{fSAD\%}$ 间有交互作用 ($P < 0.05$)。

结论: CT 定量指标能准确测量无症状健康男性肺内小气道疾病, 在不同年龄阶段和是/否吸烟中存在交互影响。在 50-69 岁无症状健康男性中, 年龄和吸烟是小气道疾病的影响因素, 在 60 至 69 岁之间, 年龄增长比吸烟对无症状健康男性的小气道病变贡献更大。

PO-1154

基于 1.5T 心脏磁共振的中国儿童心脏、主动脉和肺动脉正常值参考范围

曹玉坤、史河水

华中科技大学同济医学院附属协和医院

目的: 心脏磁共振 (CMR) 技术是评估小儿心脏疾病的重要工具。目前报道的儿童心脏大小和肺动脉宽度的参考值的样本量较小, 并且缺乏中国儿童数据。本研究旨在基于 CMR 技术建立中国儿童的双心室容积、心功能、室壁厚度和主肺动脉宽度的参考值。

方法: 本研究纳入无心血管病史的 0-15 岁中国儿童, 行 1.5T 心脏磁共振电影 (b-SSFP 序列) 扫描。基于标准化的不同切面, 测量双心室和左房容积, 左室壁厚度, 双室心功能和主肺动脉宽度。

应用 lambda-musigma [LMS] 方法, 绘制了不同年龄层的参考百分位曲线。

结果: 150 例健康儿童 (年龄: 0-15 岁, 80 例男童, 70 例女童) CMR 数据被分为 3 组 (0-5 岁, 6-10 岁, 11-15 岁)。在 10 岁以前, 双室容积 (男性 LVEDV: 25 [20-30] mL, RVEDV: 23 [18-31] mL; 女性 LVEDV: 22 [21-24] mL, RVEDV: 23 [21-26] mL, $P = 0.324$) 室壁厚度 (男性, LVMT: 4mm [2-7]; 女性 3mm [2-6], $P = 0.159$) 和主动脉宽度 (男性, 10mm [9-15]; 女性, 9mm [8-16] $P = 0.572$) 肺动脉宽度 (男性, 9mm [8-12]; 女性, 6mm [7-12], $P = 0.572$) 在性别群体之间不存在差异; 10 岁以后, 男性的双室容积和室壁厚度数值较女性更高 (所有 p 值 < 0.001)。此外, 双室容积、室壁厚度和主肺动脉宽度随着年龄增长呈显著上升趋势 (所有 p 值 < 0.001), 而心功能在不同年龄组之间无明显差异 ($p = 0.451$)。

结论: 本研究提供了性别和年龄特异的中国健康儿童心脏磁共振参考范围, 旨在为未来临床儿童心肌病早期监测和未来研究提供定量标准依据。

PO-1155

胸部低剂量 CT 应用深度学习重建算法在胸部病变诊断中的可行性研究

王金华、宋兰、隋昕、赵瑞杰、杜华阳、汪佳儒、肖然、明樱、宋伟

中国医学科学院北京协和医院

目的 探讨胸部 LDCT 应用深度学习算法 (DLR) 对于图像质量改善和胸部病变诊断评估的可行性。

方法 前瞻性纳入 60 名成人患者进行胸部常规 CT 和 LDCT 检查。常规 CT 图像用混合迭代重建算法 (HIR) 进行重建, LDCT 图像用 HIR 和 DLR 进行重建。1 名医师分别记录常规 CT 和 LDCT 的

辐射剂量,在隆突水平的气管腔内选取感兴趣区并测量其 CT 值和标准差,用于评价图像噪声和信噪比 (SNR)。2 名胸部影像医师按照 Likert 5 分制对肺部主要解剖结构 (肺裂、近端支气管及血管、外周支气管及血管、胸膜及胸膜下结构) 图像质量和异常病变 (肺结节、肺密度减低影、肺密度增高影、肺纤维灶和气道病变) 的 CT 特征进行主观评估。采用 Kruskal-Wallis 非参数检验对 3 组图像的主观和客观评分进行分析,若总体存在差异,则用 Bonferroni 校正检验进行组内两两比较。结果 LDCT 的辐射剂量 ($0.29\pm 0.03\text{mSv}$) 显著低于常规 CT ($2.05\pm 0.65\text{mSv}$) ($P < 0.001$)。常规 CT、LDCT HIR-Str 和 LDCT DLR-Str 的图像噪声分别为 33.9 ± 4.7 、 39.6 ± 4.3 和 $31.2\pm 3.2\text{HU}$ ($P < 0.001$)。显示肺部主要解剖结构,LDCT DLR-Str 图像明显优于 LDCT HIR-Str 图像 ($P < 0.001$),与常规 CT 图像无统计学差异 ($P > 0.05$)。LDCT DLR-Str 在评估实性结节、肺密度增高影、肺纤维灶和气道病变方面与常规 CT 相当 (P 均 > 0.05)。LDCT DLR-Str 对磨玻璃结节和肺密度减低影的显示优于 LDCT HIR-Str,但劣于常规 CT (P 均 < 0.05)。

结论 在辐射剂量减少 86% 的情况下,DLR 可以有效地减少图像噪声,提高图像质量,且显示肺部病变优于 HIR。除了磨玻璃结节和肺部低密度影外,LDCT DLR 对肺部病变的显示效果可与常规 CT 相当。

PO-1156

探讨超低剂量胸部 CT 不同重建算法对 AI 肺炎定量和图像质量的影响

陈伟婷¹、金晨望²、马光明³、于楠³

1. 陕西中医药大学

2. 西安交通大学第一附属医院

3. 陕西中医药大学附属医院

目的:探讨超低剂量条件下滤波反投影 (FBP)、自适应统计迭代重建 (ASIR-V) 40%、深度学习图像重建 (DLIR) 不同重建算法对人工智能影像辅助肺炎定量分析 (uAI-Discover-NCP) 和图像质量的影响。

方法:纳入 43 例肺炎复查者,根据 BMI,分为体重正常或较轻者、超重者、肥胖者,分别采用不同的管电流 (10、20、35mA) 行超低剂量 CT (ULDCT) 扫描。原始数据分别采用 FBP、ASIR-V40%、DLIR-M、DLIR-H、DLIR-H+E2 重建,共获得 5 组图像。测量空气、肺组织、胸主动脉、肩胛下肌、胸椎的 CT 值、噪声 (SD) 值,计算信噪比 (SNR)。两名资深影像医师对 5 组图像整体质量及肺炎显示进行 5 分制评分,并行 Kappa 一致性检验。图像导入 CT 影像辅助肺炎分析软件进行分析,记录肺炎指数、肺炎体积、肺炎体积百分比、肺炎质量及肺炎质量百分比。采用重复测量方差分析或 Friedman 秩和检验比较各组肺炎定量参数、感兴趣区的 CT 值、SD 值、SNR 值及主观评分的差异。

结果:5 组图像在空气、肺组织、胸主动脉、肩胛下肌、胸椎体感兴趣区 CT 值差异均无统计学意义 ($P > 0.05$); 而 SD 及 SNR 的总体差异有统计学意义 ($P < 0.05$),其中 DLIR-H 组的图像噪声最低、SNR 最高,与其他四组相比,差异均有统计学意义 ($P < 0.05$)。两名医师对各组图像的主观评分一致性较好 ($\text{Kappa} = 0.726 \sim 0.920$),5 组图像的整体质量、肺炎显示评分总体差异有统计学意义 ($P < 0.001$),其中 DLIR-H 与 DLIR-H+E2 组差异无统计学意义 ($P > 0.05$)。5 组图像肺炎定量参数 (肺炎指数、肺炎体积及肺炎体积百分比、肺炎质量及肺炎质量百分比) 总体差异均无统计学意义 ($P > 0.05$)。

结论:超低剂量扫描条件下,影像辅助肺炎定量分析结果不受重建算法的影响。与滤波反投影 (FBP)、自适应统计迭代重建 (ASIR-V) 40% 相比,高强度深度学习图像重建算法能显著降低图像噪声、明显提升图像质量,对肺炎复查有较大的优势。

PO-1157

胸部首过灌注成像检测不同风险分层的急性肺栓塞中的栓塞

周宇涵、王芝浩、雷丽敏、曹伟萌、刘杰、岳松伟
郑州大学第一附属医院

目的 本研究探讨基于多参数光谱 CT 成像在急性肺栓塞临床风险分层中评估肺灌注缺损程度的性能。

方法 回顾性分析 2023 年 2 月至 2023 年 4 月诊断为肺栓塞的 50 例患者。多参数功能 CT 用于肺动脉造影 (CTPA)。根据肺栓塞的简化临床风险分层评分, 将患者分为低风险组 (28 例) 和中风险组 (22 例)。分别利用碘密度 (ID)、有效原子序数 (Zeff) 和 ID-Zeff 融合图像 (ID-Zeff) 对胸部首过灌注图像进行后处理。Mastora 评分用于评估各组低灌注区的面积, 并绘制各组的受试者操作特征 (ROC) 曲线。计算曲线下面积 (AUC), 以比较各组在评估风险急性肺栓塞的风险分层 (中等或低) 方面的诊断效果。

结果 50 例患者中, 各组 Mastora 评分分别为: ID 图 (低危组 14 ± 5.2 , 中危组 22 ± 4.5)、Zeff 图 (低危险组 16.5 ± 4.8 , 中危对照组 24 ± 5.2)、ID-Zeff 图 (低风险组 18.5 ± 4.8 , 中危对照组 26 ± 5.8)。与 CI 图像 (AUC 0.78, 灵敏度 76%, 特异性 82%) 相比, ID 图 (AUC 0.86, 灵敏度 86%, 特异性 88.5%)、Zeff 图 (AUC 0.882, 灵敏度 89%, 特异性 89%) 和 ID-Zeff 图在急性肺栓塞的中低风险患者中具有较高的预测效能。

结论 基于多参数功能 CT 的 ID-Zeff 融合图像生成的光谱多参数图像可显著提高对不同风险急性肺栓塞患者的预测能力。为急性肺栓塞患者的风险分层和短期预后评估提供了额外的影像学证据。

PO-1158

基于肝/脾 CT 值诊断的非酒精性脂肪肝对
中晚期非小细胞肺癌患者免疫疗效的影响

李伊、周国锋、龚冰鑫
华中科技大学同济医学院附属协和医院

目的: 探讨基于肝/脾 CT 值诊断的非酒精性脂肪肝 (NAFLD) 对中晚期非小细胞肺癌 (NSCLC) 患者使用免疫检查点抑制剂 (ICIs) 疗效的影响。

方法: 回顾性收集 2020 年 3 月至 2023 年 7 月首次就诊于华中科技大学同济医学院附属协和医院的 III 期、IV 期 NSCLC 患者的临床和影像学资料, 确保其治疗前至少行一次 CT 扫描。共 479 名患者, 通过测量基线时的肝/脾 CT 值, 将患者分为 NAFLD 组 (肝/脾 CT 值 ≤ 1 , 118 例) 及非 NAFLD 组 (肝/脾 CT 值 > 1 , 361 例), 对患者进行随访, 获取患者的总生存期 (OS)、无进展生存期 (PFS)、客观缓解率 (ORR) 和疾病控制率 (DCR), 利用单因素和多因素 Cox 比例风险回归分析患者的临床、疾病进展及生存资料, 评估两组间的免疫治疗疗效, 并进行亚组分析, 构建森林图, 以评估不同亚组内免疫治疗效应的差异。

结果: NAFLD 组与非 NAFLD 组均有较高的 DCR, 分别为 94% 与 92% ($p=0.20$), 两组的 ORR 分别为 38.1% 与 44.9% ($p=0.45$), 两组之间的疗效没有差异。在单因素分析中, NAFLD 对 OS ($p=0.85$) 与 PFS ($p=0.79$) 没有显著影响。同时, 研究证实年龄是影响治疗疗效的重要因素, 老年患者的生存率低于年轻患者 (HR 1.54, 95%CI 1.06, 2.23, $p=0.02$)。此外, 肺癌患者的低短期反应率 (HR 2.04, 95%CI 1.46, 2.84, $p<0.001$) 和生存率 (HR 1.80, 95%CI 1.13, 2.86, $p=0.01$) 与初诊时肺癌的分期有关。

结论: 在 NSCLC 患者中, 基于肝/脾 CT 值定义的 NAFLD 在 ICIs 治疗后没有导致生存或疾病进展的变化。

PO-1159

基于双层探测器光谱 CT 定量参数及常规 CT 特征列线图评估肺浸润性非黏液腺癌高级别亚型的价值

洪榕、胡春洪
苏州大学附属第一医院

目的 探讨双层探测器光谱 CT 定量参数联合常规 CT 特征列线图在评估肺浸润性非黏液腺癌高级别亚型(HGP)中的价值。

方法 回顾性分析 2022 年 2 月至 2023 年 5 月苏州大学附属第一医院 71 例经手术切除且病理证实为肺浸润性非黏液腺癌患者的临床及影像学资料, 将其分为 HGP 组和非 HGP(non-HGP)组。分析评估病灶的大小、形态、密度、内部征象、边缘、胸膜牵拉征等常规 CT 特征及病灶的碘浓度(IC)、电子云密度(ED)、标准化碘浓度(NIC)等光谱 CT 定量参数。采用单因素方差分析筛选出差异有统计学意义的参数并通过多因素 logistic 回归分析筛选出 HGP 的独立危险因素, 构建常规 CT 特征模型、光谱 CT 定量参数模型及联合模型, 并绘制列线图。采用受试者操作特征(ROC)曲线下面积(AUC)评估各模型性能, AUC 比较采用 DeLong 检验。决策曲线(DCA)评估模型的临床净获益。

结果 HGP 组与 non-HGP 组在病灶密度、分叶征、毛刺征、IC_{AP}、IC_{VP}、NIC_{AP}、ED_{AP} 及 ED_{VP} 之间的差异均有统计学意义($P<0.05$)。多因素 logistic 回归分析表明, 常规 CT 特征中病灶密度($OR=15.452$, 95%CI% 4.246-56.235, $P<0.001$)和分叶征($OR=7.069$, 95%CI% 1.618-30.883, $P=0.009$)、光谱定量参数中 ED_{AP} ($OR=1.183$, 95%CI 1.064-1.315, $P=0.002$)和 IC_{VP} ($OR=0.231$, 95%CI 0.072-0.744, $P=0.014$)是预测 HGP 的独立危险因素。所构建的常规 CT 特征模型、光谱 CT 定量参数模型及联合模型的 AUC 分别为 0.835、0.890 和 0.915, 其中联合模型的诊断效能优于常规 CT 特征模型 ($P=0.008$), 灵敏度和特异度分别为 85.0%和 83.87%。DCA 分析表明列线图模型对比常规 CT 特征模型临床获益率更高。

结论 基于双层探测器光谱 CT 定量参数及常规 CT 特征的列线图模型可有效预测肺浸润性非黏液腺癌高级别亚型, 优于常规 CT 模型, 可以作为术前无创诊断 HGP 的可靠方法。

PO-1160

癌症中的免疫检查点抑制剂: 动脉粥样硬化性心血管疾病事件风险和冠状动脉钙化进展增加

龚冰鑫、梁波
华中科技大学同济医学院附属协和医院

背景: 免疫检查点抑制剂 (ICI) 为癌症治疗的进步做出了显著贡献, 改善了许多晚期癌症患者的临床结果。临床前和临床研究均表明 ICI 与动脉粥样硬化及其相关心血管事件相关; 然而, 这种联系背后的确切机制尚未阐明。

方法: 回顾性研究纳入 2020 年 3 月 1 日至 2022 年 4 月 30 日在武汉协和医院诊断为 III 期或 IV 期非小细胞肺癌 (NSCLC) 的患者。在基线及治疗后 3、6 和 12 个月的随访胸部 CT 扫描期间, 对一部分患者的冠状动脉钙 (CAC) 体积和评分进行了评估。该研究的主要终点是动脉粥样硬化性心血管疾病 (ASCVD) 事件的发生, 包括心肌梗死、冠状动脉血运重建和缺血性中风。次要终点是治疗后三个时间点的 CAC 进展。

结果：总体而言，心血管研究队列共纳入了 1,458 名患者（487 名 [33.4%] 接受 ICI 治疗，971 名 [66.6%] 未接受 ICI 治疗）。在整个随访期间（中位随访 23.1 个月），非 ICI 组发生了 24 起 ASCVD 事件（4.9%），非 ICI 组发生了 14 起 ASCVD 事件（1.4%）。CAC 影像研究队列共有 246 名患者（113 名 [45.9%] 接受 ICI 治疗，133 名 [54.1%] 未接受 ICI 治疗）。在 ICI 组中，CAC 体积/分数从 93.4 mm³/96.9（基线）增加至 104.7 mm³/105.5（3 个月）、116.7 mm³/121.0（6 个月）和 125.1 mm³/132.8（12 个月）。在非 ICI 组中，CAC 体积/分数从 70.1 mm³/68.8（基线）增加至 72.4 mm³/80.4（3 个月）、81.8 mm³/88.8（6 个月）和 84.4 mm³/87.9（12 个月）。ICI 启动后，心血管事件和 CAC 进展均增加。

结论：ICI 治疗与较高的 ASCVD 事件发生率和显著增加的 CAC 进展相关。对于有心血管危险因素的个体，包括在胸部 CT 扫描中偶然检测到冠状动脉钙化斑块的个体，在免疫治疗之前应谨慎行事。

PO-1161

冠状动脉周围脂肪组织衰减对心功能的影响： 基于 Revolution CT 的回顾性评价

席华泽、周俊林
兰州大学第二医院

目的

冠状动脉炎症的检测和量化可能有助于冠状动脉疾病（CAD）患者的早期诊断及治疗，甚至可能有助于冠状动脉斑块进展的推进，而尚无研究分析阐明冠脉炎症对冠心病患者心功能改变的促进作用。因此，本研究的目的是通过分析 PCAT 的几个定量参数与患者心功能参数之间的关系，明确冠脉炎症与冠心病患者心功能改变是否有关联。

方法和材料

我们回顾性地招募了 253 名通过 Revolution CT 进行冠状动脉计算机断层扫描（CCTA）诊断为稳定型 CAD 的患者，包括 96 名经超声检查心功能异常患者，157 名心功能正常的患者。两位独立的盲目放射学家使用半自动软件对 CCTA 图像中斑块周围 PCAT 的脂肪衰减指数（FAI）进行了量化，患者心脏超声检查结果共检查三次，对结果取平均值，平均值位于正常范围外认为患者存在心脏功能障碍。对上述不同患者之间的临床特征和 PCAT 定量参数进行了比较。

结果

在入选的参与者中，119 人是男性，134 人是女性。所有参与者的平均年龄为 53（41 至 64）岁。在年龄、性别、体重指数、是否高血压、高血脂、高血糖以及药物史等方面均没有观察到组间差异。心功能异常组患者的 LAD 段、RCA 段 FAI 值、平均 FAI 值、斑块周围 FAI 值均高于心功能正常组（ $P < 0.001$ ）。心功能异常组的 RCA 段 FAI 值和 LAD 段 FAI 值低于心功能正常组，RCA 段 FAI 值与射血分数、短轴收缩率之间存在负相关，LAD 段 FAI 值与心脏指数呈负相关，并且受到患者狭窄程度的影响。在患者斑块长度，斑块体积，斑块脂质成分含量等协变量矫正后，随着 FAI 值降低，CL 与 FAI 呈“U”型关系。主成分分析显示，根据 RCA 段 FAI 值可以将心功能异常的 CAD 患者与心功能正常的 CAD 患者进行聚类。

结论

FAI 值不仅可以作为指示 CAD 进展的生物传感器，PCAT 的定量参数还可以对患者心功能改变做出一定程度的预测。与其他筛查方法相比，基于 CCTA 测量的 PCAT 衰减值不仅可以无创且准确地检测冠状动脉炎症。同时可以在一次检查内同时对患者心功能的改变做出预警，让一些慢性 CAD 患者在常规复查时注意到潜在的心功能改变，这有助于临床改善 CAD 患者的预后。

PO-1162

肺动脉与升主动脉内径比值对接受使用免疫检查点抑制剂治疗的非小细胞肺癌患者的预后价值

龚冰鑫、梁波

华中科技大学同济医学院附属协和医院

背景：免疫检查点抑制剂（ICI）的广泛使用导致越来越多的副作用和不良事件。有研究表明 ICI 的使用会增加肺动脉与升主动脉内径（PAD/AoD）比值。但尚不清楚 PAD/AoD 比值的不同进展程度是否会对患者预后造成影响。本研究通过基于肺部增强 CT 的 PAD/AoD 比值来评估使用 ICI 的晚期非小细胞肺癌(NSCLC)患者的预后。

方法：回顾性收集 2020 年 3 月至 2023 年 9 月首次就诊于华中科技大学同济医学院附属协和医院的 III 期或 IV 期 NSCLC 患者的临床和影像学资料。通过胸部增强 CT 扫描图像分别评估患者基线及治疗后最近一次的 PAD/AoD 比值。结果包括客观缓解（ORR）、疾病控制率(DCR)、无进展生存期(PFS)和总生存期（OS）。

结果：共 441 名患者纳入研究，包括 221 名 PAD/AoD 比值进展严重患者及 220 名进展不严重患者。两组患者的基线资料没有显著差异。与非严重进展组相比，严重进展组的 DCR 较低且具有统计学意义(87.8% vs. 96.0%, $P = 0.005$)。同时，严重进展组的 ORR 也较低，尽管没有达到统计学差异(87.5% vs. 96.0%, $P = 0.063$)。在 22.0 个月的中位随访期间，严重进展组有 85 名（38.5%）患者死亡，非严重进展组有 30 名(7.3%)患者死亡。与非严重进展组相比，严重进展组具有更短的 PFS (HR: 1.48 [95% CI, 1.14 to 1.93]; $P = 0.003$) 和 OS(HR: 3.50 [95% CI, 2.30 to 5.30]; $P < 0.001$)。

结论：ICI 治疗扩大了肿瘤患者 PAD/AoD 比值，且更严重的进展程度与更差的预后相关。在随期间对 PAD/AoD 比值进行评估应该是患者 ICI 治疗过程的一部分。

PO-1163

基于瘤内及瘤周影像组术前预测临床 T1 期浸润性肺腺癌的内脏胸膜侵犯：一项多中心的研究

董浩¹、杨泽斌²、叶晓丹³

1. 杭州市萧山区第一人民医院

2. 东阳市人民医院

3. 复旦大学附属中山医院

目的 本研究将尝试建立基于瘤内及瘤周影像组学预测浸润性肺腺癌内脏胸膜侵犯的模型，并且进行独立的外部验证。方法 回顾性收集了 3 家医学中心的 317 例经手术病理确诊的伴有胸膜牵拉征象的浸润性肺腺癌患者的 CT 影像及临床资料，中心 1 的 109 例患者和中心的 100 例患者一起按 7:3 比例随机分为训练集（147）和内部验证测试集（62），中心 3 的 108 例患者作为独立的外部验证集。通过单变量分析、多变量分析、Spearman 相关分析、最小冗余最大相关（mRMR）和最小绝对收缩率和选择运算符（LASSO）用于特征选择。构建并比较临床 CT 语义模型、瘤内影像组学模型、瘤周影像组学模型和瘤内-瘤周影像组学模型。通过计算受试者工作特征曲线下面积（AUC）等指标来评估模型效能，使用决策曲线分析（DCA）来评估模型的临床应用价值。结果 瘤内模型在测试集中表现出最高的性能（AUC = 0.825, 95% CI: 0.789-0.855），高于瘤周模型（AUC = 0.787, 95% CI: 0.755-0.817）、瘤内-瘤周模型（AUC = 0.715, 95% CI: 0.671-0.759）和临床 CT 语义模型（AUC = 0.527, 95% CI: 0.488-0.565），在独立的外部验证集中瘤内模型仍是最高（AUC = 0.819, 95% CI: 0.790-0.848），表明模型具有较强的泛化能力，校准曲线和决策曲线证实

了瘤内影像组学模型的准确度和临床实用性。结论 基于 CT 的肿瘤内影像组学特征对临床 T1 期浸润性肺腺癌的内脏胸膜侵犯有较好的预测能力, 可以为临床诊断及外科治疗方案提供一定的参考依据, 帮助改善患者的预后。

PO-1164

基于胸部定量 CT 探究新型冠状病毒感染患者 俯卧位治疗前后肺结构的变化

王佳辉¹、黄晓旗²、李建龙²

1. 延安大学附属医院

2. 延安大学附属医院

目的: 基于胸部定量 CT 测量探讨新型冠状病毒感染患者俯卧位治疗前后肺结构变化。

方法: 选取 2022 年 12 月-2023 年 2 月延安大学附属医院收治的 50 例新型冠状病毒重症感染患者应用俯卧位治疗患者。回顾性分析俯卧位治疗前后的胸部定量 CT 相关指标和患者动脉血氧分压 (PaO₂)、动脉血氧饱和度 (SaO₂)、氧合指数 (PaO₂ / FiO₂)。采用 SPSS 26 对所收集数据进行统计学处理与分析, 符合正态的计量资料用 $\bar{x} \pm s$ 表示, 不符合正态的计量资料用 M (Q1, Q3) 表示, 多组间比较用 Kruskal-Wallis H 检验, 两组间比较用 Mann-Whitney U 检验。采用 ROC 曲线分析定量 CT 指标的诊断效能。将 P<0.05 有统计学意义。

结果: 患者行俯卧位治疗后, Kruskal-Wallis H 检验显示 PaO₂ (H=27.745 P<0.001)、SaO₂ (H=29.357 P<0.001)、PaO₂ / FiO₂ (H=28.295 P<0.001)、肺炎体积 (H=6.884 P=0.032)、肺炎体积占肺容积百分比 (H=6.281 P=0.043)、肺炎体积平均质量 (H=6.569 P=0.011) 与治疗前比较差异有统计学意义, ROC 曲线分析示肺炎体积曲线下面积 0.639 (P=0.010)、肺炎体积占肺容积百分比曲线下面积 0.632 (P=0.014)、肺炎体积平均质量曲线下面积 0.637 (P=0.011), 结果有统计学意义。

结论: 新型冠状病毒感染患者俯卧位治疗前后胸部定量 CT 及氧合功能变化明显, 胸部定量 CT 可以对新型冠状病毒感染患者治疗疗效提供有力的影像学依据, 值得在临床工作中推广。

PO-1165

4D FLOW CMR 分析儿童室性期前收缩左心室血流特征

冯凯、马跃

中国医科大学附属盛京医院

目的: 应用四维血流心血管磁共振 (4D FLOW CMR) 对室性期前收缩 (PVC) 患儿左心室血流特征进行分析, 评估左心室血流成分与左心室功能及 PVC 负荷的关系。

方法: 前瞻性收集 2023 年 6 月至 8 月就诊于我院确诊为 PVC 患儿共 9 例 (年龄: 8±2.9, 男: 5 例), 并收集接受 CMR 检查的无心肺疾病儿童 5 例做为对照组 (年龄: 8±3.8, 男: 2 例)。所有患儿均于 3 天内行 24 小时动态心电图检查及 CMR 测定左心室功能及血流。采用平衡稳态自由进动序列采集心脏电影序列, 测定左心室舒张末期容积、收缩末期容积、射血分数 (LVEF)、每搏输出量等功能参数, 采用三维回顾性心电图触发导航仪门控 4D FLOW 序列进行全心血流扫描, 测定左心室直接血流百分比 (LVPDF)、延迟射血血流百分数 (LVPDEF)、保留流入量血流百分数 (LVPRI) 和残余血流百分数 (LVPRV)。

结果: PVC 患儿 LVPDF、LVPDEF、LVPRI 和 LVPRV 分别为 36.03%±5.59%、23.16%±4.49%、22.98%±3.57%、17.82%±4.6%, 对照组分别为 44.41%±4.00%、22.60%±3.07%、20.41%±4.71%、12.57%±2.51%; PVC 患儿 LVPDF 显著低于对照组 (p<0.01)。PVC 患儿组 LVPDF 与

LVPDEF 及 LVPRV 与 LVEF 均呈负相关趋势 ($r=-0.585$, $P=0.098$; $r=-0.636$, $P=0.066$); (LVPDF+LVPDEF) 为 $(59.19\pm 4.69)\%$, 与 LVEF 呈显著正相关 ($r=0.824$, $P<0.001$), 且 LVEF 与 (LVPDF+LVPDEF) 之间差异无统计学意义 ($P=0.759$)。PVC 患儿 LVPDF 与 PVC 负荷呈显著负相关 ($r=-0.671$, $P=0.048$)。

结论: 4D FLOW CMR 能够在自由呼吸状态下测定 PVC 患儿的左心功能。PVC 患儿左心直接血流减少, 且左心室直接血流与左心室功能、PVC 负荷相关, 是评价 PVC 患儿左室功能及室性期前收缩负荷的重要指标。

PO-1166

基于 CT 体素形态测量法建立列线图预测 COPD 的严重程度

王雷、任涛
延安大学附属医院

目的 探讨基于体素的 CT 定量指标, 分析慢性阻塞性肺疾病(COPD)严重程度相关的危险因素, 建立个体化预测重度 COPD 的列线图模型。

方法 收集自 2020 年 5 月至 2021 年 9 月纳入延安大学附属医院行双气相扫描及肺功能检查确诊的 COPD 患者, 最终符合条件的 COPD 患者共计 118 例。按照 COPD(GOLD)严重程度分级(组), 将患者分为轻度 COPD 组(GOLD I、II 级): 66 例; 重度 COPD 组(GOLD III、IV 级): 52 例。比较轻度/重度 COPD 组双气相配准 CT 定量指标及临床指标。用 SPSS 及 R 软件进行统计分析, 建立列线图模型, 分析重度 COPD 的独立危险因素。

结果 双气相配准 CT 定量指标小气道疾病区域百分比(fsad%), 肺气肿区域百分比(Emph%)在轻度 COPD 组和重度 COPD 组之间存在显著差异, 重度 COPD 组高于轻度 COPD 组。同时随着 COPD 严重程度增加, 肺功能指标 FVC、FEV1%pred 和 FEV1/FVC%均下降; 重度 COPD 组吸烟指数高于轻度 COPD 组, 与之对应重度 COPD 组 fSAD%和 Emph%高于轻度 COPD 组; 通过多因素 Logistic 回归分析发现, 吸烟指数、fSAD%、Emph%及正常肺组织 Normal%是重度 COPD 的独立风险因子, 基于上述 4 项危险因素, 建立预测重度 COPD 的风险模型, 影响患者死亡风险权重从高至低的因素依次为: Normal%、Emph%、fSAD%和吸烟指数, 一致性指数 (C-index) 0.786 (95%CI: 0.704~0.867), 灵敏度 0.673, 特异度 0.788, 曲线下面积 (AUC) 为 0.786; 通过校准图对列线图预测模型进行内部验证, 校准图显示模型校准曲线与标准曲线接近。

结论 基于体素的 CT 定量能够准确预测 COPD 严重程度, 通过 Normal%、Emph%、fSAD%和吸烟指数的独立危险因素, 建立的预测 COPD 严重程度的列线图模型, 具有良好的诊断效能和准确度, 对甄别轻度 COPD 和重度 COPD、制定个体化干预方案具有指导意义。

PO-1167

冠心病患者合并高尿酸血症与左心室重构的相关性研究

任成龙、魏伟
陕西中医药大学附属医院

目的: 研究冠心病患者伴高尿酸血症与左心室重构的关系。

方法: 收集 2023 年 5 月-9 月心内科确诊为冠心病患者 43 例, 其中冠心病合并高尿酸血症患者 23 例 (A 组), 不合并尿酸升高患者 20 例 (B 组)。纳入标准: 临床确诊为冠心病患者; 患者入院后禁食富含嘌呤食物 1 天后清晨采集静脉血; 使用 3.0T Vida 西门子核磁共振进行心脏核磁增强扫描; 使用 QIC 软件分析心脏左心室重构相关指标, 包括: 射血分数 (%); 舒张末期容积 (ml); 舒张

末期容积指数 (ml/m²);收缩末期容积 (ml);收缩末期容积指数 (ml/m²);重构指数 (m/edv)。排除标准: 严重心脏瓣膜疾病; 肥厚性心脏病; 扩张性心脏病; 心脏淀粉样变性患者。应用 SPSS20 统计软件进行 t 检验分析。

结果: A 组患者在血清尿酸值明显高于 B 组, 差异具有统计学意义 ($P<0.05$)。A 组患者在射血分数 (%); 舒张末期容积 (ml);舒张末期容积指数 (ml/m²);收缩末期容积 (ml);收缩末期容积指数 (ml/m²);重构指数 (m/edv) 较 B 组明显差异, 差异具有统计学意义 ($P<0.05$)。

结论: 冠心病患者伴高尿酸血症患者, 血尿酸升高可能是左心室重构的影响因素。

PO-1168

基于冠状动脉 CTA 评估斑块特征及血流动力学变化对急性冠状动脉综合症的预测价值

欧阳丽娜、朱力
宁夏医科大学总医院

目的 探讨联合冠状动脉病变的解剖学严重程度、斑块形态学及定量特征和血流动力学变化对 ACS 的预测价值。

方法 对 2017 年 6 月~2020 年 12 月在宁夏医科大学总医院行 CCTA 检查的 458 例疑似冠心病患者进行了平均 3.9 年的随访, 最终共 56 例患者出现 ACS, 并采用倾向评分匹配法 ($n=1:4$) 筛选出同期性别及年龄相匹配的 204 例无 ACS 患者作为对照组, 最终研究对象共包括 56 例 ACS 患者 (包含 56 处责任病变) 和 204 例对照组 (包含 229 处非责任病变)。基于病变水平, 对比分析责任病变和非责任病变间冠状动脉病变的解剖学特征、斑块特征及 CT-FFR 的差异, 采用 COX 比例风险回归分析计算不同病变特征的 HR 及 95%CI。并采用 ROC 曲线计算单个及联合指标组成模型的灵敏度、特异度、PPV、NPV、AUC 及 95%CI。

结果 基于病变水平对比不同病变特征的差异, 结果如下: (1) 责任病变与非责任病变在解剖学和功能学等各项指标的对比中存在显著差异。责任病变的管腔直径狭窄率、非钙化斑块负荷及 Δ CT-FFR 值显著高于非责任病变, 低密度斑块和点状钙化的发生率高于非责任病变, 而钙化斑块体积、CT-FFR、最小管腔面积 (MLA) 显著低于非责任病变 (P 均 <0.05)。 (2) Δ CT-FFR (HR: 3.03) 是未来发生 ACS 的最重要危险因素, 其次是钙化斑块负荷 (HR: 2.80,)、MLA (HR: 2.56) 及低密度斑块 (HR: 2.15); (3) 预测模型 (包括低密度斑块、非钙化斑块负荷、MLA、 Δ CT-FFR) 对 ACS 事件的预测能力 (AUC: 0.865, 95%CI: 0.820-0.903) 最高。联合上述指标的模型的敏感度、特异度、PPV、NPV 分别为 78.57%、81.66%、51.20%、94.00%。

结论 Δ CT-FFR ≥ 0.06 、最小管腔面积 $\leq 2.94\text{mm}^2$ 、非钙化斑块负荷 $\geq 39.5\%$ 以及低密度斑块的出现提示未来发生 ACS 的风险高。结合斑块解剖学和功能学对冠状动脉病变的综合评估可以提高对未来 ACS 发生风险高的易损斑块的识别, 从而提高对 ACS 的预测价值。

PO-1169

基于 CMR 评价急性 STEMI 患者心肌内出血对左室动力学的影 响

辛洋、冯凯、侯阳、马跃
中国医科大学附属盛京医院

目的: STEMI 再灌注后心肌内出血 (IMH) 会加重心肌损伤, 血流动力学 (HDF) 同时反映心肌动力学功能及血流与心肌的相互作用, 本研究旨在明确 STEMI 后心肌内出血与 HDF 的关系, 探讨心梗后 IMH 通过影响左室动力学功能引起远期左室不良重构的潜在机制。

方法: 26 例急性 STEMI 患者分别于 PCI 术后 72h 内 (急性期) 和 6 个月 (慢性期) 行 CMR 检查。根据急性期 CMR 分为 IMH 组 ($n=13$, 57.2 ± 9.8 岁) 和非 IMH 组 ($n=13$, 53.0 ± 6.9 岁)。采用 Medis 软件进行后处理, 测量左室 HDF、LVEDV、LVEF、LGE 范围、心肌节段应变、ECV 等指标。通过 L-S HDF、A-B HDF 及 L-S/A-B HDF 比评估 HDFs 分布, HDFs 参数在整个心跳过程中计算, 包括收缩期和舒张期。

结果: 急性期两组间 HDF、ECV 及应变指标无显著差异, 慢性期 IMH 组 A-B 及 L-S HDF 均较非 IMH 组低 ($10.1[7.2-13.0]\%$ vs. $13.8[10.9-16.7]\%$, $1.8[1.3-2.3]\%$ vs. $2.7[2.0-3.4]\%$, $p<0.01$), 且受损较急性期显著加重 ($1.11[0.27-1.95]\%$ vs. $0.01[-0.66-0.68]\%$, $2.51[0.47-4.55]\%$ vs. $0.11[-2.24-2.46]\%$, $p<0.01$)。IMH 组梗死区及毗邻区 ECV 值较非 IMH 组明显增大 (58.0% vs. 38.1% , 41.4% vs. 32.2% , $p<0.01$), 且 IMH 组梗死区及远隔区 ECV 值持续增高 (46.0% vs. 58.0% , 31.7% vs. 36.4% , $p<0.01$), IMH 组梗死区 RS 及 CS 显著减低 (11.8% vs. 22.1% , -8.1% vs. -14.2% , $p<0.01$)。

结论: HDF 指标可反映急性 STEMI 患者 PCI 术后心肌动力学动态改变, 心肌内出血可引起左室动力学功能持续显著减低, 这与心梗后心肌内出血患者心肌应变减低及纤维化程度持续加重一致, 可能与远期左室不良重构有关。

PO-1170

不同采集方式的 4D Flow 技术对左心室腔内 血流速度测量的比较研究

马丽荣^{1,2}、郭家璇²、朱力¹、田博¹、马小兵¹

1. 宁夏医科大学总医院

2. 宁夏医科大学

目的: 评价局部区域性 4D Flow 技术和全心 4D Flow 技术在左心室腔内血流速度测量的可靠性与一致性, 为临床提供更为准确测量心腔血流的方法。

方法: 收集 2022 年 3 月 1 日-2022 年 5 月 31 日在宁夏医科大学总医院放射科行心脏磁共振检查健康志愿者 31 例 (男=16, 女=15), 年龄 20-30 岁, 同时行超声心动图检查。应用 CVI42 软件测量左心室功能参数, 分别测量和比较局部区域性 4D Flow 图像和全心 4D Flow 图像上收缩期主动脉瓣上、瓣下的血流峰值速度和压力梯度, 以及舒张期二尖瓣血流峰值速度。使用 ICC 相关系数进行超声与磁共振、以及区域性 4D Flow 和全心 4D Flow 图像测量结果的一致性分析。

结果: 心功能参数分析中, 超声心动图与心脏磁共振一致性较高 ($ICC>0.7$)。血流速度分析: 超声心动图、三腔心 4D Flow 与全心 4D Flow MRI 各瓣膜血流速度, 男女之间结果没有显著性差异 ($P>0.001$); 超声心动图与 4D flow CMR 两种扫描方法: 收缩期主动脉瓣上、瓣下峰值速度、主动脉压力梯度, 舒张期二尖瓣 E、A 峰峰值速度一致性较高 ($ICC\geq 0.6$); 三腔心与全心 4D flow MRI 以上速度结果一致性更高 ($ICC>0.75$)。

结论: 局部区域性 4D Flow 技术和全心 4D Flow 技术都可以实现对瓣膜血流速度及压力梯度的可靠评估, 并与超声心动图之间有良好的良好一致性, 但 4D Flow 技术对心腔内血流显示更为直观, 并对复杂流体的速度、压力、容积等信息进行定量测量和分析, 能提供更多的临床所关心的血流动力学指标, 因此 4D Flow 技术可作为一种新的方法对心腔内血流实现可视化与精准测量, 为更好服务于临床。

PO-1171

囊腔类肺癌 CT 影像学特征及其与病理相关性分析

陆晓燕、张宇威、马悦、鄂佳慧、王雪琦、刘颖
天津市肿瘤医院 (天津医科大学肿瘤医院)

目的 分析囊腔类肺癌的 CT 影像学特征, 并探讨其与病理相关性, 旨在提高术前诊断准确率并为临床提供有价值的预后信息。方法 回顾性收集 CT 表现为肺内含囊腔病灶并经手术病理证实为肺癌的 108 例患者的临床及术前影像资料, 依据腺癌病理亚型将其分为不同预后危险组, 分析 CT 影像征象在不同预后危险组间的差异并构建预测模型。结果 108 例囊腔类肺癌中腺癌 106 例, 鳞癌 1 例, 腺癌局灶鳞癌分化 1 例。106 例肺腺癌中依据其病理亚型分为低危组 45 例、中高危组 61 例。肺腺癌低危组与高危组的病灶大小、囊壁厚度、壁结节、实性成分差异有统计学意义 ($P < 0.05$), 多因素二元 Logistic 回归分析显示病灶平均径 ($OR = 1.084$, $P < 0.05$)、囊壁厚度 ($OR = 3.036$, $P < 0.05$) 为独立危险因素, 该模型 AUC 值 0.768, 诊断灵敏度和特异度分别为 70.5%、73.3%。结论 囊腔类肺癌更多见于肺腺癌, 联合病灶平均径和囊壁厚度的 CT 影像特征有助于判断肺腺癌不同病理亚型的预后分组。

PO-1172

3mm 和 6mm 瘤周放射组学模型预测非小细胞肺癌的淋巴结转移效能

牛愉鑫、贺祎凡、谢嘉月
大连医科大学附属第一医院

目的: 评估基于不同尺度瘤周体积 (PTV) 放射组学模型提高预测非小细胞肺癌 (NSCLC) 淋巴结转移的准确性方法。

材料与方法: 回顾性分析 2012 年 4 月至 2022 年 5 月期间接受 CT 薄层扫描、术前 2 周内病理确诊为纯实性结节或肿块样 NSCLC 的 167 例患者, 按 7:3 的比例随机分为训练数据集和测试数据集。在非增强计算机断层扫描 (NCECT) 的肺部窗口 (窗口宽度, 1500 HU; 窗口水平, -500 HU) 下, 使用 3D Slicer (5.0.3 版) 为 167 名癌症患者的 167 个病灶勾勒出 3 mm PTV 和 6mm PTV 两个感兴趣区 (ROI)。体素大小调整为 $1\text{mm} \times 1\text{mm} \times 1\text{mm}$, 并对原始图像进行了重新采样。使用该软件自带的放射组学软件包提取放射组学特征, 并使用组内和组间相关系数评估 (ICC)、相关分析、梯度提升决策树 (GBDT) 和逻辑回归等方法进行放射组学特征筛选, 构建 3mm PTV 和 6mm PTV 放射组学模型。

结果: 3mm PTV 建立的放射组学模型 (训练: $AUC = 0.651$; 测试: $AUC = 0.607$) 比 6mm PTV 放射组学模型 (训练: $AUC = 0.624$; 测试: $AUC = 0.365$) 具有更好的诊断性能。

结论: 本研究表明, NCECT 中的 3mm PTV 放射组学模型在预测纯实性结节或肿块样 NSCLC 患者的淋巴结转移方面优于 6mm PTV 放射组学模型。大多数研究者通过肿瘤总体积 (GTV) 的放射组学预测淋巴结转移与否, 而我们倾向 PTV 的放射组学信息是否能够预测非小细胞肺癌淋巴结转移情况。针对不同尺度的 PTV 放射组学研究层出不穷, 但关于通过原发灶及原发灶周围的放射组学信息来预测淋巴结转移的研究较匮乏。我们的研究针对 3mm 和 6mm 这两种瘤周尺度放射组

学进行建模, 最终发现 3 毫米 PTV 放射组学模型的诊断效果优于 6mm PTV 放射组学模型, 我们猜测, 可能 6mm 瘤周所包含的正常肿瘤组织成分范围较广, 而 3mm 的瘤周更加接近于原发灶, 所包含的肿瘤信息较为丰富, 因此 3mm PTV 放射组学相较于 6mm PTV 对 NSCLC 淋巴结转移的术前诊断更加具有辅助作用。

PO-1173

深度学习 (DLR) 与混合迭代 (HIR) 重建算法联合 CE-boost 后处理技术对下肢静脉 CTV 图像质量影响的对比探究

杜华阳、隋昕、宋兰、秦瑞遥、王曼、王金华、汪佳儒、赵瑞杰、宋伟
中国医学科学院北京协和医院

目的: CT 下肢静脉成像 (CTV) 往往强化效果不佳, 对比剂增强技术 (CE-boost) 可回顾性提升血管强化效果。本研究旨在评估深度学习重建 (DLR)、混合迭代重建 (HIR) 及 DLR 和 HIR 三次 CE-boost 对 CTV 图像客观、主观图像质量影响。

方法: 2021.06-2022.10 纳入 70 名患者, 年龄 (49.63 ± 14.70) 岁。使用佳能 CT 扫描机, 平扫、增强扫描方案均为 100kVp、噪声指数 8.8, HIR (A 组) 和 DLR (B 组) 重建层厚、层间距均为 1.0mm、0.8mm。经减影软件可获得 1-3 次减影后 HIR 和 DLR 图像。分别测量下腔静脉 (IVC)、股静脉 (FV) 和腘静脉 (PV) CT 值, 计算 SNR、CNR, 并由两名医师采用双盲法进行主观评估 (图像噪声 3 分法、静脉强化效果及整体图像质量均用 5 分法), 并记录辐射剂量。

结果: 原始增强图像和 1-3 次减影图像 IVC 的平均 CT 值 (HU) 为 (146.65 ± 17.44)、(199.01 ± 26.22)、(277.28 ± 39.80)、(393.73 ± 61.91), IVC、FV 和 PV 平均衰减在 2 组间无统计学差异。1-3 次 CE-boost 图像 IVC、FV 和 PV 衰减分别是原始图像的 1.3 (1.31-1.36)、1.8 (1.76-1.89) 和 2.6 (2.42-2.68) 倍。DLR、3 次 DLR CE-boost 图像的噪声 (HU) 分别为 (12.47 ± 2.67)、(8.99 ± 3.08)、(10.42 ± 5.76)、(14.71 ± 11.18) 明显低于 HIR 和 HIR CE-boost 图像 (21.28 ± 3.74)、(21.71 ± 5.65)、(26.59 ± 9.03)、(36.42 ± 15.01) (P 均 < 0.05)。DLR、DLR-CE-boost 图像 SNR、CNR、主观图像质量明显高于对应的 HIR、HIR-CE-boost 图像 (P 均 < 0.05)。

结论: 与 HIR、HIR CE-boost CTV 图像相比, DLR、DLR-boost 可在较低辐射剂量、较低对比剂用量, 获得满足临床诊断的优质图像, 值得临床应用。

PO-1174

增强 CT 放射组学模型: 能否为预测非小细胞肺癌的淋巴结转移提供增量价值

牛愉鑫、贺伟凡、李智勇
大连医科大学附属第一医院

目的: 比较增强 CT (CECT) 和非增强 CT (NCECT) 的放射组学模型 (RM) 预测非小细胞肺癌 (NSCLC) 淋巴结转移的诊断效能。

材料与方法: 回顾性分析 2012 年 4 月至 2022 年 5 月期间接受 CT 薄层扫描、术前 2 周内病理确诊为纯实性结节或肿块样 NSCLC 的 167 例患者, 按 7:3 的比例随机分为训练数据集和测试数据集。使用 3D Slicer (5.0.3 版) 为 167 名癌症患者的 167 个病灶在肺部窗口 (窗口宽度, 1500 HU; 窗口水平, -500 HU) 下, 从 NCECT 和 CECT 图像中在整个病变上逐层勾勒出感兴趣区域 (ROI), 并去除空腔区域及周围大血管。体素大小调整为 $1\text{mm} \times 1\text{mm} \times 1\text{mm}$, 并对原始图像进行重新采样。

使用该软件自带的放射组学软件包提取放射组学特征, 并使用组内和组间相关系数评估 (ICC)、相关分析、梯度提升决策树 (GBDT) 和逻辑回归等方法进行放射组学特征筛选, 构建 NCECT-RM 和 CECT-RM。

结果:CECT 建立的 RM (训练: $AUC = 0.664$; 测试: $AUC = 0.652$) 比 NCECT 放射组学模型 (训练: $AUC = 0.63$; 测试: $AUC = 0.596$) 具有更好的诊断性能。

结论: 本研究表明, CECT 放射组学模型在预测纯实性结节或肿块样 NSCLC 患者的淋巴结转移方面优于 NCECT 放射组学模型。大多数研究者通过 NCECT 的放射组学信息对肿瘤的相关信息进行分析, 而我们更倾向于发掘 CECT 的放射组学信息的有用性。基于 CECT 的放射组学的应用越来越广泛。相关研究表明, 碘增强成像比非增强成像的纹理分析能够更好地预测肺腺癌的侵袭性。虽然也有研究表明基于平扫 CT 的放射组学模型相比, 基于增强 CT 的放射组学模型在识别肺部良恶性结节方面没有带来额外的价值。但对于 CECT 在预测非小细胞肺癌的淋巴结转移这方面研究较少。我们的研究针对 CECT 和 NCECT 放射组学信息进行建模, 发现 CECT 放射组学模型在预测非小细胞肺癌淋巴结转移的诊断效能方面优于 NCECT 放射组学模型。

PO-1175

基于心脏 MRI 评估肥厚型心肌病与压力负荷对心肌重塑的交互作用

杨钰成¹、王海鹏²、王翠艳²

1. 山东第一医科大学附属省立医院

2. 山东第一医科大学附属省立医院医学影像科

目的: 为研究压力负荷增加对于肥厚性心肌病 (hypertrophic cardiomyopathy, HCM) 患者左心室形态、功能及组织特征的影响, 揭示 HCM 患者病理状态下的心肌对于压力负荷增高的重塑模式, 指导临床对伴有 HTN 的 HCM 患者的诊断与治疗。

方法: 回顾性收集 PACS 系统中 HCM 患者的心脏磁共振图像, 序列包括电影序列、T1 Mapping 及延迟强化, 使用 CVI42 后处理软件获得心功能参数、左心室心肌应变参数、T1 Mapping 参数, 并使用增强前、后的 T1 Mapping 生成细胞外容积分布图 (extracellular volume fraction, ECV)。将患者按照伴或不伴有高血压为分类标准分为两组进行比较分析。

结果: 在纳入的 35 名 HCM 患者中, 16 名 (46%) 患者伴有高血压, 两组患者的左室射血分数 (left ventricular ejection fraction, LVEF) 无显著差异 ($50.21\% \pm 15.11$ 比 $58.22\% \pm 11.12$, $P=0.08$), 但心指数 (Cardiac index, CI) 发生了显著的下降 (2.39 ± 0.87 比 2.93 ± 0.64 , $P=0.045$)。伴高血压的 HCM 组的峰值整体纵向应变 (peak global longitudinal strain, PGLS) 和峰值整体周向应变 (peak global circumferential strain, PGCS) 损伤 (分别为 -9.21 ± 2.91 比 -11.58 ± 2.83 , $P=0.032$; -14.28 ± 3.82 比 -18.47 ± 2.54 , $P=0.002$), 而并未发现左心室峰值整体径向应变 (peak global radial strain, PGRS) 的显著差异。左心室增强前、后 T1 值以及 ECV 均未发现显著差异。

结论: 合并高血压的 HCM 患者心肌射血功能、左心室顺应性较单纯 HCM 患者损伤加重, 这可能会影响 HCM 患者的远期预后。传统检测心功能的指标 LVEF 不能发现这种差异, CI 和 PGLS、PLCS 是一种检测这种损伤的更灵敏的工具。

PO-1176

光谱 CT 多参数成像定量分析在评估浸润性肺腺癌病理分级中的应用价值

朱紫瑞¹、申磊磊¹、刘梦琦¹、薛志强²、陈志晔¹

1. 中国人民解放军总医院海南医院

2. 中国人民解放军总医院第一医学中心

目的 探讨光谱 CT 多参数成像评价浸润性肺腺癌 (ILA) 病理分级的价值。**方法** 回顾性分析 2019 年 7 月至 2022 年 7 月在解放军总医院海南医院经术后病理证实并行光谱增强 CT 扫描的 61 例实性 ILA 患者资料, 并根据 2020 年国际肺癌研究协会提出的 ILA 病理分级系统进行分组, G1、G2 级为低级别组 (31 例), G3 级为高级别组 (30 例)。比较低级别组与高级别组的临床特征 (性别、年龄、吸烟史、分期)、形态学参数 (肿瘤大小、分叶征、毛刺征、空气支气管征、空泡征及胸膜凹陷征), 光谱参数 [碘浓度 (IC)、标准化碘浓度 (NIC)、有效原子序数 (Zeff)、单能量 CT 值 (CT_{40keV}、CT_{70keV})、曲线斜率 K 值 (40-70keV)], 并利用 Multiphase 软件生成细胞外容积 (ECV) 图, 测量病灶的 ECV 值, 后期计算动脉期联合参数 (AP_{all})、静脉期联合参数 (CP_{all})。绘制受试者工作特征曲线 (ROC) 计算曲线下面积 (AUC) 分析各参数鉴别 ILA 病理分级的效能, AUC 间比较采用 Z 检验。**结果** 低级别组 ILA 的形态学参数与高级别组无明显差异。低级别组 IC、NIC、Zeff、ECV 值在动脉期及静脉期均显著高于高级别组 [其中代表参数为: 动脉期 Zeff: 8.10±0.14 比 7.91±0.16; 静脉期 Zeff: 8.13±0.20 比 8.03±0.15] (P 均<0.05)。ROC 曲线分析显示, 动脉期 IC、NIC、Zeff、ECV 值诊断效能优于静脉期, AUC 值 (动脉期: 0.776、0.740、0.831、0.768 vs. 静脉期: 0.749、0.725、0.702、0.732), 动脉期联合参数 AP_{all} 诊断效能优于单独参数, AUC、特异度、敏感度分别为 0.855、83.3%、83.9%。**结论** 光谱 CT 多参数成像定量分析有助于 ILA 病理分级, 动脉期 Zeff、IC、NIC、ECV 值诊断效能优于静脉期, 动脉期联合参数诊断效能优于单独参数。

PO-1177

不同病理级别囊腔型肺腺癌的临床及影像特征分析

郭宁

中国人民解放军空军军医大学西京医院

摘要: **目的** 探讨不同病理级别囊腔型肺腺癌的临床及影像特征。**方法** 回顾性分析本院 2016 年 3 月至 2022 年 10 月共计 68 例经病理证实的 3 种病理级别囊腔型肺腺癌的临床及影像学特点。**结果** 68 例囊腔型肺腺癌均为单发病灶, 病理以浸润性腺癌为主, 多见于中老年男性, 多数无症状, 好发于两肺外带, 平均直径 2.1±1.0cm, 壁结节以磨玻璃结节多见。不同病理级别囊腔型肺腺癌在囊壁形态、囊腔形态及有无分隔均存在差异 (P<0.05), 恶性征象包括空气支气管征 16 例 (23.5%)、血管穿行征 65 例 (95.6%)、血管集束征 17 例 (25%)、毛刺征 30 例 (44.1%)、分叶征 35 例 (51.5%)、胸膜牵拉征 36 例 (52.9%), 研究结果发现病理级别越高, 病灶表现的恶性征象越多、越明显。Mascalchi 形态分型中以 III 型最多见。**结论** 不同病理级别的囊腔型肺腺癌临床表现无特异性, 囊壁及囊腔的 CT 特征有诊断价值, 恶性征象及生长方式有一定特点。掌握其影像特点可提高诊断率, 有助于病变的早期定性。

PO-1178

能谱纯化技术联合 ADMIRE 重建算法在超低剂量 CT 肺功能定量中应用的前瞻性探究

杜华阳、隋昕、宋兰、汪佳儒、赵瑞杰、宋伟、秦瑞遥、王曼、金征宇
中国医学科学院北京协和医院

目的 探究超低剂量 CT (ULDCT) 能谱纯化 (SPS) 技术用于定量诊断肺气肿的可行性

方法 应用三代双源 CT, 纳入 70 例肺气肿患者, 分别行常规低剂量 CT (LDCT) 及 ULDCT, LDCT 120kV, CARE 4D, 预设值 50mAs; ULDCT Sn150kV, 其他参数同 LDCT。用滤波反投影算法 (FBP) 重建 LDCT 图像 (LDCT-FBP 组), FBP (ULDCT-FBP 组)、高级模型迭代重建 ADMIRE 1~5 级重建 ULDCT 图像 (ADMIRE 1~5 组), 层厚、层间距均为 1.0mm, 使用 Pulmo 3D 测量各组图像参数, 记录机器自动生成的 CTDI、计算 ED。单因素方差分析对比各组定量结果, 辐射剂量对比采用配对样本 t 检验。

结果 LDCT-FBP 组 TLC、MLD 与 ULDCT 各组均无统计学差异 (FTLC=0.071, PTLC=0.999; FMLD=0.444, PMLD=0.849)。随 ADMIRE 等级增高, ULDCT 各组 EI、Perc 15 逐渐下降, LDCT-FBP 组、ULDCT-FBP 组、ULDCT-ADMIRE 1~5 组 EI (%) 分别为 (3.96±3.34)、(7.86±4.42)、(6.78±4.15)、(5.73±3.84)、(4.76±3.46)、(3.65±2.94)、(2.63±2.57), Perc 15 (HU) 分别为 (-919.21±21.00)、(-929.80±16.97)、(-926.65±16.06)、(-923.22±17.12)、(-919.95±21.38)、(-917.40±20.18)、(-915.14±16.06), LDCT-FBP 组与 ULDCT-ADMIRE 3~5 组 EI、Perc 15 无统计学差异 (P 均 > 0.05)。ULDCT 辐射剂量 CTDI(mGy·cm) (0.91±0.30)、ED(mSv) (0.36±0.13) 明显低于 LDCT (4.30±1.53)、ED (1.73±0.65), 有效剂量 ED 降低约 78%。

结论 ULDCT 采用 SPS 技术联合 ADMIRE (3~5 级) 迭代重建算法可用于肺气肿定量, 并能大幅度降低受检者 ED。

PO-1179

MSCT 对 Stanford B 型主动脉夹层破裂的诊断价值

陈艳、孙啸天、韩萍、史河水、孙文刚
华中科技大学同济医学院附属协和医院放射科

目的: 评价 Stanford B 型主动脉夹层破裂的 MSCT 表现, 探讨 MSCT 在主动脉夹层破裂中的诊断价值; 方法: 回顾性分析 Stanford B 型 38 例主动脉夹层破裂患者 (A 组) MSCT 图像, 分析主动脉破裂 CT 表现, 并与 38 例 Stanford B 型主动脉夹层非破裂组 (B 组) 进行对比; 评价指标包括: 破口处主动脉直径、夹层破裂部位、真假腔大小、主动脉管壁、假腔血栓、主动脉周围情况、胸腔积液; 结果: A 组与 B 组年龄无显著性差异; 夹层破裂部位为主动脉弓降部小弯侧 31 例, 破裂位于降主动脉为 7 例, 二者具有显著性差异; A 组破口处主动脉直径、假腔均大于 B 组且有显著性差异, B 组假腔内血栓较 A 组多且有显著性差异, A 组均见主动脉管壁不规则, 局部见“鸟嘴”或尖角状突起; A 组主动脉周围间隙模糊, 周围见高密度血肿, 部分假性动脉瘤形成, 血肿的分布和密度可提示主动脉破裂的部位; A 组胸腔积液较 B 组多且有显著性差异。结论: MSCT 作为快速、无创的检查方法, 能准确显示主动脉夹层破裂及其范围、并发症, 对于主动脉夹层先兆破裂具有重要价值, 对于临床手术方案的选择具有重要参考意义。

PO-1180

胸内原发滑膜肉瘤的 CT 表现及预后因素分析

刘培欣、时高峰、杨丽
河北医科大学第四医院

目的 探讨胸内原发滑膜肉瘤 CT 表现及预后相关因素。方法 回顾性分析河北医科大学第四医院 2016 年 1 月至 2023 年 5 月经手术或穿刺病理证实的 14 例胸内原发滑膜肉瘤患者的临床、影像资料及随访结果。结果 病变长径为 2.1~17.8cm，类圆形者 6 例，不规则形者 8 例。边缘清楚者 10 例，模糊者 4 例。边缘分叶者 9 例，其中深分叶 4 例。病变密度均不均匀。病变均呈不均匀强化，轻-中度强化者 10 例，明显强化者 4 例。7 例病变可见瘤内血管影。5 例胸膜-肺病变均合并胸腔积液。1 例支气管病变合并阻塞性肺不张及胸腔积液，1 例纵隔病变侵犯心包合并心包积液。所有病例均无淋巴结肿大。随访时间 3~79 个月，2 例失访。总体生存期为 3-51 个月。12 例 IPSS 中，死亡者 6 例（50%），均因复发/转移死亡；存活者 6 例（50%），其中 3 例存在复发/转移。结论 胸内原发滑膜肉瘤的 CT 表现具有一定的特异性，且对于肿瘤的预后评估具有重要参考价值。

PO-1181

无冠心病患者的不同临床特征与通过冠脉 CTA 量化的冠状动脉周围脂肪组织衰减增加值之间的关系

景梦园、周俊林
兰州大学第二医院

目的 使用冠状动脉 CT 血管造影（Coronary computed tomography angiography, CCTA）来测量冠状动脉周围脂肪组织（Pericoronary adipose tissue, PCAT）衰减增加值，以早期识别高风险的临床特征，并探索无冠心病（Coronary artery disease, CHD）患者 PCAT 衰减增加值与不同临床特征之间的关系。材料与方法 回顾性收集 2020 年 7 月至 2022 年 7 月期间于我院行 CCTA 检查的符合条件的无 CHD 患者，共 785 名。记录每位患者的临床数据如年龄、性别、是否吸烟等。基于 CCTA 图像，使用全自动软件量化每位患者左前降支（LADPCAT）、左回旋支（LCXPCAT）和右冠状动脉（RCAPCAT）近段的 PCAT 衰减增加值。使用单变量和多变量分析，以确定不同临床特征与 LADPCAT、LCXPCAT 和 RCAPCAT 升高之间的关系。结果 单变量分析显示体重指数（Body mass index, BMI）与 LADPCAT（ $rs=0.109$, $P=0.002$ ）、LCXPCAT（ $rs=0.076$, $P=0.032$ ）和 RCAPCAT（ $rs=0.083$, $P=0.019$ ）呈正相关。此外，烟龄和饮酒史与 LADPCAT 呈正相关（ $rs=0.099$, 0.165 ; $P=0.006$, 0.000 ）。高脂血症与 LADPCAT（ $rs=0.089$, $P=0.012$ ）和 RCAPCAT（ $rs=0.334$, $P=0.000$ ）呈正相关，而使用他汀类药物与 RCAPCAT（ $rs=-0.145$, $P=0.000$ ）呈负相关。多变量分析显示，LADPCAT 的重要决定因素是 BMI（ $\beta=0.359$, $P=0.001$ ）、烟龄（ $\beta=2.612$, $P=0.002$ ）、饮酒史（ $\beta=4.106$, $P<0.001$ ）和高脂血症（ $\beta=1.664$, $P=0.027$ ）。并且，LCXPCAT 与 BMI 相关（ $\beta=0.218$, $P=0.024$ ），而 RCAPCAT 与高脂血症（ $\beta=6.110$, $P<0.001$ ）和使用他汀类药物（ $\beta=-3.338$, $P<0.001$ ）相关。

PO-1182

定量 CT 肺功能检查用于小气道疾病：图像质量控制和外部验证

叶天和、李琳、吴书婷、陈光锋
华中科技大学同济医学院附属协和医院

目的:评估定量 CT 肺功能检查(QCT-PFT)中呼吸协调性对定量分析结果及小气道疾病(SAD)诊断准确性的影响,并对定量 CT 参数进行外部验证。

材料与方法:回顾性收集同时行 QCT-PFT 和金标准呼吸流量测定的 306 例患者。设计客观图像质量评分系统:呼吸努力程度(Degree of respiratory effort, DRE) = 吸气与呼气 CT 扫描的肺总量差值(TLC insp - TLC exp) / 用力肺活量(forced vital capacity, FVC)。根据 DRE 值将图像质量按百分位数分布等分为 3 个切面:组 1(低质量:DRE \leq 0.39)、组 2(一般质量:0.40 \leq DRE \leq 0.69)、组 3(高质量:DRE \geq 0.70)。采用受试者工作特征曲线(ROC)分析比较功能性气体捕获(fGT)对 3 组 SAD 的诊断效能。以 DRE 作为校正因子校正诊断 SAD。

结果:在高质量组中,fGT 诊断 SAD 的曲线下面积(AUC)为 0.88 (95% CI: 0.80 ~ 0.96)。在中等质量组中,fGT 诊断 SAD 的 AUC 为 0.76 (95% CI: 0.65 ~ 0.86)。在低质量组中,fGT 诊断 SAD 的 AUC 为 0.58 (95% CI: 0.46 ~ 0.70)。在中等质量组中,校正后的 fGT 增加,AUC 增加到 0.87 (95% CI: 0.79 ~ 0.95)。低质量组校正因子失效。

结论:本研究设计了合理的评价图像质量的客观指标。通过对 DRE 评估的高质量数据进行必要校正,可以提高 QCT-PFT 对 SAD 的诊断效能,为 QCT-PFT 的质量控制和进一步应用提供了一种简单有效的方法。

PO-1183

成人肺炎性肌纤维母细胞瘤 CT 特征与病理对照

苏海燕、郝清、杨丽、王琦、时高峰
河北医科大学第四医院

目的:结合病理探讨肺部炎性肌纤维母细胞肿瘤 (inflammatory myo-Fibroblastic tumor, IMT) 的 CT 特征以提高本病的认识及诊断水平。

资料与方法:结合病理回顾性分析经手术证实的 7 例肺部 IMT 的影像、临床资料并复习文献。

结果:7 例患者均单发,6 例为周围型,1 例位于左肺下叶跨基底段支气管壁腔内外生长。3 例病理为黏液/血管型,包含 1 例囊实性肿物,囊性成分规则,2 例实性结节,3 例均呈中度或明显强化;2 例病理为梭形细胞丰富型,包含 1 例部分实性结节,1 例实性结节,呈明显强化;2 例病理为纤维型,包含 1 例囊实性肿物,囊性成分不规则,1 例实性结节,边缘见长毛刺,2 例均呈轻度强化。4 例有分叶。3 例瘤-肺交界清楚,3 例瘤-肺交界毛糙,1 例瘤-肺交界模糊。2 例侵及胸膜,1 例侵及支气管壁。7 例均钙化及转移。

结论:肺 IMT 是一种少见的交界性肿瘤,不同病理类型 CT 特征略有不同,具有一定特征性,确诊需病理及免疫组化检查。

单次短屏气法在冠状动脉 CT 减影血管成像中的应用

孟雪
成都市第五人民医院

[摘要]

目的 冠状动脉 CT 血管成像技术用于评价冠状动脉钙化节段及植入支架节段管腔狭窄的能力有限，主要因钙化及支架的硬化伪影所致，而减影冠状动脉 CT 血管成像技术可将两次扫描图像数据相减，以避免硬化伪影的影响，该方法已成熟应用于头颈部血管检查，减少了颅骨和椎骨的影响，使后处理过程简单有效，但因心脏搏动的影响，使其在心血管领域发展滞后。第二代东芝 320 层 CT 将 Registration 配准软件应用于减影冠状动脉 CT 血管成像，使病灶对位更精确，但需要较长的屏气时间，因此部分患者难以完成，导致该技术仍未广泛应用于临床。本研究采用改良单次短屏气法，探究其在减影冠状动脉 CT 血管成像的应用及对成像质量的影响。

方法 运用单次屏气法，尽可能推迟减影冠状动脉 CT 血管成像第一次扫描的时间。分别后处理第二次扫描图像和减影后图像，采用 4 分制对同一患者常规冠状动脉 CT 血管成像(CCTA)及减影 CCTA (S-CCTA)图像质量进行评价。

结果 21 例患者的平均屏气时间为 10.34 ± 1.07 秒。用 4 分制对 18 例患者的 90 个冠脉钙化节段及 3 例患者 5 枚支架的图像质量进行评估，常规 CCTA 和 S-CCTA 钙化节段平均图像质量评分分别为 2.48 ± 0.70 分、 3.47 ± 0.69 分 ($P < 0.001$)。常规 CCTA 和 S-CCTA 支架平均图像质量评分分别为 1.84 ± 0.23 分、 2.75 ± 0.29 分 ($P < 0.05$)，差异有统计学意义。

结论 减影冠状动脉 CT 血管成像技术有两次屏气法和单次屏气法 2 种方式，前者是指通过两次屏气扫描分别获得两张图像，但两张图像无法完全匹配，可能会导致配准错误；单次屏气法是指通过一次屏气获得两张图像，减少了配准误差，但传统单次屏气法需 20~40 s，部分患者无法完成；改良的单次短屏气减影冠状动脉 CT 血管成像技术可减少屏气时间至 <12 秒，且较冠状动脉 CT 血管成像技术提高图像评估质量。

PO-1185

肺定量 CT 不同呼吸屏气状态下肺结节测量的差异分析

沈钰鸿、叶天和、杨琨、蒋涛
华中科技大学同济医学院附属协和医院

目的：通过肺 CT 定量分析测量肺结节在双气相肺 CT 扫描中的大小、密度、形态的变化情况。方法：回顾性分析 2022 年 6 月—2022 年 9 月 182 例患者进行双气相 CT 扫描的图像。我们设计了一个定量评价图像质量的标准，屏气的努力程度 (DRE)，并使用 DRE 将图像质量分成低、中、高质量三组。比较低、中、高质量组的 CT 定量参数和肺结节相关参数。结果：三组不同图像质量的肺结节体积存在显著差异 ($P = 0.005$)。在实性肺结节中，低质量组与高质量组的肺结节平均密度 ($P = 0.006$)、体积 ($p < 0.001$) 存在显著差异。在磨玻璃结节中，三组图像质量的肺结节平均密度存在显著差异 ($P = 0.013$)。在部分实性结节中，低质量组与高质量组的肺结节平均密度存在显著差异 ($P = 0.037$)。在不同部位的肺结节中，右肺中叶肺结节的体积在不同呼吸屏气状态下存在显著差异。结论：肺结节在定量 CT 扫描的不同屏气状态下的形态、密度差异可能会影响病灶的随访。因此通过定量分析和图像质量控制，判断不同图像质量对肺结节测量的影响程度，能够在结节的随访过程中提供更有价值的诊断和评价。

PO-1186

胎儿肺先天发育性疾病 MRI 表现的个案报道及回顾性分析

王南薇、古今、史河水
华中科技大学同济医学院附属协和医院

目的：胎儿肺先天发育性疾病是比较少见的肺发育性疾病，早期诊断并及时干预有利于提高患儿的存活率。本研究针对相关时间段内的胎儿肺先天发育性疾病进行个案报道及回顾性分析。

材料与方法：收集 2016 年 1 月至 2020 年 12 月在我院就诊的 23 例诊断为肺隔离症或先天性肺气道畸形的胎儿患者，其中 3 例患儿出生后行外科手术治疗。所有胎儿均行磁共振（Magnetic resonance imaging, MRI）检查，回顾性分析其临床表现、MRI 影像资料并进行随访。MRI 影像评估包括测量病灶大小、观察有无异常供血动脉。

结果：23 例胎儿患者均为母体中晚期孕行 MRI 扫描检查发现，母体孕周为 22-33 周。3 例患儿出生后行外科手术证实，其中 1 例为叶内型肺隔离症（Pulmonary sequestration, PS），1 例为先天性肺气道畸形（Congenital pulmonary airway malformation, CPAM），1 例为先天性膈膨升（Congenital diaphragmatic eventration, CDE）。其余 20 例无随访结果（其中 10 例为引产，10 例为失访）。3 例患儿中 1 例先天性膈膨升为本院外科手术治疗证实，术前诊断为肺隔离症，余 2 例为本市另外两家三甲医院手术治疗证实。3 例患儿中，1 例 PS 及 1 例 CPAM 病灶位于右肺下叶，另 1 例 CDE 病灶位于左肺下叶；1 例 PS 患儿异常供血动脉起自胸主动脉。

结论：MRI 检查无辐射、无创，有较好的软组织分辨率，可多参数、多平面成像，对胎儿肺先天发育性疾病具有一定的临床诊断价值。

探讨深度学习重建算法在改善 CTPA 图像质量中的价值

张旭阳、于楠、贺太平
Affiliated Hospital of Shaanxi University of Chinese Medicine

目的：比较滤波反投影重建算法（FBP）、常规迭代重建算法（ASiR-V）及深度学习重建算法（DL）在肺动脉 CT 血管成像（CTPA）中对图像质量的影响。

方法：回顾性分析 2023 年 7 月至 2023 年 8 月于我院行 CTPA 扫描的 50 例患者的临床及影像资料，其中男性 30 例，女性 20 例，平均年龄 64.3 ± 13.0 岁，管电压 120kV，对比剂用量 35ml，扫描数据分别进行 FBP、ASiR-V60%、ASiR-V80%、深度学习中档（DL-M）、深度学习高档（DL-H）重建。分别于肺动脉主干、左肺动脉干、右肺动脉干及肺动脉主干层面竖脊肌放置 ROI，测量 CT 值及图像噪声；分析比较五种重建算法 CT 值、图像噪声、信噪比（SNR）、对比噪声比（CNR）、主观图像质量评分。对于 CT 值、噪声、SNR 及 CNR，采用 Kolmogorov-Smirnov 检验进行正态性检验，符合正态分布采用单因素方差分析，对不符合正态分布的采用 Kruskal-Wallis 检验进行分析，两两比较采用 LSD 法。采用 Mann-Whitney U 检验比较图像主观评分，采用 ICC 检验对两名医师主观图像评分一致性进行分析，以 $P < 0.05$ 为差异具有统计学意义。

结果：所有图像均满足临床诊断要求。五种重建算法的肺动脉主干、右肺动脉干、左肺动脉干的 CT 值差异均无统计学差异（ $P > 0.05$ ）；5 组重建算法的肺动脉主干、右肺动脉干及左肺动脉干的噪声、SNR、CNR 差异均有统计学意义；深度学习重建组肺动脉主干、右肺动脉干及左肺动脉干图像噪声显著低于 FBP 重建及 ASiR 重建，但 SNR 及 CNR 值显著高于 FBP 重建及 ASiR 重建；深度学习重建组图像主观质量评分较 FBP 组及 ASiR 重建组显著提高。

结论：与 FBP 及 ASiR 重建相比，深度学习重建算法可以显著提高图像质量。

PO-1188

基于双源 CT 下人工智能 CT 血流储备分数联合冠状动脉周围脂肪衰减指数对高海拔地区冠状动脉粥样硬化性心脏病的评估及预测

罗焕、曹成瑛、高律萍、杨陵武、朱友义
青海省心脑血管病专科医院

目的 分析基于双源 CT 下人工智能 CT 血流储备分数 (FFR) 联合冠状动脉周围脂肪衰减指数 (FAI) 对高海拔地区冠状动脉粥样硬化性心脏病的评估及预测。方法 选取 2021 年 10~12 月于我院行冠脉 CT 血管造影 (CTA) 检查的 63 例疑似冠心病患者, 以冠脉 CTA 结果将患者分为血管狭窄率 $\geq 50\%$ 组与血管狭窄率 $< 50\%$ 组。比较冠脉狭窄程度、CT-FFR 与冠脉周围 FAI 检查结果; 根据冠脉血管钙化程度分组, 比较轻中度钙化组、重度钙化组中血管狭窄率 $\geq 50\%$ 组与 $< 50\%$ 组的 CT-FFR、冠脉周围 FAI 检查结果, 分析各组间 CT-FFR 与冠脉周围 FAI 单独与联合的诊断效能。结果 本研究 63 例患者中共检查 79 支冠脉血管, 血管狭窄率 $\geq 50\%$ 组共 24 支血管, 血管狭窄率 $< 50\%$ 组 55 支。血管狭窄率 $\geq 50\%$ 组与血管狭窄率 $< 50\%$ 组的病变长度差异无统计学意义 ($P > 0.05$), 单支血管冠脉狭窄率的差异具有统计学意义 ($P < 0.05$)。血管狭窄率 $\geq 50\%$ 组的 CT-FFR 低于血管狭窄率 $< 50\%$ 组, 冠脉周围 FAI 高于血管狭窄率 $< 50\%$ 组 ($P < 0.05$)。63 例患者中, 冠脉血管轻中度钙化 47 例, 重度钙化 16 例。轻中度钙化组中血管狭窄率 $\geq 50\%$ 组冠脉狭窄率高于血管狭窄率 $< 50\%$ 组, CT-FFR 低于血管狭窄率 $< 50\%$ 组 ($P < 0.05$)。重度钙化组中血管狭窄率 $\geq 50\%$ 组 CT-FFR 低于血管狭窄率 $< 50\%$ 组, 冠脉周围 FAI 高于血管狭窄率 $< 50\%$ 组, 两组冠脉狭窄率差异无统计学意义 ($P > 0.05$)。ROC 曲线显示, CT-FFR+冠脉周围 FAI 对血管钙化的诊断效能相对于两者单独检查有显著提升 ($P < 0.05$)。结论 CT-FFR 对重度钙化血管诊断效能较低, 联合冠脉周围 FAI 能为血流异常的冠心病患者提高诊断价值。

PO-1189

基于 CT 放射组学应用于预测抗-MDA5 阳性皮损炎患者的快速进展性间质性肺病和全因死亡

何文章、崔贝贝、林辉、彭礼清
华西医院

目的: 评估基于 HRCT 放射组学用于预测抗-MDA5 阳性皮损炎相关间质性肺病 (MDA5+ DM-ILD) 快速进展型间质性肺病 (RP-ILD) 和总体生存率的有效性, 并探讨不同感兴趣区域 (ROI) 对放射组学分析的影响。方法: 从 2014 年 8 月至 2022 年 3 月, 在两个中心回顾性纳入了 189 例 MDA5+ DM-ILD 患者, 分为训练组 ($n=119$)、内部验证组 ($n=41$) 和外部验证组 ($n=29$)。从四个 HRCT 区域的放射组学特征中生成了四种风险评分。使用受试者工作特征曲线下面积、校准曲线和决策曲线评估模型的性能。随访的终点是全因死亡。使用 Kaplan-Meier 曲线、Mantel-Haenszel 检验和 Cox 回归进行生存分析。结果: 在中位随访时间 31.6 个月 (四分位数范围: 12.9-49.1 个月) 内, 有 24 名患者失去随访, 46 名患者死亡 (27.9%, 46/165)。基于完整双肺靶区的风险评分在内部验证组和外部验证组分别获得了 0.869 和 0.905 的 AUC。在内部验证组和外部验证组, 该评分表现优于临床-放射学模型和诺莫图, AUC 分别为 0.882 和 0.916。基于诺莫图评分将患者分为低风险组和高风险组, 高风险组患者的死亡风险显著高于低风险组患者。结论: 该评分表可以预测 MDA5+ DM-ILD 中的 RP-ILD, 并且是全因死亡的独立预测因子。基于双侧肺区域的风险评分在四个不同 ROI 的评分中显示出更高的预测能力。

PO-1190

光谱 CT 联合不同呼吸屏气状态改善心力衰竭患者肺动脉 CTA 图像质量的可行性研究

黄国成、柯思源

华中科技大学同济医学院附属协和医院

目的：探讨不同的呼吸屏气状态对光谱 CT 定量评价心力衰竭患者肺动脉 CTA 图像质量的影响及改善图像质量的可行性。方法：前瞻性纳入 33 例接受肺动脉 CTA 的疑似肺栓塞的心力衰竭患者。我们设计了 3 种呼吸屏气状态：吸气，呼气，平静呼吸。对比分析肺动脉主干及左右分支的成像质量。我们对 40-70 keV 的图像整体质量、图像噪声、图像清晰度进行了 Likert 量表 5 分发评价。采用方差分析(ANOVA)和 kruskal-wallis 检验对结果进行比较。2 名医师测量的肺动脉主干、左右分支动脉的增强 CT 值和图像质量主管评分的组内一致性采用 ICC 评价。结果：吸气屏气时，肺动脉主干及左右分支肺动脉的增强 CT 值在 40keV 时的 3 种呼吸屏气状态中最高，平均 CT 值分别约为 273 ± 95 HU, 269 ± 88 HU, 263 ± 98 HU ($P < 0.05$)。2 名放射科医师测量肺动脉主干、左右分支动脉增强 CT 值的组内一致性 ICC 分别为 0.863, 0.810, 0.877, 评价图像整理质量、图像噪声、图像清晰度的组内一致性 ICC 分别为 0.945, 0.910, 0.928。结论：在心力衰竭患者的肺动脉 CTA 检查中，采用吸气屏气联合 40keV 单能级观察可以获得最佳的图像质量。

PO-1191

冠心病患者内脏脂肪与代谢综合征相关性研究

杨长蔚

同济大学附属东方医院

目的：通过双源 CT 测量冠心病患者心周及胸部大血管周围脂肪容积，以探讨心周及胸部大血管周围脂肪容积与代谢综合征之间的相关性。

方法：收集门诊怀疑冠心病的患者 521 例，进行冠状动脉 CT 血管造影检查，并根据 CHD 诊断标准，选择临床确诊 CHD 的患者入组，最终入组的 CHD 患者共 397 例。签署知情同意书，询问高血压、糖尿病、高血脂病史，测量身高、体重、收缩压及舒张压，计算体重指数。嘱空腹 12 小时后，抽取患者外周血以测定甘油三酯、高密度脂蛋白、空腹血葡萄糖。使用双源 CT 首先行心脏平扫，测量心包脂肪容积 (pericardial fat volume, PeCFV)、心外膜脂肪容积 (epicardial fat volume, EFV)、心旁脂肪容积 (paracardial fat volume, PaCFV)、胸主动脉旁脂肪容积 (perivascular fat volume, PVFV)。再行冠状动脉 CTA 检查，评价患者冠脉狭窄程度。统计分析。

结果：MS 组与非 MS 组相比，男性比女性更易发生 MS，差异具有统计学意义 ($P < 0.05$)；50-60 岁年龄组冠心病患者更易发生 MS，差异具有统计学意义 ($P < 0.05$)。MS 患者的心周及胸部大血管周围脂肪容积明显高于非 MS 患者，差异具有统计学意义 ($P < 0.05$)。按冠脉狭窄程度分组后，随冠状动脉狭窄程度的增加，MS 组患者 PeCFV 和 EFV 相应增加，除 1 度与 2 度患者之间 PeCFV 和 EFV 的差异无统计学意义 ($P > 0.05$)，其余各组两两比较，差异均具有统计学意义 (均 $P < 0.05$)；狭窄程度为 4 度患者的 PaCFV 和 PVFV 与 1-3 度比较，差异具有统计学意义 (均 $P < 0.05$)，而 1-3 度间两两比较，PaCFV 和 PVFV 的差异无统计学意义 (均 $P > 0.05$)。

结论：CHD 患者的内脏脂肪容积与 MS 各项指标有相关性。CHD 合并 MS 的患者心周及胸部大血管周围脂肪容积显著高于无 MS 的患者。在 CHD 合并 MS 患者中，心周及胸部大血管周围脂肪容积与冠状动脉狭窄程度正相关，尤其以 EFV 最具有临床价值。因此，心周及胸部大血管周围脂肪容积不但能预测 MS，也能判断 CHD 的预后情况。

PO-1192

肺癌 C T 多期增强扫描的影像学特征与 特异性标记物表达相关性以及联合诊断价值研究

梁海胜

上海交通大学医学院附属第九人民医院

方法 2016 年 2 月至 2021 年 2 月接受治疗的 760 例确诊原发性肺癌患者为研究对象并搜集其临床诊断资料,另选取 500 例健康体检者为对照组。对肺癌患者及正常人体血清中 C12 多肿瘤特异性标记物进行定量检测。按照瘤体直径分为大于 5 cm 的 621 例,不超过 5 cm 的 139 例;分为中央型肺癌 344 例和周围型肺癌 416 例;分为有坏死空洞征象的 188 例,无坏死空洞征象的 572 例;分为有毛刺征象的肺癌 210 例,无该征象的 550 例;有深分叶征象的肺癌 249 例,无深分叶征象的肺癌 511 例。以分析 C T 的影像学特征与该血清特异性标记物的表达相关性并评估联用诊断价值。结果 肺癌组多肿瘤标记物中糖链抗原 199 (CA199)、糖链抗原 242 (CA242)、神经元特异性烯醇化酶 (NSE)、癌胚抗原 (CEA)、铁蛋白 (Fe)、人绒毛膜促性腺激素 (HCG)、甲胎蛋白 (AFP)、癌抗原 125 (CA125)、癌抗原 153 (CA153) 的值显著高于对照组,两组差异有显著性 ($P < 0.05$);而两组间前列腺特异性抗原 (PSA)、游离型前列腺特异性抗原 (FP-SA) 和生长激素 (HGH) 的含量差异无显著性 ($P > 0.05$)。将肺癌患者根据 C T 影像学特征再分组比较 C12 多肿瘤特异性标记物水平,结果显示肿瘤大于 5 cm 患者与肿瘤不足 5 cm 的患者组间、有无坏死空洞组间、有无毛刺征象组间、有无深分叶征象组间差异均有显著性 ($P < 0.05$);而 C T 影像学特征中的不同病灶部位组间 C12 特异性标记物无显著差异 ($P > 0.05$)。结论 肺癌 C T 多期增强扫描影像学特征中的肿瘤大小、有无坏死空洞、毛刺征象、深分叶征象与 C12 多肿瘤特异性标记物的表达有相关性,不同病灶部位则与特异性标记物表达无关。可将 C T 影像与特异性标记物联用,有利于更准确地诊断疾病。

PO-1193

气管主支气管良性肿瘤的多排螺旋 CT 评价

崔倩男、曹殿波

吉林大学第一医院

目的 气管支气管良性肿瘤起源于粘膜上皮、粘膜下涎腺和管壁间叶组织,且以间叶组织来源占大多数,临床发病率较低。为此总结了气管主支气管良性肿瘤的多排 CT 表现,并结合文献进行综合分析。

方法 回顾性分析经手术病理证实的 32 例气管主支气管良性肿瘤,男性 18 例,女性 14 例,年龄范围 10-82 岁,均以非特异性呼吸道症状就诊。多形性腺瘤 3 例,神经鞘瘤 4 例,炎性肌纤维母细胞瘤 4 例,脂肪瘤 9 例,错构瘤 7 例,血管瘤 3 例,平滑肌瘤、支气管软骨瘤各 1 例。

结果 肿物位于气管 14 例,位于左主支气管 8 例,位于右主支气管 10 例,肿物大小为 0.5-3.6cm。多排螺旋 CT 表现为息肉样、类圆形或菜花状 24 例,边缘光整;呈不规则形分叶状 8 例。平扫密度均匀 15 例,均匀强化 8 例,无明显强化 14 例,脂肪与软组织成分并存 18 例。腔内生长型 22 例,其中宽基底 12 例;腔外生长型 3 例,其中 2 例呈“冰山”样改变。纵隔淋巴结肿大 5 例,伴阻塞性肺炎、肺不张及肺气肿 12 例。纵隔淋巴结肿大 5 例,均存在阻塞炎变或不张,手术清扫结果无恶性证据及周围侵犯。病变邻近气道管壁均未见明确增厚。

结论 气管主支气管良性肿瘤有一定的特征性,以腔内规则肿块多见。多排螺旋 CT 及其后处理可直观显示肿瘤的组织构成、范围和与邻近结构的关系:对于结节或肿块内部构成特征、有无伴随管壁增厚有助于良恶性鉴别、定性诊断及治疗方案制定。

PO-1194

肿瘤位置在预测直径小于 2cm 肺腺癌隐匿性淋巴结转移中的应用价值

郝沁敏、袁梅

南京医科大学第一附属医院 (江苏省人民医院)

目的:术前准确识别肺腺癌患者的隐匿性淋巴结对于选择手术方式及患者预后至关重要,既往研究主要集中于临床及影像特征的观察,对于肿瘤所在位置与隐匿性淋巴结转移之间的关系相对缺乏。因此,本研究采用了肿瘤与胸膜的关系来对肿瘤所在位置进行定义,即测量肿瘤边缘距三类胸膜 (纵隔胸膜、非纵隔胸膜 (脏层胸膜、叶间胸膜)) 的垂直距离,记录最近的胸膜类型及最短距离,以此评估其对隐匿性淋巴结转移预测的意义,并联合其他临床影响参数,无创性预测直径小于 2cm 肺腺癌隐匿性淋巴结转移。

方法:回顾性分析 2016 年 1 月至 2020 年 6 月期间接受肺叶切除术加淋巴结清扫的 249 例患者的临床、影像及位置关系资料,术后病理均证实为肺腺癌。根据是否发生隐匿性淋巴结转移将其分成阳性组 (发生隐匿性淋巴结转移) (n=85 例) 和阴性组 (未发生隐匿性淋巴结转移) (n=164 例),使用单因素 logistics 回归筛选出与隐匿性淋巴结转移显著的相关因素,建立临床影像预测模型;再纳入有意义的位置关系,与上述传统模型对比预测效能。 $P<0.05$ 被认为有统计学差异。

结果:研究表明,与胸膜的位置关系在两组患者的差异有统计学意义 ($P<0.05$),其余有意义的临床、影像参数包括 CEA、肿瘤直径、CTR (肿瘤最大实性成分与肿瘤直径的比值)、肿瘤质地 (实性/磨玻璃)、支气管血管束增厚。单因素分析显示肿瘤直径、质地、支气管血管束增厚、与胸膜的位置关系与隐匿性淋巴结转移相关,以此建立 ROC 曲线。据此所建立的传统的临床影像模型 AUC 值为 0.783;联合位置关系所建立的模型 AUC 值为 0.978。

结论:基于肿瘤与胸膜的位置关系在直径小于 2cm 的肺腺癌隐匿性淋巴结转移上有预测价值;与传统的影像临床模型相比,联合位置关系的模型预测效能更高。

PO-1195

迭代重建技术在胸廓软骨扫描中的运用价值

施辉友

贵州省人民医院

[摘要]目的 探讨第三代双源 CT 低管电压扫描联合高级建模迭代重建 (advanced modeled iterative reconstruction, ADMIRE) 技术在胸廓 (肋软骨) CT 检查中的应用价值。方法 收集临床拟行胸廓 CT 检查患者 70 例,体质指数为 18 kg/m^2 [$\text{BMI} \leq 24 \text{ kg/m}^2$],随机分为 A、B 两组,每组各 35 例;A 组:常规管电压 100kV 扫描,开启自动光电流调节技术 (CARE DOSE-4D),常规滤波反投影法 (FBP) 重建图像;B 组:低管电压 80kV 扫描,开启自动光电流调节技术 (CARE DOSE-4D),采用 ADMIRE 重建图像,强度选择 3 级。比较 A、B 两组图像质量包括 (平均 CT 值、噪声 SD、信噪比 (SNR) 和对比噪声比 (CNR) 以及) 客观评分和辐射剂量。结果 A、B 两组图像质量及主观评分比较差异无统计学意义 ($P>0.05$);辐射剂量比较, B 组 (0.56 ± 0.17) mSv 较 A 组 (1.47 ± 0.41) mSv 减少约 62%,较差异有统计学意义 ($P<0.05$)。结论 低管电压扫描联合高级建模迭代重建技术在胸廓检查中,在保证图像质量同时能有效降低辐射剂量,值得临床推广运用。

PO-1196

非酒精性脂肪肝与冠状动脉 CT 血流储备分数相关性的研究

李莎^{1,2}、张帅¹、马文珊¹、许天旗^{1,2}、王锡明^{1,2}

1. 山东第一医科大学附属省立医院

2. 山东大学

【摘要】目的 探讨非酒精性脂肪肝 (NAFLD) 与冠状动脉 CT 的血流储备分数 (CT-FFR) 之间的关系。方法 搜集 2016 年 01 月至 2018 年 12 月期间因疑似冠状动脉疾病行 CCTA 的 340 例患者。根据胸/腹部 CT 检查结果分为 NAFLD (病例组) 及非 NAFLD 组 (对照组)。比较两组一般资料、斑块性质、高危斑块特征以及 CT-FFR ≤ 0.8 的差异。采用二元 Logistic 回归分析 NAFLD 与 CT-FFR 之间的相关性。结果 NAFLD 患者的糖尿病及高脂血症患病率高, 天冬氨酸氨基转移酶 (AST)、丙氨酸氨基转移酶 (ALT)、谷氨酰转肽酶 (GGT) 和尿酸水平高于非 NAFLD 者, 差异均具有统计学意义 ($P < 0.05$)。NAFLD 患者非钙化斑块及高危斑块均高于非 NAFLD 患者 ($P < 0.05$), CT-FFR ≤ 0.8 在 NAFLD 患者中更常见 ($P < 0.05$)。在多变量 logistic 分析中, 调整传统心血管危险因素、钙化斑块、部分钙化斑块、高危斑块及阻塞性斑块后, NAFLD 仍与 CT-FFR ≤ 0.8 独立相关 (OR, 2.283; 95% CI: 1.156-4.507; $P = 0.017$)。结论 总之, 我们证明 NAFLD 与基于 CCTA 测量的 CT-FFR 相关, 独立于传统心血管危险因素。

不同扫描剂量 (常规剂量及低剂量)
下标准卷积核对肺结节测量及显示的影响

刘海法、杨丽、王琦、时高峰

河北医科大学第四医院

目的 探讨胸部常规剂量及低剂量下标准重建卷积核的多模型自适应统计迭代重建算法 (AV STND) 对肺结节测量准确性及显示的影响。方法 对内置有直径 5、8、10 mm 实性及磨玻璃结节的胸部模型进行常规剂量 (100kVp、Smart mA, CTDI_{vol} = 3.27 mGy) 和低剂量扫描 (100kVp、40 mA, CTDI_{vol} = 0.84 mGy), 分别采用 ASiR-V 算法的肺卷积核 (AV LUNG) 和标准卷积核 (AV STND) 进行肺窗图像重建。测量并计算不同重建图像的总噪声、结节的信噪比 (SNR) 及对比噪声比 (CNR), 对照结节标称值计算结节平均 CT 值偏差度和体积偏差度, 并对图像噪声、支气管血管束锐利度、结节的可见度进行主观评价。结果 1. 在胸部常规剂量及低剂量下, AV STND 均较 AV LUNG 图像噪声更低, 实性及磨玻璃结节的 SNR 与 CNR 更高, 图像噪声评分更高, 而 AV LUNG 重建图像的支气管血管束锐利度均更高 (P 均 < 0.05); 2. 在胸部常规剂量及低剂量下, AV STND 图像测得实性结节平均 CT 值偏差度更小 (P 均 < 0.001), AV LUNG 图像测得磨玻璃结节平均 CT 值偏差度更小 (P 均 < 0.001); AV LUNG 图像测得实性及磨玻璃结节体积偏差度均小于 AV STND (P 均 < 0.05); 3. 常规剂量下, 两种图像在磨玻璃结节的可见度间的差异无统计学意义 (P 均 > 0.05), 而在低剂量下 AV STND 图像的磨玻璃结节可见度评分更高 (P 均 < 0.001); 在胸部常规剂量及低剂量下, 两种卷积核图像在实性结节可见度的评分差异均无统计学意义 (P 均 > 0.05)。结论 在胸部常规剂量及低剂量条件下, AV STND 算法提升了肺窗图像质量, 提高了结节测量准确性, 改善了低剂量下磨玻璃结节的显示情况。

PO-1198

光谱 CT 定量参数鉴别纵隔高危胸腺瘤

方煜翔、杨舟、石磊
华中科技大学同济医学院附属协和医院

目的：分析高危胸腺瘤的光谱 CT 特征，探索光谱 CT 定量参数中的碘浓度 (IC) 及有效原子序数 (Zeff) 作为高危/低危胸腺瘤鉴别诊断参数的临床可行性。方法：回顾性分析本院 51 例经手术病理切片证实的胸腺瘤患者的光谱 CT 增强的影像资料。用圆形 ROI 对胸腺瘤的最大层面进行勾画，勾画时尽量覆盖整个病灶，同时避开血管、坏死、钙化以及囊变，利用 ROI 复制功能实现 IC 和 Zeff 图同一位置淋巴结的测量，同时记录碘密度值和有效原子序数值，并测量胸腺瘤的长径及短径。用圆形 ROI 对淋巴结同一层面的主动脉进行勾画并测量其 IC 及 Zeff 值进行标准化计算。结果：23 例为低危胸腺瘤，28 例为高危胸腺瘤。高危胸腺瘤组的 nIC 及 nZeff 显著高于低危胸腺瘤组 ($P < 0.001$)。Logistics 单变量回归显示，nZeff 具有最高的 OR 值 (3.69, 95%CI: 1.83-7.46, $P < 0.001$)，nIC 的 OR 值为 2.55 (95%CI: 1.67-3.91, $P < 0.001$)。结论：在胸腺瘤患者中，光谱 CT 定量参数 nIC 和 nZeff 可以更好地识别高危胸腺瘤，为高危胸腺瘤的诊断和治疗提供了更有效的参考价值。

PO-1199

持续存在肺纯磨玻璃结节血管分型预测结节未来生长趋势

舒俊、张广文、郭宁、张瑜、张威奇、郑敏文
空军军医大学西京医院

目的 预测持续存在肺纯磨玻璃结节 (pure ground glass nodules, pGGNs) 在未来是否生长的有助于制定科学合理的随访计划。磨玻璃结节-血管分型 (GGN-vessel relationship, GVR) 可进一步对 pGGNs 进行恶性程度分层，但 GVR 能否预测 pGGNs 的未来生长趋势还缺乏深入研究。方法 回顾性分析我院从 2018 年 1 月至 2020 年 12 月 179 例患者体检发现的 179 个 pGGNs 的临床及 CT 资料，所有病例均随访超过 3 年或者虽不足 3 年但是结节出现增长，增长定义为结节体积增大超过 25% 或出现实性成分。分析结节的临床特征，包括 GVR 在内的 CT 定性特征和 CT 定量特征。采用单因素及多因素 Cox 回归分析 pGGNs 的临床，CT 定性及定量特征与结节是否生长的关系。临床，CT 定性及定量特征预测 pGGNs 的 3 年内生长的诊断效能采用曲线下面积 (area under the ROC curves, AUC) 及敏感度，特异度进行评价，AUC 之间的比较采用 Delong 检验。结果 随访中共有 72 例 pGGNs 出现生长。年龄 (HR: 1.034, 95%CI: 1.009-1.059)，平均 CT 值 (HR: 1.003, 95%CI: 1.000-1.005) 和 GVR (HR: 2.515, 95%CI: 1.985-3.231) 为预测 pGGNs 生长的独立危险因素。55 个 pGGNs 的生长发生在 3 年内，年龄 > 54 岁，平均 CT 值 > -650 HU 和 GVR III/IV 型在预测结节 3 年内生长的 AUC 分别为 0.629 (95%CI: 0.554 - 0.700), 0.677 (95%CI: 0.603 - 0.745) 和 0.841 (95%CI: 0.779 - 0.891)，GVR III/IV 型的 AUC 明显高于年龄 > 54 岁和平均 CT 值 > -650 HU ($p < 0.001$)；敏感度分别为 0.618, 0.655 和 0.855；特异度分别为 0.855, 0.619 和 0.653。结论 pGGNs 具有更高的年龄，平均 CT 值和 GVR 分型更容易出现生长，GVR 分型是预测 pGGNs 未来生长趋势的最重要危险因素。

PO-1200

心脏磁共振特征跟踪对非缺血性扩张型心肌病 恶性室性心律失常诊断价值的初步研究

宋林声

四川省医学科学院·四川省人民医院

目的:非缺血性扩张型心肌病(NIDCM)合并恶性室性心律失常(MVA)患者预后差,心源性猝死风险高。虽然 MVA 的诊断通过心电图(ECG)是直接的,但这些患者的潜在心室力学异常是未知的。本研究旨在初步探讨心脏磁共振特征跟踪(CMR-FT)对扩张型心肌病 MVA 的价值。

方法:本回顾性研究将符合纳入标准的 NIDCM 患者分为 MVA 组和非 MVA 组(纳入时间为 2018 年 1 月至 2022 年 9 月)。测试了整体纵向应变(GLS)、整体周向应变(GCS)和整体径向应变(GRS)等心肌应变参数的观察者间一致性。比较两组间 GLS、GCS、GRS、左室射血分数(LVEF)、心电图 t 峰-倾向间期及脑钠肽(BNP)的变化。进行单因素和多因素受试者工作特征(ROC)曲线分析,计算这些参数预测 NIDCM MVA 的 ROC 曲线下面积(AUC)、截止点、敏感性和特异性。

结果:共纳入 NIDCM 患者 161 例(MVA 组 54 例)。GLS、GCS 和 GRS 具有良好的观察者间一致性(ICC>0.80)。MVA 组的绝对 GLS、GCS、GRS、LVEF 均低于非 MVA 组($P < 0.001$), $T_{peak-Tend}$ 和 BNP 较高($P < 0.001$)。单因素 ROC 曲线分析显示, GLS、GCS、GRS 对 MVA 有一定的诊断价值(AUC 分别为 0.795、0.802、0.754)。其中, GCS 具有较高的敏感性和特异性(GCS 0.796/0.776, GLS 0.778/0.757, GRS 0.741/0.692)。多因素 ROC 曲线分析显示 GLS 联合 GCS(AUC = 0.810)、GCS 联合 GRS(AUC = 0.802)、GLS 联合 GRS(AUC = 0.787)、GLS、GCS 联合 GRS(AUC = 0.810)。

结论:CMR-FT 测量的心肌应变参数(尤其是 GLS 和 GCS)具有一定的诊断价值,能反映 NIDCM 合并 MVA 的潜在心室运动异常。

PO-1201

基于心脏电影序列的放射组学预测扩张型心肌病的预后

李雪¹、徐源蔚¹、陈玉成¹、彭礼清¹、刘静¹、何文章¹、蒲华霞¹、印宏坤²、王思梦¹

1. 四川大学华西医院

2. 推想医疗科技有限公司

目的:评估基于 CMR 造影后增强电影序列的放射组学方法在预测扩张型心肌病预后方面的价值。

方法:2013 年 9 月至 2018 年 3 月,我们前瞻性地招募了 401 名 DCM 患者(训练集:281;验证集:120)进行 CMR 成像。主要终点是全因死亡率和心脏移植,次要终点是主要终点和心力衰竭再入院的组合。我们进行了两个靶区的勾画:整个心脏和心肌。放射组学特征均是在连续层面的左心室短轴电影图像上进行提取的(Rad I 模型来自全心靶区, Rad II 模型来自心肌靶区)。我们利用多因素回归方法在临床和 CMR 因素中寻找独立预后因素,并建立单独的临床模型及 CMR 模型。然后,为了提高单独 Rad I/II 模型的预测效能,我们将临床因素和/或 CMR 因素加入到组学模型中,构建新的模型。模型的性能用受试者工作特性曲线下的面积(AUCs)进行比较。Kaplan-Meier 曲线、对数秩检验和 Cox 回归用于生存分析。

结果:在 25.4 个月的中位随访期间(四分位间距:17.4–40.9 个月),分别有 65 名和 141 名患者经历了主要终点和次要终点。对于全心/心肌靶区,他们各自的 Rad I/II-临床-CMR 模型的性能最好,在训练和验证数据集中的 AUC 分别为 0.843/0.836 和 0.846/0.835 ($p < 0.05$)。Rad I-Clinical-CMR 模型将患者分为低风险组和高风险组,在训练集[HR=3.868; 95%CI=2.088-7.164; $P < 0.001$]和验证集(HR=6.122; 95%CI=2.170-17.27; $P < 0.001$)中,高风险组的无事件生存率比低风险组差。对于 Rad II 临床 CMR 模型中,在训练集[HR=7.741; 95%CI=3.910-15.32; $P < 0.001$]和验证集

($HR=4.844$; $95\%CI=1.966-17.27$; $P<11.94$) 中, 高风险组的无事件 (主要终点) 生存率比低风险组差。

结论: 无论对于全心靶区还是心肌靶区, 复合模型也就是 Rad I/II-临床-CMR 模型在预测扩张型心肌病患者的全因死亡率、心脏移植和心力衰竭再入院方面表现出优异的性能, 这有助于个体化风险分层和临床决策。

PO-1202

基于心脏 CT 增强的影像组学分析预测严重主动脉瓣狭窄患者 TAVI 术后左心室不良重构的价值

晏婷莉、王璐静、彭礼清、刘静、李雪、何文章、黄银秋、刘胜梅
四川大学华西医院

目的: 基于 TAVI 术前心脏增强 CT 图像, 构建影像组学模型预测严重主动脉瓣狭窄患者术后左心室不良重构。

方法: 本研究对 273 例于 2019 年 1 月-2022 年 12 月在四川大学华西医院行 TAVI 的患者进行回顾性分析, 所有患者均由经胸超声心动图证实为重度主动脉瓣狭窄, 且术后超声随访 3 个月以上以评估左心室重构情况。将 202 例非不良重构和 71 例不良重构病例随机分为训练组 ($n=220$) 和验证组 ($n=53$)。不良重构被定义为左心室舒张末期容积增加基线值的 15% 或左心室射血功能降低 10%。运用 3d slicer 软件在心脏 CT 舒张期图像上分割包括左心室壁和乳头肌的感兴趣区。采用最小绝对收缩和选择算子 (LASSO) 回归降低计算复杂度并防止过拟合, 通过五折交叉验证法分别筛选学关联度最高的影像组学特征和临床特征。采用受试者工作特征曲线 (ROC) 和决策曲线分析评估模型的性能。

结果: 通过 LASSO 回归, 共筛选 12 个影像组学特征和 5 个临床特征, 分别构建了影像组学模型、临床模型和 Nomogram。临床模型、影像组学模型和 Nomogram 在训练集中的 AUC 依次为 0.760 ($95\%CI$, 0.741 - 0.780)、0.799 (0.777 - 0.827) 和 0.859 (0.841 - 0.888)。在验证集中的 AUC 依次为 0.755 ($95\%CI$, 0.684 - 0.837)、0.766 ($95\%CI$, 0.686 - 0.836) 和 0.837 ($95\%CI$, 0.785 - 0.869)。与临床模型和影像组学模型相比, Nomogram 表现出更优的诊断效能。

结论: 基于影像组学的分析, 对重度主动脉瓣狭窄患者 TAVI 术后左心室不良重构具有良好的预测效能, 对重度主动脉瓣狭窄患者治疗方案的制定具有重要的参考价值。

PO-1203

联合深度学习-机器学习术前精准预测 IA 期肺腺癌气腔内播散: 人机对比研究

卓瑶瑶、单飞、张志勇
复旦大学附属中山医院

目的: 在 2015 年由 kadadota 研究小组首次提出气腔内播散 (spread through air spaces, STAS) 是肺腺癌的新型浸润方式, 是肺腺癌预后不良的独立预测因子。本研究拟通过联合深度学习和传统机器学习方法, 开发基于胸部薄层 CT 图像的预测模型, 以术前精准预测 IA 期肺腺癌患者 STAS 状态。

材料和方法: 本次研究从单位一招募了 1035 名经病理证实的 IA 期肺腺癌患者 (59.68 ± 10.03 岁, 481 名女性, 554 名男性), 其中 498 名患者 STAS 阳性, 537 名患者 STAS 阴性。从单位二招募

了 99 名患者 (59.58±8.57 岁, 51 名女性和 48 名男性) 作外部验证集。本文开发一个基于 3D 残差网络 (ResNet) 的深度学习模型 (DLM), 并通过五倍交叉验证法对模型进行性能的评估。筛选出 9 个临床特征来建立传统的机器学习模型 (MLM)。本次研究通过曲线下面积 (AUC) 来比较三种模型 (DLM、MLM 和融合模型) 的诊断性能, 并通过 DeLong 检验来进行各个模型之间的差异是否显著。再纳入高级、中级和低级三组医生分别对外部验证集的数据进行评估, 并与上述模型进行对比。

结果: 在预测 STAS 的外部验证集中, DLM 模型的 AUC 为 0.766 (灵敏度: 0.742, 特异度: 0.695, 准确度: 0.713), MLM 模型的 AUC 为 0.789 (灵敏度: 0.689, 特异度: 0.780, 准确度: 0.745), 而融合模型的 AUC 为 0.806 (灵敏度: 0.768, 特异度: 0.698, 准确度: 0.725)。在外部验证集中, 融合模型显著优于 DLM 模型 ($P=0.016$) 和 MLM 模型 ($P=0.029$)。高级医生的评估准确度、灵敏度和特异度分别是 0.73、0.64 和 0.80; 中级医生的评估准确度、灵敏度和特异度分别是 0.70、0.59 和 0.79; 低级医生的评估准确度、灵敏度和特异度分别是 0.59、0.48 和 0.77。

结论: 基于 3D ResNet 的 DLM 模型和 MLM 模型可用于术前预测 IA 期肺腺癌患者的 STAS, 且基于 DLM+MLM 的融合模型在预测 STAS 风险方面具有更明显优势, 而且其准确度超过中级医生水平。

PO-1204

基于定量 CT 评估中高危及急性肺栓塞的研究

姚彦娥、李建龙
延安大学附属医院

目的 观察不同危险等级急性肺栓塞患者实验室和定量 CT 检测结果的变化, 探讨定量 CT 对中高危及急性肺栓塞的诊断效能, 为临床鉴别中高危及急性肺栓塞提供新的途径。

资料与方法 回顾性收集确诊急性肺栓塞患者 143 例, 其中低危 ($n=87$) 和中高危 ($n=55$) APE。收集临床指标及实验室指标, 采用“数字肺”肺血栓自动检测工具, 采集肺栓塞栓子的定量 CT 指标。差异采用 t 检验或 Mann-Whitney U 检验, 定量 CT 指标与 APE 风险分类相关参数的相关性分析采用 Spearman 秩相关分析。采用 ROC 曲线评价临床、实验室和 CT 指标对中高危及急性肺栓塞患者的预测价值。

结果 低危与中高危及急性肺栓塞组比较年龄、舒张压在两组之间有统计学差异 ($P<0.05$), 性别及临床症状在两组之间无显著性差异 ($P>0.05$); 中高危及急性肺栓塞组较低危组 D-二聚体、天冬氨酸氨基转移酶 (AST)、直接胆红素 (DBIL)、血糖、尿酸、N 末端-B 型钠尿肽前体 (NT-proBNP)、RV/LV、PAOI 高 ($P<0.05$), 较低危组血小板计数 (PLT)、动脉血氧分压 (PO₂) 和动脉血二氧化碳分压 (PCO₂) 低 ($P<0.05$), 中高危及急性肺栓塞组定量 CT 栓子总体积、总血栓面积/管腔面积、总最大附壁长度较低危组高 ($P<0.001$)。Spearman 秩相关分析结果显示, 定量 CT 指标与 APE 风险分类相关参数均呈正相关 ($P<0.05$), 在多变量 Logistic 回归分析中, 栓子总体积与中高危及急性肺栓塞有显著且独立的相关性 ($OR=1.259, P<0.001$)。ROC 曲线分析显示, 栓子总体积对中高危及急性肺栓塞有较好的诊断价值 ($AUC=0.809$), 与 PAOI ($AUC=0.753$) 和 D-二聚体 ($AUC=0.633$) 相比。

结论 基于定量 CT 指标栓子总体积对中高危及急性肺栓塞有较好的诊断价值, 可以为临床诊断中高危及急性肺栓塞提供新的途径。

PO-1205

冠脉 CTA 量化的冠状动脉周围脂肪衰减 与冠状动脉疾病严重程度之间的关系

景梦园、周俊林
兰州大学第二医院

目的 探讨冠状动脉周围脂肪衰减指数 (FAI) 值与使用冠状动脉计算机断层扫描血管造影术 (CCTA) 测量的冠状动脉疾病 (CAD) 严重程度之间的关系。**材料与方法** 本研究回顾性地纳入了 428 名符合条件并在我院接受了 CCTA 检查的 CAD 患者。对 CCTA 图像上的 CAD 严重程度 (包括阻塞性狭窄和广泛病变)、节段狭窄和受累评分 (SSS、SIS) 以及 CAD-RADS 分级进行了评估。使用全自动软件量化了左前降支 (LAD)、左回旋支 (LCX) 和右冠状动脉 (RCA) 的 FAI 值。使用单变量和多变量回归模型评估了 FAI 值与 CAD 严重程度之间的关系。结果 单变量分析表明, 性别和目前吸烟与 FAIRCA 值升高有关 (均为 $P<0.05$), 而 CAD 严重程度与之无关 (均为 $P>0.05$)。不仅性别、吸烟和高血压等临床因素与 FAIRCA 值升高有关, 阻塞性狭窄、SIS 和 SSS 等评估 CAD 严重程度的指标也与 FAIRCA 值升高有关 (均 $P<0.05$)。多变量分析表明, 在校正了其他常规心血管危险因素和 CCTA 成像特征的影响后, 目前吸烟是 FAI 值升高的独立危险因素 (比值比 [OR]=0.569, 0.458, and 0.517; all $P<0.05$), 而 SSS (OR=1.041, $P=0.027$) 是 FAIRCA 值升高的独立危险因素。结论 在对常规心血管风险因素和 CCTA 成像特征进行校正后, 只有 SSS 是 FAIRCA 值升高的独立风险因素。

PO-1206

心脏磁共振评价的二尖瓣环平面收缩期位移: 心肌梗死后风险分层的一个可靠指标

王璐静
四川大学华西医院

目的: 探讨心脏磁共振 (cardiac magnetic resonance, CMR) 评价的二尖瓣环平面收缩期位移 (mitral annular plane systolic excursion, MAPSE) 对心肌梗死 (myocardial infarction, MI) 患者主要心血管不良事件 (major adverse cardiovascular events, MACE) 的预测价值。

方法: 本研究为历史性队列研究, 纳入 2015 年 7 月至 2022 年 6 月经 CMR 检查并确诊为 MI 的患者, 根据随访结果分为无 MACE 组和 MACE 组。采用 CVI 42 后处理软件在电影序列获得左室功能参数, 包括 LVEF、侧壁 MAPSE、间壁 MAPSE、平均 MAPSE。采用 Bland-Altman 分析评估 MAPSE 测量的一致性。采用独立样本 t 检验、Wilcoxon 秩和检验及卡方检验比较两组患者的基线资料及 CMR 参数。利用单因素及多因素 Cox 回归分析确定 MI 患者 MACE 的风险因素, 并建立预测模型。通过综合判别改进指数和净重分类计算验证模型中指标的增量预测价值。

结果: 纳入 165 例 MI 患者, 最终入选 103 例 (No-MACE 组 61 例, MACE 组 42 例)。No-MACE 组患者的 LVEF 和 MAPSE 明显高于 MACE 组患者。LVEF 和 MAPSE 均是 MI 后 MACE 发生的有效指标。MACE 的风险随着 LVEF 和 MAPSE 的增加而降低。对于心肌梗死后 MACE 的风险预测, 与模型 I (年龄) 相比, 模型 II (年龄+LVEF) (卡方值 4.0 vs. 22.7, $p<0.001$) 和模型 III (年龄+MAPSE) (卡方值 4.0 vs. 31.4, $p<0.001$) 具有显著的增量预测值。与模型 II 相比, 模型 III (卡方值为 22.7 vs. 31.4, $p=0.003$) 也具有显著的增量预测性。MAPSE 的最佳临界值为 9.70mm。

结论: CMR 评价的 MAPSE 是心肌梗死患者 MACE 发生的有效预测因子, MAPSE 具有显著的增量预测价值, 有助于为 MI 患者提供更全面的风险分层。

PO-1207

探讨极低辐射剂量联合 Pulmo 3D 技术在肺炎患者肺部 CT 检查中的应用价值

刘星

郑州大学第一附属医院

目的：探讨第三代双源 CT 能谱纯化技术 (Sn100kV) 扫描方式联合 Pulmo 3D 图像后处理技术在肺炎患者中肺部 CT 检查中的应用价值。**方法：**前瞻性收集 30 例 BMI<30kg/m² 且短期内欲复查肺部 CT 的肺炎患者，初次检查采用常规 CARE Kv 扫描方式联合 CARE Dose 4D 自动管电压技术行胸部 CT 检查，复查时采用能谱纯化技术 Sn100kV 扫描方式联合 CARE Dose 4D 自动管电压技术行胸部 CT 检查，扫描完成后对原始数据均采用 ADMIR (Strength=3) 迭代算法重建。检查结束后通过西门子 Singo Via Vb20 图像后处理工作站，使用 Pulmo 3D 技术分析 Sn100kV 图像疾病主观显示能力及图像客观定量分析信息。通过独立样本 T 检验比较患者两次检查的辐射剂量、信噪比、对比噪声比等，通过配对 T 检验比较患者真实肺功能参数及 Pulmo 3D 技术获得的模拟肺通气量参数。采用 Mann-Whitney U 检验比较两次图像主观质量评分及疾病诊断信心得分，通过 Kappa 检验对两组图像主观质量评分做一致性分析。**结果：**Sn100kV 组图像肺窗、纵膈窗 SNR、CNR 及图像主观质量评分均低于 CARE kv 组，但两组图像对疾病诊断信心评分无统计学差异 ($P>0.05$)，且 Sn100kV 组图像辐射剂量显著低于 CARE kv 组，较之减少了 90% 以上 ($P<0.05$)。两组图像主观评价结果一致性优秀 ($Kappa=0.831$, $P>0.05$)。通过 Pulmo 3D 技术获得的模拟肺容量与患者真实肺容量无统计学差异 ($P>0.05$)，Pulmo 3D 技术获得的疾病分布伪彩图更能直观反映病变累计范围及程度。**结论：**第三代双源 CT 能谱纯化技术 Sn100kV 扫描模式可以在极低的辐射剂量下获得与常规扫描模式同等诊断信心得分的图像质量，Pulmo 3D 图像后处理技术获得的疾病分布伪彩图能直观反映病变累计范围及程度，两种技术相结合在肺炎患者密切随访肺部 CT 检查中具有极大的临床应用价值。

PO-1208

“双低”技术联合高权重深度学习重建在冠状动脉血管成像中的应用价值

申利、彭荟、于勇、任占丽、陈晓侠

陕西中医药大学附属医院

目的：探讨“双低”技术联合高权重深度学习重建算法在冠状动脉血管成像中降低辐射剂量、减少对比剂剂量的应用价值。

方法：选择疑似冠心病患者 90 例，BMI<25 kg·m² 的患者分为两组，每组 45 例，A 组采用 120kv，智能毫安，噪声指数 (NI) 20，对比剂剂量 kgx0.8ml；B 组采用 70Kv 智能毫安，噪声指数 (NI) 30，对比剂剂量 kgx0.5，两组均以 9S 的平台期注射对比剂，监测降主动脉，阈值为 250HU，到达阈值后自动触发，延迟 1.5s 进行扫描，扫描结束后 A 组采用 50%权重基于多模型自适应统计迭代重建 (50%ASIR-V)，B 组采用高权重深度学习重建 (DLIR-H)。由两位工作经验丰富的医师采用五分法对图像质量进行双盲主观评价。在两组图像上分别测量主动脉根部、右冠状动脉近端、左回旋支近端、左前降支近端及心包脂肪 CT 值及 SD 值，计算 SNR 和 CNR。比较两种重建算法图像 CT 值、噪声、SNR、CNR、辐射剂量和对比剂剂量。

结果：B 组 DLIR-H 重建 AO、LAD、LCX、RCA 及心包脂肪的 CT 值显著高于 A 组 50%ASIR-V，差异有统计学意义 ($P<0.001$)，B 组 DLIR-H 重建 AO、LAD 及 RCA 的 SD 值显著低于 A 组 (P

<0.05)。B 组 DLIR-H 重建算法 AO、RCA、LAD 与 LCX 的 CNR 值、SNR 值显著高于 A 组 50%ASIR-V，且差异有统计学意义 ($P<0.001$)。两组冠状动脉图像质量主观评分均满足诊断要求，两名医生主观评分一致性好 (κ 值=0.85, $p<0.001$)，B 组图像主观评分高于 A 组且差异有统计学意义 ($P<0.001$)。B 组有效辐射剂量及对比剂剂量均显著低于 A 组且差异有统计学意义 ($P<0.001$)，且 B 组对比剂用量 (31.24 ± 3.58) mL 和辐射剂量 (1.35 ± 0.50) mSv 较 A 组 (49.51 ± 5.21) mL、 4.18 ± 1.78 mSv 分别降低了 36.9% 和 67.7%。

结论：对于 BMI $<25\text{ kg}\cdot\text{m}^2$ 的患者，“双低”技术联合 DLIR-H 重建算法可以显著降低 CCTA 辐射剂量和对比剂用量，并可获得较好的冠状动脉血管图像。

PO-1209

超低剂量胸部 CT 结合深度学习重建行肺结节评估的可行性研究

陈伟婷¹、金晨望²、马光明³

1. 陕西中医药大学

2. 西安交通大学第一附属医院

3. 陕西中医药大学附属医院

目的：探讨超低剂量 CT (ULDCT) 扫描条件下采用深度学习重建 (DLIR) 行肺结节评估的可行性，并比较其与 ULDCT 基于自适应统计迭代重建 40% (ASIR-V40%) 及标准剂量 CT (SDCT) ASIR-V40% 的图像质量、结节检出率以及结节征象显示能力。

方法：纳入本院肺结节复查患者 42 例。所有患者分别采用标准剂量 CT 检查 (SDCT) 和超低剂量 CT 检查 (ULDCT)，SDCT 采用 120kVp，自动管电流，ULDCT 根据患者 BMI ($\text{BMI}\leq 18.4\text{ kg}/\text{m}^2$ 、 $18.5<\text{BMI}<23.9\text{ kg}/\text{m}^2$ 、 $\geq 24\text{ kg}/\text{m}^2$) 分别采用 10mA、20mA、35mA 扫描，管电压与 SDCT 相同。SDCT 采用 ASIR-V40% 重建 (A 组)，ULDCT 分别采用 ASIR-V40% 重建 (B 组) 和 DLIR-H 重建 (C 组)，共获得 3 组图像。记录两次扫描的辐射剂量和 3 组图像检出结节数。测量 3 组图像肺组织、主动脉、肌肉的 CT 值和噪声值 (SD)，并计算各组织的信噪比 (SNR)。2 名资深放射医师采用双盲法对 3 组图像肺总体图像质量及肺结节征象进行 5 分制主观评分。对 3 组图像的定量指标和主观评分进行统计学分析。

结果：两种扫描方式的辐射剂量分别为 $3.38\pm0.97\text{ mSv}$ 、 $0.25\pm0.08\text{ mSv}$ ，ULDCT 相较于 SDCT 辐射剂量降低约 92.6%，差异有统计学意义 ($P<0.05$)。3 组图像的肺组织、主动脉、肌肉的 SD 值和 SNR 均有统计学差异 ($P<0.05$)，C 组图像各组织的 SD 值低于 B 组，而 SNR 高于 B 组，与 A 组对比无统计学差异 ($P>0.05$)。3 组图像肺结节检出数量均为 87 个，其中具有毛刺、分叶、胸膜牵拉、空洞或空泡、血管穿行征象的结节个数分别为 31 个、28 个、22 个、18 个、14 个。3 组图像的总体图像质量、肺结节征象主观评分有统计学差异 ($P<0.05$)，其中 C 组总体图像质量和肺结节征象主观评分优于 B 组 ($P<0.05$)，与 A 组对比无差异 ($P>0.05$)。

结论：超低剂量胸部 CT 结合深度学习重建能够获得与 SDCT ASIR40% 相当的图像质量，且对结节的检出及征象显示良好，临床可以用于对肺结节的评估。

PO-1210

心脏磁共振 T1 mapping 联合应变技术在心肌淀粉样变和肥厚型心肌病的诊断及鉴别的应用研究

游弋

成都市第五人民医院

目的: 探讨磁共振 T1 mapping 联合应变技术在心肌淀粉样变性 (CA) 和肥厚性心肌病 (HCM) 患者临床检查中的应用并分析其差异

方法: 回顾性分析 2019 年 3 月至 2022 年 12 月在我院诊治并行心脏磁共振 (CMR) 的 30 例心肌淀粉样变患者 (CA 组)、30 例肥厚型心肌病患者 (HCM 组) 及 30 名健康志愿者 (对照组) 资料, 扫描序列包括心脏电影、T1 mapping、钆对比剂延迟强化 (LGE), 通过心脏电影成像及 CVI42 后处理软件测量出心功能参数及形态学参数, 使用 T1mapping 模块计算出左心室整体及各节段 (基底段、中间段、心尖段) 心肌初始 T1 值、细胞外体积分数 (ECV), 在应变模块中测量出左心室整体及各节段 3D 径向应变 (RS)、周向应变 (CS)、纵向变 (LS) 值及相应的峰值收缩期应变率 (PSSR) 及峰值舒展期应变率 (PDSR), 计算上述参数各组间的差异。

结果: 心肌形态学及心功能参数中, 左心室质量、心率 CA 组高于 HCM 组, 左心室射血分数及左心室壁厚度 CA 组低于 HCM 组, 差异均具有统计学意义 ($P<0.05$), 其余各参数组间无明显差异; 应变参数中, CA 组整体、基底部、中间部、心尖部各应变参数 (RS、CS、LS 及其相应的 PSSR、PDSR) 均低于 HCM 组, 差异具有统计学意义 ($P<0.05$); CA 组总体、基底部、乳头肌部、心尖部心肌初始 T1 值及 ECV 值均高于 HCM 组, 差异具有统计学意义 ($P<0.05$)。

结论: CA 患者的心肌初始 T1 值及 ECV 值升高较 HCM 患者更为明显, 心肌应变较 HCM 患者下降更为明显, 因此磁共振 T1 mapping 联合应变技术在评估 CA 与 HCM 患者心肌纤维化、心脏整体及局部功能运动情况具有一定诊断价值。

PO-1211

IQon 能谱 CT 在评价吸烟人群肺部血流情况中的价值探讨

郭靖

天津市武清区中医医院

目的: 应用 IQon 能谱 CT 成像对正常人肺部血流状况进行分析, 证实能谱 CT 成像方法及多参数对肺部血流状况研究的可行性并探讨能谱 CT 对吸烟患者肺部血流情况进行评估的价值及意义。

研究方法: 选取本院 2021 年 6 月至 2023 年 3 月, 40—60 岁青壮年 15 年以上吸烟与不吸烟且同时排除合并肺部感染性病变、肺部间质病变及 COPD 病史及相应临床症状的患者各 50 例。运用 IQon 能谱 CT 增强下双期扫描能谱数据包对肺部灌注灌注情况进行评估, 首先确定把肺组织仰卧位作为观察体位, 于冠状及轴位并将肺组织沿重力方向等分为 3 个冠状层面, 即腹侧、气管隆突水平、背侧; 同时将双肺在头足侧方向上, 从上到下等分为上、中、下三部分; 再将左右肺在横断面上, 分别从外侧到内侧等分为外、中、内三个层面。在动脉期单个层面上每个部位分别均匀地测量 3 个不同感兴趣区域的标准碘密度值及单能级 40keV 下图像肺部 CT 值, 并利用原子序数融合图对肺部灌注情况进行整体评价。应用 SPSS18.0 软件, 采用方差分析、Spearman 相关性分析及配对 t 检验进行统计学分析。

研究结果: 1. 吸烟及非吸烟者全肺标准碘浓度值有明显差异, 尤其在单能级 40keV 的碘密度值下更为明显, 而常规肺部 CT 值在二者上无明显差异。2. 肺部标准碘密度值与肺功能相关指标 FEV1、FEV1% 预计值及 FEV1/FVC 成正相关性。3. 患者肺部标准碘浓度值与吸烟指数具有明显相关性。

研究结论: 1. 能谱 CT 增强两期灌注扫描可以较准确地反映整体及局部肺组织的血流灌注分布状况并可能成为综合评估吸烟患者肺功能的一个指标。2. 能谱 CT 灌注成像发现: 正常生理状态下, 肺血流在重力方向上成梯度分布, 背侧血流较丰富; 距离肺门血管越近血流越丰富。3. 吸烟患者肺部血流状况发生改变且与不吸烟患者存在明显差异。

PO-1212

超低剂量扫描条件下深度学习重建对计算机辅助检测系统肺结节定量分析影响

陈伟婷¹、金晨望²、马光明³、于楠³、申利³

1. 陕西中医药大学

2. 西安交通大学第一附属医院

3. 陕西中医药大学附属医院

目的：探讨深度学习重建算法（DLIR）在超低剂量扫描条件下（ULDCT）对肺结节 CT 影像辅助检测软件（CAD）肺结节定量分析的影响。

方法：纳入肺结节复查患者 46 例。所有患者分别采用标准剂量 CT（SDCT）和 ULDCT 检查。SDCT 采用基于多模型的自适应统计迭代重建 40%（ASIR-V40%），ULDCT 分别采用 ASIR-V40% 和 DLIR-H 重建图像，共获得 3 组图像（A 组、B 组、C 组）。记录两次扫描辐射剂量。将 3 组图像导入肺结节 CT 影像辅助检测软件（CAD）进行分析，测得每个肺结节长径、横径、密度、体积、危险度以及结节分类等参数。两名医生对 3 组肺结节图像质量进行 5 分制评分。根据肺结节密度将结节分为实性结节、钙化结节、磨玻璃结节 3 大类。将 3 组图像不同种类肺结节 CAD 定量分析数据及肺结节图像质量评分进行统计分析。

结果：ULDCT 的有效辐射剂量低于 SDCT，有统计学差异（ $P < 0.05$ ）。46 例患者共计检出肺结节 86 个，其中实性结节 40 个、钙化结节 24 个、磨玻璃结节 22 个。3 组图像实性和钙化结节长径、横径、体积、危险度无统计学差异（ $P > 0.05$ ）；A 组实性结节密度与 B 组对比有统计学差异（ $P < 0.05$ ），与 C 组对比无统计学差异（ $P > 0.05$ ）；A 组钙化结节密度与 C 组对比有统计学差异（ $P < 0.05$ ），与 B 组对比无统计学差异（ $P > 0.05$ ）。3 组图像磨玻璃结节长径、横径无统计学差异（ $P > 0.05$ ）；A 组磨玻璃结节密度、体积与 C 组对比有统计学差异（ $P < 0.05$ ），与 B 组对比无统计学差异（ $P > 0.05$ ）；A 组磨玻璃结节危险度与 B 组对比有统计学差异（ $P < 0.05$ ），与 C 组对比无统计学差异（ $P > 0.05$ ）。3 组图像不同种类肺结节图像质量评分有统计学差异（ $P < 0.05$ ），A 组与 B 组对比有差异（ $P < 0.05$ ），与 C 组对比无差异（ $P > 0.05$ ）。

结论：超低剂量扫描结合 DLIR-H 重建对实性结节定量分析与常规 CT 基本一致，但其会低估钙化结节密度和磨玻璃结节体积，高估磨玻璃结节密度，而所有结节的危险度和图像质量与常规 CT 无差异，因此临床中能使用超低剂量扫描结合 DLIR-H 重建对肺结节进行定量分析。

PO-1213

肺泡蛋白沉积症的 CT 表现及预后分析

隋昕、宋伟、汪佳儒、明樱、肖然、赵瑞杰、杜华阳、宋兰、王金华、朴思蓉

中国医学科学院北京协和医院

目的：肺泡蛋白沉积症（PAP）是一种病因不明的罕见疾病，以表面活性物质代谢受损为特征。部分患者治疗后仍科技残存病变，少数患者进展为终末期肺纤维化，本研究研究目的是通过连续 CT 观察肺部异常病变的变化，以期预测 PAP 患者临床改善因素及预后。

方法：45 例患者（25 例男性，20 例女性），年龄 23~54 岁。在基线和随访 CT 扫描上评估 PAP 的范围和分布（中位数，38 个月；范围，6-84 个月）。肺功能（PFT）测量包括用力肺活量（FVC），1 秒用力呼气量（FEV1），1 秒用力呼气量与用力肺活量（FEV1 / FVC）之间的比值，以及一氧化碳肺单次呼吸弥散能力（DLCO）。将临床表现改善的患者与表现出进展或无变化的患者的临床特征、基线和最终随访 CT 表现以及 PFT 结果进行比较。采用 Fisher 精确检验比较分类变量；采用 Mann-Whitney U 检验比较连续变量，以确定可预测 PAP 临床改善的临床或 CT 特征。

结果: PAP 患者的 CT 平扫最常见的影像学表现为磨玻璃密度影 (100%);其次为小叶间隔增厚 (86.7%)。重要的是,最终随访 CT 扫描显示肺部病变严重程度减低 ($n=30$),其中包括病变完全消失 ($n=6$);肺部病变无变化 ($n=10$);肺部病变加重 ($n=5$)。在 2 例患者可见牵引性支气管扩张和肺部结构扭曲。在单变量和多变量分析中,肺部病变总体程度的变化是 PAP 临床改善的预测因素 (优势比: 52.540; $P=0.031$)。

结论: 大多数 PAP 患者在随访中仍有病变残存,但是,进展为肺间质纤维化较为罕见。连续 CT 检查观察肺部病变异常的总体变化可以预测患者的临床改善程度。

PO-1214

基于 CCTA 的定量斑块分析评估不同斑块特征与腔内衰减梯度的相关性

王媛媛

兰州大学第二医院

目的: 研究腔内衰减梯度与冠心病患者斑块特征的相关性以评估不同斑块对局部及整体管腔腔内衰减梯度的影响。

方法与材料: 我们回顾性纳入了 80 名通过冠状动脉计算机断层造影 (CCTA) 及有创冠状动脉造影诊断为慢性冠状动脉疾病的患者,排除了因肿瘤性病变、糖尿病、高血压、高血脂、急慢性炎症造成的血流动力学改变而影响腔内衰减梯度 (TAG) 测量结果的患者,纳入其中最小狭窄程度 $>24\%$ 且只存在单一斑块的 LAD、LCX 及 RCA。其中 38 个斑块位于冠脉近段,25 个斑块位于冠脉开口处,23 个斑块位于冠脉中段,19 个斑块位于冠脉远段。三名独立的盲态放射科医生在 CCTA 图像上使用半自动化软件对斑块长度、斑块体积、最小管腔、最狭窄程度、及分别用斑块去除算法和中心线算法评估的斑块周围 TAG、斑块前 TAG、斑块后 TAG 进行量化取平均值。比较不同斑块特征对于 TAG 的影响及两种算法的差异。

结果: 在登记的参与者中,48 人为男性,32 人为女性。所有参与者的平均年龄为 60 岁 (39 至 82 岁)。在年龄、性别、体重指数危险因素方面没有观察到组间差异。斑块所在冠脉分支、斑块体积、最小管腔、最狭窄程度对于管腔 TAG 影响存在显著差异 ($P<0.001$),位于不同节段斑块对于斑块后 TAG 基于该管腔整体 TAG 的变化存在显著差异 ($P<0.001$),而对于斑块处 TAG 的变化无明显差异 ($P>0.05$);斑块去除算法与中心线算法的 TAG 测算存在显著差异 ($P<0.001$)。斑块越接近冠脉开口处,对斑块后 TAG 影响越小。中心线算法较斑块去除算法 TAG 测算更具有统计学意义。可以通过斑块所在部位及斑块本身特点评估管腔中血流动力学变化情况,以推测冠脉供血及斑块后续进展。

PO-1215

CMR 全定量心肌灌注评价川崎病患儿心肌灌注损伤:与左心室重构的关系

周忠琴、文凌仪、阿折十干莫、胡雷、郭应坤

四川大学华西第二医院放射科

目的: 将全定量心肌灌注运用于川崎病患儿,评价其心肌灌注损伤及其影响因素,并探究与左心室重构的关系。

方法：纳入我院就诊的川崎病 (KD) 患儿和年龄、性别匹配的对照共 120 名。全定量灌注成像采用双团注的方案。通过后处理获得左心室整体和三支冠状动脉供血区域的心肌血流量 (MBF)，根据患儿的收缩压和心率校正得到 MBFcor。统计学方法采用单因素方差分析和多元线性回归等。

结果：共纳入 KD 患儿 87 名 (男：60 例，年龄 7.49 ± 2.15 岁)，冠状动脉扩张患儿 45 例 (51.7%)，急性期患儿 25 例 (28.7%)；纳入对照儿童 33 例 (男：22 例，年龄： 8.22 ± 2.81 岁)。KD 的左心室整体 MBFcor 较对照组降低 (2.23 ± 0.50 vs. 2.48 ± 0.67 , $P=0.031$)。急性期患儿的左心室整体 MBFcor 较对照组降低 (2.08 ± 0.54 vs. 2.48 ± 0.67 , $P<0.05$)。中-巨大型冠状动脉瘤 (CAA) 患者的左心室整体 MBFcor 和有中-巨大型 CAA 的左前降支及左回旋支供血区域的 MBFcor 较冠状动脉未扩张及小型 CAA 患者和对照组的整体和相应冠状动脉供血区域均降低 (all $P<0.05$)，且其扩张程度 (Z 值) 与相应的 MBFcor 相关 (global: $r=-0.305$, $P=0.004$; LAD: $r=-0.299$, $P=0.005$; LCX: $r=-0.298$, $P=0.005$)。多元线性回归显示，KD 患儿的年龄、病程及冠状动脉扩张程度 (Z 值) 与整体 MBFcor 相关。KD 的左心室整体 MBFcor 与径向及轴向峰值应变 (PS) 的绝对值呈正相关 (radial: $r=0.233$, $P=0.035$; circumf.: $r=0.259$, $P=0.019$)，与左心室质量指数 (LVMI) 及左室重构指数 (LVRI) 呈负相关 (LVMI: $r=-0.268$, $P=0.012$; LVRI: -0.391 , $P<0.001$)。

结论：CMR 全定量心肌灌注能定量评价川崎病的心肌灌注异常。KD 的心肌灌注损伤与患儿的病程和冠状动脉扩张相关，且可能会导致左心室功能和左心室重构的异常。

PO-1216

基于深度学习模型非门控胸部 CT 左心房容积测量： 和心电门控 CT 手动测量比较

喻杰、钱李娟、杨帆

华中科技大学同济医学院附属协和医院

目的：

左心房三维结构不规则，手动分割定量测量困难且耗时，在非门控胸部 CT 上测量尤其具有挑战性。本研究旨在与心电门控心脏 CT 手动测量比较，验证基于深度学习的方法在非增强胸部 CT 上定量左心房容积的准确性。

方法：

2021 年 1 月 1 日至 2022 年 12 月 31 日，5000 例已知或疑似冠状动脉疾病患者接受了标准心电图门控心脏 CT 检查，其中 1000 例患者同期接受了常规非对比非门控胸部 CT 检查，用于肺癌筛查或常规体检等其他诊断目的。心电图门控心脏 CT 与非门控胸部 CT 的中位时间间隔为 0 天 (四分位数间距 [IQR] 0-2 天)。排除标准包括：金属植入术，严重运动伪影，无薄层数据。最终，900 例患者被纳入本研究。

所有符合纳入标准的患者心脏增强 CT 图像和肺部 CT 图像被传入专用工作站 (西门子, SyngoVia VB20)，由两名具有十年以上心血管 CT 诊断的医师独立使用手动分割的方法提取左心房三维构型并定量容积；同时，使用基于改进的 3D U-Net 深度学习模型深度学习算法的模型完成心脏各腔室的自动分割和体积测量。

结果：

深度学习算法自动测量的左心房容积与在专门心电门控的心脏 CT 上的手动测量值具有高度相关性 (Spearman 系数=0.90, $P<0.001$) Bland-Altman 分析显示，相对于心电门控 CT 手动测量，深度学习算法胸部非增强 CT 扫描倾向于低估左心房容积 (平均差值约 3.84ml)，平均组内相关系数为 0.96 ($P<0.01$)，显示出高度一致性。

结论：

与基于心电门控的心脏 CT 手动测量相比，深度学习算法在非门控胸部 CT 扫描中定量测量 LAV 是准确和可靠的。深度学习算法能够显著提高左心房容积测量效率和准确性，有望为临床医生提供更准确的 LAV 定量测量工具。

PO-1217

MR-T2 刀锋伪影校正技术联合 DWI 对局灶性机化性肺炎与周围型肺癌的鉴别诊断价值研究

党珊、于楠、陈媛媛
陕西中医药大学附属医院

目的：探索联合 MR-T2 加权成像（T2 weighted imaging, T2WI）与扩散加权成像（Diffusion weighted imaging, DWI）对局灶性机化性肺炎（Focal organizing pneumonia, FOP）与周围型肺癌（Peripheral lung cancer, PLC）的鉴别诊断价值。资料与方法：本回顾性研究共纳入 72 例 FOP、PLC 患者（50 个男性，平均年龄为 64.7 岁，22 个女性，平均年龄 64.9 岁），两组各 36 例。两名经验丰富的放射科医师独立阅读 MR 图像，并分别测量 T2 对比度比（T2 contrast ratio, T2 CR）及表观扩散系数（Apparent diffusion coefficient, ADC）值；使用配对 t 检验来比较两组间的 T2CR 与 ADC 值，使用 ROC 曲线来评估 MR-T2WI 与 DWI 的诊断效能。结果：两名放射科医师对 T2CR 与 ADC 值观察者间一致性良好（ICC 值分别为 0.951、0.955）；FOP 组 T2CR 和 ADC 值均显著大于 PLC 组（ p 均 <0.001 ），T2CR 与 ADC 值的阈值分别为 2.29 和 $1048 \times 10^{-6} \text{mm}^2/\text{s}$ ；联合 ADC 与 T2CR 值较单独使用二者诊断准确性及 AUC 提高（准确性：86.1% vs 84.7%、73.6%，AUC：0.924 vs 0.879、0.740）（ $p < 0.05$ ）。使用 ADC 值诊断 FOP 正确者 33 例，PLC 正确者 28 例；单独使用 T2CR 诊断 FOP 正确者 20 例、PLC 正确者 33 例；联合 T2CR 与 ADC 值对 FOP 诊断正确 29 例、PLC 诊断正确 33 例。结论：联合 T2CR 与 ADC 值有助于鉴别 FOP 与 PLC，诊断效能高于单独使用二者。

PO-1218

基于自动全肺分割的 CT 放射组学模型对肺功能下降人群的预测价值研究

屠远^{1,2}、黄定品²、楼凯华²、张侃¹、胡红杰²

1. 绍兴文理学院医学院

2. 浙江大学医学院附属邵逸夫医院

基于自动全肺分割的 CT 放射组学模型对肺功能下降人群的预测价值研究

目的：

本研究旨在建立基于自动全肺分割算法的 CT 放射组学模型，评估其在预测患者肺功能下降方面的能力。

方法：

回顾性收集 2020 年 6 月至 2023 年 3 月在本中心行胸部 CT 及肺功能检查的患者（间隔时间小于 1 月），排除 CT 图像质量不佳、大片炎症、积液等影响影像组学特征提取的患者后，共纳入 432 名患者。将肺功能检查结果为慢性阻塞性肺疾病（COPD, chronic obstructive pulmonary disease, 定义为 $\text{FEV1}/\text{FVC} < 0.7$ ）和保留比值受损肺功能（Preserved-ratio Impaired Spirometry, 定义为 $\text{FEV1}/\text{FVC} \geq 0.7$, $\text{FEV1}\%_{\text{pre}} \geq 0.8$ ）的患者定义为肺功能下降（ $N=241$ ），其余为肺功能正常（ $N=191$ ）。使用联影智能科研平台进行全肺 ROI 勾画，并提取放射组学特征，用最小绝对值收敛和选择算子（LASSO）进行特征筛选，使用 13 种分类器（AdaBoost、决策树、逻辑回归、XGBoost 等）进行模型构建，使用五折交叉验证进行模型效能检验。利用受试者工作特征曲线（ROC, Receiver operator characteristic curve）及曲线下面积（AUC, Area under curve）评估预测模型的效能。

结果：所有分类器中，使用逻辑回归算法得到了最佳放射组学模型，其预测肺功能下降的 AUC 在训练集与测试集中分别为 0.900 (95%CI: 0.869-0.934) 和 0.836 (95%CI: 0.752-0.924)。

结论：基于自动全肺分割的 CT 放射组学模型能预测患者是否存在肺功能下降，有助于在临床工作中筛查 PRISm 及 COPD 患者。

关键词：

慢性阻塞性肺疾病；保留比值受损肺功能；影像组学；机器学习

急性 Stanford A 型主动脉夹层患者 30 天内死亡率的预测模型

潘虹、柏金泉、史振洲、王舒婷、张同
哈尔滨医科大学附属第四医院

目的：德国急性 A 型主动脉夹层术后 30 天院内死亡评分系统 (GERAADA Score) 和欧洲心脏手术风险评分系统 (EuroSCORE II) 的有效性尚不清楚，我们的目的是验证这两个模型的预测精度。构建一个模型来预测急性 Stanford A 型主动脉夹层(ATAAD)患者 30 天内的死亡风险。

方法：在 2019 年 6 月至 2023 年 6 月期间在我院接受手术治疗的 ATAAD 患者，根据术后 30 天内是否发生死亡分为死亡组和生存组。计算患者的 GERAADA Score 和 EuroSCORE II，评估预测死亡率和实际死亡率。比较两组间器官灌注不足、心包积液以及冠脉相关的参数等。筛选独立预测因素并建立 ATAAD 患者 30 天内死亡的预测模型。绘制受试者工作特征曲线和决策曲线来评价模型的性能，并通过 DeLong 检验对模型进行比较。

结果：本研究共纳入 109 名患者，死亡组 35 人，存活组 74 人。死亡组的冠状动脉周围脂肪组织衰减在左前降支 (-67.5 ± 2.26) 和右冠状动脉 (-61.21 ± 1.81) 均高于生存组 (-74.45 ± 1.11 , $P=0.009$; -67.90 ± 1.72 , $P=0.019$)。逻辑回归分析显示升主动脉长度和心包积液是 ATAAD 患者 30 天内死亡的独立预测指标。我们构建 4 个模型，GERAADA Score (模型 1)；EuroSCORE II (模型 2)；模型 1、升主动脉和心包积液 (模型 3) 以及模型 2、升主动脉和心包积液 (模型 4)。模型 1 ($AUC=0.683$) 和模型 2 ($AUC=0.599$) 对夹层患者死亡率的预测价值相同 ($P>0.05$)。模型 3 ($AUC=0.832$) 和模型 4 ($AUC=0.818$) 的结果分别与模型 1 和模型 2 有显著差异 ($P<0.05$, DeLong 检验)。决策曲线表明，模型 3 可以进一步发展为一种定量工具，用于随后预测 ATAAD 患者 30 天内死亡率，我们以诺莫图的形式呈现。

结论：GERAADA Score 和 EuroSCORE II 预测效能相同。模型 3 可以提高 ATAADA 患者 30 天死亡率的预测能力。该模型可以对 ATAAD 患者进行危险分层并指导临床决策。

PO-1220

基于深度学习对肥胖患者行低剂量 CCTA 成像的应用价值

田瑞娟
南京明基医院

目的：探讨基于深度学习重建算法对肥胖患者行低剂量冠状动脉 CTA 成像的应用价值。

资料与方法：纳入 BMI ≥ 28 kg/m² 人群行冠状动脉 CTA 检查患者 100 例，随机分为对照组跟研究组，每组 50 例。对照组采用常规管电压 120kV 及对比剂剂量 (BMI $\times 1.5$)；研究组采用低管电压 100kV 及低对比剂剂量 (BMI $\times 1.5 \times 0.8$)，ASiR-V50%重建及 DLIR-H 重建。CCTA 主观图像质量评价：依据国际心血管 CT 学会冠状动脉分段标准，两名 5 年以上的心血管 CTA 工作经验的主治医师以上的医生分别对每段血管进行评分按照 5 分法对各组的图像质量进行评价。CCTA 客观图像质量评价：分别测量 A、B 两组中 ASiR-50%、DLIR-H 重建后图像的主动脉根部、左主干、三支冠状

动脉近段 CT 值,以主动脉根部邻近脂肪组织的 CT 值作为背景 CT 值、SD 值为背景噪声,以主动脉根部 SD 值为图像噪声。分别计算血管的信噪比和对比噪声比, $SNR = \text{管腔强化 CT 值} / \text{管腔 SD}$; $CNR = (\text{管腔强化 CT 值} - \text{背景 CT 值}) / \text{背景 SD}$ 。

结果:客观评价:两组的 DLIR-H 组噪声 (SD) 均低于 ASIR-V 组,信噪比 (SNR)、对比噪声比 (CNR) 均高于 ASIR-V 组,差异具有统计学意义,两组 DLIR-H 进行比较发现,主动脉根部的噪声,研究组均高于对照组,比较有统计学差异,两组 CNR 比较均无统计学差异,此外两组在主动脉根部的 SNR 分别为研究组 26.5 ± 6.0 、对照组 25.0 ± 5.7 ,研究组高于对照组,比较无统计学差异,反应了虽然降低管电压后图像的噪声有所增加,但图像客观质量并没有降低,达到了 120kV 常规管电压相同的图像效果。主观评价:DLIR-H 组主观图像质量评分明显高于 ASIR-V 组,比较有统计学差异。2 名医师评价图像质量的一致性较高。研究组 ($3.3 \pm 1.1 \text{mSv}$) 较对照组 ($4.2 \pm 1.2 \text{mSv}$) 的辐射剂量降低约 21%。

结论:肥胖患者在 100kV 低管电压下行 CCTA 检查具有可行性,并可有效降低辐射剂量及对比剂用量,且 DLIR-H 具有最高主观评分,图像客观评价指标较 ASIR-V 优越。

PO-1221

急性心肌梗死后非缺血远程心肌应变的影响因素研究

顿雨桐、康立清
沧州市中心医院

目的:

探究急性心肌梗死 (Acute Myocardial Infarction, AMI) 病人经皮冠状动脉介入治疗 (Percutaneous Coronary Intervention, PCI) 后远程心肌 (Remote Myocardium, RM) 的收缩功能情况,并探讨其影响因素。

方法:

研究选取 2018 年 11 月至 2023 年 7 月于沧州市中心医院诊断为急性心肌梗死行急诊 PCI 治疗且 2 周内行心脏磁共振 (Cardiac Magnetic Resonance, CMR) 检查的病人。收集病人临床数据、冠脉造影图像、实验室检查结果、各节段周向应变等参数。根据心肌的 CMR 成像表现及相对关系定义梗死心肌和远程心肌。根据 CMR 特征追踪技术 (Feature Tracking, FT) 识别的远程心肌峰值周向应变值将病人分为 RM 应变受损组和 RM 应变保留组。应用统计学方法对 RM 功能异常相关因素进行分析。

结果:

- 1.入组 141 例病人,54 例发生 RM 周向应变受损。共识别 423 个 RM 节段,其中 102 个节段周向应变受损。
- 2.单因素关联性分析显示,RM 应变受损组与 RM 应变保留组组间的年龄 ($P=0.035$)、高脂血症史 ($P=0.049$)、罪犯血管分布情况 ($P<0.001$) 的差异均有统计学意义。
- 3.将单因素关联性分析中有统计学意义的变量,即年龄、高脂血症史、罪犯血管分布情况以及 CMR 识别的微循环情况作为自变量纳入多因素 Logistic 回归分析示年龄 ($P=0.021$)、既往有高脂血症史 ($P=0.035$) 对远程心肌周向应变的影响具有统计学意义。相较于罪犯血管为左前降支的患者,罪犯血管为回旋支者及右冠者发生远程心肌周向应变受损的风险将分别提高 21.62 倍 ($P<0.001$) 和 3.64 倍 ($P=0.001$)。

结论:

- 1.急性心肌梗死后远程心肌收缩功能可能会受损。
- 2.相较于罪犯血管为左前降支的患者,罪犯血管为回旋支者及右冠者更容易发生远程心肌收缩功能受损。
- 3.年龄的增加会阻碍远程心肌收缩功能受损的发生,既往患有高脂血症促进远程心肌收缩功能受损的发生。

PO-1222

18F-FDG PET/CT 和血清肿瘤标志物对 非小细胞肺癌肿瘤突变负荷的预测价值

张倩、陶秀丽、袁培、张泽伟、应建明、郭蕾、李宁、王书航、李静、刘瑛、郭威、赵世俊、吴宁
中国医学科学院肿瘤医院

目的：肿瘤突变负荷（Tumor mutational burden, TMB），定义为肿瘤基因组每个编码区域的体细胞突变总数，是一种有前景的免疫治疗应答生物标志物。然而由于检测困难（侵入性操作、无法获得有效穿刺样本或重复取样、测序昂贵等），TMB 尚未在临床上广泛应用。本研究旨在探讨 18F-FDG PET/CT 代谢指标和血清肿瘤标志物是否可以作为非小细胞肺癌 TMB 的潜在替代，在临床无法检测 TMB 时通过非侵入性方法预测 TMB 水平并指导免疫治疗。

方法：在这项回顾性研究中，我们纳入了 129 例（男性 78 例，女性 51 例）在 2018 年 3 月至 2022 年 9 月期间我院接受基线 TMB 和血清肿瘤标志物检测以及 18F-FDG PET/CT 扫描的非小细胞肺癌患者。患者分为高 TMB 组（TMB ≥ 10 mutations/Mb, 27 例）和非高 TMB 组（TMB < 10 mutations/Mb, 102 例）。应用二元逻辑回归分析确定高 TMB 的独立预测因子。在对数尺度上进行线性回归分析确定 TMB 水平的独立预测因子。并对腺癌、EGFR+腺癌、EGFR-腺癌和鳞状细胞癌进行亚组分析。

结果：对于腺癌，高 TMB 组的所有代谢指标（SULpeak、SULmax、SULmean、MTV、TLG）均显著高于非高 TMB 组；吸烟（OR=27.08, P=0.018）、EGFR+（OR=0.03, P=0.033）、KRAS+（OR=7.98, P=0.083）、高 CEA（OR=33.56, P=0.029）和高 CA125（OR=13.68, P=0.030）是高 TMB 的独立预测因子；所有代谢指标和 TMB 值在对数尺度上呈显著的正线性相关关系，其中 SULpeak 是 TMB 值的独立预测因子。然而，在鳞状细胞癌中没有发现与 TMB 显著相关的代谢指标和血清肿瘤标志物。

结论：18F-FDG PET/CT 代谢指标和血清肿瘤标志物可以预测腺癌的 TMB 水平，在临床无法检测 TMB 时可以作为 TMB 的潜在替代，通过非侵入性方法指导免疫治疗。

双肺多发结节罕见病例分享

李叶
吉林大学第一医院

肺部 CT 与 PET-CT 均存在误诊。肺部 CT 检查：双肺散在沿支气管血管束分布的结节，大小约 0.32-0.74cm，增强扫描呈轻度强化。提示：双肺多发结节影，待除外转移癌；PET-CT 提示：双肺多发结节，考虑转移癌。右肺上叶磨玻璃结节，代谢不高，考虑周围型肺癌。行全麻胸腔镜下探查术。术中送检：右肺上叶楔形切除肺组织 1 块，重 17g，体积 7.06cm*2.51cm*2.32cm，肺组织内及胸膜下见灰白色结节数枚，直径 0.41cm-0.67cm。免疫组化结果显示：AE1/AE3 (-)，CD31(+), CD34 (+)，CK7 (-)，EMA (-)，FLI-1(+), Vimentin(+), Ki-67(约+2.00%) 术后病理：右肺上叶肺组织内多个结节，形态上倾向上皮样血管内皮瘤，伴玻璃样变性坏死。

多参数胸部 CT 在评估结缔组织疾病相关 肺动脉高压预后中的价值

张春芳
南京市栖霞区医院

摘要

目的: 基于胸部 CT 探讨肺血管参数、肺间质性改变、食管扩张程度及心包积液等肺高压参数在预测结缔组织疾病相关肺动脉高压 (CTD-PAH) 预后中的价值。

方法: 回顾性分析 2010 年 5 月至 2021 年 4 月在南京医科大学第一附属医院风湿免疫科经超声心动图诊断的 158 例 CTD-PAH 患者的临床资料和影像资料。测量并评估所有患者的胸部 CT 肺高压参数, 包括主肺动脉直径 (MPAd)、升主动脉直径 (AAOd) 和降主动脉直径 (DAOd) 以及右肺动脉直径 (RPAd)、左肺动脉直径 (LPAd)、间质性肺疾病评分、主动脉弓上食管冠状径、主动脉弓下食管冠状径、心包积液和胸腔积液。主要研究终点为全因死亡。采用单因素和多因素 COX 风险预测模型寻找不良预后的危险因素, 危险因素以风险比及其 95% 置信区间表示; 通过时间依赖的受试者工作特征 (ROC) 曲线寻找预测患者预后相关指标的阈值; 采用 Kaplan-Meier 方法计算患者的生存率。

结果: 多因素 COX 回归分析显示年龄、MPAd、间质性肺疾病评分及心包积液是 CTD-PAH 患者全因死亡的独立危险因素。时间依赖的 ROC 曲线结果提示, MPAd 和间质性肺疾病评分预测 CTD-PAH 患者预后相对应的最佳阈值分别为 37.70 mm 和 2 分。MPAd>37.70mm 联合肺间质性改变评分≥2 分的患者预后更差, $P\leq 0.0001$ 。

结论: 基于胸部 CT 参数 MPAd、间质性肺疾病评分及心包积液是结缔组织疾病相关肺动脉高压患者不良预后的独立危险因素, MPAd 联合间质性肺疾病评分可以更好识别临床预后不良的 CTD-PAH 患者。

PO-1225

双源 CT 冠脉成像在老年冠心病临床诊断中的有效性研究

魏应敏
南京市第一医院

目的 分析老年冠心病诊断中应用双源 CT 冠脉成像的诊断有效性, 探讨该技术的临床应用价值, 总结患者对于双源 CT 冠脉成像检查的满意度和该技术的正确应用方式。

方法 自 2022 年 7 月至 2023 年 3 月筛选本院检查的老年冠心病患者, 全部患者均确诊为冠心病, 年龄在 60 周岁及以上。纳入其中 58 例展开分析, 保持组间均衡性的前提下将患者随机分组, 抽签 1 比 1 划分对照组、实验组实施不同的诊断方法。对照组 29 例患者接受常规冠脉造影检查, 实验组 29 例患者实施双源 CT 冠脉成像检查, 检查工具为西门子双源炫速 CT Somatom Flash。收集全部患者检查结果, 分析冠状动脉分支、冠状动脉节段诊断结果。

结果 实验组检出左主干病变、左前降支病变、左回旋支病变、右冠状动脉病变的例数分别为 9 例、21 例、19 例、17 例, 分别占比 31.03%、72.41%、65.52%、58.62%, 对照组左主干病变、左前降支病变、左回旋支病变、右冠状动脉病变的例数分别为 3 例、15 例、10 例、9 例, 占比分别为 10.34%、51.72%、34.48%、31.03%, 实验组检出率均高于对照组, 差异可见统计学意义, $P<0.05$ 。实验组对冠状动脉分支诊断准确率、灵敏度、特异度分别为 93.55%、97.82%、94.10%, 高于对照组准确率、灵敏度、特异度分别为 67.74%、61.25%、70.40%, 差异可见统计学意义, $P<0.05$ 。实验组对于检查的非常满意、满意、不满意例数分别为 15 例、13 例、1 例, 分别占比 51.72%、44.83%、3.45%, 总满意度为 96.55% (28/29), 对照组检查的非常满意、满意、不满意例数分别为 10 例、12 例、7 例, 各占比 34.48%、41.38%、24.14%, 总满意度为 75.86% (22/29), 研究组检查总满意度高于对照组, 差异可见统计学意义 ($P<0.05$)。

结论 双源 CT 冠脉成像诊断老年冠心病效果较好, 具备较高的诊断特异性、敏感性和准确性, 对于冠状动脉分支、冠状动脉节段诊断结果准确, 操作简便、安全可靠。同时, 该检查适用于无法开展高级别诊断技术的基层医疗机构推广和应用, 患者满意度较为理想。

PO-1226

肺癌化疗后耶氏肺孢子菌肺炎 1 例

张托

阜外华中心血管病医院

目的：本文旨在描述一名有肺腺癌病史并接受化疗的老年男性患者，出现咳嗽、咳痰和间断性咳黄痰的症状，同时伴有胸闷和气喘，经实验室检查和影像学检查后被诊断为耶氏肺孢子菌肺炎（PCP）的病例。

方法：对患者的临床表现、实验室检查、影像学检查和呼吸道病原体二代测序结果进行综合分析，并回顾相关文献，探讨 PCP 的影像学表现与其它疾病的鉴别要点。

结果：患者有肺腺癌化疗史，出现咳嗽、咳痰和间断性咳黄痰的症状，伴有发热和呼吸困难。实验室检查显示白细胞总数增加，中性粒细胞比例增加，红细胞数量减少。呼吸道病原体二代测序显示肺孢子菌属相对丰度较高。胸部 CT 表现为双肺散在斑片影和磨玻璃影，局部呈蜂窝状改变，上叶见囊状透亮影，纵隔及双肺门见多发肿大淋巴结。经治疗后，病情较前稍有好转，发热及咳嗽、咳痰症状改善，复查肺部 CT 双肺病变较前有好转。

结论：耶氏肺孢子菌肺炎（PCP）是一种间质性浆细胞肺炎，通常见于免疫功能极低的患者。诊断 PCP 时应注意结合临床病史和其他临床表现，与其他疾病进行鉴别。

PO-1227

术前误诊的良性肺结节与典型恶性肺结节的预测研究

段丽君、曹殿波

吉林大学第一医院

目的：探讨术前误诊为恶性的良性肺结节的临床影像特征，并将其与典型恶性肺结节进行对比分析，建立临床模型预测肺结节的恶性概率。

方法：回顾性分析我院 2019 年 1 月至 2022 年 3 月有病理证实的术前误诊的良性肺结节 243 例、典型恶性肺结节 378 例。收集患者的临床影像资料，采用多因素逻辑回归分析筛选恶性结节的独立预测因素，建立临床预测模型评估恶性肿瘤的概率。另收集 2022 年 4 月至 8 月期间我院有术后病理结果的 50 例肺结节临床影像资料以验证本模型的预测效能，并与 PKUPH 模型、梅奥模型相比。

结果：术前误诊的 243 例良性肺结节患者，女性患者占 53.1%，年龄范围为 17~81（ 54.7 ± 10.5 ）岁。影像学上，实性结节占 71.2%，位于肺裂周围结节占 63.8%，呈圆形/类圆形结节占 58.8%。多因素逻辑回归分析明确结节恶性病变的 8 个独立预测因素：年龄、肿瘤标志物、直径、体积平均 CT 值、边界是否清楚、与肺裂位置关系、分叶、胸膜凹陷征（ $P < 0.05$ ）。本研究模型在验证组中的受试者工作特征曲线下面积为 0.815，大于 PKUPH 模型（0.785, $P=0.776$ ）及梅奥模型（0.502, $P=0.012$ ）的曲线下面积。

结论：术前易误诊的良性肺结节，女性居多，发病年龄偏小，影像学以圆形/类圆形、位于肺裂周围的实性成分为主。本研究所建立的预测模型对肺结节的恶性概率有较好预测效能，从而为减少良性肺结节的术前误诊提供帮助。

PO-1228

肺动脉血栓 CT 值与急性肺栓塞介入溶栓治疗疗效的相关性研究

孙潇楠、刘忠啸、张贺、唐鑫、邱慎满、孟闫凯、谢丽响、李绍东、张庆桥、徐凯

徐州医科大学附属医院

目的 分析肺动脉血栓 CT 值与急性肺栓塞 (Acute pulmonary embolism, APE) 患者介入溶栓治疗疗效的关系。方法 回顾性分析 2018 年 1 月至 2022 年 12 月于我院行 CT 肺动脉造影 (CT pulmonary angiography, CTPA) 检查诊断肺栓塞的患者 89 例。在薄层 (层厚 1.5mm) 轴位 CTPA 图像上选取最大一枚栓子的最大层面, 沿栓子边缘内侧 1mm 处勾画圆形感兴趣区, 测量栓子的 CT 值。选取 T4 椎体水平左侧肩胛下肌测量其平均 CT 值, 计算肺动脉血栓 CT 值/左侧肩胛下肌 CT 值比值。根据溶栓治疗前后 CTPA 检查结果, 计算溶栓治疗前、术后肺动脉 Qanadli 栓塞指数差 (Δ Qanadli 栓塞指数, Δ Q)。根据 Δ Q 的中位数, 将患者分为血栓溶解较好组 (Δ Q>50%)、血栓溶解较差组 (Δ Q \leq 50%), 比较两组间肺动脉血栓的 CT 定量参数差异。采用 SPSS 21.0 软件对数据进行分析, 将 $P<0.1$ 的单因素变量纳入多因素 Logistic 回归分析。肺动脉血栓 CT 值与 Δ Q 相关关系采用 Spearman 相关性分析。以 $P<0.05$ 为差异有统计学意义。结果 单因素分析显示, 肺动脉血栓 CT 值、血栓 CT 值/左侧肩胛下肌 CT 值在血栓溶解较好组、血栓溶解较差组间均具有统计学差异, P 值均 <0.05 。将两组间 P 值 <0.1 的单因素变量 (血栓 CT 值、血栓 CT 值/左侧肩胛下肌 CT 值、性别), 纳入多因素 Logistic 回归分析。多因素分析结果显示, 相对于血栓 CT 值 ≤ 53.47 HU 的患者, 血栓 CT 值 > 53.47 HU 的患者预测血栓溶解较好组的 OR 值为 9.175 (95% CI = 0.937~89.846, $P=0.057$)。肺动脉血栓 CT 值与 Δ Q 存在正相关关系 ($r=0.365$, $P=0.000$)。结论 肺动脉血栓 CT 值可以在一定程度上预测半定量 Qanadli 栓塞指数作为标准的 APE 患者介入溶栓治疗效果。肺动脉血栓 CT 值越高, 患者溶栓治疗效果越好。

PO-1229

肺腺癌 CT 放射组学与 Ki-67 表达的相关性研究

姜玲、孙建男
大庆油田总医院

目的: 探讨基于薄层 CT 扫描的肺腺癌患者的放射组学特征与 Ki-67 增殖指数 (proliferation index) 之间的关系。方法: 回顾性收集我院 2022 年 5 月-2023 年 5 月术前行薄层 CT 扫描, 术后病理证实为肺腺癌并进行了免疫组化检查具有明确 Ki-67 阳性指数的 167 例患者, 根据浸润程度分为浸润组 (131 例) 和非浸润组 (36 例), 由 2 名放射科医师使用开源软件 3D-Slicer 对术前 CT 病灶进行勾画并提取组学特征。统计分析后得到 Ki-67 的最佳临界值, 并以 Ki-67 再次分组, 统计分析后得到可预测 Ki-67 不同状态的显著放射学特征, 确定其与 Ki-67 之间的相关性。结果: 不同浸润程度的肺腺癌患者的性别、病灶直径及不同 Ki-67 PI 差异具有统计学意义 ($P=0.03$ 、 $P<0.01$ 、 $P<0.01$)。16 个放射学特征与 Ki-67 状态显著相关。多变量逻辑回归分析确定反方差、短轴和伸长率是 Ki-67 PI 的独立预测因素。反方差、熵、偏度、伸长率 ($P<0.01$ 、 $P=0.02$ 、 $P=0.03$ 和 $P=0.01$) 与 Ki-67 PI 呈正相关。反方差的高 Ki-67 状态的 AUC 为 0.737, 截止值为 0.47, 显著高于熵、偏度和伸长率 ($P=0.02$ 、 $P=0.03$ 和 $P=0.02$)。结论: 基于薄层 CT 扫描的部分放射组学特征可以作为肺腺癌患者 Ki-67 状态的无创预测指标, 其中反方差在预测 Ki-67 高表达状态时预测效能最佳。

PO-1230

早期肺腺癌 CT 异常形态血管形成的病理机制研究

邓林¹、强金伟¹、唐含州¹、赵亚婧²

1. 复旦大学附属金山医院

2. 复旦大学附属华山医院

目的：本研究基于大鼠早期肺腺癌模型及人肺腺癌样本，通过检测早期肺腺癌供血血管形成方式和血供来源，揭示早期肺腺癌致异常形态血管形成的病理机制及影像特征演变规律。

方法：使用 12 只 Wistar 大鼠建立原发性早期肺腺癌模型，分别于造模第 100、140 和 180 天，各对 4 只大鼠进行 micro-CT 肺血管成像，并与病理切片对照观察早期肺腺癌血供来源。回顾性收集 209 例人肺腺癌纯磨玻璃结节的胸部 CT 平扫图像及蜡块标本，根据浸润程度分为不典型腺瘤样增生/原位腺癌组、微浸润腺癌组和浸润性腺癌组。在 CT 图像中定量分析距离肺腺癌边缘 2cm 范围内的血管分支。对人肺腺癌病理切片进行 CD31、细胞黏合素 C 及 CD34/过碘酸雪夫免疫组化染色，并计数肿瘤内共生血管、套叠式和出芽式血管生成及血管生成拟态。在 SK-LU-1 和 A549 肺腺癌细胞培养上清液诱导下，检测肺动脉内皮细胞 (PAECs) 和支气管动脉内皮细胞 (BAECs) 的增殖、迁移和成管能力，并通过共生血管粘附实验检测两种肺腺癌细胞对 PAECs 和 BAECs 的粘附能力。

结果：12 只大鼠共计发现 157 个肿瘤，其中 139 个可见一支或多支肺动脉直接进入或肿瘤紧贴肺动脉生长，但全部肿瘤内外均无支气管动脉分布。人肺腺癌 CT 血管定量分析显示，随着浸润性进展，结节内外肺动脉血管体积、血管体积分数，血管厚度、血管分支数量、血管节点数及肺动脉体积比均出现不同程度增长 ($P<0.05$)。全部 209 例肺腺癌内外均未见支气管动脉分布。三组肺腺癌间血管共生计数和血管生成发生率均具有统计学差异 ($P<0.05$)，而血管生成拟态发生率不具统计学差异 ($P=0.523$)。三组肺腺癌组内血管共生、血管生成及血管生成拟态的发生率均存在统计学差异 ($P<0.001$)，且均以血管共生发生率最高。在肺腺癌细胞培养上清液诱导下，BAECs 较 PAECs 具有更强的增殖、迁移和成管能力 ($P<0.05$)，而共生血管粘附实验显示肺腺癌细胞粘附于 PAECs 的数量和粘附面积均明显大于 BAECs ($P<0.05$)。

结论：早期肺腺癌主要依赖血管共生作用从肺动脉获取血供，在此过程中可导致肺腺癌内血管结构呈现异常形态。

PO-1231

CCTA 减影技术结合冠状动脉人工智能辅助诊断系统的诊断效能分析

乔金晗¹、程敬亮¹、夏黎明²

1. 郑州大学第一附属医院

2. 华中科技大学附属同济医院

目的：探究 CCTA 减影技术的应用能否提升冠状动脉人工智能辅助诊断系统识别冠状动脉狭窄的诊断效能，并进一步探究该系统在不同类型斑块中的诊断效能。

方法：本研究为多中心研究，纳入于 2021 年 1 月到 2021 年 12 月期间同时行 CCTA 和 DSA 检查的患者。按冠状动脉 18 节段模型记录人工智能辅助诊断系统识别常规 CCTA 和减影 CCTA 时冠状动脉狭窄的 CAD-RADS 分级。人工评估常规 CCTA 和减影 CCTA 的图像质量，按 4 分法进行， ≥ 3 分看做图像可诊断；记录引起冠状动脉狭窄的斑块是否含有钙化成分，分为钙化斑块和非钙化斑块；评估病变长度，分为非弥漫性病变 (< 20 mm) 和弥漫性病变 (≥ 20 mm)。计算常规 CCTA 和减影 CCTA 识别冠状动脉明显狭窄 ($\geq 50\%$) 的诊断准确性，并进一步比较人工智能辅助诊断系统在不同斑块亚组中的诊断效能。 $P < 0.05$ 认为是差异具有统计学意义。

结果: 共纳入 91 例患者, 其中女性 29 例。冠状动脉人工智能辅助诊断系统共识别出 606 个存在斑块的节段, 其中 421 个节段的图像质量可诊断。CCTA 减影技术的应用提高了患者水平的诊断效能 (0.76 vs. 0.94, $P = 0.02$), 也提升了图像质量可诊断节段的诊断效能 (0.71 vs. 0.82, $P < 0.001$); 但如果所有节段均纳入, 常规 CCTA 和减影 CCTA 之间的 AUC 差异无统计学意义。在斑块亚组分析时, CCTA 减影技术的应用提高了非弥漫性钙化病变的诊断准确性 (0.69 vs. 0.82, $P = 0.001$), 而对于弥漫性钙化斑块、非钙化斑块无明显提升。

结论: CCTA 减影技术的应用提高了冠状动脉人工智能辅助诊断系统识别冠状动脉明显狭窄的诊断效能, 特别是对非弥漫性钙化斑块有提升。

PO-1232

CT-FFR 用于糖尿病患者主要心血管不良事件的预测

兰紫婷

上海市第一人民医院

兰紫婷 1†, 丁晓颖 2†, 俞雅蓉 1, 于丽华 1, 杨文丽 1, 代旭 3, 凌润健亚 3, 王宇凡 2, 杨文艺 4* 和张佳胤 1*

摘要

目的 探讨计算机断层扫描血流储备分数 (CT-FFR) 在糖尿病患者中的预后价值, 并建立关于主要心脏不良事件 (MACE) 的风险分层模型。

背景 计算机断层扫描血管成像衍生的血流储备分数 (CT-FFR) 是一种无创生理检测方式, 可根据 CCTA 数据对血流限制性狭窄进行功能评估。然而, CT-FFR 在糖尿病患者中的预后价值还缺乏相应的证据。

方法 前瞻性地招募了具有冠心病中等验前概率的糖尿病患者。所有患者均接受冠状动脉计算机断层扫描, 并随访至少 2 年。在由 957 名患者组成的训练队列中建立了两个模型: 模型 1 包括临床和常规影像学参数, 模型 2 包括上述参数+CT-FFR。一个由 411 名患者组成的内部验证队列和一个由 429 名患者组成的独立外部测试队列用于验证所提出的模型。

结果 本研究最终纳入了 1797 例患者 (平均年龄: 61.0 ± 7.0 岁, 1031 例男性)。随访期间, 7.18% 的患者 (129/1797) 发生了 MACE。多因素 Cox 回归分析显示, CT-FFR ≤ 0.80 (危险比 [HR]=4.534, $P < 0.001$)、HbA1c (HR=1.142, $P = 0.015$) 和低密度斑块 (LAP) (HR=3.973, $P = 0.041$) 是 MACE 的独立预测因素。在训练队列中, Log-likelihood-test 显示模型 1 和模型 2 之间存在统计学意义 ($p < 0.001$)。模型 2 的 C-index 明显大于模型 1 (C-index=0.82 [0.77-0.87] vs. 0.80 [0.75-0.85], $p = 0.021$)。在内部验证和外部测试队列中也发现了类似的结果。

结论 CT-FFR 是糖尿病队列中 MACE 的一个强有力的独立预测因子。结合 CTFFR、LAP 和 HbA1c 的模型在预测 MACE 方面表现出色。

关键词 糖尿病 冠状动脉计算机断层扫描 血流储备分数 高危斑块

PO-1233

4D-CT 血管量化评价临床应用初步研究

雷子乔

华中科技大学同济医学院附属协和医院

目前对血管疾病的诊断主要通过对患者病灶区域医学影像的观察和分析, 得到解剖学信息。但是血管病变的关键指标, 比如血管弹性的薄弱情况, 斑块的软硬, 血管壁力学特性和血流动力学的信息等, 均无法准确量化, 而这些指标在临床诊断和血管疾病预后中都具有非常重要的参考意义。

本研究结合 4D-CTA 图像识别技术等开展在体组织生物力学特性识别技术的研究, 主要包括: 基于图像处理技术研究血管的个性化四维建模、前处理技术; 采用有限应变插值法和反向有限元分析方法, 研究组织应力、应变计算方法和全场材料特性回归识别技术, 可以计算切除前、模拟切除后和实际切除后的血流流体力学图, 通过术前模拟, 可以减少手术时间, 降低患者术后并发症发生率。

PO-1234

合并颈动脉严重狭窄的急性主动脉 A 型夹层 患者急诊术后影像学疗效评估

赵宏亮、郑敏文
空军军医大学西京医院

目的 评价急性 A 型主动脉夹层 (acute type A aortic dissection, ATAAD) 患者单侧症状性颈总动脉累及血运重建术后脑灌注 CT 参数的变化, 并确定颈动脉夹层及 CT 脑灌注的关系。

方法 收集 2015 年 1 月至 2019 年 12 月期间, 55 例 ATAAD 且单侧症状性颈动脉累及患者, 在行主动脉全弓置换手术及颈动脉血运重建术前后接受了颈-主动脉 CTA 及颅脑 CT 灌注扫描。根据颈动脉累及 CT 特征分成三组: 颈动脉真腔闭塞组 (闭塞组, 20 例), 颈动脉夹层并再破口组 (再破口组, 19 例) 以及颈动脉假腔内存在血栓组 (血栓组, 16 例)。计算平均通过时间 (MTT)、脑血容量 (CBV) 和脑血流量 (CBF)。评估三组患者手术前的绝对和相对灌注值, 并与治疗后的值进行比较。观察病变侧颈动脉手术前后特征变化 (治愈情况)。

结果 1) 术前单因素 ANOVA 分析结果表明, 三组患者病侧大脑半球的脑血流流量 (cerebral blood flow, CBF) 值存在组间差异 ($F=4.792$, $p=0.012$), 经 post-hoc 分析, 闭塞组的 CBF 均值最低, 且低于血栓组 ($p=0.01$)。2) 术后单因素 ANOVA 分析表明, 三组患者病侧大脑半球的 CBF 值 ($F=4.970$, $p=0.011$) 及脑血容量 (cerebral blood volume, CBV) 值 ($F=3.933$, $p=0.024$) 存在组间差异, 经 post-hoc 分析, 破口组的 CBF 值低于闭塞组 ($p=0.022$) 和血栓组 ($p=0.033$); 破口组的 CBV 值低于血栓组 ($p=0.027$), 且有低于闭塞组的趋势 ($p=0.154$); 闭塞组和血栓组之间 CBF 和 CBV 无显著差异。3) 三组患者手术前后病侧大脑半球的脑灌注值均有相应改善。4) 三组患者术前病侧大脑半球的脑灌注指标均显著差于对侧大脑半球, 术后仅破口组病侧指标显著差于对侧指标。

结论 颈总动脉累及 ATAAD 患者手术后脑灌注情况均有不同程度的改善, 但颈总动脉夹层再破口患者术后无论是颈总动脉解剖变化还是脑灌注改善情况均差于真腔闭塞组和血栓组。

PO-1235

双层探测器光谱 CT 在与胸膜接触的纯磨玻璃结节中鉴别浸润性癌和微浸润性癌的价值

尹芳¹、张正华¹、康绍磊¹、张潇迪²、尹辰琳¹、陆琳¹、韩丹¹

1. 昆明医科大学第一附属医院

2. 中国四川成都飞利浦医疗中心

目的: 基于双层探测器光谱 CT 平扫定量参数联合形态学特征, 在与胸膜接触的纯磨玻璃结节 (pure ground-glass nodules with pleural contact, P-pGGNs) 中鉴别浸润性腺癌 (invasive adenocarcinoma, IAC) 和微浸润性腺癌 (microinvasive adenocarcinoma, MIA)。方法: 回顾性收集术前行双层探测器光谱 CT 胸部平扫, 表现为与胸膜接触的纯磨玻璃结节 (P-pGGNs) 且手术病理证实为 MIA 和 IAC 患者 104 例 (111 个 P-pGGNs), 分为 IAC 组 ($n=33$) 和 MIA 组 ($n=78$)。

测量结节长径、短径及三维 CT 值、电子云密度和有效原子序数值。临床资料包括性别和年龄；形态学特征包括结节形状、边界及分叶、毛刺、胸膜牵拉、空泡、空气支气管和血管异常征。比较 IAC 与 MIA 组形态及定量参数，筛选独立预测因素；ROC 曲线评价及比较各独立预测因素以及联合预测模型的诊断效能。结果：与 MIA 组相比，IAC 组结节多表现不规则、边界模糊，且更易出现分叶、毛刺、空泡、空气支气管和血管异常征 ($P < 0.05$)。IAC 组年龄、结节长径、短径、三维 CT 值和 ED 值均高于 MIA 组 ($P < 0.05$)。Logistic 回归分析结节三维 CT 值和 ED 值、长径、形状、分叶征及空泡征是 IAC 的独立预测因子。联合预测模型 AUC 高达 0.953，灵敏度 90.91%，特异度 89.74%。结论：双层探测器光谱 CT 平扫多定量参数联合形态学特征构建预测模型鉴别与胸膜接触的纯磨玻璃结节的 IAC 和 MIA 具有较高准确性。

PO-1236

双层探测器光谱 CT 定量参数对非小细胞肺癌 EGFR 突变的预测价值

李凤兰、齐琳琳、程赛楠、刘嘉宁、刘佳琪、崔舒蕾、王建卫
中国医学科学院肿瘤医院

目的 评估双层探测器光谱 CT (DLCT) 定量参数在非小细胞肺癌 (NSCLC) 患者表皮生长因子受体 (EGFR) 突变状态中的预测价值。

方法 前瞻性收集我院 2021 年 12 月至 2022 年 11 月期间行 EGFR 突变检测的 NSCLC 患者，根据基因检测结果将患者分为 EGFR 突变组和 EGFR 野生组。采用 DLCT 动脉期 (AP) 和静脉期 (VP) 双期扫描，记录患者基线资料、病灶常规 CT 影像特征和光谱图像定量参数，包括碘浓度 (IC)、虚拟平扫值 (VNC)、无水碘值 (INW)、光谱衰减曲线的斜率 (λ_{HU})、有效原子序数 (Zeff)、40keV 和 100keV 水平虚拟单能级图像值 (VMI)，计算动脉增强分数 (AEF) 和增强程度 (ED)，并测量胸主动脉 IC，计算标准化 IC (NIC) 和标准化 AEF (NAEF)。分析比较两组间的定量参数与 NSCLC 患者 EGFR 突变状态的相关性。

结果 入组 92 例 NSCLC 患者，EGFR 突变 69 例 (75.0%)。单因素分析显示，两组间的一般临床特征、常规 CT 影像特征、AEF、NAEF、Zeff (AP)、 λ_{HU} (AP) 以及双期 VMI (40keV) 和 VMI (100keV) 的差异均无统计学意义 ($p > 0.05$)。双期 IC、NIC、INW、ED 以及 Zeff (VP) 和 λ_{HU} (VP) 与 EGFR 突变状态呈显著相关 ($p < 0.05$)，其中 INW (VP) 特异性最高 (95.65%)，AUC 为 0.855 (95% CI: 0.768, 0.942)。多因素 logistic 回归分析显示，INW (AP) 和 NIC (VP) 是预测 NSCLC 患者 EGFR 突变状态的两个显著预测因素，其中 NIC (VP) 预测 NSCLC 患者 EGFR 突变的效能最高 (AUC: 0.897, 95% CI: 0.816 ~ 0.951)，敏感性为 79.71%，特异性为 86.96%，准确性 81.52%。

结论 NIC (VP) 可能是预测 NSCLC 患者 EGFR 突变的一个潜在的定量 DLCT 参数。

PO-1237

免疫检查点抑制剂相关心肌炎的心脏磁共振表现初探

赵凯、刘佳、李玮、邱建星
北京大学第一医院

目的：报道并总结本中心免疫检查点抑制剂 (ICIs) 相关心肌炎的心脏磁共振 CMR 表现及相关功能参数，探讨 CMR 成像对 ICIs 相关心肌炎的诊断价值。**方法**：回顾性收集本中心确诊的 ICIs 相关心肌炎病例。入组标准：经心肌活检或临床确诊为 ICIs 相关心肌炎；于我院行 CMR 检查，且图像质量合格。定量诊断使用 CVI42 软件，指标包括 LVEF、CO、CI、EDV/BSA、ESV/BSA、SV/BSA。

定性诊断由 2 名 CMR 诊断经验分别为 10、18 年的放射医师共同判定, 包括是否存在运动异常、是否存在心肌水肿、是否存在心肌延迟强化 LGE、LGE 分布特点等。

结果: 1、一般情况: 最终入组 27 例, 其中 2 例经心肌活检证实, 25 例临床确诊。27 例患者中, 男性 19 例, 女性 8 例; 年龄 63.30 ± 10.87 岁; 身高 169.93 ± 6.83 cm; 体重 68.09 ± 13.62 kg; BMI 23.45 ± 3.61 kg/m²。2、CMR 分析: 27 例患者 CMR 增强表现完全正常比例为 40.7% (11/27)。2.1 LVEF: 正常 ($> 50\%$) 比例为 88.9%; CO: 5.02 ± 1.25 l/min; CI: 2.81 ± 0.67 l/min/m²; EDV/BSA: 68.29 ± 16.96 ml/m²; ESV/BSA: 31.18 ± 14.37 ml/m²; SV/BSA: 37.10 ± 8.11 ml/m²。2.2 心肌运动不良发生率 37.0%, 心肌水肿发生率 33.3%, LGE 发生率 44.4%。2.3 LGE 阳性的 12 例患者 LGE 分布情况: 基底部分、中部、心尖部 LGE 发生率 100%、33.3%、41.7%; 侧壁、间隔壁、下壁、前壁 LGE 发生率 75%、58.3%、50% 8.3%; 心肌中层、心外膜下、心内膜下 LGE 发生率 66.7%、50%、41.7%。结论: 本中心 27 例 ICI 相关心肌炎患者中 LVEF 大部分正常, CMR 表现正常的比例约为 40.7%, 出现心肌水肿、LGE 的比例分别为 33.3%、44.4%, LGE 出现比例较高的位置是基底部分、侧壁和间隔壁、心肌中层, 中部和心尖部、前壁出现比例较低, 结果尚有待更大样本量的验证。

PO-1238

深吸气与深呼气下肺 CT 在肺非实性结节随访中价值的研究

蒋涛、沈钰洪、叶天河

华中科技大学同济医学院附属协和医院

目的: 通过对肺深吸气与深呼气引起的肺非实性结节定量参数的变化研究, 探讨深吸气与深呼气下肺 CT 在肺非实性结节随访中的价值。

方法: 前瞻性分析研究 2023 年 1 月 22 日至 2023 年 5 月 21 日于华中科技大学同济医学院附属协和医院就诊的 60 例共 68 个非实性肺结节患者, 均使用螺旋 CT 对患者进行肺部深吸气末与深呼气末 CT 扫描, 在后处理工作站分别使用肺密度和肺结节软件对呼吸气图像进行评估, 对两种呼吸情况下的同一非实性肺结节进行体积和密度大小的测量。得到 CT 定量指标: 吸气相非实性结节体积及肺体积、呼气相非实性结节体积及肺体积、吸气相非实性结节密度及肺密度、呼气相非实性结节密度及肺密度、非实性结节体积变化率: (呼气-吸气)/吸气。

结果: 吸气相的所有肺体积参数都大于呼气相, 且差异具有统计学意义($p < 0.001$); 呼气相的肺密度明显大于吸气相, 且差异具有统计学意义($p < 0.001$); 吸气相上非实性结节各轴向上大小和体积均大于呼气相, 且差异具有统计学意义 ($P = 0.006$, $p < 0.001$); 呼气相上非实性结节密度大于吸气相, 且差异具有统计学意义 ($P < 0.001$); 非实性结节体积变化率 V (呼气-吸气)/吸气大于密度变化率 D (呼气-吸气)/吸气, 且差异具有统计学意义 ($P < 0.001$)。

结论: 同一大小的肺结节在深吸气与深呼气下进行的肺 CT 扫描有着不同的大小和密度, 因此在肺非实性结节的随访中应尽量做到每次呼吸气的一致, 且在呼气情况下非实性结节体积变化程度大于密度变化, 因此不建议使用深呼气相扫描用于肺非实性结节的随访。深吸气下肺 CT 扫描能最大程度减少不同随访中肺非实性结节体积与密度的变化, 其训练方式较深呼气更加方便快捷, 对肺非实性结节的随访具有重要意义。

PO-1239

老年侵袭性肺真菌感染病临床影像预测模型的建立及评价： 一项多中心研究

庞小莉¹、王显棋¹、曾梦¹、张启川²、熊玮¹、陈伟¹

1. 陆军军医大学第一附属医院（西南医院）

2. 陆军军医大学第二附属医院（新桥医院）

背景: 侵袭性肺部真菌感染 (IPFI) 的早期准确诊断对于老年患者的有效抗真菌治疗至关重要。

方法: 根据病例-对照研究设计方案, 收集 2016 年 1 月 1 日至 2021 年 9 月 30 日于我科住院的老年患者 174 例侵袭性肺部真菌感染和 190 例肺部非真菌感染患者的临床、影像资料并进行分析。以我院 364 名患者为训练集, 以 2020 年 9 月 1 日至 2022 年 9 月 31 日在陆军军医大学第二附属医院住院的 104 名肺部感染患者为验证集。通过二元 Logistic 回归分析, 采用 R 软件包构建列线图预测模型, 并通过受试者工作曲线 (ROC)、曲线下面积 (AUC)、校准曲线、DCA 曲线等对模型的有效性和应用价值进行评价。

结果: 基于低白蛋白血症、糖尿病、COPD 急性发作、入院后营养不良、入院前广谱抗生素抗感染史、右肺下叶、左肺上叶、左肺下叶、磨玻璃影、空气支气管征、实变共 11 个因素构建列线图 ($R^2=0.862$, $C-index=0.981$, 95 CI: 0.970~0.992)。该模型的 The Hosmer-Lemeshow test 结果表明, 模型拟合性较好 ($p=0.980$)。训练集的 $AUC=0.981$, 外部验证集的 $AUC=0.785$ 。临床影像模型 ($AUC=0.981$), 并优于单独的临床 ($AUC=0.919$) 和放射学 ($AUC=0.932$) 模型。

结论: 基于 11 个因素建立的侵袭性肺部真菌感染临床影像预测模型, 其准确性较高。为临床医生对老年侵袭性肺部真菌感染患者提供了早期预测和及时管理提供了一个准确、有效的工具。

PO-1240

基于胸部 CT 图像的深度学习算法评估 肺腺癌的组织学微血管密度

王荣华¹、杜江锋²

1. 山西白求恩医院 (山西医学科学院)

2. 山西医科大学第一医院

目的: 本研究旨在探索和验证基于胸部计算机断层扫描 (computed tomography, CT) 图像的深度学习算法, 以预测肺腺癌微血管密度的可行性。

方法: 回顾性收集了我院 107 例及外院 45 例经手术切除的肺腺癌患者的胸部 CT 图像 (平扫及肺动脉期、主动脉期和静脉期三期增强图像), 分别组成训练组及验证组数据集。对所有术后肺癌组织病理切片行 CD34 标记染色检测微血管密度 (MVD), 包括 microvessel area (MVA)、microvessel Samples (Samples)。利用基于深度学习算法的 phigo-LK 软件分别计算平扫及三期增强 CT 图像的肿瘤 MVD 值 (CT-MVD), 同时测量肺癌的平扫 CT 值 (CT_{UE})、三期增强后的 CT 强化值 (CT_{CE}) 及 CT 净强化值 (CT_{NE}), 分析 CT-MVD、 CT_{UE} 、 CT_{CE} 及 CT_{NE} 与 CD34-MVD 参数 (MVA、Samples) 的相关性。并将肿瘤大小分为两组: $\leq 3cm$ 和 $> 3cm$ 组, 按肿瘤密度分为纯磨玻璃结节组 (pGGN)、混合磨玻璃结节组 (mGGN) 组及实性结节组 (SN), 比较不同组间 MVA、Samples 有无统计学差异。

结果: 深度学习算法基于 CT 平扫及三期增强图像得出的肺癌 CT-MVD 与 MVA、Samples 均呈线性正相关, 与 MVA 在训练组和验证组的相关系数分别为 $r: 0.665-0.859$ 和 $r: 0.652-0.846$ ($p<0.05$), 与 Samples 在训练组和验证组的相关系数分别为 $r: 0.339-0.591$ 和 $r: 0.352-0.577$ ($p<0.05$), 其中均以静脉期的相关性最强。 CT_{UE} 和 CT_{CE} 与 MVA 呈弱相关 ($r\leq 0.4$, $p<0.05$),

与 Samples 无相关性 ($p>0.05$)。CT_{NE} 与 CD34-MVD 参数无相关性 ($p>0.05$)。不同结节密度组间的 CD34-MVD 参数有明显差异 (均 $p<0.05$)，但不同结节大小组间的 CD34-MVD 参数差异无统计学意义。

结论: 本研究初步肯定了基于胸部 CT 图像的深度学习算法能够在体无创评估肺腺癌微血管生成状态的临床应用潜力，静脉期图像的相关性最高。

PO-1241

4D Flow MRI 技术评价急性心肌梗死患者左心室局部血流动能的初步研究

牛惜情¹、刘凤海²

1. 河北医科大学

2. 沧州市中心医院

目的: 应用 4D Flow MRI 技术初步探究急性心肌梗死患者左室腔内局部血流动能参数

方法: 对 30 名急性心肌梗死患者和 20 名年龄及性别匹配的健康对照者进行回顾性研究，所有受试者均完成心脏电影、对比剂延迟增强成像和 4D Flow 成像。急性心肌梗死患者进一步分为两个亚组: 梗死节段组和非梗死节段组。动能参数与左室舒张末期容积相关联，以获得左室平均动能、最小动能、收缩期动能、舒张期动能、E 波峰值动能、A 波峰值动能以及平面内动能的比例。采用独立样本 t 检验或 Mann-Whitney u 检验比较健康对照组与急性梗死组的差异，配对样本 t 检验或 Wilcoxon 配对样本秩和检验比较健康对照组和急性梗死组左室腔血流动能参数的组内差异。

结果: 在健康对照组中，左室腔同一层面内间隔壁处血流动能最大，前壁与后壁心腔血流动能参数差异无统计学意义。与健康对照组相比，急性心肌梗死组左心室平均动能 ($10.7\mu\text{J/mL}\pm 3.2$ vs. $14.7\mu\text{J/mL}\pm 3.6$, $p<0.001$)、收缩期动能 ($14.6\mu\text{J/mL}\pm 5.1$ vs. $18.8\mu\text{J/mL}\pm 3.9$, $p=0.003$)、舒张期动能 ($7.8\mu\text{J/mL}\pm 2.5$ vs. $10.5\mu\text{J/mL}\pm 3.8$, $p=0.018$) 及 E 波峰值动能 ($9.7\mu\text{J/mL}\pm 4.9$ vs. $20.9\mu\text{J/mL}\pm 7.7$, $p<0.001$) 显著降低。急性心肌梗死组的梗死节段与非梗死节段相比，梗死节段组的平均动能降低而平面内动能比例显著增加。

结论: 应用 4D Flow MRI 技术可定量评价左心腔局部血流动能参数。健康人群中左心腔同一层面不同节段的血流动能参数是有差异的，急性心肌梗死患者中梗死节段心腔的平均动能降低而平面内动能比例增加。

PO-1242

双源 CT 优化心电图脉冲编辑技术在左心功能评估中的应用

金榕、祁荣兴

南通市第一人民医院

目的 评估双源 CT 优化心电图脉冲编辑 (Pulsing) 技术在行冠状动脉 CT 造影 (CCTA) 检查同时测量左心功能的准确性、图像质量及辐射剂量。方法 连续选取 2022 年 8 月~2022 年 12 月在南通市第一人民医院采用 CCTA 优化 Pulsing 技术评估左心功能的患者 36 例，入组患者 Pulsing 范围 R-R 间期 65%~75%；另外，选取 CCTA 检查 Pulsing 范围 R-R 间期 0%~100% 患者 24 例作为对照，所有入组患者均在 1 周内行经体表二维超声心动图检查，以心超测量左心功能指标作为参考标准，评估优化 Pulsing 技术测量左心功能的准确性、图像质量及辐射剂量。结果 实验组和对照组的性别、年龄及 BMI 差异无统计学意义 ($P>0.05$)。实验组和对照组的右冠 (RCA)、左主干 (LM)、左前降 (LAD)、左回旋支 (LCX) 的 CT 值、信噪比 (SNR) 及主观评分差异无统计意义 ($P>0.05$)。实验组 DLP (132.4 ± 56.0) mGy·cm、ED (1.85 ± 0.78) mSv 明显低于对照组

DLP(348.4 ± 120.5)mGy·cm、ED (4.88 ± 1.69) mSv ($P < 0.05$)。实验组的 CCTA 图像和超声心动图测量的射血分数 (EF) (65.4 ± 13.6 、 64.8 ± 10.9)、左室舒张末期容积指数 (EDVI)、左室收缩末期容积指数 (ESVI) 差异无统计学意义 ($P > 0.05$)。CCTA 图像和超声心动图测量 EF、EDVI 和 ESVI 有很好的的一致性 (ICC = 0.908、0.812、0.888, $P < 0.001$)，Pearson 相关性分析显示两组数据有很好的相关性 ($r = 0.849$ 、0.700、0.818, $P < 0.001$)。结论 以超声心动图为参考标准，优化 Pulsing 技术 CCTA 的图像可以准确评价左室心功能，并取得很好的图像质量，且能有效的降低患者的辐射剂量，在心血管检查中具有重要价值。

PO-1243

类风湿关节炎相关间质性肺病的定量评价：纵向研究

蒲豆豆、于楠
陕西中医药大学附属医院

目的：本研究通过分析 CT 定量指标在类风湿关节炎相关间质性肺病 (RA-ILD) 患者中的变化，探索 CT 定量技术在 RA-ILD 随访中评估疾病进展的价值。

方法：分析 RA-ILD 随访队列患者 90 名的 HRCT 图像 180 例。影像诊断医师以是否出现新的影像征象或原有征象进展范围是否超过 20% 为标准，判断疾病变化情况，将患者分为进展组和非进展组。并使用“数字肺”数据分析平台分析患者 CT 图像获得定量指标。定量指标包括首次和随访过程中的犬吠体积 (TLV)、全肺密度、密度直方图、肺纤维化指标 (LAA-200 ~ -700%) 以及周围血管数量 (TNV) 和面积 (TAV)。以诊断医师主观评判作为参考标准，比较定量参数在基线扫描和随访过程中的变化，并分析定量数据结果与主观评价结果的关系。

结果：进展组与非进展组患者 CT 定量数据变化值比较发现，进展组定量数据中的 TLV、LAA-200 ~ -700%、TNV 和 TAV 的变化值均大于非进展组，差异具有统计学意义 ($P < 0.05$)。具体表现为随访过程中进展组的 TLV 减小、LAA-200 ~ -700% 增大、TNV 和 TAV 减小，且具有显著的统计学差异 ($P < 0.0001$)；而非进展组病例的定量指标 TNV 和 TAV 也存在变化，表现为 TNV 和 TAV 均减小，具有显著的统计学差异 ($P < 0.0001$)，血管指标可能比主观评价更具敏感性。

结论：CT 定量分析指标能发现并量化 RA-ILD 随访过程中疾病的进展，和主观评价结果具有一致性。且定量数据能够发现 RA-ILD 肺部细微结构的改变，是主观评价结果的补充。

PO-1244

基于光谱 CT 冠周脂肪定量参数与冠状动脉狭窄程度相关性研究

贾玉琳、邹磊、肖喜刚
哈尔滨医科大学附属第一医院

目的：双层探测器光谱 CT 衍生的多参数成像能够提供多个定量参数。本研究旨在评价基于光谱 CT 冠周脂肪定量参数与冠状动脉狭窄程度的相关性。

方法：收集临床可疑冠状动脉粥样硬化患者并进行光谱 CT 冠状动脉血管成像 (CCTA)。将患者按照管腔狭窄程度分为三组：轻度狭窄、中度狭窄、重度狭窄。分别测量常规图像、40~140keV 虚拟单能图像、虚拟平扫图像上管腔最狭窄处冠周脂肪的衰减及斑块周围冠周脂肪的有效原子序数，计算 40~70keV、40~100keV 及 70~100keV 三个能量区间的衰减曲线斜率。

结果：231 支冠状动脉存在粥样硬化斑块及管腔狭窄纳入研究，其中 123 支轻度狭窄，69 支中度狭窄，39 支重度狭窄。在三组中，常规图像、虚拟单能图像、虚拟平扫图像上斑块周围的冠周脂肪衰减及有效原子序数均差异显著 ($P < 0.05$)，而三个能量区间的衰减曲线斜率不具有显著性差异。

($P>0.05$)。在冠周脂肪的多个定量参数中, 重度狭窄组的数值最高, 其次为中度狭窄组, 轻度狭窄组的数值最低。

结论: 基于光谱 CT 的斑块周围冠周脂肪定量参数与冠状动脉的狭窄程度密切相关。当冠状动脉斑块影响管腔狭窄程度评价时或者在非对比增强图像上, 多参数评价具有较高的应用价值。

PO-1245

双层探测器光谱 CT 定量参数检测肺腺癌中的表皮生长因子受体突变的价值

李凤兰、齐琳琳、程赛楠、王建卫
中国医学科学院肿瘤医院

目的 本研究旨在探讨双层探测器光谱 CT (DLCT) 定量参数对肺腺癌表皮生长因子受体 (EGFR) 突变状态识别的诊断性能。

方法 前瞻性收集我院 2022 年 1 月至 2022 年 9 月期间行 EGFR 突变检测的肺腺癌患者, 根据基因检测结果将患者分为 EGFR 突变组和 EGFR 野生组。采用 DLCT 平扫 (UP)、动脉期 (AP) 和静脉期 (VP) 三期胸部动态扫描, 记录患者基线资料、病灶常规 CT 影像特征和光谱定量参数, 包括碘浓度 (IC)、无水碘值 (INW)、光谱衰减曲线的斜率 (λ_{HU})、有效原子序数 (Zeff)、40keV~100keV 水平虚拟单能级图像值 (VMI); 测量胸主动脉的 IC、Zeff 值, 计算标准化 IC_1 (NIC_1)、标准化动脉增强分数 $_1$ (NAEF $_1$) 和标准化 Zeff (NZeff); 排除 UP 病灶的本底的 IC 值, 获得 NIC_2 和 NAEF $_2$ 。分析比较两组间各类定量参数与 EGFR 突变状态的相关性。

结果 共入组 64 例患者, EGFR 突变 44 例 (63.8%)。除了 NAEF $_1$ ($p=0.152$)、NAEF $_2$ ($p=0.213$) 和动静脉期 VMI (40keV~100keV) (均 $p>0.05$) 以外, EGFR 突变组的定量参数均显著高于 EGFR 野生组 ($p<0.001$)。其中, IC (AP)、 NIC_1 (AP)、 NIC_2 (AP)、 λ_{HU} (AP) 和 NZeff (AP) 预测效能均显著高于 VP 所对应的定量参数 ($p<0.001$), 曲线下面积分别为 0.887、0.824、0.755、0.888 和 0.822, 但动静脉期的 NIC_2 与 NIC_1 在 EGFR 突变组和 EGFR 野生组之间均无显著差异 (均 $p>0.05$)。

结论 多种 DLCT 定量参数对肺腺癌患者 EGFR 突变状态有一定预测效能。

PO-1246

紧贴胸膜的肺部实性结节 CT 鉴别诊断研究

褚志刚、姜锦、吕发金
重庆医科大学附属第一医院

目的: 肺部紧贴胸膜的实性结节 (solid pleura-attached nodules, SPAN) 并不常见, 目前对其研究和理解还不够透彻。本研究旨在确定鉴别良恶性 SPAN 的临床和 CT 特征。

材料和方法: 从 2017 年 1 月到 2023 年 3 月, 回顾性纳入共 295 名患者共 300 个 SPAN (128 个良性和 172 个恶性)。分析患者的临床及 CT 资料, 对比良恶性 SPAN 的临床及影像学表现, 通过对比分析寻找二者之间的差异。

结果: 良性和恶性 SPAN 在患者年龄、吸烟史、临床症状、CT 特征、结节-胸膜交界面、邻近胸膜改变、周围伴发病变和淋巴结肿大方面存在显著差异。多因素分析显示, 吸烟史 (比值比 [OR], 2.016; 95% 置信区间 [CI], 1.037-3.919; $p=0.039$)、紧贴纵隔胸膜 (OR, 3.325; 95% CI, 1.235-8.949; $p=0.017$)、结节直径 (>15.6 mm) (OR, 2.266; 95% CI, 1.161-4.423; $p=0.016$), 与胸膜窄基底紧贴 (OR, 6.035; 95% CI, 2.847-12.795; $p<0.001$), 同时出现肺

门和纵隔淋巴结肿大 (OR, 4.971; 95% CI, 1.526-16.198; $p=0.008$) 是恶性 SPAN 的独立预测因素, 该模型的曲线下面积 (AUC) 为 0.890 (敏感性, 82.0%, 特异性, 77.3%) ($p<0.001$) 结论: 在有吸烟史的患者中, 紧贴纵隔胸膜、较大的 (直径 $>15.6\text{mm}$)、有分叶征的、窄基底的或同时伴有肺门和纵隔淋巴结增大的 SPAN 为恶性的可能性较大。

PO-1247

基于肺部 CT 的影像组学特征预测 EGFR 突变型肺腺癌患者脑转移

林丽娟、张金华、陈德华
福建医科大学附属第一医院

目的: 肺腺癌患者发生脑转移 (Brain metastasis, BM) 的概率约为 45%-52%, 其中以 EGFR 突变型肺腺癌最常见。肺癌脑转移瘤患者的预后差, 因此, 筛选出 BM 风险较高的肺癌患者进行预防性治疗有重要的临床价值。本研究旨在探讨基于肺部 CT 的影像组学特征预测 EGFR 突变型肺腺癌脑转移的价值。

方法: 回顾性分析 2020 年 1 月至 2022 年 12 月期间在福建医科大学附属第一医院经病理证实为 EGFR 突变型肺腺癌患者的影像学资料及临床资料。将所有研究对象分为 BM 组和非 BM 组。将所有病例以 8:2 随机分为训练集和测试集, 筛选出 851 个稳定的影像组学特征。使用 6 种机器学习分类器进行模型训练。选取具有组间差异的临床危险因素用于构建临床预测模型。联合训练集中组间具有统计学差异的临床特征与影像组学预测值进行联合模型构建。采用 ROC 曲线评估模型的预测效能。模型之间的性能比较用 DeLong 检验进行。决策曲线用于评估各预测模型的临床实用性。使用斯皮尔曼相关系数评估影像组学模型预测值与 Ki-67 表达水平之间的关系。

结果: 本研究共纳入 198 例患者, 其中 72 例患者发生脑转移。临床模型、影像组学模型、联合模型在训练集和测试集中预测 BM 的 AUC 分别为 0.730 和 0.647、0.989 和 0.865、0.963 和 0.896。在训练集中, 影像组学模型、联合模型的 AUC 均高于临床模型 ($Z=6.362$ 、 6.689 , P 均 <0.001); 在测试集中, 联合模型的 AUC 高于临床模型 ($Z=2.778$, $P<0.05$), 而影像组学模型、临床模型间 AUC 差异无统计学意义 ($Z=2.030$, $P=0.137$)。在训练集和测试集中影像组学模型与混合模型之间均无明显差异 ($Z=1.999$ 、 0.994 , P 均 >0.05)。Spearman 相关性分析结果表明病灶影像组学模型预测值与 Ki-67 表达水平有关 ($\rho_{\text{spearman}}=0.143$, $P<0.05$)。

结论: 基于临床资料、肺部 CT 影像组学特征以及二者联合的模型都可用于预测 EGFR 突变型肺腺癌脑转移。其中, 联合模型能够显著提高脑转移预测能力。影像组学模型预测值与 Ki-67 表达水平相关。

PO-1248

阻塞性睡眠呼吸暂停综合征致左室结构及 功能改变相关心脏磁共振研究

周小兵
中山大学附属第五医院

目的: 基于心脏磁共振 (CMR) 成像方法探讨阻塞性睡眠呼吸暂停综合征 (OSAS) 所致左心室结构及功能改变。方法: 排除重大心血管病后, 选取 OSAS 患者 24 例 (呼吸暂停低通气指数 [AHI] ≥ 5 次/时), 健康对照组 20 例 (AHI <5 次/时) 进行非增强 CMR 检查。左室结构及功能指标包括左室最大室壁厚度 (MWT)、左室质量指数 (LVMI)、左室舒张末期质量与容积比值

(LVMVR) 及心指数 (Ci)、射血分数 (LVEF) 等; 基于特征追踪心脏磁共振技术 (CMR-FT) 得到心肌整体应变指标包括长轴应变 (GLS)、径向应变 (GRS) 及环向应变 (GCS); 同样基于 CMR-FT 获得左房容积、射血分数及应变力指标间接反映左室舒张功能。组间比较观察左室结构及功能的组间差异; 多变量线性回归旨在发现独立影响左室结构指标 LVMi 和 LVMVR 相关危险因素。

结果: 除 9 例 OSAS 患者 (37.5%) 合并存在高血压外, 所有受试者均不存在其他心血管疾病及相关危险因素。左室常规收缩功能指标如 Ci、LVEF 及反映亚临床左室收缩能力的应变指标 GLS、GCS、GRS 组间比较中均无明显统计学差异; 左房指标在组间同样无明显统计学差异; 然而在 OSAS 患者中, 代表左室结构指标如 LVMi ($P<0.001$), LVMVR ($P<0.001$) 及 MWT ($P<0.05$) 显著高于正常对照组。多变量线性回归分析, 发现存在 OSAS 是引起 LVMi、LVMVR 指标升高的相关危险因素。结论: 本研究显示首诊 OSAS 患者在发生左心室功能受损前就已经存在心脏结构的相关改变; 同时 OSAS 患者存在向心性重构趋势; 进一步分析表明, OSAS 是独立引起 LVMi 及 LVMVR 升高的危险因素。

PO-1249

临床-影像学模型预测冠状动脉中度狭窄患者基于冠状动脉 CT 造影所获无创血流储备分数 ≤ 0.8 及预后作用

文凤、张翰元

陆军军医大学第一附属医院 (西南医院)

目的 建立临床-影像学模型, 观察其预测冠状动脉中度狭窄患者基于冠状动脉 CT 造影所获无创血流储备分数 (CT-FFR) ≤ 0.8 的效能, 探究 CT-FFR < 0.8 对冠状动脉中度狭窄患者预后的预测作用。方法 回顾性分析行冠状动脉 CT 血管成像 (CCTA) 提示冠状动脉中度狭窄并行冠状动脉造影 (ICA) 的冠心病患者 302 例, 将其分为缺血组和非缺血组。以单因素及多因素 logistic 回归分析筛选 CT-FFR ≤ 0.8 的独立影响因素, 构建临床-影像学模型, 评价其预测 CT-FFR ≤ 0.8 的效能。进行随访, 采用多因素 Logistic 回归分析 CT-FFR < 0.8 与患者发生主要不良心血管事件 (MACE) 的相关性。

结果 单因素及多因素 logistic 回归分析结果显示, RDW 升高、高同型半胱氨酸血症、典型心绞痛、LAD 病变及多支血管病变为冠状动脉狭窄患者 CT-FFR ≤ 0.8 的危险因素; 基于上述因素建立的临床-影像学模型的数据拟合 ($P=0.46$) 及泛化能力 ($Kappa=0.45$) 均可, 预测概率接近实际概率线及理想线, 其预测冠状动脉狭窄患者 CT-FFR ≤ 0.8 的曲线下面积为 $0.83[95\%CI (0.76, 0.94)]$, 敏感度为 77.23%, 特异度为 83.12%。

结论: 基于 RDW 升高、高同型半胱氨酸血症、典型心绞痛、LAD 病变及多支血管病变的临床-影像学模型预测冠状动脉狭窄患者 CT-FFR ≤ 0.8 的效能较佳。CT-FFR < 0.8 对冠状动脉中度狭窄患者 MACE 事件有重要预测作用。

PO-1250

7.0T 心脏磁共振用于慢性肾脏病大鼠心功能改变的基础研究

陈皓田、郜发宝

四川大学华西医院

目的: 慢性肾脏病 (CKD) 常伴随心脏结构与功能改变, 称为 CKD 相关心肌病。心脏磁共振 (CMR) 用于 CKD 相关心肌病的研究较为缺乏。此外, 基于 CMR 组织追踪 (CMR-FT) 技术的心

肌应力评估在该类型疾病中具有潜在价值。本研究通过建立 CKD 大鼠模型,探讨沙库巴曲缬沙坦 (ARNi) 在缓解 CKD 为心肌结构和功能损伤的治疗效果和潜在机制,并进一步评估 CMR 用于 CKD 大鼠心脏结构和功能损伤的动态监测和疗效评价作用。

方法:通过 5/6 肾切除法建立 CKD 大鼠模型及假手术组。模型建立第四周时,评估模型建立是否成功。将 CKD 大鼠随机分为假手术组 (Sham 组)、CKD 组及药物干预组 (ARNi) (n=20/组)。第四周时间点开始开始药物干预 (50mg/kg 溶于玉米油),CKD 组仅给予同体积玉米油。术前、术后 4、10、16 及 20 周对大鼠进行 CMR 检查,评估各时间点心脏结构和功能改变,并在不同时间点进行心、肾病理检查以及血液学检查。20 周时检测心肌炎症、氧化应激和凋亡情况。

结果:CKD 模型大鼠各时间点体重、收缩压、肌酐和尿素氮均较对照组显著降低 ($P < 0.05$),术后第 4 周,CKD 大鼠左心室舒张末期容积、左心室收缩末期容积以及左心室质量指数比 Sham 组均显著增高 ($P < 0.05$)。第 10 周时间点,药物干预组左心室舒张末期容积、心室质量指数已较 CKD 组明显降低 ($P < 0.05$)。治疗结束时,即第 20 周,ARNi 组大鼠左心室各 CMR 指标较均较 CKD 组明显降低,和 Sham 组相比无明显差异 ($P > 0.05$)。20 周时,大鼠心肌纤维化染色半定量结果显示,CKD 组胶原容积指数显著高于 Sham 组和 ARNi 组 ($P < 0.05$)。心肌 SOD、MDA 以及 TNF- α 指标在 CKD 组均显著增高 ($P < 0.05$)。左心室应力指标 LVGRS、LVGCS 和 LVGLS 与胶原容积指数具有较好的相关性。

结论:CKD 大鼠可见心肌结构及功能改变,随时间进展逐渐加重。ARNi 可明显缓解心肌重构,潜在机制可能与其控制血压、减轻炎症、氧化应激和凋亡;CMR 具有 CKD 心肌改变动态监测和疗效评价的价值。

PO-1251

薄层 CT 图像上“微网格征”在预测肺纯磨玻璃结节侵袭性中的价值研究

褚志刚、梁张瑞、吕发金
重庆医科大学附属第一医院

目的:评价胸部薄层 CT 图像上“微网格征”在预测肺纯磨玻璃结节 (pGGN) 侵袭性中的应用价值,为 pGGN 的临床决策提供有价值的参考信息。

材料与方法:在 2015 年 1 月至 2022 年 4 月期间,本项回顾性研究总计纳入 795 例患者 (平均年龄 53.4 ± 11.1 岁;男性 254 名,女性 541 名),在薄层 CT 上总计 876 个 pGGN 接受了手术切除并得到病理学确诊。两名有经验的胸部放射科医生独立阅读患者胸部 CT 平扫薄层图像,对 pGGN 的一系列特征进行评估,包括直径、密度、分布位置、形状 (规则/不规则)、空气支气管征、空泡征、内部血管改变、分叶征、毛刺征、边界 (清晰/不清晰)、胸膜凹陷和“微网格征” (定义为结节内交织成类似网状的多个细小线状阴影);意见不一致时通过协商得到解决。在病理评估中评估“微网格征”与病变侵袭性之间的关系。

结果:病理学性质方面,876 个 pGGN 中包括 163 个非肿瘤病变和 713 个肿瘤性病变[323 个非典型腺瘤性增生或原位腺癌 (AAH/AIS), 250 个微浸润腺癌 (MIA), 140 个浸润性腺癌 (IAC)]。不同类型病变中,在 0.0% 的非肿瘤性病变、0.0% 的 AAH/AIS、6.8% 的 MIA 和 54.3% 的 IAC 中检测到“微网格征”的存在。ROC 分析发现,“微网格征”诊断 MIA 或 IAC 的敏感性为 24.0%,特异性为 100.0%,单纯诊断 IAC 的敏感性为 54.3%,特异性为 97.7%。在包括所有 CT 特征的多变量回归分析中发现,“微网格征”是 IAC 的重要独立预测因子 ($OR=3.64$, $p=0.001$),但不是 MIA/IAC 的独立预测因子。

结论：在薄层 CT 图像上，pGGN 中的“微网格征”对评估病灶侵袭性具有较高的特异性，是诊断 IAC 的独立预测因子，对于指导 GGN 的风险评估和后续处理具有重要价值。临床实践中，对于存在网格征的 pGGN 应首先考虑为 IAC，相应的随访周期和随访间隔应缩短以及及时发现其进展情况。

PO-1252

炎症细胞浸润和相对密度与肺非肿瘤性磨玻璃结节边界表现的相关性研究

褚志刚、刘香伶、吕发金
重庆医科大学附属第一医院

目的：探讨肺部非肿瘤性磨玻璃结节（GGN）在 CT 图像上各种边界表现的相关影响因素。

材料和方法：从 2015 年 1 月到 2022 年 3 月，共 280 名患者 318 个非肿瘤性 GGN 纳入本研究。分别评估炎症细胞浸润程度和结节相对密度（ ΔCT ）与病变边界表现之间的相关性。

结果：以纤维组织增生和/或炎症细胞浸润为主要病理表现的非肉芽肿性结节（283，89.0%）是最常见的非肿瘤性 GGN，其次是肉芽肿性结节（28，8.8%）。对于非肉芽肿性 GGN，有较多和少/无炎症细胞浸润者在 137 边界清晰且边缘光滑的结节中分别为 15 (10.9%)和 122 (89.1%)例，在 65 例边界清晰但边缘毛糙的结节中分别为 16 (24.6%)和 49 (75.4%)例，在 47 例边界不清但 ΔCT ($>151HU$)较高的结节中分别为 43 (91.5%)和 4 (8.5%)例，在 34 例边界不清但 ΔCT ($<151HU$)较低的结节中分别为 4 (11.8%)及 30 (88.2%)例。炎症细胞较多的病例在边界清晰的结节中占比与其在 ΔCT 较低且边界不清的结节中占比相似（ $P = 0.587$ ），但明显低于其在 ΔCT 较高且边界不清的结节中的占比（ $P < 0.001$ ）。在肉芽肿性结节中，边界不清且 ΔCT 较高者（16，57.1%）最常见，且（7/8，87.5%）常在短期随访中出现变化。

结论：非肉芽肿性病变是最常见的非肿瘤性 GGN，其不同的边界表现与炎症细胞浸润程度和结节-正常肺密度差密切相关。

PO-1253

基于 HRCT 图像对纤维化性间质性肺疾病的定量分析研究

杨晓娜
宁夏医科大学

目的 基于 CT 定量分析技术，探讨肺纹理及肺血管在纤维化性间质性肺疾病中相较于健康人及 COPD 病人的差异，分析 CT 定量参数对疾病诊断及严重程度评估的临床价值。方法 本研究为回顾性研究。搜集 2019 年 1 月至 2023 年 3 月确诊的中度纤维化性间质性肺疾病（F-ILD）患者 50 例，男 32 例，女 18 例，平均年龄（ 65.1 ± 10.6 ）岁；GOLD II 级 COPD 患者 50 例，男 30 例，女 20 例，平均年龄（ 64.6 ± 11.8 ）；健康对照组 50 例，男 34 例，女 16 例，平均年龄（ 64.9 ± 9.6 ）岁。所有患者均行胸部 CT 检查及肺功能检查，每次两项检查时间间隔不超过 2 周。使用 AVIEW 后处理工作站进行定量分析，对肺纹理和肺血管进行分割、量化，得到 CT 定量参数：全肺容积、不同模式肺纹理占比、 N_{total}/LSA 、 $N_{<5mm^2}/LSA$ 等，所有 CT 定量参数均进行体表面积（BSA）标化。纤维化视觉评估与定量分析的一致性采用卡帕一致性检验；采用单因素方差分析比较各组之间 CT 定量参数和肺功能指标；Pearson 相关性分析检验 CT 定量参数与肺功能指标之间的相关性。结果 与 F-ILD 组相比，COPD 组的 FEV1 显著降低，FVC、TLC 显著升高，差异具有统计学意义（ $P < 0.05$ ）。CT 定量参数 N_{total}/LSA 、 $N_{<5mm^2}/LSA$ COPD 组明显低于 F-ILD 组与健康对照组；F-ILD 组高于健康对照组，差异均具有统计学意义（ $P < 0.05$ ）。F-ILD 组 N_{total}/LSA 、 $N_{<5mm^2}/LSA$ 与肺功能参数呈负相关性（ $r = -0.21 \sim -0.59$ ），COPD 组与肺功能参数呈正相关性（ $r = 0.24 \sim 0.47$ ）；F-ILD 组

全肺容积与肺功能呈正相关性 ($r=0.36\sim0.54$)，COPD 组与肺功能呈负相关性 ($r=-0.39\sim-0.69$)。蜂窝影、网格影、磨玻璃影百分比与肺功能参数呈负相关性 ($r=-0.41\sim-0.57$)、与 CPI 呈正相关性 ($r=0.71、0.74$)。结论肺血管定量参数与肺纹理分析能够较好的反映 F-ILD 和 COPD 患者疾病严重程度，可能会在临床治疗方案的选择以及预后的评价中发挥重要的作用。

PO-1254

基于 CT 影像组学预测肌炎相关性间质性肺疾病抗 MDA5 抗体阳性

龙振楚、邓宇
广州医科大学附属第一医院

目的

结合影像组学得分、肺功能参数、临床风险因素及建立联合预测列线图对肌炎相关性间质性肺 (IIM-ILD) 患者抗 MDA5 抗体阳性进行预测。

方法

回顾性分析 123 例 IIM-ILD 的临床影像资料。利用 3D Slicer 软件及其插件 PyRadiomics 对 CT 图像病灶进行半自动勾画并提取影像组学特征。按照 7:3 的比例随机将所有患者分为训练集及验证集。采用最小绝对收缩和选择算子 (LASSO) 从训练集中筛选最佳的影像组学特征并计算得到影像组学评分 (Radscore)。通过单因素和多因素回归分析筛选独立预测因子建立联合模型并绘制列线图。计算 Radscore、临床模型以及联合预测模型的 AUC 值，比较三种模型间的 AUC 值差异。利用决策曲线分析 (DCA) 评估联合模型的临床实用性。

结果

经过筛选 6 个影像组学特征参与建立 Radscore。单因素和多因素回归分析结果显示发现呼吸困难、DLCO、KL-6 与 Radscore 为独立预测因子，并基于 4 个独立因素建立联合模型。联合模型在训练集与验证集中的 AUC 分别为 0.875、0.793，均高于 Radscore 和临床模型，决策曲线分析显示联合模型在 0.1~0.8 阈值范围内表现出了良好的临床实用性。

结论

基于 CT 影像组学开发的列线图在预测 IIM-ILD 患者抗 MDA5 抗体阳性中具有一定优势，能够为临床提供一种快捷、无创且有效的预测手段。

PO-1255

CT 低密度征在鉴别肺部炎性和恶性肿瘤样病变的敏感性和特异性研究

褚志刚、付彬洁、吕发金
重庆医科大学附属第一医院

目的：低密度征 (HyS) 与肺部真菌感染有关，但在许多肺部非真菌性病变中也很常见。本研究旨在确定增强 CT 扫描 (CECT) 在鉴别肺部炎性和恶性肿瘤样病变中的价值。

方法：从 2013 年 1 月至 2021 年 1 月，回顾性评估病理确诊的 199 个肺部炎性病变 (ILs) 和 236 个恶性病变 (MLs) 患者的临床和 CT 资料。分析和比较 MLs 和 ILs 中 HyS 的 CT 特征，评估 HyS 是否有助于区分 MLs 和 ILs。

结果：ILs 和 MLs 患者在年龄和肿瘤标志物方面有显著差异 ($P<0.05$)。与 MLs 相比，ILs 中 HyS 的更常见 (62.81% vs. 28.81%; $P<0.0001$)。在 ILs 中，更多的 HyS 表现为单一、圆形或椭圆形，

边界清楚, 强化程度 (ΔCT) 较低。Logistic 回归分析显示, 边界不清、周围伴有纤维条索、有边界清晰的 HyS 和 HyS 的 $\Delta CT < 9.5HU$ 是预测 ILs 的独立指标。纳入 HyS 的 CT 特征后, 预测 ILs 的模型曲线下面积 (AUC) 从 0.953 增加到 0.986, 敏感性为 96.03%, 特异性为 94.03% ($P=0.0027$)。

结论: HyS 在 ILs 中比在 MLs 中更常见。在 CECT 上肺部肿块内出现单发、规则、边界清晰、 $\Delta CT < 9.5 HU$ 的 HyS 高度提示其为 ILs。HyS 结合其他形态学特征可提高肺部肿块样病变的诊断准确性。

PO-1256

通过新冠肺炎 (COVID-19) 住院患者的治疗前胸部 CT 表现预测肺纤维化的早期结局

金承、周福庆
南昌大学第一附属医院

目的: 旨在通过结合新冠肺炎住院患者治疗前胸部 CT 扫描以预测患者在短期随访期间肺纤维化的结局, 以及通过实验室检查结果确定肺纤维化发展的预测因素。

方法: 回顾性地收集分析了因新冠肺炎 (COVID-19) 感染的住院患者的胸部 CT 影像学资料和临床生化检查。每名患者至少进行了两次胸部 CT 扫描。根据治疗后最后一次胸部 CT 中的纤维化证据将患者分为纤维化组和无纤维化组。使用定量 CT 评分评估患者肺部的受累的严重程度, 并根据治疗前胸部 CT 的 CT 评分预测肺纤维化的结果。进行多元 Logistic 回归分析肺纤维化的危险因素。

结果: 395 例新冠肺炎患者中 205 例出现肺纤维化改变, 其中重症患者 81% 的重症患者和 19% 的普通型患者出现肺纤维化改变。ROC 曲线显示: 胸部 CT 评分和严重程度评分预测肺纤维化方面表现出色 (AUC 分别为 0.878、0.882)。Logistic 回归分析显示, C 反应蛋白 (OR: 1.093, CI: 1.022-1.170, $p=0.01$)、中性粒细胞 (OR: 5.469, CI: 1.429-20.931, $p=0.013$) 和 D-二聚体 (OR: 1.773, CI: 1.079-20.914, $p=0.024$) 是肺纤维化的危险因素。

结论: 新冠肺炎住院患者的首次治疗前胸部 CT 可以用于评估疾病肺纤维化的结局, 且肺纤维化更可能发生在临床症状更重的患者中, 特别是炎症指标高的患者中。

PO-1257

I 期非小细胞肺癌术前 CT 影像学特征与预后的关系

陈琳涛
河北医科大学第四医院

目的: 探究临床 I 期非小细胞肺癌术前 CT 影像学特征与预后的关系。方法: 收集本院 2016 年 1 月至 2017 年 12 月间具备完整术前增强 CT 检查图像且术后病理符合临床分期 I 期的 417 例非小细胞肺癌患者的影像及术后病理资料。采用查阅病例资料及电话回访的方式进行随访, 随访开始日期为手术日期, 截止日期为 2022 年 7 月。收集并分析患者年龄 (≤ 60 岁/ > 60 岁)、性别 (男/女)、肿瘤位置、肿瘤类型 (中央型肺癌/周围型肺癌)、肿瘤密度 (实性/部分实性/纯磨玻璃)、肿瘤边缘特征 (分叶征/毛刺征/胸膜凹陷征)、瘤周静脉与肿瘤的结构关系及瘤周静脉直径 (直径 $\leq 3.05mm$ /直径 $> 3.05mm$) 并结合其 5 年无病生存期 (DFS), 以评估患者的预后情况。本研究中数据采用 SPSS 26.0 软件进行数据处理分析, 采用 Kaplan-Meier 曲线及多因素 COX 比例风险模型进行生存分析, $P < 0.05$ 为差异有统计学意义。结果: 本研究共纳入 417 例临床 I 期非小细胞肺癌患者, 中位随访时间为 59 个月 (四分位距, 56-64 月), 随访时间内出现复发转移或死亡 48 例,

无病生存 369 例, 累积无病生存率为 88.5%。单因素分析结果显示: 肿瘤分期、肿瘤位置、肿瘤类型、肿瘤密度、胸膜凹陷征、毛刺征、瘤周静脉与肿瘤的结构关系及瘤周静脉直径等因素与患者预后无病生存期相关 ($P<0.05$)。进一步将以上 8 个因素纳入多因素 COX 比例风险模型进行生存分析, 结果显示: 肿瘤分期、肿瘤位置、胸膜凹陷征、瘤周静脉与肿瘤的结构关系及瘤周静脉直径等 5 个因素与 I 期非小细胞肺癌患者术后的 5 年无病生存期相关 ($P<0.05$)。结论: 本研究阐明了肿瘤分期、肿瘤位置、胸膜凹陷征、瘤周静脉与肿瘤的结构关系及瘤周静脉直径等 5 个因素是 I 期非小细胞肺癌患者术后不良预后的独立危险因素。

PO-1258

良恶性斑片状磨玻璃影的薄层 CT 鉴别诊断研究

褚志刚、梁张瑞、吕发金
重庆医科大学附属第一医院

目的: 本研究旨在探讨良恶性斑片状磨玻璃影 CT 特征的差异, 以提高其鉴别诊断。

方法: 在 2016 年 1 月至 2021 年 9 月间, 回顾性纳入经术后病理确诊或随访诊断的 226 例患者总计 247 例斑片状磨玻璃影 (GGO) (良性 103 例, 恶性 144 例)。分析患者的临床和 CT 资料, 比较良恶性病变的 CT 特征。采用二元逻辑回归分析揭示恶性病变的预测因素。

结果: 与良性斑片状 GGO 的患者相比, 恶性者年龄较大 ($P < 0.001$), 恶性肿瘤史发生率较低 ($P = 0.003$), 且多为女性 ($P = 0.012$)。在 CT 图像上, 恶性和良性斑片状 GGO 在位置、分布、密度类型、内部支气管改变及其边界方面差异均有统计学意义 ($P < 0.05$)。二元逻辑回归分析显示, 恶性 GGO 的独立预测因子如下: 患者年龄 ≥ 58 岁 [OR, 2.175; 95% CI, 1.135-6.496; $P = 0.025$], 位于上叶 (OR, 5.481; 95% CI, 2.027-14.818; $P = 0.001$), 沿支气管血管束分布 (OR, 12.770; 95% CI, 4.062-40.145; $P < 0.001$), 实性成分中心分布 (OR, 3.024; 95% CI, 1.124-8.133; $P = 0.028$), 和边界清晰 (OR, 5.094; 95% CI, 2.079-12.482; $P < 0.001$)。

结论: 在老年患者 (≥ 58 岁) 中, 边界清晰的斑片状 GGO, 中心可见实性成分, 位于上叶, 并沿支气管血管束分布应高度怀疑为恶性肿瘤。

PO-1259

基于计算机断层扫描肺动脉造影自动三维血管参数测量在肺动脉高压危险分层中的价值探究

赵永雷、陈仁彪
浙江大学医学院附属邵逸夫医院

目的: 肺动脉高压 (PAH) 患者早期进行危险分层评估有助于临床治疗决策, 使病情达到或维持低危状态是指南提出的治疗目标。本研究旨在探讨基于计算机断层扫描肺动脉造影 (CTPA) 图像使用内部开发的自动三维血管参数测量软件对 PAH 患者危险分层的评估价值。

方法: 我们回顾收集了 51 例于 2019 到 2022 年在本中心经右心导管插入术确诊的 PAH 患者。根据 2021 中国肺动脉高压诊断与治疗指南中提出的危险分层量表对以上患者进行危险分层, 将患者分为了低危、中危、高危患者, 并根据指南的治疗目标, 将患者分为低危组 ($n=15$) 和中高危组 ($n=36$)。通过使用内部开发的自动三维血管参数测量软件对这些患者的 CTPA 图像进行处理, 对 PAH 患者的近远端动脉直径、长度和容积等参数进行测量, 探究了低危患者与中高危患者之间肺动脉参数的差异性, 采用 logistics 多因素回归分析得出中高危 PAH 患者的危险因素, 并计算出 ROC 曲线下面积 (AUC 值) 进行评价。

结果：对两组 PAH 患者的相关动脉参数进行了分析，发现 PAH 患者的近远端动脉直径、容积具有统计学差异，中高危患者的肺动脉干远端最小直径、肺动脉干容积、右肺动脉容积及左肺动脉近端最小直径等参数高于低危患者，并具有统计学差异。多因素 logistics 回归分析结果显示肺动脉干容积 $>17.63\text{ml}$ 和右肺动脉容积 $>14.78\text{ml}$ 分别大于是中高危患者的独立预测因素，受试者工作特征曲线下面积(AUC)为 0.79 和 0.75。

结论：基于 CTPA 图像自动三维动脉参数测量有助于快速简便对低危 PAH 患者和中高危 PAH 患者的划分，对于临床治疗决策具有重要价值。

PO-1260

双层探测器光谱 CT 单能量联合低对比剂量在冠状动脉和静脉 “一站式”成像中的应用价值

岳汛^{1,2}、黄小华²、孙家瑜¹

1. 四川大学华西医院放射科

2. 川北医学院附属医院放射科

我们的研究旨在探讨在低造影剂的双层光谱探测器计算机断层扫描 (SDCT) 上对冠状动脉和静脉进行“一站式”成像的可行性。

材料与方法：65 名疑似冠状动脉疾病患者接受了双层光谱探测器 CT (Spectral CT 7500, 飞利浦) 冠状动脉 CT 血管造影术 (CTA)。扫描参数为：准直器， $128 \times 0.625\text{ mm}$ ；kVp，120；mAs，600；旋转时间，0.27 s。造影剂以 4.5 ml/s 的速度分 3 个阶段注入：9 ml 造影剂和生理盐水 30%:70% 混合，然后是 0.8 ml/kg 造影剂，最后是 30 毫升生理盐水冲洗，同步进行冠状动脉和静脉双重成像。通过定义升主动脉的 ROI，在信号衰减达到 100 HU 的预定阈值后 8 秒开始扫描。生成了基于迭代模型重建 (IMR) 的常规 120 kVp 图像以及 40 keV、50 keV、60 keV 和 70 keV 的虚拟单色图像 (VMI)。图像分析由两名独立的放射科医生进行。在 120 kVp 图像上对冠状动脉进行主观（伪影、噪音和整体质量）和客观（衰减）评估。对 VMI 和 120kVp 图像上的冠状静脉进行主观（噪声、对比度、清晰度、伪影和整体质量）和客观（衰减、噪声、信噪比 (SNR) 和对比度-噪声比 (CNR)) 比较。

结果：941 个冠状动脉节段的平均分数大于 4 分。与 120 kVp 图像相比，40 - 60 keV VMI 图像的主观静脉对比度、清晰度和整体图像质量明显更好 ($p < 0.05$)。40 - 70 keV VMI 的主观和客观噪声明显更好 ($p < 0.05$)。客观衰减、信噪比和 CNR 在 40 - 60 keV VMI 上明显更高 ($p < 0.05$)。

结论：本研究证实了使用低剂量造影剂的光谱 CT 进行冠状动脉和静脉“一站式”成像的可行性。利用 SDCT 获取的 120 kVp 多色图像和低 kV VMI 可分别评估冠状动脉和静脉，其中 40 kV 图像被定义为冠状静脉显像的最佳水平图像，在冠状动脉疾病诊断和心脏介入治疗中具有重要的临床意义。

PO-1261

4D-FLOW 技术结合 CMR 一站式评估 BAV 患者升主动脉血流动力学特点及亚临床左心室功能障碍

李玉敏、史河水

华中科技大学同济医学院附属协和医院

目的: 主动脉二瓣化畸形 (BAV) 是最常见的先天性心脏病之一, 具有很高的病死率和死亡率。本研究旨在: 1) 应用三维三方向相位对比磁共振 (4D Flow MRI) 技术结合常规 CMR 一站式综合评估 BAV 患者升主动脉血流动力学特点及左心室的结构和功能改变; 2) 探索 BAV 患者升主动脉血流动力学变化特点与左心室心肌损害程度的相关性, 指导临床诊断、手术选择和预后。

方法: 前瞻性收集武汉市协和医院经临床及超声确诊为 BAV 患者 (无其他瓣膜疾病) 23 例以及健康志愿者 25 例行 3.0T (Skyra) 心脏一站式 MR 检查及主动脉 4D FLOW 扫描。所有 CMR 图像应用 CVI 后处理软件进行分析。获取左室容积数据、左室整体纵向 (GLS)、周向 (GCS) 和径向 (GRS) 心肌收缩应力和左室心肌细胞外容积 (ECV) 值。分析升主动脉、主动脉弓、降主动脉多个层面的血流流速、流量、跨瓣压差、血流模式和 3D 壁面切应力 (WSS) (最大收缩期 WSS、时间-平均 WSS)。比较两组间左室的 ECV 值、心肌收缩应变以及主动脉血流动力学参数的差异, 并分析其相关性。

结果: BAV 组和对照组左室射血分数无显著差异, 且 BAV 患者均无延迟强化。和对照组相比, BAV 组左室 GCS 显著降低, ECV 值显著升高, $p < 0.01$ 。BAV 患者的血流模式以右手螺旋流 (14/23) 和涡流 (5/23) 常见。BAV 组主动脉瓣跨瓣压差、反流分数、平均及峰值流速和流量均显著高于对照组; $p < 0.05$ 。和对照组相比, 主动脉球部、升主动脉及主动脉弓最大收缩期 WSS 和时间-平均 WSS 均显著降低, $p < 0.01$ 。多变量回归分析显示, BAV 患者 GLS ($r = 0.43$, $p = 0.019$)、ECV ($r = 0.56$, $p = 0.001$) 与升主动脉最大收缩期 WSS 独立相关。

结论: 心功能正常的 BAV 患者早期已经存在升主动脉血流动力学的异常改变, 并可能存在亚临床左室收缩功能障碍和心肌纤维化, 且其与升主动脉 WSS 独立相关。4D Flow MRI 可以三维可视化直观评估主动脉血流动力学特点, 结合常规 CMR 一站式检查, 为指导临床早期诊断、预防、是否手术及手术方式选择提供了可靠的无创影像学检查方法。

PO-1262

基于 CCTA 冠周脂肪衰减指数构建冠心病 MACE 风险列线图预测模型的研究

郑娅楠、韩丹

昆明医科大学第一附属医院

【目的】 (1) 探讨基于 CCTA 测量冠周脂肪衰减指数是否是冠心病 MACE 发生风险的独立危险预测因子; (2) 探讨基于 FAI 构建列线图模型对冠心病 MACE 发生风险的预测价值。

【方法】 回顾性纳入昆明医科大学第一附属医院心内科 2018 年 10 月-2022 年 9 月诊断为冠心病并经 CCTA 检查的患者 258 例。收集所有研究对象的临床资料, 根据随访结果分为 MACE 组和无 MACE 组。利用数坤公司冠脉 CT 造影图像分析软件, 自动勾画三支主干近段距血管壁外膜 4mm 管状范围内的脂肪组织, 并计算 FAI 值。由 2 名具有 5 年以上心血管诊断工作经验的放射科医生独立评价三支血管狭窄程度及斑块性质。利用 Logistic 回归分析筛选冠心病 MACE 的独立危险预测因子, 构建列线图模型, 分别采用 ROC 曲线、校准曲线评价模型的区分度和校准度, 采用 Bootstrap 重抽样法进行内部验证, 绘制临床决策曲线评价模型的临床适用性。

【结果】最终纳入 258 例冠心病患者 MACE 组 50 例，无 MACE 组 208 例。两组患者性别、年龄、BMI、冠脉病变支数、狭窄程度分级、斑块性质、FAI 有显著统计学差异 ($P < 0.05$)。Logistic 回归分析显示，中度狭窄、重度狭窄、LAD-FAI、LCX-FAI、RCA-FAI 是冠心病 MACE 发生的独立危险预测因子 (均 $P < 0.05$)。纳入冠心病 MACE 发生风险的所有相关危险因素构建列线图预测模型并进行验证。列线图 ROC 曲线的 AUC 为 0.971，敏感度 90.0%，特异度 95.2%，相较于 LAD-FAI、LCX-FAI 和 RCA-FAI 具有较好的区分度和较高的预测效能。校准曲线显示该模型具有较好的校准度。内部验证显示模型具有较好的预测稳定性和一致性。临床决策曲线显示阈值概率在 0.0%~94.5% 时，模型拥有较高的净获益和较好的临床适用性。

【结论】(1) 基于 CCTA 测量 FAI 是冠心病 MACE 发生风险的独立危险预测因子，其中 LAD-FAI 是最佳独立危险预测因子，最佳临界值 -79.5HU；(2) 基于 FAI、狭窄程度分级、年龄及 BMI 构建的冠心病 MACE 风险列线图预测模型具有较好的区分度和一致性，临床应用价值较高。

PO-1263

心脏磁共振特征追踪技术在 LGE 阴性的扩张型心肌病患者危险分层及预后评估中的作用

张天悦
成都市第五人民医院

目的：利用心脏磁共振 (CMR) 评估 LGE 阴性的扩张型心肌病 (DCM) 患者的左室心肌形变情况，探讨 strain 在 LGE 阴性的 DCM 患者中的作用，并且利用 strain 结合不同区间的 LVEF 对 DCM 患者进行新的危险分层。

方法：本研究共纳入 2012 年 10 月-2022 年 10 月间经临床诊断为 DCM 并接受 CMR 检查的 LGE 阴性的患者 300 例。分析 DCM 总体及各亚组患者之间的各基线指标、左心室整体径向峰值应变 (PS)、周向 PS 及纵向 PS 之间的差异；同时，将全因死亡率、心脏移植作为主要终点事件，将心力衰竭再入院、室性心律失常、植入植入型心律转复除颤器 (ICD) 或心脏再同步治疗 (CRT) 作为次要终点事件。

结果：LVEF < 20% 的 DCM 患者径向 PS、周向 PS 及纵向 PS 较 LVEF = 20-35%、LVEF > 35% 的患者组明显减低；在患者的单变量 Cox 回归分析中，BSA、LBBB、CK、LVEF、GRS、GLS、GCS 与主要终点的相关性最强 ($P < 0.001$)；多因素逐步分析的结果表明，在 LVEF < 20% 的患者中，只有 GLS 是主要终点事件危险因素，并且独立于 LVEF。

结论：基于 CMR-FT 成像能够评估 DCM 患者早期心脏功能损伤的程度，结合不同区间的 LVEF 对 DCM 患者进行新的危险分层，能够帮助临床治疗 LGE 阴性的 DCM 病人。

双层光谱探测器 CT 虚拟平扫代替常规平扫的可行性研究在主动脉夹层支架术后的应用

文雨婷
四川大学华西医院

目的 探讨双层光谱探测器 CT (dual-layer spectral detector CT) 在主动脉支架术后行主动脉 CT 血管成像时，虚拟平扫 (virtual non-contrast, VNC) 代替常规平扫 (true non-contrast, TNC) 的可行性。

方法 回顾性分析 30 例在双层光谱探测器 CT 上行主动脉 CTA 的光谱基图像 (spectral based images, SBI) 数据, 在后处理工作站将 CT 主动脉血管图像重建为虚拟平扫 (VNC) 图像。扫描参数: 管电压 100 kVp, 采用管电流自动控制技术自动调节 (100~300 mAs), 对比剂注射流速 5.0ml/s, 总量 1.0ml/kg。图像支架结构部分和非支架部分分别采用 Likert 5 分制进行评分。客观评价: 支架部分血管, 在支架起始处、中段和末端分别测量 CT 值和 SD 值, 以及支架的厚度。非支架部分血管, 测量升主动脉、降主动脉、腹主动脉以及对应层面肌肉的 CT 值和 SD 值, 计算图像的 SNR 和 CNR。记录平扫、血管成像的辐射剂量。

结果: VNC 图像支架结构评分 (4.51 ± 0.43) 优于 TNC (4.13 ± 0.51) 图像 ($P < 0.01$), 非支架部分的血管图像质量评分差异无统计学意义 ($P > 0.01$)。VNC 支架起始处厚度、中段厚度和末端厚度与 TNC 差异有统计学意义 ($P < 0.001$)。VNC 与 TNC 支架各段 CT 值差异有统计学意义 ($P < 0.05$), VNC 的 CT 与 SD 值低于 TNC ($P < 0.05$), SNR 和 CNR 差异有统计学意义 ($P < 0.05$)。非支架部分 VNC 与 TNC 的 CT 值有较好的一致性 (Bland-Altman 分析一致性界限为 10 HU 时界外数据点占比 $\leq 5\%$)。VNC 的 SD 值低于 TNC, SNR 和 CNR 差异有统计学意义 ($P < 0.05$)。

TNC 占总 DLP 的 49.8% ($421.32/844.77$), 有效剂量为 (6.32 ± 1.12) mSv。

结论: 基于双层光谱探测器 CT 的 VNC 图像对于支架结构的显示优于 TNC, 且噪声较 TNC 更低, 对于主动脉支架术后行 CTA 扫描的患者, 可减少一次平扫, 有效降低辐射剂量。

PO-1265

超低管电压联合高权重深度学习图像重建算法在冠脉 CT 血管成像“双低”扫描中的应用价值

文雨婷

四川大学华西医院

目的 探讨超低管电压(70kVp)联合高权重深度学习图像重建 (high-strength deep learning image reconstruction, DLIR-H) 技术降低冠脉 CT 血管成像辐射剂量与对比剂用量的临床价值。**方法** 收集 72 例临床拟行冠状动脉 CTA 检查的患者, 随机分为 A、B 两组, 每组各 36 例。A 组扫描方案:70kV, 智能 mA 调节技术, 噪声指数 (noise index, NI) 为 30HU; 对比剂总量 16mg/kg/s, DLIR-H 重建。B 组扫描方案:120kV, 智能 mA 调节技术, NI 为 22HU, 对比剂总量 32mg/kg/s, 50%ASIR-V 重建。两组均以 10s 的对比剂注射持续时间计算对比剂注射流速。对两组图像质量进行主观评分和客观评价。图像质量主观评分采用 5 分法, 信噪比和对比噪声比用于图像质量客观评估。结果 两组图像质量主观评分满足诊断要求, A 组图像质量的主观评分优于 B 组, 差异有统计学意义 ($P < 0.001$)。A 组的背景噪声 SD 值 (12.36 ± 2.86) 明显低于 B 组 (19.06 ± 2.43), 差异有统计学意义 ($P < 0.001$); A 组冠状动脉各分支血管 RCA、LAD 和 LCX 的 SNR (36.40 ± 11.71 , 35.01 ± 10.95 , 35.32 ± 11.33) 明显高于 B 组 (20.77 ± 3.76 , 20.33 ± 3.46 , 20.15 ± 3.34), 差异有统计学意义 (P 均 < 0.001); A 组冠状动脉各分支血管 RCA、LAD 和 LCX 的 CNR (48.47 ± 13.61 , 47.08 ± 12.72 , 47.38 ± 13.12) 明显高于 B 组 (26.25 ± 4.79 , 25.82 ± 4.54 , 25.64 ± 4.15), 差异有统计学意义 (P 均 < 0.001)。A 组对比剂平均用量 22.87 ± 4.06 mL 和辐射剂量 0.82 ± 0.15 mSv 较 B 组 48.64 ± 7.09 mL、 2.23 ± 0.93 mSv 分别降低了 53% 和 63.2%。**结论** 与传统扫描方案相比, 超低管电压联合高权重深度学习图像重建算法行 CCTA 扫描, 图像质量优, 患者接受的辐射剂量与对比剂总量均明显降低。

PO-1266

基于 CCTA 多参数评估冠状动脉非钙斑性狭窄缺血风险价值初探

刘晓滢^{1,2}、江杰²、李俊²、段慧²、胡加耀¹、韩丹²

1. 保山市人民医院

2. 昆明医科大学第一附属医院

目的 探讨冠状动脉非钙化斑块周围脂肪衰减指数 (FAI) 与无创性 CT 血流储备分数 (FFR_{CT}) 及斑块参数间的关系。**方法** 回顾性收集 395 例拟诊冠心病住院患者的冠状动脉 CT 血管造影图像及临床相关资料, 根据管腔狭窄程度分为正常组 131 例, 病变组 (轻度组 140 例、中度组 78 例和重度组 46 例), 病变组均仅选取单支及单发性非钙化斑块。测量斑块定量指标 (包括斑块短径、长径、CT 值)、提取斑块周围 FAI 值及斑块远段 2.5cm 处 FFR_{CT} 值。根据斑块 CT 值分为低衰减组 24 例 (CT 值 \leq 30 HU)、中等衰减组 101 例 (30<CT 值 \leq 50HU)、高衰减组 139 例 (50<CT 值 \leq 120HU)。探讨冠状动脉狭窄程度、斑块参数和 FAI 与 FFR_{CT} 的关系, 通过受试者工作特征曲线评估对非钙化斑块导致的缺血性狭窄的诊断效能。**结果** 冠状动脉狭窄程度与年龄 (Rs=0.277, P<0.05)、斑块短径 (Rs=0.257, P<0.05)、FAI (Rs=0.548, P<0.05)、收缩压 (Rs=0.128, P<0.05) 呈正相关, 与 FFR_{CT} (Rs=-0.387, P<0.05) 呈负相关; 正常组与轻、中、重度组 FAI 差异均有统计学意义 (P<0.05), 轻度组与中、重度组 FAI 差异有统计学意义 (P<0.05), 但中度组与重度组 FAI 差异无统计学意义 (P>0.05)。非钙化斑块 CT 值与 FAI 呈负相关 (Rs=-0.241, P<0.05)。FFR_{CT} \leq 0.80 组与 FFR_{CT}>0.80 组在病变狭窄程度、斑块 CT 值、斑块周围 FAI 差异均有统计学意义 (P<0.05), FFR_{CT} \leq 0.80 组管腔狭窄程度更重、斑块 CT 值更低、斑块周围 FAI 值更高, 两组间 FAI 临界值为-69.5HU, 斑块 CT 值 ROC 曲线下面积 (AUC) 为 0.406 [95% 置信区间 (CI) 0.338~0.474], FAI 值 ROC 曲线下面积 (AUC) 为 0.793 [95% 置信区间 (CI) 0.739~0.846]。**结论** 冠状动脉非钙化斑块周围 FAI 较高者发生缺血性狭窄风险性更大, 基于斑块参数、FAI 及 FFR_{CT} 能够对冠状动脉非钙化斑块导致的心肌缺血具有一定的诊断价值。

PO-1267

基于人工智能的冠状动脉钙化积分算法在非门控胸部 CT 中的应用价值及影响因素分析

高峻峰

中国医科大学附属盛京医院

目的: 探讨人工智能软件在非门控胸部平扫 CT 的冠状动脉钙化积分测量中的应用价值及其影响因素。

方法: 回顾性纳入 237 名在一个月内心行冠状动脉 CT 血管造影和非门控胸部 CT 的患者, 分别由低、高年资的放射科医生进行心电门控心脏 CT 平扫钙化勾画 (此两组分别记为门控-L、门控-H), 通过 CACS 软件获取 Agatston 分, 以门控-H 组 CACS 作为金标准。采用基于人工智能的非门控胸部 CT 钙化积分软件获得 Agatston 积分, 记为 AI 组; 由低年资放射科医生检查 AI 计算结果并进行相应的修正, 记作 AI+L 组。记录上述 4 组每例患者的 CACS 计算时间。采用 Spearman 相关分析、Bland-Altman 一致性分析比较门控-L、AI、AI+L 组 CACS 与门控-H 组 (金标准组) 的一致性。采用 Kappa 检验评估门控-L、AI、AI+L 组与门控-H 组 CACS 危险度分层的一致性。还分析了心率和 BMI 对 AI-CACS 危险度分层的影响。P<0.05 为差异有统计学意义。

结果: AI 组计算 CACS 所需时间为 42.0s (37.0~46.0s); AI+L 组计算 CACS 所需时间为 60.0s (51.5~68.0s)。以门控-H 组 CACS 为金标准, 门控-L、AI、AI+L 组 CACS 与门控-H 组 CACS

相关性好, 相关系数 (r) 分别为 0.99、0.65、0.98, P 值均小于 0.01。Bland-Altman 图显示门控-L、AI+L 组 CACS 与门控-H 组 CACS 的一致性较 AI 组好。门控-L、AI+L 组 CACS 危险度分层一致性较 AI 组好, Kappa 系数 (κ) 分别为: 0.73、0.89、0.36, P 值均小于 0.01。AI+L 组 CACS 危险度分层准确率为 92.0%, 显著优于门控-L 组及 AI 组。心率对 AI 软件 CACS 危险度分层准确性有显著影响; BMI 则无明显影响。

结论: 基于胸部平扫 CT 的 AI 与医生协同阅片模式显著提升了评估及危险分层的准确性, 更适用于临床冠心病患者风险等级的筛查。此外, 心率偏高会对 AI 软件 CACS 危险分层产生负面影响, 该结果为今后软件优化提供了依据。

PO-1268

CT 左心室功能学新指标在肥厚型心肌病中的应用价值: 早期心功能评估和鉴别诊断

何泽明
空军军医大学

目的 由于肥厚型心肌病 (HCM) 和高血压性心脏病 (HHD) 均存在心肌肥厚, 传统影像学方法在区分这两种疾病方面存在一定困难, 且对早期左室功能损伤不敏感。因此, 本研究的目的是探讨基于 CT 技术所获得的心肌应变 (MS) 参数在评估 HCM 和 HHD 早期左室功能的可行性, 以及该参数区分这两种疾病的能力, 为临床提供参考。

资料与方法 本研究纳入了 2021 年 12 月至 2023 年 1 月期间在空军军医大学西京医院接受心脏冠状动脉血管成像检查, 结果呈阴性的 205 名成年受试者。根据各组标准将受试者分为 HCM、HHD 和健康对照组。随后使用后处理软件对三组人群的左室形态学特征、传统心功能参数以及 MS 参数进行了量化。采用统计学方法比较这些参数之间的差异, 以及对这两种疾病的鉴别能力。

结果 相较于健康对照组, HCM 与 HHD 组的 MS 绝对值均有不同程度降低 (MyoGCS, -25.80 ± 3.74 vs. -23.00 ± 4.49 vs. 21.03 ± 4.97 ; EndoGCS, -40.95 ± 8.13 vs. -35.86 ± 7.90 vs. 31.85 ± 9.16 ; GRS, 81.26 ± 37.76 vs. 66.99 ± 18.37 vs. 55.31 ± 23.19 , P 均 < 0.001), 其中以纵向应变降低最为显著 (MyoGLS, -23.03 ± 3.84 vs. -19.86 ± 2.22 vs. 15.47 ± 4.28 ; EndoGLS, -30.35 ± 5.35 vs. -25.01 ± 3.62 vs. 21.92 ± 8.16 , P 均 < 0.001)。多元 logistic 回归分析结果显示 MLVWT、LVMI 和 MyoGLS 组合模型的 ROC 曲线下面积最大, 为 0.93 (灵敏度: 97%, 特异度: 83%)。

结论 本研究结果表明, 基于 CT 所获得的 MS 参数可以用于精确评估 HCM 和 HHD 患者的早期左室功能损伤, 其中以纵向应变的损伤最为显著。所得参数中 MLVWT、LVMI 和 MyoGLS 的组合模型在区分这两种疾病时效果最佳。这些发现有望为临床提供更准确的诊断和治疗指导

PO-1269

双层探测器光谱 CT 对 stage I 期肺腺癌 PD-L1 表达的预测价值—开发和验证一种新的列线图

王彤、侯阳
中国医科大学附属盛京医院

目的: 我们研究了光谱 CT (SDCT) 定量和定性参数、临床标记物与 stage I 期肺腺癌 PD-L1 表达之间的潜在关联, 同时提出了一种术前个体化鉴别的列线图。

方法: 通过分析术后病理诊断为浸润性非粘液性肺腺癌患者的 SDCT 参数及 PD-L1 表达情况, 并根据 PD-L1 表达量是否为 1% 分为阳性组和阴性组。然后, 半自动提取定量及定性参数, 一个回顾性

集合 (N=356) 中随机选择的训练队列 (80%) 和验证队列 (20%)，用于开发和内部验证预测模型收集的放射学和生物标记物特征，通过单变量分析降低特征维度，使用 logistic 回归建立了预测 PD-L1 表达的列线图，并利用受试者工作特征 (ROC) 曲线评价了模型的预测效能。

结果: 纳入了 356 名参与者，包括阴性组 (n=202) 和阳性组 (n=154)。经过单因素分析后，有 18 个参数仍与 PD-L1 表达相关，对 AUC> 为 0.6 的显著性参数进行多元回归分析，最终确定的 CT.value (AUC=0.627, P=0.033)、CT40kev.a (AUC=0.642, P=0.025)、Zeff.a (AUC=0.756)、ED.a (AUC=0.641)、ED.v (AUC=0.607) (均 P < 0.001) 和 TK1 (AUC=0.601, P=0.026)、Dsolid (AUC=0.632, P=0.04) 为 stage I 期肺腺癌 PD-L1 表达的独立危险因素。通过结合以上 7 个有价值的预测因子，建立了一个 SDCT 参数-临床列线图，观察到在训练 (AUC=0.853) 和验证 (AUC=0.824) 组中具有令人满意的辨别能力，临床决策曲线 (DCA) 也识别出在大范围的阈值概率范围内具有最高的净收益，临床影响曲线 (Clinical Impact Curve, CIC) 表明了此列线图的临床有效性。在模型比较中，列线图比单独的任何变量具有更高的区分精度。

结论: 基于 SDCT 定量参数可以预测 PD-L1 在早期肺腺癌中的表达，其中 Zeff.a 作用突出，结合 TK1 建立了的列线图显示出优异的预测性能和良好的校准，可以促进非侵入性预测 PD-L1 表达的个体化风险。

基于心脏磁共振影像组学联合临床因素对肥厚型心肌病并发室性心律失常的预测价值

吕静¹、刘云²

1. 宁夏医科大学临床医学院

2. 宁夏医科大学总医院

目的 探讨基于心脏磁共振 (CMR) 不同区域心肌的影像组学特征及相关临床因素在预测肥厚型心肌病 (HCM) 者并发室性心律失常 (VAs) 中的价值。方法 收集 2018 年 1 月 1 日至 2023 年 5 月 31 日的 122 例确诊 HCM 者的 CMR 图像及临床资料。根据 24 小时动态心电图结果将其分为合并 VAs 组 (40 例) 与未合并 VAs 组 (82 例)。按照 7:3 的比例随机分为训练集及测试集。选择从二尖瓣水平至心尖部的左心室短轴末增强平衡式稳态自由进动序列，以舒张末期壁厚 (EDWT) 为基础，将 HCM 者心肌分为肥厚区域 (无 HCM 家族史, EDWT≥15 mm; 有 HCM 家族史, EDWT≥13 mm) 与非肥厚区域 (无 HCM 家族史, EDWT<15 mm; 有 HCM 家族史, EDWT<13 mm)。在左心室短轴位各层面心肌的心室舒张末期对全室壁心肌、肥厚区域心肌、非肥厚区域心肌进行感兴趣区勾画及影像组学特征提取、采用 Mann-Whitney U 检验、递归特征消除法及最小绝对收缩与选择算法进行影像组学特征筛选、选出最优特征集、计算影像组学评分、构建左心室全室壁心肌影像组学模型、左心室肥厚区域心肌影像组学模型、左心室非肥厚区域心肌影像组学模型。通过 Logistic 回归筛选临床危险因素建立临床因素模型。构建结合临床危险因素和不同兴趣区影像组学特征的左心室全室壁心肌联合模型、左心室肥厚区域心肌联合模型、左心室非肥厚区域心肌联合模型。采用准确度、敏感度、特异度、阳性预测值、阴性预测值和受试者工作特征曲线下面积 (AUC) 及 DeLong 检验评估和比较模型间的预测效能; 使用列线图将联合模型可视化, 并通过 H-L 检验及校正曲线评估联合模型拟合程度; 通过决策曲线分析观察各模型的临床实用性。结果 在训练集中, 3 个联合模型的 AUC 值 (0.89、0.98、0.98) 均高于与其 ROI 相同的影像组学模型 (0.74、0.85、0.86) (P<0.05), 亦高于临床因素模型 (0.81) (P<0.05)。结论 基于 CMR 不同区域心肌的影像组学特征结合相关临床因素构建的联合模型在预测 HCM 者合并 VAs 风险方面效能更佳, 可为临床决策提供指导。

PO-1271

基于 MOLLI 序列和 SMART1 序列的对比剂注射前心肌 T1mapping 成像诊断心肌病效能的初步比较研究

贾韬宇、扈锋、鲁玲、周小兵、王艺洁、潘存雪
中山大学附属第五医院

目的：比较基于 MOLLI 序列与基于 SMART1 序列的心肌 T1mapping 成像诊断心肌病效能的差异；
方法：自 2021 年 04 月至 2022 年 12 月连续对 35 例因临床疑似心肌病在我院行心脏磁共振检查的住院患者同时行对比剂注射前 MOLLI 和 SMART1 序列扫描，并同期对 8 例健康对照行心脏非对比剂注射 MOLLI 和 SMART1 序列成像。以患者出院诊断为金标准进行对比剂注射前 MOLLI 和 SMART1 mapping 诊断心肌病有无的 ROC 曲线分析、比较；

结果：最终纳入出院诊断为表现为对比剂注射前心肌 T1 值升高的心肌病患者 21 例（其中心肌炎 8 例，高血压性心脏病 4 例，扩张性心肌病 3 例，心力衰竭 2 例，儿茶酚胺性心肌病 1 例，尿毒症性心肌病 1 例，缺血性心肌病 1 例，心肌致密化不全性心肌病 1 例），健康对照 8 例。基于 SMART1 序列的患者与健康对照人群对比剂注射前心肌 T1 值差异具有统计学意义（ $1547.13 \text{ ms} \pm 89.90 \text{ ms}$ VS $1463.23 \text{ ms} \pm 82.63 \text{ ms}$ ， $P < 0.01$ ），当选择 1515.35 ms 为诊断界值时，其诊断心肌病的特异性及敏感性分别为 73.8%，67.8%，ROC 曲线下面积为 0.756（95%CI: 0.711-0.802）；基于 MOLLI 序列的患者与健康对照人群对比剂注射前心肌 T1 值差异具有统计学意义（ $1266.57 \text{ ms} \pm 67.84 \text{ ms}$ VS $1210.74 \text{ ms} \pm 59.27 \text{ ms}$ ， $P < 0.01$ ），当选择 1246.95 ms 为诊断界值时，其诊断心肌病的特异性及敏感性分别为 74.6%，65.4%，ROC 曲线下面积为 0.734（95%CI: 0.685-0.782）。两种成像序列心肌 T1 值诊断心肌病 ROC 曲线下面积差异无统计学意义（ $Z=0.869, P=0.385$ ）

结论：基于 MOLLI 与基于 SMART1 序列的心肌 T1mapping 成像诊断心肌病的效能无差异。

PO-1272

基于 CCTA 的肝脏影像组学联合冠脉多参数模型对急性冠脉综合征预测价值的研究

徐杭、尚靳、侯阳
中国医科大学附属盛京医院

目的：探究基于冠状动脉 CT 血管成像（CCTA）的肝脏影像组学联合冠脉多参数模型对疑似冠心病患者未来 3 年内发生急性冠脉综合征（ACS）的预测价值。

方法：回顾性收集 2013 年 1 月至 2020 年 12 月于我院因疑似冠心病接受 CCTA 检查的患者，所有入组患者均具备完整的临床资料及 3 年以上随访记录。将行 CCTA 检查后 3 年随访期内发生 ACS 事件的患者纳入 ACS 组（ $n=104$ ），将 3 年随访期内未发生 ACS 事件的患者，根据年龄、性别、体质指数、传统心血管危险因素和基线治疗用药情况与 ACS 组进行 1:1 匹配，纳入对照组（ $n=104$ ）。后将两组患者以 8:2 的比例随机分为训练集（ $n=166$ ）和测试集（ $n=42$ ）。于 CCTA 检查扫及肝脏最大层面手动勾画一直径约 2cm 的感兴趣区，提取并筛选最佳肝脏影像组学特征构建肝脏影像组学模型（Model 1）；评估 ACS 组罪犯斑块及对照组狭窄程度最高的斑块定量及定性特征，并测量相应斑块周围脂肪衰减指数，筛选出最佳预测因子构建冠脉多参数模型（Model 2）；加和平均 Model 1 和 Model 2 构建联合模型（Model 3）。绘制受试者工作特征（ROC）曲线比较不同模型对疑似冠心病患者未来 3 年内发生 ACS 事件的预测能力，绘制决策曲线比较不同模型的临床应用价值。

结果: ROC 曲线表明: Model 1 (AUC=0.692 [95%CI:0.531-0.852]) 对疑似冠心病患者未来 3 年内发生 ACS 事件的预测效能略低于 Model 2 (AUC=0.749 [95%CI:0.600-0.898]), 两者的差异无统计学意义 ($P=0.59$)。与 Model 2 相比, Model 3 的预测效能略有提升 (AUC=0.771 [95%CI:0.627-0.915]), 但两者差异无统计学意义 ($P=0.79$)。决策曲线表明: Model 3 的临床效益略高于 Model 1 和 Model 2。

结论: 基于 CCTA 的肝脏影像组学特征可为 ACS 事件发生提供额外的预测信息。联合模型对疑似冠心病患者未来 3 年内发生 ACS 事件具有较高的预测能力, 可为冠脉多参数模型提供一定增量预测价值, 有助于 ACS 患者的风险分层。

PO-1273

深度学习重建算法结合 70KVp 管电压在肺部 CT 扫描中的可行性: 肺部膜体研究

吕仁锋、徐哲、庄美俊
大连市中心医院

目的: 研究深度学习重建 (DLIR) 算法结合超低管电压 (70KVp) 对肺部 CT 扫描图像质量及辐射剂量的影响。**方法:** 对标准体型仿真肺部膜体进行扫描, 按照管电压的不同分为 120KVp 组和 70KVp 组。120KVp 组采用自适应统计迭代重建 (adaptive statistical iterative reconstruction-Veo, ASiR-V, 30%) 算法; 70KVp 组采用深度学习重建 (DLIR) 算法, 重建出不同权重 (DLIR-M、DLIR-H、DLIR-H+LU) 组。两组管电流均采用 100mA, 余参数设置相同, 分别对膜体进行 10 次扫描并重建 1.25mm 图像, 记录两侧肺组织内相同位置的 CT 值、皮下脂肪噪声 (SD)、CTDI, 计算信号噪声比 (SNR)、辐射剂量 (ED), 两名拥有超过 5 年的胸部诊断工作经验的放射科医生使用 1-5 分的评分系统对所有的图像进行了评估, 并对数据进行统计学分析。**结果:** 120KVp 组和 70KVp 组图像 CT 值均无统计学差异 ($P>0.05$); 两组图像的 SD、SNR 和图像质量评价有统计学差异 (均 $P<0.05$), 其中 70KV 组图像的皮下脂肪噪声明显低于 120KVp 组, 70KVp-DLIR-M 和 70KVp-DLIR-H 肺组织内噪声低于 120KVp 组, 70KVp-DLIR-M+LU 组图像肺部噪声略高于 120KVp 组。然而, 70KVp-DLIR-M+LU 组和 120KVp 组图像质量评价无统计学意义, 均可以提供更好的锐利度, 清晰地显示肺纹理的结构和分支; 70KVp 组的辐射剂量相比 120KVp 组降低了 85% (0.43 ± 0.01 vs. 3.03 ± 0.06 mSv, $P<0.05$)。结论: DLIR 算法结合管电压 70KVp 在标准体型肺部膜体 CT 扫描中明显地降低了图像噪声和辐射剂量, 采用图像增强滤波 lung (LU) 重建模式可以提供常规肺部扫描的诊断图像质量。

PO-1274

心脏磁共振 T1 mapping 联合特征追踪技术在 LGE 阴性的肥厚型心肌病中的应用价值

李杉¹、阿巴斯江²、齐海成²、刘倩²、栗岩²、邢艳²
1. 宝鸡市中心医院
2. 新疆医科大学第一附属医院

目的: 探究心脏磁共振 (CMR) T1 mapping 技术联合特征追踪 (FT) 技术在钆对比剂延迟增强 (LGE) 阴性的肥厚型心肌病 (HCM) 患者心肌纤维化和心肌形变中的诊断效能与预测价值。**方法:** 连续收集诊断为 HCM 且 CMR 检查为 LGE 阴性的患者 17 例及健康志愿者 28 例, 所有研究对象均进行 CMR 扫描, 所有图像均上传至 Cvi42 后处理软件, 分析心功能参数、native T1 值、细胞外间质容积分数 (ECV)、T2 值及左室整体纵向应变 (GLS)、周向应变 (GCS) 和径向应变

(GRS) 峰值等指标之间的差异; 采用受试者工作特征 (ROC) 曲线分析各参数诊断效能。结果: 与正常对照组相比, HCM 组左室射血分数 (LVEF) 降低, 收缩期/舒张期的心肌质量升高, 差异具有统计学意义 ($P<0.05$); 左心室整体、基底部、心尖部 native T1 值、ECV 值及中间部 T1 值均升高 ($P<0.05$); GCS、GRS、GLS 峰值均降低, 差异具有统计学意义 ($P<0.05$)。整体 ECV 值的曲线下面积 (AUC) 为 0.812、灵敏度为 0.818、特异度为 0.727、约登指数为 0.545, 提示整体 ECV 值诊断效能最高 ($P<0.05$)。结论: LGE 阴性患者的 HCM 患者的整体、基底部、中间部、心尖部 native T1 值及 ECV 值升高, 提示 HCM 患者存在不同程度的弥漫性纤维化; LGE 阴性的 HCM 患者 GLS、GRS、GCS 均下降, 提示 CMR-FT 技术可以较早地反映心肌形变及心收缩功能受损。

PO-1275

基于 CCTA 的冠脉周围脂肪组织放射组学对未来 5 年内发生不良心血管事件的预测价值

吴月、张新伟、邢艳 (通讯作者)
新疆医科大学第一附属医院

目的 本研究旨在探讨基于冠状动脉 CT 血管造影 (CCTA) 的冠脉周围脂肪组织 (PCAT) 放射组学特征是否可以评估冠心病患者未来 5 年内发生不良心血管事件的预测价值。**方法** 回顾性收集在我院接受 CCTA 检查且临床疑诊为冠心病的患者, 将 5 年内发生主要不良心血管事件 (MACE) 的 189 例患者作为病例组, 对同期数据库内未发生 MACE 事件并且年龄性别等相匹配的人群作为对照组 (189 例)。所有患者以 8:2 的比例随机分成训练集 ($n=302$) 和验证集 ($n=76$)。最后, 我们分别构建了左前降支、左回旋支和右冠状动脉的 PCAT 放射组学模型及三支冠脉的综合 PCAT 放射组学模型, 同时, 我们还分析了所有患者的 PCAT 感兴趣区域周围的脂肪衰减并建立 FAI 模型, 采用 ROC 曲线及校准曲线评估所有模型的预测效能。**结果** 从基于 CCTA 的 PCAT 放射组学特征中最终筛选出综合模型共 17 个特征、LAD-PCAT 组学模型共 14 个特征、LCX-PCAT 模型共 8 个特征以及 RCA-PCAT 组学模型共 20 个特征, 通过 Logistic 回归分析构建各自的放射组学模型。在训练集中, 综合模型、LAD-PCAT、RCA-PCAT 以及 LCX-PCAT 放射组学模型各自的曲线下面积 (AUC) 分别为 0.833、0.792、0.784、0.762, 在内部验证集中, 各模型的 AUC 分别为 0.821、0.756、0.760、0.724, FAI 模型的 AUC 值较差 (0.642, 0.531)。综合模型在评估未来 5 年内发生 MACE 事件的预测价值优于三支单独冠脉及 FAI 模型, 综合模型与其他模型相比, 训练集和验证集的 AUC 均具有统计学意义 ($P<0.05$)。在三支单独冠脉组学模型的差异性分析中, Delong 检验表明 LCX-PCAT 组学模型与其他模型具有统计学差异, 而其余单支冠脉模型之间并没有统计学差异 ($P>0.05$)。结论 基于 CCTA 的冠脉周围脂肪组织放射组学可以预测未来可能发生不良心血管事件的人群, 并且三支冠脉的 PCAT 放射组学综合模型预测效能最好, FAI 模型在此研究中预测效能最差, 单支冠状动脉 PCAT 组学模型评估不良心血管事件的预测价值有待进一步研究。

PO-1276

双能量 CT 检测心肌瘢痕特征构建陈旧性心肌梗死患者预后模型

郭倩、王天乐、龚沈初、祁荣兴
南通市第一人民医院

【摘要】目的 利用双能量 CT 检测心肌瘢痕特征, 评估其对陈旧性心肌梗死 (MI) 患者的预后价值, 并构建列线图模型。方法 连续纳入 2019 年 11 月~2022 年 12 月在南通大学第二附属医院行冠脉 CTA+双能心肌延迟强化 (LIE-DECT) 的陈旧性 MI 患者, 所有入组患者采用 40keV 单能谱+ (Mono+) 进行重建, 在左室短轴位图上评估心肌受累心肌节段数、受累心肌评分及心肌瘢痕程度。所有入组患者进行临床终点事件随访, 探讨 DECT 检测心肌瘢痕特征与心血管事件 (MACE) 发生的关系, 并构建模型, MACE 定义为心衰再住院、恶性心律失常, 心源性死亡。结果 在中位随访 24.6 (14.4, 35.2)个月期间, 纳入的 240 例陈旧性 MI 患者中, 有 69 例 (28.7 %) 患者发生心血管事件。Kaplan-Meier 分析显示, 受累心肌节段数、受累心肌评分及心肌瘢痕程度的增加与 MACE 发生相关 (log-rank $P<0.01$), 受累心肌节段数 >4 、受累心肌评分 >6 及心肌瘢痕程度大于 10% 的患者 MACE 发生率明显高于对照组。COX 比例风险回归模型显示, 调整混杂因素, 发现受累心肌节段数, 受累心肌评分及心肌瘢痕程度是发生 MACE 重要的独立危险因素。所构建列线图模型能够很好的预测陈旧性 MI 患者 MACE 的发生, 显示出良好的校准和区分能力, 受试者工作特征 (ROC) 曲线下面积 (AUC) 为 0.862(95%CI:0.830~0.887)。结论 受累心肌节段数, 受累心肌评分及心肌瘢痕程度是陈旧性 MI 患者 MACE 发生的重要的预测因子, 可作为临床陈旧性 MI 预后评估的重要指标。

PO-1277

双能量 CT 检测心肌瘢痕特征对陈旧性心肌梗死患者发生主要心血管事件的预测

郭倩、王天乐、龚沈初、祁荣兴
南通市第一人民医院

【摘要】目的 评估双能量 CT 检测心肌瘢痕特征与陈旧性心肌梗死 (MI) 患者未来发生心血管事件的关系。方法 连续纳入 2019 年 11 月~2022 年 12 月在我院行冠脉 CTA+双能心肌延迟强化 (LIE-DECT) 的陈旧性心梗患者, 所有入组患者采用 40keV 单能谱+ (Mono+) 进行重建, 在左室短轴位图上评估心肌受累心肌节段数, 受累心肌评分及心肌瘢痕程度。所有入组患者进行终点事件随访, 探讨 DECT 检测心肌瘢痕特征与主要心血管事件 (MACE) 发生的关系, MACE 定义为心衰再住院、恶性心律失常, 心源性死亡。结果 最终纳入陈旧性 MI 患者 240 例, 中位随访时间 24.6 (14.4, 35.2)个月, 发生 MACE 69 例, 占 28.75 %。发生 MACE 患者的受累心肌节段数 [6 (4.5, 8)]、受累心肌评分 [23 (11, 43.5)] 及心肌瘢痕程度 [12% (7%, 13%)] 明显高于未发生心血管事件的患者 [3 (2, 4)]、[4 (3, 8)] 及 [4% (2%, 6%)] , $P<0.01$ 。多元 logistic 回归分析显示, 调整混杂因素, 心肌瘢痕节段数 (OR=1.423, 95% CI 1.319-1.536, $P<0.01$)、受累心肌评分 (OR=1.044, 95% CI 1.035-1.054, $P<0.01$)、心肌瘢痕程度 (OR=1.321, 95% CI 1.209-1.467, $P<0.01$) 是陈旧性 MI 患者发生 MACE 的预测因子。受试者工作特征 (ROC) 曲线显示受累心肌节段数、受累心肌评分及心肌瘢痕程度均可以很好的预测陈旧性心肌梗死患者 MACE 的发生 (AUC=0.886, $P<0.01$)、(AUC=0.876, $P<0.01$) 及 (AUC=0.884, $P<0.01$)。结论 LIE-DECT 40keV Mono+图检测受累心肌节段数、受累心肌评分及心肌瘢痕程度与陈旧性 MI 患者发生 MACE 相关, 可作为评估陈旧性 MI 临床预后的重要指标。

PO-1278

基于深度学习算法下严重冠状动脉钙化血管成像及应用研究

王拓

大连理工大学附属大连市中心医院

目的: 严重冠状动脉钙化在 GE Revolution Apex CT 进行冠状动脉 CTA 血管成像, 应用深度学习算法结合图像滤过方式血管重建临床应用的可行性及优势。

方法: 我们将身体质量指数(BMI)正常的实验对象(BMI=18.5—23.9kg/m²)纳入研究标准。排除标准: 碘对比剂过敏严重心律不齐, 急性心衰及严重肝肾功能损害。

扫描方法冠状动脉 CTA: 冠状动脉 CTA 扫描范围: 16cm 探测器包含全部心脏, 扫描方向: 由头侧向足侧, 管电压 100kV, 自动管电流 600-900mA, 噪声指数 11.0, 扫描层厚 0.625mm, 层间距 0.625mm, 球管旋转时间 0.28s, 矩阵 512×512, 使用 160mm×0.625mm 探测器, 宽度 16cm, 1Beat 模式, 检查时间 0.7s, 重建最佳舒张期和收缩期。对所得图像首先使用 SSF 二代软件进行冠状动脉冻结技术, 并导入 GE AW4.7 工作站进行重建, 在重建中将含有深度学习算法的原始图像再次经过边缘强化等级 2 的滤过方式进行图像处理, 最终得到诊断要求的影像图像。辐射剂量计算记录患者检查时的容积 CT 剂量指数(CTDIvol)、剂量长度乘积(DLP), 并计算其有效剂量(ED), ED=DLP×k 系数胸部 0.0140)。

图像质量评价: 冠状动脉 CTA 主动脉根部左主干层面(450±50)HU, 又心无对比剂残留。由 5 名经验丰富的医生进行评估。

结果: 深度学习算法结合图像滤过重建对严重冠状动脉钙化的患者检查远远优越与普通重建算法, 对图像诊断及管腔内狭窄程度评估准确率大幅提升全可满足影像诊断需求和临床诊治标准。

结论: 1、深度学习算法结合图像滤过重建对钙化严重冠状动脉患者有着显著诊断提升。2、GE Revolution Apex CT 冠状动脉 CTA 扫描图像质量优, 准确率高, 对比剂少, 辐射剂量低。

PO-1279

基于实性结节影像组学的肺隐球菌病和浸润性腺癌鉴别

王丽华¹、耶尔凡·加尔肯¹、王启苑¹、李冯²

1. 浙江大学

2. 北京深睿博联科技有限责任公司

目的: 探索影像组学结合传统影像分析方法对鉴别表现为实性结节的隐球菌病和浸润性腺癌的价值以提高诊断准确性。

材料和方法: 收集手术或穿刺病理证实的表现为实性结节的 39 例肺隐球菌病及 58 例浸润性腺癌 CT 图像, 分别由有 4 年和 10 年工作经验的放射科医师通过随机双盲法运用传统影像学分析方法对上述病例进行诊断, 并统计其影像学征象如分叶, 毛刺, 晕征及胸膜凹陷等。使用肺结节自动检测分割算法在 CT 图像上获取病变的三维容积感兴趣区 (VOI)。利用 PyRadiomics 工具对所有 VOI 区域进行重采样和原始图像预处理并进行组学特征提取。在 Dr.Wise 科研平台上对已提取的组学特征进行特征清洗、筛选, 建立影像组学模型。最后由 10 年工作经验医师结合组学模型结果重新进行诊断, 比较两者结合前后的诊断准确性。

结果: 4 年和 10 年工作经验医师对隐球菌结节诊断的病理符合率分别为 35.89% 和 46.15%, 浸润性腺癌结节病理符合率分别为 93.10% 和 96.55%。两组间年龄, 结节最大径, 延迟期 CT 值和延迟期强化幅度出现显著性差异 ($p < 0.05$)。隐球菌组较浸润性腺癌组年龄小, 结节最大径小, 延迟期强化不如腺癌明显且幅度低 ($P = 0.001$)。浸润性腺癌较隐球菌结节更易出现胸膜凹陷征 ($P = 0.001$) 和分叶征 ($P = 0.011$), 而毛刺征两者无显著性差异 ($P = 0.156$), 隐球菌结节更多出现晕征 ($P = 0.024$)。每个病灶共提取 100 个影像组学特征, 在 L1 正则化特征筛选后共纳入 17

个组学特征建模, 所建立 LogisticRegression 模型训练集和验证集的 AUC 分别为 0.9057 和 0.8643。模型对两组结节的诊断准确率分别为 69.23%和 82.38%, 10 年诊断经验医师结合组学模型重新阅片后, 隐球菌结节诊断准确率提高到 76.92%, 浸润性腺癌诊断准确性相同 (96.55%)。结论: 影像组学模型结合传统影像学可提高表现为实性结节的肺隐球菌病的诊断准确性, 尤其对诊断困难的肺隐球菌结节提供帮助。

左心耳血流淤滞 CT 征象预测房颤患者 主要不良心血管事件的发生风险

顾海蓉、蒋佳坤、李磊、祁荣兴
南通市第一人民医院

【摘要】目的 本研究旨在利用 CT 检测左心耳早期血流淤滞征象来预测心房颤动(AF)患者发生主要不良心血管事件 (MACE, 定义为心源性脑卒中、全因死亡及心衰再住院) 的风险。**方法** 本研究选择回顾了 2020 年 1 月 1 日~至 2021 年 12 月 31 日在南通大学第二附属医院做行心脏 CT (CCT) 检查的连续住院患者 1783 名, 筛选出选择左心耳 (LAA) 早期充盈缺损 (FD) 的心房颤动患者 AF 患者 166 名。通过测量左心耳 LAA 充盈缺损容积与左心耳 LAA 容积的比值 (VFD/VLAA)、左心耳 LAA 形态、左心耳 LAA 充盈缺损区域 CT 值与升主动脉 CT 值的比值 (LAAFD/AA), 来预测 MACE 的发生风险, MACE 定义为心源性脑卒中、全因死亡及心衰再住院。**结果** 最终纳入 167 名 LAA 早期充盈缺损的心房颤动患者中位随访时间 27.3 (22.0,32.9) 月, 发生 MACE 34 例, 占 20.5%, 其中有 10 名患者发生心源性脑卒中, 1 名患者发生全因死亡, 23 名患者发生心衰再住院; 。Kaplan-Meier 曲线证明高的 VFD/VLAA (≥ 0.435) 与低的 LAAFD/AA (< 0.260) 的房颤患者 MACE 发生率更高 (log-rank 检验, $P < 0.01$)。COX 比例风险回归模型显示, 调整混杂因素, 高的 VFD/VLAA、低的 LAAFD/AA 是房颤患者发生主要不良心血管事件风险的危险因素。**结论** 房颤患者高的 VFD/VLAA、低的 LAAFD/AA 是发生主要不良心血管事件风险的独立危险因素预测因子, 可作为评估房颤 AF 患者预后评估的重要指标。

PO-1281

非心电图门控自由呼吸大螺距 Flash 扫描在左心耳肺静脉 CT 扫描中的应用

吴志斌
空军军医大学西京医院

【摘要】目的: 左心耳封堵术前需评估肺静脉和左心耳, 本研究旨在探讨快速低剂量扫描在此类患者中的应用价值。**方法:** 收集 56 例 A 组肺静脉左心耳 CTA 数据, 大螺距扫描, 检无需呼吸配合和心电图门控; 收集 58 例 B 组数据, 采用心电图门控螺旋扫描, 两组其他条件一致, 对比剂量 A 组为 0.8ml/kg, 注射流率 4~5ml/s, B 组量为 1.2ml/kg, 注射流率 4~5ml/s。在后处理工作站进行 MPR、VR、MIP 等重建, 观察左心耳内有无血栓, 形态, 测量左心耳口径, 肺静脉的形态及其变异情况, 所得结果与图 TEE 对比。**结果** A 组左心耳形态分别为鸡翅型 23 例、仙人掌型 19 例、风向标型 9 例、菜花型 7 例; 18 例血栓形成, 与 TEE 相比诊断符合率为 94.8%, 敏感度 88.3%, 特异度分别为 97.4%; B 组左心耳形态分别为鸡翅型 21 例、仙人掌型 18 例、风向标型 10 例、菜花型 7 例, 9 例血栓形成。与 TEE 相比诊断符合率为 96.3%, 敏感度 90.3%, 特异度分别为 98%, $P < 0.05$, 差异无统计学意义辐射剂量及对比剂 A 组明显低于 B 组。**结论** 由于双源 CT 超快速扫描能极大的减少

运动伪影,可以在自然呼吸和不施加心电门控的情况下获得优质的图像,为此类患者提供了更加高效、安全的术前检查方式,值得在临床运用中进行推广。

3D 打印技术指导复杂冠心病小切口微创冠脉搭桥的应用研究

杨旭

空军军医大学西京医院

目的 分析基于冠状动脉 CTA 数据 3D 打印技术指导复杂冠心病进行小切口微创冠脉搭桥手术的应用价值。方法 回顾性分析 2021 年 8 月-2023 年 4 月空军军医大学西京医院 78 例复杂冠心病患者行小切口微创冠脉搭桥手术的临床资料,其中基于冠脉 CTA 进行 3D 打印重建术前计划的 35 例为 3D 组,以传统方法术前计划的 43 例为常规组。记录两组患者手术情况,评估术后监护相关指标及预后情况,并统计术后不良事件。结果 两组患者年龄、性别、体重指数及合并基础病无明显统计学差异 ($P>0.05$)。两组患者手术成功率均为 100%,3D 组均成功行小切口微创冠脉搭桥术,常规组 4 例患者中转正中开胸冠脉搭桥手术;3D 组术中出血量、手术时间及输血量较常规组减少 ($P<0.02$),3D 组术后引流量、输血、呼吸机辅助时间、监护室时间也较常规组减少 ($P<0.05$);对于两组中成功开展小切口微创冠脉搭桥的患者,6 个月随访不良事件发生率差异无统计学意义 ($P>0.05$)。结论 采用基于冠脉 CTA 资料进行 3D 打印重建进行术前指导,可使复杂冠心病小切口冠脉搭桥手术更具象化,可能减少术中出血和术后输血,缩短手术时间、呼吸机时间和监护室停留时间,可能是更理想的术前评估方式。

PO-1283

Erdheim-Chester 病 (Erdheim-Chester disease, ECD) 影像诊断与鉴别

邵亚军、田宏哲

宝鸡市中心医院

【病例资料】

患者男,54 岁,外伤后右侧颞部疼痛 6 天,车祸致左侧肢体擦伤病史 10 多天,6 天前患者无明显诱因感右侧颞部持续性钝痛,无头晕,无恶心呕吐,四肢活动可,在家未行任何处置,无头晕,无恶心、呕吐,四肢活动可,急来我院急诊科就诊,行头部 CT 提示硬膜下血肿,发病以来,意识清楚,无四肢抽搐及口吐白沫,无心慌、胸闷、气短,饮食、夜休可,大小便正常。既往高血压病史 10 年,最高血压 180/100mmHg,口服酒石酸美托洛尔、硝苯地平治疗,血压控制可;升主动脉瘤病史 1 月;脑梗死病史 5 年,遗留左侧面瘫、左侧肢体无力;无肝炎、结核、疟疾病史,无心脏病史,无糖尿病、精神疾病史,无手术、输血史,无食物、药物过敏史,系统回顾无其他系统疾病,预防接种史不详;父母均去世,死因不详,3 兄 2 姐体健,2 女体健。否认家族性遗传病史。体格检查:T:36.3℃,P:70 次/分,R:17 次/分,Bp:140/80mmHg。右侧膝关节 X 线检查示:右侧股骨下段及胫骨上段髓腔密度增高(图 1A、1B)。CTA 示:主动脉全程扩张,周围见鞘样软组织包绕,呈“穿大衣的主动脉”,腹腔干动脉、双肾动脉及肠系膜上下动脉起于包鞘,远端管腔充盈不良,双肾皮质强化弱,呈“毛发征”(图 1E),肾周脂肪间隙模糊,腹膜后见不规则软组织影,双肺小叶间隔均匀增厚(图 1C);MRI 提示右侧硬膜下血肿,双侧视神经明显梭形增粗,双侧眼球突出,神经垂体未见明确显示,追问病史询及患者既往患尿崩症[1],查体见患者颈部皮肤隆起,呈淡黄色,直径约 0.5cm。经宝鸡市中心医院专家及安贞医院教授会诊,结合影像学、临床、病理及实验室结果,诊断为 Erdheim-Chester 病 (Erdheim-Chester disease, ECD)。

PO-1284

光谱 CT 参数变化预测食管癌新辅助化疗 联合免疫治疗的病理完全缓解

王慧、寇松子、雷丽敏、岳松伟、齐宇
郑州大学第一附属医院

目的：探索光谱 CT 定量参数变化预测食管癌新辅助化疗联合免疫治疗（NCPI）后病理完全缓解（pCR）的价值。

方法：前瞻性收集分析 2023 年 1 月至 8 月 NCPI 前后均行光谱 CT 增强扫描（IQon Spectral CT）的食管鳞癌患者 32 例，根据新辅助治疗后食管癌根治术病理结果分为病理完全缓解（pCR）组与非病理完全缓解（N-pCR）组。在 Philips 后处理工作站三期薄层图像上勾画病灶 ROI，生成平扫、动、静脉期有效原子序数（ZeffF /ZeffA /ZeffV）；动、静脉期碘密度（IDA/IDV）；动、静脉期电子云密度（EDA/EDV），计算标准化碘密度（NID = ID 病灶/IDA 主动脉）、动脉增强分数（AEF = NIDA/NIDV×100%）。再于单能量图像上勾画病灶 ROI，获得病灶动、静脉期光谱曲线斜率（ λA 、 λV ）。计算以上 NCPI 前后各参数变化量 Δ （参数前-参数后），采用受试者工作特征（ROC）曲线评价各参数变化评估 NCPI 疗效的效能。

结果：NCPI 后 pCR 者 13 例，N-pCR 者 19 例，组间 Δ NIDV、 Δ ZeffF、 Δ ZeffA、 Δ ZeffV、 Δ EDA、 Δ λV 差异均有统计学意义（P 值均<0.05）。ROC 曲线显示：上述参数曲线下面积（AUC）分别为：0.84, 0.73, 0.73, 0.76, 0.75, 0.84；将以上 6 个参数建立联合模型，ROC 曲线下面积为 0.95，最大约登指数为 0.79，此时阈值为 0.46,其敏感度为 84.6%,特异度为 94.7%。

结论：利用光谱 CT，通过定量分析病灶光谱 CT 静脉期标准化碘密度，平扫、动、静脉期有效原子序数，动脉期电子云密度及静脉期光谱曲线斜率，可预测食管癌 NCPI 后病理完全缓解，联合参数模型预测效能较高。

PO-1285

磁共振扩散峰度成像在鉴别非小细胞肺癌术前 纵隔淋巴结转移的应用研究

秦宇
重庆大学附属三峡医院

目的 探讨磁共振扩散峰度成像（DKI）在鉴别非小细胞肺癌（NSCLC）术前纵隔淋巴结转移的诊断价值。资料与方法 回顾性搜集 CT 检查发现肺部占位患者，进一步行 DKI 序列扫描，根据病理结果将 NSCLC 患者纵隔淋巴结分为转移组和非转移组。采用两独立样本 t 检验（正态分布）或 Mann-Whitney U 检验（非正态分布）比较转移及非转移组淋巴结 DKI（D、K 值）和 ADC 值全域直方图参数的差异；采用受试者工作特征(ROC)曲线评估直方图参数的诊断效能并确定最佳阈值，采用 DeLong 法比较各直方图参数 AUC；采用 Spearman 秩相关分析全域直方图参数与转移淋巴结的相关性。结果 本研究纳入 80 例 NSCLC 患者，术中共清扫纵隔淋巴结 274 枚，病理诊断为非转移性 240 枚，转移性 34 枚；MRI 检查因显示不清或图像质量不佳排除 42 枚，最后共检出 232 枚，其中转移 34 枚，非转移 198 枚。转移性淋巴结的 D 值及 ADC 值（mean、10th percentile、90th percentile、IQR、max、min、range、energy、entropy）、D 值（median、variance）、K 值（max、min、Kurtosis、Skewness）显著低于非转移淋巴结，而 D 值（uniformity、skewness）、K 值（mean、90th percentile、IQR、median）、ADC 值（Kurtosis、uniformity、variance）显著高于非转移组。D 值和 ADC 值中大部分直方图参数与转移性淋巴结呈负相关，而 K 值中大部分直方图参数则呈正相关。对比分析各联合全域直方图多参数 AUC 发现 D 值的 AUC 高于 K 值及 ADC

值, 并且联合全域直方图多参数 AUC 显著高于 D、K 值及 ADC 值诊断效能最高的单一直方图参数的 AUC ($P<0.05$)。结论 DKI 全域直方图参数可有效鉴别 NSCLC 术前纵隔淋巴结转移, 其诊断效能高于传统 DWI 序列; 全域直方图分析法突破了传统分析法的局限性, 对淋巴结的异质性评估以及患者个体化治疗提供了更多影像依据, 有助于临床决策。

PO-1286

基于胸部 CT 测量部分胸部呼吸肌体积变化的方法 评估重症监护病房获得性肌无力

傅琳、彭新桂
东南大学附属中大医院

目的: 危重症获得性肌无力 (intensive critical unit-acquired weakness, ICU-AW) 是重症监护病房的常见并发症, 可继发于导致危重症的各种疾病。本研究通过建立胸部 CT 测量部分肋间呼吸肌体积变化评估 ICU 获得性肌无力及其预后。

方法: 回顾性收集了 462 名东南大学附属中大医院重症监护室患者的临床资料及住 ICU 期间两次胸部 CT 图像。使用 ITK-SNAP 软件测量患者在 ICU 期间两次肋间呼吸肌体积的变化并计算变化的百分比。为了验证该方法的可重复性, 两位研究者分别对 10 名体检者的 CT 图像进行呼吸肌体积的勾画, 其中一名研究者间隔一周后进行重新勾画。测量的方法为设定呼吸肌厚度为 1cm, 在冠状面上选取测量的范围为双侧第 3-8 肋间肌及前锯肌。肋间呼吸肌体积减少大于 10% 的患者定义为 ICU 获得性肌无力组 (ICU-AW 组), 小于 10% 的患者定义为非 ICU 获得性肌无力组 (非 ICU-AW 组)。评估两组患者的一般资料及临床结局 (28 天死亡率、ICU 死亡率、住院死亡率)。使用单变量和多变量逻辑回归分析进行变量筛选, 分析 ICU 获得性肌无力的危险因素。

结果: 观察者间相关系数 ($ICC=0.895$ 95%CI:0.652-0.973 ; $P<0.001$) 和观察者内相关系数 ($ICC=0.933$ 95%CI:0.761-0.983; $P<0.001$) 均表明了该方法测量呼吸肌体积可重复性很好。根据呼吸肌体积变化定义的 ICU-AW 组 与非 ICU-AW 组 28 天死亡率、ICU 死亡率、住院死亡率有差异 (9.4% vs 20.2%, $p=0.002$; 10.6% vs 25.2%, $p<0.001$; 12.2% vs 28.4%, $p<0.001$)。多变量逻辑回归分析显示 CT 定量呼吸肌体积变化是 ICU 获得性肌无力的独立危险因素。

结论: 本研究基于胸部 CT 测量肋间呼吸肌的方法具有一定可行性, 可以将胸部肌肉快速流失的患者识别出来。胸部 CT 定量肋间呼吸肌体积变化是评估 ICU-AW 的一种有效的新方法, 能有效识别 28 天死亡率、ICU 死亡率、住院死亡率更高的患者, 帮助临床做出最佳的治疗决策。

PO-1287

基于左心室不同区域心肌 CMR 影像组学模型预测肥厚型 心肌病并发室性心律失常

吕静¹、刘云²
1. 宁夏医科大学临床医学院
2. 宁夏医科大学总医院

目的 探讨基于心脏磁共振 (CMR) 不同区域心肌的影像组学特征预测肥厚型心肌病 (HCM) 者并发室性心律失常 (VAs) 中的价值。方法 收集 2018 年 1 月 1 日至 2023 年 5 月 31 日的 122 例确诊 HCM 者的 CMR 图像。根据 24 小时动态心电图结果将其分为合并 VAs 组 (40 例) 与未合并 VAs 组 (82 例)。按照 7:3 的比例随机分为训练集及测试集。选择从二尖瓣水平至心尖部的左心室短轴末增强平衡式稳态自由进动序列, 以舒张末期壁厚 (EDWT) 为基础, 将 HCM 者心肌分为肥厚区域

(无 HCM 家族史, EDWT \geq 15 mm; 有 HCM 家族史, EDWT \geq 13 mm) 与非肥厚区域 (无 HCM 家族史, EDWT $<$ 15 mm; 有 HCM 家族史, EDWT $<$ 13 mm)。在左心室短轴位各层面心肌的心室舒张末期对全室壁心肌、肥厚区域心肌及非肥厚区域心肌 3 个感兴趣区进行勾画及影像组学特征提取、采用 Mann-Whitney U 检验、递归特征消除法及最小绝对收缩与选择算法进行影像组学特征筛选、选出最优特征子集, 通过一般逻辑回归分别构建左心室全室壁心肌影像组学模型、左心室肥厚区域心肌影像组学模型及左心室非肥厚区域心肌影像组学模型。采用准确度、敏感度、特异度、阳性预测值、阴性预测值和受试者工作特征曲线下面积 (AUC) 及 DeLong 检验评估和比较模型间的预测效能; 通过决策曲线分析观察各模型的临床实用性。结果 各模型在训练集及测试集的 AUC 值均高于 0.80; 在训练集及测试集中, 左心室非肥厚区域心肌影像组学模型的 AUC 值 (训练集: 0.89; 测试集: 0.79) 小于左心室肥厚区域心肌影像组学模型 (训练集: 0.96; 测试集: 0.95) 及左心室全室壁心肌影像组学模型 (训练集: 0.98; 测试集: 0.93) ($P<0.05$), 左心室肥厚区域心肌影像组学模型与左心室全室壁心肌影像组学模型的 AUC 值无明显统计学差异 ($P>0.05$)。结论 基于左心室肥厚区域心肌的影像组学模型和基于左心室全室壁心肌的影像组学模型在预测 HCM 者并发 VAs 风险方面效能更高, 可为 HCM 者危险分层及预后评估方面提供有用信息。

PO-1288

基于 ct 衍生的整体纵向应变可作为稳定型心绞痛患者 心血管事件的一种新的预测因子

顾慧、袁宏涛、李博文、王锡明
山东第一医科大学附属省立医院

背景: 基于 CT 特征跟踪 (CT-FT) 的 CT 衍生应变评估已经成为一种新的技术, 使冠状动脉 CT 血管造影 (CCTA) 能够提供有关心功能的额外信息。而其与冠状动脉疾病 (CAD) 的应变之间关系却很少被报道。

目的: 探讨稳定型心绞痛患者 CT 来源的左心室应变及其与主要不良心脏事件 (MACE) 发生率的关系。

方法: 本队列共纳入 303 例因稳定型心绞痛而行 CCTA 治疗的患者, 中位随访时间为 428 天。对所有患者的 CT 衍生性左心室应变进行定量分析。得到了以下应变参数: 整体纵向应变 (GLS)、整体径向应变 (GRS)、整体周向应变 (GCS) 和射血分数 (EF)。同时也获得了冠状动脉狭窄和危险因素。此外, MACE 的发生率被定义为心肌梗死、因不稳定型心绞痛住院、非计划性的冠状动脉血管重建术和全因死亡。

结果: 33 例 (10.9%) 患者在随访期间发生了 MACE 检查。多因素分析发现, MACE 组和无 MACE 组的 GLS 存在差异 (-17.49 ± 2.37 vs. -19.22 ± 2.79 , $p < 0.001$)。严重冠状动脉狭窄、糖尿病和 GLS 较高的患者 MACE 发生率显著升高 (均 $p < 0.05$)。冠状动脉狭窄 (危险比[HR] = 8.48, $p = 0.01$)、糖尿病 (HR = 3.07, $p = 0.02$) 和 GLS (HR = 4.91, $p = 0.02$) 是 MACE 的独立预测因子。由 GLS、冠状动脉狭窄和危险因素组成的联合模型比单独的危险因素具有更高的预测效果 (AUC: 0.86 vs. 0.75, $p = 0.01$)。

结论: 在稳定型心绞痛患者中, MACE 患者的 GLS 水平高于非 MACE 患者。此外, GLS 水平较高的患者发生 MACE 的风险也有所增加。

PO-1289

恶性血液病肺真菌感染的 CT 诊断与高通量测序的对照分析

杨潇、刘新顶、武鹏、周珊珊、靳翠翠、刘思萌、赵德利
哈尔滨医科大学附属第六医院

目的：探讨多层螺旋 CT 及宏基因组二代测序(mNGS)技术应用于恶性血液病(HM)肺真菌感染的诊断价值；分析 CT 影像学征象、两种检查方式特点及两者联合以期提高 HM 肺真菌感染的早期诊断准确率。

方法：收集 70 例序贯化疗期间成人 HM 疑似肺真菌感染的患者资料，行肺 CT 扫描及血液样本 mNGS 测序，以中后期痰培养结果为临床诊断金标准。采用诊断试验分析 CT 和 mNGS 与痰培养的关系，绘制受试者工作特征(ROC)曲线计算两项指标灵敏度、特异度及曲线下面积(AUC)值；当使用 CT 和 mNGS 两指标联合诊断时，通过 Logistic 回归分析模型建立新变量 CT+mNGS，绘制新变量 ROC 曲线得出 AUC 值，将 AUC 值与 CT 及 mNGS 的结果比较；并简要分析 HM 真菌性肺炎的影像学特征。

结果：在回顾性纳入的 70 例 HM 患者中，男、女占比为 1: 0.56，中位年龄 42.5 岁。HM 真菌肺炎患者的影像特征见：多叶段受累居多，表现为结节影 14 例、晕征或空洞 11 例、磨玻璃影 9 例、实变影 6 例、空气新月征 5 例、肿块影 3 例；另出现肺斑索、淋巴结增大等 12 例。CT 印象诊断为 HM 真菌性肺炎 19 例，mNGS 检测得出 HM 真菌性肺炎 17 例。ROC 曲线结果表明，CT 与 mNGS 在 HM 真菌性肺炎诊断中的灵敏度分别为 50%和 40%，特异度分别为 76.67%和 78.33%，AUC 值分别为 0.633 和 0.592；当 CT 与 mNGS 联合诊断时，得到新变量灵敏度为 80%，特异度为 65%，AUC 值为 0.706；将新变量 AUC 值分别与 CT 和 mNGS 的 AUC 值比较得出，两者 P 值分别为 0.2154 和 0.2414，均>0.05，表明新变量与 CT 和 mNGS 间诊断价值的差异不具有统计学意义。

结论：肺部 CT 在 HM 肺真菌感染早期快速诊断中具有良好的临床实用价值；并在随诊复查、监测病情变化方面具有明显优势，为患者早期抗感染治疗争取了时间，具有时效性。mNGS 对 HM 肺部真菌感染病原体检出具有较高的特异性，帮助临床判断感染类型。CT 联合 mNGS 检测在 HM 患者早期真菌肺炎判断中，具有较高灵敏度，相对单一检查手段提高了诊断效能，并为 HM 真菌性肺炎的早诊早治与合理用药提供理论依据。

PO-1290

心脏磁共振自由呼吸运动校正人工智能电影序列在
心力衰竭患者中的临床应用

冉玲平、黄璐、严祥虎、赵赞、杨朝霞、周舒畅、夏黎明
华中科技大学同济医学院附属同济医院

目的

通过评估自由呼吸运动校正人工智能 (free-breathing with motion correction artificial intelligence, FB-MOCO AI) 电影序列的图像质量、双心室体积和功能参数，探讨其在心力衰竭患者心脏磁共振检查中应用的可行性。

材料与方法

前瞻性连续纳入 2022 年 8 月至 2023 年 5 月期间来我院进行心脏磁共振检查的心力衰竭患者 29 例。所有患者均行常规屏气电影和 FB-MOCO AI 电影序列的心脏短轴面扫描。对两种电影序列采集的图像进行整体图像质量评分 (5 分法)，并测量双心室容积和功能参数以及左心室舒张末期质量 (left ventricular end-diastolic mass, LVEDM) 进行定量分析。

结果

FB-MOCO AI 电影序列的总扫描时间 ($14.3s \pm 1.9s$) 比常规屏气电影 ($79.2s \pm 11.4s$) 明显缩短 ($P < 0.001$)。FB-MOCO AI 电影 (4.4 ± 0.5) 的总体图像质量评分与常规屏气电影 (4.3 ± 0.7) 相当, 差异无统计学意义 ($P = 0.343$)。两种电影序列间所有测量的双心室容积和功能参数以及 LVEDM 差异均无统计学意义 (P 值均 > 0.05)，并且有强相关性和一致性。

结论

与常规屏气电影序列相比, 心衰患者中 FB-MOCO AI 电影序列扫描时间明显缩短并且提供了相当的图像质量、心室容积和功能指标, 有潜力替代心衰患者的常规电影序列应用于临床。

PO-1291

胸部骨骼肌指数对非小细胞肺癌免疫治疗患者预后的评估价值

冯湛¹、邹红烨¹、王敏红²

1. 浙江大学医学院附属第一医院

2. 皖南医学院附属第一医院

目的: 肌少症是指肌肉质量减少、肌力减弱和肌肉功能减退, 被证实是恶性肿瘤患者预后的一个重要预测因素。存在肌少症营养不良的肺癌患者, 往往生存时间较短。基于 CT 图像的骨骼肌指数 (Skeletal muscle index, SMI) 检测简便, 能客观反映肌肉减少情况, 但既往 SMI 需要评估腰 3 椎体层面肌肉, 而大多数非小细胞肺癌的免疫治疗复查, 不太可能单独进行腹部 CT 扫描。因此, 本研究旨在使用胸部 CT 计算骨骼肌指数, 探讨胸部 SMI 对非小细胞肺癌免疫治疗生存时间的影响。

方法: 回顾性分析 242 例非小细胞肺癌患者的免疫治疗相关临床及 CT 影像资料。在患者治疗前的胸部 CT 图像上, 选择胸 5 椎体为中心层面, 通过半自动化分割 CT 值在 -29~150HU 范围内的肌肉组织获得 SMI。SMI 通过计算骨骼肌面积与身高平方的比值 (cm^2/m^2), 并根据年龄进行校正。SMI 低于性别特异性下四分位数时归为肌少症组, 采用 Kaplan-Meier 法绘制生存曲线, 并采用对数秩检验分析其差异。

结果: 肌少症男性 SMI 为小于 $39.92cm^2/m^2$, 女性 SMI 为小于 $30.98cm^2/m^2$ 。肌少症患者与非肌少症患者的年龄没有显著统计学差异。肌少症患者中男性和女性的总生存时间均明显低于非肌少症患者。Kaplan-Meier 分析结果表明 T5 水平获得的 SMI 与非小细胞肺癌较差的无进展生存时间相关。

结论: 胸部骨骼肌测量也可用于肌少症的评估, 胸部 CT 以 T5 水平为中心获取的 SMI 是预测非小细胞肺癌免疫治疗预后的独立预测因素。

PO-1292

基于机器学习预测非小细胞肺癌新辅助化疗后的病理反应

蒋赵娟、李振辉、高德培、李清婉、阮进秋、毛柯宇、艾静

云南省肿瘤医院

目的: 新辅助化疗在非小细胞肺癌 (NSCLC) 患者中的疗效存在差异, 然而目前尚缺乏有效的无创预测标志物。本研究旨在利用 CT 影像组学建立并验证模型, 以预测 NSCLC 在新辅助化疗后的病理反应。

方法: 回顾性收集本院 2013 年 4 月至 2021 年 10 月接受新辅助化疗并手术的 130 例 IB~III 期 NSCLC 患者, 将其按 7:3 随机分为训练集和独立测试集。从新辅助化疗前最近一次的 CT 影像中提取瘤体及瘤周区域的影像组学特征, 然后用 Pearson 相关性分析及递归特征消除法 (recursive feature elimination, RFE) 选择特征后用机器学习算法 Auto-encoder (AE) 建立模型并利用 ROC 曲线验证模型的区分度, 并用校准曲线及临床决策曲线评估模型的校准度及临床效能。最后, 根据模型对患者的预测概率进行风险分层, 并分析不同风险组患者的生存情况及术后辅助化疗在不同风险组中的作用。

结果: 本研究选择 9 个影像组学特征用于建立模型, 以预测 NSCLC 患者在新辅助化疗后是否达到病理完全缓解。该模型在训练集的 AUC 为 0.874 (95% CI: 0.780 - 0.968), 在测试集中的 AUC 为 0.876 (95% CI: 0.757 - 0.996)。校准曲线及临床决策曲线显示该模型具有良好的校准度 (Hosmer-Lemeshow 检验, $p = 0.763$) 及潜在的临床应用前景。在生存分析中, 高低风险组的 OS($p = 0.011$)及 DFS($p = 0.017$)差异显著。在低风险组中, 术后辅助化疗能显著改善患者生存($p = 0.041$), 但在高风险组中, 术后辅助化疗对患者生存无显著影响($p = 0.56$)。

结论: 本研究首次利用瘤内及瘤周影像组学特征, 成功预测了 NSCLC 新辅助化疗后是否能够达到病理完全缓解, 并预测患者生存期。

PO-1293

冠脉狭窄部位冠周脂肪 CT 图像三维组学特征与心肌缺血的相关性及其预测心肌缺血的诊断价值

周可、侯阳
中国医科大学附属盛京医院

目的: 探索特定区域冠脉周围脂肪组织三维组学特征预测心肌缺血的价值, 建立基于 CT 图像放射组学的鉴别心肌缺血的预测模型。

方法: 回顾性分析 2018 年 1 月至 2022 年 10 月在多家医院行冠脉造影同时行 FFR 测量的 262 例患者 (306 支病变血管), 所有患者均在冠脉造影前 2 周内行冠脉增强 CT 检查。应用 ITK-SNAP 软件勾画冠脉狭窄段周围等冠脉直径的区域, 勾画完成后融合成三维 ROI, 提取其中 CT 值介于 -190 至 -30 的数据为目标冠脉周围脂肪数据, 构建基于 CT 图像的心外膜脂肪影像组学预测心肌缺血的模型, 并验证其效能。所有患者同时测量狭窄处斑块数据, 包括斑块特征 (N=10) 和心外膜脂肪组织特征 (N=3)。具体包括: EAT 总体积、EAT 平均密度、PVAT-CT 平均密度、斑块总体积、斑块钙化体积 (CT 指数大于 130)、斑块钙化比例、斑块脂质体积 (CT 指数介于 -30 到 30 之间)、斑块脂质比例、斑块纤维体积 (CT 指数介于 -31 到 130 之间)、斑块纤维比例、狭窄程度、重构指数、偏心指数。13 个常规特征构建常规特征模型, 同时把这些常规特征纳入到组学特征中构建联合模型, 分别评估不同模型的预测价值。

结果: 共有 124/306 条血管出现功能性缺血 (FFR ≤ 0.80)。在训练组 (ROC) 曲线下面积 (AUC): 0.770 vs 0.732, $P < 0.05$) 和测试组 (AUC: 0.740 vs 0.696, $P < 0.05$) 两方面, 放射组学模型在区分缺血和非缺血方面均优于传统模型。在训练组 (AUC: 0.810 vs 0.732, $P < 0.05$) 和测试组 (AUC: 0.809 vs 0.696, $P < 0.05$) 中, 联合模型在区分缺血和非缺血方面的表现明显优于传统模型。三个模型均显示出良好的校准度, Hosmer-Lemeshow 试验的所有 P 值均大于 0.05。当应用于临床决策时, 联合模型比传统模型和 PCAT 放射组学模型对患者显示出更多的净效益。

结论: 冠脉周围脂肪放射组学模型可以预测心肌缺血。在病变定量常规特征中联合冠脉周围脂肪放射组学可提高功能相关冠状动脉疾病的预测能力, 提示冠脉周围脂肪的影像指标与心肌缺血明显相关。

PO-1294

基于心脏磁共振影像组学对肥厚型心肌病的价值研究

吕静¹、刘云²

1. 宁夏医科大学临床医学院

2. 宁夏医科大学总医院

目的 初步探索基于心脏磁共振 (CMR) 影像组学揭示肥厚型心肌病 (HCM) 者心肌与健康人群心肌影像组学特征差异的临床应用价值。**方法** 回顾性收集 2018 年 1 月 1 日至 2022 年 12 月 31 日 122 例确诊 HCM 者及 72 例健康者的 CMR 影像资料。以舒张末期壁厚 (EDWT) 为基础, 将 HCM 者心肌分为肥厚区域 (无 HCM 家族史, $EDWT \geq 15$ mm; 有 HCM 家族史, $EDWT \geq 13$ mm) 与非肥厚区域 (无 HCM 家族史, $EDWT < 15$ mm; 有 HCM 家族史, $EDWT < 13$ mm)。在 CMR 未增强平衡式稳态自由进动序列左心室长轴位两腔心、四腔心二尖瓣口水平切面对 HCM 者左心室壁心肌和健康人群相同解剖部位室壁心肌进行相同大小感兴趣区勾画及影像组学特征提取, 对相同解剖部位的健康人心肌、HCM 者的肥厚区域心肌及非肥厚区域心肌行影像组学特征组间比较。采用 Mann-Whitney U 检验、递归特征消除法及最小绝对收缩与选择算法筛选出最优特征子集并通过 SVM 分类器建立影像组学模型; 计算准确度、敏感度、特异度、阳性预测值 (PPV)、阴性预测值 (NPV) 及受试者操作特征曲线下面积 (AUC) 分别评价各模型效能。结果 HCM 者肥厚区域心肌、非肥厚区域心肌与健康人群左心室相同解剖部位心肌的影像组学特征对比模型鉴别效果良好; 各模型训练集的 AUC 值、准确度、敏感度、特异度、PPV 及 NPV 均不低于 0.90、0.79、0.80、0.76、0.78、0.79; 测试集的 AUC 值、准确度、敏感度、特异度、PPV 及 NPV 均不低于 0.90、0.81、0.73、0.69、0.75、0.67。结论 影像组学模型不仅在 HCM 者肥厚区域心肌、非肥厚区域心肌与健康人群心肌的识别中具有良好效能, 且能很好区分 HCM 者肥厚区域心肌与非肥厚区域心肌。这说明影像组学方法可用于揭示 HCM 者不同病变状态心肌组织的微观差异, 为心肌组织学改变的影像评估提供了潜在且敏感的新技术, 有助于心肌疾病的精准诊断、评估和治疗。

PO-1295

探讨深度学习图像重建算法在肝脏低剂量 CT 扫描中的应用价值

邓莉萍、帅桃、袁元、潘雪琳、李真林

四川大学华西医院

目的 比较基于深度学习图像重建算法 (DLIR)、自适应统计迭代算法 (ASIR-V) 重建的肝脏低剂量 CT 图像质量, 探讨 DLIR 算法在肝脏低剂量 CT 扫描中的应用价值。**方法** 纳入 96 例行上腹部 CT 普通扫描的患者, 随机分配至常规剂量组和低剂量组, 各 48 例。常规剂量组噪声指数为 8, 采用自适应统计迭代算法 (ASIR-V, 30%) 进行图像重建, 记为 ND-ASIR-V; 低剂量组噪声指数为 15, 采用 ASIR-V30%、DLIR-M、DLIR-H 进行图像重建, 分别记为 LD-ASIR-V、LD-DLIR-M、LD-DLIR-H。测量肝脏 CT 值、噪声值 (SD), 计算信噪比 (SNR)、对比噪声比 (CNR)。采用单因素方差分析比较各组图像的客观评价指标, 采用 Bonferroni 法进行两两比较。结果 各组图像肝脏 CT 值差异无统计学意义。SD 值、SNR、CNR 差异有统计学意义。LD-DLIR-M 和 LD-DLIR-H 两组图像噪声均低于 ND-ASIR-V30% 组、LD-ASIR-V30% 组 ($p < 0.05$), LD-DLIR-M 和 LD-DLIR-H 两组图像 SNR、CNR 均高于 ND-ASIR-V30% 组、LD-ASIR-V30% 组 ($p < 0.05$)。DLIR 图像的主观评分高于 ASIR-V30% 图像, 其中 DLIR-H 降噪效果最好, 图像质量最好。相对于 ND 组, LD 组的辐射剂量减少了 33.42%。结论 DLIR 能够在降低辐射剂量的同时保持良好的图像质量, 在肝脏低剂量 CT 检查中具有有良好的临床应用价值。

PO-1296

18F-FDG PET/MRI 多参数预测非小细胞肺癌淋巴结转移

付芳芳、孟楠、陈千骞、黄淮、吴亚平、王梅云
河南省人民医院

目的: 评估多参数 18F-FDG PET/MRI 在预测非小细胞肺癌 (NSCLC) 淋巴结转移中的价值。

方法: 70 名非小细胞肺癌患者被纳入本研究, 其中男 34 例、女 36 例, 以术后病理结果是否有淋巴结转移为标准分为两组: 转移组 30 例, 非转移组 40 例, 其中包括鳞癌 32 例, 腺癌 38 例。所有患者均在治疗前接受一体化 18F-FDG PET/MRI (uPMR 790; UIH, 中国上海) 检查, 采用 12 通道相控阵体线圈。PET 代谢参数包括最大标准摄取值 (SUVmax)、肿瘤代谢体积 (MTV) 和糖酵解总量 (TLG)。通过多 b 值 DWI 单指数、双指数、拉伸指数模型获取表面扩散系数 (ADC), 真实水分子的扩散系数 (Dt), 假性扩散系数 (Dp) 及灌注相关体积分数 (f), 扩散分布系数 (DDC) 和扩散异质性指数 (α)。采用 t 检验或 Mann-Whitney U 检验评价 LNM 组和非 LNM 组之间各参数的差异。Spearman 相关性分析评价各参数之间的相关性。用 ROC 曲线评价各参数的诊断性能, 用 Delong 检验比较各参数的 ROC 曲线下面积(AUC)是否有统计学差异。采用组内相关系数(ICC)评价观察者之间的一致性。

结果 淋巴结转移组的 α 、SUVmax、MTV 和 TLG 高于非淋巴结转移组, ADC、Dt 和 DDC 低于非淋巴结转移组 (P 均 <0.05)。两组之间的 f 和 Dp 差异不显著 (P 均 >0.05)。a 与 TLG、MTV 和 SUVmax 均呈轻度正相关, DDC 与 SUVmax 呈轻度负相关, 余扩散相关参数与代谢相关参数均无明显相关性。在预测非小细胞肺癌淋巴结转移方面, PET 代谢参数和 DWI 扩散参数的联合显示出最高的 AUC (0.838), 其次是 TLG (0.790)、MTV (0.778)、 α (0.775)、Dt (0.723)、DDC (0.715)、SUVmax (0.69) 和 ADC (0.689)。

结论: PET 代谢参数和 DWI 扩散参数可作为术前预测 NSCLC 淋巴结转移的可靠影像学指标。此外, 扩散参数和代谢参数的联合应用可以提高对 NSCLC 淋巴结转移的诊断效能。

PO-1297

肺动脉发育不良患者体一肺侧支分布规律及形态学特征分析

冯吉贞、凌春香
山东第一医科大学附属省立医院

目的 总结肺动脉发育不良患者体一肺侧支 (Aorta-pulmonary collateral arteries, APCAs) 的分布规律及形态学特征。

方法 回顾性分析 2012 年 3 月至 2022 年 12 月 98 例我院手术确诊且合并 APCA 形成患者的计算机断层血管造影图像原始资料并结合重建图像, 记录并总结 APCAs 数量、分布规律及形态学特征。

结果 1. 全组 98 例患者中共发现 APCAs 234 支, 平均 2.39 支/例。本组病例 APCAs 起源以胸主动脉中段为主 (85 支, 36.32%), 其次为胸主动脉上段 (64 支, 27.35%)、下段 (32 支, 13.68%)、主动脉弓上血管 (24 支, 10.26%)、主动脉弓 (20 支, 8.55%)、腹主动脉 (6 支, 2.56%) 及升主动脉 (3 支, 1.28%)。

本组病例中, I 型支气管动脉分支来源的 APCAs 共发现 7 支 (占 2.99%); II 型主动脉直接分支共发现 192 支 (约占 82.05%); III 型主动脉间接分支的 APCAs 共发现 35 支 (占 14.96%)。本组病例共发现开口狭窄的 APCAs 14 支 (占 5.98%), 大部分 APCAs 走行迂曲且具有分支, 发现的支数分别为 220 支 (占 94.02%) 和 183 支 (占 78.21%)。

2. 本组病例发现 APCAs 开口起自近心面 (113 支, 占 48.29%) 和起自侧面 (121 支, 占 51.71%)。
3. APCAs 与肺动脉连接方式分为中心融合为主 (411 分支, 占 61.07%)、远端融合 (196 支, 占 29.12%) 和单独分布 (66 支, 占 9.81%)。

结论 在肺动脉发育不良的患者中, APCAs 起源部位以胸主动脉中段为主, 其次依次为胸上段、下段和主动脉弓上血管和主动脉弓, 腹主动脉、升主动脉最少。体肺侧支类型以直接体肺分支占绝大多数, 间接体肺分支较少, 支气管动脉来源分支最少。体肺侧支大部分起始部开口无明显狭窄, 狭窄者比例较小, 但应引起注意。进入肺组织前大部分 APCAs 走行迂曲, 且具有分支。绝大部分体肺侧支起源于血管近心面, 其次为侧面, 未见起源于背心面侧支。体肺侧支与肺动脉融合方式以中心性融合为主, 其次为周围性, 单独供应者较少, 弥漫融合者罕见。

PO-1298

ST 段抬高型心肌梗死患者 MR 心外膜脂肪体积与微循环障碍的关系

牡丹、赵金璇、余鸿鸣、李辉
南京鼓楼医院

目的: 本研究旨在评估 ST 段抬高型心肌梗死患者心外膜脂肪组织与心脏磁共振检测的微循环障碍体积之间的相关性。

方法: 共有 129 名成功接受经皮冠状动脉介入治疗的 ST 段抬高型心肌梗死患者入选。由一名训练有素的医生记录每位患者的临床特征, 包括基线资料、心血管危险因素、实验室检查数据和血管造影参数。所有患者在介入治疗后 1 周内接受心脏磁共振检查, 以评估梗死面积、微循环障碍体积和心外膜脂肪的分布。所有心脏磁共振数据均传输至 Q-MASS MR 8.1 成像系统, 并由两名影像学专家分别进行分析, 他们并不知晓患者的血管造影和其他临床数据。

结果: 与没有微循环障碍的 ST 段抬高型心肌梗死患者相比, 存在微循环障碍的 ST 段抬高型心肌梗死患者的肌钙蛋白 T 峰值水平更高、中性粒细胞淋巴细胞比率和 C 反应蛋白更高、梗死面积更大, 左室射血分数更低。总心外膜脂肪容积、心外膜脂肪质量指数、左房室心外膜脂肪容积, 左房室心外膜脂肪质量指数和左房室沟心外膜脂肪厚度与微循环障碍的发生显著相关。伴有微循环障碍的 ST 段抬高型心肌梗死患者的左房室心外膜脂肪质量指数显著大于无微循环障碍的心梗患者 ($24.72 \pm 5.049 \text{ g/m}^2$ vs $18.63 \pm 3.670 \text{ g/m}^2$, $P < 0.001$)。多变量 logistic 回归分析表明, 中性粒细胞淋巴细胞比率、肌钙蛋白 T 峰值水平和左房室心外膜脂肪质量指数是微循环障碍形成的独立预测因子。左房室心外膜脂肪质量指数可用于预测微循环障碍的发生 (曲线下面积 0.83 [95% CI: 0.760 to 0.895]; $P < 0.001$)。

结论与讨论: 左房室心外膜脂肪质量指数是微循环障碍的独立预测因子。使用心脏磁共振测量心外膜脂肪的各项参数可用于心梗危险分层, 并可能成为开发新疗法以减少 ST 段抬高型心肌梗死患者心肌再灌注损伤的一个潜在靶点。在心梗患者中快速确定高心外膜脂肪质量指数的人群, 在这些患者中, 可以开展一些针对心外膜脂肪的靶向治疗, 以减轻心肌损伤。

PO-1299

食管平滑肌瘤伴梗死、囊变误诊 1 列报道

梁正荣、罗钦红
曲靖市第二人民医院

患者, 女性, 57 岁, 主咳嗽、咳痰、喘息 1 月余, 伴发热 4 天入院行胸部 CT 检查。

影像表现: 后纵隔食管走行区见梭状囊实性灶, 呈等/稍低密度, CT 值 15~48Hu, 边界清楚, 邻近降主动脉形态未见异常, 未见受压、变窄, 邻近左侧肺叶部分受压、肺不张改变, 病灶大小约为 $67 \times 69 \times 80 \text{ mm}$ (前后 \times 左右 \times 上下), 图 2 及图 3 增强扫描囊性部分未见强化, 实性部分轻度强化; 病灶呈尖角状与右侧食管壁分界不清; 食道吞钡下段见弧形受压, 黏膜完整。

本病例误诊原因, 病灶呈梭状, 大部分囊性变, 密度较低, 未见强化, 而实性成分少, 病灶呈轻度强化, 影像诊断定位及定性有一定难度。

PO-1300

CT 引导下难治性气胸封堵治疗: 一项单中心回顾性研究

宋彪、闵旭红、宋奇隆、王召华、王尚虎、李源
安徽省胸科医院

方法: 2022 年至 2023 年安徽省胸科医院 20 例难治性气胸患者 (男性 14 例, 女性 6 例, 均位年龄 58.15 ± 17.73 岁) 接受了术前胸部 CT 平扫及支气管胸膜瘘三维重建, 后续进行 CT 引导下经皮穿刺封堵治疗。难治性气胸的病因: 10 例肺大泡破裂引起的支气管胸膜瘘, 7 例为肺结核继发空洞、支气管扩张引起的支气管胸膜瘘; 2 例为肺恶性肿瘤累及胸膜引起支气管胸膜瘘, 1 例为肺恶性肿瘤行微波消融后引起。所有患者治疗后均复查胸部 CT 或平片评估治疗效果, 记录相关并发症。

结果: 20 例患者经过治疗后均获得临床治愈, 气胸完全消失, 瘘口封闭, 所有患者均摆脱负压吸引及闭式引流。其中 13 例患者经过 1 次治疗, 5 例患者经过 2 次治疗, 2 例患者经过 3 次治疗。所有患者封堵材料为医用胶 (1 瓶, 0.5ml) 及碘化油 (3-8ml, 均位 3.75 ± 1.33 ml) 混合物, 其中有 3 例患者在使用医用胶及碘化油封堵前, 释放弹簧圈进行了先行填充。术中 5 例患者出现刺激性咳嗽, 手术结束后均消失。术后 1 例患者出现了较为严重的胸膜反应, 表现为治疗侧背部疼痛, NRS 疼痛评分 5 分, 予以止痛等对症治疗后 2 天好转。

结论: CT 引导下经皮穿刺封堵术对于难治性气胸是一项安全有效的治疗方式, 临床治愈率高, 并发症少, 能够反复多次进行, 尤其适用于自发性气胸术后复发, 基础状态差不适合手术的患者。

PO-1301

多层螺旋 CT 或 PET-CT 假阳性致肺结节误切的影像学征象分析及原因分析

刘丹¹、康馨丹²
1. 榆林市中医医院
2. 解放军总医院

目的: 探讨病理结果为炎性肉芽肿, 而多层螺旋 CT 或 PET-CT 误诊为恶性的肺结节, 通过分析其误诊原因及影像学征象对于评价肺结节良性与恶性价值及意义分析

方法: 选取日期 2017 年 1 月份~2023 年 1 月份期间就诊于解放军总医院, 临床诊断为肺结节的患者, 且均行肺部多层螺旋 CT 或 PET-CT 影像学检查, 最终肺结节均行外科手术切除, 最终病理结果均为炎性肉芽肿病变的 400 份病例进行分组, 根据肺部多层螺旋 CT 或 PET-CT 影像学检查结果为良性结节与恶性结节, 将病例分为两组, 诊断为良性结节病理共 109 份, 诊断为肺癌病例共 291 份, 诊断为肺癌的病例定义为误诊病例, 对两组结节的影像学征象进行对照统计学分析, 分析其影像学误诊原因及最终导致误切的原因

结果: 影响多层螺旋 CT 或 PET-CT 假阳性致肺结节误切的原因分析, 其中既有影像科医生对于肺结节征象认识不足的原因, 也有临床医生对于肺结节管理策略和随访策略的认识薄弱的原因, 其二者经过统计学分析, 均具有统计学意义

结论: 肺小结节 PET-CT 无法区分炎性肉芽肿及恶性肿瘤; 毛刺征不能作为良性病变炎症及肿瘤的鉴别诊断; 切勿单纯通过多层螺旋 CT 二维图像粗略判定结节的性质, 三维重建综合分析对肺结节良性判定意义更大; 结节随访时间短, 未能严格遵守肺结节管理策略及随访策略, 是临床误切的重要原因之一

PO-1302

应用病理全切片分析亚实性肺腺癌的放射病理相关性： 一项前瞻性临床研究

王升平、叶挺、沈旭霞、吴浩旋、胡鸿、张扬、黄清源、王泽洲、李媛、顾雅佳、陈海泉
复旦大学附属肿瘤医院

目的：探讨亚实性肺腺癌在薄层 CT 上的放射学和病理学相关性，特别是玻璃样（GGO）区域和实质成分区域的组织学特征。

方法：这是一项前瞻性临床研究（NCT05252676）。亚实性肺腺癌标本切除后制备数字化病理全切片。确定了放射学和病理学相似的切片并进行匹配。对于匹配较好的切片，在病理学切片上绘制放射学上的实质和 GGO 区域。将放射学肿瘤和实质成分的大小与病理学肿瘤和浸润部分的大小进行比较。评估放射学实质和 GGO 区域的肺腺癌的组织学特征。

结果：从 2020 年 10 月至 2022 年 8 月，分析了 102 例非黏液性肺腺癌患者（男性 33 名女性 69 名）。平均年龄为 58 ± 9.6 岁（范围 36-78 岁）。有 20 个纯 GGO 和 82 个部分实性结节。有 1 个原位肺腺癌（AIS），32 个微浸润性肺腺癌（MIA）和 69 个浸润性肺腺癌。放射学肿瘤直径大于病理学肿瘤直径（对于所有患者： $23.43 \pm 8.54\text{mm}$ vs $19.07 \pm 8.12\text{mm}$, $p=0.000$ ；对于匹配的切片： $20.07 \pm 8.35\text{mm}$ vs $17.21 \pm 7.83\text{mm}$, $p=0.000$ ），而放射学实质成分直径小于病理学浸润部分直径（所有患者： $8 \pm 6.80\text{mm}$ vs $10.5 \pm 8.15\text{mm}$, $p=0.000$ ；匹配的切片： $5.1 \pm 6\text{mm}$ vs $8.3 \pm 7.52\text{mm}$, $p=0.000$ ）。对于纯 GGO 肿瘤，贴壁，腺泡和乳头亚型分别为 100%，84.2%和 47.4%，无微乳头或实体亚型存在。对于部分实性肿瘤，在 GGO 区域，贴壁，腺泡，乳头和微乳头亚型分别为 100%，83.3%，57.1%和 11.9%，无实体亚型存在。在实质区域，贴壁，腺泡，乳头，微乳头和实体亚型分别为 19%，95.2%，59.5%，26.2%和 2.3%。部分实性肿瘤中有 7 个 STAS，2 个淋巴侵袭和一个胸膜侵袭。

结论：对于亚实性肺腺癌，放射学肿瘤大小大于病理学肿瘤大小，但实质成分大小小于病理学浸润成分大小。对于纯 GGO 肿瘤，除了贴壁亚型外，还存在浸润成分，主要是腺泡和乳头亚型，无微乳头或实体亚型存在。对于部分实性肿瘤，GGO 区域存在贴壁，腺泡，乳头和微乳头亚型，而实质区域存在腺泡，乳头，微乳头和实体亚型。

PO-1303

基于术前临床影像特征识别 I 期肺腺癌 复发危险因素的多维度分层研究

梁敏¹、吴宁²、唐威²

1. 首都医科大学附属北京朝阳医院

2. 中国医学科学院肿瘤医院

目的：识别 I 期肺腺癌术后复发的独立危险因素，并基于性别和结节类型进行分层分析，探讨男性与女性、部分实性与实性病变预后危险因素的异同。

方法：回顾性分析 2014 年 1 月至 2017 年 6 月于中国医学科学院肿瘤医院接受根治性切除术的 379 例病理 I 期肺腺癌患者的临床、影像及病理资料，复阅术前 CT 图像并进行术后随访。采用 Cox 回归分析识别无复发生存期（Relapse-free survival, RFS）的独立预测因素。分别基于性别、结节类型将纳入对象分层，行 Cox 回归分析以探索不同亚组中复发危险因素的差异。

结果：中位随访时长 70.4 个月，共 60 例患者在随访中复发。年龄（HR: 1.04, $P=0.015$ ）、毛刺征（HR: 4.55, $P=0.002$ ）、临床 T 分期（HR: 2.49, $P<0.001$ ）、肿瘤大小（HR: 2.81,

$P=0.022$) 和实性成分占比 (consolidation tumor ratio, CTR) (HR: 2.49, $P=0.016$) 是 RFS 的独立预测因素。基于性别分层后的结果显示, 在女性亚组中, 肿瘤大小 (HR: 3.97, $P=0.046$)、CTR (HR: 3.38, $P=0.024$) 和毛刺征 (HR: 4.81, $P=0.017$) 是 RFS 的独立术前预测因子; 而在男性亚组中, 临床 T 分期 (HR: 3.80, $P<0.001$) 和毛刺征 (HR: 5.57, $P=0.024$) 是 RFS 的独立术前预测因子。基于结节类型分层的结果显示, 在部分实性结节亚组中, 肿瘤大小 (HR: 1.14, $P<0.001$)、CTR (HR: 2.40, $P=0.004$) 和毛刺征 (HR: 4.95, $P=0.021$) 是 RFS 的独立术前预测因子; 而在实性结节亚组中, 临床 T 分期 (HR: 3.27, $P<0.001$) 和年龄 (HR: 1.09, $P<0.001$) 是 RFS 的独立术前预测因子。

结论: RFS 的独立预测因素在不同性别的患者、不同类型的病变间存在差异。在部分实性结节亚组和女性亚组中, 全肿瘤大小和 CTR 是 RFS 的独立术前预测因子。在实性结节亚组中, 临床 T 分期和年龄是 RFS 的独立术前预测因子。

PO-1304

联合 CCTA 影像参数及临床构建缺血性心脏病患者冠状动脉侧支循环形成的预测模型

毛婷、周晖、廖伟华
中南大学湘雅医院

目的: 本研究目的是建立一个结合临床和 CCTA 参数来预测缺血性心脏病 (IHD) 患者良好的冠状动脉侧支循环 (CCC) 的预测模型。

材料与方法: 本研究回顾性分析了 634 例经冠状动脉造影 (CAG) 诊断为严重狭窄或闭塞, 并在 CAG 术前 2 个月内接受 CCTA 治疗的 IHD 患者。根据 CAG 的结果, Rentrop 分级为 2-3 的患者为 CCC 形成良好, 而 Rentrop 分级为 0-1 的患者为 CCC 形成不良。最后, 纳入 80 例 CCC 形成良好的患者, 随机选择 80 例年龄和性别匹配的 CCC 形成不良的患者作为对照组。收集完整的临床资料, 并测量冠状动脉周脂肪衰减指数 (FAI) 和 CT-分数血流储备 (CT-FFR)。CT-FFR 测量包括病变特异性 CT-FFR (测量位置在狭窄远端 2 厘米)、血管特异性 CT-FFR (测量位置在最远端血管直径 2 mm) 和 Δ CT-FFR (病变近端和远端 CT-FFR 的差异)。分析这些临床和影像学参数与良好 CCC 的相关性和预测价值。

结果: CCC 形成良好患者的 RCA 近段 FAI、 Δ CT-FFR 和病变特异性 CT-FFR 与对照组相比存在统计学差异 [-78.49 ± 10.92 HU vs -73.54 ± 8.92 HU、0.09 (0.060, 15)、0.13 (0.10, 0.16)、0.67 (0.62, 0.73) 和 0.66 (0.59, 0.70), $P=0.002$ 、0.001、0.027]。Spearman 相关分析显示 Beta 受体阻滞剂使用和病变特异性 CT-FFR 与 CCC 形成良好呈正相关 ($r=0.282$ 、0.176, $P=0.001$ 、0.026), RCA-FAI、 Δ CT-FFR 与 CCC 形成良好呈负相关 ($r=-0.233$ 、-0.25, $P=0.003$ 、0.001)。多因素逻辑回归分析显示, Beta 受体阻滞剂的使用、RCA-FAI 和 Δ CT-FFR 构建的联合模型预测 IHD 患者 CCC 形成良好的 AUC 值为 0.747, 敏感度为 65.00%, 特异度为 80.00%。

结论: 通过 CCTA 检测的 FAI 和 CT-FFR 与 CCC 相关, 联合使用 Beta 受体阻滞剂、RCA-FAI 和 Δ CT-FFR 有助于无创评估 IHD 患者中 CCC 的程度。

PO-1305

血尿酸水平对左心功能的影响： 一项心脏磁共振组织追踪技术研究

吕建波、曲晓峰
大连医科大学附属第二医院

目的：已有研究证实血清尿酸（SUA）的增加会影响心肌功能。本研究旨在探讨 SUA 对左心功能的影响。

方法：纳入 2019 年 9 月至 2022 年 5 月就诊于我院心内科左心室射血分数正常，且接受过心脏磁共振（CMR）检查的 307 例患者。按照 SUA 四分位数将患者分为四个独立的亚组。获取患者 CMR 检查图像，使用 cvi42 图像后处理软件评估左心房（LA）和左心室（LV）的结构、功能及心肌应变参数。统计方法采用独立样本 t 检验、非参数秩和检验、 χ^2 检验、单因素方差分析、单变量和多变量线性回归， $P < 0.05$ 为差异有统计学意义。

结果：患者平均年龄为 54.05 ± 10.10 岁，56.7% 为男性。年轻男性更容易患高尿酸血症。此外，随着 SUA 四分位数升高患者的身体质量指数（BMI）、舒张压、血清甘油三酯（TG）升高，高密度脂蛋白（HDL-C）降低（ $P < 0.05$ ）。随着 SUA 四分位数的升高，患者左室收缩末期容积（LV-ESV）及舒张末期容积（LV-EDV）逐渐增大，左心室质量（LVM）、左室质量指数（LVMI）及左室重构指数逐渐升高（ $P < 0.05$ ），而 LV 整体纵向应变（GLS）、心尖部纵向应变、整体径向应变（GRS）（心尖部、中间部、基底部）、整体周向应变（GCS）（心尖部、中间部、基底部）、周向舒张期峰值应变率降低（ $P < 0.05$ ）。然而，不同尿酸分级亚组的 LA 应变参数没有明显差异（ $P > 0.05$ ）。单变量线性回归证明高尿酸血症与 LV 心肌应变参数（GLS、GRS、GCS、收缩期峰值应变率、舒张期峰值应变率等）受损相关（ $P < 0.05$ ）。对单变量分析中具有统计学差异的因素（包括血压、心率、年龄、BMI、HbA1C、HDL-C、TG 等）进行校正的多变量线性回归分析结果表明，高尿酸血症是 LV 心肌应变（GRS、GCS、心尖部及中间部 GRS、心尖部及中间部 GCS）受损的独立影响因素（ $P < 0.05$ ）。

结论：高尿酸血症是左心室心肌应变的独立影响因素，其中 GRS、GCS 受累最严重，尤其是中间部和心尖部。

PO-1306

基于冠脉衰减指数评估降糖治疗对二型糖尿病冠脉炎症的影响

刘远康、董悦、徐向阳
华中科技大学梨园医院

背景：二型糖尿病患者具有高心血管风险，炎症是糖尿病和心血管疾病发病机制中的重要共同通路。我们旨在基于冠脉衰减指数（Fat Attenuation Index）评估二型糖尿病患者和非糖尿病患者的冠状动脉炎症，以及降糖治疗对糖尿病患者冠脉炎症的影响。

方法：回顾性的纳入了来自武汉两家三级医院的 1908 名患者，（武汉中心医院的 548 名二型糖尿病患者和 795 名非糖尿病患者以及梨园医院的 174 名二型糖尿病患者和 391 名非糖尿病患者）收集了患者的临床资料和 CCTA 图像，并测量冠脉三支近端周围的冠脉衰减指数，以评估冠状动脉炎症。使用 1:1 倾向性匹配，比较了糖尿病患者和非糖尿病患者的 PCAT 衰减值，以及降糖治疗和未降糖治疗的糖尿病患者的 PCAT 衰减值，并进行多元线性回归进一步分析了多种降糖治疗对糖尿病患者冠脉炎症的影响

结果：未接受降糖治疗的二型糖尿病患者基于冠脉衰减指数评估的右冠脉炎症显著高于非糖尿病患者（ $p = 0.001$ ），接受降糖治疗的糖尿病患者冠脉衰减指数与非糖尿病患者无显著差异。在多元线性回归模型中，降糖治疗与二型糖尿病患者基于冠脉衰减指数评估的右冠脉炎症减少有关；在多种

降糖药物中,二甲双胍与左前降支低衰减值显著相关($\beta=-2.988, p=0.013$),而糖尿病患病年限与左前降支高衰减值显著相关($\beta=0.202, p=0.023$)。

结论:二型糖尿病患者右冠状动脉衰减指数显著高于非糖尿病患者。降糖治疗可能对减轻二型糖尿病患者基于冠脉衰减指数评估的右冠脉炎症产生积极影响,在多种降糖药物中,二甲双胍对改善糖尿病患者的左前降支炎症可能有帮助。

PO-1307

基于胸部 CT 探究新型冠状病毒肺炎病灶体积与多系统的关系

魏璇、王振常

首都医科大学附属北京友谊医院

目的:基于胸部 CT 图像,探讨新型冠状病毒患者肺部病灶体积与内分泌系统、淋巴系统、循环系统、骨肌系统及人体脂肪等多系统的相关性。

方法:回顾性分析北京 COVID-19 数据库 230 例患者入院时的胸部 CT 图像,经人工智能肺炎辅助诊断软件定量测算全肺病灶体积。分别选取甲状腺、脾脏作为内分泌系统及淋巴系统的代表器官,应用软件测定甲状腺左、右叶与脾脏的最大横截面积、甲状腺与脾脏的平均密度和体积、脾厚径及脾最长径;测算心胸比、肺动脉主干及下腔静脉最大径、主肺动脉比;测算冠状动脉、主动脉、颈动脉钙化积分;测算胸椎平均骨质密度、腹部及腹腔内脂肪面积。采用 Spearman 秩相关对上述指标与肺部病灶体积之间的相关性行统计学分析。

结果:冠状动脉、主动脉钙及颈动脉的钙化积分均与肺部病灶体积间存在相关性($r=0.22, P<0.00$; $r=0.4, P<0.001$; $r=0.31, P=0.018$),心胸比、肺动脉主干直径、升主动脉直径与肺部病灶体积间有相关性($r=0.41, P<0.001$; $r=0.23, P<0.001$; $r=0.28, P<0.001$);腹主动脉短径、下腔静脉短径、下腔静脉/腹主动脉直径比与肺部病灶体积间有相关性($r=0.40, P<0.001$; $r=0.14, P=0.035$; $r=-0.19, P=0.003$);甲状腺密度、脾脏厚径、脾脏平均密度与肺部病灶体积间有相关性;胸椎平均骨密度、皮下脂肪面积、腹腔内脂肪面积、肝脏平均脂肪分数与肺部病灶体积间有相关性。

结论:肺部病灶体积与多系统存在相关性,进一步表明 COVID-19 是累及多系统的全身性疾病;病灶与多系统具有相关性,这在疫情防控常态化背景下对快速量化、评估疾病的全身严重程度具有重要意义。

PO-1308

北京大学医学部

许文清¹、刘安琪²、黄强³、刘敏³

1. 北京大学医学部

2. 中国医学科学院北京协和医学院

3. 中日友好医院

目的:本研究旨在根据 2022 年 ESC/ERS 肺动脉高压指南评估 CTPA 心血管参数对慢性血栓栓塞性肺动脉高压(CTEPH)的预测价值。

方法:回顾性纳入中日友好医院 2018 年 1 月至 2023 年 3 月内疑似 CTEPH 患者 201 例,以国内现行肺动脉高压指南及新指南将其分为 3 组:mPAP \leq 20mmHg 对照组(63 例)、mPAP $>$ 20mmHg CTEPH 组(138 例)和 mPAP \geq 25mmHg CTEPH 组(123 例),对 CTPA 心血管参数进行组间比较,运用二元 logistic 回归分析评估 CTEPH 的心血管参数的独立预测因素,并对各参数进行受试者操作特征曲线分析。并探究与现有国内肺动脉高压诊断标准之间的异同。

结果:主肺动脉干直径、右心房横径及面积、双心室横径及面积、右心室游离壁厚度和室间隔偏转角在 CTEPH 及对照组中均具有显著统计学差异($P<0.05$)。其中主肺动脉干直径的诊断效能最

强 ($AUC=0.934$)，室间隔角与平均肺动脉压 ($r=0.745$, $P<0.01$)、肺血管阻力 ($r=0.700$, $P<0.05$) 和 NT-pro BNP ($r=0.633$, $P<0.05$) 呈正性较强相关。在新指南中，二元 logistic 回归分析显示主肺动脉干直径、右心室游离壁厚度和室间隔偏转角 (脊柱室间隔角、室间隔角、左室游离壁角) 是 CTEPH 诊断的独立危险因素 ($P<0.05$)。

结论：CTPA 测量的主动脉直径和室间隔偏转角可作为 2022 年 ESC/ERS 指南中 CTEPH 的独立危险因素，能够有效地判断病人的右心功能状况和预后。此外，在重建四腔心层面上，右心房结构也具有不亚于右心室的评估价值。本研究为新指南下 CTEPH 的早期诊断和制定合理的治疗方案奠定基础。

PO-1309

基于影像及临床资料的列线图对肺腺癌病理亚型的预测价值

叶媛鑫¹、邵国良²

1. 浙江省肿瘤医院放射科

2. 浙江省肿瘤医院介入治疗科

目的 探讨 CT 影像学资料联合临床资料对鉴别肺浸润性非黏液腺癌不同病理亚型的价值。**方法** 纳入浙江省肿瘤医院肺浸润性非黏液腺癌的患者 313 例，依据预后将其分为中低风险组和高风险组，收集其临床资料及 CT 影像学资料并进行统计学分析，分别建立影像学模型和联合模型，绘制列线图，使用 ROC 曲线、校准曲线、DCA 曲线以及 10 折交叉验证对模型进行评价，使用 Delong 检验对 AUC 进行比较。**结果** 两组间临床资料 (性别、吸烟、NSE、CA125、CEA)、CT 影像学资料 (密度、长径、短径、实性成分长径、实性比例、钙化、毛刺、分布、空泡征、月牙铲征及空气支气管征) 差异有统计学意义 (P 值 <0.1)。对 CT 影像学资料进行多因素分析后，长径、实性成分长径、实性比例、空气支气管征差异有统计学意义 (P 值 <0.05)，建立影像学模型，AUC 为 0.879 (95%CI: 0.840, 0.918)；对临床资料及 CT 影像学资料进行多因素分析，吸烟、NSE、长径、实性成分长径、实性比例、空气支气管征差异有统计学意义 (P 值 <0.05)，建立联合模型，AUC 为 0.899 (95%CI: 0.863, 0.934)。**结论** CT 征象及血清肿瘤学指标对鉴别肺浸润性非黏液腺癌的中低风险和高风险具有显著的预测价值，结合本实验所建立模型可以更好地了解患者病情。

PO-1310

基于冠脉 mDIXON 序列对疑似冠状动脉疾病患者的分节段冠状动脉周围脂肪组织评估的初步研究

彭鹏飞、孙家瑜、岳汛

四川大学华西医院

目的: 冠状动脉周围脂肪组织 (PCAT) 被认为与冠状动脉疾病 (CAD) 的发展有关。功能紊乱的 PCAT 可分泌促炎脂肪因子和炎性细胞因子，与冠状动脉内膜炎症的发生和斑块的形成密切相关。同时，斑块组成和狭窄程度对冠心病的危险分层和预后有价值。PCAT 的评估应转化为冠心病的新型临床诊断工具。

目前定量评估 PCAT 的首选方法是计算机断层扫描 (CT)，但由于其辐射，不适合随访检查。最近，一种冠状动脉磁共振血管造影 (MRA) 方法被引入并验证，该方法使用三维改良的 Dixon 序列 (3D-mDixon)，通过质子的化学位移将水和脂肪信号分离，从而可以更准确地定量 PCAT 体积。同时，为了在不影响图像质量的情况下加快扫描速度，我们使用了压缩感知人工智能 (CSAI) 框架，该框架结合了深度学习 (DL) 和 CS 技术，优化了 CS 重建算法，同时进行了去噪并缩短了扫描时间。

我们试图使用 CSAI 加速改良的 mDixon 序列, 定量分析已知或疑似 CAD 患者的节段 PCAT, 包括 PCAT 体积和脂肪分数, 并确定它们与冠状动脉计算机断层血管造影(CCTA)评估的冠状动脉斑块特征的关系。

方法和材料:我们纳入 35 例有症状的 CAD 患者(111 例有斑块, 169 例无斑块)。他们接受心脏磁共振(CMR)评估 8 个冠状动脉节段的 PCAT 体积和脂肪分数。我们手工跟踪分割后的 PCAT 体积。我们比较了由 CCTA 定义的不同斑块类型和狭窄程度的 8 个冠状动脉节段的 PCAT 体积和脂肪分数, 并使用 Kruskal - Wallis H 检验和单因素方差分析(ANOVA)检验探讨了它们之间的关系。

结果:有斑块的冠状动脉节段 PCAT 体积和脂肪分数高于无斑块的冠状动脉节段。同时, 混合斑块周围的分节段 PCAT 体积大于非钙化斑块和钙化斑块($p = 0.014$ 和 $p < 0.001$)。分节段 PCAT 体积与斑块类型有中度相关($r = 0.493$, $p < 0.001$)。脂肪分数也有类似的结果($r = 0.480$, $p < 0.001$)。

结论:全心冠状动脉 MRA 框架与 CSAI 能够定量分析分段 PCAT 体积和脂肪分数。与脂肪分数相比, 分节段的 PCAT 体积与冠状动脉斑块特征的相关性更显著。

PO-1311

绝经后射血分数保留型心衰患者心外膜脂肪特征及其与心肌纤维化之间的关系

蒋佳琤、祁荣兴
南通市第一人民医院

目的: 研究绝经后射血分数保留型心衰 (heart failure with preserved ejection fraction, HFpEF) 患者心外膜脂肪 (epicardial adipose tissue, EAT) 的特征及其与心肌纤维化之间的关系。

材料与方法: 研究共纳入 72 例绝经后 HFpEF 患者和 70 例绝经后非心衰患者, 通过钙化积分图像测量 EAT 体积和密度, 通过双能 CT 延迟强化得到的碘图测量计算得出心肌细胞外容积分数 (myocardial extracellular volume, ECV), 该参数可定量评估心肌间质性纤维化。利用超声心动图得到心脏结构和功能参数。

结果: 绝经后 HFpEF 患者的 EAT 体积、体积指数、密度和 ECV 均显著高于对照组($p < 0.05$)。多因素 logistic 回归分析显示, 在校正年龄、体重指数、高血压、糖尿病、房颤、血脂异常等因素后, 绝经后女性的 EAT 密度及 ECV 增加仍与 HFpEF 发生相关($p = 0.002$, $p = 0.002$)。在所有入组对象中, EAT 密度与 EAT 体积指数呈负相关 ($r = -0.321$, $p < 0.001$), 在校正年龄、体重指数、高血压、糖尿病、房颤、血脂异常等因素后, HFpEF 组中 EAT 的密度与 EAT 体积指数的相关性弱于非心衰组(standardized coefficient, HFpEF: $\beta = -0.26$, $p = 0.037$ vs. Non-HF: $\beta = -0.66$, $p < 0.001$, pinteraction = 0.035)。ECV 部分介导了 EAT 密度与 HFpEF 发生间的关系[effect = 0.188, 95% confidence interval (CI) (0.094, 0.296)], 中介效应占总效应的比例为 47.7%。

结论: 绝经后 HFpEF 患者的 EAT 体积、体积指数、密度和 ECV 值均明显高于非心衰对照组。HFpEF 患者与非心衰患者的 EAT 体积指数与密度之间的关系密切程度存在差异。ECV 在绝经后患者 EAT 密度和 HFpEF 之间的关系中起到部分中介作用。

PO-1312

CT 大重建矩阵联合重建算法对肺结节诊断的应用价值

王旭^{1,2}、刘义军²

1. 浙江医院

2. 大连医科大学附属第一医院

目的：探讨 CT 大重建矩阵 1024×1024 联合 Karl 迭代重建算法对肺结节诊断的应用价值。资料与方法：前瞻性收集 2021 年 10 月-2022 年 5 月于大连医科大学附属第一医院行胸部 CT 检查患者 500 例，对 CT 扫描图像原始数据进行分组重建。A 组采用常规 512×512 矩阵结合 Karl5 级重建；B 组采用 1024×1024 大重建矩阵结合不同等级 Karl 算法重建，获得 4 个亚组。测量主动脉弓上方的气管腔内（气管区）及左肺上叶无血管区（肺实质）的 CT 值和 SD 值，计算 SNR。两位医师采用独立双盲法对 A、B 两组肺部总体图像质量进行 5 分制评价。对 B 组中图像质量最佳的亚组与 A 组进行病灶显示情况比较，并对病例进行追踪，依据手术病理结果，比较诊断效能。结果：A、B 组的肺实质 CT 值差异无统计学意义 ($t=-0.456\sim1.056$, $P>0.05$)，B 组组内随 Karl 等级升高，气管和肺实质 SD 值逐渐下降，SNR 值逐渐升高 ($F=675.002\sim2020.903$, $P<0.05$)。两名放射科医师对各组图像质量的主观一致性较好 ($Kappa=0.796\sim0.987$, $P<0.05$)，B 组各项主观评分均高于 A 组 ($Z=-15.361\sim-6.465$, $P<0.05$)，B4 组主观评分最高。A 组和 B4 组在部分实性结节 ($\leq 3mm$) 和实性结节 ($6.1mm\sim\leq 3cm$) 的显示清晰度差异无统计学意义 ($Z=-2.000$ 、 -0.378 , $P>0.05$)；相较于 A 组，B4 组结节显示清晰率提升了 12%~100%。结节征象上仅胸膜凹陷征显示差异无统计学意义 ($\chi^2=2.143$, $P>0.05$)。以 47 例患者手术病理结果为金标准，B4 组诊断准确率为 65.11%，优于 A 组 38.88% ($\chi^2=4.674$, $P<0.05$)。结论：大重建矩阵和 Karl 算法的联合应用可获得较优的图像质量，有利于肺结节诊断。

PO-1313

双能量 CT 定量心肌细胞外容积预测射血分数保留心衰患者再住院风险

蒋佳坤、祁荣兴

南通市第一人民医院

目的：利用双能量 CT 延迟强化扫描 (LIE-DECT) 测量的心肌细胞外容积 (ECV)，作为心肌间质纤维化 (MIF) 的指标，评估其对射血分数保留心衰 (HFpEF) 患者的再住院风险预测价值。

材料与方法：收集 2019 年 11 月至 2021 年 10 月诊断为 HFpEF 患者 202 例 (平均年龄 69.5 ± 9.2 岁)，所有患者均接受了冠状动脉 CTA (CCTA) 和 LIE-DECT 扫描。将碘图和红细胞压积值输入后处理软件，自动计算出 ECV；利用碘图判断心肌内有无缺血型 LIE 存在。临床终点事件定义为患者入院行 CCT 后因心血管病变再入院。Kaplan-Meier 分析和 Cox 比例风险回归模型评估 ECV 和 HFpEF 患者再住院的相关性。

结果：在中位随访 8.2 (4.4, 14.4) 个月期间，55 例患者在住院行 CCT 检查后再次住院。Kaplan-Meier 分析显示，HFpEF 患者出院后再住院风险随着 ECV 升高而显著增加 ($\log\text{-rank } P=0.038$)。ECV 值 $\leq 30\%$ 的 HFpEF 患者再住院风险低，独立于缺血型 LIE 存在。调整临床危险因素和心脏超声测量结果，包括年龄、体重指数 (BMI)、吸烟史、高血压、糖尿病、血脂异常、左室射血分数 (LVEF)，左室质量指数 (LVMMI)、左室舒张末期容积指数 (LVEDVI)、左室收缩末期容积指数 (LVESVI) 和左房容积指数 (LVAI)，ECV 仍然是 HFpEF 患者再住院事件发生的重要独立预测因子 [风险比 (HR) = 1.139; 95%CI: 1.058~1.226], $P=0.001$ 。

结论：LIE-DECT 碘图测量的 ECV 作为 MIF 的替代指标，是 HFpEF 患者再住院风险发生的重要的独立预测因子，可作为临床 HFpEF 预后评估的重要指标

PO-1314

基于心脏磁共振 cine 图像和 T1 map 的放射组学特征的可重复性研究

蒲彩玲^{1,2}、胡溪²、吴燕^{2,3}、胡红杰²

1. 四川省人民医院

2. 浙江大学医学院附属邵逸夫医院

3. 复旦大学

目的：探究非增强的 CMR-cine 图像和 T1 map 中心肌放射组学特征的可重复性。

方法：回顾性纳入 50 例 HCM 患者，由两名观察者手动勾画整个 cine 舒张末期图像的左室心肌和平扫 T1 map 左室心肌作为感兴趣区域，利用 Pyradiomics 包进行特征提取。观察者内以及观察者间的差异使用组内相关系数 (intra correlation coefficient, ICC) 进行评价，当 ICC > 0.75 时，认为具有较好的一致性。在心肌厚度影响因素方面，以最大室壁厚度 (maximum wall thickness, MWT) 的中位数值 20 mm 为界将患者划分为两组 (MWT ≤ 20 mm 和 MWT > 20 mm)，并采用卡方检验进行两组间的差异性比较。

结果：在 cine 图像中，组内、组间、组内+组间 ICC > 0.75 的放射组学特征数量分别是 1450/1688 (85.9%)、1405/1688 (83.2%)、1366/1688 (80.9%)。在 T1 map 中，组内、组间、组内+组间 ICC > 0.75 的放射组学特征数量分别是 1035/1688 (61.3%)、959/1688 (56.8%)、907/1688 (53.7%) (表 1)。两种图像中 ICC > 0.95 的特征数目最多，其次是 ICC 在 0.90~0.95 范围的特征 (图 1)。考虑心肌厚度时，在 cine 图像中，组内 ICC 提示 MWT > 20 mm 组心肌放射组学特征的可重复性高于 MWT ≤ 20 mm 组 (P = 0.001)，而组间和组内+组间 ICC 统计结果显示 MWT ≤ 20 mm 和 MWT > 20 mm 两组的可重复性特征数量无明显统计学差异 (P > 0.05)。但在 T1 map 中，MWT > 20 mm 组心肌放射组学特征的可重复性明显高于 MWT ≤ 20 mm 组 (P < 0.001) (表 2，图 2)。

结论：大部分基于 cine 图像的放射组学特征 (> 80%) 在 HCM 患者中具有很好的可重复性，且明显高于平扫 T1 map。心肌厚度对 T1 map 的影响更大，心肌越厚的组别，其放射组学特征的可重复性越好。

PO-1315

基于配对肺部影像数据集的跨模态图像合成：MRI-to-CT

王天明、张娟

中南大学湘雅医院

目的：本研究旨在开发一种基于 ZTE 的多参数 MRI 影像的跨模态 (ZTE MRI-to-CT) 图像合成深度学习网络，能够从肺部 MRI 生成临床诊断及肿瘤分割所需的高分辨率合成 CT。

方法：在 42 名非小细胞肺癌患者的 126 幅 ZTE MRI 及其配对真实 CT 影像数据集上进行实验。在图像预处理、标准数据增强后利用预训练的处理管道构建跨模态循环生成对抗网络 (Cycle GAN) 的深度学习模型，在合成过程中输入相邻影像图片，并确保 MRI 和 CT 合成之间一致性的循环损失函数利用，将 ZTE 多参数 MRI 图像转换为高分辨率 CT 合成图像，并与 U-Net 级联以分割肺实质和肺部肿瘤。两名高年资的影像专家作为观察者手动分割肺部真实 CT 图像作为合金标准，分别阅读肺部 MRI 和合成 CT 图像后以结构化报告形式对图像质量、影像特征进行评估并以四分法评估诊断信心，采用组内相关系数 (ICC) 统计图像质量、诊断内容及诊断信心评分的一致性。使用 Dice 相似系数 (DSC)、Hausdorff 距离度量计算分割精度。所有合成 CT 通过量化图像相似度公式计算 (均方误差 MSE、峰值信噪比 PSNR 和平均结构相似度 MSSIM) 验证模型合成 CT 的准确性。

结果：两位观察者对合成 CT 的空间几何和噪声水平方面表现出极佳的满意度。相较于 MRI，合成 CT 提高了两位观察者在影像特征评估及诊断信心方面的一致性。与观察者 CT 分割进行定量比较，合成 CT 的平均 Dice 得分为 92 ± 1.5 ，与 CT 注释的比较得出了 1.8 ± 1.2 毫米的标志定位误差。真实 CT 与合成 CT 的结构相似指数(MSE、PSNR、MSSIM)均值(\pm 标准差)分别为 0.95 ± 0.011 、 78.36 ± 10.12 、 0.00121 ± 0.00029 、 30.12 ± 1.43 、 0.86 ± 0.041 。

结论：我们开发了一种基于深度学习的跨模态 (ZTE MRI-to-CT) 图像合成方法来提高肺部肿瘤诊断能力和诊断信心，并促进图像精准分割。合成 CT 与原始 CT 的相似度指标和临床评价结果保证了所提方法的可用性。

PO-1316

人工智能无创血流储备分数(FFRCT)联合 CCTA 斑块特征对 冠心病研究价值

朱占英、刘淼、徐佳妮、龚文涛
中国人民解放军联勤保障部队第九〇三医院

目的：基于机器深度学习无创血流储备分数(FFRCT)，结合 CCTA 斑块成分定量分析，比较急性冠脉综合征(ACS)与慢性冠脉综合征(CCS)两组参数的差异，评估对冠心病诊断价值。方法：回顾性收集两组各 22 例行 CCTA 检查，分析冠脉斑块成分特征和 FFRCT 血流动力学特征。结果：ACS 组纤维斑块体积和百分比(FPV、FPV%)、脂样斑块体积和百分比(LPV、LPV%)、非钙化斑块体积和百分比(NCPV、NCPV%)、总斑块体积和百分比(TPV、TPV%)以及血流储备分数差值(Δ FFRCT)显著高于 CCS 组，血管/斑块体积比值(L/P)和 FFRCT 低于 CCS 组，差异具有统计学意义(P 均 < 0.01)；ACS 组的 FFRCT、 Δ FFRCT 的 AUC(0.96 和 0.93，95%CI 0.92~0.99 和 0.88~0.97，P<0.001) 大于斑块体积百分比(0.79，95%CI 0.68~0.91，P<0.001)和斑块体积(0.78，95%CI 0.56~0.81，P<0.05)，上述参数联合 AUC 升高(0.97)，有统计学意义(P<0.001)。结论：FFRCT 联合 CCTA 的斑块成分特征对 ACS 与 CCS 有一定的鉴别，为临床提供更好的冠心病危险分层和治疗

PO-1317

基于双能低剂量 CT 的影像组学对肺磨玻璃结节良恶性的预测价值

朱永月、王道清
河南中医药大学第一附属医院

目的：探讨基于双源低剂量 CT 的影像组学对肺部磨玻璃结节良恶性的预测价值。方法：回顾性纳入 160 例磨玻璃结节患者的临床及影像学资料。根据穿刺或病理结果将其分为良性组(40 例)、AIS 组(40 例)、MIA 组(40 例)、IAC 组(40 例)，记录动、静脉期相同管电压(80、100、140KeV)下病灶的 CT 值，基于双源 CT 碘图测量病灶的碘浓度，并计算相应的标准化碘浓度(NIC)。采用单因素方差分析其临床资料；采用多因素逻辑回归分析各组的影像学资料。使用 3D-slicer 软件勾画病灶 ROI，采用组内相关系数 ICCs 对特征进行降维、筛选，分类器选择 RF、SVM 及 KNN，绘制 ROC 曲线，采用 DeLong 检验比较各参数的 AUC，筛选出效能最优的分类器，初步建立磨玻璃结节良恶性诊断的预测模型。最后，联合差异有统计学意义的管电压所对应的 CT 值、NIC、独立危险因素及筛选出的最优分类器建立 3 种组合模型，分析各组合模型评估磨玻璃结节良恶性的敏感性、特异性及准确率。结果：4 组间临床资料的差异无统计学意义(P>0.05)。各组间静脉期 80KeV 下的 CT 值、NIC 比较，CTAIS<CTMIA<CTIAC，NIC AIS<NIC MIA<NIC IAC，

差异均有统计学意义 ($P<0.05$)；组间其余静脉期各管电压下的 CT 值比较，差异均无统计学意义 ($P>0.05$)。多因素回归结果显示毛刺征象、供血血管类型是预测磨玻璃结节良恶性的独立危险因素；ROC 曲线结果显示当分类器选择 SVM 时预测效能最优，组合模型 A、B、C 的敏感度分别为 0.761、0.683、0.788，特异度分别为 0.722、0.668、0.741，准确率分别为 0.772、0.731、0.795。结论：基于双源低剂量 CT 影像组学特征可以预测磨玻璃结节的良恶性，当将静脉期 80KeV 下的 CT 值、NIC 与影像学特征联合建立综合模型时，预测效能较高。

PO-1318

急性肺动脉栓塞预测模型的建立与验证

李曼、张晗宇、黄婷婷
河南中医药大学第一附属医院

目的：建立并验证急性肺动脉栓塞 (acute pulmonary embolism, APE) 的预测模型。

方法：回顾性纳入 2015 年 2 月-2020 年 8 月河南中医药大学第一附属医院怀疑 APE 行 CT 肺动脉成像 (CT pulmonary artery imaging, CTPA) 的患者作为训练集，按照训练集：验证集 7:3 的比例前瞻性收集 2020 年 9 月-2023 年 8 月的本院患者作为验证集，根据 CTPA 及临床诊断将其分为肺栓塞组及非肺栓塞组。收集病人的临床资料，包括基线、临床症状和体征、病史、血常规、动脉血气、凝血功能、下肢超声等 75 项指标，采用单因素 Logistic 回归、LASSO 及多因素 Logistic 回归分析筛选 APE 的危险因素并构建预测模型，以列线图的形式展示。在训练和验证集中，模型的校准度采用受试者工作特征 (ROC) 曲线、校准曲线及 Hosmer-Lemeshow (H-L) 拟合优度检验评估；并绘制决策曲线评估模型的临床应用性。

结果：本研究最终纳入 752 例患者，训练集 526 例 (男 288 例，年龄 68 ± 20 岁)，验证集 226 例 (男 129 例，年龄 66 ± 22 岁)。多因素 Logistic 回归分析显示紫绀、C 反应蛋白升高、中性粒细胞升高、肌酸激酶同工酶 (CK-MB) 升高、谷氨酰转移酶升高、PCO₂ 下降、D-二聚体升高、凝血酶时间延长、下肢静脉超声阳性为 APE 的独立危险因素。该模型在训练集的 AUC 为 0.925 (95% CI: 0.835-0.850)，验证集 AUC 为 0.918 (95% CI: 0.788-0.885)。训练集 H-L 拟合优度检验 ($\chi^2 = 29.148$, $P = 0.001$)，验证集 H-L 拟合优度检验 ($\chi^2 = 8.038$, $P = 0.530$)，证明模型校准度良好；决策曲线分析证明模型在训练及验证集中具有很好的临床应用性。该模型的准确度 0.92，敏感度 0.84，特异度 0.85，诊断效能均高于各个独立危险因素。

结论：紫绀、C 反应蛋白、中性粒细胞、CK-MB、谷氨酰转移酶、PCO₂、D-二聚体、凝血酶时间、下肢静脉超声阳性是 APE 的独立危险因素。该模型具有良好的效能，有助于早期精准诊断 APE。

PO-1319

Radiogenomic-based multi-omic analysis reveals imaging intratumor heterogeneity phenotypes and therapeutic targets

Chao You, Shiyun Sun, Luyi Lin, Jiayin Zhou, Yajia Gu
Department of Radiology, Fudan University Cancer Center, Department of Oncology, Shanghai

Purpose:

To investigate whether the intratumor heterogeneity (ITH) could be assessed by heterogeneity-related MRI radiomics features and whether the patient subpopulations with distinct imaging heterogeneity harbor particular biological characteristics.

Material and Method:

A total of 1991 patients from three independent datasets were incorporated in this study. Cohort 1 (Fudan University Shanghai Cancer Center [FUSCC] dataset) comprised 929 primary breast cancer patients treated at FUSCC between August 2009 and May 2015. Cohort 2 (DUKE dataset) contained 922 breast cancer patients with matched radiomics and follow-up data from the TCIA-DUKE dataset. Cohort 3 (TCGA dataset) consisted of 140 breast cancer patients with matched radiomics and transcriptomic sequencing data ($n=121$) from the TCIA-TCGA dataset. Cohort 1 was collected to identify imaging heterogeneity and prognostic significance; validate the correlation among IITH, genomic heterogeneity and cellular heterogeneity; and determine the biological hallmarks of imaging heterogeneity. Cohorts 2 and 3 were curated to validate the prognostic power and biological traits of IITH, respectively.

we selected radiomics features most correlated with imaging heterogeneity as imaging heterogeneity-related features according to the definition of the PyRadiomics package. For first-order features, we selected features characterizing the variation in intensity values, and for textural features, we selected features depicting heterogeneous or homogeneous textural patterns. Finally, 42 radiomics features (9 first-order features and 33 texture features) were identified as heterogeneity-related features. 1968 features were initially contained in the clustering analysis.

We performed similarity network fusion (SNF; using the R package “SNFtool” 21) to identify distinct imaging heterogeneity phenotypes. Median absolute deviation (MAD) was used to assess variability of heterogeneity-related radiomics features where $\text{mad} > 1$ was defined as high inter-sample variability. Top 203 variable features (40 first-order and 163 textual features) were used in this clustering analysis. A tumor heterogeneity index (HI) was then calculated for each individual, defined as the arithmetic sum of z-score normalized positive features and the opposite value of negative features, whereby a higher HI represents higher IITH and vice versa.

Sample processing for genomic DNA and total RNA extraction, multi-omics sequencing procedures and bioinformatic operations including whole exome sequencing, copy number alterations, RNA sequencing, as well as generation and analysis metabolomics and lipidomics data were also calculated.

Student's t test, Wilcoxon's test and Kruskal-Wallis test were used to compare continuous variables. Prior to the comparisons, the normality of the distributions was tested with the Shapiro-Wilk test. Pearson's chi-squared test and Fisher's exact test were employed for the comparison of unordered categorical variables. To explore the association between imaging phenotypes and survival, Kaplan-Meier analysis and Cox proportional hazards model were employed. Difference of survival between groups was evaluated by the log rank test. In general, tests were two-sided and $p < 0.05$ was regarded as statistical significance unless otherwise specified. All statistical analyses were performed using R software (version 4.1.1).

Results:

Identification of IITH

We found that high-IITH group tumors exhibited higher T stages (Cohort 1, $p = 0.075$; Cohort 2, $p < 0.001$; Cohort 3, $p = 0.032$) and N stages (Cohort 1, $p = 0.493$; Cohort 2, $p = 0.004$; Cohort 3, $p = 0.035$) and consisted of fewer ER- and PR-positive tumors ($p \leq 0.001$ in Cohort 1 and Cohort 2). Then, we calculated the HI score of each sample. Correspondingly, a greater HI indicated greater imaging heterogeneity. Representative DCE-MRI images indicated that images with high IITH exhibited a highly heterogeneous enhancement pattern, while low-IITH samples were much more homogeneous. Overall, we developed a radiomics signature to identify distinct IITH statuses in large multicenter radiomics cohorts of breast cancer.

Discovery and validation of the prognostic value of IITH

With the long clinical follow-up period of the discovery cohort, we discovered the prognostic value of IITH. High-IITH patients presented significantly poorer RFS (log rank $p = 0.004$). A multivariable Cox proportional hazards model showed that high IITH was an independent poor prognostic indicator after adjusting for well-known prognostic factors (tumor size, positive lymph nodes, lymphovascular invasion status and clinical subtype) (hazard ratio [HR] 2.15, [95% confidence interval [CI] 1.22-3.80], $p = 0.008$). Surprisingly, IITH was also an indicator of OS for breast cancer patients (log rank $p = 0.004$). Its prognostic value was internally validated in the discovery cohort by randomly spitting the cohort in a 2:1 ratio ten times and testing the prognostic power of IITH in each subcohort. Furthermore, we externally validated the prognostic power in the DUKE cohort. As

described before, we identified high- and low-IITH patients in the DUKE dataset, and we found that high-IITH patients had a worse RFS than low-IITH patients (log rank $p = 0.003$). Moreover, multivariable Cox analysis validated the independent prognostic value of IITH in the DUKE cohort (HR 1.79 [95% CI 1.01-3.18], $p = 0.046$). In conclusion, we uncovered the independent outcome-predictive power of IITH subtypes.

Correlation of IITH with genomic and pathological ITH

To verify the robustness of IITH, we sought to compare phenotypic IITH with other assessment methods of ITH, such as microscopic genomic heterogeneity and mesoscopic cellular morphological heterogeneity. A higher MATH value indicates higher genomic heterogeneity. High-IITH patients were more genomically heterogeneous than low-IITH patients ($p = 0.049$). Additionally, we calculated tumor mutational burden (TMB) and neoantigen load and found that higher TMB ($p = 0.005$) and neoantigen load ($p = 0.043$) were present in high-IITH patients.

From whole-slide images of H&E-stained tumor samples, we extracted 14 morphological features and 9 textual features of tumor cells. Among these morphological and textual cellular features, Variation of Curvature was the most significantly different between high- and low-IITH groups, indicating that differences in IITH between the high- and low-IITH groups were mainly contributed by the ITH of nuclear curvature ($p = 0.009$). In summary, DCE-MRI image-derived IITH was consistent with genomic and pathological ITH evaluation.

Genomic, transcriptomic and metabolomic alterations related to IITH

To investigate the biological basis of the prognostic disparity between high- and low-IITH tumors, we performed multiomics analysis to uncover their molecular distinction. We did not observe many significantly differential high-frequency somatic mutations and copy number variations between high- and low-IITH tumors. In particular, high-IITH tumors exhibited a widely dysregulated metabolism comprising upregulation of fatty acids, amino acids, organic acids, nucleosides, and glycogen.

We ranked all the enriched pathways by NES and obtained the most enriched biological processes in the high- and low-IITH groups. These results revealed divergent biological characteristics of the two patient subgroups, wherein high-IITH tumors were metabolically exuberant and were confronted with oxidative stress and low-IITH tumors lacked explicit characteristics, with DNA damage repair more common in this population.

Collectively, transcriptomic and metabolomic analyses elucidated that tumors with high imaging heterogeneity were a phenotype of cancer with high malignancy and dysregulated metabolism, which endowed these tumor cells with a high tendency toward ferroptosis.

Ferroptosis is a biological hallmark and potential therapeutic target for high-IITH tumors

We further investigated the most prominent molecular process identified in the transcriptomic analysis. Consistently, the crucial factors of ferroptosis, such as ROS, iron metabolism and lipid anabolism, were highly enriched in high-IITH tumors. To confirm the hypothesis that ferroptosis is significantly upregulated in high-IITH tumors, we performed integrated multiomics analysis. These results suggested that while ferroptosis was initiated in tumors with high imaging heterogeneity, cancer cells activated some compensatory processes to inhibit this programmed cell death as a self-protective mechanism. Consequently, we could block these suppressive processes, such as the thioredoxin pathway, to induce ferroptosis in high-IITH tumors. In summary, we identified ferroptosis activity in tumors with high IITH through integrated analysis and proposed underlying therapeutic targets for these patients with a poor prognosis.

Conclusion

In summary, in this multicenter radiogenomics cohort study, we identified the distinct phenotypes of ITH assessed by DCE-MRI radiomics features and their prognostic value. Furthermore, with genomic, transcriptomic, metabolomic and digital pathological data, we comprehensively validated this heterogeneity assessment method from mesoscopic to microscopic scales and revealed the biological behavior in tumors with high IITH. Notably, we reported ferroptosis as a vulnerability of breast cancers with high IITH and as a promising target in the era of precision oncology.

PO-1320

The value of subregion-based radiomics of contrast-enhanced mammography in differentiating the HER2-enriched and non-HER2-enriched invasive breast cancers: A double-center study

Simin Wang, Ting Wang, Chao You, Yajia Gu
Fudan University Shanghai Cancer Center

Purpose: To explore the value of subregion-based radiomics of contrast-enhanced mammography (CEM) in differentiating the HER2-enriched and non-HER2-enriched invasive breast cancers.

Methods: A total of 323 female patients from two medical centers were enrolled. All the patients were divided into the training, internal validation, and external validation cohorts. After whole tumor segmentation of the largest lesions in the CEM recombined images, a two-step clustering strategy was proposed to partition the tumor into multiple subregions. First, over-segment pixels with similar intensity and local entropy into superpixels by k-means clustering at the patient level. Second, merge similar superpixels within the same tumor into subregions by hierarchical clustering at the population level. Subsequently, 851 radiomics features were extracted from the entire tumor and each subregion, respectively. According to the optimal radiomics features selected by one-way analysis of variance and LASSO regression, the whole tumor-based and tumor subregion-based radiomics models were constructed by using the XGBoost classifier. The overall performance of radiomics models was evaluated by the AUCs and 95% CIs.

Results: Three spatially distinct and phenotypically consistent subregions were identified in each tumor. In contrast to the whole tumor-based radiomics models, the tumor subregion-based radiomics models showed significantly higher AUCs in both the internal ($p < 0.010$) and the external validation cohorts ($p = 0.020$). In the internal validation cohort, the AUCs of the whole tumor-based and the subregion-based radiomics models were 0.74 (95% CI: 0.63-0.81) and 0.83 (95% CI: 0.72-0.91), respectively. In the external validation cohort, the AUCs of the two models were 0.71 (95% CI: 0.60-0.80) and 0.81 (95% CI: 0.70-0.91), respectively.

Conclusion: Subregion-based radiomics of CEM exhibited potential for differentiating the HER2-enriched and non-HER2-enriched invasive breast cancers.

Voxelwise mapping of DCE-MRI time-intensity-curve profiles enables visualizing and quantifying hemodynamic heterogeneity in breast lesions

Zhou Liu, Meng Wang, Ya Ren, Jie Wen, Qian Yang, Honghong Luo
Cancer Hospital Chinese Academy of Medical Sciences, Shenzhen Hospital

Objective:

To propose a novel model-free data-driven approach based on the voxelwise mapping of DCE-MRI time-intensity-curve (TIC) profiles for quantifying and visualizing hemodynamic heterogeneity and to validate its potential clinical applications.

Materials & Methods: From December 2018 to July 2022, 259 patients with 325 pathologically confirmed breast lesions who underwent breast DCE-MRI were retrospectively enrolled. Based on the manually segmented breast lesions, the TIC of each voxel within the 3D whole lesion was classified into 19 subtypes based on wash-in rate (nonenhanced, slow, medium, and fast), wash-out enhancement (persistent, plateau, and decline), and wash-out stability (steady and unsteady), and the composition ratio of these 19 subtypes for each lesion was calculated as a new feature set (Type-19). Compared with the three-type TIC classification and semiquantitative parameters, Type-

19 features were used to build a machine-learning model to differentiate lesion malignancy and classify histologic grades, proliferation status, and molecular subtypes.

Results: The Type-19 feature-based model significantly outperformed models based on the three-type TIC method and semiquantitative parameters both in distinguishing lesion malignancy (AUC = 0.875 vs. 0.831, $P = 0.01$ and 0.875 vs. 0.804, $P = 0.03$), predicting tumor proliferation status (AUC = 0.890 vs. 0.548, $P = 0.006$ and 0.890 vs. 0.596, $P = 0.020$), and classifying molecular subtypes (AUC = 0.697 vs. 0.548, $P = 0.009$ and 0.697 vs. 0.534, $P < 0.001$), but not in predicting histologic grades ($P = 0.820$ and 0.970).

Conclusion: In addition to conventional methods, the proposed computational approach provides another novel model-free data-driven approach to quantify and visualize hemodynamic heterogeneity.

Early prediction of pathologic complete response to neoadjuvant chemotherapy using multi-phases DCE-MRI by Siamese network in breast cancer: a prospective longitudinal study

Yao Huang^{1,2}, Xiaoxia Wang², Ying Cao^{1,2}

1. Chongqing university cancer hospital

2. Department of Radiology, Chongqing University Cancer Hospital

Objective: To predict pCR in the early stage of neoadjuvant chemotherapy (NAC) using longitudinal dynamic contrast-enhanced (DCE)-MRI by Siamese network (SN) and propose the isochronous proportional sampling (IPS) method to address the issue of rational selection of DCE-MRI phases.

Methods: This prospective longitudinal study recruited participants with breast cancer who underwent NAC, and DCE-MRI before NAC and after two cycles of NAC from March 2022 to December 2022. Firstly, constructing a clinical model based on Boruta and XGBoost. Secondly, four SN models were built based on the different phases of DCE-MRI which were selected by IPS method (SN-1 with peak enhanced phase, SN-2 with 10% phases, SN-3 with 20% phases, and SN-4 with 30% phases). Finally, four integrated models were constructed by combining the clinical and SN model's features. The model performances were compared by the Delong test, net reclassification improvement (NRI) test, and integrated discrimination improvement (IDI) test.

Results: A total of 162 participants (mean age: 50.88 years \pm 7.96) were enrolled. The clinical model achieved an AUC of 0.760 (95% confidence interval: 0.630, 0.890). As the IPS phases increased, the AUCs of SN and integrated models improved. The SN-3 and integrated-2~4 showed significantly higher AUCs than the clinical model (Delong test: all $P < 0.05$). The integrated-3 model showed the best pCR prediction performance with AUCs of 0.949 (95% confidence interval: 0.873, 1.000), which was higher than that of the integrated model with only using single timepoint DCE-MRI (NRI and IDI test: all $P < 0.05$).

Conclusion: The longitudinal multi-phases DCE-MRI based on the Siamese network demonstrates promise for predicting pathological complete response in breast cancer.

Differentiation of Triple-negative and HER2 Positive Breast Cancer Using DISCO CE-MRI

Haodong Guo, Haige Li, Jainguo Zhu
The Second Affiliated Hospital of Nanjing Medical University

Introduction the purpose of this work was to implement the aforementioned method to analyze triple-negative vs. non-triple-negative along with HER2 positive vs. HER2 negative cancer lesions, and evaluate the role of quantitative and semi-quantitative parameters in the molecular typing of breast cancer.

DISCO CE-MRI A 3.0-T MR scanner (GE SIGNA™ Premier 3.0T) with a 16-channel phased-array body coil was used for all subjects. DISCO CE-MRI was performed for each participant with a scanning time of about 1 minutes 40 seconds. Detailed scan parameters are presented in Table 1. Gd-DTPA (0.15 mmol/kg) was injected intravenously with a high pressure syringe at a flow rate of 3.0 ml/s, and then rinsed with 20ml normal saline.

Results There were statistical differences in Ktrans, kep, vp, TTP, MAX Conc, AUC and MAX Slope between the triple-negative and non-triple-negative breast cancer groups. The results showed that kep and TTP had diagnostic value for triple-negative breast cancer by binary logistic regression. The ROC curve showed that the diagnostic efficacy of combined parameters ($1.804 \times \text{kep} + 4.802 \times \text{TTP}$, AUC = 0.956, $P < 0.001$) was higher than single parameters, kep (AUC = 0.870, $P = 0.024$) and TTP (AUC = 0.928, $P = 0.002$).

Ktrans, kep, ve, vp, TTP, MAX Conc, AUC and MAX Slope had statistical differences between the HER2 positive and HER2 negative breast cancer groups. The ROC curve showed that kep has diagnostic value in HER2 positive breast cancer (AUC = 0.832, $P = 0.002$)

Conclusion Our results are encouraging and suggest that parameters derived from DISCO CE-MRI could be reliable quantitative biomarkers for the differential diagnosis of triple-negative breast cancer, as well as HER2 positive breast cancer.

PO-1324

External validation of multiparametric MRI-based decision rules for characterizing breast lesions and comparison to Kaiser score and BI-RADS category

Yongyu An, Changyu Zhou
The First Affiliated Hospital of Zhejiang Chinese Medical University (Zhejiang Provincial Hospital of Chinese Medicine)

Objectives To externally validate published multiparametric MRI (mpMRI)-based decision rules for characterization of breast lesions and compare to Kaiser score and BI-RADS category.

Methods 206 patients with 218 pathology-proven breast lesions (99 malignancies) were included in this retrospective study from January 2018 to May 2018. Two radiologists blind to pathological results evaluated lesions according to the three mpMRI-based decision rules (Kim2018, Istomin2020, Zhong2022) and Kaiser score. BI-RADS category based on the readers' experiences was retrieved from radiology reports and was also analysed. Diagnostic performance was calculated and compared for the four decision rules and BI-RADS category. The unnecessary biopsy rate for BI-RADS 4 lesions using the four decision rules was calculated.

Results The area under curve (AUC) of mpMRI-based decision rules (0.81-0.84) was significantly lower than BI-RADS category (0.91) and Kaiser score (0.94) (all $p < 0.005$). The mpMRI-based decision rules achieved higher sensitivity (100%) than Kaiser score (91.9%) ($p = 0.003$) and BI-RADS category (96.0%) ($p = 0.679$), but the specificity (21.0-31.8%) was significantly lower than

Kaiser score (87.4%) and BI-RADS category (64.7%) (all $p < 0.001$). All decision rules yielded lower performance for non-mass enhancement (NME) (AUC: 0.64-0.84) than mass (AUC: 0.86-0.96). The unnecessary biopsy rate for BI-RADS 4 lesions was 9.8% (Istomin2020), 12.2% (Zhong2022), 14.6% (Kim2018) and 70.7% (Kaiser score).

Conclusion MpMRI-based decision rules showed good performance for breast lesions characterization, but inferior to Kaiser score and BI-RADS category. The specificity of mpMRI-based decision rules needed to be improved though the sensitivity was high.

PO-1325

Radiomics model based on multi-sequence MRI for accurate diagnosis of complex cystic breast lesions

Cuiju He, Lu Han, Nannan Zhao, Tao Yu, Yahong Luo

Department of Radiology, Liaoning Cancer Hospital & Institute City of Shenyang 110042, Liaoning Province, China

Objective: To establish radiomic models for accurate diagnosis of complex cystic breast lesions.

Methods: T2 and DCE images of 142 complex cystic breast lesions from 130 patients were included in the study. Manually sketch the ROI along the edge of the lesion, and then automatically expand it by 1-3mm to obtain 3 outward expanded ROIs, further segmentation is performed inside the lesion to obtain the central and peripheral sub region ROI. Establish diagnostic models based on different ROIs and optimize the best model.

Results: The diagnostic model based on T2 1mm outward expansion ROI and T2 intra tumor segmentation central subregion ROI has superior diagnostic performance, with AUC of 0.96 and 0.89 in training and validation cohorts, respectively. The diagnostic model based on DCE 3mm outward expansion ROI and DCE intra tumor segmentation of surrounding subregion ROI has superior diagnostic performance, with AUC of 0.98 and 0.94 in training and validation cohorts, respectively. The fusion of T2 and DCE models yielded the final diagnostic model with the best diagnostic performance, with AUC of 0.98 and 0.96 in training and validation cohorts, respectively.

Conclusions: We have established a radiomic model based on T2 and DCE images which can diagnose complex cystic breast lesions accurately. It can assist clinicians in making correct diagnoses, especially when there are difficulties in conventional imaging diagnosis or conflicts between different imaging examinations.

PO-1326

Application of Magnetic Resonance Imaging Radiomic Analysis in Differential Diagnosis of Benign and Malignant Breast Lesions

Nannan Zhao

Liaoning cancer hospital and Institute

Objective To evaluate the differential diagnosis of benign and malignant breast lesions by radiomic analysis based on T1-weighted and contrast-enhanced magnetic resonance imaging (CE-MRI), and assessment the diagnostic performance.

Materials and Methods 587 breast lesions, including 404 malignant lesions and 183 benign lesions were retrospectively collected. Three experienced radiologists manually delineated the region of

interest (ROI) of the lesions, and 65 quantitative radiomic features were automatically extracted from T1WI and CE-MRI, respectively. First, Dimensionality reduction of features was conducted, prediction models for diagnosis of benign and malignant lesions were built based on both sequences by logistics regression analysis. Second, the diagnosis performance was evaluated by ROC curve and the radiomics score of the two models were superposed by generalized linear regression. Finally, the weights of the two models were compared and evaluated by nomograms. Results The diagnostic accuracy of radiomic models built by T1WI and CE-MRI was 71.2% and 83.1%, the AUC was 0.742 and 0.887, respectively. The sensitivity was 0.636 and 0.820, and the specificity was 0.740 and 0.855, respectively.

Conclusion Radiomic analysis can be used for distinguishing benign and malignant breast lesions, and the diagnostic efficacy of the model built by CE-MRI was superior to the model built by T1WI. Therefore, radiomic analysis with CE-MRI is expected to become the basic identification tool to aid clinical diagnosis.

PO-1327

Preliminary analysis of the correlation between multi-parameters MRI and ctDNA of breast cancer

Tingting Lin

Department of Radiology, Anhui Provincial Cancer Hospital, West Branch of the First Affiliated Hospital of USTC, Division of Life Sciences and Medicine, University of Science and Technology of China, Hefei, Anhui, 230031, P.R. China.

Objective This study sought to investigate the correlation between ctDNA(circulating tumor DNA, ctDNA) of breast cancer and multi-parameters MRI.

Methods Baseline puncture samples of 56 cases of breast cancer were enrolled to observe the expression status of ctDNA between pCR(pathological complete response, pCR) and non-pCR groups. SPSS software was used to analyze the ctDNA differences between pCR and non-pCR groups, and the correlation between the quantitative parameters of IVIM-DWI and DCE-MRI and the expression status of ctDNA was analyzed. $P < 0.05$ was considered statistically significant.

Results Liquid biopsy results of 42 patients were included in the analysis, including 11 cases of pCR (26.19%) and 31 cases of non-pCR (73.81%). The expression status of ctDNA was significantly different between pCR and non-pCR groups ($p < 0.001$). There was no significant correlation between the expression status of ctDNA and the quantitative parameters of IVIM-DWI and DCE-MRI ($p > 0.05$).

Conclusion The expression status of ctDNA was correlated with pCR in NAC of patients with breast cancer, but there was no correlation between multi-parameters MRI and baseline ctDNA.

PO-1328

A Multiparametric MRI-based Radiomic Model for Stratifying Postoperative Recurrence in Luminal B Breast Cancer

Ruixin Zhang, Maosheng Xu

The First Affiliated Hospital of Zhejiang Chinese Medical University (Zhejiang Provincial Hospital of Traditional Chinese Medicine)

Abstract

Purpose: To develop an MRI-based radiomics model to assess the likelihood of recurrence in Luminal B breast cancer, with the aim of clinical risk stratification and treatment decision-making.

Methods: The study analyzed medical images and clinical data from 244 patients with Luminal B breast cancer,. Of 224 patients, 35 had experienced recurrence and 209 had not of whom 35 had experienced recurrence and 209 had not. The patients were randomly divided into the training set (51.5 ± 12.5 years old; $n = 171$) and the test set (51.7 ± 11.3 years old; $n = 73$) in a ratio of 7:3. The study employed univariate and multivariate Cox regression along with the least absolute shrinkage and selection operator (LASSO) regression methods to select radiomic features and calculate a risk score. A combined model was constructed by integrating the risk score with the clinical and pathological characteristics.

Results: The study identified two radiomic features (GLSZM and GLRLM) from DCE-MRI were used to calculate a risk score. The AUCs were 0.860 and 0.868 in the training set, and 0.816 and 0.714 in the testing set for 3- and 5-year recurrence risk, respectively. The combined model incorporating the risk score, pN, and endocrine therapy showed improved predictive power, with AUCs of 0.857 and 0.912 in the training set and 0.943 and 0.945 in the testing set for 3- and 5-year recurrence risk, respectively. The calibration curve of the combined model showed good consistency between predicted and measured values.

Conclusion: Our study developed an MRI-based radiomic model that integrates clinical and radiomic features to assess the likelihood of recurrence in Luminal B breast cancer. The model shows promise for improving clinical risk stratification and treatment decision-making.

PO-1329

Based on Contrast-Enhanced Mammography Radiomics Analysis for Preoperative Prediction of Breast Cancer Molecular Subtypes

Shuangshuang Zhu¹, Sailing Guo¹, Simin Wang², Shengnan Yu¹, Yajia Gu²

1. Department of Radiology, The Third Affiliated Hospital of Soochow University

2. Department of Radiology, Fudan University Shanghai Cancer Center

Background: Preoperative prediction of breast cancer molecular subtypes can help guide individualised clinical treatment of breast cancer patients who cannot be operated on immediately. The study aimed to investigate the diagnostic efficacy of preoperative prediction of molecular subtypes of breast cancer by contrast-enhanced mammography (CEM) radiomic features.

Methods: This retrospective two-centre study included women suffering from breast cancer who underwent CEM preoperatively between August 2016 to May 2022. We finally included a total of 386 lesions in 356 patients, and the lesions were grouped into training ($n=162$), internal test ($n=160$) and external test sets ($n=64$). Radiomics features were extracted from low-energy (LE) images and recombined (RC) images, followed by features selected by minimum redundancy-maximum relevance (mRMR) and recursive feature elimination (RFE) algorithms. Three dichotomous tasks were established based on postoperative immunohistochemical results: Luminal vs. non-Luminal, human epidermal growth factor receptor (HER2)-enriched vs. non-HER2-enriched, and triple-negative breast cancer (TNBC) vs. non-TNBC subtypes. For each dichotomous task, the radiomics models for LE, RC and the LE+RC combined model were built by support vector machine (SVM) classifier. The prediction performance of radiomics models was assessed by the area under the receiver operator characteristic (ROC) curve (AUC). Then calculate accuracy, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV) for the models. DeLong's test was utilized for comparing the AUCs.

Results: Radiomics models based on CEM to predict molecular subtypes of breast cancer has a good performance. The LE+RC combined model achieved the best performance compared to the LE model and RC model in the test set. The LE+RC combined model predicted Luminal, HER2-enriched, and TNBC subtypes with AUC values of 0.93, 0.89, and 0.87 in the internal test set, and with AUC values of 0.82, 0.83 and 0.69 in the external test set respectively. In addition, the LE model performs more satisfactorily than the RC model.

Conclusion: CEM radiomics features can effectively predict molecular subtypes of breast cancer preoperatively, and the LE+RC combined model has the best predictive performance.

PO-1330

Mammography-based deep learning radiomics for the prediction of upgraded ductal carcinoma in situ

Jinhua Wang, siqing jing, zhongxian yang, cui xu, yubao liu
Shenzhen Hospital of Southern Medical University

Background: Establishing a non-invasive and efficient preoperative prediction model for upgraded ductal carcinoma in situ (DCIS) is important for the individualized management. **Purpose:** This study aims to develop a deep learning radiomics nomogram (DLRN) based on mammography for the preoperative prediction of upgraded DCIS. **Methods:** Retrospectively enrolled 336 patients diagnosed by needle biopsy from January 2015 to November 2022, and were divided into training (n=252) and test (n=84) sets. Independent predictors in clinical data, X-ray imaging, pathology and immunohistochemical results were screened. Deep learning (DL) and hand-crafted radiomic (HCR) features of the lesions were extracted respectively. Construct and validate a DLRN based on independent predictors and HCR-DL combined features for the prediction of upgraded DCIS. **Results:** Ki-67 \geq 14% and high nuclear grade were independent predictors of upgraded DCIS (P<0.05). The DLRN based on independent predictors and combined features accurately predicted upgraded DCIS, with the area under the operator characteristic curve (AUC) of 0.931 (95% CI: 0.899, 0.962) in the test set and good calibration. The DLRN outperformed the clinical model and DLR model (P<0.001, as per DeLong test) in the training and test sets. DLR features had the maximum predictive weight in the DLRN. Decision curve analysis (DCA) confirmed the clinical usefulness of the DLRN. **Conclusion:** The mammography-based deep learning radiomic nomogram exhibits excellent performance in predicting upgraded DCIS and offers valuable insights for personalized treatment.

PO-1331

Mean Apparent Propagator-MRI: A Novel Diffusion-Based Approach for Quantitative Assessment of Tumor-Stromal Ratio in Breast Carcinoma

Xiang Zhang¹, Ya Qiu^{1,2}, Wei Jiang¹, Mengzhu Wang³, Jun Shen¹
1. Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University
2. First People's Hospital of Kashi Prefecture
3. MR Scientific Marketing, Siemens Healthineers

Background: Tumor stroma is a critical component of the tumor microenvironment. Tumor-stromal ratio (TSR) can be used as an indicator for therapeutic response and prognosis in patients with breast cancer.

Purpose: To determine whether diffusion quantitative metrics from the mean apparent propagator (MAP)-MRI outperformed apparent diffusion coefficient (ADC) value in assessing the TSR status of breast carcinoma.

Materials and Methods: From August 2021 to October 2022, 271 participants were prospectively enrolled (ClinicalTrials: NCT05159323) and underwent breast diffusion spectral imaging and diffusion-weighted imaging. MAP-MRI metrics and ADC value were derived from the diffusion MRI data. All participants were divided into high-TSR (stromal component < 50%) and low-TSR groups (stromal component \geq 50%) based on pathologic examination. Multivariable logistic regression was

used to identify the independent variables for distinguishing TSR status. The area under the receiver operating characteristic curve (AUC) and sensitivity, specificity, and accuracy were compared between the MAP-MRI metrics and ADC value by the Delong test and McNemar test, respectively.

Results: One-hundred-and-eighty-one female participants (mean age, 48.56 years \pm 10.12 [SD]) were included. All the diffusion metrics differed between the high-TSR and low-TSR groups ($P < 0.001$ to $P = 0.013$). Radial non-Gaussianity [NGRad] from MAP-MRI was an independent variable for discriminating high-TSR and low-TSR groups, with a higher AUC (0.796; 95% CI: 0.729, 0.852 vs. 0.608; 95% CI: 0.533, 0.679; $P < 0.001$), specificity (75.5%; 95% CI: 66.0, 83.5 vs. 48.0%; 95% CI: 38.0, 58.2; $P < 0.001$), accuracy (74.0%; 95% CI: 67.0, 80.3 vs. 58.6%; 95% CI: 51.0, 65.8; $P < 0.001$), while a similar sensitivity (72.2%; 95% CI: 60.9, 81.7 vs. 72.2%; 95% CI: 60.9, 81.7; $P > 0.999$) as compared with ADC value.

Conclusion: MAP-MRI could serve as a better approach than ADC value in evaluating the TSR status in patients with breast carcinoma.

PO-1332

Discrimination between HER2-Overexpressing, -Low-Expressing, and -Zero-Expressing Statuses in Breast Cancer using Multiparametric MRI-based Radiomics

Xiang Zhang¹, Shaoyan Zheng², Zehong Yang¹, Daiying Lin², Jun Shen¹

1. Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University

2. Shantou Central Hospital

Objectives: To explore the performance of multiparametric MRI-based radiomics in discriminating different human epidermal growth factor receptor 2 (HER2) expressing statuses (i.e., HER2-overexpressing, HER2-low-expressing, and HER2-zero-expressing) in breast cancer.

Methods: 771 breast cancer patients from two institutions were retrospectively studied. 581 patients from Institution I were divided into a training dataset ($n_1 = 407$) and an independent validation dataset ($n_1 = 174$); 190 patients from Institution II formed the external validation dataset. All patients were categorized into HER2-overexpressing, HER2-low-expressing, and HER2-zero-expressing groups based on pathologic examination. Multiparametric (including T2-weighted imaging with fat suppression [T2WI-FS], diffusion-weighted imaging [DWI], apparent diffusion coefficient [ADC], and dynamic contrast-enhanced [DCE]) MRI-based radiomics features were extracted and then selected from the training dataset using the least absolute shrinkage and selection operator (LASSO) regression. Three predictive models to discriminate HER2-overexpressing vs. others, HER2-low expressing vs. others, and HER2-zero-expressing vs. others, were developed based on the selected features. The model performance was evaluated using the area under the receiver operating characteristic curve (AUC).

Results: Eleven radiomics features from DWI, ADC, and DCE, one radiomics feature from DWI, and seventeen radiomics features from DWI, ADC, and DCE were selected to build three predictive models, respectively. In training, independent validation, and external validation datasets, radiomics models achieved AUCs of 0.809, 0.737 and 0.725 in differentiating HER2-overexpressing from others, 0.779, 0.778 and 0.782 in differentiating HER2-low-expressing from others, 0.889, 0.867 and 0.813 in differentiating HER2-zero-expressing from others, respectively.

Conclusions: Multiparametric MRI-based radiomics model may preoperatively predict HER2 statuses in breast cancer patients.

PO-1333

The longitudinal changes in functional MRI during neoadjuvant chemotherapy can predict treatment response early in patients with HER2-positive breast cancer

Siyi Chen, Wenjie Tang, Xinqing Jiang, Xinhua Wei, Yuan Guo

Department of Radiology, Guangzhou First People's Hospital, South China University of Technology

Purpose: To investigate whether longitudinal changes in functional MRI can predict early response to neoadjuvant chemotherapy (NAC) for HER2-positive breast cancer (BC) and to further establish quantitative models based on these features.

Methods: A total of 166 HER2-positive BC patients from three centers were included. MRI was performed at baseline and after two cycles of NAC (early post-NAC). Clinicopathological characteristics were enrolled. MRI features were evaluated at baseline and early post-NAC, as well as longitudinal changes in functional MRI, including changes in the longest diameter (LD) of the tumor (Δ LD), apparent diffusion coefficient (ADC) values (Δ ADC), and time-signal intensity curve (TIC) (Δ TIC). The patients were divided into a training set ($n=96$), an internal validation set ($n=32$), and an independent external validation set ($n=38$). Univariate and multivariate logistic regression analyses were used to identify the independent indicators of pCR, which were then used to establish the clinicopathologic model, baseline MRI model, early MRI model, changes MRI model, and combined model. The AUC was used to evaluate the predictive power of the different models, and calibration curves were used to evaluate the consistency of the prediction of pCR in different models.

Results: The baseline MRI features did not predict pCR in univariate analyses (all $p > 0.05$). Ultimately, four models were enrolled in this study, including the clinicopathologic model, early MRI model, changes MRI model, and combined model. The LD of the tumor after two cycles of NAC (OR=0.943, 95% CI=0.890-0.998, $p=0.042$), Δ ADC (OR=1.004, 95% CI=1.002-1.007, $p=0.008$), and Δ TIC (OR=1.283, 95% CI=1.459-12.574, $p=0.002$) were identified as the best predictors of NAC response. The combined model constructed by the combination of LD at early post-NAC, Δ ADC, and Δ TIC showed good predictive performance in the training set (AUC=0.85), internal validation set (AUC=0.81), and external validation set (AUC=0.80), which performed better than the other three models in all sets.

Conclusions: The changes in functional MRI can predict early treatment response for HER2-positive BC and may be helpful for individualized treatment planning.

PO-1334

MRI findings of primary highly-invasive B-cell lymphoma of male breasts: a case reportLiyan Qiu, Jingfeng Zhang, Jianjun Zheng
NINGBO NO.2 HOSPITAL**Introduction**

Primary breast lymphoma is a rare extranodal primary lymphoma, accounting for only 0.05~0.53% of breast malignant tumors and 1.7~2.2% of all extranodal primary non-Hodgkin lymphomas. It is even rarer in men. Breast lymphoma is mostly non-Hodgkin lymphoma, mainly derived from B cells. The imaging findings are complex and diverse, lack specificity, and are easily misdiagnosed as breast cancer or benign tumors (such as fibroadenomas). Imaging of primary breast lymphoma, especially magnetic resonance imaging, is rarely reported.

Case report

A 74-year-old man presented to the surgical department because of the progressive enlargement of bilateral breasts for more than one month. Physical examination: male breast, symmetrical diffuse enlargement on both breasts, unclear boundary, moderate activity, and no tenderness. No obvious enlarged lymph nodes were found in the armpits and clavicles on both sides. Ultrasound findings: mixed space occupying lesions in bilateral breasts, with a diameter of about 18 mm, as a fusion of multiple echogenic areas with clear boundaries, and strip blood flow signals visible inside, suggesting that the mixed space occupying lesions in bilateral breast are BI-RADS 4A. Breast MRI findings: male breast with diffuse nodular distribution on both glands, clear boundaries, partially fused, no burr at the edges, involving the whole gland; slightly hypointense signal on T1WI and slightly hyperintense signal on T2WI, sharply hyperintense signal on DWI ($b=1000$); reduced ADC signal, restricted diffusion, and ADC value= $0.622 \times 10^{-3} \text{mm}^2/\text{s}$. Dynamic contrast enhanced MRI images showed a distinct early-homogeneous-enhancement of the lesions, while the delayed images indicated a mild decrease in the amplitude of enhancement. The time-signal intensity curves were either washout type or plateau type. A strip of edema signal shadow (appeared long on both T1WI and T2WI) was observed in bilateral posterior breast space. The above findings suggest diffuse nodular signal abnormalities in both mammary glands, therefore the initial diagnostic impression is malignant tumor, with a high probability of lymphoma. BI-RADS: 5. Coarse needle aspiration biopsy of right breast tumor was performed under ultrasound guidance. Pathological findings: (right breast) highly aggressive B-cell lymphoma. In combination with immunohistochemical markers, further consideration can be made: 1. double-hit/three-hit lymphoma; 2. CD5 positive diffuse large B-cell lymphoma. (Wax block) (Right breast): CD20 (+), PAX-5 (+), CD10 (-), Bcl-6 (-), Mum-1 (+), Bcl-2 (+90%), Ki-67 (+90%), C-myc (+90%), CD3 (-), CD5 (+), CD21 (-), CD23 (-), TdT (-), CD30 (-), P53 (normal coloring), PD-1 (-), CD19 (+weak), CyclinD1 (-), EBER (-), Her2 BC (0), ER (-), PR (-), E-Cadherin (-), p63+CKpan (-), CK5/6 (-), GATA-3 (-), CD79a (+), CD43 (+).

Discussion

Primary lymphoma of the breast is a tumor of the blood system. It is more common in women and rare in men in this case. Clinically, an enlarged, painless, and palpable mass is the first manifestation, whereas this case presents with a diffuse enlargement of both breasts, which is rare. Imaging findings lack specificity and are prone to misdiagnosis. The literature reports that radical surgery does not confer a survival benefit on patients, but is associated with a poor prognosis. At present, a combination of surgery, chemotherapy and radiotherapy is mostly used. Therefore, it is necessary to improve the radiographic understanding of primary lymphoma of the breast and to avoid surgical intervention other than excisional biopsy. Biopsy or postoperative pathology remains an effective means of confirming the diagnosis, however cytology does not allow for accurate staging and grading of NHL and whole-body PET/CT is usually recommended for proper staging. Combined with this case and previous literature, MRI of primary breast lymphoma has some meaningful imaging signs: unilateral or bilateral onset, mass or infiltrative type, clear lesion boundaries, confluent lesions, few burrs; equal or slightly hypointense signal on T1WI and slightly hyperintense signal on T2WI; early homogeneous enhancement, plateau or washout types predominant on TIC; significant increase in the DWI signal and significant decrease in ADC values. It should be mentioned that posterior interstitial breast oedema, a malignant sign in this case, is not specific, and it can also be seen in other malignant tumors of the breast.

Conclusion

Primary lymphoma of the breast is rare and has certain features on MRI, and radiologists and clinicians should raise awareness of the disease to avoid unnecessary surgical treatment.

PO-1335

Whole-tumor Histogram Analysis of Multiparametric Breast Magnetic Resonance Imaging to Differentiate Pure Mucinous Breast Carcinomas from Fibroadenomas with High-signal Intensity on T2WI.

Xue Li^{1,2}, Kun Sun², Weimin Chai², Hong Zhu², Fuhua Yan²

1. Beijing Hospital

2. Ruijin Hospital

Purpose

To investigate the utility of whole-tumor histogram analysis based on multiparametric MRI in distinguishing pure mucinous breast carcinomas (PMBCs) from Fibroadenomas (FAs) with strong high-signal intensity on T2-weighted imaging (T2-SHi).

Material and methods

The study included 20 patients (mean age, 55.80 ± 15.54 years) with single PMBCs and 29 patients (mean age, 42.31 ± 13.91 years) with single FAs exhibiting T2-SHi. Two radiologists performed whole-tumor histogram analysis between PMBC and FA groups with T2-SHi using multiparametric MRI, including T2-weighted imaging (T2WI), diffusion weighted imaging (DWI) with apparent diffusion coefficient (ADC) maps, and the first (DCE_T1) and last (DCE_T4) phases of T1-weighted dynamic contrast-enhanced imaging (DCE) images, to extract 11 whole-tumor histogram parameters, respectively. Histogram parameters were compared between the two groups to identify significant variables using univariate analyses, and their diagnostic performance was assessed by receiver operating characteristic (ROC) curve analysis and logistic regression analyses. Pearson's correlation coefficients were used to analyse the correlations between histogram parameters and Ki-67 expression.

Results

For T2WI images, mean, median, maximum, 90th percentile, variance, homogeneity, and entropy significantly differed in PMBCs and FAs with T2-SHi (all $p < 0.05$), yielding a combined area under the curve (AUC) of 0.927. For ADC maps, entropy was significantly lower in FAs with T2-SHi than in PMBCs ($p = 0.028$). In both DCE_T1 and DCE_T4 sequences, FAs with T2-SHi showed significantly higher minimum values than PMBCs ($p = 0.007$ and 0.023 , respectively). The highest AUC value of 0.956 (sensitivity, 0.862; specificity, 0.944; positive predictive value, 0.962; negative predictive value, 0.810) was obtained when all significant histogram parameters were combined.

Conclusions

Whole-tumor histogram analysis using multiparametric MRI is valuable for differentiating PMBCs from FAs with T2-SHi.

PO-1336

Comparison of Radiomics-Based Machine-Learning Classifiers for Pretreatment Prediction of Pathologic Complete Response to Neoadjuvant Therapy in Breast Cancer.

Xue Li, Chunmei Li, Hong Wang, Lei Jiang, Min Chen

Beijing Hospital

Background:

In recent years, machine learning (ML) classifiers have gradually been used to establish high-performance predictive models for pathological complete response (pCR) in breast cancer after neoadjuvant therapy (NAT). However, few studies have compared the effectiveness of different ML classifiers. This study investigated the ability of radiomics models based on pre- and post-contrast first-phase T1 weighted images (T1WI) to predict breast cancer pCR after NAT and compared the performance of different ML classifiers.

Methods: In this retrospective study, 300 patients from the Duke-Breast-Cancer-MRI dataset who underwent neoadjuvant therapy (NAT) were included, including pCR (n=76) and non-pCR (n=224) cases. These patients were randomly divided into training and validation groups at a ratio of 8:2. Radiomics features were extracted from pre- and post-contrast first-phase T1WI images of each patient. The radiomics model was built using features selected through the Spearman correlation analysis and the Least Absolute Shrinkage and Selection Operator (LASSO) algorithm after normalization. Support vector machine (SVM), random forest (RF), extraTrees, decision tree (DT), k-Nearest Neighbor (KNN), extreme gradient boosting (XGBoost), light gradient boosting machine (LightGBM) were used as classifiers. Receiver operating characteristic (ROC) curves were used to assess the predictive performance of the radiomics models.

Results:

Out of the seven classifiers used, the LightGBM classifier performed best in predicting breast cancer pCR, with an AUC of 0.813 in the validation group (95% CI: 0.697-0.928, accuracy 78.3%, sensitivity 46.7%, specificity 100.0%). During subgroup analysis, RF achieved the highest AUC in pCR prediction in luminal breast cancers (0.859, 95% CI: 0.710-1.000, accuracy 85.9%, sensitivity 68.8%, and specificity 83.3%), and DT yielded the highest AUC in pCR prediction in triple negative (TN) breast cancers (0.909, 95% CI: 0.790-1.000, accuracy 88.2%, specificity 81.8%, accuracy 100%).

Conclusion:

Overall, the LightGBM-based radiomics model demonstrated superior performance in predicting breast cancer pCR, while Random Forest (RF) and Decision Tree (DT) displayed promising results in predicting pCR for luminal and TN breast cancers, respectively, during subgroup analysis.

PO-1337

Effect of MicroRNA-766 Promotes Proliferation, Chemoresistance, Migration, and Invasion of Breast Cancer Cells

Jiping Wang, Xin Shi, Bei Zhang
First Hospital of Jilin University

Introduction: Breast cancer (BCa) remains the most common cancer in women worldwide. It has been shown that microRNAs (miRs) play essential roles in tumorigenesis and progression in many types of cancers, including BCa. We assessed the role of miR-766 on the proliferation, chemosensitivity, migration, and invasion of BCa cells.

Materials and Methods: The effect of miR-766 on the proliferation of MCF-7 and T47D BCa cells was evaluated using the MTT assay. The function of miR-766 on the migration and invasion of MCF-7 and T47D cells was examined using Transwell migration and Matrigel invasion assays. Protein expression was evaluated by Western blot. The role of miR-766 on 5-fluorouracil-induced apoptosis in MCF-7 and T47D cells was determined using the Caspase-Glo3/7 assay. A sub_x0002_cutaneous tumor xenograft was performed to examine the effect of miR-766 on tumor growth in vivo. **Results:** Upregulation of miR-766 improved the proliferation, invasion, and migration of BCa cells. Furthermore, miR-766 reduced the sensitivity of MCF-7 and T47D cells to 5-fluorouracil treatment. The tumor xenograft experiment showed that miR-766 promoted BCa growth in vivo. miR-766 decreased 5-fluorouracil-induced apoptosis by regulation of BAX and Bcl-2 expression. miR-766 also affected the epithelial-mesenchymal transition by altering

E_x0002_cadherin, N-cadherin, SNAIL, and vimentin expression in MCF-7 and T47D cells. Further study showed that the expression of phosphatase and tensin homolog and phosphorylated AKT in MCF-7 and T47D cells had changed after aberrant expression of miR-766. Conclusion: miR-766 displayed important roles in tumorigenesis and progression in BCa cells and might act as a potential biomarker to predict the chemotherapy response and progression in BCa.

PO-1338

Classification of asymmetry in mammography via the DenseNet convolutional neural network

Tingting Liao¹, Yuting Yang¹, Lin Li¹, Rushan Ouyang², Xiaohui Lin¹, Jie Ma¹

1. Shenzhen People's Hospital

2. The Eighth Affiliated Hospital of Sun Yat-sen University

Purpose: To investigate the effectiveness of a deep learning system based on the DenseNet convolutional neural network in diagnosing benign and malignant asymmetric lesions in mammography.

Methods: Clinical and image data from 460 women aged 23–82 years (47.57 ± 8.73 years) with asymmetric lesions who underwent mammography at Shenzhen People's Hospital, Shenzhen Luohu District People's Hospital, and Shenzhen Hospital of Peking University from December 2019 to December 2020 were retrospectively analyzed. Two senior radiologists, two junior radiologists, and the DL system read the mammographic images of 460 patients, respectively, and finally recorded the BI-RADS classification of asymmetric lesions. We then used the area under the curve (AUC) of the receiver operating characteristic (ROC) to evaluate the diagnostic efficacy and the difference between AUCs by the Delong method.

Results: Specificity (0.909 vs. 0.835, 0.790, $\chi^2=8.21$ and 17.22, $p<0.05$) and precision (0.872 vs. 0.763, 0.726, $\chi^2=9.23$ and 5.22, $p<0.05$) of the DL system in the diagnosis of benign and malignant asymmetric lesions were higher than those of junior radiologist A and B, and there was a statistically significant difference between AUCs (0.778 vs. 0.579, 0.564, $Z = 4.033$ and 4.460, $p < 0.05$). Furthermore, the AUC (0.778 vs. 0.904, 0.862, $Z = 3.191$, and 2.167, $p < 0.05$) of benign and malignant asymmetric lesions diagnosed by the DL system was lower than that of senior radiologist A and senior radiologist B.

Conclusions: The DL system based on the DenseNet convolution neural network has high diagnostic efficiency, which can help junior radiologists evaluate benign and malignant asymmetric lesions more accurately. It can also improve diagnostic accuracy and reduce missed diagnoses caused by inexperienced junior radiologists.

PO-1339

A machine learning approach based on multiparameter MRI to identify the risk of non-sentinel lymph node metastasis in patients with early-stage breast cancer

Haitong Yu, Qin Li, Qingliang Niu
WeiFang Traditional Chinese Hospital

Objectives It has been reported that early breast cancer patients with 1-2 positive sentinel lymph node (SLN) have a lower risk of non-sentinel lymph node (NSLN) metastasis and can not benefit from axillary lymph node dissection (ALND). The purpose of this study was to develop the potential of machine learning (ML) based on multiparameter MRI (mpMRI) and clinical factors for predicting the risk of NSLN metastasis in early breast cancer.

Methods This retrospective study included 144 patients with 1-2 positive SLN breast cancer. mpMRI morphologic findings and the detailed demographical characteristics of the primary tumor and axillary lymph node (ALN) were extracted. The logistic regression (LR), support vector machine (SVM), extreme gradient boosting (XGBoost) and random forest (RF) algorithm models were established to predict the risk of NSLN metastasis. The prediction efficiency of ML-based model was evaluated. Finally, the relative importance of each input variable was analyzed for the best model.

Results Of all patients, 55.6% (80/144) patients developed NSLN metastasis. 24 imaging features and 14 clinicopathological features were analyzed. XGBoost algorithm had the strongest prediction efficiency with area under curve (AUC) of 0.881 and 0.781 in the training set and test set, respectively. Five main factors for metastasis of NSLN were found which included histological grade, cortical thickness of lymph node (LN), fatty hilum of LN, short axis of LN and age.

Conclusions Machine learning model incorporating mpMRI features and clinical factors can predict NSLN metastasis with high accuracy for early breast cancer and provide predictive information for clinical protocol.

PO-1340

Assessment on contrast-enhanced CBBCT lexicons for breast cancers: A comparative study with mammography and MRI

Yue Ma, Zhaoxiang Ye

Tianjin Medical University Cancer Institute and Hospital

Purpose: To investigate the lexicons and evaluation standards for contrast enhanced cone-beam breast computed tomography (CE-CBBCT) by comparing the agreement with mammography or breast MRI for semantic features evaluation.

Methods and Materials: In this retrospective study, we enrolled the patients who underwent preoperative CE-CBBCT, breast MRI and mammography from December 2017 to April 2021, and were pathologically confirmed with breast cancer. A set of imaging features of breast cancer were evaluated by consensus double reading referring to the breast imaging reporting and data system (BI-RADS) atlas as guidance, with a wash-out period of 2 weeks, including breast composition category, background parenchymal enhancement (BPE), lesion focality, lesion type, morphology features, kinetic feature and microcalcification characteristics. The agreements between CE-CBBCT and another two modalities were calculated by weighted Kappa or Kappa coefficient, to determine the reliability for application of corresponding lexicons to CBBCT images. Then, we evaluated the reproducibility of these lexicons by inter-reader agreement assessment.

Results: A total of 200 malignant lesions were enrolled. The detection rate of CE-CBBCT, breast MRI and mammography were 100.00% (200/200), 99.50% (199/200), and 98.50% (197/200). The agreement on breast composition category with mammograms (Kappa=0.753) was higher than that on breast MRI (Kappa=0.626), while the BPE level showed substantial degree with breast MRI (Kappa=0.624). Compared to breast MRI, CE-CBBCT images showed almost perfect agreement on lesion type identification (Kappa=0.805), and substantial agreement on morphology and enhancement assessment (mass: Kappa=0.639-0.721; non-mass enhancement, NME: Kappa=0.602-0.617). Compared to mammograms, non-contrast enhanced CBBCT (NCE-CBBCT) showed almost perfect agreement on microcalcification detection (Kappa=0.958) and substantial agreement on features evaluation (Kappa=0.710-0.738). The inter-reader agreement showed substantial to almost perfect on CBBCT features evaluation (Kappa=0.648-0.876).

Conclusion: CE-CBBCT images combined the morphology and part of hemodynamic features on MRI images and microcalcification characteristics on mammograms, indicating that the corresponding BI-RADS lexicons could be used to describe CE-CBBCT characteristics associated with breast cancers better for comparative imaging development.

PO-1341

Diagnostic Performance of Unenhanced MR Imaging for assessment of normal-sized nodal staging in Breast cancer

Haitong Yu, Qin Li, Qingliang Niu
WeiFang Traditional Chinese Hospital

Objective To prospectively assess the diagnostic performance of axillary T1-weighted (T1W) and diffusion-weighted (DW) magnetic resonance imaging (MRI) in the detection of axillary lymph node metastases in patients with breast cancer staged as N0 with preoperative cross-sectional imaging. **Methods** Fifty patients were included. Patients with no enlarged lymph nodes on preoperative cross-sectional images who were scheduled for sentinel lymph node biopsy (SLNB) or axillary lymph node dissection (ALND) were enrolled. All patients were examined with a 3-T MRI unit, and examinations included high-spatial-resolution axillary T1W imaging without fat suppression and DW imaging ($b = 50$, and 800 sec/mm^2). Two radiologists independently scored each normal-sized nodes on a confidence level, first on T1W images, then on DW images. Two researchers independently measured the mean apparent diffusion coefficient (ADC) of each lymph node. Diagnostic performance parameters were calculated on the basis of per-node and per-patient validation.

Results With respective per-node and per-patient validation, T1W imaging had a specificity of 83%–84% and 53%–58%, sensitivity of 86% and 93%, negative predictive value (NPV) of 97% and 95%–97%, positive predictive value (PPV) of 42%–44% and 48%–51%, and area under the receiver operating characteristic curve (AUC) of 0.85–0.86 and 0.73–0.76, with good interobserver agreement ($k = 0.75$). Addition of DW imaging resulted in comparable diagnostic performance. There was no significant difference between mean ADC values of benign and malignant lymph nodes.

Conclusions High-spatial-resolution axillary T1W imaging exhibit good diagnostic performance for normal-sized nodes metastasis of patients with breast cancer diagnosed as N0 with conventional cross-sectional imaging techniques.

PO-1342

Differentiating Benign and Malignant Proliferative Breast Lesions Using a Continuous-Time Random-Walk (CTRW) Diffusion Model

Yuan Jiang¹, Ke Xue², Yongming Dai², Dongmei Wu³, Naishan Qin¹, Jianxing Qiu¹

1. Peking University First Hospital

2. MR Collaboration, Central Research Institute, United Imaging Healthcare, Shanghai, China

3. Shanghai Key Laboratory of Magnetic Resonance, School of Physics and Electronics Science, East China Normal University, Shanghai, China

Purpose

The high b-value DWI with a continuous-time random-walk (CTRW) diffusion model has been thought as useful for probing intravoxel tissue heterogeneity in cancer imaging. So the purpose of our study was to test whether high b-value DWI with a CTRW diffusion model could be used for classification of benign and malignant proliferative breast lesions.

Methods

From May 2021 to March 2022, 100 patients (all female) ranging in age from 33 to 82 years (mean age: 52 years) were included in this study. Their breast MRI examination were all performed using 3T MR system (uMR790, United Imaging Healthcare, Shanghai, China) with high b-value diffusion. They all had suspicious lesions in breast MRI described as BI-RADS 4 at least and pathologically confirmed with benign or malignant status by biopsy. Echo-planar diffusion-weighted imaging (DWI) was conducted using 11 b-values ($b = 0, 50, 100, 200, 400, 800, 1200, 1500, 2000, 2500, 3000$ s/mm²) with total scan time 6 min 13 s covering the whole breast. The ROI containing the entire tumor, excluding necrotic areas, was drawn on the slice with the maximum diameter of tumor. Three CTRW model parameters, including an anomalous diffusion coefficient D_m , and two parameters related to temporal and spatial diffusion heterogeneity α and β , respectively, were obtained. The ADC was also calculated using 2 b-values ($b = 0, 800$ s/mm²) by the same ROI. D_m , α , β and ADC were compared between benign and malignant group by Mann–Whitney U test and receiver operating characteristic (ROC) analysis was performed.

Results

This study included 87 breast cancer and 13 benign breast lesions (6 adenopathy, 3 intraductal papilloma, 2 fibroadenoma and 1 granulomatous mastitis). The D_m , α and ADC were significantly lower for malignant breast lesions [D_m : 1.081 (0.517, 1.819) $\mu\text{m}^2/\text{ms}$; α : 0.805 (0.435, 0.999); ADC: 1.178 (0.589, 1.992) $\mu\text{m}^2/\text{ms}$] than benign breast lesions [D_m : 1.452 (0.950, 2.024) $\mu\text{m}^2/\text{ms}$; α : 0.905 (0.755, 0.964); ADC: 1.632 (1.054, 2.180) $\mu\text{m}^2/\text{ms}$] ($p < 0.001$). The β between benign [β : 0.877 (0.745, 0.927)] and malignant [β : 0.842 (0.681, 1.000)] breast lesions were not significantly different ($p = 0.280$). The sensitivity, specificity, accuracy, and area-under-the-curve (AUC) of using the combination of the D_m and α were 95.4%, 69.2%, 92.0% and 0.858 for benign and malignant breast lesion classification, similar with D_m (AUC=0.828), α (AUC=0.815) and ADC (AUC=0.821) alone ($p > 0.05$).

Conclusion

It is feasible to use high b-value DWI with a CTRW Model in classification of benign and malignant proliferative breast lesions.

PO-1343

Does biopsy influence effectiveness of radiomics in the classification of benign lesions and cancers on breast MRI?

Yu Ji, YiShan Zhao, Hong Lu
Tianjin Medical University Cancer Institute and Hospital

PURPOSE

To assess robustness of radiomic features extracted from DCE-MR images acquired pre- or post-biopsy for classification of breast lesions as benign or malignant and to compare to previous results for breast lesions imaged at a different center.

METHOD AND MATERIALS

Dynamic contrast-enhanced magnetic resonance (DCE-MR) images of 602 breast lesions (283 benign lesions and 248 malignant cancers imaged pre-biopsy, 17 benign lesions and 54 malignant cancers imaged post-biopsy) were acquired under HIPAA/IRB compliance. The lesions were segmented automatically using a fuzzy c-means method. Radiomic features describing shape, morphology, kinetics and texture were extracted using previously reported CADx methods. Feature distributions with respect to biopsy condition were compared using the Kolmogorov-Smirnov statistic. For classification of lesions as benign or malignant, areas under the ROC curve (AUC) were determined for each feature using 2000 bootstrap iterations. Median of AUC and confidence interval for difference in AUC were determined for each feature by biopsy condition and compared

using correction for multiple comparisons. The results were compared to those in a previous study of 361 cases (92 benign and 30 luminal A pre-biopsy lesions; 40 benign and 199 luminal A post-biopsy lesions) collected at a different imaging center, wherein all features failed to demonstrate significant difference in median AUC for the classification task.

RESULTS

Seven features of malignant cancers (irregularity, variance of radial gradient histogram, five texture features) demonstrated significant difference in features compared pre- and post-biopsy, while one feature of benign lesions (irregularity) demonstrated significant difference. All features failed to demonstrate significant difference in median AUC.

CONCLUSION

Radiomic features extracted from DCE-MR images failed to show significant differences in AUC performance in classifying breast lesions as benign or malignant and may be robust for use in this task. This independent finding validates similar results in classification of breast lesions as benign or luminal A in images acquired at a different medical center.

CLINICAL RELEVANCE/APPLICATION

Classification of breast lesions by extracted radiomic MRI signatures might not be sensitive to biopsy condition.

PO-1344

Using machine learning to assess tumor metastatic lymph nodes and Ki-67 expression aggressiveness from breast MRI using a large clinical dataset of 300 cancers

Yishan Zhao, Yu Ji, Hong Lu
TIANJIN MEDICAL UNIVERSITY CANCER HOSPITAL

PURPOSE

To evaluate quantitative MRI radiomics in the task of identifying metastatic versus nonmetastatic axillary lymph nodes and Ki-67 expression aggressiveness.

METHOD AND MATERIALS

Our research involved a HIPAA-compliant, DCE-MRI database of 300 breast cancer cases. The average age was 47.2 years with a standard deviation of 9.6 years and a range from 25 to 77 years with a median of 47 years. The clinical cohort included 48 low Ki-67 expression (Ki-67 proliferation index < 14%) and 252 cases with high Ki-67 expression (Ki-67 proliferation index \geq 14%), indicating a range of tumor aggressiveness. The cohort also included 93 cases with axillary lymph node metastasis and 201 cases without metastasis. The images had been obtained with a gadodiamide-enhanced T1-weighted spoiled gradient-recalled acquisition in the steady state sequence. Primary lesions underwent computerized radiomic analysis in which tumor segmentation and extraction were automatically conducted on an existing CADx workstation. These computer-extracted features included MRI-based phenotypes from six categories: size, shape, morphology, enhancement texture, kinetics, and enhancement-variance kinetics. Radiomic features were input to a Bayesian artificial neural network classifier (BANN) and underwent leave-one-case-out cross validation. Area under the ROC curve (AUC) served as the figure of merit in the classification tasks.

RESULTS

In the task of identifying Ki-67 expression and lymph node status, the analyses of the various radiomic phenotypes yielded AUCs ranging from 0.50 (se = 0.05) to 0.69 (se = 0.04). The Ki-67 MRI-based tumor signature produced an AUC value of 0.71 (se = 0.04). In the task of assessing the status of axillary lymph.

PO-1345

Comparison of magnetic resonance guided core needle biopsy and vacuum-assisted biopsy in breast lesions

Yanli Dang, Pin Nie, Mei Liu, Tianju Jia, Baoying Chen
Xi'an International Medical Center Hospital

Objective: The purpose of this study was to retrospectively analyze the diagnostic value of magnetic resonance-guided core needle biopsy (CNB) and vacuum-assisted biopsy (VAB) for suspicious breast lesions.

Methods: Between August 2019 and December 2022, 36 consecutive women (mean age 45.77 ± 10.25 years; age range 22-66 years) with a total of 37 MRI-detected suspicious lesions (BI-RADS 4-5) were performed MR-guided breast lesion biopsies, 13 CNB cases and 24 VAB cases were retrospectively evaluated. The final pathology diagnosis after surgery or the results of at least six months of follow-up for benign lesions were considered the gold standard. The following parameters were evaluated and compared for the two methods: accuracy, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), false positivity, and false negativity. Then, the operation time, intraoperative and postoperative complications were compared.

Results: Technical success was achieved in all biopsies. CNB showed 84.62% (11/13) diagnostic accuracy, 60% (3/5) sensitivity, 100% (8/8) specificity and 100% (3/3) PPV, 80% (8/10) NPV whereas VAB revealed 100% (24/24) diagnostic accuracy, 100% (6/6) sensitivity, 100% (18/18) specificity and 100% (6/6) PPV, 100% (18/18) NPV. VAB required significantly longer biopsy time than CNB (39.83 ± 8.51 min vs 27.77 ± 5.36 min), the difference was statistically significant ($P < 0.001$). No severe complications such as massive bleeding and infection occurred intraoperative or postoperative in the two groups.

Conclusion: Compared with CNB, VAB is the optimal biopsy technique because of the substantially significant advantages in accuracy, sensitivity and negative predictive value of pathological diagnosis. The distribution of malignancy rate were not significantly different between the two groups.

PO-1346

Application Value of Cone-beam Breast Computed Tomography, Mammography and MRI for Diagnosing Breast Cancer

Yafei Wang, Yue Ma, Lu Yin, Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Objective: To compare the diagnostic efficiency of breast lesions based on cone-beam breast computed tomography (CBBCT), mammography (MG) and MRI, to conduct stratified analysis according to patients' age, breast density and the type of lesions, so as to provide reference for physicians and patients.

Methods: Patients who received non-contrast enhanced CBBCT (NCE-CBBCT), contrast enhanced CBBCT (CE-CBBCT), MG and MRI before treatment in a single-center were reviewed.

All lesions were confirmed by pathology or regarded as benign by at least one-year's follow-up. Three radiologists read all images and diagnosed visible lesions referring to the 5th BI-RADS. Taking pathological results as the gold standard and BI-RADS 4b as the cut-off point, AUCs, sensitivities, specificities, positive predictive values (PPVs), negative predictive values (NPVs) were calculated to evaluate the diagnostic efficiency. Subgroup analysis were conducted according to patients' age, breast density and the type of lesions. Percentage was used to display the diagnostic accuracy for pTis and pT1 breast cancer. DeLong's test, McNemar's test or continuity correction formula were used to compare the statistical difference between above indicators. Intraclass correlation coefficient (ICC) was used to evaluate the consistency of diagnosis between three radiologists.

Results: A total of 208 female patients (233 lesions) were included, with a median age of 48 years. Among enrolled lesions, 177 were malignant and 56 were benign. Detection rate of NCE-CBBCT, CE-CBBCT, MG and MRI were 95.7%, 100%, 88.0%, 97.0%. In the total sample, AUCs based on NCE-CBBCT, CE-CBBCT, MRI were 0.918, 0.965, 0.964, they were both superior to MG (AUC=0.865; all $p < 0.05$), and on CE-CBBCT and MRI were superior to NCE-CBBCT ($p = 0.007$, $p = 0.011$). Sensitivities based on NCE-CBBCT (94.4%), CE-CBBCT (98.9%) and MRI (85.9%) were both higher than MG (97.7%, all $p < 0.05$), and CE-CBBCT was 4.5% higher than NCE-CBBCT ($p = 0.008$). NPV based on CE-CBBCT (95.4%) was higher than MG (60.9%, $p = 0.042$), but other indicators between each modality were comparable (all $p > 0.05$). In subgroup analysis, sensitivities based on NCE-CBBCT (98.7%), CE-CBBCT (100%) and MRI (98.7%) were higher than MG (83.1%, $p < 0.05$) in 41-50 years old group, and on CE-CBBCT and MRI (both 98.4%) were higher than MG (87.3%, $p = 0.016$) in > 50 years old group; sensitivities based on NCE-CBBCT (94.6%), CE-CBBCT (99.3%) and MRI (98.0%) were both higher than MG (84.6%, all $p < 0.05$) in dense breast group, but there were no statistical difference compared to NCE-CBBCT and CE-CBBCT ($p > 0.05$); sensitivity based on NCE-CBBCT (90.3%) was 15% higher than MG ($p = 0.001$) in non-calcification group, other indicators were both comparable in each subgroups (all $p > 0.05$). Each modalities had comparable accuracy for diagnosing pTis stage breast cancer in both dense and non-dense breasts (all $p > 0.05$). The diagnostic accuracy based on CE-CBBCT and MRI (both 98.2%) for pT1 stage in dense breasts were higher than MG (68.2%, $p = 0.001$). ICCs for diagnosis between three physicians were at least good (ICC=0.698-0.971, $p < 0.001$).

Conclusion: The diagnostic efficiency of NCE-CBBCT, CE-CBBCT and MRI are both superior to MG, which is mainly reflected in 41-50 years old women with dense breast, and above three modalities can both increase the diagnostic sensitivity for non-calcification lesions, especially for CE-CBBCT and MRI. The diagnostic accuracy for pT1 stage breast cancer in dense breasts based on CE-CBBCT and MRI are both high, indicating that it's recommended to supplement CE-CBBCT or MRI examination for those suspicious positive people but have negative result on MG. The diagnostic efficiency based on CE-CBBCT and MRI are comparable, indicating CE-CBBCT can become an alternative method for people with contraindications to MRI.

PO-1347

Mammography-Based Nomogram for Predicting Malignant Risk of Breast Suspicious Microcalcifications

Yusi Chen, huijie jiang
the Second Affiliated Hospital of Harbin Medical University

Aim: To establish a mammography (MG)-based nomogram for predicting malignant risk of breast suspicious microcalcifications (MCs).

Materials and Methods: The patients with breast suspicious MCs detected by MG and underwent surgical excisional biopsies at our hospital from January 2016 to June 2021 were retrospectively analyzed. Univariate and multivariate analyses were used to identify potential risk factors. Then,

we developed a nomogram for predicting malignant risk of breast suspicious MCs. Finally, the receiver operating characteristic (ROC) curve, decision curve analysis (DCA) curve, and calibration curve were used to evaluate discrimination, accuracy, and practicability of the nomogram.

Results: A total of 464 patients were enrolled in this study with a malignancy rate of 39.7%. Multivariate analyses showed that maximum diameters、morphology and distribution of MCs were independent risk factors for malignant breast MCs. Based on the above independent risk factors, the nomogram was constructed for predicting malignant risk of breast suspicious MCs. The sensitivity, specificity, accuracy and the area under ROC curve (AUC) value for nomogram were 0.625, 0.950, 0.816 and 0.834 (95%CI:0.758-0.910) in the training set and 0.719, 0.945, 0.857 and 0.876(95%CI:0.833-0.919) in the validation set, respectively. The calibration curves and the DCA indicated a satisfactory predictive accuracy and clinical applicability.

Conclusions: A novel nomogram integrating maximum diameters、morphology and distribution of MCs for predicting malignant risk of breast suspicious MCs was successfully established. Our nomogram could help clinicians preoperatively make individual diagnoses and make appropriate clinical decisions.

PO-1348

Mammography-Based Radiomic Nomogram for Predicting Malignant Risk of Breast Suspicious Microcalcifications

Yusi Chen, huijie jiang

the Second Affiliated Hospital of Harbin Medical University

Aim To establish a mammography (MG)-based radiomic nomogram for predicting malignant risk of breast suspicious microcalcifications (MCs).

Methods 496 patients with histologically confirmed BI-RADS category 4 suspicious MCs were randomly divided into the training set (n=346) and the validation set (n=150). Radiomics features was extracted from the craniocaudal (CC) and mediolateral oblique (MLO) images. Least absolute shrinkage and selection operator (LASSO) algorithm were used to select radiomics features, then radiomics score (rad-score) was calculated. Univariate analysis was used to identify malignant MCs-related clinical independent risk factors. Multivariate logistic regression was used to establish a clinical-radiomics model by incorporating rad-score and clinic factors. A nomogram was developed to visualize the clinical-radiomics model. The receiver operating characteristic (ROC) curve、calibration curve and decision curve analysis (DCA) were used to evaluate the performance of the nomogram.

Results The rad-score was consisted of 29 optimal radiomics features. We developed a nomogram by incorporating rad-score, menopause status, MCs morphology and distribution, the area under the curve (AUC) value of the combined model was 0.929 (95%CI:0.896-0.962) for the validation set. The calibration curves and DCA indicated the combined model had favorable calibration and clinical utility.

Conclusion The combined model could be considered as a potential imaging marker to predict malignant risk of breast suspicious MCs.

PO-1349

Prediction of HER2 Status in Breast Cancer by Mammographic Radiomics Features and Clinical Characteristics: A Multicenter Study

Yalan Deng¹, Yiping Lu², Bo Yin², Li Liu¹
1. Fudan University Shanghai Cancer Center
2. Huashan Hospital, Fudan University

Objectives: To preoperatively evaluate the human epidermal growth factor 2 (HER2) status in breast cancer using radiomics features extracted from digital mammograph (DM) and clinical characteristics.

Methods: This study included a cohort of 1512 Chinese women, with invasive ductal carcinoma of no special type (IDC-NST), from two different hospitals (1332 from Institution A, used for training and testing the models, and 180 women from Institution B, as the external validation cohort). The Gradient Boosting Machine (GBM) was employed to establish radiomics model and multiomics model using radiomics features and clinical characteristics. Model efficacy was evaluated by the area under the curve (AUC).

Results: The number of HER2 positive patients in the training, testing and external validation cohort was 245(26.3%), 105 (26.3.8%) and 51(28.3%), respectively, with no statistical differences among the three cohorts ($P = 0.842$, Chi-square test). The radiomics model, based solely on the radiomics features, achieved an AUC of 0.814 (95% CI: 0.784-0.844) in the training cohort, 0.776 (95% CI: 0.727-0.825) in the testing cohort and 0.702 (95% CI: 0.614-0.790) in the external validation cohort. The multiomics model, incorporated radiomics features with clinical characteristics, consistently outperformed the radiomics model with AUC values of 0.838 (95% CI: 0.810-0.866) in the training cohort, 0.788 (95% CI: 0.741-0.835) in the testing cohort, and 0.722 (95% CI: 0.637-0.811) in the external validation cohort.

Conclusions: Our study demonstrates that a model based on radiomics features and clinical characteristics has the potential to accurately predict HER2 status of breast cancer patients across different centers.

PO-1350

Automatic deep learning method for detection and classification of breast lesions in dynamic contrast-enhanced magnetic resonance imaging

Weibo Gao, Jixin Chen, Fengjun Zhao, Xin Chen
Second affiliated hospital of Xian Jiaotong University, China

Purpose: The purpose of this study was to develop a deep learning-based system with a cascade feature pyramid network for the detection and classification of breast lesions in dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI).

Methods: This retrospective study enrolled 191 consecutive patients with pathological confirmed breast lesions who underwent preoperative magnetic resonance imaging (MRI) at the Second Affiliated Hospital of Xi'an Jiaotong University. Patients were randomly divided into a training set

comprising 153 patients with 126 malignant and 27 benign lesions and a validation set containing 38 patients with 31 malignant and 7 benign lesions under 5-fold cross-validation. Two radiologists annotated the location and classification of all lesions. After augmentation with pseudo-color image fusion, MRI images were fed into the developed cascade feature pyramid network system, feature pyramid network, and faster region-based convolutional neural network (CNN) for breast lesion detection and classification, respectively. The performance on large (>2 cm) and small (≤ 2 cm) breast lesions was further evaluated. Average precision (AP), mean AP, F1-score, sensitivity, and false positives were used to evaluate different systems. Cohen's kappa scores were calculated to assess agreement between different systems, and Student's t-test and the Holm-Bonferroni method were used to compare multiple groups.

Results: The cascade feature pyramid network system outperformed the other systems with a mean AP and highest sensitivity of 0.826 ± 0.051 and 0.970 ± 0.014 (at 0.375 false positives), respectively. The F1-score of the cascade feature pyramid network in real detection was also superior to that of the other systems at both the slice and patient levels. The mean AP values of the cascade feature pyramid network reached 0.779 ± 0.152 and 0.790 ± 0.080 in detecting large and small lesions, respectively. Especially for small lesions, the cascade feature pyramid network achieved the best performance in detecting benign and malignant breast lesions at both the slice and patient levels.

Conclusions: The deep learning-based system with the developed cascade feature pyramid network has

the potential to detect and classify breast lesions on DCE-MRI, especially small lesions.

PO-1351

Use of Dixon in magnetic resonance breast contrast-enhanced T1 weighted imaging for mastectomy patients at 3T

Qing Fu, Jie Liu, Chen Huang, Ziqiao Lei, Fan Yang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430022, China

Background: For patients with complete breast resection, conventional contrast-enhanced T1-weighted imaging (CE-T1WI) with frequency-selective spectral attenuated inversion recovery (SPAIR) provides limited fat suppression on the postoperative side due to the uneven skin surface, inhomogeneous tissue environment, and frequency-selective feature of the SPAIR scheme, leading to difficulties in precise diagnosis. This study aimed to investigate the image quality and performance of the Dixon method compared with SPAIR in breast CE-T1WI for mastectomy patients.

Materials and Methods: A total of 114 consecutive postmastectomy female patients were enrolled to undergo CE-T1WI with SPAIR and Dixon breast scans, and 60 female patients who had not performed any breast surgeries were randomly selected retrospectively as the control group. Subjective scores were rated using a 5-point scale. Objective parameters, including CNR, edge sharpness, and signal uniformity were measured and calculated. The Wilcoxon rank-sum test and Kappa statistic were used.

Results: The subjective scores of T1WI with SPAIR in the control group were all significantly better than those with SPAIR on the postoperative side of mastectomy patients ($P < 0.01$). Dixon outperformed SPAIR with significantly better subjective scores in regards to uniformity and degree of fat-suppression, anatomical structures depiction, lesion conspicuity, and axillary visibility ($p < 0.05$) in both post- and non-operative sides and bilateral axillary areas. The objective parameters of Dixon were significantly better than those of SPAIR.

Conclusion: The Dixon method provided better image uniformity and higher fat suppression efficiency, and showed significant advantages in delineating the anatomical structures, with better axillary and lesion visibilities, especially on the completely removed breast side.

PO-1352

MRI Radiomics for the Preoperative Evaluation of Lymphovascular Invasion in Breast Cancer: A Meta-Analysis

Qinqin Ma, Junqiang Lei
the First Hospital of Lanzhou University

Purpose: To evaluate the ability of preoperative MRI-based radiomic features in predicting lymphovascular invasion (LVI) in patients with breast cancer.

Methods: PubMed, Embase, Web of Science, Cochrane Library databases, and four Chinese databases were searched to identify relevant studies published up until June 15, 2023. Two reviewers screened all papers independently for eligibility. We included diagnostic accuracy studies that used radiomics-MRI for LVI in patients with breast cancer, using histopathology as the reference standard. Quality was assessed using the Quality Assessment of Diagnostic Accuracy Studies 2 and Radiomics Quality Score. Overall diagnostic odds ratio (DOR), sensitivity, specificity and area under the curve (AUC) were calculated to assess the prediction efficacy of MRI-based radiomic features in patients with breast cancer. Spearman's correlation coefficient was calculated and subgroup analysis performed to investigate causes of heterogeneity.

Results: Eight studies comprising 1685 female patients were included. The pooled DOR, sensitivity, specificity, and AUC of radiomics in detecting LVI were 23 [confidence interval (CI) 16,32], 0.89(0.86,0.92), 0.82 (0.78,0.86), and 0.83(0.78,0.87), respectively. The meta-analysis showed significant heterogeneity among the included studies. No threshold effect was detected. Subgroup analysis showed that more than 200 participants, radiomics with clinical factors, semiautomatic segmentation method and peritumoral or intra- and peritumoral model [DOR: 28(18,42), 26(19,37), 34(16,70), 40(10,156), respectively] could improve diagnostic performance compared with less than 200 participants, only radiomics, manual segmentation method, and tumor model [DOR: 16(7,37), 21(6,73), 20(12,32), 21(13,32), respectively].

Conclusion: Our meta-analysis showed that preoperative MRI-based radiomic features performs well in predicting LVI in patients with breast cancer. This noninvasive and convenient tool may be used to facilitate preoperative identification of LVI in breast cancer.

PO-1353

The specific manifestations of ultrasound and mammography to predict the malignancy of primary architectural distortion detected on mammography

Shuping Zhang, Zhenzhen Shao, Peifang Liu, Hong Lu, Wengui Xu
Tianjin Medical University Cancer Institute and Hospital

Objective To evaluate the detailed mammographic, ultrasonic and clinical features that may contribute to the prediction of malignancy in the presentation of architectural distortion (AD) on mammography.

Materials and methods We performed a retrospective study of consecutive female patients with architectural distortion on screening or diagnostic mammography from January 2015 to

December 2018. All the mammographic and ultrasonic imaging findings and pathology outcomes were reviewed. The t-test or Mann-Whitney U test was used to analyze the continuous variables, and the Chi-squared test or two-tailed Fisher's exact tests was used to analyze the categorical variables. Univariate and multivariate logistic regression analysis were conducted to assess the potential risk factors for ADs with malignant pathologic outcomes. $P < 0.05$ was considered statistically significant.

Results A total of 344 patients with 346 lesions were enrolled finally, with an average age of 47.40 ± 10.07 years. The PPV of architectural distortion for malignancy was 65.9% (228/346). The most common finding was invasive ductal carcinoma with or without lobular features (149/346, 43.06%) and the most common non-malignancy was radial scar or complex sclerosing lesions (48/346, 13.87%). Our study showed a trend that palpable architectural distortion on mammography being more likely to represent malignancy (141/169, 83.43%) than non-palpable architectural distortion (87/177, 49.15%) ($p < 0.001$). There was a trend toward pure architectural distortion being less likely to represent malignancy (111/187, 59.4%) than architectural distortion with associated other mammographic findings (117/159, 73.58%), and the difference was statistically significant ($p = 0.005$). 343 cases with 345 AD lesions had sonographic correlate to the architectural distortion detected on mammography. And the most common types of ultrasound findings were non-mass like hypoechoic area (217/345, 62.90%). There was a trend that AD lesions with sonographic correlate as non-mass like hypoechoic area and mass were more likely to represent malignancy than those with sonographic correlate as architectural distortion and other abnormalities, with a significantly statistical difference ($p < 0.001$). The results of logistic regression analysis showed that the occupying effect score of 3 on ultrasound was an independent risk factor for indicating malignant AD (OR = 172.332, 95% CI 52.148-569.496, $p < 0.001$).

Conclusion The occupying effect score on ultrasound maybe a strong independent predictor of malignancy of mammographic architectural distortion. And targeted "second-look" ultrasound can improve the detection of correlate ultrasound abnormality for AD, especially some nonmass-like lesions.

PO-1354

Benign and Malignant Mucocele-Like lesion of the Breast: Imaging Features

Xiaocui Rong, Yihe Kang, Guang Yang
The Fourth Hospital of Hebei Medical University

OBJECTIVE To analyzed the mammographic, sonographic and MRI imaging features of Mucocele-Like lesion (MLL), and especially highlight the MR findings.

MATERIALS AND METHODS Pathology database in our hospital was searched for diagnosed MLL of the breast between January 2017 and June 2022. All mammographic and MRI images were independently reviewed by two radiologists according to the BI-RADS, and final features and diagnosis were reached by consensus. All sonographic images were retrospectively analyzed by an experienced ultrasound expert based on the US BI-RADS.

RESULTS Eighteen patients with 19 lesions were included in this study. The manifestations of MLL on mammography were distributed as follows: 7 masses (41.2%; 3 associated with calcifications), 5 asymmetry (29.4%; 4 with calcifications), 4 calcifications (23.5%) and 1 architectural distortion (5.9%). Of the 17 lesions, calcifications were seen in 64.7% of cases. The manifestations of MLL on ultrasonography were distributed as follows: 10 masses (6 cystic solid masses, 2 cystic masses and 2 solid masses), 6 heterogeneous echo areas, 1 calcification and 1 duct dilatation. The MRI finding of MLL were as follows: one negative, 4 masses and 6 non-mass enhancement (NME). Among the 4 masses, 3 lesions shape were irregular and showed inhomogeneous high signal on T2WI and showed no obvious enhancement.

CONCLUSION Calcifications are seen in most MLL of the breast on mammography. Ultrasonography often shows cystic solid mass. MRI finding of MLL are characterized as irregular

masses with obvious high signal on T2WI and showed no obvious enhancement. These findings are nonspecific, MLL are hard to diagnosis only by imaging findings.

PO-1355

Differential diagnosis of benign and malignant breast calcification by contrast-enhanced spectral mammography

Jie Liu¹, Juan Tao¹, Wenying Zhu¹, Shuyi Peng¹, Peng Sun², Fan Yang¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Clinical & Technical Solutions, Philips Healthcare

Objective Mammography exhibits a high degree of sensitivity in detecting microcalcifications. However, certain breast lesions present solely as calcifications, lacking mass or structural distortion. Consequently, qualitative diagnoses rely on the distribution and morphology of calcifications. In cases of suspicious malignant calcification (BI-RADS 4), Dual-Energy Contrast Enhanced Spectral Mammography (CEM) can furnish information regarding the blood supply to breast tissue in calcified regions. This study endeavors to investigate the potential of DE-CESM to enhance the accuracy of qualitative diagnoses for microcalcifications of BI-RADS 4.

Methods From June 2021 to October 2022, all patients who underwent CEM and were diagnosed with suspicious malignant calcification (BI-RADS 4) on low-energy images were included in this study. All diagnoses were subsequently confirmed via surgical pathology. Two experienced radiologists independently evaluated both the low-energy images and the CEM silhouette images. The low-energy images characterized calcifications by their morphology and distribution type, categorizing them into low-risk and high-risk groups. The CEM silhouette images documented whether or not the calcified area exhibited enhancement. The sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) of diagnosing malignant calcification based on low-energy images alone or in combination with CEM images were compared between groups. The additional diagnostic performance of CEM images for BI-RADS 4 calcifications was also evaluated.

Results Of the 67 pathologically confirmed lesions, 32 were malignant and 35 were benign. Using histopathology as the gold standard, the sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and accuracy of diagnosing malignant calcifications based solely on low-energy images were 68.7% (22/32), 88.5% (31/35), 53.6% (22/41), 86.1% (31/36), and 79.1% (53/67), respectively. The sensitivity, specificity, PPV, NPV, and accuracy of diagnosing malignant calcifications using a combination of CEM silhouette images were 90.6% (29/32), 97.1% (34/35), 82.8% (29/35), 97.1% (34/35), and 94.0% (63/67), respectively. The sensitivity, PPV, and accuracy of DE-CESM in diagnosing malignant calcifications were significantly higher than those of low-energy images alone ($P < 0.05$).

Conclusion CEM can enhance the diagnostic efficiency of BI-RADS 4 calcifications, particularly for calcifications with low-risk morphology or distribution. CEM can also accurately locate calcification points and areas of enhancement, providing reliable clinical value for preoperative stereotactic localization of suspicious calcifications.

PO-1356

Breast Galactography with Contrast-enhanced mammography (CEM)—An innovative attempt

Juan Tao, Fan Yang

Union Hospital Tongji Medical College Huazhong University of Science and Technology

Objectives: This study used CEM protocol in galactography for the first time. To evaluation the application value of Contrast-enhanced mammography (CEM) in breast galactography.

Materials and Methods: 24 patients with pathological nipple discharge were examined using CEM-galactography and MRI. CEM-galactography presents two kinds of images per breast and per view— low-energy image and recombined image. Evaluation of the images created with the different imaging modalities was done by 3 investigators with varying levels of experience with complementary breast diagnostics (8 ,9 and 21 years), and their evaluations were compared with the histological findings. AGD differences were analyzed by Mann-Whitney U test.

Results: The average age of the 24 patients was 45.9 years. The average glandular dose (AGD) of CEM-galactography (median:1.65 mGy) was 21.8% higher than low-energy imaging (1.29 mGy) ($P<0.001$) in CC view, while the AGD of CEM-galactography (1.65 mGy) increased by 21.8% compared with low-energy imaging (1.29 mGy) ($P<0.001$) in ML view. Their evaluations were compared with the histopathological assessment of the surgical specimens resected from the 24 patients. There were 4 cases of intraductal carcinoma, 5 cases with ductal carcinoma in situ 11 cases with intraductal papilloma and 4 cases with duct ectasia. The recombined image generated by CEM showed that the size of the lesion was closer to that of histopathological findings.

Conclusions: CEM-galactography can better display the size of the lesions and the details of the catheter branch than the low-energy image. It could be a useful complementary procedure for the diagnosis of breast anomalies and could herald a new aissance of this method. Compared with low-energy imaging, the investigators achieved better results with recombined image, as confirmed by histopathological findings.

PO-1357

Preoperative Prediction of Axillary Lymph Node Metastasis in Breast Cancer Based on Dynamic Contrast-Enhanced MRI including the Entire Axilla

Can Peng, Yao zhou Tang, Siyao Du, Lina Zhang

The First Affiliated Hospital of China Medical University

Purpose: To noninvasively predict axillary lymph node metastases(ALNM) in breast cancer using dynamic contrast-enhanced (DCE) magnetic resonance imaging (MRI) tumoral and entire axillary radiomic features combined with or without clinicopathologic characteristics of the primary tumor.

Methods: A total of 149 patients confirmed early-stage breast cancer between May 2020 and March 2023 were randomly divided (7:3) into training and vaidation cohorts. All patients underwent preoperative MRI scans, were treated with surgery and sentinel lymph node biopsy or ALN dissection, and were pathologically examined to determine the ALNM status. A total of 851 radiomic features were extracted for each patient from both tumor and axilla. The prediction models were built with the training set using logistic regression on the most significant radiomic features in the training set combined with or without clinicopathologic characteristics. The models were evaluated by discrimination, calibration, and clinical application and compared using DeLong test.

Results: The axillary-radiomic model performed the best with AUCs of 0.759 (95% CI: 0.661-0.857) and 0.739 (95% CI: 0.588-0.889) in the training and validation cohorts, respectively. The tumoral-radiomic model performed with AUCs of 0.733 (95% CI: 0.637-0.830) and 0.650 (95% CI: 0.483-0.818), respectively. After combining clinical features, including Menopausal status and TNM stage, the combined model in the validation cohort showed good calibration and excellent performance for ALN detection (AUC=0.928). Decision curve analysis demonstrated that the combined model were clinically useful.

Conclusion: This is the preliminary attempt to demonstrate the feasibility of using entire axillary radiomics to predict ALN metastasis in breast cancer preoperatively. The combined model could effectively help the ALNM diagnosis.

PO-1358

Accuracy of cone-beam breast CT for assessing breast cancer tumor size - comparison with breast MRI

Xiangchao Song, Mengran Zhao, Zhaoxiang Ye
Tianjin Medical University Cancer Institute & Hospital

Purpose: To evaluate the accuracy of cone-beam breast CT (CBBCT) and MRI in the assessment of tumor size and to analyse the factors influencing the discordance.

Methods: The patients with breast cancer were reviewed retrospectively. Two radiologists assessed the CBBCT and MRI features and measured the tumor size with a two-week washout period. Intraclass correlation coefficient (ICC) and Bland-Altman analyses were used to assess inter-observer reproducibility and agreement based on CBBCT, MRI and pathology. Univariate analyses of differences in clinical, pathological and CBBCT/MRI features between the concordant and discordant groups was performed using the t-test, Mann-Whitney U-test, chi-square test and Fisher's exact test. Multivariate analyses were used to identify factors associated with discordance of CBBCT/MRI with pathology.

Results: A total of 115 patients were enrolled. The reproducibility and the agreement ranged from moderate to excellent (ICC=0.607-0.983). ROC analyses showed that the cut-off values of CBBCT-pathology and MRI-pathology discordance were 2.25 cm and 2.65 cm, respectively. CBBCT/MRI-pathology concordance were significantly associated with the extent of pathology, lesion type, presence of calcification, HER-2 status and fatty infiltration ($p<0.05$). In lesions containing calcification, the difference of CBBCT-pathology was significantly smaller than MRI-pathology ($p=0.021$). Non-mass-enhancement (NME) was the main predictor of CBBCT- or MRI-pathology discordance (OR=3.293-6.469, $p<0.05$), and HER-2 positivity was a predictor of CBBCT-pathology discordance (OR=3.514, $p=0.019$).

Conclusion: CBBCT and MRI have comparable accuracy in measurement of tumor size, and CBBCT is advantageous in assessing the size of calcified lesions. NME and HER-2 positivity are significant predictors leading to discordance between CBBCT-pathology.

PO-1359

Dual-layer detector spectral CT based iodine density for the diagnosis of benign and malignant breast masses: compare with BIRADS categories in mammography

Huiying Wang

Shengjing Hospital Affiliated to China Medical University

Purpose: To compare the diagnostic accuracy of benign and malignant breast masses using dual-layer detector spectral CT (DLCT) based iodine density (ID) versus BIRADS categories in mammography.

Methods and Materials: A total of 34 patients with breast masses proved by pathology underwent venous phase (VP) contrast enhanced DLCT scan and digital mammography. The patients were classified into two groups (malignant group, n=18; benign group, n=16). The ID was extracted and normalized to the ID in the aorta (NIDVP). BIRADS categories in mammography were performed by three radiologists for all lesions respectively. Receiver operating characteristic (ROC) curves, sensitivity, and specificity were compared.

Results: BIRADS category of 1, 2, 3, 4A, 4B, 4C, 5 of breast masses were 0, 1, 5, 9, 8, 11, 0 cases respectively. The area under the curve (AUC) of area NIDVP and BIRADS categories respectively were 0.816 and 0.910, while 95% confidence interval were 66.40%-96.80% and 80.30%-100.00%, respectively. With a threshold of 0.21 for NIDVP, and 3.5 for BIRADS categories, the sensitivity, specificity value were 88.90%, 68.75% and 88.90%, 87.50%, respectively.

Conclusion: DLCT based ID was observed to perform equally with BIRADS categories in mammography in the differentiating between benign and malignant breast masses.

PO-1360

Prediction of Risks in Ductal Carcinoma in Situ with Micro-invasion based on Clinicopathological and Imaging Features

Xiaoping Zhou¹, Wei Yang²

1. Ningxia Medical University

2. Department of Radiology, General Hospital of Ningxia Medical University

Purpose: To establish a predictive model that accurately identifies ductal carcinoma in situ with micro-invasion based on preoperative clinicopathological and imaging features.

Methods: Retrospectively collected consecutive women who underwent preoperative mammography and breast MRI including dynamic contrast-enhanced imaging and diffusion-weighted imaging between June 2018 and February 2022 from a single institution and yielded the diagnosis of postoperative-proven DCIS and DCISM. A total of 149 patients were represented as the development set while a subsequent prospective validation set of 97 patients was recruited between March 2022 and April 2023. The independent risk factors were identified by using multivariable logistic regression analysis. The nomogram was established. The Kruskal-Wallis or X² test was used. **Results:** Multivariate logistic regression analysis displayed the independent risk factors for DCISM were P63 status (odds ratio [OR], 0.26; 95% confidence interval [CI], 0.09–0.72; P=0.009), necrosis (OR, 6.00; 95% CI, 2.25–15.99; P<0.001), Ki-67 proliferation index (OR, 6.46; 95% CI, 2.35–17.82; P<0.001) and minimum apparent diffusion coefficient (OR, 11.82; 95% CI, 4.10–34.04; P<0.001) in the development set, all of which were used to construct a predictive model presented as the form of a nomogram. Among the women who underwent surgery, 52 out of 149 (35%) in the development set and 36 out of 97 (37%) in the validation set were diagnosed with

DCISM. The predictive model combining the independent risk factors showed the areas under the receiver operating characteristic curve (AUC) at 0.91 (95% CI: 0.85, 0.95) in the development set and 0.90 (95% CI: 0.82, 0.95) in the validation set. **Conclusion:** The Nomogram to predict DCISM of patients with preoperative clinicopathological and imaging features is an effective tool that may improve the surgical plan for DCIS with or without micro-invasion.

PO-1361

Establishment of segmentation and classification model of breast tumors based on bilateral asymmetrical detection

Xiangying Yang, Leqing chen, Juan Tao, Jie Liu, Fan Yang
Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives: The purpose of this study was to develop a deep learning model for the segmentation and classification of breast tumors by embedding the algorithm of bilateral breast asymmetry and combining the advantages of contrast-enhanced mammography (CEM), so as to improve the diagnostic accuracy of breast cancer.

Methods: A total of 500 patients undergoing CEM examination and concurrent surgical treatment were enrolled in this study. The proposed deep learning model is called ERAssNet model. The ERAssNet model utilized four recombination (RC) and two low energy (LE) images to segment the breast lesion area and accurately evaluate the malignancy. It used three modules to analyze bilateral views of the affected and contralateral sides, extract morphological features, and integrate image texture features. The results of the BiERAssNet model were compared with the results of state-of-the-art (SOTA) models, such as UNet model, TransUNet model, etc.

Results: The model corrected 18% of incorrect malignant classifications compared to radiologists. Compared to the SOTA models, in the lumps classification task, the area under the curve (AUC) of the model is the largest, which is 0.9141. In terms of breast mass segmentation, the dice accuracy of UNet model and TransUNet model was 0.77 and 0.84, while the dice accuracy of this model was improved to 88.18%.

Conclusion: We embedded the diagnosis algorithm of bilateral breast asymmetry and combined the advantages of CEM examination to establish a deep learning model, which could be superior to the existing SOTA model, and improve the diagnostic accuracy of breast cancer.

PO-1362

Tumour size change based on early DCE-MRI treatment for predicting neoadjuvant efficacy in breast cancer and the construction of an integrated clinical prediction model

Tingting Wan
Jiangxi Cancer Hospital

OBJECTIVE: To explore the value of tumour size change in early stage of treatment based on breast dynamic-enhanced magnetic resonance (DCE-MRI) for predicting pathological complete remission (pCR) after neoadjuvant therapy (NAT) for breast cancer, as well as the construction of a clinically comprehensive prediction model by combining with meaningful clinicopathological indicators. **METHODS:** A retrospective analysis was performed on 117 breast cancer patients who underwent breast DCE-MRI both before NAT and after 2 cycles of treatment from April 2019 to December 2021 in Jiangxi Province Cancer Hospital. They were randomly divided into training set and test set according to the ratio of 7:3, and divided into pCR group and non-pathological complete remission (non-pCR) group according to the pathological results at the end of NAT. Based on DCE-

MRI images, the relative regression value of the maximum diameter of the tumour before and after treatment (Diameter%) was calculated, and the relative reduction value of the volume of the tumour before and after treatment (Volume%) was calculated by semi-automatic outlining of the three-dimensional region of interest with the 3Dslicer software; the prediction models of Diameter% and Volume% were constructed respectively. The general data of the patients were statistically analysed, and the indicators that were meaningful in the one-way analysis were selected and then screened and reduced by the stepwise regression method, so as to construct the logistic regression clinical comprehensive prediction model, and to draw the column line diagram. The diagnostic efficacy of the above models was evaluated and compared.

Results: The AUC values of the Diameter% prediction model were 0.71 and 0.77 for the training set and the test set, respectively; and the AUC values of the Volume% prediction model were 0.68 and 0.80 for the testing set; the AUC values of the ER, PR, HER2 status, Ki67 index, molecular typing, Diameter%, and Volume% were statistically different between the training set pCR group and the non-pCR group. statistically different, and ER, HER2 status, Ki67 index, and Diameter% were screened by stepwise regression for constructing a clinically comprehensive model, which had the highest AUCs (0.86, 0.83), and whose ability to predict pCR in the test set was improved by 19.31% and 23.18% compared with the Diameter% and Volume% prediction models, respectively ($P=0.035, 0.005$) in the test set, and its clinical calibration curve showed that the model had good efficacy in predicting pCR. CONCLUSION: DCE-MRI-based changes in the size of tumours in the early stage of treatment can be a biomarker for non-invasive prediction of NAT outcome; and the clinically integrated prediction model constructed by Diameter%, ER, HER2 status, and Ki67 index has a high clinical application value for early prediction of pCR.

PO-1363

Identify molecular subtypes in breast cancer using time-dependent diffusion MRI based microstructural mapping

Xiaoxia Wang, Jiuquan Zhang

Department of Radiology, Chongqing University Cancer Hospital

Background: Time-dependent diffusion MRI (td-dMRI) has the potential to characterize tumor cell properties; however, its performance in identifying molecular subtypes of breast cancer is unknown. Purpose: To explore the feasibility of td-dMRI based microstructural mapping for noninvasive identification of molecular subtypes of breast cancer.

Materials and Methods: We prospectively enrolled participants with invasive breast cancer who underwent td-dMRI between February 2021 and December 2022. Four td-dMRI microstructural parameters and three conventional apparent diffusion coefficient measurements were estimated and compared among three molecular subtypes. Shapley additive explanations were used for unbiased evaluation the contribution of each parameter to model performance, and then we combined the top contributors to identify each molecular subtype. The predictive performance was assessed through area under the receiver operating characteristic curve (AUC) analysis and compared using the DeLong, net reclassification improvement (NRI) and integrated discrimination improvement (IDI) tests.

Results: The analysis included 337 patients (mean age: 52.32 years \pm 10.32 [standard deviation]) who were randomly divided into training and validation groups (236 and 101 patients, respectively). In the training and validation groups, the cellularity achieved the highest predictive performance for identifying luminal (AUC: 0.77 [95% CI: 0.71, 0.83] and 0.79 [95% CI: 0.70, 0.88]), human epidermal growth factor receptor-2 (AUC: 0.78 [95% CI: 0.71, 0.84] and 0.79 [95% CI: 0.66, 0.92]), and triple negative breast cancer (AUC: 0.63 [95% CI: 0.54, 0.72] and 0.69 [95% CI: 0.58, 0.80]), outperforming conventional apparent diffusion coefficient measurements (IDI test: all $P < 0.05$). In luminal subtype, combining cellularity and diameter significantly improved the predictive performance than using cellularity alone both in training (AUC: 0.80 [95% CI: 0.74, 0.85]) and validation groups (AUC: 0.82 [95% CI: 0.73, 0.89]) (NRI and IDI tests: all $P < 0.05$).

Conclusion: Time-dependent diffusion MRI-based microstructural mapping is effective for identification of molecular subtypes of breast cancer.

PO-1364

Tomoelastography complementing diffusion-weighted imaging for the prediction of pathological complete response to neoadjuvant chemotherapy in patients with breast cancer: A prospective longitudinal study

Xiaoxia Wang, Jiuquan Zhang
Department of Radiology, Chongqing University Cancer Hospital

Background: MRI is widely used for predicting pathologic complete response (pCR) in breast cancer but less knowledge about the role of combining apparent diffusion coefficient (ADC) and tomoelastography.

Purpose: To gain further knowledge about temporal trends of neoadjuvant chemotherapy (NAC)-associated ADC and biomechanical parameters quantified with tomoelastography and predict pCR. Materials and Methods: In this prospective longitudinal study, participants with breast cancer who received NAC were enrolled from February 2021 to May 2022. Participants underwent breast MRI at pre-NAC (T1), after 2 cycles (T2), 4 cycles (T3), and 6 cycles of NAC (T4). ADC, shear-wave-speed (c) and loss-angle (ϕ) quantifying stiffness and fluidity were obtained and compared by generalized estimating equation. Predictive performance was assessed with area under the receiver operating characteristic curve (AUC) analysis.

Results: A total of 109 participants (mean age, 50.15 years \pm 7.86 [standard deviation]) were enrolled, 29 participants experienced pCR. The ADC showed a significant upward trend in total participants, c and ϕ decreased significantly among total participants and three molecular subgroups (all $P < 0.001$). For predicting pCR, ADC combined with c and ϕ achieved the highest predictive performance at T3 (AUC, 0.803; 95% confidence interval [CI]: 0.715, 0.874), better than either ADC ($P = 0.006$) or c ($P = 0.043$) alone. In Luminal B subtype, ϕ at T3 was highly predictive of pCR (AUC, 0.832; 95% CI: 0.703, 0.921), while combining ADC, c and ϕ at T2 achieved the highest predictive performance in human epidermal growth factor receptor 2-enriched (AUC, 0.771; 95% CI: 0.531, 0.921) and triple negative breast cancer subtypes (AUC, 0.864; 95% CI: 0.678, 0.965).

Conclusion: During the course of NAC, the increase in ADC and decreases in stiffness and fluidity were more significant in patients with pCR, combining ADC and biomechanical properties at mid-NAC could predict pCR with good accuracy.

PO-1365

A Robust Deep Learning Framework for Automatic Molecular Subtypes Assessment in Breast Cancer Based on MRI: a Multicenter Study

Xiaoxia Wang, Jiuquan Zhang

Department of Radiology, Chongqing University Cancer Hospital

Background Accurate prediction of molecular subtype enables personalized treatment for breast cancer.

Purpose To build a novel deep learning framework using pretreatment dynamic-contrast enhanced (DCE) MRI for lesion segmentation and automatic molecular subtypes assessment in breast cancer without any human interaction and validate the robustness by multicenter data.

Methods In this multicenter study, eligible patients who had biopsy-proven breast cancer were recruited. And their pretreatment breast DCE-MRIs were collected for analysis. We designed an automatic segmentation model for lesions from DCE-MRI, using the 3D-ResU-Net as the backbone. We used dice to evaluate the lesion segmentation performance. Moreover, we further proposed an ensemble molecular subtypes classification model (Ensembled ResNet) merging both 2D and 3D features from lesion from a training cohort. The accuracy of Ensembled ResNet for the prediction of molecular subtypes in breast cancer was verified in one internal and two external validation cohorts. Model performances were evaluated using area under the curve (AUC).

Results Between January 2015 and January 2021, 632 patients were retrospectively recruited. Our proposed segmentation method had high accuracy among the three validation cohorts (dice scores: 0.8606, 0.8530, 0.8451) and four molecular subtypes (dice scores: 0.8525, 0.8432, 0.8290, 0.8559). Ensembled ResNet had favourable accuracy for the prediction of Luminal A subtypes (AUC of 0.7485), Luminal B subtypes (AUC of 0.6854), HER2-enriched subtypes (AUC of 0.7792) and triple negative breast cancer (AUC of 0.7999), superior than 2D-ResNet, 3D-ResNet and radiomics models in all validation datasets (with all $p < 0.05$, except for the comparison between Ensembled ResNet and the 2D-ResNet model in Luminal B and TNBC subtypes).

Conclusions Our proposed novel deep learning framework can fully automatically assess molecular subtypes with high accuracy and robustness in patients with breast cancer. And this proposed framework may be a noninvasive decision-making tool with great potential in clinical application.

PO-1366

Extracellular volume fraction derived from routine chest dual-energy CT for the characterization of breast tumor: Comparison with apparent diffusion coefficient and validation against histopathological findings

Xiaoxia Wang, Jiuquan Zhang

Department of Radiology, Chongqing University Cancer Hospital

Background: Tumor aggressiveness and therapeutic response are influenced not only by cancer cells but also by the extracellular matrix in tumor microenvironment, which can be quantified by extracellular volume (ECV) fraction derived from dual-energy CT (DECT).

Purpose: To investigate the feasibility of using routine chest DECT-derived ECV fraction for the characterization of breast tumor, compared to apparent diffusion coefficient (ADC) and validated against histopathological findings.

Methods: The ECV fraction and ADC value were retrospectively assessed in patients with breast tumor using routine chest DECT and breast MRI, respectively. The diagnostic performance in

predicting the histopathological characteristics [benign vs. malignant, invasive carcinoma vs. ductal carcinoma in situ (DCIS)], immunohistochemical biomarker status and pathological complete response (pCR) status. Histopathological sections (H&E staining) were analyzed to assess histopathological ECV by digital image analysis. Pearson's correlation analysis was used to correlate between DECT-derived ECV and histopathological ECV fractions.

Results: This study included 271 patients, with 314 breast lesions (61 benign and 253 malignant). The ECV fraction and ADC value showed comparable area under the curve (AUC) for distinguishing benign from malignant lesions (0.777 and 0.822, $p = 0.123$) and invasive carcinoma from DCIS (0.640 and 0.727, $p = 0.115$). There were significant differences in ECV fraction between different hormone receptor and Ki67 states ($p = 0.001 \sim 0.014$), while ADC values only differed among various Ki67 states ($p < 0.001$). The ECV fraction was lower ($p = 0.007$), while the ADC value was higher ($p = 0.013$) in the pCR than in the non-pCR group, with an AUC value of 0.748 and 0.730 ($p = 0.887$), respectively. There was a positive correlation between DECT-derived ECV and histopathological ECV fractions ($r = 0.615$, $p < 0.01$).

Conclusions: Routine chest DECT-derived ECV fraction is a viable quantitative imaging biomarker for the characterization of breast tumor.

PO-1367

Clinical Study on the Prediction of ALN Metastasis Based on Intratumoral and Peritumoral DCE-MRI Radiomics and Clinicoradiological Characteristics in Breast Cancer

yunxia wang, hongna tan

People's Hospital of Henan University & Henan Provincial People's Hospital

Abstract

Objective: To investigate the value of predicting axillary lymph node (ALN) metastasis based on intratumoral and peritumoral dynamic contrast-enhanced MRI (DCE-MRI) radiomics and clinicoradiological characteristics in breast cancer. **Methods:** A total of 473 breast cancer patients who underwent preoperative DCE-MRI from Jan 2017 to Dec 2020 were enrolled. These patients were randomly divided into training ($n=378$) and testing sets ($n=95$) at a ratio of 8:2. Intratumoral regions (ITR) of interest were manually delineated and peritumoral region of 3 mm (3mmPTR) were automatically obtained on images. Radiomics features were extracted and ALN status-related radiomics features were selected by Mann-Whitney U test, Z-score normalization, variance thresholding, K-best algorithm and least absolute shrinkage and selection operator (LASSO) algorithm. Clinicoradiological risk factors were selected by logistic regression, which were also used to construct predictive models combined with radiomics features. Then 5 models were constructed, including ITR, 3mmPTR, ITR+3mmPTR, clinicoradiological and combined (ITR+3mmPTR+clinicoradiological) models. The performance of the models were assessed by sensitivity, specificity, accuracy, F1score and the area under the curve (AUC) of receiver operating characteristic (ROC), calibration curves and decision curve analysis (DCA). DeLong test was used to compare the AUC differences among the models. **Results:** A total of 2264 radiomics features were extracted from each regions of interest (ROI), 3 and 10 radiomics features were selected for the ITR and 3mmPTR respectively. 5 clinicoradiological risk factors were selected by logistic regression, including lesion size, human epidermal growth factor receptor 2 (HER2) expression, status of vascular cancer thrombus and MR reported-ALN status, time-signal intensity curve (TIC) type. In the testing set, the combined model showed the highest AUC (0.839), specificity (74.2%), accuracy (75.8%) and F1Score (69.3%) among the 5 models. DCA showed it had the greatest net clinical benefit compared to the other models. **Conclusion:** The intra- and peritumoral radiomics models based on DCE-MRI could be used to predict ALN metastasis in breast cancer, especially for the combined model with clinicoradiological characteristics showing promising clinical application value.

PO-1368

Synthetic MRI and Apparent Diffusion Coefficient (ADC) Measurement in Breast Tumor: Effect of Region-of-Interest Methods on Quantitative Values and Diagnostic Ability

Weibo Gao, Quanxin Yang, Xiaocheng Wei
Second affiliated hospital of Xian Jiaotong University, China

Purpose: To investigate the difference in synthetic MRI and apparent diffusion coefficient (ADC) measurements of differently shaped regions of interest (ROIs) in breast tumors, and to investigate the diagnostic ability of differently shaped ROIs in differentiating benign from malignant breast tumors.

Materials and Methods: One hundred and ten patients with breast tumors with a solid component were evaluated. The patients underwent magnetic resonance (MR) examinations including Synthetic MRI (MAGiC) and diffusion-weighted imaging using a 3.0T MR system. Two readers measured quantitative synthetic MRI and ADCs using four ROI methods: round, square, freehand, and whole tumour volume (WTV) ROIs. The interclass correlation coefficient (ICC) and repeated-measures analysis of variance were used to assess their measurement reliability and to compare quantitative synthetic MRI and ADCs for each ROI method. Receiver operating characteristic curve analysis and unpaired t-test on each ROI were used to differentiate benign and malignant breast tumors and assess the diagnostic ability.

Results: All ROI methods of mean values showed good or excellent correlations (0.72–0.93). ADC, T2 and PD values differed significantly between the benign and malignant lesions ($P < 0.05$). When using the square ROI, the mean, minimum and maximum values of ADC and T2 maps were the highest. The optimal cutoff mean values of square ROI for ADC, T2 and PD maps in differentiating benign and malignant tumors were $1.25 \times 10^{-3} \text{ mm}^2/\text{s}$, 91.32msec and 83.03pu respectively. The ADCs in the different ROI methods showed the highest areas under the curve. Mean, minimum and maximum ADCs, T2s and PDs from all ROIs showed significant differences between benign and malignant tumors ($P < 0.05$).

Conclusion: The ROI shape influences quantitative synthetic MRI and ADC values and the optimal cutoff their values for differentiating benign from malignant breast tumors.

PO-1369

Prediction of Pathological Complete Response to Neoadjuvant Chemotherapy in Breast Cancer using a Deep Learning–Machine Learning Fusion Approach

Jialing Liu, Xu Li, Weixiong Zeng, Zilong He, Weiguo Chen
Nanfang Hospital of Southern Medical University

Objectives: To build and validate deep learning (DL) and machine learning (ML) fusion models to evaluate the pathological complete response (pCR) to neoadjuvant chemotherapy (NAC) in breast cancer based on longitudinal Magnetic Resonance Imaging (MRI) images and clinical features.

Methods: We proposed a deep learning model based on long short-term memory (LSTM) network to capture the sequential information in longitudinal dynamic contrast-enhanced (DCE) MRI images, using public dataset from I-SPY2 trial of The Cancer Imaging Archive ($n=255$). Longitudinal DCE-MRI scans were retrospectively enrolled in patients with breast cancer who received NAC followed

by surgery at center A (n=150). Clinical, imaging, and clinical-imaging models were constructed by obtaining the clinical and imaging features from center A; five ML algorithms were used as classifiers. We then combined the LSTM model's prediction probabilities with the clinical and imaging features to build the fusion model. Model classification performance were evaluated using the area under the receiver operating characteristic curve (AUC), decision curve analysis (DCA), and the calibration curve.

Results: Compared with the ML models and LSTM models, the fusion model achieved the best performance for pCR prediction in the test set with a good level of calibration. The optimal classifier (random forest) exhibited high predictive performance in the test set, yielding an AUC 0.937 (95% CI: 0.823-0.988), accuracy 0.866, sensitivity 0.714 and specificity 0.935. DCA confirmed that, compared with the ML models, LSTM models, the fusion model presented the greatest net benefit. For the optimal model, the top features for predicting pCR were LSTM model's prediction, peritumoral edema on T2WI (post-NAC) and HER2 status.

Conclusions: A fusion model that combined longitudinal DCE-MRI images and clinical-imaging features showed good performance for predicting pCR to NAC in patients with breast cancer, which could guide physicians' selection for NAC treatment.

PO-1370

Histogram Analysis of Diffusion-weighted Imaging with a Fractional Order Calculus Model in Breast Cancer: Diagnostic Accuracy and Correlation with Prognostic Factors

Caili Tang
Fudan University Shanghai Cancer Center

Background

This study explored the diagnostic accuracy of diffusion-weighted imaging (DWI) with a fractional order calculus (FROC) model in differentiating breast lesions and the correlation between FROC-derived diffusion parameters and prognostic factors and molecular subtypes in breast cancer.

Methods

This retrospective study included 147 patients confirmed by histopathology. All patients underwent breast DWI with multi-b values (0, 50, 100, 200, 400, 800, 1200, and 2000 s/mm²) based on simultaneous multi-slice (SMS) readout-segmented echo-planar imaging (rs-EPI) at 3.0T MR scanner. The histogram metrics of mono and FROC DWI-derived parameters were compared between the benign and malignant groups and the groups with different prognostic factor statuses. The histogram results of each DWI-derived parameters among the different molecular subtypes were compared. The diagnostic performance of apparent diffusion coefficient (ADC) and FROC-derived parameters in differentiating benign and malignant breast lesions were assessed.

Results

The parameters of ADC-median, DFROC-mean and DFROC-median had similar diagnostic performance. The values of ADC-mean, DFROC-10%, DFROC-mean, DFROC-median, β FROC-10%, β FROC-mean, and β FROC-median were significantly lower in the ER-positive group compared with ER-negative group. The tumors with PR-negative showed significantly higher β FROC-10%, β FROC-mean, and β FROC-median values than those with PR-positive. The values of DFROC-skewness, β FROC-10%, and β FROC-mean showed significant differences in differentiating the triple-negative subtype and the Luminal subtype.

Conclusions

The histogram analysis of diffusion parameters based on the FROC model showed similar diagnostic performance for identifying breast lesions compared with the conventional ADC.

Additionally, the FROC-derived parameters provided more information about the prognostic factors and molecular subtypes of breast cancer.

PO-1371

Application of Breast Cancer Heterogeneity Combined with Visual Features of MR Images in Predicting Lymph Node Metastasis of cN0 Breast Cancer

Dingli Ye
JiLin Cancer Hospital

Purpose

To explore the application value of breast cancer heterogeneity information together with visual features of magnetic resonance (MR) images in the prediction of axillary lymph node metastasis (ALNM) in cN0 stage breast cancer.

Materials and Methods

The clinical, pathological and imaging data of 284 female breast cancer patients who underwent preoperative breast-enhanced MRI examinations and surgical treatments at Jilin Cancer Hospital from January 2016 to June 2020 were retrospectively analyzed. In the heterogeneity analysis, the intensities of each voxel in the lesion in three different phases were extracted. The three phases were pre-contrast injection phase, contrast enhancement phase and the delayed phase. The heterogeneity information of the lesion was quantified according to equation (1).

(1)

Patients were randomly divided into the training group ($n = 199$) and validation group ($n = 85$) in the ratio of 7:3. Six machine learning (ML) models, including logistic regression, random forest, naive Bayes algorithm, decision tree, k-nearest neighbors (KNN) algorithm and support vector machine model, were used to process the data of the two groups. The efficacy of each ML model for the diagnosis of ALNM in breast cancer patients was analyzed using the receiver operating characteristic (ROC) analysis, and the best model was selected according to the area under the curve (AUC) of the validation group. The clinical benefit of the best model was evaluated by the decision curve analysis (DCA).

Results

A total of 66 patients with positive axillary lymph nodes and 218 patients with negative axillary lymph nodes were identified. Each lesion was analyzed to obtain 4 parameters of heterogeneity, which were the volume percentage of the persistent type (type I), the volume percentage of the plateau type (type II), the volume percentage of the washout type (type III), and the quantitative value of heterogeneity. Among the six ML models, the random forest model demonstrated the highest AUC (0.802) in the validation group for the diagnosis of ALNM in breast cancer, with the accuracy, specificity and sensitivity of 79.1%, 14.5%, and 99.0%, respectively. In the training group, the AUC was 0.594, with accuracy, specificity and sensitivity being 73.5%, 93.1%, and 7.7%, respectively. The results of DCA based on the random forest model showed clinical benefit was in the range of 0.6 to 1.0 in the training group, while in the range of 0.7 to 1.0 in the validation group.

Conclusion

The ML prediction models based on the heterogeneity information combined with visual features of MR images of breast lesions can help identify the ALNM in cN0 stage breast cancer patients, among which the diagnostic efficacy of the random forest model is superior.

PO-1372

MRI and clinicopathological features in HER2-low versus HER2-zero breast cancer treated with neoadjuvant therapy

Xu Huang,Yu Liu,Lei Wu,Zaiyi Liu,Changhong Liang
广东省人民医院

Objectives

Breast cancer with low human epidermal growth factor receptor 2 (HER2-low) expression is attracting attention due to progress in anti-HER2 antibody-drug conjugates. This study aims to explore differences in clinicopathological and MRI characteristics, as well as prognosis, between HER2-zero and HER2-low breast cancer subgroups.

Methods

We analyzed clinicopathologic and MRI data of patients with breast cancer who underwent surgery after neoadjuvant therapy. Univariable and multivariable analyses were used to assess differences between the HER-zero and HER2-low subgroups. Disease-free survival (DFS) was calculated using the Kaplan-Meier method, and the log-rank test was used to compare the survival curves.

Results

A total of 516 patients were included in the analysis: 167 (32.4%) and 349 (67.6%) patients had HER2-zero and HER2-low disease, respectively. The HER2-low group had more hormone receptor (HR)-positive patients (81.7% versus 59.3%, $P<0.001$), and higher expression of estrogen receptor (ER) was linked to higher HER2 expression ($P<0.001$). The signal enhancement ratio (SER) had a statistical difference between the HER2-zero and HER2-low groups ($P=0.042$) in both the whole cohort and the HR-negative subset. The HER2-zero group had a higher proportion of patients who achieved pathological complete response (pCR) (31.1% vs 18.1%, $P<0.001$), but HER2 status did not significantly affect the pCR rate in HR-negative or HR-positive patients. There was no significant difference in DFS between HER2-zero and HER2-low subgroups ($P=0.261$).

Conclusions

This study was insufficient to support the theory that HER2-low breast cancers had distinct clinicopathological, MRI features and prognosis compared to HER2-zero cancers treated with neoadjuvant therapy.

PO-1373

Classification of MRI-only suspicious breast lesions: Development and validation of a nomogram combining MRI features and apparent diffusion coefficient histogram.

Xue Li
Beijing Hospital

Rationale and Objectives:

Suspicious breast lesions (Breast Imaging Reporting and Data System [BI-RADS] 4 or 5) detected only by magnetic resonance imaging (MRI) and invisible on other initial imaging modalities (MRI-only lesions) are usually small and poorly characterized in previous literature, thus making diagnosis and management difficult. We aimed to develop and validate a nomogram combining clinicoradiologic features and apparent diffusion coefficient (ADC)-based histogram parameters for differentiating MRI-only suspicious lesions.

Materials and Methods:

We retrospectively included 90 patients who underwent breast MRI and had MRI-only suspicious lesions between May 2017 and August 2023 and were randomly divided into training ($n = 62$) and validation ($n = 28$) cohorts. The clinical information and MRI features (including kinetic pattern) of each patient were reviewed and analyzed, and the ADC maps obtained from DWI of each patient were subjected to histogram analysis and then 17 histogram parameters were extracted. Univariate analysis and multivariate logistic regression analysis were performed to identify significant variables associated with predicting MRI-only malignant lesions, which were then included in the

nomogram. The diagnostic performance of significant variables and the nomogram was evaluated and compared by the area under the receiver operating characteristic (ROC) curve (AUC) and DeLong's test. The validation cohort is used to test the diagnosis performance of the nomogram.

Results:

In univariate analysis, marginal ($P = 0.02$) and kinetic pattern ($P = 0.002$) were significantly different between benign and malignant MRI-only lesions; ADC_Energy ($P = 0.04$), ADC_Entropy ($P = 0.001$), ADC_Range ($P = 0.03$), and ADC_Uniformity ($P = 0.01$) were significantly greater in the malignant group than in the benign group. In multivariate analysis, the kinetic pattern in clinicoradiologic features ($P = 0.004$, odds ratio [OR] = 2.268) and ADC_Entropy in histogram parameters ($P = 0.003$, OR = 6.49) were significant variables associated with the differentiation of the MRI-only suspicious lesions. Combined ADC_Entropy and kinetic pattern yielded an AUC of 0.820, sensitivity of 80.65%, and specificity of 77.42%, which was higher than any single variable alone. The C-index values for the nomogram were 0.820 (95% confidence interval [CI]: 0.702-0.906) for the training cohort and 0.728 (95% CI: 0.528-0.878) for the validation cohort.

Conclusion: ADC-based histogram parameters could potentially aid in the classification of MRI-only suspicious lesions. The nomogram combining kinetic pattern and ADC_Entropy may be a simple and noninvasive tool for diagnosing MRI-only lesions.

PO-1374

时间依赖扩散加权成像联合同步多层激发技术在乳腺病变良、恶性诊断价值中的探索研究

丁婕^{1,2,3}、尤超³、顾雅佳³

1. 上海市影像医学研究所, 200032

2. 宁夏回族自治区人民医院, 医学影像中心

3. 复旦大学附属肿瘤医院放射诊断科, 复旦大学上海医学院肿瘤学系 200032

目的: 探索 TDD 成像联合 MB 技术在乳腺良、恶性病变诊断中的可行性及诊断价值。方法: 前瞻性收集 2021 年 2 月至 2022 年 7 月期间本院 45 例临床疑诊为乳腺疾病的患者。TDD 包括两种成像方案包括一种使用 MB, 另一种不使用 MB。所有患者均行了 MB 扫描方案, 其中 17 例患者同时进行了 TDS 两种扫描方案。通过 IMPULSED 双室模型计算细胞定量参数 (D、Vin、Dex、Cellularity)。计算不同扩散时间下的 ADC 值。对 non-MB 与 MB 组图像质量进行主、客观评分。对两组方案的 IMPULSED 细胞定量参数及 ADC 值的一致性比较采用 bland-altman、配对 t 检验、M-U 检验 (P 值 < 0.01 被认为有统计学意义)。采用二元 logistic 回归构建细胞定量参数和衍生 ADC 值的联合诊断模型。用 ROC 曲线计算 IMPULSED 细胞定量参数和衍生 ADC 值和联合诊断模型对乳腺恶性和良性肿瘤的鉴别诊断效能。结果: IMPULSED 定量参数和衍生 ADC 值在两种扫描方案中无统计学差异 ($P > 0.01$)。使用 MB 方案的总扫描时间比不使用 MB 方案的总扫描时间缩短了 8'36"。Vin 和 Cellularity 的 AUC 最高分别为 0.80 和 0.79。ADC-PG1000、ADC%N2 的 AUC 分别 0.75、0.80。联合模型 Model 1 和 Model 2 的 AUC 分别是 0.81 和 0.83。结论: 采用 MB 技术在基于 TDS 的乳腺 MR 成像中对定量测值无影响, 在得到更多参数的情况下, 提高检查效率和图像质量。在 IMPULSED 细胞定量参数中, 细胞内体积分数 (Vin) 和细胞密度 (Cellularity) 在乳腺良恶性病变诊断中具有更好的诊断性能。在衍生 ADC 中, ADC-PG1000、ADC%N2 诊断乳腺良恶性病变的特异性和敏感性最高。衍生 ADC 值的联合模型 Model 2 较单个衍生 ADC 值对乳腺病变良恶性诊断的效能均有提高。

PO-1375

酰胺质子转移技术联合 T1 mapping 和

DWI 成像鉴别乳腺肿块型病变的价值

丁婕^{1,2,3}、杨杰¹、张贞¹、王瑞¹、岳修正⁴

1. 宁夏回族自治区人民医院, 医学影像中心

2. 上海市影像医学研究所, 200032

3. 复旦大学附属肿瘤医院放射诊断科, 复旦大学上海医学院肿瘤学系 200032

4. 飞利浦健康科技(北京), 100600

目的: 探索酰胺质子转移技术联合 T1 mapping 和 DWI 成像在鉴别乳腺肿块型病变良恶性的诊断价值。**方法:** 53 例 MR 上表现为乳腺肿块型病变的患者, 结果均有病理证实 (22 个良性病灶和 31 个恶性病灶), 患者分别行 APT、T1 mapping 及 DWI 序列扫描。计算并比较乳腺良恶性病变的 APT SI mean 值、打药前、后 T1 mapping 值的变化率和平均 ADC 值。用二元 Logistic 回归分别建立三种成像技术两两联合、三者联合的诊断模型并绘制其 ROC 曲线计算曲线下面积。**结果:** 乳腺肿块型病变中恶性病灶的 APT SI mean 值、T1 mapping 变化率均高于良性病灶 (3.63 ± 1.20 vs. 1.71 ± 1.66 , $P < 0.05$), ($0.68 \pm 0.18\text{ms}$ vs. $0.44 \pm 0.23\text{ms}$, $P < 0.05$); 乳腺恶性病灶的平均 ADC 值低于良性病灶 ($0.99 \pm 0.43 \text{ mm}^2/\text{s} \times 10^{-3}$ vs. $1.42 \pm 0.37 \text{ mm}^2/\text{s} \times 10^{-3}$, $P < 0.05$)。APT、T1 mapping 和 ADC 三者联合的诊断效能最高 (AUC 为 0.94, 95% 置信区间: 0.88-1.00)。打药前后 T1 mapping 变化率具有最高约登指数 0.79, APT 具有最高敏感度 95.45%, 而 ADC 值具有最高特异性 80.65%。**结论:** APT 和 T1 mapping 成像技术可用于乳腺肿块型病变的良恶性诊断。APT、T1 mapping 和 DWI 三种成像技术的联合诊断模型可以明显提高其对乳腺肿块型病变的诊断效能。

PO-1376

乳腺 MRI 在乳房再造术后残余腺体评估的临床价值研究

吴虹仪、路红

天津医科大学肿瘤医院

目的: 应用乳腺 MRI 探究乳腺癌全乳切除术及乳房再造术后残留腺体皮瓣厚度与残留腺体量之间的相关性, 并对残余腺体量和皮瓣厚度进行定量评估和分析。

方法: 对 2017 年 1 月至 2022 年 1 月期间于我院进行的 500 例术后乳腺 MRI 检查进行了回顾性分析, 最终纳入了 367 名女性病人共计 436 例乳腺全乳切除及乳房再造术的乳腺 MRI 图像。将待测乳腺 MRI 图像分为外上、内上、外下、内下及乳头后方五个区域, 两位影像医生分别记录五个标准位置的残余腺体、测量皮瓣厚度并计算各位置残余腺体出现的频率, 最后统计两位医生结果的一致性 (组间一致性); Fisher 精确检验、student t 检验和组内一致性分析用于评估可重复性。

结果: 436 例乳腺全乳切除及乳房再造术的乳腺 MRI 图像中, 残余腺体出现概率约 20%, 并且在 NSM 后比 SSM 出现残余腺体频率更高 (50% vs. 13%, $p = 0.003$)。与残余腺体存在独立相关的变量有皮瓣厚度 ($p < 0.001$)、患者身高 ($p < 0.03$)、乳房切除适应证 ($p < 0.001$)、乳房切除类型 (SSM, NSM 和 TM)。乳腺癌保乳术后 (尤其是 NSM 术后) 残余腺体的发生率相对较高, 部分个体中未切除的纤维腺体组织比例较高。

结论: 通过乳腺 MRI 检查发现乳腺全乳切除及乳房再造术后残余腺体出现的概率表明, 基于 MRI 的跨学科手术计划应该考虑到残余腺体的数量、位置和分布。这种术前规划, 将来可能会提高 NSM 和 SSM 术后的安全性, 减少复发率, 提高患者预后。

PO-1377

多模态 MRI 对非肿块型乳腺钙化病变的诊断价值

曲宁、计超

辽宁省肿瘤医院

目的: 探讨多模态磁共振成像技术 (MRI) 对乳腺 X 线非肿块型钙化病变的诊断价值。

方法: 回顾性分析 2020 年 1 月至 2023 年 3 月在辽宁省肿瘤医院就诊经乳腺 X 线摄影检查诊断为非肿块型钙化病变, 且 MRI 呈非肿块样强化的 149 例患者的临床及影像资料。所有病例均采用 GE 1.5T 超导磁共振检查, 序列包括 T1WI、T2WI、抑脂、弥散加权成像 (DWI)、动态增强。分析乳腺背景实质强化(BPE)程度及良恶性病灶的强化分布方式 (段样、区域、局灶及弥漫分布)、DWI 信号、时间-信号强度曲线 (Time-intensity curve, TIC), 并采用 $b=800 \text{ s/mm}^2$, 在工作站生成的 ADC 图, 设置 3~5 个 ROI 测量病变强化区域的表现弥散系数 (ADC 值), 取其平均值为终值。以病理结果为金标准, 计算 MRI 的诊断效能。

结果: 本研究 149 例患者中, 包含 105 例乳腺癌 (恶性组) 和 44 例乳腺良性病变 (良性组)。单因素分析结果显示, 乳腺背景实质强化(BPE)、病灶的强化分布方式、DWI 及 TIC 曲线与病变良恶性之间差异均有统计学意义 (χ^2 值分别为 5.668、50.686、22.732、38.847, P 值 <0.05), 其中强化分布方式、DWI 及 TIC 曲线差异显著 (P 值为 $0.000 < 0.001$)。良性组病灶 ADC 值中位数为 $(1.270 \times 10^{-3} \text{ mm}^2/\text{s})$, 高于恶性组病灶 ADC 值 $(1.065 \times 10^{-3} \text{ mm}^2/\text{s})$ ($P=0.000 < 0.001$)。采用二元 Logistic 回归分析建立良恶性诊断模型, 并对回归模型的预测概率进行 ROC 分析, 取得回归模型的曲线下面积 (AUC)、灵敏度、特异度、阳性预测值、阴性预测值及准确度, 分别为 0.912、95.0%、70.0%、88.8%、84.8%、87.9%。

结论: 对于非肿块型乳腺钙化病变, 多模态磁共振成像技术具有较高的鉴别诊断价值。

PO-1378

多模态磁共振联合 X 线摄影对非肿块型乳腺钙化病变的诊断价值

曲宁、计超
辽宁省肿瘤医院

目的: 探讨多模态磁共振成像技术(MRI) 联合乳腺 X 线摄影 (mammography, MG)对非肿块型乳腺钙化病变的诊断价值。

材料与方法: 回顾性分析 2020 年 1 月至 2023 年 3 月在辽宁省肿瘤医院就诊 MG 表现为非肿块型钙化病变, 且 MRI 呈非肿块样强化的 149 例患者的临床及影像资料。以病理结果为金标准, 将单因素分析有统计学意义的征象纳入多因素回归分析中, 分别建立 MG、MRI 及联合检查的预测模型, 并利用 ROC 分析评价其诊断效能。

结果: 149 例患者中, 105 例为恶性病变, 44 例为良性病变。单因素分析结果显示, 两组病变的钙化形态、分布特点及是否有伴随征象(结构扭曲、局灶不对称致密影、同侧乳头凹陷和皮肤增厚)之间的差异具有统计学意义($P < 0.05$); 乳腺背景实质强化(BPE)、强化分布方式 (段样、区域、局灶及弥漫分布)、DWI 信号、TIC 曲线类型及 ADC 值与病变良恶性之间差异均有统计学意义($P < 0.05$)。多因素回归分析结果显示, MG 的诊断敏感度、特异度、PPV、NPV、诊断准确率及 AUC 分别为 84.8%、65.9%、85.6%、64.4%、79.2%及 0.787。MRI 的诊断敏感度、特异度、PPV、NPV、诊断准确率及 AUC 分别为 95.0%、70.0%、88.8%、84.8%、87.9%及 0.912。MG 联合 MRI 检查中, 诊断敏感度、特异度、PPV、NPV、诊断准确率及 AUC 值分别为 94.0%、75.0%、90.4%、83.3%、88.6%及 0.945。MRI 联合 MG 诊断的 ROC 曲线下面积明显高于 MG 单独诊断, 差异有统计学意义($P < 0.05$)。

结论: 对于非肿块型乳腺钙化病变, MRI 与 MG 联合应用可以提高诊断准确率, 具有较高的诊断效能。

PO-1379

分析磁共振扩散峰度成像在乳腺良恶性病变鉴别诊断中的价值

孔丹青、李文燕、杨苑、尹安雨、鄂林宁、张玉忠
深圳市龙华区人民医院

目的 研究磁共振扩散峰度成像在乳腺良恶性病变鉴别诊断中的价值。**方法** 回顾分析 2020 年 4 月-2021 年 4 月期间在我院诊治的 74 例乳腺病变患者, 经手术病理证实供 82 个病灶, 其中良性 46 个 (41 例), 恶性 36 个 (33 例), 所有患者均进行双侧乳腺的常规 MRI 检查和 DKI 扫描, 观察比较乳腺良恶性病变组织平均峰度系数 (MK)、横向峰度系数 (AK)、径向峰度系数 (RK)、平均扩散系数 (MD)、径向扩散系统 (RD)、各向异性系数 (FA), 并采用受试者工作特征 (ROC) 曲线评价上述指标对乳腺良恶性疾病鉴别诊断的敏感度、特异度。**结果** 恶性病灶 MK、AK、RK、FA 值均高于良性病灶, MD 低于良性病灶, 差异有统计学意义 ($P<0.05$), RD 与良性病灶比较, 差异无统计学意义 ($P>0.05$); 以术后病理为金标准对 DKI 检查 MK、AK、RK、FA、MD 各值做鉴别乳腺良恶性疾病的 ROC 曲线分析, MK 敏感度均大于 AK、RK、FA、MD, 特异度 AK 大于 MK、RK、FA、MD。**结论** 磁共振扩散峰度成像在乳腺良恶性病变鉴别诊断中具有重要的价值, 且 MK、AK、MD 指标均具有较高的敏感度、特异度, 可作为乳腺良恶性病变鉴别诊断的重要参考指标。

PO-1380

基于超声和乳腺 X 线的深度学习模型预测乳腺癌无病生存率的研究

韩珺琪¹、华辉¹、费洁¹、刘晶晶¹、郭一君²、马文娟²、陈静静¹

1. 青岛大学附属医院

2. 天津市肿瘤医院

目的: 建立基于乳腺 X 线、超声和临床数据的深度学习模型预测乳腺癌的无病生存率, 并验证其预测效能。

方法: 收集患者乳腺 X 线、超声图像和临床数据。使用 ResNet50 基于乳腺 X 线、超声图像建立深度学习模型。使用 cox 比例风险模型从基于乳腺 X 线、超声特征和临床数据特征中选择影响乳腺癌预后的独立影响因素。结合深度学习模型和独立影响因素建立联合模型。

结果: 共纳入 1420 例患者。影响乳腺癌预后的独立影响因素包括年龄、新辅助化疗、HER2、肿瘤位置、血流、可疑钙化和大小。我们建立了四个模型: 超声深度学习模型、X 线深度学习模型、超声-X 线深度学习模型和联合模型。基于乳腺 X 线、超声图像和独立影响因素的联合模型具有最高的预测性能 (训练组 AUC=0.873, 测试组 AUC=0.785)。

结论: 基于乳腺 X 线、超声和临床数据的深度学习模型有潜力成为预测乳腺癌预后的预测工具。

PO-1381

锥光束乳腺 CT 对于乳腺癌不同分子亚型的鉴别诊断价值

付岩宁、李颖
中国人民解放军总医院第一医学中心

目的: 探讨锥光束乳腺 CT 对于乳腺癌不同分子亚型的鉴别诊断价值

方法: 收集解放军总医院第一医学中心首诊乳腺肿块的女性患者 60 例, 术前接受 CBBCT 检查, 术后手术病理证实为乳腺癌并进行免疫组化分型, 对病变各种影像特征进行分析, 对于乳腺癌不同分子亚型是否存在相关性及其差异。

结果: Luminal A 型 7 人(100%)纤维腺体为致密型, Luminal B 型 33 人(97.1%), HER-2 型 10 人(71.4%), TN 型 4 人(80%), 分布上存在统计学差异($\chi^2=8.581$, $P=0.035$)。患者肿块体积中位数 Luminal A 型为 1.39, Luminal B 型为 5.04, HER-2 型为 6.5, TN 型为 21.11, 肿块体积上差异存在统计学意义($Z=8.103$, $P=0.44$)。对比剂增强后 Luminal A 型 3 人肿块表现为均匀强化(42.9%), 3 人表现为混杂强化(42.9%), 1 人表现为环形强化(14.3%); Luminal B 型 7 人肿块表现为均匀强化(21.2%), 25 人表现为混杂强化(75.8%), 1 人表现为环形强化(3%); HER-2 型表现为均匀强化和混杂强化分别为 2 人(14.3%)和 12 人(85.7%); TN 型表现为混杂强化和环形强化分别为 3 人(60.0%)和 2 人(40.0%), 肿块内部强化特征分布存在显著差异, 具有统计学意义($\chi^2=14.71$, $P=0.023$)。Luminal A 型 0 人(0%)存在钙化, Luminal B 型 12 人(35.3%), HER-2 型 7 人(50.0%), TN 型 0 人(0%), 患者在存在钙化情况的分布上存在统计学差异($\chi^2=7.942$, $P=0.047$)。

结论: 乳腺癌不同分子亚型在 CBBCT 影像表现上是多种多样的, 其中乳腺纤维腺体类型、肿块体积、肿块内部强化特征、钙化等特征有助于区分乳腺癌各分子亚型, CBBCT 对于乳腺癌不同分子亚型的鉴别诊断具有重要价值。

PO-1382

光谱 CT 多参数成像对乳腺肿瘤检查的应用

马冬

辽宁省肿瘤医院

目的: 光谱 CT 多参数成像对乳腺病变的检出, 对乳腺癌病灶及腋窝淋巴结性质的鉴别和诊断。**方法:** 选取来我院就诊, 经钼靶摄影确定乳腺肿物并伴有腋窝淋巴结肿大的 22 例患者, 年龄 30~60 岁, 行光谱 CT 增强检查。常规图像-动脉期轴位: 显示乳腺内占位病变, 边缘不规则, 边界范围显示不清晰。多参数成像显示: 单能级 40keV-动脉期图像, 软组织对比度明显增高, 乳腺病变及腋窝淋巴结边界范围显示清晰, 分别记录肿瘤及淋巴结的 CT 值。有效原子序数融合图-动脉期, 观察乳腺占位病变及淋巴结的大小、边界、范围, 分别记录有效原子序数值。碘密度融合图-动脉期, 测量乳腺病灶及淋巴结的碘密度值, 观察血供丰富情况。动脉期光谱曲线分析, 寻找与感兴趣乳腺病灶同源的腋窝淋巴结。分别对检出的乳腺病灶和同源性淋巴结进行穿刺。**结果:** 17 例患者单发乳腺病灶, 同侧同源性淋巴结 2 个(10 例患者)淋巴结 1 个(7 例患者), 穿刺病理结果为乳腺癌伴腋窝淋巴结转移。3 例患者双乳腺病灶, 双侧同源性淋巴结 2 个(左右各一), 穿刺病理结果为 2 例乳腺癌伴双侧腋窝淋巴结转移, 1 例单侧乳腺癌无腋窝淋巴结转移。2 例患者为单发乳腺良性肿瘤, 腋窝淋巴结为反应性增生。乳腺肿瘤及腋窝淋巴结检出率为 100%, 乳腺癌确诊率为 91%, 腋窝淋巴结确诊率为 86%。**结论:** 光谱 CT 的单能 40keV 图可以明显提升碘强化效果, 可显著提高病变的检出率、可视化。多参数成像的碘密度融合图可以定量测量病灶及可疑转移淋巴结的摄碘率, 为乳腺病灶和可疑转移淋巴结提供了精确的定量数据分析。有效原子序数融合图可以测量病灶有效原子序数, 为乳腺病灶、正常乳腺腺体、可疑转移淋巴结、炎性淋巴结等鉴别从精准物质成分分析的角度提供了精确定量数据分析, 并有助于区分癌组织与腺体组织。光谱曲线为乳腺癌病变区与正常腺体、乳腺癌病变区与腋窝可疑转移淋巴结的同源性判断均提供了清晰、明确的可视化曲线和强有力的统计学依据。

PO-1383

不同年龄及月经状态女性正常乳腺动态增强 MRI 半定量参数值变化

张爱娟、陈基明

皖南医学院弋矶山医院

【摘要】 目的 探讨不同年龄及月经状态女性正常乳腺动态增强 MRI 半定量参数（最大强化率，ERmax，最大上升斜率，Slopemax）的变化特征及其临床意义。方法 收集 2020 年 8 月至 2022 年 11 月皖南医学院弋矶山医院因自觉“包块”、不适 MRI 检查乳腺健康 332 例受试者资料，根据年龄分为低年龄组（n=107），中年组（n=114），高年龄组（n=111）。根据不同月经状态将受试者分为月经期（n=49）、增殖期（n=77）、分泌期（n=94）和绝经后（n=112）。在西门子后处理站中勾画感兴趣区(ROI)，生成 TIC 并计算动态增强 MRI 半定量参数（ERmax，Slopemax），比较不同年龄及月经状态的乳腺动态增强 MRI 半定量参数（ERmax，Slopemax）的差异。结果 不同年龄正常乳腺的动态增强 MRI 半定量参数（ERmax，Slopemax）差异有统计学意义（ $P<0.05$ ）；高年龄组与低年龄组的差异均有统计学意义（ $P<0.05$ ），中年组与低年龄组、高年龄组差异均无统计学意义（ $P>0.05$ ）。不同月经状态的正常乳腺组织，动态增强 MRI 半定量参数（ERmax，Slopemax）差异均有统计学意义（ $P<0.05$ ）；绝经后与月经期、分泌期的差异均有统计学意义（ $P<0.05$ ），Slopemax 增殖期与绝经后的差异有统计学意义（ $P<0.05$ ），ERmax 增殖期与绝经后的差异无统计学意义（ $P>0.05$ ），月经期、增殖期及分泌期两两比较差异无统计学意义（ $P>0.05$ ）。结论 不同年龄及月经状态正常女性乳腺动态增强 MRI 半定量参数（ERmax，Slopemax）的变化及个体之间的变异度较大，利用动态增强 MRI 半定量参数诊断女性乳腺疾病时应考虑不同年龄及月经状态下的基线动态增强 MRI 半定量参数变化。

PO-1384

DBT 和超声对小肿块（ $\leq 20\text{mm}$ ）的诊断价值对比研究

韩露、何翠菊、叶冬慢、于韬
辽宁省肿瘤医院

目的：对比 DBT 和超声对 $\leq 20\text{mm}$ 的小肿块的诊断价值

材料方法：回顾性分析 2021 年 7 月至 10 月在我院就诊行乳腺 DBT 和超声检查且病灶最大径小于等于 20mm 的肿块 110 例，由两名诊断医生参照 BI-RADS 诊断标准对 DBT 图像和超声图像进行诊断，以病理结果为金标准，影像诊断为 4A 及 4A 以下病灶为良性符合，4B 及 4B 以上病灶为恶性符合。通过受试者工作特性（ROC）曲线比较 DBT 和超声对小肿块的诊断价值，Z 检验比较曲线下面积。

结果：共 107 名患者 110 个肿块纳入研究，其中良性 48 个，恶性 62 个。DBT 对 $\leq 20\text{mm}$ 小肿块的诊断效能高于超声，AUC 分别为 0.911 和 0.802，两者差异有统计学意义（Z 值为 2.533，P 值为 0.011）；对于 $\leq 10\text{mm}$ 的更小肿块，DBT 的诊断价值仍高于超声，AUC 分别为 0.972 和 0.722，差异有统计学意义（Z 值为 2.676，P 值为 0.007）；对于 10~20mm 之间的肿块，虽然 DBT 诊断的 AUC（0.880）略高于超声（0.817），但两者无统计学差异（Z 值为 1.298，P 值为 0.194）。

结论 DBT 对 $\leq 20\text{mm}$ 的小肿块的诊断价值高于超声，且肿块越小，DBT 的优势越明显。

PO-1385

基于瘤内，瘤周和 BPE 影像组学预测乳腺癌新辅助化疗病理完全反应：多种机器学习算法

郑广莹
锦州医科大学

目的：基于瘤内、瘤周和 BPE 构建及验证一个多区域磁共振影像组学模型用于预测乳腺癌新辅助化疗后病理完全反应。为明确以 BPE 为代表的肿瘤周围微环境影响新辅助化疗疗效提供理论依据。

方法: 对 133 例进行新辅助化疗的乳腺癌患者进行回顾性分析, 其中包括病理明确的 pCR 患者 49 例。从每例患者的 T1WI、增强及减影序列中分别提取瘤内、瘤周及 BPE 区域的影像组学特征, 降维后获取与临床结局最相关的特征, 之后基于剩余特征通过不同区域的组合使用多因素逻辑斯回归选取最优特征集, 应用多种机器学习方法构建预测模型。我们使用工作特性曲线进行模型性能评价, 最终选取最优模型, 并使用 SHAP 分析进一步解析构建模型的特征与临床输出结局的关联。

结果: 基于瘤内、瘤周及 BPE 构建的标志物中, BPE 获得了最优的预测效能, 在瘤内、瘤周基础上, 增加 BPE 后, 诊断效能也得到了提高。三区域联合构建的标志物具有最佳性能, 其 AUC 在训练组和测试组中的诊断效能分别为 0.838 和 0.789, 准确性分别为 0.796 和 0.775, 敏感性分别为 0.794 和 0.733, 特异性分别为 0.797 和 0.800。而基于三个区域的特征使用 XGboost 构建的机器学习模型具有最佳性能, 其 AUC 在训练组和测试组中的诊断效能分别为 0.891 和 0.861, 准确性分别为 0.86 和 0.825, 敏感性分别为 0.882 和 0.8, 特异性分别为 0.847 和 0.84。依据 SHAP 分析, LZ_log.sigma.2.0.mm.3D_glcml_ClusterShade_T12 对模型的预测能力贡献最大。

结论: 加入 BPE 区域影像组学分析后提高了乳腺癌新辅助化疗 pCR 的预测准确性, 提示肿瘤周围微环境可以影响新辅助化疗疗效。

PO-1386

乳腺 X 线摄影引导下导丝定位在乳腺簇状钙化病变的应用

何翠菊

辽宁省肿瘤医院

[摘要] 目的 乳腺 X 线摄影引导下导丝定位穿刺在乳腺簇状钙化病变的临床应用研究。方法 乳腺影像报告及数据系统分类 (BI-RADS) 分类为 4B 类和 5 类的簇状钙化病变的患者 50 例, 采用乳腺 X 线摄影定位下穿刺的方法, 导丝留置于簇状钙化目标病变区, 在导丝引导下进行手术切检, 切除标本再次钼靶摄片, 确认钙化灶完全切除后, 送至病理组织学检查。结果 乳腺钼靶摄片发现簇状钙化病变的 50 例患者均一次性导丝定位成功, 手术均完整切除。病理检查: 恶性病灶 38 例, 良性病灶 12 例。结论 乳腺 X 线摄影引导下导丝定位活检技术可以帮助外科医生准确切除超声和 MR 图像上无法显示的簇状钙化病灶, 从而帮助确定病变性质, 提高早期乳腺癌的检出率。

PO-1387

乳腺断层摄影与全数字乳腺摄影在乳腺癌诊断中的价值对比

张蓉

空军军医大学西京医院

【目的】探讨乳腺断层摄影与全数字乳腺摄影在乳腺癌诊断中的价值对比

【方法】随机抽取我院 2023 年 5 月之前病理结果确诊为乳腺癌，且在我科接受过全数字影像摄影的患者 50 例，随机抽取我院 2023 年 5 月以来病理结果确诊为乳腺癌，且在我科接受过乳腺断层摄影的患者 50 例，对比两组检查的影像学表现及检查结果。

【结果】全数字乳腺摄影组检查出包块边界清晰的情况优于全数字乳腺摄影组。两组对比差异显著 ($P<0.05$)，全数字乳腺摄影组检查出包块包块毛刺征、血管穿入征的情况优于全数字乳腺摄影 ($P<0.05$)。

【结论】乳腺断层摄影的影响对病灶的影像学表现更为清晰，在乳腺癌诊断中较全数字乳腺摄影具有更高的价值。

PO-1388

基于多模态 MRI 影像组学区分非化脓性乳腺炎
与炎性乳腺癌研究

张睿馨、周长玉

浙江中医药大学附属第一医院 (浙江省中医院)

目的：探讨基于多模态 MRI 影像组学在非化脓性乳腺炎与非肿块型乳腺癌中的诊断价值。

方法：收集 2017 年 6 月~2022 年 4 月于浙江中医药大学附属第一医院行乳腺 MRI 扫描的患者 222 例。以 7:3 的比例随机将患者分配至训练集 ($n=155$) 和验证集 ($n=67$)。逐层手动勾画 MRI 图像 DWI、ADC、DCE (第 2 期) 的病灶区域并从中提取影像组学特征。依次利用单因素分析、mRMR 及 LASSO 算法对影像组学特征降维，筛选出重要性排名靠前的特征，并将其与相应系数进行加权求和公式，以此计算每位患者的影像组学评分 (radiomics score, Radscore)。采用单因素 Logistic 回归分析寻找区别非化脓性乳腺炎与非肿块型乳腺癌的临床危险因素。最后使用多因素 Logistic 回归构建基于临床危险因素和 Rad-score 的联合模型，绘制列线图。通过受试者工作特征 (receiver operating characteristic, ROC) 曲线下面积 (area under curve, AUC)、特异度、敏感度、准确度评估预测性能。

结果：单因素和多因素 Logistic 回归分析显示，年龄 ($OR=0.945$, $95\%CI=0.913\sim 0.975$, $P=0.001$)、乳晕或皮肤增厚 ($OR=4.881$, $95\%CI=1.949\sim 13.446$, $P=0.001$) 是区分乳腺炎和乳腺癌的影响因素的独立危险因素，其构建的临床模型在验证集的 ROC 曲线下面积 (AUC) 为 0.79。19 个影像组学特征被选择用于构建影像组学标签，其在验证集的 AUC 为 0.88。将该标签与临床模型结合获得联合模型，其在验证集的 AUC 为 0.89。临床决策曲线显示，联合模型的临床实用性最优。

结论：联合乳腺多模态 MRI 影像组学和临床危险因素构建的列线图模型可用于区分非化脓性乳腺炎与炎性乳腺癌。

PO-1389

非对比增强 MRI 在评价数字乳腺 x 线 BI-RADS 0 类病变中的价值

张睿馨、卜阳阳

浙江中医药大学附属第一医院 (浙江省中医院)

背景:数字乳腺 x 线片(DMs)对 BI-RADS 0 类病变的良恶性诊断具有重要意义。我们比较了非对比增强磁共振成像 MRI 和动态对比增强磁共振成像(DCE-MRI)对他们的诊断性能。我们试图通过 3 种 MRI 序列来评估 BI-RADS 0 类病变:STIR、STIR 结合高 b 值扩散加权成像(STIR-DWI)和 DCE-MRI。方法:我们回顾性分析了 2014 年 1 月至 2019 年 6 月 112 例患者中的 114 例乳腺 DM 不可触及 BI-RADS 0 类病变。所有患者均行 STIR、STIR-DWI 和 DCE-MRI 检查。两名乳腺放射科医生分别读取单个序列(STIR, DWI, DCE-MRI)和成对序列(STIR-DWI)来检测 DMs 中 BI-RADS 0 类病变。根据 MRI 影像、临床和病理资料相结合的最具价值的比较指标,采用受试者工作特征曲线分析来评估诊断性能。

结果:114 个病灶(患者中位年龄 47 岁;病灶中位大小为 19mm), STIR 漏检 32 例(48.5%), STIR-DWI 漏检 9 例(13.6%), DCE-MRI 漏检 3 例(4.5%)。我们研究的主要发现是 STIR-DWI 和 DCE-MRI 的诊断准确性高于 STIR ($P<0.01$)。STIR-DWI 的准确率更高(曲线下面积[AUC]= 0.858;敏感性=87.8%)高于 STIR (AUC=0.754;敏感度=51.5%),而表现与 DCE-MRI 相当(AUC=0.884;敏感性=95.5%)。

结论:STIR-DWI 是一种非对比增强 MRI 技术,在未触及 BI-RADS 0 类病变中,对良恶性病变的诊断效果与 DCE-MRI 相同。因此,STIR-DWI 可提高乳腺癌筛查的安全性和有效性,尤其是在 DMs 中未触及 BI-RADS 0 类病变。

PO-1390

致密性乳腺 1.5T 磁共振 DWI 成像时 b 值的选择

王菲菲

辽宁省肿瘤医院

目的 探讨致密性乳腺 1.5T 磁共振 DWI 成像时 b 值的选择。方法 纳入 2019 年 1 月至 2020 年 1 月于本院就诊的 64 例致密性乳腺女性,采集 T2 和 DWI 序列,弥散敏感因子 b 值分别取 600s/mm²、800s/mm²、1200 s/mm²,对比不同 b 值下的图像信号强度比(SIR)、噪声比(CNR)、表观弥散系数(ADC)及对病灶与周围乳腺组织边界的显示情况,以病理结果为诊断金标准,计算诊断的敏感性、特异性、准确率。结果 所纳入的 64 例受试者中,经临床相关检查共计发现病灶 89 个,MR 共检出病灶 83 例,检出率 93.25%,远高于乳腺 x 线检查 (46.06%), b 值分别取 600s/mm²、800s/mm² 时的 SIR、CNR 高于 1200 s/mm², b 取 800s/mm²、1200s/mm² 时对边界的判读优于 b 值取 600s/mm²。随 b 值的上升,周围乳腺组织、良恶性病灶的 AUC 值均下降,对于同一病灶,与周围乳腺组织相比,病灶的 Δ AUC 在不同组间无明显差异, b 取 800s/mm²、1200 s/mm² 时的敏感性和准确性高于 600s/mm² 组,组间特异性均没有显著差异。结论 1.5T 磁共振 DWI 成像可以作为致密性乳腺筛查的有力补充手段,综合图像质量和诊断效能的考量, b 值取 800s/mm² 较为合适。

PO-1391

相位编码方向对乳腺弥散加权成像图像质量的影响

赵媛媛、谢欢

中国人民解放军陆军特色医学中心

目的：研究相位编码方向对乳腺弥散加权（DWI）成像图像质量的影响。方法：收集我院 2022 年 2 月—2022 年 7 月行乳腺磁共振检查的患者 100 例，其中研究组 50 例，对照组 50 例。研究组患者行 DWI 后前位（P-A）相位编码方向扫描，对照组行 DWI 前后位（A-P）相位编码方向扫描，分析对比两组图像几何失真率、相位位移伪影发生率和图像信噪比（SNR），采用两独立样本 t 检验和卡方检验进行统计分析。结果：研究组乳腺长径平均拉伸率：右乳为 6.75%，左乳为 6.92%；乳腺横径平均拉伸率：右乳为 4.14%，左乳为 3.79%。对照组乳腺长径平均拉伸率：右乳为 13.82%，左乳为 16.12%；乳腺横径平均拉伸率：右乳为 8.26%，左乳为 9.56%。采用两独立样本 t 检验对右乳长径、横径，左乳长径、横径进行统计学分析，研究组形变率均小于对照组（P 右乳长径、P 右乳横径、P 左乳长径、P 左乳横径 <0.05 ）。研究组相位位移伪影发生率为 14.0%，对照组相位位移伪影发生率为 62.0%，采用卡方检验进行统计学分析，研究组相位位移伪影发生率明显小于对照组（ $P<0.05$ ）。研究组 SNR 平均值为 2.30，对照组 SNR 平均值为 2.53，采用两独立样本 t 检验进行统计学分析， $P=0.278$ ，研究组与对照组 SNR 差异无统计学意义（ $P>0.05$ ）。结论：乳腺磁共振 DWI 后前位（P-A）相位编码方向图像质量明显优于前后位（A-P）相位编码方向图像质量，更加有利于乳腺病变的显示与诊断。

PO-1392

基于超声和乳腺 X 线影像学特征预测乳腺癌分子亚型和预后的研究

韩珺琪¹、田雅琪²、刘晶晶¹、费洁¹、彭琪琪³、王晓琳¹、马文娟⁴、陈静静¹

1. 青岛大学附属医院

2. 首都医科大学附属北京友谊医院

3. 广州医科大学附属第一医院

4. 天津市肿瘤医院

目的：基于临床病理学资料、超声和乳腺 X 线影像学特征建立预测乳腺癌分子亚型和预后的模型。方法：收集乳腺癌患者的临床病理学资料、超声和乳腺 X 线影像学特征，并随访其预后结果。使用 Kaplan-Meier 生存曲线评估无病生存率。使用单变量和多变量分析选择与乳腺癌分子亚型和预后结果相关的独立影响因素。基于独立影响因素采用逻辑回归模型和 COX 比例风险回归模型分别建立预测乳腺癌不同分子亚型和预后结果的模型。

结果：本文共纳入 1546 例患者，建立了一个分类模型和六个预后模型：分类模型、综合模型、Luminal A 模型、Luminal B 模型、HER-2 过表达模型、三阴性乳腺癌模型、非三阴性乳腺癌模型。训练组和验证组的分类模型的 AUC 分别为 0.715 和 0.721。Luminal A 模型的 C 指数最高，训练组为 0.772，测试组为 0.654。HER-2 过表达模型的 1、3、5 年无病生存率的 AUC 最高，训练组分别为 0.868、0.726、0.752，测试组分别为 0.721、0.712、0.732。

结论：基于临床病理学资料、超声和乳腺 X 线影像学特征的模型有可能预测乳腺癌的不同分子亚型和无病生存率。

PO-1393

基于基线影像学征象及临床病理参数预测三阴性乳腺癌 无进展生存期的应用价值

卢艳会、罗春燕、高茜、董亚婕、韩智泉、方林林、赵瑞雪、李俊
昆明医科大学第一附属医院

目的 探讨基线影像学征象和临床病理参数对三阴性乳腺癌 (triple negative breast cancer, TNBC) 无进展生存期 (progression-free survival, PFS) 的预测价值。**方法** 回顾性分析 2017 年 7 月至 2022 年 10 月昆明医科大学第一附属医院经病理证实的 TNBC 患者的临床、病理及影像学资料, 严格按照纳排标准筛选, 最终入组 67 例。收集患者相关临床资料、影像学征象 (包括乳腺断层融合成像、磁共振成像) 及病理参数, 采用单因素和多因素 Cox 比例风险回归分析确定 PFS 的独立风险因素, Kaplan-Meier 生存曲线和 log-rank 检验分析参数间差异。**结果** 单因素分析结果显示: 临床相关参数中, 病灶最大径线 $\geq 5\text{cm}$ 、III-IV 期是 TNBC 患者 PFS 的独立风险因素 ($P < 0.05$); MRI 征象中, 致密腺体、病灶位于乳晕后区、非平行生长、病灶边缘不规则伴毛刺、环形强化、侵犯邻近结构、灶周水肿是 TNBC 患者 PFS 的独立风险因素 ($P < 0.05$); 病理参数中, 术后淋巴结分期、Ki-67 $> 30\%$ 、神经/脉管侵犯是 TNBC 患者 PFS 的独立风险因素 ($P < 0.05$); 雄激素受体阳性是 TNBC 患者 PFS 的保护因素 ($P < 0.05$)。多因素分析结果显示, 病灶边缘不规则伴毛刺、非平行生长及神经/脉管受侵是 TNBC 患者 PFS 的独立风险因素 ($P < 0.05$)。病灶边缘不规则伴毛刺、非平行生长、神经/脉管侵犯 TNBC 患者的 PFS Kaplan-Meier 生存曲线差异有统计学意义 ($P < 0.05$)。**结论** 病灶边缘不规则伴毛刺、非平行生长及神经/脉管侵犯是 TNBC 患者 PFS 的独立风险因素, 基线影像学征象和临床病理参数对 TNBC 患者的 PFS 具有一定的预测价值。

PO-1394

MRI 影像学征象对乳腺癌保乳术中切缘阳性的预测价值

黄亚博
运城市中心医院

目的: 通过探讨术前乳腺癌的 MRI 相关影像学征象, 评估 MRI 对保乳术中肿瘤切缘阳性的预测诊断价值。**方法:** 回顾性分析我院 2022 年 9 月-2023 年 7 月有完整术前 MRI 资料且首次手术为保乳术的 177 例浸润性乳腺癌进行研究, 根据术中病理的切缘情况分为切缘阳性组 (29 例) 和切缘阴性组 (148 例)。分析病例资料的术前 MRI 图像, 收集包括乳腺纤维腺体类型, 同侧背景实质强化类型, 对侧背景实质强化类型, 病灶类型, 肿块形态, 肿块边缘特征, 病灶最长径, 肿块型病灶强化特点, 病灶周围的血管征象, 病灶周围是否存在其他病变, 动态增强曲线特征, 非肿块样强化病灶分布特征、病灶周围伴有 DCIS、肿瘤周围多发点状强化、患侧病灶周围是否存在多发点状血管征象等 MRI 特征以及基本的临床信息、病理特征。通过单因素比较两组间各种 MRI 特征和基本临床信息、病理特征的差异, 再将单因素分析有统计学意义的 MRI 特征进行多因素 Logistic 回归分析, 采用受试者操作特征 (ROC) 曲线评价回归模型对保乳术中切缘阳性的预测诊断价值。**结果:** 本组研究的保乳术中切缘阳性率为 16.4% (29 / 177 例)。单因素分析结果显示, 在 MRI 特征中, 有多中心病灶 ($P=0.011$); 病灶周围存在其他病变 ($P<0.001$) 是保乳术中切缘阳性的预测特征; 在基本临床、病理特征中, HER2 阳性表达 ($P=0.048$) 是保乳术中切缘阳性的预测因素。多因素回归分析结果显示, 肿块型周围存在其他病灶 ($P=0.006$), 肿瘤周围多发点状强化 ($P<0.001$), 患侧病灶周围是否存在多发点状血管征象 ($P<0.05$), 是保乳术中切缘阳性最有预测价值的 MRI 特征。病灶周围伴有 DCIS ($P<0.001$), 是保乳术中切缘阳性最有预测价值的病理特征。**结论:** 部分术前 MRI 特征和病理特征可以对浸润性乳腺癌保乳术中切缘阳性情况进行预测。

PO-1395

酰胺质子转移成像和扩散加权成像在 预测乳腺癌预后因素中的价值

赵思奇¹、张丽娜¹、李远飞¹、武玥琪¹、宁宁¹、梁泓冰¹、林良杰²、张肖肖²

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的: 探讨酰胺质子转移(APTw)成像在评估乳腺癌预后因素中的价值, 评价 APTw MRI 能否增加扩散加权成像(DWI)对乳腺癌的诊断价值, 以指导个体化治疗策略。

材料和方法: 回顾性分析连续 2019 年 1 月至 2022 年 12 月经病理确诊为浸润性乳腺癌患者 82 例。所有受试者术前行多参数 MRI 检查, 包括 APTwMRI 和 DWI。统计分析采用 t 检验、单因素方差分析、Spearman 相关分析和 ROC 分析, $P < 0.05$ 为有统计学意义。

结果: 乳腺癌病理分级 III 级比 II 级具有更高的 APTw 值(3.10 ± 1.24 vs 1.92 ± 0.83 ; $P = .000$)和更低的 ADC(源自 DWI)值[(0.82 ± 0.12) $\times 10^{-3}$ mm²/sec vs (0.98 ± 0.14) $\times 10^{-3}$ mm²/sec; $P = .000$]。鉴别乳腺癌病理分级 III 级和 II 级的 APTw 和 ADC 值的受试者工作特征曲线下的面积(AUC)是相似的(分别为 0.78 和 0.81; $P = .65$)。ADC 联合 APTw 值的诊断性能进一步提高($AUC = 0.87$)。APTw 值与肿瘤直径、Ki-67 指数呈正相关(分别为 $r = 0.263$; $P = .017$, $r = 0.327$; $P = .003$), 与 ER 表达呈负相关($r = -0.416$; $P = .000$); 与淋巴血管侵犯、淋巴结状态、HER-2 表达和 PR 表达无相关性($P > 0.05$)。ADC 值在肿瘤直径、ER 及 PR 表达、HER-2 表达、Ki-67 指数、淋巴血管侵犯和淋巴结状态中差异无统计学意义($P > 0.05$)。单因素方差分析显示 APTw 值在区分 luminalA、luminalB (HER-2 阴性)、luminalB (HER-2 阳性)、HER-2 过表达型和三阴性乳腺癌上具有统计学意义($F = 3.790$; $P = .007$)。其中, luminalA 和 HER-2 过表达型($P = .019$)、luminalA 和三阴性乳腺癌($P = .029$)之间的 APTw 值差异有统计学意义。而 ADC 值在分子亚型上差异无统计学意义($P = .161$)。

结论: APTw 成像具有评估乳腺癌预后因素的潜力。APTw 成像联合 DWI 能够提高乳腺癌组织病理学分级的诊断效能。

PO-1396

BRCA 基因突变型与正常乳腺癌患者间 MRI 影像特征的差异及对预后的预测价值

蔺璐奕、尤超、顾雅佳
复旦大学附属肿瘤医院

背景: BRCA 基因在乳腺癌发病和精准治疗中的作用已得到广泛认识, 但基因检测的花费和耗时较高。本文尝试探索乳腺癌患者人群中 MRI 特征与 BRCA 基因突变的关系, 及对预后的预测价值。

方法: 收集包括 BRCA1 基因突变 38 例, BRCA2 基因突变 38 例, 以及 BRCA 基因野生型患者 168 例共计 244 例在本院诊断治疗的乳腺癌患者的临床病理资料、活检前 MRI 扫描图像和术后辅助治疗后的预后资料。采用卡方检验和多因素 logistic 回归分析 BRCA 基因突变型与正常乳腺癌患者间临床病理特征及 MRI 特征的差异, 采用多因素 cox 回归分析 MRI 特征和 BRCA 基因状态对乳腺癌患者预后的预测效果。

结果: 分子分型(luminal 型、Her2 过表达型、TNBC 型, $p < 0.001$)、BPE(轻微、轻度、中度、明显, $p = 0.007$)及强化曲线(I/II 型、III 型, $p = 0.010$)均是区分乳腺癌患者中 BRCA 基因野生型及 BRCA1/2 基因突变型的独立影响因素。分期较晚($p = 0.001$)、邻近淋巴结转移($p = 0.006$)、

高 BPE 水平($p=0.029$)、a 或 b 腺体型 ($p<0.001$) 的乳腺癌患者预后较差, 但 BRCA 基因突变状态仅在单因素分析中存在预测乳腺癌患者预后的趋势。

结论: BRCA 基因突变型和正常乳腺癌患者间分子分型、BPE 和强化曲线特征存在差异, 淋巴结转移状态、疾病分期、腺体致密度和 BPE 特征是乳腺癌预后的独立预测因素, 但 BRCA 基因突变状态预测预后不显著。

PO-1397

X 线三维立体定位引导下乳腺病变真空辅助旋切技术的经验体会

刘儒玫、党艳莉、聂品、张姝蕾、陈宝莹
西安国际医学中心有限公司

目的: 总结乳腺病变真空辅助旋切技术在乳腺隐匿病灶活检、治疗中的经验总结。

方法: 收集 2021 年 6 月—2023 年 5 月在我院进行 X 线引导下病变真空辅助旋切患者, 共 62 例, 病灶共 62 处, 年龄 34-65 岁, 平均 (45.5 ± 6.63) 岁, 均为女性。所有患者术前均进行乳腺 X 线检查, 表现为单纯钙化者 60 例, 表现为钙化伴肿块者 2 例。根据 BI-RADS 分类均为 4 类 (BI-RADS 4A 44 例, BI-RADS 4B 15 例, BI-RADS 4C 3 例)。利用全数字化立体定位系统进行病变定位, 并根据实际情况进行微调, 局部麻醉并行小切口置入旋切针, 再次进行 X 线摄片确定旋切针位置后取得组织, 取得病理学结果。

结果: 除 1 例患者目标病变取得较少外, 其余 61 例均成功取得较多目标病变, 1 例患者术后出现血栓性静脉炎, 1 例患者出血较多, 其余患者均未出现明显不良反应。术后病理良性病变 51 例, 恶性病变 11 例 (导管内癌 8 例, 浸润性癌 3 例)。

结论: 能够取得较多的目标病变是旋切成功的关键, 当患者钙化范围较大时, 选择钙化最为聚集的部分进行活检。旋切时采用侧卧位, 用海绵垫对患者背部进行支撑、固定, 同时在患者双腿间放置棉被, 可以让患者身体处于放松状态, 较大程度避免患者移动。对于乳房较小及乳房弹性差的患者, 在局麻时注入添加肾上腺素的生理盐水, 可以有效增加乳腺厚度和乳腺组织弹性。乳房内侧血管较多, 尽量选择从外侧进针, 可以减少血管损伤可能; 术中若患者出血较多, 除加压外, 可给予少量止血剂进行治疗。乳腺旋切术后最常见的并发症血肿形成, 在旋切后利于旋切针的抽吸功能对术区进行充分抽吸, 针退出后对患者乳房进行挤压, 将残留血液尽量挤出, 同时使用胸部加压绷带, 可以最大限度的防止血肿产生。

PO-1398

基于磁共振成像影像组学构建的 21 基因检测复发风险预测模型 评估 ER+/HER2-乳腺癌预后的探索研究

陈阳、彭卫军
复旦大学附属肿瘤医院

目的: 探究基于磁共振肿瘤内部和瘤周影像组学特征建立的乳腺癌复发风险预测模型, 是否可以用于评估 ER+/HER2-乳腺癌患者无病生存期 (disease-free survival, DFS)。

方法: 本部分研究对象包含两个队列的患者。回顾自 2017 年 4 月至 2019 年 3 月在我院就诊的 ER+、HER2-乳腺癌患者资料, 筛选出进行乳腺 21 基因检测、并有术前乳腺 MRI 扫描的患者纳入模型构建组。另回顾自 2012 年至 2016 年在本院就诊且确诊为单侧可切除 ER+/HER2-乳腺癌的患者资料, 筛选出有术前乳腺 MRI 检查、且在本院行保乳手术或乳腺全切手术、术后行 EC-wP 或 EP-wP 方案化疗和至少 5 年内内分泌治疗的患者纳入预后组。在动态对比增强末期 (CL) 图像上手动分割病灶感兴趣体积 (VOI), 并复制到 T2WI 图像上, 再运用膨胀算法获得瘤周 VOI (肿瘤周围 4 mm 环形

区域)和膨胀 VOI (包含肿瘤内部和瘤周 4 mm 区域)。选取预测效能较高的模型,将预后组患者特征带入模型,获得 3 组预测复发风险评分(predRS)。使用 Kaplan-Meier 曲线描述不同 predRS 分组患者生存过程,并使用 Log-rank 检验比较组间差异,使用 predRS 和有意义的单因素联合构建 COX 回归模型。

结果:模型构建组共入组 159 名患者,训练组 111 名(低危组 34 名,高危组 77 名),验证组 48 名(低危组和高危组分别为 24 名)。预后组共纳入 111 名研究对象,平均随访时间为 49.6 个月,共有 18 例患者出现复发,平均复发时间为 30.9 个月,总体复发转移率为 16.2%。Kaplan-Meier 曲线显示,3 个模型 predRS 高危组与低危组患者生存差异具有统计学意义($P < 0.05$)。单因素 Log-rank 检验显示,病灶大小、手术方式和肿块边缘有统计学意义($P < 0.05$)。COX 回归模型显示,3 个 predRS 分组均对生存时间的影响具有统计学意义($P < 0.05$),且 predRS 与复发风险呈正相关。

结论:基于肿瘤内部和瘤周影像组学特征,联合临床影像学特征所建立的 RS 预测模型,可作为评估乳腺癌患者复发风险的潜在生物学指标。

PO-1399

磁共振成像瘤周影像组学预测 ER+/HER2-乳腺癌 21 基因检测复发风险评分的价值研究

陈阳、彭卫军
复旦大学附属肿瘤医院

目的:运用 DCE 和 T2WI 瘤周影像组学特征,联合 MRI 影像学特征、临床信息,建立 21 基因检测复发风险预测模型。

方法:回顾自 2017.4-2019.3 来我院就诊 ER+/HER2-乳腺癌患者资料,筛选进行 21 基因检测并有术前 MRI 检查患者。按时间顺序及 7:3 比例将患者分为训练组和验证组。以 21 基因检测复发风险评分(RS)26 分为临界值,将患者分为低危组($RS < 26$)和高危组($RS \geq 26$)。在 DCE 增强后末期图像(CL)上手动分割感兴趣体积(VOI),并将其复制到 T2WI 上。运用 Python 3.7 对 VOI 轮廓进行自动向外膨胀,膨胀范围为瘤周 2 mm、4 mm、6 mm、8 mm 和 10 mm。VOI 膨胀后,可同时获得环形瘤周区域 VOI 和膨胀 VOI。提取各 VOI 影像组学特征,并进行 z-score 标准化处理。采用 Pearson 相关系数筛选法、RFE 进行特征筛选,运用 SMOTE 对训练组患者进行重采样,使用 SVM 构建预测模型。分别在 CL、T2WI 序列上建立模型,再选择较优模型,联合肿瘤内部和临床影像学特征,构建融合模型(特征融合法和 logistics 融合法)。

结果:共入组 159 名患者,训练组 111 名(低危组 34 名,高危组 77 名),验证组 48 名(低危组和高危组分别为 24 名)。随着瘤周范围逐渐增大,各瘤周模型和膨胀模型效能变化趋势相似:瘤周 4 mm 范围模型效能高于或等于瘤周 2 mm 范围模型效能,从瘤周 4 mm 至 10 mm,模型效能逐渐下降。在所有瘤周模型中,T2WI 序列 4 mm 环形瘤周模型效能最高($AUC = 0.66$),与肿瘤内部、临床影像特征融合后(特征融合法和 logistics 融合法),模型效能均有提升,其中,logistics 融合模型效能最高, $AUC = 0.75$ 。各膨胀模型中,CL 序列 4 mm 膨胀模型和 T2WI 序列 4 mm 膨胀模型效能较高, AUC 分别为 0.69 和 0.68,加入临床影像特征后,效能进一步提高($AUC = 0.74$, $AUC = 0.72$)。

结论:MRI 瘤周影像组学特征在评估 ER+/HER2-乳腺癌复发风险方面具有潜在价值,其中瘤周 4 mm 范围模型效能最高。

PO-1400

磁共振成像影像组学预测 ER+/HER2-乳腺癌 21 基因检测复发风险评分的价值研究

陈阳

复旦大学附属肿瘤医院

目的：运用 DCE 与 T2WI 序列影像组学特征，联合影像学表现、临床信息建立 21 基因检测复发风险预测模型，并评估其预测效能。

方法：回顾 2017 年 4 月至 2019 年 3 月间在我院行 21 基因检测 ER+/HER2-乳腺癌患者资料，筛选出有术前 MRI 检查的患者名单。按时间顺序及 7:3 比例将患者分为训练组和验证组。根据 2021 版 NCCN 指南，以 21 基因检测复发风险评分 (RS) 26 分为临界值，将患者分为低危组 (RS < 26) 和高危组 (RS ≥ 26)。根据 2013 版乳腺影像报告和数据系统标准对患者图像进行评估并记录。在 DCE 增强后末期图像 (CL) 上手动勾画感兴趣体积 (volume of interest, VOI)，并将 VOI 复制到 T2WI、增强前 (C0)、增强后第一期 (CF)、增强中期 (CM) 图像上。提取各序列影像组学特征，并进行 z-score 标准化处理。采用 Pearson 相关系数筛选法和递归特征消除法进行特征筛选，运用合成少数类过采样技术对训练组患者进行重采样，使用线性支持向量机 (support vector machine, SVM) 构建 RS 预测模型。绘制受试者工作特征 (receiver operating characteristic, ROC) 曲线，计算 ROC 曲线下面积 (area under the ROC curve, AUC)，评估模型预测效能。

结果：共入组 159 名患者，其中，训练组 111 名，验证组 48 名。训练组中，低危患者为 34 名，高危患者 77 名；验证组中，低危和高危患者人数均为 24 人。在 DCE 相关模型中，CF (AUC = 0.66)、CL (AUC = 0.65) 模型预测效能相对较高；DCE 与 T2WI 联合模型中，CL + T2 模型测试集 AUC 为 0.71，将临床影像特征纳入后，CL + T2 + 临床影像模型诊断效能进一步提升 (AUC = 0.74)，该模型准确性、灵敏度、特异度分别为 0.63、0.79 和 0.46。

结论：磁共振成像影像组学特征在评估 ER+/HER2-乳腺癌复发风险方面具有潜在价值，DCE 和 T2WI 序列融合模型可提高预测效能。

PO-1401

第一部分 磁共振成像影像学特征预测 ER+/HER2-乳腺癌 21 基因检测复发风险评分的价值研究

陈阳

复旦大学附属肿瘤医院

目的：探究乳腺 MRI 影像学特征与 21 基因检测复发风险评分 (recurrence score, RS) 相关性，并建立复发风险预测模型。

方法：收集 2017.4-2019.3 在我院进行 21 基因检测 ER+/HER2-乳腺癌患者的资料，筛选出有术前 MRI 检查的患者拟入组。以 RS 26 分为临界值，将患者分为高危组 (RS ≥ 26) 与低危组 (RS < 26)。运用卡方检验、Fisher's 检验或 Mann-Whitney 检验比较磁共振成像影像学特征在 RS 高危组与低危组间差异。运用多元 logistics 回归对有统计学意义特征构建模型，并绘制受试者工作特性 (ROC) 曲线、森林图、决策曲线和校准曲线。按照时间顺序，以 7:3 比例将患者分为训练组和验证组，使用 Pearson 相关系数筛选法和递归特征消除法进行特征筛选，运用合成少数类过采样技术进行重采样，使用 4 种不同机器学习模型算法构建模型 (线性支持向量机、随机森林、决策树和 k 近邻)，运用 ROC 曲线评估模型效能。

结果：共入组 159 名患者，其中低危组为 58 名，高危组为 101 名。在临床特征中，PR 状态表现出组间差异 (P = 0.017)，低危组 PR+ 患者占比更高。在磁共振成像影像学特征中，肿块边缘表现

出组间差异 ($P = 0.008$)，低危组肿块多表现为边缘毛刺 (64.8%)，高危组肿块多表现为边缘不规则 (54.7%)。将 PR 状态和肿块边缘纳入多因素 logistics 回归模型，PR+与 PR-相比，PR+患者复发风险相对低，OR 值为 0.110 ($P = 0.038$)；边缘毛刺的肿块与边缘不规则肿块相比，边缘毛刺的肿块复发风险相对低，OR 值为 0.343 ($P = 0.004$)。logistics 回归模型 AUC 为 0.67，校准曲线和决策曲线表明，该模型校准性能良好且具有一定临床实用性。以 7:3 划分后，训练组纳入 111 名患者 (低危组 34 名，高危组 77 名)，验证组纳入 48 名患者 (低危组和高危组均为 24 名)。4 种机器学习模型 AUC 范围为 0.64~0.69，支持向量机和随机森林模型预测效能相对较高。结论：磁共振成像影像学特征在评估乳腺癌患者复发风险方面具有潜在价值。

PO-1402

合成 MRI 联合酰胺质子转移成像对乳腺癌诊断的临床价值探讨

占婷、芦春花
南昌大学第二附属医院

目的：评估合成 MRI(synthetic magnetic resonance imaging, syMRI) 与酰胺质子转移成像(amide proton transfer,APT)技术在乳腺癌中的诊断价值及联合诊断效能。

方法：

回顾性分析 2022 年 7 月至 2023 年 7 月在南昌大学第二附属医院检出的 125 例经穿刺活检或手术病理证实的乳腺肿块类病灶，包括 88 个恶性病变(恶性组)及 37 个良性病变(良性组)。所有患者均行 T1WI、T2WI、动态对比增强(DCE-MRI)、syMRI 及 APT 扫描。由两位放射诊断医师分别对 syMRI 定量参数图及 APT 图像勾画感兴趣区(ROI)，进行相应的后处理,测量并记录相关定量参数。测量包括增强前后的 T1、T2、质子密度(PD)值及非对称磁化转移率(magnetization transfer asymmetry,MTRasym)。通过组内相关系数(ICC)评估观察者间测量的一致性。采用受试者工作特征(ROC)曲线评价 syMRI 与 APT 参数的阈值及诊断效能，通过二元 Logistic 回归分析将两个序列参数进行联合并评估其诊断效能。采用 Delong 检验比较 ROC 曲线下面积(AUC)的差异。

结果：

乳腺恶性组的 T2-pre 值、T2-post 值均低于良性组,差异存在统计学意义(P 值均 <0.05)，其余参数差异均无统计学意义(P 均 >0.05)。恶性组的 MTRasym 值低于乳腺良性组,两组间差异具有统计学意义($P<0.01$)；syMRI、APT 成像及 syMRI+ APT 成像曲线下面积 (AUC) 分别为 0.884、0.897、0.968。

结论：

合成 MRI 和酰胺质子转移成像技术能够用于乳腺良性病变与乳腺癌的鉴别诊断，两种成像技术联合应用诊断模型可以进一步提高乳腺癌的诊断准确率,对临床制定相关诊疗方案具有重要的指导意义。

PO-1403

酰胺质子转移技术联合乳腺体层成像诊断乳腺肿块样病变的价值

占婷、芦春花
南昌大学第二附属医院

目的：

比较乳腺体层成像(digital breast tomosynthesis,DBT)及酰胺质子转移成像(amide proton transfer,APT)技术在乳腺肿块性病变中的诊断价值及联合诊断效能。

方法：

回顾性分析 2023 年 1 月至 2023 年 7 月于南昌大学第二附属医院检出的 128 例经穿刺活检或手术病理证实的乳腺肿块类病灶，包括 88 个恶性病变(恶性组)及 40 个良性病变(良性组)；两名放射科

医师对 APT 图像进行相应的后处理,测量并记录相关定量参数,得到非对称磁化转移率(magnetization transfer asymmetry,MTRasym)值。对术前 DBT 检查的 BI-RADS 分类结果、各影像学征象,采用独立样本 t 检验和 Wilcoxon 秩和检验,分析上述 DBT 的影像学征象;比较组间病灶 MTRasym 定量值在各组间的差异是否具有统计学意义($P<0.05$)。针对组间差异有统计学意义的参数,纳入二元 Logistic 回归分析不同预测模型对乳腺肿块类病变的诊断效能。

结果:

DBT 的影像学征象中,肿块形态、肿块边缘、是否伴结构扭曲,是否伴钙化在病理良恶性之间的差异存在统计学意义(P 值均 <0.05)。乳腺恶性组的 MTRasym 值低于乳腺良性组,两组间差异具有统计学意义 ($P<0.01$); APT 和 DBT 均能用于区分乳腺良恶性肿瘤,其中 DBT 诊断的敏感度、特异度和准确率分别为 81%、87%、83.75%,APT 诊断的敏感性、特异性和准确性分别为 90.51%、93.2%、90.15%。经 logistic 回归分析, DBT+APT 联合模型的诊断效能最高, AUC 为 0.942。

结论:

APT 和 DBT 成像技术可用于乳腺肿块样病变的良恶性诊断,尤其是可以提高对 BI-RADS 4 类肿块的诊断准确性。二者联合应用可以进一步提高乳腺癌的诊断准确率,可作为传统临床 MRI 方法的补充方法,有望用于有增强检查禁忌证患者的补充检查手段。

PO-1404

MRI 在最大径 $<3\text{cm}$ 三阴性乳腺癌和纤维腺瘤中的鉴别诊断价值

马新星、魏子凡、杨玲
苏州大学附属第一医院

目的 分析最大径 $<3\text{cm}$ 三阴性乳腺癌 (TNBC) 与纤维腺瘤 (FA) 的 MRI 图像特征,探讨 MRI 对 TNBC 与 FA 的鉴别诊断价值。

方法 回顾性分析经病理证实最大径 $<3\text{cm}$ 的 37 例 TNBC 与 36 例 FA 患者 MRI 图像,采用 χ^2 检验和 t 检验比较两组 MRI 形态学表现、TIC 曲线类型及 ADC 值的差异;以病理结果为金标准,绘制 ADC 值的非参数法 ROC 曲线。

结果 37 例 TNBC 共 37 个病灶,36 例 FA 共 39 个病灶。TNBC 组平均年龄 (45.2 ± 10.4) 岁,FA 组平均年龄 (30.4 ± 8.4) 岁,差异具有统计学意义 ($P<0.05$)。与 FA 组相比,TNBC 组病灶形态多为不规则形 (83.78%), $T_2\text{WI}$ 高信号为主 (56.76%), $T_2\text{WI}$ 常无低信号分隔 (97.29%), 增强扫描早期快速强化 (97.29%), 多呈不均匀强化 (94.59%) 及边缘环形强化 (67.57%), 常伴囊性坏死 (62.16%) 及瘤周水肿 (67.56%), TIC 多为 III 型 (64.86%), 除 $T_2\text{WI}$ 信号,其他均有统计学差异 ($P<0.05$)。TNBC 组平均 ADC 值为 (1.104 ± 0.13) $\times 10^{-3} \text{ mm}^2/\text{s}$, 低于纤维腺瘤组的平均 ADC 值 (1.613 ± 0.16) $\times 10^{-3} \text{ mm}^2/\text{s}$, 且组间差异具有统计学意义 ($P<0.05$)。ROC 曲线分析显示,诊断最大径 $<3\text{cm}$ TNBC 的平均 ADC 值截断值为 $1.239\times 10^{-3} \text{ mm}^2/\text{s}$, 曲线下面积 (AUC) 为 0.997, 灵敏度为 94.6%, 特异度为 100%。

结论 MRI 形态学表现、动态增强 TIC 曲线类型及 ADC 值对三阴性乳腺癌及纤维腺瘤具有鉴别诊断价值。

PO-1405

MRI 引导下乳腺病变真空辅助旋切活检术的临床应用

党艳莉、聂品、刘儒玫、贾田菊、陈宝莹*
西安国际医学中心有限公司

目的: 探讨 MRI 引导下乳腺病变真空辅助旋切活检术的临床应用价值。

方法: 回顾性分析 2019 年 09 月-2022 年 12 月在我院因乳腺 MRI 可疑病变 (BI-RADS 4、5 类) 行 MRI 引导下真空辅助旋切活检 (vacuum-assisted biopsy,VAB) 的患者 27 例共 27 个病变。采用 3.0T MRI 扫描仪、开放式乳腺穿刺线圈、磁共振兼容活检穿刺定位架及 MRI 兼容耗材。记录病变的影像学特征、活检病理结果及恶性病变术后最终病理结果; 观察其取材成功率、活检病理准确性及术中、术后并发症情况。

结果: 所有病例均一次性成功取样并取得病理学结果, 活检成功率 100% (27/27)。5 个 (18.52%) 病变表现为肿块样强化; 22 个 (81.48%) 病变表现为非肿块样强化。平均操作时间 39.92 ± 8.34 min。活检诊断为恶性病变 7 个 (25.93%); 非典型导管增生 2 个 (7.40%); 良性病变 18 个 (66.67%)。所有活检诊断为恶性病变或非典型导管增生的患者进一步行外科手术切除, 活检结果与术后病理结果相一致, 未出现组织学低估情况; 良性病变中, 2 例乳腺炎性病变半年随访病变缩小, 其余随访未见明显变化, 中位随访时间 10 个月 (6 个月-24 个月)。1 例患者在术中出现迷走神经反应症状, 主要由精神紧张引起, 经休息、心理安抚后很快恢复。

结论: 对于乳腺 MRI 检查发现的疑似病变, MRI 引导真空辅助旋切活检技术能够安全、精准、有效地完成组织取样以用于病理学评估, 病理诊断准确性高且并发症少, 值得临床应用推广。

基于多序列 MRI 的组学模型用于鉴别呈平台型的 乳腺良恶性病变的研究价值

李远飞¹、纪元¹、张丽娜¹、赵思奇¹、武玥琪¹、宁宁¹、梁泓冰¹、林良杰²

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的 探讨 MRI 多序列的影像组学模型鉴别 DCE-TIC 呈平台型乳腺良恶性病变中的价值, 分析 MRI 多序列联合组学模型的鉴别能力。方法 回顾性分析 2022 年 2 月至 2023 年 3 月经病理证实且在 DCE-TIC 呈平台型 88 例乳腺病变患者, 良性 24 例, 恶性 64 例。选取患者 MRI-T2WI 抑脂序列、MRI-DCE 第 7 期增强图像、DWI、DWI-ADCs 图像三维病灶逐层面图像勾画感兴趣区, 提取 2286 特征, 采用 5-折交叉验证方法将样本随机分为训练集和测试集, 通过最小绝对收缩与选择算子 (least absolute shrinkage and selection operator, LASSO) 及机器学习方法进行特征降维, 筛选出一组最优特征, 通过最大最小归一化做预处理, 采用高斯过程 (GP)、随机森林 (RF)、逻辑回归 (LR) 建立 MRI 单一序列及联合序列影像组学模型, 采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评估模型的诊断效能, 分析各模型对乳腺良恶性病变鉴别能力。并使用校准曲线及决策曲线评价预测模型的临床实用性。结果 多序列影像组学模型应用高斯过程 (GP) 分类器的训练集受试者工作曲线 (ROC) 的曲线下面积 (AUC)、灵敏度、特异度、准确性、阳性精确率、阳性 F1-score 分别为 0.942、0.979、0.739、0.909、0.901、0.938, 测试集分别为 0.903、0.934、0.621、0.843、0.860、0.894。校准曲线及决策曲线显示应用 GP 联合模型具有临床应用价值。结论 本研究开发了一个基于早期 DCE、DWI 和 ADC 多序列影像组学高斯过程 (GP) 模型来分析 DCE-TIC 呈平台型乳腺良恶性病变的诊断价值, 有望助力影像医生提高对该类乳腺疾病的术前鉴别诊断能力。

PO-1407

男性乳腺经典型粘液癌伴皮肤破溃一例

林小慧¹、欧阳汝珊²、李霖¹、廖婷婷¹、杨玉婷¹、马捷¹、周敬智¹

1. 深圳市人民医院
2. 深圳市中山大学附属第八医院

本文报道 1 例男性乳腺经典型粘液癌伴皮肤破溃，患者男性 2 年前无意中发现右侧乳晕后区黄豆大小肿物，活动度可，质地稍硬，无发热及肿痛，近来自觉肿物逐渐增大，并逐渐出现皮肤红斑并破溃。MRI 平扫及增强检查显示，右侧乳腺体积增大，右侧乳腺中央区见异常信号肿块影，大小约 48mm×56mm×56mm，形态呈分叶状，其内可见分隔，T1WI 呈低信号，T2WI 及 T2 压脂呈明显高信号，DWI (b=800) 及 ADC 均呈高信号，边界清楚，肿块周围见少量可疑腺体信号。动态增强扫描呈肿块样强化，内部强化不均质，呈缓慢渐近性强化，强化逐渐向病灶中央填充，TIC 曲线呈流入型曲线，右侧乳头形态失常，并与肿块分界不清，邻近皮肤欠光整。病理诊断为粘液腺癌，经典型，II 级，癌组织侵犯乳晕乳头皮肤。

PO-1408

ER 阳性/HER2 阴性乳腺癌 Ki-67 高低表达的鉴别： 四种 MRI 扩散模型的对比研究

康钟元、杜思瑶、张立娜
中国医科大学附属第一医院

目的：拟用非侵入性的单指数扩散加权成像(DWI)、连续时间随机游走(CTRW)、分数阶微积分(FROC)和扩散峰度成像(DKI)四种磁共振扩散模型探索弥散多参数一阶特征对 ER 阳性/HER-2 阴性乳腺癌 Ki-67 表达的诊断价值。

方法：从 2020 年 5 月至 2023 年 8 月，本研究回顾性收集 101 名行标准手术方案的 ER 阳性/HER-2 阴性乳腺癌患者。所有患者在术前均接受多 b 值扩散加权磁共振成像检查，并生成九个相应弥散模型参数图 (DWI_ADC、DKI_D、DKI_K、FROC_D、FROC_β、FROC_μ、CTRW_D、CTRW_α 和 CTRW_β)。以动态增强 MRI 为参照，在 ADC 图上标注感兴趣区 (ROI) 并复制到其他参数图上，随后分别提取四个扩散模型的单个参数图的直方图特征。使用来自单个扩散模型的多个参数图以及来自四个扩散模型的组合参数进行 Logistic 回归分析。受试者工作特征曲线(ROC)用于评估两种不同建模策略的诊断效能。

结果：与低 Ki-67 组相比，高 Ki-67 组的 DWI_ADC_{90%}、FROC_D_{90%}、FROC_μ_{90%}、偏度、DKI_D_{90%}、DKI_K_{偏度}和 CTRW_D_{90%}的值显著降低；DWI_ADC_{峰度}、FROC_D_{峰度}、FROC_μ_{峰度}、CTRW_α_{90%}、CTRW_D_{峰度}、DKI_D_{峰度}和 DKI_K_{10%、峰度}的值显著升高(p 均<0.05)。四个扩散模型均表现出良好的诊断效能 (AUC=0.697-0.776, 95%CI:0.598-0.853, p 均<0.05)，其中 CTRW 模型在区分 Ki-67 表达方面性能最佳 (AUC=0.776, 95%CI:0.683-0.853, p<0.001)，而联合四个扩散模型的组合参数图诊断效能最高 (AUC=0.834, 95%CI:0.747-0.901; p<0.001)，并且与 DWI 模型相比，组合模型显示出更好的诊断性能(Delong p=0.031)。

结论：四种磁共振扩散模型中，CTRW 模型对诊断 Ki-67 表达出更佳性能。基于四种扩散模型的联合诊断模型在鉴别乳腺癌 Ki-67 表达方面具有最高的诊断价值。

PO-1409

基于多参数 MRI 深度学习模型术前预测 乳腺癌腋窝淋巴结转移的研究

张晓栋
山东第一医科大学

目的：建立术前预测乳腺癌腋窝淋巴结转移的多参数 MRI 模型，进而探讨深度学习方法对乳腺癌腋窝淋巴结转移的诊断价值。

方法：回顾分析了 252 例非特殊型浸润性乳腺癌的临床资料和术前轴位 T2WI、DWI 和 DCE-MRI 图像，以病理结果为参考标准，分为腋窝淋巴结转移(axillary lymph node metastasis, ALNM)组和腋窝淋巴结未转移(Non-ALNM)组。由 2 名专业方向为乳腺影像诊断的医师确定肿瘤的位置、大小和边界。当出现争议时，由一位具有十五年诊断经验的高级医生独立决定。使用 Matlab 软件对全部患者的轴位 T2WI、DWI 和 DCE-MRI 原始图像中的 ROI 进行逐层分割，并将分割后的 ROI 统一为 224×224 大小，然后进行图像归一化处理，作为 T2WI、DWI 和 DCE-MRI 模型的输入，这些模型均以 ResNet 50 网络为基础。全部数据集随机分为训练集和测试集(训练集 n=202 例,包括 78 例 ALNM、124 例 Non-ALNM；测试集 n=50 例,包括 20 例 ALNM、30 例 Non-ALNM)。采用 SPSS 22.0 和 MedCalc 20.0 进行统计分析。使用模型评估指标评价各模型对腋窝淋巴结转移的诊断性能，包括准确度、灵敏度、特异度、阳性预测值、阴性预测值、ROC 曲线和 AUC 值。不同模型间的 ROC 曲线进行 DeLong 检验, $P < 0.05$ 为差异有统计学意义。

结果：在测试集中，ALNM 组和 Non-ALNM 组在年龄、肿瘤大小、肿瘤边缘、TIC 曲线类型、组织学分级、雌孕激素受体及 HER2 状态方面没有显著差异。在测试集上评估乳腺癌的腋窝淋巴结状态，T2WI 模型的准确度为 0.880, AUC 值为 0.937；DWI 模型的准确度为 0.640, AUC 值为 0.690；DCE-MRI 模型的准确度为 0.680, AUC 值为 0.702。T2WI 模型与 DWI 模型及 DCE-MRI 模型的 AUC 值相比, P 值均小于 0.05(P 值分别为 0.0034、0.0060)。

结论：基于乳腺磁共振图像的传统深度学习模型具有术前评估腋窝淋巴结状态的能力, T2WI 模型在此方面优于 DWI 和 DCE-MRI 模型。

PO-1410

青年乳腺癌影像特征与预后因素的相关性研究

陈艳虹、王丽君、罗冉、张征委、刘欢欢、张玉珍、汪登斌
上海交通大学医学院附属新华医院

目的 分析青年乳腺癌（发病年龄≤40 岁）影像特征与预后因素的相关性。

方法 回顾性分析 2014 年 1 月至 2020 年 4 月在上海交通大学医学院附属新华医院确诊乳腺癌患者的资料，将年龄≤40 岁的患者纳入分析。收集病灶的乳腺 X 线摄影表现 (MG)、超声表现及乳腺磁共振 (MRI) 表现，并针对预后因素（淋巴结转移、组织学分级、分子分型）进行相关性分析。

结果 共收集青年乳腺癌 128 例。103 例 (80.5%) 因触及肿块就诊，105 例 (82.0%) 为浸润性导管癌（非特殊类型）。组织学分级高的肿块更倾向于在 MR 上表现为形态不规则 ($P=0.03$)，在超声上表现为不均匀回声或囊实性 ($P=0.02$)。伴有淋巴结转移者更倾向于在 CDFI 上见穿入血流或者周围血流信号 ($P=0.02$)。≥2cm 的病灶在超声上更易表现为形态不规则 ($P=0.02$)，边缘不清 ($P<0.01$)，及不均匀回声或囊实性 ($P=0.01$)，更倾向于在 CDFI 上见穿入血流或者周围血流信号 ($P<0.01$)。HER2 过表达者更倾向于在 MG 上见可疑钙化 ($P<0.01$)，在 MRI 上表现

为圆形或类圆形的肿块 ($P=0.01$)，在超声上表现为不均匀回声或囊实性 ($P=0.04$)。Ki-67 高表达者更倾向于在 CDFI 上见穿入血流或者周围血流信号 ($P=0.02$)。ER 受体阴性者较阳性者在 CDFI 上更易出现穿入血流或者周围血流信号 ($P=0.04$)。

结论 青年乳腺癌在 MRI、MG 和超声上的表现与预后因素相关，有利于指导临床进行个性化治疗。

PO-1411

T2 mapping 联合 mDixon Quant MRI 在需手术年轻女性乳腺良恶性疾病中的应用价值

宁宁、张丽娜、梁泓冰、赵思奇、李远飞、武玥琪
大连医科大学附属第一医院

目的：探讨 T2 mapping 结合 mDixon-Quant MRI 在定量评估需要手术的年轻女性 (≤ 40 岁) 良性和恶性乳腺疾病中的价值。

材料与方法：回顾性分析了 2020 年 5 月至 2023 年 6 月在我院接受病理确诊的 44 例患者 (≤ 40 岁) (1 组：25 例恶性病变，2 组：19 例良性病变) 的数据。所有患者均在手术前两周在 3.0 T MR 扫描仪上进行了 MRI 检查，MR 序列包括 T2 mapping、mDixon-Quant 和 DCE-MRI (详细参数见表 1)。两名放射科医生采用双盲法测了 T2 mapping 图像上病灶的 T2 值，以及 mDixon-Quant 成像图像上的脂肪分数 (FF) 值和 $R2^*$ 值。采用类内相关系数 (ICC) 评估两位观察者测量的一致性，采用独立样本 t 检验或 Mann-Whitney U 检验比较两组间各参数的差异。使用接收器操作特征曲线 (ROC) 评估各参数鉴别良性和恶性疾病的效果。DeLong 检验用于比较 ROC 曲线下面积 (AUC) 之间的差异。 $P < 0.05$ 被认为差异具有统计学意义。

结果：两位观察者的测量结果一致性良好 ($ICC > 0.80$)。两组对侧纤维腺组织的 FF 值和病变的 $R2^*$ 值无明显差异 ($P > 0.05$)。第 1 组的 FF 值和 T2 值低于第 2 组 ($P < 0.05$)。FF 值、T2 值及其组合 (FF+T2) 区分恶性和良性乳腺疾病的 AUC 值分别为 0.713、0.777 和 0.853。DeLong 检验结果表明，FF+T2 的诊断性能优于任何单一参数 ($P < 0.05$)。详见表 2-3 和图 1。

结论：T2 mapping 联合 mDixon-Quant MRI 可显著提高预测性能，在年轻女性乳腺疾病患者术前预测中应用前景良好。T2 mapping 和 mDixon-Quant MRI 对定量评估年轻女性的良性和恶性乳腺疾病很有价值。

PO-1412

基于多参数 MRI 影像组学评估年轻女性乳腺癌高复发风险因素的价值

宁宁、张丽娜、梁泓冰、赵思奇、李远飞、武玥琪
大连医科大学附属第一医院

目的：探讨基于多参数 MRI 组学特征对年轻女性 (≤ 40 岁) 乳腺癌高复发风险因素 (脉管侵犯，组织学分级，Ki-67 表达水平) 的预测价值。

材料与方法 回顾性分析 41 例经组织病理学证实的年轻女性乳腺癌患者。所有患者按照脉管侵犯 (有/无)，组织学分级 (高级别/低级别)，Ki-67 表达水平 (高表达/低表达) 分别进行分组。应用 FS-T2WI、ADC、FF 图和动态增强 MRI (90s) 四种图像进行影像组学特征提取，采用 3Dslicer 对图像病变进行分割并对各序列提取 107 个影像组学特征，以上特征经 ICC、t 检验/U 检验，spearman 相关性分析，最小绝对收缩和选择算子 (least absolute shrinkage selection operator, LASSO) 降维筛选后，剩余特征采用多因素 logistic 回归分别建立各序列模型及多序列融合

模型。上述模型采用受试者工作特征(receiver operating characteristic,ROC)曲线分析各模型的预测效能,并采用 DeLong 非参数检验比较曲线下面积(area under the curve,AUC)的差异。 $P<0.05$ 被认为差异具有统计学意义。

结果 在预测脉管侵犯中 T2WI, ADC, FF, DCE 及联合模型的 AUC 值分别为 0.821、0.698、0.845, 0.778, 0.889。其中联合模型高于其与单独模型,但只有与 DWI 相比差异具有统计学意义。在预测组织学分级中 T2WI, ADC, FF 及联合模型的 AUC 值分别为 0.730、0.723、0.843, 0.853。联合模型虽高于单独模型,但差异不具有统计学意义。在预测 Ki-67 表达水平中 T2WI, ADC, FF 及联合模型的 AUC 值分别为 0.786、0.790、0.852, 0.842。FF 模型对高于其它模型,但差异不具有统计学意义。详见表 1 和图 1。

结论 多参数 MRI 影像组学特征对术前预测年轻乳腺癌高复发风险因素前景良好。在预测脉管侵犯和组织学分级中,联合模型较优于其它模型。在预测 Ki-67 表达水平中,FF 模型较优于其它模型。

PO-1413

多模态特征融合模型在预测肿块型乳腺癌术后复发风险中的应用

盛美红

南通市第一人民医院

目的:探讨多模态特征融合列线图在预测乳腺癌术后复发风险中的价值,为临床新辅助化疗方案选择以及内分泌治疗时间确定等进行决策,改善患者预后。

材料和方法:回顾性分析 2014 年 1 月~2022 年 6 月市一院、市中医院、市三院行乳腺 MR 的且经手术或穿刺病理证实为恶性,并且有免疫组化结果的患者,参照乳腺癌术后复发评分(中国抗癌协会乳腺癌诊治指南与规范 2021 年版)将患者分为低中度风险组、高风险组。市一院病例作为训练集和测试集按 8:2 随机划分,单因素分析评估乳腺癌术后复发风险与临床危险因素、常规 MR 特征之间的关系,多因素 Logistics 确定术后复发风险的预测因子。AUC 用于评价模型的诊断效能。Delong 检验比较不同模型 AUC 差异, Hosmer-Lemeshow 检验来评估模型校准度。 $P<0.05$ 有统计学差异。

结果:纳入市一院 310 个病灶,其中高风险 87 个,平均年龄 56.66 ± 13.35 岁。市中医院及市三院 54 个病灶,高风险 18 个,平均年龄 58.83 ± 10.34 岁。(2)两组病例在病灶最大径、绝经状态、T2WI 瘤周水肿、脉管内癌栓以及 ER、PR、HER-2、Ki-67 表达差异有统计学意义(P 均 <0.05)。所有序列组学特征包括 7 个 FF, 12 个 GLCM, 2 个 GLSZM 和 1 个 GLDM 特征,共 22 个组学标签建立 LR 模型,训练集、测试集及外部验证集 AUC 分别是 0.786、0.765、0.744。Rad-score (OR=4.547)、背景实质轻度强化 (OR=0.265)、背景实质中度强化 (OR=0.377)、淋巴细胞计数 ($\geq 1.7\times 10^9$) (OR=0.481) 是术后复发风险的危险因素,多模态融合模型 AUC 在训练集、测试集及外部验证集中分别为 0.588、0.744、0.784,诊断效能最高。使用列线图对融合模型可视化, Hosmer-Lemeshow 校准曲线显示较好的校准度,模型在训练集与外部验证集中与实际概率拟合程度较高 ($P=0.764, 0.139$)。

结论:Rad-score 是预测乳腺癌术后复发风险的潜在生物标志物,多模态融合模型列线图预测乳腺癌术后复发风险,有助于精准医疗以及改善预后。

PO-1414

分数阶微积分模型扩散加权成像结合多层同时加速技术对乳腺良恶性病变应用价值研究

汪飞、孙宜楠、张宝妮、朱娟
安庆市立医院

目的 探讨分数阶微积分 (fractional-order calculus,FROC) 模型扩散加权成像结合多层同时 (simultaneous multi-slice,SMS) 加速技术对乳腺良恶性病变的鉴别诊断价值。**材料与方法** 回顾性分析 2021 年 1 月-2022 年 12 月在本院接受乳腺 MRI 扫描的 124 例患者 (141 枚病变), 所有患者均应用 3.0T 磁共振行两组多 b 值 (14 个 b 值、最高 b 值 3000s/mm²) 扩散加权成像(diffusion weighted imaging,DWI) 扫描, 一组为常规单次激发平面回波成像(single-shot echo planar imaging,SSEPI-DWI), 另一组为 SMS-SSEPI-DWI。采用独立样本 t 检验或 Mann-Whitney U 检验比较良恶性病变组的图像质量评分、ADC 值和 FROC 模型参数值 (D、 β 、 μ)。并利用受试者工作特性(receiver operating characteristic,ROC)曲线评价各参数的诊断效能。应用 Bland-Altman 图评估两组 DWI 衍生参数间的一致性。结果 乳腺恶性病变的 ADC、D、 β 值均低于良性组, 差异具有统计学意义 ($p<0.05$), 恶性病变的 μ 值高于良性组, 差异具有统计学意义 ($p<0.05$)。在 SSEPI-DWI 和 SMS-SSEPI-DWI 序列序列中, D 值 AUC 最大, β 值诊断敏感性最高, D 值特异性最高。Bland-Altman 图显示两组 DWI 序列衍生的相对应参数值均无偏倚, 具有良好的一致性。结论 基于 SMS-SSEPI-DWI FROC 模型可以在临床可接受时间内提供良好的图像质量和病变特征参数值, 与 SSEPI-DWI 相比, 其在鉴别乳腺良恶性病变方面具有一致的诊断性能, D 值和 β 值表现出较好的诊断性能。

PO-1415

基于空间异质性的影像基因组学模型预测三阴性乳腺癌病理完全缓解及预后

周嘉音、尤超、顾雅佳
复旦大学附属肿瘤医院

目的: 三阴性乳腺癌(TNBC)的异质性影响患者对新辅助化疗的反应和预后。我们旨在 DCE-MRI 上表征肿瘤的空间异质性, 开发影像基因组学模型精准预测病理完全缓解(pCR)和预后。

材料与方法: 本研究回顾性纳入接受新辅助治疗的 TNBC 患者作为影像组学开发队列($n = 315$), 其中同时具有遗传学数据的患者被纳入影像基因组学开发队列($n = 98$)。来自 DUKE 数据库的患者构成外部验证队列($n = 50$)。利用瘤体、瘤内亚区域和瘤周区域的特征来表征空间异质性。选择特征后, 通过逻辑回归建立了三个影像组学模型。通过进一步整合病理和基因组学特征, 建立了两种融合模型(PRM:病理-影像组学模型; GPRM:基因-病理-影像组学模型)。采用 AUC 和决策曲线分析评估模型性能。采用 Kaplan-Meier 曲线和多因素 Cox 回归评估模型的预后价值。

结果: 对于影像组学模型, 表征空间异质性的多区域模型在训练集、内部和外部验证集中表现出更好的预测性能, AUC 值分别为 0.87、0.79 和 0.74。GPRM 在训练集($AUC=0.97$, $P=0.015$)和验证集中($AUC=0.93$, $P=0.019$)预测 pCR 的性能最佳。多区域影像组学模型、PRM 和 GPRM 具有根据无病生存期分层患者的能力, 预测的非 pCR 与不良预后相关($P = 0.034$ 、0.001 和 0.019)。

结论:影像学空间异质性可以有效预测 TNBC 的 pCR 及预后。影像基因组学模型有潜力成为一种有价值的生物标志物来提高预测性能。

PO-1416

基于深度学习对乳腺 X 线摄影钙化的分割及良恶性分类

覃雁秋、周雯
北京大学深圳医院

目的

本研究探讨基于深度学习建立乳腺 X 线摄影图像 (FFDM) 钙化分割模型, 进一步探索深度学习在钙化良恶性鉴别中的应用价值, 并将结果与有经验的放射科医师进行对比。

方法

回顾性收集北京大学深圳医院明确有钙化的 392 例病例用于乳腺钙化分割模型训练, 每个病例包含 CC 和 MLO 位 FFDM。回顾性收集北京大学深圳医院 2020 年 1 月 1 日至 12 月 31 日明确有钙化及病理结果的 400 例用于乳腺钙化良恶性分类模型训练。收集北京大学深圳医院 2021 年 1 月 1 日至 12 月 31 日 193 例用于外部验证。

分割模型: 将 CC 及 MLO 位图像分组, 采用 U-Net 深度学习模型进行病灶分割。先由放射科医师 A 对输出结果进行评估并分类记录, 以红绿色标签分别代表良恶性钙化。将钙化按分布区域勾画, 以区域为单位判断良恶性。再由另 1 名高年资医师 B 进行审核。

良恶性二分类模型: 先标注数据格式, 在原始图像上划分良恶性钙化区域。对图像实现扩增, 用十倍交叉验证完成训练, 并选择最佳模型。

以 Dice 系数对分割模型预测出的钙化区域进行判断。计算 ROC 曲线下面积判断深度学习模型对乳腺钙化良恶性二分类的鉴别效能。

结果

乳腺钙化分割及分类模型对钙化区域的预测示意图见图 1

图 a 示右乳 MLO 原始图, 图 b 示模型预测绿色标签钙化为恶性; 图 c 示左乳 CC 原始图, 图 d 示蓝色区域划分钙化区, 预测绿色标签钙化为恶性, 乳头后方、内、外侧象限的红色标签钙化为良性。CC 位和 MLO 位图像上钙化分割的 AUC 为 0.795 和 0.809 (表 1); 分类模型的 AUC 为 0.923 和 0.935 (表 2)

钙化良恶性分类模型在外部验证集上对恶性钙化的预测 AUC 在 CC 和 MLO 位为 0.750 和 0.704, 对良性钙化的预测 AUC 在 CC 和 MLO 位为 0.704 和 0.601 (表 3 和表 4)

结论

本研究建立的乳腺钙化分割及分类模型在检测钙化和预测钙化的良恶性方面是可行的, 分类模型在恶性上更优, 可以有效提示临床医师, 减少漏诊。

PO-1417

乳腺 MRI 动态增强中表观扩散系数图像纹理分析变化在鉴别乳腺良恶性病变中的诊断价值

向春锋、赵春刚、吴治伟、范开琴、李娟、梁双、冯阳
达州市中心医院

目的：探索乳腺 MRI 动态增强前后 ADC 图纹理特征参数变化在乳腺良恶性病变鉴别中的诊断价值。

方法：回顾性分析 2021 年 1 月至 2022 年 12 月在达州市中心医院放射科进行乳腺磁共振动态增强扫描患者，所有患者临床数据完整。通过评估 ADC 图的背景信号强度与标准差、病灶与正常组织的信号强度、信噪比和对比噪声比，来研究动态增强对 ADC 图像质量的影响。通过 3D_Slicer 在乳腺磁共振 ADC 图中提取病灶的纹理特征，筛选出受动态增强影响的纹理特征参数及在乳腺病变良恶性鉴别中具有诊断价值的纹理特征参数。通过 ROC 曲线、校准曲线和决策曲线评估该纹理特征模型的诊断效能和临床收益。构建含有临床语义特征和纹理特征参数的临床语义-纹理特征联合模型以鉴别乳腺病变良恶性，以诺莫图展示各影响因素的预测性能和风险性，并通过内部数据进一步验证该联合模型在乳腺病变良恶性鉴别的诊断效能。

结果：本研究发现磁共振动态增强可以在不影响 ADC 图像质量的前提下改变不同组织结构的信号特征，发现共 138 项纹理特征参数在动态增强前后差异具有统计学意义 ($p < 0.05$)，其中 7 项纹理特征可鉴别乳腺病变良恶性具有统计学意义 ($p < 0.05$)。这些参数鉴别乳腺病变良恶性的 AUC 分别为 0.764、0.725、0.735、0.757、0.751、0.646 和 0.716，联合 AUC=0.856 (0.743-0.968)、具有良好的预测性能，该纹理特征模型具有统计学意义 ($p < 0.05$)、拟合度较好，且具有良好的临床使用净效益。构建含有临床语义特征和纹理特征的临床语义-纹理特征联合模型，通过诺莫图清晰地观测各变量之间的关系及相应预测值和风险性。该联合模型在内部数据集中具有良好的乳腺病变良恶性鉴别能力，其 AUC=0.953 (0.918-0.987)，明显优于纹理特征模型。

结论：乳腺 MRI 动态增强前后 ADC 图纹理特征参数变化在乳腺良恶性病变鉴别中具有良好的鉴别能力，当联合相应临床语义特征下具有更佳的鉴别能力，可推广应用于临床。

PO-1418

基于乳腺磁共振 ADC 图影像组学鉴别乳腺病变良恶性的多维联合模型应用场景可行性研究

向春锋、赵春刚、吴治伟、范开琴、李娟、梁双、冯阳
达州市中心医院

目的：探索基于 ADC 图影像组学参数的多维模型在乳腺病变良恶性鉴别中的应用场景及可行性。

方法：回顾性分析 2021 年 1 月至 2022 年 12 月在达州市中心医院放射科进行乳腺磁共振动态增强扫描患者，所有患者临床数据完整。读取所有病例临床语义特征，3D_Slicer 分割磁共振 ADC 图病灶并提取影像组学特征。秩和检验初步筛选参数，LASSO 分析进行降维、并计算影像组学积分。逐步回归法消除冗余、构建临床语义-组学模型，诺莫图展示各变量的预测性能和风险性。ROC 曲线、校准曲线和决策曲线评估临床语义-组学模型的诊断效能和临床收益。以 7:3 比例构建训练集和测试集，分别对比不同多维模型在训练集和测试集中的诊断效能。

结果：本研究发现年龄、病灶形态、大小、TIC 曲线类型、边界、瘤周水肿、弥散情况及 ADC 值在乳腺病变良恶性鉴别中诊断价值欠佳，AUC 分别为 0.654、0.706、0.670、0.797、0.568、0.678、0.692 和 0.721。LASSO 分析筛选出的 12 项组学参数间部分存在一定相关性，组学参数联合模型在鉴别乳腺病变良恶性的 AUC 为 0.854 (0.800-0.909)。消除冗余的临床语义-组学模型包含年龄、病灶形态、大小、TIC 曲线类型、瘤周水肿、弥散情况、ADC 值、

Wavelet_LHL_firstorder_90Percentile 和 radscore。该临床语义-组学模型鉴别乳腺病变良恶性的 AUC 为 0.972 (0.947-0.997)，明显优于组学参数模型 ($p<0.01$)。在乳腺病变良恶性鉴别中，临床语义特征识别经验缺乏者根据病灶的弥散情况联合组学参数具有较好的诊断效能 (AUC=0.878)，无法进行磁共振增强者通过其他临床语义特征联合组学参数具有非常良好的诊断效能 (AUC=0.949)，DWI 序列检查受影响时通过其他临床语义特征联合组学参数亦具有非常良好的诊断效能 (AUC=0.951)。

结论：通过充分利用 ADC 图的影像组学参数鉴别乳腺病变良恶性具有良好的诊断效能，尤其是针对缺乏临床经验者、无法进行磁共振增强检查时或弥散序列判别受到限制时，该方法在临床上具有更广泛的应用前景。

PO-1419

乳腺 CEM 环形强化肿块的临床病理特征及良、恶性鉴别

文婵娟、汪思娜、徐维敏
南方医科大学南方医院

目的：分析乳腺 CEM 环形强化病变的影像病理特征，提高环形强化病变的诊断准确性。方法：分析 46 例经 CEM 检查表现为环形强化，且经手术病理活检证实的乳腺病变的临床影像病理资料。将病变分为良性组和恶性组，对比两组之间的差异性特征。计算有统计学差异指标诊断的敏感性、特异性、阳性预测值 (PPV) 和阴性预测值 (NPV)，单独评估每个指标的诊断能力。结果：良恶性组在肿块形态学及增强特征上均具有显著差异。病变的形态、边缘、强化程度、环壁厚度及内壁情况都显示出了较好的诊断能力。恶性病变明显强化多见 (17/22)，良性轻度强化多见 (11/24)。良性组环壁多较薄 (16/24)，恶性组厚壁多见 (20/22)。恶性强化内壁多不光整 (5/24 vs 18/22, $P<0.001$)。恶性病变实性成分多大于 20%。形态规则、薄环壁及内壁光整提示良性病变可能大，NPV 分别为 88.2%，88.9%，88.6%。是否伴随可疑钙化具有最高的 PPV (100%)。结论：通过对病变的 CEM 形态学特征和强化特征，我们可以对环形强化病变的良恶性有很好的鉴别。

PO-1420

入院常规光谱 CT 术前无创评估乳腺癌的价值探讨

顾思谦、杨玲、罗俊鹏、胡春洪、刘建夏
苏州大学附属第一医院

目的 探讨入院常规中双能探测器光谱 CT 用于术前无创评估乳腺癌的价值。方法 选取经病理证实乳腺癌患者 96 例，收集其临床、影像学及病理资料，包括雌激素受体 (ER)、孕激素受体 (PR)、人类表皮生长因子受体-2 (HER-2) 及细胞增殖相关核抗原 (Ki67)。收集患者多参数图像，定量参数包括标准化 CT 值 (NCT)、标准化碘浓度值 (NIC) 和 keV-CT 值曲线 (λ HU) 及有效原子序数 (Zeff)，定性参数包括病灶形态是否规则、边缘有无毛刺、肿瘤强化程度是否均匀、病灶内部有无钙化及肿瘤最大直径。采用统计分析各参数与免疫组化指标的相关性，筛选出独立危险因素建立模型并采用 ROC 评估其诊断效能。结果 ER 阴性患者动脉期 Zeff、 λ HU、NIC 及静脉期 NCT、Zeff、 λ HU 均高于阳性患者 ($P<0.05$)，且 ER 阳性患者多表现为钙化及边缘有毛刺 ($P<0.05$)，PR 阳性患者动脉期 λ HU、NIC、静脉期 NCT 低于阴性患者 ($P<0.05$)，同时 PR 阳性患者多表现为钙化 ($P<0.05$)。其中动脉期 λ HU 用于鉴别 ER 及 PR 表达的 AUC 最高达 0.805、0.695；HER-2 阳性患者动脉期 NCT、静脉期 NIC、Zeff、 λ HU 均高于阴性患者 ($P<0.05$)，其中静脉期 NIC 预测 HER-2 表达的 AUC 最高达 0.738；Ki-67 阳性患者静脉期 λ HU 高于阴性患者 ($P<0.05$)。采用二元 Logistic 回归筛选出动脉期 λ HU、Zeff 及病灶有无钙化为评估 ER 的独立危险因素，联合上述

三个独立危险因素构建的联合模型 AUC 可达 0.889, 其灵敏度为 0.816, 特异度为 0.850。结论 双能探测器光谱 CT 多参数可用于术前无创评估乳腺癌, 为患者的诊疗及预后提供新的思路。

PO-1421

乳腺 X 线摄影中“结构扭曲”的综合影像诊断与对比研究

柏玉涵、宋之琰、彭红芬、张东友
武汉市中西医结合医院 (武汉市第一医院)

【摘要】: 目的 分析结构扭曲的 X 线摄影 (钼靶)、磁共振成像 (magnetic resonance imaging, MRI) 及超声表现, 结合病理结果, 探讨各影像检查诊断乳腺结构扭曲病变的价值。方法 回顾性分析 48 个经乳腺 X 线摄影检出结构扭曲病灶的 X 线 (全数字化乳腺摄影 FFDM 及数字乳腺断层摄影 DBT)、超声及 MRI 资料, 以病理结果为标准, 对各影像诊断方法良恶性结构扭曲征象特点的差异性及诊断价值进行比较。结果 共纳入 48 个结构扭曲病灶, 经病理证实 29 个为恶性病变, 19 个为良性病变。28 个恶性结构扭曲 DBT 显示为不对称形态, 良恶性病灶形态学差异有统计学意义 ($\chi^2=30.262$, $P<0.01$), 26 个恶性结构扭曲表现为中心高密度, 良恶性病灶中心密度差异有统计学意义 ($\chi^2=29.689$, $P<0.01$)。良恶性结构扭曲有无微钙化差异无统计学意义。48 个结构扭曲病灶 MRI 表现肿块强化 26 个, 非肿块强化 17 个, 点状强化 3 个、无强化 2 个, 良恶性结构扭曲强化类型分布差异无统计学意义。恶性结构扭曲 TIC 类型多为平台型 (11 例) 和流出型 (12 例), 良恶性结构扭曲 TIC 类型差异有统计学意义。48 个结构扭曲病灶超声表现: 9 个 (18.75%) 病灶区域未探及异常, 28 个 (58.33%) 表现为回声不均匀、形态不规则的低回声肿块, 7 个 (14.58%) 表现为腺体结构扭曲、紊乱, 4 个 (8.33%) 表现为卵圆形/圆形低回声肿块, 良恶性结构扭曲超声表现差异无明显统计学意义 ($P>0.05$)。将影像学表现 \geq BI-RADS 4 类作为可疑恶性诊断, 以病理检查结果为标准, X 线摄影、超声、MRI 诊断乳腺良恶性结构扭曲的 ROC 曲线下面积分别为 0.582, 0.426, 0.764, 三者的诊断效能具有显著性差异 ($P<0.01$)。结论 相较于 X 线摄影与超声, MRI 检出局部结构扭曲病变敏感度和特异度较高, 明显提高了病变的诊断符合率, 能为临床医师手术方案的决策提供重要依据。

PO-1422

ER 阳性、Her2 阴性、淋巴结阴性的早期浸润性导管癌 X 线征象与 21 基因检测结果间的相关性分析

王婷
复旦大学附属肿瘤医院

目的: 探究 ER 阳性、Her2 阴性、淋巴结阴性的早期浸润性乳腺癌患者的 X 线影像特征与 21 基因检测结果间的相关性。**方法:** 回顾性收集了 282 例于 2017 年 9 月至 2019 年 6 月在复旦大学附属肿瘤医院进行过乳腺 X 线检查以及 21 基因检测的 ER 阳性、Her2 阴性、淋巴结阴性的早期浸润性乳腺癌患者 (单侧) 资料。首先, 对 21 基因复发风险评分的分布情况采用 Shapiro-Wilk 检验。然后, 采用单因素和多因素有序 logistic 回归分析 X 线征象与 21 基因检测复发风险评分 (Recurrence Score, RS) 分级的相关性, 采用单因素方差分析 X 线征象与 RS 分值的相关性。**结果:** Shapiro-Wilk 检验结果表明 282 例患者的 21 基因复发风险评分数据服从正态分布。经单因素有序 logistic 回归分析 X 线征象与 RS 分级的相关性后发现, 钙化形态和肿块边缘存在显著差异 ($P<0.05$)。在包含肿块密度、肿块形态、肿块边缘、病理类型、组织学分级的多因素有序 logistic 回归分析表明, 肿块密度和肿块边缘与 RS 分级显著相关。另外, 在包含钙化形态、钙化分布、病理类型、组织学分级的多因素有序 logistic 回归分析表明, 钙化形态和组织学分级与 RS 分级显著相关。综上, 单因

素和多因素分析结果一致表明, 肿块边缘和钙化形态与 RS 分级有统计学显著相关性。进一步的单因素方差分析对回归分析结果进行检验, 发现边缘模糊肿块的平均 RS 值为 33.6, 与边缘清楚 (18.4)、毛刺 (24.9)、小分叶 (27.3)、遮蔽 (23.1) 间都存在统计学差异。不定形钙化和点状钙化的 RS 均值间也有显著差异。**结论:** 乳腺 X 线影像中的钙化形态和肿块边缘具有成为 21 基因检测的影像标志物的潜力, 为临床医生对患者进行个体化治疗方案的决策提供强有力的帮助。

PO-1423

基于超声图像的自动化可复用深度学习 (AutoRDL) 框架预测 乳腺癌新辅助化疗疗效及腋窝淋巴结转移

游荆晶、张斌、张水兴
暨南大学附属第一医院 (广州华侨医院)

目的: 早期无创预测乳腺癌新辅助化疗疗效和腋窝淋巴结状态有助于优化患者个体化治疗方案。本研究旨在基于不同质量的超声图像利用自动且可重复使用的深度学习 (AutoRDL) 框架预测病理完全缓解 (pCR) 和腋窝淋巴结转移 (ALNM)。

方法: 本研究回顾性分析三家医院 2567 名经病理确诊的乳腺癌患者, 分别为中心 1 (训练和测试)、中心 2 (外部验证集 1) 和中心 3 (外部验证集 2)。针对中心 2 的图像质量明显低于其他中心的问题 (平均分辨率: 262×370、625×847、571×763 像素), 利用迭代细化的超分辨率 (SR3) 进行处理。AutoRDL 框架包括病灶检测网络和预测网络, 其中接受新辅助化疗或直接手术的患者分别用于 pCR 和 ALNM 预测任务。采用峰值信噪比 (PSNR) 和结构相似性指数 (SSIM) 评估图像重建效果。平均精度值 (mAP) 用于评估病灶检测性能。预测模型包括临床模型、图像模型和融合模型, 通过 AUC、混淆矩阵、校准曲线和决策分析等多维度全面评估模型效能。

结果: 最终纳入 2556 名患者进入病灶检测任务, 其中 1409 和 792 名患者分别进入 pCR 和 ALNM 预测任务。通过 SR3 实现中心 2 图像质量的提高, PSNR 和 SSIM 分别为 28.11 和 0.93。在病灶检测任务中, 验证集 mAP 为 0.88-0.92。在 pCR 预测任务的外部验证集中, 基于中心 2 处理后的图像的融合模型 post-SR3 (AUC: 0.833) 预测结果优于融合模型 pre-SR3、图像模型 post-SR3、图像模型 pre-SR3 和临床模型 ($p<0.05$)。同样, 在 ALNM 预测任务的外部验证集 1 中, 基于 SR3 处理后图像的融合模型 post-SR3 (AUC: 0.825) 性能超过融合模型 pre-SR3、图像模型 post-SR3、图像模型 pre-SR3 和临床模型 ($p<0.05$); 在外部验证集 2 中, 融合模型 (AUC: 0.819) 同样优于临床和图像模型 ($p<0.05$)。

结论: 本研究所提出的 AutoRDL 框架, 可自动化乳腺癌病灶检测及 pCR 和 ALNM 的预测, 为治疗决策提供参考。通过克服成像系统的分辨率限制, 即使在基层医院和资源有限的医疗环境中也同样适用。

PO-1424

基于 CEM 的多任务迁移学习网络系统对乳腺癌患者新辅助化疗反应的早期预测

郑甜甜^{1,2}、陈玉倩¹、毛宁¹

1. 烟台毓璜顶医院

2. 滨州医学院医学影像学院

目的：针对当前乳腺癌患者新辅助化疗（NAC）反应的早期预测难题，本研究旨基于对比增强乳腺 X 线摄影（CEM）图像开发一个多任务迁移学习网络系统早期预测 NAC 反应，以指导乳腺癌患者个体化治疗决策。

方法：回顾性纳入 2018 年 7 月至 2023 年 5 月期间来自烟台毓璜顶医院和桂林市中医院的 528 例接受 NAC 并具有术前 CEM 图像的乳腺癌患者，样本分为训练集、内部测试集和外部测试集。一个基于迁移学习的 RefineNet 分割网络和两个 Xception 分类网络的多任务系统被开发，并用于执行肿瘤分割和个体化的逐级反应预测任务。根据 Miller-Payne (MP) 分级标准，Xception-1 首先被训练用于预测良好的反应（MP: 3-5），然后训练 Xception-2 用于预测病理完全反应。此外，为了揭示网络系统潜在的生物学机制，本研究基于 RNA 测序数据执行了基因分析。使用 Dice 相似系数（DSC）评估分割性能，并使用热图，接受者操作特征曲线下面积（AUC）评估分类性能。

结果：本研究构建的多任务迁移学习网络系统基于分割任务在内部测试集中实现的 DSC 为 0.888 ± 0.101 ，外部测试集中为 0.867 ± 0.132 ；在逐级反应预测任务中，Xception-1 在内部测试集和外部测试集中分别实现了 AUC 为 0.864 (95%CI:0.832-0.887) 和 0.859 (95%CI:0.827-0.876)，Xception-2 实现的 AUC 为 0.855 (95%CI:0.826-0.881) 和 0.874 (95%CI:0.852-0.896)。最后，基于多任务迁移网络系统的生物学机制探索发现，较高的深度学习得分与免疫相关通路和促进微环境中的抗肿瘤免疫细胞浸润有关。

结论：本研究构建的多任务迁移学习网络系统能够早期预测 NAC 反应，在指导乳腺癌患者个体化治疗决策中发挥重要作用。

基于深度学习的全自动化管道系统在 CEM 图像病灶分割和分类中的研究

郑甜甜^{1,2}、张海程¹、林凡¹、毛宁¹

1. 烟台毓璜顶医院

2. 滨州医学院影像学院

摘要

目的：针对当前手动分割病灶的局限以及解决乳腺病变术前难以准确定性的问题，本研究将分析探讨基于深度学习的全自动化管道系统在对增强乳腺 X 线摄影（CEM）图像上实现病灶分割和分类中的临床应用和价值。

方法：回顾性纳入烟台毓璜顶医院术前行 CEM 检查的患者 1710 例，分别采用 RefineNet, Xception 为亚网络并融合金字塔池化模块（PPM）构建一个全自动化的管道系统实现对乳腺病灶的分割和分类。对于系统的测试主要分为 3 个阶段，首先基于本院的一个数据集进行内部评估，然后在复旦肿瘤医院和广东省妇幼保健医院的 97 例患者中进行泛化性能测试。为了适应临床需求，本研究基于敏感度和特异度为评估指标探讨了在该系统辅助下对 6 名放射科医生诊断性能的改善。另外基于乳腺影像报告和数据系统（BI-RADS）的分类，进一步研究了系统辅助下医生对 BI-RADS 4 类的调整。最后，模拟真实的临床诊疗环境，在烟台毓璜顶医院的前瞻性环境中对系统进一步测试以及辅助临床价值的评估。

结果: 本研究构建的全自动化管道系统在内部数据集、2 个外部医院构成的外部测试集、前瞻性数据集中的敏感度分别为 97%、96%和 93%, 特异度分别为 50%、70%和 61%。该系统在 2 个外部医院和前瞻性数据集中的性能均优于 6 名放射科医生的性能 (p 均 <0.05), 在系统的辅助下, 放射科医生在 2 个数据集中的敏感度分别提高了 1.5%和 1.8%, 特异度提高了 2.7%和 2.7%。另外, 基于管道系统的辅助策略, 在 2 个数据集中共有 5 个患者的 BI-RADS 4A 类别被降级, 24 个患者的 BI-RADS 4 类别被升级, 因此, 这部分患者的临床管理策略可以被重新考虑。

结论: 基于深度学习构建的全自动化管道系统在 CEM 图像的病灶分割和分类中表现出了良好的性能, 能够很好地缓解当前研究面临的分割耗时以及分类困难的问题, 对临床有一定辅助价值和推广价值。

DWI 联合 DCE-MRI 影像组学特征术前预测乳腺癌 HER-2 低表达

尚怡研¹、王贇霞¹、郭亚欣²、谭红娜 (通信作者)¹

1. 河南大学人民医院 (河南省人民医院)

2. 郑州大学人民医院 (河南省人民医院)

【摘要】目的:探讨基于动态增强磁共振成像 (dynamic contrast enhanced MRI, DCE-MRI) 和扩散加权成像 (diffusion weighted imaging, DWI) 影像组学特征术前预测乳腺癌人表皮生长因子受体 2 (human epidermal growth factor receptor-2, HER-2) 低表达的临床应用价值。方法:回顾性收集 299 例 2017 年 1 月~2020 年 12 月经我院病理证实为乳腺癌患者的首次 MRI 及临床病理资料, 根据免疫组织化学 (Immunohistochemistry, IHC) 及荧光原位杂交 (fluorescence in situ hybridization, FISH) 检测结果将患者分为 HER-2 低表达组 ($n=144$) 和 HER-2 非低表达组 ($n=155$); 按照 8:2 的比例随机分为训练集 ($n=239$) 和测试集 ($n=60$)。采用 ITK-SNAP 软件手动逐层勾画 DCE-MRI 和 DWI 图像上病灶的感兴趣区 (region of interest, ROI), 并提取所勾画 ROI 的影像组学特征。采用 Mann-Whitney U 检验、Z 分数归一化、方差阈值、K 最佳和 LASSO 算法筛选特征, 以排列组合形式应用多种分类器算法建立 DCE-MRI、DWI 及二者联合预测模型。应用受试者工作特征曲线 (receiver operating characteristic, ROC) 的曲线下面积 (Area under the curve, AUC)、敏感度、特异度、准确度评估模型的预测效能。结果: 基于 DCE-MRI、DWI、二者联合模型术前预测 HER-2 低表达的 AUC 值在训练集和测试集中分别为 0.754、0.775、0.843 和 0.774、0.645、0.795。结论: 基于 DCE-MRI、DWI 组学特征模型均可术前无创性预测乳腺癌 HER-2 低表达状态, 且以二者联合模型预测效能最佳, 可为临床乳腺癌治疗方案的选择提供参考。

PO-1427

多层分段读出平面回波弥散加权成像在乳腺 良恶性病变鉴别诊断中的应用

彭舒怡、陶娟、刘洁、杨帆

华中科技大学同济医学院附属协和医院

目的: 研究同时段多层分段读出平面回波弥散加权成像 (simultaneous multi-slice readout-segmented echo planar imaging SMS-RESOLVE) 技术在乳腺 MRI 成像中应用的可行性, 并比较其与传统 RESOLVE-DWI 在乳腺良恶性病变鉴别中的诊断效能。

方法: 从 2020 年 8 月到 2021 年 10 月, 30 名志愿者 (平均年龄 40.96 岁), 及 51 名患者接受了乳房 MRI 检查。使用 3.0T 磁共振及 18 通道相控阵乳房线圈对所有患者进行乳腺 MRI 成像。在所

有 51 名患者中, 24 名患者 (平均年龄 46.9 ± 11.4 岁) 发现了恶性病变, 27 名患者 (平均年龄 38.2 ± 8.6 岁) 检出了良性病变。所有病变均经活检组织病理学证实, 并纳入本研究进行最终分析。除了标准乳腺 MRI 扫描方案外, 患者还使用了 SMS-RESOLVE DWI 序列和传统 RESOLVE-DWI 序列进行双侧乳腺弥散成像。对图像质量、信噪比 (SNR)、病灶对比噪声比 (CNR)、病灶的表观扩散系数 (ADC) 等进行评估。

结果: 与传统的 RESOLVE-DWI 相比, 高分辨率 SMS-RESOLVE 采集显著提高了图像信噪比 (平均值 20.84 vs 7.55 , $p < 0.001$)。SMS-RESOLVE 序列在图像细微结构、清晰度和整体图像质量这三个指标中的得分显著高于 RESOLVE 序列 (4.03 vs 3.47 , $p = 0.002$; 4.43 vs 3.90 , $p < 0.001$; 和 4.13 vs 3.60 , $p = 0.002$;)。SMS-RESOLVE 的 ADC 值略低于常规 RESOLVE, 但两个序列之间没有显著性差异 ($1.56 \times 10^{-3} \text{ mm}^2/\text{s}$ vs $1.57 \times 10^{-3} \text{ mm}^2/\text{s}$, $p = 0.78$;)。SMS-RESOLVE 在乳腺病灶的良恶性诊断中具有更高的诊断效能 (AUC 值 0.986 vs 0.980 ; $p = 0.74$)。

结论: 具有高空间分辨率的 SMS-RESOLVE DWI 可以提供更高的信噪比和图像质量, 显著提高乳腺图像质量, 并具有区分乳腺良恶性病变的能力。

PO-1428

基于多区域 DCE-MRI 的深度学习网络在乳腺癌患者腋窝淋巴结新辅助化疗反应的预测

李子胤^{1,2}、毛宁²

1. 滨州医学院

2. 烟台毓璜顶医院

目的: 早期预测腋窝淋巴结阳性乳腺癌患者对新辅助化疗的治疗反应有助于及时调整腋窝淋巴结清扫方案。我们的目标是开发和验证一个多任务深度学习网络 (FAIS-DL), 基于新辅助化疗早期的肿瘤和腋窝淋巴结 DCE-MRI 图像预测腋窝淋巴结的病理完全缓解。

方法: 在这项多中心、前瞻性队列研究中, 从 2013 年 12 月 16 日至 2021 年 3 月 05 日, 中国六家医院共回顾性纳入 1145 例活检证实的伴有腋窝淋巴结转移的乳腺癌患者, 并分为训练队列、外部验证队列和前瞻队列。接受全周期新辅助化疗并有手术病理结果的患者被纳入。排除的关键标准是缺少 DCE-MRI 图像和或临床病理特征。本文提出的多任务网络由两个信息互补的子网络组成, 实现了多区域特征的集成。我们使用多变量 logistic 回归分析构建临床模型作为基线。并与临床模型进行比较。

结果: 培训队列 633 例患者来自烟台毓璜顶医院和毒复旦大学肿瘤医院。分别选取桂林市中医医院 228 例、北京肿瘤医院 75 例、青岛大学附属医院 68 例以及滨州医学院附属医院 43 例患者作为独立的外部验证队列。在内部、外部和前瞻验证队列中, FAIS-DL 得出的受试者工作特征曲线 (AUC) 值分别为 0.986 (95%CI: $0.977-0.995$)、 0.902 (95%CI: $0.856-0.948$) 和 0.957 (95%CI: $0.924-0.990$), 显著高于临床模型 (AUC: $0.524-0.588$, P all < 0.05)。此外, 共有 512 名来自外部和前瞻性检测组的 ALN 转移乳腺癌患者接受了 ALND。如果根据这些患者的 FAIS-DL 结果进行 ALND, 则不必要的 LND 发生率将从 56.4% 降低到 14.9% , 最终获益率将从 52.14% 增加到 88.35%

结论: FAIS-DL 能够预测腋窝淋巴结性乳腺癌患者新辅助化疗早期的腋窝病理完全反应, 这可以指导临床医生调整治疗方案。

PO-1429

3D-APT 预测乳腺癌不同分子分型疗效的价值研究

李菊、王翠艳

山东第一医科大学附属省立医院

背景：目前国内外关于 APT 在乳腺癌新辅助治疗疗效方面的研究总体较少，且尚未有 APT 对不同分子分型乳腺癌疗效的预测研究。

目的：利用 3D-APTWI 技术研究接受新辅助治疗的不同分子分型的乳腺癌患者的相关参数及变化，从而评估与预测新辅助治疗疗效，为实现不同分子分型的个体化治疗方案提供理论基础。

材料与方法：回顾性分析 2021 年 4 月至 2023 年 9 月间经病理证实 145 例接受新辅助治疗的乳腺癌患者，所有患者均在新辅助治疗前、4 周末接受常规乳腺动态增强 MR 扫描及 3D-APTWI 成像；主要测量指标为 NAT 前及 4 周末的肿瘤大小（肿瘤长径）、ADC 值、MTR_{asym} 值等，并统计 ER、PR、HER2 和 Ki-67 增殖指数等指标的表达水平。采用卡方检验、独立样本 t 检验比较各组分子分型的 MHR 和 NMHR 组的临床基线特征；采用配对样本 t 检验、Wilcoxon 检验比较治疗前、后各参数值差异；采用独立样本 t 检验、Mann-Whitney U 秩和检验比较各参数值的组间差异；选择具有统计学意义的参数绘制受试者工作特征曲线，利用曲线下面积 AUC 来评估相应参数的诊断效能；Delong 检验用于分析各参数的 AUC 是否存在统计学差异。

结果：应用 3D-APT 序列进行研究，可在相同时间内获得更多层图像，较 2D-APT 可提供更多信息，且可以针对乳腺癌不同分子分型进行疗效和预后的预测。

辐射剂量管理系统在乳腺摄影组成及乳腺实质构成对平均腺体吸收剂量的影响研究中的应用

朱文颖、杨帆、朱维钊、刘洁、陶娟

华中科技大学同济医学院附属协和医院

背景：乳腺是对辐射致癌最敏感的器官之一，乳腺辐射剂量的准确评估及乳腺 X 线摄影检查低剂量化一直是临床研究的方向。与西方国家女性相比，中国女性在乳腺相关特征方面存在一些差异，包括乳腺腺体较为致密和乳腺相对较小等。我们使用 Radimetrics™（辐射剂量管理系统）研究了乳腺摄影组成及乳腺实质构成对全视野数字化乳腺 X 线摄影（Full Field Digital Mammography, FFDM）检查中平均腺体吸收剂量（Mean Glandular Dose, MGD）的影响。

方法：从 2020 年 7 月至 2021 年 7 月，随机收集 533 例患者的 2138 份 FFDM 图像，评估乳腺 X 线摄影乳房组成。我们使用 Radimetrics™（辐射剂量管理系统）分析了受检者年龄，乳房压迫力（N），乳房压缩厚度（mm），管电压（kVp），管电流（mAs），乳腺实质构成与 MGD 的相关性。在腺体辐射剂量高于诊断参考水平（第四四分位数，≥75%）的受检者中，我们分析了辐射增加的原因。

结果：2138 幅 FFDM 图像 MGD 为 $2.00\text{mGy} \pm 0.32\text{mGy}$ ，乳腺摄影组成参数管电压、管电流、乳房压迫力与每幅图像的 MGD 呈正相关（ $P < 0.05$ ）；相比之下，受检者年龄及乳房压迫力与每幅图像的 MGD 呈负相关（ $P < 0.05$ ）。“致密型”组的 MGD 显著高于“非致密型”组（ $P < 0.05$ ），“致密”组的年龄低于“非致密”组（ $P < 0.05$ ）。

结论：通过该研究结果，对于年轻及致密型乳房的女性，我们需要制定更加谨慎的检查方案，实现更舒适的检查过程并保证辐射剂量与图像质量之间的平衡。同时，Radimetrics™ 在全视野数字化乳腺 X 线摄影检查中用于收集受检者各项检查数据和分析与辐射剂量相关因素的实用性及有效性是肯定的。我们将继续应用 Radimetrics™ 帮助我们在临床工作中控制 X 线检查辐射剂量，并进一步扩大统计分析范围，实现 DR、CT、MRI、XA 等成像设备的多方面管理。

PO-1431

基于 DCE-MRI 治疗早期肿瘤大小变化预测乳腺癌新辅助疗效及临床综合预测模型的构建

阎岚、曾乔
江西省肿瘤医院

目的：探讨基于乳腺动态增强磁共振（DCE-MRI）的肿瘤治疗早期大小变化用于预测乳腺癌新辅助治疗（NAT）后病理完全缓解（pCR）的价值，以及联合有意义的临床病理指标构建临床综合预测模型。方法：回顾性分析 2019 年 4 月到 2021 年 12 月江西省肿瘤医院 117 例 NAT 前及治疗 2 周期后均行乳腺 DCE-MRI 检查的乳腺癌患者。按照 7: 3 比例随机分成训练集与测试集，根据 NAT 结束后病理结果分为 pCR 组与非病理完全缓解（non-pCR）组。基于 DCE-MRI 图像计算治疗前后肿瘤最大径相对退缩值（Diameter%），通过 3Dslicer 软件半自动勾画三维感兴趣区计算治疗前后肿瘤体积相对缩小值（Volume%）；分别构建 Diameter%与 Volume%预测模型。对患者的一般资料进行统计学分析，选取单因素分析有意义的指标再通过逐步回归法筛选变量，构建逻辑回归临床综合预测模型，并绘制列线图。对上述模型诊断效能进行评估、比较。结果：Diameter%预测模型在训练集与测试集的 AUC 值分别为 0.71、0.77；Volume%预测模型的 AUC 值为 0.68、0.80。训练集 pCR 组与 non-pCR 组的 ER、PR、HER2 状态、Ki67 指数、分子分型、Diameter%、Volume%存在统计学差异，通过逐步回归法筛选出 ER、HER2 状态、Ki67 指数和 Diameter%用于构建临床综合模型，其 AUC 最高（0.86、0.83），在测试集中其预测 pCR 的能力较 Diameter%、Volume%预测模型分别改善了 19.31%、23.18%（ $P=0.035$ 、 0.005 ），其临床校准曲线显示模型预测 pCR 的效能良好。结论：基于 DCE-MRI 的肿瘤治疗早期大小的变化可为无创性预测 NAT 结局的生物标记物；Diameter%、ER、HER2 状态及 Ki67 指数构建的临床综合预测模型对于早期预测 pCR 具有较高的临床应用价值。

PO-1432

DBT 影像组学预测乳腺癌腋窝淋巴结转移的应用

李晓冉、杨彩仙
山西省人民医院

目的：探讨术前数字乳腺断层 X 线摄影(Digital Breast Tomosynthesis, DBT)影像组学预测乳腺癌腋窝淋巴结（Axillary lymph nodes, ALN）转移的应用价值。

方法：搜集我院 218 例经病理证实为乳腺癌患者的 DBT 图像及其临床资料，利用 ITK 软件逐层勾画原发病灶的感兴趣区域(Region of Interest, ROI)，使用 AK 软件自动提取包括基于强度及形状的一阶特征、基于纹理的二阶特征及高阶特征等在内的 ROI 影像组学特征，并利用最小冗余最大相关算法、最小绝对收缩和选择算子逻辑回归算法筛选得到最佳特征，从而根据乳腺拍摄所涉及体位应用支持向量机分类器构建多种模型，即 CC 模型、MLO 模型及双体位联合模型。同时本研究将患者年龄、肿瘤位置、肿瘤横径、肿瘤内有无钙化、是否伴有毛刺、BI-RADS 分类、家族史及月经史等临床资料进行统计学分析，构建临床模型，以此进一步联合影像组学特征构建诺莫图，并通过决策曲线分析(Decision Curve Analysis, DCA)预测模型在不同阈值概率下的净效益情况，以评价模型的预测性能。

结果：最终共筛选出 7 个最佳影像组学特征参与建模，CC 模型、MLO 模型及联合模型所得 AUC 在训练集和验证集中分别为 0.803 及 0.787、0.810 及 0.798、0.833 及 0.820，联合模型展现出更好的预测性能。通过逻辑回归分析得出病灶内钙化情况与 ALN 转移存在相关性，因此基于临床危险

因素所构建的临床模型在训练集和验证集中 AUC 分别为 0.611 及 0.606, 远不及影像组学模型的预测结果, 而将临床因素和影像组学模型联合所构建的诺莫图在训练集和验证集中 AUC 为 0.856 及 0.844, 与单纯影像组学模型相比, 诺莫图展示出更优效能, 并且通过 DCA 曲线可以看出, 阈值落在 0.23-0.60 区间时, 诺莫图可获得最高净效益值。

结论: DBT 影像组学模型可作为一种经济有效且非侵入性方法用于评估乳腺癌 ALN 转移情况, 并且研究中加入临床特征构建模型可以进一步提高对患者个体化风险的准确预测, 为预后判断和临床决策提供了更可靠的参考信息。

PO-1433

T1、T2 弛豫图一阶特征变化对不同亚型乳腺癌新辅助化疗反应的早期预测价值

杜思瑶、赵睿萌、张立娜
中国医科大学附属第一医院

目的: 本研究使用合成 MRI 生成的 T1、T2 弛豫图, 旨在评估新辅助化疗早期其一阶特征变化对预测不同分子亚型乳腺癌的新辅助治疗后病理反应的价值。

方法: 从 2019 年 3 月至 2021 年 10 月, 本研究前瞻性招募了 200 名在本院行标准的新辅助化疗+手术的治疗方案的乳腺癌患者, 所有患者在新辅助化疗基线和早期后均接受乳腺 MRI 检查, 生成合成 T1、T2 弛豫图和质子密度 (PD) 图, 提取 22 个全肿瘤的一阶特征并计算其变化率 ($\Delta\%$)。新辅助治疗反应分为病理无反应 (pNR), 病理部分反应 (pPR) 和病理完全反应 (pCR)。使用 Spearman 等级相关分析全部患者的各特征变化与治疗反应之间的关系, 并进一步在三种分子亚型内分析其相关性。受试者工作特征曲线用于评估参数的诊断效能。

结果: 本研究共纳入 75 名 luminal-HER2 阴性, 85 名 HER2 阳性和 40 名三阴性乳腺癌 (TNBC) 患者。在所有患者中, T1、T2、PD 的一阶特征变化与治疗反应呈轻-中度正相关 ($r=0.217-0.486$, p 均 <0.001)。HER2 阳性亚型中, T1 一阶特征变化与治疗反应的相关性最高 ($r=0.386-0.565$, $p<0.001$); 对于区分 pCR 和 pNR, $\Delta\%T1-75\%$ 诊断效能最高, AUC 分别为 0.798 (95%CI 0.705-0.890, $p<0.001$) 和 0.832 (95%CI 0.732-0.933, $p<0.001$)。TNBC 亚型中, T2 一阶特征变化与治疗反应的相关性最高 ($r=0.490-0.563$, $p\leq 0.001$); 对于区分 pCR, $\Delta\%T2-05\%$ 的诊断效能最高 (AUC=0.836, 95%CI 0.705-0.968, $p<0.001$)。HER2 阴性亚型中, T1 弛豫图 10/25/50% 变化与 pNR 相关 ($r=0.329-0.416$, $p<0.001$), 其中 $\Delta\%T1-25\%$ 诊断效能最高 (AUC=0.733, 95%CI 0.622-0.845, $p<0.001$)。

结论: 合成 MRI 生成的 T1、T2 弛豫图的一阶特征早期变化可以预测不同分子亚型乳腺癌对新辅助化疗的治疗反应, T1 和 T2 弛豫图分别适用于 HER2 阳性和 TNBC 亚型。

PO-1434

基于对比增强乳腺 X 线摄影影像组学对 BI-RADS 4A 类病变的诊断价值

荣小翠、康一鹤、杨光、时高峰
河北医科大学第四医院

目的: 本研究基于对比增强乳腺 X 线摄影 (CEM) 影像组学特征建立模型, 以期提高 BI-RADS 4A 类病变的诊断准确率, 减少不必要的良性活检。

方法：回顾性分析行 CEM 检查的数字乳腺断层摄影 (DBT) 诊断为 BI-RADS 4A 类病变 99 例患者的临床资料。按照 7:3 的比例将患者随机分成训练集(69 例)和测试集(30 例)；手动标注全部病例 ROI。采用 F 检验进行特征筛选，建立影像组学模型，计算患者的影像组学评分 (Rad-score)。使用受试者操作特征 (ROC) 曲线及曲线下面积 (AUC) 评估影像组学、BI-RADS 分类及联合模型对于 BI-RADS 4A 类病变诊断效能，采用 DeLong 检验比较 AUC 的差异。

结果：训练集及测试集中，良性病变患者的 Rad-score 均高于恶性患者 (均 $P < 0.05$)。基于 CC 位、MLO 位和二者体位联合的影像组学模型在训练集和测试集中诊断乳腺 BI-RADS 4A 类病变良、恶性的 AUC 分别为 0.935、0.823、0.947 和 0.812、0.716、0.937。训练集中基于二者体位联合的影像组学模型 AUC 高于 MLO 位 ($P = 0.042$)，余差异均无统计学意义 (均 $P > 0.05$)。影像组学、BI-RADS 分类及二者联合模型在训练集和测试集中预测乳腺 BI-RADS 4A 类病变的 AUC 值分别为 0.947、0.843、0.995 和 0.937、0.821、0.994。二者联合模型在训练集 ($P = 0.002$) 及测试集中 ($P = 0.046$) 诊断的 AUC 均高于 BI-RADS 分类；而与影像组学模型比较无统计学差异 ($P = 0.053$, $P = 0.140$)。影像组学模型和 BI-RADS 分类的 AUC 值在训练集 ($P = 0.088$) 和测试集中 ($P = 0.249$) 差异均无统计学意义。

结论：影像组学模型对于 BI-RADS 4A 类病变良恶性鉴别中具有较高的诊断价值，基于 CC 和 MLO 位二者体位联合的影像组学模型在训练集中 AUC 值高于 MLO 位。与 BI-RADS 分类比较，BI-RADS 分类与影像组学二者联合模型预测的诊断效能较高。

PO-1435

常规磁共振特征联合定量参数在乳腺肿瘤中的研究价值

周哲、陈月芹、王唯伟
济宁医学院附属医院

目的：探讨常规磁共振特征联合定量参数在乳腺肿瘤良恶性鉴别以及乳腺癌分子亚型预测中的应用价值。

材料与方法：回顾性分析 2020 年 5 月至 2023 年 5 月经病理证实的 227 例乳腺肿瘤患者的临床和术前影像资料。分析常规磁共振特征及测量 DCE、IVIM 定量参数 (K_{trans} 、 K_{ep} 、 V_e 和 D 、 D^* 、 f)。组间差异性分析采用 Mann-Whitney U 检验、卡方检验及 Fisher 确切概率法。采用 Logistic 回归分析确定预测乳腺肿瘤良恶性和乳腺癌分子亚型独立影响因素，建立预测模型。采用受试者工作特征曲线 (ROC) 分析模型诊断效能，采用 DeLong 检验比较 ROC 曲线下面积 (AUC)。

结果：良恶性病变组间常规磁共振特征 (ADC 值、病变边缘、T2WI 信号、病灶数目、背景实质强化、腺体分型、病变强化方式及强化类型、TIC) 及定量参数 (K_{trans} 、 K_{ep} 、 V_e 、 D) 相比较，差异有统计学意义 (均 $P < 0.05$)。Luminal 型与其他亚型组间 ADC 值、病变强化方式及 K_{trans} 、 K_{ep} 、 D 值相比较，有统计学差异 (均 $P < 0.05$)。HER2 过表达型与其他亚型组间 ADC 值、病变边缘及 K_{trans} 、 K_{ep} 值相比较，有统计学差异 (均 $P < 0.05$)。三阴性型与其他亚型组间病变强化方式、强化类型及 V_e 、 D 值相比较，有统计学差异 (均 $P < 0.05$)。常规磁共振特征联合模型鉴别肿瘤良恶性的 AUC 为 0.937，均高于任一磁共振特征 (均 $P < 0.05$)。定量参数联合模型鉴别肿瘤良恶性的 AUC 为 0.854，均高于任一参数 (均 $P < 0.05$)。常规磁共振特征联合定量参数模型预测 Luminal、HER2 过表达及三阴性型的 AUC 分别为 0.831、0.876、0.883，均高于任一独立预测因素 (均 $P < 0.05$)。

结论：常规磁共振特征及定量参数对鉴别肿瘤良恶性及预测分子亚型具有一定价值，可作为评估乳腺肿瘤的一种无创性影像指标。

PO-1436

基于多参数磁共振生境分析早期预测 乳腺癌新辅助治疗疗效的研究

蒋雯虹、杜思瑶、张立娜
中国医科大学附属第一医院

目的：建立基于多参数磁共振的时空生境，并探讨其时间变化早期预测乳腺癌新辅助治疗（NAT）反应的价值。

材料与方法：前瞻性收集 2020 年 10 月至 2022 年 12 月在中国医科大学附属第一医院收治的 74 例经活检病理证实为浸润性导管型乳腺癌患者，肿块直径均大于 3cm。所有患者在治疗前均接受乳腺磁共振检查，并于入组后接受 NAT 一周后乳腺磁共振检查。结合弥散加权成像参数（ADC 值）和增强定量参数（Ktrans/Kep/ve 值），通过 K-均值聚类将病灶划分为三个亚区。采用独立样本 t 检验或 Mann-Whitney U 检验评估不同治疗反应组中各亚区的体积差异，以单因素及多因素 logistics 回归分析 NAT 治疗反应前后各亚区的体积变化，采用受试者操作特征曲线（ROC）及曲线下面积（AUC）分析各参数单独及联合预测乳腺癌新辅助治疗反应的效能。

结果：在 74 例（平均 49 岁；范围 28-67 岁）入组患者中，21 例（28.4%）于 NAT 后获得病理完全缓解（pCR），53 例（71.6%）为非 pCR。最终分割出三种亚区，即低灌注低细胞性（LV-LC）、中灌注高细胞性（MV-HC）及高灌注高细胞性（HV-HC）。非 pCR 患者一周的各亚区体积均高于 pCR 患者（Z 分别为 -3.993、-3.579、-3.969， $P < 0.001$ ）；pCR 患者治疗前后的 LV-LC 亚区、HV-HC 亚区体积变化均大于非 pCR 患者（Z 分别为 -2.704、-2.164， $P < 0.05$ ）。LV-LC 亚区的减少预示着更好的治疗效果，产生了良好的诊断性能，AUC 为 0.70（95%CI，0.57-0.83）。

结论：多参数磁共振时空生境的时间变化在区分早期预测乳腺癌 NAT 反应方面具有一定的价值，低灌注低细胞性（LV-LC）亚区的减少可能预示着更好的治疗效果。

PO-1437

合成 MRI 在乳腺癌分子亚型的临床价值研究

刘金瑞²、徐梦莹¹、陈兵¹、朱亚男²、周和平²、安兆会²、李正军²

1. 宁夏医科大学总医院

2. 安康中心医院

目的：探讨合成 MRI 在不同分子亚型乳腺癌中的临床价值。

方法：收集 2020 年 9 月至 2021 年 3 月因乳腺病变接受合成磁共振增强前后 MAGIC 序列检查的 211 例乳腺病变患者的临床及影像学资料。根据手术后病理免疫组化结果，将病例分为四组：Luminal A 型、Luminal B、Her-2 过表达型、三阴性（TNBC）。测量不同分子亚型组每个乳腺癌病灶注射造影剂前后的 T1、T2 弛豫时间，分别表示为 pre-T1、pre-T2、pre-PD、post-T1、post-T2、post-PD。采用 Kruskal-Wallis 方法检验各定量 MRI MAGIC 参数值。结果：不同分子亚型组乳腺癌定量 MAGIC 增强前后的 T2 弛豫时间测量结果如下：Luminal A 型组 pre-T2 为 62.33 ± 9.53 、post-T2 为 52.89 ± 7.04 ，Luminal B 型组 pre-T2 为 71.79 ± 12.27 、post-T2 为 60.74 ± 7.92 ，Her-2 过表达组 pre-T2 为 81 ± 20.73 、post-T2 为 66.47 ± 12.99 ，TNBC 组 pre-T2 为 67.78 ± 15.91 、post-T2 为 59 ± 9.31 。pre-T2、post-T2 弛豫时间值在 Her-2 过表达型组高于其他三组，且差异有统计学意义（ $P < 0.05$ ）。

结论：使用合成 MRI 定量弛豫参数有助于鉴别不同分子亚型乳腺癌。T2 弛豫时间值可作为鉴别 Her-2 过表达型与非 Her-2 过表达型乳腺癌相关的影像学参数。

PO-1438

定量 MRI 预测 I-III 期乳腺癌分子亚型和预后的可行性研究

周哲
济宁医学院附属医院

目的: 探讨体素内不相干运动 (IVIM) 成像和动态对比增强 MRI (DCE-MRI) 评估 I-III 期乳腺癌分子亚型和预后的可行性及价值。**方法:** 回顾性分析 2020 年 1 月至 2022 年 3 月在济宁医学院附属医院行 IVIM 和 DCE-MRI 检查并经手术病理证实的乳腺癌患者 144 例, 测量 IVIM 参数真实扩散系数 (D)、假扩散系数 (D^*)、灌注分数 (f) 及 DCE-MRI 参数容量转移常数 (Ktrans)、速率常数 (Kep)、血管外细胞外容量比 (Ve)。采用 Logistic 回归分析确定预测分子亚型和预后的独立影响因素, 建立预测模型。采用受试者工作特征曲线 (ROC) 分析模型诊断效能, 采用 DeLong 检验比较 ROC 曲线下面积 (AUC)。建立分子亚型预测列线图, 采用校准曲线评估列线图效能, Hosmer-Lemeshow 检验评估拟合优度。**结果:** Logistic 回归分析结果显示, D、Ktrans 和 Ve 均分别为 Luminal 型和三阴性型的独立预测因素 ($P = 0.003$ 、 <0.001 、 0.002 ; 0.027 、 0.002 、 <0.001)。D + Ktrans + Ve 联合模型诊断 Luminal 型和三阴性型的 AUC 分别为 0.883、0.850。D 和 Ktrans 为预测 HER2 过表达型的独立影响因素, D + Ktrans 联合模型具有最佳的诊断效能, AUC 为 0.913。此外, Ktrans 为预测诺丁汉预后指数 (NPI) 的独立影响因素, AUC 为 0.790; D 为预测 Ki-67 表达情况的独立影响因素, AUC 为 0.747。校准曲线显示分子亚型预测列线图有较好的校准效果, Hosmer-Lemeshow 检验拟合优度 P 值分别为 0.66、0.62 和 0.93 ($P > 0.05$)。**结论:** IVIM 和 DCE-MRI 联合诊断模型对 I-III 期乳腺癌分子亚型和预后具有较好的预测效能, 可在一定程度上指导临床治疗决策。

PO-1439

联合治疗前和治疗后深度学习量化的 DCE-MRI 血流动力学特征评估乳腺癌新辅助治疗后腋窝淋巴结状态及预后的研究

许泽艳¹、刘再毅²、丁莹莹¹
1. 云南省肿瘤医院 (昆明医科大学第三附属医院)
2. 广东省人民医院 (广东省医学科学院)

研究背景: 新辅助治疗后腋窝淋巴结状态的再评估与乳腺癌患者手术方式的选择及预后密切相关。术前准确评估乳腺癌新辅助治疗后腋窝淋巴结状态能指导临床腋窝管理策略的制定, 在保证患者能从治疗中获益的同时, 尽可能减少患者术后并发症的发生, 改善其生存质量。

研究目的: 联合治疗前和治疗后乳腺 MRI 定性特征和定量 DCE-MRI 三维容积血流动力学特征对乳腺癌新辅助治疗后腋窝淋巴结状态及预后进行分析。

研究方法: 纳入 270 例接受术前新辅助治疗的乳腺癌患者进行分析。研究终点指标为新辅助治疗后的腋窝淋巴结状态。基于乳腺 DCE-MRI 采用深度学习方法对病灶进行自动分割, 并量化病灶内三维容积血流动力学特征进行分析。采用 logistics 回归模型基于临床病理指标、治疗前和治疗后 MRI 定性特征以及 DCE-MRI 定量三维容积血流动力学特征构建预测模型, 并进一步采用 Kaplan-Meier 曲线、Log-rank 检验及多因素 Cox 回归模型分析其与患者无复发生存期的相关性。

研究结果: 三维容积血流动力学模型、临床病理特征模型和 MRI 定性特征模型的 AUC 值分别为 0.736 (95%CI, 0.677-0.796)、0.715 (95%CI, 0.651-0.780) 和 0.791 (95%CI, 0.733-0.850)。通过结合这三种类型特征构建的综合模型 AUC 值为 (0.881; 95%CI, 0.837-0.925), 明显高于任一单一模型 ($P < 0.05$)。此外, 血流动力学评分 (高 vs. 低: HR, 6.31; 95%CI,

2.11-18.84; $P = 0.001$) 和综合模型评分 (高 vs. 中&低: HR, 6.11; 95%CI, 2.24-16.67; $P < 0.001$) 均为乳腺癌新辅助治疗后无复发生存期的独立预测因素。

研究结论: 联合治疗前和治疗后 DCE-MRI 定量三维容积血流动力学特征有望为乳腺癌新辅助治疗后腋窝淋巴结精准管理及预后评估提供参考依据。

PO-1440

不同时相选择下 DISCO DCE - MRI 药代动力学参数对乳腺癌新辅助化疗后病理完全缓解的预测价值

彭灿、唐耀洲、杜思瑶、张立娜
中国医科大学附属第一医院

目的: 比较笛卡尔 K 空间共享三维容积快速动态成像 (DISCO) DCE - MRI 药代动力学参数在不同时相对乳腺癌新辅助化疗 (NAC) 后病理完全缓解 (pCR) 的预测价值。

方法: 回顾性收集原发性乳腺癌患者 272 例, 根据 HR、HER2 状态 1:2 匹配 108 例: pCR46 例, Non-pCR62 例。NAC 前行 DISCO DCE-MRI, 共 18 期, 时间分辨率为 19.4s / 期。运用 Omni Kinetics (OK) 软件的 Reference Region 模型, 分别从四个时相 (前 116.4s、174.6s、252.2s、349.2s, 记作 TP1、2、3、4) 的图像中提取容量转移常数 (Ktrans)、速率常数 (Kep) 和血浆体积分数 (Vp) 直方图特征: 第 10、25、50、75、90 百分位数、最大值、最小值、中位数、均值、能量、熵、峰度、偏度。采用 Mann-Whitney U 检验比较各时相参数差异, 多因素 logistic 回归、ROC 曲线、DeLong 检验评估并比较预测性能。

结果: 不同时相 Ktrans、Kep 和 Vp 的平均值差异显著 ($p < 0.05$)。TP1 中 Kep 熵、TP2 中 Ktrans 中位数和第 50 百分位数、TP3 中 Ktrans 偏度和体素值和、TP4 中 ktrans 第 75 百分位数是乳腺癌 NAC 后 pCR 的独立预测因子。联合参数效能 TP1 (0.608, 95%CI 0.510-0.701)、TP2 (0.708, 95%CI 0.612-0.791)、TP3 (0.697, 95%CI 0.601-0.781) 和 TP4 (0.631, 95%CI 0.533-0.722) 差异无统计学意义 (DeLong 检验: $p > 0.05$)。

结论: 不同时相的 Ktrans 是新辅助治疗后 pCR 的良好预测指标。TP2 中的联合参数具有良好的预测性能, 且延长扫描时间不能提高检验效能。

PO-1441

64 排 CT 平时加增强扫描联合穿刺活检及形态学特征在诊断乳腺癌并淋巴结转移的价值

毕文忠、王磊、马福奎
青海省藏医院

目的: 探讨 64 排 CT 平扫加增强扫描加穿刺活检结合肿块形态学特征对乳腺癌并腋窝淋巴结的诊断价值。**方法:** 回顾性分析我院近 5 年经手术后病理证实 207 例 (366 枚肿大淋巴结) 乳腺癌患者, 根据病理结果分为非转移性肿大淋巴结 204 枚和转移性淋巴结 162 枚。收集淋巴结形态学特征, 包括直径大小、形态、密度、边缘、强化程度及穿刺活检病理学检查, CT 值、动脉期及静脉期碘浓度测定, 回顾分析影响腋窝淋巴结转移的因素, 分别构建形态学模型、CT 增强扫描模型、活检穿刺模型等独立模型于联合模型, 采用 ROC 评估各模型诊断效能, 计算敏感性和特异性。结果构建的形态学特征、增强程度方式及穿刺活检核模型诊断价值模型优于其他独立因素, 敏感度及特异性分别为 85.5%、83.4%。**结论:** 64 排 CT 平时加增强扫描及穿刺活检在术前检查评估乳腺癌患者腋窝淋巴结转移患者中有很好应用价值, 联合形态学特征可明显提高诊断正确率。

PO-1442

乳腺导管原位癌伴或不伴微浸润的临床病理及影像学特征对比分析研究

周晓平¹、杨蔚²

1. 宁夏医科大学临床医学院

2. 宁夏医科大学总医院放射科

目的：探讨乳腺导管原位癌（DCIS）发生微浸润（DCISM）的临床病理及影像学预测因子并建立联合预测模型。**方法：**回顾性收集宁夏医科大学总医院于 2018 年 4 月至 2022 年 12 月间经术后病理证实的 DCIS 伴或不伴微浸润病例共 127 例患者，所有患者术前接受乳腺钼靶和 MRI 检查并依据乳腺影像报告和数据系统（BI-RADS）标准进行分类。使用 χ^2 检验、Fisher 确切概率法或 t 检验分析两组间临床病理及影像表现差异，采用二元 Logistic 回归分析法筛选具有统计学意义的参数（ $P<0.05$ ），绘制受试者工作特征（ROC）曲线，建立联合模型并用 SHAP 分析方法将各参数的贡献大小可视化。**结果：**以病理结果为金标准，127 例患者中 DCIS 患者 81 例（平均年龄 50.9 ± 10.8 岁）共 89 个病灶、DCISM 患者 46 例（平均年龄 50.6 ± 10.8 岁）共 52 个病灶。二元 Logistic 回归多因素分析显示，恶性钙化（OR: 0.318, 95%CI: 0.106~0.948, $P=0.040$ ）、MRI 内部强化方式（OR: 2.746, 95%CI: 1.284~5.871, $P=0.009$ ）、组织学分级（OR: 3.999, 95%CI: 1.087~14.713, $P=0.037$ ）、坏死（OR: 0.067, 95%CI: 0.022~0.206, $P<0.001$ ）、腋窝淋巴结状态（OR: 0.046, 95%CI: 0.003~0.670, $P=0.024$ ）是 DCISM 的独立预测因子（ $P<0.05$ ）。**结论：**联合术前乳腺 X 线摄影和乳腺磁共振成像特征及临床病理学特征可有效预测 DCIS 及 DCISM，从而提升治疗计划的准确性。

PO-1443

基于灰度共生矩阵的乳腺浸润性导管癌和非哺乳期乳腺炎 ADC 图纹理特征研究

王晓煜、张莹莹、于韬

辽宁省肿瘤医院

目的：非哺乳期乳腺炎（non-lactation mastitis, NLM）同非肿块样强化的乳腺癌 MR 影像鉴别存在一定困难。纹理分析是影像组学研究中的主要方法，灰度共生矩阵（GLCM）是使用最广泛的一种纹理分析方法。表观扩散系数（ADC）值对于乳腺良恶性病变鉴别有重要价值。本研究的目的是分析非哺乳期乳腺炎和非肿块样强化乳腺癌的 ADC 图纹理特征及其差异，探讨其在鉴别诊断中的意义。**材料与方法：**回顾性分析 2021 年 1 月至 2022 年 12 月在我院住院并经穿刺活检或手术病理证实的 27 例非哺乳期乳腺炎患者和 33 例浸润性导管癌（infiltrating ductal carcinoma, IDC）患者乳腺 ADC 图像。采用 GE Signa 1.5T 超导 MR 扫描仪，DWI 采用 EPI 序列，b 值 0、800s/mm²，TR/TE = 6000/65 ms，层厚 6 mm。生成 ADC 图，并使用 MaZda 软件对其进行 GLCM 分析。选取病灶最大层面作为感兴趣区，避开脂肪。生成 4 个方向（0°、45°、90°和 135°）GLCM 的纹理特征，包括：角二阶矩（ASM）、逆差距（IDM）、对比度（CON）、相关度（COR）和熵（ENT）。分别计算上述各个纹理特征 4 个方向上的平均值（mean）、范围（range，纹理特征在四个角度中的最大值减去最小值）。使用 R 语言（version 3.6.1）进行统计分析， $P<0.05$ 有统计学意义。根据数据分布情况采用均数±标准差、中位数（四分位间距）来表示。**结果：**1.IDC 的 IDM 均值高于 NLM [0.4749 (0.1204) Vs 0.4080 (0.0905)]；IDC 的 CON 均值和范围高于 NLM [3.8981 (2.8904) Vs 6.2948 (4.0694), 2.1862 (1.5886) Vs 4.4899 (4.7030)]。2.IDC 的 IDM、CON、COR 组内相关系数低于乳腺炎 (0.8528 Vs 0.5361、0.7994 Vs 0.5745、

0.5784Vs0.2468)。结论: IDC 和 NLM 在 ADC 图上病灶纹理特征存在差异, 对于临床鉴别诊断有参考价值。

PO-1444

术前锥光束乳腺 CT 与乳腺 MRI 预测乳腺癌保乳手术切缘状态的临床价值

赵梦然、叶兆祥
天津医科大学肿瘤医院

目的: 探讨锥光束乳腺 CT (CBBCT) 与乳腺 MRI 在预测保乳手术切缘状态中的效能。

方法: 回顾性分析 2013 年 4 月至 2022 年 8 月于天津医科大学肿瘤医院行保乳手术治疗乳腺癌患者的临床、影像学及病理学资料。由 2 名放射科医师参照乳腺影像报告和数据系统标准对乳腺 MRI 及 CBBCT 图像分别进行独立阅片。采用 t 检验、Mann-Whitney U 检验、卡方检验、Fisher 精确检验分析临床病理特征及 CBBCT 及乳腺 MRI 影像特征与切缘状态的相关性。采用多因素 Logistics 回归建立基于 CBBCT 及乳腺 MRI 的保乳手术患者切缘状态的预测模型, 利用 ROC 曲线分析基于 CBBCT 和基于乳腺 MRI 预测模型的诊断效能, 并使用 DeLong 检验比较模型间 AUC 的差异。

结果: 本研究共纳入 77 例行保乳手术治疗的乳腺癌患者 (共 77 个病变), 其中 47 个为切缘阴性组, 30 个为切缘阳性组。两组在病理范围、周围脂肪浸润以及在 CBBCT 和 MRI 中测得病变范围、病变类型、患侧血管增多征、肿瘤周围血管征、肿瘤周围异常强化中的差异具有统计学意义 (P 均 <0.05), 在 CBBCT 上是否含有钙化 ($P=0.001$) 以及在乳腺 MRI 中病灶的早期强化率 ($P=0.038$) 的差异具有统计学意义。多因素 Logistics 回归分析结果显示, 肿瘤周围血管征 ($OR=9.829$)、肿瘤周围异常强化 ($OR=9.872$) 以及伴钙化 ($OR=5.064$) 是 CBBCT 影像特征预测保乳手术切缘阳性的重要影响因素, 肿瘤周围异常强化 ($OR=4.534$) 是乳腺 MRI 影像特征预测保乳手术切缘阳性的重要影响因素。ROC 分析表明, CBBCT 模型鉴别保乳手术切缘状态的效能 ($AUC=0.891$) 高于 MRI 模型 ($AUC=0.796$), 但二者差异无统计学意义 ($P=0.055$)。

结论: CBBCT 及乳腺 MRI 影像特征对乳腺癌患者保乳手术切缘状态具有较高的预测能力, 且二者效能相当。

PO-1445

X 线特征与乳腺癌 ER、PR、HER2、Ki-67 表达的相关性

林舒婷、蔡思清
福建医科大学附属第二医院

X 线特征与乳腺癌 ER、PR、HER2、Ki-67 表达的相关性

目的:

探索乳腺癌 ER、PR、HER2、Ki-67 不同表达的乳腺 X 线图像特征。

材料和方法:

回顾性分析我院 2018 年 1 月至 2021 年 12 月术前行乳腺 X 线检查的乳腺癌患者 508 例。由两位医生独立评估 X 线图像特征。根据免疫组化结果, 分为 ER 阳性和 ER 阴性组、PR 阳性和 PR 阴性组、HER2 阳性和 HER2 阴性组、Ki-67 高表达和 Ki-67 低表达组。分析两个配对组中受体表达结果与乳腺癌临床特征及 X 线图像特征的相关性。

结果:

(1) 在临床特征上, PR 阳性组患者年龄小于 PR 阴性组, Ki-67 高表达组发生淋巴结转移的比例高于 Ki-67 低表达组, 差异均有统计学意义。

(2) 在 X 线特征上, ER 阳性组出现毛刺肿块、不定形钙化的比例高于 ER 阴性组, 出现细小多形性钙化的比例低于 ER 阴性组, 差异均有统计学意义。PR 阳性组出现毛刺肿块、不定形及散在分布钙化的比例高于 PR 阴性组, 病灶最大径 $\geq 2\text{cm}$ 、出现区域分布钙化的比例低于 PR 阴性组, 差异均有统计学意义。HER2 阳性组出现钙化、结构扭曲征象的比例高于 HER2 阴性组, 出现肿块征象的比例低于 HER2 阴性组, 差异均有统计学意义。HER2 阳性组病灶最大径 $\geq 2\text{cm}$ 、出现细小多形性、区域状分布钙化的比例高于 HER2 阴性组, 出现毛刺肿块、不定形、簇状及散在分布钙化的比例低于 HER2 阴性组, 差异均有统计学意义。Ki-67 高表达组出现肿块、累及乳头、病灶最大径 $\geq 2\text{cm}$ 、出现细小多形性钙化的比例高于 Ki-67 低表达组, 出现不定形钙化的比例低于 Ki-67 低表达组, 差异均有统计学意义。

结论:

乳腺癌 ER、PR、HER2、Ki-67 不同表达在临床及 X 线图像特征上具有一定相关性。

PO-1446

数字化乳腺断层融合 x 线摄影及影像组学一阶纹理特征对乳腺肿块样病变的诊断效能分析

姚娟、努尔也木·买买提
新疆医科大学

目的: 通过对比分析 FFDM 与 DBT 对乳腺肿块性病变的检出能力及准确率, 并探讨基于 DBT 影像组学在评估乳腺肿块样良恶性病的诊断价值。方法: 收集乳腺肿块样病变患者的临床资料, 通过卡方检验比较肿块的检出率、正确诊断率的差异。采用受试者工作特征曲线(ROC)对于临床效能进行评价; 同时使用 pyradiomics 软件包提取一维特征进行模型的性能评价。结果: DBT 可以提高肿块的检出率、正确诊断率, 对于良性病变的检出更为显著, 差异具有统计学意义。对于致密型及非致密型腺体乳腺病变检出率比较, DBT、FFDM 及 DBT 联合 FFDM 对致密性腺体内肿块的检出差异具有统计学意义。对良恶性病变诊断的敏感度、特异度比较, 采用 DM+DBT 的敏感性 & 特异性均最高分别为 93.75%、97.06%, DM+DBT、DBT、DM 在良恶性病变诊断的 ROC 曲线下面积分别为 0.954、0.847、0.697, 三者之间的差异均具有统计学差异。对于影像组学特征的筛选, 在 MLO 位及 CC 位上均有特征模型具有鉴别良恶性病变的能力(AUC>0.7)。结论: 乳腺肿块样病变的检出率和符合率 DBT 优于 FFDM, 且 DBT 对肿块边缘的显示及对 BI-RADS 分类诊断结果的准确性优于 FFDM, 此外基于 DBT 的影像组学特征对乳腺良恶性病变的鉴别具有一定意义

PO-1447

多参数 MRI 与超声成像的决策树模型与 Logistic 回归模型识别三阴性与非三阴性乳腺癌

袁华、吕赛群
成都大学附属医院

目的 运用多参数 MRI 联合超声成像决策树模型和 Logistic 回归分析模型识别三阴性乳腺癌与非三阴性乳腺癌, 并比较二者之间的识别效能。方法 收集本院 2014 年 1 月至 2020 年 6 月行乳腺动态 MRI 增强与超声检查, 病理证实为乳腺癌的 194 例病例纳入研究, 并根据病理结果分为三阴性组 68 例和非三阴性组 126 例。对比分析两组间超声与 MRI 征象的不同, 单因素分析采用秩和检验和卡方检验, 将具有统计学意义的变量作为主要风险识别因子, 用决策树模型与 Logistic 回归模型建立风险识别模型, 运用受试者工作特征曲线 (ROC) 分析评估其诊断效能。结果 单因素分析显示, 两

组在超声血流信号明显、肿瘤更大、边界不清晰、乳头受累、伴有同侧淋巴结单发转移以及 MRI-BI-RADS 分级更高时均有统计学意义 ($P<0.05$)，决策树与 Logistic 回归分析均表明伴同侧淋巴结单发转移、有乳头受累是三阴性乳腺癌的独立识别指标，决策树识别三阴性乳腺癌的准确率 76.3%、特异度 79.4%、敏感度 72.0%、阴性识别值 79.4%、阳性识别值 72.0%，ROC 曲线下面积为 0.833。Logistic 回归模型识别三阴性乳腺癌的准确率 88.7%、特异度 75.0%、敏感度 96.0%、阴性识别值 91.1%，阳性识别值 87.7%，ROC 曲线下面积为 0.907。结论 决策树模型和 Logistic 回归分析模型均能识别三阴性乳腺癌，Logistic 回归模型识别能力高于决策树模型，两者互相补充，可结合二者鉴别三阴性乳腺癌与非三阴性乳腺癌。

PO-1448

基于 DCE-MRI 肿瘤早期退缩模式与不同亚型乳腺癌新辅助化疗后病理反应的相关性研究

王梦帆、杜思瑶、张立娜
中国医科大学附属第一医院

目的：分析不同亚型乳腺癌患者新辅助化疗 (NAT) 早期动态对比增强磁共振成像 (DCE-MRI) 上的肿瘤退缩模式与 NAT 后病理反应的关系。

方法：前瞻性地招募了 344 名 2018 年 9 月至 2021 年 12 月在中国医科大学附属第一医院接受 NAT 的浸润性导管乳腺癌患者。早期 DCE-MRI 包括在 NAT 一或两个周期后 (T_1 -MRI or T_2 -MRI) 进行。退缩模式分为四种类型：向心 (CS)、碎片 (DD)、仅强化减低 (DIO) 和稳定 (SD)。根据治疗前穿刺结果将肿瘤分为 3 种亚型：HR+/HER2-、HER2+ 和三阴性乳腺癌 (TNBC)。根据 NAT 后手术病理结果，将患者分为完全缓解 (pCR) 组和非 pCR 组。使用单因素和多因素 Logistic 回归分析影响疗效的相关因素。

结果：344 名 (1 名双侧) 患者有可评估的 T_1 -MRI or T_2 -MRI 纳入早期主分析队列 (113/345 [33%] pCR)，其中 245 名有完整 T_1 -MRI (82/245 [34%] pCR) 和 207 名有完整 T_2 -MRI (69/207 [33%] pCR) 的患者纳入单周期亚分析队列。早期主分析队列多因素分析显示 HR+/HER2-亚型 DD 模式 (OR: 12.083, 95%CI (3.337-43.750), $p<0.001$) 独立于大小的变化预测 pCR；在 HER2+ (OR: 1.611, 95%CI (1.222-2.126), $p=0.001$) 和 TNBC (OR: 1.605, 95%CI (1.220-2.111), $p=0.001$) 中大小的变化是预测 pCR 的唯一因素而不是退缩模式。 T_1 -MRI 亚分析结果与主队列一致，说明一周期肿瘤退缩模式可以更早预测 pCR。 T_2 -MRI 亚队列多因素分析显示 HR+/HER2-亚型 DD 模式 (OR: 7.716, 95%CI (1.545 - 38.527), $p=0.013$) 不独立于大小的变化预测 pCR，说明二周期后大小的变化显著影响 pCR 而不是退缩模式。

结论：乳腺癌新辅助化疗早期 HR+/HER2-肿瘤的碎片型退缩模式可作为 NAT 后 pCR 简单、独立的预测指标，且可以在更早的一周期进行预测。

PO-1449

双能 CT 图像评估乳腺癌 ER 表达水平的价值

杨丹^{1,2}、岳鑫²

1. 福建医科大学临床医学部

2. 厦门大学附属中山医院

目的：探讨双能 CT 图像治疗前评估乳腺癌患者 ER 表达情况的价值。方法：回顾性收集病理诊断为乳腺癌的患者 114 例，根据雌激素受体 (ER) 表达情况分为阳性组 (84 例) 和阴性组 (30 例)。记录病灶常规影像特征，计算动脉期 70keV 标准化 CT 值 (NCT)、标准化碘浓度 (NIC)、标准化有效原子序数 (NZeff)、能谱曲线斜率 (K)、70keVCT 值差值 (Δ CT)、碘浓度差值 (Δ IC)，经单因素及多因素回归分析各项 CT 指标，构建联合模型，ROC 曲线分析各因素和不同模型的诊断效能及最佳截断值，构建列线图预测模型，绘制临床决策曲线 (DCA)、临床影响曲线 (CIC) 评估其临床应用价值。结果：两组患者年龄、发病部位、CEA、CA125、CA153 表达差异无统计学意义 ($P>0.05$)。ER 阳性组肿瘤最大径小于阴性组 ($P<0.05$)。阳性组脂肪型、散在纤维腺体型乳腺较阴性组多见，不均匀致密型、致密型乳腺及乳腺血运增加较阴性组少见 (均 $P<0.05$)。阳性组动脉期 NCT、NIC、NZeff、K 低于阴性组， Δ CT、 Δ IC 高于阴性组 (均 $P<0.05$)；多因素回归分析显示，腺体密度、动脉期 K 及 Δ IC 是 ER 的独立预测因子，AUC 分别为 0.669、0.711、0.668，灵敏度分别为 34.52%、76.19%、82.14%，特异度 90.00%、70.00%、50.00%。基于动脉期 K 及 Δ IC 构建定量参数模型，基于三项指标构建联合模型，两种模型 AUC 分别为 0.731、0.783，灵敏度分别为 88.10%、90.48%，特异度分别为 50.00%、63.33%，Delong 检验显示定量参数模型与腺体密度、联合模型诊断效能比较差异无统计学意义 ($P>0.05$)；联合模型诊断效能高于腺体密度、 Δ IC 单项诊断效能 ($P<0.05$)，与动脉期 K 诊断效能比较差异无统计学意义 ($P>0.05$)。基于三项独立预测因子构建列线图预测模型，校准曲线及 DCA、CIC 显示该列线图模型具有较好的诊断性能和临床应用价值。结论：腺体密度、动脉期 K 及 Δ IC 是 ER 的独立预测因子，基于三者构建的列线图模型对治疗前无创评估 ER 表达具有临床应用价值。

PO-1450

精准无对比剂增强乳房 MRI 成像技术研究

王萃萃、陈宝莹、聂品、党艳莉、刘儒玫

西安国际医学中心医院

目的：本研究旨探究非增强序列与增强序列图像间映射关系，进而建立增强序列图像合成模型，用于合成逼真增强序列图像。方法：回顾性收集 2020 年至 2022 年在西安国际医学中心医院行乳腺 MRI 检查的 98 例女性患者的临床信息及影像学资料，随机分为训练集 (80 例)、测试集 (18 例)。基于训练集中不同 MRI 平扫序列 (T1WI, T2WI) 及 DWI 序列，分别使用对抗生成网络构建乳腺 MRI 增强序列图像合成模型。并通过定量指标：峰值信噪比 (peak signal to noise ratio, PSNR)、结构相似性 (structural similarity, SSIM)、均方误差 (mean-squareerror, MSE) 及病灶增强曲线下平均面积 (AUC) 来评估合成的增强序列与真实扫描增强序列图像中病灶增强信息的一致性。结果：与原始的增强序列图像相比，仅使用单一 T1WI 序列图像合成的增强序列图像病灶增强 PSNR 为 35.701 ± 2.485 ；SSIM 为 0.984 ± 0.005 ；MSE 为 0.366 ± 0.094 ，AUC 为 0.69；T1WI 序列与 DWI 序列结合组中，合成病灶的 PSNR 为 36.465 ± 2.112 ；SSIM 为 0.984 ± 0.005 ；MSE 为 0.316 ± 0.061 ，AUC 为 0.97；T1WI 序列与 T2WI 序列结合组中，合成病灶的 PSNR 为 35.864 ± 2.213 ；SSIM 为 0.984 ± 0.004 ；MSE 为 0.347 ± 0.072 ，AUC 为 0.83；DWI 序列与 T2WI 序列结合组中，合成病灶的 PSNR 为 32.824 ± 1.987 ；SSIM 为 0.970 ± 0.006 ；MSE 为 0.497 ± 0.106 ，AUC 为 0.91；T1WI 序列联合 T2WI 序列及 DWI 序列组中，合成图像病灶的 PSNR 为 36.301 ± 2.304 ；

SSIM 为 0.984 ± 0.005 ; MSE 为 0.338 ± 0.076 , AUC 为 0.88。结论: 基于 T1WI 联合 DWI 序列图像的乳腺增强序列图像合成模型具有最优性能, 能够合成与扫描图像更加一致的增强序列图像; 这为逼真增强序列图像的合成提供有效证据支撑。

PO-1451

DCE-MRI 影像特征对乳腺癌 HER2 表达水平的鉴别诊断价值

沈怡媛、尤超、顾雅佳
复旦大学附属肿瘤医院

目的: 探讨 DCE-MRI 影像特征对乳腺癌 HER2 表达水平的鉴别诊断价值。

方法: 回顾性收集 2018 年 1 月至 2019 年 12 月在复旦大学附属肿瘤医院就诊的 238 例乳腺癌患者的临床、病理及影像资料, 根据其免疫组化评分和荧光原位杂交结果将其分为 HER2-零表达、低表达和过表达三组, 并对病变的影像特征进行分析, 包括纤维腺体类型、背景实质强化、病灶位置、瘤内水肿、瘤周水肿、单灶或多发、病灶类型、病灶大小、形状、边缘、分布、内部强化等特征。分析上述特征在不同 HER2 表达水平的乳腺癌中是否存在差异, 并进一步探讨 HER2-低表达组的影像特征与激素受体状态的联系。

结果: 存在瘤内水肿在 HER2-零表达组有 31 例 (49.2%), 在低表达组有 65 例 (69.1%), 在过表达组有 39 例 (48.1%), 其中低表达与零表达、低表达与过表达组的差异具有统计学意义 ($p=0.008, 0.003$)。在肿块型强化病灶中, 形态规则者在零表达组有 21 例 (37.5%), 在低表达组有 13 例 (16.7%), 在过表达组有 26 例 (38.2%), 其中低表达与零表达、低表达与过表达组的差异具有统计学意义 ($p=0.006, 0.003$); 边缘光整者在零表达组有 23 例 (41.1%), 在低表达组有 19 例 (24.4%), 在过表达组有 10 例 (14.7%), 其中零表达与低表达、零表达与过表达组的差异具有统计学意义 ($p=0.04, <0.001$)。在 HER2 低表达组中, 激素受体状态分层后的结果显示, 边缘光整的肿块在 ER 阴性组有 7 例 (46.7%), 在 ER 阳性组有 12 例 (19.0%), 差异具有统计学意义 ($p=0.042$)。

结论: 不同 HER2 水平乳腺癌病灶的 DCE-MRI 影像表现各异, 其中瘤周水肿、肿块形态和边缘对于乳腺癌 HER2 表达水平具有一定鉴别诊断价值。

PO-1452

数字乳腺断层摄影评价乳腺癌新辅助化疗疗效多因素分析

武丽霞、赵慧娟、尹成方
山东省聊城市人民医院

目的: 探讨数字乳腺断层摄影 (DBT) 对肿块并钙化乳腺癌新辅助化疗疗效多因素分析。方法: 回顾性分析 100 例肿块伴钙化乳腺癌新辅助化疗 (NAC, Neoadjuvant Chemotherapy) 患者, 按月经情况、分子分型、腺体类型、肿块密度变化、周围腺体密度变化、钙化形态、钙化数目变化分组, 以术后病理 MP [Miller & Payen] 分级为金标准, 分析不同变量对 NAC 疗效的影响。结果: 未绝经患者 45 例, 化疗显著反应 22 例, 绝经患者 55 例, 化疗显著反应 22 例, $P=0.373$; HER2 过表达型 14 例, 显著反应 13 例, LuminalA 型 7 例, 显著反应 2 例, LuminalB 型 (HER2 阳性) 24 例, 显著反应 11 例, LuminalB 型 (HER2 阴性) 44 例, 显著反应 12 例, 基底样型 11 例, 显著反应 6 例, $P<0.05$; 不均匀致密型腺体 63 例, 显著反应 30 例, 致密型腺体 4 例, 显著反应 0 例, 散在纤维型腺体 24 例, 显著反应 10 例, 脂肪型腺体 9 例, 显著反应 4 例, $P=0.317$; 化疗后肿块密度下降 81 例, 显著反应 40 例, 肿块密度不变 5 例, 显著反应 0 例, 肿块密度下降又增加 4 例, 显著反应 0 例, $P=0.021$; 化疗后周围腺体密度下降 83 例, 显著反应 40 例, 周围腺体密度增加 1

例, 显著反应 0 例, 周围腺体密度不变 15 例, 显著反应 4 例, 周围腺体密度降低又增加 1 例, 显著反应 0 例, $P=0.262$; 粗糙不均质钙化 5 例, 显著反应 1 例占比, 不定型钙化 14 例, 显著反应 3 例, 细小多形性钙化 59 例, 显著反应 32 例, 细线样钙化 14 例, 显著反应 6 例, 点状钙化 7 例, 显著反应 1 例, 壳状 1 例, 显著反应 1 例占比, $P=0.066$; 化疗后钙化数目减少 40 例, 显著反应 27 例, 钙化增加 6 例, 显著反应 3 例, 钙化数目不变 54 例, 显著反应 14 例占比, $P<0.01$ 。结论: 分子分型、肿块密度改变、钙化数目改变可以显著影响新辅助化疗疗效, HER2 过表达型、RECIST 分级 CR、肿块密度减低、钙化数目减少者易获得 pCR。

PO-1453

基于 DWI 联合 T2WI 瘤内及瘤周影像组学特征术前 预测乳腺癌组织学分级的临床研究

郭亚欣¹、谭红娜²

1. 郑州大学人民医院

2. 河南省人民医院

目的 探讨基于 MRI 扩散加权成像(diffusion weighted imaging, DWI)联合 T2 加权成像(T2 weighted Imaging, T2WI)瘤内及瘤周影像组学特征术前预测乳腺癌组织学分级的价值。**方法** 收集我院自 2017 年 1 月至 2020 年 12 月 700 例经病理证实为乳腺癌且有术前完整 DWI 及 T2WI-MRI 检查的患者临床及影像数据; 并按 8:2 的比例随机分为训练集 ($n=560$) 及测试集 ($n=140$)。采用 ITK-SNAP 软件手动逐层勾画 DWI 及 T2WI 图像上病灶的感兴趣区(region of interest, ROI), 并分别适形外扩 3mm; 通过 Z 分数归一化、方差阈值、K 最佳及最小绝对值收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 算法筛选最优影像组学特征; 分别构建 DWI 瘤内、DWI 瘤周 3mm、DWI 瘤内+瘤周 3mm、T2WI 瘤内、T2WI 瘤周 3mm、T2WI 瘤内+瘤周 3mm、DWI 联合 T2WI 的瘤内、DWI 联合 T2WI 的瘤周 3mm 及 DWI 联合 T2WI 的瘤内+瘤周 3mm 共 9 个模型用于预测乳腺癌的组织学分级。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评估各模型的预测效能, 并计算曲线下面积 (area under the curve, AUC)、灵敏度、特异度及准确度。**结果** 基于 DWI、T2WI 及 DWI 联合 T2WI 的瘤内或瘤周及瘤内+瘤周的影像组学模型在预测乳腺癌方面均有较好的预测效能, 且 DWI 联合 T2WI 的瘤内+瘤周影像组学特征构建的模型预测效能最佳, 其在训练集和测试集中的 AUC 值、灵敏度、特异度及准确度分别为: 0.860、80.4%、72.4%、75.0%和 0.781、68.9%、70.5%、70.0%。**结论**: 基于 DWI 联合 T2WI 的瘤内及瘤周影像组学特征构建的模型均可用于术前乳腺癌组织学分级的预测, 且联合序列的瘤内+瘤周预测模型效能最佳。

PO-1454

基于乳腺 DBT 图像深度学习模型 分类典型非典型结构扭曲的研究

何子龙、郭丫丫、曾伟雄、刘家玲、徐维敏、陈卫国

南方医科大学南方医院

目的: 基于深度学习分类 AD 的方法, 在 DBT 中利用卷积神经网络的方法对 AD 病灶的典型非典型进行分类, 评估深度学习分类模型的临床有效性。

方法: 基于南方医院 2014 年 3 月至 2018 年 4 月在乳腺 X 线检查中检出结构扭曲的患者的 DBT 图像, 共计 1520 例。根据序号随机法抽取 404 例 AD 病例, 136 例为典型, 268 例为非典型。每个 DBT 序列中, AD 的位置由一名放射科医师根据手术病理记录的位置进行标记, 作为模型分类的金

标准。按照 7:3 的比例随机划分为训练集和验证集,研究采用了 VGG、Resnet 卷积网络结构,构建了 DBT 图像上典型与非典型 AD 病灶的分类模型,并在一个独立的测试集上进行评估。选取 VGG 网络作为基线模型,采用反应受试者工作特征曲线 (Receiver Operating Characteristic Curve, ROC) 确定分类性能。

结果: VGG-16、Resnet-34、Resnet-101 在独立测试集中验证。通过比较三种网络的分类性能,典型非典型分类实验中, Resnet-34 网络表现最好, ACC 为 0.704, AUC 为 0.615, 选定 Resnet-34 作为最终分类网络。

结论: 利用自适应感受野的方法可有效提高非典型 AD 病灶检出能力,说明全局特征可以更好地描述非典型 AD 病灶的特征。基于 Resnet-34 及 Resnet-101 网络的分类模型可作为 AD 病灶分类网络。基于 DBT 深度学习模型能较为准确分类典型及非典型结构扭曲,为后续乳腺疾病诊断提供更多指导依据。

PO-1455

基于 FF 图的瘤内瘤周影像组学预测 年轻女性乳腺癌脉管侵犯的价值研究

宁宁、张丽娜、梁泓冰、赵思奇、李远飞、武玥琪
大连医科大学附属第一医院

目的: 探讨基于 FF 图的瘤内瘤周影像组学特征对术前预测年轻女性乳腺癌脉管侵犯的价值。

材料与方法: 回顾性分析 41 例经组织病理学证实的年轻女性乳腺癌患者。所有患者按照术后病理中的脉管侵犯 (有/无) 进行分组。所有患者均在手术前两周内在 3.0 T MR 扫描仪上进行了 MRI 检查, MR 序列包括 mDixon-Quant、DCE 序列。基于 mDixon-Quant 序列中 FF 图进行影像组学分析。使用 3Dslicer 对图像肿瘤区域进行分割,采用自膨胀算法自动对肿瘤向外扩张 5mm 形成瘤周区域,分别对瘤内、瘤周提取 851 个影像组学特征。以上特征经 ICC、t 检验/U 检验, spearman 相关性分析,最小绝对收缩和选择算子 (least absolute shrinkage selection operator, LASSO) 降维筛选后,剩余特征采用多因素 logistic 回归分别建立瘤内、瘤周模型及瘤内瘤周融合模型。上述模型采用受试者工作特征 (receiver operating characteristic, ROC) 曲线分析各模型的预测效能,并采用 DeLong 非参数检验比较曲线下面积 (area under the curve, AUC) 的差异。P<0.05 被认为差异具有统计学意义。

结果: 瘤内、瘤周模型中分别保留了 11、7 个影像组学特征。在预测脉管侵犯中,瘤内模型,瘤周模型,瘤内瘤周联合模型 AUC 值分别为 0.942, 0.843, 和 0.952。其中联合模型高于单独模型,但仅和瘤周模型相比差异具有统计学意义 (p<0.05)。详见表 1 和图 1-2。

结论: 基于 FF 图的瘤内瘤周影像组学特征对术前预测年轻乳腺癌脉管侵犯前景良好。各个模型都展现出较高的预测性能,其中,瘤内瘤周联合模型较好与单独模型。

PO-1456

乳腺浸润性导管癌磁共振影像表现与 VEGF、Her-2 表达水平的关联性分析

孔淑凤
江西省肿瘤医院

【摘要】 目的 分析乳腺浸润性导管癌 (IDC) 磁共振平扫与增强扫描的基本特征,探讨其与血管内皮生长因子 (VEGF)、人表皮生长因子受体-2 (Her-2) 表达水平的关系。 方法 回顾分析 48 例经手

术病理证实为乳腺浸润性导管癌患者的乳腺磁共振平扫及动态增强扫描图像,记录病灶大小、形态、边缘、时间-信号曲线(TIC)类型分类;并检测术后切除肿瘤组织 VEGF、Her-2 表达情况,分析其与病灶磁共振表现的相关性。结果 乳腺癌 MRI 特点为边缘多呈毛刺或不规则状、边界模糊,形态多不规则或分叶状,部分病灶出现坏死,呈不均匀或环形强化;大多癌灶 T1WI 呈略低信号,抑脂 T2WI 呈不均匀性高信号,注射对比剂增强扫描后信号明显均匀或斑驳样不均匀强化或环形强化,病灶的大小及形态征象与免疫组化指标无明显相关性;VEGF 阳性表达率 80%,Her-2 阳性表达率 76.77%,VEGF 与乳腺癌 MR 边缘毛刺和早期边缘强化呈显著正相关;Her-2 与乳腺癌 MRI 病灶内部信号环形强化呈显著正相关。结论 乳腺浸润性导管癌影像表现与 VEGF、Her-2 表达具有一定相关性,MRI 评估乳腺癌治疗和预后具有一定参考价值。

PO-1457

MRI 影像组学术前预测浸润性导管癌腋窝前哨淋巴结转移的价值

邢滔、张宏、余玉盛、周清清
南京市江宁医院

摘要:目的 探讨 MRI 影像组学术前预测浸润性导管癌腋窝前哨淋巴结转移的价值。方法 回顾性分析经手术病理证实 160 例浸润性导管癌患者(前哨淋巴结(SLN)阳性 86 例,SLN 阴性 74 例)的完整资料。采用完全随机方法将患者分为训练集(n=106)和验证集(n=54)。所有患者均行乳腺常规和动态增强扫描。所有病灶行逐层半自动 ROI 勾画,采用 AK 软件提取纹理特征,采用 LASSO 回归对训练集纹理特征降维并建立影像组学标签。分类变量采用 χ^2 检验或 Fisher 检验,连续性变量采用独立样本 t 检验或 Mann-Whitney U 检验,采用多种拟合方法建立影像组学模型,绘制 ROC 曲线评价模型的诊断效能。结果 AK 软件共提取了 3948 个影像特征,经 LASSO 回归降维得到 10 个价值较大特征,联合肿瘤最大径、ER 状态,共计 12 个参数进行建模。采用 NuSVC 拟合的影像组学模型在训练集和测试集的 AUC 值分别为 0.8707(95%CI: 0.7635-0.9636)、0.8187(95%CI:0.6335-0.9643)。结论 基于 MRI 影像组学模型术前预测浸润性导管癌腋窝前哨淋巴结转移有较高临床价值。

PO-1458

酰胺质子转移成像在不同雌激素受体状态下乳腺癌中的应用价值

赵思奇、张丽娜、李远飞、武玥琪、宁宁、梁泓冰
大连医科大学附属第一医院

目的:本研究旨在探讨酰胺质子转移成像(amide proton transfer, APT)对乳腺癌中不同雌激素受体(estrogen receptor, ER)表达状态(ER 高表达/ER 低表达/ER 阴性)的鉴别价值。方法:回顾性搜集 2019 年 1 月至 2023 年 2 月经病理证实的乳腺癌患者 119 例,依据免疫组化结果,将其分为 ER 高表达组、ER 低表达组和 ER 阴性组。所有患者术前均行动态对比增强 MRI(dynamic contrast-enhanced MRI, DCE-MRI)和 3D-APT。在 3D-APT 和 DCE-MRI 融合图像上病灶显示最大层面手动勾画圆形感兴趣区(region of interest, ROI)进行 APT 值测量。采用单因素方差分析比较不同 ER 表达的 APT 值的差异。P 值 ≤ 0.05 代表有统计学意义。结果:119 例乳腺癌中,ER 高表达 76 例,ER 低表达 8 例,ER 阴性 35 例。ER 阴性乳腺癌的 APT 值($3.36\% \pm 1.46\%$)显著高于 ER 低表达和 ER 高表达乳腺癌的 APT 值($1.95\% \pm 0.91\%$ 、 $2.49\% \pm 1.18\%$),差异具有统计学意义($P=0.005, P=0.001$)。结论:APT 值与乳腺癌的 ER 受体表达相关,APT 成像可作为一种潜在的、无创可靠的影像方法来预测乳腺癌的不同 ER 受体状态,有助于临床治疗方案的选择。

PO-1459

断层技术在乳头溢液造影诊断中的应用价值

曾利¹、宫悦²

1. 新疆伊犁州友谊医院/临床医学研究院

2. 南京市全景医学影像诊断中心

摘要: 目的: 探讨数字断层乳腺 (DBT) 乳管造影在溢液性乳腺疾病诊断中的价值。方法: 回顾性分析 100 例 120 侧进行过乳腺导管造影检查的乳头溢液患者影像学资料, 将 DBT 和 DM 和造影图像分成 A、B 两组, 由 2 名资深乳腺影像医师按质控要求对病灶进行评估分析, 采取敏感度 (sensitivity, Sen) $Sen=a/(a+c)$, 特异度 (specificity, Sep) $Sep=d/(b+d)$ 公式进行统计 (a 真阳性、b 假阳性、c 假阴性、d 真阴性), 比较两者的敏感性、特异性、准确性。结果: DBT 造影的敏感性为 94.3%, DM 造影的敏感性为 82.0%, 两者特异性均为 100%。准确性分别为 94.3% 和 83.2%。两组测量值差异有统计学意义 ($P<0.005$)。结论 乳腺导管造影有助于乳头溢液的病因诊断, DBT 乳腺导管造影提高了图像质量, 很大程度解决了由于结构重叠造成遮蔽所带来的不足, 在鉴别导管内良恶性病变的敏感性和准确性, 明显高于 DM 造影, 提高了病理性乳头溢液患者可靠诊断的可能性。结合乳腺超声、磁共振等检查, 在溢液性导管内良恶性病变的鉴别诊断中具有重要价值。

PO-1460

影响乳腺导管造影质量及成功率的因素

曾利¹、宫悦²

1. 新疆伊犁州友谊医院/临床医学研究院

2. 南京市全景医学影像诊断中心

摘要: 目的 探讨乳腺导管造影成像实践中的操作方法、注射剂量及摄片压力等因素对造影质量的影响。方法 将 100 例 120 侧乳腺导管造影, 根据实践中的几种不同因素分成实验 (A) 组 80 侧和对照 (B) 组 40 侧。A 组在在方法学上进行改进完善, 术前加强和患者沟通, 在术中控制进针深度、对比剂总量及注射压力、注射速度、对比剂类型、注射结束到摄片的时限, 以及乳腺摄影技师的 QC 职责等; B 组采用常规造影方法。结果 A 组 80 侧中, 一次性造影成功 75 侧, 2 侧第 2 次插管造影成功, 3 侧造影失败。一次性造影成功率 93.75% (75/80), 导管各级分支均显示良好, 图像清晰。A 组造影图片质量优良率: 优+良: 81.25% (65/80), 一般: 12.5% (10/80), 失败: 6.5% (65/80)。B 组 40 侧中一次性造影成功 30 侧, 7 侧第 2 次插管造影成功, 3 侧造影失败。一次性造影成功率 75% (30/40), 导管树的充盈程度、图像清晰度, 均较 A 组显影淡薄, 充盈不充分, 导管树显影不完全或对比剂进入腺泡等。B 组造影图片质量优良率: 优+良: 55% (22/40), 一般: 37.5% (15/40), 失败: 7.5% (3/40); 2 组乳腺导管造影质量及显示效果比较 (见表 1), 差异有统计学意义 ($P<0.05$)。120 侧造影评估结果: 21 侧导管正常, 8 侧导管炎症, 12 侧乳腺囊性增生, 23 侧单纯乳腺导管扩张症, 1 侧乳腺结核, 46 侧导管内乳头状瘤, 9 例乳腺导管内癌。本组检查对导管内占位性病变的敏感性为 A 组 94.6%, B 组 87.3%, 特异性均为 100%。结论 乳腺导管造影有助于乳头溢液的病因诊断, DBT 乳腺造影解决了图像结构重叠造成的遮蔽效应, 提高了诊断敏感性。结合乳腺超声、磁共振等检查, 在溢液性导管内良恶性病变的鉴别诊断中具有重要价值。

PO-1461

乳腺精简序列 MR 检查对致密型乳腺癌 筛查降本增效的临床价值研究

刘永波、曹钢

长治市北大医疗潞安医院有限公司

背景：由于乳腺 X 线摄影投照速度快且对微小钙化较敏感，价格实惠，目前仍是女性乳腺癌的首选筛查方法。我国女性乳腺偏致密，由于乳腺 X 线摄影是对组织的重叠成像，致密性的乳腺容易漏掉隐藏的病灶，故 X 线摄影对致密型乳腺癌的诊断效能较低，易漏诊。本研究旨在乳腺 X 线摄影结合精简序列 MR 对乳腺癌的筛查，起到更高的诊断效能，降低回召率和术前活检率。传统乳腺 MR 检查技术多参数成像，分辨高，具有较高的特异性和敏感性，可以检测出许多 X 线及超声未检查到的病灶，但检查时间长，价格昂贵，耐受性差，结合以上传统 MR 的不足，我们提出了乳腺精简序列 MR 检查技术，弥补了 X 线对致密型乳腺癌筛查的不足，也解决了传统 MR 检查的不足。

材料方法：回顾性分析经乳腺 X 线报告 BI-RADS 分级 4 类筛查致密性乳腺 150 例，分别行传统乳腺 MR 检查和精简序列 MR 检查，由三名高年资医师阅片，记录两种筛查方式的结果，通过统计分析以确定乳腺精简序列 MR 检查方案与传统 MR 检查方案的诊断效能。

结果：150 例患者分别行传统 MR 检查和精简序列检查，共发现病灶 172 个，59%为恶性病灶，41%为良性病灶，传统 MR 检查和精简序列检查的特异性为 94.5%、93%，敏感性为 98%、99%。

结论：乳腺精简序列 MR 检查方案与传统 MR 检查技术有相仿的特异性与敏感性，不久的将来可作为有效的乳腺癌筛查手段。

PO-1462

基于压缩感知序列的超早期快速扫描序列 在乳腺良恶性疾病诊断中的价值探讨

姚薇薇、吕建勋、罗振东、周丽莎、李瑞婷、马玉佩、沈新平

香港大学深圳医院

目的：探讨基于压缩感知序列的超早期快速扫描序列在乳腺良恶性病变诊断中的价值

材料与方法：

收集我院 2020 年 12 月 23 日-2023 年 5 月 18 日在 3.0TMR（西门子 skyra，GE Architect）行乳腺 MR 检查并采用压缩感知序列完成超早期快速扫描序列者共 210 例，排除不符合入组条件病例，最终共纳入乳腺恶性病变（导管原位癌、导管浸润癌）89 例（均为女性，年龄 46.3820 ± 10.3950 ），乳腺良性病变（纤维腺瘤、腺病等）22 例（均为女性，年龄 43.7727 ± 11.6166 ）。

所有患者均采用乳腺线圈俯卧位扫描，采集序列及顺序分别为平扫 T1-SE、T2 压脂像、DWI/ADC，T1 压脂像，高压注射器 2.0ml/s 推注钆类细胞外造影剂，打药同时启动压缩感知序列（6.8s/期，共 20 期）。

两名乳腺 MR 诊断医生在后处理工作站独立双盲阅片评估：1、MIP 像：评估病灶显示能力，1 分无法显示、2 分模糊显示、3 分显示清晰；2、选取病灶强化最明显的区域绘制压缩感知序列病灶的时间信号曲线并记录信号值，计算 a、病灶增强时间 (time-to-enhancement, TTE)，以较上一期信号值增强 1.5 倍作为强化标准；b、最大斜率 (Maximum slope, MS) 两个连续相位之间信号增强的最大百分比变化；c、冲入斜率 (wash-in slope, WIS)：为增强峰值 (S_{lmax}) 除以达到峰值强度的时间；4、评价时间信号曲线类型：a、低强化、缓升型，b、低强化，有肩型，c、高强化，无肩型；d、高强化、有肩型。

结果：

1.在 MIP 像病灶显示能力评估中,压缩感知序列对恶性病灶的显示能力在重度背景实质强化的患者中明显优于传统动态增强序列;在轻中度背景实质强化的患者中两者显示能力相当。2.TTE、MS、WIS 三种参数在乳腺良、恶性病变中均存在显著性差异 ($P<0.001$) 3.四种时间信号曲线中高强化且有肩型与恶性病变高度相关。

结论:

基于压缩感知序列的超早期快速扫描序列在乳腺良恶性疾病术前诊断中有着很好的诊断能效,并在重度背景实质强化时仍然可以清楚显示病灶,对减少召回率及 MR 筛查的推广有一定的帮助。

PO-1463

动态增强 MRI 纹理分析对乳腺癌分子分型及腋窝淋巴结状态的诊断价值

张婷婷、林倩
宜昌市第一人民医院

目的:利用乳腺动态增强磁共振(MRI)图像进行纹理分析,研究纹理特征鉴别乳腺癌患者分子分型及腋窝淋巴结状态的可行性及价值,探讨基于 MRI 纹理特征结合机器学习算法建立的预测模型的诊断效能。

方法:回顾性收集宜昌市第一人民医院符合纳排标准的乳腺癌患者 75 例。所有患者均在术前接受 MRI 检查,病理免疫组化结果分为管腔 A 型、管腔 B 型、HER-2 过表达型及三阴性乳腺癌(TNBC)四种分子亚型,根据腋窝淋巴结状态分为淋巴结转移与无转移组。采用卡方检验、方差分析分析患者一般资料。采用独立样本 t 检验或 Mann-Whitney U 检验识别最优纹理参数,采用受试者工作曲线(ROC)曲线下面积(AUC)评价纹理分析的诊断效能。基于 MRI 纹理特征构建逻辑回归分类模型,绘制 ROC 曲线并评价模型对不同分子亚型及淋巴结状态的诊断效能。

结果:(1)在 75 例乳腺癌患者中,管腔 A 型 11 例、管腔 B 型 36 例、HER-2 过表达型 14 例及 TNBC 14 例,有淋巴结转移者 24 例,无淋巴结转移者 51 例。不同分子分型患者间 MRI 强化情况、病理学分型、淋巴结状态、年龄、绝经状态差异均无统计学意义($P>0.05$) (2)基于不同分子分型 2 组间的比较:管腔 A 型与非管腔 A 型组间 3 个纹理参数有统计学意义。(3)基于淋巴结状态两组间比较:淋巴结转移与无淋巴结转移组间有 3 个纹理特征有统计学意义。(4)通过特征筛选降维构建了基于逻辑回归的二分类模型,鉴别不同分子亚型及淋巴结是否转移最佳模型的 AUC 分别为 0.92、0.83、0.83、0.72 和 0.91,其中鉴别管腔 A 型与非管腔 A 型、淋巴结转移与无淋巴结转移组的预测模型的诊断效能较好,AUC 值均在 0.9 以上。

结论:(1)动态增强 MRI 纹理分析可术前有效预测乳腺癌分子分型及腋窝淋巴结状态,特别是对鉴别诊断 HER-2 过表达型乳腺癌很有帮助,3D_glszm_SALGLE 可成为最佳纹理指标。(2)基于动态增强 MRI 特征参数构建的逻辑回归分类模型在鉴别乳腺癌分子分型、淋巴结状态方面有较好的表现,可应用于临床对乳腺癌分子分型及腋窝淋巴结状态进行无创预测,为临床医生术前决策提供一定的理论参考依据。

PO-1464

乳腺导管造影 GICS 及 GGS 分级系统的临床应用价值

彭程宇、刘万花
东南大学附属中大医院

目的 探讨全数字化乳腺 X 线摄影引导下的乳腺导管造影技术对乳头溢液性疾病的诊断效能。**材料与方法** 回顾性研究 203 例 2013 年 1 月至 2021 年 9 月期间本院就诊具有乳头溢液表现的患者, 分析其临床资料、乳腺导管造影图像表现及病理结果。本研究利用了 GICS 分级和 GGS 分级对 FFDM 乳腺导管造影图像进行分级评估。采用 ROC 曲线分析方法, 将 AUC 值、敏感性、特异性、假阳性率、假阴性率指标用来比较放射科医师与两种分级系统评估乳头溢液患者良恶性病变的诊断效能。**结果** 203 例患者平均年龄 48.54 ± 12.09 岁 (26 岁~80 岁), 病理结果显示良性病变 129 例, 恶性病变 74 例。放射科医师基于 FFDM 乳腺导管造影图像进行良恶性鉴别诊断的曲线下面积 AUC 为 0.829, 敏感度为 0.797, 特异性为 0.860, 假阴性率为 0.203, 假阳性率 0.140。GICS 分级和 GGS 分级系统进行良恶性诊断的曲线下面积 AUC 分别为 0.753 和 0.785。**结论** FFDM 乳腺导管造影在鉴别乳头溢液良恶性病变中有较好的鉴别诊断效能, 对乳头溢液疾病有一定的诊断价值。GICS 分级和 GGS 两种分级方法可应用于乳头溢液患者的临床诊疗过程中。

PO-1465

多参数 MRI 预测乳腺癌驱动蛋白 Kif2a 表达水平的研究

汤卫霞、盛美红
南通市第一人民医院

探讨乳腺多参数 MRI 预测驱动蛋白 Kif2a 在乳腺癌中的表达及意义。**方法:** 回顾性分析 2017 年 1 月-2021 年 12 月经手术病理证实、且在术前行乳腺 MR 的 55 例患者, 采用免疫组化方法检测乳腺癌组织中 Kif2a 的表达, 记录多模态 MR 相关参数: 病灶 ADC 值、T2 相对信号强度、T2 病灶周围水肿、早期强化率 (ΔSI)、强化峰值 (PV)、达峰时间 (s)、病灶周围血管数量及管径、同侧腋窝淋巴结皮质最大厚度; 临床病理资料包括患者的年龄、绝经状态、腋窝淋巴结转移状况。采用单因素分析评估患者临床、多参数 MRI 特征与乳腺癌 Kif2a 表达的关系。对乳腺癌同侧腋窝淋巴结皮质最大厚度绘制 ROC 曲线、计算曲线下面积(AUC)及各参数的敏感性、特异性。多因素 logistics 回归方程分析的输入变量为临床特征和多参数 MR 特征, 以确定 kif2a 表达的预测因子。**结果:** 55 例乳腺癌中 kif2a 高表达 38 例, 低表达 17 例, kif2a 高表达组有 52.6% (20/38) 有腋窝淋巴结转移, 低表达组 11.7% (2/17) 有腋窝淋巴结转移。kif2a 表达与 DCE-MR 强化峰值、弥散序列 ADC 值、同侧腋窝淋巴结厚度差异有统计学意义 ($P=0.013$ 、 0.007 、 $0.047 < 0.05$)。通过 ROC 曲线分析腋窝淋巴结皮质最大厚度最佳临界值为 5.5mm, 乳腺癌 kif2a 高表达 ROC 曲线下面积 (AUC) 0.714, 其诊断敏感性为 60.5%, 特异性为 82.4%。logistic 二元回归显示多参数 MR 中 ADC 值、同侧腋窝淋巴结皮质最大厚度影响 kif2a 表达 ($OR=0.995$ (0.991-1.0), 4.139(1.061-16.14), $P<0.05$)。**结论:** 驱动蛋白 kif2a 与乳腺癌腋窝淋巴结转移密切相关, 多参数 MRI 中 ADC 值与同侧腋窝淋巴结最大厚度可作为独立预测因子, 无创检测驱动蛋白 kif2a 的表达, 为乳腺癌患者手术方案的选择以及未来新型靶向药物的疗效监测提供依据

PO-1466

基于 FFDM 的影像组学模型鉴别 BI-RADS 4 类病变良恶性的临床价值研究

王昭华、马彦云
山西医科大学第一医院

目的：通过基于瘤内、瘤周和对侧乳腺实质的全视野数字化乳腺 X 线摄影（FFDM）的影像组学对 BI-RADS 4 类乳腺病灶良恶性进行鉴别，以期为放射科医师提供一个有效的辅助意见，从而最大限度减少患者不必要的活检，帮助提升乳腺癌的早期检出率，改善患者的预后。**方法：**回顾性分析了从 2020 年 11 月至 2021 年 8 月在我院行全视野数字化乳腺 X 线摄影（FFDM）检查的 BI-RADS 4 类患者，按纳排标准纳入 117 例患者。将患者按病理标准分为良性病变和恶性病变两组，使用相关软件对图像进行 ROI 标注和影像组学特征的提取与降维，分析筛选出的特征，并构建出单区域影像组学模型及多区域影像组学模型，再联合患者的影像学特征及常见的临床资料构建临床模型和临床-影像组学联合模型，最后评估不同模型对 BI-RADS 4 类病灶的诊断效用、不同模型之间是否有差异。**结果：**一共 51 例良性病例，66 例恶性病例，在 3 个不同区域分别构建了单区域影像组学模型，除了对侧实质模型，其他均可以有效鉴别 BI-RADS 4 类病灶的性质，其中联合模型都优于单区域影像组学模型和临床模型，并且优于放射科医生。瘤内模型、瘤周模型、对侧实质模型、临床模型和临床-影像组学联合模型在测试集的 AUC 分别为 0.80、0.74、0.52、0.79、0.87。**结论：**基于 FFDM 的瘤内、瘤周影像组学模型可以鉴别乳腺 BI-RADS 4 类病变的性质，由其构成的联合模型可以进一步提高对 BI-RADS 4 类病变的诊断效能，但对侧实质纹理模型无法鉴别乳腺病变的良恶性。

PO-1467

基于 DBT 的影像组学对乳腺癌分子分型的鉴别价值

武静
山西医科大学第一医院

目的：基于数字乳腺断层摄影技术，探讨乳腺癌影像特征与分子分型之间的关系。**方法：**回顾性分析 200 例乳腺癌术前 DBT 检查资料和术后病理、免疫组织化学资料。所有患者均经手术和病理证实为原发性乳腺癌，患者术后根据雌激素受体（ER）、孕酮受体（PR）、人类表皮生长因子受体 2（HER-2）表达水平将乳腺癌分为 luminal A 型（ER 阳性和（或）PR 阳性、HER-2 阴性），luminal B 型（ER 阳性和（或）PR 阳性、HER-2 阳性），HER-2 过表达型（ER 阴性、PR 阴性、HER-2 阳性），三阴性乳腺癌（ER 阴性、PR 阴性、HER-2 阴性）。用 Pearson χ^2 检验或 Fisher 确切概率法探讨乳腺癌影像特征（单纯肿块、单纯钙化、肿块伴钙化）与分子分型的关系。**结论：**乳腺癌不同分子分型在 DBT 上的图像各有特征，可以通过乳腺癌 DBT 图像特征去推测乳腺癌的分子类型，在未进行手术及活检之前指导临床工作，做好个性化诊疗方案。

PO-1468

多参数 MR 与转录因子 E2F2 在 乳腺癌生物侵袭性行为预测中的应用

张铭¹、盛美红²

1. 南通市肿瘤医院

2. 南通市第一人民医院

目的 探讨转录因子 E2F2 在乳腺癌组织中的表达情况, 研究其与乳腺癌患者的 MR 特征、临床及病理特征的相关性, 评估多参数 MR 与 E2F2 对乳腺癌生物侵袭性行为的预测作用, 为患者预后评估提供依据。

方法 回顾性分析南通大学第二附属医院 2014 年 10 月至 2020 年 12 月期间行乳腺磁共振检查且病理诊断为恶性乳腺肿瘤的患者 179 例。通过纳排标准最终纳入 92 例患者、对乳腺癌标本蜡片进行 E2F2 抗体染色进行分类。收集患者的临床基线资料、MR 特征及病理特征。采用独立样本 t 检验、Mann-Whitney U 检验或卡方检验比较两组间的特征差异, 并在此基础上选择 $P \leq 0.1$ 的特征进行多因素 Logistic 回归分析确定 E2F2 高表达的独立预测因素。使用划痕实验来验证 MCF-7 乳腺癌细胞的生物侵袭性行为。对照组: 含有 1 μL 二甲基亚砜溶液的完全培养基; 实验组: 含有 1 $\mu\text{M/L}$ 三苯甲烷三异氰酸酯抑制剂、2 $\mu\text{M/L}$ JQ-1 抑制剂、1 $\mu\text{M/L}$ BET 溴区抑制剂、2 $\mu\text{M/L}$ I-BET 抑制剂的完全培养基。Gradpad prism 9.3 进行统计分析、作图。实验数据用均数 \pm 标准差表示, 多组间比较采用单因素方差分析, $P < 0.05$ 表示差异具有统计学意义。

结果 92 例乳腺癌患者中 E2F2 高表达组比低表达组在有无瘤周水肿、TIC 类型、ER 表达、HER-2 表达、有无脉管内癌栓及分子分型差异有统计学意义。从比较结果中选取 $P \leq 0.1$ 的特征参数进行多因素 Logistic 回归分析, 结果显示瘤周水肿是 E2F2 高表达的独立预测因素 ($OR=7.061$, $P=0.004$)。BET 抑制剂干预的乳腺癌 MCF-7 细胞的划痕愈合百分比明显减低 ($P < 0.05$); 不同浓度的 JQ-1、I-BET 抑制剂干预的 MCF-7 细胞的划痕愈合百分比在组间有明显差异 ($P < 0.05$), 且随着浓度的增加细胞愈合能力减弱。

结论 转录因子 E2F2 高表达在乳腺癌中的占比率高, 瘤周水肿是转录因子 E2F2 高表达的独立预测因素, 并且与乳腺癌的侵袭性显著相关, 为乳腺癌的诊断、治疗及预后评估提供新的思路。

PO-1469

初探 mDIXON-QUANT 联合 DWI 在平台型乳腺导管原位癌与乳腺良性病变的价值

李远飞、张丽娜、赵思奇、武玥琪、宁宁、梁泓冰

大连医科大学附属第一医院

目的 利用 mDixon-Quant 技术探讨脂肪分数(fat fraction, FF)联合 DWI 衍生的 ADC 图像在鉴别平台型乳腺导管原位癌与乳腺良性病变中的诊断价值。

方法 回顾性分析 2022 年 3 月至 2023 年 6 月经病理证实乳腺病变患者, 术前均行 mDixon-Quant 扫描及扩散加权成像 DWI、动态对比增强 MRI (DCE-MRI) 检查。对照 DWI 图像在表观扩散系数 (apparent diffusion coefficient, ADC) 图像上测量平均 ADC 值 (ADCmean), 观察病灶形态及血流动力学信息。采用独立样本 t 检验分析两组间 FF 值和 ADC 值, 通过 ROC 曲线评价 DWI 联合 mDIXON-QUANT 对平台型导管原位癌与乳腺良性病变的鉴别能力。

结果 最终纳入 28 例乳腺病变患者, 其中良性 16 例 (乳腺纤维腺瘤 7 例, 乳腺导管内乳头状瘤 3 例, 纤维腺瘤伴腺病 4 例, 肉芽肿性乳腺炎 2 例), 导管原位癌 12 例, 平均年龄 45.21 ± 10.80 , 范围 24~68 岁。FF 值在平台型乳腺良性病变、导管原位癌两组间差异具有显著统计学意义

($P=0.045$)；与良性组相比，DCIS 组的 FF 值较小($15.76\%\pm 7.51\%$ vs. $10.21\%\pm 5.99\%$)。DCIS 组平均 ADC 值为[$(1.02\pm 0.35)\times 10^{-3}\text{mm}^2/\text{s}$]低于良性组[$(1.28\pm 0.29)\times 10^{-3}\text{mm}^2/\text{s}$]，差异具有统计学意义($P<0.05$)。ROC 曲线显示 FF 值及 ADC 值独立鉴别诊断的 AUC 值分别为 0.711、0.719，两者联合诊断效能进一步提高(AUC 为 0.771，敏感度 0.583，特异度 0.875)。

结论 基于 mDixon-Quant 衍生的 FF 值可用于术前无创性鉴别平台型乳腺良性病变和导管原位癌，ADC 联合 FF 值有助于提高平台型导管原位癌和乳腺良性病变的鉴别诊断效能。

PO-1470

数字乳腺断层摄影引导下活检技术的临床应用初探

荣小翠、杨光、康一鹤、殷风华
河北医科大学第四医院

目的：数字乳腺断层摄影（DBT）在乳腺癌筛查和诊断中应用越来越广泛，使得 DBT 引导活检的发展成为必要。本研究旨在探讨 DBT 引导下活检技术在临床中的应用价值。

方法：回顾性收集我院 DBT 检查（设备为 GE Pristina Serena）显示可疑恶性病变（诊断 BI-RADS 4A 类及以上）患者 42 例，均行 DBT 引导下导丝定位或穿刺活检术，获得组织病理学结果。操作流程：

①选择合适穿刺体位，对目标区域进行断层摄影；②在清楚显示病变层面精确标记目标靶点；

③自动导航定位；④再次断层摄影观察穿刺针或导丝头端位置，引导活检。

结果：42 例患者中，2 例 DBT 表现为肿块，2 例表现为结构扭曲，1 例表现为不对称致密影，37 例表现为微钙化。其中 9 例行 DBT 引导下穿刺活检（恶性 3 例，良性 6 例）；33 例行 DBT 引导下导丝定位，均定位准确（恶性 5 例，良性 28 例）。操作时间平均为 18 分钟。

结论：DBT 引导下活检精准、定位时间短，可用于微钙化等多种表现的病变，具有广阔的应用前景。

PO-1471

基于多参数 MR 列线图在 HR 阳性乳腺癌术后 复发风险评估中的预测价值

张莉华、盛美红
南通大学第二附属医院南通市第一人民医院影像科

目的

评估乳腺癌术后复发风险预测工具临床治疗评分 CTS5 在激素受体（HR）阳性乳腺癌患者中的预测效能，并探讨基于多参数 MR 列线图在 CTS5 复发风险分层的价值。

方法

纳入南通大学第二附属医院 2015 年 1 月~2023 年 5 月行乳腺 MR 且经病理证实的 HR 阳性乳腺癌患者，排除 MR 检查前行穿刺活检、定位或手术切除等侵入性操作、确诊时已发生转移、合并其他恶性肿瘤、既往乳腺癌病史患者。回顾性收集患者临床病理资料、乳腺 MR 特征，参照 CTS5 将患者分为高复发风险组与中低复发风险组。随访 2015 年 1 月~2019 年 12 月入组患者真实生存事件，比较 CTS5 风险分层与真实生存事件一致性。2020 年 1 月~2023 年 2 月入组患者为列线图构建训练集，2023 年 3~5 月患者为验证集，logistic 回归分析确定与 CTS5 高复发风险相关的独立预测因子，并构建列线图，受试者工作特征曲线下面积（AUC）、Hosmer-Lemeshow（H-L 检验）评估模型性能。

结果

2015 年 1 月~2019 年 12 月获得 106 例随访数据, CTS5 中低复发风险组 77 例, 其中 4 例出现真实复发事件; 高复发风险组 29 例, 22 例发生复发; CTS5 复发风险分层与真实生存事件具有较强一致性 ($Kappa: 0.730; p < 0.001$)。纳入 218 例训练集患者与 33 例验证集患者, 临床病理资料脉管内癌栓、HER2、血小板计数、淋巴细胞/单核细胞比值与 MR 特征病灶形态、纤维腺体类型、瘤周水肿、强化方式、子灶、引流血管增粗、皮肤受侵、ADC 差值在 CTS 高复发风险和中低复发风险组间差异具有统计学意义; 多因素 logistic 回归分析淋巴细胞/单核细胞比值、脉管内癌栓、引流血管增粗及皮肤受侵与 CTS5 高复发风险独立相关, 基于上述特征构建列线图在训练集与验证集中 AUC 分别为 0.812、0.750, H-L 拟合度检验 p 值分别为 0.747、0.399。

结论

CTS5 有效区分 HR 阳性乳腺癌患者的术后高复发风险与中低复发风险, 基于淋巴细胞/单核细胞比值、脉管内癌栓与 MR 特征的列线图在预测 CTS5 高复发风险具有良好的区分和校准能力, 可进一步有效评估 HR 阳性乳腺癌患者的术后复发风险。

PO-1472

乳腺癌异质性联合 MRI 图像视觉特征在预测 cN0 乳腺癌腋窝淋巴结转移中的应用研究

叶钉利

吉林省肿瘤医院

目的 探讨基于乳腺癌异质性信息联合 MR 图像视觉特征在预测 cN0 期乳腺癌腋窝淋巴结转移中的应用价值。方法 根据纳入及排除标准, 回顾性分析 2016 年 1 月至 2020 年 6 月在吉林省肿瘤医院接受手术治疗的 284 例女性乳腺癌患者的临床、病理及影像资料。患者术前均接受乳腺增强 MRI 检查。采用异质性分析软件 MITK 以体素为单位分别提取得到病灶区域内对比剂注射前期、对比增强最显著期和延迟期三个不同期相的各体素信号强度, 根据各体素信号强度变化趋势的不同, 计算得到病灶中渐增型、平台型和流出型三种成分的百分比, 进而量化病灶的异质性信息。按 7:3 的比例将患者随机分为训练组($n=199$)和验证组($n=85$)。采用 6 种机器学习模型对 2 组数据进行处理, 采用受试者操作特征(ROC)曲线分析各机器学习模型对乳腺癌腋窝淋巴结转移的诊断效能, 根据验证组 AUC 大小, 选择最佳模型, 并用决策曲线分析(DCA)评价最佳模型的临床获益。结果 共有腋窝淋巴结阳性患者 66 例, 腋窝淋巴结阴性患者 218 例。每个病灶经过分析得到 4 个异质性参数, 分别为渐增型所占体积百分比、平台型所占体积百分比、流出型所占体积百分比和异质性量化值。将 4 个异质性信息与 2 个临床指标(年龄和绝经状态)和 4 个影像学指标(病灶位置、有无钙化、病灶数量、病灶长径)一起, 共 10 个参数, 构建预测模型。6 种机器学习模型中, Logistic 回归模型在验证组中诊断乳腺癌腋窝淋巴结转移的 AUC 最高(0.703), 准确率 66.3%、特异度 60.0%、敏感度 68.2%, 在训练组的 AUC 为 0.685、准确率 69.2%、特异度 56.5%、敏感度 73.0%, 为最佳机器学习模型。基于 Logistic 回归模型的决策曲线分析结果显示, 训练组中阈值为 0.6~1.0, 验证组中阈值为 0.7~1.0, 有临床获益。结论 基于乳腺癌异质性信息联合 MR 图像视觉特征建立的预测模型能够鉴别 cN0 期乳腺癌腋窝淋巴结转移, 其中以 Logistic 回归模型的诊断效能更优。

PO-1473

DCE-MRI 不同增强时相的组学特征在 乳腺癌新辅助治疗后残余癌识别中的应用价值

罗瑶、曹崑、邓旭波、孙应实
北京大学肿瘤医院

目的：探讨乳腺癌新辅助治疗后 DCE-MRI 不同增强时相的组学特征在残余癌识别中的应用价值。

方法：回顾性分析 2018 年 1 月至 12 月我院就诊完成新辅助治疗及手术的乳腺癌患者的 306 个病灶，随机分为训练组（214 个）和验证组（92 个）。根据术后病理结果将所有病例分为残余癌与无残余癌组，其中残余癌选取了 2 种不同的定义。分别提取增强前（PH0）、增强早期（PH2）及增强晚期（PH5）MRI 的组学特征及计算特征变化（ Δ PH20、 Δ PH50、 Δ PH52）。采用单因素方差分析、最小绝对收缩和选择算子算法（LASSO）进行特征筛选，逻辑回归建立模型，ROC 曲线和德龙检验分别评价和比较模型的诊断效能。

结果：不同定义的残余癌占比（即仅浸润癌残余和浸润癌和/或导管原位癌残余）分别为 65%（199/306）和 75.5%（231/306）。在验证组中，各增强时相组学模型诊断残余癌的 AUC 范围分别为 0.644~0.798 和 0.658~0.803。当残余癌被定义为仅浸润癌残余时，不同增强时相的组学模型诊断表现无差异；当残余癌被定义为浸润癌和/或导管原位癌残余时，对比基于 Δ PH50 的组学模型，基于 Δ PH20 的组学模型诊断表现更好（AUC 分别为 0.644 和 0.798， $p=0.027$ ）。

结论：DCE-MRI 不同增强时相的组学特征均可用于乳腺癌新辅助治疗后残余癌的识别，增强晚期时相的组学特征诊断表现并没有优于增强早期，因此影像组学工具的应用或许可以优化疗效评估中 DCE-MRI 的成像方案。

PO-1474

Development and application of hepatocellular carcinoma risk prediction model based on clinical characteristics and liver related indexes

Wenxuan Wang
Nanchong Central Hospital

Background and aims: Hepatocellular carcinoma (HCC) is difficult to diagnose and has a low survival rate. The survival of patients with HCC is closely related to the stage of diagnosis. Using logistic regression model, this study aimed to identify risk factors associated with HCC and establish a risk prediction model based on clinical characteristics and liver-related indicators to predict the presence of HCC.

Methods: The clinical data of patients in Affiliate Hospital of North Sichuan Medical College from 2016 to 2020 were collected. Based on the time of admission, the cases were divided into training cohort ($n = 1739$) and validation cohort ($n = 467$). Using HCC as a dependent variable, the research indicators were incorporated into logistic univariate and multivariate analysis. An HCC risk prediction model, which was called NSMC-HCC model, was then established in training cohort and verified in validation cohort.

Results: The area under receiver operating characteristic curve (AUC) of NSMC-HCC model in HCC diagnosis was 0.960, with sensitivity 94.40% and specificity 95.35% in training cohort, and AUC was 0.966, with sensitivity 90.00% and specificity 94.20% in validation cohort. In early-stage HCC diagnosis, the AUC of NSMC-HCC model was 0.946, with sensitivity 85.93% and specificity 93.62% in training cohort, and AUC was 0.947, with sensitivity 89.10% and specificity 98.49% in validation cohort.

Conclusions: NSMC-HCC model was an effective risk prediction model in HCC and early-stage HCC diagnosis.

PO-1475

Preoperative assessment of peripheral vascular invasion of pancreatic ductal adenocarcinoma based on high-resolution MRI

Xiaoqi Zhou, Danyang Xu, Jifei Wang, Yanji Luo, Meng Wang, Shi-Ting Feng, Guangbin Cui
The First Affiliated Hospital of Sun Yat-Sen University

Objectives: Preoperative imaging of vascular invasion is important for surgical resection of pancreatic ductal adenocarcinoma (PDAC). However, whether MRI and CT share the same evaluation criteria remains unclear. This study aimed to compare the diagnostic accuracy of high-resolution MRI (HR-MRI) and conventional MRI (non-HR-MRI) and CT for PDAC vascular invasion. **Methods:** Pathologically proven PDAC with preoperative HR-MRI (79 cases, 58 with CT) and non-HR-MRI (77 cases, 59 with CT) were retrospectively collected. Vascular invasion was confirmed surgically or pathologically. The degree of tumour-vascular contact, vessel narrowing and contour irregularity were reviewed respectively. Diagnostic criteria 1 (C1) was the presence of all three characteristics, and criteria 2 (C2) was the presence of any one of them. The diagnostic efficacies of different examination methods and criteria were evaluated and compared.

Results: HR-MRI showed satisfactory performance in assessing vascular invasion (AUC: 0.87–0.92), especially better sensitivity (0.79–0.86 vs 0.40–0.79) than that with non-HR-MRI and CT. HR-MRI was superior to non-HR-MRI. C2 was superior to C1 on CT evaluation (0.85 vs 0.79, $P=0.03$). C1 was superior to C2 in the venous assessment using HR-MRI (0.90 vs 0.87, $P=0.04$) and in the arterial assessment using non-HR-MRI (0.69 vs 0.68, $P=0.04$). The combination of C1-assessed HR-MRI and C2-assessed CT was significantly better than that of CT alone (0.96 vs 0.86, $P=0.04$).

Conclusions: HR-MRI more accurately assessed PDAC vascular invasion than conventional MRI and may contribute to operative decision-making. C1 was more applicable to MRI scans, and C2 to CT scans. The combination of C1-assessed HR-MRI and C2-assessed CT outperformed CT alone and showed the best efficacy in preoperative examination of PDAC.

PO-1476

Prediction of intra-tumoural tertiary lymphoid structures and survival of intrahepatic cholangiocarcinoma using MRI-based radiomics

Ying Xu, Feng Ye, Xinming Zhao
National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objective To predict the tertiary lymphoid structures (TLSs) status and recurrence-free survival (RFS) of patients with intrahepatic cholangiocarcinoma (ICC) using preoperative magnetic resonance imaging (MRI) texture analysis.

Methods A total of 192 ICC patients were divided into training ($T = 105$), internal validation ($V1 = 46$), and external validation groups ($V2 = 41$). Three MRI sequences were performed with texture analysis. Radiomics score was calculated to predict the TLSs status and stratify ICC into high- and low-risk groups. Logistic regression was applied to select the significant clinico-radiological features

related to TLS status. The performance was compared with receiver operating characteristic curve (ROC).

Results The AUCs of arterial phase diffuse hyperenhancement were 0.59 (95% CIs, 0.50–0.67), 0.52 (95% CIs, 0.43–0.61), and 0.66 (95% CIs, 0.52–0.80) in the T, V1, and V2 cohorts. Eleven features were combined to establish the Rad-score with an AUC of 0.85 (95% CIs, 0.77–0.92), 0.81 (95% CIs, 0.67–0.94), and 0.84 (95% CIs, 0.71–0.96) in the T, V1, and V2 cohorts, respectively. The median RFS of the low-risk group with a Rad-score cut-off less than -0.21 was 38.7 months (95% CIs, 5.4–71.9 months), which was better than that of the high-risk group (median RFS: 14.1 months; 95% CIs, 7.0–21.2 months) ($p = 0.048$). This was also confirmed in cohort V1 and cohort V2.

Conclusion The MRI radiomics signature could serve as a better preoperatively predictive biomarker of the intra-tumoural TLSs status and survival of ICC patients than MRI imaging features.

PO-1477

The clinical and radiological features of pediatric adrenal cortical carcinoma: compared with benign/uncertain malignant potential counterparts.

Peian Hu

Children's Hospital of Fudan University

Purpose Pediatric adrenal cortical carcinoma (ACC) is rare. This research aims to analyze the clinical and radiological features of ten cases with ACC and compare these features with the benign/uncertain malignant potential ones.

Materials and Methods Twenty cases (twenty-one masses) of adrenal cortical tumors in our institution, from October 2011 to October 2016, were collected and analyzed. Ten cases (eleven masses) were pathologically proven ACC, four uncertain malignant potential cortical tumors, and six adenomas (two suspected) were included. Sixteen cases were performed CT scans, ten MR scans (seven with DWI), and seven cases underwent both CT and MR scans. These masses were divided into the malignant and benign/uncertain malignant potential groups. The clinical and radiological findings of carcinoma and its counterpart were compared. The independent samples T-test and Fisher exact test (SPSS Version 17.0) were used for statistical analysis.

Results Eleven complained of precocious puberty, ten with an elevated level of hormones (mainly androgen); the sex ratio is 3:2. In the malignant group, the age ranged from 18 months to 12 years old, with the median age being 3 years old; 90% of patients were less than five years old. Sixty percent suffered from precocious puberty, 30% manifested abdominal mass; 80% manifested the elevation of hormone level. While in the counterpart group, the median age was 5 years old (7 months to 13 years old), the rate of precocious puberty was 50%, and only two the elevated hormone levels. The maximal diameter of the malignant (7.35 ± 3.08 cm) was larger than the counterpart group (3.87 ± 2.11 cm). All the masses showed a gradually enhanced pattern. The unenhanced CT values, calcification rate, and hemorrhage/necrosis rate of the malignant group are significantly higher than the benign/uncertain malignant potential group ($p < 0.05$). Conversely, the CT value of the artery, and portal vein phase had no significant differences between these two groups. On T1WI, the parenchyma showed homogeneous mainly iso-signal intensity. On T2WI, the masses showed heterogeneous hyper-signal intensity, with necrosis. Six cases (four carcinomas) of them showed reticular enhancement. The ADC values of ACC (1.01 ± 0.09 mm²/s) were significantly lower than that of its counterparts (1.23 ± 0.04 mm²/s) ($p < 0.05$). Metastasis was detected in six cases (54.5%) of carcinoma, two with recurrence; the lung (6 cases) was the most metastatic site, followed by the liver (2 cases), lymph node (1 retroperitoneum, 1 hilum of right lung).

Conclusion The clinical and radiological features of pediatric adrenal cortical carcinoma are different, compared with its counterparts. ACC occurs younger; is more likely with elevated hormone level, larger and more commonly accompanied by calcification, hemorrhage/necrosis;

enhances more heterogeneous and with lower ADC values; recurs easily and has a high metastasis rate (54.5%), lung is the most common metastasis site.

PO-1478

Extracellular volume fraction determined by equilibrium contrast-enhanced CT to predict the survival outcomes in patients with resectable pancreatic ductal adenocarcinoma

Hongwei Liang, qiao Zheng, haotian Liu, zhiwei Zhang, yongmei Li
Department of Radiology, the First Affiliated Hospital of Chongqing Medical University

Objectives To evaluate whether extracellular volume (ECV) fraction with equilibrium contrast-enhanced computed tomography (CT) can predict survival outcomes in patients with resectable pancreatic ductal adenocarcinoma (PDAC).

Methods Eighty-three PDAC patients who underwent radical resection and preoperative pancreatic CT from January 2014 to January 2019 were retrospectively included. ECV fraction was calculated using ROI measurement within the primary tumor and aorta on unenhanced and equilibrium-phase CT images, followed by the correction of hematocrit value. The CT variables (tumor margins, parenchymal atrophy, main pancreatic duct dilation, peripancreatic tumor infiltration, venous contact, adjacent organ invasion) were assessed. Multivariable Cox proportional-hazards models were conducted to evaluate the effects of clinical factors, CT variables and ECV fraction on the recurrence-free survival (RFS) and overall survival (OS). Survival rates were derived by Kaplan-Meier method. We also evaluated the association between ECV fraction and recurrence pattern in PDAC.

Results Median OS and RFS were 17.1 and 10.7 months, respectively. On multivariate analysis, tumor ECV fraction and adjacent organ invasion were found to be associated with RFS ($P=0.017$; $P=0.006$), and only tumor ECV fraction showed an independent prognostic factor for OS ($P=0.022$). Increasing ECV fraction was associated with a positive effect on RFS (HR, 0.968; 95% CI: 0.942, 0.994), and OS (HR, 0.968; 95% CI: 0.942, 0.995). When stratified patients into low and high ECV groups, based on the median ECV fraction (35.4%, [IQR, 29.0-43.2%]). The median RFS and OS of patients with high ECV group were significantly longer than that of those with low ECV group (RFS, 14.7 months vs 8.3 months, $P=0.047$; OS, 27.9 months vs 12.2 months, $P=0.021$). In recurrence pattern analysis, the ECV fraction did not exhibit association between local recurrence and non-local recurrence groups ($P=0.455$), while patients in low-ECV group were more inclined to experience distant recurrence ($P=0.037$).

Conclusion ECV fraction determined by equilibrium contrast-enhanced CT was a useful imaging biomarker for predicting survival outcomes in resectable PDAC patients, which may facilitate further risk stratification and personalized care.

PO-1479

Multi—slice spiral computerized tomography findings of colorectal cancer with chronic schistosomiasis

Bo Zhang, Peijun Wang
Shanghai Tongji Hospital

Objective To retrospectively analyze computerized tomography (CT) imaging features of colorectal cancer with chronic schistosomiasis in order to improve the diagnostic accuracy.

Methods Eighty patients whose diagnosis was pathologically confirmed as colorectal cancer with schistosomiasis were collected from Tongji Hospital and Kunshan Chinese Medicine Hospital from January 2007 to December 2012. All the patients underwent abdominal plain CT and contrast-enhanced CT scan. The lesion location, morphology, size, calcification features, enhancement patterns and cancer metastasis were evaluated and compared by two radiologists who were blind to the diagnosis. Twenty colorectal cancer cases without schistosomiasis from the same area were also collected as controls.

Results CT imaging showed that the tumors all occurred in the colon and rectum in 80 patients, mainly in colon descendens, colon sigmoideum and rectum. The lesion was characterized by irregular bowel wall thickening with soft tissue masses, and the average length of impaired intestine was (21.35 ± 4.50) cm. The lesions were solitary in 68 cases (85.0%) and were multifocal in 12 cases (15.0%). Linear, spotty and small patchy calcifications were seen in all the patients, with margins unclear in 59 patients (73.8%) and margins clear in 21 patients (26.2%). Early phase enhancement was seen in 68 cases (85.0%), of which 45 cases (56.2%) had homogenous enhancement and 23 cases (28.8%) had heterogeneous enhancement. Late phase enhancement was seen in 73 cases (91.2%) and necrosis was hardly seen. Only two cases (2.5%) had liver metastasis without lymphatic metastasis. All the 20 colorectal cancer cases without schistosomiasis presented with single lesion, which was characterized by irregular bowel wall thickening and local ulcer. The average length of impaired intestine was (6.90 ± 3.40) cm. No calcification was seen in these lesions. All cases had early phase lesion with remarkable heterogeneous enhancement with low density necrotic area. The late phase enhancement was decreased. Four cases (20.0%) had liver metastasis. Compared to cases without schistosomiasis, cases with schistosomiasis tended to have multifocal ($\chi^2=100$, $P=0.000$) and longer lesion ($t=45.506$, $P=0.000$), and more calcification ($\chi^2=100$, $P=0.000$). The early phase heterogeneous enhancement was less frequent ($\chi^2=88$, $P=0.000$) and late phase enhancement was more frequent ($\chi^2=100$, $P=0.000$). The liver metastasis rate was significantly lower ($\chi^2=8.688$, $P=0.014$).

Conclusions The CT imaging of colorectal cancer with schistosomiasis is characterized by calcifications inside the tumor with obscured margins and multiple intestinal segments involvement. Hematogenous metastasis and lymphatic metastasis are rarely seen.

PO-1480

Correlation study between CT-based perirenal fat variables and preoperative blood biochemical indicators with T Stage of clear cell renal cell carcinomaZehua Sun¹, Yumei Zhang¹, Chenchen Wang¹, Yuanhao Xia^{1,2}, Wei Zhang³, Yang Chen^{1,4}, Heng Ma^{1,2,4}, Hao Guo¹

1. Qindao University Medical College Affiliated Yantai Yuhuangding Hospital

2. School of Medical Imaging, Binzhou Medical University, Yantai, China

3. Department of Radiology, Yantai Penglai People's Hospital Yantai, Shandong Province, China.

4. Department of Medical Imaging, Weifang Medical University, Weifang, China

Purpose T stage is important for individualizing treatment regimens and prognosis for patients with clear cell renal cell carcinoma (ccRCC). However, few studies investigated the role of available preoperative variables of blood biochemistry and CT for T stage risk stratification of ccRCC currently. We aimed to explore the cut-off intervals of variables that are non-linearly related to ccRCC T stage for effective risk stratification to guide personalized treatment.

Materials and Methods We performed a retrospective analysis using a derived cohort of 218 ccRCC patients with a determined pathological T stage. The patients were divided into two cohorts: high T stage and low T stage. Preoperative blood biochemical indexes (BBI) and fat-related parameters based on CT images were included. Nonlinear tests were performed on the factors affecting the T stage of ccRCC, followed by identification of variables with a nonlinear relationship with the T stage. We used the generalized sum model to determine the cut-off interval for the corresponding variable.

Results The significantly higher indexes in patients with high T stage ccRCC included fibrinogen, platelet counts (PLT), white blood cells, monocyte counts (Mono), neutrophils counts, tumor-associated materials (TAM) and adipose parameters. Fibrinogen (2.63-4.06 g/L), PLT ($> 200.34 \times 10^9/L$) or Mono ($> 1.69 \times 10^9/L$) were significantly positively correlated with high T stage in specific intervals, while PLT ($< 200.34 \times 10^9/L$) was significantly negatively correlated with T stage in a certain interval. TAM was positively correlated with T stage to varying degrees at different cut-off intervals (TAM <90.56 U/mL; TAM >90.56 U/mL).

Conclusion This may be the first study to provide specific intervals for these indicators that are non-linearly related to T stage of ccRCC. This information could be used to stratify risk of preoperative ccRCC T stage, making routinely measured BBI attractive to improve the effectiveness of clinical transformation.

PO-1481

A risk prediction model for proliferative hepatocellular carcinoma and its prognostic value: using LI-RADS v2018 and other MR imaging featuresMengtian Lu, Xueqin Zhang, Tao Zhang, Qi Qu
Nantong Third People's Hospital

Objective: To develop a predictive model for proliferative hepatocellular carcinoma (HCC) using Liver Imaging Reporting and Data System (LI-RADS) and other magnetic resonance imaging (MRI) features and to investigate its prognostic value for HCC.

Methods: 241 HCC patients who underwent gadoteric-enhanced MRI were retrospectively included. In the training set, a diagnostic nomogram was developed using logistic regression analysis to identify proliferative HCC. The model performance was tested in the validation set and characterized by the area under the receiver operating characteristic curves (AUC). All patients were divided into high- and low-risk subgroups, and the recurrence-free survival (RFS) in different

subgroups was analyzed by Kaplan-Meier curves and the log-rank test. Cox regression analysis was performed to determine risk factors for RFS.

Results: Corona enhancement (OR, 3.373; $p = 0.006$), rim arterial phase hyperenhancement (APHE) (OR, 2.787; $p = 0.037$), infiltrative appearance (OR, 7.818; $p = 0.018$), intratumoral artery (OR, 4.706; $p = 0.001$), and substantial hypoenhancing component (OR, 2.684; $p = 0.033$) are identified as independent predictors of proliferative HCC. The model performed well, with AUCs of 0.823 and 0.803 for the training and validation sets, respectively. Differences in RFS were significant between the subgroups (high-risk vs. low-risk, $p = 0.001$; proliferative HCC vs. non-proliferative HCC, $p < 0.001$). Serum PIVKA level (HR, 1.013; $p < 0.001$) and risk score (HR, 8.026; $p < 0.001$) were risk factors for RFS.

Conclusion: LI-RADS v2018 and other MRI features may predict proliferative HCC before surgery, which is also predictive for RFS of HCC.

PO-1482

Preoperative CT-based radiomics model for predicting muscle invasion in patients with upper tract urothelial carcinoma

Hanmei Zhang¹, yi wang¹, yige bao¹, xianglan zhu¹, bin song^{1,2}

1. West China Hospital, Sichuan University

2. Sanya People's Hospital

Objectives: The study aimed to development of a preoperative CT-based radiomics model for predicting muscle invasion in patients with upper-tract urothelial carcinoma.

Materials and Methods: 117 consecutive patients who underwent radical nephroureterectomy for stage pT1–2 UTUC were retrospectively enrolled in a single center. Lesion segmentation, extraction and selection of radiomic features on pre-surgical CT urography, development and validation of predictive models were performed. Risk stratification of UTUC was evaluated and the diagnostic performances of the radiomics model and risk stratification were analyzed. Reference standard was histopathological analysis.

Results: Among 117 patients (mean age, 52 years \pm 9 [standard deviation], 70 men), 61.5% had pT2 grade tumors. 1165 features with intraclass coefficients >0.75 were retained for least absolute shrinkage and selection operator (LASSO) regression. Eight radiomic features with non-zero coefficients on LASSO regression were selected from the training dataset and used for constructing the predictive models. Ten-fold cross-validation was used to ensure optimal training and robustness of the predictive models. In training datasets, the averaged areas under the curve for linear discriminant analysis (LDA), logistic regression (LR), and support vector machine (SVM) models were 0.856, 0.858, and 0.856, respectively; the corresponding values in validation datasets were 0.852, 0.833, and 0.843, respectively. The LDA model was the best, with a sensitivity and specificity of 81.7% and 68.9%, respectively. 7 patients were stratified as low-risk. The sensitivity and specificity were 98.6% and 13.9%, respectively.

Conclusions: The preoperative radiomics model showed promising diagnostic performance in predicting UTUC muscle invasion.

PO-1483

Simultaneous multislice accelerated free-breathing diffusion-weighted imaging of the liver lesions at 3T

Yingyi Wu,Zheng Ye,Peng Wu,Bin Song
West China Hospital of Sichuan University

Purpose: To investigate the diagnostic value of simultaneous multi-slice (SMS) accelerated diffusion-weighted imaging (DWI) for differentiating malignant and benign liver lesions, with the comparison to conventional DWI (CON-DWI).

Methods: This prospective study was approved by the institutional ethics committee. Fifty-nine patients with 59 focal liver lesions (32 pathological confirmed HCC and 27 benign lesions) were enrolled. Free-breathing SMS-DWI and CON-DWI examinations were acquired with b-values of 50, 400, and 800 s/mm². The acquisition time for SMS-DWI and CON-DWI was 52s and 83s, respectively. Qualitative image quality, visual lesion signal, and quantitative measurements of the average ADC for the lesions were compared between SMS-DWI and CON-DWI. The Wilcoxon rank-sum test, Friedman test, and paired Student t-test were used for statistical analysis. P-values < 0.05 are considered statistically significant.

Results: There were no significant differences in image artifact and visual lesion signal between SMS-DWI and CON-DWI in all b-value images. On b=50 s/mm² images, SMS-DWI demonstrated significantly superior overall image quality (3.92 ± 0.57 vs. 3.83 ± 0.56 , $P=0.025$) and better conspicuity of lesion than CON-DWI (4.17 ± 0.95 vs. 4.00 ± 1.00 , $P=0.004$). For malignant lesions, the ADC was 1.00×10^{-3} mm²/s in SMS-DWI and 1.09×10^{-3} mm²/s in CON-DWI ($P=0.20$). For benign lesions, the mean ADC was 1.81×10^{-3} mm²/s in SMS-DWI and 1.83×10^{-3} mm²/s in CON-DWI ($P=0.78$). The ADC cutoff for differentiating benign and malignant lesions was 1.14×10^{-3} mm²/s for SMS-DWI (sensitivity, 1; specificity, 0.84) with the area under the curve (AUC) of 0.96 (95% CI: 0.88-1.00), and 1.21×10^{-3} mm²/s for CON-DWI (sensitivity, 0.96; specificity, 0.84) with AUC of 0.93 (95% CI: 0.83-0.98). No significant difference was observed between the SMS-DWI and CON-DWI regarding ADC values ($P = 0.76$) and the AUCs ($P=0.32$).

Conclusions: SMS-DWI achieved comparable image quality to CON-DWI in considerable scan time reduction, and yielded similar diagnostic accuracy in differentiating malignant and benign liver lesions.

PO-1484

A Gd-EOB-DTPA-MRI-based multivariable model using LI-RADS v2018 and other imaging features for preoperatively predicting Ki-67 expression in hepatocellular carcinoma

Yingying Liang,Hongzhen Wu
广州市第一人民医院

Objectives To construct a Gd-EOB-DTPA-MRI-based multivariable model to predict Ki-67 expression levels in hepatocellular carcinoma (HCC) using LI-RADS v2018 and other imaging features. **Methods** A total of 121 patients with HCC who underwent Gd-EOB-DTPA-MRI and were enrolled in this study. The patients were divided into three groups according to Ki-67 cut-offs: Ki-67 $\geq 20\%$ ($n = 86$) vs. Ki-67 $< 20\%$ ($n = 35$); Ki-67 $\geq 30\%$ ($n = 73$) vs. Ki-67 $< 30\%$ ($n = 48$); Ki-67 $\geq 50\%$ ($n = 45$) vs. Ki-67 $< 50\%$ ($n = 76$). A

multivariable model was established using LI-RADS v2018 and other imaging features. The performance characteristic of the multivariable model was assessed using receiver operating characteristic curves. **Results** The presence of mosaic architecture ($p=0.045$), the presence of infiltrative appearance ($p=0.039$), and the absence of targetoid hepatobiliary phase (HBP, $p=0.035$)

were independent differential factors for the prediction of HCC when Ki-67 \geq 50%, while no features predicted HCC when Ki-67 \geq 20% and Ki-67 \geq 30%. The multivariable model based on mosaic architecture, infiltrative appearance, and targetoid HBP performed better diagnostically than infiltrative appearance alone (0.776 vs. 0.619, $p=0.002$) and targetoid HBP alone (0.776 vs. 0.575, $p<0.001$), but had a comparable AUC with mosaic architecture (0.776 vs. 0.727, $p=0.082$). **Conclusions** A Gd-EOB-DTPA-MRI-based multivariable model was constructed to predict the expression of Ki-67 in HCC, which provides individualized guidance for prognostic evaluation and clinical decision-making in HCC patients.

PO-1485

Predicting overall survival in hepatocellular carcinoma patients using the functional liver imaging score model

Feier Ding, Shuo Cai, Changhu Liang, Xinya Zhao

Department of Radiology, Shandong Provincial Hospital Affiliated to Shandong First Medical University

Purpose For patients with hepatocellular carcinoma (HCC), most of them have chronic liver disease and compromised liver function, leading to poor prognosis. The functional liver imaging score (FLIS), derived from hepatobiliary contrast agents-enhanced MRI, correlates with liver function. To develop a nomogram based on the functional liver imaging score to predict overall survival in HCC patients.

Methods This retrospective study included 460 HCC patients who underwent gadobenate dimeglumine-enhanced MRI from three hospitals. A nomogram was established integrating deep MRI information and clinicopathologic factors for better prediction. Harrell's concordance index (C-index) and time-dependent receiver operating characteristic (ROC) were used as performance metrics. Overall survival (OS) and recurrence-free survival (RFS) were estimated by the Kaplan-Meier method and compared with the log-rank test.

Results In multivariable analysis, functional liver imaging score (FLIS) (HR = 0.194, 95% CI = 0.119-0.317, $p < 0.001$), alpha-fetoprotein (AFP) > 400 ng/mL (HR = 2.149, 95% CI = 1.068-4.326, $p = 0.032$) tumor number (HR = 2.149, 95% CI = 1.044-4.421, $p = 0.038$) and tumor size > 5cm (HR = 3.036, 95% CI = 1.438-6.410, $p = 0.004$), were independent predictors of OS. A nomogram for predicting OS in HCC patients was developed using these factors. The C index (0.927; 95% CI = 0.864-0.990) for the FLIS model of the training cohort was significantly higher than other 8 prediction systems. Kaplan-Meier curves demonstrating differences in OS of patients with HCC between the FLIS model-low risk group and FLIS model-high risk group ($p < 0.001$).

Conclusion A nomogram incorporating functional liver imaging score and clinical parameters showed good discrimination and calibration abilities in predicting overall survival in HCC patients after liver resections.

PO-1486

Multiparametric MRI for Staging of Bowel Inflammatory Activity in Crohn's Disease with MUSE-IVIM and DCE-MRI: A Preliminary Study

Jianguo Zhu

The Second Affiliated Hospital of Nanjing Medical University

Objectives To investigate if the combination of multi-shot diffusion imaging based multiplexed sensitivity encoding intravoxel incoherent motion (MUSE-IVIM) and dynamic contrast-

enhanced magnetic resonance imaging (DCE-MRI) is feasible for staging Crohn's Disease (CD) activity.

Material and methods A total of 65 CD patients were enrolled and analyzed in this retrospective study. The simplified endoscopic score for Crohn's Disease (SES-CD) and magnetic resonance index of activity (MaRIA) were used as the reference. The MUSE-IVIM and DCE-MRI data were acquired at 3.0-T MRI scanner and processed by two radiologists. Three MUSE-IVIM parameters: fast apparent diffusion coefficient (ADC_{fast}), slow apparent diffusion coefficient (ADC_{slow}), and the fractional perfusion (Fraction of ADC_{fast}), as well as four DCE-MRI parameters: volume transfer constant (K_{trans}), rate constant (K_{ep}), extravascular extracellular volume fraction (V_e) and plasma volume fraction (V_p) were generated. Intra-class correlation coefficient (ICC), non-parametric test (Kruskal-Wallis H and Mann-Whitney U), logistic regression, receiver operating characteristic analysis, Delong test, and Spearman's correlation test were performed.

Results According to SES-CD, 116 ileocolonic segments with CD lesions were identified as: inactive (n = 38), mild (n = 46), and moderate to severe (n = 32). Inter-reader agreement has been validated with high ICC coefficients > 0.9 for all MUSE-IVIM and DCE-MRI parameters. Relative to the two active groups, MaRIA (p < 0.001), ADC_{fast} (p < 0.001), K_{trans} (p < 0.001), K_{ep} (p < 0.001) and V_e (p < 0.001) all showed lower values in inactive group. Fraction of ADC_{fast} (p < 0.001) was higher in inactive than the other two groups. With multivariable logistic regression analysis, ADC_{fast} (p < 0.001), Fraction of ADC_{fast} (p = 0.005), K_{trans} (p < 0.001) and K_{ep} (p = 0.003) were identified as significant factors for differentiating among the three groups. Significantly different parameters were revealed between inactive and active groups, including MaRIA score (p < 0.001), ADC_{fast} (p < 0.001), Fraction of ADC_{fast} (p < 0.001), K_{trans} (p < 0.001), K_{ep} (p < 0.001) and V_e (p = 0.011). Binary logistic analyses identified ADC_{fast} (Odds Ratio = 2.009, p = 0.001), K_{trans} (Odds Ratio = 54.771, p = 0.014) and K_{ep} (Odds Ratio = 6.105, p = 0.029) as independent predictors for the active status. The combination of ADC_{fast}, K_{trans} and K_{ep} performed better than MaRIA score (p = 0.028), for differentiating inactive and active status. MaRIA score was positively correlated with ADC_{fast} (r = 0.594, p < 0.001), K_{trans} (r = 0.581, p < 0.001), K_{ep} (r = 0.443, p < 0.001) and V_e (r = 0.294, p = 0.001), however, negatively correlated with Fraction of ADC_{fast} (r = -0.394, p < 0.001). **Conclusion** The combination of MUSE-IVIM and DCE-MRI has been demonstrated to accurately stage inflammatory activity in CD.

PO-1487

Establishment and Validation of the LI-RADS Morphologic Type II Hepatocellular Carcinoma Early Recurrence Risk Scoring System.

Can Yu, Yajuan Sun, Xinxin Wang, Rui Yang, Zhipeng Ding, Yang Zhou
Harbin Medical University Cancer Hospital

Abstract:

Background: Tumor morphology is associated with early recurrence of hepatocellular carcinoma (HCC), and there is controversy regarding the recurrence risk of LI-RADS morphologic Type II HCC, which serves as a transition between Type I and Type III. This study aimed to explore the risk factors for early recurrence of Type II HCC, establish a risk scoring system, and provide reliable references for accurate diagnosis and treatment of HCC.

Methods: A retrospective analysis was conducted on patients who underwent curative resection for HCC and underwent preoperative contrast-enhanced MRI examinations at Harbin Medical University Cancer Hospital from June 2016 to June 2020. Patients classified as Type II based on morphology were included as the modeling group, and HCC patients from the TCIA database were included as the validation group. Univariate and multivariate Cox regression analyses were used to determine the independent risk factors for early recurrence of Type II HCC. Risk scores were assigned to the independent risk factors to establish the scoring system, with the mean score used

for risk stratification to define high-risk and low-risk groups. Additionally, an early recurrence prediction model was established using the scoring system. The predictive ability of the model was evaluated using the area under the receiver operating characteristic (ROC) curve (AUC), and the model and scoring system were validated using the validation group data.

Results: A total of 95 Type II HCC patients from our hospital were included as the modeling group, and 29 cases from the TCIA database were included as the validation group, with early recurrence rates of 33.7% (32/95) and 37.9% (11/29), respectively. In the modeling group, the results of multivariate analysis showed that age (HR 0.93, 95% CI 0.89-0.97, $P=0.001$), histological grade (HR 2.03, 95% CI 1.01-3.77, $P=0.024$), AFP (HR 3.39, 95% CI 1.37-8.41, $P=0.008$), and intratumoral hemorrhage (HR 4.19, 95% CI 1.84-9.52, $P=0.001$) were independent risk factors associated with early recurrence. The diagnostic performance of the model for early recurrence was AUC=0.817 (95% CI 0.72-0.89) in the modeling group. A scoring system was established based on the four variables mentioned above, with a cumulative score range of 0-6. Scores ≤ 3 were classified as the low-risk group for early recurrence, while scores >3 were classified as the high-risk group. Compared to the low-risk group, the high-risk group had significantly lower recurrence-free survival (40.0% vs 73.2%, $P=0.001$), and consistent results were obtained in the validation group (25.0% vs 73.3%, $P=0.028$).

Conclusions: Age <52 years, lower histopathological grade, elevated AFP levels, and preoperative imaging evidence of intratumoral hemorrhage are independent risk factors for early recurrence of Type II HCC. The risk scoring system established in this study demonstrated good discrimination and predictive ability after validation, enabling the assessment of early recurrence risk in Type II HCC and providing important references for clinicians to identify high-risk individuals.

PO-1488

Feasibility of abdominal aortic angiography utilizing ultra-low-dose contrast medium based on low-level virtual monoenergetic imaging: An prospective study

Shuwen Dong,jieqiong chen,li fan,shiyuan liu
Changzheng Hospital,Naval Medical University

Purpose: To investigate the feasibility of ultra-low-dose contrast medium (CM) utilization based on low-level virtual monoenergetic images (VMI) in abdominal aortic angiography.

Material and methods: Fifty-eight patients who underwent abdominal aortic CT angiography examination on a dual-layer detector CT (Spectral CT 7500, Philips Healthcare, Best, Netherlands) were randomly divided into ultra-low-dose CM group (LDCM) ($n=27$) and normal dose CM group (NCCM) ($n=31$). CM injection amount in NCCM was set as body weight (Kg) \times iodine concentration (mg/ml)/CM concentration (mg/ml). In LDCM group, 25% CM dosage of NCCM was used, and VMI 40keV were reconstructed instead of conventional images (VMI-LDCM). For objective analysis, circular regions of interest (ROIs) were placed on the abdominal aorta at the level of bifurcation of renal artery. The CT values, signal-to-noise ratios (SNRs), and contrast signal-to-noise ratios (CNRs) of abdominal aorta were calculated and compared in two groups (NDCM and VMI-LDCM). Subjective assessments were performed by two radiologists independently (0-3 point grading score: 0 = non-diagnostic, 3= excellent angiographic images). T test, Kruskal-Wallis Test (Mann Whitney) and Cohen's kappa test were used for statistical analysis.

Results: The CNR of VMI-LDCM were significantly higher than NDCM group ($p<0.01$). There were no significant differences in subjective scoring for primary and secondary arterial branches between NDCM and VMI-LDCM images ($p>0.05$), but there were significant differences in the third and fourth grade arterial branches ($p<0.01$). There was substantial agreement between the two independent readers.

Conclusion: The combination of VMI 40keV enabled 75% CM reduction in clinical abdominal aortic CTA scans and improve the imaging quality of small branch angiography.

PO-1489

Imaging and Pathological Feature Analysis of Idiopathic Portal Hypertension

Hanyu Li, Mengyao Tao, Dong Tang, Ling Gong, Wenjun Yang
Affiliated Hospital of Hangzhou Normal University

Background:

Idiopathic portal hypertension (IPH) is a relatively rare clinical condition characterized by portal hypertension without liver cirrhosis. With the ongoing challenge in diagnosing.

Objective: To assess the distinctive radiological and pathological features that differentiate between idiopathic portal hypertension (IPH) and cirrhosis.

Methods:

Pathological and radiological parameters (CT/MRI) were retrospectively evaluated in patients with histologically confirmed IPH versus those with cirrhosis. This study included 14 patients with IPH and 30 patients with cirrhosis.

Results:

There was a significant difference in spleen thickness between the IPH and liver cirrhosis groups ($P < 0.05$). Atrophy and hyperplasia of hepatic lobe in the two groups are also different. Both IPH and liver cirrhosis groups showed changes in liver morphology and parenchyma, with diffuse regenerative nodules and focal nodular hyperplasia being significant for distinguishing between IPH and liver cirrhosis. All 14 IPH patients had abnormalities in the portal vein system, including main portal vein dilation, stiffness, straightening, and distal branch vein stenosis or occlusion, while 9 liver cirrhosis patients had portal vein abnormalities, with thinning of the portal vein.

In terms of pathology, patients in the cirrhosis group showed varying degrees of cell necrosis and edema, and pseudolobule formation was observed in all patients. Patients with IPH showed varying degrees of fibrosis in the portal and confluent areas, but lobular inflammation was not evident. Some IPH patients showed portal vein occlusion and stenosis.

Conclusion:

In patients with early IPH, if a giant spleen is found on the image and the liver surface is smooth, it is necessary to consider IPH. While focusing on the changes in the portal system by image observation, atrophy and hyperplasia of hepatic lobe must be given some reference significance. In addition, FNH and diffuse hepatic regenerative nodules can also be used as key points to differentiate IPH and cirrhosis. The pathological absence of pseudobulbar changes and abnormal changes such as fibrosis, stenosis and occlusion of the portal venous system require cautious consideration of cirrhosis.

PO-1490

Risk Stratification and Overall Survival Prediction in Advanced Gastric Cancer Patients Based on Whole-volume MRI Deep Learning Radiomics

Wujie Chen
zhejiang cancer hospital

Purpose: The prognosis of advanced gastric cancer (AGC) patients has always been the focus of attention which is a lack of real predictive method. We are eager to explore and predict risk stratification and overall survival (OS) in AGC patients using MRI deep learning radiomics.

Methods: A dataset of 337 patients with clinicopathologically confirmed AGC was retrospectively collected between February 2014 and October 2020. All patients underwent preoperative standard 3.0T MRI examination. The dataset was randomly allocated into a training cohort with 236 patients and an internal validation cohort with 101 cases. A total of 3705 radiomic features and 1876 deep learning features were extracted for each patient. Least absolute shrinkage and selection operator (LASSO) algorithm and multivariate Cox-regression analysis were conducted to obtain the optimized subset of texture feature and construct the final survival model. The risk score (RS) was calculated by each sample based on the characteristics and correlation coefficients. A survival prediction model was built by combining RS and independent clinical factors, and its performance was assessed with the receiver operating characteristic (ROC) analysis and calibration curves in both the training and validation cohorts, respectively.

Results: According to multivariate analysis, age ($P<0.001$) and LVI ($P=0.042$) were clinical independent predictors of OS. The RS consisting of 5 radiomic features and 6 deep learning features were found to be significantly associated with OS ($P<0.001$ for primary cohort and $P=0.006$ for validation cohort). Integrated with LN, LVI and RS, a survival prediction model was built, showing a favorable classification ability with an AUC in prediction on 3-year and 5-year OS was 0.765 and 0.788, 0.757 and 0.729 in the training set and validation set, respectively. The calibration curves also showed goodness-of-fit of the model and the nomogram was established.

Conclusions: This study puts forward a survival prediction model that combines the RS, LN, and LVI, which can be powerful predictors in preoperative prediction of OS in AGC patients. The survival prediction model may aid the identification of high-risk patients and optimization of decision-making.

PO-1491

Hepatic Epithelioid Hemangioendothelioma: CT Manifestations and Clinicopathologic Findings

Wujie Chen
zhejiang cancer hospital

Purpose: Hepatic epithelioid hemangioendothelioma (EHE) is an extremely rare malignant vascular tumor with insufficient recognition leading to low diagnostic accuracy in the clinic.

Methods: All 12 cases with pathologically proven hepatic EHE were retrospectively evaluated between June 2006 and February 2020. The CT manifestations, clinical information, and pathological findings were recorded.

Results: Twelve patients pathologically confirmed hepatic EHE were enrolled in the study from June 2006 to February 2020. These patients presented with clinical symptoms of upper abdominal pain ($n=3$), bloating ($n=3$), loss of appetite ($n=2$), low fever ($n=1$), swollen left neck ($n=1$), and the remaining 6 patients were asymptomatic. Nine of 12 (75%) involved multiple intrahepatic

lesions, while another 3 (25%) were solitary lesion. For 9 multifocal patients, the lesions were all distributed under the hepatic subcapsular or suffused, while for the 3 solitary lesions, none of them were located under the hepatic subcapsular. Besides, nodule clustered distribution, lollipop sign, semicircle sign, vascular sign, and capsule retraction sign were present in a portion of the hepatic EHEs. Most patients showed positive expression of CD31 and CD34, 2 of 12 (17%) showed positive expression of CK7 antibody for the epithelial component, 5 of 12 (42%) showed positive expression of Vimentin, EMA, and CD117.

Conclusions: The aim of the study is to move forward mindfulness and understanding of hepatic EHE and diminish the misdiagnosis rate within the future via the CT manifestations and clinicopathologic findings.

PO-1492

Shape changes in the levator ani muscle obtained by dual-energy computed tomography compared with 3T MR imaging in women with stress urinary incontinence

Kun Ou, Kun Zhang
Hunan University of Chinese Medicine

Purpose Using magnetic resonance imaging (MRI) and dual-energy computed tomography (DECT) of healthy people and patients with stress urinary incontinence (SUI) of levator ani muscle imaging, to explore the levator ani muscle imaging manifestations of patients with SUI in MR and DECT images.

Methods and Materials This study enrolled 30 healthy volunteers and 32 patients with SUI underwent pelvic examinations including 3.0-T MR and non-enhanced CT gemstone spectral imaging. The thickness of iliococcygeus muscle (tICM) and the angle of iliococcygeus (aICM) from coronal position were measured on CT of 110keV virtual monochromatic images and MR of coronal T2W images. The correlation between results of CT and MRI was evaluated, and the differences between the healthy group and the SUI group were compared.

Results The measured values of CT and magnetic resonance imaging MRI had strong and positive correlation (left tICM, $r=0.745$, $P<0.001$; right tICM, $r=0.708$, $P<0.001$; left aICM, $r=0.682$, $P<0.001$; right aICM, $r=0.838$, $P<0.001$). Our result showed that the tICM of SUI group (left, 3.19 ± 0.62 mm; right, 3.01 ± 0.79 mm) was significantly lower than that of healthy group (left, 3.51 ± 0.98 mm, $P=0.021$; right, 3.66 ± 0.76 mm, $P=0.002$), and the aICM (left, $33.43\pm6.51^\circ$; right, $35.14\pm7.49^\circ$) was higher than that of the healthy group (left, $26.59\pm5.19^\circ$, $P=0.005$; right, $27.99\pm6.95^\circ$, $P=0.001$) in MRI. And in CT, the tICM of SUI group (left, 3.11 ± 0.88 mm; right, 3.17 ± 0.67 mm) was also significantly lower than that of healthy group (left, 3.68 ± 0.78 mm, $P=0.009$; right 3.60 ± 0.91 mm, $P=0.012$), and the aICM (left, $33.10\pm5.59^\circ$; right, $34.25\pm6.98^\circ$) was higher than that of the healthy group (left, $25.18\pm6.99^\circ$, $P=0.003$; right, $26.28\pm5.62^\circ$, $P<0.001$).

Conclusion DECT and MRI of anus levator anatomical parameters measured value has significant correlation. The thickness of iliococcygeus muscle of SUI patients is lower than that of healthy people, and the angle of iliococcygeus is higher than that of healthy people.

Clinical Relevance Currently the imaging of levator ani muscle damage is still confined to MRI and ultrasound, this study proves that spectral imaging of DECT is feasible to detect levator ani muscle damage, showing strong correlation with MRI. DECT has the advantages of fast scanning speed. For patients such can't tolerate MRI examination, DECT scanning is clinically valuable.

PO-1493

Age-related variations in levator ani muscle fat and muscle content of once vaginal delivered females evaluated using spectral CT imaging

Kun Ou, Kun Zhang
Hunan University of Chinese Medicine

Purpose To evaluate changes in muscle and fat contents of levator ani muscle with aging by using material decomposition (MD) technique in spectral CT imaging.

Methods and Materials An analysis of 33 female volunteer who underwent non-enhanced gemstone spectral imaging for Pelvic floor. The muscle and fat contents were measured for levator ani muscle on muscle-based MD images and fat-based MD images respectively. All the volunteers underwent only once vaginal delivery. And all the volunteers were divided into two groups, respectively for the young (20-44 years old, 31.8 ± 5.9) and the middle aged and elderly group (45-70 years old, 53.0 ± 6.5). The correlation of muscle contents-age, fat contents-age and the differences of muscle and fat contents in each age group were statistically analyzed.

Results Our result shows that the fat contents of levator ani muscle and age were positively and strongly correlated ($r=0.695$, $P<0.001$), and the muscle contents and age were negatively and strongly correlated ($r=-0.714$, $P<0.001$). In the middle aged and elderly group, fat content (94.3 ± 12.3 mg·cm⁻³) was significantly higher than that of the young group (78.2 ± 11.5 mg·cm⁻³, $P<0.001$), while muscle content in older (984.3 ± 27.7 mg·cm⁻³) lower than that the younger (1017.5 ± 25.9 mg·cm⁻³, $P<0.001$).

Conclusion The muscle degeneration in levator ani muscle occurs with aging .

Clinical Relevance This research through material decomposition (MD) technique in spectral CT imaging reveals female levator ani muscle degeneration of law: levator ani muscle appears aged degenerative change, which is the decrease of muscle content and the increase of fat content. Degeneration of the pelvic floor muscles will lead to the occurrence of pelvic floor functional disorder. The results provides not only evidences for understanding underlying mechanism but also valuable tools for early diagnosis of subsequent pelvic floor functional disorder.

PO-1494

Spatial Evaluation of the First-line Systemic Therapy Related Pathological Indicators in Hepatocellular Carcinoma with Multiparametric Magnetic Resonance Imaging

Chenyu Song, Xiaoqi Zhou, Meicheng Chen, Shi-Ting Feng
The First Affiliated Hospital of Sun Yat-sen University

Purpose:

We aimed to explore the feasibility of multiparametric magnetic resonance imaging (MRI) in evaluating the first-line systemic therapy related pathological indicators (VEGFA, PD-L1) in hepatocellular carcinoma (HCC).

Materials and Methods:

C57/BL6 mouse HCC model underwent MRI scan. MRI and pathological planes ($n_{\text{tumor}}=15$, $n_{\text{plane}}=115$) were spatially matched with 3D printing technology. We analyzed MRI parameters and immunohistochemically stained pathological indicators in different spatial regions (margin, center, plane, whole tumor). MRI evaluation model of the pathological indicators were established, respectively. The pathological indicators were further grouped into $V^{\text{high}}|^{\text{high}}$ (high VEGFA, high PD-L1), $V^{\text{high}}|^{\text{low}}$, $V^{\text{low}}|^{\text{high}}$, $V^{\text{low}}|^{\text{low}}$ groups. The combined indicators evaluation model was established.

Results:

The expressions of VEGFA and PD-L1 significantly differed between the marginal and central regions. MRI parameters significantly correlated to the pathological indicators in different spatial regions. Ktrans, Kep, Ve, and α significantly differed between VEGFA high- and low- groups in different spatial regions. The area under the curves (AUCs) of VEGFA evaluation model at the regions of margin combining center (ROC^{M+T}) and margin (ROC^M) were 0.732(95%CI 0.663-0.793), and 0.715(95%CI 0.621-0.797), respectively. Kep, Ve, iAUC60, T1pre, and T1pos significantly differed between PD-L1 high- and low- groups in different spatial regions. The AUCs of PD-L1 evaluation models of ROC^{M+T} , ROC^M , ROC^{plane} were 0.707(95%CI 0.637-0.770), 0.647(95%CI 0.552-0.735), 0.648(95%CI 0.552-0.736), respectively. Ktrans, Kep, Ve, and T1pre significantly differed among $V^{high|high}$, $V^{high|low}$, $V^{low|high}$, and $V^{low|low}$ groups. The combined indicators evaluation model was statistically significant ($P=0.001$).

Conclusion:

Multiparametric MRI was feasible to evaluate the first-line systemic therapy related pathological indicators (VEGFA, PD-L1) with the consideration of spatial heterogeneity.

PO-1495

The correlation of gut microbiome and metabolites with MR enterography and their combined efficacy in evaluation of bowel damage of patients with Crohn's disease

Xiaodi Shen, Jixin Meng, Ruonan Zhang, Zhoulei Li, Yangdi Wang, Shiting Feng, Xuehua Li
The First Affiliated Hospital, Sun Yat-Sen University

Purpose: Bowel damage (BD) is a significant complication of Crohn's disease (CD) associated with microbial dysbiosis and metabolic disorder. MR enterography (MRE) can reflect BD at the macroscopic imaging anatomic level. However, the correlation of gut microbiome and metabolites with MRE is unknown, and whether combining macro-level data (i.e., MRE) with micro-level data (i.e., gut microbiome and metabolites) can better assess BD has not been investigated. This study aimed to address these two questions which had not been fully understood.

Materials and Methods: This prospective study included 230 CD patients whose stools and serums were collected within one week of MRE examination and stored in the -80°C freezer. CD patients were classified as BD ($n=103$) and non-BD ($n=127$) groups by Lémann index. MRE features (e.g., bowel wall thickness and T2WI hyperintensity, stricture, penetrating diseases, comb sign, etc.) between the two groups were compared by K-W test. The correlations among MRE features, gut microbiota, fecal and serum metabolites were analyzed by Spearman correlation; subsequently, gut microbiota and metabolites markers related to BD were selected. MRE model, gut microbiota model, fecal metabolites model, serum metabolites model, and comprehensive model that integrating all of the above data were developed to assess BD.

Results: Seven MRE features (i.e., penetrating diseases, bowel wall thickness and T2WI hyperintensity, comb sign, lesion length, etc.) were significantly different between BD and non-BD groups. 26 gut microbiota and metabolites that relating to BD were selected. According to the correlations of intestinal microbiota, fecal metabolites, serum metabolites, and MRE features, the biomarkers of BD were defined. The comprehensive model showed the highest efficacy for assessing BD ($AUC=0.708$, $P\leq 0.05$), followed by fecal metabolites model ($AUC=0.671$, $P\leq 0.05$), MRE model ($AUC=0.651$, $P\leq 0.05$), serum metabolites model ($AUC=0.640$, $P\leq 0.05$), and gut microbiota model ($AUC=0.588$, $P\leq 0.05$).

Conclusion: MRE findings are inextricably related to gut microbiome and metabolites; integrating MRE and gut microbiome and metabolites allows for a more comprehensive assessment of BD in patients with CD.

PO-1496

A Deep Learning Model Based on MRI for Prediction of Vessels Encapsulating Tumour Clusters and Prognosis in Hepatocellular Carcinoma: A Two-Centre Study

Jiawen Yang¹, Xue Dong², Wenbin Ji¹

1. taizhou hospital

2. Department of Radiology, Beijing Friendship Hospital, Capital Medical University, Beijing, China.

Abstract

Objectives: This study aimed to build and evaluate a deep learning (DL) model to predict vessels encapsulating tumour clusters (VETC) and prognosis preoperatively in patients with hepatocellular carcinoma (HCC).

Methods: 320 pathologically confirmed HCC patients (58 women and 262 men) from two hospitals were included in this retrospective study. Institution 1 (n=219) and Institution 2 (n=101) served as the training and external test cohorts, respectively. Tumours were evaluated three-dimensionally and regions of interest were segmented manually in the arterial, portal venous, and delayed phases (AP, PP, and DP). Three ResNet-34 DL models were developed, consisting of three models based on a single sequence. The fusion model was developed by inputting the prediction probability of the output from the three single-sequence models into logistic regression. The area under the receiver operating characteristic curve (AUC) was used to compare performance, and the Delong test was used to compare AUCs. Early recurrence-free survival (ERFS) rate was evaluated by Kaplan-Meier survival analysis.

Results: Among the 320 HCC patients, 227 were VETC- and 93 were VETC+. The fusion model in the external test cohort showed an AUC of 0.772, a sensitivity of 0.80, and a specificity of 0.61. The fusion model-based prediction of VETC high-risk and low-risk categories exhibits a significant difference in ERFS rates, akin to the outcomes observed in VETC+ and VETC- confirmed through pathological analyses ($p < 0.05$).

Conclusions: A DL framework based on Resnet-34 has demonstrated potential in facilitating non-invasive prediction of VETC as well as patient prognosis.

PO-1497

Preoperative MR-based deep transfer learning and radiomics feature prediction of disease-free survival in patients with early-stage cervical cancer

chao Wu

The First Affiliated Hospital of Chongqing Medical University

Objective To explore the deep learning radiomics nomogram (DLRN) to predict the disease free survival (DFS) in patients with early-stage cervical cancer (ECC).

Methods A total of ECC 225 patients from 2 centers (training cohort, n=113; internal validation cohort, n=57; external validation cohort, n=55) were retrospectively recruited. Handcrafted and deep learning based radiomics features were derived from the T2-weighted imaging (T2WI) and diffusion-weighted imaging (DWI). DFS-related radiomics signatures were selected in 3 target tumor volumes (VOI, VOI3, and VOI6) to build 3 rad-scores using the least absolute shrinkage and

selection operator (LASSO) Cox regression analysis. Logistic regression was applied to build combined model incorporating rad-scores of handcrafted and DL-based radiomics signatures with clinical risk factors and compared with clinical model alone. Kaplan–Meier analysis was used to further validate prognostic value of selected clinical and radiomics characteristics.

Results Rad-score (VOI6) performed best in both handcrafted and DL-based radiomics signatures with AUCs of 0.700 (95% CI 0.638-0.824) and 0.854 (95% CI 0.751-0.957) in the internal validation cohort, and 0.784 (95% CI 0.710-0.906) and 0.806 (95% CI 0.683-0.929) in the external validation cohort. Combined model was constructed by incorporating menopausal status, FIGO stage, serum SCC-Ag level and handcrafted and DL-base radiomics signatures. The DLRN performed better than clinical model in DFS prediction in the training set (0.815 vs 0.709; $p=0.024$), internal validation set and external validation set (C-index 0.866 vs 0.719; $p=0.001$).

Conclusion A deep learning radiomics nomogram combining handcrafted and DL-based radiomics signatures can aid in the prediction of DFS for ECC, thereby facilitating clinical decision-making.

PO-1498

Susceptibility-weighted Imaging for Renal Iron Overload Assessment: A Pilot Study

Jun Sun

The First People's Hospital of Changzhou

Purpose: To explore the feasibility of susceptibility-weighted imaging (SWI) for evaluating renal iron overload.

Methods: Twenty-eight rabbits were randomly assigned into control ($n=14$) and iron ($n=14$) group. In the 0th week, the study group was injected with iron dextran. Both groups underwent SWI examination at the 0th, 8th, and 12th week. The signal intensity (SI) of cortex and medulla was assessed. Angle radian value (ARV) calculated with phase image was taken as the quantitative value for cortical and medullary iron deposition. After the 12th week, the left kidneys of rabbits were removed for pathology. The difference in the ARV among three groups was used Kruskal-Wallis test. The difference of the iron content between two groups was analyzed through independent sample t-test.

Results: In the iron group: at the 12th week, 8 rabbits were found to have decreased SI of only cortex, and the other 6 rabbits had decreased SI of cortex and medulla by the same degree; the ARV of cortex at the 8th and 12th week was significantly higher than that of the 0th week ($P<0.05$); the ARV of the 6 rabbits' medulla at the 12th week was significantly higher than that of the 0th week, 8th week, and the other 8 rabbits at the 12th week ($P<0.05$); at the 12th week, 8 rabbits (iron group) were found to have many irons only deposit in the cortex, and the others were found to have many irons deposit in both cortex and medulla; the iron content of cortex and 6 rabbits' medulla in the iron group was significantly higher than that of the control ($P<0.05$).

Conclusion: The ARV of SWI can be used to quantitatively assess excess iron deposition in the kidneys. Excessive iron deposition mainly occurs in the cortex or medulla and causes their SWI SI to decrease.

PO-1499

The Role of MRI Texture Analysis Based on Susceptibility-Weighted Imaging in Predicting Fuhrman Grade of Clear Cell Renal Cell Carcinoma

Jun Sun

The First People's Hospital of Changzhou

Background The Fuhrman nuclear grade system is one of the most important independent indicators in the patients with clear cell renal cell carcinoma (ccRCC) for aggressiveness and prognosis. Preoperational assessment of tumor aggressiveness is meaningful for surgical decision making.

Purpose To explore the role of MRI texture analysis based on susceptibility-weighted imaging (SWI) in predicting Fuhrman grade of ccRCC.

Material and Methods A total of 45 patients with SWI and surgically proven ccRCC were divided into low-grade group (Fuhrman I and II, $n = 29$) and high-grade group (Fuhrman III and IV, $n = 16$). Texture features were extracted from SWI images. Feature selection were performed, and the multivariable logistic regression analysis was performed to develop the SWI-based texture model for grading ccRCC. The ROC curve analysis and leave group out cross validation (LGOCV) was performed to test the reliability of the model.

Results A total of 396 SWI-based texture features were extracted from each SWI image. The SWI-based texture model developed by the multivariable logistic regression analysis was: $\text{SWIscore} = -0.59 + 1.60 * \text{ZonePercentage}$. The AUC of the SWI-based texture model for differentiating high- from low-grade ccRCC was 0.81 (95% CI: 0.67–0.94), with 80% accuracy, 56.25% sensitivity, and 93.10% specificity. After 100 times LGOCV, the mean accuracy, sensitivity, and specificity was 90.91%, 91.83%, and 89.89% for the training sets, and 77.29%, 80.52%, and 71.44% for the test sets.

Conclusion SWI-based texture analysis might be a reliable quantitative approach for differentiating high- from low-grade ccRCC.

PO-1500

Using the “2 standard deviations” rule with Dixon MRI to differentiate renal cell carcinoma types

Jun Sun

The First People's Hospital of Changzhou

Background: Clear cell and non-clear cell renal cell carcinoma (RCC) are distinguishable based on microscopic fat, detectable by chemical shift MRI. However, these assessments are often subjective. Conversely, Dixon MRIs and the “2 standard deviations” rule (2SDR) are quantitative methods that may decrease diagnostic subjectivity. Therefore, this study assessed the value of the 2SDR for detecting microscopic fat and thus differentiating clear cell and non-clear cell RCC using Dixon MRI.

Methods: This retrospective study included patients with RCC who underwent preoperative Dixon MRI. The patients were grouped based on tumor type: clear cell RCC and non-clear cell RCC. The 2SDR value was calculated based on in-phase and opposed-phase images and then compared between the two groups. 2SDR values >0 indicated clear cell RCCs, whereas values <0 indicated non-clear cell RCC.

Results: We included 151 patients; 114 patients had clear cell RCC, of which 106 had a 2SDR value >0 . Furthermore, 37 patients had non-clear cell RCC, of which 3 had a 2SDR value >0 . The 2SDR value was significantly higher in the clear cell RCC group than in the non-clear cell RCC

group ($p = 0.000$). Overall, 93.0% (106/114) and 8.1% (3/37) of patients with clear cell and non-clear cell RCC, respectively, had microscopic fat. The evaluation indices for this 2SDR method were: accuracy: 92.72%, sensitivity: 92.98%, specificity: 91.89%, positive predictive value: 97.25%, and negative predictive value: 80.95%.

Conclusions: 2SDR values calculated from Dixon magnetic resonance images can differentiate clear cell from non-clear cell RCCs by detecting microscopic fat.

PO-1501

Application of convolutional neural network in diagnosing gastric poorly cohesive carcinoma in CT late arterial phase

Changfeng Ji

The Affiliated Hospital of Nanjing University Medical School

Objective: To develop and test a convolutional neural network (CNN) model with CT late arterial phase for diagnosing gastric poorly cohesive carcinoma (PCC).

Methods: A total of 195 patients (46 cases of PCC and 149 cases of non-PCC) with gastric cancer were retrospectively collected. Their preoperative CT images from the late arterial phase were divided into training sets (156 images) and testing sets (39 images) at a ratio of 4:1. The training sets were augmented and then were taken into a CNN model for analysis. After training, we employed seven traditional classification models to assess the performance of our network in predicting PCC in testing sets.

Results: The trained CNN model, built with support vector machine, showed the highest Accuracy and F1 score with an AUC of 0.78. The logistic regression model showed the highest AUC of 0.81.

Conclusion: The CNN model with CT late arterial phase serves as a promising assistant tool in differentiating PCC from non-PCC.

PO-1502

A prognostic nomogram model for guiding treatment selection in unresectable hepatocellular carcinoma treated by transarterial chemoembolization plus lenvatinib with or without PD-1 inhibitor therapy

Qing Wang, Wei Xing

chang zhou first people hospital

Background: To establish and verify a prognostic nomogram model for guiding treatment selection in unresectable hepatocellular carcinoma treated by transarterial chemoembolization plus lenvatinib with or without PD-1 inhibitor therapy.

Methods: Data from 241 patients with unresectable HCC (uHCC) who underwent transarterial chemoembolization plus lenvatinib (TACE-L group, $n=128$) and TACE-L combined with PD-1 inhibitor (TACE-L-P group, $n=113$) were retrospectively reviewed, and the differences in tumor responses, progression-free survival (PFS), overall survival (OS) and adverse events (AEs) between the two groups were compared. Then, a prognostic nomogram model was established based on independent clinical-radiologic factors and confirmed by Cox regression analysis for predicting PFS and OS. The treatment selection for uHCC patients was stratified by the nomogram score using locally weighted methods.

Results: Compared to TACE-L, TACE-L-P presented prolonged PFS (14.0 vs. 9.0 months, $P<0.001$), longer OS (24.0 vs. 15.0 months, $P<0.001$), and a better overall objective response rate

(54.0% vs. 32.8%, $P=0.001$). There was no significant difference between the rate of AEs in the TACE-L-P group and the TACE-L group, with rates of 56.64% and 46.09% ($P=0.102$), respectively. Additionally, there was no difference in the rate of grade 3 or 4 AEs, with rates of 11.50% and 9.38% ($P=0.588$), respectively. Therapy method, nonobjective initial treatment response, Barcelona Clinic Liver Cancer (BCLC) C stage, extrahepatic metastasis, higher albumin-bilirubin (ALBI) grade, size, and higher AFP were independent risk factors for PFS. Additionally, therapy method, nonobjective initial treatment response, BCLC C, extrahepatic metastasis and higher ALBI grade were independent risk factors for OS. The nomogram model presented good discrimination, with a C-index of 0.790 for predicting PFS and 0.749 for predicting OS. HCC patients who scored more than 9 in the nomogram model had better 2-year PFS with TACE-L-P, and those with a nomogram score over 25 had better 2-year OS for TACE-L-P.

Conclusions: TACE-L-P showed significant improvements in efficiency and safety among patients with uHCC compared with TACE-L. The nomogram model was useful for stratifying treatment decisions and selecting a suitable population for TACE-L-P therapy in uHCC patients.

PO-1503

What imaging modality is more effective in predicting early recurrence of hepatocellular carcinoma after hepatectomy using radiomics analysis: CT or MRI or both?

Qing Wang, Wei Xing

Third Affiliated Hospital of Soochow University, Changzhou & Changzhou First People's Hospital

Background: It is of great importance to predict early recurrence (ER) of hepatocellular carcinoma (HCC) after hepatectomy using preoperative imaging modalities. Nevertheless, no comparative studies have been conducted to determine which modality, CT or MRI with radiomics analysis, is more effective.

Methods: We retrospectively enrolled 119 HCC patients who underwent preoperative CT and MRI. A total of 3776 CT features and 4720 MRI features were extracted from the whole tumor. The minimum redundancy and maximum-relevancy algorithm (MRMR) and least absolute shrinkage and selection operator (LASSO) regression were applied for feature selection, and support vector machines (SVMs) were applied for model construction. Multivariable logistic regression analysis was employed to construct combined models that integrate clinical-radiologic-pathological (CRP) traits and radscore. To compare the efficacy of CT, MRI, and CT&MRI models in the test cohort, receiver operating characteristic (ROC) curves, calibration curves and decision curve analysis (DCA) were used.

Results: There was no significant difference between the CT model and MRI model for the prediction of ER in HCC patients ($P=0.911$). RadiomicsCT&MRI demonstrated a superior predictive performance than either RadiomicsCT or RadiomicsMRI alone ($P=0.032$, 0.039). The combined CT&MR model demonstrated significantly better performance for stratifying patients at high risk of ER (area under the curve (AUC) of 0.951 in the training set and 0.955 in the test set) than the CT model (AUC of 0.894 and 0.784) and the MRI model (AUC of 0.856 and 0.787). DCA demonstrated that the CT&MR model provided a greater net benefit than the models without radiomics analysis. Conclusions: No significant difference was found in predicting ER of HCC between CT models and MRI models. However, the multimodal radiomics model derived from CT and MRI can significantly improve the prediction of ER in HCC patients after resection.

PO-1504

Feasibility of T1 Mapping with Histogram Analysis for the Diagnosis and Staging of Liver Fibrosis: Preclinical Results

Qing Wang, Wei Xing

Third Affiliated Hospital of Soochow University, Changzhou & Changzhou First People's Hospital

Purpose To compare the diagnostic accuracy of parameters derived from the histogram analysis of precontrast, 10-min hepatobiliary phase (HBP) and 20-min HBP T1 maps for staging liver fibrosis (LF).

Methods LF was induced in New Zealand white rabbits by subcutaneous injections of carbon tetrachloride for 4-16 weeks (n=120), and 20 rabbits injected with saline served as controls. Precontrast, 10-min and 20-min HBP modified Look-Locker inversion recovery (MOLLI) T1 mapping was performed. Histogram analysis of T1 maps was performed, and the mean, median, skewness, kurtosis, entropy, inhomogeneity and 10th/25th/75th/90th percentiles of T1native, T110min and T120min were derived. Quantitative histogram parameters were compared. For significant parameters, further receiver operating characteristic (ROC) analyses were performed to evaluate the potential diagnostic performance in differentiating LF stages.

Results Finally, 17, 20, 21, 21 and 20 rabbits were included for the F0, F1, F2, F3, and F4 pathological grades of fibrosis, respectively. The mean/75th of T1native, entropy of T110min and entropy/mean/median/10th of T120min demonstrated a significant good correlation with the LF stage ($|r|=0.543-0.866$, all $P<0.05$). The 75th of T1native, entropy10min, and entropy20min were the three most reliable imaging markers in reflecting the stage of LF. The area under the ROC curve of entropy20min was larger than that of entropy10min ($P<0.05$ for $LF \geq F2$, $\geq F3$, and $\geq F4$) and the 75th of T1native ($P<0.05$ for $LF \geq F2$ and $\geq F3$) for staging LF.

Conclusion Magnetic resonance histogram analysis of T1 maps, particularly the entropy derived from 20-min HBP T1 mapping, is promising for predicting the LF stage.

PO-1505

A nomogram model integrating LI-RADS features and radiomics based on contrast-enhanced magnetic resonance imaging for predicting microvascular invasion in hepatocellular carcinoma falling the Milan criteria

Haifeng Liu, Yan-Zhen-Zi Zhang, Qing Wang, Zuhui Zhu, Wei Xing

Radiology Department, Third Affiliated Hospital of Soochow University

Purpose: Preoperative prediction of MVI in HCC patients meeting the Milan criteria has particular clinical significance for guiding early-stage treatment decisions and improving patient outcomes. However, liver imaging reporting and data system (LI-RADS) features and radiomics based on contrast-enhanced MRI (CEMRI) for the prediction of MVI in patients with HCC falling into the Milan criteria has not been explored until now. Thus, the development of a combined model incorporating LI-RADS features and radiomics derived from CEMRI to predict MVI in HCC patients falling into the Milan criteria is desirable. This study aimed to establish and validate a nomogram model incorporating both LI-RADS features and CEMRI-based radiomics for predicting microvascular invasion (MVI) in hepatocellular carcinoma (HCC) falling the Milan criteria. **Material and Methods:** In total, 161 patients with 165 HCCs diagnosed with MVI (n = 99) or without MVI (n = 66) were assigned to a training and a test group. MRI LI-RADS characteristics including major features, ancillary features favoring HCC in particular, ancillary features favoring

malignancy but not HCC in particular, and baseline findings of HCCs were analyzed blindly by Two radiologists. Additionally, radiomics features consisted of 3D shape- features, first-order histogram features, texture features were selected by the ICC, mRMR and LASSO algorithm to establish the Rad-score models. Then, the independent features acquired by univariate and multivariate logistic were integrated to develop the nomogram model. The predictive ability of the nomogram was evaluated with receiver operating characteristic (ROC) curves.

Results: Larger tumor size (>3 cm), nonsmooth margins, nodule-in-nodule, mosaic architecture and corona enhancement were indicated to be independent factors associated with MVI ($P<0.05$). After combining these significant MRI features, the MRI feature model for predicting MVI in HCC falling within the Milan criteria presented a sensitivity of 89.13%, a specificity of 66.67% and an AUC value of 0.85 (95% CI: 0.78-0.92) in the training group, and they were 80.00%, 73.33% and 0.85 (95% CI: 0.74-0.95) for the test group, respectively.

The six most valuable features associated with MVI were combined to construct the Rad-score model based on the following formula: $\text{Rad-score} = 0.30464 \times \text{Shape-MajorAxisLengthAP} + 0.04237 \times \text{Glcm-CorrelationAP} - 0.02774 \times \text{Glrlm-RunVarianceAP} - 0.04997 \times \text{Glszm-ZoneVarianceAP} + 0.13854 \times \text{Glszm-SmallAreaLowGrayLevelEmphasisPVP} + 0.19174 \times \text{Firstorder-SkewnessDP}$. The sensitivity, specificity and AUC value of the Rad-score model in predicting MVI were 80.43%, 73.91% and 0.82 (95% CI: 0.73-0.90) for the training group and 60.00%, 96.67% and 0.80 (95% CI: 0.67-0.93) for the test group, respectively.

After multivariate analysis, the retained independent predictors for MVI in HCC falling Milan criteria were related to larger size (OR=4.1, 95% CI: 1.3-12.9, $P=0.02$), nonsmooth margin (OR=4.4, 95% CI: 1.1-18.0, $P=0.04$), mosaic architecture (OR=3.2, 95% CI: 1.0-9.6, $P=0.04$), corona enhancement (OR=3.7, 95% CI: 1.1-12.2, $P=0.03$) and higher Rad-score (OR=10.2, 95% CI: 1.0-102.2, $P=0.04$). The nomogram presented improved AUC values of 0.87 (95% CI: 0.81-0.94) in the training group and 0.89 (95% CI: 0.81-0.98) in the test group ($P<0.05$) for predicting MVI. The calibration curves suggested that the predictive nomogram and the actual probability of MVI were well fitted in both the training and test groups. Additionally, the DCA results showed that the predictive nomogram curve was higher than the default lines for either all or none of the patients having MVI over all reasonable threshold probabilities.

Furthermore, the combined nomogram model demonstrated better performance than the MRI features and the Rad-score model for predicting MVI in HCC falling into the Milan criteria, with AUC values of 0.87 vs. 0.85 ($P=0.13$) for the nomogram compared with the MRI features and 0.87 vs. 0.82 ($P=0.02$) for the nomogram compared with the Rad-score model. However, no significant difference in the AUC value (0.85 vs. 0.82, $P=0.30$) was found in the comparison between the MRI features and the Rad-score model.

Conclusions: Larger tumor size, nonsmooth margins, mosaic architecture, corona enhancement and higher Rad-score were identified as effective imaging markers for preoperatively predicting MVI in patients with HCC falling into the Milan criteria. Moreover, the nomogram combining LI-RADS and radiomics features based on CEMRI demonstrated improved performance in predicting MVI, with high goodness-of-fit and clinical benefits, and this model may provide a noninvasive tool for predicting MVI and for guiding individualized treatment decision-making for HCC patients falling into the Milan criteria.

PO-1506

Machine learning-based CEMRI radiomics integrating LI-RADS features achieves optimal evaluation of hepatocellular carcinoma differentiation

Haifeng Liu, yang lu, qing wang, Yu-Jie Lu, Wei Xing
Third Affiliated Hospital of Soochow University

Purpose: As far as we know, there is a scarcity of developed models that combine ML-based CEMRI radiomics with LI-RADS features for evaluating HCC differentiation. The purpose of this study was to establish and compare the performance of contrast-enhanced magnetic resonance imaging (CEMRI)-based radiomics model using different machine learning (ML) classifiers for predicting hepatocellular carcinoma (HCC) differentiation and to validate the most effective model. Furthermore, an investigation was conducted to explore a combined model that incorporated both radiomics and Liver Imaging Reporting and Data System (LI-RADS) features.

Methods: A total of 251 patients with HCCs ($n = 262$) were assigned to a training ($n = 200$) cohort and a validation ($n = 62$) cohort. A collection of 5502 radiomics signatures were extracted from the CEMRI images for each HCC nodule. To reduce redundancy and dimensionality, spearman rank correlation, minimum redundancy maximum relevance (mRMR), and the least absolute shrinkage and selection operator (LASSO) approach were employed. Eight ML classifiers including the logistic regression (LR), support vector machine (SVM), K-nearest neighbor (KNN), random forest (RF), ExtraTrees, eXtreme Gradient Boosting (XGBoost), light gradient boosting machine (LightGBM) and multilayer perceptron (MLP)

were trained to obtain the best radiomics model. The performance of each model was evaluated based on the area under the receiver operating characteristic curve (AUC). The radiomics model was integrated with liver imaging reporting and data system (LI-RADS) features to design a combined model.

Results: The inter- and intrareader variability for radiomics signatures was 0.88(95%CI: 0.81-0.93) and 0.91(95%CI: 0.84-0.95), respectively. After removing redundant radiomic parameters with Spearman correlation coefficients greater than 0.90, a total of 305, 313, and 318 signatures were retained from AP, PVP, and DP, respectively. Upon applying mRMR and the LASSO approach for further dimension reduction and redundancy removal, a total of eighteen highly robust signatures were selected and retained to train the ML classifier models.

The AUCs of different ML classifiers in diagnosing pHCC ranged from 0.85 to 1.00 in the training cohort and from 0.73 to 0.88 in the validation cohort. Among the eight ML classifiers, the XGBoost model achieved the highest AUC (1.00) and accuracy (1.00), followed by Extratrees (AUC = 1.00, accuracy = 1.00), RF (AUC = 1.00, accuracy = 0.995), LightGBM (AUC = 0.96, accuracy = 0.86), SVM (AUC = 0.88, accuracy = 0.88), KNN (AUC = 0.89, accuracy = 0.80), MLP (AUC = 0.88, accuracy = 0.76), and LR (AUC = 0.85, accuracy = 0.78). The detailed information of various ML classifiers for diagnosing pHCC

Larger tumor size, nonsmooth margin, mosaic architecture, intratumoral blood products, and corona enhancement were identified as significant risk factors associated with pHCC. The LI-RADS model, which combines these five significant MRI features, demonstrated an accuracy of 0.72, sensitivity of 0.69, specificity of 0.73, and an AUC value of 0.77 (95% CI: 0.70-0.83) in the training cohort. In the validation cohort, the corresponding values were 0.68, 0.92, 0.60, and 0.82 (95% CI: 0.70-0.94)

The nomogram model that incorporated XGBoost-based Rad-signatures and significant MRI LI-RADS features demonstrated an AUCs value of 1.00 (95% CI: 0.99-1.00) and 0.86 (95% CI: 0.76-0.96), for evaluating pHCC in the training and validation cohorts, respectively, shown in (Figure. 4A-B).

The calibration curves indicated that three models (Radiomics, LI-RADS, nomogram) presented good agreement in both training and validation cohorts. Furthermore, the DCA results suggested that the nomogram model curve was higher than either "treat all" (pHCC, solid black line) or "treat

none" (npHCC, virtual black line) across a full range of reasonable threshold probabilities, suggesting that the nomogram model has improved clinical benefits in individualized clinical decision-making for HCC differentiation.

Conclusions: CEMRI radiomics integrating LI-RADS features demonstrated excellent performance in evaluating HCC differentiation, suggesting an optimal clinical decision tool for individualized diagnosis of HCC differentiation.

Discussion: In our study, we observed that the CEMRI-based radiomics model showed higher AUCs and accuracies compared to previous studies, indicating it was able to optimally predict HCC differentiation. We speculate that our research findings may be attributed to the following two factors: 1) A large number ($n=5502$) of quantitative radiomics signatures were extracted from the CEMRI images for each HCC nodule. Then, spearman rank correlation, LASSO, mRMR approaches were employed to select the most robust signatures for developing the radiomics model. This comprehensive selection process possibly contributed to the higher AUC. 2) Comparison of eight ML classifiers, including regression, classification, and clustering algorithms. These classifiers were used to establish the most effective radiomics model, addressing both linear and nonlinear classification problems. In contrast, most previous studies solely employed linear models, leading to lower accuracy. The inclusion of diverse ML classifiers in our study enhanced the accuracy for diagnosing HCC differentiation. Therefore, our study suggests that a larger number of extracted radiomics signatures, combined with a variety of ML classifiers, can improve the accuracy of diagnosing HCC differentiation, which is useful for advancing the current understanding of radiomics model with ML classifiers.

PO-1507

Association between renal surface nodularity and increased adverse vascular event risk in patients with arterial hypertension

Jiule Ding¹, Jie Chen¹, Dehui Xiang², Wei Xing¹

1. Department of Radiology, Third Affiliated Hospital of Soochow University

2. School of Electronics and Information Engineering, Soochow University, Suzhou, Jiangsu, China

Objective: To explore the association of renal surface nodularity (RSN) with the increased adverse vascular event (AVE) risk in patients with arterial hypertension. **Methods:** This cross-sectional study included patients with arterial hypertension aged 18–60 years who underwent contrasted computed tomography (CT) of kidney from January 2012 to December 2020. The subjects were classified into AVE or not (non-AVE) matched with age (≤ 5 years) and sex. Their CT images were analyzed using both qualitative (semiRSN) and quantitative RSN (qRSN) methods, respectively. Their clinical characteristics included age, sex, systolic blood pressure (SBP), diastolic blood pressure, hypertension course, diabetes history, hyperlipidemia, and estimated glomerular filtration rate (eGFR).

Results: Compared with non-AVE group ($n = 91$), AVE ($n = 91$) was at lower age, higher SBP, and fewer rate of diabetes and hyperlipidemia history (all $P < .01$). Rate of positive semiRSN was higher in AVE than non-AVE (49.45% vs 14.29%, $P < .001$). qRSN was larger in AVE than non-AVE [1.03 (0.85, 1.33) vs 0.86 (0.75, 1.03), $P < .001$]. The increased AVE was associated with semiRSN (odds ratio = 7.04, $P < .001$) and qRSN (odds ratio = 5.09, $P = .003$), respectively. For distinguishing AVE from non-AVE, the area under receiver operating characteristic was bigger in the models combining the clinical characteristics with either semiRSN or qRSN than that of semiRSN or qRSN alone ($P \leq .01$).

Conclusion: Among the patients with arterial hypertension aged 18–60 years, CT imaging-based RSN was associated with increased AVE risk.

PO-1508

Different treatment options for Primary vaginal malignant melanoma with abdominal multiple metastases: Two cases reports

Huogen Zhang, Yuguang You
First Affiliated Hospital of Gannan Medical College

Objective: Primary vaginal malignant melanoma is clinically rare and highly aggressive, and easy to spread to the surrounding lymph nodes and the occurrence of distant metastasis. The authors reported the two cases of primary vaginal malignant melanoma with abdominal multiple metastases. The treatment strategy for this disease changes as it develops. The treatment of high-risk patients is presently recommended radical surgery and supplemented by chemistry, radiation and immunotherapy. To explore the imaging findings of primary vaginal malignant melanoma with different abdominal viscera metastasis and the different treatments outcomes monitoring.

Methods: Retrospective analysis the clinical presentation, Magnetic resonance imaging (MRI) and other imaging findings of two cases pathologically confirmed primary vaginal malignant melanoma with different abdominal viscera metastasis. Then the MRI follow-up performance after the different treatment methods was analyzed.

Results: Both patients were elderly women, main clinical manifestations consist of postmenopausal vaginal bleeding and vaginal wall black mass. Abdomen MRI showed the two cases of primary vaginal malignant melanoma both were medium T1 signal, high diffusion weighted imaging signal, and under clear border, inhomogeneous obvious enhancement, and multiple enlarged lymph nodes were seen in the pelvic cavity and groin, and the enhancement scan showed uneven enhancement. Difference included that the right wall case is high T2 signal of MRI, and the abdomen MRI and Computed Tomography (CT) both showed liver parenchyma has multiple mass and ring enhancement, were both considered as more likely metastatic lesions. However, the vaginal front wall malignant melanoma is T2 hypointense, and the cystoscope showed the posterior wall of the bladder has multiple black nodules, which were considered for the metastatic nodules. About the treatment method, the right wall case adopted immunotherapy with toripalimab, MRI review after half a year showed the vaginal malignant melanoma was increased, and multiple metastases in the liver also increased number and increased range compared with the previous. But the front wall case performed Laparoscopic total vaginectomy and pelvic lymph node dissection and Removal repair of bladder nodules, and there was no obvious recurrence by MRI after surgery half a year. The two cases were both pathologically confirmed primary vaginal malignant melanoma, and multimodal imagings showed abdominal different viscera metastasis. Main clinical manifestations both consist of postmenopausal vaginal bleeding and vaginal wall black mass. A case of MRI and CT showed liver multiple metastatic nodules, and MRI review showed the vaginal malignant melanoma and liver multiple metastases increased after half year immunotherapy with toripalimab. Another case the cystoscope showed the bladder posterior wall has multiple metastatic nodules, and half year MRI showed no obvious recurrence by after Laparoscopic total vaginectomy and Removal repair of bladder nodules surgery.

Conclusion: Primary vaginal malignant melanoma has highly aggressive, high recurrence rate, which is more easily spread to regional lymph nodes and distant metastases. A variety of imaging tests can be used to make a more comprehensive assessment for range and severity of primary vaginal malignant melanoma with abdominal metastases, can also be applied to the prognosis monitoring of different therapeutic approaches.

PO-1509

Preliminary study of multi-parameter Spectral Detector Computer Tomography imaging in predicting lymphovascular space invasion in cervical cancer

Xinyan Sun, Yue Dong, Tao Yu, fengying Qin, Qing Yu
Department of Radiology, Liaoning Cancer Hospital and Institute

Objectives: To investigate the clinical value of spectral CT multi-parameter imaging in predicting lymphovascular space invasion (LVSI) in cervical carcinoma. **Methods:** 108 patients with cervical carcinoma proved by operation and pathology were divided into LVSI positive group (n = 50) and LVSI negative group (n = 58) according to pathological results. Spectral CT arteriovenous phase conventional energy images (CI), 40 to 200 KeV monoenergetic images (VMIs), and iodine density maps were analyzed by an imaging physician to obtain dual-phase CT values and iodine values of cervical cancer lesions and different background tissues, and lymph node metastasis status and tumor maximum diameter were assessed on VMI40Kev. Monoenergetic curve slope (K), normalized iodine concentration (NIC) were calculated. Univariate and multivariate logistic regression analysis was performed to determine the independent risk factors that can be used to assess LVSI status in spectral CT multiparametric image characteristics and clinical characteristics, and receiver operating characteristic (ROC) curves were used to assess the predictive efficacy of combining spectral multiparametric variables and clinical variable models for LVSI status in cervical cancer. **Results:** Squamous cell carcinoma antigen (SCC) and differentiation were obtained by univariate analysis. Lymph node metastasis status, tumor maximum diameter (MD), GTV, CI, 40Kev, 80Kev and 100Kev arterial phase CT value, K, arterial phase iodine value (IC (AP)) and arteriovenous phase standardized iodine value (NIC muscle (AP)) were correlated with LVSI status in cervical carcinoma ($P < 0.05$). Multivariate logistic regression analysis showed that differentiation, lymph node metastasis status, tumor maximum diameter, lesion CT40Kev (AP) value, IC (AP), and NIC muscle (AP) were independent risk factors for LVSI in cervical cancer patients ($P < 0.05$). The area under the curve (AUC), sensitivity, and specificity of the clinical prediction model (M1) were 0.671, 64.7%, and 61.4%, respectively; the AUC, sensitivity, and specificity of the clinical combined conventional image parameter prediction model (M2) were 0.717, 64.7%, and 63.2%, respectively; and the AUC, sensitivity, and specificity of the spectral multiparametric prediction model (M3) were 0.831, 80.4%, and 71.9%, respectively. DeLong's test showed that there was a significant difference in AUC values between M1 and M3 ($P = 0.0051$); no statistical difference between M2 and M3 ($P = 0.0408$). **Conclusion:** The clinical combined spectral CT multi-parameter model has a high diagnostic efficacy for predicting LVSI status in cervical cancer.

PO-1510

Study of the optimal monoenergetic images of cervical cancer on Dual-layer spectral detector Computed Tomography

Xinyan Sun, Yue Dong, Tao Yu, fengying Qin, huiting Pang, qing Yu, mingke Tian
Department of Radiology, Liaoning Cancer Hospital and Institute

Objective To investigate the optimal KeV level of virtual monoenergetic images (VMIs) of Dual-layer spectral detector Computed Tomography (dl-SDCT) for assessment cervical cancer (CC) lesions. **Materials and methods** 105 patients with CC underwent abdominal dl-SDCT and pelvic MR enhanced scan before treatment. One fellow analyzed conventional images (CIs) and 40~200KeV images of the arterial and venous phase, recorded the CT attenuation and standard

deviation (SD) for cervical lesions and background tissues, and calculated signal to noise ratio (SNR) and contrast to noise ratio (CNR). Subjective image analysis was performed by two radiologists independently who assessed lesion conspicuity and diagnostic confidence in staging on 5-point scales for conventional and VMI40KeV reconstructions images. The differences of parameters and subjective scores between VMIs and CIs were compared. Results The CT, SNR, CNRuterine body and CNRvaginal values of VMI40KeV were the highest in the arterial and venous phase, which were significantly higher than those low monoenergetic levels and CIs ($P < 0.05$). The SNR values in the venous phase were higher than those in the arterial phase regardless of CI or VMI40KeV~VMI80KeV images ($P < 0.05$). For the CNRuterine body, the arterial phase was higher than that in the venous phase regardless of CI or VMI40KeV~VMI100KeV images ($P < 0.05$). For the CNRvaginal, the arterial phase was higher than that in the venous phase regardless of CI or VMI40KeV~VMI70KeV ($P < 0.05$). In the arterial and venous phase, the Kappa scores of the two radiologists on CI-A、CI-V、VMI40KeV-A、VMI40KeV -V images were 0.77, 0.77, 0.84, 0.80, respectively, and the score on VMI40KeV images were higher than that on CIs ($P < 0.05$). Conclusion Compared with CIs and other VMIs, VMI40KeV showed the optimal SNR and CNR, improving the objective image quality and subjective performance of CC lesions.

Value of Gd-EOB-DTPA-Enhanced MRI and Diffusion-Weighted Imaging in Detecting Residual Hepatocellular Carcinoma After Drug-Eluting Bead Transarterial Chemoembolization

Haifeng Liu¹, yong-sheng xu², hao Liu², Kuan-Yu Che³, Ye Sheng¹, Jiu-Le Ding¹, Jing-Gang Zhang¹, Jun-Qiang Lei², Wei Xing¹

1. Radiology Department, The Third Affiliated hospital of Soochow University

2. First hospital of Lanzhou University,

3. Lanzhou First People's Hospital

Objectives: To investigate the value of gadolinium ethoxybenzyl diethylenetriamine pentaacetic acid (Gd-EOB-DTPA)-enhanced magnetic resonance imaging (MRI) and diffusion-weighted imaging (DWI) in diagnosing residual hepatocellular carcinoma (HCC) after drug-eluting bead transarterial chemoembolization (DEB-TACE). **Materials and Methods:** Sixty-two patients (50 men, 12 women; mean age, 56.8 ± 1.4 years) with 74 HCCs who underwent Gd-EOBDTPA-enhanced MRI and DWI in 1-2 month intervals after DEB-TACE were retrospectively studied. Imaging features derived from GdEOB-DTPA-enhanced MRI and DWI were analyzed and compared between residual HCCs and necrotic tumors. The sensitivity and specificity of Gd-EOB-DTPA-enhanced MRI and DWI with quantitative apparent diffusion coefficient (ADC) values in diagnosing residual HCCs were calculated and compared, based on the reference standard of pathology and/or angiography. **Results:** Thirty-three residual HCCs and 41 necrotic tumors were diagnosed. Residual HCCs presented characteristics of arterial hypervascularity (90.91%) and DWI hyperintensity (78.78%), which were of importance in differentiating necrotic tumors ($p < 0.05$). DWI showed lower sensitivity (78.79% vs. 96.97%, $p < 0.001$) and specificity (78.05% vs. 100%, $p < 0.001$) than Gd-EOB-DTPA-enhanced MRI in diagnosing residual HCCs after DEB-TACE. Residual HCCs had a significantly higher mean ADC value than necrotic tumors ($1.30 \pm 0.32 \times 10^{-3} \text{ mm}^2/\text{s}$ vs. $1.55 \pm 0.50 \times 10^{-3} \text{ mm}^2/\text{s}$, $p < 0.001$). Receiver operating characteristic curve analysis for identifying residual HCCs demonstrated that the threshold ADC value of $1.25 \times 10^{-3} \text{ mm}^2/\text{s}$ had 84.85% sensitivity and 87.80% specificity. **Conclusion:** Gd-EOB-DTPA-enhanced MRI is superior to DWI in diagnosing residual HCCs after DEB-TACE, and arterial hypervascularity and DWI hyperintensity are important imaging features in distinguishing residual HCCs from necrotic tumors.

PO-1512

Dynamic contrast-enhanced MRI with Gd-EOB-DTPA for the quantitative assessment of early-stage liver fibrosis induced by carbon tetrachloride in rabbits

Haifeng Liu¹, Qing Wang¹, Ya-Nan Du¹, Zu-Hui Zhu¹, Yu-Feng Li¹, Li-Qiu Zou², Wei Xing¹

1. The third affiliated hospital of Lanzhou University

2. The Sixth Affiliated Hospital of Shenzhen University Health Science Center

Purpose: To explore quantitative parameters obtained by dynamic contrast-enhanced magnetic resonance imaging (DCE MRI) with Gd-EOB-DTPA in discriminating early-stage liver fibrosis (LF) in a rabbit model. **Materials and methods:** LF was established in 60 rabbits by the injection of 50% CCl₄ oil solution, whereas 30 rabbits served as the control group. All rabbits underwent pathological examination to determine the LF stage using the METAVIR classification system. DCE MRI was performed, and quantitative parameters, including K_{trans}, K_{ep}, V_e, V_p and R_e were measured and evaluated among the different LF stages using spearman correlation coefficients and receiver operating characteristic curve. **Results:** In all, 24, 25, and 22 rabbits had stage F0, stage F1, and stage F2 LF, respectively. K_{trans} ($r = 0.803$) increased, and K_{ep} ($r = -0.495$) and R_e ($r = -0.701$) decreased with LF stage progression ($P < 0.001$), while no significant correlation was found for V_e or V_p. K_{trans} and R_e were significantly different between all LF stage pairs compared (F0 vs. F1, F0 vs. F2, F1 vs. F2, F0 vs. F1-F2, $P < 0.05$). With the exception of F0 vs. F1, K_{ep} differed significantly between stages ($P < 0.05$). The AUC of K_{trans} was higher than that of other quantitative parameters, with an AUC of 0.92, 0.99, 0.94 and 0.92 for staging F0 vs. F1, F0 vs. F2, F1 vs. F2, and F0 vs. F1-F2, respectively. **Conclusion:** Among quantitative parameters of Gd-EOB-DTPA DCE MRI, K_{trans} was the best predictor for quantitatively differentiating early-stage LF.

PO-1513

Preoperative multiphase liver MRI for predicting early recurrence of single hepatocellular carcinoma after curative resection

Liping Zuo, Jinlei Fan, Dexin Yu

Department of Radiology, Qilu Hospital of Shandong University

Abstract:

PURPOSE

To investigate whether preoperative contrast-enhanced multiphase MRI can help identify early recurrence in patients with single hepatocellular carcinoma (HCC) after curative resection.

METHODS

This retrospective study included patients with single HCC treated with surgical resection between January 2015 and February 2019 who underwent preoperative multiphase liver MRI. Clinical, biologic, and imaging features associated with early recurrence (within 2 years) were identified and analyzed. Multivariable Cox regression analysis was performed to determine predictors of early recurrence. Early recurrence and overall recurrence were evaluated by using Kaplan-Meier analysis.

RESULTS

In multivariable cox analysis, peritumoral arterial phase hyperenhancement (odds ratio = 1.3; 95% confidence interval [CI] = 0.9, 2.1; $P=0.044$) and non-smooth tumor margin (odds ratio = 1.5; 95% CI = 0.8, 2.6; $P=0.027$) were independent significant variables associated with early recurrence in

MRI findings. Clinicopathologic characteristics presenting as microvascular invasion (odds ratio = 1.6; 95% CI= 1.1, 2.6; P=0.019) and satellite nodules (odds ratio = 1.8; 95% CI= 1.1, 3.1; P=0.006) also were independent predicting factors with early recurrence.

CONCLUSION

Presence of peritumoral arterial phase hyperenhancement, and non-smooth tumor margin in contrast-enhanced multiphase MRI and microvascular invasion and satellite nodules in pathological characteristics help to predict early recurrence of single HCC after curative resection.

PO-1514

Early tumor shrinkage as a predictor of survival in patients with advanced esophageal squamous cell carcinoma treated with first-line checkpoint inhibitors

Yue Zhou, Jianbo Gao

The first affiliated hospital of Zhengzhou university

Purpose: Early tumor shrinkage (ETS) is a promising parameter for assessing treatment responses. Our study hypothesized that an ETS with an optimal cut-off value was an imaging biomarker for advanced esophageal squamous cell carcinoma (ESCC) treated with first-line immunotherapy.

Methods: We retrospectively enrolled 129 patients with unresectable locally advanced ESCC treated with first-line immunotherapy between 2019 and 2021. ETS was defined as the relative change in the sum of the target lesions' longest diameters at the first evaluation compared with that at baseline. Multivariate analyses were conducted to identify the significant prognostic variables in progression-free survival (PFS) and overall survival (OS).

Results: The median value of ETS was 29.5%. An ETS with a 10% cut-off value was statistically significantly associated with PFS in the univariate analysis (hazard ratio [HR]: 2.26; 95% confidence interval [95% CI]: 1.21-4.24; $p = 0.009$). Besides, in the univariate analysis, the longest diameter, maximum short diameter, central necrosis on enhanced computed tomography, enhanced pattern, and ETS values were statistically significant predictive factors for OS. In the multivariate analysis, ETS with a 10% cut-off value was an independent predictive factor for OS (HR: 3.14; 95% CI: 1.45-6.83; $p = 0.004$).

Conclusion: ETS is associated with survival outcomes in patients with advanced ESCC treated with immunotherapy. Early tumor size shrinkage of at least 10% can be regarded as a promising biomarker predictor for PFS and OS. ETS supports clinical decisions by identifying patients who can benefit from immunotherapy.

PO-1515

Multi-slice spiral CT study on the anatomical variation of the left renal vein

Lu Wang,cheng cheng
Department of Radiology, Daping Hospital, Army Medical University

Background: To investigate the diagnostic value of multi-slice spiral computed tomography (MSCT) in the anatomical variation of left renal vein (LRV).

Materials and Methods: The clinical and imaging data of 96 patients with LRV variation in our hospital from June 2019 to December 2022 were retrospectively analyzed, and the imaging manifestations, classification, and clinical significance were discussed in combination with the literature.

Results: Among the 96 patients with LRV variation, 30 patients (30/96, 31.25%) were type I (annular aortic type), including 20 cases of type IA, 7 cases of type IB, and 3 cases of type IC. A total of 17 cases (17/96, 17.71%) were type II (complete retroaortic type), with 15 cases were type IIA and 2 cases were type IIB. There were 52 cases (52/96, 54.17%) of type III (abnormal reflux type), with 32 cases of type IIIA and 20 cases of type IIIB. There were 15 cases (15/96, 15.63%) of type IV (delayed confluence type). Taken together, 18 of the 96 patients (18/96, 18.75%) had both types of variants, including 10 cases with other types of variants accompanied by delayed confluence of the LRV, and 5 cases with other types of variants combined with abnormal reflux.

Conclusion: Fully understanding the anatomical variation of renal vein before operation is of great guiding significance for the selection of renal transplant donors, and helps to formulate the best renal surgery plan, guide the correct treatment of renal vein before operation, avoid renal vein tear, bleeding, miscut and misligation, and reduce surgical complications.

PO-1516

The Value of Combined Clinical-Radiomics-Deep Learning Model for Diagnosis of Clinically Significant Prostate Cancer

Xiaomeng Qiao,Jie Bao,Ximing Wang
The First Affiliated Hospital of Soochow University

Objective: To investigate the diagnostic performance of deep learning model and radiomics model for clinically significant prostate cancer (csPCa), and to establish a mixed model that combines clinical features, radiomics, and deep learning.

Methods: A total of 885 patients with prostate diseases who underwent 3.0 T MRI examination and confirmed by pathology from January 2015 to March 2022 at the First Affiliated Hospital of Soochow University were collected retrospectively. Among them, 531 cases were diagnosed with csPCa, 99 cases were clinically insignificant prostate cancer (ciPCa), and 255 cases were benign lesions. The data were randomly divided into training cohort (n=708) and testing cohort (n=177) at a ratio of 7:3. The radiomics model was built using support vector machine, the deep learning model was constructed using DenseNet, and the mixed model (DR model) was established by combining deep learning and radiomics with logistic regression. Clinical features including prostate-specific antigen (PSA) and Prostate Imaging Reporting and Data System (PI-RADS) score by experienced radiologists were included to establish a clinical-radiomics-deep learning combined model (DRC model). The diagnostic performance of the models and clinical features was evaluated using receiver operating characteristic (ROC) curves, and the areas under the curves (AUCs) was compared using the Delong test. The clinical utility of the models and clinical features was also assessed using Decision curve analysis.

Results: In the test group, the AUCs of radiomics model and deep learning model were 0.88 and 0.86, respectively, with no statistically significant differences between them ($P = 0.6$). Moreover, there were no statistical differences between their AUCs and that of PI-RADS (AUC=0.87) ($P = 0.62, 0.97$). The AUC of DR model was 0.88, which was higher than that of deep learning model ($P = 0.002$), but showed no statistical difference compared to those of radiomics model and PI-RADS ($P = 0.89, 0.59$). The AUC, sensitivity and specificity of DRC model were 0.92, 83% and 87%, respectively. The AUC of DRC model was higher than those of the radiomics model, deep learning model, DR model and PI-RADS (all $P < 0.05$), and the specificity of DRC model was significantly improved compared to PI-RADS (54%) ($P < 0.001$). The decision curve analysis showed that the DRC model achieved a superior net benefit, outperforming PI-RADS.

Conclusion: The diagnostic performance of the radiomics model and the deep learning model is equivalent for csPCa, which is comparable to that of experienced radiologists. The combined clinical-radiomics-deep learning model has highest diagnostic performance for csPCa and is superior to experienced radiologists, which can help reduce unnecessary biopsies.

PO-1517

Prediction of Fuhrman nuclear grade for clear cell renal carcinoma by a multi-information fusion model that incorporates CT-based features of tumor and serum tumor associated material

yumei zhang, hao guo, zehua sun, chenchen wang, heng ma
Yantai Yuhuangding Hospital

Purpose Prediction of Fuhrman nuclear grade is crucial for making informed herapeutic decision in clear cell renal cell carcinoma (ccRCC). The current study aimed to develop a multi-information fusion model utilizing computed tomography (CT)-based features of tumor and preoperative biochemical parameters to predict the Fuhrman nuclear grade of ccRCC in a non-invasive manner.

methods 218 ccRCC patients confirmed by histopathology were retrospectively analyzed. Univariate and multivariate logistic regression analyses were performed to identify independent predictors and establish a model for predicting the Fuhrman grade in ccRCC. The predictive performance of the model was evaluated using receiver operating characteristic (ROC) curves, calibration, the 10-folds cross-validation method, bootstrapping, the Hosmer-Lemeshow test, and decision curve analysis (DCA).

Results R.E.N.A.L. Nephrometry Score (RNS) and serum tumor associated material (TAM) were identified as independent predictors for Fuhrman grade of ccRCC through multivariate logistic regression. The areas under the ROC curve (AUC) for the multi-information fusion model composed of the above two factors was 0.810, higher than that of the RNS (AUC, 0.694) or TAM (AUC, 0.764) alone. The calibration curve and Hosmer-Lemeshow test showed the integrated model had a good fitting degree. The 10-folds cross-validation method (AUC, 0.806) and bootstrap test (AUC, 0.811) showed the good stability of the model. DCA demonstrated that the model had superior clinical utility.

Conclusion A multi-information fusion model based on CT features of tumor and routine biochemical indicators, can predict the Fuhrman grade of ccRCC using a non-invasive approach. This model holds promise for assisting clinicians in devising personalized management strategies.

PO-1518

Fast non-Gaussian diffusion-weighted imaging with deep learning-based reconstruction in locally advanced esophagogastric junction adenocarcinoma: image quality assessment and prediction of microsatellite instability status

Yongjian Zhu, Peng Wang, Liming Jiang, Xinming Zhao

Department of Imaging Diagnosis, Cancer Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College, Beijing China, 100021

Purpose Deep learning-based reconstruction (DLR) can potentially improve image quality and reduce acquisition time. Microsatellite instability (MSI) esophagogastric junction adenocarcinoma (EGA) is a special molecular phenotype with substantial therapeutic and prognostic significance. We aim to assess the image quality and investigate the feasibility of fast non-Gaussian diffusion-weighted imaging (DWI) with DLR for predicting MSI status in EGA in comparison with conventional reconstruction (CR).

Method Between November 2022 to August 2023, a total of 53 patients with locally advanced EGA were enrolled in this study. Non-Gaussian DWI were acquired by using the standard CR and DLR with a reduced number of excitations, both of which consist of thirteen b-values (0–1500 s/mm²). Image quality of DLR was qualitatively and quantitatively evaluated compared with CR. Six diffusion metrics were extracted from conventional DWI, intravoxel incoherent motion (IVIM) model, and diffusion kurtosis (DK) model. These parameters were compared between two acquisition sequences. The predictive efficacy of various diffusion metrics for predicting MSI status in EGA were analyzed by receiver operating characteristic curves.

Results The mean acquisition time for the DLR (116.25 ± 29.23 sec) was significantly shorter ($p < 0.001$) than for CR (266.48 ± 45.82 sec). DLR showed significant higher image quality than CR in both subjective and objective evaluations in all b value images, but no significant differences were found regarding diffusion parameters. True diffusion coefficient (D), perfusion fraction (f), mean diffusivity (MD), and mean kurtosis (MK) showed significantly different between different MSI status. The combination model of D and MK demonstrated the best predictive efficacy for MSI status in EGA with the highest AUC of 0.933. The DLR-based model showed comparable predictive performance with CR-based model ($p > 0.05$).

Conclusion DLR-based non-Gaussian DWI provides feasible technique with improved image quality and reduced acquisition time for routine clinical use. The DLR-based non-Gaussian DWI of IVIM and DKI model may serve as potential tool for noninvasive prediction of MSI status in EGA patients.

PO-1519

A Radiomics Differentiation Model of “rich blood supply like” Pancreatic Ductal Adenocarcinoma Based on MRI

Jiaping Zhou, Risheng Yu

Department of Radiology, Second Affiliated Hospital, School of Medicine, Zhejiang University

Objectives: Construct radiomics-clinical model for a differential diagnosis of “rich blood supply like” pancreatic ductal adenocarcinoma (rPDAC) from focal-mass chronic pancreatitis (MFCP).

Methods: The magnetic resonance images of 38 MFCP patients and 35 PDAC patients containing three non-enhanced sequences and four enhanced sequences were acquired, and 883 radiomics features were extracted from each phasic imaging to build radiomics models using SVM. The single

sequence and multi-sequence image radiomics models were established and then combined with clinical features to obtain the radiomics-clinical model.

Results: The generated radiomics model resulted in an accuracy of 64% in test and 71% in the all the dataset. The model has demonstrated 79% sensitivity and 81% specificity in train dataset. The tumor classifier generated a F1-score of 0.73 for all dataset. AUC of the generated model 0.86 and 0.65 for training and test set, respectively. Radiomics-clinical model performed similar with the multi-sequence radiomics model showed improvement than simple clinical model measuring as 0.86 of AUC for training cohort and 0.65 of AUC for the test cohort.

Conclusions: Radiomics is helpful for a differential diagnosis between MFCP and rbPDAC in clinical practice as a noninvasive and quantitative method

PO-1520

Quantitative differentiation of non-invasive bladder urothelial carcinoma and inverted papilloma based on CT urography

Pengfei Jin,Xu Wang
Zhejiang Cancer Hospital

Purpose: To investigate the value of CT urography (CTU) indicators in the quantitative differential diagnosis of bladder urothelial carcinoma (BUC) and inverted papilloma of the bladder (IPB).

Material and methods: Retrospective analysis of clinical and imaging data of 103 patients who underwent CTU prior to transurethral resection of the bladder tumor or radical cystectomy from January 2019 to December 2022. The imaging data included 6 qualitative indicators and 7 quantitative measures. The recorded clinical information and imaging features were subjected to univariate and multivariate logistic regression analysis to find independent risk factors for BUC, and a combined multi-indicator prediction model was constructed, and the prediction model was visualized using nomogram. ROC curve analysis was used to calculate and compare the predictive efficacy of independent risk factors and nomogram.

Results: Junction smoothness, maximum longitudinal diameter, tumor-wall interface and arterial reinforcement rate were independent risk factors for distinguishing BUC from IPB. The AUC of the combined model was 0.934 (sensitivity = 0.808, specificity = 0.920, accuracy = 0.835), and its diagnostic efficiency was higher than that of junction smoothness (AUC=0.667, sensitivity = 0.654, specificity = 0.680, accuracy = 0.660), maximum longitudinal diameter (AUC=0.757, sensitivity = 0.833, specificity = 0.604, accuracy = 0.786), tumor-wall interface (AUC=0.888, sensitivity = 0.755, specificity = 0.808, accuracy = 0.816) and Arterial reinforcement rate (AUC=0.786, sensitivity = 0.936, specificity = 0.640, accuracy = 0.864).

Conclusion: Above qualitative and quantitative indicators based on CTU and the combination of them may be helpful to the differential diagnosis of BUC and IPB, thus better assisting in clinical decision-making.

PO-1521

Correlation between CT-Based Adipose Variables and Short-Term Postoperative Complications in Clear Cell Renal Cell Carcinoma

Zehua Sun¹, Yumei Zhang¹, Yuanhao Xia^{1,2}, Hao Guo¹, Heng Ma¹

1. Yantai Yuhuangding Hospital

2. School of Medical Imaging, Binzhou Medical University, Yantai, China

Purpose: The intricate relationship between clear cell renal cell carcinoma (ccRCC), inflammation, and adipose tissue has yielded inconsistent findings. This study aimed to identify non-linearly correlated variables related to short-term complications in ccRCC, enhancing preoperative risk stratification.

Materials and Methods: A retrospective analysis of 218 ccRCC patients (January 2014 to November 2021) stratified by short-term postoperative complications was conducted. Abdominal and perirenal fat variables were assessed via preoperative CT images, alongside collecting inflammatory, adipose-related, and renal function indexes from the latest preoperative evaluation. The generalized sum model was used to identify cut-off intervals for nonlinear variables.

Results: Patients without complications demonstrated higher Mayo Adhesion Probability Score (MAPS), visceral fat area (VFA), and the visceral fat area to total fat area ratio (VFA/TFA). Patients with complications exhibited elevated subcutaneous fat area (SFA) and glomerular filtration rate (GFR). Indices exhibiting non-linear correlations with postoperative complications included total fat area (TFA), VFA, perirenal fat volume (PFV), and lymphocytes. Specific intervals revealed negative correlations with short-term postoperative complications: VFA ($>81.03 \text{ cm}^2$), PFV ($95.20\text{-}365.04 \text{ cm}^3$), and lymphocytes ($<2.08 \times 10^9/\text{L}$).

Conclusion: Preoperative VFA, PFV and lymphocytes are nonlinearly related to short-term postoperative complications in ccRCC patients. These intervals can aid in the risk stratification of ccRCC patients before surgery, allowing for more personalized treatment planning made.

PO-1522

Estimating Vessels Encapsulating Tumor Clusters in Hepatocellular Carcinoma at Pretreatment CT: Prognostic Impact for Outcomes after Transarterial Chemoembolization

Yixuan Guo, Fang-Ming Chen

Wuxi No.2 People's Hospital

Background and purpose: Vessels encapsulating tumor clusters (VETC) pattern in hepatocellular carcinoma (HCC) may have implications for outcomes after transarterial chemoembolization (TACE). This study aimed to develop and validate a predictive model for estimating VETC pattern using CT imaging features and to compare outcomes between predicted VETC-positive and VETC-negative HCCs after TACE according to the proposed model.

Methods: Patients undergoing liver resection or TACE for HCC from January 2014 to June 2020 were identified from a prospectively maintained bicentric database. A CT-based predictive model for estimating VETC pattern in HCC was developed and validated using two independent sets ($n = 360$ and 255) that underwent resection. Diagnostic performance was calculated for the model. Subsequently, patients in the TACE cohort ($n=120$) were stratified into groups with predicted VETC-positive or VETC-negative HCCs according to the model. The primary outcome was overall survival

(OS), and the secondary outcomes were tumor response rate. These were compared between the two groups with use of the χ^2 test and the log-rank test.

Results: The proposed model for VETC pattern, named the VETC score, incorporated presence of heterogeneous enhancement with septations or with irregular ring-like structures, presence of necrosis and hypovascular enhancement proportion $\geq 20\%$. The area under the receiver operating characteristic curve for the VETC score was 0.844 for training and 0.834 for validation. According to the VETC score, patients with predicted VETC-positive HCCs ($n = 35$) had lower tumor response rate (34.8% vs 65.5%; $P = 0.027$) and worse OS (17.0 months vs 29.5 months; $P < .001$) than those with VETC-negative HCCs ($n = 85$).

Conclusion: The proposed model demonstrated good performance for estimating VETC pattern in HCC. According to the VETC score, patients with predicted VETC-positive HCCs have worse therapeutic outcomes than those with predicted VETC-negative HCCs after TACE.

PO-1523

Predicting Microvascular Invasion in Hepatocellular Carcinoma Using an CT and MRI-Based Multimodality Deep Learning Model

Yan Lei
Jiangmen Central Hospital

Purpose: To investigate the value of multimodality deep learning (MDL) model based on CT and MRI for predicting microvascular invasion (MVI) in hepatocellular carcinoma (HCC).

Methods and Materials: Two hundred and eighty-seven patients with HCC from our institution and 58 patients from an external institution from January 2008 to May 2022 were collected. Of these, 119 with only CT images and 116 with only MRI images were selected for training the single-modality models. And then, a multi-modality CT and MRI-based deep learning (MDL) model was developed, incorporating the parameters obtained from the single-modality models by using transfer learning (TL). We input the robust convolutional features extracted from DenseNet121 into extreme learning machine (ELM) classifier to build a classification model. In addition, 110 patients with both CT and MRI images were divided into training cohort ($n=66$) and validation cohort ($n=44$) to train and validate the performance of MDL models. The area under the receiver operating characteristic curve (AUC) was used to evaluate the models' performance.

Results: The AUC of MDL model is of 0.844, which outperformed single-phase CT (AUC = 0.706 to 0.776), single-parameter MRI (AUC = 0.706 to 0.717), single-modality fusion DL model (AUCCT fusion = 0.722, AUCMRI fusion = 0.731), clinical model (AUC = 0.574 to 0.651) and radiological model (AUC = 0.701 to 0.772). When combined with clinical features in a nomogram model, the AUC of MDL model statistically increased from 0.844 to 0.871, resulting in an overall net gain greater than single- or multi-phase CT, single- or multi-parameter MRI, and clinical model.

Conclusions: The MDL model based on CT and MRI images is a valuable noninvasive technique for preoperatively predicting MVI of HCC, and TL technique based on a large number of single modality images may be a potential approach for further improving the performance of MDL model.

PO-1524

Predictive value of computed tomography imaging features in Vessels that encapsulate tumor clusters pattern of HCCYumeng Zhao^{1,2}, shuagnshuang Xie², jiaming Qin^{1,2}, xiaotian Li^{1,2}, cheng Zhang², caixin Qiu², wen Shen²

1. Nankai University

2. Tianjin First Center Hospital

Objectives: To investigate the non-invasive prediction of VETC-HCC based on imaging features of contrast-enhanced computed tomography (CE-CT).

Methods: Total 241 HCC patients who underwent CE-CT and immunohistochemical staining for CD34 were retrospectively evaluated between January 2014 and November 2022. In chronological order, 241 HCC patients were divided in chronological order: training (n=169) and validation (n=72) cohorts. Univariate and multivariate analyses identified independent factors for differentiating VETC-HCCs from non-VETC-HCCs. A nomogram and scoring model were developed to assess the probability of VETC-HCC. ROC analysis was employed to assess the efficacy of the two cohorts, while decision curve analysis was utilized to assess the clinical utility of the nomogram.

Results: Tumor size >5 cm (P= 0.030), intratumoral necrosis (P=0.038), and non-smooth margins (P=0.011) were independent predictors of VETC-HCC. Area under the ROC curve of the logistic regression coefficient-based nomogram in the training and validation cohorts were 0.768 and 0.742, respectively. These features were used to construct an SNM model (where S is size, N is necrosis, and M is margin), demonstrating similar predictive capabilities in the training and validation cohorts. Preoperative high SNM phenotype (P<0.001) and VETC-HCC (P=0.028) were linked to early recurrence following surgical resection.

Conclusion: Preoperative CE-CT features and predictive models are applicable for delineating VETC-HCC and have prognostic significance in predicting early recurrence.

PO-1525

Added value of CE-CT radiomics to predict high Ki-67 expression in hepatocellular carcinomaYumeng Zhao^{1,2}, shuangshuang Xie², jiaming Qin^{1,2}, xiaotian Li^{1,2}, caixin Qiu², wen Shen²

1. Nankai University

2. Tianjin First Center Hospital

Background: This study aimed to develop a computed tomography (CT) model to predict Ki-67 expression in hepatocellular carcinoma (HCC) and to examine the added value of radiomics to clinico-radiological features. **Methods:** A total of 208 patients (training set, n = 120; internal test set, n = 51; external validation set, n = 37) with pathologically confirmed HCC who underwent contrast-enhanced CT (CE-CT) within 1 month before surgery were retrospectively included from January 2014 to September 2021. Radiomics features were extracted and selected from three phases of CE-CT images, least absolute shrinkage and selection operator regression (LASSO) was used to select features, and the rad-score was calculated. CE-CT imaging and clinical features were selected using univariate and multivariate analyses, respectively. Three prediction models, including clinic-radiologic model (CR), rad-score model (R), and clinic-radiologic-radiomic (CRR) model, were developed and validated using logistic regression analysis. The performance of different models for predicting Ki-67 expression was evaluated using the area under the receiver operating characteristic curve (AUROC) and decision curve analysis (DCA). **Results:** HCCs with high Ki-67 expression were more likely to have high serum α -fetoprotein levels (P= 0.041, odds ratio [OR] 2.54, 95% confidence interval [CI]: 1.04–6.21), non-rim arterial phase hyperenhancement (P = 0.001, OR 15.13, 95% CI 2.87–79.76), portal vein tumor thrombus (P = 0.035, OR 3.19, 95% CI: 1.08–9.37), and two-trait predictor of venous invasion (P = 0.026, OR

14.04, 95% CI: 1.39–144.32). The CR model achieved relatively good and stable performance compared with the R model (AUC, 0.805 [95% CI: 0.683–0.926] vs. 0.678 [95% CI: 0.536–0.839], $P = 0.211$; and 0.805 [95% CI: 0.657–0.953] vs. 0.667 [95% CI: 0.495–0.839], $P = 0.135$) in the internal and external validation sets. After combining the CR model with the R model, the AUC of the CRR model increased to 0.903 (95% CI: 0.849–0.956) in the training set, which was significantly higher than that of the CR model ($P = 0.0148$). However, no significant differences were found between the CRR and CR models in the internal and external validation sets ($P = 0.264$ and $P = 0.084$, respectively). **Conclusions:** Preoperative models based on clinical and CE-CT imaging features can be used to predict HCC with high Ki-67 expression accurately. However, radiomics cannot provide added value.

PO-1526

Development of a radiomics-based model to predict occult liver metastases of pancreatic ductal adenocarcinoma: a multicenter study

Ben Zhao, Shenghong Ju
Zhongda Hospital Affiliated Southeast University

Background: Undetectable occult liver metastases are a blockade to the long-term survival of pancreatic ductal adenocarcinoma (PDAC). This study aimed to develop a radiomics-based model to predict occult liver metastases and assess its ability to predict survival.

Materials and Methods: Patients who underwent surgical resection and were pathologically proved to have PDAC were recruited retrospectively at five tertiary hospitals between January 2015 and December 2020. Radiomics features were extracted from tumors, and the radiomics-based model was developed in the training cohort using LASSO-logistic regression. The model's performance in the internal and external validation cohorts was assessed using the area under the receiver operating curve (AUC). The association of the model's risk stratification with progression-free survival (PFS) and overall survival (OS) was then statistically examined using Cox regression analysis and the log-rank test.

Results: A total of 438 patients (mean [SD] age, 62.0 [10.0] years; 255 [58.2%] male) were divided into the training cohort ($n = 235$), internal validation cohort ($n = 100$), and external validation cohort ($n = 103$). The radiomics-based model yielded an AUC of 0.73 (95% CI: 0.66–0.80), 0.72 (95% CI: 0.62–0.80), and 0.71 (95% CI: 0.61–0.80) in the training cohort, internal validation cohort, and external validation cohort, respectively, higher than the preoperative clinical model. The model's risk stratification was an independent predictor of PFS (all $P < 0.05$) and OS (all $P < 0.05$). Furthermore, the model also demonstrated the added value to the prognostic stratification of TNM staging systems.

Conclusion: The radiomics-based model provided a promising tool to predict occult liver metastases and retained its prognostic significance.

PO-1527

Correlation between quantitative multi-parameters of energy-spectrum CT and short-term prognosis of acute-on-chronic liver failure

Yuan Xu, Jianli Liu, Junlin Zhou
Lanzhou University Second Hospital

Objective: Analyzing the correlation between clinical features and quantitative multiparametric imaging (conventional and energy-spectral CT) and the prognosis of acute-on-chronic liver failure (ACLF). A comprehensive prediction model for the progression of ACLF was further constructed, and explore the value of applying the model and draw a nomogram to assist in clinical decision making.

Materials and Method: Retrospective collection of ACLF cases between June 2019 and June 2022, ACLF was diagnosed in accordance with the Asia-Pacific Association for the Study of the Liver guidelines, and all patients underwent liver energy-spectrum CT scans within one week before and after the diagnosis of ACLF. Patients were grouped (stable and progressive groups) according to whether disease progression (deterioration, death, or liver transplantation) within 90 days of the diagnosis of ACLF. Independent risk factors associated with disease progression in clinical characteristics and quantitative imaging parameters were identified by logistic regression analysis, and further construct the prediction model and compared with clinical scores. The effectiveness of the model was evaluated by applying the area under the receiver operating characteristic (ROC) curve (AUC), C-index, calibration curve, and decision curve (DCA).

Results: A total of 107 patients were included, with 44 cases in the stable group. Multifactorial logistic regression analysis showed that the clinical characteristics of BUN (OR=1.774, 95% CI: 1.617-1.971; P=0.027) and the quantitative imaging parameters of VCR (OR=0.003, 95% CI: 0.001-0.087; P=0.010), IC-VP (OR=0.820, 95% CI: 0.728-0.924; P=0.001) and NIC-VP (OR=0.002, 95% CI: 0.001-0.026; P=0.004) were independent risk factors for 90-day disease progression in patients with ACLF, and a comprehensive prediction model-nomogram was developed based on the results of regression analysis. The ROC curve showed the highest predictive accuracy of the nomogram with an AUC of 0.893, sensitivity of 84.13%, and specificity of 84.09%, both higher than the clinical model (MELD and MELD-Na scores). The C-index and corrected C-index of the Nomogram were 0.893 (95% CI: 0.833-0.953) and 0.876, respectively, showing good model discrimination. The calibration curves show good agreement between predicted and actual risks. The DCA indicates that the model has good clinical application.

The model combined BUN, VCR, IC-VP and NIC-VP can predict early disease progression within 90 days in patients with ACLF. The nomogram derived from this study allows the assessment and risk stratification of 90-day disease progression in ACLF, providing effective guidance for active and precise implementation of clinical decisions.

PO-1528

Comparison of Image Quality and Radiation Dose of CT Colonography Using Different Low-dose CT Scanning Parameters and Statistic-based Reconstruction Algorithm levels: A Study Using Pig Colonic Phantoms and An Anthropomorphic Phantom

Yongrui Li

The First Hospital of Jilin University

Objective: To compare image quality and radiation dose on CT colonography (CTC) images acquired using different scanning parameters and reconstruction methods, using both pig colonic phantoms and an anthropomorphic phantom.

Methods: Seven pig colonic phantoms with lengths of approximately 120cm were prepared, with 161 simulated polyps. The simulated polyps were made of small bowel, stomach, and lymph nodes tissue from pigs specimens. Among the 161 polyps, 105 were sessile, 35 were pedunculated, and 21 were flat. The colonic specimens were placed in a large plastic case filled with 45 L of water, and 40 ml of diatrizoatemeglumine was added to water to simulate abdominal absorption. Room air was injected through a 14-F Foley catheter. CT images were scanned under 7 different settings of tube voltages and currents (120, 100, 80kvp, and 50, 30, 10mAs) using a 256-channel multi-detector row CT. Images were reconstructed using a statistical based reconstruction algorithms (iDose4; Philips Healthcare) at a matching workstation, with a level between 3 and 5 selected from a total of 7 levels. Two experienced radiologists independently evaluated all sets of CTC images for image noise and contrast-to-noise ratios (CNRs). Subjective image quality was assessed on a 5-point scale. The anthropomorphic phantom is used for measuring radiation dose scanned under the same parameters as porcine phantoms. Data were analyzed using analysis of variance. Interobserver variability was estimated by using k statistics between the two radiologists. The significance level for all tests was 0.01 (two-sided) to allow for type 2 errors due to multiple testing.

Results: The sensitivities for the two readers to detect all simulated polyps using different scanning parameters ranged from 75 to 100%. The sensitivity of detection of flat polyps tended to be lower than that of sessile polyps and pedunculated polyps. Using the same scanning parameters with different statistical based reconstruction algorithm levels, there were no significant differences ($p < 0.01$) in polyps detection of all sizes and shapes. Using the same statistical based reconstruction algorithm level, there were no significant differences in sensitivities ($p < 0.01$) among all groups except group C3. The rise of reconstruction levels resulted in less image noise and higher CNRs with statistically significant difference ($p < 0.01$). The quality of images among different scanning parameters and statistic-based reconstruction levels remained diagnostic acceptable, and showed no significant differences among all sets ($p > 0.05$). A dose reduction of 84.8% was achieved at 80kVp/30mAs compared with 120kVp/50mAs.

Conclusion: The phantom study shows that image quality of CTC using 80kVp/30mAs with iDose4 level-3 could be comparable to the standard 120kVp/50mAs, which can be used in clinical widely for screening. The anthropomorphic phantom showed screening and diagnostic examinations could be acquired with a potential dose saving of about 84.8% without compromising image quality.

PO-1529

Role of tomoelastography in differentiating between pancreatic neuroendocrine neoplasms and solid pseudopapillary neoplasms

Jiaxin Yuan, Jinhui Yu, Tingting Wen, Yangdi Wang, Jiawei Liu, Shi-Ting Feng, Yanji Luo, Siya Shi, Liqin Wang
The First Affiliated Hospital, Sun Yat-sen University

Objectives: To explore the diagnostic performance of stiffness and fluidity quantified with tomoelastography for the differentiation between pancreatic neuroendocrine neoplasms (pNENs) and solid pseudopapillary neoplasms (SPNs).

Methods: Tomoelastography, a multifrequency magnetic resonance elastography technique, provides high-resolution maps of shear wave speed (c in m/s) and phase angle (ϕ in rad), allowing to evaluate the stiffness and fluidity of the pancreas. This prospective study enrolled 83 untreated patients with pathologically confirmed SPNs and pNENs who underwent pancreatic tomoelastography examination from September 2021 to May 2023. Two radiologists measured the stiffness and fluidity independently and intra/inter-observer agreements were assessed. Multivariate logistic regression analysis was performed to identify independent relevant clinical and radiological features to differentiate SPNs and pNENs. The diagnostic performance of stiffness and fluidity as well as clinical features for discrimination were evaluated by receiver operating characteristic (ROC) curves.

Results: There were 22 patients with SPNs and 61 patients with pNENs (Grade 1, 22 patients; Grade 2, 27 patients; Grade 3 or neuroendocrine carcinoma, 12 patients). Two radiologists showed substantial or near-perfect inter-observer agreements in clinical and radiological features evaluation. SPNs showed significantly lower stiffness (1.870 vs 2.290 m/s, $P < 0.001$) and fluidity (0.950 vs 1.090 rad, $P < 0.001$) than pNENs. The independent relevant factors for the differentiation were age ($P = 0.010$), stiffness ($P = 0.008$) and fluidity ($P = 0.021$) in the multivariate analysis. The area under the curves (AUCs) of stiffness and fluidity for differentiation were 0.879 (cutoff, 2.068 m/s) and 0.844 (cutoff, 1.048 rad), respectively. The differentiate performance of radiological model ($c + \phi$) was better than age (AUC = 0.931 vs 0.812; $P = 0.031$). The differentiate performance of clinical-radiological model ($c + \phi + \text{age}$) was comparable to the radiological model (AUC = 0.961 vs 0.931; $P = 0.071$).

Conclusions: Tomoelastography enables non-invasively and quantitatively to distinguish SPNs from pNENs with higher diagnostic efficacy comparing to clinical features.

PO-1530

Preoperative gadoxetic acid-enhanced MRI features for evaluation of vessels encapsulating tumor clusters and microvascular invasion in hepatocellular carcinoma: nomogram for risk assessment

Qi Ju

Department of Radiology, Affiliated Nantong Hospital 3 of Nantong University, Nantong Third People's Hospital, Nantong, 226000, Jiangsu, China
Nantong University

Abstract

Objectives: To develop nomograms based on preoperative gadoxetic acid (GA)-enhanced magnetic resonance imaging (MRI) features to predict microvascular invasion (MVI), vessels

encapsulating tumor clusters (VETC) pattern, and recurrence-free survival (RFS) in patients with hepatocellular carcinoma (HCC).

Methods: This retrospective study included 240 patients who underwent radical hepatectomy with a postoperative pathological diagnosis of hepatocellular carcinoma, all of whom received preoperative GA-enhanced MRI. Patients were assigned at random to training cohort ($n = 168$) and validation cohort ($n = 72$) according to 7:3 ratio. Multivariate logistic regression analyses were used to screen out the independent risk factors to predict MVI-HCC, VETC-HCC, and a combination of VETC and MVI (VETC+/MVI+ HCC) in HCC in the training set, and then the nomogram models were further established. The area under the curve (AUC), calibration curve, and decision curve analysis (DCA) were used to evaluate the predictive performance and discriminative ability of the nomogram, and the results were validated in the validation dataset. Risk scores were stratified according to three nomogram models, and the Kaplan-Meier method was used to plot recurrence-free survival (RFS) curves for high- and low-risk groups.

Results: Serum protein induced by vitamin K absence or antagonist-II (PIVKA-II) level >40 mAU/mL (odds ratio [OR], 4.283; $p = 0.025$), arterial peritumoral enhancement (OR, 5.289; $p = 0.003$), intratumoural vessels (OR, 4.033; $p = 0.015$), and nonsmooth tumor margin (OR, 3.621; $p = 0.019$) as independent predictors of MVI-HCC. Predictors of VETC-HCC included PIVKA-II level >40 mAU/mL (OR, 3.658; $p = 0.005$), $\geq 50\%$ arterial phase hypovascular component (OR, 3.529; $p = 0.040$), peritumoral hypointensity on hepatobiliary phase (HBP) (OR, 5.885; $p = 0.002$), and lower relative intensity ratio (RIR) on HBP images (OR, 0.009; $p = 0.001$). PIVKA-II level >40 mAU/mL (OR, 6.507; $p = 0.030$), arterial peritumoral enhancement (OR, 8.194; $p = 0.001$), and lower RIR on HBP images (OR, 0.001; $p = 0.007$) were significantly associated with VETC+/MVI+ HCC. The area under the curves (AUCs) of the predictive models for evaluating MVI, VETC and VETC+/MVI+ were 0.892 and 0.839, 0.848 and 0.810, 0.888 and 0.882 in the training and validation cohorts, respectively. Calibration plots and DCA also showed superior predictive performance. In the three prediction models based on nomograms, patients in the high-risk subgroups performed the poorer RFS than in the low-risk subgroups, similarly, patients in the pathologically-confirmed positive expression subgroups performed the poorer RFS than pathologically-confirmed negative expression subgroups (all $p < 0.001$).

Conclusions: Nomograms based on preoperative GA-enhanced MRI characteristics and clinical serological parameters showed good predictive performance in the preoperative noninvasive assessment and postoperative RFS of MVI, VETC, and VETC+/MVI+ in HCC.

PO-1531

A comparative study of constructing prediction models for muscle invasive of bladder cancer based on different machine learning algorithms combined with MRI radiomic

Tianhui Zhang, Yabao CHENG, Xiumei DU, Rihui YANG, Xi LONG, Nanhui CHEN, Weixiong FAN, Zhicheng HUANG
People's Hospital of Meizhou

OBJECTIVE: To explore the comparative study of constructing prediction models for muscle invasive of bladder cancer based on different machine learning algorithms combined with MRI radiomic.

METHODS: Data of bladder cancer patients who underwent MRI examination in our hospital from October 2016 to March 2020 and confirmed by pathology were retrospectively collected. The patients were divided into MIBC group and NMIBC group according to the surgical pathology results. Tumor volume of interest (VOI) was outlined on the three sequence images of T2WI, DWI, and ADC, and the radiomic features were extracted by A.K software, and dimensionality reduction was performed using the maximum correlation minimum redundancy (mRMR) algorithm combined with LASSO. Six machine learning algorithms, including K Nearest Neighbor (KNN), Decision Tree (DT), Support Vector Machine (SVM), Logistic Regression (LR), Random Forest (RF), and Explanatory

Booster Machine (EBM), were used to construct the radiomic model and calculate the corresponding area under the curve (AUC), accuracy, sensitivity, and specificity, respectively.

RESULTS: Six machine learning algorithms, including KNN, DT, SVM, LR, RF, and EBM, were used to construct the model, and the AUC values for predicting muscle invasive of bladder cancer in the training set were 0.863, 0.838, 0.853, 0.866, 0.977, 0.997, and in the test set were 0.748, 0.833, 0.860, 0.868, 0.870, 0.900. Among them, the MRI radiomic model constructed based on EBM had the highest predictive efficacy for muscle invasive of bladder cancer, with AUC values, accuracy, sensitivity and specificity of 0.997, 97.7%, 95.7% and 98.1% in the training set, and 0.900, 87.7%, 80.0%, and 89.4% in the testing set, respectively.

CONCLUSION: Machine learning algorithms combined with MRI radiomic to construct models have good predictive efficacy for muscle invasive of bladder cancer, and the model constructed based on EBM shows the highest predictive value.

PO-1532

CT-based radiomics signature of visceral adipose tissue and bowel lesions for identifying patients with Crohn's disease at high risk of primary nonresponse to infliximab

Yangdi Wang¹, Zixin Luo², Zhengran Zhou³, Xiaodi Shen¹, Xinyue Wang¹, Bingsheng Huang², Shi-ting Feng¹, Xuehua Li¹

1. The first affiliated hospital of Sun yat-sen University

2. Medical AI Lab, School of Biomedical Engineering, Shenzhen University Medical School

3. Zhongshan School of Medicine, Sun Yat-Sen University

Purpose

Approximately 13%–40% of patients with Crohn's disease (CD) show a primary nonresponse to infliximab (IFX). Recent evidences show that computed tomography (CT) based radiomics features could potentially identify CD patients at high risk of primary nonresponse to IFX. However, their predictive efficacy still needs to be improved. Visceral adipose tissue (VAT) has recently been considered to effect on IFX therapy. We developed a comprehensive radiomics model (RM) combining with VAT and bowel features to compare with bowel-RM alone, to explore whether VAT can further improve the predictive efficacy on the basis of bowel RM.

Methods

This retrospective study included 244 CD patients (training cohort, n=119; test cohort 1, n=51; test cohort 2, n=74) recruited from two tertiary referral centres. The outcome of IFX induction therapy at week 14 was classified as primary response or nonresponse. A machine-learning VAT-RM and bowel-RM were separately developed using the selected CT features and support vector machine classifier to identify CD patients with primary nonresponse to IFX. Finally, a comprehensive model that consisting of VAT and bowel radiomics features was further established to verified whether features extracted from VAT could potentially provide more information to improve the prediction efficacy of bowel-RM. Area under the operating characteristic (ROC) curve (AUC) and decision curve analysis were used to compared the prediction performance. The clinical utility of the comprehensive model was then compared using integrated differentiation improvement (IDI).

Results

VAT-RM and bowel-RM exhibited comparable performance for identifying patients with primary nonresponse in test cohort 1 [AUC of VAT-RM, 0.720(95% CI, 0.577-0.837); AUC of bowel-RM, 0.789 (95% CI, 0.652-0.891)] and test cohort 2 [AUC of VAT-RM, 0.725(95% CI, 0.609-0.823); AUC of bowel-RM, 0.789 (95% CI, 0.678-0.875)], with a relatively good net benefit in clinical utility. Adding VAT-RM into bowel-RM to develop a comprehensive RM, this model yielded a satisfactory predictive efficacy in test cohort 1 (AUC=0.848, 95% CI, 0.720-0.933) and test cohort 2 (AUC=0.839, 95% CI, 0.735-0.914). Moreover, the comprehensive RM significantly improved

predictive efficacy compared with bowel-RM alone in test cohort 1 (IDI=8.3%, $P<0.001$) and test cohort 2 (IDI=12.2%, $P<0.001$).

Conclusion

VAT has effect on IFX treatment response and improves the performance for identification of CD patients at high risk of primary nonresponse to IFX therapy.

PO-1533

Prediction of Postoperative Reintervention Risk for Uterine Fibroids using CE-T1WI Radiomics Nomogram before High-Intensity Focused Ultrasound Ablation

Shize Qin, Xiaohua Huang

Affiliated Hospital of North Sichuan Medical College

Objective: To develop and validate a contrast enhancement T1-weighted imaging (CE-T1WI)-based radiomics nomogram for predicting postoperative reintervention risk for uterine fibroids before high-intensity focused ultrasound (HIFU) ablation.

Materials and Methods: Retrospective continuous collection of 189 patients with uterine fibroids treated by HIFU between 2018 and 2021 (43 reintervention; 146 non-reintervention). All patients were randomly divided into a training cohort ($n=132$) and a validation cohort ($n=57$). The smote algorithm was used to oversample the minority (reintervention) class and undersample the majority (non-reintervention) class in the training cohort to achieve class balance. Multivariate analysis was used to determine independent clinical-imaging features that predicted the risk of reintervention for uterine fibroids. The maximum correlation minimum redundancy and least absolute shrinkage and selection operator were used to select the optimal radiomics features. The rad-score for each patient was calculated by a linear combination of selected features and their coefficients. Logistic regression was used to construct a clinical-imaging model based on independent clinical-imaging features, a radiomics model based on the rad-score, and a radiomics nomogram incorporating the rad-score and independent clinical-imaging features. Receiver operating characteristic (ROC) curves and decision curve analysis (DCA) were used to evaluate the models'; predictive performance and clinical application. The integrated discrimination index (IDI) was used to compare the predictive performance of the models.

Results: Age ($p<0.001$), fibroid volume ($p=0.001$), and fibroid enhancement degree ($p=0.001$) were independent clinical-imaging features. The area under the ROC curves (AUC) of the radiomics model was 0.845 (95% CI: 0.799-0.890) and 0.822 (95% CI: 0.659-0.984) in the training and validation cohorts, respectively. The AUC of the radiomics nomogram was 0.869 (95% CI: 0.828-0.911) and 0.801 (95% CI: 0.682-0.920) in the training and validation cohorts, respectively. The specificity and sensitivity of the radiomics nomogram in the training cohort were 0.853 and 0.724, respectively. The specificity and sensitivity of the radiomics nomogram in the validation cohort were 0.646 and 0.889, respectively. The IDI results showed a significant improvement in the overall predictive performance of 12.5% (training cohort, $p<0.001$) and 14.0% (validation cohort, $p=0.019$) for the radiomics nomogram compared to the clinical-imaging model. The DCA indicated that the radiomics nomogram had more excellent clinical application value across most risk thresholds.

Conclusion: CE-T1WI-based radiomics nomogram can effectively predict the risk of reintervention after HIFU ablation for uterine fibroids. The nomogram has the potential to assist clinicians in formulating accurate and individualized treatment plans to reduce the incidence of reintervention. Furthermore, it may help develop early chronic disease management plans following HIFU ablation to improve patients'; long-term quality of life.

9. Johns Hopkins University

Introduction:

Early or incidental detection of pancreatic ductal adenocarcinoma (PDAC) is associated with prolonged survival. Noncontrast CT imaging routinely performed for established clinical indications offers an opportunity for large-scale screening of asymptomatic adults. The objective of this study was to develop a novel approach – PANcreatic cancer Detection with AI (PANDA) – that can detect and classify pancreatic lesions, via noncontrast CT imaging modality alone.

Methods:

The design of the algorithm leverages supervision from contrast-enhanced CT annotations and pathology-level ground truth labels, incorporating diagnostic cues from pancreas-lesion global morphology and local texture information. PANDA is trained on a large curated dataset with 3208 patients from a single center and has been extensively evaluated in a larger international multi-center validation study cohort of 6239 patients from 10 centers, two reader studies of 48 radiologists, and a real-world multi-scenario (i.e. involving patients from a combination of physical exam, emergency department, outpatient, and inpatient visits) validation cohort consisting of 20530 consecutive patients from a high-volume pancreatic cancer institution (ChiCTR2200064645).

Results:

PANDA generalizes well across multi-center datasets with reported AUCs (area under the curve) of 0.986–0.996, outperforms mean radiologist scores by 34.1% in sensitivity and 6.3% in specificity on PDAC identification, and achieves a sensitivity of 92.9% and a specificity of 99.9% for pancreatic lesion detection in real-world validation studies.

Conclusions:

PANDA may potentially serve as a new tool for large-scale (opportunistic or designed) pancreatic cancer screening that is highly accurate, readily distributable across medical institutions, cost-effective and highly beneficial to patients. Furthermore, our method for developing an AI system on noncontrast CT could also feasibly be generalized to other cancer screening tasks.

PO-1535

Development of a diagnostic model based on Contrast-Enhanced CT to distinguish Clear Cell Renal Cell Carcinoma from Small Renal Masses

Jiayue Han^{1,2}, Ci Cheng¹, Yuxi Tao¹, Ci Chen¹, Songtao Yin², Hao Chen³, Junyu Lin¹, Yao Lu⁴, Yaqin Zhang¹

1. The Fifth Hospital of Sun Yat-sen University

2. Inner Mongolia Autonomous Region People's Hospital

3. Anhui Provincial Hospital

4. School of Computer Science and Engineering, Sun Yat-sen University

Objectives

This study aimed to develop and validate a diagnostic model based on contrast-enhanced CT for distinguishing clear cell renal cell carcinoma (ccRCC) from small renal masses (SRMs).

Methods

This retrospective multicenter study enrolled patients with pathologically confirmed SRMs. Two radiologists evaluated the imaging features of all tumours on CT and gave the diagnostic results. Univariate and multivariate logistic regression analyses were used to screen independent risk factors for ccRCC and build the classification and regression tree (CART) diagnostic model. Data from three centers were used as training set ($n=229$), with data from one center serving as an independent external validation test set ($n=81$). The average value of the areas under the curve (AUC) was used as the evaluating indicator of the model. The AUCs of different models were compared by DeLong test.

Results

There were 310 SRMs in 309 patients. A total of 71% (220/310) of patients were ccRCC. Enhancement pattern, early dark cortical band (EDCB), the ratio of lesion to normal cortex attenuation (L/C) in the corticomedullary phase, non-enhancing phase L/C and gender were used to develop the CART model. In the testing cohort, the AUC of the CART model was 0.903 (95%CI 0.807, 0.974). Compared with the assessment results of two radiologists, the CART model had a higher AUC value (0.903 vs. 0.694, $P = 0.0005$; 0.903 vs. 0.616, $P < 0.0001$).

Conclusion

The CART diagnostic model can distinguish ccRCC from SRMs with a diagnostic efficacy that is better than that of experienced radiologists, potentially reducing the number of unnecessary biopsies.

Clinical relevance statement

An easy-to-use, highly interpretable decision tree model was developed in this study for the diagnosis of SRMs, which could be used as a tool for risk stratification to reduce unnecessary surgery and biopsy of patients and assist clinical decision-making.

PO-1536

Prediction of postoperative disease-free survival in colorectal cancer using CT radiomics nomogram: a multicenter study

Manman Li¹, Guodong Xu¹, Feng Feng²

1. 盐城市第一人民医院

2. Affiliated Tumor Hospital of Nantong University

Objectives To explore the value of CT radiomics nomogram in predicting disease-free survival (DFS) of patients with colorectal cancer (CRC) after operation.

Methods A total of 569 CRC patients from three centers were retrospectively included. Radiomics features were extracted from portal venous phase CT images, and the Least absolute shrinkage and selection operator Cox regression algorithm was employed to select radiomics features. Clinical risk factors associated with DFS were selected through univariate and multivariate Cox regression analysis to build the clinical model. A predictive nomogram was developed by amalgamating pertinent clinical risk factors and radiomics features. The predictive performance of the nomogram was evaluated by the C-index, calibration curve and decision curve analysis. DFS probabilities were estimated using the Kaplan-Meier method, with comparisons made using the log-rank test.

Results Integrating the retained 15 radiomics features and three clinical risk factors (pathological N stage, microsatellite instability, peripheral nerve invasion), a nomogram was constructed. The C-index for the nomogram were 0.811 (95% CI: 0.789-0.833), 0.810 (95% CI: 0.772-0.848), 0.797 (95% CI: 0.766-0.828), and 0.794 (95% CI: 0.760-0.828) in the training set, internal validation set,

external validation set 1, and external validation set 2, respectively. The calibration curves demonstrated a favorable congruence between the predicted and observed values as depicted by the nomogram. The decision curve analysis underscored that the nomogram yielded a heightened clinical net benefit.

Conclusions The constructed radiomics nomogram, amalgamating the radiomics features and clinical risk factors, exhibited commendable performance in the individualized prediction of postoperative DFS in CRC patients.

PO-1537

Comparison of preoperative CT- and MRI-based multiparametric radiomics in the prediction of lymph node metastasis in rectal cancer

Yue Niu, Xiaoping Yu
Hunan Cancer Hospital

Abstract

Objective To compare computed tomography (CT)- and magnetic resonance imaging (MRI)-based multiparametric radiomics models and validate a multi-modality, multiparametric clinical-radiomics nomogram for individual preoperative prediction of lymph node metastasis (LNM) in rectal cancer (RC) patients.

Methods 234 rectal adenocarcinoma patients from our retrospective study cohort were randomly selected as the training ($n = 164$) and testing ($n = 70$) cohorts. The radiomics features of the primary tumor were extracted from the non-contrast enhanced computed tomography (NCE-CT), the enhanced computed tomography (CE-CT), the T2-weighted imaging (T2WI) and the gadolinium contrast-enhanced T1-weighted imaging (CE-T1WI) of each patient. Three kinds of models were constructed based on training cohort, including the Clinical model (based on the clinical features), the radiomics models (based on NCE-CT, CE-CT, T2WI, CE-T1WI, CT, MRI, CT combining with MRI) and the clinical-radiomics models (based on CT or MRI radiomics model combining with clinical data) and Clinical-IMG model (based on CT and MRI radiomics model combining with clinical data). The performances of the 11 models were evaluated via the area under the receiver operator characteristic curve (AUC), accuracy, sensitivity, and specificity in the training and validation cohort. Differences in the AUCs among the 11 models were compared using DeLong's test. Finally, the optimal model (Clinical-IMG model) was selected to create a radiomics nomogram. The performance of the nomogram to evaluate clinical efficacy was verified by ROC curves and decision curve analysis (DCA).

Results The MRI radiomics model in the validation cohort significantly outperformed than CT radiomics model (AUC, 0.785 vs. 0.721, $p < 0.05$). The Clinical-IMG nomogram had the highest prediction efficiency than all other predictive models ($p < 0.05$), of which the AUC was 0.947, the sensitivity was 0.870 and the specificity was 0.884.

Conclusion MRI radiomics model performed better than both CT radiomics model and Clinical model in predicting LNM of RC. The clinical-radiomics nomogram that combines the radiomics features obtained from both CT and MRI along with preoperative clinical characteristics exhibits the best diagnostic performance.

PO-1538

PI-RADS version 2.1 evaluation of prostate 'nodules in nodule': clinical, imaging and pathological features

Minghua Sun, Dongdong Xie, Liyu Cao, Li Xu, Xiaoyan Zhang, Kai Liu, Hao Wu
Fuyang Hospital Affiliated to Anhui Medical University

Abstract

Objectives: To analyze whether the imaging features of prostate 'nodules in nodule' are correlated with other clinical and pathological indicators of the prostate.

Methods: We retrospectively analyzed the prostate images of 47 male patients who underwent MRI scans and pathological biopsy examinations from January 2022 to July 2023. Two radiologists (R1/2) evaluated the morphology and signal intensity of the 'nodules in nodule' in a double-blind manner and calculated the PI-RADS v2.1 score. The results were compared with the clinical indicators and pathological results of the prostate.

Results: Third-four percent (16/47) of patients were pathologically diagnosed with prostate cancer. There were significant statistical differences in total PSA, free/total PSA, PSAD and volume between PCa and BPH patients. On MRI, R1/R2 detected 17/16 prostate 'nodules in nodule', of which 10.60% (16/151) (R1) and 10.46% (16/153) (R2) had a DWI PI-RADS v2.1 score of 4 and 0.66% (1/151) (R1) had a score of 3. The proportion of 'nodules in nodule' pathologically conformed as PCa with encapsulated, circumscribed or atypical nodules (partially or completely absent capsule) and obscured boundaries was 0.00% (0/151), 0.00% (0/151), 5.96% (9/151), 5.30% (8/151) for R1 and 0.00% (0/153), 0.00% (0/153), 5.88% (9/153), 4.58% (7/153) for R2, respectively. **Conclusion:** Prostate 'nodules in nodule' with a PI-RADS v2.1 category 1 showing incomplete capsulation or obscured boundaries on T2WI and DWI PI-RADS V2.1 ≥ 4 should be updated to PI-RADS V2.1 category 3. Total PSA ≥ 18.01 ng/ml or PSAD ≥ 0.57 is a high-risk factor for PCa.

PO-1539

Curled edge Sign of Epstein-Barr virus-associated gastric cancer on CT imaging

Min Cao
Peking University Cancer hospital

Objective: To assess the appearance of Epstein-Barr virus-associated gastric (EBVaGC) on CT imaging and to investigate the potential of qualitative and quantitative CT images analysis to differentiate EBVaGC from gastric cancer not associated with EBV infection (EBVnGC).

Materials and methods: This study reviewed an institutional database of patients who underwent resection of GC and identified patients with EBVaGC and Random matching patients with the same amount of EBVnGC. The imaging characteristics and correlated histopathological basis of the cancers on CT were investigated.

Results: Sixty-four patients with EBVaGC were classified as EBVaGC group in this study. After matching EBVaGC (n = 64) and EBVnGC patients (n = 64), a total of 128 cases were analyzed. The binary logistic regression analysis showed that the location, thickness to length ratio and the curled edge sign of tumor were independent predictors of EBVaGC, with an area under the curve (AUC) of 0.78 on the receiver operating characteristic (ROC) curve analysis.

Conclusion: Three CT features, including the location, thickness to length ratio and curled edge sign of the tumor, are good predictors of patients with EBVaGC.

PO-1540

Predictive value of modified MRI-based split scar sign (mrSSS) score for pathological complete response after neoadjuvant chemoradiotherapy for patients with rectal cancer

Fangying Chen, Yuan Yuan, Fu Shen, Chengwei Shao
Changhai Hospital, Naval Medical University

Purpose To measure the diagnostic performance of modified MRI-based split scar sign (mrSSS) score for the prediction of pathological complete response (pCR) after neoadjuvant chemoradiotherapy (nCRT) for patients with rectal cancer.

Methods The modified MRI-based split scar sign (mrSSS) score, which consists of T2-weighted images (T2WI)-based score and diffusion-weighted images (DWI)-based score. The sensitivity, specificity, and accuracy of modified mrSSS score, endoscopic gross type, and MRI-based tumor regression grading (mrTRG) score, in the prediction of pCR, were compared. The prognostic value of the modified mrSSS score was also studied.

Results A total of 189 patients were included in the study. The Kendall's coefficient of interobserver concordance of modified mrSSS score, T2WI -based score, and DWI-based score were 0.899, 0.890, and 0.789 respectively. And the maximum and minimum k value of the modified mrSSS score was 0.797 (0.742–0.853) and 0.562 (0.490–0.634). The sensitivity, specificity, and accuracy of prediction of pCR were 0.66, 0.97, and 0.90 for modified mrSSS score; 0.37, 0.89, and 0.78 for endoscopic gross type (scar); and 0.24, 0.92, and 0.77 for mrTRG score (mrTRG=1). The modified mrSSS score had significantly higher sensitivity than the endoscopic gross type and the mrTRG score in predicting pCR. Patients with lower modified mrSSS scores had significantly longer disease-free survival ($P<0.05$).

Conclusion The modified mrSSS score showed satisfactory interobserver agreement and higher sensitivity in predicting pCR after nCRT in patients with rectal cancer. The modified mrSSS score is also a predictor of disease-free survival.

PO-1541

Association between radiomics features of visceral fat derived from computed tomography enterography (CTE) and short-term prognosis in UC disease

Jun Lu, Lixue Xu, Jing Zheng, Tianxin Cheng, Zhenghan Yang
Beijing Friendship Hospital, Capital Medical University

Purpose: Intestinal inflammation induces dynamic changes in the balance between water and lipid content in visceral fat especially the adipose tissue which around the intestinal as captured by CT attenuation index in standard computed tomography enterography (CTE). Emerging evidence points to a link between visceral fat and illness behaviour and prognosis of ulcerative colitis (UC). This study aimed to establish and validate radiomics signatures using radiomics features of visceral fat for early assessing short-term prognosis in UC.

Methods: 138 patients from two center in local institution were enrolled. Among them, 66 patient could benefit from the basic treatment plan (mesalazine, steroids and azathioprine) and achieve remission and the other 72 not. 851 radiomics features were extracted from the third lumbar level based on CTE images. The features were selected using Mann-Whitney U-test, Pearson correlation and followed by refining using least absolute shrinkage and selection operator (LASSO) regression combing 5-fold cross-validation. The optimal radiomics features were processed by Logistic Regression (LR), Support Vector Machine (SVM) and Random Forest (RF) to construct

prediction models for early identifying patients who could not achieve remission. The radiomics signatures were developed in the train (n=96) and validated in the validation dataset (n=42) from another center. The performance of the radiomics signatures were evaluated using discrimination and calibration.

Results: Three radiomics signatures constructed by three different machine learning algorithm comprising of six robust features were built. The Random Forest signature showed the highest AUC of 0.811/0.781 in the train and validation dataset. The accuracy, sensitivity and specificity were 85.00%, 86.21%, 68.00% and 76.76%, 72.00%, 81.82% in the training and validation dataset. The Hosmer-Lemeshow test concluded that the radiomics signatures showed goodness of fit (all $p > 0.05$).

Conclusion: The CTE-based radiomics features profiling of visceral fat detects the structural remodeling associated with UC, which might attribute to inflammation. A new artificial intelligence-powered imaging biomarker can be a promising approach for early identify the patient who could not benefit from the basic treatment plan, which contributes to making a tailored and upgrading treatment decision timely.

PO-1542

Arterioportal Shunt as a Prognostic Factor in HCC Patients Treated With DEB-TACE

Bai Lei, Shuwei Zhou, Yuancheng Wang
东南大学附属中大医院

Purpose: To investigate the influence of Arterioportal Shunt (APS) on treatment response and postoperative complications after drug-eluting beads transcatheter arterial chemoembolization (DEB-TACE) for hepatocellular carcinoma (HCC).

Materials and Methods: We prospectively included 102 patients received DEB-TACE for HCC, follow-up with contrast-enhanced-MRI (CE-MRI) for 12 months, from December 2017 to December 2020. Two radiologists independently assessed APS and other related imaging features. Response was assessed by using changes in viable tumor volume by using modified RECIST (mRECIST). Factors influencing APS and complication rate were identified by logistic regression model.

Results: A total of 76 patients developed APS. Patients occurred APS at early term (within 1.5 month) after latest DEB-TACE show better treatment response and more obvious tumor reduction rate than patients without APS (All $P < 0.05$). Direct bilirubin (DB) was an risk factor for APS, patients with lower DB were more likely to develop APS ($P < 0.001$). Besides, APS is significantly correlated to biliary injury ($P < 0.001$).

Conclusion: The occurrence of APS indicates a positive response to DEB-TACE treatment in HCC patients, however, it is noteworthy that there may be increased risk of biliary injury and further validation is needed.

PO-1543

Progress in the application of dual-energy CT in pancreatic diseases

Sha Wang, Yanli Zhang, Yongsheng Xu, Pengcheng Yang, Junqiang Lei
The First Clinical Medical College of Lanzhou University, Department of Radiology, The First Hospital of Lanzhou University, Lanzhou, China.

Pancreatic diseases are difficult to diagnose due to their insidious onset and complex pathophysiological developmental characteristics. In recent years, dual-energy computed tomography (DECT) imaging technology has rapidly advanced. DECT can quantitatively extract and analyze medical imaging features and establish a correlation between these features and clinical results. This feature enables the adoption of more modern and accurate clinical diagnosis and treatment strategies for patients with pancreatic diseases so as to achieve the goal of non-invasive, low-cost, and personalized treatment. The purpose of this review is to elaborate on the application of DECT for the diagnosis, biological characterization, and prediction of the survival of patients with pancreatic diseases (including pancreatitis, pancreatic cancer, pancreatic cystic tumor, pancreatic neuroendocrine tumor, and pancreatic injury) and to summarize its current limitations and future research prospects.

PO-1544

Preoperative CT features for characterization of vessels that encapsulate tumor clusters in primary hepatocellular carcinoma

ziyu liu,yun mao,yin zhou,junjie li

The first Affiliated hospital of Chongqing Medical University

Purpose This study aimed to estimate the potential of preoperative CT in the prediction of vessels that encapsulate tumor clusters (VETC) in primary hepatocellular carcinoma (HCC) and to evaluate whether the estimations are associated with recurrence after hepatic resection.

Materials and Methods From January 2015 to October 2021, patients who underwent curative resection and preoperative CT were retrospectively included in the hospital. Clinical and imaging features related to histopathologic VETC status (VETC + or VETC-) were determined by logistic regression analyses. Early recurrence was determined using the Kaplan–Meier survival curve. Prognostic factors associated with early recurrence after surgical resection were identified by using Cox regression analyses. P value < 0.05 was considered statistically significant.

Result In total, 212 patients (median age, 57 years; interquartile range, 21-88 years; 185 women) were evaluated. The multivariable logistic regression analyses revealed total bilirubin(TBL) > 17.1umol/l (odds ratio [OR], 4.981; 95% confidence interval [CI]: 2.132, 11.638; p = 0.000), arterial peritumoral enhancement (OR,4.894; 95% CI:1.923, 12.452; p = 0.001) and intratumor vascularity (OR, 2.499; 95% CI:1.116, 5.95; p = 0.026) as independent predictors of VETC of HCC. In Kaplan–Meier survival analysis, the VETC status was associated with early and overall recurrence (p = 0.001, P=0.000). In the Cox proportional hazard regression model, VETC+ (hazard ratio [HR], 2.211; 95% CI: 1.319, 3.707; p = 0.003), intratumor vascularity (HR,1.595; 95% CI:1.004, 2.535; p = 0.048) and the number of the tumor (HR, 1.84; 95% CI: 1.023, 3.312; p = 0.042) were independently associated with early recurrence.

Conclusion Preoperative CT features could be used for the characterization of vessels that encapsulate tumor clusters pattern and were of prognostic significance for early recurrence in patients with hepatocellular carcinoma.

PO-1545

A modified targetoid feature emphasizing thin-rim APHE to improve the diagnostic performance of LI-RADS for malignant hepatic tumors

Runqian Huang, Siyue Mao

Zhongshan University Cancer Prevention and Treatment Center; Sun Yat-sen University Cancer Center

Objective: The Liver Imaging Reporting and Data System version 2018 (LI-RADS v2018) provided a LI-RADS M (LR-M) category for hepatic observations that reflect probable or definite malignancy but not specific to HCC. To identify imaging features that help distinguish between HCCs and non-HCC malignancies assigned to LR-M and evaluate the diagnostic performance of a LI-RADS with modified targetoid criteria using thin-rim Arterial phase hyperenhancement (APHE).

Methods: This retrospective study included 381 patients (387 observations) at high-risk for HCC who underwent enhanced-MRI before surgery. The tumor diagnosis was based on histopathological examination. Two radiologists reviewed imaging findings for LI-RADS categorization of hepatic observations. The thin-rim ($< 30\%$) APHE was defined based on the thickest thickness of rim APHE compared with the tumor radius, on the contrary, if the thickness of the thickest part of the rim-enhancement was between 30% and 70% of the tumor radius, it was defined as thick-rim APHE. And a modified LI-RADS emphasizing thin-rim APHE as a specific feature of LR-M was established. We compared the diagnostic performance of conventional LI-RADS and modified LI-RADS.

Results: Thin-rim APHE, targetoid diffusion-weighted imaging (DWI), and bile duct dilatation were found as independent predictive factors of non-HCC malignancies, while enhancing capsule and peripheral washout were noted as independent variables significantly associated with HCC of LR-M ($P < 0.05$). The noticeable performance of thin-rim APHE in distinguishing non-HCC malignancies from HCCs was evaluated by ROC curve. Emphasizing thin-rim APHE on targetoid features, the modified LR-M revealed significantly superior specificity and accuracy (89.4% vs. 81.1%, $P=0.004$; and 87.9% vs. 82.2%, $P=0.027$, respectively) while maintaining high sensitivity (82.2% vs. 86.0%; $P=0.529$) compared with the LR-M. Meanwhile, the modified LI-RADS 5 (LR-5) achieved greater sensitivity and accuracy (88.6% vs. 79.7%, $P=0.004$; and 85.8% vs. 80.1%, $P=0.036$, respectively) for diagnosing HCC, without compromising specificity (78.3% vs. 81.1%; $P=0.608$) compared with the LR-5.

Conclusion: Thin-rim APHE may be the specific imaging feature for differentiating non-HCC malignancies from HCCs within LR-M. The modified targetoid criteria emphasizing thin-rim APHE can improve the diagnostic performance of LI-RADS for hepatic malignancies.

PO-1546

Predicting mismatch-repair status in rectal cancer using multiparametric MRI-based radiomics models: A preliminary study

Guodong Jing, Fu Shen, Chengwei Shao
Shanghai changhai hospital

Objective Detecting mismatch-repair (MMR) status is crucial for personalized treatment strategies and prognosis in rectal cancer (RC). A preoperative, non-invasive and cost-efficient predictive tool for MMR is critically needed. Therefore, this study developed and validated machine learning radiomics models for predicting MMR status in patients directly on preoperative MRI scans.

Methods Pathologically confirmed RC cases administered surgical resection in our hospital were examined in this retrospective trial. Totally 78 and 33 cases were included in the training and test sets, respectively. Then, 65 cases were enrolled as a validation set. Radiomics features were obtained from preoperative rectal MR images comprising T2-weighted imaging (T2WI), diffusion-weighted imaging (DWI), contrast-enhanced T1-weighted imaging (T1WI) and combined multi-sequences. Optimal features related to MMR status were selected by the least absolute shrinkage and selection operator (LASSO) method. Support vector machine (SVM) learning was adopted to establish four predictive models, i.e., ModelT2WI, ModelDWI, ModelCE-T1WI and Modelcombination, whose diagnostic performances were determined and compared by receiver operating characteristic (ROC) curves and decision curve analysis (DCA).

Results Four optimal radiomics features for predicting MMR status from combined sequences were selected to build Modelcombination, which provided a better performance compared with other models in all data sets (all $p < 0.05$). The usefulness of the proposed model was confirmed by DCA. Therefore, the present pilot study showed the radiomics model combining multiple sequences derived from preoperative MRI is effective in predicting MMR status in RC cases.

Conclusions The present pilot study showed the radiomics model derived from preoperative MRI is effective in predicting MMR status in patients with RC. In addition, the model combining multiple sequences might show improved performance.

PO-1547

Differential diagnosis of dual-phenotype hepatocellular carcinoma (DPHCC) from non-DPHCC and intrahepatic cholangiocarcinoma (ICC) based on MRI radiomics and deep learning models

Qian Wu¹, Yixing Yu¹, Tao Zhang², Chunhong Hu¹
1. the First Affiliated Hospital of Soochow University
2. Affiliated Nantong Hospital 3 of Nantong University

Objectives: To develop and validate radiomics and deep learning models based on contrast-enhanced MRI (CE-MRI) for differentiating dual-phenotype hepatocellular carcinoma (DPHCC) from non-DPHCC and intrahepatic cholangiocarcinoma (ICC).

Methods: Our study consisted of 306 patients from two centers with 102 DPHCCs, 108 non-DPHCCs, and 96 ICCs who were randomly divided into a training set ($n=244$) or a validation set ($n=62$). Radiomics and deep transfer learning (DTL) models based on CE-MRI were established for differential diagnosis, respectively, and their predictive performances were compared using the confusion matrix and area under the receiver operating characteristic (ROC) curve (AUC).

Results: The AUC and accuracy of the DTL models were mostly higher than the radiomics models, especially in the vgg19 model. The accuracy, macro-AUC, and F1-score of the combined radiomics model were 0.72, 0.91, and 0.71 in validation set. The accuracy, macro-AUC, and F1-score of the vgg19 model were all higher than 0.85. In the validation set, the accuracy, macro-AUC, and F1-score of the vgg19-combined model were 0.92, 0.98, and 0.92. Furthermore, the fusion models exhibited higher predictive efficacy, the accuracy, macro-AUC, and F1-score were all higher than 0.9 in the Fusion-vgg19-combined model. In the validation set, the accuracy, macro-AUC, and F1-score of the Fusion-vgg19-combined model were 0.94, 0.98, and 0.95.

Conclusions: Both the radiomics and the DTL models were able to differentiate DPHCC from non-DPHCC and ICC before surgery. DTL models tend to be superior to radiomics models, and the fusion models showed better diagnostic accuracy.

PO-1548

Evaluation of image quality and diagnostic performance of deep learning-based reconstruction of prostate T2WI for transition zone prostate cancer

Bowen Yang, hao cheng, chunmei li, min chen
Beijing Hospital

Objective Comparison with standard T2-weighted imaging, we evaluated the image quality and diagnostic performance of prostate T2-weighted imaging reconstructed based on deep learning known as T2 Deep Learning for transition zone prostate cancer. **Methods** 79 patients who underwent prostate MRI for elevated prostate specific antigen from December 2020 to September 2022 were prospectively consecutively collected from Beijing Hospital. Scan sequences included axial T2-weighted imaging (T2WI) and T2 Deep Learning, axial diffusion-weighted imaging (DWI), and T2WI scan time was recorded. For subjective evaluation of image quality, and subjective image quality evaluation metrics included image quality, diagnostic confidence, noise level, artifacts, clarity and lesion detectability. For objective evaluation of image quality, signal-to-noise ratio (SNR) and contrast signal-to-noise ratio (CNR) were calculated. Two-parameter prostate imaging-reporting and data system version 2.1 (PI-RADS v2.1) scoring was performed for transition zone lesions using T2 Deep Learning and T2WI standard, respectively. The subjective and objective image quality evaluation metrics for T2 Deep Learning and T2WI standard were compared using the Wilcoxon signed rank test. For transition zone lesions, the diagnostic performance of PI-RADS scores for T2 Deep Learning and T2WI standard for transition zone PCa was evaluated by plotting the receiver operating curve (ROC) based on the lesion (all lesions in the transition zone) and the patient (the most malignant lesions in the transition zone), respectively, using the pathologic results as the gold standard, and the area under the curve (AUC) was compared using the DeLong's test. **Results** We found that T2 Deep Learning significantly reduced the examination time by 64.6%, from 4:37 s to 1:38 s. The median of subjective image quality evaluation metrics of T2 Deep Learning and T2WI standard are same, ranging from 5.00 (4.00, 5.00), the differences in image quality and lesion detectability were statistically significant ($Z=-2.32$, -2.36 , $P=0.020$, 0.018), and the differences of all other image quality evaluation metrics were not statistically significant ($P>0.05$). The SNR of T2 Deep Learning and T2WI standard were 17.11 (14.09, 21.92) and 9.15 (7.16, 11.17), with a statistically significant difference ($Z=-7.72$, $P<0.001$). The CNR of T2 Deep Learning and T2WI standard were 20.78 (13.42, 31.42) and 11.05 (7.82, 16.25), and the difference was statistically significant ($Z=-7.54$, $P<0.001$). Based on the lesion, the AUC of the two-parameter PI-RADS score for diagnosing PCa in the transition zone with T2 Deep Learning and T2WI standard were 0.915 (95% CI 0.86~0.98) and 0.916 (95% CI 0.86~0.98), and the differences were not statistically significant ($Z=-0.03$, $P=0.973$). Based on the patient, the AUC of the two-parameter PI-RADS score for diagnosing PCa in the transition zone with T2 Deep Learning and T2WI standard were 0.921 (95% CI 0.86~0.98) and 0.939 (95% CI 0.89~0.99), and the differences were not

statistically significant ($Z=-0.59$, $P=0.558$). Conclusions Compared with T2WI standard, T2 Deep Learning of the prostate reduces scanning time while maintaining image quality and has comparable diagnostic performance for transition zone Pca.

PO-1549

Spectral-CT iodine concentration to evaluate human epidermal growth factor receptor 2 expression in node-negative gastric cancer

Tiezhu Ren, junlin Zhou
Lanzhou University Second Hospital

Objectives: The purpose of this study was to investigate the spectral computed tomography (CT) parameters in the preoperative evaluation of human epidermal growth factor receptor 2 (HER2) in node-negative gastric cancer (GC).

Methods and materials: We retrospectively analysed 76 patients with GC. All cases were confirmed by pathology, underwent spectral-CT examination, and were divided into positive group ($n=15$) and negative group ($n=61$) depending on immunohistochemistry (IHC) results of HER2 status. Clinical characteristics, including demographic information, serum tumour markers, and gastroscopic pathological information, were collected. The iodine concentration (IC), water concentration, and CT values of 70 keV (CT70keV) were measured in the arterial (AP) and venous (VP) phases. The venous-to-arterial phase IC ratio (V/A ratio) was calculated. Parameter differences between the two groups were compared, and diagnostic performance was evaluated.

Results: The HER2 positive group's VP-IC, VP-CT70keV, and V/A ratio were substantially greater than those of the negative group (VP-IC, 24.10 ± 6.34 vs 18.92 ± 5.23 ; VP-CT70keV, 92.09 ± 25.67 vs 79.12 ± 17.43 ; V/A ratio, 1.25 ± 0.48 vs 1.01 ± 0.56 , all $p < 0.05$). Predictive efficacy analysis demonstrated that V/A ratio exhibited a favourable performance ($AUC=0.757$). The VP-IC and V/A ratio combined with histological grade exhibited good evaluation efficacy ($AUC=0.855$, sensitivity=80.2%, specificity=85.4%).

Conclusions: Spectral-CT IC-derived parameters exhibited considerable value in the preoperative evaluation of HER2 expression in GC. The combination of VP-IC, V/A ratio and histological grade exhibited a favourable performance in predicting HER2 status in GC.

PO-1550

Quantitative iodine concentrations measurements with dynamic spectral CT imaging to detect viability of hepatocellular carcinoma after transcatheter arterial chemoembolization

Dong Dong
the First Hospital of Jilin University

Purpose:

To investigate the value of iodine concentrations measurements in detecting viability of HCC after TACE with dynamic spectral CT scan.

Material and Methods:

20 patients who had 36 iodized-oil areas in HCCs treated with TACE were included. All patients underwent CT examination with spectral imaging during arterial phase (AP), venous phase (VP),

and parenchymal phase (PP) of enhancement. Normalize iodine concentrations (NIC), the lesion-normal parenchyma iodine concentration ratio (LNR) were calculated in 28 iodized-oil defect areas in triple phases respectively. Two radiologists reviewed both conventional dynamic CT images and spectral CT images with iodine concentrations to evaluate viability, and then diagnosis confidence rate was explored (5-point scale).

Results:

There were 19 viable tumors and 9 non-viable tumors in our study. NICs and LNRs of viable tumors differed significantly from those in patients of the non-viable tumors. Mean NICs: $0.18 \pm 0.08 \text{ mg/ml}$ compared with $0.07 \pm 0.07 \text{ mg/ml}$ in AP, respectively, and $0.49 \pm 0.13 \text{ mg/ml}$ compared with $0.23 \pm 0.16 \text{ mg/ml}$ in VP, and $0.52 \pm 0.36 \text{ mg/ml}$ compared with $0.30 \pm 0.19 \text{ mg/ml}$ in PP. Mean LNRs: 4.98 ± 1.18 compared with 1.29 ± 1.05 in AP, respectively, and 0.49 ± 0.13 compared with 0.23 ± 0.16 in VP, and 0.88 ± 0.23 compared with 0.53 ± 0.37 in PP. The differences were significant ($p < 0.05$). The rate of diagnosis confidence rate was significantly improved in spectral CT group with iodine concentrations compared with conventional CT (4.86 ± 0.36 and 4.04 ± 0.69 , $p < 0.05$).

Conclusions:

Dynamic spectral CT imaging with quantitative analysis of iodine concentration was able to detect viable tumors of HCC after TACE, and may help to increase diagnosis confidence.

PO-1551

Adrenal hyperplasia and lipid-poor adenoma: Can they be differentiated with CT density and volume?

Xin Bai, Gumuyang Zhang, Lili Xu, Xiaoxiao Zhang, Jiahui Zhang, Li Chen, Qianyu Peng, Zhengyu Jin, Hao Sun
Peking Union Medical College Hospital

Purpose: To explore the potential of CT density and volume in the differentiation of lipid-poor adenoma from nodular hyperplasia and evaluate the diagnostic performance.

Methods: A cohort of 128 patients with pathologically confirmed lipid-poor adrenal adenoma ($n=83$) and nodular hyperplasia ($n=45$) who underwent preoperative unenhanced and enhanced CT were enrolled. Regions of interest were placed to determine each lesion's unenhanced attenuation (CTpre) and portal-venous phase attenuation (CTp), along with the abdominal aorta's portal-venous phase attenuation. Absolute enhancement, relative enhancement, and relative enhancement ratio were calculated, lesion size was measured and volume was assessed by ITK-snap software. Intergroup differences were analyzed using student t-test and chi-square test. Logistic regression models were developed, and receiver operating characteristic curves were constructed to determine the area under the curve (AUC), sensitivity and specificity. The model's performance was compared against radiologists' subjective assessments. The inter-reader and intrareader agreement among radiologists were calculated.

Results: Significant differences between lipid-poor adenoma and nodular hyperplasia were observed in gender, CTpre, CTp, absolute enhancement, lesion size, and lesion number. The AUC of multivariate logistic regression model incorporating CTpre, volume ratio and lesion number was 0.835 (95%CI 0.764–0.907, sensitivity 73.5%, specificity 80%). Radiologists' specificity and accuracy were worse than the model. The inter-reader agreement among radiologists ranged from 0.082 to 0.535. The intrareader agreement of two radiologists was 0.734 and 0.583, respectively.

Conclusion: CT density and volume can be utilized to distinguish adenoma from hyperplasia. The model integrating density, volume, and lesion number exhibited superior diagnostic performance than radiologists with low variability and reproducibility.

PO-1552

Multiparametric spectral CT imaging for the evaluation of perineural invasion in rectal cancer

Wenzheng Lu, Shudong Hu
Affiliated Hospital of Jiangnan University

Objectives

To determine whether the preoperative perineural invasion (PNI) status of patients with rectal cancer (RC) can be diagnosed using the parameters derived from spectral CT.

Methods

This retrospective study included 62 patients with RC who underwent surgical resection and preoperative spectral CT. Clinical features and quantitative parameters obtained from spectral CT were used to predict PNI. The virtual monochromatic images (VMIs), effective atomic number (Z_{eff}) and iodine concentration (IC) were measured in the venous phase (VP). Multivariable logistic regression was performed to identify potential predictors of PNI. Then, a nomogram was established, and the predictive efficacy was assessed using receiver operating characteristic (ROC) curve analysis.

Results

All spectral CT parameters (VMIs, K(HU), Z_{eff} and IC) were higher in the PNI-positive group compared to the PNI-negative group. The highest predictive efficiency of PNI was observed at 40 keV VMIs, with an Area under the curve (AUC) value of 0.778. Multivariable analysis revealed that the N stage and 70 keV of VMIs were independent predictors of PNI. The combined model (combined N stage and 70 keV) had an AUC value of 0.856 (0.761 - 0.951).

Conclusion

Spectral CT parameters demonstrate considerable capabilities in the preoperative evaluation of PNI in RC. The combination of clinical and spectral-CT parameters further improves the diagnosis efficiency in the prediction of PNI.

PO-1553

Exploring a Multiparameter MRI-Based Radiomics Approach to Predict Tumor Proliferation Status of Serous Ovarian Carcinoma

Li Liu
The People's Hospital of Yubei District of Chongqing City

Objectives: To explore the value of prediction for tumor proliferation status of serous ovarian carcinoma (SOC) using radiomics combined clinical and MRI features.

Materials and Methods: (1) A total of 134 patients eligible undergoing 3.0 T MRI examination from Institute A from January 2016 to December 2020 were screened in this retrospective study and allocated into the training (n = 93) and internal validation (n = 41) sets. From Institute B, 42 patients from January 2019 to March 2022 were screened as the external validation set. The clinical data included expression level of Ki-67, age, serum carbohydrate antigen 125, human epididymis protein 4, neutrophil-to-lymphocyte ratio, and the International Federation of Gynecology and Obstetrics stage. MRI data included mass distribution, size, shape (lobulated/non-lobulated), mass angiogenesis, solid part containing homogeneous slightly higher signal intensity area on T2-weighted imaging fat-suppressed fast spin-echo (T2FSE), peritoneum/mesentery nodules, metastases of distant parenchymal organs, retroperitoneal lymphadenopathy, and amount of ascites. (2) All patients underwent abdominal pelvic enhanced MRI scan within 1 month before surgery, including T2FSE, and T1 with contrast enhancement (T1CE) using liver acquisition with

volume acceleration 3D with fat saturation (LAVA). (3) The region of interest (ROI) of each case was determined by two radiologists by drawing the ovarian mass boundaries manually slice-by-slice on T2FSE and T1CE images using ITK-SNAP software. A total of 1688 handcrafted radiomic features were extracted from each sequence (T2FSE and T1CE), and the features were then selected using variance threshold algorithm, SelectKBest algorithm, and least absolute shrinkage and selection operator. Then, the logistic regression algorithm was used to establish the radiomics models based on single sequence T2FSE, T1CE and dule sequence (T2FSE+T1CE), respectively. (4) Univariate and multivariate analyses were used to screen the clinical and MRI independent predictors of tumor proliferation status of SOC. (5) The radiomic model (T2FSE, T1CE, and T2FSE+T1CE) with the highest area under the curve (AUC) was used to integrate the clinical and radiological independent predictors as a radiomic-clinical-radiological model by multivariate logistic regression. (6) The DeLong method was used to assess model differences, and the performance of the optimal model was validated in the internal and external validation sets. (7) The Hosmer-Lemeshow test and calibration curve were used to evaluate the accuracy of the model, that is, the consistency between the tumor proliferation status the model predicted and the actual proliferation status.

Results: (1) The average age of 134 patients with SOC eligible from institution A was 54 years (range 27~80 years), and that of 42 patients with SOC eligible from institution B was 54 years (range 30~74 years). (2) The optimal radiomic model was based on combined-sequence (T2FSE+T1CE) among the three radiomic models ($P<0.05$). (3) The homogeneous solid component of the ovarian mass was considered the only independent predictor of the expression level of Ki-67 by univariate and multivariate regression analyses among the five clinical and nine radiological variables. (4) In the internal validation set, the AUC value of the radiomic-radiological model was higher than that of the optimal radiomics model or the radiological model (AUC = 0.974 vs. 0.937/0.897), and the differences between the two groups were significant ($P < 0.05$). (5) The calibration curves in the training, internal validation, and external validation sets were close to the ideal diagonal.

Conclusions: In this study, the radiomics method combined with MRI features was used to construct a radiomic-radiological model for predicting the expression level of Ki-67 of SOC. The model has high repeatability and accuracy, and performed well after internal and external verification, which is of great significance for the guidance of individualized treatment programs and clinical monitoring of SOC.

PO-1554

Computed tomography-based body composition parameters can predict short-term prognosis in ulcerative colitis patients

Jun Lu,Lixue Xu,Zhenghan Yang
Beijing Friendship Hospital, Capital Medical University

Objectives: Emerging evidence suggests a potential relationship between body composition and short-term prognosis of ulcerative colitis (UC). Early and accurate assessment of rapid remission based on conventional therapy via abdominal computed tomography (CT) images has rarely been investigated. This study aimed to build a prediction model using CT-based body composition parameters for UC risk stratification.

Methods: Totally, 118 patients with abdominal CT images were enrolled. Eleven quantitative parameters related to body composition involving skeletal muscle mass, visceral adipose tissue (VAT) and subcutaneous adipose tissue (SAT) were measured and calculated using a semi-automated segmentation method. A prediction model was established with significant parameters using a multivariable logistic regression. Receiver operating characteristic(ROC) curve was plotted to evaluate prediction performance. Subgroup analysis were implemented to evaluate diagnostic

efficiency of prediction model between different disease locations, centers and CT scanners. The Delong test was used for statistical comparison of ROC curves.

Results: VAT density, SAT density, gender, and visceral obesity were significantly statistically different between the rapid remission and invalidation groups (all $p < 0.05$). The accuracy, sensitivity, specificity, and AUC of prediction model were 82.61%, 95.45%, 69.89% and 0.855 (0.792-0.917), respectively. The positive predictive value and negative predictive value were 70.79% and 93.88%. No significant differences in the AUC of prediction model were found in different subgroups (all $p > 0.05$).

Conclusion: The predicting model constructed with CT-based body composition parameters is a reliable non-invasive approach for short-term prognosis identification and risk stratification. Additionally, VAT density was an independent predictor for escalating therapeutic regimens in UC cohorts.

PO-1555

Construction and validation of a novel CT-measured body composition Radiomics model to estimate prognosis of Pancreatic Ductal Adenocarcinoma after resection

Qianbiao Gu¹, Peng Liu¹, Xiaoli Hu², Jiabei Liu¹, Jianbin Liu¹, Feng Huang¹, Yaqiong He¹

1. Hunan Provincial People's Hospital, First Affiliated Hospital of Hunan Normal University

2. First Affiliated Hospital of Hunan University of Chinese Medicine

Background: Prediction models for the disease-free survival (DFS) of localized pancreatic ductal adenocarcinoma (LPDAC) remain unsatisfactory.

Objective: The purpose of this study was to construct and validate a CT-measured body composition radiomics model to predict DFS in patients who underwent curative resection for LPDAC.

Methods: This single-institution study included retrospectively identified 191 patients with pathologically diagnosed LPDAC and were chronologically divided into training ($n=142$) and validation group ($n=49$). Preoperative CT images of the L3 vertebral level were used for body composition radiomics analysis. Univariate and multivariate Cox regression analyses were conducted in the training group to establish radiomic models based on fat, muscle, and combined variables to predict DFS. Then, median radiomic risk scores were employed to separate the patients into high- and low-risk groups. DFS was calculated through the Kaplan–Meier technique. The predictive power of the model was assessed by receiver operating characteristic (ROC) curve. Results: The radiomic models based on fat (HR 3.510; $p < 0.001$) and muscle (HR 3.377; $p < 0.001$), each constructed from 7 and 4 features, respectively, were effective prognostic factors for DFS. The combined radiomics model could better differentiate high-risk patients with poor prognosis and was validated in the validation group. ROC curves revealed that our model had favourable prediction accuracy for both the training and validation groups.

Conclusions: The radiomics model based on CT-measured body composition can be useful in predicting DFS in patients undergoing curative resection for LPDAC.

PO-1556

Risk stratification for Overall Survival and Recurrence-Free Survival after R0 Resection for Solitary Intrahepatic Mass-Forming Cholangiocarcinoma Based on Preoperative MRI and Clinical Features

Shuang Chen, Hongmei Zhang

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose To establish two nomograms integrated with preoperative magnetic resonance imaging (MRI) features for predicting overall survival (OS) and recurrence-free survival (RFS) in patients with solitary intrahepatic mass-forming cholangiocarcinoma (IMCC).

Methods This retrospective study included 120 consecutive patients who were diagnosed with solitary IMCC. Preoperative MRI and clinical features were collected. Based on the univariate and multivariate Cox regression analyses, two nomograms were constructed to predict OS and RFS, respectively. The effective performance of the nomograms was evaluated using concordance index (C-index). The prognostic stratification systems for OS and RFS were developed and used to classify patients into high- and low-risk groups.

Results Suspicious lymph nodes, arterial phase (AP) enhancement patterns, and bile duct dilatation were independent predictors of OS, while suspicious lymph nodes, AP enhancement patterns, and necrosis were independent predictors of RFS. The nomograms achieved the C-index values of 0.705/0.710 for OS and 0.721/0.759 for RFS in the development/validation cohorts, which were significantly higher than those of the T and TNM stages ($P < 0.05$). Patients were stratified into high- and low-risk groups, the 1-year OS and RFS rates of high-risk patients were poorer than those of patients with low-risk in the development cohort (OS: 93.5% vs 76.3%, $P < 0.001$; RFS: 74.5% vs 22.4%, $P < 0.001$). Similar results were observed in the validation cohort.

Conclusions Two nomograms were constructed based on preoperative MRI features in patients with solitary IMCC for predicting the OS and RFS and facilitate further prognostic stratification.

PO-1557

MRI Radiomics Features of Mesorectum Can Predict Metachronous Metastasis in Patients with Rectal Cancer

Jie Dai, Kexin Wang, Xiaohan Bai, Hongyuan Shi, Qing Xu, Jing Yu
The First Affiliated Hospital of Nanjing University

Objectives: Metachronous metastases remain the main challenge and affect the prognosis of patients with rectal cancer. Some studies have explored the predictive value for metachronous metastases based on rectal tumors, while limited research has been conducted on mesorectum features. Therefore, we aimed to build MRI-based radiomics models using tumor and mesorectum features to predict metachronous metastasis.

Materials and Methods: From January 2014 to December 2020, 143 out of 859 rectal cancer patients in the PACS system were included in this study. Among them, 73 developed metachronous metastases within five years. Radiomics features were extracted from mesorectum and tumor regions in T2WI images. ANOVA, Pearson correlation analysis, and the LASSO method were used to select the most potent features, and radiomics models were established using logistic regression. Model performance was assessed by the ROC curve. The cut-off value of model was used to divide the patients into high- and low-risk groups, and metachronous metastasis-free survival was evaluated using K-M survival analysis.

Results: The joint model, combining tumor and mesorectum features, outperformed with an AUC of 0.942, while the mesorectum and tumor models achieved AUCs of 0.887 and 0.776, respectively. And in the internal validation using 5-fold cross-validation, the AUC of the joint model were 0.902(0.888-0.916) and 0.771(95% CI, 0.681–0.861) in the training and validation cohort. The DeLong test showed that the joint model was statistically different from the other two models ($p < 0.001$), highlighting the improved predictive performance. Through the K-M survival analysis, the stratification effect of the joint model radiomics score was significant ($P < 0.001$).

Conclusion: The combined radiomics model of mesorectum and tumor exhibited strong predictive capabilities for metachronous metastasis in rectal cancer and the radiomic features of the mesorectum serve as more effective biological markers.

PO-1558

Preliminary Study on CT Radiomics Model for Evaluating Peritoneal Cancer Index

Sijie Li, Qianwen Zhang, Yuan Yuan
Changhai Hospital, Shanghai

Materials and Methods: Pathologically confirmed pancreatic, colon, rectal, and gastric cancer cases with PM administered exploratory laparotomy in 2 different cohorts were retrospectively analyzed. Surgical PCIs (sPCIs) were confirmed by the surgery team, and CT-PCI scores were assessed by radiologists. Totally 63 and 27 cases in cohort 1 were assigned to the training and test groups, respectively. Then, 73 cases in cohort 2 were enrolled as an external validation set. Radiomics features were derived from the portal venous phase of preoperative abdominopelvic CT scans. Nineteen optimal features related to sPCI were finally selected. Support vector machine (SVM) was adopted for radiomics model generation. The associations of CT-PCI, radiomics PCI and sPCI were analyzed. The performances indistinguishing between low-sPCI (≤ 20) and high-sPCI (> 20) cases were also assessed by receiver operating characteristic (ROC) curve analysis and decision curve analysis (DCA).

Results: Both CT-PCI and radiomics PCI scores had positive associations with sPCI. The radiomics approach had higher agreement for detecting sPCI than CT-PCI. In addition, the radiomics model had enhanced diagnostic performance than CT-PCI (AUCs were 0.894, 0.822 and 0.810 in training, test and validation sets, respectively, vs 0.749, 0.678 and 0.693, respectively). The net reclassification index was 0.266. The usefulness of the proposed model was confirmed by DCA in an external validation set.

Conclusion: The present pilot study showed that the radiomics model based on preoperative abdominopelvic CT has increased agreement and diagnostic performance in detecting sPCI than CT-PCI in patients with PM, which could be used to optimize individualized treatment strategies.

PO-1559

Diagnostic Accuracy of liver and spleen stiffness on Magnetic Resonance Elastography for the Detection of Gastroesophageal Varices: A Systematic Review and Meta-analysis

You Zheng, Daijing Guo
The Second Affiliated Hospital of Chongqing Medical University

Objective: The aim of this meta-analysis was to assess the performance of magnetic resonance elastography (MRE) for gastroesophageal varices in patients with chronic liver disease (CLD).

Method: Literature search in English and Chinese databases such as PubMed, EMBASE, Cochrane Library, Web of Science, and China National Knowledge Infrastructure was conducted. The pooled sensitivity (SEN), specificity (SPE), diagnostic odds ratio (DOR), and area under curve (AUC) of the summary receiver-operating characteristic (SROC) curve with 95%CI were calculated. The quality analysis of the included study was evaluated by the QUADAS-2 tool, and the meta-analysis was performed with Stata16.

Result: A total of nine relevant articles that compared LS or SS (using MRE) with EGD for detecting the existence of GEV were identified. The pooled summary sensitivity, specificity, PLR, NLR, and DOR of liver or spleen stiffness for the detection of GEV were 81% (95% CI: 74%, 87%), 72% (95% CI: 62%, 80%), 2.89 (95% CI: 2.12, 3.94), 0.26 (95% CI: 0.19, 0.36) and 10.91 (95% CI: 6.53, 18.24), respectively.

Conclusion: Given these results, magnetic resonance elastography expresses good diagnostic accuracy for gastroesophageal varices.

PO-1560

Development and Validation of CT-based Radiomics Deep Learning Signatures to Preoperatively Predict Lymph Node Metastasis in Non-functional Pancreatic Neuroendocrine Tumor: A Multi-cohort Study

Wei Tang
Fudan University Shanghai Cancer Center

Purpose:

Lymph node status is an important factor for the patients with non-functional pancreatic neuroendocrine tumors (NF-PanNETs) with respect to surgical methods, prognosis, recurrence. Our aim is to develop and validate a combination model based on contrast-enhanced CT images to preoperatively predict the lymph node metastasis (LNM) in NF-PanNETs.

Materials and Methods:

Retrospective data were gathered for 320 patients with NF-PanNETs who underwent curative pancreatic resection and CT imaging at two institutions (Center 1, n= 236 and Center 2, n=84) between January 2010 and March 2022. RDPs (Radiomics deep learning signature) were developed based on ten machine-learning techniques. These signatures were integrated with the clinicopathological factors into a nomogram for clinical applications. The evaluation of the model's performance was conducted through the metrics of the area under the curve (AUC).

Results:

The RDP signature showed excellent performance in both centers with a high AUC for predicting LNM and DFS in Center 1 (AUC, 0.88; 95% CI: 0.84, 0.92; DFS, p <.05) and Center 2 (AUC, 0.91;

95% CI: 0.85, 0.97; DFS, $p < .05$). The clinical factors of vascular invasion, perineural invasion, and tumor grade were associated with LNM ($p < .05$). The combination nomogram showed better prediction capability for LNM (AUC, 0.93; 95% CI: 0.89, 0.96). Notably, our model maintained a satisfactory predictive ability for tumors at the 2-cm threshold, demonstrating its effectiveness across different tumor sizes in Center 1 (≤ 2 cm: AUC, 0.90 and > 2 cm: AUC, 0.86) and Center 2 (≤ 2 cm: AUC, 0.93 and > 2 cm: AUC, 0.91).

Conclusions:

Our RDPs may have the potential to preoperatively predict LNM in NF-PanNETs, address the insufficiency of clinical guidelines concerning the 2-cm threshold for tumor lymph node dissection, and provide precise therapeutic strategies.

PO-1561

MRI-based multiregional radiomics for pretreatment prediction of distant metastasis after neoadjuvant chemoradiotherapy in patients with locally advanced rectal cancer

Rui Zhao, Hongmei Zhang
Cancer Hospital Chinese Academy of Medical Sciences

Purpose: To develop and validate a nomogram based on intratumoral and peritumoral radiomics signatures for pretreatment prediction of distant metastasis-free survival (DMFS) in patients after neoadjuvant chemoradiotherapy (NCRT) with locally advanced rectal cancer (LARC).

Methods and Materials: This retrospective study included 230 patients (161 training cohort; 69 validation cohort) with LARC who underwent NCRT and surgery. Radiomics features were extracted on T2-weighted images from gross tumor volume (GTV) and volumes of 4-mm, 6-mm, and 8-mm peritumoral regions (PTV₄, PTV₆, and PTV₈). The least absolute shrinkage and selection operator (LASSO)-Cox analysis were used for features selection and models construction. The performance of each model in predicting DMFS was evaluated by the Concordance index (C-index) and time-independent receiver operating characteristic curve (ROC).

Results: The PTV₄ radiomics model demonstrated superior performance compared to the PTV₆ and PTV₈ radiomics models, with C-indexes of 0.750 and 0.703 in the training and validation cohorts, respectively. The nomogram was constructed by integrating the GTV radiomics signature, PTV₄ radiomics signature, and relevant clinical characteristics, including CA19-9 level, clinical T stage, and clinical N stage. The nomogram achieved C-indexes of 0.831 and 0.748, with corresponding AUCs of 0.872 and 0.808 for 5-year DMFS in the training and validation cohorts, respectively. Kaplan-Meier analysis revealed that a cut-off value of 1.653 effectively stratified patients into high- and low-risk groups for DM ($p < 0.001$).

Conclusion: The intra-peritumoral radiomics nomogram is a favorable tool for clinicians to develop personalized systemic treatment and intensive follow-up strategies to improve patient prognosis.

PO-1562

Preoperative prediction of renal fibrous capsule invasion in clear cell renal cell carcinoma using CT-based radiomics model

Yaodan Zhang, Jinkun Zhao, Zhijun Li, Meng Yang, Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

Abstract

Objectives: To develop radiomics-based classifiers for preoperative prediction of fibrous capsule invasion in RCC patients by CT images.

Methods: In this study, clear cell RCC (ccRCC) patients who underwent both preoperative abdominal contrast-enhanced CT and nephrectomy surgery at our hospital were analyzed. By transfer learning, we used base model obtained from Kidney Tumor Segmentation (KiTS) challenge dataset to semi-automatically segment kidney and tumors from corticomedullary phase (CMP) CT images. Dice similarity coefficient (DSC) was measured to evaluate the performance of segmentation models. The least absolute shrinkage and selection operator (LASSO) algorithm was used to select the most related features. Ten machine learning classifiers were compared in our study. Performance of the models was assessed by their accuracy, precision, recall and area under the receiver operating characteristic curve.

Results: This retrospective study enrolled 163 ccRCC patients. The semiautomatic segmentation model using CMP CT images obtained DSCs of 0.98 on training cohort and 0.96 on test cohort for kidney segmentation, and DSCs of 0.94 and 0.86 for tumor segmentation on training and test set, respectively. For preoperative prediction of renal capsule invasion, the AdaBoost had best performance in batch1, with accuracy, precision, recall and F1-score equal to 0.8571, 0.9091, 0.8333 and 0.8696, respectively; and the same classifier was also the most suitable for this classification in batch 2. Nine common significant features for classification were found from two independent batch datasets, including morphological and texture features.

Conclusions: The CT-based radiomics classifiers performed well for preoperative prediction of fibrous capsule invasion in ccRCC.

Advances in knowledge: Noninvasive prediction of renal fibrous capsule invasion in RCC is rather difficult by abdominal CT images before surgery.

A machine learning classifier integrated with radiomics features shows a promising potential to assist surgical treatment options for RCC patients.

PO-1563

Development of a CT-based scoring system to predict progression after intraoperative radiotherapy in locally advanced pancreatic cancer with initial stable disease

Wei Cai, Yong-Jian Zhu
中国医学科学院肿瘤医院

Objectives: We aimed to develop a risk scoring system integrating CT imaging features and serum carbohydrate antigen 19-9 (CA19-9) for stratifying the short-term outcomes in locally advanced pancreatic cancer (LAPC) patients receiving intraoperative radiotherapy (IORT) with initial stable disease (SD).

Materials and Methods: We retrospectively recruited 103 consecutive patients with LAPC who received IORT as first-line treatment. All patients underwent CT examinations and serum CA19-9 test baseline and post-IORT. Clinical and CT imaging features were analyzed. The risk scoring

system was constructed using the coefficient of the independent risk factors for progression-free survival (PFS) from cox regression model. Time-dependent receiver operating characteristic (ROC) curve was used to evaluate the predictive performance of the scoring system.

Results: All patients developed disease progression after IORT and the median PFS time was 6.40 (4.95–7.86) months. Multivariable analysis revealed that CA19-9 non-response (hazard ratio [HR] = 1.672, $P = 0.018$), the percentage change of relative enhanced ratio (HR = 2.318, $P = 0.030$), rim-enhancement (HR = 1.784, $P = 0.007$), and peripancreatic fat infiltration (HR, 1.799, $P = 0.006$) were significant correlated with poor PFS. Time-dependent ROC showed a satisfactory predictive performance for disease progress with area under the curve (AUC) all above 0.70. Low-risk patients (risk score < 5) progress significantly slower than high-risk patients (risk score ≥ 5) ($P < 0.001$).

Conclusion: The scoring system integrating CT imaging features and CA19-9 can be used as a convenient and practical method for prognosis prediction in LAPC patients showing SD receiving IORT.

PO-1564

4. The Value of Deep Learning Image Reconstruction Algorithm on Double-Low Renal artery CTA

Xiaobo Ding
the first hospital of jilin university

Objective: To assess the influence of deep learning image reconstruction(DLIR) algorithm on image quality of renal arteries CT angiography with low radiation dose and contrast volume technique.

Materials and Methods: This prospective study included five patients suspicious of renal hypertension. All patients were scanned by Revolution CT with the below scanning parameters: 80 kV, noise index of 24, automatic current modulation(mA range of 200-600), rotation speed of 0.5 s, collimation of 128x0.625 mm, pitch of 0.992:1, 50% ASIR-V, standard kernel, bolus tracking technique. Data acquisition was initiated after breath holding when the CT value reached a threshold of 100 Hounsfield units (HU) in a region-of-interest (ROI) in the descending aorta. The volume and injection rate of contrast agent(320 mgI/ml) were 40 ml and 4 ml/s. Raw data were retrospective constructed by three algorithms: DLIR-H, DLIR-M and ASIR-V 50%. CT values and standard deviations(SD) of abdominal aorta, subcutaneous adipose tissue(SAT), proximal and distal segments of bilateral renal artery at the level of renal hilus, upper and lower segmental renal arteries of left and right kidneys were measured to calculate signal noise ratio(SNR, $SNR = CT \text{ value} / SD$). SD of SAT was defined as background noise. CTDI and Dose length product(DLP) was recorded. Two radiologists evaluated images using a 4-point scale(1.poor;2.moderate;3.good;4.excellent). Wilcoxonsigned-rank test were used to analyze the differences among any 2 groups. p value <0.05 was considered significant.

Results: The CTDI and DLP were 2.15 mGy and 81.24 mGy·cm. There were no differences in CT values of various tissues between any two groups($p > 0.05$). All SNRs were highest for DLIR-H, followed by DLIR-M, were lowest for ASIR-V ($p < 0.05$ each). SD of SAT for DLIR-H was significantly lower than DLIR-M and ASIR-V(10.83 vs. 17.21, $p = 0.002$; 10.83 vs. 21.58, $p < 0.001$). No significant differences in subjective evaluation were found among groups($p > 0.05$).

Conclusion:DLIR-H is the optimal algorithm for double-low renal artery CTA.

Clinical Relevance: The image quality is better for the deep learning algorithm of low dose renal artery CTA of Ge revolution 256 row wide body CT than that of traditional iterative algorithm, which can improve the successful rate of diagnosis and confidence of clinicians, reduce the rate of misdiagnosis, reduce the radiation dose and contrast agent dosage of patients, and reduce the burden of liver and kidney of patients.

PO-1565

Diagnostic benefit of dual-energy spectral CT imaging over conventional contrast-enhanced CT in patients with bladder cancer

Chunlei He¹, Lei Ye¹, Yuntian Chen¹, Bin Song^{1,2}, Jin Yao¹

1. Sichuan University

2. Department of Radiology, Sanya People's Hospital

Purpose: To assess the clinical applicability of local tumor staging in bladder cancer (BC) with quantitative parameters derived from preoperative spectral computed tomography (CT).

Methods and Materials: Patients who were suspected of BC were prospectively recruited in March 2022 and April 2022. All patients underwent transurethral resection or radical cystectomy after spectral CT scanning. Patients with pathologically confirmed urothelial carcinoma were finally included. Iodine concentration, virtual non-contrast (VNC) images, electron density (ED) and effective atomic number (Zeff) were calculated. The diagnostic performance of the quantitative parameters for discriminating muscle-invasive BC (MIBC) from non-muscle invasive BC (NMIBC) was assessed by receiver operating characteristic curves (ROC).

Results: A total of 60 patients with BC were finally included, including 16 MIBC and 44 NMIBC. No significant difference was observed between MIBC and NMIBC regarding age, sex, pathological grade, and surgery method. The VNC attenuation and ED in VP from spectral CT in the MIBC group were significantly higher than those in NMIBC group (both P values <0.05). The VNC attenuation showed slightly higher diagnostic performance (AUC = 0.734), sensitivity (0.750 vs. 0.813), and specificity (0.659 vs. 0.591) than the ED between MIBC and NMIBC images (AUC = 0.733). The ROC analysis showed there was no improvement in discriminating MIBC from NMIBC after combining the ED in VP and VNC attenuation (AUC: 0.733, sensitivity: 81.30%, specificity: 59.1%).

Conclusions: Quantitative parameters derived from preoperative spectral CT, including VNC attenuation and electron density performed moderate in predicting MIBC pre-operatively.

PO-1566

Mono+ algorithm assessment of the diagnostic value of dual-energy CT for high-risk factors for colorectal cancer: a preliminary study

Junfan Chen, XINJIE LIU

重庆医科大学附属第二医院

Objective: To assess the diagnostic value of dual-phase, DECT based on the Mono+ algorithm for high-risk factors for colorectal cancer (CRC).

Methods: This prospective study was performed from 2021-2023. A dual-phase DECT protocol was performed for consecutive patients with primary CRC. The SNR, CNR, overall image quality, lesion delineation and image noise of the dual-phase DECT images were assessed. Then, the optimal energy level image was selected to analyze the IC, NIC, Z, Rho, DEI, and slope of the energy spectrum curve within the tumor between the high- and low-risk CRC groups. Multifactor binary logistic regression analysis was used to construct a differential diagnostic regression model for high- and low-risk CRC; receiver operating characteristic curves were plotted, and AUC was calculated to assess the diagnostic value of the model.

Results: A total of 74 patients were enrolled in this study, namely, 41 patients with high-risk factors and 33 patients with low-risk factors. The SNR and CNR were best at 40 keV virtual monoenergetic

imaging (VMI+) (SNR 8.79 ± 1.27 , CNR 14.89 ± 1.77 , $P < 0.03$). The overall image quality and lesion contours were best at 60 keV VMI+ and 40 keV VMI+, respectively ($P < 0.01$). Among all the DECT parameters, the AP-IC, NIC, DEI and IHU and the VP-NIC were statistically different between the two groups. AP-IC was the optimal DECT parameter for predicting high- and low-risk CRC, with AUC, sensitivity, specificity and cutoff values of 0.96, 97.06, 87.80 and 2.94, respectively. Integrating the clinical factors and DECT parameters, the AUC, sensitivity, specificity and predictive accuracy of the model were 0.99, 97.06, 90.24 and 89.33%, respectively.

Conclusions: The DECT parameters based on 40 keV noise-optimized VMI+ reconstruction images could depict CRC tumors best, and the clinical DECT model may have significant implications for the preoperative prediction of high-risk factors in CRC patients.

PO-1567

Bi-regional quantitative dynamic contrast-enhanced MRI-based nomogram for prediction of microvascular invasion in solitary hepatocellular carcinoma and its significance for prognosis and treatment

Yongjian Zhu, Peng Wang, Zhaowei Chen, Rong Cong, Xiaohong Ma, Xinming Zhao

Department of Imaging Diagnosis, Cancer Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College, Beijing China, 100021

Purpose The peritumoral region (PTR) of liver is the main-site of microvascular invasion (MVI) taken place in hepatocellular carcinoma (HCC), and contains perfusion information which can reflect the hemodynamic change during MVI. We aimed to construct a nomogram based on quantitative dynamic contrast-enhanced MRI (DCE-MRI) for predicting MVI of HCC in both intra-tumoral region (ITR) and PTR, and to assess the its ability for stratifying the risk of recurrence after hepatectomy and directing the choice of hepatectomy approaches.

Methods A total of 133 HCC patients who underwent quantitative DCE-MRI studies between October 2019 and September 2021 were enrolled in our hospital. Arterial fraction (ART), arterial blood flow (Ft), portal-venous total (Fp), blood flow (Ft), distribution volume (DV), and mean transit time (MTT) were obtained from dual-input single compartment model in both ITR and PTR. Variables were compared using Student's t-test, Mann-Whitney U, χ^2 , or Fisher's exact test as appropriate. A combined perfusion DCE parameter (C_{DCE}) was constructed to predict MVI. A nomogram incorporating and clinical-radiological (CR) features and C_{DCE} was constructed through multivariate logistic regression analyses for MVI prediction. The performance of the nomogram was assessed with respect to ROC curve analysis, discrimination calibration, and decision curve analysis. The Kaplan–Meier survival analysis was used to explore the prognostic significance of the prediction results of the nomogram and the survival benefits of hepatectomy approaches [anatomical resection (AR) or non-anatomical resection (NAR)].

Results Multivariate analysis showed that AFP, corona enhancement, two-trait predictor of venous invasion (TTPVI), and C_{DCE} were independent predictors of MVI (all $p < 0.05$). The nomogram based on these variables showed good discrimination and calibration with the areas under the receiver operating characteristic curve (AUC) of 0.966 (0.935–0.996). Decision curve analysis confirmed the clinical usefulness of these nomogram. Survival analysis demonstrated that the nomogram could stratify HCC patients in terms of recurrence-free survival (RFS) according to the predicted risk of MVI ($p < 0.001$). AR was associated with better RFS than NAR in high-risk group ($p = 0.014$), while no significant effect observed in the low-risk group ($p = 0.610$).

Conclusion The nomogram combining the perfusion DCE parameters and clinical-radiological features achieved preoperative non-invasive MVI risk prediction and patient benefit assessment after hepatectomy, which may help clinicians implement more appropriate interventions.

PO-1568

Texture Analysis Based on Iodine Based Material Decomposition Images of Spectral CT Imaging for Predicting the Expression of Ki-67 in Colorectal Cancer

Yue Wang¹, Anliang Chen¹, Yuhui Liu³, Qingwei Song¹, Ailian Liu^{1,2}

1. First Affiliated Hospital, Dalian Medical University

2. Dalian Engineering Research Center for Artificial Intelligence in Medical Imaging, Dalian Liaoning, China

3. Dalian Medical University

Purpose:

To investigate the value of texture analysis based on iodine based material decomposition images of spectral CT imaging in prediction the expression of Ki-67 in colorectal cancer.

Methods and Materials:

The 78 colorectal cancer patients confirmed by postoperative pathology were included in our study. All patients have underwent Revolution CT enhanced spectral imaging scan in our hospital within one month before surgery. The post-operative tissues have been tested by immunohistochemical examination to detect the protein expression levels of Ki-67 (group 1: $\leq 50\%$, low expression, $n=13$; group 2: $> 50\%$, high expression, $n=65$). Import all the images into GE AW 4.6 workstation and reconstruct the arterial phase iodine (water) maps using GSI Viewer software. Export them with Digital Imaging and Communications in Medicine (DICOM) format. Select the slice with the largest axial diameter of the colorectal cancer and its adjacent upper and lower Slices. The ITK-SNAP software was used to perform lesion segmentation (Figure 1). Use the Artificial Intelligent Kit software to extract 107 radiomics features, including histogram features, texture features, and shape features. Because of the imbalance of the samples, we used Synthetic Minority Over-sampling Technique (SMOTE) method with R software to overcome imbalances. Use the independent-samples t-test or the Mann Whitney U test to compare the differences between two groups according to the normality of data distribution. Logistic regression and receiver operating characteristic (ROC) curve analyses were performed to evaluate the diagnostic efficiency of parameters.

Results:

We extracted 107 radiomics features, including histogram features, texture features, and shape features. 20 parameters were different between the two groups (The details were shown in Table 1). Their diagnostic efficacy, and the area under the curve (AUC), 95% confidence interval of AUC, cutoff value, sensitivity and specificity were shown in Table 2. The ROC curve were shown in Figure 2-5.

Conclusions:

The texture analysis based on arterial phase iodine (water) maps of spectral CT imaging can effectively predict the expression of Ki-67 in colorectal cancer. The texture analysis based on arterial phase iodine (water) maps of spectral CT imaging can effectively predict the protein expression of Ki-67 in colorectal cancer. It has potential to become a new way for obtaining immunohistochemical results noninvasively, which is also meaningful for predicting therapeutic response, providing treatment decisions and prognosis prediction in colorectal cancer.

PO-1569

Dual-layer spectral-detector CT for predicting microsatellite instability status and prognosis in locally advanced gastric cancer

Yongjian Zhu, Peng Wang, Liming Jiang, Xinming Zhao

Department of Imaging Diagnosis, Cancer Hospital, Chinese Academy of Medical Sciences & Peking Union Medical College, Beijing China, 100021

Objective To construct and validate a prediction model based on dual-layer detector spectral CT (DLCT) and clinicoradiological features to predict the microsatellite instability (MSI) status of gastric cancer (GC) and to explore the relationship between the prediction results and patient prognosis.

Methods A total of 264 GC patients who underwent preoperative DLCT examination were randomly allocated into the training set ($n = 187$) and validation set ($n = 80$). Clinicoradiological features and DLCT parameters were used to build the clinical and DLCT model through multivariate logistic regression analysis. A combined DLCT parameter (C_{DLCT}) was constructed to predict MSI. A combined prediction model was constructed using multivariate logistic regression analysis by integrating the significant clinicoradiological features and C_{DLCT} . The Kaplan–Meier survival analysis was used to explore the prognostic significance of the prediction results of the combined model.

Results In this study, there were 70 (26.52%) of MSI-high (MSI-H) GC patients. Tumor location and CT_N staging were independent risk factors for MSI-H. In the validation set, the area under the curve (AUC) of the clinical model and DLCT model for predicting MSI status was 0.721 and 0.837, respectively. The combined model achieved a high prediction efficacy in the validation set, with AUC, sensitivity, and specificity of 0.879, 78.95%, and 75.4%, respectively. Survival analysis demonstrated that the combined model could stratify GC patients according to recurrence-free survival ($p = 0.010$).

Conclusion The combined model provides an efficient tool for predicting the MSI status of GC noninvasively and tumor recurrence risk stratification after surgery.

PO-1570

An MRI-based pelvimetry nomogram for predicting surgical difficulty of transabdominal resection in patients with middle and low rectal cancer

Minglu Liu, Fu Shen, Chenwei Shao

Changhai Hospital Affiliated to Navy Medical University

Objective: The current work aimed to develop a nomogram comprised of MRI_x0002_based pelvimetry and clinical factors for predicting the difficulty of rectal surgery for middle and low rectal cancer (RC). **Methods:** Consecutive mid to low RC cases who underwent transabdominal resection between June 2020 and August 2021 were retrospectively enrolled. Univariable and multivariable logistic regression analyses were carried out for identifying factors (clinical factors and MRI-based pelvimetry parameters) independently associated with the difficulty level of rectal surgery. A nomogram model was established with the selected parameters for predicting the probability of high surgical difficulty. The predictive ability of the nomogram model was assessed by the receiver operating characteristic (ROC) curve and decision curve analysis (DCA). **Results:** A total of 122 cases were included. BMI (OR = 1.269, $p = 0.006$), pelvic inlet (OR = 1.057, $p = 0.024$) and intertuberos distance (OR = 0.938, $p = 0.001$) independently predicted surgical difficulty level in multivariate logistic regression analysis. The nomogram model combining these predictors had an area under the ROC curve (AUC) of 0.801 (95% CI: 0.719–0.868) for the prediction of a high level of surgical difficulty. The DCA suggested that using the nomogram to predict surgical difficulty

provided a clinical benefit. Conclusions: The nomogram model is feasible for predicting the difficulty level of rectal surgery, utilizing MRI-based pelvimetry parameters and clinical factors in mid to low RC cases.

PO-1571

Intussusception caused by an inverted colonic diverticulum: a case report

Jiping Wang,Xin Shi,Bei Zhang
First Hospital of Jilin University

Background: Intussusception is an unusual disorder among the complications of diverticula in adults. This study aimed to report intussusception due to an inverted colonic diverticulum. Such a large inverted colonic diverticulum has rarely been reported.

Case presentation: A 62-year-old Chinese woman presented to the First Hospital of Jilin University with abdominal pain, vomiting, and bloody stool. Preoperative computed tomography imaging indicated intussusception. The intraoperative diagnosis was consistent with postoperative pathology. Our patient was diagnosed as having an inverted colonic diverticulum near the ileocecal valve with intussusception and intestinal necrosis.

Conclusion: Although inverted colonic diverticulum is extremely rare, it should also be considered among the causative factors of intussusception

PO-1572

Which Definition of Upper Rectal Cancer Is Optimal in Selecting Stage II or III Rectal Cancer Patients to Avoid Postoperative Adjuvant Radiation?

Minglu Liu,Fu Shen,Chenwei Shao,Xianhua Gao
Changhai Hospital Affiliated to Navy Medical University

Background: In most guidelines, upper rectal cancers (URC) are not recommended to take neoadjuvant or adjuvant radiation. However, the definitions of URC vary greatly. Five definitions had been commonly used to define URC: 1) >10 cm from the anal verge by MRI; 2) >12 cm from the anal verge by MRI; 3) >10 cm from the anal verge by colonoscopy; 4) >12 cm from the anal verge by colonoscopy; 5) above the anterior peritoneal reflection (APR). We hypothesized that the fifth definition is optimal to identify patients with rectal cancer to avoid adjuvant radiation. Methods: The data of stage II/III rectal cancer patients who underwent radical surgery without preoperative chemoradiotherapy were retrospectively reviewed. The height of the APR was measured, and compared with the tumor height measured by digital rectal examination (DRE), MRI and colonoscopy. The five definitions were compared in terms of prediction of local recurrence, survival, and percentages of patients requiring radiation. Results: A total of 576 patients were included, with the intraoperative location of 222 and 354 tumors being above and straddle/below the APR, respectively. The median distance of the APR from anal verge (height of APR) as measured by MRI was 8.7 (range: 4.5–14.3) cm. The height of APR positively correlated with body height ($r=0.862$, $P<0.001$). The accuracy of the MRI in determining the tumor location with respect to the APR was 92.1%. Rectal cancer above the APR had a significantly lower incidence of local recurrence than those straddle/below the APR ($P=0.042$). For those above the APR, there was no significant difference in local recurrence between the radiation and no-radiation group. Multivariate analyses showed that tumor location regarding APR was an independent risk factor for LRFS. Tumor height as measured by DRE, MRI and colonoscopy were not related with survival outcomes.

Fewer rectal cancer patients required adjuvant radiation using the definition by the APR, compared with other four definitions based on a numerical tumor height measured by MRI and colonoscopy. Conclusions: The definition of URC as rectal tumor above the APR, might be the optimal definition to select patients with stage II/III rectal cancer to avoid postoperative adjuvant radiation.

PO-1573

Renal fat deposition measured on Dixon-based MRI is significantly associated with early kidney damage in obesity

Huali Tang, Ping Yang, Xiaofang Zhao, Yi Li, Yun Mao
The First Affiliated Hospital of Chongqing Medical University

Background: Obesity is an independent risk factor for the occurrence and development of chronic kidney disease (CKD). Obesity could lead to renal fat deposition, which often occurs in the perirenal space, renal sinus, and renal parenchyma. This study was aimed to investigate the renal fat deposition on Dixon-based magnetic resonance imaging and explore whether the renal fat biomarkers of magnetic resonance (MR-RFBs) have predictive value for early kidney damage in obesity.

Methods: This prospective study included 56 obese volunteers and 47 non-obese healthy volunteers. All volunteers underwent renal magnetic resonance examinations. The differences in MR-RFBs [including renal proton density fat fraction (PDFF), renal sinus fat volume (RSFV), and perirenal fat thickness (PRFT)] measured on Dixon-based MRI between the obese and non-obese volunteers were analyzed using a general linear model, taking sex, age, diabetes, and hypertension as covariates. The relationship between estimated glomerular filtration rate (eGFR) and demographic, laboratory, and imaging parameters in obese volunteers was examined by correlation analysis.

Results: All of the MR-RFBs in obese volunteers were significantly higher than those in non-obese volunteers after controlling for age, sex, diabetes, and hypertension (renal PDFF, $p = 0.003$; RSFV, $p = 0.002$; PRFT, $p < 0.001$). Renal PDFF ($r = -0.285$; $p = 0.033$), RSFV ($r = -0.279$; $p = 0.038$), and PRFT ($r = -0.416$; $p = 0.001$) were significantly negatively correlated with eGFR in obesity. After adjusting for age, sex, body mass index, diabetes, hypertension, visceral adipose tissue, subcutaneous adipose tissue, renal PDFF, and RSFV, PRFT remained independently negatively associated with eGFR ($\beta = -0.587$; $p = 0.003$).

Conclusions: MR-RFBs are negatively correlated with eGFR in obesity. The MR-RFBs, especially PRFT, may have predictive value for early kidney damage in obesity.

PO-1574

Magnetic resonance diagnosis of polypoid endometriosis

Yuequan Shi, HAI PING DONG, CHUN XIA CHEN, XIA PING CHEN, QING XIA YANG
Fujian Provincial Maternity and Childrens Hospital

Purpose: Polypoid endometriosis (PEM) is a rare type of endometriosis. Its location and clinical manifestations are similar to EM, some patients' clinical manifestations are similar to malignant tumors, which are easily misdiagnosed as malignant tumors or confused with other diseases. The prognosis of PEM patients is good, and reproductive function can be preserved by local tumor resection. Accurate preoperative diagnosis is important for women with reproductive needs. Previous reports mostly describe the clinical and pathological features of PEM. In this report, we describe and summarize the imaging findings of 8 cases of PEM, and discuss the correlation

between magnetic resonance imaging and pathological findings. **Methods and Materials:** Eight patients, aged from 31 to 67 years (mean 42.4 ± 10.4 years), underwent 1.5 T superconducting MRI. Axial, sagittal and coronal images of T2WI, axial T1WI, DWI, ADC and dynamic enhanced scanning images were obtained. The lesion size, location, growth pattern, signal intensity, internal structure, hemorrhage and necrosis, and invasion of surrounding structures were analyzed. The intensity was compared with the signal intensity of myometrium and endometrium. To find out the correlation between these radiological findings and pathological findings. ***Results:** PEM was single, 2 cases located in muscular layer, adnexal region in 5 cases, broad ligament in 1 case, cystic-solid changes in 7 cases and solid changes in 1 case with clear boundary. The solid part of the mixed tumor showed low signal intensity on T1WI, nodular and high signal intensity on T2WI, the solid nodule inside with low signal ring at the edge, high signal intensity on DWI and ADC. The solid part showed uneven enhancement and was weaker than or similar to myometrium, with a rapid rise enhancement curve. The signal of cystic part was mixed. and enhanced scan showed no enhancement. **Conclusions:** PEM is mainly composed of endometrial-like glands and interstitial components. Some glands are cystic dilated, some are dense in cells or with mitotic phase. MRI shows clear solid part boundary of the mass, T2WI shows vesicle-like changes, corresponding to cystic dilated acini seen under microscope, and the distribution of fiber bundles in solid part is consistent with the low signal band on the solid part edge of the image. On DWI and ADC, the lesions were similar to endometrial polyps, which could be distinguished from other malignant pelvic masses. Mixed bleeding signals in different periods of cystic part suggest evidence of endometriosis. These may be the characteristics of PEM. **Clinical Relevance/Application:** Magnetic resonance imaging of polypoid endometriosis is related to pathology, and imaging features may provide accurate preoperative diagnosis.

PO-1575

Three-dimensional MR Elastography Identifies Portal Hypertension in Cirrhosis: A Prospective Multicenter Study

Zhiying Wang¹, Xiaolong Qi², Shenghong Ju², He Zhu³, Zhenghan Yang⁴, Jie Chen⁵, Meng Niu⁶, Jin Wang⁷, Yong Zhang⁸, Yu Shi¹

1. 中国医科大学附属盛京医院
2. 东南大学附属中大医院
3. 沈阳市第六人民医院
4. 首都医科大学附属北京友谊医院
5. 四川大学华西医院
6. 中国医科大学附属第一医院
7. 中山大学附属第三医院
8. 郑州大学第一附属医院

Purpose: To develop a non-invasive multivariate models based on Three-dimensional MR elastography (3D-MRE) to determine portal hypertension (PH), particularly to diagnose clinically significant portal hypertension (CSPH, HVPg>10mmHg) and severe portal hypertension (SPH, HVPg>12mmHg), using Hepatic Venous Pressure Gradient(HVPg) as the gold standard.

Methods and Materials: This prospective, multicenter study enrolled patients with cirrhosis scheduled for HVPg, and who intended to undergo MR imaging (including 3D-MRE and diffusion-, T1-, and T2-weighted imaging) before the HVPg procedure. A total of 57 patients were recruited from five institutions. Multiple viscoelastic parameters of the liver and spleen, as well as shear stiffness (SS) ratios and subtraction values, were evaluated independently by two radiologists. Univariable and multivariable linear regression analyses were conducted to assess the associations between mechanical parameters and HVPg. Univariable and multivariable logistic regression analyses were used to predict CSPH and SPH, respectively.

Results: HVPg showed the strongest positive correlation with splenic SS at 60Hz ($r = 0.785$; $P < .001$), followed by hepatic SS at 30Hz ($r = 0.631$; $P < .001$), splenic SS at 30Hz ($r = 0.612$; P

< .001), hepatic SS at 60Hz ($r = 0.547$; $P < .001$). Multivariable linear regression analysis showed splenic SS at 60Hz ($\beta = 1.017$; 95% CI: 0.71, 1.325; $P < .001$), liver SS ratio ($\beta = -2.359$; 95% CI: -4.477, -0.241; $P = .03$), and liver stiffness difference ($\beta = 1.169$; 95% CI: 0.251, 2.087; $P = .001$) was the independent factors determining HVP. Approximately 56.5% of the total variability in HVP was explained by these 3 variables (adjusted $R^2 = 0.565$). Logistic regression analysis showed splenic SS at 60Hz (OR = 2.217 [95% CI: 1.292, 3.803]; $P = 0.004$) and liver SS at 30Hz (OR = 6.211 [95% CI: 1.218, 31.669]; $P = 0.028$) were independently associated with CSPH, establishing a model with excellent performance in diagnosing CSPH (area under the receiver operating characteristic curve [AUC], 0.975 [95% CI: 0.79, 0.99]). As for SPH, it showed splenic SS at 60Hz (OR = 1.65 [95% CI: 1.25, 2.16]; $P = .001$) were independently associated with HVP, also with better performance (AUC, 0.969 [95% CI: 0.81, 0.98]).

Conclusions: 3D-MRE with dual frequencies is a very promising method in both predicting HVP and diagnosing the presence CSPH and SPH. Splenic stiffness at 60Hz, combining liver stiffness ratio (60Hz/30Hz) and differences (60Hz-30Hz), was the independent parameters associating HVP.

PO-1576

Differentiation of Crohn's disease from intestinal tuberculosis by clinical, endoscopic and radiological features

Wenxin Chen

Department of Medical Imaging, Subei People's Hospital, Medical School of Yangzhou University

Objective: Similar clinical, radiological and endoscopic features are exhibited by Crohn's disease (CD) and intestinal tuberculosis (ITB). The purpose of the present study was to compare the clinical, radiological and endoscopic features of these two disorders.

Methods: 79 patients with CD and 72 patients with ITB were studied retrospectively. The clinical, radiological and endoscopic features were undertaken to investigate differences in these two disease characteristics.

Results: It was determined that the indicative clinical features of CD were hematochezia and perianal disease, whereas those of ITB included the occurrence of ascites, pulmonary tuberculosis and night sweats ($P < 0.05$). Endoscopic manifestations indicative of CD were longitudinal ulcers and a cobblestone appearance to the mucosa, while the manifestations indicative of ITB were ring- and rodent-like

ulcers ($P < 0.05$). The computed tomography (CT) manifestations indicative of CD included mural stratification, intramural gas, intramural fat, intestinal stricture and the comb sign, whereas the manifestations indicative of ITB were a mural single layer and necrotic lymph nodes ($P < 0.05$).

Conclusion: The present study indicates that the combined evaluation of clinical features, endoscopy and CT is key to differentiating between CD and ITB.

PO-1577

The Diagnostic Value of Extracellular Volume Fraction Based on CT Scan in Differentiating Clear Cell Renal Carcinoma from Minimal Fat Renal Angiomyolipoma

Deliang Ma, Li Hao, Yang Song
Dalian Municipal Central Hospital

Objective: To explore the value of extracellular volume fraction (ECV) calculated based on CT scan in the differential diagnosis of minimal fat renal angiomyolipoma (MFAML) and homogeneous renal clear cell carcinoma (CCRCC), and to provide useful information for clinical treatment.

Methods: A total of 33 cases of MFAML and 40 cases of homogeneous CCRCC confirmed by pathological examination after surgery were retrospectively included in Dalian Central Hospital from January 2018 to April 2023. All patients underwent abdominal enhanced CT scan before surgery, and hematocrit was collected before examination. The collected enhanced CT images were measured and calculated, the region of interest was placed in the solid area of the tumor, and the CT value of the lesion in plain scan and delayed phase was recorded respectively, the CT value of aorta in plain scan and delayed phase at the tumor level was measured, and the ECV of the two groups of lesions was calculated. Independent-sample t-test was used to compare the difference in ECV between MFAML and CCRCC. The value of ECV in the diagnosis between MFAML and CCRCC was analyzed by using the receiver operating characteristic (ROC) curve.

Results: The ECV value of homogeneous CCRCC was $59.04 \pm 16.56\%$, and that of MFAML was $35.10 \pm 18.74\%$. The ECV value of homogeneous CCRCC was higher than that of MFAML. The difference was statistically significant ($P < 0.01$). ECV had a good diagnostic efficacy in differentiating homogeneous CCRCC from MFAML. ROC curve analysis showed that the AUC (95% CI) evaluated by ECV was 0.843, sensitivity and specificity were 87.5% and 75.8%, respectively.

Conclusion: ECV has a high diagnostic efficiency in the differential diagnosis of MFAML and homogeneous CCRCC, and has certain clinical application value.

PO-1578

Pretreatment MRI-based radiomics for prediction of rectal cancer outcome: a discovery and validation study

Hongyan Huang^{1,2}, Lujun Han³, Jianbo Guo⁴, Yanyu Zhang², Shiwei Lin¹, Shengli Chen¹, Xiaoshan Lin¹, Caixue Cheng¹, Zheng Guo⁵, Yingwei Qiu¹

1. Huazhong University of Science and Technology Union Shenzhen Hospital

2. The Third Affiliated Hospital of Guangzhou Medical University

3. Sun Yat-sen University Cancer Center

4. Meizhou People's Hospital

5. Shenzhen University General Hospital

Background: Accurate prediction of local recurrence or distant metastasis is critical for developing individualized therapies for locally advanced rectal cancer (LARC) patients after standard therapy. This study aims to develop and validate a multiparameter MRI-based radiomics signature (RS) for prognostic prediction in LARC patients receiving neoadjuvant chemoradiotherapy (nCRT) and total mesorectal excision (TME) and to explore the ability of RS for personalized survival risk stratification.

Methods: In this multi-center study, 454 patients who received nCRT and TME and completed 3 years of follow-up participated. RS was constructed for prognostic prediction based on features extracted from pretreatment multiparameter MRI in a training cohort (TC; $n = 298$), which was tested in an internal validation cohort (IVC; $n = 75$) and further validated in an independent external

validation cohort (EVC; $n = 81$). Furthermore, the ability of RS for personalized survival risk stratification was explored using the Kaplan–Meier survival curves.

Results: The RS model showed satisfactory accuracy for prognostic prediction with AUCs of 0.83, 0.81 and 0.82 in the TC, IVC and EVC, respectively. In addition, RS helped to refine risk stratification for LARC patients on the basis of significantly different 3-year disease-free survival rates, independent of their pathological stage, pre-surgery CEA, and even treatment modality.

Conclusions: The proposed RS can be used not only to predict local recurrence or distant metastasis but also to serve as an effective postoperative survival risk stratification tool for clinicians to facilitate decision-making for LARC patients receiving standard treatment.

PO-1579

Multiphase and multiparameter MRI-based radiomics for prediction of tumor response to neoadjuvant therapy in locally advanced rectal cancer

Hongyan Huang^{1,2}, Lujun Han³, Jianbo Guo⁴, Yanyu Zhang¹, Shiwei Lin², Shengli Chen², Xiaoshan Lin², Caixue Cheng², Zheng Guo⁵, Yingwei Qiu^{1,2}

1. The Third Affiliated Hospital of Guangzhou Medical University
2. Huazhong University of Science and Technology Union Shenzhen Hospital
3. Sun Yat-sen University Cancer Center
4. Meizhou People's Hospital
5. Shenzhen University General Hospital

Background: To develop and validate radiomics models for prediction of tumor response to neoadjuvant therapy (NAT) in patients with locally advanced rectal cancer (LARC) using both pre-NAT and post-NAT multiparameter magnetic resonance imaging (mpMRI).

Methods: In this multicenter study, a total of 563 patients were included from two independent centers. 453 patients from center 1 were split into training and testing cohorts, the remaining 110 from center 2 served as an external validation cohort. Pre-NAT and post-NAT mpMRI was collected for feature extraction. The radiomics models were constructed using machine learning from a training cohort. The accuracy of the models was verified in a testing cohort and an independent external validation cohort. Model performance was evaluated using area under the curve (AUC), sensitivity, specificity, positive predictive value, and negative predictive value.

Results: The model constructed with pre-NAT mpMRI had favorable accuracy for prediction of non-response to NAT in the training cohort (AUC = 0.84), testing cohort (AUC = 0.81), and external validation cohort (AUC = 0.79). The model constructed with both pre-NAT and post-NAT mpMRI had powerful diagnostic value for pathologic complete response (pCR) in the training cohort (AUC = 0.86), testing cohort (AUC = 0.87), and external validation cohort (AUC = 0.87).

Conclusions: Models constructed with multiphase and multiparameter MRI were able to predict tumor response to NAT with high accuracy and robustness, which may assist in individualized management of LARC.

PO-1580

Nomogram Using CT Radiologic Features and Clinical Risk Factors for Preoperative Estimation of Microvascular Invasion in Hepatocellular Carcinoma: Multicenter Development and External Validation Study

Yuxi Tao¹, Jiayue Han¹, Tao Liu², Junyu Lin¹, Hanqiu Zeng¹, Lianmei Luo¹, Pinxiong Li³, Zhuang Kang⁴, Zaiyi Liu³, Yao Lu^{2,5}, Yaqin Zhang¹

1. the Fifth Affiliated Hospital of Sun Yat-sen University

2. Perception Vision Medical Technologies Co Ltd

3. Guangdong Provincial People's Hospital & Guangdong Academy of Medical Sciences

4. the Third Affiliated Hospital of Sun Yat-sen University

5. School of Data and Computer Science of Sun Yat-sen University

Objectives: Construction of a visible nomogram for microvascular invasion (MVI) prediction in hepatocellular carcinoma (HCC) patients using clinical and imaging features to guide treatment decisions.

Materials & Methods: This retrospective multicenter study enrolled 335 patients (252 in the training cohort and 83 in the external validation cohort) with pathologically confirmed HCC from three independent institutions. Imaging characteristics were evaluated from contrast CT images before treatment. Texture features were extracted in the regions shrunk and dilated 5 mm from the boundary of the tumor. In the training cohort, the clinical radiological (CR) model and clinical radiological texture feature (CRT) models were developed by logistic regression analysis, with ultimate models visualized as nomograms. Subgroup analyses were conducted by tumor size and the best cut-off value of tumor size for MVI prediction was determined by maximizing the Youden index.

Results: Elevated alpha-fetoprotein, tumor size, invasion of liver capsule, incomplete "capsule", peritumoral enhancement, intratumor necrosis, portal venous phase (PVP) peritumoral hypo-enhancement (PPHE) and satellite nodule were independent risk factors for MVI. With the newly discovered features, PVP peritumoral hypo-enhancement, the AUCs of CR nomogram reached 0.863 (95% CI: 0.773-0.941) in the external validation cohort and it is higher than the AUC of 0.834 (95% CI: 0.742-0.917) of the model without this feature. The predictive performance of the CRT model did not outperform that of the CR model, with AUCs of 0.845 and 0.863, respectively. The best cut-off value of tumor size was about 4.5 cm. Incomplete "capsule" and PVP peritumoral hypo-enhancement were risk factors of MVI in tumors larger than 4.5 cm, while the invasion of the liver capsule and peritumoral enhancement independently predicted MVI in smaller HCCs.

Conclusion: The nomogram, integrating clinical and radiologic features with a rarely reported feature, PVP peritumoral hypo-enhancement, demonstrates good performance for predicting MVI. The optimal cut-off value of tumor size in predicting MVI is about 4.5cm and there are more noteworthy imaging features in different sizes of HCCs. The findings proposed new features related to MVI, and the nomogram can accurately predict MVI status in patients with HCC. It is helpful to make individualized treatment decisions.

PO-1581

Predicting Early Response to Transarterial Chemoembolization in Hepatocellular Carcinoma Using a Multimodality Deep Learning Model With CT and MRI

Shiman Gan, Enming Cui
Jiangmen Central Hospital

Purpose

To investigate the value of CT- and MRI-based multimodality deep learning (MDL) model in preoperatively predicting the early response to transarterial chemoembolization (TACE) in patients with hepatocellular carcinoma (HCC).

Method and Materials

A total of 553 patients with 693 HCC lesions (response = 445; non-response = 248), who received enhanced CT or enhanced MRI prior to initial TACE treatment between January 2017 and December 2022, were retrospectively collected. Of these, 362 had CT-only, 156 had MRI-only, and 175 had both CT and MRI. CT-only and MRI-only cases were used as training datasets for single-modality deep learning (SDL) model development, respectively. 104 cases with both CT and MRI were used as a training dataset for MDL model development, and 71 cases with both CT and MRI were used as a test cohort for MDL model test. The CT- and MRI-based MDL model were developed using transfer learning (TL), which immigrated the parameters from SDL model development. Feature extractors were established by using a pre-trained ResNet-18 convolutional neural network, and an extreme learning machine (ELM) was the classifier. Independent clinical risk factors were determined by univariate and multivariate logistic regression analyses, and clinical prediction models were developed. The prediction model was evaluated by area under the curve (AUC), calibration curve and decision curve analysis (DCA).

Results

Three-phase CT-based model (AUC = 0.759) is superior to each single-phase CT-based model (AUC = 0.705 to 0.718). Similarly, multiparameter MRI-based model (AUC = 0.757) is superior to each single-parameter MRI-based model (AUC = 0.700 to 0.725). In addition, the CT- and MRI-based MDL model (AUC = 0.836) with TL achieved the best performance compared with other SDL model (AUC = 0.759 and 0.757, respectively). The CT- and MRI-based MDL model (AUC = 0.836) with TL is also superior to clinical prediction model (AUC = 0.511). The DCA indicates that the CT- and MRI-based MDL model achieved greater clinical utility in predicting the early response to TACE compared with other models.

Conclusion

By using TL, the CT- and MRI-based MDL model is a reliable technique for predicting the early treatment response to TACE in patients with HCC.

PO-1582

Multi-parametric MRI-based intratumoral and peritumoral radiomics for predicting pathological differentiation of hepatocellular carcinoma

Haifeng Liu, Yang Lu, Qing Wang, Yu-Jie Lu, Wei Xing
Radiology Department, The first hospital of Lanzhou University

Purpose: To investigate the predictive potential of intratumoral and multi-region peritumoral radiomics from multi-parametric magnetic resonance imaging (MRI) for determining pathological differentiation in hepatocellular carcinoma (HCC).

Methods: A total of 265 patients with 277 HCCs (training cohort n = 193, validation cohort n = 84) who underwent preoperative MRI scans were retrospectively analyzed. The risk features identified through stepwise regression analysis were utilized to construct a clinical model. Radiomics models based on MRI (arterial phase, portal venous phase, delayed phase) across various regions (entire intratumoral, Peri_5mm, Peri_10mm, Peri_20mm) were developed using the least absolute shrinkage and selection operator approach. The signatures obtained from the intratumoral region and the optimal peritumoral region were combined to design the fusion IntraPeri model. The performance was assessed using the area under the receiver operating characteristic curve (AUC).

Results: Larger tumor size, nonsmooth margin, and mosaic architecture were identified as risk features for poorly differentiated HCC (pHCC). The clinical model achieved an AUC of 0.77 in the training cohort and 0.73 in the validation cohort, the corresponding AUC values were 0.84 and 0.77 for the intratumoral model. The Peri_10mm model demonstrated superior performance compared to the Peri_5mm and Peri_20mm models, with AUC values of 0.95 vs. 0.84 vs. 0.77 (all $P < 0.05$) in the training cohort, 0.86 vs. 0.77 vs. 0.73 in the validation cohort, respectively. The IntraPeri model exhibited a remarkable AUC values of 0.95 and 0.86 for predicting pHCC in the training and validation cohorts, respectively.

Conclusions: Our study highlights the potential of MRI-based radiomics model that integrates intratumoral and peritumoral signatures as a promising tool for predicting HCC differentiation.

PO-1583

Evaluation of Hypoxia Status in a Rat Liver Fibrosis Model Using IVIM and T1 Mapping

Wenlu Dong

The Affiliated Hospital of Qingdao University

Objective: To assess the diagnostic performance of intravoxel incoherent motion (IVIM) and T1 mapping in detecting hypoxia status of liver fibrosis using a carbon tetrachloride (CCl_4) – induced rat model.

Method: The hypoxia group of liver fibrosis included 8 rats induced by injection of CCl_4 , 9 rats were injected of oil as control group. All 17 rats underwent MRI examination at the timepoint of 13th week after injection, using T1 mapping and IVIM. The hypoxia index of pimonidazole was performed by immunohistochemical examination. The pathological examination included hematoxylin eosin, masson trichrome, prussian blue staining. The quantitative analysis of hypoxia of liver fibrosis was used by pimonidazole immunohistochemical staining and H-score. The quantitative parameters were analyzed in two groups, with histopathological results serving as the reference standard. The differences of MRI multi-parameters and pimonidazole score between control and hypoxia group were compared with IVIM parameters and T1 relaxation time and pimonidazole score.

Results: There were significant differences between control group and hypoxia group in D^* and f values of IVIM parameters, T1 mapping and pimonidazole scores (all $p < 0.01$). D^* and T1 mapping values showed a positive correlation with pimonidazole scores ($r = 0.508$ & 0.489). The optimal cut-off value of D^* was 0.75, and the sensitivity, specificity and AUC were 75%, 88.9% and 0.875, respectively.

Conclusion: IVIM and T1 Mapping are promising methods for non-invasive detection of hypoxia status in liver fibrosis.

PO-1584

The Value of Pelvic Skeletal Muscles to Identify the Low-Risk Rectal Cancers with Poor Prognosis

Yu Fu, Huimao Zhang
The First Hospital of Jilin University

Objective

This study was aimed to establish a radiomics model based on pelvic skeletal muscles in coronal T2WI to identify the low-risk rectal cancer (RC) with poor prognosis.

Methods

Study Population: A total of 99 postoperative histopathological proved RC (allocated to a training and testing set with a 7:3 ratio) with low risk factors (cT1–cT3a/b, N0, MRF clear, no EMVI, no LVI and PNI) were recruited in our study. All patients underwent MR examination preoperatively, had no postoperative treatments followed by TME, and followed up 2-6 years. Our institutional review board approved this retrospective study and waived the requirement for informed consent.

MRI Acquisition: MRI examinations were performed with a 3.0-T system (uMR780; Shanghai United Imaging Healthcare Co., Ltd.) with phased-array surface coils. 2D fast spin-echo (FSE) T2WI was performed in coronal planes, repetition time 4900 ms, echo time 153.72 ms, slice thickness 4 mm, gap 0.4 mm, field of view 320x320 mm², refocus flip angle 90°.

Annotation: Two gastrointestinal radiologists (G.J. and F.Y., with 5 and 11 years of experience in rectal MRI, respectively) annotated the area of interests (ROIs) together. When opinions were consistent, the label would be output. ITK-SNAP software (version 3.6, www.itk-snap.org) was used for manual segmentation of 2D MR images, and the muscles were delineated layer by layer on the coronal T2WI sequence, including bilateral piriformis, obturator internus and perianal complex.

Statistical Analysis: Statistical Analysis: Total 33 radiomic signatures based on 1257 3D features was generated using the least absolute shrinkage and selection operator (LASSO) Cox regression model by 5 folds cross validation. Then 8 radiomic signatures with p value less than 0.1 were selected by Cox single factor. Finally, 3 radiomic signatures with p value less than 0.05 were selected by Cox multi factor analysis. The Cox-score is obtained by the coefficient of the Cox model and the value of radiomic signatures. The Cox-score with DFS was investigated by Kaplan-Meier survival curves. Survival curves were compared by the log-rank test. One model was built and assessed for their predictive values, using the Harrell concordance index.

Results

The Cox-score stratified patients into low- and high-risk groups for DFS in the training set ($P = 0.006$), and was successfully validated in the testing set ($P = 0.031$). The model with 3 radiomic signatures had good performance in training set (C index=0.776, 95% confidence interval [CI] 0.598-0.914) and testing set (C index=0.753, 95% confidence interval [CI] 0.591-0.939). The calibration curves depicted consistency between the predicted and observed outcomes.

Conclusion

The novel radiomic signatures could be used to predict DFS in patients with low-risk RC. The radiomic model has the ability to estimate DFS ($P=0.006$, 0.031 in training set and in validation set, respectively), and may help guide individualized treatment in such patients.

PO-1585

A CT-based radiomics nomogram involving the cystic fluid area for differentiating appendiceal mucinous neoplasms from appendicitis with intraluminal fluid

Xinbin Wang^{1,2}, Na Feng¹, Yonggang Qiu², Hao Dong², Cuncheng Lou², Jieni Yu¹, Jianxia Xu³, Risheng Yu¹

1. The Second Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, China.

2. The First People's Hospital of Xiaoshan District, Hangzhou, Zhejiang, China.

3. The Second Affiliated Hospital of Zhejiang Chinese Medical University, Hangzhou, Zhejiang, China

Objective To develop and validate a radiomics nomogram based on computed tomography (CT) to distinguish appendiceal mucinous neoplasms (AMNs) from appendicitis with intraluminal fluid (AWIF).

Method A total of 211 patients from two medical institutions were retrospectively analysed, of which 109 were pathologically confirmed as having appendicitis with concomitant CT signs of intraluminal fluid and 102 as having AMN. All patients were randomly assigned to a training (147 patients) or validation cohort (64 patients) at a 7:3 ratio. Radiomic features of the cystic fluid area of the appendiceal lesions were extracted from nonenhanced CT images using 3D Slicer software. Minimum redundancy maximum relevance and least absolute shrinkage and selection operator regression methods were employed to screen the radiomic features and develop a radiomics model. Combined radiomics nomogram and clinical-CT models were further developed based on the corresponding features selected after multivariate analysis. Lastly, receiver operating characteristic curves, calibration curves, and decision curve analysis (DCA) were used to assess the models' performances in the training and validation cohorts.

Results A total of 851 radiomic features were acquired from the nonenhanced CT images. Subsequently, a radiomics model consisting of eight selected features was developed. The combined radiomics nomogram model comprised rad-score, age, and mural calcification, while the clinical-CT model contained age and mural calcification. The combined model achieved area under the curves (AUCs) of 0.945 (95% confidence interval [CI]: 0.895, 0.976) and 0.933 (95% CI: 0.841, 0.980) in the training and validation cohorts, respectively, which were larger than those obtained by the radiomics (training cohort: AUC, 0.915 [95% CI: 0.865, 0.964]; validation cohort: AUC, 0.912 [95% CI: 0.843, 0.981]) and clinical-CT models (training cohort: AUC, 0.884 [95% CI: 0.820, 0.931]; validation cohort: AUC, 0.767 [95% CI: 0.644, 0.863]). Finally, DCA showed that the clinical utility of the combined model was superior to that of the clinical-CT and radiomics models.

Conclusion Our combined radiomics nomogram model constituting radiomics, clinical, and CT features exhibited good performance for differentiating AMN from AWIF, indicating its potential application in clinical decision-making.

PO-1586

Construction of a Nomogram Predicting the Healing Time of Clinically Relevant Pancreatic Fistula after Pancreaticoduodenectomy Based on Abdominal Visceral Fat Area

Yuan Xu, Junlin Zhou
Lanzhou University Second Hospital

Background: Pancreaticoduodenectomy (PD) is often accompanied by a high incidence of clinically relevant pancreatic fistula (CR-PF) which may lead to limited postoperative recovery or even death. Many previous studies have focused on predicting the occurrence of CR-PF, but few have paid

attention to the healing time of CR-PF (CR-PF-HT). It has been shown that the nutritional status of patients is closely related to the clinical outcome of PF and other complications. In addition to clinical routine nutritional status indicators and treatment methods, information on nutritional status included in CT images is often ignored or underestimated. The aim of this study was to develop a prediction model based on postoperative clinical and imaging nutritional factors to predict CR-PF-HT after PD.

METHODS: A retrospective study was conducted including 244 patients with pancreatic cancer who underwent PD and developed CR-PF (training group: 171 cases from Lanzhou University Second Hospital; validation group: 73 cases from Affiliated Hospital of Qingdao University). According to the revised criteria of the International Study Group on Pancreatic Fistula (ISGPS) in 2016, B- and C-grade PF were classified as CR-PF. CR-PF-HT was defined as the time from diagnosis of pancreatic fistula to the removal of drainage tubes. Patients were divided into two groups based on median healing time: healing and delayed healing groups. Univariate and multivariate logistic regression analyses were performed using preoperative CT images, treatment interventions, and clinical factors to develop a prediction model (nomogram). The efficiency of the model was evaluated using the area under the ROC curve (AUC), calibration curve, and decision curve analysis (DCA).

RESULTS: The average CR-PF-HT was 42 ± 23 days (median time: 36 days; range 12-118 days). Univariate and multivariate logistic regression analyses identified enteral nutrition support, neutrophil-to-lymphocyte ratio (NLR) ≤ 2.1 , prognostic nutritional index (PNI) > 38 , and abdominal visceral fat area (VFA) $> 134.6 \text{ cm}^2$ for male or $> 91.1 \text{ cm}^2$ for female as factors associated with a shorter CR-PF-HT. A nomogram based on enteral nutrition support, NLR, PNI, and VFA was developed. In the validation group, the AUC value of the nomogram was 0.778 (95% CI: 0.734-0.795), with a sensitivity of 69.7% and specificity of 82.1%. DCA and calibration curves showed good consistency and clinical applicability of the nomogram.

CONCLUSION: Enteral nutrition support, NLR, PNI, and VFA are important factors affecting CR-PF-HT. The nomogram developed based on data from two centers can accurately predict pancreatic fistula healing time, providing valuable reference information for clinicians managing pancreatic fistula.

PO-1587

Predictive Nomogram for Healing Time of Esophagojejunal Anastomotic Leakage after Total Gastrectomy for Gastric Cancer Based on Skeletal Muscle Index

Bo Liu, Wence Zhou
The Affiliated Hospital of Qingdao University

Background: Esophagojejunal anastomotic leakage (EJAL) occurs in 4-15% of gastric cancer patients who undergo radical total gastrectomy, and its failure to heal can lead to poor prognosis and a mortality rate of up to 60%. Previous studies have mainly focused on predicting EJAL based on preoperative conditions and surgical procedures, research on the prognosis of EJAL, such as healing time, is relatively scarce. Nutritional status plays a crucial role in the healing of anastomotic leakage, and besides clinical conventional nutritional indicators, nutritional information contained in CT images is often overlooked. This study aims to predict the healing time of EJAL based on postoperative clinical and imaging nutritional status.

Methods: We retrospectively collected data from 218 patients with EJAL of grades II-III according to the Clavien-Dindo complication classification, who underwent radical total gastrectomy for gastric cancer at two centers from 2018 to 2023 (training group: 126 cases from Lanzhou University Second Hospital; validation group: 92 cases from Affiliated Hospital of Qingdao University). EJAL was diagnosed based on medical records, imaging or endoscopic examination. The healing time of EJAL was defined as the time from diagnosis to the time of abdominal drainage tube removal,

and patients were divided into a healing group and a delayed healing group based on the median healing time. We conducted univariate and multivariate logistic regression analysis to construct a prediction model (Nomogram) based on relevant characteristics including the first abdominal CT scan, clinical nutrition, and treatment interventions following diagnosis of EJAL. The area under the ROC curve (AUC), calibration curve, and decision curve (DCA) were used to evaluate the performance of the model.

Results: The average healing time of EJAL was 15 ± 6 days (median: 11 days, range 4-63 days). Patients who received combined enteral and parenteral nutrition support, had a systemic immune-inflammation index (SII) $< 2.93 \times 10^{12}$, a controlling nutritional status score (COUNT) > 4 , and a skeletal muscle index (SMI) for male and female > 40.31 or $30.88 \text{ cm}^2/\text{m}^2$ had a shorter healing time for EJAL. We constructed a Nomogram based on these four factors. In the validation group, the AUC value of the Nomogram was 0.751 (95% CI: 0.709-0.791), with a sensitivity of 64.3% and a specificity of 77.4%. The DCA and calibration curve showed that the Nomogram had good predictive performance and clinical application value.

Conclusion: Postoperative nutritional support methods, SII, COUNT, and SMI are important factors affecting the healing time of EJAL. The prediction model constructed based on the two centers can relatively accurately predict the healing time of EJAL, providing reference value for clinicians managing nutritional support and clinical interventions in EJAL patients.

PO-1588

Correlative study of clinical, serum biochemical, CT parameters and pathological findings between hepatoid adenocarcinoma of the stomach and common gastric adenocarcinoma

Xiaoyu Gu, Bo Yin
Huashan Hospital, Fudan University

Objective:

Gastric adenocarcinoma is the most important type of gastric cancer, which can be divided into common type and special type. Gastric hepatoid adenocarcinoma belongs to special gastric adenocarcinoma and has the worst prognosis among other types of gastric adenocarcinoma. Definite preoperative diagnosis is beneficial to guide clinical treatment and improve prognosis of patients with gastric hepatoid adenocarcinoma. Combined with pathological results, clinical parameters, serum biochemical biomarkers and CT for the predictive value of gastric hepatoid adenocarcinoma alone and in combination were discussed.

Materials and Methods:

We collected clinical parameters, serum biochemical biomarkers and CT features of pathologically proved 44 gastric hepatoid adenocarcinoma patients and 116 common gastric adenocarcinoma patients, retrospectively. Gender, age, serum biochemical biomarkers (AFP, CEA, CA19-9 and CA125 levels), location of lesion were analyzed in two groups. Following CT features were evaluated: maximum diameter, growth mode, enhancement mode, necrotic cystic circumstance on plain and contrast-enhanced phase and the CT attenuation values of plain and contrast-enhanced phase. TNM stage, T stage, N stage, differentiation degree, vascular tumor thrombi, nerve invasion and HER-2 expression were analyzed. The statistical differences of the above indicators were analyzed. Binary logistic regression analysis was used to screen the preoperative valuable indicators for predicting gastric hepatoid adenocarcinoma. The receiver operating characteristic curves were drawn. The area under the curves was calculated. In addition, the diagnostic efficiency of each indicator and its combination were evaluated.

Results:

There were no statistically significant differences in age, gender, maximum diameter of lesion, growth mode, enhancement mode, necrotic cystic circumstance, CT attenuation values of plain

and arterial phase, CA19-9 and CA125 groups ($P > 0.05$). The location of lesion in gastric antrum (65.9%; 34.5%), serum AFP (13.27ng/ml; 2.70ng/ml), serum CEA (4.07ng/ml; 2.42ng/ml) and CT attenuation values of venous phase (82.34 ± 8.46 Hu; 91.02 ± 10.62 Hu) and delayed phase (72.89 ± 8.83 Hu; 78.27 ± 9.51 Hu) were significantly different in two groups ($P < 0.05$). The cut-off value of serum AFP and CT attenuation values of venous phase in differentiating gastric hepatoid adenocarcinoma from common gastric adenocarcinoma was 4.7ng/ mL and 85Hu. The AUC of the location of lesion, serum AFP, CT attenuation values of venous phase and combined diagnosis were 0.657, 0.881, 0.749 and 0.903, respectively. Gastric hepatoid adenocarcinoma patients had higher N stage, lower differentiation, higher incidence of vascular cancer thrombin and lower expression of HER-2 than those in common gastric adenocarcinoma patients ($P < 0.05$).

Conclusion:

The location of lesion, serum AFP and CT attenuation values of venous phase are valuable indicators for preoperative prediction of gastric hepatoid adenocarcinoma. For gastric cancer occurring in the gastric antrum, if preoperative serum AFP concentration is greater than 4.7ng/ml and CT attenuation values of venous phase is less than 85Hu, it suggested the diagnosis is gastric hepatoid adenocarcinoma

PO-1589

The Value of Intravoxel Incoherent Motion Imaging in Diagnosing Placenta Accreta Spectrum Disorders and Predicting Their Intraoperative Bleeding

Xiaohan Zheng, Changyuan Xu, Guangbin Wang

Shandong Provincial Hospital Affiliated to Shandong First Medical University

Objective To investigate the changes and diagnostic value of placental microcirculation perfusion and diffusion parameters in patients with placenta accreta spectrum disorders (PASDs) using intravoxel incoherent motion (IVIM) imaging, and to analyze the correlation between IVIM parameters and intraoperative hemorrhage in patients with PASDs.

Methods 69 patients with PASDs and 37 normal pregnant women underwent 1.5-T magnetic resonance examinations with IVIM-DWI. The perfusion percentage (f), pseudo-diffusion coefficient (D^*), and diffusion coefficient (D) were calculated and analyzed in each group. ROI includes the entire placenta. Comparison of IVIM parameters between multiple groups was performed using a nonparametric rank-sum test. ROC curves were used to evaluate IVIM parameters that predicted placental implantation and massive intraoperative bleeding.

Results The f -value of patients with PASDs was significantly higher than that of normal pregnant women ($P < 0.001$). f -value in the deep placental implantation group was significantly higher than that in the superficial implantation group in the PASDs group ($P < 0.001$); the D -value in the deep placental implantation group was higher than that in the normal group ($P < 0.05$); and the difference in D^* values between the groups was not statistically significant ($P > 0.05$). The best cut-off f value for predicting PASDs was 0.326, with a sensitivity of 0.750 and a specificity of 0.919; the best cut-off f value for discriminating shallow and deep placental implantation was 0.339, with a sensitivity of 0.680 and a specificity of 0.931; the best cut-off D value for discriminating between normal and deep implantation was 1.83×10^{-3} mm/s, with a sensitivity of 0.632 and a specificity of 0.703; the best critical f value for predicting massive maternal blood loss was 0.310, with a sensitivity of 0.881 and a specificity of 0.667.

Conclusions Placental perfusion is significantly increased in patients with PASDs. f -value and D -value can be used to diagnose PASDs, and f -value helps to predict intraoperative blood loss in PASDs.

PO-1590

Histogram analysis of MR quantitative parameters: Are they correlated with prognostic factors in prostate cancer?

Yanling Chen, Huanjun Wang, Yan Guo, Wenxin Cao
Department of Radiology, The First Affiliated Hospital, Sun Yat-Sen University

Purpose: To investigate the correlation between quantitative MR parameters and prognostic factors in prostate cancer (PCa).

Method: A total of 186 patients with pathologically confirmed PCa who underwent preoperative multiparametric MRI (mpMRI), including synthetic MRI (SyMRI), were enrolled from two medical centres. The histogram metrics of SyMRI [T1, T2, proton density (PD)] and apparent diffusion coefficient (ADC) values were extracted. The Mann-Whitney U test or Student's t test was employed to determine the association between these histogram features and the prognostically relevant factors. Receiver operating characteristic (ROC) curve analysis was conducted to evaluate the differentiation performance. Spearman's rank correlation coefficients were calculated to determine the correlations between histogram parameters and the International Society of Urological Pathology (ISUP) grade group as well as pathological T stage.

Results: Significant correlations were found between the histogram parameters and the ISUP grade as well as pathological T stage of PCa. Among these histogram parameters, ADC_minimum had the strongest correlation with the ISUP grade ($r = -0.481$, $p < 0.001$), and ADC_Median showed the strongest association with pathological T stage ($r = -0.285$, $p = 0.008$). The ADC_10th percentile exhibited the highest performance in identifying clinically significant prostate cancer (csPCa) (AUC: 0.833; 95% CI: 0.771~0.883). When discriminating between the status of different prognostically relevant factors, a significant difference was observed between extraprostatic extension-positive and -negative cancers with regard to histogram parameters of the ADC map (10th percentile, 90th percentile, mean, median, minimum) and T1 map (minimum) ($p = 0.002 \sim 0.032$). Moreover, histogram parameters of the ADC map (90th percentile, maximum, mean, median), T2 map (10th percentile, median), and PD map (10th percentile, median) were significantly lower in PCa with perineural invasion ($p = 0.009 \sim 0.049$). The T2 values were significantly lower in patients with seminal vesicle invasion (minimum, $p = 0.036$) and positive surgical margin (10th percentile, 90th percentile, mean, median, and minimum, $p = 0.015 \sim 0.025$).

Conclusion: Quantitative histogram parameters derived from synthetic MRI and ADC maps may have great potential for predicting the prognostic features of PCa.

PO-1591

Feasibility of machine learning based CT radiomics to predict gastric poorly cohesive carcinoma

Jia Fu, Xiang Wang, Xuan Jin, Nai-shan Qin, Jian-xing Qiu, Ying-hua Zou
Peking University First Hospital

Purpose: To explore the value of machine learning based CT radiomics in preoperative prediction of gastric poorly cohesive carcinoma.

Materials and Methods: The clinical data and preoperative CT images of 116 patients with postoperative pathology confirmed gastric cancer were retrospectively enrolled. According to WHO classification, 30 patients with gastric poorly cohesive carcinoma and 86 patients with non-poorly cohesive carcinoma were classified. The volume of interest was delineated on the CT venous phase axial image, and the radiomics features were extracted. They were divided into training set and test set according to 8:2, and the least absolute shrinkage and selection operators were used to screen the radiomics features. Four machine learning models (logistic regression, random forest,

decision tree and support vector machine was constructed. The receiver operating curve was performed.

Results: There were the significant difference in venous phase ($P=0.009$) and delayed phase CT values ($P<0.001$). The accuracy of the four types of machine learning models is higher than 70%. The model with the highest accuracy is random forest in the training set, with an accuracy of 93.54%; in the test set, it is a decision tree model with an accuracy of 82.61%.

Conclusion The CT radiomics model based on machine learning have the ability to noninvasively distinguish poorly cohesive carcinoma with good accuracy, which may provide add information for clinical.

PO-1592

Dynamic prediction of Overall survival After Transarterial Chemoembolization for Hepatocellular Carcinoma using artificial intelligence

Zhongqi Sun, huijie jiang
The Second Affiliated Hospital of Harbin Medical University

Objectives: Developing and validating a MRI-based deep learning model for predicting overall survival (OS) of patients with hepatocellular carcinoma (HCC) undergoing transcatheter chemoembolization.

Methods: In this retrospective study, 268 patients with hepatocellular carcinoma (HCC) who received TACE from 2012 to 2017 were collected and divided into training ($n = 187$) and validation ($n = 81$) cohorts. The residual network was used to extract prognostic information from MRI images, which was then combined with the AFP factors to predict survival using a bayesian joint models. Harrell C index, the time-dependent area under the receiver operating characteristic curves (TD AUCs), calibration curve, and decision curve were used to evaluate the performance of the models, the independent cohort is used to verify the validity and superiority of the model.

Results: With a median follow-up of 2 years for all patients, we identified independent risk factors affecting survival after transcatheter arterial chemoembolization, including tumor size, number of tumors, and AFP. The final model showed accurate calibration and very high discrimination in the development cohort (overall dynamic AUC: 0.846; 95% CI: 0.832-0.860) with a persistent improvement in AUC for each new repeated measurement (from AUC: 0.810; 95% CI: 0.769-0.780 to 0.931; 95% CI: 0.915-0.934; $p<0.0001$). The predictive performance was confirmed in the external validation cohorts (overall AUC: 0.849; 95% CI: 0.838-0.861).

Conclusions: The deep learning model based on MRI images and Dynamic change of AFP can predict the overall survival of patients with transarterial chemoembolization.

PO-1593

Automated Segmentation of Liver Segment on Portal Venous Phase MR Images Using a 3D Convolutional Neural Network

Xinjun Han, Zhenghan Yang
Department of Radiology, Beijing Friendship Hospital, Capital Medical University, Beijing, China

Objective: We aim to develop and validate a three-dimensional convolutional neural network (3D-CNN) model for automatic liver segment segmentation on MRI images.

Methods: This retrospective study evaluated an automated method using a deep neural network that was trained, validated, and tested with 367, 157, and 158 portal venous phase MR images, respectively. The Dice similarity coefficient (DSC), mean surface distance (MSD), Hausdorff distance (HD), and volume ratio (RV) were used to quantitatively measure the accuracy of segmentation. The time consumed for model and manual segmentation was also compared. In addition, the model was applied to 100 consecutive cases from real clinical scenario for a qualitative evaluation and indirect evaluation.

Results: In quantitative evaluation, the model achieved high accuracy for DSC, MSD, HD and RV (0.920, 3.34, 3.61 and 1.01, respectively). Compared to manual segmentation, the automated method reduced the segmentation time from 26 min to 8 sec. In qualitative evaluation, the segmentation quality was rated as good in 79% of the cases, moderate in 15% and poor in 6%. In indirect evaluation, 93.4% (99/106) of lesions could be assigned to the correct segment by only referring to the results from automated segmentation.

Conclusion: The proposed model may serve as an effective tool for automated anatomical region annotation of the liver on MRI images.

PO-1594

Virtual monoenergetic imaging in dual-layer spectral CT can improve diagnostic performance of active Crohn's disease

Yue Teng, Yonggang Li
The First Affiliated Hospital of Soochow University

Purpose: To investigate the diagnosis value of virtual monoenergetic images (VMI) in CT enterography (CTE) using dual-layer spectral CT for active Crohn's disease lesions.

Methods: Forty-five pathologically confirmed patients of Crohn's disease were analyzed retrospectively. All patients underwent CTE on a dual-layer spectral CT (IQon, Philips Healthcare, Best, the Netherlands) and endoscopy within two days. Three radiologists blinded to enteroscopy findings assessed CTE images for the presence of active lesions in the colorectum, ileocecum and small bowel separately using conventional enhanced images and VMI 40 keV with one-month intervals to avoid recall bias. A 5-point scale was applied for recording lesions ranging from 1 (definitely absent) to 5 (definitely present), with scores ≥ 3 being considered positive finding. All image findings were compared with the enteroscopy result. Receiver operating characteristic (ROC) analysis was used to assess the improvement of radiologists' performance.

Forty-five pathologically confirmed patients of Crohn's disease were analyzed retrospectively. All patients underwent CTE on a dual-layer spectral CT (IQon, Philips Healthcare, Best, the Netherlands) and endoscopy within two days. Three radiologists blinded to enteroscopy findings assessed CTE images for the presence of active lesions in the colorectum, ileocecum and small bowel separately using conventional enhanced images. The radiologists were asked to perform a re-evaluation using VMI 40 keV one month later to avoid recall bias. A 5-point scale was applied for recording lesions ranging from 1 (definitely absent) to 5 (definitely present), with scores ≥ 3 being considered positive finding. All image findings were compared with the enteroscopy result. Receiver operating characteristic (ROC) analysis was used to assess the improvement of radiologists' performance.

Result: In total, 66 and 83 positive findings were recorded on conventional CT images and VMI 40 keV (inter-reader agreement $\alpha = 0.610$ and 0.684). Using enteroscopy result as golden standard, the overall area under the curve (AUC), sensitivity, and specificity of VMI 40 keV were significantly improved (all $p < 0.05$) from 0.817 to 0.944, 85.7% to 93.1% and 70.0% to 90.0%, respectively, compared with conventional enhanced images.

Conclusion: The VMI 40keV could improve the diagnostic performance for active lesions of Crohn's disease.

PO-1595

Multifrequency three-dimensional MR elastography assessment liver fibrosis heterogeneity in Rat Models

Minghui Zhou, Chengli Gu, Aoran Yang, Yu Shi
Shengjing Hospital of China Medical University

Purpose: Liver fibrosis usually affect the entire liver, however, its spatial distribution may be heterogeneous. This study aims to investigate the potential value of Magnetic resonance imaging (MRI) and Three-dimensional (3D) MR elastography (3D-MRE) in assessing the spatial distribution heterogeneity of liver fibrosis progression and alleviation in rat liver fibrosis models.

Methods and Materials: 80 male Sprague-Dawley rats were induced with different grades of fibrosis using bile duct ligation (BDL) and carbon-tetrachloride (CCl₄) intoxication. Meanwhile, 20 age-matched rats were given sham operation or intraperitoneal injection of olive oil as the control group. In both the BDL and CCL4 models, 20 rats in each group were administered silymarin orally at a dose of 150 mg/kg per day. Multiparameter MRI sequences, included 3D-MRE, diffusion-, T1-, T2-weighted, T1 mapping, T2 mapping, and T2* mapping were performed on the model group, control group, and treatment group at predetermined time points. 3D-MRE was used to calculate liver shear stiffness (SS) and damping ratio (DR) for the left lateral lobe, left lobe, middle lobe, and right lobe of the liver at various frequencies (60, 80, 100, 150, and 200 Hz) for each animal. Liver and serum samples were collected for histologic and biochemical analyses.

Results: A total of 400 liver lobes from 100 rats were evaluated. Strong correlations was found between liver stiffness ($r=0.80$, $P < 0.01$), T2 value ($r=0.71$, $P < 0.01$) and the stage of liver fibrosis. The area under the curves (AUCs) range of liver shear stiffness for predicting $\geq F1$, $\geq F2$, $\geq F3$, and F4 were 0.82, 0.83, 0.91 and 0.86 in the BDL model. For the CCl₄ model, the AUCs range of liver shear stiffness for predicting $\geq F1$, $\geq F2$, $\geq F3$, and F4 were 0.89, 0.87, 0.90 and 0.97, respectively. Based on the results of MRE and pathological fibrosis staging, among the 40 BDL model rats and 40 CCL4 model rats, 35 rats exhibited a one-stage difference in fibrosis staging between different liver lobes, and 4 rats showed a two-stage difference in fibrosis staging between different liver lobes. Both models showed a heterogeneous distribution of liver stiffness compared to controls.

Conclusions: This preclinical study provides evidence that MR elastography can accurately depict the heterogeneity distribution of liver fibrosis in the global liver.

PO-1596

Diagnosis of primary biliary melanoma with distinct imaging features: a case report and literature review

Juan Wu
Shanghai TCM-Integrated Hospital, affiliated to Shanghai University of Traditional Chinese Medicine

Primary biliary melanoma arises from proliferating melanocytes in the mucosal surface of the bile duct and is extremely rare. Since the vast majority of biliary melanomas represent metastases of cutaneous origin, accurate preoperative diagnosis of melanoma and exclusion of other primary

sources are vital in cases involving primary lesions. Although melanomas with pigmented cells have typical signal characteristics, obtaining a non-invasive pre-treatment diagnosis remains difficult, due to their low incidence. Here, the case of a 61-year-old male Asian patient who presented with upper quadrant abdominal pain, swelling and jaundice for 2 weeks, and who was diagnosed with primary biliary melanoma following extensive preoperative blood analyses, computed tomography (CT) and magnetic resonance imaging (MRI), is described. Post-resection immunohistochemistry confirmed the diagnosis and the patient received six chemotherapy cycles of temozolomide and cisplatin, however, progression of multiple liver metastases was observed at the 18-month follow-up CT. The patient continued with pembrolizumab and died 17 months later. The present case of primary biliary melanoma is the first reported diagnosis based on typical MRI features and the exhaustive exclusion of a separate primary origin.

PO-1597

T1 mapping predicts progression-free survival of clear cell renal cell carcinoma after nephrectomy

Lianting Zhong

Zhongshan Hospital (Xiamen) affiliated to Fudan University

Purpose: To demonstrate the prognostic significance of T1 mapping in prediction of Progression Free survival (PFS) in patients with ccRCC (clear cell renal cell carcinoma) after nephrectomy.

Materials and methods: A total of 195 ccRCC cases with eligible data were included in the study. Univariate and multivariable Cox proportional hazard regression models were performed to identify the independent predictive effectors and then integrated to build a comprehensive nomogram for predicting the 1, 3-year, and 5-year PFS. Based on the numbers of independent predictive factors, Kaplan-Meier survival analysis was used to evaluate the difference in PFS.

Results: The median follow-up was 27.6 months (range, 1-88 months), in which 22 (11.3%) patients had metastasis or recurrence. The enhanced T1 relaxation time ($P=0.001$) and the integrality of tumor capsule ($P=0.000$) were independently related to the PFS of ccRCC. The Kaplan-Meier plot showed that high-risk patients tended to have higher enhanced T1 relaxation time and incomplete tumor capsule (log-rank test all $p < 0.05$).

Conclusions: The enhanced T1 mapping may be a new reliable biomarker for PFS prediction in patients with ccRCC.

PO-1598

Intraindividual Comparison of CT and MRI for Predicting Vessels Encapsulating Tumor Clusters in Hepatocellular Carcinoma: Which Imaging Modality is Better?

Junhan Pan, Yanyan Zhu, Huizhen Huang, Feng Chen

Zhejiang University School of Medicine First Affiliated Hospital

Purpose: This study aimed to investigate imaging features of vessels encapsulating tumor clusters (VETC) pattern in hepatocellular carcinoma (HCC) using CT and MRI, and to compare the predictive performance of these imaging modalities.

Materials and Methods: Between July 2019 and August 2020, consecutive patients with surgically confirmed HCC who underwent preoperative dynamic contrast-enhanced CT and MRI were retrospectively included. Two abdominal radiologists independently reviewed the CT and MRI scans. Univariate and multivariate logistic regression analyses were conducted to determine predictors associated with the VETC pattern in solitary HCC. Two separate scoring models were

developed based on the significant CT and MRI predictors, weighted by their regression coefficients. The optimal threshold for each scoring model was determined using receiver operating characteristic analysis with the Youden index. Sensitivity, specificity, and the area under the curve (AUC) of the two scoring models were calculated and compared using generalized estimating equations. Additionally, postoperative early recurrence was evaluated using the Kaplan-Meier method and compared using the log-rank test.

Results: A total of 324 patients (262 men; median age, 58.6 years; IQR, 18–85 years) were enrolled in the study, with 227 patients in the training cohort and 97 patients in the validation cohort. Logistic regression analyses revealed that five factors independently predicted the VETC pattern on CT, including tumor size > 5.0 cm (odds ratio [OR] 3.81; $P = 0.002$; 7 points), intra-tumoral artery (OR 6.07; $P < 0.001$; 9 points), 3 or 4 type of enhancement pattern (OR 3.74; $P = 0.002$; 7 points), tumor-to-liver ratio at arterial phase > 1.57 (OR 4.86; $P = 0.001$; 8 points), and serum alpha-fetoprotein > 400 ng/ml (OR 7.31; $P < 0.001$; 10 points). Conversely, incomplete “capsule” (OR 12.83; $P < 0.001$; 10 points), necrosis or serve ischemia (OR 8.31; $P < 0.001$; 7 points), marked diffusion restriction (OR 10.93; $P < 0.001$; 8 points), tumor-to-liver ratio at apparent diffusion coefficient ≤ 1.03 (OR 6.89, $P < 0.001$; 7 points), and serum alpha-fetoprotein > 400 ng/mL (OR 4.35; $P = 0.004$; 6 points) were identified as independent predictors for the VETC pattern on MRI. CT-based and MRI-based scoring models were constructed using these predictors, with cutoff values of >17 points and >21 points, respectively. Compared to the MRI-based model, the CT-based model exhibited lower sensitivity (training cohort: 87.0% vs. 72.5%, $P = 0.041$; validation cohort: 76.7% vs. 86.7%, $P = 0.453$) but higher specificity (training cohort: 93.0% vs. 83.5%, $P = 0.002$; validation cohort: 85.1% vs. 74.6%, $P = 0.119$). However, both CT-based and MRI-based models demonstrated similar AUC values in predicting the VETC pattern (training cohort: 0.83 vs. 0.85, $P = 0.468$; validation cohort: 0.81 vs. 0.80, $P = 0.966$). Moreover, patients predicted to have the VETC pattern by the models had significantly higher early recurrence rates than those without the predicted VETC pattern in both the training and validation cohorts (all $P < 0.05$).

Conclusion: Preoperative CT and MRI may show comparable predictive performances for identifying the VETC pattern in HCC. The application of CT or MRI should be determined by the preferred trade-off between sensitivity and specificity in clinical practice.

PO-1599

Acid-etched Layered Double Hydroxides Armed with Dual “Doorkeepers” for Immunomodulatory-NIR III Photodynamic Therapy of Hepatocellular Carcinoma

Yuanfei Lu, Risheng Yu

Department of Radiology, Second Affiliated Hospital, School of Medicine, Zhejiang University

Immune checkpoint blockade (ICB) therapy for hepatocellular carcinoma (HCC) is limited due to its immunosuppressive tumor microenvironment (TME). Proinflammatory pyroptosis as a new schedule can induce immunogenic cell death (ICD), thereby reversing immunosuppressive TME and improving ICB efficiency. Herein, we report an acid-etched layered double hydroxides nanosheets (E-LDH)-based smart nanoplateforms armed with H₂O₂/pH dual “doorkeepers” (denoted as CTEP) targeting HCC to realize membrane-anchored photodynamic therapy (PDT) and evoke potent pyroptosis to improve anti-tumor immunity. The hybrid Hepa1-6 cancer cell membrane (CM) and thylakoid (TK) membrane is cloaked on the surface of pH-(low)-insertion peptide (pHLIP) modified E-LDH to obtain CTEP. Once CTEP nanoplateforms arrive at tumor regions, the dual “doorkeepers” will orderly open to perform PDT precisely. Given the fact that TK membranes have the catalase mimetic function, CTEP responds to high concentrations of H₂O₂ in TME and rupture the hybrid CM-TK membrane to expose pH-sensitive peptide pHLIP. Membrane-localized PDT can induce gasdermin-D (GSDMD) mediated pyroptosis, effectively stimulating tumor immunogenicity. Pyroptotic cell death release damage-associated molecular

patterns (DAMPs) and consequently robust ICB ability. CTEP-evoked pyroptosis together with anti-PD-L1 blockade therapy activates adaptive immunity in HCC, successfully inhibiting the progression of primary and distant HCC tumors with mitigation of the side effects.

MRI quantitative hemodynamic parameter histogram assessment of hepatocellular carcinoma development in a rabbit VX2 liver cancer model

Rui Guo, Jing Ma

Xinjiang production & Construction Corps Hospital

Background Nowadays, liver cancer is the second leading cause of cancer death in the world. Therefore, it is very important to understand tumor progression and evaluate tumor microcirculation for treatment strategy.

Objective To explore the application of MRI quantitative hemodynamic parameter histogram analysis in the development of a rabbit VX2 liver cancer.

Method This study was approved by the animal protection and ethics committee of The First Affiliated Hospital of Shihezi University School of Medicine. Five New Zealand white rabbits were randomly selected each time for liver Dynamic contrast-enhanced MR perfusion (DCE-MRI) imaging at the 1st, 2nd, 3rd, 4th and 5th weeks after liver tumor implantation. The dynamic changes and the significant differences between the tumor volume and related derived parameters during tumor progression were compared and analyzed.

Result In the development of the VX2 liver cancer model, the tumor volume between the end of 1~5w group ($F=44.11$; $P=0.000$) was statistically significant ($P<0.01$), and the significant differences were found between the 5th week and the 1st, 2nd, 3rd, 4th week, the 4th week and the 1st, 2nd week, the 3rd week and the 5th week ($P<0.01$), respectively. The skewness and kurtosis of the K_{trans} value, the maximum, 90th percentile and skewness of the K_{ep} value, and the skewness, kurtosis, 75th and 90th percentiles of the V_p value were statistically significant ($P<0.05$) at the end of each week. The 10th, 25th, 50th percentiles of the K_{ep} value, the 10th, 25th percentiles of the V_e value, the 10th percentile of the V_p value was positively correlated with tumor volume ($r>0$, $P<0.05$). The expression of α -SMA was negatively correlated with the mean, 75th percentile of the K_{trans} value, the 50th, 75th percentiles of the K_{ep} value, the mean, minimum of the V_p value ($r<0$, $P<0.05$). It was positively correlated with the skewness, kurtosis of the K_{trans} value, the skewness of the V_p value ($r>0$, $P<0.05$).

Conclusion MRI quantitative hemodynamic parameter histogram analysis can reflect the progress of the rabbit VX2 liver cancer. In particular, the skewness, kurtosis and percentiles of K_{trans} , K_{ep} and V_p can reflect the microvascular information and can be used as biomarkers to assess the development of Hepatocellular Carcinoma (HCC).

PO-1601

The Comprasion of Modified ESUR Score and Mehralivand Grade for Predicting Extracapsulare Extension in Prostate Cancer

Liqin Yang

Hangzhou Hospital of Traditional Chinese Medicine

Purpose To compare the value of the modified ESUR score and Mehralivand grade in predicting extracapsulare extension (ECE) of prostate cancer (PCa), and to explore the potential value of clinical variables in predicting ECE.

Methods A retrospective study of 235 PCa patients were enrolled in this study. Two radiologists (reader 1 and 2) assessed the ECE by the modified ESUR score and Mehralivand grade. The inter- and intra-observer correlation coefficient (ICC) were calculated and the receiver operating characteristic (ROC) curve were used to evaluate the performance of the modified ESUR score and Mehralivand grade for ECE. Univariate and Binary Logistics regression analysis were used to screen out the independent risk factors from clinical variables, and combined models were constructed to predict ECE. Finally, Delong test was used to compare the performance between the combined models and the two scoring methods.

Results Both scoring methods showed good inter- and intra-observer stability (both ICC > 0.75). The modified ESUR score achieved an AUC of 0.696 in reader 1 and 0.691 in reader 2 in predicting ECE, and Mehralivand grade achieved an AUCs were 0.746 in reader 1 and 0.753 in reader 2. The AUCs of Mehralivand grade were significantly higher than those of the modified ESUR score in both reader 1 and 2 ($P < 0.05$). PSA, PI-RADS v2.1 score, Gleason Group, modified ESUR score and Mehralivand grade were determined as the independent risk factors of ECE and the combined models were constructed. The AUCs of the combined model were 0.826 and 0.841, which were both significantly higher than that in separate scoring method ($P < 0.05$).

Conclusion The Mehralivand grade showed better diagnostic performance for predicting ECE than the modified ESUR score. The combination model of scoring methods and clinical variables can be a potential tool in the prediction of ECE.

PO-1602

Differentiate gastric stromal tumors from adenocarcinomas of the stomach: spectral CT quantitative parameters

Wenzheng Lu, Yuxi Ge, Shudong Hu

Affiliated Hospital of Jiangnan University

Objective: To investigate the value of different quantitative parameters of dual-energy CT in the differential diagnosis in differentiating gastric stromal tumors and gastric adenocarcinomas.

Methods: In this study, 48 patients were included to compare clinical features such as age, sex, tumor size, tumor location and virtual monochromatic images, energy level slope (K(HU)), effective atomic number maps and iodine maps of dual-energy CT during different phases by t-test, rank sum test and chi-square test. The efficacy of quantitative parameters for the identification of gastric stromal tumors was evaluated by receiver operating characteristic curves (ROC).

Results: Among the clinical features, the gender and tumor location were statistically significant ($p=0.021$, $p=0.042$), and all the quantitative parameters were statistically significant ($p < 0.05$). Both gastric stromal tumors and gastric adenocarcinoma are progressively strengthened, with HU in the

venous phase being higher than in the arterial phase. In the quantitative parameters of the arterial phase, the virtual single-energy image at 40keV (AUC=0.914) and K(HU) (AUC=0.917) had the better discriminative performance for GST and adenocarcinoma patients. Among the parameters of the venous phase, the AUC of K(HU) and Z-eff were 0.945 and 0.946, respectively.

Conclusions: The derivative parameters of dual-energy CT can improve the difference between gastric stromal tumors and gastric adenocarcinoma compared with conventional CT.

PO-1603

Machine learning methods based on CT features differentiate G1/G2 from G3 pancreatic neuroendocrine tumors

Haiyan Chen¹, Yao Pan², Jieyu Chen¹, Risheng Yu², Guoliang Shao¹

1. Zhejiang Cancer Hospital

2. Second Affiliated Hospital, Zhejiang University School of Medicine

Abstract

Objective: Pancreatic neuroendocrine tumors (PNETs) constitute a group of heterogeneous tumors with different radiological features and clinical outcomes based on their grades. Our study is to distinguish grade 1 (G1)/ grade 2 (G2) PNETs from grade 3 (G3) neuroendocrine tumors (NETs) based on CT quantitative and qualitative features by using different machine learning methods.

Materials and Methods: A total of 149 patients with 156 lesions of PNETs confirmed by biopsy or surgery were retrospectively collected, and 25 lesions were G3 PNETs, while 131 lesions were G1/G2 PNETs. General demographic data, such as sex, age, symptoms, and tumor markers were included. Radiological features, including location, maximum size (mm), shape, margin, texture, calcifications, pancreatic duct, and biliary dilation, pancreatic atrophy, pancreatitis, invasion of the nearby tissues, lymph node enlargement, liver metastasis, and performance of enhancement within the lesion. The arterial/portal relative enhancement ratio, and arterial/portal enhancement ratio were calculated. The whole data was separated into training and validation groups by a ratio of 7:3. Firstly, the least absolute shrinkage and selection operator (LASSO) algorithm was initially implemented to reduce the dimension of features. Secondly, principal component analysis (PCA) was used to further select features. Three machine learning classifiers, including support vector machine (SVM), K-nearest neighbor classifier (KNN), and linear logistic regression (LR), were performed to build diagnostic differentiated models when distinguishing G1/G2 PNETs from G3 PNETs, respectively. Receiver operating characteristic (ROC) curves and precision-recall curves (PRC) for each machine learning method were generated to determine their differentiation ability. The area under the curve (AUC), accuracy rate, sensitivity and specificity were calculated.

Results: G3 PNETs were more likely to present as a larger, irregular shape with an ill-defined margin, and invasive behaviors such as causing pancreatitis, invasion of nearby tissues, lymph node enlargement, and liver metastasis than G1/G2 PNETs ($p < 0.05$). Furthermore, G3 PNETs had a much lower arterial/portal relative enhancement ratio and arterial/portal enhancement ratio than G1/G2 PNETs ($p < 0.05$). Twelve features were initially selected by the LASSO algorithm using 10-fold cross-validation with the minimum λ value of 0.025. Four features were included in the PCA algorithm, and three models were built through SVM, KNN, and LR. The LR classifier yielded the highest AUC of 0.964 (95%CI:0.930, 0.972), with an accuracy rate of 95.4%, a sensitivity of 95.7%, and specificity of 92.9%, followed by SVM (AUC of 0.957 (95%CI:0.833, 0.983), accuracy rate of 94.4%, sensitivity of 95.7%, specificity of 86.7%), and KNN (AUC of 0.893 (95%CI:0.843, 0.906), accuracy rate of 84.3%, sensitivity of 86.3%, specificity of 50%) in the training group. In the validation group, the SVM classifier reached the highest AUC of 0.952 (95%CI:0.860, 0.981), with an accuracy rate of 91.5%, a sensitivity of 97.3%, and specificity of 70%, followed by LR (AUC of 0.949, (95%CI:0.902, 0.962), accuracy rate of 91.5%, sensitivity of 94.9%,

specificity of 75%), and KNN (AUC of 0.923 (95%CI:0.818, 0.948), accuracy rate of 87.2%, sensitivity of 90.2%, specificity of 66.7%) in the validation group.

Conclusions: Different machine learning methods had relatively good diagnostic performance when differentiating G1/G2 PNETs from G3 PNETs. The LR classifier and SVM classifier did the best performance in the training and validation groups respectively.

PO-1604

T1 mapping of the pancreas in patients with pancreatic cancer—does pancreatic extracellular volume fraction or signal intensity ratio increase the diagnostic value?

Haiyan Chen¹, Kai Li¹, Yishi Wang², Lei Shi¹

1. Zhejiang cancer hospital

2. Philips Healthcare

Purpose: Fibrosis in pancreatic cancer (PC) closely related to therapeutic effect, occurrence, and prognosis, there is an urgent need for quantitative methods to evaluate noninvasively. To evaluate whether the T1 relaxation time of the pancreas can detect parenchymal changes in PC patients and whether signal intensity ratio (SIR) and extracellular volume (ECV) fraction improve the diagnostic value.

Methods: Our study was the prospective study. A total of 113 patients who underwent MRI were included. 76 patients with pancreatic cancers (PCs), 16 patients with other solid pancreatic lesions (Non-PCs), and 21 patients with normal pancreas (NP) were separated. 3.0 T MR including T1 mapping with Modified Look-Locker inversion recovery sequence (MOLLI). The T1 relaxation times of the lesion, pancreas, liver, spleen, paraspinal muscle, dorsal subcutaneous fat, and aorta were extracted. The SIR and pancreatic ECV were calculated. Mann-Whitney U test; χ^2 test; and receiver operating characteristic (ROC) curve.

Results: Native T1 relaxation time of the pancreas in patients with PCs was significantly higher than in patients with Non-PCs and NPs (1102.9 ± 233.9 ms vs. 960.4 ± 231.0 ms/ 867.6 ± 91.3 ms, $P < 0.05$), while no difference was evident in patients with Non-PCs and NPs. According to SIR, we succeeded in finding evidence of a significant difference in SIR p-liver, SIR p-muscle, SIR p-fat and SIR p-aorta between PC and Non-PCs. Pancreatic ECV fraction values of the PC, Non-PCs, NP groups were $82.9 \pm 38.6\%$, $77.2 \pm 32.2\%$ and $74.4 \pm 42.3\%$, respectively, but we failed to show a significant difference among these three groups.

Data Conclusion: Native T1 relaxation of the pancreas could be a potential imaging biomarker to evaluate pancreatic fibrosis in patients with PCs. The SIR of the pancreas could increase the diagnostic capability, while pancreatic ECV did not improve the diagnostic performance.

PO-1605

Preoperative Prediction of Microvascular Invasion in Pancreatic Neuroendocrine Tumors Through Analysis of Portal Venous Phase CT Images

Haiyan Chen¹, Yao Pan², Jieyu Chen¹, Risheng Yu², Lei Shi¹

1. Zhejiang Cancer hospital

2. Second Affiliated Hospital, Zhejiang University School of Medicine

Objectives: Microvascular invasion (MVI) has been identified as a strong independent risk factor for both overall survival and recurrence-free survival. However, the nature of MVI remains poorly understood, with limited available knowledge. Hence, our study was to evaluate clinical and CT

imaging features on portal venous-phase for predicting MVI in patients with pancreatic neuroendocrine tumors (PNETs).

Methods In this retrospective study, 160 patients underwent surgical resection for PNETs were included, with 25 patients had MVI, 135 patients without MVI. Demographic data and CT features on portal venous-phase were collected. The independent predictive factors for predicting MVI were confirmed through univariate and multivariate logistic regression analyses. The predictive performance was assessed by employing receiver operating characteristic curve for predicting MVI, and a forest map was pictured. Sensitivity and specificity were further analysis according to selected quantitative parameters.

Results PNETs with MVI were more frequent presented with larger size, irregular shape, invasion of surrounding tissues, lymph nodes and liver metastases, a much lower enhancement ratio, absolute enhancement, and relative enhancement ratio ($p < 0.05$). After multivariate analyses, invasion of surrounding tissues (odds ratio [OR]: 4.12, 95% confidence interval [CI], 1.19-14.3), absolute enhancement (OR: 0.84, 95%CI, 0.72-0.97), and relative enhancement ratio (OR: 16.1, 95%CI, 1.54-167.81) were identified as independent predictors for predicting MVI in PNET patients, with area under curve of 0.819(95%CI, 0.720-0.917), demonstrating a sensitivity of 64% and a specificity of 90.4%. When the absolute enhancement was > 150 HU, the specificity was 94.1%, while the relative enhancement ratio $> 400\%$, the specificity was 93.3% for predicting MVI.

Conclusions Invasion of surrounding tissues, absolute enhancement, and relative enhancement ratio were identified as independent predictors for predicting MVI in PNET patients. Furthermore, clinical and imaging features from portal venous phase CT images can be used to accurately predict the presence of MVI in patients with PNETs prior to surgery.

PO-1606

A nomogram for predicting the prognosis of pancreatic neuroendocrine tumors patients with liver metastases

Haiyan Chen, Jieyu Chen, Guoliang Shao
Zhejiang Cancer hospital

Background: An increased incidence of pancreatic neuroendocrine tumors (PNETs) has been reported worldwide recently, and metastasis is the dominant cause of PNET-related death. Studies focus on the prognosis of PNETs with liver metastases are limited.

Methods: A population-based retrospective study was carried out in the Surveillance, Epidemiology, and End Results (SEER) database from 2010 to 2016. A univariate and multivariate Cox regression analysis were performed to select independent prognostic factor, and two nomograms were constructed to predict both overall survival (OS) and cancer-specific survival (CSS), respectively. The discrimination and calibration plots were obtained to evaluate the performance of the nomogram using the concordance index (C-index) and calibration plots respectively. The Kaplan-Meier survival analysis with log-rank was used to analyze survival outcomes. Statistical analysis was conducted by Stata 14.0, and the nomogram was developed using the R 3.6.0 software with the "RMS" R library.

Results: A cohort of 1354 liver metastatic PNETs patients were included. The median age of the whole cohort was 61 years, and 765 (56.50%) cases were male. The lesion was mostly located in pancreatic tail, followed by head. Grade I was more likely to develop a liver metastasis, followed by grade III and grade II. Primary site surgery was performed in 40.29% of grade I patients, but only performed in 20.22% of grade III patients. 36.34% of cases had found regional lymph nodes metastases. Near half of cases (51.11%) had chemotherapy and only 1.85% of cases had radiotherapy. After univariate and multivariate Cox regression analysis, we found that an age older than 60 years (Hazard ratio (HR) = 1.404, 95% confidence interval (CI): 1.194-1.651, $P < 0.001$), grade III (HR = 3.224, 95%CI: 2.397-4.335, $P < 0.001$), surgery of primary site (HR = 0.363, 95%CI: 0.1995-0.659, $P = 0.001$) and lung metastasis (HR = 0.526, 95%CI: 0.398-0.695, $P < 0.001$) were independent factors to predict CSS, which were applied to develop a nomogram. The C-index was

0.678, with 95% confidence interval (CI) of 0.658 to 0.700. The second nomogram to predict OS was built including age ≥ 60 years (HR = 1.425, 95%CI: 1.218-1.668, $P < 0.001$), grade III (HR = 3.104, 95%CI: 2.329-4.137, $P < 0.001$), insurance status (HR = 1.240, 95%CI: 1.014-1.518, $P = 0.036$), surgery of primary site (HR = 0.413, 95%CI: 0.237-0.720, $P = 0.002$), lung metastasis (HR = 0.508, 95%CI: 0.388-0.664, $P < 0.001$) and bone metastasis (HR = 0.735, 95%CI: 0.567-0.953, $P = 0.02$). The C-index was 0.692 (95%CI: 0.672-0.712). The internal calibration curves presented well veracity and consistency in predicting 1-, 3- and 5-year OS and CSS probabilities. The median survival month of entire cohort was 13 months. However, the median survival was 24 months in grade I patients, and was only 6 months in grade III patients. For patients performed with primary site surgery, they had 29 median survival months, longer than patients did not performed surgery (10 months). The KM analysis also shown that patients with surgery of primary site, better grade, had chemotherapy and without lung metastasis had better OS than those were not ($P < 0.001$). Conclusions: The nomogram was constructed and verified to predict 1-, 3- and 5-year OS and CSS in patients with liver metastatic PNETs. The nomogram showed a good performance, suggesting it could be an optimal too for serving clinicians. Surgery of primary site did benefit to OS and CSS, even in patients with live metastasis.

PO-1607

Dual-energy CT Quantitative Parameters to Evaluate Occult Peritoneal Metastasis in Advanced Gastric Cancer Preoperatively

Qiuxia Feng

The first affiliated hospital of Nanjing Medical University

Background: Patients with advanced gastric cancer have the possibility of occult peritoneal metastasis (OPM) and the treatment is different from the one without metastasis. But accurate preoperative assessment remains a challenge. There is an urgent need for a noninvasive approach to reliably identify patients with occult peritoneal metastasis.

Purpose: To explore whether dual-energy CT (DECT) quantitative parameters could provide more analytic ability for the diagnosis of OPM preoperatively compared to conventional CT features.

Materials and Methods: This retrospective study included 219 patients with advanced gastric cancer and DECT scans between March 2022 and March 2023. The patient's clinical data and DECT related iodine concentration (IC) parameters and effective atomic number (Zeff) were collated and analyzed among non- peritoneal metastasis (NPM), OPM and radiologically peritoneal metastasis (RPM) groups. By means of Synthetic Minority Oversampling Technique, the relevant analysis of normalized IC, venous to arterial phase (V/A) IC ratio, and Zeff were conducted within NPM and OPM using logistic regression. The predictive performance of the DECT parameters was compared with that of the CT features through evaluating area under curve of the precision-recall (AUC-PR), F1 score, balanced accuracy, sensitivity, specificity, positive predictive value (PPV) and negative predictive value (NPV).

Results: Of 213 patients, Borranmam IV type diagnosed on CT and serum tumor indicator CA125 index were statistically different between the NPM and OPM groups ($P < 0.05$). DECT quantitative parameters of PM group includes IC and NIC in arterial and venous phases and the Zeff were lower than the NPM group and all of them declined earlier in OPM stage. The DECT predictive nomogram combined the three independent predictors, including V_NIC (OR, 0.44; 95% CI: 0.33, 0.58), V/A IC ratio (OR, 8.01; 95% CI: 2.92, 22.46), and Zeff (OR, 0.83; 95% CI: 0.70, 0.98; $P < 0.001$), produced a better diagnostic performance than the conventional CT feature scheme which was based on Borranmam IV type and serum CA125 index in AUC-PR with 0.770 vs 0.750, F1 score with 0.750 vs 0.667, balanced accuracy with 0.860 vs 0.844, specificity with 0.971 vs 0.939, PPV with 0.750 vs 0.600, and NPV with 0.971 vs 0.968.

Conclusions: The lower quantitative NIC, V/A IC ratio, and Zeff on DECT was associated with peritoneal metastasis in advanced gastric cancer and was promising to identify patients with occult peritoneal metastasis noninvasively.

PO-1608

Combination of MRI with clinical parameters helps in predicting recurrence in patients with stage IB2 and IIA2 cervical cancer receiving neoadjuvant surgery and concurrent chemoradiotherapy

Huiting Pang, Yue Dong
Liaoning Cancer Hospital

Purpose: To investigate the practicality of clinical indexes and different MRI parameters in predicting the recurrence of stage IB2 and IIA2 cervical cancer undergoing neoadjuvant therapy followed by radical hysterectomy (NAT+RH) and concurrent chemoradiotherapy (CCRT).

Methods: Data from 170 patients with stage IB2 and IIA2 cervical cancer from February 2015 to October 2018 were retrospectively included, among whom 100 cases were treated with NAT+RH and 70 cases were treated with CCRT. All patients underwent pretreatment MRI including DWI scan, and imaging indexes including tumor size and tumor apparent diffusion coefficient (ADC) values were measured. Clinical and pathological indices, and recurrence and metastasis of the patients were recorded. The correlation between recurrence and clinical indices and MRI parameters were analyzed by univariate analysis, and statistically significant parameters were further assessed by logistic regression analysis, and the predictive performance was estimated by receiver operating characteristic analysis.

Results: 26 of 170 cases had recurrence and metastasis, including 15 cases in neoadjuvant group and 11 cases in CCRT group. In the entire cohort, there were significant differences in SCC-Ag, lymph nodes metastases (LNM), ADCmax and ADCmin between recurrent and non-recurrent patients ($P < 0.05$). In NAT+RH group, there were significant differences in SCC-Ag, LNM, lymphovascular space invasion, deep stromal invasion and ADCmin between recurrent and non-recurrent patients ($P < 0.05$). In CCRT group, there were significant differences in tumor size, ADCmax and ADCmin between recurrent and non-recurrent patients ($P < 0.05$). In all patients, the area under curve (AUC) of ADCmin was the highest (0.722), and the sensitivity and specificity were 84.00% and 57.70%. The AUC of the combined prediction model was 0.977, the sensitivity was 92.30%, and the specificity was 95.80%. The AUC of the combined prediction model was significantly higher than that of ADCmin ($P < 0.05$).

Conclusion: Tumor ADCmin and ADCmax may be helpful in predicting the recurrence of patients with stage IB2 and IIA2 cervical cancer, and the conjunctive model has a better predictive value for recurrence.

PO-1609

The CT features and prognosis of acquired cystic disease-associated renal cell carcinoma: a review

Han Xiang¹, Wu Xiang²

1. Daping Hospital, Army Medical University, Chongqing, China

2. Chongqing Beibei Traditional Chinese Medical Hospital, Chongqing, China

Background

Acquired cystic disease-associated renal cell carcinoma (ACD-RCC) is a relatively new subtype of RCC and was added to the list of RCC subtypes in the 2016 World Health Organization classification. It is the third most common type of RCC in acquired cystic kidney disease (ACKD). ACD-RCC is generally believed to be indolent, however, some tumors may show local recurrence and distant metastasis. Increased awareness of this new entity has given rise to a recent accumulation of case reports and investigative studies in the literature. However, the literature published at home and abroad mainly focused on this disease's clinicopathological features, there is scarce research describing the imaging features and prognosis of ACD-RCC. This study aimed to review the literature to reveal recent findings on computed tomography (CT) features and prognosis of ACD-RCC, as well as strategies to surveillance this disease.

Methods

PubMed was searched for studies of ACD-RCC published before 31 December 2022. Excluded were studies that either did not describe the image features or reported prognosis and surveillance of patients with ACD-RCC.

Results

1. CT Imaging:

On non-enhanced CT, the bilateral renal atrophy with multiple lesions of varying sizes cysts. The lesion can be solitary or multifocal and can be seen in one or both kidneys. Multifocal lesions were found in more than 50% of ACKD-RCC's cases, and bilateral in more than 20%. Tumors are generally solid masses with regular margin, more often exophytic than intrarenal, and often arises in a cyst. Size is variable but averages probably 3 cm. Pseudocapsules with calcification may be seen in larger lesions. Focal hemorrhage and necrosis can be present in some tumors. ACD-RCCs are hypovascular masses and showed mild enhancement patterns on dynamic enhanced CT.

2. Prognosis

Generally, ACD-RCC is believed to be indolent; but there are also a small number of cases of developed sarcomatoid or rhabdomyoid transformation, indicating that the tumor is aggressive and may experience local recurrence and distant metastasis, leading to poor prognosis. Lymph nodes and organs (lungs, liver, bones, etc.) are common metastase sites. Duration of hemodialysis more than 20 years ($P=0.0085$) and tumor necrosis ($P=0.049$) are clinically significant adverse prognostic features associated with metastasis.

3. Surveillance

Contrast-enhanced ultrasound (CEUS) can be used for the follow-up of non-surgical renal lesions, many research estimating the prevalence of RCC in patients with ACKD was based on Ultrasound (US) diagnosis, while the detection rate of RCC by the US is dissatisfied. Contrast-enhanced CT (CECT) is the best imaging technique for the diagnosis of ACD-RCC, the main disadvantage is cumulative radiation exposure from recurrent CT scanning for regular screening. Therefore, magnetic resonance imaging (MRI) was recommended for regular screening and CECT for further examination.

It is not clear that regular screening for ACD-RCC is beneficial to all end-stage renal disease (ESRD) patients. Younger ESRD patients with high life expectancy may benefit from screening. For most kidney transplant recipients, the evidence of screening for RCC was weak and insufficient.

Conclusion ACD-RCC is the third most common kidney in ACKD patients. ACD-RCCs are typically solid masses that exhibit mild enhancement on CT. Although the disease is a low-grade malignant tumor, it may also cause local recurrence or distant metastasis. Regular screening for ACD-RCC

may be beneficial to younger ESRD patients, MRI was recommended for regular screening and CECT for further examination.

PO-1610

Evaluation of Pancreatic Iodine Uptake and Related Influential Factors in Multiphase Dual-energy CT

Chen Pan¹, Tao Yu¹, Jiani He², Haiyan Tang², Jialin Li¹, Yu Shi¹

1. Shengjing Hospital of China Medical University

2. The First Affiliated Hospital of University of South China

Objectives: To establish normative values and identify potential influential factors related to pancreatic iodine uptake using multiphase dual-energy CT (DECT).

Materials & Methods: This dual-institution retrospective study consecutively selected participants without pancreatic diseases from September 2021 to September 2022 who underwent multiphase abdominal contrast-enhanced DECT including entire pancreas at Shengjing Hospital of China Medical University (SJ-CMU) and The First Affiliated Hospital of University of South China (FH-USC). The arterial phase (AP), portal venous phase (PP), and equilibrium phase (EP) were defined as 35s-40s, 60s-70s, and 150s-180s after the injection of contrast agent, respectively. Normalized iodine concentration (NIC), the ratio of iodine concentration (IC) of pancreas to IC of aorta was calculated. Abdominal obesity was determined by the visceral fat area (VFA). An 1:1 ratio propensity score matching (PSM) was performed. Multiple linear regression analyses were performed to determine independent factors affecting iodine uptake.

Results: A total of 562 participants (mean age 56 years \pm 12 [standard deviation], with 282 men) were evaluated. After 1:1 PSM was performed, the mean IC differed significantly between institutions (all $p < 0.001$) across three contrast-enhanced phases, while mean NIC showed no significant differences (AP: 0.21 vs. 0.21; PP: 0.41 vs. 0.43; EP: 0.46 vs. 0.47, all $p > 0.05$). In multiple linear regressions, NIC_{AP} was independently affected by VFA ($\beta = -0.301$, $p = 0.017$), smoking ($\beta = -0.240$, $p = 0.001$) and type-II diabetes mellitus ($\beta = -0.449$, $p < 0.001$); NIC_{PP} by VFA ($\beta = -0.301$, $p = 0.017$) and smoking ($\beta = -0.291$, $p < 0.001$); and NIC_{EP} by smoking ($\beta = -0.154$, $p = 0.10$) and alcohol abuse ($\beta = -0.350$, $p < 0.001$).

Conclusion: NIC values were consistent across two institutions. Abdominal obesity, smoking, alcohol abuse, type-II diabetes mellitus, and gender are independent factors influencing pancreatic iodine uptake.

PO-1611

A machine learning-derived radiomics signature of visceral adipose tissue predicts the cardiovascular events risk in patients with T2DM

Qingling Yu¹, Junyi Peng², Xiaodong Zhang¹

1. the third affiliated hospital of southern medical university

2. Southern medical university

Objective: Visceral adipose tissue (VAT) is a metabolically active fat depot that plays an important role in cardiovascular diseases. Computed tomography (CT) is a well-established and precise method to measure VAT distribution. In this study, our aim was to investigate the relationship between major adverse cardiovascular events (MACEs) and VAT detected by CT in patients with Type 2 diabetes mellitus (T2DM).

Materials and methods: Our study included 1541 patients with T2DM who underwent baseline non-contrast CT examinations from December 20, 2011 to September 26, 2022 at the third affiliated hospital of southern medical university. VAT area and mean attenuation were quantified using automatic software from CT and a total of 1561 radiomics features were extracted from VAT. Machine learning was developed to identify significant imaging biomarkers associated with MACEs-related traits using selected reproducible features. We also set a 5-year follow-up in 147 patients to demonstrate the long-term predictive effectiveness.

Results: In this study of 1541 participants with T2DM (649 men and 892 women), a substantial number of patients were suffered from MACEs (921, 59.8%), with hypertension (1082, 70.2%), hyperlipidemia (602, 39.1%). VAT attenuation was increased in T2DM patients with MACEs compared to those without MACEs (-90.5HU VS -93.1HU , $P=0.002$), VAT area was not significantly different in patients with or without MACEs (124.1 cm^2 VS 121.2 cm^2 , $P=0.372$). Combined with age and blood glucose level, sixteen VAT texture features achieved areas under the curve (AUCs) and accuracy of 0.802 and 74.4% respectively. The predicted incidence of high-risk population using those features was as high as 84.6% during the 5-year follow-up ($P=0.009$).

Conclusion: This study shows that the texture features of VAT have significant clinical implications in evaluating MACEs and predicting the risk of develop MACEs in T2DM patients.

PO-1612

Prediction value of iodine based images of dual-energy CT on venous phase in esophageal variceal bleeding: a prospective analysis of one-year follow up

Changqin Jiang, Qiang Feng
Weifang City Yidu Central Hospital

Objectives

This study seeks to assess the potential clinical benefits of utilizing iodine-based images generated from contrast-enhanced dual-energy CT in port-venous phase for evaluating esophageal varices (EV) and predicting EV associated bleeding (EVB) in patients suffering from liver cirrhosis.

Methodology

Cirrhotic patients were prospective enrolled and divided into groups of non-EV, mild-EV, and conspicuous (including moderate and severe) EV (CEV) based on the EV severity assessed by esophagogastrosocopy. They were also categorized into EVB and non-EVB groups after a one-year follow-up. All patients underwent upper abdominal multi-phase contrast-enhanced CT scans in a dual-energy model. Through iodine-based images, quantitative parameters of iodine concentration (IC), iodine concentration ratio ($\text{ICR}_{\text{E/H}}$), overlay value (OV), and overlay value ratio ($\text{OVR}_{\text{E/H}}$) were obtained from the lower end of the esophagus. Binary logistic regression was deployed to identify risk factors for EVB. The AUC, sensitivity, and specificity of models with /without clinical factors were calculated, and the difference of performance will be compared.

Results

A total of 138 liver cirrhosis patients initially enrolled for EV evaluation, they were divided into non-EV, mild EV, and CEV groups as 36, 44, and 58 cases, respectively. After follow-up, 116 patients were included for the prediction of EVB analysis, among which 32 (27.6%) patients experienced EVB. The agreement between iodine based images and endoscopy in EV evaluation was recorded at 0.842 (Kappa value). In addition to clinical factors of platelet count and EV grade, the logistic regression model identified $\text{ICR}_{\text{E/H}}$ as an independent risk factor for predicting EVB, with an odds ratio of 24.26 (CI: 3.630-162.25), $p=0.001$. The AUC of $\text{ICR}_{\text{E/H}}$ for predicting the presence of EVB was 0.820 (95% CI: 0.753-0.896), is higher than $\text{OVR}_{\text{E/H}}$ (0.786, 95% CI: 0.701~0.858), but did not show statistical differences, $p=0.133$. The multivariate logistic regression model, which included $\text{ICR}_{\text{E/H}}$, demonstrated an AUC of 0.905 (95% CI: 0.856-0.952),

with a sensitivity of 93.75%, specificity of 72.62%, demonstrating a better performance compared to the prediction model did not include $ICR_{E/H}$, with AUC of 0.843 (0.762-0.915), $p=0.033$.

Conclusions

The quantitative parameters provided by iodine based images in venous phase show incremental value in predicting EV associated bleeding in patients with liver cirrhosis.

Key Points

There is high consistency between CT and endoscopy in EV degree evaluation .

The quantitative parameters on the lower esophagus of cirrhosis patients who experienced EVB is significantly higher than that of patients did not experience EVB.

The combination of significant clinically influencing factors and $ICR_{E/H}$ improves the predictive power of whether EVB will occur in patients with liver cirrhosis.

PO-1613

The Affiliated Huai'an No 1 People's Hospital of Nanjing Medical University

Yingying Zhuang, Lili Guo

The Affiliated Huai'an No 1 People's Hospital of Nanjing Medical University

Background: Gallbladder cancer (GBC) is a rare but aggressive malignancy that is often diagnosed at an advanced stage and is associated with poor outcomes. Radiomics analysis has demonstrated promising abilities for potential use in diagnosing several types of cancers. In this study, we aimed to develop a radiomics model to discriminate between benign and malignant gallbladder lesions using enhanced CT imaging.

Methods: A retrospective analysis was performed on 144 lesions of 135 patients who underwent cholecystectomy for suspected GB diseases between January 2014 and March 2022. All patients had a preoperative contrast-enhanced CT scan, which was independently analyzed by two radiologists. The regions of interest (ROIs) were manually delineated on portal venous phase images, and radiomics features were extracted. Feature selection was performed using the minimum redundancy maximum relevance (mRMR) and LASSO methods. The patients were randomly divided into a training and test group at a ratio of 7:3. Clinical and radiomics parameters were identified in the training group, three models were constructed, and the models' prediction accuracy and ability were evaluated using AUC and calibration curves.

Results: In the training group, the AUC of the clinical model and radiomics model was 0.914 (95% CI 0.854~0.973) and 0.968 (95% CI 0.940-0.996), and that of the nomogram model was 0.980 (95% CI 0.960~1.00), respectively. There were statistically significant differences in diagnostic accuracy between the nomograms and radiomics features ($P<0.05$). There was no significant difference in diagnostic accuracy between the nomograms and clinical features ($P>0.05$) or between the clinical features and radiomics features ($P>0.05$). In the testing group, the AUC of the clinical model and radiomics model were 0.904 (95% CI 0.816-0.993) and 0.941 (95% CI 0.872-1.00), and that of the nomogram model was 0.948 (95% CI 0.883-1.00), respectively. There was no significant difference in diagnostic accuracy between the three groups ($P>0.05$). The calibration curves of the nomogram prediction models in the training group and test group showed a better fit than the ideal curve.

Conclusion: The performance of the nomogram was good, and the calibration curve showed a good fit of the nomogram. It was suggested that radiomics analysis using enhanced CT imaging can effectively discriminate between benign and malignant gallbladder lesions. This study provides a noninvasive approach to diagnose gallbladder diseases, which may have clinical implications for patient management.

PO-1614

Contrast enhanced CT imaging to predict early recurrence of Primary liver cancer post-ablation

Huimao Zhang,Kan He,Yingzhu Cui
The First Bethune Hospital of Jilin University, China

Objective:This study aimed to assess the prognostic significance of Radiomics features from pre-ablation contrast-enhanced CT images in Primary liver cancer patients, especially concerning early recurrence (within 1 year) post-ablation.

Methods:Between June 2014 and December 2019, 124 eligible patients were retrospectively included. 31 patients with less than one year of follow-up were excluded. 93 patients participated in constructing and validating the nomogram models to predict early recurrence (within 1 year) post-microwave ablation of liver cancer. These patients were randomly allocated to a training cohort (n=70) and a testing cohort (n=23).Radiomics labels in the training cohort were established post-dimension reduction via LASSO.All clinical variables underwent logistic regression analysis. Univariate analysis selected variables with a p-value less than 0.10 for inclusion in the multivariate regression model.Clinical variables with a p-value below 0.05 in the multivariate analysis were deemed significant.Prediction models for early recurrence of primary liver cancer were constructed, encompassing clinical, radiological, and combined clinical-radiological models.The predictive performance of each model was evaluated using the area under the curve (AUC), sensitivity, specificity, and by creating nomograms.The classification performance of the model on the test cohort was assessed using the confusion matrix method.

Results:We selected two significant clinical variables, presence of CA199 and diabetes, for predicting early recurrence of primary liver cancer. A clinical model was constructed based on these variables. For the training cohort, the clinical model exhibited an AUC of 0.635 (95% CI: 0.506-0.764) with a sensitivity of 0.65 and specificity of 0.60. For the testing cohort, it yielded an AUC of 0.794 (95% CI: 0.618-0.970) with a sensitivity of 0.80 and specificity of 0.72.In the training cohort, the Radscore model exhibited an AUC of 0.805 (95% CI: 0.686 – 0.924) with a sensitivity of 0.80 and specificity of 0.92. In the testing cohort, it showed an AUC of 0.811 (95% CI: 0.625 - 0.997), a sensitivity of 1, and a specificity of 0.61.The combined clinical and Radiomics model, constructed using the optimal clinical features and Radscore, demonstrated an AUC of 0.851 with a sensitivity of 0.85 and specificity of 0.74 for the training cohort. For the testing cohort, it yielded an AUC of 0.889 with a sensitivity of 0.80 and a specificity of 0.94.

Conclusions:In this study, we established and validated a nomogram model based on radiomics features and conventional clinical characteristics. This model predicts early recurrence of HCC post-ablation, offering added value in forecasting the prognosis for HCC patients undergoing ablation therapy.

PO-1615

CT Radiogenomics: a potential tool for prediction of molecular subtypes in gastric stromal tumor

Xiaonan Yin,Bo Zhang,Xijiao Liu
West China Hospital, Sichuan University

Objectives: This study aims to develop a combined model based on clinical and contrast-enhanced CT (CE-CT) features for predicting gastric GISTs with KIT exon 11 mutations or KIT exon 11 codons 557-558 deletions.

Methods: A total of 231 GIST patients with definitive genetic phenotype were categorized into a training data set and a validation data set with a ratio of 7:3. Clinical features, conventional CT features and radiomics features extracted from abdominal CE-CT images were selected and classified to construct the following models: model CT sign, model CT sign + rad and model CT

sign + rad + clinic. The diagnostic performance of the three models were evaluated by the receiver operating characteristics (ROC) curve analysis and Delong test.

Results: The results of ROC analyses showed that the AUCs of model CT sign, model CT sign + rad, and model CT sign + rad + clinic for KIT exon 11 mutation were 0.743, 0.818, and 0.915 in the training cohort, and 0.670, 0.781, and 0.811 in the validation cohort, respectively. The AUCs of model CT sign, model CT sign + rad, and model CT sign + rad + clinic for KIT exon 11 codons 557-558 deletions were 0.667, 0.842, and 0.72 in the training cohort, and 0.610, 0.782, and 0.795 in the validation cohort, respectively. Based on the decision curve analysis, Model CT sign + rad + clinic was found to be clinically significant and useful.

Conclusions: Our results demonstrated that model CT sign + rad + clinic can effectively distinguish GISTs with KIT exon 11 mutation and KIT exon 11 codons 557-558 deletions. The combined model may be useful in assessing the genotype of GISTs.

PO-1616

Development of a combined nomogram integrating radiomics, deep learning, and clinical risk factors to predict neoadjuvant chemoradiotherapy outcomes in patients with rectal cancer

Yumei Jin¹, Hongkun Yin¹, Chaomei Jiang¹, Che He¹, Jian Bai¹, Guoyun Chen¹, Bin Song^{1,2}

1. Kunming Medical University, Qujing First People's Hospital

2. Department of Radiology, Sichuan University, West China Hospital

Abstract

Objective: To develop a nomogram integrating clinical variables and radiomics signatures, deep learning (DL) features from T2-weighted MR images for the non-invasive prediction of nCRT outcome in patients with rectal cancer.

Materials and Methods: A total of 292 rectal cancer patients were retrospectively collected and randomly divided into a training (n = 230) and a validation dataset (n = 62). Both intra-tumoral and peri-tumoral regions were manually labeled on the T2-weight MR images. Deep features and radiomics features were extracted from the intra-tumor regions only and the combined intra- and peri-tumoral regions, respectively, and used for the development of deep learning models and radiomics model. Clinical risk factors were selected through univariate and multivariate regression analysis. Furthermore, a nomogram was constructed by integrating DL features, radiomics features and clinical risk factors. The performance of these models was evaluated by receiver operating characteristics curve (ROC) analysis and decision curve analysis (DCA).

Results: The AUCs of the DL model and radiomics model based on intra-tumor regions were 0.666 (95% CI, 0.534–0.780) and 0.817 (95% CI, 0.698–0.903) in the validation dataset, respectively. The performance of DL model and radiomics model was improved after integrating peri-tumoral regions, with AUCs increasing to 0.739 (95% CI, 0.612–0.842) and 0.845 (95% CI, 0.731–0.924) in the validation dataset, respectively. The nomogram showed the best predictive capability with AUCs achieving 0.921 (95% CI, 0.824–0.874) in the validation dataset, which was significantly higher than other models (all p-values < 0.05). All models showed good calibration, and the DCA demonstrated that the net benefit of the nomogram was higher than other models across majority range of threshold probabilities.

Conclusion: The nomogram incorporating deep learning features, radiomics signatures and clinical variables showed good performance and can be served as a noninvasive tool for predicting postoperative outcomes in patients with rectal cancer.

PO-1617

Computed tomography-based tumoral and peritumoral radiomics: Clinical machine-learning models for the prediction of postoperative recurrence and metastatic risk in localized clear cell renal cell carcinoma

Xiaoxia Li

复旦大学附属中山医院厦门医院

Purpose: We aimed to develop an intra- and peritumoral radiomic signature using machine-learning models to improve postoperative recurrence and metastatic risk stratification for use with localized clear cell renal cell carcinoma (ccRCC) patients.

Methods: In this study, 407 patients with pathologically diagnosed ccRCC were included in the training (n = 325) and testing cohort (n = 82) with a cohort distribution ratio of 8:2. Tumors inside and at various distances outside the tumor were analyzed for the selection and extraction of intra- and peritumoral radiomic characteristics. After dimension reduction and selection, multiregional radiomic and clinical models were built using different machine-learning models. Ultimately, a radiomic-clinical model was created by combining radiomic and clinical features. The models were evaluated using a receiver operating characteristic curve. A radiomic nomogram was created by combining multiregional radiomic and clinical characteristics.

Results: Using computed tomography images, a total of 9170 radiomic features were identified inside and around tumors from five regions of interest. After dimension reduction, 23 radiomic features were thought to be important. Among the radiomics models, the logistic regression (LR) model showed the best prediction accuracy and robustness, with an area under the curve (AUC) of 0.936 in the training set, and 0.906 in the test set. Among the clinical models, the LR model also had the greatest prediction accuracy, with AUCs of 0.838 in the training set, and 0.896 in the test set. The combined model had the best prediction accuracy (AUCs: training set, 0.952; test queue, 0.914).

Conclusion: Our radiomic nomogram using a combination of radiomic and clinical features demonstrated excellent predictive accuracy for recurrence and metastasis in postoperative ccRCC.

PO-1618

Apparent diffusion coefficient histogram metrics of multiplexed sensitivity encoding diffusion weighted imaging in evaluating pelvic lymph node metastasis of cervical cancer

Tiebao Meng¹, Nannan Bai¹, Tong Ye², Weijing Zhang¹, Haoqiang He¹, Chuanmiao Xie¹

1. Sun Yat-sen University Cancer Center

2. The Brain Cognition and Brain Disease Institute of Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

Purpose: To investigate apparent diffusion coefficient (ADC) histogram metrics of multiplexed sensitivity encoding diffusion weighted imaging (MUSE DWI) in evaluating pelvic lymph node metastasis of cervical cancer (CC).

Methods: We retrospectively analyzed the clinical data of 54 cervical cancer patients who were pathologically confirmed after extensive hysterectomy and pelvic lymph node dissection. A total of 74 lymph nodes were extracted, including 28 metastatic lymph nodes and 46 non metastatic lymph nodes. All patients underwent routine magnetic resonance imaging (MRI) examination and MUSE-DWI scan before surgery. Referring to T2 Weighted Imaging, in MUSE-DWI, the region of interest (ROIs) covering the entire lymph nodes were drawn on the b=800 s/mm² images of

MUSE-DWI, enabling the extraction of ADC histogram parameters including minimum, maximum, mean, median, percentile (10%, 25%, 75%, 90%), kurtosis, and skewness. We compared the differences of ADC histogram parameters between the CC pelvic lymph node metastasis group and the non-metastatic group, and evaluated the diagnostic efficacy using receiver operating characteristic curves and area under the curve (AUC).

Results: The mean, median, 25%, and 75% in the metastatic lymph node group were significantly lower than those in the non-metastatic lymph node group ($p < 0.05$). However, there were no statistically significant differences in minimum, maximum, 10%, 90%, kurtosis, and skewness ($p > 0.05$). The median showed the highest diagnostic efficacy with AUC of 0.718, sensitivity of 64.3%, and specificity of 71.7%.

Conclusion: As a high-definition diffusion sequence, the ADC histogram parameters of MUSE DWI have high diagnostic value for pelvic lymph node metastasis in cervical cancer, especially the mean, median, 25%, and 75% metrics.

PO-1619

Implementation of CT colonography for colorectal cancer screening in a Chinese hospital: initial outcomes from the first pilot study

Zhiye Chen, Wenping Fan, Wenhao Ge, Shuqiang Zhao
Chinese PLA General Hospital

Background: Although colorectal cancer (CRC) is ranked as the second in incidence and the fifth leading cause of death for men and women in China, there is significant medical resource shortage of optical colonoscopy (OC) for population-wide screening, resulting in less than 10% of early-stage diagnosis of CRC in China. Computed-tomography colonoscopy (CTC) is well established as an alternative to OC, unfortunately, no Chinese hospital has established and implemented a clinical procedure of CTC for clinical practice. This study aims to investigate the performance of CTC as a complementary approach of OC for population-wide early screening of CRC.

Methods: We conducted a 6-month feasibility study to evaluate a newly established clinical procedure for CTC.

Results: Among 131 referred patients, a total of 16 colonic polyps were detected in fourteen patients (10.6%), with the findings of follow-up OC in 3 CTC patients matched with the original CTC results. In addition, we identified 2 (1.3%) patients with important extracolonic findings in liver or adrenal gland. We also created a new indicator, named Rate of complete visualization of the entire colon (RCV), for quality assessment of entire CTC procedure. More than 95% CTC had acceptable RCV index.

Conclusion: The evaluated CTC clinical procedure could be used as a complementary approach of OC for population-wide early screening of CRC.

PO-1620

Value of routine CT parameters for PD-L1 expression status in gastric cancer

Min Xu

Lanzhou University Second Hospital

Objective: We aimed to explore the correlation between routine computed tomography (CT) imaging features and programmed cell death ligand-1(PD-L1) expression status in gastric cancer and evaluate the predictive value of imaging parameters for this immunotherapy biomarker. **Materials and Methods:** Patients with gastric adenocarcinoma who underwent abdominal CT three-stage enhanced scan and PD-L1 immunohistochemical testing before treatment were retrospectively examined. All diagnoses were confirmed through pathology. According to the expression status of PD-L1, they were divided into the positive (CPS ≥ 5) or negative group (CPS < 5). Baseline CT imaging features were collected. Diagnostic performances of the different variables were evaluated using receiver operating characteristic (ROC) curve.

Results: In total, 67 patients (17 women and 50 men; mean age: 59.55 ± 10.22 years) with gastric adenocarcinoma were included in the study. The probability of maximum lymph node short diameter > 1 cm and peak of lesion enhancement occurring in the arterial phase were statistically significant between the two groups ($p < 0.05$). Moreover, the arterial enhancement fraction (AEF) was significantly higher in the positive group than that in the negative group ($p < 0.05$), and ROC curve analysis showed that the AEF exhibited a high evaluation efficacy (area under the curve [AUC]=0.724 [95% confidence interval (CI): 0.602–0.826]). The combined parameters had the best diagnostic efficacy (AUC=0.786 [95%CI: 0.669–0.877]), sensitivity (58.33%), and specificity (88.37%).

Conclusions: These findings confirm a correlation between CT imaging features and PD-L1 expression status in gastric cancer, and AEF may help evaluate high PD-L1 expression and select patients suitable for immunotherapy.

PO-1621

Optimal treatment strategy for Child-Pugh stage B of hepatocellular carcinoma based on recurrence time and tumor size: A propensity score matching study

Zhongqi Sun, huijie jiang

The Second Affiliated Hospital of Harbin Medical University

Purpose : Child-Pugh stage B of hepatocellular carcinoma (HCC) is usually treated with transhepatic arterial chemoembolization (TACE) or TACE combined with lenvatinib, but the optimal treatment strategy remains controversial. This study was designed to compare the efficacy of treating HCC patients with TACE-Lenvatinib or TACE at Child-Pugh stage B.

methods: A total of 116 HCC patients were included between June 2016 and January 2020, with 64 patients in the TACE-Lenvatinib group and 52 patients in the TACE group. The primary endpoints were median repeat recurrence-free survival (rRFS) and overall survival (OS). Propensity-score matching (PSM) was conducted to minimize bias. Subgroup analysis based on recurrence patterns (recurrence time and tumor size) and prognostic factors were studied.

Results: Before PSM, the TACE-Lenvatinib group had better median OS (32.0 vs 22.0 months, $P < 0.001$) and rRFS (11.0 vs 9.0 months, $P = 0.003$). After PSM, the TACE-Lenvatinib group also had a better median OS (33.5 vs 28.0 months, $P = 0.026$), but there was no significant difference in median rRFS between the two groups (11.0 vs 10.0 months, $P = 0.085$). Subgroup analysis

showed that when tumor diameter>5 cm, TACE-Lenvatinib had a better median OS (30.5 vs 23.0 months, $P = 0.022$) and rRFS (12.0 vs 10.1 months, $P = 0.030$).

Conclusion: In summary, HCC has better efficacy to TACE-Lenvatinib for HCC with tumor diameter >5 cm. We suggest using TACE-Lenvatinib to treat Child-Pugh stage B of HCC.

PO-1622

Nomogram based on energy spectral computed tomography for predicting mutation status of c-KIT exon 11 in gastrointestinal stromal tumors

Jiachen Sun, junlin Zhou
Lanzhou university second hospital

Purpose

This study aimed to develop a nomogram that combined clinical indexes and quantitative parameters of energy spectrum CT to predict the mutation status of c-KIT exon 11 in gastrointestinal stromal tumors (GISTs).

Method

61 patients with confirmed GISTs by pathology were retrospectively enrolled. All patients underwent energy spectrum CT preoperatively and c-KIT gene testing. Univariate analysis was used to compare the clinical indexes and energy spectrum CT quantitative parameters of two patient groups. The statistically significant parameters in the above univariate analysis were incorporated into Logistic regression, and screened independent predictors for predicting the mutation status of c-KIT exon 11. Draw a nomogram for predicting the mutation status of c-KIT exon 11, and evaluate the discrimination, calibration, and clinical net benefit of nomogram using C-index, calibration curve, and decision curve analysis.

Results

In our research, 26 were men and 35 were women. The average age of all participants was 59.25 ± 14.25 years. The logistic regression analysis showed that age, the CT values at a single energy level of 60 keV and 120 keV in the venous phase were independent predictors in the predictive model. Based on these predictors, we developed a nomogram to predict the mutation status of GISTs c-KIT exon 11. The C-index of a nomogram was 0.827 (95% CI: 0.723-0.932), the sensitivity and specificity were 72.5% and 81.0%, respectively. The calibration curve showed the predicted values of the nomogram was in good consistency with the actual values ($P=0.724$). Decision curve analysis showed that a nomogram achieved high clinical net benefits.

Conclusion

This study presents a nomogram that combined clinical indexes and quantitative parameters of energy spectrum CT, which has high efficiency in predicting the mutation status of GISTs c-KIT exon 11.

PO-1623

Influence of skeletal muscle and intermuscular fat on postoperative complications and long-term survival in rectal cancer patients

Tong Nie, Bo Liang, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: The body composition of rectal cancer patients, specifically muscle and adipose tissue, can potentially impact both short-term and long-term postoperative outcomes. The aim of this study is to explore the correlation of skeletal muscle and adipose tissue quantified by computed tomography (CT) with postoperative complications and long-term prognosis in rectal cancer patients after surgical resection.

Methods: This retrospective cohort study included 415 patients with rectal cancer who underwent surgical resection at Wuhan Union Hospital between December 2014 and May 2018. Skeletal muscle and adipose tissue indexes were quantified with CT images at the third lumbar vertebra (L3) and umbilicus levels obtained within three months prior to surgery. Adipose tissue indexes include visceral fat area (VFA), subcutaneous fat area (SFA), and intermuscular fat area (IMFA), while skeletal muscle indexes include skeletal muscle area (SMA) and skeletal muscle radiodensity (SMD). The sex-specific optimal cut-off value for each body composition was defined by using the X-tile software. Logistic and Cox proportional hazards models were used to assess the associations between body composition and postoperative complications, overall survival (OS) and disease-free survival (DFS). Furthermore, receiver operating characteristic (ROC) analysis was used to estimate the predictive ability of body composition combined with clinical indicators.

Results: A total of 415 patients (240 males and 175 females) were included, the mean (SD) age was 57.8 (10.5) years. Logistic regression analysis indicated no significant correlation between body composition and postoperative complications (all $P > 0.05$). Multivariate Cox regression analysis showed that SMD at the L3 level (HR 0.338, 95% CI 0.131-0.876, $P = 0.026$) and IMFA at the umbilical level (HR 1.993, 95% CI 1.053-3.769, $P = 0.034$) were independent prognostic factors for OS and DFS (HR 0.371, 95% CI 0.160-0.861, $P = 0.021$; HR 2.256, 95% CI 1.410-3.612, $P = 0.001$). Furthermore, ROC analyses revealed the predictive accuracy of a combination of body composition and clinical indicators for OS and DFS with the area under the ROC curve of 0.861 and 0.823, respectively (both $p < 0.05$).

Conclusions: There was no significant correlation between CT-quantified body composition and postoperative complications. Low SMD at the L3 level and high IMFA at the umbilical level were associated with shorter OS and DFS. The combination of CT-quantified body composition and clinical indicators could help physicians to recognize worse survival outcomes in rectal cancer patients after surgery.

PO-1624

Prognostic value of platelet-to-lymphocyte ratio in patients with unresectable hepatocellular carcinoma undergoing transarterial chemoembolization and tyrosine kinase inhibitors plus immune checkpoints inhibitors

Yiwan Guo, Wenlong Wu, Bo Sun, Tingting Guo, Chuansheng Zheng, Xin Li
Wuhan Union Hospital

Purpose To investigate the prognostic value of platelet-to-lymphocyte ratio (PLR) in patients with unresectable hepatocellular carcinoma (uHCC) treated with transarterial chemoembolization (TACE) and tailored tyrosine kinase inhibitors (TKIs) plus immune checkpoints inhibitors (ICIs).

Materials and methods Ninety-eight patients from May 2018 to January 2022 in our hospital were enrolled in this study. The receiver operating characteristic (ROC) curve analysis was performed to determine the optimal PLR cut-off. Overall survival (OS), progression-free survival (PFS), and adverse events (AEs) of patients were evaluated based on the PLR cut-off. The factors affecting survival were assessed using univariate and multivariate analyses.

Results The PLR cut-off was 98.89. There were 49 patients in the low pretreatment PLR group ($PLR \leq 98.89$) and 49 patients in the high PLR group ($PLR > 98.89$). Patients with low pretreatment PLR had significantly longer median OS (25.7 months vs 16.1 months; $P < 0.001$) and PFS (14.9 months vs 10.2 months; $P < 0.001$) than those with high pretreatment PLR. The multivariate analysis revealed that ALT, tumor size, and PLR are risk factors affecting OS. The four independent factors affecting PFS are tumor size, HBV infection, AFP, and PLR. The AEs were tolerable and manageable.

Conclusion The low pretreatment PLR ($PLR \leq 98.89$) was an independent protective factor for the survival outcomes of patients in this study. PLR was helpful for clinicians to predict the prognosis and identify the patients with uHCC who were most likely to benefit from TACE + TKIs + ICIs.

PO-1625

Using Intra-voxel Incoherent Motion MRI to Dynamically Evaluate the Anti-hepatic Fibrotic Effects of Donafenib Combined with Carvedilol in a Thioacetamide-induced Rat Model

Jiacheng Liu, Chuansheng Zheng
Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective

To dynamically evaluate the anti-hepatic fibrotic effects of donafenib combined with carvedilol using intra-voxel incoherent motion (IVIM) MRI at different time points of disease course in a thioacetamide (TAA)-induced rat model.

Materials and Methods

In this study, forty male Sprague-Dawley rats received TAA for 6 weeks to induce liver fibrosis and were divided into four groups randomly ($N = 10$). From week 3 to week 6 of modeling, each group of rats received daily gavage of vehicle, carvedilol (CARV), donafenib (DON) and donafenib plus carvedilol (DON+CARV), respectively. IVIM MRI was used to assess the degree of liver fibrosis in the above groups at 0, 2, 4 and 6 weeks after modeling.

Results

The mean pathological collagen areas and the expression of α -SMA and Collagen I in CARV, DON and DON + CARV groups were significantly less than that in vehicle group ($P < 0.001$). IVIM-derived parameters (D, D* and f) and ADC values were negatively correlated with the fibrosis levels (D: $r^2 = 0.594$, $P < 0.001$; D*: $r^2 = 0.556$, $P < 0.001$; f: $r^2 = 0.737$, $P < 0.001$; ADC: $r^2 = 0.694$, $P < 0.001$). At 4 and 6 weeks after modeling, the mean IVIM parameters and ADC values of the DON+CARV group were significantly higher than those of the vehicle group.

Conclusion

IVIM MRI is a non-invasive and valuable dynamic monitoring tool for liver fibrosis, and it was useful to monitor the dynamic inhibition process of donafenib and carvedilol on liver fibrosis in a TAA-induced rat model.

PO-1626

Influence of regional adipose tissue distribution on prognosis in patients with locally advanced rectal cancer

Weiyan Huang¹, pengfei rong²

1. Xiangya Hospital Central South University

2. The Third Xiangya Hospital of Central South University

Background: Body composition is recognized to be associated with clinical outcomes in patients with locally advanced rectal cancer (LARC). This study aimed to determine the prognostic role of regional adipose tissue distribution in patients with LARC.

Methods: This study retrospectively included in patients who underwent radical surgery for LARC between 2013 and 2019. Patients underwent contrast-enhanced CT scans before surgery. Visceral adipose tissue (VAT), abdominal subcutaneous adipose tissue (aSAT), and gluteal subcutaneous adipose tissue (gSAT) were quantified on the CT images. The association of adipose tissue distribution with progression-free survival (PFS) was analyzed using Cox proportional hazards analysis.

Results: A total of 176 patients with LARC were included in this study. During a median follow-up period of 24 months, 54 (30.7%) patients experienced local recurrence or metastasis. In patients with LARC, univariate analyses showed that pT staging (hazard ratio [HR] 8.41, 95% confidence interval [CI] 1.13-62.52; $P = 0.038$), pN staging (HR 3.05, 95% CI 1.61- 5.78; $P = 0.001$) VAT (HR 1.93, 95% CI 1.53- 2.43; $P < 0.000$), aSAT (HR 1.54, 95% CI 1.22- 1.94, $P < 0.000$) and gSAT (HR 1.38, 95% CI 1.08- 1.77, $P = 0.011$) were significantly associated with PFS. In multivariate analysis, only VAT was a predictor of poor prognosis (HR 1.94, 95% CI 1.45- 2.58; $P < 0.001$). Kaplan-Meier survival curves showed that visceral obesity was associated with an increased risk of local recurrence or metastasis in patients with LARC ($P = 0.0028$).

Conclusion: Visceral obesity is an adverse prognostic factor in patients with surgically LARC. VAT can be used as a prediction indicator for patients' postoperative survival prognosis.

PO-1627

Locally Advanced Rectal Cancer: Add Value of Amide Proton Transfer Weighted MR imaging in the Evaluation of Complete Response to Neoadjuvant Chemo- and Radiation Therapy

Lan Zhang, Yuan Liu, Xin Li

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: Complete response (CR) to neoadjuvant chemotherapy and radiation therapy (NCRT) provides the opportunities to avoid surgical complications, and the benefits of decreased overall recurrence and disease-free survival in patients with locally advanced rectal cancer (LARC). Thus, accurate preoperative evaluation of CR through imaging techniques is essential.

Purpose: To investigate the added value of Amide Proton Transfer weighted (APTw) magnetic resonance imaging (MRI) in the evaluation of CR to NCRT in patients with LARC.

Materials and Methods: Institutional review board approved this single-center prospective study and the patient informed consent requirement was obtained from all study participants. Patients with LARC (T3-4N0M0 or T1-4N+M0) who underwent NCRT and subsequent surgery, with adequate MRI quality were enrolled from November 2021 to April 2023 in Wuhan Union Hospital. All patients underwent conventional MRI and APTw imaging before and after NCRT. Tumor segmentation and histogram analysis were performed based on post-NCRT APTw images. Conventional evaluation of CR to NCRT, based on post-NCRT T2WI and DWI, were evaluated by two experienced radiologists independently. Pathologic complete response (pCR) served as the reference standard. The independent risk factors markedly correlated with pCR were assessed using multivariate logistic regression analyses. Diagnosis performance was assessed by receiver operating characteristic curve (ROC) analysis. The AUCs were compared using the Delong method. **Results:** In total, 64 participants were evaluated: 21 with pCR and 43 with non-pCR. Diagnostic accuracy in the evaluation of CR was significantly improved when APTw imaging was added to conventional evaluation based on T2WI and DWI, with AUC improved from 0.706 to 0.969.

Conclusion: Adding APTw imaging to conventional T2WI and DWI yields better diagnostic accuracy than only use of combination of T2WI and DWI in the evaluation of CR to NCRT in patients with LARC. Superimposing the advantage of noninvasiveness, APTw imaging may provide additional valuable information for clinical decision making after NCRT.

PO-1628

Imaging follow-up and literature review of 2 intractable case of visceral angiosarcoma

Jiawei Wu, Xin Li

Wuhan Union Hospital, Huazhong University of Science and Technology

Background: Angiosarcoma is a highly aggressive and malignant neoplasm. Visceral angiosarcoma is extremely rare and there are few reports describe changes in follow-up images till now.

Case presentation:

Case1: A 58-year-old male was admitted to our hospital, with diagnosis of pericardial effusion and mild abnormal hepatic function.

Hepatic MRI revealed high signal intensity mass in the right lobe on T2-weighted imaging mimicking hepatic hemangioma, with mild 18FDG uptake (SUVmax 3.7). Furthermore, Positron emission tomography (PET) examination showed moderate 18FDG uptake (SUVmax 5.7) in the region of

ventricular septum, while CT-scan showed no definite abnormality. After treatment, the patient's condition improved significantly and was discharged from hospital. Discharge diagnosis included pericardial infection, pericardial effusion, and hepatic hemangioma.

Two months later, the patient's condition deteriorated rapidly, 18FDG-PET/CT image revealed multiple moderate and high 18FDG uptake lesions, including lung, liver and the region of ventricular septum. Finally, he was diagnosis as Angiosarcoma by CT-guided fine-needle aspiration (FNA) biopsy.

Case2: A 59-year-old male underwent PET/CT examination because of pulmonary ground-glass nodules. The ground-glass nodules represented mild 18FDG uptake (SUVmax 0.8), were considered as inflammatory granulomas. Moreover, PET/CT images showed a low-density lesion in the spleen with mild uptake of 18FDG (SUVmax 2.6).

Six months later, he was admitted to our hospital because of anemia. Moderate and high 18FDG uptake was found in the huge mass of liver and spleen as well as multiple lesions of spine on 18FDG-PET/CT images. Pathologic analysis of bone suggested a diagnosis of Angiosarcoma.

Conclusions: Early diagnosis of angiosarcoma requires an appreciation for their unique anatomic predilections and a high clinical index of suspicion. Visceral angiosarcoma has a rapid progression without early diagnosis.

PO-1629

Inter-operator variation and error sources in response assessment for advanced hepatocellular carcinoma to combined targeted immunotherapy

Wencui Li, Zhaoxiang Ye
Tianjin Medical University Cancer Institute and Hospital

To explore the inter-operator variation and the potential sources of discordance in response assessments achieved by different criteria in advanced hepatocellular carcinoma with combined targeted immunotherapy.

Methods: Thirty patients with advanced HCC who received immune checkpoint inhibitors combined with anti-angiogenic agents between October 2020 and October 2022 were scrutinized for this retrospective study. The baseline and follow-up images were evaluated separately by three radiologists with different expertise in liver imaging (operator 1, 20 years; operator 2, 5 years; operator 3, no specific training in liver imaging), according to: response evaluation criteria in solid tumors (RECIST1.1), immunotherapy modified RECIST (iRECIST) and modified RECIST (mRECIST).

Results: The objective response rate (ORR) evaluated by RECIST 1.1 was 33.3%, and the disease control rate (DCR) was 80%, both of which were same with the iRECIST. According to RECIST 1.1 and mRECIST, the result of the response assessments was statistically different between the complete response (CR), partial response (PR), the stable disease (SD) and progressive disease (PD) groups ($P=0.018$), however, no statistically significant differences were observed in ORR and DCR ($P=0.161$). The overall response concordance between the more expert operators was good, irrespective of the criteria. The most evident discordance was in target lesion response assessment, with expert operators disagreeing mostly on lesion selection and less expert operators on lesion measurement.

Conclusion: Decision on whether a patient is a responder or progressor under combined targeted immunotherapy may vary among different operators. The patients should be evaluated by experienced radiologists to minimise variability, regardless of the adopted criteria.

PO-1630

Development of combining CT features and CA 125 to diagnose occult peritoneal metastasis in patients with advanced gastric cancer preoperatively

Zhen Ning Zhu, Qiu Xia Feng, Qiong Li, Wei Yue Xu, Xi Sheng Liu
The first affiliated hospital with Nanjing Medical University

Abstract

Objectives: To explore the diagnostic value of clinical characteristics and conventional CT features in diagnosing occult peritoneal metastasis (OPM) of advanced gastric cancer (AGC).

Methods: In this retrospective study, 66 patients with OPM and 111 patients with non-peritoneal metastasis (NPM) who underwent preoperative contrast-enhanced computed tomography (CECT) between January 2020 and December 2021 were included. Patient information, clinical characteristics, CT features, and abdominal fat such as visceral fat, subcutaneous fat were observed. A combined indicator was established using multivariate logistic regression. ROC and AUC were performed to assess the diagnostic performance of our combined indicator.

Results: A total of 177 patients were included in this study, of whom 66 patients underwent OPM and 111 patients had no PM, in other words, non-peritoneal metastasis (NPM). The mean age of the patients was 66.1 ± 9.3 years and majority of them were men (143, 80.8%). Variables covering age, NLR, PLR, Carbohydrate antigen 125 (CA125) and Carbohydrate antigen 72-4 (CA 72-4) were significantly different between OPM and NPM. The evaluated characteristics of tumor length, Borrmann IV, NAPV, pelvic effusion, visceral fat, visceral fat/abdominal fat and mean of visceral fat were significantly different between OPM and NPM with $P < 0.05$. Patients with OPM illustrated more tumor length, more Borrmann IV, more pelvic effusion, less visceral fat, lower visceral fat to abdominal fat ratio and less mean of subcutaneous fat. Variables including gender, body mass index (BMI), Carcinoembryonic antigen (CEA), Carbohydrate antigen 153 (CA 153), Carbohydrate antigen 199 (CA 199), tumor thickness, NVPV, cT stage, cN stage, subcutaneous fat, mean of subcutaneous fat showed no significant difference between two groups. On stepwise logistic analysis, Borrmann IV ($P = 0.002$; odds ratio [OR], 3.70; 95% confidence interval [CI], 1.59-8.59), pelvic effusion ($P = 0.004$; OR, 3.22; 95% CI, 1.47-7.07), CA125 ($P = 0.001$; OR, 3.80; 95% CI, 1.72-8.40) and NAPV ($P < 0.001$; OR, 4.02; 95% CI, 1.85-8.71) proved to be independent risk factor of OPM in AGC. The AUC of the combined indicator for detecting OPM was higher (AUC=0.820; 95% CI, 0.753-0.887) than that of single independent risk factor of Borrmann IV (AUC=0.643; 95% CI, 0.553-0.734), pelvic effusion (AUC=0.681; 95% CI, 0.594-0.769), CA125 (AUC=0.696; 95% CI, 0.612-0.779) and NAPV (AUC=0.676; 95% CI, 0.589-0.763). In order to assess whether AUC values were significantly different between combined indicator and each independent risk factor, the DeLong test was performed. The results indicated AUC values were significantly different between combined indicator and each independent risk factor. The SEN, SPE, PPV and NPV of combined indicator were 0.752, 0.783, 0.656, 0.851 respectively.

Conclusion: A predictive indicator based on CT features and CA 125 provided valuable information and was of important potential in clinical practice in terms of individual treatment of AGC.

PO-1631

Nomogram Based on Body Composition and Prognostic Nutritional Index Predicts Survival After Curative Resection of Gastric Cancer

Chao Tao, Yongmei Yu

Department of Radiology, the First Affiliated Hospital of Wannan Medical College

Purpose: This study aimed to identify independent prognostic factors for gastric cancer patients after curative resection using quantitative computed tomography (QCT) combined with prognostic nutritional index (PNI), and to develop a nomogram prediction model for individualized prognosis.

Method: This study retrospectively analyzed 119 patients with gastric cancer who underwent curative resection from January 2016 to March 2018. The patients' preoperative clinical pathological data were recorded, and all patients underwent QCT scans before and after curative resection to obtain QCT parameters: bone mineral density (BMD), skeletal muscle area (SMA), visceral fat area (VFA), subcutaneous fat area (SFA) and CT fat fraction (CTFF), then relative rate of change in each parameter (Δ BMD, Δ SMA, Δ VFA, Δ SFA, Δ CTFF) was calculated after time normalization. Multivariate Cox proportional hazards was used to establish a nomogram model that based on independent prognostic factors. The concordance index (C-index), area under the time-dependent receiver operating characteristic (ROC) curve and clinical decision curve were used to evaluate the predictive performance and clinical benefit of the nomogram model.

Results: This study found that Δ CTFF, Δ VFA, Δ BMD and PNI are independent prognostic factors for overall survival (hazard ratio: 1.034, 0.895, 0.976, 2.951, respectively, all $p < 0.05$). The established nomogram model could predict the area under the ROC curve (AUC) of overall survival at 1, 3, and 5 years as 0.816, 0.815 and 0.881, respectively. The C-index was 0.743 (95% CI, 0.684-0.801), and the decision curve analysis showed that this model has good clinical net benefit.

Conclusion: The nomogram model based on body composition and PNI is reliable in predicting the individualized survival of underwent curative resection for gastric cancer patients.

PO-1632

A non-contrast CT radiomics nomogram for early differentiation of acute necrotizing pancreatitis from acute interstitial edematous pancreatitis

Jiayi Bao^{1,2}, Yuanqing Liu¹, Yang Yu¹, Rong Hong¹, Feiwen Feng¹, Su Hu¹, Chunhong Hu¹

1. the First Affiliated Hospital of Soochow University; The First Affiliated Hospital of Ningbo University

2. The First Affiliated Hospital of Ningbo University

Objective: The aim of this study was to investigate non-contrast CT-based nomogram predictions for early differentiation of acute necrotizing pancreatitis (ANP) from acute interstitial edematous pancreatitis (AEP).

Methods: This retrospective study included 161 patients with acute pancreatitis (AP) who underwent an early non-contrast CT between January 2016 and January 2022. The diagnosis for AEP and ANP was determined by follow-up enhanced MRI or CT. Clinical data (age, gender, white blood count, serum glucose and lactate dehydrogenase within 48 hours of admission) were collected. The minimum redundancy maximum relevance (mRMR) and the least absolute shrinkage and selection operator (LASSO) were used for dimension reduction and feature selection, and radiomics model was established. The nomogram was developed based on radiomics scores (Radscore) and clinically risk factors.

Results: The nomogram model outperformed both the clinical model and the radiomics model in predicting ANP in both the training cohort (AUC 0.93; 95% CI: 0.88 to 0.97) and the validation cohort (AUC 0.84; 95% CI: 0.73 to 0.95).

Conclusions: Non-contrast-CT-based radiomics nomogram offers a new non-invasive method to accurately identify AEP and ANP at an early stage, which may help in the individual management of AP patients.

PO-1633

Hepatic alveolar echinococcosis accompanied by lung and kidney metastases: a case description of imaging findings

Xukun Gao

Affiliated Hospital of Qinghai University

Alveolar echinococcosis is a zoonotic disease caused by larvae of *Echinococcus multilocularis*. Almost all alveolar echinococcosis originate in the liver, with the lungs and brain being the most common organs of transfer. In contrast, metastasis to the kidneys is very rare; here, we report a case of hepatic alveolar echinococcosis metastasis to the lung and kidney successively with imaging manifestations and features. On March 23, 2017, a 49-year-old woman came to our hospital due to discomfort and pain in her lower back. Imaging at our hospital suggested hepatic alveolar echinococcosis with intrapulmonary metastases. From 2018 to 2019, the patient underwent follow-up examinations at our hospital, which showed enlarged liver and lung lesions. In May 2020, the patient underwent liver transplantation and resection of an intrapulmonary lesion due to the gradual enlargement of the lesions in other hospitals and was diagnosed with HAE with lung metastasis. On August 15, 2022, the patient again visited our hospital with "intermittent pain in the left lumbar abdomen. The clinical diagnosis was hepatic alveolar echinococcosis with renal metastases, and renal tumors were not excluded. The renal lesion underwent radical resection and was confirmed as alveolar echinococcosis by pathological examination. During postoperative follow-up, the patient had no uncomfortable symptoms. In this case, the patient's hepatic alveolar echinococcosis metastasized successively to the lung and kidney. We have complete imaging data, from which we have analyzed the relevant features to provide some assistance in future clinical diagnosis and treatment.

PO-1634

The prediction of mortality outcomes at CT in patients with severe acute pancreatitis: Non-Local Means Denoising and Histogram Analysis

Di Tao

Affiliated Hospital of North Sichuan Medical College

Background: Severe acute pancreatitis (SAP) carries a significant risk of mortality and places a substantial financial burden on patients's families. Contrast-enhanced CT (CECT) is frequently utilized as a diagnostic and severity assessment tool for acute pancreatitis (AP).

Purpose: This study aimed to create a histogram model based on Contrast-enhanced CT to early predict the risk of death in severe acute pancreatitis patients and investigate the impact of Non-Local means denoising on prediction accuracy.

Methods: Patients diagnosed with severe acute pancreatitis from September 2014 to April 2023 were involved, and their clinical characteristics and Contrast-enhanced CT data were involved. Non-Local means denoising techniques were applied to Contrast-enhanced CT images. Histogram

analysis was conducted on volume of interest data obtained from arterial and portal phase Contrast-enhanced CT images. Statistical analyses encompassing both univariable and multivariable assessments were conducted. A histogram model based on Contrast-enhanced CT for predicting death risk was constructed. Comparing the prediction accuracy of the histogram model with clinical model and CT model.

Results: The study involved a collection of 74 patients, 27 of whom (36.5%) suffered mortality. A total of 8 histogram models were developed. However, there was no statistically significant difference in the prediction ability among the various levels of noise coefficient in both the artery phase and the portal venous phase ($P > 0.05$). These histogram models outperformed both the conventional CT and clinical models ($P = .009$ and $P = .048$, respectively). Statistical significance between the CT model and the clinical model was not found ($P = 0.699$).

Conclusion: Histogram analysis supplements the conventional Contrast-enhanced CT diagnosis of AP, and shows strong predictive capabilities for the mortality outcomes among patients with severe acute pancreatitis.

PO-1635

Pathological Grading of Clear Cell Renal Cell Carcinoma: Role of Perirenal Fat, Automated Segmentation and Ensemble Learning

Shichao Li, Ziling Zhou, Zhen Li

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: To develop and validate a comprehensive approach combining automated segmentation and machine learning to predict ccRCC grade, while exploring the role of perirenal fat.

Materials and Methods: In this retrospective study, patients with pathologically confirmed ccRCC from a local hospital and an open-source dataset were retrospectively analyzed. Use TransUNet combined with the train-while-annotation method to train an automatic segmentation model for tumors, kidneys, and perirenal fat. Randomly partition local data for training and internal validation, and utilize images from public datasets for external validation. Multi-filter radiomics features were extracted, lasso regression was used to screen features, and SVM was used to establish a pathological grading prediction model. Dice coefficient and performance metrics such as accuracy and AUC were calculated to evaluate the segmentation and classification model. Besides, the SHapley Additive exPlanations (SHAP) method was employed for interpreting and visualizing the WHO/ISUP grading model.

Results: A total of 614 patients (mean age 56.3, 430 males, and 184 females) were included in the analysis. In the segmentation task, the mean Dice coefficient was 0.836 for the cancer region. For WHO/ISUP grading, the ensemble model of perirenal fat showed predictive value, with an AUC of 0.711 (95% CI, 0.604-0.802) in the internal validation set. AUC of the ensemble model of combination (including tumor, kidney, and perirenal fat) was 0.814 (95% CI, 0.717-0.889) in the internal validation set, significantly higher than the ensemble model of tumor 0.760 (95% CI, 0.657-0.845).

Conclusion: Our study proposes a novel method to predict pathological grade of ccRCC using automated segmentation and radiomics analysis. And found that perirenal fat has incremental value for the prediction of ccRCC pathological grade.

PO-1636

CT-radiomics-based surrogates of distinct vascular patterns assisted surgical procedure decision-making and prognostic prediction

Xiangpan Meng, Xiangming Fang
the Affiliated Wuxi People's Hospital of Nanjing Medical University

Background and Purpose: The distinct vascular patterns, including microvascular invasion (MVI) and vessels encapsulating tumor clusters (VETC), represent the biological aggressiveness of hepatocellular carcinoma (HCC). Imaging surrogates of these vascular patterns potentially helped for assistance in surgical planning and prognostic prediction. Herein, a prognostic model integrating CT-radiomics-based surrogates of these distinct vascular patterns was developed and validated to assist decision making for the optimal surgical procedure.

Materials and Methods: Clinic-radiologic data of 1,285 HCC patients undergoing surgical resection were retrospectively enrolled. The CT-radiomics-based surrogate of MVI or VETC was individually built by conventional radiomics approach based on two independent sets ($n = 360$ and 255). The prognostic model using clinical data and CT-radiomics-based surrogates of MVI and VETC patterns was developed ($n = 297$) and externally validated ($n = 373$) for predicting recurrence-free survival (RFS). Whether the model's stratification was associated with postoperative recurrence following anatomic resection was evaluated.

Results: The radiomics signatures of MVI and VETC demonstrated effective performance in their respective training and independent validation sets (area under the curve: 0.841-0.892 for MVI and 0.830-0.851 for VETC). The prognostic model incorporating serum alpha-fetoprotein, tumor multiplicity, the radiomics signatures of MVI and VETC achieved a C-index of 0.734-0.766 for developing and external validation and generated three prognostically distinct strata. For patients at model-predicted medium risk, anatomic resection was associated with improved RFS ($P < 0.05$). By contrast, anatomic resection had no impact on RFS in patients at model-predicted low or high risk (both $P > 0.05$).

Conclusions: The proposed model integrating CT-radiomics-based surrogates of distinct vascular patterns demonstrated relatively accurate predictions and potentially be used to identify HCC surgical candidates who may benefit from anatomic resection.

PO-1637

Inferior vena cava thrombosis after gastrointestinal ulcer perforation

XIWEI LIU, SHENG XIE
China-Japan Friendship Hospital

Abstract

Gastrointestinal ulcer perforation is a serious disease of digestive tract, which can cause serious complications and even endanger the patient's life. Common complications include hemorrhage, abdominal infection, toxic shock, pulmonary infection, pyloric obstruction, etc.

The patient in this case was a 34-year-old male who was admitted to the hospital with "Upper gastrointestinal bleeding, duodenal ulcer, peritonitis, and moderate anemia" due to intermittent abdominal pain for 5 years, hematemesis with black stool for 11 days. Previous gastroscopy indicated duodenal ulcer and a history of *Helicobacter Pylori* infection. The patient developed haematemesis with black stool after staying up late due to fatigue 11 days ago. The gastroscopy indicated giant ulcer of duodenal bulb with bleeding, Forrest grade (Ib). Give hemostatic treatment. Fever occurred after eating porridge 2 days ago. An unenhanced CT examination showed multiple

exudative lesions at the posterior margin of the head of pancreas, around the abdominal aorta, around the anterior and posterior fascia of the right kidney, and secondary peritonitis. After admission, An enhanced CT examination of the abdomen and pelvis revealed penetrating duodenal ulcer with surrounding inflammatory encapsulation, which was closely related to inferior vena cava, thrombosis in the right renal vein, collateral circulation formation, and thrombosis in inferior vena cava to the iliac vein. After treatment with anti-infection, gastrointestinal mucosal protective agents and heparin anticoagulant drugs, the symptoms improved. An enhanced CT examination of abdomen and pelvis was reviewed 8 and 36 days later, respectively, and no significant changes were found in venous thrombosis, duodenal penetrating ulcer and peripheral inflammatory exudation improved.

Inferior vena cava thrombosis is a rare complication of duodenal ulcer perforation. It is necessary to be alert to this possibility when patients present with abdominal pain, fever and other peritonitis after duodenal perforation, especially when the perforation is located close to the inferior vena cava, resulting in peripheral inflammatory exudation and inferior vena cava thrombosis. Therefore, when duodenal perforation is suspected, the enhanced CT examination should be performed in time to confirm whether there is inferior vena cava thrombosis, and timely treatment to avoid serious consequences.

PO-1638

Value of magnetic resonance imaging for diagnosis of LR-3 and LR-4 lesions coexisting with hepatocellular carcinoma

Yang Liu², Yuyao Xiao¹, Xiaoyan Ni¹, Peng Huang¹, Fei Wu¹, Changwu Zhou¹, Jianming Xu², Mengsu Zeng¹, Chun Yang¹

1. Suzhou Science & Technology Town Hospital
2. Suzhou Science & Technology Town Hospital

Introduction:

To explore which preoperative clinical data and conventional magnetic resonance imaging (MRI) features may indicate the presence of hepatocellular carcinoma (HCC) in HCC patients coexisting with LR-3 and LR-4 lesions.

Materials:

HCC Patients coexisting with LR-3 and LR-4 lesions who participated in a prospective clinical trial (ChiCTR2000036201) were included in this study. Two radiologists independently assessed the preoperative MRI features and each lesion was assigned according to the Liver Imaging Reporting and Data System (LI-RADS). The preoperative clinical data were also evaluated. The relative values of these parameters were assessed as potential predictors of HCC.

Results:

We enrolled 102 HCC patients (58.1 ± 11.5 years; 84.3% males) coexisting with 110 LR-3 and LR-4 lesions (HCCs group [n = 66]; non-HCCs group [n = 44]). The presence of restricted diffusion (OR: 18.590, p < 0.001), delayed enhancement (OR: 0.113, p < 0.001), and mild-moderate T2 hyperintensity (OR: 3.084, p=0.048) were found to be independent predictors of HCC diagnosis. The sensitivity and specificity of the above independent variables for the diagnosis of HCC ranged from 66.7-80.3% and 56.8-88.6%, respectively. ROC analysis showed that, in discriminating HCC, the AUCs of the above factors were 0.777, 0.686, and 0.670, respectively. Combining these three findings for the prediction of HCC resulted in a specificity greater than 97%, and the AUC further increased to 0.874.

Conclusion:

The presence of restricted diffusion, delayed enhancement, and mild-moderate T2 hyperintensity can be useful features for risk stratification of coexisting LR-3 and LR-4 lesions in HCC patients.

PO-1639

Computed tomography radiomics nomogram to predict the intraoperative hypertensive crisis of abdominal pheochromocytoma and paraganglioma: a two centers study

Xu Fang¹, Liangping Ni², Yun Bian¹, Li Wang¹, Chengwei Shao¹, Jianping Lu¹
1. Changhai Hospital of Second Military Medical University
2. The Second Hospital of Anhui Medical University

Background: Patients with abdominal pheochromocytoma and paraganglioma (PPGL) are prone to a hypertensive crisis during surgery, which may endanger their lives. This study aimed to develop and validate a computed tomography (CT) radiomics nomogram for the prediction of intraoperative hypertensive crisis in patients with PPGL.

Methods: In this retrospective study, 212 patients with abdominal PPGL underwent abdominal-enhanced CT and surgical resection. Radiomic features were extracted from arterial and venous phases. Multivariable logistic regression models were developed using an internal validation and an external test set. The performance of the nomograms was determined by their discrimination, calibration, and clinical usefulness.

Results: A total of 212 patients with PPGL were included, including 44 with hypertension crises. The patients were divided into training ($n = 117$), validation ($n = 51$), and test ($n = 44$) sets. Eighteen radiomics-relevant radiomic features were selected. History of coronary heart disease and CT radiomics score were included in the prediction model, which achieved an area under the curve of 0.91 (95% confidence interval (CI) 0.85–0.97) in the training set, 0.93 (95% CI 0.84–0.99) in the internal validation set, and 0.85 (95% CI 0.72–0.97) in the external test set. The decision curve analysis demonstrated that the radiomics nomogram was clinically useful.

Conclusion: The CT radiomics nomogram may preoperatively predict intraoperative hypertensive crisis of abdominal PPGL and as an accurate method that can reduce intraoperative cardiovascular complications and contribute to improved surgical outcomes.

PO-1640

CT-based radiomics nomogram to predict the intraoperative massive blood loss of abdominal pheochromocytoma and paraganglioma: a two centers study

Xu Fang¹, Qianru Zhang¹, Liangping Ni², Yun Bian¹, Li Wang¹, Chengwei Shao¹, Jianping Lu¹
1. Changhai Hospital of Second Military Medical University
2. The Second Hospital of Anhui Medical University

Objectives: Patients with abdominal pheochromocytoma and paraganglioma (PHEO/PGL) are prone to massive blood loss during surgery, which may endanger their lives. This study aimed to develop and validate a CT-based radiomics nomogram for the prediction of intraoperative massive blood loss of PHEO/PGL.

Methods: In this two centers retrospective study, a total of 168 patients of PHEO/PGL underwent abdominal enhanced CT and surgical resection. Radiomics features were extracted from 3D CT features in multi-phase, including nonenhanced phase, arterial phase, and venous phase. A clinical model was constructed with clinical and imaging characteristics. A radiomics model included CT radiomics score, clinical and imaging characteristics. A multivariable logistic regression models

were developed basing on a training cohort consisting of 117 patients with <400ml blood loss and 51 patients with ≥ 400 ml blood loss between June 2011 and December 2018. The performance of the nomograms was determined by its' discrimination, calibration, and clinical usefulness. The models were validated in 43 consecutive patients between January 2019 and December 2021, of which 36 and 8 patients had <400ml and ≥ 400 ml blood loss, respectively.

Results: Location, tumor size, vascular invasion and nutrient artery were selected for the clinical model. The radiological model achieved an area under the curve (AUC) of 0.83 (95% CI 0.77–0.89) in the training cohort and 0.78 (95% CI 0.53–1.00) in the validation cohort. Location, tumor size, vascular invasion, nutrient artery and CT radiomics score were selected for the radiomics model. The radiomics model achieved an AUC of 0.88 (95% CI 0.82–0.93) in the training cohort and 0.85 (95% CI 0.70–1.00) in the validation cohort. The radiomics model outperformed the radiological model. The decision curve analysis demonstrated that the radiomics nomogram was clinically useful.

Conclusion: The CT-based radiomics nomogram could preoperatively predict intraoperative massive blood loss of PHEO/PGL, and may help clinical decision-making.

PO-1641

The Value of MRI Radiomics in Differential Diagnosis of Autoimmune Pancreatitis and Pancreatic Cancer

Wei Wang, Hui Xu, Zhenghan Yang
Beijing Friendship Hospital, Capital Medical University

Purpose: Explore the value of MRI radiomics in the differential diagnosis of autoimmune pancreatitis (AIP) and pancreatic ductal adenocarcinoma (PDAC).

Methods: This retrospective study included 262 patients diagnosed with AIP versus PDAC from seven independent institutions between June 2015 and July 2022. Among them, 202 patients from 5 institutions were used as the training set and test set, and 60 patients from 2 other institutions were used as the external validation set. The average age of 262 patients was 62.34 ± 10.53 [standard deviation], including 171 males and 91 females. All patients underwent MR abdominal plain scan and enhanced examination, including magnetic resonance plain scan (T1WI, T2WI, DWI, ADC), enhanced scan (arterial phase AP, venous phase VP, delayed phase DP), and manually segmented the region of interest (ROI) on each sequence of images. The radiomics features were extracted by Shukun scientific research platform, and the Pearson correlation and lasso regression algorithms were used to screen the features. Four models (logistic regression, LR), support vector machines (SVM) random forest (RF) and stochastic gradient descent (SGD) were developed using the data from the training set, and the diagnostic efficiency of the model was tested using the test set. Clinical variables affecting diagnosis (including age, sex, lesion location and laboratory tests (IgG4, CA199, CA125, CEA) were added to the machine learning model for adjustment. Finally, the diagnostic efficacy of radiomics model, clinical model and radiomics clinical combined model was verified with external validation set.

Results: The area under the ROC curve (AUC) of radiomics models T1WI, T2WI, DWI (B0), DWI (B800), ADC, AP, VP, DP were 0.882, 0.930, 0.947, 0.931, 0.926, 0.938, 0.920, 0.960 in the training set; The AUCs of multi parameter MRI omics model, clinical model and radiomics clinical combined model were 0.964, 0.768 and 0.773, respectively.

Conclusions: MRI radiomics model has good diagnostic efficacy in the differential diagnosis of AIP and PDAC.

PO-1642

Profiling intussusception in adults: focusing on treatment decision based on the clinical manifestations and MDCT features

Qiujie Dong, Chunlai Zhang
Army Medical Center

Purpose: To introduce clinical manifestations, multidetector computed tomographic (MDCT) features and treatment of three types of intussusceptions in adults, in order to identify indicators that an intussusception may require surgery.

Methods: We retrospectively reviewed 186 adult patients with 194 intussusceptions. Depending on the location, intussusceptions were classified as enteric, ileocolic and colonic types. Meanwhile, three types of intussusceptions were further divided into surgical and conservative groups based on treatment. Clinical manifestations, MDCT features and treatment were compared. Uni- and multivariate logistic analyses were used to identify risk factors for intussusception requiring surgery. **Results:** There were 73 enteric intussusceptions in 66 patients, and 32 intussusceptions in 28 patients were in the surgical group. Intussusception diameter ($OR=2.972$, $P=0.009$) and discernible lead point on MDCT ($OR=27.064$, $P<0.001$) were reliable indicators of enteric intussusception requiring surgery. Each of the 49 patients had one ileocolic intussusception and 46 intussusceptions belonged to the surgical group. Seventy-one patients had 72 colonic intussusceptions, and all but one patient with one intussusception were in the surgical group. Enteric and ileocolic intussusceptions mainly presented with abdominal pain (78.79% and 85.71%). Hematochezia/melena (63.38%) was the main symptom of colonic intussusception. Ileocolic intussusceptions were longer in length, larger in diameter, and had more hypodense layer and fluid collection than enteric and colonic intussusceptions.

Conclusion: The clinical manifestations and MDCT features of three types of intussusceptions have different emphases. Less than half of enteric intussusceptions require surgery, and MDCT features are effective in identifying them. Surgery remains the treatment of choice for most ileocolic and colonic intussusceptions.

PO-1643

Fat Free Muscle Area measurement based on liver MRI workflow to assess sarcopenia

Jiaqi Gong
The First Bethune Hospital of Jilin University

Objective

Fat free muscle area (FFMA) is usually measured on T2WI-TSE sequence, but T2WI-TSE sequence is not routine MRI workflow, and the scanning time of T2WI-TSE sequence is obviously longer than T1WI e-dixon sequence, so we develop a new algorithm to measure FFMA on T1WI edixon-fat phase.

Method

16 patients with fatty liver ($F:M=10:6$, age 50 ± 1.2) underwent liver MRI examinations on a 3T system (MAGNETOM Vida, Siemens Healthineers). The protocols include an axial T1WI edixon sequence and T2WI TSE sequence without fat saturation. Typical scanning parameters are shown in table1.

First, an experienced radiologist carefully delineated the contour of bilateral psoas on the maximum cross-sectional images of lumbar spine three on T2WI TSE and T1WI edixon-fat phase, respectively, and generated the corresponding regions of interest. The total muscle area (TMA) of

the psoas muscles was obtained by Itk-snap(www.itksnap.org). Subsequently, both images were converted to binary images based on signal intensity. On T2WI TSE and T1WI edixon-fat phase muscular tissue and adipose tissue are characterized by low and high signal intensity, respectively. Therefore, binarization allowed for separation of lean muscular tissue from intramuscular adipose tissue. Summation of pixels with high signal intensity and multiplication with the corresponding surface area resulted in intramuscular adipose tissue area (ATA), which was subtracted from TMA to obtain FFMA. The algorithm was implemented by scripts in MATLAB software, and the consistency was compared with the previous FFMA measurement results based on T2WI TSE image by Consistency check.

Result

The mean value of bilateral psoas FFMA at the maximum cross-sectional area of lumbar spine 3 vertebral body measured based on T1WI edixon-fat phase was 217.5mm² (164.8, 332.5) and that measured based on T2WI TSE sequence was 238.2 mm² (152.7, 311.3). The intraclass correlation coefficient of the two method was 0.933 (ICC=0.933).

Conclusion

FFMA of bilateral psoas muscles based on edixon sequence proposed in this paper are highly consistent with those of previous methods based on T2WI TSE sequence. This method is possible to provide quantitative indicators for evaluating sarcopenia for routine clinical MRI examination

PO-1644

Clinical value of intratumoral necrosis in the prognosis of pancreatic ductal adenocarcinoma based on pathological and MDCT characteristics

Qiuji Dong, Chunlai Zhang, Yi Wang
Army Medical Center

Purpose: To evaluate the relationship between intratumoral necrosis and prognosis in patients with pancreatic ductal adenocarcinoma (PDAC), and to explore the accuracy of preoperative multidetector computed tomography (MDCT) characteristics in diagnosing intratumoral necrosis.

Methods: A total of 89 patients with PDAC who were completely resected by surgery with negative margins were included in the study and grouped according to the presence or absence of pathologically diagnosed necrosis. Clinical, pathological and MDCT characteristics of the two groups were analyzed, and the Kaplan-Meier method was applied to analyze survival curves. Univariate and multivariate Cox proportional hazard models were used to identify prognosis factors. **Results:** There were 27 PDACs with pathologically diagnosed necrosis. PDACs with pathologically diagnosed necrosis had a significantly shorter overall survival (OS) compared to those without necrosis (median, 12.0 vs 31.0 months, $P < 0.001$). Multivariate Cox regression revealed that age over 65 years ($HR=2.277$, $P=0.011$), pathologically diagnosed necrosis ($HR=2.094$, $P=0.029$), and poorly differentiated tumors ($HR=2.382$, $P=0.014$) were independent predictors of poor prognosis. Using pathologically diagnosed necrosis as the reference standard, the sensitivity, specificity, positive prediction value (PPV), and negative prediction value (NPV) for MDCT-detected necrosis estimated by observer 1 were 74.1%, 71.0%, 52.6%, and 86.3%, respectively. Similarly, the sensitivity, specificity, PPV and NPV of MDCT-detected necrosis estimated by observer 2 were 74.1%, 67.7%, 50.0% and 85.7%. The inter-observer agreement for MDCT-detected necrosis was good ($k=0.772$).

Conclusion: Pathologically detected necrosis could be a potential predictor of poor prognosis in PDAC patients. MDCT characteristics can be utilized to initially estimate the presence of intratumoral necrosis.

PO-1645

Whole-lesion iodine map histogram analysis in the risk classification of gastrointestinal stromal tumor: Comparison single-slice iodine concentration measurement

Yijing Xie, Junlin Zhou
Lanzhou university second hospital

Purpose: To evaluate and compare the diagnostic performances of whole-lesion iodine map (IM) histogram analysis and single-slice IM measurement in the risk classification of gastrointestinal stromal tumors (GISTs).

Methods: Thirty-seven patients with GISTs, including 19 with low malignant underlying GISTs (LG-GISTs) and 18 with high malignant underlying GISTs (HG-GISTs), were evaluated with dual-energy computed tomography (DECT). Whole-lesion IM histogram parameters (mean; median; minimum; maximum; standard deviation; variance; 1st, 10th, 25th, 50th, 75th, 90th, and 99th percentile; kurtosis, skewness, and entropy) were computed for each lesion. In other sessions, iodine concentrations (ICs) were derived from the IM by placing regions of interest (ROIs) on the tumor slices and normalizing them to the iodine concentration in the aorta. Both quantitative analyses were performed on the venous phase images. The diagnostic accuracies of the two methods were assessed and compared.

Results: The minimum, maximum, 1st, 10th, and 25th percentile of the whole-lesion IM histogram and the IC and normalized IC (NIC) of the single-slice IC measurement significantly differed between LG- and HG-GISTs ($p < 0.001 - p = 0.042$). The minimum value in the histogram analysis (AUC = 0.844) and the NIC in the single-slice measurement analysis (AUC = 0.886) showed the best diagnostic performances. The NIC of single-slice measurements had a diagnostic performance similar to that of the whole-lesion IM histogram analysis ($p = 0.618$).

Conclusions: Both whole-lesion IM histogram analysis and single-slice IC measurement can differentiate LG-GISTs and HG-GISTs with similar diagnostic performances.

PO-1646

Predicting Preoperative Pathologic Grades of Bladder Cancer Using Intravoxel Incoherent Motion and Amide Proton Transfer-Weighted Imaging

Lingyu Chang¹, Xinghua Xu¹, Guangtai Wu¹, Lianhua Cheng¹, Shuyi Li¹, Wencheng Lv^{1,2}, Dmytro Pylypenko³, Weiqiang Dou³, Dexin Yu¹, Qing Wang¹, Fang Wang¹
1. Qilu Hospital of Shandong University
2. Jiaozhou Branch of Shanghai East Hospital, Tongji University
3. GE Healthcare, MR Research China

Rationale and Objectives: To investigate the predictive value of intravoxel incoherent motion (IVIM) combined with amide proton transfer-weighted (APT_w) imaging for the preoperative grading of BCbladder cancer (BC).

Materials and Methods: A total of 69 patients with histopathologically confirmed bladder cancer underwent diffusion-weighted imaging (DWI), IVIM, and APT_w imaging at 3.0T MRI. Two radiologists independently measured the mean apparent diffusion coefficient (ADC) in DWI, true diffusion coefficient (D), perfusion-related pseudo-diffusion coefficient (D*), and perfusion fraction (f) in IVIM, and APT_w values, respectively. The areas under the receiver operating characteristic curves (AUCs) were utilized to compare the diagnostic efficacy of these single and combined quantitative parameters.

Results: ADC and D values of low-grade BC were significantly higher than those of high-grade BC ($[1.420 \pm 0.200 \times 10^{-3} \text{ mm}^2/\text{s}]$ vs. $[1.0986 \pm 0.2547 \times 10^{-3} \text{ mm}^2/\text{s}]$ and $[1.240 \pm 0.2439 \times 10^{-3} \text{ mm}^2/\text{s}]$ vs. $[0.8985 \pm 0.1875 \times 10^{-3} \text{ mm}^2/\text{s}]$, respectively; all $P < 0.001$). Opposite patterns were found for APTw ($[1.5327 \pm 0.421]\%$ vs. $[2.384 \pm 0.712]\%$, $P < 0.001$). The ROC curves indicated that the combination of D and APTw values could distinguish low- from high-grades of BC with the highest predictive efficacy ($\text{AUC} = 0.964$), as well as a significant difference compared to those by ADC, D, and APTw values separately ($\text{AUC} = 0.844, 0.8878, 0.853$, respectively; all $P < 0.05$).

Conclusion: IVIM combined with APTw imaging significantly improved the predictive efficacy of assessing low-and high-grade BC compared to the individual parameters on their own, providing an effective non-invasive method for clinical preoperative prediction of BC grading.

PO-1647

Diagnostic Value of Clear Cell Likelihood Score v1.0 and v2.0 for Pathological Subtypes of Small Renal Masses: A Multicenter Comparative Study

Yuwei Hao^{1,2}, Xueyi Ning¹, Xu Bai¹, Jian Zhao¹, Huiyi Ye¹, Haiyi Wang¹

1. the Sixth Medical Centre of Chinese PLA General Hospital

2. the Sixth Medical Center of Chinese PLA General Hospital

Purpose: To compare the diagnostic performance and interobserver agreement of clear cell likelihood score version 1.0 (ccLS v1.0) and clear cell likelihood score version 2.0 (ccLS v2.0) for diagnosing each pathological subtypes of small renal masses (SRMs).

Methods: Clinical data and MR images of patients with pathologically confirmed SRMs were retrospectively collected from three academic medical centers between October, 2017 and December, 2021. Six abdominal radiologists were trained in the ccLS algorithm and scored independently using ccLS v1.0 and ccLS v2.0, respectively. Random-effects logistic regression was used to generated plot ROC to evaluate the diagnostic performance of ccLS v1.0 and ccLS v2.0, and AUCs of these two scoring systems were compared using the DeLong's test. The weighted Kappa test was used to evaluate the interobserver agreement of the ccLS score, and the difference in the weighted Kappa was compared using z test.

Results: 797 patients (563 males, 234 females; mean age, 53 ± 12 years) with 806 SRMs were identified. The results suggested that the pooled AUCs of ccLS v1.0 and ccLS v2.0 for diagnosing ccRCC, pRCC, RO, AMLwvf and malignancy were 0.851, 0.888, 0.679, 0.766, 0.757 and 0.907, 0.926, 0.745, 0.826, 0.818, respectively, and the difference was statistically significant ($P < 0.01$). The weighted Kappa coefficient of ccLS v1.0 was 0.571 (95% CI: 0.473-0.669), and the weighted Kappa coefficient of ccLS v2.0 was 0.628 (95% CI: 0.534-0.772), and the difference was not statistically significant ($P > 0.05$). The interobserver agreement of ccLS in the diagnosis of pRCC and malignancy was relatively greater.

Conclusion: ccLS v2.0 provided better diagnostic performance than ccLS v1.0 for diagnosing ccRCC, pRCC, RO, AMLwvf and malignancy of SRMs, and may be considered to support the daily diagnostic work of radiologists.

PO-1648

Combined intravoxel incoherent motion and diffusion kurtosis imaging in preoperative assessment of bladder cancer with different grades and stages

Xinghua Xu¹, Lingyu Chang¹, Guangtai Wu¹, Lianhua Cheng¹, Shuyi Li¹, Weiqiang Dou², Dmytro Pylypenko², Dexin Yu¹, Fang Wang¹, Qing Wang¹

1. QILU HOSPITAL OF SHANDONG UNIVERSITY

2. GE Healthcare, MR Research China

Objectives: To compare the diagnostic efficacy of combined intra-voxel incoherent motion (IVIM) and diffusion kurtosis imaging (DKI) in differentiating between high- and low-grade bladder cancer (BC) and in identifying muscle-invasive bladder cancer (MIBC, stage T2 or higher) and non-muscle-infiltrating bladder cancer (NMIBC, stage T1 or lower).

Methods: 61 patients with pathologically confirmed BC underwent DKI and IVIM measurement at 3.0T. Two radiologists independently outlined the regions of interest (ROIs) and measured apparent diffusion coefficient (ADC), true diffusion coefficient (D), perfusion-related pseudo-diffusion coefficient (D*), perfusion fraction (f), mean diffusivity (MD), and mean kurtosis (MK) by dedicated software. An independent samples t-test and Mann-Whitney U-test were used to compare the differences in each parameter between different grades and stages of tumors. The diagnostic efficacies of DKI, IVIM, and combined model (IVIM+DKI) were evaluated with receiver operating characteristic (ROC) and compared with conventional DWI and single parameter (IVIM or DKI) by DeLong method.

Results: D and MD were lower in the high-grade than in the low-grade group, and in the MIBC than in the NMIBC group. Opposite patterns were found for MK (all $p < 0.01$). For BC grading, the AUCs of IVIM, DKI, and the combined model (0.819, 0.829, 0.836, respectively) were higher than ADC of DWI (0.727). The combined model achieved the highest AUC, indicating the most robust diagnostic efficacy. For BC staging, the AUCs of IVIM, DKI, and the combined model (0.855, 0.889, 0.919, respectively) were higher than ADC (0.803) of DWI. The best diagnostic performance was also revealed in the combined model of IVIM and DKI, validated by highest AUC.

Conclusion: IVIM and DKI derived parameters have been demonstrated different in BC with different staging and grading. The combined IVIM and DKI model has been further revealed with the most robust diagnostic efficacy in both BC staging and grading.

PO-1649

Decoding Tumor Stage by Peritumoral and Intratumoral Radiomics in Resectable Esophageal Squamous Cell Carcinoma

Xianzheng Tan¹, Rong Ma¹, Peng Liu¹, Chang-Hong Liang², Zai-Yi Liu²

1. Guangdong General Hospital

2. Department of Radiology, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University, Guangzhou 510180, Guangdong, China

Purpose To evaluate the potential application of radiomics in predicting Tumor-Node-Metastasis (TNM) stage in patients with resectable esophageal squamous cell carcinoma (ESCC).

Methods This retrospective study included 122 consecutive patients (mean age, 57 years; 27 women). Corresponding tumor of interest was identified on axial arterial-phase CT images with manual annotation. Radiomics features were extracted from intra- and peritumoral regions. Features were pruned to train LASSO regression model with 93 patients to construct a radiomics

signature, whose performance was validated in a test set of 29 patients. Prognostic value of radiomics-predicted TNM stage was estimated by survival analysis in the entire cohort.

Results The radiomics signature incorporating one intratumoral and 4 peritumoral features was significantly associated with TNM stage. This signature discriminated tumor stage with an area under curve (AUC) of 0.823 in the training set, with similar performance in the test set (AUC, 0.813). Recurrence-free survival (RFS) was significantly different between different radiomics-predicted TNM stage groups

(Low-risk vs high-risk, log-rank $P = 0.004$). Univariate and multivariate Cox regression analyses revealed that radiomics predicted TNM stage was an independent preoperative factor for RFS.

Conclusions The proposed radiomics signature combining intratumoral and peritumoral features was predictive of TNM stage and associated with prognostication in ESCC.

PO-1650

Feasibility of three-dimension chemical exchange saturation transfer MRI for predicting tumor and node staging in rectal adenocarcinoma: an exploration of optimal ROI measurement

Yijing Luo, Xiao WANG, Wenguang LIU, Yinggang PEI, Wenzheng LI
Xiangya Hospital Central South University

Objectives: To investigate the feasibility of predicting tumor (T) and node (N) staging with amide proton transfer weighted-signal intensity (APT_w-SI) and magnetization transfer (MT) derived from three-dimensional chemical exchange saturation transfer (3D-CEST) for rectal adenocarcinoma (RA) and to explore the optimal ROI measurement.

Methods: Fifty-eight RA patients with pathologically TN staging underwent 3D-CEST and DWI. APT_w-SI, MT and ADC values were measured using three ROI approaches (ss-ROI, ts-ROI, and wt-ROI) to analyze the TN staging (T staging: T1-2 vs T3-4; N staging: N- vs N+), and the reproducibility of APT_w-SI and MT were also evaluated. The AUC was used to assess the staging performance and determine the optimal ROI strategy.

Results: MT and APT_w-SI respectively gained an excellent and a good reproducibility with three ROIs. Significant differences of MT were observed (all $P < 0.05$) but not APT_w-SI and ADC (all $P > 0.05$) in TN staging among various ROIs. AUCs of MT with ss-ROI were 0.860 (95% CI: 0.743 - 0.937) and 0.852 (95% CI: 0.735 - 0.932) in predicting T and N staging, which is similar to ts-ROI (T staging: 0.856 [95% CI: 0.739 - 0.934], N staging: 0.831 [95% CI: 0.710 - 0.917]) and wt-ROI (T staging: 0.833 [95% CI: 0.712 - 0.918], N staging: 0.848 [95% CI: 0.729 - 0.929]) (all $p > 0.05$).

Conclusions: MT of 3D-CEST has an excellent reproducibility and predictive performance with ss-ROI method for RA patients' TN staging. Compared to ts-ROI and wt-ROI, the ss-ROI is easy to operate and could be used for clinical diagnosis.

PO-1651

Role of clinical and MDCT features in the prediction of patients with intestinal lipoma developing intussusception

Qiujie Dong, Chunlai Zhang, Yi Wang
Army Medical Center

Purpose: To present the clinical and multidetector computed tomography (MDCT) features between intestinal lipomas with and without intussusception and to look for risk factors that predict intussusception caused by intestinal lipomas.

Materials and methods: We retrospectively reviewed 281 adult patients diagnosed with intestinal lipomas by MDCT. The patients were divided into adult intussusception (AI) and non-AI groups based on the MDCT images. Uni- and multivariate logistic regression analyses were performed to identify risk factors for intestinal lipoma-induced intussusception.

Results: A total of 281 patients with intestinal lipomas were included in the study, with an average age of 68.00 ± 11.30 years old, and the male to female ration was about 1:1.44. Among them, 24 patients developed intussusception. Lipomas occurred more in the small bowel (224/281, 79.7%) than in the large bowel (57/281, 20.3%). Patients in the AI group presented with more abdominal pain (70.8% vs 47.1%, $P = 0.026$), nausea/vomiting (37.5% vs 14.8%, $P = 0.009$), hematochezia/melena (29.2% vs 11.3%, $P = 0.021$) and abdominal tenderness (66.7% vs 24.9%, $P < 0.001$). Lipomas in the AI group showed more heterogeneous hypodensity (41.7% vs 15.6%, $P = 0.004$), longer length (median, 2.22 vs 1.18 cm, $P < 0.001$) and larger volume (median, 4.14 vs 0.57 cm³, $P < 0.001$). In multivariate logistic regression, hematochezia/melena (OR = 6.080, $P = 0.003$), abdominal tenderness (OR = 5.667, $P = 0.001$), lipoma length (OR = 3.289, $P < 0.001$) were independent risk factors for intestinal lipoma-induced intussusception.

Conclusion: The possibility of intussusception caused by intestinal lipoma should be warned when patients with intestinal lipoma develop new hematochezia/melena and abdominal tenderness with no apparent predisposing causes. The risk of developing intussusception increases with lipoma length. In addition, the predilection site of intestinal lipoma may have changed from the colon to the small intestine.

PO-1652

The role of MRI Compared to CT in Diagnosing metastasis of Ovarian Cancer

Yang Wang
Xijing Hospital

Objective: To investigate the diagnostic value of metastasis of ovarian cancer by MRI compared to CT.

Methods: Thirty-six patients were retrospectively recruited. All patients underwent MRI and CT before surgery. Two radiologists who were blind to pathological results analyzed CT and MR images independently. Inter-observer agreement was assessed using kappa(κ) statistics. Sensitivity, specificity and accuracy between MRI and CT were compared using McNemar's test.

Results: The κ of MRI was higher than CT ($\kappa = 0.826, 0.641$). The sensitivity, specificity and accuracy of MRI were significantly higher than CT ($\chi^2 = 4.806, 4.093, 4.257, P = 0.024, 0.037, 0.033$).

Conclusions: MRI had better diagnostic performance compared to CT in metastasis of ovarian cancer.

PO-1653

Development of a nomogram based on body composition analysis of quantitative CT combined with clinical prognostic factors to predict disease-free survival after surgery and adjuvant chemotherapy in patients with gastric cancer

Longyu Wei

Anhui Provincial Cancer Hospital

Background: Gastric cancer patients have a high recurrence rate after surgery. To predict disease-free survival, we investigated the value of body composition changes measured by quantitative computed tomography in assessing the prognosis of patients with gastric cancer undergoing resection combined with adjuvant chemotherapy and to construct a nomogram model in combination with clinical prognostic factors.

Method: A retrospective study of 60 patients with gastric cancer between February 2015 and June 2019 was conducted. Pre-and post-treatment computed tomography images of patients was used for body composition analysis, including bone mineral density (BMD), subcutaneous fat area (SFA), visceral fat area (VFA), total fat area (TFA), and paravertebral muscle area (PMA) were measured in both groups of computed tomography images, and the rate of body composition change was calculated. Prognostic factors such as maximum tumor diameter, HER-2, Ki-67, and lymph node metastasis were derived from postoperative pathological findings. Independent prognostic factors affecting disease-free survival in gastric cancer were screened by univariate and multivariate Cox regression analysis ($P < 0.05$), a nomogram was constructed. The Kaplan-Meier method was used to plot survival curves and calculate median disease-free survival time. The comparison of survival curves between groups was performed using the log-rank test. Receiver operating characteristic curves, calibration curves and decision curves to evaluate the efficacy of nomogram predictive disease-free survival.

Results: The results of multivariate Cox regression analysis showed that Δ BMD ($P = 0.008$, HR: 4.577, 95%CI:1.483–14.132), Δ PMA ($P = 0.025$, HR:0.173, 95%CI:0.037–0.799), HER-2 ($P < 0.001$, HR:4.819, 95%CI:2.201–10.549), and maximal tumor diameter ($P < 0.001$, HR:3.973, 95%CI:1.893–8.337) were independent influences on disease-free survival. Δ BMD, Δ SFA, Δ VFA, Δ TFA, and Δ PMA were -3.86%, -23.44%, -19.57%, -22.45%, and -5.94%, respectively. The median disease-free survival was 55 months. The prognostic model of body composition changes combined with clinical prognostic factors had the highest predictive performance (The area under the curve was 0.844). Decision curve analysis showed good clinical benefit for the prognostic nomogram. The concordance index of the prognostic nomogram was 0.814, and the area under the curve of predicting 2-year and 3-year disease-free survival were 0.879 and 0.928, respectively. The fitted lines of the predicted 2-year and 3-year disease-free survival in the calibration plots roughly coincide with the reference line, indicating that the nomogram-predicted disease-free survival align well with the actual disease-free survival.

Conclusion: computed tomography-based body composition analysis and clinical prognostic factors (HER-2, maximal tumor diameter) correlated with prognosis in patients with gastric cancer undergoing surgical resection combined with adjuvant chemotherapy. The prognostic nomogram combining body composition changes and clinical prognostic factors was able to predict the disease-free survival of gastric cancer patients reliably.

PO-1654

A Bibliometric Analysis of Medical Imaging in Hepatocellular Carcinoma from 2000 to 2022

Xiwen Wang, Yinping Leng, Ying Liu, Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Objectives: In order to identify the research hotspots and development trends in medical imaging for hepatocellular carcinoma, we conducted a systematic and comprehensive statistical analysis through the application of bibliometrics in this study.

Methods: A systematic search was conducted on the Web of Science Core Collection to retrieve studies on hepatocellular carcinoma and medical imaging published from 2000 to 2022. The results were independently examined by two experienced radiologists. Microsoft Excel 2019 software was used to analyze the general information. VOSviewer 1.6.19 was utilized for visual analysis, while CiteSpace 6.2.R3 was employed to generate the dual-map overlay of journals. Additionally, the R package software "Bibliometrix" was used for the three fields plot.

Results: A total of 11965 papers were included in this study, comprising 10526 articles and 1439 reviews. There was an overall upward trend in the annual number of publications, with the annual cumulative number of papers continuing to increase. The journal with the most publications was European Radiology (502 publications, 4.2%), and the most co-cited journal was Radiology, both of which are the authoritative journals in this field. The People's Republic of China had the highest number of publications (2718 publications, 22.72%), followed by the United States of America (USA) (2133 publications, 17.83%) and Japan (1935 publications, 16.17%). The author with the most publications was LEE JM, who also had the highest numbers of local citations in this field. The keyword analysis showed that in addition to the research on imaging, studies on histopathology and clinical treatment were also prevalent. Furthermore, the research hot topics and frontier areas of medical imaging in hepatocellular carcinoma for the last five years included: LI-RADS, microvascular invasion, sorafenib, microwave ablation, magnetic resonance imaging and deep learning.

Conclusions: This study highlighted the key contributions made to the research of medical imaging in hepatocellular carcinoma over the past nearly 20 years through bibliometric analysis. It systematically assessed the current status, providing a knowledge framework and identifying emerging trends in this field.

PO-1655

A radiomics nomogram based on MSCT and clinical factors can stratify fibrosis in inflammatory bowel disease

Xu Zeng
The Second Affiliated Hospital of Harbin Medical University

Abstract

Intestinal fibrosis is one of the major complications of inflammatory bowel disease (IBD) and a pathological process that significantly impacts patient prognosis and treatment selection. Although current imaging assessment and clinical markers are widely used for the diagnosis and stratification of fibrosis, these methods suffer from subjectivity and limitations. In this study, we aim to develop a radiomics diagnostic model based on multi-slice computed tomography (MSCT) and clinical factors. MSCT images and relevant clinical data were collected from IBD patients, and a large number of quantitative image features were extracted. Using these features, we constructed a radiomics model and transformed it into a user-friendly diagnostic nomogram. Based on these methods, a nomogram was developed to predict fibrosis in IBD by integrating multiple factors. The

nomogram exhibited favorable discriminative ability, with an AUC of 0.865 in the validation sets, surpassing both the logistic regression (LR) model (AUC=0.821) and the clinical model (AUC=0.602) in the test set. In the train set, the LR model achieved an AUC of 0.975, while the clinical model had an AUC of 0.735. The nomogram demonstrated superior performance with an AUC of 0.971, suggesting its potential as a valuable tool for predicting fibrosis in IBD and improving clinical decision-making. In conclusion, the radiomics nomogram, incorporating MSCT and clinical factors, demonstrates promise in stratifying fibrosis in IBD. The nomogram outperforms traditional clinical models and offers personalized risk assessment. However, further validation and addressing identified limitations are necessary to enhance its applicability.

PO-1656

Preliminary study on deep learning image reconstruction algorithm for improving abdominal thin layer image quality

peng jia

Department of Radiology, Nanjing BenQ Medical Center, The Affiliated BenQ Hospital of Nanjing Medical University

Objective To compare the effects of conventional filtered back projection (FBP), multi-model-based iterative reconstruction (ASiR-V) algorithm and deep learning image reconstruction (DLIR) algorithm on the image quality of adult abdominal enhanced CT thin slices and whether there is room for reducing radiation dose. **Methods** A total of 75 patients with the same scanning conditions were retrospectively collected with enhanced CT scan of the upper abdomen. DLIR-H was used for image reconstruction, and the reconstructed slice thicknesses were 5 mm and 1.25 mm, respectively. Subjective (5-point scale) and objective (noise, signal-to-noise ratio and contrast-to-noise ratio) evaluation of images in each group were performed by two radiologists. The agreement of the observers for the scores was assessed by calculating the kappa value; the differences between groups of each parameter were compared by one-way ANOVA or rank sum test. **Results** Compared with FBP and 40% ASiR-V, the objective evaluation indexes of slice thickness DLIR-H reconstruction images were significantly different between the two groups ($P < 0.05$). There was a statistical difference in SNR ($P < 0.05$), and a statistical difference between CNR and FBP reconstructed image ($P < 0.05$). Compared with 80% ASiR-V, the two groups of slice thickness DLIR-M reconstructed images had statistical differences in SD and SNR (P value < 0.05). The subjective scores of DLIR-M reconstructed images with slice thickness between the two groups were only not significantly different between the 5 mm slice thickness DLIR-M reconstructed images and 40% ASiR-V (P value > 0.05), and the rest had statistical differences (P value < 0.05). The 1.25mm slice thickness DLIR-H reconstructed image was significantly different from the FBP and 80% ASiR-V reconstructed images (P value < 0.05); Statistical difference (P value < 0.05). Compared with 5mm40% ASiR-V, the DLIR-H reconstruction image with 1.25mm slice thickness had no statistical difference in various evaluation indicators (P value > 0.05). **Conclusion** Compared with the FBP and ASiR-V reconstruction algorithms, the DLIR reconstruction algorithm effectively improves and improves the image quality, especially in thin-layer images. Moreover, the 1.25mm DLIR-H reconstructed image has reached the image quality level of 5mm40% ASiR-V, which provides a technical basis for further reducing the radiation dose of abdominal enhanced CT.

PO-1657

A comparative study of two-dimensional single-shot fast spin echo (2D SSFSE) with deep learning based reconstruction and three-dimensional fast imaging employing steady state acquisition (3D FIESTA) in the assessment of active inflammation in Crohn's Disease

Yan Wang¹, Jingyun Cheng¹, Weiyin Liu², Yunfei Zha¹

1. Renmin Hospital of Wuhan University

2. GE Healthy, MR Research

Introduction and Purpose

Crohn's disease (CD) is a chronic inflammatory disease that can affect any portion of the gastrointestinal tract. Endoscopy is commonly used to diagnose CD as the reference standard while magnetic resonance imaging has the advantage of being non-invasive and able to investigate small bowel involvement that cannot be reached by endoscopy. Previous studies have shown that FIESTA sequence was superior to SSFSE sequence in showing linear ulcers and pseudopolyps[1]. However, the scanning time of 3D FIESTA sequence is longer than that of 2D SSFSE sequence but provides higher resolution and better image quality. Deep learning reconstruction (DLR) is excellent at noise reduction without additional acquisition and post-processing time and has recently been introduced for clinical use. Our study aimed to explore the feasibility of 2D SSFSE with DLR (SSFSEDL) for evaluating bowel inflammation in CD using 3D FIESTA sequence as reference.

Materials and Methods

Patients: Forty-seven patients with histological diagnosis of CD confirmed by endoscopy (36 male/11 female, age: 14–56 years) were prospectively recruited in this study. **Imaging:** All patients fasted for 6–8 hours prior to the scheduled exam time, and ingested 2000 mL of oral contrast agent (water with polyethylene glycol electrolytes powder dissolved) over 1 hour before magnetic resonance enterography (MRE) scan. All MRE scans were performed on a 3.0 T clinical MRI scanner (Signa Architect, GE Healthcare). Parameters of 3D FIESTA and 2D SSFSE sequences were shown in Table 1. 2D SSFSEDL and SSFSEO were automatically reconstructed with commercial DL-based reconstruction algorithm (AIRTM Recon DL). **Assessment:** Two radiologists made diagnosis in consensus and independently drew regions of interest on the bowel-segment of the suspected lesions to calculate signal-to-noise-ratio (SNR) and contrast to-noise-ratio (CNR). Representative MR images are shown in Figure 1. **Statistical Tests:** According to data normality and equality of variance, paired Wilcoxon signed-rank tests or paired t-test were performed to evaluate the statistical significance of differences in SNR and CNR between 2D SSFSE with and without DLR (SSFSEO), and between 2D SSFSE with DLR and 3D FIESTA. P value <0.05 was considered to be statistically significant.

Results SSFSEDL showed significantly higher SNR in jejunum (125.24 ± 106.84 vs. 69.41 ± 42.79 , $P=0.026$), ileum (167.87 ± 110.42 vs. 98.18 ± 49.51 , $P=0.001$) and terminal ileum (190.34 ± 80.70 vs. 123.24 ± 48.10 , $P<0.0001$) than SSFSEO as well as in ileum (94.85 ± 45.88 , $P=0.02$) and terminal ileum (88.81 ± 33.57 , $P<0.0001$) than 3D FIESTA. SSFSEDL showed significantly higher CNR in jejunum (123.64 ± 107.00 vs. 68.08 ± 42.87 , $P=0.027$), ileum (166.24 ± 110.61 vs. 96.73 ± 49.67 , $P=0.001$) and terminal ileum (188.60 ± 80.71 vs. 121.85 ± 48.15 , $P<0.0001$) than SSFSEO as well as . ileum (93.29 ± 45.87 , $P=0.02$) and in terminal ileum (87.16 ± 33.43 , $P<0.0001$) than 3D FIESTA. There was no significant difference of SNR and CNR in jejunum between 2D SSFSEDL and 3D FIESTA ($P=0.477$) (Figure 2).

Discussion and conclusion

2D DLR SSFSE showed overall better image quality, has shorter scanning time and consistent diagnosis performance on assessing bowel inflammation in CD with 3D FIESTA. The previous

research showed that SSFSE has superior lesion detection rate and imaging ability on motion target to DWI. The SSFSE sequence alone might be sufficient in lesion detection[2]. With DLR SSFSE images, inter-observer agreement on the lesion detection rate elevated. The inline DLR SSFSE shortened scan time and increase patient compliance.

PO-1658

Application of MR Radiomics in Predicting Extramural Vascular Invasion in Rectal Cancer

lu liu, duo zhang

Affiliated Hospital of BeiHua University

Objective: To investigate the application value of MRI- based imaging model in preoperative prediction of extramural vascular invasion of rectal cancer.

Methods: A total of 202 patients who underwent pelvic MRI examination in our hospital from January 2019 to October 2022 and were pathologically confirmed as rectal cancer after surgery were selected, of which 63 were positive and 139 were negative. The patients were divided into the training set (141 cases) and the verification set (61 cases) in a ratio of 7:3. Clinical and imaging data of patients were collected and statistically significant ($p \leq 0.05$) data were included to establish clinical models. Receiver operating characteristic curve (ROC) was plotted and area under the curve (AUC) was calculated. In the radiomics analysis, IntelliSpace Discovery (ISD) software was used to conduct semi-automatic 3D delineation of the primary lesion and the area of interest (ROI) of peritumoral vessels and lymph nodes along the lesion contour, and the 3D volume of interest (VOI) of the lesion was generated automatically by the computer. The three-dimensional volume of interest delineated on the HR-T2WI sequence of the primary tumor lesion was referred to as T2 tumor lesion (VOI1) for short. In the last phase of DCE-T1WI sequence enhancement, the diameter range of the outer edge of the intestinal wall of the focus was delineated to be about 4mm, and the three-dimensional volume of interest formed by the thickened and tortuous vessels outside the wall was referred to as DCE-T1 extrawall vessels (VOI2) for short. The three-dimensional volume of interest delineated on the DWI sequence of lymph node formation around the rectum is referred to as DWI lymph node (VOI3) for short. Four radiomic models and one combined clinical-radiomic model were established: T2 tumor lesion (Model 1), DCE-T1 extramural vessel (model 2), and DWI lymph node (model 3), from the above three models, two models with better prediction efficiency were selected to form the joint image omics model (Model 4); Then the model with the best predictive efficacy was selected from the four models to calculate the Radscore, and a combined clinics-imaging model (Model 5) was formed by combining the clinical data with the Radscore of the optimal model, and a nomogram was made. In the process, the Pyradiomics tool of Philips was used to extract the all radiomicss features of the outlined VOI. After dimensionless processing of the original image data, independent sample t-test was applied to the data conforming to normal distribution, and independent sample Mann-Whitney U test was applied to the non-normal distribution for preliminary screening. Then, the minimum absolute compression and selection algorithm (LASSO) in the machine learning model is applied to further reduce the dimension screening and select more meaningful features. Support vector machine SVM classifier was used to divide the sample data into training set and validation set in a ratio of 7:3. The ten-fold cross-validation method was used to draw ROC curve and calculate the value of AUC, sensitivity, specificity and accuracy to quantify the prediction efficiency. Finally, the model with the most predictive value was compared among the five models and a column graph was established. Calibration Curve and Decision Curve were used to evaluate the predictive performance of calibration curve. Calibration curve and decision curve were used to verify the clinical application value of calibration curve.

Results: 1. In clinical imaging data: mrT stage, mrN stage and mrEMVI of patients had statistical significance ($p \leq 0.05$), and CEA in training set had statistical significance ($p \leq 0.05$).

2.DCE-T1 extramural vessel (Model 2) had the best predictive efficacy in the imaging omics model, with AUC value of 0.94 in the training set and 0.94 in the test set. DWI lymph nodes (Model 3) had the second best predictive efficacy, with AUC value of 0.93 in the training set and 0.91 in the test set. The combined clinical information-imaging feature model (Model 5) further improved the predictive efficacy, with the AUC value of 0.980 in the training set and 0.983 in the test set.

3.Extramural vascular invasion probability of rectal cancer patients can be calculated based on the column diagram of Model 5.

Conclusion: 1.Model 5 has the best predictive ability of EMVI, and it shows good identification and calibration ability in both experimental and verification queues.

2.DCA shows that the Model 5 to draw a nomogram has application value in clinical diagnosis and treatment.

PO-1659

Development of a model including MRI features for predicting advanced-stage recurrence of hepatocellular carcinoma after liver resection

Hanyu Jiang¹, Chongtu Yang¹, Yidi Chen¹, Yanshu Wang¹, Weixia Chen¹, Maxime Ronot², Victoria Chernyak³, Kathryn Fowler⁴, Mustafa Bashir⁵, Bin Song^{1,6}

1. West China Hospital, Sichuan University

2. Université Paris Cité, UMR 1149, CRI, Paris & Service de Radiologie, Hôpital Beaujon, APHP.Nord, Clichy, France

3. Department of Radiology, Memorial Sloan Kettering Cancer Center, NYC NY

4. Department of Radiology, University of California San Diego San Diego, CA, USA

5. Department of Radiology, Center for Advanced Magnetic Resonance in Medicine, and Division of Gastroenterology, Department of Medicine, Duke University Medical Center, Durham, NC, USA

6. Department of Radiology, Sanya People's Hospital, Sanya, China

Purpose: To develop an MRI-based model to predict postoperative advanced-stage hepatocellular carcinoma (HCC) recurrence.

Methods: This single-center, retrospective study included consecutive adult patients who underwent preoperative contrast-enhanced MRI and curative-intent resection for very early- to intermediate-stage HCC (Dec 2011-Apr 2021). Three radiologists evaluated 52 qualitative features on MRI. In the training set, Fine-Gray proportional subdistribution hazard analysis was performed to identify clinical, laboratory, imaging, pathological, and surgical variables to include in the predictive model. In the test set, the C-index was computed to compare the developed model with current staging systems. The Kaplan-Meier survival curves were compared using the log-rank test. Results: 532 patients (median age, 54 years; 465 males) were included, 302 (median age, 54 years; 265 males) from the training set, and 128 (median age, 53 years; 108 males) from the test set. Advanced-stage recurrence was observed in 12.6% and 11.7% of these patients, respectively. Serum neutrophil count ($10^9/L$), tumor size (cm), and arterial-phase hyperenhancement proportion on MRI were associated with advanced-stage recurrence (subdistribution hazard ratio range, 1.16-3.83 [95% CI: 1.02, 7.52]; P range, <.001-.02) and constituted the predictive model. The model showed better test set prediction for advanced-stage recurrence than 4 staging systems (2-year C-indexes, 0.82 [95% CI: 0.74, 0.91] vs 0.63-0.68 [95% CI: 0.52, 0.82]; P range, .001-.03). High-risk patients (model score ≥ 15 points) showed increased advanced-stage recurrence and worse all-stage recurrence-free survival (RFS), advanced-stage RFS, and overall survival than low-risk patients (P range, <.001-.02).

Conclusions: A model combining serum neutrophil count, tumor size, and arterial-phase hyperenhancement proportion predicted advanced-stage HCC recurrence better than current staging systems and could identify high-risk patients.

PO-1660

The Relationship between CT Imaging Characteristics and the Preoperative Response to Anti-PD1 Therapy in Colorectal Cancer with High Microsatellite Instability (MSI-H)

Caixia Zhang,Guanshun Wang,Zhenhui Li

The Third Affiliated Hospital of Kunming Medical University, Yunnan Cancer Hospital, Yunnan Cancer Center

Background: Immunotherapy has shown significant promise in treating colorectal cancer (CRC) patients, particularly those with the microsatellite instability-high (MSI-H) subtype. However, the value of imaging in assessing the response to immunotherapy in CRC is unknown. Thus, the study aims to evaluate the predictive value of pre-treatment CT features for the preoperative immunotherapy response in MSI-H CRC.

Methods: This retrospective study enrolled patients with MSI-H CRC who underwent anti-PD1 therapy prior to surgery. All patients underwent a CT scan prior to receiving immunotherapy. We divided all the patients into two groups: Pathological Complete Response (pCR) and Non-pCR. We compared the CT image features between the two groups. The receiver operating characteristic (ROC) curve was used to evaluate the effectiveness of CT features in predicting pCR.

Results: A total of 48 patients (mean age 48 ± 12 , 29 men) were evaluated. Of these, 31 (61.9%) achieved pCR. The lesion wall thickness based on pre-treatment CT imaging, was significantly associated with pCR ($p = 0.018$). Other CT imaging features, including the CT values of the lesion on venous phase or plain scanning and lesion length, had no association with pCR (all $p > 0.05$). The area under the ROC was 0.715 (95% confidence interval [CI]: 0.557-0.842, $p = 0.006$, sensitivity: 94.1%, specificity: 42.3%) for the lesion wall thickness in predicting pCR.

Conclusions: The lesion wall thickness on CT imaging reflects the preoperative anti-PD1 response in MSI-H colorectal cancer. This could assist physicians in promptly identifying non-responsive MSI-H rectal cancer patients, enabling personalized treatment regimens.

PO-1661

Predicting MVI and Early Recurrence of Hepatocellular Carcinoma: A Real-world Study Based on HBP Imaging Radiomics Combined with Liver Function Indices

xingxin wang,hongxia zhang,rui yang,zhipeng ding,chunhui zhang,yali cui,yang zhou
Harbin Medical University Cancer Hospital

Aim: To develop a predictive model integrating liver function indices and radiomics based on magnetic resonance imaging (MRI) for preoperative identification of MVI and assess ER in HCC after hepatectomy in the real world.

Methods: From December 2016 and June 2021, consecutive patients who underwent surgery for HCC and MRI were included in this retrospective study. The patients were divided into the training, test, and validation groups according to time. Gradient Boosting Decision Trees were used to extract radiomic features from the MR images, and the Forest model was used to determine the Rad-score. A combined model containing the Rad-score and clinical and radiological liver function indices was developed. The receiver operating characteristic (ROC) curve was used to assess the prediction performance. The ER based on model-predicted high- and low-risk MVI was evaluated for validation based on Kaplan-Meier survival curves.

Results: Of the 228 patients included, histological MVI was diagnosed in 79 patients. Alanine transaminase (ALT)/aspartate aminotransferase (AST) ≤ 1.21 (odds ratio [OR]=0.22), size (OR=0.35), morphology (OR=0.30) and hepatocellular uptake index (HUI) (OR=8.89) were

independent risk factors. The AUCs for the final model were 0.89 (training), 0.88 (test) and 0.78 (validation). The patients with model-predicted high-risk MVI had significantly shorter recurrence-free survival (RFS) ($p=0.014$), which was similar to the histological results ($p=0.005$).

Conclusion: A preoperative MVI predictive model incorporating liver function indices with radiomic features based on MRI could accurately predict MVI and RFS and have the potential to influence individual treatment planning.

PO-1662

Assessing Vessels That Encapsulate Tumor Clusters via Preoperative MRI in HCC Based on Integrating Deep Learning and Radiomics Features

Yanyan Zhu, Lili Yang, Huizhen Huang, Junhan Pan, Yanci Zhao, Feng Chen
The First Affiliated Hospital, Zhejiang University School of Medicine

Purpose: To assess if integrated deep learning and radiomics features can predict the Vessels That Encapsulate Tumor Clusters (VETC) in preoperative MRI of hepatocellular carcinoma (HCC) patients.

Methods: All 350 eligible patients were included retrospectively between July 2019 and July 2020, and assigned into the training cohort ($n = 245$) and the testing cohort ($n = 105$). These patients were divided into VETC positive and VETC positive negative. Both deep learning and radiomics features were extracted from MRI sequence of T2WI, arterial phase (AP), portal venous phase (PVP). Three models for the prediction of VETC were constructed, radiomics model, deep learning (DL) model and hybrid model, respectively. A clinical-hybrid model for the prediction of VETC integrated significant clinical features and the features generated from the hybrid model with the optimal area under the receiver operating characteristics curve (AUC) in the testing cohort. Otherwise, prognostic model were constructed in prediction of recurrence and mortality via Cox proportional hazard analysis.

Results: The clinical-hybrid model for VETC represented an AUC of 0.856, accuracy of 88.32%, sensitivity of 85.56% in the testing cohort. The clinical-hybrid models for identification of RFS and OS outperformed prediction performance of the radiomics model or the DL model alone. The clinical-hybrid model for prognostication showed great predictive value with discrimination and classification abilities after validation.

Conclusion: The feature set integrating deep learning and radiomics features is more effective in predicting VETC than only one feature type, and might facilitate predicting tumor recurrence and mortality in order to optimize clinical decisions for patients with early stage HCC.

PO-1663

Preoperative CT histogram analysis to predict the expression of Ki-67 in solid pseudopapillary tumors of the pancreas

Zhengxiao Li, Minggang Huang, Yan Zhang
Shaanxi Provincial People's Hospital

Purpose: To explore the value of preoperative computed tomography (CT) histogram features in predicting the expression status of Ki-67 in patients with solid pseudopapillary pancreatic tumors (SPTP).

Materials and Methods : This retrospective study analyzed venous phase CT images of 39 patients with SPTP confirmed by surgery and pathology and measured using the Ki-67 proliferation index in our hospital from November 2015 to February 2022. According to the Ki-67 proliferation index, they were divided into high expression ($Ki-67 \geq 4\%$) and low expression ($Ki-67 < 4\%$) groups. The histogram features of quantitative parameters were extracted using MaZda software, and the quantitative parameters of CT histograms were compared between groups. The receiver operating characteristic (ROC) curves of the subjects were plotted according to the parameters, with statistically significant differences. The area under the curve (AUC), sensitivity, and specificity were calculated, and the effectiveness of the histogram parameters in predicting Ki-67 expression was analyzed and evaluated.

Results: In total, 27 SPTP patients were enrolled, including 11 with high expression of Ki-67 and 16 with low expression of Ki-67. Comparative analysis of the Ki-67 high-and low-expression groups revealed a statistically significant variance ($P < 0.05$). ROC curve analysis showed that the AUC of variance predicting Ki-67 expression status was 0.841, with sensitivity of 81.3% and specificity of 81.8%.

Conclusion : Preoperative CT histogram features help predict the Ki-67 expression status in patients with SPTP.

PO-1664

Prognostic MRI features to predict postresection survivals for very early to intermediate stage hepatocellular carcinoma

3. Université Paris Cité, UMR 1149, CRI, Paris & Service de Radiologie, Hôpital Beaujon, APHP.Nord, Clichy, France

4. Department of Radiology, University of California San Diego, CA, USA

5. Department of Radiology, Center for Advanced Magnetic Resonance in Medicine, and Division of Gastroenterology, Department of Medicine, Duke University Medical Center, Durham, NC, USA

6. Department of Radiology, Sanya People's Hospital, Sanya, Hainan, China

Purpose: Contrast-enhanced MRI can provide individualized prognostic information for hepatocellular carcinoma (HCC). We aimed to investigate the value of MRI features to predict early (≤ 2 years)/late (> 2 years) recurrence-free survival (E-RFS and L-RFS, respectively) and overall survival (OS).

Methods: Consecutive adult patients at a tertiary academic center who received curative-intent liver resection for very early to intermediate stage HCC and underwent preoperative contrast-enhanced

MRI were retrospectively enrolled from March 2011 to April 2021. Three masked radiologists independently assessed 54 MRI features. Uni- and multivariable Cox regression analyses were conducted to investigate the associations of imaging features with E-RFS, L-RFS and OS.

Results: This study included 600 patients (median age, 53 years; 526 men). During a median follow-up of 55.3 months, 51% of patients experienced recurrence (early recurrence: 66%; late recurrence: 34%), and 17% died. Tumor size, multiple tumors, rim arterial phase hyperenhancement, iron sparing in solid mass, tumor growth pattern, and gastroesophageal varices were associated with E-RFS and OS (largest $P=.02$). Nonperipheral washout ($P=.006$), markedly low apparent diffusion coefficient value ($P=.02$), intratumoral arteries ($P=.01$), and width of the main portal vein ($P=.03$) were associated with E-RFS but not with L-RFS or OS, while the VICT2 trait was specifically associated with OS ($P=.02$). Multiple tumors ($P=.048$) and radiologically-evident cirrhosis ($P<.001$) were the only predictors for L-RFS.

Conclusion: Twelve visually-assessed MRI features predicted postoperative E-RFS (≤ 2 years), L-RFS (> 2 years), and OS for very early to intermediate-stage HCCs.

PO-1665

Deep learning-based compressed SENSE improved diffusion-weighted image quality and liver cancer detection: a prospective study

Ting Duan, Zhen Zhang, Yidi Chen, Hanyu Jiang, Bin Song
West China Hospital of Sichuan University

Objective: To assess whether diffusion-weighted imaging (DWI) with Compressed SENSE (CS) and deep learning (DL-CS-DWI) can improve image quality and lesion detection in patients at risk for hepatocellular carcinoma (HCC).

Materials and Methods: This single-center prospective study enrolled consecutive at-risk participants who underwent 3.0 T gadoxetate disodium-enhanced MRI. Conventional DWI was acquired using parallel imaging (PI) with SENSE (PI-DWI). In CS-DWI and DL-CS-DWI, CS but not PI with SENSE was used to accelerate the scan with 2.5 as the acceleration factor. Qualitative and quantitative image quality were independently assessed by two masked reviewers, and were compared using the Wilcoxon signed-rank test. The detection rates of clinically-relevant (LR-4/5/M based on the Liver Imaging Reporting and Data System v2018) liver lesions for each DWI sequence were independently evaluated by another two masked reviewers against their consensus assessments based on all available non-DWI sequences, and were compared by the McNemar test.

Results: 67 participants (median age, 58.0 years; 56 males) were enrolled. Among the three DWI sequences, DL-CS-DWI showed the best qualitative and quantitative image qualities (p range, <0.001 - 0.039). For clinically-relevant liver lesions, the detection rates (91.4%-93.4%) of DL-CS-DWI showed no difference with CS-DWI (87.3%-89.8%, $p=0.230$ - 0.231) but were superior to PI-DWI (82.7%-85.8%, $p=0.015$ - 0.025). For lesions located in the hepatic dome, DL-CS-DWI demonstrated the highest detection rates (94.8%-97.4% vs 76.9%-79.5% vs 64.1%-69.2%, $p=0.002$ - 0.045) among the three DWI sequences.

Conclusion: In patients at high-risk for HCC, DL-CS-DWI improved image quality and detection for clinically-relevant liver lesions, especially for the hepatic dome.

PO-1666

Are Systematic Reviews of Diagnostic Tests for Rectal Cancer Trustworthy? A Cross-sectional Study

Zhifan Li, Junqiang Lei
First Hospital of Lanzhou University

Purpose: Many systematic reviews (SRs) have evaluated the value of different diagnostic tests for rectal cancer. But the quality of these SRs remains unclear. This study aimed to examine epidemiological characteristics, methodological and reporting quality of SRs of diagnostic tests for rectal cancer, and to explore factors that may affect the quality.

Methods: PubMed, EMBASE, Cochrane Library, and Chinese Biomedicine Literature were searched to identify SRs evaluating diagnostic tests for rectal cancer. We used AMSTAR to assess the methodological quality and PRISMA-DTA for reporting quality.

Results: 33 SRs were included in our analysis and the number of publications had gradually decreased each year. 33 SRs involved 8 topics and 6 diagnostic tests. The median number of index test was 1 (range: 1-5) and there were 6 index tests, of which MRI (22/33, 66.7%) was the most studied index test. PubMed/Medline (100.0%) was the most frequently searched database. Only 15 (45.5%) SRs reported search strategy. The overall methodological quality was poor. All the SRs were not fully assessed the scientific quality of the included studies, only 33.3% performed a comprehensive literature search, 21.2% used the scientific quality appropriately in formulating conclusions, and 33.3% assessed the publication bias. There were many flaws in reporting quality. None of the SRs presented a structured summary, protocol or registration, only 6.1% provided the results of individual studies, 6.1% conducted additional analyses, 36.4% fully reported limitations, and 21.2% completely reported funding.

Conclusion: The quality needs to be further improved, especially referring to the performance of comprehensive literature search, assessment of scientific quality of included studies, assessment of publication bias, structured summary, protocol and registration, additional analyses, limitations, and funding.

PO-1667

Development and validation a model in predicting the expression of Ki-67 in pancreatic ductal carcinoma with radiological features and dual-energy computed tomography quantitative parameters

Youjia Wen, Zuhua Song, Qian Li, Dan Zhang, Xiaojiao Li, Jiayi Yu, Zongwen Li, Xiaofang Ren, Jiayan Zhang, Qian Liu, Jie Hung, Dan Zeng
Chongqing General Hospital

Objective: To construct and validate a model on the basis of the dual-energy computed tomography (DECT) quantitative parameters and radiological features to predict Ki-67 expression level in pancreatic ductal adenocarcinoma (PDAC).

Materials and methods: Data from 102 PDAC patients were analyzed. The variables of clinic, radiology and DECT were evaluated. In arterial phase and portal venous phase (PVP), normalized iodine concentration (NIC), normalized effective atomic number and slope of the spectral attenuation curves were measured. Extracellular volume fraction (ECVf) were measured in the equilibrium phase. Univariate analysis were used to screen independent risk factors to predict Ki-67 expression. The models of Radiology, DECT and DECT-Radiology were erected and the diagnostic effectiveness and clinical applicability of them were obtained through area under

the curve (AUC) and decision curve analysis, respectively. The nomogram was established based on the optimal model and its goodness-of-fit was assessed by calibration curve.

Results: Computed tomography reported regional lymph node status, NIC of PVP, and ECVf were ascertained as independent predictors for Ki-67 expression prediction. The AUC of the models of Radiology, DECT, and DECT–Radiology were 0.715, 0.917, and 0.938, respectively, in the training cohort; 0.727, 0.831, and 0.889, respectively, in the validation one. DECT–Radiology nomogram was established based on the DECT–Radiology model which showed the highest net benefit and satisfactory consistency.

Conclusions: The DECT–Radiology model shows favorable predictive efficacy for the Ki-67 expression, which may be of value for clinical decision-making in PDAC patients.

PO-1668

The Influence of Female Pelvic Configuration at All Ages on Pelvic Organ Prolapse

Luyang Ma¹, Yujiao Zhao², Xiaodong Ji², Lixiang Huang², Cheng Zhang¹, Wen Shen¹

1. Tianjin Medical University
2. Tianjin First Central Hospital

Purpose:

In this study, we retrospectively analyzed pelvic dimension in women with pelvic organ prolapse (POP) compared with normal group of all ages to ensure the relationship between pelvic configuration and POP.

Methods:

We retrospectively recruited 130 patients with POP (age 21-82) as the POP group and 130 normal women without any pelvic floor dysfunction (age 23-89) as the control group. Their age, body mass index (BMI), parity, and menopause were recorded as demographic data. The diameter of the transverse inlet, the bispinous diameter, the bituberous diameter, the pelvic inclination, the anterior angle, the anatomic conjugate, the obstetric conjugate, the diagonal conjugate, the anteroposterior diameter of mid plane, the anteroposterior diameter of lower mid plane, the sagittal outlet, the coccygeal curved length, the ratio of sacrococcyx, the area of left and right obturator internus muscles and the area of anterior and posterior pelvic area were measured on MR image.

SPSS version 26.0 (IBM Corp., Armonk, NY, USA) and R statistical software, version 4.3 (R Foundation for Statistical Computing, Vienna, Austria) was used for the statistical analysis. T test was used to compare the normal distribution between the two groups, and Wilcoxon test was used to compare the abnormal distribution between the two groups, and χ^2 test was used to compare the classified data between the two groups. Univariate analyses were performed for imaging parameters after testing multicollinearity on the variables, and the remaining variables were included in the Multivariate logistic regression after excluding the parameters that were not statistically significant. In addition, the above parameters remained statistically different after including demographic characteristics as covariates. At the same time, in order to ensure the repeatability of the parameters, 30 cases were randomly selected from the data 2 months after the first measurement by the same physician through simple random sampling method for retest, and the intra-group correlation coefficient (ICC) was used for evaluation.

Results:

We detected good interobserver reliability. The demographic characteristics and imaging parameters of the two groups were analyzed, it showed that BMI (24.03 vs 23.15, $p=0.02$), diameter of the transverse inlet (143.18 vs 137.57 mm, $p < 0.001$), bispinous diameter (112.25 vs 109.16 mm, $p=0.001$), bituberous diameter (131.22 vs 125.61 mm, $p < 0.001$), anterior angle (94.17 vs 91.81°, $p=0.005$), anteroposterior diameter of mid plane (128.46 vs 125.55 mm, $p=0.042$), anteroposterior diameter of lower mid plane (114.87 vs 110.39 mm, $p < 0.001$), sagittal outlet (94.41 vs 91.62 mm, $p=0.004$), coccygeal curved

length(36.04vs31.75mm, $p < 0.001$), anterior pelvic area(6144.60vs5405.14mm², $p < 0.001$) and posterior pelvic area(2020.32vs1690.40mm², $p < 0.001$) in POP group were all higher than those in normal group, but pelvic inclination(57.46vs61.23°, $p < 0.001$) was lower than the normal group, and no statistical differences in the rest. After variance inflation factor was used to multiple collinearity test for the pelvimetry variables, we deleted anatomic conjugate and obstetric conjugate, and performed univariate regression on the remaining variables, and the results were consistent with the characteristic analysis. Multivariate logistic regression was performed after excluding collinearity by step-by-step regression method for statistically significant parameters again to avoid over-fitting, and the results showed that as an independent risk factor for POP in women, the larger the diameter of the transverse inlet(OR:1.103; $p=0.02$), the sagittal outlet(OR:1.051; $p=0.035$), the coccygeal curved length(OR:1.107; $p < 0.001$), the anterior pelvic area(OR:1.001; $p < 0.001$), the smaller the anteroposterior diameter of mid plane(OR:0.949; $p=0.019$), the pelvic inclination(OR:0.925; $p=0.01$), the higher the risk of POP. We found that coccygeal curved length had the greatest influence on POP, and the anteroposterior diameter of mid plane changed from the original exposure factor to the protective factor after collinearity was excluded. In addition, the above parameters remained statistically different after including demographic characteristics as covariates.

Conclusion:

Compared with normal women, patients with POP have larger diameter of the transverse inlet, sagittal outlet, coccygeal curvature length, and anterior pelvic area, and smaller pelvic inclination and anteroposterior diameter of mid plane, and the coccygeal curved length has a greater impact on POP than other parameters, regardless of age, BMI, parity, and menopausal status.

PO-1669

Extracellular volume fraction determined by equilibrium contrast-enhanced dual-energy CT for the prediction of histological grade

Xi Tang, Dongqing Wang, Lirong Zhang, Haitao Zhu, Zijian Zhuang
Affiliated Hospital of Jiangsu University

Objectives: To evaluate the feasibility and diagnostic efficacy of extracellular volume (ECV) based on iodine density measurement with dual-energy CT (DECT) for evaluating histological grade of rectal adenocarcinoma, as compared with single-energy CT (SECT).

Methods: We prospectively collected the basic data of 97 patients with rectal adenocarcinoma confirmed by surgery and pathology in Affiliated Hospital of Jiangsu University from November 2017 to March 2022, including gender, age, T stage, N stage, CEA and CA19-9. All patients underwent dual-energy computed tomography enhanced examination. Hematocrit was collected within 7 days before the examination. Unenhanced and 120-kVp equivalent images equilibrium phase were used to calculate tumor SECT-derived ECV fractions (SECT-ECV), and iodine density images were obtained from equilibrium-phase DECT for DECT-derived ECV fractions (DECT-ECV). Attenuation values were measured on unenhanced and the equilibrium-phase 120-kVp equivalent CT images for tumor and the aorta at the same plane, and iodine densities of the tumor and aorta were measured in the equilibrium-phase. SECT-ECV and DECT-ECV of the tumor were calculated. With postoperative pathological results as the gold standard, adenocarcinoma patients were divided into low-grade (moderately differentiated and well-differentiated) or high-grade (poorly differentiated) groups according to the histological grading criteria of rectal adenocarcinoma. Mucinous adenocarcinoma was excluded. Assessing whether the differences in parameters between the low-grade and high-grade groups were statistically significant. Receiver operating characteristic (ROC) curve and the area under the receiver-operator curve (AUC) were performed to analyze the ability of SECT-ECV and DECT-ECV to predict the histological grade of rectal adenocarcinoma before operations. The Delong test was used to investigate whether there was a

statistical difference in predictive performance between the two AUCs. Correlations between SECT- and DECT-derived ECV fractions were identified using the Pearson correlation coefficient . Results: Among the 97 participants, 15 were in the high-grade group and 82 were in the low-grade group. There were significant differences in the SECT-ECV ($P<0.001$) and DECT-ECV ($P<0.001$) between high and low grade groups. In terms of clinical features, there were statistically significant differences in age ($P=0.049$), N phase ($P=0.003$) and CA19-9 ($P=0.014$) between two groups. The ROC curve demonstrated that the best efficacy in evaluating the histological grade of rectal adenocarcinoma was achieved by DECT-ECV, with an area under the curve of 0.840, which was higher than SECT-ECV (0.712) , age (0.660), N stage (0.701) and CA19-9 (0.690) of the two groups. The Delong test showed that the difference between the SECT-ECV and DECT-ECV was statistically significant ($P<0.05$). In addition, the correlation between SECT- and DECT-derived ECV fractions was low ($r = 0.42$; $P = 0.012$).

Conclusions: The ECV fractions obtained by iodine density from the equilibrium-phase of dual-energy computed tomography is more effective than single-energy computed tomography in predicting the histological grade of rectal adenocarcinoma patients.

PO-1670

Hepatoid carcinoma of the pancreas: A case report and literature review

Xing Li, Su Lui, Zhengyan Li

Department of Radiology, West China Hospital of Sichuan University

Background: Hepatoid adenocarcinoma (HAC) is a malignant tumor with a poor prognosis. HAC has a similar morphological feature to hepatocellular carcinoma and presents with elevated alpha-fetoprotein (AFP). Hepatoid adenocarcinoma of the pancreas is rare and underrecognized. Here we report a rare case of HAC arising from the pancreas in the early stage and treated with distal pancreatectomy and splenectomy as well as adjuvant chemotherapy.

Case summary: A 70-year-old male patient was admitted to our hospital with space-occupying lesions of the pancreas. Laboratory tests indicated an increase in alpha-fetoprotein. He had a history of hypertension, diabetes mellitus, and hepatitis B infection. Contrast-enhanced abdominal computed tomography and magnetic resonance imaging revealed a mild enhanced soft tissue nodule located in the body of the pancreas. Distal pancreatectomy and splenectomy were performed. The patient was diagnosed with HAC according to the clinical pathological characteristics and immunochemical staining. The patients received chemotherapy with oxaliplatin and capecitabine after surgery.

Conclusion: Early diagnosis of hepatoid adenocarcinoma of the pancreas is difficult but plays a vital role in the treatment and prognosis of patients. Hepatoid adenocarcinoma should be considered when patients present with pancreatic mass and elevated AFP.

PO-1671

Diffusion-weighted MRI to predict the efficacy of irreversible electroporation for the ablation of pancreatic cancer

Feiyuan Zhang, Mifang Li, Lingyan Zhang
Shenzhen Longgang Central Hospital

Background : The purpose of our study was to evaluate the response to IRE ablation in pancreatic cancer patients using DWI MRI.

Methods: This is a retrospective study and pancreatic cancer patients who received IRE ablation were enrolled. DWI MRI was performed before and after IRE ablation, and apparent diffusion coefficient (ADC) values were calculated based on DWI MRI. The response to IRE was assessed by using RECIST (version 1.1) standard, ADC values and CA19-9.

Results: Twenty three patients with pancreatic cancer were treated with IRE and underwent DWI before and after treatment. According to RECIST criteria, there were 0 cases of complete remission, 4 cases of partial remission, 11 cases of stability, and 8 cases of progression. The ADC values after and before IRE ablation were 1.5848×0.001 , and 1.2880×0.001 , respectively, which had a significant difference ($P = 0.01$). After IRE ablation, the median CA19-9 decreased (305 U/mL vs 280.20 U/mL), but there was no statistical difference ($P = 0.913$).

Conclusions: DWI MRI can accurately display the lesion, and evaluate the effect of IRE ablation of pancreatic cancer. It can be used as an effective method for monitoring the efficacy of IRE ablation, and provides an important reference for clinical efficacy monitoring.

PO-1672

Prediction of Vessels Encapsulating Tumor Clusters (VETC) Pattern and Prognosis of Hepatocellular Carcinoma Based on Preoperative Gd-EOB-DTPA MR

Miaomiao Wang^{1,2}, liang Cao², yinzhong Wang², hongliang Huang², shi Cao³, xiaoxue Tian⁴, junqiang Lei²
1. 17683902840

2. Department of Radiology, The First Hospital of Lanzhou University

3. Department of Pathology, The First Hospital of Lanzhou University

4. Department of nuclear medicine, Second Hospital of Lanzhou University

Background VETC (Vessels encapsulating tumor clusters) is a novel vascular pattern distinct from microvascular invasion (MVI) that is significantly associated with poor prognosis in patients with hepatocellular carcinoma (HCC).

Purpose To predict VETC status and prognosis of patients with hepatocellular carcinoma based on preoperative Gd-EOB-DTPA MRI.

Methods Patients with HCC who underwent surgical resection and preoperative Gd-EOB-DTPA MRI between 1 January 2016 and 31 August 2022 were retrospectively included. The variables associated with VETC were evaluated by logistic regression, a nomogram model was constructed based on independent risk factors and the area under receiver operating characteristic curve (AUC) was calculated to evaluate the diagnostic performance of MR features for VETC. COX regression was used to determine the variables associated with recurrence-free survival (RFS) of HCC patients, and survival curves were plotted by Kaplan-Meier method. P value < 0.05 was considered as statistical significance.

Results A total of 98 HCC patients were included, the overall median age was 53 years, ranging from 48.75 to 64.25. Peritumoral hypointensity on hepatobiliary phase (HBP) (OR[Odd ratio]=2.58 [95%CI(1.05 , 6.33)], $P=0.038$), tumor/liver SI(Signal intensity) ratio on HBP ≤ 0.75

(OR=27.80[95%CI (1.53, 502.91)], P=0.024] and tumor/liver ADC ratio \leq 1.23 (OR=4.65[95%CI (1.01, 21.38)], P=0.048] were independent predictors of VETC pattern. A nomogram was constructed by combining the above three significant variables, the accuracy, sensitivity and specificity were 69.79%, 71.74% and 68.00%, respectively, with AUC of 0.75[95%CI (0.65, 0.83)], indicating good diagnostic performance. Variables significantly associated with RFS of HCC patients after surgery were BCLC stage (HR=2.15 [95% CI (1.09, 4.22)], p=0.026) and VETC pattern (2.28 [95% CI (1.29, 4.02)]), and studies have shown that VETC-positive HCC have worse RFS.

Conclusion The preoperative imaging features based on Gd-EOB-DTPA MRI can be used to predict VETC pattern, which has prognostic significance for postoperative recurrence-free survival of patients with hepatocellular carcinoma.

PO-1673

Evaluation of Amide Proton Transfer-Weighted Imaging and T2 mapping for preoperative risk stratification of endometrioid adenocarcinoma

Lianhua Cheng¹, Lingyu Chang¹, Xinghua Xu¹, Meng Zhao¹, Guangtai Wu¹, Shuyi Li¹, Dmytro Pylypenko², Weiqiang Dou², Dexin Yu¹, Fang Wang¹, Qing Wang¹

1. Qilu Hospital of Shandong University

2. GE Healthcare, MR Research China

Objective: To evaluate the contribution of amide proton transfer-weighted (APTw) imaging and T2 mapping to characterizing the risk stratification of endometrioid adenocarcinoma (EA) before surgery.

Materials and Methods: Seventy-five patients (33 low-risk EA, 42 non-low-risk EA) were incorporated into the prospective study and underwent preoperative multiparametric MRI, including APTw imaging and T2 mapping. Two observers independently delineated the region of interests (ROIs) and the interobserver agreement was assessed by intraclass correlation coefficients (ICCs), independent samples t-tests and Mann-Whitney U test were applied to compare quantitative variables between the two groups, the receiver operator characteristic (ROC) curve was conducted to evaluate the predictive performances of different parameters and the Delong test was implemented to compare the area under the curve (AUC) for each of the meaningful parameters and their combinations.

Results: The APTw values of the low-risk EA group were significantly lower than those of the non low-risk EA group ($[17.416 \pm 4.531] \times 10^{-3} \text{ mm}^2/\text{s}$ vs $[26.084 \pm 6.787] \times 10^{-3} \text{ mm}^2/\text{s}$, $P < 0.001$). The T2 values of the low-risk EA group was significantly higher than that of the non low-risk EA group ($[102.231 \pm 9.485] \text{ ms}$ vs $[93.291 \pm 7.354] \text{ ms}$, $P < 0.001$). The combination of APTw and T2 mapping yielded the highest AUC of 0.882 which had no significant difference with APTw imaging but was significantly higher than T2 mapping alone (AUC= 0.843 and 0.757, respectively).

Conclusion: APTw imaging and T2 mapping parameters have been demonstrated differently in EA with different risks. The combination of APTw imaging and T2 mapping has the robust potential to improve the risk stratification of EA.

PO-1674

Inflammatory pseudotumor-like follicular dendritic cell sarcoma of liver

Ronghua Yan, Mengting Mei, Si Wei
Peking University Shenzhen Hospital

Objective: Inflammatory pseudotumor-like follicular dendritic cell sarcoma(IPT-FDCS) is described as an independent subtype in the 5th edition of WHO Classification of Haematolymphoid Tumor which is a kind of rare and easily misdiagnosed tumor. This study analyzed the imaging and pathological manifestations of 5 patients diagnosed with hepatic IPT-FDCS and reviewed previous literature reports to improve the understanding of IPT-FDCS in MR and CT imaging.

Methods: 5 patients (3 males and 2 females) were pathologically diagnosed with hepatic IPT-FDCS, including 3 cases of upper abdominal MRI and 2 cases of CT examination were performed. And we retrospectively analyzed the imaging features of more than 30 cases reported in previous literature before 2023.

Results: All 5 patients (with 5 lesions) in this study were pathologically confirmed as IPT-FDCS. As the literature which has been reported, hepatic IPT-FDCS mainly occurs in adult female. Clinical manifestations include abdominal discomfort, weight loss, anemia, etc. Three of the five patients were confirmed in the left lobe of liver. Based on its imaging manifestations and the reported literature, the imaging manifestations of hepatic IPT-FDCS include: large, isolated, rounded, with clear border and slightly hypodensity on non-contrast CT. Hepatic IPT-FDCS shows hypointense on T1WI, hyperintense both on T2WI and DWI. Enhanced MRI or CT performed "fast in and fast out" (3 cases) or "fast in and slow out" (2 cases). Abundant and enlarged feeding arteries can be found around the lesion on enhanced MRI, which is the characterization of that manifestation. According to literature, mildly intensified "pseudocapsules" was detected in 2 patients. Abnormal perfusion of liver parenchyma may occur in 2 patients.

Conclusion: From what has been discussed above, hepatic IPT-FDCS should be considered in, among the differential diagnosis when the cases show abundant and enlarged feeding arteries around the tumor, pseudocapsule, and abnormal perfusion of parenchyma in liver while no viral hepatitis background was confirmed.

PO-1675

Value study in predicting CK19 positive hepatocellular carcinoma and recurrence based on MRI radiomics and clinical characteristic nomograms

qian Wang^{1,2,3}, miaomiao Wang^{1,2,3}, junxia Xu^{1,2,3}, shunmin Zhao^{1,2,3}, junqiang Lei^{2,3}

1. The First Hospital of Lanzhou University

2. Department of Radiology, The First Hospital of Lanzhou University

3. Intelligent Imaging Medical Engineering Research Center of Gansu Province

Objective To investigate the predictive value of Gadoxetate disodium (Gd-EOB-DTPA) enhanced MRI radiomics features combined with clinical and imaging characteristics for cytokeratin 19 (CK19) positive hepatocellular carcinoma (HCC) and postoperative recurrence.

Methods The Gd-EOB-DTPA enhanced MRI images and clinicopathological data of 142 HCC patients who underwent hepatectomy from January 2017 to December 2021 were retrospectively collected. Patients were randomly divided into a training group and a test group at a ratio of 7:3. Variance analysis (ANOVA) and recursive feature elimination (RFE) were used for feature dimension reduction and screening. The radiomics model was constructed using four classifiers: Logistic regression (LR), support vector machine (SVM), linear discriminant analysis(LDA) and

adaptive boosting (Adaboost). The receiver operating characteristic(ROC)curve analysis was used to evaluate the predictive efficacy of CK19 expression and postoperative recurrence. Kaplan-Meier analysis and log-rank test were used for survival analysis and recurrence-free survival (RFS).

Results Among radiomics features, The classifier model of LR algorithm based on the first 11 features of hepatobiliary phase had the best performance in predicting CK19, and its AUC in the training group and the verification group were 0.7877(0.691-0.861) and 0.750 (0.587-0.867), respectively. The predictive efficacy of combined model was better than that of other models, and its AUC, sensitivity and specificity in predicting CK19 positive HCC in the training group and the validation group were 0.843 (0.757-0.908), 0.792, 0.868 and 0.841 (0.695-0.935), 0.896, 0.723, respectively. CK19-positive HCC patients had lower RFS after hepatectomy (1-year RFS 65.5 % vs 81.4 %, 2-year RFS 51.0 % vs 65.9 %), but there was no significant statistical difference (LogRank $P = 0.103$). HBP peritumoral low signal and intratumoral necrosis were independent risk factors for HCC postoperative recurrence. A nomogram based on independent risk factors and CK19 was constructed to predict RFS and the C index was 0.714.

Conclusion The nomogram based on the clinical-imaging-omics model can be used as a non-invasive marker for predicting CK19-positive HCC, with a view to developing individualized treatment plans for HCC patients.

PO-1676

CT radiomics nomogram to predict the intraoperative hypertensive crisis of abdominal pheochromocytoma and paraganglioma

Qianru Zhang, Xu Fang, Li Wang, Jianping Lu, Yun Bian, Chengwei Shao
Changhai Hospital, Naval Medical University

Objectives Patients with abdominal pheochromocytoma and paraganglioma (PPGL) are prone to hypertensive crisis during surgery, which may endanger their lives. This study aimed to develop and validate a CT radiomics nomogram for the prediction of intraoperative hypertensive crisis of PPGL.

Methods In these two centers retrospective study, a total of 212 patients of PPGLs underwent abdominal enhanced CT and surgical resection. Radiomics features were extracted from arterial and venous phases. A multivariable logistic regression models were developed in an internal validation and an external test set. The performance of the nomograms was determined by its' discrimination, calibration, and clinical usefulness.

Results A total of 212 patients with PPGL were included including 44 patients with hypertension crisis. Patients were divided into training ($n = 117$), validation ($n = 51$), and test ($n = 44$) sets. A total of 18 radiomics relevant radiomics features were selected. History of coronary heart disease and CT radiomics score were included the prediction model, which achieved an AUC of 0.91 (95% CI 0.85–0.97) in the training set, 0.93 (95% CI 0.84–0.99) in the validation set, and 0.85 (95% CI 0.72–0.97) in the test set. The decision curve analysis demonstrated that the radiomics nomogram was clinically useful.

Conclusions The CT radiomics nomogram could preoperatively predict intraoperative hypertensive crisis of abdominal PPGLs, and accurate method that can reduce intraoperative cardiovascular complication and contributes to improved surgical outcomes.

PO-1677

Comparative study of the diagnostic efficacy of CT and MRI in the identification of supraclavicular lymph node metastasis in patients with esophageal squamous cell carcinoma

jingsai Du^{1,2}, yue Huang², jinrong Qu²

1. Xinyang Central Hospital of Henan Province

2. the Affiliated Cancer Hospital of Zhengzhou University & Henan Cancer Hospital

Objectives: To compare the diagnostic efficacy of CT and MRI in the identification of supraclavicular lymph nodes metastasis (SCLNM) in patients with esophageal squamous cell carcinoma(ESCC).

Materials and Methods: This retrospective study enrolled 137 consecutive patients with esophageal cancer who had suspected SCLNM and confirmed with ultrasound-guided fine needle aspiration(US-FNA) pathologic results between April 2015 and March 2023. Concurrent CT and MRI were performed in one week before US-FNA. Morphological features of supraclavicular lymph nodes, such as short axis, shape, border, enhancement and quantitative parameter of ADC, were analyzed and significant indicators were screened to build three different models, including CT model, MRI model and MRI+DWI model. The area under the curves (AUCs) were used to assess the performance of logistic models. The AUCs of different models were compared by Delong test.

Results: Multivariate analyses showed that short axis, border and enhancement were independent risk factors for SCLNM and used to construct the CT model. Short axis and enhancement were independent risk factors for MRI model. Short axis, enhancement and ADC were independent risk factors for MRI+DWI model. The AUCs of CT, MRI and MRI+DWI models were 0.906, 0.914 and 0.942, respectively ($p < 0.05$).

Conclusion: The combined MRI + DWI model is superior to single CT and conventional MRI model in evaluating SCLNM and may function as a valuable tool.

PO-1678

The application of multi-layer perception network classifier based on CT in the diagnosis of extrapancreatic perineural invasion in pancreatic ductal adenocarcinoma

Jieyu Yu

naval medical university, changhai hospital

Objective: Extrapaneatic perineural invasion (EPNI) is an important cause of positive surgical margin and early recurrence after resection of pancreatic ductal adenocarcinoma (PDAC). However, the existing imaging scores are greatly affected by subjectivity. In this study, a new scoring method, tumor-vascular contact (TVC) score, was established for the diagnosis of EPNI. Finally, based on clinical features, TVC score, deep learning and radiomics features (DLR), the DLR multi layer perception classifier was formed to diagnose EPNI before surgery.

Methods: The clinical, imaging and pathological data of 690 patients with PDAC who were admitted to the our hospital from March 2016 to December 2020 were collected. According to the results of pathological EPNI, the patients were divided into EPNI positive group and EPNI negative group. The nnU-Net model was used for automatic segmentation of pancreatic tumor and surrounding blood vascular, and then the radiomics features of intratumoral and perivascular space and deep learning features of intratumoral were extracted. The least absolute shrinkage and selection

operator (LASSO) logistic regression algorithm was used for feature selection. Finally, the multi-layer perceptual network classifier was used to build the clinical model and DLR model respectively. The area under the receiver operating characteristic curve (AUC), sensitivity, specificity, positive predictive value, negative predictive value and accuracy were used to evaluate the performance of the two models.

Results: A total of 690 patients were enrolled, including 506 patients in the EPNI positive group and 184 patients in the EPNI negative group. The DLR prediction model showed good diagnostic performance in the training set and validation set, with AUC of 0.89 and 0.88, respectively. The sensitivity, specificity, positive predictive value, negative predictive value and accuracy of the training set and the validation set were 81.10%, 81.53%, 92.79%, 59.54%, 0.81 and 76.74%, 86.65%, 92.59%, 67.35%, 0.86, respectively.

Conclusion: The CT-based DLR multi-layer sensing network classifier is an accurate non-invasive tool for the diagnosis of EPNI in PDAC patients.

PO-1679

Comparative study of stretched-exponential and kurtosis models of diffusion-weighted imaging in renal assessment to distinguish patients with primary aldosteronism and healthy controls

Deying Wen, Jiayu Sun
West China Hospital of Sichuan University

Objectives To compare the ability of diffusion parameters obtained by stretched-exponential and kurtosis models of diffusion-weighted imaging (DWI) to differentiate between patients with primary aldosteronism (PA) and healthy controls (HCs) in renal assessment.

Methods Forty-four participants (22 patients and 22 HCs) underwent renal MRI with a 11 b-value DWI sequence and a 3 b-value diffusion kurtosis imaging (DKI) sequence. The independent-sample t test or the Mann-Whitney U test was used. Binary logistic regression was used to construct regression models combining different diffusion parameters. Receiver operating characteristic (ROC) curve analysis and comparison were used to evaluate the ability of single diffusion parameters and combined diffusion models to differentiate the two groups.

Results A total of 44 participants were included and 10 regression models were studied. The values of the cortical anomalous exponent term (α_{Cortex}) and medullary fractional anisotropy (FA_Medulla) were significantly higher in patients than in HCs, and the cortical FA (FA_Cortex), cortical axial diffusivity (Da_Cortex), medullary mean diffusivity (MD_Medulla) and medullary radial diffusivity (Dr_Medulla) were significantly lower in patients. The area under the curve (AUC) of Dr_Medulla was 0.855, comparable to that of FA_Cortex and FA_Medulla and significantly higher than that of α_{Cortex} , Da_Cortex and MD_Medulla. The AUC of Model_all parameters was 0.967, comparable to that of Model_FA (0.946) and Model_DKI (0.966) and significantly higher than that of other models. The sensitivity and specificity of Model_all parameters were 87.2% and 95%, respectively.

Conclusion Model_all parameters, Model_FA and Model_DKI were valid for differentiating between PA patients and HCs with similar differentiation efficacy and were superior to signal diffusion parameters and other models.

PO-1680

Quantification of MCTSI Scoring and Improvement in Predictive Ability for the Duration of Hospitalization in Patients with Acute Hypertriglyceridemic Pancreatitis: A Focus on CT Values

Lixuan Chen

the first affiliated hospital of Wenzhou Medical University

Abstract

Object: MCTSI, a frequently used scoring system for evaluating patients with acute pancreatitis, possesses inherent subjectivity. This study aims to objectify the scoring system by utilizing CT values. Furthermore, we explore the potential of the improved MCTSI scoring system in predicting the length of hospital stay for patients with acute hypertriglyceridemic pancreatitis (HTGP).

Methods: We retrospectively collected data from 170 HTGP patients, meeting the RAC criteria. Severity classification was performed by two experienced physicians based on RAC criteria, dividing the patients into three groups: mild, moderate, and severe. We calculated APACHE II, BISAP, Ranson, SIRS, Marshall, Balthazar, and MCTSI scores for each patient. Additionally, CT values of the pancreatic head, body, and tail were measured on the most comprehensive image levels of the pancreas in the non-enhanced, arterial, and portal venous phases. Two models were established based on these measurements. Statistical analyses involved chi-squared tests and Fisher's exact tests for categorical variables, and analysis of variance for continuous variables. The ability of different scoring systems, including the new model, to predict the duration of hospitalization for HTGP patients was evaluated using ROC curves.

Results: Among all the existing scoring systems, MCTSI demonstrates the highest predictive efficacy for the duration of hospitalization in HTGP patients. However, the newly proposed Model1 and Model2 in this study have higher AUC values, namely 0.801 and 0.804, respectively, compared to both MCTSI and other scoring systems. Model1 achieves a higher sensitivity than MCTSI, whereas Model2 demonstrates a higher specificity compared to MCTSI.

Conclusion: CT values are an effective approach to objectify MCTSI and facilitate the detection of difficult-to-recognize necrosis. The modified MCTSI, therefore, improves the predictive efficacy for the duration of hospitalization in HTGP patients.

PO-1681

Noninvasive Evaluation of Renal Oxygenation by Blood Oxygenation Level-dependent Magnetic Resonance Imaging: Comparison between Patients with Primary Aldosteronism and Healthy Controls

Deying Wen, Jiayu Sun

West China Hospital of Sichuan University

Objectives To explore the application of blood oxygenation level-dependent magnetic resonance imaging (BOLD-MRI) for the task of renal oxygenation in patients with primary aldosteronism (PA), by comparison with healthy controls.

Materials and methods All the patients and healthy controls (HCs) underwent renal BOLD-MRI. The region of interest (ROI) method was used to measure $R2^*$ values in the renal cortex and medulla separately. Independent samples t-test or Mann-Whitney U test were used. The correlation between renal BOLD parameters and clinical indicators were analyzed by Pearson correlation

analysis or Spearman correlation analysis. Receiver operating characteristic (ROC) curve was used to distinguish the PA patients and healthy volunteers.

Results A total of 20 PA patients (female:male, 14:6; age, 46 ± 12 years) and 20 HCs (female:male, 14:6; age, 47 ± 10 years) were enrolled. The cortical $R2^*$ was significantly lower than medullary $R2^*$ in the HCs and PA patients ($p<0.001$). The cortical $R2^*$ of the PA group was higher than the cortical $R2^*$ of the HCs ($p=0.003$). The correlation analysis showed that there was a statistical significant positive correlation between the medullary $R2^*$ value and urea nitrogen ($r = 0.566$, $p = 0.018$). The ROC curve showed that the optimal diagnostic threshold of cortical $R2^*$ was 17.13 Hz to distinguish PA patients and healthy volunteers, and the corresponding sensitivity and specificity were 84.30% and 55.30%, respectively. The area under the curve (AUC) was 0.692.

Conclusion BOLD-MRI provides a useful technique to detect oxygenation levels in the renal cortex and medulla of patients with PA.

PO-1682

Performance of Node-RADS Scoring System: Lymph node invasion in preoperative rectal cancer patients

Li Jiang, Dongqing Wang, Lirong Zhang, Haitao Zhu, Zijian Zhuang
Affiliated Hospital of Jiangsu University

Purpose: To evaluate the diagnostic performance of the Node Reporting and Data System (NODE-RADS) in the diagnosis of lymph node invasion (LNI) of preoperative rectal cancer (RC) patients, based on three different modalities: T2WI, enhanced T1WI and contrast CT. Furthermore, we compared the diagnostic value of NODE-RADS classification and the short-axis of the suspicious lymph nodes.

Methods: This retrospective study included 105 patients who were diagnosed with RC between March 2018 and March 2022. They all underwent both MRI and contrast CT scans within two weeks prior to surgery. Regional lymph nodes with the highest score were assessed accordingly to the NODE-RADS stratification and their short-axis were measured by two radiologists blinded for pathologic results. The histopathological findings served as the reference standard. Receiver operating characteristic (ROC) curve analysis was used to evaluate the diagnostic performance of the NODE-RADS score system in the prediction of pN staging at the three modalities. Delong test was used for the calculation of the difference between two areas under the curve (AUCs).

Results: In total, 105 patients (mean age, 65 ± 10 years; 71 men) were included. In discriminating pN+ patients from pN- patients, the AUCs of the NODE-RADS and the short-axis were 0.868 vs. 0.743 for T2WI, 0.907 vs. 0.732 for enhanced T1WI, 0.866 vs. 0.693 for contrast CT, respectively. The NODE-RADS classification in enhanced T1WI showed the best diagnostic performance (AUC=0.907) compared to the others ($P<0.05$). Among all the three modalities, the NODE-RADS showed better performance in predicting LNI than the short-axis ($P<0.05$). Besides, there is no difference in the diagnostic performance between the three modalities ($P<0.05$).

Conclusion: The NODE-RADS risk stratification system exceeds the short-axis in LNI prediction. Our study lays a foundation for the application of NODE-RADS in RC patients in clinical routine and may guide clinical treatment.

PO-1683

Value of diffusion kurtosis MR imaging and conventional diffusion weighed imaging for evaluating response to first-line chemotherapy in unresectable pancreatic cancer

Zehua Zhang¹, Caixia Fu², Zhengrong Zhou¹

1. Department of Radiology, Fudan University Shanghai Cancer Center

2. MR Application Development, Siemens Shenzhen Magnetic Resonance Ltd

Synopsis

This study firstly compared diffusion kurtosis imaging (DKI) and traditional diffusion weighted imaging (DWI) in evaluating first-line chemotherapy in unresectable pancreatic cancer. The result demonstrated that higher efficacy was shown in DKI derived parameters than DWI by the ROC curve analysis. DKI has potential to become a new non-invasive tool for clinical efficacy evaluation and help clinicians select individualized treatment.

Introduction

Pancreatic cancer is a malignant digestive tumor with poor prognosis. For those patients who are diagnosed at advanced stage losing their opportunity to undergo radical surgery, first-line chemotherapy regimens recommended by NCCN guidelines are used to prolong the survival period and improve the life of quality[1]. However, few studies have evaluated the efficacy of first-line chemotherapy among unresectable pancreatic cancer patients using diffusion kurtosis imaging (DKI). The purpose of our study was to compare the application of DKI and traditional diffusion weighted imaging (DWI) in evaluating chemotherapy efficacy in patients with unresectable pancreatic cancer.

Methods Patients fulfilling the following criteria were included in this study: 1) clinically diagnosed with unresectable pancreatic cancer; 2) without radiotherapy during the treatment phase; 3) underwent 3T MRI with both DKI and DWI sequence before and after chemotherapy; 4) the tumor size ≥ 2 cm; and 5) Eastern Cooperative Oncology Group performance status (ECOG PS) score of 0-1. Patients were excluded for incomplete standard treatment (severe adverse reaction, n=3; cytoreductive surgery n=1) or loss to follow-up (n=4). According to the recommendation of comprehensive guidelines for the diagnosis and treatment of pancreatic cancer, patients underwent the following first-line chemotherapy regimens: 1) gemcitabine combined with tegafur gimeracil oteracil potassium (GS): gemcitabine 1000 mg/m² on Day 1 and Day 8, qd, intravenously; tegafur gimeracil oteracil potassium 60 to 100 mg, Day 1-15, bid, orally; every 3 weeks; and 2) gemcitabine combined with nab-paclitaxel (AG): nab-paclitaxel 125 mg/m² and gemcitabine 1000 g/m² on Day 1, Day 8, and Day 15, qd, intravenously, every 4 weeks.

All MRI examinations were performed on a 3T scanner (MAGNETOM Skyra, Siemens Healthcare, Erlangen, Germany) using a 16-channel phased-array volume coil as the receiving coil within 15 days before and after two courses of chemotherapy. The conventional DWI were obtained using a free-breathing single-shot echo-planar sequence (TR, 8,500 ms; TE, 56 ms; FOV, 381×309 mm²; matrix, 256×208; number of slices, 28; thickness, 5 mm; b values, 0, 50, 800 s/mm², acquisition time, 2 min 40 s). The DKI sequence used the same scan parameters as the conventional DWI, except the b values (0, 100, 700, 1400, 2100 s/mm²). The acquisition time was 4 min 45 s.

Measurement of DWI and DKI parameters

Both conventional DWI parameters (ADC values) and DKI parameters (MD, MK) were obtained by using a post-processing research application (MR Body Diffusion Toolbox; Siemens Healthcare, Erlangen, Germany).

ADC maps were calculated voxel-wise by fitting the DW images to a mono-exponential signal decay model[2, 3]:

$$S(b) = S_0 \times \exp(-b \cdot \text{ADC})$$

in which S(b) represents the signal intensity with diffusion weighting b, S₀ represents the intensity without a diffusion gradient, and ADC represents the apparent diffusion intensity.

The DKI parameters were generated voxel-wise by fitting the multi-b DWI to the diffusion kurtosis signal decay equation according to a two-variable linear least squares algorithm[4]:

$$S(b)=S_0 \times \exp (-b \cdot D +1/6 \cdot b^2 D^2 K)$$

in which D value represents the corrected diffusion coefficient, K value represents the diffusion kurtosis coefficient, indicating the degree to which the molecular motion deviates from the ideal Gaussian distribution model.

Statistical analysis

The nonparametric Shapiro-Wilk test and the independent t test were adopted to compare the DWI and DKI parameters among different efficacy groups before and after the treatment. Continuous variables are expressed as the mean \pm standard deviation. All statistical analyses were performed using SPSS software (version 22.0, Chicago, IL, USA) and MedCalc software (version 17.5.5, MedCalc Software, Ostend, Belgium). Dependent variables (PR=1, non-PR=0) (partial response, PR) and independent variables (DWI and DKI parameters) were selected for the construction of ROC curves. $P < 0.05$ was considered statistically significant. ROC curve analysis was used to evaluate potential variables. Internal validity was assessed by use of bootstrapping procedure. ROC analyses were further performed to evaluate the diagnostic efficacy of each parameter in predicting the chemotherapeutic response of unresectable pancreatic cancer.

Results

Patient characteristics

The subjects enrolled 21 patients, including 6 women and 15 men, with an average age of 64 ± 8 years old. Patients were classified into the PR group ($n=7$, Figure 1) and the non-PR group according to the treatment response ($n=14$, Figure 2).

Statistics of functional parameters

The ADC_{change} and MD_{change} in the PR group (0.21 ± 0.05 , 0.37 ± 0.24) were significantly higher than those in the non-PR group (0.11 ± 0.09 , 0.10 ± 0.12) ($P=0.02$, 0.002 respectively) (Figure 3). However, no statistically significant differences were shown between the PR group and non-PR group concerning certain aspects of ADC_{pre} , ADC_{post} , MK_{pre} , MK_{post} , MK_{change} , MD_{pre} , and MD_{post} ($P=0.734$, 0.09 , 0.686 , 0.289 , 0.573 , 0.153 , 0.166). The ICCs ranged from 0.857 to 0.912 for intraobserver agreement. The AUC of DWI and DKI parameters were successfully validated by 1000 times bootstrapping. The results of ROC curve analysis showed that MD_{change} (AUC=0.898) had greater diagnostic efficacy than ADC_{change} (AUC=0.80) (Figure 4). The MD_{change} had sensitivity of 85.7% and specificity of 85.7%, while the cutoff value was 0.1373. The combined model SUM_{change} ($ADC_{change}+MD_{change}$) showed higher AUC (0.912, $P=0.002$) than that of MD_{change} or ADC_{change} (Figure 4).

Discussion and Conclusion

ADC_{change} and MD_{change} demonstrated strong potential for evaluating the response to chemotherapy in unresectable pancreatic cancer. MD_{change} showed higher specificity in the classification of PR and non-PR than ADC_{change} . Other parameters, including ADC_{pre} , ADC_{post} , MK_{pre} , MK_{post} , MK_{change} , MD_{pre} , and MD_{post} , are not suitable for response evaluation. Further experiments are needed to evaluate the potential of DWI and DKI parameters in predicting the prognosis of patients with unresectable pancreatic cancer. DKI parameters have potential to be the new indicators for clinical efficacy evaluation while these results require further validation with a larger cohort.

PO-1684

The development and external validation of automatic future liver remnant (FLR) assessment system for non-anatomic resection (NAR) based on deep learning

Tingting Xie, Guanxun Cheng
Peking University Shenzhen Hospital

Objective: First, to build automatic FLR assessment system by developing five 3D U-Net models for the automated segmentation of liver, Couinaud segments, hepatic vein, portal vein and hepatic lesion; second, to verify the feasibility of the automatic FLR assessment system by using external validation data set.

Materials and Methods: This retrospective study developed five 3D U-Net models for the automated segmentation of liver, Couinaud segments, hepatic vein, portal vein and hepatic lesion on contrast-enhanced CT scans. Images were obtained from 353 patients from January 2018 to March 2019. First, radiologists annotated the anatomic structures. Then, 3D U-Net models were trained in medical center A (n=353) and tested in medical center B in cases with various liver diseases (n1=146) and in candidates for major hepatectomy (n2=32). The segmentation accuracy was evaluated using dice similarity coefficient (DSC) and volumetric similarity (VS). The difference in FLR assessment and the prediction in resection between automated and manual method were compared.

Results: The hepatic lesion with narrow margin (1cm) and wide margin (2cm) were obtained by rule. The DSC and VS values of 5 models ranged from 0.73 ± 0.12 to 1.00 ± 0.01 . The automated, manual FLR% assessments ranged from 29.24% to 87.52%, 32.82% to 89.67%, respectively ($P > 0.99$). Based on automated FLR% assessment results, 32, 32 cases in data set 2 were categorized as candidates for NAR with narrow, wide margin reserved, respectively. Those were 32, 31 cases by using manual FLR% assessment results, respectively. No statistical difference was found in the prediction of NAR ($P > 0.99$). **Conclusion:** Automatic FLR assessment system on CT images prior to NAR by using deep learning is feasible.

Clinical relevance: This study developed and verified automatic FLR assessment system for different margin reserved non-anatomic resection. The resection margin can be freely defined. The FLR% assessment system provide a quantitative output and a 3D visualization for surgeons.

PO-1685

Automatic future liver remnant (FLR) assessment prior to major hepatectomy : comparison between hepatic VCAR and deep learning based assessment system

Tingting Xie, Guanxun Cheng
Peking University Shenzhen Hospital

Objective: FLR assessment is essential before major hepatectomy to minimize postresectional liver failure. Currently used method (hepatic VCAR, GE Health Care) is accurate but depend on doctor's virtual cut. This study aim to compare the difference between hepatic VCAR and deep learning based FLR assessment system.

Materials and Methods: Five 3D U-Net models for the automated segmentation of liver, Couinaud segments, hepatic veins, portal veins and hepatic lesions on contrast-enhanced CT were trained and used for the development of automated FLR assessment system. Patients who underwent contrast enhanced portovenous phase CT scan in 2022 were included. Total liver volume (TLV), FLR and FLR% were measured using these two methods for four types of major hepatectomy. The

difference in FLR% assessment and the prediction in resection between two methods were compared.

Results: TLV, FLR and FLR% ranged from 752.0 to 1904.0 cm³, 48.7 to 1339.0 cm³ and 3.5% to 82.9% by using hepatic VCAR, and 776.1 to 1911.8 cm³, 74.1 to 1348.0 and 6.1% to 81.9% by using assessment system, respectively. There is a positive linear correlation in the volumetry of FLR and FLR% between the hepatic VCAR and assessment system ($r=0.937$, 0.938 , $P < 0.0001$), and the consistency of the two methods is high. Based on FLR% assessment results, 57,23,58,54 cases were categorized as candidates for hepatectomy by using assessment system for four types of hepatectomy, those were 57,2,58,45 cases by using hepatic VCAR, respectively.

Conclusion: Both hepatic VCAR and assessment system are accurate and easily applicable.

Clinical relevance: This study provided the comparison of hepatic VCAR and automated FLR% assessment system in the FLR% assessment and the prediction of four types of major hepatectomy. Hepatic VCAR provided a feasible and flexible method.

PO-1686

Automatic future liver remnant (FLR) assessment prior to major hepatectomy: comparison between hepatic VCAR and human doctor

Tingting Xie, Guanxun Cheng
Peking University Shenzhen Hospital

Objective: FLR assessment is essential before major hepatectomy in clinical practice. Currently used method is accurate but depend on doctor's manual segmentation. This study aimed to compare the difference between hepatic VCAR (GE, Healthcare) and human doctor in the pre-operative FLR% assessment and the prediction of resection.

Materials and Methods: Patients who underwent contrast enhanced portovenous phase CT scan in 2022 were included. Total liver volume (TLV), FLR and FLR% were measured using these two methods for four types of virtual major hepatectomy. Time needed to determine TLV, FLR and FLR% was measured. The difference in FLR% assessment and the prediction in resection between two methods were compared.

Results: TLV, FLR and FLR% ranged from 752.0 to 1904.0 cm³, 48.7 to 1339.0 cm³ and 3.5% to 82.9% by using hepatic VCAR, and 776.1 to 1911.9 cm³, 77.77 to 1348.2 and 6.4% to 80.8% by using manual method, respectively. There is a positive linear correlation in the volumetry of FLR and FLR% between the hepatic VCAR and assessment system ($r=0.94$, 0.94 , $P < 0.0001$), and the consistency of the two methods is high. Based on FLR% assessment results, 56,19,57,51 cases were categorized as candidates for hepatectomy by using manual method for four types of hepatectomy, those were 57,2,58,45 cases by using hepatic VCAR, respectively. The median time needed for complete FLR% analysis was 91.1 ± 4.9 min with manual method and 4.8 ± 1.4 min using hepatic VCAR. Conclusion: Hepatic VCAR is accurate and easily applicable in the pre-operative FLR% assessment.

Clinical relevance: This study provided the comparison of hepatic VCAR and human doctor in the FLR% assessment and the prediction of four types of major hepatectomy. Hepatic VCAR provided a feasible, accurate and flexible method.

PO-1687

Fully Automated Segmentation and Volumetry of key anatomic structures of the liver at CT prior to hepatectomy using deep learning

Tingting Xie, Guanxun Cheng
Peking University Shenzhen Hospital

Objective: To verify the feasibility of the automatic segmentation model of liver, Couinaud segments, hepatic vein, portal vein, bile duct and hepatic lesion in a whole system by using external validation data set.

Materials and Methods: This retrospective study develop six 3D U-Net models for the automated segmentation of key anatomic structures of the liver on contrast-enhanced CT scans. Images were obtained from 353 patients from January 2018 to March 2019. First, radiologists annotated the hepatic veins and portal veins. Then, six 3D U-Net models were trained in medical center A (n=353) and tested in medical center B (n=178) in cases with various liver conditions (n=146) and in candidates for major hepatectomy (n=32). The segmentation accuracy was evaluated using dice similarity coefficient (DSC) and volumetric similarity (VS). Correlation analysis and Bland-Altman analysis were used to assess the correlation and consistency of the two methods.

Results: The DSC values ranged from 0.73 ± 0.12 to 0.99 ± 0.01 , and VS values ranged from 0.83 ± 0.09 to 1.00 ± 0.01 , respectively. There is a positive linear correlation between the automatic and the manual segmentation results (r ranged from 0.77 to 0.99, $P < 0.0001$), and the consistency of the two methods is high.

Conclusion: It's feasible for the automatic segmentation of key anatomic structures in a whole system by using 3D U-Net algorithm.

Clinical relevance: This study provided adequate validation in diverse liver conditions and thorough evaluation using clinical cases, and provide liver, Couinaud segments, hepatic veins, portal veins, bile duct and hepatic lesion assessment in a whole system both in a quantitative volumetric output and as a 3D visualization for surgeons.

PO-1688

Arteriovenous Shunt in Hepatocellular carcinoma: Characteristics based on DSA, CT and MR Imaging

Ziyi Liu, Xin Zhang, Bin Liang
Wuhan Union Hospital

Background: Hepatic arteriovenous shunt (AVS) is a characteristic finding for hepatocellular carcinoma (HCC) on digital subtraction angiography (DSA), but the abnormalities on CT/MRI and their comparison with DSA findings remain unclear. The purpose of the study is to evaluate the imaging characteristics of the HCC-related AVS based on DSA, CT and MR Imaging.

Material and methods: Clinical and imaging data of consecutive HCC patients who received digital subtraction angiography (DSA) in the hospital between June 2015 to August 2021 were reviewed. and enhanced CT and/or MR were done in these patients before DSA imaging. Grading and classification of the AVS were performed based on DSA, and the positive findings of CT/MR were summarized for enrolled patients. In addition, statistical analysis of imaging characteristics between the severe and non-severe AVS was performed.

Results: Fifteen HCC patients with angiographically evident AVS were enrolled, S[L1] evere AVS was diagnosed in 40.0% patients (6/15), while non-severe AVS were diagnosed in 60.0% (9/15) patients. Positive findings of AVS were noted in 73.3% (11/15) patients in CT/MR. Among these, early enhancement of the hepatic vein (HV) or the retro-hepatic inferior vena cava (IVC) in the

arterial phase was observed in 40% (6/15) patients, abnormal hypoperfusion of non HCC foci hepatic parenchymal in the arterial were seem in 13.3% (2/15) patients, hepatic vein involvement were noted in 73.3% (11/15) patients, and tumor thrombosis was observed in 60.0% (8/15) patients. The comparison analysis showed that the presence of tumor thrombosis ($P=0.019$) and the early enhancement of hepatic veins/IVC in CT/MR ($P=0.002$) was more prone to be found in severe AVS than non-severe AVS, and there was significant difference.

Conclusion: A part of patients is absent for positive findings in CT/MR, and the diagnosis of HCC-associated AVS is highly rely on DSA. The comparison between the severe and non-severe AVS bore statistically significant relationship to the early enhancement of the HV/IVC and the presence of tumor thrombosis.

PO-1689

Value of renal Intravoxel incoherent motion diffusion-weighted imaging in different regions in distinguishing Immunoglobulin A nephropathy patients from healthy volunteers

xue Zhai,shaopeng zhou,haiyi wang,Xue Zhai
中国人民解放军总医院第一医学中心

Objective To explore the value of quantitative parameters of Intravoxel incoherent motion diffusion-weighted imaging (IVIM-DWI) in different renal regions in distinguishing Immunoglobulin A nephropathy (IgAN) patients from healthy volunteers. **Methods** Twenty-six patients with pathologically-proven IgAN and twenty-five healthy volunteers who underwent T2WI and IVIM-DWI of kidney were retrospectively collected. The maps of apparent diffusion coefficient (ADC), pseudo-diffusion coefficient (D), pure diffusion coefficient (D^*) and perfusion fraction (f) parameters of the right renal cortex, medulla and parenchyma was obtained after post processing by two abdominal radiologists. The intraclass correlation coefficient (ICC) was used to evaluate the data consistency between two observers. T-test or nonparametric test were used to analyze the differences of the IVIM-DWI parameters in cortex, medulla and parenchyma between healthy volunteers and IgAN patients, and the differences of ROI measurements in renal cortex, medulla and parenchyma of all subjects. And the parameters with statistical significance were further evaluated using receiver operating characteristic curve (ROC). **Results** The consistency of renal IVIM-DWI measurement results in different renal regions of the IgAN patients was acceptable ($ICC \geq 0.5$); Except for cortex D value ($ICC=0.473$)、medulla D value ($ICC=0.227$), the consistency of other parameters of healthy volunteers is acceptable ($ICC \geq 0.5$). ADC、 D^* and f values in the cortex、medulla and parenchyma of the right kidney in the healthy volunteers were higher than those in the IgAN patients (except for medulla $D^* P=0.065$, medulla f $P=0.163$; the rest $P<0.05$), but there was no significant difference in the D values of different regions of the right kidney between the two groups (all $P>0.05$). In addition to D values (IgAN patients $P=0.109$ 、healthy volunteers $P=0.084$)、f values (IgAN patients $P=0.191$ 、healthy volunteers $P=0.058$) between the right renal cortical and parenchymal among two groups, and D values($P=0.148$)、 D^* values($P=0.443$) between the medulla and parenchyma of healthy volunteers had no significant difference; There were statistical differences in other parameters of different ROI between the two groups (all $P<0.05$). The AUC (95%CI) of cortical ADC, cortical D^* , and parenchymal ADC values in distinguishing the IgAN from healthy volunteers were 0.768 (0.628-0.874), 0.732 (0.590-0.847), and 0.752 (0.612-0.862), respectively; The AUC value of other parameters is between 0.65 to 0.7. **Conclusion** Renal IVIM-DWI parameters were affected by regional variation, and IVIM-DWI-derived parameters, especially the ADC value、 D^* value of renal cortex, and renal parenchymal ADC value, can effectively distinguish

IgAN patients from healthy volunteers. Especially the ADC value、D* value of renal cortex, and renal parenchymal ADC value have good efficacy.

PO-1690

Pre-/post- transplant CT-based deep learning radiomics prognostic nomograms for hepatocellular carcinoma: comparison with existing criteria

Pei Nie¹,Guangjie Yang¹,Wei Rao¹,Zhenguang Wang¹,Ximing Wang²

1. The Affiliated Hospital of Qingdao University

2. Shandong Provincial Hospital Affiliated to Shandong First Medical University

Purpose The Milan and University of California San Francisco (UCSF) criteria, and the Risk Estimation of Tumor Recurrence After Transplant (RETREAT) score, which fail to reflect tumor heterogeneity, may be insufficient for predicting recurrence of hepatocellular carcinoma (HCC) after liver transplantation (LT). The aim of this study was to develop and validate pre- and post-transplant CT-based deep learning radiomics nomograms (DLRNs) for outcome prediction in HCC after LT. The performance of the DLRNs was compared with the existing criteria.

Methods From March 2010 to August 2021, patients with preoperative enhanced CT and pathologically confirmed HCC after LT were derived from 3 hospitals. The endpoint was recurrence-free survival (RFS). A pre-transplant DLRN incorporating clinical, CT, deep learning and radiomics features, and a post-transplant DLRN combining the above pre-transplant factors and the explant pathological variables were developed for predicting tumor recurrence in HCC patients after LT. The performance of the DLRNs was compared with that of the Milan, USCF and RETREAT criteria. Model performance was assessed with Kaplan-Meier curves, Harrell's concordance index (C-index) and decision curve analysis (DCA).

Results A total of 210 HCC patients who underwent LT (median age, 54 years; 179 males; training/test cohort, 146/64) were included. The pre- and post- transplant DLRNs were associated with RFS (log rank $P < 0.0001$) in the training and test cohorts. In predicting RFS for HCC patients after LT, the pre-transplant DLRN achieved higher C-index (0.898) than the Milan (0.856) and USCF (0.864) criteria; and the post-transplant DLRN provided higher C-index (0.910) than the RETREAT score (0.852) in the test cohort.

Conclusion The pre- and post- transplant DLRNs could accurately predict tumor recurrence and outperformed the existing criteria in HCC patients after LT, thus facilitating in better candidate selection for LT and guiding management of HCC patients after LT.

PO-1691

Comparison of T1 ρ , DKI, and IVIM Imaging Parameters for Liver Fibrosis Staging in a Rat Model

Yiwan Guo,Tingting Guo,Xin Li
Wuhan Union Hospital

Purpose: To compare the efficacy of imaging parameters derived from T1 relaxation times in the rotating frame (T1 ρ or T1 ρ), intravoxel incoherent motion (IVIM) and diffusion kurtosis imaging (DKI) for differentiating varying liver fibrosis stages.

Materials and Methods: Thirty rats were divided into one control group (n = 6) and four fibrosis experimental groups (n = 6 each group) induced by intraperitoneal injection of thioacetamide (TAA) for 2, 4, 6, 8 weeks. T1 ρ , DKI and IVIM imaging were performed; the parameters derived from T1 ρ , DKI and IVIM were measured and compared among different liver fibrosis stages with

one-way analysis of variance (ANOVA). Corresponding liver histopathological results were obtained. Spearman rank correlation was used to assess the relationship between the imaging parameters and histopathological scores. Receiver operating characteristic (ROC) curve analysis was used to evaluate the diagnostic efficiency of different imaging parameters for staging liver fibrosis. Interobserver reproducibility of imaging parameters was evaluated by the intraclass correlation coefficient (ICC).

Results: According to the histopathological results, there were 6, 6, 5, 7, 6 rats designated into stage F0, F1, F2, F3 and F4, respectively. All imaging parameters exhibited excellent interobserver reproducibility, with ICC values > 0.75 ($P < 0.001$ for all). ANOVA test showed that only D^* derived from IVIM had no significant difference among various liver fibrosis stages ($P = 0.584$). $T1\rho$, mean apparent diffusion (MD) derived DKI and D derived from IVIM all had strong correlations with histopathological scores (Sirius red and α SMA-positive ratios). ROC curve analysis suggested that the mean area under the ROC curve (AUC) value, sensitivity, and specificity of $T1\rho$ and MD were comparable but much higher than those of other imaging parameters. The model combining $T1\rho$ and MD exhibited better performance with larger AUC values than any individual method for staging liver fibrosis.

Conclusion: Among the evaluated imaging parameters, $T1\rho$ and MD were superior for differentiating varying liver fibrosis stages. And the model combining $T1\rho$ and MD was promising to be a credible diagnostic biomarker to detect and accurately stage liver fibrosis.

PO-1692

Quantification of arterial enhancement fraction and extracellular volume fraction extracellular: utility for differentiating pathological grade of renal clear cell carcinoma

Xiaoxiao Zhang, Gumuyang Zhang, Lili Xu, Jiahui Zhang, Xin Bai, Li Chen, Qianyu Peng, Erjia Guo, Hao Sun, Zhengyu Jin
Peking Union Medical College Hospital

Purpose To evaluate whether the arterial enhancement fraction (AEF) and extracellular volume fraction (ECV) based on iodine maps could predict WHO/ISUP pathological grading of clear cell renal cell carcinoma (ccRCC).

Materials and Methods We retrospectively included patients ($n=50$) with pathologically confirmed ccRCC who underwent preoperative dual-layer spectral computed tomography urography (CTU) (2017.10-2021.02). They were divided into low-grade (WHO/ISUP 1/2, $n = 30$) and high-grade groups (WHO/ISUP 3/4, $n = 20$). AEF and ECV images were generated based on iodine map. The Hounsfield (HU)-based AEF (AEF-HU) and iodine concentration (IC)-based AEF (AEF-IC) of ccRCC were obtained based on the conventional images and iodine map of the arterial and venous stages, respectively. At the same time, the HU-based ECV (ECV-HU) and -based ECV (ECV-IC) of the tumor were obtained by conventional excretion stage images and excretion iodine. The difference of quantitative parameter between high-grade and low-grade groups was compared and receiver operating characteristic curves (ROC) were used to evaluate the ability of these parameters to predict WHO/ISUP grade.

Results The AEF-IC of low-grade tumors was higher than that of high-grade tumors ($52.29\% \pm 11.10\%$ vs. $43.33\% \pm 14.97\%$, $p = 0.017$), but the AEF-IC had no difference between the two groups ($46.80\% \pm 13.47\%$ vs. $46.51\% \pm 17.31\%$, $p = 0.947$). The ECV-HU and ECV-IC of low-grade tumors was both higher than that of high-grade tumors ($55.85\% \pm 12.26\%$ vs. $44.60\% \pm 12.29\%$, $p = 0.002$; $51.24\% \pm 10.41\%$ vs. $34.92\% \pm 4.96\%$, $p < 0.001$). ECV-IC has the highest area under the curve (AUC) of 0.9685 in predicting pathological grade of ccRCC. When the

threshold was 40.05%, ECV-IC could distinguish higher grade from lower grade tumors with sensitivity of 96.67% and specificity of 90.48%.

PO-1693

Histogram analysis of whole placental T2-weighted magnetic resonance image-derived in patients with Pre-eclampsia

Yonglu Chen, Ting Song, Yamei Deng, Qiongtong Liu, Qun Su
The Third Affiliated Hospital of Guangzhou Medical University

Objective: The whole placental T2-weighted magnetic resonance image histograms were used to investigate whether the parameters can distinguish between the patients with pre-eclampsia(PE) and normal pregnant women.

Materials and methods: The clinical and prenatal pelvic MRI data of 22 patients with PE and 24 normal pregnant women were retrospectively analyzed, forming the two study groups. Histogram parameters including included mean, variances, kewnness, kurtosis, entropy, 10th percentile, 50th percentile, 90th percentile and 99th percentile were calculated from the whole-volume placental of T2-weighted image. The volume and thickness were recorded as the morphological parameters. Histological examinations of placentas were conducted following delivery and where available. Student-t test or Mann-Whitney U test was used to compare the continuous data between the two groups. Chi-square test was used to compare the categorical data. The diagnostic efficacy for PE with parameters was analyzed by receiver operating characteristic(ROC).

Results: In the T2WI histogram, the differences between the two groups in two of the parameters (variance and 99th percentile) were statistically significant ($P < 0.05$). In the morphological measurement, the differences between the two groups in one parameter(volume) was statistically significant ($P < 0.05$). The distinguishing ability of variances, 99th percentile and volume for PE was good, with area under the ROC(AUC) were 0.713, 0.693 and 0.709 respectively. The combined AUC value of the three parameters was higher than that of a single parameter ($AUC = 0.899$, $P = 0.000$), with sensitivity of 86.36% and specificity of 77.27%.

Conclusion: The histogram parameters of the whole placenta T2WI have good diagnostic efficacy in distinguishing PE patients. It provides a novel method for distinguishing the PE group from the normal group, which may have a positive effect on disease monitoring and prediction.

PO-1694

Utility of reduced FOV diffusion-weighted MRI in distinguishing endometrial cancers from invasive histologic subtype

Ruqi Fang
Fujian Maternity and Children Health Hospital

Objective: To evaluate the utility of apparent diffusion coefficient (ADC) value derived from reduced FOV diffusion-weighted imaging (DWI) in differentiating invasive histologic subtype from noninvasive subtype.

Methods: 78 patients with endometrial cancers (49 noninvasive, 29 invasive) were included from May 2022 to September 2023. All patients were given conventional MRI examination and reduced FOV DWI were included. The ADC values derived from reduced FOV DWI in different groups were

compared. The ROC curves were used to analyze the diagnostic efficacy of ADC values to differentiating invasive histologic subtype from noninvasive subtype..

Results : The ADC values of noninvasive histologic subtype were $1.08 \pm 0.19 \times 10^{-3} \text{ mm}^2/\text{s}$, the The ADC values of invasive histologic subtype were $0.87 \pm 0.21 \times 10^{-3} \text{ mm}^2/\text{s}$, The ADC values of invasive histologic subtype were significantly lower than noninvasive subtype ($P < 0.05$). The ADC values yield AUC of 0.89 in ROC analysis, and a diagnostic thresholds of $0.94 \times 10^{-3} \text{ mm}^2/\text{s}$ created sensitivity and specificity of 0.876 , 0.789 to differentiating invasive histologic subtype from noninvasive subtype.

Conclusion: Apparent diffusion coefficient (ADC) value derived from reduced FOV diffusion-weighted MRI can differentiate invasive histologic subtype from noninvasive subtype in endometrial cancer.

PO-1695

Deep learning reconstruction to improve characterization of gastrointestinal system tumors in low-keV virtual monoenergetic dual-energy CT: a comparative study with routine imaging

Yiyang Liu

The First Affiliated Hospital of Zhengzhou University

Objectives

To qualitatively and quantitatively compare dual-energy computed tomography (DECT)-derived 55keV virtual monochromatic images (VMIs) using deep learning image reconstruction (DLIR) with 70keV VMIs using adaptive statistical iterative reconstruction (ASiR-V) in the Gastrointestinal (GI) system tumors and to investigate whether DLIR can influence the measured iodine parameters.

Methods

This observational study included 47 patients with GI system tumors who underwent DECT. Qualitative and quantitative assessment was performed on 70keV VMIs using ASiR-V40%, and 55keV VMIs using DLIR at low (DLIR-L), medium (DLIR-M), and high strength (DLIR-H). Quantitative evaluation included calculation of the contrast-to-noise ratio (CNR) and the signal-to-noise ratio (SNR). Overall image quality, lesion conspicuity, and diagnostic confidence were evaluated qualitatively by 2 radiologists. Iodine parameters of tumor lesions were compared among four groups of algorithms.

Results

There were no significant differences in the image noise between DLIR-M and ASiR-V40, whereas image noise was significantly lower in DLIR-H than ASiR-V40 and DLIR-M (both phases, $P < 0.001$). DLIR-M and DLIR-H had significantly higher CNR and SNR compared with ASiR-V40 on both phases (all $P \leq 0.001$). When compared to ASiR-V40, DLIR-M and DLIR-H had similar or improved qualitative assessment metrics. DLIR-L yielded the highest image noise, and the lowest overall image quality score among these algorithms. Lastly, the measured iodine parameters were equivalent among different algorithms (all $P > 0.1$).

Conclusion

55keV VMIs with DLIR (-M, and -H) has the potential to replace 70keV VMIs with ASiR-V40% for GI system tumor. DLIR at any strength could maintain the measured iodine parameters similar to those of ASiR-V40%.

PO-1696

Imaging-based surrogate classification predicts response to adjuvant hepatic arterial infusion chemotherapy in hepatocellular carcinoma with microvascular invasion

Lidi Ma

Sun Yat-sen University Cancer Center (SYSUCC)

Background and Aims:

Adjuvant hepatic arterial infusion chemotherapy (HAIC) with FOLFOX has shown promising results in microvascular invasion (MVI) positive hepatocellular carcinoma (HCC). We aim to develop an imaging-derived biomarker to depict HCC patients with MVI more precisely and promote individualized treatment strategies of adjuvant HAIC.

Methods: The multicenter study enrolled HCC patients with MVI positive. Imaging features were reviewed and predictors associated with RFS were determined by multivariate Cox proportional hazards regression analysis. Model performance was evaluated using the area under the receiver operating characteristic curve (AUROC). The primary endpoint was recurrence-free survival (RFS), compared by the Kaplan-Meier method with a log-rank test.

Results: A total of 758 patients were enrolled, divided into training cohort (n=470) and validation cohort (HAIC cohort [n=143], control cohort [n=145]). Independent predictors for RFS included arterial phase peritumoral enhancement, boundary of the tumor enhancement, tumor necrosis stratification, and boundary of the necrotic area, incorporated into the multivariate model. The 2-year AUROC of the model constructed for the RFS prediction was 0.83(95% CI, 0.79-0.87), 0.73 (95% CI, 0.62-0.83), 0.84(95% CI, 0.74-0.93) respectively for the training, HAIC and control cohorts. The median RFS time of low-risk groups for the above cohorts was longer than high-risk groups (all $P < 0.01$). Besides, there was no significant statistical difference between HAIC high-risk group and control group ($P = 0.61$).

Conclusion: The radiological characteristics can reflect the heterogeneity of tumors. We successfully proposed and validated the model predicting postoperative recurrence risk and guiding postoperative HAIC for HCC patients with MVI-positive

PO-1697

Quantitative evaluation of acute pancreatitis based on dual-energy computed tomography

Yuting Lu, Ping Han, Ming Yang

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To evaluate the value of dual-energy computed tomography (DECT) parameters for the quantitative diagnosis of acute pancreatitis (AP) and classification of its severity.

Methods: Patients with AP underwent a plain CT scan and three contrast-enhanced DECT scans. We analyzed the group differences in iodine concentration (IC) and slope of the spectral Hounsfield unit curve (λ_{HU}) of the three-phase enhanced scans (arterial, venous, and delayed phases).

Results: The study included 60 patients with AP (38 men and 22 women; mean age: 47.43 ± 13.47 years). Based on the CT severity index (CTSI), the patients were divided into two groups: group A (mild AP, $n = 26$) and group B (moderate/severe AP, $n = 34$). IC and λ_{HU} in the arterial and venous phases were all significantly higher in group A than in group B ($P < 0.001$) and could effectively differentiate the two groups. The areas under the curve were 0.753, 0.799, 0.774, and 0.842 for IC at arterial and venous phases and λ_{HU} at arterial and venous phases, respectively. These parameters decreased with the increases in CTSI, showing significant negative correlations, with r values between -0.569 and -0.492 ($P < 0.001$).

Conclusion: DECT imaging can quantitatively analyze AP, and the IC and λ_{HU} can be used to distinguish mild and severe cases, adding functional information to the CT morphology to determine the severity and prognosis of the disease.

PO-1698

Dual-Energy Computed Tomography Imaging in Early-Stage Hepatocellular Carcinoma: A Preliminary Study

xiangru liu

Department of Radiology, the Second Affiliated Hospital of Harbin Medical University

Purpose

Small hepatocellular carcinoma (HCC), also known as early-stage liver cancer, has no obvious clinical symptoms. Radiofrequency ablation (RFA) is typically minimally invasive and minimally invasive, but HCC recurs easily after RFA. To address this, preoperative quantification of tumor effect after RFA is important for preoperative planning and improvement of patient prognosis. Aiming at this research direction, this paper applied texture analysis combined with clinical variables to determine the tumor response of patients with small HCC after RFA, in order to obtain preoperative non-invasive imaging indicators.

Methods

A total of 63 patients with small HCC who received RFA in from August 2017 to September 2020 were included in this study. Two to four weeks after RFA, DECT scan was performed to obtain dual-phase quantitative energy spectrum parameters and clinical baseline variables. Meanwhile, 6 CT texture features are extracted by manual segmentation of energy spectrum images, and the least absolute shrinkage and selection operator (LASSO) was used for feature selection and data dimensionality reduction, and logistic regression analysis was used to establish a clinical model containing clinical variables and quantitative energy spectrum parameters, and then texture features were included to establish a clinical texture model. The ROC was used to evaluate the diagnostic efficacy of different models, and then the DCA was used to evaluate their clinical application value.

Results

A total of 6 optimal texture analysis features (CTTA) were selected by LASSO algorithm, and there was statistical difference between patients with tumor progression and patients without tumor progression ($P < 0.05$). The linear product of the 6 optimal CTTA features was used to obtain CTTA-score for each patient. When only clinical variables and energy spectrum quantitative parameters were included, the clinical model based on multivariate logistic regression analysis showed albumin-bilirubin (ALBI) grade (OR=2.77; 95% CI, 1.35 to 6.65; $P=0.010$), λ (40-100KeV) (OR=3.21; 95% CI, 3.16 to 5.65; $P=0.045$) and IC (ICAP) on AP (OR=1.25; 95% CI, 1.01 to 1.62; $P=0.028$) was associated with tumor progression within 1 year, while after inclusion of CTTA-score, clinical-texture model based on multivariate Logistic regression analysis showed ALBI (OR=2.40; 95% CI, 1.19 to 5.68; $P=0.024$), λ (40-100keV) (OR=1.43; 95% CI, 1.10 to 2.07; $P=0.019$) and CTTA-score (OR=2.98; 95% CI, 1.68 to 6.66; $P=0.001$) was an independent risk factor for tumor progression. The clinical model, clinical texture model and CTTA-score all performed well in predicting tumor progression within 1 year after RFA (AUC = 0.92, 0.96 and 0.91, respectively), and the concordance index (C-index) of clinical model and clinical-texture model was 0.917 and 0.957, respectively, and the predicted probabilities matched well with the actual probabilities.

Conclusion

The clinical prediction model constructed by energy spectrum CT parameters, texture analysis and clinical variables can predict the response of HCC patients after RFA, and provide early warning for potential tumor progression risk of post-RFA HCC patients.

Key words: energy spectrum CT; Radiomics; Radiofrequency ablation; Texture analysis; Tumor response

PO-1699

Case report: Idiopathic mesenteric phleboscrosis: clinical experience and literature review

Qiane Yu,tijiang zhang
Affiliated Hospital of Zunyi Medical University

Abstract Content:

Background

Idiopathic mesenteric phleboscrosis (IMP) is a rare ischemic enteritis, which is characterized by extensive calcification, fibrosis and intestinal wall thickening of the branches of mesenteric veins and the venous wall of the colon wall. This disease mainly occurs in Asian population, and its etiology is still unclear. It was first named as IMP by A et al. in 2003. CT showed characteristic linear calcification of the colonic mucosa as well as the mesenteric veins and their branches. Its incidence is low, and clinicians lack of understanding of the disease, which is easy to lead to misdiagnosis, missed diagnosis and delayed treatment.

Case report

A 53-year-old male patient was admitted to the hospital due to abdominal pain with no obvious trigger for 1 week. Abdominal CT scan showed slight thickening of the intestinal wall and diffuse calcification at the edge of the intestinal canal. Gastrointestinal endoscopy showed multiple colonic submucosal protrusions. Based on the clinical manifestations, characteristic imaging findings and colonoscopy findings, the clinician diagnosed mesenteric phleboscrosis. After treatment, the patient's symptoms improved and he was discharged. Telephone follow-up at 3 months after discharge showed that the patient did not have abdominal pain, abdominal distension and other symptoms.

Conclusion

In summary, IMP has a low incidence and lack of specificity in clinical manifestations, which often leads to missed diagnosis and misdiagnosis. However, the imaging and endoscopic findings have certain characteristics. As long as clinicians improve the understanding of the disease, comprehensive medical history and related auxiliary examination results, the early diagnosis and treatment of IMP can still be achieved.

PO-1700

The diagnostic value of dual-energy CT for the preoperative T staging of gastric cancer

Jianan Cai,Bosheng He,Jushun Yang
Affiliated Hospital 2 of Nantong University

Objective: To explore the diagnostic value of dual-energy CT multi-parametric and optimal energy level for preoperative T staging of gastric cancer, and assist clinical professionals in formulating appropriate treatment plans.

Methods: Patients diagnosed with gastric cancer who underwent abdominal dual-energy CT enhancement examinations from October 2021 to December 2022 at the Second Affiliated Hospital of Nantong University were collected as the research subjects. Liver VNC software was used to measure the iodine content (IC) of gastric cancer, normal gastric wall, and peritumoral fat tissue of gastric cancer, while measuring the IC of the same level of aorta, and then calculate the normalized iodine content (NIC). Mono+ technology was utilized to measure the Δ CT value of lesions in both arterial and venous phases, as well as peritumoral fat tissue, on the optimal energy level image. Applied the Syngovia Workstation post-processing workstation to obtain energy spectrum curves

of gastric cancer lesions in arterial and venous phases, as well as peritumoral fat tissue, and calculate the spectral slope. The patients were divided into T1-3 group and T4 group, and compared the differences in clinical baseline data and dual-energy CT imaging features between the two groups. Applied logistic regression analysis to explore the relevant imaging features for preoperative T staging diagnosis of gastric cancer, and constructed a Nomogram diagnostic model based on these features, then evaluated the diagnostic value of the Nomogram model for preoperative T staging of gastric cancer through ROC curve, Hosmer-Lemeshow goodness-of-fit test, calibration curve, and decision curve analysis (DCA).

Results:

1. The differences in clinical baseline data between the groups: In the T4 group, the maximum tumor diameter, ratio of low differentiation, lymph node metastasis rate, and tumor marker abnormal rate were significantly higher than those in the T1-3 group ($P<0.05$). There was no statistically significant difference in other baseline data between the groups ($P>0.05$).
2. Differences in multi-parameter of dual-energy CT between groups: the T4 group's artery and venous-phase lesion IC, perilesional fat IC, lesion NIC, and perilesional fat NIC were significantly higher than those in the T1-3 groups ($P<0.05$). The T4 group's venous-phase lesion NIC difference, perilesional fat IC difference, and perilesional fat NIC difference were significantly higher than those in the T1-3 groups ($P<0.05$), while the lesion IC difference between groups was not significant ($P>0.05$). The T4 group's spectral slope was significantly higher than that of the T1-3 groups ($P<0.05$).
3. Differences in lesion CT and Δ CT values of 40 keV monochromatic images between groups: The venous phase lesion CT value in the T4 group was significantly higher than in the T1-3 group ($P<0.05$). There was no significant difference in the arterial phase lesion CT value and Δ CT value ($P>0.05$).
4. Analysis of imaging features related to T staging: The analysis results of a univariate unconditional regression equation showed that the difference in NIC between the arterial and venous phases, the difference in NIC of the surrounding fat between the arterial and venous phases, the Δ CT value at 40 keV, and the spectral slope were imaging features related to the diagnosis of T staging ($P<0.05$). The analysis results of a multivariate unconditional regression equation showed that the difference in NIC of the surrounding fat between the arterial and venous phases was an independent imaging feature for diagnosing T staging ($P<0.05$).
5. Construction of Nomogram diagnostic model for T staging: Based on the results of logistic regression analysis, the diagnostic model for T staging was constructed by considering the arterial and venous phase lesion NIC difference, arterial and venous phase peritumoral fat NIC difference, venous phase 40 keV Δ CT value, and spectral slope. The constructed diagnostic model was visualized using Nomogram.
6. Nomogram diagnostic model evaluation for T staging: ROC results showed that the AUC of the Nomogram diagnostic model was 0.986 (95% CI: 0.961-1.000) ($P<0.01$). The Nomogram prediction model demonstrated good diagnostic efficacy, and the AUC was higher than that of the difference in NIC values of lesions during arterial and venous phases, the Δ CT value of 40 keV during the venous phase, and the spectral slope when diagnosed separately ($Z=3.16$, $P<0.01$; $Z=2.76$, $P<0.01$; $Z=2.87$, $P<0.01$). There was no significant difference in AUC between the Nomogram prediction model and the difference in NIC values of the surrounding fat during the arterial and venous phases ($Z=1.36$, $P=0.17$). The diagnostic curve of the Nomogram diagnostic model matched well with the calibration curve, and the results of the Hosmer-Lemeshow goodness-of-fit test showed $\chi^2=3.82$, $P=0.87$, $P>0.05$, indicating good diagnostic performance of the predictive model. The DCA analysis results showed that when the probability threshold for the Nomogram model diagnosing gastric cancer T staging was 0.00~0.99, patients could benefit more and the area under the curve was larger, making it suitable for clinical application.

Conclusions:

Patients with stage T4 gastric cancer show significantly higher iodine uptake parameters and spectral slope in dual-energy CT compared to patients with stage T1-3. The lesion Δ CT value of the venous phase is significantly higher in stage T4 patients than in stage T1-3 patients. The Nomogram diagnostic model constructed based on imaging features such as the difference in NIC values between arterial and venous phases, the difference in NIC values between lesion and

surrounding fat, the Δ CT value at 40 keV in the venous phase, and the spectral slope has a good diagnostic value for T4 staging.

PO-1701

Volumetric visceral fat machine learning phenotype on CT for differential diagnosis of inflammatory bowel disease

Ziling Zhou^{1,2}, Ziman Xiong¹, Ran Cheng², Qingyu Luo³, Yuanqiu Li¹, Qingguo Xie², Peng Xiao², Daoyu Hu¹, Xuemei Hu¹, Yaqi Shen¹, Zhen Li¹

1. Tongji hospital, Tongji Medical college, Huazhong university of science and technology

2. College of Life Sciences and Technology, Huazhong University of Science and Technology

3. School of Artificial Intelligence and Automation, Huazhong University of Science and Technology

Objectives: To investigate whether volumetric visceral adipose tissue (VAT) features extracted using radiomics and three-dimensional convolutional neural network (3D-CNN) approach are effective in differentiating Crohn's disease (CD) and ulcerative colitis (UC).

Methods: This retrospective study enrolled 316 patients (mean age, 36.25 ± 13.58 [standard deviation]; 219 men) with confirmed diagnosis of CD and UC who underwent CT enterography between 2012 and 2021. Volumetric VAT was semi-automatically segmented on the arterial phase images. Radiomics analysis was performed using principal component analysis (PCA) and the least absolute shrinkage and selection operator (LASSO) logistic regression algorithm. We developed a 3D-CNN model using VAT imaging data from the training cohort. Clinical covariates including age, sex, modified body mass index, and disease duration that impact VAT were added to the machine learning model for adjustment. The model's performance was evaluated on the testing cohort separating from the model's development process by its discrimination and clinical utility.

Results: Volumetric VAT radiomics analysis with LASSO had the highest AUC value of 0.717 (95% CI, 0.614-0.820), though difference of diagnostic performance among the 3D-CNN model (AUC = 0.693; 95% CI, 0.587-0.798) and radiomics analysis with PCA (AUC = 0.662; 95% CI, 0.548-0.776) and LASSO have not reached statistical significance (all $p > 0.05$). The radiomics score was higher in UC than in CD on the testing cohort (mean \pm SD, UC 0.29 ± 1.05 versus CD -0.60 ± 1.25 ; $p < 0.001$). The LASSO model with adjustment of clinical covariates reached an AUC of 0.775 (95% CI, 0.683-0.868).

Conclusion: The developed volumetric VAT-based radiomics and 3D-CNN models provided comparable and effective performance for the characterization of CD from UC.

PO-1702

To investigate the correlation between DCE-MRI quantitative parameters and tumor microvascular characteristics and the value of combined prediction of lymph node metastasis in cervical cancer

Yi yi Luan

Liaoning Cancer Hospital

Objective The objective of this study is to investigate the correlation between dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) quantitative parameters (K_{trans} , K_{ep} and V_e) and tumor microvascular characteristics of primary cervical cancer and the value of combined prediction of lymph node metastasis (LNM). **材料与方法** 回顾性分析 2015 年 1 月至 2017 年 6 月在我院病理确诊的 IB1-IIA2 期宫颈癌患者 85 例。根据术后淋巴结状态病理结果, 将患者分为 LNM 组

(43 例) 和非 LNM 组 (42 例)。从病历中收集患者的临床病理特征, 包括年龄、国际妇产科联合会 (FIGO) 2009 年分期、触诊时肿瘤最大直径、组织学类型、分化程度、淋巴血管间隙浸润 (LVSI)、基质浸润深度等。85 例宫颈癌患者在临床治疗前接受了常规 MRI 和 DCE-MRI 检查。在首席放射科医生的监督下, 一位具有 3 年经验的放射科住院医师对患者的临床和病理信息视而不见, 使用了 Tissue 4D 软件 (西门子医疗, 西门子医疗, 中国)。中国) 对 DCE 图像进行后处理, 得到原发性宫颈癌的定量 DCE-MRI 参数, 包括体积转移常数 K_{trans} (min^{-1})、间质到血浆速率常数 K_{ep} (min^{-1})、血管外至细胞外体积分数 V_e 及其图像伪彩色图像。CD34 用于标记宫颈癌组织病理切片中的微血管内皮细胞, 并利用 α 平滑肌肌动蛋白 (α -SMA) 标记微血管中的周细胞。具有 10 年工作经验的高级病理学家根据说明书对宫颈癌组织的病理切片进行了免疫组织化学双重染色。微血管密度 (MVD) 和微血管周细胞覆盖指数 (MPI) 分别用于评估宫颈癌的微血管生成和微血管成熟度。采用卡方检验和秩和检验比较 LNM 组与非 LNM 组临床病理特征、DCE-MRI 定量参数、微血管特征参数 (MVD 和 MPI) 的差异。采用 Spearman 相关法分析原发肿瘤 DCE-MRI 定量参数 (K_{trans} 、 K_{ep} 、 V_e) 与 MVD、MPI 的关系。采用二元 logistic 回归分析筛选宫颈癌 LNM 的危险因素, 并根据分析结果建立联合预测模型。采用受试者工作特征 (ROC) 曲线分析比较各参数和组合模型诊断宫颈癌 LNM 的能力。结果 1、LNM 组与非 LNM 组在 2009FIGO 期 ($p=0.019$)、LVSI ($p=0.003$) 和基质侵袭深度 ($p=0.003$) 方面存在显著差异; 两组患者年龄 ($p=0.323$)、触诊时肿瘤最大直径 ($p=0.100$)、组织学类型 ($p=0.527$)、分化程度 ($p=0.840$) 比较差异无统计学意义 ($P > 0.05$)。与非 LNM 组相比, LNM 组原发性宫颈癌 K_{trans} 值和 K_{ep} 值较高, MPI 较低 ($P < 0.001$)。LNM 组与非 LNM 组的 V_e 值和 MVD 差异无统计学意义 ($p > 0.05$)。2、Spearman 相关分析表明, DCE-MRI 的所有定量参数均与 MVD 不相关 ($p > 0.05$)。DCE-MRI 定量参数 K_{trans} 和 K_{ep} 与 MPI 呈负相关 ($r=-0.410$, $p < 0.001$; $r=-0.314$, $p=0.003$), V_e 与 MPI 无显著相关性 ($p > 0.05$)。3、二元 logistic 回归分析显示, LVSI、基质浸润深度、 K_{trans} 、 V_e 和 MPI 是宫颈癌 LNM 的危险因素。ROC 曲线分析显示, 2009FIGO 期曲线下面积 (AUC)、LVSI、基质侵袭深度、 K_{trans} 、 V_e 和 MPI 预测 LNM 分别为 0.614 (0.494~0.734)、0.660 (0.543~0.777)、0.645 (0.526~0.763)、0.779 (0.680~0.877)、0.731 (0.625~0.837) 和 0.781 (0.681~0.881)。利用上述危险因素构建的组合模型预测 LNM 的 AUC 为 0.894 (0.828~0.960), 最佳诊断临界值为 0.497, 敏感性为 86.0%, 特异性为 81.0%, 高于任何单个参数。结论 1、宫颈癌微血管的成熟度可能与 LNM 有关, 宫颈癌组织术前病理微血管染色可能有助于评估 LNM 的状态。2、原发性宫颈癌 DCE-MRI 定量参数可在一定程度上反映肿瘤微血管的成熟度, 术前盆腔 DCE-MRI 检查有助于预测 LNM。3、与单独的 DCE-MRI 定量参数或微血管特征参数相比, 由临床病理特征、DCE-MRI 定量参数和微血管成熟度参数组成的组合模型在预测宫颈癌 LNM 方面具有更好的诊断效果。

PO-1703

Preliminary Study of Functional Magnetic Resonance Imaging in Evaluating Pathological Features and Hypoxic Microenvironment of Cervical Squamous Cell Carcinoma

Yiyi Luan

Liaoning Cancer Hospital

Abstract

Objective To evaluate the correlation of quantitative parameters of dynamic contrast-enhanced magnetic resonance (DCE-MR) and diffusion-weighted imaging (DWI) with the pathological features and the expression of hypoxia-inducible factor 1- α (HIF-1 α) in patients with cervical squamous cell carcinoma (CSCC).

Methods A total of 81 patients with CSCC in Liaoning Cancer Hospital & Institute from 2015 to 2017 were retrospectively included. According to FIGO 2009 clinical stage, 53 cases were stage IB,

27 cases were stage IIA, and 1 case was stage IIB. CSCC was confirmed as by biopsy. The patients examine enhanced computed tomography (CT) scan, pelvic magnetic resonance (MR) scan, diffusion-weighted imaging (DWI) and dynamic enhanced magnetic resonance imaging (DCE-MRI) before treatment. The patient's age, clinical stage, lymph node metastasis (LNM), lymphovascular space invasion (LVSI), deep stromal invasion (DSI) and differential degree (DD) were collected. Measure DCE-MR parameters (Ktrans, Kep and Ve) and ADC values. HIF-1 α expression and Ki-67 expression were obtained by immunohistochemistry. The differences of HIF-1 α expression and Ki-67 expression between patients with or without lymph node metastasis, vascular tumor thrombus, interstitial infiltration depth and pathological differentiation were compared by rank sum test. The diversity of DCE-MRI quantitative parameters Ktrans, Kep, Ve and DWI parameters ADC values between groups with or without lymph node metastasis, vascular tumor thrombus, interstitial infiltration depth and pathological differentiation were compared by rank sum test. DCE-MRI quantitative parameters Ktrans, Kep, Ve and DWI parameters ADC values and HIF-1 α expression, Ki-67 expression were analyzed by non-parametric Spearman correlation analysis, using SPSS 25.0 software, $P < 0.05$. The difference was statistically significant.

Result 1. HIF-1 α expression: 12 patients (14.8%) had score 0, 2 patients (2.5%) had score 1, 11 patients (13.6%) had score 2, 6 patients (7.4%) had score 3, 18 patients (22.2%) had score 4, 25 patients (30.9%) had score 6, and 7 patients (8.6%) had score 9. Low expression was observed in 49 patients (60.5%) and high expression in 32 patients (39.5%). Ki-67 expression: $< 50\%$: 52 (64.2%), $\geq 50\%$: 29 (35.8%)

2. In The expression of HIF-1 α in CSCC patients was significantly different between groups with or without LNM ($P=0.007$), LVSI ($P=0.002$), DSI ($P=0.003$) and DD ($P=0.021$). Patients with LNM, HIF-1 α expression was higher; in patients with lymphovascular space invasion, HIF-1 α expression was higher than that in patients without vascular tumor thrombus; the deeper the deep stromal invasion, the higher the HIF-1 α expression; and the lower the differential degree, the higher the HIF-1 α expression. Ki-67 expression was different between lymph node metastasis and non-metastasis groups ($P = 0.005$), and Ki-67 expression was higher in patients with lymph node metastasis than in those without lymph node metastasis; Ki-67 expression was different between groups with stromal invasion depth $\geq 1/2$ and stromal invasion depth $< 1/2$ ($P = 0.017$), and the deeper the depth of stromal invasion, the higher the Ki-67 expression. There was no significant difference in Ki-67 expression between the group with vascular tumor thrombus and the group without vascular tumor thrombus and between the poorly differentiated, moderately differentiated, and well differentiated groups ($P > 0.05$).

3. The Ktrans ($P=0.001$) was significantly different between non-LNM and LNM groups. The other DCE and DWI parameters had no significant difference between the groups with or without LNM, LVSI, DSI and DD ($P>0.05$).

4. HIF-1 α was positively correlated with Ki-67 ($r=0.249$, $P=0.025$). HIF-1 α was positively correlated with Ktrans and Kep ($r=0.478$, $r=0.388$, $P=0.001$). There was no correlation between HIF-1 α expression and Ve, ADC value. There was no correlation between Ki-67 expression and Ktrans, Kep and Ve. Ki-67 expression was negatively correlated with ADC ($r = -0.359$, $P = 0.001$).

Conclusion 1. HIF-1 α is associated with LNM, LVSI, DSI and DD of cervical squamous cell carcinoma. Patients with LNM and LVSI, deeper the deep stromal invasion, and cervical squamous cell carcinoma with lower differential degree has a greater degree of malignancy, more severe tumor hypoxia, and higher HIF-1 α expression.

2. Ki-67 is related to lymph node metastasis and depth of stromal invasion in cervical squamous cell carcinoma. Cervical squamous cell carcinoma with deep stromal invasion has a high degree of malignancy, the more significant the cell proliferation, and the higher the Ki-67 expression. Ki-67 expression was positively correlated with HIF-1 α expression, and hypoxia was more pronounced in tumors with significant cell proliferation.

3. Functional magnetic resonance imaging parameters can predict HIF-1 α and Ki-67 expression, and then assess the hypoxic microenvironment of the cervical squamous cell carcinoma.

PO-1704

Feasibility of 3D magnetic resonance elastography for assessing cervical stiffness in healthy and diseased participants

Wenxu Qi, Qiang Liu, Yu Shi
Shengjing Hospital, China Medical University

Background: The feasibility and reproducibility of three-dimensional magnetic resonance elastography (3D-MRE) in evaluating cervical stiffness in healthy individuals and patients with cervical disease have not been extensively investigated.

Objective: This prospective study aimed to assess the feasibility of 3D-MRE in quantifying cervical stiffness and explore its potential application in characterizing cervical diseases, including cervical cancer and cervical insufficiency.

Methods: A total of twenty-five healthy volunteers and thirteen patients with cervical disease (five with cervical cancer and eight with non-pregnant cervical insufficiency) were enrolled in this prospective study between October 2021 and April 2023. 3.0-T MRE was conducted at frequencies of 40, 60, 80, and 100 Hz. Image quality was evaluated using the image quality score (IQS), and cervical stiffness of four subregions in healthy volunteers and different cervical conditions were measured. Statistical analysis included assessing inter- and intra-rater agreement levels using intraclass correlation coefficients (ICC) and Cohen's kappa coefficient (κ). The Kruskal-Wallis rank sum test followed by Dunn's multiple comparison were employed to compare image quality scores and cervical stiffness between groups.

Results: Among the 38 individuals across 142 subregions, image quality scores exhibited significant differences at different vibration frequencies, with scores significantly higher at 40 Hz (3 [2-3]) and 60 Hz (2 [2-3]) compared to 80 Hz (1 [1-1]) and 100 Hz (1 [1-1]). Excellent inter- and intra-observer agreement was observed at 40 Hz and 60 Hz (ICC: 0.83-0.95; IQS: 0.85-0.89). The inner subglandular zone exhibited significantly higher stiffness than the outer stroma at both 40 Hz and 60 Hz frequencies, while the supravaginal portion demonstrated higher stiffness compared to the vaginal portion at 40 Hz. Healthy subjects exhibited higher mean shear stiffness values at 40 Hz (1.48 [1.31-1.57] kPa) and 60 Hz (3.16 [2.92-3.44] kPa) than individuals with cervical incompetence (1.24 [1.10-1.34] kPa at 40 Hz, 2.86 [2.62-3.07] kPa at 60 Hz) ($P < 0.05$), but lower values than those with cervical cancer (2.4 [2.3-2.6] kPa at 40 Hz, 4.7 [3.9-5.5] kPa at 60 Hz) ($P < 0.05$).

Conclusions: Our prospective study demonstrates that 3D-MRE at 40 Hz and 60 Hz is a feasible and reproducible method for quantifying spatial stiffness differences in cervical subregions. Furthermore, it holds promise for characterizing cervical diseases such as cervical cancer and cervical insufficiency.

PO-1705

Prediction of Fuhrman grade of renal clear cell carcinoma by multimodal MRI radiomics: a retrospective study

Liang Pan, Songlin Guo, Wei Xing
First People's Hospital of Changzhou

Purpose: To explore the value of multimodal MRI radiomics combined with traditional radiologist-defined semantic characteristics and conventional (CMR) and functional MRI (FMR) texture features in predicting Fuhrman grade of clear cell renal cell carcinoma (ccRCC).

Materials and Methods: The data of 89 patients with pathologically proven ccRCC (low-grade, 54; high-grade, 35) were collected. Texture features were extracted from CMR (T1 and T2 weighted imaging) and FMR (Dixon-MR, BOLD-MR, and SWI) images, and the traditional characteristics (TC) were evaluated. Logistic regression analysis was performed to develop models based on TC, CMR, and FMR texture features for grading. ROC curve analysis and leave-group-out cross-validation (LGOCV) were performed to test the reliability of combined models.

Results: Two T2 weighted imaging-based, two Dixon_W-based, one Dixon_F-based, one BOLD-based, and three SWI-based texture features, and three TC were extracted for feature selection. TC, CMR, FMR, CMR+FMR, CMR+TC, FMR+TC, and CMR+FMR+TC models were constructed. The AUC of the CMR+FMR+TC model for differentiating high- from low-grade ccRCC was 0.74, with 81.42% accuracy, 75.93% sensitivity, and 91.43% specificity. The FMR+TC model exhibited a performance similar to that of the CMR+FMR+TC model ($P > 0.05$). The AUCs of the FMR+TC and CMR+FMR+TC models were significantly higher than those of the other five models (all $P < 0.05$). For the CMR+FMR+TC model, the mean accuracy was 85.40% after 100 LGOCV for the test sets.

Conclusion: Multimodal MRI radiomics combined with TC, CMR, and FMR texture features may be a reliable quantitative approach for differentiating high-grade ccRCC from low-grade ccRCC.

PO-1706

Radiogenomics of clear cell renal cell carcinoma and non-clear cell renal cell carcinoma: Associations between multimodal MRI texture features and mutations

Liang Pan, Songlin Guo, Wei Xing
First People's Hospital of Changzhou

Purpose: To investigate the associations between genetic mutations and MRI texture features and the biological processes on the mutation genes.

Methods: Third-one patients with pathologically proven renal cell carcinoma (ccRCC 19; n-ccRCC, 12) were included. Texture features were extracted from T1-weighted, T2-weighted, Dixon-MR, cortical-medulla phase (CMP), nephrographic phase (NGP), and delayed phase (DEP) images. The correlation between mutation genes with texture features were analyzed. Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway annotation analysis was performed.

Results: In the ccRCC group, PTEN mutation was correlated with DE_Phase_InverseDifferenceMoment_angle0_offset7. In the non-ccRCC group, SETD2 mutation was correlated with CMP_InverseDifferenceMoment_AllDirection_offset1 and Dixon_W_InverseDifferenceMoment_AllDirection_offset7, PBRM1 mutation was correlated with DEP_InverseDifferenceMoment_angle0_offset7 and DEP_HaraVariance, and FAT1 mutation was correlated with DEP_HaraVariance and NGP_Inertia_angle135_offset4. The KEGG pathway annotation analysis showed that the mechanisms of the mutation genes that correlated with MRI texture features in the ccRCC group were related to the p53 signaling pathway, inositol phosphate

metabolism, central carbon metabolism in cancer, EGFR tyrosine kinase inhibitor resistance, PD-L1 expression and PD-1 checkpoint pathway in cancer, and phosphatidylinositol signaling system. The mutation genes that correlated with MRI texture features in the non-ccRCC group were mainly associated with lysine degradation.

Conclusion: This study showed associations between MRI texture features and underlying genetic mutations of ccRCC as well as n-ccRCC, and revealed the potential biological processes.

PO-1707

Diffusion kurtosis versus diffusion-weighted MRI in differentiating clear cell renal cell carcinoma and renal angiomyolipoma with minimal fat: a comparative study

Qingqiang Zhu

Department of Medical Imaging, Clinical Medical College, Yangzhou University

Objective: To quantitatively compare the diagnostic values of conventional diffusion-weighted imaging (DWI) and diffusion kurtosis imaging (DKI) in differentiating clear cell renal cell carcinoma (ccRCC) and renal angiomyolipoma with minimal fat (RAMF).

Methods: Sixty-eight patients with ccRCC and 18 patients with RAMF were retrospectively studied. For DKI and ADC, respiratory triggered echo-planar imaging sequences were acquired in axial plane (three b-values: 0, 1000, 2000s/mm²) and (one b-value: 2000s/mm²). Mean Diffusivity (MD), fractional Anisotropy (FA), mean kurtosis (MK), kurtosis anisotropy (KA), radial kurtosis (RK) and apparent diffusion coefficient (ADC) were performed. The diagnostic efficacy of various diffusion parameters for predicting ccRCC and RAMF was compared.

Results: The ADC and MD values of ccRCCs were higher than those of RAMFs ($p < 0.05$), while comparable FA, MK and KA values were found between ccRCCs and RAMFs ($p > 0.05$). Moreover, the RK values of RAMFs were higher than those of ccRCCs ($p < 0.05$). ROC curve analyses showed that MD values had the highest diagnostic efficacy in differentiating ccRCCs from RAMFs. For pairwise comparisons of ROC curves and diagnostic efficacy, ADC was worse than DKI analysis ($p < 0.05$).

Conclusion: DKI analysis performs better than ADC analysis in differentiating ccRCC and RAMF.

PO-1708

A Comprehensive Prediction Model Based on MRI Radiomics to Predict Tumor Therapeutic Response After Neoadjuvant Chemoradiotherapy in Rectal Cancer

Hao Jiang¹, Wei Guo², Huijie Jiang¹

1. The Second Affiliated Hospital of Harbin Medical University

2. Harbin Medical University Cancer Hospital

Rationale and Objectives: To establish a prediction model for the efficacy of neoadjuvant chemoradiotherapy (nCRT) in patients with locally advanced rectal cancer (LARC), using pre-treatment magnetic resonance imaging (MRI) multi-sequence image features and clinical parameters.

Materials and Methods: Patients with clinicopathologically confirmed LARC were included (training and validation datasets, $n=100$ and 27 , respectively). Clinical data of patients were collected retrospectively. We analyzed MRI multi-sequence imaging features. The tumor regression grading (TRG) system proposed by Mandard et al was adopted. Grade 1-2 of TRG was a good response group, and grade 3-5 of TRG was a poor response group. In this study, a clinical model, a single

sequence imaging model, and a comprehensive model combined with clinical imaging were constructed respectively. The area under the subject operating characteristic curve (AUC) was used to evaluate the predictive efficacy of clinical, imaging, and comprehensive models. The decision curve analysis method evaluated the clinical benefit of several models, and the nomogram of efficacy prediction was constructed.

Results: The AUC value of the comprehensive prediction model is 0.99 in the training data set and 0.94 in the test data set, which is significantly higher than other models. Radiomic Nomo charts were developed using Rad scores obtained from the integrated image omics model, CRM, DoTD, and CEA. Nomo charts showed good resolution. The calibrating and discriminating ability of the synthetic prediction model is better than that of the single clinical model and the single sequence clinical image omics fusion model.

Conclusion: Nomograph, based on pre-treatment MRI image characteristics and clinical risk factors, has the potential to be used as a non-invasive tool to predict outcomes in patients with LARC after nCRT.

PO-1709

GSI-Deep learning image reconstruction to improve accuracy of iodine quantification and image quality in Spectral CT of the abdomen: preliminary clinical application study

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

*Purpose: To investigate the effect of Gemstone Spectral Imaging with DLIR on the accuracy of iodine quantification and image quality of Spectral Computed Tomography compared to that of other reconstruction algorithms in an abdominal clinical study.

*Methods and Materials: Contrast-enhanced CT of the abdomen in clinical patients with x-ray source switches rapidly between 80 kVp and 140 kVp DECT (Revolution Apex Platform). All images were reconstructed using 50% iterative reconstruction (50% ASIR-V), and GSI-DLIR algorithms. Measured and nominal iodine concentrations were compared among the algorithms. In arterial and portal venous phase images, iodine concentration, image noise, and coefficients of variation for four locations were retrospectively compared among the algorithms. One-way repeated-measures analyses of variance were used to evaluate differences in the iodine concentrations, SD, coefficients of variation, and percentages of error among the algorithms.

*Results: 26 clinical patients enrolled in this study, iodine concentrations were equivalent among the algorithms for each location (all $p > 0.99$). Image noise and coefficients of variation were lower with GSI-DLIR than with 50% ASIR-V algorithms ($p < 0.05$).

*Conclusions: TrueFidelity for GSI reduced image noise and variability of iodine concentration values compared with 50% ASIR-V in the spectral CT

PO-1710

TrueFidelity for contrast-enhanced CT of the upper abdomen: similar image quality with lower radiation dose in direct comparison with ASIR-V

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To evaluate the effect of a commercial deep learning algorithm on the image quality of chest CT, focusing on the upper abdomen.

***Methods and Materials:** 36 consecutive patients who simultaneously underwent contrast-enhanced chest and abdominal CT were collected. The radiation dose was optimized for each scan (mean CTDIvol: chest CT, 2.89 ± 1.21 mGy; abdominal CT, 5.88 ± 1.31 mGy). Three image sets were collected: chest CT reconstructed with 50% ASIR-V-chest, chest CT with DLIR-chest-H, and abdominal CT with 50% ASIR-V-abo. Afterwards, the images covering the upper abdomen were extracted, and image noise, the SNR and CNR were measured. For subjective evaluation, three senior radiologists independently assessed noise, spatial resolution, presence of artifacts, and overall image quality. Additionally, readers selected the most preferable reconstruction technique among three image sets for each case.

***Results:** The average measured noise for DLIR-chest-H, 50% ASIR-V-chest, and 50% ASIR-V-abo was 7.21 ± 2.12 , 14.6 ± 2.21 , 12.8 ± 2.26 , respectively ($p < 0.05$). DLIR also showed the best SNR and CNR ($p < 0.05$). However, in the subjective analysis, 50% ASIR-V-abo showed less subjective noise than DLIR-chest-H (2.52 ± 0.18 vs. 2.68 ± 0.21 ; $p < 0.05$), while DLIR-chest-H showed better spatial resolution (2.42 ± 0.21 vs. 2.38 ± 0.28 ; $p < 0.05$). 50% ASIR-V-abo showed a better overall image quality ($p < 0.05$), but two of the three readers preferred DLIR-chest-H more frequently.

***Conclusions:** With $< 50\%$ of the radiation dose, DLIR-chest-H showed comparable image quality in the upper abdomen to that of dedicated abdominal CT and was preferred by most readers.

PO-1711

Gadoxetate-enhanced Abbreviated MRI for Hepatocellular Carcinoma Surveillance in At-Risk Patients: A multi-center Study in China

Xu He^{1,2}, Dingsheng Han^{1,2}, Yalin Li^{1,2}, Jiacheng Zhang^{1,2}, Qian Xu^{1,2}, Fukun Shi^{1,2}, Peng Liu³, Hongtao Hu⁴, Lan Zhang^{*2,5}

1. Henan University of Chinese Medicine

2. Department of MRI, the First Affiliated Hospital of Henan University of Chinese Medicine

3. Department of Radiology, Hunan Provincial People's Hospital

4. Department of Minimal-Invasive Intervention, The Affiliated Cancer Hospital of Zhengzhou University and Henan Cancer Hospital

5. Zhengzhou Key Laboratory of Intelligent Analysis and Utilization of Traditional Chinese Medicine Information, Henan University of Chinese Medicine

Objective To evaluate the diagnostic performance of three different abbreviated MRI (AMRI) sets extracted from a complete gadoxetic acid (Gd-EOB-DTPA)-enhanced MRI for hepatocellular carcinoma (HCC) surveillance in at-risk patients.

Methods This retrospective multi-center study in China enrolled 251 consecutive patients from 3 different hospitals (137 males and 114 females; mean age, 56 years) with chronic hepatitis B or C virus infection and/or cirrhosis who underwent Gd-EOB-DTPA-enhanced MRI for HCC surveillance from 2020 through 2023. Three AMRI sets were extracted from the complete Gd-EOB-DTPA-enhanced MRI: non-contrast abbreviated MRI (NC-AMRI) including T2-weighted imaging (T2WI)

and diffusion-weighted imaging (DWI); dynamic-AMRI (Dyn-AMRI) including early and late arterial phases (AP), portal venous phase (PVP), and DWI; and Hepatobiliary phase AMRI (HBP-AMRI) including T2WI, DWI, and HBP. MR images were independently reviewed by two abdominal radiologists. Each eligible patient was classified as HCC positive/HCC negative based on the reference standard. Per-lesion diagnostic sensitivity, specificity, and accuracy of each AMRI set were compared by using Cochran's Q test.

Results Totally 298 lesions were detected in the 251 included patients, 104/251 patients with HCC (prevalence, 41.4%; mean size, 17.30 ± 10.06 mm). The sensitivity (Cochran's Q=11.511, $P=0.003$), specificity (Cochran's Q=6.333, $P=0.042$), and accuracy (Cochran's Q=134.224, $P<0.001$) of three AMRI sets were statistically significant (P all <0.05). Compared with NC-AMRI, Dyn-AMRI and HBP-AMRI had significantly higher sensitivity and accuracy from post hoc tests (all $P<0.05$). However, post hoc test comparisons among three sets of AMRI indicated no significant differences in specificity between any two AMRI sets (all $P>0.05$). Moreover, post hoc test comparisons demonstrated that the accuracy of Dyn-AMRI or HBP-AMRI was significantly higher than that of NC-AMRI (all $P<0.001$). The value of area under curve (AUC) for each AMRI set were 0.748 (95% CI, 0.694-0.796), 0.856 (95% CI, 0.810-0.893), and 0.859 (95% CI, 0.814-0.896), respectively.

Conclusion AMRI may offer an alternative option for HCC surveillance/screening to support the growing at-risk population. HBP-AMRI set, the combination of T2WI, DWI, and HBP has a considerable sensitivity and diagnostic accuracy equivalent to Dyn-AMRI as an acceptable regimen for HCC surveillance/screening in at-risk patients.

PO-1712

Collateral vessels on preoperative enhanced computed tomography for predicting high WHO/ISUP grade in ccRCC

yuting shi, longsheng wang
the Second Affiliated Hospital of Anhui Medical University

Objectives: To retrospectively evaluate the association between the presence of collateral vessels and grade of clear cell renal cell carcinoma (ccRCC) and whether the presence of collateral vessels could serve as a predictor to differentiate high- and low-grade ccRCC.

Materials and Methods: Between May 2018 to September 2022, a total of 160 ccRCC patients with pathological diagnosis were enrolled in this study. Patients were divided into a high-grade group and a low-grade group according to WHO/ISUP grading system. Multivariate logistic regression analyses were performed to determine independent factors among clinical and CT features. The predictive performance of collateral vessels on WHO/ISUP grade was calculated. Furthermore, to investigate the additional predictive contribution of collateral vessels, a primary model and a control model were constructed to predict WHO/ISUP grade.

Results: The proportion of ccRCC patients with collateral vessels was significantly larger in high-grade ccRCC than those in low-grade ccRCC (87.5% vs. 26.8%, $P<0.001$). Multivariate logistic regression analyses shown that the presence of collateral vessels was an independent predictor for high WHO/ISUP grade ($P<0.001$). The sensitivity and specificity of the presence of collateral vessels for differentiating high- and low-grade ccRCC were 87.5% and 73.2% respectively. Including collateral vessels in predictive model improves predictive performance for WHO/ISUP grade, increasing the area under the curve (AUC) value from 0.889 to 0.914.

Conclusion: The presence of collateral vessels has high sensitivity and specificity for differentiating high- and low-grade ccRCC and can improve the predictive performance for high WHO/ISUP grade.

PO-1713

The Value of High-resolution MRI in The Diagnosis of Adjacent Organ Invasion in Middle and Lower Rectal Tumors Involving Anterior Wall

Yujiao Deng, Bing Wu, Qiang Yue, Huanyu Zhou
Sichuan University West China Hospital

Purpose:

Infiltration of adjacent organs determines neoadjuvant treatment options and extent of surgical resection. This study prospectively explored the diagnostic value of high-resolution magnetic resonance imaging for adjacent organ infiltration in middle and lower rectal tumors involving anterior wall, and its role in accurate preoperative staging.

Methods and Materials

This study was approved by Medical Ethics Center of West China Hospital. The inclusion criteria included middle and lower primary rectal adenocarcinoma involving anterior wall who performed MRI and radical surgery. The exclusion criteria included incomplete clinical, pathological and imaging data of the patients and poor image quality. From September 2021 to December 2022, 50 patients were finally enrolled. Conventional MRI combined with 3D T2 CUBE sequence and HR 3D T1 LAVA sequence constituted high-resolution MRI. Assessment contained infiltration of adjacent organs, subjective image quality scores, preoperative T staging. The weighted kappa test was applied to compare the consistency of adjacent organ infiltration. Rank sum test was used for grade variables, and chi-square test was used for dichotomous variables. When $p < 0.05$, the difference was statistically significant.

Results:

For adjacent organ infiltration, there was a strong degree of consistency between high-resolution MRI group and pathology, with a kappa value of 0.878 ($p < 0.05$). The high-resolution MRI group achieved a negative predictive value and sensitivity of 100%, accuracy of 98%, specificity of 97.8% and a positive predictive value of 80%. The conventional MRI group had poor consistency with pathology. In the conventional MRI group, the negative predictive value was the highest (94.7%), followed by the specificity (78.3%), accuracy (76%), sensitivity (50%), and positive predictive value (16.7%). For preoperative T staging, there was a strong degree of consistency between the high-resolution MRI group and the pathology, with a kappa value of 0.867 ($p < 0.05$). In the high-resolution MRI group, the overall T staging accuracy was 92%. For preoperative T staging, the degree of consistency between the conventional MRI group and the pathology was general, with a kappa value of 0.217 ($p < 0.05$). In the conventional group, the overall accuracy of T staging was 40%.

Conclusion:

High-resolution MRI was of high diagnostic value in the evaluation of adjacent organ infiltration and preoperative staging of the middle and lower rectal tumor involving anterior wall.

PO-1714

Dual-Energy Computed Tomography Iodine Imaging Combined with Laboratory Data for Preoperative Evaluation of Microvascular Invasion in Patients with Hepatocellular Carcinoma: A Two-Center Study

Huan Li^{1,2}, Dai Zhang^{1,2}, Jinxia Pei^{1,2}, Jingmei Hu^{1,2}, Li Xiaohu³, Bin Liu³, Longsheng Wang^{1,2}

1. The Second Affiliated Hospital of Anhui Medical University

2. Medical Imaging Research Center, Anhui Medical University

3. The First Affiliated Hospital of Anhui Medical University

Objectives Microvascular invasion (MVI) is a recognized biomarker associated with poorer prognosis in patients with hepatocellular carcinoma (HCC). Dual-energy computed tomography (DECT) is a highly sensitive technique that can determine the iodine concentration (IC) in tumor and provide an indirect evaluation of internal microcirculatory perfusion. This study aimed to assess whether the combination of DECT with laboratory data can improve preoperative MVI prediction.

Methods This retrospective study enrolled 119 patients who underwent DECT liver angiography at two medical centers preoperatively. To compare DECT parameters and laboratory findings between MVI-negative and -positive groups, Mann-Whitney U test was employed. Additionally, principal component analysis (PCA) was conducted to determine fundamental components. Mann-Whitney U test was applied to determine whether the PC scores varied across MVI groups. Finally, a general linear classifier was used to assess the classification ability of each PC score.

Results Significant differences were noted ($P < 0.05$) in AFP level, normalized arterial phase IC, and normalized portal phase IC between the MVI groups in the primary and validation datasets. The PC1–PC4 accounted for 67.9% of the variance in the primary dataset, with loadings of 24.1%, 16%, 15.4%, and 12.4%, respectively. In both primary and validation datasets, PC3 and PC4 were significantly different across MVI groups, with area under the curve values of 0.8410 and 0.8373, respectively.

Conclusion Both bilirubin parameters and the intratumoral IC in the arterial phase were considered important for MVI analysis.

PO-1715

The value of H2O based automated machine learning in predicting microvascular infiltration in hepatocellular carcinoma

jinxia pei,huan li,longsheng wang
the Second Affiliated Hospital of Anhui Medical University

[Abstract] **Objective** This study is to explore the application value of H2O automated machine learning (AutoML) in predicting microvascular invasion (MVI) in hepatocellular carcinoma (HCC) patients preoperatively. Additionally, the study aims to provide visual explanations for the model. **Method** Retrospective analysis of clinical data and contrast-enhanced CT images of 121 patients confirmed as HCC postoperatively. The patients were divided into positive and negative groups based on the presence or absence of MVI, and the intergroup differences were analyzed. Multiple machine learning algorithms for predicting HCC MVI were established using the H2O AutoML framework. The receiver operating characteristic (ROC) curve was plotted for the best model, and the area under the curve (AUC) was calculated. Moreover, important variables were visualized, and the Shapley Additive Explanation (SHAP) algorithm was used for local explainability analysis of the optimal model. **Results** The AFP levels and tumor maximum diameter were significantly higher in the MVI-positive group than in the MVI-negative group ($P < 0.05$). The best model built using the H2O AutoML framework was the Gradient Boosting Machine (GBM) model, with an AUC of 0.856, Gini of 0.712, R^2 of 0.319, and LogLoss of 0.505 in the training set. In the validation set, the model achieved an AUC of 0.637. The most important variables in the model were tumor shape, followed by tumor number, AFP, age, and tumor maximum diameter. The SHAP force plot and waterfall plot visualized the feature impacts on the GBM model's predictions of MVI. **Conclusion**, the HCC MVI prediction model built using the H2O AutoML framework demonstrated good performance and allowed for individual-level visual interpretation of the features, promoting its application in clinical practice.

PO-1716

MR radiomics to predict microvascular invasion status and biological process in combined hepatocellular carcinoma-cholangiocarcinoma.

Yuyao Xiao
Zhongshan Hospital Fudan University

Objectives To establish a robust MRI-based radiomics model for predicting MVI (microvascular invasion) status of combined hepatocellular carcinoma-cholangiocarcinoma (cHCC-CCA), and to investigate the biological process underlying the radiomics model.

Methods The study consisted of one retrospective dataset and one prospective dataset from two hospitals. Uni- and multivariate logistic regression analyses were employed to develop the clinical-imaging model, while radiomic features were extracted to construct a radiomics model. The prediction models were built based on the training set, and their diagnosis performance was validated in the validation set and test set. The prognostic aspects of the radiomics model were investigated using Kaplan-Meier method and log-rank test. Additionally, differential gene expression analysis and Gene Ontology (GO) analysis were conducted to explore the biological processes underlying the radiomics model based on RNA sequencing data.

Results Among 82 patients (mean age, 56.7 ± 10.4 ; 67 men) including in the radiomics modeling, 38 (46.3%) were confirmed as MVI-positive. The radiomics model included 26 radiomic features and exhibited good performance in predicting MVI status, with the area under the curve (AUC) of 0.953, 0.873 and 0.779 in training set, validation set and test set, respectively. Recurrence-free survival (RFS) and overall survival (OS) were, marginally or significantly, different between the predicted MVI-negative and MVI-positive groups (median RFS: 18 vs. 10.5 months, $p = 0.100$; median OS: 25 vs. 18 months, $p = 0.006$). Radiogenomic analysis revealed associations between the radiomics model and biological processes involved in regulating immune response.

Conclusions A robust MRI-based radiomics model was established for predicting MVI status in cHCC-CCA. The model demonstrated good diagnostic performance and potential prognostic value. Additionally, the study revealed potential biological processes that regulate immune response underlying the radiomics model through GO analysis.

PO-1717

MR imaging findings of stage I intravenous leiomyomatosis: A Retrospective Single-Center Study in 19 Cases

Qiwen Hu, Jinhua Wang, Zheng Bi, Jiamin Zhang, Mengwei Wu, Haiping Liu
jiangxi maternal and child health hospital

Objectives: To explore the magnetic resonance imaging (MRI) presentation and diagnostic value of stage I intravenous leiomyomatosis (IVL).

Materials and methods: Clinical, immunohistochemical, and MRI features of 19 cases of stage I IVL confirmed by surgical pathology were collected, and MRI features emphasized on the tumor size, complication, parauterine infiltration, T1WI, T2WI, contrast-enhanced T1WI, DWI, and ADC values were retrospectively analyzed.

Results

1. MRI findings

The MRI finding data were summarized in Table 1. All 19 cases of IVL were located within the myometrium or parametrium (figure 2), with an average diameter of 11.2 ± 4.8 cm. Among the cases, 14 (74%) were found to have combined leiomyoma (Figure 3), while 6 cases (32%) involved the broad ligament (Figure 4). Tortuous vessels were observed within or next to the lesion in 17 cases

(89.3%), and multiple intravascular cord-like filling defects were observed in 11 cases (57.9%) on T2WI (Figure 5). The mean ADC value was $1.771 \times 10^{-3} \text{ mm}^2/\text{s}$, which did not differ significantly from the normal myometrial ADC value ($1.473 \times 10^{-3} \text{ mm}^2/\text{s}$) ($p > 0.05$). Isointensity was observed in 14 cases (73.7%) on T1WI, while 5 cases (26.3%) showed slightly hypointensity. On T2WI, iso- or hyperintensity was observed in 4 cases (21.1%), and slightly hyperintensity was observed in 15 cases (78.9%). Table 3 showed that there is a significant difference between the normalized T2WI signal of IVL and myometrium ($p < 0.001$).

2. Clinical, histopathology and follow-up

The patients of stage I IVL ranged in age from 33 to 66 years, with a mean age of 46 ± 7.6 years. Among the cases, four presented with prolonged menstruation, 3 with increased menstruation, 14 with concomitant leiomyoma, and 12 with uterine masses detected through physical examination (Table 1). Immunohistochemical data were available for 17 out of 19 patients diagnosed with IVL. Positive expression of estrogen and progesterone receptors was observed in all 17 patients. Additionally, smooth muscle marker (SMA) expression was positive in 12 patients (70.6%), while Desmin and Caldesmon expression was positive in 14 patients (82.4%). CD10 expression was negative in 10 patients (58.8%) and focally positive in 5 patients (29.4%). CD31 and CD34 expression were positive in 15 patients (88.2%). Ki67 was $\leq 5\%$ in 14 patients (82.4%) (Table 2).

3. Correlation between ADC values and tumor cell density

Pearson correlation analysis was used to analyze the correlation between ADC values and tumor cell density. The results showed that there was a negative correlation between them. $r = -0.946$, $p < 0.001$ (Figure 6).

Conclusion

The pathogenesis of IVL remains unclear, with two main theories attempting to explain its etiology. One theory suggests that the tumor originates directly in the venous wall, while the other theory proposes that it is the result of vascular invasion by the primary tumor caused by leiomyoma[15]. Our study presents immunohistochemical findings that show a 100% rate of positive estrogen and progesterone receptors, which partly confirms the idea that IVL originates from the uterus and is an estrogen-dependent tumor. Additionally, 70.6% of patients exhibited positive smooth muscle marker (SMA) expression, and 82.4% exhibited positive Desmin and Caldesmon expression, indicating that IVL shares molecular cytogenetic features with leiomyoma. Ki-67 was $\leq 5\%$ in 82.4% of patients, suggesting that IVL has a low degree of malignancy despite sharing some biological behavior with malignant tumors. CD34 expression was positive in 88.2% of patients, while CD10 expression was negative in 58.8% and focally positive in 29.4%, indicating that the tumor originated from smooth muscle cells rather than endometrial mesenchymal cells or vascular endothelial cells[11]. Furthermore, 14 cases (74%) in our study were combined with leiomyoma, supporting the idea that stage I IVL is a result of vascular invasion by leiomyoma.

Studies have indicated that the clinical presentation of IVL confined to the uterus and parametrium resembles that of leiomyoma, with altered menstrual periods being the most common symptom. This can include increased menstrual flow (32%), prolonged periods (38%), or abnormal uterine bleeding (33.3%). Larger masses can lead to compression symptoms such as pelvic masses (42%), pelvic pain (6.6%), abdominal pain and distention (6.6%), urinary frequency (5%), constipation, lumbar pain, and even hydronephrosis[9, 16-18]. In this study, all 19 patients had stage I IVL, with 11 cases (57.9%) presenting with prolonged periods and increased menstruation and 6 cases (31.6%) having no obvious clinical manifestations, which is consistent with the 30% reported in the literature[6, 11].

The treatment of IVL is based on surgical resection, and complete tumor resection is the key to successful treatment. For stage I IVL, hysterectomy and bilateral oophorectomy are commonly performed. Ma et al. reported an absence of postoperative complications in stage I patients, in contrast to 34.1% (14/41) of stage II-IV patients who experienced complications[6]. In our study, all 19 IVL patients achieved a favorable outcome following hysterectomy and bilateral oophorectomy, with no postoperative complications observed. Nonetheless, one case (5.2%) exhibited recurrence during follow-up. In a larger cohort of 166 patients with stage I IVL, Peng et al. reported a recurrence rate of only 5.4%[9]. In a systematic review by Lim et al., the recurrence rate for stage I IVL was 4.8%[16]. By contrast, Yu et al. observed that 31% (18/58) of patients relapsed, of which 31 had tumor extension to the inferior vena cava and heart[19]. Tumor recurrence was found to be

correlated with the extent of the preoperative tumor and the involvement of large veins. The postoperative recurrence rate noted in our study was in general agreement with those reported in the literature. Given the paucity of imaging studies and atypical early clinical presentation in IVL, the timely and accurate diagnosis of stage I IVL through MRI is paramount to achieving favorable patient outcomes. IVL often lacks typical ultrasonographic and CT imaging features, making it difficult to distinguish from leiomyoma, particularly in small intramural lesions, which may result in misdiagnosis using ultrasonography. MRI has significant diagnostic value for stage I IVL in the following ways[20-22].

First, previous reports indicated that about 25.9% of IVL cases have a history of leiomyoma, and 22.9% of patients are complicated by leiomyoma. Our study has unveiled that 14 (73.7%) cases of stage I IVL had concurrent leiomyoma, suggesting a high incidence of co-occurrence between IVL and leiomyoma. Second, the mass is likely to involve the broad ligament[9, 11, 23]. In our study, 6 cases (31.6%) involved the broad ligament. Third, most IVL masses showed iso- or slightly hypointensity on T1WI, iso- or slightly hyperintensity on T2WI, and hyperintensity or slightly hyperintensity in DWI, consistent with leiomyoma literature reports[12, 24]. In our study, 73.7% (14/19) showed isointensity, 26.3% (5/19) showed slightly hypointensity on T1WI; 21.1% (4/19) showed iso- or slightly hyperintensity, and 78.9% (5/19) showed slightly hyperintensity on T2WI. Among them, our research showed that there is a significant difference between the normalized T2WI signal of IVL and myometrium ($p < 0.001$). The presence of hyaline, cystic, or mucinous degeneration or edematous infiltration results in an inhomogeneous signal in the tumors, which is a crucial imaging feature for the diagnosis of stage I IVL. Fourth, due to the benign nature of the tumor, it tends to grow slowly and with the turbulent flow of veins, rendering the tumor surface irregular with some fissures parallel to the long axis of the cord-like structure. Blood flowing through these fissures appears as an intravascular striated filling defect on MRI[14]. Fifth, the disease presents multiple tortuous vessels inside or next to the tumor, which is a hallmark imaging feature. Our study revealed multiple tortuous vascular images within or next to the tumor in 17 cases (89.5%), and 11 cases (57.9%) of tortuous vessels demonstrated multiple intravascular striated filling defects. Enhancement scans of the tumor were significantly enhanced in the early stage and still significantly enhanced in the delayed stage, mostly with inhomogeneous enhancement[13].

DWI indirectly reflects information such as tissue structure and cell density at the microscopic level[25]. Therefore, we investigated the relationship between the ADC value of stage I IVL and cell density. Previous studies have shown that there is a significant negative correlation between tumor ADC value and tumor cell density, and ADC value can be used to predict tumor staging and therapeutic efficacy evaluation[26]. The result of this study showed a negative correlation between ADC value and cell density, which was consistent with the result of previous experiments[27]. Within a certain range, the ADC value can indirectly reflect the size of tumor cell density. It can be used to identify the degree of tumor malignancy and evaluate the development and prognosis of the disease.

The differential diagnosis of IVL includes leiomyoma with degeneration, deep venous thrombosis, uterine sarcoma, and ovarian tumors. Preoperatively, IVL can be easily misdiagnosed as leiomyoma with degeneration. In our study, 5 out of 19 cases were initially misdiagnosed as leiomyoma with degeneration, highlighting the importance of careful differentiation. IVL is a slow-growing tumor with no clear demarcation from the normal myometrium. Other uterine malignant tumors, such as uterine sarcoma, often demonstrate large masses with moderate to hyperintensity on T2WI and invasive growth[28]. However, some IVL patients with degeneration can display hyperintensity on T2WI, and the addition of DWI sequence and ADC mapping can help differentiate them. Contrast-enhanced scanning can also aid in distinguishing venous thrombosis from IVL, as thrombosis does not show enhancement while IVL is significantly enhanced[12]. In cases where the mass is located in the broad ligament, it can be mistaken for an ovarian tumor. Benign ovarian tumors are usually cystic and relatively easy to diagnose, while borderline or malignant ovarian tumors often show vegetation in cystic components or necrosis in solid components. The solid components of ovarian tumors often demonstrate moderate to slightly hyperintensity on T2WI, while the cystic fluid typically shows a watery hyperintensity[29]. Following enhancement, ovarian

tumors often show significant enhancement, but the uterine arteries are not typically distorted or tortuous.

Nevertheless, our study has some limitations that should be acknowledged. Firstly, due to the rarity of the disease, the sample size in our study was relatively small. In future studies, increasing the sample size may help to address this limitation. Secondly, dynamic contrast-enhanced MR imaging was performed in only a subset of patients for a specific purpose. Thirdly, our study only collected samples from a single hospital. Therefore, additional multicenter studies are required to confirm these findings further.

In conclusion, despite being histologically benign, IVL can display aggressive biology. Due to its rarity and specificity, clinical misdiagnosis of early-stage IVL (stage I) is a common occurrence. MRI is the cornerstone technology for diagnosis, staging, and operative decision-making. The typical MRI presentation of stage I IVL includes a huge and irregular mass in the uterus and adnexal region, often with concurrent leiomyoma and involving the broad ligament. It often shows isointensity on T1WI and slightly hyperintensity on T2WI. The myometrium or parametrium commonly exhibits irregular, tortuous, shuttle-like solid masses with multiple tortuous vessels within or adjacent to the tumor, alongside multiple intravascular cord-like filling defects typically observed on T2WI. Our findings aim to enhance understanding of the disease, facilitating early diagnosis and appropriate treatment to achieve a favorable prognosis.

PO-1718

Quantitative analysis of MRI parameters in the diagnosis of clinically significant prostate cancer in lesions with PI-RADS 4

Ze Wang

Affiliated Hospital 2 of Nantong University

Objective: To investigate the diagnostic value of quantitative analysis of MRI parameters for clinically significant prostate cancer (csPCa) in PI-RADS 4 lesions.

Methods: We conducted a retrospective analysis of patients with suspected PCa who underwent a 3-T MRI study and had prostate biopsy results from January 2018 to June 2020. The signal intensity of the lesion (T2, DW), the background signal intensity of the same plane (T2B, DB), the obturator internal muscles (TM, DM), and the inner pelvic cavity of the same plane were measured on the Tra TSE T2WI sequence and b=1400 unit DWI sequence. Fat signal intensity (TF, DF); Measure the ADC value of the lesion; in the images of each phase of DCE, select the initial enhancement phase of the lesion and set it on the sequence Measure the signal strength (C), the background signal strength (CB) of the same layer and the signal strength of the obturator internal muscle (CM) of the same layer. The independent sample T test was used to compare the difference between the two groups in the difference between the lesion and the background signal/fat signal ratio, and the Mann-Whitney rank sum test was used to compare the lesion/muscle signal ratio, the lesion/fat signal ratio, the lesion and the background signal between the two groups Difference/muscle signal ratio difference, ROC curve evaluates the diagnostic efficacy of TB/F, PSAD, EB/M and the combination of the three in the two groups of lesions.

Results: A total of 49 patients (4 cases of clinically insignificant prostate cancer (ciPCa)、15 cases of benign prostate lesions in the low-risk group and 30 cases of csPCa in the high-risk group) were included. The PSAD of the low-risk group was lower than that of the high-risk group ($P=0.038$), the cutoff value was 0.2, and the AUC was 0.707 (95% CI 0.530-0.803, $P=0.032$). The TB/F in the low-risk group was higher than the TB/F between the high-risk groups ($P=0.000$); the cutoff value was -0.29, and the AUC was 0.884 (95% CI 0.753-0.954, $P<0.0001$). EB/M in the low-risk group was lower than that in the high-risk group ($P=0.043$); the best cutoff value was 0.6, and the AUC was 0.665 (95% CI 0.499-0.806, $P=0.068$). The diagnostic performance of TB/F was better than that of PSAD and EB/M ($P=0.048, 0.043$) between the low-risk group and the high-risk group.

Conclusions: MRI parameter analysis of PI-RADS 4 lesions may improve the diagnosis rate of CsPCa.

PO-1719

Accelerated 3D MR cholangiopancreatography using a deep learning-based reconstruction in patients with cholelithiasis

Yu Zhang, Chunhao Xia, Zhenlin Li
West China Hospital, Sichuan University

Synopsis

In this work, we aimed to compare image quality and lesion detectability in patients suspected with gallstones among single breath-hold three-dimensional (3D) magnetic resonance cholangiopancreatography (MRCP) with gradient and spin-echo (GRASE) technique, with compressed sensing (CS) and with deep learning (DL) technique. DL MRCP showed the best image quality and better lesion conspicuity and lesion edge sharpness.

Introduction

Cholelithiasis is a very common condition (~10 - 20% of the global adult population) and is associated with high socioeconomic costs. 3D MRCP is a noninvasive imaging technique to evaluate the biliary tree. MRI accelerated imaging techniques have been applied to 3D MRCP to enable imaging in a single breath-hold, including the 3D GRASE technique and 3D CS technique. Recently, the DL-based image reconstruction has been introduced to 3D MRCP promising higher acceleration factors while simultaneously increasing SNR. Sometimes the reduction in noise could bring about a reduction in image detail and decrease in diagnostic performance. It is necessary to evaluate the diagnostic efficacy of accelerated techniques. The purpose of this study is to compare the imaging quality and diagnostic confidence among GRASE, CS and DL in patients suspected with cholelithiasis.

Methods

This study was approved by the local IRB. Fifty-three patients suspected with cholelithiasis were examined on a 3.0T system (Ingenia Elition, Philips Healthcare) with a 16-element phased-array coil. The MRCP sequences were scanned in a random order. The imaging parameters were shown as following: (1) 3D GRASE: TR/TE = 235/93 ms, field of view (FOV) = 300x300x100 mm², voxel size = 0.59x0.59x1 mm³, NSA = 1, acquisition time (TA) = 13 s; (2) 3D CS: TR/TE = 1800/390 ms, FOV = 300x300x100 mm², voxel size = 0.59x0.59x1 mm³, NSA = 1, CS acceleration factor = 24, TA = 13 s; (3) AI-CS: TR/TE = 1800/385 ms, FOV = 300x300x100 mm², voxel size = 0.59x0.59x1 mm³, NSA = 1, CS acceleration factor = 24, TA = 13 s. Two radiologists independently and blindly evaluated image quality and lesion detectability using the 5-grade scoring (5 = excellent, 4 = good, 3 = moderate, 2 = poor, 1 = nondiagnostic). The image quality included the following parts: overall image quality, artifacts, background suppression and duct visualization of common bile duct, right hepatic duct, anterior branch, posterior branch, left hepatic duct, medial branch, lateral branch, pancreatic duct. The lesion detectability included lesion conspicuity and lesion edge sharpness.

Results

DL sequence received significantly higher scores than GRASE for overall image quality (3.83 ± 0.64 vs 3.40 ± 0.69), duct visualization of common bile duct (3.83 ± 0.75 vs 3.30 ± 0.70), right hepatic duct (3.58 ± 1.08 vs 3.04 ± 1.02), anterior branch (3.38 ± 1.09 vs 2.68 ± 1.24), posterior branch (3.39 ± 1.10 vs 2.68 ± 1.19), left hepatic duct (3.74 ± 0.98 vs 3.26 ± 0.94), medial branch (3.15 ± 1.17 vs 2.25 ± 1.24), lateral branch (3.53 ± 0.97 vs 2.74 ± 1.15), pancreatic duct (2.68 ± 1.25 vs 2.23 ± 1.20) (all $p < 0.05$). Compared with CS, DL also demonstrated better duct visualization in anterior branch (3.38 ± 1.09 vs 3.11 ± 1.10) and posterior branch (3.39 ± 1.10 vs 3.13 ± 1.19) of the right hepatic duct and medial branch (3.15 ± 1.17 vs 3.05 ± 1.18) and lateral branch (3.53 ± 0.97 vs 3.26 ± 1.06) of the left hepatic duct (all $p < 0.05$).

Lesion conspicuity was rated good to excellent in all 3 sequences with higher scores for DL (4.60 ± 0.77) in comparison to CS (4.45 ± 0.87) and GRASE (4.02 ± 1.35 , $p < 0.05$). Lesion edge sharpness was higher scores for DL (4.63 ± 0.87) in comparison to CS (4.42 ± 0.66) and GRASE (3.99 ± 1.17 , $p < 0.05$).

Two radiologists showed good to perfect interobserver consistency (0.77 - 0.92).

Discussion and Conclusion

DL reconstruction provides better duct visualization, especially small hepatic duct visualization than GRASE and CS. And DL shows a significant higher lesion conspicuity and lesion edge sharpness compared GRASE in patients suspected with cholelithiasis. Therefore, DL reconstruction could denoise 3D MRCP without any loss of image details.

PO-1720

Radiomics analysis of magnetic resonance imaging improves diagnostic performance of lymph node metastasis and prognosis in patients with cervical cancer

Mingke Tian,yue dong
Liaoning cancer hospital

Objective: To improve the accuracy of the diagnosis and outlook of lymph node metastasis (LNM) in cervical cancer patients using an imaging histology model based on conventional magnetic resonance and clinical aspects. **Materials and methods:** In 485 patients with surgically and pathologically confirmed cervical cancer from two medical centers, preoperative magnetic resonance imaging (MRI) images and clinicopathological data (including patient age, squamous cell carcinoma antigen (SCC-Ag), pathology, type of tumor, maximum diameter, tumor volume, and clinical characteristics) were retrospectively analyzed. A training cohort ($n=261$), an internal validation cohort ($n=113$) in a 7:3 ratio, and an external validation cohort from Medical Centre 2 ($n=111$) were randomly selected from the Medical Centre 1 dataset. Each patient's transaxial fat saturation (FS) T2W image and sagittal contrast-enhanced (CE) T1W image histological characteristics were retrieved. Clinical features linked to LNM status were chosen using a single multi-factor logistic regression, and significant features among radiological features were chosen using analysis of variance-based feature screening (ANOVA F-value). The area under the curve (AUC), the sensitivity, and the sensitivity were used to calculate the area under the curve for the conventional clinical imaging diagnostic model (M1), the SVM model with linear kernel based on imaging histological features (M2), and the joint model M3 constructed by conventional MRI features and optimal imaging histological features, respectively. The area under the curve (AUC), sensitivity, specificity, and accuracy of the receiver operating characteristic (ROC) were used to assess the model's efficacy. The group and matching Disease-Free Survival(DFS) survival curve were divided by the follow-up findings, and a discrepancy in the model's prognosis between the two groups was seen. **Results:**① In the training cohort, internal validation cohort, and external validation cohort, M3 performed the best in detecting cervical cancer LNM, with AUCs of 0.892, 0.781, and 0.827, respectively. ② The Rad-score combination model ($p=0.003$) was a reliable predictor of the specific recurrence of cervical cancer. **Conclusion:** The preoperative prediction of LNM in patients with cervical cancer and the prediction of patient prognosis can both be accomplished using the support vector machine binary classification model proposed in this study, which combines the imaging histological models of transverse-axial FS-T2WI, sagittal CE-T1WI, and clinical features.

PO-1721

Influence of rectal susceptibility artefacts on diagnosis of prostate cancer based on biparametric magnetic resonance imaging

Zheng Wang, Chengxin Yu, Peng Lu, Song Liu, Chengzhi Fu, Song Yu
Yichang Central people's Hospital

Objective: To explore the impact of rectal susceptibility artefacts on the prostate cancer diagnosis of radiologists using biparametric Magnetic Resonance Imaging (bpMRI).

Materials and Methods: A retrospective analysis was conducted on 685 patients who underwent biparametric Magnetic Resonance Imaging including T2WI and DWI examinations. All patients have confirmed pathological results via either biopsy or surgical resection. Three groups of radiologists with varying years of experience independently reviewed suspicious lesions on prostate MRI according to the Prostate Imaging Reporting and Data System (PI-RADS) version 2.1, along with the presence and degree of rectal artifacts. The consistency of the scoring was assessed using the weighted Kappa coefficient. Differences in PI-RADS scores and rectal artifact scores among radiologists with different years of experience were compared using the chi-square test. The diagnostic differences among readers were compared using the multi-reader multi-case receiver operating characteristic curve (MRMC-ROC). A significance level of $P < 0.05$ was considered statistically significant.

Results: This study included a total of 685 patients, comprising 199 cases of prostate cancer and 486 cases of benign lesions. An analysis of the diagnostic efficacy AUC of the six radiologists based on the presence and absence of artifacts showed that the AUC for junior radiologists 1 was 0.890 without artifacts and 0.799 with artifacts in the AUC, a statistically significant difference ($P = 0.033$), while the AUC for junior radiologists 2 was 0.796 without artifacts and 0.654 with artifacts in the AUC, a statistically significant difference ($P = 0.022$). The difference was not statistically significant ($P > 0.05$) between the diagnostic efficacy of the middle and senior radiologists. Regarding the assessment of different degrees of rectal artifacts, there were no statistically significant differences in the diagnostic performance AUC among all radiologists ($0.35 \leq P < 0.89$). Based on subjective scoring criteria, the six radiologists rated the rectal artifact with a consistency of 0.85. Further subgroup analysis based on nodule location and the presence or absence of artifacts revealed that artifacts had an impact on the diagnostic accuracy of peripheral zone prostate cancer for junior radiologists. The AUC in the artifact-free area was higher than that in the area with artifacts (Reader 1: 0.92 vs. 0.88; Reader 2: 0.83 vs. 0.77), and these differences were statistically significant ($P < 0.001$). However, no statistically significant differences were observed in the remaining subgroups ($P > 0.05$).

Conclusions: Rectal susceptibility artifacts have a significant impact on the diagnostic performance of less experienced physicians, while they have a minimal impact on the diagnostic performance of physicians with moderate to high experience. Therefore, specialized training for less experienced physicians is beneficial in reducing misdiagnosis or missed diagnosis of prostate cancer, improving diagnostic accuracy, and providing more precise imaging evidence for clinical diagnosis and treatment.

PO-1722

High-resolution DWI for hepatic lesions detection: prospective comparison with gadoxetic acid-enhanced MRI using DWI

Zhen Zhang, Bin Song, Zhenlin Li

West China School of Medicine, West China Hospital, Sichuan University

Purpose

To evaluate the ability of high-resolution diffusion-weighted imaging (HR-DWI) with dynamic MRI in comparison with gadoxetic acid-enhanced MRI using HBP and conventional DWI for hepatic lesion detection.

Methods

A prospective study was performed on 29 patients with 140 suspected hepatic focal lesions. All patients underwent gadoxetic acid-enhanced MRI and HR-DWI on a 3-T system with a 32-channel phased-array coil (Ingenia Elition 3.0T; Philips Healthcare, Best, The Netherlands). Two experienced radiologists (H.Y.J. and D.Y.C. with 11 and 11 years of experience in interpreting liver MRI, respectively) reviewed two different MRI sets, separately and independently. Two imaging sets included: 1) HR-DWI (including b values sequences) + dynamic contrast-enhanced images; 2) and conventional DWI + HBP+ dynamic contrast-enhanced images. Inter-reader agreement between two reviewers was evaluated by Cohen's kappa efficiency and intraclass correlation coefficient (ICC).

Results

A total of 140 lesions were identified in 29 patients. The detection rate was comparable for HR-DWI sets (112/140, 80%) and HBP+DWI sets (121/140, 86.4%, $p=0.874$). There were excellent agreements for hepatic lesions detection between the two imaging sets with ICC of 0.990 (95% CI 0.977-0.996) and 0.977 (95% CI 0.945-0.990) for reader 1 and 2, respectively. Meanwhile, the inter-reader agreement was statistically higher for HR-DWI sets (ICC=0.939 [95% CI 0.86-0.97]) compared with that for HBP+DWI sets (ICC = 0.881 [95% CI 0.731-0.95]) ($P<0.001$).

Conclusion

Our results indicate that HR-DWI showed ability for hepatic lesions detection compared with HBP in gadoxetic acid-enhanced MRI, which was reflected by an increased image quality, along with a higher confidence for liver tumor detection.

PO-1723

CDP-choline modulates cholinergic signaling and gut microbiota to alleviate DSS-induced inflammatory bowel disease

Lingnan Guo, Fan Zhang, Yiyuan Gao, Maosheng Xu

The First Affiliated Hospital of Zhejiang Chinese Medical University (Zhejiang Provincial Hospital of Chinese Medicine)

Objective: This study aimed to investigate the efficacy and underlying mechanism of cytidine diphosphate (CDP)-choline (citicoline), an intermediate product of choline metabolism, in a mouse model of IBD induced by dextran sulfate sodium salt (DSS).

Methods: The 30 mice were divided randomly into three groups: the control group ($n=10$); the DSS group ($n=10$); and the CDP + DSS group ($n=10$). The related proteins in the colon of mice were detected in the laboratory, the intestinal microbiota of mice was detected by 16S rDNA

miseq sequencing, and the SCFAs in mouse feces was analyzed by liquid chromatography combined with a tandem mass spectrometer (LC-MS/MS) with derivatization.

Results: The results demonstrated that CDP-choline effectively alleviated colonic inflammation and deficiencies in choline, ACh, and PC by increasing the raw material. Further detection showed that CDP-choline also increased the ACh content by altering the expression of high-affinity choline transporter (ChT1) and acetylcholinesterase (AChE) in DSS-induced mice colon. Moreover, CDP-choline increased the expression of $\alpha 7$ nicotinic acetylcholine receptor ($\alpha 7$ nAChR) and activated the cholinergic anti-inflammatory pathway (CAP), leading to reduced colon macrophage activation and proinflammatory M1 polarization in IBD mice, thus reducing the levels of TNF- α and IL-6. In addition, CDP-choline reduced intestinal ecological imbalance and increased the content of hexanoic acid in short-chain fatty acids (SCFAs) in mice.

Conclusion: This study elucidates the ability of CDP-choline to mitigate DSS-induced colon inflammation by addressing choline and its metabolites deficiencies, activating the CAP, and regulating the composition of the intestinal microbiome and SCFAs content, providing a potential prophylactic and therapeutic approach for IBD.

PO-1724

The application value of dual-layer detector CT in reducing metal artifacts of abdominal coils

Jia Tan

West China Hospital of Sichuan University

Objective:

To investigate the application value of subtraction technique which combined OMAR, metal artifact reduction (OMAR) technique and monoenergetic imaging of dual-layer detector CT in reducing metal artifacts of upper abdominal coils.

Method:

A total of 71 patients with metal coil artifacts in the abdomen after interventional portal hypertension were enrolled in this study. All patients underwent upper abdominal CT vascular three-dimensional reconstruction scan on the dual-layer detector CT. Arterial phase, portal phase and venous phase images were obtained in all cases after threshold trigger monitoring scanning. Six kinds of images were reconstructed in each phase, including conventional images(CI), virtual non-contrast images(VNI), OMAR+ conventional images(CIOMAR), virtual monochromatic images(VMI40keV), OMAR+virtual monochromatic image(VMI40keVOMAR), subtracted images of VMI40keVOMAR and VNI in the same phase (SUB-OMAR). The signal-to-noise ratio (SNR), contrast noise (CNR) and background noise of CI, CIOMAR, VMI40keVOMAR and Sub-OMAR images were quantitatively calculated. All images were qualitatively assessed for artifacts by two independent senior radiologists using a coil artifact score (CA score: 5-point Likert scale). All the results were statistically analyzed, and when $P < 0.05$, the difference was considered statistically significant.

Results:

Compared with CI, the SNR, CNR and CA scores of CIOMAR, VMI40keVOMAR and Sub-OMAR images were improved($P < 0.05$). In addition, according to the results of CA scoring, SUB-OMAR images were found to have better metal artifact reduction performance than CI, CIOMAR and VMI40keVOMAR($P < 0.05$), which is conducive to the visualization of upper abdominal vessels, especially portal vein vessels.

Conclusion:

The metal artifact reduction technique of dual-layer detector CT including OMAR and SUB-OMAR can significantly reduce the metal coil artifacts in abdominal CT images, improving the image quality of abdominal vascular CT images, which is beneficial to clinical diagnosis and efficacy evaluation.

PO-1725

Tumor markers combined with quantitative parameters of double-layer detector CT predict vascular nerve infiltration in patients with colorectal cancer

Huiyi Yang, Jiayu Sun

Affiliated Hospital of North Sichuan Medical College

Objective: To evaluate the value of tumor markers combined with quantitative parameters of bilayer detector CT in evaluating vascular invasion (LVI) and neuroinfiltration (PNI) status in patients with colorectal cancer.

Materials and METHODS: A total of 49 patients with colorectal adenocarcinoma who received double-layer detector CT scan in our hospital from June 2022 to July 2023 were prospectively enrolled and confirmed by postoperative pathology. The patients were divided into LVI (+) group (n=14) and LVI (-) group (n=35), PNI (+) group (n=20) and PNI (-) group (n=29) according to the pathological results. The spectral parameters of the arterial and venous phases of colorectal cancer patients were analyzed, including CT values on conventional CT images, 40KeV virtual single-level images (VMI) and virtual plain scan (VNC) images, iodine density value (IC), standard iodine density value (NIC), effective atomic order value (Eff-Z) and energy spectrum curve slope (λ HU). Clinical features were collected, including demographic characteristics, tumor markers, and postoperative pathological biopsy information. Independent sample t test, Mann-Whitney U test or Chi-square test were used to compare the differences between different groups, and binary logistic regression analysis was used to construct a joint parameter model. Receiver operating characteristic curve (ROC) was used to evaluate the efficacy of serum markers and spectral CT parameters in the diagnosis of colorectal vascular and nerve infiltration alone and in combination. **Results:** Tumor markers, IC, NIC, Eff-Z, CT-40KEV-VMI and λ HU in LVI positive and PNI positive groups were significantly higher than those in negative group. There were statistically significant differences in T stage and N stage between LVI positive group and negative group ($P < 0.05$), and there were statistically significant differences in tissue differentiation grade and tumor gross morphology between PNI positive group and negative group ($P < 0.05$). There were significant differences in IC, NIC, Eff-Z, CT 40kev-VMI and λ HU in arterial and venous phases between positive and negative LVI groups. There were significant differences in IC, Eff-Z and λ HU in arterial phase and IC, NIC, Eff-Z, CT 40 KeV-VMI and λ HU in venous phase between positive and negative PNI groups. ROC curve analysis showed that the diagnostic efficacy of AP parameters in the LVI group was better than that of VP parameters, the diagnostic efficacy of VP parameters in the PNI group was better than that of AP parameters, and the diagnostic efficacy of tumor markers combined with spectral parameters was better than that of single parameters. The Eff-Z combined with tumor markers in arterial phase had the best diagnostic efficacy for vascular invasion, and its AUC, sensitivity and specificity were 0.796 (95%CI: 0.666-0.926), 64.3% and 85.7%, respectively. The diagnostic efficacy of intravenous Eff-Z combined with tumor markers was the best, with AUC, sensitivity and specificity 0.769 (95%CI: 0.635-0.903), 85% and 62.1%, respectively.

Conclusion: Dual-energy CT imaging parameters have good diagnostic value for preoperative assessment of vascular nerve infiltration in patients, and Eff-Z combined with tumor markers is the best diagnostic model for reflecting vascular nerve invasion of colorectal cancer. Dual-energy CT provides a noninvasive and effective method for preoperative prediction of LVI and PNI through quantitative enhancement measurement.

PO-1726

DISCO 定量参数与半定量参数在前列腺癌的诊断应用价值评估张家伟¹、杨淑兰²、吴晓辉²、张剑锋¹、钟洪波¹

1. 唐山市人民医院

2. 河北省唐山市妇幼保健院

目的：探讨基于笛卡尔采集 K 空间共享三维容积快速动态成像 (DISCO) 技术定量参数与半定量参数在前列腺癌的诊断价值。**方法** 回顾性分析经病理证实为前列腺疾病 (前列腺癌、良性前列腺增生和/或慢性前列腺炎) 患者 183 例行 DISCO 技术检查，并测量血流动力学参数：容积转运常数 (K_{trans})，速率常数 (K_{ep})，血管外细胞外容积分数 (V_e)，初始增强曲线下面积 (IAUGC)，最大增强斜率 (MaxSlope)，对比增强比率 (CER)，再根据 ROC 曲线评价各参数及联合参数的诊断价值。**结果** 与前列腺良性疾病相比，前列腺癌 K_{trans}, K_{ep}, V_e, IAUGC, MaxSlope, CER 均升高 (P < 0.05)；DISCO 定量参数联合鉴别良恶性病灶 ROC 曲线下面积为 0.89，高于 DISCO 半定量参数联合鉴别良恶性病灶 ROC 曲线下面积 (0.82)，高于单独 K_{ep}、单独 V_e 检测 ROC 曲线下面积 (0.84, 0.67)，但与单独 K_{trans} 鉴别 ROC 曲线下面积 (0.88) 无显著统计学差异 (Z = 0.84, P > 0.05)。**结论** DISCO 定量参数 K_{trans}、K_{ep} 和半定量参数 IAUGC, MaxSlope, CER 对前列腺癌均具有较高诊断效能；与半定量参数联合比较，定量参数联合诊断效能有所提高，可为前列腺癌诊断及鉴别诊断提供更加精确、更加可靠的量化参数。

PO-1727

基于钆塞酸二钠增强 MRI 利用 LI-RADS v2018 辅助特征提高小肝细胞癌(≤20mm)的诊断效能

吕蓉

天津市第三中心医院

目的 探讨 2018 版肝脏影像报告与数据系统 (LI-RADS v2018) 辅助特征在钆塞酸二钠增强 MRI (EOB-MRI) 上对 ≤20mm 的小肝癌 (HCC) 的诊断效能。

方法 回顾性收集 154 例患者 183 个肝病灶。按以下方法分类：①仅使用 LI-RADS 主要征象；②先用主要征象，后按 LI-RADS 原则用辅助征象调整分类。用逻辑回归分析确定独立显著的辅助征象，将其作为新的主要征象改进 LI-RADS (mLI-RADS) 中 LR-5 分类的升级标准。计算 mLI-RADS 的诊断效能，并与 LI-RADS v2018 的进行比较。

结果 扩散受限、移行期低信号和肝胆期低信号是独立显著的辅助征象。mLI-RADS a、c、e、g、h 和 i (分别使用上述独立显著的辅助征象中的某一种、两种、三种作为新的主要征象重新将上述根据方法①仅使用主要征象分为 LR-4 类的病灶重新分类)，结果其 LR-5 诊断 HCC 的敏感度显著高于 LI-RADS v2018 (68.0%、69.1%、69.1%、69.1%、69.1%、68.0% vs. 61.9%，p 均 < 0.05)，而特异度无差异 (84.9%、86.0%、84.9%、83.7%、84.9%、87.2% vs. 88.4%，p 均 > 0.05)。当单独使用上述独立显著的辅助征象对方法②联合使用主要和辅助征象分为 LR-4 类的结节重新分类 (mLI-RADS b、d、f) 后，其 LR-5 诊断 HCC 的敏感度提高 (69.1%，69.1%，70.1% vs. 61.9%，p 均 < 0.05)，但特异度降低 (76.7%，81.4%，80.2% vs. 88.4%，p 均 < 0.05)。

结论 扩散受限、移行期低信号和肝胆期低信号作为诊断 HCC 独立显著的辅助征象可用于将仅依据主要征象分为 LR-4 类的小病灶升级到 LR-5 类，从而提高 LI-RADS 对小 HCC 的诊断效能。

PO-1728

辅助征象替代阈值增长后 LI-RADS 对 HCC 的诊断效能

吕蓉

天津市第三中心医院

目的 作为 2018 版肝脏影像报告和数据系统 (LI-RADS v2018) 中诊断肝细胞癌 (HCC) 的主要征象之一的“阈值增长”, 其作用各种研究结论不完全一致。因此本研究探讨用特异性辅助征象替代阈值增长后, LI-RADS v2018 中 LR-5 (肯定 HCC 的类别) 对 HCC 的诊断效能, 从而验证阈值增长的作用。

方法 回顾性收集未经治疗并行钆塞酸二钠增强 MRI (EOB-MRI) 且经病理证实的 HCC 和其他肝内恶性肿瘤 (OM) 病人 262 例共 262 个病灶。由 2 名放射科医师依据 LI-RADS v2018 对病灶进行分析, 采用 t 检验比较 HCC 和 OM 病灶中伴和不伴阈值增长的病灶大小; 分析 HCC 和 OM 病灶间主要和辅助影像征象的差异, 并确定 HCC 特异性辅助征象。分别计算 LI-RADS v2018 以及 HCC 特异性辅助征象替代阈值增长后 (变更 LI-RADS) LR-5 对 HCC 的诊断效能, 并采用 McNemar χ^2 检验比较其差异。

结果 262 个病灶中, HCC 187 个 (71.4%), OM 75 个 (28.6%)。共 47 个 HCC 和 29 个 OM 病灶用于阈值增长评价, 其中 22 个 HCC 和 14 个 OM 病灶出现阈值增长。HCC 和 OM 病灶中, 伴有阈值增长的病灶直径均小于不伴阈值增长者 (均 $P < 0.05$)。主要征象中, OM 较 HCC 更常见阈值增长; 辅助征象中, HCC 较 OM 更常见结中结和病灶内含脂 (均 $P < 0.05$)。以结中结和病灶内含脂作为特异性辅助征象替代阈值增长, 诊断 HCC 的敏感度、特异度、准确度分别为 75.4%、88.6%、81.0%和 74.9%、89.3%、81.0%, 诊断效能与 LI-RADS v2018 (74.3%、88.6%、80.4%) 的差异无统计学意义 (P 均 > 0.05)。

结论 当阈值增长被 HCC 特异性辅助征象 (结中结和病灶内含脂) 替代后, 并未影响 LI-RADS 诊断 HCC 的效能, 提示阈值增长可能没有那么重要。

PO-1729

基于钆塞酸二钠增强 MRI 简化 LI-RADS 诊断肝细胞癌的价值

吕蓉

天津市第三中心医院

目的 研究基于钆塞酸二钠增强 MRI (EOB-MRI) 图像简化 2018 版肝脏影像与报告系统 (LI-RADS v2018) 诊断表对肝细胞癌 (HCC) 的诊断效能。

方法 回顾性收集 331 例 (356 个肝脏病灶) 行 EOB-MRI 的 HCC 高危患者资料。仅使用一个尺寸标准 (10mm 或 20mm) 评估简化 LI-RADS (sLI-RADS A-D) 的诊断效能, 经与 LI-RADS v2018 比较选择最佳 sLI-RADS。增加肝胆期 (HBP) 低信号为 HCC 主要征象, 以最佳 sLI-RADS 形成最终的简化 LI-RADS (F-sLI-RADS) 诊断表, 并评价其诊断效能。同时比较根据 F-sLI-RADS 和 LI-RADS v2018 标准进行病灶分类所需的时间。

结果 最佳 sLI-RADS 即 sLI-RADS D 的原则为以单一 20mm 为分界, 对所有 < 20 mm 的伴有动脉期高增强的结节均采用 LI-RADS v2018 诊断表中 10-19 mm 结节的分类标准进行分类。sLI-RADS D 的敏感度高于 LI-RADS v2018 (89.8%/87.0%, $p = 0.031$), 特异度未降低 (89.4%/90.1%, $p > 0.999$)。以 HBP 低信号为主要征象, F-sLI-RADS 的敏感度高于 LI-RADS v2018 (93.0%/87.0%, $p < 0.001$) 和 sLI-RADS D (93.0%/89.8%, $p = 0.016$), 特异度未降低 (86.5%/90.1%, $p = 0.062$; 86.5%/89.4%, $p = 0.125$)。与 LI-RADS v2018 相比, F-sLI-RADS 减少了病灶分类所用的时间 (51 ± 21 秒/ 73 ± 24 秒, $p < 0.001$)。

结论 以 HBP 低信号为主要征象,简化的 LI-RADS 可提高 LR-5 类诊断 HCC 的敏感度,节省分类时间,更有利于临床应用。

PO-1730

肥胖人群减重术前的定量 CT 体质成分与代谢综合征组分的关系

洪薇、郝小军、陶超、殷鹏展、周运锋
皖南医学院附属医院/皖南医学院弋矶山医院

目的 探讨不同性别、肥胖程度人群减重术前定量 CT(QCT)体质成分的差异,及其与代谢综合征 (MS) 组分的关系。**方法** 纳入本院 2021 年 1 月至 2023 年 3 月拟行减重手术的肥胖患者 97 名,记录其身体质量指数 (BMI),生化指标以及基于 QCT 测量的体质成分。按照不同性别、肥胖程度、MS 组分数进行分组,比较各组之间体质成分的差异,同时分析各体质成分与代谢指标的相关性,采用受试者工作特征曲线分析各体质成分对不同 MS 组分肥胖人群的诊断效能。**结果** 患者中女性 75 例 (77.3%)。男性肥胖患者较女性有较高的腹部总脂肪面积 (TFA, $P<0.001$)、内脏脂肪面积 (VFA, $P<0.001$)、胰头脂肪含量 (pHF, $P=0.007$) 及骨骼肌指数 (SMI, $P<0.001$)。随肥胖程度的增加,腹部脂肪的增加以皮下脂肪 (SFA) 为主。随 MS 组分的增加,VFA、内脏脂肪/皮下脂肪 (V/S)、肝脏脂肪含量 (LF)、pHF 以及 SMI 随之升高。在诊断合并 2 项 MS 组分中,VFA 的评估效能 ($AUC=0.706$, $95\%CI=0.577\sim0.834$) 优于其他体质成分指标;在诊断合并 3 项、4 项及 5 项 MS 组分中,LF 的评估效能 ($AUCMS3=0.712$, $95\%CI=0.605\sim0.818$; $AUCMS4=0.652$, $95\%CI=0.537\sim0.766$; $AUCMS5=0.706$, $95\%CI=0.576\sim0.836$) 更好。**结论** 不同性别、肥胖程度及合并 MS 组分数的肥胖患者腹部体质成分存在差异。VFA 及 LF 对评估肥胖患者合并不同 MS 组分具有重要价值。

PO-1731

经阴道三维超声子宫肌瘤血管网评估高强度聚焦超声消融疗效的应用价值

郝琼¹、侯若莹¹、黄文霞¹、林振江²、彭格红¹
1. 遵义医科大学附属医院超声科
2. 遵义医科大学附属医院妇科

【摘要】目的 探讨经阴道三维超声子宫肌瘤血管网在评估高强度聚焦超声(HIFU)消融子宫肌瘤疗效中的应用价值。**方法** 选取接受 HIFU 消融单个子宫肌瘤患者 67 例,分别在术前,术后当天、3、6 和 12 月采用阴道三维超声高分辨力血流成像技术对靶肌瘤血供进行重建及分级,分析子宫肌瘤血管网评估治疗前、后子宫肌瘤内血供不同分级与 HIFU 疗效的相关性。**结果** HIFU 治疗前子宫肌瘤血管网显示了子宫肌瘤内部不同程度的血供,Adler 分级 1 级 5 例,2 级 2 例,3 级 60 例,增强 MRI 显示低增强 8 例,中等增强 2 例,明显增强 57 例,两种检查方法对子宫肌瘤内部血供评价的 ICC 为 0.766 ($P=0.001$),一致性较好。治疗后子宫肌瘤血管网与超声造影评估 HIFU 疗效结果比较,差异无统计学意义 ($P>0.05$),治疗后当天及治疗后 12 月子宫肌瘤内血供少的 0 和 1 级患者,肌瘤缩小率明显高于分级为 3 级患者,差异具有统计学意义 ($P<0.05$)。**结论** 三维超声子宫肌瘤血管网能立体直观显示子宫肌瘤内部血供,子宫肌瘤血管网的分级对 HIFU 疗效预估、术后随访有提示作用,具有一定的临床应用价值。

PO-1732

基于增强 CT 的影像组学模型在鉴别肾上腺醛固酮瘤与肾上腺无功能腺瘤的应用

杨文华、徐安辉

华中科技大学同济医学院附属同济医院

【摘要】目的：为确定肾上腺偶发瘤（adrenal incidentaloma, AI）有无内分泌功能，以实现个性化精准医疗。本研究探讨了基于增强 CT 的影像组学模型是否可以区分肾上腺醛固酮瘤（aldosterone producing adenomas, APAs）与无功能腺瘤（non-functioning adrenal adenomas, NAAs）。

方法：本研究回顾性地分析了 2017 年 1 月至 2023 年 5 月之间在本机构进行肾上腺静脉采血的 243 个原发性醛固酮增多症患者，最终纳入了 68 名 APAs 与 60 名 NAAs 病例，按照 8: 2 的比例随机地分为训练组和验证组。在训练组中，单变量分析和最小绝对收缩和选择算子回归分析用于挑选影像组学特征并计算影像组学得分(Radscore)。将 Radscore 与基线临床资料进行多变量逻辑回归分析，并构建临床-影像组学的列线图模型。列线图模型的诊断效能采用受试者工作特征曲线、校准曲线及决策曲线分析进行评价。

结果：影像组学模型的曲线下面积（area under the curve, AUC）在训练组及验证组中分别为 0.869[95%置信区间（confidence interval, CI）0.769~0.943]和 0.762[95%CI 0.572~0.952]；敏感性和特异性分别为 0.889、0.77 和 0.929、0.58。包含了血清钾浓度、年龄、Radscore 的列线图模型在训练组和验证组中的 AUC 分别是 0.988[95% CI 0.972~1.000]和 0.988[95% CI 0.957~1.000]；敏感性和特异性分别是 0.981、0.940 和 1.000、0.920。

结论：基于增强 CT 的影像组学模型具有较大的区分肾上腺 APAs 与 NAAs 的诊断效能，在结合基线临床资料后，临床-影像组学模型的诊断效能进一步增加。

PO-1733

MRI 征象及临床因素对胎盘植入性疾病的风险预测研究

黄华驰、林剑军、马慧、陈晴、李珊珊

广西壮族自治区妇幼保健院

目的 通过分析临床因素及 MRI 征象，对胎盘植入性疾病的发生进行风险预测，为临床诊治本病提供参考依据。**方法** 收集胎盘植入性疾病患者 48 例，另收集 48 例非胎盘植入患者作对照进行对比研究。记录孕产妇年龄、孕周及既往剖宫产、流产次数。参考既往研究的观察指标分析相应的 MRI 征象。对各临床因素及 MRI 征象进行单因素分析。计算各因素（临床因素及 MRI 量化指标除外）的 PPV 和 OR 值。将单因素分析有统计学意义的因素纳入二元 logistic 回归分析。**结果** 胎盘植入性疾病的存在与否和剖宫产次数、前置胎盘、胎盘主要附着位置、胎盘邻近子宫肌层情况、T2WI 低信号、宫颈上方胎盘厚度、异常血管、胎盘突出征、子宫膀胱间隙消失有关（ $P<0.05$ ）。胎盘主要附着于子宫下壁、胎盘与邻近子宫肌层分界不清/肌层欠连续及其他 MRI 异常征象（MRI 量化指标除外）存在时， $OR>1$ （ $P<0.05$ ）。剖宫产次数、前置胎盘、异常血管为胎盘植入性疾病的独立危险因素（ $P<0.05$ ）。**结论** 通过分析临床因素及 MRI 征象进行风险预测，有助于对胎盘植入性疾病的诊断。根据本研究结果，需关注有剖宫产史、前置胎盘、胎盘附着于子宫下壁、胎盘与邻近子宫肌层分界不清/肌层欠连续、T2WI 低信号、宫颈上方胎盘较厚、异常血管、胎盘突出征、子宫膀胱间隙消失的病例，而后结合分析各因素，以便相对准确地诊断胎盘植入性疾病，从而为临床的诊疗提供参考依据。

PO-1734

全模型迭代重建 (IMR)算法在改善 CT 门静脉成像中的应用研究

王辉
天津市第三中心医院

目的: 探究全模型迭代重建算法对 CT 门静脉成像图像质量的应用研究, 分析受检者所受辐射剂量的改变, 讨论全模型迭代重建算法的应用价值。方法: 纳入接受 CT 门静脉成像的患者, 根据筛选标准选出 60 例, 采用数字法随机分为常规组和实验组, 每组 30 例。常规组采用正常辐射剂量, 使用四级混合迭代重建算法重建图像; 实验组采用稍低辐射剂量, 使用全模型迭代算法重建图像, 保持实验组与常规组的其它摄影参数一致。记录所需数据, 选用独立样本 t 检验比较两组辐射指标和客观参数指标, 再让两位有多年诊断经验的影像医师对其进主观评价。采用 Kappa 检验评价两位医师评分结果的一致性。结果: 实验组的 CTDIvol 为 $[(11.74 \pm 1.23) \text{ mGy}]$ 低于常规组 $[(13.83 \pm 0.81) \text{ mGy}]$, $P < 0.05$; 实验组的 ED 为 $[(6.31 \pm 0.57) \text{ mSv}]$ 低于常规组 $[(7.38 \pm 0.72) \text{ mSv}]$, $P < 0.05$; 实验组图像质量评分 (3.93 ± 0.74) 高于常规组评分 (3.43 ± 0.73) , $P < 0.05$; 实验组的 SD 为 $[(7.17 \pm 1.58) \text{ Hu}]$ 明显低于常规组 $[(14.19 \pm 0.95) \text{ Hu}]$, $P < 0.05$; 实验组的 SNRH 为 (14.23 ± 1.23) 高于常规组 (4.71 ± 0.83) , $P < 0.05$ 。结论: 全模型迭代重建算法在保证图像质量略有提高的同时还能进一步降低患者所受的辐射剂量, 其对 CT 门静脉图像有明显的改善能力, 具有实践应用价值。

PO-1735

APT 定量参数评估直肠癌预后相关因素

李娟、高雪梅、程敬亮
郑州大学第一附属医院

目的: 分析酰胺质子转移成像 (APT) 定量参数评估直肠癌预后相关因素的价值。方法: 以 104 例病理证实为直肠癌的患者为研究对象, 行高分辨 MRI、APT 及 DWI, 测量不同组织病理类型、分级、分期以及相关结构侵犯状态的 APT 信号强度 (APT SI) 及表观扩散系数 (ADC)。结果: 直肠黏液腺癌 APT SI、ADC 值高于普通腺癌, 差异具有统计学意义 ($P < 0.001$); 低级别普通腺癌 APT SI 低于高级别普通腺癌, 差异具有统计学意义 ($P < 0.05$); T 分期, N 分期, 壁外血管侵犯, 神经侵犯及脉管癌栓不同组间 APT SI、ADC 值的差异均无统计学意义 ($P > 0.05$)。APT SI、ADC 值鉴别直肠黏液腺癌与普通腺癌的 ROC 曲线下面积分别为 0.932、0.980; APT SI 鉴别低级别与高级别普通腺癌的 ROC 曲线下面积为 0.741。结论: APT 有助于评估直肠癌患者的组织病理类型及肿瘤分级。

PO-1736

磁共振成像对粘连性小肠梗阻手术与否的预判价值探讨

曲林涛、程永远
烟台市莱阳中心医院

【摘要】目的: 探讨磁共振成像对粘连性小肠梗阻手术与否的预判价值。方法: 回顾性分析我院 2019 年 6 月 1 日至 2023 年 6 月 6 日收治的粘连性小肠梗阻患者 55 例, 其中男 36 例, 女 19 例, 年龄 16~89 岁, 平均年龄 61.9 ± 14.8 岁, 分为手术组 25 例, 非手术组 30 例; 25 例手术组中有 17 例肠梗阻均经手术证实为绞窄性肠梗阻。30 例非手术组肠梗阻中, 均经保守治疗好转, 最终均临床诊断为粘连性小肠梗阻。采用荷兰 PHILIPS Achieva 1.5T 超导型磁共振扫描仪及专用腹部多通

道线圈进行腹部 MRI 成像扫描。由 2 名高年资影像医师于 PACS 系统上对 MRI 图像进行协商回顾性分析, 统计学分析采用 SPSS17.0 软件。定性资料采用卡方检验, 定量资料采用 t 检验, $P<0.05$ 为差异有统计学意义。结果: 25 例手术组肠梗阻肠管扩张程度为 $3.90\pm0.73\text{cm}$, 30 例非手术组肠管扩张程度为 $3.67\pm0.61\text{cm}$, 差异无统计学意义; 手术组患者 MR-T2WI 可见“C”形征 (17/25, 68%)、“黑靶环征” (16/25, 64%)、“黑积液征” (10/25, 40%) 具有较高的诊断特异度, 较非手术组差异有统计学意义; 其中“黑靶环征”对绞窄性肠梗阻的诊断特异度和灵敏度分别是 100% (38/38) 和 94.12% (16/17), “黑积液征”对绞窄的诊断特异度和灵敏度分别是 92.11% (35/38) 和 58.82% (10/17)。手术组患者均可见多腹腔间隙积液, 敏感度较高, 较非手术组有统计学差异, 但特异度较差。结论: 联合 MR-T2WI 的“C”形征、“黑靶环征”、“黑积液征”三种征象对粘连性小肠梗阻的手术指征具有较高的诊断特异度和灵敏度, MRI 可作为指导临床手术与否的重要检查手段, 多腹腔间隙积液对于手术指征具有一定的辅助提示价值。

联合 80KV 管电压及 Karl 迭代重建降低 320 排 CT 腹部增强扫描辐射剂量的可行性

曹建新、朱卓、许炜、李嘉帅、张清、孟钰
武汉市普仁医院

目的: 探讨联合 80KV 管电压及 Karl 迭代重建降低 320 排 CT 腹部增强扫描辐射剂量的可行性。方法: 100 例行全腹部增强 CT 检查的患者分成 120KV 组和 80KV 组, 120KV 组使用滤波反投影图像重建, 80KV 组使用 Karl 迭代图像重建。比较两组的辐射剂量和图像质量。结果: 120KV 组和 80KV 组有效辐射剂量分别为 $11.0\pm1.7\text{mSv}$ 和 $5.6\pm0.7\text{mSv}$, 与 120KV 组相比, 80KV 组辐射剂量下降 49.1% ($P<0.01$)。动脉期两组图像上肝脏 CT 值及噪声差异无统计学意义 ($P>0.05$); 80KV 组腹主动脉的 CT、噪声及信噪比相对于 120KV 组增加, 差异有统计学意义 ($P<0.01$)。在静脉期, 与 120KV 组相比较, 80KV 组的肝脏及门静脉 CT 值显著增加 ($P<0.01$), 肝左外叶噪声无明显增加 ($P>0.05$), 肝右后叶噪声、门静脉噪声及门静脉信噪比稍增加 ($P<0.05$)。肝脏、脾脏、胰腺、肾脏及胃肠道的图像质量主观评分在两组间比较差异均无统计学意义 ($P>0.05$)。结论: 联合 80KV 低管电压及 Karl 迭代重建能够显著降低 320 排 CT 腹部增强扫描的辐射剂量, 并保持诊断需要的图像质量。

PO-1738

假性肝硬化的临床及影像诊断现状

宋怡沛、胡梦瑶、龚良庚
南昌大学第二附属医院医学影像中心

目的: 假性肝硬化大都伴有尾状叶肥大、结节状肝轮廓与肝实质萎缩等影像征象, 同时也可并发门脉高压和肝细胞衰竭等临床表现, 通常与肝硬化难以区分。然而, 目前国内对假性肝硬化认识不足, 少有报道。现将国内外报道假性肝硬化系列病例的临床及影像特征作一综述, 为患者鉴别及诊疗提供多角度判断。

方法: 假性肝硬化概念最早由 Honma 提出, 命名为“hepar lobtum”, 包含一类影像学类似肝硬化但缺乏后者典型病理证据支持的疾病, 主要有肝转移瘤化疗后假性肝硬化、粟粒性肝转移、急性肝衰竭、结节病及寄生虫感染性疾病。具体列举并分析其临床及影像诊断现状。

结果: 在影像诊断过程中, 我们常根据肝脏形态改变诊断肝硬化, 但在临床工作中, 我们还需考虑一些特殊背景下发生的假性肝硬化。假性肝硬化的典型特征是在组织学检查中再生结节之间没有桥

接纤维化。在乳腺癌肝转移患者中,肝包膜回缩是常见的,可通过回顾患者的病史和先前的影像学检查鉴别;当已知原发性恶性肿瘤且无门脉高压征象的患者出现细小的肝表面结节,应考虑粟粒性转移;在急性肝衰竭患者中,肝脏形态大多是正常或可以看到增大的脂肪肝,少数影像学表现可以类似肝硬化,这通常被认为是由于融合再生结节和大面积坏死形成;CT 上表现弥漫性肝实质和表面结节、脾脏内多个低密度结节,部分还存在腹膜后淋巴结肿大,临床结合血清 ACE 水平升高或纵隔淋巴结肿大提示结节病;疫区患者肝脏影像表现为肝周包膜下和门脉周围多个楔形低强化区,应考虑到寄生虫感染性疾病。

结论:目前假性肝硬化的报道与研究仍不够深入,需要未来更系统的观察研究。早期识别,短期内复查并采取不同治疗方法处理这些疾病非常重要,可为患者的预后提供更好的指导作用。

多参数成像在肾脏恶性肿瘤诊断及鉴别诊断中的价值

吕琦、王培军、王金红、王国良、葛仁斌
上海市同济医院

目的 探讨 3.0TMR 磁敏感成像结合弥散加权成像序列与肾癌病理分级分期的关系及 320 CT 动态增强扫描在不同类型肾癌鉴别诊断中的作用。

方法 回顾性分析 65 例不同类型肾脏恶性肿瘤,采用 3.0TMR 行 b 值=800s/mm² DWI 及 SWI 检查,所有肿瘤均经手术病理或穿刺活检证实,其中肾透明细胞癌 38 例,乳头状肾细胞癌 15 例,肾嫌色细胞癌 12 例。对病灶的 DWI 及 SWI 信号特点进行记录和分析,将其中的 T 分期与术后病理 T 分期进行对比,计算并比较临床各期 ADC 值间的关系。比较肿瘤动态增强各期增强特点和强化程度,并测量动态增强扫描各期肾癌的 CT 值,对各组数据进行统计学处理,计算均值与标准差,并计算强化幅度。

结果 肾癌中,各期两两比较发现,在未用 SWI 检测出血时,I 期与其余各期相比,差异有统计学意义,III 与 IV 期相比差异有统计学意义,而 II 期与 III、IV 期相比,差异无统计学意义,参照 SWI 除出血区域后测量 ADC 值发现,I 期与其余各期、II 期与 III、IV 期两两比较相比,差异均有统计学意义,而 I、II 期之间及 III 期与 IV 期之间相比,差异无统计学意义 ($P<0.01$)。不同亚型肾癌 CT 动态增强扫描发现,肾透明细胞癌与非透明细胞癌强化幅度差异有统计学意义 ($P<0.01$),而乳头状肾癌与嫌色细胞癌两者差异无统计学意义 ($P>0.05$),肾透明细胞癌强化幅度最高。

结论 利用磁共振多参数序列成像能准确、良好的判断肾癌的临床分期,而 CT 动态增强扫描在鉴别不同亚型肾癌有方面较高的临床应用价值。

PO-1740

基于双参数 MRI 联合 PSA 等衍生参数构建模型预测灰区前列腺癌的诊断价值研究

徐辉景、李志平、张永胜、崔凤
浙江中医药大学附属杭州市中医院

目的 探讨基于双参数磁共振 (bp-MRI) 前列腺影像报告和数据系统版本 2.1(PI-RADS v2.1)联合前列腺特异性抗原(PSA)等衍生参数在诊断 PSA 灰区前列腺癌 (PCa) 中的价值,并建立预测模型和列线图以指导临床决策。方法 回顾性分析 118 例 PSA 灰区 (4~10ng/mL) 患者行双参数 MRI 检查,并有病理学结果的患者资料。入组患者被随机分配到训练集($n=82$, 70%)和验证集($n=36$, 30%)。进行单因素和多因素 Logistic 回归分析筛选出灰区 PCa 的独立风险因子,构建量化、可视化风险评估列线图模型,采用受试者工作特征曲线(ROC)及校准曲线评价模型效能,决策曲线分析(DCA)评

价临床有用性。结果 单因素分析发现年龄、体积、F/TPSA、PSAD、AVR、PI-RADS v2.1 评分在灰区 PCa 组和非 PCa 组之间差异具有统计学意义($P<0.05$)，再进行多因素 Logistic 回归分析显示体积、PSAD、AVR、PI-RADS v2.1 评分是预测灰区 PCa 的独立危险因素。基于上述 4 个预测因子构建灰区 PCa 列线图模型 AUC 值最高，其训练集和验证集的 AUC 分别 0.935 和 0.878，均高于其他单独指标，体积、PSAD、AVR、PI-RADS v2.1 分别为 0.743 和 0.678、0.699 和 0.644、0.775 和 0.756、0.850 和 0.844。校准曲线表明列线图模型预测预测灰区 PCa 的概率一致性较好，决策曲线分析表明该模型具有较好的临床应用价值。结论 基于 PI-RADS v2.1 双参数 MRI 联合 PSA 等衍生参数构建的列线图风险模型，具有较好的预测效能，可用于预测 PSA 灰区前列腺癌，能减少不必要的穿刺活检。

PO-1741

LI-RADS v2018 对 HCC 高危人群肝脏病变的诊断效能： 增强 CT 和 MRI 的对比研究

吕蓉
天津市第三中心医院

目的 探讨 2018 版肝脏影像报告和数据系统 (LI-RADS v2018) 基于增强 CT (CECT) 和钆塞酸二钠增强 MR (EOB-MRI) 图像对肝细胞癌 (HCC) 及非 HCC 恶性肿瘤 (OM) 的诊断效能。

方法 收集行 CECT 和 EOB-MRI 检查 HCC 高危患者 248 例 285 枚肝脏局灶性病灶，以穿刺或手术病理为金标准。两名医师双盲下据上述图像进行 LI-RADS 分类，计算 LR-5 对 HCC、LR-M 对 OM 的诊断价值，并比较不同检查方法诊断效能的差异。

结果 285 枚病灶中包括 HCC 187 枚，OM 33 枚，良性病灶 65 枚。CECT 和 EOB-MRI 对病灶分类的一致性较好 ($Kappa=0.764$, $P<0.001$)。CECT 和 EOB-MRI 两种检查方法 LR-5 类对 HCC 的诊断效能分别为灵敏度 54.01% 和 76.47%、特异度 94.90% 和 89.80%、阳性预测值 95.28% 和 66.67%、阴性预测值 51.96% 和 66.67%、准确度 68.07% 和 81.05%、约登指数 0.489 和 0.663；除特异度比较无统计学差异 ($P=0.125$) 外，EOB-MRI 的灵敏度和准确度均高于 CECT (P 均 <0.05)。CECT 和 EOB-MRI 两种检查方法 LR-M 类对 OM 的诊断效能分别为灵敏度 93.94% 和 87.88%、特异度 98.81% 和 94.84%、阳性预测值 91.18% 和 69.05%、阴性预测值 99.20% 和 98.35%、准确度 98.25% 和 94.04%、约登指数 0.927 和 0.826；除灵敏度差异无统计学意义 ($P=0.625$) 外，CECT 的特异度和准确率均高于 EOB-MRI (P 均 <0.05)。

结论 LI-RADS v2018 在 CECT 和 EOB-MRI 上对病灶分类的一致性较好。LR-5 分类对 HCC 的诊断效能 EOB-MRI 检查好于 CECT，而 LR-M 分类对 OM 的诊断效能 CECT 优于 EOB-MRI。

PO-1742

血吸虫肠病合并结直肠癌的计算机 X 线断层扫描影像学表现

张博、王培军
上海市同济医院

目的 回顾性分析血吸虫肠病合并结直肠癌的 CT 表现，提高对该病诊断的准确性。

方法 2007 年 1 月至 2012 年 12 月同济大学附属同济医院和昆山市中医院收治的 80 例经病理学检查证实为血吸虫肠病合并结直肠癌患者，均行腹部 CT 平扫+增强扫描，由两名放射科医师采用盲法阅片，对病灶部位、形态、大小，钙化特点及强化方式，有无转移进行评估；同时收集同一地区非血吸虫结直肠癌患者 20 例作为对照。

结果 80 例血吸虫肠病合并结直肠癌患者的肿瘤以降结肠、乙状结肠和直肠为主, 表现为管壁不规则增厚, 伴软组织团块, 累及肠管长度为 $(21.35\pm 4.50)\text{cm}$; 其中单发病灶 68 例, 多发病灶 12 例, 表现为多节段肠管受累; 肿瘤组织均可见不同形态的钙化灶, 钙化发生比例为 100.0%, 主要表现为线状、斑点状及小斑片状钙化影, 其中 59 例钙化边缘模糊, 21 例钙化边缘较清晰; 增强早期 68 例病灶明显强化, 均匀强化 45 例, 不均匀强化 23 例, 增强晚期 73 例持续强化, 坏死少见; 仅 2 例伴发肝脏转移瘤, 均无淋巴结转移。20 例非血吸虫结直肠癌患者肿瘤均为单发病灶, 表现为肠壁不规则增厚, 伴局部溃疡形成, 累及肠管长度为 $(6.90\pm 3.40)\text{cm}$; 肿瘤组织内均未见钙化影; 均表现为增强早期病灶明显不均匀强化, 可见低密度坏死区存在, 增强晚期不同程度降低; 4 例伴发肝脏转移瘤。与非血吸虫结直肠癌患者比较。血吸虫肠病合并结直肠癌患者多发病灶的比例较高 ($P=0.000$), 病变管壁长度较长 ($P=0.000$), 钙化灶发生比例较高 ($P=0.000$), 增强早期病灶明显不均匀强化比例较低 ($P=0.000$), 晚期病灶持续强化比例较高 ($P=0.000$); 肝脏转移发生比例较低 ($P=0.014$)。

结论 血吸虫肠病合并结直肠癌在 CT 上特征性表现为瘤组织内不同形态钙化影, 钙化边缘模糊, 并累及多节段肠管; 血道转移及淋巴道转移均少见。

PO-1743

影像学诊断老年隐匿性急性肾衰竭

李晓阳

唐山市人民医院

目的 通过影像学诊断老年隐匿性急性肾衰竭 (急性肾损伤), 分析总结 OAKI 病理基础、临床表现、影像学特征, 及时诊断 OAKI, 避免由于老年急性肾损伤 (Acute kidney injury, AKI) 具有一定的临床隐匿性或亚临床特性而导致治疗延误, 造成患者肾脏慢性损伤或不可逆肾损伤、甚至患者死亡。

方法 前瞻性收集通过医学影像学诊断为 AKI 的老年患者 153 例, 患者均年龄大于 75 岁; 其中临床最终诊断符合 OAKI 的共计 57 例, 57 例中上呼吸道感染静脉输入阿昔洛韦过敏 9 例, 恶性肿瘤患者 11 例, 急性胆囊炎患者 5 例, 急性胰腺炎 7 例, 手术后腹膜后脓肿患者 3 例, 术后腹膜后血肿 4 例, 慢性阻塞性肺疾病伴肺炎 7 例, 左心衰肺水肿患者 8 例, 复合脏器外伤患者 3 例。观察、统计患者临床症状, AKI 实验室诊断指标血清肌酐和尿素。检查设备使用 GE 宝石能谱 750 HD 多层螺旋 CT 机、Philips Bariliance 64 排多层螺旋 CT 机、超导型 16 通道 GE Signa TwinSpeed 1.5T MR 机。为了加重肾脏损伤和防止对比剂肾病的发生, 所有患者均未做影像增强检查。影像诊断由两名高年资医师承担。结果: OAKI 临床表现复杂, 其慢性、隐匿性、亚临床特征明显; 且作为诊断标准的血清尿素氮和肌酐水平均在正常范围, 且至今为止尚未发现新的标志物来明确 AKI 的诊断。

MSCT 和 MR 检查提示 AKI 诊断已经成为共识, AKI 影像学表现: CT 和 MR 共同表现为两侧肾脏外形增大、形态饱满, 肾周脂肪囊均可见桥隔增粗和吉氏筋膜增厚; MSCT 显示双侧肾实质密度弥漫减低; MR 检查 T1WI 表现肾脏实质信号减低, T2WI 肾脏实质信号弥漫性不均一增高, T2WI 压脂肾实质信号不均一增高; 部分病例肾周少量积液。结论: 老年人 AKI 存在明显的临床隐匿性特性或慢性亚临床特征, 但同时又具有典型的肾脏以及肾周异常影像学表现, 影像和临床结合可早期诊断及时治疗。

PO-1744

3.0T MR DWI 序列在肾脏肿块型病变的诊断价值

吕琦、王培军
上海市同济医院

目的 评价 3.0T MR 弥散加权成像 (Diffusion weighted imaging,DWI)序列在肾脏肿块型病变的诊断及鉴别诊断价值。

方法 回顾性分析 139 例肾脏肿块型病变,采用 3.0TMR 行 b 值=800s/mm² DWI 检查,除良性囊肿性病例外,所有肿瘤均经手术病理或穿刺活检证实,对病灶的 DWI 信号特点进行记录和分析:1、计算 ADC 值鉴别肾脏良恶性肿瘤的敏感性、特异性,阳性预测值、阴性预测值。2、测量比较所有病灶、病灶周围及健侧肾组织的 ADC 值。

结果 肾癌与癌周组织及正常肾实质 ADC 值相比,差异有统计学意义($P<0.05$),癌周组织与正常肾组织 ADC 值相比,差异无统计学意义($P>0.05$)。肾癌、肾盂癌、肾脓肿、肾血管平滑肌脂肪瘤、肾良性囊肿性病及肾癌囊变区各组 ADC 值差异有统计学意义($F=129.71, P=0.000$),其中肾癌、肾血管平滑肌脂肪瘤及肾盂癌组的 ADC 值两两之间差异有统计学意义 ($P<0.01$),肾癌及肾盂癌的 ADC 值统计学上均低于良性病变(肾脓肿及肾血管平滑肌脂肪瘤),肾盂癌的 ADC 值最低,肾血管平滑肌脂肪瘤的 ADC 值最高。良性囊肿性病及肾癌囊变区的 ADC 值差异有统计学意义 ($t=3.756, P=0.000$)。其中透明细胞癌病理各分期两两比较发现,I 期与 III、IV 期及 II 期与 III、IV 期相比,差异有统计学意义 ($P<0.01$),III 期及 IV 期的 ADC 值较低。

结论 高 b 值 DWI 鉴别肾脏良恶性肿瘤有较高的准确率,结合量化分析 ADC 值能够更好的显示肾脏肿块的病变特征,有助于肾脏肿块的鉴别、恶性程度评估以及预后预测等方面有着重要的意义。

PO-1745

多频 MRE 术前预测肝细胞癌 MVI 的初步研究

钟林辉、龙仕超、刘文广、裴贻刚、李文政
中南大学湘雅医院

目的: 探索多频 MRE 机械参数是否能够在术前预测 MVI 状态及其价值。

材料与方法: 2021 年 1 月至 11 月在中南大学湘雅医院前瞻性招募临床拟诊肝细胞癌患者 328 名。所有患者均接受了常规多参数 MRI 及多频 MRE 检查,最终纳入经术后病理确诊的肝细胞癌患者共 124 例。收集患者临床资料、评估常规 MRI 影像学特征及测量肿瘤及背景肝实质多频 MRE 机械参数 $c(m/s)$ 和 $\phi(rad)$ 。通过单因素分析中 $P<0.05$ 的参数进入二元 logistic 回归进行多因素分析,以阐明 MVI 的危险因素。以进入多因素分析中的临床变量、常规 MRI 影像学特征分别建立预测模型;多频 MRE 机械参数及其联合多因素分析中临床变量、常规 MRI 影像学特征建立预测模型。使用 ROC 曲线下面积评估预测效能。使用校准曲线评价模型拟合度。使用临床决策曲线分析评价模型的临床获益度。 $P<0.05$ 为差异有统计学意义。

结果: (1) MVI+组的肿瘤硬度 c 及相对硬度比较 MVI-组高 ($2.85\pm0.62m/s$ Vs $2.54\pm0.63m/s$; 1.47 ± 0.39 Vs 1.24 ± 0.33 , P 均 <0.05)。(2) 多因素 Logistic 回归结果表明,瘤内动脉 ($OR11.68, 95\%CI (2.65-52.00)$, $P<0.001$)、肿瘤边缘是否光滑 ($OR0.08, 95\%CI (0.02-0.38)$, $P<0.001$)、肿瘤硬度 c ($OR14.28, 95\%CI (2.16-94.58)$, $P=0.006$) 是 MVI 的独立危险因素。(3) 在 MVI+的预测模型中,常规 MRI 影像特征模型的特异性最高 (0.89)、常规 MRI 影像特征联合多频 MRE 机械参数模型的 AUC 值 (0.911 (0.864-0.959))、敏感性及准确性最高 (分别为 0.86、0.82)。

结论: 多频 MRE 的机械参数 c 能够在术前预测 MVI 状态。临床资料、常规 MRI 影像学特征联合多频 MRE 机械参数可以提升预测 MVI 效能。

PO-1746

探讨多层螺旋 CT 评估胃间质瘤病理危险度分级的可行性

王思凯

西南医科大学附属中医医院

目的 探讨胃间质瘤 (GST) 的多层螺旋 CT (MSCT) 影像学特征预测其病理危险度分级(美国国防病理学研究所标准, AFIP)的可行性, 为 GST 患者治疗前提供影像学依据。

方法 回顾性收集经手术病理证实为单发 GST 的 424 名患者 (424 枚病灶) 的临床影像资料, 其中男 223 例, 女 201 例, 年龄 61 (14-85) 岁。根据病理 AFIP 危险度分级标准, 将 424 枚 GST 分为低风险组 (含极低危险度与低危险度, 282 枚), 中风险组 (中危险度, 72 枚), 高风险组 (高危险度, 70 枚)。比较三组间的临床资料及影像学特征的差异性。定量资料采用 Kruskal-Wallis H 检验, 对统计学有差异的变量采用 LSD 法进行两两比较; 分类资料采用秩和检验, 对统计学有差异的变量采用 Bonferroni 检验进行两两比较。纳入单因素分析中 $p < 0.05$ 的指标进入多因素模型, 再根据赤池信息准则 (AIC) 进行多因素双向逐步 Logistic 回归分析, 并构建列线图模型。

结果 三组间肿瘤位置、生长方法、形态、坏死、溃疡、供血动脉、血管样强化、病灶周围脂肪阳性征、静脉期 CT 值、静脉期增强幅度、肿瘤长径存在统计学差异 (均 $p < 0.05$)。成功创建两个列线图模型。以低风险组为参照, 预测高风险 GST 的独立危险因子包含肿瘤位置、溃疡和肿瘤长径, 该预测模型的 ROC 曲线下面积 (AUC) 为 0.911 (95% CI: 0.872 - 0.951), 灵敏度和特异度分别为 80.0%、89.0%。以中风险组为参照, 预测高风险 GST 的独立危险因子含肿瘤形态、坏死和血管样强化, 该预测模型的 AUC 为 0.826 (95% CI: 0.759 - 0.893), 灵敏度和特异度分别为 85.7%、70.8%。

结论 MSCT 预测 GST 的病理 AFIP 危险度分级具有一定价值, 特别区分高风险和非高风险具有较高价值, 能为患者的治疗前提供一定影像学依据。

PO-1747

基于 LI-RADS v2018 对肝细胞癌 CK19 表达风险分层及术后复发预测价值

鲁梦恬、张学琴、张涛、瞿琦

南通市第三人民医院

目的: 探讨 2018 版肝脏影像报告和数据系统 (LI-RADS v2018) 对肝细胞癌 (HCC) 细胞角蛋白 19 (CK19) 表达的术前预测及预后评估的价值。

方法: 回顾性纳入 220 例术前接受 MRI 检查并经病理证实的 HCC 患者, 包括 CK19 阳性组 59 例, CK19 阴性组 161 例。总患者分为训练集和验证集, 比较组间临床、病理及影像资料。通过 Logistic 回归分析确定 HCC-CK19 表达的独立预测因素并构建列线图评分模型。采用受试者工作特征 (ROC) 曲线分析模型诊断效能。计算患者的列线图得分并进行高低风险分组, 采用 Kaplan-Meier 生存曲线比较不同亚组患者的总体、早期及晚期无复发生存率 (RFS)。采用时间依赖性 ROC 曲线下面积 (tdAUC) 分析 CK19 预测模型对 HCC 术后复发的预测效能。

结果: 甲胎蛋白 (AFP) 水平 ($P=0.012$; OR=1.002)、靶样弥散受限 ($P=0.003$; OR=17.667)、环形动脉期高强化 ($P=0.016$; OR=12.932)、晕状强化 ($P=0.011$; OR=5.041)、不光滑肿瘤边缘 ($P=0.019$; OR=4.412) 及肝胆期相对增强比 (RER) ($P=0.023$; OR=0.026) 是 HCC-CK19 表

达的独立预测因素,模型在训练集和验证集的 AUC 分别为 0.896、0.711。CK19 阳性与阴性组的总体 RFS、高与低风险组的总体(及早、晚期)RFS 之间均存在显著差异($P<0.05$)。CK19 风险评分预测 HCC 术后复发的 tdAUC 在第 1-6 年分别为 0.619、0.607、0.578、0.612、0.622、0.565。

结论:LI-RADS v2018 结合其他 MRI 征象可对 HCC 的 CK19 表达进行术前风险预测,并有助于预测 HCC 术后复发。

PO-1748

嗜酸性实性和囊性肾细胞癌:一例新型肾脏肿瘤的病例报告

余韩^{1,2}、张伟国^{1,2}、向晗^{1,2}、王舒楠^{1,2}、熊坤林^{1,2}

1. 陆军军医大学大坪医院

2. 重庆市影像与核医学临床研究中心

目的:第五版 WHO 肾脏肿瘤新分类将嗜酸性实性囊性肾细胞癌(Eosinophilic solid and cystic renal cell carcinoma, ESC-RCC)作为一种以形态学定义的新肾细胞癌亚型,因具有独特的形态特征、镜下特征及免疫表型而被熟知,通常表现为惰性的生物学行为,这使得在影像上很难与其他良性肾脏肿瘤区分开。然而,由于罕见的发病率,目前关于它的影像学报道甚少。因此,本文旨在通过个案病例报道,加深对其影像学特点理解,从而在临床工作中减少误诊。

方法:通过回顾性个案病例报道,结合其他相关文献,描述、总结 ESC-RCC 独特的病理、免疫组化及影像学特点,在此基础上,提出并强调其影像学特点及鉴别诊断要点。

结果:本例为男性,40 岁,平素无特殊及肾癌三联征,MRI 表现为左肾上极皮质的囊实性肿块,大小约 30mm×35mm,肿块突出于肾轮廓之外,见假包膜,信号不均匀,囊性成分主要位于肿瘤边缘,实性成分呈稍长 T2 信号。DWI 示肿瘤呈不均匀高信号,实性成分 ADC 值减低。增强扫描皮质期肿块呈明显不均匀强化,强化程度弱于肾皮质,囊性成分未见强化,延迟期强化程度减退。镜下呈实性区及囊性区混合生长结构,实性区肿瘤细胞呈巢状排列,胞质丰富,呈显著嗜酸性;细胞核呈圆形或卵圆形,可见明显核仁,约相当于 ISUP2/3 级,间质中可见局灶性泡沫细胞和淋巴细胞浸润。免疫组化标记显示 CK20、RCC 抗原均不同程度阳性表达,CD117、CK7、CA-IX、TFE3 表达均为阴性。

结论:ESC-RCC 作为一种新肾细胞癌类型,具有独特的形态学、病理及影像学特点。实性和囊性的混合生长结构具有特异性,胞质内见具有诊断意义的嗜酸性颗粒,CK20 阳性/CD117 阴性是最重要的诊断免疫组化标记物及鉴别要点。特征性影像学特点上为囊实性肿块影,大小不一的囊性成分主要位于肿瘤边缘区,但尚需大样本数据总结。

PO-1749

肝血管瘤 CT 增强诊断分型与肝固有动脉直径相关性研究

王娇、贾科峰

天津市第三中心医院

目的 探讨不同血供分型血管瘤的 CT 增强扫描影像学表现特点,并分析血供分型与肝固有动脉直径的相关性。方法 回顾性分析 2019 年 1 月—2021 年 9 月经影像或临床明确诊断为肝血管瘤的患者资料与图像。根据其动脉期强化特征将其分为高速灌注、中速灌注与低速灌注三组。分类标准如下:高速灌注为动脉期出现中心填充趋势,表现为斑片状、片状强化;中等灌注动脉期填充部分血窦、勾勒部分病灶边缘,表现为结节状、线状强化;低速灌注为病灶边缘少许血窦填充,表现为边缘点状强化。测量患者肝固有动脉直径、病灶直径,分析其血流灌注快慢与肝固有动脉直径、病灶直径的相关性。结果 入组的 111 例病灶中,高速灌注 57 例,中速灌注 18 例,低速灌注 36 例。高速灌

注、中速灌注的肝固有动脉直径均大于低速灌注, 差异有统计学意义 ($P < 0.05$)。中速、高速灌注的肝固有动脉直径比较, 差异无统计学意义 ($P > 0.05$)。将高速灌注、中速归为富血供型血管瘤, 低速灌注归为乏血供型血管瘤。绘制两组间肝固有动脉 ROC 曲线, 曲线下面积 (AUC) 为 0.788, 截断值为 4.2cm, 敏感性 77.3%, 特异度为 75.0%。另外, 三组之间的病灶直径比较, 差异无统计学意义 ($P > 0.05$)。结论 CT 增强扫描可以显示肝血管瘤的灌注特点并对其进行分型。肝固有动脉直径大小是肝血管瘤的灌注的影响因素, 测量其大小有助于肝血管瘤血供分型。

PO-1750

扩散峰度成像在胃印戒细胞癌的诊断效能

苑乐添
山东省立医院

目的: 探究扩散峰度成像 (diffusion kurtosis imaging, DKI) 在诊断印戒细胞癌与非印戒细胞癌的诊断效能。

材料和方法: 前瞻性的收集在山东第一医科大学附属省立医院住院的胃癌患者 94 例的 MRI 图像。根据病理结果将其分为印戒细胞癌组 45 例, 非印戒细胞癌 49 例。参考 T1WI 及 T2WI 图像, 选择肿瘤的最大截面及其上、下邻近两个截面, 将感兴趣区(region of interest, ROI)选在病灶的实性部分。将所有 ROI 的测量值的平均值作为测量最终数值。将符合正态分布的数据用平均数 \pm 标准差 ($\bar{x} \pm s$) 表示, 组间比较采用独立样本 t 检验; 不符合正态分布的数据表示为中位数 (M) 或四分位数间距 (Q1, Q3), 组间比较采用多个独立样本非参数检验。采用受试者工作特性曲线 (receiver operating characteristic, ROC) 来分析具有统计学差异的成像参数鉴别印戒细胞癌与非印戒细胞癌的诊断效能, 并且通过计算曲线下面积 (area under curve, AUC) 来确定阈值、敏感度和特异度等诊断效能相关参数。 $P < 0.05$ 为差异具有统计学意义。

结果:

①印戒细胞癌与非印戒细胞癌之间的 ADC 值与 D 值均存在统计学差异 ($P < 0.05$), 印戒细胞癌与非印戒细胞癌之间 K 值不具有统计学差异 ($P > 0.05$);

②D 值和 ADC 值鉴别印戒细胞癌与非印戒细胞癌的 AUC 值分别为 0.837 (95%CI: 0.787~0.971)、0.744 (95%CI: 0.801~0.980)。ADC 值以 $1.142 \times 10^3 \text{mm}^2/\text{s}$ 为临界值时, 其敏感度和特异度分别为 77.93%, 85.36%; D 值以 $1.157 \times 10^3 \text{mm}^2/\text{s}$ 为临界值时, 其敏感度及特异度分别为 83.17%, 92.85%。

结论: 扩散峰度成像具有鉴别区分印戒细胞癌与非印戒细胞癌的潜能, 其中 ADC 值与 D 值具有较高的诊断效能。

PO-1751

不同治疗方案下输尿管结石能谱 CT 参数的改变

苏彤、余成龙、白燕华、张凌飞
宁夏回族自治区中医医院暨中医研究院

目的: 初步探讨单源双能量 CT (SS-DECT) 能谱扫描模式 (GSI) 在手术及非手术两种治疗方案输尿管结石的成分评估中的应用价值。

方法: 收集输尿管结石患者 41 例, 患者行单源双能量 CT 扫描, 然后进行 DECT 数据采集。设置 80~140Kv 瞬时自动切换, 管电流采用自动 mA, 噪声指数 (NI) 10。在结石最大径层面勾画 ROI (面积约最大层面面积 $1/2 \sim 2/3$, 测量两次取平均值), 采集 (羟基灰石 (水), 碳酸氢钙 (水), 尿酸 (羟基灰石), 草酸钙 (水), 磷酸氨镁 (水) 及胱氨酸 (水)) 等数据, 用 flie 格式记录

ROI 的 CT 值、有效原子序数 (Eff-Z) 等能谱信息。采用独立样本 T 检验分析比较组间差异, $P < 0.05$ 为差异具有统计学意义。

结果: (1) 采集的病例中手术治疗 18 例 (平均年龄 47 ± 10.94), 非手术治疗 14 例 (平均年龄 49.08 ± 8.47), 9 例未能随访。(2) 手术组与非手术组结石的 CT 值分别为 (1461.61 ± 504.04)HU, (902.37 ± 436.94)HU, Eff-Z 值分别为 12.54 ± 1.0 、 11.11 ± 1.53 。两组间差异均有统计学意义 ($t = 2.558$, 2.535 , $P = 0.020, 0.021$)。 (2) 对照能谱能谱有效原子序数参考值表, 手术组包括 10 例钙结石 (包括草酸钙和磷酸氢钙), 4 例鸟粪石及 4 例半胱氨酸结石。非手术组结石包括 2 例钙结石, 2 例鸟粪石, 2 例尿酸结石及 8 例半胱氨酸结石。手术组各基物质对参数明显高于非手术组, 尿酸 (羟基灰石) 差异无统计学意义 ($P > 0.05$), 其余各组参数差异有统计学意义 ($P < 0.05$)。相同结石成分条件下, 各组基物质对参数间差异无统计学意义 ($P > 0.05$)。

结论: 大量研究证明, 输尿管结石的 CT 值及有效原子序数值 (Eff-Z) 对鉴别结石成分具有一定的临床意义。本研究病例收集病例数较少, 也可加大样本量进行进一步探讨。

PO-1752

透明细胞肾癌的诊断和病理相关分析: 一项基于 CT 直方图的初步研究

苏晟

南京医科大学第二附属医院

目的: 评价 CT 直方图 (CT histogram, CTH) 定量参数及参数联合对透明细胞肾癌 (clear cell renal cell carcinoma, ccRCC) 诊断价值和效能; 与术后病理指标作对照, 评估 CTH 定量指标是否能够预测肿瘤分化程度。方法: 采用回顾性研究方法, 收集 2019 年 1~12 月手术病理证实的 ccRCC 病例 66 例 (67 个肿瘤)。所有病例术前接受 CT 增强三期扫描, 包括皮质期、髓质期和排泄期。两位放射科医师采用 Omini-Kinetics 软件分别于增强三期图像瘤区和对照区勾画感兴趣区, 合计得到参数 32 个 (30 个直方图参数和 2 个瘤区容积参数)。比较瘤区和对照区 CTH 参数的组间差异; 采用二元 logistic 回归和受试者工作特征曲线 (receiver operator characteristic, ROC), 比较各期 CTH 参数和联合参数对 ccRCC 的诊断价值和效能; 采用 spearman 相关分析, 比较 CTH 参数、瘤区容积参数与病理指标的相关性。结果: 皮质期参数 MedianIntensity、Kurtosis、Entropy, 髓质期参数 MinIntensity, 排泄期参数 MinIntensity、uniformity、skewness 共 7 个参数对 ccRCC 具有诊断价值。ROC 显示联合参数 (髓质期 MinIntensity+排泄期 MinIntensity+排泄期 uniformity) 诊断效能最高 (敏感性=95.5%, 特异性=98.5%, $AUC = 0.996$)。排泄期 MinIntensity、skewness 比值 (瘤区/对照区) 与 Fuhrman 分级呈统计学负相关; 瘤区容积相关参数与 Fuhrman 分级、Ki-67 计数呈统计学正相关。结论: CTH 定量参数和联合参数反应肿瘤的异质性, 对 ccRCC 具有诊断效能; 结合瘤区容积测量, 能够有效预测 ccRCC 的病理分级和分化程度。

PO-1753

多材料分离技术重建虚拟平扫 CT 图像： 评估儿童肝脏肿瘤的诊断价值

魏伟安

湖南省儿童医院

目的：通过多材料分解后的虚拟平扫对儿童肝脏肿瘤的定量分析，评估虚拟平扫（VUE）替代真实平扫（TUE）并减少辐射剂量的可行性。

方法：回顾性分析 24 例肝肿瘤患儿的动脉、门脉期 VUE，与 TUE 进行定量和定性对比。采用方差分析比较肝实质、肝肿瘤肌肉的 CT 和 SNR、CNR 以及背景噪声 SD，通过 Pearson 分析三者相关性、绘制 Bland-Altman 图。计算病灶和钙化灶的检出率，同时分别评价病灶的显示能力。

结果：富血供与乏血供肝肿瘤分别各 12 例，三组肝实质 CT 值和 CNR 值差异无统计学意义，其余参数的差异均有意义。VUEa 和 VUEpv 所有参数均无差异，且两者的肝实质和肝肿瘤 CT 值的存在显著关联性（ $r=0.878/0.972$, $p<0.001$ ）。VUEa、VUEpv 与 TNC 的肝实质 CT 值具有较强的关联性（ $r=0.787/0.802$, $p<0.001$ ），VUEpv 与 TNC 的肝肿瘤 CT 值的关联性一般（ $r=0.497$, $p=0.014$ ），而 VUEa 与 TNC 的肝肿瘤 CT 值无关联性（ $r=0.394$, $p=0.057$ ），但肝肿瘤中的非富血管灶提示 VUEa 与 TNC 存在显著关联性（ $r=0.749$, $p=0.005$ ）。Bland-Altman 图显示与 TNC 的肝肿瘤 CT 值相差 10HU 以上的病灶 VUEa 有 6 例，VUEpv 有 7 例，其中富血管病灶居多。肝肿瘤检测能力分别为 TNC（76/111, 68.47%），VUEa（64/111, 83.78%），VUE(PV)（93/111, 83.78%），VUEpv 与 TNC 对肝肿瘤的显示能力、内部结构和图像整体质量的评分均无差异，除了 TNC 的肝肿瘤显示能力与 VUEa 无差异，其余评分均优于 VUE（A）。

结论：VUE 可以替代 TNC 图像，两者的肝实质与肝肿瘤的 CT 值具有一定关联性，其中，VUEpv 提高了肝肿瘤病变显示及内部结构改变，并进一步减少辐射剂量与扫描时间。

PO-1754

增强 CT 量化分级奥沙利铂相关肝窦损伤

郭婷婷

南昌大学第二附属医院

摘要 目的：探讨 3Dslicer 软件图像分割技术在奥沙利铂化疗后出现肝窦损伤病人的肝脏组织损伤划分方法的可行性，分析肝脏总容积和肝窦损伤低灌注容积的变化规律。方法：回顾接受奥沙利铂相关化疗患者 CT 影像资料，纳入 24 例奥沙利铂化疗后出现显著肝窦损伤患者，收集患者化疗前、化疗后各周期患者的上腹部增强 CT 门静脉期图像。设计自身对照，将患者分为三组：化疗前组（手术后未进行第一次化疗的时期）、化疗中期组（化疗后开始出现肝窦损伤的时期）、化疗后期组（化疗后肝窦损伤最显著的时期），由 2 名医生分别运用 3Dslicer 软件勾画并测量各组图像的肝脏总容积（ILV）及肝窦损伤低灌注容积（HSHV），计算肝脏总容积增大百分比（PIILV）和肝窦损伤低灌注容积增大百分比（PIHSHV），进行统计学分析。结果：2 名医生对肝脏总容积和肝窦损伤低灌注容积的测量结果具有较好的一致性（Kendall=0.945, $P<0.05$ ）。肝脏总容积（ILV） 化疗后期组大于化疗前组[（1208.963±208.275）cm³vs（1118.764±241.775）cm³, $P<0.05$]，化疗后期组肝脏总容积增大百分比（PIILV）约为 10.06 %（ $P<0.05$ ）。肝窦损伤低灌注容积（HSHV） 化疗后期组大于化疗前组、化疗后期组大于化疗中期组[（376.761±68.524）cm³, $P<0.05$ vs（235.949±59.633）cm³, $P<0.05$]，化疗中期组及化疗后期组的肝窦损伤低灌注容积增大百分比（PIHSHV）约为 19.78%、30.26%（ $P<0.05$ ）。结论：应用 3Dslicer 软件可对奥沙利铂相关肝窦损伤的肝实质进行三维重建，并预测肝脏总容积和肝窦损伤低灌注容积的变化规律。

随着化疗周期的增加肝脏总容积逐渐增大,肝窦损伤低灌注容积也逐渐增大,肝窦损伤最显著时期肝脏总容积约为化疗前的 110.06%,肝窦损伤低灌注容积约为化疗前的 130.26%。

PO-1755

酰胺质子转移加权和脂肪定量测量技术评估子宫内膜癌淋巴血管间隙浸润

田士峰、刘爱连
大连医科大学附属第一医院

目的 探讨酰胺质子转移加权 (APT_w) 和脂肪定量测量 (mDIXON-Quant) 技术评估子宫内膜癌 (EC) 淋巴血管间隙浸润 (LVSI) 的价值。**材料和方法** 回顾性分析经手术病理证实的 50 例 EC 患者资料,其中有 LVSI 者(LVSI(+))18 例,无 LVSI 者(LVSI(-))32 例,术前 MR 扫描序列包括 APT_w 和 mDIXON-Quant,经后处理获得 APT、横向弛豫率 (R2*)、脂肪分数 (FF) 图。测量两组病例的 APT、R2*和 FF 值,采用独立样本 t 检验或 Mann-Whitney U 检验比较两组病例各参数值的差异,采用受试者工作特征曲线评价有统计学差异的参数及其联合后评估 LVSI 的效能,采用 Delong 检验比较各曲线下面积 (AUC) 之间的差异,采用 Pearson 相关分析评价 APT 值与 R2*、FF 值的相关性。**结果** LVSI(+EC) 的 APT、R2*和 FF 值分别为 2.947±0.399 %、20.605 (18.525, 27.953) /s 和 2.234±1.047 %, LVSI(-)EC 的上述参数值分别为 2.628±0.307 %、18.968 (16.225, 20.544) /s 和 2.103±1.070 %, LVSI(+EC) 的 APT、R2*值高于 LVSI(-)者 (P<0.05), 两组之间的 FF 值无差异 (P>0.05)。APT、R2*、APT+R2*值评估 LVSI 的 AUC 分别为 0.751、0.713、0.781, 各 AUC 之间无统计学差异 (P>0.05)。APT 值与 R2*值呈中等正相关 (r=0.528, P<0.001), APT 值与 FF 值呈弱的正相关 (r=0.312, P=0.027)。结论 APT_w 和 mDIXON-Quant 技术均可有效评估 EC LVSI, 联合应用可提升评估效能。

PO-1756

基于临床- CT 影像组学动态列线图预测 T1~2 期直肠癌淋巴结转移

吴树剑、俞咏梅
皖南医学院弋矶山医院

目的 探讨临床特征联合 CT 影像组学构建的动态列线图在预测 T1~2 期 RC 发生 LNM 的价值。**方法** 收集皖南医学院一附院 183 例 T1~2 期 RC 患者的完整资料。按 7:3 随机分为训练组 (n=128) 及内部验证组 (n=55), 另选取芜湖市第二人民医院 54 例患者为外部验证组, 根据 LN 状态分为 LNM 组与 NLNM 组。利用 MaZda 软件提取纹理特征, LASSO 回归降维筛选最优特征, 基于最优特征构建影像组学标签评分 (radscore)。采用单因素与多因素 logistic 回归分析筛选独立危险因素, 构建联合预测模型, 绘制模型的动态列线图及校准曲线。利用受试者工作特征 (ROC) 曲线及曲线下面积 (AUC) 评价模型的区分度, 利用赤池信息准则 (AIC)、贝叶斯信息准则 (BIC) 及 delong 检验比较各模型效能, 临床决策曲线 (DCA) 评价模型的临床适用性。**结果** LASSO 回归筛选出 3 个最优特征, 单因素与多因素 logistic 回归肿瘤 T 分期、碳水化合物抗原 (CA19-9)、中性粒细胞与淋巴细胞比 (NLR)、影像淋巴结短径及 radscore 为独立危险因素。联合模型 AUC 训练组、内部验证组及外部验证组分别为 0.877、0.831、0.797, 联合模型 AIC 与 BIC 值均最低, delong 检验联合模型诊断效能最高 (均 P<0.05), 校准曲线及 DCA 表明联合模型具有较高的校准度及很好的临床适用性。

结论 临床特征联合 CT 影像组学构建的动态列线图模型能够有效的预测 T1~2 期 RC 患者 LN 状态, 且动态列线图可直接输出个体预测结果, 有助于外科医师为患者制定最佳治疗方案。

PO-1757

MiT 家族易位性肾癌影像诊断与鉴别诊断

赵娜、史彬、陈东、宋德梅、曹锋、高飞、董江宁

中国科学技术大学附属第一医院(西区)、安徽省肿瘤医院

[摘要] 目的: 探讨 MiT 家族易位性肾细胞癌 (MiT RCC) 的影像表现及与肾透明细胞癌 (CCRCC) 及乳头状肾细胞癌 (PRCC) 的鉴别诊断价值。方法: 选择经手术病理证实的 11 例 MiT RCC 患者 CT 及 MRI 影像资料, 分析患者的性别及年龄、病灶大小、形态、出血、假包膜、强化模式、生长方式以及对周围组织侵犯等影像学特征, 并与 11 例 CCRCC、11 例 PRCC 的影像特点对照分析。结果: 11 例 MiT RCC 患者中男 3 例, 女 8 例。患者年龄 10-73 岁, 平均年龄 33.18 ± 17.41 岁。11 例 MiT RCC 和 11 例 CCRCC、11 例 PRCC 三组间分析结果显示, 年龄、性别、肿块位置、有无假包膜、有无出血、发病年龄分布、强化程度的三组间差异具有统计学意义 ($p < 0.05$); 肿块大小及形态、钙化、坏死囊变、强化模式、生长方式、对组织侵犯以及转移征象无统计学差异 ($p > 0.05$)。MiT RCC 相比 CCRCC、PRCC 发病年龄更小, 女性更多见, 出血发生率更高, 更易表现为肾髓内生长, 假包膜 MiT RCC 及 CCRCC 发生率均较高, 明显高于 PRCC ($p < 0.05$); 强化程度 $CCRCC > MiT RCC > PRCC$ ($p < 0.01$)。结论: MiT RCC 的影像学表现有一定特征性, 结合好发于 30 岁以下的儿童及年轻人、出现肾轮廓内肿块伴出血、钙化、假包膜、多发淋巴结及远处转移, 有助于提高术前诊断率。

PO-1758

Gd-EOB-DTPA 增强 MRI 和 CT 对粗梁-团块型肝细胞癌患者的预测价值

李晓明、成杰、蔡萍

中国人民解放军陆军军医大学第一附属医院

目的: 对比钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 和 CT 影像学特征对粗梁-团块型肝细胞癌 (MTM-HCC) 的预测能力, 并筛查影响 MTM-HCC 患者无病生存期 (DFS) 的预后因素。方法: 本回顾性研究共纳入 316 例经手术证实的 HCC 患者, 其中 MTM-HCC 患者 91 例, 非 MTM-HCC 患者 225 例。利用统计学方法比较两组患者的临床及影像学特征, 采用多变量逻辑回归分析筛查独立危险因素, 绘制受试者工作曲线评价模型的预测效能, 利用 R 软件构建可视化诺莫图, 并绘制 Calibration 校准曲线评估诺莫图性能。结果: Gd-EOB-DTPA 增强 MRI 影像征象对 MTM-HCC 的预测效能 (ROC 曲线下面积为 0.797, 95% CI: 0.741 ~ 0.854, $P < 0.001$) 略高于 CT (ROC 曲线下面积为 0.763, 95% CI: 0.701 ~ 0.824, $P < 0.001$), 但两者间差异无统计学意义 ($P = 0.089$)。基于 2 个临床因素 (AFP 和 PT-INR) 和 Gd-EOB-DTPA 增强 MRI 的四个影像学特征包括无瘤内脂肪、动脉期瘤周强化、包膜不完整和肝胆期瘤周低信号构建的可视化诺莫图对 MTM-HCC 的术前分类和术后 1 年 DFS 具有较高的预测价值, ROC 曲线下面积分别为 0.812 和 0.711。结论: Gd-EOB-DTPA 增强 MRI 对 MTM-HCC 的预测效能与 CT 相当。基于 Gd-EOB-DTPA MRI 影像特征和临床因素构建的诺莫图对 MTM-HCC 术前分类和术后超早期复发风险具有较好预测价值。

PO-1759

双能量螺旋 CT 肝脏门静脉海绵样变性成像扫描技术

景建梅

空军军医大学西京医院

目的：通过造影剂团注追加盐水的对比研究，探讨双能量螺旋 CT 肝脏门静脉成像的最佳扫描技术和延迟时间。

方法：选取肝脏门静脉高压和肝脏门静脉海绵样变性患者各 30 例。分别以 90ml 和 100ml 对比剂，并在对比剂团注后分别追加 16ml 和 20ml 盐水。获得大小两次剂量到达峰值，并且肝脏内血管对比剂填充最充分的时间，分别计算两类患者肝脏门静脉到达峰值的平均时间和差值。

结果：双能量螺旋 CT 肝脏门静脉成像，对于肝脏门静脉高压患者，给予 90ml 造影剂，流速 3.2ml/s，追加 16ml 盐水冲管，流速 4.0ml/s。对于肝脏门静脉海绵样变性患者，剂量 100ml，流速 3.5ml/s 追加盐水 20ml，流速 5.0ml/s。在造影剂开始团注后 28 秒开始动脉期扫描，延时 18 秒后进行门脉期扫描，再延时 45 秒进行延迟期扫描。门脉期门静脉的 CT 值为 175~210HU，平均 190HU。门脉期腹主动脉 CT 值比门静脉低 40~50HU。

结论：通过造影剂的快速团注及追加大于造影剂盐水的冲管，可以使门静脉高压患者以及门静脉海绵样变性患者的门静脉在 55 秒~60 秒的门脉期充盈良好，并且与主动脉等大动脉形成良好的 CT 差值，方便图像的后期处理以及三维重建效果。

PO-1760

基于转录组学的直肠癌新辅助放化疗抵抗 差异基因筛选与图像识别

赵青、张红梅、赵心明

中国医学科学院肿瘤医院

目的：探索局部进展期直肠癌（LARC）患者新辅助治疗（NCRT）抵抗的基因转录差异，筛选差异基因并分析其与 MRI 征象相关性及潜在生物学机制。

方法：回顾性纳入 25 名 2021 年于我院行 NCRT 及根治性手术的 LARC 患者，其中包括 19 例 NCRT 敏感者（Dworak TRG 3-4）和 6 例 NCRT 抵抗者（Dworak TRG 0-2）。获取患者的直肠活检标本进行全转录组 RNA 测序，筛选影响 NCRT 敏感性的差异表达基因并进行功能富集分析。卡方检验对比两组患者临床资料及直肠 MRI 征象差异。

结果：全转录组 RNA 测序共识别出 NCRT 抵抗者存在 604 个上调表达和 1112 个下调的差异表达基因，功能富集分析显示上述基因差异表达可引起淋巴细胞的增殖活性降低和激活状态受阻。NCRT 抵抗组和敏感组患者的临床特征均不具有显著差异，MRI 显示 NCRT 抵抗者直肠癌原发灶更倾向于表现为 T2WI 信号增高（6/19 VS. 5/6, $P=0.026$ ），直肠系膜筋膜内索条影增多（7/19 VS. 5/6, $P=0.047$ ）和脂肪相对体积减少（4/19 VS. 4/6, $P=0.037$ ）。

结论：本研究揭示了 NCRT 抵抗的 LARC 原发灶微环境免疫抑制状态及相关差异表达基因，MRI 检查肿瘤 T2WI 信号增高、直肠系膜筋膜内索条影增多及脂肪相对体积减少可能对微环境改变和 NCRT 抵抗具有提示意义。

PO-1761

基于 MRI 影像组学的直肠癌新辅助放化疗 抵抗预测与肿瘤微环境研究

赵青、张红梅、赵心明
中国医学科学院肿瘤医院

目的: 基于基线 MRI 影像组学在治疗前预测局部晚期直肠癌 (LARC) 患者新辅助放化疗 (NCRT) 抵抗, 并分析其微环境特征。

方法: 回顾 180 例入组的 LARC 患者临床资料, 并按 7:3 比例随机分为训练集 (126 例) 和验证集 (54 例)。两名放射科医生在基线直肠 MRI-T2WI 连续层面勾画肿瘤感兴趣区 (ROI) 并提取组学特征。根据 Dowrak 肿瘤退缩分级 (TRG) 评价病理反应, 定义治疗抵抗为 TRG 0-2, 治疗敏感为 TRG 3-4。利用肠镜活检切片评估肿瘤间质比 (TSR), 免疫组化评估 CD3、CD8 和 HIF- α 表达水平。分别采用六种机器学习算法构建临床-组学模型预测 NCRT 抵抗, 并对比模型性能。

结果: NCRT 抵抗者 82 例, 敏感者 98 例。TSR 升高 (HR=3.458, $P<0.001$) 是治疗抵抗的唯一临床危险因素。共有 9 个放射组学特征与治疗反应显著相关。随机森林算法在训练集 (AUC: 0.9833, $P=0.002$) 和验证集 (AUC: 0.8224, $P=0.036$) 中表现最优。治疗抵抗患者 CD3、CD8 表达明显降低 ($P=0.035$), HIF- α 表达明显升高 ($P=0.02$)。

结论: 我们构建了治疗前预测 LARC 患者 NCRT 抵抗的模型, 并证实了直肠癌微环境显著影响肿瘤治疗敏感性。

PO-1762

基于 CTE 影像组学模型预测肠道克罗恩病炎症活动度的价值

金军¹、莫信¹、曹晋博¹、王静¹、朱凯¹、王玉理²

2. 深圳大学第一附属医院 (深圳市第二人民医院) 医学影像科

[摘要] 目的 探讨基于 CT 小肠造影 (CTE) 的影像组学模型 (RM) 对肠道克罗恩病 (CD) 活动性炎症的诊断价值。方法 回顾性分析 105 例病理确诊为肠道 CD 患者的 CTE 图像和临床资料, 以临床经典克罗恩病活动度评分 (CDAI) 为参照标准分为无-轻度活动组和中-重度活动组。按 8:2 比例随机选取 84 例作为训练组 (43 例阳性, 41 例阴性), 另外 21 例作为试验组 (11 例阳性, 10 例阴性)。使用 ITK-Snap 对 CTE 静脉期图像上的所有病变区域 (包括肠道外病灶) 进行手动勾画, 提取特征后用 DARWIN 软件进行特征降维。采用极致梯度提升 (XGBOOST) 建立二分类 RM, 并应用到测试集进行验证, 计算敏感度、特异度和曲线下面积 (AUC)。最后, 应用 AUC 评估 RM 对肠道 CD 活动性炎症的诊断效能及最佳诊断阈值。结果 在训练集中, RM 区分无-轻度活动性及中-重度活动性的 AUC 为 0.93, 敏感度为 90.2%, 特异度为 83.7%; 在验证集中, AUC 为 0.86, 敏感度 90%, 特异度为 81.8%。结论 基于 CTE 的影像组学模型可准确、客观、有效地评估肠道 CD 活动度。

PO-1763

定量磁化率成像技术在直肠癌不同病理特征中的初步应用探讨

张海妮

徐州医科大学附属医院

目的 探讨基于 QSM 技术的定量磁化率值在直肠癌不同病理学特征中的差异。方法 回顾性分析 2022 年 10 月-2023 年 2 月于我院进行直肠 MRI 检查的患者资料。使用运行在 MATLAB version 2018b 软件的 STI_Suite V3.0 对扫描获得的 QSM 原始图像进行后处理,得到 QSM 加权图像。将 QSM 加权图像导入 FireVoxel build 394D 软件进行图像分割。由两名具有 20 年以上直肠癌 MRI 诊断经验的高级职称医生,在距离肿瘤外缘内侧 1mm 处分割最大层面内的肿瘤组织,软件自动计算出肿瘤组织的磁化率直方图。采用 SPSS 26.0 统计软件进行数据分析。观察者间的一致性程度采用组内相关系数检验 (ICC)。不同临床病理学特征间组织磁化率直方图结果的比较,采用独立样本 t 检验。 $P < 0.05$ 认为差异具有统计学意义。结果 本研究纳入 28 名患者。T3-4 期直肠癌第 60、70、80、90 百分位的顺磁效应明显高于相应的 T1-T2 期直肠癌 [(60th: $-0.087 \pm 0.05 \text{ ppm}$ 比 $-0.036 \pm 0.067 \text{ ppm}$)、(70th: $-0.048 \pm 0.046 \text{ ppm}$ 比 $0.009 \pm 0.072 \text{ ppm}$)、(80th: $-0.009 \pm 0.042 \text{ ppm}$ 比 $0.055 \pm 0.081 \text{ ppm}$)、(90th: $0.030 \pm 0.043 \text{ ppm}$ 比 $0.101 \pm 0.091 \text{ ppm}$)], 均 $P < 0.05$, 差异具有统计学意义], 随着百分位的增加,病灶顺磁性效应降低,逆磁性效应增加。脉管癌栓阳性组第 50、60、70、80、90 百分位的顺磁效应高于脉管癌栓阴性组 (P 值均 > 0.05)。同时,随着百分位的增加,病灶顺磁性效应降低,逆磁性效应增加。神经侵犯阳性组、阴性组的组织磁化率直方图参数结果 P 值均 > 0.05 , 差异均不具有统计学意义。结论 基于 QSM 技术的定量磁化率值直方图分析可以反映直肠癌的不同病理学特征差异。

PO-1764

比较小视野多激发平面回波序列 DWI 与常规单激发平面回波序列 DWI 在直肠癌中的应用价值

张海妮

徐州医科大学附属医院

目的 比较直肠癌 rFOV IRIS-DWI 序列与 fFOV ssEPI-DWI 序列的图像质量。方法 回顾性分析 2022 年 10 月-2022 年 12 月于我院进行直肠 MRI 检查的患者资料。所有入组患者均完成小视野基于图像空间重建技术 DWI (rFOV IRIS-DWI) 序列、常规视野单激发平面回波 DWI (fFOV ssEPI-DWI) 序列。所有图像均传至 Philips IntelligenceSpace Portal 后处理工作站分析。由两名具有 20 年以上直肠癌 MRI 诊断经验的高级职称医生,采用双盲法分别评估两组 DWI 图像。图像质量评价包括主观评价和客观评价。主观评价采用 5 分制进行评分,包括总体图像质量、图像伪影、图像变形、病变对比度、图像解剖结构。客观评价包括肿瘤最大层面面积、肿瘤平均最大面积、ADC 值、肿瘤信号噪声比 (SNR) 和对比信号噪声比 (CNR)。采用 SPSS 26.0 统计软件进行分析。两组 DWI 的图像质量主观评分比较采用配对 Wilcoxon S 秩和检验,客观图像质量比较采用配对样本 t 检验。 $p < 0.05$ 表示差异有统计学意义。结果 本研究纳入 30 例患者,平均年龄为 63.2 ± 10.6 岁。rFOV IRIS-DWI 序列主观评价中的图像总体质量、变形、伪影、对比度、解剖结构均优于 fFOV ssEPI-DWI 序列 ($p < 0.05$)。rFOV IRIS-DWI 序列 ADC 值明显低于 fFOV ssEPI-DWI 序列,分别为 $0.86 \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $1.08 \times 10^{-3} \text{ mm}^2/\text{s}$ ($p = 0.000$)。rFOV IRIS-DWI 序列的最大层面面积、平均最大面积均大于 fFOV ssEPI-DWI 序列 ($p < 0.05$)。结论 相对于 fFOV ssEPI-DWI 序列,rFOV IRIS-DWI 序列能明显提高直肠癌图像分辨率,减轻磁敏感伪影、图像变形,提高图像质量。

PO-1765

基于 L3 水平骨骼肌 CT 图像的深度学习模型在胃癌患者生存结局中的预测价值

陈秋颖、张斌、张水兴
暨南大学附属第一医院

目的：探讨基于 L3 水平骨骼肌 CT 图像的深度学习模型与胃癌生存结局的关系，比较其与人体成分参数对胃癌预后的预测价值。

方法：回顾性纳入 2010 年 11 月至 2020 年 12 月期间行胃癌根治性切除术的患者，按 4:1 分为训练队列和测试队列。临床终点事件为无复发生存（Recurrence-free survival, RFS）和疾病特异性生存（Disease-specific survival, DSS）。将每位患者 L3 水平的整个 CT 图像和相应的骨骼肌掩模输入 Transformer 提取特征构建深度学习模型。比较模型与人体成分参数（骨骼肌指数、骨骼肌平均灰度值、体重指数）对 RFS 和 DSS 的预测表现。采用多因素 Cox 回归评估模型评分对胃癌预后的影响。根据最佳截断值将患者分为高、低危险组进行组间生存率比较。分析模型在不同性别、年龄亚人群的漏诊率和误诊率以评估模型公平性。

结果：共收集 1553 例符合标准的胃癌患者。在测试队列中模型表现优越，预测 RFS 和 DSS 的 AUC 值分别为 0.783（95%CI: 0.733-0.827）和 0.716（95%CI: 0.662-0.765），显著高于人体成分参数（AUC 为 0.506-0.529；DeLong 检验，所有 $P<0.001$ ）。模型评分是 RFS（HR: 158.4；95%CI: 90.8-276.3； $P<0.001$ ）和 DSS（HR: 55.1；95%CI: 32.1-94.6； $P<0.001$ ）的一个强大独立影响因素，并对患者具有良好的预后分层作用，高、低危险组间 5 年生存率差异达到 50-77%。模型在服务不同性别、年龄亚人群时的误诊率和漏诊率相似，体现了模型良好的公平性。

结论：基于 L3 水平骨骼肌 CT 图像的深度学习模型作为胃癌生存预后的新型影像生物标志物，可以提供比传统人体成分参数更有价值的信息，能够准确地预测胃癌患者的生存结局，并有效识别复发或死亡高风险患者，辅助临床决策。

PO-1766

联合肿瘤及 L3 水平骨骼肌 CT 图像构建深度学习模型 辅助胃癌预后评估及化疗决策

陈秋颖、张斌、张水兴
暨南大学附属第一医院

目的：探讨整合了胃癌患者术前肿瘤和 L3 水平骨骼肌 CT 图像的深度学习模型是否可以提高预后评估的准确性和辅助化疗决策。

方法：回顾性纳入 1553 例接受了根治性切除术的胃癌患者，并将其随机分配到训练集（ $n=1242$ ）和内部验证集（ $n=311$ ），从另一中心纳入 309 例患者组成外部验证集以评估模型的泛化性。使用 Transformer 开发和验证预测胃癌无复发生存（Recurrence-free survival, RFS）的骨骼肌模型、肿瘤模型和融合模型。通过 C 指数评估不同模型的预测性能，DeLong 检验差异的存在。计算净重分类改善度以量化模型预测准确性的相对提高。观察最优模型对 1、3 和 5 年 RFS 的预测表现，采用校准曲线和决策曲线评估模型校准效果和临床应用价值。将患者分为高、低危险组，利用 Kaplan-Meier 生存分析探讨不同危险组患者与生存结局和全程辅助化疗之间的关联。引入梯度加权类激活映射技术为模型生成可视化解释。

结果：融合了肿瘤和 L3 水平骨骼肌 CT 图像的深度学习模型比基于单一信息源的模型表现更佳，在内部和外部验证集中预测 RFS 的 C 指数为 0.761（95%CI: 0.746-0.783）和 0.755（95%CI: 0.739-0.776），预测分类准确度相对提高了 33.4%。它对 1、3 和 5 年 RFS 的预测在所有队列上

均达到稳定的性能, 且具有良好的校准度和临床获益。模型评分在三个数据集上都可以很好地区分预后不同的患者。对于高危组患者, 接受全程辅助化疗可以提高 RFS (内部验证集 HR: 0.6; 95%CI: 0.4-0.9; P=0.025); 然而, 对于低危组患者, 全程辅助化疗对 RFS 无显著影响 (内部验证集 HR: 1.0; 95%CI: 0.5-1.9; P=0.981)。

结论: 肿瘤和骨骼肌之间的协同作用为胃癌患者提供了一种新型联合影像生物标志物, 考虑这种协同作用将有助于更精准的预后评估和辅助化疗决策。

PO-1767

矢状位 RS-EPI DWI 与 SS-EPI DWI 对直肠病变 DWI 图像质量的影响

马天文
宜昌市第二人民医院

目的: 探讨 3.0TMR 矢状位 RS-EPI DWI 与 SS-EPI DWI 对直肠病变 DWI 图像质量的影响。方法: 搜集经病理证实的 151 例直肠病变患者, 其中恶性肿瘤 126 例, 良性肿瘤 25 例, 均采用飞利浦 3.0TMR 进行矢状位 RS-EPI DWI 和矢状位 SS-EPI DWI 序列检查。由 2 名放射科医师分别对两种序列上的直肠与病灶解剖结构的显示、病灶的清晰度与几何变形进行评分; 同时对图像质量进行客观评价, 评价指标包括病灶性噪比 (SNR)、对比度 (CR)、对比噪声比 (CNR) 以及表观扩散系数 (ADC) 值。采用 Kappa 检验评价两位医师评分的一致性, 采用配对 Wilcoxon 秩和检验和配对样本 t 检验比较两种序列主观评分及定量评估指标的差异。结果 直肠矢状位 RS-EPI DWI 显示直肠与病灶解剖结构、病灶的清晰度与几何变形的分数均高于 SS-EPI DWI (p 均 <0.05)。直肠矢状位 RS-EPI DWI 中的 SNR 和 CNR 高于 SS-EPI DWI (p 均 <0.05); 在矢状位 RS-EPI DWI 与 SS-EPI DWI 之间, 肿瘤的平均 ADC 值无统计学意义 ($p>0.05$)。结论 直肠矢状位 RS-EPI DWI 图像质量优于 SS-EPI DWI, 可常规用于直肠病变 MRI 扫描。

PO-1768

T1MAPPING 定量分析移植肾肾功能的价值

严金国
南京医科大学第二附属医院

摘要: 目的: 需要一种评估移植后肾移植功能的非侵入性方法, 本研究旨在通过 T1-mapping 定量分析技术评估肾移植术后肾功能。方法: 收集我院异体肾移植术后第 12 周的患者 45 例, 均行常规序列和斜矢状面 T1mapping 序列 MRI 检查、SPECT 检查。根据 SPECT 肾动态显像结果, 将患者组分为 2 组: A 组为移植肾功能良好组 (23 例); B 组为移植肾功能受损组 ($n=22$)。分别测量出各组移植肾皮、髓质 T1 值。比较两组内及组间肾脏皮髓质 T1 值的差异, 同时分析移植肾皮质、髓质 T1 值与 eGFR 间的相关性, 采用 ROC 曲线分析 T1 值对不同功能移植肾的鉴别诊断价值。结果: 各组内肾皮质的 T1 值均明显小于肾髓质 ($P<0.01$)。A、B 组肾皮质 T1 值分别为 (1535.95 ± 67.1)、(1663.22 ± 78.8) ms, 各组间的差异均有统计学意义 ($P<0.05$)。A、B 组肾髓质的 T1 值分别为 (1987.95 ± 87.3)、(2056.1 ± 56.5) ms, 各组间的差异均有统计学意义 ($P=0.04$)。移植肾皮质的 T1 值与 eGFR 呈负相关 ($r=-0.47, P<0.01$)。移植肾 T1 值区分移植肾功能损伤与非损伤组时曲线下面积 (AUC) 为 0.74, 灵敏度及特异度分别为 80.5% 及 79.1%。结论: T1-mapping 定量分析技术对评估肾移植术后早期肾功能具有一定价值, 并且可能有助于识别移植后并发症和肾活检的指征。

PO-1769

基于定量 CT 身体组分分析及临床预后因子的列线图预测局部晚期宫颈癌同步放化疗后生存

付宝月
安徽省省立医院西区

目的 探讨同步放化疗 (CCRT) 前后的定量 CT (QCT) 身体组分参数变化在评估局部晚期宫颈癌 (LACC) 患者总生存期 (OS) 和无进展生存期 (PFS) 中的价值, 并联合临床预后因子 (CPF) 构建列线图模型。**方法** 回顾性收集自 2014 年 1 月到 2017 年 10 月经我院病理证实为 LACC 的 88 例患者的临床病理资料。所有患者于 CCRT 前后行 QCT 扫描, 分别测量前后两次 QCT 参数, 包括 L1、L2 骨密度 (BMD) 和 L3 水平皮下脂肪面积 (SFA)、内脏脂肪面积 (VFA)、总脂肪面积 (TFA)、椎旁肌群面积 (PMA), 将 QCT 扫描时间间隔标准化为 180 天, 计算治疗前后的 QCT 参数的变化率。对 QCT 参数和 CPF 进行单因素和多因素生存分析, 筛选出独立预后因子, 并构建列线图模型。结果 多因素 COX 回归分析显示 Δ BMD, Δ SFA, 疗前鳞状抗原 (SCC-Ag) 和淋巴结转移 (LNM) 是 OS 的独立预后因子, Δ PMA, SCC-Ag 和 LNM 是 PFS 的独立预后因子。QCT 参数和 CPF 的联合模型预测效能最高, 曲线下面积 (AUC) 分别是 0.837, 0.846。校准曲线显示了 OS 和 PFS 的列线图模型预测 LACC 患者生存的效能和实际有良好的一致性。结论 QCT 身体组分参数和 CPF 与接受 CCRT 的 LACC 患者的生存密切相关, 基于 QCT 身体组分参数和 CPF 的列线图对预测 LACC 患者 CCRT 后 OS 和 PFS 具有较高的临床价值。

PO-1770

比较小视野 IRIS-DWI 序列和 TSE-DWI 序列在直肠癌中的应用价值

曾建威
徐州医科大学附属医院

目的 比较直肠癌 rFOV IRIS-DWI、rFOV TSE-DWI 序列的图像质量。**方法** 本研究回顾性分析了临床诊断为直肠癌患者的弥散加权成像数据 30 例。所有患者均采用 3.0T MR 扫描仪 (Elition, PHILIPS, 荷兰) 扫描。由一名具有 20 年以上直肠癌 MRI 影像诊断的放射科高级职称医生在 Philips IntelligenceSpace Portal (ISP) 工作站 (版本号 V10.1) 上进行图像分析。图像的评估包括主观图像质量评估和客观图像质量分析。主观图像质量评估采用 5 分的评估标准, 评估图像变形、图像伪影、病变可视度和图像解剖结构清晰的程度。客观图像质量分析包括图像信噪比 (SNR)、对比信噪比 (CNR)、肿瘤 ADC 值、肿瘤最大面积平均值、肿瘤最大层面面积、肿瘤体积。结果 主观图像质量评估中, rFOV TSE-DWI 序列图像相较于 rFOV IRIS-DWI 序列图像, 变形程度更弱、伪影程度更轻 ($P < 0.05$)。在对病变的显示及正常肠壁解剖结构的显示上, rFOV IRIS-DWI 序列明显优于 rFOV TSE-DWI 序列, P 值分别为 0.003、 < 0.001 。客观图像质量分析中, rFOV IRIS-DWI 序列的 ADC 值明显低于 rFOV TSE-DWI 序列, 分别为 $0.86 \times 10^{-3} \text{mm}^2/\text{s}$ 、 $1.07 \times 10^{-3} \text{mm}^2/\text{s}$, 差异具有统计学意义 ($P < 0.001$)。rFOV TSE-DWI 序列的 SNR 明显高于 rFOV IRIS-DWI 序列 ($P = 0.002$)。而 rFOV IRIS-DWI 序列 CNR 明显高于 rFOV TSE-DWI 序列, 分别为 0.85、0.52, 差异具有统计学意义 ($P < 0.05$)。结论 直肠癌 rFOV TSE-DWI 的图像变形和伪影更少, 而 rFOV IRIS-DWI 序列能更好的显示肿瘤、解剖结构。

PO-1771

基于多序列 MRI 的影像组学模型术前预测 早期子宫内膜癌 ki-67 表达水平

丁思萱、孟欢、殷小平

河北大学附属医院

目的：开发和验证基于多序列 MRI 的影像组学模型预测早期子宫内膜癌的 ki-67 表达水平。**方法：**回顾性分析 131 名早期子宫内膜癌患者的临床病理资料及术前 MRI 图像，根据 ki-67 表达水平分为两组。基于 T2 加权成像(T2WI)、增强 T1 加权成像(CE-T1WI)和表观扩散系数(ADC)图提取影像组学特征。使用皮尔逊相关系数对影像组学特征进行筛选。采用多层感知机和五折交叉验证法构建影像组学模型。使用受试者工作特征(ROC)曲线对模型进行评估。结果：T2WI、DCE-T1WI 和 ADC 图的多序列融合影像组学模型显示出比单独使用任何一个序列更好的区分能力。多序列融合的影像组学模型获得了最高的 ROC 曲线下面积，验证集 AUC 值为 0.852，准确率为 0.827，敏感性为 0.844，特异性为 0.773，精准性为 0.799。结论：基于多序列 MRI 的影像组学模型，可以术前无创性的预测早期子宫内膜癌的 ki-67 表达水平，为临床诊疗提供客观的影像学依据。

PO-1772

影像组学联合深度学习在 CT 平扫上自动识别隐匿性脾挫裂伤

郭轶¹、杨清宁¹、夏雨薇²、冯俊榜¹、陈凤喜³、石峰²、李传明¹

1. 重庆大学附属中心医院

2. 上海联影智能医疗科技有限公司

3. 陆军军医大学第一附属医院

目的：建立并验证用于自行识别隐匿性脾挫裂伤的人工智能模型。

材料与方法：回顾性分析重庆大学附属中心医院腹部外伤患者 213 例，根据 CT 平扫、增强扫描将患者分为隐匿性脾挫裂伤组（93 例）和无脾挫裂伤组（120 例），以 8:2 的比例随机分为训练集和测试集。在联影智能科研平台上使用 VB-net 网络在 CT 平扫上行脾脏的自动识别、分割，通过 Research Portal VX. X 在 CT 平扫上建立脾脏自动分割框架结构，从每个患者的全脾感兴趣区域中自动提取影像组学特征。降维后，共使用了 13 种不同的机器学习（Machine learning, ML）方法来开发一种从 CT 平扫中自动分割和自动检测隐匿性脾挫裂伤的方法，并在测试集上验证。此外，从陆军军医大学第一附属医院收集了 142 名腹部外伤患者（包括 46 名隐匿性脾挫裂伤患者和 96 名无脾挫裂伤的患者）为外部验证集。运用受试者工作特征曲线下面积（AUC）、灵敏度、特异度及准确率和来评估模型性能。结果：共提取了 2264 个放射组学特征，降维后，共筛选出 19 个与隐匿性脾挫裂伤相关的特征。在 13 种不同的 ML 算法中，基于高斯过程（Gaussian Processes, GP）的诊断模型表现出良好性能，且在所有模型中精度最高，其训练集、测试集、外部验证集上 AUC 分别为：0.989、0.984、0.948；灵敏度分别为：0.981、0.944、0.894；特异度分别为：0.958、0.958、0.853；准确率分别为：0.941、0.952、0.866。校准曲线显示，预测腹部外伤患者合并隐匿性脾挫裂伤发生风险的模型结果具有良好的一致性和稳定性。临床决策曲线显示 GP 模型患者获益概率范围最广，具有临床价值。结论：深度学习联合影像组学模型能够自动识别和分割脾脏，并能够基于腹部 CT 平扫图像准确诊断隐匿性脾挫裂伤，可显著提高该病的临床诊断率。

PO-1773

影像组学综合列线图预测 BRAF 突变型结直肠癌患者的术后早期复发：多中心研究

薛婷

中国人民解放军海军军医大学第二附属医院

目的：探讨影像组学综合列线图对 BRAF 突变型结直肠癌患者术后早期复发的预测价值。

方法：回顾性研究共纳入来自 2 家机构的 220 例经手术及病理确诊的 BRAF 突变型结直肠癌患者。来自机构 1 的所有患者以 7:3 的比例被随机分为培训队列 (n=108) 和内部验证队列 (n=45)，而来自机构 2 的患者被作为外部验证队列 (n=67)。在训练队列中评估了影像组学特征与早期复发之间的关系，并在验证队列中进行了验证。此外，通过结合影像组学评分和临床危险因素来评估综合列线图的预测性能。采用受试者工作特征曲线分析、校准曲线分析和决策曲线分析来评价预测性能。

结果：由 4 个选定的影像组学特征产生的影像组学评分显示，在训练 (AUC 0.81)、内部验证 (AUC 0.73)、外部验证 (AUC 0.63) 队列中均具有良好的早期复发预测能力。随后，将两个独立的预测因子 (包括影像组学评分和临床危险因素) 整合到列线图中，显示出更有价值的鉴别性能，两个队列的 AUC 均提高到 0.88 和 0.81。

结论：基于 CT 影像组学特征与 BRAF 突变型结直肠癌患者的早期复发相关，此外影像组学综合列线图有望应用于 BRAF 突变型结直肠癌患者早期复发的个性化术前预测。

PO-1774

卵巢子宫内膜样癌的 MRI 影像及肿瘤指标分析

陆小燕

南京市妇幼保健院

目的 总结我院经手术及病理确诊的卵巢子宫内膜样癌 (OEC) 的 MRI 影像特征和临床肿瘤指标，提高对该疾病的 MR 影像认识及诊断水平。方法 回顾性分析 2016 年 1 月至 2021 年 12 月我院收治的 26 例经手术及病理证实的 OEC，而 MR 误诊为卵巢其它性质肿瘤的患者。结果 26 例患者中，5 例双侧，15 例右侧，6 例左侧；2 例实性，1 例为双侧囊性，23 例囊实性，实性肿块明显强化，囊性肿块囊壁明显强化，囊实性肿块实性部分以宽基底形式附着于囊壁，实性部分动态早期明显强化，呈持续强化，强化程度可高于或等于子宫肌层。临床肿瘤指标 6 例 CA125 明显升高 (>1000U/ml)，余 20 例轻度升高。CA199 2 例明显升高 (>1000U/ml)，余 26 例轻度升高。结论 OEC 的 MR 影像表现具有一定的特征性，以囊实性肿块多见。临床肿瘤指标多有 CA125 及 CA199 的轻度升高。结合临床表现及实验室指标，有助于提高 OEC 的术前诊断准确性。

PO-1775

双参数 MRI 影像组学对前列腺癌 ISUP 分级的预测价值

张永胜¹、崔凤¹、李志平¹、许茂盛²

1. 杭州市中医院

2. 浙江省中医院 (浙江中医药大学附属第一医院)

【摘要】目的 探讨基于术前双参数 MRI 影像组学对前列腺癌 (PCa) 国际泌尿病理协会 (ISUP) 分级的预测价值。方法 回顾性分析浙江中医药大学附属第一医院从 2013 年 1 月至 2020 年 09 月间

的 165 例 PCa 患者。根据 ISUP 分级分组系统将 PCa 患者分为 5 组: G1 组(Gleason 评分=6 分)、G2 组(Gleason 评分=3+4 分)、G3 组(Gleason 评分=4+3 分)、G4 组(Gleason 评分=8 分)、G5 组(Gleason 评分=9 或 10 分)。从每例患者的 T2WI、弥散加权成像和表观弥散系数图中共提取 3948 个影像组学特征。对训练组采用最小冗余最大相关 (mRMR) 和最小绝对值收敛和选择算子 (LASSO) 两种方法进行特征降维后建立影像组学标签 (Rad-score)。采用 Spearman 秩相关分析评价 Rad-score 与 ISUP 分级的相关性。采用 Kruskal-Wallis 检验比较 Rad-score 在 5 组间两两比较的差异性。采用受试者工作特征 (ROC) 曲线评估 Rad-score 对上述 5 组的诊断效能。结果经过 mRMR 和 LASSO 降维后筛选出 11 个价值较大的影像组学特征及其相关系数组成 Rad-score。Rad-score 与 ISUP 分级之间具有良好的相关性 ($r = 0.53$, $P < 0.05$) , Rad-score 在 G1、2 组与 G3、4、5 组间差异均有统计学意义 ($P < 0.05$) , 除此之外两组间差异均无统计学意义 ($P > 0.05$) 。Rad-score 诊断 G1-5 组的 ROC 曲线下面积依次分别是 0.827、0.762、0.563、0.657、0.698。结论 双参数 MRI 影像组学对 PCa 患者 ISUP 分级具有一定的预测价值, 特别对于 ISUP 1~2 级患者。

PO-1776

基于钆塞酸二钠增强磁共振功能性肝脏影像评分联合 T2*mapping 序列在小肝癌术前肝功能评估中的应用价值

李少朋、邓克学

中国科学技术大学附属第一医院安徽省立医院南区

目的 以 15 min 吲哚菁绿保留率作为参考标准, 对比钆塞酸二钠增强磁共振成像功能性肝脏影像评分 (FLIS) 联合 T2*mapping 序列对小肝癌术前肝脏储备功能评估的诊断价值, 并与 T1mapping 序列比较, 统计分析诊断效能。

资料与方法 回顾性分析术前影像学符合小肝癌表现患者 60 例, 所有受试者都接受钆塞酸二钠增强磁共振扫描, 包括注射前 (T1-pre) mapping、注射后 (T1-post) 20 min mapping、T2*mapping 等序列。选取相同位置 ROI 测量计算 R2*值、注射前 (T1-pre)、注射后 (T1-20min) T1 松弛时间, 最后得到的为平均值, 并计算 T1 弛豫时间降低率 ($T1\text{-pre} - T1\text{-20min} / T1\text{-pre}$)。评估肝胆期图像肝实质、胆道和门静脉信号强度, 计算 FLIS。根据术前均行吲哚菁绿滞留试验将患者分为 3 组 ($<10\%$ 、 $10\% \sim 20\%$ 、 $\geq 20\%$)。分析三组之间正常肝脏 R2*值、FLIS 及 T1 弛豫时间降低率之间的差异, ROC 曲线评估上述参数对肝储备功能的诊断效能, 采用 DeLong 检验比较诊断效能。

结果 3 组之间 R2*值、FLIS 及 T1 弛豫时间降低率差异均有统计学意义 ($P < 0.01$) , R2*值、FLIS 及 T1 弛豫时间降低率与肝功能分级 Spearman 相关系数分别为 -0.921、0.821、0.981。R2*值、FLIS 及 T1 弛豫时间降低率 ROC 曲线下面积 1 组与 2 组之间为 0.883、0.825、0.914, 2 组与 3 组之间为 0.867、0.8、0.869。T1 弛豫时间降低率诊断效率最高, R2*值、FLIS 两者联合诊断效能提高 (0.945, 0.935)。

结论 FLIS 及 T2*mapping 可以准确评估小肝癌患者肝脏储备功能, 两者联合诊断效能高于 T1 弛豫时间降低率, 且 T2*mapping 序列扫描时间明显缩短, 值得临床推广。

PO-1777

基于 CT 的影像组学结合腹部脂肪面积预测肝细胞癌的微血管侵犯

张瑾

哈尔滨医科大学附属第二医院 CT 诊断科

目的：探索基于 CT 肿瘤及瘤周区域的支持向量机模型对肝细胞癌微血管侵犯（Microvascular invasion of Hepatocellular carcinoma, HCC-MVI）的预测性能以及联合腹部脂肪面积参数对 HCC-MVI 的附加预测价值。方法：回顾性收集 120 例经术后病理证实为 HCC 患者的 CT 图像，在平扫图像上测量所有患者腹部脂肪面积，采用 t 检验等方法对比阳性及阴性组脂肪面积差异的显著性。分别在 CT 动脉期及门脉期逐层勾画肿瘤区域以及瘤周切缘 10mm 感兴趣区域 ROI，各 ROI 分别提取 846 个影像组学特征。将所有数据集采用随机分层抽样法以 7: 3 划分为训练集（n=84）和测试集（n=36），使用 200%SMOTE 平滑算法扩充训练集的样本量，生成平滑后的训练集数据用于后续数据降维及建模，在测试集进行验证，最终得到四个支持向量机模型，腹部脂肪面积参数结合性能较优模型构建最终联合模型。采用受试者操作特征曲线下面积(AUC)、灵敏度、特异性和准确性评估不同模型预测性能，Delong 检验比较不同模型 AUC 值，校准曲线用于评估模型预测和实际值的一致性。结果：逐层特征筛选及降维后，各 ROI 分别剩余 7、9、9、8 个特征用于支持向量机模型的构建，其中基于门脉期肿瘤区域模型性能较优，在 SMOTE 训练集和测试集中的 AUC 值分别为 0.85、0.86，联合模型的 AUC 值分别为 0.94 和 0.89。Delong 检验显示，SMOTE 训练集中联合模型效能显著高于单纯机器学习模型，差异具有统计学意义（P=0.015），校准曲线显示模型预测和实际值的一致性较好。结论：与瘤周区域模型相比，基于 CT 肿瘤区域的支持向量机模型在 HCC-MVI 方面具有较优预测价值，联合腹部脂肪面积参数可以进一步提升 HCC-MVI 的预测性能。

PO-1778

基于 CT 的机器学习预测肝细胞癌微血管侵犯

张瑾

哈尔滨医科大学附属第二医院 CT 诊断科

目的：探索基于 CT 门脉期的机器学习模型对肝细胞癌微血管侵犯的预测价值。方法：回顾性收集 120 例经病理证实是否存在微血管侵犯(Microvascular invasion, MVI)的肝细胞癌（Hepatocellular carcinoma, HCC）患者 CT 图像。根据随机分层抽样的原则将患者以 7: 3 的比例划分为训练集和测试集，提取门脉期肿瘤的影像组学特征，采用 Spearman 相关性分析和 Lasso 算法进行特征筛选，并分别构建六种机器学习模型，采用受试者工作特征曲线下面积（Area under curve, AUC）评估模型的预测效能，校准曲线来验证校准能力，决策曲线用于分析和比较模型的临床实用性，Delong 检验评估各模型之间预测效能的差异。结果：基于门脉期肿瘤提取的影像组学特征经过逐层特征筛选及降维后剩余 10 个影像组学特征用于六种机器学习模型的构建，其中支持向量机模型的预测性能较好，在训练集和测试集中的 AUC 值分别为 0.904 (0.844-0.965)和 0.838 (0.717-0.959)，校准曲线显示模型拟合良好，决策曲线提示该较好的临床实用性。结论：基于 CT 门脉期的机器学习模型对 HCC-MVI 具有较高的预测价值。

PO-1779

影像组学在胃癌术后早期复发与晚期复发者中的比较

史曙光

连云港市第一人民医院

目的: 探讨影像组学标签在胃癌术后早期复发 (≤ 1 年) 与晚期复发者 (> 1 年) 之间的相关性。

方法: 回顾性纳入 84 例胃癌术后复发病例, 将其随机分为训练组 ($n=58$) 和验证组 ($n=26$)。分析与复发相关的临床危险因素、基本影像特征、肿瘤指标及术后病理危险因素, 建立预测早期复发与晚期复发的临床模型。利用 3D-slicer 软件在胃癌病灶勾画感兴趣区提取影像组学特征, 并利用 LASSO 分析选择有效的纹理特征建立影像组学标签, 分析训练组与验证组中早期与晚期复发的 Rad-score 值差异, 分析训练组与验证组预测早期复发的 AUC、最佳截断值、敏感性与特异性。对训练组各危险因素做单因素及多因素分析, 选择能区分胃癌术后早期复发与晚期复发的独立预测因子。

结果: 从 CT 静脉期图像中提取出共 1409 个纹理特征, 最终选出 9 个有效的纹理特征值建立影像组学标签。训练组影像组学标签在早期与晚期复发间有统计学意义 ($P<0.001$), 验证组影像组学标签在早期复发与晚期复发间有明显差异 ($P=0.009$)。训练组中影像组学标签区分早期复发与晚期复发的最佳截断值为 0.724, AUC 值为 0.907(95%CI: 0.833-0.982), 特异性为 0.905, 敏感性为 0.784; 验证组影像组学标签区分早期与晚期复发的最佳截断值为 -1.437, 特异性为 0.500, 敏感性为 0.812, AUC 值为 0.619(95%CI: 0.388-0.850)。单因素分析显示 Rad-score ($P<0.001$)、CA-199 ($P=0.038$)、术前 T 分期 ($P=0.021$) 及 EGFR ($P=0.038$) 对区分训练组早期复发与晚期复发有统计学意义, 多因素分析显示影像组学标签区分胃癌早期复发与晚期复发有统计学意义 ($P<0.001$)。

结论: 影像组学标签是区分胃癌早期与晚期复发的独立危险因素。早期与晚期复发 RS 值有明显差异。训练组区分早期复发与晚期复发的效能良好。

PO-1780

对比分析增强 CT 于 MRI 对于妇科恶性肿瘤的评估价值

白浩言

辽宁省肿瘤医院

目的: 分析增强 CT 与 MRI 对于妇科恶性肿瘤的诊断价值及效能。方法: 选取 2020 年 1 月—2021 年 2 月在辽宁省肿瘤医院妇科诊断为宫颈癌、子宫内膜癌、卵巢癌妇科恶性肿瘤的 1260 名女性患者作为研究对象, 患者术前均行增强 CT、MRI 检查, 以术后病理结果作为金标准, 对比分析增强 CT 与 MRI 的检查结果的准确性, 比较其灵敏度、特异度、阳性预测值、阴性预测值, 并绘制 ROC 曲线。

结果: 经病理确诊为宫颈癌 565 例、子宫内膜癌 385 例、卵巢癌 510 例; 增强 CT 诊断为宫颈癌 502 例、子宫内膜癌 273 例、卵巢癌 458 例, 准确率分别为 88.85%、70.91%、89.80%; 增强 MRI 诊断为宫颈癌 513 例、子宫内膜癌 315 例、卵巢癌 440 例, 准确性分别为 90.80%、81.82%、86.27%。增强 CT 与 MRI 检查宫颈癌、子宫内膜癌、卵巢癌的准确性差异均不显著 ($P>0.05$); 增强 CT 与 MRI 检查的灵敏度、特异度、阳性预测值、阴性预测值之间的差异无统计学意义 ($P>0.05$); 绘制 ROC 曲线, 增强 CT 的 AUC 值为 0.69 (0.538–0.823), 增强 MRI 的 AUC 值为 0.701 (0.562–0.843)。

结论: 增强 CT 与 MRI 对于妇科恶性肿瘤均表现出较好的诊断意义, 对于妇科恶性肿瘤术前评估提供了有价值的帮助, 指导临床决策, 在临床实际应用过程中, 可以依据患者的病情及影像学图像特征选择合适的影像学检查方式。

PO-1781

血清 GDF15、sB7-H1 联合 MSCT 对胃癌患者淋巴结转移的诊断价值

苑乐添
山东省立医院

【摘要】目的 探讨血清生长分化因子 15 (GDF15)、可溶性 B7-H1 (sB7-H1) 联合多层螺旋 CT (MSCT) 对胃癌患者淋巴结转移的诊断价值。方法 选取我院 2021 年 5 月~2023 年 5 月期间收治的 96 例胃癌患者作为研究组, 根据有无淋巴结转移将研究组患者分为转移组 (41 例) 和未转移组 (55 例), 另选取同期 96 例胃良性疾病患者作为对照组。Spearman 法分析患者血清 GDF15、sB7-H1 表达水平与 MSCT 参数的相关性; Logistic 回归分析影响胃癌患者发生淋巴结转移的相关因素; 受试者工作特征 (ROC) 曲线分析血清 GDF15、sB7-H1 及 MSCT 参数对胃癌患者淋巴结转移的诊断价值。结果 转移组血清 GDF15、sB7-H1 表达水平均高于对照组和未转移组 ($P < 0.05$); 血清 GDF15、sB7-H1 表达水平与病变区血容量 (BV) 和出血流量 (BF) 均呈负相关, 与对比剂平均通过时间 (MTT) 和表面通透性 (PS) 呈正相关 ($P < 0.05$); 转移组肿瘤 ≥ 2 cm、浸润深度为黏膜下层的患者所占比例显著高于未转移组 ($P < 0.05$); 肿瘤大小、浸润深度、GDF15 及 sB7-H1 为胃癌患者发生淋巴结转移的危险因素 ($P < 0.05$); 血清 GDF15、sB7-H1 及 MSCT 单独诊断胃癌患者淋巴结转移的曲线下面积 (AUC) 分别为 0.867、0.804、0.740、0.855、0.580 及 0.655, 血清 GDF15、sB7-H1 联合 MSCT 检测的 AUC 为 0.965。结论 血清 GDF15 和 sB7-H1 表达水平与胃癌患者淋巴结转移的发生密切相关, 二者联合 MSCT 对胃癌患者淋巴结转移具有较高的诊断价值。

PO-1782

MR 体素内不相干运动成像评价兔肾动脉狭窄肾纤维化的研究

查婷婷、陈杰、俞胜男、刘国强、陈婧、邢伟
常州市第一人民医院

目的 探讨 MR-IVIM 评价兔肾动脉狭窄肾纤维化 (RF) 的价值。材料与方法 将 78 只健康新西兰大白兔随机分为对照组 ($n=8$) 和 RF 组 ($n=70$), RF 组再随机分为 6 个亚组, 分别为建模前 pre-RF 亚组、建模后 RF-1W、RF-2W、RF-3W、RF-4W 亚组 ($n=12$), 以及动态观察 RF-L 亚组 ($n=10$)。RF 组实验兔行左肾动脉狭窄建立 RF 模型, 分别于术前、术后 1、2、3 和 4W 行 IVIM 扫描。各亚组 MR 末次扫描后立即切除左肾并行病理组织学检查。在 IVIM 图像上分别测量双肾皮、髓质的 D、D*、f 值。采用重复测量方差分析比较各组左右肾皮质和髓质 D、D*、f 值随时间的差异。采用独立样本 t 检验比较各组每个时间点双肾皮、髓质 D、D*、f 值的差异。采用 Spearman 相关性分析比较左肾皮、髓质 D、D*、f 值与 RF 程度的相关性。采用 ROC 曲线判断左肾皮、髓质 D、D*、f 值对 RF 诊断和分期的效能。结果 RF 组左肾皮质和髓质的 D 值和 f 值随 RF 均逐渐减低。RF 组右肾皮质和髓质的 D* 值和 f 值随 RF 均逐渐升高。RF-4W 亚组左肾皮质与髓质的 D 值、D* 值均有统计学差异; pre-RF、RF-3W 和 4W 亚组的左肾皮质与髓质的 f 值均有统计学差异, P 均 < 0.05 。pre-RF、RF-4W 亚组右肾皮质与髓质的 f 值有统计学差异, $P < 0.05$ 。Spearman 相关性检验显示左肾皮质 D、f 值、髓质 f 值与 RF 程度呈中等或强负相关 (r 值分别为 -0.595、-0.717、-0.412, P 均 < 0.01)。f 值对鉴别 pre-RF 和 RF-1~4W、pre-RF~RF-1W 和 RF-2~4W 的效能最优; D 值对鉴别 pre-RF~RF-2W 和 RF-3~4W、pre-RF~RF-3W 和 RF-4W 的效能最优。结论 MR-IVIM 可以从灌注和扩散两方面反映 RF 发生发展的过程, 可以为 RF 的分期诊断提供信息, 对 RF 的评价具有较大的应用前景。

PO-1783

DKI 及 ASL 评价对比剂相关的急性肾损伤向持续性肾功能不全进展中的应用研究

王斌
山西医科大学第一医院

目的：探讨基于 DKI、ASL 成像评估 CA-AKI 向 PRD 进展的过程，进一步评价 DKI、ASL 在对比剂相关的急性肾损伤向持续性肾功能不全进展中的应用价值。方法：我们将 SD 大鼠随机分为四个 CA-AKI 组，每组 6 只，另取 6 只设立对照组。CA-AKI 组建立 CA-AKI 模型。对照组注射生理盐水；所有大鼠分别于注射对比剂前 24 小时及注射对比剂后 1 天、3 天、7 天、13 天进行 DKI、ASL 扫描及图像分析，在扫描结束后留取大鼠血液、尿液及双肾标本。并将影像学参数与肾脏组织学评分、AQP2、HIF-1 α 做相关性分析。结果：与对照组相比，CA-AKI 组 CysC 和 NGAL 值在第 1 至 13 天显著升高。CA-AKI 组病理评分在第 1 至 13 天明显升高。CA-AKI 组 AQP2 的表达水平在第 1 至 13 天升高；CA-AKI 组大鼠肾皮质 HIF-1 α 表达在第 3 天、第 7 天升高，外髓外带及外髓内带 HIF-1 α 表达在第 3 至 13 天升高。CA-AKI 组大鼠肾皮质 Δ MK 值仅在第 3 天升高，外髓外带及外髓内带 Δ MK 值在第 1 天开始升高，第 3 天达到最大值，随后逐渐下降，但在第 13 天时仍明显高于基线。CA-AKI 组大鼠肾皮质 Δ Ka 值在第 13 天升高。外髓内带 Δ Ka 值在第 7 天、第 13 天升高；CA-AKI 组大鼠肾皮质 Δ Kr 值在第 3 天、第 7 天升高，外髓外带及外髓内带 Δ Kr 值在第 3 至第 13 天升高。CA-AKI 组肾皮质 Δ RBF 值在第 1 天至第 7 天降低；外髓外带及外髓内带 Δ RBF 值第 1 天至第 13 天的各个时间点均降低。肾脏组织学病理评分与 Δ MK 值、 Δ Ka 值、 Δ Kr 值呈正相关，与 Δ RBF 值呈负相关；AQP2 与 Δ MK 值、 Δ Ka 值和 Δ Kr 值呈正相关；HIF-1 α 与 Δ RBF 值呈负相关。结论：多模态磁共振可以无创检测 CA-AKI 大鼠肾脏组织微观结构的复杂性，在一定程度上反映 CA-AKI 向 PRD 持续发生发展过程的病理生理改变，对 CA-AKI 向 PRD 进展进行无创、早期诊断。

PO-1784

多模态磁共振评价法舒地尔在对比剂相关急性肾损伤向持续性肾功能不全进展中的保护作用

王斌
山西医科大学第一医院

目的：利用 T1-mapping 成像技术探讨法舒地尔在 CA-AKI 向 PRD 进展过程中的保护作用。方法：随机将 72 只 Sprague-Dawley 雄性大鼠分为 3 组：对照组、CA-AKI 组、CA-AKI+Fasudil 组，每组 24 只。实验大鼠腹腔注射 3%戊巴比妥钠麻醉后，CA-AKI 组大鼠经尾静脉按 8 mg/kg 体重注射碘普罗胺，CA-AKI+Fasudil 组分别在注射碘普罗胺前 12 小时、注射对比剂后 2 小时及 4 小时注射法舒地尔，对照组大鼠尾静脉注射 0.9%生理盐水；所有大鼠分别于注射对比剂前 24 小时及注射对比剂后 1 天、3 天、7 天、13 天进行 T1-mapping 扫描及图像分析。MRI 扫描结束后，另取血液标本测量 CysC、IL-1 β 、NGAL 含量。取肾组织切片做 HE 染色、Masson 染色及免疫组化检测。结果：与 Control 组相比，CA-AKI 组在第 1 至 13 天血清 CysC、IL-1 β 和尿 NGAL 水平明显升高；与 CA-AKI 组相比，CA-AKI+Fasudil 组第 1 至 13 天血清 IL-1 β 水平明显降低。在对比剂使用后的第 1 至 13 天，CA-AKI+Fasudil 组大鼠组织学损伤评分明显低于 CA-AKI 组；在对比剂使用后第 3 至 13 天，CA-AKI+Fasudil 组大鼠组织 Masson 染色胶原纤维表达量低于 CA-AKI 组；在对比剂使用后第 1 至 13 天，CA-AKI+Fasudil 组 HIF-1 α 、p-MYPT1、ROCK-1、 α -SMA 表达量明显低于 CA-AKI 组。在对比剂注射后第 1 至 13 天，CA-AKI+Fasudil 组大鼠肾脏皮质、外髓外带及外髓内带的 Δ T1 值均明

显低于 CA-AKI 组。结论：法舒地尔可通过激活 Rho A/ROCK 信号通路以及抑制 TGF- β 1、HIF-1 α 信号通路及 α -SMA 蛋白表达来减轻 CA-AKI 向 PRD 进展中出现肾缺氧、肾纤维化和肾功能异常。

PO-1785

磁共振动态增强及弥散加权成像对胰腺癌诊断及其侵袭性预测价值的临床研究

傅君、黎继昕、杨绮华
中山大学孙逸仙纪念医院

【目的】

探讨磁共振动态增强及弥散加权成像相关参数对胰腺癌诊断及其侵袭性预测的临床价值。

【方法】

前瞻性收集临床怀疑胰腺占位，临床怀疑胰腺炎病例以及健康志愿者进行磁共振动态增强及弥散加权成像检查；设定肿瘤实质组、肿瘤组、胰腺癌背景组、胰腺炎组、健康志愿者组不同 ROI 勾画标准，使用飞利浦图像后处理工作站及 Omni Kinetics DCE 分析软件对磁共振动态增强 8 个相关参数及弥散加权成像 2 个定量参数进行测量。使用 SPSS 及 Medcalc 统计软件对五组间参数进行统计分析，将肿瘤实质组根据侵袭性指标及临床病理情况分为 10 个亚分组，分别进行各亚分组参数对比分析。

【结果】

胰腺癌组的 ADC 值、 K^{trans} 值、 K_{ep} 值、 V_p 值低于炎症组，胰腺癌组 TTP 值高于炎症组；胰腺癌组 ADC 值、 K_{ep} 值、 V_p 值低于正常胰腺组织，胰腺癌 eADC 值、 V_e 值、TTP 值、AUC 值高于正常胰腺组织；上述差异具有统计学意义。其中独立预测因子 TTP 诊断效能最高（胰腺癌组 vs 正常组：AUC=0.922；胰腺癌组 vs 炎症组：AUC=0.908）。由 eADC、 K^{trans} 、 V_e 及 AUC 参数构成的胰腺炎综合诊断模型的诊断效能接近较高水平（AUC=0.894）。除 eADC 参数外，其余参数在胰腺癌背景组与胰腺炎组间的差异无统计学意义。胰腺癌发生器官侵犯组 K^{trans} 值、 V_e 值、AUC 值高于无器官侵犯组，发生种植转移组的 K^{trans} 值低于无种植转移组，Ki67 高表达组的 K^{trans} 值高于低表达组，上述差异均具有统计学意义。

【结论】

磁共振动态增强及弥散加权成像部分参数在胰腺癌诊断及与胰腺炎的鉴别诊断中显示出较高诊断效能，多参数预测模型能够提高胰腺炎与正常胰腺组织之间的鉴别能力。DCE-MRI 相关参数在胰腺癌转移、侵犯及病理情况预测中显示出相对较好的诊断效能。胰腺癌背景胰腺组织在 DCE-MRI 及 DWI 参数上与胰腺炎具有高度相似性。

PO-1786

磁敏感加权成像评价肾脏过量铁沉积的价值

孙军
苏州大学附属第三医院（常州市第一人民医院）

目的 探讨磁敏感加权成像（SWI）评价肾脏过量铁沉积的价值。

方法 将 30 只新西兰大白兔随机分为铁剂组 15 只（注射右旋糖酐铁）和对照组 15 只，于铁剂注射前 0 周及注射后 8 周行 SWI 检查。分析对照组 0 周、8 周和铁剂组 0 周、8 周的图像，在 Phase 图上测量肾皮质的相位值并计算角弧度值，应用普鲁士蓝染色观察肾铁沉积分布、原子吸收分光光度计测量肾铁含量。两组间的角弧度值比较、肾铁含量比较采用独立样本 t 检验。角弧度值与肾铁含量间的相关性研究采用 Pearson 相关分析。

结果 (1)仅铁剂组 8 周的肾皮质 SWI 信号强度显著低于髓质, 铁剂组 8 周的肾皮质 SWI 信号强度显著低于铁剂组 0 周和对照组 8 周的肾皮质。(2)铁剂组 8 周的角弧度值 (0.2101 ± 0.0771) 明显高于铁剂组 0 周 (-0.0226 ± 0.0276) 和对照组 8 周 (-0.0244 ± 0.0314) ($t=11.007, 10.913, P$ 均 $=0.000$)。(3)仅铁剂组 8 周的肾皮质内见明显蓝色铁离子沉积、髓质内见极少量蓝色铁离子沉积; 铁剂组 8 周的肾铁含量 (135.3 ± 14.1) mg/kg 明显高于对照组 8 周 (75.5 ± 9.8) mg/kg ($t=13.938, P=0.000$)。(4)铁剂组 8 周和对照组 8 周的角弧度值与其所测肾铁含量呈高度正相关 ($r=0.913, P=0.000$)。

结论 SWI 能够评价肾脏过量铁沉积, 过量铁主要沉积于肾皮质并使其 SWI 信号强度减低, 由相位值计算角弧度值可以量化铁沉积。

PO-1787

增强 CT 形态学特征及 CT 值评估结直肠癌分化程度

李辉

南京鼓楼医院

目的 通过增强 CT 形态学特征及 CT 值评估结直肠癌分化程度。

方法 回顾性分析我院病理确诊的结直肠癌增强 CT 图像 162 例。评估包括部位、形态、肌层外壁、钙化、坏死/囊变、强化是否均匀、周围脂肪间隙、肿大淋巴结、多发淋巴结、周围异常血管、近段肠管有无扩张和近段肠管有无气液平 12 个 CT 特征。测量肠壁范围、CT 值系列参数。数据进行 Kolmogorov-Smirnov 正态性检验。连续变量使用 Mann-Whitney U 检验进行分析。分类变量采用 χ^2 检验或者 Fisher 精确性检验。

结果 部位 ($P=0.011$)、坏死/囊变 ($P=0.007$)、强化是否均匀 ($P=0.014$)、肿大淋巴结 ($P=0.010$)、多发淋巴结 ($P=0.011$) 5 个 CT 特征在不同分化程度组间有显著差异。中低-低中分化的结直肠癌病灶肠壁范围显著高于中-高分化病灶 ($P=0.025$), 而平扫 CT 值显著低于中-高分化病灶 ($P=0.028$)。

结论 部位、坏死/囊变、强化是否均匀、肿大淋巴结、多发淋巴结、病灶肠壁范围和平扫 CT 值参数在不同分化程度组间有显著差异, 这些影像学表现可以为临床评估结直肠癌侵袭性提供一定的帮助。

PO-1788

双源 CT 评估不同部位的克罗恩病与肝脏脂肪变性的相关性

周群、施婷婷、刘松

南京鼓楼医院

目的: 采用双源 CT 定量分析发生在不同部位的克罗恩病与肝脏脂肪变性的相关性。

方法: 回顾性分析 2021 年 5 月至 2023 年 1 月间于我院住院治疗并确诊为克罗恩病 (CD) 并在此期间行双源 CT 小肠三维重建检查的患者 40 例。根据 CD 发生部位分为回肠组 (病灶仅发生于回肠) 和回结肠组 (病灶同时发生于回肠及结肠), 图像均上传至后处理工作站, 采用手动勾画的方法勾画出肝门层面的肝脏的整体轮廓作为感兴趣区 (ROI), 分别测量两组图像的动脉期及静脉期全肝的脂肪含量及肝脏/腹主动脉的碘浓度比值, 比较两组的肝脏脂肪含量与碘浓度比值是否具有统计学差异。

结果: 根据 CD 发生部位分为回肠组 (25 例) 和回结肠组 (15 例), 回肠组动脉期肝脏脂肪含量 [$(2.38\pm4.29)\%$] 略高于与回结肠组的肝脏脂肪含量 [$(2.24\pm2.50)\%$], 但无明显统计学差异 ($P>0.05$)。回肠组静脉期肝脏脂肪含量 [$(2.23\pm3.80)\%$] 高于回结肠组 [$(1.18\pm2.36)\%$], 二者

无统计学差异 ($P>0.05$)。回肠组动脉期肝脏碘浓度比值 (5.30 ± 4.37) 略低于回结肠组 (6.73 ± 3.23)，二者无统计学差异 ($P>0.05$)。回肠组静脉期肝脏碘浓度比值 (52.01 ± 12.61) 高于回结肠组 (42.75 ± 22.01)，二者无统计学差异 ($P>0.05$)。

结论：本研究结果表明发生在回肠与发生于回结肠的克罗恩病患者的肝脏脂肪含量及碘浓度比值并无明显相关性。

PO-1789

双源 CT 评估克罗恩病不同部位病变肠壁脂肪变性的相关性

施婷婷

南京大学医学院附属鼓楼医院

目的：采用双源 CT 定量分析克罗恩病发生在不同部位病变肠壁脂肪变性的相关性。

方法：回顾性分析 2021 年 5 月至 2023 年 1 月间于我院住院治疗并确诊为克罗恩病 (CD) 并在此期间行双源 CT 小肠三维重建检查的患者 40 例。根据 CD 发生部位分为回肠组 (病灶仅发生于回肠) 和回结肠组 (病灶同时发生于回肠及结肠)，图像均上传至后处理工作站，采用手动勾画的方法勾画出病变最明显处肠壁轮廓作为感兴趣区 (ROI)，分别测量两组图像的动脉期及静脉期病变肠壁的脂肪含量及肠壁/腹主动脉的碘浓度比值，比较两组的肠壁脂肪含量与碘浓度比值是否具有统计学差异。

结果：根据 CD 发生部位分为回肠组 (25 例) 和回结肠组 (15 例)，回肠组动脉期病变肠壁脂肪含量 [16.06 ± 4.93] % 略高于与回结肠组的病变肠壁脂肪含量 [14.16 ± 2.77] %，但无统计学差异 ($P>0.05$)。回肠组静脉期病变肠壁脂肪含量 [14.66 ± 4.52] % 略低于回结肠组 [14.81 ± 4.59] %，二者无统计学差异 ($P>0.05$)。回肠组动脉期病变肠壁碘浓度比值 (15.28 ± 5.01) 略高于回结肠组 (14.14 ± 3.02)，二者无统计学差异 ($P>0.05$)。回肠组静脉期病变肠壁碘浓度比值 (41.00 ± 9.17) 高于回结肠组 (35.50 ± 7.31)，二者无统计学差异 ($P>0.05$)。

结论：双源 CT 定量分析克罗恩病发生在不同部位病变肠壁脂肪无相关性。

PO-1790

基于 CT 的腹部脂肪定量与 Borrmann IV 型胃癌术后病理的关系

季长风、张国庆

南京鼓楼医院

目的：探讨 CT 测定的腹部脂肪参数与 Borrmann IV 型胃癌术后病理的关系。

方法：回顾性收集在我院行手术切除的 78 例 Borrmann IV 型胃癌。在每个病例的术前 CT 平扫图像上，测量 L3 椎体水平腹部的脂肪参数，包括：内脏脂肪面积 (VFA)、皮下脂肪面积 (SFA)、总脂肪面积 (TFA)、内脏/总脂肪比 (VFA/TFA)、内脏/皮下脂肪比 (VFA/SFA)。收集并记录每个病例手术后的病理结果，包括：WHO 分型、Lauren 分型、手术切缘、脉管侵犯、神经侵犯、TN 分期、腹膜转移。采用 Mann-Whitney U 或 Kruskal-Wallis 检验来分析 Borrmann IV 型胃癌不同病理特征的腹部脂肪参数差异。

结果：Borrmann IV 型胃癌腹膜转移组的 VFA、SFA、TFA 显著高于非转移组 ($P < 0.05$)。低分化组及弥漫型的 SFA 显著高于中分化、混合型/肠型 ($P < 0.05$)。相较于切缘阴性组，切缘阳性组的 SFA、VFA 占比更低，均有显著差异 ($P < 0.05$)。CT 测定的腹部脂肪面积与 Borrmann IV 型胃癌的其他病理分组无显著差异。

结论：不同病理结果的 Borrmann IV 型胃癌其腹部脂肪定量存在差异。基于 CT 测量的脂肪定量参数具有预测 Borrmann IV 型胃癌病理结果的潜能。

PO-1791

在体孕期子宫 MRI 三维模型构建及其意义

刘强、乞文旭
中国医科大学附属盛京医院

目的 探讨利用 MRI 原始数据集构建在体孕期子宫数字化三维模型的方法及意义。资料及方法 选择 12 例单胎足月孕妇行盆腔 MRI 检查，利用快速平衡稳态采集（FIESTA）序列获得 MRI 原始数据集，将原始 Dicom 数据集并录入 Mimics 软件中进行宫颈数字化三维重建。结果 成功重建出在体宫颈的数字化三维模型，该模型可以进行任意角度旋转便于多视角、多平面地观察子宫颈的整体形态和结构，同时可以测量宫颈长度，宫颈角角度等数据。结论 应用 MRI 原始数据集重建在体子宫颈数字化三维模型，具有立体感强，多角度观察、可进行三维测量等优点，为在体子宫颈的解剖教学、整体形态学研究及疾病诊疗提供新的思路。

PO-1792

磁共振弹性成像在宫颈癌诊断中的初步应用研究

刘强、乞文旭
中国医科大学附属盛京医院

[摘要] 目的 本研究旨在探究磁共振弹性成像（Magnetic resonance imaging, MRE）在宫颈癌研究中的应用潜力，以及评估宫颈癌患者宫颈的弹性特征，并与健康对照组进行比较，以探讨 MRE 技术在宫颈癌早期诊断和治疗监测中的临床应用前景。材料与方法：前瞻性地招募 10 名经临床和病理诊断确诊为宫颈癌的患者（宫颈癌组）和 24 名健康女性志愿者（健康对照组），每名受试者进行宫颈常规磁共振检查和频率为 60hz 的 MRE 检查。由两名有着 5 年以上盆腔影像诊断经验的放射科医师绘制 ROI（感兴趣），测量两组受试者宫颈的弹性值以及宫颈癌组肿瘤的最大左右径、前后径及上下径。采用独立样本 t 检验对宫颈癌组和健康对照组的弹性值进行对比分析。同时，收集宫颈癌组患者临床资料，包括：年龄、体质指数（Body mass index, BMI）、肿瘤浸润程度。运用一元及多元线性回归分析影响宫颈癌组织弹性值的变量。结果：研宫颈癌患者组的平均弹性值为 5.47 ± 0.98 kPa，健康对照组宫颈平均弹性值为 2.94 ± 0.13 kPa，宫颈癌组的平均弹性值明显高于健康对照组（ $P < 0.001$ ）。同时，在我们的研究中发现，4kPa 的临界值可以准确地区分宫颈癌与正常宫颈组织。在单元线性回归分析中，肿瘤的最大前后径（ $P < 0.01$ ）及浸润程度（ $p < 0.001$ ）均与癌变组织弹性值相关。多元线性回归分析中，肿瘤的浸润程度（ $P < 0.001$ ）是影响癌变组织弹性值的重要独立因素。结论： 本研究表明，MRE 技术可以作为一种非侵入性的辅助检查手段，帮助早期发现和诊断宫颈癌，并且有助于评估病情严重程度，在宫颈癌研究中具有潜在的临床应用前景。

PO-1793

基于术前增强 MRI 影像组学分析的列线图模型预测肝细胞癌切除术后复发风险的价值

王晴、邢伟
常州市第一人民医院

目的 探讨术前增强磁共振 (magnetic resonance imaging, MRI) 影像组学分析的列线图模型预测肝细胞肝癌 (hepatocellular carcinoma, HCC) 切除术后复发风险的价值。

材料和方法 回顾性分析 2015 年 8 月至 2020 年 8 月在常州市第一人民医院进行 HCC 切除术的患者资料, 共纳入 164 例于术前 2 周内进行增强 MRI 检查的病例, 随机分为训练集 (115 例)、测试集 (49 例)。单因素及多因素 Cox 回归分析术前临床、病理及影像学特征与术后复发关系。运用最小绝对收缩和选择算子的 Cox 回归进行影像组学分析。联合影像组学标签及肿瘤复发的独立预测因素建立列线图预测模型, 并在测试集进行验证。校准曲线观察模型预测概率与实际观察值一致性。根据训练集影像组学标签界值对 HCC 术后肿瘤复发风险分层, Kaplan-Meier 法绘制生存曲线、Log-rank 检验比较风险亚组间的生存差异。

结果 肿瘤边缘、肿瘤坏死、影像组学标签为预测 HCC 术后肿瘤复发独立因素 (风险比=2.1, 2.5, 64.1, 95%可信区间分别为 1.3-3.3, 1.5-4.3 和 20.6-199.9, $P<0.05$)。列线图模型预测肿瘤复发风险的 C-index 分别为训练集 0.796 (0.738-0.854) 和测试集 0.784 (0.684-0.885)。模型预测概率与实际观察值有较好一致性。按影像组学标签界值进行复发风险分层, 低危组无复发生存率较高, 较高危组差异在训练集及测试集中均具有统计学意义 (训练集: $\chi^2=52.88$, $P<0.001$, 测试集: $\chi^2=4.14$, $P=0.042$)。

结论 基于术前增强 MRI 影像组学分析的预测模型可有效预测 HCC 切除术后复发风险, 有助于 HCC 术后患者个体化管理。

PO-1794

影像组学在卵巢癌早期诊断及铂耐药预测中的研究进展

任袁^{1,2}、孙蓬明^{1,2}
1. 福建医科大学妇产临床医学院
2. 福建省妇幼保健院

目的: 卵巢癌是发病率第 3 位的女性生殖系统恶性肿瘤, 但早期诊断率低, 恶性程度高, 预后差。影像组学通过建立影像学标记物指导临床疾病的诊断和治疗。本文探讨了影像组学在卵巢癌早期诊断中的研究进展及其在预测铂耐药中的作用, 以期今后临床工作中卵巢癌早诊和精准治疗提供个体化方案和参考。

方法: 计算机检索了 CNKI、Wanfang、PubMed 等数据库中近 5 年发表的影像组学与卵巢癌的相关文献。纳入关于影像组学与卵巢癌的相关研究并筛选, 对最终纳入的文献进行归纳综述。

结果: (1) 卵巢癌的早期诊断受限于早期筛查的低特异性和高假阳性率, 即使经过系统治疗, 70% 的患者在 3 年内复发, 且多数复发患者最终会发展为铂耐药。(2) 影像组学旨在从检查图像中提取定量信息并寻找其与临床数据之间的关联, 指导个性化临床决策。近年来, 影像组学与机器学习相结合, 可以单独地或与人口统计学、组织学、基因组学或蛋白质组学数据结合地用于解决临床问题。(3) 研究发现, 应用于阴道超声的影像组学模型, 在预测卵巢肿物的良恶性方面具有较高的准确率。近年来研究发现基于 CT、MRI 检测技术的影像组学构建的诺模图模型, 提高了早期卵巢癌的诊断效能, 更有研究进一步证实, 基于 MR 图像的影像组学建模可以区分 I 型和 II 型上皮性卵巢癌。另有研究发现综合了年龄、FIGO 分期、基因组数据、血清标志物、残余肿瘤等重要临床指标构建的影像组学列线图可提示卵巢癌患者耐药发生的可能性, 有助于预测卵巢癌复发风险。

结论：卵巢癌的早筛和耐药问题一直是困扰临床医生的难题，影像组学作为一种非侵入性的肿瘤良恶性鉴别和预测耐药及预后的方法，在卵巢癌中有较好的预测性能，应用前景广阔，期待更多大样本多中心研究及标准化流程，提高影像组学的应用性能。

PO-1795

体素内不相干运动扩散加权成像定量参数在术前评估胰腺导管腺癌可切除性的价值

刘琪

常州市第一人民医院

目的：探讨体素内不相干运动扩散加权成像 (IVIM-DWI) 定量参数在术前评估胰腺导管腺癌 (PDAC) 可切除性的价值。

方法：回顾性分析 2018 年 11 月至 2019 年 9 月本院 39 例病理诊断为 PDAC 的临床和影像学资料，利用 IMAgenGINE 软件测量病灶感兴趣区 (ROI) 的 IVIM 相关定量参数：真扩散系数 (D) 值，灌注相关扩散系数 (D*) 值，灌注分数 (f) 值。利用组内相关系数 (ICC) 分析各参数值的测量者内可重复性，t 检验比较可切除与不可切除组各参数的差异性，受试者工作特性 (ROC) 曲线评价各参数值的诊断效能， χ^2 检验比较单一 IVIM 参数值与影像征象评估 PDAC 是否可切除的差异，比较 IVIM 参数值联合影像征象是否评估效能高于单一 IVIM 参数值。

结果：可切除组 PDAC 的 D、D*、f 值分别为 $(1.66 \pm 0.39) \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $(1.91 \pm 2.29) \times 10^{-2} \text{ mm}^2/\text{s}$ 、 $37.8 \pm 14.2\%$ ，不可切除组 PDAC 的 D、D*、f 值分别为 $(1.30 \pm 0.33) \times 10^{-3} \text{ mm}^2/\text{s}$ 、 $(1.14 \pm 1.82) \times 10^{-2} \text{ mm}^2/\text{s}$ 、 $23.9 \pm 13.8\%$ ，其中 D、f 值的差异具有统计学意义 (P 值均 < 0.05)。各参数值的测量可重复性较好 (ICC=0.799, P < 0.001)。D、f 值预测 PDAC 为可切除性的 ROC 曲线下面积 (AUC) 分别为 0.714、0.728，D 值 $> 1.42 \times 10^{-3} \text{ mm}^2/\text{s}$ 时预测 PDAC 可切除的敏感度为 79.3%，f 值 $> 17.2\%$ 时预测 PDAC 的可切除性的敏感度为 96.6%，IVIM 参数值联合常规影像征象较单一 IVIM 参数值评估 PDAC 是否可切并无统计学差异。

结论：IVIM 定量参数，尤其是 D，f 值能预测胰腺导管腺癌的术前可否切除性。

PO-1796

光谱 CT 及 MRI 评价宫颈癌分期与临床分期一致性的初步研究

孙心言、董越、于韬、秦凤英、庞慧婷、于庆、田名可

辽宁省肿瘤医院

目的：本研究旨在通过与临床宫颈癌国际妇产科协会 (FIGO) 分期比较，探讨光谱 CT 常规图像 (CI)、虚拟单能量图像 (VMI) 和磁共振成像 (MRI) 对于评估宫颈癌 FIGO 分期的准确性。方法：回顾性收集我院 2022 年 2 月-2023 年 3 月经手术病理证实的 131 例初治宫颈癌患者，所有患者术前同时行全腹+盆腔光谱增强 CT 检查及盆腔增强 MRI 检查。患者采用光谱 CT 扫描后分别获得动脉期和静脉期 CI 及光谱图像，使用飞利浦星云工作站 ISP 对采集的图像进行数据重建。由 1 名影像科医师分别在光谱 CT 的 CI、VMI40KeV 上测量宫颈癌病灶的最大径，并评估肿瘤局部侵犯范围，两次评估间隔 2 周；另一名影像科医师在 MR 图像上测量宫颈癌病灶的最大径，并评估肿瘤局部侵犯范围。评估光谱 CT、MRI FIGO 分期与临床 FIGO 分期的一致性标准为 Kappa 检验；使用 McNemar Bowker 检验比较基于光谱 CT 的 CI、VMI40KeV 及 MRI 评估的宫颈癌分期与临床分期诊断准确一致性。结果：基于光谱 CI、VMI40KeV 及 MRI 分期患者与临床结果一致分别为 Kappa=0.385, 0.643, 0.738。MRI (83.2%) 及光谱 VMI40Kev (72.5%) 评估宫颈癌 FIGO 分期准确性高于光谱 CI (54.2%) (P < 0.05)；MRI、光谱 VMI40Kev 对于穹窿侵犯

(86.8%,83.8%,75%), 宫旁侵犯(81.1%,67.6%,54.1%), 阴道下 1/3 侵犯(87.5%,87.5%,25%), 盆壁侵犯(82.4%,76.5%,41.2%), 膀胱直肠侵犯(75%,75%,50%)的检出率高于光谱 CI。结论: 光谱 CT 的 VMI40KeV、MRI 诊断宫颈癌 FIGO 分期准确性较高, 有助于临床诊断和治疗。

PO-1797

多参数光谱 CT 技术预测宫颈癌 LVSI 的初步研究

孙心言、董越、于韬、秦凤英、于庆
辽宁省肿瘤医院

目的: 探讨光谱 CT 多参数成像技术预测宫颈癌淋巴血管间隙浸润 (LVSI) 的临床应用价值。方法: 回顾分析 108 名经手术病理证实的宫颈癌患者, 根据病理结果分为 LVSI 阳性组(n=50)及 LVSI 阴性组(n=58), 所有患者治疗前均行全腹+盆腔光谱 CT 增强检查。由 1 名影像科医师分析光谱 CT 动脉期 (AP)、静脉期 (VP) 常规能量图像 (CIs)、单能量图像 (VMIs) 及碘密度图, 获得宫颈癌病灶及不同背景组织(邻近血管及肌肉)的双期 CT 值和碘值 (IC), 在所有光谱图像上评估淋巴结转移状态及肿瘤最大径 (MD)。计算能谱曲线斜率 (K), 标准化碘浓度 (NIC) 和肿瘤体积 (GTV)。进行单变量、多变量 Logistic 回归分析以确定光谱 CT 多参数影像特征及临床特征中可用于评估宫颈癌 LVSI 状态的独立危险因素, 采用受试者工作特征 (ROC) 曲线评估各模型对 LVSI 状态的预测效能。结果: 单因素分析得到鳞状细胞癌抗原 (SCC)、肿瘤分化程度、光谱多参数图像中淋巴结转移状态、MD、GTV、动脉期病灶 CT 值 (CI、40Kev、80Kev、100Kev)、K、AP-IC、AP-NIC 肌肉与宫颈癌 LVSI 状态具有相关性 ($P < 0.05$)。多因素 Logistic 回归分析显示淋巴结转移状态、MD、AP-NIC 肌肉是宫颈癌患者发生 LVSI 的独立危险因素 ($P < 0.05$)。临床模型 (M1)、临床结合常规影像参数模型 (M2)、光谱多参数模型 (M3) 曲线下面积 (AUC) 分别为 0.671、0.717 和 0.831, DeLong 检验显示, M3 诊断效能优于 M1、M2 ($P=0.0051$, $P=0.0408$), 其敏感度及特异度分别为 80.4%和 71.9%。结论: 光谱 CT 多参数模型对于预测宫颈癌 LVSI 状态具有较高的诊断效能, 优于常规临床和影像模型。

PO-1798

超高 b 值弥散加权成像评估促红细胞生成素治疗肾缺血再灌注损伤效果

伏庆琳、陈杰
常州市第一人民医院

目的 探讨超高 b 值弥散加权成像 (HBV-DWI) 评估促红细胞生成素 (EPO) 治疗肾缺血再灌注损伤 (IRI) 效果的价值。方法 将 18 只健康新西兰大白兔随机均分为 IRI + EPO 组、IRI 组及对照组, 每组各 6 只。对 IRI + EPO 组于左肾蒂夹闭再灌注后立即腹腔注射 EPO (3000U/kg), IRI 组在相同时间注射等量生理盐水; 对照组除未夹闭左肾蒂外均同 IRI 组。于再灌注 48h 后行 MR 扫描, 测量左肾皮质 (CO) 及髓质 (OM) 超高 b 值表现观弥散系数 (ADC_{uh}); 行免疫组织化学染色, 测量水通道蛋白 AQP-1、AQP-2 累积光密度 (IOD) 值; 以 Pearson 相关分析评价左肾 CO 及 OM 的 ADC_{uh} 与免疫组织化学指标的相关性。结果 IRI 组、IRI + EPO 组及对照组左肾 CO 层 ADC_{uh} 值分别为 0.4243 ± 0.0082 、 0.4379 ± 0.0092 、 0.4613 ± 0.0118 , 左肾 OM 层 ADC_{uh} 值分别为 0.3952 ± 0.0136 、 0.4158 ± 0.0136 、 0.4403 ± 0.0157 , 组间两两比较均有统计学意义 ($P < 0.05$)。免疫组化结果显示对照组左肾髓质 AQP-1、AQP-2 表达量均高于 IRI 组及 IRI + EPO 组 ($P < 0.01$)。IRI 组左肾髓质 AQP-1 表达量低于 IRI + EPO 组 ($P=0.010$ 、 $P=0.005$)。IRI 组左肾 CO 层 AQP-2 表达量和 IRI + EPO 组无明显差异 ($P=0.267$)。IRI 组左肾 OM 层 AQP-2 表达量

低于 IRI+EPO 组 ($P=0.032$)。左肾皮髓质 ADC_{uh} 值与 AQP-1 (CO 层: $r=0.756$ 、 $P<0.01$; OM 层: $r=0.720$ 、 $P=0.001$)、AQP-2 (CO 层: $r=0.819$ 、 $P<0.01$; OM 层: $r=0.850$ 、 $P<0.01$) 表达水平均具有相关性。结论 HBV-DWI 可无创性评估 EPO 治疗兔肾 IRI 效果。

PO-1799

T2mapping 成像动态定量评估肾脏缺血再灌注损伤的价值

陈婧
常州市第一人民医院

目的 探讨 T2mapping 成像动态定量评估肾缺血再灌注损伤的可行性。

方法 健康新西兰大白兔 48 只分为 IRI 组 (40 只) 和对照组 (8 只)。于建模前和建模后 1、12、24、48 小时行动态 MRI 扫描, 包括 T2WI 及 T2mapping 序列, 分别在髓内、髓外和皮质层面手动勾画感兴趣区。IRI 组于建模前后各时间点随机选取 8 只处死, 对照组于建模后 48h 扫描后处死。所有肾脏标本行 HE 染色, 然后行病理半定量损伤评分。采用单因素方差分析比较 IRI 组兔肾各部位 5 个时间点 T2 值的差异, 采用重复测量方差分析比较对照组兔肾各部位 5 个时间点 T2 值的差异。采用独立样本 t 检验比较 IRI 组与对照组 T2 值的差异。采用 Spearman 相关性分析比较 IRI 组建模后兔肾各部位 4 个时间点的 T2 值与损伤评分的相关性。

结果 对照组兔肾各部位不同时间点间的 T2 值差异无统计学意义。IRI 组建模前后各部位 5 个不同时间点 T2 值的差异有统计学意义 (均为 $P < 0.05$)。2 组间髓内、髓外和皮质在建模后 4 个时间点的 T2 值差异有统计学意义 (P 均 < 0.05)。IRI 组建模后 4 个时间点髓内 T2 值与细胞坏死、间质炎症、管型呈负相关性 ($r = -0.42$ 、 -0.39 、 -0.53 , $P < 0.05$); 髓外 T2 值与细胞水肿呈正相关 ($r = 0.53$), 与细胞坏死、间质炎症、管型呈负相关性 ($r = -0.48$ 、 -0.40 、 -0.54 , $P < 0.05$); 皮质 T2 值与损伤评分无相关性 ($P > 0.05$)。

讨论 T2mapping 成像可以反映肾 IRI 后组织不同时间点的动态变化, 对早期发现肾 IRI 损伤有一定帮助。

PO-1800

前列腺影像报告和数据系统的阳性预测值研究

沈夏枫、沈建良、王世威
浙江中医药大学附属第一医院 (浙江省中医院)

目的: 评估前列腺影像报告和数据系统在诊断前列腺癌中的阳性预测值。方法: 回顾性分析 2014 年 1 月至 2022 年 9 月进行磁共振检查且有完整临床数据的患者资料, 使用 PI-RADS 进行分级和诊断, 纳入 PI-RADS 2 分以上的病例共 610 例。其中, PI-RADS 2 分 49 例, 病理为 PCa15 例; PI-RADS 3 分 170 例, 病理为 PCa40 例; PI-RADS 4 分 265 例, 病理为 PCa164 例; PI-RADS 5 分 126 例, 病理为 PCa101 例。采用独立样本 t 检验和秩和检验来比较非 PCa 组与 PCa 组之间年龄和前列腺特异性抗原 (Prostate Specific Antigen, PSA) 的差异, 采用方差分析和非参数检验比较不同 PI-RADS 评分间年龄和 PSA 的差异, 并采用邦弗伦尼法进一步进行两两比较。结果: 总体 PI-RADS 的 PPV 为 52.46% (320/610), PI-RADS 2 的 PPV 为 30.61% (15/49), PI-RADS 3 的 PPV 为 23.53% (40/170), PI-RADS 4 的 PPV 为 61.89% (164/265), PI-RADS 5 的 PPV 为 80.16% (101/126)。非 PCa 组与 PCa 组之间年龄和 PSA 差异存在统计学意义 (P 均 < 0.001), 不同 PI-RADS 评分组比较, 年龄与 PSA 差异也不全相同 (P 均 < 0.001)。组间比较时, PI-RADS 5 与 PI-RADS 2 和 PI-RADS 3 的年龄差异有统计学意义 ($P=0.001$, $P=0.008$), 其余年龄差异无统计学意义。而 PI-RADS 2 和 PI-RADS 3 的 PSA 差异无统计学意义 ($P=0.392$), 其余 PSA 差异

均有统计学意义 (P 均 <0.05)。结论: PI-RADS 的 PPV 为 52.46%, PI-RADS 3 分以上的 PPV 为 54.37%, 对 PCa 的预测能力不强, 建议结合其他指标进行 PCa 的诊断。

PO-1801

基于对比增强 CT 的影像组学模型预测 急性胰腺炎后糖尿病的初步研究

胡然、杨华
重庆市中医院

目的:探究基于对比增强 CT 的影像组学模型可否用于预测急性胰腺炎后糖尿病 (Post-acute pancreatitis diabetes mellitus PPDM-A)。

方法:回顾性地分析来自两个三级转诊中心的 374 例首次发作的急性胰腺炎患者, 其中训练组 224 人, 内部验证组 56 人, 外部验证组 94 人。每个队列中分别有 86 例、22 例和 27 例 PPDM-A 患者。从动脉期和静脉期的 CT 图像中提取 2398 个影像组学特征, 并从病历中收集临床特征。采用重采样和 Min-Max 归一化分别对图像和数据进行预处理。采用基于随机森林的递归特征消除法、共线性分析和最小绝对收缩和选择算法(LASSO)进行特征选择。运用极端梯度提升 (eXtreme Gradient Boosting, XGBoost)进行影像组学建模分析。受试者工作曲线用来评价基于影像组学模型、临床模型及两者联合建立的 XGBoost 模型的诊断效能。

结果:经重复性试验和降维后, 选出 11 个影像组学特征。影像组学模型在训练组、内部验证组和外部验证组预测 PPDM-A 的准确性均较好(分别为 0.964、0.875、0.968)。在外部验证组中, 影像组学模型的 AUC 显著优于临床模型(0.857 vs 0.619, $p=0.000$), 而联合模型与影像组学模型之间无显著差异(0.882 vs 0.857, $p=0.317$)。

结论:基于双期增强 CT 的影像组学 XGBoost 模型对于预测急性胰腺炎后糖尿病具有良好的效果。作为一种定量手段, 影像组学为预防急性胰腺炎后糖尿病的发生提供了可能。

PO-1802

化疗药物相关性急性胰腺炎的 CT 表现: 一项横断面观察性研究

左立平、范金蕾、李芳轩、安悦铭、田子玉、王博文、于德新
山东大学齐鲁医院

背景: 化疗药物相关性急性胰腺炎(Chemotherapy drug-related acute pancreatitis, CDRAP)是一种罕见的化疗相关不良事件, 主要为少数病例报告, 缺少其 CT 表现的观察总结。

目的: 描述恶性肿瘤化疗药物相关性急性胰腺炎的 CT 表现。

方法: 临床诊断为 CDRAP 的 22 名患者被纳入此项横断面观察性研究。根据修订版 Atlanta 急性胰腺炎标准进行 CT 特征记录, 具体特征如下: 胰腺正常、胰腺增大(弥漫性或局灶性)、胰腺不均匀强化(弥漫性或局灶性)、胰周渗出、急性胰周积液、假性囊肿、急性坏死性积液(胰腺坏死和胰周坏死)和主胰管扩张。并尽可能记录 CDRAP 患者的 CT 影像学转归表现。其他化疗相关不良事件, 包括药物性肝炎、多发性脑神经病变和死亡也进行记录。

结果: CT 结果示, 23%(5/22)患者表现为胰腺正常, 77%(17/22)患者出现急性胰腺炎改变。CDRAPs 的 CT 表现如下: 弥漫性 ($n=7$) 或局灶性 ($n=8$) 胰腺肿大, 弥漫性 ($n=6$) 或局灶性($n=1$)胰腺不均匀强化, 胰周渗出 ($n=5$), 急性胰周积液 ($n=7$) 和假性囊肿 ($n=1$)。没有患者出现急性坏死性积液或主胰管扩张。81%的 CDRAP 患者的严重程度分类为轻度急性胰腺炎。其他化疗相关不良事件包括药物性肝炎 ($n=3$)、多发性脑神经病变 ($n=1$) 和死亡 ($n=1$)。关于胰腺转归, 2 例患者在初始 CT 表现为正常胰腺形态上出现了急性胰腺炎改变。

结论：化疗药物相关性急性胰腺炎 CT 主要表现为轻度急性胰腺炎或正常胰腺，胰腺炎者主要为弥漫性或局灶性胰腺肿大，初次 CT 表现为正常胰腺者应注意影像学转归结果。

PO-1803

1.5T 磁共振自由呼吸高分辨序列 AX 3D T1（QuickStar）联合 JET T2WI FS 对肠道肿瘤的研究价值

安坤宝、牟鹏、杨洁、段庆红
贵州医科大学附属肿瘤医院

目的：1.5T 磁共振自由呼吸高分辨序列 AX 3D T1（QuickStar）联合 JET T2WI FS 对肠道肿瘤图像的研究价值。

方法：采用 Vantage Elan（日本 Canon）1.5TMRI，从 2022 年 1 月至 2023 年 6 月，共收集 62 例肠道肿瘤志愿患者，所有研究对象扫描采取同层同范围自由呼吸扫描序列 AX 3D T1（QuickStar），JET T2WI FS，常规 AX T1WI FS+C，AX T2WI FS，以常规 FSE 序列为对照，与 QuickStar 和 JET 序列作比较，分别测量其常规 FSE 序列图像和 QuickStar 及 JET 序列图像的信噪比（SNR）与对比信噪比（CNR）。用 5 点 Likert 评分对图像质量和诊断信任度进行定性评价。采用 Cohen's Kappa 统计法计算阅读器间的一致性。采用 Kappa 统计对图像进行定量评价。

结果：用同一 MRI 后处理软件测量常规 FSE 序列图像及 QuickStar 和 JET2WI FS 图像 SNR 和 CNR，QuickStar 和 JET2WI FS 序列图像均有不同程度的提升。Likert 评分 QuickStar 和 JET2WI FS 图像质量优于常规 FSE 序列图像，肠道运动伪影均低于常规 FSE 序列图像。

结论：QuickStar 和 JET2WI FS 序列图像肠道运动伪影明显减少，图像质量和诊断信任度均高于常规 FSE 序列图像，完全自由呼吸模式极大提高肠道 MRI 诊断率，明显提高肠道肿瘤患者 MRI 图像质量，具有广阔的临床应用前景。

PO-1804

探讨 DWI 不同 B 值序列在 MRI 胰腺肿瘤的研究

葛润钦、安坤宝、段庆红
贵州医科大学附属肿瘤医院

目的：探讨 DWI 不同 B 值序列在胰腺肿瘤 MRI 图像的质量研究。

方法：采用 Vantage Elan（日本 Canon）1.5TMRI，从 2022 年 4 月至 2023 年 7 月，共收集 65 例胰腺肿瘤志愿患者，所有研究对象扫描采取同层同范围扫描多个 AX DWI 序列（B 值 600、800、1000、1200），分别测量其图像的信噪比（SNR）与对比信噪比（CNR）。用 5 点 Likert 评分对图像质量和诊断信任度进行定性评价。采用 Cohen's Kappa 统计法计算阅读器间的一致性。采用 Kappa 统计对图像进行定量评价。

结果：用同一软件 Vantage Elan1.5TMRI 后处理软件测量各个序列图像 SNR 和 CNR，B 值为 800 的 DWI 序列图像为最佳，Likert 评分 B 值为 800 的 DWI 序列图像优于其他对照组图像。

结论：胰腺 DWI B 值为 800 序列图像质量和诊断信任度均高于其他 B 值序列图像，明显提高胰腺肿瘤患者 MRI DWI 图像质量。

PO-1805

集成 MRI 弛豫时间定量技术在前列腺癌术前神经侵犯评估中的应用价值

郝慧婷

扬州大学附属医院 (扬州市第一人民医院)

目的 探讨集成 MRI 弛豫时间定量技术在前列腺癌神经侵犯术前评估中的应用价值。

方法 回顾性搜集 2020 年 11 月至 2022 年 12 月扬州大学附属医院行前列腺 MRI 常规序列和磁共振图像编译 (MAGiC) 序列扫描并行根治性手术的前列腺癌患者 69 例, 依据手术病理结果分为前列腺癌神经侵犯阳性组 32 例, 前列腺癌神经侵犯阴性组 37 例。MAGiC 图像经过后处理后得到 T1、T2、质子密度 (PD) 值, 同时用相关软件进行后处理生成表观扩散系数 (ADC) 值, 并采用独立样本 t 检验或 MannWhitney U 检验分析两组间数据的比较, 采用受试者工作特征 (ROC) 曲线分析各定量参数诊断前列腺癌神经侵犯状况的诊断效能。

结果 前列腺癌神经侵犯阳性的 T1 值和 T2 值 [M (Q1, Q3)] 均高于神经侵犯阴性性 [2 174.0 (1 620.9, 2 776.5) ms 比 1 101.3 (1 103.5, 1 298.2) ms; (162.6±54.9) ms 比 79.0 (74.0, 83.8) ms] (均 P<0.05), 两组 PD 值差异无统计学意义 (P>0.05)。T2 值显示出与 ADC 值相似的曲线下面积 (AUC) (0.963 比 0.991, P=0.105)。

结论 集成 MRI 获得的定量 T1 和 T2 值能够用于前列腺癌神经侵犯术前评估, T2 值与 ADC 值诊断效能相当。集成 MRI 通过定量组织 T1、T2 值, 有助于术前诊断前列腺癌神经侵犯, 具有一定的临床应用价值。

PO-1806

直肠癌新辅助治疗后淋巴结的磁共振评价与病理对照

张志文、陈琰

中山大学附属第一医院

目的: 直肠癌患者在新辅助治疗后, 多数区域淋巴结会缩小、消失。然而, 在磁共振上发现的残留淋巴结仍有肿瘤转移的可能。本研究旨在评价欧洲胃肠和腹部放射学学会 (ESGAR) 的诊断标准 (短径≥5mm) 对直肠癌新辅助治疗后转移淋巴结的诊断效能, 并且探讨淋巴结的形态学特征 (包括形状、边缘、信号均匀度、强化均匀度) 能否提高短径≥5mm 的淋巴结诊断效能。

方法: 这项回顾性研究共纳入 90 个局部进展期的直肠癌患者, 所有纳入患者均接受了手术及术前磁共振检查。两位放射科医生分别测量所有可见淋巴结的短径, 以及仅评价≥5mm 的淋巴结的形态学特征。将组织病理学结果作为金标准, 进行逐个淋巴结的影像-病理对照。构建受试者工作特征曲线 (ROC) 评估淋巴结短径的诊断效能。分类变量分析采用 χ^2 检验或 Fisher 确切概率法。

结果: 总共评估了 298 枚淋巴结。短径诊断淋巴结转移的 AUC 为 0.81。以 5mm 作为截断值, 敏感性、特异性、阳性预测值、阴性预测值和准确度分别为 65.9%、87.0%、46.8%、93.6% 和 83.9%。≥5mm 的淋巴结中, 良恶性淋巴结的形态学特征无显著性差异 (P > 0.05)。

结论: 在新辅助治疗后的直肠癌患者中, ESGAR 标准在鉴别良恶性淋巴结方面表现出中等诊断效能。短径能够有效诊断 <5mm 淋巴结的性质。然而短径无法鉴别 ≥5mm 的良恶性淋巴结, 形态学特征亦不能提高此部分淋巴结的诊断效能。

PO-1807

CT 联合腹部脂肪定量预测肾细胞癌侵袭性

徐家军、张虎、张晓金、袁娜、王家伟、黄国权
芜湖市第二人民医院

目的：探讨 CT 联合腹部脂肪定量指标预测肾细胞癌（RCC）侵袭性的价值。方法：搜集 122 例经手术病理证实的 RCC 患者资料，按病理分期和病理分级分为非侵袭组（73 例）、侵袭组（49 例）。单、多因素 Logistic 回归分析筛选 RCC 侵袭性的独立预测因子，采用列线图构建联合预测模型，并评估其校准度、稳定性和临床净效益。结果：边缘模糊（OR=3.815，P=0.012）、大小（OR=1.752，P=0.010）、腹部皮下脂肪面积/内脏脂肪面积（SVR）（OR=5.381，P=0.006）和 RENAL 总分（OR=2.110，P<0.001）是 RCC 侵袭性的独立预测因子。列线图 AUC 为 0.902（95%CI: 0.842~0.962，P<0.001），高于各独立预测因子（均 P<0.05）。校准曲线的校准度较高；5 折交叉验证平均 AUC 为 0.899，与列线图一致。决策曲线（DCA）显示阈值范围 0.07~1.0 时临床有获益。结论：CT 联合腹部脂肪定量指标构建的列线图预测 RCC 侵袭性准确性高，临床获益价值较大。

PO-1808

CT 小肠造影、小肠胶囊内镜在小肠疾病诊断中的应用价值

文勇
贵州医科大学附属肿瘤医院

目的 探究多层螺旋 CT 小肠造影（CTE）、小肠胶囊内镜（CE）在小肠病变诊断中的应用价值，寻找更为简便、检出率高的检查方式以满足临床需求。方法 选取本院收治的小肠疾病患者 97 例作为研究对象，依次行 CT 小肠造影、小肠胶囊内镜检查；以病理活检结果为金标准，将所有患者的 CT 小肠造影、小肠胶囊内镜检查结果与病理诊断的结果相比较，分析两种检查方法对小肠疾病的敏感性、特异性、准确性以及检出率。结果 97 例患者中，CT 小肠造影检查对小肠疾病的敏感性、特异性与小肠胶囊内镜检查对比，比较差异是否具有统计学意义（P<0.05）。经 CT 小肠造影检查的肠壁强化、肠壁增厚、合并腹腔病变的检出率高于小肠胶囊内镜检查，比较差异具有统计学意义（P<0.05）；但在小粘膜病变、肠壁溃疡、出血、息肉方面的检出率，小肠胶囊内镜则高于 CT 小肠造影检查，比较差异具有统计学意义（P<0.05）。两种检查方式对于多节段病变的检出效果均较好，且二者之间的比较差异不具有统计学意义（P>0.05）。结论 CT 小肠造影不仅可以显示黏膜病变、肠壁增厚和强化，还能够分析肠管外的结构及病变，提高了对小肠病变的检出率。小肠胶囊内镜在小粘膜病变、肠壁溃疡、出血、息肉等方面的检出率很高，已成为小肠疾病检查的一线检查方式。两种检查方法在小肠病变诊断中具有较高的临床应用价值。二者联合检查、互为补充，可明显提高小肠疾病的临床诊断准确率。

PO-1809

异基因造血干细胞移植后患者肠壁积气症的 CT 表现及其诊断价值

刘春蕾

中国医学科学院血液病医院 (中国医学科学院血液学研究所)

目的 分析异基因造血干细胞移植后患者肠壁积气症 (PI) 的 CT 及临床表现特点, 以提高对本病的认识及诊断水平。**方法** 回顾性分析中国医学科学院血液病医院 2016 年 6 月至 2023 年 5 月收治的 22 例异基因造血干细胞移植合并 PI 患者的临床和 CT 检查资料。由两名高年资且从事影像诊断多年的放射科医生对 CT 进行阅片, 调整 CT 窗宽、窗位, 观察 PI 发生部位、形态、程度及范围, 是否合并纵膈积气及腹腔游离气体。根据 PI 形态将其分为囊状、线样及弥漫海绵状, (其中弥漫海绵状指 PI 将肠壁分为 3-4 层, 伴多发小分格样结构, 其内见气体填充)。根据 PI 范围分为: ①单节段型, 仅 1 段小肠或结肠出现 PI。②多节段型, 即 ≥ 2 段小肠或结肠及直肠同时出现 PI (结肠肝曲、脾曲归为单独肠管)。**结果** 1. 临床资料: 22 例患者中, 男 15 例, 女 7 例, 年龄 4-68 岁, 中位年龄 36 岁。其中急性淋巴细胞白血病 1 例, 急性髓系白血病 10 例, 骨髓异常增生综合征 5 例, 再生障碍性贫血 3 例, 淋巴瘤 1 例, 慢性粒细胞白血病 2 例。22 例患者中 13 例患者无明显腹部症状, 于胸部常规检查时偶然发现。CT 发现 PI 与异基因造血干细胞移植间隔 28-290 天、中位时间间隔 133 天。2. CT 表现: 22 例患者, 病变位于小肠 3 例, 位于结肠 14 例, 同时位于结肠和小肠的 5 例, 伴有腹腔游离气体者 14 例, 3 例伴有门静脉积气, 5 例患者同时合并纵膈积气。22 例患者, 根据 CT 表现分型, 其中线样 4 例, 囊状 4 例, 弥漫海绵状 14 例。根据病变发生部位分型, 22 例患者中, 单节段型 4 例, 多节段型 18 例。**结论** 异基因造血干细胞移植后并发 PI 的 CT 表现具有特征性, CT 肺窗为 PI 最佳诊断方式, 能够评价积气程度和肠道受累范围, 并及时发现伴发的腹腔及纵膈游离气体, 为疾病诊断和预后评估提供有力证据。

PO-1810

CT 影像组学结合机器学习诊断 T1-T2 期结直肠癌淋巴结转移价值研究

张虎、张晓金、黄国权

华东师范大学附属芜湖医院 (芜湖市第二人民医院)

摘要: **目的:** 探讨 CT 影像组学结合机器学习 (ML) 方法诊断 T1-T2 期结直肠癌 (CRC) 淋巴结转移 (LNM) 的价值。**方法:** 搜集 243 例经手术病理证实的 T1-T2 期 CRC 患者资料, LNM 者 45 例, 按 (7:3) 分为训练组 (170 例) 和内部验证组 (73 例)。比较组间临床、CT 指标, 构建临床 CT 模型; 在静脉期 CT 图像对肿瘤区域进行图像分割, 提取的影像组学特征经降维、筛选, 获得影像组学评分 (rad-score); 基于临床 CT 指标和 rad-score 构建联合模型。观察各模型诊断 LNM 的效能。**结果:** 组间术前 CEA、术前 CA199、CT 淋巴结短径有统计学差异 (均 $P < 0.05$)。临床 CT 模型训练组和验证组曲线下面积 (AUC) 分别为 0.694、0.691。最终纳入 12 个影像组学特征用于构建 rad-score 模型, 训练组和验证组 AUC 分别为 0.851、0.861。联合模型训练组和验证组 AUC 分别为 0.876、0.917, 均优于临床 CT 模型 (均 $P < 0.001$)。联合模型决策曲线 (DCA) 分析显示训练组和验证组阈值概率为 0.08~0.73、0.13~0.85 时临床有净获益。**结论:** CT 影像组学结合 ML 方法有助于 T1-T2 期 CRC 是否发生 LNM 的正确分类。

PO-1811

临床-CT 影像组学列线图预测结直肠癌无病生存价值研究

张虎、张晓金、黄国权

华东师范大学附属芜湖医院 (芜湖市第二人民医院)

【摘要】 目的 构建预测结直肠癌 (CRC) 患者无病生存 (DFS) 的临床模型、影像组学模型 (radscore) 和基于上述两者的联合模型, 比较各模型诊断效能。方法 搜集 2015 年 1 月~2019 年 12 月间接接受增强 CT 检查的 II 期和 III 期 CRC 患者资料, 样本随机分为训练组 (n=217 例) 和验证组 (n=86 例)。比较临床变量组间差异并建立预测 DFS 的临床模型; 在静脉期 CT 图像勾画肿瘤三维体积感兴趣区 (VOI), 提取的影像组学特征经降维、筛选后获得 11 个最优特征用于建立 radscore; 并构建联合模型。最优模型以列线图展示, 并评估其校准度和临床获益; 比较各模型效能。结果 两组间肠梗阻、术前 CEA、术前 CA199、差分化、T 分期、淋巴结转移、脉管侵犯 (LVI)、神经侵犯 (PNI)、淋巴结清扫数目差异有统计学意义 (均 $P < 0.05$)。临床模型、radscore、联合模型 AUC 分别为 0.745、0.771、0.842 (训练组); 0.753、0.738、0.834 (验证组)。联合模型显示出较高的校准度, DCA 阈值范围 0.12~0.90 时临床有获益。联合模型 AUC 均大于临床模型、radscore (均 $P < 0.05$)。结论 基于临床变量和 CT 影像组学构建的列线图可用于预测 CRC 的 DFS, 有望成为 CRC 预后评估的新工具。

PO-1812

CT 影像组学在 II 期结肠癌风险分层中的应用研究

张晓金、张虎、黄国权

华东师范大学附属芜湖医院 (芜湖市第二人民医院)

【摘要】 目的 探讨 CT 影像组学模型对 II 期结肠癌 (CC) 风险分层的预测价值。方法 连续搜集 2015 年 1 月~2023 年 7 月经手术证实的 167 例 II 期 CC 患者资料, 按欧洲肿瘤内科学会 (ESMO) 指南将患者分为低风险组 77 例, 中高风险组 90 例; 按 7:3 将样本随机分为训练组 (n=116) 与内部验证组 (n=51)。在术前静脉期 CT 图像上对肿瘤进行分割并提取影像组学特征, 特征经降维、筛选后, 采用 logistic 回归分析构建预测模型, 观察模型校准度和临床获益。结果 训练组中高风险 64/116 例; 内部验证组中高风险 26/51 例, 两组间观测指标差异无统计学意义 (均 $P > 0.05$)。共筛选出 6 个影像组学特征用于构建 II 期 CC 低风险和中高风险的预测模型, AUC 为 0.822, 灵敏度: 84.4%, 特异度: 71.2%; 内部验证组 AUC 为 0.802, 灵敏度: 96.2%, 特异度: 60.0%。模型显示出较高的校准度; 决策曲线分析 (DCA) 阈值概率范围 0.04~0.85 时临床有获益。结论 基于静脉期 CT 图像构建的影像组学模型实现了低风险和中高风险 II 期 CC 的准确分类, 有望改善临床对该类患者的分层管理。

PO-1813

基于 ZOOM-mDixon 的 T2*/R2* 成像术前预测胰腺导管腺癌淋巴结转移的价值

刘扶摇、张京刚
常州市第一人民医院

目的: ZOOM-mDixon 序衍生出的 T2*/R2* 成像扫描时间短, 还可实现病灶定量, 探讨其在术前评价胰腺导管腺癌淋巴结转移的可行性。**材料与方法:** 回顾性分析经病理证实的 59 例胰腺导管腺癌患者, 其中淋巴结转移 (LNM) 31 例, 非淋巴结转移 (nLNM) 28 例。术前均行包括 ZOOM-mDixon 序列的 MRI 扫描, 分析两组的临床基本资料 (年龄、术前 CA19-9 水平等)、常规影像学特征 (部位、形态等) 和 T2*/R2* 值。使用 ICC 组内相关系数评价其可重复性, 采用 U 检验、t 检验或 χ^2 检验比较两组间各参数的差异, 利用 ROC 曲线评价相关指标的诊断性能。**结果:** T2*/R2* 值的组间和组内的 ICC 值均在 0.83~0.97 之间。LNM、nLNM 两组间的年龄、肿块形态、肿块短径、肿块部位、术前 CA19-9、CA125、CEA 水平等均无统计学差异, 而性别、病灶长径和病灶边界存在统计学差异 (P 值分别为 0.023, 0.048, 0.040)。两组间的 T2* 值和 R2* 值有显著统计学差异 (P 值均 < 0.05)。与 nLNM 组相比, LNM 组的 R2* 值较小 (24.00 (20.0, 28.3/s, 17.63 (15.1, 22.5)/s); T2* 值更高 (49.71±12.67ms, 63.77±13.95ms)。T2*/R2* 值预测胰腺癌淋巴结转移的 AUC 分别为 0.763 和 0.752。**结论:** ZOOM-mDixon 序列衍生出的 T2*/R2* 成像量化值可术前预测胰腺导管腺癌的淋巴结转移, 为临床治疗提供参考。

PO-1814

双参数 MRI 机器学习模型和不同年资医师 PI-RADS 对前列腺癌和临床显著性前列腺癌诊断价值的多中心研究

乔晓梦、包婕、王希明
苏州大学附属第一医院

目的 构建基于双参数 MRI (bpMRI) 的机器学习模型诊断前列腺癌 (PCa) 和临床显著性前列腺癌 (csPCa), 并探讨该模型对不同年资医师的前列腺影像报告和数据系统 (PI-RADS) 评分的辅助诊断价值。

方法 回顾性收集 2015 年 1 月至 2020 年 12 月 4 个中心共 1616 例行术前 MRI 且经病理证实的前列腺病患的影像资料, 其中 csPCa 共 532 例, 无显著临床意义的前列腺癌 (ciPCa) 共 266 例, 良性病变共 818 例。由中心一的低年资医师、高年资医师和前列腺 MRI 专家完成 PI-RADS 评分。中心一、二数据按照 7: 3 比例随机划分为训练组和内部测试组, 中心三、四数据分别设为独立外部测试组 1 和 2。提取 T2WI、DWI 和 ADC 图像的影像组学特征, 使用随机森林 (RF) 构建机器学习模型用于预测 PCa 和 csPCa。最后, 根据机器学习模型结果对 PI-RADS 评分进行调整。

结果 机器学习模型诊断 PCa 的 AUC 在内部测试组、外部测试组 1 和外部测试组 2 分别为 0.869、0.845 和 0.928; 诊断 csPCa 的 AUC 分别为 0.874、0.876 和 0.893。机器学习模型对 PCa 和 csPCa 的诊断效能与专家 PI-RADS 效能相当 (AUC 间差异除在诊断 PCa 时在外部测试组 1 中 P=0.01, 其余 P 均 > 0.05)。经过模型辅助诊断后, 不同年资医师调整后 PI-RADS 的特异度得到不同程度的提升; 低年资医师调整后 PI-RADS 的诊断效能可达到专家 PI-RADS 水平 (AUC 间差异除在诊断 csPCa 时在外部测试组 1 中 P=0.018, 其余 P 均 > 0.05)。

结论 基于 bpMRI 机器学习模型对 PCa 和 csPCa 的诊断效能可达到前列腺 MRI 专家的诊断水平并具有良好的泛化性; 机器学习模型可辅助不同年资医师诊断, 特别是对低年资医师, 可有效减少患者不必要的穿刺活检。因此, 基于 bpMRI 机器学习模型有望作为辅助诊断工具广泛应用于临床。

PO-1815

深度学习重建算法在提高肝脏及门脉 CT 图像质量中的应用研究

陈永明

北京大学第三医院

目的: 探讨深度学习重建算法(AIIR)在提高肝脏及门脉 CT 图像质量中的应用研究

方法: 选取今年 6-7 月份在我院行肝脏增强 CT 扫描患者 78 例, 其中男 45 例, 女 33 例。排除标准:①肝脏及门脉术后患者;②无法配合呼吸的患者。仪器与方法: 采用联影 960 CT, 螺旋扫描, 扫描参数: 120 kV, mA 调制技术, 参考 mAs:200,造影剂(优威显 370) 80ml,注射速率 3-4ml/s, 并追加 20ml 生理盐水,注射后 60s 行门脉期扫描。图像重建: 使用联影探索者科研工作站, 利用患者门脉期扫描数据, 重建层厚 5mm,间距 5mm 的五组轴位图像用于评价, 1 组:FBP(滤波反投影)算法;2 组: 迭代重建 (KARL 3D) 5 级;3-5 组 AIIR 算法;其中 3 组 AIIR 等级 5 级, 4 组 AIIR 等级 3 级, 5 组 AIIR 等级 1 级。客观评价: 由一名主治医师测量门脉主干最大层面肝实质、门静脉主干及右侧椎旁肌肉的 CT 值及 SD 值, 并计算五组图像的信噪比 SNR、对比噪声比 CNR, $SNR=CT \text{ 肝脏} / SD \text{ 肝脏}$, $CNR=CT \text{ 门脉}-CT \text{ 肌肉} / SD \text{ 肌肉}$ 。主观评价: 由两名副主任医师在不知情的情况下, 独立对五组图像行 5 分制主观评价, 3 分以上满足诊断。统计学方法: 采用 SPSS 21.0 统计分析软件, 计量资料以均值 \pm 标准差 ($\bar{x} \pm s$) 表示, 2 名放射科医师对图像质量主观评分的一致性采用 Kappa 检验, $P < 0.05$ 为差异有统计学意义。

结果: 客观评价: 各组间相同部位 CT 值差异无统计学意义 ($P > 0.05$), SD 值由 1 至 5 组逐渐减小, 图像 SNR,CNR 由 1 至 5 组逐渐增大, 差异有统计学意义 ($P < 0.05$); 主观评价: 各组得分, 4 组 > 3 组 > 2 组 > 1 组 > 5 组, 差异有统计学意义 ($P < 0.05$); 两名医师之间的主观评分具有高度一致性 ($K = 0.832$)。

结论: 深度学习重建算法 (AIIR 等级 3) 可显著减小肝脏及门脉 CT 图像噪声, 提高图像质量。

PO-1816

对妊娠期高血压及先兆子痫孕妇的分层管理: 基于胎盘 IVIM 灌注及虚拟磁共振弹性成像优于超声及实验室检查

邓景¹、宋佳成¹、张爱宁¹、赵萌¹、穆西虎¹、周欣¹、曲菲菲²、陈婷¹

1. 南京医科大学第一附属医院 (江苏省人民医院)

2. 西门子医疗有限公司

目的: 一部分妊娠高血压 (GH) 患者会随妊娠进程会进一步发展为先兆子痫 (PE), 这对母胎健康均会造成显著风险。因此准确预测 GH 中发展来的 PE, 对于及早干预和管理至关重要。本研究旨在探讨一种新的预测方法, 即使用胎盘 MRI 形态学参数、体素内不相干运动 (IVIM) 和虚拟磁共振弹性 (vMRE), 以比较其与传统超声及实验室检查的优越性。

方法: 前瞻性纳入 38 例 MRI 检查时血压 $> 140/90$ mmHg 并无其他并发症的患者, 根据 MRI 检查后随访中是否存在蛋白尿等并发症分为 GH 组 ($n=14$) 和 PE 组 ($n=24$)。另纳入 30 例血压正常的对照组。由两位放射科医生勾画胎盘的感兴趣区。通过 T2WI 图像测量胎盘面积及体积。功能磁共振 (fMRI) 参数包括以下: 选取低和高 b 值 (200 和 800 s/mm²), 通过 MATLAB 计算基于 DWI 的 vMRE 参数 (μ_{diff})。使用 Firevoxel 软件计算 VIM 参数[真扩散系数(D)、伪扩散系数(D*)、灌注分数(f)]和表观扩散系数(ADC)。在 MRI 检查两周内进行超声检查, 测量脐动脉 (UA) 及大脑中动脉

的 PI、RI、S/D 及脑胎盘比(CPR)，再获得实验室指标 AST、ALT 及凝血酶原时间 (PT) 等。对以上参数进行 ANOVA 分析及 ROC 分析。

结果：超声(UA-PI、RI、S/D 及 CPR)和 fMRI(μ_{diff} 和 f)能有效预测 GH 中的 PE，fMRI 联合模型预测效能高于超声联合模型 (AUC 0.845 vs. 0.792)，联合 fMRI 及超声可进一步提高 AUC (0.920)。此外，fMRI 参数(μ_{diff} 和 f)也可鉴别 GH 和对照组，但所有超声参数均不可鉴别这两组。

结论：与传统超声及实验室检查方法相比，IVIM 灌注和 vMRE 可以全面评估胎盘血流动力学和组织力学性质，可以更好的用于更早期发现胎盘功能障碍，从而识别具有高风险的妊娠高血压患者。

PO-1817

能谱 CT 容积定量参数评估结直肠癌组织学分级的可行性

李晓凤、曾燕
重庆医科大学附属第三医院

目的：探讨能谱 CT 容积定量参数在结直肠癌组织学分级评估中的可行性，以期探索一种更好的评估 CRC 组织学分级的能谱参数获取方法。

方法：收集 2019 年 1 月至 2022 年 10 月经手术病理证实的 CRC 患者 130 例，经过纳排标准筛选最终纳入管状腺癌 77 例进行分析，根据病理结果及 WHO 标准将其分为低级别管状腺癌组 55 例，高级别管状腺癌组 22 例。分别采用 ROI 勾画方法包括容积 ROI、面积 ROI、圆形小 ROI 测量肿瘤动脉期及静脉期的碘浓度 IC、水浓度 WC、有效原子序数 Eff-Z，并计算出标准化碘浓度 NIC。采用 ICC 进行一致性检验，组间比较采用两独立样本 t 检验、Mann-Whitney U 检验、 X^2 检验等，以 $P < 0.05$ 为差异具有统计学意义。绘制 ROC 曲线评价三种 ROI 测量的能谱定量参数对结直肠管状腺癌组织学分级的诊断效能。

结果：两组间动脉期和静脉期三种 ROI 勾画方法测量的 IC 和 NIC、容积 ROI 法测量的 Eff-Z 组间差异具有统计学意义；面积 ROI 和圆形小 ROI 法测量的 Eff-Z 组间差异不具有统计学意义 ($P > 0.05$)；两组间的 WC 差异均无统计学意义 ($P > 0.05$)。高级别 CRC 管状腺癌的 IC、NIC 和 Eff-Z 均高于低级别肿瘤，且静脉期观测值高于动脉期观测值。ROC 曲线分析显示，通过截面 ROI 和圆形小 ROI 方法获取的 IC 和 NIC 对 CRC 管状腺癌组织学分级的诊断效能低于容积 IC 和容积 NIC。动脉期容积 IC 和容积 NIC 的诊断效能高于静脉期，动脉期容积 IC 的 AUC 为 0.879，最佳诊断阈值为 1.53mg/cm³，动脉期容积 NIC 的 AUC 为 0.802，最佳诊断阈值为 0.15。其中动脉期容积 IC 的诊断效能高于容积 NIC 和容积 Eff-Z。

结论：能谱 CT 容积定量参数评估结直肠管状腺癌组织学分级的价值高于常规方法获取的定量参数，尤其是动脉期容积 IC 具有更大的诊断价值。

PO-1818

能谱 CT 容积定量参数鉴别结直肠黏液腺癌和管状腺癌的价值

李晓凤
重庆医科大学附属第三医院

目的：探讨能谱 CT 容积定量参数鉴别结直肠黏液腺癌和管状腺癌的价值，以期探索一种术前无创检测 CRC 病理类型的影像学标志物。

方法：收集 2019 年 1 月至 2022 年 10 月经手术病理证实的 CRC 患者 130 例，包括管状腺癌 99 例，乳头状腺癌 4 例，黏液腺癌 23 例，印戒细胞癌 2 例，鳞状细胞癌 1 例，黑色素瘤 1 例，经过纳排标准筛选最终纳入 96 例 CRC 患者进行研究，根据病理结果将其分为黏液腺癌组 19 例，管状

腺癌组 77 例。所有患者均采用 Revolution CT 进行常规平扫及 GSI 模式下增强扫描。运用容积 ROI 方法测量包含肿瘤整体的能谱定量参数, 包括碘浓度 (IC)、水浓度 (WC)、有效原子序数 (Eff-Z), 并计算出标准化碘浓度 (NIC)。采用独立样本 t 检验、U 检验、 χ^2 检验等进行组间比较, 对有统计学意义的参数运用 ROC 曲线评价其诊断效能, 采用 Youden 指数确定最佳诊断阈值, 并分别计算出相应的敏感度和特异度。

结果: 能谱 CT 容积定量参数中, 动脉期和静脉期的 IC、NIC、Eff-Z 在结直肠黏液腺癌和管状腺癌两组间差异具有统计学意义 ($P<0.01$), 且静脉期观测值高于动脉期; 而无论动脉期还是静脉期, WC 在两组间差异均无统计学意义。黏液腺癌的 IC、NIC、Eff-Z 均低于管状腺癌的 IC、NIC、Eff-Z。动脉期和静脉期的 IC、动脉期和静脉期的 Eff-Z、静脉期的 NIC 具有中等诊断效能, ROC 曲线下面积分别为 0.792, 0.735, 0.726, 0.779, 0.784。其中动脉期 NIC 的诊断价值最大, 其 AUC 为 0.871, 最佳诊断阈值为 0.11, 敏感度为 77.90%, 特异度为 78.9%, 约登指数为 0.568, 95% 置信区间为 0.790~0.952。

结论: 能谱 CT 容积定量参数对鉴别结直肠黏液腺癌和管状腺癌具有一定价值, 其中动脉期 NIC 的诊断价值最高。

PO-1819

基于图像空间重建技术的小视野 DWI (rFOV IRIS-DWI) 序列在 直肠癌 T 分期中的应用价值

2. 飞利浦 医疗保健事业部 (上海)

3. 睢宁县人民医院

目的: 探讨 rFOV IRIS-DWI 序列联合常规高分辨率 T2WI 序列诊断直肠癌 T 分期的效能。方法: 回顾性分析 2022 年 6 月-11 月行直肠 MRI 检查的患者资料。每位患者均使用 3.0T MR 扫描仪进行检查, 均完成小视野 (Reduced field of view, rFOV) 基于图像空间重建 (Image reconstruction using image-space sampling function, IRIS) 技术 DWI (rFOV IRIS-DWI) 序列、常规高分辨率斜轴位 T2WI 序列。图像由一名直肠癌研究方向的影像科高级职称医生进行评估。第一轮评估所有入组患者的高分辨率 T2WI 序列图像, 一周后第二轮评估观察高分辨率 T2WI 序列和 rFOV IRIS-DWI 序列图像, 分别记录两次评估的磁共振 T 分期结果。采用 MedCalc 统计软件 (Version 18.2.1) 进行分析。两种诊断方法对 pT 分期的诊断准确性采用 Fisher 精确概率检验。采用受试者工作特征 (Receiver operating characteristic, ROC) 曲线评估两种诊断方法对 pT 分期的诊断效能。两种诊断方法诊断信心差值符合正态分布采用配对样本 t 检验, 差值不符合正态分布采用配对 Wilcoxon 秩和检验。 $P<0.05$ 认为差异具有统计学意义。结果: 本研究共纳入 27 例直肠癌患者, 中位年龄 69 岁。基于 rFOV IRIS-DWI 联合 T2WI 序列, 对 pT1-2、pT3 期的诊断准确性分别为 91.7%、93.3% ($P<0.0001$), 两种诊断方法诊断 pT3 期的曲线下面积分别为 0.928、0.658 ($P=0.002$)。两种诊断方法对入组病例的诊断信心分别为 2.37、2.9 分 ($P=0.0002$)。结论 rFOV IRIS-DWI 联合高分辨率 T2WI 序列能够显著提高直肠癌的 T 分期的诊断效能和诊断信心。

PO-1820

基于 DCE-MRI 影像组学联合临床特征术前鉴别肝内胆管细胞癌与混合型肝癌

邱俊杰

贵州医科大学附属肿瘤医院

目的 探讨动态增强 MRI(DCE-MRI)影像组学模型联合临床特征对肝内胆管细胞癌(ICC)和混合型肝癌(cHCC-CC)的鉴别诊断价值。**方法** 回顾性分析我院经病理证实的 84 例 ICC 和 36 例 cHCC-CC 的患者的临床资料。将 84 例 ICC 患者随机分成训练组(56 例)和测试组(28 例), 36 例 cHCC-CC 患者随机分成训练组(24 例)和测试组(12 例)。分析临床表现及 MR 特征。从 DCE-MR 图像瘤内及瘤周 5mm 提取放射组学特征, 利用最小绝对收缩和选择算子算法进行特征降维, 并构建影像组学模型; 利用多因素 logistic 回归筛选临床及影像学危险因素并构建临床模型; 最终以瘤内、瘤周及临床特征构建联合模型。通过受试者工作特征和曲线下面积(AUC)来评估模型的性能。结果 甲胎蛋白及背景性肝病(肝硬化或慢性肝炎)用于构建临床模型。临床模型、瘤内模型、瘤周模型、瘤内+瘤周模型及联合模型在训练集的 AUC 分别为 0.783、0.824、0.845、0.852、0.870; 在验证集中的 AUC 分别为 0.760、0.802、0.810、0.831、0.852。经 DeLong 检验, 训练集中联合模型与临床模型、瘤内模型、瘤周模型之间差异有统计学意义 ($Z=2.730、2.241、2.032, P=0.021、0.034、0.038$)。结果表明在训练集和验证集中联合模型的预测能力优于临床模型、瘤内模型、瘤周模型及瘤内+瘤周模型。结论 基于 DCE-MRI 影像组学模型及临床特征构建的联合模型可更好地鉴别 cHCC-CC 和 ICC。

PO-1821

甲胎蛋白联合 EOB-MRI 影像特征诊断微小 (<1cm) 肝细胞癌的新标准建立

黄鹏、吴菲、周长武、杨春、曾蒙苏

复旦大学附属中山医院

目的: 研究甲胎蛋白 (AFP) 在钆塞酸二钠增强磁共振成像 (EOB-MRI) 诊断微小 (<1cm) 肝细胞癌 (HCC) 中的作用。

方法: 本研究回顾性纳入了 2017 年 1 月至 2023 年 3 月期间在 EOB-MRI 上观察到单发<1cm 病灶的慢性乙型肝炎患者。HCC 组的最终诊断由手术切除病理学检查确认, 良性对照组的最终诊断由病理学或长期随访 (>2 年) 确诊。使用 Youden 指数确定 AFP 诊断微小 HCC 的新临界值。通过对 AFP 和影像特征的单因素/多因素 logistic 回归分析, 确定独立预测因素并建立新诊断标准。使用 McNemar 检验比较了新诊断标准与动脉期强化+门脉期廓清 (“快进快出”) 进行了比较。同时对肝胆期低信号结节进行了亚组分析。

结果: 共计 305 名患者 (平均年龄 51.5 ± 10.7 岁, 153 名男性) 被分为训练队列和时间独立验证队列。以下四项指标是诊断微小 HCC 的独立预测因子: 甲胎蛋白>13.7ng/mL、动脉期非周边强化、门脉期非边缘廓清和移行期低信号。一项新标准 (四项显著性因子中至少满足三项) 显示出比 “快进快出” 更高的灵敏度 (训练队列, 71.6% vs. 52.3%, $P < 0.001$; 时间独立验证队列, 75.0% vs. 47.5%, $P = 0.003$), 而特异性没有降低 (训练队列, 92.5% vs. 92.5%, $P > 0.999$; 时间独立验证队列, 92.0% vs. 92.0%, $P > 0.999$)。另一项标准 (所有四项显著性因子均满足) 的特异性略高于诊断标志 (训练队列, 99.1% vs. 92.5%, $P = 0.023$; 时间独立验证队列, 100.0% vs. 92.0%, $P = 0.134$)。对 242 枚肝胆低信号结节的亚组分析也得出了类似的结果。

结论: 将甲胎蛋白纳入诊断标准可提 EOB-MRI 诊断微小 HCC 的诊断效能。

PO-1822

肾上腺静脉术前规划中的新技术： CT 容积双能量成像结合全息可视化三维重建

李笑石、耿纪刚、朱寅虎、金大永、李馨、秦越
西安大兴医院

目的：探讨 CT 容积扫描模式下，使用双能量成像技术结合全息可视化三维重建在肾上腺静脉术前规划中的应用，提高重建图像质量与手术成功率。

方法：前瞻性收集我院内分泌科 2021 年 10 月至 2023 年 3 月临床继发性高血压患者确诊为原发性醛固酮增多症共 40 人。按性别比例平均分配为 A、B 两组，每组各 20 人，两组患者年龄、BMI、血压、检查前血糖、心率等差异均无统计学差异 ($P>0.05$)。所有患者检查前均签署知情同意书。A 组采用容积双能量扫描，B 组采用常规螺旋扫描。由 1 名影像科主治医师使用模型构建软件对右肾上腺静脉进行三维重建模型可视化处理。再由另外 2 名高年资副主任医师影像诊断医师分别对 2 组可视化模型影像进行主观质量评分，采用 5 分制评分法。并在原始数据图上测量右肾上腺静脉 (RAV) 的 CT 值及噪声值 (SD)，同层面肌肉噪声值，通过计算得到信噪比 (Signal To Noise Ratio, SNR) 和对比噪声比 (Contrast To Noise Ratio, CNR)。记录对比两组患者剂量长度乘积 (Dose Length Product, DLP) 并计算有效辐射剂量 (Effective Radiation, ED)。

结果：A 组中可视化三维模型满足临床诊断需求 (评分 3、4 分者) 的有 20 例 (100%)，而 B 组为 14 例 (70%)，两组对比有统计学差异，($P<0.05$)；A 组 CT 值、SNR 值较 B 组显著增高，差异有统计学意义 ($P<0.05$)，A 组 SD 值、CNR 值较 B 组无显著差异 ($P>0.05$)；A 组 DLP 值及 ED 值均比 B 组降低，差异有显著统计学差异 ($P<0.0001$)。

结论：容积扫描模式 CT 双能量成像技术可以在不提高辐射剂量的前提下，大幅度提高右侧肾上腺静脉可视化三维重建的图像质量，对于静脉采血术前规划有着较高的临床意义，值得推广应用。

PO-1823

基于 MRI 影像组学列线图预测早期宫颈癌非肿大淋巴结转移

喻泓清、翟建
皖南医学院第一附属医院 (皖南医学院弋矶山医院)

目的 探讨基于 MRI 影像组学列线图术前预测早期宫颈癌短径 $\leq 9\text{mm}$ 淋巴结转移 (LN) 的临床价值。

方法 回顾性分析 186 例经手术病理确诊的 I A1~II A2 期宫颈癌患者，所有患者均接受盆腔常规 MRI 平扫+增强扫描后行根治性广泛全子宫及淋巴结清扫术，根据术后病理结果将患者分为 LN+ (66 例) 和 LN- (120 例)。收集患者临床及病理完整资料，包括年龄、月经状态、鳞状细胞癌相关抗原 (SCC)、淋巴血管间隙浸润 (LVSI)、宫颈浸润深度等。基于横断面 T2WI、T1CE 图像提取三维影像组学特征，以 7: 3 的比例将数据分为训练集 (130 例) 和验证集 (56 例)，使用最大相关最小冗余 (mRMR) 和最小绝对收缩和选择算子 (LASSO) 回归对训练集影像组学特征进行降维，根据各自的影像组学系数建立影像组学标签。单因素 ANOVA 和多因素 Logistic 回归分析以确定 LN 高危因素。联合高危因素和影像组学标签建立列线图。采用受试者工作特征曲线 (ROC) 和决策曲线分析 (DCA) 评估其预测效能及临床收益。验证集数据用于验证模型。

结果 基于 T2WI 及 T1CE 分别提取 1316 个影像组学特征，经降维后分别获得 10、13 个最佳特征，用于分别构建单序列影像组学标签。共筛选出 11 个特征用于构建联合序列影像组学标签，其训练集和验证集数据中的 AUC 值分别为 0.79、0.78。在临床病理因素中，LN+ 和 LN- 组间 LVSI、宫颈浸润深度、SCC 值差异具有统计学意义 (P 均 <0.05)，纳入以上 LN 高危因素及联合序列的影像组学标签共同建立列线图模型。ROC 曲线及校准曲线均显示出良好的预测效能，在训练集和验证

集中的 AUC 值分别为 0.89、0.85。DCA 显示, 阈值取 0.09~0.84 时, 列线图模型的净收益高于联合序列影像组学模型。

结论 基于 MR 影像组学列线图对术前早期宫颈癌患者非肿大淋巴结转移具有良好的预测效能, 具有潜在临床应用价值。

PO-1824

低剂量容积扫描 CTA 扫描技术在动脉型勃起功能障碍诊断与治疗中的应用

李笑石、耿纪刚、朱寅虎、金大永、肖刚、秦越
西安大兴医院

目的: 探究在低剂量容积扫描 CTA 扫描技术对于动脉型勃起功能障碍的诊断效能。

方法: 选取 2021 年 10 月至 2023 年 6 月我院收治需进行阴茎动脉 CTA 以确诊动脉型勃起功能障碍 (Erectile Dysfunction, ED) 的患者 40 人, 所有患者采用低剂量容积扫描, CTA 扫描参数一致。收集统计临床资料与超声、CTA 影像学数据及辐射剂量。所有患者在注射前列地尔后, 先进行阴茎双功能多普勒超声检查, 之后进行 CTA 扫描, 在 CTA 检查完后 72 小时再进行 DSA 检查与治疗。以 DSA 检查结果为金标准, 比较 CTA 与多普勒超声在确诊阴茎勃起功能障碍为动脉型的诊断效能及对狭窄程度的准确性判断。

结果: CTA 诊断血管 (阴部内动脉、双侧阴茎背动脉、双侧海绵体动脉) 狭窄的准确性 (95.21%)、灵敏性 (93.05)、特异性 (95.52) 均高于多普勒超声 (分别为 92.56%、88.07%、90.16%); CTA 判断狭窄程度与 DSA 无显著差异 ($P>0.05$), 两者狭窄分级进行 Kappa 对比一致性良好 ($Kappa>0.85$); CTA 在诊断是否为动脉型 ED 的受试者特异性曲线下面积 (AUC) 为 0.92, 高于双功能多普勒超声 (0.86)。

结论: 低剂量阴茎动脉 CTA 在诊断动脉型 ED 中具有良好的鉴别能力, 与金标准 DSA 效能相当; 诊断血管狭窄情况较双功能多普勒超声具有更好的准确性、灵敏性与特异性; 低剂量容积扫描 CTA 技术可以在临床诊断动脉型勃起功能障碍中作为常规扫描, 推广应用。

PO-1825

光谱 CT 虚拟平扫代替普通平扫价值

于庆
辽宁省肿瘤医院

目的: 探讨光谱 CT 肝脏虚拟平扫代替普通平扫的价值。

方法: 回顾性分析本院经光谱 CT 扫描的 32 例肝脏增强患者的影像资料。通过后处理工作站获取动脉期、静脉期、延迟期虚拟平扫图像。客观评价普通平扫和动脉期、静脉期、延迟期虚拟平扫图像上的 CT 值、背景噪声、图像的信噪比及对比噪声比、辐射剂量。

结果: 肝脏普通平扫和动脉期、延迟期虚拟平扫图像 CT 值差异有统计学意义 ($P<0.05$), 与静脉期虚拟平扫图像 CT 值差异无统计学意义 ($P>0.05$)。肝脏普通平扫与肝脏三期虚拟平扫的 SNR 差异均有统计学意义 ($P<0.05$)。肝脏 4 种图像间的对比噪声比及背景噪声无统计学意义 ($P>0.05$)。

结论: 基于光谱 CT 获得的肝脏静脉期虚拟平扫能更好的还原肝脏 CT 值, 可以替代肝脏普通平扫, 同时有效减低辐射剂量。

PO-1826

巨大肠系膜多形性未分化肉瘤一例

包圆圆
晋城市人民医院

患者 女, 73 岁, 因腹部疼痛 20 余天入院。患者于 20 天前无明显诱因出现腹胀、腹痛, 伴腰酸、乏力, 不欲饮食, 就诊于县人民医院, 予相关检查及治疗, 症状未见明显改善, 今日就诊于我院急诊科, 行相关检查, 考虑“盆腔内实性为主包块”, 为求进一步诊治, 收入综合病房。患者入院以来, 神志清楚, 精神差, 腹胀、腹痛, 腰酸、乏力, 不欲饮食, 留置尿管, 大便量少。既往 20 年前曾行子宫切除术, 具体不详。体检: P94 次/分, BP154/92mmHg。腹部膨隆, 腹硬, 下腹可触及一肿物, 压痛阳性, 无反跳痛, 未触及肌紧张。肿标: 神经元特异性烯醇化酶 19.77ng/ml, CA72-4 124.34U/ml, CA125 293.20U/ml。

PO-1827

CT 影像组学模型在双表型肝癌和肝内胆管细胞癌鉴别诊断中的价值

韦秋莹、廖锦元
广西医科大学第一附属医院

目的: 探讨 CT 影像组学模型在鉴别双表型肝癌 (dual-phenotype hepatocellular carcinoma, DPHCC) 与肝内胆管细胞癌 (intrahepatic cholangiocarcinoma, ICC) 中的价值。方法: 收集分析广西医科大学第一附属医院 2018 年 1 月至 2022 年 6 月此时间段内 59 例 DPHCC 及 53 例 ICC 患者的影像资料, 同时收集患者的年龄、性别及术后病理组织学的分化程度等一般临床资料。其中所有患者均完善术前三期增强扫描, 且病理证实并具有免疫组化检查。应用 Syngo.via 软件勾画 CT 增强三期图像上的肿瘤病灶, 从中提取并筛选特征参数, 从而精准建立影像组学模型并进行数据分析, 来评估其鉴别诊断效能。结果: 在 Boruta 降维后筛选出 1691 个有效特征, 建立三个影像组学模型, 分别为: 动脉期、静脉期、延迟期。其中动脉期和静脉期的模型在训练组表现出较高的 AUC、敏感度、特异度、准确度, 在测试组结果较差; 延迟期模型训练组 AUC 值为 0.8810, 灵敏度、特异度和准确度分别为 0.9024、0.7142、0.8260; 测试组 AUC 值为 0.8529, 灵敏度、特异度和准确度分别为 0.8823、0.7272、0.8214。结论: CT 延迟期影像组学模型对 DPHCC 和 ICC 的鉴别诊断有一定价值, 为临床医师术前精确诊断制定决策、患者术后生存预后效果的评估提供帮助。

PO-1828

肝脏淀粉样变性计量学分析

魏泽华、刘星星、陈欣、丁墩
西安交通大学第二附属医院

背景: 肝脏淀粉样变性较为罕见。既往文章多以病例报告为主, 且缺乏特异性临床表现及影像学特征。既往无研究对已发表的肝脏淀粉样变性进行定量文献计量分析。在本研究中主要对近二十三年来发表的肝脏淀粉样变性的关键词共现进行分析。

方法: 从中国期刊全文数据库 (CNKI) 及 Web of Science (WOS) 核心数据库中检索 2000-1-1 至 2023-5-13 发表的肝脏淀粉样变性的文章。利用 VOS viewer 对共同引用的关键词进行分析。

结果：检索到的 2000-1-1 至 2023-5-13 发表的关于肝脏淀粉样变性的中文文章和英文文章分别为 104 篇和 77 篇。共同引用的关键词聚类标签分别显示了 4 个和 3 个主要聚类，中文：#0 肝脏淀粉样变性的临床表现、诊断及治疗；#1 淀粉样变性累及肝的主要表现及多发性骨髓瘤的鉴别；#2 肝脏淀粉样变性诊断金标准；#3 肝脏淀粉样变性与肝窦阻塞综合征的影像学鉴别。英文：#0 肝脏淀粉样变性的自然病程；#1 肝淀粉样变性的病理机制；#2 以硼替唑米和地塞米松为代表的化疗药物研究。

结论：由于肝脏淀粉样变性的罕见性，目前所发表文章多属于病例报告，且误诊率较高，需临床医生提高对肝脏淀粉样变性的认识程度。肝脏淀粉样变性预后较差，因此早诊断和治疗的研究为肝脏淀粉样变性重要研究方向，近五年来，治疗药物以及影像学表现两方面的研究为主要的发表趋势，多中心研究或可进一步明确肝脏淀粉样变性的诊断要点。该研究提供了目前肝脏淀粉样变性研究领域发表文章的趋势，有助于确定肝脏淀粉样变性的早诊断和治疗方法。

PO-1829

直肠腺癌伴骨化生一例

彭聪、杨华
重庆市中医院

直肠腺癌伴骨化生是一个罕见的现象，分析其临床及影像学表现，探讨这一现象对临床诊治的价值。方法：回顾性分析因大便秘结及性状改变伴便血 1 月余入院 54 岁男性病例一例，并对相关文献进行复习。结果：CT 显示直肠壁不规则增厚，局部呈肿块影，形态不规则，局部浆膜面欠光整，其内及边缘见点状、线状钙化，大小约 5.3cmx4.5cm，实性成分增强后呈轻度不均匀强化，肿块内可见斑片状无明显强化区。盆腔 MRI 增强显示直肠壁见菜花状肿块影，累及肠壁 1/2 圈（1 点钟方向-7 点钟方向），肿块最大截面约 3.9cmx2.0cm，肿块向腔内腔外生长，肿瘤下缘距肛缘约为 6.7cm，增强扫描不均匀较明显强化；肿块累及直肠系膜筋膜上份，肿块与壁外血管关系密切。骨化组织在短时间内较明显增多。肠镜：直肠距肛门 5-12cm 处见一肿物，占管腔约 5/6 周，中间隆起，边缘溃烂。行直肠癌根治术，病理诊断为直肠中分化腺癌并骨化生，癌组织侵透肠壁肌层达外膜下，大部分为钙化及骨化组织，部分为纤维组织，根据 AJCC 的 TRG 分级为 2 级。送检组织近端、远端吻合口及自取双侧断端、系膜切缘未见癌。系膜淋巴结<4/9>见有癌转移。免疫组化：MSH（+），MSH6（+），PMS2（+），MLH1（+），CK（+），LCK（+），P53（+约 35%），Ki-67（+约 25%）。

结论：骨化生是一种罕见的现象，在诊断时应想到直肠癌的骨化生的可能性，和其他胃肠道肿瘤做鉴别，并避免将其诊断为骨来源肿瘤。

PO-1830

自适应迭代技术联合能谱在腹部 CT 三期增强扫描对肝实质图像质量的应用与研究

徐玉娇
南京明基医院有限公司

目的：探讨最佳自适应统计迭代重建（ASIR）结合最优单能量技术提高肝实质质量。

方法：选取 2022 年 1 月 0 日至 2022 年 11 月行腹检查的 55 例患者为研究对象。所有患者均从横膈膜水平至耻骨联合水平进行扫描，扫描层厚度为 5 mm，重建层厚度为 0.625mm。患者检查采用常规能谱扫描进行，预选代为 60%，预设噪声指数（NI）为 8.5 采用 40Kev、50 Kev、60 Kev 结合不同百分比的 ASIR-V 算法，在动脉期、门静脉期和静脉期测量右前叶、右后叶、皮下脂肪和竖

脊肌的 CT 值和 SD 值进行重建三组图像。主观评价：两位具有 7 年以上经验的放射科医生对十二组图像的整体图像质量进行 5 分法评分。

结果：客观评价：9 组不同重建方法的右前叶和右后叶 CT 值、SD 值和 CNR 值均有统计学差异 ($P<0.05$)，肝左叶和肝脏右叶 60Kev-40%ASIR SD 值明显较低 47.53 ± 5.12 ， 14.63 ± 2.94 ， 18.28 ± 2.62 ， 18.41 ± 3.9 ， 16.13 ± 3.71 ， 15.36 ± 2.59)，SNR 值均高于其他 8 组 (47.53 ± 7.67 ， 44.35 ± 8.66 ， 37.57 ± 3.53 ， 42.12 ± 8.77 ， 40.71 ± 7.8 ， 42.12 ± 8.77)。主观评价：2 名诊断组医生对图像重建质量主观评分的 Kappa 值为 0.73、一致性强。在图像噪声方面，图像对比度显示，60Kev-40%ASIR 图像明显优于其他 8 组重建图像 ($P<0.05$)。

结论：随着 ASIR 权重的逐渐增大，噪点减小，但过高的 ASIR 对比度会降低，导致图像过度平滑，噪点纹理看起来“斑驳”、“蜡状”或“不自然”，因此结论是 60Kev-40%ASIR 在图像上的诊断值最高。

PO-1831

肝多灶性吻合状血管瘤一例

郭义万、郭爽、郭婷婷、李欣
华中科技大学同济医学院附属协和医院

患者，女，56 岁，因胸闷、发热行胸部 CT 检查时发现肝内多发低密度占位，遂转诊至我院。

实验室检查：乙丙肝均为阴性；AFP 等肿瘤标志物均正常。

影像学检查：胸部及腹部增强 CT 示两肺多发感染性病变，部分为间质性病变，伴两侧胸腔积液。肝内多发大小不一类圆形低密度结节及肿块影，边界欠清，较大者横截面约 $2.8\times3.7\text{cm}$ ，增强扫描动脉期呈明显环形强化，门脉期强化范围稍增大，延迟期较小病灶似呈等密度，较大病灶边缘仍可见环形强化，中心更低密度区未见明显强化。全身糖代谢 PET/CT 显像示肝内多发大小不一类圆形低密度结节及肿块影，边界欠清，较大者直径约 3.2cm ，部分病灶代谢轻度异常增高，SUVmax $2.0-3.0$ （该患者正常肝实质 SUVmax 2.5）；余探测部位未见明显恶性肿瘤病变征象。

术前影像诊断：肝内多发占位，考虑肝上皮样血管内皮瘤可能。

手术及病理：术中见肝脏多发占位，左外叶表面显露明显，未见明显转移灶，遂行肝左外叶切除术。

眼观：紧邻肝手术切缘及被膜见多处灰红间褐小结节，大小约 $0.9\times0.7\text{cm}\sim3.0\times2.2\text{cm}$ ，质地中等，边界尚清。镜检：肿瘤于肝组织内弥漫浸润性生长，但相对有界限，未见明显侵袭征象。肿瘤主要由紧密堆集的毛细血管样管腔构成，呈吻合状或交通状，形成窦隙样结构，并可见灶状髓外造血。血管内衬单层立方上皮，形态温和，核分裂象罕见。免疫表型：血管内皮标志物 CD34、CD31、ERG 均阳性，SMA 阳性，D2-40、Des、TFE3、PCK 均阴性，Ki-67（散在+）。病理诊断：肝多灶性吻合状血管瘤。

PO-1832

胰腺癌化疗患者预后的危险因素分析及 影像相关列线图风险模型构建

王晓洁、余日胜
浙江大学医学院附属第二医院

目的：化疗是治疗胰腺癌患者的重要手段，但由于患者临床病理组织特征不同、治疗方式不同等因素，患者预后存在个体差异。本研究通过纳入公共数据平台及我院来源胰腺癌化疗患者，结合包括影像特征在内的多层次信息，分析胰腺癌化疗患者预后的危险因素，并构建影像相关可视化列线图预测模型，为制定临床决策提供参考价值。

方法：第一部分：在公共数据库中筛选 2013 年至 2016 年期间接受胰腺癌化疗的患者，收集临床、病理特征及总生存期（OS），对变量进行 Cox 分析以获得胰腺癌化疗患者 OS 的独立影响因子。第二部分：回顾性分析本院 2015 年至 2020 年期间胰腺癌根治术后辅以吉西他滨（GEM）化疗的患者，收集临床、病理、影像特征及患者无病生存期（DFS），对变量进行 Cox 分析以获得胰腺癌术后辅以 GEM 化疗患者 DFS 的独立影响因子。利用 R 软件构建预测列线图模型，对列线图的预测能力和临床获益性进行评价。

结果：第一部分：公共数据库共计 706 例胰腺癌化疗患者入组，分析显示：肿瘤病理分级、TNM 分期、原发部位手术为胰腺癌化疗患者 OS 的独立影响因子（ $p < 0.05$ ）。第二部分：本院共计 86 例胰腺癌术后辅以 GEM 化疗患者入组研究，结果显示 BMI、术前 CA199 >1000 U/ml、N 分期、肠系膜上静脉受累为胰腺癌术后辅以 GEM 化疗患者 DFS 的独立影响因子（ $p < 0.05$ ）。成功构建胰腺癌术后辅以 GEM 化疗患者 6 个月、1 年 DFS 的列线图预测模型，内部验证得该模型 C-index 为 0.713（95% CI: 0.660~0.763），校准曲线显示预测 DFS 与实际 DFS 具有良好一致性，模型 6 个月、1 年、3 年 AUC 为 0.749、0.809、0.735，时间 AUC 曲线及 DCA 曲线结果良好。

结论：本研究成功筛选出胰腺癌化疗患者生存情况的独立影响因素，并构建了影像特征相关的可视化列线图预测模型，该模型为制定精准临床决策提供参考价值。

PO-1833

深度学习重建算法在提高上腹部平扫及增强 CT 图像中的价值

贾永军、于楠、杨创勃、段海峰
陕西中医药大学附属医院

目的 探索深度学习重建算法（deep learning image reconstruction, DLIR）在提高上腹部平扫及增强 CT 图像质量中的临床应用价值。

材料与方法 回顾性分析经 GE Revolution CT 扫描的 57 例患者的上腹部平扫及增强 CT 原始扫描数据，分别采用深度学习重建算法低、中、高强度（DL-L、DL-M、DL-H）和迭代重建算法（ASiR-V 50%）对获得的图像薄层（0.625mm）CT 重建处理。一名观察者对重建图像进行定量分析，包括肝脏、脾脏、背部肌肉、主动脉 CT 值和代表图像噪声的标准差（SD）。两名观察者采用双盲法对重建图像进行定性评分，分为血管显著性、图像噪声和纹理、病变显著性、病变诊断信心 4 部分。

结果 相较于临床常用的 ASiR-V 50%，DLIR 算法在不影响平扫及增强各期图像上肝脏、脾脏、背部肌肉、主动脉的 CT 值，但图像噪声不同程度降低，图像质量主观评分也有明显提升，其中 DL-H 表现最好。

结论 与 ASiR-V 算法相比，DLIR 算法能改进上腹部 CT 平扫及增强图像质量，由于 DL-H 算法重建的 CT 图像噪声更低，主观评分更高，临床应用中优先推荐使用。

PO-1834

基于钆塞酸二钠增强 MRI 预测 VETC 阳性肝细胞癌的相关研究

张继云、张涛、张学琴
南通市第三人民医院

目的：本研究主要是探讨基于钆塞酸二钠增强 MRI 定性、定量特征术前预测血管包绕肿瘤簇（vessels encapsulating tumor clusters, VETC）阳性肝细胞肝癌的价值。

方法：回顾性分析 2013 年 1 月~2020 年 1 月间南通大学附属南通第三医院经病理和免疫组织化学检测的 HCC 的患者 234 例。其中 VETC 阳性 HCC 共 101 例，VETC 阴性 HCC 共 133 例，记录所有入组患者的术前实验室相关检查指标、病理结果以及影像学特征，依据 7: 3 将所有患者分为训练组和验证组。应用训练组数据构建预测 VETC 阳性 HCC 预测模型，绘制受试者工作特征 (ROC) 曲线并计算曲线下面积 (AUC) 验证模型的诊断效能，绘制校准曲线图 (Calibration Plot) 验证模型的校准度。通过临床及影像检查术后定期随访复查明确肿瘤是否复发，记录患者的无复发生存期 (RFS)。

结果：多因素 Logistics 回归分析预测 VETC 阳性 HCC 的独立危险因素：门脉期周边廓清 (优势比 (Odds ratio, OR): 6.493)，坏死或缺血严重 (OR: 4.756)，移行期或肝胆期靶征 (OR: 0.307)，LLR 动脉期 (OR: 0.074)。训练组预测 VETC 阳性 HCC 的 AUC 为 0.790 (95%CI: 0.720-0.859)；验证组预测 VETC 阳性 HCC 的 AUC 为 0.779 (95%CI: 0.668-0.889)。所有入组患者平均 RFS 为 31.52 个月 (1-52 个月)，VETC 阳性患者平均 RFS 为 24.19 个月 (1-47 个月)，VETC 阴性患者平均 RFS 为 37.34 个月 (3-52 个月)；

结论：基于 Gd-EOB-DTPA 增强 MRI 定性、定量特征对于术前预测 VETC 阳性 HCC 具有重要价值，门脉期周边廓清、病灶坏死或缺血严重、移行期或肝胆期靶征、LLR 动脉期是 VETC 的独立危险因素。

PO-1835

评估磁共振成像特征预测肝细胞癌 PD-L1 表达的诊断价值

陈千娟、龙莉玲、冯丽娟
广西医科大学第一附属医院

摘要

目的 旨在采用磁共振成像技术来评估肝细胞癌免疫抑制剂检查点 PD-L1 在患者术前和免疫治疗前的表达情况。方法 本研究前瞻性收集 144 例肝细胞癌患者。所有患者均在术前两周内进行 Gd-EOB-DTPA 的增强磁共振扫描。两名放射科医生对肝细胞癌患者的磁共振成像特征进行评估。这些特征包括：包膜 (完整/不完整)、动脉期瘤周强化、瘤内动脉、肝胆特异期信号、肝胆特异期瘤周低信号、癌栓、肿瘤大小以及表观弥散系数 (ADC)。采用免疫组织化学检测 HCC 患者肝癌组织中 PD-L1 的表达水平。使用相关性分析和逻辑回归分析评价磁共振成像特征与 HCC 中 PD-L1 表达水平之间的关系。结果 PD-L1 与包膜、ADC 值组间存在显著差异 ($P < 0.05$)，二元逻辑回归结果显示，包膜及 ADC 值均是 PD-L1 的独立预测因素 (包膜: OR=2.314, 95%CI 1.096-4.887, $P=0.028$; ADC: OR=0.997, 95%CI 0.995-1.000, $P=0.020$)。结论 术前 Gd-EOB-DTPA 的增强磁共振成像特征在术前预测肝细胞癌的免疫检查点 PD-L1 的表达具有潜在的价值。

PO-1836

联合影像组学及深度学习在 CT 平扫上自动识别隐匿性肝挫裂伤

冯俊榜^{1,2}、杨清宁^{1,2}、李畅^{1,2}、夏雨薇³、李传明^{1,2}

1. 重庆大学附属中心医院

2. 重庆市急救医疗中心 (重庆市第四人民医院、重庆市急救医学研究所)

3. 上海联影智能医疗科技有限公司

目的：建立并验证用于自行识别隐匿性肝挫裂伤的人工智能模型。

方法：回顾性收集重庆大学附属中心医院外伤病人 526 例，根据 CT 平扫和增强扫描分为有隐匿性肝挫裂伤组 (231 例) 和无肝挫裂伤组 (295)，按照 7:3 的比例随机的分为训练集和测试集。在联影智能一站式科研平台上使用 U-Net 网络演化的 VB-net 网络在 CT 平扫上自动行全肝的识别、分

割, 通过 Research Portal VX. X 在 CT 平扫上建立肝脏自动分割框架结构从每个患者的全肝感兴趣区域 (Region of interest, ROI) 中, 自动提取 2264 个影像组学特征。降维后, 在训练集上采用 4 个独立的机器学习分类器 (逻辑回归 (Logistic regression, LR)、高斯过程 (Gaussian process, GP)、随机森林 (Random forest, RF) 和二次判别分析 (Quadratic discriminant analysis, QDA)) 进行训练, 并在测试集上进行验证。采用受试者工作特性曲线下面积 (Area under the curve, AUC) 指标评价模型性能。

结果: 每例患者共纳入 2264 个影像组学特征, 降维后, 发现 15 个特征与隐匿性肝挫裂伤相关。基于 GP 诊断模型表现出良好性能, 训练集、测试集上 AUC 分别为 0.974、0.970。DeLong 检验表明, GP 模型在所有模型中精度最高。校准曲线显示, 预测外伤病人合并有隐匿性肝挫裂伤发生风险的模型结果具有良好的一致性和稳定性。临床决策曲线显示 GP 模型呈显著正效应, 患者获益概率范围广, 具有临床实用价值。

结论: 基于 CT 平扫的肝脏的影像组学特征构建的 GP 模型表现最佳, 可作为评估外伤病人合并隐匿性肝挫裂伤的辅助诊断工具。该机器学习模型可以自动识别、分割和提取肝脏组学特征, 实现外伤患者合并隐匿性肝挫裂伤的自动识别。

PO-1837

基于钆塞酸二钠增强 MRI 列线图预测 MVI 阴性肝细胞癌术后复发

瞿琦^{1,2}、张涛¹、张学琴¹

1. 南通市第三人民医院

2. 南通大学

目的: 探讨基于钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 列线图模型预测微血管浸润 (MVI) 阴性肝细胞癌 (HCC) 患者根治性切除术后无复发生存期的价值。

方法: 回顾性研究 2015 年 2 月至 2021 年 5 月在我院接受根治性肝切除术且病理证实为 MVI 阴性 HCC 的患者 125 例, 分析患者的术前临床资料、MR 图像及术后病理资料。通过单因素和多因素 Cox 比例风险模型分析获得患者术后无复发生存的独立危险因素, 并构建预测患者 1、3 和 5 年无复发生存率的列线图模型, 采用 C-index 和受试者工作特征 (ROC) 曲线来评价模型的区分度, 采用校准曲线评价模型的一致性。

结果: 随访过程中, 37 例 HCC 患者发生复发, 中位无复发生存时间 27.1 个月 (95% CI: 43.3~54.1 个月), 术后 1、3 和 5 年无复发生存率分别为 88.0%、71.9%、45.9%。多因素分析显示: 病理分级 (HR =4.807, 95% CI:1.126~20.526, P=0.034)、肝胆期瘤周低信号 (HR =3.755, 95% CI:1.736~8.122, P=0.001)、RIR_{肝胆期} (HR =0.019, 95% CI:0.001~0.396, P=0.010) 是 HCC 患者术后无复发生存期的独立危险因素。整合上述三个变量构建的列线图预测模型曲线下面积 (AUC) 为 0.819 (95% CI: 0.740~0.882), 同时经 Bootstrap 内部验证, 该模型 C-index 为 0.795 (95% CI: 0.723~0.867), 且校准曲线验证结果显示该模型预测概率和实际观察概率吻合度较好。

结论: 基于 Gd-EOB-DTPA 增强 MRI 构建的列线图可以有效预测 MVI 阴性 HCC 患者术后无复发生存期。

PO-1838

双层探测器光谱 CT 定量参数在结直肠腺癌 Ki-67 和 HER2 表达中的评估

陈菁华¹、刘可夫²、黄健¹

1. 太仓市中医医院

2. 南京医科大学附属苏州市立医院

目的：评估双层探测器光谱 CT (SDCT) 定量参数对结直肠腺癌 (CRAC) Ki-67 和 HER2 表达状态的诊断能力，同时探讨 SDCT 定量参数与 CRAC 中 Ki-67 和 HER2 表达状态之间相关性。

方法：对 88 例符合条件的 CRAC 患者进行回顾性分析，两名观察者分别独立测量了动脉期 (AP) 和静脉期 (VP) 40keV 和 100keV 的 CT 值、有效原子序数 (Zeff)、碘浓度 (IC)、光谱曲线斜率 (λ HU) 和标准化碘浓度 (NIC) 等光谱参数。组内相关系数 (ICC) 用于评估两名观察者的内部一致性。符合正态分布的参数采用独立样本 T 检验评价鉴别 CRAC 中 Ki67 和 HER2 表达状态的诊断价值，并采用受试者工作曲线 (ROC) 评估诊断效能。Spearman 相关性分析用于分析 SDCT 参数与 Ki-67 表达程度以及 HER2 表达状态之间的相关性。

结果：CRAC 光谱定量参数测量值在观察者内部一致性较好 (ICC 范围 0.793-0.978)。CRAC 中 Ki-67 高表达组和低表达组的静脉期 SDCT 参数 CT40keV、Zeff、IC、 λ HU 有显著性统计学差异 ($P=0.035$, $P=0.041$, $P=0.036$, $P=0.044$)。静脉期 SDCT 参数 CT40keV、Zeff、IC、 λ HU 与 CRAC Ki-67 表达呈正相关 ($r=0.227$, $P=0.034$; $r=0.219$, $P=0.040$; $r=0.225$, $P=0.035$; $r=0.216$, $P=0.043$)。SDCT 参数在 CRAC HER2 参数表达状态和相关性不具有统计学意义 (P 值均 >0.05)。

结论：SDCT 定量参数可用于区分 CRAC 中 Ki-67 的低表达和高表达，其中静脉期 SDCT 参数 CT40keV、Zeff、IC、 λ HU 可能是用于评估 CRAC 中 Ki-67 表达的有效参数。

PO-1839

双层探测器光谱 CT 定量参数在结直肠腺癌分化程度、 T 分期及淋巴结转移 的应用价值初步研究

陈菁华¹、刘可夫²、黄健¹

1. 太仓市中医医院

2. 南京医科大学附属苏州市立医院

目的：探讨双层探测器光谱 CT (SDCT) 定量参数在结直肠腺癌 (CRAC) 分化程度、T 分期及淋巴结转移的应用价值。

方法：将符合条件的 85 例 CRAC 患者纳入本研究，两名观察者独立测量了动脉期 (AP) 和静脉期 (VP) 常规 CT 值、40keV 值、100keV 值、有效原子序数值 (Zeff)、碘密度 (IC) 值、同层腹主动脉/髂动脉 IC。计算标准化碘浓度 (NIC) 及光谱曲线斜率 (λ HU)。组内相关系数 (ICC) 用于评估两名观察者的内部一致性。符合正态分布的 SDCT 参数采用方差分析比较不同分化程度诊断价值，对于组间差异有统计学意义的光谱参数，进一步采用 LSD 法进行两两比较，并计算其诊断效能。SDCT 定量参数与常规检查结果使用 ROC 分析进行比较。并比较 SDCT 定量参数在 T 分期和淋巴结转移的诊断价值和相关性。

结果: CRAC 光谱定量参数测量值在观察者内部一致性较好 (ICC 范围 0.790-0.979), 静脉期光谱参数 CT40keV, CT100keV, IC, λ HU 在 CRAC 不同分化程度 (低-高分化以及中-高分化) 之间存在显著差异性 ($P<0.05$), 且具有较高的诊断效能, 以 CT100keV 诊断效能最高。静脉期 100keV 与常规增强相比 (低-高分化: $AUC=0.812$ VS $AUC=0.768$; 中-高分化: $AUC=0.684$ VS $AUC=0.656$)。光谱多参数值在 CRAC 的 T 分期和淋巴结转移上不具有统计学差异 (P 均 >0.05), 光谱多参数与 T 分期和淋巴结转移之间不具有相关性 (P 均 >0.05)。

结论: SDCT 定量参数静脉期 CT40keV, CT100keV, IC, λ HU 对 CRAC 不同分化程度鉴别具有较好诊断效能, 可作为 CRAC 分化程度的个体术前预测的临床工具。而对于 T 分期和淋巴结转移的评估, 诊断价值及相关性需要进一步深入研究。

PO-1840

基于多模态 MRI 影像学表现的 Logistic 回归分析模型对鉴别小肝癌和肝局灶性结节增生的应用价值

于泳、花村、周晓俞
南京中医药大学附属盐城中医院

【摘要】目的: 综合分析小肝癌 (sHCC) 和肝局灶性结节增生 (FNH) 的临床和多模态 MRI 影像学表现, 提高对两者鉴别诊断的水平。方法: 搜集 2015 年 1 月-2022 年 12 月经手术病理证实的直径均 ≤ 3 cm 的 79 例 sHCC 和 41 例 FNH, 综合分析两者临床及多模态 MRI 影像学表现的差异。结果: 与 sHCC 组相比, FNH 组患者发病年龄小, 乙肝病史者及临床症状均较少, 大部分患者无 AFP 升高, 但病灶中心部分可见瘢痕且不侵犯周围结构, 病灶中心在 T2WI 像易出现高信号, 增强后病灶延迟强化常见, 但少见包膜/包膜样强化, 以上特征均具有统计学差异 (P 均 <0.05)。Logistic 回归模型分析显示, 鉴别 sHCC 和 FNH 的独立危险因素包括平扫 AFP 升高 ($OR=22.498$)、病灶延迟期相对强化率 ($OR=8.189$)、患者临床症状 ($OR=0.223$)、肿瘤 T2WI 序列病灶中心高信号 ($OR=0.017$), 进一步进行 ROC 曲线分析, AFP 升高、病灶延迟期相对强化率、患者临床症状、肿瘤 T2WI 序列病灶中心高信号的 AUC 值分别为 0.794、0.813、0.654、0.834。结论: 综合分析患者的临床及 MRI 影像学特征, 有利于提高对 sHCC 和 FNH 的鉴别诊断水平。

PO-1841

肠道神经鞘瘤的影像学表现

于泳^{1,2}、龚沈初²
1. 南京中医药大学附属盐城中医院
2. 南通市第一人民医院 (南通大学第二附属医院)

【摘要】目的 研究肠道神经鞘瘤 (IS) 的影像学表现, 提高对该病的诊断能力。方法 回顾性分析 14 例经手术病理证实的 IS 患者的临床和影像学资料, 评估内容包括肿瘤的部位、大小、形态、性质、生长方式、CT 密度、MRI 信号、PET/CT 代谢等特征。结果 14 例 IS 中, 位于十二指肠 3 例, 盲肠 2 例, 结肠 8 例, 直肠 1 例。病灶均为类圆形或椭圆形, 最大径平均 (2.4 ± 1.1) cm。病灶为实性 13 例, 肠腔外生长型 10 例, 囊变 1 例, 黏液变性 1 例。9 例病变肠周可见慢性炎性淋巴结, 其中 6 例淋巴结短径大于 5mm。14 例 IS 的 CT 平扫均为低密度, 增强后均为渐进性强化, 其中轻度强化 1 例, 中度强化 2 例, 明显强化 11 例。2 例 IS 在 MRI 上均表现为 T1WI 低信号, T2WI 稍高信号, DWI 明显高信号, 增强后明显渐进性强化。2 例 IS 在 18F-FDG-PET/CT 上均表现为高代谢, 病灶 SUVmax 分别为 9.4 和 8.8。结论 IS 的影像学表现具有一定的特征性, 主要表现为肠道粘膜下

来源的实质性结节或肿块，密度或信号均匀，增强后明显渐进性强化，18F-FDG-PET/CT 上肿瘤明显高代谢，灶周常见均质稍大淋巴结。

PO-1842

基于磁共振构建胎盘植入性疾病产后大出血的影像组学-临床联合预测模型

胡玉敏

丽水市中心医院

目的：提取与胎盘植入性疾病产后大出血相关的影像组学特征、磁共振影像学特征及实验室指标，构建影像组学-临床联合模型的诺模图，以预测胎盘植入性疾病是否产后会出现大出血。

方法：回顾性收集 134 名丽水地区超声产前怀疑存在胎盘植入性疾病孕妇的资料，按照国际对于产后大出血的定义（即剖宫产 24h 内出血量大于 1000ml），将这些孕妇分为存在产后大出血（n=53 人）和不存在产后大出血（n=81 人）。将这些数据按照 8:2 比例将队列分为训练组和验证组，训练组 106 人，验证组 28 人。胎盘组学特征在 T2WI 矢状位图像上提取，通过降维的方法获得相关性最强的组学特征，利用单因素及多因素回归获得最相关的胎盘磁共振影像特征及实验室指标。获得影像组学模型及影像组学-临床预测模型，并进行模型之间的比较，最终获得最佳模型，并转化为相应的列线图模型，最终对列线图模型的效能进行验证。

结果：通过降维获得与产后大出血最相关的 4 个影像组学特征，单纯的组学模型在训练组和验证组的 AUC 分别为 0.773(95%CI 0.682-0.863)和 0.781(95%CI 0.587-0.974)。通过筛选获得胎盘内 T2WI 上低信号灶、胎盘内血管增多征、D2 聚体三项临床特征，将三项特征与影像组学特征合并构建影像组学-临床联合模型，其在训练组和验证组的 AUC 分别为 0.866(95%CI 0.798-0.935)和 0.840(95%CI 0.686-0.993)。校正曲线和决策曲线均显示出影像组学-临床联合预测模型诺模图具有较好的效能。

总结：基于磁共振构建的胎盘植入性疾病产后大出血的影像组学-临床联合预测模型在预测胎盘植入性疾病产后大出血这一严重产后并发症中具有较好的效能和临床应用价值。

PO-1843

CT 对局部进展期胃癌转化治疗效果的预测

贺星云

陆军军医大学第一附属医院（西南医院）

目的：术前准确预测胃癌转化治疗效果是选择合适的胃癌治疗方案的关键。我们开发了一种整合了 CT 图像和临床病理参数的可视化诺模图，用于胃癌转化治疗效果的个体化术前预测。

材料和方法：本回顾性研究包括 60 例 LAGC 患者(男性 39 例，女性 21 例，年龄 60.5 ± 11.61 岁)，行增强 CT 扫描。根据 RECIST1.1 评分，分为有效组（n=38）和无效组（n=22）。通过使用 ROC 来检测模型的性能。DeLong 检验用于评估两个模型之间 AUC 的差异。

结果：分层强化、肿瘤厚度和 Boroman 4 型是胃癌转化治疗效果的显著预测因素（ $p < 0.05$ ）。这三个因素的诺模图（与原始模型相比）显示出更高的预测效果（ $p < 0.001$ ）。模型的曲线下面积 (AUC) 为 0.830（95%CI 0.788-0.873），

结论：基于 CT 表型的诺模图显示了良好的区分和校准，它可以方便地用于胃癌转化治疗效果的术前个体风险评级。

PO-1844

定量磁敏感图与慢性肾脏病病理对照的初步研究

单佳媛
南通大学附属医院

目的 探讨定量磁敏感图 (quantitative susceptibility mapping, QSM) 与慢性肾脏病 (chronic kidney disease, CKD) 病理对照的临床价值。

方法 纳入 2019 年 10 月至 2021 年 11 月获得肾活检病理结果的慢性肾功能损伤患者 26 例, 根据估算肾小球滤过率 (estimated glomerular filtration rate, eGFR) 分为两组: 轻度肾损伤组 (mild renal injury group, m-RI; eGFR $\geq 60 \text{ ml} \cdot \text{min}^{-1} \cdot 1.73 \text{ m}^{-2}$) 和中重度肾损伤组 (moderate-severe renal injury group, ms-RI; eGFR $< 60 \text{ ml} \cdot \text{min}^{-1} \cdot 1.73 \text{ m}^{-2}$)。所有受试者均完成常规 MRI 及 QSM 检查, 测量肾皮质、髓质的磁化率。采用 Mann-Whitney U 检验比较 m-RI 与 ms-RI 病理损伤的差异。采用 Spearman 相关分析 CKD 患者肾皮质、髓质磁化率值与病理组织学评分的相关性。

结果 ms-RI 组的肾小球硬化、间质炎性细胞浸润、间质纤维化及肾小管萎缩评分均高于 m-RI 组 ($P < 0.05$)。肾皮质、髓质磁化率值与病理损伤评分之间存在负相关 (P 均 < 0.05), 其中肾皮质磁化率值与节段损伤的相关性最高 ($r = -0.569, P = 0.002$), 肾髓质磁化率值与肾小管萎缩的相关性最高 ($r = -0.564, P = 0.003$)。

讨论 QSM 可评估轻度肾损伤组与中重度肾损伤组病理损伤的差异及与病理组织学评分的相关性, 有助于慢性肾脏病病理机制的研究。

PO-1845

基于增强 CT 的 LI-RADS M 类肝细胞癌与肿块型肝内胆管细胞癌鉴别诊断及预后研究

秦琴、陈婕、叶铮、宋彬
四川大学华西医院

目的: 建立基于增强 CT 鉴别肝脏影像学报告和数据库系统 (Liver Imaging Reporting and Data System, LI-RADS) M 类肝细胞癌 (hepatocellular carcinoma, HCC) 与肿块型肝内胆管细胞癌 (mass-forming intrahepatic cholangiocarcinoma, mICC) 的诊断模型, 并比较两种病理类型患者的预后。

方法: 回顾性纳入我院 2018 年 1 月至 2020 年 12 月期间经病理证实并根据术前增强 CT 图像评定为 LR-M 类的 HCC 和 mICC 患者。CT 图像由两名不知晓临床病理信息的放射科医生独立评估。采用单因素和多因素逻辑回归分析识别与 mICC 相关的临床及 CT 影像特征, 并构建诊断模型。通过受试者工作特征曲线评估模型诊断效能。采用 Kaplan-Meier 曲线比较两种病理类型患者的无复发生存期和总生存期。

结果: 研究共纳入 98 例 HCC 和 60 例 mICC 患者。多因素逻辑回归分析显示, 动脉期高强化占比 $< 50\%$ 、分叶状、淋巴结转移、非肝硬化、甲胎蛋白 $\leq 19.52 \text{ ng/mL}$ 、糖类抗原 $19-9 \geq 29.28 \text{ U/mL}$ 及癌胚抗原 $\geq 3.74 \text{ ng/mL}$ 为 mICC 的独立预测因子。受试者工作特征曲线分析显示, 基于多因素逻辑回归分析的诊断模型曲线下面积为 0.97, 敏感度为 0.97, 特异度为 0.90。生存分析显示, HCC 患者的中位无复发生存期明显优于 mICC 患者 (47 月 vs 16 月, $p=0.023$), 但两组患者的平均总生存期无统计学差异 (48 月 vs 47 月, $p=0.671$)。

结论: 基于上述增强 CT 影像特征和肿瘤标志物的模型能够准确鉴别肝脏 LR-M 类病灶中的 HCC 与 mICC。LR-M 类 HCC 患者的肿瘤无复发生存期优于 mICC 患者, 但患者总体生存时间在两组患者间未见差异。

PO-1846

一站式驰豫定量 (MAGiC) 技术预测前列腺移行带 PI-RADS3 分病灶良恶性能力的临床价值研究

徐文娟
扬州大学附属医院

目的: 探讨 MAGiC 技术鉴别前列腺移行带 PI-RADS 3 分病灶良恶性的临床价值。方法: 回顾性分析 134 例病人共 134 个前列腺移行带 PI-RADS 3 分病灶的 MAGiC 定量图谱图像, 观察指标包括前列腺癌与前列腺良性增生的 T1、T2 及 PD 值, 比较移行带 PI-RADS 3 分病灶良恶性的 MAGiC 定量参数 (T1、T2 及 PD 值) 的差异, 观察这三个定量参数在 PCa 诊断中的最佳诊断界值、敏感性、特异性、PPV、NPV、95%CI 以及约登指数。结果: 前列腺移行带 PI-RADS 3 分病灶中 PCa 的 T1、T2、PD 值分别为 $1171.86 \pm 25.75\text{ms}$ 、 $74.41 \pm 1.13\text{ms}$ 、 $66.16 \pm 1.45\text{pu}$, T1、T2、PD 值均低于良性增生病灶; 在前列腺移行带 PI-RADS 3 分病灶中 T1、T2 和 PD 值诊断 PCa 的 AUC 值分别为 0.617、0.820 和 0.549; 三者的敏感性、特异性、PPV 和 NPV 分别为 47.06%、83.13%、63.20%、71.90%, 76.47%、80.72%、70.90%、84.80%和 47.06%、85.54%、66.70%、72.40%, 三者的 95% CI 分别为 0.529~0.700、0.745~0.881、0.460~0.635, 约登指数分别为 0.302、0.572、0.326, 因此 T2 值可以用来鉴别移行带 PI-RADS 3 分病灶良恶性, 其最佳诊断界值为 77ms。结论: MAGiC 定量参数的 T2 值具有预测前列腺移行带 PI-RADS 3 分病灶良恶性的能力, 从而减少不必要的穿刺活检。

PO-1847

基于光谱 CT 参数的结直肠癌术后极早期远处转移风险分层新型标志物研究

彭文静¹、万丽娟¹、董书杉²、张红梅¹
1. 中国医学科学院肿瘤医院
2. 飞利浦中国

目的: 结直肠癌(CRC)术后极早期远处转移(VEDM)提示局部治疗策略的失败, 目前鲜有有效的生物标志物用于 VEDM 的风险分层, 以指导治疗调整。本研究旨在探究双层探测器光谱 CT (DLSCT) 定量参数在预测 CRC 术后 VEDM 的潜力。

方法: 本文为前瞻性研究, 纳入 2021 年 4 月至 2022 年 7 月期间经活检证实的 CRC 患者接受术前三期增强 DLSCT。由两位影像科医生进行图像的勾画和光谱特征的提取, 得到包括平扫有效原子序数、三期病灶碘浓度、三期病灶归一化碘浓度(NIC-A/V/E)、三期光谱曲线斜率(λ -A/V/E)、两种动脉增强分数、静脉增强分数(VEF)和三期 1/NIC (1/NIC-A/V/E)共 16 个光谱参数。类内相关系数(ICC)用于评价观察者间一致性。采用倾向性评分匹配(PSM)将术后发生与未发生 VEDM 的患者进行匹配, 基于匹配后的队列使用单/多因素逻辑回归分析探究各参数的预测效能。匹配前的全队列用于参数验证和建模, 生成联合的临床、联合的光谱及临床-光谱预测模型。模型的效能使用受试者工作特征曲线下面积 (AUC) 表示, 模型间的比较使用 DeLong 检验。

结果: 共 222 例 CRC 患者纳入本研究, 13 例发生 VEDM。光谱特征提取的观察者间一致性较优(ICC, 0.773-0.964)。共有 3 个光谱 CT 参数 (VEF、 λ -v 和 1/NIC-v) 表现较好的预测效能($p < 0.05$), AUC 值分别为 0.822、0.738 和 0.713, 对应的最佳截断值分别为 67.16%、2.46 和 2.44。在全队列中, 三个光谱参数的预测能力得到验证, 联合光谱模型显示出与联合临床模型相当的预测效能(AUC,

0.771 vs. 0.779, $p>0.05$); 临床-光谱模型显著优于联合临床模型(AUC, 0.887 vs. 0.779, $p=0.015$), 但不优于联合光谱模型(AUC, 0.887 vs. 0.771, $p=0.078$)。

结论:本项初步性研究发现基于光谱 CT 的定量参数具有较好的预测 CRC 患者术后 VEDM 的潜力, 这些参数与病灶的静脉期光谱灌注密切相关。未来需要更大样本的研究进一步验证。

PO-1848

提高胎盘植入性病变诊断效能的 MRI 影像特征及整合方法研究

袁逍

空军军医大学第附属医院信息科病案室

目的:分析胎盘植入性病变的 MRI 特征表现, 整合不同级别胎盘植入的影像特点, 以提高该疾病诊断的准确性。方法: 回顾性分析 2015 年 1 月~2023 年 4 月本院经手术证实胎盘植入的 235 例患者为例, 所有患者均通过病理诊断确诊。年龄 22~41 岁, 平均 (29.71 ± 3.23) 岁, 孕周 28~38 周, 平均 (35.26 ± 0.64) 周, 剖宫产史者有 188 例, 主动流产刮宫史者 48 例, 初产妇有 16 例。胎盘植入部位深度分布: 胎盘粘连者 110 例, 胎盘植入者 97 例, 胎盘穿透者 17 例, 所有患者进行 MRI 检查, 结合病理结果, 分析胎盘粘连、胎盘植入及胎盘穿透各自特征 MRI 表现。结果: 胎盘植入患者中, 胎盘/子宫膨出、膀胱壁中断、胎盘床异生血管、局部外生团块, 这四个征象单独出现时, 诊断胎盘植入的准确性较高, 其敏感性和特异性均高于 95%, $P<0.05$; 当上述征象联合其它 MRI 征象出现时, 更支持胎盘植入的诊断。在胎盘粘连患者中, 当出现胎盘内 T2WI 低信号带垂直于胎盘母体面、胎盘后 T2WI 低信号带消失及子宫肌层变薄这些征象时, 更支持胎盘粘连的诊断, 其敏感性和特异性均较高, 大于 90%, $P<0.05$, 当联合其它征象出现时, 如胎盘信号不均、胎盘不对称增厚/形状改变、胎盘缺血性梗死、胎盘内异常血管等征象时, 需高度怀疑胎盘粘连。当胎盘组侵犯膀胱或长入腹腔, 可明确诊断胎盘穿透。结论: 胎盘/子宫膨出、膀胱壁中断、胎盘床异生血管、局部外生团块是胎盘植入的最敏感征象, 胎盘后 T2WI 低信号带消失, 胎盘内出现垂直于母体胎盘的短 T2WI 信号影及伴有子宫壁变薄有助于胎盘粘连的诊断, 异常 MRI 征象越多, 胎盘植入的可能性越大, 需密切结合临床高危因素。

PO-1849

基于基线腹部对比增强 CT 的临床-影像组学列线图评估胃癌同时性卵巢转移: 一项双中心研究

张倩雯、杨盼盼、陈琪、沈浮

海军军医大学第一附属医院 (上海长海医院)

背景: 构建并验证基于术前 CT 和临床数据的影像组学列线图以检出女性胃癌患者的同时性卵巢转移 (SOM)。

方法: 回顾性研究纳入两个队列的胃癌患者。所有患者接受术前腹部增强 CT 和盆腔增强 MRI 检查, 如盆腔 MRI 发现疑似卵巢病变则行病理组织学检测。队列 1 (101 例患者) 作为训练样本, 提取影像组学特征并设置影像评分。联合影像评分及临床参数构建列线图检出 SOM。在队列 1 采用自举法进行内部验证。在队列 2 (46 例患者) 进行外部验证。ROC 曲线分析、决策曲线和混淆矩阵联合评估影像评分、列线图和主观诊断模型的效能。

结果：在训练组，联合了年龄和影像评分的列线图具有最高的 AUC 值（0.910，vs.影像评分 0.827 和主观诊断 0.773）。在外部验证组，上述列线图同样具有最高的 AUC 值（0.850，vs.影像评分 0.790 和主观诊断 0.675）。在两个队列中，决策曲线和混淆矩阵均证实列线图优于影像评分。

结论：研究证实联合了影像评分和临床特征的列线图模型可有效检出女性胃癌患者的 SOM，其在临床诊疗应用优于主观诊断或单独的影像评分。

PO-1850

腹部增强 CT 动脉期后不同间隔时间与 门静脉强化幅度的相关性研究

李信友、张志伟、李王佳、周芳露、常艳丽、吕发金
重庆医科大学附属第一医院

目的 研究腹部增强 CT 动脉期后不同间隔时间与门静脉强化幅度的相关性，探讨门静脉强化幅度高的动脉期后最佳间隔时间。方法 回顾性分析 2022 年 1 月至 2023 年 6 月重庆医科大学附属第一医院采用相关技术参数及对比剂注射方案完成的腹部增强 CT 检查患者 300 例(BMI23~26，排除心功能不良及肝硬化)。设备为 GE Discovery 64 排螺旋 CT，对比剂选择碘美普尔（400 mgI/ml），对比剂总量按 450mgI/kg 体重计算，对比剂维持注射时间设置为 20s，相同速率维持注射 10s 生理盐水；根据动脉期后间隔时间（含动脉期扫描时间）不同分为 A、B、C 三组：A 组间隔时间为 16s，B 组间隔时间为 18s，C 组间隔时间为 20s。采用阈值触发/实时增强监测方法完成动脉期扫描，监测平面选择肝门区腹主动脉，触发阈值设置为 120HU，动脉期后间隔相应时间（18~22s-动脉期扫描时间）扫描门脉期，并再次间隔 19~22s 扫描静脉期，选取门脉期图像分别测量门脉主干及左、右属支 CT 值。结果 三组病例的门脉左支 CT 值分别为：184.56±8.17HU，171.11±9.23HU，159.46±8.71HU；门脉右支 CT 值分别为：185.22±6.83HU，169.35±10.27HU，161.36±8.61HU；门脉主干 CT 值分别为：182.32±8.55HU，165.46±9.08HU，153.12±8.27HU。结论 腹部增强 CT 动脉期后间隔 16s 扫描门脉期，门静脉主干及左、右属支的强化幅度更高，与周围组织的对比更好，能呈现更好的门静脉血管显示。

PO-1851

影像组学联合深度学习在肝细胞癌 TACE 疗效评估中的应用价值

王丹丹
哈尔滨医科大学附属第二医院

目的：探讨影像组学和深度学习对预测肝细胞癌（hepatocellular carcinoma, HCC）首次经动脉化疗栓塞术（Transarterial chemoembolization, TACE）疗效的价值。方法：回顾性收集 2015 年 1 月至 2021 年 1 月行 TACE 治疗的 HCC 患者影像及临床信息，从术前 CT 图像中分别获得影像组学分数（Rad-score）和深度学习分数（DL-score），采用单因素和多因素 Logistic 回归筛选与疗效相关的变量，并构建临床模型（Clin-score）。然后应用多因素 Logistic 回归开发结合 Rad-score、DL-score 和 Clin-score 因素的跨尺度预测模型，通过区分度、校准度和临床决策能力来评估模型性能。进一步通过 log-rank 检验，比较模型对于患者生存能力的预测性能。结果：研究共纳入 265 名患者，按 8: 2 比例随机拆分为训练集和测试集。在测试集中，深度学习和影像组学的联合模型（DL_RAD）可以更好的预测 TACE 的疗效，其受试者工作曲线下的面积（Area under curve, AUC）为 0.843，优于深度学习-临床（AUC: 0.838）和影像组学-临床（AUC: 0.786）联合模型，以及 DL-score（AUC: 0.806）、Rad-score（AUC: 0.775）和 Clin-score（AUC: 0.730）单一

模型。一步通过生存分析显示,该联合模型可以将患者分成生存期具有显著差异的不同亚组(700 天 vs. 1349 天, $P=5.6e-9$)。结论:联合影像组学和深度学习的预测模型可以在术前预测 TACE 疗效,助力精准医疗。

PO-1852

CT 严重指数 (CTSI) 与急性生理和慢性健康评分 (APACHE II) 对急性胰腺炎严重程度评价

彭容、张泽明、赵张平、王智清、陶芳旭、杨翠
攀枝花市中心医院

目的:探究 CT 严重指数(CTSI)与急性生理和慢性健康评分 (APACHE-II 评分) 对急性胰腺炎(AP) 患者预后指标的评估效能。

材料与amp;方法:回顾性分析我院 2021 年 1 月至 2021 年 12 月收治的 273 例急性胰腺炎(AP)患者,观察其腹部增强 CT 图像。CT 表现分为水肿性 AP 和坏死性 AP,并根据其图像进行 CT 严重指数(CTSI) 评分。在入院后 24 小时内计算 APACHE II 评分、局部并发症、死亡、住院时间及入住 ICU 天数。

统计分析 CTSI、APACHE II 评分分别与局部并发症、死亡、住院时间及入住 ICU 天数的关系。

结果:在急性胰腺炎患者中,发生局部并发症患者 CTSI 评分高于无局部并发症患者($P=0.000$),而有、无局部并发症患者之间 APACHE-II 评分无统计学差异($P=0.322$)。死亡患者 APACHE II 评分高于存活患者 ($P=0.001$),而死亡与存活患者之间 CTSI 评分无统计学差异 ($P=0.167$)。在预测住院天数方面,CTSI 评分及 APACHE II 评分评分越高,住院时间越久($r=0.340$ 和 $r=0.264$)。需要转入 ICU 患者的 CTSI 评分及 APACHE II 评分均高于不需要转入 ICU 的患者($P=0.000$ 和 $P=0.000$)。

结论:在急性胰腺炎患者中,CTSI 在评估局部并发症方面优于 APACHE II 评分,但在评价死亡方面不如 APACHE II;CTSI 及 APACHE II 评分能预测住院天数和是否转入 ICU。

PO-1853

基于增强 CT 影像组学的诺莫图术前预测胰腺癌神经侵犯

邓艳¹、于浩鹏¹、宋彬^{1,2,3}
1. 四川大学华西医院放射科
2. 功能与分子影像四川重点实验室
3. 三亚市人民医院放射科

目的:基于增强 CT 提取的影像组学特征及临床特征建立诺莫图用于术前无创评估胰腺癌神经侵犯,并对模型的稳定性进行验证,评估模型的性能。

方法:回顾性收集四川大学华西医院经病理证实为胰腺腺癌并明确是否有神经侵犯的患者共 217 例,根据术后病理将胰腺腺癌患者分为神经侵犯阳性组(PNI+)和 阴性组(PNI-),按照 7:3 的比例随机分为训练组和验证组。基于术前增强 CT 的动脉期和门脉期手动逐层勾画胰腺癌整个病灶,并提取相应的影像组学特征。通过对训练组的数据进行单因素和最小绝对收缩和选择算子(LASSO)进行特征选择,选出的组学特征用逻辑回归分析计算影像组学得分(rad-score)。临床特征如肿瘤大小、CA19-9 等用单因素和多因素分析在 PNI+与 PNI-组之间是否有差异。由 2 名有经验的放射科医师基于术前增强 CT 影像学表现评估神经侵犯的状态。通过影像及临床指标构建诺莫图,用 ROC 曲线和校准曲线评估模型的表现性能,用临床决策曲线评估模型的临床效能。

结果: 根据单因素和多因素分析, 纳入的临床指标仅组织病理分化程度和淋巴结状态在 PNI+与 PNI-组之间有统计学差异。因此用 Rad-score 和放射科医师对神经侵犯的评估状态建模。该联合模型的受试者工作特征曲线下面积(AUC)在训练组和验证组中分别为 0.785 和 0.778, 该模型的表现性能在训练组和验证组中均优于单独的影像组学模型(训练组: 0.720 VS 验证组: 0.650)和放射科医师的评估(训练组: 0.610 VS 验证组: 0.665) ($P<0.05$)。校准曲线显示用诺莫图预测神经侵犯与实际发生神经侵犯的概率具有较好的一致性。临床决策曲线显示, 在任何阈值概率时, 基于诺莫图评估神经侵犯优于放射科医师的评估。

结论: 基于增强 CT 的影像组学和放射科医师评估神经侵犯的诺莫图有望术前无创评估胰腺腺癌的神经过侵犯, 从而有助于帮助患者制定个体化治疗决策。

PO-1854

对比剂个性化在肝脏增强 CT 扫描的初步应用研究

黄海波、秦杏清、卢瑜、丁可
南宁市第二人民医院

目的 评价对比剂个性化在肝脏增强 CT 应用的图像质量及可比性。方法 募集我院对比剂个性化肝脏三期增强扫描肝脏受检者, 入组标准: 18 岁 \leq 年龄 \leq 80 岁, 言语理解并配合良好, 图像噪声良好、肾功能正常。排除标准: 年龄 $>$ 80 岁或 $<$ 18 岁、信息不全、碘对比剂禁忌等。采用双筒高压注射器, 对比剂浓度 300~370mgI/ml, 个性化方案: 以 450mgI/Kg 计算对比剂总量、体重对应碘流率计算注射速率; 记录实际单位体重碘剂量、对比剂总量、有效总碘剂量等。医师双盲法评价主动脉强化、扫描时机及肝实质期增强效应, 观察图像质量分布、变异系数, 医师一致性检验。结果: 纳入受检者共 192 例, 实际单位体重碘剂量(374.8 ± 72.1)mgI/Kg, 实际注射碘流率(1138.0 ± 180.9)mgI/s, 对比剂总量(62.3 ± 10.5)ml, 有效总碘剂量(21320.0 ± 3717.7)mgI, 主动脉 CT 值动脉期为(338.6 ± 107.3)Hu, 肝门静脉 CT 值动脉期为(176.2 ± 49.3)Hu, 肝实质期 EU 值为(52.6 ± 13.7)Hu、变异系数约 13.1%。主动脉强化优秀 108 例、可接受 56 例、强化过度 21 例、显影不足 7 例, 满足诊断约 89.1%; 动脉期时机评价满意 160 例、可接受 21 例、过早 10 例、太晚 1 例, 扫描时机满足诊断约 94.3%; 肝实质期强化效应评价满意 106 例、可接受 35 例、强化过度 47 例、强化不足 4 例, 满足诊断约 97.9%; 动脉期主动脉强化($c2=3.333$)、扫描时机($c2=1.833$)、肝实质期强化效应($c2=7.667$)评价医师间无显著差异(均 $P\geq 0.05$), 医师间图像评价高度一致(kappa 值分别为 0.861, 0.803, 0.914, 均 $P=0.000$)。结论 对比剂个性化应用可获得总体质量良好的肝脏图像, 该技术应用简便、可操作且重复性好, 具有较高的临床推广价值。

PO-1855

肝脏增强 CT 扫描对比剂个性化的应用价值

黄海波、卢瑜、秦杏清、丁可
南宁市第二人民医院

目的 探讨肝脏增强 CT 对比剂个性化扫描的应用价值。方法 肝脏三期增强受检者以对比剂个性化和对照方案分组扫描, 入组标准: 18 岁 \leq 年龄 \leq 80 岁, 图像噪声良好、肾功能正常。排除标准: 信息不全、伪影严重、碘对比剂禁忌等。评价图像质量及肝脏强化效应可重复性等组间差异。结果 纳入研究和对照组被试分别为 192 例和 100 例, 实际单位体重碘剂量(374.8 ± 52.1)研究组/(451.8 ± 39.1)对照组 mgI/Kg; 实际注射碘流率(1138.0 ± 130.9)研究组/(1020.0 ± 56.3)对照组 mgI/s, 有效总碘剂量(21320.0 ± 3017.7)研究组/(25650.0 ± 4245.8)对照组 mgI, 肝脏 EU 肝实质期为(53.2 ± 7.0)研究组/(66.8 ± 19.3)对照组 Hu, 肝实质期强化变异性为 13.1%研究组/28.8%对照组; 肝实质期强化效应评

价满意 55.2%研究组/36.0%对照组、可接受 18.2%研究组/18.0%对照组, 满足诊断约 97.9%研究组/99.0%对照组。主动脉强化 AP 优秀 56.3%研究组/56.0%对照组, 满足诊断约 89.06%研究组/95.0%对照组; 动脉期时机满意 83.3%研究组/48.0%对照组, 满足诊断约 94.3% 研究组/81.0%对照组; 实际单位体重碘剂量、有效总碘剂量、肝脏增强值研究组显著小于对照组(均 $P=0.000$); 研究组肝实质期 EU 值均数(53.2Hu)显著低于对照组(66.8Hu)($t=-8.673$, $P=0.000$), 研究组变异系数(13.1%)显著低于对照组(28.8%)即可重复性研究方案显著优于对照扫描; 单位体重碘剂量、有效总碘剂量研究组显著低于对照组($P=0.000$)。结论 对比剂个性化的肝脏图像质量与强化效应可重复性均显著优于对照方案并降低碘总量约 16.9%, 研究方案具有相对较高的推广价值。

PO-1856

基于双能量 CT 定量参数对结直肠癌神经浸润的预测价值

黄豆豆、陈峻帆、韦鑫、罗银灯、刘欣杰*

重庆医科大学附属第二医院

【摘要】目的 探讨双能量 CT 术前预测结直肠癌神经浸润(perineural invasion, PNI)的可行性。方法 回顾性分析 2021 年 12 月至 2023 年 3 月于我院术前行腹部双能 CT 扫描、术后病理诊断为结直肠腺癌的患者 65 例。将其分为 PNI 阳性组(17 例)和阴性组(48 例)。比较两组间临床资料、影像特征及双能 CT 定量参数差异。采用多因素逻辑回归分析筛选 PNI 预测因素, 分别构建影像特征模型、双能 CT 参数模型和联合预测模型, 评估各模型的诊断效能。结果 临床资料在 PNI 阳性组与阴性组之间均无明显差异; 原发肿瘤位置、肠壁最大厚度、肠系膜条索影、肠周淋巴结个数(短径 $>5\text{mm}$)以及肿瘤沉积组间差异具有统计学意义($P<0.05$)。动脉期 IHU、IC、NIC、DEI 及静脉期 NIC 组间差异有统计学意义($P<0.05$)。影像特征与双能 CT 参数的联合预测模型诊断效能最高(AUC=0.952, 敏感度、特异度为 100%、75%)。结论 双能 CT 定量参数联合影像特征对结直肠癌术前 PNI 状态具有良好的预测价值。

PO-1857

特发性与硬化性门静脉高压影像学对比分析及病理对照研究

李涵宇、唐栋、陶梦瑶、龚玲、杨文君

杭州师范大学附属医院

目的:

探讨特发性门脉高压(idiopathic portal hypertension, IPH)与肝硬化相关门脉高压的影像学特点及病理对照分析, 提高对 IPH 的诊断准确性。

方法:

收集经临床及病理学证实的 14 例 IPH 患者及 30 例肝硬化患者 CT 增强及 MR 增强影像资料, 分别从脾脏厚度、肝脏形态、肝叶萎缩、增生情况、门静脉血栓、动静脉期肝脏灌注、再生结节、肝局灶性结节样增生、门静脉形态、脾肾分流、肝肾分流等方面对其影像表现分析、比较, 探寻影像征像与病理特点之间的相关性。

结果:

影像方面, IPH 组和肝硬化组之间的脾脏厚度有显著差异($P<0.05$)。IPH 组和肝硬化组 b(肝左叶冠状径)、c(尾状叶冠状径)、a/c(尾右比)项有显著差异($P<0.05$); IPH 组和肝硬化组都会发生肝脏形态及肝实质改变, 其中弥漫性再生结节及 FNH 对于鉴别肝硬化与 IPH 十分有意义; IPH 组与肝硬化组都会发生脾-肾分流及胃-肾分流, 但并无统计学意义; 14 例 IPH 均有门脉系统的异常,

具体表现为门静脉主干增宽、门静脉僵硬变直、远端分支静脉狭窄、闭塞，而肝硬化组有 9 例肝硬化患者门脉系统异常、表现为门静脉变细；

在病理方面，肝硬化组患者均有不同程度的细胞坏死、水肿，所有病人均可见假小叶形成，而在 IPH 患者病理中未见假小叶形成；在 IPH 患者病理中有不同程度的门脉及汇管区纤维化、但小叶炎症不明显，部分病人可见门静脉闭塞、狭窄，而在肝硬化患者中未见明显门脉狭窄、闭塞改变。

结论：

对于肝脏形态改变且伴有门脉高压的患者，影像上若发现巨脾，而肝表面光滑时，需要考虑 IPH 的可能性，同时在影像观察中注重门脉系统的改变，肝脏尾右比及肝左外叶的增生、萎缩情况也有一定的参考意义；此外 FNH 及弥漫性肝再生结节也可作为鉴别两者的关键点；病理上无假小叶改变，而有门静脉系统纤维化、纤细、闭塞等异常改变，需考虑 IPH 的可能性。

PO-1858

多参数 MRI 定量分析在卵巢-附件磁共振成像报告和数据系统 (O-RADS MRI) 4 分病变中的诊断价值

雷岩¹、沈钧康²、宋彬¹

1. 复旦大学附属闵行医院

2. 苏州大学附属第二人民医院

目的：探讨基于多参数 MRI 图像（ADC 图、T2WI 及多期增强 T1WI）的定量分析在 O-RADS MRI 评分 4 分病变良恶性鉴别中的诊断效能。

方法：回顾性分析复旦大学附属闵行医院 2015 年 3 月至 2022 年 12 月间经手术病理证实的卵巢-附件病变患者的临床、影像及手术病理资料。纳入标准为术前 4 周内进行了盆腔 MRI 增强检查及 O-RADS MRI 最终评分为 4 分病灶。临床基线资料及 MRI 多模态定量参数纳入单因素、多因素 logistic 回归分析，得出 O-RADS MRI 评分 4 分病变良恶性的独立预测因子，并构建良恶性预测模型，使用列线图可视化展示并验证。

结果：最终 57 个病灶纳入本研究，良性 26 个，恶性 31 个。多因素分析显示 T2WI 信号强度值 SD、最低信号区 ADCmean 为 O-RADS MRI 评分 4 分病变良恶性的独立预测因子（ $P = 0.01$ 及 0.016 ）。ROC 分析结果显示 T2WI 信号强度值 SD 和最低信号区 ADCmean 的最优阈值为 40.85 和 $1.73 \times 10^{-3} \text{mm}^2/\text{s}$ 。良恶性预测模型的 AUC、灵敏度、特异度、正确率、阳性预测值和阴性预测值为 0.851、87.1%、73.1%、80.7%、79.4%、82.6%。

列线图的 Hosmer-Lemeshow 拟合优度检验显示 $P = 0.910$ 。校准曲线显示列线图预测 O-RADS MRI 评分 4 分病变良恶性预测概率与实际概率之间拟合良好。DCA 结果显示，当阈概率范围约为 4~84% 时，模型预测 O-RADS MRI 评分 4 分病变良恶性的获益性较高。

结论：基于多参数 MRI 图像（ADC、T2WI 及多期增强 T1WI）的定量参数 T2WI 信号强度 SD 和最低信号区 ADCmean 是 O-RADS MRI 评分 4 分病变良恶性评价的独立预测因素，其构建的 O-RADS MRI 评分 4 分病灶良恶性预测模型，具有良好的诊断效能，有助于临床制定最佳治疗策略。

PO-1859

多参数 MRI 图像纹理分析在区分 O-RADS MRI 4 分病变良恶性中的价值

雷岩¹、沈钧康²、宋彬¹

1. 复旦大学附属闵行医院

2. 苏州大学附属第二人民医院

目的: 探讨多参数磁共振纹理分析对区分卵巢-附件磁共振成像报告和数据系统 (O-RADS MRI) 4 分病变良恶性的诊断价值。

方法: 回顾性分析 57 个经手术病理证实的 O-RADS MRI 评分 4 分卵巢附件肿瘤, 其中良性 26 例, 恶性 31 例。基于 T2WI、ADC、T1WI 增强图像, 提取整个病灶纹理特征。采用最小冗余最大相关性(mRMR)方法选择特征, 随机森林(RF)算法构建 T2WI 模型、ADC 模型、T1WI 增强模型和三者联合模型 4 个预测模型。使用十折交叉验证来验证模型预测性能, 并采用受试者工作特征(ROC)分析评价模型性能, 记录曲线下面积(AUC)、准确性、敏感性、特异性、阳性预测值(PPV)和阴性预测值(NPV)。

结果: 分别从 ADC、T2WI、T1WI 增强图像中提取 3474 个纹理特征, 构建 ADC 模型、T2WI 模型、CE_T1WI 模型及联合模型, 每个模型各包含 10 个纹理特征。ADC 模型、T2WI 模型、CE_T1WI 模型及联合模型的 AUC 分别为 0.749(95% CI: 0.621 ~ 0.876)、0.671(95% CI: 0.524 ~ 0.818)、0.786(95% CI: 0.662 ~ 0.909)及 0.860(95% CI: 0.76 ~ 0.959)。联合模型的 AUC 明显高于其他三组模型, 联合模型区分 O-RADS MRI 4 分病变良恶性的准确性、敏感性、特异性、PPV、NPV 分别为 75.9%、77.8%、74.1%、72.4%、79.3%。

结论: 多模态 MRI 纹理分析可用于改善 O-RADS MRI 评分 4 分病变良恶性的诊断效能, 对临床决策提供一定的帮助。

PO-1860

LI-RADS v2018 影像学特征对甲胎 蛋白阴性肝细胞癌患者预后价值

王乐瑶、马霄虹、赵心明

中国医学科学院肿瘤医院

目的: 评价肝脏影像学报告与数据系统 (LI-RADS v2018) 影像学特征及临床参数对甲胎蛋白阴性 (AFP ≤ 20 ng/ml) 肝细胞癌 (HCC) 患者预后的诊断价值, 并与 AJCC-TNM 分期系统及 BCLC 分期系统进行比较。

材料和方法: 回顾性纳入了 2015 年 1 月至 2020 年 8 月期间我院接受术前磁共振扫描及根治性切除手术的 169 例甲胎蛋白阴性 HCC 患者 (训练集:验证集= 118:51)。利用 Cox 回归分析确定与预后相关的危险因素, 并构建预后预测模型。

结果: 6 个危险因素与甲胎蛋白阴性 HCC 术后无复发生存期相关, 即 LI-RADS 分级、微血管侵犯、肿瘤大小、肿瘤内出血、肝硬化和白蛋白-胆红素等级。联合以上危险因素构建的预后模型在训练集和验证集中的 C 指数分别为 0.705 和 0.674。此外, 该模型在预测患者预后方面优于 AJCC-TNM 分期系统和 BCLC 分期系统。该模型能有效地将甲胎蛋白阴性 HCC 患者分为高危复发组和低危复发组, 两组预后差异有统计学意义 ($p < 0.05$)。

结论：将 LI-RADS 分级、微血管侵犯、肿瘤大小、肿瘤内出血、肝硬化和白蛋白-胆红素等级整合的预后模型是预测甲胎蛋白阴性 HCC 患者预后的重要工具。

PO-1861

定性和定量磁共振参数对微血管侵犯阴性肝细胞癌患者的预后价值

王乐瑶、马霄虹、赵心明
中国医学科学院肿瘤医院

目的：本研究旨在通过钆塞酸二钠磁共振成像的定性和定量参数分析，建立微血管侵犯阴性肝细胞癌（HCC）患者预后的预测模型。

材料和方法：回顾性纳入 2015 年 1 月至 2019 年 12 月连续行术前钆塞酸二钠磁共振检查的微血管侵犯阴性 HCC 患者。共有 122 名患者以 7:3 的比例随机分配到训练组和验证组。通过单因素和多因素逻辑回归分析以确定重要的临床参数和磁共振成像特征，包括与预后相关的定量和定性参数，并将其纳入预后诺模图。采用 Kaplan-Meier 法和 log-rank 检验评价诊断效果。

结果：本研究的中位随访为 58.86 个月，38 例患者出现术后复发。多因素逻辑回归分析显示 LI-RADS 分类、肝胆期低信号无动脉期明显增强、较低肝胆期相对增强比、轻中度 T2 高强度、高 AST 水平与微血管侵犯阴性 HCC 预后显著相关，并将以上因素纳入预后模型。训练组和验证组的 C 指数分别是 0.732 和 0.692。肝胆期相对增强比的最佳界值为 1.197。RER 肝胆期相对增强比 < 1.197 的患者术后复发率明显高于肝胆期相对增强比 > 1.197 的患者（ $p = 0.004$ ）。

结论：将定性及定量影像学参数与临床参数相结合的模型能较好地预测微血管侵犯阴性 HCC 患者的预后。

PO-1862

基于多参数 MSCT 检查在胃神经鞘瘤与间质瘤鉴别诊断的价值。

易坤明、王璐
中国人民解放军陆军特色医学中心

目的：探讨多参数 MSCT 检查在区分胃神经鞘瘤与间质瘤的价值。

方法：回顾性分析胃神经鞘瘤（ $n = 16$ ）和胃间质瘤（ $n = 56$ ）的 CT 图像。记录平扫/动脉期/静脉期期间肿瘤/主动脉的绝对 CT 值，分别为肿瘤平扫（Tp）/主动脉平扫（Ap）、肿瘤动脉期（Ta）/主动脉动脉期（Aa）和肿瘤静脉期（Tv）/主动脉静脉期（Av），并计算三相的归一化 CT 值分别为 $Sp = Tp / Ap$ 、 $Sa = Ta / Aa$ 和 $Sv = Tv / Av$ 。计算动脉期和静脉期之间的肿瘤 CT 值的差异并将其记录为 Tv-a。CT 数据包括肿瘤大小、轮廓、边缘、生长方式、钙化的存在、囊性变化、评估每位患者的出血、溃疡、病灶周围淋巴结、对周围结构的局部侵袭、转移、腹水、强化方式/强化程度、Tp、Ta、Tv、Sp、Sa、Sv。接受者操作特征（ROC）曲线分析用于评估 CT 数据区分神经鞘瘤与胃间质瘤的能力。

结果：与胃间质瘤相比，胃神经鞘瘤更容易表现出圆形轮廓、相对较小的肿瘤大小、均匀的增强模式和较少的周围淋巴结显示（ $P < 0.05$ ），而在间质瘤中囊性变化的情况更为常见（ $P < 0.05$ ）。胃神经鞘瘤的 Sa、Ta 和 Tv-a 比 GIST 少（ $P < 0.05$ ）。ROC 分析表明，与其他[曲线下面积（AUC）> 0.7]相比，肿瘤的大小、囊性改变、PLN 的存在、肿瘤增强模式和 Sa 表现出更高的诊断潜力，其中囊性改变表现出最佳的诊断能力（AUC = 0.86），肿瘤大小显示出最高的敏感性（90%）和

Sa 显示出最佳的特异性 (90%)。定量分析表明,某些特征有助于通过 CT 成像区分胃神经鞘瘤和道间质瘤,肿瘤增强模式和 Sa 的诊断潜力较其他[曲线下面积 (AUC) > 0.8]更高,其中囊性变化显示出最佳的诊断能力 (AUC = 0.86),肿瘤大小显示出最高的敏感性 (90%),Sa 显示出最佳的特异性 (90%)。

结论:多参数 MSCT 检查有助于区分胃神经鞘瘤和间质瘤。

PO-1863

凶险性前置胎盘 MRI 征象与产后出血的相关性分析

唐兆伦

连云港市第一人民医院

目的 探讨凶险性前置胎盘(PPP)孕妇产后出血的危险因素,并分析 MRI 征象与产后出血的关系.方法 回顾性分析 68 例 PPP 孕妇的临床资料及 MRI 表现,根据产后出血情况分成产后出血组(41 例)与非产后出血组(27 例),分析 PPP 孕妇 MRI 征象与产后出血的相关性.结果 PPP 孕妇 MRI 征象中,子宫肌层信号局部中断消失、胎盘下段膨隆伴子宫轮廓变形、胎盘基底血流信号增多、T2WI 低信号带及胎盘凹陷均与产后出血显著相关($P < 0.01$),多变量 Logistic 回归显示子宫下段胎盘厚度是 PPP 产后出血的独立危险因素,受试者工作特征(ROC)曲线分析显示曲线下面积(AUC)为 0.753[95%置信区间(CI)0.637~0.869],截断点为 3.86cm 时,预测产后出血的敏感度为 68.3%,特异度为 85.2%.结论 前次前置胎盘史此次妊娠为完全性前置胎盘伴胎盘植入时易发生产后出血,MRI 征象及子宫下段胎盘厚度测量可用于预测产后出血。

PO-1864

基于多序列 MRI 影像组学列线图预测肝外胆管癌 PD-L1 表达

刘炯、王小勇、王利敏、黄新莽、杨春梅、舒健

西南医科大学附属医院

目的 探讨多序列 MRI 影像组学联合临床特征的列线图术前无创预测肝外胆管癌 PD-L1 表达状态的价值。

资料与方法 回顾性搜集 2011 年 1 月—2021 年 12 月西南医科大学附属医院手术病理确定的肝外胆管癌患者 87 例,以 7:3 随机拆分为训练集和测试集。使用 3D-Slicer 软件在 MRI 图像上逐层勾画感兴趣区,并提取影像组学特征,然后进行数据标准化、特征降维及筛选。采用高斯朴素贝叶斯构建影像组学模型,同时获取影像组学评分。利用多因素 Logistics 回归筛选临床特征,并分别构建临床模型和联合模型。采用受试者工作特征曲线下面积 (AUC) 对三种模型预测效能进行评估,通过校准曲线和决策曲线评估联合模型列线图拟合优度和临床净收益。

结果 最终筛选出 9 个影像组学特征和 3 个临床特征,临床特征分别为 ALT ($P=0.020$)、AST ($P=0.025$)、TBIL ($P=0.026$)。联合模型的预测效能 (训练集 AUC=0.813,测试集 AUC=0.818) 优于单独的临床模型 (训练集 AUC=0.711,测试集 AUC=0.705) 和影像组学模型 (训练集 AUC=0.769,测试集 AUC=0.767)。校准曲线与决策曲线表明联合模型列线图拟合优度佳,并可取得较好的临床净获益。

结论 基于术前多序列 MRI 图像的影像组学评分,以及 ALT、AST、TBIL 三种临床特征,构建联合模型列线图,能有效预测肝外胆管癌 PD-L1 表达状态,为患者精准个性化的免疫治疗提供指导。

PO-1865

APT 联合 DWI 鉴别前列腺癌与前列腺增生价值评估

李茜玮¹、陈丽华¹、王楠¹、林良杰²、王家正²、刘爱连¹

1. 大连医科大学附属第一医院

2. 北京飞利浦临床科研部

目的：本研究旨在研究酰胺质子加权成像(Amide proton transfer-weighted, APTw, APT) 联合弥散加权成像 (Diffusion Weighted Imaging, DWI) 鉴别前列腺癌与前列腺增生的价值。材料与方法：回顾性收集行前列腺 3.0T MRI 扫描 (包括 APT 及 DWI 序列) 的前列腺癌患者 62 例, 前列腺增生患者 47 例。由两名观察者于病灶实体显示最大层面放置 ROI 测量两组病例的 APT 值及 ADC 值, ROI 应避开病灶出血、坏死及囊变区域。采用组内相关系数 (intraclass correlation coefficient, ICC) 评估两名观察者各测量参数的一致性。采用 Shapiro-Wilk 检验评估两组病例 APT 值及 ADC 值的正态性。采用独立样本 t 检验或 Mann-Whitney 检验评估两组病例各参数值的差异性分析。采用 Logistic 回归计算 APTw 及 DWI 序列联合参数模型的预测值。采用受试者工作特征 (ROC) 曲线评估有差异的参数单独或联合的诊断效能, 并利用 Delong 检验比较各 ROC 曲线间的差异。结果：两名观察者测量参数值一致性好 (ICC>0.75)。前列腺癌组的 APT 值大于前列腺增生组 [(2.44%±0.62%) vs (1.83%±0.63%)], 差异具有统计学意义 (t=4.913, P<0.01); 前列腺癌组的 ADC 值小于前列腺增生 [0.70 (0.58, 0.71) mm²/s vs 1.20 (1.03, 1.35) mm²/s], 差异具有统计学意义 (z=-8.371, p<0.01)。APT 值、ADC 值及二者联合鉴别两组病例的 AUC 值分别为 0.747, 0.969 及 0.975, 敏感度、特异度及阈值分别达到 67.7%、80.6%、87.1%, 74.5%、100%、97.9%, 2.2%、0.84mm²/s 及 0.77。结论：APT 值及 ADC 值对于鉴别前列腺癌与前列腺增生有很好的价值, 二者联合模型的诊断效能提升, 具有很好的临床应用前景。

PO-1866

血清总胆汁酸与 TACE 治疗无效的肝细胞癌患者增强磁共振影像组学特征的相关性研究

赵莹¹、王继翔²、李佳奕²、许岂豪¹、宋清伟¹、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连医科大学, 医学影像学院

目的：评估血清总胆汁酸 (TBA) 与经动脉化疗栓塞 (TACE) 治疗无效的肝细胞癌患者增强 MRI 动脉期影像组学特征及常规影像征象的相关性。

材料与方法：回顾性收集 124 例接受 TACE 治疗的 HCC 患者, 根据 mRECIST 标准分为治疗有效组 (n=61) 和治疗无效组 (n=63)。记录患者 TBA、肿瘤大小、边界、包膜、瘤周强化、卫星结节、瘤内动脉、放射学肝硬化。使用 ITK-SNAP 软件在增强 MRI 动脉期图像上逐层手动勾勒肿瘤边缘获得三维容积感兴趣区。通过 AK 软件提取病灶的一阶影像组学特征, 包括 MaxIntensity、MeanValue、MedianIntensity、MinIntensity、Range、Variance、VolumeCount、VoxelValueSum、Energy、Entropy、Kurtosis、Skewness、Uniformity。使用 Mann-Whitney U 检验比较治疗有效组 and 无效组间 TBA 的差异, 通过 Spearman 或 Pearson 相关性检验评估 TBA 与影像组学特征及常规影像征象的相关性。

结果：TACE 治疗无效组 [13.2 (5.2, 25.2) umol/L] 的 TBA 显著高于治疗有效组 [8.4 (5.75, 14.55) umol/L] (P=0.018), TBA 与 TACE 疗效具有显著相关性 (r=0.214, P=0.017)。TBA 与 MinIntensity、Range、VolumeCount、VoxelValueSum、Uniformity、肿瘤大小、瘤内动脉、放射学肝硬化具有相关性 (r=0.349、-0.325、-0.344、-0.298、0.301、-0.311、-0.285、0.490, P<0.05)。

结论：胆汁酸代谢水平影响肝癌患者 TACE 治疗效果，TBA 与增强 MRI 影像组学特征及常规影像征象相关。

PO-1867

腹膜后血管瘤 CT 及 MRI 影像学表现

马丽娅¹、李群英²、胡道予¹

1. 华中科技大学同济医学院附属同济医院

2. 铜仁市人民医院

背景：腹膜后血管瘤属于腹膜后脉管瘤，其按病理细分包括吻合状血管瘤（也称交织状血管瘤）、海绵状血管瘤，部分病灶同时含血管瘤及淋巴管瘤构象。本研究旨在总结腹膜后血管瘤 CT、MRI 影像学特征，尤其是吻合状血管瘤。

方法：回顾性搜集 2013 年 1 月至 2023 年 7 月我院病理诊断为腹膜后血管瘤的病例，收集患者的年龄、性别、症状、病理等，并对术前的影像图像进行总结及测量，包括腹部 CT 增强、MRI 平扫、DWI 及增强，记录病灶的个数、部位、大小、形状、与周围组织关系、CT 值（HU）、CT/MRI 的强化程度、方式、MRI 平扫及 DWI 的信号强度等。

结果：本次研究共纳入 17 例病例、共 19 个病灶，年龄为（40.6±16.5）岁，包括 10 例男性、7 例女性，3 例患者有轻微腰腹痛症状、余 14 例患者无明显症状，其中有 3 例患者为多发病灶（3 个）、余 14 例为单发。影像学 CT 增强扫描可见 4 个病灶周围淋巴结异常增多、余 10 例无明显增多淋巴结，11 例病灶有钙化、6 例无钙化，5 例病灶有分隔、9 例无分隔；对比剂增强后有 4 个病灶无强化、5 个病灶弱强化、余 10 个病灶均呈明显不均匀强化、部分呈渐进性强化；15 个病灶位于肾周（8 例在肾门周围），4 个病灶未与肾脏毗邻；CT 值动脉期（46.2±36.5）HU、静脉期（68.3±60.7）HU、延迟期（51.2±39.0）HU，MRI 共 3 例，其中 2 例呈长 T1 长 T2 信号，DWI 未见明显扩散受限，另一例呈明显混杂 T1 及混杂 T2 信号，病理提示有出血、坏死。

其中吻合状血管瘤 3 例，均呈明显、渐进填充式强化，1 例成人有 3 个病灶，余 2 例为单发；1 例 5 月婴儿为形态不规则病灶，余 2 例、5 个病灶呈类圆形；4 个病灶位于腹膜后肾周、1 例（多发病灶之一）位于腹主动脉远端与左侧腰大肌间；增强后 CT 值动脉期（103.6±14.1）HU，静脉期（162.2±28.9）HU，延迟期（121.3±3.2）HU。

结论：腹膜后血管瘤表现形式多样，大多数单发，绝大多数见于成年人、无明显症状，大多数为单发、明显强化，少部分病灶也可呈弱强化甚至无强化，部分病灶有钙化、分隔，其中吻合状血管瘤均呈明显填充式强化，延迟期强化稍减低。

PO-1868

肌肉减少症影像学评估对免疫治疗的晚期肝癌患者疗效和预后的影响

冬冬、王楠娅
吉林大学第一医院

背景：肌肉减少症是恶性肿瘤患者常见的临床综合征之一，其发生发展对肿瘤患者疗效和预后的不良影响已在不同的肿瘤类型以及接受不同治疗的肿瘤患者中得以证实。免疫治疗在肝癌领域取得了较大进展。近年来多项免疫联合治疗方案研究已经成为肝癌多线治疗的标准治疗方案，但目前尚缺乏预测疗效和预后的生物标志物。本研究探索肌肉减少症影像学评估对接受免疫治疗的晚期 HCC 患者疗效和预后的影响。

方法: 回顾性分析于吉林大学第一医接受免疫治疗的 36 例晚期 HCC 患者。治疗前采用腹部 CT 测量第 3 腰椎(the third lumbar vertebral,L3)层面骨骼肌横截面积(cm^2),肌骨骼肌指数(skeletal muscle index, SMI)为 L3 水平骨骼肌横截面积/身高 2(cm^2/m^2)。根据日本肝病学会标准,肌肉减少症定义为男性 $\text{SMI} < 42 \text{ cm}^2/\text{m}^2$,女性 $\text{SMI} < 38 \text{ cm}^2/\text{m}^2$ 。治疗过程中,2-3 个月评估一次疗效(采用增强 CT/MRI 根据 RECIST 1.1 评估疗效)。

结果: 中位随访时间为 10.0 个月(1.6-24.9 个月)。共纳入 36 例原发性肝癌患者,其中肌肉减少症患者有 19 例(52.8%),非肌肉减少症患者有 17 例(47.2%);年龄 27-77 岁,中位年龄 55 岁;男性 33 例,女性 3 例。肌肉减少症组的疾病控制率(disease control rate,DCR)有小于无肌肉减少症组的趋势(DCR 分别为 52.6% vs 70.6%, $P=0.322$)。肌肉减少症组和无肌肉减少症组的客观缓解率(objective response rate,ORR)分别为(26.3%和 17.6%, $p=0.226$),差异无统计学差异。

两组的中位无进展生存时间(progression free survival, PFS)均未达到。肌肉减少症组的 3、6 和 12 个月的 PFS 率分别 84.2%、63.2%和 50.5%,均低于无肌肉减少症组的 88.2%、74.7%和 74.7%。

结论: 肌肉减少症与免疫治疗的 HCC 患者较差的疗效和预后有关,无肌肉减少症的肝癌患者可能预示着较长的无进展生存率。

PO-1869

不同呼吸模式下呼气后憋气扫描磁共振肝脏弹性成像的对比研究

王威

东南大学附属中大医院

目的:

本研究旨在比较胸式呼吸与腹式呼吸憋气扫描磁共振肝脏弹性成像的差异,探讨其在肝脏疾病诊断中的应用价值。

方法:

本研究选择了 10 名健康志愿者参与研究,志愿者年龄在 20 至 40 岁之间,其中 5 名为男性,5 名为女性。所有志愿者的身体状况均经过详细检查。在开始实验之前,对所有志愿者进行了细致的胸式呼吸和腹式呼吸训练。在训练结束后,要求每一名志愿者分别用胸式呼吸和腹式呼吸的方式进行呼气后憋气的肝脏磁共振弹性成像序列扫描。全部扫描均由同一名 3 年以上磁共振弹性成像扫描经验的磁共振技师操作完成。扫描完成后,由一名具有 5 年以上放射诊断工作经验的放射科医师对每例检查的肝脏硬度 95%可置信区间面积以及肝脏硬度数值进行测量,并比较上述数值在不同呼吸模式下的差异。

结果:

通过对比分析,我们发现健康志愿者在胸式呼吸憋气情况下肝脏弹性成像的 95%可置信区间面积与腹式呼吸憋气情况相比呈现出较明显的差异。具体来说,胸式呼吸憋气情况下肝脏弹性成像的 95%可置信区间面积为 8.5 ± 2.1 平方厘米,而腹式呼吸憋气情况下肝脏弹性成像的 95%可置信区间面积为 6.3 ± 1.8 平方厘米。这些数据表明,在胸式呼吸情况下,肝脏的弹性显著高于腹式呼吸。差异具有统计学意义($P < 0.05$)。同时,我们注意到尽管不同呼吸方式测得的肝脏整体硬度数值差异没有达到统计学意义,但在部分志愿者中,胸式呼吸下的肝脏硬度数值略高于腹式呼吸。

结论:

胸式呼吸与腹式呼吸憋气扫描磁共振肝脏弹性成像具有一定的差异,这种差异可能与呼吸方式对肝脏周围结构的影响有关。虽然胸式呼吸情况下肝脏弹性成像的 95%可置信区间面积较高,但其最终结果没有统计学差异。由于弹性成像扫描过程中需要使用机械波对患者腹部进行反复冲击,对部分被检者来说可能会影响其憋气效果,进而较大程度的影响到检查的最终结果。故磁共振弹性成像还应综合评估患者具体情况选取适合的扫描方案,才能达到稳定的检查质量。

PO-1870

以患者为中心的上腹部普美显磁共振检查前准备方法对降低患者动脉期补扫率的作用与价值

谢欢

中国人民解放军陆军特色医学中心

目的：研究以患者为中心的上腹部普美显磁共振检查前准备方法对降低患者动脉期补扫率的作用与价值。

方法：回顾性分析 2023 年 1 月-2023 年 7 月在我院影像科行上腹部普美显磁共振检查的患者 200 例，把这些患者按其检查前的准备方式不同分为以患者为中心准备组（CP）和常规准备组（RP），每组 100 例。RP 组患者采用常规准备方式进行上腹部普美显磁共振检查前准备；CP 组患者采用我们全新设计的以患者为中心的方式进行上腹部普美显磁共振检查前准备（如检查流程学习、噪声熟悉、注射预刺激训练和检查适应性训练等）。两组患者动脉期图像是否需要再次扫描由我科工作 10 年以上诊断医师评定。采用配对卡方检验对两组患者动脉期补扫率、图像质量以及检查效率进行差异性分析。

结果：CP 组患者动脉期补扫率为 5/100（5.0%），RP 组患者动脉期补扫率为 16/100（16.0%）， $P=0.02$ ；CP 组图像质量评分平均分为 4.6 分，RP 图像质量评分平均分为 3.5 分， $P=0.03$ ；CP 检查效率中位检查时间为 17.5min，RP 检查效率平均时间为 25.3min， $P=0.018$ 。

结论：上腹部普美显磁共振检查采用以患者为中心的准备方式可以提高其检查成功率、图像质量及检查效率，降低动脉期补扫率。也减少了对比剂的使用，降低了患者因注射对比剂而发生过敏的风险，有助于患者的身心健康，也提高了患者对此项检查的满意度，值得进行推广。

PO-1871

分析上腹部普美显增强检查动脉期图像伪影发生与普美显注射刺激的关系研究

谢欢

中国人民解放军陆军特色医学中心

目的：分析上腹部普美显增强检查动脉期图像伪影发生与普美显注射刺激的关系。方法：收集我院 2020 年 11 月-2021 年 12 月行上腹部普美显磁共振增强检查患者共 327 例，其中 127 例患者为自身对照，另外 200 例患者为互相对照。本次研究分为两个部分，第一部分为 127 例自身对照的患者行上腹部普美显磁共振增强检查前，先以 3ml/s 的速度注射生理盐水 10ml 同时行 T1 三维容积梯度回波序列扫描，将这部分图像定义为对照组；等待 60s 患者状态恢复后，再以相同速度注射普美显 10ml 同时行相同序列扫描动脉期，将这部分图像定义为研究组。评价两组图像质量，并对图像质量进行评分。这 127 例患者中有 69 例患者在注射生理盐水和普美显时进行了心率的监测。第二部分为研究组、对照组患者各 100 例；研究组 100 例患者在行上腹部普美显增强扫描前，先以 3ml/s 的速度注射生理盐水 10ml，同时行 T1 三维容积梯度回波序列扫描，观察图像质量，若图像质量不理想，与患者进行沟通，再以相同速度注射普美显 10ml 行相同序列扫描动脉期。对照组 100 例患者按照常规方法以 3ml/s 的速度注射普美显 10ml 行相同序列扫描动脉期。评价两组动脉期图像质量。结果：第一部分 127 例自身对照患者注射生理盐水和注射普美显时伪影发生率分别为 13.39% 和 10.24%，图像质量平均分分别为 3.67 和 3.76；采用配对卡方检验进行统计学分析， P 值分别为 0.48 和 0.18。69 例监测心率自身对照的患者注射生理盐水和注射普美显的平均心率分别为 78 次/分和 77 次/分，采用配对 t 检验进行统计学分析 P 值为 0.09。第二部分研究组和对照组注射普美显动脉期图像伪影发生率为分别为 6.55% 和 15.52%，采用配对卡方检验进行统计学分析 P 值为

0.001。结论：普美显的药物刺激不是引起上腹部动脉期图像伪影的主要原因，主要原因跟注射刺激、患者心理因素以及对检查流程的不熟悉相关。

PO-1872

基于 MRI 影像组学模型预测直肠癌术前同时性远处转移

姜昊¹、郭伟²、姜慧杰¹

1. 哈尔滨医科大学附属第二医院

2. 哈尔滨医科大学附属第三医院

目的：基于术前 MR 成像数据开发和验证一种新的非侵入性人工智能模型，以预测直肠癌同步远处转移（Synchronous Distant Metastasis, SDM）的存在。

方法：符合纳入标准的 RC 患者共 169 例，采集 T2WI 和 DWI 两个序列图像。通过 Python 语言的 PyRadiomics 包提取影像组学特征，共提取了 1688 个影像组学特征，包括一阶特征、形状特征、纹理特征、小波特征。选取受试者工作特征(ROC)、曲线下面积(AUC)、准确性、敏感性、特异性和 95%置信区间(CI) 5 个指标对模型进行评价。

结果：使用四个独立危险因素(CEA、年龄、CA199 和 T 分期)建立的临床模型在训练和测试数据集上的 AUC 值分别为 0.81 和 0.83。结合临床因素和不同序列图像的影像组学特征，我们建立了三种临床-影像组学模型，即 DWI+临床模型、T2W+临床模型和 nomogram (影像组学+临床)模型。结果显示 nomogram 模型在预测直肠癌 SDM 上的判别性能最好。训练集中，nomogram 模型的 AUC、准确率、灵敏度、特异性和 95% CI 分别为 0.93, 0.85, 0.85, 0.86, 0.89-0.96；测试集中，nomogram 模型五项指标分别为 0.94, 0.89, 0.88, 0.89, 0.79-0.97。校正图在临床影像组学模型预测和实际观察概率之间是一致的。决策曲线分析显示，与临床模型和影像组学模型相比，nomogram 模型在训练集和测试集上获得了最高的净效益。

结论：我们的预测模型对于指导和管理直肠癌 SDM 患者是有价值的，对于改善患者治疗决策和指导个性化治疗方案提供方案。

PO-1873

酰胺质子转移加权成像评估子宫内膜癌 PTEN 基因表达的价值

王野、田士峰

大连医科大学附属第一医院

【摘要】目的 探讨酰胺质子转移加权 (amide proton transfer weighted, APTw) 评估子宫内膜癌 (endometrial carcinoma, EC) 磷酸酶及张力蛋白同源物 (phosphatase and tensin homolog deleted on chromosome ten, PTEN) 基因表达的价值。**方法** 回顾性分析 25 例经手术病理证实为 EC 的患者资料，其中 PTEN 表达阳性组 11 例，PTEN 表达阴性组 14 例，术前行 3.0T MR 检查，扫描序列包括 APTw，扫描后经后处理获得 APT 图。由两位观察者分别测量两组病例的 APT 值，采用同类相关系数 (intra-class correlation coefficients, ICC) 检验两位观察者对两组病例各参数值测量结果的一致性，采用独立样本 t 检验比较两组病例 APT 值的差异，采用 ROC 曲线评估 APT 值评估 EC PTEN 表达的效能，并计算曲线下面积 (Area Under Curve, AUC) 及相对应的截断值、敏感度、特异度。结果 两位观察者测量各组数据的一致性很好 (ICC>0.75)。PTEN 表达阳性组的 APT 值 (2.727±0.342 %) 小于 PTEN 表达阴性组 (3.029±0.330 %)，差异具有统计学意义 (t=2.230, P=0.036)；APT 值评估 EC PTEN 基因表达的 AUC 值为 0.688，截断值为 2.675 %，敏感度为 92.9 %，特异度为 54.5 %。结论 APTw 有术前定量评估 EC PTEN 基因表达的潜力，具有一定临床应用价值。

PO-1874

多模型 MRI 扩散加权成像评估大鼠标准 肝部分切除术后残肝再生的价值

邱才新、谢双双、沈文
天津市第一中心医院

目的：探讨多种模型 MRI 扩散加权成像（包括单指数、双指数和峰度模型）在评价大鼠标准肝部分切除术后残肝再生中的价值。

材料和方法：70 只大鼠随机分成 MR 扫描组（n=14）和病理组（n=56），MR 扫描组又分为 2/3 肝切除组（n=7）和假手术组（n=7）。MR 扫描组在术前和术后第 1、2、3、5、7、14、21 天行多 B 值 DWI 磁共振扫描，分别获得单指数模型参数（ADC 值）、双指数模型参数[真实扩散系数（D）、假性扩散系数（D*）以及灌注分数（f）]和扩散峰度模型参数[平均扩散系数（MD）及平均扩散峰度值（MK）]。测量肝脏体积，并计算肝再生率。病理组行约 2/3 肝切除后于上述每个时间点随机选取 7 只实验鼠取肝脏组织进行病理学检查，采用苏木精-伊红染色和 Ki-67 免疫组化染色进行组织学检查，测量肝细胞大小（直径）和肝细胞增殖活性（Ki-67 指数）。观察影像学指标和病理指标的变化规律，分析 MR 参数与肝脏体积及病理指标间的相关性。采用 ROC 曲线评估 MR 参数诊断肝脏再生生活性能。

结果：大鼠肝部分切除术后，肝实质所有 MR 参数值均表现为先升高后逐渐恢复至术前基线的趋势。D*和 f 值两者均与肝体积有较好的相关性（r 值分别为 0.718，0.476，P 值均<0.01），与 Ki-67 增殖指数（r 值分别为-0.693，-0.41，P 值均<0.01）和肝细胞大小（r 值分别为-0.469，-0.425，P 值均<0.01）有中度负相关。MK 值与 Ki-67 指数呈高度相关（r=-0.807）、肝脏体积和肝细胞大小呈中度相关（r 值分别为 0.595，-0.562，P 值均<0.01）。ADC、D、MD 与肝再生相关指标无相关性或弱相关。f 值诊断肝脏再生生活性的曲线下面积（AUC=0.952）显著高于其他参数（ADC、D、D*、MD、MK 的 AUC 值分别为 0.821、0.758、0.867、0.789、0.863）（P<0.05）。

结论：D*、f、MK 值能反映肝脏再生过程的微观变化，可纵向评价大鼠肝部分切除术后残肝再生情况，f 值在评价肝脏再生生活性方面更有价值。

PO-1875

双层探测器光谱 CT 虚拟平扫替代常规平扫 评估结直肠癌的可行性研究

魏博¹、赵卫¹、付蓝琦²、王艺洁¹、陈海静¹、曹朝阳¹、杨亚英¹

1. 昆明医科大学第一附属医院

2. 浙江省中医院（浙江中医药大学附属第一医院）

目的 探讨双层探测器光谱 CT（SDCT）虚拟平扫技术在结直肠癌诊断中的价值。方法 收集我院 52 例结直肠癌患者的影像资料，比较真实平扫、动脉期虚拟平扫、静脉期虚拟平扫、延迟期虚拟平扫（TNC、VNC-A、VNC-V、VNC-D）四组图像中结直肠癌病灶、腹主动脉、椎旁肌/臀大肌、皮下脂肪的 CT 值、噪声、信噪比（SNR）、对比噪声比（CNR），并对四组图像质量进行评分。结果 四组图像中结直肠癌病灶、椎旁肌/臀大肌 CT 值均无显著性差异（P 均>0.05），而腹主动脉、皮下脂肪 CT 值均存在显著性差异（P 均<0.05）。与 TNC 图像相比，各组织在三组 VNC 图像中的噪声均明显降低，且病灶及腹主动脉 SNR 高于 TNC 图像（P 均<0.05）。四组图像均能满足诊断要求，两名观察者的主观评价一致性较好。采用“VNC+直接增强扫描”方案可降低约 22.39%的辐射剂量。结论 在评估结直肠癌方面，由 SDCT 获得的 VNC 图像质量接近于 TNC，且辐射剂量更低。

PO-1876

瘤周脂肪特征联合全身炎症反应指数预测结肠直肠癌新辅助治疗的病理完全反应

卢婷
兰州大学第二医院

目的 探索结肠直肠癌 (CRC) 瘤周脂肪 (PA) 特征联合全身炎症反应指数 (SIRI) 能否预测 CRC 患者新辅助治疗后的病理完全反应 (pCR)。

方法 回顾性收集兰州大学第二医院 2019 年 1 月至 2022 年 12 月 136 例经新辅助治疗的 CRC 患者。对 CRC 患者行新辅助治疗前的 PAT 侵犯程度、横向及纵向瘤周脂肪累及范围进行评分, 计算累计分, 建立 PAT 分级。0~1 分为 PAT1 级, 1 分为 PAT2 级, 3 分为 PAT3 级。采集 CRC 患者新辅助治疗前的外周静脉血, 计算 SIRI, $SIRI = \text{中性粒细胞计数} \times \text{单核细胞计数} / \text{淋巴细胞计数}$ 。评价病理学肿瘤退缩分级 (TRG), 将 TRG 0 级定义为 pCR, TRG1~3 级定义为非 pCR。比较 pCR 与非 pCR 组间的 PAT 特征以及 SIRI, 并建立联合参数。比较 PAT 特征、SIRI 以及 PAT 特征联合 SIRI 的受试者工作特性曲线下面积 (AUC) 评估预测 pCR 的性能。采用 DeLong 检验比较单一参数和联合参数。

结果 本研究共纳入 136 例患者, 47 例出现 pCR, 89 例出现非 pCR, 其中 PAT1 级较 2-3 级更易出现 pCR, 差异具有统计学意义 ($\chi^2=8.183$, $P=0.004$)。pCR 组 SIRI 低于非 pCR 组, 差异具有统计学意义 (342.16 ± 35.72 比 417.03 ± 38.11 , $t=7.612$, $P=0.001$)。基于 PAT 分级与 SIRI 建立的联合模型 AUC 为 0.825 (95% CI=0.809, ~ 0.973, $P<0.001$), 高于 PAT 分级 AUC 为 0.790 (95%CI=0.669 ~ 0.911), SIRI AUC 为 0.819 (95%CI=0.713 ~ 0.925), AUC 差异具有统计学意义 (DeLong test: $p<0.001$)。

结论 CRC 新辅助治疗前的 PAT 特征联合 SIRI 可以预测 CRC 新辅助治疗后的病理完全反应, 且预测效能良好。

PO-1877

双螺旋 128 排 CT 对于肾损伤的影像诊断以及治疗措施的相关研究

张生
徐州医科大学附属医院

目的:更详细的了解肾损伤的相关病因, 临床表现自己肾损伤的影像学表现。

肾损伤的病因主要包括 1 暴力因素最常见:直接暴力包括 撞击、跌打、挤压等 间接暴力包括高处坠落移位, 对冲伤等 2.锐器因素比较少见 枪弹、刀刃等 3.医源性因素结石 冲击波碎石、对肾脏行穿刺活检、输尿管插管等。

影像学检查方法包括: 增强 CT 是肾脏损伤的金标准, 动脉期和静脉期可以排除所有的创伤, 延迟期可以评估集合系统是否有对比剂外漏。动脉期图像显示活动性出血、创伤性假性动脉瘤 静脉期有助于鉴别出血与假性动脉瘤。

I 级:包膜下血肿或挫伤, 不伴有撕裂

II 级:肾周血肿局限于 Gerota 筋膜;实质撕裂 $\leq 1\text{cm}$, 无尿外渗

III 级肾实质撕裂伤深度 $>1\text{cm}$, 没有集合系统破裂或尿液外渗; Gerota 筋膜内的肾血管损伤或活动性出血

IV 级实质撕裂伤延伸至集合系统, 伴有尿外渗; 肾盂撕裂和/或肾盂输尿管完全断裂; 节段性静脉或动脉损伤; 超过 Gerota 筋膜进入腹膜后或腹腔的活动性出血; 无活动性出血的血管血栓形成导致的节段性或完全性肾梗死

V 级: 肾动脉或静脉主干撕裂, 或肾门撕脱; 肾血供中断伴有活动性出血; 肾破碎。值得注意的是: 双侧肾损伤分级应提升一至三级; 如果一侧肾脏多处损伤应以最严重的分级归类。并且在 2018 年将血管损伤 (假性动脉瘤、动静脉畸形) 纳入内脏损伤影像学标准。其中血管损伤 CT 诊断的血管损伤包括假性动脉瘤 (PSA) 和动静脉瘘 (AVF), 源于节段性动脉水平远端的较小分支的肾脏内血管损伤 (PSA, AVF) 属于 III 级, 而源于节段性动脉水平近端的血管损伤属于 IV 级。PSA 被定义为一种局灶性边界清晰的血管外造影剂的集合, 并在延迟期保持相同的大小 AVF 的特点是在动脉期出现肾静脉的早期增强以及静脉扩张。

在治疗上, I 级和 II 级以及部分 III 级肾实质损伤都可以保守治疗, IV-V 级可能需要栓塞或外科手术。输尿管-肾盂连接处完全撕脱需要手术修复。节段性梗死通常会自然消退或导致微小的实质瘢痕, 因此对其进行保守治疗

结论: 大约 90% 的肾损伤由钝性伤引起

血尿是最常见的症状, 但严重肾损伤可无血尿。增强 CT 是肾损伤评估的金标准, 肾损伤的治疗取决于损伤程度。

PO-1878

基于能谱 CT 定量参数及临床特征预测肝硬化食管静脉曲张出血风险的列线图模型研究

黄瑞岁、覃雯祺、丁可
南宁市第二人民医院

目的 构建基于能谱 CT 定量参数及临床特征预测肝硬化食管静脉曲张破裂出血风险的列线图模型。方法 选取 2017 年 1 月至 2023 年 7 月在本医院确诊为肝硬化并食管静脉曲张的患者为研究对象, 分别行电子胃镜及上腹部能谱 CT 增强扫描检查, 并收集其临床资料。根据患者内镜下表现及临床症状, 分为出血组和非出血组, 比较两组间的能谱 CT 定量参数及临床特征, 将有统计学差异的变量纳入 Logistic 回归分析, 筛选食管静脉曲张破裂出血的危险因素, 采用 R 软件构建预测破裂出血的列线图模型, 分别使用受试者工作特征曲线、校准曲线、决策曲线分析评估模型的区分度、校准度、临床实用性。结果 共纳入 115 例患者, 其中出血组 55 例, 非出血组 60 例。单因素分析显示, 肝左叶标准化碘基值、肝尾叶标准化碘基值、门静脉内径、胃左静脉内径、脾脏体积、脾脏碘浓度、性别、血小板计数及凝血酶原时间差异具有统计学意义 ($P < 0.05$)。多因素 Logistic 回归分析显示, 肝左叶标准化碘基值及血小板计数是食管静脉曲张破裂出血的危险因素 ($OR = 0.009$ 、 0.989 , $P < 0.05$)。列线图模型预测评估的区分度曲线下面积为 0.832, 对应的敏感度、特异度分别为 78.40%、75.00%; 校准曲线显示预测结果与实际结果一致性良好, Hosmer-Lemeshow 拟合优度检验 $\chi^2 = 6.55$, $P > 0.05$; 与 2 个独立危险因素比较, 模型的决策曲线离两种极端情况最远, 在阈值 0-80% 区间内体现出更高的净获益。结论 肝左叶标准化碘基值和血小板计数是食管静脉曲张破裂出血的独立危险因素, 由此构建的列线图预测模型具有较好的区分度、校准度及临床实用性, 可为临床无创性预警食管静脉曲张破裂出血提供重要参考依据。

PO-1879

子宫附腔畸形 1 例并文献学习

董玉莹

徐州医科大学附属医院

目的：根据本院 1 例确诊为子宫附腔畸形（Accessory cavitated uterine malformation）患者的临床及影像学资料，通过文献学习，了解该病的发病机制、发展过程、临床表现及影像学表现特点，提高对该病的认识，为以后的诊断工作奠定基础。

方法：根据本院 1 例术后确诊为子宫附腔畸形患者的超声、影像学、实验室检查、临床表现及术后病理，结合相关文献学习，总结相关临床特征及影像学表现。

结果：MRI 示子宫左侧壁团块影，大小约 39×45mm，边界不清，病灶中心示类圆形短 T1 长 T2 信号影，可见液液平面，DWI 信号增高，中心边缘示条状 T2 低信号影，增强后病灶实性成分不均匀强化，病灶囊腔与子宫腔不相通，腹腔镜下切除子宫病变，病理示子宫附腔畸形伴腺肌症。

结论：子宫附腔畸形是一种比较罕见的苗勒管畸形，是一种孤立的囊肿性子宫病变，位于子宫肌层的外侧，位于子宫圆韧带的下方，含有功能性子宫内膜的子宫附腔与子宫不相通，其在青少年女性患者中常表现为从初潮开始进行性加重的痛经，常被误诊为青少年囊性子宫腺肌病。ACUM 的起源尚不明确，有假说认为，苗勒管组织的重复或持续存在可能与引带功能（发育为圆韧带有关），异常苗勒管与对侧的对称苗勒管进行了正常的融合吸收，但是子宫内膜没有吸收，形成了游离异常腔室，从而导致一种新的苗勒管畸形，即 ACUM 的形成，多数报道均为一个腔室，亦有发现同侧有两个腔室者。影像学表现：在超声上病变独立于正常子宫腔，表现为边界清晰的球形空化病变，包含有回声的液体，周围环绕着肌层，子宫肌层和充满液体的腔隙被认为是超声的决定性特征，子宫肌层内有血管，但病变空化部分没有血管。诊断标准①正常宫腔及内膜腔；②正常的卵巢及输卵管；③经手术切除并通过病理证实的空腔样包块；④子宫附腔内包含有腺体和间质的内膜组织；⑤附腔内含有巧克力样液体；⑥未证实子宫腺肌病（如行子宫切除）。ACUM 诊断相对困难，需要与囊性子宫腺肌病、子宫肌瘤囊性变，以及其他与痛经相关的阻塞性苗勒管畸形中的单角子宫伴近端残角子宫伴功能性子宫内膜相鉴别。

PO-1880

卵巢癌术后病理检查结果与 CT 及超声影像特征的比较分析

高瑾

徐州医科大学附属医院

目的比较分析卵巢癌 CT 及超声影像特征与术后病理检查结果的关系。方法将 2016 年 8 月至 2018 年 7 月我院收治 79 例疑似卵巢癌患者作为研究对象,所有患者均进行手术治疗且术前进行 CT 和超声检查,将其检查结果与术后病理检查结果进行对比分析,评估 CT 和超声对卵巢癌的诊断效能。结果术后病理检查显示,79 例患者中 64 例为卵巢癌。卵巢癌超声显示肿瘤瘤体较大,回声强,囊壁有突起,周边及内部血流主要表现为高速低阻;CT 图像病灶以囊实性为主,肿块体积较大,形态不规则,轮廓模糊,囊壁和间隔分布不均,密度均匀或不均匀,部分病灶内可见钙化。超声对卵巢癌诊断灵敏度、特异度、准确度依次为 84.38%、66.67%、81.01%;CT 对卵巢癌诊断灵敏度、特异度、准确度依次为 93.75%、86.67%、92.41%;CT 检查准确度高于超声($\chi^2=4.448, P<0.05$)。结论 CT 及超声对卵巢癌均有一定诊断价值,但 CT 对卵巢肿块组织学特征显示效果更好,诊断价值相对较高。

PO-1881

体素内不相干运动扩散加权成像评估肝细胞癌 TACE 治疗早期疗效的价值

张倩瑜¹、赵莹¹、李佳奕²、任雪¹、周丽萍²、王楠¹、宋清伟¹、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连医科大学医学影像学院

目的

探讨体素内不相干运动扩散加权成像 (IVIM-DWI) 定量参数评估肝细胞癌 (HCC) 经动脉化疗栓塞 (TACE) 治疗早期疗效的价值。

材料与方法

回顾性收集我院 2017 年 1 月至 2022 年 2 月期间进行上腹 MRI 检查且采取 TACE 治疗的患者 44 例, 根据 mRESICT 标准评估 TACE 术后 3 个月内肿瘤治疗反应, 其中客观应答 (objective response, OR) 24 例, 无应答 (non-response, NR) 20 例。上腹 MRI 检查包括 T1WI、T2WI、动态增强扫描、DWI 和 IVIM-DWI。在 GE AW4.6 工作站, 使用 Functool 软件重建图像, DWI 序列生成 ADC 图、IVIM-DWI 序列生成 Standard ADC 图、D-Bi、D*-Bi、f-Bi 图、DDC 和 α 图。参照 T2WI 及动脉期, 在肿瘤最大层面及瘤周区域 (肿瘤周围 $<1\text{cm}$) 分别放置 3 个大小相等的感兴趣区 (ROI) (图 1), 取 3 个 ROI 平均值用于统计分析。采用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异; 采用 logistic 回归分析建立有统计学差异参数组合的预测模型; 使用受试者操作特征 (ROC) 分析评估预测效能。

结果

DWI 序列的 ADC 值在 OR 和 NR 组间无统计学差异 ($P > 0.05$)。OR 组的 D*-Bi-瘤周 (0.078 ± 0.0347) 显著高于 NR 组 (0.055 ± 0.029), OR 组的 α -肿瘤和 α -瘤周值 [0.594 ($0.561, 0.689$)、 0.448 ($0.394, 0.477$)] 明显低于 NR 组 [0.679 ($0.592, 0.736$)、 0.507 ($0.456, 0.581$)] ($P < 0.05$), 其余 IVIM-DWI 定量参数在两组间无统计学差异 ($P > 0.05$)。D*-Bi-瘤周、 α -肿瘤和 α -瘤周值预测客观应答的曲线下面积 (AUC) 分别为 0.690、0.698 和 0.732; 三个参数联合后, 预测效能有所提高 (AUC=0.821)。

结论

相比于 DWI 序列, IVIM-DWI 对评估 HCC 患者 TACE 治疗早期疗效更具价值, 有潜力揭示肿瘤周围区域的侵袭性。

PO-1882

基于低剂量双层光谱探测器 CT 平衡期的细胞外体积分数在胃部 病变诊断中的可行性分析

左孟哲¹、陈雪莲¹、孙丹琦²、王红燕¹、李勇刚²、王建良¹

1. 昆山市第一人民医院

2. 苏州大学附属第一医院

目的: 探讨基于低剂量双层光谱探测器 CT (SDCT) 增强扫描平衡期的碘密度图像 (IDIs) 测定细胞外体积分数 (fECV) 作为评价胃部病变的影像学指标的可行性。

方法: 将经内镜活检证实的 38 例胃癌患者和 42 例胃炎患者随机平均分为 A 组和 B 组, 每组均包括 19 例胃癌患者和 21 例胃炎患者, 再分为胃癌组和胃炎组, 即 A1 组和 A2 组, B1 组和 B2 组。A 组和 B 组患者分别进行低剂量 (120kV, 90mAs) 和常规剂量 (120kV, 200mAs) 腹部 CT3 分钟延迟增强平衡期扫描, 并通过光谱数据 (SBI) 重建 IDIs。基于 IDIs 测定 fECV 值, 并生成 ECV 图。比较低剂

量组 (A1 组和 A2 组) 和常规剂量组 (B1 组和 B2 组) 的图像质量和辐射剂量。将两名医生测量的 fECV 值在 A 组和 B 组以及胃癌组 (A1 和 B1 组) 和胃炎组 (A2 和 B2 组) 之间进行比较, 同时评价两名医生测定 fECV 值的一致性。

结果: A1 组患者的图像噪声及噪声评分均高于 B1 组 ($P<0.05$), 但 A 组患者的辐射剂量较 B 组显著降低约 54% ($P<0.05$), A1 组与 B1 组、A2 组与 B2 组的信噪比 (SNR)、对比噪声 (CNR) 差异无统计学意义 ($P>0.05$); A1 组与 B1 组、A2 组与 B2 组的 fECV 值差异无统计学意义 ($P>0.05$), 而 A1 组和 A2 组的 fECV 值分别高于 B1 组和 B2 组 ($P<0.05$)。同时, 两名医生测定 fECV 值的一致性较高 ($ICC=0.828$, $P<0.05$)。

结论: SDCT 低剂量平衡期扫描可在不影响胃部病变图像质量的情况下大幅降低患者的辐射剂量, 基于低剂量 IDIs 测定的 fECV 在胃部病变的诊断和评估中有一定的可行性。

PO-1883

静脉内平滑肌瘤病一例报告

徐红霞、李宏伟、邹孟宏
绵阳市第三人民医院

静脉内平滑肌瘤病 (intravenous leiomyomatosis, IVL) 是指生长于静脉内的平滑肌瘤, 亦可发生于淋巴管内, 故又称脉管内平滑肌瘤, 是一种罕见的特殊类型的子宫平滑肌瘤病, 属于良性肿瘤, 具有沿腔静脉或卵巢静脉延伸至下腔静脉, 甚至到达右心和肺动脉, 严重者可引起猝死。

PO-1884

基于 QCT 探讨腹部脂肪与胡桃夹现象的关系

李丽军¹、李春燕²
1. 南宁市第一人民医院
2. 广西医科大学一附院

目的 应用定量 CT (Quantitative Computed tomography, QCT) 测量腹部脂肪面积, 探讨胡桃夹现象与腹部脂肪的关系, 为临床选择治疗方案提供依据。方法 回顾 1345 例行全腹部 CT 平扫+增强的图像, 按胡桃夹现象在各年龄段的发生率, 随机抽取阳性及阴性病例各 141 例, 收集肠系膜上动脉与腹主动脉间夹角 (AMA) 类型、角度、左肾静脉在 AMA 夹角前和夹角中的横径比 (后简称左肾静脉横径比)、左肾静脉及 L2/3 水平层面腹部脂肪 (内脏脂肪、总脂肪、皮下脂肪) 指数、BMI。分析不同 AMA 夹角类型中胡桃夹现象与腹部脂肪的关系。结果 在 AMA 夹角 I 型组, 左肾静脉横径比与 AMA 角度呈中等负相关性 ($r=-0.375$, $P<0.05$), 与腹部脂肪指数、BMI 无相关性。II 型组, 左肾静脉横径比与 AMA 角度呈显著负相关性 ($r=-0.519$, $P<0.05$), 与腹部脂肪指数、BMI 存在中等负相关, 以左肾静脉水平内脏脂肪指数 (Visceral Adipose Tissue Index, VATI) 相关性最高 ($r=-0.328$, $P<0.05$); AMA 角度及左肾静脉水平 VATI 评估胡桃夹现象 AUC 分别 0.778、0.680, 取临界值 38.5° 、 $18.29\text{cm}^2/\text{m}^2$, 敏感性分别为 0.659、0.909, 特异性 0.792、0.415。结论 AMA 夹角 I 型组腹部脂肪与左肾静脉横径比不相关, 增加腹部脂肪不能改善左肾静脉受压的情况。II 型组 AMA 角度与左肾静脉横径比存在显著负相关性, AMA 角度 $\leq 38.5^\circ$ 对诊断胡桃夹现象具有一定的诊断效能; 腹部脂肪与左肾静脉横径比存在中等负相关, 增加腹部内脏脂肪可以改善左肾静脉受压的情况, 左肾静脉水平 VATI 高于 $18.29\text{cm}^2/\text{m}^2$ 时, 胡桃夹现象基本消失。

PO-1885

基于 IVIM 序列的超高 b 值 AQP-MRI 预测骨转移性前列腺癌价值评估

李茜玮¹、陈丽华¹、王楠¹、林良杰²、王家正²、刘爱连¹

1. 大连医科大学附属第一医院

2. 北京飞利浦临床科研部

目的: 本研究旨在比较不同超高 b 值预测前列腺癌骨转移的价值。**材料与方法:** 38 名患者接受了 3.0T MRI 扫描 (Ingenia CX, 飞利浦, 荷兰), 18 名有骨转移的患者和 20 名无骨转移的患者, 将扫描获得的原始 IVIM 图像被转移到 ISP V10。两位观察者在五组不同的超高 b 值 (第一组: $b=2000, 3000, 4000\text{s/mm}^2$; 第二组: $b=2000, 3000, 5000\text{s/mm}^2$; 第三组: $b=2000, 4000, 5000\text{s/mm}^2$; 第四组: $3000, 4000, 5000\text{s/mm}^2$; 第五组: $b=2000, 3000, 4000, 5000\text{s/mm}^2$) 肿瘤实体显示的最大层面测量 AQP-ADC 值。根据原始 IVIM 图像 ($b=2000$), 在肿瘤实体最大显示水平勾画 ROI, 勾画时避开囊变及坏死区域。同时, 在不同组的超高 b 值伪彩图上测量 AQP-ADC 值 (图 1)。采用观察者间一致性检验评估 2 位观察者测量的一致性。采用独立样本 t 检验或 Mann-Whitney U 检验来评估 AQP-ADC 在预测前列腺癌骨转移的价值。使用 ROC 曲线来评估不同 b 值的预测能力。**结果:** 两位观察者的测量结果一致性良好 ($\text{ICC}>0.75$), 见表 1。五组不同 b 值下的 AQP-ADC 值在预测前列腺癌骨转移方面有显著差异 ($P<0.05$), 见表 2, 其中 $b=2000, 3000, 4000\text{s/mm}^2$ 时, 诊断效能和敏感性最高, 见表 3。**结论:** AQP-ADC 测量在预测前列腺癌骨转移方面有很好的意义。当 $b=2000, 3000, 4000\text{s/mm}^2$ 时, 不仅预测性能明显提高, 而且扫描时间缩短, 图像的信噪比好, 值得进一步探索。

PO-1886

宫颈淋巴瘤 MR 影像分析及文献荟萃

唐华佑

重庆市奉节县人民医院

目的: 探讨女性生殖系统淋巴瘤磁共振成像 (magnetic resonance imaging, MRI) 特征, 以期提高治疗前的诊断准确性。

方法: 回顾分析本院及重医附二院于 2021 年至 2023 年期间经过手术病理确诊为原发性宫颈淋巴瘤的 MRI 资料。两例来自于本院, 1 例来自于重医附二院。本组病例年龄 45~79 岁, 平均年龄 65.3 岁。2 例患者表现为阴道不规则流血 (1 例为绝经后), 1 例表现为腹痛。术前临床怀疑为为宫颈癌, 行术前 MRI 评估。术后病理结果均为非霍奇金淋巴瘤, 弥漫性大 B 细胞瘤。

结果: 通过对本研究病例的临床及 MRI 表现进行回顾性总结, 并对国内外文献进行回顾, 研究发现宫颈淋巴瘤的患者的临床表现多无特殊, 通常表现为阴道不规则流血、流液及腹痛, 临床前期及 MRI 易误诊为宫颈癌。[LY1] 宫颈淋巴瘤的典型 MRI 影像表现为宫颈明显增大, 正常形态消失, 被软组织肿块影所取代, 呈长 T1 长 T2 信号。DWI 及 ADC 示弥散明显受限, ADC 平均值约 $0.47 \times 103 \text{ mm}^2/\text{s}$, 低于宫颈癌的 ADC 平均值约 $0.99 \times 103 \text{ mm}^2/\text{s}$ 。宫颈粘膜及宫颈基质环受累少见, 可见正常形态残留[LY2], 不同于宫颈癌的正常粘膜受侵、破坏。动态对比增强磁共振成像 (Dynamic contrast enhancement magnetic resonance imagination, DCE-MRI[LY3]) 呈轻度持续性均匀强化, 强化程度低于正常子宫肌层, 囊变、坏死少见, 而宫颈癌 DCE-MRI 表现为快进快出, 多呈不均匀强化, 较大者多见坏死、囊变。部分可见非引流区淋巴结转移, 转移淋巴结强化方式同原发灶一致。

结论: 宫颈淋巴瘤具有一定的 MR 特征性表现。通常表现为较大的均匀强化的软组织肿块, DCE-MRI 呈轻度均匀强化, 并表现为明显的弥散受限 (ADC 值显著降低), 并有正常宫颈粘膜的残留的典型表现, 可与宫颈癌鉴别, 这对术前诊断、分期及治疗方案制定具有重要意义。

PO-1887

MSCT 对盆腔淤血综合症的病因价值分析

李强、史燕巧
宁波大学附属人民医院

目的：回顾性分析盆腔淤血综合征（PCS）患者的 MSCT 影像学资料，并对病因学进行分析，为介入治疗提供解剖学依据。方法：回顾性分析 134 例行 MSCT 增强检查诊断为 PCS 患者的临床资料和影像资料，观察腹、盆腔静脉的走行、形态、管径变化、管腔内结构、血流动力学方面（阻塞或反流）和动静脉畸形等情况。结果：134 例患者中可识别的血管解剖变异计 69 例，包括左肾静脉远端近下腔静脉处狭窄 37 例，前胡桃夹征象 22 例，左肾静脉变异 2 例，卵巢静脉发育或汇入异常 6 例，盆腔动静脉瘘 2 例，左髂静脉压迫综合征 1 例、左肾动静脉瘘 1 例、门静脉高压导致的脾肾静脉引流 1 例和肾脏旋转不良 1 例；血管未变异计 65 例。结论：MSCT 增强扫描有助于早期诊断 PCS，并可全方位地识别的解剖学病因。

PO-1888

基于 CT 的肾囊性病变 2019 版 Bosniak II~III 类阅片者间一致性分析

梁田
哈尔滨医科大学附属第二医院

【摘要】目的 评估根据 2019 版 Bosniak 分类标准评估 II~III 级肾囊性病变 CT 图像不同阅片者在分类和判断上的一致性。方法 回顾性选择 2017 年 1 月至 2022 年 12 月哈尔滨医科大学附属第二医院 PACS 系统中符合条件的 82 例 II-III 级肾囊性病变病例。高年资医师 R1 根据 2019 版 Bosniak 标准筛选 II-III 级病例，作为一致性分析对象。医师 R2-R4 采用单盲法独立进行 Bosniak 分类和良恶性判断。使用加权 Cohen's Kappa 及 Fleiss's Kappa 来评估阅片者在所有病例、不同分类和不同病理类型病例中的一致性。结果 阅片者 R2~R4 的 bosniak 分类结果与 R1 的一致性系数：R2 为 0.770，R3 为 0.775，R4 为 0.762，均达到高度一致性。阅片者 R2~R4 的良恶性判断与病理结果的一致性系数为 0.82、0.772 和 0.759。结论 本研究基于 2019 版 Bosniak 分类标准评估 II~III 级肾囊性病变 CT 图像，在不同阅片者在分类和判断上的一致性均达到了较高水平，为临床诊断提供参考。

PO-1889

腹腔镜下直肠癌全系膜切除术困难程度的影响因素的术前评估： 腹膜反折的重要性

张绍婷¹、陈芳莹²、佟达丰²、邵成伟²、沈浮²、史晓辉²

1. 山东第一医科大学附属肿瘤医院 (山东省肿瘤医院, 山东省肿瘤防治研究院)

2. 上海长海医院

目的: 术前评估影响腹腔镜下直肠癌全系膜切除手术困难程度的因素, 尤其是与腹膜反折相关的因素。

方法: 回顾性收集 2020 年 12 月至 2021 年 12 月期间在行腹腔镜下直肠癌全系膜切除术前进行直肠磁共振检查的直肠癌患者。记录手术时间、术中出血量、住院天数、术后并发症来评估手术的困难程度。每个指标通过中位数分为高水平组和低水平组。在 MRI 矢状位图像上测量肿瘤下缘距腹膜反折的距离、肿瘤下缘距肛门距离、肛门距腹膜反折的距离、肿瘤相对于腹膜反折的位置关系。记录上述数据及其他临床资料。对连续变量进行可重复性检测; 用 Kappa 检验分析观察者间对于肿瘤相对于腹膜反折的位置关系判定的一致性; 使用单因素及多因素 Logistic 回归分析与手术困难程度相关的因素。

结果: 共纳入 283 例直肠癌患者 (平均年龄 60.98 ± 11.17 岁, 204 例男性)。肿瘤下缘距肛门距离 (ICC, 0.959; CV, 6.928%)、肛门距腹膜反折的距离 (ICC, 0.901; CV, 5.648%)、肿瘤下缘距腹膜反折的距离 (ICC, 0.995; CV, 9.814%) 的测量一致性较高; 肿瘤相对于腹膜反折的位置关系的 Kappa 值为 0.843。多因素 Logistic 回归分析发现肿瘤相对于腹膜反折的位置关系是手术时间 ($P=0.039$) 和术后并发症 ($P=0.014$) 的独立影响因素。

结论: 肿瘤相对于腹膜反折的位置关系是影响直肠癌患者行腹腔镜下全系膜切除术的手术困难程度的独立因素, 可以术前无创的评估手术困难程度。

PO-1890

基于临床-CT 征象模型对胃肠道移植抗宿主病诊断的研究

冯庆¹、李涛¹、彭鹏²

1. 柳州市工人医院

2. 广西医科大学第一附属医院

胃肠道移植抗宿主病 (GI-GVHD) 是造血干细胞移植 (HSCT) 后易发生的并发症之一, 早期的诊断和治疗对患者预后至关重要。目前临床诊断中缺乏非入侵的诊断方法。共收集 2018 年 1 月至 2022 年 12 月期间, 两个中心共 267 例接受 HSCT 后出现胃肠道症状患者, 其中 190 例经过病理证实为 GI-GVHD (发病率 71%)。GVHD 的临床分级、黏膜下小气囊、“环靶征”、多灶性肠道炎症、CRP 增高、总胆红素增高均为 GI-GVHD 诊断的独立危险因素 ($p < 0.05$)。然后, 我们将 190 个确诊 GI-GVHD 的患者进行多变量分析, 最终四个候选因子被纳入最终诊断模型: II-IVaGVHD、“环靶征”、多灶性肠道炎症、总胆红素增高。根据移植时间, 将队列分为训练集 ($n=114$) 和验证集 ($n=76$)。模型在训练集和验证集的 ROC 曲线下面积分别为 0.867 和 0.828。校准图显示预测结果和观察结果之间高度一致。决策曲线分析表明, GI-GVHD 患者可以受益于诊断模型的临床应用。无创性诊断 GI-GVHD 患者可能有助于及时治疗并提高患者预后。

PO-1891

一体化 PET/MR 对肝癌术后复发的诊断价值

许远帆、徐晨洁、潘建虎
杭州全景医学影像诊断中心

目的

比较 18F-FDG PET/MR 与 PET/CT 对肝癌术后复发的诊断价值。

方法

回顾性分析 92 例肝癌术后怀疑复发患者，全身 18F-FDG PET/CT 检查及上腹部 PET/MRI 扫描的影像与临床资料，以病理结果及临床诊断为金标准，对比观察 PET/CT 与 PET/MRI 对比两者图像质量、诊断效能。

结果

92 例患者共 43 例出现复发。PET/CT 的敏感度、特异度和准确率分别为 45.15%、90.45% 和 78.38%；PET/MRI 的敏感度、特异度和准确率分别为 100%、84.61% 和 94.59%，诊断准确率显著高于 PET/CT ($P < 0.05$)。有 15 例 PET/CT 中 CT 与 PET 图像错位，PET/MR 图像融合准确，两侧有显著统计学差异 ($P < 0.05$)。共 25 例肝癌复发侵犯胆道，16 例出现胆管梗阻合并梗阻性黄疸，10 例 PET/CT 能显示梗阻征象，PET/MR 均能清楚显示，两侧有显著统计学差异。25 例出现淋巴结转移，两者均能清晰显示。20 例出现血管侵犯，其中 14 例侵犯门静脉或下腔静脉，两台设备、均能清晰分别；另有 12 例侵犯腹腔干、肠系膜上动脉脾血管、肠系膜上静脉等，PET/MR 比 PET/CT 多明确诊断 8 例，有显著统计学差异 ($P < 0.05$)。15 例出现肺、骨、肾上腺、脑等器官侵犯，PET/MR 比 PET/CT 多明确诊断 7 例，有显著统计学差异 ($P < 0.05$)。

结论 PET/MRI 诊断肝癌术后复发的敏感度、特异度、和准确度均高于 PET/CT，图像配比更准确，能更好的判断淋巴结转移、周围结构及其它器官侵犯的情况。

PO-1892

腹膜后多发平滑肌瘤并玻璃样变性一例

周刚、杨丽、黄水仙、吴玲、邓开闯、龙艳
红河州滇南中心医院（个旧市人民医院）

患者 女，45 岁。因“发现下腹包块 2 年”于 2020 年 10 月 24 日入院治疗，患者近 2 年无诱因自行扪及下腹部包块，且逐渐增大，伴肛门坠胀感、反复便秘。性激素全套：孕酮 10.4ng/ml↑，余 (-)；肿瘤标志物、生化全套、粪便常规、尿常规、血常规均为阴性。CT 平扫：腹膜后见一巨大团块状病灶（以下称之为“病灶一”）及一类圆形病灶（以下称之为“病灶二”），大小分别约 21.6cm×14.3cm×29.4cm（左右经×前后径×上下径）、4.5cm×4.7cm×4.1cm（左右经×前后径×上下径），病灶密度不均匀，呈等、稍低密度，未见高密度出血及钙化（图 1）。泌尿系造影：膀胱、左侧输尿管中下段受压、向右侧偏移，泌尿系未见梗阻及扩张；大部分肠管受推压、聚集、向上移位，腹部未见肠梗阻征象（图 2）。MRI：T1WI 示腹膜后两个病灶，呈等、稍低信号，信号不均匀（图 3）；T2WI 示病灶一信号不均匀，可见不均匀高信号与低信号混杂交错，病灶形态不规则，边界尚清楚；病灶二主要呈高信号，内部可见不均匀片状低信号，病灶形态规则，边界清楚，位于子宫左后方、直肠右前方，与子宫、直肠分界清晰；病灶一与病灶二边缘均可见低信号的包膜样结构（图 4）；T2WI 冠状面示子宫、阴道及膀胱因病灶一推压、向右侧移位（图 5）；T2WI 矢状面示病灶一下缘延伸至左侧坐骨肛门窝区及会阴区（图 6）；DWI 横断面示病灶一部分区域呈稍高信号，ADC 值约 1.509~2.684×10⁻³mm²/s；病灶二大部分区域呈稍高信号，ADC 值约 1.168~

1.443×10⁻³mm²/s (图 7、8)；增强扫描示病灶一内可见片状不均匀强化影像，呈渐进性强化，病灶二呈渐进性强化，强化不均匀 (图 9、10、11)；增强扫描示右侧卵巢显示，向右、向上移位 (图 12)；增强扫描示左侧卵巢显示，向后、向上移位 (图 13)。手术经过：开腹，包块位于腹膜后，切开后腹膜，见巨大团块状肿瘤与周围组织粘连，见左侧输尿管与肿瘤粘连；另见骶骨岬右下方有一个类圆形的肿瘤；完整切除肿瘤。病理诊断：两个病灶均为平滑肌瘤 (玻璃样变)。

PO-1893

基于 MSCT 评估术前结肠癌壁外血管侵犯 对临床预后的价值研究

王美蓉、何伯圣
南通市第一人民医院

目的：探讨多层螺旋 CT (MSCT) 术前评估结肠癌壁外血管侵犯 (EMVI) 对患者临床预后的价值研究。方法：回顾性分析 2019 年 4 月-2020 年 4 月在南通市第一人民医院接受结肠癌根治性手术的 101 例患者的临床、影像和病理资料，术前 MSCT 判断肿瘤部位、大小、T 分期 (ctT)、淋巴结转移 (ctN)、ctEMVI 情况，根据 ctEMVI 情况将患者分为阴性组、阳性组，比较两组患者临床和病理特征的差异。术后随访患者发生进展性事件及对应时间。分析不同影像特征患者无病生存期 (DFS) 差异采用 Kaplan-Meier 生存曲线和 log-rank 检验，影响患者预后的危险因素采用 Cox 回归模型。结果：101 例结肠癌患者中 ctEMVI 阳性 40 例，阴性 61 例，ctEMVI 与 ctT、ctN、病理 T 分期 (pT)、病理淋巴结转移 (pN) 相关 ($P < 0.05$)。入组患者的随访时间为 36 (18, 36) 个月，共 29 例患者出现进展性事件，ctEMVI 阳性组 19 例，阴性组 10 例，阳性组累积 DFS 率低于阴性组，差异具有统计学意义 ($\chi^2=13.991$, $P < 0.001$)。单因素回归分析显示 ctEMVI (HR=3.872, 95%CI 1.795-8.352, $P=0.001$)、ctN (HR=2.741, 95%CI 1.171-6.417, $P=0.02$)、pN (HR=6.314, 95%CI 2.195-18.166, $P=0.001$)、病理分级 (HR=2.623, 95%CI 1.216-5.658, $P=0.014$) 是结肠癌术后 DFS 的影响因素。多因素回顾分析显示 ctEMVI 阳性 (HR=2.663, 95%CI 1.155-6.14, $P=0.022$) 和 pN 阳性 (HR=5.012, 95%CI 1.685-14.907, $P=0.004$) 是结肠癌术后 DFS 的独立影响因素。根据 pN 情况进行分组，pN0 组 45 例，pN 阳性组 56 例，ctEMVI 对结肠癌患者的累积 DFS 率均具有统计学意义 ($P < 0.05$)。结论：术前 MSCT 可有效判断结肠癌 EMVI 情况，ctEMVI 作为结肠癌术后 DFS 的独立影像学因素，可为结肠癌患者制定治疗方案及评估预后提供帮助。

PO-1894

联合应用 CT 淋巴管成像与 99Tcm-DX 淋巴显像在原发性乳糜尿诊断中的应用价值

郝琪^{1,2}、李兴鹏³、刘梦珂³、张怡梦³、张晓杰³、王玉坚¹、郝文瀚¹、郑飞¹、尹平¹、洪楠¹、王仁贵^{2,3}

1. 北京大学第二临床医学院 (北京大学人民医院)

2. 北京大学第九临床医学院

3. 首都医科大学附属北京世纪坛医院

目的：探讨联合应用 CT 淋巴管成像 (CTL) 与 99Tcm-DX 淋巴显像在原发性乳糜尿诊断中的应用价值。

方法：回顾性分析经临床确诊的原发性乳糜尿的 50 例患者的临床及影像学资料，所有患者均行 CTL 及 99Tcm-DX 淋巴显像两种检查。根据 99Tcm-DX 淋巴显像中胸导管显影的差异将原发性乳

糜尿分为三型：I 型：胸导管未显影型，II 型：胸导管一过性显影型，III 型：胸导管异常浓聚型，并分别记录每组的 CTL 影像学表现，CTL 影像学指标包括：会阴、腹股沟、盆腔、直肠周、膀胱、髂窝、肾脏、肾窦、肾实质、肾周、肾上腺、腹膜后、腰干区域、肠系膜、肠周、肠壁、肠管内、肝周、胰周、脾周、胸膜外、肋间、纵隔、肺脏、胸导管末端对比剂的异常沉积。将各组 CTL 影像学指标进行统计学分析， $P < 0.05$ 为差异具有统计学意义。

结果：99Tcm-DX 淋巴显像示 20 例 (40.0%) 患者单肾或双肾早期显像，胸导管末端未显影 14 例 (28.0%)，一过性显影 14 例 (28.0%)，持续增宽显影 19 例 (38.0%)，胸导管双侧引流 3 例 (6.0%)；根据 99Tcm-DX 淋巴显像的胸导管显像特点对于 50 例原发性乳糜尿进行分型，其中 I 型 14 例，II 型 14 例，III 型 22 例，三组间在性别、年龄、发病年龄、病程及临床症状之间无统计学差异 ($P > 0.05$)；三组间直肠周对比剂异常分布的差异具有统计学意义 ($P = 0.005$)，且 I 型患者的发生率高于 II 型；肾脏、肠系膜对比剂异常分布的差异具有统计学意义 ($P < 0.05$)，且 III 型患者的发生率高于 II 型；三组间肺脏的对比剂异常分布的差异具有统计学差异 ($P = 0.048$)，且 III 型患者的发生率高于 I、II 型。

结论：99Tcm-DX 淋巴显像能够评价胸导管回流入血情况，而 CTL 能够显示肾脏及全身淋巴管异常的部位、程度，两者的表现具有一定的相关性，对于明确原发性乳糜尿的诊断、显示淋巴管异常的程度及范围、探讨胸导管回流与淋巴管异常的关系具有重要价值，为原发性乳糜尿的诊治提供影像依据。

PO-1895

基于临床及 CT 影像特征的诺模图预测克罗恩病活动性的价值研究

盛静¹、彭鹏²、张卫¹、赵雄英¹、韦玉婷¹、赵小笠¹、杨鹏¹、黄冬¹

1. 柳州市人民医院放射科

2. 广西医科大学第一附属医院放射科

目的和意义：探讨基于临床和 CT 特征的诺模图在预测克罗恩病 (Crohn's disease, CD) 活动性中的应用价值。**方法：**回顾性分析我院 171 例经临床、病理综合确诊为 CD 患者的临床和 CT 影像资料，包括年龄、性别、腹痛、腹泻、便血、C 反应蛋白 (CRP)、血沉 (ESR)、血小板计数 (PLT) 及 14 个肠壁、肠系膜、并发症的影像特征。所有患者按经 CD 活动指数 (Crohn's disease activity index, CDAI) 分为非活动组 (53 例) 和活动组 (118 例)，并分析其临床特征和 CT 特征。按 7: 3 的比例将总体队列随机分为训练集 (121 例) 和验证集 (50 例)。在训练集中，通过单因素及多因素 Logistic 回归分析，确定 CD 活动性相关的独立危险因素。引入 R 软件，构建预测 CD 活动性的诺模图，并进行 ROC 曲线分析。采用验证集对模型的效能进行验证。**结果：**血小板计数 (优势比 [OR]=1.01, 95% 置信区间 [CI] 1.01~1.02, $P < 0.001$)、肠壁最大厚度 (OR=42.45, 95%CI 1.61~117.94, $P=0.025$)、肠壁分层强化 (OR=5.47, 95%CI 1.55~19.24, $P=0.008$)、肠系膜脂肪组织增生 (OR=13.83, 95%CI 2.62~73.10, $P=0.002$) 是活动期 CD 的独立危险因素。诺模图的曲线下面积 (AUC) 为 0.93 (95% CI 0.89~0.97)，敏感性和特异性分别为 84.13% 和 94.73%，略优于单独临床模型 (AUC=0.90, 95% CI 0.84~0.96；敏感性=80.72%；特异性=86.84%) 及影像模型 (AUC=0.92, 95% CI 0.87~0.97；敏感性=83.33%；特异性=86.84%)。**结论：**基于临床和 CT 特征的诺模图在预测活动期克罗恩病有较大的应用价值，可为临床个体化评估 CD 患者病情提供一定的帮助。

PO-1896

CT 淋巴管成像 (CTL) 和非增强 MR 淋巴管成像 (MRL) 对于原发性乳糜尿的诊断价值初探郝琪^{1,2}、李兴鹏³、刘梦珂³、张怡梦³、张晓杰³、王玉坚¹、郝文瀚¹、郑飞¹、尹平¹、洪楠¹、王仁贵^{2,3}

1. 北京大学第二临床医学院 (北京大学人民医院)

2. 北京大学第九临床医学院

3. 首都医科大学附属北京世纪坛医院

目的 探讨联合应用 CT 淋巴管成像 (CTL) 和非增强 MR 淋巴管成像 (MRL) 在诊断原发性乳糜尿中的应用价值。

方法 回顾性收集确诊为原发性乳糜尿的 55 例患者的临床及影像学资料, 所有患者均行 CT 淋巴管成像 (CTL) 和非增强 MR 淋巴管成像 (MRL) 检查。将 CTL 与 MRL 各指标结果进行统计学分析, 统计指标包括: ①双髂、双侧腰干、双侧肾窦、胸导管、双侧支气管纵隔干、双侧颈干、双侧锁骨下干等淋巴管形态及扩张情况; ②泌尿系统及胸腹盆部淋巴管异常情况。采用配对 χ^2 检验的 McNemar 检验对 CTL 与 MRL 各指标进行对比分析, $P < 0.05$ 差异有统计学意义; 同时采用一致性 Kappa 检验评价 CTL 与 MRL 两种方法诊断原发性乳糜尿的一致性。

结果 CTL 及 MRL 对于显示双侧支气管纵隔干、右侧颈干、双侧锁骨下干、胸导管末端、右侧淋巴导管的异常扩张的差异具有统计学差异 ($P < 0.05$), 且 MRL 显示率高于 CTL; 两者对于显示左颈干、左髂、右髂、腹膜后、左侧腰干及右侧腰干异常扩张的差异无统计学意义 ($P > 0.05$); 两者对于显示双侧肾窦、盆腔、肠系膜、会阴、膀胱、胰周、肝周、胸膜外的淋巴扩张的差异具有统计学差异 ($P < 0.05$), 且 CTL 显示率高于 MRL; CTL 及 MRL 对于显示脾脏、骨骼淋巴管瘤的差异无统计学差异 ($P > 0.05$)。

结论 CTL 和 MRL 均能清晰显示原发性乳糜尿的腹部中央淋巴管的异常情况, 而 CTL 能进一步显示肾内、肾周淋巴管及远端异常扩张淋巴管分布, 明确与周围组织结构关系, MRL 能够进一步显示胸部淋巴干、胸导管末端及右淋巴导管异常扩张的部位及程度, 二者联合应用能够对于原发性乳糜尿的诊治具有重要价值。

PO-1897

光谱 CT 虚拟单能量成像在神经内分泌肿瘤肝转移检出中的优势: 与常规 CT 和普美显 MR 的对比研究

解添淞、周正荣

复旦大学附属肿瘤医院

目的: 探讨基于双层光谱探测器 (Dual-detector spectral-CT, DLCT) 衍生的虚拟单能量成像 (Virtual monoenergetic images, VMIs) 在检出肝转移性神经内分泌肿瘤中的价值, 并对 DLCT、常规 CT 和普美显增强 MR 的诊断效能进行头对头的对比分析。

方法: 回顾性纳入 2021 年 9 月至 2022 年 9 月间在复旦大学附属肿瘤医院就诊的神经内分泌肿瘤肝转移患者, 上述患者均在 3 周内行 DLCT 扫描和普美显 MR 增强扫描。首先对常规混合能量 CT 和各能量 VMIs 成像上肝转移瘤的信噪比 (Signal-to-noise ratio, SNR) 和对比噪声比 (Contrast-to-noise ratio, CNR) 进行对比分析; 进一步由 2 位放射科医师在盲法、独立阅片前提下基于常规混合能量 CT、常规 CT+VMIs 成像和普美显 MR 对肝脏病灶进行诊断, 比较上述三种影像方法对 NETLM 上的诊断价值。

结果: 在增强四期扫描中, 肝转移瘤在 40keV 能量 VMIs 成像中均表现出最高的 SNR 和 CNR 值, 并显著优于混合能量 CT (all $P < 0.01$)。在诊断效能对比中, 普美显 MR、常规 CT+VMIs、常规

混合能量 CT 的敏感度分别为 0.95、0.90、0.76 (McNemar test, $P < 0.05$), AUC 值分别为 0.97、0.90、0.85 (DeLong's test, $P < 0.05$), 三种影像方法间的诊断效能差异显著。进一步亚组分析发现, 上述影像方法的诊断差异集中在小于 10mm 的病灶中, 在大于等于 10mm 的病灶中上述影像手段的诊断效能接近。

结论: 基于 DLCT 衍生的 40keV 低能量 VMIs 成像可显著提高肝转移性神经内分泌肿瘤的客观成像效果。普美显 MR 是最敏感的影像方法, 而在常规 CT 基础上联合低能量 VMIs 成像可显著提高对小于 10mm 转移灶的诊断敏感度。

PO-1898

基于 CE-CT 的机器学习模型术前预测患者半肝切除术后的残肝再生

曹丹^{1,2}、王芳²、陈青青²、胡红杰²

1. 浙江大学医学院附属第四医院

2. 浙江大学医学院附属邵逸夫医院

目的: 残肝再生能力不足可能直接导致肝功能衰竭甚至死亡。本研究的目的是开发一种基于 CE-CT 的放射组学模型, 用于术前预测患者半肝切除术后的残肝再生能力。

材料与方法:

回顾性收集 2012 年 1 月至 2022 年 12 月期间来自三个中心的 213 名接受半肝切除术患者的临床资料及影像组学资料, 通过术前 CE-CT 门静脉期图像对未来残肝 (基于手术记录及术后图像) 进行了半自动分割测量未来残肝体积 (LVpre), 并从门静脉期的未来残肝中提取放射组学特征。术后残肝体积 (LVpost) 在随访的 CE-CT 上测量得到。再生指数 (RI) 按以下公式计算: $RI(\%) = (LVpost - LVpre) / LVpre \times 100 (\%)$ 。基于训练队列使用 XG Boos 建立机器学习模型, 并在内部验证队列及外部验证队列进行验证。单因素、多因素 logistic 回归分析确定预测 RI 的独立预测因子。使用受试者工作特征曲线 (ROC) 及曲线下面积 (AUC)、敏感性、特异性、准确度和 F1 分数来评估模型对术前预测残肝再生能力的诊断效能。所有检验均为双尾检验, $P < 0.05$ 为有统计学意义。

结果: 研究发现, 经单因素、多因素 logistic 回归分析后, 仅有影像组学评分为预测 RI 的独立预测因子。机器学习模型在训练队列、内部验证队列及外部验证队列中的诊断效能良好, AUC 分别为 0.88 (95%CI: 0.81-0.96)、0.80 (95%CI: 0.65-0.95) 及 0.85 (95%CI: 0.67-1.00) (图 1)。该模型在训练队列中的敏感性、特异性、准确度和 F1 分数分别为 0.79、0.88、0.85 和 0.79; 在内部验证队列中的敏感性、特异性、准确度和 F1 分数分别为 0.63、0.86、0.79 和 0.65; 外部验证队列中分别为 0.82、0.83、0.83 和 0.72 (图 2)。对影像组学评分和残肝再生能力的进一步分析表明, 较高的影像组学评分与高再生相关 (图 3)。

结论: 基于 CE-CT 的机器学习模型在术前预测半肝切除术患者术后残肝再生能力方面具有良好的诊断效能, 并且较高的影像组学评分预示着残余肝脏较高的再生能力。

PO-1899

脾脏少见原发肿瘤的影像与病理对照分析

王婷
宁夏医科大学总医院

摘要：目的 分析 6 例不同组织类型的脾脏原发肿瘤的影像表现与病理特征，以提高对这些少见肿瘤的识别能力。方法 搜集 6 例经临床和病理证实的脾脏少见肿瘤，术前均行影像检查，其中炎性假瘤样滤泡树突样肉瘤(IPT-like FDCS)1 例、原发性血管瘤 1 例、原发性血管性结节样转化 (SANT) 2 例、囊腺瘤 2 例。结果 上述脾脏肿瘤表现多样化，炎性假瘤样滤泡树突样肉瘤老年女性发病，肿瘤呈多结节样，富含血管合并坏死，递增向心性强化，有假包膜，其原位杂交 EBER 弥漫阳性；原发性血管瘤青年男性发病，表现为低信号为主混杂信号灶，合并瘤内出血及大范围囊变、坏死，增强瘤内见粗大不规则动脉血管，无乙肝病史，早期即有转移，肝转移最常见；原发性血管性结节样转化 (SANT) 中年男性发病，属血管良性瘤样病变，病理上多个增生血管结节和纤维组织带交替排列是影像“轮辐”征的基础，多无症状，结合免疫组化可与血管瘤鉴别；脾脏囊腺瘤及其罕见，本组两例均女性发病，与囊肿类似，但囊壁不均匀可有强化，也可表现为多房样，本组两例均以腹痛发病，其一实验室检查指标 CA-199、D-D 二聚体升高，结合实验室检查与影像资料均未准确诊断，依靠病理确诊。结论 本组 6 例脾脏肿瘤临床均较少见，炎性假瘤样滤泡树突样肉瘤、血管瘤应与富血供血管瘤鉴别，后者 T2WI 明显高信号，不伴远处转移。原发性血管性结节样转化 T2WI 呈放射状低信号较具特征。脾脏单发囊性病灶合并症状或实验室指标异常时要考虑到囊腺瘤。通过影像与病理之间的对照分析，初步总结 6 例脾脏少见肿瘤的影像特征，以供大家在临床工作中鉴别参考。

PO-1900

基于增强 CT 的衰减系数预测局部晚期结直肠癌新辅助化疗联合贝伐珠单抗与信迪利单抗的治疗反应

卢婷
兰州大学第二医院

目的 评估基于增强三期 CT 值的衰减系数 (AI) 能否预测使用新辅助化疗联合贝伐珠单抗与信迪利单抗的局部晚期结直肠癌(LARC)患者的治疗反应。

方法 本研究共纳入兰州大学第二医院 2019 年 1 月至 2023 年 7 月的 71 例使用新辅助化疗联合贝伐珠单抗与信迪利单抗的局部晚期结直肠癌患者，计算动脉期-静脉期 AI ($avAI$)、静脉期-延迟期 AI ($vdAI$)，计算方法： $avAI = (\text{病灶动脉期 CT 值} / \text{病灶周围正常肠壁动脉期 CT 值} - \text{病灶静脉期 CT 值} / \text{病灶周围正常肠壁静脉期 CT 值}) / \text{动静脉期的时间间隔} \times 100$ ； $vdAI = (\text{病灶静脉期 CT 值} / \text{病灶周围正常肠壁静脉期 CT 值} - \text{病灶延迟期 CT 值} / \text{病灶周围正常肠壁延迟期 CT 值}) / \text{静脉期到延迟期的时间间隔}$ ，使用最大约登指数计算 $avAI$ 和 $vdAI$ 的截断值，行单变量与多变量分析评价 $avAI$ 和 $vdAI$ 的截断值与治疗反应的关系。

结果 2 名研究者得出的 $avAI$ 截断值分别为 0.638 与 0.492， $vdAI$ 截断值分别为 0.034 与 0.019。多变量分析结果显示 $avAI$ (比值比 = 6.512 / 5.892, 95%CI = 3.199-13.743 / 4.142-25.145, P 均 < 0.05) 和 $vdAI$ (比值比 = 0.037 / 0.081, 95%CI = 0.019-0.746 / 0.002-1.281, $P = 0.003 / 0.009$) 与治疗反应之间存在相关性，其中 $vdAI$ 与治疗反应分级的相关性由弱到强 ($p=0.001$)。

结论 基于增强三期 CT 值的 AI 能够作为一种非侵入性的方法预测使用新辅助化疗联合贝伐珠单抗与信迪利单抗治疗 LARC 患者的治疗反应。

PO-1901

运用 T1 mapping 定量成像技术探究宫颈癌复发的危险因素

刘洁、李淑健、曹勤琛、张勇、程敬亮
郑州大学第一附属医院

目的：本研究旨在通过 T1 mapping 定量成像技术来确定宫颈癌（CC）患者复发的危险因素。

方法：收集本院 2018 年 5 月至 2021 年 4 月经组织病理学确诊为 CC 的患者共 107 例，并分为手术组和非手术组。根据患者在治疗后 3 年内是否复发，进一步将每组患者分为复发和非复发亚组。计算肿瘤的纵向弛豫时间（native T1）和表观扩散系数（ADC）值。分析复发和非复发亚组的 native T1 和 ADC 值之间的差异，并为具有统计学差异的参数绘制受试者工作特性（ROC）曲线。采用 Logistic 回归分析影响 CC 复发的重要因素。无复发生存率通过 Kaplan-Meier 分析进行评估，并使用对数秩检验进行比较。

结果：手术组和非手术组分别有 13 例和 10 例患者在治疗后 3 年内出现复发。手术组和非手术组复发组和非复发组的 native T1 值存在显著差异（ $P < 0.05$ ）；但 ADC 值无差异（ $P > 0.05$ ）。用于区分 CC 手术和非手术治疗后复发的 native T1 值 ROC 曲线下面积分别为 0.742 和 0.780。Logistic 回归分析表明，native T1 值是手术组和非手术组肿瘤复发的危险因素（分别为 $P = 0.004$ 和 0.040 ）。与临界值相比，两组 native T1 值较高的患者无复发生存曲线与 native T1 值较低的患者有显著差异（分别为 $P = 0.000$ 和 0.016 ）。

结论：T1 mapping 定量成像技术可以帮助识别复发风险高的 CC 患者，补充除临床病理特征外的肿瘤预后信息，并为个体化治疗和随访方案提供理论依据。

PO-1902

运用定量和定性磁共振成像参数预测宫颈癌治疗后 2 年随访期内复发的初步研究

刘洁、李淑健、曹勤琛、张勇、程敬亮
郑州大学第一附属医院

目的：通过 native T1 mapping、常规 MRI 成像参数和临床病理学指标研究宫颈癌（CC）复发的预测因素。

方法：本前瞻性研究共纳入 144 例经组织病理学证实的 CC 患者（90 例接受手术治疗，54 例未接受手术治疗）。获得了 native T1 值、常规 MRI 成像参数和临床病理特征。使用单变量和多变量 Cox 比例风险回归分析评估定量和定性参数与治疗后的肿瘤复发的相关性。将独立的风险因素组合成预测复发风险的模型和个体预后指数方程。由受试者工作特性（ROC）曲线确定最佳截断值。

结果：90 名接受手术治疗的患者中有 12 名（13.3%）出现肿瘤复发。Native T1 值（X1）（危险比[HR]，1.008；95%置信区间[CI]，1.001–1.016）、最大肿瘤直径（X2）（HR，1.065；95%CI，1.020–1.113）和子宫旁浸润（X3）（HR：3.930；95%CI：1.013–15.251）是独立的肿瘤复发风险因素。建立的复发风险模型的个体预后指数（PI）为 $PI = 0.008X1 + 0.063X2 + 1.369X3$ 。Cox 回归模型的 ROC 曲线下面积（AUC）为 0.923。54 例非手术患者中有 20 例（37.0%）发生肿瘤复发。Native T1 值（X1）（HR，1.012；95%CI，1.007–1.016）和淋巴结转移（X2）（HR：4.064；95%CI：1.378–11.990）是独立的肿瘤复发风险因素。相应的 PI 计算如下： $PI = 0.011X1 + 1.402X2$ ；Cox 回归模型 AUC 为 0.921。

结论：Native T1 值结合常规 MRI 成像参数和临床病理变量可有助于 CC 复发的治疗前预测。

PO-1903

双能 CT 定量参数在预测胰十二指肠切除术后急性胰腺炎中的应用价值

白潇涵、尹杰、郁思翳、舒玉萍、史红媛、蒋奎荣、徐青
江苏省人民医院(南京医科大学第一附属医院)

目的: 探索术前双能 CT 定量参数预测胰十二指肠切除术后的急性胰腺炎的可行性和价值。

方法: 回顾性分析 2022 年 4 月至 2022 年 9 月行术前双能 CT 检查并接受胰十二指肠切除术的患者, 纳入患者 69 例。根据是否发生胰腺术后急性胰腺炎 (postpancreatectomy acute pancreatitis, PPAP), 分为 PPAP 组和无 PPAP 组。分别测量所有患者胰腺实质切缘的胰腺实质期、门脉期及延迟期碘浓度 (iodine concentration, ID), 延迟期的脂肪分数 (fat fraction, FF) 和同层面腹主动脉 ID, 根据公式计算细胞外容积分数 (extracellular volume fraction, ECV)。采用独立样本 t 检验, 比较两组间双能 CT 定量参数差异, 采用单因素及多因素 Logistic 回归, 确定 PPAP 发生的独立危险因素, 并进行 ROC 曲线分析评估其诊断效能。

结果: 纳入的 69 例患者中, 包括胰腺癌 39 例, 壶腹癌 10 例, 胰腺导管内乳头状黏液肿瘤 7 例, 胆管癌 4 例, 慢性胰腺炎 4 例, 胰腺神经内分泌肿瘤 3 例, 囊腺瘤 2 例, 共有 9 例患者发生 PPAP。PPAP 组胰腺实质的门脉期 ID、延迟期 ID、FF 及 ECV 均低于非 PPAP 组, 差异均具有统计学意义 ($p < 0.05$)。多因素 Logistic 回归结果显示, ECV 是 PPAP 发生的独立危险因素 ($p < 0.001$), 其 AUC 为 0.839, 敏感度为 100.0%, 特异度为 58.3%。

结论: 胰十二指肠切除术前双能 CT 定量参数对 PPAP 具有一定的预测价值, 胰腺实质 ECV 的降低可作为 PPAP 预测的有效影像学标志物。

PO-1904

早期 CT 定量参数变化预测胰腺神经内分泌瘤肝转移索凡替尼治疗效果及无进展生存期

谷小磊¹、张健维²、崔湧¹、陆明¹、孙应实¹
1. 北京大学肿瘤医院
2. 中国医学科学院肿瘤医院深圳医院

目的:

本研究旨在通过评估肝转移瘤的大小及密度相关参数在索凡替尼治疗前后的变化, 探索定量 CT 参数预测胰腺 NELMs (neuroendocrine liver metastases, NELMs) 患者预后的效能, 筛选出评价胰腺 NELMs 患者治疗效果和预测预后的最有效影像学指标。

方法:

回顾性连续收集多家医学中心 (Ⅲ期临床试验) 2012 年 1 月-2017 年 12 月胰腺 NELMs 患者共 95 例。分析 NELMs 大小及密度相关参数, 采用 Logistic 回归评估其与治疗效果的相关性; 采用 Cox 回归分析和 Kaplan-Meier 曲线评估其与无进展生存期 (progression-free survival, PFS) 的相关性, 计算风险比 (hazard ratio, HR) 及 95% 置信区间 (95% confidence interval, 95% CI)。

结果:

动脉期 CT 值变化率 (HR: 0.070; 95% CI: 0.009-0.536; $P=0.010$) 是 PFS 的独立风险因素, 以变化率中位数将患者分为两组, 变化率更高者比变化率低者 PFS 更长 (HR: 0.530, 95% CI:

0.270-1.030; $P=0.058$)。肿瘤生长速率 (OR: 0.005; 95% CI: <0.001-0.376; $P=0.017$) 是客观缓解率的独立预测因素。

结论:

动脉期CT值变化率是患者PFS的独立风险因素,变化率更高的患者比变化率低的患者PFS更长;肿瘤生长速率可用于患者的疗效评估。

PO-1905

基于增强 CT 图像的肾细胞癌病理 T3a 侵犯影像组学预测模型的建立与时间验证

袁恩雨¹、陈云天¹、姚晋¹、宋彬¹、印宏坤²、张慧玲²

1. 四川大学华西医院

2. 推想医疗科技股份有限公司

目的: 建立并时间验证基于增强 CT 图像的影像组学模型对肾细胞癌病理 T3a 侵犯的预测价值。

方法: 本研究回顾性收集了 2014.1-2023.5 因肾脏肿块在本中心行外科治疗的患者。拥有术前 3 个月内增强 CT 检查、术后病理证实为肾细胞癌且手术为一线治疗手段的初发患者的静脉期 CT 图像纳入后续研究, 其中 2014.1-2021.12 的患者图像用于建立和内部交叉验证模型, 2022.1-2023.5 的患者图像用于时间验证。所有静脉期图像预先重采样至统一像素大小。一位医师借助基于 U-net 的半自动分割算法独立勾画病灶 ROI, 由另外两位医师共同检查并修正其勾画结果。由算法自动将 ROI 向外扩张 5mm, 并分别提取肿瘤和瘤周影像组学特征。使用肿瘤特征、瘤周特征和两个混合特征, 筛选特征并分别建立预测模型。使用巢式交叉验证对模型进行内部验证, 包括 20 次 5 折交叉验证作为内循环以优化超参数和 200 次 5 折交叉验证作为外循环以验证模型性能。内部验证和时间验证时记录的参数包括 ROC 曲线下面积、平均查准率、敏感度、特异度、阳性预测值、阴性预测值、准确度、约登指数和 F1 指数。同时校准度曲线和决策曲线也分别用于评估模型的性能。校正后 alpha 取 0.0167。

结果: 共纳入 1003 例患者, 其中内部验证集 729 例, 时间验证集 274 例。内部验证中, 肿瘤模型和混合模型区分度无明显差异 (0.8362 ± 0.0017 vs. 0.8347 ± 0.0018), 而瘤周模型区分度显著低于前两者 (0.7994 ± 0.0020)。校准度曲线示肿瘤模型和混合模型保持好的校准度, 而瘤周模型校准度稍差于前两者。决策曲线示肿瘤模型和混合模型的净获益相近, 且高于瘤周模型。时间验证中, 肿瘤模型、瘤周模型和混合模型的区分度无明显差异 (0.8457 ± 0.0519 vs. 0.8486 ± 0.0510 vs. 0.8426 ± 0.0527)。校准度曲线和决策曲线也未显示出明显差异。特征分析显示, 球形度为肿瘤模型中最重要的特征, 与 T3a 侵犯负相关, 灰度不均匀性为瘤周模型中最重要的特征, 与 T3a 侵犯正相关。

结论: 基于增强 CT 图像的影像组学模型能准确的预测肾细胞癌病理 T3a 侵犯。

PO-1906

术前 R.E.N.A.L 评分联合光谱 CT 参数预测肾透明细胞癌的 WHO/ISUP 核分级

张宏瑜

兰州大学第二医院

目的: 本研究旨在探讨联合肾肿瘤评分系统和光谱 CT 参数评估肾透明细胞癌病理分级的可行性。

方法: 这项回顾性分析纳入了 99 名术前接受光谱 CT 扫描并最终病理证实为肾透明细胞癌的患者。受试者在病理学上被分为低级别组(WHO/ISUP I, n=30)和高级别组(WHO/ISUP II ~ IV, n=69)。我们收集了患者的常规 CT 特征、肾肿瘤计量学评分和光谱 CT 参数等信息, 绘制受试者工作特征(ROC)曲线并计算曲线下面积(AUC)、灵敏度、特异度, 以评价参数的诊断效能。

结果: 两组的肿瘤最大径、肿瘤坏死及 R.E.N.A.L 评分存在差异($P<0.05$), 而 PADUA 评分无统计学差异($P>0.05$)。在肾皮质期和实质期, 高级别肾透明细胞癌患者的 70keV 单能量 CT 值(CT_{70keV})、有效原子序数(Zeff)、碘浓度值(I)明显低于低级别肾透明细胞癌患者($P<0.05$)。两组患者的水浓度值(WC)在统计学上没有差异($P>0.05$)。ROC 曲线分析表明, 皮质期 I 的诊断效能优于其它参数($AUC=0.722$, $p<0.001$, 灵敏度=73.9%, 特异度=66.7%)。常规 CT 特征、R.E.N.A.L 评分和能谱参数的联合可提供最佳的诊断效能($AUC=0.809$, $p<0.001$, 灵敏度=78.3%, 特异度=73.3%)。

结论: 术前联合使用常规 CT 特征、R.E.N.A.L 评分和能谱 CT 参数, 可以更好地预测肾透明细胞癌的 WHO/ISUP 核分级, 有助于临床医生术前治疗决策的制定。

PO-1907

基于增强 CT 门静脉影像组学模型在门脉高压诊断中的应用

崔英珠、李明洋
吉林大学第一医院

目的: 本研究旨在探讨增强 CT 门静脉影像组学模型在门脉高压无创诊断中的价值。

方法: 回顾性收集 2013 年 6 月至 2022 年 12 月受肝静脉力梯度(HVPG)测量的门脉高压患者共 110 人, 排除临床资料不全的患者 69 人, 最终纳入 41 人为门脉高压组。同时纳入 47 名健康人以平衡组间比例。由两名医生对门静脉期门静脉进行逐层 ROI 勾画, 并从 Rise 软件提取门静脉影像组学特征, 采用 LASSO 回归对影像组学特征进行筛选并构建门脉高压影像组学分类模型。用受试者工作特征曲线下面积(AUC)评估诊断性能。

结果: 本研究共采用 SVM、LR 两种模型, 测试集中 AUC 值最高的模型为 SVM, 模型 SVM 的测试集的灵敏度为: 0.97, 特异度为: 0.92, 精确率为: 0.92, 召回率为: 0.86, F1 分数为: 0.92, 准确率为: 0.89。

结论: 本研究构建的门静脉影像组学模型在无创诊断门脉高压中具有一定的价值, 值得进一步探索和研究。

PO-1908

表观扩散系数直方图对 EPE 分级系统预测 前列腺癌包膜外侵犯的附加价值

徐鸿昊、刘百川、白旭、赵建、马元昊、宁雪怡、王海屹、叶慧义
中国人民解放军总医院第一医学中心

目的: 探讨磁共振表观扩散系数(ADC)直方图对美国国家癌症研究所前列腺癌包膜外侵犯分级系统(EPE 分级系统)预测前列腺癌包膜外侵犯(EPE)的诊断价值。

方法: 回顾性连续入组 2021 年至 2022 年期间于解放军总医院第一医学中心行根治性前列腺切除术, 并于术前行标准多参数磁共振扫描的 100 例前列腺癌患者, MRI 扫描于前列腺穿刺术后 3 个月以上或穿刺术前扫描。由 2 名放射科医师使用 EPE 分级系统对所有病例进行独立评估, 意见不一致时由高年资医师审核作为最终结果。1 名医师利用 FireVoxel 软件在 ADC 图上逐层手动勾画肿瘤感兴趣区(VOI), 进行直方图分析得到 ADC 平均值、第 1、5、10、25、50、75、90、95 和 99 百分位数 ADC 值(1%、5%、10%、25%、50%、75%、90%、95%和 99%ADC)。采用 Mann-

Whitney U 检验比较 EPE 阳性组和 EPE 阴性组间 ADC 直方图参数的差异,对差异有统计学意义的 ADC 直方图参数进一步纳入多因素 Logistic 回归分析,筛选预测 EPE 的独立危险因素并构建联合模型。以受试者工作特征曲线评估 ADC 直方图、EPE 分级系统和联合模型的预测效能,并计算曲线下面积 (AUC),采用 DeLong 检验比较 AUC 的差异。

结果:100 例患者年龄 50~82 (68.34±6.66) 岁,经术后病理证实 34 例患者 EPE 阳性 (34%)。ADC 直方图各参数两组间差异均具有统计学意义 ($P<0.05$)。多因素 Logistic 回归分析显示 99% ADC ($P<0.01$, 比值比为 0.99) 和 EPE 分级系统 ($P<0.01$, 比值比为 4.15) 是预测 EPE 的独立危险因素。99% ADC、EPE 分级系统及联合模型预测 EPE 的 AUC 分别为 0.76、0.81 和 0.86,99% ADC 和 EPE 分级系统的 AUC 值并无显著统计学差异 ($P=0.43$),联合模型 AUC 优于 99% ADC 和 EPE 分级的 AUC,且差异有统计学意义 ($P<0.05$)。

结论:ADC 直方图对 EPE 分级系统术前预测 EPE 展现出一定附加价值,99% ADC 联合 EPE 分级系统能显著提高 EPE 的诊断效能。

PO-1909

高分辨 T2WI 形态学参数预测直肠癌临床分期的价值

朱先锋、黄国权、张虎、汤凯、张晓金、张林杰、杨澜
芜湖市第二人民医院

目的:探讨高分辨 T2WI (HR-T2WI) 形态学参数预测直肠癌临床分期的价值。方法:回顾性分析 2019 年 3 月至 2022 年 10 月于我院行直肠 MRI 检查并行手术治疗,经组织病理学证实的 78 例直肠癌患者的临床资料,根据术后病理分为 I 期 (T1-2N0 M0)、II 期 (T3-4N0M0)+III 期 (任何 T、N1-2M0) 2 组。运用 HR-T2WI 测量肿瘤最大厚度 (MTT)、肿瘤长径 (MTL)、肿瘤下缘距肛门距离 (DTA)、肿瘤最大截面积 (MTA)、肿瘤体积 (GTV),并评判肿瘤是否累及肠管全周。采用 Spearman 检验分析各指标间的相关性;采用受试者工作特征 (ROC) 曲线分析各参数预测直肠癌临床分期的价值。结果:I 期、II+III 期患者 MTL、GTV、环周受累情况比较差异均有统计学意义 ($P<0.05$);AUC 值分别为 0.732、0.716、0.791 ($P<0.05$)。MTL 和 GTV 呈正相关 ($r=0.779$, $P<0.01$)。以 $MTL>3.65$ cm 联合环周受累诊断直肠癌临床分期的 AUC 值为 0.842;以 $GTV>17.96$ cm³ 联合环周受累诊断直肠癌临床分期的 AUC 值为 0.838。结论:HR-T2WI 参数 MTL、GTV、环周受累在鉴别 I 期、II+III 期直肠癌中价值较高,MTL 联合环周受累收益最高,可有效筛选出新辅助放化疗 (nCRT) 获益者。

PO-1910

双能 CT 定量参数及形态学特征对 IB-IIA 期宫颈癌淋巴结转移的预测价值

陆遥、张爱宁、曹雨薇、邓景、陈婷、吴飞云
南京医科大学第一附属医院 (江苏省人民医院)

目的:探讨双能 CT 定量参数及形态学特征对 IB-IIA 期宫颈癌淋巴结转移的预测价值。

方法:选择 2020 年 6 月—2023 年 6 月在南京医科大学第一附属医院术前行 DECT 检查、术后病理证实为 IB-IIA 期宫颈癌 (腺癌或鳞癌) 的患者 19 例,共纳入淋巴结 48 枚,根据病理诊断是否发生淋巴结转移分为转移组 5 例、淋巴结 10 枚,未转移组 14 例、淋巴结 38 枚。比较两组间 DECT 定量参数差异以及形态学特征差异,DECT 定量参数包括动脉期和静脉期各能量 (40keV、50keV、70keV、100keV、150keV)、能谱曲线斜率、虚拟平扫 (VNC)、净增强率 (CM)、碘浓度

(IC)、标准化碘浓度 (NIC)、脂肪分数、电子密度 (Rho)、有效原子序数 (Z) 和双能指数 (DEI)，形态学特征包括淋巴结的短径、长径、短长比、边缘是否光整、淋巴门结构是否存在，评估双能 CT 参数以及形态学特征对 IB-IIA 期宫颈癌淋巴结转移的预测效能。

结果：与未转移组相比，转移组具有更高的动脉期 NIC、静脉期 40keV、50keV、70keV (P 均 < 0.05) 和更低的静脉期能谱曲线斜率和脂肪分数 (P 均 < 0.05)。形态学特征中，相比于未转移组，转移组具有更短的短径、更长的长径，边缘不光整、淋巴门结构不存在的淋巴结占比也更多 (P 均 < 0.05)。DECT 中表现最好的单一指标是动脉期 NIC (AUC, 0.802; 灵敏度, 77.8%; 特异度, 76.0%)，而形态学参数的最佳指标为淋巴结短径 (AUC, 0.807; 灵敏度, 80%; 特异度, 89.5%)。联合模型的预测效能最高 (AUC, 0.849; 灵敏度, 77.8%; 特异度, 88.0%)。

结论：DECT 定量参数可以辅助预测 IB-IIA 期宫颈癌患者淋巴结转移，DECT 定量参数结合淋巴结形态学参数具有最高的预测效能。

PO-1911

基于深度学习的放射组学模型预测肝癌术后早期复发

张荣魁

吉林大学第一医院

目的：提出一种基于深度学习的影像组学方法，用多期相的 CT 图像预测肝细胞性肝癌的术后早期复发。方法和材料：这项回顾性研究纳入 2018-2022 年间 334 例经手术切除和病理证实肝细胞性肝癌患者。其中 65 例患者术后 1 年内出现早期复发，204 例患者无早期复发。由一位 3 年工作经验的放射科医师在 ITK-SNAP 上勾画肝细胞性肝癌在 CT 平扫期、动脉期和门静脉期的边框。本研究还纳入性别，年龄，肿瘤数量，肿瘤大小，门静脉侵犯，HBV，ALT，AST，AKP，中性淋巴比 NLR，肝硬化，BCLC 分期，AFP 水平等常规临床指标。我们将 334 名患者随机分为 10 组，使用 10 折交叉验证法分别训练和测试模型。本研究基于深度学习构建了包含放射学特征和临床数据在内的 4 种组合模型。通过比较 ROC 曲线下面积 (AUC 值) 评估放射组学模型，临床模型，以及组合模型 A, B, C, D 的预测性能。结果：使用和不使用迁移学习的放射学模型 AUC 值分别为 0.736 和 0.689，略低于基于 SVM 的临床模型 0.7088，基于随机森林的临床模型 0.7532。此外，基于深度学习的放射组学模型比基于低阶特征的放射组学模型预测效能更高，AUC 值为 0.834 和 0.775。组合模型 A, B, C, D 的预测准确性分别为 0.789, 0.815, 0.785, 0.835。结论：基于深度学习的放射学模型有助于术前预测肝细胞性肝癌的早期复发，结合放射组学特征和临床指标的组合模型比单独使用放射组学或临床模型预测效能更好。

PO-1912

使用延迟双源 CT 细胞外体积分数 评估肝纤维化分期及程度的应用价值

余传林、贺亚琼

湖南省人民医院放射科

目的：研究双源 CT 不同延迟期测量肝细胞外体积分数 (extracellular volume fraction, ECV) 的差异，探索评估肝纤维化较为可靠的延迟扫描时间点。

方法：前瞻性纳入 2021 年 1 月至 2021 年 12 月进行多期腹部双源 CT 扫描和肝活检的慢性肝病患者，多期双源 CT 包括 3min、5min 延迟期。测量所有患者延迟期肝实质碘浓度 (IC) 及主动脉碘浓度 (ICA) 并计算 ECV。使用 Spearman 相关分析评估肝纤维化分期与 ECV 之间的相关性；使用单因素方差分析及最小显著性差异法比较不同分期肝纤维化间 ECV 值的差异；使用受试者

工作特征 (receiver operating characteristic, ROC) 曲线评估 ECV 值鉴别不同程度肝纤维化的诊断效能, 并计算其截断值、敏感度、特异度以及 ROC 曲线下面积 (area under the curve, AUC)。结果: 本研究共评估了 90 名参与者, 其中 S1 期 10 例, S2 期 29 例, S3 期 25 例, S4 期 26 例。肝纤维化分期与 ECV3min ($r=0.519$, $P<0.001$)、ECV5min ($r=0.447$, $P<0.001$) 呈中等程度正相关, 不同肝纤维化分期的 ECV3min、ECV5min 总体差异有统计学意义 ($P<0.05$)。肝纤维化不同分期组间的 ECV3min 与 ECV5min 值均无统计学差异。在诊断显著性肝纤维化 (S2-4) 时, ECV3min (AUC=0.874) 诊断效能优于 ECV5min (AUC=0.790), 且差异有统计学意义 ($P<0.05$); 在诊断进展期肝纤维化 (S3-4) 及肝硬化 (S4) 时, 两者诊断效能无显著差异, AUC 值分别为 0.776vs0.711 和 0.754vs0.737。

结论: 使用双源 CT 延迟测定的 ECV 值与肝纤维化组织学阶段具有较好的相关性, 并且延迟 3min 采集所得 ECV 值可以区分不同程度肝纤维化。

PO-1913

Native T1 mapping 在胰腺导管腺癌诊断中的可行性研究

李开、陈海燕、唐利荣、石磊

中国科学院大学附属肿瘤医院 (浙江省肿瘤医院)

目的 通过扫描 Native T1 mapping 序列, 探讨 Native T1 mapping 在 PDAC 诊断中的价值。方法 收集 2021 年 7 月至 2023 年 1 月确诊 PDAC 患者 53 例, 将 PDAC 分为病变区和非病变区, 同时收集 31 例无胰腺相关疾病的患者作为对照组。所有患者扫描 DWI 和 T1 mapping 序列, 由 2 名医师在病变最大层面测量 Native T1 值和 ADC 值, 参考 T2WI、增强等轴位图像, 利用手绘法绘制 ROI, 避开主胰管、周围的血管、脂肪、病灶内坏死等成分, 取 2 位测量值之和平均值为最终值, 采用单因素方差分析或 Kruskal-Wallis H 检验比较各组参数值在 PDAC 病变区、非病变区和对照组间有无差异, 对有差异的参数, 则进一步进行 K 个独立样本非参数检验, 两两比较, 其中 $P<0.05$ 代表差异具有统计学意义; 采用 ROC 曲线评价单个参数以及多个参数联合鉴别 PDAC 和非胰腺癌 (非病变区和对照组) 之间的诊断效能, 计算各参数值 AUC、敏感度、特异度及临界值。

结果 Native T1 和 ADC 值在 PDAC 病变区、非病变区和对照组分布分别为 1594.27 (1537.25~1701.10) 和、 $1.23(1.11\sim1.37)\times10^{-3}\text{ mm}^2/\text{s}$ 、1076.68 (985.03~1202.03) 和 $1.14(1.06\sim1.24)\times10^{-3}\text{ mm}^2/\text{s}$ 、861.45 (825.55~912.68) 和 $1.08(0.96\sim1.19)\times10^{-3}\text{ mm}^2/\text{s}$, 两参数三组比较差异都有统计学意义 ($P<0.05$), 其中参数 Native T1 值两两比较差异有统计学意义 ($P<0.05$), ADC 值在病变区和对照组比较差异有统计学意义 ($P<0.05$), 病变区和非病变区以及非病变区和对照组比较差异无统计学差异 ($P>0.05$); ROC 曲线显示各参数值及联合 Native T1+ADC 鉴别 PDAC 和非胰腺癌的 AUC 分比为 0.954、0.651 和 0.954。结论 Native T1 mapping 有助于 PDAC 诊断, 可以有效鉴别 PDAC 病变区、非病变区和正常胰腺组织, 相比 ADC 值诊断效能更好, 两个参数联合诊断效能未见提高。

PO-1914

能谱 CT 在胰腺癌与肿块型慢性胰腺炎鉴别诊断中的应用价值

房昌星¹、乔英²

1. 山西医科大学

2. 山西医科大学第一医院

目的: 探讨能谱 CT 在胰腺癌与肿块型慢性胰腺炎鉴别诊断中的应用价值

材料与方法: 收集经病理证实及经随访证实的胰腺导管腺癌和肿块型慢性胰腺炎的患者, 其中, 胰腺导管腺癌 75 例, 肿块型慢性胰腺炎 34 例, 获取患者 CT 的动静脉 CT 图像, 结合能谱 CT 后

处理技术, 获取淋巴结常规动静脉期 CT 值、40Kev 单能量 CT 值、有效原子序数值、标准化碘浓度值及能谱曲线斜率, 同时获取定性指标: 是否有胰腺导管截断、动静脉是否受累、远端胰腺是否萎缩、胰胆管是否扩张, 导管与实质的比值是否 ≥ 0.34 等。采用 SPSS 18.0 统计分析软件。首先对定量资料进行正态性分布检验, 符合正态分布采用配对 T 检验, 否则采用 Wilcoxon 秩和检验; 对定性资料采用卡方检验或 Fishers 精确检验。将有意义的单因素纳入多因素 Logistic 向前逐步回归分析, 得出结论。 $P < 0.05$ 认为具有统计学意义。

结果: 在多因素分析中, 动脉期 40KeVCT 值、胰腺导管截断比较存在统计学差异, 可作为鉴别胰腺导管腺癌与慢性肿块型胰腺炎的独立预测因素。

结论: 能谱 CT 是近年来 CT 领域一种新型的成像方式, 能够实现“同时、同源、同向、同步”, 能谱 CT 实现定量和定性参数相结合有助于胰腺导管腺癌与肿块型慢性胰腺炎的鉴别, 为二者的治疗和预后具有一定的指导意义。

PO-1915

基于光谱 CT 的放射组学模型术前预测胃癌 Lauren 分型

房昌星、乔英
山西医科大学第一医院

目的: 探讨基于光谱 CT 动脉期 40KeV、静脉期 40Kev 的放射组学模型对胃癌 Lauren 分型的预测价值。

方法: 对 168 例术前行光谱 CT 及术后病理证实的胃癌患者进行回顾性分析。根据病理结果, 患者分为肠型组和非肠型组。训练集 ($n=105$) 和测试集 ($n=63$) 按 7:3 的比例随机分配。两名放射科医生分析传统特征, 使用逻辑回归确定独立预测因子建立临床模型。利用 FAE 软件对动静脉图像进行放射组学特征提取。采用 ICC 和 MRMR 算法进行降维, 使用 logistic 回归构建放射组学模型。采用 ROC 和 DCA 对模型性能进行评价。

结果: 临床因素中, 最大肿瘤厚度是 Lauren 分型的独立预测因子, 并用于建立临床模型。分别建立临床、放射组学、临床+放射组学模型。在训练集中, 各放射组学模型的预测效果均优于临床模型, 其中临床+放射组学模型的预测效果最好 (AUC: 0.934)。在测试集中, 临床+放射组学模型的预测性能也优于临床模型 (AUC: 0.908)。

结论: 基于基于光谱 CT 动脉期 40KeV、静脉期 40Kev 的临床+放射组学模型对胃癌 Lauren 分型的预测价值。

PO-1916

定量形态学特征鉴别小肾透明细胞癌与肾乏脂肪血管平滑肌脂肪瘤的价值

王旭
浙江省肿瘤医院

目的: 探讨定量形态学特征在鉴别小肾透明细胞癌 (ccRCC) 与肾乏脂肪血管平滑肌脂肪瘤 (fpAML) 中的价值。

方法: 回顾性收集 2017 年 1 月至 2020 年 12 月经病理证实的直径 ≤ 4 cm 的 ccRCC (52 例) 与 fpAML (23 例) 的 CT 扫描图像, 测量肿瘤的定量形态学参数, 包括肿瘤长短径、肿瘤周长、瘤肾

界面长度、肾内肿瘤皮质夹角及肾外肿瘤皮质夹角,并获得肿瘤纵横比、瘤肾界面比、肾内外肿瘤皮质夹角比、肿瘤周长直径比。对两种肿瘤间各定量形态学参数的差异进行统计分析,进一步通过多因素分析筛选关键特征构建逻辑回归(LR)预测模型,绘制 ROC 曲线并计算曲线下面积(AUC)评价诊断效能。

结果: 单因素分析显示, ccRCC 的肿瘤短径、肿瘤周长、瘤肾界面长度、瘤肾界面比、肿瘤周长长径比均高于 fpAML, 而肿瘤纵横比及肿瘤周长短径比低于 fpAML, 两组间的差异存在统计学意义 ($P<0.05$); 两组肿瘤的长径、肾内肿瘤皮质夹角、肾外肿瘤皮质夹角及肾内外肿瘤皮质夹角比值间均无统计学差异 ($P>0.05$)。多因素分析显示瘤肾界面长度、纵横比及性别为鉴别两种肿瘤的独立因素。基于这三个独立因素构建的 LR 预测模型的准确率为 80.0%, 敏感度为 86.5%, 特异度为 65.2%。ROC 曲线显示单一定量形态学特征的 AUC 为 0.65~0.77, 而 LR 模型的 AUC 达 0.90。Delong 检验显示 LR 预测模型的性能优于单一的定量形态学特征 ($P<0.05$)。

结论: 定量形态学参数可以量化 ccRCC 与 fpAML 的形态学特征, 在两种肿瘤的鉴别中具有较好的诊断价值及应用潜能。

PO-1917

基于体素内不相干运动成像的直肠癌脉管浸润预测模型构建

付宇
吉林大学第一医院

目的: 探索体素内不相干运动 (IVIM) 在直肠癌脉管浸润预测方面的应用

方法: 回顾性收集吉林大学第一医院 2019 年 1 月至 2020 年 1 月术前进行 IVIM 扫描 ($b=0, 25, 75, 125, 150, 175, 200, 400, 600, 800, 1000$ s/mm²) 的 83 名直肠癌患者, 脉管浸润阳性 (LVI+) : 脉管浸润阴性 (LVI-) = 51:32, 我们以 7: 3 的比例将患者分为训练集和验证集。感兴趣区 (ROI) 在 T2WI、DWI ($b=1000$ mm²/s) 图像上沿肿瘤边缘逐层勾画, 并测量 IVIM 定量参数 (ADC、D、D* 和 f 值)。利用多元逻辑回归构建基于 IVIM 定量参数模型; 另外, 基于 T2WI、IVIM 功能图 (包括 DWI、ADCmap、Dmap 和 fmap) 肿瘤区域, 构建影像组学模型, 最后在验证集中对模型效能进行验证。LVI+、LVI-组的变量差异使用 t 检验或 Mann-Whitney U 检验。统计学显著性设定为 $P<0.05$ 。在“rms”软件包上进行逻辑回归分析。通过 ROC 曲线下方的面积 (AUC 值) 评估模型的性能。

结果: LVI+、LVI-组间 ADC、D 和 D*值无显著差异 (P 分别为 0.086、0.108、0.750), LVI+病灶的 f 值显著高于 LVI-病灶 ($P=0.002$, $P<0.05$)。基于单变量逻辑回归, 建立了基于 f 值的预测模型, AUC (95%CI) 为 0.699 (0.580-0.818)。基于 T2WI、IVIM 功能图 (包括 DWI、ADCmap、Dmap 和 fmap) 肿瘤区域构建的影像组学模型, 验证集 AUC (95%CI) 为 0.894 (0.731, 1.000)。

结论: 研究结果表明, 基于 IVIM 功能图的影像组学模型在术前预测直肠癌脉管浸润方面具有较好的诊断效能, 并优于基于 IVIM 定量参数构建的模型效能, 有望为术前预测直肠癌脉管浸润提供有效工具, 辅助临床决策。

PO-1918

MSCT 多平面重组技术在腹股沟疝鉴别及嵌顿疝预测中的价值丁文博¹、陈颖²、李红³、施海华⁴

1. 苏州大学附属传染病医院放射科

2. 南京医科大学附属苏州医院放射科

3. 苏州大学附属第二医院放射科

4. 南京医科大学附属苏州医院胃肠外科

目的 分析多排螺旋 CT (MSCT) 多平面重组(MPR)技术在腹股沟疝鉴别及嵌顿疝预测中的价值。

方法 回顾性分析 2017 年 1 月至 2022 年 12 月经手术证实的 110 例腹股沟疝术前 MSCT 图像, 其中斜疝 49 例, 直疝 36 例, 股疝 25 例。观察冠状位及斜冠状位 MPR 图像中腹股沟韧带、腹壁下动脉、直疝三角、股三角的显示情况, 以及疝内容物、疝囊颈比、特殊征象等。结果 腹股沟韧带在冠状位 MPR 和斜冠状位 MPR 图像中完全显示分别为 24 例 (20.7%) 和 63 例 (54.3%), 部分显示分别为 43 例 (37.1%) 和 33 例 (28.4%), 不显示分别为 49 例 (42.2) 和 20 例 (17.2%), 斜冠状位 MPR 对腹股沟韧带的完全显示率优于冠状位 MPR, 两者差异存在统计学意义 ($P=0.00$)。三种类型疝内容物包括小肠、积液、肠系膜、脂肪等。其中, 股疝疝囊内出现积液的几率高于斜疝和直疝 ($P=0.00$), 斜疝疝囊内出现脂肪的几率低于直疝和股疝 ($P<0.05$)。侧新月征和直疝三角填塞征在直疝中的发生率高于斜疝和股疝 ($P=0.00$), 股三角填塞征在股疝中的发生率高于斜疝和直疝 ($P=0.00$)。7 个 (7/51, 13.7%) 斜疝疝囊发生嵌顿, 6 个 (6/39, 15.4%) 直疝疝囊发生嵌顿, 19 个 (19/26, 73.1%) 股疝疝囊发生嵌顿, 股疝嵌顿发生率高于斜疝和直疝 ($P<0.05$)。嵌顿性斜疝和直疝中, 疝囊出现积液的几率高于非嵌顿疝 ($P=0.00$)。嵌顿性和非嵌顿性斜疝的疝囊颈比分别为 3.9 ± 2.4 和 1.6 ± 0.5 , 两组差异存在统计学意义 ($P=0.02$), 当临界值为 2.3 时, 约登指数最大 (0.91), ROC 曲线下面积 (AUC) 为 0.97; 嵌顿性和非嵌顿性直疝的疝囊颈比分别为 4.6 ± 0.5 和 2.4 ± 0.9 , 当临界值为 3.9 时, 约登指数最大 (0.97), AUC 为 0.98; 嵌顿性和非嵌顿性股疝的疝囊颈比分别为 3.9 ± 1.4 和 2.6 ± 0.7 , 当临界值为 3.2 时, 约登指数最大 (0.59), AUC 为 0.84。结论 MSCT MPR 技术能很好显示腹股沟区解剖结构及判断腹股沟疝类型, 疝囊内积液、疝囊颈比有助于嵌顿疝的术前诊断。

PO-1919

影像学方法对孤立性肝细胞癌微血管侵袭的术前预测能力：一项系统回顾和荟萃分析董雪¹、苟骏久²、李璟琪²、李盈锋²、杨正汉¹

1. 首都医科大学附属北京友谊医院

2. 贵州医科大学

目的: 孤立性肝细胞癌为肝细胞癌的其中一种特殊亚型。微血管浸润 (MVI) 是肝细胞癌的一种侵袭性血管亚型, 与往往导致较差的预后。近年来, 许多医学成像领域的研究探究了对 MVI 术前无创预测, 包括放射组学与常规成像方法。本荟萃分析目的在于比较放射组学和非放射组学方法在孤立性肝细胞癌中 MVI 状态的术前预测中的价值。

方法: 检索了 PubMed、Embase、Web of Science 和 Cochrane 数据库, 时间截至 2023 年 4 月 7 日。使用随机效应模型计算合并的敏感性、特异性、阳性似然比和阴性似然比。生成总结受试者工作特性曲线和曲线下面积 (AUC), 以评估放射组学模型和非放射组学模型的诊断准确性。使用标准化的数据抽取表格收集每个出版物的信息。meta 回归分析和亚组分析用于解释异质性。

结果: 最终纳入 26 篇文献, 涉及 3539 名孤立性肝细胞癌患者, 其中 1430 例 MVI 阳性病例和 2109 例患者 MVI 阴性。对于放射组学模型, 合并敏感度、特异度、SROC 曲线下的 AUC 分别为

0.74[95%CI:0.59-0.84]、0.80[95%CI:0.74-0.85]、0.84 [95%CI:0.81 - 0.87]，非放射组学模型对应为 0.74[95%CI: 0.65, 0.81]、0.88[95%CI:0.82, 0.92]、0.88[95%CI:0.85, 0.91]，均具有中等诊断价值。通过 meta 回归和亚组分析显示，放射组学和非放射组学模型中肿瘤大小是敏感度异质性的显著影响因素，影像学检查方式和建模方法是特异度异质性的显著影响因素。

结论：基于放射组学或非放射组学的孤立性肝细胞癌 MVI 术前预测模型均具有中等诊断价值，放射组学模型表现出较高的敏感性，但特异度较差且具有异质性。未来的研究中设计前瞻性、大规模、多中心、更严格标准化的评估方案，从而更有力提示放射组学具有用于孤立性肝细胞癌 MVI 的预测潜力。

PO-1920

临床-CT 影像组学列线图术前预测结肠癌淋巴结转移应用研究

董明松、张虎、徐家军、朱先锋、过永、黄国权
华东师范大学附属芜湖医院（芜湖市第二人民医院）

摘要 目的 构建预测结肠癌（CC）淋巴结转移（LNM）的临床影像模型、影像组学模型和基于上述两者的联合模型，比较各模型诊断效能。方法 回顾性分析经手术病理证实的 328 例 CC 患者资料，其中 LNM 者 156 例，随机分为训练组（229 例）和验证组（99 例）。比较临床影像指标组间差异并构建诊断 LNM 的临床影像模型；肿瘤三维体积感兴趣区（VOI）用于影像组学特征提取，经降维、筛选后获得 8 个特征用于构建影像组学评分（rad-score）；构建临床影像指标和 rad-score 的联合模型。比较各模型诊断 LNM 的效能，并评估最优模型校准度和临床获益。结果 两组间临床影像指标：CEA、CA199、肿瘤长径、淋巴结短径有统计学差异（均 $P < 0.05$ ）。临床影像模型、影像组学模型、联合模型 AUC 分别为 0.721、0.814、0.854（训练组），0.744、0.732、0.808（验证组）。联合模型 AUC 最大，训练组和验证组均大于临床影像模型（均 $P < 0.05$ ）。联合模型显示出较高的校准度，DCA 阈值范围 0.09~0.91 有临床获益。结论 基于临床影像指标和 CT 影像组学构建的列线图诊断 CC 淋巴结转移价值较高。

PO-1921

基于对比增强 CT 的定量测量鉴别小透明细胞肾细胞癌和小良性肾脏肿瘤

罗诗维、刘军
中南大学湘雅二医院

目的：评估在对比增强 CT 上的定量测量在鉴别小（ ≤ 4 cm）透明细胞肾细胞癌（clear cell renal cell carcinoma, ccRCC）和小良性肾脏肿瘤[包括乏脂性血管平滑肌脂肪瘤（fat-poor angiomyolipoma, fpAML）和肾脏嗜酸细胞瘤（renal oncocytoma, RO）]的潜力。

方法：我们纳入 244 名经病理证实为 ccRCC（ $n=184$ ）和良性肾脏肿瘤（fpAML, $n=50$ ；RO, $n=10$ ）的病例，并随机分为训练队列（ $n=193$ ）和测试队列 1（ $n=51$ ），并从另一个医院纳入一个外部测试队列 2（ $n=50$ ）。我们通过对多期对比增强 CT（包括平扫期，UP；皮髓质期，CMP；实质期，NP；排泄期，EP）中肾脏病灶和肾脏皮质的密度进行测量与计算以获取定量测量参数。单变量和多变量逻辑回归分析用于评估这些参数和 ccRCC 之间的相关性。最后，构建的多变量模型将与放射科医生的诊断进行比较。

结果：在单变量逻辑回归分析中，UP 相关参数，尤其是 UPC-T（UP 时肾皮质密度减去肿瘤密度）在训练队列中取得了 0.766 的 AUC，在测试队列 1 中 AUC 为 0.901，在测试队列 2 中 AUC 为 0.805。异质性相关参数 SD（标准差）在训练队列、测试队列 1、测试队列 2 的 AUC 分别为 0.781，

0.834 和 0.875。在多变量逻辑回归分析中, 纳入 UPC-T, NPC-T (NP 肾皮质密度减去肿瘤密度), CMPT-UPT (CMP 肿瘤密度减去 UP 肿瘤密度) 和 SD 的模型 1 在训练队列、测试队列 1、测试队列 2 中的 AUC 分别为 0.866, 0.923 和 0.949。当与放射科医生进行比较时, 4 个多变量模型均显示出比 3 个放射科医生评估更高的准确度 (模型的准确度为 0.800-0.860, 放射科医生的准确度为 0.700-0.720) 和敏感度 (模型的准确度为 0.794-0.971, 放射科医生的准确度为 0.599-0.706)。结论: 在对比增强 CT 上的定量测量, 尤其是 UP 相关参数和异质性相关参数, 具有鉴别小 ccRCC 和小良性肾脏肿瘤 (包括 fpAML 和 RO) 的潜能。

PO-1922

吞服异物引起的各种并发症的临床及影像特征分析

程词

中山大学附属第五医院

目的: 本文分析了从口腔摄入的各种异物引起的罕见并发症的 17 例患者, 提高临床医师对此类疾病的认识, 减少漏诊和误诊。

方法: 回顾性收集 2013-2023 年因吞服异物所引起的严重并发症而就诊的患者, 总结这些患者出现的不同系统并发症的临床及影像表现。

结果: 共 17 例患者因异物相关并发症入院, 主要表现为消化系统的并发症, 其次还有循环系统以及呼吸系统的并发症。其中, 异物引起穿孔并临近组织急性感染或化脓者共 7 例, 异物引起慢性肉芽肿 3 例, 异物引起小肠坏死 2 例, 异物穿破颈内静脉并血栓形成者 1 例, 异物移行到肝脏引起慢性炎症团块者 1 例, 异物穿孔引起广泛皮下气肿 1 例, 异物穿孔引起肝脓肿者 1 例, 异物引起血肿形成者 1 例。在所有的异物类型中, 鱼骨占绝大多数, 有 13 例患者症状皆由鱼骨引起, 鸡骨 1 例, 枣核 1 例, 围棋 1 例, 木筷残端 1 例。所有患者都有患病部位的 CT 检查图像, 手术治疗患者 13 例, 内镜治疗患者 3 例, 保守治疗患者 1 例。

总结: 临床上不同异物引起的症状和表现千差万别, 针对一些不太常见的影像表现, 临床医生需要结合病史排除异物穿孔或梗阻引起并发症的可能, 这对于及时有效地治疗患者至关重要。

PO-1923

双层探测器光谱 CT 在鉴别原发肝癌与富血供肝转移瘤中的价值

黄冬冬

中山大学肿瘤防治中心

目的: 探讨双层探测器光谱 CT 在鉴别原发性肝癌与富血供肝转移瘤中的价值。

方法: 回顾性收集 2021 年 10 月至 2023 年 5 月经病理或临床确诊的 24 例富血供肝转移瘤患者及 32 例原发肝癌患者, 测量并分析动脉期和静脉期下 40keV-190keV (每间隔 10keV) 单能量 CT 值, 无水碘 (INW)、碘密度 (ID)、有效原子序数 (Zeff) 及电子密度 (ED), 并计算出以同层肝实质为对照的单能量相对 CT 值 (nCT1)、相对无水碘 (nINW1)、相对碘密度 (nID1)、相对有效原子序数 (nZeff1)、相对电子密度 (nED1) 和以同层腹主动脉为对照的单能量相对 CT 值 (nCT2)、相对碘密度 (nID2)、相对无水碘 (nINW2)、相对有效原子序数 (nZeff2)、相对电子密度 (nED2)。分析上述参数在富血供肝转移瘤和原发肝癌患者间的统计学差异。

结果: 动脉期中, 富血供肝转移瘤在 40keV、50keV、60keV 下的 nCT1 及 nINW1、nID1、nZeff1、nZeff2 均小于原发肝癌, 具有统计学差异; 静脉期中, 富血供肝转移瘤 nZeff2 小于原发肝癌, nED2 的富血供肝转移瘤大于原发肝癌, 具有统计学差异。其中, 动脉期中 40keV 下的 nCT1 及 nINW1、nID1 具有较大临床意义, 其他均具有中等程度临床意义。以富血供肝转移瘤为对照, 动

脉期下, nCT1 为 40keV、50keV、60keV 时在鉴别富血供肝转移和原发肝癌上呈较弱正相关关系, nNW1、nID1 呈中等正相关, nZeff1、nZeff2 呈较弱正相关; 静脉期下 nZeff2 呈较弱正相关, nED2 呈较弱负相关。对以上有意义值绘制受试者工作特征曲线 (ROC), 并计算曲线下面积 (AUC)。AUC 在动脉期下的 nID1 最大, 为 0.747, 以 3.115 为阈值鉴别原发与转移最佳, 敏感度和特异性分别为 62.5%、87.5%。

结论: 双层探测器光谱 CT 多项定量参数在鉴别富血供肝转移瘤和原发肝癌中具有显著作用。尤其是动脉期中, 40keV 下的 nCT1、nINW1 和 nID1 在鉴别两者上具有较大的临床意义, 可作为临床鉴别富血供肝转移瘤和原发肝癌的重要指标。

PO-1924

应用能谱 CT 细胞外体积分数评估卵巢癌 WT-1 状态的初步探索

李烨、宋庆玲、刘爱连
大连医科大学附属第一医院

目的 探索双能量 CT 测量胰腺细胞外体积分数(extracellular volume fraction, ECV)评估卵巢癌肾母细胞瘤基因-1 (Wilms tumor gene-1, WT-1)状态。

材料和方法 回顾性收集在大连医科大学附属第一医院经行单源双能 CT 能谱扫描并经病理证实的卵巢癌患者 93 例。其中 WT-1 阳性患者 70 例; WT-1 阴性患者 23 例。收集 CT 扫描前的血细胞比积 (HCT), 测量肿瘤实性成分增强延迟期的标准化碘浓度值 (D-NIC), 计算 ECV 值 ($ECV = (1 - HCT/100) * (D-NIC)$)。通过两独立样本 t 检验比较 WT-1 阳性与阴性患者 ECV 分数, 采用受试者工作特征(ROC)分析, 评价 ECV 预测卵巢癌 WT-1 表达的效能。

结果 卵巢癌 WT-1 阳性患者的患者 ECV (0.38 ± 0.23) 高于 WT-1 阴性 ECV (0.23 ± 1.55), $P=0.03$ 。ECV 预测卵巢癌 WT-1 表达阳性的曲线下面积 (area under the curve, AUC) 为 0.718 ($0.615, 0.806$), 敏感度、特异度分别为 61.43%、78.26%。

结论 卵巢癌 WT-1 阳性组的 ECV 值高于 WT-1 阴性组。ECV 对于预测卵巢癌 WT-1 表达具有一定的临床应用价值。

PO-1925

基于磁共振多 b 值 DWI 数据的生境成像与肝细胞癌 VETC 占比的相关性研究

李晨晖、谢金桓、陈千娟、龙莉玲
广西医科大学第一附属医院

目的: 利用生境成像从定量磁共振成像数据中识别出 HCC 病灶内不同的子区域, 并与通过组织病理切片评估的 VETC 区域的面积比例进行对照, 分析两者之间的相关性。

方法: 收集 2022 年 1 月 1 日至 2023 年 1 月 31 日期间 104 例 HCC 患者的 CD34 免疫组织化学染色的病理切片, 所有患者均在手术前行包含多 b 值 DWI 序列的常规 MR 腹部检查。DWI 数据通过软件后处理得到 ADC 图及 IVIM 的 D*图。利用生境成像分析在两个参数图上将整个肿瘤分割成四个子区域, 分别是低 ADC 值/低 D*值区 (Low_ADC/Low_D*, LL)、低 ADC 值/高 D*值区 (Low_ADC/Hight_D*, LH)、高 ADC 值/低 D*值区 (Hight_ADC/Low_D*, HL)、高 ADC 值/高 D*值区 (Hight_ADC/Hight_D*, HH), 然后计算各个子区域的体积百分比。在 CD34 免疫组织化学染色的病理切片上评估存在 VETC 结构的区域占整个肿瘤组织总面积的比例 (VETC 占比), 通过 VETC 占比将病例分为 VETC-、VETC+和 VETC++三个分组。使用单因素方差分析评估生境

成像衍生的各子区域的体积比在组织病理学定义的三个 VETC 分组之间的差异。使用 Spearman 相关性分析评估 VETC 占比与低 ADC 值/高 D*值 (LH) 子区域体积比之间的相关性。

结果: 104 例患者中, 48 例 (46.2%) 为 VETC-, 45 例 (43.3%) 为 VETC+, 11 例 (10.6%) 为 VETC++。只有低 ADC 值/高 D*值 (LH) 子区域体积比在 VETC-、VETC+和 VETC++三个组织病理学分组之间都有显著性差异 (所有 $p < 0.001$)。LH 子区域的体积比与 VETC 占比呈现出正向的强相关性 ($r=0.722$, $p < 0.001$)。

结论: 从 MRI 多 b 值 DWI 数据中分析得出的肿瘤生境与组织病理学染色呈现正相关, 它提供了一种无创评估 HCC 的 VETC 结构特征的影像学新方法。

PO-1926

DTI 定量参数预测宫颈鳞状细胞癌周围神经侵犯的可行性研究

安琪¹、孟醒²、田士峰¹、马长军¹、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连市妇女儿童医疗中心 (集团)

目的: 探讨磁共振扩散张量成像 (diffusion tensor imaging, DTI) 定量参数预测宫颈癌神经侵犯的可行性。 **方法:** 回顾性分析经手术病理证实的 44 例宫颈鳞状细胞癌患者资料, 其中神经侵犯 19 例, 无神经侵犯 25 例, 所有患者术前均行 1.5 T MR (Signa HDxt, GE Medical Systems, USA) 扫描, 包涵 DTI 序列扫描。由两位观察者分别测量两组病例实质区 DTI 的平均扩散系数 (DC avg)、各向异性分数 (FA)、各向同性 (Iso)、容积比各向异性分数 (VRA)、衰减指数 (Exat) 以及 T2 加权迹线 (T2-weighted trace, T2-WT) 值。使用组内相关系数 (intra-class correlation coefficients, ICC) 来检验两位观察者测量值的一致性。检验两组病例间各参数值的差异, 使用 ROC 评估有统计学差异参数的鉴别效能。 **结果:** 两位观察者测量各组数据的一致性很好 (ICC > 0.75)。神经侵犯 (peripheral nerve invasion, PNI) 阳性组的 DC avg 值、FA 值和 VRA 值小于 PNI 阴性组, 差异均有统计学意义 ($P < 0.05$)。两组间 Iso、Exat 和 T2-WT 值无统计学差异 ($P > 0.05$)。DC avg 值、FA 值和 VRA 值的曲线下面积 (area under curve, AUC) 分别为 0.688、0.687 和 0.699。 **结论:** DTI 可以更准确地反映水分子的扩散情况, 并有效预测宫颈鳞状细胞癌 PNI 的发生, 为患者后期治疗方案提供重要参考。

PO-1927

基于 APT 影像组学评估宫颈癌淋巴结转移

张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦 (中国) 投资有限公司

目的: 本研究旨在探讨 3D 酰胺质子转移加权 (APT_w) 影像组学模型在预测宫颈癌淋巴血管间隙浸润的诊断价值。

方法: 回顾性分析 2019 年 7 月至 2023 年 4 月经手术病理证实的 74 例宫颈癌患者的临床资料及术前 MRI 图像, 其中淋巴转移组患者 18 例; 非淋巴结转移组患者 56 例。对对照常规 MRI 平扫和增强图像, 在 3D APT_w 定量图像上进行特征提取。使用 uAI Research Portal 软件进行影像组学分析。通过最小冗余-最大相关性 (mRMR) 和最小绝对收缩和选择算子 (LASSO) 算法对提取的特征进行降维处理。使用随机森林模型 (Random forest, RF) 构建影像组学模型。

结果: 最终本研究纳入 8 个影像组学特征并用于构建模型。RF 模型显示, 训练集和测试集的 AUC 分别为 0.933 和 0.886。在测试集中, 灵敏度、特异性、准确度分别为 0.75、0.91 和 0.87。

结论: 基于 APT 影像组学能有效预测宫颈癌的淋巴结转移。这种无创性预测技术能为患者的术前诊断、个性化治疗方案制定、预后评估提供重要信息, 在未来的临床诊疗工作中具有广阔的应用前景。

PO-1928

基于 MRI 的肾上腺体积对肌、脂、骨成分改变的影响

安琪¹、张钦和¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的: 肾上腺体积 (AGV) 被认为是下丘脑-垂体-肾上腺 (HPA) 轴激活的标志物, 在机体代谢和健康中起到重要的调节作用。本研究旨在探讨 AGV 对于肌肉、脂肪和骨成分的影响, 以更好地理解 HPA 轴在身体组成调节中的作用机制。**方法:** 回顾性分析 2017 年 1 月至 2021 年 3 月于我院行 1.5T 或者 3.0T MRI 检查的住院患者的临床及影像资料。基于 MRI 图像对每位受试者的皮下脂肪组织 (SAT)、内脏脂肪组织 (VAT)、肝脏脂肪分数 (HFF)、胰腺脂肪分数 (PFF)、骨髓脂肪组织 (BMAT)、腹部肌肉 (AM) 和双侧平均 AGV 进行测量。采用独立样本 t 检验或 Mann-Whitney U 检验比较两组之间各参数值的差异。采用 Pearson 和 Spearman 相关性分析以及偏相关分析 (对身高、体重、BMI 以及年龄进行调整) 评估双侧平均 AGV 与肌肉、脂肪和骨成分之间的相关性。**结果:** 共纳入患者 238 例 (男 117 例, 女 121 例)。男性的 VAT 面积、AM 面积和双侧平均 AGV 显著高于女性, 而 SAT 面积则低于女性 ($P < 0.05$)。相关性分析结果显示, 在整体患者群中, 双侧平均 AGV 与身高、体重、BMI、VAT 面积、PFF 和 AM 面积均呈正相关; 在男性中, 双侧平均 AGV 与体重、BMI、VAT 面积和 PFF 均呈正相关, 而在女性中, 双侧平均 AGV 与体重、BMI、年龄、SAT 面积、VAT 面积、PFF 和 AM 面积均呈正相关 ($P < 0.05$)。经过校正身高、体重、BMI 和年龄后的偏相关分析结果显示, 在整体患者群和女性中, 双侧平均 AGV 与 VAT 面积和 PFF 呈正相关, 而在男性中, 双侧平均 AGV 只与 VAT 面积呈正相关 ($P < 0.05$)。**结论:** 本研究探讨了 AGV 与肌肉、脂肪和骨成分之间的关系, 并强调了 HPA 轴可能主要通过影响腹部 VAT 面积和 PFF 来对机体代谢和健康产生重要的调控作用, 此外, 性别、年龄和体型差异可能会对这种调控作用产生影响。这一发现对于理解 HPA 轴活动与代谢调控之间的关系提供了新的见解, 对未来的健康研究具有重要意义。

PO-1929

CT 影像-代谢组学对急性胰腺炎严重程度的预测价值

张钦和¹、安琪¹、项开来¹、王森²、姚宇²、刘爱连¹

1. 大连医科大学附属第一医院

2. 中科院成都信息技术股份有限公司

目的: 急性胰腺炎是一种临床上常见且严重的疾病, 其严重程度的早期准确评估对于有效治疗和改善患者预后至关重要。本研究旨在探讨 CT 影像-代谢组学的急性胰腺炎严重程度的预测价值。

方法: 回顾性分析自 2016 年 8 月至 2018 年 5 月在大连医科大学附属第一医院住院治疗的急性胰腺炎患者的临床、影像及实验室资料。根据改良的 Marshall 系统评分标准将急性胰腺炎分为轻症和中重症, 最终纳入轻症组 30 例, 中重症组 12 例。对所有患者血清进行非靶向代谢组学分析。使用联影 uAI Research Portal 科研平台对全胰腺进行手动分割, 得到感兴趣区体积 (VOI), 并进行标准化处理和影像组学特征的提取。按照 8:2 的比例将影像资料随机分为训练集与验证集。采用 t 检验 (t test) 和最小绝对值收敛和选择算子 (LASSO) 回归分析对提取的组学特征进行筛选, 采用随机森

林模型(random forest,RF)在训练组中进行建模对胰腺炎的严重程度进行鉴别。通过绘制受试者工作特征(ROC)曲线评价模型的诊断效能。

结果:本研究最终筛选出 7 个影像组特征和 15 个代谢组特征用于构建模型。模型在训练集的 AUC、灵敏度、特异度分别为 97.73%、81.82%和 100%;在验证集中的 AUC、灵敏度、特异度分别为 87.50%、100%和 87.50%。

结论:基于 CT 影像-代谢组学模型在急性胰腺炎严重程度方面具有良好的预测价值。本研究为临床医生提供了一种新的工具,有助于更准确地评估急性胰腺炎患者的病情严重程度,从而采取适当的治疗干预措施,提高患者的治疗效果和预后。

PO-1930

基于磁共振脂肪分数图的肝脏脂肪、胰腺脂肪和内脏脂肪与血清总胆汁酸的相关性研究

张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦(中国)医疗

目的:基于 MRI 脂肪分数图定量评估血清总胆汁酸(serum total bile acid, TBA)与胰腺脂肪分数(pancreatic fat fraction, PFF)、肝脏脂肪分数(hepatic fat fraction, HFF)和内脏脂肪组织(visceral adipose tissue, VAT)的相关性。

材料与方法:回顾性分析大连医科大学附属第一医院 2017 年 1 月至 2021 年 3 月行上腹部 1.5T 或 3.0T MRI 扫描的患者资料,扫描序列包括 IDEAL-IQ 或 mDixon Quant 序列。测量每个患者的 HFF、PFF 和 VAT 面积。对 TBA 与 HFF、PFF 以及 VAT 面积的相关性进行评估。参数呈正态分布采用皮尔逊相关系数;否则,采用 Spearman 相关系数。

结果:本研究共纳入 179 名受试者(男性 78 例,女性 101 例),平均年龄为 60 岁,平均 BMI 为 24.46 kg/m²。TBA 与 PFF、HFF 之间存在显著相关性(r 值分别为 0.220 和 0.181, P < 0.05)。TBA 与 VAT 面积无相关性(r = 0.130, P = 0.084)。结论:TBA 可能与 HFF 和 PFF 相关。早期干预胆汁酸代谢可能成为预防和治疗肝脏、胰腺脂肪浸润的新途径。本研究确定胆汁酸与 HFF 和 PFF 的关系,了解其潜在的作用机制,为肝脏脂肪浸润和胰腺脂肪浸润的诊断和治疗提供了新思路。

PO-1931

基于 MRI 评估肾上腺体积与 T2DM 的关系

安琪¹、张钦和¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦(中国)投资有限公司

目的:本研究旨在使用 MRI 评估肾上腺体积(AGV),并探讨其作为下丘脑-垂体-肾上腺(HPA)轴激活的标志物在 T2DM 中的潜在作用。方法:回顾性收集 2017 年 1 月至 2021 年 3 月大连医科大学附属第一医院住院患者的临床及影像信息。共纳入 238 例患者,其中 T2DM 患者 53 例,非 T2DM 患者 185 例。所有受试者均接受了腹部 1.5T 或 3.0T 的 MRI 扫描,扫描序列包括肝脏快速容积成像(LAVA)、非对称回波最小二乘估算法迭代水脂分离序列(IDEAL-IQ)或魔镜成像(mDixon Quant)序列,图像质量均满足测量要求。基于 MRI 图像对每位受试者的皮下脂肪组织(SAT)、内脏脂肪组织(VAT)和双侧平均 AGV 进行测量。采用类内相关系数(ICC)对观察者间和观察者内测量结果的一致性进行分析,采用独立样本 t 检验或 Mann-Whitney U 检验比较各参数值之间的差异。采用单因素和多因素 Logistic 回归模型分析 SAT 面积、VAT 面积、VAT/SAT

(V/S) 和双侧平均 AGV 与 T2DM 的关系。**结果:** 观察者间和观察者内的测量结果一致性良好 (ICC > 0.75)。T2DM 组的 VAT 面积、V/S 和双侧平均 AGV 均高于非 T2DM 组, 差异均具有统计学意义 ($P < 0.05$)。然而, 两组之间的 SAT 面积无显著性差异 ($P > 0.05$)。**logistic** 回归分析结果显示,在校正身高、体重、性别、V/S、VAT 面积后, 年龄和双侧平均 AGV 仍然与 T2DM 显著相关 (年龄: OR = 1.060, 95% CI = 1.029-1.093; AGV: OR = 2.516, 95% CI = 1.837-3.446)。**结论:** VAT 面积和双侧平均 AGV 增加均与 T2DM 的患病风险增加相关, 然而, 双侧平均 AGV 是 T2DM 的独立危险因素。这一发现提示了 AGV 作为 HPA 轴激活的标志物, 在 T2DM 中可能通过介导内脏脂肪的积累发挥潜在作用。本研究为深入理解 T2DM 的发病机制提供了新的见解, 并为相关疾病的预防和治疗提供了潜在的靶向策略。

PO-1932

基于肾上腺体积的影像组学模型对 2 型糖尿病诊断价值的研究

李军¹、张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦 (中国) 投资有限公司

目的: 2 型糖尿病 (T2DM) 是一种常见且目前不能彻底治愈的疾病, 早期诊断并准确评估对其治疗与改善预后至关重要。本研究旨在探讨基于肾上腺体积 (AGV) 的影像组学模型对 T2DM 的诊断价值。**方法:** 回顾性分析自 2017 年 1 月至 2021 年 3 月在大连医科大学附属第一医院住院治疗的 T2DM 患者的临床及 MRI 资料。利用 ITK-SNAP 软件对患者双侧肾上腺进行感兴趣区 (ROI) 的勾画, 使 ROI 的范围尽量覆盖整个肾上腺。使用联影 uAI Research Portal 平台进行标准化处理和影像组学特征的提取。使用 K 最佳选择法 (select K Best) 和最小绝对值收敛和选择算子 (LASSO) 回归对提取的组学特征进行筛选, 采用 Bagging 决策树构建 T2DM 的影像组学诊断模型。通过绘制患者工作特征 (ROC) 曲线评价模型的诊断效能。**结果:** 本研究共提取 1184 个影像组学特征, 最终筛选出 4 个特征用于构建模型。Bagging 决策树在训练集的 AUC、灵敏度、特异度分别为 0.93 (0.904-0.957)、88.60% 和 80.60%; 在验证集中的 AUC、灵敏度、特异度分别为 0.865 (0.775-0.956)、83.30% 和 77.90%。**结论:** 基于 AGV 的影像组学模型对 T2DM 具有良好的诊断效能。本研究为临床医生提供了一种新的工具, 有助于早期诊断 T2DM, 从而采取适当的治疗干预措施, 极大改善患者的预后。

PO-1933

T1/T2 期直肠癌周围脂肪与皮下脂肪和内脏脂肪的影像组学差异性研究

张紫亭、安琪、张钦和、刘爱连

大连医科大学附属第一医院

目的: 本研究旨在探讨 T1/T2 期直肠癌周围脂肪组织与皮下脂肪组织 (SAT) 和内脏脂肪组织 (VAT) 的影像组学特征的差异, 以揭示直肠癌早期发展过程中肿瘤周围脂肪组织的变化情况。**方法:** 回顾性分析大连医科大学附属第一医院 2017 年 1 月至 2022 年 9 月期间经手术病理证实的 86 例 T1/T2 期直肠癌患者的临床及影像资料。使用 ITK-SNAP 软件手动勾画直肠癌肿瘤周围脂肪组织、SAT 和 VAT。使用联影 uAI Research Portal 科研平台对图像进行标准化处理和影像组学特征的提取。采用 K 最佳选择法 (select K Best) 和最小绝对值收敛和选择算子 (LASSO) 回归分析对提取的组学特征进行筛选。采用单因素方差分析或 Kruskal-Wallis H 秩和检验对筛选后的组学特征进行差异性分析。**结果:** 本研究共获得 2264 个影像特征参数, 通过特征降维及筛选最终保留 5 个特征

参数, 分别为 `laplaciansharpening_firstorder_10Percentile`、`recursivegaussian_firstorder_Median`、`wavelet_firstorder_wavelet-LLH-RootMeanSquaredv`、`wavelet_firstorder_wavelet-HLL-MeanAbsoluteDeviation` 以及 `wavelet_firstorder_wavelet-HLLH-RobustMeanAbsoluteDeviation`。单因素方差分析结果显示, 肿瘤周围脂肪组织与 SAT 和 VAT 之间的影像组学特征差异有统计学意义 ($P < 0.05$)。结论: 本研究发现 T1/T2 期直肠癌患者的肿瘤周围脂肪组织在影像组学上显示出与 SAT 和 VAT 不同的特征。这可能意味着早期直肠癌肿瘤周围的脂肪组织发生了潜在的白色脂肪褐变。这一发现对于了解直肠癌早期发展过程中脂肪组织的变化以及影响肿瘤生长的机制具有重要意义。未来进一步研究阻断脂肪组织褐变的治疗方法可能为早期直肠癌患者提供有效的治疗方案。

PO-1934

CT 腹部脂肪定量测量与腹主动脉钙化相关性的研究

陈若余

苏州大学附属第一医院

目的: 探讨腹主动脉钙化严重程度与腹部内脏脂肪的相关性。方法: 回顾性分析临床病史资料齐全并接受全腹及盆腔 CT 平扫的 166 例受试者。根据腹主动脉钙化 (AAC) 积分将受试者分为三组 (无钙化组、轻度钙化组、重度钙化组), 采用组内相关性检验 (ICC 检验) 和 Kappa 一致性检验分别评估 2 名影像医师对腹部脂肪测量和腹主动脉钙化分级的一致性, 采用独立样本 t 检验和多因素 Logistic 回归分析腹主动脉钙化积分与腹部脂肪的关系。结果: ①2 名影像医师对腹部脂肪测量 (ICC 均 > 0.833) 和腹主动脉钙化分级 ($\kappa = 0.86$) 具有较高一致性。②L3-4 椎体中间层面的内脏脂肪面积 (VFA) 对腹腔总体内脏脂肪体积 (VFV) 具有代表性 ($r = 0.838$, $P < 0.001$)。③重度钙化组 VFA 占比 (VFA%) 显著高于无钙化组 ($p < 0.01$)。④年龄 ($OR = 3.803$ $p < 0.01$)、VFA% ($OR = 1.728$ $p < 0.05$)、血脂异常 ($OR = 3.08$ $p < 0.05$) 是腹主动脉钙化的独立危险因素。结论: 腹主动脉钙化严重程度与腹部内脏脂肪显著相关。

PO-1935

动态定量增强磁共振成像对外周带前列腺癌的诊断价值

吴玉锦

苏州大学附属第一医院

目的 探讨磁共振动态增强扫描 (DCE-MRI) 定量分析在外周带前列腺癌的诊断价值, 并分析 DCE 定量参数在鉴别外周带前列腺癌与正常腺体的诊断效能。材料与方法 收集苏州大学附属第一医院临床高度怀疑前列腺癌且经穿刺或手术病理证实的外周带前列腺癌的 mp-MRI (T2WI, DWI, DCE) 资料和临床资料, 选取 23 例外周带癌 (共 42 个病灶), 并选取正常外周带腺体 39 例 (共 68 个区域), 分别获取前列腺癌组与正常腺体组 DCE-MRI 定量参数容积转运常数 (K_{trans})、速率常数 (K_{ep})、血管外细胞外间隙容积分数 (V_e) 数值, 进行组间比较, 并分析各参数对外周带前列腺癌的诊断效能。结果 外周带癌区与正常腺体组的 K_{trans} 、 K_{ep} 、 V_e 值分别为 (0.22 ± 0.18) VS (0.07 ± 0.05)、(1.15 ± 0.67) VS (0.57 ± 0.29)、(0.19 ± 0.06) VS (0.12 ± 0.06); 两组间行独立样本 t 检验, K_{trans} 、 K_{ep} 和 V_e 值之间差异均具有统计学意义 ($P < 0.01$)。 K_{trans} 、 K_{ep} 和 V_e 曲线下面积分别为 0.900、0.829、0.782; 若以 K_{trans} 值 0.100、 K_{ep} 值 0.697、 V_e 值 0.106 为界值诊断前列腺外周带癌, 敏感度和特异度分别为 85.71%、78.57%、95.24% 和 91.18%、85.29%、50.00%。结论 前列腺外周带癌区的 K_{trans} 、 K_{ep} 、 V_e 值均大于外周带正常腺体区, 对前列腺外

周带癌的诊断具有重要应用价值；且 Ktrans、Kep 和 Ve 参数对外周带癌的检出都具有较高诊断效能，在临床中具有重要的应用前景。

PO-1936

DWI 联合 mDixon-Quant 序列评估直肠癌 ki-67 表达的价值

谢宗源、刘爱连
大连医科大学附属第一医院

目的 探讨 DWI 联合 mDixon-Quant 在评估直肠癌细胞增殖抗原 Ki-67 表达的价值。方法 回顾性分析 20 例经临床病理证实的直肠癌患者的影像资料，对病理标本进行免疫组化 ki-67 染色，以各视野肿瘤阳性百分比的平均值作为表达指数分为高低表达两组，ki-67 高表达组 14 例，ki-67 低表达组 6 例。所有患者均于术前行 MRI 扫描，扫描序列包括常规 MRI、DWI 及 mDixon-Quant 序列。由两位观察者分别测量病灶 DWI 序列的 ADC 值及 mDixon-Quant 序列的脂肪分数 (FF) 值、表观弛豫率 ($R2^*$) 值及横向弛豫时间 ($T2^*$) 值。采用组内相关系数 (ICC) 评估两位观察者测量结果的一致性，采用独立样本 t 检验或 Mann-Whitney U 检验比较各参数值的差异，采用受试者工作特征 (ROC) 曲线评估有统计学意义的参数预测直肠癌 ki-67 表达的效能。通过二元 logistic 回归分析预测直肠癌 ki-67 高表达影像学定量参数的独立风险因素。采用 Delong 检验比较各曲线下面积 (AUC) 间的差异性。结果 两位观察者测量值的一致性良好 ($ICC > 0.75$)。ki-67 高表达组的 ADC 值 ($(0.76 \pm 0.10) \times 10^{-3} \text{mm}^2/\text{s}$) 低于 ki-67 低表达组的 ADC 值 ($(0.93 \pm 0.08) \times 10^{-3} \text{mm}^2/\text{s}$)，ki-67 高表达组的 $R2^*$ 值 ($22.92 \pm 1.38 \text{ Hz}$) 高于 ki-67 低表达组的 $R2^*$ 值 ($20.97 \pm 1.43 \text{ Hz}$)，且差异均具有统计学意义 ($P < 0.05$)；两组间 $T2^*$ 值、FF 值间的差异无统计学意义。多因素 logistic 回归分析，发现 ADC 值及 $R2^*$ 值为预测 ki-67 高表达的独立风险因素；ADC 值及 $R2^*$ 值及联合参数评估 ki-67 表达的 AUC 值分别为 0.863、0.869、0.881；联合参数的诊断效能均高于单一参数的诊断效能；各单一参数 AUC 间差异均具有统计学意义 ($P < 0.05$)。结论 DWI 和 mDixon-Quant 序列的多定量参数可以有效评估直肠癌 ki-67 的表达，并且二者联合可提高预测效能，具有很好的临床应用前景。

PO-1937

胆总管原发性神经内分泌癌一例

周永进、陈家骏
丽水市中心医院

【摘要】神经内分泌癌 (neuroendocrine carcinoma, NEC) 是一种罕见的恶性肿瘤，主要发生于胃肠道和肺，原发于肝外胆管的极其罕见。因其缺乏典型临床特点及影像学表现，术前极易误诊。本文报道 1 例女性患者，入院体检发现胆总管占位，以“运动障碍 1 年余，进行加重 1 月”收住入院。体检心肺及腹部检查未见明显阳性体征。入院辅助检查：肿瘤标志物：神经元特异性烯醇化酶 31.1 ng/ml，铁蛋白 216.1 ng/ml，余指标正常。血常规、肝肾功能正常。入院后腹部超声：胆总管内径 15mm，胰腺段管腔内见 22x14mm 等回声团。胰腺增强 CT 示：胆总管下段占位伴肝内外胆管、胰管扩张 (图 1)。上腹部 MR 增强示：胆总管下段占位伴肝内外胆管扩张，肿瘤可能大，建议 PET-CT 检查 (图 2-4)。ERCP 镜刷：“胆总管下段刷检”：见异型细胞，倾向腺癌。术后病理镜下所见：胆总管内见一菜花样肿物，大小 2.5cmx1.5cmx0.8cm，胆管腺上皮示导管内乳头状肿瘤伴高级别上皮内瘤变，局部粘膜固有层至肌层见高级别神经内分泌癌成分，其间夹杂少量中分化腺癌成分。最后病理诊断：“胆总管”高级别神经内分泌癌。

PO-1938

扩散峰度成像多定量参数预测肝细胞癌 TACE 术后早期疗效的价值

李佳奕¹、赵莹²、张倩瑜²、周丽萍¹、刘爱连²、任雪²、许岂豪²、宋清伟²

1. 大连医科大学医学影像学院

2. 大连医科大学附属第一医院放射科

目的

探讨弥散峰度成像 (DKI) 多定量参数预测肝细胞癌 (HCC) 经动脉化疗栓塞 (TACE) 术后早期疗效的价值。

材料与方法

回顾性收集进行上腹 MRI 检查 (包括 DKI 序列) 且采取 TACE 治疗的 53 例 HCC 患者 (治疗客观反应 (objective response, OR) 29 例, 治疗无反应 (non-response, NR) 24 例)。在 AW 4.6 工作站 (GE Healthcare) 使用 Functool 软件自动生成 DKI 定量参数图, 包括平均峰度 (MK)、轴向峰度 (Ka)、径向峰度 (Kr)、平均扩散系数 (MD)、轴向扩散系数 (Da)、径向扩散系数 (Dr)、峰度各向异性分数 (FAk) 及各向异性分数 (FA)。参照 T2W 和 DK 图像, 分别于肿瘤最大层面、瘤周区域 (1cm 内) 及远瘤周正常肝实质 (5cm 内) 各放置 3 个大小相等的类圆形感兴趣区域 (region of interest, ROI), 记录 MK、Ka、Kr、MD、Da、Dr、FAk 及 FA 值。使用 3 个 ROI 的平均值进行统计分析。使用 Kolmogorov-Smirnov 检验来评估各参数的正态性, 使用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异。使用 logistic 回归建立不同参数组合的预测模型。使用受试者操作特征 (receiver operating characteristic, ROC) 分析评估诊断性能。

结果

OR 组的 MK-肿瘤、Ka-肿瘤显著低于 NR 组, OR 组的 MD-肿瘤、Da-肿瘤及 Dr-肿瘤显著高于 NR 组, 差异均具有统计学意义 ($P < 0.05$)。余定量参数在两组间无统计学差异 ($P > 0.05$)。MK-肿瘤、Ka-肿瘤、MD-肿瘤、Da-肿瘤和 Dr-肿瘤预测客观反应的曲线下面积 (AUC) 分别为 0.716、0.691、0.739、0.727 和 0.707。当 MK-肿瘤、Ka-肿瘤、MD-肿瘤、Da-肿瘤和 Dr-肿瘤参数联合时, 预测性能有所提高 ($AUC = 0.803$)。

结论

DKI 序列的多定量参数对术前预测 HCC 患者 TACE 治疗的早期疗效具有一定价值。

PO-1939

CT 及 MRI 诊断肝内胆管导管内乳头状瘤一例

陆静瑜

苏州大学附属第一医院

一名 45 岁女性患者一月前体检时发现肝占位性病变。无恶心呕吐、无呕血黑便, 否认乙肝病史。体格检查无明显异常, 肿瘤指标及余检验学检查未见明显异常。行 CT 检查发现肝脏内囊实性病变, 大小约 44*41mm, 边界清晰, 实性部分 CT 值平均值 57HU。MRI 增强检查示病灶囊性部分呈 T1 低 T2 高信号, 实性部分呈 T1 等 T2 稍高信号, DWI 可见弥散受限, 增强实性部分呈渐进性强化。

结果: 手术发现肝右叶表面见一微隆起肿块, 直径约 4.0cm, 紧贴胆囊, 胆囊表面未见异常, 腹腔内未见转移灶。腹腔内无腹水, 肝脏无明显肝硬化表现, 大小尚正常, 表面无弥漫性结节。病理检查示诊断为胆管导管内嗜酸性乳头状肿瘤。

讨论: 本例患者为中年女性, 体检偶然发现肝脏占位, 肿瘤标记物无异常。肝脏病灶为边界清晰的囊实性病变, 囊内无明显分隔, 见乳头状结节, 实性部分弥散受限。值得注意的是, 病灶边缘有多

发扩张的肝内胆管,呈小囊状突起,与大囊相通,需考虑肝内胆管来源肿瘤。胆管导管内乳头状肿瘤(*intraductal papillary neoplasm of bile duct*, IPNB) 是一种以胆管黏膜上皮细胞呈乳头状增生为特点的具有高度恶性潜能的罕见肿瘤,可同时累及肝内外胆管系统。根据内衬细胞形态及分泌黏液量的不同将 IPNB 分为嗜酸细胞型、胃型、肠型及胰胆管型 4 种病理类型。本病主要需要与肝内胆管囊腺瘤及囊腺癌鉴别。肝内胆管囊腺瘤表现为单发或多发内部有分隔的多房囊性病变,境界清晰,壁及分隔可见强化。肝内胆管囊腺癌病灶一般较大,表现为多房囊性病变,边界欠清,增强扫描显示间隔和附壁结节有强化。这两类病变鉴别的要点为病灶是否与胆管相通,肝内 IPNB 表现为肝内扩张的胆管内伴有或不伴有乳头状实性结节,而肝内胆管囊性瘤或囊腺癌的囊性部分通常并不与胆管相通。

PO-1940

提高成人 Currarino 综合征检出率及影像诊断的准确性

季丹、张志国、茅旭平
张家港市中医医院

目的:提高成人 Currarino 综合征(Currarino syndrome, CS)检出率,提高 CS 影像诊断的准确性,为临床手术方式的选择提供依据,以期减少术后并发症。

材料与方法:回顾性分析 9 例我院诊断为 CS 的成年患者影像资料,观察并分析各影像检查方法在诊断 CS 中的优劣,包括骺骨发育不良程度、骺前肿块、肿块与骺管之间关系的诊断效能。

结果:1.9 例成人患者均有骺前肿块及不同程度的骺骨发育不良,但均未被早期诊断。2.超声可以清晰显示骺前肿块,但是很难显示骺骨情况及骺前肿块与骺管的关系。3.计算机断层扫描(Computed Tomography, CT)联合三维重建显示骺骨发育不良最佳,磁共振成像(Magnetic resonance imaging, MRI)显示骺前肿块与骺管的关系最佳, MRI 平扫与 MRI 增强扫描诊断效能相同。

结论:1.由于临床症状隐匿,成人 CS 的发病率可能被低估。2.超声发现骺前肿块的患者,先行骨盆 X 线摄片,如若有骺骨发育不全,则进行 MR 检查。3.CT 发现骺前肿块,骨窗观察是否有骺骨发育不全,如若有,则进行 MR 检查。4.CS 诊断最优检查方法为 CT 三维重建联合 MR 平扫。

PO-1941

预测孤立性肝细胞癌患者肝切除术后超早期复发的诺模图

于岩岩、周洋、王欣欣、陶雨晴、杨蕊、丁志鹏
哈尔滨医科大学附属第三医院

目的:本研究旨在确定早期孤立性肝细胞癌患者超早期复发的独立危险因素,并构建预测超早期复发的个体预测诺模图。

材料与方法:本研究纳入 2015 年 01 月至 2021 年 05 月在我院经病理诊断为孤立性肝细胞癌并行根治性肝切除术的患者。根据患者 6 个月复发状态分为非超早期复发组和超早期复发组。采用单因素和多因素 Cox 回归分析用于构建诺模图,并通过 Bootstrap 重抽样法对诺模图的性能进行内部验证。

结果:332 例早期孤立性肝细胞癌患者中超早期复发组为 39 例(11.7%)。肿瘤形态、年龄 >46 岁、AFP $>332.4\text{ng/ml}$ 、GGT $>51.2\text{U/L}$ 、ALP $>126\text{U/L}$ 、PT $>12.8\text{s}$ 和卫星结节是影响早期孤立性肝细胞癌患者超早期复发的独立预后因素,并被纳入预测超早期复发诺模图的最终模型。诺模图和 Bootstrap 重抽样法得出的 C-index 分别为 0.842 和 0.815。校准图显示诺模图的预测概率与超早期复发的实际观察结果一致,决策曲线分析(DCA)结果显示诺模图的临床应用价值良好。此外,

AFP>332.4ng/ml、AST>35 U/L、GGT>51.2U/L、ALP>126U/L、肿瘤形态、肿瘤大小、卫星结节及瘤内出血是影响早期孤立性肝细胞癌患者的总生存期的危险因素。

结论：我们的研究结果构建了一种预测早期孤立性肝细胞癌患者术后超早期复发状态的诺模图，这在一定程度上有助于为临床决策者提供有价值的辅助决策信息，指导临床决策者选择最合适的治疗方案。

PO-1942

腰椎 X 线影像组学联合机器学习方法预测中晚期慢性肾病患者腹主动脉钙化及其预后

刘静¹、伍志发¹、李新春¹、张水兴²

1. 广州医科大学附属第一医院

2. 暨南大学附属第一医院（广州华侨医院）

目的：探讨基于腰椎 X 线的影像组学及临床特征构建机器学习模型评估中晚期慢性肾病（CKD）患者腹主动脉钙化（AAC）程度并预测其预后的可行性。方法：回顾性分析经临床确诊的 440 名 3-5 期 CKD 患者的临床及影像资料。所有患者首次就诊接受标准腰椎侧位 X 线检查，根据腹主动脉钙化评分（AACS）将 CKD 患者进一步分为无至轻度钙化组和中至重度钙化组。本研究使用基于 Python 语言的 PyRadiomics 库从 ROI（腹主动脉区域）中提取了总共 833 个影像组学特征。采用监督最小绝对收缩和选择算子回归进行特征筛选和降维，并使用五折交叉验证法划分数据集。根据选定的影像组学特征（RS）、临床特征及联合特征标签分别构建了基于逻辑回归的机器学习模型，使用受试者操作特征曲线和决策曲线分析评估各个模型的性能。各模型诊断 AAC 的曲线下面积（AUC）比较采用 DeLong 检验。多变量 Cox 风险回归分析和 Kaplan-Meier 生存曲线用于评估 RS 和临床特征对中晚期 CKD 患者全因死亡的预测能力。结果：研究结果显示无至轻度钙化组为 265 例，中至重度钙化组为 175 例。共筛选出 41 个影像组学特征用于构建模型。在训练集中，RS 模型和临床特征模型均显示出良好的校准和区分能力（AUC：0.86，0.83）；在验证集中，性能均略有降低（AUC：0.76，0.78），DeLong 检验显示两者均无统计学差异（ $p=0.233$ ， 0.486 ）。联合特征模型在训练集和验证集中分别显示出优越和良好的诊断性能（AUC：0.93，0.83），DeLong 检验显示其与 RS 模型和临床特征模型均具有显著统计学差异（训练集： p 值均 <0.001 ；验证集： $p<0.001$ ， 0.010 ）。在中位 52 个月随访中，RS 评分是中晚期 CKD 病人全因死亡的独立相关因素（风险比：1.543； $p<0.001$ ）。Kaplan-Meier 生存曲线显示，较低的 RS 与全因死亡风险增加显著相关（RR：0.425， $p=0.001$ ）。结论：基于腰椎 X 线侧位片的影像组学特征（RS）和临床特征构建的联合诊断模型可能有助于预测不同程度腹主动脉钙化和具有不良预后风险的中晚期 CKD 患者。

PO-1943

基于深度学习技术与压缩感知的三维各向同性高分辨率的膀胱 T2WI 磁共振成像的可行性探究

徐慧、姚晋、宋彬

四川大学华西医院

目的：探讨深度学习算法（DLA）在膀胱癌三维 t2 加权成像（T2WI）中的临床应用价值。

方法与材料：67 例膀胱癌患者（肌层浸润性膀胱癌/非肌层浸润性膀胱癌= 12/42）行 3.0T MR T2WI 扫描的高分辨率 3D T2WI（扫描时间 10 分钟），在分别使用（扫描时间 4 分 25 秒）和不使用 DLA（扫描时间 6 分 32 秒）。以病理结果作为诊断评价的金标准。采用 Wilcoxon 符号秩和检验比较 T2WI 图

像的图像质量评分, 采用独立样本 t 检验定量评估信噪比(SNR)和对比噪声比(CNR) ($p < 0.05$ 为差异有统计学意义)。

结果:在 DLA、压缩感知(compressed SENSE, CS)的辅助下, 压缩 32.5%的扫描时间, 3D T2WI 组诊断效能的 AUC 分别为 0.895、0.888。两组图像 SNR、CNR 差异均无统计学意义。此外,3DT2WI CS=15 x 配合 DLA 的图像膀胱壁连续性有更高的评分(3.72 vs 4.18, $p < 0.01$)、伪影等级评分(3.5 对比 4.06, $p < 0.05$)和总体图像质量(3.11 对比 3.46, $p < 0.05$); 与 3D-T2WI (CS = 10)比较, 差异有统计学意义($p < 0.01$)。

结论:基于压缩感知的 DLA 重建技术在膀胱癌三维 T3WI 成像中, 可有效缩短扫描时间, 满足诊断要求, 提高图像质量, 减少伪影。

PO-1944

多参数 MR 为基础的预测模型术前评估胃肠间质瘤的危险度分级

杜娟、杨林沙、郑涛、衣慧灵、刘兰祥、刘兴家
秦皇岛市第一医院

目的: 探讨基于多参数、多层面磁共振图像经随机森林算法筛选的影像组学特征评估胃肠间质瘤(gastrointestinal stromal tumor, GIST)的价值。方法: 本回顾性研究纳入了 121 例在秦皇岛市第一医院经病理证实的胃肠间质瘤患者, 将其随机分入训练集($n=83$)和测试集($n=38$)。每名患者提取 500 个组学参数, 应用随机森林算法进行参数筛选。应用 ROC 曲线分析和 PR 曲线分析评估模型的区分能力; 应用校准曲线分析评估模型的拟合优度。对病理最大径 $\leq 5\text{cm}$ 的 GIST 进行亚组分析。结果: 临床模型(ModelC)对 GIST 预测能力有限。由 5 个特征构成的组学模型(ModelR)在训练集和测试集中均具有较好的区分能力, 其在训练集和测试集的 ROC 曲线下面积分别为 0.893 和 0.855; 训练集和验证集的 P-R 曲线 F1max 分别达到 0.741 和 0.842。肿瘤的二维最大径和位置未筛选到模型 ModelCR 中, ModelCR 与 ModelR 相同。与 ModelC 比较, 训练集和验证集 ModelR 的区分能力明显改善(训练集: $\text{NRI}=0.298$, $P=0.040$; 验证集 $\text{NRI}=0.349$, $P=0.015$)。亚组分析表明 ModelR 对于 $\leq 5\text{cm}$ 的 GIST 具有良好的预测能力, AUC 为 0.946。结论: 以多参数、多层面 MR 为基础建立的影像组学模型能够用于术前预测 GIST 危险度分级。

PO-1945

基于 QCT 身体组分参数和临床因素构建直肠癌根治术患者预后的列线图预测模型

孙铭洁、高飞
安徽省肿瘤医院

目的 探讨定量 CT (QCT) 身体组分参数评估直肠癌 (rectal cancer, RC) 根治术患者预后中的价值。方法 回顾性收集 2016 年 1 月至 2021 年 11 月经病理证实为直肠腺癌的患者共 94 例, 记录患者的性别、年龄、CEA、CA199、最大瘤径、肿瘤 TNM 分期、肿瘤病理分化程度等资料; 所有患者均在术前 10 天内接受 QCT 扫描。测量 L3 椎体水平骨骼肌横截面积、总脂肪面积、皮下脂肪面积、内脏脂肪面积, 并计算骨骼肌指数 (SMI)、总脂肪组织指数 (TATI)、皮下脂肪指数 (SATI)、内脏脂肪指数 (VATI)。通过绘制 ROC 曲线获得 TATI、SATI、VATI 预测 RC 患者术后预后情况的截断值, 通过 SMI 评估肌肉减少症。采用多因素 logistics 回归分析筛选影响 RC 预后的独立危险因素, 并构建列线图模型。用 ROC 曲线、校准曲线分析评估模型的预测效能并计算 ROC 曲线下面积 AUC。结果 ROC 曲线分析显示 TATI、SATI、VATI 的截断值分别为 $106.39 \text{ cm}^2/\text{m}^2$ 、 $47.33 \text{ cm}^2/\text{m}^2$ 、 $42.61 \text{ cm}^2/\text{m}^2$ 。肌肉减少症的总体发生率为 30.0%(28/94)。多因素分析结果显示, 肿瘤

N 分期、肌肉减少症和 VATI 是 RC 患者术后预后的独立危险因素($P<0.05$)。列线图模型的 AUC 为 0.844 (95%CI: 0.755~0.911)。校准曲线结果显示模型的预测概率与实际概率吻合较好。结论 肿瘤 N 分期、肌肉减少症和 VATI 与接受手术的 RC 患者的预后相关。本研究建立的列线图模型对评估可切除 RC 患者的预后有一定的价值。

PO-1946

Feasibility of accelerated 3D isotropic high-resolution T2-weighted bladder magnetic resonance imaging using the deep learning-constrained compressed sensitivity encoding technique (SENSE)

徐慧¹、宋彬²、姚晋²

1. 四川大学华西医院

2. 四川大学华西医院

Objectives: This study aimed to evaluate the clinical value of DLA reconstruction in 3D T2WI for BCA.

Methods : 54 patients with BCA (MIBC/NMIBC=12/42) underwent T2WI at 3.0T MR high-resolution 3D T2WI with and without the DLA .Compare with the patnological results, the Wilcoxon signed-rank test was performed to compare image quality score acquisition between T2WI images.

Results: The diagnose efficiency of AUCs of the two 3D T2WI groups, with the assistance of the DLA-CS, and the compressed 32.5% scan time, were 0.895 and 0.888, respectively. DLA T2WI had higher scores for bladder wall continuity (3.72vs.4.18), minimization of artifacts (3.52vs.4.06), and overall image quality (3.11vs.3.46) than 3D-T2WI($p<0.05$)

Conclusions: DLA reconstruction with the CS helped high-resolution 3D T3WI decrease the scan time, meet the diagnostic requirements, improve image quality in bladder cancer.

PO-1947

双能量 CT 的不同定量参数在直肠癌术前评估中的应用价值

李杭、袁艺、蒲红

四川省医学科学院·四川省人民医院

摘要：目的：探讨双能量 CT 的不同定量参数在直肠癌患者术前评估中的诊断价值。

方法：回顾性纳入 118 例直肠癌患者，术前均行双能量 CT 扫描。根据病理，分为无淋巴结转移组和有淋巴结转移组、癌结节组和无癌结节组、脉管神经侵犯组和无脉管神经侵犯组。比较不同分组在动静脉期的造影剂含量、碘浓度(iodine concentration, IC)、标准化碘浓度(normalized iodine concentration, nIC)、电子云密度(the electron density , Rho)、原子序数(effective atomic number, Z)、双能量指数(dual energy index, DEI)、能谱曲线斜率(K)的差异。绘制受试者工作特征(receiver operator characteristic, ROC)曲线，比较 ROC 曲线下面积(area under the ROC curve, AUC)，明确诊断效能。

结果：两名医师测得的双能量 CT 定量参数的组间一致性为 0.803-0.928。直肠癌患者术前无淋巴结转移组的静脉期 nIC 明显低于有淋巴结转移组($P < 0.001$)，nIC 预测淋巴结转移的 AUC 值为 0.771。直肠癌患者术前无癌结节组的静脉期 Rho 高于癌结节组($P = 0.037$)，静脉期 Rho 预测癌结节的诊断效能最高，其 AUC 为 0.635。直肠癌患者术前无脉管神经侵犯组的动脉期 Rho 高于脉管神经侵犯组($P = 0.025$)，动脉期 Rho 预测脉管神经侵犯的诊断效能最高，其 AUC 为 0.648。

结论：双能量 CT 的不同定量参数可用于评估直肠癌患者术前的淋巴结状态、癌结节和脉管神经侵犯情况，为直肠癌患者精准化治疗提供有效依据。

PO-1948

双层探测器光谱 CT 碘密度图影像组学对直肠癌区域淋巴结转移的诊断价值

刘波涛¹、乔英²

1. 山西医科大学

2. 山西医科大学第一医院

目的 探讨基于双层探测器光谱 CT 碘密度图的影像组学对直肠癌区域淋巴结转移的诊断价值。**方法** 回顾性收集 2020 年 5 月至 2023 年 6 月山西医科大学第一医院术前行腹盆部光谱 CT 增强扫描、经手术病理证实的 157 例直肠癌患者（158 枚非转移淋巴结和 109 枚转移淋巴结）的临床、病理及影像资料。经病理证实的 267 枚淋巴结按照 7 : 3 的比例被分为训练集（108 枚非转移淋巴结和 78 枚转移淋巴结）和验证集（50 枚非转移淋巴结和 31 枚转移淋巴结）。采用 ITK-SNAP 软件在光谱 CT 动静脉期碘密度图上手动勾画淋巴结的三维感兴趣容积，使用开源软件 FeAture Explorer (FAE) 软件于每枚淋巴结提取动脉期和静脉期各 1781 个组学特征。用最小绝对收缩和选择算子 (LASSO) 回归的方法进行组学特征选择和影像组学标签建立。利用 logistic 回归建立基于淋巴结 CT 图像特征（模型 1）、组学特征（模型 2）和两者联合（模型 3）的诊断模型。将模型 3 用列线图直观表示，采用 ROC 曲线及曲线下面积 (AUC) 评估 3 个模型诊断效能，并使用 Delong 检验比较 3 个模型的诊断效能。**结果** 模型 1 由淋巴结短径、强化程度、强化方式和结外侵犯 4 个特征构成。LASSO 回归共筛选出 9 个组学特征并建立了影像组学标签（模型 2）。模型 3 由淋巴结短径、强化程度、结外侵犯和影像组学标签构成。在训练集和验证集中，病理转移阳性与阴性淋巴结间淋巴结短径、强化程度、结外侵犯、影像组学分数差异均有统计学意义 (P 均 < 0.05)。模型 1、模型 2、模型 3 于训练集的 ROC 曲线下面积 (AUC) 分别为 0.80、0.89、0.92，于验证集的 AUC 分别为 0.78、0.85、0.89。在训练集和验证集，模型 3 均具有最优的诊断效能。**结论** 光谱 CT 碘密度图影像组学能有效诊断直肠癌淋巴结转移，联合常规 CT 图像特征可进一步提高诊断准确性。

PO-1949

肝异常灌注与原发性肝癌复发、转移之间的关系

位影、胡笑含、郭泽尚

吉林大学第一医院

目的：为了探究肝异常灌注与原发性肝癌复发、转移之间的关系。**方法**：回顾性分析 100 例经我院病理证实的原发性肝癌患者的资料，包括肿瘤类型及病理、特征性影像学征象及病情随访。其中有肝异常灌注患者 52 例，对照组患者 48 例。原发性肝细胞癌 82 例、原发性胆管细胞癌 18 例。**结果**：原发性肝恶性肿瘤合并肝异常灌注的患者较不合并肝异常灌注患者肿瘤更容易复发、转移。**结论**：合并肝异常灌注的原发性肝恶性肿瘤患者更容易发生复发和转移，应该引起我们的重视。

PO-1950

双层探测器光谱 CT 双期参数对术前预测胃癌分化与 E-cadherin 蛋白表达的价值

吴吟晨、余德君、曹代荣
福建医科大学附属第一医院

目的

探讨基于双层探测器光谱 CT 动、静脉期虚拟单能量图像 (VMI)、有效原子序数 (Z_{eff}) 图和碘浓度 (IC) 图对胃癌分化程度和 E-cadherin 蛋白表达水平的预测价值。

方法

回顾性分析 2021 年 10 月至 2022 年 10 月福建医科大学附属第一医院 183 例经手术病理证实为胃癌的术前上腹部光谱 CT 资料, 根据胃癌分化程度和 E-cadherin 蛋白水平进行分组。所有患者 CT 光谱图像均重建动、静脉期常规 120kVp 混合能量图像 (PI)、40-100keV VMI、 Z_{eff} 、IC 图。测量每期图像的病灶 CT 值 (CT_{keV})、 Z_{eff} 、IC, 计算对比噪声比 (CNR)、信噪比 (SNR)、标准化参数 (NZ_{eff} 、NIC) 及曲线斜率 (λ_{HU})。采用 Mann-Whitney U 检验比较组间计量资料差异, Spearman 相关分析评价参数与蛋白表达水平相关性。Logistic 回归模型建立联合参数。ROC 曲线和 DeLong 检验评估能谱参数预测胃癌分化程度及蛋白表达水平效能。

结果

双期 40KeV VMI 的 CNR 和 SNR 明显高于同期其余图像 ($P < 0.05$)。低分化组 $CT_{\text{ap/vp-40-70keV}}$ 、 $NZ_{\text{effap/vp}}$ 、 $NIC_{\text{ap/vp}}$ 、 $\lambda_{\text{HUap/vp}}$ 、 Z_{effvp} 和 IC_{vp} 均明显高于中高分化组 (P 均 < 0.05)。CTap/vp-40keV、 Z_{effvp} 和 IC_{vp} 预测胃癌分化程度的 AUC 分别为 0.760、0.872、0.791、0.768。Logistic 回归模型显示联合参数的 AUC 为 0.934, 明显高于任一单参数, 差异具有统计学意义 ($Z = 3.307 \sim 5.390$, $P < 0.001$)。E-cadherin 蛋白阳性表达组 CTap/vp-40keV、 Z_{effvp} 和 IC_{vp} 均明显低于阴性表达组 (P 均 < 0.001), 且与表达水平呈负相关 ($r = -0.55$ 、 -0.51 、 -0.52 、 -0.53 , $P < 0.001$)。

结论

双层探测器光谱 CT 参数 CTap/vp-40keV、 Z_{effvp} 和 IC_{vp} 有助于术前预测胃癌分化和 E-cadherin 蛋白表达水平, 联合参数可进一步提高分化预测效能。

PO-1951

特发性腹膜后纤维化的多层螺旋 CT 影像及临床诊断价值

王婷婷、吴哲、姜超、李宁
锦州医科大学抚顺市中心医院研究生培养基地

【摘要】目的: 探讨多层螺旋 CT (multi-slice spiral CT, MSCT) 对特发性腹膜后纤维化 (idiopathic retroperitoneal fibrosis, IRPF) 疾病的影像特点总结, 提高对该病的综合诊断能力。**方法:** 回顾性分析 79 例经临床诊断为 IRPF 患者的 MSCT 影像资料及血生化数据, 评估病灶形态、密度、累及范围、病灶强化程度, 有无肾脏积水及血流灌注、排泄异常等。**结果:** 79 例诊断为 IRPF 患者, 多数软组织密度灶分布于肾动脉水平以下, 包绕远端腹主动脉 69 例 (87.3%, 69/79), 沿尾侧方向延伸至髂血管近端, 多呈双侧受累, 髂总动脉双侧受累 50 例 (92.6%, 50/54), 髂内动脉双侧受累 13 例 (76.5%, 13/17), 髂外动脉双侧受累 8 例 (88.9%, 8/9)。除累及腹膜后动脉, 病变最常包绕输尿管 45 例 (57.0%, 45/79), 表现为受累输尿管向内侧偏移, 早期累及单侧输尿管 24 例 (53.3%, 24/45), 晚期纤维化逐渐向对侧输尿管延续 21 例 (46.7%, 21/45), 并导致双侧肾孟

及输尿管不同程度扩张积水 40 例 (50.6%, 40/79), 肾脏排泄功能受到影响, CT 显示 42 例 (53.2%, 42/79) 肾脏造影剂填充密度减低。纵向范围最常累及腰椎层面, 以 L3-5 椎体层面为主, L5 水平受累最多 58 例 (73.4%, 58/79)。增强扫描病灶具有典型的持续渐进性强化, 峰值多位于静脉期, CT 值 $66 \pm 10 \text{HU}$ 。大部分高水平血清 IgG4 经临床诊治一段时间后, 浓度减低。**结论:** 特发性腹膜后纤维化有特定的发病部位、特异性影像学表现、强化特点, 结合病理影像学分析及血生化实验室检查, 可对该病作出明确诊断, 做到早发现。早治疗。

PO-1952

对比分析磁共振 Ishim-DWI 序列与双能量 CT 定量参数在预测胃癌 Lauren 分类的应用价值

蓝燕芬、林宇英、郑云艳、马明平
福建省立医院

目的: 探讨胃癌术前磁共振 Ishim-DWI 序列与双能量定量参数在预测胃癌 Lauren 分类的应用价值
资料与方法: 收集我院 2020 年 2 月-2022 年 12 月已由内镜确诊为胃癌患者行磁共振和双能量 CT 扫描, 测量磁共振 ishima-DWI 的 ADC 值及双能量 CT 动脉期、静脉期、延迟期肿瘤感兴趣区的标准化碘浓度和能谱曲线斜率, 对比分析其与经手术病理证实的胃癌 Lauren 分类的相关性差异是否有统计学意义, 评估 ishima-ADC 值、标准化碘浓度和能谱曲线斜率的诊断性能。采用受试者工作特征 (receiver operating, ROC) 曲线分析它们的最佳诊断阈值, 评价其诊断效能。

结果: 本研究共纳入 140 例, 以术后病理学检查结果为金标准, 分为肠型 ($n=72$)、弥漫型 ($n=40$)、混合型 ($n=28$), 单因素分析结果提示 T 分期 ($\chi^2=18.43$, $P<0.001$)、神经侵犯 ($\chi^2=15.78$, $P<0.001$)、脉管癌栓 ($\chi^2=17.13$, $P<0.001$)、强化方式 ($\chi^2=10.29$, $P=0.006$)、门脉期标准化碘浓度 (NICv) ($Z=7.001$, $P=0.030$)、延迟期标准化碘浓度 (NICd) ($F=26.08$, $P<0.001$)、门脉期能谱曲线斜率 (λHUv) (40-110keV) ($Z=10.41$, $P=0.005$)、延迟期能谱曲线斜率 (λHUd) (40-110keV) ($Z=28.91$, $P<0.001$)、ishima-ADC 值在三组间差异有统计学意义。ROC 曲线分析示 ishima-ADC 在鉴别肠型与弥漫型胃癌、弥漫型与混合型胃癌的 AUC 值最大, 分别为 0.927、0.822, 敏感度分别为 82.50%、82.50, 特异性分别为 95.83%、78.57%; NICd 在鉴别肠型与弥漫型胃癌的 AUC 值高于 NICv 和 λHUv 差异有统计学意义 ($P<0.05$)

结论: 磁共振 ishima-ADC 在鉴别肠型与弥漫型胃癌的诊断效能最高, 仅 ishima-ADC 可用于鉴别弥漫型胃癌与混合型胃癌, NICd 与 λHUd 在鉴别肠型与混合型胃癌的诊断效能相当。ishima-ADC、NICv 与 λHUv 无法鉴别肠型胃癌与混合型胃癌。

PO-1953

T1-mapping 联合 DWI 预测前列腺癌神经侵犯的可行性研究

陈丽华、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 探索 T1-mapping 联合 DWI 预测前列腺癌神经侵犯的可行性。

方法: 回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 56 例, 其中无神经侵犯组 (A 组) 36 例, 有神经侵犯组 (B 组) 20 例。所有患者均行 T2WI、T1-mapping、DWI 扫描。扫描图像上传至 ISP (IntelliSpacePortall, Philips Healthcare) 工作站, 由两名观察者分别于病灶显示最大层面测量两组病变的 T1 值、ADC 值。采用组内相关系数 (ICC) 检验两名观察者测量结果的一致性; 采用独立样本 t 检验比较两组病变各参数值的差异; 采用受试者工作特征 (receiver operating

characteristic curve, ROC) 曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能; 采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果: 两名观察者测量各组数据的一致性良好 ($ICC > 0.75$)。A 组的 T1 值 [(1216.79 ± 245.73) ms]、ADC 值 [$(0.76 \pm 0.15) \times 10^{-3} \text{mm}^2/\text{s}$] 高于 B 组的 T1 值 [(1063.15 ± 306.59) ms]、ADC 值 [$(0.67 \pm 0.11) \times 10^{-3} \text{mm}^2/\text{s}$]，差异均有统计学意义 ($P < 0.05$)。T1 值、ADC 值及二者联合鉴别两组病变的 ROC 曲线下面积分别为 0.642、0.667 及 0.728。单独及联合诊断效能间无统计学差异 ($P > 0.05$)，两参数联合的诊断效能优于单独诊断效能。

结论: T1 值、ADC 值可用于无创性预测前列腺癌神经侵犯，两者联合的诊断效能有所提升，可以为临床诊断提供更多参考。

PO-1954

T2-mapping 联合 DWI 预测前列腺癌神经侵犯的可行性研究

陈丽华、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 探索 T2-mapping 联合 DWI 预测前列腺癌神经侵犯的可行性。

方法: 回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 54 例，其中无神经侵犯组 (A 组) 36 例，有神经侵犯组 (B 组) 18 例。所有患者均行 T2-mapping、DWI 扫描。扫描图像上传至 ISP (IntelliSpacePortall, Philips Healthcare) 工作站，由两名观察者分别于病灶显示最大层面测量两组病变的 T2 值、ADC 值。采用组内相关系数 (ICC) 检验两名观察者测量结果的一致性; 采用独立样本 t 检验比较两组病变各参数值的差异; 采用受试者工作特征 (receiver operating characteristic curve, ROC) 曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能; 采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果: 两名观察者测量各组数据的一致性良好 ($ICC > 0.75$)。A 组的 T2 值 [(78.27 ± 8.73) ms]、ADC 值 [$(0.75 \pm 0.14) \times 10^{-3} \text{mm}^2/\text{s}$] 高于 B 组的 T2 值 [(72.95 ± 6.98) ms]、ADC 值 [$(0.67 \pm 0.11) \times 10^{-3} \text{mm}^2/\text{s}$]，差异均有统计学意义 ($P < 0.05$)。T2 值、ADC 值及二者联合鉴别两组病变的 ROC 曲线下面积分别为 0.667、0.667 及 0.701。单独及联合诊断效能间无统计学差异 ($P > 0.05$)，两参数联合的诊断效能优于单独诊断效能。

结论: T2 值、ADC 值可用于无创性预测前列腺癌神经侵犯，两者联合的诊断效能有所提升，可以为临床诊断提供更多参考。

PO-1955

肾脏罕见原发恶性肿瘤 CT、MRI 影像学表现及其病理学特征

戴玲玲
苏州大学附属第一医院

目的: 探讨肾脏罕见原发恶性肿瘤的 CT、MRI 表现及其病理学特征。方法: 回顾性分析 22 例经病理证实的肾脏罕见原发恶性肿瘤的 CT 及 MRI 影像学资料，对其影像特征进行分析。结果: 黏液样小管状和梭形细胞癌、集合管癌肿瘤呈圆形或不规则分叶状软组织影，可见囊变、坏死及出血，增强扫描呈轻-中度渐进性强化，但集合管癌肿瘤边界模糊不清，易侵犯肾周、肾窦，出现肾门处及腹膜淋巴结转移; 多房囊性肾细胞癌肿瘤呈多房囊性，囊壁及分隔粗细不均、可伴有壁结节，增强扫描肿瘤皮质期明显强化，多呈“快进快出”强化方式; 原发肾淋巴瘤可呈单发或弥漫性肿块，T1WI、T2WI 以等信号为主，DWI 呈明显高信号，增强扫描呈轻度强化，并可见“血管漂浮征”; 原

发肾血管肉瘤肿瘤内可见囊变、坏死，边界欠清，增强扫描动皮质可见小片状明显强化（接近动脉密度），静脉期强化范围增大、且强化程度减低。结论：肾脏罕见原发恶性肿瘤具有一定的 CT、MRI 影像学特征，准确的术前诊断对指导临床治疗方式的选择有重要价值。

PO-1956

初探 mDIXON-Quant 联合弥散加权成像鉴别前列腺癌有无神经侵犯的可行性

陈丽华、宋清伟、刘爱连
大连医科大学附属第一医院

目的：探索 mDIXON-Quant 联合 DWI 鉴别前列腺癌有无神经侵犯的可行性。

方法：回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 38 例，其中无神经侵犯组（A 组）20 例，有神经侵犯组（B 组）18 例。所有患者均行 T2WI、mDIXON-Quant 及 DWI 扫描。扫描图像上传至 ISP 工作站，由两名观察者分别于病灶显示最大层面测量两组病变的 mDIXON-Quant 定量值（FF、R2*、T2*）和 ADC 值。采用组内相关系数（ICC）检验两名观察者测量结果的一致性；采用独立样本 t 检验比较两组病变各参数值的差异；采用 ROC 曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能；采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果：两名观察者测量各组数据的一致性良好（ICC>0.75）。A 组的 R2* 值[（16.00±2.97）ms]低于 B 组的 R2* 值[（23.52±14.74）ms]，A 组的 T2* 值[（65.52±11.47）ms]高于 B 组的 R2* 值[（53.06±15.11）ms]，A 组的 ADC 值[（0.79±0.16）10⁻³mm²/s]高于 B 组的 ADC 值[（0.67±0.12）10⁻³mm²/s]，差异均有统计学意义（P<0.05）；两组的 FF 值差异无统计学意义（P>0.05）。R2* 值、T2* 值、ADC 值单独及三者联合鉴别两组病变的 ROC 曲线下面积分别为 0.746、0.717、0.717 及 0.828。单独及联合诊断效能间无统计学差异（P>0.05），三参数联合的诊断效能优于单独诊断效能。

结论：mDIXON-Quant 和 DWI 可用于无创性预测前列腺癌神经侵犯，多参数联合后的诊断效能有所提升，可以为临床诊断提供更多参考。

PO-1957

4D-Flow MR 成像预测肝硬化门脉高压患者胃肾及脾肾分流的值

郑悠、胡琼、李想、周君、郭大静
重庆医科大学附属第二医院

目的：评估 4D-Flow MRI 作为无创成像标记物预测肝硬化门脉高压患者胃肾/脾肾分流及其分流程度的可行性。

材料和方法：本研究前瞻性收集了 60 名肝硬化门脉高压患者进行 4D-Flow MR 成像扫描，将患者分为胃肾/脾肾分流组和无分流组，其中胃肾/脾肾分流组中根据分流交通支管径大小分为轻中度分流（≤8mm）和重度分流（>8mm）两个亚组。所有 4D-Flow 图像导入 CVI 后处理工作站，测量门静脉主干(PV)的血流参数，包括血流量、峰值速度、平均速度和管壁剪切力，使用单变量分析和多变量逻辑回归分析来确定有/无分流以及轻中度/重度分流的独立预测因子，并进行受试者工作特征（ROC）曲线分析来评估每个预测因子的诊断能力。

结果：60 名肝硬化患者中，33 例患者无胃肾/脾肾分流，27 例患者有胃肾分流，其中 18 例为轻中度分流，9 例患者为重度分流。在无分流组中，参数血流量、峰值速度、平均速度显著高于有分流

组, 多因素逻辑回归分析显示, 血流量、峰值速度是预测肝硬化患者胃肾分流的独立预测因子 (敏感性=84%, 特异性=81%, 曲线下面积=0.812)。重度分流患者中, 参数血流量显著低于轻中度分流患者, 其中血流量是预测肝硬化患者重度胃肾分流的独立预测因子 (敏感性=80%, 特异性=78%, 曲线下面积=0.769)。

结论: 4D-Flow MRI 可作为预测肝硬化门脉高压患者胃肾/脾肾分流及其分流程度的无创成像标记物, 血流量、峰值速度能有效预测肝硬化患者是否会出现胃肾/脾肾分流, 血流量是预测肝硬化患者出现重度胃肾/脾肾分流的独立预测因子。

PO-1958

酰胺质子转移成像联合弥散加权成像预测 前列腺癌神经侵犯的可行性研究

陈丽华、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 探索酰胺质子转移成像 (Amide proton transfer, APT) 联合弥散加权成像 (Diffusion weighted imaging, DWI) 预测前列腺癌神经侵犯的可行性。

方法: 回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 64 例, 其中无神经侵犯组 (A 组) 44 例, 有神经侵犯组 (B 组) 20 例。所有患者均行 T2WI、APT 及 DWI 扫描, 扫描参数见表 1。扫描图像上传至 ISP (IntelliSpacePortall, Philips Healthcare), 由两名观察者分别于病灶显示最大层面测量两组病变的 APT 值、ADC 值。采用组内相关系数 (ICC) 检验两名观察者测量结果的一致性; 采用独立样本 t 检验比较两组病变各参数值的差异; 采用受试者工作特征 (receiver operating characteristic curve, ROC) 曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能; 采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果: 两名观察者测量各组数据的一致性良好 (ICC>0.75)。A 组 APT 值[(2.40±0.57)%]低于 B 组 APT 值[(2.78±0.76)%], A 组 ADC 值[(0.75±0.15) 10⁻³mm²/s]

高于 B 组 ADC 值[(0.67±0.11) 10⁻³mm²/s], 差异均有统计学意义 (P<0.05)。APT 值、ADC 值及二者联合鉴别两组病变的 ROC 曲线下面积分别为 0.620、0.663 及 0.726。单独及联合诊断效能间无统计学差异 (P>0.05), 两参数联合的诊断效能优于单独诊断效能。

结论: APT 值、ADC 值可用于预测前列腺癌神经侵犯, 两者联合的诊断效能有所提升, 具有很好的临床应用前景。

PO-1959

基于增强 CT 影像组学对肾透明细胞癌恶性程度的鉴别

梅超^{1,2}、朱庆强¹、叶靖¹、李璐璐^{1,3}、莫小小^{1,2}
1. 江苏省苏北人民医院
2. 大连医科大学研究生院
3. 扬州大学

目的: 探索基于 CT 增强图像影像组学鉴别肾透明细胞癌恶性程度的价值。

方法: 回顾性分析 192 例经病理证实为肾透明细胞癌 (ccRCC) 增强 CT 图像资料, 其中低级别组 (I-II 级, n=111)、高级别组 (III-IV 级, n=81)。对于增强 CT 皮质髓质期 (CMP)、肾实质期 (NP)、排泄期 (EP) 及三期联合的图像进行影像组学特征提取, 运用最小绝对收缩率和选择运

算符 (LASSO) 进行降维, 选取有价值的组学特征, 采用五折交叉验证将样本量分为训练组及测试组, 训练组采用支持向量 (support vector machine, SVM) 及逻辑回归 (logistic regression, LR) 两类分类器创建 CMP、NP、EP 及三期联合的影像组学模型, 运用受试者工作特征曲线下面积 (AUC)、准确度、灵敏度、特异度、精确度最终评估影像组学模型对于肾透明细胞癌恶性程度的诊断效能, 并用测试组进一步验证。结果: 基于 CMP、NP、EP 及三期联合图像所建立的影像组学模型与 ccRCC 恶性程度显著相关, 且 CMP 影像组学模型对于 CCRCC 恶性程度诊断效能最高 ($R=0.831, 0.801$)。SVM 分类器模型测试组 CMP、NP、EP 及三期联合诊断效能 ROC 曲线下面积 (AUC) 值分别为 0.819、0.808、0.785、0.812; LR 分类器模型测试组 CMP、NP、EP 及三期联合 AUC 值分别为 0.860、0.808、0.789、0.799; 在 SVM 与 LR 分类器中, CMP 与 EP、CMP 与 NP 影像组学模型 AUC 值之间具有显著差异 ($P<0.05$), NR 与 EP 模型之间无差异 ($P>0.05$)。两类分类器均有较好的诊断性能, 且 SVM 分类器建立的影像组学模型性能较 LR 分类器更稳定、全面。结论: 基于增强 CT 影像组学特征所建立的影像组学模型对于肾透明细胞癌恶性程度鉴别具有临床指导性作用, 且 SVM 分类器建立的影像组学模型性能更加稳定、全面。

PO-1960

双源 CT 胰腺脂肪定量对 2 型糖尿病患者冠脉狭窄的预测价值

刘玲、孙文杰、刘宜鑫
大理大学

目的 探讨双源 CT 双能量技术胰腺脂肪定量参数对 2 型糖尿病 (type 2 diabetes mellitus, T2DM) 患者冠脉狭窄的预测价值。方法 回顾性分析 120 例经临床证实的 T2DM 患者的临床及双源 CT 影像资料, 其中冠脉正常组 18 人、轻-中度狭窄组 80 人、重度狭窄组 22 人, 比较各组间胰腺平均脂肪容积分数 (FVF%) 的差异, 比较冠脉重度狭窄组与非重度狭窄组之间相关实验室及影像指标的差异。分析冠脉重度狭窄的独立危险因素及各因素对冠脉重度狭窄的诊断效能。结果 T2DM 患者的胰腺平均 FVF% 随着冠脉狭窄程度的增高而升高, 且各组间差异有统计学差异 ($P<0.05$)。单因素及多因素 Logistic 回归分析显示胰腺平均 FVF%、冠周脂肪体积、冠脉钙化积分及脂蛋白 a 为冠脉重度狭窄的独立危险因素。受试者工作特征 (receiver operating characteristic, ROC) 曲线显示冠周钙化积分对冠脉重度狭窄的诊断效能最高。结论 胰腺平均 FVF% 可作为预测 2 型糖尿病患者冠脉狭窄的指标之一, 胰腺平均 FVF%、脂蛋白 a、冠周脂肪体积及冠脉钙化积分是冠脉重度狭窄的独立危险因素, 可为临床提供参考。

PO-1961

肝脏特异性对比剂钆贝葡胺增强 MRI 影像学特征对肝细胞癌微血管侵犯的术前预测研究

周丽莎¹、宋亨²、沈新平¹、姚薇薇¹、罗振东¹、吕建勋¹

1. 香港大学深圳医院

2. 广州医科大学附属第三医院

目的: 基于术前肝脏动态增强 MRI 的影像学特征探讨肝脏特异性对比剂钆贝葡胺 (gadobenate dimeglumine, Gd-BOPTA) 在预测肝细胞癌 (hepatocellular carcinoma, HCC) 微血管侵犯 (microvascular invasion, MVI) 上的能力。

方法: 本研究搜集并整理在我院经手术病理诊断为肝细胞癌患者 42 例, 所有患者术前均行肝脏特异性对比剂钆贝葡胺 MR 增强扫描。回顾性分析患者术前影像学资料和一般临床资料, 其中影像学资料包括肿瘤数目、大小、肿瘤边缘、肿瘤信号、T1WI 低信号、肿瘤脂肪、肿瘤假包膜、强化类

型、动脉期环状强化、非周边廓清、动脉期瘤周实质强化、肝胆期肿瘤低信号、肝胆期瘤周低信号；患者的一般临床资料包括年龄、性别、病毒性肝炎感染病史、Child-Pugh 分级、术前甲胎蛋白 (Alpha fetoprotein, AFP) 水平。根据组织病理学结果将患者分为 MVI 阳性组和 MVI 阴性组。采用 χ^2 检验及多因素 logistic 回归分析对患者影像学资料和一般临床资料分别进行分析，根据得出的独立危险因素建立 MVI 预测模型。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评估预测模型的效能，并采用 Log-rank 检验对患者无进展生存期进行生存分析。结果：病灶边缘不光滑和 T1WI 不均匀低信号是预测 MVI 的独立危险因素。Gd-BOPTA 组模型的曲线下面积 (area under curve, AUC) 为 0.814。生存分析显示模型预测的 MVI 阳性组、MVI 阴性组的平均无进展生存期与组织病理证实的 MVI 阳性组、MVI 阴性组的平均无进展生存期均存在显著差异。结论：病灶边缘不光滑和 T1WI 不均匀低信号是预测 MVI 的独立危险因素。Gd-BOPTA 对比剂可用于预测 MVI 的发生。

PO-1962

基于深度学习重建的高分辨率 SSFSE MRI 在卵泡计数中的应用价值

杨仁杰、刘昌盛、李亮、邹宇洁、查云飞
武汉大学人民医院

目的:探讨基于深度学习(DL)重建算法的高分辨率单次激发快速自旋回波(SSFSE)成像在卵泡计数方面的诊断性能，并与原始 SSFSE 图像和常规快速自旋回波(FSE)图像进行比较。方法:前瞻性招募已确诊 PCOS 的患者 20 名(平均年龄= 22.5±4.7 岁，年龄在 15 - 31 岁之间)，总共 40 个卵巢。所有的受试者均接受了高分辨率卵巢 MRI 检查，包括三平面 T2 加权 FSE 序列和与之层面匹配 T2 加权 SSFSE 序列。在 SSFSE 序列中应用 DL 重建算法获取 SSFSE-DL 图像，并保留原始 SSFSE 图像。两名影像诊断医生独立地对 SSFSE-DL、SSFSE 和常规 FSE 图像进行定性评估，评估指标包括模糊伪影、主观噪声和卵泡清晰度。利用类内相关系数和 Bland-Altman 图估计基于三种图像的每个卵巢卵泡数(FNPO)评估的重复性和再现性。结果:与 SSFSE 和 FSE 相比，SSFSE-DL 图像模糊伪影、主观噪声更小，卵泡清晰度更高($P<0.05$)。对于 FNPO 评估的重复性，SSFSE-DL 显示观察者内一致性($ICC=0.930$;95% CI: 0.878-0.962)和观察者间一致性($ICC=0.914$;95% CI: 0.843-0.953)最高。SSFSE-DL、SSFSE 和 FSE 的观察者间 95%一致性界限(LOA)分别为-3.7 ~ 4.5、-4.4 ~ 7.0 和-7.1 ~ 7.6。SSFSE-DL、SSFSE 和 FSE 的观察者内 95% LOA 分别为-3.5 ~ 4.0、-5.1 ~ 6.1、-5.7 ~ 4.2。SSFSE-DL 的观察者内和观察者间差异绝对值显著低于 SSFSE 和 FSE 的差异($P<0.05$)。SSFSE-DL 的观察者内和观察者间差异的绝对值无显著性差异($P=0.071$)。结论:与原始 SSFSE 图像和常规 FSE 图像相比，DL 重建的高分辨率 SSFSE 图像能更好地显示卵泡，从而提高 FNPO 评估的重复性和再现性。

PO-1963

基于能谱 CT 细胞外容积分数评估上皮性卵巢癌 P53 状态

宋庆玲、刘爱连、李烨
大连医科大学附属第一医院

目的: 探究基于能谱 CT 评估上皮性卵巢癌 P53 状态。

方法: 回顾性分析 2019 年-2022 年于本院经手术病理证实的 92 例卵巢上皮性癌患者, 根据术后病理及免疫组化结果, 根据 P53 表达情况分为突变型组和野生型组。所有患者均于术前在 Discovery CT 750HD 扫描机上行能谱 CT 扫描, 重建动脉期、静脉期、延迟期碘浓度 CT 图像。于延迟期测量病灶最大层面实性部分延迟期碘浓度值和同层面髂外动脉的碘浓度值 (iodine concentration, IC), 计算延迟期标准化碘浓度值 (delay-phase normalized iodine concentration, DNIC), 公式为“ $DNIC = \text{病灶 DIC} / \text{髂外动脉 DIC}$ ”。收集患者血细胞比积 (HCT), 根据公式“(1-HCT) * DNIC * 100%”计算卵巢癌细胞外容积分数 (extracellular volume, ECV)。采用独立样本 t 检验及秩和检验比较 P53 突变型组和野生型组卵巢癌 ECV 差异。绘制受试者特征曲线(receiver operating characteristic curve, ROC)得到各指标的曲线下面积 (area of curve, AUC)、敏感度及特异度, 评价 ECV 的诊断效能。

结果: P53 突变型组患者 40 例, 野生型组患者 27 例。P53 突变型组卵巢癌 ECV 明显高于野生型组卵巢癌 (0.29 (0.23, 0.46) vs. 0.19 (0.10, 0.27), $P < 0.05$)。ECV 的曲线下面积 (area of curve, AUC) 为 0.762, 敏感度及特异度分别为 70.37% 和 77.78%。

结论: 基于能谱 CT 细胞外容积分数在评估上皮性卵巢癌 P53 状态方面具有潜在临床应用价值。

PO-1964

基于能谱 CT 碘图参数评估高级别浆液性卵巢癌腹膜转移的价值

宋庆玲、刘爱连、李烨
大连医科大学附属第一医院

目的: 探讨基于能谱 CT 碘图参数评估高级别浆液性卵巢癌腹膜转移的价值。

方法: 回顾性分析 2017 年至 2022 年于本院经手术病理证实的 73 例卵巢上皮性癌患者, 根据病理报告中腹膜是否存在转移病灶将患者分为腹膜转移阳性和阴性组。所有患者均于术前在 Discovery CT 750HD 扫描机上行能谱 CT 扫描, 重建动脉期、静脉期、延迟期碘浓度 CT 图像。测量病灶最大层面实性部分的增强三期碘浓度值和同层面髂外动脉的碘浓度值 (iodine concentration, IC), 计算增强三期标准化碘浓度值 (normalized iodine concentration, ANIC、VNIC、DNIC), 公式为“ $NIC = \text{病灶 IC} / \text{髂外动脉 IC}$ ”。采用独立样本 t 检验及秩和检验比较腹膜转移阳性和阴性组 ANIC、VNIC 和 DNIC 的差异。绘制受试者特征曲线(receiver operating characteristic curve, ROC)得到各指标的曲线下面积 (area of curve, AUC)、敏感度及特异度, 评价各参数的诊断效能。

结果: 腹膜转移阳性患者 47 例, 腹膜转移阴性患者 26 例。腹膜转移阳性组 ANIC、VNIC 及 DNIC 明显高于腹膜转移阴性组 (所有 $P < 0.05$)。ANIC、VNIC 及 DNIC 的 AUC 分别为 0.851、0.863 及 0.840, 敏感度及特异度分别为 63.83% 和 92.31%、89.36% 和 69.23%、78.72% 和 76.92%。

结论: 基于能谱 CT 碘图参数有潜力成为无创性评估高级别浆液性卵巢癌腹膜转移影像标志物。

PO-1965

能谱 CT 碘水值及 ECV 纹理分析预测直肠癌神经侵犯

王悦¹、陈安良¹、胡文君¹、王家正³、林良杰³、宋清伟¹、刘爱连^{1,2}

1. 大连医科大学附属第一医院

2. 大连市医学影像人工智能工程技术研究中心

3. 飞利浦医疗, 北京, 中国

目的:

探讨能谱 CT 碘水值及基于细胞外体积分数(extracellular volume, ECV)纹理分析在预测直肠癌(rectal cancer, RC)神经侵犯中的价值。

材料与方法:

我们回顾性地收集了 74 例经手术和病理证实并于术前行 Revolution 能谱 CT 增强扫描检查的 RC 患者图像与临床信息。根据 RC 的组织学分类标准, 将患者分为神经侵犯组(A 组, 17 例)和非神经侵犯组(B 组, 57 例)。将所有图像导入 GE AW 4.6 工作站, 使用 GSI Viewer 软件重建延迟期碘(水)图。两名放射科医生(2 年及 8 年腹部诊断经验)各自将三个椭圆形 ROI 放置在病灶的最大层面上, 测量并计算其均值作为最终碘水值(Iodine concentration, IC)。延迟期标准化 IC (DNIC)=病灶的 IC /同层面左髂外动脉的 IC; $ECV=(1- \text{红细胞压积}/100)*NIC*100$ 。将延迟期碘水图导入 Matlab 软件生成 ECV 图, 并导入 ITK-SNAP 软件; 由 2 名分别具有 2 年和 8 年腹部影像诊断经验的影像科医师采用盲法, 参照增强三期原始图像沿病灶边缘逐层手动勾勒感兴趣区(ROI), 并融合生成三维感兴趣区(volume of interest, VOI)。使用联影 AI 平台(V1.6)进行纹理特征提取; 采用差异性检验比较各参数是否具有统计学差异; 建立 logistic 回归模型, 绘制受试者工作特征(ROC)曲线评估预测效能, 计算 ROC 曲线下面积(AUC)、敏感度及特异度。

结果:

ECV 及 DNIC 在两组间没有差异($P>0.05$); 经筛选得到 12 个最优纹理特征, 包括 2 个一阶特征, 6 个灰度共生矩阵特征(GLCM)特征, 2 个灰度依赖矩阵(GLDM)特征, 1 个灰度游程矩阵(GLRLM)特征, 1 个灰度级大小区域矩阵特征(GLSZM)特征(表 1)。Logistic 回归模型预测 HCC 肝切除术后早期复发的 AUC、灵敏度及特异度分别为 0.885、88.2%、84.2%(图 1, 表 2)。结论: 基于能谱 CT 碘水图延迟期 ECV 的全肿瘤纹理分析对于直肠癌神经侵犯具有一定的预测价值。

PO-1966

LI-RADS v2018 CT 征象与 HCC 的关联性和诊断效能

赵林伟、李勇、杨国庆、冯敏、严高武、殷成坤、吴佳佳

遂宁市中心医院

目的 研究 LI-RADS 适用人群和非 LI-RADS 定义的风险人群中, LI-RADS CT 征象与肝细胞癌(HCC)的关联性及诊断 HCC 效能。

方法 回顾分析 2014 年 1 月至 2022 年 12 月在遂宁市中心医院经病理证实的 435 例患者 482 个肝脏病灶(HCC 327 个, 非 HCC 恶性肿瘤 77 个, 良性病变 78 个)资料, 根据病理结果分为 HCC 组和非 HCC 组。LI-RADS v2018 CT 征象诊断 HCC 效能采用 ROC 分析。各征象与 HCC 的关联性采用 Logistic 回归分析。

结果 CT 征象与 HCC 关联性, 非周边廓清(OR, 15.1; 95 %CI: 5.6, 40.4; $P=0.00$)及非环形 APHE(OR, 12.4; 95 %CI: 7.5, 20.5; $P=0.00$)高于强化包膜(OR, 9.9; 95 %CI: 2.8, 34.8; $P=0.00$; OR, 2.4; 95 %CI: 1.4, 3.8; $P=0.01$)。诊断 HCC 的灵敏度、特异度、阳性预测值(PPV)、阴性预测值(NPV)、曲线下面积(AUC), 非周边廓清分别为 85%、83%、

91%、73%、0.84；非环形 APHE 分别为 82%、77%、88 %、66%、0.79；强化包膜分别为 31%、98%、97%、40%、0.65。所有征象联合诊断 HCC 灵敏度 (88% vs. 87%)、特异度 (83% vs. 82%)、PPV (92 % vs. 91%)、NPV (77% vs. 76%)、AUC (0.90 vs. 0.87) 略高于非周边廓清+非环形 APHE+强化包膜。强化包膜 (OR, 13.3; 95% CI: 3.6, 48.9; P=0.00)、肿块内出血 (OR, 20.3; 95% CI: 2.4, 171.4; P=0.00)、马赛克征 (OR, 37.7; 95% CI: 4.2, 340.0; P=0.00) 与非典型 HCC 有较强的关联性, 诊断非典型 HCC 特异度为 98-99%。

结论 LI-RADS 适用人群及非 LI-RADS 定义的风险人群, LI-RADS v2018 CT 征象诊断 HCC 准确度高, 灵敏度 88%, 特异度 83%。辅助征象肿块内出血、马赛克征对于非典型 HCC 具有高度特异性。

PO-1967

小视野结合压缩感知技术短时间屏气高分辨 3D-MRCP 的可行性研究

董新锋

广东省人民医院

目的: 通过缩小 FOV 结合压缩感知技术改良 3D 屏气 MRCP 序列, 达到小视野高分辨短时间屏气 MRCP 成像。

方法: 前瞻性招募 50 例疑似胰胆道疾病患者, 分别以随机顺序进行改良的小视野压缩感知 3D 屏气 MRCP, 原始 3D 屏气 MRCP 扫描, 记录屏气情况。两名放射科医师以 5 分独立盲法评估, 图像质量、背景抑制、运动伪影、胰胆管清晰度, 及诊断自信度。Wilcoxon 符号检验比较个体内差异, ICC 系数评价观察者间一致性, 受试者特性曲线 ROC 计算诊断效能。

结果: 改良后小视野 3D 屏气 MRCP 序列扫描时间为 13s, 原始 3D 屏气 MRCP 序列扫描时间为 18s。50 例患者中约 34 例患者屏气不佳, 无法完成 18s 原始 MRCP 序列稳定屏气, 而 13s 改良 MRCP 序列患者完成率占到了 92% (46 例), 差异有统计学意义 ($p<0.05$)。二者在图像质量总体评分无统计学差异 (原始 MRCP 为 3.87 ± 0.73 , 改良 MRCP 为 3.80 ± 0.89 , $z=0.5$, $p=0.617$)。而改良 MRCP 的背景抑制效果评分要劣于原始 MRCP, 差异有统计学意义 (原始 MRCP 为 4.57 ± 0.51 , 改良 MRCP 为 4.17 ± 0.44 , $z=2.70$, $p=0.007$)。改良 MRCP 的运动伪影评分要优于原始 MRCP, 差异具有统计学意义 (原始 MRCP 为 4.15 ± 0.63 , 改良 MRCP 为 4.60 ± 0.62 , $z=2.62$, $p=0.009$)。在其余胰胆管等结构的显示上, 两种扫描序列图像质量评分没有显著差异 ($p>0.05$)。两种序列对于胰胆道的解剖变异和疾病的诊断准确度相似 ($p=0.72-0.88$)。

结论: 通过缩小视野提高分辨率, 并结合压缩感知技术减少扫描时间的情况下, 改良 3D 屏气 MRCP 与原始 3D 屏气 MRCP, 两种序列图像质量总评分差异无统计学意义, 且改良后只有 13s 屏气时间对于患者的配合度更好, 同时又降低运动伪影提高扫描成功率, 对于不能配合呼吸的患者可能更有用。

PO-1968

“善变”的肝血管瘤——肝脏硬化性血管瘤李阳阳¹、谭艳²

1. 山西医科大学

2. 山西医科大学第一医院

背景及目的：肝不典型血管瘤是一种罕见变异，其中包括巨大不规则血管瘤、离心样强化的血管瘤、硬化性/玻璃样变的血管瘤等，非典型血管瘤特征很难与原发性或转移性恶性肿瘤鉴别。本文将讨论硬化性/玻璃样变的血管瘤临床特征及影像学表现。

方法：本文回顾性分析 1 例肝脏 S7 段的硬化性/玻璃样变的血管瘤的临床、影像学特点，讨论其诊断、治疗及预后情况，并结合相关文献进行分析。

结果：患者，女性，64 岁，4 月前无明显诱因右上腹间断胀痛，未予重视，近期加重就诊。急诊行腹部 CT 检查显示：肝 S7 段可见一混杂密度肿块影，局部突出于肝脏轮廓之外，周围脂肪间隙内密度增高，增强扫描见环形强化并向内填充，考虑为炎性假瘤或胆管细胞癌可能。患者以“肝占位”就诊于肝胆外科，查体未见明显异常。患者自发病以来食欲差，体重减轻 7.5 kg。为明确诊断进一步行 MRI 检查，提示 S7 段可见团块状长 T1 短 T2 信号，其内可见更长 T2 信号，DWI 扫描病灶中央呈高信号，增强扫描动脉期未见明显强化，静脉期及延迟期可见病灶内分隔轻度强化，肝胆期病灶廓清，部分分隔持续性强化，考虑胆管细胞癌可能。行右半肝及尾状叶部分切除术中发现肿瘤位于尾状叶附近，直径约 5cm，质韧，切面黄白相间。病理显示病灶内可见较多厚壁血管增生，伴管壁玻璃样变性，并可见较多炎细胞浸润及含铁血黄素沉积，符合血管瘤改变。

结论：硬化性/玻璃样变血管瘤是罕见的非典型肝血管瘤，是海绵状血管瘤退行性改变引起的纤维化和玻璃样变，属于海绵状血管瘤变性的终末期，无特殊症状。回顾文献报道总结硬化性海绵状血管瘤的特征如下：①多无肝炎、肝硬化病史；②病灶呈地图样轮廓，包膜回缩，随时间推移病灶体积缩小；③T2WI 信号强度低于脑脊液，注入对比剂后早期强化不足，晚期外周轻度增强；④PET/CT 未见显像剂累积；⑤影像学上只有当先前的检查显示典型血管瘤，观察到时间演变时才可能进行推定诊断。深入了解其影像学表现并纳入肝脏病变的鉴别诊断可以改变患者的治疗及管理。

PO-1969

光谱 CT 多参数定量评估胃癌 HER-2 表达的相关性研究

叶露

天津医科大学肿瘤医院

目的：探讨基于光谱 CT 的多参数定量分析对于胃腺癌 HER-2 表达评估的应用价值。 **方法：**回顾性分析 60 例经手术病理证实为胃癌患者的临床、病理及影像学资料。基于光谱 CT 测量并计算胃癌 CT 动脉期 (AP) 和静脉期 (PP) 的碘浓度值 (IC)、标准化碘值 (nIC)、40keV 单能级 CT 值 (CT40keV) 及有效原子序数 (Z-eff)。利用单变量分析确定各参数与胃癌 HER-2 表达的相关性，筛选可提示 HER-2 表达水平的光谱 CT 参数，利用受试者工作特征曲线 (ROC) 分析相关参数评估 HER-2 表达水平的效能。 **结果：**将 HER-2 表达为 2+ 或 3+ 定义为 HER-2 表达阳性组 (n=19)，将 HER-2 表达为 0 或 1+ 定义为 HER-2 表达阴性组 (n=41)。HER-2 表达阳性组的 nICAP、nICPP、CT40AP 均低于 HER-2 表达阴性组 (nICAP=0.16±0.05 vs. 0.21±0.09, P=0.035; nICPP=0.49±0.17 vs. 0.59±0.16, P=0.030; CT40AP=151.95±45.30HU vs. 189.48±74.40HU, P=0.047)，且差异具有统计学意义；HER-2 表达阳性组的 ICAP、ICPP、CT40PP、Z-effAP、Z-effPP 亦均低于 HER-2 表达阴性组，但差异均无统计学意义。基于 ROC 曲线分析，参数 nICAP、nICPP、CT40AP 的曲线下面积分别为 0.684 (95%CI: 0.538, 0.831)、0.656 (95%CI: 0.493,

0.819)、0.673 (95%CI: 0.526, 0.820), 其中当诊断阈值为 0.166 时动脉期标准化碘浓度值诊断效能最高, 敏感性为 75.6%, 特异性为 68.4%。结论: 光谱 CT 动、静脉期的标准化碘值 nIC 及动脉期 40keV 单能级 CT 值可在一定程度上提示胃癌病灶中的 HER-2 表达水平, 对其诊断及鉴别具有一定的指导意义。

PO-1970

基于盆底 MR 三维模型分析子宫无韧带状态下受腹压影响的应力改变

李焯¹、刘爱连¹、弭佳辰²、庄明睿²

1. 大连医科大学附属第一医院

2. 大连理工大学

目的:利用健康志愿者的盆底 MR 三维模型, 分析无韧带牵拉子宫受腹压影响的应力改变。

方法:收集 29 岁健康女性 (BMI=21.09 kg/m², 前位子宫) 盆底磁共振成像(MRI)的数据, 使用 Ingenia 3.0T CX MR 扫描仪 (Philips Healthcare, Best, the Netherlands) 获得基于压缩感知薄层高分辨三维 T2WI (5 倍 CS-SENSE 加速, TR/TE=1250 ms/148 ms, FOV=300x300 mm², FA: 90°, 层厚/间距:1.0mm/-0.5mm, 层数 240, 用时 4min55s) 建模重塑盆腔三维模型, 模型包括子宫 (无宫腔)、膀胱、直肠。通过有限元探讨子宫表面及内部在 Valsalva 状态下的应力分析、应变分析及最大位移分析。

结果:通过盆底 MR,成功建立了无韧带盆腔三维模型。子宫表明: 应力分析显示子宫的最大应力出现在子宫峡部前壁 (图 1a), 最大位移出现在子宫底及体部, 且峰值出现在子宫体后壁 (图 1b)。子宫内部: 应力分析显示子宫内部的应力主要出现在子宫体部 (图 2a), 且子宫体部应力大于子宫表面 (图 2a vs. 图 1a)。最大位移出现在子宫体部, 且峰值出现在子宫体后壁 (图 2b), 子宫内部位移较子宫表明位移小 (图 2b vs. 图 1b)。

结论:对于无韧带支撑的子宫, 加腹压状态下子宫峡部内侧承受力最大, 子宫表面的应力大于内部。加腹压状态下子宫体背侧位移最大, 且子宫表面的受力大于内部。通过对无韧带子宫有限元分析, 初步确定了腹压对子宫内、外部的直接影响, 可为临床工作提供一些参考。

PO-1971

双源 CT 肝动脉三期扫描及增强灌注扫描诊断肝硬化背景下小肝癌的价值

穆西虎

江苏省人民医院 (南京医科大学第一附属医院)

目的 探讨双源 CT 肝动脉三期扫描及增强灌注扫描诊断肝硬化背景下小肝癌的价值。

方法 回顾性分析 2019 年 2 月至 2021 年 9 月医院收治的 85 例肝硬化背景下小肝癌患者的临床资料为研究组, 另回顾性分析医院同时间段收治的 45 例肝硬化背景下肝脏良性结节患者的临床资料为对照组。两组均行双源 CT 肝动脉三期扫描与增强灌注扫描, 分析动脉三期病灶强化特征及病灶检出率, 比较不同肝硬化程度患者与对照组灌注参数[血容量 (BV)、肝动脉分数 (HAF)、血流量 (BF)、肝动脉灌注量 (HAP)], 比较不同分化程度患者与对照组的灌注参数, 绘制受试者工作曲线 (ROC), 以曲线下面积 (AUC) 分析双源 CT 肝动脉三期扫描与增强灌注扫描对肝硬化背景下小肝癌的诊断价值。

结果 85 名肝硬化背景下的小肝癌患者中, 病理诊断病灶有 92 个, 病灶直径 0.8~3.0cm, 平均 (1.85±0.37) cm。动脉晚期、动脉中期 CT 绝对值、强化值、检出率均高于动脉早期 (P<0.05),

动脉中期、动脉晚期 CT 绝对值、强化值、检出率比较差异无统计学意义 ($P>0.05$)。不同肝硬化程度患者与对照组 BV、BF、HAF、HAP 比较有统计学意义 ($P<0.05$)；肝硬化患者 HAP、HAF 均高于对照组 ($P<0.05$)；随着肝硬化程度的加重，HAF、HAP 逐渐增加，而 BV、BF 逐渐下降；不同分化程度患者与对照组 BV、BF、HAF、HAP 比较有统计学意义 ($P<0.05$)，随着分化程度的增加，BV、BF、HAF、HAP 逐渐下降；双源 CT 肝动脉三期扫描与增强灌注扫描诊断肝背景下小肝癌的灵敏度分别为 83.53%、90.59%；特异度分别为：84.78%、86.96%；AUC 值 (95%CI) 分别为 0.842 (0.768~0.899)、0.888 (0.821~0.936)，双源 CT 肝动脉三期扫描与增强灌注扫描对肝背景下小肝癌的诊断效能比较差异无统计学意义 (Z 值=1.012, P 值=0.312)。结论 双源 CT 肝动脉三期扫描有助于发现肝硬化背景下小肝癌病灶，增强灌注扫描可有效评估患者肝硬化程度与分化程度，二者在诊断肝硬化背景下小肝癌中均具有良好的价值。

PO-1972

基于三期增强 CT 影像组学和临床特征在小肾透明细胞癌鉴别诊断中的应用分析

乔冠中

哈尔滨医科大学附属第二医院

目的 探讨基于三期增强 CT 的影像组学和临床特征在小肾透明细胞癌与小肾非透明细胞癌的鉴别诊断中的应用价值。

方法 回顾性研究共计 112 例(透明细胞癌 75 例，非透明细胞癌 27 例)经病理诊断为肾细胞癌的患者，包括性别、年龄、肿瘤最大径、肿瘤位置(左肾或右肾)、出血、钙化、囊变坏死、中心瘢痕、假包膜在内的临床信息及患者的增强三期 CT 图像，在每一期的图像上逐层勾画 ROI；提取病灶的纹理特征；利用方差阈值法、K 最佳法、Lasso 模型进行降维筛选，分别在皮质期、实质期、排泄期筛选出来 20、11、14 个最佳特征；利用这些影像组学特征和具有统计学意义的临床特征构建基于 SVM 模型的单期、两期联合、三期联合分类器模型；通过受试者工作特征 (ROC) 曲线和校准曲线来评价模型的性能。

结果 患者仅假包膜一项临床信息与小肾癌的病理类型的差异具有统计学意义($P=0.017$)，其余的临床信息包括：性别、肿瘤位置、出血、钙化、囊变坏死、中心瘢痕、年龄、肿瘤最大径与小肾癌病理类型的差异均无统计学意义($P>0.05$)；在测试集上，实质期模型达到了 $AUC = 0.59$ ，排泄期模型达到 $AUC=0.60$ ，皮质期加实质期模型达到 $AUC=0.75$ ，皮质期加排泄期模型达到 $AUC=0.77$ ，实质期加排泄期模型达到 $AUC=0.73$ ，三期联合模型达到 $AUC=0.73$ 。皮质期模型表现最佳： $AUC = 0.79$ 。

结论 基于皮质期增强 CT 的影像组学与临床特征可用于小肾透明细胞癌和小肾非透明细胞癌的鉴别诊断。

PO-1973

基于营养学深度学习模型的慢加急性肝衰竭患者 90 天不良预后预测

彭云松、张茜、王荣品

贵州省人民医院

目的：慢加急性肝衰竭 (ACLF) 是一种以急性失代偿 (AD) 为特征的综合征，伴有慢性肝病和器官衰竭 (肝内或肝外)，导致短期死亡率高。有效识别预后不良的患者并进行早期干预是挽救患者

生命的关键。因此,本研究旨在应用深度学习提取 ACLF 患者的营养影像学特征,构建营养学深度学习预后预测模型。通过独立验证集,验证该模型对 ACLF 患者 90 天不良预后的预测准确性。

方法: 从 2020 年 7 月至 2022 年 7 月,从我院招募 163 名符合 APSAL 诊断标准并有随访记录的 ACLF 患者。这些患者被随机分配到训练集 ($n = 99$) 和测试集 ($n = 64$)。在增强 CT 动脉期获得第三腰椎骨骼肌、皮下脂肪和内脏脂肪的感兴趣区 (ROI), 三个 ROI 区域与患者的营养学水平相关。本研究将三个 ROI 区域分别提取,叠加为一个三层的图像作为深度学习模型输入,通过基于 Transformer 模块的三组特征提取模块,最终使用全连接层将营养学相关图像特征与血常规、血液生化、凝血功能和甲胎蛋白信息进行融合,并预测患者结局。研究终点是 ACLF 患者的 90 天无肝移植生存率。

结果: 在训练集和测试集中,分别有 30.3% (30/99) 和 29.7% (19/64) 的患者出现疾病进展 (死亡或肝移植)。该模型在训练集中的曲线下面积 (AUC) 为 0.904 (95% CI 0.879-0.957), 灵敏度和特异度分别为 0.875 和 0.854; 在测试集中的曲线下面积 (AUC) 为 0.811 (95% CI 0.753-0.932), 灵敏度和特异度分别为 0.845 和 0.681。Dlong 检验用于比较营养学深度学习模型与子模型 (单一影像模型和单一临床模型) 和传统经典模型 (MELD 和 MELD-Na) 的 AUC。结果显示,营养学深度学习模型优于上述任何一种模型 ($P < 0.05$)。

结论: 基于营养学深度学习模型能有效预测 ACLF 患者 90 天的不良预后。这一综合模型可为临床实践提供一种新颖而有价值的方法,以尽早发现需要积极干预的患者,从而提高 ACLF 患者的生存率。

PO-1974

新型 ^{18}F 放射性标记分子探针用于高表达 GPC3 肝细胞癌的 PET 成像

陈铨^{1,2}、Xiaoyun Zhou²、Juno Van Valkenburgh²、Peter Conti²、Kai Chen²、郑传胜¹

1. 华中科技大学同济医学院附属协和医院

2. Keck School of Medicine, University of Southern California, USA

目的: Glypican-3 (GPC-3) 是一种细胞表面蛋白多糖,在肝癌 (HCC) 细胞膜上过度表达。本研究旨在开发一种靶向特异性放射性标记氟化肽,用于正电子发射断层扫描 (PET) 成像检测高 GPC3 表达的肝细胞癌。

方法: 采用 Click 化学方法合成了一种新的 GPC3 结合肽 (GP3239), 并利用氟化铝标记法对其进行了快速的 ^{18}F 放射性标记。随后对得到的 PET 探针进行了生物学评估。GP3239 中螯合一个高亲水性连接体,以减少探针在肝脏中的吸收,提高肿瘤与背景的总对比度。对 ^{18}F 标记肽的辛醇-PBS 分配系数、细胞摄取量和稳定性进行了测试。通过对肝癌荷瘤肿瘤小鼠进行 PET 成像,明确 $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 的肿瘤靶向性及其体内生物分布。

结果: $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 可快速进行合成,放射化学纯度极高 ($>98\%$)。经测定, $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 具有亲水性,测得的 LogP 值为 -3.58 ± 0.02 ($n = 5$)。 $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 表现出良好的体外稳定性,以及在 GPC3 表达阳性 HepG2 肝癌细胞系中良好的特异性。在 PET 成像中,注射后 1 小时, $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 在 HepG2 肿瘤中摄取良好 ($\%ID/g: 1.97 \pm 0.45$),而在肝脏中蓄积极少 ($\%ID/g: 0.52 \pm 0.29$),因此肿瘤与肝脏 (T/L) 对比良好。生物分布结果与 PET 研究结果一致。

结论: $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 是对 HCC 中 GPC3 表达进行 PET 成像的一种有前景的探针。 $\text{Al}[^{18}\text{F}]\text{F-GP3239}$ 的放射合成方便、对 HCC 中的 GPC3 具有极好的特异性以及良好的排泄特性,值得进一步研究以实现临床转化。使用 GPC3 特异性探针进行 PET 成像将为临床医生提供有价值的信息,从而对 HCC 患者的治疗产生重大影响。

PO-1975

构建预测结直肠癌 POLE 致病突变的影像组学模型

管真、张晓燕、朱海涛、孙应实
北京大学肿瘤医院

目的: POLE 致病突变在结直肠癌较为罕见, 由于其对于免疫治疗较为敏感, 因此早期准确筛选、识别 POLE 致病突变患者具有重要的临床意义。本研究拟基于基线 CT 图像, 应用影像组学构建预测结直肠癌患者 POLE 致病突变的预测模型。

材料与方法: 回顾性连续收集 2008 年 1 月至 2022 年 6 月多家医学中心通过高通量测序明确 POLE 基因状态的结直肠癌患者。将 POLE 致病突变、非致病突变/野生型患者以 7:3 比例随机划分为训练集及验证集。采用 3D-Slicer 软件手动勾画感兴趣区 (ROI), 包括 ROI 1 静脉期图像中原发灶、ROI 2 原发灶周围脂肪组织密度异常的区域。应用 Pyradiomics 3.0.1 提取全部患者 ROI 影像特征。在训练组两组样本间进行 t 检验, 保留 P 值 < 0.05 的特征, 然后进行两两特征之间的相关检验, 淘汰相关系数绝对值 > 0.5 的一对特征中 t 值较小的特征, 使用逻辑回归联合 LASSO 回归, 在其中选取用于构建模型的特征用于模型构建。

结果: 训练集纳入 17 例 POLE 致病突变患者及 62 例非致病突变/POLE 野生型 CRC 患者, 验证集纳入 8 例 POLE 致病突变及 32 例非致病突变/POLE 野生型 CRC 患者。基于原发灶及原发灶周围脂肪组织 2 个 ROI 分别提取 851 个特征, 共得到 1702 个特征。利用逻辑回归和 LASSO 回归, 筛选出 4 个特征用于模型构建, 根据建模权重得到影像学评分, 结合临床病理特征, 使用 Logistic 回归构建临床-影像组学联合预测模型。训练集中, 临床模型、影像组学模型、联合模型诊断的 AUC 值分别为 0.845、0.901、0.961; 灵敏度均为 1.000; 特异度分别为 0.532、0.645、0.839。验证集中, 临床模型、影像组学模型、联合模型诊断的 AUC 值分别为 0.789、0.887、0.906; 灵敏度分别为 0.875、1.000、0.750; 特异度分别为 0.562、0.656、1.000。

结论: 本研究基于结直肠癌原发灶及其周围脂肪组织基线 CT 图像特征, 构建的影像组学模型对于 POLE 致病突变具有较好的预测效能, 有助于筛选出免疫治疗潜在受益的结直肠癌患者。

PO-1976

基于机器学习的影像特征在鉴别肾上腺增生
和乏脂肪腺瘤中的诊断价值

白鑫、张古沐阳、许梨梨、张晓霄、张家慧、陈丽、彭倩瑜、郭二嘉、金征宇、孙昊
中国医学科学院北京协和医院

目的: 肾上腺增生与腺瘤在临床表现上相似, 但治疗方法不同。肾上腺增生通常采用药物治疗, 而腺瘤则需要手术干预。乏脂肪的肾上腺病变在临床及影像学上均难以准确区分是增生还是腺瘤。本研究旨在探讨机器学习算法在区分肾上腺增生与乏脂肪腺瘤方面的适用性和潜在价值。

方法: 回顾性分析 2019 年 1 月至 2020 年 10 月期间在我院接受腹部平扫及增强 CT 检查并经病理证实为肾上腺腺瘤和增生的患者 (病灶平扫 CT 值 > 10HU), 以 8: 2 的比例随机划分为训练集和测试集。在门脉期图像上勾画感兴趣区, 以确定病灶的平扫 CT 值、门静脉期 CT 值及腹主动脉门静脉期 CT 值, 并计算病灶的绝对增强 (门脉期 CT 值 - 平扫 CT 值)、相对增强 [(绝对增强 / 平扫 CT 值) × 100%] 及相对增强比 [(绝对增强 / 腹主动脉门静脉期 CT 值) × 100%]。此外, 测量病灶的最大径, 记录病灶数量, 使用 ITK-snap 软件分别测量病灶及肾上腺的体积并计算二者体积比。结合具有显著相关性的临床特征, 使用随机森林、逻辑回归、神经网络、梯度提升以及朴素贝叶斯等机器学习算法分别建立相应的预测模型。使用受试者工作特征曲线 (ROC) 和曲线下面积 (AUC) 评估各类模型的分类性能。

结果: 研究共纳入 128 例患者 (83 例腺瘤, 45 例增生), 随机森林模型及神经网络模型均表现出最佳的分类性能 (训练集 AUC=1.000, 测试集 AUC=0.938), 优于梯度提升模型 (训练集 AUC=1.000, 测试集 AUC=0.931)、朴素贝叶斯模型 (训练集 AUC=0.834, 测试集 AUC=0.925) 及逻辑回归模型 (训练集 AUC=0.871, 测试集 AUC=0.906)。

结论: 结合影像特征和临床特征的机器学习算法在区分肾上腺增生和乏脂肪腺瘤方面表现出优越性, 有助于降低将肾上腺增生误诊为腺瘤的概率, 避免不必要的手术治疗对肾上腺增生患者的风险。

PO-1977

卵巢甲状腺肿的术前影像学诊断及鉴别

王进进¹、蔡宋琪²、周建军²、曾蒙苏²、计一丁¹

1. 苏州市第九人民医院

2. 复旦大学附属中山医院

目的 通过对照分析卵巢甲状腺肿 (struma ovarii, SO) 与 I 期卵巢上皮来源恶性肿瘤 (Epithelial Ovarian Cancer, EOC) 的术前临床资料及影像学资料, 总结 SO 的临床特点及影像学特征。方

法 回顾性分析经手术及病理确诊的 42 例 SO 与 40 例 I 期 EOC 患者的临床资料及影像学资料, 临床资料包括症状、年龄、肿瘤指标 (CA125、HE4 和 CA19-9)。影像学资料包括: 病变部位、数目、大小、形态、质地、囊壁及分隔厚度、CT 密度和 MRI 信号特征、强化方式及程度等。比较两组患者的临床指标及影像学特征是否有统计学差异。通过多参数回归分析明确独立预测因素, 并计算联合诊断效能。结果 两组患者的 CA125 ($P<0.001$) 及 HE4 ($P<0.001$) 是否升高、绝经后阴道流血症状 ($P=0.005$) 均具有统计学差异。两组肿瘤质地、蜂房、壁结节、囊液密度、实性信号、肿块强化方式及程度的差异均有统计学意义 ($P<0.05$); 其中 CA125 及肿块强化程度是独立预测因素 ($P=0.022$, $OR=0.128$; $P=0.002$, $OR=11.148$), 两者联合诊断的特异性达 90.0%。结论 SO 与 I 期 EOC 在临床症状、肿瘤标志物及影像学特征上均有差异。其中 CA125 是否升高及肿瘤实性成分的强化程度是两者鉴别诊断的独立预测因素。

PO-1978

结肠癌影像 T 分期诊断流程及其效能评价

管真、孙应实
北京大学肿瘤医院

目的: 本研究拟前瞻性分析穿壁动脉异常影像学表现及肠壁外缘光滑或毛糙等原发灶分期相关 CT 影像特征在不同病理 T 分期 (pT) 中的分布差异, 在此基础上提出影像 T 分期 (rT) 诊断流程, 接下来在回顾性、多中心研究中进一步验证 rT 的诊断效能, 分析 rT 的预后价值以佐证其可靠性, 从而提高结肠癌术前分期的准确性及可重复性, 为临床决策的制定提供依据。

方法: 前瞻性连续收集我院 2021 年 5 月-2021 年 12 月的结肠癌患者共 101 例, 分析不同 pT 中原发灶分期相关影像特征的分布差异, 提出 rT 诊断流程; 回顾性连续收集两家医学中心 2016 年 1 月-2017 年 12 月的结肠癌患者共 179 例, 计算 rT 及常规 T 分期 (cT) 诊断 T 分期的准确性, 采用单因素 Cox 回归分析和 Kaplan-Meier 曲线评估其与预后的相关性, 计算风险比及 95% 置信区间。

结果: pT1-4b 期中原发灶分期相关影像特征的分布存在明显差异, 包括肿瘤外缘是否光滑、肿瘤是否侵透肠壁全层、肿瘤周围脂肪间隙是否清晰、小动脉征及肿瘤是否侵犯邻近器官 (P 均 <0.05)。回顾性队列中, rT 诊断 T 分期的准确率、过分期率、分期不足率分别为 89.9%、3.9%、6.1%。cT 诊断 T 分期的准确率、过分期率、分期不足率分别为 52.0%、32.4%、15.6%。其中, 影像过分期、病理诊断为 T3 的病例中, 49 例被判断为 cT4a, 仅有 4 例被判断为 rT4a; 影像过分期

期、病理诊断为 T1-2 的病例中, 7 例被判断为 cT3-4a, 仅有 2 例被判断 rT3。影像分期不足、病理诊断为 T4a 的病例中, 18 例被判断为 cT3, 10 例被判断为 rT3。Kaplan-Meier 生存分析曲线显示 rT、pT 分期与患者的 OS、MFS 显著相关 (rT: $P=0.003$ 、 $P=0.010$; pT: $P=0.001$ 、 $P<0.001$); 而不同 cT 分期中, 患者的 OS、MFS 并无显著差异 ($P=0.457$ 、 $P=0.052$)。

结论: 本研究基于原发灶分期相关的 CT 影像特征提出结肠癌 rT 诊断流程, 并且在多中心研究中证实 rT 判断 T 分期的准确性及其预后价值。rT 诊断流程能够为术前准确地判断结肠癌 T 分期提供有价值的指导, 为临床制定治疗决策提供有意义的参考。

PO-1979

CT 在食管尖锐异物诊断中的应用: 病例回顾分析与 CT 食管碘水造影模具实验研究

郝璐雯^{1,2}、姜宇晨¹、王雨梵¹、胡学梅¹、胡道予¹、李震¹、沈亚琪¹

1. 华中科技大学同济医学院附属同济医院

2. 泰康同济(武汉)医院

目的: 回顾分析食管尖锐异物病例的影像与临床资料, 并联合体外模具实验筛选 CT 食管碘水造影中不同浓度规格对比剂的最佳稀释比例, 旨在探讨 CT 在食管尖锐异物诊断和随访中的应用, 并解决目前 CT 食管碘水造影检查中对比剂稀释比例混乱、标准不一的问题。

方法: 回顾本中心十年内(2012 年 10 月至 2022 年 10 月)因食管尖锐异物入治疗的病例, 分析患者的影像及临床资料。在模拟 CT 食管造影检查的体外实验研究中, 将 4 种浓度规格(320 mgI/mL、350 mgI/mL、370 mgI/mL、400 mgI/mL)的碘对比剂原液分别按 21 种比例稀释后进行常规 CT 扫描(采用 3 种常用管电压 80 kVp、100 kVp、120 kVp)与双能 CT 扫描, 对图像质量进行客观和主观评估。

结果: 本研究共纳入食管尖锐异物 241 例: 所有患者异物取出前的 CT 检查均检测到异物的存在; 最初入院时 CT 提示穿孔 155 例(155/241, 64.32%); 临床证实 12 例(12/241, 4.98%)患者在治疗后仍存在穿孔; CT 检查可以发现 25 例(25/226, 11.06%)内镜漏诊的异物和 2 例(2/12, 16.67%)X 线食管碘水造影阴性的异物穿孔。通过模具实验发现不同稀释比例 CT 图像之间的客观评估参数的差异有统计学意义($P<0.05$); 并进一步通过主观图像质量评分, 筛选出可获得高质量图像的稀释比例: 以 100 kVp 扫描为例, 浓度为 320 mgI/mL 的最佳稀释比例为 1: 6~1: 19, 其余 3 种浓度均为 1: 8~1: 19。此外, 双能 CT 扫描被证明可以在降低辐射剂量的同时显著降低模具实验图像的硬化伪影。

结论: 对于临床高度怀疑但内镜未能发现的异物和治疗后 X 线食管碘水造影阴性但患者病情无明显改善的穿孔病例, 应补充 CT 检查; 根据模具实验得到碘对比剂的最佳稀释比例, 为 CT 食管碘水造影技术的临床应用提供依据。

PO-1980

增强 T2*血管加权成像预测肝细胞癌肝切除术后早期复发的价值

左桢¹、赵莹²、李佳奕¹、任雪²、张倩瑜²、王楠²、宋清伟²、刘爱连²

1. 大连医科大学医学影像学院

2. 大连医科大学附属第一医院放射科

目的: 探讨增强 T2*血管加权成像(enhanced T2-star weighted angiography, ESWAN)预测肝细胞癌肝切除术后早期复发的价值。

方法：回顾性收集进行上腹 MRI 检查（包括 ESWAN 序列）且接受肝切除术的肝细胞癌患者 29 例（早期复发（ER）15 例，早期未复发（NER）14 例）。在 AW 4.6 工作站（GE Healthcare），使用 Functool 软件自动生成 ESWAN 定量参数图，包括幅度图、相位图、R2*图和 T2*图。参照 T2WI 图像，在病变的最大层面，分别于肿瘤、瘤周区域（1cm 内）及远瘤周正常肝实质（5cm 内）各放置 3 个大小相等的类圆形感兴趣区域（ROI），记录幅度值、相位值、R2*值和 T2*值。使用 3 个 ROI 的平均值进行统计分析。采用 Kolmogorov-Smirnov 检验评估各参数的正态性，使用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异。使用受试者操作特征（ROC）分析评估诊断性能。

结果：ER 组的幅度值(肿瘤)、幅度值(瘤周)、幅度值(肝值)、R2*(肿瘤)、R2*(瘤周)和 R2*(肝)显著高于 NER 组，差异具有统计学意义（ $P<0.05$ ）。余定量参数在两组间的差异无统计学意义（ $P>0.05$ ）。幅度值(肿瘤)、幅度值(瘤周)、幅度值(肝)、R2*(肿瘤)、R2*(瘤周)、R2*(肝)预测早期复发的曲线下面积（AUC）分别为 0.590、0.600、0.681、0.890、0.924 和 0.929。当幅度值(肿瘤)、幅度值(瘤周)、幅度值(肝)、R2*(肿瘤)、R2*(瘤周)和 R2*(肝)参数联合时，预测效能升高（AUC=0.971）。

结论：ESWAN 序列的多个定量参数对预测肝细胞癌肝切除术后早期复发具有一定的价值。

PO-1981

APT 联合 T1-mapping 预测前列腺癌神经侵犯的可行性研究

王芋楠、陈丽华、宋清伟、刘爱莲
大连医科大学附属第一医院

目的：探索酰胺质子转移成像（Amide proton transfer, APT）联合 T1-mapping 预测前列腺癌神经侵犯的可行性。

方法：回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 60 例，其中无神经侵犯组（A 组）40 例，有神经侵犯组（B 组）20 例。所有患者均行 APT 和 T1-mapping 扫描。扫描图像上传至 ISP（IntelliSpacePortall, Philips Healthcare），由两名观察者分别于病灶显示最大层面测量两组病变的 APT 值、T1 值。采用组内相关系数（ICC）检验两名观察者测量结果的一致性；采用独立样本 t 检验比较两组病变各参数值的差异；采用受试者工作特征（receiver operating characteristic curve, ROC）曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能；采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果：两名观察者测量各组数据的一致性良好（ $ICC>0.75$ ）。A 组 APT 值[（ 2.40 ± 0.49 ）%]低于 B 组 APT 值[（ 2.74 ± 0.75 ）%]，A 组 T1 值[（ 1191.26 ± 252.98 ）ms]高于 B 组 T1 值[（ 1043.62 ± 294.88 ）ms]，差异均有统计学意义（ $P<0.05$ ）。APT 值、T1 值及二者联合鉴别两组病变的 ROC 曲线下面积分别为 0.606、0.638 及 0.702。单独及联合诊断效能间无统计学差异（ $P>0.05$ ），两参数联合的诊断效能优于单独诊断效能。

结论：APT 值、T1 值可用于预测前列腺癌神经侵犯，两者联合的诊断效能有所提升，具有很好的临床应用前景。

PO-1982

APT 联合 T2-mapping 预测前列腺癌神经侵犯的可行性研究

宋嘉琦、陈丽华、宋清伟、刘爱连
大连医科大学附属第一医院

目的:探索酰胺质子转移成像(Amide proton transfer, APT)联合 T2-mapping 预测前列腺癌神经侵犯的可行性。

方法:回顾性分析本院行 3.0T MR 扫描并经病理证实的前列腺癌 56 例,其中无神经侵犯组(A 组) 38 例,有神经侵犯组(B 组) 18 例。所有患者均行 APT 和 T2-mapping 扫描。扫描图像上传至 ISP(IntelliSpacePortall, Philips Healthcare),由两名观察者分别于病灶显示最大层面测量两组病变的 APT 值、T2 值。采用组内相关系数(ICC)检验两名观察者测量结果的一致性;采用独立样本 t 检验比较两组病变各参数值的差异;采用受试者工作特征(receiver operating characteristic curve, ROC)曲线评估有差异参数单独及联合对两组病变鉴别诊断的效能;采用 Delong 检验比较各参数及联合参数诊断效能的差异。

结果:两名观察者测量各组数据的一致性良好(ICC>0.75)。A 组 APT 值[(2.41±0.52)%]低于 B 组 APT 值[(2.79±0.77)%], A 组 T2 值[(77.76±8.55) ms]

高于 B 组 T2 值[(72.95±6.98) ms],差异均有统计学意义(P<0.05)。APT 值、T2 值及二者联合鉴别两组病变的 ROC 曲线下面积分别为 0.610、0.650 及 0.709。单独及联合诊断效能间无统计学差异(P>0.05),两参数联合的诊断效能优于单独诊断效能。

结论:APT 值、T2 值可用于预测前列腺癌神经侵犯,两者联合的诊断效能有所提升,具有很好的临床应用前景。

PO-1983

基于肝脏普美显的人工智能研究

李金
吉林大学第一医院

目的:本文主要就普美显 MRI 在肝癌影像诊断过程中的数据信息进行了探究分析

方法:就本院收治的 20 例肝癌患者作为研究对象,并对所有患者的 MRI 诊断检查资料进行回顾性分析

结果:对肝癌患者进行普美显 MRI 检查,其具备良好的诊断准确率以及诊断特异性

结论:借助于人工智能的统计能够使得肝癌的检出率得到大幅度的提升,并能够对肝癌的信号变化特点、分化程度进行有效的提供,从而给予治疗方案以及预后方案的针对性制定提供足够多的诊断依据,值得临床应用跟推广。

PO-1984

MRI DWI 评估肝纤维化的最佳 b 值组合

袁杰、谭文莉、詹松华
上海中医药大学附属曙光医院

目的

扩散加权成像 (DWI) 被认为可以用于评估肝纤维化。但是其用于肝纤维化分期的最佳 b 值组合目前还没有达成共识。本研究拟以穿刺活检作为对照, 确定能够准确评估肝纤维化的 DWI 的最佳 b 值组合。

材料和方法

本研究招募 81 名慢性肝病患者 (平均 49 岁, 24-75 岁) 和 21 名健康志愿者 (平均 45 岁, 26-65 岁)。应用联影 uMR790 进行 DWI 扫描, 具体扫描参数为: TR/TE 为 4000/78 ms, 层厚 5 mm, FOV=300 mm x 380 mm, b 值分别为 0、50、100、150、200、800、1000、1200 和 1500 s/mm²。用于计算 ADC 值得 b 值组合为 20 组 (0-800、0-1000、0-1200、0-1500、50-800、50-1000、50-1200、50-1500、100-800、100-1000、100-1200、100-1500、150-800、150-1000、150-1200、150-1500、200-800、200-1000、200-1200、00-1500)。

结果

健康志愿者 ADC 值均显著高于肝纤维化组 ($P < 0.01$)。随着肝纤维化进展, ADC 值在 b 值组合 (100 和 1000 s/mm², 150 和 1200 s/mm², 200 和 800 s/mm², 200 和 1000 s/mm², $P < 0.01$) 中的 ADC 值显著降低。ADC₁₀₀₋₁₀₀₀、ADC₁₅₀₋₁₂₀₀、ADC₂₀₀₋₈₀₀ 和 ADC₂₀₀₋₁₀₀₀ 区分 METAVIR F1 和 F2-4 受试者曲线下面积 (ROC) 分别为 0.693、0.785、0.774 和 0.756。区分 F1-2 和 F3-4 期肝纤维化的 ROC 分别为 0.713、0.680、0.802 和 0.769。区分 F1-3 和 F4 期肝纤维化的 ROC 分别为 0.728、0.705、0.834 和 0.779。

结论

DWI 的技术可以表征肝纤维化, 并提供肝纤维化程度的信息。临床上推荐 b 值为 200-800 s/mm² 或 200-1000 s/mm² 两种组合来评估肝纤维化。b 值为 200 和 800 s/mm² 时效果可能更好。

PO-1985

计算机视觉处理生成的能谱 CT 斜率参数图图像质量及定性诊断
克罗恩病的效能评价

岳鑫、林子楹、钟华、洪敏、杨丹、张燕
厦门大学附属中山医院

目的: 探讨经计算机视觉处理生成的斜率参数图的图像质量及其定性诊断克罗恩病的价值。

方法: 收集经能谱 CTE 及结肠镜检查确诊克罗恩病患者 76 例及无病对照组 53 例。在主机自带的工作站上重建门脉期 120kVp-like、40-100keV 虚拟单能量图像 (VMI₄₀₋₁₀₀), 使用 Python 软件生成 40-100keV 斜率参数图 (K₄₀₋₁₀₀ 图), 测量计算正常肠壁、病变部位的信噪比 (SNR) 和对比噪声比 (CNR)。采用 5 分法对各组总体图像质量、噪声及对比度进行主观评分。两名放射科医师独立评估 120kVp-like、120kVp-like + 最佳 VMI 及 120kVp-like + K₄₀₋₁₀₀ 图, 使用 5 分置信量表诊断是否存在克罗恩病。比较各组客观参数和主观图像质量评分, 采用 ROC 曲线评价两名医师三种阅片方式诊断克罗恩病的效能。

结果:

1、各组图像 SNR 组间均无统计学差异, 对照组 (4.02, 7.26)、病例组 (5.82, 9.39) K₄₀₋₁₀₀ 图 CNR 高于对照组 (-2.22_{VMI100}, 5.34_{VMI40})、病例组 (0.19_{VMI100}, 13.42_{VMI40}) VMI₅₀₋₁₀₀ 和对照组 (-0.05, 1.91)、病例组 (2.18, 4.46) 120kVp-like 图 ($P < 0.05$)。

2、主观评价, K_{40-100} 图的对比度 (5-5) 高于 VMI_{50-100} (2-5) 和 120kVp-like 图 (3-4) ($P < 0.05$)。 VMI_{40} 与 VMI_{50} 的对比度高于 VMI_{60-100} 和 120kVp-like 图像 ($P < 0.05$)。 VMI_{50} 图像的总体图像质量优于其余各组图像 ($P < 0.05$)。

3、120kVp-like + K_{40-100} 图联合诊断克罗恩疾病诊断效能 (AUC: 0.973-0.977) 高于 120kVp-like 图像 (AUC: 0.913-0.931) 和 120kVp-like + VMI_{50} 联合诊断 (AUC: 0.949-0.962)。

结论: 由计算机视觉处理生成的 K_{40-100} 图图像质量好, 与 120kVp-like 联合诊断可提高放射科医师对克罗恩病的诊断效能及诊断信心。

PO-1986

术前超重/肥胖和脂肪组织分布对胃癌预后的价值: 一项回顾性队列研究

张扬帆¹、郑屹峰¹、张景峰²、郑建军²

1. 湖州市中心医院

2. 宁波市第二医院 (原: 宁波华美医院)

目的: 肥胖与肿瘤预后之间的相关性一直存在争议, 在大多数研究中, 肥胖常被用作辅助参数而未被进一步分析, 其中脂肪组织分布对肿瘤长期预后的影响研究尚缺乏。计算机断层扫描 (CT) 是分析脂肪组织成分的金标准方法, 本研究拟采用 CT 评估胃癌患者术前的脂肪组织分布, 探讨超重/肥胖和脂肪组织分布与胃癌长期预后之间的关系。

方法: 本回顾性队列研究共纳入了 607 例胃癌患者, 其中身体质量指数 (BMI) 大于 25 kg/m² 的患者被定义为超重/肥胖。入组患者在胃癌手术前 15 天内进行腰椎 CT 检查, 并使用 SliceOmatic 软件的 ABACS 自动分割模块测定第三腰椎水平的脂肪组织分布参数, 包括内脏脂肪组织 (VAT)、皮下脂肪组织 (SAT) 和 VAT/SAT 比率。在调整包括年龄、性别、T 分期、N 分期和化疗等协变量后, 应用多元 Cox 回归模型评估超重/肥胖与胃癌特异性生存期 (DSS) 之间的相关性。此外, 除上述协变量外, 对超重/肥胖也进行了额外调整, 并采用多元 Cox 回归模型评估胃癌患者脂肪组织分布参数与 DSS 之间的相关性。

结果: 超重/肥胖是胃癌预后的预测因素 (HR=0.61, 95%CI:0.37–0.99), 与非超重/肥胖的患者相比, 超重/肥胖患者的预后明显更好 ($p=0.009$)。在对超重/肥胖进行调整后, 高 SAT 百分比是胃癌 DSS 的独立保护因素 (HR=0.59, 95%CI:0.36–0.96), 而高 VAT 百分比 (HR=1.68, 95%CI:1.06–2.68) 和高 VAT/SAT 比率 (HR=1.99, 95%CI:1.19–3.34) 是胃癌 DSS 的独立危险因素。与其他患者 (超重/肥胖伴低 VAT/SAT 比率、非超重/肥胖或高 VAT/SAT 比率) 相比, 非超重/肥胖症伴高 VAT/SA 比率的患者预后较差 (HR=1.89, 95%CI:1.28–2.77)。

结论: 超重/肥胖是胃癌预后的预测因素, VAT/SAT 比率可作为胃癌的一个有前景的预后因素, 因此, 在胃癌患者术前评估中, 不仅要注意 BMI, 还要注意脂肪组织的分布。

PO-1987

体素内不相干运动成像与宫颈癌病理学特征的相关性

周婷婷

泰州市人民医院

目的：本研究主要探讨了宫颈癌组织病灶边缘区和中央区的扩散加权成像（DWI）和体素内不相干运动成像（IVIM）各参数值的临床统计学意义，并进一步探讨病灶最佳区域的各参数与宫颈癌病理学特征的相关性。

方法：收集宫颈癌患者 46 例，对每个病灶的 DWI 和 IVIM 图像分别进行边缘区和中央区的感兴趣区（ROI）的绘制。根据手术或穿刺病理结果分为宫颈鳞癌组 39 例和腺癌组 7 例，鳞癌组进一步分为高、中、低分化。各自比较分析出病灶边缘区和中央区各参数的统计学意义。

结果：不同分组间的边缘区数据测量的 ADC 值和 D 值较中央区更具有统计学意义。宫颈鳞癌边缘区的 ADC 值和 D 值低于腺癌，差异具有统计学意义（ $P < 0.05$ 、 $P < 0.01$ ），D 值具有最优的鉴别能力，阈值分别为 $1.10 \times 10^{-3} \text{mm}^2/\text{s}$ 和 $0.83 \times 10^{-3} \text{mm}^2/\text{s}$ ，敏感度为 94.9%、94.9%，特异度为 71.4%、85.7%。在鉴别宫颈癌鳞癌中、低分化中，D 值具有最优的鉴别能力，ADC 值和 D 值的阈值为 $0.93 \times 10^{-3} \text{mm}^2/\text{s}$ 和 $0.76 \times 10^{-3} \text{mm}^2/\text{s}$ ，敏感度为 100%、87.5%，特异度为 81.8%、100%。在鉴别宫颈癌鳞癌高、低分化中，ADC 值和 D 值 ROC 曲线下面积 AUC 值相等（0.96），阈值为 $0.92 \times 10^{-3} \text{mm}^2/\text{s}$ 和 $0.77 \times 10^{-3} \text{mm}^2/\text{s}$ ，敏感度为 100%、91.7%，特异度为 81.8%、100%。

结论：颈癌病灶边缘区的 DWI、IVIM 各参数值较中央区各参数值更具有统计学意义；在宫颈鳞癌和腺癌的鉴别方面，边缘区的 D 值具有最佳诊断效能，其次是边缘区的 ADC 值；在鉴别宫颈癌鳞癌中分化和低分化中，边缘区的 D 值具有最优鉴别能力；在鉴别宫颈癌鳞癌高分化和低分化中，边缘区的 ADC 值和 D 值具有同等鉴别能力。

PO-1988

直肠癌/直肠系膜脂肪 CT 影像组学预测局部淋巴结转移

曾淑敏、容鹏飞

中南大学湘雅三医院

目的：提取中低位直肠癌病灶以及直肠系膜脂肪影像学特征，联合临床相关因素构建模型来预测接受中低位直肠癌根治性手术的患者淋巴结转移的情况。

方法：回顾性分析中南大学湘雅三医院 2014 年 11 月至 2018 年 12 月的 232 例中低位直肠癌根治性手术患者的临床资料及影像数据，所有患者按照 7: 3 的比例随机分成训练组（ $N=162$ ）和验证组（ $N=70$ ）。

结果：232 例中低位直肠癌患者中有 92（39.7%）例患者有淋巴结转移，140（60.3%）例患者没有淋巴结转移。（1）经过单因素特征筛选及 LASSO 算法降维后，在病灶及直肠系膜脂肪中分别选择 19、17 个特征用来建立模型。在训练组中，病灶 ROI、直肠系膜脂肪 ROI 及两者结合的影像组学结合模型的 AUC 值分别为 0.796(95%CI: 0.721, 0.856), 0.747(95%CI: 0.667, 0.817), 0.840 (95%CI: 0.776, 0.903)；在验证组中，病灶 ROI、直肠系膜脂肪 ROI 及两者结合的影像组学结合模型的 AUC 值分别为 0.768(95%CI: 0.635, 0.861), 0.766(95%CI: 0.638, 0.865), 0.816 (95%CI: 0.697, 0.897)。影像组学结合模型的效能最佳。（2）将筛选出的 ctEMVI、ctTDs 及 ctNsII 三个危险因素纳入临床模型，临床模型在训练组和验证组中的 AUC 值分别为 0.750 (95%CI: 0.616, 0.863), 0.744 (95%CI: 0.538, 0.906)。

结论：基于肿瘤病灶及灶周直肠系膜脂肪影像组学联合临床因素构建的临床-影像组学联合模型显示了较好的预测性能，该模型可被用于预测接受中低位直肠癌根治性手术患者的淋巴结转移情况。

PO-1989

基于 CT 放射学列线图对肾透明细胞癌患者病理 T1-3 分期的个体化预测

于思文、王涛、胡兆申
哈尔滨医科大学

目的 评价基于 CT 扫描的多参数列线图对肾透明细胞癌 (ccRCC) 患者病理 T1-3 分期的个体化预测性能。

方法 回顾性分析哈尔滨医科大学 2020 年 6 月至 2023 年 4 月经病理学确诊为 ccRCC 的 188 例患者。基于 CT 扫描, 半自动化将腹部脂肪分割为皮下脂肪、内脏脂肪和肌间脂肪区域, 并计算腹部总脂肪量, 以获得相对内脏脂肪 (rVAF)。将所有参数依据身高归一化获得个体化内脏脂肪体积 (VAFI)、皮下脂肪体积 (SAFI)、肌间脂肪体积 (IMAF)。选择并组合与病理 T (pT) 分期相关的最佳影像学特征及临床特征, 通过多变量 logistic 回归分析建立放射学诺莫图, 并对其进行评估和验证 (区分度和有用性)。此外, 还评估了不同性别亚组中 rVAF 的预测能力。

结果 纳入 3 个 (肿瘤直径、IMAF、rVAF) 最佳的特征, 基于腹部脂肪分布与量与临床参数相结合的诺莫图能够预测高 pT 分期 (ROC 曲线下面积 (AUC) = 0.846), 并在不同性别亚组中具有较好的预测能力 (AUC 分别为 0.824、0.866)。决策曲线分析表明, 此诺莫图具有临床应用价值。

结论 基于多参数 CT 测量的腹部脂肪联合临床参数建立的列线图可以实现对 ccRCC 患者高 pT 分期的个体化预测, 有可能提高术前对肾透明细胞癌的诊断分期水平。

PO-1990

基于 CT 影像组学联合身体成分预测 pMMR/MSS 型结直肠癌预后

邵芳、容鹏飞
中南大学湘雅三医院

目的: 开发并验证基于术前增强 CT 图像、临床特征和身体成分的模型, 以预测错配修复功能完整/微卫星稳定型 (pMMR/MSS) 结直肠癌 (CRC) 患者术后的总生存 (OS)。

方法: 回顾性纳入 2014 年 1 月至 2018 年 12 月期间中南大学湘雅三医院 135 名 pMMR/MSS CRC 患者, 收集其人口统计学、临床数据、术后病理及影像学资料, 并将患者分为训练队列 ($n = 90$) 和验证队列 ($n = 45$)。选取增强 CT 门脉期图像, 通过 3D-Slicer 勾画感兴趣区, 经 LASSO 降维、筛选特征; 通过 ImageJ 在 L3 椎体中份水平勾画身体成分, 计算相应面积及指数。

结果: 1) 从 851 个影像组学特征中筛选出 9 个最具统计学意义的特征, 其中小波特征数量超过三分之二, 且具有最佳预测效能的特征亦为小波特征。

2) 经单因素及多因素 Cox 分析, 结果显示与 pMMR/MSS CRC 患者术后 OS 显著相关的临床因素 (包含身体成分) 为病理 N 分期 (N1: OR = 4.13, 95%CI 1.42-11.97, $P = 0.009$; N2: OR = 7.73, 95%CI 2.71-22.03, $P < 0.001$) 和骨骼肌密度 (SMD) (OR = 0.94, 95%CI: 0.89-0.99; $P = 0.026$), 其余特征在本研究中无统计学意义。

3) 比较影像组学模型、临床模型、综合模型的预测性能, 发现综合模型在 3 年和 5 年 ROC 曲线中具有最高的 AUC 值 (3 年 AUC = 0.887、5 年 AUC = 0.891); 随后经 C 指数分析, 结果显示综合模型 C 指数值最高 (0.787, 95%CI: 0.869-0.705)。

结论： 综上，开发了基于增强 CT 影像组学、 临床数据及身体成分的预测模型，用于评估 pMMR/MSS CRC 患者的术后 OS。比较其性能， 发现综合模型在预测 pMMR/MSS CRC 患者术后长期 OS 方面性能最为优异，构建简洁实用的列线图，实现个体化治疗。

PO-1991

计算机视觉处理生成的能谱 CT 斜率参数图诊断克罗恩病的价值

岳鑫、林子楹、钟华、洪敏、杨丹、张燕
厦门大学附属中山医院

目的：探讨计算机视觉处理生成的能谱 CT 斜率参数图参数在克罗恩病诊断中的应用价值。

方法：收集经能谱 CTE 及结肠镜检查确诊克罗恩病患者 76 例及无病对照组 53 例，根据内镜活动评分 (SES-CD) 作为金标准确定正常及病变肠段，在主机自带的工作站上重建门脉期 120kVp-like、40-100 keV 虚拟单能量图像 (VMI₄₀₋₁₀₀)，使用 Python 软件生成 40-100keV 斜率参数图 (K₄₀₋₁₀₀ 图)，测量正常、病变肠壁及肠系膜脂肪部位动脉期及门脉期图像 K₄₀₋₁₀₀ 及 VMI₄₀₋₁₀₀ 的单能量 CT 值 (HU_{40-100keV})。采用 ROC 曲线评价以上两种定量参数对克罗恩病的诊断效能。

结果：

双期病变组肠壁及爬行脂肪的 K₄₀₋₁₀₀ 及 HU_{40-100keV} 均明显高于正常组 (P<0.001)。ROC 曲线显示动脉期病变肠壁 HU_{40keV} 诊断克罗恩疾病的曲线下面积最大 (AUC=0.948)，敏感度和特异度分别为 82.0%、100.0%，与 K₄₀₋₁₀₀ 无统计学差异 (AUC=0.946, 灵敏度: 89.8%, 特异度: 92.5%)；动脉期爬行脂肪 K₄₀₋₁₀₀ 在诊断克罗恩病的曲线下面积最大 (AUC=0.969)，敏感度和特异度分别为 88.0%、98.1%，高于 HU_{40keV} (AUC=0.935, 灵敏度: 83.8%, 特异度: 90.6%, P<0.05)。

结论：

计算机视觉处理生成的能谱 CT 斜率参数图 K₄₀₋₁₀₀ 值及单能量 CT 值在诊断 CD 具有临床应用价值；动脉期爬行脂肪的 K₄₀₋₁₀₀ 诊断效能优于 HU_{40-100keV}。

PO-1992

计算机视觉处理生成的能谱 CT 斜率参数图评估 克罗恩病活动度的价值

岳鑫、林子楹、钟华、洪敏、杨丹、张燕
厦门大学附属中山医院

目的：探讨计算机视觉处理生成的能谱 CT 斜率参数图参数在克罗恩病活动度评估中的应用价值。

方法：收集经能谱 CTE 及结肠镜检查确诊克罗恩病患者 76 例及无病对照组 53 例，根据内镜活动评分 (SES-CD) 标准确定缓解期、轻度活动期和中重度活动期肠段，在主机自带的工作站上重建门脉期 120kVp-like、40-100 keV 虚拟单能量图像 (VMI₄₀₋₁₀₀)，使用 Python 软件生成 40-100keV 斜率参数图 (K₄₀₋₁₀₀ 图)，测量正常、病变肠壁及肠系膜脂肪部位动脉期及门脉期图像 K₄₀₋₁₀₀ 及 VMI₄₀₋₁₀₀ 单能量 CT 值 (HU_{40-100keV})。采用 ROC 曲线评价两种定量参数对克罗恩病活动度评估的效能。

结果：双期中重度组病变肠壁及爬行脂肪的 K₄₀₋₁₀₀ 值及 HU_{40-100keV} 均高于非中重度组 (P<0.001)。ROC 曲线显示动脉期 HU_{40keV} 和 HU_{50keV} 诊断中重度克罗恩疾病的曲线下面积最大 (AUC=0.908)，敏感度和特异度分别为 88.1%、85.2%及 88.1%、84.3%，与 K₄₀₋₁₀₀ (AUC=0.902, 灵敏度: 89.8%, 特异度: 84.3%) 无统计学差异；爬行脂肪 K₄₀₋₁₀₀ 在动脉期诊断中重度克罗恩病疾病活动度的曲线下面积最大 (AUC=0.935)，敏感度和特异度分别为 79.7%、93.5%，高于单能量 CT 值

($AUC=0.715_{VMI100} \sim 0.886_{VMI40}$, 敏感度: $78.0\%_{VMI100} \sim 84.7\%_{VMI40}$, 特异度: $58.3\%_{VMI100} \sim 80.6\%_{VMI40}$, $P<0.05$)。

结论: 计算机视觉处理生成的能谱 CT 斜率参数图及单能量 CT 值在评估克罗恩病活动度方面具有临床应用价值; 动脉期爬行脂肪的 K_{40-100} 诊断效能优于 $HU_{40-100keV}$ 。

PO-1993

局部进展期胃癌新辅助化疗疗效的预测: 能谱 CT 与 DWI 的对比研究

李靖、陈学军、曲金荣
郑州大学附属肿瘤医院

目的: 比较能谱 CT 和扩散加权成像在预测局部进展期胃癌新辅助化疗后病理学反应的效能。方法: 本研究从一项前瞻性试验中抓取数据进行回顾性分析。所有胃癌患者均接受标准的新辅助化疗联合手术切除并有明确的肿瘤消退分级 (tumor regression grading) 结果。以 TRG 为参考标准, 将患者分为缓解良好组 (TRG 0+1) 和缓解不良组 (TRG 2+3)。所有纳入的患者在基线期同时行腹部平扫+增强三期能谱 CT 扫描和上腹部 DWI-MRI 检查。比较两组间患者临床病理特征和基线期影像学特征, 包括肿瘤厚度、Bormann 分型、临床 T/N 分期。测量胃癌病灶增强动脉期、静脉期、延迟期的碘基值 (iodine concentration, IC), 并计算标准化碘基值 (normalized iodine concentration, nIC), 及表观扩散系数 (apparent diffusion coefficient, ADC), 比较不同病理缓解组间上述参数的差异。采用受试者工作特征曲线 (receiver operating characteristic, ROC) 分析各预测参数的效能, 采用 Delong 检验比较效能间的差异。采用 Spearman 检验探索碘基值和 ADC 值与 TRG 结果的相关性。结果: 共纳入 65 例患者, 缓解良好组 24 例, 缓解不良组 41 例。不同病理缓解组间的延迟期标准化碘基值 (nICDP) 和 ADC 值的差异有统计学意义 ($P<0.05$), 且与 TRG 相关 ($P<0.05$)。两组间患者的人口学信息和基线期影像学形态学特征的差异均无统计学意义。nICDP 和 ADC 值预测胃癌新辅助化疗疗效的效能相当, AUC 分别为 0.673、0.674。两者联合后的 AUC 为 0.770, 显著高于单一参数 (Delong test, $P=0.037$ for vs. ADC; $P=0.037$ for vs. nICDP)。结论: 能谱 CT 和 DWI 是预测胃癌新辅助化疗疗效的有效影像学方法, 联合 nICDP 和 ADC 值后效能进一步提高。

PO-1994

光谱 CT 显示左结肠动脉的最佳虚拟单能量

陈海静、李青青、赵卫、胡继红、何波、杨亚英
昆明医科大学第一附属医院

目的: 探讨双层探测器光谱 CT 显示左结肠动脉 (LCA) 的最佳虚拟单能量, 以便为腹腔镜直肠癌根治术前评估 LCA 提供帮助。方法: 回顾性分析 2022 年 10 月至 2023 年 2 月在昆明医科大学第一附属医院行腹部 CTA 扫描的 100 例患者图像, 将动脉期原始图像重组为混合能量图像以及基于能谱的间隔 10keV 的 40~70 keV 的单能量图像。对 5 组图像 LCA 的 CT 值、信噪比 (SNR)、对比噪声比 (CNR)、图像噪声以及图像质量评分进行比较。结果: 40~70keV 组单能量图像 LCA 的 CT 值、噪声、CNR、SNR 随着能级的升高呈递减趋势。常规混合能量图像组及 40~70keV 单能量图像组两两比较, 各组间 CT 值、SNR、CNR、噪声差异有统计学意义 ($P<0.05$)。40 keV 组图像 LCA 的 CT 值、CNR、SNR 均高于其他组, 噪声低于常规混合能量图像组。两名影像科医师图像质量主观评价的一致性良好 ($0.40 \leq \text{Kappa 值} < 0.75$), 各组间图像主观评分差异均有统计学意义 (P 均 < 0.001)。40 keV 组图像主观评分最高, 40~70 keV 组单能量图像质量均高于常规混合能量

图像。结论: 40 keV 为显示 LCA 的最佳虚拟单能量, 显示血管清晰、边缘锐利, 能更清晰显示 LCA 及其解剖变异, 利于外科医生腹腔镜直肠癌根治术的顺利进行。

PO-1995

ct 主动脉造影作为判断腹主动脉瘤动脉壁不稳定性的诊断工具

孙阳
四平市中心人民医院

目的:本研究的目的是通过 CT 扫描来探索和揭示主动脉及周围组织的具体结构变化, 被认为是主动脉壁不稳定的迹象

方法和材料:采用 160 层 CT 扫描仪进行 CT 研究, 具有固有和动脉造影剂相。104 例确诊患者 CT 资料

对腹主动脉瘤(AAA)进行回顾性研究。对主动脉壁不稳定体征的评估基于以下发现:

月牙征过度衰减, 顶骨血栓团块裂裂, 垂下主动脉, 主动脉泡, 主动脉周围搁浅。此外, 还对患者的治疗策略进行了研究。

结果:根据上述结果, 将患者分为 3 组:1.aaa 破裂 28 例(26.9%)。2.AAA 未破裂, 伴有一个不稳定征象 50 例(48%), 其中 10 例(20%)患者接受手术治疗。AAA 未破裂, 并伴有多个不稳定的征象 26(25.1%)例。本组 6 例患者急诊手术治疗, 4 例未治疗患者在术后数天内发生 AAA 破裂, 占 38.4%。

结论:CT 能快速、全面地诊断 AAA, 破裂后 AAA 出现不稳定体征的频率较高

它们具有较高的预后意义。2 个或 2 个以上的征兆的结合表明一个高风险的威胁破裂, 结合其他因素可以被认为是紧急手术治疗的指征。主动脉瓣不稳定最常见的 CT 征象包括高衰减的新月形征象、主动脉垂布和主动脉周围搁浅。

PO-1996

CT 征象评估预测胃肠道穿孔部位: 100 例手术患者的回顾

焦桥
四平市中心人民医院

目的:本研究的目的是回顾性评估 ct 在术前确定手术证实的胃肠道穿孔部位的准确性, 并确定在此诊断中最具预测性的结果。方法和材料:我们回顾性分析了于 2017 年 3 月至 2019 年 3 月在我院 100 例手术证实 GI 穿孔的患者(64 例男性;年龄 32-92 岁)。83 例患者使用静脉造影剂。两位分别有 25 年和 4 年放射学经验的观察者, 对手术诊断不知情, 通过以下 ct 表现预测穿孔部位:腔外空气(等级和分布)、壁缺损、壁增厚、壁异常强化、腹膜液体、脂肪束和炎性包块。我们还评估了这些体征在预测消化性溃疡与憩室炎引起的穿孔方面的作用, 憩室炎是上、下 GI 穿孔的最常见原因。使用卡方检验分析结果。

结果:37 例为上 GI 穿孔, 63 例为下 GI 穿孔。严重的游离空气($p=0.04$)、上结肠室游离空气($p=0.00$)和腹膜液($p=0.00$)是上 GI 穿孔的有力预测因素, 而轻度和中度游离空气($p=0.04$)和脂肪束($p=0.00$)提示下 GI 穿孔。有消化性溃疡 35 例, 憩室炎 28 例。肠系膜上腔室($p=0.00$)、腹膜液($p=0.00$)提示消化性溃疡所致穿孔, 盆骨、腹膜后腔室($p=0.03$)、脂肪束($p=0.00$)、肠壁异常强化($p=0.05$)、炎性肿块($p=0.05$)提示憩室炎所致穿孔。

结论:cT 对上、下消化道穿孔的鉴别具有较高的准确性。

局限性:17 例患者行 CT 平扫。

PO-1997

CT 小肠造影预测克罗恩瘘管病发病率和短期手术中的价值

朱宇

四平市中心人民医院

目的:分析 CT 小肠造影(CT enterography, CTE)预测肛周瘘管病患者 1 年内发病率及手术治疗风险的价值,为指导临床评估及合理选择治疗方案提供依据。

方法和材料:对 279 例新诊断的克罗恩病进行回顾性分析。随访 1 年。记录 CTE 成像参数,评估盆腔 MR 图像是否存在肛瘘。

结果:204 例患者符合分析条件。肛瘘组(组 1)47/88 例(53.41%)有结肠受累,非肛瘘组(组 2)38/116 例(32.76%)有结肠受累($P=0.006$)。组 1 肠壁强化主要表现为 1 型和 2 型,为 69/88(78.41%),组 2 肠壁强化主要表现为 3 型和 4 型,为 78/116(67.25%)($P<0.001$)。手术组(3 组)12/18 例(66.67%),非手术组(4 组)22/53 例(41.51%),管腔狭窄 15/18 例(83.33%),3 组 4/18 例(22.22%),腹内瘘 33/53 例(62.27%),3 组 2/53 例(3.77%)。多因素分析显示,直肠累及($OR1.911$ (1.102 ~ 4.185), $P<0.001$)、管腔狭窄($OR 2.627$ (1.760 ~ 6.024), $P=0.028$)和腹腔内($OR 1.337$ (1.093 ~ 3.585), $P=0.006$)增加了手术风险。

结论:结肠受累和肠壁强化可预测肛周瘘管病的发生。直肠受累、管腔狭窄和腹腔内瘘增加了术周瘘管病的短期手术风险。

局限性:局限性有:1.只有选择偏见;2.很少患者不使用灌肠;少数患者的药物治疗不规范。

PO-1998

多模态磁共振成像纹理特征分析鉴别肝细胞癌与肝脏局灶性结节性增生的初步研究

黄薇薇¹、黄攀^{1,2}、孟庆林¹、刘梦琦³、陈志晔^{1,2}

1. 中国人民解放军总医院海南医院

2. 南方医科大学第二临床医学院

3. 中国人民解放军总医院第一医学中心

目的 基于多模态磁共振成像纹理特征分析鉴别肝细胞癌(HCC)与肝脏局灶性结节性增生(FNH)。**方法** 回顾性分析解放军总医院海南医院经病理确诊的 38 例 HCC 和 14 例 FNH 患者,分别对两组患者的横轴位 T₂WI 及 DWI 图像进行纹理特征分析,参数包括角二阶矩(ASM)、对比度(Contrast)、自相关(Correlation)、逆差距(IDM)、熵(Entropy)。采用 Kolmogorov-Smirnov 检验及 Mann-Whitney 检验比较组间纹理特征参数差异,应用多元回归分析获得整体模型拟合中入选变量及其值,得到回归方程,最终选择 ROC 曲线评估 HCC 与 FNH 的诊断效能。**结果** 基于 DWI 图像纹理特征参数证实 FNH 组的角二阶矩、自相关、逆差距显著大于 HCC 组,而 FNH 组的对比度、熵则显著小于 HCC 组($P_{ASM}=0.000$, $P_{Correlation}=0.000$, $P_{IDM}=0.026$, $P_{Contrast}=0.020$, $P_{Entropy}=0.000$)。基于 T₂WI 图像纹理特征参数证实 FNH 组的角二阶矩、自相关显著大于 HCC 组,而 FNH 组的对比度、逆差距、熵则显著小于 HCC 组($P_{ASM}=0.000$, $P_{Correlation}=0.000$, $P_{Contrast}=0.020$, $P_{IDM}=0.026$, $P_{Entropy}=0.000$)。DWI 组在整体模型拟合中入选变量是熵、对比度和常量,得到回归方程 $Y=-1.621 \times Entropy - 0.031 \times Contrast + 12.410$; T₂WI 组、T₂WI 联合 DWI 组入选变量及其值均相同,入选变量为熵和常量,得到回归方程 $Y=-2.595 \times Entropy + 16.419$ 。DWI 组受 ROC 曲线下面积(0.945)最大,肝细胞癌的 T₂WI 联合 DWI 组的正确率(93.42%)最高。**结论** 基于多模态磁共振成像的图像纹理特征分析可以有效鉴别肝细胞癌与肝脏局灶性结节性增生。

PO-1999

基于 CT 影像组学评估结直肠癌肝转移一线化疗的早期疗效

袁隆、周俊林
兰州大学第二医院

[摘要] 目的: 观察临床、病理联合 CT 影像组学特征构建的联合模型预测结直肠癌肝转移 (CRLMs) 化疗反应的价值。方法: 回顾性分析了我院 169 例 CRLMs 患者的临床、病理、化疗前及化疗 2 个月时的增强 CT 图像等资料。每位患者随机抽取一个肝转移灶 (n=169), 包括有反应 75 例和无反应 94 例, 按 7: 3 比例将病灶随机分为训练集 (n=118) 和验证集 (n=51)。提取训练集门脉期 CT 中病灶 1688 个影像组学特征, 以 Select Percentile 单因素分析、Spearman 相关性分析及最小绝对收缩和选择算子 (LASSO) 筛选最优影像组学特征, 以分类器 logistic 回归 (LR) 构建模型并计算影像组学评分 Radscore; 以 t 检验、U 检验以及 2 检验筛选有统计学差异的临床、病理特征, 并与 Radscore 结合分别构建临床-病理模型、影像组学模型及联合模型; 使用受试者工作特征 (ROC) 曲线、校准曲线评价模型的预测效能及校准度, 并以联合模型预测指标构建列线图。结果: 共筛选出 9 个最优影像组学特征以及 3 个临床、病理特征, 包括肝转移类型、CEA 及 RAS 基因。在训练集和验证集中, 联合模型预测化疗反应的 AUC (0.896, 0.798) 均高于临床-病理模型 (0.681, 0.68)。联合模型在训练集中的 AUC 略高于影像组学模型 (0.895, 0.786), 在验证集的 AUC 与影像组学模型差异无统计学意义 (Z= 0.5478, P=0.5838)。校正曲线显示影像组学及联合模型列线图的校准度良好。结论: 化疗前 CT 影像组学特征可以有效预测 CRLMs 化疗疗效; 联合临床、病理特征可提高预测效能。

PO-2000

多参数光谱 CT 对于胰腺神经内分泌肿瘤与腺癌的鉴别价值

范雪姣
辽宁省肿瘤医院

目的: 神经内分泌肿瘤 (NEN) 最常见的原发部位是胰腺, 而胰腺腺癌表现出相对较差的临床预后, 以及对某些化疗方案的反应良好, 因此需要不同的临床诊疗策略。而 CT 是最广泛使用的成像方式, 因此本文的研究目的是, 探讨胰腺神经内分泌肿瘤与腺癌进行鉴别诊断的效能和意义。

方法: 该研究总共纳入 100 例经病理证实的 NEN 患者, 和 100 例胰腺腺癌, 均在活检或切除前 15 天内行多期增强 DLCT 扫描。记录肿瘤各期衰减、碘浓度 (IC)、有效原子序数 (Zeff), 并评估定性特征 (如成分、均质性、边缘、钙化、主胰管扩张、血管侵犯、淋巴病变等), 最后进行多元 Logistic 回归分析和 ROC 分析。

结果: 在定量参数方面, 与 NEN 相比, 腺癌在动脉期 (71.5 vs 110.5) 和门静脉期 (78.2 vs 113.5) 的中位数衰减 (HU) 都显著更低 (P<0.001), 但在平扫期无显著差异 (P=0.24)。NEC 在动脉期 (IC: 1.0 vs 2.5; Zeff: 7.9 vs 8.6) 和门脉期 (IC: 1.3 vs 2.7; Zeff: 8.1 vs 8.6) 的 IC (mg/mL) 和 Zeff 都显著低于 NEN。在定性特征方面, 腺癌的血管侵犯 (73.3% vs 34.8%) 和淋巴结转移 (53.3% vs 26.9%) 明显高于 NEN (P<0.05)。两者在成分、均匀性、边缘、钙化和主胰管扩张方面无显著差异 (均 P>0.05)。结论: 与传统 CT 衰减、碘浓度相比, 多参数光谱 CT (DLCT) 特征参数在治疗前准确鉴别 NEN 和腺癌具有重要意义, 可以有效辅助临床决策。

PO-2001

基于增强 CT 影像组学模型预测泌尿系梗阻患者分肾功能的价值

马樱¹、江新青²、杨蕊梦²、甄鑫³、张婉丽²、唐鹏³、卢梓涵³

1. 广州市第一人民医院南沙医院

2. 华南理工附属第二医院 (广州市第一人民医院)

3. 南方医科大学

目的: 探讨基于增强计算机断层扫描的影像组学模型, 预测泌尿系梗阻患者分肾功能的价值。

方法: 回顾性收集本院确诊泌尿系梗阻并完成腹部增强 CT 及肾动态显像检查的患者 118 例(单肾者 6 人), 最终 230 个肾脏被纳入研究。根据肾动态显像所得分肾 GFR 结果: 将入组肾脏分为正常组与异常组, 异常组又分为轻中度亚组与重度亚组。在病历系统中收集患者年龄及相关实验室检查结果等数据, 建立临床特征组合。在 CT 图像中测量肾皮质厚度、肾实质厚度等数据, 建立放射学特征组合。在 CT 图像中勾画肾脏感兴趣区, 获得多个期相的肾脏容积感兴趣区 (VOI), 并从 VOI 中提取影像组学特征, 并对多期特征进行串联组合。将不同组合的影像组学特征组合、临床特征组合、放射学特征组合, 输入到 140 个分类模型中, 以评估影像组学、放射学、临床三大类特征的单类别特征组合和多类别特征组合模型在预测泌尿系梗阻患者分肾功能中的效能, 并设置独立测试集予以验证。分肾功能预测模型分两个阶段共三个任务: 第一阶段即任务一 (区分正常组和异常组); 第二阶段对分肾功能行分级预测, 包括任务二 (区分正常组和轻中度亚组) 和任务三 (区分轻中度亚组和重度亚组)。对各个预测模型在验证集和训练集中通过十折交叉验证进行筛选, 最终通过净重新分类改善指数 (NRI) 对上述多任务分肾功能预测模型进行效能评估。预测效能评估指标有 ROC 曲线下面积 (AUC), 准确率 (ACC), 敏感度 (SEN) 和特异度 (SPE) 和净重新分类改善指数。

结果: 具有最大正值净改善的预测模型分别为: 任务一为“三期影像组学特征组合”模型, AUC 为 0.972; 任务二为“三期影像组学特征组合+放射学特征组合”模型, AUC 为 0.939; 任务三为“皮髓质期影像组学特征组合”模型, AUC 为 0.964。最终, 来自皮髓质期图像的纹理特征占排名前十位的关键特征的比例最高。

结论: 基于增强 CT 的综合特征模型, 以包含影像组学纹理特征的预测模型诊断性能更高, 排名前十的关键特征以来自皮髓质期图像的纹理特征占比最高, 是预测分肾功能的最可靠特征, 影像组学模型可以作为一种评估泌尿系梗阻患者分肾功能的有效诊断工具。

PO-2002

双层探测器光谱 CT 在恶性淋巴瘤活性状态评估中的应用探索

陈荷冰、叶天和、潘峰、万佳语、杨炼
华中科技大学同济医学院附属协和医院

目的:

FDG PET/CT 仍然是恶性淋巴瘤治疗前分期和治疗反应评估的核心工具, 但 PET-CT 在应用上仍有一定的局限性, 例如检查费用昂贵、病人接受的辐射剂量较大, 其次对于惰性淋巴瘤, 其最大标准化摄取值 (SUVmax) 通常低于侵袭性淋巴瘤, 临床上并不推荐其常规使用 FDG PET/CT 检查手段。目前, 双层探测器光谱 CT 扫描技术不仅可以获得血流灌注信息, 还可以获得组织成分信息。因此, 本研究旨在初步探索光谱 CT 定量参数中的碘浓度 (IC) 及有效原子序数 (Z_{eff}) 作为淋巴瘤活性监测指标的价值。

方法:

28 名初诊和 35 名经过化学治疗的患者被纳入本研究进行回顾性分析。由一名高级和初级医生共同对 PET-CT 图像进行审阅及标注, 对于初诊患者, 通过测量淋巴结的 SUVmax 判断淋巴结是否具有代谢活性, 对于治疗后的患者, 通过 Deauville 评分标准, 小于等于 3 分的淋巴结视为代谢活性

抑制, 大于 3 分的淋巴结视为仍有代谢活性, 最终将所评估的淋巴结分为受累组和非受累组, 分别有 117 个和 352 个淋巴结。随后, 由另外两名放射科医生对静脉期光谱 CT 图像上相应位置的淋巴结进行 IC 和 Zeff 的测量。为了消除个体循环的影响, 还测量了同层面锁骨下动脉、胸主动脉或者腹主动脉的 IC 和 Zeff 的测量, 最终得到标准化碘浓度 (nIC) 和标准化有效原子序数 (nZeff)。由于一个患者可能被纳入多个淋巴结, 需要考虑同一患者不同淋巴结之间的相关性, 因此我们采用广义线性混合模型对 nIC 和 nZeff 分析, 最后通过 ROC 曲线评估 nIC 和 nZeff 在判断淋巴瘤活性状态中的应用价值。

结果:

受累组淋巴结的 nIC 及 nZeff 要显著高于非受累组淋巴结 ($p < 0.001$)。广义线性混合模型分析结果显示 nIC 及 nZeff 的固定效应参数的估计值均有统计学意义。nIC 和 nZeff 的 AUC 分别为 0.911 (95%CI: 0.881-0.935) 和 0.898 (95%CI: 0.867-0.924)。

结论:

nIC 及 nZeff 在检测淋巴瘤活性方面具有良好的诊断性能, 并可能是一种潜在的成像生物标志物。

PO-2003

基于深度学习的 CT 水平脾挫裂伤分类网络框架的建立

王雅宁、何刊、穆琳、李明洋、张惠茅
吉林大学第一医院, 放射科

目的: 建立深度学习网络框架, 通过输入 CT 图像检测脾脏是否存在挫裂伤。

背景: 创伤发生率高, 情况复杂, 容易造成严重的经济财产损失。脾脏挫裂伤在腹部创伤中较为常见, 其血供丰富和质地脆弱等生理特点使脾挫裂伤的发生率和死亡率均在较高水平。在急诊场景下, 快速且准确的检测出受伤脾脏将有利于创伤患者的诊疗。通常, 脾挫裂伤的诊断需要结合多学科会诊, 必要时还需要进行手术、穿刺等有创检查。CT 在腹部创伤的诊断中具有良好的敏感度和特异度, 然后单纯平扫诊断难度大, 具有较高的假阳性。深度学习网络的加入可能会提高平扫诊断的准确率, 为临床筛查提供快速准确的结论。

方法: 回顾性连续性收集吉林大学第一医院 2018 年至 2023 年, 影像报告提示脾脏创伤的患者共 320 例作为阳性组, 按照 7: 1 分成训练组和测试组, 并按照 1: 1 收集未出现脾挫裂伤的患者作为阴性对照组, 基于开源分割网络 Totalseg 对所有患者进行预分割, 并将分割结果作为分类模型的输入, 基于 nnUNET 算法训练创伤分类模型, 所有分类结果均来自放射学报告并由两名放射科医生根据图像进行核对。最终测试集结果与报告金标准进行比较, 判断模型的诊断效能, 评价指标包括: 敏感度, 特异度, AUC。

结果: 模型在 280 例脾脏挫裂伤的患者及 280 例健康人 CT 图像上进行训练, 随后在 80 例的测试集上获得了 82.5 (95%CI: 73.2-95.8) 的敏感性, 86.2 (95%CI: 79.9-91.5) 的特异性, 并获得了 0.914 的曲线下面积, 模型可以在 CT 上有效的筛查出创伤的患者。

结论: 我们建立了基于深度学习框架的脾挫裂伤分类网络, 可以在 CT 上有效检测出存在脾挫裂伤的患者, 然而模型的敏感度尚无法达到筛查水平, 需要更大的数据集和更优化的网络框架以进一步完善脾创伤的筛查。

PO-2004

磁共振酰胺质子转移加权成像对卵巢肿瘤性质的鉴别价值

施雨廷、崔乃心、刘爱连、宋庆玲、李烨
大连医科大学附属第一医院

目的：探讨磁共振酰胺质子转移加权成像 (Amide proton transfer-weighted, APT) 值对卵巢肿瘤性质的鉴别价值。

材料和方法：回顾性分析 2019 年 4 月至 2023 年 9 月间在大连医科大学附属第一医院经飞利浦 3.0T MR(Ingenia CX, Philips Healthcare, the Netherlands)行盆腔 MR 扫描并经手术病理证实为卵巢占位的 24 例患者，其中（其中卵巢囊腺瘤 10 例，卵巢癌 14 例（高级别浆液性癌 8 例，透明细胞癌 2 例，内膜样癌 4 例）。由两名观察者分别测量 APT 值，在肿瘤液性部分最大层面放置三个 ROI，大小约为病灶的 1/2，3 个 ROI 均值为测量值。采用组内相关系数 (The intra-class correlation coefficient, ICC) 检验两位观察者测量所得 APT 值的一致性，采用 Mann-Whitney U test 检验进行差异性分析。采用受试者操作特征 (ROC) 曲线计算 APT 值对卵巢癌的诊断效能。

结果：卵巢癌 APT (5.45, (4.15, 6.28)) % 高于囊腺瘤 APT (3.09, (1.83, 4.19)) %， $P=0.0002$ 。APT 诊断卵巢囊腺瘤的 AUC 值为 0.821，当阈值为 4.45 % 时，敏感度和特异度分别为 90.00% 和 71.43%。

结论：APT 能够对卵巢肿瘤的良恶性进行鉴别，对临床有一定的指导意义。

PO-2005

基于重建的深度学习技术在克罗恩病磁共振小肠成像中的应用

程静云
武汉大学人民医院

目的：在克罗恩病 (Crohn's disease, CD) 磁共振小肠成像 (magnetic resonance enterography, MRE) 中，比较 SSFSE 与 2D-FIESTA 序列在经基于重建的深度学习处理后 (DL-SSFSE 和 DL-FIESTA) 与经常规重建处理后 (Conv-SSFSE 和 Conv-FIESTA) 的图像质量比较

材料与方法：回顾性分析 32 例确诊为 CD 的 MRE 图像，分别计算 DL-SSFSE、DL-FIESTA Conv-SSFSE、Conv-FIESTA 序列中各肠段病灶的信噪比 (SNR)，采用 5 点法评估序列中各肠段病灶的锐利度及显著度。采用配对 Wilcoxon 符号秩检验或配对样本 t 检验比较比较 DL-SSFSE、DL-FIESTA 与 Conv-SSFSE、Conv-FIESTA 上病灶的信号强度 (SI)、SNR、锐利度及清晰度是否存在差别。

结果：DL-SSFSE、DL-FIESTA 序列上病灶的 SNR、锐利度及显著度均显著高于 Conv-SSFSE、Conv-FIESTA 序列。DL-SSFSE、DL-FIESTA 序列上病灶的 SI 与 Conv-SSFSE、Conv-FIESTA 序列无显著差别，一致性为 0.998。

结论：基于重建的深度学习技术可显著提高 CD 患者 MRE 成像中 SSFSE 与 FIESTA 序列图像质量，且对病灶的 SI 无影响。

PO-2006

术前 CT 影像特征对于肾透明细胞癌 Fuhrman 分级的预测价值

金嵌¹、王洁琼²、邹俊婷¹、竺梦霞¹、史炯¹、付尧¹

1. 南京鼓楼医院

2. 南京市泰康仙林鼓楼医院

目的 探讨肾透明细胞癌 (Clear cell renal cell carcinoma, CCRCC) 的 CT 影像特征对于术前预测 Fuhrman 分级的价值。**方法** 回顾性分析经病理确诊的 185 例 CCRCC, 其中低级别组 99 例 (Fuhrman 分级 1、2 级), 高级别组 86 例 (Fuhrman 分级 3、4 级); 提取的临床特征包括年龄和性别, CT 特征包括肿瘤大小、平扫及增强皮质期 CT 值、 Δ CT 值 (肿瘤皮质期增强净值)、 Δ CT 比值 (肿瘤和正常肾皮质增强净值比值)、钙化、坏死、出血、脂质、生长方式、假包膜有无及完整性、区域淋巴结、肾静脉癌栓、集合系统侵犯等。应用 SPSS22.0 软件进行统计学分析。**结果** 高级别组中, 年龄 ≥ 60 岁的患者较低级别组多 ($P < 0.05$)。高、低级别组 CCRCC 在肿瘤大小、皮质期 CT 值、 Δ CT 值、 Δ CT 比值、钙化、出血、脂质、假包膜不完整、区域淋巴结肿大、肾静脉癌栓和集合系统侵犯时具有统计学差异 ($P < 0.05$)。**结论** CCRCC 的 CT 影像特征可以反映其恶性程度, 术前通过 CT 特征预测 CCRCC 的 Fuhrman 分级具有可行性, 有助于临床进行个体化治疗。

PO-2007

术前 CT 评估胃癌新辅助化疗后腹主动脉分支周围软组织反应在手术方面的临床意义

刘一婷、王胤奎、陕飞、李子禹、唐磊

北京肿瘤医院

目的: 在新辅助化疗后的手术过程中, 通常会观察到血管周围软组织水肿及纤维化。这一现象目前缺乏相关病理学解释, 但却在临床上较为常见。同时, 这一现象增加了淋巴结清扫及血管断离的手术操作难度。作者发现了对应的 CT 影像学征象, 进而在术前预测该种改变。

方法: 回顾性纳入北京大学肿瘤医院术前行 SOX/XELOX 治疗 1~6 周期后进行手术的 42 例及直接进行手术治疗的 10 例胃癌患者, 由 10 名临床经验的胃肠外科医生在不知道患者分组的情况下对手术视频对血管周围组织情况进行评估, 分为 easy-to-desperate and hard- to-desperate 两组。由 1 名具有 7 年影像工作经验的放射科医在单盲的情况下判读新辅助治疗前后的术前 CT 图像, 对腹主动脉、胃左动脉、肝总动脉、肠系膜上动脉及脾动脉周围软组织情况进行评价。以术中所见作为金标准, 评价新辅助化疗后 CT 预测手术操作相关血管周围反应的性能。

结果: 52 例患者中, 被外科医生评价为“难以切除”的患者共计 36 例。从这些患者的手术视频中, 观察到术区血管周围组织存在水肿和纤维化。这种水肿和纤维化一方面会影响手术器械的功率, 另一方面会影响组织层次的分辨, 给手术带来困难。另有 16 例患者表现为血管周围软组织反应轻, 手术易于切除。新辅助化疗组中, 反应重的占 83.3% (35/42); 直接手术组中, 反应轻的占 70% (7/10)。“难以切除”患者的新辅助化疗后 CT 图像上, 可以观察到血管周围脂肪密度模糊增高及索条影 (出现率 CA 76.19%, LGA 45.24%), 对应术中见到的渗出及纤维化改变 (图 1)。而“易于切除”的分组中, 血管周围组织没有异常, 或紧贴血管出现一圈边界光整的“包鞘样”稍高密度影 (图 2)。CT 预测血管周围反应的灵敏度 91.67%, 特异度 93.75%, 准确率 92.31%, 且与手术时长有相关性 ($p < 0.05$)。

结论: CT 上的血管周围脂肪密度模糊增高及索条影的征象能够提示水肿和纤维化, 用于评估胃癌周围脉管手术切除难度的表现良好, 往往提示更长的手术时长。借助新辅助化疗后的腹主动脉分支血管周围组织的 CT 征象, 预测胃癌手术脉管操作的难易程度。

PO-2008

非子宫附件部位子宫内膜异位症影像表现

王一棣

上海交通大学医学院附属新华医院

目的 探讨非子宫附件部位子宫内膜异位症的影像特点及影像诊断价值。**方法**：回顾性收集于2012.01-2021.10之间就诊于我院且经手术病理证实为非子宫、卵巢部位子宫内膜异位症的患者结果，排除术前未进行CT/MRI扫描或图像丢失的病例，通过HIS系统收集患者的临床病史资料，通过PACS系统采集图像并分析病变的部位、大小、成分、密度特征、各序列信号及强化特点、与周围组织结构关系、是否发现其他部位子宫内膜异位症等影像特征。**结果**：共收集到我院手术确诊为非子宫、卵巢部位子宫内膜异位症的患者104例，腹壁86例（82.7%），结直肠5例（4.8%），腹膜3例，腹股沟2例，肛旁2例，会阴、膀胱、输尿管、阴道直肠隔、回盲部、肺各1例，共36例行术前CT/MRI检查：31例行MRI检查，9例行CT检查。在所有行影像检查的患者中，28例为腹壁子宫内膜异位症患者，其临床症状以腹痛（46.4%）和腹部肿块（50%）最常见，仅有5例具有明显周期性下腹痛，而且另有2例因其他腹部疾病就诊，几乎所有的患者（96.6%）均有剖宫产史，仅有一例患者实在无手术史的情况下发生了腹壁子宫内膜异位症，剖宫产术后至出现症状的平均时间为 5.69 ± 5.0 （1-23）年，至初次入院检查的平均时间为 7.12 ± 5.0 （2-25）。病例共36例行术前CT/MRI检查。28例腹壁子宫内膜异位症中，多数对腹直肌有一定程度的浸润腹壁异位灶更多的为实性的结节或肿块，该组患者中仅有1例为囊实性，未见纯囊性灶。腹壁子宫内膜异位症的CT特征为与手术瘢痕区相关的非特异性软组织密度肿块，密度可较邻近肌肉稍高或稍低，边界显示不清晰，增强后呈中度以上较均匀强化。MRI表现部分具有特异性，在本组病例中多为T1WI等-稍低信号及T2WI均匀/不均匀高信号（20例），DWI可呈高信号；3例以T1WI及T2WI低信号为主；增强后多数病例可见较均匀明显强化。**结论** 非子宫附件部位子宫内膜异位症影像诊断较困难，易发生漏误诊。CT可以帮助排除或提示肿块的存在并判断其范围和性质。典型的MRI表现加临床病史、症状有助于诊断，对于帮助术前精确手术范围具有重要价值。

PO-2009

双层探测器光谱 CT 70keV 单能量扫描技术在胰腺癌术前诊断中的应用

周洁

江苏省人民医院（南京医科大学第一附属医院）

【摘要】目的 探讨双层探测器光谱CT(dual-layer detector spectral CT, DLCT) 70keV单能量扫描技术在胰腺癌术前诊断中的应用。**方法** 收集自2019年3月-2022年5月期间于我院经病理检查确诊为PDAC且行DLCT检查患者的病历资料。将患者分为淋巴结转移组64例和非转移组40例。对比两组患者的一般特征及DLCT参数。**结果** 两组患者的性别、年龄、病变部位等一般特征对比无统计学差异（ $P>0.05$ ）；两组患者的病灶最长径，Zeff，动脉期nIC，静脉期IC、nIC、CT40keV、CT50keV、 λ_{HU1} 、 λ_{HU2} 、 λ_{HU3} 对比具有统计学差异（ $P<0.05$ ）；Logistic回归分析结果提示，病灶最长径、动静脉期nIC、Zeff是预测PDAC淋巴结转移的独立危险因素（ $P<0.05$ ）；ROC曲线结果提示，病灶最长径、动静脉期nIC、Zeff的AUC分别为0.886、0.855、0.712、0.778，敏感度分别为69.9%、97.1%、79.2%、76.0%，特异度分别为100.0%、66.0%、71.0%、66.0%。**结论** 病灶最长径、动静脉期nIC、Zeff是预测PDAC淋巴结转移的独立危险因素。

PO-2010

CT 检查改良公式法判断食管胃结合部腺癌 Siewert 分型的临床价值

刘一婷、陕飞、李子禹、唐磊
北京肿瘤医院

目的: Siewert 分型的主要依据是肿瘤中心与食管胃结合部 (esophagogastric junction, EGJ) 的距离, 而此处消化道走行迂曲, 影响分型的准确率与术后病理结果比较。基于此, 本研究通过 CT 轴位和冠状位双平面联合, 推导出 Siewert 分型的计算公式, 通过图像层面序号和分型规则对应关系, 计算 EGJ 径线的相对位置关系, 从而进行 Siewert 分型。

方法: 利用 CT 这种无创且常规的检查手段, 通过轴位和冠状位双平面图像联合, 确定各径线的层面, 继而通过层面和层厚的简单计算得到各分型关键解剖点的相对位置关系, 进而推导出计算 Siewert 分型的层面序号公式。而仰卧位扫描时, 胃远端相对前倾, 更接近于水平方向, 而食管胃结合部的胃腔长轴更接近于垂直方向, 故胃部浸润范围的计算值较实际情况偏短(图 2), 导致 Siewert III 型误判为 II 型。故本研究针对此情况进行了改良。改良公式法校正的第一步, 大致判断了肿瘤中心点距校正后食管胃交界线胃侧 2cm 线的相对距离, 因该线的主体位置位于胃腔左偏区, 故采用 $\sin 35^\circ$ 的值进行校正。校正的第二步, 即公式 a、公式 b, 是将肿瘤中心点的计算分别按照肿瘤走行左偏及右偏进行校正, 再和食管胃交界线胃侧 2cm 线进行相对位置的判断 (见附件)。

结果: 回顾性纳入北京大学肿瘤医院 2019 年 3 月至 2020 年 12 月采用传统术前 CT 影像学误判分型的 II 型及 III 型 AEG 患者 20 例, 其中 II 型患者 3 例, III 型患者 17 例。分别利用三段公式法及改良公式法利用患者冠状位及轴位 CT 图像进行 Siewert 分型。其中, 无须三段公式法判断正确 4 例 (II 型 3 例, III 型 1 例), 需要改良公式法校正判断正确 16 例 (II 型 0 例, III 型 16 例)。改良公式法判断传统影像学误判 AEG 患者的 Siewert 分型准确率 80%, 其中, III 型准确率可达 94.12%。

结论: 本项目通过 CT 轴位和冠状位双平面联合, 设计了 Siewert 分型改良公式法, 进而设计了易于临床应用的软件, 通过输入 CT 层面序号, 即可得出 Siewert 分型, 内科、外科及影像科医生在临床工作中易于操作。

PO-2011

社区全人群与 2 型糖尿病人群的慢性肝脏疾病检出率及临床特征: 一项基于瞬时弹性成像技术的前瞻性研究

刘川¹、向奕¹、曹慧²、张东敬²、杨坚波³、许玉花²、章文佳²、张玉南²、陈中霞²、占强²、祁小龙¹
1. 东南大学附属中大医院
2. 无锡市人民医院
3. 无锡市新吴区民政卫健局

目的: 探讨社区全人群与 2 型糖尿病 (T2DM) 人群的肝脏疾病检出率及临床特征。

方法: 本前瞻性研究于 2022 年 10 月至 2023 年 2 月期间, 对无锡市新吴区随机抽取的 6 个街道 10019 名社区居民进行筛查, 所有参与对象进行现场体格检查 (测量身高、体重、腰围、臀围、血压), 并采集个人信息 (年龄、性别、教育程度、职业等) 和既往传染病、肝脏病及糖尿病史。通过瞬时弹性成像技术 iLivTouch® 测量脂肪超声衰减参数 (UAP) 和肝脏硬度值 (LSM)。根据 UAP 将人群分为四组: 无非酒精性脂肪性肝病 (NAFLD) 组 ($UAP \leq 244 \text{ dB/m}$)、轻度 NAFLD 组 ($244 \text{ dB/m} < UAP \leq 269 \text{ dB/m}$)、中度 NAFLD 组 ($269 \text{ dB/m} < UAP \leq 296 \text{ dB/m}$) 和重度 NAFLD 组 ($UAP > 296 \text{ dB/m}$)。根据 LSM 是否 $\geq 7.3 \text{ kPa}$ 将人群分为有无肝纤维化组, 根据是否 $\geq 10 \text{ kPa}$ 分为有无代偿期进展性慢性肝病 (cACLD) 组。组间比较采用方差分析或卡方检验。

结果: 在本研究筛查的社区人群中, 检出 T2DM 患者 3.6% (366 例)。社区自然人群中 NAFLD 占比 57.6% (5765 例), 其中轻度、中度、重度 NAFLD 占比分别为 28.1% (2811 例)、21.4% (2146 例) 和 8.1% (808 例)。而社区 T2DM 人群中合并 NAFLD 占比 63.9% (234 例), 其中合并轻度、中度、重度 NAFLD 占比分别为 23.5% (86 例)、29.2% (107 例) 及 11.2% (41 例)。社区自然人群中的肝纤维化患者占比 22.5% (2253 例)、cACLD 患者占比 4.9% (487 例)。而社区 T2DM 人群中合并肝纤维化患者占比 38.8% (142 例)、合并 cACLD 患者占比 12.6% (46 例)。通过 Logistic 回归分析发现, 社区自然人群和 T2DM 人群的血压、臀围、腰围等指标无显著性差异, 但两组体重指数存在显著性差异。此外, 两组在 NAFLD、肝纤维化、cACLD 的检出率方面也具有统计学差异 (P 值均 <0.001)。

结论: 社区人群中较高的肝脏疾病检出率, 其中 T2DM 人群比自然人群具有更高的 NAFLD、肝纤维化和 cACLD 发生风险。

PO-2012

孤立性肝癌超标准复发术前预测评分系统

陶雨晴、王欣欣、杨蕊、王玥琪、俞灿、周洋
哈尔滨医科大学附属肿瘤医院

目的: 肝细胞癌(HCC)的肝切除术后复发率可高达 50-70%。由于再复发患者可行挽救性肝移植, 但如出现不可移植的复发 (NTR) 则无法进行挽救性肝移植, 我们试图确定术前危险因素来预测切除术后的 NTR, 以辅助孤立性肝癌患者选择前期肝切除术(LR)或肝移植(LT)。

患者和方法: 对 253 例接受根治性切除术并且术前行 MRI 的 HCC 患者进行了回顾性分析, 定义 NTR 患者为发生复发时超过 UCSF 标准。根据临床及肿瘤影像学特征进行 COX 回归分析, 建立我们的 NTR 评分并进行验证。

结果: 253 例患者中, 86 例患者出现复发;在复发患者中, 34 例(39.5%)发生 NTR。在多变量分析中, 与 NTR 相关的因素包括甲胎蛋白(AFP) [10ng/mL][HR: 3.42, 95%可信区间(CI): 1.54, 7.63, P : 0.003]、APHE[HR: 2.23, 95%可信区间(CI): 1.03, 4.81, P : 0.041], 廓清[HR: 0.35 95%可信区间(CI): 0.15, 0.84, P : 0.019], 包膜[HR: 0.44, 95%可信区间(CI): 0.22, 0.88, P : 0.021]。使用每个因素的 b 系数建立简化的基于影像的评分 (c 指数 0.747, 95% CI: 0.6688-0.8252) 并使用评分构建分组。

结论: NTRscore 具有较强的区分能力, 可能是临床上对孤立性肝癌患者进行风险分层和指导治疗的有用工具。

PO-2013

全腹平扫 CT 在胃肠间质瘤靶向治疗疗效评估中的应用价值

郝清、苏海燕、杨丽
河北医科大学第四医院

目的 探讨全腹平扫 CT 在胃肠间质瘤靶向治疗疗效评估中的应用价值, 参照 RECIST 及 Choi 两种评价标准, 对比平扫及增强 CT 疗效评估结果, 评价平扫 CT 在 GIST 靶向治疗疗效评估中的准确性及可行性。

方法 收集胃肠间质瘤患者在靶向治疗前后的全腹增强 CT 扫描图像, 从中筛选出经病理证实的患者 53 例, 分别在平扫和静脉期图像测量靶病灶的长径之和与平均 CT 值, 并计算出靶病灶长径之和变化率与靶病灶平均 CT 值变化率, 参照 RECIST 标准及 Choi 标准分别使用平扫及静脉期图像评估, 观察 53 例患者新发病灶、靶病灶新发出血、钙化的情况。使用统计学方法研究平扫与静脉期图像

中靶病灶的长径之和、靶病灶长径之和变化率、靶病灶平均 CT 值变化率的差异；参照 RECIST 标准及 Choi 标准分别统计平扫及静脉期图像评效的一致性；统计 53 例患者单次全腹平扫 CT 及全腹增强 CT 扫描的有效辐射剂量的差异。

结果 平扫与静脉期中靶病灶长径之和、靶病灶长径之和变化率的差异均无统计学意义 (P 均 >0.05)，且一致性很强 (ICC 值 = 1.000, 0.999)；平扫与静脉期靶病灶平均 CT 值变化率的差异有统计学意义 ($P < 0.05$)，一致性较强 (ICC 值 = 0.672)；平扫与静脉期参照 RECIST 标准的评估结果一致性很强，Kappa 值为 1.000 ($P < 0.05$)；平扫与静脉期参照 Choi 标准的评估结果一致性很强，Kappa 值为 0.882 ($P < 0.05$)；平扫与增强扫描平均辐射剂量差异具有统计学意义 ($P < 0.05$)，全腹平扫 CT、增强 CT 平均有效辐射剂量约 8.490(6.0,11.6)mSv，28.404(19.2,34.4)mSv，单次平扫 CT 较增强 CT 检查辐射剂量降低约 70.11%；53 例患者治疗后有 3 例患者见新发病灶，3 例患者治疗后新发瘤内出血，5 例患者治疗后新发钙化，平扫 CT 均可识别。结论 全腹平扫 CT 参照 RECIST 及 Choi 标准在胃肠道间质瘤靶向治疗疗效评估的准确性好，可以一定程度上减少患者的辐射暴露损伤及检查费用负担，具有一定的应用价值。

PO-2014

直肠癌 APTw 成像的基线值及其预测 新辅助治疗抵抗的可行性研究

张兰、陈慢慢、李欣

华中科技大学同济医学院附属协和医院

背景：新辅助放化疗联合全系膜直肠切除术是局部晚期直肠癌的标准治疗，而准确的治疗抵抗预测是实现个性化精准治疗的前提，目前尚无可靠有效的预测手段。酰胺质子转移加权 (APT_w) 成像是一种分子 MRI 技术，主要基于组织内源性游离蛋白和多肽中的酰胺质子产生图像对比度，已在中枢神经系统疾病中显示出潜在的应用前景，近年来有几篇关于直肠癌中 APT_w 相关的探索性研究报道，但尚没有关于 APT_w 成像预测新辅助放化疗治疗抵抗的研究。

目的：探究 APT_w 成像在直肠癌治疗抵抗中应用的可行性。

方法与材料：21 例病理和临床诊断的局部晚期直肠癌患者纳入，进行了基线常规 MR 扫描和 APT_w 成像，并进行了后续同一方案的新辅助治疗和标准的全系膜直肠切除术、以及标准化的病理评估。两名放射科医生在后处理工作站 (IntelliSpace Portal, Philips Healthcare, Best, 荷兰) 上独立绘制 roi 进行 APT 值的测量。病理特征包括肿瘤分级和肿瘤消退分期 (TRG)。使用组内相关系数 (ICC) 分析观察者间的 APT 值的一致性。采用独立样本 t 检验比较不同病理分级组间的 APT 值差异，采用 Pearson 相关分析评价 APT 值与 TRG 的相关性。

结果：所有肿瘤的 APT 值为 3.55 ± 1.78 (%)，范围 1.09 ~ 7.80)。2 名放射科医师 APT 值的 ICC 值为 0.963 ($p < 0.05$)。TRG0-1 组 (APT 值 1.95 ± 0.74) 与 TRG2-3 组 (APT 值 4.10 ± 1.71) 间 APT 值差异有统计学意义 ($p < 0.05$)。TRG 与 APT 值有显著相关性 ($R = 0.793, p < 0.05$)。

结论：直肠癌通常具有很强的增殖性，这可能导致大量的游离细胞蛋白和多肽的存在。我们测定了直肠癌基线 APT 值，并发现其与新辅助 CRT 后新辅助治疗后的 TRG 显著相关。我们推测 APT 值可能是评估直肠癌病理特征和预测新辅助治疗抵抗的有用生物标志物，可能对患者的临床治疗策略产生潜在影响，这需要在进一步的更大样本量的研究中进行验证。

PO-2015

探讨磁共振 mDIXON-Quant 序列 R2 值 对卵巢上皮肿瘤性质的鉴别价值

郭嘉骏¹、张一涵¹、刘爱连²、李烨²、宋庆龄²

1. 大连医科大学

2. 大连医科大学附属第一医院

目的: 探讨磁共振 mDIXON-Quant 序列中 R2*值对卵巢上皮肿瘤性质的鉴别价值。

材料和方法: 回顾性分析 2019 年 4 月-2023 年 9 月在大连医科大学附属第一医院经飞利浦 3.0T MR (Ingenia CX, Philips Healthcare, the Netherlands) 行盆腔 MR 扫描并经手术病理证实为卵巢占位的 25 例患者, 其中卵巢占位良性病变 (卵巢囊腺瘤) 患者 12 例, 卵巢占位恶性病变患者 13 例 (高级别浆液性癌 6 例, 透明细胞癌 3 例, 内膜样癌 4 例)。入组条件: ①患者病例资料完成, 影像资料和病理资料证实为卵巢囊实性肿瘤, 病理资料完整; ②卵巢肿瘤直径 $\geq 1.5\text{cm}$; ③患者的 MR 扫描序列包括 mDIXON-Quant 序列。出组条件: ①mDIXON-Quant 序列伪影重; ②mDIXON-Quant 序列未包全肿瘤。在工作站测量 mDIXON-Quant 序列的 R2*值, 选取病灶最大层面放置 3 个 ROI, ROI 大小约为病灶直径的 1/2, 3 个 ROI 的均值为测量值。采用 Mann-Whitney U test 检验进行差异性分析。采用受试者操作特征 (ROC) 曲线计算 R2*值对卵巢癌的诊断效能。

结果: 卵巢癌的 R2* (11.52, (10.05, 14.44)) % 低于卵巢囊腺瘤 R2* (12.47, (10.39, 20.34)) %, $P=0.026$ 。R2*值诊断卵巢囊腺瘤的 AUC 值为 0.763, 当阈值为 12.31Hz 时, 灵敏度和特异度分别为 53.8%和 83.3%。(见图 1)

结论: R2*能够对卵巢上皮肿瘤的良恶性进行鉴别, 对临床有一定的指导意义。

PO-2016

基于能谱 CT 多期增强碘水图的影像组学特征预测肾透明细胞癌侵犯肾包膜

张硕、刘静红、刘爱连
大连医科大学附属第一医院

目的:

肾细胞癌是成人泌尿系统常见的恶性肿瘤, 其中肾透明细胞癌(cc RCC)最常见, 占 70% ~ 80%。肾包膜侵犯是肾细胞癌分期的重要因素。基于能谱 CT 增强扫描碘(水)图图像建立术前预测肾癌患者被膜侵犯的影像组学模型。

方法:

回顾性分析 27 例 ccRCC 患者的临床资料, 其中 17 例有包膜侵犯, 10 例无包膜侵犯。所有患者术前均行肾脏能谱 CT 动态增强扫描, 采用后处理生成皮髓质期、实质期和排泄期的碘(水)图像。利用术前 CT 扫描图像构建影像组学模型, 将患者分为包膜侵犯组和无包膜侵犯组。由两名具有 1 年和 3 年腹部影像诊断经验的放射科医师使用 ITK-SNAP 软件(版本 4.0.0)逐层手动绘制覆盖整个肿瘤的感兴趣体积(VOIs)(图 1.2)。对各期 ct 影像组学特征数据进行标准化, 并采用最小冗余 最大相关(mRMR)和最小绝对收缩和选择算子(LASSO)回归分析进行特征选择并建立影像组学模型, 并计算影像组学评分(Radscore)。采用 ROC 曲线评估模型的鉴别预测能力(图 3)。

结果:

采用联影 UAI 软件分别从皮髓质期、实质期和排泄期提取出 104 个纹理特征。LASSO 回归分析显示皮髓质期、实质期、排泄期最具预测价值的特征分别为 1,6 和 6(图 4)。皮髓质期、实质期、排泄期和三相组合模型的曲线下面积(AUC)分别为 0.700、0.529、0.571 和 0.794。

结论:

能谱 CT 增强扫描碘(水)图纹理分析构建的 4 种模型术前对肾被膜侵犯均具有较好的预测效能, 其中三相联合模型的预测效能最佳。

PO-2017

胃 T2WI 图像质量优化：HASTE-GRE-Separated、HASTE-TSE-Separated、TSE-BLADE 和 TSE 序列的对比研究

徐校胜、杨丽、时高峰
河北医科大学第四医院

目的：比较 HASTE-GRE-Separated、HASTE-TSE-Separated、TSE-BLADE 和 TSE 序列在胃部 T2WI 中的图像质量，探索胃部 T2WI 最佳的成像方案。

方法：纳入 25 例胃癌患者(男 17 例，女 8 例)，均在 3.0T 磁共振上进行扫描。计算病灶各序列的 SNR、病灶与水的信号强度比及 CNR。由两位腹部诊断医师（诊断经验分别为 15 年和 5 年）将图像按照 5 分法分别对图像质量进行评分，5=优(胃壁及胃周脂肪间隙显示清晰)，4=良好(胃壁及胃周脂肪间隙少许伪影)，3=中等(胃壁显示可)，2=欠佳(胃壁显示欠清)和 1=差(胃壁及病灶显示不清)。所有定量和定性参数采用 One-way ANOVA 和 Kruskal-Wallis 单因素方差分析，组间两两比较采用 Bonferroni 校正。应用 Kappa 分析对两位医师评分的一致性进行分析。

结果：客观定量参数分析表明，胃部四种 T2WI 的 SNR 及 CNR 均有统计学差异 ($F=4.709$, $P<0.05$; $F=4.164$, $P<0.05$)。HASTE-GRE-Separated 序列的 CNR 高于 TSE 序列 ($P<0.05$)。HASTE-GRE-Separated 和 HASTE-TSE-Separated 序列的信号强度比无显著差异 ($P>0.05$)，但 HASTE-TSE-Separated 序列显示组织 CNR 略高。HASTE-GRE-Separated 和 HASTE-TSE-Separated 序列的主观评价得分 $[(4.52\pm0.59)$ 和 (4.64 ± 0.49) 分] 明显高于 TSE-BLADE 及 TSE $[(3.16\pm0.80)$ 和 (3.04 ± 1.02) 分，($F=32.47$, $P<0.001$)]。其中 HASTE-TSE-Separated 序列图像得分最高。两位医师对四种序列主观评分一致性均为良好。

结论：尽管 HASTE 序列的信号强度不如 TSE-BLADE 和 TSE 序列，但 HASTE 序列由于具有较快的成像速度、运动伪影较少，尤其 HASTE-TSE-Separated 成像序列的出现，进一步提高了传统 HASTE 的成像质量，在胃部 MR T2WI 成像中具有较大的应用潜力。

PO-2018

基于 IVIM-DWI 的纹理分析预测肝细胞癌术后复发的价值

张硕、赵莹、刘爱连
大连医科大学附属第一医院

目的

探讨基于体素内不相干运动扩散加权成像 (intravoxel incoherent motion diffusion weighted imaging, IVIM-DWI) 定量参数图的纹理分析预测肝细胞癌 (hepatocellular carcinoma, HCC) 术后复发的价值。

材料与方法

回顾性收集 2015 年 8 月至 2021 年 11 月期间我院病理证实的 75 例 HCC 患者，分为复发组 ($n=28$) 和非复发组 ($n=47$)。所有患者行上腹 MRI 检查，包括 T1WI、T2WI、动态增强扫描及 IVIM-DWI 序列。使用 Functool 软件对 IVIM-DWI 图像进行后处理，获得 Standard ADC、D mono、D* mono、及 f mono 图。参照动脉期图像，在定量参数图上沿肿瘤边缘逐层勾画肿瘤轮廓获得三维容积感兴趣区 (VOI) (图 1)。提取 104 个纹理特征，包括一阶特征、形状特征、灰度共生矩阵 (GLCM)、灰度游程矩阵 (GLRLM)、灰度大小矩阵 (GLSZM)、灰度依赖矩阵 (GLDM) 及邻域灰度差矩阵 (NGTDM)。采用 Lasso 方法进行特征选择，通过逻辑回归方法构建 HCC 术后复

发预测模型, 包括 Standard ADC、D mono、D* mono、f mono 及影像组学联合模型。使用受试者工作特征 (ROC) 曲线评估模型的效能。

结果

经筛选 Standard ADC、D* mono 及 f mono 分别获得 8、1、6、6 个最优纹理特征 (表 1)。Standard ADC、D mono、D* mono、f mono 模型预测 HCC 术后复发的效能, 敏感度及特异度分别为 0.616、89.4%、39.3%; 0.616、89.4%、39.3%; 0.574、78.7%, 42.9%; 0.672, 76.6%, 53.6%。

结论

IVIM-DWI 纹理分析对 HCC 术后复发预测具有一定价值。

PO-2019

多参数磁共振脂肪定量技术预测宫颈癌淋巴结转移

张硕、田士峰、刘爱连
大连医科大学附属第一医院

目的: 评价磁共振脂肪定量成像在预测宫颈癌淋巴结转移中的作用。

背景: 宫颈癌是一种主要的妇科癌症, 居全球女性常见恶性肿瘤的第三位, 也是全球女性癌症死亡的第四大原因。

方法: 回顾性分析 2019 年 7 月至 2023 年 5 月经手术病理证实的 47 例宫颈癌患者, 其中 15 例为淋巴结转移组, 32 例为非淋巴结转移组。术前均行 mDIXON-Quant 检查; 由三年影像学诊断经验的医师测量其 R2*值, T2*值。使用 spss27.0 进行统计, 根据数据分布的正态性, 对连续变量进行独立样本 t 检验或 U 检验。采用 Logistic 回归和受试者工作特征(ROC)曲线分析评价单项和联合参数的诊断效能。

结果: 淋巴结转移组的 R2*值 (20.58 ± 5.08) 小于淋巴结非转移组的 R2*值 (27.46 ± 7.17), 淋巴结转移组的 T2*值 (55.58 ± 15.75) 大于淋巴结非转移组 (42.36 ± 10.72), 差异均具有统计学意义。R2*值, T2*值以及二者联合鉴别早期淋巴结转移组与淋巴结非转移组的 AUC、敏感度、特异度分别为 0.777, 0.244, 0.779; 93.3%, 13.3%, 93.3%; 56.3%, 96.9%, 56.3%。

结论: R2*值及 T2*预测宫颈癌转移有一定价值, 两者联合诊断的效能得到了提升, 具有一定价值。

PO-2020

MRI 体素内不相干运动对高原妊高征胎盘微循环及微结构的研究

刘飞、闫占月、康莲云、方晨、王生兰、刘刚
青海红十字医院

目的 通过 MRI IVIM 探索高原地区妊高征孕妇胎盘微循环和微结构的研究。方法 回顾性分析 2019 年 8 月至 2022 年 1 月于青海红十字医院就诊正常孕晚期单胎妊娠孕妇 22 例和妊高征孕妇 20 例。所有孕妇均行超声、常规 MRI 和 IVIM 检查, 测得整体胎盘和胎盘各部位真实扩散系数(D), 假性扩散系数(D*), 灌注分数(f)值, 记录估计胎儿体重和出生后体重。统计学采用独立样本 t 检验或单因素 ANOVA 分析, 随后两组胎盘各定量参数组间多重比较采用 Bonferroni 法分析。结果 正常晚孕组胎盘胎儿侧及整体胎盘 f 值均高于妊高征组 ($P < 0.05$), 正常孕晚期胎盘母体侧及整体胎盘 D 值均高于妊高征 ($P < 0.05$), 正常孕晚期 EFW 和胎儿出生体重均高于妊高征 ($P < 0.05$)。结

论 IVIM 可有效分析高原地区妊高征孕妇胎盘血流微循环和微结构, 为临床评估胎盘结构和功能变化提供新依据。

PO-2021

MR 弹性成像与钆塞酸二钠增强 T1 mapping 评估肝纤维化定量的对比研究

张豪、邹立秋、王阳、张凯、王英腾
华中科技大学协和深圳医院

目的 探讨 MR 弹性成像 (MRE)、钆塞酸二钠 (Gd-EOB-DTPA) 增强 T1 mapping 在肝纤维化定量 (liver fibrosis, LF) 的价值。**方法** 实验材料为纯种 6 月龄新西兰大白兔 (共 120 只), 分为正常对照组 (n=20) 与肝纤维化组 (LF 组, n=100), LF 组建模采用每周皮下注射 0.1~0.3ml/kg 的 50% 四氯化碳 (CCL₄) 油溶液模型, 分别在第 4、5、6、15 周末取 5 只对照组与 25 只 LF 组兔行 MRI 肝脏轴位 T1WI、MRE 及钆塞酸二钠 (Gd-EOB-DTPA) 增强 T1 mapping 扫描, 影像学获得肝脏弹性硬度值 (liver stiffness, LS)、平扫 T1 弛豫时间 T1_{native} 及 Gd-EOB-DTPA 增强 T1 mapping 扫描 20 分钟后 T1 弛豫时间 T1_{20min}、T1 弛豫时间减少率 ($\Delta T1_{20min}$) 及 1/T1 弛豫时间增加值 ($\Delta R1_{20min}$); LF 病理学分期依 Scheuer 评分系统, 所得定量参数在早期诊断中的价值, 采用单因素方差分析, 采用 Spearman 法比较各定量参数与 LF 病理分期相关性, 采用 ROC 曲线评估各定量参数对 LF 分期诊断效能。**结果** 病理学评分获得: F0 期 (n=15)、F1 期 (n=22)、F2 期 (n=22)、F3 期 (n=18)、F4 期 (n=19), 共纳入 96 只兔。LS、T1_{native}、T1_{20min}、 $\Delta T1_{20min}$ 、 $\Delta R1_{20min}$ 于 LF 各期间差异均有统计学意义 (P<0.05)。LS、T1_{native}、T1_{20min}、 $\Delta T1_{20min}$ 、 $\Delta R1_{20min}$ 均与 LF 分期相关 (r=0.935、0.559、0.770、-0.418、-0.686, P<0.0001)。ROC 曲线评估 (诊断 F0vsF1~F4、F0vsF1~F2、F0vsF3~F4、F1~F2vsF3~F4) LS 诊断效能最佳 (AUC 分别为 0.988、0.979、1.000、0.995), 其次为 T1_{20min} (AUC 分别为 0.914、0.852、0.987、0.896)。**结论** 在定量评估 LF 分期中, MRE 优于 Gd-EOB-DTPA 增强 T1 mapping。

PO-2022

基于 CT 的体成分分析与肠痿患者术后并发症的相关性研究

王一哲、李洁、王立学、郑卓肇
清华大学附属北京清华长庚医院

目的: 评估基于 CT 的体成分分析对肠痿患者确定性手术术后并发症的预测价值。

方法: 回顾性分析 2016 年 01 月至 2021 年 12 月间在北京清华长庚医院接受确定性手术的 88 例肠痿患者的临床资料及术前腹部 CT 资料。将所有患者根据术后并发症发生情况分为主要结局 (术后并发症 Clavien-Dindo Grade \geq III 级) 组和次要结局组 (包括术后并发症 Clavien-Dindo Grade < III 级及无术后并发症者)。对 CT 图像中 L3 椎体横突层面的体成分 (内脏脂肪、皮下脂肪、腰大肌、腰方肌、竖脊肌和总腹部肌肉) 进行手工勾画得出面积, 进而将面积除以患者身高的平方, 计算出各个体成分指数。对两组间临床数据和 CT 体成分指标进行单因素的统计学差异分析; 然后, 采用 Logistic 回归分析确定确定性手术术后主要并发症的独立预测因子; 最后, 联合临床指标及 CT 体成分指标绘制预测主要结局发生的 ROC 曲线, 确定预测价值最高的模型。

结果: 在纳入研究的 88 例患者中, 有 16 例 (18.08%) 患者出现术后主要结局。单因素分析中, 低腰方肌指数 (QLI) (P = 0.047)、低 QLA/体重指数 (BMI) (P = 0.023)、高 C 反应蛋白 (CRP) (P = 0.036)、较长住院时间 (LOS) (P = 0.002)、较少术前住院史 (P = 0.049) 是术后主要结局发生的危险因素。在多变量回归分析中, QLI (OR= 0.383, 95%CI:0.138~0.803,

$P = 0.011$) 和 LOS (OR= 1.006, 95%CI:1.001~1.010, $P = 0.012$) 是术后主要结局的独立危险因素。CT 体成分指标 QLA/BMI、QLI 联合住院时间、CRP、性别及年龄的诊断价值最高, 曲线下面积为 0.815 (95% CI: 0.693~0.937), 诊断特异度及灵敏度分别为 64.8%和 93.8%。

结论: 联合临床及 CT 体成分指标可成为预测肠痿患者术后并发症的筛选手段; 且 QLI 是肠痿患者确定性手术后主要结局的独立预测因素, 可作为肠痿患者的风险分层工具。

PO-2023

基于 CTE 的影像特征及体成分分析可提高肠白塞 与克罗恩病的鉴别效能

李园秋、沈亚琪

华中科技大学同济医学院附属同济医院

目的: 白塞病(BD)累及肠道时与克罗恩病(CD)表现相似。计算机断层扫描(CTE)可以准确显示肠道受累情况、提取提成分定量数据。本研究旨在评估 CTE 是否可以提高肠 BD 和 CD 的鉴别能力。

方法: 系统回顾我院 2015 年 1 月至 2022 年 10 月诊断为肠 BD 和 CD 的患者。评估首次入院时的临床、实验室、内镜和影像特征。选择 CTE 动脉期进行体成分分析, L1-5 各取中间一层, 分析: 内脏脂肪 (VAT) 与皮下脂肪 (SAT) 面积以及体积的比值、各层 VAT CT 值分布和 5 层之间 VAT 面积的变异系数 (CV)。将感兴趣的变量进行单因素分析并将 P 值 <0.1 的变量进行多因素分析以建立两种鉴别模型 (传统模型:临床数据结合内镜特征; 综合模型:传统模型加上 CTE 特征)。绘制 ROC 曲线比较两种模型的效能。

结果: 本研究纳入 20 例肠 BD 和 179 例 CD 患者。肠 BD 患者年龄更大, 复发性口腔和生殖器溃疡更常见。肠 BD 患者内镜下溃疡多为局灶分布。在影像特征方面, 肠 BD 患者多为息肉样肠壁增厚, 以下特征在 CD 患者中更常见:近端回肠受累、系膜侧强化、肠狭窄。CD 患者 L1-5VAT 与 SAT 面积比、体积比更大, 但仅 L4、L5 层面的面积比有统计学意义 ($P=0.046$; $P=0.013$), 且 CD 患者 VAT 密度的四分位数均比肠 BD 患者高 (P 值均 <0.05)。传统模型纳入的变量有: 年龄 ($P=0.002$)、性别 ($P=0.253$) 局灶性溃疡分布 ($P=0.001$)。综合模型纳入的变量有: 年龄 ($P=0.016$)、性别 ($P=0.887$)、局灶性溃疡分布 ($P=0.001$)、近端回肠受累 ($P=0.007$)、系膜侧强化 ($P=0.167$)、肠道狭窄 ($P=0.017$)、CV ($P=0.038$)、L4 层面 VAT 与 SAT 面积比 ($P=0.118$)。综合模型 ($AUC=0.941$) 的鉴别效能高于传统模型 ($AUC=0.862$) ($P=0.005$)。

结论: 肠 BD 和 CD 可以相互区分。与传统的临床加内镜模式相比, CTE 的加入可显著提高鉴别效能。

PO-2024

初探 mDixon-Quant 技术脂肪分数对 鉴别卵巢上皮肿瘤良恶性的价值

许启帆¹、苏煜¹、刘爱连¹、宋庆玲²、李烨²

1. 大连医科大学

2. 大连医科大学附属第一医院

目的：利用 mDixon-Quant 技术探讨脂肪分数(fat fraction, FF)值对卵巢上皮肿瘤良恶性鉴别的可行性。

材料与方法：回顾性分析 2019 年 4 月至 2023 年 9 月间在大连医科大学附属第一医院经飞利浦 3.0TMR (Ingenia CX, Philips Healthcare, the Netherlands) 行盆腔 MR 扫描并经手术病理证实为卵巢上皮肿瘤患者共 18 例。其中卵巢囊腺瘤 10 例, 高级别浆液性癌 4 例, 透明细胞癌 2 例, 子宫内膜样腺癌 2 例。在肿瘤液性部分最大层面放置 3 个 ROI, 大小约为病灶直径的 1/2, 3 个 ROI 均值为测量值。采用独立样本 Mann-Whitney U 检验进行卵巢癌和卵巢囊腺瘤间 FF 值比较。绘制受试者工作特征(receiving operator characteristic, ROC)曲线, 利用曲线下面积(area under the curve, AUC)比较诊断性能。

结果：卵巢囊腺瘤囊液的 FF 值 (2.11 (2.03, 3.23)) % 高于卵巢癌的 FF 值 (1.38 (0.92, 2.03)) %, $P=0.027$ 。(见图 1) FF 诊断卵巢癌的 AUC 值为 0.80, 当阈值为 1.64% 时, 敏感度和特异度分别为 70.00% 和 100.00%。(见图 2)

结论：FF 值对鉴别卵巢上皮肿瘤的良恶性具有一点作用, 对于临床诊断肿瘤性质具有一定帮助。

PO-2025

不同 MRI 对比剂在预测肝细胞癌微血管侵犯中的应用探究

徐迅、孙书文、刘秋萍、刘希胜

江苏省人民医院 (南京医科大学第一附属医院)

目的：基于 MRI 影像学特征探究肝脏特异性对比剂 (Gd-EOB-DTPA) 与常规对比剂 (Gd-DTPA) 在预测肝细胞癌 (hepatocellular carcinoma, HCC) 微血管侵犯 (microvascular invasion, MVI) 上的差异。

方法：回顾性分析 2010 年 1 月—2019 年 1 月行手术治疗的 HCC 患者 253 例 (Gd-DTPA 组 121 例、Gd-EOB-DTPA 组 132 例)。评估患者术前 MRI 影像学特征, 通过多因素 Logistic 回归分别建立 MVI 预测模型, 以受试者工作特征曲线及临床决策曲线评估模型效能及差异, 并对患者术后生存情况进行随访分析。

结果：Gd-DTPA 组中病灶大小、边界侵袭征及 Gd-EOB-DTPA 组中病灶大小、边界侵袭征、卫星灶是预测 MVI 的独立风险因素。Gd-DTPA 组和 Gd-EOB-DTPA 组模型的曲线下面积 (area under curve, AUC) 分别为 0.761、0.791。临床决策曲线显示 Gd-DTPA 与 Gd-EOB-DTPA 在预测 MVI 发生上具有相近的临床效益。生存分析显示组织病理证实的 MVI 阳性组与 MVI 阴性组的平均无疾病生存时间及模型预测的 MVI 阳性组与 MVI 阴性组的平均无疾病生存时间均存在显著差异。

结论：病灶大小、病灶边界侵袭征及卫星灶是预测 MVI 的独立危险因素。使用 Gd-EOB-DTPA 在预测 MVI 发生方面不能比 Gd-DTPA 获得更多临床效益, 但是 Gd-EOB-DTPA 具有较高的敏感度。

PO-2026

探讨单源双能 CT 标准化碘浓度值对卵巢癌 WT-1 表达的预测价值

王美佳¹、徐嘉君¹、刘爱连¹、李烨²、宋庆玲²

1. 大连医科大学

2. 大连医科大学附属第一医院

目的：利用单源双能 CT 增强扫描三期的标准化碘浓度值(normalized iodine concentration, NIC)预测卵巢癌的肾母细胞瘤基因-1 (Wilms's tumour-1 Gene, WT-1) 的表达情况。材料和方法：回顾性分析 2019 年 1 月-2022 年 7 月在大连医科大学附属第一医院经单源双能 CT 增强扫描行盆腔扫描并经手术病理证实的卵巢占位患者。入组条件为：①患者做过单源双能 CT 增强扫描；②患者病例资料完整，术后病理免疫组化包括 WT-1。出组条件：①图像有伪影；②病灶的实性成分小于 1cm 最终入组卵巢癌患者共 66 例（浆液性癌 44 例，粘液腺癌 2 例，子宫内膜样腺癌伴鳞状分化 6 例，透明细胞癌 13 例，癌肉瘤 1 例）。测量增强三期的碘水值，选取肿瘤病灶实性成分最大层面，沿着实性成分边沿勾画感兴趣区 (Region Of Interest, ROI)。采用独立样本 t 检验比较 WT-1 阳性和阴性的三期碘定量值；使用 ROC 曲线计算三期碘定量值对 WT-1 阳性组的诊断效能。结果：①动脉期 WT-1 阴性组 NIC ($0.11 \pm 0.09 \text{mg/ml}$) 与阳性组 NIC ($0.13 \pm 0.07 \text{mg/ml}$) 差异无统计学意义， $P=0.425$ 。②静脉期 WT-1 阴性组 NIC ($0.33 \pm 0.21 \text{mg/ml}$) 低于 WT-1 静脉期阳性组 NIC ($0.46 \pm 0.22 \text{mg/ml}$)， $P=0.035$ 。③延迟期：WT-1 阴性组 NIC ($0.33 \pm 0.24 \text{mg/ml}$) 低于 WT-1 延迟期阳性组 NIC ($0.61 \pm 0.35 \text{mg/ml}$)， $P<0.001$ 。静脉期及延迟期 NIC 诊断 WT-1 阳性的 AUC、灵敏度、特异度分别为 0.671 及 0.740、72.92% 及 62.50%、61.11% 及 83.33%。结论：单源双能 CT 标准化碘浓度值能够对卵巢癌的 WT1 的表达进行预测，具有一定的临床指导意义。

PO-2027

基于多参数 MRI 预测子宫肌瘤 HIFU 术后复发

方如旗、刘朝禄

福建省妇幼保健院

目的：探究构建基于多参数核磁共振成像 (MRI) 的子宫肌瘤高强度聚焦超声 (HIFU) 术后复发的评估模型。方法：选 2022 年 4 月至 2023 年 4 月于我院行 HIFU 的患者 150 例，对其进行术后半年随访，根据其随访情况分为复发组 (23 例)、未复发组 (127 例)。比较两组术前 MRI 影像资料及相关临床表现，采用二元 logistics 回归分析构建基于多参数 MRI 的子宫肌瘤 HIFU 术后复发的评估模型。结果：共 150 例子宫肌瘤患者，年龄 23~43 岁，中位年龄为 34 岁，其中术后 1 年有 23 例患者出现复发，127 例患者未复发，复发率为 15.33%。计量资料如年龄、腹壁厚度等，以中位数为临界点进行分类。与未复发组相比，复发组年龄 <34 岁、StandardADC 值 $<0.50 \times 10^{-3} \text{mm}^2/\text{s}$ 、SlowADC 值 $<0.81 \times 10^{-3} \text{mm}^2/\text{s}$ 占比更大 ($P<0.05$)。以年龄、StandardADC 值、SlowADC 值为自变量，复发为因变量。Logistic 回归分析显示 StandardADC 值、SlowADC 值影响复发的因素 ($P<0.05$)。将 StandardADC 值、SlowADC 值纳入研究进行重复建模，至纳入方程中的变量均保持 P 值 <0.05 。最终进入回归方程的变量有 2 个，复发评估模型 $Y=1.224\text{StandardADC 值}+1.891\text{SlowADC 值}-3.499$ 。ROC 曲线结果显示，评估曲线下面积为 0.791，特异度为 0.929、敏感度为 0.609，界值为 0.286，具有一定临床参考价值。结论：基于多参数 MRI 及临床构建子宫肌瘤 HIFU 术后复发的评估模型准确度尚可，可用于临床参考。

PO-2028

基于 CT 平扫的影像组学在预测急性胰腺炎预后的应用价值

薛铭、林帅、谢德轩、高齐
哈尔滨医科大学附属第一医院

目的：AP 患者病情进展迅速，且预后不良，因此早期准确判断 AP 进展并做出及时干预对于患者预后至关重要。本实验目的是探讨基于胰腺实质 CT 平扫图像建立的影像组学模型对预测早期 AP 预后的应用价值。

方法：回顾性收集 137 例根据 2012 年修订的亚特兰大分类诊断为 AP 的患者，并分析基线临床资料及影像信息。根据是否出现新的局部、全身并发症或并发症的加重，将患者分为进展组（95 例）与非进展组（42 例），将这 137 例病例以 7: 3 的比例被随机分成训练集和验证集，其中训练集 95 例（非进展组 29 例，进展组 66 例），验证集 42 例（无并发症组 13 例，有并发症组 29 例）。所有患者均接受胰腺 CT 扫描，分析 CT 检查图像人工勾画 ROI，并进行 MCTSI 评分，采用联影科研平台提取 CT 纹理特征，使用 mRMR 和 LASSO 回归进行降维、筛选，基于十倍交叉运算优化组学特征子集，并计算每个患者的 Rad-score，融合 MCTSI 构建模型影像组学模型，将临床基线数据构建临床模型，将二者融合建立临床-影像组学联合模型。ROC 曲线分析评估各模型的效能，使用 DeLong 检验比较各模型的 AUC 间的差异。

结果：通过 mRMR 算法和 LASSO 回归筛选出 13 个价值较大的纹理特征，并计算各个纹理特征的 Rad-score 融合 MCTSI 评分建立影像组学模型，而后建立临床模型及临床-影像组学模型。经 ROC 曲线分析结果显示在训练集中，临床-影像组学模型的 AUC 及 95%CI、准确度、灵敏度、特异度分别为 0.984 (0.964-1.000)、0.947、0.955、0.931；在验证集中，临床-影像组学模型的 AUC 及 95%置信区间、准确度、灵敏度、特异度分别为 0.942 (0.870-1.000)、0.929、0.966、0.846。DeLong 检验显示临床-影像组学联合模型的预测效能高于临床特征模型 (P=0.005) 和影像组学模型 (P=0.042)。

结论：基于胰腺实质 CT 临床-影像组学模型预测早期 AP 患者病情进展具有较高的诊断效能，明显优于临床模型或影像组学模型，联合模型有助于尽早识别并判断急性胰腺炎患者的进展趋势，指导临床尽早改善患者的预后和生存。

PO-2029

术前磁共振扩散加权成像结合血清 CA125 对
子宫内膜癌及其淋巴结转移的评估价值

薛长菊、刘刚、王海尧
青海红十字医院

目的：分析术前磁共振弥散加权成像 (DWI) 结合血清糖类抗原 125 (CA125) 对子宫内膜癌及其淋巴结转移的评估价值。方法：选取 2022 年 9 月—2023 年 3 月在我院经手术病理组织学检查确诊的 144 例子宫内膜癌患者为观察对象，术前均接受磁共振 DWI 检查与血清 CA125 检测。分析血清 CA125 水平与患者临床病理特征的关系及磁共振 DWI 检查图像特征。结果：血清 CA125 水平随着病灶直径、肌层浸润深度、手术病理分期、分级的增加而增加，淋巴结转移者血清 CA125 水平也明显高于无转移者 (P<0.05)。在 DWI 图像中本组所有子宫内膜癌病变呈明显高信号、边界清晰，表观扩散系数 (ADC) 图显示病变信号明显低于周围正常肌层。淋巴结转移者平均 ADC 值低于无淋巴结转移者 (P<0.05)。以手术病理为“金标准”，磁共振 DWI 结合血清 CA125 对子宫内膜癌患者淋巴结转移诊断的灵敏度、特异度、准确率、阳性预测值、阴性预测值 (95.24%、94.92%、95.00%、86.96%、98.25%) 明显高于血清 CA125 (76.19%、74.58%、75.00%、51.61%、

89.80%) 和磁共振 DWI (90.47%、83.05%、85.00%、65.52%、96.08%) 等单独诊断。结论 磁共振 DWI 检查、血清 CA125 均可反映子宫内膜癌患者的病情严重程度, 二者联合可有效提高其淋巴结转移的诊断效能。

PO-2030

不同严重程度初发性急性胰腺炎患者 复发性急性胰腺炎的 CT 特征

张菊¹、蒲红¹、印隆林¹、王玉婷¹、张小明²

1. 四川省医学科学院·四川省人民医院

2. 医学影像四川省重点实验室暨川北医学院附属医院放射科

背景: 急性胰腺炎、复发性急性胰腺炎和慢性胰腺炎是同一疾病的连续过程。以往研究表明, 初发为轻症的急性胰腺炎患者较少与慢性胰腺炎相关联, 而反复发作的重症坏死性胰腺炎可诱发最终导致慢性胰腺炎。然而, 不同严重程度初发性急性胰腺炎患者复发性急性胰腺炎的 CT 特征尚未见报道。我们进行这项研究, 目的是调查不同严重程度初发性急性胰腺炎患者复发性急性胰腺炎的 CT 特征。

方法: 回顾性收集 2013 年 1 月至 2019 年 12 月中国四川省三家三甲医院因复发性急性胰腺炎和急性胰腺炎发作入院而接受增强 CT 检查的同一患者。根据复发或初发, 将患者分为复发性急性胰腺炎组和急性胰腺炎组。根据 2012 年修订的亚特兰大分类中初发性急性胰腺炎的严重程度将复发性急性胰腺炎和急性胰腺炎患者分为两组。初发性急性胰腺炎为轻症的复发性急性胰腺炎和急性胰腺炎患者为第 1 组, 初发性急性胰腺炎为中重症和重症的复发性急性胰腺炎和急性胰腺炎患者为第 2 组。分别分析两组患者复发性急性胰腺炎和初发性急性胰腺炎的人口统计学数据、2012 年修订的亚特兰大分类、CT 特征、CT 严重程度指数评分以及 CT 胰外炎症评分。分别采用秩和检验、卡方检验和 Fisher 精确检验来比较两组之间的连续变量和分类变量。

结果: 在 99 名急性胰腺炎患者中, 共收集到 111 次复发。复发性急性胰腺炎和急性胰腺炎患者最常见的病因都是高脂血症。在第 1 组患者中, 与急性胰腺炎组相比, 复发性急性胰腺炎组的 CT 严重程度指数评分更高 ($P=0.02$); 根据 2012 年修订的亚特兰大分类, 复发性急性胰腺炎组的轻症占比更低, 而中重症占比更高 ($P<0.001$)。在第 2 组中, 与急性胰腺炎组相比, 复发性急性胰腺炎组的住院时间更短 ($P=0.01$), CT 胰外炎症评分更低 ($P=0.007$); 根据 2012 年修订的亚特兰大分类, 复发性急性胰腺炎组的轻症占比更高, 而中重症和重症的占比更低 ($P<0.001$)。

结论: 根据 2012 年修订的亚特兰大分类, 与急性胰腺炎相比, 初发为轻症的急性胰腺炎患者复发性急性胰腺炎的严重程度更高, 而初发为中重症和重症的急性胰腺炎患者复发性急性胰腺炎的严重程度更低。

PO-2031

应用多个非高斯弥散模型预测膀胱癌的组织学分级

郭俊婷¹、王效春²

1. 山西医科大学

2. 山西医科大学第一医院

目的: 组织学分级对于膀胱癌来说是重要的预后因素之一, 本研究的主要目的在于探讨非高斯弥散模型在膀胱癌组织学分级中的鉴别价值。

方法: 2022 年 1 月至 6 月间疑诊膀胱癌的 93 名患者于术前行常规 MRI 和多 b 值弥散成像, 在 2 周内经病理确诊分为两组 (低级别和高级别), 所有的研究均在 3.0T MRI 扫描仪上进行。多 b 值弥

散成像经后处理后获得 5 个非高斯弥散模型：连续时间随机模型 (CTRW)、体素内不相干运动模型 (IVIM)、拉伸指数模型 (SEM)、扩散峰度成像 (DKI) 和分数阶微积分扩散模型 (FROC)。感兴趣区 (VOI) 分别由两名具有十年和八年泌尿系统阅片经验的放射科医师在 DWI ($b=0 \text{ sec/mm}^2$) 进行勾画，参照 T2 和增强扫描，VOI 尽可能包含整个肿瘤，不包括出血、坏死、囊变和肿瘤柄。所有的统计学分析应用 SPSS 软件 (25.0 版本)，P 值小于 0.05 被认为具有统计学差异，采用独立样本 t 检验或 Mann-Whitney U 检验比较膀胱癌低级别和高级别组间单个弥散参数是否存在统计学差异。基于 Logistic 回归结合最优子集筛选，利用存在统计学差异的参数进行建模，预测膀胱癌组织学分级。绘制受试者工作特征曲线 (ROC)，曲线下面积 (AUC) 用于评估模型分类效能。

结果：最终纳入 60 例符合要求的患者。35 例 (58.33%) 经病理学确诊为低级别尿路上皮癌，25 例 (41.67%) 为高级别，在定量参数值中，低级别组中的 CTRW-D, DKI-Dapp, DKI-Kapp, FROC-D, IVIM-D 和 SEM-DDC 值均明显高于高级别组 ($P<0.05$)，单个参数中，CTRW-D 的 AUC 最高，达到 0.769。基于所有参数的组合模型分类效能最高，AUC 达 0.848。

结论：研究表明相比于传统的 DWI 单指数模型，CTRW、IVIM、SEM、DKI 和 FROC 非高斯弥散模型更有利于鉴别膀胱癌组织学分级，指导临床诊疗。

PO-2032

能谱 CT 参数对胃癌新辅助化疗疗效的预测价值

邓娟、周俊林
兰州大学第二医院

目的：探讨化疗前能谱 CT 参数对胃癌新辅助化疗反应的预测价值。

材料与方法：回顾性收集 60 例化疗前行新辅助化疗并进行能谱 CT 检查的胃癌患者，根据术后病理肿瘤消退程度分为反应组和无反应组。收集患者临床特征。测定化疗前门静脉相碘浓度 (IC)、水浓度 (WC)、有效原子序数 (Eff-z)，并且 IC 与主动脉的 IC 进行归一化，得到归一化 IC (NIC)。采用独立样本 t 检验、Mann-Whitney U 检验或卡方检验分析两组差异，采用受试者工作曲线 (ROC) 评价不同变量的预测效果。

结果：反应组中性粒细胞与淋巴细胞比值 (NLR) 低于无反应组 ($P<0.05$)。反应组 IC、NIC、Eff-z 值显著高于无反应组 ($P<0.01$)。NLR、IC、NIC、Eff-z 的 ROC 曲线下面积分别为 0.694、0.688、0.799、0.690。NIC、Eff-z、NLR 值联合预测 GC 对 NAC 的反应具有较好的诊断效果，ROC 曲线下面积为 0.857，敏感性 76.92%，准确度 80.00%，特异性 85.71%。

结论：能谱 CT 参数可作为预测胃癌患者对新辅助化疗反应的无创工具。

PO-2033

临床联合能谱 CT 参数在预测胃癌 Lauren 分型中的价值

邓娟、周俊林
兰州大学第二医院

目的：探讨临床联合能谱 CT 参数在评估胃癌 Lauren 分型的价值。

材料与方法：回顾性收集术前行能谱 CT 检查并经病理证实的 59 例弥漫型胃癌和 41 例肠型胃癌患者。收集患者临床特征并测定两组肿瘤的动脉期碘浓度 (AIC)、有效原子序数 (AZeff)、水浓度 (AWC) 和静脉期碘浓度 (VIC)、有效原子序数 (VZeff)、水浓度 (VWC)。采用类内相关系数 (ICC) 来检验测量结果的一致性。采用独立样本 t 检验、Mann-Whitney U 检验或卡方检验分析两组差异，采用受试者工作曲线 (ROC) 评价不同变量的预测效果。

结果 两组患者的临床参数 CT-T 分期与 N 分期差异有统计学意义 ($P < 0.05$)，弥漫型胃癌 T3-4、N1-3 的患者比例较肠型胃癌高 (83.05% vs 58.54%, 72.88% vs 54.66%)。弥漫型胃癌 AIC、AZeff、VIC 及 VZeff 值显著高于肠型胃癌 ($P < 0.01$)。在单个参数中，VIC 产生的 ROC 曲线下面积最大 (AUC=0.774)。联合临床参数和能谱 CT 参数的联合模型组合产生了最好的整体性能，灵敏度为 88.14%，特异性为 60.98%，曲线下面积为 0.802。

结论 临床联合光谱 CT 参数在术前鉴别胃癌 Lauren 分型中表现出不错的潜力。

PO-2034

CT 影像组学在鉴别有无功能肾上腺腺瘤中的临床应用研究

高齐、薛铭、谢德轩、邹磊
哈尔滨医科大学附属第一医院

目的：肾上腺皮质腺瘤是起源于肾上腺皮质的良性肿瘤，绝大部分肾上腺腺瘤是无功能的，少部分因自主分泌激素成为功能性腺瘤，从而对机体产生影响。本研究的目的是分析基于 CT 的影像组学能否鉴别功能性肾上腺腺瘤与无功能性肾上腺腺瘤。

方法：回顾性分析哈尔滨医科大学附属第一医院接受肾上腺 CT 平扫及增强扫描、且经病理证实为肾上腺皮质腺瘤的 131 例患者的图像和临床资料。其中 111 例（功能性肾上腺腺瘤患者 56 例，无功能性 55 例）用作建立影像组学模型：在 Philips EBW4.5 工作站测量肿瘤横断面最大径；随后手动勾画平扫和动脉期、静脉期图像病灶，使用平台自动提取肿瘤平均 CT 值和影像组学特征；对提取后的特征进行 Z 分数归一化，随即依次使用 mRMR 和 LASSO 算法筛选出各个期相的最佳特征；而后把患者按照 8:2 的比例随机分为训练组和测试组，使用平扫及动脉期、静脉期筛选出的特征建立 Logistic 回归分类模型，计算并比较三个期相模型的 ROC 曲线下的 AUC 值、灵敏性、特异性和准确性。其余 20 例患者（功能性 10 例，无功能性 10 例）用来对模型进行外部验证。使用 DeLong 检验分析各个模型之间的差异。

结果：临床数据和 CT 图像中，功能组及无功能组肾上腺腺瘤的患者年龄与肿瘤最大径差异具有统计学意义。在影像组学方面，共筛选出 8 个平扫特征、7 个动脉期特征与 4 个静脉期特征分别建立三个期相的 Logistic 回归分类模型。其中静脉期模型在鉴别有无功能肾上腺腺瘤方面的准确性最高，训练组 AUC 值 0.992，测试组 AUC 值 0.856，其次为动脉期模型（AUC 训练组：0.988，测试组：0.848）和平扫模型（AUC 训练组：0.871，测试组：0.826）。外部验证组中各个模型表现均良好，平扫及动脉期、静脉期模型的 AUC 值分别为 0.860 与 0.850、0.820。DeLong 检验结果显示，训练组中平扫与动脉期模型、平扫与静脉期模型 ROC 曲线之间的差异具有统计学意义，测试组与外部验证组中各个模型之间的差异不显著。

结论：基于 CT 的影像组学特征在鉴别功能性肾上腺腺瘤与无功能性肾上腺腺瘤方面具有一定价值，可以帮助临床医生制定治疗方案。

PO-2035

开发和验证影像组学空间综合模型预测直肠癌新辅助治疗患者病理完全反应：基于机器学习的人工智能模型研究

李小甜
浙江省人民医院

目的：本研究旨在探讨直肠癌新辅助治疗不同时间点的磁共振影像组学特征对直肠癌新辅助治疗患者病理完全缓解（pathologic complete response, pCR）的预测效能，并使用机器学习开发和验证

影像组学空间综合模型 (radiomics spatial synthesis model, RSSM) 在预测 pCR 患者中的人工智能干预效能。

方法: 回顾性分析 83 例直肠癌患者的临床及影像资料进行分析, 并依据术后病理结果分为 pCR 患者和非 pCR 患者。所有患者均接受了新辅助治疗前后两次 MRI 检查以便于提取影像组学特征, 包括治疗前、治疗后及 delta 特征, delta 特征为治疗前后特征之间计算获得, 基于以上三类特征进行特征降维后使用机器学习方法构建 RSSM, 使用 ROC 曲线评估模型性能。

结果: 治疗前特征、治疗后特征及 Delta 特征构建的单独基础模型的 AUC 值分别为 0.762、0.735 及 0.746, 敏感性为 0.909、0.682 及 0.864, 特异性为 0.74、0.721 及 0.607。结合治疗前、治疗后及 delta 特征构建的联合基础模型的 AUC、敏感性和特异性分别为 0.834、0.955 及 0.541。在此基础上使用 KNN 构建的 RSSM 模型的 AUC、敏感性及特异性分别为 0.887、0.864 及 0.803, Delong 检验显示 RSSM 模型与治疗前、治疗后及 delta 模型均有统计学差异 ($P < 0.05$), 与三者联合基础模型没有统计学差异 ($P > 0.05$)。

结论: 基于新辅助治疗前后及 delta 的联合特征使用 KNN 分类器构建的 RSSM 模型对新辅助治疗的病理完全反应的预测效能最佳, 这可能为临床提供了一种新的工具来协助直肠癌患者的个体化管理。

PO-2036

在诊断和治疗 Zinner 综合征中对精囊腺囊肿进行分类: 六例病例报告和文献复习

谭正武、李欣

华中科技大学同济医学院附属协和医院

目的: 探讨影像学检查 CT/MR 在诊断精囊囊肿合并同侧肾脏缺如 (Zinner 综合征) 中的作用, 并提高对本病的认识, 包括胚胎学、影像学、临床诊断及其治疗。方法: 收集我院 2014 年-2017 年 6 例精囊囊肿/缺如伴同侧肾脏缺如的 CT 或 MRI 检查资料, 6 例 CT 检查, 5 例 MR 检查, 其中 5 例同时有 CT、MRI 检查。5 例 CT 和/或 MR 诊断 Zinner 综合征 (1 例左侧精囊囊肿合并同侧肾缺如、输尿管囊性扩张, 1 例双侧精囊囊肿合并同侧肾缺如、输尿管囊性扩张, 1 例左侧精囊及同侧肾、输尿管缺如, 1 例右侧精囊囊肿合并同侧肾缺如、输尿管囊性扩张, 1 例右侧精囊囊肿合并同侧肾、输尿管缺如), 1 例诊断左侧输尿管下段间叶性肿瘤合并同侧肾脏缺如。结果: 3 例行机器人辅助下腹腔镜精囊囊肿切除, 并病理证实 2 例精囊囊肿合并同侧输尿管开口异位于精囊, 1 例双侧精囊囊肿合并左侧输尿管开口异位于精囊, 3 例术后住院时间平均 12 天, 术后随访恢复情况好, 其余 3 例均无任何手术史及外伤史。结论: Zinner 综合征是发生在男性泌尿生殖系统一种罕见的疾病, 而影像学检查 CT/MRI 在诊断该疾病起到至关重要的作用, 同时提高对病变认识并熟悉影像学特征对临床诊断及其治疗起到指导作用。

PO-2037

CT 平扫自发性孤立性肠系膜上动脉夹层 周围脂肪模糊的临床意义

谭正武、李欣

华中科技大学同济医学院附属协和医院

目的: 自发性孤立性肠系膜上动脉 (SMA) 夹层 (SISMAD) 患者通常因急性或慢性腹痛而入院, 并在急诊科或消化科接受辅助检查, 通常是腹部平扫 CT 或增强 CT。平扫 CT 是急诊放射科最重要

的检查。SMA 直径增大和血管周围脂肪层 (PFS) 尽管不是特异性的, 但可能是 SISMAD 的唯一适应症。这些结果很容易被忽视, 从而导致可能会漏诊 SISMAD。然而, CT 上 SMA 周围的 PFS 可能是可能存在 SISMAD 的唯一指标, 尤其是在血管壁未发生巨大变化的早期阶段。本研究旨在确定 PFS 是否有助于 SISMAD 的诊断。

方法与材料: 本研究 161 例接受腹部增强或 CTA 检查的 SMA 夹层患者的数据进行了回顾性回顾。SMA 直径、分类、PFS、并发症、合并症和治疗方法进行了分析。

结果: SISMAD 的 PFS 与入院类型 (急诊)、临床表现 (急诊)、并发症 (并发症) 和治疗方法显著相关。入院类型 (急诊)、临床表现 (腹痛)、诊断方式和夹层亚型明显相关。

结论: 在平扫 CT 上, SMA 周围的 PFS 可能是 SISMAD 的标志性征象、尤其是在急诊情况下, 这表明需要进行 CTA 检查。

PO-2038

卡维地洛预防基于新型无创模型分层的临床显著门静脉高压患者的肝硬化失代偿

刘川¹、王瑞莹²、董丙田³、于谦¹、祁小龙¹

1. 东南大学附属中大医院

2. 兰州大学第一医院

3. 安徽医科大学第一附属医院

目的: 本研究旨在开发一种新的无创模型用于预测肝硬化患者的临床显著门脉高压 (clinically significant portal hypertension, CSPH), 并研究卡维地洛能否降低基于新型无创模型分层的高危 CSPH 患者的肝功能失代偿风险。

研究人群: 共纳入 1304 名肝硬化患者。在卡维地洛纵向治疗队列中, 51 名患者接受了卡维地洛治疗。

方法: 研究共纳入来自 6 个国家的 3 个队列: 国际多中心肝静脉压力梯度 (hepatic venous pressure gradient, HVPG) 横断面队列、国际多中心纵向随访队列和纵向卡维地洛治疗队列。主要研究结果为首次肝功能失代偿的发生 (显著腹水、内镜发现的静脉曲张出血以及 3-4 级肝性脑病)。

结果: 本研究共涉及 6 项荟萃分析, 肝硬度测量和血小板计数被最终确定为 CSPH 的独立风险因素, 其汇总风险比分别为 1.10 (95% 置信区间: 1.06-1.15) 和 0.99 (95% 置信区间: 0.98-0.99)。

新的 CSPH 风险模型如下: $0.095310 \times \text{LSM (kPa)} - 0.01005 \times \text{PLT (} \times 10^9/\text{L)} - 0.11$ 。在 HVPG 队列 (n=151) 中, 新型模型、ANTICIPATE 模型和 Baveno VII 标准用于 CSPH 分层的 ROC 曲线下面积分别为 0.91 (95% 置信区间 (CI): 0.86-0.95)、0.80 (95% CI: 0.73-0.87) 和 0.83 (95% CI: 0.77-0.89)。值得注意的是, 新的 CSPH 风险模型将灰色区域缩小至 22.5%, 明显低于采用 Baveno VII 标准时的 50.3% (P<0.001)。在随访队列 (n=1102) 中, 基于新模型建立的分界值具体为: >0、0 至 -0.68、<-0.68 分别为高、中、低风险, 其在评估失代偿事件的累积发生率时有显著差异 (p<0.001), 分别为 1.7%, 2.5%, 15.8%。

结论: 本研究建立的新型无创模型在对肝硬化患者的 CSPH 和随后的失代偿事件分层表现良好。对于根据新模型分层的高危 CSPH 患者, 应用卡维地洛治疗可显著降低肝功能失代偿的发生风险。

PO-2039

基于 IVIM 序列评估局部进展期直肠癌新辅助放化疗效果的研究

谢宗源¹、刘爱连²

1. 大连医科大学附属第一医院

2. 大连医科大学附属第一医院

目的 本研究旨在探讨多序列 MR 图像(常规 MR、IVIM 及增强成像)在评估局部进展期直肠癌新辅助放化疗效果的价值。**方法** 回顾性分析 81 例新辅助放化疗 (NCRT) 后行全直肠系膜切除术 (TME) 的局部进展期患者数据。所有患者在 NCRT 前和 TME 术前一周内分别行常规 MR、体素不相干运动序列 (IVIM) 及增强成像。将多序列图像结合起来对 MR 分期为局部进展期 (T3-4Nx 或 TxN+) 患者行新辅助放化疗, 结束后行 TME 手术。根据术后病理肿瘤退缩分级 (TRG), 分为疗效敏感组 (pCR, TRG 0-1 级) 和疗效非敏感组 (npCR, TRG 2-3 级)。比较放化疗前后及疗效敏感组和非敏感组之间的 IVIM 定量参数: 真性扩散系数(D)、假性扩散系数(D*)、灌注分数(f)、表观扩散系数(ADC)值差异。结果 81 例患者 NCRT 后有 72 例病灶明显缩小, 其中 PCR 组(n=46)、npCR 组(n=35), NCRT 前 IVIM 定量 ADC、D、f 值均低于 NCRT 后, NCRT 前后 ADC、D、f 变化差值 pCR 组大于 npCR, 有统计学意义 ($P<0.05$), 而 D*值数值未出现稳定变化, 在 NCRT 前后及组间比较无统计学差异。ADC、D、f 变化差值的 ROC 曲线下面积及约登指数分别为: 0.84、0.93、0.76; 0.70、0.856、0.41。结论 多序列 MR 成像对局部进展期直肠癌新辅助放化疗效果具有较高的评估价值, IVIM 定量参数 ADC、D、f 值的变化可以有效预测术后病理的缓解情况。

PO-2040

CT 影像组学对 Bosniak II~III 级肾脏囊性病
变良恶性的鉴别诊断

梁田

哈尔滨医科大学附属第二医院

【摘要】目的 评估根据 2019 版 Bosniak 分类标准评估 II~III 级肾囊性病通过 CT 影像组学进行分析以鉴别其良恶性。**方法** 回顾性选择 2017 年 1 月至 2022 年 12 月哈尔滨医科大学附属第二医院 PACS 系统中符合条件肾囊性病病例。以高年资医师根据 2019 版 Bosniak 标准筛选出 II-III 级病变, 共 82 例, 采用 3D slicer 软件对图像进行处理, 并进行图像分割以及特征提取, 获得影像组学特征。应用降维方法对影像组学特征进行降维以及模型构建, 计算敏感度、特异度、准确度以及 AUC, 用以评估每个模型的诊断效能。结果 对最具判别能力的 3 个纹理参数: 皮髓期差熵 (AUC=0.769)、皮髓期长游程增强 (AUC=0.773), 以及实质期逆差矩 (AUC=0.7459) 绘制 ROC 曲线, 评估多参数联合的诊断价值, 得到结果: AUC=0.867, SEN=0.786, SPE=0.838。结论 本研究 CT 影像组学对 Bosniak II~III 级肾脏囊性病变良恶性的鉴别诊断, 为临床诊断提供参考。

PO-2041

基于增强 CT 构建图卷积神经网络模型 识别肝细胞癌患者微血管侵犯

杨雪

郑州大学第一附属医院

目的

基于增强 CT 构建图卷积神经网络模型 (graph convolutional network, GCN) 识别肝细胞癌微血管侵犯, 并利用病理学特征行模型事后可解释性分析

方法

回顾性选取自 2015 年 1 月到 2021 年 12 月经手术治疗的肝细胞癌患者, 收集临床资料及增强 CT 图像信息, 且获取肿瘤病理学特征: Edmondson-Steiner 分级, Ki67 指数, 侵袭性高的肿瘤亚型: 粗梁-团块型、角蛋白-19 阳性及肿瘤包绕型血管的生长方式。按照 6:2:2 将患者随机分为训练集 (167 例)、验证集 (56 例)、测试集 (56 例), 据病理诊断 MVI 状态分组: MVI+组、MVI-组。利用图卷积神经网络, 融合自适应学习模块, 学习肿瘤及瘤周的异质性空间拓扑结构信息, 构建分类模型, 识别肝细胞癌患者微血管侵犯。并对比影像组学模型、卷积神经网络模型 (convolutional neural network, CNN) 识别肝细胞癌患者微血管侵犯的效能。另, 利用图卷积神经网络模型的特征行层次聚类分析, 比较各聚类间病理特征差异, 及分析聚类与病理特征的相关性, 对模型进行事后可解释性分析。

结果

纳入 279 例 HCC 患者, 116 例 MVI 阳性患者。GCN 模型较影像组学模型、CNN 模型识别肝细胞癌微血管侵犯的效能最优, 测试集 AUC: 0.784, 准确率: 0.750。基于 GCN 模型特征, 聚类为 3 类: Cluster1-Cluster3, 3 个聚类间病理特征: Edmondson-Steiner 分级、瘤内坏死、Ki67 指数、粗梁团块型肝细胞癌、瘤内坏死、肿瘤包绕型血管、均存在差异 ($p = 0.000-0.005$, <0.05)。以 Cluster 1 为参考, 上述所有差异病理特征均与 Cluster 3 相关 ($p = 0.000-0.003$, <0.05), 除 Ki67 指数的上述所有差异病理特征均与 Cluster2 相关 ($p = 0.001-0.031$, <0.05)。

结论

基于增强 CT 图像的 GCN 模型, 有利于获取肿瘤异质性拓扑图结构信息, 可能有助于 HCC 患者 MVI 的非侵入性识别。病理信息为 GCN 模型提供形态学水平可解释性的可能。

PO-2042

MDCT 和 EUS 对胃十二指肠异位胰腺 与小于 3cm 胃肠道间质瘤的鉴别

张春来

中国人民解放军陆军特色医学中心

目的: 本研究的目的是比较多排螺旋 CT(multidetector computed tomography, MDCT) 与超声内镜(endoscopic ultrasound, EUS)对胃十二指肠 HP 与小于 3cmGIST 的诊断性能, 并研究 MDCT 及 EUS 联合应用在 HP 与小于 3cmGIST 鉴别中的作用。

方法: 收集经病理证实的 HP 或 GIST 患者, 经筛选后收集 MDCT 90 例(HP 43 例, GIST 47 例), EUS 98 例(HP 62 例, GIST 36 例)。分析 MDCT 表现, 包括位置、长径(LD)、短径(SD)、LD-SD 比、轮廓(是否具有中央凹陷征或微分叶征)、边缘、生长模式、病变形态、导管状结构、大囊性结构、病变强化特征等影像学特征, 强化特征主要分析病变各期的强化值、强化比、对胰腺的增强比、Sp、Sa、Sv、Sb。内镜超声分析的内容为病变位置、长径[LD]、短径[SD]、LD/SD 比、边缘、回

声强度、均质性、起源层、存在< 3mm 的微囊性(无回声管状)结构、大囊性结构、是否存在中央凹陷。寻找 HP 与 GIST 患者的临床特征、MDCT 征象和 EUS 征象的差异, 随后采用 Logistic 回归分析构建 MDCT 和 EUS 诊断模型。绘制出 ROC 曲线下面积用于评价 MDCT 和 EUS 模型的诊断效能, 确定模型的最佳阈值, 并计算出敏感度、特异度、阳性预测值(positive predictive value, PPV)、阴性预测值(negative predictive value, NPV)及准确性。

结果: 多因素分析显示 LD/SD 比值、CT 平扫值为诊断两个病变的独立 MDCT 特征。EUS 诊断 HP 的特征为回声强度。当 LD/SD 比值、平扫值与回声强度 3 个指标联合应用时, 能够显著提高对 HP 与 GIST 的鉴别诊断效能。

结论: 对于胃十二指肠 HP 与小于 3cm GIST 的诊断, MDCT 与 EUS 相结合, 在鉴别 HP 与 GIST 方面具有明显优势, 相较于单独使用一种检查方法, 诊断效能显著提高。

PO-2043

ADC 直方图分析在卵巢占位性病变鉴别诊断中的应用

于怡蓓、王立学、赵红亮、郑卓肇
清华大学附属北京清华长庚医院

目的: 探究 ADC 直方图分析对 O-RADS MRI 评分诊断卵巢占位性病变的附加价值。

方法: 本研究回顾性分析了 36 例成年女性患者(包括 13 例卵巢恶性占位, 23 例卵巢良性占位)的临床及影像学资料, 所有患者术前均行 3.0 T MRI 检查。由两位放射科医师使用 FireVoxel 软件在患者的 ADC 图像上勾画感兴趣区并进行直方图分析, 记录直方图参数[包括 ADC 最小值(ADCmin)、ADC 最大值(ADCmax)、ADC 平均值(ADCmean)、方差、标准差、第 5、10、25、50、75、90、95 百分位数、偏度、峰度、熵值]; 同时根据 ACR O-RADS MRI 评分标准对病灶进行评分, 其中评分存在分歧的病灶由一位高年资医师阅片后给出最终评分。采用单因素回归分析筛选独立危险因素, 将筛选出的独立危险因素与标准化的 O-RADS MRI 评分相结合, 采用多因素回归分析确定最佳诊断模型。应用 ROC 曲线评估最佳诊断模型的诊断效能, 并与单独使用 O-RADS MRI 评分比较。

结果: ADC 直方图中的峰值是预测卵巢占位良恶性的独立危险因素, ADC 峰度联合 O-RADS MRI 评分诊断卵巢占位性病变的效能优于单独使用 O-RADS MRI 评分或 ADC 峰度的诊断效能, ROC 曲线下面积(area under the curve, AUC)值分别为: 0.953, 0.905 及 0.799。联合诊断的灵敏度及特异度分别为 92.3%和 91.3%, 诊断准确度为 88.89%。

结论: 基于全病灶的 ADC 直方图分析有助于提高 O-RADS MRI 评分对卵巢占位性病变的诊断效能。

PO-2044

构建并验证基于 MRI 影像组学的列线图 用于肝内胆管癌的区域淋巴结转移和预后预测

钱贤灵^{1,2}、缪庚运^{1,2}、黄鹏^{1,2}、张云飞^{1,2}、杨春^{1,2}、曾蒙苏^{1,2}
1. 复旦大学附属中山医院
2. 上海市影像医学研究所

目的: 构建并验证一个基于临床、影像学特征和 MRI 影像组学特征的列线图, 用于肿块型肝内胆管癌(ICC)患者区域淋巴结转移(LNM)和预后的术前预测。

方法：将 296 名经术后病理诊断为肝内胆管癌（ICC）的患者随机分成训练和测试组（207:89），采用 5 折交叉验证法筛选独立的临床-影像学特征。使用最大相关最小冗余算法（mRMR）和 LASSO 回归从 MRI 图像中提取和选择可重复性高的影像组学特征。使用逻辑回归进行模型组合，评估各模型的预测区分度、校准度和临床实用性。采用生存分析比较淋巴结转移（LNM）阳性和阴性组的总生存率。

结果：CA199、肝内胆管扩张和强化方式是独立的临床-影像学特征。影像组学模型由 T2WI 和延迟期模型组合而成。融合临床、影像学 and 影像组学模型的综合 LNM 预测模型在训练、验证和测试队列中均表现出出色且稳定的预测效能（AUC 分别为 0.888、0.884 和 0.811），并具有正净收益（NRI 95% CI>0）。决策曲线证实了列线图的临床实用性。与术前 PET/CT 检查具有更高的敏感性相比，综合 LNM 预测模型具有更高的特异性和良好的敏感性。区域 LNM 高风险组的总生存期明显低于低风险组（ $p=0.0001$ ）。

结论：综合 LNM 预测模型可以有效预测肿块型 ICC 患者的区域 LNM，且基于模型预测所得的 LNM 可能是预后预测的潜在生物学标志物。

PO-2045

儿童肝母细胞瘤 MRI 特点探讨

张海芳

青海省第五人民医院

目的：探究儿童肝母细胞瘤 MRI 特点。

方法：回顾性分析自 2014 年 1 月-2021 年 1 月共 23 例儿童肝母细胞瘤患者的 MRI 资料，了解患者的临床表现；根据 MRI 表现对其进行分型，记录病灶的位置、数目、大小、病灶侵犯及转移的情况，观察病灶 DWI 图像特点，通过后处理工作站测量病灶实质部分及周围正常肝实质的 ADC 值，分析各区域 ADC 值差异。

结果：23 例病例肝内共 36 例病灶；累及肝右叶 7 例；累及肝左叶 1 例；同时累及肝左、右叶 15 例；肝外转移病 4 例；灶共 7 例，其中，肺转移 4 例，脑转移 1 例，肾转移 1 例，腰 5 椎体转移 1 例；分型：实质型 20 例；多发结节型（结节数大于 3 个）1 例；病灶大小：<5cm 8 例；5-10cm 11 例；>10cm 4 例；侵犯及转移情况：侵犯胆管共 3 例；侵犯门静脉共 5 例，侵犯肝静脉共 5 例；侵犯下腔静脉共 4 例；病灶实质部分、周围肝实质 ADC 值分别为：病灶实质 ADC 值 > 周围正常肝实质 ADC 值；

结论：儿童肝母细胞瘤向血管丰富区域侵袭性生长，具有生长快、转移率高等特点。儿童肝母细胞瘤高 b 值 DWI（ $b=800s/mm^2$ ）序列呈高信号，磁共振成像能从功能上反应出病灶的生长特性。

PO-2046

使用基于 MRI 的影像组学模型预测富粗梁亚型肝细胞癌

张超

山东大学

目的：开发并验证动态对比增强 MRI（DCE-MRI）的影像组学模型，以术前预测 HCC 患者的 MTM 亚型和预后。

方法：回顾性纳入 2015 年 1 月至 2023 年 3 月期间来源于 3 个医疗中心的回顾性数据集。430 例行手术切除的成人患者术前 DCE-MRI 检查纳入研究。从术前配准 MRI 图像上的肿瘤和肿瘤周围区域提取影像组学特征。在训练集中提取影像组学特征，经过特征筛选通过逻辑回归构建五个影像组学

模型，并在内部和外部测试集中验证其性能。将最佳 AUC 影像组学模型和临床影像学特征结合起来构建混合模型。根据模型得出的高分和低分来分析早期无复发生存率和总生存率。

结果：在用于影像组学建模的 430 例患者（中位年龄 57 岁；IQR51-66 岁；男性 348 例）中，155 例（36%）被证实具有 MTM 亚型。分为训练集（n=192）、内部测试集（n=82）、外部测试集（n=156）。内部测试集的影像组学和混合模型的 AUC 分别为 0.84 和 0.87，外部测试集的 AUC 分别为 0.86 和 0.89。早期无复发生存期 ($P < 0.01$) 和总生存期 ($P < 0.005$) 可以使用混合模型进行分类。

结论：MRI 影像组学模型可以精准预测富粗梁亚型肝细胞癌。

PO-2047

基于 T2WI 影像组学模型预测胰腺浆液性囊性肿瘤 和黏液性囊性肿瘤

方旭、边云、王莉、邵成伟、陆建平
海军军医大学第一附属医院（上海长海医院）

目的：建立并验证一种基于 T2WI 影像组学的诊断模型来预测胰腺浆液性囊性肿瘤(SCN)和黏液性囊性肿瘤(MCN)。

方法：回顾性分析 2011 年至 2021 年收治的 304 例（216 例 SCN 和 88 例 MCN）术前行 MRI 检查且经手术病理确诊的患者。按照时间顺序将 2011 年至 2018 年共 223 例患者（159 例 SCN 和 64 例 MCN）组成训练集，2019 年至 2021 年共 81 例患者（57 例 SCN 和 24 例 MCN）组成验证集。比较 SCN 和 MCN 两组患者的临床特征和 MRI 影像特征，筛选出独立危险因素，建立临床预测模型。在 T2WI 图像提取影像组学特征，采用最小绝对收缩与选择算子算法回归模型进行特征筛选并构建影像组学模型，获得 T2WI 影像组学评分，联合临床预测模型和 T2WI 影像组学评分建立临床-组学预测模型。绘制列线图的受试者工作特征曲线（ROC），计算曲线下面积（AUC），评估模型的鉴别诊断效能，使用决策曲线分析评估模型的临床应用价值。

结果：临床预测模型在训练集的 AUC 值为 0.90（95%CI 0.86~0.94），灵敏度、特异度和准确率分别为 90.6%、86.7%和 80.7%，在验证集的 AUC 值为 0.83（95%CI 0.72~0.93），灵敏度、特异度和准确率分别为 91.7%、71.9%和 77.8%。临床-组学预测模型在训练集的 AUC 值为 0.93（95%CI 0.90~0.96），灵敏度、特异度和准确率分别为 81.2%、92.5%和 89.2%，在验证集的 AUC 值为 0.87（95%CI 0.75~0.96），灵敏度、特异度和准确率分别为 91.7%、78.9%和 82.7%。临床决策曲线分析表明临床-组学预测模型具有临床诊断价值。

结论：基于 T2WI 影像组学模型可作为有效预测 SCN 和 MCN 的临床工具，为临床决策提供参考依据。

PO-2048

临床-影像组学模型预测前列腺 PI-RADS 4-5 分病灶的良恶性以避免不必要的活检

何康文、李震
华中科技大学同济医学院附属同济医院

目的：本研究结合前列腺磁共振 T2 加权成像（T2WI）和扩散加权成像（DWI）衍生的影像组学与临床信息建立模型，用于预测术前前列腺 MRI PI-RADS4-5 分病灶的良恶性，以避免不必要的活检。

方法: 纳入术前 MRI 评估为 PI-RADS 4-5 分并进行了前列腺穿刺手术的患者, 以穿刺病理结果作为金标准。收集每位患者的临床特征和术前 T2WI 和 DWI 图像。在 T2WI 和表观扩散系数图 (由 DWI $b=0$ 和 $1500s/mm^2$ 生成) 上使用 3D slicer 手动分割病灶, 并使用 PyRadiomics 提取影像组学特征。利用 student's t 检验和最小绝对收缩和选择算子 (least absolute shrinkage and selection operator, LASSO) 进行特征筛选。构建了三个预测模型: 临床模型、影像组学模型以及临床-影像组学模型。接收器工作特性曲线(ROC)和决策曲线分析(DCA)用以评估模型的预测效果, Delong 检验来比较各模型的预测性能。

结果: 一共纳入了 295 例患者, 其中 204 例为前列腺癌, 91 例为良性。随机分为训练集 ($n=181$) 和验证集 ($n=114$)。经特征筛选得到 7 个与良恶性鉴别相关性最强的影像组学特征并计算获得 Radscore。临床参数中总前列腺特异性抗原 (TPSA) 和年龄为显著性变量。临床-影像组学模型的预测效果最佳, 在训练集和测试集的 ROC 曲线下面积 (AUC) 分别为 0.87、0.79。影像组学模型与其表现相当 (训练集 $AUC=0.85$, 验证集 $AUC=0.77$), 但显著高于临床模型 (训练集 $AUC = 0.68$, 验证集 $AUC = 0.63$)。决策曲线分析表明在阈值概率大于 0.2 的情况下, 临床-影像组学模型可获得更多用于临床决策的净收益。

结论: 基于 T2WI 和 DWI 的临床-影像组学模型可以预测前列腺 PI-RADS 4-5 分病灶的良恶性, 以避免患者接受不必要的活检。

PO-2049

多层螺旋 CT 结合脂肪酶、D-二聚体、 糖蛋白 2 对急性胰腺炎的临床诊断价值探讨

董军强

空军军医大学西京医院

目的: 研究多层螺旋 CT (MSCT) 结合血清脂肪酶 (LPS)、D-二聚体 (D-D)、糖蛋白 2 (GP2) 对急性胰腺炎 (AP) 的诊断价值。

方法: 选取 2017 年 1 月~2023 年 1 月我院收治的 89 例 AP 患者, 记作研究组。另取同期健康体检人员 80 例作为健康组。对所有 AP 患者均开展 MSCT 检查, 并分析相关影像学表现特征。比较两组血清 AMY、LPS、D-D 及 GP2 水平。以受试者工作特征 (ROC) 曲线分析明确 MSCT 联合血清 LPS、D-D 及 GP2 诊断 AP 的效能。

结果: AP 患者的 MSCT 影像学表现特征明显, 且急性水肿型胰腺炎体积明显肿大或呈轻度增大, 显示不均匀强化, 胰腺轮尚可, 周围渗出明显, 小肠扩张, 肠壁增厚, 见少量腹腔积液。而急性坏死性胰腺炎以胰腺体积显著增大为主, 坏死区呈片状低密度影, 其内有高密度出血灶, 增强无强化或不明显强化, 形态不规则, 胰腺轮廓模糊不清, 胰周、肾周积液。在血清 AMY、LPS、D-D 及 GP2 水平方面对比, 研究组均高于健康组 (均 $P<0.05$)。经 ROC 曲线分析发现, MSCT 联合血清 AMY、LPS、D-D 及 GP2 诊断 AP 的曲线下面积 (AUC)、灵敏度、特异度以及约登指数均高于上述五项单独诊断。

结论: MSCT 联合血清 LPS、D-D 及 GP2 诊断 AP 的效能较佳。

PO-2050

基于平扫 CT 的肌肉分层分析技术在 预测肝移植术后并发症中的研究

张磊

吉林大学第一医院 放射科

目的 本文旨在 Myosteatosis 的基础上, 利用分层分析的方法将肌肉内部按照不同的密度范围划分成不同的亚分区, 进一步研究肌肉密度改变对原位肝移植 (orthotopic liver transplantation, OLT) 术后并发症 (Clavien-Dindo \geq III) 的影响, 从而建立全新的预测模型评估 OLT 患者术后并发症的发生情况。

方法 回顾性分析 2013 年 5 月至 2020 年 9 月 145 例就诊于吉林大学第一医院 OLT 患者的病历信息及术前一个月内的肝移植上腹部 CT 平扫检查, 选取每个患者腰 3 椎体水平最大层面的 CT 平扫图像作为原始图像数据, 利用 Neusoft Fat Analysis 软件对 CT 平扫图像进行相关肌肉参数的测量, 根据肌肉测量结果和相关实验室检查建立多种机器学习模型, 绘制不同模型的受试者工作曲线 (ROC), 计算曲线下面积 (AUC)、敏感度、特异度、精确率、召回率、F1 分数、准确率等。

结果 采用肌肉分层分析前的临床特征建立逻辑回归 (logistic regression, LR)、支持向量机 (support vector machine, SVM)、随机森林 (random forests, RF) 三种机器学习模型, 其中 RFC-C 模型测试集的 AUC 值较高为 0.803 (95%CI: 0.660-0.946)、灵敏度 0.588, 特异度 0.778。采用肌肉分层分析后的临床特征建立的 LR-CS、SVM-CS、RFC-CS 模型中, LR-CS 和 SVM-CS 模型测试集的 AUC 值较高, 分别为 0.852 (95%CI: 0.719-0.984) 和 0.852 (95%CI: 0.713-0.991)、灵敏度分别为 0.765 和 0.706、特异度分别 0.889 和 0.926, 相比肌肉分层分析前, LR-CS 和 SVM-CS 模型的灵敏度和特异度均有着明显的提升。

结论 在 Myosteatosis 的基础上, 利用分层分析的方法将肌肉按照不同的密度划分成不同子区, 对于预测 OLT 患者术后并发症情况存在一定价值, 值得我们进一步探讨和研究, 这可能为预测 OLT 患者术后并发症提供新的思路。

PO-2051

基于多期增强 CT 影像组学对原发性胃淋巴瘤与 Borrmann IV 型胃癌的诊断价值

刘霞、李杭

四川省医学科学院·四川省人民医院

【目的】 探讨基于多期增强 CT 影像组学模型鉴别 Borrmann IV 型胃癌与原发性胃淋巴瘤的诊断价值。

【方法】 回顾性收集 2016 年 1 月至 2022 年 5 月病理确诊的 Borrmann IV 型胃癌或原发性胃淋巴瘤的病例共 136 例, 其中训练组 96 例, 验证组 40 例。采用计算机软件对 CT 平扫、动脉期、静脉期图像提取影像组学特征, 再选择 Lasso Logistic 回归方法进行特征筛选, 并建立平扫模型、动脉期模型、静脉期模型、影像组学联合模型 1 (动脉期+静脉期)、影像组学联合模型 2 (平扫+动脉期+静脉期) 等 5 个 CT 影像组学模型。同时筛选 CT 主观影像学征象构建 CT 主观征象模型, 并利用 CT 主观征象及组学特征构建联合模型。应用受试者工作特征 (receiver operating characteristic, ROC) 曲线评估模型的预测性能。校准曲线和霍斯默莱梅肖检验用于评估校准性能。决策曲线分析 (decision curve analysis, DCA) 用于评估临床净效益。

【结果】浆膜亮线征、标准化静脉期 CT 值、瘤周脂肪浸润三个特征构建 CT 主观征象模型，其在训练组、验证组中曲线下面积(area under the ROC curve, AUC) 分别为 0.902、0.878。与其他影像组学模型相比，影像组学联合模型 2（平扫+动脉期+静脉期）显示出良好的预测性能，训练组和验证组的 AUC 分别为 0.871 和 0.865。与 CT 主观征象模型和影像组学模型比较，CT 主观征象-影像组学联合模型进一步提高了判别性能，其在训练组、验证组中的 AUC 值分别为 0.960、0.932。DCA 表明 CT 主观征象-影像组学联合模型的临床效益最大。

【结论】CT 主观征象-影像组学联合模型能够较准确地鉴别 Borrmann IV 型胃癌与原发性胃淋巴瘤，为临床辅助诊断提供有利的手段。

PO-2052

全组 MRI 定量参数预测直肠癌脉管侵犯及其独立危险因素筛选

海梦璐、许春苗
河南省肿瘤医院

目的：探讨 MRI 定量参数在直肠癌脉管侵犯的预测价值。**方法：**回顾性分析 120 例直肠癌患者的临床病理及 MRI 资料，根据病理结果将患者分为脉管侵犯阳性组和阴性组。分析两组间临床病理及 MRI 特征参数的差异，并用二元 Logistic 回归分析直肠癌脉管侵犯的独立影响因素，采用 ROC(receiver operating characteristic curve)曲线下面积(area under the curve, AUC)评价其预测效能。**结果：**(1)本研究共入组 120 例患者，其中脉管侵犯阳性组 38 例(31.67%，38/120)，脉管侵犯阴性组 80 例(68.33%，82/120)；合并神经侵犯及淋巴结转移的直肠癌患者更易出现脉管侵犯，且在两组间的差异均有统计学意义(P 值均<0.05)。(2)在 MRI 定量参数中，Ve 值越高的患者更易出现脉管侵犯，且在两组间的差异有统计学意义(P 值<0.05)。(3)Logistic 回归分析结果显示淋巴结阳性为脉管侵犯的独立危险因素(P 值<0.05)，其 AUC 为 0.911。**结论：**淋巴结阳性状态是直肠癌脉管侵犯的独立危险因素，且具有较高的诊断效能。

PO-2053

基于多层螺旋 CT 增强扫描的卵巢浆液性囊腺癌术前腹膜转移风险预测模型

孙羽、崔迪、张祥林、郑石磊
锦州医科大学附属第一医院

目的：探讨多层螺旋 CT 增强对卵巢浆液性囊腺癌腹膜转移诊断的临床意义。

方法：将 181 例卵巢浆液性囊腺癌患者随机分为两组:训练组和验证组分别使用训练组增强 CT 检查结果对图像特征进行最小绝对收缩和选择算子(LASSO)回归，筛选出特征因素，建立线图模型。将模型应用于验证组，检验模型的有效性，并对训练组和验证组进行 ROC 分析和决策曲线分析。

结果：使用 17 个图像特征进行 LASSO 回归，筛选出双侧卵巢、腹水、腹膜结节、实性成分强化程度 4 个特征因素。回归系数分别为:0.1031、0.1239、0.5952、0.0005。用 4 个特征因子构成折线图。训练集的 ROC 曲线下面积(AUC)为 0.86 (95%CI: 0.84 ~ 0.86)，验证集的 AUC 为 0.98 (95%CI: 0.92 ~ 0.98)。

结论：增强 CT 检查卵巢浆液性囊腺癌风险预测模型有助于腹膜转移的早期诊断和预防疾病的发生发展。

PO-2054

磁共振扩散峰度成像直方图分析对前列腺癌的诊断价值及侵袭性评估

朱子超
成都市第五人民医院

目的 探讨磁共振扩散峰度成像 (DKI) 直方图分析对前列腺癌的诊断价值及其鉴别低级别和高级别前列腺癌的应用价值。

方法 回顾性分析成都市第五人民医院自 2021 年 4 月至 2023 年 4 月临床怀疑前列腺疾病于我院行 MRI 检查的患者 110 例, 经超声穿刺或手术病理确诊, 良性前列腺增生组 57 例, 前列腺癌组 53 例, 其中低级别癌灶 (LG) 12 例 (Gleason 评分 ≤ 6), 高级别癌灶 (HG) 41 例 (Gleason 评分 ≥ 7)。所有患者于术前行 MRI 检查, 序列包括: T1WI、T2WI、DWI 和 DKI。使用 Firevoxel 软件对 DKI、DWI 序列图像进行感兴趣区 (ROI) 勾画, 测量得到 ROI 的 DKI 参数及 ADC 值的直方图参数。采用组内相关系数 (ICC) 分析数据测量的可重复性。采用独立样本 t 检验分别评估良性前列腺增生与前列腺癌、低级别与高级别前列腺癌之间各测量参数的差异。采用受试者工作特性曲线 (ROC) 分析各参数鉴别诊断前列腺癌及鉴别低级别与高级别前列腺癌的诊断效能。采用 Spearman 秩相关分析评估各参数与 Gleason 评分的相关性。

结果 前列腺增生组的 Dapp-25th、Dapp-50th、Dapp-75th、ADC25th、aADC50th、aADC75th 明显高于前列腺癌组 ($P<0.001$), Kapp-25th、Kapp-50th、Kapp-75th 明显低于前列腺癌组 ($P<0.001$)。高级别前列腺癌的 Dapp-25th、Dapp-50th、Dapp-75th、aADC25th、aADC50th、aADC75th 明显低于低级别前列腺癌 ($P<0.05$), Kapp-25th、Kapp-50th、Kapp-75th 明显高于低级别前列腺癌 ($P<0.05$)。Dapp、ADC 参数与 Gleason 评分呈负相关, Kapp 参数与 Gleason 评分呈正相关, Kapp-75th 与 Gleason 评分具有良好的相关性 ($r=0.619$, $P<0.05$)。

结论 DWI 和 DKI 参数直方图分析可以有助于鉴别诊断前列腺癌并评估前列腺癌的侵袭性, 为临床治疗提供帮助。

PO-2055

mDixon-Quant 序列预测前列腺癌神经侵犯价值评估

李茜玮¹、陈丽华¹、王楠¹、林良杰²、王家正²、刘爱连¹

1. 大连医科大学附属第一医院

2. 北京飞利浦临床科研部

目的: 本研究旨在研究 mDixon-Quant 序列预测前列腺神经侵犯价值研究。材料与方法: 回顾性收集行前列腺 3.0T MRI 扫描 (包括 APT 及 DWI 序列) 的前列腺癌神经侵犯患者 14 例, 前列腺癌非神经侵犯患者 35 例。由两名观察者于病灶实体显示最大层面放置 ROI 测量两组病例的 FF 值、T2* 及 R2* 值, ROI 应避开病灶出血、坏死及囊变区域。采用组内相关系数 (intraclass correlation coefficient, ICC) 评估两名观察者各测量参数的一致性。采用 Shapiro-Wilk 检验评估两组病例 FF 值、T2* 及 R2* 值的正态性。采用独立样本 t 检验或 Mann-Whitney 检验评估两组病例各参数值的差异性分析。采用受试者工作特征 (ROC) 曲线评估有差异的参数的预测效能, 并利用 Delong 检验比较各 ROC 曲线间的差异。结果: 两名观察者测量参数值一致性好 (ICC >0.75)。前列腺癌神经侵犯组与非神经侵犯组的 FF 差异无统计学意义 ($z=0.365$, $P<0.715$); 前列腺癌神经侵犯组的 R2* 值大于前列腺增生 [57.17 (52.18, 67.05) s⁻¹ vs 46.60 (38.35, 61.40) s⁻¹], 差异具有统计学意义 ($z=-1.970$, $p=0.049$)。前列腺癌神经侵犯组的 T2* 值小于前列腺增生 [17.80 (14.85, 19.90) ms vs 22.15 (16.55, 26.35) ms], 差异具有统计学意义 ($z=-2.003$, $p=0.045$)。R2* 值、T2* 值预测前列腺癌侵犯的 AUC 值分别为 0.680 及 0.683, 敏感度、特异度及阈值分别达到 62.86%、78.57%、

19.00s⁻¹, 68.57%、71.43%、55.00ms。结论: mDixon-Quant 序列对于预测前列腺癌神经侵犯具有一定的价值, 具有很好的临床应用前景。

PO-2056

比较不同呼吸方式对胰腺志愿者磁共振弥散加权成像测量可重复性及图像质量的临床价值

白煜、裴贻刚、刘文广、李文政
中南大学湘雅医院

目的: 评估 FOCUS-MUSE DWI、MUSE DWI、FOCUS DWI 和 SS DWI 四种不同 DWI 序列使用四种不同呼吸方案的可靠性, 并系统地比较 ADC 值测量的可重复性和图像质量。

方法: 招募 24 名健康志愿者在 3.0 T MRI 上接受胰腺 DWI 检查($b = 50,800 \text{ s/mm}^2$)。所有志愿者根据四种不同的呼吸方案(RT、NT、BH 和 FB)分为四组, 每组均使用 FOCUS-MUSE DWI、MUSE DWI、FOCUS DWI 和 SS DWI 四种序列进行扫描。所有 DWI 序列扫描 2 次, 间隔 10 分钟。通过系统比较 ADC 值测量的可重复性和图像质量评分, 确定具有最佳临床应用价值的序列。采用组内相关系数(intraclass correlation coefficient, ICC)分析 ADC 值在观察者内和观察者间的重复性。ICC 超过 0.75 代表很好的一致性。使用 Bland-Altman 方法比较 95%置信区间(一致限[LOAs])以及第一次和第二次 DWI 扫描之间 ADC 值的平均差异来展示其 ADC 值测量的可重复性。当 P 值小于 0.05 时, 认为差异显著。

结果: 在四种呼吸方案下扫描的 FOCUS-MUSE、MUSE、FOCUS 和 SS DW 四种序列图像中, 相较于 NT、BH、FB 呼吸方式, RT 均具有更可靠的观察者内一致性、观察者间一致性及 ADC 值测量可重复性。此外, 在图像质量评分方面, RT-DWI 的评分高于 BH 和 FB, 与 NT 相似。

结论: 在 3.0 T 磁共振上, 呼吸触发 (RT) 下扫描的 FOCUS-MUSE、MUSE、FOCUS 和 SS DWI 对 ADC 值测量的可重复性优于 NT、BH 和 FB。RT-DWI 能够提供更好的 ADC 值可重复性测量和良好的图像质量, 并推荐其应用于胰腺 DWI 扫描中。

PO-2057

伊犁地区少数民族女性卵巢恶性肿瘤的多模式联合诊断价值

陈婷
新疆伊犁州新华医院

【摘要】目的 探讨伊犁地区少数民族女性卵巢恶性肿瘤的多模式联合诊断价值。方法 回顾分析 2013 年 5 月至 2021 年 6 月我院经穿刺或手术病理证实的少数民族女性患者卵巢恶性肿瘤 60 例共 84 个病灶的影像学表现, 其中维吾尔族 25 例, 哈萨克族 24 例, 回族、东乡族 9 例, 其他少数民族蒙古族、柯尔克孜族各 1 例。60 例均行术前超声、MR 常规扫描及增强扫描、CT 平扫增强扫描。根据病理结果观察单项检查及两两影像检查、三者联合影像检查的灵敏度、准确度。结果 超声检查的灵敏度、诊断符合率分别为 89.2%、72.3%, MR 常规扫描及增强扫描的结果分别为 96.1%、83.8%、, CT 常规及增强扫描的结果为 93.3%、80.5%, 超声与 MR 联合灵敏度为 96%、诊断准确率 85.6% ;超声与 CT 联合诊断灵敏度为 90.9%、准确率 80.5%, 三种影像检查联合的灵敏度和准确度为 95.7%、86.2%, 结论 MR 联合超声或者三种影像检查联合的术前诊断符合率高于单种检查方式。

PO-2058

能谱 CT 碘基值术前预测可切除性胃癌 Lauren 分型的价值

姚晓强、贝天霞、李靖
河南省肿瘤医院

【摘要】目的：探讨能谱 CT 碘基值 (IC) 术前预测可切除性胃癌 Lauren 分型的价值。**方法：**前瞻性搜集 336 例经手术病理证实为胃癌患者的资料，术前均行腹部增强三期能谱 CT 扫描并测量碘基值，术后病理分为 Lauren 肠型、混合型和弥漫型。单因素方差分析三组间年龄、性别、肿瘤部位、厚度、分化程度、病理 T 分期 (pT)、病理 N 分期 (pN)、脉管侵犯、神经侵犯、Borrmann 分型、临床 T 分期 (cT)、动脉期碘基值 (ICAP)、静脉期碘基值 (ICVP)、延迟期碘基值 (ICDP)、动脉期标化碘基值 (nICAP)、静脉期标化碘基值 (nICVP)、延迟期标化碘基值 (nICDP) 的差异；LSD-t 检验进行组间两两比较；Logistic 回归分析筛选出弥漫型胃癌的独立危险因素；受试者工作特征 (ROC) 曲线分析相关指标鉴别弥漫性胃癌的诊断效能，Delong 检验比较曲线下面积 (AUC) 间的差异。**结果：**肠型、弥漫型及混合型分别 92 例、131 例、113 例，三组间部位、pT、厚度、cT、ICAP、nICAP 的差异无统计学意义 ($P>0.05$)；年龄、性别、分化程度、pN、脉管侵犯、神经侵犯、Borrmann 分型、ICVP、ICDP、nICVP、nICDP 的差异有统计学意义 ($P<0.05$)。肠型与弥漫型年龄、ICVP、nICVP、ICDP、nICDP 的差异有统计学意义 ($P<0.05$)，与混合型 nICVP、nICDP 的差异有统计学意义 ($P<0.05$)；混合型与弥漫型年龄、ICDP、nICDP 的差异有统计学意义 ($P<0.05$)。年龄和 ICDP 是弥漫型胃癌的独立危险因素，并由此构建联合参数。年龄、ICVP、ICDP、nICVP、nICDP 及联合参数预测弥漫型胃癌的 AUC 分别为 0.579、0.597、0.622、0.567、0.610、0.660。联合参数与 ICDP、nICDP 间 AUC 的差异无统计学意义 ($P>0.05$)，与 ICVP、nICVP、年龄间 AUC 的差异有统计学意义 ($P<0.05$)。**结论：**能谱 CT 的碘基值能有效预测胃癌 Lauren 分型，年龄和 ICDP 是弥漫型胃癌的独立危险因素，ICDP 是最有价值的碘基值。

PO-2059

基于磁共振成像预测结直肠癌肝转移患者 RAS 基因突变状态和肝切除术后的预后的临床模型的开发和外部验证

韩哲
浙江省肿瘤医院

目的：本研究旨在分别构建并验证诊断和预后模型，用于预测 RAS 突变状态和接受肝切除术的结直肠癌肝转移患者的生存率。

方法：2014 年 1 月至 2020 年 5 月间，来自三家机构的患者被纳入研究。结果为 RAS 突变状态、无疾病/无复发生存期 (DFS/RFS) 和总生存期 (OS)。研究人员采用 LASSO 方法来选择合适的变量建立模型。根据模型构建了多个列线图，分别预测 RAS 突变状态、1 年 DFS/RFS 和 3 年 OS。预测模型的性能通过 AUC 或 C-指数以及校准图进行估算和报告，校准图包括模型开发和外部验证。**结果：**诊断模型研究共纳入 173 例患者，其中 117 例用于建立模型，33 例和 23 例用于外部验证。最终模型的预测变量包括肝转移的发生时间、原发病灶的位置、瘤内坏死的类型和瘤周肝实质的早期强化。开发队列、内部验证队列、外部验证队列 1 和外部验证队列 2 的 AUC 分别为 0.742、0.741、0.703 和 0.708。在同一时期，共有 167 名患者被纳入预后模型研究，其中 112 人用于开发模型，32 人和 23 人用于外部验证。DFS/RFS 模型中选择的预测因子包括 RAS 突变状态、肝转移的发生时间、CA199、原发肿瘤位置和主血管侵犯。OS 模型中的预测因子包括 RAS 突变状态、肝转移的发生时间、原发肿瘤位置、肿瘤负荷评分 (TBS)、肝转移位置和肿瘤周围胆管扩张。DFS/RFS 模型中开发队列、外部验证队列 1 和外部验证队列 2 的 C 指数分别为 0.710、0.702 和

0.719。OS 模型中开发队列、外部验证队列 1 和外部验证队列 2 的 C 指数分别为 0.740、0.786 和 0.753。

结论：整合临床、人口学和放射学特征，尤其是基于核磁共振成像的方法，或许能准确预测肠癌肝转移患者的 RAS 突变状态和预后，从而帮助分诊，并有可能缩短进行诊断和挽救生命所需的时间。这将为预后分层和治疗决策奠定基础。

PO-2060

术前 Gd-BOPTA MRI 在微血管浸润阴性肝细胞癌患者中的预后价值研究

张娟^{1,2}、李寅乔²、贾宁阳²、李勇刚¹

1. 苏州大学附属第一医院

2. 海军军医大学第三附属医院

目的：评估术前基于 Gd-BOTPA MRI 在单发肝细胞癌(HCC)且微血管浸润(MVI)阴性患者中的无肿瘤复发(RFS)的预后价值分析。

方法：本研究以回顾性方式纳入本单位两所院区 2016 年 1 月至 2018 年 12 月术前 2 周内行 Gd-BOTPA MRI 检查且组织病理学证实为 MVI 阴性的 HCC 患者。两名放射科医生根据 2018 版 LIRADS 独立评估 MRI 特征。分别将两家院区病例分成训练集队列(院区 1)和验证集队列(院区 2)。运用单因素和多因素 Cox 回归分析院区 1 队列，确定 RFS 的独立风险因素。根据这些风险因素绘制列线图 and ROC 曲线，并在院区 2 队列中对其性能进行验证。RFS 采用 Kaplan-Meier 生存曲线和对数秩检验进行分析。

结果：在院区 1 队列中和院区 2 队列中分别纳入 107 例和 50 例单发且 MVI 阴性 HCC 患者，其中两个队列中分别有 42 例和 23 例出现术后复发。多因素 Cox 回归分析表明，MRI 影像特征马赛克征、肝胆期瘤周低信号和临床指标 HBeAg 阳性是与 RFS 相关的风险因素，并将其纳入了列线图。在训练集和验证集中，模型的 C 指数分别为 0.761 和 0.748，显示出较好的诊断效能。

结论：术前 Gd-BOTPA MRI 特征能有效的预测 MVI 阴性 HCC 患者的 RFS，能为临床个体化的治疗方案提供重要信息。

PO-2061

脾脏硬化性血管瘤样结节转化的 MR 特征及病理学基础

王旻姝

中国人民解放军总医院第四医学中心

目的：探讨脾脏硬化性血管瘤样结节转化 (SANT) 的磁共振成像 (MRI) 特征及病理基础，提高术前诊断水平。

材料与方法：回顾性分析 12 例经组织病理学证实为脾脏硬化性血管瘤样结节转化 (SANT) 的患者临床及 MR 影像资料，分析患者的临床症状、组织病理学特征与 MR 特征的表现，包括在 MR 图像上病灶数量、大小、形状、边界、信号强度和增强模式。

结果：12 例脾脏 SANT 患者均为单发病灶，12 例均呈圆形或椭圆形，T2WI 呈稍低和低信号的有 9 例 (9/12)，出现星状或纤维瘢痕的 10 例 (10/12)，DWI 呈均匀或不均匀低信号的有 11 例 (11/12)，MR 增强后 12 例均表现渐进持续向心性强化，其中 8 例出现轮辐样强化 (8/12)，结节样强化的 5 例 (5/12)，12 例均无坏死、囊变，2 例出现出血。

结论：脾脏 SANT 是一种罕见的良性非肿瘤性病灶，磁共振特征主要为 T2 及 DWI 为低信号，平扫及增强可见轮辐征，增强呈向心性延迟强化，以上特征对术前诊断脾脏 SANT 有一定价值。

PO-2062

探究动脉自旋标记灌注成像 (ASL) 评估慢性肾病的价值

张倩瑜¹、鞠焯¹、骆仁娜¹、霍宇婷²、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连医科大学影像技术学院

目的

探究动脉自旋标记灌注成像评估慢性肾病(chronic kidney disease, CKD)患者肾功能的价值。

材料与方法

回顾性收集 3.0 T MRI 检查的慢性肾病共 50 例, 扫描序列包括常规 T2WI 及 ASL 序列。根据 CKD 分期标准将其分为 A 组(轻度肾损害, n=27)和 B 组(中重度肾损害, n=10), 同时搜集 12 例健康志愿者作为对照组 (C 组)。将所有原始图像导入工作站生成伪彩图, 由两名观察者对照 T2WI 图像在双肾最大横断面及其相邻上下两个层面的皮质、髓质区分别放置一个椭圆形感兴趣 (ROI), 最终结果取三个层面皮质、髓质测量值的均值进行统计分析。使用 Shapiro-Wilk 检验数据正态性, 使用方差齐性检验、单因素 ANOVA 检验比较三组总体间差异性, 用邦弗伦尼检验进行事后两两比较; 应用二元 Logistic 回归和受试者工作特征 (receiver operating characteristic, ROC) 曲线分析各单一参数和联合参数的诊断效能。

结果

双肾皮质、髓质 BF 值在三组间均存在显著差异($P < 0.01$)。其中, C 组右肾皮质 BF 值显著高于 A 组 (差值为 76.94 mL/min/100g) 和 B 组 (差值为 106.89 mL/min/100g) ($P < 0.01$)。C 组右肾髓质 BF 值显著高于 B 组 (差值为 58.31 mL/min/100g) ($P < 0.01$)。C 组的左肾皮质 BF 值明显高于 B 组 (差值为 112.87 mL/min/100g) ($P < 0.01$)。C 组的左肾髓质 BF 值显著高于 A 组 [差值为 40.75 mL/min/100g ($P = 0.02$)] 和 B 组 [差值为 64.66 mL/min/100g ($P < 0.01$)]。右肾皮质、髓质、左肾皮质、髓质及四者联合鉴别 B 组和 C 组的 ROC 曲线下面积(AUC 值)分别为 0.925, 0.908, 0.858, 0.933, 0.967; 右肾皮质、左肾髓质及二者联合鉴别 A 组和 C 组的 AUC 值分别为 0.869, 0.804, 0.866。

结论

ASL 可无创性评估 CKD 肾功能损害程度, 有助于疾病的早期发现与诊断, 为疾病治疗方案的制定与预后评估提供一定的临床参考价值。

PO-2063

下腔静脉 MRI 4D Flow 成像参考值

刘翠芳

重庆市中医院

目的: 利用 MRI 的 4D Flow 技术测量下腔静脉的血容量、流速和壁剪切力, 建立健康成人的正常参考值, 并对比分析健康成人与肝硬化患者下腔静脉的血容量、流速和壁剪切力是否有差异。方法: 在这项回顾性研究中, 我们筛选了 2022 年至 2023 年期间我院的健康成年人及肝硬化患者, 在 3.0 T MRI 下获得的所有可用的上腹部 MRI 4DFlow 检查。对下腔静脉的 3 个平面(肝段、肾上段、肾下段)的血容量、流速和壁剪切力进行量化。并对比分析健康成人与肝硬化患者下腔静脉的血容量、流速和壁剪切力。结果: 健康体检者 13 例, 女性 6 例, 男性 7 例, 年龄 36-75 岁; 肝硬化患者 45 例, 女性 16 例, 男性 29 例, 年龄 25-78 岁。我们使用 4DFlow 报告了健康下腔静脉的血容量、流速和壁剪切力的参考值。健康成人与肝硬化患者下腔静脉的血容量、流速和壁剪切力间均有差异性。

结论：我们报道了正常下腔静脉的血流动力学值，这是 MRI 4D Flow 在下腔静脉新兴临床应用所必需的基线数据。

PO-2064

基于 MRI 的深度学习模型与 LI-RADS 标准在肝细胞癌诊断中的对比研究

陈青青¹、王芳¹、朱雅靖²、邓丽萍¹、胡红杰¹

1. 浙江大学医学院附属邵逸夫医院

2. 上海商汤智能科技有限公司

目的：本研究旨在探究基于多序列 MRI 的多任务深度学习模型与基于 LI-RADS 标准在肝细胞癌（HCC）中的诊断效能。

材料与方法：研究共纳入 406 例患者共 468 个病灶（285 个 HCC，47 个非 HCC 恶性肿瘤和 136 个良性病变）进行两个分类任务，分别为二分类（HCC，非 HCC）和三分类（HCC，非 HCC 恶性病变，良性病变）。CNN 模型的分类结果与不同年资阅片者（3 名高年资和 3 名低年资阅片者）基于 2018 MRI LI-RADS 的分级结果比较分类诊断的准确性、敏感性和特异性。对于二分类任务，采用 McNemar's 检验比较不同 LI-RADS 标准以及 CNN 模型与阅片者间诊断敏感性和特异性的差异。对于三分类任务，分别计算 CNN 模型与阅片者的诊断准确性。

结果：二分类 CNN 模型的诊断准确性高于六名阅片者（0.904 vs 0.809~0.904），敏感性显著高于三名低年资阅片者（0.982 vs 0.821~0.893, $P < 0.001$ ），特异性与六名阅片者无明显差异（0.789 vs 0.789~0.895, $P > 0.05$ ）。CNN 模型三分类的诊断准确率高于低年资阅片者（0.894 vs 0.798~0.840），接近或达到高年资阅片者诊断水平（0.894 vs 0.840~0.904）。当病变直径小于 20mm 时，六名阅片者诊断准确性和敏感性显著降低，而 CNN 模型的诊断性能几乎不受肿瘤大小的影响。

结论：基于多序列 MRI 构建的肝肿瘤二分类和三分类 CNN 模型高于低年阅片者，接近或达到高年资阅片者的诊断水平。CNN 模型有助于提高医生，尤其是低年资医生的诊断信心，促进 HCC 的早期诊疗。

PO-2065

穿刺活检后前列腺 MRI 出血回避征对前列腺癌的诊断价值

刘百川¹、白旭¹、张云²、董喆²、徐鸿昊¹、崔梦秋¹、叶慧义¹、王海屹¹

1. 中国人民解放军总医院第一医学中心放射诊断科

2. 中国人民解放军总医院第六医学中心放射诊断科

目的 验证前列腺穿刺活检后 MRI 上的出血回避征对前列腺癌的诊断价值，并探讨其检出的相关影响因素。方法 回顾性连续入组 2021 年 1 月至 2022 年 2 月期间于解放军总医院第一医学中心行根治性前列腺切除术，并于术前行标准 mpMRI 扫描的 91 例外周带前列腺癌患者，年龄 48-80（ 66.0 ± 7.0 ）岁。全部患者均在 MRI 检查前行超声引导下 8-15 针系统穿刺活检。活检至 MRI 检查的中位间隔时间为 32（22, 42）天。将 T1 高信号的病变定义为出血灶，由两名放射科医师在 T1WI 上勾画前列腺内总出血体积，并除以前列腺体积得到前列腺出血分数。出血回避征定义为 T1WI 上存在由高信号区域包绕的低信号区，或连续扇形高信号区域突然截断。两名高年资放射科医师在 T1WI 上对出血回避征进行了独立盲法评估，并依据 6 分法记录病灶位置。以术后病理切片图像为金标准，在高年资泌尿生殖亚专业病理科医师的协助下核对出血回避征所示病灶位置的配准情况。应用受试者工作曲线评估出血回避征的诊断效能，并分析其灵敏度、特异度、阳性预测值（PPV）

及阴性预测值 (NPV)。运用 Mann-Whitney 检验及卡方检验比较有无出血回避征患者组间临床、影像及病理特征差异。运用单因素及多因素 Logistic 回归筛选影响出血回避征检出的独立风险因素。结果 观察者 1 报告了 30/91 (33.0%) 例出血回避征, 观察者 2 报告了 34/91 (37.4%) 例出血回避征; 两者曲线下面积 (AUC)、灵敏度、特异度、PPV 及 NPV 分别为 0.695 [95%CI: 0.589-0.787]、39.0%、100%、100%、23.0% 及 0.710 [95%CI: 0.605-0.800]、49.3%、95.8%、97.06%、40.35%。出血回避征阳性组的穿刺间隔时间 ($P=0.060$) 及出血分数 ($P<0.001$) 均高于出血回避征阴性组。多因素 Logistic 回归显示仅有出血分数是出血回避征出现的独立风险因素 ($P=0.001$)。结论 出血回避征的检出与前列腺穿刺后出血程度相关, 具备较为优异的诊断特异度, 可辅助放射科医师在穿刺活检后 MRI 上准确识别前列腺癌位置。

PO-2066

基于磁共振质子密度脂肪分数成像在 前列腺癌风险分层中的应用研究

李广政、李勇刚
苏州大学附属第一医院

【摘要】

目的: 本研究的目的是通过磁共振质子密度成像获取前列腺癌内脂肪分数, 并收集患者临床及磁共振常规特征, 通过多因素 logistics 回归, 获得高风险前列腺癌的危险因素。

方法: 收集经病理证实的 143 例良性病变和 191 例前列腺癌患者的临床资料。所有前列腺癌患者根据格里森评分, 进行病理风险分层, 其中低风险组 (Gleason 评分 $\leq 3+4$) 63 例, 高风险组 (Gleason 评分 $\geq 4+3$) 128 例。所有患者均接受 3.0T MRI 检查, 并统计与前列腺癌相关的临床危险因素。通过多元逻辑回归分析确定前列腺癌风险分层独立的危险因素, 建立前列腺癌风险分层预测模型, 并进行受试者工作特征 (ROC) 曲线分析, 建立列线图用于可视化分析。

结果: 研究显示, 良性病变组和前列腺癌组在前列腺体积、前列腺特异抗原浓度、全腺体脂肪分数、前列腺周围脂肪厚度和皮下脂肪厚度之间差异有统计学意义 ($p<0.05$)。前列腺癌低风险组和高风险组在患者 BMI、前列腺体积、前列腺特异抗原浓度、肿瘤 ADC 值、标准 T2 信号强度、PI-RADS 评分、病灶脂肪分数和前列腺周围脂肪厚度之间差异有统计学意义 ($p<0.05$)。两组患者在年龄、吸烟史、饮酒史、糖尿病史和皮下脂肪厚度之间差异没有统计学意义 ($p>0.05$)。GS 和 FF ($p=0.6$, $p<0.001$)、PSA ($p=0.432$, $p<0.001$)、ADC 值 ($p=-0.379$, $p<0.001$) 以及 PIRADS 评分 ($p=0.366$, $p<0.001$) 呈现显著相关。通过多元 Logistic 回归分析显示, 脂肪分数的增加、PIRADS 评分 5 分以及 ADC 值和前列腺体积的减少是高风险前列腺癌的独立预测因子 ($p=0.000$ 、 0.04 、 0.03 和 0.032)。建立前列腺癌风险分层的预测模型, 构建 ROC 曲线显示以 0.67 为模型的最佳截断值, 区分高风险前列腺癌曲线下面积为 0.907, 灵敏度 78.1%、特异度为 88.9%。

结论: 基于磁共振质子密度成像获取前列腺癌内脂肪分数与前列腺癌 Gleason 评分存在显著相关性, 是高风险前列腺癌的独立预测因素。

PO-2067

直肠癌区域淋巴结良恶性与周围浸润程度 相关性的磁共振成像分析

许飒

浙江中医药大学附属第一医院（浙江省中医院）

目的：通过对直肠癌患者 MRI 周围浸润情况及区域淋巴结良恶性分析，探讨壁外血管侵犯与区域淋巴结良恶性的相关性。方法：回顾性分析我院 2018 年 10 月-2023 年 5 月经手术病理证实的直肠癌患者 85 例，其中 EMVI 患者 46 例，根据其 MRI 检查及病理结果，获得 MRI-EMVI、DWI 区域淋巴结信号强度、病理学 EMVI、肿瘤浸润程度（T 分期）、区域淋巴结良恶性情况等临床病理资料，分析 MRI 评价 T 分期及 EMVI 准确性，MRI-EMVI、肿瘤 T 分期、DWI 淋巴结信号强度及病理 T 分期与区域淋巴结良恶性的相关性。结果：MRI 评价 EMVI 准确性 83%；MRI-EMVI、肿瘤 T 分期、DWI 及病理 EMVI 与区域淋巴结良恶性相关性有统计学意义（ $p<0.05$ ）。通过对以上诊断效能分析，ROC 曲线下面积分别为 0.83、0.81、0.71 和 0.91。MRI-EMVI、T 分期和 DWI 信号强度对评价区域淋巴结良恶性准确性分别为 83.4%、81.5%和 71.2%。结论：直肠癌 MRI 周围浸润情况对评价区域淋巴结良恶性有一定帮助。

PO-2068

双能 CT 碘（水）图细胞外体积分数直方图 分析预测直肠癌 T 分期

陈安良、董德硕、王悦、胡文君、刘爱连

大连医科大学附属第一医院

目的：探讨双能 CT 碘（水）图细胞外体积分数（ECV）直方图分析预测直肠癌 T 分期的价值。

方法：回顾性分析直肠癌患者并有术后病理 T 分期资料病灶 74 例，其中 T1-2 期 25 例、T3-4 期 49 例，术前均行双能 CT 增强三期能谱扫描。将直肠癌延迟期碘（水）图图像导入 matlab 软件，输入患者血细胞比容（HCT），获得碘（水）图 ECV 图像，使用 itk-snap 软件手动勾画全肿瘤感兴趣区域（ROI）。使用联影 uAI Research Portal 软件提取直方图参数，采用秩和检验用于比较两组之间的参数的差异性。采用受试者工作特征（receiver operating characteristic, ROC）曲线下面积（area under the curve, AUC）、敏感度及特异度来评估直方图参数的诊断效能。

结果：ECV 直方图参数 Energy、Entropy、InterquartileRange、Range、Variance 在直肠癌 T 分期的差异有统计学意义（均 $P<0.05$ ），曲线下面积（AUC）分别为 0.742、0.661、0.691、0.717、0.691，敏感度分别为 55.1%、93.88%、85.71%、61.22%、89.8%，特异度分别为 84%、40%、52%、80%、48%。

结论：基于双能 CT 碘（水）图细胞外体积分数（ECV）直方图分析对于预测直肠癌 T 分期具有一定的价值，可无创术前为诊疗计划提供帮助，Entropy 参数具有高敏感度。

PO-2069

小体积管腔增强 CT 成像对非肿瘤性小肠出血的定位及病因分层

姜宇晨、沈亚琪

华中科技大学同济医学院附属同济医院

背景：小肠出血是胃肠道出血病例中约占 10% 的一种情况，其诊断具有相当大的挑战性。目前的方法如内窥镜和数字减影血管造影（DSA）存在显著的局限性，因此需要对增强 CT 扫描的诊断潜力进行深入探索。

方法：本回顾性研究评估了从 2013 年 12 月至 2023 年 3 月期间在我们机构接受腹部 CT 检查的非肿瘤性小肠出血患者（包括十二指肠）。根据出血原因，将患者分为憩室和非憩室组。在 CT 图像上，活动性出血被定义为动脉期肠腔对比剂外渗和/或静脉期对比剂逐渐积聚。每位患者的图像由两名放射科医生分别评估，评估内容包括活动性出血、潜在出血病变的位置和形态，他们之间寻求达成共识以确定诊断。

结果：本研究共纳入了 167 名患者，以男性为主，中位年龄为 30 岁。49% 的患者被确定为活动性出血。回肠是潜在出血部位最常见的位置。值得注意的是，在憩室组中发现的所有出血性憩室均表现为盲囊状终止。在确定的出血原因中，克罗恩病最为常见。憩室组和非憩室组的诊断方法存在显著差异，憩室组主要采用手术治疗，而非憩室组主要采用内窥镜检查。憩室组的对比剂外渗明显更高，管状样的 Meckel 憩室出现比其他憩室更为显著。

结论：CT 扫描可以更高地检测到憩室性出血，即使是无症状的，可以指导将其分类为多个可能临床相关的类别。

PO-2070

双能 CT 碘（水）图细胞外体积分数纹理分析
预测直肠癌肿瘤出芽分级

陈安良、董德硕、王悦、胡文君、刘爱连

大连医科大学附属第一医院

目的：探讨双能 CT 碘（水）图细胞外体积分数（ECV）纹理分析预测直肠癌肿瘤出芽分级的价值。

方法：回顾性分析直肠癌患者肿瘤出芽分级资料病灶 74 例，其中中低级别 48 例、高级别 26 例，术前均行双能 CT 增强三期能谱扫描。将直肠癌延迟期碘（水）图图像导入 matlab 软件，输入患者血细胞比容（HCT），获得碘（水）图 ECV 图像，使用 itk-snap 软件手动勾画全肿瘤感兴趣区域（ROI）。使用联影 uAI Research Portal 软件提取纹理参数，采用秩和检验用于比较两组之间的参数的差异性。采用受试者工作特征（receiver operating characteristic, ROC）曲线下面积（area under the curve, AUC）、敏感度及特异度来评估纹理参数的诊断效能。

结果：ECV 纹理参数 glcm_Autocorrelation、glcm_JointAverage、gldm_HighGrayLevelEmphasis、gldm_LargeDependenceLowGrayLevelEmphasis、gldm_LowGrayLevelEmphasis 在直肠癌肿瘤出芽分级的差异有统计学意义（均 $P < 0.05$ ），曲线下面积（AUC）分别为 0.682、0.679、0.675、0.691、0.673，敏感度分别为 84.62%、73.08%、73.08%、76.92%、69.23%，特异度分别为 54.17%、64.58%、64.58%、56.25%、66.67%。

结论：基于双能 CT 碘（水）图细胞外体积分数（ECV）纹理分析对于预测直肠癌肿瘤出芽分级具有一定的价值，可术前为患者诊疗计划提供帮助。

PO-2071

Gd-EOB-DTPA 增强 MRI 对不典型增生结节和肝细胞癌的鉴别诊断效能的 Meta 分析

李文婧、许永生、雷军强

兰州大学第一医院

系统评价 Gd-EOB-DTPA 增强 MRI 的不同序列成像特征和组合序列在鉴别不典型增生结节 (dysplastic nodules, DN) 和肝细胞癌 (hepatocellular carcinoma, HCC) 中的总体诊断效能。方法 计算机检索各大中英文数据库, 搜索关于 Gd-EOB-DTPA 增强 MRI 鉴别 DN 和 HCC 的原始研究, 检索年限为 1998 年 1 月到 2023 年 3 月。由两位研究者独立完成文献筛选、提取数据特征和质量评价后, 采用 Stata 17.0、Meta-disc1.4 软件进行 Meta 分析。结果 共纳入 14 篇文献, 包括 DN 375 个, HCC 653 个。Meta 分析结果显示: 多参数联合诊断序列中, 合并的敏感度、特异度、阳性似然比、阴性似然比、曲线下面积分别为 0.95 (95%CI, 0.87-0.98)、0.95 (95%CI, 0.91-0.97)、18.57 (95%CI, 9.64-35.78)、0.06 (95%CI, 0.02-0.14) 和 0.98 (95%CI, 0.97-0.99)。结论 Gd-EOB-DTPA 增强磁共振对于 DN 和 HCC 具有明确的鉴别诊断效能, 肝胆期成像大大弥补了动态增强对早期 HCC 低敏感度的诊断缺陷。

PO-2072

原发性肝癌热消融治疗的 MR 评估及进展

颜荣华

北京大学深圳医院

目的: 探讨磁共振成像 (MR) 在原发性肝癌 (HCC) 热消融围手术期的应用价值与前景。

方法: 总结本中心 MR 在 HCC 热消融治疗的术前、术中和术后各个阶段中的应用, 以及近五年来此领域的国内外研究进展。

结果: HCC 严重威胁我国人民的健康和生命, 热消融治疗, 主要是射频和微波消融, 已成为早期 HCC 及不适合手术或拒绝手术患者的一线根治性治疗手段。影像学检查, 尤其是 MR, 包括各种功能成像、肝胆特异性对比剂增强 MR、多模态融合成像及影像组学等, 在 HCC 的围手术期发挥了重要的作用。一、术前早期精准诊断与鉴别诊断, 判断 HCC 生物学行为, 确定病灶的大小、数目、位置, 选择合适穿刺路径、热消融范围和综合治疗方式, 根据肿瘤浸润范围、位置等制定消融策略, 保证足够的安全范围, 尽可能获得一次性、适形的完全消融治疗; 病变位于高危部位 (膈下、门静脉旁)、动脉期环形强化、肝胆期瘤周低信号等均被认为是与 HCC 热消融治疗后预后不良相关的 MR 特征; 非富血供肝胆期低信号结节 (NHHN) 的存在也被认为是局部和远处复发的预测因素。二、本中心采用超声-MR 融合成像, 术中引导穿刺、布针、监测及协助控制治疗过程、即时判断疗效, 指导即时补充消融获得充足的消融范围, 协助胆囊旁、肝门部胆管旁 HCC 热消融, 随访时间五年以上, 取得了良好的治疗效果。三、术后, MR 可早期发现严重并发症; 肝脏影像报告和数据系统治疗反应算法 (LI-RADS TRA) 为术后评估提供了一个全面的方案, 以标准化 LI-RADS 局部治疗后的治疗反应评估; 影像组学也在预测 HCC 射频消融后的治疗反应和患者预后方面取得了初步的良好结果, 是未来研究的趋势。

结论: MR 辅助下的精准热消融, 对于提高疗效, 改善预后具有重要意义, 融合成像、EOB-MR、影像组学等 MR 新技术在肝癌热消融治疗评估和预测中发挥了越来越多的作用, 但也需要更多的前瞻性多中心研究验证其临床效用。

PO-2073

三维酰胺质子转移磁共振成像与直肠腺癌预后因素相关性的研究

张彩霞¹、李振辉¹、王关顺¹、杨银蕊¹、刘丽珠¹、徐永舟²

1. 云南省肿瘤医院

2. 飞利浦(中国)投资有限公司

目的：酰胺质子转移成像 (APT_w) 在直肠癌精准评估的价值有待进一步研究。本研究采用全新的数据测量方式，探究三维酰胺质子转移磁共振成像参数与直肠腺癌预后因素的相关性，以提高术前评价直肠腺癌预后因素的准确度，为直肠癌的精准治疗提供影像学依据。

方法：前瞻性连续性纳入 2022 年 1 月至 2023 年 4 月，被确诊为直肠腺癌且未行新辅助治疗而直接进行直肠癌根治术的患者。所有患者术前 MR 检查均包括 APT_w、T1WI 加权增强图像 (T1WI-C)。APT 加权成像 (WI) 信号强度 (SI) (%) 定义为 3.5 ppm 偏移处的磁化转移率不对称性百分比 (MTR_{asym})。使用 ITK-SNAP 4.0 软件，以 APTWI-T1WI-C 成像为参照勾画图像，计算直方图数据。根据直肠腺癌预后因素进行分组，采用单因素方差分析/Mann-Whitney U 检验/Kruskal-Wallis H 检验比较不同分组的 APTWI SI。使用受试者工作特性曲线 (ROC) 来确定 APTWI SI 评估直肠腺癌预后因素的诊断性能。

结果：共连续纳入 200 例患者，最终共 50 例患者符合研究纳入与排除标准，平均年龄 58 岁 (55 ~ 61 岁)。直肠腺癌 T1-T2 分期组 (n = 24, 1.93 ± 0.64%) 的平均 APTWI SI 低于 T3-T4 分期组 (n = 26, 2.32 ± 0.73%) (p = 0.05)。有脉管浸润组 (n = 5, 2.7 ± 0.97%) 的平均 APTWI SI 高于无脉管浸润组 (n = 45, 2.06 ± 0.65%) (p = 0.032)。使用平均 APTWI SI 评估直肠腺癌预后因素的曲线下面积分别为 0.66 (95% CI: 0.513 ~ 0.789)、0.70 (95% CI: 0.559 ~ 0.825)。当使用平均 APTWI SI ≥ 1.93% 作为 T3-T4 分期的指标时，敏感性和特异性分别为 76.9% 和 58.3%。当使用平均 APTWI SI ≥ 3.29% 作为有脉管浸润的指标时，敏感性和特异性分别为 40.0% 和 100.0%。结论：酰胺质子转移成像有评价直肠腺癌 T 分期及脉管浸润状态的价值。

自适应迭代技术与频谱 CT 相结合在肝实质检查动脉期中的应用

王东升

南京明基医院

目的：探讨最佳自适应统计迭代重建 (ASIR) 结合最优单能量技术提高肝实质质量

方法：选取 2021 年 1 月至 2022 年 11 月行全腹检查的 55 例患者为研究对象。所有患者均从横膈膜水平至耻骨联合水平进行扫描，扫描层厚度为 5 mm，重建层厚度为 0.625mm。患者检查采用常规能谱扫描进行，迭代率为 60%，预设噪声指数 (NI) 为 8.5 采用 40Kev、50 Kev、60 Kev 结合不同百分比的 ASIR-V 算法，测量动脉期的右前叶、右后叶、皮下脂肪和竖脊肌的 CT 值和 SD 值进行重建三组图像。其对比度噪声比 (CNR) 计算如下：CNR = (肝实质的 HC 值 - 等面竖立脊肌 CT 值) / 相同水平的竖立脊肌的 CT 值的标准差。信噪比 = 肝脏 CT / 肝脏 SD。主观评价：两位具有 7 年以上经验的放射科医生对十二组图像的整体图像质量 (肝脏图像噪声和伪影) 进行主观评分：1 分，组织结构显示不清晰，图像噪点和伪影很大；2 分，组织结构模糊，图像噪点和伪影较大；3 分，组织结构不清晰，图形噪点和伪影稍大；4 分，结构仍然清晰，图像噪点和伪影小；5 分，结构非常清晰，图像没有明显的噪点和伪影。

结果：客观评价：9 组不同重建方法在动脉期的右前叶和右后叶 CT 值、SD 值和 CNR 值均有统计学差异 (P < 0.05)，肝右叶 60Kev-40%ASIR SD 值明显较低 17.04 ± 5.12, 14.63 ± 2.94, SNR 值均高于其他 8 组 (47.53 ± 7.67, 44.35 ± 8.66)。主观评价：2 名诊断组医生对图像重建质量主观评分的 Kappa 值为 0.77、一致性强。在图像噪声方面，图像对比度显示，60Kev-40%ASIR 图像明显优于其他 8 组重建图像 (P < 0.05)。

结论: 随着 ASIR 权重的逐渐增大, 噪点减小, 但过高的 ASIR 对比度会降低, 导致图像过度平滑, 噪点纹理看起来“斑驳”、“蜡状”或“不自然”, 因此结论是 60Kev-40%ASIR 在图像上的诊断值最高。

PO-2075

基于双能 CT 的细胞外体积分数构建 诺模图预测胃癌微卫星不稳定性状态

胡文君、赵莹、陈安良、刘爱连
大连医科大学附属第一医院

目的: 探索基于双能 CT 的细胞外体积分数 (ECV) 及碘浓度参数评估胃癌微卫星不稳定 (MSI) 状态的可行性, 并建立、验证基于双能 CT ECV 分数和 CT 特征的诺模图术前预测胃癌的 MSI 状态。
方法: 回顾性收集本院行双能 CT 能谱成像增强扫描检查且术后病理证实为胃癌的患者 123 例。根据术后免疫组化检测将患者分为 MSI 组 41 例, 微卫星稳定 (MSS) 组 82 例, 然后按照 7: 3 的比例随机分配到训练组 (86 例) 和验证组 (37 例)。两位观察者分别测量患者 CT 特征 (肿瘤最厚径、肿瘤位置、Borrmann 分型、浆膜侵犯、淋巴结转移)、增强三期碘浓度 (IC) 及标准化碘浓度 (nIC), 并根据延迟期病灶及腹主动脉的 IC 值结合患者红细胞压积计算 ECV 分数。采用组内相关系数 (ICC) 检验两名观察者测量结果的一致性。采用独立样本 t 检验或 Mann-Whitney U 检验比较两组病灶各参数值的差异。将单因素分析有统计学意义的变量, 进行多因素 logistic 回归分析筛选胃癌 MSI 的独立预测因素并构建诺模图。通过用受试者操作特征 (ROC) 曲线评估诺模图和各有差异变量的诊断效能, 并通过 Delong 检验进行比较。通过校准曲线 (Hosmer-Lemeshow 检验) 及决策曲线评估诺模图校准性能和临床实用性。

结果: 两名观察者测量各组数据的一致性良好 ($ICC > 0.75$)。MSI 组的 ECV 分数、增强三期 IC、静脉期及延迟期 nIC 值均低于 MSS 组 ($P < 0.05$)。MSI 组中 Borrmann I-II 型和胃窦癌的发病率高于 MSS 组 ($P < 0.05$)。肿瘤位置、Borrmann 类型和 ECV 分数是 MSI 状态的独立预测因素, 被用于建立诺模图。诺模图在训练组和验证组的 AUC 值分别为 0.826(0.729-0.899) 和 0.833(0.675-0.935), 高于其他单变量 AUC ($P < 0.05$)。且诺模图具有良好的校准性能和临床实用性。

结论: 基于双能 CT ECV 分数和 CT 特征的诺模图能有效术前预测胃癌 MSI 状态, 有潜力为胃癌患者的个性化治疗提供更多有价值信息。

PO-2076

基于双能 CT 衍生的影像组学术前预测 直肠腺癌组织学分级的价值

唐希、王冬青、张礼荣、朱海涛、庄子健
江苏大学附属医院

目的: 探讨基于双能计算机断层扫描 (DECT) 静脉相碘图 (IM) 的影像组学模型对直肠腺癌组织学分级的预测价值, 并与静脉相 120 kVp 等效混合图像 (MIX) 进行比较。

方法: 我们前瞻性收集 2017 年 11 月—2022 年 3 月于江苏大学附属医院经手术和病理证实的直肠腺癌 144 例患者的基本资料, 所有患者行双能计算机断层扫描增强检查。以术后病理结果为金标准, 根据直肠腺癌的组织学分级标准, 将腺癌患者分为高级别组 (组织学分级为低分化) 42 例和低级别组 (组织学分级为高分化及中分化) 102 例。按 7: 3 的比例分为训练组 (100 例, 高级别组 29 例、低级别组 71 例) 和验证组 (44 例, 高级别组 13 例、低级别组 31 例)。用 3D-Slicer 分别在 IM 及 MIX 上手动分割原发肿瘤, 获得感兴趣容积, 分别用 3D-Slicer 软件中 radiomics 模块提取影

像组学特征。感兴趣容积由两名放射科医生分别进行勾画，计算组内相关系数 (ICC) 以评估影像组学特征提取的可重复性和稳定性。在训练组中，使用最小绝对收缩与选择算子 (LASSO) 回归对影像组学特征进行降维，并各自建立影像组学模型。使用受试者工作特征 (ROC) 曲线和校准曲线评估两组模型性能，使用 Delong 检验评价两个模型间 ROC 曲线下面积 (AUC) 的差异，使用决策曲线分析 (DCA) 评估预测模型的临床价值。

结果：从 IM 和 MIX 的每个感兴趣容积中总共各提取了 648 和 587 个特征，其中 483 和 425 个特征 ICC 均大于 0.80。训练组中由 LASSO 回归各筛选出 9 个非零系数最佳影像组学特征，分别建立 IM-影像组学 (R-IM)、MIX-影像组学 (R-MIX) 模型。在训练组及验证组中，R-IM 的 AUC 值分别为 0.93、0.86；R-MIX 的 AUC 值分别为 0.78、0.69。Delong 检验提示训练组和验证组的 R-IM 与 R-MIX 间差异具有统计学意义 ($P < 0.05$)。通过校准和决策曲线分析，分别观察到良好的校准和临床应用。

结论：基于 DECT-IM 的 R-IM 模型在预测直肠腺癌的组织学分级方面具有很大的潜能，优于 120 kVp 等效 MIX 图像的 R-MIX 模型。

PO-2077

矢状位 T2WI 新征象对于新辅助治疗后 直肠癌完全缓解的诊断价值

管真、孙应实
北京大学肿瘤医院

目的：准确判断局部进展期直肠癌新辅助治疗后是否达到完全缓解，对于制定下一步治疗决策至关重要。本研究旨在探讨矢状位 T2WI 影像学新征象对于识别肿瘤完全缓解的诊断效能。

材料与方法：回顾性连续收集 2021 年 10 月至 2023 年 2 月于北京大学肿瘤医院接受新辅助放化疗联合全直肠系膜切除术的局部进展期直肠癌患者，选取术前 MRI 与手术之间间隔时间小于 30 天的病例。判断肿瘤完全缓解的新征象包括术前 MRI 矢状位 T2WI 呈厚均匀等低信号，以及矢状位 T2WI 呈分层征及 DWI 无明确高信号。以手术病理标本为参考标准，计算新征象对于肿瘤完全缓解判断的准确性、灵敏度、特异度、阳性预测值 (positive predictive value, PPV)、阴性预测值 (negative predictive value, NPV)、ROC 曲线下面积 (area under curve, AUC)。

结果：共纳入 111 例患者，其中 96 例被诊断为 MRI 肿瘤退缩分级 (MRI tumor regression grade, mrTRG) 1-3 级，15 例为 mrTRG4-5 级。新征象诊断肿瘤完全缓解的准确率为 86.5%，灵敏度为 56.7%，特异度为 97.5%，PPV 为 89.5%，NPV 为 85.9%，AUC 值为 0.768。针对 mrTRG1-3 级患者，即难以准确判断肿瘤是否残留的患者，新征象的准确率为 84.4%，灵敏度为 56.7%，特异度为 97.0%，PPV 为 89.5%，NPV 为 83.1%，AUC 值为 0.768。

结论：矢状位 T2WI 中的厚均匀等低信号和分层征对于识别直肠癌新辅助治疗后肿瘤完全缓解者具有极高的特异性，有助于筛选适合行“等待观察”策略的患者。

PO-2078

基于增强 CT 图像的瘤内和瘤周影像组学 预测胃肠道间质瘤危险度分级的研究

印隆林¹、刘一铭²、刘黎¹

1. 四川省医学科学院·四川省人民医院

2. 成都市温江区人民医院

目的：探讨基于 CT 增强图像的瘤内及瘤周影像组学预测胃肠道间质瘤（GIST）危险度分级的价值。**方法：**回顾性纳入经手术病理证实为原发性 GIST 患者 241 例，根据改良版 NIH 标准将其分为低危组及高危组，按 7:3 比例随机分为训练集及测试集。收集入组病例的临床、病理及 CT 特征，通过单因素分析筛选组间比较 $P<0.1$ 的特征纳入二元逻辑回归分析得到与危险度分级相关的独立危险因素，通过 Logistic 回归构建临床模型。利用 3D-slicer 软件在 CT 静脉期图像逐层分割出瘤内、3mm 瘤周及 5mm 瘤周 ROI，并通过 Python 软件提取影像组学特征。经过 ANOVA 及 LASSO 进行特征降维，通过 Logistic 回归建立 5 个影像组学模型，选择表现最佳的影像组学模型计算 Rad-score，将其与临床独立危险因素结合建立临床-影像组学联合模型、绘制诺模图、评估各模型预测 GIST 危险度分级的性能、比较各模型间 AUC 值的差异性、评价诺模图的校准度，采用 DCA 比较联合模型的临床价值。结果：1、训练集 169 例（低危组：78 例；高危组：91 例）、测试集 72 例（低危组：33 例；高危组：39 例），分析结果显示肿瘤最大径、Ki-67 指数及 CT 图像上肿瘤坏死是 GIST 危险度分级的独立危险因素。2、从瘤内、3mm 瘤周及 5mm 瘤周 ROI 提取影像组学特征，将 3mm 瘤周及 5mm 瘤周的影像组学特征分别与来自瘤内的影像组学特征结合，最终建立 5 个影像组学模型，包括 1 个瘤内模型（ITV）、2 个瘤周模型（PTV3、PTV5）及 2 个瘤内-瘤周联合模型（ITV+PTV3、ITV+PTV5），ITV+PTV3 在训练集、测试集均表现出最佳的危险度分级预测性能，Delong 检验显示其预测性能最优，决策曲线表明其临床净效益最高。3、最佳影像组学模型 ITV+PTV3 的 Rad-score 结合临床资料建立的临床-影像组学联合模型预测性能最佳。结论：基于 CT 静脉期图像的瘤内及瘤周区域建立的影像组学模型及临床-影像组学联合模型，在预测 GIST 危险度分级方面表现出较高的诊断效能，可指导 GIST 的精准诊疗。

PO-2079

双层探测器光谱 CT 虚拟单能量图像在 下腔静脉成像中的临床研究

汪自然、高大鹏、田贝贝

华中科技大学同济医学院附属协和医院

【摘要】目的 探讨双层探测器光谱 CT 单能量图像在下腔静脉 CTV 中的应用。**方法** 回顾性分析 2019 年 9 月至 2022 年 10 月在华中科技大学同济医学院附属协和医院采用双层探测器光谱 CT 行下腔静脉 CTV 的 202 例患者的影像资料。重建常规 120 kVp 混合能量图像（PI）和 40~100 keV 虚拟单能量图像（VMI）。对 120 kVp PI 和 VMI 的图像质量进行客观评分，客观指标包括下腔静脉 CT 值、信噪比（SNR）和对比噪声比（CNR）。采用配对样本 t 检验或 Wilcoxon 秩检验分析探索 CT 值、SNR、CNR 与能级水平的相关性。结果 VMI 的 CT 值、SNR 和 CNR 与能级水平呈负相关。40 keV VMI 的 CT 值、SNR 和 CNR 最高，显著高于 120 kVp PI 和 50~100 keV 各能级 VMI 的 CT 值、SNR 和 CNR，差异具有统计学意义（ P 均 < 0.001 ）。结论 在下腔静脉 CTV 检查中，使用双层探测器光谱 CT 单能量成像能够显著提高 SNR 和 CNR，优化图像质量。

PO-2080

基于多参数 MRI 联合影像组学在前列腺癌骨转移风险评估中的应用研究

李丹燕、祝丽、孟婕
南京鼓楼医院

目的：基于多参数 MRI (multiparametric MRI, mpMRI) 联合影像组学构建分类模型，实现对前列腺癌 (prostate cancer, PCa) 患者骨转移的风险评估。

材料和方法：回顾性收集经穿刺或手术病理证实并在本院接受 mpMRI 及单光子发射计算机断层显像的 PCa 患者 109 例，年龄 45~87 岁，平均 (72.4±8.51) 岁，其中有骨转移 50 例，无骨转移 59 例，按照 7:3 随机分为训练集 (n=77 例) 和测试集 (n=32 例)，其中有骨转移训练集中 35 例，测试集中为 15 例。从 T2WI、DWI 及 ADC 轴位图上勾画前列腺肿瘤全体积 (volume of interest, VOI) 作为感兴趣区，并提取影像组学特征，使用 LASSO 回归选取用于建模的特征。使用受试者操作特征 (receiver operating characteristic, ROC) 曲线下面积 (area under the curve, AUC)、敏感度、特异度和准确度作为评价机器学习分类器性能的指标。比较传统参数，包括患者年龄、ADC、tPSA 等组间差异。构建不同组合模型，评价传统定量参数、影像组学模型和综合模型在前列腺癌骨转移风险评估中的诊断效能。

结果：应用组学分析软件优化筛选出 20 个与 PCa 骨转移密切相关的影像组学特征 ($P<0.01$)，包括 6 个 T2WI 组学特征，4 个 DWI 组学和 10 个 ADC 图组学特征。研究发现基于逻辑回归 (logistic regression, LR) 分类器可以在训练集、测试集上生成最准确的分类模型。基于 LR 分类器，ADC、DWI 和 T2WI 的多模态影像组学模型在训练集、测试集中前列腺癌骨转移风险评估中的 AUC 分别为 0.978 和 0.937；多模态影像组学联合传统定量参数的综合模型在训练集、测试集中的 AUC 分别为 0.977、0.945。

结论：基于前列腺 T2WI、DWI 和 ADC 的影像组学特征构建的机器学习模型能够对 PCa 骨转移风险做出评估，从而可能为 PCa 患者临床上治疗方法的选择、预后的评估及患者全流程管理起到较好的参考作用。

PO-2081

多发结节型脾脏窦岸细胞血管瘤的影像表现与病理对照分析

李莹
武汉大学人民医院

目的 结合文献总结脾脏窦岸细胞血管瘤 (LCA) 的临床特点、影像表现及病理特征，从而提高对本疾病的认识。方法 回顾性对 6 例多发结节型脾脏窦岸细胞血管瘤的临床资料、CT、MRI 影像表现与病理进行对照分析、总结。结果 本组病例中 3 例因腹部不适就诊，4 例伴有不同程度贫血；较大病灶 (直径 $>2.0\text{cm}$) 病灶强化方式呈由内向外，出现“花瓣样”改变，可能是其特征性表现，较小病灶 (直径 $<2.0\text{cm}$) 病灶强化方式显示欠清。T2WI 上的“雀斑征”、DWI 高信号是 its 特点。结论 对于贫血伴有或不伴腹部不适患者，影像学检查提示脾脏多发占位，LCA 应被考虑在内。

PO-2082

双能 CT 结合 DCE-MRI 对直肠癌肿瘤出芽分级的价值研究

陈安良、董德硕、王悦、胡文君、刘爱连
大连医科大学附属第一医院

目的 探讨双能 CT 结合 DCE-MRI 对直肠癌肿瘤出芽分级的价值研究。

方法 回顾性分析直肠癌患者肿瘤出芽分级资料病灶 70 例，其中中低级别 41 例、高级别 29 例。获取双能 CT 动、静脉碘浓度 (IC) 值及 DCE-MRI 参数 (Ktrans、Kep 和 Ve) 值。分别将三个 ROI 放置于病灶最大层面的实性成分上，并将三个 ROI 的平均值作为该病灶的参数定量值，双能 CT 和 DCE-MRI 所测量的病灶层面尽可能一致。标准化碘浓度值 (NIC) = 病灶 IC / 该层面左侧髂动脉或股动脉 IC。采用秩和检验分析双能 CT 参数值 ANIC、VNIC 和 DCE-MRI 参数值 Ktrans、Kep、Ve 的两组间差异性，并同时联合参数检验，利用有差异单一参数及联合参数生成 ROC 曲线，计算曲线下面积 (AUC) 并获得各参数的诊断效能。使用 Delong 检验比较各参数 AUC 效能。

结果 中低级别肿瘤出芽患者 VNIC 值为 0.555 (0.480,0.656)，低于高级别患者 0.703 (0.606,0.806)，两组之间有统计学意义的差异 ($p < 0.05$)，其 AUC、最大 Youden 指数和诊断阈值分别为 0.758、0.486 和 0.596，敏感度和特异度分别为 82.76% 和 65.85%。中低级别肿瘤出芽患者 Kep 值为 2.382 (1.763,3.182) min⁻¹，高于高级别患者 1.806 (1.348,2.778) min⁻¹，两组之间有统计学意义的差异 ($p < 0.05$)，其 AUC、最大 Youden 指数和诊断阈值分别为 0.643、0.292 和 1.526 min⁻¹，敏感度和特异度分别为 41.38% 和 87.8%。Ktrans 和 Ve 以及 ANIC 两组间无明显统计学差异。联合 VNIC 及 Kep 诊断直肠癌肿瘤出芽分级的 AUC、敏感度、特异度分别为 0.790、89.66%、60.98%。比较各参数的诊断效能单一参数 Kep 与 VNIC+Kep 两者间具有统计学差异，而 Kep 与 VNIC 间、VNIC 与 VNIC+Kep 间效能无统计学差异。

结论 VINC 和 Kep 值对预测直肠癌肿瘤出芽分级具有一定意义，两者联合可以提高一定的诊断效能及敏感度，对术前无创诊疗计划提供帮助。

PO-2083

基于常规 CT 征象评估胰腺导管腺癌胰周血管侵犯的研究

李政晓、黄明刚、张艳
陕西省人民医院

目的：1.探讨术前增强 CT 征象在评估胰腺导管腺癌 (Pancreatic ductal adenocarcinoma, PDAC) 胰周血管侵犯的价值。

材料与方法：1.回顾性分析 2015 年-2022 年于我院行手术治疗并经病理组织活检证实的 128 例 PDAC 患者的术前临床、病理及 CT 影像资料。依据血管是否受累分为血管侵犯组与非血管侵犯组。分析患者年龄、性别、术前糖类抗原 CA199、CA125 及 AFP、CEA 等临床资料；观测术前增强 CT 肿瘤部位、肿瘤横径、肿瘤与周围血管的最大夹角 (T/动脉夹角、T/门静脉夹角、T/肠系膜上静脉夹角等)、瘤周脂肪间隙以及淋巴结转移等特征；随后对两组患者进行单因素、多因素 Logistic 回归筛选分析 PDAC 周围血管侵犯的独立预测因子。对于具有统计学显著差异的参数，绘制受试者工作特征 (Receiver operating characteristic, ROC) 曲线，计算曲线下面积 (Area under the curve, AUC) 值，以评估不同参数预测血管侵犯的能力。

结果：1.128 例 PDAC 中，血管侵犯组 35 例，非血管侵犯组 93 例。两组在 T/动脉夹角、T/门静脉夹角、T/肠系膜上静脉夹角、肿瘤横径及 CA199 的差异上具有统计学意义 ($P < 0.05$)；而在淋巴结转移、瘤周脂肪间隙、平扫及增强各期 CT 值两组间差异不具有统计学意义 ($P > 0.05$)；多因素 Logistic 回归结果显示，T/动脉夹角和 T/门静脉夹角是 PDAC 患者血管侵犯的独立预测因子。

ROC 曲线分析显示, T/动脉夹角、T/门静脉夹角预测 PDAC 血管侵犯的 AUC 值分别为 0.642 和 0.687。

结论: 1.CT 影像征象能够术前预测 PDAC 血管侵犯表达状态; T/动脉夹角及 T/门静脉夹角 $\geq 180^\circ$ 可以间接评估血管侵犯。

PO-2084

基于增强 CT 影像组学预测胰腺导管腺癌胰周血管侵犯的研究

李政晓、黄明刚、张艳
陕西省人民医院

目的: 探讨 CT 影像组学特征结合临床特征构建的列线图模型在术前预测胰腺导管腺癌 (PDAC) 胰周血管侵犯的应用价值。

材料与方法: 回顾性收集经手术病理证实的 101 例 PDAC 患者 (血管侵犯组 43 例、非血管侵犯组 58 例) 的术前临床、病理及 CT 影像资料。将所纳入病例随机性地分配为训练组 (70 例) 和验证组 (31 例), 从动脉期、静脉期及延迟期 CT 图像中提取 5622 个影像组学特征, 随后采用 Man Whitney U 检验、SelectKBst 及最小绝对收缩和选择算子 (LASSO) 筛选出能够预测血管侵犯的影像组学特征。选择 5 种不同的分类器对预测模型进行训练和验证, 根据混淆矩阵计算得出模型的准确性、敏感性、特异性。使用 ROC 曲线评估血管侵犯的诊断效能, 将效能最优的组学模型和临床因素融合构建列线图, 并采用决策曲线 (DCA) 评估肿瘤血管侵犯预测模型的临床实用性。

结果: 基于三期增强 CT 图像建立的影像组学模型由 23 个影像组学特征组成。5 种不同分类器建立的影像组学预测模型中, XGBOOST 的诊断效能最优, 训练集预测血管侵犯的 AUC、ACC、SEN、SPE 分别为 0.92、0.957、0.966、0.88; 验证集的 AUC、ACC、SEN、SPE 分别为 0.88、0.847、0.798、0.861。此外, 由 XGBOOST 结合临床因素构建的临床-影像组学融合模型诊断效能较单一因素模型诊断效能进一步提高, 其训练集的 AUC、ACC、SEN、SPE 为 0.97、0.971、0.976、0.975; 验证集的 AUC、ACC、SEN、SPE 分别为 0.92、0.932、0.886、0.982。校准曲线结果显示实际区分 PDAC 血管侵犯的结果和临床-影像融合模型的预测概率相当, DCA 显示融合模型可获得最佳净收益值。

结论: 三期增强 CT 图像上提取的组学特征结合临床因素建立的临床-影像组学融合模型在术前预测 PDAC 血管侵犯的准确性和敏感性较高, 可以作为临床治疗方案选择和评估患者生存预后的手段。

PO-2085

卵巢 sertoli-leydig 细胞瘤 MRI 表现 2 例

禹雯婧¹、杨慧敏¹、刘新疆²
1. 滨州医学院附属医院
2. 复旦大学附属浦东医院

卵巢 Sertoli-Leydig 细胞瘤 (Sertoli-Leydig cell tumor, SLCT) 是一种罕见的分泌性激素的卵巢性索间质肿瘤, 在原发卵巢肿瘤中所占比例低于 0.5%, 98% 的患者位于单侧卵巢, 性索间质来源于原始体腔的间叶组织, 可向男女两性分化。

MR 表现呈边界清楚的实性或囊实性信号影, 囊性部分一般在 T1WI 呈低信号, T2WI 呈高信号, 但有时伴随出血或囊液蛋白沉积时 T1WI 可出现斑片状高信号, T2WI 出现低信号; 实性成分在 T1WI 表现为低或等信号, T2WI 信号不一, 可表现为低、等或高信号, 这与肿瘤内部纤维间质的数量有关。增强扫描囊性壁和分隔以及实性成分表现为中等或明显强化。DWI 实性成分多呈等或高信号, 提示肿瘤弥散受限。SCLT 是一种罕见的原发肿瘤, 当 MR 提示囊性为主肿块、实性成分表现为囊壁及分隔 增厚或沿其生长的宽基底实质区, 或 T2WI 信号不一但囊壁以及实性部分强化, DWI 高信

号, 同时结合临床表现以及睾酮水平增高时, 应考虑该疾病, 但最终确诊应考虑术后病理及免疫组化。

PO-2086

基于增强 CT 图像的影像组学在胃 NEC 与胃腺癌鉴别中的价值

印隆林、曹新玥、刘黎、田茂衡
四川省医学科学院·四川省人民医院

目的: 探讨基于 CT 增强图像的影像组学模型在鉴别胃腺癌 (adenocarcinoma, ADC) 和胃神经内分泌癌 (neuroendocrine carcinoma, NEC) 中的诊断价值。材料和方法: 回顾性收集本院经病理证实的胃 NEC45 例、胃 ADC99 例作为训练集, 收集外院经病理证实的胃 NEC23 例、胃 ADC40 例作为外部验证集。采集患者的临床资料, 并评估 CT 主观特征。临床及 CT 特征通过单因素/多因素分析筛选出独立危险因素, 使用二元 Logistic 回归建立临床模型。对 CT 增强扫描静脉期图像进行影像组学特征提取及降维, 筛选特征建立影像组学模型。通过绘制 ROC 检验模型的诊断效能。计算影像组学模型的 Rad-score, 结合临床特征中的独立危险因素构建临床-影像组学联合模型, 并比较三种模型的效能。各模型 AUC 的差异采用 Delong 检验进行比较。采用决策分析曲线 (decision curve analysis, DCA) 评估各模型的临床应用价值。结果: 单因素/多因素分析显示, 肿瘤部位、坏死、淋巴结转移是鉴别胃腺癌与胃 NEC 的独立危险因素。对以上 3 个因素运用二元 Logistic 回归建立临床预测模型, 得到训练组的 AUC 为 0.768 (95%CI: 0.689-0.846), 验证组的 AUC 为 0.811 (95%CI: 0.7-0.921)。筛选从增强 CT 静脉期图像中提取影像组学特征并使用 Logistic 回归建模, 发现使用 9 项特征建立的影像组学模型达到了最高的诊断效能, 训练集 AUC 为 0.796 (95%CI: 0.716-0.876), 验证集 AUC 为 0.813 (95%CI: 0.696-0.93)。使用临床特征及影像组学特征建立的联合模型, 训练集 AUC 为 0.874 (95%CI: 0.81-0.938), 验证集 AUC 为 0.86 (95%CI: 0.756-0.963)。结论: 通过 Logistic 回归分析建立的临床特征模型和基于增强 CT 的影像组学模型在胃腺癌与胃神经内分泌癌的鉴别方面均具有一定的诊断能力。但使用临床及影像组学特征建立的联合模型可以进一步提高诊断效能。

PO-2087

基于增强 CT 影像组学术前预测肝细胞癌微血管侵犯的研究

印隆林、吴颖、蒋源秋、刘黎
四川省医学科学院·四川省人民医院

目的: 基于增强 CT 影像组学联合临床信息, 建立用于术前预测肝细胞癌 (HCC) 微血管侵犯 (MVI) 的联合模型, 并对模型效能进行比较。方法: 回顾性分析 262 例行根治性肝切除术且病理证实为 HCC 患者资料, 并按照 7: 3 的比例随机分为训练集 (191 例) 和验证集 (71 例)。采用单-多因素逻辑回归分析构建临床特征模型。采用 3D-Slicer 软件对静脉期图像逐层勾画 VOI, 包括肿瘤区域 (GTV)、瘤内及瘤周外扩分别 5mm (GPTV5)、10mm (GPTV10) 区域。从不同的 VOI 提取影像组学特征并建模, 选择在验证集中 ROC 曲线下面积最大的影像组学模型预测概率值作为影像独立生物标志物 (R-Score)。R-score 结合临床特征构建联合模型, 并以列线图形式展示。采用 AUC、敏感度、特异度、Hosmer-Lemeshow 检验 (H-L 检验)、决策曲线分析 (decision curve analysis, DCA)、DeLong 检验、净重新分类指数 (net reclassification index, NRI) 和综合判别改善指数 (integrated discrimination improvement, IDI) 对模型进行评价。结果: 甲胎蛋白 (alpha fetoprotein, AFP) 等 5 项临床特征可作为 HCC 患者 MVI 的独立预测因子。GTV、GPTV5 和 GPTV10 模型 AUC 值在训练集中分别为 0.854、0.863、0.842; 验证集中分别为 0.812、

0.783、0.704。选择 GTV 模型的预测概率值作为 R-Score。临床-影像组学联合模型在训练集、验证集的 AUC 分别为 0.883、0.876。NRI、IDI 结果显示联合模型较临床模型和 R-score 模型均有所提高 (NRI 均 >0 ，IDI 均 >0 、P 均 <0.05)。DCA 结果显示，联合模型在阈值概率范围内提供了更高的临床净获益。结论：基于增强 CT 的临床-影像组学联合模型能较好地术前无创预测 HCC 患者 MVI，将成为临床有力的参考工具。并且从 GTV 整体获得的影像组学特征预测效能优于 GTPV5、GPTV10。

PO-2088

基于影像及临床特征的 LI-RADS 形态 II 型肝癌早期复发风险评分系统的建立及验证

厉惠滢¹、王欣欣¹、刘宜鑫²、孙亚娟¹、俞灿¹、范恬恬¹、周洋¹

1. 哈尔滨医科大学附属肿瘤医院

2. 哈尔滨医科大学

目的：肿瘤形态与肝细胞癌早期复发相关，LI-RADS 形态 II 型肝癌作为 I 型和 III 型的过度，其发生复发的发生存在争议。本研究旨在探讨 II 型肝癌早期复发的危险因素，建立风险评分系统，并对其验证，为肝癌精准诊疗提供可靠参考。

方法：回顾性分析 2016 年 6 月-2020 年 6 月行肝癌根治手术且术前进行 MR 检查定义为形态 II 型的患者临床及影像资料，作为建模组，搜集 TCIA 数据库肝细胞癌患者资料作为验证组。采用单因素和多因素 Cox 回归分析确定 II 肝癌早期复发的独立危险因素。AUC 评价预测模型预测能力。赋予风险分值建立评分系统，以均值作为危险分层，划分高风险组和低风险组。最后将验证组数据代入模型及评分系统进行验证。

结果：共纳入我院 II 型肝癌患者资料 95 例作为建模组，TCIA 29 例为验证组，早期复发率分别为 33.7% 和 62.0%。在建模组中，多因素分析结果显示：年龄 (HR, 0.93, 95%CI, 0.89-0.97, P=0.001)、组织学分级 (HR, 2.03, 95%CI, 1.01-3.77, P=0.024)、AFP (HR, 3.39, 95%CI, 1.37-8.41, P=0.008)、瘤内出血 (HR, 4.19, 95%CI, 1.84-9.52, P=0.001) 是早期复发相关的独立危险因素。模型预测早期复发的诊断效能，建模组 AUC 为 0.817 (95%CI, 0.72-0.89)，验证组 AUC 为 0.922 (95%CI, 0.76-0.99)。由以上 4 个变量赋值建立评分系统，累积总分 0-6 分。将 ≤ 3 分划分为早期复发的低风险组， >3 分为高风险组，相比低风险组，高风险组的患者无复发生存率低 (40.0% vs 73.2%, P=0.001)，验证组得到一致的结果 (25.0% vs 73.3%, P=0.028)。

结论：年龄 <52 岁、组织病理分级低、AFP 增高、术前影像见瘤内出血是 II 型肝癌早期复发的独立危险因素。本研究所建立的评分系统经验证具有较好的区分度和预测能力，能够预测 II 型肝癌早期复发的风险，为临床医生识别高危人群提供重要参考。

PO-2089

腹膜后副神经节瘤的多模态影像表现

马雯慧

中国人民解放军联勤保障部队第 926 医院

本文报道一例腹膜后副神经节瘤 (Primary retroperitoneal paraganglioma) 的多模态影像表现并分析其误诊原因。回顾性分析误诊为孤立性纤维瘤 1 例，经病理证实为腹膜后副神经节瘤。影像表现为左下腹膜后较大肿块 T1WI 呈低/稍高混杂信号，STIR 呈明显高信号，内部见血管流空信号影，DWI 呈扩散受限，增强病灶明显不均匀强化，内部见低强化囊变区，内部见明显强化血管影，

周围组织成推压改变。患者临床表现不明显。腹主动脉旁、肾门附近及下腔静脉旁囊实性圆形、类圆形肿块,伴有囊变、坏死、出血、钙化,增强扫描呈明显持续性强化,且病灶内见流空血管影,实验室检查儿茶酚胺类物质数值增加者,在鉴别诊断中要考虑到此病可能,最终确诊需要根据病理及免疫组化检查。

PO-2090

联合多模态磁共振成像在肝细胞癌病理分级诊断的应用

包艳俊、张铎
北华大学附属医院

目的: 评价弥散加权成像(DWI)、磁敏感加权成像(SWI)、体素内不相干运动成像(IVIM)在肝细胞癌(HCC)病理分级中的诊断价值。方法:前瞻性选取我院就诊,根据临床诊断或超声、CT 等影像学检查诊断为 HCC 的患者 65 例,所有患者均行 MRI 平扫、DWI、IVIM 及 SWI 检查,共有 40 例患者共 47 个病灶符合纳入标准,根据病理结果分为高级别 HCC 组和低级别 HCC 组两组。利用后处理工作站及软件观察图像及测量参数值,记录 SWI 图像上肿瘤内的磁敏感信号(ITSS)的数量,并进行评分,在 DWI、IVIM 图像上人工勾画 ROI,测量 ADC、D、D*以及 f 值。最后整合各值利用 SPSS 23.0 软件进行统计学分析。结果: 1.肝细胞癌最大直径在高低级别 HCC 组之间无统计学差异。2.高级别 HCC 组的 ITSS 评分高于低级别组,且差异有统计学意义 ($P<0.05$),ITSS 评分与 HCC 分级呈正相关。曲线下面积 AUC 为 0.73,当评分取 1.5 时,其灵敏度为 86.4%,特异度为 76%。3. ADC、D 值在高、低级别 HCC 组之间的差异有统计学意义, D*、f 值在高、低级别 HCC 组之间的差异不具有统计学意义($P>0.05$)。ADC 和 D 值与 HCC 病理分级的相关系数分别为-0.33($P<0.05$), -0.446。4.联合 IVIM 和 DWI 诊断高低级别肝细胞癌的 AUC 为 0.82,灵敏度和特异度分别是 68% 和 92%;联合 SWI 和 DWI 诊断高低级别肝细胞癌的 AUC 为 0.89,灵敏度和特异度分别是 96%和 88%;联合 SWI 和 IVIM 诊断高低级别肝细胞癌的 AUC 为 0.90,灵敏度和特异度分别是 77%和 88%;联合 IVIM、SWI 和 DWI 诊断高低级别肝细胞癌的 AUC 为 0.92,灵敏度和特异度分别是 91% 和 84%。对比分析各联合诊断的 ROC 曲线显示,任意两者比较无统计学差异

PO-2091

基于双能 CT 细胞外体积分数图的直方图分析 识别胃癌微卫星不稳定状态的价值

胡文君¹、林良杰²、陈安良¹、刘爱连¹
1. 大连医科大学附属第一医院
2. 飞利浦医疗(中国)

目的: 探讨基于双能 CT 细胞外体积分数图的直方图参数预测微卫星不稳定(MSI)状态的可行性。方法: 回顾性分析 23 例 MSI 胃癌(MSI 组)及 37 例微卫星稳定(MSS)胃癌(MSS 组)患者的资料。所有患者均经术后病理检查证实,且术前均接受腹部能谱 CT 成像。使用 ADW 4.6 工作站的 GSI Viewer 软件重建平衡期碘(水)图,导入 MatLab 软件计算 ECVf 图,计算公式为: $ECVf(\%) = (1 - \text{红细胞压积}) \times (ID_{\text{tumor}} / ID_{\text{aorta}}) \times 100$,其中红细胞压积于检查前 3 天内采集 ID_{tumor} 和 ID_{aorta} 分别为肿瘤和主动脉平衡期的碘密度。然后将 ECVf 图导入 uAI Research Portal 平台,选取病灶最大层面及其相邻上下两个层面沿病灶边缘勾画 ROI 并进行直方图分析,获得 18 种纹理特征。比较两组间各纹理参数的差异并采用 Logistic 回归将纹理参数进行联合,通过 ROC 曲线分析不同纹理参数及参数联合预测的效能。

结果: MSI 组的峰度 (25.86 ± 5.21 vs. 21.00 ± 3.35) 和第 10 百分位数 (21.57 ± 3.65 vs. 16.89 ± 4.56) 明显低于 MSS 组 ($P < 0.05$), 峰度、第 10 百分位数及两参数联合预测胃癌 MSI 的效能分别为 0.777, 0.762 和 0.827。

结论: 基于双能 CT 细胞外体积分数的直方图分析可在术前无创预测胃癌 MSI 状态, 且将多纹理参数联合后预测效能更优。

PO-2092

多模态磁共振成像对宫颈癌的诊断及在宫颈癌分化程度的相关性研究

郭鑫、张铎
北华大学附属医院

目的: 探讨和比较 DWI、IVIM 和 DKI 在宫颈癌中的诊断及其与分化程度的相关性。

方法: 回顾性分析 39 例宫颈癌 (宫颈癌组) 和 30 例正常宫颈病人 (正常宫颈组) 的 DWI, IVIM 和 DKI 影像学资料。DWI 单指数模型 ADC 值, IVIM 相关双指数参数 [慢扩散系数 (ADC- slow, D), 快速扩散系数 (ADC- fast, D*) 和扩散分数 (f)] 和 DKI 相关参数 [表观扩散系数 (MK), 表观峰度系数 (MD)], 比较不同分化程度的宫颈癌组, 正常宫颈组和宫颈癌的参数差异。

结果:

1. 相较于正常宫颈组织, 宫颈癌的 ADC、D、MD 值降低, 而 D*、f、MK 值升高, 各参数值均有统计学意义 ($P < 0.05$); D 值具有最佳的诊断效能;

2. 宫颈癌的分化程度越高, ADC、D、MD 值越大, D*、f、MK 值越小。分化的程度不同的宫颈癌分别比较, ADC、D、MK 值差异都有统计学意义 ($P < 0.05$), 在鉴别低和中高分化、高和中低分化宫颈癌时, MK 值具有最佳诊断效能 ($P < 0.003$), f 值在鉴别高和中低分化宫颈癌中差异无统计学意义 ($P > 0.05$), MD 值在鉴别低和高中分化宫颈癌中差异无统计学意义 ($P > 0.05$)。

结论:

1、鉴别宫颈癌和正常宫颈组织方面, DWI、IVIM、DKI 均具有一定作用;

2、鉴别不同分化程度宫颈癌方面, IVIM 和 DKI 有着重要的意义。

PO-2093

治疗前中性粒细胞/淋巴细胞比值联合基于腹部 CT 的身体成分参数在乳腺癌患者新辅助化疗疗效中的预测价值

史雨鑫、靳激扬
东南大学附属中大医院

目的: 探讨新辅助化疗前中性粒细胞/淋巴细胞比值 (neutrophil to lymphocyte ratio, NLR) 联合基于腹部 CT 的身体成分参数对乳腺癌患者新辅助化疗病理完全缓解 (pathologic complete response, pCR) 的预测价值。

方法: 对 85 例接受新辅助化疗的非转移性乳腺癌患者进行研究, 其中, 新辅助化疗后达到 pCR 者 (pCR 组) 26 例, 未达到 pCR 者 (Non-pCR 组) 59 例。收集患者治疗前临床病理参数和治疗前一周内的腹部 CT 图像。利用腹部 CT 图像在第 3 腰椎水平获得骨骼肌面积 (SMA)、内脏脂肪面积 (VFA) 和皮下脂肪面积 (SFA), 高 VFA 和高 SFA 定义为 $\geq 100 \text{ cm}^2$, 用身高 (m) 对 SMA 进行标准化, 计算骨骼肌指数 (SMI), 低肌肉量定义为 $\text{SMI} < 39 \text{ cm}^2/\text{m}^2$ 。采用单因素和多因素

Logistic 回归分析筛选出 pCR 的独立预测因素。使用 ROC 曲线来分析 Logistic 回归模型对 pCR 的预测效能。

结果: 比起 Non-pCR 组, pCR 组 SMI 更高, SFA 更小, ki67 指数更大, 雌激素受体阳性率更高, T 分期更低, NLR 更低 ($P < 0.05$), 两组间年龄、体重、BMI、VFA、孕激素受体表达状态、Her-2 表达、绝经状态、N 分期差异无统计学意义。多因素 Logistic 回归分析显示高 SMI、低 SFA、高 Ki67 指数和低 NLR 是非转移性乳腺癌患者新辅助化疗后 pCR 的独立预测因素, 联合这四个指标构建的综合模型的 AUC 为 0.882 (95CI: 0.793-0.942), 敏感性为 0.923, 特异性为 0.729。

结论: 乳腺癌患者新辅助化疗前 NLR 和基于腹部 CT 的身体成分参数对预测新辅助化疗后的病理完全缓解有一定价值, 可为乳腺癌的个体化治疗提供参考。

PO-2094

探究扩散峰度成像 (DKI) 定量参数预测宫颈癌病理分型

张倩瑜、田士峰、宋庆龄、刘爱连
大连医科大学附属第一医院

目的

探讨扩散峰度成像 (diffusion kurtosis imaging, DKI) 定量参数对宫颈癌病理分型的预测价值。

材料与方法

回顾性收集经手术病理证实的宫颈癌患者 29 例, 其中鳞癌 (鳞癌组) 19 例, 腺癌 (腺癌组) 10 例。所有患者均行 1.5T MRI 检查, 扫描序列包括 T1WI、T2WI、DKI。在 GE AW4.6 工作站, 使用 Functool 软件对 DKI 图像进行后处理, 测量两组病灶实质区各 DKI 参数值, 包括平均扩散峰度 (MK) 和平均扩散系数 (MD)。采用独立样本 t 检验或 Mann-Whitney U 检验比较两组间定量参数的差异; 使用受试者操作特征 (ROC) 分析评估预测效能。

结果

腺癌组的 MD 值 [1.83 (1.21, 2.30)] 显著高于鳞癌组 [1.05 (0.74, 1.91)] ($P < 0.05$), MK 值在两组间无统计学差异 ($P > 0.05$)。MD 值预测腺癌的曲线下面积 (AUC) 为 0.737, 阈值、敏感度、特异度分别为 2.03 $\mu\text{m}^2/\text{ms}$ 、50%、94.7%。

结论

DKI 定量参数可无创性地预测宫颈癌分型, 具有一定的临床应用价值。

PO-2095

基于机器学习的 CT 影像组学方法预测肝细胞肝癌 M2 级微血管侵犯

岳鑫、林子楹、钟华、张燕、杨丹、洪敏
厦门大学附属中山医院

目的: 探索影像组学模型预测肝细胞肝癌 M2 级微血管侵犯的诊断效能。

方法: 该研究为单中心回顾性研究。纳入标准为年龄 18-99 岁、2016 年 9 月至 2021 年 8 月于我院行术前增强 CT 及免疫组化检查、行肝细胞肝癌手术切除的患者。金标准为免疫组化检查。研究对象以 7:3 的比例随机分为训练集和测试集。由三名影像科医生在动脉期和门静脉期 CT 图像上手动勾画肝细胞肝癌区域。分别使用从动脉期、门静脉期感兴趣区提取的影像组学特征构建动脉期、门静脉期影像组学模型。使用影像组学特征、人口学信息、实验室检查和影像特征构建联合影像组学

模型。使用回归特征消除进行特征选择, 使用支持向量机作为分类器。使用受试者特征 (receiver operating characteristic, ROC) 曲线、校准曲线和决策曲线分析评价模型的预测效能。

结果: 研究共纳入 255 例患者, 其中 M2 级微血管侵犯者 47 例。动脉期、门静脉期和联合影像组学模型分别纳入 17 个、5 个和 18 个特征, 测试集的 ROC 曲线下面积分别为 0.826 (95%置信区间 0.719,0.933), 0.806 (95%置信区间 0.699,0.914) and 0.870 (95%置信区间 0.779,0.961)。校准曲线和决策曲线分析显示联合影像组学模型具有良好的临床应用价值。

结论: 联合影像组学模型在预测肝细胞肝癌 M2 级微血管侵犯中具有较好的诊断效能。

PO-2096

基于机器学习的 CT 影像组学方法预测肝细胞肝癌高 Ki-67 表达

岳鑫、林子楹、钟华、张燕、杨丹、洪敏
厦门大学附属中山医院

目的: 探索联合影像组学模型对肝细胞肝癌高 Ki-67 表达 ($\geq 30\%$) 的诊断效能。

方法: 该研究为单中心回顾性研究。纳入标准为年龄 18-99 岁、2016 年 12 月至 2021 年 8 月于我院行术前增强 CT 及免疫组化检查、行肝细胞肝癌手术切除的患者。金标准为免疫组化检查。研究对象以 7:3 的比例随机分为训练集和测试集。由三名影像科医生在动脉期和门静脉期 CT 图像上手动勾画肝细胞肝癌区域。使用从感兴趣区提取的影像组学特征、人口学信息、实验室检查和影像特征构建联合影像组学模型。使用回归特征消除进行特征选择, 使用支持向量机作为分类器。使用受试者特征 (receiver operating characteristic, ROC) 曲线、校准曲线和决策曲线分析评价模型的预测效能。

结果: 研究共纳入 207 例患者, 其中高 Ki-67 表达者 111 例。联合影像组学模型最终纳入 18 个特征。训练集和测试集的 ROC 曲线下面积分别为 0.870 (95%置信区间 0.812,0.929) 和 0.722 (95%置信区间 0.594,0.850)。校准曲线和决策曲线分析显示联合影像组学模型具有良好的临床应用价值。

结论: 联合影像组学模型在预测肝细胞肝癌高 Ki-67 表达中具有较好的诊断效能。

PO-2097

基于 DKI 的全肿瘤及瘤周多参数在预测肝细胞癌微血管侵犯中的价值

熊妍希、赵莹、任雪、许岂豪、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 微血管侵犯 (MVI) 是导致肝切除和移植后预后较差的独立因素, 评估扩散峰度成像 (DKI) 在预测肝细胞癌微血管侵袭的鉴别能力。

方法: 对我院经病理证实的 63 例原发性肝癌患者进行回顾性分析。将患者分为 MVI 阳性组 ($n=22$) 和 MVI 阴性组 ($n=41$)。采集常规 MRI Ax T1 FSPGR、Ax T2 FSE、DWI 序列、双回声序列、DKI 序列。使用 GE AW 4.6 工作站上的 Functool 软件, 从 DKI 序列自动生成定量 DKI 衍生图谱, 包括 FA、MD、Da、Dr、FAK、MK、Ka 和 Kr。参考 DWI 图像上获得的病变信息, 将 FA、MD、Da、Dr、FAK、MK、Ka 和 Kr 图导入 3DSlicer-5.0.3 中逐层勾画肿瘤边缘、瘤周区域分别等距外扩 (8mm), 所有肿瘤及瘤周的每个参数的平均值用于进一步的统计分析。采用独立样本 t 检验或 Mann-Whitney U 检验比较各参数值的差异, 采用受试者工作特征 (ROC) 曲线评估有统计学意义的参数预测肝细胞癌微血管侵犯中的价值。

结果: MVI 阳性组和 MVI 阴性组之间的全肿瘤 DKI 参数比较, MVI 阴性组的 MK、Ka 和 FA 值显著低于 MVI 阳性组 ($P<0.05$); MK、Ka 和 FA 预测 MVI 的 AUC 分别为 0.744、0.622、0.721,

组合 (Ka+MK+FA) 为 0.812。当组合 (Ka+MK+FA) 时, AUC 得到改善, 灵敏度为 45.5%, 特异性为 100% (临界值: 0.740); MVI 阳性组和 MVI 阴性组之间的瘤周 DKI 参数比较, MVI 阴性组瘤周的 MK、Ka 值显著低于 MVI 阳性组瘤周 ($P<0.05$); MK、Ka 预测 MVI 的 AUC 分别为 0.811、0.712, 组合瘤周 (MK+Ka) 为 0.824, 当组合瘤周 (MK+Ka) 时, AUC 得到改善, 灵敏度为 54.2%, 特异性为 98% (临界值: 0.735)。

结论: 基于 DKI 的全肿瘤及瘤周定量参数对识别 HCC 中的微血管侵犯具有一定的价值, 具有很好的临床应用前景, 其中全肿瘤和瘤周 MK、Ka 值具有较高价值。

PO-2098

3D-ASL 序列评估慢性肾病患者肾纤维化程度的价值

鞠烨、刘爱连、张倩瑜、胡庆晨、霍宇婷、骆仁娜、刘爱连
大连医科大学附属第一医院

目的: 本研究旨在探索 3D-ASL 序列与纤维化肾脏组织病理学指标之间的关联关系, 通过病理指标和 ASL 序列的参数的映射关联, 验证 ASL 序列在评估 CKD 患者肾脏纤维化程度中的价值。方法: 通过回顾性队列研究数据, 收集大连医科大学附属第一医院 2020 年 5 月至 2023 年 9 月接受肾脏功能磁共振检查的 CKD 患者。扫描序列包括 3.0 T 磁共振常规序列及 3D-ASL 序列, 所有患者在 MRI 检查后 3 天内, 在超声引导下肾活检。肾活检方法采用国家肾脏疾病临床医学研究中心发明并推广的“B 超引导下斜角进针负压吸引一秒钟快速经皮肾活检法”。收集肾活检常规病理数据(球性硬化比例)以及肾脏病理诊断。球性硬化比例=硬化肾小球数量/切片上所有肾小球数量。根据肾小球球性硬化百分比进行分组, 以小于 10%, 10%-30%, 30%-50%和大于 50%分为四组, 分析对应的磁共振序列参数变化。采用 SPSS 27.0 统计学软件(IBM SPSS Statistics)进行统计分析。功能磁共振序列参数与肾纤维化病理指标的相关关系采用皮尔逊相关系数(Pearson's r)或斯皮尔曼相关系数(Spearman's Rho)。所有检验均为双侧检验, $P<0.05$ 为差异有统计学意义, $P<0.01$ 为差异有非常显著统计学意义。

结果: 双肾皮、髓质区的 RBF 值在不同球性硬化分组间均存在统计学差异 ($P<0.05$)。肾皮、髓质区的 RBF 值与球性硬化百分比之间的相关性分析发现, 右肾皮质 RBF 值、左肾髓质 PBF 值与球性硬化比例之间均存在显著负相关性, 分别为: $Rho = -0.597, P<0.01$; $Rho = -0.613, P<0.01$ 。

结论: 3D-ASL 序列对评估慢性肾纤维化程度具有优势。本研究将 3D-ASL 序列的参数与肾脏病理纤维化指标进行相关性分析, 以明确其对肾脏纤维化的评估作用和 CKD 进展的预后判断能力。未来可以尝试用于患者远期预后判断和随访过程中肾脏慢性化病变进展的监测。

PO-2099

基于 DKI 的全肿瘤及瘤周多参数在预测肝细胞癌早期复发中的价值

熊妍希、赵莹、任雪、许岂豪、宋清伟、刘爱连
大连医科大学附属第一医院

目的: 肝细胞癌 (HCC) 手术切除后的 5 年总生存率仅为 30-40%, 70%的患者在 5 年内肿瘤复发, 评估扩散峰度成像 (DKI) 对肝细胞癌根治性切除后两年早期复发 (ER) 的预测能力。

方法: 对我院经病理证实的 35 例原发性肝癌患者进行回顾性分析。将患者分为早期复发 (ER) 组 ($n=20$) 和非早期复发 (NER) 组 ($n=15$)。使用 GE AW 4.6 工作站上的 Functool 软件, 从 DKI 序列自动生成定量 DKI 衍生图谱, 包括 FA、MD、Da、Dr、FAK、MK、Ka 和 Kr。参考 DWI 图像上获得的病变信息, 将参数图导入 3DSlicer-5.0.3 中逐层勾画肿瘤边缘、瘤周区域分别等距外扩

(8mm)，所有肿瘤及瘤周的每个参数的平均值用于进一步的统计分析。采用独立样本 t 检验或 Mann-Whitney U 检验比较各参数值的差异，采用受试者工作特征 (ROC) 曲线评估有统计学意义的参数预测肝细胞癌早期复发的价值。

结果：ER 组和 NER 组之间的全肿瘤 DKI 参数比较：NER 组 MK 值明显低于 ER 组 ($P<0.05$)，Da 值明显高于 ER 组 ($P<0.01$)；用于预测 ER 的 MK 和 Da 的 AUC 分别为 0.710、0.760，组合 (MK+Da) 为 0.807。当组合 (MK+Da) 时，AUC 得到改善，灵敏度为 80.0%，特异性为 75.0% (临界值：0.423)。ER 组和 NER 组之间的瘤周 DKI 参数比较：NER 组 MK 和 Fa 值明显低于 ER 组 ($P<0.05$)，Da 值明显高于 ER 组 ($P<0.01$)；用于预测 ER 的瘤周 MK、Fa、Da 的 AUC 分别为 0.812、0.802、0.734，组合瘤周 (MK+Fa+Da) 为 0.832。当组合瘤周 (MK+Fa+Da) 时，AUC 得到改善，灵敏度为 85.5%，特异性为 89.0% (临界值：0.623)；组合全肿瘤 (MK+Da) 和瘤周 (MK+Fa+Da) 为 0.912，灵敏度为 91.2%，特异性为 95%。

结论：基于 DKI 的全肿瘤及瘤周定量参数对预测肝细胞癌早期复发具有一定的价值，具有很好的临床应用前景，其中全肿瘤和瘤周 MK、Da 值具有较高价值。

PO-2100

4 例不同部位血管球瘤的 CT 影像特征及文献复习

赵光堂、李传资
海南医学院第二附属医院

目的 探讨血管球瘤 (Glomus tumor, GT) 的 CT 平扫及增强扫描的影像特征。方法 回顾性分析本院经手术病理诊断证实的 4 例 GT 患者术前临床及 CT 影像学资料，分析不同部位 GT 的 CT 影像特征。结果 本组 4 例患者发病部位及主要临床表现：左肾 1 例，反复左腰部隐痛；胃窦 1 例，剑突下疼痛；食管 1 例，吞咽困难；左肺下叶背段 1 例，无明显不适。病灶平扫均密度均匀，边界清，3 例有点状钙化，1 例无钙化，4 例均无坏死囊变及空洞，4 例增强扫描动脉期呈边缘结节样明显强化，静脉期及延迟期呈逐渐均匀强化，增强扫描各期病灶密度与主动脉相似。结论 GT 的 CT 动态增强扫描表现具有一定特征性，能有效提高术前诊断准确率，为临床术前评估提供重要的指导价值。

PO-2101

非酒精性脂肪性肝病肝纤维化分期：非增强 T1 ρ 色散成像与基于 Gd-EOB-DTPA 增强 T1mapping 细胞外体积成像比较

胡富碧
成都医学院第一附属医院

目的：比较评估 T1 ρ 值、T1 ρ 色散值、肝胆期 T1 值和细胞外体积分数 (extracellular volume fraction, ECV) 对于非酒精性脂肪性肝病兔肝纤维化的评估价值。

材料与方法：60 只新西兰大白兔随机分配到标准对照组 ($n=12$) 和不同高脂高胆固醇饮食喂养周数的 NAFLD 模型组 (共 6 组包括 2 周、4 周、6 周、8 周、10 周和 12 周组，每组 8 只兔子)。所有兔子在相应时间节点完成 T1 ρ mapping (FSL=0Hz 和 500Hz)，native T1mapping 和增强 Gd-EOB-DTPA 肝胆期 T1mapping 扫描，扫描完成获取肝脏标本。测量 T1 ρ 值、T1 ρ 色散值、肝胆期 T1 值和 ECV。根据 NASH CRN 评分系统，对组织病理学结果进行评估。使用组内相关系数、方差分析、多元线性回归和受试者工作特征曲线进行统计分析。

结果：在多元回归分析中，肝纤维化是唯一独立影响 T1 ρ 色散值的独立因素 ($R^2=0.746$, $P=0.000$)。相反，肝细胞脂肪变性、小叶炎症和纤维化与 T1 ρ 独立相关 ($R^2=0.799$, $P=0.000$)。肝小叶炎症、肝细胞气球样变性和肝纤维化是肝胆期 T1 值的独立因素 (R^2 分别为 0.631,

$P=0.000$)。肝细胞气球样变性和肝纤维化是影响 ECV 的独立因素 ($R^2=0.728$, $P=0.000$)。对于诊断早期肝纤维化 ($\geq F1$) 和显著肝纤维化 ($\geq F2$), T1 ρ 色散值具有最佳的诊断效能(AUC 分别为 0.849 和 0.916), 其次为 ECV (AUC 分别为 0.821 和 0.905), 然而 1 ρ 色散值和 ECV 诊断效能无统计学差异 ($P>0.05$)。

结论: 非增强 T1 ρ 色散成像在识别早期肝纤维化上与基于 Gd-EOB-DTPA 增强 T1mapping 的 ECV 成像诊断效能相当, 但具有无需注射对比剂和延长扫描时间优点, 有利于对非酒精性脂肪性肝病进行纵向监测和多次随访。

PO-2102

DTI 与 T1mapping 序列评估慢性肾病纤维化程度的价值

张瀚月、鞠烨、骆仁娜、刘爱连
大连医科大学附属第一医院

目的: 本研究旨在探索功能磁共振序列与纤维化肾脏组织病理学指标之间的关联关系, 通过病理指标和磁共振序列参数的映射关联, 验证 DTI 序列和 T1mapping 序列在评估 CKD 患者肾脏纤维化程度中的价值。方法: 通过回顾性队列研究数据, 收集大连医科大学附属第一医院 2020 年 5 月至 2023 年 8 月接受肾脏功能磁共振检查的 CKD 患者。扫描序列包括 3.0 T 磁共振扩散张量成像 (diffusion tensor imaging, DTI) 和 T1mapping 序列。功能磁共振参数值分别为 FA 值和 T1 值。所有患者在 MRI 检查后 3 天内, 在超声引导下肾活检。收集肾活检常规病理数据(球性硬化比例)以及肾脏病理诊断。球性硬化比例=硬化肾小球数量/切片上所有肾小球数量。根据肾小球球性硬化百分比进行分组, 以小于 10%, 10%-30%, 30%-50%和大于 50%分为四组, 分析对应的磁共振序列参数变化。采用 SPSS 27.0 统计学软件(IBM SPSS Statistics)进行统计分析。功能磁共振序列参数与肾纤维化病理指标的相关关系采用皮尔逊相关系数(Pearson's r)或斯皮尔曼相关系数(Spearman's Rho)。所有检验均为双侧检验, $P<0.05$ 为差异有统计学意义, $P<0.01$ 为差异有显著的统计学意义。结果: DTI 序列和 T1mapping 序列在不同球性硬化分组间均存在统计学差异 ($P<0.05$)。就 DTI 序列和 T1mapping 序列与球性硬化百分比之间的相关性分析发现, DTI 序列参数值 (FA 值) 与球性硬化比例之间存在显著负相关性 ($Rho=-0.693, P<0.01$)。T1mapping 序列参数值 (T1 值) 与球性硬化比例之间存在显著正相关性 ($Rho=0.552, P<0.01$)。结论: DTI 序列和 T1mapping 序列对评估慢性肾病纤维化程度具有优势。本研究将 DTI 序列和 T1mapping 序列与肾脏病理纤维化指标进行相关性分析, 以明确其对肾脏纤维化的评估作用和 CKD 进展的预后判断能力。未来可以尝试用于患者远期预后判断和随访过程中肾脏慢性化病变进展的监测。

PO-2103

压缩感知 3D MRU 与常规 3D MRU 对采集时间、图像质量和诊断效能的对照研究

刘晓鸽
郑州大学第一附属医院

目的 通过对压缩感知 (compressed sensing, CS) 3D 磁共振尿路成像 (magnetic resonance urography, MRU) 和常规 3D MRU 的采集时间、图像质量和诊断效能对比分析, 探讨压缩感知 3D MRU 的临床可行性。

材料与方法 56 名患者进行 MRU 检查, 采集序列包括屏气压缩感知 MRU(breath-holding CS MRU, BH-CS MRU), 导航触发压缩感知 MRU(navigator-triggered CS MRU, NT-CS MRU)和常规导航触发 MRU(conventional NT MRU, cNT MRU)。借助 5 分法 (1-5, 差-优) 评估图像质量包括尿路显

示锐度、背景抑制程度。依据尿路病变检出难易程度对不同序列进行 5 分法评估。计算不同序列的敏感度、特异度、受试者工作特征曲线下面积(area under the receiver operating characteristic curve, AUC), 以量化诊断效能。

结果 BH-CS MRU 序列的采集时间是 17s。NT-CS MRU 和 cNT MRU 的采集时间分别是 213.8 ± 62.5 s 和 512.8 ± 106.7 s ($p < 0.001$)。BH-CS MRU 序列显示尿路锐度好于 NT-CS MRU 和 cNT MRU ($p = 0.038$, $p = 0.030$)。NT-CS MRU 序列显示背景抑制效果好于 BH-CS MRU 和 cNT MRU ($p = 0.038$, $p = 0.042$)。3 种 MRU 序列诊断效能相当($p = 0.783$)。

结论 与 cNT MRU 相比, BH-CS MRU 和 NT-CS MRU 以较好的图像质量、较短的采集时间和相当的诊断效能临床中具有可行性。

PO-2104

基于 MRI 的超出米兰标准的多结节性 HCC 患者预后分层系统

吴菲、杨春、曾蒙苏
复旦大学附属中山医院

研究目的: 确定超出米兰标准的多结节型肝细胞癌 (MHCC) 患者肝切除术后的临床影像预后因素, 并进一步构建预后分层系统。

研究方法: 回顾性连续纳入自 2015 年 1 月至 2019 年 1 月期间, 肝切除术前接受增强 MRI 检查, 且经病理证实的超出米兰标准的 MHCC 患者。收集并分析术前临床资料及影像学特征。采用多因素 Cox 回归选择与无复发生存期 (RFS) 和总生存期 (OS) 相关的临床影像学因素, 并构建预测模型。采用 Harrell 一致性指数 (C 指数) 和校正曲线对模型进行评价。进一步构建基于预测模型的风险分层系统。

研究结果: 共计 176 名超出米兰标准的 MHCC 患者纳入本研究。谷草转氨酶 >40 U/L (HR: 1.533; 95%CI: 1.028-2.289; $P=0.036$)、肿瘤负荷评分增加 (HR: 1.088; 95%CI: 1.010-1.172; $P=0.026$)、影像学肝硬化 (HR: 1.465; 95%CI: 1.029-2.085; $P=0.034$) 和肿瘤边缘不光滑 (HR: 2.461; 95%CI: 1.454-4.165; $P=0.001$) 是超出米兰标准的 MHCC 接受肝切除术后不良 RFS 的独立危险因素, 谷草转氨酶 >40 U/L (HR: 1.796; 95%CI: 1.070-3.015; $P=0.027$)、甲胎蛋白 >400 ng/mL (HR: 2.111; 95%CI: 1.129-3.945, $P=0.019$) 和影像学肝硬化 (HR: 1.792; 95%CI: 1.058-3.035; $P=0.030$) 是术后不良 OS 的独立危险因素。根据以上临床影像学因素构建的预测 RFS 和 OS 的预测模型显示出较好的预测效能, C 指数分别为 0.653 (95%CI: 0.602-0.794) 和 0.685 (95%CI: 0.623-0.747)。基于预测模型, 超出米兰标准的 MHCC 被进一步分成三组, 具有显著不同的 RFS 和 OS ($P<0.001$)。

研究结论: 提出了基于 MRI 的预后分层系统, 有助于对超出米兰标准的 MHCC 进行优化和分层, 以选择最适合手术切除的对象。

PO-2105

DTI 与 T1mapping 序列评估慢性肾脏病患者肾功能的价值

张瀚月、鞠烨、骆仁娜、刘爱连
大连医科大学附属第一医院

目的: 本研究旨在探索功能磁共振序列与肾功能指标之间的关联关系, 通过肾功能指标和磁共振序列参数的映射关联, 验证 DTI 序列和 T1mapping 序列在评估 CKD 患者肾功能中的价值。方法: 回顾性分析大连医科大学附属第一医院 2020 年 5 月至 2023 年 8 月接受肾脏功能磁共振检查的 CKD 患者, 收集患者的临床资料和影像资料。扫描序列包括 3.0 T 磁共振扩散张量成像 (diffusion tensor

imaging, DTI) 和 T1mapping 序列。功能磁共振参数值分别为 FA 值和 T1 值。通过基于肌酐的 CKD-EPI 公式计算肾小球滤过率 (GFR)。GFR = $a \times (\text{血肌酐浓度}/b)^c \times (0.993)^{\frac{\text{年龄}}{24}}$ [a 参数值: 女性 = 144, 男性 = 141。b 参数值: 女性 = 0.7, 男性 = 0.9。c 参数值根据血肌酐大小采用如下数值: 女性: 血肌酐 ≤ 0.7 mg/dL = -0.329, 血肌酐 > 0.7 mg/dL = -1.209; 男性: 血肌酐 ≤ 0.7 mg/dL = -0.411, 血肌酐 > 0.7 mg/dL = -1.209]。根据 GFR 对患者进行 CKD 分期, 分析功能磁共振序列与 CKD 患者 GFR 之间的相关关系。采用 SPSS 27.0 统计学软件 (IBM SPSS Statistics) 进行统计分析。功能磁共振序列参数与肾功能指标的相关关系采用皮尔逊相关系数 (Pearson's r) 或斯皮尔曼相关系数 (Spearman's Rho), $P < 0.05$ 为差异有统计学意义。结果: DTI 和 T1mapping 序列在不同 CKD 分期间均存在统计学差异 ($P < 0.05$)。就 DTI 和 T1mapping 序列与 GFR 之间的相关性分析发现, DTI 序列参数值 (FA 值) 与 GFR 之间存在负相关性 ($Rho = -0.434, P < 0.05$)。T1mapping 序列参数值 (T1 值) 与 GFR 之间存在正相关性 ($Rho = 0.544, P < 0.05$)。结论: DTI 序列和 T1mapping 序列与 GFR 之间存在较好的相关性, 对评估慢性肾脏病患者的肾功能具有优势, 有可能作为 CKD 患者肾功能损伤的评判候选指标, 在 CKD 的分层诊断和预测上具有重要意义和研究前景。

PO-2106

酰胺质子转移成像联合 Mapping 在肝脏局灶性病变诊断中的价值研究

王思齐、赵莹、任雪、李军、刘爱连
大连医科大学附属第一医院

目的: 探讨酰胺质子转移加权 (amide proton transfer, APTw) 成像联合 Mapping 序列对肝脏局灶性病变 (Focal liver lesions, FLLs) 诊断的价值。方法: 回顾性分析 2021 年 1 月至 2023 年 5 月于大连医科大学附属第一医院行 3.0T MRI 扫描的肝脏局灶性病变患者的临床及影像资料, 扫描序列包括 APT 序列、T1 Mapping 序列和 T2 Mapping 序列。共纳入 67 例肝脏局灶性病变患者, 包括肝血管瘤 21 例、转移瘤 18 例、原发性肝癌 28 例 (肝细胞肝癌 14 例、胆管细胞癌 14 例)。根据病理诊断结果将患者分为良性肿瘤组 (21 例)、继发性恶性肿瘤组 (18 例)、原发性恶性肿瘤组 (28 例)。根据数据是否符合正态分布, 采用方差分析或 Kruskal Wallis 秩和检验比较各参数的差异。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线评估 APT、T1/T2 Mapping 及其联合对肝脏局灶性病变良恶性的鉴别价值, 并计算其 ROC 曲线下面积 (AUC)、灵敏度和特异度。结果: 原发性恶性肿瘤组的 APT 值高于良性肿瘤组和继发性恶性肿瘤组; 良性肿瘤组的 T1 mapping 值高于原发性恶性肿瘤组和继发性恶性肿瘤组; 良性肿瘤组的 T2 mapping 值高于原发性恶性肿瘤组和继发性恶性肿瘤组, 差异均具有统计学意义 ($P < 0.05$)。此外, 良性肿瘤组和恶性肿瘤组之间的 APT 值和 T2 mapping 值的存在显著差异 ($P < 0.05$)。APT 值、T2 mapping 值以及两者联合诊断肝脏局灶性病变良恶性的 AUC 分别为 0.549、0.831、0.835, 敏感度分别为 0.609、0.848、0.848, 特异度分别为 0.571、0.857、0.143。结论: APT 值、T2 mapping 值以及它们的联合应用在诊断肝脏局灶性病变的良恶性方面都具有潜在的诊断价值, 特别是 T2 mapping 在敏感度和特异度方面表现出色。本研究为临床医生提供了一种有潜力的非侵入性诊断工具, 以更准确地评估患者的肝脏病变。

PO-2107

CT 联合肿瘤标志物对肝细胞癌的诊断及预后评价

原雨航

吉林大学第一医院放射线科

CT 联合肿瘤标志物对肝细胞癌的诊断及预后评价

目的:目前临床上唯一确认的 HCC 肿瘤标志物是 AFP, AFP 已被广泛用于 HCC 筛查, 但其敏感性非常有限(39-65%), 特异性不高(76-94%), 特别是对于小肝癌和早期 HCC。目前, 对 TM 的鉴定还处于起步阶段, 研究者正在尝试对 TM 单独或组合的性能进行评价。本研究旨在探讨 CT 联合肿瘤标志物(TM)在肝细胞癌(HCC)诊断及预后中的应用价值。

方法:选择 60 例肝癌患者为研究组, 均行肝切除术。另外, 40 名健康受试者作为对照组。研究组术前采血, 采集患者血液样本测定血清甲胎蛋白(AFP)、糖类抗原 19-9 (CA199)和癌胚抗原(CEA)水平。通过病理检查探讨血清 TM 水平与临床病理特征的相关性。通过螺旋 CT 平扫和增强扫描探讨 HCC 的影像学特征。采用受试者工作特征曲线(ROC)分析单独检测 TM、联合检测 TM、联合检测 TM 与 CT 的诊断效率。

结果:HCC 患者血清 AFP、CA19-9、CEA 水平均显著高于对照组($p<0.05$)。低分化无远处转移患者 AFP、CA19-9、CEA 水平高于高分化无远处转移患者($p<0.05$)。不同年龄、性别、临床分期 HCC 患者 TM 水平差异无统计学意义($p>0.05$)。ROC 分析显示, 单独检测血清 AFP、CEA 或 CA19-9 的特异性和敏感性较 3 种 TMs 联合检测低($p<0.05$)。CT 联合检查特异性为 93.47%, 敏感性为 88.23%, 优于 TMs 联合检查($p<0.05$)。5 例 HCC 患者术后 6 个月内复发。与术前比较, 复发患者血清 AFP、CA19-9、CEA 水平均显著升高, TM 水平高于未复发患者($p<0.05$)。

结论:血清 AFP、CA19-9、CEA 与 CT 联合检测可克服单一检测的不足, 避免误诊漏诊, 显著提高 HCC 的阳性检出率。

PO-2108

基于双能 CT 定量参数、影像征象及临床特征构建的机器学习模型预测胰腺癌 Ki-67 表达的临床价值

宋祖华

重庆市人民医院

背景与目的 胰腺癌是最具侵袭性的肿瘤之一, 其 Ki-67 的表达越高, 提示肿瘤分级越高, 侵袭性越强。本研究拟通过基于术前双能 CT 定量参数、影像征象及临床特征, 探究机器学习方法预测预测胰腺癌 Ki-67 表达的临床价值。

方法 回顾性分析重庆市人民医院在 2021 年 8 月—2023 年 2 月期间术前行双能 CT 检查的经病理证实的胰腺癌患者资料, 参考标准是经免疫组化检查明确的 Ki-67 增殖指数, 本研究根据既往研究以 50%作为临界值, 将患者分为 Ki-67 高表达组 ($Ki-67 > 50\%$) 和 Ki-67 低表达组 ($Ki-67 \leq 50\%$)。

双能 CT 定量参数包括动脉期和静脉期的标准化碘浓度 (NIC)、标准化有效原子序数 (NZeff)、能谱曲线斜率 (λHU) 以及细胞外容积分数 (ECV), 临床指标及影像征象包括年龄、性别、BMI、CEA、CA199、CA125、肿瘤位置、淋巴结转移情况、T 分期、胰管扩张情况、胰尾部萎缩情况、血管受侵情况。另将患者按照 7: 3 的比例随机分为训练集 ($n = 70$ 例) 和测试集 ($n = 30$ 例), 在训练集中应用 3 种机器学习方法支持向量机 (SVM)、极致梯度提升 (XGBoost) 及逻辑回归 (LR) 构建预测 Ki-67 表达的机器学习模型, 在验证集中独立验证模型的效能, 通过绘制受试者曲线 (ROC) 获得曲线下面积 (AUC) 值选择最优模型, 利用 SHAP 方法再选择最优特征。

结果 Ki-67 高表达组 ($Ki-67 > 50\%$) 有 56 人, Ki-67 低表达组 ($Ki-67 \leq 50\%$) 有 44 人。在验证集中, 基于双能 CT 定量参数、影像征象及临床指标构建的 SVM 模型的 AUC 值为 0.917, XGBoost 模型的 AUC 值为 0.960, LR 模型的 AUC 值为 0.767。基于效能最高的 XGBoost 模型利用 SHAP 方法可视化分析, 筛选出最强的 3 个特征为: ECV、动脉期斜率、门脉期斜率。
结论 本研究开发的基于双能 CT 定量参数和临床特征构建的机器学习模型能够有效地预测胰腺癌 Ki-67 表达情况, 其中 XGBoost 模型效能最高。

PO-2109

磁共振 Dixon 水脂分离技术在鉴别 2 型糖尿病患者中糖尿病肾病与非糖尿病肾病的价值

周少鹏、王倩、翟雪、赵建、白旭、王海屹
中国人民解放军总医院第一医学中心

目的: 探究磁共振 Dixon 水脂分离技术在鉴别 2 型糖尿病患者中糖尿病肾病与非糖尿病肾病的价值。
方法: 2019 年 2 月至 2023 年 6 月前瞻性、连续性纳入在解放军总医院第一医学中心行肾脏磁共振扫描并接受肾脏穿刺活检的 2 型糖尿病伴肾功能不全患者 92 例 (年龄 51.40 ± 9.92 , 男 68 例, 女 24 例), 同时招募健康对照组 28 名 (年龄 40.18 ± 12.09 , 男 21 例, 女 7 例), 测得双侧肾脏实质脂肪分数 (fat fraction, FF)。根据肾脏穿刺结果将患者分为 DN 组和 DNRD 组。应用 Kruskal-Wallis H 检验比较三组间的脂肪分数, 应用受试者工作特征 (ROC) 曲线分析肾脏 FF 对各亚组的诊断效能。

结果: 在 92 名 2 型糖尿病伴肾功能不全患者中, DN 患者为 41 例 (年龄 50.76 ± 9.56 , 男 32 例, 女 9 例), DNRD 患者为 51 例 (年龄 51.92 ± 10.26 , 男 36 例, 女 15 例)。DN 组及 DNRD 组肾脏 FF 值均显著高于健康对照组 ($1.73\% \text{ vs } 0.94\%$, $1.67\% \text{ vs } 0.94\%$; $P < 0.05$), 但 DN 组及 DNRD 组肾脏 FF 值不存在显著性差异 ($1.73\% \text{ vs } 1.67\%$, $P > 0.05$)。肾脏 FF 值鉴别 DN 组与志愿者及 DNRD 组与志愿者间的 AUC 值分别为 0.739 及 0.708。

结论: 2 型糖尿病伴肾损伤患者肾脏脂肪沉积程度显著高于健康志愿者, 但糖尿病肾病与非糖尿病肾病患者肾脏脂肪沉积程度类似。

PO-2110

光谱探测器 CT 虚拟单能量成像优化 Riolan 弓图像质量的研究

王明、赵建
河北医科大学第三医院

[摘要] 目的: 本研究旨在探讨光谱探测器计算机断层摄影 (SDCT) 的虚拟单能图像 (Virtual Monoenergetic Images, VMI) 能否提高 Riolan 弓 (Arc of Riolan, AOR) 的可视化程度并确定最佳单能量水平 (keV), 以帮助外科医生更好地观察 AOR。方法: 纳入 2022 年 1-12 月在本院接受全腹部双能 CT 增强检查且 CTA 显示具有完整 Riolan 动脉弓的患者 33 例。使用动脉期基于光谱图像数据包 (spectral-based images, SBI) 重建常规图像 (conventional images, CI) 和 VMI (40~100 keV, 间隔 10 keV)。测量并比较不同单能量图像及常规图像上 Riolan 动脉弓的 CT 值及 SD 值、同层面左侧竖脊肌的 CT 值、背景 SD 值、信噪比 (SNR)、对比噪声比 (CNR) 及信号强度比 (SIR)。根据四点 Likert 分级评价 Riolan 弓在各组图像的图像质量。结果: Riolan 动脉弓 CT 值、SD 值、CNR 和 SIR 在 40、50keV VMI 均明显高于 CI ($P < 0.001$), 40 keV 时的 VMI 显著高于 50 keV ($P < 0.05$); 在 90、100keV VMI 均低于 CI ($P < 0.001$); 60-80keV VMI 与 CI 间的差异无统计学意义 ($P > 0.05$)。背景 SD 值、左侧竖脊肌 CT 值及 SNR 在各 VMI 与 CI 相比差异均无

统计学意义 ($P>0.05$)。40、50keV VMI Riolan 弓的主观评分明显高于 CI ($P<0.001$)，且 40 keV 的 VMI 主观评分高于 50keV VMI。结论：SDCT 的低 keV 单能量图像较常规图像具有更优的对比度，在 40 keV VMI 显示 Riolan 动脉弓效果最佳。

PO-2111

基于双能 CT 的静脉增强分数评估胃癌神经、 脉管浸润：初步探索

胡文君、刘爱连
大连医科大学附属第一医院

目的：探讨基于双能 CT 的静脉增强分数 (VEF) 评估结直肠癌神经 (PNI)、脉管 (LVI) 浸润的可行性及诊断效能。

方法：回顾性分析本院经病理证实的 123 例胃癌患者资料，分为 PNI/LVI 阳性组 (88 例) 及 PNI/LVI 阴性组 (35 例)。所有患者行双能 CT 能谱增强检查，使用 ADW 4.6 工作站的 GSI Viewer 软件重建动脉期及静脉期碘 (水) 图，两位观察者分别测量两组病灶的 VEF 值， $VEF=ICv/ICa$ ，ICv 和 ICa 分别为病灶静脉期及动脉期碘浓度值。采用组内相关系数 (ICC) 检验两名观察者测量结果的一致性。采用独立样本 t 检验比较两组病灶 VEF 值的差异。采用受试者操作特征 (ROC) 曲线评估 VEF 值对两组鉴别诊断的效能。

结果：两名观察者测量参数的一致性良好 ($ICC=0.89$)。PNI/LVI 阳性组的 VEF 值 (1.79 ± 0.56 vs. 1.30 ± 0.40) 明显高于阴性组 ($P<0.001$)，ROC 曲线分析显示 VEF 值预测 PNI/LVI 的效能为 0.771。

结论：基于双能 CT 的 VEF 值可反映胃癌患者的神经、脉管浸润情况，为临床提供一种新的术前评估方法。

多参数 MRI 联合 SCC-Ag 预测早期宫颈癌盆腔 淋巴结转移的价值

徐晓倩¹、刘凤海²、康立清²
1. 河北医科大学
2. 沧州市中心医院

多参数 MRI 联合 SCC-Ag 预测早期宫颈癌盆腔淋巴结转移的价值

目的：探讨 DCE-MRI 及 IVIM-DWI 联合 SCC-Ag 预测早期宫颈癌盆腔淋巴结转移的价值。

方法：回顾性纳入 115 例病理证实的 FIGO IB-IIA 期宫颈癌患者，测量记录原发肿瘤的 Ktrans、Kep、Ve、ADCmean、ADCmin、ADCmax、D、D*、f、SCC-Ag。采用 Mann-Whitney 检验和独立样本 t 检验比较 PLNM 阳性组与阴性组间参数，二元 logistic 回归分析确定独立危险因素，建立预测模型并评估效能。

结果：115 例患者中 PLNM 阳性者 32 例，阴性者 83 例。PLNM 阳性组 SCC-Ag ($14.25(6.74, 36.75)$ ng/ml vs. $2.13(1.32, 6.00)$ ng/ml, $p<0.001$) 显著高于阴性组，Ktrans (0.51 ± 0.20 min⁻¹ vs. 0.80 ± 0.33 min⁻¹, $p<0.001$)、ADCmean (0.85 ± 0.09 mm/s² vs. 1.06 ± 0.35 mm/s², $p<0.001$)、ADCmin ($0.67(0.61, 0.75)$ mm/s² vs. $0.75(0.64, 0.90)$ mm/s², $p<0.05$)、ADCmax (1.22 ± 0.28 mm/s² vs. 1.42 ± 0.40 mm/s², $p<0.05$)、f (0.91 ± 0.09 vs. 0.26 ± 0.14 , $p=0.001$) 低于阴性组。二元 logistic 分析：SCC-Ag ($OR=1.154$, $p=0.007$)、Ktrans ($OR=0.003$, $p<0.001$)、f ($OR=0.001$, $p=0.036$) 是独立危险因素。预测模型建立为：Logit(P)= $4.116+0.054*SCC-Ag$ -

8.045*f-6.261*Ktrans, 敏感度和特异度为 79.1%和 94.0%。预测模型 AUC 值为 0.896, 高于各单一参数 SCC-Ag (0.824)、Ktrans (0.797) 及 f (0.703)

结论: 基于多参数 MRI 联合 SCC-Ag 建立的模型可以有效预测宫颈癌盆腔淋巴结转移, 有助于为临床个性化精准治疗提供影像依据。

PO-2113

基于 CT 影像自动分割的肿瘤-血管空间位置信息在预测胰腺导管腺癌患者血管受累中的应用

文禹、李欣

华中科技大学同济医学院附属协和医院

研究目的: 探讨基于 CT 影像自动分割的肿瘤-血管空间位置信息是否能改善胰腺导管腺癌 (Pancreatic Ductal Adenocarcinoma, PDAC) 患者血管受累的术前评估。

方法: 回顾性连续纳入从 2020 年 7 月至 2022 年 6 月术前四周内接受双能量增强 CT 扫描且经组织病理学证实为 PDAC 的患者。由 2 名放射科医师独立评估增强 CT 图像中腹腔干、肝总动脉、肠系膜上动脉、门静脉和肠系膜上静脉 5 支主要血管受累情况。根据 NCCN 指南将肿瘤-血管关系分为无接触、邻贴 (肿瘤-血管接触 $\leq 180^\circ$)、包绕 (肿瘤-血管接触 $> 180^\circ$ 或血管畸形)。利用在公开数据集上训练的基于部分标注的多器官联合分割模型, 为三维 CT 影像中的肿瘤生成像素级分割掩码, 并提取肿瘤-血管包绕角度、血管狭窄程度等多个肿瘤-血管侵犯相关的局部影像学指标, 描述患者 CT 影像中肿瘤-血管的精确空间关系, 以作为血管受累预测的主要特征。以术中所见作为评估血管受累的参考标准。

结果: 本研究共纳入 87 例患者; 根据医师评价增强 CT 中胰腺周围 5 支主要血管与肿瘤的关系, 以肿瘤贴邻或包绕预测血管侵犯的灵敏度分别为 89%~94%, 特异度为 77%~96%; 以肿瘤包绕为阈值预测血管侵犯的灵敏度约 44%~78%, 特异度 89%~99%; 以自动分割预测血管侵犯的灵敏度约 38%~92%, 特异度分别 94%~100%。以自动分割预测腹腔干、肠系膜上动脉、门静脉、肠系膜上静脉受累的特异度高于贴邻或包绕, 预测腹腔干、肠系膜上静脉受累的灵敏度高于包绕 ($P < 0.05$)。

结论: 基于 CT 影像自动分割的肿瘤-血管空间位置信息预测有助于改善 PDAC 患者血管侵犯的预测, 与基于 NCCN 标准的医生评价结果具有互补作用。

PO-2114

ECV 对肝血管瘤与肝细胞癌的鉴别诊断价值

张瀚月¹、赵莹¹、任雪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦 (中国) 投资有限公司

目的: 本研究旨在探索肝血管瘤(HH)患者与肝细胞癌(HCC)患者细胞外体积分数 (ECV) 的差异, 探讨 ECV 对肝血管瘤与肝细胞癌的鉴别诊断价值。方法: 本研究回顾性分析 2022 年 1 月至 2023 年 2 月于大连医科大学附属第一医院行上腹部 3.0 T MRI 检查、扫描序列包括 T1mapping 序列、T1mapping 增强序列且图像质量满足测量要求的患者 12 例, 收集患者的临床资料和影像资料。根据临床诊断结果将患者分为肝血管瘤组(6例)和肝细胞癌组 (6例)。使用 MATLAB 软件根据 ECV 计算公式获得 ECVnii 图像[$ECV = (1/T1_{\text{肝脏增强后}} - 1/T1_{\text{肝脏增强前}}) / (1/T1_{\text{主动脉增强后}} - 1/T1_{\text{主动脉增强前}}) \times (1 - \text{hematocrit})$]。基于 ECVnii 图像使用 ImageJ 软件测量肝脏的 ECV 值。采用 SPSS 27.0 软件进行统计学分析, 符合正态分布的计量资料以均数 \pm 标准差表示, 不符合正态分布

的计量资料以四分位数间距表示。采用独立样本 t 检验观察肝血管瘤患者和肝细胞癌患者的 ECV 值是否有差异， $P < 0.05$ 为差异具有统计学意义。结果：本研究纳入了 6 名肝血管瘤患者和 6 名肝细胞癌患者。肝细胞癌患者的肝脏平均 ECV 值显著高于肝血管瘤患者（ $P < 0.05$ ）。结论：肝血管瘤患者和肝细胞癌患者的肝脏平均 ECV 值存在差异。这一发现可能有助于更深入地理解肝血管瘤和肝细胞癌对肝脏组织的影响，为肝血管瘤与肝细胞癌的鉴别诊断提供了新的影像学参考依据。

PO-2115

妊娠性绒毛膜癌 CT 及 MRI 影像表现分析

朱蓉、王关顺
昆明医科大学第三附属医院

目的 探讨妊娠性绒毛膜癌的 CT 及 MRI 影像特点及诊断价值。方法 回顾性分析 18 例妊娠性 GCC 患者 MRI、CT 影像资料，所有病例经病检或临床最终确诊。结果 18 例患者均行 CT 检查，16 例患者行 MRI 检查。16 例病灶发生于子宫体，1 例发生于宫颈，1 例发生于卵巢。13 例呈结节、肿块样，肿瘤最大径从 1.5cm~10cm 不等，5 例呈弥漫浸润生长，12 例患者子宫体积增大，11 例见大小不一囊变坏死区，所有病例均伴有出血。CT 平扫病灶呈等密度 5 例，混杂密度 13 例；T1WI 呈等、高混杂信号 14 例，等信号 2 例；T2WI 呈不均匀高信号 14 例，高、低混杂信号 2 例；DWI 呈不均匀稍高信号 12 例，信号不高 4 例。增强动脉期病灶实性部分及血管均明显强化，在增强静脉期弥漫浸润型病灶强化趋于均匀，结节、肿块型病灶与明显强化的子宫相比，病灶实性成分呈低强化，病灶内部及边缘的血管仍明显强化，坏死囊变部分无强化。17 例患者出现子宫、宫旁血管影增多迂曲的现象，肿块型病灶增粗迂曲血管影主要位于病灶周围、宫旁，而弥漫浸润型病灶增粗迂曲血管可弥漫分布于占整个子宫及宫旁。6 例伴有动静脉畸形，其中 1 例伴有假性动脉瘤形成。发生肺转移 14 例，脑转移 4 例，脑转移并发硬膜下血肿 1 例，肝转移 4 例，脾和肾转移 3 例，肾上腺转移 1 例，骨转移 3 例，椎管内转移 1 例，乳腺转移 1 例，纵隔转移 1 例。伴发卵巢黄素化囊肿 5 例。结论 妊娠绒毛膜癌的 CT、MRI 表现取决于其病理改变，病灶常伴有明显坏死、出血是其特征性表现，子宫及宫旁血管不仅受滋养细胞侵犯，还受高水平 HCG 刺激，致部分患者还伴有动静脉畸形。妊娠绒毛膜癌早期就可出现血管侵犯及远处转移，患者首发表现可能为转移部位的相关症状，并不一定都存在子宫原发灶相关症状。对于育龄期女性，在排除了妊娠或妊娠物残留后的 HCG 持续升高，并发现多个部位的转移灶时，需考虑绒毛膜癌的可能。CT、MRI 可反映妊娠绒毛膜癌的病理特征、病灶大小形态、侵犯范围、程度、转移部位及数目，可协助临床分期，为临床诊断及治疗方案的选择提供客观依据。

PO-2116

光谱 CT 细胞外容积在结肠癌分化程度中的应用研究

王艺洁、赵卫、何波、杨亚英
昆明医科大学第一附属医院

摘要：目的：探讨双层探测器光谱 CT（Dual-layer spectral CT，DLCT）的细胞外容积（Extracellular volume，ECV）在术前预测结肠癌分化程度的价值。方法：回顾性收集 2021 年 9 月至 2023 年 7 月经 DLCT 检查的结肠癌患者 108 例，根据术后病理结果将患者分为高分级组 24 例（低分化）、低分级组 82 例（中分化、高分化），测量并计算基于光谱 CT 的定量参数值，包括三期增强扫描的碘浓度（Iodine concentration，IC）、标准化碘浓度（Normalized iodine concentration，NIC）、有效原子序数（Z-effective，Zeff）、ECV（%），采用卡方检验比较分类资料的差异，使用两独立样本 T 检验比较不同分化程度组间各参数的差异，绘制受试者操作特征曲

线(Receiver operating characteristic, ROC), 进而评价 ECV 预测结肠癌分化程度的效能。结果: 高分级组延迟期 ECV (%)、NIC、Zeff 值均高于低分级组, 差异有统计学意义 ($P<0.05$), 且与病理分级成正相关 ($P<0.05$), 两组间动脉期及静脉期 NIC 差异无统计学意义。延迟期 ECV 预测结肠癌病理分级的 AUC 为 0.708 (95%CI 0.588~0.828), 临界值为 30.37%时, 灵敏度为 70.83%, 特异度为 64.63%。结论: 基于 DLCT 的 ECV 在鉴别结肠癌分化程度中具有较高的诊断价值。

PO-2117

能谱 CT 诊断膀胱癌壁外脂肪间隙侵犯的价值

柯晓艾、薛彩强、李昇霖、刘显旺、邓娟、周俊林
兰州大学第二医院

目的: 探讨能谱 CT 在膀胱癌壁外脂肪间隙侵犯的诊断价值。

方法: 回顾性分析手术及病理证实的 35 例膀胱癌患者, 术前均行平扫及双期能谱 CT 增强扫描, 其中发生膀胱癌壁外脂肪间隙侵犯 (A 组) 13 例, 未出现壁外侵犯 (B 组) 22 例。

结果: 膀胱癌壁外脂肪间隙侵犯组动脉期和静脉期测量碘浓度分别为 -2.88 ± 4.38 、 -0.50 ± 4.33 , 高于未发生侵犯组的 -6.71 ± 4.80 ($P<0.05$)、 -4.17 ± 5.59 ($P=0.05$), 差异具有统计学意义。膀胱癌壁外脂肪间隙侵犯组动、静脉期标准化碘浓度值分别为 -0.02 ± 0.04 、 -0.02 ± 0.14 , 未发生侵犯组动、静脉期标准化碘浓度值分别为 -0.07 ± 0.05 、 -0.16 ± 0.22 , 差异具有统计学意义 ($P<0.05$)。膀胱癌壁外脂肪间隙侵犯组动脉期和静脉期测量水浓度分别为 985.50 ± 20.43 、 980.05 ± 15.98 , 未发生侵犯组的 973.52 ± 26.88 、 971.49 ± 22.54 , 差异不具有统计学意义 ($P>0.05$)。ROC 曲线显示, 动脉碘浓度及标准化碘浓度曲线下面积分别达到了 0.705、0.755。静脉期的碘浓度及标准化碘浓度曲线下面积分别为 0.678 和 0.685。

结论: 能谱 CT 测量动、静脉期碘浓度及标准化碘浓度对判断膀胱癌发生壁外脂肪间隙侵犯有一定的价值。

PO-2118

男性远段尿道结石在不同影像学检查中的表现

吴锦华、邓安春、吴明峰、魏源、陈瀚炜、苏永丽、李晓娅
贵州省人民医院

【摘要】目的 了解男性远段尿道结石在钼靶、CT、DR 等不同影像学检查中的成像原理以及不同类型结石在不同检查设备显示结果。

材料与方法 一般材料: 男性患者, 尿急、尿痛、排尿困难, 尿道远段可触及结节状异物。

摄影方法: ①利用西门子 SIEMENS (型号 MAMMOMAT Inspiration) 软 X 线钼靶机进行摄影, 患者站立于钼靶摄影机前, 双手握住摄影机扶手, 身体前倾将尿道远段置于摄影机架托盘上, 不采用加压自动模式摄影, 采用手动模式 (Manual), 摄影条件为: 28 千伏 (KV)、56 毫安秒 (mAs)。

②CT 检查采用西门子 SIEMENS (型号 SOMATOM Force), 患者仰卧摄影架, 做泌尿系平扫, 利用图像后处理软件进行图像重建。③采用锐柯 Carestream (型号 DRX innolotion) 进行尿道正斜为摄影。

结果 大部分病例男性远段尿道结石在钼靶、CT、DR 等不同影像学检查中都能显示, 少部分病例只能在钼靶和 CT 检查中显示, DR 摄影中显示不清或不能显示。

结论 男性尿道生理特点：长、细、弯。男性尿道还具有三个狭窄和两处生理弯曲，三个狭窄处分别是尿道内口、尿道膜部、尿道外口。男性尿道最狭窄的部位是尿道外口，所以泌尿系结石排出体外时，最容易形成梗阻的是尿道远段尿道外口处。

泌尿系结石成分与密度：泌尿系结石主要成分类型有草酸钙结石、碳酸盐结石、胱氨酸结石、磷酸钙结石等质硬的阳性结石，普通 X 摄影可见，尿酸结石质软密度低，在普通 X 线不被显示，但在软 X 线下可清晰显示。

双源 CT 和 DR 摄影一般千伏值为 40 至 120KV，为硬 X 射线，高能量 X 射线都能穿透体积较小密度较低的尿道结石，只有极少部分低能量 X 线被结石吸收，因为 CT 密度分辨率高于 DR 摄影，所以阴结石可以显示。软 X 线的优点，钼靶摄影一般千伏值为 25 至 35KV，为软 X 射线，阴性结石在 DR 摄影中容易被硬 X 射线穿透而不显影，当采用钼靶软 X 射线摄影时，阴性尿道结石虽然体积小、密度低，但可以吸收大部分软 X 射线，所以在 X 线 DR 摄影中未显影而在钼靶摄影中则可以清晰显示。因此尿道远段结石可改用软 X 射线钼靶检查，以明确结石的大小、数量、形状及位置。

PO-2119

定量 MRI 用于评估离体供及长期随访结果

陈根、胡学梅、胡道予、李震
华中科技大学同济医学院附属同济医院

目的：探讨体外磁共振成像(MRI)-质子密度脂肪分数(PDFF)是否有利于肝移植物的选择，并获得肝移植物质量的移植前指标信息。

材料和方法：使用 3.0T 磁共振扫描仪进行 MRI-PDFF。共有 35 个供肝获得病理证实，19 个供肝用于肝移植。肝供肝视觉评分分别为 3、2 和 1。MRI-PDFF 的准确性通过每个肝段进行测量，并通过病理组织学结果的受试者工作特征 (ROC) 曲线分析进行评估。对植入前获得的离体供肝 MRI-PDFF 和病理组织学结果以及早期和长期结果进行分析。

结果：队列中 9 个 ROI PDFF 的平均值为 $4.1 \pm 4.4\%$ 。大泡脂肪变性组 PDFF 高于正常组 ($P < 0.05$)。大泡脂肪变性组的视觉评分高于正常组 ($P < 0.05$)。大泡脂肪变性组的 1 年、2 年和 3 年移植物存活率分别为 100%、66.7%和 66.7%，低于正常组的 100%、78.6%和 78.6%。大泡脂肪变性组早期同种异体移植功能障碍 (EAD) 发生率为 50%，正常组为 33.3% ($P = 0.60$)。

结论：证实离体 MRI-PDFF 是一种安全、准确、无创的肝移植选择工具，并提供了移植前肝移植物质量指标的信息。

PO-2120

术前 CT 影像特征预测腹部嗜铬细胞瘤/ 副神经节瘤术中大量出血的危险因素

张茜茹、方旭、边云、王莉、邵成伟、陆建平
长海医院

目的 探讨术前预测腹部嗜铬细胞瘤/副神经节瘤 (PPGL) 术中大量出血的危险因素。方法 回顾性分析 2011 年 1 月至 2021 年 12 月在海军军医大学第一附属医院经手术病理确诊的 168 例腹部 PPGL 患者的临床和影像学资料。根据术中出血量将患者分为大量出血组和少量出血组。收集患者临床因素，包括性别、年龄、身体质量指数、典型“三联征”症状、既往病史、术前是否行降压药物准备；

收集患者影像学因素,包括病灶部位、最大径、数量、形态、病灶 CT 值、有无钙化、囊变范围、有无包膜侵犯、有无血管侵犯、是否显示供血动脉、是否显示引流静脉、有无瘤周侧支血管。采用独立样本 t 检验、秩和检验、卡方检验或 Fisher 确切概率法进行统计学分析。采用多因素 logistic 回归分析 PPGL 术中大量出血的独立危险因素。**结果** 少量出血组 117 例,其中男性 57 例、女性 60 例;大量出血组 51 例,其中男性 24 例、女性 27 例。两组病灶部位(肾上腺、肾上腺外)、最大径、形态(类圆形、分叶状)、动脉期及静脉期 CT 值、钙化、包膜侵犯、血管侵犯、显示供血动脉、瘤周侧支血管比较差异均有统计学意义(P 值均<0.05)。多因素 logistic 回归分析结果显示,病灶部位(肾上腺外)[OR (95%CI)=2.819 (1.250, 6.358)]、最大径[OR (95%CI)=1.031 (1.013, 1.049)]、血管侵犯[OR (95%CI)=3.148 (1.085, 9.133)]、显示供血动脉[OR (95%CI)=3.036 (1.009, 9.132)]是腹部 PPGL 术中大量出血的独立危险因素。**结论** 病灶部位(肾上腺外)、最大径、血管侵犯、显示供血动脉是术前预测腹部 PPGL 术中大量出血的独立危险因素。

PO-2121

基于 MRI 四种强化模式下肝细胞癌患者行手术切除和射频消融术后早期复发率比较及复发危险因素研究

邓林¹、贾喆¹、陈勇²

1. 榆林市第二医院

2. 宁夏医科大学总医院

目的 探讨 MRI 四种强化模式下的肝细胞(HCC)癌患者行手术切除和射频消融(RFA)术后的复发率,并预测分析 HCC 患者 RFA 术后早期复发危险因素。**材料与方法** 收集榆林市第二医院及宁夏医科大学总医院 2016 年 1 月至 2022 年 12 月经手术切除或者 RFA 治疗的 HCC 患者 182 名。分析 MRI 4 种强化模式下的 HCC 患者行手术切除或 RFA 治疗后复发率的差异,采用 COX 多因素回归分析预测 HCC 患者 RFA 术后复发的独立危险因素。**结果** 137 名经手术切除的 HCC 患者,4 种强化模式的患者间早期复发率没有差异。相反 45 例经 RFA 治疗的 HCC 患者,4 种强化模式的患者间早期复发率有显著差异,1 型、2 型、3 型、4 型 HCC 患者早期复发率分别为 75.00%、66.67%、100%、93.75% (P<0.001)。进一步分层分析显示 1&2 型强化模式的 HCC 患者经手术切除和 RFA 术后早期复发率没有显著差异(P 值分别为: 0.231, 0.268);相反 3&4 型强化模式的 HCC 患者经手术切除和 RFA 术后早期复发率有显著差异(P 值分别为: 0.024, 0.001)。多因素 COX 分析显示 NLR (HR=1.206, 95%CI=1.010~1.434, P=0.035)、包膜是否完整 (HR=0.655, 95%CI=0.430~0.998, P=0.049)、4 型强化模式 (HR=1.270, 95%CI=1.090~1.479, P=0.002) 是 HCC 射频消融术后复发的独立危险因素。**结论** 肿瘤的影像特征可用于预测肿瘤的早期复发及手术方式的抉择。

PO-2122

双层探测器光谱 CT 预测结直肠癌微卫星不稳定状态的价值

魏博、赵卫、何波、杨亚英

昆明医科大学第一附属医院

目的 探讨双层探测器光谱 CT 多参数成像鉴别结直肠癌(CRC)微卫星不稳定(MSI)和微卫星稳定(MSS)状态的价值。**方法** 回顾性分析行光谱 CT 三期增强扫描并经病理证实的 CRC 患者 92 例,根据免疫组化结果将患者分为 MSI 组 (n=20) 和 MSS 组 (n=72)。测量并分析两组病灶增强三期 40、70、100 keV 下单能量 CT 值、有效原子序数值 (Eff-Z),碘浓度 (IC) 值,并计算标准

化碘浓度 (NIC) 值, 能谱曲线斜率(λ HU)。对有统计学意义的参数绘制受试者工作特征曲线, 分析各参数评估 CRC 微卫星不稳定状态的效能。结果 MSI 组动脉期 40、70、100keV CT 值、静脉期 40、70keV CT 值、动静脉期 IC、NIC、Eff-Z、 λ HU 均小于 MSS 组 (p 均 <0.05)。动脉期各参数诊断效能高于静脉期, 其中动脉期 NIC 诊断效能最高(AUC 0.818, 敏感度 93.1%, 特异度 65.0%), 其次为动脉期 IC (AUC 0.815, 敏感度 77.8%, 特异度 75.0%)。两组病灶延迟期各参数差异均无统计学意义 ($p>0.05$)。结论 双层光谱 CT 动静脉期定量参数对于预测结直肠癌 MSI 状态有一定价值, 其中动脉期的 NIC 为最佳参数。

PO-2123

IVIM 联合 ESWAN 及 ITSS 预测肝细胞肝癌微血管侵犯

任雪¹、赵莹¹、许岂豪¹、庄明睿²、王洪凯²、宋清伟¹、郭妍³、吴艇帆⁴、刘爱连¹

1. 大连医科大学附属第一医院

2. 大连理工大学生物医学工程学院

3. GE 医疗

4. 联影医疗集团有限公司中央研究所

【目的】探讨体素内不相干运动(IVIM)联合磁敏感加权成像(SWI)和自动定量瘤内磁敏感信号(ITSS)预测肝细胞癌(HCC)微血管侵犯(MVI)的价值。

【方法】回顾性分析 76 例经病理证实的 HCC 患者, 包括 26 例 MVI 阳性患者及 50 例 MVI 阴性患者, 所有患者均于术前行 3.0T MRI 扫描, 包括常规磁共振扫描序列及 IVIM, ESWAN 扫描序列。将扫描生成的图像传输至 GE AW 4.6 工作站上, 使用 Functool 软件自动生成 IVIM 序列的参数图 D、D* 和 f 和 ESWAN 序列的参数图幅度, 相位, R2* 和 T2*。放射科医师采用双盲法在各参数图像上于病变的最大层面放置三个感兴趣区 (ROI), 并使用 A.S. 软件自动计算肿瘤最大层面的 ITSS。采用 t 检验或 U 检验比较 MVI 阳性组和阴性组之间各参数之间的差异, 采用受试者工作特征 (ROC) 曲线评价 IVIM 和 ESWAN 各参数的阈值及诊断效能, 采用逻辑回归分析将两个序列参数进行联合并评估其诊断效能。采用 Delong 检验比较 ROC 曲线下面积 (AUC) 的差异。

【结果】MVI 阴性组的 D、D*、幅度值和 T2* 值显著高于 MVI 阳性组, 而 MVI 阴性组的 R2* 和 ITSS 值显著低于 MVI 阳性组 ($P < 0.05$)。D、D*、幅度值、R2*、T2* 和 ITSS 预测 MVI 的 AUC 分别为 0.739、0.707、0.673、0.798、0.764 和 0.657。IVIM (D+D*)、SWI(幅度值+R2*+T2*+ITSS) 和 IVIM 与 ESWAN 联合 (D+D*+幅度值+R2*+T2*+ITSS) 预测 MVI 的 AUC 分别为 0.772、0.841 和 0.905。当 IVIM 与 ESWAN 联合使用时, 其敏感度提升至 84.6%, 特异性提升至 82.0% (阈值: 0.346), IVIM 与 ESWAN 联合使用的 AUC 显著高于各参数与 IVIM 和 ESWAN 单独应用。

【结论】IVIM 和 ESWAN 的联合应用可能有助于临床术前无创性预测 MVI, 这可能有助于提高对 HCC 患者生存期的预测以及预防复发和转移。

PO-2124

基于弥散加权成像的磁共振影像组学预测克罗恩病对抗 TNF 药物的治疗反应

周科峰

浙江中医药大学附属第一医院 (浙江省中医院)

目的: 探讨弥散加权成像 (Diffusion weighted imaging, DWI) 的磁共振影像组学在预测克罗恩病对抗 TNF 药物的治疗反应方面的价值。

方法：回顾性收集本院确诊为 CD、在抗 TNF 治疗前进行了 MR 肠道造影检查（包括 DWI 序列）、内镜检查以及 3 个月或 6 个月后进行内镜复查的患者。根据复查内镜下结果将患者分为“有反应”组与“无反应”组。将病例按 7 : 3 的比例随机分为训练组与验证组，采用 A.K 软件对治疗前 MR 图像特性进行特征提取，利用互信息（Mutual information, MI）方法对保留的组学特征进行降维，并采用逻辑回归分析构建影像组学模型，并通过受试者工作特征曲线、校准曲线和决策曲线分析影像组学模型效能。

结果：共纳入 89 例患者。通过降维共得到 8 个最佳影像特征集，构建的逻辑回归影像组学模型训练组 AUC 为 0.847，敏感性为 0.765，特异性为 0.900，验证组 AUC、敏感性、特异性分别为 0.835、0.706、0.800。

结论：基于弥散加权成像的磁共振影像组学可以较好的预测克罗恩病患者对抗 TNF 药物的治疗反应，为临床提供准确的影像学证据，从而实现个体化评估。

PO-2125

BOLD-MRI 无创评价肾氧合：原发性醛固酮增多症患者与健康对照组的比较

温德英、孙家瑜
四川大学华西医院

目的：探讨血氧水平依赖磁共振成像（blood oxygenation level-dependent magnetic resonance imaging, BOLD-MRI）在原发性醛固酮增多症（primary aldosteronism, PA）患者肾脏氧合状态评估中的应用，并与健康对照组进行比较。

方法：所有患者和健康对照组（healthy controls, HCs）均行肾脏 BOLD-MRI 检查。采用感兴趣区（region of interest, ROI）方法分别测量肾皮质和髓质中的 $R2^*$ 值。采用独立样本 t 检验或 Mann-Whitney U 检验比较患者和健康组之间有无差异。采用 Pearson 相关分析或 Spearman 相关分析，分析肾脏 BOLD 参数与临床指标的相关性。采用受试者工作特征（receiver operating characteristic, ROC）曲线来区分 PA 患者和健康志愿者。

结果：共纳入 20 例 PA 患者（女性：男性，14：6；年龄 46 ± 12 岁）和 20 例 HCs（女性：男性，14：6；年龄 47 ± 10 岁）。HCs 和 PA 患者的皮质 $R2^*$ 明显低于髓质 $R2^*$ （ $p < 0.001$ ）。PA 组的皮质 $R2^*$ 高于 HCs 组的皮质 $R2^*$ （ $p = 0.003$ ）。相关分析显示，髓质 $R2^*$ 值与尿素氮呈正相关（ $r = 0.566$, $p = 0.018$ ）。ROC 曲线显示，皮质 $R2^*$ 对区分 PA 患者和健康志愿者的最佳诊断阈值为 17.13 Hz，相应的敏感性和特异性分别为 84.30% 和 55.30%。曲线下面积（area under the curve, AUC）为 0.692。

结论：BOLD-MRI 提供了一种有用的技术来检测 PA 患者肾皮质和髓质的氧合水平。

PO-2126

扩散加权成像参数与子宫内膜癌免疫组化预后因子及病理分型的相关性

花烨
南通大学附属医院

探讨 MRI 扩散加权成像 (DWI) 的表观扩散参数与子宫内膜癌免疫组化预后因子及病理分型的相关性。方法: 回顾性分析自 2013 年 1 月至 2017 年 5 月在我院经病理及临床确诊为子宫内膜癌并获得免疫组化结果的患者 49 例。所有患者均行盆腔增强 MRI 及 DWI 扫描, 并测量表观扩散系数 (ADC) 及相对表观扩散系数 (rADC)。记录免疫组织化学结果, 观察雌激素受体 (ER)、孕激素受体 (PR)、人表皮生长因子受体 II 型 (Cerb-2) 及预后因子 Ki-67 的表达情况, 同时患者进行病理分型。各受体在不同表达状态下及不同病理分型子宫内膜癌患者的 ADC 值和 rADC 值均采用 Mann-Whitney U 检验比较, ADC 值、rADC 值和 Ki-67 阳性表达率的相关性采用 Spearman 方法评价。结果: 低分化组子宫内膜癌患者的 ADC 值低于高分化组, 差异有统计学意义 ($P<0.05$)。ER、PR 阳性患者的 ADC 值及 PR 阳性患者的 rADC 值高于 ER、PR 阴性患者, 差异有统计学意义 ($P<0.05$)。Cerb-2 阳性和阴性患者的 ADC 值差异无统计学意义 ($P>0.05$)。子宫内膜癌患者的 ADC 值、rADC 值与 Ki-67 表达均呈负相关 ($r=-0.76$ 和 -0.66 , $P<0.05$)。结论: 磁共振 DWI 检查可在一定程度上提示子宫内膜癌的不同病理类型, 并且有潜力从分子水平评估恶性程度。

PO-2127

基于弥散张量成像评估狼疮性肾炎早期肾功能损害及无创性分级肾功能损害程度的价值

王晔¹、何楚彤²、韦瑞丽¹、袁诗雯¹、杨蕊梦¹

1. 广州市第一人民医院

2. 暨南大学附属第一医院 (广州华侨医院)

目的 探讨弥散张量成像 (DTI) 识别狼疮性肾炎 (LN) 患者早期肾功能损害并分级肾功能损害程度的价值。

方法 前瞻性收集 2021 年 9 月至 2023 年 5 月间 54 名 LN 患者和 29 名健康志愿者 (对照组) 行肾脏常规 MRI, DTI 成像, 并且 LN 患者行肾动态显像。以估算肾小球滤过率 (eGFR) 大于 90 mL/min/1.73m^2 为指标挑选出 eGFR 正常的 LN 患者组 (eLN), 并以双肾肾动态显像求得的肾小球滤过率 (rGFR) 为 90 mL/min 作为阈值将这组患者分为 rGFR 正常的 LN 患者组 (eLNn, 7 例) 和 rGFR 异常的 LN 患者组 (eLNab, 23 例)。此外, 所有 LN 患者根据单肾 rGFR 被分为 LN 轻度组 (LNm, 40 例, $\text{rGFR} \geq 30\text{ mL/min}$) 和 LN 中重度组 (LNms, 14 例, $\text{rGFR} < 30\text{ mL/min}$) 两组, 以分级肾功能损害程度。由两名经验丰富的放射科医生分别独立测量肾皮质和髓质的 DTI 参数 (表观扩散系数 [ADC]、分数各向异性 [FA])。采用单因素方差分析对比较不同组间肾皮、髓质各参数值的差异, 采用 Pearson 相关分析比较肾皮、髓质各参数值与 rGFR 间的相关性, 采用二元 logistic 回归分析及 ROC 评价各参数单独及联合在预测肾损害方面的鉴别诊断效能, 采用 Delong 检验比较曲线下面积 (AUC) 的差异。

结果 除髓质 ADC 值外, 皮质 ADC 值及皮髓质 FA 值在 eLNn、eLNab 组与对照组间差异有统计学意义 (均 $p < 0.001$)。在鉴别 eLNn 组和对照组时, 髓质 FA 的诊断效能最优, 其 AUC 值达到 0.828, 敏感度和特异度分别为 77.8% 和 86.2%。所有 DTI 测量值在对照组与 LNm、LNms 组间

均呈逐渐下降趋势, 差异有统计学意义 (均 $p < 0.05$)。在鉴别 LNm 和 LNms 时, 髓质 FA 具有与皮质 ADC 和髓质 FA 联合相似的诊断效能 ($p > 0.05$)。

结论 髓质 FA 可早于 rGFR 识别肾功能损害并预测肾功能损害程度进展, 因此 DTI 可用于无创评估及监测早期狼疮性肾炎肾功能损害。

PO-2128

肾脏混合型上皮和间质肿瘤的 CT、MRI 表现及临床特征分析

何秀超¹、王玉涛²

1. 宁波大学附属第一医院

2. 宁波市第九医院医疗健康集团

目的: 探讨肾脏混合型上皮和间质肿瘤的 CT、MRI 特点及临床特征, 提高本病的认识, 降低术前影像误诊率。方法: 回顾性分析宁波大学附属第一医院经病理证实的 12 例肾脏混合型上皮和间质肿瘤患者资料。结果: 临床表现, 12 例患者 1 例为肋骨骨折、1 例腹痛、1 例排便异常检查发现, 其余均为体检发现, 其中有 1 例患者定期随访复查 7 年, 患者均无明显不明症状和体征, 实验室检查和肿瘤标记物检查均为阴性。CT 或 MR 表现 12 例肿瘤均为单发, 左肾 5 例、右肾 7 例, 位于肾脏上部 9 例、下部 2 例、中部 1 例。肿瘤边界清楚, 最大径 17~107mm, 中位值 28.8mm。12 例位于肾实质内并局部向肾轮廓外突出, 边界清楚, 10 例伴瘤内多发囊变, 3 例伴瘤内出血, 1 例瘤内小钙化灶。12 例均无肿大淋巴结、双侧肾上腺异常、肾静脉和 (或) 下腔静脉瘤栓和其他脏器受累。混合性上皮和间质肿瘤是由上皮和间质成分相混合构成的肾脏肿瘤。肿瘤构成复杂, 由大囊、微囊和小管构成。大囊囊壁内衬柱状或立方上皮, 有时形成乳头状簇。部分囊壁内衬尿路上皮, 有时有增生, 微囊和小管内衬扁平、立方或柱状上皮。这些内衬上皮细胞浆或透明, 或淡染, 或嗜酸, 或呈囊泡状。微囊结构多样, 有的为微囊伴周围丰富的间质, 有的为密集簇状排列的微囊, 有的形成复杂分支迷路, 并引起囊腔扩张。这些成分常在肿瘤的同区域混合存在。间质有多少不等的梭形细胞, 这些细胞核大、胞浆丰富, 有时黏液样间质和束状平滑肌细胞显著, 常见致密胶原, 偶见脂肪, 该肿瘤细胞异型性及核分裂难以找到。免疫组化, 梭形细胞: Actin 和 Desmin 强阳性, ER、PR 阳性; 上皮成分常常表达 CK 和 Vimentin。结论: 肾脏混合性上皮和间质肿瘤诊断有一定困难, 但肿瘤实性成分的多少、间隔的形态以及增强方式可以为诊断及鉴别诊断提供依据。

PO-2129

基于术前 ADC 图纹理分析对胰腺癌组织学分级的预测价值

金红瑞、刘静静、张勇、程敬亮

郑州大学第一附属医院

目的 探究术前 ADC 图纹理分析对胰腺癌组织学分级的预测价值。方法 以 2018 年 2 月至 2022 年 2 月经我院病理证实的胰腺癌患者 122 例作为研究对象。依据美国肿瘤联合会分期, 将研究对象分为高分化组 (47 例), 中低分化组 (75 例)。术前患者行包含扩散加权成像的磁共振成像检查。由 2 名医师提取患者 ADC 图像参数。利用单变量 ADC 纹理特征参数预测, ROC 曲线分析纹理参数对胰腺癌组织学分级的预测价值。Pearson 分析检验参数间的相关性。利用支持向量机预测模型、逻辑回归预测模型、多任务学习预测模型三种多变量 ADC 纹理特征参数预测。建立 LOOCV 模型, 筛选出三个预测模型中频次较高参数。利用统计学 bootstrap 法比较单变量模型和多变量模型的预测性能。结果 ADC 纹理参数中, ADC10、短游程补偿、差熵等均为胰腺癌组织学分级有统计学意义的参数。多变量模型预测较单变量模型预测性能更优。ADC 纹理特征参数中, 63.64% 的参数具

有相关性。结论 ADC 图纹理参数在一定程度上反应胰腺癌组织学分级信息, 给术前胰腺癌组织学分级预测提供了重要方法。

PO-2130

双期增强 CT 成像特征能否预测胃癌新辅助治疗后的病理完全缓解? 初步回顾性研究

李敏、杨丽、王琦
河北医科大学第四医院

目的: 旨在对比研究双期 CT 的成像特征在预测 GC 患者 pCR 状态方面的价值。

方法: 选择 2015 年 4 月至 2022 年 12 月期间接受新辅助化疗在我院进行胃根治性切除术的 115 例胃癌或食管-胃结合部癌患者进行连续分析。其中, pCR 患者 41 名, Non-pCR 患者 74 名。分析了所有患者治疗前、后双期 CT 成像特征, 双期 CT 成像特征分为定量特征和定性特征。比较了 pCR 组和 Non-pCR 组治疗前后参数的差异, 分类变量采用卡方检验, 非正态分布的连续变量采用 Mann-Whitney U 检验, 正态分布的连续变量采用独立样本 t 检验。pCR 状态与双期 CT 成像特征之间的关系通过单变量逻辑分析, 然后通过多变量逻辑回归和接受者操作特征 (ROC) 曲线分析。

结果: pCR 组 TMT first, TMT Post、LNSD Post 均小于 Non-pCR 组 ($P < 0.05$); Δ CTA、 Δ TMT、 Δ TMT-1 和 Δ LNSD 高于 Non-pCR 组 ($P < 0.05$)。与 Non-pCR 组相比, pCR 组肿瘤的 cT4 分期占比略低 (80.5%vs,90.5%, $P < 0.05$)。在 pCR 组中, 治疗后肿瘤溃疡的发生率为(19.5%, 8/41), 低于 Non-pCR 组的肿瘤溃疡发生率($P < 0.001$)。单变量逻辑分析显示, 治疗方案、TMT first, TMT Post、 Δ CTA、 Δ TMT、 Δ TMT-1、 Δ LNSD、治疗后肿瘤有无溃疡、治疗前 cT 分期、治疗后黏膜线强化、治疗后病变增强模式和治疗后病变厚度分层与 pCR 状态相关 (所有 $P < 0.05$)。然而, 在多变量分析中, TMT first、 Δ TMT 和治疗后黏膜线强化是 pCR 的独立预测因子。组合三个双期 CT 成像特征, 通过多变量逻辑回归模型获得的曲线下面积为 0.955 (95% CI 0.596-0.687)。结论: 双期 CT 成像特征, 包括 TMT first、 Δ TMT 和治疗后黏膜线强化及其组合, 可用作 GC 患者 pCR 状态的预测指标。

PO-2131

MRI 特征列线图模型鉴别胰腺实性假乳头状肿瘤与非功能性胰腺神经内分泌瘤

王明亮、曾蒙苏
上海市老年医学中心/复旦大学附属中山医院

目的: 探讨 MRI 特征列线图模型在胰腺实体假乳头状肿瘤与非功能性胰腺神经内分泌肿瘤鉴别中的价值; 方法: 回顾性分析 2010 年 01 月至 2021 年 01 月经手术病理证实的 pSPN 53 例和 NF-pNET 81 例患者临床信息、病理及 MRI 资料, 对两组病例的肿瘤部位、长径、形态、边界、是否位于胰腺轮廓外、磁共振平扫各序列信号、DWI、病灶与胰腺的 ADC 比值 (rADC)、T1WI 平扫信号强度是否均匀、强化程度、强化特点、强化趋势、囊变、囊实性比例、出血、主胰管扩张、胰周脂肪侵犯等, 采用卡方检验、独立样本 t 检验或 Mann-Whitney U 检验。将单因素分析具有统计学意义的变量均纳入二元 Logistic 回归模型, 采用逐步法筛选出 pSPN 和 NF-pNET 的独立预测因素, 建立 logistic 回归模型并绘制列线图。结果: pSPN 与 NF-pNET 的性别、年龄、部位、长径、T1WI 平扫信号强度、rADC、囊变、囊实性比例、出血、环形强化、浮云征、强化程度及强化趋势等差异有统计学意义 ($P < 0.05$), 肿瘤的部位、形态、边界、是否位于胰腺轮廓外、rADC 值、主胰管

扩张、胰周脂肪浸润、腊肠样强化等方面差异均无统计学意义 ($P>0.05$)。诊断 pSPN 和 NF-pNET 的独立预测因素包括年龄、T1WI 平扫信号强度、强化程度、强化趋势、浮云征, 成功建立术前预测 pSPN 的列线图模型, 其受试者操作特征曲线下面积为 0.985, 校准预测曲线与标准曲线贴合良好。结论: 根据 MRI 特征建立的列线图模型在术前预测 pSPN 有较高的应用价值, 为鉴别 pSPN 与 NF-pNET 提供了一种个体化预测方法。

PO-2132

双源 CT 碘定量参数预测胃癌浆膜侵犯和不同亚型分析

杨婉、施桦、刘松

南京大学医学院附属鼓楼医院

目的 探究胃癌浆膜侵犯与双源 CT (DECT) 碘相关参数之间的关系, 并对不同亚型进行分析, 为临床术前预测胃癌浆膜侵犯提供参考。

方法 回顾性收集 2021 年 12 月至 2022 年 11 月我院手术病理证实为胃癌的患者临床及影像学资料。采用德国西门子第三代双源 CT (SOMATOM Force) 进行动静脉期双能量扫描。将 100KV 和 Sn150KV 动静脉期薄层图像导入后处理工作站。选择 Liver VNC 程序, 两名阅片人分别评估观察动脉期 (AP) 和静脉期 (VP) 融合图像。在病变最大的横断面上手工勾画不规则感兴趣区 (ROI), 勾画出病变的轮廓, 包括肿瘤异质性区域 (如囊变、坏死)。测量 AP 和 VP 的 ROI 面积、碘浓度 (IC)、归一化碘浓度 (nIC)、脂肪分数、CT 值平均值和标准差。另外, 根据手术病理结果, 对管状腺癌 (TAC) 和低粘附性癌 (PCC) 分别进行亚组分析。采用 SPSS 软件进行统计学分析, 采用双侧检验, 以 $P<0.05$ 为差异具有统计学意义。采用 Mann-Whitney U 检验评估定量变量的差异。

结果 本研究共纳入 93 例胃癌患者, 浆膜侵犯阳性患者 27 例, 阴性 66 例。单因素分析结果显示在动脉期 DECT 参数中, ROI 面积值在有无浆膜侵犯患者间有统计学差异 ($P<0.05$)。在静脉期 DECT 参数中, ROI 面积、IC、nIC、CT 值平均值

在有无浆膜侵犯患者间均有统计学差异 ($P<0.05$), ROI 面积以及静脉期 IC 在有浆膜侵犯患者中更高。另外, PCC 亚组分析显示静脉期 ROI 面积值、IC、nIC、CT 值平均值以及动脉期 ROI 面积值在有无浆膜侵犯患者中差异均有统计学意义 ($P<0.05$)。在 TAC 亚组分析中, 动脉期 CT 值标准差在有无浆膜侵犯患者间有统计学差异 ($P<0.05$), 其他参数差异无统计学意义 ($p>0.05$)。

结论 DECT 相关参数中, ROI 面积以及静脉期 IC 在胃癌浆膜侵犯不同状态组间有统计学差异, ROI 面积以及静脉期 IC 在有浆膜侵犯患者中更高。在亚型分析中, PCC 的结果与总体结果一致, DECT 也许能够为术前预测胃癌浆膜侵犯状态提供一定参考。

PO-2133

弥散加权成像的拉伸指数模型和峰度模型在肾脏评估中区分原发性醛固酮增多症患者与健康对照组的比较研究

温德英、孙家瑜

四川大学华西医院

目的: 比较弥散加权成像 (diffusion-weighted imaging, DWI) 的拉伸指数模型和峰度模型获得的弥散参数对原发性醛固酮增多症 (primary aldosteronism, PA) 患者和健康对照组 (healthy controls, HCs) 的鉴别能力。

方法: 44 名参与者 (22 例患者和 22 例 HCs) 接受了肾脏 MRI 检查, 采用 11 个 b 值的 DWI 序列和 3 个 b 值的弥散峰度成像 (diffusion kurtosis imaging, DKI) 序列。采用独立样本 t 检验或

MannWhitneyU 检验比较各弥散参数在患者和健康对照组有无差异。采用二元逻辑回归方法建立结合不同扩散参数的回归模型。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线分析和比较, 评价单个扩散参数模型和联合扩散模型对两组的区分能力。

结果: 共纳入 44 名参与者, 并研究了 10 个回归模型。患者皮质异常指数项 (α _Cortex) 和髓质各向异性 (FA_Medulla) 显著高于 HCs, 患者皮质 FA (FA_Cortex)、皮质轴向扩散 (Da_Cortex)、髓质平均扩散 (MD_Medulla) 和髓质径向扩散 (Dr_Medulla) 显著低于 HCs。Dr_Medulla 的曲线下面积 (AUC) 为 0.855, 与 FA_Cortex 和 FA_Medulla 相当, 显著高于 α _Cortex、Da_Cortex 和 MD_Medulla。Model_all parameters 的 AUC 为 0.967, 与 Model_FA (0.946) 和 Model_DKI (0.966) 相当, 显著高于其他模型。Model_all parameters 的敏感性和特异性分别为 87.2% 和 95%。

结论: Model_all parameters、Model_FA 和 Model_DKI 对 PA 患者和 HCs 的区分效果相似, 优于单个扩散参数等模型。

PO-2134

急性坏死性液体积聚和包裹性坏死合并感染的 CT/MRI 评价

肖波

重庆医科大学附属璧山医院

目的: 基于新亚特兰大标准, 对急性坏死性液体积聚 (ANC) 和胰腺包裹性坏死 (WON) 合并感染进行 CT/MRI 评价。方法: 回顾性分析因并发感染性胰腺坏死 (ANC 或 WON 合并感染) 行外科处理后将脓液标本培养证实有细菌或真菌生长者, 且患者发病后 3-10 天首次 CT 或 MRI 检查, 在感染性胰腺坏死外科治疗前后有 CT 或 MRI 复查者。综合观察感染性胰腺坏死灶的部位、数目、形态、大小、病灶密度及信号、增强特征, 并计算首次 CT 或 MR 严重指数 (CT/MR severity index, CTSI/MRSI); 随访患者术后演变及临床预后。结果: 纳入 ANC 或 WON 合并感染患者 40 例 (男 28 例、女 12 例, 年龄 50.9 ± 12.2 岁), 包括 ANC 合并感染 3 例和 WON 合并感染 37 例, 从患者发病至发现感染性胰腺坏死的时间为 38.4 ± 20.9 d。所有患者首次积分 CTSI/MRSI 为 7.8 ± 1.7 分 (6-10 分)。37 例 WON 合并感染者共 44 个胰腺 WON 病灶, 大小为 8.7 ± 3.6 cm; 所有 WON 病灶内含“非液性物质影”; 56.8% 的 WON 合并感染者见“气泡征”、“气液平征”; 13.5% 的 WON 合并感染者见胰尾部 WON 侵犯脾脏、脾内呈脓腔样病灶伴花环样强化及内部分隔样强化。所有患者外科引流引出褐色脓性液体后送细菌培养: 67.5% 的患者出现多重感染。结论: ANC 或 WON 合并感染在 CT/MRI 上有较为特异的一些征象可提示诊断, 能为外科治疗前后提供重要的参考价值。

PO-2135

基于修订版亚特兰大标准: 急性胰腺炎“假性囊肿”术语的影像学意见

肖波

重庆医科大学附属璧山医院

目的 探讨在修订版亚特兰大国际共识中急性胰腺炎 (Acute pancreatitis, AP) “假性囊肿”这一术语的使用问题。资料与方法 回顾性分析近十年住院的 AP 连续性病例的临床资料, 纳入 AP 发病后在我院有首次影像学资料, 且 AP 后期有 MRI 复查资料证实局部并发症“胰腺假性囊肿形成者”。MR 扫描包括 GRE T1 加权、SSFSE T2 加权、MRCP、3D-LAVA 序列等。综合各序列观测急性胰腺炎“假性囊肿”病灶的部位、数目、大小、体积、内容物、信号等。并依修订版亚特兰大新术语区分“假性囊肿”和“包裹性坏死 (WON)”。结果 共计 113 例连续性 AP 病例 (男 69 例、女 44 例, 年龄

50.5±14.1 岁) 由 MRI 共发现“假性囊肿”病灶 170 个, 大小为 8.5±4.8cm (1.5~24.5cm), 体积约 445±707ml。95 例 (84.1%) 属胰腺和胰周均坏死型, 8 例 (7.1%) 属仅胰腺坏死型, 7 例 (6.2%) 属仅胰周坏死型, 仅 3 例 (2.6%) 属间质水肿性型。位于胰内的包裹性液性积聚有 45 个 (26.5%)、胰周+胰内均受累有 52 个 (30.6%)。167 个 (98.2%) 病灶内见或多或少的“非液性物质影”, 它们在压脂 T2WI 上为低信号影, 增强扫描均未强化。76 例患者行外科操作后 64 例有病理学证实“胰腺囊肿内”含无结构坏死物, 符合胰腺包裹性坏死改变。结论 符合 AP 修订版亚特兰大标准定义的“假性囊肿”已相当罕见, 影像学 MRI 上拟诊的“急性胰腺炎假性囊肿”绝大多数应采用“胰腺包裹性坏死”这一新诊断术语。

PO-2136

坏死性胰腺炎伴胰管中断综合征的 MR 征象: “厚层性/透壁性胰腺坏死-胰管中断-胰腺包裹性坏死”三部曲

肖波

重庆医科大学附属璧山医院

目的 探讨急性坏死性胰腺炎所致胰管中断综合征的 MRI 特征。方法 回顾性分析急性胰腺炎住院病例因局部并发症行外科手术证实胰管中断的患者, 同时发病后 3-10 天有 MRI 检查且术前有 MRI 复查者。分析首次 MRI 检查上是否存在胰腺坏死, 统计胰腺坏死部位、范围、深度、类型及 MRSI 评分; 评价复查 MRI 上主胰管中断显示率、中断位置及与胰腺包裹性坏死的关系。结果 共纳入胰管中断综合征患者 26 例 (男 15 例, 女 11 例, 年龄 50.2±15.2 岁) 进入研究, 首次 MRI 检查均为急性坏死性胰腺炎, 透壁性胰腺坏死占 65.4% (17/26)、厚层性胰腺坏死占 34.6% (9/26); 胰腺内坏死厚度为 2.4±0.3cm (2~3.2cm), 坏死范围: >50% 者占 61.5% (16/26)、30%~50% 者占 38.5% (10/26), MRSI 评分为 8.9±0.9 分 (8~10 分)。MRI 复查示 73.1% (19/26) 的患者见“主胰管中断综合征”的直接征象即胰体部中断者占 57.9% (11/19)、胰体尾交界区中断者占 26.3% (5/19)、胰颈部中断者占 15.8% (3/19)。所有病例均见胰腺包裹性坏死形成, 19 例患者上游胰腺组织内的主胰管如“苹果柄”状近直角汇入病灶并相通。结论 急性胰腺炎厚层性/透壁性胰腺坏死致胰管中断综合征具有相应的 MRI 征象, 后期出现的胰腺包裹性坏死为胰管中断综合征的并发症, 可视为“厚层性/透壁性胰腺坏死-胰管中断-胰腺包裹性坏死”三部曲。

PO-2137

基于腹部 CT 的身体成分参数对乳腺癌新辅助化疗病理完全缓解的预测价值

史雨鑫、靳激扬

东南大学附属中大医院

目的: 本研究旨在探究新辅助化疗前身体成分参数对乳腺癌患者新辅助化疗后病理完全缓解的预测价值。

方法: 回顾性收集接受新辅助化疗并行手术治疗的非转移性乳腺癌患者 85 例, 收集患者的临床病理资料及新辅助化疗前 1 周内的腹部 CT 图像, 根据新辅助化疗后手术标本的病理结果, 将患者分为病理完全缓解 (pCR) 组和非病理完全缓解 (non-pCR) 组。由一名放射科医生在对病理结果不知情的情况下使用 slice-o-matic 软件在患者腹部 CT 的腰 3 椎体水平手动测量骨骼肌面积 (SMA)、内脏脂肪面积 (VFA) 和皮下脂肪面积 (SFA), 高 VFA 和高 SFA 定义为 ≥100cm², 用身高 (m) 对 SMA 进行标准化, 计算骨骼肌指数 (SMI), 低 SMI 定义为 SMI<39cm²/m²。使用 t 检验、

Mann-Whitney U 检验、卡方检验评价 pCR 组与 non-pCR 组临床病理资料及身体成分参数的统计学差异。运用多因素 Logistic 回归分析及受试者工作特征 (ROC) 曲线分析评价身体成分参数对乳腺癌患者新辅助化疗后 pCR 的预测效能。

结果: 本研究患者中, 新辅助化疗后达到 pCR 者 26 例, 未达到 pCR 者 59 例。单因素分析结果显示 pCR 与 SMI、SFA、雌激素受体状态、ki67 增殖指数、临床 T 分期和分子亚型有关, 而与年龄、体重、BMI、VFA、孕激素受体状态、Her-2 表达状态、绝经状态、临床 N 分期无关。将单因素分析中有统计学意义的指标以及结合临床有意义的指标一并纳入多因素 Logistic 回归模型, 结果显示肌少症、皮下脂肪面积、ki67 增殖指数、分子亚型是 pCR 的独立预测因素 ($p<0.05$), 联合四个指标构建的综合模型的 AUC 为 0.851 (95CI: 0.757-0.919), 敏感性为 0.808, 特异性为 0.814。

结论: 高 SMI、低 SFA 的乳腺癌患者新辅助化疗后更容易达到 pCR, 联合 SMI、SFA 和临床病理参数构建的综合模型预测对 pCR 有较好的预测效能。

PO-2138

原发性肝癌肉瘤的临床特征和 MRI 表现

王宁¹、张红霞¹、王明亮²

1. 泰州市人民医院

2. 复旦大学附属中山医院

目的 探讨原发性肝癌肉瘤的临床特点及 MRI 影像特征。方法 搜集 2013 年 12 月-2021 年 11 月复旦大学附属中山医院经手术病理证实的原发性肝癌肉瘤患者 11 例, 回顾性分析总结其临床特征及 MRI 表现。结果 11 例患者, 男性 9 例, 女性 2 例, 年龄 46-73 岁, 中位年龄 62 岁。8 例患者有慢性乙型肝炎病史, 1 例患者有肝炎肝硬化病史, 实验室检查中 7 例 AFP 升高, 1 例 CA199 轻度升高。11 例中, 8 例为单发, 3 例为多发, 共 21 个病灶, 其中肝右叶 14 个, 肝左叶 3 个, 同时累及肝左叶和右叶 4 个; 21 个病灶呈类圆形或浅分叶, 边界均清晰; 病灶最大径约 2.0-17.7cm, 其中 4 个病灶直径 >10 cm, 平均直径 (7.9 ± 1.4) cm。MRI 平扫呈囊实性或实性肿块, T1WI 以低信号为主, T2WI 以高或稍高混杂信号为主, 10 例病灶内可见大片状、多发小簇状或分隔状囊变区, 3 例病灶内可见出血信号, 2 例病灶内见少许脂肪成分, 动态增强扫描病灶边缘动脉期可呈轻度-明显不规则或环形强化, 门脉期及延迟期表现为快速廓清、逐渐填充及持续强化, 其中 6 例可见假包膜, 且延迟期显示更清晰。结论 肝脏边界清楚的孤立性肿块, 信号不均匀, 伴有明显的囊变坏死, 出血常见, 偶可见少许脂肪成分, 可有假包膜, 增强扫描实性成分可表现为快进快退型、渐进填充型及持续强化型。

PO-2139

增强 CT 图像联合实验室指标对急性胰腺炎严重度早期预测的影像学组学研究

肖波

重庆医科大学附属璧山医院

目的: 建立一个基于胰腺与胰周区域增强 CT 图像和实验室指标的早期预测急性胰腺炎 (acute pancreatitis, AP) 严重程度的联合模型和诺模图, 以实现重症急性胰腺炎 (severe acute pancreatitis, SAP) 的早期预测。

方法: 本研究对 209 例首发急性胰腺炎患者进行了回顾性分析, 其中训练集为 2016 年 1 月到 2021 年 7 月的 137 例样本, 男性 85 例, 女性 52 例, 平均年龄 51.3 ± 16.1 岁; 测试集为 2021 年 8 月到 2022 年 6 月的 72 例样本, 男性 39 例, 女性 33 例, 平均年龄 55.4 ± 17.8 岁。收集患者入院 48 小

时内的 CT 增强图像和实验室指标数据。从胰腺和胰周区域的门静脉期图像中提取影像组学特征，基于 LightGBM 构建特征筛选算法，获得最佳影像组学特征，建立逻辑回归影像组学模型，并根据受试者工作特征曲线下面积、灵敏度、特异度和准确度评价模型的预测性能。将提取的影像组学特征和实验室指标纳入 LightGBM 模型，筛选出可预测 AP 严重程度的风险因素并构建逻辑回归联合模型，并基于最佳联合特征建立诺模图，评价模型的预测性能。

结果：1.构建了影像组学模型，该模型由 9 个最佳影像组学特征构成，模型的 AUC 值：训练集为 0.960[95%可信区间：0.914~0.989]，验证集为 0.939，测试集为 0.833，灵敏度为 0.75，特异度为 0.789，准确度为 0.781；构建了增强 CT 图像与实验室指标的联合模型，该联合模型由 4 个影像组学特征和 3 个实验室指标所组成。训练集的 AUC 值为 0.940[95%可信区间：0.879~0.979]，验证集为 0.917，测试集为 0.858，灵敏度为 0.778，特异度为 0.844，准确度为 0.819。基于联合特征的诺模图显示，当总分大于 181 分时，模型预测为 SAP。基于 7 个特征的联合模型较基于 9 个特征的影像组学模型对 AP 严重程度的早期分类具有更好的预测性能。

结论：基于胰腺及胰周区域 CT 增强图像和实验室指标的联合模型在 AP 严重程度的早期预测中表现良好。基于最佳联合特征的诺模图为临床评估 AP 的严重程度提供了参考。

PO-2140

在局部晚期直肠癌患者中预测术后远处转移风险： 使用基于 MRI 的 Delta 影像组学方法

朱钰

云南省肿瘤医院

背景 术后远处转移是局部晚期直肠癌患者预后不良的重要因素，准确预测 LARC 患者术后远处转移风险，有助于制定适当的个性化治疗方案。

目的 利用 nCRT 前后 2 次 MRI 提取的 delta-影像组学特征，用于预测局部晚期直肠癌患者术后远处转移风险。

资料与方法 回顾性纳入云南省肿瘤医院 2016 年 1 月-2019 年 6 月 213 例局部进展期直肠癌患者，所有患者均在 nCRT 后施行手术治疗，且均接受 nCRT 前后的 MRI 检查。除外术后发生终点事件的患者，其余患者术后至少随访 3 年。按 7:3 比例随机分为训练组和验证组（训练组 n=149，验证组 n=64），分别用于特征选择和验证。在 nCRT 前后的 T2 加权图像上对肿瘤病灶进行逐层勾画，利用 3D-slicer 软件进行特征提取。delta-影像组学特征被定义为 nCRT 前后影像组学特征的差异。使用最小绝对收缩和选择子算法(The least absolute shrinkage and selection operator algorithm,LASSO)用于特征降维和提取，构建 3 个 delta-影像组学模型，包括基于 nCRT 前后影像组学特征绝对和相对变化量的 delta-影像组学模型和 delta-影像组学联合模型。采用受试者操作特征曲线评价模型对 DM 的预测价值。

结果 本研究共纳入 213 例 LARC 患者，平均年龄为 58.50 ± 12.37 岁，中位随访时间为 39.8 个月，共有 36 例（16.9%）患者术后出现 DM。nCRT 前后每个病灶均提取 1382 个特征，进行特征降维和筛选后，训练集基于 nCRT 前后影像组学特征绝对和相对变化量的 delta-影像组学模型中各纳入 7 个关键特征。在训练集中，绝对与相对变化量 delta-影像组学模型，及 delta-影像组学联合模型的 ROC 曲线下面积分别为 0.77、0.74、0.82，相应测试集中 AUC 分别为 0.73、0.70、0.84。

结论 基于 MRI 的 delta-影像组学特征建立的联合预测模型，有助于对局部进展期直肠癌术后远处转移风险进行预测，且优于单纯的绝对和相对变化量的 delta-影像组学模型。

PO-2141

基于双能量 CT 多参数成像精准诊断 继发性胆总管结石的研究

肖长慧、谭显政
湖南省人民医院

目的：探讨双能量 CT 诊断 CBDS 的价值；并基于双能量 CT 制定新的风险分层标准，探讨其对现有指南（即 ASGE 标准）的改进效能。

方法：回顾性收集我院 2019 年 1 月至 2022 年 11 月期间经 US 诊断为胆囊结石，拟行腹部双能量 CT 检测 CBDS 的患者。以外科手术或 ERCP 结果为参考标准，评估双能量 CT 不同组合图（虚拟平扫图像 [VNC]、虚拟单能图像 [40KeV+190KeV]、Rho+Z 图）在诊断 CBDS 的效能差异，择出最优参数图。将最优参数图指标代替现有 ASGE 指南中 US 指标制定基于双能量 CT 新的分层标准，并与现有指南对比。评价指标包括受试者操作特征曲线下面积（AUC）、敏感度、特异度。敏感度、特异度比较采用 McNemar 检验。AUC 比较采用 Delong 检验。采用 Kappa 检验评估观察者内和观察者间的一致性。P<0.05 被认为有统计学意义。

结果：共纳入 159 例患者。双能量 CT 参数图中，虚拟单能图像诊断 CBDS 的 AUC 高于 VNC 图像（0.907 vs 0.785；P<0.001）及 Rho+Z 图像（0.907 vs 0.850；P<0.05）；同时具有最高的观察者内及观察者间一致性（观察者内 Kappa 值：0.93 [95% CI: 0.78-1.00]；观察者间 Kappa 值：0.86 [95% CI: 0.66-1.00]）。与现有指南对比，基于双能量 CT 的 ASGE 标准提高了预测 CBDS 的特异度（90.0% vs 78.9%；P<0.001）的同时，二者敏感度（76.8% vs 75.4%；P=0.782）无显著统计学差异。

结论：双能量 CT 不同参数图中，虚拟单能图像诊断 CBDS 的诊断效能最高，且具有最高的观察者内及观察者间一致性。与现有 2019 年版 ASGE 指南对比，基于双能量 CT 新的风险分层标准提高了预测 CBDS 的特异度，减少了部分患者诊断性 ERCP 的使用。

PO-2142

光谱 CT 虚拟单能量图像对胰腺导管内乳头状粘液性肿瘤与胰管交通结构显示的研究

张丹
重庆市人民医院

目的：探讨光谱 CT 虚拟单能量图像（VMI）对胰腺导管内粘液性乳头状肿瘤（IPMN）与胰管交通结构的显示。

方法：回顾性收集重庆市人民医院 2021 年 10 月至 2023 年 7 月的 25 例 IPMN 患者。分析光谱 CT 动脉期及门脉期原始图像、40KeV 至 70KeV 虚拟单能量图像。客观定量指标：胰腺实质、主胰管及病灶的 CT 值、标准差（SD），信噪比（SNR）、对比噪声比（CNR）、衰减差异（AD）。主观评价指标：采用李克特 5 分量表（Five-point Likert scales）评估 IPMN 病灶显著性、边缘锐利度、主胰管边缘锐利度及 IPMN 与胰管交通结构边缘轮廓清晰度。统计分析采用 SPSS 软件进行。客观定量指标采用单样本 Kolmogorov-Smirnov（K-S）检验法进行正态分布检验，采用 Levene 检验法进行方差齐性检验。主观评价指标采用卡方检验分析。

结果：SNR 实质、SNR 病灶、SNR 主胰管各组间差异统计检验量分别为：22.425、5.375、2.432，P 值分别为：<0.001、<0.001、0.024，SNR 实质、SNR 主胰管在门脉期 VMI40 显示最佳，SNR 病灶在动脉期 VMI40 显示最佳。CNR 实质/病灶、CNR 实质/主胰管各组间差异统计检验量分别为：20.885、3.752，P 值分别为：<0.001、0.001。CNR 实质/病灶在门脉期 VMI40 显示最佳，CNR 实质/主胰管在动脉期 VMI40 显示最佳。AD 实质/病灶、AD 实质/主胰管各组间差异统计检验量分别为：34.289、2.042，P 值分别为：<0.001、0.073。AD 实质/病灶及 AD 实质/主胰管在门脉期 VMI40 显示最佳。病灶边缘锐利度、显著性、病灶与胰管交通结构边缘轮廓清晰性、主胰管边缘锐

利度各组间差异统计检验量分别为：154.616、158.710、135.568、139.623，P 值分别为：< 0.001、<0.001、<0.001、<0.001。各主观评分均在门脉期 VMI40 最佳。

结论：对于 IPMN 患者，门脉期或动脉期 VMI40 可以很好的显示病灶与主胰管交通情况，从而为 IPMN 的诊断提供主要依据。

PO-2143

原发性肝癌肝外转移患者预后生存影响因素分析

白玉、陈勇
宁夏医科大学总医院

【摘要】 目的 探讨影响原发性肝癌（PLC）肝外转移患者预后的相关因素，构建列线图预测 PLC 肝外转移患者的生存情况。方法 选取 2016 年 11 月至 2021 年 11 月宁夏医科大学总医院确诊的 201 例 PLC 肝外转移患者，将其 7:3 随机分为训练组和验证组。采用 LASSO 回归筛选协变量，基于多因素 Cox 回归确定独立预后因素，构建预测 PLC 肝外转移患者生存预后的列线图模型。采用 Bootstrap 法重复抽样 1000 次进行内部验证，计算一致性指数（CI），绘制校准曲线评价该列线图模型的校准度，决策曲线（DCA）以评价该列线图模型的临床有效性。结果 本组研究显示：NLR \geq 5（HR=2.053，95%CI:1.153~3.654）、肿瘤最大径 2-5cm（HR=2.566，95%CI:1.061~6.204）、肿瘤最大径 5-10cm（HR=2.624，95%CI:1.097~6.280）、肿瘤最大径 \geq 10cm（HR=3.574，95%CI:1.442~8.856）、肿瘤多发（HR=1.647，95%CI:1.049~2.587）、存在血管侵犯（HR=2.335，95%CI: 1.523~3.580）、联合靶向和（或）免疫治疗（HR=0.537，95%CI: 0.335~0.862）是 PLC 肝外转移患者的独立预后因素（ $P<0.05$ ），基于上述 5 个预测因子构建的列线图模型具有良好的预测性能。模型内部验证一致性指数(c 指数)训练组和验证组分别为 0.765（95%CI: 0.726~0.804）和 0.712（95%CI: 0.673~0.751）。校准曲线显示出良好的一致性。DCA 显示列线图具有正的净效益。结论 基于 NLR、肿瘤最大径、肿瘤数目、血管侵犯、联合靶向和（或）免疫治疗 5 个预测因子构建的列线图模型在 PLC 肝外转移患者生存预测方面表现良好，对临床有较高的指导意义，可很好的帮助个体化临床决策并促进精准治疗。

PO-2144

IVIM 和 DKI 技术评估直肠癌肿瘤间质比的研究

袁杰、詹松华、谭文莉
上海中医药大学附属曙光医院

目的

肿瘤间质百分比（TSP）作为肠癌肿瘤微环境评估的重要方法，与结直肠癌的生长和浸润密切相关，且是术后患者生存期的重要预测指标。体素内不相干运动（IVIM）和弥散峰度成像(DKI)是弥散加权成像技术的延伸。IVIM 和 DKI 不仅能够更好的反映癌症特征，还可以反映肿瘤微环境的组成和复杂性。本研究的目的是探讨 IVIM 和 DKI 定量参数在评价直肠癌肿瘤间质比中的作用。

材料和方法

对 27 名内镜下证实原发性直肠腺癌患者（年龄范围，37-88 岁，平均年龄 64.30 \pm 11.73 岁，16 名男性和 11 名女性）在进行全直肠系膜切除术之前进行 MRI。IVIM-DKI 详细的成像参数如下：轴向横断位；TR, 5700ms；TE 76ms；总采集时间，9 分 32 秒；FOV, 200 mm;体素尺寸为 1.0 \times 1.0 \times 3.0 mm³；层厚 3mm，带宽，1724；b 值，0,20,40,80,150,200,400,600,800,1000,1500,2000,2500。应用后处理软件勾画感兴趣区，IVIM 功能定量参数：灌注分数（f），纯扩散系数（D）和灌注相关扩散系数（D*）。DKI 功能定量参数：

平均扩散峰度 (Kapp) 和平均扩散系数 (Dapp)。术后, 对病理切片进行 HE 染色, 评估 TSP。应用 SPSS 进行统计分析。

结果

肿瘤间质比高组 D 值显著高于肿瘤间质比低组 ($t=-2.567$, $P=0.017$)。肿瘤间质比高组与低组 D* 值与 f 值未见显著统计学差异 ($t=1.267$, $P=0.214$; $t=-0.858$, $P=0.399$)。肿瘤间质比高组 Dapp 值明显高于肿瘤间质比低组 ($t=-2.548$, $P=0.020$)。肿瘤间质比高组与低组 Kapp 值未见显著统计学差异 ($t=-0.087$, $P=0.931$)。

结论

IVIM 定量参数 D 值和 DKI 定量参数 Dapp 值可以用于评估直肠癌肿瘤间质比。直肠癌 IVIM 和 DKI 可以作为识别直肠癌微环境的生物标志物。

PO-2145

基于 CT 影像组学及临床特征的 II 期结直肠癌患者预后预测

李梦蕾

复旦大学附属肿瘤医院

目的: 结直肠癌是最常见的消化道恶性肿瘤之一。目前, 对于 II 期结直肠癌患者术后是否给予术后辅助化疗 (adjuvant chemotherapy, ACT) 治疗一直存在争议。而且大多数预后指标 (例如: T4 期、血管浸润、分化差等) 与病理有关, 无法在术前获得。因此, 迫切需要开发更准确的预后预测因子以协助临床诊疗。本研究旨在探讨 CT 影像组学 (Radiomics) 特征在 II 期结直肠癌预后评估中的应用价值, 建立并验证基于 CT 影像组学特征与临床特征的预后预测模型。

方法: 我们首先收集了 230 例 (训练集 170 例, 验证集 60 例) 经临床病理证实的 II 期结直肠癌患者。然后, 我们使用影像组学方法提取原发灶的影像组学特征, 并构建模型来预测 II 期结直肠癌患者的预后。最后, 为了提高模型的预后预测性能, 我们纳入了多项术前可获得的临床特征, 并采用信息融合方法, 结合 CT 影像组学特征和临床特征构建了融合预测模型, 最后分析比较单一影像组学模型与融合模型的预测性能。

结果: 研究显示融合模型生成的 DFS 和 OS 预测 AUC 值分别提高到 0.906 (95% CI: [0.835, 0.977]) 和 0.980 (95% CI: [0.956, 1.000]), 均高于单一影像组学模型产生的 DFS 和 OS 预测 AUC 值: (0.862 (95% CI: [0.773, 0.952]) 和 0.942 (95% CI: [0.906, 0.978])。

结论: 本研究通过 CT 扫描原发病变的影像组学特征分析, 并结合临床特征, 建立了预测 II 期结直肠癌预后的临床-影像组学融合模型, 可辅助临床筛查预后不良的高危患者, 以实现精准医疗。

PO-2146

基于人工智能临床影像与病理多模态融合对胰腺癌术后患者生存期预测的研究

诸露冰

宁波大学附属第一医院

一直以来影像学很难找到一个较好的指标与胰腺癌患者的预后相关, 也很难基于目前肉眼可见的影像学特征建立一个较为准确的模型预测预后。但影像组学在免疫浸润环境及免疫检查点预测方面有进展, 由临床变量和 CT 放射学特征组成的预测模型可以进行晚期肺腺癌 PD-L1 表达的无创性评估。有学者提出了一个基于无创胸部 CT 图像的深度学习模型, 该模型在预测非小细胞肺癌患者 EGFR 突变/PD-L1 表达状态及其亚型方面表现出良好的性能, 此外, 有学者发现放射基因组学可以预测 p53 基因突变, 进而预测 PDAC 患者的预后。能否通过影像组学特征预测胰腺癌预后相关的病理特

征来预测胰腺癌的预后呢? VISTA 是新近发现的一个免疫抑制检查点, 在多种肿瘤细胞及肿瘤浸润免疫细胞表面不同程度地表达 VISTA, 作为 PD-L1 同源的 B7 家族一员, VISTA 的表达与肿瘤的预后息息相关, 有关研究发现在胰腺导管腺癌中, 癌组织中 VISTA 高表达的胰腺癌患者与 VISTA 低表达的胰腺癌患者相比预后更好, 那么通过影像组学建立预测 VISTA 表达的模型, 或许能对胰腺癌诊疗以及其预后的预测带来帮助。本课题组通过回溯性研究, 通过相关排纳准则收集 93 例 2014-2022 年间病理确诊为胰腺导管腺癌的患者, 分为训练组与验证组, 通过相关软件勾画肿瘤区域等, 提取相关影像组学特征, 经过 logistic 回归等统计学分析, 选择相关性较高的组学特征, 构建模型, 再通过验证组验证, 绘制 ROC 曲线, 确定准确性与精确性, 验证通过组学特征构建模型能预测 VISTA 的表达, 从而预测胰腺癌的预后。

PO-2147

应用钆塞酸二钠增强磁共振 T1 加权成像对 肝细胞癌肝切除术后肝脏再生的术前评估

唐鹤菡、魏毅、宋彬
四川大学华西医院

目的: 探讨钆塞酸二钠增强 T1 加权成像 (T1 WI) 参数在肝部分切除术 (partial hepatectomy, PH) 后 HCC 患者术前预测肝再生 (liver regeneration, LR) 中的潜在价值。

方法: 研究共招募 206 例 HCC 患者, 术内在 GE 750w 3.0T 扫描仪上进行钆塞酸二钠增强前后的扫描。肝胆延迟期 (hepatobiliary phase, HBP) 的时间为注射对比剂后 20 分钟。由两位放射科医生采用双盲法测量对钆塞酸二钠增强前后 T1 WI 参数进行测量。Spearman 相关性检验用于评估 T1 WI 参数与再生指数 (regeneration index, RI) 之间的相关性, 再生指数计算为 $100\% \times (\text{术后残余肝脏体积} - \text{术前残余肝脏体积}) / \text{术前残余肝体积}$ 。多元线性回归分析用于确定 RI 的因素。

结果: 通过排除标准, 最后共对 57 例 HCC 患者 (47 男 10 女, 平均年龄 51.26 ± 10.79 岁) 进行分析。组内相关系数 (ICC) 在 0.791-0.973 之间。Spearman 相关性检验显示, 小肝切除患者的 SIHBP (肝) ($r=0.450$, $P=0.011$)、SI[HBP pre (肝)] ($r=0.531$, $P=0.002$)、DR (肝) ($r=0.4570$, $P=0.008$)、SI/HBP pre ($r=-0.358$, $P=0.048$) 与 RI 相关。但多变量分析显示, 只有 SI[HBP pre (肝)] (模型 1: 标准化 $\beta = 0.425$, $P=0.007$) 和 SIHBP (肝脏) (模型 2: 标准化 $\beta = 0.337$, $P=0.035$) 与 RI 相关。在接受小肝切除术的患者中, SIHBP (肝) 和 SI[HBP pre (肝)] 也与纤维化分期呈负相关 (分别为 $r=-0.290$, $P=0.046$ 和 $r=-0.175$, $P=0.029$), 纤维化分期与 RI 也呈负相关。然而, 在多变量分析中, 对于总患者和大肝切除患者, 没有 Gd-EOB-DTPA 增强的 T1WI 参数与 RI 相关 ($P>0.05$)。

结论: SI[HBP pre (肝)] 和 SIHBP (肝) 可能是肝再生的可靠术前预测指标。

PO-2148

基于能谱 CT 影像组学在预测小肝癌微血管浸润中的研究

刘相如

哈尔滨医科大学附属第二医院

目的：微血管浸润（Microvascular invasion, MVI）被认为是一种早期的血管侵犯，当存在 MVI 时，小肝癌的短期复发率增加。MVI 的诊断依赖术后有创的组织病理学检查。因此，术前准确、可重复的非侵入性检测手段预测预后是十分必要的。双能计算机断层扫描（Dual-Energy Computed Tomography, DECT）成像是一种新型技术，可以在微观上对于小肝癌及其周围血供情况提供定量信息。评估 DECT 参数在早期肝癌浸润范围及治疗疗效中的应用价值，构建组学模型预测是否存在肝癌 MVI，以期获得术前无创的影像评估指标。

方法：回顾性收集本院 117 例小肝癌患者的影像及临床资料，经术后病理证实，50 例患者存在 MVI。将小肝癌动脉期 CT 增强图像上传至深睿科研平台。影像组学-临床模型（联合模型）预测模型的建立由三部分组成：A. 临床参数筛选：纳入 70Ke 能量水平 IC、NIC、WC、NWC、Zeff 和 λ （40-100KeV）6 个能谱参数和临床基线变量，进行单因素分析筛选具有统计学差异的变量（ $P < 0.05$ ），构建临床模型；B. 影像组学模型构建：原始图像获取和感兴趣区分割（由两位资深放射科医师进行勾画），进行特征提取及特征选择，随后训练逻辑回归、支持向量机、多层感知机、决策树、随机森林 5 种机器学习模型，评估性能，输出最优模型并计算影像组学评分；C. 将具有统计学差异的变量和影像组学评分结合建立的联合模型，采用受试者工作曲线对模型诊断性能进行分析，校准曲线进一步判断模型的优劣，决策曲线来评估临床效能。

结果：MVI 组 IC、NIC、 λ （40-100KeV）均显著高于 non-MVI 组（ $P < 0.05$ ）。WC、NWC、Zeff 与临床基线变量在两组之间没有明显统计学差异（ $P > 0.05$ ）。通过 LASSO 10 折交叉验证筛选出最优的 13 个影像组学特征，构建影像组学-临床模型（联合模型），二元逻辑回归联合模型表现最好，ROC 曲线下面积（area under the curve, AUC）为 0.87。

结论：临床参数与影像组学结合构建的联合模型对小肝癌术前预测 MVI 具有良好的诊断价值。

PO-2149

双能量 CT 图像在胃癌显示中的优化选择

蔡佳楠、何伯圣、杨巨顺

南通大学第二附属医院

目的 探讨双能量 CT Monoenergetic+算法在胃癌显示优化中的价值。

方法 收集 2021 年 10 至 2022 月 12 月于南通大学第二附属医院行腹部双能量 CT 增强检查的胃癌确诊患者为研究对象。应用 Syngovia Workstation 后处理工作站，运用 Mono+算法获得动脉期及静脉期图像（40~90 keV）共 12 组。分别将动脉期及静脉期 100 kVp 和 140 kVp 图像以系数 0.5 融合，获得 120 kVp 融合图像共 2 组。重建出层厚 3 mm、层间距 3 mm 的横断面图像，用于主观及客观评估。比较各能量级的主客观评分差异性。

结果

1. 动、静脉期图像主观评分情况：40 keV 组 5 分占比最高，显著高于其他 6 组（ $P < 0.05$ ），120 kVp 组 5 分占比高于 60 keV~90 keV 单能级图像组，差异有统计学意义（ $P < 0.05$ ），而与 50 keV 单能级图像相比差异无统计学意义（ $P > 0.05$ ）。

2. 动、静脉期图像客观评分情况：120 kVp 组图像信噪比（SNR）最高，与其他组两两比较显示差异有统计学意义（ $P < 0.05$ ）；40 keV 单能级图像 SNR 虽然高于其它单能级图像，但与其它单能级图像组（50~90 keV）两两比较差异无统计学意义（ $P > 0.05$ ）；50~90 keV 单能级图像组的

SNR 值，两两相比差异无统计学意义（ $P>0.05$ ）。40 keV 单能级图像对比噪声比（CNR）高于其他各组图像，与 70、80、90 keV 两两比较显示差异有统计学意义（ $P<0.05$ ），与其它组比较差异不显著（ $P>0.05$ ）。50 keV 及常规 120 kVp 与 80、90 keV 两两比较显示差异有统计学意义（ $P<0.05$ ）。

结论

双能量 CT Mono+算法获得的 40 keV 单能级图像可以明显优化胃癌病灶的显示，有助于胃癌病灶的识别及观察。

PO-2150

基于常规磁共振联合临床特征影响组学模型预测 宫颈癌淋巴结转移和预后的研究

田名可、董越
辽宁省肿瘤医院

目的：建立一种基于常规磁共振和临床特征的影像组学模型，用于提高宫颈癌患者淋巴结转移（lymph node metastasis, LNM）的诊断性能和预后。材料和方法：回顾性分析来自两个医学中心的 485 例经手术病理证实为宫颈癌患者的术前磁共振（Magnetic Resonance, MRI）影像及临床病理资料（包括患者年龄、鳞状细胞癌抗原（Squamous cell carcinoma antigen, SCC-Ag）、病理类型、肿瘤最大径、肿瘤体积、MR 诊断有无 LNM）。医学中心 1 数据集按照 7: 3 的比例随机分成训练队列（ $n=261$ ）和内部验证队列（ $n=113$ ），医学中心 2 数据集作为外部验证（ $n=111$ ）。从肿瘤的横轴位脂肪抑制（Fatsaturation, FS）T2WI 及矢状位对比增强（Contrast enhanced, CE）T1WI 上提取每位患者影像组学特征。基于二分类向量机（Support vector machine, SVM）方法分别获取常规临床影像诊断模型（M1），基于影像组学特征建立具有线性核的 SVM 模型（M2）及常规 MRI 特征及最优影像组学特征共同构建的联合模型 M3，利用曲线下面积（Area under the curve, AUC）、灵敏度、特异性和受试者工作特征曲线（Receiver operating characteristic, ROC）的准确性对模型效率进行评价。根据随访结果进行分组及相应无进展生存期（Disease-Free Survival, DFS）的生存曲线划分，观察模型在两组间预后的差异。结果：①M3 诊断宫颈癌 LNM 性能最佳，在训练队列、内部验证队列和外部验证队列中 AUC 分别为 0.892、0.781 和 0.827。②Rad-score 结合模型（ $p=0.003$ ）是宫颈癌特异性复发的独立预测因子。结论：本研究提出的结合横轴位 FS-T2WI、矢状位 CE-T1WI 和临床特征的影像组学模型的支持向量机二分类模型可应用于宫颈癌患者的 LNM 的术前预测及患者预后预测。

PO-2151

IVIM 模型对直肠腺癌壁外血管侵犯的诊断价值及 与 Ki-67 的相关性

宋铁军
安庆市立医院

目的 探讨体素内不相干运动（IVIM）模型鉴别直肠腺癌壁外血管侵犯（EMVI）的诊断价值，并分析各参数值与 Ki-67 表达的相关性。方法 回顾性分析安庆市立医院 2020 年 1 月至 2022 年 1 月收治的 36 例经病理证实的直肠腺癌患者的资料；恶性组中 EMVI 阳性 16 例、阴性 20 例。测量病灶的参数值包括：ADCstandard（标准表观扩散系数）；ADCslow（慢速表观扩散系数）；ADCfast（快速表观扩散系数）；f（灌注分数）；DDC（分布扩散系数）；Alpha（扩散异质性指数）。对

36 例经病理证实的直肠腺癌患者的 IVIM 参数进行分析, 探讨其对直肠腺癌 EMVI 的术前评估价值。以病理结果作为检验标准, 采用 Spearman 相关分析比较各参数值与 Ki-67 表达水平的相关性。结果 EMVI 阳性组中的 ADCslow、ADCfast、f、DDC 参数值高于阴性组; ADCstandard、alpha 值在两组间差异无统计学意义 ($P>0.05$)。在评估 EMVI 时, ADCfast 的 ROC 曲线下面积最大 (0.818), 具有较高的准确性。以 $5.045 \times 10^{-3} \text{mm}^2/\text{s}$ 为诊断阈值时, 其敏感性及特异性分别为 87.5%、94.3%。结论 IVIM 模型在评价直肠腺癌 EMVI 有较高价值, 且 ADCfast 诊断准确性最高。

PO-2152

基于定量 CT 研究腹部脂肪分布、肝脏脂肪含量及胰腺脂肪含量预测急性胰腺炎复发的价值

罗慧、翟建
皖南医学院弋矶山医院

目的 基于定量 CT (QCT) 探讨腹部脂肪分布、肝脏脂肪含量及胰腺脂肪含量预测急性胰腺炎(AP)复发的价值, 建立复发性急性胰腺炎(RAP)的临床影像特征风险模型。

方法 回顾性收集 2017 年 1 月至 2022 年 12 月在皖南医学院弋矶山医院首次诊断为 AP 的 468 例患者, 均在发病 7 天内进行 CT 平扫和增强扫描, 经临床随访, 其中 261 例归为无复发 AP 组, 207 例归为复发性急性胰腺炎(RAP)组; 使用 QCT Pro 软件测量患者 L3 椎体中部层面的腹部内脏脂肪面积 (VFA)、腹部皮下脂肪面积 (SFA)、胰腺脂肪含量、肝脏脂肪含量, 并计算相应层面腹部总脂肪面积 (TFA); 同时收集两组患者临床特征及 CT 常规影像特征; 分析急性胰腺炎复发的风险因素。采用 Mann Whitney U 检验或 χ^2 检验比较两组间临床特征、CT 常规影像特征及 QCT 体脂参数, 将差异有统计学意义的特征纳入多因素 logistic 回归, 建立预测 AP 复发的综合模型, 使用受试者操作特征曲线评估模型预测 AP 复发的效能。

结果 无复发 AP 组与 RAP 组组间在年龄、饮酒、高脂血症、胆道结石、胰腺边缘 (清晰或模糊)、VFA、TFA、肝脏脂肪含量、胰腺脂肪含量差异均有统计学意义 (P 均 <0.05); 多因素 Logistic 回归分析显示高脂血症、胆道结石、饮酒、胰腺脂肪含量是 RAP 的独立危险因素, 胰腺边缘是 RAP 的保护因素; 基于高脂血症、胆道结石、饮酒及胰腺边缘情况构建临床-影像特征模型, 胰腺脂肪含量联合上述指标构建综合模型, 经 Delong 检验发现, 胰腺脂肪含量预测 AP 复发的 AUC 值 (0.770) 高于临床-影像模型 (0.701, $Z=2.00$, $P<0.05$), 综合模型预测 AP 复发的 AUC 值 (0.860) 高于临床-影像模型、胰腺脂肪含量 (0.701、0.770, $Z=6.98$ 、5.57, P 均 <0.001)。

结论 VFA、TFA、肝脏脂肪含量及胰腺脂肪含量是急性胰腺炎复发的影响因素, 其中胰腺脂肪含量是复发的独立危险因素, 并且胰腺脂肪含量联合临床及 CT 影像特征的综合模型可有效预测 AP 的复发, 能够为 RAP 的预防及临床诊治提供依据。

PO-2153

基于 MRI 影像特征和组学分析的联合模型预测子宫内膜样癌微卫星高度不稳定状态的初步研究

孙昕、赵嘉琪
辽宁省肿瘤医院

目的: 构建 MRI 影像和组学特征联合模型, 对术前预测 EEC 的微卫星高度不稳定 (MSI-H) 状态的应用价值进行评估。方法: 本研究回顾性收集本院 144 名病理证实的 EEC 患者资料。根据免疫组化结果将患者分为 MSI-H 组 ($n=48$) 和 non-MSI-H 组 ($n=96$)。收集临床特征及各个常规 MRI 诊断特

征（肌层浸润深度、肿瘤最大径线、宫颈受累及淋巴结情况）。基于临床常规 MRI 诊断特征提取 MSI-H 的临床危险因素，利用 logistic 回归分析构建常规 MRI 特征模型（M1）。利用 ITK-SNAP 软件分割 MRI 图像的 ROI，继而将标注图像导入 AK 软件设置三大类纹理参数进行组学特征提取。使用 IPMs 计算 ICC 来评价分割病灶的一致性，而后将患者按 7:3 随机分为训练组（n=100）和验证组（n=44），采用自变量与自变量的相关系数、梯度提升决策树分析、逐步逻辑回归进行影像组学特征的降维和筛选，构建影像组学模型（M2）。利用 logistic 回归分析结合影像组学特征和常规 MRI 特征建立联合模型（M3），并绘制出诺模图。绘制各个模型的校准曲线及决策曲线分析评估模型的分类效能及校准性能。结果：在训练组和验证组中，非 MSI-H 组与 MSI-H 组患者肌层浸润深度、宫颈间质情况存在的差异有统计学意义（ $p<0.05$ ）。校准曲线和决策曲线表明，三种模型中 M3 模型表现最佳且临床应用价值最高。M3 与 M1 的诊断效能存在差异（ $p<0.001$, $p=0.017$ ）。M2 与 M1 两个模型的诊断效能存在差异有统计学意义（ $p=0.033$ ），但在验证组中差异无统计学意义（ $p=0.600$ ）。M3 与 M2 的诊断效能存在差异有统计学意义（ $p=0.013$ ），但是在验证组中差异无统计学意义（ $p=0.421$ ）。在训练组和验证组内，相较 M1 和 M2，M3 均获得正向分类改善（ $NRI>0$, $IDI>0$, $p<0.05$ ）。结论：基于 MRI 图像的影像组学特征构建的影像组学模型可以很好地预测 EEC MSI-H 状态。常规 MRI 与影像组学联合模型可以有效提高预测 EEC MSI-H 的能力，为临床了解 MSI-H 状态提供重要价值。

PO-2154

全容积 ADC 直方图分析联合 ADC 值术前预测直肠癌肿瘤沉积的价值

冯飞文、胡粟、胡春洪
苏州大学附属第一医院

【摘要】

目的：探讨基于肿瘤全容积的 ADC 直方图参数联合 ADC 值在术前预测直肠癌肿瘤沉积（TDs）中的应用价值。

方法：回顾性分析苏州大学附属第一医院 2016 年 6 月至 2023 年 6 月术前行直肠 MRI 检查且经病理确诊的 111 例直肠癌患者的临床及影像学资料，根据病理结果将其分为 TDs 阳性组（ $n=30$ ）和 TDs 阴性组（ $n=81$ ），将扩散敏感系数（ b 值）=1000 s/mm² 的 DWI 生成的 ADC 序列图像导入 ITK-SNAP 软件中，手动勾画肿瘤全容积并生成 3D 感兴趣区，利用 Feature Explorer (FAE) 软件提取 ADC 直方图参数，包括第 10 百分位数（ADC10%）、第 90 百分位数（ADC90%）、最大值（ADCmax）、最小值（ADCmin）、均数（ADCmean）、中位数（ADCmedian）、峰度及偏度；同时测量肿瘤最大层面的 ADC 值。分析比较两组患者之间 ADC 值及 ADC 直方图参数的差异，将有统计学差异的参数纳入多因素 logistic 回归分析并构建联合模型，利用 ROC 曲线分析 ADC 值、全容积 ADC 直方图参数及两者的联合模型的预测效能。采用 DeLong 检验比较各 AUC 间的差异。

结果：ADC 值、ADC10%、ADC90%、ADCmax、ADCmean、ADCmedian 及峰度在 TDs 阳性组和阴性组间差异具有统计学意义（ $P<0.05$ ），以 ADC90% 的预测效能最高（AUC、灵敏度、特异度分别为 0.778、80.0%、65.4%）。由 ADC 值、ADC10%、ADC90%、ADCmax、ADCmean 构建的联合模型的 AUC、灵敏度、特异度、准确度分别为 0.940、86.7%、83.8%，其诊断效能优于 ADC 值（AUC 为 0.645）及各全容积 ADC 直方图参数（AUC 为 0.649-0.778），差异均有统计学意义（ $P<0.05$ ）。

结论：全容积 ADC 直方图参数及肿瘤最大层面的 ADC 值可用于术前预测直肠癌 TDs，基于两者的联合模型具有最高的预测效能。

PO-2155

肝硬化背景下肝内胆管细胞癌和肝细胞癌的影像诊断对照研究

何苹、闫建华
天津市第三中心医院

目的:对照分析肝硬化背景下肿块型肝内胆管细胞癌和肝细胞癌的多期动态增强 CT、MRI 表现,并探讨有助于诊断肿块型肝内胆管细胞癌的特征性表现,指导临床及术前诊断、分期。

方法:回顾性分析 2015 年 1 月—2022 年 7 月在天津市第三中心医院就诊并经手术或穿刺病理证实的肝硬化背景下 16 例肿块型肝内胆管细胞癌(男性 12 例,女性 4 例,年龄 31-69 岁,平均年龄 58.32 岁)和 22 例肝细胞癌(男性 16 例,女性 6 例,年龄 34-67 岁,平均年龄 51.30 岁)的多期动态增强 CT、MRI 表现及 MRI 多参数表现。

观察指标包括两组患者病灶的大小、形态、动态增强各期信号、强化方式及伴随征象,尤其特异性造影剂 Gd-EOB-DTPA 影像表现特点,同时分析患者的血清学指标及临床表现。连续性变量采用 t 检验,分类变量采用卡方检验或 Fisher 精确概率检验。 $P<0.05$ 为有统计学差异。

结果:统计学分析显示肿瘤的强化方式、MRI 延迟期信号($p=0.000$)以及伴随征象如肿瘤最大径($P=0.010$)、包膜凹陷($P=0.001$)、门静脉侵犯($P=0.002$)、肝内胆管扩张($P=0.007$)及腹腔淋巴结肿大($P=0.000$)等表现在肝硬化背景下肿块型肝内胆管细胞癌和肝细胞癌中均存在统计学差异。其中肿块型肝内胆管细胞癌最常见的强化方式是渐进性强化及环状强化,肝细胞癌最常见的强化方式是快进快出。另外,16 例肿块型肝内胆管细胞癌中只有 3 例(20.0%)表现为 MRI 延迟期低信号,而 22 例肝细胞癌中有 19 例(90.4%)表现为此信号($P=0.000$)。表观弥散系数 ADC 图肝内胆管细胞癌大多表现肿瘤周边环形低信号,肝细胞癌表现为团块样弥散受限。同时,肝硬化背景下肿块型肝内胆管细胞癌和肝细胞癌的肿瘤标志物 CA199、AFP 及 CEA 也具有统计学差异。

结论:肝硬化背景下出现多期动态增强 CT/MRI 渐进性强化或外周环状强化、MRI 延迟期相对等高信号伴随包膜凹陷、门静脉侵犯、肝内胆管扩张、腹腔淋巴结肿大、CA199 和/或 CEA 升高则有助于肿块型肝内胆管细胞癌的诊断,尤其环状的 DWI 弥散受限及特异性造影剂肝胆期相的晕征具有一定特异性。

PO-2156

基于双能 CT 的影像指标在急性阻塞性肠系膜缺血发生不可逆透壁性肠坏死评估中的价值

杨巨顺、何伯圣、陈飞翔、王美蓉
南通市第一人民医院

目的:探讨双能 CT (DECT) 第二代虚拟单能谱图像 (VMI+) 与碘密度图在预测急性阻塞性肠系膜缺血 (AOMI) 不可逆透壁性肠坏死 (ITIN) 中的价值。

方法:连续性收集 2012 年 01 月~2022 年 01 月在本医院就诊的 AOMI 患者。CT 包括常规 MDCT 和 DECT 扫描,DECT 扫描的双能量数据重建 120kVp 混和能量图像、50 keV VMI+和碘密度图。主观评估包括肠系膜血管、肠壁及肠外 CT 征象。客观评价包括在 50keV VMI+和碘图上测量病变肠壁 CT 值 ($CT_{50keV \text{ 病变}}$)、正常与病变肠壁 CT 值比值 ($CT_{50keV \text{ 正常/病变}}$),病变肠壁的碘浓度 (IC 病变) 和正常与病变肠壁 IC 比值 ($IC_{\text{正常/病变}}$)。

结果:(1) 纳入 AOMI 患者共 102 例,ITIN 共 48 例。(2) 在 47 例 DECT 组中,ITIN 组患者病变肠壁的 $CT_{50keV \text{ 病变}}$ 和 $IC_{\text{病变}}$ 值明显低于非 ITIN 组;ITIN 组 $CT_{50keV \text{ 正常/病变}}$ 与 $IC_{\text{正常/病变}}$ 高于非 ITIN 组。

(3) 102 例患者中,ITIN 组患者肠壁强化降低或缺失、肠腔扩张和实质脏器梗死的发生率明显高于非 ITIN 组。Logistic 回归发现肠壁强化降低或缺失 ($P=0.009$)、肠腔扩张 ($P<0.001$) 和实质性脏器梗死 ($P=0.007$) 是发生 ITIN 的独立危险因素;联合 CT 主观征象预测 ITIN 的 AUC 为

85.30%。(4) 在 DECT 扫描的 47 例患者中, 以 $CT_{50keV \text{ 正常/病变}}=2.81$ 为截值, 预测 ITIN 的 AUC 为 0.794; 以 $IC_{\text{正常/病变}}=2.39$ 为截值, 预测 ITIN 的 AUC 为 0.777; 主观征象联合预测 ITIN 的 AUC 为 0.801。Delong 检验 $CT_{50keV \text{ 正常/病变}}$ 、 $IC_{\text{正常/病变}}$ 和 CT 主观征象预测 ITIN 的 AUC 无差异 ($P=0.782\sim0.957$)。分别使用客观指标 $CT_{50keV \text{ 正常/病变}}$ 、 $IC_{\text{正常/病变}}$ 代替 CT 主观中的肠壁强化降低与缺失, 预测 ITIN 的 AUC 分别为 0.857 和 0.896。

结论: 门静脉期 $CT_{50keV \text{ 正常/病变}}$ 、 $IC_{\text{正常/病变}}$ 是预测 AOMI 发生 ITIN 有效的客观影像学指标, 其中 $IC_{\text{正常/病变}}$ 联合 CT 主观征象的预测效能最佳。

PO-2157

80kV 三低扫描技术在低 BMI 指数病人 CT 门静脉血管成像中的应用

吴志斌

空军军医大学西京医院

[摘要] 目的 探讨在低体重指数患者腹部 CT 门静脉血管成像中使用 80kV 低辐射剂量、低对比剂量以及低注射流速 (三低) 扫描技术的可行性。方法 选取来我院行门静脉 CT 血管成像 $BMI \leq 18.5 kg/m^2$ 患者 80 例随机分为两组, 每组 40 例, A 组采用 80kV, 300mAs 参考值, 造影剂量为 0.9ml/kg, 造影剂注射流率为 2.7ml/s; B 组采用 120kV, 300mAs 参考值, 造影剂量为 1.2ml/kg, 造影剂注射流率为 3.5ml/s。对比评价两组的图像质量、辐射剂量和最终诊断结果, 所得图像由两位放射科医师对两组图像质量进行 5 分评价对所得到的图像数据运用 SPSS17.0 软件进行统计学分析。结果 A 组的容积 CT 剂量指数 (CTDIvol)、剂量长度乘积、有效辐射剂量明显低于 B 组, 差异有统计学意义 ($P < 0.05$)。A、B 两组图像所测门静脉主干、门静脉分支、肝门层面腹主动脉强化值 $A < B$, 差异有统计学意义 ($P < 0.05$)。所用对比剂量 A 组小于 B 组, 差异有统计学意义 ($P < 0.05$)。A、B 两组各图像静脉主干、门静脉分支、肝门层面腹主动脉信噪比 SNR 及对比噪声比 CNR 无明显差异, 无统计学意义。A 组图像得分 (4.4 ± 0.5), B 组得分 (4.8 ± 0.38)。结论 门静脉 CT 血管成像扫描中使用低 kV 扫描可以在同时降低辐射剂量、对比剂剂量、降低注射对比剂的流速 (三低) 的情况下仍可获得符合临床诊断要求的优质图像, 减少对比剂量可降低患者对比剂肾病的发生几率, 降低注射流速可降低注射对比剂时皮下外渗的发生几率, 在老年患者、糖尿病患者及放化疗患者等体质差人群中可以推广应用。

PO-2158

能谱纯化技术与低浓度对比剂对门静脉血管成像质量的研究

姜文龙

空军军医大学西京医院

目的: 探讨能谱纯化技术联合低对比剂浓度对门静脉血管成像质量的影响。方法: 收集 2023 年 3 月至 2023 年 7 月来我院行门静脉血管 CTA 扫描的 100 例患者, 采用前瞻性随机对照研究, 随机分常规组 (A 组)、对照组 (B 组) 各 50 例, A 组采用 120Kv, 参考管电流 300mAs, 对比剂使用碘海醇 (350mg/ml), B 组采用能谱纯化技术 Sn100Kv, 参考管电流 300mAs, 对比剂使用碘克沙醇 (270mg/ml), 分别测量门静脉左右支 CT 值, 肝实质噪声 (SD 值), 门静脉对比噪声 (CNR 值) 以及 CT 剂量指数 (CTDIvol), 主观评价采用四分法。结果: A 组平均 CT 值 130.32 ± 23.73 , SD 值 16.92 ± 5.74 , CNR 值 17.63 ± 3.71 , 辐射剂量 $12.54 \pm 3.67 mGy$, 图像质量评分 2.72 ± 0.36 ; B 组平均 CT 值 189.36 ± 20.85 , SD 值 18.11 ± 3.54 , CNR 值 19.23 ± 4.54 , 辐射剂量 $7.82 \pm 3.85 mGy$, 图像质量评分 3.32 ± 0.61 。其中 AB 两组的 CT 值、辐射剂量及图像质量评分有显著差异 ($P < 0.05$), SD

值和 CNR 值未见明显差异 ($P>0.05$)。结论: 能谱纯化技术可提高患者检查的舒适性以及门静脉血管的成像质量并降低辐射剂量, 值得临床推广。

PO-2159

双能 CT 能谱技术对急性阻塞性肠系膜缺血 异常肠壁图像显示的优化

杨巨顺、何伯圣、陈飞翔、王美蓉
南通市第一人民医院

目的: 比较双能 CT (DECT) 第二代虚拟单能谱图像 (VMI+) 和常规 120kVp 图像显示急性阻塞性肠系膜缺血 (AOMI) 异常肠壁的图像质量, 旨在确定显示异常肠壁的最佳能级 (keV), 为准确评估 AOMI 是否发生肠坏死及其预后提供技术支撑。

方法: 连续性收集 2017 年 01 月~2022 年 01 月在本院就诊高度怀疑为 AOMI 的患者。将门静脉期 90kVp 和 Sn 150kVp 双能量原始数据重建常规 120kVp 混和能量图像和范围从 40~90keV (间隔为 10keV) 共 6 组 VMI+ 图像。对上述 7 组图像进行图像质量客观和主观评价。

结果: (1) 最终纳入患者共 43 例, 21 名男性和 22 名女性, 中位年龄 72 (64, 78) 岁。(2) 7 组图像中, 病变肠壁的 CT 值、正常肠壁的 CT 值及两者之间的差值均存在统计学差异 (P 值均 <0.001)。两两比较, 40keV、50keV、60keV 组正常和病变肠壁 CT 值均高于 120kVp 组 (P 值均 <0.05); 40keV、50keV、60keV 组正常与病变肠壁 CT 值的差值均高于 120kVp 组, 但只有 40keV、50keV 组与 120kVp 组存在统计学差异 (P 值均 <0.05)。CNR: 病变肠壁相对于正常肠壁的 CNR 存在差异 ($F=8.63$, $P<0.001$)。其中 40keV、50keV、60keV 组的 CNR 均高于 120kVp 组 (P 值均 <0.05)。7 组图像的噪声存在差异 ($F=76.18$, $P<0.001$)。其中 40keV、50keV、60keV 组噪声高于 120kVp 组 (P 值均 <0.05)。(3) 病变肠壁显著性评分: 7 组图像的病变肠壁显著性评分存在统计学差异 ($H=257.09$, $P<0.001$)。40keV、50 keV 组的病变肠壁显著性评分高于其它组 (P 值均 <0.05)。图像总体质量评分: 7 组图像的图像总体质量评分存在统计学差异 ($F=203.27$, $P<0.001$)。其中 50keV、60keV 组图像总体质量评分高于其他组 (P 值均 <0.05)。

结论: DECT 50keV 的 VMI+ 可以在不影响图像总体质量的同时, 显著增加 AOMI 病变段肠壁的 CNR, 更有利于病变段肠壁的检出。

PO-2160

钆塞酸二钠增强 MRI 诊断肝嗜酸性粒细胞浸润 1 例

张嘉诚
河南中医药大学第一附属医院

男, 47 岁, 主诉: 右上腹钝痛不适, 间断发热 1 周, 无胸闷、胸痛等症状。外院胸部 CT 未见明显异常, 上腹部 CT 提示肝内异常密度影。入院前 1 周每日出现午后低热, 最高 37.1°C 。入院后实验室检查: 白细胞计数 $10.5\times 10^9/\text{L}$, 中性粒细胞计数 $4\times 10^9/\text{L}$, 嗜酸性粒细胞计数 $1.72\times 10^9/\text{L}$, 嗜酸性粒细胞比 21.11%。血清肿瘤标记物检查: AFP 7 ng/ml, CA19-9 25 U/ml, CEA 2.3 ng/ml。肝脏钆塞酸二钠 (gadolinium ethoxybenzyl diethylenetriamine pentaacetic acid, Gd-EOB-DTPA) 增强 MRI 提示: 肝右叶前下段异常信号, 考虑为感染性病变。遂行超声引导下穿刺活检术, 术后病理提示嗜酸性粒细胞增多症。

PO-2161

肝假性淋巴瘤的典型及不典型 MRI 特征

赵小二

中国科学技术大学附属第一医院(安徽省立医院)南区

【摘要】目的 总结肝假性淋巴瘤(hepatic pseudolymphoma, HPL)的典型及不典型 MRI 特征,以提高其术前诊断水平。方法 回顾性分析经病理证实且接受 MRI 平扫、DWI 及动态增强扫描的 35 例 HPL 患者 50 个肝病灶的 MRI 数据,分析病灶的 MRI 特征。定量资料组间比较采用 Mann-Whitney U 检验,一致性比较采用 Kappa 检验。结果 27 例单发病灶,8 例多发病灶中 2 例合并肝外病灶。50 个肝病变中 45 个最大径 $\leq 20\text{mm}$,仅 5 个 $>20\text{mm}$,46 个呈类圆形,4 个不规则形,49 个呈均匀 T1WI 低信号、T2WI 高信号,仅 1 个长径 50mm 病灶中央伴囊变坏死。ADC 值可准确测量的 44 个病灶 ADC 值均低于邻近肝脏 ADC 值 $0.93(1.12, 1.51) \times 10^{-3}\text{mm}^2/\text{s}$,38 个病灶 ADC 值为 $0.55(0.46, 0.73) \times 10^{-3}\text{mm}^2/\text{s}$ 低于脾脏 ADC 值 $0.93(0.79, 1.09) \times 10^{-3}\text{mm}^2/\text{s}$,6 个病灶 ADC 值为 $1.3(1.07, 1.8) \times 10^{-3}\text{mm}^2/\text{s}$ 高于脾脏 ADC 值,组间 ADC 值差异有统计学意义(病灶与邻近肝比较,病灶与同层脾脏比较, R 均 <0.001)。36 个病灶出现 DWI“连续线状高信号征”即在 DWI($b=500\text{mm}^2/\text{s}$)图中表现为高信号肿块与邻近门脉间连续性线状高信号相连,36 个病灶出现增强“尖角征”即强化峰值期病灶边缘欠光整可见“尖角状”高信号向外延伸,且两种影像征象一致性极好(Kappa 值 $=0.802$)。增强方式多样,以模糊“廓清型”为主。6 个病灶增强无“环形征”,44 个病灶增强出现“环形征”,其中 2 个及以上多期相同时出现“环形征”占 75%(33/44),单期相出现“环形征”占 25%(11/44)。结论 HPL 典型表现为单发、呈类圆形均匀 T1WI 低信号、T2WI 高信号,ADC 值低于脾脏、特征性 DWI“连续线状高信号征”、增强“尖角征”及多期相同时出现“环形征”。不典型表现包括多发合并肝外病灶、不规则形可伴中央囊变坏死、ADC 值高于脾脏、DWI 及增强无特异性表现。

PO-2162

DWI 和半定量 DCE-MRI 预测醋酸甲羟孕酮治疗子宫内膜非典型增生和子宫内膜样腺癌疗效的价值

刘明明、梁宇霆、王新莲、王克扬、赵维敬

首都医科大学附属北京妇产医院/北京妇幼保健院放射科

目的 保留女性患者生育能力是临床决策中不可或缺的组成部分。关于子宫内膜癌和子宫内膜非典型增生保留生育能力治疗的有效性和风险,包括是否完全缓解的最佳检查方案尚不确定。建立预测保守治疗子宫内膜非典型增生和子宫内膜癌疗效的生物标志物非常必要。因此,本研究将探讨扩散加权成像和半定量动态磁共振增强成像预测醋酸甲羟孕酮治疗子宫内膜非典型增生和子宫内膜样腺癌疗效的可行性。

方法 回顾性分析北京妇产医院 12 例子宫内膜癌和子宫内膜非典型增生患者临床病理资料,醋酸甲羟孕酮治疗后第 3 个月和第 6 个月每次随访的治疗效果均进行病理评价和 MRI 检查,且治疗后第 6 个月随访时的完全缓解。采用重复测量方差分析法比较治疗前、治疗后 3 个月、治疗后 6 个月病变及相应部位内膜 ADC 值和 ME 值的差异是否有统计学意义。TIC 曲线的差异是否有统计学意义采用 Fisher 确切概率法。

结果 子宫内膜癌治疗前、治疗后第 3 个月和第 6 个月 ADC 值差异有统计学意义,呈递增趋势($P<0.05$),而 ME 值差异无统计学意义($P>0.05$)。子宫内膜癌治疗前后 TIC 曲线类型差异有统计学意义($P<0.05$)。子宫内膜非典型增生治疗前、治疗后第 3 个月和第 6 个月 ADC 值、ME 值和 TIC 曲线类型差异均无统计学意义($P>0.05$)。

结论 ADC 值和 TIC 曲线类型可以作为预测醋酸甲羟孕酮治疗子宫内膜癌完全缓解的成像标记。ADC 值和 TIC 曲线类型可以作为预测醋酸甲羟孕酮治疗子宫内膜癌完全缓解的成像标记, 而 ME 值不可以。与子宫内膜癌患者相比, 虽然子宫内膜非典型增生患者在治疗后第 6 个月较治疗后第 3 个月 ADC 值升高, 有一些预测疗效价值, 但整体而言, ADC 值、TIC 曲线类型和 ME 值尚不能反应醋酸甲羟孕酮治疗的疗效。

PO-2163

基于靶向整合素 $\alpha v\beta 3$ 的新型 MR 超微纳米探针用于肝纤维化诊断的可行性研究

张新、石喻
中国医科大学附属盛京医院

目的: 靶向整合素 $\alpha v\beta 3$ 分子显像可无创评价其表达和功能状态, 为肝纤维化程度及预后提供重要信息。本研究旨在合成新型超微纳米探针超微超顺磁性氧化铁-聚乳酸-精氨酸-甘氨酸-天冬氨酸 (USPIO-PLA-RGD), 通过磁共振显像评估其在肝纤维化领域的可行性。

方法: 首先构建出新型超微纳米探针 USPIO-PLA-RGD, 进行探针表型验证、稳定型及细胞学靶向性验证; 应用 20%四氯化碳-橄榄油溶液腹腔注射方法构建肝纤维化 SD 大鼠模型, 分别于 2-4-6-8 周 (n=6/时点), 行 7.0T 小动物 MRI 显像对比大鼠 USPIO-PLA-RGD 尾静脉注射前, 注射后 6 小时肝脏 T2 Mapping 变化, 以 T2 Mapping 变化率 ΔT 作为定量参数; 大鼠显像后安乐死取肝组织, 评估肝内整合素 $\alpha v\beta 3$ 的表达及肝纤维化程度。对照组大鼠 (n=6) 亦同模型组大鼠进行注射探针前后显像。建模 4 周大鼠选取 3 只进行额外一次 RGD 标记前的非靶向探针显像, 在上述第一次显像后即刻完成, 6 小时后再注射靶向探针 USPIO-PLA-RGD 显像。

结果: 新型 USPIO-PLA-RGD 探针粒径 18-20nm, 分散度良好, 细胞学实验显示普鲁士蓝染色可见活化的肝脏星状细胞内摄取明显高于非标记 RGD 的 MRI 分子探针; 大鼠尾静脉注射后无明显急性毒性副反应; 模型大鼠肝纤维化 S1-S4 分期不等; 模型组 T2 Mapping 信号高于对照组; 模型组 T2 Mapping 变化率 ΔT 3.14%-24.72%不等; ΔT 与肝内整合素 $\alpha v\beta 3$ 的表达量及肝纤维化分级呈正相关 (相关系数 r 分别为 0.79、0.67)。对照组大鼠 USPIO-PLA-RGD 注射前后, 肝脏 T2 Mapping 无明显变化。建模 4 周大鼠 RGD 标记前的非靶向探针显像肝脏 T2 Mapping 信号与注射前相比无变化, USPIO-PLA-RGD 注射后肝脏 T2 Mapping 信号出现减低。

结论: 新型超微纳米探针 USPIO-PLA-RGD 对整合素 $\alpha v\beta 3$ 的靶向性良好, 在体评估整合素 $\alpha v\beta 3$ 表达水平及功能、辅助诊断肝纤维化方面安全、有效。

基于多参数 MRI 和 68Ga-PSMA 0PET/CT 的前列腺腺癌的对比较研究

赵妮妮¹、杨勇¹、全志永²、汪静²

1. 陕西中医药大学附属西安医院 (西安市中医医院) 影像科

2. 空军军医大学附属西京医院核医学科

目的: 比较多参数磁共振成像 (multiparameter magnetic resonance imaging, mpMRI) 和 68Ga-前列腺特异性膜抗原正电子发射断层扫描/计算机断层扫描 (68Ga-prostate specific membrane antigen positron emission tomography/computed tomography, 68Ga-PSMA PET/CT) 对前列腺腺癌 (prostate adenocarcinoma, PA) 的诊断情况。方法: 临床疑似 PA 的患者术前行前列腺 mpMRI 扫描, 包括 T2 加权成像 (T2 weighted imaging, T2WI) 和弥散加权成像 (diffusion weighted

imaging, DWI), 间隔两周内行 ^{68}Ga -PSMA PET/CT 扫描, 影像学检查后两周内行手术或全前列腺穿刺活检术。将手术结果与两种成像结果相对照, 评估不同方法诊断 PA 的效能, 并将 PA 分为匹配组 (两种成像异常表现区相吻合且组织学为腺癌)、不匹配 1 组 (mpMRI 上呈癌灶特征, 而 ^{68}Ga -PSMA PET/CT 上无阳性且组织学为腺癌)、不匹配 2 组 (^{68}Ga -PSMA PET/CT 上呈癌灶特征, 而 mpMRI 上无阳性且组织学为腺癌)、不匹配 3 组 (两种成像显示癌灶范围不同且组织学为腺癌)。结果: 符合纳排标准的 32 例疑似 PA 患者被纳入, 其中 26 例病理确诊为 PA。mpMRI 和 ^{68}Ga -PSMA PET/CT 诊断 PA 的灵敏度、特异度、阳性预测值、准确度分别为 88.5%、66.7%、92.0%、84.4%和 82.8%、83.3%、96.0%、90.6。26 例 PA 患者中, 匹配组 17 例 (65.38%), 不匹配 1 组 2 例 (7.69%), 不匹配 2 组 3 例 (11.54%), 不匹配 3 组 4 例 (15.38%)。结论: mpMRI 和 ^{68}Ga -PSMA PET/CT 均可用于 PA 的诊断, ^{68}Ga -PSMA PET/CT 诊断效能更佳; PA 在 mpMRI 和 ^{68}Ga -PSMA PET/CT 上存在不匹配现象, 两者结合可提高诊断效能。

PO-2165

应用光谱多参数 CT 鉴别门静脉血栓与癌栓的诊断研究

王芝浩¹、周宇涵¹、曹伟萌¹、雷丽敏¹、刘杰¹、陈伟华¹、董书彬²

1. 郑州大学第一附属医院

2. 飞利浦医疗

目的: 本研究旨在探讨应用光谱 CT 多参数 (Spectral based image) 增强 CT 成像在门静脉系统中血栓与癌栓的鉴别诊断价值, 以提高两者临床鉴别诊断效能。

方法: 本研究回顾性纳入 2023 年 2 月-2023 年 4 月行光谱 CT 腹部扫描患者, 结合临床资料, 确诊门静脉血栓癌栓患者各 50 例。在栓塞位置绘制兴趣区 (Region of interest, ROI), 分别得到常规 CT 混合能量图像 (Conventional image, CI)、碘密度图 (Iodine density, ID)、有效原子序数图 (Effective atomic number, Z-eff) 及光谱曲线 (Spectral curve), 并测量 ROI 区域常规混合能量图像 CT 值 (CIHU)、碘密度值 (ID)、有效原子序数 (Z-eff) 及光谱曲线斜率 (Slope of the spectral curve, λHU)。参数间差异采用独立样本 t 检验。采用单因素 Logistic 回归评估门静脉血栓与癌栓预测概率, 并建立光谱多参数联合模型 (Iodine Density & Effective Atomic Number, ID-Z-eff)。绘制受试者工作特征曲线 (Receiver operating characteristic, ROC), 并计算 AUC (Area under curve) 及截断值 (Cutoff value)。

结果: 与 CT 值 (AUC 为 0.72, 截断值 134, 灵敏度 60%, 特异度 72%)、ID 值 (AUC 为 0.78, 截断值 2.14, 灵敏度 67%, 特异度 73%)、Z-eff 值 (AUC 为 0.825, 截断值 8.96, 灵敏度 80%, 特异度 82%)、 λHU 值 (AUC 为 0.82, 截断值 1.22, 灵敏度 82%, 特异度 85%) 相比, 光谱联合模型 (AUC 为 0.92, 灵敏度 85%, 特异度 92%) 对门静脉血栓与癌栓的鉴别效能最高。

结论: 光谱多参数联合模型较常规 CT 值及各光谱参数在鉴别门静脉血栓或癌栓方面具有更高的鉴别诊断价值, 或可为门静脉系统血栓, 癌栓患者的临床早期诊断、治疗策略制定及预后预测提供更多影像学支持。

PO-2166

肿瘤标志物联合双层探测器 CT 定量参数预测结直肠癌患者脉管神经浸润

杨慧义^{1,2}、孙家瑜²

1. 川北医学院附属医院

2. 四川大学华西医院放射科

目的：探讨肿瘤标志物和双层探测器 CT 定量参数相结合在评估结直肠癌患者脉管浸润（LVI）和神经浸润（PNI）状态中的价值。

方法：前瞻性纳入 2022 年 6 月至 2023 年 7 月于本院接受双层探测器 CT 扫描且经术后病理证实为结直肠癌的 49 例患者。并根据病理结果将患者分为 LVI（+）组（n=14）和 LVI（-）组（n=35），PNI（+）组（n=20）和 PNI（-）组（n=29）。分析结直肠癌患者动脉期和静脉期的光谱参数，包括常规 CT 图像、40KeV 虚拟单能级图像（VMI）和虚拟平扫（VNC）图像上的 CT 值，碘密度值（IC），标准碘密度值（NIC），有效原子序数值（Eff-Z）和能谱曲线斜率（λHU）。采用独立样本 t 检验、Mann - Whitney U 检验或卡方检验比较不同组之间的差异，采用二元 logistic 回归分析构建联合参数模型。采用受试者工作特征曲线（ROC）评价血清标志物和光谱 CT 参数对结直肠脉管、神经浸润的单独及联合诊断效能。

结果：LVI 阳性组与阴性组 T 分期、N 分期差异有统计学意义（ $P<0.05$ ），PNI 阳性组和阴性组组织分化等级、肿瘤大体形态差异有统计学意义（ $P<0.05$ ）。LVI 阳性组与阴性组动脉期和静脉期 IC、NIC、Eff-Z、CT 40kev-VMI 和 λHU 差异均有统计学意义，PNI 阳性组和阴性组动脉期 IC、Eff-Z、λHU 和静脉期 IC、NIC、Eff-Z、CT 40kev-VMI、λHU 差异均有统计学意义。ROC 曲线分析显示肿瘤标志物结合光谱参数诊断效能优于单个参数的诊断效能。动脉期 Eff-Z 结合肿瘤标志物评估脉管侵犯的诊断效能最佳，其 AUC、灵敏度、特异度分别为 0.796（95%CI: 0.666-0.926）、64.3%、85.7%。静脉期 Eff-Z 结合肿瘤标志物评估神经侵犯的诊断效能最佳，其 AUC、灵敏度、特异度分别为 0.769（95%CI: 0.635-0.903）、85%、62.1%。

结论：双能 CT 成像参数对于术前评估患者脉管神经浸润状态具有较好的诊断价值，为术前预测 LVI 和 PNI 提供了无创、有效的方法。

PO-2167

基于动态增强 CT 术前预测结直肠癌肿瘤间质比状态的研究

叶蕴锐

广东省人民医院

目的：肿瘤间质比为肿瘤微环境重要形态学参数，是多种实体肿瘤的独立预后因素。本研究分析了结直肠癌（colorectal cancer, CRC）患者术前增强计算机断层成像（computed tomography, CT）影像学特征与肿瘤间质比（tumor stroma ratio, TSR）及预后的关系。

方法：回顾性收集 2010 年 1 月-2017 年 12 月病理组织检查确诊为结直肠癌患者的术前增强 CT 图像及临床病理学信息。评估的增强 CT 影像学特征包括肿瘤位置、肿瘤内低密度占比、强化程度、强化形式和肠壁增厚形式。通过 HE 染色评估肿瘤组织中间质成分所占比例。采用 Kaplan-Meier 方法进行生存分析。采用 kappa 一致性检验评价影像学特征评估结果的一致性。

结果：本研究共纳入 554 例 CRC 患者，29.5%（163 例）为 TSR-High，70.5%（391 例）为 TSR-Low。研究发现，肿瘤强化程度和强化形式与肿瘤间质比状态密切相关，差异具有统计学意义（ $P<0.05$ ）。肿瘤间质含量占比较高组肿瘤强化程度多低于肠壁，且为不均匀强化。另外，肠壁增厚

形式也与肿瘤间质密切相关, 偏心性增厚及环形增厚患者肿瘤间质含量占比高, 预后差 ($P < 0.05$)。

结论: 强化程度、强化形式和肠壁增厚与结直肠癌患者肿瘤间质比状态相关。基于 CT 常见影像学征象, 实现结直肠癌患者 TSR 状态的术前无创预测, 进一步改善结直肠癌患者的预后分层。

PO-2168

能谱 CT 多参数术前鉴别 HER2-0, HER2 低阳性及阳性胃癌的价值

胡文君、陈安良、刘爱连
大连医科大学附属第一医院

目的: 探讨能谱 CT 多参数成像在术前评估胃癌 HER2 状态的价值。

方法: 回顾性分析本院行能谱 CT 增强扫描、经病理证实的 96 例胃癌患者资料, 根据免疫组化(IHC) 结果, 分为 HER2-0 组 (IHC 0, 55 例)、HER2 低阳性组 (IHC 1+或 2+, 35 例)、HER2 阳性组 (IHC 3+, 6 例)。两位观察者分别测量能谱 CT 上动脉期、静脉期及延迟期 40、70 keV 单能量图像中病灶的 CT 值 (CT40 keV 值、CT70 keV 值)、碘浓度 (IC)、归一化碘浓度 (NIC), 并计算 40~70 keV 的能谱曲线斜率 K (40-70)。采用单因素 ANOVA 检验比较各组之间参数差异, 两两比较采用 LSD。采用受试者操作特征 (ROC) 曲线评估各参数区分不同 HER2 状态的效能。

结果 HER2 阳性组患者静脉期 NIC 较 HER2-0 和 HER2 低阳性组高, HER2 低阳性组上述参数较 HER2-0 组高, 差异有统计学意义 ($P < 0.05$)。受试者工作特征曲线 (ROC) 分析, 静脉期 NIC 鉴别 HER2 阳性组与 HER2-0、HER2 低阳性组的曲线下面积 (AUC) 分别为 0.783、0.732。

结论 能谱 CT 静脉期 NIC 有潜力成为术前预测胃癌 HER-2 状态的影像标志物。

PO-2169

瘤周侧支血管对肾透明细胞癌 WHO/ISUP 分级预测研究

成文欣、牛玉军
锦州医科大学附属第一医院

摘要: 目的: 探讨瘤周侧支血管对肾透明细胞癌 (CcRCC) 的 WHO/国际泌尿病理学会 (ISUP) 分级的评估价值。方法: 收集锦州医科大学附属第一医院经病理、检查证实的 ccRCC 患者共 207 例进行回顾性分析和筛查, 通过排除标准, 组中选取 207 例患者作为研究对象, 依据 WHO/ISUP 分级标准分为低级别组 ($n=167$) 和高级别组 ($n=40$), 肾透明细胞癌患者对计算机断层扫描 (CT) 图像进行成像分析, 以评估瘤周侧支血管的存在, 并了解与 WHO/ISUP 分级的潜在联系。通过 t 检验、Mann-Whitney U 检验、 χ^2 检验、多因素 logistic 回归分析筛选组间差异有统计学意义的因素, 绘制 ROC 曲线评价模型预测效能 结果: 多因素 Logistic 回归分析结果显示, 年龄、肿瘤最大直径及有无侧支循环对于鉴别 ccRCC 高、低级别组患者差异具有统计学意义 ($P < 0.05$), 有侧支循环能更好的预测高级别 ccRCC; 单因素 (有无侧支循环) 模型预测高级别的 AUC 值是 0.671 (95%CI 0.668-0.854 $p < 0.05$)。结论: 在肿瘤周围有侧支血管的患者中, 能更好的预测高级别 ccRCC; 在男性患者中, 肿瘤周围侧支血管与高 WHO/ISUP 分级的肾细胞癌之间存在一种新的相关性, 肾周脂肪组织中瘤周侧支血管的存在可预示更具侵袭性的肾细胞癌。

PO-2170

结合 CT 影像组学和基于深度学习的病理学特征预测 II 期结直肠癌患者预后

戎泽宁¹、赵可²、崔艳芬³、童彤¹

1. 复旦大学附属肿瘤医院

2. 广东省人民医院

3. 山西省肿瘤医院

目的: 本研究旨在探索 CT 影像组学特征和基于深度学习评估的病理学特征在 II 期结直肠癌患者预后评估中的价值及其关联。

方法: 共在两个中心回顾性纳入了 479 名经病理确诊为 II 期结直肠癌的患者, 其中, 山西省肿瘤医院的患者被划分为训练集 (n=182) 和测试集 (n=78), 来自复旦大学附属肿瘤医院的患者被作为外部验证集 (n=189)。使用 PyRadiomics 在患者的增强 CT 图像上提取了共 1218 个影像组学特征。对于患者的 HE 数字病理图像, 使用 U-Net 模型对各类组织区域进行分割, 使用 Hover-Net 模型对各类细胞核进行识别与分割, 并进一步定义如间质内淋巴细胞密度, 中性粒细胞/淋巴细胞比例等共 31 个病理学指标。使用 Cox 回归建立预测患者 OS 的模型。使用一致性指数 C-index 和曲线下面积 AUC 评估模型, 根据模型对患者的分组进行 Kaplan-Meier 生存分析, 并计算影像组学模型确定的高危与低危组间病理特征的差异。

结果: 由 8 个影像组学特征组成的预测 II 期结直肠癌患者 OS 的影像组学模型在两个中心中均取得效果 (测试集: C-index=0.655, AUC=0.663; 外部验证集: C-index=0.628, AUC=0.592)。在验证集中, 发现影像组学评分和肿瘤区域内淋巴细胞与中性粒细胞比例等多个病理学特征相关 (p=0.001)。并进一步构建了由 8 个影像组学特征、1 个病理学特征和 1 个临床特征组成的临床-影像-病理模型, 在两个中心中取得了良好效果 (测试集: C-index=0.748, AUC=0.762; 外部验证集: C-index=0.682, AUC=0.689)。根据确定的最佳截止值, 将患者分为高危组和低危组, Kaplan-Meier 生存分析显示两组间存在显著差异 (影像组学模型: 测试集: p=0.016; 外部验证集: p=0.005; 临床-影像-病理模型: 测试集: p=0.002; 外部验证集: p<0.001)。

结论: 基于 CT 的影像组学模型和临床-影像-病理模型可有效预测 II 期结直肠癌患者的预后, 影像组学评分与患者病理学特征相关。

PO-2171

基于 CT 图像的老年糖尿病伴肌少症患者的胰腺影像组学研究

于浩鹏¹、程悦^{1,2}、曾妮^{1,3}、黄子星¹

1. 四川大学华西医院

2. 重庆大学附属肿瘤医院

3. 成都市龙泉驿区第一人民医院

目的:

探究伴有肌少症与不伴肌少症的老年糖尿病患者的胰腺实质是否存在基于 CT 图像的影像组学特征差异, 并构建影像组学诊断模型。

材料和方法:

本研究回顾性地连续纳入从 2016 年 1 月至 2017 年 12 月于我院有腹部 CT 检查图像的年龄≥60 岁的糖尿病患者。根据腰 3 椎体 (L3) 层面骨骼肌指数 (skeletal muscle index, SMI) 性别分界点将患者分为肌少症组和非肌少症组。利用 ITK 软件在平扫 CT 影像上勾画胰腺三维感兴趣区 (three-dimensional region of interest, 3D ROI), 并使用 PyRadiomics 工具包提取影像组学特征。对提取的影像组学特征进行筛选, 基于筛选出的组学特征分别采用逻辑回归 (logistic regression, LR)、高斯朴素贝叶斯 (gauss naive bayes, NBG)、随机梯度下降 (random gradient descent,

SGD)、多层感知机 (multilayer perceptron, MLP) 以及线性判别分析 (linear discriminant analysis, LDA) 算法构建影像组学诊断模型, 采用五折交叉验证法进行模型的训练和验证, 采用受试者工作特征 (receiver operating characteristic, ROC) 曲线、决策分析曲线 (decision curve analysis, DCA) 分别评估模型效能和临床价值。

结果:

研究最终纳入患者 211 例, 其中肌少症组 160 例、非肌少症组 51 例。筛选得出两组患者胰腺平扫 CT 图像存在差异的影像组学特征有 8 个。分别采用 LDA、LR、MLP、NBG 和 SGD 算法建立的模型, 训练集 AUC 值分别为 0.836、0.837、0.828、0.820 和 0.834, 验证集 AUC 分别为 0.778、0.748、0.776、0.782 和 0.763, DCA 表明所有模型均有临床价值。

结论:

伴肌少症与不伴肌少症的老年糖尿病患者的胰腺的 CT 影像组学特征存在差异, 并且基于这些组学特征构建的诊断模型具有良好效能。

PO-2172

基于人工智能技术的胰腺平扫 CT 图像诊断糖尿病的研究

于浩鹏¹、曾妮^{1,3}、程悦^{1,2}、黄子星¹

1. 四川大学华西医院

2. 重庆大学附属肿瘤医院

3. 成都市龙泉驿区第一人民医院

目的:

本研究采用影像组学及深度学习的方法探索正常人与 2 型糖尿病患者的胰腺结构的微观差异, 以期进一步促进糖尿病的风险预测、早期诊断、疗效评估以及随访监测的研究。

材料和方法:

回顾性分析 2017 年 12 月至 2020 年 12 月在我院放射科行腹部 CT 的患者, 分别纳入了 2 型糖尿病 (Type 2 Diabetes mellitus, T2DM) 及对照组患者, 按照 8:2 的比例随机分配到训练集和验证集中。使用 ITK-Snap 手动分割胰腺, 采用 PyRadiomics (V3.0) 工具包对分割图像进行影像组学特征提取, 通过逻辑回归筛选特征并建立影像组学模型, 并通过提出了一种基于 MobileNetV2 架构的深度学习模型; 最后建立融合影像组学特征和深度学习的融合模型, 通过模型来判断区分糖尿病患者和正常对照组。通过受试者工作特性曲线(receiver operating characteristic, ROC)分析对模型性能进行评估。

结果:

最终纳入 T2DM 患者 396 例, 对照组 396 例。T2DM 组和对照组之间甘油三酯和胆固醇水平有显著差异。将 T2DM 组和对照组患者随机分为训练集和验证集, 训练集有 316 例 T2DM 和 316 例正常对照, 验证集有 80 例 T2DM 和 80 例正常对照。从胰腺分割图像中提取 602 个影像组学特征参数, 经回归降维处理筛选出的 27 个组学特征。在基于影像组学的 T2DM 诊断模型中, 表现出比较好的性能, 在训练集和测试集的曲线下面积 (areas under curve, AUC) 分别达到 0.769 (95% 置信区间, 0.734-0.802) 和 0.713 (95% 置信区间, 0.636-0.783)。但是深度学习模型在训练、验证集中, AUC 分别为 0.931(95% 置信区间, 0.908-0.950), 0.579(95% 置信区间, 0.497-0.657), 融合模型在训练集及验证集中 AUC 分别为 0.895(95% 置信区间, 0.868-0.918), 0.687(95% 置信区间, 0.636-0.783)。

结论:

基于腹部 CT 平扫图像影像组学的模型表现出良好的性能, 对于诊断糖尿病较好的能力。

PO-2173

基于双能 CT 单能量图的 Delta 纹理特征术前 预测胃癌淋巴结转移的价值

胡文君、陈安良、刘爱连
大连医科大学附属第一医院

目的：探讨基于双能 CT 单能量图的 Delta 纹理特征术前预测胃癌淋巴结转移的可行性。

方法：回顾性分析本院经病理证实的 48 例胃癌患者资料，分为淋巴结转移组（33 例）及非淋巴结转移组（17 例）。所有患者行双能 CT 能谱增强检查，使用 ADW 4.6 工作站的 GSI Viewer 软件重建静脉期 40、70keV 单能量图，选取病灶最大层面及其相邻上下两个层面沿病灶边缘勾画 ROI 并提取特征，提取的纹理参数包括最小值、最大值、平均值、中位值、标准差、偏度、峰度、均匀性、能量值、熵，计算每个纹理特征在高低能级的变化，即 Delta 特征值，公式为：Delta 特征值 = 40keV 纹理特征值 - 70keV 纹理特征值。比较两组间各 Delta 纹理特征的差异。并采用 Logistic 回归将有差异纹理特征进行联合，通过 ROC 曲线分析不同纹理特征及特征联合预测的效能。

结果：淋巴结转移组的峰度 [3.81(2.75, 3.29) vs. 2.56(2.74, 3.46)] 和熵 (7.14±0.41 vs. 7.54±0.44) 明显高于非淋巴结转移组 (P<0.05)，峰度、熵及两特征联合预测胃癌 MSI 的效能分别为 0.751，0.732 和 0.813。

结论：基于双能 CT 单能量图的 Delta 纹理特征能有效术前预测胃癌淋巴结转移，有助于为指导临床治疗方案的选择提供更多信息。

PO-2174

多层螺旋 CT 血管造影检查在胡桃夹综合征的应用

程天明、高丽、葛英辉
河南省人民医院

【摘要】目的 通过螺旋 CT 三维重建处理技术，提高对“胡桃夹症”的诊断水平。

材料与方法 本组患者 19 例，男 18 例，女 7 例，年龄 13~40 岁，平均 22.5 岁。临床表现反复腰痛伴血尿、蛋白尿，其中男性患者精索静脉曲张 7 例，女性月经量较多 3 例。采用 GE Lightspeed Plus 4 排 CT 进行 HQ 扫描，层厚 2.5mm，重建间隔 1.25mm，并在 ADW4.0 工作站进行二维多平面重建（MPR）、曲面重建（CPR）和最大密度投影（MIP）。分别测量肠系膜上动脉与腹主动脉（AA）间的夹角（A）、左肾静脉（LRV）在 AA 前方的内径值（D1）、面积（S1）和 LRV 在 SMA 左侧的内径值（D2）、面积（S2）以及之比（D2/D1、S2/S1）。

结果 分别测量胡桃夹综合征患者测量 A、D1、D2、D2/D1、S1、S2 和 S2/S1 为 22.5±5.3°、3.1±0.2mm、13.8±0.6mm、4.5±0.6、34.6±3.2mm²、141.8±15.4mm² 和 4.1±0.7，而正常对照组为 66.3±15.2°、7.1±2.5 mm、10.5±2.2 mm、1.6±0.6、95.5±35.5 mm²、129.9±30.1 mm² 和 1.5±0.6，两者差异具有统计学意义（P<0.05）。

结论 1、多层螺旋 CT 三维重建可以直观的显示“胡桃夹症”的 LRV 的受压情况，并能准确地测量 AA 与 SMA 间的夹角、左肾静脉（LRV）在 SMA 左侧的内径值（A）和 LRV 在 AA 前方的内径值（B）之比（A/B），有利于临床治疗前后的评价。2、可以直观的显示增粗 LRV 及其侧枝循环血管（如睾丸静脉等）。3、可以测量两侧肾脏皮质的厚度及强化程度，为临床评价两侧肾脏功能提供依据。4、利用多层螺旋 CT 的容积扫描数据，可以对肾脏及其周围组织进行观察。5、直观的显示腹主动脉及双侧肾动脉情况。

PO-2175

医学影像在评估肾细胞癌肾外脂肪浸润中的价值

马俊朝、袁恩雨、陈云天、宋彬、姚晋
四川大学华西医院

肾癌是全球第十四大常见的癌症，其中肾细胞癌占 90%。随着医学成像技术的广泛应用，越来越多的局部肾癌被检测出。手术一直是治疗局部肾癌的最佳方案，其中部分肾切除术能更好地保留肾脏功能、降低代谢和心血管疾病发展的风险。但是，根据指南该术式不适用于伴有局部浸润的肾癌患者。在不同类型的局部浸润中，对肾外脂肪浸润的评估-肾周脂肪浸润和肾窦脂肪浸润，是放射科医生最具有挑战性的任务。既往的研究提出了许多影像征象来解决这个难题，然而它们各有优缺点。因此，本研究总结了影像学评估肾细胞癌肾外脂肪浸润的最新进展和未来方向，以帮助临床决策和患者风险分层。目前对肾周脂肪浸润的评估征象主要包括（1）肾周软组织线-相对较高的敏感性，但由于潜在的病理机制多样，特异性低（2）肾周强化结节-高度特异性（92%-100%），有研究推测其病理机制为肾周脂肪内的“卫星灶”，但由于低度敏感性（31%-50%），临床应用受限（3）不规则的肿瘤边缘-相对较高的特异性（83%-94%），但敏感性较低，同时对客观定义“不规则”具有挑战（4）假包膜-磁共振 T2 加权图像上出现的肿瘤边缘低信号带，目前的研究报道较少，现存研究提示改征象对排除肾周脂肪浸润准确性较高（95%）（5）肿瘤大小-具有高度一致性的特点，但临界值变化较大，诊断效能尚不明确。目前对肾窦脂肪浸润的评估征象主要包括（1）肾盂肾盏系统受侵-肿瘤同肾盂肾盏系统的空间关系对评估肾癌浸润肾窦脂肪具有重要的意义，其中“侵犯模式”显示出较高的预测效能（准确性达 94%）（2）指状凸起征-肿瘤突入肾窦脂肪部分局部形成手指状凸起，一个最近报道的新征象，来源于一个类似的病理学术语，显示出较高的特异性（85-89%）（3）不规则的肿瘤边缘和肿瘤大小-同样也是评估肾窦脂肪受侵的重要征象，其中不规则的肿瘤边缘敏感性达 71-88%，特异性达 62-79%。未来的研究可能会集中在三个方向上改善影像学在术前评估肾癌肾外脂肪浸润的表现：（1）研究稳健的特征、制定更客观的定义、运用多变量预测模型（2）改进成像协议、运用新技术（光谱 CT 等）（3）定量图像分析(影像组学、深度学习等)。

PO-2176

探究个体化低剂量 CT 成像参数对 QCT 肝脏脂肪含量测量的影响

王诗瑜、刘义军、魏巍、李贝贝、王旭、童小雨
大连医科大学附属第一医院

目的: 基于管电压预置技术 (Auto-prescription) 探究个体化低剂量 CT 成像参数对 QCT 肝脏脂肪含量测量及图像质量的影响。方法: 收集胸及上腹部 CT 联扫的患者 231 例，胸部采用个体化低剂量扫描 (A 组)，基于 Auto-prescription 技术选择的 80kVp、100kVp，记为 A1、A2 组。上腹部为常规扫描 (B 组)，管电压 120kVp，与 A 组患者对应分为 B1、B2 组。A 组图像分别结合 40%、60%、80% 后置 ASIR-V 重建，B 组采用常规 40% 后置 ASIR-V 重建。对胸腹部扫描重叠部分肝脏进行分析，测量肝脏 CT 值、SD 值，计算肝脏 SNR、CNR。图像传至 QCT 工作站，获得肝脏脂肪含量值 (Fat%_{QCT})。A 组组内不同权重 ASIR-V 测得的 Fat%_{QCT} 值采用单因素方差分析，A、B 组间图像客观值采用配对样本 t 检验，对肝脏 Fat%_{QCT} 进行 Spearman 相关分析，并基于常规 120kVp 构建线性回归方程。由两位观察者对低剂量胸部图像进行五分法评价，并行 Kappa 一致性检验。结果: 随着 ASIR-V 权重的增加，A 组 SD 值降低 (P<0.05)，SNR、CNR 逐渐升高 (P<0.05)；A 组结合不同权重 ASIR-V 测得的 Fat%_{QCT} 值差异无统计学意义，A、B 组 Fat%_{QCT} 值呈高度正相关 (r=0.9397, 0.9872, P<0.05)，80kVp、100kVp 扫描条件下的线性回归方程分别为: y=0.976x+3.119, y=1.007x+2.041。2 名观察者对 A、B 两组图像质量评分一致性较好 (Kappa=0.781~0.914, P<0.05)，A 组中结合后置 60% ASIR-V 与 B 组常规管电压结合后置

40% ASIR-V 的主观评分差异无统计学意义 ($P>0.05$)。结论: 基于 Auto-prescription 技术可实现个体化胸部低剂量成像, ASIR-V 的使用不会影响肝脏 Fat%QCT 定量, 初步构建了低管电压 (80kVp/100kVp) 下肝脏脂肪含量量化的回归方程。

PO-2177

探究 CT 成像参数对 QCT 肝脏脂肪含量测量的影响

王诗瑜、刘义军、魏巍、李贝贝、王旭、童小雨
大连医科大学附属第一医院

目的: 基于管电压预置技术 (Auto-prescription) 探究个体化低剂量 CT 成像参数对 QCT 肝脏脂肪含量测量及图像质量的影响。方法: 收集胸及上腹部 CT 联扫的患者 231 例, 胸部采用个体化低剂量扫描 (A 组), 基于 Auto-prescription 技术选择的 80kVp、100kVp, 记为 A1、A2 组。上腹部为常规扫描 (B 组), 管电压 120kVp, 与 A 组患者对应分为 B1、B2 组。A 组图像分别结合 40%、60%、80% 后置 ASIR-V 重建, B 组采用常规 40% 后置 ASIR-V 重建。对胸腹部扫描重叠部分肝脏进行分析, 测量肝脏 CT 值、SD 值, 计算肝脏 SNR、CNR。图像传至 QCT 工作站, 获得肝脏脂肪含量值 (Fat%_{QCT})。A 组组内不同权重 ASIR-V 测得的 Fat%_{QCT} 值采用单因素方差分析, A、B 组间图像客观值采用配对样本 t 检验, 对肝脏 Fat%_{QCT} 进行 Spearman 相关分析, 并基于常规 120kVp 构建线性回归方程。由两位观察者对低剂量胸部图像进行五分法评价, 并行 Kappa 一致性检验。结果: 随着 ASIR-V 权重的增加, A 组 SD 值降低 ($P<0.05$), SNR、CNR 逐渐升高 ($P<0.05$); A 组结合不同权重 ASIR-V 测得的 Fat%_{QCT} 值差异无统计学意义, A、B 组 Fat%_{QCT} 值呈高度正相关 ($r=0.9397, 0.9872, P<0.05$), 80kVp、100kVp 扫描条件下的线性回归方程分别为: $y=0.976x+3.119$, $y=1.007x+2.041$ 。2 名观察者对 A、B 两组图像质量评分一致性较好 (Kappa=0.781~0.914, $P<0.05$), A 组中结合后置 60% ASIR-V 与 B 组常规管电压结合后置 40% ASIR-V 的主观评分差异无统计学意义 ($P>0.05$)。结论: 基于 Auto-prescription 技术可实现个体化胸部低剂量成像, ASIR-V 的使用不会影响肝脏 Fat%_{QCT} 定量, 初步构建了低管电压 (80kVp/100kVp) 下肝脏脂肪含量量化的回归方程。

PO-2178

基于不同区域的 ¹⁸F-PSMA-1007 PET 影像组学特征预测前列腺癌患者根治术后 PSA 持续状态

李丽聪、边淑盈、姚飞、杨运俊
温州医科大学附属第一医院

目的: PSA 是常规检测前列腺癌的敏感指标, 在患者进行根治性前列腺切除术后需常规随访。目前大多数前列腺癌影像组学研究聚焦于肿瘤病灶本身, 而未探讨其周围区域的预测效能。因此, 本研究旨在比较从前列腺内三个不同区域提取的 ¹⁸F-PSMA-1007 PET 影像组学特征对前列腺癌患者根治术后 PSA 持续状态的预测效能。

方法: 回顾性研究 2019.3 至 2022.12 本院 325 例病理证实的前列腺癌患者。所有患者均接受了标准化术前 ¹⁸F-PSMA-1007 PET/CT 检查和根治性前列腺切除术, 收集患者的一般信息、PSA 随访情况以及影像学资料。将 325 例患者分为训练组和测试组, 由 2 位经验丰富的核医学科医师在 ¹⁸F-PSMA-1007 PET 上用 LIFEX 软件半自动勾画整个前列腺作为初始感兴趣区域, 将前列腺分为 3 个放射组区, 并分别提取 3 个感兴趣区域的 PET 影像组学特征。进行一致性检验, 选取 ICC>0.75 的特征进行 lasso 和 logistic 回归分析建立 7 个影像组学特征模型 (模型 1 为第 1 区域, 模型 2 为第

2 区域, 模型 3 为第 3 区域, 模型 4 为第 1、2 区域, 模型 5 为第 1、3 区域, 模型 6 为第 2、3 区域, 模型 7 为第 1、2、3 区域), 计算不同模型的 **ROC** 和 **AUC**, 比较各个模型之间的预测性能。PSA 持续状态定义为前列腺癌患者进行根治性切除术后 4-8 周内 PSA \geq 0.1ng/ml。

结果: 基于 lasso 和 logistic 回归分析建立 7 个 PET 影像组学模型, 最好的三个分别为模型 5、模型 4、模型 1。3 个模型在训练组中的 AUC 分别为 0.78 (95% CI:0.70-0.85)、0.76 (95% CI:0.68-0.83) 和 0.76 (95% CI:0.68-0.83), 在测试组中的 AUC 分别为 0.76 (95% CI:0.61-0.90)、0.76 (95% CI:0.65-0.88) 和 0.70 (95% CI:0.55-0.86)。影像组学模型 5 实现了最佳性能。

结论: 前列腺模型 5、模型 4、模型 1 的影像组学特征可有效预测前列腺癌患者根治术后 PSA 持续状态, 模型 5 实现了最佳的预测效能, 可为患者预后提供更好的个体化随访工具。

PO-2179

基于 MRI 测量脾体积预测肝细胞癌伴肝硬化患者行根治性手术切除后晚期复发风险

杨崇图、陈钊地、蒋涵羽、宋彬
四川大学华西医院

目的: 肝细胞癌 (hepatocellular carcinoma, HCC) 行手术切除后发生晚期复发主要与肝病严重程度相关。本研究旨在探索 HCC 伴肝硬化患者行手术切除后发生晚期复发的危险因素。

方法: 回顾性分析 301 例行手术切除并有术前 MRI 检查的 HCC 伴肝硬化患者, 所有患者完成两年以上随访并记录是否发生晚期复发。使用基于 MRI 的人工智能技术全自动测量脾体积, 并由三名放射科医师独立评估反映肿瘤侵袭性的 MRI 定性影像特征。使用单因素和多因素 Cox 回归分析探索晚期复发的独立预测因素并构建评分系统, 并基于区分度和校准度进行预测效能评估。

结果: 随访期间共 84 例患者发生晚期复发。术前脾体积是晚期复发的独立预测因素, 且脾体积 >370 cm³ 的患者发生晚期复发的风险显著升高 (风险比: 2.02, 95%置信区间: 1.31-3.12, $p=0.002$)。脾体积与反映肝纤维化严重程度的实验室及病理指标呈中度-弱关联 ($r<0.6$)。此外, 反映肿瘤侵袭性的 MRI 定性征象均与晚期复发无显著相关性。基于 APRI 评分、脾体积和肿瘤数目构建了一项风险评分, 其受试者曲线下面积为 0.700 至 0.751。使用 0.42 作为该评分的截断值, 可有效区分两组晚期复发风险显著不同的患者 (高风险组风险比: 2.38, 95%置信区间: 1.73-3.26, $p<0.001$)。

结论: 基于 MRI 及人工智能技术全自动测量的术前脾体积与 HCC 伴肝硬化患者术后晚期复发风险相关。本研究构建了一项评分系统用于预测晚期复发风险, 有助于辅助指导术后监测计划制定。

PO-2180

肝脏弥漫结节型血管肉瘤 1 例误诊分析并文献复习

王松、袁怀平
安徽省公共卫生临床中心

病例 男, 64 岁, 因间断性腹痛腹胀 1 月余入院。患者 1 月前无明显诱因出现下出现腹痛腹胀, 既往有肝硬化病史。入院查体: 上腹部轻压痛, 未触及肿块。实验室检查: 肿瘤指标 CA125 424.10U/mL, AFP(-); 肝功能指标总蛋白 52.7(g/L), 白球比 1.15, 总胆红素 298.21(umol/L), 直接胆红素 274.18(umol/L), 间接胆红素 24.03(umol/L), 总胆汁酸 99.1(umol/L), 碱性磷酸酶 293(U/L), 谷氨酰转肽酶 318(U/L), 谷丙转氨酶 140(U/L), 谷草转氨酶 161(U/L)。超声检查: 肝脏弥漫性病变, 肝硬化。CT 平扫+增强检查: 平扫示肝脏形态欠规则, 密度欠均匀。增强后肝内见多发斑片状、结节状异常强化灶, 增强早期病灶即可见明显强化, 门脉期及延迟期病灶强化程度仍旧明显高于周围肝实质。影像初步考虑原发性弥漫型肝癌 (图 1-4)。超声引导下穿刺: 用 17G 同轴活检针进入肝脏包块内, 沿同轴定位针送入 18G 活检针切取 1.3cm 长组织条 1 条, 2.3cm 长组织条 1 条。病理: 镜下肿瘤细胞明显异型性, 核分裂象多见。免疫组化: CD34 (+)、CD31 (+)、Fli-1 (+)、ERG (+)、CK (-)、S-100 (-)、SMA (部分+)、Ki67 (+, 约 50%)。病理诊断: 肝脏血管肉瘤。

PO-2181

术前肝细胞癌微血管侵犯预测: 细胞外对比剂增强磁共振与肝胆特异性对比剂增强磁共振效能相当

盛流吉、蒋涵羽、魏鸿、宋彬
四川大学华西医院

目的: 本研究旨在评估和比较肝胆特异性对比剂增强 MRI (EOB-MRI) 和细胞外对比剂增强 MRI (ECA-MRI) 在肝细胞癌 (HCC) 中预测微血管侵犯 (MVI) 的效能。

方法: 自 2009 年 11 月至 2021 年 12 月, 回顾性纳入我院术前行增强 MRI 且经术后病理确诊为 HCC 的患者。按照检查方式, 将患者分别纳入 ECA-MRI 组 (N=415) 或 EOB-MRI 组 (N=121)。使用 1:1 倾向性分数匹配将 ECA-MRI 组与 EOB-MRI 组进行匹配, ECA-MRI 组匹配出的患者构成 ECA-MRI 测试集 (N=121), 余下患者构成 ECA-MRI 训练集 (N=294)。在 ECA-MRI 训练集中, 通过单因素和多因素逻辑回归构建 ECA-MRI MVI 诊断评分。而 EOB-MRI MVI 诊断评分参照本课题组前期研究成果[1], 其纳入的 HCC 患者与本研究具有相同的纳排标准。在 ECA-MRI 测试集和 EOB-MRI 组中分别评估和比较两种不同 MVI 诊断评分效能。采用 Kaplan-Meier 曲线评估两种 MVI 诊断评分预测早期复发的效能。

结果: 基于 ECA-MRI 训练集, 构建的 ECA-MRI MVI 诊断评分包括甲胎蛋白>400 ng/ml (比值比 [OR] = 2.3)、浸润样外观 (OR = 4.9)、瘤内动脉 (OR = 2.5) 以及结中结征 (OR = 2.4) 四个变量。ECA-MRI MVI 诊断评分的 AUC 为 0.720, EOB-MRI MVI 诊断评分的 AUC = 0.721, 两者之间不具有统计学差异性 (P = 0.99)。ECA-MRI MVI 灵敏度和特异度分别是 54.7% 和 89.1%; EOB-MRI MVI 灵敏度和特异度分别是 52.8% 和 75.0%; 两者灵敏度和特异度之间均没有统计学差异性 (P = 0.84; P = 0.06)。在 ECA-MRI 和 EOB-MRI 组中, 两种 MVI 诊断评分预测 MVI 阳性患者的早期复发时间均显著短于 MVI 预测阴性患者 (P < 0.001)。

结论: 基于术前甲胎蛋白和 MRI 影像特征 (浸润样外观、瘤内动脉、结中结征), ECA-MRI 在预测 HCC MVI 方面与 EOB-MRI 具有相似的预测效能。

PO-2182

胰腺脂肪含量与糖尿病的相关性研究

杨行、黄子星、廖凯、李真林
四川大学华西医院

基于中国西南区域自然人群队列四川简阳和郫都区受试者 2022 年的调查数据, 所有受试者均行上腹部定量 CT(quantitative computed tomography, QCT)扫描, 采用 QCT Pro 软件测量 QCT 参数: 胰腺头、体、尾部脂肪含量、腹部总脂肪面积 (Total fat area, TFA)、腹内脂肪面积 (Visceral fat area, VFA)、皮下脂肪面积 (Subcutaneous fat area, SFA)、总肌肉面积 (Total muscle area, TMA)。采集受试者的空腹静脉血: 糖化血红蛋白、空腹血糖。采用单因素方差分析比较三组一般资料、QCT 参数、血生化指标之间的差异, 采用 logistic 回归分析胰腺脂肪含量、腹部脂肪、肌肉脂肪与糖尿病前期和糖尿病的关系。

结果: 本研究共纳入 370 名受试者, 根据糖代谢状况分为糖代谢正常组、糖尿病前期组和糖尿病组。与正常组相比, 糖尿病组胰腺头、体、尾部脂肪含量、VFA、TFA、SMA、HbA1c、GLU 均显著增高 ($P<0.05$)。多因素分析发现, 胰尾脂肪每上升 1%, 糖尿病前期患病风险增加 $OR=1.10$ (95%CI: 1.01~1.21)。胰头、胰体和胰尾脂肪每上升 1%, 糖尿病患病风险分别增加 $OR=1.10$ (95%CI: 1.03~1.18)、1.11 (95%CI: 1.04~1.18)、和 1.08 (95%CI: 1.02~1.16), $P<0.05$ 。糖尿病组 SFA、VFA、TFA、TMA、分别增加 22.62(95%CI: 6.40~38.84)、35.06(95%CI: 15.87~54.25)、57.75(95%CI: 27.29~88.20)、13.76(95%CI: 0.74~26.78), $P<0.05$ 。

结论: 胰腺脂肪含量增加和腹部脂肪代谢异常与糖尿病的发生具有相关性。

PO-2183

生活方式与胰腺脂肪含量的相关性研究

杨行、黄子星、李真林、廖凯
四川大学华西医院

目的: 探讨人群生活方式与胰腺脂肪含量的相关性。

方法: 本研究基于中国西南区域自然人群队列四川简阳和郫都区受试者 2022 年的调查数据, 所有受试者均行上腹部定量 CT(quantitative computed tomography, QCT)扫描, 采用 QCT Pro 软件测量胰腺头、体、尾部脂肪含量, 采集受试者的空腹静脉血: 糖化血红蛋白、空腹血糖。填写调查问卷: 婚姻状况、受教育程度、收入水平、吸烟状况、饮酒状况。采用单因素方差分析比较三组一般资料、胰腺脂肪、血生化指标和既往生活习惯之间的差异。采用 logistic 回归分析既往/现在饮酒、吸烟与胰腺脂肪增多的相关性。 $P<0.05$ 有统计学意义。

结果: 本研究共纳入 370 名受试者, 多因素分析发现, 是否吸烟与胰腺脂肪无关; 相较于不饮酒者, 既往/现在饮酒者胰头脂肪含量减少 1.34% (95%CI: -2.34%~-0.33%), 胰尾脂肪含量减少 1.19% (95%CI: -2.24%~-0.13%)。

结论: 饮酒会导致胰头及胰尾脂肪含量减少。吸烟不是胰腺脂肪含量的影响因素。

PO-2184

VI-RADS：膀胱癌双参数 MRI 的准确性及 DCE 的必要性探讨

孟晓岩、何康文、李世超、胡道予、李震
华中科技大学同济医学院附属同济医院

目的：探讨 T2WI 和 DWI 评分与 VI-RADS 不一致病例的影像学特点及动态对比增强（DCE）的必要性，以及基于双参数 MRI（bpMRI, T2WI+DWI）的 VI-RADS 评分对膀胱癌肌层浸润评估的准确性。

材料与方法：回顾性收集本院 2018 年 5 月至 2021 年 5 月期间经手术病理证实为膀胱癌患者的磁共振影像及临床资料。纳入 106 例膀胱癌患者的 mpMRI 影像资料，每个序列分别进行独立的 VI-RADS 评分，当 T2WI 评分 4 且 DWI 评分 2 时，与评分系统相矛盾，定义为“不一致”组，其余符合 VI-RADS 评分系统的病例，定义为“一致”组。利用 ROC 曲线、德隆检验等方法比较不同 MRI 序列及不同序列组合（bpMRI 及 mpMRI）对膀胱癌肌层浸润评估的诊断效能。

结果：共 14 例（13.2%）患者纳入“不一致”组，影像特征为：T2WI 肌层低信号连续性中断（T2WI 评分 4 分），DWI 序列肿瘤呈高信号，内部见低信号“蒂”或基底部见低信号内层增厚（DWI 评分 2 分），DCE 序列预测膀胱癌肌层浸润的 AUC 为 0.875。在“一致”组和总体 106 例患者中，bpMRI VI-RADS 的诊断效能与 mpMRI 相近，差异无统计学意义（ $P=0.57$ 、 0.64 ）。

结论：VI-RADS 评分在预测膀胱癌肌层浸润方面具有较高的诊断准确性，bpMRI 与 mpMRI 对肌层浸润的诊断效能是相似的；但在评分“不一致”组病例中，DCE 对肌层浸润的评估至关重要。

PO-2185

双平面小视野 DWI (rFOV DWI) 在膀胱癌肌层侵袭性评估中的应用

孟晓岩、何康文、李世超、冯翠、李震
华中科技大学同济医学院附属同济医院

目的：比较小视野(rFOV)扩散加权成像(DWI)与全视野(fFOV)扩散加权成像(DWI)在膀胱癌诊断中的成像质量；探讨双平面(轴状和矢状)rFOV DWI 在预测膀胱癌肌层侵袭方面的价值。

材料和方法：本回顾性研究分析了 61 例接受 DWI 序列检查的膀胱癌患者，包括轴位 fFOV DWI、轴位 rFOV DWI 和矢状 rFOV DWI。对轴位 fFOV DWI 序列和 rFOV DWI 序列进行定性和定量的图像质量评价。将 DWI 上基底部能清晰显示的肿瘤定义为可评估病变，记录单轴位 fFOV DWI、轴位 rFOV DWI、矢状位 rFOV DWI 和双平面 rFOV DWI 序列中可评估病变的数量并进行比较。基于轴位 fFOV DWI 和 rFOV DWI 序列，比较非肌层浸润性膀胱癌(NMIBC)和肌层浸润性膀胱癌(MIBC)的表观弥散系数(ADC)，采用 VI-RADS 评估膀胱癌肌层浸润的总体风险，采用受试者工作特征(ROC)分析评估诊断性能。

结果：rFOV DWI 的对比信噪比(CNR)显著高于 fFOV DWI ($p<0.01$)，信噪比(SNR)显著低于 fFOV DWI ($p<0.01$)。rFOV DWI 主观评分显著高于 fFOV DWI ($p<0.01$)。在 rFOV DWI 和 fFOV DWI 上，MIBC 组的 ADC 值均显著低于 NMIBC 组($p<0.01$)。双平面 rFOV DWI 检测到的可评估病变数量显著高于单轴、轴向 rFOV DWI 和矢状面 rFOV DWI ($p < 0.01$)。基于双平面 rFOV DWI 的 VI-RADS 对膀胱癌是否存在肌层浸润有较高的预测能力(ROC 曲线下面积 0.946)。

结论：与单平面 DWI 相比，双平面 rFOV DWI 在预测膀胱癌存在肌层浸润方面可能提供更高的诊断可信度，并且图像质量优于 fFOV DWI。

PO-2186

DWI 及 MRI 影像征象预测肝细胞肝癌 CK19 的表达

任雪¹、赵莹¹、许岂豪¹、宋清伟¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦医疗

【目的】探讨弥散加权成像(DWI)及 MRI 影像征象对肝细胞肝癌(HCC)细胞角蛋白 19 (CK19) 表达的预测价值。

【方法】回顾性分析 54 例经病理证实的 HCC 患者, 根据免疫组化结果将患者分为 CK19 阳性组 17 例及 CK19 阴性组 33 例, 所有患者均于术前行 3.0T MRI 扫描。采用双盲法对常规 MRI 影像学征象进行分析, 包括肿瘤坏死、肿瘤出血、脉管癌栓、神经侵犯、被膜累及、淋巴结转移和卫星灶。将扫描生成的 DWI 图像传输至 GE AW 4.6 工作站上, 使用 Functool 软件自动生成 DWI 序列的参数图, 放射科医师采用双盲法在于病变的最大层面放置三个感兴趣区 (ROI), 记录 ADC 值取均值, 避开囊变、坏死、出血区。分类变量记录为病例数与百分比, 采用 χ^2 或 Fisher 精确检验比较 CK19 阳性组与阴性组之间的差异; 连续变量采用 t 检验或 U 检验比较 CK19 阳性组与阴性组之间的差异, 采用受试者工作特征 (ROC) 曲线评价 DWI 的阈值及诊断效能。

【结果】CK19 阳性组的 ADC 值为 $(1.887 \pm 0.523) \times 10^{-3} \text{mm}^2/\text{s}$, 显著高于 CK19 阴性组 $(1.287 \pm 0.247) \times 10^{-3} \text{mm}^2/\text{s}$ ($P < 0.001$), 其鉴别两组的 AUC 值达 0.857 (阈值: 0.002), 敏感度为 75.9%, 特异度为 88.7%。相较于 CK19 阴性组, 被膜累及在 CK19 阳性组更为常见 ($P = 0.001$), 其他影像学征象在两组间无显著统计学差异。

【结论】DWI 的 ADC 值结合常规 MRI 影像征象对预测肝细胞肝癌 CK19 的表达有一定价值。

PO-2187

Gd-BOPTA 增强 MR 对肝转移瘤的检出价值

任雪¹、赵莹¹、许岂豪¹、宋清伟¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦医疗

【目的】探讨 Gd-BOPTA 增强 MR 对肝转移瘤的检出价值

【方法】回顾性分析于我院行 3.0T MRI 扫描的肝转移瘤患者 21 例, 所有患者均于术前行 3.0T MRI 扫描, 包括常规磁共振扫描序列及 APT 扫描序列, 静脉团注对比剂钆贝葡胺 (Gd-BOPTA) 后 60 分钟后行肝胆期成像扫描。将 MR 扫描生成的原始数据传输到 ISP 工作站(Intellispace Portal v10, Philips Healthcare)进行后处理。分别对动脉期、门脉期、平衡期、肝胆期图像进行分析, 在病灶最大层面放置三个感兴趣区 (ROI), 记录信号强度 (SI), 记为 SI 病灶, 在同层面肝左叶、肝右前叶和肝右后叶的正常肝实质各放置一个 ROI, 记为 SI 肝实质, 避开血管和其他异常肝组织。在病灶同层面右侧竖脊肌放置一个 ROI, 记录 SI 和标准差 (SD), 记为 SI 肌肉与 SD 肌肉。通过下述公式计算信噪比 (SNR), 对比噪声比 (CNR), 病灶-肝脏信号强度比 (LLR): 计算公式如下: $\text{SNR 病灶} = \text{SI 病灶} / \text{SD 肌肉}$, $\text{CNR 病灶} = (\text{SI 病灶} - \text{SI 肌肉}) / \text{SD 肌肉}$, $\text{LLR} = (\text{SI 肝实质} - \text{SI 病灶}) / \text{SI 肝实质}$ 。采用 Mann-Whitney U 检验比较增强扫描不同期相的 SNR、CNR 和 LLR 的差异, 组内两两比较采用 Friedman 检验。

【结果】平衡期的 SNR 为 41.25(20.63, 54.94), 显著高于肝胆期 24.00(8.15, 38.46); 肝胆期的 LLR 为 0.63(0.47, 0.87), 显著高于增强动脉期 (0.40(0.28, 0.59))、静脉期 (0.34(0.22, 0.57)) 与平衡期 (0.35(0.14, 0.76))。

【结论】Gd-BOPTA 增强肝胆期 MR 显像可在一定程度上提高肝转移瘤的检出率。

PO-2188

200 例减重与代谢手术病人上消化道碘水造影应用体会

阮吉陆

曲靖市第二人民医院

目的 探讨减重与代谢手术病人术前、术后行上消化道碘水造影常规开展的必要性。**方法** 回顾性分析 2018 年 1 月到 2022 年 12 月曲靖市第二人民医院 200 例行减重与代谢手术病人的临床资料，了解术前胃腔形态，排空情况，食管下段及胃有无返流；术后胃腔外形，有无返流及吻合口情况。**结果** 术后行上消化道碘水造影，患者均出现胃腔明显缩小，对比剂快速通过残胃腔到达十二指肠，胃腔充盈良好，壁光滑；术后 3 天 5 例出现腹痛，行上消化道碘水造影显示吻合口瘘，对比剂游离于胃腔之外；术前上消化道碘水造影 4 例显示胃、食管返流；2 例显示胃排空缓慢；2 例诊断为食管裂孔疝；同时参考内镜检查结果，10 例显示胃、食管返流，慢性胃炎 6 例，2 例显示胃、食管返流；**结论** 对于减重与代谢手术病人，术前术后行常规上消化道碘水造影阳性率不高，但可以了解胃的外形及有无梗阻，检查方便易行，可重复使用，推荐应用。

PO-2189

基于术前增强 CT 的影像组学预测胰腺癌间质亚型

曹卜月、居胜红

东南大学附属中大医院

背景：胰腺癌是恶性程度最高的肿瘤之一，五年生存率仅 11%。研究发现胰腺癌具有三种特征性的肿瘤间质亚型，即荒漠型、中间型和反应型，其与患者治疗反应及预后密切相关。因此亟需探究无创方法反映肿瘤间质亚型，指导临床决策。

目的：基于术前增强 CT 胰腺癌影像组学特征无创评估胰腺癌肿瘤间质亚型，并探究组学模型对新辅助化疗患者客观缓解率的预测价值。

方法：本研究回顾性收集 3 个中心行根治性切除，1 个中心行根治性切除且术前行新辅助化疗的胰腺癌患者。所有患者均收集临床资料、术前增强 CT 图像、术后数字化病理切片和随访数据。两名病理专家基于 HE 病理切片确定胰腺癌的三种间质亚型。两名放射科医生使用 ITK-SNAP 软件手动勾画肿瘤病灶，然后利用 Pyradiomics 对动脉期、静脉期病灶 ROI 进行影像组学特征提取，然后通过 FAE 软件进行建模预测间质分型并比较新辅助化疗患者不同间质亚型的客观缓解率。

结果：本研究共纳入 4 个中心 503 个病人（中位年龄，61 岁；四分位间距，52–68 岁；211 女），我们将研究对象按照中心分成三个数据集：中心 1+中心 2：298 个患者作为训练集，中心 3：121 个患者作为外部验证组，中心 4：84 个新辅助治疗患者。通过训练集数据集构建胰腺癌间质分型的预测模型。影像组学模型在评估肿瘤间质亚型时获得了较高的诊断准确性，在内部验证和外部验证队列中，AUC 分别为 0.782 和 0.775。在根治性切除队列中，反应型间质患者可能预示着较差的生存预后（ $P<0.01$ ），荒漠型、中间型和反应型中位生存期分别为 26.2M、18.0M 及 17.1M。在新辅助化疗队列中，荒漠型间质患者客观缓解率低于反应型间质患者（20.00% vs 42.86%， $P<0.05$ ）。

讨论：本研究探究了胰腺癌影像组学特征预测胰腺癌间质分型的价值，为胰腺癌患者的个体化治疗和预后评估提供了新的方法和依据。

PO-2190

胰腺切除术后临床相关胰瘘的术前预测模型及风险分层

马倩、陈海燕
浙江省肿瘤医院放射科

目的：术后临床相关胰瘘（clinically relevant postoperative pancreatic fistula, CR-POPF）是胰腺切除手术后常见的严重并发症，本研究旨在从术前计算机断层扫描（computed tomography, CT）特征和临床指标中确定与胰瘘风险增加相关的术前特征，并建立风险评分系统。

方法：回顾性纳入了 178 例 2015 年-2022 年期间在浙江省肿瘤医院接受胰腺切除术的患者，其中胰瘘组与对照组各 89 例，收集术前 CT 图像特征和临床信息，包括主胰管直径、胰腺厚度和病变最大直径等。建立了放射学模型、临床模型和联合模型。使用 ROC 曲线来评估模型的预测性能，并根据危险预测因子建立风险评分系统。

结果：联合模型多因素 logistic 回归分析显示，整体胰腺质地 < 2.5 、残留区胰腺最厚厚度 $\geq 22.85\text{mm}$ 、切缘主胰管直径 $< 2.85\text{mm}$ 、病灶最大径 $< 22.05\text{mm}$ 、 $\text{BMI} \geq 21.3$ 、 $\text{CA19-9} < 213.01\text{U/ml}$ 与 CR-POPF 独立相关。联合模型、放射学模型和临床模型的 ROC 曲线下面积分别为 $0.877(95\%CI: 0.824, 0.930)$ 、 $0.837(95\%CI: 0.776, 0.897)$ 和 $0.764(95\%CI: 0.693, 0.835)$ 。并基于联合模型确定了四个风险组：可忽略风险组、低风险组 ($< 10\%$)、中风险组 ($10\%-60\%$) 和高危组 ($\geq 60\%$)。

结论：术前放射学特征及临床指标有助于预测 CR-POPF 的发生，联合模型的预测效果优于放射学模型与临床模型。基于联合模型的四个术前风险分组将有助于临床医生进行个性化治疗。

PO-2191

基于 CT 全肿瘤直方图分析的肾细胞癌
淋巴结转移非侵入性预测研究

张帆、胡学梅
华中科技大学同济医学院附属同济医院

目的：本研究旨在探索应用 CT 全肿瘤直方图分析预测肾细胞癌（RCC）淋巴结转移（LNM）的可能性。

方法：我们回顾性分析了 88 例接受根治性或部分肾切除的 RCC 患者，其中 20 例为 LNM 阳性，68 例为 LNM 阴性。收集了各种患者信息和肿瘤特征，包括：基本信息、血液参数、肾功能指标、尿液检测结果和肿瘤影像特征。我们对 CT 图像进行了直方图分析，并对结果进行了逻辑回归分析，以确定 LNM 的独立预测因子。

结果：在乳酸脱氢酶、红细胞计数、尿蛋白水平、肿瘤形状、假包膜的存在、侵及肾门和淋巴结图像异常等参数上，两组间存在显著差异。直方图分析显示，LNM 患者的均值、中位数、25%分位数、75%分位数和 95%分位数显著低于非 LNM 患者。尿潜血、淋巴结图像异常和 95%分位数被确定为 LNM 的独立预测因子。结合这些变量的模型显示出最高的预测准确性，曲线下面积（AUC）为 0.85。

结论：全肿瘤直方图分析作为一种非侵入性方法，提供了一种定量的方法，以提高诊断的精准性，有可能提高 RCC 患者 LNM 预测的准确性。通过确定关键预测因子，我们可以改善和指导治疗策略。然而，需要进行进一步的研究和验证，以确定这种方法的临床应用价值。

PO-2192

普美显增强 MRI 鉴别肝硬化背景下混合型肝细胞癌-胆管癌与肝细胞癌的诊断价值

何苹、闫建华
天津市第三中心医院

目的：探讨普美显-钆塞酸二钠(Gd-EOB-DTPA)增强 MRI 对混合型肝细胞癌-胆管癌(cHCC-CCA)与肝细胞癌(HCC)的鉴别诊断价值。

方法：回顾性纳入 2018 年 2 月至 2023 年 6 月天津市第三中心医院经病理证实的 32 例 cHCC-CCA 和 82 例 HCC 患者。所有患者均行 MRI 平扫、扩散加权成像(DWI)及 Gd-EOB-DTPA 增强检查,比较两组患者的临床资料和 MRI 征象。使用 logistic 回归分析筛选出鉴别 cHCC-CCA 与 HCC 的独立预测指标,采用受试者工作特征(ROC)曲线分析各独立因素及其联合模型预测 cHCC-CCA 的诊断效能。

结果 单因素 logistic 回归分析结果显示,糖类抗原 19-9(CA19-9)升高(19/32)、动脉期环形强化(22/32)、门脉期周边廓清(16/32)、延迟性中央强化(23/32)、马赛克征(20/32)及 DWI/肝胆期(HBP)靶征(17/32)提示为 cHCC-CCA;而肿瘤出血(32/82)、“快进快出”(63/82)提示为 HCC($P<0.05$)。多因素 logistic 回归分析显示,CA19-9 升高、动脉期环形强化及 DWI/HBP 靶征是鉴别 cHCC-CCA 与 HCC 的独立预测指标($P<0.05$)。CA19-9 升高、动脉期环形强化、DWI/HBP 靶征独立及三者联合模型诊断 cHCC-CCA 的曲线下面积(AUC)分别为 0.702、0.671、0.748 及 0.870,联合模型可提高诊断效能($P<0.05$)。结论 Gd-EOB-DTPA 增强 MRI 对 cHCC-CCA 与 HCC 的鉴别诊断具有重要价值,CA19-9 升高、动脉期环形强化及 DWI/HBP 靶征是 cHCC-CCA 的独立预测指标,结合 3 个独立指标的联合模型可提高诊断效能。

PO-2193

基于增强 CT 图像建立影像组学模型精准预测非功能性胰腺神经内分泌肿瘤的生长抑素受体 2 (SSTR2) 表达情况——一项初步研究

陈颖俐¹、顾文超²、陈洁¹、汤伟¹
1. 复旦大学附属肿瘤医院
2. 筑波大学医学院放射介入科

目的：探讨基于增强 CT 图像的影像组学模型预测散发型无功能性胰腺神经内分泌肿瘤 (Nonfunctional pancreatic neuroendocrine tumors, NF-panNETs) 的生长抑素受体 2 (Somatostatin receptors 2, SSTR2) 表达强度的价值。

方法：回顾性分析 2012 年 1 月至 2022 年 12 月复旦大学附属肿瘤医院术后病理证实、具有术前增强 CT 图像的 NF-panNETs 患者 90 例。SSTR2 免疫组化分析采用 HER2 评分法,定义 - 及 + 为阴性,++ 及 +++ 为阳性 (阴性组 $n=51$, 阳性组 $n=34$)。采用简单随机法,按照 6: 4 的比例将患者分为训练组 ($n=54$) 和测试组 ($n=36$)。全手动勾画病灶体积,采用 Pyradiomics 方法 (Python, version 3.6.0) 提取影像组学特征,并基于组内相关系数 (intraclass correlation coefficient, ICC)、Spearman 回归分析、t 检验以及 LASSO 回归分析选取特征,然后采用 GBM 机器学习算法建立影像组学模型。最终,影像组学模型的预测效能用受试者工作特征 (Receiver Operating Characteristic, ROC) 曲线、校正曲线和决策曲线分析 (DCA) 来评估。

结果：本研究初步提取了 1830 个影像组学特征。经筛选后,通过保留 9 个影像组学特征建立 SSTR 2 特征模型。每个特征的相关系数 r 小于 0.6 ($p\text{-value}>0.05$),显示特征之间没有显著关联性。训练集和测试集的 AUC 值分别为 0.876 (95% CI, 0.845-0.813) 和 0.855 (95% CI, 0.821-

0.782)，在各自的数据集中显示出良好的 SSTR2 表达强度区分效能。另外，DCA 和校正曲线结果都表明影像组学模型区分效能的可靠性及准确性。

结论：在这项初步研究中，基于动脉期 CT 图像的影像组学模型能有效并可靠地区分 SSTR 2 阴性及阳性表达，旨在帮助暂时无法行核医学生长抑素受体成像的患者初步预测 SSTR 2 表达情况并将其分层，有助于临床决策。

PO-2194

影像组学预测肝细胞癌微血管侵犯：一项系统评价

袁恩雨、陈云天、宋彬

四川大学华西医院

目的：全面评估预测肝细胞癌微血管侵犯的影像组学模型的报告质量、偏倚风险和影像组学方法学质量。

方法：截至 2022 年 1 月 21 日，在 PubMed、Embase、Web of Science、Scopus 和 Cochrane 图书馆对现有文献进行系统检索。包括基于影像组学数据开发和/或验证机器学习模型以预测肝细胞癌微血管侵犯的研究。两名研究者对这些研究进行了审查，并使用一致数据进行分析。报告质量、偏倚风险和影像组学方法学质量分别通过个体预后或诊断的多变量预测模型的透明报告 (TRIPOD)、预测模型偏倚风险评估工具 (PROBAST) 和影像组学质量评分 (RQS) 进行评估。结果：共有 30 项研究符合纳入标准，其中 24 项模型开发研究和 6 项模型开发及外部验证研究。总体 TRIPOD 依从性的中位数为 75.4% (范围为 56.7%-94.3%)。所有研究都存在高偏倚风险，20 个偏倚来源中至少有 2 个存在偏倚。此外，28 项研究显示，由于缺乏具体报告，多达 5 个信号问题存在不明确的偏倚风险。RQS 得分中位数为 37.5% (范围 25%-61.1%)。

结论：目前用于 MVI 状态预测的影像组学模型具有中等至良好的报告质量、中等的影像组学方法学质量，并且在模型开发和验证中存在较高的偏倚风险。

PO-2195

CT 影像组学在慢性肾脏病患者预后预测方面的应用研究

高萌萌、李震

华中科技大学同济医学院附属同济医院

目的：本研究旨在探讨基于计算机断层扫描 (CT) 图像的影像组学特征在慢性肾脏病 (CKD) 患者预后预测方面的应用价值。

方法：本研究回顾性纳入了 174 例 CKD 患者，随机分为训练组 (n=139) 和验证组 (n=35)。在 CT 平扫图像上勾画整个肾实质的感兴趣区，并提取影像组学特征。采用最小绝对收缩和选择算子 (LASSO) 惩罚的多元 Cox 比例风险回归分析筛选出对预后预测最具价值的影像组学特征，并计算影像组学得分 (Rad-Score)。我们还收集了患者的常规人口统计学信息、实验室指标和共病信息，并基于 Cox 比例风险回归分析构建了影像组学模型、临床模型和综合模型。使用 C 指数和时间依赖性受试者工作特征曲线下的面积 (AUC) 来评估这些模型的预测性能。

结果：Rad-Score 由 19 个影像组学特征组成。单变量和多变量 Cox 分析表明，Rad-Score、血尿素和血清白蛋白是独立的预后预测因子。整合影像组学特征和临床特征的综合模型，在训练组和验证组中预测 CKD 患者 3 年、5 年和 7 年预后可能性的 AUC 值分别为 0.824、0.805、0.772 和 0.812、0.876、0.941。与单独的影像组学或临床模型相比，综合模型在预测 CKD 预后方面更具准确性 (C 指数：训练组：0.767 vs. 0.762 vs. 0.689，验证组：0.757 vs. 0.713 vs. 0.739)。Kaplan-Meier 生

存曲线显示在训练组和验证组的高-低进展风险分层组之间存在显著的统计学差异（训练组： $p<0.0001$ ，验证组： $p=0.0034$ ）。

结论：Rad-Score 可作为一种新型生物标志物，用于早期识别高进展风险 CKD 患者。CT 影像组学可作为一种有效工具，用于早期无创预测患者的预后，为个体化治疗和更密切的随访提供指导，从而有效地预防慢性肾脏病的进展。

PO-2196

直肠癌术后吻合口漏与腹部脂肪及肌肉参数的相关性研究

马丽娅¹、刘坚²、罗彦¹、胡学梅¹、李震¹

1. 华中科技大学同济医学院附属同济医院

2. 武汉市中医院

目的：探究腹部脂肪、骨骼肌肉分布情况与直肠癌术后吻合口漏是否存在相关性。

方法：回顾性搜集 2013 年至 2020 年于我院行腹部手术的病人，术后病理诊断为直肠癌，且患者术前于我院行全腹部增强 CT。

采用动脉期、L3 椎体水平 5mm 厚的图像，使用 sliceOmatic 半自动勾画脂肪及肌肉区域（ cm^2 ），包括骨骼肌（SM）、内脏脂肪（VAT）、皮下脂肪（SAT）、肌间脂肪（IMAT），并计算出相应指数（index），即各指标与身高的比值（ cm^2/m^2 ），分别称为骨骼肌指数（SMI）、内脏脂肪指数（VATI）、皮下脂肪指数（SAT）、肌间脂肪指数（IMATI），并计算出内脏/皮下脂肪比（VSR）、肌间脂肪/肌肉比（IMAMR）、内脏脂肪/肌肉比（VMR）。

搜集患者的相关危险因素，包括性别、年龄、BMI 及分类、术前放、化疗、麻醉评分 ASA、临床伴发疾病（DM、心血管疾病、肾病、肝病、肺疾病）、吸烟、酒精、营养状况（血白蛋白、血红蛋白）、血液炎性指标（CRP、PCT、WBC、中性粒细胞）及手术前后变化、血脂指标（甘油三酯、胆固醇）、肿瘤的部位、手术方式（是否腹腔镜、是否前切除/低位前切除/超低位前切除，是否预防性回肠造瘘）、病理类型、分期及 TNM 分期等。

有急性吻合口漏为术后 1 个月内发生的吻合口漏（AL），将病人分为 AL 组、非 AL 组，对比两组间的脂肪分布及各危险因素。

结果：收集了 451 例进行了直肠癌手术的患者，其中 431 例非 AL、20 例有 AL，两组间性别、年龄等基本特征无明显统计学差异，AL 组患者酒精摄入更高，手术前、后血中白蛋白更低、术前血胆固醇更低，术后 5 天内血 PCT、白细胞、中性粒细胞更高，且术后血 WBC 及 PCT 升高的程度更高，并且肠道病灶直径更大（上述危险因素 $P<0.04$ ）。但两组间腹部脂肪、肌肉状态、分布及比例的各项参数均无明显统计学差异。

结论：进行了直肠癌手术的患者，酒精摄入、血白蛋白较低、血 PCT、WBC、中性粒细胞较高、病灶更大均为急性吻合口漏的危险因素，但腹部脂肪、肌肉各项指标与 AL 的发生无明显统计学相关性，可能与样本量较小有关，需进一步扩大样本量或进行前瞻性研究以明确。

PO-2197

1.5T 和 3.0T MRI 评估垂体铁沉积与肝脏、心脏铁沉积的相关性研究

李梅成、彭鹏、曾红秀、唐成、黄一羚
广西医科大学第一附属医院

目的：地中海贫血等需长期输血的患者，易出现肝脏、心脏、垂体、胰腺等器官铁沉积，垂体铁沉积会导致其发生不可逆的功能损害。本研究采用 1.5T 和 3.0T MRI 评估垂体、肝脏、心脏铁沉积，并探讨垂体铁沉积与肝脏、心脏铁沉积的相关关系。

方法：本研究共纳入 147 例地中海贫血患者，分析 3.0T 垂体 T2 (T2 MAP) 值、T2 (MAGIC) 值、T1 值、PD 值与心脏 T2* (3.0T) 值、心脏 T2* (1.5T) 值、肝脏 T2* (3.0T) 值、肝脏 T2* (1.5T) 值、血清铁蛋白的相关性，1.5T 垂体 T2 值、T2* 值与肝脏 T2* (3.0T) 值、心脏 T2* (3.0T) 值、肝脏 T2* (1.5T) 值、心脏 T2* (1.5T) 值、血清铁蛋白的相关性，1.5T 垂体 T2 值、T2* 值与 3.0T 垂体 T2 (T2 MAP) 值、T2 (MAGIC) 值、T1 值、PD 值的相关性。

结果：3.0T 垂体 T2 (T2 MAP) 值与心脏 T2* (3.0T) 值、心脏 T2* (1.5T) 值、肝脏 T2* (1.5T) 值、血清铁蛋白的相关系数分别为 0.503、0.401、0.460、-0.488，T2 (MAGIC) 值与肝脏 T2* (1.5T) 值、血清铁蛋白的相关系数分别为 0.416、-0.472。垂体 T2 (1.5T) 值与心脏 T2* (3.0T) 值、肝脏 T2* (1.5T) 值、血清铁蛋白的相关系数分别为 0.464、0.412、0.417 (P 均 < 0.001)，垂体 T2* (1.5T) 值与心脏 T2* (3.0T) 值、肝脏 T2* (1.5T) 值的相关系数分别为 0.428、0.401 (P 均小于 0.001)。1.5T 垂体 T2 值与 3.0T 垂体 T2 (T2 MAP) 值、T2 (MAGIC) 值的相关系数分别为 0.816、0.756 (P 均 < 0.001)，1.5T 垂体 T2* 值与 3.0T 垂体 T2 (T2 MAP) 值、T2 (MAGIC) 值的相系数分别为 0.756、0.732 (P 均 < 0.001)。

结论：垂体铁沉积与肝脏、心脏铁沉积、血清铁蛋白存在中度相关，1.5T 垂体 T2 值、垂体 T2* 值与 3.0T 垂体 T2 (T2 MAP) 值、T2 (MAGIC) 值的存在高度相关。

PO-2198

Spectral CT assists differentiation of osteoblastic bone metastasis from bone island in newly diagnosed cancer patients

Honghong Luo, zhou liu, liyan zou, qian yang, dehong lu
Cancer Hospital Chinese Academy of Medical Sciences, Shenzhen Cancer Hospital

Objectives: To investigate measurements derived from plain and enhanced spectral CT in differentiating osteoblastic bone metastasis (OBM) from bone island (BI). Materials & Methods: From January to November 2020, 73 newly diagnosed cancer patients with 201 bone lesions (OBM = 92, BI = 109) having received spectral CT were retrospectively enrolled. Measurements including CT values of 40-140 keV, slope of the spectral curve, effective atomic number (Zeff), Water (Calcium) density, Calcium (Water) density, and Iodine (Calcium) density were derived from manually segmented lesion on plain and enhanced spectral CT, and then analyzed using Student t-test and Pearson's correlation. Multivariate analysis was performed to build models (plain spectral model, enhanced spectral CT model, and combined model) for the discrimination of OBM and BI with performance evaluated using receiver operator characteristics curve and DeLong test. Results: All features were significantly different between BI group and OBM group (all P < 0.05), highly correlated with the corresponding features between plain and enhanced spectral CT both in OBM (r: 0.392-0.763) and BI (r: 0.430-0.544). As for the model performance, combined model achieved the best performance (AUC = 0.925, 95% CI: 0.879 to 0.957), which significantly outperformed plain spectral CT model (AUC = 0.815, 95% CI: 0.754 to 0.866, P < 0.001) and

enhanced spectral CT model (AUC = 0.901, 95% CI: 0.852 to 0.939, P = 0.024) in differentiating OBM and BI. Conclusion: In addition to plain spectral CT measurements, enhanced spectral CT measurements would further significantly benefit the differential diagnosis.

PO-2199

Application of 3.0T 1H MRS in differential diagnosis of benign and malignant compression fracture of spine

Rong Chang¹, Xiaowen Ma¹, Ming Zhang²

1. Xi'an Honghui Hospital

2. The First Affiliated Hospital of Xi 'an Jiaotong University

Objective: To investigate the characteristics of 3.0T 1H MRS in benign and malignant spinal compression fractures due to osteoporosis and malignant tumors of the spine and to provide scientific basis for differentiating benign or malignant compression fractures of the spine.

Methods: A total of 221 subjects were collected from June 2019 to September 2022 in Xi'an Honghui Hospital, including 50 patients in the normal bone mass group, 65 in the osteopenia group, 62 in the osteoporosis compression fracture group, and 44 in the malignant tumor compression fracture group. The age range was 35-75 years, including 99 males and 122 females. The patient's age, sex, and BMI were collected. Fat fraction (FF %) and Fat water ratio (LWR) measured by 1H MRS scanning for all subjects. In this study, 3.0 T GE superconducting MR machines and body coils were used to acquire the spectrum. SPSS20.0 was used for data analysis, mean \pm standard deviation was used for statistical description of quantitative data such as age, FF % and LWR, and frequency were used for statistical description of classified data such as gender. The ANOVA was used for the comparison among multiple groups of quantitative indicators, and the Bonferroni method was used for the horizontal comparison. Pearson correlation analysis was used for correlation analysis among quantitative indicators.

Results: By analyzing the age and BMI of different groups, variance analysis showed that there were differences in age among different groups. The age of the normal group was the smallest (53.05 ± 10.35 years old), followed by that of the osteopenia group (59.01 ± 6.34 years old). The age of the osteoporosis group was the largest (66.54 ± 5.32 years). After the analysis of different gender groups, it was found that there was a statistical difference between different groups, $P < 0.001$. The proportion of bone mass loss and osteoporosis in women was much higher than that in men. For the malignant tumor group, the proportion of males was higher than that of females, $P < 0.001$. There was a significant difference between the fat fraction and the lipid water ratio between the four groups. 1H MRS FF% was the lowest in malignant tumor group (15 ± 5.21) and the highest in osteoporosis group (65.8 ± 4.99). Bonferroni method was used to compare the difference between the two groups, which was statistically significant ($P < 0.001$). There was a high correlation between MRS FF% and LWR, $r = 0.865$, $P < 0.001$.

Conclusion: There were statistically significant differences in FF% and LWR of 3.0T 1H MRS in benign and malignant spinal compression fractures caused by osteoporosis and malignant tumors. It can be used in the differential diagnosis of benign and malignant compression fractures of the spine.

PO-2200

A series of radiologically misdiagnosed visceral lymphatic malformation (LM)

Peian Hu¹, Zhengrong Zhou²

1. Children's Hospital of Fudan University
2. Fudan University Shanghai Cancer Center

Purpose This study aims to explore the clinicopathological and imaging findings of a series of radiologically misdiagnosed visceral lymphatic malformations (LM), to familiarize their typical clinicopathological and imaging features.

Methods The clinicopathological and imaging findings of 11 cases with histologically proven visceral LM misdiagnosed radiologically, were reviewed. All the patients underwent CT examinations (one with unenhanced CT only), and six underwent MR examinations.

Results The median age was 34 years old with a gender ratio (male: female) of 1.2:1. The tumor's greatest diameter ranged from 1.2 to 12 cm, with an average of 5.12 ± 3.62 cm. Most were asymptomatic and found incidentally, other symptoms included abdominal pain, epigastric discomfort with the elevation of CA19-9, and a pulmonary mass. There was no significant correlation between the tumors' greatest diameter and the presence of symptoms. Eight cases were lobulated multi-cysts with fine and uniform fibrous septa, and three were solitary round unilocular cysts. LM mainly showed fluid attenuation on unenhanced CT (one filled with gas), hypo-signal intensity (SI) on T1WI, and hyper-SI on T2WI with internal hypo-SI fibrous septa. And the septa showed mild to moderate enhancement. These masses were misdiagnosed as congenital pulmonary airway malformation (CPAM), hepatic mesenchymal hamartoma, splenic cyst, intraductal papillary mucinous tumors (IPMN), mucinous cystadenoma, serous cystadenoma, pancreatic ductal adenocarcinoma respectively. They were all surgical-excision completely. The positive rates of D2-40, CD34, CD31, and F8 staining were 100%, 100%, 100%, and 83.3% respectively.

Conclusion Visceral LM was rare and easily misdiagnosed. But it had typical imaging and pathological features and can be completely excised. The LM needed to be reminded of in the differentiation of visceral cystic mass, a definite diagnosis maybe made

PO-2201

MRI-based radiomics models of the patella predict the radiographic progression of osteoarthritis: Data from the FNIH OA Biomarkers Consortium

Hai Jiang¹, Yi Peng¹, Hou dong Zuo^{1,2}

1. Affiliated Hospital of North Sichuan Medical College
2. Department of Radiology, Chengdu Xinhua Hospital, Affiliated Hospital of North Sichuan Medical College, Chengdu 610067, Sichuan Province, China

Objective: To analyse the MRI-based radiomics features to establish a radiomics model for predicting the radiographic progression of osteoarthritis (OA).

Design: The patella was manually delineated, and radiomic features were extracted from the sagittal intermediate-weighted (IW) fat-saturated turbo spin-echo (TSE) sequences of 565 participants randomly divided into training and validation groups at a 7:3 ratio. The training cohort consisted of 395 participants and included 202 cases. The validation cohort consisted of 170 participants and included 87 cases. Least absolute shrinkage and selection operator (LASSO) was used for feature selection. Support vector machine (SVM) was used to establish radiomics models

and clinical and biomarker models for predicting the radiographic progression of OA. The predictive ability of the model was evaluated by the area under the curve (AUC).

Results: The baseline, 24 M, Delta, and combination (24 M+Delta) radiomics models all showed good predictive performance in the training and validation cohorts, with the combination model exhibiting the best performance. In the training cohort, the AUCs were 0.851, 0.825, 0.804 and 0.884, respectively. The AUCs in the validation cohort were 0.741, 0.786, 0.745 and 0.802, respectively. The DeLong test showed that the predictive performance of the radiomics models in the training and validation cohorts was significantly better than that of the clinical and biomarker models.

Conclusions: The MRI-based radiomics models of the patella performed better than the clinical and biomarker models in predicting the radiological progression of OA. This indicates a close relationship between the patella and the radiographic progression of OA.

PO-2202

Comparisons of volumetric Hounsfield units and bone density in discriminating vertebral fractures on lumbar CT scans

Fengyun Zhou^{1,2}, Ling Wang², Xiaoguang Cheng²

1. College of Medical Technology, Shaanxi University of Chinese Medicine

2. Beijing Jishuitan Hospital, Capital Medical University

Purpose: To compare the discrimination of volumetric Hounsfield units (HU) and volumetric bone mineral density (vBMD) by quantitative CT (QCT) in vertebral fractures (VFs).

Methods: We retrospectively included CT scans of the lumbar spine 101 VFs cases (60 women, mean age: 64 ± 4 years; 41 men, mean age: 73 ± 10 years) and sex- and age-matched 101 control subjects (60 women, mean age: 64 ± 4 years; 41 men, mean age: 72 ± 7 years) without any VF. In order to discriminate the probability of VFs in both men and women, binary logistic regressions were used to compare CT-measured volumetric bone attenuation in the HU of the L1 and L2 vertebrae with QCT-measured vBMD.

Results: The average HU value of the two vertebrae were significantly associated with QCT-measured vBMD of the lumbar vertebrae in both men and women with and without VFs (from 0.96 to 0.98, all $p < 0.001$). For the patients who were matched for age and sex, there was a statistically significant difference in HU value and vBMD between the patients with fractures and controls ($p < 0.001$). When age and BMI were taken into account as covariances and corrected simultaneously, odds ratios (ORs) for vBMD and HU values, which represent the risk of VFs, were significant ($p < 0.001$). Compared with HU, vBMD was more strongly associated with VFs occurrence in both men (vBMD: OR, 6.57; 95% CI, 2.99-14.46 vs HU: OR, 3.77; 95% CI, 1.97-7.22) and women (vBMD: OR, 6.39; 95% CI, 3.35-12.28 vs HU: OR, 3.82; 95% CI, 2.25-6.48). The area under the receiver operating characteristic curve (AUC) for predicting VFs using the average HU and vBMD of two vertebrae was 0.83 and 0.89 in men and 0.79 and 0.86 in women.

Conclusions: The QCT-measured volumetric bone mineral density is more associated with acute VFs than volumetric HU values of the lumbar spine. Although the use of HU values for the diagnosis of osteoporosis and predicting fracture risk is limited to scanner- and imaging protocol-specific, volumetric HU values have great potential for opportunistic osteoporosis screening.

PO-2203

Evaluation of the magnification of full-length weight-bearing lower extremity measurement using a single-shot exposure x-ray system

Fengyun Zhou^{1,2}, Ling Wang², Xiaoguang Cheng²

1. College of Medical Technology, Shaanxi University of Chinese Medicine

2. Beijing Jishuitan Hospital, Capital Medical University

Objective. To evaluate the magnification of full-length weight-bearing lower limb measurements using a single-shot digital x-ray system (New Oriental 1000LB, Wandong Medical, Beijing, China) compared with conventional radiography and fluoroscopy (R/F) slot system (Sonialvision Safire, Shimadzu Corp., Kyoto, Japan) and to verify its clinical applicability.

Materials and methods. A lead ruler and cadaver bones from the lower limb were imaged with both units in an upright weight-bearing position, and the lengths of the ruler, femur, tibia and total limb were measured on each image. The lengths of the femur, tibia and total limb were also measured on an EOS imaging system (EOS-imaging, Paris, France) and used as the ground truth. All image measurements on the three devices were performed using their respective post-processing software. Finally, the percentage errors in length due to image magnification were calculated. In a separate clinical study, examination time of the anterior-posterior (AP) was recorded and compared for 8 patients on each system.

Results. The magnification errors measured for the single-shot exposure x-ray system were slightly higher (< 3%) than those measured for the R/F system (< 1%). When compared to the R/F system, the single-shot exposure x-ray system had a significantly shorter mean examination time (10.57 s vs. 23.32 s).

Conclusion. The shorter examination time allows for higher patient throughput and cheaper examination costs compared with a conventional R/F system. Although there is a slight magnification error, this is reduced by the built-in calibration scale.

Clinical Relevance/ Application. In orthopedics, it is important to have optimal, reliable images without magnification or distortion, especially in preoperative planning. Image magnification has been shown to pose a risk of error in the measurement of joint replacement dimensions in surgical orthopedics. In addition, when determining the length of lower limbs, image magnification also makes the measurements unreliable. Thus, it's important to assess the image magnification of the single-shot exposure x-ray system.

PO-2204

Quantitative study of patellar ligament in patients with knee osteoarthritis based on MRI T2 mapping technology

Mengjuan Kong, Yeda Wan, Lin Guo

Tianjin University Tianjin Hospital

Purpose Using MRI T2 mapping technology to study the quantitative changes in T2 values of the patellar ligament in patients with knee osteoarthritis (KOA), as well as whether there are differences in T2 values between different parts of the patellar ligament, and to explore the characteristics of patellar ligament degeneration in KOA patients. **Materials and Methods** Group 1, healthy control group, 31 knee joints; Group 2, mild osteoarthritis group (VAS score < 80), 52 knee joints; Group 3, severe osteoarthritis group (VAS score > 120), 37 knee joints. Using quantitative T2 mapping sequence scanning, select the layer on the image that displays the largest area of the patellar ligament, and divide the patellar ligament into three sub regions (PPL, MPL, DPL) on average from the proximal to the distal end. Select circular regions of interest (ROIs) with an area of 50mm² at

the above positions, and select three ROIs with an area of 1mm² at the center of the circle where the signal is uniform, and measure their T2 values. Single factor analysis of variance was used to compare the differences in T2 values between three groups at different measurement points of the patellar ligament, as well as the differences in T2 values between different measurement points of the patellar ligament within the three groups. Results ① The T2 values at different measuring points of the patellar ligament were statistically different among the three groups ($P<0.05$), and there were significant differences between the two groups ($P<0.05$). Group 1>Group 2>Group 3. ② The T2 values of PPL, MPL and DPL in the three groups were compared in pairs. Only the difference within group 2 was statistically significant, and the average T2 value of MPL was greater than the average T2 value of PPL and DPL. Conclusion The degeneration of the patellar ligament occurs earlier at both ends and later in the middle, but it will eventually become consistent with the further deterioration.

PO-2205

A retrospective study of the association between disc shape alterations following percutaneous endoscopic lumbar discectomy and the 1-year postoperative outcomes.

Bing Li^{1,2}, Yan Wang¹, Guoquan Zheng¹, Tianhao Wang¹, Yi Huang³, Qi Wang¹, Yiming Fan¹, Han Yu^{1,2}, Chao Xue¹, Dengbin Qi¹

1. The First Medical Centre of the PLA General Hospital

2. Medical College of the PLA

3. Medical College of Nankai University

Background: Lumbar disc herniation (LDH) is a common orthopedic disease. Percutaneous endoscopic lumbar discectomy (PELD) has developed as an alternative to open surgery as a less invasive treatment. The majority of relevant studies have focused on cross-sectional comparisons of the differences in treatment outcomes between patients treated with conventional and minimally invasive surgery, as well as the complications and recurrence rates associated with the surgery, and fewer studies have examined the relationship between the changes in disc morphology before and after minimally invasive surgery and the prognosis. There is no specific study to elucidate the relationship between changes in disc morphology after PELD and the development of symptoms experienced by postoperative patients.

Objectives: This study investigates the possible association between the two postoperatively by observing the changes in the morphological parameters of the different reference surfaces of the intervertebral disc and the improvement in clinical symptoms after percutaneous endoscopic lumbar discectomy (PELD).

Study Design: A retrospective case study.

Setting: The First Medical Centre of the PLA General Hospital.

Methods: In this study, a total of 98 patients who were treated with percutaneous endoscopic lumbar discectomy (PELD) for lumbar disc herniation (LDH) at the First Medical Centre of the People's Liberation Army General Hospital from October 2019 to October 2021 were included. Preoperative and 3-month postoperative lumbar spine MRI DICOM data were obtained and measured using the RadiAnt DICOM viewer (version 2022.1.1). Morphological parameters of the diseased disc and the disc of the previous segment were measured by T2-weighted images in three reference planes: median sagittal, parasagittal, and transverse. In addition, we classified LDH according to the Michigan State University (MSU) classification criteria into three levels (denoted as 1, 2, and 3) according to the degree and four regions (designated as A, AB, B, and C) according to the location and evaluated the efficacy of LDH by using the Oswestry Disability Index (ODI), the visual analog pain scores for back and leg (VAS-back/VAS-leg), the Japanese Orthopaedic Association (JOA) score and recovery rate to assess efficacy. We compared postoperative differences in disc parameter changes and postoperative outcomes between patients with different

types of surgical segments and LDH based on the presence or absence of a subluxated disc and MSU staging. The patients were followed up in the outpatient clinic at 3, 6, and 12 months postoperatively, and questionnaires were completed at each visit. The follow-up time was 14.69 ± 4.21 months (12 to 24 months). (Chinese Clinical Trial Registry: ChiCTR2300071767)

Results: All the patients' health improved after the operation. Oswestry Disability Index (ODI), visual analog pain scores for the back and leg (VAS-back/VAS-leg) at postoperative follow-up were significantly lower, and JOA scores were significantly higher compared to preoperative, with statistically significant differences in postoperative follow-up results compared to preoperative ($p < 0.05$). Among these imaging parameters, those statistically significant postoperatively compared to preoperatively were disc height (DH), superior disc height (S-DH), disc height index (DHI), superior disc height index (S-DHI), protrusion distance (PD), disc height in the parasagittal plane (P-DH), disc height index in the parasagittal plane (P-DHI), protrusion distance in the parasagittal plane (P-PD), the vertical diameter of the disc (VD), aspect ratio of the disc (AR), superior aspect ratio of the disc (S-AR), disc circumference (DC), and disc area (DA). These parameters were reduced postoperatively compared to the preoperative parameters. The Pearson correlation coefficients showed that ΔDH was negatively correlated with the amount of change in VAS scores for low back pain at three months postoperatively and six months postoperatively ($r = -0.419$, $P < 0.01$), ($r = -0.402$, $P < 0.01$) among the parameters of median sagittal change. The ΔDHI was negatively correlated with the amount of change in VAS scores for low back pain at three months postoperatively and at six months postoperatively ($r = 0.411$, $P < 0.01$), ($r = 0.409$, $P < 0.01$). Among the parameters of parasagittal change, $\Delta P-PD$ was negatively correlated with the amount of change in VAS scores for low back pain at three months postoperatively and at six months postoperatively ($r = 0.367$, $P < 0.01$), ($r = 0.364$, $P < 0.01$). Among the parameters of cross-sectional variation, the parameter differences did not correlate with the values of changes in the efficacy indicators. Postoperatively, there was no significant difference in the changes in morphological parameters of the discs, nor the efficacy indicators at various time points between the two types of operated segments with subluxated discs (Inf group) and segments without subluxated discs (N-Inf group), nor between the MSU-A, MSU-B, MSU-AB, and MSU-C groups.

Limitations: A single-centre retrospective design was used for this study, which should be considered for its inherent selection bias and limited statistical power.

Conclusions: After percutaneous endoscopic lumbar discectomy (PELD), the values of change in the height of the discs in the operated segment in the median sagittal plane and the parasagittal plane, and the distance of herniation were associated with the speed of relief of low back pain at three months as well as at six months postoperatively; the values of change in the parameters of the discs' area and circumference in the transverse plane were not associated with the difference in the outcome of the treatment at one year after the operation. There were no significant differences in changes in disc parameters and changes in efficacy between different types of surgical segments and between different types of lumbar disc herniation (LDH) after surgery.

PO-2206

Optimization of keV for radiomics extracted from spectral virtual monochromatic images to predict osteoporosis

Jinling Wang, Jing Ouyang, Jiayi Tang, Kun Zhang
The First Hospital of Hunan University of Chinese Medicine

Purpose: To investigate the effect of radiomics obtained from different virtual monochromatic images (VMIs) by dual-energy computed tomography (CT) on the prediction of osteoporosis. **Materials and Methods:** A retrospective study of 62 participants who underwent both single source dual-energy CT and quantitative computed tomography (QCT) lumbar-spine examination were enrolled. With QCT as the reference standard, the patients were divided into two groups according to the guidelines introduced by the International Society for Clinical Densitometry (ISCD) and American College of Radiology (ACR), osteoporosis ($n=16$) of the spine was defined

as a BMD value $<80 \text{ mg/cm}^3$, and non-osteoporosis ($n=46$ [osteopenia and normal]) was defined as a BMD value $\geq 80 \text{ mg/cm}^3$. Radiomics scores (RSs) for osteoporosis prediction were constructed from 11 sets of VMIs (40-140 keV, 10 keV interval). Receiver operating characteristic (ROC) curves were drawn and the area under the curves (AUCs) was calculated to evaluate the discriminatory power of RS for each VMI. Results: The AUC values for osteoporosis prediction with RS of 40-140 keV VMIs were 0.995, 0.996, 1.000, 1.000, 1.000, 1.000, 0.793, 0.787, 0.807, 0.821, 0.846. The accuracies of RS of VMIs were 0.952, 0.968, 0.984, 1.000, 1.000, 1.000, 0.705, 0.721, 0.746, 0.742, 0.770. The sensitivities of RS of VMIs were 0.882, 0.938, 0.941, 1.000, 1.000, 1.000, 0.400, 0.375, 0.444, 0.444, 0.545. The specificities of RS of VMIs were 0.978, 0.978, 1.000, 1.000, 1.000, 1.000, 0.765, 0.774, 0.796, 0.792, 0.820. The negative prediction values of RS of VMIs were 0.957, 0.978, 0.979, 1.000, 1.000, 1.000, 0.867, 0.891, 0.896, 0.894, 0.891. And the positive prediction values of RS of VMIs were 0.938, 0.938, 1.000, 1.000, 1.000, 1.000, 0.250, 0.200, 0.267, 0.267, 0.400. Conclusions: The RS obtained from multiple VMIs in dual-energy CT had a good ability to predict osteoporosis. And the RS of 40-90 keV VMIs showed higher performance than the RS of 100-140 keV VMIs.

PO-2207

Combination of 3.0T magnetic resonance imaging T2 mapping with texture analysis for evaluating the degeneration of lumbar facet joints

Muqing Luo, Kun Zhang

The First Hospital of Hunan University of Chinese Medicine

Objective: Quantitative magnetic resonance imaging has been successfully applied to assess the status of cartilage biochemical components. This study aimed to investigate the performance of 3.0T magnetic resonance imaging T2 mapping combined with texture analysis for evaluating the early degeneration of lumbar facet joints. Methods: A total of 38 patients (20 in the asymptomatic group and 18 in the symptomatic group) were enrolled. All patients underwent 3.0T magnetic resonance imaging conventional sequences, water excitation three-dimensional spoiled gradient echo sequence (3D-WATSc), and T2 mapping scans. The bilateral L4/5 and L5/S1 lumbar facet joints were morphological graded using the Weishaupt criteria, T2 values, and texture parameters derived from T2 mapping of cartilage. The Kruskal-Wallis H test was used to compare the differences of parameters among different groups. Multivariate logistic regression analysis was used to obtain the independent predictive factors for evaluating the early degeneration of lumbar facet joints. Receiver operating characteristic (ROC) curve was performed and the area under curve (AUC) was calculated. Spearman correlation analysis was used to evaluate the correlation of the independent predictors of cartilage T2 value and texture parameters with the subjects' Japanese Orthopedic Association (JOA) score or Visual Analogue Scale (VAS) score. Results: A total of 148 facet joints were selected, including 70 in Weishaupt 0 (normal) group, 58 in Weishaupt 1 group, and 20 in Weishaupt 2-3 group. T2 value, entropy, and contrast increased significantly as the exacerbation of facet joint degeneration (all $P < 0.05$), while the inverse difference moment, energy, and correlation decreased (all $P < 0.05$). Entropy among different groups was significantly different (all $P < 0.05$), and the differences of T2 value, contrast, inverse difference moment, and energy between Weishaupt 0 and Weishaupt 1 groups, or Weishaupt 0 and Weishaupt 2-3 groups were statistically significant (all $P < 0.05$). Multivariate logistic regression analysis suggested that T2 value and inverse difference moment were the independent predictors for evaluating early degeneration of facet joints. The combination of T2 value with inverse difference moment achieved the best performance in distinguishing Weishaupt 0 from Weishaupt 1 (AUC=0.85), with sensitivity and specificity at 92.7% and 76.5%, respectively. In the symptom group, the cartilage T2 value combined inverse difference moment was correlated with JOA score ($r=-0.475$, $P < 0.05$) and VAS score ($r=0.452$, $P < 0.05$). Conclusion: 3.0T magnetic resonance imaging T2 mapping combined with

texture analysis is helpful to quantitatively evaluate the early degeneration of lumbar facet joints, in which the T2 value and inverse difference moment show an indicative significance.

PO-2208

Evaluation of early cartilage degeneration of knee based on 3.0T multi-parameter MRI and its correlation with β -catenin and MMP-13

Muqing Luo, Kun Zhang
The First Hospital of Hunan University of Chinese Medicine

Abstract Objective: To investigate the performance of 3.0T MR T2 mapping combined with T1 ρ for evaluating the early degeneration of knee cartilage, and to preliminarily clarify the relationship between quantitative parameters and biochemical changes. **Methods:** According to the improved cast immobilization method and braking time, forty rabbits were randomly divided into 4 groups: control group, 2, 4 and 6 weeks groups. T2 mapping and T1 ρ imaging of the right posterior knee were performed. OARSI grading was used to evaluate the histological changes of cartilage, and the contents of type II collagen and proteoglycan as well as the expression levels of β -catenin and MMP-13 were analyzed by immunohistochemistry. The differences of T2 and T1 ρ value among different groups was compared by the Kruskal-Wallis H test. Spearman correlation analysis was used to evaluate the correlation of T2 value and T1 ρ values with OARSI grading and pathological indexes. Multivariate logistic regression analysis was used to obtain the independent predictive factors for evaluating the early degeneration of knee cartilage. **Results:** A total of 37 knee cartilage were selected, including 8 in 0 (normal) group, 20 in OARSI 1~2.5 group, and 9 in OARSI 3~6.5 group. T2 and T1 ρ value among different groups were significantly different, and increased significantly as the exacerbation of knee cartilage (all $P < 0.05$). T2 and T1 ρ value were negatively correlated with the contents of type II collagen ($r = 0.704$, $r = -0.611$) and proteoglycan ($r = 0.820$, $r = -0.573$) (all $P < 0.05$), MMP-13 ($r = 0.843$, $r = 0.592$) and β -catenin ($r = 0.759$, $r = 0.663$) were positively correlated (all $P < 0.05$). The combination of T2 value with T1 ρ value achieved the best performance in distinguishing OARSI 0 from OARSI 1~2.5 (AUC=0.84). **Conclusion:** The combination of T2 value and T1 ρ value can quantitatively predict the early degeneration of articular cartilage, which may have the potential in noninvasive evaluation of the cartilage pathological indicators.

PO-2209

Study on morphology and position of coracoid process in patients with subscapular tendon tear based on CT three-dimensional model

Yansong Qi, Yongsheng Xu
Inner Mongolia People's Hospital

Objective To investigate the correlation between the shape and position of the coracoid process and subscapularis tendon tear (STT).

Methods We retrospectively collected the imaging data of shoulder joint of patients with degenerative rotator cuff tear after arthroscopy and healthy people. They were divided into rotator cuff tears with STT group (group A, n = 28), rotator cuff tear without STT group (group B, n = 26), and healthy group (group C, n=22). The Mimics software was used to establish the three-dimensional modeling of the scapula and evaluate the positions of the coracoid process and scapular glenoid. The length of the coracoid (LC), the anteroposterior distance of the coracoid (ADC), the height of the coracoid (HC), the version angle of the glenoid (VAG), and the inclination angle of the glenoid (IAG) were measured, and the parameters of each group were analyzed and compared.

Result The LCs in groups A, B and C were (21.32 ± 3.83) mm, (18.95 ± 2.36) mm, and (17.75 ± 2.69) mm, respectively. The ADCs in groups A, B, and C were (23.52 ± 4.04) mm, (22.83 ± 2.37) mm, and (24.03 ± 3.65) mm, respectively. The HCs in groups A, B, and C were (20.76 ± 3.35) mm, (23.33 ± 2.7) mm, and (22.86 ± 3.64) mm, respectively. The VAGs in groups A, B, and C were $(-2.99 \pm 3.27)^\circ$, $(-2.28 \pm 4.9)^\circ$ and $(-2.83 \pm 4.4)^\circ$, respectively. The IAGs in group A, B, and C were 107.82° ($101.59-112.04$) $^\circ$, 110.19° ($105.86-118.72$) $^\circ$ and 110.37° ($104.9-118.02$) $^\circ$, respectively. There were significant differences in LC, HC, and IAG between group A and group B ($P < 0.05$), but there was no significant difference in ADC and VAG between the two groups ($P > 0.05$). There were significant differences in LC, HC, and IAG between group A and group C ($P < 0.05$), but there was no significant difference in ADC and VAG between the two groups ($P > 0.05$). There was no significant difference in all the measured indexes between group B and group C ($P > 0.05$).

Conclusion The longer the coracoid process, the lower the position and the smaller the inclination angle of the glenoid, the more likely it to cause subscapular tendon tears. However, the ADC and VAG are not significantly related to the subscapular tendon tears.

PO-2210

Application of dual-energy CT fat-muscle decomposition techniques in assessment of paraspinal muscles in young patients with chronic nonspecific low back pain

Yinqi Liu, Kun Zhang
The First Hospital of Hunan University of Chinese Medicine

Objective: To explore the imaging signs of paraspinal muscle in young patients with chronic nonspecific low back pain (CNLBP) by dual-energy CT material decomposition techniques. To guide the evaluation of clinical conditions and efficacy. **Methods:** 56 young CNLBP patients and 51 healthy volunteers were selected. The balanced male-to-female ratio within and between groups. Lumbar dual-energy CT were performed on two groups. The fat content of the bilateral multifidus and erector spinal muscles were measured at the middle level of the L1-L5 vertebral of the two groups of volunteers. CNLBP patients completed the Oswestry questionnaire to evaluate the degree of lumbar dysfunction. The differences in fat content of paraspinal muscles between CNLBP

patients and healthy volunteers were analyzed. The relationship between fat content and dysfunction in CNLBP patients were analyzed. Results: Compared with healthy volunteers, young patients with CNLBP had statistical differences in the fat content of the multifidus muscle at the middle level of the L4 and L5 vertebral ($p < 0.001$). There is a moderate positive correlation between the fat content of L4 and L5 vertebral in CNLBP patients and their dysfunction ($p < 0.05$). Conclusion: Dual-energy CT fat-muscle decomposition techniques can non-invasively quantify the fat content of paraspinal muscles in young CNLBP patients at the microscopic level and has a good consistency. There is a certain correlation between the degree of fatty infiltration of CNLBP paraspinal muscles and the degree of dysfunction. Dual-energy CT fat-muscle decomposition techniques is expected to become an effective means for clinical evaluation of the condition and efficacy of CNLBP.

PO-2211

Effect of Zhitong-Jiangu recipes on cartilage Wnt5a expression in knee osteoarthritis rabbits and correlation between Wnt5a expression and T2 value

Yinqi Liu, Kun Zhang

The First Hospital of Hunan University of Chinese Medicine

Objective: To study the effects of Zhitong-Jiangu recipe on the expression of Wnt5a in articular cartilage of rabbit knee osteoarthritis(KOA). To preliminarily clarify the correlation between the content of Wnt5a and T2 value in articular cartilage and to explore the feasibility of T2 mapping imaging in evaluation of the effect of Zhitong-Jiangu recipe in treatment of articular cartilage injury in rabbit KOA. Methods: The knee osteoarthritis model of New Zealand white rabbits was established by Improved cast immobilization method. According to different intervention methods, 32 rabbits were randomly divided into normal control group, model control group, glucosamine sulfate treatment group and Zhitong-Jiangu recipes treatment group. The treatment group was given the corresponding drug by gavage for intervention, and the control group was given the same volume of distilled water by gavage for intervention. T2 mapping was performed on the right knee and the content of Wnt5a in articular cartilage was analyzed with immunohistochemistry 6 weeks after experiment. Safranin-Fast green staining was used to detect cartilage damage. The differences of T2 value and Wnt5a content of articular cartilage among the four groups were compared by Kruskal-Wallis H and Mann-Whitney U test. Spearman correlation analysis was used to evaluate the correlation of T2 value and Wnt5a content of articular cartilage. Results: Compared with the normal control group, glucosamine sulfate treatment group, Zhitong-Jiangu recipes treatment group and model control group had different degrees of articular cartilage damage by Safranin-Fast green staining. Compared with the normal control group, the expression of Wnt5a and T2 value of articular cartilage in glucosamine sulfate treatment group, Zhitong-Jiangu recipes treatment group and model control group were increased, the difference was statistically significant ($P < 0.05$). Compared with the model control group, the glucosamine sulfate treatment group and Zhitong-Jiangu recipes treatment group decreased ($P < 0.05$). The expression of Wnt5a in articular cartilage was positively correlated with T2 value ($r = 0.884$, $P < 0.01$). Conclusion: Zhitong-Jiangu recipes can alleviate cartilage damage by down-regulating the expression of Wnt5a. Zhitong-Jiangu recipes could effectively lower Wnt5a expression. There is a good correlation between T2 mapping imaging and the expression of cartilage Wnt5a, which is helpful for non-invasive evaluation of the efficacy of Zhitong-Jiangu recipe in the treatment of KOA articular cartilage injury in rabbits.

PO-2212

Chronic non-specific low back pain, gender and BMI influenced fat infiltration in lumbar paraspinal muscles for young patients

Xiaona Zhou, Kun Zhang
First Affiliated Hospital of Hunan University of Chinese Medicine

Objective: To analyze the correlation between the fat content of lumbar paraspinal muscle and chronic non-specific low back pain (CNLBP), gender and body mass index (BMI) for young patients.

Materials and Methods: The clinical data of 107 young patients (< 29 years old) in our hospital from November 2021 to March 2023 were retrospectively analyzed, according to whether there was CNLBP, the patients were divided into CNLBP group (56 cases) and control group (51 cases). All participants underwent 256-rows dual energy CT imaging. Fat content was measured on lumbar paraspinal muscle (the erector spinae muscles at L1/2-L4/5, and the multifidus muscles at L2/3-L5/S1) with fat-muscle decomposition techniques. The factors influencing fat content of lumbar paraspinal muscle were analyzed by multiple linear regression.

Results: A multiple linear regression analysis was performed to adjust for CNLBP, BMI and gender. The R², adjusted R² and standard deviation of the overall linear model were 0.706, 0.499 and 0.484,

respectively ($P < 0.05$). Multivariate linear regression analyses demonstrated that CNLBP ($\beta = 25.820$, $SE = 5.710$, $t = 4.522$, $P < 0.0001$), the BMI ($\beta = -6.713$, $SE = 0.830$, $t = -8.092$, $P < 0.0001$) and gender ($\beta = 23.749$, $SE = 6.652$, $t = 3.570$, $P = 0.001$) were the influence factors of mean fat content of total lumbar paraspinal muscle. For the mean fat content of multifidus: The R², adjusted R² and standard deviation of the overall linear model were 0.716, 0.513 and 0.499, respectively ($P < 0.05$), that CNLBP ($\beta = 45.551$, $SE = 6.853$, $t = 6.647$, $P < 0.0001$), BMI ($\beta = -7.698$, $SE = 0.996$, $t = -7.731$, $P < 0.0001$) and gender ($\beta = 20.940$, $SE = 7.983$, $t = 2.623$, $P = 0.01$) were the influence factors. For the mean fat content of erector spinae muscles: The R², adjusted R² and standard deviation of the overall linear model were 0.661, 0.437 and 0.426, respectively ($P < 0.05$). Gender ($\beta = 27.197$, $SE = 6.275$, $t = 4.334$, $P < 0.0001$) and BMI ($\beta = -5.600$, $SE = 0.777$, $t = -7.202$, $P < 0.0001$) were the influence factors.

Conclusions: This study demonstrated that CNLBP, BMI and gender may be associated with fatty infiltration of the lumbar paraspinal muscles for young patients, especially the multifidus muscles.

PO-2213

Application of IDEAL-IQ technique in quantitative assessment of adipose infiltration in dermatomyositis/polymyositis

Yuqi Wang, zhaorong tian, zhijun wang
Ningxia Medical University General Hospital

Purpose: To explore the FF value of IDEAL-IQ technology in assessing the extent of fat infiltration in dermatomyositis (DM)/polymyositis (PM).

Materials and Methods: A total of 68 patients with PM/DM (47.9 ± 15.0 years old) were retrospectively collected from December 2021 to June 2023, including 24 males and 44 females. According to disease duration exceeding six months, they were divided into an acute group (28 cases) and a chronic group (40 cases). Additionally, 24 normal volunteers were included, consisting of 10 males and 14 females. All subjects underwent bilateral thigh-axis IDEAL-IQ sequence

scanning, and the FF values of the three muscle groups in the thigh were measured by two radiologists on the IDEAL-IQ sequence. Intra- and interobserver consistency were evaluated using intraclass correlation coefficients (ICCs). One-way analysis of variance was used to compare the differences in FF values among different groups. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) was calculated to analyze the diagnostic efficiency of FF values for DM/PM fat infiltration.

Results: The intra- and interobserver ICC values of all muscle FF values were above 0.75. The FF values of the anterior, medial, and posterior muscle groups in the acute PM/DM group were higher than those in the corresponding muscle groups of the chronic group and the control group, and the differences were statistically significant ($P < 0.05$). The AUC of the FF values of the three muscle groups in the acute group vs. chronic group, acute group vs. control group, and chronic group vs. control group were 0.601 (95% CI 0.561-0.640), 0.817 (95% CI 0.784-0.850), and 0.759 (95% CI 0.725-0.794) ($P < 0.05$).

Conclusion: The FF value of IDEAL-IQ technology can quantitatively analyze the extent of muscle infiltration in PM/DM patients, which can reflect the disease progression of DM/PM and provide imaging evidence.

PO-2214

Application of MR Integrated sequences in active stage diagnosis of dermatomyositis/polymyositis

Yuqi Wang, zhaorong tian, zhijun wang
Ningxia Medical University General Hospital

Purpose: To investigate the MAGiC sequence in assessing dermatomyositis (DM)/polymyositis (PM) and its activity, and to analyze the correlation between quantitative parameters and clinical indicators.

Methods: A total of 68 PM/DM patients and 24 normal volunteers were retrospectively collected. According to myositis disease activity assessment tools, patients were divided into an active group (28 cases) and a non-active group (40 cases). All subjects underwent MAGiC sequence scanning, and the T1 values of the muscles in the thigh were measured twice by two radiologists on the MAGiC sequence. One-way analysis of variance was used to compare the differences in T1 values among different groups. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) was calculated to analyze the diagnostic efficiency of T1 values for PM/DM and its activity. Spearman correlation analysis was used to analyze the correlation between the quantitative parameters of DM/PM patients and lactate dehydrogenase (LDH) values.

Results: The T1 value of the anterior muscle group in the DM/PM active group was higher than that in the non-active group and control group ($P < 0.05$). The differences in the T1 values of the medial and posterior muscle groups were not statistically significant ($P > 0.05$). The AUC of the T1 values of the anterior muscle group in the active group vs. non-active group, active group vs. control group, and non-active group vs. control group were 0.704 (95%CI 0.641-0.768), 0.644 (95%CI 0.578-0.710), and 0.567 (95%CI 0.507-0.627) ($P < 0.05$). The T1 value of the anterior muscle group was significantly positively correlated with LDH ($r = 0.384$, $P < 0.05$).

Conclusion: The MAGiC quantitative spectrum technique can quantitatively analyze muscle edema in DM/PM patients and is correlated with the clinical indicator LDH, which can serve as an imaging biomarker for the diagnosis of active period.

PO-2215

Application of MR Integrated sequences in quantitative evaluation of edema muscle in dermatomyositis/polymyositis

Yuqi Wang,zhaorong tian,zhijun wang
Ningxia Medical University General Hospital

Purpose: To investigate the T2 value of the MAGiC sequence in assessing edematous muscles in dermatomyositis (DM)/polymyositis (PM), and to analyze the correlation between quantitative parameters and clinical indicators.

Methods: A total of 68 PM/DM patients and 24 normal volunteers were retrospectively collected from December 2021 to June 2023. According to electromyography and myositis disease activity assessment tools, patients were divided into an active group (28 cases) and a non-active group (40 cases). All subjects underwent bilateral thigh-axis MAGiC sequence scanning, and the T2 values of the three muscle groups in the thigh were measured twice by two radiologists on the MAGiC sequence. One-way analysis of variance was used to compare the differences in T2 values among different groups. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) was calculated to analyze the diagnostic efficiency of T2 values for edematous muscles in PM/DM. Spearman correlation analysis was used to analyze the correlation between the quantitative parameters of DM/PM patients and creatine kinase (CK) values.

Results: The T2 values of the anterior, medial, and posterior muscle groups in the DM/PM active group were higher than those in the non-active group and control group, and the differences were statistically significant ($P < 0.05$). The AUCs of the T2 values of the posterior muscle group in the acute vs. chronic group, acute vs. control group, and chronic vs. control group were 0.722 (95%CI 0.678-0.765), 0.937 (95%CI 0.918-0.957), and 0.849 (95%CI 0.820-0.877) ($P < 0.05$). The T2 value of the posterior muscle group was significantly positively correlated with CK ($r = 0.48$, $P < 0.01$).

Conclusion: The T2 value of the MAGiC sequence can quantitatively analyze edematous muscles in DM/PM patients and is highly correlated with the clinical indicator CK, which can be used to evaluate the improvement of inflammation after treatment.

PO-2216

Application of MR Integrated sequences in the diagnosis and quantitative evaluation of dermatomyositis/polymyositis

Yuqi Wang,zhaorong tian,zhijun wang
Ningxia Medical University General Hospital

Purpose: To investigate the diagnostic value of MAGiC sequence for the activity of dermatomyositis (DM)/polymyositis (PM) and analyze the correlation between quantitative parameters and clinical indicators.

Methods: Retrospective image and clinical data of 68 patients with confirmed PM/DM were collected. According to disease activity evaluation tools, patients were divided into an active group (28 cases) and a non-active group (40 cases). Additionally, 24 normal volunteers were included. Two radiologists measured the T2 and T1 values of the three muscle groups in the thigh twice on the MAGiC sequence. One-way analysis of variance test was used to compare the differences in T2 and T1 values among different groups. Receiver operating characteristic (ROC) curves were plotted, and analyze the diagnostic efficiency of T2 values for DM and its activity. Spearman

correlation analysis was used to assess the correlation between quantitative parameters and creatine kinase (CK) values in DM/PM patients.

Results: The T2 values of the anterior lateral, medial and posterior muscle group in the DM/PM activity group were higher than those in the non-active group and the corresponding muscle groups in the control group ($F = 48.17/94.60/79.11$, $P < 0.05$). The T1 value of the anterior lateral muscle group in the activity group was higher than that in the non-active group and the control group ($F = 16.13$, $P < 0.05$); the differences in the medial and posterior muscle group were not statistically significant ($P > 0.05$). The AUCs of the T2 values in the three muscle groups of the patient and the control group were 0.939. The AUC of the T2 values in the groups during the active and non-active periods was 0.722. The T2 value of the posterior group was positively correlated with CK ($r = 0.48$, $P < 0.01$).

Conclusion: The MAGiC quantitative mapping technique can quantitatively analyze the muscle involvement in DM/PM patients and are correlated with the clinical indicator CK.

PO-2217

Application value of MAGiC combined with IDEAL-IQ technology in the diagnosis of dermatomyositis/polymyositis

Yuqi Wang, zhaorong tian, zhijun wang
Ningxia Medical University General Hospital

Purpose: To investigate the diagnostic efficiency of the MAGiC sequence combined with IDEAL-IQ technology in the clinical diagnosis of dermatomyositis (DM)/polymyositis (PM).

Methods: A total of 68 patients (47.9 ± 15.0 years old) were retrospectively collected from December 2021 to June 2023, including 24 males and 44 females. Additionally, 24 normal volunteers (10 males and 14 females) were included. All subjects underwent bilateral thigh-axis MAGiC and IDEAL-IQ sequence scanning. Two radiologists measured the T2 and FF values of the three muscle groups in the thigh twice on both the MAGiC and IDEAL-IQ sequences. Intra- and interobserver consistency were evaluated using intraclass correlation coefficients (ICCs). One-way analysis of variance was used to compare the differences in T2 and FF values among different groups. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) was calculated to analyze the diagnostic efficiency of T2 and FF values for PM/DM.

Results: The intra- and interobserver ICC values of all muscle T2 and FF values were above 0.75. The T2 and FF values of the PM/DM group were higher than those of the control group, and the differences were statistically significant ($P < 0.05$). The AUCs of the T2 values and FF values of the PM/DM and control groups were 0.887 (95%CI 0.865-0.907) and 0.783 (95%CI 0.754-0.813), respectively, and the differences were statistically significant ($P < 0.05$). The AUC of the combined T2 and FF values of the PM/DM and control groups was 0.933 (95%CI 0.918-0.957), and the difference was statistically significant ($P < 0.05$).

Conclusion: The IDEAL-IQ sequence can quantitatively evaluate the degree of fat infiltration in PM/DM and determine the progression of the disease, while the MAGiC sequence can reflect the degree of muscle edema in DM/PM. The combination of the two sequences has high diagnostic value for PM/DM.

PO-2218

Quantitative diagnosis of dermatomyositis/polymyositis by IDEAL-IQ technique

Yuqi Wang,zhaorong tian,zhijun wang
Ningxia Medical University General Hospital

Purpose: To investigate the quantitative diagnostic value of IDEAL-IQ technology's $R2^*$ value in assessing thigh muscle lesions in dermatomyositis (DM)/polymyositis (PM).

Methods: A total of 68 PM/DM patients (47.9 ± 15.0 years old) and 24 normal volunteers were retrospectively collected from December 2021 to June 2023. According to disease duration exceeding six months, patients were divided into an acute group (28 cases) and a chronic group (40 cases). All subjects underwent bilateral thigh-axis IDEAL-IQ sequence scanning, and the $R2^*$ values of the three muscle groups in the thigh were measured by two radiologists on the IDEAL-IQ sequence. Intra- and interobserver consistency were evaluated using intraclass correlation coefficients (ICCs). One-way analysis of variance was used to compare the differences in $R2^*$ values among different groups. Receiver operating characteristic (ROC) curves were plotted, and the area under the curve (AUC) was calculated to analyze the diagnostic efficiency of $R2^*$ values for thigh muscle lesions in DM/PM.

Results: The intra- and interobserver ICC values of all muscle $R2^*$ values were above 0.75. The $R2^*$ value of the posterior muscle group in the acute PM/DM group was lower than that in the chronic group and control group, and the difference was statistically significant ($P < 0.05$). The differences in the $R2^*$ values of the anterior and medial muscle groups were not statistically significant ($P > 0.05$). The AUC of the $R2^*$ values of the posterior muscle group in the acute group vs. chronic group, acute group vs. control group, and chronic group vs. control group were 0.679 (95%CI 0.600-0.759), 0.797 (95%CI 0.729-0.866), and 0.672 (95%CI 0.591-0.753), and the differences were statistically significant ($P < 0.05$).

Conclusion: IDEAL-IQ technology's $R2^*$ value can quantitatively analyze muscle involvement in PM/DM patients, which can reflect the disease progression of DM/PM and evaluate the improvement of lesions after treatment.

PO-2219

Quantitative diagnosis of dermatomyositis/polymyositis by MAGiC combined with IDEAL IQ technology

Yuqi Wang,zhaorong tian,zhijun wang
Ningxia Medical University General Hospital

Objective: To investigate the efficacy of the MAGiC sequence combined with the IDEAL-IQ sequence for the quantitative diagnosis of thigh muscle in patients with dermatomyositis (DM) and polymyositis (PM).

Methods: 67 patients diagnosed with DM/PM were retrospectively enrolled as the case group. Matched volunteers ($n=23$) in terms were recruited as the control group. Were scanned with MAGiC sequence and IDEAL-IQ sequence Two radiologists measured the T2, T1, PD, FF and $R2^*$ values of 12 muscles on each sequence. The one-way analysis of variance test was used to compare the T2, T1, PD, FF and $R2^*$ values among different groups. The receiver operating characteristic (ROC) curves were drawn to calculate the area under the curve (AUC) to analyze the diagnostic efficacy of T2, PD, FF and $R2^*$ values, as well as the combination of T2 value and FF value.

Results: The T2 value of the DM/PM group was higher than that of the control group ($Z=-19.818$, $P < 0.05$), while the FF value was higher ($Z=-14.586$, $P < 0.05$), the PD value was lower ($Z=-6.803$, $P < 0.05$), and the $R2^*$ value was lower ($Z=-5.475$, $P < 0.05$) than those of the control group. There

was no significant difference in T1 value between the two groups ($Z=-0.936$, $P=0.349$). The AUC of the T2 value was 0.902 (0.880-0.925), $P<0.05$. The AUC of the FF value was 0.817 (0.786-0.848), $P<0.05$. The AUC of the PD value was 0.653 (0.613-0.694), $P<0.05$. The AUC of the $R2^*$ value was 0.712 (0.674-0.750), $P<0.05$. The AUC of the combination of T2 value and FF value was 0.934 (0.917-0.951), $P<0.05$. The sensitivity and specificity of EMG were 83.58% and 72%, respectively, $P<0.05$.

Conclusion: MAGiC quantitative spectrum technology can quantitatively evaluate the degree of thigh muscle edema in DM/PM patients, and IDEAL-IQ sequence can quantitatively evaluate the degree of thigh fat infiltration. The combination of the two sequences has a higher diagnostic value for DM/PM than EMG.

PO-2220

Prognostic value of FDG-PET/CT based radiomics analysis in newly-diagnosed multiple myeloma: comparison with clinical assessment

Xiang Wang, Li fan, Shiyuan Liu
Changzheng Hospital

Objective: The aim of this study was to explore the clinical utility of FDG-PET/CT-based radiomics fusion diagnostic model for Predicting multiple myeloma (MM) Survivability.

Methods: Our study included a total of 249 newly-diagnosed multiple myeloma from two centers. All patients were examined with whole body PET-CT within one month before treatment, and we built three prediction models in total, including the radiomic model, the clinical model and the fusion prediction model. The combined hematologic diagnoses, R-ISS and PET/CT was selected as an independent clinical model. The hematologic diagnoses included additionally quantification of serum protein, serum albumin, glomerular filtration rate, beta-2 microglobulin, hemoglobin, hematocrit, calcium levels, and serum lactate dehydrogenase. The dataset was randomly assigned to the training cohort or the test cohort in a ratio of 7:3. Synthetic minority oversampling technique (SMOTE) was used to make positive/negative samples balance. Pearson correlation coefficient (PCC)、Principle component analysis (PCA) and Kruskal Wallis methods were used to reduce features. 5-fold cross validation was applied on the training dataset to select hyper-parameters, support vector machine (SVM) and Lasso were selected as the classifier. The prediction performance of the nomogram was assessed using the area under the receiver operating characteristic curve (AUC), calibration curves, and decision curve analysis.

Results: 944 radiomics features were selected to build the radiomic model. The fusion diagnostic model achieved the best model. The fusion prediction model showed better calibration and higher discriminatory capacity (AUC of 0.81 in the internal test cohort, respectively, and 0.79 in the external test cohort, respectively) than the radiomic model and clinical model (AUC of 0.661 and 0.674 for radiomic model in the in the internal test cohort and external test cohort, respectively and AUC of 0.661 and 0.674 for clinical model in the in the internal test cohort and external test cohort).

Conclusions: This fusion prediction model had a remarkable prognostic power for estimating the survival outcomes of patients with NDMM. This fusion prediction model helps discriminate patients with a good prognosis from those with a poor prognosis more precisely.

PO-2221

Automatic grading of knee osteoarthritis using a radiomic model based on plain radiographs: the effect of combined use of anteroposterior & lateral images

Wei Li¹, Jin Liu¹, Yijie Fang¹, Zhongli Xiao¹, Baoxin Qian², Shaolin Li¹

1. The Fifth Affiliated Hospital of Sun Yat-sen University

2. Huiying Medical Technology (Beijing), Huiying Medical Technology Co.

Purpose: This study intends to establish a radiomics-based automatic grading model for knee OA, and compare the effect of different body positions on the model effect.

Methods and Materials: A total of 473 pairs of knee joints plain radiographs from 473 patients (May 2020 to July 2021) were retrospectively analyzed. Each knee joint including anteroposterior (AP) and lateral (LAT) images which were randomly assigned to the training cohort and the validation cohort at a ratio of 7:3. First, Assessment of knee OA severity was done by two independent radiologists with Kallgren-Lawrence grading scale. Then, two radiologists independently delineated the region of interest (ROI) for radiomics features extracting and selecting. The radiomics classification features were dimensionally reduced and a classification was conducted using Logistic Regression classification. At last, receiver operating characteristic (ROC) curve, calibration and decision curves were used to evaluate the classification efficiency of the model.

Results: The AUC (macro/micro) of the combined use of the anteroposterior and lateral images were 0.772/0.778, 0.818/0.799, and 0.864/0.879, respectively. The radiomic features from the combined images achieved better classification performance than the individual position image ($P < 0.05$).

Conclusions: A radiomics model constructed by combining the anteroposterior and lateral images of the knee joint can better grade KOA and assist clinicians in accurate diagnosis and treatment.

PO-2222

The Advantage of 3-Dimensional Quantitative Assessment for Supraspinatus Intramuscular Fatty Infiltration in Patients with Different Degree of Rotator Cuff Tear.

Dong Sun, xin li, xiaolin Quan, Zhiren Han, Mao Nie, Guangyong Ai

Second Affiliated Hospital of Chongqing Medical University, China

Purpose: To determine whether 2D-FF can accurately reflect 3D-FF and whether the relationship is associated with the different degree of tendon retraction and tear size.

Methods: A total of 46 participants with rotator cuff tears were studied. A T2*-corrected 3D multi-echo Dixon (q-Dixon) sequence was performed. Included subjects were categorized into 3 groups based on tendon retraction and 2 groups based on tear size. 2D-FF was calculated from the scapular Y-view. The whole supraspinatus muscle was manually segmented and 3D-FF was automatically obtained on the workstation. A paired t test was used to compare the individual differences between 2D-FF and 3D-FF results. Linear regression equations were performed to determine the agreement between 2D-FF and 3D-FF.

Results: 2D-FF were significantly higher than 3D-FF in the supraspinatus. Patients were prone to significantly be overestimated in the supraspinatus with small tear size ($5.64 \pm 2.38\%$ vs $3.91 \pm 2.33\%$ $P = 0.001$) and no tendon retraction ($5.19 \pm 2.63\%$ vs $3.83 \pm 2.40\%$ $p = 0.02$). 2D-FF overrated the FF compared with 3D-FF by $>50\%$ in 30.4% of the subjects ($n = 46$), and this predominantly ($n = 78.6\%$) was in patients with small tear size and no tendon retraction. The agreement between 2D-FF and 3D-FF was lower in patients with small tear size and no tendon retraction.

Conclusion: 2D-FF couldn't represent 3D-FF for estimating FI of supraspinatus muscle and 2D-FF was significantly higher than 3D-FF, especially in patients with small tear size and no tendon retraction.

PO-2223

The value of improving artifacts by using WARP sequences in assessing image quality after internal fixation implants

Bocheng Wang, MING JUE SI, HAO QING PAN, QIU FANG ZHU, BING BING SUN, LING LING CAI
the 9th hospital affiliated to Shanghai Jiao Tong University School of Medicine

Purpose: the aim of this article is to evaluate the value of improving artifacts by using WARP sequences in assessing image quality after internal fixation implants.

Methods: Analyze total 24 subjects image scores which scanned by using WARP sequences and normal TSE sequences after internal fixation implants operation. Compare the difference between two type sequences about SNR, image scores, scanning time. All data were processed by SPSS 23.0 software edition and checked for statistical significance.

Results: The image scores of WARP sequences were higher than normal TES sequences ($P < 0.01$) as well as the same SNR in these two groups ($P > 0.01$) even if it expended much time ($P < 0.01$).

Conclusion: WARP sequences could help to improved image quality with lower artifacts influence in patients suffered internal fixation implants.

PO-2224

Risk Factors of Intravertebral Cleft in Acute Spinal Fractures and Its Relationship with Cement Leakage After Percutaneous Vertebroplasty or Percutaneous Kyphoplasty

Yi Guo¹, Haitao Yang^{2,3}, Lin Du^{2,3}, ChuanMing Li¹

1. Chongqing University Central Hospital

2. First Affiliated Hospital of Chongqing Medical University

3. ChongQing Tongliang District Hos pital of Traditional Chinese Medicine

Objective: To investigate the risk factors of intravertebral cleft (IVC) in acute spinal fractures (ASF) and its relationship with cement leakage after percutaneous vertebroplasty (PVP) or percutaneous kyphoplasty (PKP).

Methods: 1612 patients diagnosed with ASF in two medical centers were retrospectively included. 127 vertebrae (125 patients) were diagnosed with intraspinal fissure sign and included in the IVC group. 125 age and gender matched patients without IVC were included in the control group (134 vertebrae). Clinical and imaging characteristics including demography, presence of trauma, trauma position, severity of osteoporosis and compression, and the vertebral part of fracture line involvement were compared between the two groups. For the patients who received PKP or PVP within three months, the incidence and type of bone cement leakage were analyzed.

Results: There were significant differences in the compression severity and vertebral fracture line involvement of the inferior endplate, posterior wall and basivertebral foramen between the IVC and control groups ($p < 0.05$). While no significant difference was found in age, presence of trauma, osteoporosis severity, and vertebral fracture line involvement of superior endplate, anterior wall, left lateral wall or right lateral wall between the two groups ($p > 0.05$). The vertebral fracture line involvement of basivertebral foramen was an independent risk factor for IVC (95% CI: 2.415 (1.051~5.550), ($p < 0.05$)). Within 3 month, 64 vertebrae underwent PKP or PVP in the IVC group, and 15 cases experienced leakage. While 61 vertebrae in the control group underwent PKP or PVP,

with 6 cases experiencing leakage. There was a significant difference between the two groups ($p=0.042$). C-type leakage was the most common type for the IVC group, accounting for 86.67% (13/15).

Conclusion: The involvement of basivertebral foramen by vertebral fracture line was an independent factor of the IVC in acute spinal fractures. The vertebral fracture with IVC was more prone to have cement leakage after PVP or PKP.

PO-2225

Diagnostic value of cervical spine DWI-ZOOM in cervical spondylotic myelopathy ---A novel diffusion imaging in spinal

Li Zhang,ning wang,yong wang,baogen zhao
The First hospital of Hebei Medical University

Objective: To investigate the clinical application value of non-shared incentive diffusion imaging technique (ZOOM-DWI) in the diagnosis of cervical spondylotic myelopathy (CSM).

Methods: The patient group consisted of 49 CSM patients treated at the Third Hospital of Hebei Medical University from January 2022 to December 2022, while the control group included 50 healthy volunteers from the same period. All subjects underwent conventional MRI and ZOOM-DWI of the cervical spine, as well as neurological assessment using modified Japanese Orthopedic Association (mJOA) scores in the patient group. Apparent diffusion coefficient (ADC) values were measured at various levels in the patient group and controls. Statistical analyses were performed to compare ADC values and evaluate the correlation between patient ADC values and mJOA scores. The receiver operator characteristic (ROC) curve analysis was conducted to assess diagnostic accuracy.

Results: The mean ADC showed no significantly different levels in the control group. Among the ADC values at each measurement level in the patient group, except for C4-5 and C6-7 segments was not statistically significant, the remaining pairwise comparisons all showed statistically significant differences ($F=24.368$, $p\text{-value} < 0.001$). And C5-6 had the highest ADC value. The C5-6 ADC value in the patient group was significantly higher compared with the ADC value in the control group ($t=9.414$, $p < 0.001$), with statistical significance; The ADC value at the patient stenosis showed a significant negative correlation with the mJOA score ($r = -0.493$, $p < 0.001$), the value of area under ROC curve (AUC)=0.907.

Conclusion: Cervical ZOOM-DWI can be applied to diagnose CSM, and spinal ADC value can be used as reliable imaging data for the diagnosis of cervical myelopathy.

PO-2226

Advancements in the Application of Compressed Sensing Techniques in Spinal and Articular Imaging

Shuo Li
First Hospital of Shanxi Medical University

Abstract: Starting from the application origin of Compressed Sensing (CS) technology, this study primarily integrates domestic and foreign literature from the past decade to review the current status and development trends of CS in spinal and articular Magnetic Resonance Imaging (MRI). This article introduces the fundamental concepts of MRI and elaborates on CS theory. Finally, an analysis is conducted regarding the clinical application of CS-MRI in the context of spinal and articular imaging. The application of Compressed Sensing technology in MRI can reduce imaging

time, accelerate imaging speed, facilitate timely understanding of patient conditions by medical professionals, ensure image quality, effectively suppress artifacts, provide higher-resolution images, and contribute to more accurate clinical diagnoses.

PO-2227

Muscles fat infiltration evaluation for second hip fracture among female adults: a qualitative and quantitative study

Wenshuang Zhang^{1,2}, Ling Wang², Yandong Liu², Yi Yuan^{1,2}, Xiaoguang Cheng²

1. Department of Radiology, Peking University Fourth School of Clinical Medicine

2. Beijing Jishuitan Hospital, Capital Medical University

Purpose

To compare the qualitative and the quantitative muscle parameters as risk predictors of second hip fracture independently of areal bone mineral density (aBMD) in female adults.

Method and Materials

Two female adult groups were included, one with a first, and another with a second hip fracture. Subjects were recruited from the longitudinal Chinese Second Hip Fracture Evaluation (CSHFE), and computed tomography (CT) scans were obtained immediately following their first fracture. On qualitative evaluation, muscles fat infiltration was assessed according to the Goutallier classification system. Quantitative parameters including cross-sectional area and density of the gluteus maximus (G.MaxM) and gluteus medius and minimus (G.Med/MinM) muscles were measured on CT images. CT X-ray absorptiometry was used to measure aBMD of the contralateral femur. Median follow-up time to second fracture was 4.5 years. Cox proportional hazards models were used to compute hazard ratios (HR) of second hip fracture risk in subjects with a first hip fracture.

Results

Two hundred and six female participants (74.9 ± 9.5 years) with a first hip fracture were included in the analysis. Among them, after 4.5 years of follow-up, 35 females (79.3 ± 7.7 years) sustained a second hip fracture, 153 (73.4 ± 9.6 years) without a second hip fracture and 18 (79.5 ± 8.1 years) with death. Except for G.MinM Goutallier grade 3 (HR, 5.83; CI, 1.49–22.83) before adjustment for covariates, there were no statistically significant HRs for qualitative muscles fat infiltration classification in predicting second hip fracture. Among quantitative metrics on muscles fat infiltration evaluation, G.Med/MinM density (HR, 1.44; CI, 1.02–2.04) was significant after adjustment for covariates. G.Med/MinM density remained borderline statistically significant for predicting second hip fracture after adjustment for femoral neck (FN) aBMD in the competing risk analysis (HR, 1.43; CI, 0.99–2.06; $p=0.057$).

Conclusion

Goutallier classification as the most commonly used qualitative method in evaluating muscle fat infiltration is less effective than quantitative muscle metrics in the female fracture cohort, and G.Med/MinM density is a FN aBMD borderline independent predictor of second hip fracture risk for female adults. For practical considerations, quantitative muscle parameters especially G.Med/MinM density appear to be more instructive than qualitative classification as risk predictors of second hip fracture. Incorporating these quantitative muscle measures in clinical assessments may enhance the accuracy of predicting hip fracture risk and enable more effective prevention strategies. For female adults with the first hip fractures, more attention should be paid to muscle mass as well as bone density in order to prevent a second hip fracture.

PO-2228

A practical deep learning framework for the segmentation of Pelvic and sacral tumors on Multiple MRI sequences

Ping Yin, Nan Hong

Department of Radiology, Peking University People's Hospital

Purpose To efficiently segment Pelvic and sacral tumors (PSTs) from MRI images, we developed a deep-learning (DL) method using the available MRI sequences.

Method This study included a total of 616 patients pathologically diagnosed with PSTs between April 2011 to May 2022. We proposed a practical DL framework integrating 2.5D U-net and MobileNetV2 for automatic PSTs segmentation with a fast annotation strategy on multiple MRI sequences (T1-w, T2-w, DWI, and CET1-w). Two different models, the All-sequence segmentation model and the T2-fusion segmentation model were built. During the implementation of our DL models, all regions of interest (ROIs) in the training set were coarse labeled, and ROIs in the test set were fine labeled.

Results The 2.5D MobileNetV2 architecture demonstrated improved segmentation performance compared to 2D and 3D U-Net models, with a Dice score of 0.741 and an IoU of 0.615. The All-sequence model trained using a fusion of four MRI sequences (T1-w & CET1-w & T2-w & DWI), exhibited superior performance with Dice scores of 0.659 for T1-w, 0.763 for CET1-w, 0.819 for T2-w, and 0.723 for DWI as inputs. In contrast, the T2-fusion segmentation model, which used T2-w and CET1-w as inputs, achieved a Dice score of 0.833 and an IoU value of 0.719.

Conclusion All-sequence model demonstrated satisfactory performance with any one of T1-w, DWI, CET1-w, or T2-w as input. And the T2-fusion model produced superior segmentation masks for T2-w sequences with both T2-w and CET1-w as inputs. These models offer solutions for different clinical scenarios and have potential for wide-ranging applications.

PO-2229

Diagnostic value of color-coded virtual non-calcium dual-energy CT for the assessment of bone marrow edema of wrist rheumatoid arthritis

Guodong Xu^{1,2}, Zhongzheng Jia¹

1. Affiliated Hospital of Nantong University

2. Yancheng No. 1 People's Hospital

Objective To evaluate the value of color-coded dual-energy CT (DECT) virtual non-calcium (VNCA) images in the diagnosis of wrist bone marrow edema (BME) in patients with rheumatoid arthritis (RA).

Methods Forty patients with wrist involvement in active RA were prospectively underwent DECT and MRI between January 2021 and September 2022. Functional reconstruction of DECT images was undertaken to obtain VNCA images. CT values of both bone marrow edema and normal bone marrow were measured. Paired chi-square test was applied to compare the differences between VNCA technique and MRI in the diagnosis of BME. Mann-Whitney U test was used to compare the difference of CT values between BME areas and normal bone marrow areas. The optimal CT value for detecting BME in VNCA images was selected based on the receiver operating characteristic curve analysis. The correlation between VNCA image score, MRI image score and RA activity was evaluated.

Results There was no statistically significant difference between VNCA technique and MRI in diagnosing BME ($P = 0.111$). On the VNCA images, there was a statistically significant difference in CT values between BME and normal bone marrow ($P < 0.001$). A cut-off value of -57.2 HU yielded an overall sensitivity, specificity, and accuracy of 90.63%, 94.00%, and 93.04%, respectively, for the detection of wrist BME in RA. The area under the receiver operating

characteristic curve was 0.99 in differentiation of the BME from normal bone marrow. On conventional CT images, there was no statistically significant difference ($P = 0.082$) in CT values between BME and normal bone marrow. The VNCA images score of BME was positively correlated with RA activity ($r = 0.372$, $P < 0.05$).

Conclusions The DECT VNCA technique demonstrates its potential in diagnosing wrist BME in patients with RA and offers a valuable tool for assessing the disease activity in RA.

PO-2230

Reversible Changes of the Knee Articular Cartilage After a Half-marathon: an MRI Study in Healthy Amateur Runners

Yanjing Zhang, Jianping Ding
The Affiliated Hospital of Hangzhou Normal University

Purpose: To explore and assess the effect of long-distance running on knee articular cartilage.

Methods: 12 amateur marathon runners (age: between 28 and 51 years) were recruited. 3D-DESS and T2* mapping were performed on both knees of amateur runners before (t0), immediately after (t1), 3 days after (t2), and 1 week after (t3) the half-marathon running. The non-exercisers were scanned only at t0. An automatic cartilage segmentation method was used to quantitatively assessed the morphological and T2* of knee cartilage pre- and post-marathon. The cartilage thickness, volume, and T2* values of 21 sub-regions were quantitatively assessed, respectively. A one-way repeated measures ANOVA was used to analyze changes in T2* values of cartilage at the four-time points.

Results: The volume and thickness of cartilage in all 21 regions showed no statistical difference before and after the half-marathon exercise. Immediately after running a half-marathon (t1), the regional cartilage analysis of amateur runners showed that T2* values increased in Femur medial posterior, Femur trochlea lateral, and Tibia medial central cartilage, while decreased in Patella lateral central cartilage ($P < 0.05$). The T2* values of all cartilage regions were not significantly different from the baseline level 3 days and 1 week after running.

Conclusion: 1) The change of cartilage T2* value is more sensitive than volume and thickness. 2) After running, the T2* value of the femur and tibia cartilage increased, while the T2* value of the patellar cartilage decreased, which may be related to the load they bear during exercise. 3) The recovery time of T2* value after a half-marathon is about three days.

PO-2231

Effect of lumbosacral transitional vertebrae on developmental alterations of the hip investigated by quantitative measurements of lumbo-pelvic-hip complex on whole body CT

Yuxi Luo
The First Affiliated Hospital of Chongqing Medical University

Purpose: To investigate the effect of LSTV on the hip joint through assessing the alignment and balance of the LPHC by the quantitative imaging measurements.

Methods: This study matched 23 presacral vertebrae (PSV) ($n=102$), 25 PSV ($n=108$) and normal anatomy with 24 PSV ($n=100$) by age and sex. Hip measurement parameters included the measurements of acetabular anteversion angle (AAA), CE angle, Sharp angle, and femoral neck-

shaft angle. Spinopelvic parameters included the measurements of pelvic incidence (PI), pelvic tilt (PT), sacral slope (SS), lumbar lordosis (LL).

Results: The results showed that significant differences were found in the sagittal-AAA values between each pair of the controls and the LSTV subgroups (Right $p < 0.001$, Left $p < 0.05$). Sharp angle, CE angle, femoral neck-shaft angle, Sagittal-AAA and Axial-AAA were correlated with the pelvic incidence (PI) ($p < 0.05$), the pelvic tilt (PT) ($p < 0.05$). PI showed a weak positive correlation with hip parameters, and PT showed a moderate positive correlation with them. Compared to the normal group (24PSV), both the 23PSV and 25PSV groups exhibited an increase in the sagittal-AAA value, with a more significant increase observed in the right side. Furthermore, the increase was more pronounced in the 23PSV group compared to the 25PSV group. Additionally, our paired t-test revealed that apart from Sagittal-AAA, Axial-AAA and femoral neck-shaft angles in LSTV groups and the control group have significant differences, CE angle also showed a significant difference between the 24PSV and 25PSV groups.

Conclusion: Development of variation of LSTV results in excessive coverage of the lateral and anterior acetabulum, particularly an increase in coverage of the anterior acetabular rim, which has a corresponding impact on the development of secondary bone-related lesions. LSTV is unrelated to other hip measurements that reflect acetabular inclination and coverage of the lateral rim of both acetabulum and femur development.

PO-2232

Evaluation of anatomical variations with morphological measurements and their relationship to ligament injury

Kunming Yi, Qin Xiao, Linlin Hu
Army Medical Center of PLA, Army Medical University

Purpose: The objective of this study was to reveal the anatomical risk factors for anterior and posterior cruciate ligament (ACL and PCL) injuries. We aim to investigate whether there are significant relationship between tibial tubercle-trochlear groove distance (TT-TG), patella angle, trochlear sulcus angle (TSA), trochlear groove depth (TGD), medial tibial condyle angle (MTA) and lateral trochlea length (MT and LT), MT/LT ratio, lateral patellar tilt angle (LPTA), patella-patellar tendon angle (P-PTA), quadriceps-patellar tendon angle (QPA), Insall-Salvati index (ISI), medial and lateral trochlear inclination (MTI and LTI) measurements and important common pathologies such as ACL, PCL, medial and lateral meniscal injuries (MM and LM), peripatellar fat pad edema, chondromalacia and effusion. Thus, the mechanisms of injury will be better understood by revealing important anatomical variations for ligament damage

Methods: In this retrospective study, 246 patients with knee magnetic resonance imaging examination included in this study. Our patients who underwent knee MRI were divided into groups according to the presence of MM tear, LM tear, ACL tear, PCL tear, peripatellar fat pad edema, chondromalacia and effusion. TT-TG distance, patella angle, TSA, TGD, MT, LT, MT/LT ratio, LPTA, P-PTA, QPA, ISI, MTI and LTI were measured.

Results: In patients with ACL tear; age, LT, ML/LT ratio and QPA measurements were found to be significantly higher. There was no significant difference between the participants' LPTA value and the presence of ACL tear, MM and LM injury. MT and ML/LT ratio were found to be significantly lower in the group with MM tear ($p < 0.001$). The TT-TG distance was found to be significantly lower in the group with LM tear. **Conclusion:** Increased age, LT, ML/LT ratio and QPA are predispose risk for ACL tear. Decreased MT and ML/LT ratio are among the risk factors for MM tear. The anatomical variations are associated with ligament and meniscal injury.

PO-2233

Diffusion-relaxation correlation spectrum imaging for detecting early-stage knee osteoarthritis with four compartment

Peng Luo, Guanwu Li

Yueyang Hospital of Integrated Traditional Chinese and Western Medicine, Shanghai University of Traditional Chinese Medicine

Purpose: To present a technique that enables knee early-stage OA detection using diffusion-relaxation correlation spectrum imaging (DR-CSI).

Methods: Fifty-five early osteoarthritis (OA, Kellgren-Lawrence [KL] score 1 to 2; mean age, 56.4 years) and forty-nine healthy volunteers (mean age, 56.7 years) were tested on MR scans with T2-mapping and DR-CSI techniques. Maps of mean apparent diffusion coefficient (ADC), T2 relaxation time and volume fraction V_i for DR-CSI compartment i (A, B, C, D) sensitivity, specificity, and positive and negative likelihood ratio (PLR, NLR) were assessed to determine the diagnostic accuracy for detection of early-stage degeneration in knee articular cartilage. The structural abnormalities of articular cartilage were evaluated by the modified Whole-Organ MR Imaging Scores (WORMS).

Results: All intra- and inter-observer agreements for DR-CSI compartment volume fractions and modified Whole-Organ MR Imaging Scores (WORMS) of cartilage were excellent. Early OA versus the controls had higher V_C , lower V_A and V_B ($p < 0.001$), but comparable V_D ($p > 0.05$). V_A , V_B and V_C had a moderate association with WORMS. No significant correlation was identified between V_D and WORMS. V_C had better ability than V_A , V_B , V_D , T2 and ADC to discriminate early OA patients from healthy controls (area under the curve, 0.898). Sensitivity, specificity, PLR, and NLR of V_C with cutoff value 29.9% were 81.8% (95% CI, 69.1% - 90.9%), 95.9% (86.0% - 99.5%), 20.05% (5.13% - 78.34%), and 0.19% (0.11% - 0.33%).

Conclusions: DR-CSI compartment volume fractions may be sensitive indicators for detecting early-stage degeneration in knee articular cartilage.

PO-2234

Effect of lumbosacral transitional vertebrae on sagittal balance of lumbo-pelvic complexity assessed by quantitative whole-body CT imaging

Suying Zhou, Lin Du, Haitao Yang

The First Affiliated Hospital of Chongqing Medical University

Objective This study aims to investigate the influences of lumbosacral transitional vertebrae (LSTV) on sagittal lumbo-pelvic balance assessment and provide some recommendations for preoperative imaging evaluation.

Methods Based on whole-body CT images, a total of 310 individuals with complete segmentation anomalies of LSTV were included and divided into 23 presacral vertebrae (PSV) (sacralization, $n = 102$), 25 PSV (lumbarization, $n = 108$). The control group with 24 PSV (normal, $n = 100$) was matched by age and gender. Sagittal lumbo-pelvic parameters including pelvic incidence (PI), pelvic tilt (PT), sacral slope (SS), lumbar lordosis (LL), sacral table angle (STA), sacral kyphosis (SK) and pelvic radius (PR) were measured at the ontogenetical S1 (Ontog S1) level and the morphological S1 (Morph S1), respectively. The association of lumbo-pelvic parameters with LSTV types and measurement levels was investigated.

Results All the parameters at the Ontog S1 differed significantly from those at the Morph S1 (all $p < 0.001$). At the Ontog S1 level, PI, PT, SS and LL were negatively correlated with vertebrae counts; SK and PR were positively correlated with vertebrae counts (all $p < 0.001$). Instead, reverse results

were obtained at the Morph S1 level. The measurement level and vertebrae counts were independent influence factors for the measurement of PI, PT, SS, SK and PR (all $p < 0.05$). Compared with the measured values of the matched controls, the variability of most lumbo-pelvic parameters (PI, SS, LL, STA, SK, PR values of 25 PSV subgroup, and PI, PT, SS, LL, STA values of 23 PSV subgroup) at the Morph S1 level were significantly smaller than that at the Ontog S1. The measurements of PT, SS, LL and PR were less influenced by the measurement level and vertebrae counts than those of PI and SK.

Conclusion Morph S1 is more recommended for the measurements of most lumbo-pelvic parameters in patients with LSTV. The parameters (PT, SS, LL, STA, PR) are shown more stable and recommended to help reduce the effects caused by LSTV.

PO-2235

MRI features in the ankles of amateur marathon runners and analysis of associated factors

Wanzhen Yao, Zhenmei Huang, Jianping Ding
The Affiliated Hospital of Hangzhou Normal University

Objective To explore the MRI features of and factors associated to ankle injuries in amateur marathon runners.

Materials and methods 72 amateur marathon runners as the study group and 32 healthy volunteers as the control group were recruited. All subjects were asked to complete a questionnaire at the beginning of the study and underwent MRI of the ankle. To compare the differences of ankle injuries between the two groups, and to explore the MRI manifestations of ankle injuries in amateur marathon runners. The independent sample chi-square test was used to analyze the relationship between ankle injury and different sex, BMI, foot strike pattern, running years and monthly running distance in the study group.

Results The main MRI features in the study group were peritendinous effusion and ligament injuries. The peritendinous effusion was mainly found in flexor tendons and ligament injuries mainly manifested as old lateral collateral ligament injury. Others common ankle injuries included bone marrow edemalike signal intensity and Achilles tendinopathy. The main MRI features in the control group were peritendinous effusion, and flexor hallucis longus tendon and posterior tibialis tendon were common. There was no statistically significant difference in peritendinous effusion of flexor hallucis longus tendon (chi-square value was 0.320, $p=0.572$) and flexor digitorum longus tendon (chi-square value was 0.256, $p=0.613$) between the two groups. The difference between the other major injuries between the two groups was statistically significant ($p<0.05$). In the study group, the incidence of calcaneofibular ligament injury was higher in women than in men, the incidence of Achilles tendinopathy was higher in those who habitually used a non-rearfoot strike pattern than in those who habitually used a rearfoot strike pattern, the incidence of anterior talofibular ligament injury was higher in those who habitually used a rearfoot strike pattern than in those who habitually used a non-rearfoot strike pattern, and the incidence of Achilles tendinopathy was higher in a higher running years group than in a lower running years group, the all differences were statistically significant (All $p<0.05$). BMI and monthly running distance were not significantly different between the groups (All $p>0.05$).

Conclusion Recreational marathon may lead to several positive MRI findings without correlation with clinical findings. The main MRI features of amateur marathon runners are peritendinous effusion and old lateral collateral ligament injury. Other common ankle injuries include bone marrow edemalike signal intensity and Achilles tendinopathy. In addition, the MRI features of ankle injuries in amateur marathon runners are related to different sex, foot strike pattern and running years.

PO-2236

Blood Oxygenation Level Dependent MRI on Assessing the Muscle Perfusion of Patients with Peripheral Arterial Occlusive Disease under the P30 Model

Xiaojuan Peng¹, Jianling Cui²

1. Daping Hospital, Army Military Medical University

2. The Third Hospital of Hebei Medical University, Hebei Province Biomechanical Key Laboratory of Orthopedics

Objectives: To investigate the repeatability and feasibility of blood oxygenation level dependent MRI (BOLD-MRI) on assessing the perfusion of calf muscles under the ischemia-hyperemia model, which was provoked by the quick inflation and deflation of a cuff placed around the midthigh level with a pressure of brachial systolic blood pressure plus 30 mmHg (P30 model).

Methods: 15 young healthy volunteers, 15 age-matched old healthy volunteers and 20 patients with peripheral arterial occlusive disease (PAOD) were recruited in the study for BOLD-MRI imaging. And 15 subjects (5 subjects for each group) were randomly selected to be rescanned after 24 hours in the same condition. The BOLD parameters were calculated on standardized BOLD time-signal curves for each muscle, including gastrocnemius, soleus, peroneus, tibialis anterior and tibialis posterior.

Results: TTP and Shyp showed excellent interscan repeatability, especially TTP (ICC= 0.969, CV= 9.3%). There were significant difference among the three groups in TTP and Shyp (all $P < 0.05$), and the MIV of soleus was larger than the other four muscles ($P < 0.05$). Meanwhile, TTP and Shyp performed a good diagnostic capability on distinguishing the perfusion deficit between PAOD patients and healthy controls, with the area under the curve (AUC) were 0.979 and 0.917 respectively.

Conclusion: BOLD-MRI had a good repeatability and feasibility on assessing the perfusion of calf muscles under the P30 model.

PO-2237

QRAPMASTER for Quantitative evaluation of knee cartilage: ready for clinical daily practice?

Lin Mu, Huimao Zhang

The First Hospital of Jilin University

Synopsis

Quantitative MRI assigns absolute quantification of T1, T2 and PD based on tissue characteristics, such as the T2 metric values a surrogate marker for cartilage collagen integrity. The QRAPMASTER technology enables inline generation of quantitative T1 maps and T2 maps and scans of high image quality, representing a promising synthetic MRI option that appears clinically feasible and may eventually facilitate the time neutral acquisition of quantitative T1 maps, T2 maps in the knee MRI.

Introduction

Knee pain affects approximately 25 % of adults, limits function and mobility, and impairs life quality (1). Based on the structural and contrast abnormalities of MR images, many diseases can be diagnosed, such as ligament fibers rupture, meniscal tissue tear, and articular cartilage substance defects (2). However, specific states of disease, such as early articular cartilage degeneration and healing after cartilage restoration, may escape detection with morphologic MRI. T1 and T2 relaxation times are physiological tissue property which reflect cartilage collagen integrity (3,4). "Quantification of Relaxation Times and Proton Density by Multi echo acquisition of a saturation-recovery using Turbo spin-Echo Readout" (QRAPMASTER) is a novel method, which generates multiple contrast images and absolute quantification of relaxation time within a single scan. QRAPMASTER collects four reverse times and two echoes to obtain the T1 map, T2 map and PD

map(5). An important feature of QRAPMASTER method is that T1 and T2 maps are measured independently at the same location, so there is no error propagation between them, and registration is not required. In addition, based on these quantization parameters, it can generate many contrasts, such as T1WI, T2WI, PDWI, etc. The concomitant T1, PD and T2 maps are generated by inversion recovery methods with different inversion times and multi echo spin echo methods with different TE fitting, respectively. Studies have shown QRAPMASTER may be feasible in the diagnosis of knee disease, T2WI and PDWI showed substantial image quality for the assessment of knee diseases compared with conventional imaging. While few study investigate the value of quantitative image T1 and T2 maps of synthetic MRI in knee diseases. The purpose of this study was to characterize articular cartilage using T1 and T2 maps generated from QRAPMASTER based on multiple-dynamic multiple echo (MDME) sequence in a clinical setting.

Methods

The study was approved by the local IRB, and written informed consent was obtained from all subjects. A total of 10 volunteers were examined on a 3T MRI scanner (MAGNETOM Vida, Siemens Healthcare, Erlangen, Germany) with a dedicated knee coil. Reference scanning including sagittal 2D T1WI, B1 inhomogeneity-corrected variable flip angle (VFA) T1mapping and spin echo T2mapping were performed with the detail imaging parameters as shown in table1. The MDME sequence was performed using the following imaging parameters in a sagittal orientation for synthetic reconstruction (Table1). Quantitative image analysis (reference scan VBF T1mapping and SE T2mapping vs synthetic T1, T2mapping) was performed by three radiologists with more than 5 years of experience. ROIs were placed on muscle (gastrocnemius muscle), fat pad, and cartilage. Based on the ROIs, value of T1/T2mapping, signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) were analyzed for objective evaluation. All numerical values were reported as the mean \pm SD. We used a paired t-test to compare the value, SNR, and CNR with the common and synthetic sequences. Statistical significance was defined as a p-value less than 0.05.

Results

The total scan time for each knee T1WI, T1mapping, T2mapping was around 10mins. and the scan time of MDME was around 7mins.

The quantitative image analysis results for the different anatomical locations are shown in Table 1. The T1 and T2 relaxation times of fat pad and cartilage were significantly different between two methods (reference scan VFA\SE sequence and QRAPMASTER)(6), and these values were within the results reported in the previous literatures. No difference was found for the SNR of fat tissue in two T1\T2 mapping. The SNR for cartilage in T1mapping was 10.01 ± 5.67 , which is significantly different from synthetic T1mapping. The CNR (muscle-cartilage) of synthetic T1mapping and T2mapping, CNR (fat pad-cartilage) of synthetic T2mapping did not demonstrate significantly reduced compared to the reference sequence. Figure 2 showed metric values of T1/T2mapping comparable to that of the conventional method, and there was significant difference between the quantitative value in cartilage of knee.

Discussion

The QRAPMASTER based on MDME showed image quality comparable to that of the reference method, especially for cartilage in T2mapping, which took obviously shorter scan time(5). These quantitative imaging analyze the cartilage mainly by providing information regarding water content, collagen integrity, and proteoglycan content. The small structures such as cartilage in knee MRI were also demonstrated well in synthetic images, and produced visually sharper images compared to conventional method. However, the synthetic images became very noisy and the values of fat pat and cartilage in quantitative sequence were significantly different. The above results suggests that the MDME scan may be useful for getting a high-quality quantitative image to improve diagnostic confident and save 33% of scanning time, and it is essential to enable this new technology to be implemented in clinical routine, especially the evaluation of cartilage. The initial results, which need to be further validated in a larger patient cohort, demonstrated the ability of T1 and T2 metric values to characterize articular cartilage and other knee normal structures.

Conclusion

QRAPMASTER for quantitative evaluation of knee cartilage may decrease up to 33% scan time, demonstrated the ability of T1 and T2 metric values to characterize articular cartilage in knee MRI.

PO-2238

Effects of vitamin D on bone marrow fat fraction and microvascular permeability in diabetic rabbits:a quantities MRI study

Yuchen Yan¹,Liang Li¹,Yan Wang¹,Changsheng Liu¹,Weiyin Liu²,Yunfei Zha¹

1. Renmin hospital of wuhan university

2. MR Research, GE healthcare, Shanghai

Abstract

Objectives: To evaluate the effect of vitamin D on the proton density fat fraction (PDFF) and permeability of bone marrow in the vertebrae of alloxan-induced diabetic rabbits using the iterative decomposition of water and fat with echo asymmetry and least-squares estimation quantitation (IDEAL-IQ) technique and quantitative dynamic contrast agent-enhanced magnetic resonance imaging (DCE-MRI) sequence.

Methods: Thirty male New Zealand rabbits aged 28-32 weeks were randomly divided into three groups: diabetic, intervention, and control groups. Scans were performed at weeks 0, 4, 8, 12, and 16. The parameters of IDEAL-IQ (PDFF) and DCE-MRI (transfer constant [K_{trans}], rate constant [K_{ep}], and volume of extracellular space [V_e]) were compared in pairs between the groups using repeated measures at fixed time points. The correlations of DCE-MRI and PDFF parameters with the microvessel density (MVD), endothelial progenitor cells (EPCs) and adipocytes were analyzed using Spearman's correlation coefficient.

Results: Vitamin D did not significantly improve the parameters of IDEAL-IQ and DCE-MRI in diabetic rabbits based on the PDFF, K_{trans}, K_{ep}, and V_e ($P < 0.05$ for all). In the 16th week, the PDFF in the intervention and diabetic groups showed no significant differences ($t = -0.481$, $P = 0.412$), while the MVD showed statistical significance ($t = 15.681$, $P < 0.05$). The PDFF showed a significant positive correlation with adipocytes ($r = 0.828$, 95%CI: 0.611~0.965), and the MVD was significantly positively correlated with K_{trans} and K_{ep} ($r = 0.672$, 95%CI: 0.394~0.816; $r = 0.827$, 95%CI: 0.704~0.911) in diabetic rabbits. However, the EPCs showed a significant negative correlation with K_{trans} ($r = -0.395$, 95%CI: -0.553~0.096) and were not correlated with K_{ep} ($P > 0.05$).

Conclusions: Vitamin D did not improve the progression of bone marrow fat tissue and microvascular permeability in diabetic rabbits in the 16th week using the quantitative DCE-MRI and IDEAL-IQ sequence.

PO-2239

Deep learning based on knee MRI for fully automated precision diagnosis of rheumatoid arthritis, gout, and pigmented villonodular synovitis

Qizheng Wang, Ning Lang
Peking University International Hospital

Purpose: To develop a deep learning (DL) segmentation model of the suprapatellar capsule (SC) and infrapatellar fat pad (IPFP) based on knee MRI, and to establish classification models based on the two regions of interests (ROIs) to distinguish 3 common knee synovitis. Their discrimination performance was compared with the radiologists' assessment.

Materials and Methods: In this retrospective study, 376 patients (Internal training set: 233 cases, internal test set: 93 cases, external test set: 50 cases) with pathologically diagnosed knee synovitis, including rheumatoid arthritis (RA), gouty arthritis (GA) and pigmented villonodular synovitis (PVNS) from two institutions were included. Manual annotation was performed on SC and IPFP, and a semantic segmentation model was trained based on Resnet and UNet networks based on PD-weighted images to reduce the burden of manual annotation. Segmentation of SC and IPFP obtained and then processed through two pooling layers for feature extraction, with the patient's gender and age features added and processed through polynomial feature mapping. The professional doctors' classification results were compared with five machine learning methods: support vector machine (SVM), multilayer perceptron (MLP), decision tree, AdaBoost and XGBoost.

Results: Patients enrolled in institution A were assigned to a training cohort (69 with RA, 87 with GA, and 77 with PVNS) and a test cohort (25 with RA, 43 with GA, and 25 with PVNS). Patients included in Institution B formed the external test cohort (15 with RA, 21 with GA, and 14 with PVNS). The test results of the automatic segmentation model recall (internal test set=0.8164, external test set=0.7065), precision (I=0.7796, E=0.6598), mIoU (I=0.6633, E=0.5178) and mACC (I=0.9907, E=0.9893) all show a more accurate segmentation of ROI (IPFP and SC). The test results of the automatic segmentation model recall (internal test set (I)=0.8164, external test set (E)=0.7065), precision (I=0.7796, E=0.6598), mIoU (I=0.6633, E=0.5178) and mACC (I=0.9907, E=0.9893) all show a more accurate segmentation of segmentation of the ROI (IPFP and SC) was relatively accurate. The performance of classification models was assessed mainly by the results of the area under curve (AUC), and with the comparison results of SVM (I=0.8046, E=0.6903), MLP (I=0.8264, E=0.7558), Adaboost (I=0.7873, E=0.7429), XGboost (I=0.7648, E=0.7013), and Decision Tree (I=0.7663, E=0.7669) and professional doctors (I= , E=) show that our ROI segmentation and classification diagnosis model has higher classification accuracy and less manual burden.

Conclusion: The established DL methods for segmentation and classification of different knee synovitis lesions based on SC and IPFP can support an accurate radiologic diagnosis.

PO-2240

Dual-energy computed tomography for measuring bone mineral density at different energy levels: correlation with quantitative CT

Yali Li, Dan Jin, Ming Ni, Chenyu Jiang, Huishu Yuan
Peking University Third Hospital

Purpose

The objective of this study was to evaluate the precision and agreement between BMD measurements performed in quantitative CT (QCT) and DECT-derived hydroxyapatite (HAP) concentration of the L1 vertebra to L3 vertebra with European Spine Phantom (ESP) under different radiation exposure, and to assess how the keV level influences BMD measurements and determine the usefulness of keV level of quantitative DECT closest to the results of QCT.

Materials and Methods

Data acquisitions were scanned using Revolution CT (GE Healthcare, Waukesha, WI) at 120kV with tube rotation times of 0.8 seconds and modulated tube currents of 100 and 500mA, and fast tube voltage switching between high and low energy (140/80kVp) with tube rotation times of 0.5 seconds and modulated tube currents of 240 and 365mA

on March 2023 on ESP (No. 145, Germany ORM company) for ten repeated times without repositioning. The HAP values of the three vertebrae were measured from the axial-view HAP (Water)-based material decomposition (MD) images, and the DECT-derived HAP values were reconstructed with 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76keV monochromatic images acquired by QCT, respectively. The BMD value of the three ESP vertebrae of the L1, L2, L3, and the average L1-3 were measured by QCT PRO workstation (Mindways QCT PRO workstation). The relative errors (RE) and relative standard deviations (RSD) were calculated and compared with the nominal values of the ESP (L1, 51.0; L2, 102.2; L3, 200.4mg/cm³). The association of the two measurements were analyzed by Pearson correlation. One-way analysis of variance (ANOVA) was used to compare BMD values of different keV levels and tube currents on ESP.

Results

The volume CT dose index (CTDI_{vol}) of QCT were 5.53mGy in 100mA and 27.66mGy in 500mA, whilst DECT were 5.80mGy in 240mA and 9.25mGy in 365mA. Under different scanning conditions, the QCT-derived BMD values of the L1, L2, and L3 were 53.60±0.27, 106.25±0.11, 202.76±0.23mg/cm³, respectively. The DECT-derived HAP values of the L1, L2, and L3 were 55.56±1.05, 117.23±1.02, 233.50±1.80mg/cm³ in 66keV, 54.40±1.13, 115.26±0.88, 228.25±1.44mg/cm³ in 67keV, 53.45±1.44, 112.91±1.27, 223.80±2.09mg/cm³ in 68keV, 52.33±1.17, 110.66±1.13, 219.39±2.01mg/cm³ in 69keV, 51.28±1.13, 108.71±0.74, 214.77±1.18mg/cm³ in 70keV, 50.9±1.22, 107.02±0.71, 210.65±0.86mg/cm³ in 71keV, 50.00±1.37, 105.32±1.26, 207.13±1.42mg/cm³ in 72keV, 49.64±1.35, 104.20±0.85, 204.68±0.88mg/cm³ in 73keV, 48.60±0.77, 100.89±0.51, 200.23±0.82mg/cm³ in 74keV, 46.61±1.00, 99.04±0.82, 195.47±0.90mg/cm³ in 75keV, 48.70±7.70, 97.93±0.79, 193.08±1.02mg/cm³ in 76keV, respectively. For QCT-derived BMD values of the L1, L2, and L3, the RE and RSD of the L1, L2, and L3 were 5.09, 4.94, 1.18mg/cm³ versus 4.85%, 4.71%, 1.16%, respectively. For DECT-derived HAP values, the RE and RSD of the L1, L2, and L3 were 8.94, 14.70, 16.52mg/cm³ versus 8.20%, 12.82%, 14.18% in 66keV, 6.66, 12.78, 13.90mg/cm³ versus 6.24%, 11.33%, 12.20% in 67keV, 4.80, 10.48, 11.68mg/cm³ versus 4.58%, 9.49%, 10.46% in 68keV, 2.60, 8.28, 9.47mg/cm³ versus 2.54%, 7.65%, 8.65% in 69keV, 0.55, 6.37, 7.17mg/cm³ versus 0.54%, 5.99%, 6.69% in 70keV, -0.20, 4.71, 5.11mg/cm³ versus -0.21%, 4.50%, 4.87% in 71keV, -1.97, 3.25, 3.36mg/cm³ versus -2.01%, 4.50%, 4.87% in 72keV, -2.67, 1.95, 2.14mg/cm³ versus -2.74%, 1.92%, 2.09% in 73keV, -4.71, -1.28, -0.09mg/cm³ versus -4.95%, -1.30%, -0.09% in 74keV, -8.60, -3.09, -2.46mg/cm³ versus -9.41%, -3.19%, -2.52% in 75keV, and -4.52, -4.18, -3.65mg/cm³ versus -4.73%, -4.36%, -3.79% in 76keV, respectively. Results indicated that the RE and RSD values of each vertebral body at the energy level of 74keV were lowest, whilst highest in

66keV, and closest to the QCT-derived BMD values. As the energy level changed, the RE and RSD of the L1 showed a largest variation than L2 and L3. There was a strong positive correlation between the two methods in 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76keV ($r=0.7091, 0.7983, 0.8411, 0.7617, 0.8620, 0.9855, 0.7040, 0.7003, 0.9104, 0.7240, 0.05032, P<0.05$), respectively. There were significant differences at different energy levels ($P<0.05$), whilst no statistically significant differences in different tube current groups ($P>0.05$).

Conclusion

The DECT-derived HAP values at energy level of 74keV was closest to the QCT-derived BMD values, indicating that patients who undergo DECT with the scan parameters of 240mA, 0.5r/s, and 74keV can be selected to measure BMD with relatively high accuracy and precision and reduce radiation exposure on patients.

PO-2241

Association of Lumbar Trabecular Bone Ultrashort Echo Time Magnetization Transfer Ratio (UTE-MTR) with Intervertebral Disc Degeneration

Jin Liu, Xiaoling Liang, Wei Li, Jiaxin Feng, Jianwei Liao, Jianbang Zhang, Shaolin Li
The Fifth Affiliated Hospital of Sun Yat-Sen University

Purpose: To investigate the relationship between ultrashort echo time magnetization transfer ratio (UTE-MTR) measurements of lumbar trabecular bone and intervertebral disc degeneration (IVDD). **Methods and Materials:** A total of 150 patients with IVDD (age 42 ± 8 years, age range 37-75) were recruited and scanned with UTE-MT sequence in lumbar on a 3T MRI scanner (Signa, Pioneer, GE Healthcare). The UTE-MT sequence was scanned twice with flip angle of 750° for MT-On and 0° for MT-Off. Other UTE-MT sequence parameters were as follows: TR = 100 ms, TE = 0.032 ms, excitation flip angle = 5° , number of spokes per-TR = 5, FOV = 28cm \times 28cm, matrix = 140 \times 140, slice thickness = 3.6mm, and slice number = 16, oversampling factor = 1.2, and scan time = 3min. The UTE-MTR is calculated by the signal ratio of the difference between UTE-MT-OFF and UTE-MT-ON to the UTE-MT-OFF. Mean lumbar trabecular bone UTE-MTR value corresponding to each disc was calculated by averaging adjacent upper and lower vertebral body UTE-MTR. The grade of IVDD was assessed using the Pfirrmann scoring system. Pearson correlation analysis was performed to calculate the correlations between lumbar trabecular bone UTE-MTR and age, gender, and ODI, respectively. A one-way ANOVA test was used to compare lumbar trabecular bone UTE-MTR between different grades of disc degeneration. A value of $P < 0.05$ was considered as a statistically significant.

Results: The lumbar trabecular bone UTE-MTR showed a strong negative correlation with grade of IVDD ($r = 0.352, P < 0.001$), lumbar trabecular bone UTE-MTR decreased with grade of IVDD. Moreover, our results showed that the lumbar trabecular bone UTE-MTR was negatively correlated with age ($r = -0.482, P < 0.001$) and ODI ($r = -0.396, P < 0.05$), while had no association with gender. **Conclusion:** UTE-MTR measurements of lumbar trabecular bone may be a useful biomarker to predict IVDD.

PO-2242

Utilization of T1-Mapping for the pelvic and thigh muscles in Duchenne Muscular Dystrophy: a quantitative biomarker for disease involvement and correlation with clinical assessments

Fei Peng,Guanghua Luo,Heng Zhao
The First Affiliated Hospital of University of South China

Objectives: Little is known about the disease distribution and severity detected by T1-mapping in Duchenne muscular dystrophy (DMD). Furthermore, the correlation between skeletal muscle T1-values and clinical assessments is less studied. Hence, the purposes of our study are to investigate quantitative T1-mapping in detecting the degree of disease involvement by detailed analyzing the hip and thigh muscle, future exploring the predicting value of T1-mapping for the clinical status of DMD.

Methods: Ninety-two DMD boys were included (mean age was 8.78 ± 2.06 years, range 5-15 years). Four representative cross-section levels (①level near the sciatic foramen; ②level near the greater trochanter-ischial tuberosity; ③level near the closer proximal part of the femoral diaphysis; ④approximately 5 cm below level ③) that contained larger area of visible muscle with the excellent distinction of different muscle compartments were chosen for MRI assessments. Grading fat infiltration and measuring the T1-values of Nineteen muscles (gluteus maximus, gluteus medius, gluteus minimus, iliopsoas, tensor fascia, obturator internus, pectineus, rectus femoris, vastus lateralis, vastus intermedius, vastus medialis, gracilis, sartorius, adductor longus, adductor brevis, adductor magnus, semitendinosus, semimembranosus, biceps femoris long head) in the right side of the pelvic girdle and right thigh in axial T1-weighted images (T1WI) and T1-maps, respectively, the disease distribution and severity were evaluated and compared. Visual grading of axial T1WI through the 5-point modified Mercuri scale of fat infiltration (0=normal, 1=mild fatty streaks, 2=mild fat infiltration < 30%, 3=moderate fat infiltration between 30%–60%, 4=severe fat infiltration >60%) . The region of interest (ROI) was obtained by manually tracing the outline of the individual muscle. The ROI size was determined by using the individual muscle size on the axial images. Placing the ROI of each muscle on the T1-maps automatically generated a mean T1-value for each muscle. Finally, the average value measured by the two radiologists was taken as the T1-value of each muscle. Clinical assessments included age, height, weight, body mass index (BMI), wheelchair use, timed functional tests (10-m run/walk, Gowers manoeuvre, 4-stair climb, 4-stair descend), NorthStar ambulatory assessment (NSAA) score, serum creatine kinase (CK) level. The NSAA used a 17-item rating scale, and each item was 0-2 points, with a total score being 34 points (the higher total score, the better motor function). The Shapiro-wilk test was used to evaluate the normality of the data distribution. The individual muscle T1-value among different grades of fat infiltration was compared by test for trend. The Spearman method with Benjamini-Hochberg correction was used to assess the correlation between T1-values, the Mercuri scale and clinical assessments. Multiple linear regression analysis was used to determine the independent association of T1-value and clinical motor function. The above results were considered statistically significant when the $P < 0.05$. Bland-Altman plots and interclass correlation coefficient (ICC) were used to determine the reproducibility of the T1-value ROI measurement. All statistical analyses were conducted with SPSS version 22.0 and MedCalc Version 20.011.

Results: Approximately 12.0 % of patients (11 of 92) used a wheelchair in the study group. Since the timed functional tests can only be carried out in cooperative patients with mild to moderate dysfunction, the 10-m run/walk, Gowers manoeuvre, 4-stair climb, 4-stair descend were obtained in 77, 68, 68, 68 patients, respectively. NSAA scores and serum CK levels were acquired in all 92 patients. The gluteus maximus achieved the highest mean score of fat infiltration and had the lowest T1-value, followed by the adductor magnus, the gracilis muscle showed the lowest mean

score of fat infiltration and had the highest T1-value. T1-value decreased as the grade of fat infiltration increased scored by T1WI (P-value <0.001). Negative correlations were found between T1-value and the participants' age ($r = -0.297$ to -0.629 , all P-value <0.05), height ($r = -0.244$ to -0.571 , all P-value <0.05), weight (P-value of 17 muscles were <0.05, $r = -0.283$ to -0.495), BMI (P-value of 6 muscles were <0.05, $r = -0.255$ to -0.286), wheelchair use (P-value of 18 muscles were <0.05, $r = -0.223$ to -0.527), 10-m run/walk (P-value of 12 muscles were <0.05, $r = -0.268$ to -0.605), Gowers manoeuvre (P-value of 9 muscles were <0.05, $r = -0.366$ to -0.705), 4-stair climb (P-value of 9 muscles were <0.05, $r = -0.308$ to -0.668), 4-stair descend (P-value of 8 muscles were <0.05, $r = -0.333$ to -0.527). Positive correlations were discovered between T1-value and NSAA ($r = 0.232$ to 0.721 , all P-value <0.05), serum CK level (P-value of 14 muscles were <0.05, $r = 0.292$ to 0.491). Notably, the T1-value of gluteus maximus, gluteus medius, tensor fascia, pectineus, rectus femoris, vastus lateralis, vastus intermedius, vastus medialis, adductor magnus, biceps femoris long head showed a correlation (P-value <0.05) with both NSAA and timed functional tests. Besides, most of the correlations between T1-values and clinical assessments were moderate or high [r (absolute value) = 0.404 to 0.721 , P-value <0.01]. Although some of the correlations appeared to be relatively weak ($r = -0.394$ to 0.396), they were still statistically significant (P-value <0.05). Especially in the correlations between T1-values and NSAA, except the gracilis and sartorius showed a relatively weak correlation ($r = 0.232$ to 0.330 , P-value <0.05), the T1-values of the remaining 17 muscles all showed good correlation with NSAA ($r = 0.419$ to 0.721 , P-value <0.01). Multiple linear regression analysis showed that the T1-value of tensor fascia and adductor magnus possessed an independent association with the NSAA score (P-value <0.05), the T1-value of vastus medialis showed an independent association with 10-m run/walk (P-value <0.05), the T1-value of gluteus maximus and vastus lateralis achieved an independent relevance with 4-stair climb (P-value <0.05), and the T1-value of vastus intermedius manifested an independent relevance with 4-stair descend (P-value <0.05). The Bland-Altman plots and ICC analysis showed excellent reproducibility of T1-value ROI measurement. Bland-Altman plots presented good agreements between the two independent observers. The range of ICC-intra and ICC-inter was 0.931-0.994 and 0.908-0.985, respectively.

Conclusion: T1-value generated by T1-mapping of pelvic and thigh muscles decreases as the grade of fat infiltration increased scored by T1WI. Skeletal muscle T1-value can be used as a quantitative biomarker for disease involvement, further to assess the disease severity and predict motor function by quantifying chronic fatty degenerations in DMD.

PO-2243

A splicing method to reduce misalignment artifacts and radiation dose in digital radiography(DR) full-length photography of both lower extremities

Jun Xu, Kun Luo, ZiQiao Lei

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: The splicing method is related to image quality and radiation dose.

Objective: To explore a splicing method to reduce misalignment artifacts and radiation dose in digital radiography(DR) full-length photography of both lower extremities.

Methods: Thirty-five patients who underwent DR full-length non-weight-bearing photography of both lower extremities in our hospital and had duplicate photography or misalignment artifacts in the spliced images were collected retrospectively. The original images of all patients were re-spliced, and the duplicate photographic images were not used in the re-splicing process. The resulting images were then divided into groups A and B based on their respective splicing methods. Group A: Only one conventional splicing process was performed, i.e., the original images were

spliced from top to bottom by automatic splicing and manual adjustment. The actual exposure times were included in group A. Group B: The conventional splicing process was performed first to ensure that the right lower extremity was spliced well, then the left lower limb was cut off by a rectangular cutting tool, and the pubic symphysis and the right lower limb were preserved; the original images were spliced once again to ensure that the left lower limb was spliced well, then the right lower limb was cut off by a rectangular cutting tool, and the pubic symphysis and the left lower limb were preserved; the two preserved images were spliced into a full-length image of both lower limbs through the common part of the pubic symphysis. The theoretical exposure times were included in group B. Finally, the quality of the spliced images (with and without splicing misalignment artifacts) and the exposure times were compared between the two groups.

Results: After the original images of all patients were re-spliced, 35 full-length images in group A still had splicing misalignment artifacts, while all images in group B had no splicing misalignment artifacts, and the image quality scores of group B were significantly higher than those of group A ($\chi^2=34.323$, $P<0.001$). There was a statistical difference in the exposure times between the two groups ($\chi^2=14.233$, $P<0.05$), the radiation doses in group B were lower than that in group A (total exposure times in group A were 131, and total exposure times in group B were 108), and the radiation doses were reduced by about 17.6%.

Conclusions: Splicing and cutting the original image many times can help improve image quality and reduce radiation doses in DR full-length photography of both lower extremities.

PO-2244

The Discriminatory Potential of Multiparametric Spectral CT in Distinguishing Bone Islands from Osteoblastic Metastases

Yuhan Zhou¹, Zhihao Wang¹, Limin Lei¹, Weimeng Cao¹, Shushan Dong², Songwei Yue¹

1. The First Affiliated Hospital of Zhengzhou University

2. Philips Healthcare

Objective To investigate the diagnostic and differential diagnostic value of multi-parameter imaging based on DLCT in osteoid osteoma and osteoblastic metastases is the aim of this study.

Methods This retrospective study collected 80 patients (42 males and 38 females) who underwent a DLCT chest or abdominal plain scan with contrast-enhanced scan, image evaluation was performed only on the plain phase. Record the total CT dose index (DLP), dose length product (CTDI) and effective radiation dose (ED) of both the plain scan and multi-phase contrast-enhanced scan phases. Spectral data were post-processed to obtain conventional images (CI), effective atomic number (Z-eff) and electron density (DE) maps, and the slope of the X-ray attenuation curve (λ HU), which were then measured. Differences in various spectral quantitative parameters between bone islands (BIs) and osteoblastic metastases (OBMs) were evaluated by t-test. Single-factor logistic regression was used to evaluate the predictive probability of spectral multi-parameters for bone islands and osteoblastic metastases, and a spectral multi-parameter joint model was established. The receiver operating characteristic curves (ROC) and area under the curve (AUC) were used to evaluate the diagnostic efficacy of the spectral multi-parameter joint model and each parameter in bone islands and osteoblastic metastases.

Results There were significant differences in conventional CT value, Z-eff, ED, and λ HU between the BIs and OBMs groups, and all of them could effectively distinguish BIs from OBMs ($P<0.001$). The spectral multi-parameter joint model had the highest discriminative power for differentiating BIs from OBMs (AUC=0.931), while conventional CT value (AUC=0.92) and each spectral parameter (Z-eff: AUC=0.888; ED: AUC=0.84; λ HU: AUC=0.888) also showed good independent predictive

performance. Compared to multiphase contrast-enhanced scans (DPL: CTDI: ED:), the radiation dose during the plain phase is significantly reduced (DPL: CTDI: ED:).

Conclusions The spectral multi-parameter joint model obtained solely during the plain phase has a higher discriminative diagnostic value for differentiating bone islands from osteoblastic metastases compared to conventional CT value and each spectral parameter, and can significantly reduce patient radiation exposure. This provides more imaging support for the clinical early diagnosis, treatment strategy formulation, and prognosis prediction of osteoblastic metastases.

PO-2245

Value-added Opportunistic Chest CT Screening for Osteoporosis using Bone Mineral Density Estimation Computed by Multi-View Semi-Supervised Learning

Jinrong Yang, Fan Yang

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objectives To evaluate the value of bone mineral density estimation computed by multi-view semi-supervised learning on chest CT for opportunistic osteoporosis screening.

Methods Patients who underwent chest CT for lung cancer screening and received dual-energy X-ray absorptiometry (DXA) during the same period in our general medical department from October 2018 to October 2019 were collected. After excluding scans with low quality, metal implants and bone fractures, a total of 1295 patients were included. The patients were divided into three groups: normal group, osteopenia group and osteoporosis group based on bone mineral density measured by DXA. And a new proposed indicator—bone mineral density estimation of all thoracic vertebrae and the first lumbar vertebra were automatically computed by multi-view semi-supervised learning on chest CT images. The differences of bone mineral density estimation were compared between the three groups. The correlation between bone mineral density estimation and T values of the first lumbar vertebra was analyzed, and the diagnostic efficacy for distinguishing osteopenia and osteoporosis from normal group were also evaluated.

Results The bone mineral density estimation of thoracic and first lumbar vertebrae was significantly different among three groups and between any two groups ($P < 0.001$), and decreased successively in normal group, osteopenia group and osteoporosis group. The bone mineral density estimation of thoracic vertebrae and the first lumbar vertebrae were positively correlated with T values of the first lumbar vertebrae ($R = 0.58-0.77$, $P < 0.01$), and bone mineral density estimation of first lumbar vertebrae had the strongest correlation with the T values of first lumbar vertebrae ($R = 0.77$). The bone mineral density estimation of thoracic vertebrae and the first lumbar vertebrae had high diagnostic efficacy for distinguishing osteopenia and osteoporosis from normal group ($AUC = 0.777-0.824$).

Conclusions The bone mineral density estimation of thoracic and first lumbar vertebrae, which computed by multi-view semi-supervised learning on chest CT, is of great value in the opportunistic screening of osteopenia and osteoporosis.

PO-2246

Combined radiomics-radiologic model to predict acute and chronic Osteoporotic Vertebral Compression Fractures on CT

怡毛

02368746919

【Purpose】The purpose of this study was to differentiate acute osteoporotic compression fractures of the spine by use of radiomics-radiologic model.

【Method】Preoperative Unenhanced CT and MR data of 54 patients with Osteoporotic Vertebral Compression Fractures. On CT image, seven features (presence of cortical or endplate fracture line, presence of trabecular fracture line, presence of condensation band, pneumatosis, cloudy high density, Paravertebral soft tissue swelling and Fracture level) were analyzed. MaZda 4.7 software was used to manually draw the maximum ROIs along inner edge of bone cortex at midsagittal image CT, avoiding the effects of bone cortex and pneumatosis. The radiologic model、the radiomics model、the combined radiomics-radiologic model was constructed respectively by integrating significant clinical parameters with radiomics score using multivariate logistic regression analysis.

【Result】: A total to 155 fractures (55 acute, 45 chronic and 55 normal) and 67 fractures (23 acute, 20 chronic and 24 normal) were included in the training and test cohorts, respectively. The AUC of the radiologic model was 0.907 in the training and 0.841 in the test cohorts. The AUC of the radiomics model was 0.886 in the training and 0.825 in the test cohorts. The AUC of the Combined model was 0.909 in the training and 0.870 in the test cohorts.

【Conclusion】: The radiologic models had better diagnostic value than radiomics models in differentiating acute and chronic osteoporotic compression fractures on CT, the combining radiomics –radiologic model improved performance.

PO-2247

Analysis of the use of MRI and CT in the diagnosis of SAPHO syndrome

Huaqing Tan¹, Shihan FU²

1. Affiliated Hospital of Qinghai University

2. Qinghai Province People's Hospital

Purpose: To investigate the relationship between the duration of disease and sternal stalk hypertrophy in patients with synovitis-acne-pustulosis-hyperostosis-osteitis (SAPHO) syndrome. Analysis The imaging presentation and distribution of lesion involvement in SAPHO syndrome.

Methods: Retrospective analysis of our hospital Clinical data and imaging data of 24 patients with SAPHO syndrome diagnosed from January 2020 to September 2022, CT and MRI were performed in all 24 patients to analyze their imaging characteristics. The patients' disease duration was divided into ≤ 5 years and > 5 years into 14 and 10 cases, and the sternal stalk was measured on chest CT images to compare the relationship between the duration of the disease and sternal stalk hypertrophy.

Results: The sites of involvement in 24 patients included the anterior chest wall, spine, sacroiliac joints and peripheral osteoarthritis. The rate of osteosclerosis and bone erosion lesions in the anterior chest wall was higher than that in the spine, and the difference was statistically significant ($P < 0.05$, $P = 0.017$, $P = 0.030$), and the rate of fat deposition lesions in the spine was higher than that in the anterior chest wall and sacroiliac joints, and the difference was statistically significant ($P < 0.05$, $P = 0.001$, $P = 0.017$). Patients with a disease duration of > 5 years had higher rates of sternal stalk thickness and sternoclavicular joint involvement than those with a disease duration of ≤ 5 years, and the difference was statistically significant ($P < 0.05$, $P = 0.023$, $P = 0.041$). The correlation between changes in sternal stem width ($r^2=0.003$, $P=0.815$) and sternal stem thickness ($r^2=0.035$, $P=0.379$) and the course of the disease is poor.

Conclusion: The types of lesions in SAPHO syndrome are complex, with osteosclerotic and bony erosive lesions being more prevalent in the anterior chest wall and fat deposition lesions being more common in the spine. A long course of the disease is more likely to lead to a change of sternal

stalk thickness, and the involvement of the sternoclavicular joint may be a sign of a long course of disease.

PO-2248

The value of MRI in assessing structural changes in the spine in SAPHO syndrome

Huaqing Tan¹, Shihan Fu²

1. Affiliated Hospital of Qinghai University

2. Qinghai Provincial People's Hospital

Purpose: To assess the MRI manifestations of SAPHO syndrome involving the spine and to study the correlation between the duration of bone pain and the number of segments and lesions involved in the spine of SAPHO syndrome.

Methods: Clinical and MRI data of 43 patients with SAPHO syndrome were retrospectively analyzed. (1) Clinical features and spinal MRI characteristics of SAPHO syndrome were comprehensively summarized and statistically assessed. (2) The degree of spinal involvement in each patient was assessed by MRI to quantify the number of segments involved and the total number of lesions, and linear regression analysis was used to explore the correlation between the duration of bone pain and the number of spinal segments and the total number of lesions involved.

Results: The 43 patients included in the study were 32 females and 11 males, with a mean age of (38.1 ± 10.7) years. The average duration of bone pain was (36.3 ± 68.8) months. The spinal lesions of SAPHO syndrome mainly involved the thoracic and lumbar segments, which accounted for 40.1% and 40.8% of the spinal lesions, respectively, and the difference was statistically significant compared with that of the cervical segments ($P < 0.001$). The cervical, thoracic, and lumbar spine were predominantly involved in the vertebral angle ($P < 0.001$). MRI manifestations mainly included bone marrow edema, fat deposition, osteosclerosis, and bone erosion, among which fat deposition was more common, accounting for 51.7% (109/211) of the total number of lesions. The number of involved segments ($r^2 = 0.008$, $P = 0.343$) and the total number of involved lesions ($r^2 = 0.076$, $P = 0.073$) correlated poorly with the course of bone pain.

Conclusion: Spinal involvement in SAPHO syndrome is dominated by fat deposits in the vertebral horns, and the distribution of involvement is somewhat characteristic. There was no clear relationship between the number of spinal segments involved and the total number of lesions involved and the duration of bone pain.

PO-2249

Chronic Ankle Instability: A Cadaveric Anatomical and 3D High-Resolution MRI Study for Surgical Reconstruction Procedures

Meng Dai, Xi Liu, Lian Yang, Qiqi Jiang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Abstract

Objectives: To quantitatively investigate the anatomy of the anterior talofibular ligament (ATFL) and calcaneofibular ligament (CFL) for surgical reconstruction procedures in chronic ankle instability.

Materials and Methods: 3D MRI were performed on five fresh-frozen cadaveric ankles with six different spatial resolutions (0.3×0.3×0.3mm³, 0.45×0.45×0.45mm³, 0.6×0.6×0.6mm³, 0.75×0.75×0.75mm³, 0.9×0.9×0.9mm³, 1.05×1.05×1.05mm³). Resolution of 0.45×0.45×0.45mm³ was performed on 24 healthy volunteers on bilateral ankles. Classification of the ATFL and the four distances of surgically relevant bony landmarks were analyzed (distance 1 and 3, the fibular origin of the ATFL and CFL to the tip of fibula, respectively; distance 2, the talar insertion of the ATFL to the bare zone of talus; distance 4, the calcaneal insertion of the CFL to the peroneal tubercle).

Results: In subjective evaluation, the interobserver ICC was 0.95 [95% confidence interval(CI):0.94-0.97] between two readers. The spatial resolution of 0.3×0.3×0.3mm³ and 0.45×0.45×0.45mm³ received highest subjective score on average and demonstrated highest consistency with autopsy measurements in objective evaluation. Regarding the measurements on the 48 volunteer ankles, distance 1 in type I and II were 12.65±2.08 mm, 13.43±2.06 mm (superior-banded in Type II) and 7.69±2.56 mm (inferior-banded in Type II) (means ± SD), respectively. Distance 2 in type I and II were 10.90±2.24 mm, 11.07±2.66 mm (superior-banded in Type II), and 18.44±3.28 mm (inferior-banded in Type II), respectively. Distance 3 and 4 were 4.71±1.04 mm and 14.35±2.22 mm, respectively.

Conclusion: The feasibility of quantifying the distances for surgery of the lateral ankle ligaments using high-resolution 3D MRI. High-resolution 3D MRI provides a potential tool assisting surgeons in formulating operation plan before operation.

PO-2250

Sex-specific Body Composition Profile Determined by Pelvic Computed Tomography Associated with Mortality in Older Patients with Hip Fracture

Qianyun Liu

Yueyang Central Hospital

AbstractObjective: To investigate the sex-specific associations between body composition profile and mortality in older patients undergoing hip fracture surgery.

Materials and methods: This retrospective cohort study was conducted among consecutive older patients (aged ≥ 60 years) with hip fracture who were treated with surgery between June 1, 2017, and November 30, 2020. The cross-sectional area and attenuation of the skeletal muscle, subcutaneous adipose tissue, and intermuscular adipose tissue at the upper thigh level on preoperative pelvic computed tomography (CT) were measured. The association between body composition and mortality was determined using Cox proportional hazards analysis stratified by sex.

Results: Of 488 patients included in this study, the median age was 77.0 years, and 312 (63.9%) were female. A total of 89 (18.2%) patients died within 1 year after surgery. Female patients had greater subcutaneous adipose tissue area (SATA), whereas skeletal muscle area (SMA) was higher in males (both $P < 0.001$). In the sex-stratified multivariable analyses, SATA in females (per 10 cm² increase; hazard ratio [HR] 0.92; 95% CI, 0.86~0.97; $P = 0.003$) and SMA in males (per 10 cm² increase; HR 0.93; 95% CI, 0.86~1.00; $P = 0.05$) were significant predictors of 1-year mortality. Mediation analysis revealed that SATA mediated an estimated 40.8% (95% CI, 13.3%~96.0%; $P = 0.002$) of the sex gap in 1-year mortality. Incorporating SATA or SMA within the existing Nottingham Hip Fracture Score (NHFS) demonstrated improved performance predicts mortality in males. Low subcutaneous adiposity may represent the depletion of energy storage and result in unfavorable clinical outcomes or predicting 1-year mortality among females (area under the curve [AUC], 0.70 vs 0.64, $P = 0.11$) or males (AUC, 0.76 vs 0.71, $P = 0.06$), respectively.

Conclusion: Reduced subcutaneous adiposity is associated with mortality in older females undergoing hip fracture surgery while reduced muscle mass predicts mortality in males. Low subcutaneous adiposity may represent the depletion of energy storage and result in unfavorable clinical outcomes.

PO-2251

Differential Diagnosis of Osteogenic Metastatic and Bone Island with Multiparameter Spectral CT Enhanced Imaging

Weimeng Cao, Yuhan Zhou, Limin Lei, Zhihao Wang
The first affiliated hospital of ZhengZhou university

Purpose: This study aims to explore the differential diagnostic value of Spectral Based Image enhanced imaging in osteogenic metastatic and bone islands

Method: this study retrospectively included a total of 104 tumor patients who underwent enhanced spectral CT examination from December 2022 to April 2023. Combined with clinical and imaging data, they were diagnosed with osteogenic metastatic or bone islands during followed-up, including 53 osteogenic metastatic lesions and 5 bone island patients. A Philips post-processing workstation was used to reconstruct the spectral data and measure the Regular CT value (rCT), Virtual monochromatic imaging (VMI) 40KeV / 100KeV CT value, Iodine Density maps (ID), Effective atomic number maps (Z-eff), Electron Density (ED) and Standard deviation (SD) of each lesion in the arteriovenous phase, Slope of the spectral curve (Δ HU) and the Standard Deviation (SD value) of various spectral parameters. The difference between osteogenic metastatic and bone islands in various spectral parameters was evaluated using an independent sample t-test. Using univariate logistic regression to evaluate the discrimination probability of the two and combining ID value, ED value, Z-eff value, VMI 40/100 KeV CT value to establish a spectral multi-parameter joint model. Draw Receiver operating characteristic (ROC) curve and calculate area under curve (AUC) and Cutoff value to evaluate the differential diagnostic efficacy of each parameter for osteogenic metastatic and bone islands.

Result: Except for the arterial phase SDZ off value, the differences in all parameters were statistically significant ($P < 0.05$). The ROC curves were plotted for each spectral parameter (ID, ED, Z-off, VMI 40keV, VMI 100keV) in the arterial and venous phases, with AUC less than 0.9; The AUC of the multi-parameter joint model for arterial and venous phases were 0.914 and 0.908, respectively. The joint model of multiple parameters in the arterial and venous phase spectra (ID, ED, Z-eff, VMI 40KeV, 100KeV) has the best diagnostic performance of AUC=0.953 (sensitivity=96%, specificity=94.2%), which is superior to the arterial/venous phase energy images (arterial phase AUC rCT=0.918, cutoff=872.2HU, static Pulse period AUC=0.904, cutoff=824.5HU).

Conclusion: Compared to conventional CT ,the application of spectral CT multi-parameter combined model has the best predictive performance in the differentiation of osteogenic metastatic and bone islands , providing more imaging information for early diagnosis and differential diagnosis of the two.

PO-2252

CT-based intratumoral and peritumoral radiomics for predicting prognosis in osteosarcoma: a multicenter study

Qiushi Su, Pei Nie, Wenjian Xu
The Affiliated Hospital of Qingdao University

Purpose: To evaluate the performance of CT-based intratumoral, peritumoral and combined radiomics signatures in predicting prognosis in patients with osteosarcoma.

Methods: The data of 202 patients (training cohort:102, testing cohort:100) with osteosarcoma admitted to the two hospitals from August 2008 to February 2022 were retrospectively analyzed. Progression free survival (PFS) and overall survival (OS) were used as the end points. The radiomics features were extracted from CT images, three radiomics signatures (RS intratumoral, RS peritumoral, RS combined) were constructed based on intratumoral, peritumoral and combined radiomics features, respectively, and the radiomics score (Rad-score) were calculated. Kaplan-Meier survival analysis was used to evaluate the relationship between the Rad-score with PFS and OS, the Harrell's concordance index (C-index) was used to evaluate the predictive performance of the radiomics signatures.

Results: The median follow-up time of 202 patients with osteosarcoma was 45 months (range: 3-170 months). The disease progression rate was 38.61% (78/202), and the median PFS was 7 months (interquartile range, 4-12 months) for patients with progression, and 34 months (interquartile range, 17-66 months) for patients without progression. The median OS was 32 months (interquartile range, 17-52 months). The 1 - year, 3 - year and 5-year survival rate was 90.10%, 56.44% and 42.57%, respectively. For the construction of radiomics prediction signature, 8, 6 and 21 features were selected to construct RS intratumoral, RS peritumoral, and RS combined, respectively. Kaplan-Meier survival analysis confirmed that the Rad-scores of the three RSs were significantly correlated with the PFS and OS of patients with osteosarcoma. Among the three radiomics signatures, RS combined had better predictive performance, the C-index of PFS prediction was 0.833 in the training cohort and 0.814 in the testing cohort, the C-index of OS prediction was 0.796 in the training cohort and 0.764 in the testing cohort.

Conclusions: CT-based intratumoral, peritumoral and combined radiomics signatures have excellent performance in predicting the prognosis of patients with osteosarcoma, which can help to guide the individualized treatment and improve the prognosis of patients with osteosarcoma.

PO-2253

Hip muscle size and density are associated with trochanteric fractures of elderly women

Pengju Huang¹, Ling Wang², Yufeng Ge², Aihong Yu¹, Xiaoguang Cheng²

1. Beijing Anding Hospital Affiliated to Capital Medical University

2. Beijing Jishuitan Hospital Affiliated to Capital Medical University

Purpose We aimed to investigate the differences in hip muscle area and density between older patients with femoral neck (FNF) and trochanteric fractures (TRF).

Methods A total of 554 older women patients were enrolled, including 314 FNF (77.02 ± 7.15 years) and 240 TRF (79.70 ± 6.91 years) for the comparisons. The area and density of the gluteus medius and minimus muscle (G.Med/MinM) and the gluteus maximus muscle (G.MaxM) were measured by CT. Total hip (TH) areal bone mineral density (aBMD) and femoral neck aBMD (FNaBMD) were measured by quantitative CT. A cutoff of 80 years was used to stratify the cohort and to further explore the age-specific relationship.

Results For the total subjects, all these muscle parameters were higher in the FNF group than in the TRF group ($p < 0.001$). The muscle parameters except for the G.Med/MinM density were significantly correlated with hip fracture typing after adjustment for age, BMI, and THaBMD. In the age ≥ 80 group, no statistically significant correlation was found between all hip muscle parameters and fracture types. In contrast, in the age < 80 group, interestingly, after adjustment of age, BMI, and THaBMD, the associations between G.MaxM density, G.MaxM area, G.Med/MinM density, and G.Med/MinM area and fracture type were all statistically significant.

Conclusions Our results indicate that in older women, especially under 80 years of age, gluteus muscle parameters are related to trochanteric fractures.

PO-2254

Prevalence and risk factors of osteoporosis in Chinese inpatients with major depressive disorder — a cross-sectional study based on quantitative CT

Pengju Huang¹, Wenbin Wang¹, Ling Wang², Xiaoguang Cheng², Aihong Yu¹

1. Beijing Anding Hospital Affiliated to Capital Medical University

2. Beijing Jishuitan Hospital Affiliated to Capital Medical University

Objective The relationship between major depression disorder (MDD) and osteoporosis remains controversial. We aimed to report the prevalence of osteoporosis in inpatients with MDD in China and explore the risk factors for osteoporosis in MDD patients.

Methods 306 inpatients with MDD and 604 healthy physical examination people were included in this study. The lumbar bone mineral density (BMD) of the study subjects was measured by quantitative CT. BMD < 80 and 80 to 120 mg/cm³ were used to define osteoporosis and osteopenia, respectively. 274 pairs were matched according to age and sex between the patient group and the control group for case-control analysis. Intergroup difference analysis and binary logistic regression were used.

Results The prevalence of osteoporosis in MDD patients was 23.9% (95% CI: 19.1%-28.7%). 2) the risk of osteoporosis in the MDD group was higher than that in the control group even after adjustment for age, sex, and BMI. 3) the patients in the low BMD group (BMD < 120 mg/cm³) were older and had a lower education level, a more significant proportion of the Han population, and a more significant proportion with a history of hypertension than the normal BMD group. However, there were no statistically significant differences in gender distribution, average disease duration, the proportion of smokers, diabetes, and hyperlipidemia between the two groups.

Conclusions The prevalence of osteoporosis in inpatients with MDD in China was higher than that of healthy people; MDD may be a risk factor for osteoporosis; The decrease of BMD in MDD patients is related to aging, low education level, and hypertension.

PO-2255

Fusion with or without fixation in combined posterior laminoplasty and anterior discectomy for multilevel cervical spondylotic myelopathy with a single prominent disc herniation

Shuai Tian, Liang Jiang, Ning Lang, Huishu Yuan
Peking University Third Hospital

Objective For multilevel cervical spondylotic myelopathy (MCSM) with severe ventral compression, a combined posterior-anterior surgical approach might be indicated. In MCSM cases with single-level severe ventral compression, anterior cervical interbody fusion with or without plate could be chosen. We aimed to compare the clinical and radiological results between these two surgical methods, namely fusion with standalone cage (SC), and cage with plate (CP) after laminoplasty.

Methods Between 2012 and 2013, a total of 81 consecutive patients with MCSM were treated with combined posterior-anterior surgery (SC group, $n = 23$; CP group, $n = 58$). Outcome measures included modified Japanese Orthopedic Assessment scale (mJOA), the neck disability index (NDI), visual analog scale (VAS), fusion rate, cage subsidence, Swallowing-Quality of Life Questionnaire (SWAL-QOL), blood loss, and operative time. All patients had follow-up at regular intervals of 3, 6, 12 and 24 months after surgery.

Results The final follow-up rate was 93.8% (76/81). There were no significant differences between the two groups with respect to age, sex, baseline characteristics, operative time, and blood loss ($p > 0.05$). There were no significant differences between the two groups in the recovery of mJOA, NDI, or VAS during the follow-up period. There was a significant difference in the SWAL-QOL score at 3-month follow-up ($p = 0.017$), though not at later follow-up. All cases achieved bony fusion without screw loosening, subsidence or displacement at the final follow-up.

Conclusions Patients with stand-alone cages showed similar clinical and radiological outcomes as those with cages and plates in the combined posterior-anterior surgery for MCSM with severe single level ventral compression. Anterior fusion with standalone cage might reduce the incidence of dysphagia in the early postoperative period with similar fusion rates.

PO-2256

Differentiation of abdominal extra-abdominal desmoid-type and nodular fasciitis based on conventional MRI signs and quantitative segmentation methods

Peng Gao, Jing Li, Shaowei Zheng, weisheng zhang
The First Affiliated Hospital of Dalian Medical University

Objective: Explore the application value of MRI routine signs and quantitative segmentation and measurement of tumor tissue based on ImageJ software in the differential diagnosis of extra-abdominal desmoid-type fibromatoses and nodular fasciitis.

Methods: This study retrospectively analyzes the MRI images of 30 patients with extra-abdominal desmoid-type fibromatoses and 14 cases of nodular fasciitis confirmed by pathology. The imageJ software is used to segment the image, calculate the tumor volume, the range of edema and other values, and combine conventional imaging signs and clinical characteristics to make a differential diagnosis of the diseases.

Results: There was no statistically significant difference in age, gender, tumor growth site, morphology, boundary, presence or absence of capsule, T1WI circular target sign, fat fissure sign, fascial tail sign, and peritumoral edema between the two groups. There were statistically significant differences between the two groups in terms of whether it crossed the muscle cavity, the ratio of length to diameter, whether the edge was smooth, and whether the edema boundary was clear ($P < 0.05$). There was no statistical difference in the percentage of peritumoral edema in volume between the two groups based on ImageJ software for tissue segmentation measurement of tumor bodies; The proportion of low signal to volume on T2WI showed statistical differences between the two groups and had the highest diagnostic efficacy ($AUC = 0.840$), with sensitivity and specificity of 0.633 and 0.929, respectively.

Conclusion: The imaging manifestations in conventional sequences and the quantitative segmentation measurement method of tumor tissue based on ImageJ software are helpful for the differential diagnosis of the two. Among them, whether it crosses the muscle cavity, whether the edge is smooth, the ratio of length to diameter, whether the edema boundary is clear, and the percentage of low signal to volume on T2WI have important diagnostic value.

PO-2257

Solitary sacral osteochondroma growing into the spinal canal: Case report and review of the literature **Running title: Solitary sacral osteochondroma**

聪 黄

Department of Radiology, No. 926 Hospital, Joint Logistics Support Force of PLA

Background

Osteochondroma is one of the most common benign bone tumors, mainly involving the bone ends of long bones, and involving the spine is rare. It often involves the competing, followed by the thoracic and lumbar spine, and rarely involves the sacrum, accounting for approximately 0.5%. About 90.9% of previously reported (2005 – 2022) sacral chondromas involved had neurological symptoms.

Case presentation

A 37-year-old woman presented with progressive low back pain associated with left buttock pain and discomfort for 1 month, marked soft tissue tenderness on the left side of the L5-S1 spinous process and spinous process, negative vertebral percussion pain, and radiating soreness on the left buttock. CT showed a bony mass growing into the spinal canal in the left lamina of S1, resulting in compressive bone resorption of the L5 vertebral body and stenosis of the left foramen. MRI showed that the mass was similar to the bone signal, no significant abnormal enhancement was observed on enhancement, the left intervertebral foramen was narrowed, and the left nerve root was compressed, edematous, and enhanced. Radiological diagnosis revealed osteochondroma of the left lamina of S1. Postoperative pathological diagnosis of osteochondroma.

Conclusion

This is the 11th solitary osteochondroma of the sacrum reported so far, and the first osteochondroma arising from the left lamina of S1, with radicular symptoms, and the lesion was removed en bloc and the symptoms were relieved after surgery.

PO-2258

Correlation between Skeletal Muscle Changes and Insulin Resistance and Islet β Cell Function in Type 2 Diabetes Mellitus Evaluated Using MRI

Jinge Li, weisheng zhang, shaowei zheng
First Affiliated Hospital of Dalian Medical University

Background: Skeletal muscle changes are associated with insulin resistance and islet β cell function and other markers of type 2 diabetes mellitus (T2DM) related glycolipid metabolism. MRI sequences including diffusion-tensor imaging (DTI) and mQixon-quant may enable to detect muscle abnormalities related to type 2 diabetes mellitus.

Purpose: To explore MRI characteristics and potential indicators of skeletal muscles in evaluation of patients with T2DM.

Materials and Methods: Seventeen male patients with newly diagnosed T2DM and 17 healthy volunteers were enrolled in this prospective study from November 2021 to November 2022. The general condition and blood indexes of these two groups were recorded and insulin resistance index (HOMA-IR) and insulin secretion (HOMA- β) were calculated. The skeletal muscles of lower extremity and lumbar were scanned using 3.0T MR Scanner. The contents of intermuscular adipose tissue (IMAT) and intramuscular fat (intraMF) in left thigh and lumbar muscles, as well as the FA and ADC values of skeletal muscle fibers, were obtained. ROC curve was used to analyze the cut-off value and diagnostic efficacy. Independent sample t test and population correlation analysis were used to perform statistical analysis.

Results: There were significant differences for the IMAT value of left thigh, the FF of psoas major muscle, the FF of quadratus lumborum muscle, the FF of autochthonous back muscles and the mean FF of lumbar muscles between experimental group and control group ($p < 0.05$). There were no significant differences for MRI parameters in other skeletal muscles between two groups ($p > 0.05$). Moreover, the sensitivity and specificity for the diagnosis of T2DM were 82.4% and 81.2% with the cut-off value as proportion of 8.995% for the IMAT. The sensitivity and specificity for the diagnosis of T2DM were 64.7% and 81.2% with the cut-off value 4.835% for FF of psoas major muscle, while 88.2% and 62.5% with 3.010%, respectively. The sensitivity and specificity for the diagnosis of T2DM were 64.7% and 87.5% with cut-off value of 12.490% for FF of autochthonous back muscles. And the sensitivity and specificity for the diagnosis of T2DM were 70.6% and 81.2% with cut-off value 7.025% for mean FF of lumbar muscles. Thirdly, the area under the curve (AUC) of IMAT of left thigh, FF of psoas major muscle, FF of quadratus lumborum muscle, FF of autochthonous back muscles and mean FF of lumbar muscles for the diagnosis of T2DM were 0.842, 0.765, 0.750, 0.765 and 0.776, respectively. Lastly, the IMAT of left thigh, FF of psoas major muscle, FF of quadratus lumborum muscle, FF of autochthonous back muscles and mean FF of lumbar skeletal muscle were correlated with fasting blood glucose. The FF of psoas major muscle is correlated with HbA1c. The IMAT of left thigh, FF of quadratus lumborum muscle, FF of autochthonous back muscles and mean FF of lumbar muscles were correlated with HOMA-IR. The FF of psoas major muscle, autochthonous back muscles and mean FF of lumbar muscles were correlated with HOMA- β . And the IMAT of left thigh, FF of psoas major muscle, FF of quadratus lumborum muscle and mean FF of lumbar muscles were correlated with high density lipoprotein.

Conclusions: The contents of intraMF of lumbar skeletal muscle and IMAT of left thigh are correlated with insulin resistance in male patients with newly diagnosed T2DM. There is a potential value for mDixon-Quant sequence in evaluating skeletal muscle changes and predicting β cell function conditions.

PO-2259

Quantification of Volumetric Thigh and Paravertebral Muscle Fat Content: Comparison of Q-Dixon MRI with High-Speed T2-Corrected Multiecho MR Spectroscopy

Wenshuang Zhang^{1,2}, Ling Wang², Fengyun Zhou², Yi Yuan^{1,2}, Xiaoguang Cheng²

1. Department of Radiology, Peking University Fourth School of Clinical Medicine

2. Beijing Jishuitan Hospital, Capital Medical University

Objective To validate the water-fat separation-based method Q-Dixon MRI against the HISTO MRS reference standard for quantifying the volumetric fat content in thigh and paravertebral muscles.

Materials and Methods This retrospective study involved 54 subjects (60.2 ± 14.2 years; 38 men) for thigh muscles and 56 subjects (mean age, 50.0 ± 15.3 years; 22 men) for paravertebral muscles, employing 6-point Q-Dixon MRI, HISTO MRS, and conventional T1-weighted sequence. Quantitative parameter proton density fat fraction (PDFF) was measured with Q-Dixon MRI and HISTO MRS respectively within upper-middle part of the left quadriceps femoris and at the level of L4/L5 vertebrae in the paravertebral muscles in a small voxel. On Q-Dixon, the volumetric PDFF from the freehand delineation of the quadriceps or paravertebral muscles was also measured. The weighted Cohen's kappa coefficient, Intraclass correlation coefficient (ICC), Bland-Altman plots, Spearman correlation coefficients and Wilcoxon signed rank test with Bonferroni correction were used to assess agreement between observers and methods.

Results Q-Dixon PDFF exhibited excellent inter- and intra-observer agreement (ICC = 0.927, 0.932). Q-Dixon PDFF correlated positively with HISTO PDFF ($r = 0.98$, $p < 0.001$) across 110 small voxels, with average differences of 0.12% insignificantly ($p = 0.35$). The average differences were 0.04% for thigh and 0.19% for paravertebral muscles, both statistically insignificant ($p = 0.82$, 0.29, respectively). PDFF values from small voxels in Q-Dixon and HISTO significantly differed from the volumetric PDFF obtained via freehand delineation on Q-Dixon (all $p < 0.001$).

Conclusion Volumetric PDFF using Q-Dixon MRI exhibited good correlation and consistency with HISTO MRS for quantitative fat assessment in thigh and paravertebral muscles, and the freehand segmentation of volumetric Q-Dixon PDFF offers a more comprehensive reflection of actual MFI compared to small voxel PDFF.

PO-2260

A Correlative Study of Monosodium Urate Crystal Volume Measured by Dual-energy CT and Gout-related Hematological Indicators.

Jiachun Zhuang^{1,2}, Lin Liu², Lina Chen³, Yingyi Zhu², Haijun Wu²

1. Guangdong Provincial People's Hospital

2. Department of Radiology, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University, Guangzhou, Guangdong, 510080, PR China.

3. CT Collaboration, Siemens Healthcare Ltd, Guangzhou 510000, Guangdong, PR China.

Abstracts

Purpose

Monosodium urate (MSU) crystals deposition is the central pathological feature of gout. However, the clinical significance of the MSU crystal volume quantification by dual energy computed tomography (DECT) is rarely discussed, especially its relationship with hematologic indicators. The purpose of this study was to evaluate the correlation between the hematological indicators and the volume of MSU crystals detected by DECT, and to further explore the influencing factors of MSU crystals deposition in the first metatarsophalangeal (MTP) joint.

Materials and Methods

This retrospective study included 680 patients who underwent hematologic examinations and DECT scans of hands, knees, and feet bilaterally between January 2017 and September 2022. MSU deposits were visualized and color-coded and volume measurement were performed automatically by a Siemens MultiModality Workspace workstation with Syngo Via VB40 (Figure 1A). Hematological indicators included serum uric acid (SUA), glomerular filtration rate (GFR), serum creatinine (Scr), and erythrocyte sedimentation rate (ESR). Pearson correlation test was used to assess the association between MSU crystal volume and laboratory indicators. All tests were two tailed and $p < 0.05$ was considered as statistically significant.

Results

There was a weak correlation between the laboratory indicators including GFR, Scr ESR and CRP and the volume of MSU crystals in patients without intervention (correlation coefficients were all around 0.15) (Figure 1B). Univariate logistic regression showed that age and duration were all significant predictive factors of the deposition of MSU in the first MTP. In multivariable analysis, duration [OR: 1.122 (confidence intervals, CIs: 1.049–1.200), $p = 0.001$] and ESR [OR: 0.987 (0.976–0.998), $p = 0.024$] were independent predictive factors of the deposition of MSU in the first MTP. No other variable was predictive of the deposition of MSU in the first MTP, including laboratory indicators.

Conclusion

The volume of MSU crystals could reflect GFR, Scr, ESR and CRP levels effectively. A longer duration of disease is a independent predictive factor for the occurrence of MSU crystals in the first MTP joint. In this study, it could not be considered that hematological indicators have a definite influence on the MSU deposition of the first MTP joint.

PO-2261

Implementation of a Novel Classification and Stratification System for Solitary Bone Tumor: Osseous Tumor Radiological and Interpretation and Management System (OT-RIMS)

Lin Liu

Guangdong Provincial People's Hospital
Shantou University Medical College

Purpose: A streamlined and practical imaging classification system of bone tumors oriented by tumor biological behavior and patient treatment urgently needs to be developed, emphasizing the correlation of key radiological features with histological grades and patient management. To propose a histological-grades-based Osseous Tumor Radiological Interpretation and Management System (OT-RIMS) for bone tumor patients that would streamline the radiological evaluation of bone tumors and consolidate key radiological features into ordinal severity categories that would inform corresponding patient management actions and that could be used as a clinical decision support tool.

Materials and Methods: This retrospective study between January 2015 and August 2022 evaluated consecutive patients with solitary bone tumors confirmed by pathology and imaging follow-up received two or three imaging modalities of radiographs, CT, or MRI. Three radiologists independently assessed the radiological features, categorized bone lesions based on the OT-RIMS criteria, and reached a consensus. Kappa statistics and observed agreement were calculated.

Results: A total of 341 patients (182 men and 159 women; mean age, 26.0 years [interquartile range, 16.0–44.5 years]) were included, with 102 malignant, 177 benign, and 62 intermediate or low-grade malignant bone lesions. The overall sensitivity and specificity of OT-RIMS for categorizing solitary malignant bone tumors accurately as OT-RIMS 4 for three readers were as follows: 93.1% (95 of 102) and 93.3% (223 of 239) for reader 1, 96.1% (98 of 102) and 91.6% (219

of 239) for reader 2, 92.2% (94 of 102) and 89.5% (214 of 239) for reader 3, respectively. Inter-reader agreement of the OT-RIMS category for three readers was considered excellent (Kendall's $W=0.924$, $p<0.001$) with a kappa value of reproducibility in category 1&2, 3, and 4 of 0.764, 0.528, and 0.930, respectively.

Conclusion: The OT-RIMS category demonstrated excellent reproducibility regardless of the reader's expertise level in categorizing the risk stratification of bone tumors and informing patient management, with histological grades used as the reference standard.

PO-2262

Prediction of Arthroscopic Meniscopectomy or Meniscectomy for a Torn Discoid Meniscus: Using Conventional Magnetic Resonance Imaging and Quantitative T2-Mapping

Bo Jin, Huimiao Sun, Yanjun Wu, Jie Yang, Jiaxiang Wen, Xiaoyan Yang
Children's Hospital of Shanxi

Objective. To predict discoid meniscal meniscopectomy or meniscectomy using conventional magnetic resonance imaging (MRI) and quantitative T2-mapping.

Methods. We retrospectively studied 69 patients who underwent arthroscopic meniscopectomy or total meniscectomy between February 2021 and May 2023. The patients underwent 3.0 T MRI and quantitative T2-mapping examinations. Six independent orthopedic surgeons prospectively reviewed all MRI images and provided predictions for each discoid meniscal treatment. Finally, all patients underwent arthroscopy by a single surgeon with 20 years' arthroscopy experience.

Results. There is no obvious difference in the morphology of the discoid meniscus between the two operations ($P = 0.473$). Tear type ($P = 0.002$), zone of the tear ($P < 0.001$), length of tear ($P = 0.002$) and width of tear ($P = 0.001$) are significantly different in two treatments. For the anterior and posterior part of discoid meniscus, T2 values of the meniscopectomy group were significantly lower than those of the meniscectomy group ($P < 0.001$ and $P < 0.001$). For the middle part, T2 values did not significantly differ between the groups ($P = 0.103$). The group with above 5 years' experience was good for differentiating two surgical treatments (k -value = 0.737). Orthopedic surgeons with more than 5 years of experience have higher consistency than those with less than 5 years of experience. (agreement: 87.0%, 72.5%, respectively).

Conclusions. The combined use of conventional MRI and quantitative T2-mapping techniques will help orthopaedists develop a more accurate operation for patients with discoid meniscus. Surgeon's experience level will influence the prediction of surgical treatment.

PO-2263

Deep learning-based artificial intelligence model for classification of vertebral compression fractures: A multicenter diagnostic study

Fan Xu

Guangzhou Red Cross Hospital

Objective: To develop and validate an artificial intelligence diagnostic system based on X-ray imaging data for diagnosing vertebral compression fractures (VCFs) **Methods:** In total, 1904 patients who underwent X-ray at four independent hospitals were retrospectively (n=1847) and prospectively (n=57) enrolled. The participants were separated into a development cohort, a prospective test cohort and three external test cohorts. The proposed model used a transfer learning method based on the ResNet-18 architecture. The diagnostic performance of the model was evaluated using receiver operating characteristic curve (ROC) analysis and validated using a prospective validation set and three external sets. The performance of the model was compared with three degrees of musculoskeletal expertise: expert, competent, and trainee. **Results:** The diagnostic accuracy for identifying compression fractures was 0.850 in the testing set, 0.829 in the prospective set, and ranged from 0.757 to 0.832 in the three external validation sets. In the human and deep learning (DL) collaboration dataset, the area under the ROC curves(AUCs) in acute, chronic, and pathological compression fractures were as follows: 0.780, 0.809, 0.734 for the DL model; 0.573, 0.618, 0.541 for the trainee radiologist; 0.701, 0.782, 0.665 for the competent radiologist; 0.707, 0.732, 0.667 for the expert radiologist; 0.722, 0.744, 0.610 for the DL and trainee; 0.767, 0.779, 0.729 for the DL and competent; 0.801, 0.825, 0.751 for the DL and expert radiologist. **Conclusions:** Our study offers a high-accuracy multi-class deep learning model which could assist community-based hospitals in improving the diagnostic accuracy of VCFs

PO-2264

Morphological changes of meniscus after anterior cruciate ligament injury : posterior base angle of medial meniscus

Yupeng Zhu, Ning Lang

Peking University Third Hospital

Purpose

To compare the meniscus parameters of patients with simple ACL injury and volunteers, analyze the correlation between meniscus parameters and ACL injury, and explore the morphological changes of meniscus after ACL injury.

Methods

A retrospective study of patients with ACL injury from January 2021 to December 2021 was conducted. Patients with simple ACL injury were selected according to the inclusion and exclusion criteria, and patients with complete ACL were matched for comparative study. The meniscus slopes, posterior meniscus angles and alpha angle (α angle) were measured in MR images. The meniscus slopes include the slope of the anterior horn of the medial meniscus (SAHMM), the slope of the posterior horn of the medial meniscus (SPHMM), the slope of the anterior horn of the lateral meniscus (SAHLM), and the slope of the posterior horn of the lateral meniscus (SPHLM). The posterior meniscus angles include the posterior base angle of the medial meniscus (PBAMM) and the posterior base angle of the lateral meniscus (PBALM). The parameters of patients with ACL injury and patients with ACL integrity were compared.

Results

This study included 70 patients with simple ACL injury and 70 patients with ACL integrity. Comparing the meniscus slope of the two groups, it was found that the SPHMM of patients with ACL injury was higher than that of patients with ACL integrity ($P=0.019$). The SPHMM of patients with ACL injury was $23.24^{\circ} \pm 3.42^{\circ}$, while that of patients with ACL integrity was $21.88^{\circ} \pm 3.35^{\circ}$. Comparing the posterior horn of the meniscus, it was found that the PBAMM in patients with ACL injury was significantly higher than that in patients with ACL integrity ($73.78^{\circ} \pm 6.32^{\circ} > 67.82^{\circ} \pm 5.88^{\circ}$, $P=0.00$). The α angle of patients with ACL injury was significantly larger than that of patients with ACL integrity ($40.62^{\circ} \pm 2.15^{\circ} > 35.62^{\circ} \pm 1.94^{\circ}$, $P=0.000$). In the receiver operating characteristics curve analysis, the cut-off value of SPHMM was 20.62, and values above this showed 81.4% sensitivity and 45.7% specificity for ACL injury. The cut-off value of PBAMM was 73.55, and values above this showed 54.3% sensitivity and 84.3% specificity for ACL injury. The cut-off value of α angle was 37.75, and values above this showed 91.4% sensitivity and 91.4% specificity for ACL injury.

Conclusions

The results of this study strongly indicate that there is a correlation between the morphological changes of the posterior horn of the medial meniscus and ACL injury, and this correlation is more obvious in the posterior horn of the medial meniscus. The morphological changes of meniscus can predict the damage of ACL.

PO-2265

HawkinsⅢ型距骨颈骨折与距骨完全脱位的对比分析

张泽坤、贾丽英、桑辉
河北省中医院

目的分析 HawkinsⅢ型距骨颈骨折脱位、距骨完全脱位的影像学特点及鉴别要点；

方法 回顾性分析 9 例 HawkinsⅢ型距骨颈骨折脱位、7 例距骨完全脱位患者的临床及影像学资料，9 例 HawkinsⅢ型距骨颈骨折脱位 8 例男性、1 例女性，年龄 20~53 岁，中位年龄 29 岁；7 例距骨完全脱位的图像，均为男性，年龄 21~61 岁，中位年龄 43 岁，对比分析 HawkinsⅢ型距骨颈骨折脱位及距骨完全脱位影像学特点及征象；

结果 9 例 HawkinsⅢ型距骨颈骨折脱位冠状面距骨内移 6 例、外移 3 例，矢状面距骨后移 8 例、无前后移位 1 例，CT 横断面距骨外展 3 例；根据距骨移位分为后内侧移位 5 例，后外侧移位 3 例，单纯内移 1 例；根据距骨旋转分为跖屈型 3 例，背屈外展型 3 例，背屈外翻型 2 例，外翻型 1 例，伴发内踝骨折 5 例，外踝骨折 2 例。7 例距骨完全脱位冠状面距骨外移 7 例，矢状面距骨前移 7 例，横断面距骨外展 3 例，根据距骨移位均为前外侧移位；伴发距骨后突骨折 5 例，内踝骨折 1 例，外踝骨折 2 例；

结论 9 例 HawkinsⅢ型距骨颈骨折脱位距骨以后内移位和后外移位多见，距骨完全脱位距骨以前外侧移位多见，距骨的旋转相对复杂，应从三个维度分析距骨移位及旋转情况，常伴有周围骨质骨折。

PO-2266

尺侧腕骨轴向骨折脱位的影像诊断

张泽坤、张欲翔、王勇
河北省中医院

目的 分析尺侧腕骨轴向骨折脱位的影像学征象及特点;

材料和方法 回顾性分析 10 例尺侧腕骨轴向脱位、骨折脱位病例, 男性 6 例, 女性 4 例, 年龄 16~43 岁, 平均年龄 28.4 ± 6.2 岁; 9 例行 DR 摄影, 3 例行 CT 扫描;

结果 10 例尺侧腕骨轴向骨折脱位右腕 7 例, 左腕 3 例, 9 例 X 线平片显示: 第 4、5 掌骨与钩骨一起移位, 钩骨骨折脱位 6 例, 钩骨脱位 3 例, 豌豆骨脱位 5 例, 三角骨骨折 2 例, 头状骨撕脱骨折 1 例, 第 4 掌骨基底骨折 3 例; 3 例 CT 显示: 第 4、5 掌骨与钩骨一起移位, 钩骨骨折脱位 3 例, 豌豆骨脱位 2 例, 三角骨骨折 2 例, 第 4 掌骨基底骨折 1 例; 综合平片及 CT: 经钩骨型 4 例, 钩骨周围、豌豆骨周围型 2 例, 经钩骨、经三角骨、豌豆骨周围型 3 例, 经头状骨、钩骨周围、豌豆骨周围型尺侧腕骨轴向脱位 1 例;

结论 尺侧腕骨轴向骨折脱位虽然罕见且分型复杂, 但其共性为钩骨与第 4、5 掌骨作为一个整体的移位, 并且常伴有豌豆骨脱位。

PO-2267

大弧损伤性月骨脱位的分型及影像诊断

张泽坤、桑辉、赵青
河北省中医院

目的 探讨腕间关节大弧损伤性月骨脱位的分型、影像诊断及其临床价值;

材料和方法 回顾性分析 23 例大弧损伤性月骨脱位病例, 男性 17 例, 女性 6 例, 年龄 20~60 岁, 平均年龄 37 ± 11.9 岁。16 例行 DR 摄影, 19 例行 CT 扫描; Siemens Multix Fusion 800ma 摄片 X 光机, Mindray DigiEye 640ma 摄片 X 光机, Siemens 128 层螺旋 CT 扫描仪扫描, 应用 SSD、MPR、CPR 及 VRT 重建技术; 结果 23 例腕关节大弧损伤性月骨脱位患者中, 23 例近排腕骨近侧及远侧关节面连线均不连续。综合 X 线平片及 CT 改变, 经三角骨月骨脱位伴茎突骨折 7 例, 经舟骨、三角骨月骨脱位伴茎突骨折 6 例, 经舟骨月骨脱位伴茎突骨折 5 例, 经三角骨月骨脱位 3 例, 经舟骨、三角骨月骨脱位 1 例, 经舟骨月骨脱位 1 例。X 线平片正位平片显示月骨与头状骨重叠, 头月关节间隙、桡月关节间隙变窄, 轮廓不清; 侧位平片显示月骨向掌侧旋转移位, 月骨窝状关节面空虚、朝向掌侧, 呈“倾倒茶杯”征, 舟骨和/或三角骨骨折块伴随月骨移位。CT 横断面、冠状面重建显示舟骨或/和三角骨骨折断端伴月骨向前旋转移位, 冠状面重建显示“月骨丢失”征; 矢状面重建显示月骨“倾倒茶杯”征; 三维重建多方位、多角度显示月骨移位、旋转的情况, CT 对小的撕脱骨折显示清晰。

结论 大弧损伤性月骨脱位种类较多, 以经舟骨和/或三角骨月骨脱位伴茎突骨折类型常见, 分析月骨旋转移位征象及月骨周围腕骨骨折是诊断的重点, 多层螺旋 CT 对腕间关节的对位关系及月骨周围小的撕脱骨折优于平片。

PO-2268

IDEAL IQ 和 BOLD-MRI 定量评估大鼠股四头肌脂肪浸润和血流灌注对肌肉减少症早期诊断的实验研究

黄鑫尘、何波
昆明医科大学第一附属医院

目的：严重的肌肉减少症可导致重度残疾。早期诊断是目前改善肌肉减少症治疗的关键。本研究旨在纵向评估基于 MRI 的脂肪浸润和血流灌注成像在肌肉减少症发展进程中的早期诊断价值。

材料与方法：依据地塞米松注射的不同天数（0,2,4,6,8,10 天）将 48 只 SD 大鼠随机分为 6 个组，并在注射结束后进行评估。多模态 MRI 扫描大鼠股四头肌评估肌肉质量；大鼠四肢握力和游泳力竭实验评估肌肉力量和功能。HE 染色和油红 O 染色评估肌纤维的萎缩和脂肪浸润情况。CD31 免疫荧光染色评估股四头肌的毛细血管形成。通过蛋白质印迹检测 VEGF-A 和 MuRF-1 蛋白的表达。皮尔逊相关分析评估 MRI 定量参数与组织病理学标志物之间的相关性强度。最后，通过 ROC 曲线分析 MRI 定量参数在肌肉减少症大鼠成模评估中的诊断效能及截断值。

结果：相比对照组，基于 MRI 的定量参数 PDFF、R2* 和 T2 值在第 2 天表现出显著统计学差异，早于第 6 天出现统计差异的 MRI-CSA 值和大鼠四肢握力以及第 8 天出现统计差异的游泳力竭时间（以上均为： $p<0.05$ ）。MRI-CSA 与 HE-CSA 值（ $r=0.67$ ； $p<0.001$ ）；ORO 面积与 PDFF（ $r=0.67$ ； $p<0.001$ ）；MVD（ $r=-0.79$ ； $p<0.001$ ）和 VEGF-A（ $r=-0.73$ ； $p<0.001$ ）与 R2* 之间存在较强相关性。肌肉减少症大鼠在第 8 天成模，用于成模评估的 PDFF、R2* 和 T2 值的 AUC 分别为 0.81（CI 95%：0.69-0.93），0.93（CI 95%：0.86-1.00）和 0.98（CI 95%：0.94-1.00）。

结论：MRI 定量参数 PDFF、R2* 和 T2 作为具有高灵敏度的影像生物标志物，可用于早期诊断和监测肌肉减少症的脂肪浸润与血流灌注病理改变。当 PDFF 大于 1.25，R2* 大于 53.85，T2 大于 33.88 时，可以判断肌肉减少症大鼠模型成功构建。

PO-2269

扩散张量磁共振成像非侵入性评估肌肉减少症大鼠腰椎旁肌细胞外基质重塑

黄鑫尘、何波
昆明医科大学第一附属医院

目的：骨骼肌细胞外基质重塑是肌肉减少症的主要组织病理学改变之一。本研究目的是探讨扩散张量磁共振成像技术在评估肌肉减少症大鼠腰椎旁肌细胞外基质重塑改变中的价值。

方法：将 20 只 6 月龄雌性 Sprague-Dawley 大鼠随机分为地塞米松组（DEX）和生理盐水对照组。两组大鼠均接受 3.0T 磁共振成像扫描，包括 Mensa，T2WI 和扩散张量成像序列。苏木精-伊红染色和天狼星红染色评估竖脊肌的肌纤维和细胞外基质改变。蛋白质印迹评估竖脊肌中 Collagen I，III 和纤连蛋白的表达。皮尔逊相关分析评估 MRI 定量参数与相应组织病理学标志物之间的相关性强度。

结果：影像学结果显示，相比对照组，DEX 组大鼠竖脊肌横截面积和分数各向异性值显著降低（ $P<0.05$ ）。苏木精-伊红染色显示 DEX 组肌纤维萎缩以及排列紊乱；天狼星红染色显示 DEX 组的胶原体积分数显著增加（ $P<0.05$ ）。蛋白质印迹结果显示 DEX 组 I 型胶原，III 型胶原和纤维连接蛋白表达显著增加（均为 $P<0.05$ ）。分数各向异性值与胶原体积分数，胶原蛋白 I，胶原蛋白 III，纤连蛋白之间的相关系数分别为 -0.77，-0.94，-0.85，-0.88（均为 $P<0.05$ ）。

结论: 分数各向异性值与病理胶原体积分数, I 型胶原, III 型胶原和纤维连接蛋白的表达密切相关, 表明扩散张量磁共振成像技术可以无创性地评估肌肉减少症竖脊肌细胞外基质重塑的变化, 为肌肉减少症的早期诊断提供潜在的影像生物标志物。

PO-2270

3.0T 1H MRS 在脊柱良恶性压缩性骨折鉴别诊断中的应用

常荣¹、马晓文¹、张明²

1. 西安交通大学附属红会医院

2. 西安交通大学第一附属医院

目的: 探讨骨质疏松及恶性肿瘤所致脊柱良恶性压缩性骨折的 3.0T 1H MRS 特征, 为鉴别脊柱良恶性压缩性骨折提供科学依据。

方法: 2019 年 6 月至 2022 年 9 月, 在西安市红会医院收集 221 例受试者, 其中骨量正常组 50 例, 骨量减少组 65 例, 骨质疏松压缩骨折组 62 例, 恶性肿瘤压缩性骨折组 44 例。年龄范围为 35-75 岁, 其中男性 99 例, 女性 122 例。收集患者的年龄、性别和 BMI。所有受试者进行 1H MRS 扫描并测量的脂肪分数 (FF %) 和脂水比 (LWR)。本研究采用 3.0 T GE 超导磁共振成像仪和体线圈获取波谱。数据分析采用 SPSS26.0, 年龄、FF %、LWR 等定量数据的统计描述采用均数±标准差, 性别等分类数据的统计描述采用频数。多组定量指标间比较采用方差分析, 横向比较采用 Bonferroni 法。定量指标间的相关分析采用 Pearson 相关分析。

结果: 通过对不同组的年龄和 BMI 进行方差分析, 发现不同组的年龄存在差异。正常组年龄最小 (53.05±10.35 岁), 其次为骨质减少组 (59.01±6.34 岁)。骨质疏松组年龄最大 (66.54±5.32 岁)。在对不同性别组间进行分析后, 发现不同组间存在统计学差异, $P<0.001$ 。女性骨量丢失和骨质疏松的比例明显高于男性。在恶性肿瘤组中, 男性比例高于女性, $P<0.001$ 。四组间 FF% 和 LWR 差异均有统计学意义。1H MRS FF% 恶性肿瘤组最低 (15±5.21), 骨质疏松组最高 (65.8±4.99)。采用 Bonferroni 法比较两组间的差异, 有统计学意义, $P<0.001$ 。MRS FF% 与 LWR 高度相关, $r=0.865$, $P<0.001$ 。

结论: 3.0T 1H MRS 在骨质疏松及恶性肿瘤导致脊柱良恶性压缩骨折中的 FF%、LWR 差异有统计学意义, 可用于脊柱良恶性压缩骨折的鉴别诊断。

PO-2271

磁共振 IDEAL-IQ 在糖尿病继发肌少-骨质疏松症定量诊断中的应用价值

常荣¹、马晓文¹、张明²

1. 西安交通大学附属红会医院

2. 西安交通大学第一附属医院

目的: 本研究旨在探讨磁共振 IDEAL-IQ 在糖尿病继发肌少-骨质疏松症中的应用价值, 并早期对肌肉减少及骨质疏松情况进行定量诊断。

方法: 收集 2022.3-2023.3 年糖尿病继发肌少-骨质疏松症 60 例研究对象。其中男性 25 例, 女性 35 例。年龄范围为 50-80 岁。糖尿病继发肌少-骨质疏松症 30 例进行 MRI IDEAL-IQ 序列扫描后在 FF 图上用专用后处理软件分别进行腰椎每个椎体及周围肌肉 (腰大肌、竖脊肌、多裂肌) 的兴趣区 (ROI) 脂肪定量 (FF) 测定, 计算的相应水平椎体及肌肉的 FF 的平均值。糖尿病继发肌少-骨质疏松症 30 例进行 DXA 扫描, 与 DXA 骨密度 BMD 进行对比研究, 分析观察肌肉减少、骨质疏松情况, 进行统计学分析。

结果: 采用 SPSS 22.0 进行统计学分析。计量资料用均数 \pm 标准差($\bar{x} \pm s$)表示, 组间比较用 t 检验。计数资料用例数(百分率)表示, 组间比较采用 χ^2 检验。Logistic 回归分析骨质疏松与年龄、BMI 及肌少症的相关性。以 $P < 0.05$ 为差异有统计学意义。平均年龄(66.73 ± 6.86)岁, 平均 BMI 为(25.76 ± 3.53) $\text{kg} \cdot \text{m}^{-2}$ 。腰椎每个椎体及周围肌肉(腰大肌、竖脊肌、多裂肌)的感兴趣区(ROI)脂肪定量(FF)测定平均值分别约为(66.2 ± 4.51 , 36.2 ± 3.41 , 32.3 ± 6.37 , 35.2 ± 5.18)。腰椎 DXA BMD 为(1.21 ± 0.21) $\text{g} \cdot \text{cm}^{-2}$ 。MRI FF%与年龄呈正相关($r=0.90$), 而 DXA 中 BMD 与年龄呈负线性关系($r=-0.89$)与男性相比, 女性的 FF%更高。

结论: MRI IDEAL-IQ 可作为一种无创的新影像技术应用于肌骨系统, 早于肌肉减少及骨量的变化之前检测肌肉及骨髓脂肪的变化, 为客观评估糖尿病继发肌少-骨质疏松症提供新的量化标准和技术支持。

PO-2272

MRI T2-mapping 及 MR-DTI 在膝关节软骨损伤中的价值研究

邢福义、袁铨、何海娟、沈巨峰
绍兴市上虞人民医院

【摘要】目的: 分析膝关节软骨损伤中应用 T2-mapping 及 DTI 的临床应用价值。方法: 选择 2022 年 6 月—2023 年 6 月绍兴市上虞人民医院收治的 77 例膝关节软骨损伤患者, 均通过 MRI 常规扫描、T2-mapping 及 DTI 序列检查, 以关节镜评估软骨损伤为标准, 分为三组, 正常组($n=17$)、损伤组($n=37$)、撕脱组($n=23$)三组, 对每组膝关节软骨 T2 值、FA 值进行测量, 最后对诊断结果进行评估。结果: 77 例患者的膝关节软骨共 385 个部分(股骨内外侧髁、胫骨内外侧平台、髌软骨), 三组正常组、损伤组、撕脱组的 T2 值分别平均为(26.37 ± 4.37) ms, (24.22 ± 6.13) ms, (21.78 ± 5.39) ms, 差异有统计学意义($P < 0.05$)。结论: 磁共振 T2-mapping 及 DTI 有利于评估膝关节软骨损伤, T2 值及 FA 值对评价膝关节软骨损伤的定性及定量分析具有重要价值, 是膝关节常规 MR 序列检查的重要补充, 为临床的早期诊断、治疗及预后评估提供依据及指导。

PO-2273

基于透明质酸的磁共振可视化水凝胶促进关节软骨修复再生

陈彤彤、陆勇
上海交通大学医学院附属瑞金医院

背景: 将临床常用影像技术应用于生物材料的在体监测有利于研究其在体内的真实分布及降解过程, 然而临床用磁共振成像较低的分辨率及造影剂的非特异性全身使用限制了磁共振成像在生物材料辅助组织再生领域应用的效率。

目的: 比较大鼠局部软骨缺损处植入透明质酸水凝胶材料后, 患处的磁共振信号变化与实际组织病理切片的对应关系

方法: 在 SD 大鼠股骨滑车处制造一 3mm 直径的圆形缺损, 并随即填充修饰有 GD-DTPA 的透明质酸-降冰片烯水凝胶材料, 同时设置阴性(手术后缺损处没有填充材料)和阳性(假手术)对照组, 在手术后的第 2 周和第 8 周分别对大鼠膝关节进行 9.4T 高分辨率磁共振扫描, 包括 PDWI、T1WI 和 T2WI, 随后将对应老鼠的膝关节组织切片进行番红固绿染色。分析局部缺损处 PD、T1、T2 信号值随着时间的变化与组织切片中材料的分布、降解, 新生骨/软骨组织的对应关系。

结果: 修饰有 Gd-DTPA 的降冰片烯透明质酸, 在局部缺损处与明胶-巯基交联形成的水凝胶具有较好的体外弛豫率, r_1 值为 $34.45 \text{Mm}^{-1} \text{s}^{-1}$, 是临床用造影剂的 3 倍。植入 HA 水凝胶材料后第 2 周和第 8 周的组织切片对比, HA 水凝胶的横截面积有明显减少(p), 磁共振 PDWI、T1WI、T2WI

局部信号均有明显改变。同时两者的变化值在相关性分析中呈现明显的正相关 (p , R)。术后第 8 周, 植入 HA 水凝胶的大鼠组织切片 ICRS 评分与阴性对照组有明显差异 (p), 与正常对照组的差异不明显 (p); 对术后第 8 周的大鼠膝关节磁共振图像进行 CaLS (Cartilage Lesion Score) 评分时, 与正常对照组没有明显差异 (p)。

结论: 高分辨率 MRI 提供了在无创条件下定量监测植入材料在体内降解过程及局部组织修复程度的可能性, 可以作为研究生物材料在体分布、降解情况以及组织修复效率的先进工具。

PO-2274

骨密度及体质成分特征对新冠病毒感染后住院时长的影响

管文敏、魏璇、魏巍、孙婧、张婷婷、颜颖、宋丽君、王振常
首都医科大学附属北京友谊医院

目的: 胸部 CT 平扫是新型冠状病毒感染早期发现及协助疾病分期的有效手段, 胸部 CT 中病变累及范围、形态和密度与新冠感染的预后密切相关。胸部 CT 除提供呼吸系统相关信息外, 也涵盖了大量其他系统信息。基于影像多模式与多维度协同的多要素关联诊断理念, 胸部 CT 图像提取的肺外改变与 COVID-19 预后的关系值得进一步探索。本研究旨在探索基于定量 CT (QCT) 的骨密度 (BMD) 及体质成分与新冠感染住院时长的相关性。

方法: 本研究回顾性收集 2020 年 1 月-2021 年 2 月期间成年住院新冠感染患者, 采用 QCT 测量其胸部 CT 图像中 L1~L2 骨密度、L1~L2 椎间隙层面椎旁肌肉面积、椎旁肌肉脂肪面积、腹部皮下脂肪面积及腹腔内脂肪面积。

结果: 本研究共纳入 88 例新冠感染者, 平均年龄 43.0 ± 12.6 岁, 其中男性 59 例 (67.0%), 女性 29 例 (33.0%); 平均住院时长 27.4 ± 8.7 天。L1-L2 平均 BMD 为 $145.6 \pm 36.9 \text{ mg/cm}^3$; L1~L2 椎间隙层面椎旁肌肉面积、椎旁肌肉脂肪面积、腹部皮下脂肪面积、腹腔内脂肪面积分别为 41.9 cm^2 、 1.7 cm^2 、 78.0 cm^2 、 122.2 cm^2 。在单因素分析中住院时长与年龄 ($r=0.202$, $p=0.046$)、L1~L2 椎间隙层面椎旁肌肉脂肪面积与椎旁肌肉面积之比 ($r=0.246$, $p=0.021$) 呈正相关。在纳入年龄、BMI、骨密度、椎间隙层面椎旁肌肉面积/椎旁肌肉脂肪面积、腹部皮下脂肪面积、腹腔内脂肪面积的广义线性模型中, 新冠感染住院时长与 L1~L2 椎间隙层面腹腔内脂肪面积呈正相关 ($\beta: 9.304$, $p=0.025$)。

结论: 本研究首次基于真实世界新冠感染者胸部 CT 数据, 应用 QCT, 对我国新冠感染者住院时长相关骨肌特征进行了探索。新冠肺炎感染者体质成分特征与其住院时长相关。新冠肺炎感染者增龄、椎旁肌肉脂肪含量增加、腹腔内脂肪增多, 均与更久住院时长相关。

PO-2275

新型冠状病毒感染患者一年随访骨密度及体质成分特征分析

管文敏、魏璇、魏巍、孙婧、张婷婷、宋丽君、颜颖、王振常
首都医科大学附属北京友谊医院

目的: 新型冠状病毒 (COVID-19) 感染临床症状虽以肺部表现为主, 但该病除累及呼吸系统外, 还可累及多系统, 但目前有关 COVID-19 对骨肌系统影响的研究较为缺乏。本研究旨在探索 COVID-19 对骨肌系统的影响。

方法: 本研究纳入有入院、出院及 1 年后随访胸部 CT 资料的 COVID-19 感染者, 采用定量 CT (QCT) 分析其胸椎骨密度 (BMD) 及体质成分特征。

结果: 本研究共纳入 33 例 COVID-19 感染者, 平均年龄 47.1 ± 15.0 岁, 其中男性 22 人, 占 66.7%; 女性 11 人, 占 33.3%。其中无症状感染者、轻型、普通型、重型患者各 2 例、8 例、19 例及 4 例,

无危重型患者。平均住院时长为 29.5 ± 9.6 天, 平均随访时间为 423.0 ± 53.6 天。入院、出院、1 年后随访胸 1~胸 12 平均 BMD 分别为 $165.6 \pm 34.6 \text{mg/cm}^3$ 、 $165.3 \pm 35.2 \text{mg/cm}^3$ 、 $165.2 \pm 35.4 \text{mg/cm}^3$, 三者之间无明显统计学差异。胸 12~腰 1 椎间隙层面腹部皮下脂肪、腹腔内脂肪及腹部总脂肪面积亦未见明显变化。将入组患者分为无症状感染者及轻型组 (10 例, 占 30.3%)、普通型及重型组 (23 例, 占 69.7%) 两组, 无症状感染者及轻型组患者入院及 1 年随访胸 1~胸 12 平均 BMD 高于普通型及重型组 ($173.9 \pm 33.6 \text{mg/cm}^3$ vs. $162.0 \pm 35.2 \text{mg/cm}^3$); 普通型及重型组患者入院及 1 年后随访腹腔内脂肪面积及腹部总脂肪面积均大于无症状感染者及轻型组。

结论: 本研究提示感染 COVID-19 一年后, 并未导致患者胸椎骨密度和腹部脂肪面积发生明显变化。本研究首次基于真实世界 COVID-19 感染者胸部 CT 影像数据, 应用 QCT 软件, 对我国 COVID-19 感染者的骨密度及体质成分特征进行了阐述和对比, 并首次描述了该群体一年随访骨密度及腹部脂肪变化情况, 以期助力探索 COVID-19 对骨肌系统的长期影响。

PO-2276

基于可解释机器学习模型探讨 X 线征象在骨肿瘤分类中的价值

潘德润、刘仁懿、秦耿耿、陈卫国
南方医科大学南方医院

目的: 基于数字化 X 线影像征象及临床信息构建多种骨肿瘤的机器学习分类模型, 确定对骨肿瘤分类最重要的影像特征, 更好地辅助骨肿瘤临床诊断工作。

方法: 回顾性收集南方医科大学南方医院 2014 年 1 月~2019 年 9 月经手术病理证实的骨肿瘤患者的影像学图像及病例资料。由 2 名具备 8 年以上工作经验的骨关节放射科医师对入组病例的 X 线图像进行独立阅片, 确定影像学征象结果, 包括病灶的位置、边缘、偏心性、膨胀性、硬化边、骨膜反应、病灶密度、病灶内高密度成分和骨质破坏类型等。随后, 基于影像学征象及临床信息构建 LR、DT、RF 及 SVM 模型, 对骨肿瘤进行良性、中间型和恶性三分类研究。同时选用 SHAP 值这一解释模型输出结果的重要方法, 评估对骨肿瘤诊断最重要的特征。

结果: 共纳入 796 例骨肿瘤病例, 良性骨肿瘤 412 例, 恶性骨肿瘤 215 例, 中间型骨肿瘤 169 例, 平均年龄 (26 ± 18) 岁。DT、RF、LR 及 SVM 模型的 micro AUC 值分别为 0.821、0.935、0.930 和 0.944, LR、RF 及 SVM 模型在三分类中的 AUC 值均高于 DT 模型, 且差异有统计学意义 ($P < 0.05$), RF 和 SVM、LR 和 SVM 模型在良恶性和中间型骨肿瘤中的 AUC 值差异均无统计学意义 ($P > 0.05$), 而 LR 和 RF 模型在良性、恶性骨肿瘤的 AUC 值差异均有统计学意义 ($P < 0.05$)。模型对中间型骨肿瘤、血管瘤、良性纤维组织细胞瘤、脊索瘤和软组织肉瘤诊断准确性偏低。各模型都将“病灶的边缘”评估为骨肿瘤分类最重要影像征象, 其次分别是“病灶内高密度成分”, “骨皮质受累情况”和“病灶的膨胀性”等。

结论: 结果表明 SVM 模型是本研究构建的 4 种机器学习模型中性能最优的模型。机器学习模型对重要特征评估的结果在一定程度上解释了模型的输出规则, 增强了临床医生对机器学习模型的理解程度, 提高了模型的可信度, 有望有效促进模型的临床应用推广。

PO-2277

基于 X 射线图像的深度学习模型改善医生对原发性骨肿瘤组织学分类的研究

谢卓耀¹、赵浣淼²、宋丽文¹、阳维²、赵英华¹

1. 南方医科大学第三附属医院 (广东省骨科研究院)

2. 南方医科大学生物工程学院

目的 基于 X 线图像开发深度学习(DL)模型判别原发性骨肿瘤(PBT)的组织学类型, 并评估其临床实用性。

方法 这项回顾性研究纳入两家医院经病理证实的 878 名 PBT 患者 (训练集、验证集、内部测试集和外部测试集分别为 638 例、77 例、80 例和 83 例), 本研究将 PBT 分为五种组织学类型: 成骨性肿瘤、软骨源性肿瘤、富含破骨细胞的巨细胞肿瘤、骨的其他间叶源性肿瘤和其他组织学类型的 PBT。基于 EfficientNet-B3 结合 X 线图像和临床特征构建 DL 模型, 采用受试者工作特征曲线下面积(AUC)、准确度、敏感度和特异度评估模型性能, 通过观察该模型是否可提升放射科医生判别 PBT 组织学类型的能力来评估其临床实用性。

结果 DL 模型在内部和外部测试集的 AUC 分别为 0.904 (95%CI, 0.852–0.942)和 0.873 (95%CI, 0.812–0.920)、准确度分别为 67.5% (95%CI, 58.8%–76.2%)和 68.7% (95%CI, 61.4%–78.3%)、敏感度分别为 79.7% (95%CI, 75.0%–84.1%)和 80.4% (95%CI, 75.9%–84.6%)、特异度分别为 92.1% (95%CI, 89.3%–94.3%) 和 91.6% (95%CI, 89.3%–93.8%)。初级放射科医生在模型辅助前后的准确度由 50.6%提升至 72.3%, 判读时间由 53.07 秒减少至 18.55 秒, 李克特 5 点量表法显示置信度由 3.10 增加至 3.70; 高级放射科医生在模型辅助前后的准确度由 68.7%提升至 75.3%, 判读时间由 32.50 秒减少至 21.42 秒, 置信度由 4.19 增加至 4.37, 所有的 P 均小于 0.05。

结论 我们的 DL 模型有效地判别 PBT 的组织学类型, 并可在临床上帮助放射科医生获得比独立视觉判别更好的临床效益, 因此该模型具有改善 PBT 患者临床决策的潜力。

PO-2278

定量 CT 评估锁骨不同区域骨密度的差异

马培旗、孙舒宝、许健、彭彬、张宗夕、袁玉山

阜阳市人民医院

目的 通过 QCT 测量锁骨远端不同区域骨密度的差异, 为外科修复重建喙锁韧带提供参考。

方法 回顾性分析 2022 年 10 月至 2022 年 12 月在安徽医科大学附属阜阳人民医院(阜阳市人民医院)行胸部 CT 体检的 101 例患者 202 例锁骨影像学信息, 由内侧向外侧划分锁骨远端为以下 8 个区域, 分别为锥状结节区(A 区)、结节间区(B 区)方区(C 区)以及锁骨远端区(D 区), 再将每个区域分为前半部分和后半部分确定 8 个亚分区, 在亚分区中设置半自动感兴趣区(region of interest, ROI), (ROI A1、A2、B1、B2、C1、C2、D1、D2), 将每个原始数据传输至 QCT pro 分析工作站, 采用 QCT BMD 测量系统, 对锁骨远端以上 8 个 ROI 松质骨骨密度进行测量, 比较测量结果。

结果 (1) 锁骨 A1、A2、B1、B2、C1、C2、D1、D2 八个亚分区 BMD 值差异具有统计学意义 ($H=1131.899$, $P<0.05$); 两两比较显示除 A1 与 A2、D1 与 D2、A2 与 B1 之间 BMD 水平差异无统计学意义($P>0.05$), 其余亚分区 BMD 值两两比较差异均有统计学意义($P<0.05$); (2) 与锥状带解剖止点 A2 区 BMD 值比较, 结节间区(B 区)BMD 值低, 差异有显著性意义($P<0.05$); 与斜方韧带解剖止点 C1 区 BMD 值比较, C2 区、D1 区及 D2 区 BMD 值低, 结节间区(B 区)BMD 值高, 差异均有统计学意义($P<0.05$)。

结论 QCT 评估锁骨远端不同区域骨密度的差异对于喙锁韧带修复重建术具有重要指导意义。

PO-2279

腰椎管狭窄患者硬膜囊横截面积与马尾神经冗余关系的 MRI 研究

刘英、李旭雪、陈君蓉
四川省骨科医院

目的 分析腰椎管狭窄患者的腰椎硬膜囊横截面积 (dural sac cross-sectional area, DSCA) 与马尾神经冗余 (redundant nerve roots, RNRs) 之间关系, 拟探索 RNRs 形成机制及其对椎管狭窄的诊断价值。**方法** 收集我院 2022 年 2 月-2022 年 8 月临床诊断为腰椎管狭窄患者的 MRI 资料共 155 例。根据矢状位 T2W 图像马尾神经形态将患者分为 RNRs (+) 和 RNRs (-), 测量并记录狭窄节段椎管硬膜囊面积及硬膜囊前后径, 统计分析 RNRs (+) 和 RNRs (-) 之间硬膜囊面积、硬膜囊前后径、椎管狭窄程度的差异, 进一步分析 RNRs (+) 组椎管不同狭窄程度间马尾神经冗余长度的差异。结果 腰椎管狭窄病人中马尾神经冗余的发生率为 34.2%。RNRs (+) 组平均年龄大于 RNRs (-) 组, 腰椎管最窄层面平均硬膜囊面积及硬膜囊前后径均小于 RNRs (-) 组, 椎管狭窄程度大于 RNRs (-) 组 (P 值均 <0.05)。RNRs (+) 组女性发生率较男性稍高 (56.6% vs 43.4%), 但差异无统计学意义; RNRs (+) 组椎管不同狭窄程度间马尾神经冗余长度差异具有统计学意义 ($P<0.05$)。结论 马尾神经冗余征是一种特殊的影像学表现, 常见于较严重的腰椎管狭窄患者, 能够被 MRI 清晰地展现, 为腰椎管狭窄症的明确诊断提供了重要的依据。

PO-2280

比较业余马拉松运动员与健康志愿者大腿肌肉的质与量: 一项基于多参数磁共振的定量研究

孟凡晶^{1,2}、丁建平^{1,2}
1. 杭州师范大学附属医院
2. 杭州师范大学临床医学院

目的: 本研究旨在通过定量多参数磁共振成像探讨中老年男性业余马拉松运动员与健康志愿者大腿肌肉体积、肌间脂肪体积、肌内脂肪分数、T1 和 T2 弛豫时间的差异, 为提升中老年男性大腿肌肉质与量, 预防老年性肌肉减少及相关疾病提供数据参考。

方法: 本研究为前瞻性研究, 于杭州马拉松运动医学研究所招募了基线情况匹配 (男性, 55-70 岁) 的 30 名业余马拉松爱好者和 30 名健康志愿者。对受试者优势侧的大腿中段进行 MRI 扫描, 使用高清 T1 序列、q-Dixon 序列分别获得标准化肌肉体积 (肌肉体积/BMI)、标准化肌间脂肪体积 (肌间脂肪体积/BMI) 与肌内脂肪分数; 使用 T1mapping、T2mapping 序列分别获得 T1、T2 弛豫时间。采用独立样本 t 检验比较业余马拉松运动员组与健康志愿者组优势侧的大腿肌肉体积、大腿肌间脂肪体积、肌内脂肪分数、T1 与 T2 弛豫时间。

结果: 运动组的大腿中段标准化肌肉体积显著大于对照组 ($P<0.05$); 对于体现肌肉质的脂肪浸润检测, 运动组大腿中段肌内脂肪分数显著低于对照组 ($P<0.05$), 并且运动组大腿中段肌间脂肪体积显著低于对照组 ($P<0.05$)。此外, 运动组的大腿 T1、T2 弛豫时间显著低于对照组 ($P<0.05$)。

结论: 多参数磁共振成像提示中老年男性业余马拉松运动员与健康志愿者大腿肌肉存在显著差异, 马拉松运动可能显著增加中老年男性的大腿肌肉体积, 并且显著减少大腿肌间脂肪体积与肌内脂肪分数。本研究结果可能为老年性肌肉减少及相关疾病的预防和治疗提供一定启示。

PO-2281

能谱 CT 成像评估壮医治疗对痛风石内钙、羟基磷灰石吸收的应用分析

黄丽娟、韦寅
广西国际壮医医院

摘要：目的 通过能谱 CT 成像分析壮医治疗后痛风石内的钙、羟基磷灰石变化情况，评估壮医治疗痛风性关节炎的有效性，为壮医治疗痛风疗效的评估提供客观依据。方法 25 例痛风性关节炎患者均行 256 排 CT 能谱扫描，经后处理测量治疗前后痛风石 UA、HAP、Ca、Water 各基物质对的浓度变化，分析壮医治疗痛风石内尿酸盐以及钙、羟基磷灰石吸收效果。结果 痛风性关节炎患者经壮医治疗，治疗 1 个月后痛风石 UA(HAP)、Water (HAP) 相对浓度有显著性下降 ($p<0.05$)，Water(Ca)、Ca (Water)、HAP(Water)、Ca (UA)、HAP(UA) 相对浓度降低，但无统计学差异 ($p>0.05$)。治疗 3 个月后 UA(HAP)、UA(Ca)、Water (HAP)、Water(Ca)、Ca (Water)、HAP(Water)、Ca (UA) 相对浓度降低相对浓度有显著性下降 ($p<0.05$)，HAP(UA) 相对浓度降低，但无统计学差异 ($p>0.05$)，其中 1 例病例在治疗三个月后发现 HAP 结晶吸收、消失。结论 壮医综合治疗不仅在缓解痛风性关节炎疼痛上有着明显效果，还在痛风石吸收上有着良好的疗效：壮医治疗首先促进痛风石内尿酸盐成分、水分的吸收，后期对痛风石内钙成分——钙、羟基磷灰石的吸收仍有效果。

PO-2282

大转子疼痛综合征的诊断

周宇堃
山西医科大学第一医院

目的：引起髋部及大腿疼痛的常见原因很多，大转子疼痛综合征是其中的常见原因。准确的诊断本病有助于临床医生选择合适的治疗方式，进而有效缓解患者疼痛。通过本次的资料报告及相关的文献学习可以帮助影像科医生更好的了解疾病，提高诊断的准确性。

方法：回顾了大转子疼痛综合征患者的临床资料、影像资料，并进行了相关疾病的文献复习。

结果：大转子疼痛综合征常因大转子附近软组织受到长期反复的过度牵拉而发生慢性损伤及继发性无菌性炎症所致。诊断标准包含 6 种征象，臀肌腱病、肌腱撕裂、转子滑囊炎或滑囊积液、髂胫束增厚、骨髓水肿及骨侵蚀。

结论：磁共振扫描可以较为准确的诊断大转子疼痛综合征，熟悉疾病的发病部位、发病机制、特征性影像表现，有助于提高影像科医师诊断的准确性。

PO-2283

AI 辅助压缩感知 (ACS) 技术在膝关节 MRI 扫描中的应用研究：3D-MRI 视角

倪铭、袁慧书
北京大学第三医院

目的：探讨人工智能辅助压缩感知 (ACS) 技术优化膝关节 MRI 扫描流程的潜在价值。

材料与方法：志愿者和患有运动损伤疾病的患者接受了一系列加速技术的前瞻性 MRI 扫描。志愿者接受了不同 ACS 加速级别的检查以确定最有效的加速级别。患者在确定的最佳 3D-ACS 加速级别后进行相应 MR 扫描，同时进行 3D 压缩感知 (CS) 和 2D 并行采集技术 (PAT) 扫描。通过多平面重建 (MPR) 对 3D-ACS 图像进行 3.5 mm/2.0 mm 图像重建。由经验丰富的放射科医生对 3D-ACS-MRI 和 3D-CS-MRI、3.5 mm/2.0 mm MPR 和 2D-PAT-MRI 获得的图像质量进行评估和比较、疾病诊断，并将结果与关节镜检查结果进行比较。采用 Cohen kappa 相关系数评价诊断一致性，并采用绝对评价法和相对评价法进行客观评价。

结果：该研究共纳入 15 名志愿者和 53 名运动损伤患者。10.69x 的加速因子被认为是最佳的加速级别。图像质量评估表明，与 2D-PAT 相比，3D-ACS 提供的骨结构可视化较差，软骨可视化有所改善，并且 3.5 mm/2.0 mm MPR 的横轴位图像不太令人满意。在客观评价方面，相对评价在不同群体中得到了令人满意的结果，而绝对评价则显示大多数特征存在显著差异。尽管如此，所有诊断均观察到高水平的诊断一致性 (κ : 0.81-0.94) 和准确性 (0.83-0.98)。

结论：ACS 技术作为 3D-MRI 膝盖扫描中传统 CS 的替代品具有巨大的潜力，可以在不牺牲诊断准确性的情况下实现更薄的 MPR 和显著更快的扫描。

PO-2284

胸部低剂量 CT 联合定量 CT 评估肺癌筛查人群的骨折风险

姜文蓁

天津医科大学肿瘤医院

目的 评估肺癌筛查人群中基于胸部低剂量 CT 联合定量 CT 预测骨折风险的效能，为建立一站式肺癌筛查及骨折风险评估的健康体检新模式提供理论依据。**方法** 回顾性纳入参加胸部低剂量 CT 基线检查的社区肺癌筛查人群。获取其腰椎 BMD 估计值 (BMD_L^*)。使用骨折风险评估工具根据基线信息计算主要部位骨质疏松性骨折概率 (PMOF) 和髌部骨折概率 (PHF)。于三年复查时收集过去三年内临床骨折发生情况，并于复查胸部 CT 图像上评估椎体骨折有无及程度。采用逻辑回归分析建立基于基线 BMD_L^* 、PMOF 及 PHF 的骨折预测模型并采用受试者工作特征 (ROC) 曲线，并通过比较各模型的曲线下面积 (AUC) 对评估各模型的骨折预测效能。结果 最终纳入 549 例受试者，其中男性 251 例，女性 298 例。受试者基线时的中位年龄为 62.0 岁，中位 BMD_L^* 为 102.3 mg/cm^3 ，骨质疏松患病率为 22.2%。三年复查时自我报告的临床新发骨折为 16 例 (2.9%)，其中 13 例为脆性骨折；341 例 (62.1%) 诊断为椎体骨折，其中 74 例为中重度椎体骨折，新发中重度椎体骨折 4 例；中位随访时间为 36.4 个月。逻辑回归分析结果显示，基线 BMD_L^* 、PMOF、PHF 均为椎体骨折的独立影响因素 (P 均 < 0.05)，但与临床新发骨折及脆性骨折均无显著相关性 (P 均 > 0.05)。与基于 PMOF 及 PHF 的椎体骨折预测模型 ($AUC = 0.612$ 、 0.626) 相比，基于 BMD_L^* 的模型 ($AUC = 0.832$) 效能显著较高 (P 均 < 0.001)；在 BMD_L^* 的基础上进一步联合临床危险因素后的模型预测椎体骨折的效能没有显著提高 ($AUC = 0.840$, $P = 0.071$)。结论 胸部低剂量 CT 联合定量 CT 测得的下段胸椎 BMD 替代腰椎 BMD 具有良好的骨折风险预测效能，可能有助于建立一站式肺癌筛查及骨折风险评估的健康体检新模式。

PO-2285

髌部骨折患者股骨头不同区域骨微结构与股骨近端几何结构分析

苑筱晴、梁彦博、杨慧、秦健、李长勤
山东第一医科大学第二附属医院(泰山医学院附属医院)

目的：探讨髌部骨折患者股骨头不同区域松质骨微结构的差异，并分析骨微结构与股骨近端几何结构的相关性。

方法：收集髌部骨折并行髌关节置换术患者的股骨头 18 例。采用 Micro-CT 对样本进行扫描，采用 Avatar v1.6.5 (PINGSENG Healthcare Inc.) 进行分析。三个圆柱形感兴趣区分别位于主压缩区、主拉伸区和非应力区。分析不同区域内松质骨微结构参数，包括骨体积分数 (BV/TV)、骨表面积密度 (BS/BV)、骨小梁厚度 (Tb.Th)、骨小梁数目 (Tb.N)、骨小梁间距 (Tb.Sp)、结构模型指数 (SMI) 和骨小梁连通密度 (Conn.D)。在患者骨盆正位片上测量健侧髌轴长度 (HAL)、股骨头宽度 (FWW)、股骨颈宽度 (FNW) 和颈干角 (NSA)。分析骨微结构与股骨近端几何结构的相关性。

结果：三组间骨微结构均存在统计学差异 ($P < 0.05$)；其中，与主拉伸区和非应力区相比，主压缩区 BV/TV、Tb.Th 最高，BS/BV、Tb.Sp、SMI 最低。HAL 与主压缩区 Tb.Th、Tb.Sp 呈负相关 ($r = -0.719$ 和 -0.686)，与主压缩区 Tb.N 呈正相关 ($r = 0.814$)；FNW 与各区域 Tb.Th 均呈负相关 ($r = -0.812$, -0.735 和 -0.634)，与主压缩区 Tb.Sp 呈负相关 ($r = -0.573$)，与主压缩区 Tb.N 呈正相关 ($r = 0.653$)；FWW 仅与非应力区 Tb.Th 呈负相关 ($r = -0.514$)，而 NSA 与骨微结构之间均无相关性。

结论：(1) 髌部骨折患者股骨头不同区域松质骨微结构存在差异，主压缩区骨微结构明显优于主拉伸区和非应力区，临床治疗髌部骨折时需要充分考虑内固定物及固定位置。(2) HAL 和 FNW 与骨小梁厚度、骨小梁间距和骨小梁数目存在相关性，HAL 和 FNW 值越高，骨微结构越差，其可作为评估髌部骨折患者骨微结构的一项重要参考指标。

PO-2286

基于腹部 CT 的影像组学模型在预测髌部骨量异常中的应用价值

苑筱晴、梁彦博、杨慧、秦健、李长勤
山东第一医科大学第二附属医院(泰山医学院附属医院)

目的：探讨基于腹部 CT 图像构建的影像组学模型在预测髌部骨量异常方面的价值。

方法：回顾性收集 2021 年 8 月至 2023 年 7 月来自山东第一医科大学第二附属医院的 163 例患者的影像资料，所有患者均于 14 天内接受双能 X 线吸收仪 (DXA) 和腹部 CT 检查。以 DXA 为参考标准，将患者分为骨量正常 ($T\text{-score} \geq -1.0$) 和骨量异常 ($T\text{-score} < -1.0$) 组，骨量异常包括骨质疏松和骨质减少。按照 7:3 的比例将患者随机分为训练集 ($n=114$) 和验证集 ($n=49$)。在腹部 CT 图像上自动勾画左侧股骨近端作为三维容积感兴趣区并提取影像组学特征，采用最小冗余最大相关 (mRMR) 和最小绝对收缩和选择算法 (LASSO) 筛选最有价值的特征，并构建影像组学模型。采用受试者工作特征曲线 (ROC) 评估模型在训练集和测试集中预测骨量异常的效能，采用 DeLong 检验比较训练集和测试集 AUC 的差异，采用校准曲线评估模型的预测准确性，采用 Hosmer-Lemeshow 检验评估模型的拟合效果。

结果：最终选择 14 个最有价值的特征用于构建影像组学模型。模型在训练集和测试集中的 AUC、灵敏度、特异度、准确率分别为 0.96 (95% CI, 0.92-0.99)，91.4%，89.9%，90.0% 和 0.92 (95% CI, 0.84-0.99)，91.7%，83.8%，83.7%。DeLong 检验显示训练集和测试集的 AUC 具有统计学差异 ($P=0.342$)，校准曲线显示理想结果和实际结果接近，H-L 检验显示在训练集和测试集中 P 值均大于 0.05。

结论: 基于腹部 CT 图像构建的影像组学模型对髌部骨量异常具有良好的预测价值, 可以在不增加额外扫描时间和辐射剂量的情况下, 为患者提供一种潜在的骨质疏松筛查方法, 有助于临床医生制定后续诊疗计划。

PO-2287

基于 Micro-CT 和微有限元分析研究辛伐他汀对去卵巢小鼠骨组织和生物力学的影响

梁彦博、苑筱晴、秦健、杨慧、李长勤
山东第一医科大学第二附属医院(泰山医学院附属医院)

目的: 通过微型计算机断层扫描 (Micro-Computed Tomography, Micro-CT) 和微有限元分析 (micro-finite element analysis, μ FEA) 定量分析辛伐他汀 (Simvastatin, Sim) 对去卵巢 (ovariectomy, OVX) 小鼠的椎骨骨微结构及力学性能的影响, 探讨辛伐他汀对去势引起的骨改变的作用。

方法: 将 24 只 8 周大小的雌性小鼠 (C57BL/6J) 随机分为 3 组, 每组 8 只: OVX+Sim 组、OVX 组和对照组。OVX 组与 OVX+Sim 组小鼠行双侧卵巢切除术, 对照组小鼠仅行背部切口, 未切除卵巢。术后 4 周, OVX+Sim 组予以辛伐他汀口服喂养, 剂量为 10mg/(kg.d), 持续 4 周。OVX 组和对照组小鼠予以等量生理盐水口服喂养。8 周后处死取材, 采用 Micro-CT 和 μ FEA 评估 L4 椎体骨微结构和力学性能。

结果: 各组间骨体积分数 (BV/TV)、骨小梁厚度 (Tb.Th)、骨小梁数目 (Tb.N)、骨小梁间距 (Tb.Sp)、骨小梁连接度 (connectivity) 和骨小梁密度 (Tb.BMD) 均存在统计学差异。其中, OVX+Sim 组 BV/TV、Tb.N、connectivity 和 Tb.BMD 显著高于 OVX 组, 而 Tb.Th 和 Tb.Sp 变化不明显; OVX+Sim 组 BV/TV、Tb.Th、Tb.N、connectivity 和 Tb.BMD 显著高于对照组, 而 Tb.Sp 变化不明显。OVX+Sim 组总形变、等效应变和等效应力均显著低于 OVX 组; OVX+Sim 组总形变显著高于对照组, 而等效应变和等效应力的差异无统计学意义。总形变和等效应力与 BV/TV 均呈负相关性 ($R^2=0.767$ 和 0.701)。

结论: 辛伐他汀通过对骨重建的调节, 改善了骨小梁微结构, 提高了骨力学性能, 为临床医生对绝经后骨质疏松患者的治疗提供了新思路。

PO-2288

基于 MRI 特征的影像组学模型在预测脊柱转移瘤立体定向放射治疗疗效方面的应用研究

陈永晔、秦思源、赵伟丽、王奇政、刘珂、辛培锦、袁慧书、庄洪卿、郎宁
北京大学第三医院

目的: 本研究旨在使用机器学习 (ML) 算法从 MRI 中提取影像组学特征, 并将其与临床特征相结合, 构建脊柱转移瘤患者体立体定向放射治疗 (SBRT) 后治疗疗效的预测模型。

方法: 选取了 2018 年 7 月至 2023 年 4 月期间在我们医院接受 SBRT 治疗的脊柱转移瘤患者。使用实体瘤疗效评价标准 (RECIST; 版本 1.1) 对其治疗疗效进行评估。将病变分为进展组 (PD) 组和非 PD 组。从 T1 加权、T2 加权和脂肪抑制 T2 加权序列中提取影像组学特征。采用组内相关系数、最小冗余最大相关和最小绝对收缩和选择算子进行特征筛选。利用 13 种 ML 算法构建了影像组学预测模型。将临床特征、常规影像学特征和影像组学特征组合构建结合模型。使用受试者工作特征曲线 (ROC 曲线) 分析评估模型性能, 使用决策曲线分析 (DCA) 评估临床价值。

结果:共纳入 194 名患者,其中非 PD 组为 142 例(73.2%),PD 组为 52 例(26.8%)。每个感兴趣区域生成了 2264 个特征。临床模型显示出中等的预测效能(ROC 曲线下面积(AUC)=0.733),而影像组学模型表现更好(AUC=0.745–0.825)。影像组学结合临床特征的模型的表现最好(AUC=0.828)。

结论:基于 MRI 的影像组学模型对接受 SBRT 的脊柱转移瘤患者的疗效预测方面有较好的价值。影像组学预测模型有潜力为临床决策提供帮助,在改善接受 SBRT 治疗的脊柱转移病患者的预后方面存在一定的价值。

PO-2289

骨促结缔组织增生性纤维瘤的影像学表现特点

吴俊华、易雪冰、陈君蓉、钟鉴、张德洲
四川省骨科医院

目的:探讨骨促结缔组织增生性纤维瘤的 CT 及 MRI 表现特点,以加深对本病的认识和鉴别。材料与方法:收集 2018 年 1 月至 2023 年 6 月间在我院经病理证实为骨促结缔组织增生性纤维瘤 15 例,分析其 CT 及 MRI 图像并总结其影像学表现特点。结果:15 例中发生于长骨 12 例,发生于骨盆 3 例;病灶主要呈轻度局限性膨胀、边缘清晰、有不完整硬化缘、局部侵蚀或突破骨皮质的溶骨性病变,病灶内 CT 表现为较均匀的软组织密度、MRI 表现为高低混杂信号影。结论:骨促结缔组织增生性纤维瘤好发于长骨,影像学具有一定的特征性,需要注意与纤维结构不良、骨性纤维结构不良、非骨化性纤维瘤、骨巨细胞瘤等鉴别。

PO-2290

双能 CT 中的新型胶原蛋白成像在腰椎间盘突出症评估中的应用

穆星星
安康市高新医院

摘要:腰椎间盘突出症是一种常见的脊柱疾病,严重影响人们的生活质量。传统的成像技术如 X 线、CT 和 MRI 等可以显示椎体及椎间隙的状态,但对于软组织如胶原蛋白的成像较为困难。双能 CT 作为一种新型成像技术,其利用不同能量的 X 射线对不同组织进行成像,可实现软组织的高分辨率成像。因此,本研究旨在探讨双能 CT 中的新型胶原蛋白成像技术在腰椎间盘突出症评估中的应用。采集了 50 名腰椎间盘突出症患者及 50 名健康志愿者的双能 CT 图像,根据临床症状和放射学发现被诊断患有腰椎间盘突出症。并利用新型胶原蛋白成像技术定量分析了患者与健康人群间的差异。利用 SPSS 20.0 软件进行数据处理和统计分析,采用 t 检验和方差分析等方法比较两组数据的差异。结果表明,腰椎间盘突出症患者的胶原蛋白含量显著低于健康人群,而且随着病情的加重,胶原蛋白含量也不断下降。因此,双能 CT 中的新型胶原蛋白成像技术可定量评估腰椎间盘突出症患者的胶原蛋白含量,为临床诊断和治疗提供了一种新的方法。该技术应用前景广泛,但仍需进一步研究和改进。总之,DECT 中的胶原蛋白成像是一种非常具有前途的评估腰椎间盘突出症的技术,可以提供结构和功能信息。这种 DECT 中的新型胶原蛋白成像可能成为诊断和治疗腰椎间盘突出症的重要工具,为治疗规划和患者护理提供有价值的信息。如得到证实,DECT 中的胶原蛋白成像可能成为脊柱疾病领域中重要的影像学检查技术。

PO-2291

X 线几何测量参数预测慢性踝关节不稳的临床价值

李春丽、黄益龙、何波（通讯作者）
昆明医科大学第一附属医院

目的 探究 X 线几何测量参数对慢性踝关节不稳（CAI）预测的临床价值。**方法** 回顾性分析 2018 年 1 月至 2022 年 6 月我院行踝关节 X 线检查患者的图像，纳入 CAI 患者 104 例和正常对照 136 例。踝关节正位片上测量胫骨远端内侧角（MDTA）、腓骨相对大小、内踝倾斜角、踝角、 α 角和 β 角。侧位片上测量腓骨相对位置、距骨高度、距骨半径、胫距接触率、踝穴角、跟骨角、Kite 角，分析以上影像学测量参数与 CAI 的关系。**结果** 踝关节 CAI 组的 MDTA、 α 角、 β 角高于对照组，而胫距接触率、腓骨相对位置、腓骨相对大小低于对照组，且差异有统计学意义（ $P<0.05$ ）。MDTA、腓骨相对位置、腓骨相对大小、胫距接触率是 CAI 的独立预测因素，其中胫距接触率预测 CAI 的 AUC 最大（0.663），而联合腓骨的相对位置、相对大小与胫距接触率后，AUC 可达 0.736。**结论** MDTA、腓骨相对位置、腓骨相对大小、胫距接触率是 CAI 的独立影响因素，对 CAI 的发生有临床预测价值。

PO-2292

**基于 CT 脊柱骨质定量系统的腰椎相关参数在
评估骨量异常中的应用价值**

秦健、梁彦博、姚倩倩
山东第一医科大学第二附属医院

目的：探讨基于 CT 脊柱骨质定量系统测得的第 1 腰椎（L1）椎体骨皮质、骨松质参数在评估骨量异常中的应用价值。

方法：回顾性收集 2021.07-2023.04 于我院行 256 排 Revolution 胸腹部 CT（同步 QCT）检查的患者 233 例，将 L1 椎体的 CT 图像导入 CT 脊柱骨质定量系统并自动测量 L1 椎体总体积、皮质体积、松质体积、皮质平均厚度、皮质总 HU、皮质平均 HU 和松质平均 HU。以 QCT 测得的 L1~2 椎体体积骨密度（vBMD）平均值为参考标准，将患者分为骨量异常（ $\leq 120 \text{ mg/cm}^3$ ）和骨量正常（ $> 120 \text{ mg/cm}^3$ ）组。采用独立样本 t 检验比较各参数的组间差异；对各参数和骨密度进行 Pearson 相关性分析；采用多因素 Logistic 回归构建模型，按照 7:3 的比例将患者分为训练集（ $n=163$ ）和测试集（ $n=70$ ），采用受试者工作特征曲线（ROC）分析模型诊断骨量异常的效能，采用 DeLong 检验进行曲线下面积（AUC）的比较。

结果：L1 椎体所有参数在两组间差异均有统计学意义，骨量异常组各参数均较低（ $P<0.05$ ）；L1 椎体皮质平均 HU 和松质平均 HU 与骨密度呈正相关（ $r=0.713$ 、 0.825 ， $P<0.05$ ）；在训练集与测试集中，多因素 Logistic 回归模型诊断骨量异常的 AUC 分别为 0.890、0.884，敏感性（75.0%、79.2%）和特异性（91.3%、87.0%）较高，训练集与测试集的 ROC 曲线无统计学差异（ $P = 0.922$ ）。**结论：**骨量异常患者基于 CT 脊柱骨质定量系统测得的 L1 各参数均较低；L1 皮质平均 HU 和松质平均 HU 与骨密度呈正相关。本研究表明骨量异常患者不仅骨量减少，骨皮质、松质的体积和密度也发生下降，并且 L1 椎体参数所构建的模型对骨量异常的评估具有较高的应用价值。

PO-2293

3D 机器人系统锥形束计算机断层成像在颈椎成像中的应用价值

邢俊、孙炎冰
上海市胸科医院

目的: 通过与常规X线摄影和CT进行比较, 探讨 Siemens 双悬吊 3D 机器人系统 (Multitom RAX) 锥形束计算机断层成像 (CBCT) 在颈椎检查中的临床应用价值。方法: 回顾性将在本院骨科就诊且因疑似颈椎疾病而分别行正侧位 X 线摄影 (A 组)、颈椎 CT (B 组) 或 3D RAX CBCT (C 组) 检查的 60 例患者纳入本研究。基于 3 组图像, 测量每例患者颈椎解剖学参数, 包括枕颈角 (OC2A)、第 1 胸椎倾斜角 (T1S)、C2 与 C7 矢状位轴向距离 (cSVA) 及颈椎前凸角 (CL), 并采用 5 级评分法评估图像质量。计算各组的辐射剂量, 包括容积剂量指数 (CTDI)、剂量长度乘积 (DLP) 和剂量面积乘积 (DAP)。对 3 组的各项解剖学参数的测量结果、图像质量及辐射剂量指标进行比较。结果: A、C 两组的 OC2A、CL 及 cSVA 分别为 $18.29^{\circ} \pm 6.73^{\circ}$ 、 $10.52^{\circ} \pm 12.53^{\circ}$ 、 $(26.77 \pm 10.33) \text{ mm}$ 及 $18.14^{\circ} \pm 7.23^{\circ}$ 、 $10.54^{\circ} \pm 11.08^{\circ}$ 、 $(27.07 \pm 9.26) \text{ mm}$, 两组间差异均无统计学意义 ($P > 0.05$); B 组的 OC2A、CL 及 cSVA 分别为 $14.78^{\circ} \pm 6.98^{\circ}$ 、 $3.32^{\circ} \pm 13.70^{\circ}$ 和 $(21.92 \pm 8.85) \text{ mm}$, 与 A、C 两组间的差异均有统计学意义 ($P < 0.05$)。三组之间图像质量主观评分 (A 组: 2.5 ± 0.65 、B 组: 3.72 ± 0.45 、C 组: 3.52 ± 0.62) 的差异有统计学意义 ($P < 0.05$)。C 组的剂量长度乘积 (DLP) 较 B 组降低了 54.6%, 较 A 组 DAP 增大了 86.9%, 差异均有统计学意义 ($P < 0.001$)。结论: 颈椎检查时, 采用 3D 机器人系统 CBCT 较常规 X 线能提供质量更高的图像且相比 CT 有更精准的站立位测量数据及更低的辐射剂量, 能为临床提供更精准、更有价值的测量参数。

PO-2294

针刺治疗膝骨性关节炎患者的脑结构 MRI 研究

郑运松^{1,2}、张聪²
1. 陕西中医药大学附属医院
2. 陕西中医药大学

目的 基于体素的形态学测量 (voxel-based morphometry, VBM) 探讨膝骨性关节炎 (KOA) 患者在针刺治疗前后的脑灰质体积改变, 进而分析其针刺疗效机制。方法 前瞻性纳入 30 例 KOA 患者, 对 KOA 患者行针刺治疗, 并在针刺治疗前后进行 VAS、SAS、SDS、MOCA 相关评分量表评估及高分辨率 T1WI 像扫描。采用 VBM 方法分析针刺治疗前后 KOA 患者脑灰质结构差异, 分析其与评估量表结果间的相关性。结果 针刺治疗后 KOA 患者对疼痛、焦虑、抑郁均有缓解 ($P < 0.001$), 认知功能有所提高 ($P < 0.001$)。治疗后灰质体积增加的脑区包括左侧舌回、左侧脑岛; 灰质体积减少的脑区包括左侧枕中回、中央旁小叶 (体素水平 $P < 0.001$, 团块水平 $P < 0.05$)。结论 针刺治疗可以明显缓解 KOA 患者的临床症状, 同时发现 KOA 患者治疗后多个脑区结构改变, 因此推测针刺疗效可能是通过大脑多个脑区相互作用而实现。

PO-2295

灌注加权成像在股骨头缺血性病变早期诊断中的价值

刘君艳
辽宁省肿瘤医院

目的

股骨头缺血性坏死是由一系列股骨头疾病和损伤导致股骨头缺血改变所引起。传统的磁共振成像不能反映与股骨头缺血相关的早期变化情况，例如早期血流灌注的变化。我们使用磁共振灌注加权成像 (PWI) 来评估股骨头的早期血流灌注改变，用来评估 PWI 所示血流灌注结果与股骨头缺血改变程度的相关性。

方法

从 2020 年到 2021 年，纳入 20 名临床诊断为单侧股骨头缺血的患者 (实验组) 进行 MR-PWI 扫描。软件后处理后测量感兴趣区 (ROI) 的相对增强率 (RE)、最大增强率 (ME)、达峰时间 (TTP) 值。绘制股骨头血流灌注曲线，同时与对侧 (对照组) 股骨头同样区域进行对比，并对差异进行统计学分析。

结果

20 例股骨头病变患者 (实验组) 的 RE、ME 和 MRE 均低于对照组 ($P < 0.05$)，TTP 高于对照组 ($P < 0.05$)。患股骨头内侧和外侧柱的 RE、ME、MRE 和 TTP 与对照股骨头相比无显著差异。

结论

在本研究中，我们发现股骨头缺血部位的 RE、ME 和 MRE 在不同程度上降低，TTP 增加。因此，PWI 能够发现股骨头缺血的早期血流变化，对于早期发现或预警股骨头缺血坏死具有一定的作用。

PO-2296

基于临床因素预测冠状动脉粥样硬化患者的骨量健康状况

梁彦博、苑筱晴、秦健
山东第一医科大学第二附属医院

目的：探讨基于临床因素在预测冠状动脉粥样硬化患者的骨量健康状况中的应用价值。

方法：收集 2021 年 6 月至 2023 年 7 月就诊于我院并根据冠状动脉 CT 血管成像检查评估为冠状动脉粥样硬化的患者 157 例。以 QCT 测得的体积骨密度 (vBMD) 为参考标准，将患者分为骨量正常 ($vBMD > 120 \text{ mg/cm}^3$) 和骨量异常 ($vBMD \leq 120 \text{ mg/cm}^3$) 组。收集所有患者的一般资料如年龄、性别、吸烟史、饮酒史、血压、血糖、血脂、血钙等。首先将各因素纳入单因素 Logistic 回归分析，然后将 $P < 0.05$ 的因素纳入多因素 Logistic 回归分析以筛选骨量异常的独立预测因素，并构建预测骨量异常的回归方程模型，根据预测概率绘制受试者工作曲线 (ROC)，并计算曲线下面积 (AUC)。所有统计分析均采用 R 语言分析。 $P < 0.05$ 认为具有统计学意义。

结果：多因素 Logistic 回归分析显示年龄和低密度脂蛋白是影响冠状动脉粥样硬化患者骨量的独立危险因素，OR 值分别为 1.13 (95% CI: 1.08-1.18)、2.62 (95% CI: 1.52-4.51)。当 Cutoff 值为 0.382，约登指数为 0.538 时，AUC (95% CI)、灵敏度、特异度、准确率分别为 0.820 (95% CI: 0.754-0.885)、67.1%、86.7%、76.4%。

结论：年龄和低密度脂蛋白是冠状动脉粥样硬化患者发生骨量异常的独立风险因素，随着年龄的增长和低密度脂蛋白的升高，冠状动脉粥样硬化患者的骨状况也越差。因此，本研究表明有必要对冠状动脉粥样硬化患者采取干预措施以降低未来发生骨质疏松的风险。

PO-2297

全身磁共振扩散加权成像评估多发性骨髓瘤不同骨髓浸润模式

吴雅雯、李玉清
杭州师范大学附属医院

目的 采用全身磁共振扩散加权成像 (WB-DWI) 评估多发性骨髓瘤 (MM) 患者不同骨髓浸润模式的表观扩散系数 (ADC) 值, 并确定不同骨髓浸润类型的 ADC 阈值。**方法** 招募首次确诊的 MM 患者 19 例, WB-DWI 检查的图像经视觉评估后, 将各部位 (颈椎、肋骨、胸骨、肱骨、肩胛骨、骶椎、髂骨、股骨、胸椎、腰椎) 病灶类型分为局灶组 (包括混合型中局灶病变) (ROI=141)、弥漫组 (ROI=150)、混合型中弥漫病变组 (ROI=127)、“盐和胡椒”组 (ROI=54)、正常组 (ROI=68), 测量并比较各部位的 ADC 值, 绘制 ADC 值区分不同骨髓浸润类型的受试者工作特征 (ROC) 曲线。**结果** 混合型中弥漫病变组与“盐和胡椒”组 ($P>0.99$) ADC 值差异无统计学意义, 余组间 ADC 值差异均有统计学意义 ($P<0.005$)。ROC 曲线显示, 鉴别局灶组及“盐和胡椒”组骨髓浸润的曲线下面积 (AUC) 为 0.889 (95%CI: 0.844~0.934), 鉴别弥漫组及正常组骨髓浸润的曲线下面积 (AUC) 为 0.968 (95%CI: 0.949~0.987), ADC 值能够准确、直观地区分不同骨髓浸润模式。**结论** ADC 值能够作为量化工具, 客观地区分 MM 患者不同骨髓浸润模式。

PO-2298

MRI 中 PDWI 序列在膝关节损伤中的应用价值

陈旭、段庆红
贵州医科大学附属肿瘤医院

目的: 探讨 pdwi(质子密度加权像)序列在膝关节损伤的应用价值。**方法:** 收集 2022 年 3 月至 2022 年 6 月医院的膝关节损伤患者 60 个, 进行不同的扫描序列对膝关节的扫描分析, 采用相同的层厚 4mm, 层间距 1mm, 小 fov 参数, 进行扫描, 分别采用 pdwi 压脂序列、stir 序列, fs 序列进行扫描。**结果:** 通过 mri 的 3 种序列对比观察: pdwi 扫描的图像质量率为 70%, fs 为 20%, stir 为 10%, 分析原因: pdwi 扫描时间短, 获得图像的 snr 和空间分辨率较好, 噪声小, 显示半月板、肌腱、韧带断裂清楚。stri 主要用于骨髓性病变, fs 的噪声大, snr 低, 图像的颗粒感强, 显示关节处不清楚。**结论:** pdwi 序列在膝关节损伤的价值明显高于 stir、fs, 更好地发现病变, 满足临床需求, 提高准确率。

PO-2299

膝关节骨骺发育主观评价在 MRI 骨龄预测的应用

贾晓茜
西安交通大学第一附属医院

目的: 采用 Vieth-classification 进行膝关节 MRI 骨骺发育主观评价, 探索该评价方法在青少年膝关节骨龄预测中的适用性。

方法: 回顾性纳入 2016 年 1 月至 2021 年 1 月 10~20 岁膝关节 MRI 数据, 经评估符合纳入标准和排除标准, 最终有效样本共 1517 例, 其中男性 1112 例, 女性 405 例, 年龄波动在 10.03~20.21 岁。MRI 检查采用 1.5T 或者 3.0T 场强, 膝关节线圈, T1 自旋回波序列(T1TSE)、脂肪抑制质子密度加权序列、T2 自旋回波序列(T1TSE)。获得冠状位、矢状位、和轴位图像。采用 Vieth-classification 进行评级, 其中所有分级评估 T1TSE 序列图像, PDWI 作为补充评估以区分 5 和 6

级, 其不同骨化时期的形态学特征见附件。将所测量数据录入至 EXCEL 表格, 录入后的结果导入至 R 软件 (版本号: V4.2.1) 进行分析。通过计算 Kappa 系数确定观察者组内和组间一致性; 描述性分析不同阶段对应的年龄值 (包括最大值、最小值、中位数、上下四分位数) 及分布情况, 使用 Mann-Whitney U 检验分析股骨远端与胫骨近端之间评级差异, 以确定其统计相关性 ($P<0.05$, 精确, 双侧)。

结果: 男性股骨远端评级为 6 的 100% 超过 16 岁且 93.66% 超过 18 岁, 评级为 4 的 100% 大于 14 岁, 评级为 3 的 100% 大于 12 岁, 评级为 2 的 93.10% 小于 14 岁。女性股骨远端评级为 6 的 100% 超过 16 岁且 82.26% 超过 18 岁, 评级为 5 的 100% 大于 14 岁, 评级为 4 的 100% 大于 12 岁, 评级为 2 的 100% 小于 14 岁。

结论: 因地域差异, Vieth-classification 方法在中国青少年骨龄评估中 18 岁年龄判定效果弱于欧洲国家, 但可以肯定的是 MRI 可获得更丰富的骨龄评价信息, 值得进一步探索基于 MRI 的能完全判定中国青少年 18 岁的骨骺发育特点。

PO-2300

两种不同的站立位双下肢全长拍摄、 拼接方式肢体力线测量差异与准确度研究

张蓉

空军军医大学西京医院

【目的】 探讨两种不同拍摄及拼接方式对站立位双下肢全长肢体力线测量的准确度。

【方法】 利用机器 GE Definium6K 不打角度站立位双下肢全长成像和锐珂 DRX-COMPASS 打角度站立位双下肢全长称下两种方式分别对人体下肢骨骼标本进行标准体位双下肢全长拍摄, 经各自机器自带拼接软件拼接得到双下肢全长影像, 分析和总结两种机型所得双下肢全长影像的力线, 并与拍摄所用骨骼标本力线进行对比。

1. 站立位双下肢全长拍摄方法: 使用大头针和铜丝对人体下肢骨骼标本的股骨头中心和踝关节中心做标识, 标本分别呈解剖学体位站立于机器 GE Definium6K 和锐珂 DRX-COMPASS 自带的全长拍摄摄影架前, 上界包括骨盆上缘, 下界包括足底进行拍摄。机器 GE Definium6K 为 17IN*17IN 探测器, 自动条件, 定位时采用机头不打角度, 上下平行移动至上界和下界分别定位, 机头和平板探测器由上界至下界平行移动的同时进行摄影, 得到 6-8 幅图, 通过自带软件对图像进行拼接, 得到站立位双下肢全长图像。机器锐珂 DRX-COMPASS 为 17IN*17IN 探测器, 手动条件, 定位时, 将机头放置约上下界连线中点的位置, 向上打角度至定位线包含骨盆上缘, 向下打角度至定位线至足底, 探测器处于上下界中心位置不移动, 上下打角度, 同时探测器由上界至下界移动进行摄影, 得到 3-4 幅图, 通过自带软件对图像进行拼接, 得到站立位双下肢全长图像。

2. 力线测量: GE Definium6K 和锐珂 DRX-COMPASS 分别用机器自带的软件测量力线。标本采用万能角度尺测量。

【结果】 两种机型拍摄的双下肢全长影像力线测量差异与骨骼标本实际力线相比的差异均在临床允许范围内。

【结论】 使用 GE Definium6K 和锐珂 DRX-COMPASS 两种机型得到的站立位双下肢全长影像均可靠。

PO-2301

男性业余马拉松运动员胫股关节软骨厚度、体积及 T2* 值改变

黄艺、张晏境、丁建平
杭州师范大学附属医院 (杭州市第二人民医院)

目的: 横断面比较业余马拉松运动员与匹配的久坐对照组的胫股关节软骨厚度、体积及软骨 T2* 值的变化, 以初步评价马拉松运动对膝关节胫股关节软骨的影响。方法: 收集 2018 年 1 月至 2021 年 12 月期间在我院进行右膝关节磁共振检查的男性业余马拉松运动员 28 人, 以及与之匹配的久坐对照组 13 人。将获取的 3D-DESS、T2* mapping 序列数据使用后处理原型软件进行自动化软骨分割, 得到膝关节软骨 21 个亚区的厚度、体积及 T2* 值, 通过独立样本 t 检验或秩和检验方法对两组数据进行统计分析。结果: 业余马拉松运动员膝关节股骨滑车外侧软骨全层、浅层及股骨外侧前部软骨浅层区域 T2* 值显著低于久坐对照组, 差异具有统计学意义 (t 分别为 -3.30, -3.51, -3.47, P 均 < 0.05)。两组之间各软骨分区的厚度和体积无统计学差异 (P 均 > 0.05)。结论: 长期的马拉松运动可能不会引起膝关节软骨的厚度和体积的改变。以股骨外侧非承重区为主的浅层关节软骨 T2* 值在业余马拉松运动员中较健康对照组有所减低, 表明马拉松运动在一定程度上可能降低胫股关节 OA 的风险, 其与 OA 的发生发展之间的关系及与马拉松运动的关系有待今后的进一步研究。

PO-2302

b 值及脂肪抑制方式对磁共振四肢软组织弥散成像的影响

陈地友
中国人民解放军陆军特色医学中心

目的: 探讨不同 b 值及脂肪抑制方式的 DWI 在四肢软组织中的差异, 并筛选出优势组合。材料与方法: 纳入了陆军特色医学中心 2021 年 1 月至 2023 年 5 月接受大腿近端软组织 DWI 的病例。主要参数如下: a 序列 b 值 50/800s/mm², 脂肪抑制方式为反转恢复; b 序列 b 值 0/800s/mm², 脂肪抑制方式为反转恢复; c 序列 b 值 50/800s/mm², 脂肪抑制方式为频率选择+反转恢复; d 序列 b 值 50/600s/mm², 脂肪抑制方式为频率选择+反转恢复, e 序列 b 值 50/600s/mm², 脂肪抑制方式为频率选择。采用主、客观评价方法进行图像质量分析。主观评价由具有 5 年以上骨关节影像诊断经验的放射科医师独立完成, 根据清晰度、失真度 (变形)、脂肪抑制效果和伪影按 1-5 评价, 4/5 分为优质影像。工作经验 8 年以上的磁共振扫描技师独立完成兴趣区和噪声测量两次, 取平均值作为客观评价实际值。客观评价指标包括信噪比、对比噪声比、ADC 值、畸变程度、扫描时长。使用 SPSS23.0 软件进行统计学分析。主观评价一致性使用加权 Kappa 系数进行评估, 使用 RxC 列联表比较序列影像的优质率。信噪比、对比噪声比、ADC 值、畸变程度和扫描时长的差异采用方差分析进行比较。结果: 不同诊断医师的主观评价具有较好的一致性, Kappa 值为 0.925。a 序列、b 序列、c 序列、d 序列、e 序列的影像评分分别为 4.43、4.56、4.75、4.68、4.28, 优质率分别为 79%、76%、83%、81%、72%。影像优质率无显著性差异 (P > 0.05)。信噪比、对比噪声比、畸变程度和扫描时长存在显著性差异 (P < 0.05), 然而 ADC 值则没有 (P > 0.05)。结论: b 值为 50/800、采用频率选择+反转恢复脂肪抑制方式的成像模式是优势组合, 在四肢软组织弥散成像中具有更好的临床应用价值。

PO-2303

中老年人胫骨结节-股骨滑车沟距离与髌股关节软骨退变之间的关系研究

于子川
天津大学天津医院

目的：利用膝关节核磁共振成像（MRI）扫描探讨中老年人髌股关节软骨退变程度与胫骨结节-股骨滑车沟间距（TT-TG）之间的关系。方法：选取 2020 年 9 月—2022 年 12 月在我院行膝关节 MRI 扫描的中老年患者 515 例。由两名从事骨科相关的影像科医生对髌股关节软骨退变分级进行客观评价。并利用 GE 工作站使用膝关节轴位图像后处理，进行 TT-TG 距离测量。比较髌骨侧软骨退变及股骨滑车侧软骨退变各组间 TT-TG 间距，采用 Logistic 回归分析 TT-TG 间距是否是关节软骨退变的影响因素，并绘制受试者特征曲线（ROC）进行分析。结果：髌骨侧软骨退变及股骨滑车侧软骨退变各组间 TT-TG 间距存在统计学意义（ $P<0.05$ ）。髌骨侧关节软骨退变分级与 TT-TG 间距存在相关性（ $P=0.021$ ）；股骨滑车侧关节软骨退变分级与 TT-TG 间距不存在相关性（ $P=0.737$ ）。TT-TG 间距对评估髌骨侧关节软骨退变存在诊断意义（ $AUC=0.583$ ），但诊断能力较低；而对股骨滑车侧关节软骨退变则不存在诊断意义（ $AUC=0.487$ ）。结论：TT-TG 间距对于髌骨侧关节软骨退变分期有一定的预测作用，但是对于股骨滑车侧关节软骨退变无法准确预测。

PO-2304

定量 MRI 对业余马拉松运动员椎体脂肪含量相关性的研究

李博怡、邓小龙、李佳慧、陈勇
杭州师范大学附属医院（杭州市第二人民医院）

目的：应用 MR 化学位移成像技术，对业余马拉松运动员腰椎骨髓脂肪（BMF）进行定量分析研究，探讨马拉松运动与其相关性。方法：招募男性业余马拉松运动员 47 名（年龄 30-50 岁之间）作为实验组，按跑龄分为低跑龄组：小于 3 年， $n=16$ ；中等跑龄组：3-5 年， $n=16$ ；高跑龄组：大于 5 年， $n=15$ ；健康男性久坐志愿者 18 名作为对照组。所有受试者接受 Dixon 序列扫描，获得基于 Dixon 扫描的氢质子密度脂肪分数值（MRI-PDFF），并测量椎体高度。采用 Pearson 相关性检验分析实验组椎体 PDFF 值与跑龄的相关性；采用单因素方差分析比较实验组与对照组椎体高度的差异。结果：不同跑龄志愿者间椎体的 MRI-PDFF 值差异均有统计学意义（ P 均 <0.01 ）。所有实验组 L3、L4、L5 椎体的腰椎骨髓脂肪（BMF）按照跑龄的增加而递减（ $p<0.05$ ），其中 L4 椎体的 BMF 与对照组的差异性最大（ $p<0.05$ ），L2 椎体的 BMF 与对照组相比无明显差异（ $p>0.05$ ），所有实验组 L2、L3、L4、L5 椎体的高度与对照组有边缘性差异（ $p=0.048$ ）。结论：马拉松运动会降低椎体的 BMF，且随着跑龄的增加，腰椎椎体的 BMF 会逐渐降低。

PO-2305

腰椎孤立性纤维瘤病例 1 例并文献复习

吴少强
四川省精神卫生中心·绵阳市第三人民医院

目的：SPB 临床较为罕见，有较高风险进展为多发性骨髓瘤，因此早期发现并明确诊断至关重要。本研究目的是通过临床病例及文献复习，分析 SPB 影像学特点，提高对该病的认知和诊断的准确性。

方法：分析我院最近收治 1 例腰椎 SPB 患者影像学资料，并复习相关文献。

结果：

1、患者男，62 岁，腰痛 1 月，加重 2 周；脊柱 DR 示腰 2 椎体骨质密度不均匀，见纵形条状高密度影；腰椎 CT 示腰 2 椎体膨胀性骨质破坏，其内见残存骨嵴，部分骨皮质不连续，椎旁区未见肿块形成；腰椎 MRI 示腰 2 椎体呈稍长 T1 稍长 T2 信号影改变，内见右侧部分椎弓，病灶内见少许低信号分隔，邻近椎间隙未见明显变窄，病灶周围未见明显肿块影；穿刺活检及腰 2 椎体切除术后病理证实为 SPB。

2、文献复习表明 SPB 是一类以分泌免疫球蛋白的浆细胞单克隆增生导致的恶性肿瘤，目前病因与发病机制不明，起病比较隐匿，以病变部疼痛为主要临床表现，实验室检查一般无异常。影像特点：X 线表现为溶骨性骨质破坏，无骨膜反应。CT 表现为椎体及附件骨质内穿凿样、充蚀状溶骨性、膨胀性骨质破坏，骨皮质变薄、不完整，但整体轮廓仍较规则，骨破坏区内为软组织密度应充填，边缘可见环形壳状残存骨小梁结构，残存骨嵴上下径大于左右径，与椎体应力有关，横断位残存骨嵴呈高密度与等低密度的软组织肿块组成类似大脑半球的脑沟、脑回影，呈较具特征性的“微脑”征改变。MRI 表现为病灶信号不一，T1WI 呈稍低信号、等信号，常规 T2WI 呈等信号、稍高信号、稍低信，STIR 序列呈明显高信号，增强扫描病灶明显强化，境界清楚，骨质破坏后残留的骨嵴及硬化边呈低信号，镶嵌在等 T1、长 T2 或强化后呈高信号的软组织肿块中，类似于颅脑横断位影像，与 CT 表现相对应，亦称之为“微脑”征。

结论：SPB 影像学表现主要特点为单发的以椎体为中心的膨胀性、溶骨性骨质破坏，破坏区可有残留骨嵴及硬化边，典型表现为“微脑”征。

PO-2306

增强后多时序 T1mapping 量化退行性颈椎病血 脊髓屏障破坏的初步研究

张力、张玉金、赵保根、王宁、王勇
河北医科大学第一医院

目的：利用 Gd-DTPA 增强前后颈髓 T1mapping 值的变化评估退行性颈椎病(Degenerative Cervical Myelopathy DCM)受压节段血脊髓屏障(Blood Spinal Cord Barrier BSCB)破坏，初步探讨 T1mapping 量化 BSCB 功能障碍的可行性。

方法：招募 DCM 患者 60 名及健康志愿者 30 例纳入本研究。DCM 患者组根据 Reiber 诊断标准分为 BCSB 完整组及 BSCB 破坏组。首先进行矢状位 T2WI 扫描，患者组根据 T2WI 图像确定最狭窄位置，对照组选取 C5-6 椎间盘水平，进行轴位增强前 T1mapping (Native T1)，增强后 1min、5min、15min T1mapping 扫描。测量增强前后脊髓 T1 值，计算不同延迟时间 T1 变化值 ($\Delta T1_{1m}$ 、 $\Delta T1_{5m}$ 、 $\Delta T1_{15m}$)。多因素方差分析比较组别间 Native T1 值及不同时期 $\Delta T1$ 值，不同时间 $\Delta T1$ 值与 AlbQ 进行 pearson 相关性分析，绘制不同时间 $\Delta T1$ 值与 AlbQ(脑脊液和血清中标准化的白蛋白商)的 ROC 曲线，确定发生 BCSB 破坏的 $\Delta T1$ 最佳截断值。

结果：DCM 出现 BSCB 破坏的为 21 例，未出现 BSCB 破坏的为 39 例。各组间 Native T1 存在差异 ($F=5.32$ $P=0.007$)，BSCB 破坏组 $\Delta T1_{1m}$ 、 $\Delta T1_{5m}$ 、 $\Delta T1_{15m}$ 均高于 BSCB 完整组 ($P=0.039$ 0.002 0.028)。DCM $\Delta T1_{5m}$ 与 AlbQ 呈强相关性， $R=0.734$ 。 $\Delta T1_{1m}$ 、 $\Delta T1_{5m}$ 、 $\Delta T1_{15m}$ 诊断 BSCB 破坏的 ROC 曲线下面积分别为 0.712、0.758 及 0.638，截断值分别为 39.2ms、47.75ms、44.4ms。结论：增强后不同时序 T1mapping 变化值可评估 DCM 患者 BSCB 的完整性，其中增强后 5 分钟 T1 变化值是量化 DCM 患者 BSCB 破坏程度最佳影像学参数。

PO-2307

神经根型颈椎病症状发作及缓解期臂丛扩散张量成像的对比研究

张力、张玉金、赵保根、王宁、王勇
河北医科大学第一医院

目的：通过对比神经根型颈椎病(cervical spondylotic radiculopathy CSR)患者症状发作及缓解期臂丛神经扩散张量成像(Diffusion tensor imaging DTI)特征,探讨 DTI 评估神经根型颈椎病临床症状严重程度及持续时间的可行性。

方法：招募症状发作 72 小时之内 CSR 患者 54 例作为患者组,健康志愿者 36 例作为对照组。患者组进行症状 72 小时内及症状消失 72 小时后双侧臂丛神经 DTI 成像,对照组行臂丛神经 DTI 成像。使用纤维束示踪成像技术测量 C5-6、C6-7、C7-8、C8-T1 双侧神经根 FA 值及 MD 值。收集患者颈部功能障碍指数(neck disability index, NDI)和症状持续时间。独立样本 T 检验比较组间不同节段神经根 FA 值、MD 值,配对样本 T 检查比较患者组发作期及缓解期不同节段神经根 FA 值、MD 值,同时比较患者组健侧及患侧不同节段症状发作期 FA 值及 MD 值。进行患者症状发作期 DTI 参数与症状持续时间和 NDI 的 Pearson 相关性分析。

结果：与对照组相比,患者组患侧 C6-7 及 C7-8 神经根 FA 值明显降低,MD 值明显增高。患者组发作期患侧 C6-7 及 C7-8FA 值较健侧降低,MD 值增高。患者组患侧发作期 C6-7 及 C7-8FA 值较缓解期降低,MD 值增高。患者组发作期 C6-7FA 值与症状持续时间及 NDI 评分均呈明显负相关。结论：臂丛神经 DTI 可作为评估 CSR 患者症状严重程度及持续时间有效影像学手段,推测症状发作期患侧 C6-7 神经根 FA 值可预测症状持续时间和严重程度。

PO-2308

**双源下肢静脉 CTV 对下肢 DVT
(深静脉血栓)的显示与诊断的研究**

弓通
中国人民解放军陆军特色医学中心

目的：双源下肢静脉 CTV 对下肢 DVT(深静脉血栓)的显示与诊断的研究。

方法：将 90 例拟行双源下肢静脉 CTV 检查的病例随机分成 A, B, C3 组,每组 30 例。对比剂采用碘佛醇 320mg/ml, A 组用量 400mg/kg, B 组用量 450mg/kg, C 组用量 500mg/kg, 注射速率 4 m L/s, 注射完毕后同等速率注入生理盐水 30 m L。对这 90 例病例用双源后处理单能+分别做出 50kv, 70kv, 100kv, 140kv 的图像,测量下腔静脉,髂外静脉,股静脉,腘静脉,胫前静脉,足背静脉的 CT 值,记录并分析数值来评价双源单能+及对比剂用量对下肢 DVT 的显示与诊断。

结论：双源 CT 在减少对比剂的情况下可以用于诊断 DVT。

PO-2309

西门子双源螺旋 CT 扫描技术在成人股骨头坏死临床诊断中的应用和疗效观察

詹力、曹晖

中国人民解放军陆军特色医学中心

目的：通过对比分析明确西门子双源螺旋 CT 应用于股骨头坏死诊断中的价值。方法：以 2022 年 1 月-12 月作为本次研究的时间阶段，随机选择共 35 例股骨头坏死成年患者作为对象开展研究，以 X 线检查结果为对照组，西门子双源螺旋 CT 检查结果为观察组。X 线检查：利用西门子 DR 成像系统，指导患者置于仰卧位，并且将足尖内旋，角度为 15-20°，以充分暴露双侧股骨头、股骨颈为标准。按照临床诊断要求，拍摄爱舍股骨头轴位片、标准正位片。螺旋 CT 检查：利用西门子双源螺旋 CT 设备进行检查，准直器宽度参数调节分别是 200mA、130kV、0.6mm，重建间隔调节为 1mm，螺距调节为 1mm，收到秒层距调节为 4mm，层厚调节为 5mm。参数调节完成后，要求患者置于仰卧位，设定扫描范围开始扫描，即从患者两侧髌臼上缘作为起点，至股骨颈、股骨头，获得横断面影像信息。检查结束后均由两名医生的影像科医生读片，并且获得诊断最终结果。分期采用 ARCO 分级，分为：I 期（检查无明显改变，骨头外形，密度正常）、II 期（股骨头斑片状、囊变形成、硬化、密度不均匀，影像学检查未塌陷，检查为阳性，髌臼未发生变化）、III 期（正侧位照片新月征，关节面塌陷）、IV 期（关节间隙变窄、关节破坏、骨关节炎、股骨头或者关节面塌陷，髌臼改变）。对比检查后不同期的患者数量，以及总检出率，对比结果 $P < 0.05$ 表示有统计学对比意义。结果：观察组的总检出率高于对照组，差异对比存在统计学意义 ($P < 0.05$)。结论：双源螺旋 CT 有较好的临床应用价值，能够应用于成人股骨头坏死的诊断中，可以保证检出率。通过进行全面的、准确地、及时地检测，以及及时地评估，能够更好地帮助患者恢复健康，并且能够更好地改善他们的生活质量。

PO-2310

探讨去金属伪影 (iMAR) 算法与电影式体积渲染技术 (cVRT) 在髌关节成形术后 CT 评价中的临床价值。

刘星

郑州大学第一附属医院

目的：探讨去金属伪影 (iMAR) 算法与电影式体积渲染技术 (cVRT) 在髌关节成形术后 CT 评价中的临床价值。

方法与材料：对 120 例接受 CT 扫描的髌关节成形术后患者进行了回顾性研究。重建 CT 图像，包括常规、iMAR 和相应的体积渲染 (VR) 和 cVRT 图像。测量感兴趣区域 (ROI) 的 CT 值和标准差 (SD)，计算客观评价指标。使用 Likert 5 分制评价主观评分和诊断信心评分。使用配对 T 检验、Mann-Whitney U 检验和 Kappa 检验进行统计分析。

结果：iMAR 组在高密度区域显示 CT 值降低，在低密度区域显示 CT 值增加，伪影指数显著降低 ($P < 0.05$)。iMAR 组中所有 ROI 的 SD 均减小 ($P < 0.05$)，除了背景噪声，不同区域之间的伪影去除率没有差异 ($P > 0.05$)。iMAR 组在图像质量评分和诊断信心评分方面均有改善，分别增加了 2.70 和 2.88 分 ($P < 0.05$)。与 cVRT 重建相结合的 iMAR 图像获得了最高的主观评分 ($P < 0.05$)，其次是与 VR 重建相结合的 iMAR 图像 ($P < 0.05$)，常规组中的 cVRT 和 VR 图像获得了最低的评分 ($P > 0.05$)。

结论: iMAR 可以有效纠正低密度区域、高密度区域和同一层次对侧软组织的 CT 值, 大大减少图像噪声, 并提高诊断信心。与 cVRT 重建相结合时, 金属植入物的稳定性以及与相邻组织的关系可以更直观地显示和评价。

PO-2311

基于 CT 影像组学在肺转移预测中的研究

刘颖、洪楠
北京大学人民医院

目的:

尤文肉瘤患者的主要预后不良事件包括肺转移, 肺转移的预测可能为指导个体化治疗方案提供潜在的可靠依据。本研究旨在建立并验证基于计算机断层扫描 (Computed Tomography, CT) 图像的影像组学模型, 探究其在尤文肉瘤肺转移预测中的价值。

材料与方法:

回顾性纳入 143 例经组织病理学诊断为尤文肉瘤的患者, 按照 7:3 的比例随机分为训练组 100 例, 测试组 43 例。在 CT 平扫和 CTE 图像中沿着每个肿瘤的边缘手动勾画 ROI, 并提取影像组学特征。建立了 6 个不同的模型, 包括 3 个影像组学模型 (Pre-CT、CTE 和 ComB 模型) 和 3 个临床-影像组学模型 (Pre-CT_clinical、CTE_clinical 和 ComB_clinical 模型) 用于预测尤文肉瘤肺转移。通过计算 AUC、ACC、敏感性和特异性来评价不同模型, 并采用 DeLong 检验比较影像组学模型和临床-影像组学模型的 AUC 值是否有统计学差异。

结果:

在临床因素中, 治疗方式在转移组和非转移组有统计学差异。影像组学模型及临床-影像组学模型在预测尤文肉瘤患者肺转移方面均表现良好, 其中 ComB 模型应用 LR 分类器取得的 AUC 值最高 (训练组/测试组 AUC: 0.885/0.848), 但是影像组学与临床-影像组学模型的 AUC 值没有统计学差异。

结论:

在尤文肉瘤患者中, 联合影像组学特征和临床特征建立的临床-影像组学模型对肺转移具有较好的预测能力, 但是与影像组学模型相比, 临床-影像组学模型的预测效能没有提高。

PO-2312

应用深度学习分析颈椎 CT 形态学参数

李媛、张恩龙、欧阳汉强、郎宁、袁慧书
北京大学第三医院

目的: 颈椎 CT 形态学参数的测量是可重复和耗时的。深度学习 (DL) 提高了效率和一致性。我们建立了一系列基于 DL 的分割算法来自动测量脊髓型颈椎病评估的五个关键参数, 并将我们的算法的性能与医生的性能进行了比较, 以评估其准确性和临床应用价值。

方法: 将 685 例患者的颈椎 CT 图像分为训练组 (n=548) 和测试组 (n=137)。训练集用于开发 VB-Net-DL 模型, 包括多个颈椎亚区的 3D 分割模型和颈椎 CT 中矢状面上的关键点定位模型。测量参数包括矢状椎管径 (SCD)、矢状椎体径 (VBD)、巴甫洛夫比、横向椎管径 (TCD), 和骨性椎管面积 (OSCA)。由放射科医生和脊椎外科医生进行手动测量。使用 Mann-Whitney U 检验、Pearson 相关性、平均绝对误差和 Bland-Altman 图评估模型性能。

结果: 测试集中巴甫洛夫比率、SCD、VBD、TCD 和 OSCA 的 DL 和手动测量在准确性和一致性方面具有可比性。对于大多数参数, VB-Net 模型的 Pearson 相关系数超过 0.8。

结论: 我们基于 VB-Net 的 DL 方法可以有效地近似人工测量人类颈部 CT 形态参数, 从而为医生提供准确高效的辅助诊断工具。

PO-2313

颈椎 MRI 中央椎管和椎间孔狭窄自动检测与分类的深度学习模型

张恩龙¹、要美伊²、李媛¹、郎宁¹、袁慧书¹

1. 北京大学第三医院
2. 中国科学院计算机所

目的: 开发一种在颈椎 MRI 上自动检测和分类颈管和神经孔狭窄的深度学习 (DL) 模型, 可以提高其诊断的准确性和效率。

方法: 在 DL 模型的基础上, 提出了一种由感兴趣区域 (ROI) 检测和级联预测组成的颈椎管狭窄症诊断方法。首先, 使用三部分特定的卷积神经网络来检测颈部 MRI 图像不同部分的 ROI。然后, 对狭窄类别进行级联预测, 以获得患者各切片上狭窄程度和位置的结果。最后, 在测试中, 将结果进行融合, 以获得患者级别的诊断报告。使用 DL 模型的准确性 (ACC)、曲线下面积 (AUC)、敏感性、特异性、F1 评分和诊断时间以及 ROI 检测定位的召回率等指标来评估性能。

结果: 在我们的 DL 模型的五次交叉验证下, ROI 定位的平均召回率达到 89.3% (神经孔) 和 99.7% (中央椎管)。在二分类法分类 (正常或轻度 vs 中度或重度) 中, DL 模型的 ACC 和 AUC 非常接近放射科医生的水平。

结论: DL 模型在颈椎 MRI 上对中央椎管和神经孔狭窄的检测和分类方面表现出与专科放射科医生相当的性能。

PO-2314

Hoffa 脂肪垫能谱 CT 成像在膝骨关节炎诊断中的临床应用价值

贾永军、杨创勃、于楠
陕西中医药大学附属医院

目的: 探讨能谱 CT 脂肪-肌肉分离图像及基物质含量在膝骨关节炎诊断中的临床应用价值。

资料与方法: 前瞻性收集临床初次诊治膝骨关节炎患者 90 例, 所有患者行患侧膝关节 MR 检查和双侧膝关节 CT 能谱成像。以 T2WI 抑脂序列上矢状面 Hoffa 脂肪垫最大层面为标准, 在相同层面常规 CT 图、脂肪基物质图、肌肉基物质图上测量脂肪内异常密度/灰度长径, 同时分别沿 Hoffa 脂肪垫边缘用自由笔圈出边界测量面积。此外, 比较症状严重膝关节与对侧膝关节常规 CT 图、脂肪基物质图、肌肉基物质图上矢状面 Hoffa 脂肪垫最大层面面积和相应 CT 值、脂肪基物质含量、肌肉基物质含量。

结果: 以 T2WI 抑脂序列为标准, 脂肪基物质图内异常灰度长径更为接近标准, 且两者差异无明显统计学意义 ($P < 0.05$), 均大于常规 CT 图、脂肪基物质图、肌肉基物质图上测量面积 ($P < 0.05$)。脂肪基物质图勾画矢状面 Hoffa 脂肪垫最大层面更为接近, 且两者差异无明显统计学意义 ($P < 0.05$), 均大于常规 CT 图、脂肪基物质图、肌肉基物质图上测量面积 ($P < 0.05$)。症状严重膝关节与对侧膝关节比较, 矢状面 Hoffa 脂肪垫最大层面面积和相应 CT 值、脂肪基物质含量、肌肉基物质含量存在差异, 脂肪基物质含量鉴别敏感性和特异性均最高。

结论 能谱 CT 脂肪-肌肉分离图像能较好地反映膝骨关节炎患者 Hoffa 脂肪垫大小、损伤情况, 有利于客观反映骨性关节炎临床症状严重程度。

PO-2315

能谱 CT 定量与发作期膝骨关节炎中医证型的相关性研究

贾永军、杨创勃、段海峰、于楠
陕西中医药大学附属医院

目的：探讨不同中医证型发作期膝骨关节炎（KOA）能谱 CT 髌下脂肪垫（IFP）、关节间隙和骨赘间的差异，为 KOA 辨证分型研究提供客观依据。

方法：选取发作期 KOA 住院患者 118 例并进行中医辨证分为 3 组：A 组(寒湿痹阻证)、B 组(气滞血瘀证)、C 组(肝肾亏虚证和气血虚弱证)。所有患者均采用能谱 CT 检查，使用 GSI Viewer 进行基物质分离图像后处理及分析，脂肪（肌肉）基物质图像、CT 图获得矢状位 IFP 最大面积及其脂基物质含量和常规 CT 值，骨（脂肪）基物质图像获得冠状位内外关节间隙最大面积并观察骨赘分级。分析各组不同急性发作期 KOA 中医证型在能谱 CT 成像 IFP 定量、关节间隙定量、骨赘评级之间的差异。

结果：根据主要证候分组，A 组寒湿痹阻证 51 例，B 组气滞血瘀证 40 例，C 组肝肾亏虚证和气血虚弱证 27 例。各中医证型间脂肪（肌肉）物质分离图像 IFP 最大面积和 CT 值无统计学差异，IFP 脂基物质含量方面，A 组<B 组<C 组，且差异有统计学意义。膝关节内侧间隙面积 A 组和 C 组之间无统计学差异，但均大于 B 组，差异有统计学意义。膝关节外侧间隙面积和骨赘评级在各中医证型间无统计学差异。

结论：IFP 脂基物质含量和关节间隙定量与发作期 KOA 中医证型间存在一定相关性，能谱 CT 基物质分离在中医辨证施治 KOA 中有一定临床应用价值。

PO-2316

健康人膝关节股骨内髁软骨 T2 值研究

曹娜娜
天津大学天津医院

摘要：目的 应用定量磁共振 T2 mapping 技术，探讨健康人膝关节股骨内髁承重区与非承重区各层软骨 T2 值的差异，进一步了解形态完整的关节软骨各层含水量变化。方法 对健康人行膝关节 MRI 矢状位 T2 mapping 检查，共收集 22 例，38 个膝关节，平均年龄（27.05±1.05）岁。在 T2 mapping 图上对膝关节股骨内髁承重区、非承重区关节软骨进行 T2 值测量：于关节软骨完整且最厚处行深、中、浅三层测量。采用单因素方差分析(多组间统计数据的方差分析，如有统计学意义再做 LSD 两两组间比较)对同区域关节软骨深、中、浅层 T2 值进行比较；采用配对 t 检验比较股骨内髁承重区与非承重区间关节软骨相应深、中、浅层 T2 值的差异。结果 膝关节软骨在 T2 mapping 伪彩图上（阈值 0-80ms），根据颜色分为三层：深层呈黄色、中层呈绿色、浅层呈蓝色；股骨内髁承重区软骨深、中、浅三层两两间 T2 值差异均有统计学意义（ $P<0.001$ ），非承重区软骨深层与中层、深层与浅层间 T2 值差异有统计学意义（ $P<0.001$ ）；股骨内髁承重区与非承重区软骨深层间、中层间 T2 值差异均有统计学意义（ $P<0.001$ ）。结论：应用 T2 mapping 序列测量 T2 值能够定量评价膝关节软骨。基于膝关节软骨含水量和胶原纤维排列的组织学特点，评价关节软骨建议分为深层、中层、浅层进行研究，且推荐在软骨深层、中层中完成 T2 值定量测量。同时，根据承重部位不同进行分区研究亦是必要的。

PO-2317

中轴骨痛风的 CT 及 MRI 表现

苏树燕、陈柳江、黄瑞滨
汕头大学医学院第一附属医院

目的: 探讨中轴骨痛风的 CT、MR 特点, 以提高对该病的认识。方法: 回顾性分析本院经病理证实的 54 例中轴骨痛风的临床及影像学资料, 分析其 CT、MR 特点。结果: 54 例中轴骨痛风中, 男 43 例, 女 11 例; 3 例发生于胸肋关节, 51 例发生于脊柱, 其中 3 例累及骶髂关节。脊柱单一部位发病 45 例 (88.24%, 45/51), 其中腰骶椎最多 (58.82%, 30/51), 其次为颈椎 (15.69%, 8/51)、胸椎 (13.73%, 7/51); 两个及两个以上部位同时发病仅 6 例 (11.76%, 6/51)。44 例出现溶骨性骨质破坏 (81.48%, 44/54), 多为穿凿样骨质破坏, 其中 16 例可观察到骨质破坏边缘见硬化边。CT 密度多为不同程度的高密度; MR 信号多样, T1WI 多为等、低信号, T2WI 可为高、低不等的混杂信号。29 例行增强扫描检查, 除了 3 例无强化外, 其余 26 例均可见强化。结论: 中轴骨痛风的影像表现具有一定特点, 如近关节或关节内的穿孔样骨质侵蚀、边缘突出和硬化、痛风石等, 对于不明原因的中轴疼痛、尤其伴有高尿酸血症的高危人群, 诊断时应考虑是否存在中轴骨痛风的可能。

PO-2318

膝骨性关节炎疼痛因素分析

许鹏君、许晨思
联勤保障部队 960 医院

目的 利用问卷调查联合受试者进行膝关节 CT 扫描的方式, 探讨 KOA 相关疼痛的发病机制。

方法 收集 2022 年 3 月至 2022 年 9 月解放军第 960 医院进行膝关节 CT 平扫患者 35 例, 共 70 例膝关节影像。应用 WOMAC 问卷针对其左右膝关节的感受分别从疼痛、僵硬和关节功能三大方面对患者的骨关节炎指数进行评分。WOMAC 评分相对较高的一侧被分为“感受较多疼痛”组, 记为组 1, 相对较低的被分为“感受较少疼痛”组, 记为组 2。对患者两侧膝关节同时进行扫描并应用 Bone Density 软件 (AVW 2.0 医学影像后处理工作站, 东软医疗) 完成胫骨软骨下骨密度测量。由两名高年资医师对患者是否有囊肿及膝关节对齐方式进行诊断, 通过双盲法对膝关节骨关节炎进行 Kellgren-Lawrence 分级。

结果 患者平均年龄 55.7 ± 9.0 岁, 平均 BMI 为 25.9 ± 3.0 。膝关节内外翻对于 WOMAC 评分呈现出显著差异性, $p < 0.01$ 。KL 分级和 WOMAC 之间没有明显关联 ($p > 0.05$), 膝关节软骨下囊肿对于 WOMAC 评分呈现出显著差异性 ($p < 0.01$), KL 分级和 WOMAC 之间没有明显的联系 ($p > 0.05$)。BMI 和 WOMAC 之间没有明显的相关性 ($p > 0.05$)。配对 t 检验显示, 在距软骨下表面 0-2.5 mm 的深度处, 组 1 与组 2 的内外侧 BMD 存在显著差异 ($p < 0.05$)。与组 2 相比, 组 1 的外侧 BMD 较高 (平均差异为 63.80 mg/cm^3 ; Cohen's d 值为 0.471)。

结论 膝骨关节炎患者的 WOMAC 评分与内外翻、是否有囊肿及胫骨软骨下骨内外侧骨密度变化有关, 与 KL 分级及 BMI 无关, 胫骨软骨下的 BMD 改变及膝关节排列方式和状态的改变是 KOA 相关疼痛的特征。

PO-2319

合成 MRI 在业余马拉松运动员距骨软骨急性改变中的初步研究

黄珍媚^{1,2}、姚婉贞²、丁建平²、黄艺¹

1. 杭州师范大学

2. 杭州师范大学附属医院 (杭州市第二人民医院)

目的 探讨合成 MRI 对业余马拉松运动员距骨软骨急性改变定量检测的价值。**方法** 2022 年 9 月至 2023 年 5 月间招募业余马拉松运动员 42 名。在跑前基线及以 10km/h 速度跑步 30 分钟后分别对其右踝关节进行扫描, 扫描序列包括合成 MRI 序列, 扫描后可获得 T1、T2、PD 3 种定量图谱。将距骨软骨分为六个隔室: 内侧前 (MA), 内侧中心 (MC), 内侧后 (MP), 外侧前 (LA), 外侧中心 (LC) 和外侧后 (LP) 6 个亚区, 基于合成 MRI, 测量各软骨亚区的 T1、T2、PD 值。跑步前后距骨软骨 T1、T2 及 PD 值的比较采用 Wilcoxon 符号秩和检验。**结果** 距骨软骨整体 T1、T2 及 PD 值在跑后均高于跑前, 差异有统计学意义 (P 均 <0.05)。MC、MP、LC 亚区 T1 值差异有统计学意义; 除 LA 亚区外, 其他亚区 T2 值差异均有统计学意义; 仅 MC 亚区 PD 值差异具有统计学意义 (P 均 <0.05)。**结论** 合成 MRI 技术的定量参数 T1、T2、PD 值可用于业余马拉松运动员踝关节距骨软骨急性改变的检测。

PO-2320

定量 MR 技术对业余马拉松运动员椎间盘生化成分的研究

李佳慧^{1,2}、邓小龙^{1,2}、李博怡^{1,2}、陈勇^{1,2}

1. 杭州师范大学

2. 杭州师范大学附属医院 (杭州市第二人民医院)

目的: 采用 MR 化学位移成像技术, 探讨不同跑龄业余马拉松运动员及健康志愿者对椎间盘生化成分的影响

方法: 共招募 40 名年龄 25-55 岁之间的男性志愿者, 其中 30 名为业余马拉松运动员作为实验组, 10 名为健康志愿者作为对照组, 将实验组按跑龄分为低跑龄组: 小于 3 年, $n=10$; 中等跑龄组: 3-5 年, $n=10$; 高跑龄组: 大于 5 年, $n=10$; 所有受试者进行 MRI 检查, 获得其腰椎间盘 (IVD) 的 Dixon-VIBE、矢状位 T2*mapping 及矢状位 T2WI 序列图像。将 IVD 绘制成大致等距的五个 ROI, 纤维环被分割为前纤维环 (AAF) 和后纤维环 (PAF), 髓核被分割成三个区域, 即前髓核 (ANP)、中央髓核 (CNP) 和后髓核 (PNP), 获得各个亚区 ROI 的 T2 值。并将其腰椎间盘的退变程度采用 Pfirrmann 分级评估定级。采用 Mann-Whitney U 检验比较运动组与对照组 IVD Pfirrmann 分级的差异; 采用独立样本 t 检验比较组间腰椎体 IVD 不同区域 ROI T2*值的差异。**结果:** 不同跑龄志愿者及健康志愿者间 L1/2~L5/S1 IVD Pfirrmann 分级差异均有统计学意义 (P 均 <0.01)。运动组 L1/2 中央髓核、L1/2 前髓核、L1/2 后髓核、L2/3 中央髓核、L1/2 后髓核、L3/4 后髓核 T2*值小于对照组, 差异具有统计学意义 ($P<0.05$), 其余组 T2*值差异无统计学意义 ($P>0.05$)。

结论: 随着跑龄的延长, 腰椎间盘退变程度逐渐加快, 且主要影响腰椎间盘髓核区域的退变。

PO-2321

胸部 CT 联合 QCT 机会性测定南京地区健康人群 T8-L2 骨密度分布规律及低骨量、骨质疏松患病率的研究

胡楠栋、王洁、唐红叶、王江川、魏子成、陈晓
江苏省中医院

目的 利用胸部 CT 联合定量 CT (QCT), 测定并探讨南京地区健康人群胸腰椎骨密度分布规律及骨量异常患病率。

方法 回顾性选取江苏省中医院 2021 年 08 月至 2022 年 08 月行胸部 CT 的健康人群共 1086 例, 其中男 568 例, 女 518 例, 根据年龄分为 14 个年龄段: 20~24、25~29、30~34、35~39、40~44、45~49、50~54、55~59、60~64、65~69、70~74、75~79、80~84、85~89; 同时获得 QCT 原始数据并将数据传至 PACS 及 BMD 后处理工作站“QCT Pro”, 通过 QCT 异步体膜法测量 T8、T9、T10、T11、T12、L1、L2 骨密度, 并以 L1+L2 骨密度平均值判断受检者骨量状态。采用 Pearson 相关、线性回归分析不同性别各年龄段间胸椎骨密度规律及其与性别、年龄的差异与相关性, 及骨质疏松的患病率。

结果 各年龄组胸椎 T8~T12 平均骨密度均高于腰椎 L1~L2 的平均骨密度, 二者差异有统计学意义 ($P<0.001$); T8-T10 骨密度呈现递增趋势, T10 至 L2 椎体骨密度逐渐递减; 各年龄组各胸椎骨密度与腰椎 L1、L2 骨密度间均高度相关(相关系数 r 均 >0.90), 且均有统计学意义 ($P<0.001$), 胸腰椎相邻椎体间骨密度差异均无统计学意义 ($P>0.05$)。男性和女性的椎体骨密度均随年龄增长逐渐减低, 在各年龄段间两两比较, 差异均有统计学意义 (P 均 <0.001), 在 45~49 组之前, 男性骨密度低于女性, 但随后女性 BMD 减低幅度明显增大并低于男性。随年龄增长, 男性和女性骨质疏松症患病率均呈上升趋势, 其中 55-89 岁各组女性患病率均明显高于同龄男性。

结论 南京地区健康人群下位胸椎 (T8-T12) 的平均骨密度高于腰椎 (L1-L2), 并呈显著正相关; 两性椎体骨密度均随年龄增长而降低, 中老年人群, 尤其是绝经后女性是骨质疏松症的高危人群。

PO-2322

基于 X 线及磁共振影像组学预测骨肉瘤术后复发的研究

罗振东¹、刘仁懿²、李晶³、沈新平¹

1. 香港大学深圳医院

2. 中山市中医院

3. 中山大学肿瘤防治中心(中山大学附属肿瘤医院、中山大学肿瘤研究所)

目的: 探索基于 X 线和多参数磁共振影像组学在预测骨肉瘤术后复发的价值。**材料和方法:** 回顾性收集经病理证实的 92 例骨肉瘤患者的 X 线及 MRI 资料, 根据术后 2 年后随访分为术后局部复发 (LRs) 36 例和术后局部无复发 (NLRs) 56 例, 按照 7:3 的比例随机分为训练组和验证组。所有患者均在治疗前行 X 线和多参数 MRI 成像, 经预处理后, 手动勾画三维肿瘤感兴趣区, 从 X 线、多参数 MRI (T1WI、T2WI 和 CE-T1WI) 中提取影像组学特征。采用最小冗余-最大相关性 (mRMR)、最小绝对收缩和选择算子 (LASSO) 回归和递归特征消除随机森林分类器 (RFE-RF) 三个步骤筛选特征, 并使用 XGB、LR、KNN、SVM 和 RF 5 种分类器构建基于 X 线、MRI 及 X 线联合 MRI 的预测模型。使用受试者工作特征曲线 (ROC) 和曲线下面积 (AUC) 来评估分类器的性能。**结果:** 基于 X 线、T1WI、T2WI、T1WI-CE 提取的特征, 经 mRMR、LASSO 和 RFE-RF 最终筛选的特征数为分别为 1、5、1、3 个。基于 X 线、MRI、X 线联合 MRI 影像组学特征的 XGB 模型在验证组中的 AUC 值分别为

0.611、0.609、0.682, LR 模型 0.540、0.759、0.759, KNN 模型 0.686、0.654、0.690, SVM 模型 0.459、0.759、0.768, RF 模型 0.627、0.704、0.868。联合 X 线和 MRI 组学特征的模型具有较好的预测性能。

结论: 联合 X 线和 MRI 影像组学特征构建的机器学习模型在预测骨肉瘤术后复发具有一定的价值, 可为临床早期干预提供了一个新的决策依据。

PO-2323

骨质疏松性椎体压缩骨折椎体强化术后残余背痛的临床-影像预测模型研究

杨淇麟、彭翌
通江县人民医院

目的 探讨基于 CT 影像组学与临床相关危险因素的联合模型对骨质疏松性椎体压缩骨折 (OVCF) 行椎体强化术后发生残留背痛的预测价值。方法 回顾性分析 101 例 OVCF 行椎体强化术后患者的临床和 CT 影像资料, 将术后第一天视觉模拟评级法 (VAS) 评分 ≥ 4 定义为残留背痛 (RBP)。所有病例按 8:2 的比例随机分层抽样分为训练集 (80 例) 和测试集 (21 例)。从术前平扫 CT 图像中提取出影像组学特征并筛选出强相关特征; 采用单因素分析及多因素 Cox 回归分析筛选出临床独立危险因素。最后将临床独立危险因素, 强相关影像组学特征输入到 logistic 回归模型中分别构建临床模型、影像模型、临床-影像联合模型, 采用受试者操作曲线 (ROC) 对模型的预测性能进行评定, 以决策曲线分析 (DCA) 评估联合模型收益。结果 经过筛选, 10 个影像组学特征与术后 RBP 强相关, 椎体高度损失为临床独立危险因素 ($HR=3.39, p<0.01$); 基于以上特征用于分别构建风险预测模型, 影像模型及临床模型在训练组与测试组中的 AUC 分别为 0.86、0.78、0.86 和 0.87。临床-影像联合模型训练组与测试组的 AUC 为 0.91 和 0.90, 均高于影像模型及临床模型, DCA 显示联合模型具有一定的临床收益。结论 影像组学特征联合椎体高度损失特征构建的风险模型对 OVCF 患者行 VA 术后发生 RBP 有一定的预测能力。

PO-2324

膝关节应力位 CT 扫描技术

巩庆雷、刘海玲、任闻闻、曹修祥
中国人民解放军联勤保障部队第九六〇医院

目的: 探讨膝关节应力位 CT 检查技术, 研制膝关节应力位辅助用具, 为临床分析关节各解剖结构及其周围韧带损伤程度, 判定手术提供准确可靠的影像依据。

方法: 针对临床科下肢关节手术的要求, 研究应力功能体位设计并使用辅助器械, 对 30 例膝关节进行强制外翻和强制内翻应力位 CT 平扫, 病例选取患者年龄在 40-80 岁之间。扫描参数: KVP: 120, MAS: 200

结果: 30 例膝关节强制外翻和强制内翻应力位一侧关节间隙增宽者 21 例, 其中 10 例只进行了内翻应力位扫描显示外侧间隙。辐射剂量: 3.093mSv, 其中 DLP: 309.3mGy*cm, K 值 0.01。

结论: 膝关节外伤在没有骨折的情况下, 也很容易造成副韧带、半月板、交叉韧带的损伤等。外侧副韧带损伤易导致小腿的内翻和内旋, 内侧副韧带损伤易导致小腿的外翻和外旋。DR 图像直观快捷辐射剂量低, CT 扫描骨骼影像清晰, 由于密度分辨力高, 软组织副韧带、半月板及交叉韧带的显示优于 DR, 图像也可以三维重建。应力位 CT 扫描的研究是技术创新, 拓展了检查范围得到了功能位影像, 对判断膝关节副韧带损伤有一定的意义。

PO-2325

基于低剂量胸部 CT DCNN 辅助筛查骨质疏松的可行性研究

曹蕊、王林
南通市第一人民医院

目的：分析基于低剂量胸部 CT 影像图像及临床资料建立深度卷积神经网络（DCNN）模型评估骨量的可行性和效能，作为人工智能辅助机会性筛查骨质疏松以应用于临床的手段。

材料方法：回顾性分析 500 名脊柱外科住院患者 1000 张图像及相应临床资料。图像来源于脊柱外科患者住院期间同时行管电压 100kv 的低剂量胸部 CT 入院常规检查和术前腰椎定量 CT（QCT）的检查。以腰椎 QCT 测量骨密度结果为标准将测量结果分为骨量正常、低骨量和骨质疏松，利用骰子相似系数（DSC）评价 DCNN 分割效能。基于训练集（240 人）建立 DCNN 分类模型 1（腰 1+腰 2 融合特征构建）和模型 2（腰 1+腰 2 融合特征图像和临床指标），模型 3（腰 1+腰 2 融合特征图像和临床指标及组学特征）在测试集（260 人）中使用 ROC 曲线比较三种模型评估骨量的效能。

结果：模型 1、模型 2、模型 3 诊断骨质疏松的敏感性、特异性、AUC 依次为：0.911，0.941，0.966；0.895，0.971，0.975；0.927，0.963，0.977。三种模型对骨质疏松的诊断效能有统计学意义。考虑临床资料及组学特征对诊断效能有提高的作用。

结论：基于 DCNN 的模型对于低剂量胸部 CT 影像图像可辅助诊断骨质疏松，同时考虑临床因素及组学特征的模型效能更佳。

PO-2326

不同病原体脊柱感染的 MR 鉴别诊断

赵晖、陈思、梁聪聪、张继杨、徐劭、张越、罗嗣频、郭林
天津市天津医院

目的：探讨结核性脊柱炎、化脓性脊柱炎、布氏杆菌性脊柱炎的不同 MR 特征，以提高鉴别诊断水平。

方法：分析 77 例经手术、穿刺病理、实验室检查确诊的脊柱感染患者 MR 影像资料，分为结核性脊柱炎组、化脓性脊柱炎组、布氏杆菌性脊柱炎组，所有患者均行 MR 扫描，扫描序列包括常规矢状位 T2WI、T1WI、STIR 和横断位 T2WI，分别由两位主任医师对 MR 资料进行独立分析，评估项目包括：发病部位、累及椎体数目、椎体破坏情况、椎体骨髓水肿范围（轻度，范围<椎体高度 1/2；重度，范围>椎体高度 1/2）、椎体塌陷程度（无明显塌陷；轻度，高度>相邻正常椎体高度 1/2；重度，高度<相邻正常椎体高度 1/2）、椎间盘受累情况（未受累；轻度，范围<正常椎间盘范围 1/2；重度，范围>正常椎间盘范围 1/2）、椎间隙狭窄情况（无明显狭窄；轻度狭窄，程度<正常椎间隙 1/2；重度狭窄，程度>正常椎间隙 1/2）、脓肿范围（无脓肿；少量脓肿，范围<1 个相邻正常椎体高度 1/2；大量脓肿，范围超过受累椎体总长度）。对计数资料用卡方检验，以 $P<0.05$ 为差异存在统计学意义。

结果：46 例结核感染 106 个椎体，20 例化脓性感染 41 例椎体，11 例布氏杆菌感染 25 个椎体。结核性脊柱炎侵犯腰椎占 44.34%，胸椎占 42.45%，颈椎占 13.21%；化脓性脊柱炎侵犯腰椎占 68.29%，胸椎占 29.27%，骶椎占 2.43%；布氏杆菌性脊柱炎侵犯腰椎占 60.00%，颈椎占 36.00%，骶椎占 4%。统计学分析显示：骨质破坏情况、椎体塌陷程度、椎间隙狭窄情况、脓肿范围，三组发生率有显著性统计学意义（ $P<0.01$ ）；累及椎体数目、椎体骨髓水肿范围、椎间盘受累情况三组发生率无显著性统计学意义（ $P>0.05$ ）。

结论：结核性脊柱炎、化脓性脊柱炎、布氏杆菌性脊柱炎的 MR 表现在骨质破坏情况、椎体塌陷程度、椎间隙狭窄情况、脓肿范围方面有显著性差异，有助于鉴别诊断。

PO-2327

基于 MRI 影像及数字病理的组学列线图预测软组织肉瘤术后复发风险的研究

王童语¹、王鹤翔²、郝大鹏²

1. 青岛大学

2. 青岛大学附属医院

目的

探讨基于 MRI 影像及数字病理的组学列线图预测软组织肉瘤 (STS) 术后复发风险的价值。

方法

回顾性收集 2016 年 1 月至 2021 年 3 月青岛大学附属医院经手术病理证实的 STS 患者，其中于崂山院区就诊的患者作为训练集 (112 例)，市南院区就诊的患者作为验证集 (80 例)。分别提取病灶的 MRI 影像组学和病理组学特征，采用多因素 Cox 回归分析基于影像组学特征、病理组学特征和两者组合特征构建预测模型，采用一致性指数 (C index) 和时间依赖受试者操作特征曲线下面积 (t-AUC) 评价各模型预测 STS 术后复发风险的效能，确定最优组学模型。采用多因素 Cox 回归筛选临床和影像学特征，建立临床模型。基于 T 分期、N 分期及 M 分期建立 TNM 模型。结合最优组学模型和临床模型，构建组学列线图，采用 C index 和 t-AUC 评估各模型的预测性能，采用 DeLong 检验比较 AUC 间的差异。

结果

联合模型的性能优于单一影像组学或病理组学模型，在验证集中的 C index 值为 0.727 (95%CI: 0.632-0.823)，中位 AUC 值为 0.737。结合临床模型和联合模型构建的组学列线图，在验证集中的 C index 值为 0.763 (95%CI: 0.685-0.842)，中位 AUC 值为 0.783。组学列线图的验证集 AUC 值高于临床模型、TNM 模型、影像组学模型及病理组学模型，差异有统计学意义 (Z=3.33、2.18、2.08、2.72, P 均<0.05)；组学列线图与联合模型的验证集 AUC 值差异无统计学意义 (Z=0.70, P=0.487)。在训练集和验证集中，三个复发风险组 STS 患者的术后复发率差异有统计学意义 (训练集 $\chi^2=73.90$, P<0.001；验证集 $\chi^2=18.70$, P<0.001)。

结论

组学列线图对于 STS 术后复发风险评估具有较好的预测性能，并可为 STS 患者个体化治疗方案的制定提供依据。

PO-2328

中老年直肠癌患者骨盆骨髓扩散高信号的影响因素及潜在原因研究

胡亮、韩铮

金华市中心医院

目的：中老年人骨盆骨髓扩散高信号容易被误认为是病理改变，尤其是肿瘤患者。在 DWI 上，部分中老年直肠癌患者骨盆骨髓扩散表现高信号，本研究旨在探讨了中老年直肠癌患者骨盆骨髓 DWI 高信号的影响因素及潜在原因。

方法：收集我院中老年直肠癌患者 IVIM 和 IDEAL-IQ 的检查，根据骨盆骨髓与邻近肌肉扩散信号强度的比较，将骨盆骨髓扩散信号分为低、等、稍高、高信号四级及等低信号和高信号两组。分析贫血、红细胞分布宽度 (RDW)、质子密度脂肪分数 (PDFF)、年龄和性别因素对骨盆骨髓扩散信

号的影响, 并分析骨盆骨髓扩散信号分级与之的相关性。最后比较骨盆骨髓扩散高信号组和等低信号组 IVIM 参数间的差异, 并分析 IVIM 各参数与信号分级间的相关性。

结果: 共纳入 74 人, 男 51 人, 女 23 人。范围为 50-88 岁, 平均年龄为 68 岁。骨盆骨髓扩散表现为低信号 12 例, 等信号 31 例, 稍高信号 22 例, 高信号 9 例; 其中等低信号组 43 例, 高信号组 31 例。多因素分析显示, 贫血($OR = 5.265$, $P = 0.007$)和 PDFF ($OR = 0.895$, $P = 0.001$)是骨盆骨髓扩散信号强度的重要影响因素, 而年龄、性别及 RDW 则不是。贫血分级与扩散信号分级呈正相关($r=0.441$, $P<0.001$), 而 PDFF 与扩散信号分级呈负相关($r=-0.566$, $P<0.001$)。高信号组的标准表现观扩散系数(ADC)、扩散系数(D)和假扩散系数(D*)值较等低信号组低。而灌注分数(f)值两者不存在明显差异。此外, 骨盆骨髓扩散信号分级与标准 ADC 值($r=-0.208$)、D 值($r=-0.502$)和 D* 值($r=-0.284$)之间存在相关性, 但与 f 值不相关。

结论: 中老年直肠癌患者骨盆骨髓扩散信号强度与贫血和 PDFF 相关。中老年患者直肠癌患者骨盆骨髓扩散高信号主要是骨髓细胞增生的表现, 而骨髓内灌注增加不明显。

PO-2329

远侧尺桡关节不稳定的 MRI 影像学分析

郭林、何鑫、罗嗣频、陈菲、董潇蔓
天津市天津医院

目的: 远侧尺桡关节(distal radioulnar joint, DRUJ)是维持手腕部稳定和前臂/腕关节旋转功能的重要解剖结构, 骨性结构和软组织结构共同维持 DRUJ 稳定性。DRUJ 失稳是临床常见病, 关节失稳的机制尚不明确。既往很少有使用 MRI 评估 DRUJ 不稳定的研究报道。本研究旨在探讨基于 MRI 图像评估创伤后与 DRUJ 失稳的相关影响因素。

方法: 收集从 2021 年 4 月至 2022 年 4 月期间 121 例外伤后伴或不伴有 DRUJ 不稳定的患者进行了 MRI 检查。体检显示所有患者均有腕关节疼痛症状或腕关节功能障碍。将患者的年龄、性别、远端尺桡骨横断面形态、三角纤维软骨盘、背侧尺桡韧带、掌侧尺桡韧带、远端骨间膜、尺侧腕伸肌腱和旋前方肌作为感兴趣的变量纳入单因素和多因素 Logistic 回归模型进行分析。通过雷达图和条形图比较变量间的差异。

结果: 121 例患者的平均年龄为 42.16 ± 16.07 岁。50.4%的患者存在 DRUJ 不稳定, 20.7%的患者存在远端骨间膜斜束。多因素 Logistic 回归模型发现三角纤维软骨盘损伤($OR: 4.640$, $p=0.03$)和旋前方肌异常($OR: 54.759$, $p=0.006$)是发生远侧尺桡关节不稳定的危险因素, 存在远侧骨间膜($OR: 0.107$, $p=0.001$)是防止 DRUJ 不稳定的保护因素。DRUJ 不稳定组韧带损伤的发生率较高。缺少远侧骨间膜的患者更容易发生 DRUJ 失稳、三角纤维软骨盘和尺侧腕伸肌腱的损伤。桡骨远端横断面形态为 C 型、三角纤维软骨盘结构完整和存在远侧骨间膜的患者拥有更好的 DRUJ 关节稳定性。

结论: 本研究基于 MRI 影像学发现远侧尺桡关节不稳定与三角纤维软骨盘和旋前方肌的损伤情况、远侧骨间膜是否存在密切相关性。该结论可以早期发现 DRUJ 不稳定的潜在风险, 并为采取相应预防措施提供临床依据。

PO-2330

胸椎 QCT 诊断骨质疏松 BMD 阈值的临床研究

任庆云、刘斋
河北医科大学第一医院

目的 分析下部胸椎与腰椎骨密度的相关性并确定诊断骨质疏松及骨量减少的胸椎骨密度阈值。**方法** 回顾性分析因临床需要进行腹部 CT 扫描的患者 276 名。测量 T10-L3 各椎体的 BMD,使用 pearson 相关分析各椎体间的 BMD 及胸椎 (T10-12) 与腰椎 (L1-L3) BMD 的相关性,应用线性回归方程计算诊断骨质疏松及骨量减少的胸椎平均 BMD 阈值。结果 T10 至 L3 椎体 BMD 逐渐减低, BMD 范围 $120.49 \pm 35.96 \sim 95.62 \pm 35.95 \text{ mg/cm}^3$, T10-L3 各椎体之间 BMD 均呈明显正相关 ($r=0.894 \sim 0.967$, $p < 0.05$), T10-12 平均 BMD 与 L1-3 平均 BMD 相关系数为 0.957。胸椎诊断骨质疏松及骨量减少的平均 BMD 阈值分别是 96.59 mg/cm^3 及 134.75 mg/cm^3 。结论胸椎与腰椎 BMD 呈明显相关性, 胸椎 BMD 测量可以作为诊断骨质疏松及骨量减少的方法。

PO-2331

不同勾画方法及参数定量评估 DLS 患者椎旁肌群 MRI 特点

邓亚利、陈伟
陆军军医大学第一附属医院 (西南医院)

目的 使用两种不同的椎旁肌勾画测量方法, 多参数定量评估退行性腰椎侧凸 (degenerative lumbar scoliosis, DLS) 患者多裂肌、竖脊肌、腰大肌退行性改变特点。**方法** 收集 2019 年 8 月至 2022 年 3 月于本院确诊为 DLS 的患者 33 例作为实验组, 同期招募健康志愿者 35 例作为对照组, 行腰椎 MRI 常规序列和多回波 Dixon-vibe 序列扫描。两位观察者在腰椎间盘 4/5 中心层面 (L4/5) 的水、脂相图中分别对椎旁肌执行总横截面积 (TCSA)、纯肌肉横截面积 (PCSA) 两种不同勾画方案。采用组内相关系数 (ICC) 评估两观察者测量结果的可重复性。分析两组患者三种椎旁肌多种定量参数差异性。使用受试者操作特性 (ROC) 曲线比较三种椎旁肌具有显著差异性参数的曲线下面积大小。结果 TCSA、PCSA 两种勾画方法在退变较严重的 DLS 患者多裂肌和竖脊肌中一致性较好 ($ICC > 0.75$, $P < 0.05$); DLS 组患者中多裂肌的总脂肪浸润 (TMFI)、纯肌肉脂肪浸润 (PMFI)、功能面积相对值 (RFCSA) 与对照组具有极其显著性差异 ($P < 0.001$); 竖脊肌 PCSA 不对称性 (ARPCSA)、腰大肌相对横截面积 (RTCSA) 与对照组具有显著性差异 ($P < 0.01$); 多裂肌 PCSA 相对值 (RPCSA)、TCSA 相对值 (RTCSA)、PMFI 不对称性 (ARPMFI)、TCSA 不对称性 (ARTCSA) 参数, 竖脊肌 TMFI、PMFI、RTCSA、ARTMFI, 腰大肌 ARTCSA 参数与对照组患者椎旁肌各参数具有统计学差异 ($P < 0.05$); 其中多裂肌 TMFI、竖脊肌 ARPCSA、腰大肌 RTCSA 在三种肌肉各参数中具有较大曲线下面积 ($AUC = 0.7619$ 、 0.7108 、 0.7126)。结论在 DLS 患者中, 利用 Dixon-vibe 序列对多裂肌和竖脊肌的两种勾画测量方法具有较好的可重复性, 在 L4/5 层面多裂肌的退变表现最突出, 肌肉内外受脂肪浸润严重, 功能面积减小; 竖脊肌表现为纯肌肉面积的不对称性程度显著增大, 而腰大肌相对横截面积表现出显著减小。

PO-2332

双能 CT 的虚拟去钙技术对非创伤性股骨头坏死骨髓水肿的检出价值

杨淑辉^{1,2}、李天然¹、杨本涛²

1. 中国人民解放军总医院第四医学中心

2. 首都医科大学附属北京同仁医院

摘要 目的 以 MR 为参考标准,评价双能 CT 的虚拟去钙 (VNCa) 技术对非创伤性股骨头坏死 (ONFH) 骨髓水肿 (BME) 的检出价值。方法 前瞻性纳入 2022 年 10 月~2023 年 5 月期间本院 30 例非创伤性股骨头坏死患者,共 48 个髋关节,分析其双能 CT 及 MRI 图像。以 MRI 结果作为参考标准,分别计算两名医师在 VNCa 彩色编码图像主观评估 BME 的敏感性、特异性、阳性预测值、阴性预测值和准确性。比较 VNCa 彩色编码图像和 MRI 显示 BME 范围。比较正常骨髓和 BME 的常规 CT(rCT)值及 VNCa CT 值。勾画基于 VNCa CT 值的受试者工作特征 (ROC) 曲线,计算曲线下面积 (AUC),找出区分正常骨髓和 BME 的最佳截断值,并计算该截断值下预测 BME 的敏感性、特异性、阳性预测值、阴性预测值和准确性。结果 48 个髋关节中,34 个髋关节在 MRI 上显示骨髓水肿,14 个无骨髓水肿。两名医师在 VNCa 彩色编码图上视觉主观评估 BME 的敏感性、特异性、PPV、NPV 和准确性分别为 97.06%和 97.06%、92.86%和 71.43%、97.10%和 94.4%、92.90%和 89.2%、94.96%和 84.25%。VNCa 彩色编码图像与 MRI 对 BME 范围的显示无统计学差异 ($Z=-1.404$, $p=1.160$)。正常骨髓的 rCT 值平均为 400.7 ± 82.8 HU, BME 的 rCT 值为 443.7 ± 65.7 HU,两者的 rCT 值无统计学差异 ($t=-1.9$, $p=0.062$); 正常骨髓的 VNCa CT 值平均为 -103.1 ± 27.8 HU, BME 的 VNCa CT 值为 -32.9 ± 25.7 HU,两者的 VNCa CT 值有统计学差异 ($t=-8.4$, $P<0.001$)。基于 VNCa CT 值区分正常骨髓和 BME 的 ROC 曲线的 AUC 为 0.958,最佳截断值为 -74.5 HU,该截断值下预测 BME 的敏感性、特异性、PPV、NPV 和准确性分别为 97.06%、92.86%、97.1%、92.9%和 94.96%。结论 DECT 的虚拟去钙技术对非创伤性 ONFH 骨髓水肿的检出效能较高,且能准确显示骨髓水肿的范围。

PO-2333

椎间盘突出 MRI 表现和 椎旁肌脂肪浸润与慢性腰痛的相关性

牟章林

第一附属医院

摘要背景:慢性腰痛 (CLBP) 患者存在着椎旁肌脂肪浸润及横截面积的改变。然而,关于椎间盘相关改变与椎旁肌的关系尚不清楚。因此,我们研究旨在探讨 CLBP 患者腰椎间盘突出程度及类型与椎旁肌脂肪浸润以及椎旁肌横截面积的关系。

方法:前瞻性收集慢性腰痛患者共 494 例 (201 例男性和 293 例女性),平均年龄 45.75 岁。采用常规磁共振扫描序列、同反相位及 IDEAL-IQ 序列,并对患者进行 VSA 疼痛评估,根据 L4-S1 水平的 T2 轴位图像评估腰椎间盘突出的程度和类型,分别在同反相位上和 IDEAL-IQ 序列上测量 L4-S1 段椎间盘中心层面双侧多裂肌、竖脊肌截面积 (CSA) 和质子密度脂肪分数 (PDFF),并以身高 2 进行标化。将数据进行统计分析以确定腰椎间盘突出程度及类型是否与椎旁肌脂肪浸润以及椎旁肌横截面积否存在统计学意义,同时评估 VAS 与腰椎间盘突出程度的相关性。

结果:合并椎间盘突出的 CLBP 患者 L4/5 水平多裂肌的 PDFF 小于有突出者, $P<0.05$,合并椎间盘突出的 CLBP 的 VAS 4 (2-6) 大于对照组的 VAS 6 (4-6), $p<0.05$;而腰疼患者的椎旁肌横截面积改变与是否合并椎间盘突出之间的差异并无统计学意义。

结论:合并椎间盘突出的慢性腰痛患者,椎间盘的突出相比于 PDF、CSA 的改变是引起患者疼痛更为重要的因素,腰疼患者合并椎间盘突出应积极手术治疗,但同时也不能忽略对椎旁肌肉功能进行康复训练。

PO-2334

基于横断位 T2 脂肪抑制 MRI 桡骨乙状切迹 影像组学模型诊断远端尺桡关节失稳

罗嗣频、岳瑞敏、马欢、郭林
天津市天津医院放射一科

目的:桡骨乙状切迹与远端尺桡关节(DRUJ)稳定性相关。本研究的目的是利用影像组学方法,提取桡骨乙状切迹的 MRI 纹理特征,建立远端尺桡关节失稳的诊断模型。

方法:回顾分析了 2022 年 1 月至 2 月 40 例腕关节外伤后进行了 MRI 检查的患者资料。通过体格检查,其中 19 例患者诊断为 DRUJ 失稳。根据排除标准筛选后,19 例 DRUJ 失稳、16 例无失稳的患者纳入研究。两名影像科医师分别使用 3Dslicer 软件在横断位 fsT2WI MRI 影像资料中对桡骨乙状切迹进行标注。将患者资料随机分为训练集和测试集。使用 Pyradiomics 提取影像特征,使用 LASSO 算法降维,并使用 logistic regression 建模,并进行五折交叉验证。评估模型是否能够诊断 DRUJ 失稳。

结果:经过图像预处理后,将患者资料按 7:3 分为训练集和测试集。提取了 1316 个纹理特征,经过计算 ICC,保留了 610 个特征用于建模。经过 LASSO 降维后保留了 2 个特征。经过五折交叉验证的 logistic regression 建模,诊断 DRUJ 失稳的模型训练集中准确率为 0.792, F1score 为 0.762,召回率为 0.615, AUC 为 0.909 (0.799~0.986),测试集中分别为 0.727、0.667、0.5、0.867 (0.625~1.0)。

结论:基于桡骨乙状切迹的纹理特征可以建立诊断 DRUJ 失稳的模型。

PO-2335

腰椎椎体及椎旁肌 MRI 改变预测 2 型糖尿病患者椎体骨折

寸晗雪、何波
昆明医科大学第一附属医院

目的:T2DM 患者是否发生骨折受多种因素的影响,目前关于 T2DM 患者骨折风险的预测主要从骨骼方面进行,鲜少有人关注椎旁肌质量及脂肪浸润对骨折风险的影响。因此,本研究旨在探究基于 MRI 的腰椎椎体及椎旁肌的改变对 T2DM 患者发生椎体骨折及其程度之间的关系。

方法:回顾性收集 2021 年 1 月 1 日至 2022 年 1 月 31 日于昆明医科大学第一附属医院确诊 T2DM 患者的一般资料和腰椎 MRI 图像,并使用 Image J 软件对椎旁肌面积及脂肪浸润进行勾画。使用 Pearson's 相关分析评估 T2DM 患者 VBQ 评分与椎旁肌改变之间的相关性。使用单因素及多因素逻辑回归分析确定 T2DM 椎体骨折程度的危险因素,并使用 ROC 曲线分析模型的效能。

结果:本研究共纳入 T2DM 患者共 168 例,其中骨折组患者 81 例(男性 49 例,女性 32 例),未骨折组患者 87 例(男性 39 例,女性 48 例)。骨折组患者年龄及 BMI 较无骨折组患者更高 ($P=0.038$ 、 $P=0.000$),糖尿病病程更长 ($P=0.013$);骨折组 VBQ 评分及椎旁肌 FI 大于无骨折组 ($P<0.001$);骨折组椎旁肌相对 CSA 小于无骨折组 ($P<0.001$)。重度骨折组椎旁肌 CSA 较轻度骨折组小,且中度、重度骨折组 FI 较轻度骨折组高 ($P<0.05$);相关性分析仅发现椎旁肌 FI 与相对 CSA 呈轻度负相关关系 ($r=-0.300$, $P<0.05$);多因素逻辑回归表明 T2DM 患者 BMI 越高,DM 病程 >5 年,VBQ 评分越高,椎旁肌相对 CSA 越低,椎旁肌脂肪浸润越多,其发生骨折的

风险就越高,且 ROC 曲线结果显示,该模型训练集和验证集的 AUC 分别为 0.973、0.979 ($P=0.011$ 、 $P<0.001$)。

结论:磁共振评估的 VBQ 评分升高、椎旁肌相对横截面积减小及椎旁肌脂肪浸润增加是 T2DM 患者发生腰椎椎体骨折的危险因素,且椎旁肌脂肪浸润与骨折程度有关。

PO-2336

慢性腰痛患者椎旁肌肉脂肪浸润与椎体骨质量评分有关, 但与 Modic 分类无关:一项前瞻性横断面研究

陈佳鑫、何波
昆明医科大学第一附属医院

目的:慢性腰痛(Chronic low back pain, CLBP)已是全球公认的健康问题,许多研究已经发现 CLBP 患者椎旁肌肉存在脂肪浸润,但其与椎体相关改变的关系尚不清楚。因此,本研究目的是探讨 CLBP 患者椎体骨质量(Vertebral bone quality, VBQ)评分和莫迪克变化 (Modic changes, MCs)与椎旁肌肉脂肪浸润的关系。

方法:前瞻性地收集 CLBP 患者。扫描前收集患者基本信息。所有患者行 3.0T 磁共振扫描,扫描序列包括常规序列、同反相位序列和非对称回波的最小二乘估算法迭代水脂分离序列(IDEAL-IQ)。根据 T1 和 T2 加权成像的信号,将 MCs 分为 3 型;在正中矢状 T1 加权成像上设定感兴趣区,采用公式计算 VBQ 评分: SIL1-L4/SICSE; 分别在同反相位和 IDEAL-IQ 序列上以 L4-S1 椎间盘中心层面测量多裂肌、竖脊肌的横截面积(Cross-sectional area, CSA)和质子密度脂肪分数(Proton density fat fraction, PDFF),取两侧肌肉的平均值分析。

结果:本研究纳入 476 例 CLBP 患者。无 Modic 变化者占 69%,有 Modic 变化者占 31%,其中 Modic III 型数量较少,未纳入统计分析。在 L4-S1 层面椎旁肌肉的 CSA 和 PDFF 在 Modic I 型与 II 型间均无差异, P 值均 >0.05 。多元线性回归分析显示,年龄($\beta=0.141, p<0.001$)、性别($\beta=4.285, p<0.001$)和 VBQ($\beta=1.310, p=0.001$)与椎旁肌肉总 PDFF 相关。年龄与各水平椎旁肌肉的 PDFF 呈轻度正相关($r=0.194 \sim 0.351, p<0.05$)。

结论:在 CLBP 患者中,Modic I 型与 II 型间椎旁肌肉的 CSA 和 PDFF 无显著性差异,而 VBQ 与椎旁肌总 PDFF 呈线性正相关。

PO-2337

能谱 CT 单能量成像+MARs 技术在 肢体外固定支架术后评估中的应用

邓欣
天津市天津医院放射一科

目的:

肢体长骨骨折在骨科创伤中很常见,其处理方式与关节功能和预后关系密切。CT 广泛应用于骨折的术前诊断、指导制订手术方案和评价疗效,因局部金属伪影干扰大,不易准确判断。近年来开发应用的能谱 CT 金属伪影去除技术,为肢体外固定术后疗效评价和指导康复训练提供一种新的方法。

方法:收集本院 52 例肢体骨折外固定术后行能谱 CT 检查患者的临床资料。观察图像窗选择:窗宽为 1500Hu,窗位为 500Hu;层厚为 0.625 mm。分别在应用 MARs 技术前后的混合能量图像和单能量 MARs 图像上进行感兴趣区(ROI)测定。观察图像窗选择:窗宽为 1500Hu,窗位为 500Hu;层

厚为 0.625 mm。分别在应用 MARs 技术前后的混合能量图像和单能量 MARs 图像上进行感兴趣区 (ROI) 测定。①所有图像均由三位有经验的放射医师采用盲法进行独立评分, 按金属伪影对图像质量的影响程度予以记 3、2、1、0 分 (3 分为图像质量好, 基本无伪影; 2 分为图像质量较好, 有部分伪影; 1 分为伪影较重, 图像尚能观察; 0 分为伪影很重, 图像无法观察); ②量化分析: 在伪影最重的层面选择伪影最重的两个部位进行感兴趣区 (ROI) 测定, 同时选择无或伪影最少部位进行测定作为正常对照, 分别获得不同感兴趣区的 SD 值, 伪影部位的 SD 值采用两个伪影点的均值, 然后通过计算获得伪影的 SD 值

结果:

所获得的数据采用 SPSS 17.0 进行配对 t 检验分析, 分析混合能量图像质量与能谱图像的图像质量之间有无差异, 以 $P < 0.05$ 为差异有统计学意义。3 名评价者一致认为经 MARs 技术重建后图像金属伪影明显减少, 即处理后图像质量明显高于处理前图像 ($P < 0.01$), 经过 MARs 技术处理后, 金属伪影区域的 SD 值明显下降 ($P < 0.01$), 其 SD 均值 / SD 参照值明显低于 QC 图像 ($P < 0.01$)。即能谱图像的图像质量明显优于混合能量图像的图像质量。

结论:

宝石 CT 的能谱扫描能有效去除外固定支架引起的伪影, 使外固定支架部位的图像质量显著提高, 具有广泛的临床应用价值。随着后处理软件的不断完善, 在去除伪影方面宝石能谱 CT 会发挥更大的临床价值。

PO-2338

OLT 磁共振软骨 T2 值与 Jagged1 表达的相关性分析

李伟

内蒙古医科大学第二附属医院

目的

探讨距骨骨软骨损伤 (osteochondral lesions of the talus, OLT) Notch 信号通路相关蛋白 Jagged1 的表达与磁共振 T2 值之间的关系及其在距骨骨软骨损伤的机制。

材料与方法

1. 收集 60 例踝关节距骨骨软骨损伤行微创治疗术患者, 招募 60 名健康志愿者, OLT 患者及志愿者均行 3.0T 常规踝关节磁共振成像及 T2 -mapping 功能成像, 测量距骨骨软骨 T2 值。

2. OLT 患者术后离体距骨骨软骨行苏木精 — 伊红染色 (HE) 和 Western Blot 法分析距骨骨软骨 Jagged1 的表达;

3. 统计学分析 OLT 距骨骨软骨 T2 值与 Jagged1 表达的相关性。

结果

距骨骨软骨损伤以内中侧最为多见 (磁共振 6 分区法), 距骨骨软骨 T2 值随软骨损伤 Mankin 分级明显增大 ($P < 0.05$)。软骨 Jagged1 表达高级别与低级别差异明显 ($P < 0.05$)。软骨 T2 值与软骨 Jagged1 表达呈线性相关趋势, Pearson 分析距骨骨软骨损伤 T2 值增加与 Jagged1 表达增加呈直线性正相关 ($r = 0.757$, $P < 0.0001$)。

结论

距骨骨软骨损伤以内中侧最为多见, 距骨骨软骨磁共振 T2 值随软骨损伤分级逐级递增; 距骨骨软骨损伤磁共振 T2 值与 Jagged1 表达呈正相关, 距骨骨软骨磁共振 T2 -mapping 功能成像 T2 值定量分析可在体、无创性预测不同级别软骨损伤 Jagged1 的表达含量, 为临床治疗 OLT 提供影像学定量依据。

PO-2339

膝关节置换术后假体周围骨溶解诊断效能对比

苏宇

吉林大学第一医院

X 射线、MRI 及 SPECT / CT 对膝关节置换术后假体周围骨溶解的诊断效能比较

苏宇

吉林大学第一医院放射科

目的：分析 X 射线、磁共振成像 (MRI) 及单光子发射计算机体层摄影 (SPECT) / 计算机体层成像 (CT) 对膝关节置换术后假体周围骨溶解的诊断效能。

方法：选取 2016 年 8 月 - 2020 年 8 月收治的 90 例膝关节置换术后疑似假体周围骨溶解患者。所有患者均接受 X 射线、MRI 及 SPECT / CT 检查。以翻修术结果为金标准，分析 X 射线、MRI 及 SPECT / CT 对假体周围骨溶解的诊断效能。

结果：翻修术结果显示，70 例患者有假体周围骨溶解，其余 20 例患者中无菌性松动 13 例，感觉障碍 4 例，假体周围骨折 3 例。X 射线、MRI、SPECT / CT 及联合诊断假体周围骨溶解与金标准的一致性分别为 0.585、0.686、0.842、0.906。SPECT / CT 诊断的敏感性 (95.71%) 及准确性 (94.44%) 均高于 X 射线与 MRI ($P < 0.05$)；联合诊断的敏感性 (98.57%) 及准确性 (97.78%) 高于 X 射线与 MRI ($P < 0.05$)。4 种诊断效能从高至低依次为联合诊断、SPECT / CT、MRI、X 射线。

结论：X 射线、MRI 及 SPECT / CT 对膝关节置换术后假体周围骨溶解有一定的诊断效能，SPECT / CT 的敏感性、准确性最高，联合诊断可提高诊断效能，临床可根据实际情况合理选择诊断方式

关键词：假体周围骨溶解；膝关节置换术；X 射线；磁共振成像；单光子发射计算机体层摄影；计算机体层成像；诊断效能

PO-2340

DCE-MRI 联合脂肪酸代谢组学评价兔糖尿病重症肢体缺血骨髓内皮祖细胞功能

费紫嫣、查云飞 (通讯作者)

武汉大学人民医院

目的 采用 DCE-MRI 和脂肪酸代谢组学评价糖尿病重症肢体缺血图骨髓微血管渗透性与内皮祖细胞功能。方法 将 28 只雄性新西兰大耳白兔随机分为糖尿病重症肢体缺血实验组 ($n=14$)、重症肢体缺血对照组 ($n=11$) 和空白对照组 ($n=3$)。造模成功后各时间点 (0、1、2、3、4 周) 进行 DCE-MRI 检查以及外周血 MMP-9 浓度测量，第 4 周进行外周血和骨髓 EPCs 数量、迁移和成血管功能测定、骨髓 MMP-9 浓度测量、骨髓代谢组学、CD31 免疫组学组织病理学。分析 K_{trans} 、 K_{ep} 、 V_e 与外周血及骨髓内皮祖细胞数量和功能、MMP-9 浓度变化、微血管密度以及脂肪酸代谢组学的相关性。结果 糖尿病重症肢体缺血兔 K_{trans} 、 K_{ep} 、 V_e 值均随周数变化呈升高趋势，并显著高于重症肢体缺血兔和正常空白对照组兔，糖尿病重症肢体缺血组和重症肢体缺血组两组各时间点间 K_{trans} 值和 V_e 值差异均具有统计学意义。CD31 免疫组化结果显示糖尿病重症肢体缺血兔股骨上段骨髓 MVD 较重症肢体缺血兔和正常兔明显减少。与重症肢体缺血兔和正常兔相比，糖尿病重症肢体缺血兔骨髓 EPCs 数量无明显变化，外周血 EPCs 数量减少，外周血 EPCs 和骨髓 EPCs 迁移能力和血管生成能力受损。代谢组学结果显示糖尿病重症肢体缺血兔棕榈油酸和二十二碳三烯酸含量、MUFA 比例以及从头脂肪生成指数和硬脂酰辅酶 A 去饱和酶 1 活性指数减少，PUFA 比例和延长酶

活性指数增加。在糖尿病重症肢体缺血兔和重症肢体缺血兔中, K_{trans} 、 K_{ep} 、 V_e 值、骨髓 MVD、外周血 EPCs 和骨髓 EPCs 数量和迁移以及血管生成功能、外周血 MMP-9 浓度以及骨髓脂肪酸差异代谢物相关指标互相存在相关性。**结论** DCE-MRI 联合脂肪酸代谢组学评价兔糖尿病重症肢体缺血骨髓早期微血管渗透性、内皮祖细胞功能与脂肪酸差异代谢物具有相关性, 可以为早期调脂改善骨髓内皮祖细胞功能和预防截肢的病理生理机制提供可视化影像学证据。

PO-2341

膝关节骨性关节炎肌肉改变的 IDEAL 定量研究

曹毅、郭林
天津市天津医院

目的: 采用 IDEAL 技术, 分析半膜肌和股内侧肌在正常和膝关节骨性关节炎 (KOA) 时信号强度值的变化, 以及肌肉面积在 KOA 时是否改变。方法: 收集我院 2022 年 1 月—8 月行膝关节磁共振检查的 81 个病例, 将所有受试者分为两组: N 组为对照组, 共纳入 33 例志愿者, 年龄范围 24-58 岁, 平均年龄 33.58 ± 12.78 岁, 男性 15 例, 女性 18 例。D 组为膝关节退变有严重症状组, 共纳入 48 例, 年龄范围 35-72 岁, 平均年龄 57.02 ± 7.4 岁, 男性 14 例, 女性 34 例。扫描序列包括常规序列及 IDEAL 序列。使用 GE AW4.6 工作站中的工具软件, 对股内侧肌、半膜肌、股骨进行轮廓勾画, 记录股内侧肌和半膜肌的水相信号值、脂相信号值和半膜肌/股骨横截面面积 (SM/F) 及股内侧肌/股骨横截面面积 (VM/F)。采用独立样本 t 检验分别比较 N、D 两组间的 IDEAL 水相信号值及脂相信号值, 并且讨论在不同组内男性与女性之间的 IDEAL 水相信号值和脂相信号值的差异。对不同组间肌肉面积与股骨面积的比较采用独立样本 t 检验。结果: 半膜肌和股内侧肌的水相信号值 N、D 两组间比较差异无统计学意义, 而脂相信号值 N、D 两组间的比较差异有统计学意义。男性半膜肌的水相信号值, N、D 两组间比较无显著性差异; 脂相信号值两组间比较有统计学差异。男性股内侧肌的水相信号值, N、D 两组间比较无显著性差异; 脂相信号值两组间比较有统计学差异。女性半膜肌的水相和脂相信号值, 在 N、D 两组间比较均有统计学差异。女性股内侧肌的水相信号值 N、D 两组间差异无统计学意义; 脂相信号值 N、D 两组间比较有统计学差异。SM/F 比值, N、D 组间差异无统计学意义; VM/F 比值, N、D 组间差异有统计学意义。男性 SM/F 在 N、D 两组间差异无统计学意义, 男性 VM/F 在 N、D 两组间差异有统计学意义。女性 SM/F 和 VM/F 在 N、D 两组间差异均有统计学意义。

结论: KOA 时, 半膜肌及股内侧肌脂肪含量的改变较水含量的改变更明显。女性肌肉内脂肪含量较男性多, 这可能是女性 KOA 多发的原因。KOA 时, 股内侧肌的面积减小, 而半膜肌面积的改变不明显。

PO-2342

钙化上皮瘤影像表现 1 例及文献回顾

钱佳慧
东部战区总医院

目的: 钙化上皮瘤常见于儿童, 但对其影像以及病理的表现并不充分。通过分析钙化上皮瘤的 CT 及 MRI 表现, 并探讨其病理基础, 提高对钙化上皮瘤的诊断水平。方法: 通过对 1 例钙化上皮瘤患者临床分析, 并结合文献探讨钙化上皮瘤的临床、病理及影像学特点。结果: 钙化上皮瘤典型表现为皮下单发、质硬的实性包块, 多见于头颈部。毛母质瘤的 CT 特征通常为边界清楚的皮下肿块, 伴有轻度至中度强化和不同程度的钙化。在 T1WI 上呈均匀的中等信号, 在 T2WI 上呈不均匀的中高信号, 呈弥漫不均匀性强化, 脂肪抑制 T2WI 和脂肪抑制增强 T1WI 上常出现网状或环状高

信号。结论：钙化上皮瘤的影像学表现具有一定的特征性表现，结合其临床以及病理表现，提高对该疾病的认识，减少误诊率。

PO-2343

单侧永存坐骨动脉伴下肢缺血一例

朱能新
湖州市南浔区人民医院

目的：通过分享典型病例，以期永存坐骨动脉的诊治提供借鉴。方法：患者行双下肢 CTA 检查及相关文献学习分析总结。结果：本例患者经 CTA 检查发现,诊断为右侧永存坐骨动脉（persistent sciatic artery, PSA），为下肢供血伴右股动脉发育不全，右侧 PSA 继发血管硬化及血栓形成，引发右下肢出现缺血症状。结论：永存坐骨动脉是一种胚胎时期血管发育异常遗留的疾病。由于 PSA 特殊的解剖走行，易发生动脉硬化及动脉瘤等。

PO-2344

基于 MR 单髌小视野扫描的股骨头坏死 ARCO 分期诊断：一项可行性研究

方军杰、陈良
宁波市第二医院

目的：本研究旨在评估单髌 MR 小视野扫描在股骨头坏死（ONFH）ARCO 分期诊断中的可行性，并探讨各期 MRI 影像特点。

方法：回顾收集了 2019 年 2 月至 2023 年 4 月宁波市第二医院治疗随访的 123 例 ONFH 患者，共 162 侧髌关节。所有患者均行单髌 MR 小视野检查及 CT 检查。以高年资放射诊断医师及关节外科医师通过结合 MRI 和 CT 影像作为 ARCO 分期标准组，2 位中级职称放射医师单独根据 MRI 检查资料对 ONFH 进行 ARCO 分期作为观察组。评估观察组和标准组诊断符合率，以及观察者 A 和 B 的诊断一致性。

结果：观察组的分期准确率 I 期 81.5%、II 期 86.5%、III A 期 93.6%、III B 期 94.9%、IV 期 96.5%，总体准确率 91.4%；观察者 A 和 B 之间诊断一致性的 Kappa 值为 0.825，两者一致性好。

结论：单髌 MR 小视野扫描可用于 ONFH 的 ARCO 分期，且具有较高的准确性和可重复性。

PO-2345

基于多模态磁共振评估全身振动训练对 PCOS 大鼠模型下肢骨骼肌胰岛素代谢功能的影响

于夫尧¹、邢川²、叶楠¹、潘诗农¹

1. 中国医科大学附属盛京医院

2. 辽宁省人民医院

目的：多囊卵巢综合征（PCOS）是一种常见的内分泌和代谢紊乱性疾病，其中高达 95% 的 PCOS 患者存在明显的胰岛素抵抗。研究表明，PCOS 的内源性胰岛素抵抗可能是由于骨骼肌对胰岛素的反应失调造成的。全身振动训练（WBV）对多种代谢性疾病的康复有益，故此研究旨在基于多模态磁共振序列为平台，探索 WBV 是否能增强 PCOS 患者的骨骼肌代谢功能、改善 PCOS 病情发展。

材料与方法：使用 15 只 1 个月龄的雌性 SD 大鼠，体重 200~250g，通过灌胃来曲唑溶液建立 PCOS 模型。模型成功后，大鼠分为 PCOS 组和振动训练组。振动训练采用 0.45g、10Hz，每天 30 分钟，每周 5 天，持续 4 周。所有大鼠在治疗前后测量睾酮、空腹血糖和空腹胰岛素，治疗 4 周后进行 2 小时葡萄糖耐量试验。所有大鼠进行 T2WI、DTI、Dixon 及 T2-mapping 磁共振扫描。取下肢股四头肌进行葡萄糖转运蛋白 4（GLUT-4）及胰岛素受体底物-1（IRS-1）免疫组化染色，以及 H&E 和油红 O 染色。

结果：PCOS 大鼠卵巢成熟卵泡增大，且其空腹血糖、胰岛素、睾酮及体重均高于对照组。4 周全身振动训练治疗后，WBV 组体重、睾酮、空腹血糖、胰岛素及 2 小时血糖、胰岛素、HOMA-IR 较 PCOS 组明显下降（ $p < 0.05$ ）。H&E 及油红 O 染色表明，PCOS 大鼠骨骼肌结构紊乱、脂肪增多，WBV 骨骼肌结构恢复、脂肪减少；在 PCOS 骨骼肌中，GLUT-4 及 IRS-1 表达下降，而较 PCOS 组相比，WBV 表达明显增高，且较对照组无明显差异。磁共振显示，WBV 组骨骼肌 T2、ADC 及肌间脂肪（IMAT[%]）较 PCOS 组明显下降（ $p < 0.05$ ），骨骼肌 FA 值平行增高，且较对照组无明显差异。骨骼肌 T2、FA 及 IMAT（%）值与 GLUT-4 及 IRS-1 免疫组化阳性面积显著相关（ $p < 0.05$ ），骨骼肌 ADC 值与 IRS-1 免疫组化阳性面积相关。

结论：全身振动训练可以改善 PCOS 大鼠的骨骼肌胰岛素代谢，减少骨骼肌脂肪，并缓解 PCOS 大鼠骨骼肌胰岛素抵抗。此外，多模态磁共振可以评价 PCOS 大鼠的骨骼肌胰岛素代谢情况，为我们后续的研究奠定了基础。

PO-2346

基于 MRI 分析业余马拉松运动员大腿肌肉与 膝关节损伤和跑步因素的相关性

周静¹、郑孝众²、吴雅雯¹、黄杰¹

1. 杭州师范大学附属医院

2. 浙江省中医院附属第二医院

目的:应用磁共振 T1WI 成像评估业余马拉松运动员大腿前、内、后群肌肉横截面积(Crosssectionalarea, CSA),并探究肌群 CSA 与膝关节半月板损伤分级、骨髓水肿分级以及跑步因素,包括年龄、体重指数(body massindex, BMI)、跑龄、配速、月跑量间的相关性。

方法:对所有符合纳入标准的 51 名业余马拉松运动员进行双侧大腿轴位磁共振 T1WI、T2WI 扫描及双侧膝关节冠、矢状位 PDWI、3Ddss 序列扫描。在大腿 T1WI 图像上勾画前群、内侧群、后群肌肉 CSA。根据美国全器官磁共振成像评分(WORMS 评分)标准对膝关节骨髓水肿分级。采用 Pearson 检验分析大腿各群肌肉 CSA 与各跑步因素的相关性。采用 Kendall 检验分析大腿各肌群 CSA 与对应膝关节各半月板损伤分级和骨髓水肿评分的相关性。

结果:右侧大腿后群、内侧群肌肉和左侧大腿前群 后群、内侧群肌肉 CSA 与 BMI 呈正相关(P 值分别为 0.005 0035 0.048、0.017 0.011, 相关系数分别为 0.275、0.204、0.191、0.231、0.246)。

左、右侧大腿前群肌肉 CSA 与年龄均呈负相关(P 值分别为 0.001、0.003, 相关系数分别为-0.452、-0.412)。左侧大腿后群肌肉 CSA 与配速呈负相关(P=0.046, 相关系数为-0.281);与月跑量呈正相关(P=0.026, 相关系数为 0.229)。其余双侧大腿各肌群 CSA 与年龄、跑龄、配速、月跑量、BMI 无明显相关性。右侧大腿内侧群肌肉 CSA 与右膝内侧半月板前角损伤等级呈正相关(P=0.025, 相关系数为 0.260)。左侧大腿前群肌肉 CSA 与左膝外侧半月板后角损伤等级呈负相关(P=0.010, 相关系数为-0.286)。双膝关节其余半月板的损伤等级和骨髓水肿评分与大腿各群肌肉 CSA 无明显相关性。

结论:跑龄、配速、月跑量对业余马拉松运动员大腿肌肉横截面积变化无影响。不同肌群横截面积与不同部位的半月板损伤等级相关程度不同。膝关节骨髓水肿评分与大腿各肌群横截面积变化无相关性。

PO-2347

妊娠期合并富巨细胞骨肉瘤 1 例

乌宏娟

朝阳市第二医院

妊娠期合并富巨细胞骨肉瘤个案报道 1 例,

患者女,20 岁,急性起病,孕 24 周+1 天,于 17 小时前无明显诱因突发右下腹痛,呈持续性锐痛,右下肢平展时加重,行走时坐卧不便。于县级医院急诊行剖腹探查术,术后发现腹膜后占位,未切除占位,急诊转入我院。以“腹痛待查,腹膜后占位”为诊断收入病房。化实验室检查,甲胎蛋白 68.8ng/ml,血清淀粉样蛋白 A>320mg/ml,碱性磷酸酶阴性。结合 CT(图 1-3)及 MRI(1-3),考虑右侧髂骨区骨巨细胞瘤(不排除二级以上)伴动脉瘤样骨囊肿。

PO-2348

腰椎定量 CT 骨密度测定与双能 X 线骨密度测量对老年患者骨质疏松症中的应用效果对比

曹雨
吉林大学第一医院

目的：对比分析腰椎定量 CT(QCT)骨密度(BMD)测定与双能 X 线(DXA)BMD 测量在老年骨质疏松症中的应用效果

方法：先后对 52 例老年男性患者（平均年龄 60 岁）行腰椎 QCT BMD 测定和腰椎正位 DXA BMD 测量,对比分析 QCT 测定 BMD 与 DXA 测量 BMD 对老年骨质疏松的检出率.

结果：腰椎正位 DXA 对骨质疏松的检出率为 14.6%,腰椎 QCT 为 39.8%,检出率差异有统计学意义 ($P<0.01$). 由此得出腰椎 QCT 测量骨密度在老年患者骨质疏松的诊断中可能具有较高的临床价值.

PO-2349

破碎脂肪垫征：鉴别膝关节类风湿性关节炎和骨关节炎的重要影像征象

王奇政、郎宁
北京大学第三医院

目的：影像学诊断在膝关节骨关节炎 (OA) 和类风湿关节炎 (RA) 患者的治疗前检查中具有重要作用。因此，我们基于术前磁共振检查 (MRI) 探索膝关节髁下脂肪垫 (IPFP) 形态对于二者的鉴别诊断意义。

方法：回顾性分析 162 例年龄和性别匹配的病理确诊的 RA 和 OA 患者的治疗前 MRI 图像。所有随机的 MR 图像均由两名放射科医生进行盲法和独立审查。整个评估过程包括初次诊断、征象评估和最终诊断，每次评估间隔 3 周。常规 MRI 矢状面 t_2 加权成像评估破碎脂肪垫 (Broken-fat pad sign, BFP) 征象。使用曲线下面积 (AUC) 和 kappa (κ) 来评估分类性能。同时，应用影像组学从 IPFP 中提取两个形状特征进行定量解释。

结果：研究人群的中位年龄为 57.6 岁(31.0-78.0 岁)。BFP 征象在 RA 患者中的检出率(72.8%)高于 OA 患者(21.0%)。两位放射科医生通过参考 BFP 征象取得了更好的表现，低年资医师的准确率分别从 58.0%提高到 75.9%。在明确 BFP 征象后，低年资医师与高年资医师的读者间相关系数从一般 ($\kappa=0.30$) 增加到优秀 ($\kappa=0.75$)。通过定量分析，RA 的 IPFP 球形度明显低于 OA (0.54 ± 0.04 vs. 0.59 ± 0.03 , $p<0.01$)，表面体积比高于 OA (0.38 ± 0.05 vs. 0.37 ± 0.04 , $p=0.25$)。

结论：破碎脂肪垫征象是常规膝关节 MRI 鉴别 RA 与 OA 的潜在重要诊断线索，尤其是对于低年资医师，可以有效减少漏误诊。

PO-2350

代谢综合征下肢肌肉 CT 直方图与脂肪分布分析

侯博文、李亦彤、刘潺媛、章瑶、文东琳、李小明
同济医院

目的：对下肢肌肉进行 CT 直方图分析，用以表征代谢综合征（Metabolic Syndrome, MS）肌肉脂肪浸润程度，测量不同部位肌肉及脂肪比例参数，分析 MS 风险因素及建立 MS 影像诊断模型。

方法：纳入病例组主要为诊断为 MS 的患者，对照组主要是以体格检查为主要目的，且实验室检查及影像学结果均为阴性的患者，分别测量大腿中部，小腿中部及 L3 椎体层面的肌肉，皮下脂肪组织（Subcutaneous Adipose Tissue, SAT），肌肉细胞间隙脂肪（Extramyocellular lipid, EMCL）及内脏脂肪组织（Visceral Adipose Tissue, VAT）的含量，分别对不同部位肌肉进行感兴趣区（Region Of Interest, ROI）的勾画，提取直方图参数。统计临床资料及影像学参数，记录慢性病史，采用独立 t 检验，卡方检验等比较不同组的临床及影像学参数，进行回归分析，得出其受试者工作特征曲线（Receiver Operating characteristic Curve, ROC），计算曲线下面积（Area Under the receiver operating characteristic Curve, AUC）。P < 0.05 被认为差异具有统计学意义。

结果：其中纳入的病例组 47 人，对照组 48 人。对下肢的肌肉及脂肪含量及直方图参数进行统计，病例组的肌肉及脂肪比例失调，主要表现为脂肪比例增多，肌肉比例下降，病例组中大腿 EMCL 含量增多。在直方图参数的统计上，病例组中肌肉 CT 值分布表现峰度值降低（P = 0.041），偏度减小（P = 0.049），肌肉中低 CT 值的分布频率更高。以直方图参数及肌肉脂肪含量参数为自变量进行回归分析，大腿及腹部 EMCL 含量及直方图参数表现较好，联合直方图参数及含量参数的诊断模型 AUC 值较高。

结论：直方图参数峰度，偏度等特征值可用来评估肌肉脂肪浸润，肌肉及脂肪比例失调与 MS 相关，联合脂肪肌肉含量和直方图参数组成的影像诊断模型较好。在对代谢异常时的人体成分评估中，大腿中部和腹部均可作为肌肉脂肪分析的参考位置。

PO-2351

基于能谱 CT 物质分离技术在创伤性骨髓水肿的定量研究

刘金瑞、王宁、朱亚男、李正军、周和平
安康中心医院

目的：基于能谱 CT 物质分离技术，探讨其在创伤性骨髓水肿的临床应用价值

材料与方法：回顾性分析 2017 年 11 月至 2018 年 3 月行双能 CT 检查的 24 名急性骨折患者的图像，并重建出相应的水-钙分离伪彩图像。由两名影像诊断医师对图像进行评估，判断骨折及其骨髓水肿范围，并测量骨髓水肿区和正常骨髓区的 CT 值和水-钙值。使用配对 t 检验评估两组的差异，以 Kappa 值评估两位医师判断骨髓水肿区的一致性。

结果：24 例骨折患者均伴有骨髓水肿。两位医师在水-钙分离彩色编码图像识别骨髓水肿区的一致性良好（Kappa 值为 0.878）。骨髓水肿区域的水-钙值及 CT 值（ $1040.28 \pm 33.55 \text{mg/cm}^3$ ， $210.18 \pm 108.63 \text{HU}$ ）显著高于正常骨髓区（ $1011.11 \pm 45.83 \text{mg/cm}^3$ ， $133.44 \pm 134.06 \text{HU}$ ）（P < 0.001），差异有统计学意义。

结论：基于能谱 CT 测量的水-钙分离值和 CT 值在定量评估创伤性骨髓水肿方面有较高的敏感性。

PO-2352

脊椎骨内神经鞘瘤的影像学诊断与鉴别诊断

刘玉

上海交通大学医学院附属第九人民医院

目的: 探讨脊椎骨内神经鞘瘤(intraosseous schwannoma, IOS)的特征性影像学表现, 以期与其他脊椎溶骨性病变鉴别。

方法: 回顾性分析我院经手术病理证实的脊椎 IOS 的临床资料及 CT、MRI 等影像学资料。我们搜集了 11 例脊椎 IOS 病例。所有患者行 CT 和 MR 检查。由两名高年资骨关节系统放射科医师对所有影像学征象进行评估, 并复习了近几年来文献报告的脊椎 IOS 影像学征象。

结果: 病变累及部位包括颈椎 3 例, 胸椎 1 例, 腰椎 5 例, 骶椎 2 例, 平均直径 5.8cm, 形态均为不规则形。CT 示偏心性膨胀性溶骨性骨质破坏, 密度不均匀, 平扫平均 CT 值: 43.0HU, 增强后不均匀轻度强化, CT 值: 70.3HU, 病灶边界清晰, 有硬化边, 未见骨膜反应, 病灶易沿着椎间孔向椎管内外延伸。在 MRI 上, 跟肌肉组织对比, 病灶在 T1WI 上呈等稍低信号, 在 T2WI 上呈混杂稍高信号, 压脂后呈混杂高信号, DWI 未见弥散受限, 增强后不均匀明显强化。

结论: 脊椎 IOS 是一种罕见的良性肿瘤, 影像学表现具有一定的特征性, 在鉴别诊断边界清晰的具有异质性的脊椎溶骨性病变时应予以考虑。

PO-2353

泡沫滚轴及静态拉伸对半程马拉松后大腿肌肉微损伤恢复的多模态磁共振研究

吴雅雯、李玉清

杭州师范大学附属医院

目的 采用多模态磁共振评估业余马拉松运动员在一次半程马拉松后通过被动恢复 (REST) 及泡沫滚轴 (Foam Rolling, FR)、静态拉伸 (Static Stretching, SS) 等主动恢复方式后肌肉微损伤及其恢复程度。方法 招募业余马拉松运动员 18 名, 随机分为 3 组, 静态拉伸组 (SS, n=6)、泡沫滚轴组 (FR, n=6) 以及 REST 组 (REST, n=6)。对于所有受试者进行半程马拉松前基线、跑后 3 小时内以及跑后 24、48、72 小时的双侧大腿 DTI 及 T2 mapping 磁共振序列扫描。FR 及 SS 组在跑后 3 小时内、24、48 小时磁共振扫描后进行干预, REST 组则不进行任何运动及放松方式。对大腿前侧肌群 (股直肌、股内侧肌、股外侧肌、股中间肌)、后侧肌群 (半膜肌、半腱肌、股二头肌长头) 进行 ROI 勾画后, 采集 FA、ADC、T2 值。结果 三组跑后大腿肌肉 FA 值较跑前降低, ADC 值及 T2 值较跑前增高, 跑前及跑后 3 小时均存在统计学差异 ($p < 0.05$)。REST 组大腿肌肉 FA 值在跑后 24 小时到达峰值, ADC 及 T2 值在跑后 48 小时到达峰值, 各组在跑后 72 小时均未回到基线水平; FR 及 SS 组 FA 值、ADC 值、T2 值在跑前及跑后 3 小时均存在统计学差异 ($p < 0.01$), 都在跑后 3 小时到达峰值, 除 SS 组的 T2 值未在跑后 72 小时回到基线水平, 余组均回到基线水平, FR 组的 ADC 及 T2 值在跑后各时间点存在统计学差异 ($p < 0.05$)。FR 组与 REST 组的 FA 值、ADC 值在跑后 24、48、72 小时存在统计学差异 ($p < 0.05$), T2 值在跑后 48 小时存在统计学差异 ($p = 0.001$)。SS 组与 REST 组的 ADC 值在跑后 24、48、72 小时存在统计学差异 ($p < 0.05$), T2 值在跑后 48 小时存在统计学差异 ($p = 0.001$)。结论 DTI 结合 T2 mapping 能够评估一次半程马拉松后产生的大腿肌肉微损伤, 泡沫滚轴与静态拉伸较休息能更好促进肌肉微损伤的恢复, 且泡沫滚轴较静态拉伸效果更好。

PO-2354

q-Dixon 和 T2 mapping 评价下腰痛患者腰椎间盘突出退行性变和腰痛情况的定量研究

冯福婷、罗敏、孙冕雪、王伟
自贡市第四人民医院

摘要:目的 探究下腰痛患者椎间盘 T2 及 T2*值、椎体 BMF 值与椎间盘退变 Pfirrmann 分级、患者腰痛 ODI 评分之间的相关性。方法 收集 2021 年 1 月-2023 年 3 月下腰痛患者 95 例,使用 1.5T 磁共振行 q-Dixon 和 T2 mapping 技术进行扫描。腰痛评价使用的是 Oswestry 功能障碍指数 (Oswestry disability index, ODI) 进行,根据 ODI 指数得分不同,将患者分为轻度疼痛组、中度疼痛组、重度疼痛组。Pfirrmann 分级由两位放射诊断医师根据 T2WI 图像商讨完成,在正中矢状位的 T2 map、T2* map 和 BMF 图上由两位放射诊断医生手动绘制感兴趣区,分别测量椎间盘前纤维环(AAF)、髓核(NP)、后纤维环(PAF)的 T2 值、T2*值、椎体脂肪分数(BMF)。采用 Pearson 相关比较椎间盘的 T2 和 T2*值、BMF 值与 Pfirrmann 分级、ODI 得分的相关性。采用 ANOVA 检验比较各 Pfirrmann 分级、ODI 分组椎间盘的 T2 和 T2*、BMF 值差异。结果 椎间盘 AAF、NP、PAF 的 T2、T2*值以及椎体的 BMF 值和 Pfirrmann 分级、ODI 指数均有相关性,并且 NP 的 T2、T2*值和和 Pfirrmann 分级呈强相关关系,BMF 和 Pfirrmann 分级呈中等程度相关关系。AAF、PAF 的 T2 值在大部分的 Pfirrmann 分级之间有差异。NP 的 T2、T2*值在各 Pfirrmann 分级(除了 IV 级与 V 级之间)均有统计学差异。BMF 在较低的 Pfirrmann 分级之间有统计学差异。在不同疼痛分组之间,轻度和中度疼痛组除了 AAF 的 T2*值,其余各参数值均有统计差异,轻度和重度疼痛组之间各参数均有统计学差异。结论 椎间盘 AAF、NP、PAF 的 T2、T2*值以及椎体的 BMF 值能反映腰椎间盘的退行性变,并且有从定量的角度体现腰痛情况的潜力。

PO-2355

基于能谱 CTA 的下肢动脉硬化闭塞性疾病支架显示质量评价研究

黄欣
西安交通大学第一附属医院

下肢动脉 CTA 已经广泛应用于临床,成为下肢动脉疾病的术前评估、术后随访的主要检查手段。对于下肢动脉植入支架的患者,使用多层螺旋 CT 进行 CTA 检查后,图像会存在金属伪影,影响对支架通畅性的观察,可能造成过度诊断。

目的基于能谱 CTA 对下肢动脉支架植入的患者进行(40~100 keV)单能量、120 kVp 能量、虚拟平扫(Virtual unenhanced images, VUE)和去金属伪影(Metal artifact reduction, MAR)图像重建,通过对比各组图像,寻找显示下肢动脉支架植入最佳单能量图像。

材料与方法回顾性收集我院行能谱下肢动脉 CTA 检查的患者 20 例,共 21 例支架植入。所有患者进行能谱扫描,以及重建 VUE 和 MAR 图像。将所有 CTA 数据上传至工作站,使用能谱 CT 后处理软件进行处理获得单能量图像(120 kVp 常规组、40 keV-100keV)。选取支架近端、中间和远端水平的横截面计算平均支架观察视野,在支架相邻肌肉和脂肪组织评估图像的 CNR 和噪声,并测量支架厚度。图像质量根据支架内腔和结构分别采用四分法和五分法来评价。

结果根据支架平均视野的结果可以看出 VUE、MAR 和 80 keV 平均视野较大,且三者之间无统计学差异。支架平均观察视野的显示范围随着单能量的升高(40 keV~80 keV)不断在增大,但当单能量大于 90 keV 时,平均支架观察视野范围减小。经测量 80 keV 所显示的支架厚度最薄($1.48\pm 0.33\text{mm}$),伪影最小。对于 CNR 的测量显示,仅 VUE 重建组与其他组之间有统计学差异

($P=0.03$)。随着单能量 keV 的升高,动脉植入支架的显示能力越来越清晰。基于支架显示进行主观定性分析发现,除 100 keV,随着单能量 keV 强度水平的增加(40 keV-90 keV),支架管腔显示和支架结构显示的评分越来越高。MAR 和 80 keV 图像为支架评分最高、图像质量最佳。

结论

能谱 CT 下肢动脉成像是针对下肢动脉支架植入术后复查的主要方法。相较于其他能量的图像,MAR 技术和 80 keV 单能量成像提高了下肢动脉和支架内腔显示的图像质量。

PO-2356

多模态影像检查在肩袖钙化性肌腱炎诊断中的应用价值

潘小磊

郑州市骨科医院

目的:探讨肩袖钙化性肌腱炎应用 X 线与 MRI 诊断的价值。

方法:选择医院现有的数字化 X 射线摄影系统进行 X 线检查,包括 X 线正侧位与冈上肌出口位片。

MRI:应用 3.0T 超导 MRI 扫描仪进行 MRI 检查,使用肩关节线圈。常规扫描肩关节轴位、斜矢状位、斜冠状位图像评价

X 线与 MRI 扫描图像均交由本院影像科经验丰富的医师 2 名完成,采取双盲法阅片,有不同意见则协商,或经上级医师综合评判,直到结果统一。主要分析与评估受累的肌腱及具体位置情况,肌腱浅层或深层,肌腱止点区等情况,同时分析钙盐沉积情况,包括其数目、大小及信号等。

统计学分析数据分析软件为 SPSS22.0,计数资料%表示、 χ^2 检验,计量资料表示、t 检验, $P<0.05$ 有统计学意义。

结果:X 线诊断大部分可见钙化灶,而 MRI 诊断 T2WI、PDWI 多为低信号,T1WI 为低信号;不同肌腱部位钙化灶在 MRI 诊断长短径上对比,差异不显著($P>0.05$)

X 线诊断符合率为 86.54% (45/52),

MRI 则为 94.23% (49/52),差异不显著($P>0.05$)。

结论:肩袖钙化性肌腱炎应用 X 线与 MRI 诊断均有较高的价值,但 X 线因体位、骨重叠等导致其有漏诊可能,而 MRI 可结合 T2WI、PDWI 等多序列扫描综合评估,可为临床提供更多的参考依据,值得应用。

PO-2357

儿童颅骨骨内脑膜瘤影像学表现

张华月

河南省人民医院

探讨儿童颅骨骨内脑膜瘤的 CT 与 MR 表现。

回顾性分析 1 例经手术病理证实为颅骨骨内脑膜瘤 12 岁患者的临床病史、CT 及 MR 表现。

患者，女，12 岁，因“发现额部肿块 1 年余”就诊，1 年前发现额部肿块，初期大小约 1cm×1cm，定期复查，现肿块增大至 5cm×5cm。CT 提示额骨增厚，病变跨越冠状缝累及顶骨前份，MR 提示病灶临近硬脑膜增厚。术中所见颅骨病变范围 7cm×8cm，质硬，血供一般。病理结果示颅骨骨内脑膜瘤（板障型脑膜瘤），CNS-WHO 1 级。

颅骨骨内脑膜瘤临床表现不具有特异性，须与骨瘤、骨纤维异常增殖症鉴别。

PO-2358

探讨 MRI 对膝关节腱鞘巨细胞瘤与结节状增生的慢性滑膜炎的鉴别诊断价值

郭晓桐^{1,2}、杨忠现¹、谢祎¹、魏星宇¹、周全²、刘于宝¹

1. 南方医科大学深圳医院

2. 南方医科大学第三附属医院（广东省骨科研究院）

目的：腱鞘巨细胞瘤（GCTTS）与结节状增生的慢性滑膜炎（NCS）临床和 MRI 影像学特征相似，本研究旨在探讨 MRI 对两者的鉴别诊断价值。

方法：回顾性分析 2014 年 6 月至 2023 年 6 月经手术、病理证实的膝关节 GCTTS（13 名男性，20 名女性，10-64 岁）和 NCS（12 名男性，40 名女性，19-75 岁）的资料，比较两者的一般临床资料（包括年龄、性别比例、发病部位）及 MRI 影像学特征（包括病灶形态、信号、厚度、关节腔分布情况、膝关节 MRI 骨关节炎评分（MOAKS 评分）、周围软组织改变），使用独立样本 T 检验、卡方检验、秩和检验来比较两组特定特征。

结果：GCTTS（33 名）更常表现为分叶状、肿块状、毛毯状生长，于 PDWI、T2WI 呈不均匀低信号，NCS 表现为小结节状、毛毯状生长，PDWI、T2WI 呈均匀低信号。GCTTS 的病灶增厚程度（ $14.26 \pm 5.37\text{mm}$ ）较 NCS（ $8.90 \pm 4.26\text{mm}$ ）更高（ P 值 < 0.000 ）。NCS 发病年龄（ 52 ± 13 岁）较 GCTTS（ 40 ± 14 岁）高（ P 值 < 0.05 ）。NCS 基于 MRI 的膝关节骨关节炎评分（包括软骨损伤程度、骨髓损伤程度、骨质增生程度、半月板损伤程度、韧带韧带损伤程度、关节腔积液程度）较 GCTTS 高（ P 值均 < 0.05 ）。NCS 周围软组织肿胀程度较 GCTTS 更高（ $P < 0.000$ ）。两者之间性别比例、发病部位、病灶关节腔分布差异无统计学意义（ P 值 > 0.05 ）。

结论：GCTTS 滑膜病灶增厚程度较 NCS 高，于 T2WI、PDW-SPAIR 上更常表现为病灶不均匀低信号，NCS 发病年龄、MRI 骨关节炎评分较 GCTTS 更高，周围软组织肿胀程度更明显，MRI 影像学特征对 GCTTS 和 NCS 有鉴别诊断价值。

PO-2359

多参数定量 MRI 评价外源性硫化氢干预兔糖尿病重症肢体缺血骨髓氧化应激水平与微血管渗透性

高宇凡、查云飞
武汉大学人民医院

目的：联合磁共振动态增强扫描技术（DCE-MRI）和非对称回波最小二乘估算法水脂迭代分离量化序列（IDEAL-IQ）定量 MRI 评价外源性硫化氢（H₂S）在糖尿病重症肢体缺血并发症中的保护作用。

材料与方法：将 14 只糖尿病合并重症肢体缺血模型兔随机分为 DM+CLI+Saline 组（n=7）、DM+CLI+NaHS 组（n=7），另设置 NS 组（n=6），DM+CLI+NaHS 组实验兔连续 3 周予耳缘静脉注射 NaHS 溶液（30 μmol/kg）。分别于造模后 0、1、2、3 周行 MRI 右侧股骨矢状位 DISCO 和 IDEAL-IQ 扫描，并通过后处理计算得到右股骨上段骨髓的血容量转移常数（K^{trans}）及脂肪含量比值（FF%）等定量参数。第 3 周扫描后对实验兔股骨上段行 CD31 免疫组化和 HE 染色，计算骨髓微血管密度（MVD）和骨髓脂肪细胞。流式细胞仪检测原代骨髓内皮祖细胞（EPCs）内活性氧（ROS）水平，组织生化法检测骨髓组织超氧化物歧化酶（SOD）水平，酶联免疫吸附试验测定血清可溶性细胞间粘附分子 1（sICAM-1）、血管生成素-1（Ang-1）水平。

结果：DM+CLI+NaHS 组第 2、3 周 K^{trans} 和 FF 值、第 3 周 V_e 值低于 DM+CLI+Saline 组（P<0.05），股骨上段 MVD 较 DM+CLI+Saline 组明显增高、骨髓脂肪细胞减少（P<0.05），相关性分析显示骨髓 K^{trans} 与 MVD 呈负相关，FF% 与骨髓脂肪细胞数量呈正相关。DM+CLI+NaHS 组骨髓内皮祖细胞 ROS 阳性率较 DM+CLI+Saline 组降低、骨髓组织 SOD 水平升高，股骨上段骨髓 V_e 值与骨髓内皮祖细胞 ROS 阳性率呈显著正相关、与骨髓组织 SOD 水平呈显著负相关。DM+CLI+NaHS 组第 3 周血清 sICAM-1 显著降低、血清 Ang-1 浓度显著增加，与股骨上段骨髓 K^{trans}、K_{ep}、V_e 值之间均无显著相关关系。

结论：多参数定量 MRI 可作为一种监测骨髓氧化应激水平、评价骨髓微血管渗透性的非侵袭性影像学技术，为探究外源性 H₂S 在糖尿病合并重症肢体缺血骨髓微环境的保护机制提供了无创、定量的影像学证据。

PO-2360

二维超声联合剪切波弹性成像对产后腹直肌肌力评估的临床研究

陈茂娟¹、查云飞¹、李嘉²
1. 武汉大学人民医院
2. 东南大学附属中大医院

研究目的：应用二维超声（Two dimensional ultrasound, 2DUS）联合 SWE 对受检者进行腹直肌成像，旨在探讨应用相关超声测量参数评估腹直肌肌力的可行性。

研究方法：本研究纳入了在 2021 年 4 月至 2021 年 12 月于一院进行腹直肌检测的 91 例单胎初产妇。通过手动肌肉测试（Manual muscle test, MMT）来初步评估腹直肌肌力等级。应用 2DUS 测量不同位点下的 IRD，按照最大 IRD 将其分为 DRA 组和非 DRA 组。获取最大 IRD 位点处双侧腹直肌 CSA，应用 SWE 获取同一位点处双侧腹直肌剪切波速度（Shear wave velocity, SWV）（平均值），重复三次，取双侧腹直肌 SWV 的平均值。通过 Pearson 系数和 Spearman 系数描述上述超声参数与腹直肌肌力等级的相关性。

研究结果：腹直肌肌力等级与卷腹位 IRD 负相关（p=0.011, r=-0.264），与静息位腹直肌 CSA

正相关 ($p=0.045$, $r=0.226$)，卷腹位 IRD 还与静息位腹直肌 SWV 负相关 ($p=0.002$, $r=-0.354$)。此外，产后 6-8 周女性 DRA 发生率高达 73.6%，DRA 组中最大 IRD 位点常位于脐水平 (82.1%)，其次是脐上 3cm (16.4%)。

研究结论：超声测量腹直肌 CSA 与腹直肌 SWV 分别与腹直肌肌力等级和 IRD 相关，此超声参数可用于评估腹直肌肌力。

PO-2361

动态 CT 血管扫描技术在骨肌血管影像检查中的应用研究

傅菲

天津市天津医院

目的：采用动态 CT 血管扫描技术对骨盆外伤病人进行“死亡冠”血管扫描，对比术中“死亡冠”血管显示率的一致性，探讨动态 CT 血管扫描技术在肌骨血管影像中的临床应用。

资料和方法：收集因骨盆创伤就诊于天津市天津医院行盆腔 CTA 检查的患者，共得到 339 位受检者的盆腔 CTA 图像。依据不同的检查方法将研究对象分为两组：A 组采用动态 CT 血管扫描技术进行盆腔 CTA 扫描，扫描时限为动脉早期至静脉晚期，动脉期扫描应用对比剂示踪法，当感兴趣区 CT 值达到 120 HU 时开始动态 CTA 扫描。静脉期从注射对比剂后 75-80 s 开始动态扫描。B 组采用双期扫描，动脉期扫描时相与 A 组相同，静脉期扫描时间为对比剂注射后 90s。本研究分为两个部分：第一部分为动态 CT 血管扫描技术在“死亡冠”显示中的应用；第二部分为“死亡冠”解剖的相关研究。采用卡方检验和单因素方差分析进行统计学分析。

结果：①动态 CT 血管扫描技术可以多期显示动、静脉 CMOR。A 组动脉 CMOR，显示率为 15.5% (54/348)，静脉 CMOR 显示率为 64.1% (223/348)，B 组动脉 CMOR 显示率为 17.2% (56/324)，静脉 CMOR 显示率为 47.8% (155/324)；A、B 两组间动脉 CMOR 血管的显示率差异无统计学意义 ($P>0.05$)，静脉 CMOR 血管显示率之间差异有统计学意义 ($P<0.05$)；A 组和 B 组内动脉 CMOR 和静脉 CMOR 显示率的差异有统计学意义 ($P<0.05$)。

②手术总共观察了 402 例半骨盆的 CMOR 血管，其中与 CTA 相符的有 398 例，真阳性 201 例，真阴性 137 例，假阴性 4 例，灵敏度为 85.71%，特异度 100%。一致性检验中 Kappa 值为 0.84，表明一致性较好。

结论：①动态 CT 血管扫描技术对 CMOR 的显示率与手术中发现的 CMOR 一致性较好。

②动态 CT 血管扫描技术对 2mm 左右血管有较好的显示率，在外伤及肌骨血管检查中有较高的临床应用价值。

PO-2362

混杂型肩袖撕裂与肩袖病变磁共振征象对比分析

李智伟¹、刘中冲²

1. 遂宁市中心医院

2. 中国人民解放军陆军第八十集团军医院

目的：比较肩袖病变与混杂型肩袖撕裂 (rotator cuff tears, RCT) 磁共振成像 (magnetic resonance imaging, MRI) 中图像特征的差异，为肩袖撕裂伤病关系判定提供依据。

方法：回顾性分析 87 例 RCT 患者的病历与 MRI 资料，包括 16 例肩袖病变与 71 例混杂型撕裂，其中混杂性撕裂又分为骨折脱位组 (22 例) 和轻度创伤组 (49 例)。根据 MRI 图像测量 RCT 内外侧长

度(media1-1atera1 tear size ,ML)、韧带损伤数量、撕裂类型、肌骨挫伤及撕裂端脂肪浸润信号。对三组患者的基线资料和 MRI 测量参数进行比较。

结果: ML、撕裂类型、韧带损伤数量和肌骨挫伤信号三组的比较差异具有统计学意义($P<0.05$), 其中骨折脱位组 ML 最小、韧带损伤数量最多, 轻度创伤组全层撕裂发生率最高。年龄、性别、撕裂端脂肪浸润信号这三组比较差异无统计学意义($P>0.05$)。

结论: 依据 MRI 韧带损伤数量和肌骨挫伤信号可推断创伤大小, 但肩袖撕裂内外侧长度、撕裂类型与创伤大小无关。撕裂端脂肪浸润信号发生率低, 判断伤病关系价值有限。

PO-2363

改良法双下肢直接法 CT 静脉造影在下肢静脉曲张性病变中的成像研究

吴庭苗、李燕、阮怀军、金凡志、王永天、刘佳、李辉、袁怀平
安徽省公共卫生临床中心(安徽省医科大学第一附属医院北区)

目的: 探索双下肢直接法 CT 静脉成像最佳成像方法, 以达到下肢静脉性疾病的诊断 CT 成像要求。

方法: 收集我院 2020 年 6 月至 2023.5 月我院因下肢静脉曲张行下肢直接法 CTV 检查的患者 60 例, 分为三组, 每组 20 例, 对比剂为含碘量 32gI/100ml 的碘克沙醇注射液, 予以生理盐水按比例稀释, A 组检查对比剂稀释浓度为 (1:4), B 组对比剂稀释浓度为 (1:6), C 组对比剂稀释浓度为 (1:8), 注射速率为 3ml/s, 扫描前于踝关节上方 5CM 结扎, 髌骨下方结扎, 扫描范围为深静脉以下腔静脉至足背静脉。测量股深静脉、腘静脉及胫前静脉管腔 CT 值, 并观察股静脉有无层流现象。结果: A 组深静脉管腔平均 CT 值明显高于 B 组 ($P<0.05$), 差异有统计学意义; B 组深静脉管腔 CT 值明显高于 C 组 ($P<0.05$), 差异有统计学意义; A 组发生层流现象 (100%), B 组发生层流现象 (15%), C 组发生层流现象 (12%), A 组与 B 组及 C 组间差异有统计学意义 ($P<0.05$), B 组与 C 组差异无统计学意义 ($P>0.05$)。结论: 改良法双下肢直接法 CT 静脉成像对比剂稀释浓度为 (1:6) 成像效果最佳。

PO-2364

基于 DCE-MRI 影像组学及临床特征深度学习预测骨肉瘤患者新辅助化疗反应的研究

张璐、程天明、赵飞
河南省人民医院

目的: 评估基于磁共振动态对比增强 (DCE-MRI) 影像组学及临床特征的深度学习方法来预测骨肉瘤患者新辅助化疗 (NAC) 治疗反应的价值。

方法: 纳入 102 例接受 NAC 的骨肉瘤患者。所有患者 NAC 前均行 DCE - MRI 扫描。将获取的数据随机分为 70 % 用于训练, 30 % 用于测试。基于人工智能机器学习的方法, 建立应用原始动态增强 MRI 图像的影像组学特征和临床变量的联合机器学习模型。对接受新辅助化疗的骨肉瘤患者的 MRI 图像归一化处理后, 使用 nn UNet 训练的深度学习分割模型, 对术前 MRI 的 ROI 进行分割。使用方差阈值、单变量特征选择和最小绝对收缩和选择算子 (LASSO) 选择最优特征。采用 (K 近邻算法 (KNN))、支持向量机 (SVM) 和逻辑回归 (LR) 3 种分类器进行建模。此外, 收集临床相关危险因素, 包括年龄、肿瘤大小和部位、病理性骨折和手术分期, 评估其对 NAC 疗效的预测价值。然后建立临床、影像组学和临床-影像组学模型的多种机器学习方法, 并使用相同测试数据集进行

验证。采用混淆矩阵和受试者工作特征(Receiver Operating Characteristic, ROC)曲线和决策曲线分析(DCA)评价不同分类器的性能。

结果: 临床相关性危险因素分析显示只有手术分期是骨肉瘤患者 NAC 疗效的独立预测因素。通过影像组学特征提取和筛选, 共选取 7 个影像组学特征, 基于这些特征建立 3 个机器学习模型(KNN、SVM 和 LR)。3 个模型的预测准确率(ACC)分别为 0.89、0.84 和 0.84。3 个模型的受试者工作曲线下面积(AUC)分别为 0.86、0.92、0.93。在训练集和测试集中, 联合模型的 ACC 和 AUC 均高于影像组学模型(ACC = 0.91 , AUC = 0.95), 表明综合了临床特征和影像组学特征的机器学习模型表现更突出。

结论: 临床-影像组学列线图可以很好地在术前对骨肉瘤患者 NAC 治疗反应进行预测。这一发现可能为改进骨肉瘤患者个性化治疗方案提供新的决策依据。

PO-2365

不典型部位骨巨细胞瘤影像学表现

钱堃

遵义医科大学附属医院

目的: 分析不典型部位骨巨细胞瘤影像学表现

方法: 回顾性分析遵义医科大学附属医院 2014 年 1 月至 2023 年 5 月经病理证实的不典型部位骨巨细胞瘤 15 例, 其中发生于股骨头颈部 3 例、坐耻骨 3 例、股骨大转子 2 例、跟骨、距骨、足舟骨、髌骨、髌臼、大多角骨及锁骨各 1 例, 15 例患者中男性 5 例, 女性 10 例, 年龄 16-75 岁, 平均 32.8 岁。

结果: 15 例不典型部位骨巨有以下特点: 1、发生在股骨头颈部及髌骨的骨巨细胞瘤未表现出膨胀性改变, 发生在其余部位的骨巨细胞瘤表现为不同程度的膨胀性改变; 2、少有硬化边; 3、增强扫描明显强化。

结论: 多数不典型部位骨巨细胞瘤表现为膨胀性骨质破坏, 发生于股骨头颈部的不表现为膨胀性骨质破坏与股骨头颈缺少骨外膜这一解剖因素相关; 典型或不典型部位的骨巨细胞瘤增强扫描均匀明显强化是其影像学特点。

PO-2366

T2mapping 定量测量前交叉韧带重建术后移植物的韧带化进程

吕嘉玲、李顶夫、夏军、朱伟民

深圳市第二人民医院 (深圳大学第一附属医院)

目的: 探讨前交叉韧带(ACL)重建术后移植物的韧带化过程。方法: 前瞻性研究 30 例 2020 年 1 月至 2021 年 12 月期间的膝关节镜下腘绳肌腱单束重建 ACL 并定期随访的患者, 并选取 30 例无膝关节症状的志愿者进行对照。记录患者的性别、年龄、体重、身高、体重指数(BMI)、ACL 断裂病程时长和半月板处理情况。术后 3 月、6 月、12 月、18 月通过 T2mapping 序列测量韧带移植物关节腔内段 (近端、远端) 以及骨道内移植物 (股骨段、胫骨段) 的 T2 弛豫时间, 以评估 ACL 重建术后的韧带化进程。采用重复测量的方差分析比较术后不同时间节点的关节腔内段、股骨骨道内段及胫骨骨道内段的移植物 T2 弛豫时间的差异; 采用单因素方差分析比较术后各个时间节点 ACL 移植物的亚区域的 T2 弛豫时间的差异 (关节腔远端 vs 近端; 骨道内股骨段 vs 胫骨段)。当 $P < 0.05$ 为差异具有统计学意义。结果: 30 例患者纳入本次前瞻性研究, 年龄 29.3 ± 3.2 岁, 26 名男性, 4 名女性, BMI 指数 24.0 ± 2.0 。在关节腔内段, ACL 移植物信号为 $22.3 \pm 3.5\text{ms}$ (术后 3 月), $36.2 \pm 5.4\text{ms}$ (术后 6 月), $29.4 \pm 3.6\text{ms}$ (术后 12 月), $25.6 \pm 4.7\text{ms}$ (术后 18 月)。30 例志愿者

测得正常的前交叉韧带信号为 $20.2 \pm 2.5\text{ms}$ 。ACL 移植物在韧带化进程中出现节段性不同：在关节腔内段，移植物近端的 T2 弛豫时间术后 3 月、6 月、12 月、18 月的 T2 弛豫时间均高于移植物远端 ($P < 0.05$)；股骨骨道内的移植物 T2 弛豫时间在术后 3 月、6 月、12 月、18 月的均值均高于胫骨骨道内的移植物 ($P < 0.05$)；胫骨骨道段内的移植物在术后 3 月、6 月、12 月、18 月的 T2 弛豫时间未见显著统计学差异 ($P > 0.05$)。结论：ACL 移植物 T2 弛豫时间在术后 6 月达峰并逐渐下降，在术后 18 月仍未达到正常韧带水平。ACL 移植物在韧带化进程中出现节段性不同。T2mapping 序列可能为 ACL 移植物的韧带化进程提供客观的量化结果，并可能提高临床医生在重返运动决策前无创评估移植物成熟度的能力。

PO-2367

定量弛豫时间测量值可以有效地辅助诊断膝关节半月板损伤程度

王慧峥¹、陈文¹、刘薇音²

1. 十堰市太和医院

2. GE 医疗中国磁共振科研部

目的

膝关节损伤半月板中的胶原纤维含量减少，定量评估比定性评估更有助于确定临床治疗方法。因此，我们旨在探讨 MAGiC 对区分半月板严重程度的诊断效果，甚至早期发现分子改变以预防半月板恶化。

方法

这项前瞻性研究共纳入了 2022 年 5 月至 2022 年 10 月期间 87 名疑似 OA 患者，所有参与者均接受了常规 MRI 序列和 MAGiC 序列。在合成质子密度加权图像 (PDWI) 上绘制受损半月板的感兴趣区 (ROI)，然后复制到 T1、T2 和 PD 图上以检索测量结果。两周后由放射科医生重复测量。使用组内相关系数 (ICC) 检验观察者之间的一致性。所有数据均以均值 \pm 标准差 ($\bar{x} \pm s$) 表示。对半月板 WOMRS 和定量参数 (T1、T2 和 PD) 的相关性进行斯皮尔曼相关性检验。独立样本 t 检验或 Mann-Whitney U 检验用于比较不同半月板 WOMRS 分级，分别通过 Kolmogorov-Smirnov 检验和 Levene's 检验进行检验。P < 0.05 为差异有统计学意义。

结果

松弛度测量值和面积测量值在评分者之间具有良好的一致性。内侧后半月板的严重程度与 T1 值 ($r = -0.272$, $P = 0.030$)、T2 值 ($r = -0.278$, $P = 0.026$) 和 PD 值 ($r = 0.692$, $P = 0.000$) 显著相关。由于 WOMRS 值为 0 和 1 的患者较少，本研究仅对 WOMRS 值为 2 和 3 的患者进行了相关性分析和比较。WOMRS II 和 III 之间的面积差异不大 ($P = 0.194$)。在 WOMRS II 和 III 患者之间，发现内侧后半月板的 T1、T2 和 PD 有明显差异 ($P = 0.009$ 、 0.040 和 0.000)。

结论

内侧后半月板撕裂的严重程度可通过 T1、T2 和 PD 的最大横截面 ROI 测量值进行明显区分。若能及早发现半月板的状况并采取适当的治疗措施，则有可能逆转半月板的退化。我们的研究表明，省时的 MAGiC 成像序列在半月板的预后判断、辅助治疗选择和长期随访方面具有巨大潜力，无需进行侵入性关节镜手术。

PO-2368

弥散加权成像 ADC 值和 SPARCC 评分 在强直性脊柱炎活动期评估中的价值探讨

王晶
南通大学附属医院

目的通过分析强直性脊柱炎 (AS) 活动期患者及骶髂关节表观扩散系数 (ADC 值) 及加拿大脊柱关节炎评分 (SPARCC), 探讨弥散加权成像技术 (DWI) ADC 值及 SPARCC 评分在评估 AS 活动期中的价值。方法选取临床确诊为 AS 活动期患者 62 例, 同时收集 28 例健康体检者作为正常组。对两组进行骶髂关节横断位及斜冠状位扫描。通过 DWI 序列及 ADC 图, 测量患者与正常组骶髂关节 ADC 值, 同时测量 L5 椎体中央区 ADC 值, 比较两组骶髂关节相对 ADC 值 ($rADC$) 变化。同时对活动期 AS 患者骶髂关节行 SPARCC 评分, 并对 $rADC$ 与 SPARCC 评分之间的相关性进行分析。结果 DWI 可显示骶髂关节炎活动期骨髓水肿情况; 活动期双侧骶髂关节 $rADC$ 值大于正常对照组。活动期 AS 患者髂侧 ADC 多大于骶侧 ADC, 两组差异均有统计学意义 (均 $P<0.05$), 活动期骶髂关节平均 $rADC$ 值与 SPARCC 评分呈正相关 ($r=0.725$, $P<0.05$)。结论 ADC 值在 AS 患者病情活动度评估中具有一定价值, ADC 值与 SPARCC 评分可以成为判断 AS 活动性的重要指标。

PO-2369

基于对比增强 T1 加权图像结合机器学习 预测软骨肉瘤术后复发风险的价值研究

李晓芬
江西省人民医院

目的: 本研究旨在通过对比增强 T1 加权图像结合不同机器学习算法构建相应组学模型, 探讨影像组学模型预测软骨肉瘤术后 2 年内复发风险的价值研究。

资料与方法: 回顾性收集 2006 年 1 月-2018 年 12 月省内三级骨科中心经病理组织学证实的 102 例软骨肉瘤患者的临床及影像学资料, 根据临床随访分为 2 年内有复发和无复发, 并统计与预后相关的临床风险因素 (部位、年龄、性别、病灶大小、病理分级)。按照 7:3 随机分成测试组 ($n=72$) 和验证组 ($n=30$), 由两名经验丰富的骨肌诊断医生对患者对比增强 T1 加权图像进行 ROI 感兴趣区的勾画, 并提取影像组学特征, 采用最小绝对收缩及选择算子回归分析进行特征降维及筛选, 应用 Logistic 回归、随机森林、支持向量机构建不同的影像组学模型, 同时通过多元逻辑分析获得与肿瘤复发相关的独立预测风险因素, 并构建联合模型, 通过绘制受试者操作特征曲线及校准曲线、决策曲线, 来评估不同模型对软骨肉瘤术后 2 年内复发风险的预测价值。

结果: 发病部位及病理分级是软骨肉瘤患者术后 2 年内复发的独立预测风险因素 ($P<0.05$), 基于 CET1WI 序列筛选出 4 个影像组学特征, 构建的三种不同机器学习模型在训练集和验证集的 AUC 分别为 LR: 0.85、SVM: 0.9、RF: 1.0 和 LR: 0.82、SVM: 0.78、RF: 0.70, 训练集中准确度 75%, 灵敏度 80.5%, 特异度 67.7%; 验证集准确度 70%, 灵敏度 76.5%, 特异度 61.5%, 提示 LR 模型的诊断效能最高。联合发病部位、病理分级及 LR 影像组学标签构建的诺莫图, 其在训练集中 AUC 为 0.88 (95%CI:0.80-0.97), 校准曲线提示该诺莫图预测效能与实际复发风险相一致, 决策曲线显示当阈值概率为 10%至 70%时获得较大的净收益。

结论: 基于对比增强 T1 加权图像构建的影像组学模型可作为一种无创、可靠、实用的生物学标志物来预测软骨肉瘤术后 2 年内的早期复发风险。

PO-2370

SEMAC 结合压缩感知成像技术在骨肉瘤假体植入术后评估中的应用

刘小明、谢铭飞、李强、向正东、杨帆、雷子乔
华中科技大学同济医学院附属协和医院

目的: 探讨层间编码去金属伪影结合压缩感知技术 (CS-SEMAC) 在骨肉瘤假体植入术后评估中的可行性及临床应用价值。

材料与方法: 收集我院骨肉瘤假体植入术后患者 36 例, 采用 1.5T 磁共振对所有受检者进行 T2WI STIR, T2WI WARP, T2WI SEMAC, T2WI CS-SEMAC (序列成像。由两名放射科医师对图像质量进行主观评价和客观评估。采用 Mann-Whitney U 检验分析三组图像清晰度、图像对比度、运动伪影、假体结构可见性、图像模糊度, 对比噪声比, 金属伪影的体积大小与层面内的大小。

结果: CS-SEMAC 和 SEMAC 的金属伪影体积最小, 而 T2WI STIR 的金属伪影体积最大 ($P<0.001$)。高带宽 T2WI WARP 金属伪影体积明显大于 CS-SEMAC 金属伪影体积 ($P<0.01$), 但层面内的金属伪影面积一致 ($P=0.64$)。SEMAC 和 CS-SEMAC 的图像质量与伪影的大小均无统计学差异。SNR 和 CNR 在 T2WI STIR、SEMAC 和 CS-SEMAC 上相似, 在 T2WI WARP 上最低。CS-SEMAC 的伪影较小, 噪声较少, 运动较少, 假体及周围组织显示较好, 且无错层伪影 ($P<0.001$), 高带宽 T2WI WARP 具有较好的清晰度 ($P<0.001$) 和靶区可见度。

结论: 与常规 SEMAC 相比, CS-SEMAC 在节约时间的情况下可骨肉瘤假体植入术后评估, 其成像精度高于高带宽 T2WI WARP 和 T2WI STIR。

PO-2371

基于弥散磁共振的早期脊髓型颈椎病配对病例对照研究

倪铭、袁慧书
北京大学第三医院

背景: 早期脊髓型颈椎病 (CSM) 诊断困难, 依赖医生的经验且漏诊率较高, 通过研究 CSM 患者邻近未受压颈髓的弥散磁共振 (dMRI) 改变, 可以更深入地了解疾病的病理机制, 为实施个体化治疗提供助益。

目的: 通过 DTI (diffusion tensor imaging), DKI (diffusion kurtosis imaging) 和 NODDI (neurite orientation dispersion and density imaging) 三种 dMRI 模型, 以病例对照研究方法探讨 dMRI 在识别早期 CSM 的价值, 并研究 CSM 患者邻近未受压节段颈髓的 dMRI 变化。

方法: 按照年龄和扫描位置 1:1 配对纳入 CSM 患者和志愿者。通过配对 t 检验计算组间 dMRI 参数的差异, 通过方差膨胀系数 (variance inflation factor, VIF) 评估 dMRI 的多重共线性, logistic 回归判断 dMRI 参数在区分正常和 CSM 患者的价值。使用单样本 t 检验分析 CSM 患者与志愿者在邻近未受压迫区域间的差异。

结果: 共纳入 CSM 患者和志愿者各 56 例。配对 t 检验结果表明除 MK (mean kurtosis) 和 NDI (neural density index) 外其它参数均在组间存在显著差异, logistic 回归结果表明 ODI (orientation division index) 呈显著正相关 ($r=2.12$, $p=0.035$), AWF (anisotropic water fraction) 呈显著负相关 ($r=-0.98$, $p=0.015$)。FA (Fractional anisotropy), MD (mean diffusivity), RD (radial diffusivity), ISOVF (isotropic volume fraction), ODI 和 AWF 在所有年龄的邻近、下未受压迫区域均有显著差异。

结论: 结合 ODI 和 AWF 有助于区分正常人和早期 CSM 患者, 并帮助临床医生更好地理解疾病机制, 制定个体化的治疗方案。

PO-2372

基于机会性胸部 CT 对中老年男性骨量减低的诊断价值研究

袁峰、黄晓旗
延安大学附属医院

[摘要] 目的 基于胸部 CT 比较骨量正常、骨量减少、骨质疏松三组临床指标、定量测量指标的差异,分析骨密度测量值(T 值)与临床指标以及定量测量指标的相关性。评价敏感指标对骨量减少或骨质疏松的诊断效能,建立多个指标联合诊断骨密度减低的预测模型,比较、评价各个模型。
方法 收集延安大附院 2022 年 6 月到 2023 年 3 月进行健康体检,同时行胸部 CT 检查及 DXA 骨密度测量的中老年男性患者共 106 例,并收集一般资料及临床数据。分别分为正常骨密度组、骨密度减低组。利用 VR 软件对确诊患者 T4、T7、T10、T11、T12 五个椎体进行定量测量,分别测量椎体 CT 值,椎体中部高度(MH)、前部高度(AH),胸椎指数表示为 MH/AH。采用独立样本 t 检验或非参数检验比较 2 组 CT 定量参数及临床指标的差异,均以 $P < 0.05$ 为差异有统计学意义。有差异的指标纳入多因素二元 logistic 回归分析,分别建立临床指标模型,定量 CT 指标模型,临床与定量 CT 指标联合模型,绘制受试者工作特征(ROC)曲线比较各个模型对腰椎骨密度减低的诊断效能,最优模型使用 R 语言绘制诺莫图及校准曲线。
结果 2 组间 CT 定量参数:椎体 CT 值,椎体中部高度(MH)、前部高度(AH),胸椎指数(MH/AH)均有显著性差异($P < 0.05$)。二组临床指标:体重、长期吸烟者占比、长期饮酒者占比、碱性磷酸酶、谷草转氨酶、谷丙转氨酶均有显著性差异。二元 logistic 回归分析结果示,长期饮酒史、谷草转氨酶、T7-CT 值, T4 中部高度(MH)(临床+定量 CT 指标模型)是骨密度减低发生的独立预测因素。采用 ROC 计算曲线下面积 $AUC = 0.884(95\% CI: 0.818 \sim 0.949)$, 高于临床指标模型($AUC = 0.744$)及定量 CT 指标模型($AUC = 0.853$)。
结论: 临床+定量 CT 模型(长期饮酒史、谷草转氨酶、T7-CT 值, T4 中部高度(MH))联合诊断对骨密度减低具有较高的预测价值。

PO-2373

髋关节临床应用解剖 CT 数字化测量及相关性分析

邬超、苏宁
包头市中心医院(内蒙古自治区脑血管病研究所)

[摘要] 目的: 通过 CT 多平面重建技术(MPR)及实影渲染技术(CR)测量髋关节形态解剖参数指标,比较不同年龄段成人髋关节解剖参数差异,分析不同解剖指标之间与身高、体重、BMI 等基线资料的相关性,为髋关节相关性疾病的诊断评估及髋关节置换术提供精准解剖参数依据。方法: 纳入病例 156 例,共 312 侧,按 10 岁一个年龄段,分为 6 组。在 CR 基础上通过 CT 多平面重建技术测量双侧髋关节髋臼外展角、股骨头中心距离、髋臼覆盖率、髋臼深度、颈干角、股骨偏心距、中心边缘角、髋臼前后断面角、髋臼前倾角。运用 SPSS 统计软件比较不同年龄段双侧髋关节解剖参数差异,分析不同解剖指标之间与临床基线资料的相关性。结果: 髋关节解剖参数指标按左右侧比较, CV、FO 差异存在统计学意义, $P < 0.05$; 按性别比较, Sharp 角、FO、FHD、AAT 女性大于男性; 按不同年龄段分组比较, 青年组在 AD、AC、AASA、PASA、AAT、CEA 指标上数值小于老年组,但是 Sharp 角大于老年组。AC-T 与 AC-I、AD-C 与 AD-A 比较, 差异无统计学意义,但存在显著相关性($r = 0.76、0.95, P < 0.01$)。Sharp angle 与 BMI、AC、AD、CEA、AASA、PASA 呈负相关($P < 0.05$), AC、AD、CEA、AASA 及 PASA 彼此之间存在正相关($P < 0.01$)。
结论: 不同性别、不同年龄段髋关节解剖参数指标存在明显差异,不同解剖参数指标之间存在显著相关性。

PO-2374

布氏杆菌性脊柱炎的磁共振成像诊断

张宁、彭琨

太原钢铁（集团）有限公司总医院

目的：分析布氏杆菌性脊柱炎的临床资料及磁共振成像特点，提高对本病的认识，避免误诊。方法：回顾性分析我院收治的布氏杆菌性脊柱炎患者的临床及磁共振成像资料，并查阅相关文献进行总结。结果：布氏杆菌性脊柱炎病灶分布多以下腰段为主，L4 椎体发病率最高，椎体前缘可见多发不规则骨质破坏，病灶周围可有骨质明显增生、硬化形成，因骨质修复大于骨质破坏，椎体边缘常呈鸢嘴样骨质增生，一般无死骨形成及椎弓根破坏，椎体形态一般正常或仅有轻度楔形变，椎旁脓肿范围较小，与腰大肌分界较清，壁较厚，脓肿内无钙化等改变。结论：布氏杆菌病是由布氏杆菌引起的一种人畜共患的传染性疾病，此病常侵袭脊柱引起脊柱炎，多数患者以腰痛就诊，其临床症状及影像学表现与脊柱结核等其他脊柱疾病相似，易引起误诊、误治。MRI 是一种灵敏的影像学技术，是脊柱炎诊断的首选影像学检查，可提高诊疗效率，具有较高的临床价值。

PO-2375

基于临床及早期影像学特点的儿童急性过伸性脊髓损伤的发病机制探讨

范茜茜、卢浩然、郭晓东、杨炼

华中科技大学同济医学院附属协和医院

目的：儿童急性过伸性脊髓损伤由于发病原因不明确，目前尚无有效治疗手段。本研究回顾既往病例的临床以及急性期甚至超急性期核磁共振多模态影像学特点，探讨其发生机制。

方法：收集 2010 年 9 月至 2022 年 11 月间在我院就诊的因脊柱后伸导致的儿童急性脊髓损伤的病例资料和 MRI、MRA、DTI 等核磁共振多模态影像学资料，结合脊柱解剖学、生物力学等，分析其发病机制。

结果：总共纳入 47 例符合标准的病例，其中女童 44 例（93.6%），男童 3 例（6.4%），平均年龄 6.1 ± 1.3 岁（3.5-10 岁）。发病原因为下腰（41/47）、平躺行过伸运动（4/47）、站立时突然坐下（2/47）。入院时的脊髓损伤 ASIA 分级为 29 例 A 级、13 例 B 级、3 例 C 级和 2 例 D 级。末次随访时的 ASIA 分级为 29 例 A 级、4 例 B 级、1 例 C 级、9 例 D 级、4 例 E 级。大部分病例（46/47）脊髓损伤平面集中于 T9-L1，入院时 MRI 均见脊髓内水肿。29 例 ASIA A 级的患儿神经功能无改善，27 例见髓内出血；MRI 动态检查见髓内水肿进行性上升；22 例患儿在脊髓损伤后 2-6 月中下段胸髓发生萎缩甚至消失；19 例患儿 MRI 显示脊髓圆锥-马尾神经交界处表现为脊髓圆锥腹侧出现弧形凹陷，1 例患儿伤后 10 小时 DTI 检查显示胸段脊髓神经纤维束尚完整，伤后 50 小时复查 DTT 发现脊髓神经纤维束部分断裂。17 例完成 MRA 检查的病例均未见明确血管畸形、血管栓塞、动静脉瘘。

结论：基于本组急性期完成 MRI、MRA、DTI 检查的病例资料，推测本病可能的发病机制为：脊柱过伸后脊髓被牵拉，特别是圆锥-马尾交界部的纵向牵拉损伤（类似肌腱-肌腹交界处损伤断裂），过伸时椎体一过性脱位及前后韧带对脊髓的横向挤压损伤（特别是对顶椎 T9-10 的挤压）；导致脊髓局部小微静/动脉损伤、静脉回流障碍、脊髓动静脉压力梯度改变，引起脊髓供血不足、缺血水肿并恶性循环，出现脊髓脊膜腔综合征（spinal cord compartment syndrome, SCCS）或脊髓内高压征（spinal cord intramedullary hypertension），最后出现脊髓梗死。

PO-2376

双层探测器多参数光谱 CT 在鉴别骨岛与成骨细胞转移瘤中的应用价值

周宇涵¹、雷丽敏¹、曹伟萌¹、王芝浩¹、董书杉²、刘杰¹、岳松伟¹

1. 郑州大学第一附属医院

2. 飞利浦医疗

目的：本研究旨在探讨基于双层探测器光谱 CT (dual-layer spectral CT, DLCT) 的多参数成像在骨岛 (bone islands, BIs) 与成骨型转移瘤 (osteoblastic metastases, OBMs) 中的诊断及鉴别诊断价值。

方法：本研究回顾性收集接受 DLCT 胸部或腹部平扫扫描患者 80 例 (42 名男性和 38 名女性)，对光谱数据进行后处理分别获得混合能量 CT 图像 (Conventional image, CI)、有效原子序数图 (effective atomic number, Z-eff) 及电子云密度图 (electron density, DE)、钙抑制图 VNCa80 (Virtual non-calcium, VNCa) 及 X 线衰减曲线斜率 (λ HU) 并测值。t 检验评估骨岛与成骨型转移瘤中各光谱定量参数差异，单因素 Logistic 回归评估光谱多参数对骨岛与成骨型转移瘤的预测概率，并建立光谱多参数联合模型 (Z-eff、DE、 λ HU)，采用受试者工作特征曲线及曲线下面积 (area under curve, AUC) 评估光谱多参数联合模型与各参数在骨岛与成骨型转移瘤的诊断效能。结果：常规 CT 值、Z-eff、ED、 λ HU，在 BIs 组与 OBMs 组间均存在显著差异且均可有效区分骨岛与成骨型转移瘤 ($P < 0.001$)。光谱多参数联合模型对骨岛与成骨型转移瘤的鉴别效能最高 (AUC=0.931)，常规 CT 值 (AUC=0.92) 及各光谱参数 (Z-eff: AUC=0.888; ED: AUC=0.84; λ HU: AUC=0.888) 亦具有较好的独立预测效能。

结论：光谱多参数联合模型较常规 CT 值及各光谱参数在鉴别骨岛与成骨型转移瘤方面具有更高的鉴别诊断价值，为成骨型转移瘤的临床早期诊断、治疗策略制定及预后预测提供更多影像学支持。

PO-2377

蜡油样骨病影像学表现

卢小婷、杨炼

华中科技大学同济医学院附属协和医院放射科

目的 探讨蜡油样骨病的影像表现特点，以 X 线为主，CT、MRI 及全身骨显像核素检查为补充。方法 回顾性分析蜡油样骨病影像表现。结果 15 个病例均为单侧骨骼发病，无双侧骨骼发病病例。病变累及 1 块骨骼 3 例，累及 2 块者 1 例，累及 3 块者 1 例，4 块者 2 例，6 块 1 例，9 块 1 例，10 块 2 例，11 块 1 例，12 块 1 例，16 块 1 例，21 块 1 例。8 例为右侧，7 例为左侧。累及上肢骨 3 例，下肢骨 12 例。15 例患者共累及骨骼 112 块，其中趾骨 25 块，跖骨 15 块，股骨 9 块，胫骨 9 块，腓骨 9 块，楔骨 8 块，指骨 6 块，骰骨 5 块，距骨 5 块，髌骨 3 块，跟骨 3 块，足舟骨 3 块，骾骨 2 块，桡骨 2 块，掌骨 2 块，尺骨 1 块，月骨 1 块，小多角骨 1 块，头状骨 1 块，坐骨 1 块，耻骨 1 块。15 个病例均可见病变区域骨膜增生，骨皮质增厚，骨髓腔变窄甚至闭塞，骨小梁结构消失，其中骨干上新骨堆积呈波浪状 5 例，长管骨呈蜡泪样流淌状骨肥厚 5 例，软组织内斑片状或不规则钙化 8 例，软组织肿胀 8 例。其中 15 例中有 7 例行 CT 检查，4 例行 MRI 检查，3 例行全身骨显像核素检查。其中 CT 发现关节间隙变窄甚至消失 4 例，共累及 27 个关节。结论 蜡油样骨病 x 影像表现典型，常规 X 线检查即可以明确诊断，CT 和 MRI 可作为有效的补充。

PO-2378

髌骨肿瘤样病变的骨痛风一例

姚红艳、王平
甘肃省人民医院放射科

26 岁青年男性患者，无痛风病史，根据患者临床及影像学表现，该患者最初被误诊为髌骨良性肿瘤性病变。行右髌骨痛风结节刮除植骨术，术后病理证实为髌骨痛风。该案例说明对于髌骨骨质破坏性病变的表现，在临床日常工作中我们要考虑骨痛风发生的可能性，并注意与骨肿瘤进行鉴别，同时，要注重结合双能 CT 的检查优势，避免误诊、漏诊。

PO-2379

老年退行性脊柱畸形患者活动受限与椎旁多裂肌脂肪浸润相关性的单体素波谱研究

赵骏、罗飞、陈伟、陈品珍、王健
陆军军医大学第一附属医院（西南医院）

目的:应用磁共振单体素波谱(Single Voxel Magnetic Resonance Spectroscopy, SVMRS)技术计算老年脊柱畸形(Degenerative spinal deformity, DSD)患者 L4/5 椎间盘多裂肌(Multifidus Muscle, MM)脂肪含量与腰椎冠状面和矢状面运动范围的相关性。

方法:30 名 DSD 患者和 35 名老年健康志愿者入组，用手持式数字肌肉测试仪测量腰椎屈、伸、冠状面 bending 方向活动范围与矢状线角度各 3 次，重复测量方差分析计算腰椎活动范围的重复性。所有受试者均行 3.0T 腰椎 MR 成像，SVMRS 测量 L4/5 椎间盘水平双侧 MM 的脂质含量。采用 Spearman 相关法计算 L4/5 椎间盘 MM 凹侧和凸侧脂质含量与腰椎四个方向运动角度，以及冠状面和矢状面活动角度的相关性。

结果:DSD 组和对照组前屈后伸 bending 方向运动范围的重复性无统计学差异($P=0.705$ 、 0.208 、 0.147 、 0.105)，($P=0.284$ 、 0.079 、 0.620 、 0.638)。L4/5 凹侧和双侧 MM 脂质含量与后伸角度呈负相关($R=-0.385^*$ ， $P=0.036$ ， $R=-0.387^*$ ， $P=0.035$)。

结论: L4/5 椎间盘为 DSD 患者活动受限的主要解剖学层面，凹侧 MM 脂肪浸润为活动受限重要成分退变指标。

PO-2380

软组织血管纤维瘤的 MRI 表现

董印、王丽娜、刁瑞圆
山东第一医科大学附属省立医院

目的: 探讨 MRI 对软组织血管纤维瘤的诊断价值。资料与方法: 搜集我院 2021 年 7 月~2023 年 6 月经手术病理及免疫组化、分子及基因检测证实，MRI 检查资料齐全的软组织血管纤维瘤 11 例，其中男 4 例，女 7 例，年龄 39~67 岁，平均 51.2 岁。临床病程 2 周~6 个月，平均 3.4 个月。症状主要表现为缓慢增大的局部无痛性包块、伴活动受限。采用 Siemens Verio 3.0T MR 仪进行常规平扫及多期增强扫描，采用快速自旋回波序列(TSE) T1WI、T2WI 及脂肪抑制 T2WI (FS-T2WI)，增强扫描采用脂肪抑制 T1WI (FS-T1WI)。对比剂采用钆喷酸葡胺 (Gd-DTPA)，剂量为 0.1mmol/kg ，通过高压注射器经肘前静脉团注，注射速率 2.0ml/s 。结果: 肿瘤发生于肢体大关节周围 (膝关节周围 4 例，肩关节周围 2 例，髋关节周围 2 例)、胸腹壁 (2 例) 及盆腔 (1 例)。表

现为肌间隙或皮下单发软组织肿块, 最大径 5.1-12.6cm, 平均为 8.4cm, 临近结构受压推移。肿块相对均质, 内无明显钙化或脂肪成分, 边缘光整, 未见明显“尾征”或“绳系征”。MRI 检查 T1WI 病变相对骨骼肌呈较均匀等信号 (4 例) 或稍高信号 (7 例); T2WI 呈不均匀高信号, FS-T2WI 呈显著高信号 (11 例), 其内见索条状 T2WI 低信号 (7 例) 及/或流空血管 (9 例); 病变周围可见引流静脉 (3 例)。动态增强扫描早期呈显著不均质强化, 且渐进性填充 (11 例)。结论: MRI 在一定程度上反映了软组织血管纤维瘤的病理特点, 有一定特征性。病变边界清晰, T2WI 明显高信号伴流空信号、增强扫描呈显著渐进性强化有提示意义。

PO-2381

双能量 CT 骨髓水肿在骨肌创伤中的临床应用

张炜

华中科技大学同济医学院附属协和医院

目的 探讨双能量 CT 骨髓分析在骨肌创伤中的临床应用价值。材料与方法 使用双源双能 CT 系统 (SOMATOM Force CT: 软件版本 VA50A; 后处理工作站:syngo.via 软件版本为 VB20A), 收集我院 2021 年元月以来入组双能量 CT 扫描外伤患者 138 例, 后处理工作站骨髓水肿 (BMO) 检测, 分析骨骼肌损伤中的影像学表现。结果 通过 DECT 评估 BMO 衰减增加的定性检测, 分析 DECT-VNCa 图与常规 CT、MRI 入组患者创伤的敏感性 & 特异性, 放射科医生可以提高对细微和隐匿性骨折的检出率, 并估算不确定发生时间骨折的敏锐度与愈合情况。结论 DECT 在研究骨小梁优势区域 (如椎体、骨盆、髌部、长骨干骺端) 的应力 (即疲劳或功能不全) 和脆性骨折方面具有显著优势; MRI 禁忌症检查 (例如起搏器, 金属异物、不配合等), DECT 可替代 MRI 检查。随着 DECT 技术的不断进步, VNCa 图像质量将得到改善, 从而允许在肌肉骨骼创伤中得到更广泛的应用。

PO-2382

基于 QCT 研究中青年腰椎间盘突出与椎旁肌脂肪浸润及骨密度之间的关系

艾军^{1,2}、赵清敏^{1,2}、李传明¹、何珂¹、薛波¹、郭轶¹

1. 重庆大学附属中心医院

2. 贵州省思南县人民医院

目的 研究椎旁肌脂肪含量及骨密度与中青年腰椎间盘突出之间的关系。方法 回顾性收集本院行腰椎 CT 检查的 60 岁以下患者 104 例, 共纳入 416 个椎间盘节段作为研究对象, 依据腰椎间盘是否突出分为突出组 (n=205) 与无突出组 (n=211)。使用联影 UCT760 进行统一参数下扫描, 并用定量 CT 测量腰 1-2、腰 2-3、腰 3-4、腰 4-5 椎间盘水平椎旁肌 (双侧腰大肌、多裂肌、竖脊肌) 脂肪含量及腰 1-5 椎体骨密度。使用 Mann-Whitney U 检验、Kruskal-Wallis 检验比较两组间及组内三种肌群脂肪含量的差异, 使用卡方检验、Wilcoxon 符号秩和检验、T 检验分别比较两组间性别、年龄及椎体 BMD 值差异。建立二项 logistics 回归模型分析腰椎间盘突出与三种椎旁肌脂肪含量、腰椎 BMD 值、性别及年龄之间的关系。绘制受试者工作特征曲线评价三种椎旁肌脂肪含量及腰椎 BMD 值诊断腰椎间盘突出的效能。结果 两组间 BMD 值差异有统计学意义 ($t=5.806, p<0.001$)。两组间三种肌肉脂肪含量差异有统计学意义 ($P<0.001$)。两组间年龄差异有统计学意义 ($p<0.001$)。两组间性别差异有统计学意义 ($\chi^2=11.957, P<0.001$)。二项 logistics 回归模型提示性别与腰椎间盘突出呈正相关 ($OR=1.968, 95\% CI: 1.099-3.523, P=0.023$); 竖脊肌脂肪含量与腰椎间盘突出呈正相关 ($OR=1.384, 95\% CI: 1.227-1.561, P<0.001$)。腰大肌脂肪含量 AUC 为 0.681, 临界值为 3.025%, 灵敏度为 0.659, 特异度为 0.635; 多裂肌脂肪含量 AUC 为 0.708, 临界值为

3.675%，灵敏度为 0.727，特异度为 0.583；竖脊肌脂肪含量 AUC 为 0.762，临界值为 5.35%，灵敏度为 0.678，特异度为 0.73；椎体 BMD 值 AUC 为 0.34。结论 中青年腰椎间盘突出与椎体骨密度及椎旁肌肉脂肪浸润程度相关，其中以竖脊肌脂肪含量预测椎间盘突出的效能最好。

PO-2383

寒区长跑运动膝关节慢性损伤的区域性特征及相关性分析

石琳、祝静雅、段阳、冯捷、杨宁、李小婉、王金宝、杨本强、张楠
中国人民解放军北部战区总医院

目的：探讨寒区长跑运动膝关节慢性损伤的区域性特征及相关性分析。

方法：收集寒区 188 例因长期运动造成慢性膝关节损伤患者的临床资料和 MRI 影像资料，分析膝关节慢性损伤的特点与温度、年龄与关节部位的相关性。

结果：188 例单侧膝关节损伤患者（平均年龄 30 岁，男 174 例），5 个月的间隔期内出现对侧膝关节损伤，单侧与对侧膝关节损伤 MRI 评分之间存在着显著正相关（ $r=0.628, P<0.05$ ）。前交叉韧带损伤发生率最高（73.7%，75.3%）。两侧膝关节前交叉韧带损伤程度之间、内侧半月板损伤程度之间存在着显著正相关（ $r=0.392, p<0.05$ ； $r=0.610, p<0.05$ ）。外侧半月板损伤与气温存在显著差异（ $\chi^2=4.316, P<0.05$ ），内侧半月板损伤与年龄存在显著差异（ $\chi^2=12.942, P<0.05$ ）。结论：寒区长跑运动膝关节慢性损伤与年龄、气温有关，前交叉韧带和内侧半月板最易损伤，单侧膝关节损伤后持续运动 5 个月易引起对侧膝关节损伤。

PO-2384

DXA 在青海地区绝经后类风湿关节炎患者发生骨质疏松症危险因素分析

方靖、刘有云、王建辉、祁生平、李作瑞、杨富艳、王燕彬、畅旭东、韩琼
青海省中医院

目的：探讨双能 X 线（DXA）在青海地区绝经后类风湿关节炎（RA）患者发生骨质疏松症（OP）危险因素。方法：选取 2022 年 5 月—2023 年 4 月在青海省中医院收治的 200 例绝经后女性 RA 患者，所有患者入院后进行骨密度检测，采用 DXA，测量腰椎 L1~L4、腰整体、大转子、Wards 三角区、整体、前臂整体等部位，将上述任何部位的 t 值 $\leq -2.5SD$ 诊断为 OP 组，而 $> -2.5SD$ 为非 OP 组。收集所有患者一般资料和相关指标及上述部位的 t 值等。结果：OP 组 L1、L2、L3、L4、腰整体、大转子、Wards、三角区、整体及前臂整体 t 值均明显低于非 OP 组；ROC 曲线分析结果显示，L1、L2、L3、L4、腰整体、大转子、Wards、三角区、整体及前臂整体 t 值诊断 OP 的敏感度分别为 96.20%、95.22%、90.16%、96.03%、92.01%、89.36%、99.26%、90.02%、96.03%，特异度分别为 81.00%、82.19%、85.22%、83.06%、83.06%、90.22%、80.06%、86.23%、83.09%，AUC 分别为 0.908、0.905、0.896、0.906、0.903、0.879、0.918、0.901、0.906；Logistic 回归分析结果显示，影响青海地区绝经后女性 RA 患者发生 OP 的危险因素包括高龄、病程长、DAS28 评分及血沉、补充钙剂等。结论：DXA 检测 RA 发生 OP 患者骨密度，可作为 OP 评估的金标准，且影响青海地区绝经后女性 RA 患者发生 OP 的危险因素较多，临床应结合相关因素制定合理的措施，以降低 OP 的发生率。

PO-2385

运用 CT 三维重建技术测量骨质疏松性椎体压缩骨折与中青年创伤性胸腰椎(T11-L5)骨折患者椎弓根宽度的临床价值

陈兵、陈运久
四川省骨科医院

【摘要】 目的：探讨运用 CT 三维重建技术测量骨质疏松性椎体压缩骨折(OVCF)与中青年创伤性胸腰椎(T₁₁-L₅)骨折患者椎弓根宽度(POW)的临床价值。方法：收集 2020 年 10 月-2022 年 10 月本院收治的 117 例脊柱胸腰段骨折患者资料进行回顾性分析，将 OVCF 患者(n=65)纳入 A 组，将中青年创伤性胸腰椎(T₁₁-L₅)骨折患者(n=52)纳入 B 组，均采用 CT 三维重建技术测量 T₁₁-L₅ 各对应脊椎 POW，比例两组各对应弓根两侧 POW 及不同性别间的差异，并计算 POW<5 mm 及<7 mm 的百分比。结果：A 组对应脊椎左右侧 POW 比较无显著性差异(P>0.05)。A 组 T₁₁-L₅ 各对应脊椎的 POW 值小于 B 组(P<0.05)。A 组和 B 组 T₁₁-L₅ 各对应脊椎的 POW 值男性大于女性(P<0.05)，A 组 T₁₁-L₃ 各对应脊椎的男性和女性 POW 值小于 B 组(P<0.05)，A 组和 B 组的 L₄、L₅ 脊椎 POW 值比较无显著差异(P>0.05)。A 组共测量 655 个椎弓根，POW<5mm 者占椎弓根总数的 7.48%，主要分布于 T₁₁-L₃ 脊椎，<7 mm 占比 37.25%，T₁₁-L₄ 均有分布；B 组共测量 359 个椎弓根，POW<5 mm 者占椎弓根总数的 1.67%，T₁₂-L₂ 分别均有分布，<7 mm 患者占比 13.09%，分布于 T₁₁-L₃。结论：老年 OVCF 患者 T₁₁-L₃ POW 小于中青年创伤性胸腰椎骨折患者，且女性小于男性，故临床应对胸腰椎骨折患者术前行 CT 三维重建检查，测量 POW，以评估手术治疗的可行性，并降低并发症发生。【关键词】 骨质疏松；椎体压缩骨折；创伤性胸腰椎骨折；CT；三维重建技术；椎弓根宽度

PO-2386

基于深度学习多特征融合机会性筛查骨质疏松可行性研究

潘晶¹、王林²、龚沈初²、林鹏程³、张堃³

1. 南京市中医院

2. 南通市第一人民医院（南通大学第二附属医院）

3. 南通大学

目的 基于胸部 CT 图像，联合临床信息、影像组学特征构建多特征深度学习模型，探讨其筛查骨质疏松症的可行性及性能，并选出最佳模型指导临床诊疗决策。

方法 回顾性收集 2021 年 1 至 10 月间 1048 例受试者胸部 CT 图像为主数据集，2022 年 2 月至 4 月间使用不同 CT 扫描获得的 386 例受试者胸部 CT 图像用于外部验证。以 QCT 将其分为骨量正常、低骨量和骨质疏松三类。首先基于胸部 CT 图像构建分割模型[训练集 (n=548 例)，验证集 (n=100 例) 和测试集 (n=400 例)]以提取腰 1 和腰 2 椎体图像，并利用 DSC 比较其与手工标注的一致性；然后基于训练数据集 (n=530 例) 和验证集 (n=100 例)，建立 8 种模型：(1) 基于随机森林建立的组学模型；(2) 基于朴素贝叶斯建立的组学模型；(3) 基于 CNN-Net 的 DCNN 模型；(4) 基于组学特征及深度学习组成的融合模型；(5) 基于临床信息及深度学习组成的融合模型；(6) 基于临床信息、组学特征及深度学习组成的融合模型；(7) 在第 3 个模型的基础上，单独使用腰 1 图像构建模型 7；(8) 在模型 6 的基础上，单独使用腰 1 图像构建模型 8。使用 ROC、DCA 曲线评估模型的诊断效能及临床价值。不同模型之间的比较采用 Delong 法检测其 AUC 的差异。

结果 共 1434 名体检者。采用训练集图像数目时在测试集中 DSC 为 0.951±0.030，外部验证集中 DSC 为 0.941±0.050。基于单独腰 1 椎体 CT 图像、组学特征及临床信息组成的深度学习多特征融合模型（模型 8）诊断骨量正常、低骨量、骨质疏松的敏感性、特异性、AUC 依次为：0.920、0.970、0.992，0.922、0.923、0.973，0.941、0.989、0.989，性能最佳，且临床决策曲线也证明此多特征融合诊断模型的净收益最佳。

结论 单独使用腰 1 椎体 CT 图像及临床信息构建的深度学习多特征融合模型可以在不增加辐射剂量的情况下快速筛查骨质疏松高危人群。

PO-2387

骨内副神经节瘤的影像特征分析及文献复习

晏杰、黄水仙、龙艳、李唯、李谦、范路萍、李荣惠
红河州滇南中心医院/个旧市人民医院

目的 探讨骨内副神经节瘤的影像学特征。方法 以“Paraganglioma”、“Chemodectoma”、“Intraosseous”为关键词检索 PubMed 数据库,检索时间为 1990 年 1 月 1 日至 2023 年 7 月 1 日,获取文献,共收录 10 例患者;以“副神经节瘤”、“化学感受器瘤”、“骨”为关键词检索中国知网数据库,获取同期中文文献,共收录 34 例患者,删除重复病例及临床病史资料不全病例,纳入本例个案共收录 41 例患者分析其影像学特征。结果 骨内副神经节瘤在 X 线/CT 上多表现溶骨性、膨胀性骨质破坏伴边界清楚或不清楚的软组织肿块,呈圆形、类圆形或不规则形,2 例伴点片状残留骨及钙化,6 例病灶边缘有硬化边。CT 平扫呈等或低密度肿块,肿块较大时密度不均匀,可见坏死、囊变及出血,钙化少见;增强扫描病灶明显强化,其内可见多发迂曲增粗血管影。MRI 表现为 T1WI 呈等或稍低信号, T2WI 呈稍高或高信号,压脂序列呈高信号;肿瘤较大伴坏死和出血呈不均匀混杂信号,增强扫描明显不均匀强化,病灶内可见点状、匍匐状流空血管,形成所谓的“椒盐征”。ECT 及 PET/CT 表现为放射性异常浓聚及高摄取。结论 骨内的副神经节瘤罕见,CT 和 MRI 是骨内副神经节瘤定位、定性诊断的重要影像学检查方法,影像学上多表现为溶骨性、膨胀性骨质破坏伴边界清楚或不清楚的软组织肿块, MRI 病灶内点状、匍匐状流空血管具有一定特征;两者均能很好地显示肿瘤本身及其与周围结构的关系,CT 和 MRI 在发现病灶、副神经节瘤的诊断及鉴别诊断方面具有重要意义。

PO-2388

探讨临床及影像多种因素对首诊新鲜肋骨骨折漏诊的影响

张杨
西安市人民医院

【摘要】目的:探讨临床及影像多因素对首诊新鲜肋骨骨折漏诊的影响。方法:回顾性分析 2021 年 06 月至 2023 年 06 月本院的 93 例肋骨三维检查的患者,分析病史是否明确、骨折单发/多发、断端有无移位、诊断医师的阅片习惯、图像质量等因素对首诊新鲜肋骨骨折漏诊的影响。93 例首诊新鲜肋骨骨折中,漏诊 38 例、未漏诊 55 例。将肋骨骨折分为漏诊组、未漏诊组,利用卡方检验分析以上多种因素对两组间的差异。结果:申请单病史是否明确、图像质量、骨折单发/多发对是否漏诊首诊新鲜肋骨骨折的影响不显著 ($P>0.05$);申请单病史是否明确对是否漏诊单发首诊新鲜肋骨骨折具有显著的影响 ($P<0.001$);肋骨骨折端有无移位、诊断医师阅片习惯对是否漏诊首诊新鲜肋骨骨折具有显著的统计学差异 ($P<0.01$)。在申请单明确外伤病史的患者中,骨折单发/多发、骨折端有无移位对是否漏诊肋骨骨折具有显著的统计学差异 ($P<0.01$)。结论:骨折端无移位的首诊新鲜肋骨骨折更容易漏诊;良好的阅片习惯可降低首诊新鲜肋骨骨折的漏诊率;申请单明确外伤病史可显著降低单发首诊新鲜肋骨骨折的漏诊率。

PO-2389

腺泡状软组织肉瘤的 CT 及 MRI 影像学特征

吴珊、刘军、张明、徐小玲
西安交通大学第一附属医院

目的：探讨腺泡状软组织肉瘤（ASPS）这一罕见肿瘤的 CT 及 MRI 影像学特征，以提高该肿瘤影像诊断的准确率。

方法：系列病例报告。回顾性分析我院 2012 年 1 月—2022 年 1 月经手术病理证实的 11 例 ASPS 患者的影像学资料。其中男 4 例，女 7 例，首次就诊年龄 20~52 岁，平均 30.5 岁。术前 5 例患者行 CT 平扫检查，1 例行 CT 及 MRI 平扫，5 例行 MRI 平扫（其中 1 例同时行 MRI 增强扫描）。总结 ASPS 的 CT 及 MRI 影像学特征并复习相关文献。

结果：本研究 11 例 ASPS 患者中，肿瘤位于左侧股直肌 4 例，左侧股中间肌 1 例，右侧股中间肌 1 例，右侧股骨四头肌 1 例，左上肢三角肌 1 例，左侧腹膜后 3 例；9 例呈卵圆形，1 例呈圆形，1 例呈不规则形；肿瘤最大直径 4.7~11.1 cm（平均 8.1 cm）；9 例病灶边界清晰，2 例病灶上下缘边界不清。CT 影像特征：6 例病灶呈不均匀稍低密度，平均 CT 值约为 26~38 HU，1 例病灶内见点状钙化。MRI 特征：MR 平扫 T1 加权像（T₁WI）2 例呈等信号，4 例呈稍高信号；6 例 T₂WI 呈不均匀高信号，6 例病灶内及周围均见低信号条状或迂曲血管影；MRI 增强扫描 1 例呈明显不均匀强化。

结论：腺泡状软组织肉瘤好发于年轻患者，四肢是其好发部位，肿块一般较大。CT 表现为不均匀的低密度，MRI 征象相对特异，T₁WI 呈等或稍高信号，T₂WI 呈不均匀高信号，病灶内及周围有低信号条状或迂曲的血管影，增强扫描呈明显强化。熟悉其 CT 及 MRI 影像特征有助于对患者的诊断和治疗。

PO-2390

脊柱泡型包虫病影像学表现特征

杨梅
青海省人民医院

目的：分析脊柱泡型包虫病的 CT、MRI 影像学特征，提高对该病的认识和诊断。方法：分析经病理证实的 15 例脊柱泡型包虫，均行 CT 扫描及三维重建、MR 检查，观察病灶骨质破坏形式、椎体附件及邻近肋骨、椎间盘累及情况，是否有囊样低密度或“小囊泡”样信号、钙化、死骨等各种征象。结果：15 例脊柱泡型包虫，3 例为原发，无其它脏器转移；12 例原发灶来源于肝脏，CT 检查呈斑片、地图样溶骨性骨质破坏伴骨质硬化，相应附件受侵且周围形成不规则软组织包块 12 例，软组织包块内见不规则钙化，并增强扫描见多发环形强化灶，椎间盘受累 8 例。MR 主要表现为病变椎体及周围软组织包块呈高低混杂信号，12 例病灶内见散在“小囊泡”样 T₂WI 高信号影，并可见长 T₁WI、短 T₂WI 骨质硬化影或不规则钙化灶，其中 3 例邻近肋骨受累；结论：脊柱泡型包虫病影像学表现有一定特征，CT 和 MR 检查相结合，对早期诊断及鉴别诊断具有重要意义。

目的：分析脊柱泡型包虫病的 CT、MRI 影像学特征，提高对该病的认识和诊断。方法：分析经病理证实的 15 例脊柱泡型包虫，均行 CT 扫描及三维重建、MR 检查，观察病灶骨质破坏形式、椎体附件及邻近肋骨、椎间盘累及情况，是否有囊样低密度或“小囊泡”样信号、钙化、死骨等各种征象。结果：15 例脊柱泡型包虫，3 例为原发，无其它脏器转移；12 例原发灶来源于肝脏，CT 检查呈斑片、地图样溶骨性骨质破坏伴骨质硬化，相应附件受侵且周围形成不规则软组织包块 12 例，软组织包块内见不规则钙化，并增强扫描见多发环形强化灶，椎间盘受累 8 例。MR 主要表现为病变椎体及周围软组织包块呈高低混杂信号，12 例病灶内见散在“小囊泡”样 T₂WI 高信号影，并可见长 T₁WI、短 T₂WI 骨质硬化影或不规则钙化灶，其中 3 例邻近肋骨受累；结论：脊柱泡型包虫病影像学表现有一定特征，CT 和 MR 检查相结合，对早期诊断及鉴别诊断具有重要意义。

磁共振 T2* mapping 分析不同跑量下业余马拉松运动员单侧膝关节周围肌肉改变及趋势变化

郑雪妮¹、兰晓川¹、宋凌恒¹、陈伟²

1. 中国人民解放军陆军第九五八医院放射科

2. 陆军军医大学第一附属医院 (西南医院)

目的: 基于磁共振 T2* mapping 分析不同跑量下业余马拉松运动员单侧膝关节周围肌肉改变及趋势变化。

材料与方法: 本研究前瞻性招募 35 例业余马拉松运动员及 18 例一般对照组志愿者进行单侧膝关节周围肌肉 T2* mapping 扫描, 所有受试者按照跑量区分为高跑量组 ($\geq 300\text{km}/\text{月}$) 16 例、中低跑量组 ($< 300\text{km}/\text{月}$) 19 例及一般对照组 18 例, 主要在矢状面上选取膝关节周围肌肉中的缝匠肌、股内侧肌、半膜肌、腓肠肌内侧头、腓肠肌外侧头、股二头肌进行感兴趣区测量, 采集数据时选取各肌肉显示最大层面及肌肉最大层面的前后各一层面进行相同方法测量, 同一块肌肉共测量三次。根据 3 次测量取平均值作为相应肌肉区域的 T2* 值进行分析。数据采用成组多样本方差分析对有统计学意义的肌肉进行 T2* 值比较, 多组样本均数两两比较采用 LSD 法。组内相关系数用于评价观察者间一致性和重测重复性。

结果: 所有受试者常规 MRI 检查显示膝关节周围肌肉信号均未见异常征象。高跑量组及中低跑量组膝关节各肌肉 T2* 平均值均低于健康对照组, 其中腓肠肌内侧头、腓肠肌外侧头及缝匠肌组间 P 值 < 0.05 , 差异有统计学意义, 其余肌肉组间差异无统计学意义。高跑量组半膜肌、腓肠肌内侧头、腓肠肌外侧头、股二头肌 T2* 值整体平均值较一般对照组下降 [25.29 比 27.07、25.59 比 27.15、25.29 比 27.05、25.74 比 27.71, P 值均 < 0.05 , 差异有统计学意义]; 高跑量组及中低跑量组缝匠肌 T2* 值整体平均值较一般对照组下降 [24.03/24.36 比 26.40] 且 p 值 < 0.05 (0.012, 0.004), 差异有统计学意义。

结论: 随着运动强度增加, 部分肌肉 T2* 值下降, T2* 值主要受水含量及胶原网格结构的影响, 在一定程度上可以间接暗示了肌肉损伤的严重程度, 在本研究观察肌肉中, 没有发现明显肌肉损伤, T2* 值较一般人群下降, 我们认为适量强度的肌肉运动导致肌内水分子含量减少, 生化成分发生改变, 适量运动有助于促进肌纤维形成。

PO-2392

ZTE-MRI 在膝关节间隙和角度诊断中的临床应用

王慧峥¹、陈文¹、刘薇音²

1. 十堰市太和医院

2. GE 医疗中国磁共振科研部

目的传统的 X 光片可用于观察关节间隙狭窄, 并确定 KL 分级, 我们尝试研究 ZTE-MRI 在利用关节间隙和角度诊断膝关节方面的临床应用, 并以 KL 分级作为分类器比较组间差异。

方法这项前瞻性研究从 2022 年 5 月至 2023 年 5 月招募了 87 名疑似 OA 患者。所有参与者均接受了常规磁共振扫描和 ZTE 序列。在 ZTE-MRI 上测量了关节间隙、髌腱长度与髌骨长度之比 (IS)、髌骨表面最低点到胫骨平台前上角的距离 (CD)、股骨长轴与股骨髁长轴之间的夹角 (FF) 以及股骨长轴与胫骨长轴之间的夹角 (FT)。采用类内相关系数 (ICC) 分析了 X 光片和 ZTE-MRI 上 KL 分级的模态间一致性。根据数据的正态性和方差齐性, 采用独立样本 T 检验和 Mann-Whitney U T 检验分析上述数值的组间比较。 $P < 0.05$ 为差异有统计学意义。

结果基于 X 光片和 ZTE 的 KL 分级的模态间一致性良好 ($k = 0.872$, $P < 0.05$)。JS 和 FF 之间有明显的相关性 ($r = 0.299$, $P = 0.048$)。此外, KL 分级对 ZTE 的影响 (KLZTE) 与 JS 和 CD 相关

(分别为 $r=0.459$, $P=0.002$; $r=-0.386$, $P=0.010$)。根据 KLZTE, JS 和 CD 在轻度/中度组和晚期组之间以及 FF 在轻度组和晚期组之间的差异均有统计学意义。

结论我们的研究表明, ZTE-MRI 可测量关节间隙和关节角度以评估膝关节机械功能, 并进一步支持使用 Kellgren-Lawrence 分级系统进行解剖评估。定量信息有利于长期跟踪和患者对 KOA 进展的理解。我们发现 JS 和 CD 均与 KLZTE 评分相关, 且两者在轻度/中度组和晚期组之间存在显著差异。当 JS 或 CD 不在正常范围内时, KOA 患者会有膝关节疼痛的表现, 并可能反映出骨质退化。无辐射的 ZTE-MRI 不仅能提供类似 CT 的图像, 清晰显示关节间隙和骨结构, 还能与常规 MRI 同时获取, 用于常规膝关节 MRI 检查。使用 ZTE-MRI 和常规 MR 成像进行一站式膝关节检查将为患者带来便利。

IDEAL-IQ 定量参数 FF 值评估女性贫血的价值

刘雅怡

青岛市妇女儿童医院

Objective To investigate the diagnostic value of bone marrow fat content in female with anemia
Method 175 patients with a pelvic MRI appearance were retrospectively evaluated. proton density fat fraction maps were calculated, and measurements were performed in the lumbar vertebra, anterior superior spine, acetabulum, caput femoris, collum femoris and metaphysis of upper femur
Result Fat fraction was significantly different in the different locations evaluated ($P=0.001$), except the value of caput femoris and acetabulum($P>0.05$). Fat fraction in the normal group were higher than those in the anemia group($P<0.05$). Fat fraction in light anemia group were higher than those in moderate and severe anemia group($P<0.05$)
Conclusion Fat fraction can indirectly reflect the anemia of women from the perspective of bone marrow component changes, and can preliminarily determine the degree of anemia

发生于左胫骨远端的急性痛风 1 例

肖丹

西南医科大学附属医院

痛风是嘌呤代谢紊乱性疾病, 以体液、血液中尿酸增加以及尿酸单钠 (MSU) 晶体在各种间叶组织中沉积引起炎症反应为特征。急性痛风性关节炎主要表现为夜间突发的关节剧痛, 伴关节压痛, 周围皮温升高、红肿, 服用非甾体抗炎药、秋水仙碱或类固醇后可迅速缓解。痛风主要好发于中年男性, 最常累及第一跖趾关节。案例介绍: 一名 16 岁的男孩近 2 月来反复出现左踝关节疼痛, 活动后加剧, 伴关节周围红肿, 主要发生在晚上, 口服非甾体抗炎药物后疼痛可迅速缓解。实验室检查提示: 血清尿酸升高: $726.5\mu\text{mol/L}$ (正常参考: $208-428\mu\text{mol/L}$), 左踝关节 CT 平扫提示: 左侧胫骨远端关节面下囊状骨质破坏区, 边界清, 边缘见硬化边, 累及关节面; 左踝关节 MRI 平扫进一步提示: 左侧跟腱局部欠连续, 见斑片状 FS-T2WI 高信号影, 左踝关节周围软组织肿胀; 左踝关节腔及邻近部分肌腱腱鞘少量积液。结果: 最终病理检查确诊为左胫骨远端痛风。结论: 本病例报告提示: 近年来痛风具有年轻化的趋势, 对于影像学上表现为伴硬化边的骨质破坏病变, 我们应仔细观察关节周围软组织改变、结合临床及实验室检查结果综合分析, 如果患者尿酸水平高或影像学检查提示关节周围软组织异常改变, 则应考虑痛风的可能。
