河南省洛阳正骨医院 (河南省骨科医院)

摘要: 目的 探讨腰椎间盘突出症重吸收患者的临床及影像学特征, 为其治疗方案的选择提供依据。方法 以 42 例腰椎间盘突出症重吸收患者作为研究对象, 分析患者的年龄、性别、重吸收时间和 MRI 影像学特征, 椎间盘突出程度采用 Komori 分型和 MSU 分级, 组织成分采用分 lwabuchi 分型。结果 42 例患者平均年龄 41 ± 5.6 岁; 男女之比为 1.1:1; 重吸收时间为 3~15 个月, 平均 6.58 ± 5.54 个月。42 例患者首次 MRI 检查时突出椎间盘均突破后纵韧带; 各分型中, Komori 3 型最容易发生重吸收, 占比 66.67%; MSU 3 级最容易发生重吸收, 占比 73.81%; lwabuchi 1 型最容易发生重吸收, 占比 92.86%; 合并 Modic 变性 6 例。结论: 腰椎间盘突出症重吸收患者的 MRI 表现有一定特征, 可为其手术或非手术治疗的选择提供影像学指导。

PO-2396

钙化在骨肉瘤患者肺良恶性结节鉴别诊断中的价值

张锦香¹、邵京京¹、徐丹阳¹、厉兵²、丁磊¹、高振华¹

1. 中山大学附属第一医院放射科

2. 广东药科大学附属第一医院医学影像科

目的: 通过分析比较骨肉瘤患者肺良恶性结节钙化发生率来协助肺结节的定性诊断。

方法: 回顾性分析 2011 年 1 月至 2023 年 8 月 114 例骨肉瘤患者经手术病理证实的 193 个肺结节的胸部 CT 图像, 包括良性结节 23 个、转移结节 170 个。两名放射科医生结合肺结节 AI 软件, 在胸部薄层 CT 平扫纵隔窗图像上独立观察测量肺结节内有无钙化, 并达成一致意见。

结果: 骨肉瘤患者 193 个肺结节中, 肺良性结节 23 个和转移结节 170 个。23 个良性结节中出现钙化 4 个 (17.4%), 170 个恶性结节中出现钙化 106 个 (62.4%), 良恶性结节内钙化发生率上的差异具有统计学意义 ($\chi^2 = 16.7, P < 0.01$)。肺良性结节随访时间 11-575 天, 中位数为 178 天 (四分位数间距 84-296 天); 肺转移结节随访时间 1-1424 天, 中位数为 179 天 (四分位数间距 42.25-242 天)。通过 Mann-Whitney 检验, 骨肉瘤患者肺良恶性结节观察随访时间上的差异无统计学意义 ($Z = 0.626, P = 0.53 > 0.05$)。

结论: 骨肉瘤患者中良恶性肺结节在近似的随访时间内发生钙化的机率不同, 提示骨肉瘤患者肺结节内有钙化时倾向肺转移瘤的诊断。

PO-2397

酰胺质子转移成像 APT 在鉴别良恶性骨与软组织肿瘤中的应用价值

刘新新、李鹏翔、常龙腾、刘瑞、严由伦、马晓文
西安市红会医院

研究背景:

酰胺质子转移成像 (APT) 可以检测活体内游离蛋白质和多肽中的酰胺质子, 由于肿瘤细胞的异常增生, 细胞内蛋白质合成的浓度、速度增加, 酰胺质子含量增加。APT 成像是目前一种较理想的肿瘤分子成像技术。

研究目的:

探讨 APT 成像在鉴别骨与软组织良恶性肿瘤中的应用价值。

研究方法:

纳入 20 名健康志愿者, 40 名良恶性骨或软组织肿瘤患者, 分别于术前两周内在 Philips 3.0T (Ingenia CX) 扫描仪和体部线圈上扫描。肿瘤患者均行手术治疗取得病理结果。扫描序列冠状位 FS-T2WI、矢状位 FS-T2WI、横轴位 T1WI、横轴位 T2WI、横轴位 APT 成像。比较良恶性肿瘤组、正常组与良性肿瘤组 APT 值是否有统计学差异。对服从正态分布资料运用独立样本 T 检验; 对不服从正态分布资料运用非参数分析独立样本 U 检验。

研究结果:

健康志愿者组 APT 值 $1.94 \pm 0.23\%$; 良性肿瘤组 APT 值 $2.94 \pm 0.70\%$; 恶性肿瘤组 APT 值 $5.39 \pm 0.89\%$ 。正常志愿者组与良性肿瘤组 APT 值有统计学差异 $P < 0.001$; 良、恶性肿瘤组 APT 值有统计学差异 $P < 0.001$ 。

结论: APT 成像具有鉴别骨与软组织肿瘤良、恶性的作用, 可指导临床医生制定合理的手术方案。

PO-2398

前交叉韧带重建术后移植物及大腿肌肉评估的多参数 MRI 研究

范广涛¹、黄益龙²、郑继坤¹、何波²

1. 云南中医药大学第一附属医院

2. 昆明医科大学第一附属医院

目的: 使用 T2* mapping、T2 mapping 序列评估 ACLR 后移植物重塑状态, 探讨其定量值与膝关节稳定性及临床功能评分的关联性, 观察 ACLR 后大腿肌肉面积及脂肪浸润情况, 从而进一步指导临床康复治疗。方法: 收集 ACLR 患者及对照组各 26 例, 所有受试者均行膝关节 T2* mapping、T2 mapping 扫描。ACLR 组于术后 1、3、6、12 月扫描, 对照组行单次扫描。ACLR 组术后 6、12 月另行临床评分, ACLR 组术后 12 个月另行大腿肌肉扫描及 Ligs 测量。于 GE AW4.6 工作站行图像后处理, 获得 ACL 及移植物 T2*值、T2 值及术后 12 月双侧大腿肌肉的 CSA、FF。根据 Ligs 测量结果, 将患者分为稳定组及不稳组。结果: ACLR 术后 1、3 月移植物 T2*值低于对照组 ACL, 术后 6、12 月移植物 T2*值高于术后 1、3 月, 术后 1、3 月移植物 T2 值低于对照组, 术后 6 月 T2 值高于对照组, 术后 6、12 月 T2 值高于术后 1、3 个月, 术后 12 月移植物 T2 值低于术后 6 月, 差异均有统计学意义。ACLR 组术后 12 月 IKDC 评分、Lysholm 评分均较术后 6 月明显升高, 且差异有统计学意义。术后 6 月 T2*值与 IKDC 评分、Lysholm 评分, 术后 12 个月移植物 T2*值与 Lysholm 评分, ACLR 组术后 12 个月移植物 T2 值与 IKDC 评分均呈中度负相关关系。不稳组术后 6、12 月移植物 T2*值、术后 12 月移植物 T2 值高于稳定组, 术后 12 月 IKDC 评分、Lysholm 评分低于稳定组, 差异均有统计学意义。术后 12 月患侧总肌肉、前外侧群肌肉、股四头肌面积明显小于健侧, 差异有统计学意义。结论: 1.定量 MRI T2* mapping、T2 mapping 序列可用于无创定量

评估 ACLR 术后移植物修复愈合状态, ACLR 术后早期移植物 T2*值增加可能预测术后膝关节不稳。2.ACLR 术后移植物的 T2*值、T2 值一定程度上与患者膝关节功能状态相关, 为 ACLR 后膝关节综合评估手段及参数提供新的参考。3. ACLR 术后一年, 患肢股四头肌发生了明显萎缩, 因此康复治疗中应关注股四头形态学指标的恢复。

PO-2399

中国多发骨髓瘤患者中肌少症与虚弱评分的关联性研究

端木羊羊¹、王玲²、程晓光²、邓克学¹

1. 中国科学技术大学附属第一医院 (安徽省立医院) 南区

2. 首都医科大学附属北京积水潭医院

目的: 在确诊为多发性骨髓瘤的患者中, 普遍存在虚弱和肌少症, 这最终会增加对健康的负面影响的风险。目前没有太多研究评估多发性骨髓瘤患者的虚弱指数与肌少症之间的关联。因此, 本研究旨在确定多发性骨髓瘤患者虚弱相关的临床指标, 有助于早期发现和治疗多发性骨髓瘤患者的虚弱问题。

方法: 肌少症是一种临床症状, 表现为骨骼肌含量和质量下降。为了估算躯干肌肉的含量和质量并确定肌少症, 我们使用 OsiriX 软件对 L3 椎体水平的 CT 图像进行精确分割和测量。我们测量了躯干肌肉的大小[横截面积 (CSA)]和肌肉密度 (平均 HU), 分别代表肌肉含量和肌肉质量。虚弱指数采用英国骨髓瘤研究联盟提出的骨髓瘤风险概况 (MRP) 进行评估。根据 MRP 评分对北京积水潭医院 2014 年 1 月至 2022 年 11 月期间的 223 名多发性骨髓瘤患者进行了评估。采用多元有序 logistic 逻辑回归分析评估了虚弱的相关参数。使用了 Cox 回归分析法来评估不同变量与死亡率之间的关系。

结果: 本次分析共纳入 223 名患者 (中位年龄 62 岁, 59.8%)。共有 119 名患者被归类为高风险 (HR) 荧光原位杂交 (FISH) 细胞遗传学患者。肌少症的发病率为 91.1%。多元逻辑回归分析显示, 在男性 (OR=1.069, P=0.009) 和女性 (OR=1.067, P=0.018) 中, 肌肉密度的降低与虚弱指数的升高具有一定的相关性。随访结束时, 有 47 名患者失访, 66 名患者 (女性和男性分别占 46% 和 31%) 均已死亡。MRP 评分与死亡率有关 (HR=2.945, P=0.037 女性和 HR=4.670, P=0.002 男性)。肌肉密度也与女性死亡率相关 (HR=0.923, P=0.037)。

结论: 肌肉密度与多发性骨髓瘤患者的虚弱风险增加相关。我们的研究表明, 在校正了虚弱指数和临床其他风险因素的基础上, 肌肉密度与多发性骨髓瘤女性患者的死亡率有关。我们建议在评估多发性骨髓瘤患者的虚弱指数中应将肌肉质量纳入。

PO-2400

开发和验证用于预测 axSpA 骶髂关节结构性进展的影像组学-临床列线图模型

崔佳、李博雅

天津市第一中心医院

目的: 构建一个包含影像组学特征和临床因素的列线图模型, 以预测 axSpA 患者骶髂关节 (SIJ) 的结构性进展。

方法: 本研究纳入 257 名经临床确诊为 axSpA 并有基线及一年随访的骶髂关节核磁的患者, 将患者按 7: 3 的比例随机分为训练组 (n = 179) 和验证组 (n = 78)。从每名患者的图像中提取 1691 个影像组学特征, 并在训练组中依次使用相关性检验、F 检验及 Lasso 进行特征选择, 构建最佳影像组

学模型。纳入六个临床风险预测因子构建临床模型。结合影像组学及临床模型,通过多变量逻辑回归构建列线图模型。利用 ROC 分析、校准曲线和决策曲线来评估所建模型的性能。

结果:最终提取 7 个影像组学特征来构建 Rad-score 函数。训练组的影像组学模型、临床模型和列线图模型的 AUC 分别达到 0.90、0.78 和 0.93,验证组的影像组学模型、临床模型和列线图模型的 AUC 分别达到 0.80、0.79 和 0.86。校准曲线 ($P>0.05$) 和 DCA 证明诺模图模型可用于预测 axSpA 结构性进展。

结论:本研究提出了一种可以预测 axSpA 患者骶髂关节结构性进展的影像组学模型,构建的临床-影像组学列线图模型可以进一步提高预测效果,这可能有助于临床决策过程。

PO-2401

慢性腰痛患者椎间盘高度的 MRI 分析

杨健、陈君蓉、王然、王文斌、陈玥、兰九钧、王威、周学军
四川省骨科医院 (成都体育医院、成都运动创伤研究所)

目的:探讨慢性腰痛患者椎间盘高度与年龄、性别及身体质量指数的相关变化及差异。

方法:回顾性分析 2022 年 4 月-2023 年 6 月本院就诊的慢性腰痛患者,共纳入 1388 例患者 (男性 665 例,女性 723 例,平均年龄 46.84 ± 12.479),根据年龄分为 3 组:青年组 (20-39 岁)、中年组 (40-59 岁) 及老年组 (60 岁以上),根据身体质量指数 BMI 分为四组:低体重组 ($BMI<18.5$)、体重正常组 ($18.5\leq BMI\leq 23.9$)、超重组 ($24.0\leq BMI\leq 27.9$) 及肥胖组 ($BMI\geq 28.0$)。所有患者均完成腰椎 MRI 检查,并在 T2WI 正中矢状位层面测量 L1/2 到 L5/S1 椎间盘前缘、中间、后缘高度,并得到相应椎间盘高度平均数;观察椎间盘高度平均数与年龄、性别及身体质量指数的关系。

结果:在青年组患者当中, L1/2、L2/3、L5/S1 椎间盘高度平均数显著低于中年组 ($P<0.001$),且显著低于老年组患者 ($P<0.001$);男性患者的 L1/2、L2/3、L3/4、L4/5 椎间盘高度平均数显著高于女性患者 ($P<0.001$);在体重正常组患者 ($18.5\leq BMI\leq 23.9$) 当中, L1/2、L2/3、L3/4 椎间盘高度平均数显著低于超重组 ($24.0\leq BMI\leq 27.9$) 患者 ($P<0.001$); L1/2、L2/3、L5/S1 椎间盘高度平均数与年龄成正相关 ($r=0.306, 0.198, 0.182, P<0.001$), L1/2、L2/3 椎间盘高度平均数与 BMI 指数成正相关 ($r=0.112, 0.096, P<0.001$)。

结论:这项对慢性腰痛患者腰椎 MRI 数据的大规模横断面分析表明, L1/2、L2/3、L5/S1 腰椎间盘高度会随着年龄的增长而增大,其中 L5/S1 椎间盘高度变化更多取决于年龄,而 L4/5 椎间盘高度变化更多取决于性别。

PO-2402

光谱多参数 CT 增强成像在成骨型转移瘤与骨岛的鉴别诊断研究

曹伟萌、周宇涵、王芝浩、雷丽敏、刘杰
郑州大学第一附属医院

目的:本研究旨在探讨应用光谱 CT 多参数增强成像在成骨型转移瘤与骨岛中的鉴别诊断价值。

方法:本研究回顾性纳入 2022 年 12 月-2023 年 4 月行光谱 CT 增强检查的肿瘤患者共 104 例,结合临床及影像数据随访确诊为成骨型转移瘤或骨岛,其中成骨型转移瘤病灶 53 个,骨岛患者 5 个。应用飞利浦后处理工作站重建光谱数据并测量各病灶动静脉期的常规 CT 值 (rCT)、40keV 和 100keV 虚拟单能级图像 (VMI) CT 值、碘密度值 (ID)、有效原子序数 (Z-eff)、电子云密度 (ED)、及其标准差 (SD),光谱曲线斜率 (λHU) 及各光谱参数噪声值 (Standard deviation, SD 值)。成骨型转移瘤与骨岛的各光谱参数间差异性评估采用独立样本 t 检验;采用单因素 logistic 回

归评估二者鉴别概率并联合 ID 值, ED 值, Z-eff 值, VMI40/100keV CT 值建立光谱多参数联合模型, 绘制受试者工作特征(Receiver operating characteristic ROC)曲线及并计算曲线下面积 (Area under curve, AUC), 并计算截断值 (Cutoff value) 评估各参数对成骨型转移瘤与骨岛的鉴别诊断效能。

结果: 除动脉期 SDZ-eff 值外, 各参数差异均有统计学意义 ($P<0.05$)。动脉期和静脉期各光谱参数 (ID, ED, Z-eff, VMI40keV, VMI100keV) 分别绘制 ROC 曲线, 其 AUC 均小于 0.9; 动脉期和静脉期多参数联合模型的 AUC 分别为 0.914 和 0.908; 动静脉期多参数联合模型 (ID, ED, Z-eff, VMI40keV, VMI100keV) 具有最佳的 AUC, 为 0.953 (敏感度=96%, 特异度=94.2%), 诊断效能均优于动/静脉期能量图像(动脉期 AUC rCT=91.8 cutoff=872.2, 静脉期 AUC=90.4, cutoff=824.5)

结论: 相较于常规 CT, 应用光谱 CT 多参数联合模型在成骨型转移瘤与骨岛鉴别中具有最佳预测效能, 可为二者的早期诊断及鉴别诊断提供更多影像学信息。

PO-2403

First-Time Resolution of Unsaturated Fatty Acid Peaks in Trabecular Bone Using Clinical 1D Magnetic Resonance Spectroscopy

鲍建峰¹、李莹¹、王潇¹、张勇¹、陈忠²、蔡聪波²、程敬亮¹

1. 郑州大学第一附属医院磁共振科

2. 厦门大学电子学与技术学院

The study addresses the difficulty in isolating unsaturated fatty acid peaks in bone marrow using traditional Magnetic Resonance Spectroscopy (MRS). Such peaks are critical for understanding bone metabolism but are challenging to identify due to the complex environment in bone marrow. Researchers employed a 1D acquisition method with intermolecular double-quantum coherence (iDQC) to improve spectral resolution on a clinical 3.0 Tesla scanner. Tested on a 62-year-old female's lumbar vertebra, this method succeeded in resolving additional fatty acid peaks. These results have important implications for studying bone-related diseases and potentially offer a more effective and time-efficient approach for clinical scans.

PO-2404

应用 MRI 去金属伪影技术评估骨肉瘤保肢术后影像表现

谢铭飞、刘曼、刘小明、柳曦

华中科技大学同济医学院附属协和医院

目的: 应用 1.5T-MRI 压缩感知的层面编码金属伪影矫正 (Compressed Sensing Slice-Encoding for Metal Artifact Correction, CS SEMAC) 技术评估骨肉瘤保肢术后影像表现, 包括肿瘤复发、感染、无菌性松动, 及其诊断效能。

方法: 回顾性收集 2020 年 8 月至 2023 年 8 月四肢骨肉瘤保肢假体植入术后患者 102 例, 并接受 1.5T MRI CS SEMAC 序列检查。放射科两名肌肉骨骼专业医生对骨肉瘤保肢假体植入术后肿瘤复发组、感染组、无菌性松动组及对照组进行了回顾性评估。采用 Fisher 精确检验对各组进行比较。对每个发现的敏感性、特异性和准确性进行评估。观察者间的可靠性用 Kappa 统计量进行评估。

结果: 对肿瘤复发组的 12 名患者 (平均年龄 38 ± 10 岁; 8 名男性)、感染组 5 名患者 (平均年龄 32 ± 11 岁; 3 名男性)、无菌性松动组 8 名患者 (平均年龄 33 ± 11 岁; 4 名男性) 和对照组的 77 名患者 (平均年龄 30 ± 13 岁; 40 名男性) 进行了评估。四组之间的软组织结节或肿块、骨膜反应、

滑囊水肿和骨溶解有统计学差异 ($P < 0.001$)。12 例肿瘤复发患者中有 12 人出现软组织结节或肿块, 最小病灶直径约 1cm, 对照组 77 名患者中未见软组织结节或肿块。5 例感染患者中有 4 例出现骨膜反应, 77 例对照患者中有 5 例出现骨膜反应。5 例感染患者中有 5 例出现滑囊水肿, 77 例对照患者中有 8 例出现滑囊水肿。8 例无菌性松动患者中有 6 例出现骨溶解, 对照组 77 名患者中出现 9 例骨溶解。观察者之间的一致性较好, k 值在 0.90 和 0.93 之间。四组在骨髓水肿、积液、肌肉水肿方面没有差异性。

结论: 应用 1.5T-MRI 去金属伪影技术能准确评估骨肉瘤保肢术后影像表现, 软组织结节或肿块对肿瘤复发、骨膜反应和滑囊水肿对假体周围感染、骨溶解对假体无菌性松动的评估均具有很高的准确性。

PO-2405

人工智能辅助压缩传感技术在踝关节 MR 成像中的应用

胡帅、宋清伟
大连医科大学附属第一医院

目的: MR 是诊断踝关节软组织损伤理想的影像学方法, 特别是使用 PD-SPAIR (3D-PD-SPAIR-ISO)、T1WI 和 T2WI 序列。然而, 传统的 PD-SPAIR、T1WI 和 T2WI 序列获取时间限制了其在临床上的广泛应用。本研究旨在将人工智能辅助与深度学习重建技术相结合, 为踝关节 3D PD-SPAIR-ISO 序列、T1WI 和 T2WI 序列成像确定合适的加速度因子, 优化成像速度, 同时保持图像质量。

方法和材料: 10 名志愿者接受踝关节 MRI 检查 (3D PD-SPAIR-ISO、T1WI 和 T2WI 序列), 使用最近开发的人工智能辅助技术, 具有不同的加速因子 (ACS3.0 至 ACS9.0)。使用 3.0T 扫描仪 (欧米茄, 上海联合影像医疗股份有限公司)。传统的加速方法为部分傅里叶和并行成像, 以 3.0 倍加速度 ($F3$) 作为参考。两位经验丰富的放射科医生对图像质量进行评估。测量胫骨远端、附近肌肉等不同解剖部位的信噪比 (SNR) 和对比噪声比 (CNR), 并进行统计学比较。利用 4 分法对主观评分进行评估, 评估图像信号的均匀性, 边缘清晰度。

结果: 不同加速因子下的 3D PD-SPAIR-ISO、T1WI 和 T2WI 序列下的胫骨远端和邻近的肌肉间 SNR 和 CNR 值组间没有显著差异 ($P > 0.05$), 图像主观评分组间无统计学差异 ($P > 0.05$)。

结论: 人工智能辅助可以在不影响图像质量的情况下加速踝关节 3D PD-SPAIR-ISO、T1WI 和 T2WI 序列。在更短的时间内提供与临床标准相当的诊断质量, 提高了 MR 扫描仪的生产率。

大临床相关性应用: 人工智能辅助集成了压缩传感和深度学习技术, 为扫描踝关节 3D-PD-SPAIR-ISO 序列 T1WI 和 T2WI 序列扫描节省了时间。人工智能辅助的应用具有很大的临床应用潜力, 提高了患者的舒适度和 MRI 效率。

PO-2406

基于卷积神经网络的颈椎 CT 椎间盘突出自动检测和分类的应用研究

田帅、李媛、欧阳汉强、姜亮、郎宁、袁慧书
北京大学第三医院

目的: 我们提出了一个基于深度学习在 CT 上自动评估和分类椎间盘突出的网络模型。

材料和方法: 从 2021 年 1 月到 2021 年 4 月收集了 768 名脊髓型颈椎患者的数据。70% 的数据用于训练集 ($n=558$), 10% 用于验证集 ($n=70$) 和 20% ($n=140$) 进行测试集。在外部测试集中评估了 100 名患者。椎间盘由三位经验丰富的放射科医师使用 Kang 分级系统独立评估, 并分为 0 至

3 级（为参考标准）。对于 C2-T1 节段的颈椎间盘，我们利用训练集和验证集来构建 3D-DenseNet 模型用于椎间盘突出分类，测试集的 CT 图像分别由 DenseNet 和两名放射科住院医师（5 年和 2 年工作经验）进行独立评估。我们最终使用 Cohen 的 κ 检验、ROC 曲线下面积、准确度、灵敏度、特异性和 F1 分数来评估和比较分类性能。

结果：评估了包含 25491 张轴位 CT 图像的内部数据集中的所有患者（平均年龄， 58.6 ± 17.5 岁；范围，32-78 岁）。对于内部测试，二分类（根据脊髓是否受压）显示 DenseNet 模型和两名放射科住院医师与参考标准相比基本一致，各自的 κ 值分别为 0.726、0.666 和 0.638 ($P < 0.001$)。DenseNet 模型对椎间盘进行分类的准确性略高于放射科住院医师（分别为 88.2%，85.8% 和 84.7%； $P = 0.011$ ）。为了进一步探索所提出的 DenseNet 模型的三分类（根据硬膜囊和脊髓是否受压）性能，对 DenseNet 模型、一名住院医师和参考标准进行了比较。DenseNet 模型对椎间盘进行分类的准确性略低于住院医师（78.2% 对 85.8%； $P = 0.003$ ）。外部测试集结果显示，DenseNet 模型和住院医师的二分类基本一致（ κ 值，0.681 和 0.712； $P < 0.001$ ）。

结论：对于颈椎 CT 椎间盘突出的评估和分类，所提出的深度学习网络模型可以达到与人工评估相当的性能。

PO-2407

业余滑板运动员不同运动类型对踝关节健康影响的影像研究

王琦、丁建平

杭州师范大学附属医院（杭州市第二人民医院）

目的：本研究旨在通过磁共振多模态技术，了解不同运动类型的业余滑板运动员踝关节健康情况，为滑板运动员基于踝关节磁共振影像数据选择合适的运动方式提供参考。

方法：本研究通过杭州市数家滑板培训机构招募了 35 名业余滑板运动员（平均年龄 23.6 ± 4.4 (SD)），此外，招募了 35 名健康被试作为对照组（平均年龄 23.4 ± 2.4 (SD)）。使用 1.5T MRI 对受试者双侧踝关节进行扫描，扫描序列包括 3D T1WI 及定量 mapping 等，通过图像分析软件分别获得踝关节影像数据，判断踝关节撞击存在与否及严重程度，使用 Mann-Whitney U 和卡方检验进行数据统计分析， $p < 0.05$ 被认为具有统计学意义。

结果：多模态影像学结果提示，实验组存在踝关节撞击情况显著高于对照组 ($P < 0.05$)，其中以刷板侧(前脚)为主；对于刷板侧(前脚)，存在前踝和(或)前内踝撞击情况的尖翻型运动组人数显著大于跟翻组 ($P < 0.05$)。

结论：滑板运动中尖翻动作可能增加刷板脚位的前踝和(或)前内踝撞击概率，导致该侧踝关节背屈、内翻动作受限并出现弹响、疼痛等症状。结合影像表现，对于出现相应症状的滑板运动员应避免长期进行尖翻动作。

PO-2408

医学影像在脊柱侧弯畸形中的应用价值及技术要点

李义、章茜、朱智明

中南大学湘雅医院

目的 总结分析全脊柱拼接 DR 摄影与 CT 容积扫描和 MR 扫描在全脊柱侧弯畸形中的临床应用诊断价值及技术要点。

方法 总结放射科自 2020 年至 2022 年在我院脊柱外科接受治疗的 60 例患者对其在我科做的 X 线，CT 扫描，MR 检查，对 CT 数据进行重建处理，请诊断及临床医生对其进行图像质量分析总结。

结果 1 X 线脊柱拼接能直观地显示脊柱整体解剖形态及侧凸部位, 判断脊柱的整体结构和活动度, 通过测量 Cobb 角对脊柱侧弯的严重程度诊断、在术前评估及预后判断具有一定的价值。2 CT 通过一次扫描全脊柱进行三维重建 MPR/CMR 能更加全面地观察畸形部位细节并且可以测量脊椎旋转角度, 还能发现椎管内外及小关节存在的骨性病变, VRT 通过调节不同阈值并辅以不同的伪彩依次可显示骨质及椎管的形态, 尤其适用观察侧弯的分类和椎管情况, 通过重建椎弓根指导手术钉道位置, 复查术后钉道所处位置情况在评价脊柱侧弯的程度, 进展, 为临床制定手术方案具及术后效果有重要的临床指导意义。3 磁共振 3DMRI SPACE 序列采用三维扫描, 实现无缝拼接, 可多方位重建, 不仅可显示脊髓病变如脊髓空洞, 脊髓肿瘤, 脊髓栓系和 Chiari 畸形等, 还能显示椎体及周围软组织情况。总之 MRI 可指导制定矫形手术方案, 显示和选择手术路径, 对脊柱侧弯矫形的术前评估具有重要意义。

结论 因为脊柱侧弯的解剖结构复杂, X 线检查是脊柱侧弯的首选检查方法, 也是不可缺少的检查方式。对于准备手术和术后复查患者螺旋 CT 扫描进行三维重建能够更好的指导手术对制订手术方案和复查术后效果是不能缺少的检查方法; 对于发现脊髓病变进行 MRI 扫描, 从而更好地、全面地了解脊柱侧弯原因相关脊髓病变情况。

PO-2409

7.0T 磁共振 SWI 序列与 UHRCT 对膝关节骨结构对比研究

荆国庆

陆军军医大学第一附属医院 (西南医院)

目的: 与 UHRCT 对比, 探讨 7.0T 磁共振 SWI 序列在膝关节骨结构成像中的价值。

方法: 分析陆军军医大学第一附属医院 2022 年 12 月-2023 年 3 月, 16 例行膝关节超高分辨率 CT (ultra-high-resolution Computed Tomography, UHR-CT) 扫描的患者, 一周内行 7.0T 磁共振膝关节扫描。所有数据经西门子 Syngovia 处理, 使用 Bone J 软件在膝关节 UHR-CT 与 7.0T 磁共振图像解剖相同层面测量股骨后份骨皮质厚度, 对 UHR-CT 和磁敏感加权成像 (susceptibility weighted imaging, SWI) 膝关节髌骨上下缘及胫骨平台层面行骨小梁拟合度分析, 以 UHR-CT 为标准评估 SWI 对骨质微结构显示能力。

结果: 在髌骨上缘层面测量股骨后份骨皮质厚度, CT 测值为: 0.23 ± 0.025 , 磁共振测值为: 0.32 ± 0.020 ($P < 0.001$)。髌骨下缘层面股骨后份骨皮质厚度, CT 测值为: 0.158 ± 0.028 mm, 磁共振测值为: 0.26 ± 0.021 ($P = < 0.001$)。髌骨上缘层面, 股骨骨小梁 CT 和磁共振拟合度为 $47 (\pm 11) \%$, 髌骨下缘层面, 股骨骨小梁 CT 和磁共振拟合度为 $53 (\pm 10) \%$, 胫骨平台髁线上水平缘层面胫骨骨小梁 CT 和磁共振拟合度为 $55 (\pm 06) \%$ 。

结论: 在 7.0T 磁共振下, SWI 能够较准确显示骨皮质图像, 但对骨小梁的显示有一定限度。

PO-2410

血友病性骨关节病 X 线表现及鉴别诊断 (附 60 例报告)

张丽芳、杨磊、张建强、彭雪静

昆明医科大学第一附属医院

目的 旨在探讨血友病性关节病 X 线征象, 提高其诊断与鉴别诊断。方法 回顾性总结 60 例经过临床及实验室检查证实的血友病患者 X 线表现。结果 60 例患者, 涉及 91 个关节 (膝关节 49 个、踝关节 17 个、髌关节 18 个、肘关节 7 个) 和 1 节指骨。X 线表现膝关节 29 例 (其中双膝 16 例且 3 例累及双髌及踝关节, 1 例伴双肘关节)、踝关节 11 例 (其中双踝 6 例)、髌关节 14 例 (其中双髌 4 例)、肘关节 5 例及指骨 1 例, 同时出现血友病性假肿瘤表现。X 线表现均有周围软组织肿胀,

关节间隙不同程度变窄, 关节面模糊、破坏而不规整 (19 例); 股骨髁间凹增宽、加深 (24 例) 伴髌骨脱位 2 例, 髌骨呈方形 6 例; 膝、踝关节骨端或骨骺增大伴骨质疏松 (17 例); 髌关节骨端糜烂模糊及关节间隙一致性变窄 11 例; 1 例指骨呈明显多房状膨胀性溶骨破坏区, 周围软组织肿胀, 曾考虑内生软骨瘤可能。结论 血友病性骨关节病 X 线征象具有一定特征, 结合临床实验室检查可以做出正确诊断。但需与以下关节疾病鉴别: (1) 渗出性关节炎: 主要与类风湿、结核、化脓性关节炎鉴别: 1) 类风湿性关节炎: 好发成年女性, 以手足小关节起病, 多呈对称性。早期常为骨质疏松, 继而关节面和边缘虫蚀及蜂窝状骨质破坏, 累及膝、髌关节, 以关节间隙变窄伴骨质疏松为主, 常致关节变形。2) 关节结核: 常发生于膝、髌等承重关节, 上下关节面对应部位骨质破坏(对吻性死骨)为其典型表现。3) 化脓性关节炎: 关节软组织肿胀, 骨质破坏及广泛骨质增生硬化, 关节间隙变窄, 晚期骨性强直。(2) 退行性骨关节病: 好发老年人, 常为骨端增生硬化伴囊变, 关节间隙狭窄。(3) 血友病性假肿瘤与骨肿瘤的鉴别: 1) 骨巨细胞瘤: 长骨端关节面下偏心性囊状或囊状膨胀性骨质破坏, 边缘无硬化。2) 内生软骨瘤: 囊状膨胀性骨质破坏, 其间点节状钙化, 软组织无肿胀。(4) 夏科氏关节: 病变关节无痛性肿胀, 关节破坏严重, 多有脊髓空洞症、糖尿病等病史。

PO-2411

18 岁及以下患者骨巨细胞肿瘤的临床及影像学特征分析

张雪萍

郑州大学第一附属医院

目的: 大多数骨巨细胞瘤 (giant cell tumors of bone, GCTB) 发生在成人患者, 特别是年龄在 20-40 岁之间。本研究旨在探讨儿童患者 GCTB 的影像学特征, 并与成人病例进行比较。

方法: 回顾性分析 57 例 18 岁及以下的 GCTB 患者, 占 2001-2019 年郑州大学第一附属医院所有年龄 GCTB 患者的 12.8%。本研究还对 126 例成年患者 (19 岁及以上) 长管骨 GCTB 患者纳入研究。从病历中确定了以下临床信息: 年龄、性别和随访资料。影像学特征由两名肌肉骨骼放射科医生进行了分析。

结果: 本研究共纳入 57 例患者 (女性 32 例, 男性 25 例)。患者年龄为 9~18 岁 (中位=值为 17 y)。大多数肿瘤发生在管状骨 (=38,66.7%) 和骨盆 (n = 8,14.0%)。与成人 GCTB 患者相比, 儿童 GCTB 患者的上-下 (SI) 直径更大 (P = 0.005), 左-右直径/SI 直径比更小 (P = 0.001)。与成人患者相比, 儿童 gctb 患者的骨骺受累相对较少 (P = 0.009)。无骨骺受累的中位年龄低于有骨骺受累的中位年龄 (11 岁 vs 17 岁)。结论: 小儿年龄组的 GCTB 比较罕见。本研究发现, 在儿童 GCTB 患者中, 骨骺的受累性相对较少, 肿瘤更有可能发生纵向生长。这些发现有助于儿童人群中 GCTB 的诊断。

PO-2412

双层探测器光谱 CT 虚拟单能量 40 keV 在老年病人下肢动静脉血管造影中的应用价值

王皓、聂春焰、杨帆、朱晓鸣、王友、姜磊

南京医科大学第四附属医院

目的 探讨通过双层探测器光谱 CT 虚拟单能量 (VMI) 40keV 技术在老年患者下肢动脉血管造影 (CTA) 和下肢静脉血管造影 (CTV) 一站式扫描的可行性与应用价值。方法 回顾性分析 2021 年 10 月至 2022 年 11 月在南京医科大学第四附属医院使用双层探测器光谱 CT (IQon Spectral CT, Philips, Netherlands) 行下肢 CTV 扫描患者的影像资料。纳入标准: (1) 年龄≥60 岁; (2) 接受

双层探测器光谱 CT 下肢进行 CTV 检查。排除标准：（1）下腔静脉 CT 值 <100 HU；（2）下肢金属内固定植入术后。共纳入患者 30 例，男 13 例，女 17 例，年龄 61-89（ 72 ± 9 ）岁。对重建获得的 VMI 40keV 组和传统混合能量图 CI 组进行主客观评价，两名医师双盲采用 Likert5 分法评价两组的图像质量，采用 Wilcoxon 秩和检验比较两组评分，采用 Kappa 一致性检验评价两位医师主观评分，采用配对样本 t 检验分别比较两组的髂动静脉、股动静脉、腘动静脉、胫后动静脉的 CT 值（CTHU）、信噪比（SNR）和对比噪声比（CNR）。结果 40keV 组各段血管主观评分均高于 CI 组，差异具有统计学意义（ $p<0.001$ ），两位医师的主观评分一致性较好，Kappa 值分别为 0.797，0.757，0.628 和 0.562，40 keV 组的各段血管主观评分均优于 CI 组，差异具有统计学意义（ $p<0.001$ ），40keV 组各段血管的 CTHU、SNR 和 CNR 均高于 CI 组，差异具有统计学意义（ $p<0.001$ ）。结论 双层探测器光谱 CT VMI 40keV 技术可以一次扫描同时获得下肢动脉和静脉的高质量成像，该技术适用于老年病人，值得临床推广应用。

PO-2413

增强现实导航在经皮影像引导脊椎活检中的应用

田帅、陈腾、黄鑫、郎宁、袁慧书

北京大学第三医院

目的：本研究的目的是评估增强现实导航系统（augmented reality navigation, ARN）系统用于经皮脊椎活检（percutaneous spinal biopsy, PSB）的准确性（偏离目标或预期路径）和有效性（插入时间）。

方法：提出一种基于多模态成像信息的 AR 手术导航系统，该系统包括透视、光学跟踪和深度相机。我们还提出了一种六自由度光学跟踪装置和深度相机在不同坐标系下的自适应校准和转换方法。由于荧光透视成像的频率大大降低，该系统可以实时准确地跟踪虚拟穿刺针并将其叠加在荧光透视图像上。在最初采集 CT 进行靶点标记和规划后，使用 ARN 由同一手术操作者进行 30 次脊椎活检。通过 CT 验证穿刺针的位置。

结果：活检针插入的平均准确度（ $n=30$ ）为 $0.71\text{ mm}\pm 0.33\text{ mm}$ ，与计划路径相比角度偏差为 $0.9^\circ\pm 0.4^\circ$ 。中位穿刺路径长度为 36 mm（范围 16–71 mm， $p=0.175$ ）。中位穿刺针到位时间为 274 秒（范围 117–492 秒）。

结论本研究表明，ARN 可用于经皮脊椎活检的导航，具有较高的准确性和有效性。

PO-2414

冬季北方寒区长跑人群运动性踝关节损伤特点的初步研究

祝静雅、张楠

中国人民解放军北部战区总医院

目的：通过 MR 影像学检查和踝关节损伤的流行病学特征分析冬季北方寒区长跑人群的踝关节损伤特征，探讨踝关节损伤特征与季节的相关性。

方法：采集 2022 年 1 月及 2023 年 1 月的长跑人群来我院行踝关节 MR 体检筛查，共 424 人，分为非冬季组和冬季组。

结果：在 19-60 岁的人群中，踝关节损伤高发年龄段为 19-25 岁（47.18%）；其中韧带损伤 131 例（33.58%），肌腱损伤 73 例（18.72%），骨软骨质损伤 186 例（47.69%），差异有统计学意义（ $\chi^2=70.993$ ， $p<0.001$ ）；左踝损伤 135 例，右踝损伤 141 例，差异无统计学意义（ $\chi^2=2.025$ ， $p>0.05$ ）。

$p=0.155$)。冬季损伤 (167 例) 高发于非冬季损伤 (135 例), 差异有统计学意义 ($\chi^2=9.887$, $p<0.05$)。损伤高发年龄段均为 19-25 岁, 构成比分别为 50.37% 和 44.91%; 损伤高发部位亦均为骨及软骨损伤, 构成比分别为 52.07% 和 44.34%。

结论: 踝关节损伤冬季损伤率高; 总体而言, 四季骨及软骨损伤率明显高于韧带及肌腱损伤; 冬季肌腱损伤率发生率较高。

PO-2415

深度学习重建算法对腰椎 QCT 图像质量的影响

赵艳红、张晓文、曹永佩

宁夏回族自治区人民医院

的: 通过与滤波反投影 (FBP) 及混合迭代 (ASIR-V) 重建算法的对比, 探讨深度学习 (DLIR) 重建算法的对腰椎 QCT 图像质量的影响及对诊断的准确性的影响。资料与方法: 纳入临床考虑骨质疏松行腰椎 QCT 检查的患者 28 例, 所有患者利用 Revolution APEX CT 进行腰椎 QCT 成像, 管电压选择 120Kv, 分别利用滤波反投影重建 (A 组)、40%ASIR-V 重建 (B 组)、深度学习低 (DLIR-L) (C 组)、深度学习中 (DLIR-M) (D 组)、深度学习高 (DLIR-H) (E 组) 重建算法重建重建出五组图像, 所有图像传输至 QCT 工作站, 在 QCT 工作站测量 T12-L2 椎体的骨密度 (BMD) 值, 同时在 ADW 工作站测量腰椎椎体、椎间盘、背部肌肉 CT 值及 SD, 计算 SNR 及 CNR。所有患者同期进行腰椎双能 X 线吸收检测仪 (DXA) 检查, 比较五组图像腰椎的 BMD 值, CT 值、SD、SNR 及 CNR 图像质量的差异。比较五组重建算法下对腰椎骨质疏松诊断真确性与 DXA 进行对比。结果: 五组图像腰椎的 BMD 值差异无明显统计学意义 (P 值 >0.05), 五组 QCT 图像对腰椎骨质情况的诊断差异无明显统计学意义 (P 值 >0.05)。五组图像腰椎 CT 值差异亦无明显统计学意义 (P 值 >0.05)。FBP、40%ASIR-V、DLIR-L、DLIR-M、DLIR-H 五组图像的噪声分别为 27.63 ± 12.34 、 20.07 ± 4.56 、 19.43 ± 5.07 、 17.13 ± 4.83 、 14.77 ± 4.64 , 差异有统计学意义 ($P<0.05$), DLIR-H 重建算法下噪声较 FBP 降低 46.54%, 较 40%ASIR-V 降低 27.36%, 五组图像信噪比及对比噪声比差异均有统计学意义 (P 值均 <0.05), DLIR-H 重建算法下信噪比及对比噪声比均较 FBP 及 40%ASIR-V 提高。五组图像对腰椎骨质疏松诊断结果与 DXA 无明显统计学差异。结论: DLIR 重建算法可以在不影响骨密度值准确性测量的情况下, 降低腰椎 QCT 的图像噪声, 提高信噪比及对比噪声比。

PO-2416

基于 L3 层面躯干肌质量与腰椎小关节炎严重程度相关性的研究

周兴顺

中国人民解放军联勤保障部队第 926 医院

摘要: 目的 研究中老年人群 L3 层面躯干肌质量与腰椎小关节炎严重程度相关关系。方法 使用 OsiriX 图像处理软件测定 346 名 44~82 岁人群 L3 椎体下终板层面躯干肌总面积及 CT 均值, 计算骨骼肌指数 (Skeletal muscle mass index, SMI); 同时利用 Weishaupt 椎小关节炎分级标准测定 L4-5 双侧椎小关节炎程度。应用 SPSS 23.0 统计软件进行数据处理, 使用独立样本 t 检验比较男女两组间 L3 下终板层面躯干肌 CT 均值、L3 下终板层面躯干肌面积、SMI、BMI、年龄及 L4-5 右、左两侧 FJOA 分级的差异性。关节炎分级相关性采用 Spearman 相关分析及偏相关分析。结果 不同性别组别之间, 男性组, 躯干肌均值和年龄有统计学意义 ($P<0.05$), 躯干肌均值与 L4-5 双侧 FJOA 均呈负相关 (r 值分别为 -0.25、-0.28), 年龄与 L4-5 双侧 FJOA 均呈正相关 (r 值分别为 0.23、0.21)。女性组, 躯干肌均值、年龄及 BMI 有统计学意义 ($P<0.05$), 躯干肌均值与 L4-5

双侧 FJOA 均呈负相关 (r 值分别为 -0.29、-0.33)，年龄与 L4-5 双侧 FJOA 均呈正相关 (r 值分别为 0.27、0.34)，BMI 与 L4-5 双侧 FJOA 均呈正相关 (r 值分别为 0.20、0.23)。控制年龄因素，采用偏相关分析，分析受检者躯干肌均值与 FJOA 间相关性，男性组与女性组 L4-5 双侧 FJOA 严重程度均与 L3 躯干肌均值呈一定负相关。结论 L3 层面躯干肌质量与腰椎小关节炎严重程度存在一定相关性。

PO-2417

跑步相关慢性踝关节不稳 MRI 损伤特征及足底压力、小腿肌力变化

黄杰、姚婉贞、黄珍媚、林俊、林上本、丁建平
杭州师范大学附属医院

目的：探讨跑步相关慢性踝关节不稳 MRI 损伤的特征，以及患侧足底压力、小腿肌力变化特点。方法：对 50 例跑步过程中反复发生踝关节扭伤的患者进行踝关节不稳评估，对符合入组条件的受试者进行双侧踝关节 MRI 检查、足底压力、小腿肌力检测。将受试者左、右踝分成两组，比较距腓前韧带厚度、长度的差异；对两组距骨、胫骨、内外踝、跟骨骨髓水肿进行定性诊断并比较差异；比较两组之间足底压力、小腿肌力变化。结果：符合慢性踝关节不稳诊断标准的受试者 18 例，其中男性 14 例，女性 4 例。受试者左、右踝距腓前韧带长度、厚度之间存在差异性 ($P < 0.05$)；两组距骨、外踝骨髓水肿的存在差异性 ($P < 0.05$)，胫骨、内踝、跟骨骨髓水肿的差异无统计学意义 ($P > 0.05$)；两组足底压力、小腿肌力变化具有的差异有统计学差异 ($P < 0.05$)。结论：跑步相关踝关节不稳患侧踝关节距腓前韧带发生慢性损伤（增粗或变细），容易导致外踝和距骨内侧部长期存在骨髓水肿；而患侧足底压力分布会发生变化且小腿后侧肌群肌力减低。

PO-2418

股骨近端骨原发性假肌源性血管内皮瘤 1 例 影像及病理分析

周兴顺
中国人民解放军联勤保障部队第 926 医院

骨原发性假肌源性血管内皮瘤 (pseudomyogenic hemangioendothelioma, PHE) 是一种罕见的骨的中间型血管源性肿瘤，文献对其报道较少，且多以病理报道为主。本文通过分析 1 例经手术病理证实的骨原发性 PHE 的影像学表现，并复习相关文献，以扩大该病的影像学资料库，助力对该病的影像诊断及鉴别诊断认识。

PO-2419

合成磁共振成像对半月板损伤分级的定量评估

张凌滔
暨南大学

本研究利用合成磁共振成像技术 (SyMRI) 联合常规 MRI 对半月板损伤产生的异常信号进行 Stoller 分级, 分析 SyMRI 各测量值与 Stoller 分级之间的相关性。以手术中关节镜下所见为金标准, 探讨 SyMRI 是否能对半月板损伤程度进行准确诊断, 以期减少不必要的关节镜检查。

方法收集 2022 年 7 月至 11 月在暨南大学附属第一医院骨科 60 例患者以及 20 例健康受试者。手术前对所有患者及健康受试者进行常规 MRI 及 SyMRI 检查。将 SyMRI 图像在主机上进行后处理, 并测量半月板的 T1 值、T2 值及 PD 值, 与常规 MRI 所见的半月板损伤的 Stoller 分级情况进行对应。采用单因素方差分析比较正常组、变性组及撕裂组半月板的 T1 值、T2 值及 PD 值。利用 Pearson 相关分析研究有意义的测量值与 Stoller 分级的相关性。以关节镜下所见半月板形态为金标准, 判断 SyMRI 诊断半月板损伤的准确性。采用 McNemar 检验分析常规 MRI 和 SyMRI 对于半月板变性和撕裂诊断效能的差异。

结果 1. SyMRI 与半月板 Stoller 分级相关性研究: SyMRI 测量的 T1 值及 PD 值组间没有统计学差异, T2 值的差异具有统计学意义, 三组组间的 T2 值均有差异。T2 值与 Stoller 分级之间的相关系数 $r=0.938$, 两者之间有显著相关性。

2. SyMRI 定量分析半月板损伤准确性研究: 以关节镜所见情况为金标准, 三组的 T1 值及 PD 值的差异无统计学意义, T2 值的差异具有统计学意义, 三组组间的 T2 值的差异均具有统计学意义。SyMRI 诊断半月板撕裂的灵敏度及特异度均高于常规 MRI。当 T2 值的阈值取 51.67 (ms) 时, AUC 为 0.934。

结论首先, SyMRI 测量值与 Stoller 分级具有较高相关性, 能有效地定量反映半月板损伤情况。其次, SyMRI 与半月板诊断金标准有较高的一致性, 说明 SyMRI 能够对临床治疗进行一定的指导作用。

PO-2420

定量 DWI 评估前交叉韧带重建术后 6、12 个月移植植物成熟度变化及其与临床评分的相关性

张妃媛、李米芳、周全、张灵艳
深圳市第九人民医院/深圳市龙岗中心医院

目的: 基于 DWI 定量评估前交叉韧带重建术 (ACLR) 后 6、12 个月移植植物重塑状态及其与相应临床功能评分的相关性。

方法: 前瞻性纳入 2020 年 8 月—2021 年 10 月行 ACLR 的 44 例患者。患者于术后 6、12 个月行 3.0T 常规 MRI 及 DWI 扫描, 测量关节内移植植物及其近、中、远 3 个节段的 ADC 值。术后各时间点行 IKDC、Lysholm 评分。采用 Wilcoxon 检验比较术后 6 个月与 12 个月 ADC 值的差异。采用 Pearson 相关系数分析移植植物关节内段 ADC 值与术后 6、12 个月 IKDC 评分、Lysholm 评分的相关性。

结果: ACL 移植植物整体关节内段及其近、中、远端三个部分的 ADC 值在 6 ~ 12 个月显著下降 ($P < 0.05$)。术后 6、12 个月移植植物 ADC 值与 IKDC 评分、Lysholm 评分均无明显相关性。术后 6 个月移植植物关节内段远端 ADC 值高于近、中段 ($P < 0.05$), 术后 12 个月时三者 ADC 值相近。

结论: ACLR 术后 6 至 12 个月, 移植植物持续成熟, 但与评价膝关节整体临床功能评分不一致。在评估移植植物成熟度方面, 提示 DWI 和 ADC 值比膝关节整体临床评分更有临床价值。

PO-2421

甲基乙二醛——干预糖尿病骨代谢紊乱的新靶点

张平、董妍宏、张博允、赵建
河北医科大学第三医院

目的：甲基乙二醛是糖酵解过程中的有毒产物，可与蛋白反应生成晚期糖基化终末产物，诱导细胞及组织损伤。探索 MG 异常积累对骨密度及骨微结构的影响，发现改善骨骼质量的新靶点。

方法：选择 C57BL / 6 小鼠，通过连续腹腔注射 MG，建造 MG 高水平积累的动物模型。本实验购入 72 只雄性 C57BL / 6 小鼠，随机分为实验组及对照组，每组 36 只。实验组和对照组再随机分为三组，分别为一期组：腹腔注射 MG，连续注射 4 天休息一天，累计注射 28 天后完成一期造模，对照组同时腹腔注射等剂量生理盐水。一期造模完成后，进行 QCT 扫描，扫描完成处死取股骨进行 micro-CT 扫描。二期组：小鼠腹腔注射 MG，累计注射 42 天后完成二期造模，实验组及对照组进行 QCT 扫描，扫描完成处死取股骨行 micro-CT 扫描。三期组：小鼠腹腔注射 MG，累计注射 56 天后完成三期造模，行 QCT 扫描，扫描完成处死取股骨行 micro-CT 扫描。利用 QCT 分析软件对小鼠腰椎进行骨密度测量，利用 micro-CT 分析软件测量小鼠股骨骨微结构，并对数据进行统计学分析。纵向比较各组三个时期骨密度及骨微结构的情况，横向比较每一时期实验组和对照组之间骨密度及骨微结构的情况。

结果：纵向比较显示，随时间延长，骨体积分数、骨小梁厚度、骨密度实验组及对照组均表现下降趋势，结构模式指数、骨小梁间距、骨皮质厚度实验组表现为先升后降而对照组表现为先降后升趋势，骨小梁数目实验组表现为先降后升而对照组表现为先升后降。横向比较显示，一期组和二期组，实验组骨密度、BV/TV 骨体积分数、骨小梁厚度、骨小梁数目、皮质厚度及面积数值减小，结构模型指数、骨小梁间距数值增大。第三期数据显示实验组和对照组仅骨小梁间距有显著差异，实验组大于对照组。

结论：MG 在体内高水平积聚会导致骨密度减低、骨体积相对减少、骨小梁厚度减低而间隙增大，对骨骼系统造成毒性作用，导致骨骼过早疏松进入衰老状态。早期干预 MG 异常积聚有望成为治疗相关疾病骨骼系统损伤的新靶点。

PO-2422

腺泡装软组织肉瘤 MRI 特征、全体积表观扩散系数（ADC）直方图评估 Ki-67 表达水平及组织学分级

孟帆
河南省肿瘤医院

目的：评估腺泡装软组织肉瘤 MRI 特征、全体积表观扩散系数（ADC）直方图在确定 Ki-67 表达水平及组织学分级中的价值

材料和方法：回顾性分析 2010.1 至 2023.9 经手术及病理证实的 30 例腺泡装软组织肉瘤患者，年龄 5-68 岁(中位年龄 28 岁)。术前均接受磁共振成像检查，包括弥散加权成像和 ADC 图($b=0$ 和 1000 s/mm^2)。记录肿瘤的位置、深度、大小、形态、边界、T2 信号异质性、强化程度、瘤周水肿、瘤旁浸润、肿块及周围是否有流空血管。采用全实体肿瘤体积感兴趣区(ROI)测量病灶全域 ADC 直方图参数。Ki-67 低表达定义为 30%阳性染色，Ki-67 高表达定义为 $\geq 30\%$ 阳性染色。组织学分级高级别包含 II 级和 III 级，低级别为 I 级。采用 χ^2 检验或 Fisher 精确概率法比较 Ki-67 表达及组织学分级和常规影像学表现的差异。采用 Kruskal-Wallis 检验分析直方图参数与肿瘤组织学分级、Ki-67 表达水平的相关性。采用 Mann-Whitney U 检验比较肿瘤组织学分级、Ki-67 表达水平之间的差异。

结果: 大小、瘤周水肿、瘤旁浸润在 Ki-67 表达水平存在差异, 大小、形态、边界、T2 信号异质性、瘤旁浸润在组织学分级存在差异。ADC 直方图分析的第 5 百分位数、第 10 百分位数、第 25 百分位数、第 50 百分位数、平均值与组织学分级相关, 均有统计学意义 ($p=0.003$ 、 $p=0.002$ 、 $p=0.002$ 、 $p=0.005$ 、 $p=0.019$)。ADC 直方图分析的第 50 百分位数、第 75 百分位数、平均值与 Ki-67 表达相关, 均有统计学意义 ($p=0.036$ 、 $p=0.015$ 、 $p=0.036$)。肿瘤组织学分级、Ki-67 表达水平在 ADC 直方图各参数间无差异。

结论: 腺泡状软组织肉瘤 MRI 特征、全体积表观扩散系数 (ADC) 直方图在鉴别 Ki-67 表达、组织学分级方面具有一定的作用。

PO-2423

压缩感知对腰骶丛神经 3D-T2*-FFE 磁共振成像的影响

刘娜

大连大学附属中山医院

目的 探索压缩感知技术 (Compressed SENSE, CS) 加速因子 (Acceleration Factor, AF) 对腰骶丛神经 3D-T2*-FFE 磁共振成像图像质量的影响。资料与方法 招募志愿者 21 人 (男 10 人, 平均年龄 45.00 ± 13.85 岁)。3.0T MR 结合平行采样技术 (Sensitivity Encoding, SENSE) 以及 CS 的腰骶丛神经 3D-T2*-FFE 序列扫描, 采用的 AF 分别为 SENSE AF=2、CS AF=2、3、4、5、6。两名观察者在原始图上划定感兴趣区 (Region Of Interest, ROI) 测量信号强度 (Signal Intensity, SI) 和噪声强度 (Standard Deviation, SD), 并计算信噪比 (SNR) 和对比噪声比 (CNR)。对图像质量进行四分法主观评分。组内相关系数 (ICC)、Kappa 检验两观察者测量数据和主观评分的一致性, 若一致性良好, 选择高年资医师主观评分进行后续分析。使用 Friedman 检验不同 AF 之间 SNR、CNR 及主观评分的差异性。若差异性有统计学意义, 则使用最小差异性检验 (LSD 法) 进行两两比较。结果 两名观察者测量数据和主观评分一致性良好 (ICC: 0.841-0.998, Kappa: 0.774-0.915)。不同 AF 之间 SNR、CNR 和主观评分差异有统计学意义 ($p < 0.05$)。与 SENSE 2 相比, 当 CS=2 时, 多个节段神经节、神经干主观评分及客观评分增高 ($p < 0.05$); CS=3 时, 其主观与客观评估增高 ($p < 0.05$) 或相仿; CS ≥ 4 时, 多节段神经节、神经干主观评分明显降低 ($p < 0.05$), SNR、CNR 也下降 ($p < 0.05$)。结论 腰骶丛神经 3D-T2*-FFE 序列随着 AF 的增加, 扫描时间逐渐降低。CS AF=3 对比 SENSE AF=2, 在确保图像质量前提下, 扫描时间缩短 43.11%。临床推荐使用 CS=3 行腰骶丛神经 3D-T2*-FFE 序列扫描。

PO-2424

36 例韧带样型纤维瘤病的 CT、MR 征象及病理分析

金梦妮、左敏静

南昌大学第二附属医院

目的 分析韧带样纤维瘤病的 CT 和 MRI 影像学表现及其形成的病理基础, 以提高对本病的影像学诊断。

方法 收集 2019 年 5 月至 2023 年 1 月南昌大学第二附属医院经手术病理证实的 36 例韧带样纤维瘤病患者临床资料。回顾性分析 CT、MRI 影像学表现及病理结果。

结果 本组 36 例患者中 1 例为多发病灶, 35 例均为单发病灶, 其中 12 例腹外型, 14 例腹壁型, 10 例腹内型。在 14 例腹壁型患者中, 6 例患者近 2 年内有腹壁损伤或手术史。病灶呈梭形或椭圆形 31 个, 不规则形 5 个。其中 18 个边界清楚, 18 个边界不清。CT 平扫示病灶均为等/略低软组织密

度, 增强扫描以中等以上渐进性强化为主, 强化均匀或不均匀, 均无坏死及出血。MRI 示 T1WI 等/稍低信号, T2WI 稍高信号, 6 例内见线状/条片状低信号, 为致密胶原纤维形成的低信号区; DWI 呈高信号, ADC 呈稍低信号; 增强 8 例呈明显不均匀强化。病理组织学上肿瘤主要由增生的梭形纤维母细胞/肌纤维母细胞及数量不等的胶原纤维组成, 细胞无明显异型性, 核分裂像罕见; 免疫组化标记物 β -Catenin、Vimentin、SMA 均为阳性。

结论 韧带样纤维瘤病在 CT、MRI 表现上具有一定的特征性征象。在肿瘤的组成成分和对周围组织浸润评估上 MRI 更有优越性, 对手术切除范围的判断更具有优势。

PO-2425

3D 打印个性化截骨导板在骨盆肿瘤切除重建术中的精准评价研究

赵露露、张钰佳、周鑫、李小敏、艾松涛
上海交通大学医学院附属第九人民医院

目的: 骨盆肿瘤的外科治疗被广泛认为是具有挑战性的, 基于影像图像数字化处理和 3D 打印技术的个性化的截骨导板用于辅助术中实现肿瘤精确切割。本研究的目的是通过术前术后影像建模图像之间以及假体模型配准方法评估基于影像图像数字化处理和 3D 打印技术的个性化截骨导板精准切除骨盆肿瘤的精确性。

方法: 2014 年 4 月至 2023 年 5 月, 我院 26 例骨盆肿瘤患者被纳入本研究, 对所有的患者术前行常规 CT 和 MRI 增强检查。将 DICOM 数据并导入 Medraw Print 软件, 手动勾画肿瘤边界, 选择影像图像配准融合模块, 重建骨盆肿瘤三维模型。对于导板组患者, 术前基于骨盆肿瘤三维模型设计个性化的截骨导板并 3D 打印, 用于术中辅助截骨。对于常规组患者, 术前基于骨盆肿瘤三维模型确定截骨方案, 术中行常规方法截骨。记录了所有患者的基本资料和术中情况, 对所有患者术后影像学进行随访, 获得术后 CT 图像, 通过术前术后影像建模图像之间以及假体模型配准方法评估实际截骨面与规划截骨面之间的距离偏差及角度偏差。

结果: 26 例患者手术顺利完成, 所有获得手术标本病理切缘均是安全的。

导板组纳入患者 17 例, 男 9 例, 女 8 例; 年龄 21-70 岁, 平均 45.2 岁; 肿瘤类型: 软骨肉瘤 6 例、骨巨细胞瘤 5 例、转移性肿瘤 2 例、纤维瘤 2 例、骨肉瘤 1 例、多形性肉瘤 1 例。

常规组纳入患者 9 例, 男 4 例, 女 5 例; 年龄 26-74 岁, 平均 43.5 岁, 肿瘤类型: 软骨肉瘤 4 例、骨肉瘤 1 例、骨软骨瘤 1 例、恶性纤维组织细胞瘤 1 例、弥漫性腱鞘巨细胞瘤 1 例、神经纤维瘤累及骨质 1 例。

导板组实际截骨面与规划截骨面距离平均 $4.91 \pm 2.83\text{mm}$, 与对照组 $7.21 \pm 3.89\text{mm}$ 比较差异有统计学意义 ($P=0.037$)。

导板组实际截骨面与规划截骨面角度平均 $5.93 \pm 4.01^\circ$, 与对照组 $8.18 \pm 4.41^\circ$ 相比差异无统计学意义 ($P=0.072$)。

导板组术中出血量平均 $2484 \pm 1515\text{ml}$, 与常规组 $8533 \pm 13788\text{ml}$ 相比差异有统计学意义 ($P=0.017$)。

结论: 基于影像图像数字化处理和 3D 打印技术的个性化的截骨导板能够使骨盆肿瘤截骨重建术获得更好的准确性。

PO-2426

脊柱原发原始神经外胚层瘤的 MRI 诊断

王琳琳

郑州大学第一附属医院

【摘要】目的 回顾性分析脊柱原发原始神经外胚层瘤(primitive neuroectodermal tumor, PNET)的 MRI 表现特征,以提高对该病的认识及影像诊断。材料与方法 收集我院 2012.01-2023.04 月之间经病理证实的原始神经外胚层瘤患者 30 例,男性 21 例,女性 9 例,年龄 3-74 岁,中位年龄 22.9 岁。30 例患者术前均行 MRI 平扫及/或增强扫描。结果 30 例 PNET 患者中,病变位于胸段 8 例,胸腰交界区 3 例,腰段 7 例,腰骶段交界区 4 例,骶尾椎 8 例(其中 1 例伴胸腰段椎管内多发转移)。MRI 平扫示病变主要发生在椎管内脊髓外硬膜下、椎管硬膜外、椎体,累及 2-5 个椎体节段不等,以累及 2-3 个椎体节段多见。胸腰段病例几乎均沿一侧或双侧椎间孔向椎管外生长,并于附件区或椎旁形成大小不等的软组织肿块,呈等/稍长 T1 等/稍长 T2 信号,信号不均匀。30 例中,21 例病变累及椎体,其中,9 例受累椎体形态失常,多表现为上下径不同程度变短或前后径增长;3 例椎体呈双凹状;1 例呈铜板样改变。增强病变呈中度或明显不均匀强化,而发生于胸段病变常伴有病变邻近上下段硬脊膜增厚并强化,位于腰骶段病变未见此征象。结论 MRI 对 PNET 的诊断具有一定的影像学价值,可为该病的临床诊断、治疗提供一定的影像学指导价值。

PO-2427

腕部磁共振 T2 mapping 成像对不同类型 TFCC 损伤的诊断性能

高冰、马晓文

西安市红会医院

目的: 本研究旨在评估 T2 mapping 成像在腕部磁共振成像中检测不同类型 TFCC 损伤的益处。方法: 76 例患者行腕部 MRI 检查,并收集其横轴位 PD FS 序列、冠状位 PD FS 序列、横轴位 T2 mapping 序列、冠状位 T2 mapping 序列的图像。对于每个患者, MRI 数据集由两名经委员会认证的放射科医生独立分析。关节镜检查或手术证实作为参考标准。主观评估诊断性能和 TFCC 不同类型、不同区域损伤程度。根据 Palmer 分型,将 TFCC 损伤分为 2 个主要类型: I 型,创伤性损伤; II 型,退行性损伤。I 型根据损伤部位又分为四个亚型。II 型根据软骨盘的损伤程度又分为五个亚型。通过 MRI 工作站调出 T2 mapping 解剖图和伪彩图,手动勾画 TFCC 各个区域的感兴趣区(ROI),避开边缘,测量 3 次计算其平均值作为 T2 值,根据伪彩图色阶变化及 T2 值对 TFCC 损伤进行分型。将常规 PD FS 序列与 T2 mapping 序列的评价结果分别与术后或经关节镜证实的结果进行比较,所有数据进行统计学分析。结果: 34 (44.7%) 例为创伤型患者,42 (55.3%) 例为退变型患者。与常规 PD FS 序列相比, T2mapping 图像提高了对创伤性 IA 型 (R1/R2:0.71/0.68 vs0. 85/0.87)、IB 型 (R1/R2:0.69/0.71 vs0. 84/ 0.86) 和退变性 IIA 型 (R1/R2:0.72/0.75 vs0. 90/0.88)、IIB 型 (R1/R2:0.68/0.68 vs0. 87/0.90)、IIIC 型 (R1/R2:0.73/0.72 vs0. 91/0.92) 的诊断准确性,而对其他类型的损伤,两种序列诊断性能相当(所有 $p < 0.001$)。结论: 与常规 PD FS 序列相比, T2 mapping 成像对于 TFCC 部分损伤类型诊断的准确性较高,有更好的应用前景。

PO-2428

膝关节屈曲位磁共振成像对前交叉韧带撕裂合并 Ramp 区损伤患者的诊断价值

夏会、曾舜华、陈琴
大连大学附属新华医院

目的:探讨膝关节屈曲位磁共振成像(MRI)对前交叉韧带撕裂患者半月板斜坡病变的诊断价值。

材料与方法:回顾性收集本院 60 例(平均年龄 24.5 ± 9.5 岁;45 例男性, 15 例女性)经关节镜证实前交叉韧带撕裂的患者纳入本次研究,以是否伴有 Ramp 区损伤为分组依据分为研究组和对照组。在 MRI 上记录了以下两个重要特征:内侧半月板后缘不规则,内侧半月板后角与囊缘之间有完全的液体充盈,它们是 Ramp 区损伤在影像学上的良好预测指标。关节镜检查结果作为参考标准。计算诊断敏感性、特异性和观察者间的一致性。

结果:两组患者的平均年龄和性别无显著差异。同样,在前交叉韧带撕裂的一侧或从受伤到手术的平均时间方面,两组之间没有观察到显著差异。关节镜检查发现 22 例斜坡病变(36.6%)。MRI 显示后缘内侧半月板不规则,屈膝 10° 时敏感性和特异性分别为 87.5 和 59.3%,屈膝 90° 时敏感性和特异性分别为 93.8 和 85.2%。MRI 上完全液体充盈征象在膝关节屈曲 10° 时的敏感性和特异性分别为 31.3 和 100%,在膝关节屈曲 90° 时为 87.5 和 100%。两个观察者对两个 MRI 特征的一致性非常好($k = 0.70-0.88$)。

结论:这项研究显示,在膝关节屈曲位的 MRI 上观察到的内侧半月板后缘不规则和完全的液体充盈比膝关节伸展位的 MRI 对内侧半月板 Ramp 区的检测更敏感。因此,膝关节屈曲位 MRI 与膝关节伸直位 MRI 相比,在半月板 Ramp 区病变的检测中提高了诊断性能。

PO-2429

磁共振 T1 ρ 成像在非专业马拉松军事学员膝关节软骨改变中的价值

郭燕、任静、郑建民、杜向熠
空军军医大学西京医院

目的:应用 3.0T MR T1 ρ 成像评价 10 公里马拉松军事学员膝关节软骨 T1 ρ 值的变化。方法:对 30 名参加马拉松赛的学员的 30 个支撑腿膝关节在赛前、赛后及赛后一周行膝关节 3.0T 磁共振成像,平均年龄(21 ± 6.3)岁,应用 T1 ρ 成像观察和测量股骨内外髁与胫骨平台负重区及非负重区软骨浅、深层的平均 T1 ρ 值,比较赛前和赛后、赛后一周变化,并进行统计学分析。结果:磁共振 T1 ρ 成像示关节软骨浅层 T1 ρ 值在赛前及赛后均高于深层,差异有统计学意义($P < 0.05$);赛后浅层软骨 T1 ρ 值高于赛前,差异有统计学意义($P < 0.05$);赛后一周浅层软骨 T1 ρ 值低于赛后,差异有统计学意义($P < 0.05$)。结论:磁共振 T1 ρ 成像通过对色阶图像的观察及平均 T1 ρ 值的测量可定量分析军事学员膝关节软骨组织成分在马拉松前后的变化。

PO-2430

实性动脉瘤样骨囊肿的影像学表现

韩志巍

空军军医大学西京医院

目的 探讨实性动脉瘤样骨囊肿的影像学表现, 以提高本病诊断及鉴别诊断能力。**资料与方法** 回顾性分析 2007 年 1 月—2019 年 1 月空军军医大学西京医院经术后病理证实的 5 例实性动脉瘤样骨囊肿的 X 线、CT、MRI 资料, 分析病灶所在母骨位置、病灶大小形态、边缘、肿瘤基质和周围软组织改变等影像学征象。结果 5 例均为女性, 病灶发生于胫骨 2 例、股骨 1 例、寰椎椎弓 1 例、髌臼周围 1 例, 均偏心性位于母骨。病灶大小 4.0~17.0 cm, 均为大片状地图样、溶骨性破坏, 膨胀性较轻。病灶边界清晰 3 例、模糊 2 例, 有窄且长短不等硬化缘。所有病灶骨皮质变薄、壳样改变, 局部断裂、筛孔状改变或大段缺失。1 例周围有软组织肿块。所有病变均无骨膜反应。2 例病灶周围广泛水肿。**CT 表现:** 2 例病灶内部呈等或略低于肌肉密度, 无基质矿化。**MRI 表现:** 2 例病灶内部 T1WI 信号略高于肌肉, T2WI 呈均匀高信号, 且有点状更高信号。所有病例均无病理性骨折。**结论** 实性动脉瘤样骨囊肿青年女性好发。病灶呈轻度膨胀性、溶骨性改变, 有窄硬化缘, CT 呈均匀等低密度, MRI 呈混杂信号, 可突破骨皮质形成软组织肿块, 邻近骨髓与软组织明显水肿。

PO-2431

骶尾椎骨巨细胞瘤的影像学表现及临床诊断价值分析

刘婷婷、侯冬梅、曹和涛

南通大学附属医院

目的 分析研究骶尾椎骨巨细胞瘤的 X 线、CT 和 MRI 的影像学特征及诊断价值, 提高本病的诊断准确率及鉴别诊断能力, 充分指导临床手术治疗及预后。

方法 搜集南通大学附属医院经手术病理证实的 21 例骶尾椎骨巨细胞瘤患者的 X 线、CT 和 MRI 的影像学资料, 两名高年资医师对其进行回顾性分析。20 例患者均行 X 线检查, 17 例行 CT 检查, 13 例行 MRI 检查, 其中 2 例行 MRI 增强扫描。

结果 X 线平片简便易行, 能显示病变部位的整体情况。而 CT 和 MRI 检查可以提供更多信息资料。X 线、CT 及 MRI 的诊断准确率分别为 68.52%、89.66%、90.13%, CT 检查及 MRI 检查诊断准确率明显高于 X 线 ($P < 0.05$)。X 线检查表现: 10 例可见膨胀性骨质破坏, 10 例可见溶骨性骨质破坏, 9 例累及骶髂关节, 5 例可见周围软组织肿块形成。**CT 检查:** 10 例可见溶骨性骨质破坏, 7 例可见膨胀溶骨性骨质破坏, 9 例其内可见骨嵴影, 4 例其内可见液化、坏死区, 8 例周围见硬化边, 13 例不同程度累及椎体附件及骶髂关节, 并在周围形成软组织肿块, 病灶边界不清。**MRI 检查:** T1WI 2 例呈低信号, 3 例呈等低信号, 8 例呈等信号; T2WI 1 例呈等信号, 3 例呈高信号, 6 例呈等高信号, 3 例呈高低混杂信号。**MRI 增强扫描,** 1 例呈明显均匀强化, 1 例呈不均匀强化。

结论 X 线、CT 及 MRI 均可有效显示骶尾椎骨巨细胞瘤的影像学特点, 其中 CT 检查和 MRI 检查的诊断准确率较高, 能显示肿瘤的内部细微结构、肿瘤侵犯程度及与周围组织的关系。充分分析骶尾椎骨巨细胞瘤的影像学特点, 结合临床, 综合运用各种影像学检查方法, 对提高骶尾椎骨巨细胞瘤的诊断、对临床分期、手术方案制定、术后评估及预后具有重要的意义。

PO-2432

下尺桡关节形态与腕关节慢性疼痛的相关性分析

闻锦旭¹、李暖暖²、曹磊¹、吴文娟¹

1. 河北医科大学第三医院

2. 河南省洛阳正骨医院 (河南省骨科医院)

目的: 通过观察腕关节 X 线平片及 CT/MRI 断层影像表现, 分析下尺桡关节 (DRUJ) 骨性结构的形态学差异与发生腕关节慢性疼痛风险的相关性, 探讨 X 线正位片评估下尺桡关节稳定性的敏感指标。

方法: 回顾性分析 2021 年 1 月到 2022 年 10 月于我院因腕关节慢性疼痛 > 3 个月就诊的患者作为观察组; 收集同时期因其他原因就诊, 无慢性疼痛史的患者作为对照组。所有纳入对象均排除腕关节骨折、脱位及肿瘤等病史, 且均进行腕关节 X 线正位片和 CT/MRI 检查。测量多项影像学参数, 分析下尺桡关节不同分型与腕关节慢性疼痛的相关性, 找到与腕关节慢性疼痛相关的最佳影像学指标, 制作腕关节慢性疼痛风险的 X 线综合评分表。

结果: 纳入 144 例患者中, 观察组 70 例, 男性 36 例, 女性 34 例, 平均年龄 34.9 ± 12.5 岁; 对照组 74 例, 男性 35 例, 女性 39 例, 平均年龄 36.3 ± 11.8 岁。与对照组相比, 观察组桡骨茎突和正向尺骨变异更长, 桡骨茎突长度指数、尺弓角、尺骨座桡倾角、下尺桡关节间距和背侧偏移比更大, 尺骨远端直径、乙状切迹曲率角更小, 且差异均具有统计学意义。其中尺弓角、正向尺骨变异、尺骨座桡倾角、下尺桡关节间距有较高的诊断效能 ($AUC=0.835$ 、 0.764 、 0.596 、 0.865)。乙状切迹掌背侧均突起型、改良 Tolat 尺侧倾斜型是发生腕关节慢性疼痛的危险因素 ($OR=5.379$ 、 5.667)。乙状切迹“C”型和“S”型是腕关节慢性疼痛的保护因素 ($OR=0.135$ 、 0.034)。制定腕关节 X 线正位片综合评分表将发生腕关节慢性疼痛的风险划分为低、中、高、极高四个等级, 该表的 AUC 值为 0.860 , 预测效能良好。

结论: 尺弓角、正向尺骨变异、尺骨座倾角等参数可作为判断发生腕关节慢性疼痛风险的独立预测指标。乙状切迹掌背侧均突起型、改良 Tolat 尺侧倾斜型和乙状切迹平坦/滑坡型是发生腕关节慢性疼痛的危险因素。制定腕关节 X 线正位片综合评分表, 对评估发生腕关节慢性疼痛的潜在风险具有良好的预测效能。

PO-2433

骨上皮样血管内皮细胞瘤临床特征与 MR 表现分析

李贝贝

郑州大学第一附属医院

【摘要】目的 探讨骨上皮样血管内皮瘤 (B-EHE) 的 MRI 特征性表现及其临床特点。方法 对 8 例 (男性 3 例, 女性 5 例) 患者的临床资料及 MRI 表现进行回顾性分析, 所有患者均经手术病理证实为骨上皮样血管内皮细胞瘤。8 例 B-EHE 均行 MRI 检查, 其中 6 例行 MRI 平扫、动态增强及延迟增强扫描。结果 8 例 B-EHE 中, 3 例位于腰骶椎, 2 例位于胫骨, 1 例位于肱骨, 1 例位于胸骨, 1 例位于股骨。其中 1 例合并颅脑上皮样血管内皮瘤, 1 例合并椎体多发转移灶, 其余均为单发。T1WI 中, 3 例病灶呈低信号, 5 例病灶呈混杂等/低信号。T2WI 压脂序列中, 3 例呈较均匀高信号, 5 例呈混杂高信号。8 例均可见骨质破坏, 4 例可见骨膜反应, 3 例伴软组织肿块, 6 例伴周围软组织肿胀, 2 例伴病理性骨折。肿胀软组织和肿块在 T1WI 上呈低信号, 在 T2WI 和 T2WI 压脂序列呈高信号。6 例动态增强扫描中, 可见病灶不同程度强化, 其中 1 例为轻度强化, 1 例为中度强化, 4 例为明显强化。结论 B-EHE 的 MR 表现能有效评估病变的范围及性质, 需结合临床及病理明确诊断。

PO-2434

腰椎间盘与椎小关节退变的 T2、T2*值直方图分析研究

梁晓青¹、李小明²

1. 郑州大学第一附属医院

2. 华中科技大学同济医学院附属同济医院

目的：探索 T2、T2*值直方图分析评估腰椎间盘和腰椎小关节退变的可行性，并探索两者间的相关性。

材料与方法：收集 66 例下腰痛患者（男 31，女 35）和正常对照者 21 例（男 9，女 12），共 420 组“三关节复合体”。分别依据 Pfirrmann 和 Weishaupt 分级将椎间盘评为 I-V 级、将椎小关节分为 0-3 级。使用软件获得 T2、T2*值直方图参数。探索 T2、T2*值直方图分析评估腰椎间盘和椎小关节退变的可行性及相关性。

结果：椎间盘的 T2、T2*值直方图参数均具有鉴别正常（Pfirrmann 1-2 级）和退变（3-5 级）椎间盘的能力（AUC=0.562-0.864）；椎小关节中仅 T2 值的平均值、中位数、第 5、10、25、75 百分位数、偏度和峰度具有鉴别正常（Weishaupt 0-1 级）和退变（2-3 级）椎小关节的能力（AUC=0.546-0.620）。椎间盘及椎小关节的退变比率随年龄增长而增加，5 个年龄组椎间盘的退变比率依次为 15.04%、24.72%、55.29%、90.00%、95.24%，椎小关节的退变比率依次为 36.28%、38.76%、44.12%、65.00%、73.02%。在 20-29 和 30-39 岁组中，椎小关节的退变比率显著高于椎间盘（ $X^2=16.436$ ， $p<0.001$ ； $X^2=5.210$ ， $p=0.022$ ）。“三关节复合体”中除 T2 值的偏度、峰度和熵、T2*值的峰度外，椎间盘的其它 T2、T2*值直方图参数与其后方的椎小关节呈低到中度正相关（ $r=0.104-0.563$ ， $p<0.05$ ），左、右两个椎小关节的 T2、T2*值参数间低到高度相关（ $r=0.168-0.680$ ， $p<0.05$ ）。两个椎小关节间的相关系数 r 的绝对值均高于椎间盘与椎小关节间的 r。

结论：本研究证实了 T2、T2* mapping 直方图分析用于评估椎间盘和椎小关节退变的可行性。在 39 岁以下的年龄组中，椎小关节的退变比率显著高于椎间盘，不同于脊柱退变始于椎间盘的传统认知，提醒临床医生对椎小关节病变的重视。“三关节复合体”中椎间盘和椎小关节具有相互的关系，但不如成对的椎小关节间的相互关联性强。

PO-2435

北京地区青少年肘关节 X 线骨龄研究

李新民、蒋雯、马毅民、吕艳伟、程晓光

首都医科大学附属北京积水潭医院

目的 以 Sauvegain 法等研究为基础，评估北京地区青少年肘关节 X 线发育特征，建立推断年龄的回归方程，为临床应用提供依据。**方法** 回顾分析北京积水潭医院 2019-2021 年间因急诊外伤摄左肘正侧位片者，共 510 例（男性 299 例，女性 211 例），年龄范围 8-18 岁；均为汉族，长期居住于北京，均有精确出生日期及详细病史；排除脏器及内分泌疾病患者、发育异常及残缺畸形者、服用影响骨发育药物及曾参加文艺、体育训练者。采用 Kodak DR7500 摄左肘正侧位片。参考文献分级标准，由两名有 5 年以上骨放射诊断经验的医师共同盲法阅片，不一致时以讨论意见为准。随机选取 40 例（男、女各 20 例）、采用 Kappa 检验评估观察者间的一致性。描述统计男性、女性青少年肘关节各骨骨化中心出现及闭合的年龄，用单因素方差分析比较两者差异；以年龄为因变量（Y），分级指标（X1 肱骨内上髁、X2 肱骨滑车、X3 肱骨外上髁、X4 肱骨小头、X5 桡骨小头及 X6 尺骨鹰嘴）为自变量，选取全部样本的 70%、用多元线性回归模型分析骨龄的影响因素，以逐步回归进行变量筛选，建立肘关节年龄推断的回归方程；以剩余 30%样本进行回代检验，验证回归方程的准确率。结果 （1）分级标准 Kappa 一致性检验结果，两名观察者 X1~X6 的 Kappa 值分别

为 0.773、0.657、0.805、0.705、0.787、0.882。(2)按分级标准,青少年肘关节各继发骨化中心出现、闭合的平均年龄男女比较,均有统计学差异($P<0.05$)。(3)回归方程:男性: $Y=7.952+0.472X_1+0.444X_3+0.247X_5+0.192X_6$;女性: $Y=4.452+0.778X_1+0.404X_3+0.599X_4$ 。

(4)回代检验:分别以 0.5 岁、1.0 岁、1.5 岁、2 岁及以上年龄为标准,验证回归方程年龄预测的准确率,男性、女性的累计准确率分别为 38.9%、34.9%、94.3%、100%和 67.7%、63.5%、92.1%、100%。结论 以 Sauvegain 法等研究为基础的肘关节骨龄研究,得出的北京地区青少年肘关节推断年龄的回归方程,可为临床应用提供依据。

PO-2436

椎旁肌肉参数与椎体骨折分级的相关性研究

刘艳东、王玲、葛宇峰、张雯双、袁艺、马康康、周凤云、程子桐、李凯、程晓光
北京积水潭医院

目的:本研究旨在评估椎旁肌肉参数与椎体半定量(SQ)分级和骨质疏松性椎体骨折(OVF)风险的相关性。

材料与方法:本研究纳入 3475 名受试者进行腰椎 CT 扫描,使用 SQ 法对椎体情况进行分级与分组(SQ0、SQ1 和 SQ2-3 组),使用定量 CT(QCT)测量体积骨密度(vBMD),并根据 vBMD 进行骨量分级(骨量正常、骨量减少和 OP)。测量 L3 椎体中心层面的肌肉参数:椎旁伸肌的大小(PEMS)、密度(PEMD)、脂肪面积(FS)和浸润指数(FI)以及双侧腰大肌的大小(PMMS)和密度(PMMD),首先比较了 SQ0、SQ1 和 SQ2-3 组的椎旁肌肉参数差异;再通过建立单因素和多因素 logistic 回归模型分析各肌肉参数与 OVF 发生风险的相关性;计算受试者工作特征曲线曲线下面积(AUC)评价肌肉参数对 OVF 的诊断效能。

结果:最终纳入 2992 人,男性 1109 名(64.70 ± 7.64 岁),女性 1883 名(63.42 ± 7.49 岁)。男性 SQ0 组与 SQ1 组的肌肉参数无统计学差异,与 SQ2-3 组的 PEMS、PEMD、PMMD、FS 和 FI 有统计学差异。女性 SQ0 组与 SQ1 组除 PMMS 无统计学差异之外,其他肌肉参数均有差异, SQ0 组与 SQ2-3 组的所有肌肉参数均有统计学差异。PEMD (OR: 0.68, 95% CI: 0.47~0.99, $p=0.045$)、FS (OR: 1.41, 95% CI: 1.1~1.81, $p=0.007$)和 FI (OR: 1.37, 95% CI: 1.07~1.76, $p=0.013$)与男性 GSQ2-3 级椎体骨折风险独立相关;PMMS (OR: 1.20, 95% CI: 1.01~1.43, $p=0.039$)和 FS (OR: 1.17, 95% CI: 1.01~1.36, $p=0.038$)与男性 SQ1-3 椎体变形/骨折的风险独立相关。PEMD (OR: 0.78, 95% CI: 0.61~0.98, $p=0.034$)与女性 SQ2-3 级椎体骨折的风险独立相关。男性椎旁肌肉参数诊断 SQ2-3 级骨折的 AUC 与 vBMD 的 AUROC 没有统计学差异。

结论:SQ 级别越高,椎旁肌肉更小、密度更低,脂肪浸润越严重。

PO-2437

骨矿物质密度 CT 定量分析简易校准体模的制作

张宗军、荆梅、李清瑶
江苏省中西医结合医院

目的:制作一种价格低廉简单易行的骨矿物质密度定量 CT 用体模,用于机会性骨质疏松的 CT 筛查。

材料和方法:采用 20ml 注射器和不同浓度的磷酸氢二钾溶液制作体模,磷酸氢二钾溶液浓度分别为 50、100、150、200、300、400、600 和 800mg/ml;制作完成的体模置于水箱中与欧洲脊柱体模(ESP 393)同时进行 CT 扫描,CT 扫描采用 GE 64 层、256 层和东软 64 排,扫描条件为

120KV、150-200mAs, 准直 0.625mm, 重建层厚 1-1.25mm, 标准软组织算法。分别测量其 CT 值, 同时采用能谱 HAP/水物质解析 QCT 定量软件计算其相应的 BMD。

结果: QRM-ESP 体模 L1-3 的标准骨矿物质密度为 50、103 和 198mg/ml。三台 CT 测量的体模 L1-3 椎体的 CT 值分别为 61 (56.51-66.9) HU、127.84 (122.9-134.5) HU 和 243.47 (235-250) HU, QCT 定量分析 L1-3 椎体的 BMD 为 47.1 (45.43-48.1)、102.93 (102.3-103.86) 和 196.3 (192.23-198.4) mg/ml; 双能物质解析获得对应 L1-3 椎体 BMD 为 52.81、103.28 和 189.89 mg/ml。50-800mg/ml 磷酸氢二钾溶液对应的 CT 值为 44、99、143、183、281、368、550 和 701HU, 采用 QRM-ESP 体模曲线校正后的对应 BMD 为 36.4 (33-41)、81.3 (77-87)、117.5 (113-120)、150 (145-158)、231、302、454 和 580 mg/ml。采用能谱物质解析获得 BMD 为 37.8、75.43、108、7、146、216、275、406 和 525 mg/ml。三台 CT 中两台 64 排 CT 的结果比较一致, $P = 0.41$, 256CT 与东软 64 排 H 和 VCT 差异具有统计学差异, P 值为 0.03 和 0.006。结论: 采用已知浓度的磷酸二氢钾溶液作为定量 CT 的校准体模用于机会性骨质疏松的 CT 筛查是可行的, 该模型具有制作简单、费用低且稳定的优点。可以用于不同 CT 机型之间的差异校准。

PO-2438

Kummell 病的影像学诊断

王玉玲

甘肃省中医院

Kummell 病又称为迟发性创伤后椎体塌陷、缺血性椎体骨坏死、椎体骨折不愈合及椎体内裂隙, 多见于老年骨质疏松患者。目前发病机制尚不明确, 可能是椎体缺血性坏死和椎体内假关节形成等多种因素相互作用所致。主要的临床表现为迟发性的慢性腰背痛, 影像学特征为椎体塌陷和真空裂隙征。经影像学检查及临床诊断的学习旨在提高对 Kummell 病的诊断及认识。

PO-2439

利用 IDEAL-IQ 实现对髌髌关节骨质侵蚀与脂肪沉积的定性与定量评估

李亦彤、李小明

华中科技大学同济医学院附属同济医院

目的: 为了验证 IDEAL-IQ 对髌髌关节骨质侵蚀与脂肪沉积定性与定量评估的可行性与优势, 将其与传统 T1 FSE 序列诊断表现进行比较, 并对其定量评估表现进行检验。

方法: 纳入 34 例疑似髌髌关节炎的患者, 所有患者同时接受了 MRI 和 CT 检查。每个髌髌关节被划分成 4 个象限, 最终纳入 272 个象限进行分析。由两位阅片者分别独立评价骨质侵蚀与脂肪沉积。在定性评估中, 以 CT 作为侵蚀诊断金标准, 计算 IDEAL-IQ 和常规 T1 FSE 的诊断性能, 并采用 McNemar 检验比较二者诊断性能; 同时, 利用 Cochran's Q 检验确定不同方法检测侵蚀的差异; 并且, 采用 McNemar 检验比较 IDEAL-IQ 和 T1 FSE 对脂肪沉积的检测。在定量评估中, 在 IDEAL-IQ 的脂肪分数图上手动绘制各象限感兴趣区域, 图像处理软件 FireVoxel 自动生成相应直方图参数: PDFF (质子密度脂肪分数) mean、PDFF_{10th}、PDFF_{25th}、PDFF_{50th}、PDFF_{75th}、PDFF_{90th}、偏度、峰度、异质性和熵, 采用独立样本 t 检验和 ROC 分析对各参数评估脂肪沉积的能力进行检验。

结果: 在定性评估方面, IDEAL-IQ 对骨质侵蚀的诊断敏感度 (93.04% vs 79.11%) 和准确性 (90.07% vs 82.35%) 均大于 T1 FSE ($P < 0.05$); IDEAL-IQ 和 CT 相比 T1 FSE 可检测到更多骨质侵蚀 ($P < 0.05$); IDEAL-IQ 在脂肪沉积的诊断方面与 T1 FSE 无统计学差异 ($P = 0.678$)。在定量评估方面, PDFF 所有直方图参数在脂肪沉积象限与正常象限之间均具有统计学差异 ($P < 0.05$), 并且均可对

二者进行区分 ($P < 0.05$)，其中 PDF_{F75th} 在鉴别脂肪沉积象限与正常象限上表现最优 ($AUC = 0.966$)。

结论：IDEAL-IQ 表现出优于常规 T1 FSE 的骨质侵蚀诊断性能以及不输于 T1 FSE 的脂肪沉积诊断性能，并且可通过直方图分析提供更客观、准确的脂肪沉积定量评估，具有良好应用价值，是当前髋膝关节 MR 扫描方案的潜在有力补充。

PO-2440

跗骨窦综合征的影像诊断价值

徐婷婷

甘肃省中医院

目的 本研究旨在探讨对跗骨窦综合征的诊断有指导价值的影像学检查方法，并评估不同影像学检查方法在跗骨窦及其周围解剖结构的表现上的差异。

材料与方法 回顾性分析 52 例临床诊断为跗骨窦综合征患者的 MSCT 及磁共振影像资料，分析跗骨窦区的 CT、MRI 图像各自的特征，在不同检查方法上观察跗骨窦内各种组织的变化，并进行统计学分析。

结果 (1)52 例跗骨窦综合征患者的 CT 表现为陈旧性骨折 7 例，骨关节退行性表现 45 例；(2) 52 例跗骨窦综合征患者的 MRI 表现为跗骨窦区水肿 43 例、积液 16 例、囊肿 5 例、出血 2 例、纤维化者 3 例；颈韧带损伤 26 例，距跟骨间韧带损伤 22 例；跗骨窦骨髓水肿 32 例、骨质囊变 16 例、陈旧性骨折 3 例；(3)跗骨窦综合征的患者有 46 例患者的跗骨窦容积变小，主要出现在早期跗骨窦区骨折治疗不当和老年患者关节发生退行性变。

结论 MSCT 能明显观察到骨质的情况并能直观地显示足踝部的解剖位置关系，MRI 能够更好地显示跗骨窦及其周围解剖结构的改变包括韧带、正常脂肪组织等改变，对于跗骨窦综合征的诊断，多种影像学检查方法结合起来能够提供更为准确的诊断依据。

PO-2441

基于 T2*mapping 成像技术定量分析膝骨性关节炎患者的软骨损伤

张玲、景蒙、李建龙、黄晓旗

延安大学附属医院

目的：我们旨在使用 3.0T 磁共振 T2*mapping 成像分析膝骨性关节炎患者软骨损伤的情况。

方法：回顾性分析延安大学附属医院 29 例膝骨性关节炎患者的 X 线、常规 MRI 和 T2*mapping 等影像资料。首先将每位患者的软骨划分为 14 个亚区，再将每个亚区按照软骨厚度分为深、浅两层，共获得 28 个软骨亚区。将扫描后的图像上传至后处理平台手动勾画 ROI，并记录各软骨亚区 T2* 值。然后将获得的软骨亚区按照 ICRS 标准分为 0 级、I 级、II 级、III 级、IV 级，最终将所有软骨亚区分为正常组 (0 级)、轻度损伤组 (I-II 级)、重度损伤组 (III-IV 级)。根据数据是否满足正态分布，分别用均数±标准差或中位数 (四分位数) 表示。软骨深层与浅层的两组间差异比较使用独立样本 t 检验或 Mann-Whitney U 检验，多组间比较使用单因素方差分析或 Kruskal-Wallis H 检验。软骨亚区 T2* 值与损伤程度的相关性用 Spearman 分析。

结果：各软骨亚区浅层的 T2* 值均高于深层 ($P < 0.05$)，但股骨内侧前区深层与浅层软骨之间差异无统计学意义 ($P = 0.101$)；另外，正常组、轻度损伤组与重度损伤组三组间 T2* 值均存在差异，

并且重度损伤组的 $T2^*$ 值高于其余两组 ($P < 0.05$)； $T2^*$ 值与软骨损伤程度呈正相关 ($r=0.34$, $P < 0.05$)，软骨损伤程度越重，对应 $T2^*$ 值越高。

结论： $T2^*$ mapping 技术可以定量评估软骨损伤情况，有助于早期识别并分析膝关节软骨的损伤程度，对骨关节炎患者的软骨损伤提供必要的诊断依据。

PO-2442

光谱检测器计算机断层扫描 VMI 对评估椎体溶骨转移显示的价值

李佳泓、董越
辽宁省肿瘤医院

目的:探讨双探测器层谱计算机断层扫描(SDCT)虚拟单能图像(VMI)在不同背景下的最佳能级水平,以评估椎体溶骨性转移的显示。

材料和方法:本研究包括两名放射科医生鉴定的 56 个病变。采用 Philips 智能 Portal 工作站获取动脉期(包括 40keV-A, 50keV-A and 60keV-A)和静脉期(包括 40keV-V, 50keV-V and 60keV-V)常规图像(CI)和 VMIs,并在 CI 和 VMIs 上记录病变及背景(肌肉、脂肪)的 CT、SD 值。计算各图像序列上病灶的信噪比(SNR)和对比度噪比(CNR)。采用配对样本 t 检验比较 VMIs 和 CI 在不同背景下(脂肪和肌肉)的动脉和静脉期病变的 SNR 和 CNR。

结果:在动脉期,在脂肪和肌肉背景下,40keV VMI 的信噪比分别为 17.62 ± 9.79 、 16.18 ± 8.04 , CNR 分别为 35.27 ± 16.17 、 34.70 ± 14.76 ,均高于 50keV、60keV VMI 和 CI ($p < 0.001$)。静脉期,在脂肪和肌肉背景下,40keV VMI 的信噪比分别为 19.17 ± 9.77 、 17.48 ± 8.46 , CNR 分别为 34.70 ± 10.46 、 12.07 ± 6.70 ,均高于 50keV、60keV VMI 和 CI ($p < 0.001$)。VMIs 和 CI 的脂肪和肌肉背景在动脉期和静脉期的 SNR 和 CNR 差异无统计学意义。

结论:40 keV 为最佳单能水平,可显著提高 CT 对椎体溶骨转移灶的识别能力。

PO-2443

小腿腺泡状软组织肉瘤一例并文献复习

邵小桐、牛洪涛、张琦昱
秦皇岛市第一医院

患者女,22 岁,因右小腿内侧肿物 3 年,持续性胀痛 1 周于本院就诊。查体:该肿物为椭圆形,质硬,活动度差,左膝活动未见异常,左踝背伸受限,足趾感觉运动血运未见异常。超声:右小腿比目鱼肌内混杂低回声团块。MRI:比目鱼肌内边界清晰的异常信号, T_2WI 及 DWI 呈高信号, T_1WI 呈低信号,ADC 值低。病理:灰黄灰红色质软有包膜。免疫组化结果显示 TFE3(+),MyoD1(胞质+),结果支持腺泡状软组织肉瘤。

PO-2444

双能 CT 虚拟去钙技术在膝关节外伤性骨髓水肿中的应用价值

杨旭

空军军医大学西京医院

目的: 探讨 Siemens 第三代 Force 双源 CT 虚拟去钙(VNCa)技术在急性创伤患者膝关节处骨髓水肿(BME)中的诊断价值。方法: 连续纳入我院 2021 年 7 月至 2022 年 7 月膝关节急性外伤后怀疑隐匿性骨折并在 24 小时内接受双能 CT (DECT)和 MRI 检查的患者 56 例。双能量 CT 图像传送至 Syngo.via 后处理工作站生成 VNCa 图像, 由两名放射科医师使用二元系统对图像进行分级(0=没有异常骨髓密度, 1=BME)。以 MRI 作为参考标准, 计算 VNCa 图像主观分析结果诊断 BME 的敏感性、特异性、准确性、阳性预测值和阴性预测值; 比较水肿骨髓和正常骨髓 CT 值的是否有差异, 并使用受试者操作特征曲线分析检验 BME 的最佳截断 CT 值。对 VNCa 图像的 CT 值进行受试者操作特性曲线(ROC)分析,以 MRI 结果为标准。结果: MRI 显示 49 例患者存在 BME,DECT 显示 47 例患者存在 BME(95.92%),两名医师通过 DECT 的 VNCa 图像显示 BME 的敏感性、特异性、准确性、阳性预测值和阴性预测值分别为 95.92%、91.67%、95.24%、98.00%、84.62%和 96.00%、92.31%、95.24%、97.96%、85.71%,阅片医师间对 DECT 图像定性分级的一致性较高(Kappa=0.85)。定量分析 DECT 的阳性区域平均 CT 值为(-11.85±35.08)HU,阴性区域平均 CT 值为(-61.83±39.51)HU,两区域 CT 值对比有显著差异(P<0.001)。VNCa 图像 CT 值曲线下面积(AUC)为 0.83(95%置信区间 0.73~0.93),诊断阈值为-24.15HU,定量分析 DECT 的敏感性、特异性、准确性阳性预测值和阴性预测值分别为 98.00%、92.31%、96.83%、98.00%、92.31%。结论: DECT 可以诊断膝关节处急性创伤背景下的 BME,与 MRI 相比无明显差别。

PO-2445

基于定量 CT 分析腰椎间盘突出症患者
椎旁肌肉退变与骨密度的相关性

刘春雨、翟建

皖南医学院第一附属医院(皖南医学院弋矶山医院)

目的: 探讨定量 CT(QCT)对腰椎间盘突出症患者椎旁肌肉退变和腰椎骨密度的相关性价值研究。方法: 纳入 2019 年 12 月-2022 年 10 月在弋矶山医院的脊柱骨科确诊为腰椎间盘突出症的 312 例患者(LDH 组)及年龄、性别相匹配的 151 例健康体检者(NLDH 组),所有被试者行腰椎间盘 CT 平扫。采用 QCT Pro 软件测量在每例受试者 L3 椎体中部水平椎旁各组肌肉面积(CSA)并计算肌指数(skeletal muscle mass index, SMI)、椎后脂肪面积及椎后肌群肌肉脂肪浸润程度(MFI)及腰椎 vBMD。使用独立样本 t 检验及 Mann-Whitney U 检验比较两组间各组肌群 SMI、椎后脂肪面积、椎后脂肪肌肉浸润及骨密度的差异,使用线性相关分析研究各组肌群与腰椎 BMD 之间的关系,绘制受试者工作特征曲线(receiver operating characteristic curve, ROC)评价各组肌群 SMI 诊断 LDH 的效能。结果: 男性组中 LDH 组年龄、椎后肌群脂肪面积、MFI 高于对照组(P<0.001);椎旁肌群 SMI、双侧腰大肌 SMI 及腰椎 BMD 均低于对照组(P<0.001),但椎后肌群 SMI、BMI 低于对照组,两者之间统计学无差异(p>0.05)。椎后肌群脂肪面积、双侧腰大肌 SMI、MFI 是独立危险因素,诊断 LDH 效能分别是 0.713、0.735、0.668,联合模型为 0.827。女性组中年龄、椎后肌群脂肪面积、MFI 高于对照组(P<0.001),双侧腰大肌 SMI 及腰椎 BMD 均低于对照组(P<0.001),但椎旁肌群 SMI、椎后肌群 SMI 低于对照组及 BMI 高于对照组,均无统计学差异(p>0.05)。vBMD、椎后肌群脂肪面积、双侧腰大肌 SMI、MFI 是独立危险因素,诊断 LDH 效能分别是 0.857、0.750、0.788、0.663,联合模型为 0.921。结论: 腰椎间盘突出症患者椎旁肌肉会发生萎缩退变,椎后肌

群脂肪会增加, 该疾病患者更易引起骨量的减少, 椎旁各组肌群 SMI 对 LDH 的诊断具有一定的指导意义, 尤其双侧腰大肌 SMI。

PO-2446

基于 QCT 分析维持性血液透析患者骨密度、 体质成分变化及其相关性

詹昊

安徽医科大学第二附属医院

【摘要】目的 应用定量 CT (QCT) 探讨维持性血液透析患者骨密度、体质成分变化及其相关性。方法 选取我院 2022 年 3-11 月维持性血液透析患者 156 例, 收集其一般资料以及骨代谢指标, 包括血钙、血磷、完整甲状旁腺激素 (iPTH)、碱性磷酸酶 (ALP)。另选取 150 例与血透患者年龄性别相匹配的体检人员作为对照组。使用 QCT 软件测量所有患者及体检人员腰椎 (L1-3) 体积骨密度 (vBMD) 以及体质成分, 包括皮下脂肪含量 (SAT)、内脏脂肪含量 (VAT)、椎旁肌面积及椎旁肌脂肪面积。比较两组间 vBMD、体质成分的差异。将血透组患者分为继发性甲状旁腺功能亢进 (SHPT) 和非继发性甲状旁腺功能亢进 (N-SHPT) 两组, 并比较两组 vBMD、体质成分、骨代谢指标之间的差异; 使用相关性分析研究两组患者 vBMD 与年龄、透析龄、体质成分及骨代谢指标的相关性。结果 维持性血液透析患者 156 例, 其中 SHPT 78 例, N-SHPT 78 例。血透组患者 VAT 和椎旁肌脂肪面积均高于对照组; 其他指标无显著差异性。血透组中 SHPT 组患者 vBMD 高于 N-SHPT 组 ($P<0.05$); 体质成分无显著差异性。SHPT 组患者的透析龄、血钙、iPTH、ALP 高于 N-SHPT 组 ($P<0.05$)。SHPT 组、N-SHPT 组患者 vBMD 均与年龄、椎旁肌脂肪面积呈负相关; SHPT 组 vBMD 与 iPTH、ALP 呈正相关, N-SHPT 组 vBMD 与 ALP 呈负相关, 与 iPTH 无显著相关性。结论 维持性血液透析患者内脏脂肪与椎旁肌脂肪面积较健康人群增加, 椎旁肌脂肪含量越高 vBMD 越低; SHPT 患者 vBMD 较非 SHPT 患者高, 可能与 SHPT 患者 iPTH 的升高有关。

PO-2447

腰椎躯干肌的 CT 测量参数与躯体功能及 上肢肌肉力量的相关性研究

刘兴利

云南省第一人民医院

目的: 通过腰椎 L1~L5 层面躯干肌的 CT 参数 (密度及面积) 与躯体功能及上肢肌肉力量的相关性评估, 探讨腰椎躯干肌对躯体功能、肌少症的预测价值及最佳的腰椎评估层面。

方法: 共纳入 50 岁以上受试者 615 名 (男性组 191 例 年龄 61.68 ± 9.02 岁; 女性组 424 例 年龄 59.18 ± 8.19 岁), 受试者均来自云南省骨松-肌少队列 (ChiCTR2100052153)。所有受试者均进行腰椎 CT 平扫、简易躯体功能评估 (SPPB) 及上肢肌肉力量测定。CT 图像通过 Osirix 软件进行脂肪阈值分割后分别测量 L1-L5 层面的躯干肌面积及密度。简易躯体功能评估包括平衡测试、4m 步速及椅子站立实验, 上肢肌肉力量测定通过液压握力器完成。数据采集完成后通过 Pearson/Spearman's 相关性分析及多元线性回归逐一获取 L1-L5 层面躯干肌 CT 参数与 SPPB 总分、SPPB 各分项及上肢肌肉力量间的相关性, 同时对年龄和 BMI 进行校正。

结果: 男性组较女性组具有更大的躯干肌面积、更高的躯干肌密度、更强的上肢肌肉力量 ($P<0.001$) 但两组躯体功能 SPPB 评分及 BMI 未见明显差异。男性组较女性组而言, 其躯干肌 CT 参数

与躯体功能及上肢躯体力量间的相关性更强、敏感性更高, 男性组躯干肌 CT 参数与上肢握力、SPPB 总分及平衡测试单项评分间均表现不同程度相关, 而女性组仅与上肢握力及平衡测试单项评分相关。但两组均为 L1 椎体层面的躯干肌密度与上肢肌肉力量和躯体功能评分间的关联性最强 (男性组: β 上肢肌肉力量=0.24 (0.16,0.72); β SPPB=0.31(0.05,0.14); β 平衡测试=0.16(0.00,0.033); 女性组: β 上肢肌肉力量=0.19 (0.08,0.28); β 平衡测试=0.15 (0.003, 0.022))。除此之外, 两组结果均证明腰椎躯干肌肌肉密度相较于肌肉面积而言, 与躯体功能和肌肉力量具有更强的相关性。

结论: 基于 CT 的腰椎躯干肌密度是中老年人群躯体功能和肌肉力量的良好预测指标, 其中 L1 椎体层面的躯干肌密度表现出了最强的相关性。L1 椎体层面的躯干肌密度评估可能是未来肌少症筛查的有益新型指标。

PO-2448

基于 MR Q-Dixon 序列和 QCT 测量 小鼠肝脏脂肪含量的可行性研究

蒋海波、王龙胜
安徽医科大学第二附属医院

目的 探讨定量 CT(QCT, quantitative CT)与 MR Q-Dixon 序列测量小鼠肝脏脂肪含量的可行性研究。方法 本研究采用高脂饮食诱导的肥胖 (Diet-induced obesity,DIO) 的小鼠动物模型, 6 周龄 C57BL/6 小鼠 30 只, 随机分成三组, 每组 10 只, 第一组给予普通饲料饲养 40 周, 第二组给予高脂饮食 20 周, 第三组给予高脂饮食 40 周, 2 名医师利用 QCT 和 MR Q-Dixon 序列对小鼠肝脏脂肪含量进行测量, 对 QCT 测得的肝脏脂肪含量 (Fat%Q) 和 MR Q-Dixon 序列测得的肝脏脂肪含量 (Fat%M) 进行一致性检验和相关性分析。结果 本实验 QCT 肝脏脂肪含量测量值为 17.6 (6.00,28.95) %, MR Q-Dixon 序列肝脏脂肪含量测量值为 19.6 (5.70,29.55) %。两种方法评估脂肪肝严重程度比较, 无显著差异 ($\chi^2=4.000$, $P=0.216$), 且一致性较高 (Kappa=0.816, $P<0.001$); 两种方法的测量结果呈正相关 ($r=0.978$, $P<0.01$)。结论 在定量测量小鼠肝脏脂肪含量方面, 定量 CT 与 MR Q-Dixon 序列具有较好的一致性和相关性, 即可在体定量研究小鼠脂肪肝动物实验。

PO-2449

腺泡状软组织肉瘤 MRI 表现与病理学指标的相关性研究

袁军辉
河南省肿瘤医院

目的 探讨 MRI 表现与病理学指标的相关性, 术前预测腺泡状软组织肉瘤 (ASPS) 的组织学分级和 Ki-67 表达效能。方法 回顾性收集 2014 年 1 月至 2022 年 5 月河南省肿瘤医院 26 例 ASPS 患者。采用 3.0 T MRI (包括常规序列) 进行检查, 并获得了 DCE 扫描参数 TIC 曲线和 DWI 参数 ADC 值。通过术后病理学证实将所有患者分为低级别 (组织学 I 级) 组和高级别 (组织学 II 级和 III 级) 组。采用免疫组化法检测 ASPS 瘤组织中 Ki-67 的表达水平, Ki-67 表达指数 $\geq 30\%$ 为高表达组, $<30\%$ 为低表达组。运用卡方检验、独立样本 t 检验、二元 logistic 回归分析、Pearson 相关分析、接收者操作特征曲线 (ROC) 分析各观察指标数据。结果 低级别组有 10 例患者, 高级别组有 16 例患者。Ki-67 表达范围是 10%-70%。在所有 MRI 表现中, 瘤内坏死、肿瘤强化特征、TIC 类型及 ADCmean 在高级别组和低级别组之间的差异具有统计学意义 ($P<0.05$), 且远处转移是组

织学分级的独立预测因素。高级别组的 ADC 值显著低于低级别组 ($P = 0.047$)，ADC 预测 ASPS 高级别组和低级别组的 AUC、灵敏度和特异度分别为 0.725、62.5%和 80.0%。ADC 值与 Ki-67 表达呈中度负相关 ($r = -0.494$; $P = 0.010$)。当 ADC 临界值为 $0.851 \times 10^{-3} \text{ mm}^2/\text{s}$ 时，预测 Ki-67 高表达的 AUC、灵敏度和特异度分别为 0.818、63.6%和 93.3%。结论 MRI 定性和定量参数有助于预测 ASPS 组织学分级及 Ki-67 表达水平。

PO-2450

双源双能量 CT 脂肪图定量测量肥胖患者 肝脏脂肪含量可行性研究

陈其春

安徽医科大学第二附属医院

目的 探讨双源双能量 CT (DECT) 平扫脂肪图定量测量肥胖患者肝脏脂肪含量 (HFC) 的可行性及临床价值。方法 以 2021 年 6~11 月安徽医科大学第二附属医院普外科收治的 46 例拟行减重手术的肥胖患者 ($\text{BMI} \geq 30 \text{ kg/m}^2$) 为研究对象，术前均接受第三代双源 DECT 腹部或腹盆腔平扫检查，DECT 数据经后处理工作站采用多材料分解 (MMD) 算法自动计算生成肝脏脂肪图，由两名医师 (A 和 B) 采用盲法选择多点感兴趣区独立测量 HFC 值，医师 A 和 B 在 1 周后分别对同一数据重复测量 1 次，采用组内相关系数 (ICC) 评价测量者内 (A、B 前后两次测量) 及测量者间 (A 与 B 首次测量间) 测量结果的可重复性。在 100kV 平扫 CT 图像上测量肝脏 CT 值、肝脾 CT 值比值 (CTL/S)。计算 DECT 脂肪图与 CTL/S 法评价脂肪肝严重程度差异，HFC 值与肝脏 CT 值、CTL/S 间的相关性，并计算 HFC 值与临床指标 [身高、体质量、身体质量指数 (BMI)、腰围、三酰甘油、血清尿酸] 的相关性。结果 DECT 脂肪图 HFC 值测量结果，两名医师前后两次测量的可重复性 ICC 分别为 0.985 和 0.983 ($P < 0.001$)，医师 A 与 B 第一次测量间的可重复性 ICC 为 0.979 ($P < 0.001$)。DECT 脂肪图测量本组对象的 HFC 值范围为 0%~42.29%，中位数为 12.09%。DECT 脂肪图与 CTL/S 法评价脂肪肝严重程度结果比较，差异无统计学意义 ($\chi^2 = 6.000$, $P = 0.112$)。HFC 值与肝脏 CT 值 ($r = -0.978$, $P < 0.001$)、CTL/S ($r = -0.981$, $P < 0.001$) 均呈负相关。HFC 值与身高、体质量、BMI、腰围无明显相关性 (P 均 > 0.05)，与三酰甘油水平存在弱相关性 ($r = 0.293$, $P = 0.048$)，与血清尿酸水平呈中等相关 ($r = 0.339$, $P = 0.021$)。结论 采用 MMD 算法，双源平扫 DECT 脂肪图定量评估肝脏脂肪含量可重复性较好，是一种新的具有潜在临床应用价值的脂肪肝无创定量方法。

SAPHO 综合征 5 例影像表现分析及文献复习

李国荣

宜昌市第一人民医院 (三峡大学人民医院)

SAPHO (synovitis-acne-pustulosis-hyperostosis-osteitis syndrome) 综合征是主要累及皮肤、骨和关节的一种慢性疾病，诊断主要根据临床特点及影像表现。本文主要从全身骨闪烁显像、计算机断层扫描成像 (computed tomography, CT) 及磁共振成像 (nuclear magnetic resonance, MRI) 来介绍本院收录的 5 名 SAPHO 综合症患者影像学表现并进行文献复习。

PO-2452

SEMAC-VAT 在全髋关节置换术后慢性髋关节疼痛的评估

黄龙全、毛一朴、许梅海、潘洋洋
南宁市第一人民医院

目的 探讨层面编码去金属伪影矫正-视角倾斜技术(SEMAC-VAT)在全髋关节置换术 (THA) 后慢性髋关节疼痛中的应用价值。**方法** 收集 2021 年 1 月至 2023 年 1 月在本院行 THA 术后慢性髋关节疼痛需要磁共振 (MRI) 复查的 32 例患者, 所有患者均行冠状面、横断面的常规短时反转恢复序列 (STIR) 及 SEMAC-VAT 序列扫描。分别测量 2 组序列图像的金属假体及周围伪影面积, 记录异常病变的发现数目, 并对假体清晰度、周围重要解剖结构的可见度进行 Likert 评分。**结果** 32 例患者中, 冠状面及横断面 STIR 图像的金属假体及周围伪影面积分别为 (71.31±10.65)、(32.28±4.31); SEMAC-VAT 序列图像分别为 (39.78±5.99)、(21.84±4.44), 差异均具有统计学意义 (P 均<0.05)。SEMAC-VAT 序列对假体清晰度、周围重要解剖结构可见度的评分均明显高于 STIR 序列 (P 均<0.05)。SEMAC-VAT 序列较 STIR 序列更有助于异常病变的检出 (P<0.05)。**结论** 相较常规 STIR 序列, SEMAC-VAT 序列可显著减轻金属伪影, 提高图像质量, 能发现更多的阳性征象, 对 THA 术后慢性髋关节疼痛的评估具有重要的临床意义。

PO-2453

基于多参数光谱 CT 的痛风算法在痛风诊疗中的应用研究

张艺腾¹、张雨¹、姚慧²、夏春潮¹、唐静¹、李真林¹

1. 四川大学华西医院
2. 飞利浦全球 CT 科研部

目的: 提出一种改进的基于多参数双层探测器光谱 CT 的痛风算法 (improved urate algorithm, IUA), 与现有的痛风算法 (current urate algorithm, CUA) 相比, 在保持病灶显示效果相似的同时, 显著减少了图像伪影 (假阳性)。

方法: 2022 年 5 月-2023 年 5 月持续性纳入痛风性足部关节炎疑诊患者, 并进行光谱双层探测器 CT 足部扫描。然后根据 ACR/EULAR 2015 指南将所有患者分为痛风组和非痛风组, 并对所有受试者的 CT 图像进行 CUA 和 IUA 重建。在非痛风组中, 统计各类图像伪影的数量并计算 IUA 相比 CUA 的伪影去除率。在痛风组中, 记录痛风阳性率、痛风最大体积的最大截面积 (S_{IT-max})。

结果: 49 名患者 (82 只患足) 被纳入痛风组, 35 名患者 (67 只患足) 被纳入非痛风组。与 CUA 图像相比, IUA 图像的甲床伪影、皮肤伪影、束硬化伪影、血管伪影、肌腱伪影及总伪影的去除率分别为 40.54%、48.89%、74.31%、99.19%、99.57% 和 80.03%。定性诊断方面, IUA 和 CUA 图像的痛风阳性率均为 100%。定量诊断方面, CUA 组的 S_{IT-max} 均略高于 IUA 组 (P<0.05)。

结论: 基于多参数双层探测器光谱 CT 的改进痛风算法, 能够在保证痛风定性诊断效能相似的同时, 有效地减少了 80% 的图像伪影, 对肌肉伪影和血管伪影的去除效果尤为显著, 可达 99% 以上。而对于新算法在临床真实环境中是否实现了更加准确的尿酸盐定量, 未来需要体膜研究和动物研究进一步论证。

PO-2454

探讨韧带样型纤维瘤病 (DF) 的影像学特征及其病理学基础

程天明、关舒元、葛英辉
河南省人民医院

目的探讨韧带样型纤维瘤病 (DF) 的影像学特征及其病理学基础。

方法回顾性分析经手术病理证实的韧带样型纤维瘤 11 例, 其中 5 例行 CT 检查, 其中 4 例行增强检查, 8 例行 MRI 检查, 其中 4 例增强。分析 CT 及 MRI 表现, 并对肿瘤的病理特点进行分析。

结果本组病例病变分布特点, 腹腔内 5 例, 主要位于腹膜后, 腹壁 3 例, 臀部 2 例, 足底 1 例, 肿瘤平均直径 5.9cm, 肿瘤形态为不规则形或分叶状 8 例, 类圆形或梭形的 3 例。肿瘤与周围结构分界不清, 或部分分界不清的 8 例。5 例在 CT 上表现为稍低密度或者等密度, 4 例增强后中度或明显强化, 以等密度区强化为主。8 例病灶在 MRI 上表现为 T1WI 6 例呈不均匀稍等信号, 2 例呈不均匀等信号。T2WI 7 例呈不均匀等信号, 压脂 T2WI 上所有病灶均呈不均匀高信号, 增强后 4 例病变明显不均匀强化, 原病变内所有序列显示为地形区域均未见强化。韧带样型纤维瘤病在病理上主要有纤维母细胞、胶原蛋白及成熟的纤维组织组成。病变很少发生钙化、出血或坏死等。

结论韧带样型纤维瘤病 (Desmoid-Type Fibromatoses) 属于良性纤维增生性病变, 具有明显的侵袭性生长的生物学行为, 恶变和转移少见, 但是术后复发率高。

韧带样型纤维瘤病在病理上主要有纤维母细胞、胶原蛋白及成熟的纤维组织组成。病变很少发生钙化、出血或坏死等。因此在 MRI 图像中, T1WI 呈等低信号 (与肌肉比较), T2WI 呈高信号的区域以纤维母细胞、粘液成分和增生的血管为主, 粘液及增生血管在 FS T2WI 上呈更高信号, 增强扫描, 显示不同程度的强化, 渐进性或进行性明显强化。低信号区域是瘢痕性胶原纤维组织, 增强扫描未见强化, 具有一定的特异性。

PO-2455

低位腰椎椎间盘突出与脊柱-骨盆矢状位参数的相关性研究

王文斌、陈君蓉、王然、杨健、陈玥、兰九钧、王威
四川省骨科医院

目的 探讨低位腰椎间盘突出与脊柱骨盆矢状位参数的关系

方法 回顾性分析四川省骨科医院 2022 年 12 月—2023 年 7 月收治的 202 例腰椎间盘突出症患者, 其中男性 119 例, 女性 83 例; 年龄范围在 12-71 岁; 所有病例均排除脊柱畸形、肿瘤、感染、椎管狭窄、腰椎滑脱等疾病; 所有患者入院拍摄站立位脊柱全长正侧位 DR 片及腰椎 MRI 数据; 在全长 DR 片上测量患者的骨盆入射角 (pelvic incidence, PI)、骨盆倾斜角 (pelvic tilt, PT)、骶骨倾斜角 (sacral slope, SS)、胸椎后凸角 (thoracic kyphosis, TK)、腰椎前凸角 (lumbar lordosis, LL)、矢状面垂直轴 (sagittal vertical axis, SVA); 在 MR 图像上, 根据突出位置分为 L4/5 及 L5/S1 组; 参考 MSU (Michigan State University) 分型分别对突出椎间盘的程度、突出范围及髓核游离程度进行分组: 突出程度分为 1/2/3 级, 突出范围分中央型及旁中央型, 髓核游离程度分为 0/1/2/3 级; 应用 SPSS 17 版软件进行统计学分析, 计量资料样本符合正态分布采用独立样本 t 检验及方差分析; 不符合正态分布采用非参数检验方法; 相关性分析采用 Spearman 相关分析; 本研究获得四川省骨科医院伦理委员会同意。

结果: 年龄、BMI、椎间盘突出程度与髓核游离程度与脊柱-骨盆矢状位各参数均无明显统计学差异; 女性的 PI、SS 及 LL 均大于男性, 差异均有统计学意义 ($P < 0.05$); 女性的 SVA 小于男性, 差异有统计学差异 ($P < 0.05$); L4/5 突出组与 L5/S1 突出组间在 PI 上有统计学差异 ($P < 0.05$); 中央型和旁中央型突出组与 SVA 有统计学差异 ($P < 0.05$); PI 与腰椎间盘突出位置呈负相关 ($r_s = -0.194$, $p = 0.006$)

结论: PI 是影响腰椎间盘突出位置的原因之一; 女性脊柱-骨盆矢状面参数对椎间盘突出的代偿能力较男性更强; SVA 值的变化, 可能与神经根受压关系密切; 椎间盘突出程度及髓核游离程度变化与脊柱-骨盆矢状位各参数无明显相关。

PO-2456

MDCT 结合 MPR 诊断 Bastrup 病的价值

邢璐、伏平友、刘媛、孙永梅
山东黄河河务局山东黄河医院

目的 结合 CT 骨算法 MPR 探讨 Bastrup 病的 MDCT 影像学表现及其临床特点。**方法** 回顾性收集我院 96 例 Bastrup 病患者的 MDCT 表现, 结合 CT 骨算法 MPR, 对其临床及影像学表现进行分析。**结果** Bastrup 病的 MDCT 表现为腰椎相邻两个棘突间距缩小或相互接触, 部分甚至形成棘突间假关节, 两个棘突相对缘骨质增生硬化, 部分可见棘突肥大, CT 骨算法 MPR 重组腰椎正中矢状位显示最显著。**结论** CT 骨算法 MPR 重组腰椎正中矢状位可显示 Bastrup 病的特征性表现, 腰椎相邻两个棘突间距缩小或相互接触, 部分甚至形成棘突间假关节, 两个棘突相对缘骨质增生硬化, 部分可见棘突肥大; 并可显示关节面下的囊性变及棘突间积气影。

PO-2457

磁共振脂肪定量技术评估放化疗过程中骨髓脂肪含量的变化

李晶灵
空军军医大学西京医院

目的: 盆腔恶性肿瘤是放化疗是最常用的治疗方法。但副作用是减少红骨髓而增加含有脂肪的黄骨髓, 从而造成更高的质子密度脂肪分数(PDFF)。这种变化可以降低病人的造血能力。本研究的目的是在患者放疗和化疗期间使用基于 MRI 的脂肪定量技术评估实时骨髓毒性评价的可行性。

材料与方法: 6 位入组女性 (年龄 39 岁~60 岁, 平均 49 岁) 都被诊断为宫颈鳞状细胞癌 (FIGO IIB-IIIIB) 并接受放化疗。增强 CT 定位, 盆腔照射剂量为 50Gy/25 次, 每周 5 次。化疗方案为顺铂单药 40mg/m²/周。治疗前及放化疗过程中每周接受 GE 3.0 T (美国通用电气医疗集团 MR750) Ideal IQ 序列扫描, 以皮下脂肪组织作为参考, 分别测量放疗前 L4, S1 椎体脂肪分数 (图 1)。IDEAL-IQ 是用于生成定量脂肪分数的序列。详细的扫描参数: FOV38x38cm, 层厚 5mm, 翻转角度 3°, 矩阵 160x160。分别进行轴位, 矢位和冠位扫描。ROI 由经验丰富的放射科医师在脂肪分数图像手动放置在 S1 椎体和皮下脂肪组织, 最后脂肪分数计算的平均值从三个平面中获取。

结果: 治疗期间, S1 椎体分别为: 38.40±17.79, 47.42±13.92, 55.53±11.89, 66.21±10.39, 73.88±4.68, 75.40±3.51, 皮下脂肪组织分别为 85.56±3.29, 85.80±3.21, 85.44±2.51, 85.77±3.49, 86.92±2.67, 86.78±3.66。由此可看出在 S1 椎体上有明显的增长趋势 (图 2)。表明在放化疗过程中, 红骨髓更多的转化为黄骨髓。

结论: MRI 脂肪定量技术对骨髓脂肪含量的变化较敏感, 可以反应骨髓的实时脂肪含量变化。脂肪定量图像可以给放疗医师提供丰富信息, 对放疗计划的制定或提供指导性的建议, 根据病人的骨髓脂肪分数选择合适的放化疗。

PO-2458

地诺单抗治疗后骨巨细胞瘤的 CT 影像表现研究

沈婧、顾尚尉、李鹏、王关顺、陶海波
昆明医科大学

目的探讨经地诺单抗治疗后骨巨细胞瘤的 CT 影像学特征性表现。

方法回顾性分析 2017 年 9 月至 2022 年 4 月本院收治的 24 例骨巨细胞瘤患者临床和影像学资料。患者平均年龄为 31.6(16~67)岁,男 10 例,女 14 例。病变位于扁骨及不规则骨 7 例(骶骨 2 例,髌骨 4 例,腰椎 1 例),位于四肢骨 17 例(胫骨 7 例,腓骨 2 例、股骨 6 例和肱骨 1 例)。所有接受地诺单抗治疗的患者每 4 周接受 120mg 地诺单抗皮下注射,第 8 天和第 15 天增加 2 次负荷剂量。患者治疗前后均接受平扫及增强 CT 检查,计算病灶治疗前后的平扫、增强及平扫与增强 CT 差值的变化,以及通过 CT 评价病灶治疗后骨包壳的情况,探讨应用 CT 检查评价地诺单抗治疗骨巨细胞瘤的效果。

结果用药前和用药后病灶平均平扫 CT 值分别为 $47.14\pm 12.32\text{HU}$ 和 $57.03\pm 16.33\text{HU}$,用药后的平扫 CT 值明显升高 ($P=0.023$, $t=2.357$)。用药前和用药后病灶平均增强 CT 值分别为 $110.0\pm 21.34\text{HU}$ 和 $91.52\pm 19.13\text{HU}$,增强 CT 值较前降低,具有统计学意义($P=0.004$, $t=3.041$)。用药前和用药后病灶平扫与增强 CT 差值分别为 $63.40\pm 24.38\text{HU}$ 和 $34.60\pm 22.94\text{HU}$,有统计学意义($p<0.001$, $t=4.076$)。治疗后增强 CT 值对于评价肿瘤治疗后骨包壳形成具有较好的诊断效能($\text{AUC}=0.827$, 95% CI 60.9-100%, 灵敏度 77.8%, 特异性为 88.9%, Cutoff 值=94.7HU, $p=0.019$)

结论骨巨细胞瘤经地诺单抗治疗后有骨质修复、肿瘤血运减少的表现,CT 影像检查可作为评估临床治疗疗效的潜在方法。

PO-2459

不同剂量下重建矩阵对定量 CT 椎体骨密度测量值的影响

王旭
浙江医院
大连医科大学附属第一医院

目的:探讨不同剂量下重建矩阵对定量 CT (QCT) 椎体骨密度 (BMD) 测量值的影响。方法:应用联影 uCT760 对欧洲标准脊柱体模 (ESP) 和 QCT 校准体模,采用两种剂量水平 (管电压 120 kVp, 管电流 150 mAs 和 30 mAs) 进行扫描。扫描完成后,基于原始数据重建 512×512 、 768×768 、 1024×1024 矩阵的图像。重建图像传至 QCT pro 工作站进行各椎体 BMD 测量,基于椎体标定值,计算相对误差(RE),分析不同重建矩阵下椎体骨密度相对误差差异。回顾性分析于我院行胸部高分辨 CT (HRCT) 和胸部低剂量 CT (LDCT) 的患者各 45 例,对原始图像分别以 512×512 和 1024×1024 重建矩阵完成 QCT 椎体骨密度测量,分析不同重建矩阵间椎体 T12、L1 及 T12-L1 均值骨密度的差异。结果:150 mAs 和 30 mAs 两种剂量水平下不同重建矩阵 ESP 体模 V1、V2、V3 及 V 平均骨密度测量相对误差差异均无统计学意义 ($P>0.05$)。相同重建矩阵 150 mAs 和 30 mAs 间 V1、V2、V3 及 V 平均骨密度测量相对误差差异均无统计学意义 ($P>0.05$)。两位医师测量的患者椎体骨密度一致性较好 (ICC 值=0.978~0.990,均 >0.75)。HRCT 和 LDCT 的 45 例患者 512×512 和 1024×1024 间 T12、L1 骨密度值及 T12-L1 骨密度均值差异均无统计学意义 ($P>0.05$)。结论:不同重建矩阵对 QCT 椎体骨密度测量值无影响,胸部 HRCT 和 LDCT 数据均可用于机会性筛查骨质疏松症。

PO-2460

骶髂关节周围韧带钙化规律的 CT 征象分析

张丹、王其军、崔姝、马民、封会建、赵大庆
青岛市黄岛区人民医院

目的 探讨骶髂关节周围韧带钙化的分布规律，以期为脊柱韧带骨化机制的研究提供更多依据。**方法** 回顾性分析 2022 年 1 月青岛市西海岸新区人民医院影像 PACS 工作站上包含骶髂关节的腹盆腔检查及腰骶部检查的患者的 CT 影像资料，通过纳入及排除标准入组连续病例 1266 例，男性 702 例，女性 564 例，年龄范围 18 ~ 95 岁。按照骶髂关节韧带骨化位置分为前方、中间、后方及上下部 4 组；按照 10 岁间隔分为 7 个年龄段组，其中 20 岁以下患者纳入 18-29 岁组，90 岁以上患者的纳入 >80 岁组。应用 SPSS25.0 统计软件中 χ^2 检验及 Spearman 相关分析统计分析骶髂关节周围韧带钙化的发生率以及患者年龄、性别的相关性，各组间比较使用 t 检验。结果 骶髂关节周围韧带钙化发生的发生率在不同性别间具有统计学意义 ($P < 0.05$)，女性 (82.45%) 高于男性 (73.79%)，且钙化数量在不同性别间亦具有统计学差异 ($P < 0.05$)；骶髂关节后方韧带钙化的发生率在不同性别间具有统计学差异 ($P < 0.05$)，钙化数量也具有统计学的差异 ($P < 0.05$)；在不同性别间，40-59 岁年龄段人群骶髂关节后方韧带钙化的发生率具有统计学差异 ($P < 0.05$)；骶髂关节其余位置韧带钙化的发生率在各年龄段中无性别差异。结论 骶髂关节周围韧带骨化在发生几率及数量上女性高于男性，高发年龄段为 40-49 岁，钙化更易于发生于骶髂关节后方韧带，因此，骶髂关节周围韧带骨化的年龄、性别及位置的分布规律为脊柱韧带骨化机制的研究提供了更多的数据，提示影像科医师在日常诊断工作中应重视骶髂关节韧带骨化的提示意义。

PO-2461

弹簧韧带损伤的 MRI 诊断价值

杨江飞
山东第一医科大学附属省立医院

目的：探讨弹簧韧带损伤的 MR 诊断价值

方法：1.1 一般资料 回顾分析 2018-2021 年 20 例弹簧韧带损伤所致获得性平足患者足踝部 MR 资料。患者年龄 20-62 岁，平均年龄 39 岁，男 9 例，女 11 例，左足 8 例，右足 12 例。判断弹簧韧带是否损伤，以及损伤程度，分析弹簧韧带损伤 MR 诊断价值。

1.2 检查方法：采用 Philips3.0T 超导磁共振，使用 16 通道踝关节专用线圈，采用踝关节常规扫描方案，矢状位 FSE T1WI 序列，轴位、矢状位及冠状位压脂图像均采用 Philips 专有 mDIXION 压脂，层厚 3mm，间距 0.1mm，FOV20cm。

1.3 观察与判断 弹簧韧带主要分为三束（内侧束、中间束、外侧束），内侧束主要在冠状位和轴位上观察，中间束和外侧束主要在矢状位及轴位观察。判断标准，急性韧带损伤主要表现为韧带水肿、T2WI 信号增高，部分中断、完全中断，陈旧性损伤主要表现为韧带中断或韧带松弛。

结果：弹簧韧带损伤的严重后果是扁平足，创伤性平足是临床常见病，大部分原因是扭伤后破坏正常足弓的骨及韧带结构，从而导致的创伤性平足，而非骨折性创伤性平足也不少见，早期不易引起重视。非创伤性平足其常见原因为外伤或过度运动后导致骨挫伤、胫骨后肌功能不全、弹簧韧带损伤、足底韧带损伤等，各种损伤常同时发生，也可单独存在。20 例获得性平足患者中，既往均有明确扭伤或暴力性损伤病史，均未经过及时有效治疗；首诊 MR 显示弹簧韧带损伤 17 例，同时合并距骨、跟骨、舟骨骨挫伤 14 例，同时合并胫骨后肌损伤的 12 例，足底韧带损伤 4 例。足弓塌陷后复查 MR，均显示显示弹簧韧带松弛或中断。

结论：弹簧韧带损伤与创伤性平足具有明显相关性。高场强 MR 能清晰显示弹簧韧带正常结构及病变，对弹簧韧带损伤提供可靠的诊断依据，对诊断弹簧韧带损伤早期诊断、临床治疗方案的选择提供了有力依据，能有效预防平足症的发生。

PO-2462

The feasibility of ASL and IVIM in the identification of pediatric IgAN and HSPN

Yupeng Zhu^{1,2}, Ning Lang¹, Yun Peng²

1. Peking University Third Hospital

2. MOE Key Laboratory of Major Diseases in Children, Beijing Children's Hospital, Capital Medical University, National Center for Children's Health

Purpose Pediatric nephropathies are ordinary and frequently-occurring disease diseases when children have chronic abdominal diseases. These conditions tend to be recurrent and the prognoses are poor¹⁻². IgA nephropathy (IgAN) and Henoch Schonlein purpura nephritis (HSPN) are pediatric nephropathy. The clinical characteristics and laboratory results in the development of these two diseases are similar, and the diagnosis can only be confirmed by renal biopsy in clinic. However, because the puncture biopsy is an invasive examination, there is a risk of problems such as poor repeatability and poor patient compliance, and it is impossible to evaluate the patient's condition in the multi-disease phase³. Functional magnetic resonance imaging (fMRI) has high application value in clinic diagnosis⁴⁻⁸. Arterial spin labeling (ASL) can evaluate renal blood flow and intravoxel incoherent motion (IVIM) can evaluate renal perfusion and diffusion. These two techniques can noninvasively evaluate renal function and have high repeatability, which can be used for disease follow-up and prognosis observation. However, few studies have focused on researching the application of ASL and IVIM on pediatric IgAN and HSPN. The goal of this study is to investigate the evaluation of ASL and IVIM in differentiating IgAN from HSPN.

Methods There were twenty-five pediatric patients with nephropathy (IgAN, 12 cases; HSPN, 13 cases) for kidney examinations were performed on a 3.0T MR scanner (Ingenia CX, Philips Healthcare, the Netherlands) using 32-channel abdominal coil. The protocol consisted of T1WI, T2WI, ASL and IVIM. The detailed scan parameters were shown in Table 1. ASL images were processed in Philips's workstation (ISP, Philips Healthcare, the Netherlands) and region of interest (ROI) of renal cortex and medulla were delineated respectively. The measurement parameter of ASL is renal blood flow (RBF). MITK-Diffusion software (4.13.2, <https://www.mitk.org/>) was used to process IVIM images and outline ROIs of renal cortex and medulla, respectively. The IVIM measurement parameters include pure diffusion coefficient (D), the perfusion fraction (f) and the pseudodiffusion coefficient (D*). Independent Student's T test or Mann-Whitney U test were used to analyze the differences of ASL and IVIM parameters between IgAN and HSPN. The ROC curve of the above parameters was used to analyze the diagnostic efficiency between IgAN and HSPN. P values < 0.05 were considered significant.

Results Corresponding parameter mapping of ASL and IVIM were showed in Figure 1. The results showed that RBF of renal cortex of HSPN was higher than that of renal cortex of IgAN (305.04 ± 37.75 vs 273.18 ± 50.28 ; $P=0.017$) in Table 2. The D of renal medulla of IgAN was higher than that of renal medulla of HSPN (1.67 ± 0.24 vs 1.43 ± 0.18 ; $P=0.003$) in Table 3. The area under the ROC curves (AUCs) of RBF of cortex and D of medulla were 76.3% and 83.7% for identify IgAN and HSPN, respectively (Table 4 and Figure 2). The sensitivity of the above parameters with feasible thresholds were 61.5% and 76.9%, the corresponding specificity were 83.3% and 75.0%.

Conclusions fMRI can evaluate the renal function of pediatric patients with nephropathy. ASL and IVIM can achieve differentiate diagnosis of IgAN and HSPN. Further researches are essential for evaluating the progression and prognosis of pediatric nephropathy.

PO-2463

Development and validation of a risk prediction nomogram for multiple magnets ingestion in children, a large sample retrospective study

Yizhen Luo, hongwu Zeng
Shenzhen children's hospital

BACKGROUND & AIMS: In recent years, multiple magnets ingestion in children has rapidly increased worldwide. Timely gastroscopic or surgical intervention is extremely important for high-risk cases to reduce complications, while for low-risk patients, spontaneous discharge can be expected. Clinically, how to make a risk assessment and a scientific decision is the key step. This study is to develop an appropriate nomogram for risk management and judge decisions based on multiple clinical factors and radiology features.

METHODS: Patients with multiple magnets ingestion in Shenzhen Children's Hospital from 2017 to 2021 were enrolled in this study. Their clinical and radiology data were retrospectively analyzed. Single-factor and multi-factor logistic regression analyses were used to screen for risk factors, and clinical models (model C) and clinical imaging models (model C & R) were constructed. The two models were evaluated and validated by area under the curve (AUC), Hosmer-Lemeshow test, calibration curve, 1000 bootstrap decision curve analysis (DCA), NRI and IDI. Finally, the nomograms were plotted for the demonstration of two models.

RESULTS: Totally 113 cases with multiple magnets ingestion, 53 (45.1%) were treated with gastroscopy or surgery imperatively. After the screening, Model C included four independent risk factors: number of foreign bodies >4, vomiting, abdominal pain, and abdominal pressure pain, with an AUC of 0.924 (95% CI 0.875-974) and an internally validated AUC of 0.917. Model C&R included five independent risk factors: number of foreign bodies >4, vomiting, abdominal pain, abdominal pressure pain, and intestinal obstruction diagnosed on abdominal radiographs, with an AUC of 0.945 (95% CI 0.900,0.989). The calibration plots showed excellent agreement for both models. DCA had excellent net benefits. Comparing two models by NRI and IDI, Model C&R had superior performance.

CONCLUSION: In this study, Model C and Model C & R were built for the evaluation of multiple magnets ingestion in children, showing the good value of discrimination, calibration, and clinical utility. They can facilitate the clinical assessment and treatment strategy, whether it needs gastroscopic or surgical intervention for multiple magnets ingestion in children.

PO-2464

Comparison of maternal comfort level and fetal MR imaging quality in supine and left-lying position in a 75-cm bore magnet

Aonan Wang, Jiajia Xu, Shujing Li, Ran Huo, Ying Liu, Huishu Yuan
Peking University Third Hospital

Purpose Although supine and left-lying position had been recommended for fetal MR imaging, the supine position was still the mainly position in clinics, and little attention has been focused on maternal experiences during MR scans. This study aimed to compare the comfort level of pregnant women when imaging fetal brain in supine and left-lying position, and to compare the image quality when combined with a conventional or a super-flexible coil.

Methods Single pregnancy women were enrolled and performing fetal MR in a 75-cm bore scanner in supine and left-lying position. Participants scored the comfort level separately. The images were classified into Group1 (supine with conventional coil, n=50), Group2 (supine with super-flexible coil, n=50), and Group3 (left-lying with super-flexible coil, n=50) at a ratio of 1:1:1. The images were

scored subjectively by two radiologists and then measuring the signal-to-noise ratio and contrast-to-noise ratio objectively. Comfort level scores were compared between supine position and left-lying position; Subjective and objective scores of image quality were compared between Group1, Group2 and Group3.

Results A total of 50 pregnant women (13 in mid pregnancy and 37 in late pregnancy) were enrolled with gestational ages between 25 and 36 weeks (mean GA=30.5). Comfort level score of left-lying position was higher than supine position (4.2 ± 0.8 vs 3.8 ± 0.9 , $p < 0.05$). Subjective score showed no significant differences. Objective score showed SNR of Group3 was significantly higher than that of Group1&2 in bilateral frontal and right cerebellum. CNR of Group3 in right frontal lobe and right occipital lobe were significantly higher than that of Group1&2. Further analysis revealed women in late pregnancy contributed to the significance.

Conclusions In condition of a 75-cm bore system, left-lying position acquired higher comfort level scores and higher image quality than supine position, mostly for late pregnancy.

PO-2465

Early imaging differentiation of children with acute hematologic malignancies that present in pancytopenia

Wei Ma¹, Ye Xu²

1. The People's Hospital of Yubei District of Chongqing City
2. Children's Hospital of Chongqing Medical University

Objective: To find the potential differentiation indicators on thoracic and abdominal computed tomography (CT) among three hematologic malignancies characterized by acute pancytopenia in children.

Materials and Methods: Included in this study was a consecutive series of 133 children with pancytopenia, hospitalized in our institution from August 2016 to November 2021, who were divided into three groups, 23 children in Group 1 (malignancy associated hemophagocytic lymphohistiocytosis, M-HLH), 58 in Group 2 (acute leukemia, AL) and 52 in Group 3 (Epstein-Barr virus associated HLH, EBV-HLH). Differences of thoracic and abdominal CT features were statistically analyzed.

Results: 1. Chest CT: Incidences of pulmonary lesion, thickening of bronchovascular bundle, pleural effusion were significantly different among the groups. Short diameters of mediastinal largest lymph nodes (LLN) in Group 1 were significantly bigger than those in other groups. ROC analysis revealed a cut-off value of 11.45 mm (sensitivity 65.2% and specificity 98.2%) in distinguishing M-HLH from AL and a value of 11.60 mm (sensitivity 65.2% and specificity 100%) from EBV-HLH. Mediastinal LLNs in Group 1 were usually situated at retroinnominate space. Short diameters of axillary LLN in Group 1 was significantly bigger from those in Group 3. ROC analysis revealed a cut-off value of 5.95 mm (sensitivity 65.2% and specificity 76.9%). 2. Abdominal CT: Incidences of widened periportal space, ascites, splenomegaly and intrarenal lesion were significantly different among the groups. Short diameters of abdominal LLN in Group 1 was bigger than those in other groups. ROC analysis revealed a cut-off value of 9.30 mm (sensitivity 72.7% and specificity 77.2%) in distinguishing M-HLH from AL and a value of 9.60 mm (sensitivity 72.7% and specificity 75.0%) from EBV-HLH.

Conclusions: Thoracic and abdominal CT manifestations are usually different among pediatric hematologic malignancies that present in acute pancytopenia.

PO-2466

Altered functional connectivity density in distinct brain networks of early onset schizophrenia

Bochao Cheng^{1,2}, Xiao Hu¹

1. West China Second University Hospital of Sichuan University

2. Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

Aim: Schizophrenia is deemed to be a brain network or connectome disorder and is associated with brain development. Early-onset schizophrenia (EOS) provides an exceptional opportunity to evaluate neuropathology and the development of schizophrenia at a very early stage without potential confounding factors. The study intended to identify the abnormal function connectivity brain region in EOS patients.

Method: Function connectivity density (FCD) in resting-state functional Magnetic Resonance Imaging (rsfMRI) was used to investigate functional integrity of global brain regions in 76 first-episode, treatment-free EOS patients and 72 age and gender-matched healthy controls (HCs). As well as the correlation between the regional altered FCS and clinical variables in EOS patients was examined.

Result: Compared with HCs, EOS patients have lower total IQ scores and increased FCD in bilateral precuneus, left dorsolateral prefrontal cortex, left thalamus and left parahippocampus (paraHIP), and decreased FCD in right cerebellum posterior lobe and right superior temporal gyrus. The PANSS total score was positively related to the FCD in the left paraHIP in EOS patients.

Conclusion: Our study revealed the disrupted brain hubs for EOS concerning over-activation of DMN, ECN and limbic system, and suppression of MNS. Patients with EOS have a higher FCD in paraHIP which is positively related with total PANSS scores, implicating clinical symptoms are related to the altered connectome property of EOS. The disrupted functional brain connectivity maybe a neuroimaging biomarker in EOS and may have prognostic and therapeutic implications.

PO-2467

Quantification of myelination in Children with Attention-deficit/hyperactivity Disorder: A Comparative Assessment with Synthetic MRI and DTI

Shu Su, Liping Lin, Yingqian Chen, Yan Dai, Zhiyun Yang
First Affiliated Hospital, Sun Yat-sen University

Background: Evaluation of myelin content is crucial for attention-deficit/hyperactivity disorder (ADHD). To estimate myelin content in ADHD based on synthetic MRI-based method and compare it with established diffusion tensor imaging (DTI) method.

Methods: Fifth-nine ADHD and fifty typically developing (TD) children were recruited. Global and regional myelin content (myelin volume fraction [MVF] and myelin volume [MYV]) were assessed using SyMRI and compared with DTI metrics (fractional anisotropy and mean/radial/axial diffusivity). The relationship between significant MRI parameters and clinical variables were assessed in ADHD. **Results:** No between-group differences of whole-brain myelin content were found. Compared to TDs, ADHD showed higher mean MVF in bilateral internal capsule, external capsule, corona radiata, and corpus callosum, as well as in left tapetum, left superior fronto-occipital fascicular, and right cingulum (all PFDR-corrected < 0.05). Increased MYV were found in similar regions. Abnormalities of DTI metrics were mainly in bilateral corticospinal tract. Besides, MVF in the right retro lenticular part of internal capsule was negatively correlated with cancellation test scores ($r = -0.41$, $P = 0.002$), and MYV in right posterior limb of internal capsule ($r = 0.377$, $P = 0.040$) and left superior corona radiata ($r = 0.375$, $P = 0.041$) were positively correlated with cancellation test scores in ADHD.

Conclusions: Increased myelin content underscored the important pathway of frontostriatal tract, posterior thalamic radiation, and corpus callosum underlying ADHD, which reinforced the insights into myelin quantification and its potential role in pathophysiological mechanism and disease diagnosis.

PO-2468

Evaluation of Deep Gray Matter Iron and Myelin Changes in children with Attention-deficit/hyperactivity disorder: A Combined Assessment with QSM and Synthetic MRI

Shu Su, Liping Lin, Yingqian Chen, Yan Dai, Zhiyun Yang

Department of Radiology, First Affiliated Hospital, Sun Yat-sen University, Guangzhou, China.

Background: Application of magnetic susceptibility have been consistently demonstrated abnormal iron content in subcortical of ADHD children, but some uncertainties remain concerning the underlying neurobiological processes. We applied quantitative susceptibility mapping and synthetic magnetic resonance imaging (SyMRI) to clarify the relative contribution of iron and myelin changes to deep gray matter changes in ADHD.

Methods: Forty-eight drug-naïve pediatric ADHD and 41 age-, gender-, and handedness-matched typically developing controls (TDs) were enrolled. Compared with TDs, iron and myelin (concentration and content) of DGM, including subcortical and thalamic nuclei, were assessed with analysis of covariance. Partial correlation analysis was used to assess the relationship between significant MRI parameters and clinical symptom severity in ADHD.

Results: ADHD children showed significant increased iron content in the bilateral putamen and thalamic nuclei and reduced mean iron in bilateral substantia nigra (SN), left parabrachial pigmented nucleus (PBN) and right ventral tegmental area (VTA) (all $P < 0.001$, Bonferroni-corrected). Regarding myelin, increased myelin concentration was in the right caudate, left internal globus pallidus and bilateral SN, hypothalamus and mamillary nucleus (all $P < 0.001$, Bonferroni-corrected). Detailed results of the between-group analyses are reported in Table. For correlation analysis, iron concentration of left substantia nigra pars reticulata (SNpr, $r = -0.474$, $P = 0.0015$) and right SNpr ($r = -0.349$, $P = 0.0235$) were negatively correlated with clinical symptom severity of ADHD patients.

Conclusions: The subcortical maturation delay and dysfunction in dopaminergic transmission may play an important role in the pathophysiology of ADHD. Our findings provide new potential targets to investigate the pathophysiology of ADHD.

PO-2469

Cortical microstructural abnormality of Self-limited epilepsy with centrotemporal spikes: a surface-based and voxel-based morphometry

Yanyong Shen,Zhao Xin,Zhang Xiaolan
The Third Affiliated Hospital of Zhengzhou University

Rationale and Objectives Through surface-based morphometry (SBM) and voxel-based morphometry (VBM) to explore the cortical microstructure abnormality of Self-limited epilepsy with centrotemporal spikes (SeLECT).

Materials and Methods 3DT1 images of 38 children with SeLECTS and 46 age- and gender-matched healthy control children were acquired. Then cortical reconstruction and grey-white matter tissue contrast (GWC) calculation were performed using Freesurfer, and FSL to perform the voxel-based morphometry.

Results The results show that clusters of significantly reduced GWC compared with the healthy control group were found in the left paracentral gyrus, left lateral occipital gyrus, and right superior frontal in children with SeLECTS ($p < 0.05$). Furthermore, cortex volume in the left lateral occipital cortex and right middle temporal gyrus was reduced significantly ($p < 0.05$). Moreover, the left occipital lobe's gray matter (GM) volume decreased in VBM analysis. In correlation analysis, GWC was negatively correlated with age and duration of epilepsy onset, cortex volume was positively correlated with onset age, and decreased GM volume of the left occipital lobe in VBM analysis was negatively correlated with epilepsy duration.

Conclusion Several representative cortical microstructure measurements of SeLECTS were significantly reduced compared with healthy control children, which may indicate the presence of cortical microstructure abnormalities in SeLECTS and help to understand the pathogenesis and pathophysiology of SeLECTS.

PO-2470

Forensic age estimation of living hands and wrists: A comparison of MRI and X-ray to evaluate the feasibility of MRI estimation of bone age

Lei Wan
Academy of Forensic Science

Objective: To compare the effects of X-ray and MRI on bone age assessment and evaluate whether MRI can meet the requirements of bone age assessment in children and adolescents. **Methods:** X-ray data of 500 patients and MRI data of 497 patients were collected during routine medical investigation. Both groups were aged between 6 and 20. The four-stage system (Kramer's modified classification system) was used to assess the development of ossification and to analyze differences in growth-plate fusion in MRI and X-ray images. Define minimum, maximum, mean, standard deviation, standard error, median, and 95% confidence intervals for X-rays and MRI in men and women of all age groups. Kruskal-Wallis H method was used to analyze the differences among the groups. **Results:** The age of epiphyseal fusion in male was 1~2 years later than that in female. The correlation coefficients between the ossification stage of distal radius, distal ulna, first metacarpal bone, first proximal phalangeal bone, and second to fifth metacarpal bone (x1, x2, x3, x4, x5) and real age were 0.90, 0.90, 0.88, 0.90, 0.89, respectively. The X-ray correlation coefficients of male wrist and hand were 0.86, 0.87, 0.84, 0.85 and 0.86, respectively. For MRI of female wrist and hand, the correlation coefficients of x1, x2 and x3 ossification stage with real age

were 0.91, 0.92 and 0.85, respectively. The X-ray correlation coefficients of female wrist and hand were 0.89, 0.86 and 0.83, respectively. The correlation coefficient of wrist ossification stage in MRI images of male and female wrist was slightly higher than that of X-ray, with no statistical significance ($p>0.05$). Conclusion: MRI is an effective and reliable method for bone age assessment. In addition, there is no radiation during the MRI scan, making it safer to estimate the living age.

PO-2471

Non-ECG-triggered dual-source dependent CTA in children with congenital heart disease

Shipeng Zhang

Medical Imaging Center, Gansu Provincial Maternal and Child-care Hospital

Abstract

Objective: To explore the value of non-electrocardiogram-triggered (non-ECG-triggered) on third-generation dual-source CT application in children with congenital heart disease (CHD) in a high heart rate.

Methods: Data on children with CHD received cardiac CT angiography (CTA) were collected between November 2019 and March 2021. CT images were obtained using two different protocols: non-ECG-triggered and retrospectively-ECG-triggered (retro-ECG-triggered). All children received transthoracic echocardiography (TTE) before surgery. Sex, age, weight, heart rate, volume CT dose index (CTDI vol), and dose length product (DLP) were recorded, and the effective dose (ED) was calculated. Image quality was rated using five-point Likert scales and the diagnostic values of CTA and TTE were compared.

Results: Children's age ranged from 1 day to 34 months, with minimum and maximum heart rates of 90 bpm and 160 bpm. There were significant differences between the retro- and non-ECG-triggered groups in the average tube current (54.95 ± 23.52 vs. 45.47 ± 24.65 mAs, $p=0.003$), CTDI vol (2.41 ± 1.6 vs. 0.58 ± 0.27 mGy, $p<0.001$), DLP (44.43 ± 34.65 vs. 9.92 ± 5.48 mGy.cm, $p<0.001$), and ED (1.48 ± 0.90 vs. 0.35 ± 0.17 mSv, $p<0.001$). There was no difference between the two protocols in the demonstration of extracardiac and intracardiac malformations (all $p\geq0.05$). The diagnostic accuracy of both retro- and non-ECG triggering in intracardiac and extracardiac malformations were high with no significant differences ($p=1.00, 0.80$). The diagnostic advantage of TTE is mainly in intracardiac malformations ($p=0.03, 0.01$).

Conclusions: High-pitch non-ECG-triggered CTA can significantly reduce radiation dose, whereas there was no significant difference in image quality and diagnostic accuracy between non- and retro-ECG-triggered CTA.

PO-2472

ASSEMENT OF ULTRA-LOW-DOSE CHEST CT IMAGING USING A NOVEL ARTIFICIAL INTELLIGENCE ITERATIVE RECONSTRUCTION TECHNIQUE IN INFANTS WITH CONGENITAL HEART DISEASE

Feifei Zhang, Yinghui Ge

Fuwai central china cardiovascular hospital

Background Radiation dose is still the most important issue for infants to undergo CT scanning now. But sometimes it is inevitable for infants with congenital heart disease to undergo chest

computed tomography (CT) examination to rule out lung diseases, such as tracheobronchial stenosis, pneumonia, etc. Based on this situation, it is very meaningful to reduce the dose of chest CT scan as much as possible without affecting the diagnosis.

Objective To investigate the image quality and feasibility of a novel artificial intelligence iterative reconstruction (AIIR) algorithm for chest CT with a low radiation dose protocol in comparison with hybrid iterative reconstruction (HIR) algorithm for standard chest CT.

Method Participants were divided into two groups: SDCT (80kV, 100mAs) and LDCT (80kV, 10mAs). SDCT was reconstructed using the HIR method, and LDCT was reconstructed using the HIR method (LDCT-HIR) and AIIR (LDCT-AIIR) respectively. Objective parameters (Noise, SNR, CNR) and subjective parameters (overall image quality, depiction of normal and abnormal lung structures) were compared between three image series.

Result 104 patients (mean age, 7.56M; mean weight, 7.08Kg) were enrolled in SDCT, and 119 patients (mean age, 6.32M; mean weight, 6.73Kg) in LDCT. The mean effective doses were 0.83 ± 0.01 mSv for SDCT and 0.08 ± 0.00 mSv for LDCT. The noise of LDCT-AIIR was lowest, the SNR and CNR of it were highest. All the subjective parameters of LDCT-HIR were significantly lower than SDCT and LDCT-AIIR. The Overall image quality of LDCT-AIIR was 4.07 ± 0.55 , which was adequate for diagnosis. While the Overall image quality of LDCT-HIR was 1.97 ± 0.51 , which was can't be used for clinical diagnosis.

Conclusion LDCT-AIIR had approximately 90 % dose reduction compared with SDCT while maintaining image quality on chest CT of infants.

PO-2473

Altered White Matter Integrity and Gray Matter Morphology in pediatric acute lymphoblastic leukemia without clinically diagnosed central nervous system infiltration

Liping Lin, shu su, yingqian chen, zhiyun yang
Department of Radiology

Purpose: Dysfunction of the glymphatic system is present in pediatric acute lymphoblastic leukemia (ALL) without clinically diagnosed central nervous system (CNS) infiltration; however, brain structure alterations in such cases are still unclear. We aim to explore white matter (WM) and grey matter (GM) alterations using surface-based morphometry (SBM) and tract-based spatial statistics (TBSS) methods in pediatric ALL without CNS infiltration.

Methods: Thirty-five ALL and 33 typically developing (TD) children were prospectively recruited. They underwent three-dimensional T1-weighted and diffusion tensor (DTI) imaging. DTI metrics were compared between groups differences. Additionally, analyses of cortical GM features were conducted to determine group differences in cortical surface area (CSA), thickness (CT), and volume (CV), as well as deep GM nuclei volume using T1-weighted imaging.

Results: In pediatric ALL, the only identified WM change was an increased FA in the body of corpus callosum (P_{FWE-corrected} = 0.023) and left superior coronal radiata (P_{FWE-corrected} = 0.045). Relative to TDs, pediatric ALL presented a significant decrease in CSA, CT, and CV in orbital gyri, supramarginal gyrus, middle temporal gyrus, and superior temporal gyrus (all CWP = 0.01). Additionally, increased CT and CSA were found in lingual gyrus and left sulcus intermedius primus, respectively (all CWP = 0.01). Smaller volumes in pediatric ALL were observed in bilateral thalamus, caudate, hippocampus, and right putamen (P_{FDR-corrected} < 0.05).

Conclusions: Widespread brain structural abnormalities were found in pediatric ALL without clinically diagnosed CNS infiltration, which might provide novel insight into the pathophysiology of pediatric ALL, treatment, brain development, and long-term outcomes.

PO-2474

Relative mediastinal displacement index: A stable indicator to predict adverse events for fetuses with isolated left congenital diaphragmatic hernia by prenatal MRI

Fan Wu¹, Yonghao Chen¹, Xin Zhang¹, Yuchao Li¹, Zhaoji Chen¹, Chaoxiang Yang², Hongsheng Liu¹

1. Guangzhou Women and Children's Medical Center, Guangzhou Medical University, Guangdong Provincial Clinical Research Center for Child Health, Guangzhou, 510623, China

2. Guangdong Women and Children's Hospital and Health Institute, Guangzhou, China

Objective To quantify the extent of mediastinal displacement in fetus with isolated left congenital diaphragmatic hernia (iLCDH) with the new MRI parameter which is defined as relative mediastinal displacement index (RMDI) and to verify its efficacy in predicting adverse events including in-hospital deaths or the use of extracorporeal membrane oxygenation (ECMO). And to investigate the gestational age (GA) related stability of RMDI.

Methods A retrospective analysis was performed on 139 fetuses with prenatally diagnosed iLCDH (24 with adverse events and 115 without) and 36 controls without chest lesions and chromosomal anomalies. RMDI was measured on T2WI-TRUFI or T2WI-SSFSE axial images. The calculation formula of RMDI is $(DL + DR) / DH$. For all fetuses, the RMDI was determined by two operators and inter-operator variability. And the GA-related changes were investigated in both groups. The efficacy of RMDI predicting postnatal survival was compared with observed/expected total fetal lung volume (o/e TFLV) and mediastinal shift angle (MSA).

Results In the iLCDH and control groups, RMDI did not change with GA ($P > 0.05$). There were significant differences in RMDI values not only between the iLCDH group [0.890 (0.650, 1.000)] and the control group [-0.245 (-0.357, -0.170)] ($Z = -9.209$, $P < 0.001$), but also between with [1.23 (1.15, 1.47)] and without [0.82 (0.59, 1.00)] adverse events in the iLCDH group ($P < 0.001$). The best cut-off value of RMDI was 1.105 (sensitivity = 83.3%; specificity = 93.04%). Meanwhile, there was a significant difference in diagnostic accuracy between RMDI [AUC = 0.900 (95% CI 0.837-0.944)] and MSA [AUC = 0.820 (95% CI 0.746-0.880)] ($P = 0.041$), and between RMDI and o/e TFLV [AUC = 0.728 (95% CI 0.647-0.800)] ($P = 0.003$).

Conclusion RMDI is expected to be a stable, simple and accurate tool for predicting adverse events including in-hospital deaths or the use of ECMO in fetuses with iLCDH. The test performance of RMDI is better than o/e TFLV and MSA.

PO-2475

Dose optimization for pediatric on Emergency head CT : from age-specific to size-specific study

Liwei Hu¹, Jingyi Wang², Guozhi Zhang², Yumin Zhong¹

1. Shanghai Children's Medical Center

2. Shanghai United Imaging Healthcare Co., Ltd.

Purpose

To investigate the possibility of replacing the conventional age-specific with a size-specific one for pediatric patients on Emergency head CT.

Methods and Materials

Firstly, a retrospective analysis was performed to confirm the appropriateness of the age-specific scanning protocol in head CT for pediatric patients. Fifty-five 5-year-old pediatric patients who underwent head CT with the same acquiring parameters (100kVp, 250mAs) were included, and the results showed that there were significant differences in image quality among pediatric patients

with different head diameters, which were defined as the distance between temples. Secondly, the prospective research was conducted to explore the feasibility of replacing the age-specific head CT protocol with a size-specific scanning protocol for pediatric patients based on head diameters. One hundred and ninety-one pediatric patients were enrolled and assigned to groups A (150-160 mm) and B (160-170 mm) according to their head diameters. In group A, six subgroups were divided, where the tube current was adjusted from 250mAs (reference) to 190mAs, one set every 10mAs. The noise, contrast-to-noise ratio (CNR), signal-to-noise ratio (SNR), and subjective score were compared. The image quality was evaluated subjectively by using the five-point Likert scale (5: excellent, 1: poor), which was compared using the independent T-test.

ResultsIn the prospective study, the noise on images with 190mAs in group A was significantly higher than that on images with 250mAs ($p<0.001$). The SNR, CNR, and subjective scores on images with 190mAs in group A were significantly lower than those on images with 250mAs ($p<0.001$). In addition, the objective and subjective scores with 200mAs were comparable to those with 250mAs ($p>0.05$). The results proved that 200 mAs was the lowest available tube current for pediatric patients with a head diameter of 150-160mm, and the corresponding lowest CT dose index-volume (CTDIvol) was 21.05 mGy. Similarly, the lowest tube current and CTDIvol required for pediatric patients in Group B were 210mAs and 22.07mGy, respectively.

ConclusionReplacing the age-specific head CT with the size-specific head CT for pediatric patients is possible.

It is more scientific to select the appropriate scanning parameters and radiation dose based on the differences of head diameters.

Clinical Application

The size-specific head CT could reduce the radiation dose for emergency pediatric patients reasonably when maintaining the image quality, which might improve the patient care.

PO-2476

Structural or/and functional MRI-based machine learning for the diagnosis of attention-deficit/hyperactivity disorder: a systematic review and meta-analysis

Lu Tian, helin Zheng, jinhua Cai

Children's Hospital Affiliated to Chongqing Medical University

Background: Attention-deficit/hyperactivity disorder (ADHD) is one of the common neuro-developmental diseases among children, and its diagnosis is mainly depend on behavior analysis, which is subjective and inconsistent. Therefore, the diagnosis of ADHD requires objective and quantizable evidence. With the development of artificial intelligence (AI) in the field of medicine, Machine learning (ML) techniques based on structural magnetic resonance imaging (sMRI) or/and functional MRI (fMRI) have shown powerful capabilities in neuroimaging processing, and provided a new opportunity for the objective diagnosis of ADHD. However, the results of these studies varied widely and were difficult to directly compare, mainly due to diverse ML methods, especially in terms of feature selection and classifier selection. Therefore, the diagnostic value of ML techniques based on sMRI or/and fMRI for ADHD remains elusive. The aim of this study was to investigate the diagnostic value of ML techniques based on sMRI or/and fMRI for ADHD through a meta-analysis of the existing studies.

Method: We conducted a comprehensive search (from database creation date to March 2023) for relevant English articles on sMRI or/and fMRI-based ML techniques for diagnosing ADHD. The pooled sensitivity, specificity, positive likelihood ratio (LR+), negative likelihood ratio (LR-), summary receiver operating characteristic (SROC) curve and area under the curve (AUC) were calculated to assess the diagnostic value of sMRI or/and fMRI-based ML techniques. The I² test was used to assess heterogeneity and the source of heterogeneity was investigated by performing

a meta-regression analysis. Publication bias was assessed using the Deeks funnel plot asymmetry test.

Results: Forty-one studies were included in the systematic review, 26 of which were included in our meta-analysis. The pooled sensitivity and specificity of sMRI or/and fMRI-based ML techniques for the diagnosis of ADHD were 0.74 (95% CI 0.66-0.81) and 0.75 (95% CI 0.67–0.82), respectively. SROC curve showed that AUC was 0.81. Based on these findings, the sMRI or/and fMRI-based ML techniques have relatively good diagnostic value for ADHD. The sMRI or/and fMRI-based ML techniques have a moderate positive likelihood ratio (3.0) and a relatively low negative likelihood ratio (0.34), indicating that sMRI or/and fMRI-based ML techniques had good ability to confirm or exclude ADHD. Deeks' funnel plots for included studies showed unpublished bias ($P > 0.05$). However, substantial heterogeneity was detected among the studies ($I^2=98.11\%$, 95% CI 97.78-98.44). We performed subgroup analyses and meta-regression analysis to identify the source of heterogeneity. The meta-regression analysis showed that the feature (functional connectivity (FC) vs. non-FC), imaging modality (sMRI and fMRI vs. sMRI or fMRI) and classifier (support vector machines (SVM) vs. non-SVM) were the source of heterogeneity for these studies. And the subgroup analysis results showed that: 1) there was no statistical difference in the diagnosis of ADHD between the study group that selected only morphological features and the study group that selected only functional features; 2) The sensitivity and specificity of the study group selecting combination of morphological and functional features were slightly higher than those of the study group that only selective morphological or functional features; 3) The sensitivity and specificity of the study group selecting FC feature were slightly higher than those of the study group that did not selective FC feature, suggesting that FC feature should be an important discriminative feature for the diagnosis of ADHD; 4) the sensitivity and specificity of the study group selecting SVM classifier were higher than those of the study group that did not selective SVM classifier, suggesting that the advantage of SVM as a machine learning technology classifier for ADHD diagnosis.

Conclusions: This paper reviewed the research progress of sMRI or/and fMRI-based ML techniques in the diagnosis of ADHD, and explore the diagnostic accuracy of sMRI or/and fMRI-based ML techniques for ADHD through a meta-analysis of the existing studies. Despite automatic ADHD diagnostic ML techniques based on MRI/fMRI data is a challenging task, Our meta-analysis showed revealed the potential of sMRI and fMRI-based machine learning techniques for the diagnosis of ADHD through systematic review and meta-analysis. we hope that the results of the above meta-analysis could promote further development in this field.

PO-2477

White Matter Integrity Abnormalities in children with Global Developmental Delays: A DKI Study Utilizing Tract-Based Spatial Statistics and ROI-Based Analysis

Yanyong Shen,Xin Zhao,Xiaoan Zhang
郑州大学第三附属医院（河南省妇幼保健院）

Abstract: Objective This study aimed to assess white matter integrity in children with global developmental delay (GDD) using diffusion kurtosis imaging (DKI) and its derived white matter tract integrity (WMTI) metrics, and to investigate the relationship between diffusion parameters and development quotient (DQ). Methods We enrolled 34 children with GDD and 44 healthy controls in this study and acquired MRI images. Diffusion parameters, including fractional anisotropy (FA), mean diffusivity (MD), axonal diffusivity (AD), radial diffusivity (RD), anisotropy (MO), mean kurtosis (MK), axial kurtosis (AK), kurtosis fractional anisotropy (FAK), radial kurtosis (RK), and WMTI parameters, such as the axial diffusivity of the extra-axonal space (EAS_AD), the radial diffusivity of the extra-axonal space (EAS_RD), the diffusivity of the intra-axonal space (IAS_DA), the axonal water fraction (AWF), and the tortuosity of the extra-axonal space (EAS_TORT), were obtained by Pydesigner and FSL procedure. We used tract-based spatial statistics analysis to compare the

diffusion parameters of the whole brain and covariance analysis to compare the diffusion parameters in the corpus callosum's genu, body, and splenium. Lastly, we used partial correlation analysis to assess the correlation between diffusion parameters and DQ. Results The results of TBSS showed that FA, AD, MO, MK, RK, and EAS_TORT were significantly reduced ($P<0.05$), while RD, AK, KFA, AWF, EAS_AD, and EAS_RD significantly increased in children with GDD compared to healthy controls ($P<0.05$). In the corpus callosum, FA, MO, IAS_DA, and EAS_TORT were significantly reduced ($P<0.05$), while AK, KFA, and AWF were significantly increased ($P<0.05$). In the correlation analysis, fine motor skills DQ was negatively correlated with AK and AWF ($P<0.05$) and positively correlated with MO ($P<0.05$). Additionally, Adaptability DQ was negatively correlated with AWF ($P<0.05$). Conclusion DKI and its derived WMTI parameters can be used to characterize the white matter integrity of children with GDD and have a certain correlation with the DQ, which can aid in understanding the specific pathological changes inside and outside axons and assist in clinical diagnosis.

PO-2478

Microstructural alterations of the corpus callosum in young-age autism spectrum disorder: a diffusion kurtosis imaging study

Yanyong Shen,Xin Zhao,Xiaoan Zhang
郑州大学第三附属医院 (河南省妇幼保健院)

Abstract

Objective The objective of this study was to analyze the changes in the microstructure of the corpus callosum in preschool children with autism spectrum disorder (ASD) and to determine the diagnostic value of diffusion kurtosis imaging and its derived White Matter Tract Integrity (WMTI) index. **Methods** Fifty-eight children with ASD and 43 healthy control (HC) children were acquired DKI images, and DKI parameters and WMTI parameters were calculated. The differences between the groups of these diffusion parameters were compared, and Logistic Regression (LR) and Linear Discriminant Analysis (LDA) models were constructed to evaluate the ability of each diffusion parameter to distinguish between ASD and HC. **Results** The results showed that children with ASD had a significant increase in the AD of the corpus callosum's three subregions, as well as a significant increase in the MD of the body and splenium. There was no substantial difference in FA and RD compared to the HC group. In the DKI index, the three subregions of the corpus callosum in children with ASD showed a significant increase in MK, AK, and KFA. The WMTI parameters indicated that AWF was considerably increased in all three subregions of the corpus callosum, and EAS_AD had a significant increase in the genu of the corpus callosum compared to the HC group. Children with ASD also exhibited a significant increase in EAS_TORT and a significant decrease in EAS_RD in the body of the corpus callosum. Furthermore, the DKI and its derived WMTI parameters proved highly effective in diagnosing ASD, with the LR-Bootstrap model constructed from AWF parameters demonstrating the highest AUC value and accuracy. **Conclusion** In conclusion, this study suggests that DKI and its derived WMTI parameters can effectively evaluate the abnormalities of callosum microstructure in children with ASD. MK and AWF parameters have high diagnostic value and could prove useful in the diagnosis and treatment of ASD.

PO-2479

Cortical gray-white matter contrast abnormalities in male children with attention deficit hyperactivity disorder

Changhao Wang^{1,2}, Yanyong Shen^{1,2}, Meiyong Cheng^{1,2}, Xiaoxue Zhang^{1,2}, Zhanqi Feng^{1,2}, Zhexuan Yang^{1,2}, Xin Zhao^{1,2}

1. The Third Affiliated Hospital of Zhengzhou University

2. Henan International Joint Laboratory of Neuroimaging

Purpose: Presently, research concerning alterations in brain structure among individuals with attention deficit hyperactivity disorder (ADHD) predominantly focuses on entire brain volume and cortical thickness, either globally or within specific brain regions. In this study, we extend our examination to the cortical microstructure of male children with ADHD. To achieve this, we employ the gray-white matter tissue contrast (GWC) metric, allowing for an assessment of modifications in gray matter density and white matter microstructure. Furthermore, we explore the potential connection between GWC value and the severity of disorder in male children affected by ADHD.

Methods: We acquired 3D-T1 sequences from the public ADHD-200 database. In this study, we conducted a comparative analysis between 43 male children diagnosed with ADHD and 50 age-matched male controls exhibiting typical development trajectories. Our investigation entailed assessing differences in GWC values and cortical thickness. Additionally, we explored the potential correlation between GWC values and the severity of ADHD. To delineate the cerebral landscape, each hemisphere was subdivided into 34 cortical regions using freesurfer 7.2.0. For quantification, GWC values and cortical thickness were computed by evaluating the intensity contrast of non-normalized T1 images above and below the gray-white matter interface.

Results: Our findings unveiled elevated GWC values within the bilateral parahippocampal, bilateral insular, and left transversetemporal regions in male children with ADHD when contrasted with their healthy counterparts. Moreover, compared to the healthy control group, ADHD-afflicted children exhibited increased cortical thickness in the bilateral superiorparietal, left superiortemporal, left transversetemporal, and right cuneus areas. Intriguingly, the GWC value of left transversetemporal demonstrated a negative correlation with the extent of inattention experienced by male children with ADHD.

Conclusion: Utilizing GWC as a metric facilitates a more comprehensive assessment of microstructural brain changes in children with ADHD. The fluctuations in GWC values observed in specific brain regions might serve as a neural biomarker, illuminating structural modifications in male children grappling with ADHD. This perspective enriches our comprehension of white matter microstructure and cortical density in these children. Notably, the inverse correlation between the GWC value of the left transversetemporal and inattention severity underscores the potential role of structural and functional anomalies within this region in ADHD progression. Enhancing our insight into ADHD-related brain changes holds significant promise in deciphering potential neuropathological mechanisms. Such understanding is pivotal for robust disease evaluation, facilitating early diagnoses, timely intervention, and prognosis estimation in affected children.

PO-2480

Performance Evaluation of Deep Learning-based Bolus-tracking Technology For pediatric abdominal enhanced CT

nan yang
Tianjin Children Hospital

Purpose: The process of bolus-tracking scans before CT angiography usually include monitoring location selection and region-of-interest (ROI) placement to generate a time-density curve (TDC) triggering the CT scan. In this study, we aimed to evaluate the performance of an artificial

intelligence-based algorithm, SmartPlan, for the bolus-tracking process in pediatric abdominal enhanced CT examination.

Methods: 226 pediatric abdominal enhanced CT data were prospectively collected. The monitoring locations for placing ROI by experienced technicians for dynamic contrast-enhancement monitoring in bolus-tracking scans and TDC generated in the ROIs were recorded as the control group; The scout scans and time-resolved images were then imported into the SmartPlan software to automatically determine the monitoring location for placing ROI and to generate TDC, and the results were recorded as the experimental group. There are two steps during the SmartPlan process, monitoring section selection and ROI selection. For the monitoring section selection step, we calculated the accuracy of section selection and defined SmartPlan as accurate if the distance between the section selected by SmartPlan and the section selected by technicians was less than 1cm. For the ROI selection, we calculated the passing ratio of SmartPlan and defined the passing criteria as ROIs were located inner the aortas.

Results: For the monitoring section selection and ROI selection process in SmartPlan, the accuracy of monitoring section selection was 97.35% with a 95% Confidence Interval [95.24%, 99.44%], and the passing ratio of monitoring ROI selection was 0.962 with 95% Confidence Interval [0.919, 1]. There was no difference in the peak value of TDC curves between the experimental and control groups (all $P > 0.05$). Time-consuming was found significantly decreased by 18.18 ± 1.17 seconds in the experimental group compared with that in the control group ($P < 0.05$).

Conclusions: The AI-based automatic bolus-tracking technique can efficiently provide good performance on bolus-tracking accuracy of pediatric abdominal enhanced CT with experienced technicians.

Clinical Relevance: The AI-based automatic bolus-tracking technique could simplify the CT scan process of pediatric abdominal enhanced CT by fast and acutely automatically triggering CT scans.

PO-2481

The Optimal Level of Adaptive Statistical Iterative Reconstruction Veo Algorithm for Improvement of the Pediatric Superior Mesenteric Artery Image Quality in the Era of Dual-Energy Spectral CT

Zijian Wang, Nan Yang, Zhe Yan, Chunxiang Wang
Tianjin Children's Hospital

Objective: To investigate the effect of the optimal level of adaptive statistical iterative reconstruction Veo (ASiR-V) on improving the superior mesenteric artery (SMA) image quality in pediatric abdominal enhanced spectral CT scanning.

Materials and Methods: Thirty pediatric patients who underwent upper abdominal enhanced gemstone spectral CT angiographic scans were retrospectively involved in this study. 120kVp-like images with 11 ASiR-V levels (from 0% to 100% at 10% increments) of the arterial phase were evaluated. Quantitative analysis included measurement of the CT value, image noises (IN), background CT value and noises, contrast-to-noise ratio (CNR), signal-to-noise ratio (SNR), and image scores of the vessels and surrounding tissues. Two senior radiologists assessed qualitative analysis using a 5-point Likert scale independently. The quantitative and qualitative data were compared with the linearly blended data set using McNemar's and Mann-Whitney U tests, respectively. The interobserver agreement for quantitative data was plotted using Bland Altman plots, and qualitative data were evaluated using weighted kappa statistics.

Results: CT value of the SMA and surrounding tissues showed no statistical difference among 120kVp-like images with 11 ASiR-V levels (all $P > 0.05$), while there were significant differences in image noise, SNR and CNR among images with 11 ASiR-V levels (all $P < 0.05$). Specifically, image noise gradually decreased, and SNR and CNR increased with the increase of ASiR-V level.

However, the qualitative assessment showed that 120 kVp-like images with 50% ASiR-V achieved the highest scores.

Conclusion: 120kVp-like imaging combined with 50% iterative reconstruction can significantly improve the image quality of the superior mesenteric artery of children.

Clinical Relevance: Lately, spectral CT is finding increasing applications in evaluating abdominal pathologies. We revealed that 120kVp-like imaging combined with 50% ASiR-V could improve the image quality of the superior mesenteric artery (SMA) in pediatric abdominal enhanced spectral CT scanning.

PO-2482

A comprehensive segmentation of chest X-ray improves deep learning-based WHO radiologically confirmed pneumonia diagnosis in children

Lin Zhang, Jungang Liu
Xiamen Children's Hospital

Objectives: To investigate a comprehensive segmentation of chest X-ray (CXR) in promoting deep learning-based World Health Organization (WHO)'s radiologically confirmed pneumonia diagnosis in children.

Methods: A total of 4400 participants were identified and divided into primary endpoint pneumonia (PEP), other infiltrates and normal groups according to WHO's diagnostic criteria. In the comprehensive segmentation stage, the CXR was divided into six segments of left lung, right lung, mediastinum, diaphragm, ext-left lung and ext-right lung by adopting the RA-UNet. In the pneumonia diagnosis stage, seven feature combinations between the six segments were devised, and fed into the CBAM-ResNet for the three-category classification. Besides, the interpretability of the CBAM-ResNet for pneumonia diagnosis was also performed by adopting a Grad-CAM module.

Results: The RA-UNet achieved a high spatial overlap between manual and automatic segmentation (averaged DSC=0.9639). The CBAM-ResNet when fed with the six segments achieved superior three-category diagnosis performance (Accuracy=0.8243) over other feature combinations such as solely left and right lungs and other deep learning models under comparison, which was increased by around 6% in accuracy, precision, specificity, recall, F1-score, and around 3% in AUC. The Grad-CAM could also capture the pneumonia lesions more accurately, generating a more interpretable visualization results and enhancing the superiority and reliability of our study in assisting pediatric pneumonia diagnosis.

Conclusions: This study demonstrated that the comprehensive segmentation of CXR could improve deep learning-based pneumonia diagnosis in childhood with a more reasonable WHO's radiological standardized classification of pneumonia instead of conventional dichotomous bacterial pneumonia and viral pneumonia.

PO-2483

Exploring the clinical value in dual energy spectral imaging multi-material artifact reduction (MMAR) technique for metal foreign bodies in the stomach of children

Shuang Ma
Tianjin Children's Hospital

ObjectiveTo assess the clinical value of spectral CT Multi-Material Artifact Reduction (MMAR) by comparing the artifact index in the scanning of metal foreign bodies in the intestinal canal of children.

Methods24 children (aged 1-10 years) who ingested metallic foreign bodies in the digestive tract and underwent spectral CT examination were retrospectively selected. The noise (standard deviations, SD) and contrast-to-noise ratio (CNR) were calculated on MAR images and non-images. artifact index (AI) was used to evaluate the image quality of the two groups of images subjectively by two doctors with many years of experience.

ResultsThe CNR of MAR group images was significantly higher than that of non-MAR group, and the SD value and AI value of MAR group images were significantly lower than those of non-MAR group (all $P < 0.05$) in the affected organs such as intestinal canal, liver, kidney as well as vertebral bodies. The subjective score of image quality in MAR group was higher than that in non-MAR group, and the difference was statistically significant.

ConclusionMMAR can significantly reduce the artifacts of metallic foreign bodies in the digestive tract and improve the image quality.

PO-2484

Prediction of drug treatment response in children under 3 years old with asthma by using the morphological structure of large airways

Xin Hou, Yuewen Hao, Peng Zhang
Xi'an Children's Hospital

Background: Pediatric asthma usually begins before the age of three. Without objective and quantitative indices, its early diagnosis and severity assessment always remains a challenge. Studies have shown that changes of large airway structures in asthmatic adults may represent the early stage of asthma.

Purpose: To investigate the morphological characteristics of large airways in children with asthma and explore the potential image markers for predicting asthma severity.

Material and Methods: In this study, we retrospectively analyzed low-dose computed tomography (CT) data, exploring whether the morphological characteristics of large airways could predict the drug treatment response in children with asthma under 3 years of age by using a machine learning method.

Results: Two hundred and forty-four children with asthma were diagnosed as having moderate ($n = 164$) and severe ($n = 80$) asthma by observing their drug treatment responses. For the between-group comparison, the airway in patients with severe asthma exhibited more uneven wall thickness and higher degree of ellipticity, suggesting subtle changes of the morphological structure of large airways in children with severe asthma. Furthermore, using these airway morphological measurements, moderate and severe cases were correctly classified with an area under the receiver operating characteristic curve (AUC) of 0.83 and an accuracy of 0.79.

Conclusion: Our findings can provide information as to the understanding of asthma pathogenesis, the predicted progression of the disease, and an effective therapeutic window for the early clinical stages of asthma

PO-2485

Altered neurovascular coupling in children with refractory temporal lobe epilepsy

Haifeng Ran, Yulun He, Yuxin Xie, GuiQin Chen, Tijiang Zhang

Department of Radiology, the Affiliated Hospital of Zunyi Medical University, Medical Imaging Center of Guizhou Province, Zunyi 563000, China;

Introduction: Pediatric epilepsy patients account for approximately 10.5 million cases, and the frequent seizures often affect the growth and development of these children^{1,2}. Early diagnosis are critical to improve the prognosis of children with epilepsy. Temporal lobe epilepsy (TLE) is one of the most common types of medically refractory epilepsy, which lack of objective biomarkers to make diagnosis. Basic research has confirmed that recurrent epileptic seizures can lead to neurovascular coupling (NVC) alteration, which may be a potential objective biomarker for TLE³⁻⁶. However, specific neuroimaging evidence of NVC alterations in children with refractory left TLE are still lacking. Thus, this study aimed to evaluate the NVC alteration and its clinical significance in childhood refractory left TLE combining resting-state functional magnetic resonance imaging (rs-fMRI) and arterial spin labeling (ASL) and provide a new perspective to understand the neuropathological mechanisms of this disease.

Methods: The study finally included 59 right-handed subjects (24 children with refractory left TLE and 35 healthy controls [HCs]). The inclusion criteria for the case group were as follows: (1) clinically diagnosed refractory TLE; (2) Conventional head MRI examination results were normal; and (3) age 6-16 years at the time of MRI scanning. The exclusion criteria were: (1) any other neurological disorders and/or history of malignant tumors or head trauma; (2) image artifacts affecting the image analysis; (3) history of substance abuse; and (4) head motion with maximum displacement >3 mm or >3° rotation noted during rs-fMRI data preprocessing. All participants underwent MRI scans using a 3.0-T magnetic resonance scanner (GE Discovery MR750w, Chicago, IL, USA). The functional images were acquired using a gradient-echo echo-planar imaging sequence (TR: 2000 ms; TE: 30 ms; voxel size: 3.75 mm × 3.75 mm × 4 mm; FOV: 240 mm × 240 mm; slice number: 35; slice thickness: 4 mm; flip angle: 90°). The perfusion images were obtained with a pseudo-continuous ASL sequence (TR: 4854 ms; TE: 10.7 ms; slice number: 36; FOV: 240 mm × 240 mm; slice thickness: 4 mm; flip angle: 90°). Degree centrality (DC) and cerebral blood flow (CBF) were calculated based on the rs-fMRI and ASL. For each participant, across-voxel correlation analyses were performed between DC and CBF in the whole gray matter (GM) to quantitatively evaluate the global NVC. For all voxels, we calculated the CBF/DC ratio using the original values of CBF and DC, without z-transformations, to represent the regional NVC. The intergroup differences in CBF, DC, and CBF/DC ratio maps were analyzed using a voxel-wise two-sample t-test, adjusting for the covariates of age, sex, and years of education. For the resulting CBF, DC, and CBF/DC ratio maps, the Gaussian random field (GRF) method ($P < 0.05$) was selected to correct for multiple comparisons. The mean value of each cluster with significant between-group differences in CBF, DC, and CBF/DC ratio was extracted and correlated with the clinical variables using Pearson correlation.

Results: All subjects exhibited significant across-voxel spatial correlations between CBF and DC. the CBF-DC coupling within the GM mask was significantly higher in the refractory left TLE group than in the HC group ($P < 0.05$, Mann-Whitney U-test). The refractory left TLE group showed significantly higher CBF/DC ratio in the left superior frontal gyrus and superior parietal gyrus, with significantly lower CBF/DC ratio in the left posterior cingulate cortex/precuneus and inferior temporal gyrus compared to the HC group (GRF corrected: $P < 0.05$). The refractory left TLE group also showed a significantly lower CBF than the HC group in the right superior temporal gyrus, right

medial frontal gyrus, right supramarginal gyrus, right caudate lobe, and left posterior cingulate cortex/precuneus, and a higher CBF in the right middle temporal gyrus, right angular gyrus, left superior frontal gyrus and left precentral gyrus (GRF corrected: $P < 0.05$). The refractory left TLE group exhibited a lower DC in the right and left postcentral gyrus compared to the HC group, though the brain region of higher DC was not reported (GRF corrected: $P < 0.05$). The results showed a significant positive correlation between the decreased CBF in the left posterior cingulate cortex/precuneus and the lower verbal comprehension scores ($r = 0.523$, $p = 0.009$), perceptual reasoning scores ($r = 0.525$, $p = 0.008$), working memory scores ($r = 0.555$, $p = 0.005$), full-scale intelligence quotient scores ($r = 0.612$, $p = 0.001$); and the decreased DC in right postcentral gyrus were positively correlated with lower verbal comprehension scores ($r = 0.439$, $p = 0.032$), perceptual reasoning scores ($r = 0.427$, $p = 0.037$), and full-scale intelligence quotient scores ($r = 0.482$, $p = 0.017$).

Conclusion: Children with refractory left TLE present increased global CBF-DC coupling, and regional disrupted CBF-DC coupling in several brain regions, indicating neurovascular decoupling. Furthermore, the abnormal decreased CBF and DC are associated with executive and cognitive dysfunction. These findings provide new neuroimaging evidence of neurovascular decoupling in children with refractory left TLE and may be helpful for a deeper understanding of the potential neuropathological mechanisms in seizure generation, providing new biomarkers of cognitive performance in childhood refractory left TLE.

PO-2486

The integrity of cerebral white matter fiber tracts in children with global developmental delay assessed by diffusion kurtosis imaging: a tract-based spatial statistics study

Xiaoxue Zhang, Xin Zhao, Yanyong Shen, Zhanqi Feng, Zhexuan Yang, Changhao Wang, Xiaohan Zhang
The Third Affiliated Hospital of Zhengzhou University

Objective

The aim of this study was to assess abnormalities in the white matter microstructure of the whole brain in children with global developmental delay (GDD) using diffusion kurtosis imaging (DKI).

Materials and Methods

The present study included 27 children with GDD and 32 healthy controls (HCs). All of the above children were scanned for DKI sequences. The Chinese version of the Gesell Developmental Schedules (GDS) was used to assess the development of all children with GDD comprehensively. An automated processing pipeline was applied to the DKI data to obtain derived metrics of diffusion

tensor (DT), kurtosis tensor (KT), and white matter tract integrity (WMTI). Tract-based spatial statistics (TBSS) analysis was performed to investigate the differences in all derived metrics of whole-brain white matter fiber tracts between the GDD group and HCs. And correlations were analyzed between the parametric values of the fiber tracts with significant differences and correlated them with the GDS.

Results

TBSS analysis showed abnormalities of DT, KT, and WMTI parametric maps in extensive cerebral white matter tracts in the GDD group compared to HCs. These white matter regions mainly included corpus callosum(CC), retrolenticular part of internal capsule(RPIC), corona radiata(CR), fornix, superior longitudinal fasciculus(SLF), inferior fronto-occipital fasciculus(IFO) and uncinate fasciculus(UF). Significant correlations between mean kurtosis(right superior corona radiata) and radial diffusivity of extra-axonal space (right RPIC) and the adaptive development subscale were found in children with GDD.

Conclusions

White matter fiber integrity is generally reduced in children with GDD, and the ability of DKI to capture these changes is important in exploring the underlying pathological mechanisms of GDD.

PO-2487

Does premotor connectivity reflect stereotyped behavior in ASD children Evidence from resting fMRI study

Zengjun Zhang,guangbin cui,haiyan nan,gangfeng li,yanli he,weiqiang yan

Department of Radiology ,Tangdu Hospital,the Air Force Military Medical University ,Xi'an,710038,China

Objective Stereotyped behavior relates to one of the most typical characteristics in children with autism spectrum disorders (ASD), however, the neurobiological mechanism is still unclear. In this study, we examined the resting state functional connectivity of premotor area in order to determine whether alterations can be found to distinguish ASD from healthy controls, and correlated the behavior variables with connectivity.

Methods 39 children with ASD and 42 age, sex, and IQ-matched healthy children were recruited. All the 81 subjects performed scaling with behavior scale index and underwent resting-state fMRI scans. After the fMRI data preprocessing, the left and right side premotor were selected as ROI seeds to perform functional connectivity. Results Compared with healthy controls, children with ASD showed significant increased connectivity between the left premotor area and the posterior cingulate cortex, as well as decreased functional connectivity between the left premotor area and the left insula. In addition, a negative linear correlation exists between the connectivity of the left premotor and the insula and the behavioral scores. Conclusion Imbalanced premotor functional connectivity may be one possible mechanism of stereotyped behavior in ASD, representing an attention deficit and/or impaired sensory preception to the external salient stimuli.

PO-2488

Neurovascular coupling analysis in children with periventricular leukomalacia with cerebral palsy

Rongqian Xie,Miaoyan Wang,Haoxiang Jiang

Affiliated Children's Hospital of Jiangnan University

Purpose To combine resting-state functional magnetic resonance imaging (rs-fMRI) and arterial spin labeling (ASL) for detection neuralvascular coupling changes in Children with periventricular leukomalacia (PVL) with cerebral palsy (CP).

Materials and Methods This study included 10 children with PVL with CP (mean age 4.76 ± 5.19 years) and 16 gender and age-matched healthy control group (mean age 4.69 ± 2.43 years). The children with CP were diagnosed by two pediatric neurologists. In this study, 3D T1WI, 3D T2WI, rs-fMRI, and 3D-ASL were performed in a 1.5T scanner (Siemens magnetom aera) with 20-channel head coil. Scanning sequence: 3D T1 (TR2200ms / TE 3.06ms, thickness 1.0mm, interlayer spacing 0mm), 3D T2 (TR 1200ms / TE 96ms; thickness 1.0mm, interlayer spacing 0mm). The rs-fMRI parameters: TR 2000ms/TE 25ms, FLIP 90°, FOV 192mm, Voxel Size: 3x3x3mm, 36 Slices, thickness 3mm, Bandwidth 2298Hz, 200 Volume. 3D-pASL parameters: TR 4600ms/TE 16ms, Flip 180°, Label-time 700ms, PLD = 1200 ms, FOV 230mm, Voxel size: 1.8x1.8x3mm, thickness 3mm, bandwidth 2894Hz. Cerebral blood flow (CBF) and functional connectivity (FC) were calculated after data processing at Matlab. For pearson correlation analysis of FC-CBF based on whole brain voxel level, we calculated the group difference of FC-CBF correlation coefficient between CP and normal group. Neurovascular coupling level was assessed in children with CP based on group differences in CBF/FC ratio between the two groups. P values <0.05 were considered to be statistically significant differences.

Results Neurovascular injury analysis based on fMRI and ASL showed that PVL children with CP had lower FC in occip-parietal and frontal-striatal network compared with normal control group (Figure 1a) and increased CBF values in bilateral frontal-parietal and striatal regions (Figure 1b). Neurovascular coupling analysis of FC-CBF found increased frontal-striatal network and cerebellar CBF/FC ratio in PVL children with CP, reflecting neurovascular injury and decoupling (Figure 2 a-b). Neurovascular coupling analysis based on whole brain voxel level showed that the FC-CBF coupling degree in CP was $r=0.15$ ($p < 0.001$) (Figure 3a), while the FC-CBF coupling degree in normal children was $r=0.35$ ($p < 0.001$) (Figure 3b).

Conclusions Neurovascular coupling degree in PVL children with CP was reduced, especially the frontal-striatal network and cerebellar CBF/FC ratio increases, suggesting neurovascular damage and decoupling. This study provides a new understanding of the pathophysiological mechanism in children with CP, and provides specific imaging markers for the early diagnosis of PVL with CP.

Clinical Relevance Children with PVL with CP have neurovascular damage and decoupling. Multimodal MRI is helpful to explore the pathophysiological mechanism, identify specific imaging markers, and provide a new pathway for early diagnosis of PVL with CP.

PO-2489

Sex Differences in Normal Fetal Regional Brain Apparent Diffusion Coefficient Changes Assessed by Utero-DWI

Jingya Ren, Suzhen Dong

Shanghai Children's Medical Center affiliated with Shanghai Jiao Tong University School of Medicine

BACKGROUND: There are differences between male and female fetal brains in their vulnerability to adverse intrauterine exposure, preterm birth, and associated perinatal brain injury.

PURPOSE: The main objective of this study was to detect any statistical difference in the change of apparent diffusion coefficient (ADC) in intracranial regions of male and female fetuses in the 2nd to 3rd trimester.

METHODS: DWI (diffusion-weighted imaging) was performed in 200 fetuses between 20 and 37 gestational ages (GA) with normal or questionably abnormal results on sonography followed by normal structural MRI. Pairwise ADC values of the regions of interest (ROIs) were manually delineated in each side of the cerebral white matter (frontal, parietal, occipital, temporal WM), basal ganglia (BG), thalamus (THA), and cerebellar hemisphere (CBM), as well as a single measurement in the pons. The changes in those values were studied over the gestational range, along with potential gender differences and asymmetries of the cerebral hemispheres.

RESULTS: From the 2nd to 3rd trimester, the areas with the strongest negative and linear change of decrease were CBM, pons, and THA in both male and female fetuses. During the 3rd trimester, ADC values in temporal WM and CBM were significantly higher in male fetuses than that in females

($p < 0.05$). After correction for FDR (False Discovery Rate), the difference in CBM was statistically significant. However, the ADC value of male fetuses in cerebral WM (except for frontal), BG, THA, CBM, and pons decreased at higher rates than that of female fetuses.

CONCLUSIONS: We have shown several differences in intracranial regional ADC changes between male and female fetuses using utero-DWI during the 2nd to 3rd trimester.

PO-2490

A simple and reliable quantitative diagnosis model of idiopathic central precocious puberty in girls based on fisher stepwise discriminant analysis

Hailun Peng, lu Tian
Children's Hospital of Chongqing Medical University

Background: Idiopathic central precocious puberty (ICPP) is defined as the premature activation of the hypothalamic-pituitary-gonadal (HPG) axis with clinical pubertal symptoms among girls under 8 years old and boys under 9 years of age in the absence of obvious etiology and organic disease. In recent years, due to the improvement of living conditions and changes in the social environment, the incidence of precocious puberty in children has been increasing year by year. The prevalence of precocious puberty in girls is 5-10 times that of boys, of which more than 90% are idiopathic. The ICPP can affect future height and even cause social psychological disturbances. More importantly, girls with ICPP have an increased risk of breast or cervical cancer. Therefore, early diagnosis and treatment are very important for girls with ICPP. In routine clinical diagnosis, it is difficult to distinguish ICPP from non-ICPP unless the gonadotropin-releasing hormone (GnRH) stimulation test is performed. However, the GnRH stimulation test is invasive, time-consuming, and expensive, with a large number of blood samples collected at different times. In addition, in nontertiary or community hospitals with limited resources, this cumbersome test is not always available. Therefore, the aim of this study was to develop a simple and reliable quantitative diagnostic model for ICPP in girls by using fisher stepwise discriminant analysis (FSDA) based on easily available data in the clinic.

Methods: A total of 254 female paediatric patients who had secondary sexual characteristics before 8 years old and had taken a GnRH stimulation test were randomly divided into a training group (203 patients, 80%) and a validation group (51 patients, 20%). The 203 patients in the training group were divided into two groups (ICPP ($n=115$) and non-ICPP ($n=88$)) according to the GnRH stimulation test results. Characteristic parameters were extracted from clinical data and imaging data and were statistically analysed. The stepwise discriminant method was used to select characteristic parameters. Based on these characteristic parameters, Fisher discriminant analysis was performed to establish a quantitative diagnostic model. The diagnostic ability of the model was verified by leave-one-out cross validation, test group and receiver operating characteristic (ROC) curve analysis. Decision curve analysis (DCA) was applied to assess the clinical utility of the model. **Results:** A total of four characteristic parameters, including basal follicle-stimulating hormone (FSH), uterine volume, bone age, and basal luteinizing hormone (LH) had significant discriminant values between the two groups. Using these characteristic parameters, the following diagnostic model was established: where X_1 , X_2 , X_3 and X_4 represent basal FSH ($1=<0.1$ IU/L; $2=\geq 0.1$ IU/L), basal LH ($1=<0.1$ IU/ml; $2=\geq 0.1$ IU/ml), uterine volume, bone age, respectively. The variable (X) is the characteristic parameter value that measured in the clinic is substituted into the model and calculating G values. The critical value of the discriminant function was $G_0 = -0.272$. By comparing the G and G_0 values, subjects were classified according to the following principles: if $G > G_0$, the subjects were assigned to the ICPP group; if $G < G_0$, the subjects were assigned to the non-ICPP group; if $G = G_0$, the subjects were assigned to either the ICPP group or the non-ICPP group. According to the leave-one-out cross validation, the accuracy of the model was 93.6%. When the test group data were substituted into the model formula, the results showed that the overall

accuracy of the model was 96.1% and the area under curve (AUC) of ROC was 0.95 (95%CI, 0.89-1.00). In addition, the clinical decision curve suggests that the model has a good clinical net benefit. Conclusion: We developed a quantitative diagnostic model for differentiating ICPP and non-ICPP by using FSDA based on easily accessed clinical and imaging data. This model has a high accuracy and is easy to be applied in clinic, especially in some non-tertiary or community hospitals where GnRH stimulation test is not available.

PO-2491

Deep learning based pediatric brain region segmentation and volumetric analysis in healthy children

Hui Zheng, Yuzhen Zhang, Dengbin Wang

Xinhua hospital affiliated to Shanghai Jiaotong University school of medicine

In order to provide quantitative reference basis for brain structural changes in children with neurological disorders, we applied deep learning technique to the brain region segmentation and volumetric analysis in healthy children. In this study, 312 healthy children aged 1.5 to 14.5 years (210 boys and 102 girls) were recruited and averagely divided into 5 age groups. High-resolution structural T1-weighted images were acquired for brain region segmentation using the platform Ull_mrbrain based deep learning technique. In each age group, volume of gray matter and white matter, thickness and surface area of cortex were calculated and compared between male and female children. The results showed that the gray matter and white matter of bilateral cerebral hemispheres volume and total brain volume of healthy children increased with age growth. Volumes of left and right hippocampus, amygdala and thalamus increased with age growth. Cortical thickness and surface area decreased with age growth. We provide quantitative reference basis for brain structural changes in children with neurological disorders.

PO-2492

Maturation and reorganization of structural connectivity in infants within half a year

Tingting Liu¹, Zhiyong Zhao², Yuqing You³, Ying Lv⁴, Dan Wu²

1. Zhongda Hospital, Southeast University

2. Department of Biomedical Engineering, College of Biomedical Engineering & Instrument Science, Zhejiang University, Hangzhou, Zhejiang, China

3. Department of Radiology, Children's Hospital, Zhejiang University School of Medicine

4. Department of Child Health, Children's Hospital, Zhejiang University School of Medicine

Purpose

Although brain networks have been extensively investigated, networks based on diffusion imaging are remain under-explored, particularly for infants in the early postnatal period, during which time axons undergo overproduction and elimination, complicated by increased axon diameter and myelination, which may cause alterations in topology of intercortical connections. However, the structural network refinement in early life is still under-researched.

Methods

Totally, 104 preterm infants with few complications aged 0 and 6 months were enrolled. The whole-brain tractography was performed for each participant using the second-order integration over the fiber orientation distribution method, which were then sifted to 1 million streamlines. The network density was set from 0.2 to 0.3 with an interval of 0.01, and then averaged the measures at all densities.

Results

The present study discovered that although the clustering coefficients of the entire brain tended to increase with age, while the degree of the temporo-parieto-occipital lobe gradually decreased, whereas the frontal lobes demonstrated the opposite. The hub edges between the hemispheres mainly connected the bilateral cingulate gyrus, cuneus and calcarine cortex, and the betweenness of the cuneus and calcarine cortex increases with age. Besides, the hub edges within the hemispheres were U-fibers, and their topology was gradually regular and symmetrical. Modularity in infants within half a year was found an age-related decline.

Conclusion

The present study discovered that the temporo-occipital lobe matures earlier in infancy in structural brain networks compared with the frontal lobe, manifesting as a decline in energy consumption along with a progressive increase in whole-brain information transfer efficiency. Besides, the visual cortex showed a rapid maturation within the first few months of life, which is sensitive to injury. Finally, the subcortical fibers are matured earlier than long fibers in infancy.

PO-2493

Contrast-Enhanced CT-Based Radiomics Facilitates Prediction of Synchronous Pulmonary Metastasis from Pediatric Hepatoblastoma

Jinning Li¹, Hui Zheng¹, Yaqiong Ge², Shaofeng Duan², Xiaojun Yuan¹, Dengbin Wang¹

1. Xinhua Hospital, Shanghai Jiao Tong University School of Medicine

2. GE Healthcare, Precision Health Institution

Background: This study aimed to develop a combined model comprising contrast-enhanced CT-based radiomics signature and clinical factors for predicting synchronous pulmonary metastases in pediatric hepatoblastoma and to investigate its value in clinical context.

Methods: This was a retrospective study, approved by the Institutional Ethics Committee of Xinhua Hospital affiliated to Shanghai Jiao Tong University School, and informed consent was waived. Ninety pediatric patients with hepatoblastoma (median age, 17 months; age range, 2–122 months; 55 male) were included and randomly classified into training (n=64) and test cohort (n=26). Age, sex, initial AFP concentration, and histopathological results were collected. According to the 2017 PRETEXT system, two radiologists, blinded to the results for lung metastasis, assessed the PRETEXT stage (I–IV) and annotation factors in consensus. Another two radiologist, blinded to the PRETEXT results and annotations, reviewed lung metastasis on chest CT by consensus. The annotation factors included hepatic vein or inferior vena cava involvement (V), portal vein involvement (P), extrahepatic tumor extension (E), multifocality (F), tumor rupture (R), caudate lobe involvement (C), and lymph-node metastasis (N). Clinical factors (age, gender, alpha-fetoprotein concentration, PRETEXT stage and annotation factors) were recorded to build a clinical model. Portal venous phase images were used for tumor segmentation and radiomic features extraction. Feature selection was performed with max-relevance and min-redundancy and recursive feature elimination. Radiomics signature (Rad-score) was constructed using support vector machine. Multivariable logistic regression model was adopted to develop a combined radiomics-clinical model, the performance of which was evaluated with receiver operating characteristic (ROC) analysis and decision curve analysis (DCA).

Results: Pulmonary metastasis was confirmed with chest CT in 21 (23.3%) patients. There was no significant difference between the two cohorts in terms of age ($P = 0.862$), sex ($P = 0.958$), AFP concentration ($P = 0.264$), PRETEXT stage ($P = 0.946$), annotation factors (PVEFRCN, $P \geq 0.064$), or histological subtype ($P = 0.235$). In total, 1,192 radiomic features were extracted from segmented images. Rad-score was constructed with fifteen most relevant radiomics features. Area under the ROC curve (AUC) of Rad-score for predicting pulmonary metastases was 0.88 [95% confidence interval (CI), 0.78–0.98] in the training cohort and 0.86 (95% CI, 0.67–1.00) in the test cohort. The multivariable regression revealed that only multifocality (OR, 25.11; 95% CI, 3.19–313.03; $P =$

0.005) and Rad-score (OR, 0.002; 95% CI, 0.00–0.05; $P < 0.001$) were independent predicative factors. The combined model built with these two factors yielded an AUC of 0.93 (95%CI, 0.85–1.00) in the training cohort and 0.88 (95%CI, 0.73–1.00) in the test cohort, which were higher than 0.75 ($P=0.002$) and 0.67 ($P=0.060$) of clinical model respectively. The calibration curves of the combined model (Fig. 6A) in predicting pulmonary metastasis showed good agreement between the predicted and observed values in both the training ($P = 0.667$) and test cohorts ($P = 0.404$). DCA revealed that if the high-risk threshold was more than 0.22, using the combined radiomics-clinical model was more beneficial than using the radiomic signature or the clinical model.

Conclusions: The combined model incorporating radiomics signature and multifocality could be used as a valuable tool for predicating synchronous pulmonary metastases in pediatric hepatoblastoma.

PO-2494

Global Trends in Neonatal MRI Brain Neuroimaging Research over the Last Decade: Bibliometric Analysis

Shengfang Xu^{1,2}, Jing Zhang¹

1. 兰州大学第二医院

2. 甘肃省妇幼保健院

Objectives: Conduct Bibliometrics and visualization analysis of the related researches in the field of neonatal magnetic resonance imaging (MRI) brain neuroimaging in the past ten years; summarize its research status, hotspots and frontier development trends.

Method: With Web of Science (WoS) core collection database as the literature source, retrieve the relevant papers and reviews in the field of neonatal MRI brain neuroimaging published in the Web of Science Core Collection (WoSCC) and SCI-Expanded Science Citation Index (SCI-Expanded) from 2013 to 2022. VOSviewer and CiteSpace are used to conduct bibliometric and visualization analysis of the annual publication volume, countries, institutions, journals, authors, co-cited literature and the overall distribution of keywords.

Result: We retrieved 3,568 papers and reviews published from 2013 to 2022. The number of publications increased during this period. The United States and the United Kingdom were the largest contributors, with the United States receiving the highest Hindex and number of citations (Nc). The institutions that published the most were the University of London and Harvard University. The most prolific authors were Benders, Manon, and the prolific journal was NEUROIMAGE. The research mainly focuses on cerebral cortex, brain tissue, brain structure network, artificial intelligence algorithm, automatic image segmentation, and premature infants.

Conclusion: This study reveals the research status and hotspots of MRI in the field of neonatal brain neuroimaging in the past decade, which helps researchers to better understand the research status, hotspots and frontier development trends in this field from a macro perspective, and provides certain references for future topic selection and research development direction.

PO-2495

Altered brain networks in pediatric autistic patients: A connectivity gradient-based research

Yi Zhuang¹, Hongwei Chen²

1. Jiangnan University Affiliated Children's Hospital

2. The Affiliated Wuxi People's Hospital of Nanjing Medical University

Purpose: Autism spectrum disorder (ASD) is an ongoing neurodevelopmental disorder with a highly complex behavioral phenotype. The gradient can be used to find the main axis of variance in the data by a method similar to PCA to find the orthogonal eigenvectors in high-dimensional data. Since ASD is associated with deficits in sensory processing and higher neural functions, we have attempted to provide a concise explanation of the various symptoms associated with this condition.

Materials and Methods: Our dataset included 34 ASD patients and 43 age-matched healthy controls. In this study, T1-MPRAGE and BOLD were performed in a 1.5T scanner (Siemens Magnetom Aera). Scanning sequence: T1-MPRAGE (TR 2200ms/TE 3.06ms/TI 900ms, Flip Angle=8°, Voxel Size=0.9x0.9x1mm); BOLD (TR=2000ms, TE=25ms, Voxel Size:3x3x3mm, 200 Volume). First, a functional connection matrix is constructed using resting state fMRI time series correlation. Next, an affinity matrix is constructed by applying a specific cosine function to represent similarities in the functional connection profile between all regions. Then, the matrix is dimensionally reduced to identify a series of major components and gradients of the target brain structure. Finally, the two sets of data were statistically analyzed and FDR corrected.

Results: Our study found a general decrease in gradient connectivity in children with autism throughout the brain. Through the scheafer400-7network template, we found that at the gradient 1 level, the main differences are concentrated in Visual Network, Sensorimotor Network, and Default Mode Network; At the gradient 2 level, the main differences are concentrated in Visual Network, Sensorimotor Network, and Dorsal Attention Network ($p < 0.05$, FDR corrected).

Conclusions: The aim of this study is to discover a low-dimensional functional connectivity parameter as a neurobiological indicator. We evaluated various algorithms and emphasized the importance of threshold setting since each parameter can impact the predictive accuracy of gradients. We hope that these findings will provide researchers with a solid foundation for the effective use of gradient frameworks in future studies.

PO-2496

Machine Learning and Statistic Analysis to Predict Drug Treatment Outcome in Pediatric Epilepsy Patients with Tuberous Sclerosis Complex

Cailei Zhao, xia zhao
shenzhen Children's hospital

Objectives Prediction of Epilepsy drug treatment outcome is valuable for the children with tuberous sclerosis complex (TSC). We aimed to investigate the association between multi-modality features and epilepsy drug treatment outcomes and propose a multi-modality features-based model to predict epilepsy drug treatment outcomes.

Methods This retrospective study consecutively enrolled 103 epilepsy children with rare TSC (41 in the controlled group and 62 in the uncontrolled group). Multi-modality data were used to characterize risk factors for epilepsy drug treatment outcome of TSC, including clinical data, TSC1, and TSC2 genes test results, magnetic resonance imaging (MRI), computerized tomography (CT), and electroencephalogram (EEG). Three common feature selection methods and six common machine learning models were used to find the best combination of feature selection and machine

learning model for epilepsy drug treatment outcomes prediction with multi-modality features for TSC clinical application.

Results Infantile spasms, age of onset, EEG discharge type, age of first doctor visit, angiofibroma, gene mutation type, type II lesions, epileptiform discharge in the right frontal area of EEG, drug-resistant epilepsy, shagreen patch and angiomyolipomas (AML) were significantly related to epilepsy drug treatment outcomes in these patients ($p < 0.05$). The analysis of variance based on selected 35 features combined with multilayer perceptron (MLP) achieved the best area-under-curve score of $0.812 (\pm 0.005)$, which shows the feasibility of using machine learning to predict the outcomes of drug treatments. Our machine learning results found that among MRI features, lesion type is the most important in the outcome prediction, followed by location and quantity.

Conclusion We developed and validated an effective prediction model for epilepsy drug treatment outcomes of TSC. Our results suggested that multi-modality features analysis and MLP-based machine learning may enable more precise and individualized prediction of epilepsy drug treatment outcomes of TSC.

PO-2497

Feature Selection and Combination of Information in the Brain Connectome for Discrimination of Autism Spectrum Disorder and Analyses of Altered Brain Patterns

Ting Yi, Weian Wei, Bing Gao, Guangchun Wu, Siping He, Ke Jin
Hunan childrens Hospital

Abstract

Objective: Explore the topology of the white matter connectivity network in preschool autism spectrum disorder (ASD) and Healthy control (HC) based on diffusion basis spectrum imaging (DBSI).

Methods: Brain DBSI data from 31 patients with ASD and 30 HC were collected in Hunan Children's Hospital from September 2022 to July 2023, aged 2-6 years. All data were imported into the post-processing server, and whole-brain fiber tracking and brain network were constructed using the MATLAB 2013a toolkit. The most discriminative features were extracted from the consensus connectivity, global and node indices separately using the two-sample T-test. To effectively combine the multimodal information, we employed the multi-kernel learning support vector machine (MKL-SVM).

Result: In ASD group, the value of assortativity (A_r), modularity score (Q), Hierarchy (H_r), global efficiency (E_{global}), local efficiency (E_{local}), clustering coefficient (C_p) were lower than HC group, while normalized clustering coefficient (γ), normalized characteristic path length (λ), small-world (σ), characteristic path length (L_p), synchronization (S_r) higher. The difference was statistically significant. Consensus connectivity results showed that most of the consensus connectivity between frontal, parietal, and temporal lobe and thalamic regions was reduced in ASD patients. The model combining consensus connected connectivity, global and nodal graph metrics features can achieve the best performance in identifying ASD patients, with an accuracy of 96.72%.

Conclusion: The combination of global and nodal graph metrics and consensus connectivity of brain networks can identify preschool ASD patients and contribute to early clinical diagnosis.

PO-2498

A prediction nomogram for refractory mycoplasma pneumonia in children with community acquired pneumonia: using low-dose computed tomography

Caiting Chu, Lei Xu, Wenhua Li, Chengjin Gao, Lisu Huang
Xinhua Hospital affiliated to Shanghai Jiao Tong University School of Medicine

Objective: The early predictive value of the chest imaging has not been adequately studied in the assessment of refractory mycoplasma pneumonia pneumonia (MPP). We aimed to build a nomogram for early predicting refractory MPP based on low-dose computed tomography in children. **Methods:** We retrospectively evaluated hospitalized children with MPP with probability of RMPP from June 2014 to December 2018. Low-dose chest computer tomogram (CT) were applied in each patient and interpreted in a blinded fashion by two radiologists. Total of 368 children diagnosed MPP were randomly assigned in a 7:3 ratio to either the training set or testing set. Multivariate logistic regression analysis was performed to identify independent predictors and establish a nomogram to predict the occurrence of RMPP. The predictive performance of the model and nomogram was evaluated by the receiver operator characteristic curves and decision curve analysis (DCA).

Results:

Multivariate logistic regression demonstrated that number lobes of lung consolidation (odds ratio [OR] 34.76, 95% confidence interval [CI] 14.53–98.44, $p < 0.01$), the left lower lobe of lung consolidation (OR 2.07, 95%CI 0.94–4.5, $p = 0.06$), pleural effusion (OR 2.82, 95%CI 1.25–6.34, $p = 0.01$) were independent predictors for RMPP. The area under curves of the prediction model in the training and testing sets were 0.90 and 0.87 respectively. The Hosmer–Lemeshow test showed that the model was a good fit ($P = 0.133$). The calibration curve of the nomogram was close to the ideal diagonal line. Furthermore, the decision curve analysis demonstrated significantly better net benefit in the model. The validation proved the reliability of the prediction nomogram.

Conclusion: A nomogram based on low-dose computed tomography was developed to predict the occurrence of RMPP in children. It provided clinicians with simple and practical tool for the early prediction and timely management of RMPP.

PO-2499

Dual-energy CT (DECT)—an important role in the diagnosis of acute osteomyelitis in children

Lulin Bi¹, Shuming Xu¹, Tianfang Tong²
1. Department of Radiology, Children's Hospital of Shanxi, Taiyuan, Shanxi, China
2. Siemens Healthineers (Beijing), China

Background and purpose: This case report highlights the importance of dual-energy CT (DECT) imaging in demonstrating the bone marrow of children with acute osteomyelitis. It could provide early evidence for diagnosing bone marrow diseases and guide treatment decisions intuitively, conveniently, and quickly. **Case Description:** A six-year-old boy was admitted to the hospital mainly due to swelling, pain and limited movement of the right lower leg for one week. Physical examination showed that the proximal right tibia was swollen with high local skin temperature and deep tenderness, the right lower limb could not move and could only present a slightly hip-flexed knee position. No other significant abnormalities were found. **Diagnosis:** A diagnosis of acute osteomyelitis was proposed and confirmed by pathological results for the swollen right lower extremity with tenderness. During the operation, cartilage and inflammatory necrosis were seen under the microscope, and acute and chronic inflammatory cell infiltration was seen between the

striated muscles, which was consistent with the changes in purulent osteomyelitis. **Discussion and conclusions:** Dual-energy CT Virtual Non-Calcium (VNCa) bone marrow imaging technology could present abnormalities in bone marrow manifestations or subtle bone marrow edema that cannot be shown by conventional X-ray or conventional CT images, which is comparable to the clinical utility of MRI.

PO-2500

Feasibility of CT-like MR for the diagnosis of fractures in children based on point-to-point encoding time reduction of radial acquisition (PETRA) sequences: comparison of conventional and "CT-like" ultrashort echo time (UTE) images

xiamei zhuang
Hunan Children's Hospital

Objective CT-like PETRA images offer a radiation-free alternative to CT for depicting fractures, but data on children are lacking. The purpose of this study was to determine whether CT-like PETRA images improve the detection and characterization of fractures in children.

Materials and Methods Thirty-two pediatric patients with fractures underwent both CT and MR scans, which were included for analysis. MR and CT images were evaluated independently by two readers. Image quality was evaluated using visual scoring and quantitative measurements of the apparent contrast-to-noise ratio (CNR), signal-to-noise ratio (SNR), and contrast ratio (CR). Comparisons were made using the Wilcoxon test for means and the ANOVA test for ratios. Diagnostic performance parameters of the three imaging methods were determined using CT as the reference standard. Using Cohen's kappa tests and intraclass correlation coefficients, we evaluated the agreement between MR sequences and CT scans, as well as between readers.

Results CT-like PETRA image quality was good. Mean CNR and SNR with CT-like PETRA images were 90.48 ± 2.76 and 9.47 ± 3.25 , respectively, higher than those with T1 TSE ($P < 0.001$). The diagnostic accuracy of CT-like PETRA images was higher than that of T1 TSE for detecting callus formation/periosteal reaction and free bone fragment, as well as the area under curve (AUC), sensitivity, accuracy and negative predictive values (NPV). CT-like PETRA images showed more consistency with CT than T1 TSE for diagnosis. CT and CT-like PETRA had higher inter-reader agreement than T1 TSE.

Conclusion Our results confirm that CT-like PETRA images provide accurate imaging of bone morphology for fractures in children, with CT-like contrast that is not available with standard MR T1 TSE.

PO-2501

Automated Fiber Quantification Analysis Identifies Tract-specific Microstructural Alterations in Intermittent exotropia

Jianlin Guo, Yun Peng
Beijing Children's Hospital, Capital Medical University

Abstract

Background: Growing evidence of neuroimaging has indicated brain microstructural abnormalities in comitant strabismus. Nonetheless, few studies have investigated neuropathological alterations in patients with intermittent exotropia (IXT). This study aimed at examining the characteristics of brain microstructure along major fiber tracts in IXT patients using an automated fiber quantification analysis.

Methods: A total of 25 patients with IXT as well as 25 healthy participants matched for age and gender finished the diffusion tensor imaging scanning and the ophthalmic examination. Automated fiber quantification analysis of 20 major fiber tracts was carried out for IXT patients and healthy subjects, respectively. Diffusion metrics of 100 equidistant nodes resampled along each tract were measured for every subject and compared between two groups. Effect size analysis was performed to identify the most affected fiber tracts in IXT.

Results: Widely declined MD was noted in IXT along major tracts containing bilateral thalamic radiations, bilateral corticospinal fasciculi, bilateral cingulum cingulate, left inferior fronto-occipital fasciculus, right arcuate fasciculus and superior longitudinal fasciculus. Local reduction in FA was observed in IXT along left cingulum hippocampus, right inferior longitudinal fasciculus and right uncinate fasciculus, in contrast to the regionally increased FA along bilateral thalamic radiation, left corticospinal tract and left arcuate fasciculus. Among the tracts with significantly changed diffusion metrics in IXT, right inferior longitudinal fasciculus was the most affected one in FA while left thalamic radiation was the most influenced one in MD.

Conclusions: Abnormalities in microstructural properties along visual-related fiber tracts are likely to contribute to difficulties in visual information processing in IXT patients, which could serve as the neural basis of underlying pathological mechanism of IXT.

PO-2502

A fully automated deep learning approach for accurate differentiation of subtypes in primary intracranial germ cell tumors using preoperative MR images

Yanong Li
Beijing Tiantan Hospital

Background: Accurate differentiation between intracranial germ cell tumors (iGCTs) subtypes, germinomas (GEs) and non-germinomatous germ cell tumors (NGGCTs), is crucial for treatment decisions and prognosis assessment.

Purpose: To develop a deep learning model that can automatically differentiate GEs from NGGCTs using preoperative MR images and determine whether the DL model could help clinical decision making.

Materials and Methods: This multicenter retrospective-prospective study collected a total of 344 patients between January 2010 and August 2021 (mean age [SD], 13.32 [6.4] years; 228 males) with pathology-confirmed iGCTs including the development set (n=280) that was split into training (n=200) and testing datasets (n=80), and three independent validation datasets (n=22,22,20,

respectively). We developed and validated a DL model based on a modified 3D nnU-Net and preoperative T2-weighted images to differentiate GEs from NGGCTs and compared to the diagnostic performance using conventional features including conventional MR presentation and clinical information. Further, we evaluated the role of our model in clinical decision making, the diagnostic performance of six neuroradiologists were analyzed in the testing and three validation datasets, with and without referring to the DL model's output. The area under the curve (AUC) was used to assess the diagnostic performance of DL model and neuroradiologists.

Results: The DL model achieved AUCs of 0.950, 0.921, 0.869, and 0.905 in the testing and three validation datasets, respectively. The performance is superior to that using conventional features (AUC=0.768, $P=0.009$) in testing dataset. The diagnostic performance of neuroradiologists was improved from an average AUC of 0.751 without reference to the DL output to 0.870 with reference to the DL output in the testing and validation datasets (13.61% improvement, $P=0.008$).

Conclusions: We developed and validated a DL model using a large dataset to accurately differentiate GEs from NGGCTs using preoperative T2-weighted images, which could help neuroradiologists to improve their differential diagnosis.

PO-2503

Extracellular volume for predicting pre-heart failure in children with Duchenne Muscular Dystrophy.

Xinyuan Zhang, Huayan Xu, Yingkun Guo, Hang Fu
West China Second University Hospital, Sichuan University

Background

Cardiac failure is the leading cause of death in Duchenne muscular dystrophy (DMD). Early detection of heart failure (HF) in DMD can be challenging due to progressive muscle necrosis, physical inactivity and loss of function, often leaving children unaware of their deteriorating cardiac health. Pre-heart failure (pre-HF) is being recognized as an essential stage known to progress to symptomatic HF. The identification of measures that are associated with pre-HF in DMD could aid clinicians in detecting early cardiac involvement and following disease progression for patients. Therefore, our study aimed to investigate the predictive value of cardiac magnetic resonance (CMR) for pre-HF in children with DMD.

Materials and Methods

A total of 87 DMD patients (8.1 ± 1.7 years) were included from January 2019 to July 2022. All subjects underwent CMR with cine, T1 mapping and late gadolinium enhancement (LGE) sequences. The study outcome was pre-HF, which was defined as patients without current or prior symptoms of HF, but those with evidence of abnormal cardiac biomarkers (BNP ≥ 35 pg/mL, NT-proBNP ≥ 125 pg/mL or persistently elevated cardiac troponin), functional or structural heart disease. The X-tile software version 3.6.1 was used to determine the optimal cut-off value. Kaplan-Meier analysis was used to calculate the cumulative incidence rates of pre-HF. The variables were assessed by univariate and multivariate Cox regression analysis.

Results

During a median period of 16.8 months, pre-HF was present in 30 (34%) DMD patients. Univariable analysis indicated that extracellular volume (ECV), T1 mapping, end-diastolic volume index (EDVI) and left ventricle mass index (LVMI) were associated with pre-HF ($p < 0.1$). Multivariate analysis showed that ECV (hazard ratio [HR]: 5.503, 95% CI: 2.111–14.343; $p < 0.001$) was an independent risk factor for pre-HF. The cut-off value of ECV was 0.31, and it appropriately discriminated between low- and high-risk groups for pre-HF in DMD patients. The cumulative pre-HF-free survival rates of the low-risk group were significantly higher than those of the high-risk group ($P < 0.001$) according to the Kaplan-Meier curves.

Conclusions

The ECV was a feasible independent prognostic factor for pre-HF of DMD patients and provided incremental prognostic information and significant improvement for risk stratification, which could aid clinicians in detecting early cardiac involvement and providing early intervention for patients.

PO-2504

Discussion of children's axial-axis radiography techniques

Shen Wen¹, Wuxing Luo², Haifen Liu³, Dongxia Mo¹, Xianlei Meng¹

1. SHENZHEN CHILDREN HOSPITAL

2. The First Affiliated Hospital of Hunan University of Traditional Chinese Medicine

3. Hunan Provincial Traditional Chinese Medicine Hospital

Objective: To analyze and study the methods of calcaneal axon radiography and to explore the calcaneal axonography standards, so as to reduce the radiation dose of children, improve the quality of photography and improve the diagnostic efficiency.

Methods: A total of 50 cases of calcaneal axon X-ray photos from February to May 2022 were analyzed. Among them, 28 were male and 22 were female. Be aged 6 to 16 years. In all cases, Ruike DR VX3733-SYS photography was used, and two methods were taken, methods (1) The child was lying on the supine photographic table, the lower limb was straightened, the long axis of the calf was parallel to the long axis of the photographic table, the ankle was extremely dorsiflexed, the ankle joint was placed in the center of the detector, and the center line was tilted 35° to 45° to the side of the head, 70KV, 6MAS. Aiming at the calcaneal joint through the base of the third metatarsal into the center of the detector. METHOD (2) THE CHILD STOOD ON THE PHOTOGRAPHIC TABLE, ROTATED BOTH FEET INWARD, MADE THE FEET PARALLEL, THE FEET WERE 80 MM APART, THE MEDIAL EDGE OF THE FOOT WAS PARALLEL, THE ANKLE DORSIFLEXION WAS 10°, 50KV, 4MAS, THE PHOTOGRAPHIC DISTANCE WAS 100CM, AND THE CENTER LINE WAS AIMED AT 45° THE midpoint of the Inner and Outer Ankle Line. Calcaneal axial image display standards: 1. The calcaneal body and calcaneus protrusion are clearly displayed 2. The full calcaneus is displayed in the center of the image, showing the bone, articular surface and surrounding soft tissue of the calcaneus on the side of the examinee³, and the bone trabeculae and surrounding soft tissues are clearly displayed.

Results: The calcaneal space showed poor performance, and there were factors such as improper body position, poor fit, and poor exposure dose. Method (1) The probability of calcaneal gap display was 80.2%, and method (2) The display rate of calcaneal gap was about 90%, and both sides could be compared simultaneously to reduce the retake rate, thereby reducing the irradiation of the children.

Results: Method 1 requires the child to use both hands or others to help pull the forefoot to make the ankle joint excessive dorsiflexion, due to the child's poor fit, insufficient internal rotation or abduction, resulting in improper position, metatarsal morphology development, increased exposure times, cumulative irradiation exposure. Method 2 requires the child to stand still, which greatly improves the film shooting rate. Familiar with the anatomical characteristics of calcaneal axon X-ray is the basis of calcaneal axon X-ray photography, master the calcaneal axon photography technology, improve the film rate, thereby reducing the incidence of cancer, reducing radiation dose, and conducive to children's growth and development. It is a fact that radiation can cause side effects on children, but the use of optimized radiation technology can achieve good imaging results, while minimizing side effects and reducing the harm to the child's body.

Conclusion: Familiar with calcaneal axon X-ray anatomy is the gold standard for photographing the calcaneus, and mastering the calcaneal shooting skills can improve the level of calcaneal axon X-ray photography.

PO-2505

Cerebral blood flow changes in COVID-19 children with neurological symptoms

Qing Han

Affiliated Children's Hospital of Jiangnan University

Purpose: To evaluate the changes of cerebral blood flow (CBF) in COVID-19 children with neurological symptoms based on arterial spin labeling (ASL), and explore the impact of novel coronavirus infection on cerebral hemodynamics and potential neurological sequelae in children.

Materials and Methods: 25 COVID-19 children with neurological symptoms (mean age 5.08 ± 3.91 years) and age-matched healthy control group were included. In this study, 3D T1WI, T2WI, DWI and 3D-ASL were performed in a 1.5T scanner (Siemens magnetom aera). CBF values were calculated after data processing at Matlab. Through spatial standardization, the CBF map obtained was registered to the MNI space. After data normalization and smoothing, the general linear model was used to statistically model and estimate the CBF of children with COVID-19 and healthy controls with SPM software, and multiple comparison corrections were performed. $P < 0.05$ was considered as statistically significant difference.

Results: Among 25 COVID-19 children with neurological symptoms, there were 15 cases of febrile seizures, 8 cases of epileptic seizures, 1 case of dizziness, and 1 case of paroxysmal abnormal movements. There were 13 cases with normal MRI findings and 7 cases with focal demyelination/abnormal myelination. On DWI, there were 3 cases with limited diffusion of the corpus callosum parietal, 1 case with right hippocampus hyperintensity, and 1 case with bilateral ventrolateral thalamic nucleus hyperintensity. Compared with the controls, CBF values of patients were significantly lower across the gray matter and the peak values were observed in the right middle temporal gyrus, right cuneus/precuneus, left middle frontal gyrus, left calcarine fissure ($P < 0.05$, GRF corrected) (Table1 and Figure1a-c).

Conclusions: CBF decreased in COVID-19 children with neurological symptoms, reflecting local blood-brain barrier disruption, ischemia, hypoxia, and brain damage. The involved brain regions were related to the visual motor coordination, executive cognition, language auditory processing, memory, and stress functions. Therefore, it is necessary for timely intervention and prevention of potential neurological sequelae.

Clinical Relevance: The assessment of CBF in children with COVID-19 based on 3D-ASL will help to study the hemodynamics and physiological mechanism related to clinical neurological symptoms.

PO-2506

An Investigation into Disparities in Accuracy and Clinical Utility of Artificial Intelligence for Assessing Bone Age in Pediatric Imaging

Jiyun Zhang¹, Jianhua Yin¹, Ying Shi², Bin Yang¹

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Objective: The aim of this study is to assess the precision of artificial intelligence (AI) systems for measuring children's bone age, specifically focusing on the TW3-RUS, Carpal, and G-P mapping methods. We will investigate disparities between AI-based assessments and real-world evaluations, analyze the underlying factors contributing to these discrepancies, and propose potential enhancements to enhance accuracy.

Methods: We conducted a retrospective analysis of imaging data from 894 pediatric cases who underwent left wrist orthotopic X-rays at Kunming first people's hospital between August 2021 and

August 2023. AI-assisted bone age assessments were performed using TW3-RUS, TW3-Carpal, and G-P mapping standards. These assessments provided AI-derived bone age estimates. Simultaneously, three senior pediatric imaging physicians evaluated the same cases based on TW3-RUS, TW3-Carpal, and G-P mapping criteria. The average of the bone age values obtained by the three physicians was considered the gold standard. The bone age results were categorized into 3-year intervals. The distribution of cases by age included 84 in the 1 to 3-year group, 116 in the 4 to 6-year group, 178 in the 7 to 9-year group, 226 in the 10 to 12-year group, 183 in the 13 to 15-year group, and 107 in the 16 to 18-year group.

For each age group, we calculated the accuracy within 0.5 year, accuracy within 1 year, and accuracy within 2 years, mean absolute error (MAE), and root mean square error (RMSE) to quantify the discrepancies between the bone age results and the reference standard bone age. The intra-group correlation coefficient (ICC) was used to assess the consistency between AI-derived bone age and the reference standard. Additionally, Bland-Altman charts were generated to visually depict the agreement between AI-based bone age assessments and the reference standard.

Results The accuracy of the AI system error within 0.5 year in the overall sample was 81.2% (726/894), the accuracy of the error within 1 year was 89.6% (801/894), and the accuracy of the error within 2 years was 93.9% (839/894), respectively. MAE was 0.410, 0.494, and 0.530, respectively, and RMSE was 0.487, 0.563, and 0.636, respectively. Across different age groups, the accuracy in terms of errors less than 0.5 years, less than 1 year, and less than 2 years was as follows:

- 1 to 3-year-old group: 98.1% (82/84), 100% (84/84), 100% (84/84).
- 4 to 6-year-old group: 80.4% (93/116), 87.5% (103/116), 92.2% (107/116).
- 7 to 9-year-old group: 78.8% (140/178), 85.4% (152/178), 91.7% (163/178).
- 10 to 12-year-old group: 83.2% (188/226), 91.4% (207/226), 93.6% (212/226).
- 13 to 15-year-old group: 76.3% (140/183), 81.7% (150/183), 85.8% (157/183).
- 16 to 18-year-old group: 90.7% (97/107), 97.6% (104/107), 98.2% (105/107).

Additionally, the Mean Absolute Error (MAE) and Root Mean Square Error (RMSE) were calculated. The Bland-Altman chart revealed that the AI system's 95% consistency limits for TW3-RUS and TW3-Carpal bone age assessments were -0.82 to 1.12 years and -0.79 to 1.21 years, respectively.

Conclusion The AI-based bone age measurement results exhibit commendable reliability and accuracy. However, it is worth noting that in practical clinical applications, manual adjustments and further deep learning may still be necessary to ensure optimal performance. Furthermore, our analysis revealed that there is no statistically significant difference between the 1 to 3-year-old age group and the 16 to 18-year-old age group ($P > 0.05$). In contrast, statistically significant differences were observed among the 4 to 6-year-old, 7 to 9-year-old, 10 to 12-year-old, and 13 to 15-year-old age groups ($P < 0.05$).

PO-2507

A Study Assessing the Precision of an Artificial Intelligence-Based Bone Age Measurement System for Evaluating Bone Age in Pediatric Patients with Delayed Growth and Development

Jiyun Zhang¹, Ying Shi², Jianhua Yin¹, Bin Yang¹

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Objective: This study aims to investigate the precision of employing an artificial intelligence (AI) system for bone age assessment in clinical settings for children experiencing delayed growth and developmental issues.

Methods: Between June 2020 and August 2023, a retrospective analysis was conducted on a total of 814 patients, comprising 478 male cases and 336 female cases, aged between 5 and 15 years old, with an average age of 11.6 ± 0.8 years old. All of these children underwent orthotopic radiography of the left wrist through X-ray imaging. From this pool, 244 children were meticulously selected to participate in the study. Inclusion criteria mandated that all cases must have been evaluated by the same three senior pediatric imaging physicians, resulting in a consistent diagnosis. Utilizing the patient's actual physiological age as the reference standard, a greedy algorithm was employed to meticulously match 122 cases in the AI application group with 122 cases in the manual evaluation group. Continuous variables were analyzed using paired t-tests and Wilcoxon rank-sum tests, while intra-group correlation coefficients were employed to assess the consistency and accuracy of bone age evaluations across the AI application group, manual evaluation group, and reference standard.

Results: Both the manual evaluation team and the AI application group yielded bone age estimates for all 244 patients that were lower than the actual physiological age of the children, which had a mean of (10.8 ± 1.5) years. Specifically, the AI application group's G-P mapping and TW3-c-Carpal bone age measurements were (9.5 ± 2.1) years and (8.8 ± 3.7) years, respectively, while the manual evaluation group's G-P mapping and TW3-c-Carpal bone age measurements were (10.6 ± 1.7) years and (10.4 ± 2.3) years, respectively. In the AI application group, the measurement error fell within 1 to 2 years for 62.3% (76/122) of cases, with an accuracy rate of 66.4% (81/122) within 2 to 3 years, and an accuracy rate of 67.2% (82/122) for errors exceeding 3 years. Conversely, the manual evaluation team achieved higher accuracy, with a measurement error within 1 to 2 years for 88.1% (107/122) of cases, an accuracy rate of 89.2% (108/122) within 2 to 3 years, and an accuracy rate of 92.3% (113/122) for errors exceeding 3 years. Notably, the accuracy of the G-P mapping method and TW3-c-Carpal bone age assessment within the AI application group was significantly lower than that of the manual evaluation group, with statistically significant differences ($P < 0.05$).

[RUS-CHN] Comparison of Bone Age Assessment Results with Reference Standards: The AI application team and the manual evaluation team achieved an accuracy of 75.3% (91/122) and 77.4% (94/122) within a margin of 1 to 2 years, respectively. For errors falling within 2 to 3 years, the accuracy rates were 88.1% (107/122) for the AI application team and 86.3% (105/122) for the manual evaluation team. Furthermore, for errors exceeding 3 years, the AI application team achieved an accuracy of 81.4% (99/122), while the manual evaluation team achieved 83.7% (102/122). In terms of the RUS-CHN bone age assessment method, both the AI application team and the manual evaluation team demonstrated good consistency and achieved high levels of accuracy when compared to the reference standard.

Conclusion: The accuracy of AI-based bone age assessment for children aged 5-15 years with growth retardation is lower than that of manual evaluation, with an average error of 1.8 ± 1.3 years. However, there was good consistency in the RUS-CHN method between the two groups. The G-P

and TW3-C-Carpal bone age evaluation results obtained through AI application cannot accurately reflect the actual physiological age of children and require manual intervention for recalibration.

PO-2508

Diagnosis of Fungal Infections and Management of Antifungal Agents in Pediatric Acute Lymphoblastic Leukemia: What is the Role of Chest CT

Zhixin Gao, Weiguo Cao
Shenzhen Children's Hospital

Objective: To evaluate the impact of a preemptive diagnosis-driven approach to computed tomography (CT) on the diagnosis of fungal infections and management of antifungal agents in pediatric acute lymphocytic leukemia (ALL).

Methods: A retrospective analysis was conducted on a pediatric cohort diagnosed with ALL who exhibited signs of pneumonia while undergoing chemotherapy during the time span between March 2016 and August 2021. The study collected information on the demographics, medical history, and laboratory findings of each pediatric patient. Additionally, the CT images were evaluated with radiologic severity index (RSI), based on the affected volume and regional opacity. A t-test, U-test, Pearson's chi-square test, or Fisher exact test was used to determine the clinical and radiologic characteristics of both fungal and non-fungal pneumonia cases. Furthermore, linear regression models were implemented to analyze the correlation between the RSI and other clinical features.

Results: During initial chemotherapy, 51 children diagnosed with ALL developed pneumonia (31 boys and 20 girls, with a mean age of six years \pm 4 [standard deviation]). Fungal infection was suspected in 15 children (29%). Four children (8%) received a diagnosis of alveolar lavage. The CT images in 65% of cases showed a ground glass opacity (GGO). The use of antifungal drugs was associated with lower levels of serum albumin content ($p = 0.006$), leukocyte count ($p = 0.031$), and lymphocyte count ($p = 0.029$). The peak radiologic severity index (RSI) value could predict the requirement of antifungal drugs at a cutoff of 3.5 (AUC 0.76 [0.61, 0.91]) with a sensitivity of 75% and specificity of 60%.

Conclusions: Chest CT examination is a valuable tool for evaluating chemotherapy-related fungal pneumonia, as it provides characteristic imaging findings. Additionally, it can aid in deciding whether to use antifungal drugs, based on the peak RSI value over 4.5 out of a total of 36 points.

PO-2509

Exploring predictive factors for hypoplastic aortic arch development in pediatric patients with complex coarctation of the aorta

Ying Lv, ling he, lu tian, xiao fan
Children's Hospital of Chongqing Medical University

Background

Complex aortic coarctation (CoA) is a pediatric cardiovascular disease influenced by multiple factors, impacting its treatment and prognosis. Among these factors, hypoplastic aortic arch (HAA) may play a pivotal role in determining the complexity of the condition and the selection of treatment

approaches. However, it is presently unclear which factors can predict whether children with complex CoA will exhibit underdeveloped aortic arch development. The aim of our study was to explore the potential predictive factors for HAA in pediatric patients with CoA and to assist healthcare professionals in gaining a deeper understanding of the pathophysiological processes of this condition, predicting patients' disease progression in advance, and providing a basis for the development of personalized treatment and management strategies.

Methods

A retrospective analysis of 103 patients diagnosed with complex CoA by CTA and echocardiography was performed. Aortic diameter was measured at six different levels. Correlation factors were compared between the non-HAA and HAA groups. Univariate and multivariate logistic regression analyses were used to identify risk factors for HAA in each arch segment.

Results

Of the 103 children with complex CoA, 55 were in the non-HAA group and 45 in the HAA group. The incidence of PDA (56.3% vs. 32.7%, $p < 0.05$), severe coarctation (CDR $< 50\%$, 81.3% vs. 34.5%, $p < 0.01$), and collateral vessels (39.6% vs. 0, $p < 0.01$) were higher in the HAA group than in the non-HAA group. Aortic arch size was positively correlated with age and negatively correlated with severe narrowing, VSD, collateral vessels, and left heart dysfunction. Logistic regression results showed that collateral vessels were risk factors for dysplasia in three segments of the aortic arch (proximal arch OR = 11.458; $p < 0.01$, distal arch OR = 4.211; $p < 0.05$, and isthmus OR = 11.744; $p < 0.01$), severe constriction (OR = 6.653; $p < 0.01$), and left heart dysfunction (OR = 5.149; $p < 0.01$) were risk factors for isthmus dysplasia.

Conclusion

The development of the segments of the aortic arch may be asynchronous in complex CoA. Collateral arteries, severe coarctation, and left heart dysfunction are risk factors for HAA, and children with collateral arteries may require more extensive arch reconstruction surgery.

PO-2510

Effect of different solutions on CT manifestation of crystal ball in vitro

Dalin Luo, Xuehua Peng

Department of Imaging Center, Wuhan Children's Hospital (Wuhan Maternal and Child Healthcare Hospital)

Objective: To observe the effects of different solutions on the CT performance of crystal ball in vitro.

Methods: The subjects were divided into 4 groups. 9 crystal balls of the same size were put into paper cups in groups A, B, C and D. Group A was 100 mL 0.9% saline and group B was 100mL low concentration of iodine solution (87.5mg I /mL). Group C was 100 mL highly concentrated of iodine solution (262.5mg I /mL), group D was 100 mL milk. The paper cup was placed in Siemens dual-source CT scanning to collect images. Test 1 was collected once per hour for a total of 24 hours. CT values of the lowest density area, of the highest density area and average CT value of each group at the same time were compared to evaluate the impact of different solutions on the crystal ball. Compare the retention time and the interaction of the same solution with different concentrations (Group B and Group C) on the CT value of the crystal ball. Test 2 was collected every 24 hours for a total of 120 hours. The average CT value of each group at the same time were compared to evaluate the impact of different solutions on the crystal ball. And observed whether the crystal balls are broken.

Result: The effects of different solutions on the CT value of lowest density area, CT value of highest density area and average CT value of the crystal ball showed great significance ($P < 0.05$). An interaction effect was observed on the CT value of lowest density area and average CT value of crystal ball in retention time and different concentration of same solution (Group A and Group B) ($P < 0.05$). As time increased, the average CT value of group B and C differed from group A and D

significantly. There were no differences between group A and D, and great significant differences between group B and C. The CT values stabilized in the nearly 120h (5 days), and the morphology of crystal balls was intact in all groups, and no broken occurred.

Conclusion: Different solutions affected the CT manifestations of the crystal ball in same time, but low concentration iodine solution (87.5mg I /mL) showed a striking contrast in the crystal ball. The crystal ball will not break in low concentration iodine within 120 hours.

PO-2511

Evaluation of cerebral development in preterm infants by using multiparametric MRI

Chi Qin,xin zhao,lin lu,xiaoan zhang
The third affiliated hospital of zhengzhou university

ObjectiveThe purpose of this study was firstly to identify multiparametric MRI makers that according to the degree of prematurity, and secondly to evaluate the impact of clinical complications on these markers.

Materials and methods

We prospectively enrolled preterm infants who were divided into two groups according to their degree of prematurity: extremely preterm(< 28 weeks' gestational age) and very preterm (28-32 weeks' gestational age). They underwent a multiparametric brain MRI scan at term-equivalent age including conventional MRI, diffusion kurtosis imaging (DKI) and arterial spin labeling (ASL). Then, we compared the parameters for the two groups. We also evaluated the effects of clinical data on those parameters.

ResultsIn the extremely preterm infant group, the MK and RK values of posterior limbs of the internal capsule (PLIC), anterior limb of internal capsule (ALIC) and parietal white matter (PWM) were lower than those in very preterm group. There were no significant differences in cerebral blood flow (CBF) values between the left and right cerebral hemispheres in the frontal lobe, temporal lobe, parietal lobe, occipital lobe, basal ganglia and thalamus ($p > 0.05$) both in two groups. The CBF values of frontal and occipital lobes in the extremely preterm infant group were significantly lower than those in very preterm group ($p < 0.05$). Regarding clinical complications, the presence of bronchopulmonary dysplasia was not associated to a significant CBF variation in the different ROIs.

ConclusionMultiparametric MRI scans performed at term-equivalent age in preterm infants by providing quantitative imaging parameters that differ with the degree of prematurity.

PO-2512

Study and progression of artificial intelligence assisted system in bone age imaging assessment of children

Jiyun Zhang¹, Ying Shi², Jianhua Yin¹, Bin Yang¹

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Bone age assessment is a crucial tool for gauging an individual's developmental stage and biological age based on skeletal growth and development. It finds broad applications in clinical medicine, forensic analysis, and sports-related fields. Bone age assessment is a significant research area in pediatric radiology. Currently, many clinical approaches (such as TW3-RUS, TW3-Carpal, and G-P atlas) involve comprehensive evaluations of a child's bone age. However, they are time-consuming, demand a high level of expertise from assessing physicians, and may exhibit inherent biases.

In recent years, with advancements in computer technology and the application of artificial intelligence algorithms, particularly deep learning and neural network models in the field of medical imaging, various artificial intelligence-assisted bone age assessment systems have made rapid strides. These systems enable swift, precise, and effective bone age assessments. As research progresses and becomes more specialized, there is a growing emphasis on anatomical information and skeletal morphological details in bone age assessments. Some studies attempt to integrate clinical data into these tasks. The use of entire hand images and specific regions of interest for training and prediction has significantly enhanced the accuracy of artificial intelligence (AI) bone age measurement systems. AI-based automatic bone age assessment algorithms, thanks to their amalgamation of deep learning capabilities and clinical interpretability, have garnered increasing attention from researchers and clinical practitioners. They have also achieved promising results and hold the potential for practical clinical applications.

This article provides an in-depth review of the developmental trajectory of artificial intelligence-based bone age assessment systems, offering fresh insights and prospects for the advancement of automated bone age assessment technology.

PO-2513

Preliminary research on the construction of artificial intelligence bone age assessment system based on deep learning of characteristic regions in digital hand-wrist radiograph

Jiyun Zhang¹, Ying Shi²

1. First People Hospital of Kunming

2. First Affiliated Hospital of Kunming Medical University

Objective To detect the feasibility and efficiency of bone age artificial intelligence estimation based on deep learning features from traditional regions of interest in hand digital radiographs.

Methods We conducted a retrospective analysis of imaging data from 2182 pediatric cases who underwent left wrist orthotopic X-rays at Kunming first people's hospital and Kunming children's hospital between March 2021 and May 2022 was split to training 1746 (80.0%) and validation 436 (20.0%) set in this study. The deep learning method was applied to construct the localization model of 17 feature regions and the regression model of bone age based on traditional ROIs in the images. Another set of bone age data with 635 subjects also in the hospital was adopted for test. Mean average precision (mAP)、mean absolute error (MAE) and root mean square error (RMSE) were used to assess model accuracy of detection and BA prediction, respectively.

Results The mAP of ROIs detection of the model was 0.93, and MAE of all subjects was 0.467 and 0.443 years respectively in validation and test sets. RMSE of all subjects was 0.487 and 0.563 years respectively in validation and test sets. The difference less than 1 year in test accounted for 89.6% (391/436) between BA assessment of the model and of the paediatric radiologists. The difference less than 2 years in test accounted for 93.9% (409/436) between BA assessment of the model and of the paediatric radiologists. The significant difference mainly appeared in conical epiphysis or epiphysis fusion covering interphalangeal articular surface in training set data of corresponding age.

Conclusion An AI model based on deep learning of traditional ROIs' features in hand DR images is initially achieved to automatically predict BA rapidly and effectively, yet manual adjustment and further deep learning are still needed in practical clinical applications.

PO-2514

超声对唇腭裂的产前诊断价值：Meta 分析

王文轩、蒋炳虎、张利平、张福洲
南充市中心医院

【摘要】目的：用 Meta 分析评价超声（US）对唇腭裂的产前诊断的临床应用价值。方法：检索 EMBASE、PubMed、Web of science、Cochrane Library、万方、维普、中国知网及中国生物医学文献等数据库，查找所有评价 US 对胎儿唇腭裂产前诊断的相关研究，检索时限为 2000 年 1 月至 2022 年 12 月，同时手检纳入文献的参考文献。制定纳入排除标准，采用 STATA 17.0 进行 Meta 分析：检验异质性；计算汇总诊断比值比（DOR）、灵敏度（SEN）、特异度（SPE）、阳性似然比（+LR）、阴性似然比（-LR）、受试者工作特性曲线下面积（AUC）、验前验后概率及 95%可信区间。结果：纳入文献 12 篇，共含病例 617 例。US 合并敏感性及其特异性分别为：0.86（0.77-0.92）、0.90（0.63-0.98）。US 合并 AUC：0.92（0.90-0.94）。结论：（1）对唇腭裂的产前诊断，US 具有较高的诊断效能，可作为胎儿唇腭裂的首选筛查方式；（2）US 在诊断唇裂方面优势独特，而在诊断腭裂畸形方面表现欠佳。

PO-2515

深度学习在儿童先天性室间隔缺损和房间隔缺损辅助检测中的应用研究

姚小芬
上海交通大学医学院附属上海儿童医学中心

目的：评估以深度学习为代表的人工智能方法对先天性室间隔缺损（ventricular septal defect, VSD）和房间隔缺损（atrial septal defect, ASD）心脏 CT 病例的检测效能。方法：回顾性分析 165 例心脏 CT 数据。利用卷积神经网络训练 CT 缺损检测模型，采用十折交叉验证法对模型进行效能评估，并统计深度学习模型与影像医师检测情况的差异性及一致性。结果：深度学习模型检测 VSD 和 ASD 总测试集的平均准确性、平均敏感性及其平均特异性等均高于 80%。总测试集模型、VSD 模型及 ASD 模型的平均 AUC 分别为 0.85、0.81 和 0.89。此外，深度学习模型对测试集数据平均每例缺损的检测时间也远小于影像医师。统计分析显示深度学习模型与影像医师对于缺损的诊断情况没有差异且一致性较高。结论：利用深度学习方法能够有效检出先天性室间隔缺损和房间隔缺损，可辅助影像科医生进行诊断和教育培训。

PO-2516

儿童噬血细胞综合征中枢神经系统受累 (CNS-HLH) 预后危险因素分析

马维¹、徐晔²

1. 重庆市渝北区人民医院

2. 重庆医科大学附属儿童医院

目的: 探讨儿童噬血细胞综合征中枢神经系统受累 (CNS-HLH) 的临床变量、脑部 MRI 影像标志物和基础疾病与死亡的关系。

方法: 回顾性分析 2012 年 1 月~ 2022 年 3 月于重庆医科大学附属儿童医院临床确诊的 CNS-HLH 患儿的临床及脑部 MRI 资料。患者分为死亡组和存活组。分析了 12 项主要临床指标、7 项脑部 MRI 影像特征及基础疾病, 借以探索可预测 CNS-HLH 患儿死亡风险的标志物。

结果: 共纳入 114 例 CNS-HLH 患儿, 其中死亡 59 例, 存活 55 例。纳入的临床变量包括性别/年龄、神经精神表现/症状、脑脊液结果、血常规检查、肝功能、凝血功能等 12 项结果与患儿死亡没有统计学上的独立相关性。对于 MRI 变量, 多变量分析显示病变扩散受限 (OR = 9.64, 95% CI: 3.39-27.43, $p < 0.001$) 和受累脑区数量 (OR = 1.24, 95% CI: 1.03-1.49, $p = 0.02$) 是患儿死亡的独立危险因素。ROC 曲线显示受累脑区数量 (AUC = 0.79, 95% CI: 0.70-0.87, $p < 0.001$) 具有较高的预测价值, 最佳临界值为 4.5 (敏感性 76%, 特异性 73%)。对于 HLH 基础病因, 相比感染性 HLH 而言, 家族性 HLH (F-HLH, OR = 9.90, 95% CI: 2.01 ~ 48.87, $p = 0.005$) 和免疫损害相关 HLH (IC-HLH, OR = 4.95, 95% CI: 1.40 ~ 17.46, $p = 0.01$) 与死亡的关系更密切。与其他 HLH 亚型相比, 家族性 HLH 和免疫损害相关 HLH 脑部更容易发生大病灶、弥散受限和更多的脑区受累; 家族性 HLH 最容易发生颅内出血。

结论: 脑部 MRI 影像标志物, 如病变弥散受限和较多的受累脑区, 可独立预测 CNS-HLH 患儿死亡。其次, 不同 HLH 亚型具有不同的脑部 MRI 表现和不同预后。

PO-2517

儿童塑形性支气管炎的临床及 MSCT 影像特征分析

黄华驰、戴李华、黄惠萍

广西壮族自治区妇幼保健院

目的 分析儿童塑形性支气管炎的临床及 MSCT 影像特征。 **方法** 收集 2018 年 1 月至 2022 年 12 月赴我院就诊且经电子支气管镜确诊及治疗的塑形性支气管炎患者 22 例, 回顾分析其胸部 MSCT 影像及临床资料。 **结果** 22 例患者均有发热、咳嗽, 绝大多数患者 CRP、D-二聚体水平增高。胸部 CT 影像表现为气道内软组织密度影及肺炎、肺不张或肺实变; 有 30 个肺叶不张或实变, 左肺上叶 5 例 (22.7%)、下叶 8 例 (36.4%), 右肺上叶 5 例 (22.7%)、中叶 4 例 (18.2%)、下叶 8 例 (36.4%)。术中见塑形内生性物质分布的支气管所在肺叶如下: 左肺上叶 5 例 (22.7%)、下叶 9 例 (40.9%), 右肺上叶 5 例 (22.7%)、中叶 2 例 (9.1%)、下叶 5 例 (22.7%)。22 例塑形性支气管炎病理分型均为 I 型 (炎症细胞型)。对患者灌洗液进行病原学检查, 检出肺炎支原体 19 例 (86.4%)、病毒 11 例 (50%)、细菌 3 例 (13.6%)、真菌 3 例 (13.6%)。通过支气管镜去除黏液栓后, 22 例患者病情均好转并出院, 2 例真菌感染患者因病情反复再次入院。 **结论** 儿童塑形性支气管炎影像表现为气道内软组织密度影及肺炎、肺不张或肺实变, 其病情危重、进展快、病死率高, 病原体以肺炎支原体最多见; 电子支气管镜是诊治塑形性支气管炎的最优方法, MSCT 检查能提示气道阻塞, 为支气管镜诊治提供精准的影像学信息, 有助于及时确诊和有效治疗。

PO-2518

三维动脉自旋标记在足月新生儿缺氧缺血性脑病的早期诊断和预后分组中的价值

刘畅
安徽省立医院

[摘要] 目的 探讨三维动脉自旋标记(3D ASL)灌注成像与 DWI 序列对足月新生儿缺氧缺血性脑病(hypoxic ischemic encephalopathy, HIE)的早期诊断价值以及对患者预后分组的价值。材料与方法 选择 2017 年 12 月至 2022 年 5 月在我院临床诊断为 HIE 的足月新生儿共 40 例, 对照组 40 例。所有 HIE 患儿根据其预后分为预后良好组和预后不良组, 所有受试者同时进行 3D-ASL 和 DWI 检查, 比较各感兴趣区的脑血流(CBF)和表观弥散系数(ADC), 并分析其一致性。感兴趣区包括双侧基底节、丘脑和额叶白质, 最终取双侧平均值。并研究 HIE 患儿不同脑区的 CBF 值与新生儿行为神经学评估(NBNA)的相关性, CBF 值的早期变化与 HIE 患儿预后分组的关系。结果 1.预后不良组基底节和丘脑的 CBF 值高于预后良好组, 差异有统计学意义($P<0.01$); 2.HIE 组新生儿基底节和丘脑的 CBF 值大于正常对照组, 差异有统计学意义($P<0.01$); 3.HIE 组额叶白质区的 CBF 值小于正常对照组, 差异有统计学意义($P<0.01$); 4.CBF 值的 ROC 曲线下面积为 0.973, CBF 值的特异性和敏感性为 97.5%和 90.2%; ADC 值的 ROC 曲线下面积为 0.881, 敏感性和特异性为 82.5%和 92.7%; 5.基底神经节区及丘脑的 CBF 值与 NBNA 评分高度相关($r=-0.8196, p<0.01$)、($r=-0.8504, p<0.01$); 额叶 CBF 值与 NBNA 评分无相关性($r=-0.0802, p=0.6229$)。结论 足月新生儿出生后 3 天内的 3D-ASL 结果与 NBNA 评分高度相关, 可以早期诊断 HIE 并预测脑功能损伤的结果, 比 DWI 有更好的诊断效果。

PO-2519

儿童先天性肺气道畸形的 CT 表现与病理对照

陈华、侯欣 郝跃文
西安市儿童医院

目的: 探讨儿童先天性肺气道畸形(CPAM)的 CT 特征性表现, 并与组织病理学结果对照, 以提高本病影像诊断的准确性及术前病理分型的认识。方法: 纳入经外科手术病理证实的 CPAM 患儿 73 例, 男 34 例, 女 39 例, 所有病例均行术前胸部高分辨率 CT 平扫加增强扫描。回顾性的分析 73 例 CPAM 患儿的临床资料及 CT 特征性表现, 按照 Stocker 分型法对其进行病理分型, 观察 CT 特征表现, 并与病理学分型结果进行对照。结果: 术后病理 Stocker 分型中 0 型未见。Stocker1 型 13 例(13/73, 17.8%), CT 主要表现为大囊周围环以多发小囊, 其中大囊直径大于 2.0cm, CT 分型与病理分型符合率 100% (13/13)。Stocker2 型 54 例 (54/73, 74%), 其合并叶内型肺隔离症者 18 例 (18/54, 33%), CT 主要表现为多发含气或含液小囊腔, 囊腔直径多在 0.5cm-2.0cm 之间, 合并肺隔离症者可见异常体循环动脉供血。其中 2 例合并感染, 误诊为肺脓肿; CT 分型与病理分型符合率约 96% (52/54)。Stocker3 型 2 例 (2/73, 3%), CT 主要表现为肺内大片透光增强区, 其内含蜂窝状微囊, 1 例误诊为大叶性肺气肿; CT 分型与病理分型符合率约 50% (1/2)。Stocker4 型 4 例 (4/73, 5%), CT 主要表现为肺外带单个或分隔样大囊, 囊腔直径多大于 10cm。其中 1 例误诊为肺囊肿; CT 分型与病理分型符合率约 75% (3/4)。结论: 儿童 CPAM 的 CT 表现具有明显特征性, 主要囊性病变为主、特别是多囊病变最为常见, 胸部 CT 表现可以有效提示病理分型, 术前胸部 CT 分型与术后病理分型有很高符合率, 特别是 Stocker 分型中的 1 型和 2 型。

PO-2520

双能量 CT 小肠造影定量评估儿童克罗恩病活动性的初步研究

陈华、侯欣 郝跃文
西安市儿童医院

目的 探讨双能量 CT 小肠造影 (DECTE) 扫描技术定量评估儿童克罗恩病 (CD) 活动度的价值。
方法 回顾性分析经临床及病理证实的 50 例 CD 患儿的双能量 CT 影像学资料, 以儿童克罗恩病活动指数 (Pediatric Crohn's Disease Activity Index, PCDAI) 将患者分为活动期和缓解期, 其中活动期 (PCDAI > 10 分) 28 例; 缓解期 (PCDAI ≤ 10 分) 22 例。分析两组能谱曲线斜率 K 及标准化碘浓度 (NIC), 绘制受试者工作特征曲线 (ROC), 计算曲线下面积 (AUC), 并得到最佳诊断阈值相对应的灵敏度、特异度。分析 DECTE 对 CD 患儿活动度的诊断价值。结果 活动期病变肠段能谱曲线斜率 K 及标准化碘浓度均高于缓解期, 差异均具有统计学意义 (P 均 < 0.01)。标准化碘浓度 (NIC) 在动脉期时 AUC 最大 (0.899), 当标准化碘浓度诊断阈值为 24.35% 时, 其诊断 CD 病变肠段处于活动期的灵敏度、特异度分别为 60.7% 和 81.8%。能谱曲线斜率 K 在门脉期时 AUC 最大 (0.979), 当 K 的诊断界值为 3.45 时, 诊断病变肠段处于活动期的敏感度、特异度分别为 71.4% 和 100%。结论 DECTE 能谱曲线斜率 K 及标准化碘浓度 (NIC) 在评估 CD 活动性方面具有很高的诊断价值和较好的敏感度和特异度, 可为临床精确诊断 CD 活动度提供客观依据。

PO-2521

儿童失神发作癫痫患者异常个体脑结构网络的探索

程勃超
四川大学华西第二医院

研究目的: 失神发作是一种常见的儿童癫痫, 已被广泛认为存在异常的大脑结构和功能。然而, 是否存在特异性的个体协方差结构网络特征尚不清楚。

研究方法: 本研究中对 73 名儿童的个体结构协方差网络进行了映射和分析。38 名首次发作未经治疗的失神发作癫痫儿童和 35 名性别年龄匹配的正常儿童对照。全脑个体结构协方差网络是基于自动解剖标记 (AAL) 模板构建的并计算全局和节点网络度量进行统计分析。

结果: 我们发现失神发作儿童和正常对照儿童的脑结构网络均表现出小世界特性。失神发作儿童相对正常对照儿童在楔前叶存在较高的最短路径长度, 较低的全局效率, 以及更高的节点效率。

结论: 上述这些结果表明, 失神发作儿童存在特征性的脑结构网络异常, 该结构的异常可能导致认知功能受损。我们的发现可能有助于理解儿童失神发作, 并提示楔前叶可能在失神发作中的结构网络中起到重要作用提供了初步证据。

PO-2522

双能 CT 虚拟平扫技术在儿童腹部增强 CT 扫描中的应用: 降低辐射剂量

谢明叶、何玲
重庆医科大学附属儿童医院

目的 探讨儿童腹部双能 CT 虚拟平扫图像 (VNC) 代替真实平扫图像 (TNC), 降低儿童腹部多期检查辐射剂量的可行性。材料与方法 回顾性收集我院行腹部能谱增强 CT 检查的 0~16 岁患儿 136 例, 重建其动、静脉期 VNC (VNC-AP、VNC-VP)。测量 TNC、VNC-AP、VNC-VP 三组图像肝脏、肾脏、竖脊肌以及占位性病变 ($n=63$) 的 CT 值, 采用 Bland-Altman 法分析 VNC 和 TNC 间的

CT 值一致性。以竖脊肌 SD 作为图像噪声, 计算信噪比 (SNR) 和对比信噪比 (CNR), 并由两名影像医师对图像进行主观评分。对三组图像的病灶检出率以及辐射剂量进行评估比较。结果 VNC 与 TNC 各部位 CT 值一致性较好 (差异均值 $<7\text{HU}$), 病灶 CT 值差异 $\leq 4\text{HU}$ 。VNC-AP、VNC-VP 两组图像噪声均低于 TNC (15.53 ± 2.93 vs. 14.48 ± 2.39 , $P < 0.001$, $t=4.930$; 15.53 ± 2.93 vs. 14.49 ± 2.37 , $P < 0.001$, $Z=-4.871$), CNR 高于 TNC (1.77 ± 0.51 vs. 2.05 ± 0.57 , $P < 0.001$, $Z=-6.232$; 1.77 ± 0.51 vs. 2.03 ± 0.57 , $P < 0.001$, $Z=-5.992$)。在主观评价中, 三组图像所有图像均具有诊断价值, TNC 图像质量主观评价略高于两组 VNC (P 均 < 0.001)。三组平扫图像的病灶检出率无统计学差异 (94.12% vs. 92.94% vs. 92.94% , $P=0.939$, $\chi^2=0.126$)。两组 VNC 图像在各个指标上的差异均无统计学意义 ($P > 0.05$)。使用 VNC 的有效辐射剂量较使用 TNC 显著降低 (2.71 ± 1.80 vs. 4.23 ± 3.06 , $P < 0.001$)。结论 儿童腹部 VNC 图像质量能够满足影像诊断需求, 对病变描述较准确, 具有代替 TNC 的潜力。VNC 代替 TNC 后总辐射剂量可降低约 35.93%。

PO-2523

双能 CT 联合前瞻性心电门控技术在先心病患儿心脏 CT 血管成像的应用: 辐射剂量与对比剂剂量

谢明叶、何玲
重庆医科大学附属儿童医院

目的 通过比较减碘剂量双能 CT 虚拟单能图像 (VMI) 与常规单能 CT 图像, 探讨双能 CT 联合多期前瞻性心电门控, 降低先心病患儿心脏 CTA 辐射剂量以及对比剂剂量的可行性 方法 100 例先天性心脏病患儿被纳入研究。其中双能扫描组 ($n=50$) 采用双能扫描模式, 使用前瞻性心电门控; 常规扫描组 ($n=50$) 采用常规扫描模式, 使用回顾性心电门控。双能扫描数据重建 40~60KeV (间隔 5KeV) 5 组 VMI 图像。比较主动脉弓、升主动脉、肺动脉主干、降主动脉以及四个心腔的 CT 值、背景噪声、信噪比以及对比信噪比, 并由 2 名医师对图像质量做出主观评级。结果 各部位 CT 值、噪声、SNR、CNR 受 VMI 能级的显著影响。CT 值、噪声、SNR、CNR 均随着能级的降低而增加, 在 40KeV 组达到最大值 (P 均 > 0.05)。在主观评价中, 5 组 VMI 图像总体质量评分有差异 ($P < 0.001$)。40KeV~50KeV 评分均值显著高于 55KeV~60KeV 均值 (3.59 ± 0.60 vs. 2.88 ± 0.67 , $P < 0.001$)。45KeV 组 VMI 主要大血管及心腔 CT 值均高于常规 CT 组 ($P < 0.003 \sim 0.836$)。在图像噪声的比较中, 45KeV 组图像噪声高于常规 CT 组 ($P=0.004$)。SNR 与 CNR 在两组间无统计学差异。相较于常规扫描组, 45KeV 图像对比剂硬化伪影更少 ($P < 0.001$), 整体图像质量更高 ($P=0.037$)。两组间 CHD 诊断正确率无统计学差异 (80.90% vs. 74.36% , $P=0.310$, $\chi^2=1.031$)。双能扫描组辐射剂量较于常规扫描组降低 64.52%、碘剂量下降 40.45%。结论 双能 CT 联合前瞻性心电门控技术能降低 CHD 患儿心脏 CTA 检查辐射剂量与碘剂量。减碘剂量后 45 KeV VMI 血管内 CT 值、SNR、CNR 与常规扫描图像相同或更高, 且具有更少的对比剂伪影, 图像质量满足诊断要求。

PO-2524

能谱 CT 在儿童胸部大血管疾病的应用

何玲
重庆医科大学附属儿童医院

能谱 CT 利用不同能量 X 射线在物质中的衰减系数不同, 通过高、低两种能量对同一组织进行成像, 获得两种能量的衰减信息, 从而实现物质的鉴别、定量和定性分析, 相较于常规 CT 提供更丰富的信息。在成人中, 能谱 CT 已在肿瘤诊断与鉴别、心血管疾病诊断以及骨骼疾病评估等领域广泛应

用,并取得了显著的临床成果。然而,在儿童中,由于其生理特点与生长发育的不同,能谱 CT 的应用尚未充分被挖掘。

胸部心脏大血管疾病包括先天性心脏病、主动脉狭窄、动脉导管未闭、室间隔缺损、肺动脉狭窄、法洛四联症等,是儿科最常见疾病之一。然而,儿童胸部大血管疾病的正确诊断在儿科医学中仍然面临挑战。儿童生长发育阶段心脏和大血管结构复杂性的影响,传统 CT 成像在分辨率和软组织对比方面的局限,以及对儿童辐射安全的关注,使得儿童胸部大血管疾病的准确诊断相对困难。

能谱 CT 儿童胸部大血管疾病的准确诊断上具有独特优势。能谱 CT 可以提供更准确的软组织对比效果、物质定量分析以及物质鉴别,使医生能够获得更多有关儿童胸部大血管疾病的信息,从而更好地实现疾病的鉴别和评估治疗效果。此外,能谱 CT 在低辐射剂量与低对比剂剂量方面的优势,也有望进一步保障儿童患者的安全。

因此,能谱 CT 能为儿童胸部大血管疾病的准确诊断与治疗提供更可靠的支持,帮助医生更好地应对儿童胸部大血管疾病的挑战。

PO-2525

髋关节平片对 DDH 患者 limbus 的预测

黄新颜

重庆医科大学附属儿童医院

目的 探讨通过回顾 DDH 患儿的治疗前平片及 MRI,确定是否可以通过髋关节平片来初步推断孟唇形态。

方法 收集 2019 年 1 月至 2021 年 12 月在重庆医科大学附属儿童医院诊断为 DDH 且同时有治疗前平片及 MRI 影像学资料的患儿共 237 例 336 髋,男 78 例女 159 例,平均年龄 21.8 月,138 例单侧发病,99 例双侧发病。在治疗前 MRI 图像上判断孟唇形态并将患髋分为内翻、骑跨、外翻三组。在治疗前平片上测量相关数据,其中单侧发病的患儿测量各组患侧髋臼长度与正常侧髋臼长度的比值(记作 A/N)及患侧髋臼长度与髋一锥体椎弓根长度的比值(记作 A/S),双侧发病的患儿仅测量 A/S。采用独立样本 T 检验分析各组间的 A/N 值与 A/S 值是否存在差异,并作 ROC 图,计算曲线下面积,选取最佳截断值。

结果 单髋发病的 138 例患儿中,23 髋孟唇外翻,47 髋孟唇骑跨,68 髋关节孟唇内翻,双髋发病 99 例患儿中,77 髋孟唇外翻,40 髋孟唇骑跨,81 髋孟唇内翻。A/N 值在外翻型与骑跨型之间以及内翻型与外翻型之间有统计学差异($P<0.001$, $P<0.001$),A/S 值在内翻与外翻、内翻与骑跨以及外翻与骑跨三组之间均存在统计学差异($P<0.001$, $P<0.001$, $P=0.006$)。受试者工作曲线(ROC 曲线)提示当 A/N 值大于 0.945 时或 A/S 值大于 0.575 时,DDH 患侧髋臼孟唇形态为外翻的可能性大。

结论 在治疗前 X 线平片图像上测量 A/N 值及 A/S 值等指标可以较好的预测 DDH 患儿患侧髋关节孟唇的形态。

PO-2526

基于 MRI 的影像组学特征与儿童低级别胶质瘤免疫组化指标联系的研究

徐加利¹、史长征²

1. 蚌埠医学院第一附属医院

2. 暨南大学附属第一医院 (广州华侨医院)

目的: 探讨基于术前 MRI 的影像组学特征与儿童低级别胶质瘤 Ki-67, CD34, p53 表达状态的联系。

材料及方法: 收集资料完整的儿童低级别胶质瘤患者的临床、影像及免疫组织化学结果, 进行回顾性分析; 基于磁共振 T2 FLAIR 序列提取三维影像组学特征, 进行组学流程分析, 对 Ki-67, CD34, p53 表达状态进行二分类, Ki-67 分类方法是 Ki-67 $\leq 1\%$ 划分为阴性, $>1\%$ 划分为阳性, p53 定义零表达为阴性, 非零为阳性。利用受试者操作特性曲线、校准曲线及决策曲线分析评估模型诊断价值。结果: 该研究基于 T2 FLAIR 序列影像组学特征建立了三个预测模型。Ki-67 预测模型在训练集和测试集操作者工作特性曲线下面积分别为 0.775(95%CI:0.654-0.878), 0.871(95%CI:0.762-0.977); 敏感性分别为 0.629,0.533; 特异性分别为 0.829,0.882; 准确性分别为 0.737 和 0.719。CD34 预测模型在训练集和测试集操作者工作特性曲线下面积分别为 0.937(95%CI:0.880-0.979), 0.714(95%CI:0.516-0.886); 敏感性分别为 0.976, 0.833; 特异性分别为 0.765,0.571; 准确性分别为 0.880 和 0.719。p53 预测模型在训练集和测试集操作者工作特性曲线下面积分别为 0.891(95%CI:0.795-0.964), 0.643(95%CI:0.403-0.850); 敏感性分别为 0.813,0.5; 特异性分别为 0.862,0.667; 准确性分别为 0.836 和 0.577。据决策曲线分析 Ki-67, CD34 和 p53 模型均有临床净收益。结论: 利用基于 T2 FLAIR 序列的影像组学模型可以预测儿童低级别胶质瘤 Ki-67,CD34 和 p53 表达状态。

PO-2527

影像组学、临床因素和 CT 形态学特征的联合列线图模型在鉴别支原体肺炎和细菌性肺炎中的价值

管艳¹、徐树明¹、宋晨¹、毕璐琳¹、全帅²

1. 山西省儿童医院 (山西省妇幼保健院)

2. 通用电气药业 (上海) 有限公司

目的评估一种基于计算机断层扫描 (CT) 的放射组学特征、临床指标和 CT 形态学特征的联合列线图模型在区分儿童支原体肺炎与细菌性肺炎方面的临床价值。

方法回顾性分析 2019 年 11 月到 2022 年 2 月在山西省儿童医院接受胸部 CT 检查的 176 例支原体肺炎和 250 例细菌性肺炎患儿的资料。将所有病例数按 7: 3 随机划分为训练集 (n=410) 和测试集 (n=176), 根据病原学结果分为支原体肺炎亚组和细菌性肺炎亚组。对每位患儿的 CT 图像使用 phigo-LK 分割软件 (GE Healthcare) 进行自动分割。获得全肺区域的感兴趣区 (VOI) 并提取影像组学一阶特征、纹理特征及滤波特征。对训练组采用最大相关最小冗余 (MRMR) 算法和最小绝对收缩和选择算子 (LASSO) 为主的方法筛选关键特征, 并完成影像组学标签构建。采用受试者工作特征 (ROC) 曲线评价基于临床指标及 CT 图像特征、影像组学及其联合模型区分两种肺炎的能力。绘制校准曲线和决策曲线评估三种模型的校准效能和临床应用价值。

结果在临床-CT 模型中, 白细胞计数、C 反应蛋白、乳酸脱氢酶、树霉征及单肺病变为鉴别支原体肺炎和细菌性肺炎的独立特征, 训练组和验证组 ROC 曲线下面积分别为 0.913 和 0.909; 在放射组学模型中, 5 个放射组学特征与两种肺炎的识别相关, 在训练组和验证组中的 AUC 分别为 0.918 和

0.895; 包括临床指标、CT 图像特征和影像组学标签评分的联合列线图模型诊断效能最高, 在训练组和验证组中的 AUC 分别为 0.971 和 0.958, 校准曲线表明此列线图与实际具有良好的一致性。决策曲线分析表明其具有较高的临床净获益。

结论此联合列线图模型结合了基于 CT 的放射组学特征、临床因素和 CT 图像的形态学特征, 可为临床早期区分支原体肺炎和细菌性肺炎提供决策依据。

PO-2528

基于 DTI 图论分析法对痉挛型脑瘫儿童认知功能的研究

杨艳丽¹、胡杰¹、张晶晶¹、彭莹¹、李同欢²、聂莉莎³、何成⁴、杨华⁵、刘衡¹

1. 遵义医科大学附属医院放射科

2. 遵义医科大学附属医院儿童神经康复科

3. GE 医疗中国磁共振科研部

4. 重庆大学附属中心医院医学影像科

5. 重庆市中医院影像科

DTI 被用于研究 CP 大脑的微观结构, 但既往研究多关注其运动功能。SCP 认知功能损伤的机制尚不清楚。因此, 本研究基于 DTI 采用图论分析法探讨痉挛型脑瘫 (spastic cerebral palsy, SCP) 儿童的脑网络属性与认知功能的关系。

招募 21 例 SCP 儿童 (男性 11 例, 年龄 8.6 ± 2.5 岁) 及 32 例对照组儿童 (男性 17 例, 年龄 8.9 ± 2.5 岁), 采集 3D-T₁WI、DTI 图像、行韦氏智力量表评估。SCP 组纳入标准: ① 4 岁-16 岁儿童; ② 3D-T₁WI、DTI 图像完整。排除标准: ① MRI 图像运动伪影; ② 韦氏智力评估失败。分析两组儿童脑网络小世界属性 (小世界标量 σ 、标准化最短路径长度 λ 、标准化聚类系数 γ)、全局属性 (全局效率 E_{glob} 、局部效率 E_{loc} 、特征路径长度 L_p 、聚类系数 C_p) 及节点属性 (节点中心度 DC 、节点效率 Ne 、介数中心性 Bc 、节点最短路径长度 NL_p 、节点聚类系数 Nc_p 、节点局部效率 Nle), 进行相关性分析。

(1) 组间比较: SCP 组儿童: ① 韦氏智力量表合成分数 (全量表智商 $FSIQ$ 、言语理解指数 VCI 、知觉推理指数 PRI 、工作记忆指数 WMI 、加工速度指数 PSI) 降低, $P < 0.05$ (表 1)。② 全局属性: E_{glob} 减低, L_p 、 λ 增加, $P < 0.05$ (图 1)。③ 节点属性: 多个脑区 DC 、 Ne 减低, NL_p 增高, $P < 0.05$, FDR 校正 (图 2)。(2) 相关性分析: SCP 组儿童右侧额下回后部 DC 与 $FSIQ$ 、 VCI 、 WMI 、 PRI 呈正相关 (表 2), 右侧额下回后部、右侧中央前回、右侧中央后回、左侧中央旁小叶 Ne 与 PRI 呈正相关 (表 3), 右侧中央前回 Ne 与 WMI 呈正相关 (表 3), 右侧额下回后部 Nl_p 与 PRI 呈负相关 (表 4), $P < 0.05$ 。

SCP 儿童全局及多个区域脑网络拓扑属性存在改变, 右侧额下回后部、右侧中央前回、右侧中央后回和左侧中央旁小叶节点属性改变与患儿认知功能损伤相关。

PO-2529

基于胎盘的虚拟磁共振弹性成像及基于 IVIM 的双指数和拉伸指数模型参数在预测小于胎龄儿预后中的价值

邓景¹、曹雨薇¹、陆遥¹、赵萌¹、周欣¹、曲菲菲²、吴飞云¹、陈婷¹

1. 南京医科大学第一附属医院 (江苏省人民医院)

2. 西门子医疗有限公司

目的: 对传统的影像学及实验室检查方法不能发现的真正存在不良结局的小于胎龄儿进行早期监测和处理至关重要。本研究旨在探讨基于弥散加权成像(DWI)的虚拟磁共振弹性成像(vMRE)和基于体素内不相干运动(IVIM)的双指数和拉伸指数模型参数在预测小于胎龄儿(SGA)的新生儿围产期不良结局中的价值。

方法: 本前瞻性研究纳入 20 例有不良结局的 SGA 新生儿和 40 例无不良结局的 SGA 新生儿。由两位经验丰富的放射科医生勾画胎盘的感兴趣区。选取低 b 值和高 b 值 (200 和 800 s/mm²), 通过 MATLAB 计算 1 个基于 DWI 的 vMRE 参数 (μ_{diff})。使用 Firevoxel 软件计算 5 个基于 IVIM 的参数 [真扩散系数(D)、伪扩散系数(D*)、灌注分数(f)、扩散分布系数(DDC)、扩散异质性指数(Alpha)]和表观扩散系数(ADC), 并进行组间比较。多因素分析得出 SGA 新生儿不良结局的独立危险因素。采用 Pearson 相关分析来阐明胎盘 μ_{diff} 值与胎龄之间的关系。

结果: 有不良结局的 SGA 新生儿胎盘 μ_{diff} 值显著高于无不良结局的 SGA 新生儿, f、DDC 和 ADC 值显著低于无不良结局的 SGA 新生儿。余参数在两组间无统计学差异。 μ_{diff} 和 f 值是 SGA 新生儿不良结局的独立预测危险因素。 μ_{diff} 和 f 值联合预测模型提高了预测效果。此外, 胎盘 μ_{diff} 与胎龄之间无统计学意义的相关性。

结论: 基于 DWI 的 vMRE 参数和基于 IVIM 的功能参数可以量化 SGA 新生儿胎盘弹性和微循环灌注。这是一种创新的辅助现有的产科早期监测和预测新生儿围产期不良结局的非侵入性方法。

PO-2530

三维动脉自旋标记灌注成像显示多动症儿童脑部血流灌注量降低

唐世龙、何玲

重庆医科大学附属儿童医院

目的: 探讨三维动脉自旋标记(3D-ASL)灌注成像在多动症儿童脑部的应用可行性。

方法: 前瞻性选取 5-13 岁多动症儿童 78 名为研究组, 选取年龄、性别相匹配健康儿童 89 名为对照组, 所有儿童均行磁共振常规序列、3D-ASL、3D-T1 序列扫描。通过软件后处理获得脑部各区脑灰白质体积和脑血流量 CBF 灌注值(采用 GE ADW 4.6 工作站, 将 3D-ASL 序列原始数据导入 Functool 软件, 获得脑血流 CBF 定量图, 为了计算不同脑区体积、CBF 等定量参数值, 我们采用了基于体素的形态学分析 VBM 法, 我们在 MATLAB 2018a 平台上, 使用 SPM12 软件, 将 3D-T1 序列结构图与 CBF 定量图进行配准, 在 SPM12 软件中利用 CAT12 工具包将配准后的 CBF 结构定量图进行分割, 最后提取各个脑区体积参数值和 CBF 参数值。), 比较分析两组儿童脑部各区脑灰白质体积和脑血流灌注量 CBF 值, 找出多动症儿童脑部各区脑灰白质体积和脑血流灌注量特点。

结果: 多动症儿童脑部总体积和脑部总血流量值低于健康儿童 ($P < 0.05$); 多动症儿童额叶、颞叶、海马、尾状核、壳核、苍白球等脑区灰白质体积低于健康儿童 ($P < 0.05$); 多动症儿童额叶、颞叶、海马、尾状核、壳核、苍白球等脑区灰质 CBF 值低于健康儿童 ($P < 0.05$); 多动症儿童额

叶、颞叶、海马、尾状核、壳核、苍白球等脑区白质与健康儿童相对应脑区白质 CBF 值差异无统计学意义 ($P>0.05$)；额叶、尾状核等脑区 CBF 值能区分多动症儿童 ($AUC>0.05$, $P<0.05$)。结论：3D-ASL 技术显示多动症儿童部分脑区脑血流灌注量降低,额叶、尾状核等脑区 CBF 值能区分多动症儿童。

PO-2531

定量磁共振成像技术在注意缺陷多动障碍伴孤独症特征儿童诊断中的应用

唐世龙、何玲
重庆医科大学附属儿童医院

目的：探讨定量磁共振成像技术在注意缺陷多动障碍伴孤独症特征儿童诊断中的应用可行性。

方法：前瞻性选取 4-5 岁注意缺陷多动障碍伴孤独症特征儿童 (ADHD-ATs) 56 名为研究组, 选取性别年龄相匹配注意缺陷多动障碍儿童 (without ATs) 53 名为对照组, 所有儿童均行磁共振 ESWAN、3D-PCASL、3D-T1 序列扫描; 通过软件后处理获得脑区铁含量 QSM 值、脑血流量参数 CBF 值 (为了计算不同脑区体积、QSM、CBF 等定量参数值, 我们采用了基于体素的形态学分析 VBM 法, 在 MATLAB 2018a 平台上使用 SPM12 软件, 将 3D-T1 序列结构图与 QSM、CBF 等定量图进行配准, 在 SPM12 软件中利用 CAT12 工具包将配准后的结构定量图进行分割, 最后提取各个脑区参数值), 比较分析两组儿童脑区参数值, 找出 ADHD-ATs 儿童脑区参数值特点。

结果：ADHD-ATs 儿童额叶、颞叶、海马、尾状核等脑区铁含量低于 ADHD 儿童, ADHD 儿童脑部总铁含量高于 ADHD-ATs 儿童 ($P<0.05$)；ADHD-ATs 儿童额叶、颞叶、苍白球、尾状核、壳核、海马等脑区 CBF 值低于 ADHD 儿童, ADHD-ATs 儿童脑部总 CBF 值低于 ADHD 儿童 ($P<0.05$)；ADHD-ATs 儿童额叶、颞叶、海马、尾状核等脑区 QSM 值与 CBF 值呈正相关；额叶、颞叶、尾状核等脑区 CBF、QSM 值能区分 ADHD-ATs 儿童和普通 ADHD 儿童 ($AUC>0.05$, $P<0.05$)，QSM 技术 AUC 值最高 (0.913)。

结论：ADHD-ATs 儿童脑部额叶、颞叶、尾状核等处铁含量、脑血流量低于普通 ADHD 儿童, 磁共振定量成像 (QSM、3D-PCASL) 技术可区分 ADHD-ATs 儿童, QSM 技术可作为 ADHD-ATs 儿童首选诊断技术选择。

PO-2532

扩散峰度成像显示注意力缺陷/多动障碍儿童部分脑区灰质和白质发育异常

唐世龙、何玲
重庆医科大学附属儿童医院

目的：探讨扩散峰度成像 (DKI) 在多动症儿童脑部的应用可行性。

方法：67 名多动症儿童和 72 名年龄、性别相匹配健康儿童纳入研究, 所有儿童均行磁共振 3D-T1、DKI 和常规序列扫描。通过软件后处理获得各脑区体积和 DKI 参数值 (采用 GE ADW 4.6 工作站, 将 DKI 序列原始数据导入 Functool 软件, 获得 DKI 参数图, 为了计算不同脑区体积、DKI 参数值, 我们采用了基于体素的形态学分析 VBM 法, 我们在 MATLAB 2018a 平台上, 使用 SPM12 软件, 将 3D-T1 结构图与 DKI 参数图进行配准, 在 SPM12 软件中利用 CAT12 工具包将配准后的 DKI 结构参数图进行分割, 最后提取各个脑区体积和 DKI 参数值), 比较分析两组儿童各脑区体积和 DKI 参数值, 找出多动症儿童各脑区体积和 DKI 参数值特点。

结果: 多动症儿童脑部总体积低于健康儿童 ($P<0.05$); 多动症儿童额叶、颞叶、海马、尾状核、壳核、苍白球等脑区体积低于健康儿童 ($P<0.05$); 多动症儿童额叶、颞叶、尾状核等脑区 Ka、MK、FA、Kr 值低于健康儿童, MD、FAK 值高于健康儿童 ($P<0.05$); ROC 结果分析显示额叶、尾状核、颞叶等脑区 Ka、MK、FA、Kr 值能区分多动症儿童 ($AUC>0.05$, $P<0.05$)。结论: DKI 成像显示多动症儿童部分额叶、尾状核、颞叶等脑区脑灰质和白质异常。

PO-2533

研究探讨 3.0T 磁共振准连续式动脉自旋标记灌注中不同标记距离及延迟时间在新生儿缺血缺氧性脑病的应用分析

高凯、孙惠苗、李佳雯、武艳君、杨洁、杨宏、胡磊、温家祥、靳波、杨晓燕
山西省儿童医院 (山西省妇幼保健院)

目的: 缺血缺氧性脑病是指围生期窒息引起的部分或完全缺氧、脑血流减少或暂停而导致的胎儿或新生儿脑损伤。缺血是新生儿 HIE 脑损伤早期的主要改变, 准连续式动脉自旋标记技术能够显示缺血性脑血管疾病所引起的血流低灌注, 且可以长期监测缺血区 CBF 变化情况, 了解缺血的发展进程。本研究通过分析不同标记距离及延迟时间对准连续式动脉自旋标记技术在新生儿缺血缺氧性脑病的应用, 以求取得最优参数。

方法: 选取本院自 2021 年 1 月至 2023 年 6 月 360 例结合病史、临床表现诊断为新生儿缺血缺氧性脑病的患儿行常规 MRI 及准连续式动脉自旋标记灌注检查, 在同一受试者的准连续式动脉自旋标记灌注采集 8 组数据, 延迟时间分别为 1500 ms、1750 ms、2000ms、2250ms, 在每个延迟时间下均采集了标记距离为 75 mm、90mm 两组数据。对比以上 8 组灌注结果的信噪比。由高年资医师对病灶对比度及分辨率进行对比评分, 结合 ROC 曲线对 8 组图像进行评价。

结果: 比较 8 组准连续式动脉自旋标记灌注检查结果。结合常规 MRI, 结果: 不同标记距离及延迟时间检查出的新生儿缺血缺氧性脑病的信噪比, 敏感性, 特异性, 准确性以及阳性预测值比较, 差异具有统计学意义 ($P<0.05$)。

结论: 经过我们对 360 例患儿扫描图像的对比研究, 综合分析信噪比, 敏感性, 特异性, 准确性以及阳性预测值, 在 3.0T 磁共振准连续式动脉自旋标记灌注检查新生儿缺血缺氧性脑病取延迟时间为 2000 ms, 标记距离为 90mm 时取得的效果最佳, 为最优组合。

PO-2534

产前 1.5T MRI 联合超声对胎儿 ACC 的诊断价值研究

蒋士杰、连鹏、杨海仓、吕朋、杨立娟
西安市人民医院 (西安市第四医院)

[摘要] 目的: 探讨产前 1.5T 磁共振成像 (MRI) 联合超声对胎儿胼胝体发育不全 (ACC) 的诊断价值。方法: 选取 2018 年 1 月至 2020 年 10 月我院经产前超声和 MRI 检查发现疑似胎儿 ACC 的孕妇 30 例。引产后的胎儿进行尸检诊断, 正常分娩的胎儿出生后行 MRI 进一步明确诊断。以产后确诊为金标准, 采用 Kappa 检验分析产前 MRI、超声与金标准的一致性。比较产前 MRI 与产前超声对完全型、部分型 ACC 的诊断效能。分析产前 MRI 与超声联合诊断的效能。结果: 30 例疑似病例中, 经出生后影像学检查或尸检结果确诊为 ACC 的胎儿有 22 例, 其中完全型 ACC 胎儿 15 例, 部分型 ACC 胎儿 7 例。产前 MRI 的灵敏度为 95.45%, 特异度为 100%, 准确率为 96.67%, 与金标准具有高度一致性 ($Kappa=0.918$)。产前超声的灵敏度为 81.82%, 特异度为 87.50%, 准确率为 83.33%, 与金标准的一致性中等 ($Kappa=0.619$)。产前 MRI 对完全型 ACC 的检出率为 100%, 漏诊率为 0; 产前超声对完全型 ACC 的检出率为 86.67%, 漏诊率为 13.33%。产前 MRI 对部分型

ACC 的检出率为 85.71%，漏诊率为 14.29%；产前超声对部分型 ACC 的检出率为 71.43%，漏诊率为 28.57%。两种方法对完全型、部分型 ACC 的检出率、漏诊率比较无显著差异 ($\chi^2=2.143$, $P=0.143$; $\chi^2=0.424$, $P=0.515$)。产前 MRI 与超声联合诊断的准确率为 100%。结论：产前 1.5T MRI 联合超声能提高胎儿 ACC 的诊断准确率，对于疑似病例可在产前超声的基础上进一步行 MRI 鉴别诊断。

PO-2535

儿童肝脏间叶性错构瘤与未分化胚胎性肉瘤的 CT 影像特征分析

孙雪峰

首都儿科研究所附属儿童医院

目的 探讨儿童肝脏间叶性错构瘤 (HMH) 与未分化胚胎性肉瘤 (UES) 的 CT 影像鉴别特征，以提高术前影像诊断正确率。

方法 回顾性分析经手术及病理证实的 25 例 HMH 和 15 例 UES 患儿的临床资料及 CT 影像，比较两组病例患儿 CT 影像表现及临床资料的差异。对患儿性别、血清甲胎蛋白 (AFP)、病灶位置、数量、生长方式、形态、边缘、有无钙化及出血、病灶内囊腔数量、囊内分隔、囊腔形态、囊腔内壁是否光滑、平扫实质密度、增强扫描动脉期病灶内有无增粗迂曲的血管、动脉期及门脉期强化程度的比较采用 χ^2 检验，对患儿年龄、病灶大小的比较采用 Mann-Whitney U 检验或 t 检验。

结果 两组在性别、病灶位置及数量、生长方式、形态、边缘、钙化、囊腔内分隔、平扫实质密度及增强扫描强化程度的比较差异均无统计学意义 ($P>0.05$)，在患儿年龄、血清 AFP、病灶大小、出血、病灶内囊腔数量、囊腔形态、囊腔内壁是否光滑、增强扫描动脉期病灶内血管的显现比较差异均有统计学意义 ($P<0.05$)。HMH CT 表现为：多显示为实性为主的囊实性病灶，病灶内囊腔多发、囊变区之间肿瘤实质较多，囊腔形态较规则，囊壁有一定张力，囊腔内壁较光滑。UES CT 表现为：多显示为囊性为主的囊实性病灶，病灶较大，易出血，囊性区为多房分隔样，囊腔形态不规则且囊壁无张力，囊腔内壁欠光滑，动脉期病灶内见增粗迂曲的血管。

结论 儿童 HMH 与 UES 在 CT 影像上有一定特征性，了解其影像特点，结合患儿年龄及血清 AFP 化验室检查，有助于对二者做出鉴别诊断。

PO-2536

ADHD 儿童动态功能稳定性的相关性研究： 基于静息态功能磁共振

陈双利、王美豪

温州医科大学附属第一医院

背景和目的：注意力缺陷/多动障碍 (ADHD) 是儿童期最常见的神经发育障碍，其特征是发育不当的注意力不集中和/或多动/冲动症状。静态和动态功能连接 (FC) 研究揭示了多动症患者的大脑功能障碍。然而，很少有研究测量 ADHD 儿童动态功能结构的稳定性。本研究旨在根据静息态功能磁共振成像数据，探究未经药物治疗过的 ADHD 儿童的功能稳定性 (FS) 变化。方法：收集 42 名 ADHD 儿童和 30 名健康对照 (HC) 的静息态功能磁共振数据。使用滑动窗口方法，通过测量动态 FC 随时间的一致性来获得每个体素的 FS。然后，我们选择 FS 改变的大脑区域作为种子来检查大脑区域的远程动态功能连接 (dFC)。最后，进行组间比较和相关性分析。结果：结果显示 ADHD 儿童表现出 (1) 双侧额上回 (SFG) FS 降低，右侧颞中回 (MTG) FS 增加，均属于默认模式网络 (DMN)；(2) 双侧 SFG (属于默认网络) 和左侧脑岛 (属于凸显网络) 之间的 dFC 增加 (GRF 矫正，体素 $p<0.001$ ，体簇 $p<0.05$)；和 (3) Stroop 试验中较差的表现与双侧 SFG

中 FS 的降低显著相关 ($r=-0.322$, $p=0.042$)。结论: 我们的研究结果表明, ADHD 儿童的异常功能结构涉及 DMN (双侧 SFG 和右侧 MTG) 和 SN (左侧脑岛) 区域。这项初步研究为多动症的动态大脑功能网络提供了新的见解。

PO-2537

CT 影像组学在高危神经母细胞瘤患者队列中识别超高危亚组

王浩入、何玲
重庆医科大学附属儿童医院

目的: 利用 CT 影像组学分析在高危神经母细胞瘤患者队列中识别超高危 (ultra-high-risk, UHR) 亚组。

材料与方法: 回顾性纳入 105 例高危神经母细胞瘤患者, 按 7: 3 的比例分为训练集 ($n=74$) 和测试集 ($n=31$)。UHR 定义为在诊断后 18 个月内死于疾病的患者。从动脉期 CT 图像中提取并选择影像组学特征, 利用支持向量机算法建立最佳影像组学模型。计算曲线下面积 (area under the curve, AUC) 和 95% 置信区间 (confidence interval, CI) 等评价指标。此外, 我们还分析了该模型的拟合度和临床效益, 以及其与总生存期 (overall survival, OS) 的相关性。

结果: 识别 UHR 的最佳影像组学模型由 11 个特征组成, 在训练集中的 AUC、准确度、灵敏度和特异度分别为 0.911 (95%CI: 0.840-0.982)、0.892、0.857 和 0.906, 在测试集中的 AUC、准确度、灵敏度和特异度分别为 0.828 (95%CI: 0.669-0.987)、0.839、0.778 和 0.864。影像组学模型的预测概率和实际概率之间无统计学差异 ($P>0.05$), 且该模型在不同的风险阈值下具有净收益。影像组学模型在训练集中预测 OS 的一致性指数为 0.743 (95%CI: 0.672-0.814), 在测试集中预测 OS 的一致性指数为 0.688 (95%CI: 0.566-0.810)。该模型在训练集中预测 1 年、2 年和 3 年 OS 的 AUC 分别为 0.832、0.863 和 0.721, 在测试集中预测 1 年、2 年和 3 年 OS 的 AUC 分别为 0.870、0.836 和 0.638。

结论: 基于 CT 图像的影像组学模型有助于在高危神经母细胞瘤患者队列中识别 UHR 亚组, 并且该模型有助于预测疾病早期进展。

PO-2538

学龄前孤独症谱系障碍患儿静息态脑镜像同伦功能连接研究

马文敏、李仕广
遵义医科大学第三附属医院 (遵义市第一人民医院)

目的: 孤独症谱系障碍 (autism spectrum disorder, ASD) 是儿童常见的神经疾病, 是儿童常见的神经发育性疾病, 但其神经机制目前仍不清楚。本研究使用静息态功能磁共振技术, 基于体素镜像同伦功能连接 (voxel mirror homunculus connection, VMHC) 方法, 对学龄前 ASD 患儿进行大脑半球间同伦功能连接研究, 以探索半球间功能连接的变化。

方法: 本研究包括 24 例 (48.3 ± 11.9 , 19 名男性) 学龄前 ASD 患者和 17 例匹配健康对照者 (43 (33,65), 14 名男性), 所有参与者都接受了静息态功能磁共振和基于 T1WI 的三维磁化准备快速梯度回波扫描, 通过 DPABI (<http://www.rfmri.org>) 软件对数据进行预处理。采用 VMHC 方法进行大脑半球间功能连接改变。

结果: 与健康对照组相比, 学龄前 ASD 患儿的缘上回、海马、颞上回、颞极-颞中回、中扣带回、颞下回及直回的 VMHC 值减低 (FDR 矫正, 体素 >24)。

结论：我们的研究表明，学龄前 ASD 患儿额颞顶叶及边缘系统的 VMHC 减低，提示双侧大脑半球这些区域的同步性活动损害，半球间的信息交换机整合过程障碍。这可能与 ASD 患儿的认知功能损害、社会情感功能缺陷及感觉功能障碍有关，潜在反映了学龄前 ASD 患儿的神经病理机制。

PO-2539

实影渲染技术在儿童肋软骨病变的临床应用价值

白刚、徐树明

山西省儿童医院（山西省妇幼保健院）CT 室

目的：探究实影渲染技术在重建儿童肋软骨的独特优势及临床应用价值。方法：选取 2021 年 1 月至 2022 年 12 月于我院受检的肋软骨畸形患儿 40 例作为研究对象，所有患儿均由 SIEMENS Force CT 扫描且上传至工作站行图像三维重建，A 组应用实影渲染技术重建（40 例），B 组应用容积再现技术重建（40 例），两组图像按照 4 个等级评估图像质量。结果：A 组图像明显好于 B 组图像，A 组图像上均可清晰显示肋软骨结构，而 B 组图像对肋软骨的显示清晰度明显低于实影渲染技术的三维成像。结论：实影渲染技术三维成像可以直观且立体呈现整体胸廓的解剖结构，在儿童肋软骨的三维成像方面有其独特的优势，可以大幅降低肋软骨病变的误诊率，对于临床诊断肋软骨病变有极其重要的指导意义。

PO-2540

CT 影像组学融合模型鉴别儿童支原体肺炎和病毒性肺炎

毕璐琳、管艳、郭米蕾、徐树明

山西省儿童医院（山西省妇幼保健院）

目的：基于 CT 影像组学和临床特征相结合的融合模型，用于区分儿童支原体肺炎和病毒性肺炎。材料与方法：回顾性分析从 2021 年 8 月-12 月山西省儿童医院（山西省妇幼保健）453 例经病原学检测确诊为社区获得性肺炎患儿的临床及影像所有相关资料，其中支原体肺炎患儿 251 例，病毒性肺炎患儿 202 例。分为训练集（n=317）和测试集（n=136）。通过影像组学分析软件提取所有患儿的胸部 CT 平扫图像，经特征筛选构建影像组学标签，通过 Logistic 回归分析构建影像组学模型、临床特征模型及融合模型。使用 ROC 曲线、校准曲线及决策曲线评估模型性能。结果：从每个患儿胸部 CT 平扫图像中共提取 386 个纹理特征，并筛选出 10 个有价值的特征。影像组学模型中训练集的 AUC 是 0.936，测试集的 AUC 是 0.932。临床特征模型中训练集的 AUC 是 0.926，测试集的 AUC 是 0.915。在融合模型中训练集 AUC 为 0.967，测试集 AUC 为 0.963，且校准曲线一致性良好，决策曲线呈现较高的临床实用性。结论：影像组学融合模型鉴别支原体肺炎和病毒性肺炎，为临床早期诊治提供有效依据。

PO-2541

基于全脑体素分析研究扩散峰度成像 在新生儿缺氧缺血性脑病中的应用价值

王雪源¹、陆林²、赵鑫²、张小安³

1. 郑州大学

2. 郑州大学第三附属医院

3. 河南科技大学

目的通过基于体素分析 (VBA) 方法, 探究扩散峰度成像 (DKI) 在新生儿缺氧缺血性脑病 (HIE) 中的诊断价值, 并比较不同程度新生儿 HIE 间 DKI 参数的差异。

材料与方法

以在我院医学影像科进行 MRI 检查且被临床诊断为 HIE 的新生儿 66 例为 HIE 组研究对象, 并分为轻度组、中度组和重度组。25 例围产期病史正常、无器质性神经系统疾病的新生儿作为对照组。HIE 组和对照组研究对象均在生后 28 内进行颅脑常规 MRI 和 DKI 的扫描。VBA 方法比较各组间全脑 DKI 衍生参数的差异, 统计方法采用 ANOVA/ANCOVA 及 scheffe 事后分析, 并采用高斯随机场 (GRF) 对结果进行校正。

结果 1. VBA 方法比较对照组、轻度组及中重度间差异, 发现大脑损伤的区域主要在上放射冠、上纵束、胼胝体、尾状核、丘脑和顶枕叶皮层区域, 且在峰度参数图及 FA 图中更为显著。此外, 还发现小脑上部、小脑中脚及小脑蚓部也出现了显著的损伤, 在 MD 图、Da 图及 Dr 图中更为显著。

2. VBA 方法事后比较中, 发现对照组与中重度间差异十分显著, MK 图、FA 图的差异主要在放射冠、上纵束、胼胝体及尾状核, Ka 图、Kr 图、MD 图及 Dr 图的差异主要在小脑上部和小脑中脚。对照组与轻度组间仅有 FA 图呈现出显著的差异, 主要在左侧上放射冠、小脑中脚和右侧小脑上部。而轻度组和中重度组间未表现出明显的差异。

结论 VBA 方法可进行自动全脑分析, 可显示 HIE 患儿常见的大脑白质和深部灰质损伤, 并且还呈现了 HIE 患儿皮层和小脑的损伤。同时, VBA 方法表现出不同损伤部位在不同参数图中的差异。大脑损伤在峰度参数图和 FA 图中有显著差异, 而小脑损伤则在 MD 图、Da 图和 Dr 图中有显著差异。

PO-2542

纵向揭示重组人生长激素对身材矮小儿童自发性脑活动的影响： 一项静息态功能磁共振成像研究

沈黎婷

温州医科大学附属第二医院

背景: 重组人生长激素 (Recombinant human growth hormone, rhGH) 能改善身材矮小儿童身高和行为异常。然而, 目前关于 rhGH 对身材矮小儿童的自发性脑活动的影响尚不清楚。

目的: 探讨 rhGH 对身材矮小儿童生长发育、认知行为及自发性脑活动的影响。

材料与方法: 本研究共纳入 35 例身材矮小儿童, 并分为治疗组 (n = 14) 和未治疗组 (n = 21)。所有患儿分别在基线和一年随访结束时接受静息态功能磁共振成像和神经心理学评估。采用基于 rs-fMRI 的低频振幅 (low-frequency fluctuation amplitude, ALFF) 分析方法评估自发性脑活动。使用混合效应分析检测 rhGH 和时间对脑去 ALFF 值的相互作用效应。最后, 进行 Pearson 相关分析, 探讨显著改变的脑区 ALFF 值与临床指标之间的相关性。

结果: 治疗组的身高、体重、胰岛素样生长因子-1 水平、胰岛素样生长因子结合蛋白 3 水平和加工速度指数均显著升高。rhGH 与时间的交互作用在右侧壳核中表现明显, 其 ALFF 值在 rhGH 治疗后显著升高。此外, 在随访一年后, 未治疗组在左侧背外侧额上回观察到时间的主要效应, 其 ALFF

值明显下降。相关性分析显示, 未治疗组的左侧背外侧额上回的 ALFF 值与随访时的身高及加工速度指数呈正相关。

结论: rhGH 治疗不仅对身材矮小儿童的生长发育及认知行为有积极影响, 而且可以改善患儿的自发性脑活动。

PO-2543

膝关节滑膜炎炎症弥散加权成像表现与幼年特发性关节炎临床活动性的相关性研究

徐琳

上海交通大学医学院附属上海儿童医学中心

目的: 总结幼年特发性关节炎 (JIA) 患儿膝关节滑膜炎的 DWI 表现, 探讨其与临床活动性的相关性。

方法: 回顾性分析 2018-2022 年临床确诊为 JIA 并 MRI 增强扫描提示膝关节滑膜增厚的 95 例患儿的临床和影像资料, 所有患儿均进行了膝关节 DWI 扫描, 对 DWI 图像中滑膜 ADC 值进行测量, 同时收集与 MRI 检查同期的红细胞沉降率 (ESR)、C 反应蛋白 (CRP) 等数据。采用 Mann-Whitney-U 检验比较临床活动性组与非活动性组的各项参数数值。利用 Spearman 相关分析法进行滑膜 ADC 值与实验室指标的相关性分析。

结果: 95 例 JIA (临床活动性组 54 例, 非活动性组 41 例), 中位年龄为 8.3 岁。ESR、CRP 和 ADC 值在临床活动性组与非活动性组间有显著差异; 临床活动性组与非活动性组中位 ADC 值分别为 $1.49 \times 10^{-3} \text{mm}^2/\text{s}$ 及 $1.25 \times 10^{-3} \text{mm}^2/\text{s}$, $p = 0.001$, 95% 可信区间为 $0.11 \sim 0.53 \times 10^{-3} \text{mm}^2/\text{s}$ 。ADC 值与 ESR 及 CRP 呈正相关 ($r = 0.62$, $r = 0.45$, $p < 0.05$)。

结论: DWI 做为无创性检查方式, 其 ADC 值可用于判断幼年特发性关节炎患儿膝关节炎症活动性。

PO-2544

腰部 MRI 评估腹侧马尾神经根横截面积在 II 型和 III 型脊髓性肌萎缩的应用价值

陈希文、吴慧莹、隋艺、陈臻、曹亚先、鹿连伟、张明杰

广州市妇女儿童医疗中心

目的 探讨腰部 MRI 评估腹侧马尾神经根横截面积在 II 型和 III 型脊髓性肌萎缩 (SMA) 的应用价值。方法 回顾性分析 2019 年 11 月至 2023 年 5 月于广州市妇女儿童医疗中心确诊的 SMA 患者 26 例, 其中 SMA II 型组 16 例、SMA III 型组 10 例。收集 2019 年 1 月至 2023 年 5 月期间与 SMA 患者性别、年龄匹配的正常志愿者 26 例为对照组。基于腰部 MRI 轴位 T2WI 快速自旋回波序列, 选取脊髓圆锥下方 10 mm 作为测量平面, 将图像放大 300 倍以清晰显示马尾神经根, 测量左、右腹侧马尾神经根最大横截面积。绘制 SMA II 型组、SMA III 型组与对照组的年龄与左、右腹侧马尾神经根横截面积散点图。采用 Pearson 相关性分析各组年龄与左、右腹侧马尾神经根横截面积相关性, 采用 Mann-Whitney 检验比较组间左、右腹侧马尾神经根横截面积差异。结果 Pearson 相关性分析结果显示 SMA II 型组 (左侧: $P = 0.105$, 右侧: $P = 0.068$)、SMA III 型组 (左侧: $P = 0.227$, 右侧: $P = 0.091$) 腹侧马尾神经根横截面积与年龄间不存在线性关系, 对照组腹侧马尾神经根横截面积与年龄间存在明显线性关系 (左侧与右侧 P 均 < 0.01)。SMA II 型组、SMA III 型组

与对照组间腹侧马尾神经根横截面积具明显统计学差异 (左侧与右侧 P 均 <0.01) , SMA II 型组与 SMA III 组组间左、右腹侧马尾神经根横截面积不具统计学差异 (左侧: $P = 0.121$, 右侧: $P = 0.053$) 。 结论 腰部 MRI 可用于评估 SMA II 型和 III 型儿童腹侧马尾神经根横截面积。腹侧马尾神经根萎缩是 SMA 患者的特征性生物学标志。

PO-2545

基于核磁共振放射组学模型预测儿童腹部神经母细胞瘤基因异常

贾绚

浙江大学医学院附属儿童医院

【摘要】 目的 探索基于核磁共振的放射组学特征预测儿童腹部神经母细胞瘤 (Neuroblastoma, NB) 存在基因异常的方法。资料与方法 回顾性分析 2019.4~2021.3 我院收治的 74 例经病理证实的腹部神经母细胞瘤患儿, 对他们术前腹部核磁共振图像进行感兴趣区勾画, N4 偏置场矫正、各向同性体素重采样及信号强度归一化后提取放射组学特征, 每例提取 1874 个放射组学特征; 采用 t 检验结合 lasso 进行特征筛选获取的放射组学特征, 应用 SMOTE (Synthetic minority over-sampling technique, SMOTE) 矫正数据不平衡性, 采用随机森林 (Random forest) 进行模型构建, 利用 80% 数据作为训练集对模型调优, 并用 20% 数据验证模型的准确度、敏感度、特异度及 ROC 曲线下面积 (AUC) 检验模型效能; 同时对比组学特征与肿瘤指标神经元特异性烯醇化酶 (NSE) 预测 NB 基因异常的效能。结果 74 例儿童腹部神经母细胞瘤中, 有基因异常的 27 例 (36%), 无基因异常的 47 例 (64%), 通过 t 检验和 Lasso 算法共获得 6 个放射组学特征与之相关, 利用这些特征基于随机森林构建模型, 经训练集数据进行机器学习后, 对腹部神经母细胞瘤有基因异常和无基因异常患儿进行预测, 训练集 10 次交叉验证后的平均特异度 0.67, 敏感度 0.69, 受试者工作特征曲线的曲线下面积 0.71, 模型准确度为 0.68; 测试集特异度 75%, 敏感度 73%, AUC 值 0.74, 模型准确度为 0.74; NSE 预测 NB 基因异常的 AUC 值 0.687。结论 应用放射组学以及机器学习技术对儿童腹部神经母细胞瘤基因异常进行预测是可行的, 通过 random forest 分类器建立的基于 6 个放射组学特征模型的诊断效能尚可; 同时放射组学特征预测存在基因异常 NB 的诊断效能优于肿瘤标记物 NSE。

PO-2546

产前超声联合 MRI 诊断胎儿先天性肺气道畸形的价值

贾阳、马荟茜、谢林均、徐蓉、郭应坤

四川大学华西第二医院

目的: 对先天性肺气道畸形 (CPAM) 胎儿进行产前诊断, 对评价不良出生结局或做好产时干预准备有一定价值。目前, 产前诊断主要包括超声检查和 MRI 检查。本研究旨在进一步探讨超声结合 MRI 在胎儿先天性肺气道畸形产前诊断中的价值。

方法: 收集 2018 年 1 月 1 日至 2022 年 12 月 31 日 29 例疑似 CPAM 并完成 MRI 检查的病例。收集超声和 MRI 测量的病灶-肺-头比 (CVR)。同时分别通过 MRI 测量患侧和健康侧肺肝信号强度进行比较。结合后期多次超声检查结果, 以及产后影像学检查和手术病理结果, 评价超声联合 MRI 的诊断价值, 为先天性肺气道畸形提供更合适的产前诊断和妊娠复查方案。

结果: 本研究共纳入 62 例患者, 其中引产 7 例, 出生后病变消退 5 例, 经产后影像学或手术结果证实的 CPAM 48 例, 支气管囊肿 1 例, 肺隔离症 1 例。其中产前超声确诊 55 例, 产前 MRI 确诊 56 例, 敏感性分别为 96.49% 和 98.25%。在病变的多次影像学回顾中, CVR 值表现出一定的波动规律。例如, CVR 的峰值出现在 26-28 周, 而在妊娠后期检查中, CVR 值呈现一定的消退趋势,

并在 30-33 周保持稳定。然而,在妊娠晚期的检查结果中,有 14 例在妊娠 30-37 周超声检查中难以发现病变,而 MRI 可以清晰显示妊娠晚期病变。患病侧与健康侧肺-肝信号比值的配对秩和检验,差异有统计学意义($P<0.05$),患侧的肺-肝信号强度比值低于健侧。

结论:超声联合 MRI 能准确诊断 CPAM,但超声在反映妊娠后期病灶范围及内部信号特征方面优势更明显。在检查过程中,CPAM 随孕周的增加呈现出先上升后下降的变化趋势。对于孕晚期超声检查的成像局限性,孕早期超声筛查的开展结合孕晚期 MRI 复查,可以对病变进行动态观察,患侧肺-肝信号强度比值与健侧存在差异。MRI 对先天性肺气道畸形肺发育程度的评价具有一定的价值。

PO-2547

弥散张量成像对孤独症谱系疾病儿童的研究

舒意凯¹、张小安²、赵鑫¹

1. 郑州大学第三附属医院 (河南省妇幼保健院)

2. 河南科技大学

摘要:目的:基于磁共振弥散张量成像(Diffusion tensor imaging, DTI)分析 2~6 岁孤独症谱系障碍(Autism spectrum disorder, ASD)儿童与同龄对照儿童脑白质不同区域差异性。方法:2022 年 12 月—2023 年 8 月,选取 10 例 ASD 儿童和 10 例正常对照儿童的 DTI 特点及 Gesell 发展量表(GDS)发育商,比较两组平均弥散系数(Mean diffusivity, MD)、各向异性比值(fractional anisotropy, FA)、表面弥散系数(apparent diffusion coefficient, ADC)的差异,并探索 ASD 组感兴趣区 FA 值与量表评分之间的关系。结果:与对照组相比,ASD 组的左侧小脑后脚、左侧胼胝体体部、左侧内囊后肢 FA 值降低($P<0.05$),ASD 组左侧小脑后脚、左侧胼胝体体部 ADC 值较正常对照组增高,其余感兴趣区的参数值未见明显差异($P>0.05$)。ASD 组左侧胼胝体体部的 FA 值与 Gesell 发展量表(GDS)发育商呈正相关($r=0.432, P<0.05$)。ASD 组 Gesell 量表发育商与左侧胼胝体体部 ADC 值呈负相关($r=-0.535, P<0.05$)。结论:ASD 儿童大脑可能存在广泛微结构改变,其中胼胝体损伤可能参与了 ASD 的病理生理过程并可进一步探究疾病严重程度。

PO-2548

能谱 CT 虚拟平扫在儿童腹部成像中的应用研究

王晓霞、钟玉敏

上海交通大学医学院附属上海儿童医学中心

目的:通过定量分析儿童腹部虚拟平扫(VNE)与常规平扫(TNE)图像,探讨 VNE 在儿童腹部 CT 成像中应用的可行性。方法:自 2017 年 1 月至 2018 年 6 月,前瞻性连续纳入于上海儿童医学中心行腹部能谱 CT 扫描的患儿 35 例。应用 64 排 CT (GE Discovery CT 750 HD)行腹部平扫和增强扫描,采用低管电流(260mA)宝石能谱 CT 技术行动脉期扫描, TNE 和门静脉期采用常规多层螺旋 CT 扫描模式,利用虚拟平扫技术重建动脉期 VNE。测量比较 VNE 和 TNE 中肝脏、肾脏、胰腺、脾脏和肌肉的 CT 值、图像噪声值(SD 值)、对比噪声比(CNR)、图像质量主观评分、有效辐射剂量(ED)。结果:VNE 与 TNE 的各脏器 SD 值、CNR 比较,差异无统计学意义($P>0.05$)。VNE 各脏器与竖脊肌的平均 CT 值略低于 TNE,但具有良好的相关性($r: 0.509-0.952$)。VNE 主观图像质量评分与 TNE 比较,差异无统计学意义($P>0.05$)。省略 TNE 的两期方案的有效辐射剂量(动脉期采用能谱 CT 扫描模式、门静脉期采用常规多层螺旋 CT 扫描模式)略低于常规三期方案,差异无统计学意义($P>0.05$)。结论:VNE 图像 CT 值与 TNE 具有很好的相关性,图像质量较好,可满足临床诊断需求。VNE 技术在儿童腹部 CT 成像中具有一定的可行性,并可能为儿童腹部 CT 成像提供了一种更简单的方案。

PO-2549

儿童甲型 H3N2 与 H1N1 流感相关性脑病的影像表现比较分析

曾伟彬

深圳市儿童医院

目的：探讨儿童甲型 H3N2 及 H1N1 流感相关性脑病 (Influenza associated encephalopathy, IAE) 并发症的 CT 和 MR 影像表现，比较两者影像学表现的差异。

方法：回顾分析经临床实验室检查确诊的 17 例儿童甲型 H3N2 流感以及 19 例 H1N1 流感的临床及影像资料，并复习相关文献。

结果：36 例患儿中男孩 23 例，女孩 13 例，年龄范围 8 月~13 岁，H3N2 及 H1N1 平均年龄分别是 5.23 ± 3.73 岁、 6.01 ± 3.01 岁。患儿均有发热，H3N2 及 H1N1 抽搐比例分别是 58.8%、47.4%，出现意识障碍症状分别是 23.5%、36.8%。H3N2 患者中有 4 例并发急性坏死性脑病 (acute necrotizing encephalopathy, ANE)，H1N1 流感并发 ANE 有 7 例，ANE 预后明显较差，总病例中 12 例死亡，H3N2 及 H1N1 占比分别是 17.6%、47.4%。两种病毒的颅脑 CT 及 MRI 影像表现均表现为多灶性、部分对称性的异常表现，均以累及双侧丘脑、基底节区、双侧大脑半球额顶颞枕叶、小脑半球及脑干，出现不同程度脑肿胀，病变区 CT 表现为低密度影，MRI 的 T1WI 呈低信号，T2WI 及 FLAIR 呈高信号影，DWI 呈高信号，ADC 图呈不均匀低信号，ANE 典型表现 ADC 图可见“三色模式”。H1N1 型流感累及脑干、小脑明显多于 H3N2 型，前者发热最高体温明显高于后者，差异均具有统计学意义。

结论：儿童甲型 H3N2 及 H1N1 流感相关性脑病的 CT 和 MR 影像表现相似，H1N1 型流感累及脑干、小脑更多于 H3N2 型，且发热最高体温更高于后者，尽早应用 MRI 检查可避免漏诊。

PO-2550

超低剂量胸部平扫结合深度学习算法 (DLR)
重建在儿童肺部感染筛查中的应用

李鹏

郑州大学第一附属医院

目的：探索深度学习重建算法 (DLR) 结合超低剂量胸部平扫在儿童肺部感染筛查中的应用价值。

方法：收集临床怀疑肺部感染而行胸部平扫的患儿共 30 名，随机分为两组，实验组 A ($n=14$) 和对照组 B ($n=16$)，A 组采用 80KVp、转速 0.28rot/s 超低剂量扫描协议，并将扫描数据进行 DLR 图像重建；B 组采用 100kvp、转速 0.35rot/s 常规扫描协议，并采用 Asir-V 迭代算法进行图像重建。分别记录两组扫描数据的 CTDI、DLP、主动脉 CT 值、主动脉 SD 值、背部肌肉 CT 值和 CT 值。分别计算两组图像的 SNR 和 CNR 值，进行图像客观评估，并采用 3 分法对图像的呼吸运动伪影进行主观评估。结果：CTDI 和 DLP 实验组和对照组分别为 1.42mGy，35.65 mGy*cm 和 3.46 mGy,89.48mGy*cm，实验组较对照组分别降低了 59%和 64%，组间差异具有显著性意义；SNR、CNR 值对照组高于实验组，组间差异没有显著意义；主观评分实验组明显高于对照组，组间差异具有显著性意义。结论：深度学习重建算法 (DLR) 结合超低剂量扫描可以在保证图像质量的同时明显降低辐射剂量，减少呼吸运动伪影，在儿童肺部感染筛查中具有一定的意义。

PO-2551

基于深度学习的 Bolus 跟踪技术在儿童腹部 CTA 中的性能评估

杨楠
天津市儿童医院

目的: CTA Bolus 注跟踪扫描过程通常包括监测位置选择和感兴趣区域 (ROI) 的放置, 以生成触发 CT 扫描的时间密度曲线 (TDC)。在此研究中, 我们旨在评估基于人工智能的算法 SmartPlan 在儿科腹部增强 CT 检查中的推注跟踪过程的性能。

方法: 前瞻性收集 226 例小儿腹部 CTA 检查。记录多年资儿童 CT 影像技师在推注跟踪扫描中放置 ROI 的监测位置和 ROI 中生成的 TDC 作为对照组(Fig.1-2); 然后将定位扫描和时间分辨图像导入 SmartPlan 软件, 以自动确定放置 ROI 的监测位置并生成 TDC, 并将结果记录为实验组。SmartPlan 过程中有两个步骤, 即监测部分选择和 ROI 选择。对于监测断面选择步骤, 我们计算了断面选择的准确性, 并将 SmartPlan 定义为如果 SmartPlan 选择的断面与技术人员选择的断面之间的距离小于 1cm, 则 SmartPlan 是准确的。对于 ROI 选择, 我们计算了 SmartPlan 的通过率, 并定义了通过标准, 因为 ROI 位于主动脉内。

结果(Fig.3): 对于 Smart Plan 中的监测断面选择和 ROI 选择过程, 监测断面选择的准确性为 97.35%, 置信区间为 95%[95.24%, 99.44%], 监测 ROI 选择通过率为 0.962, 置信区间为 95%, 实验组与对照组 TDC 曲线峰值无差异 (均 $P>0.05$), 实验组耗时比对照组显著减少 18.18 ± 1.17 秒 ($P<0.05$) (Table.1)。

结论: 结合经验丰富的儿童 CT 影像技师, 基于人工智能的自动推注追踪技术可以有效地提高儿科腹部增强 CT 推注追踪的准确性。

临床相关性: 基于 AI 的自动推注追踪技术可以通过快速、急性自动触发 CT 扫描来简化儿童腹部 CTA 的 CT 扫描过程。

PO-2552

中国华北地区儿童心脏形态、功能磁共振参考值

杨楠
天津市儿童医院

目的: CMR 双心室体积、功能和质量正常参考值对于儿童心室舒张功能障碍评估是至关重要的, 是多种儿科心脏病发病率和死亡率的重要预测指标, 尚没有关于亚洲地区的报道。我们试图通过结合先前发表的研究数据并以标准化的重建和量化方式创建中国华北地区儿童双心室体积、功能和质量基于 SSFP 的 CMR 参考值。

方法:

1. 研究人群

此项研究回顾性收纳了 CMR 检查且检查结果为阴性的 28 天至 18 岁儿童患者 217 例, 评估其双心室大小和收缩功能参数。

2. CMR 采集协议: 所有 CMR 检查由 1.5T 完成的。心脏成像协议中包括标准电影稳态自由进动序列。此 CMR 方案中不包括静脉注射钆造影剂。

3. CMR 分析

CMR 图像由三名多年资医学影像技师使用专用软件程序进行分析。CMR 数值指数使用以 Du Bois 公式确定的患儿体表面积。

3.1 心室容积和功能

左心室: 手动追踪舒张末期 LV 心内膜和心外膜边界、收缩末期仅追踪 LV 心内膜边界 (图 1), 包含乳头肌、LV 流出道和室间隔

左心室容积=舒张末期心外膜和心内膜体积之差

左心室质量=心肌体积×心肌密度

LV 舒张末期和收缩末期根据短轴和长轴图像（分别为最大和最小容积）进行定义，相应相位用于 LV 分析

4.统计学分析：利用箱形图、正态概率图和密度函数直方图对样本变量作正态分布验证。Student t 检验用于连续变量的性别间比较，卡方检验用于分类变量的比较。

结果：全部患儿 CMR 图像显示均不存在结构性心脏病。全部样本的个体信息汇总统计数据归纳在表 1 中。男孩的指数双心室容积和左心室质量较大 48.5 ± 9.62 .vs 36.6 ± 6.0 g/m, 62.2 ± 4.1 vs $62.8\pm 4.2\%$ (表 2)。对于所分析的大多数参数，观察者观察者之间的一致性良好。

结论：本研究提供了除新生儿期以外的儿童总体和性别分类下的心脏大小、功能以及心肌组织特性的 CMR 参考值。这些信息对临床实践很有用，可能有助于该人群心脏疾病的鉴别诊断。

PO-2553

MRI 3D-UTE 序列不同翻转角成像以及与 3D-DESS 序列 在未成年猪离体膝关节中的对比研究

白万晶、宁刚、李学胜、熊鲜、杨雪茹、周翰鸿
四川大学华西第二医院

目的：探讨 3D-UTE 不同翻转角 (FA) 以及与 3D-DESS 在未成年猪离体膝关节 (标本) 中的应用价值，为儿童膝关节成像做初步研究。

方法：运用膝关节线圈对 4 个标本进行两种 3D 扫描，主要成像参数如下。3D-UTE: TR=171ms, TE1=0.04ms, TE2=2.8ms; 每个标本采用不同 FA (3、5、8、11、15) 扫描。3D-DESS 序列: TR=14ms, TE=5ms, FA=28°。对所有图像进行矢状位重建，分别在后交叉韧带、胫骨骨皮质、邻近完整肌肉、股骨远端、胫骨近端、髌骨三个部位的软骨放置大小约 20mm² 的感兴趣区 (ROI)，测量信号值 (SI) 和标准差 (SD)，计算得到信噪比 (SNR=SI/SD)。对 3D-UTE 同一部位不同 FA 条件下 TE1 的 SNR 进行单因素方差分析；对同一部位 3D-UTE 的 TE2 和 3D-DESS 上的 SNR 进行配对 t 检验。

结果：(1) FA=3、5、8、11、15 时，SNR 在后交叉韧带依次为 18.43 ± 9.04 、 16.23 ± 3.09 、 16.47 ± 1.78 、 21.24 ± 6.36 、 19.37 ± 3.94 ，在胫骨骨皮质依次为 9.1 ± 2.16 、 8.77 ± 2.66 、 11.52 ± 5.16 、 9.53 ± 2.94 、 11.90 ± 3.05 ，在邻近完整肌肉依次为 13.06 ± 4.81 、 14.85 ± 5.72 、 15.72 ± 5.47 、 15.61 ± 6.06 、 13.64 ± 4.81 。(2) 两种 3D 序列在股骨远端软骨的 SNR 分别为 15.64 ± 3.35 、 16.14 ± 2.04 ，在胫骨近端软骨的 SNR 分别为 17.21 ± 4.98 、 15.67 ± 4.14 ，在髌骨软骨的 SNR 依次为 16.49 ± 3.26 、 15.27 ± 3.7 。(3) 上述差异无统计学意义 ($P>0.05$)。

结论：(1) 3D-UTE 能够显示韧带、骨皮质、肌肉，不同 FA 条件下 SNR 相差不大。(2) 两种 3D 序列参数不同，但对标本软骨的显示能力相当。

PO-2554

多模态 MRI 在脊髓性肌萎缩症肌肉定量研究中的应用进展

胡颖熠^{1,2}、李志勇¹

1. 深圳市儿童医院放射科

2. 中国医科大学深圳市儿童医院放射科

目的：脊髓性肌萎缩症(spinal muscular atrophy, SMA)是由于染色体 5q13.2 上的运动神经元存活 (survival motor neuron, SMN)1 基因发生双等位基因缺失或突变而导致的常染色体隐性遗传病，主

要表现为进行性、对称性肌无力和肌萎缩。目前以诺西那生钠为代表的反义寡核苷酸药物已广泛用于改善 SMA 患者的运动功能,因此,一种无创、客观、敏感的生物标志物对于疾病监测及疗效评估具有重要临床价值。定量 MRI (quantitative MRI, qMRI) 能可靠地反映神经肌肉疾病的肌肉组织特征,早期、客观地反映显示个体肌肉受损情况。本文拟从肌肉微结构角度,阐述肌肉 qMRI 技术在 SMA 研究中的应用进展。

方法: 在 PubMed、Web of Science、Geenmedical 数据库中搜索关键词“脊髓性肌萎缩症、定量磁共振”,查阅 2010 年 3 月-2023 年 1 月 qMRI 在 SMA 肌肉微结构定量应用的相关文献,整理并排除无关文献,主要参考近 5 年文献进行分析。

结果: 最终纳入 17 篇文献研究,其中英文 17 篇,中文 0 篇,文献内 5 年引用率为 76%,外文引用率为 100%。本文得出,多种 qMRI 技术如 T1WI、化学位移同反相位成像技术、DTI 技术,可用于反映 SMA 疾病严重程度、监测疾病进展及评估药物疗效,而 T₂ mapping 的临床价值尚存争议。31P-MRS 可量化细胞能量代谢过程中的含磷生物分子,通过分析磷酸肌酸的恢复动力学来评估线粒体功能。MT 肌肉成像尚未在 SMA 中开展,其应用价值仍需在未来研究中探索。

结论: qMRI 可客观定量评估 SMA 疾病严重程度,并对疾病的进展及疗效评价具有重要意义。因此,随着影像技术的革新与发展,我们应着重应用客观、无创的影像技术从肌肉微结构角度评估 SMA 严重程度、疾病进展情况及药物疗效,挖掘可靠、多重性的影像学生物标记物,为临床提供个性化指导。

PO-2555

磁共振 3D UTE 序列与常规 2D 序列在儿童膝关节疾病中的对比研究

李亚琦、宁刚、程勃超、李学胜、白万晶、熊鲜、朱宏霞
四川大学华西第二医院

目的 探讨 3D UTE 与常规 2D 序列在儿童关节疾病中的应用研究。

材料与方法 选取 5 例来我院行磁共振膝关节患儿,男性 4 例,女性 1 例,6 岁-14 岁,应用联影 uMR570 扫描。用膝关节专用线圈,扫描序列为: T1WI-FSE、PDWI-FSE-FS、3D UTE, 3D UTE 主要扫描参数: TR=7ms, TE1=0.09-0.16ms, TE2=4.48ms, Flip Angle°=8, scan time=5: 07min, 并生成短 TE 回波、长 TE 回波、SUB 三组图像。图像进行多平面重建,在矢状面测量计算各序列股骨远端、胫骨近端、髌骨软骨及前、后交叉韧带 SNR。统计分析用两样本 t 检验或两样本秩和检验。比较计算上述软骨及韧带 SNR 在 3D UTE 短 TE 回波与 T1WI-FSE 图像上的差异, 3D UTE 长 TE 回波与 PDWI-FSE-FS 图像上的差异。记录 3D UTE SUB 图像上述软骨及韧带 SNR, 用均数±标准误差表示。

结果 测得膝关节上述软骨及韧带 SNR 在 3D UTE 短 TE 回波图像上为 15.5, 16.2, 18.32±6.12, 17.4, 21.7, 长 TE 回波图像上为 10.3, 11.2, 19.1, 12.6, 5.94±2.42, T1WI-FSE 图像上为 9.0, 10.8, 13.27±3.62, 6.6, 3.9, PDWI-FSE-FS 图像上为 4.2, 5.2, 4.9, 3.5, 3.22±0.64, 以上每组差异均有统计学意义 (P<0.05)。3D UTE SUB 图像上 SNR 为 4.92±1.63, 4.24±1.30, 3.09±1.53, 6.73±3.26, 5.68±2.13。

结论 1、膝关节上述软骨及韧带 SNR 3D UTE 短 TE 回波高于 T1WI-FSE, 3D UTE 长 TE 回波高于 PDWI-FSE-FS。2、3D UTE SUB 图像, 能给临床提供更多信息, 对诊断儿童早期关节疾病具有较大指导应用价值。

PO-2556

利用 MARs 及深度学习图像重建减少儿童脊柱术后 CT 图像金属伪影的可行性

孙记航

首都医科大学附属北京儿童医院

目的：评估降低金属伪影算法 (MARs) 结合深度学习图像重建 (DLIR) 在儿童脊柱术后患儿 CT 扫描中，降低椎弓根螺钉引起的金属伪影的应用可行性。

方法：对 25 例 (7~14 岁) 儿童 (共 196 颗椎弓根螺钉) 在脊柱手术后进行 140kV 低剂量 CT 扫描，固定管电流 70mA，以确认脊柱或螺钉的状况。对照组仅使用 DLIR 算法进行图像重建，研究组同时使用 DLIR 与 MARs (DL-MARs) 进行图像重建。测量硬化伪影 (LHA) 的长度，定义为沿螺钉长轴从螺钉头到正常图像区域的阴影的长度。椎弓根的图像质量使用 4 分制进行评估 (4 分：清晰，3 分：受伪影影响但可观察，2 分：因严重伪影而难以观察，1 分：无法观察)。

结果：CT 扫描辐射剂量为 $2.61 \pm 0.00 \text{mGy}$ 。DL-MARs 图像中的 LHA 为 $17.00 \pm 12.56 \text{mm}$ ，显著低于仅 DLIR 图像中的 $29.78 \pm 15.15 \text{mm}$ 。主观评分结果 DL-MARs 明显优于对照组 (3.9 ± 1.1 vs. 2.8 ± 1.0) ($P < 0.05$)。

结论：DLIR 结合 MARs 可显著减少金属螺钉引起的低密度伪影，提高椎弓根结构和金属螺钉的可视性。

PO-2557

婴儿泛发性动脉钙化的一例报告并文献复习

闫喆

天津市儿童医院

目的：探讨婴儿泛发性动脉钙化的影像学表现特点。方法：回顾性分析一例婴儿泛发性动脉钙化的 CT 及 MRI 表现，以分析本病的影像学特点。结果：婴儿泛发性动脉钙化 (generalized arterial calcification, GACI) 是一种罕见的常染色体隐性遗传病。本病特征性表现为大中动脉内弹力层弥漫性钙化，由于内膜增生导致管腔中断或狭窄。本病预后较差，确诊需要病理组织活检，影像学检查具有非常重要的诊断意义。产前超声可发现胎儿水肿、羊水过多、血管壁回声增高等。生后超声心动可发现左心室不同程度的肥厚、血管广泛管壁回声增高、心脏增大等。X 线平片可发现心影增大、肺水肿等。明确诊断主要依靠的是 CT 检查，CT 平扫可明确显示受累动脉及其分支血管管壁钙化这一直接征象，部分病例可见胸锁关节、髋关节内钙化或关节周围钙化。通过 CT 或 MR 血管造影可进一步显示受累血管的管腔情况，明确狭窄或闭塞的范围和严重程度，同时观察受累血管所支配的组织器官有无缺血性改变，有无出现灌注减低的征象。对于存在多部位血管异常的患儿，需根据不同征象帮助临床作出病因的鉴别诊断，包括大动脉炎、肌纤维发育不良。心脏 MRI 虽不能直接显示钙化，但可通过 CE-MRA 显示血管管腔变细或判断是否存在梗阻，心脏电影序列可进行心功能处理，提示左心室或双心室功能减弱。GACI 的发病年龄、症状及严重程度甚至包括影像学表现均与不同的致病遗传基因有关，ENPP1 基因致病较 ABCC6 基因致病的婴儿泛发性动脉钙化更容易发生血管广泛性钙化。ABCC6 基因突变可导致弹性假黄瘤变 PXE，后者被认为与 GACI 为异位钙化疾病谱的不同表现。结论：产后即出现心衰、高血压且影像学发现大中动脉广泛钙化，可高度提示婴儿泛发性动脉钙化；若起病年龄晚且表现不典型，但影像学提示多发血管异常亦不能除外本病的可能性，及时提示临床以助于早期诊断。

PO-2558

1 例婴幼儿心内膜弹力纤维增生症的 MRI 表现及文献复习

翟爱国、彭雪华、朱百奇、邵剑波
华中科技大学同济医学院附属武汉儿童医院

目的：探讨 MRI 在婴幼儿心内膜弹力纤维增生症(endocardial fibroelastosis, EFE)诊断中的价值 **方法：**回顾性分析、总结我院 1 例诊断为心内膜弹力纤维增生症患儿的影像学表现并相关文献复习 **结果：**本例为 7 个月的男性患儿，因间断咳嗽伴喘息就诊，超声提示左室显著增大、收缩功能减低，左室局部心肌结构疏松，心脏 MRI 表现为左心室扩大，左室壁运动减低，T2WI 上局部心肌信号增高，首过灌注示基底及中间部前间隔段、前段及前外侧段心内膜下低信号影，10 分钟延时增强扫描可见强化，左室 EF 值约 23%，同时该患儿冠脉 CTA 示左右冠状动脉起源及走行未见异常，结合临床及影像表现诊断为 EFE。**结论：**心内膜弹力纤维增生症的 MRI 影像表现具有一定的特征性，能够对心脏形态、功能及组织特性进行一站式检查，为临床早期诊断及预后提供依据。

PO-2559

基于 CT 三维可视化技术在儿童胰胆管合流异常肝血管解剖变异中的分析

毛慧敏
苏州大学附属儿童医院

目的：通过 CT 重建及三维可视化技术来观察和分析儿童胰胆管合流异常 (pancreaticobiliary maljunction, PBM) 的肝血管解剖和变异。

方法：回顾性分析 2015 年 1 月至 2023 年 4 月在我院诊断为 PBM 并保留有腹部薄层增强 CT 扫描图像的患儿资料。共纳入 160 名 PBM 患儿，其中女性 126 名 (78.7%)，年龄 (3.57±3.09) 岁。此外，纳入年龄、性别与 PBM 组相匹配的非 PBM 儿童作为对照组，回顾性分析其影像资料。对照组共纳入 234 名儿童，其中女性 176 名 (75.2%)，年龄 (3.81±3.12) 岁。

所有检查者均采用美国 GE optima CT 660 扫描机，扫描完成后图像传至 GE 后处理工作站，重组层厚 0.625 mm、层间距 1mm 的薄层图像，使用工作站自带的 Viewer 软件包进行三维立体重建，获得多平面重组、曲面重组、最大密度投影以及容积再现等多种方法进行观察。由两名经验丰富的放射科医生对影像图像进行独立双盲分析，记录肝动脉及门静脉的解剖分型。如果观察结果不一致，则通过讨论协商达成统一。肝动脉系统采用 Hiatt 分型方法，分为 I~VI 型；门静脉系统采用 Couinaud 分型方法，分为 I~V 型。

结果：根据 Hiatt 分型，PBM 组中肝动脉变异发生率为 18.1%，其中最常见是 II 型 (9.4%)，其次是 V 型 (3.8%)；对照组中肝动脉变异发生率为 12.8%，最常见的类型分别是 II 型 (4.7%) 和 III 型 (4.3%)。根据 Couinaud 分型，PBM 组中门静脉变异发生率为 20.0%，最常见的类型是 IV 型 (5.0%)；对照组中门静脉变异发生率为 15.8%，最常见的类型是 III 型 (5.1%)。与对照组相比，PBM 组肝动脉和门静脉变异的发生率均没有显著差异 ($P > 0.05$)。但 PBM 组中同时存在肝动脉和门静脉变异的发生率显著高于对照组 (7.5% vs. 2.1%; $P < 0.05$)。

结论：PBM 患儿同时存在肝动脉和门静脉变异的发生率高于一般人群，CT 三维可视化技术有助于确定肝血管的解剖变异，对 PBM 患者术前精准评估及指导手术具有一定意义。

PO-2560

儿童慢性肾脏病心脏重构的 CMR 研究

宋思思^{1,2}、谢林均²、傅航²、许华燕²、郭应坤²

1. 德阳市人民医院

2. 四川大学华西第二医院 (四川大学华西妇产儿童医院)

目的: 利用心脏磁共振 (cardiac magnetic resonance, CMR) 探讨慢性肾脏病 (chronic kidney disease, CKD) 儿童心脏重构的特征及其影响因素。

方法: 本研究前瞻性招募 CKD 儿童 138 例以及正常对照组 50 例, 所有研究对象均进行 CMR 心脏电影序列评估。心脏重构参数包括: 左心室心肌质量指数 (left ventricular mass index, LVMI)、左心室重构指数 (left ventricular remodeling index, LVRI) 及左室壁厚度。

结果: 与正常对照组相比, CKD 1–2 期、CKD 3–5 期患儿的左室壁厚度 (4.66 ± 0.63 vs. 5.06 ± 0.73 vs. 5.69 ± 1.11 mm) 及 LVRI (0.53 ± 0.05 vs. 0.59 ± 0.10 vs. 0.67 ± 0.15 g/ml) 均有增加 (all $P < 0.05$)。且 CKD 3–5 期患儿的左室壁厚度及 LVRI 均较 CKD 1–2 期增加。CKD 1–2 期患儿与对照组相比 LVMI 的差异无统计学意义 ($P = 0.189$), 而 CKD 3–5 期患儿 LVMI 较对照组明显增加 (53.0 ± 14.8 vs. 38.6 ± 6.2 g/m², $P < 0.001$)。

多元线性回归分析显示 eGFR、蛋白尿分级、收缩压与心脏重构参数 LVMI (eGFR: $\beta = -0.047$; 蛋白尿分级 $\beta = 1.741$; 收缩压 $\beta = 0.391$)、LVRI (eGFR: $\beta = 0.000$; 蛋白尿分级 $\beta = 0.033$; 收缩压 $\beta = 0.003$) 独立相关 (all $P < 0.05$)。血红蛋白是重构参数 LVMI ($\beta = -0.176$) 的独立影响因子。

结论: CKD 儿童普遍存在心脏重构, 在早期即可发生。心脏重构的影响因素有肾小球滤过率减低、蛋白尿、高血压及贫血。

PO-2561

基于沿血管周围弥散张量成像分析和脑网络参数诊断难治性癫痫

邱露¹、王妙艳²、韩青¹、谢荣倩¹、蒋昊翔¹

1. 无锡市儿童医院

2. 江南大学

目的: 结合沿血管周围弥散张量成像 (DTI-ALPS)、分数各向异性 (FA)、平均弥散性 (MD) 和脑网络参数构建模型, 对儿童难治性癫痫 (IE) 进行早期诊断。

方法: 回顾性收集我院性别、年龄匹配的癫痫患儿 72 例, 健康儿童 26 例。在癫痫组中, IE 15 例, 药物敏感性癫痫 (DSE) 57 例。所有参与者均在 Siemens 1.5T MRI 上进行 3D-T1WI、3D-T2WI 和 DTI 检查。利用 FSL 和 MATLAB 软件测量 DTI-ALPS、FA 和 MD 值, 使用 Panda 和 Gretna 软件提取脑网络特征。三组间定量资料比较采用方差分析, 定性资料比较采用卡方检验。采用受试者工作特征曲线 (ROC) 评价模型对儿童癫痫的诊断效果。 $P < 0.05$ 为差异有统计学意义。

结果: 与对照组比较, 癫痫组 DTI-ALPS、FA 值较低, MD 值较高。与 DSE 组比较, IE 组 DTI-ALPS 和 FA 值较低, MD 较高, 累及穹隆、左内囊后肢、左额枕上束、左胼胝体毯部、豆状核后部和右海马扣带 (图 1a)。癫痫组的节点效率低于对照组 (图 1b), IE 组的节点效率低于 DSE 组 (图 1c), 累及右中央前回、左额中回、右楔叶、右尾状核、与右眶部额中回和左内侧额上回。单参数识别癫痫和对照组的 AUC 值为 0.65~0.73 (图 1d-e), 识别 DSE 和 IE 的 AUC 值为 0.76~0.86 (图 1d-h)。多参数模型诊断癫痫的敏感性为 72.22%, 特异性为 84.62%, AUC 为 0.86 (图 1f); 诊断 DSE 和 IE 的敏感性为 80.00%, 特异性为 92.98%, AUC 为 0.94 (图 1i)。

结论: DTI-ALPS、FA 及节点效率值随病情加重而降低, 反映癫痫患儿存在脑类淋巴系统循环紊乱、神经纤维束损伤及脑连接异常。基于 DTI-ALPS, FA, MD 和节点效率的预测模型可进一步提高癫痫的诊断效率。

PO-2562

“双低”扫描结合迭代重建技术应用于干细胞移植后 儿童腹部大血管 CTA 成像

陈锡建、宁刚、马鑫茂、杨皓翔
四川大学华西第二医院

目的 本研究旨在通过结合多模型自适应迭代统计重建技术与低管电压扫描结合, 评估干细胞移植后儿童腹部大血管 CTA 成像质量。**方法** 将 26 例干细胞移植后儿童患者作为病例组, 扫描条件为: 管电压 80kVp, 对比剂 1.0ml/kg; 选取同时期 25 例非移植儿童患者为对照组, 管电压 100kV, 对比剂 1.5ml/kg, 每位病例分别选取迭代重建算法比例为 0%,30%,50%重建 3 组图像。客观比较两组目标动脉的 CT 值、信噪比 (SNR)、对比噪声比 (CNR)、噪声、有效辐射剂量(ED)、碘摄入量。主观评价由两名高年资的放射科医生采用双盲法对图像质量进行评分。**结果** 病例组血管平均 CT 值高于 A 组 ($p<0.01$), 在低迭代比例组, 对照组图像噪声优于比例组 ($p<0.01$), 高迭代比例组两组之间无统计差异。与对照组相比, 病例组的平均 CNR/SNR 更高 ($P<0.01$)。与对照组相比, 病例组的平均有效辐射剂量(ED)和碘摄入量分别降低了 32.8%和 40.0%。**结论** 儿童腹部大血管 CTA 使用低管电压扫描和低对比剂总量结合 ASiR-V 重建算法显著降低了患儿的扫描辐射剂量和碘对比剂负荷量, 同时有良好的血管对比图像质量。该方法为干细胞移植后儿童腹部 CTA 检查, 在不降低图像质量的同时降低辐射剂量和碘对比剂摄入量提供了良好的解决方案。

PO-2563

基于头颅 MRI 影像学表现分析早产儿脑损伤与预后的相关性

赵文华
西安市中心医院

目的: 本研究为回顾性队列研究, 基于头颅 MRI 影像诊断回顾性分析早产儿脑损伤 (Brain injury in premature infants, BIPI) 与早产儿神经系统功能发育的相关性, 以期实现早期诊断并提高脑损伤早产儿的生存质量。**方法:** 选取 2018 年 1 月 1 日至 2020 年 12 月 31 日在西北妇女儿童医院新生儿科住院期间行头颅 MRI 检查并在儿保科定期随访的早产儿作为研究对象, 回顾性收集纳入研究的早产儿影像学资料、临床资料以及儿童保健科随访的 Gesell 量表评估分数。**研究分组及内容:** 依据头颅 MRI 诊断结果将研究对象分为 BIPI 组与非 BIPI 组, 分析 BIPI 与早产儿神经系统功能发育的相关性。**结果:** 1. 239 例纳入研究的早产儿中, BIPI 组 69 例, 非 BIPI 组 170 例, BIPI 的发生率为 28.9%。BIPI 组中适应性发育落后占比为 91.3% (63/69), 大运动发育落后占比为 91.3% (63/69), 精细动作发育落后占比为 89.9% (62/69), 语言发育落后占比为 84.1% (58/69), 个人-社交发育落后占比为 78.3% (54/69); 2. BIPI 与早产儿适应性 ($r=-0.208$, $P=0.001$)、大运动 ($r=-0.264$, $P<0.001$)、精细动作 ($r=-0.272$, $P<0.001$)、语言 ($r=-0.242$, $P<0.001$) 以及个人-社交发育 ($r=-0.210$, $P=0.001$) 均呈显著相关且为负相关关系; 3. BIPI 组与非 BIPI 组对早产儿适应性 ($\chi^2=11.740$, $P<0.001$)、大运动 ($\chi^2=13.341$, $P<0.001$)、精细动作 ($\chi^2=20.974$, $P<0.001$)、语言 ($\chi^2=7.030$, $P=0.008$) 以及个人-社交 ($\chi^2=4.877$, $P=0.027$) 发育影响差异均具有统计学意义。**结论:** 早产儿脑损伤影响其神经系统功能发育, 胎龄和出生体重与脑损伤早产儿神经系统功能发育情况呈负相关, 出生胎龄越小、出生体重越低, 早产儿脑损伤的神经系统功能发育落后发生率越高, 应尽量预防极早早产儿 (GA<32 周) 和极低出生体重儿 (BW<1500g) 的出生。

PO-2564

儿童 H3 K27M 突变型弥漫性中线胶质瘤的 MRI 表现及随访

马秋红

湖南省儿童医院

目的 探讨儿童伴 H3 K27M 突变型弥漫性中线胶质瘤 (DMG) 的 MRI 表现, 随访术后患儿, 提高对该病的认识及诊断水平。**资料与方法** 回顾性分析 2018 年 9 月—2023 年 8 月经湖南省儿童医院及外院经病理证实的 21 例 H3 K27M 突变型 DMG 患儿的临床及影像学资料, 21 例行 MRI 平扫, 其中 19 例增强, 15 例行扩散加权成像 (DWI) 检查, 14 例行磁敏感加权成像 (SWI) 检查。观察分析肿瘤部位、形态、边界、瘤周水肿、大小、信号特点 (有无囊变、出血)、扩散情况及强化特点等。结果 21 例肿瘤主体均位于中线部位; 12 例形态不规则, 9 例呈类圆形; 15 例边界清晰, 瘤周无水肿, 6 例边界模糊, 瘤周轻中度水肿; 肿瘤最大直径 3.3~6.1 cm; 21 例病灶信号均欠均匀, 14 例肿块内存在形态及大小不一的囊变, 均呈偏心性改变, 7 例无囊变, 1 例出血。15 例 DWI 示病变均呈不同程度扩散受限, minADC 值为 $(0.992 \pm 0.262) \times 10^{-3} \text{mm}^2/\text{s}$ 。19 例增强后 9 例呈环状强化, 5 例小斑片状轻度强化, 2 例结节状强化, 2 例轻度不均匀强化, 1 例无强化; 15 例有基底动脉包绕。结论 儿童伴 H3 K27M 突变型 DMG 好发于脑桥等中线部位, 瘤内易发生偏心性囊变, 瘤周清晰多无水肿, 多呈环状、结节状及小斑片状强化等, MRI 特征具有一定的特异性。

PO-2565

18F-FDG PET/MR 全身显像在儿童横纹肌肉瘤分期中的应用价值

许远帆、云帅、潘建虎

杭州全景医学影像诊断中心

目的:

分析和探讨 18F-FDG PET/MR 全身显像在儿童横纹肌肉瘤分期中的应用价值。

方法:

回顾性分析本中心 77 例已确诊为横纹肌肉瘤的患儿临床资料, 分为治疗前组 (n=40) 和治疗后组 (n=37), 分析其 PET/MR 表现, 观察肿瘤的大小、形态、信号特征、与周围组织的关系、病灶 SUVmax 值、转移情况及其分期特征。以病理及临床诊断结果为金标准。

结果:

40 例治疗前例患儿包括 I 期 3 例(7.5%), II 期 5 例(12.5%), III 期 16 例(40.0%), IV 期 16 例(40.0%)。10(25.0%)例肿瘤发生在眼眶, 4 例(10.0%)肿瘤发生在头颈, 4 例(10.0%)肿瘤发生在胆道, 17 例(42.5%)肿瘤在膀胱及前列腺, 2 例(5.0%)肿瘤发生在肢体, 2 例肿瘤(5.0%)发生在背部, 1 例肿瘤(2.5%)发生于腹膜后。病灶平均最大径为 $10.25 \pm 3.12 \text{cm}$, 最大径多为上下径。肿块边界光滑清楚, 局限于原发解剖位置的 28 例 (70%); 8 例(20%)侵犯邻近器官及组织。淋巴结转移 21 例 (52.5%); 远程转移 17 例 (42.5%), 其中肺转移 9 例, 骨转移 8 例, 肝转移 2 例, 皮下转移 2 例。治疗后组中有 12 例 (32.4%) 出现淋巴结转移, 10 例 (27.0%) 出现远程转移。PET/MR 显像后分期: 治疗前组有 15 例 (37.5%) 分期发生改变, 其中 11 例由 III 期提高到 IV 期, 4 例由 II 期提高到 IV 期。治疗后组共有 12 例 (32.4%) 分期发生改变, 其中 7 例由 0 期提高到 IV 期, 2 例由 III 期提高到 IV 期, 3 例因 PET/MR 摄取阴性而降低分期。

结论:

18F-FDG PET/MRI 对儿童横纹肌肉瘤分期的诊断价值优于临床分期, 在探查肿瘤周围侵犯和远处转移更具优势, 明显提高了肿瘤的原始分期及再分期的准确性。

PO-2566

全面性发育迟缓婴幼儿脑白质微观变化 MRI 研究

孙惠苗¹、李倩云²、张泽栋²、杨洁¹、武艳君¹、杨晓燕¹

1. 山西省儿童医院 (山西省妇幼保健院)

2. 山西医科大学

目的: 应用磁共振扩散张量成像 (Diffusion tensor imaging, DTI) 评估全面性发育迟缓 (Global developmental delay, GDD) 婴幼儿脑白质纤维束发育的异常变化。

方法: 选取接受 DTI 检查的全面性发育迟缓婴幼儿 22 例作为 GDD 组, 年龄范围在 6-24 月; 另选年龄范围同在 6-24 月的正常发育婴幼儿 22 例作为对照组。利用 FMRIB software library 软件进行图像后处理获取双侧大脑各 30 个脑白质纤维束的分数各向异性 (Fraction anisotropy, FA)、轴向扩散系数 (Axial diffusivity, AD) 及径向扩散系数 (Radial diffusivity, RD) 参数值。比较两组参数值差异性, 之后将 GDD 组异常纤维束的 DTI 参数值与儿童神经心理发育量表评分进行相关性分析。

结果: 与对照组相比, GDD 组多个脑白质纤维束的 DTI 参数值存在异常改变, 主要表现为双侧内囊前后肢、双侧上纵束及胼胝体等 21 个纤维束的 FA 值减低, 穹窿、右侧内囊前肢及左侧放射冠后部三个纤维束的 AD 值增高, 双侧内囊后肢、双侧上纵束及双侧丘脑后辐射等 20 个纤维束的 RD 值增高, 差异均有统计学意义 ($p < 0.05$)。对胎龄、年龄、出生体重及性别因素进行控制后, GDD 组儿童神经心理发育量表的言语评分与双侧内囊前肢的 FA 值呈正相关 ($r = 0.505$ 、 0.470 , $P < 0.05$); 精细动作评分与左侧放射冠后部 AD 值呈负相关 ($r = -0.536$, $p < 0.05$), 也与右侧丘脑后辐射、左侧矢状层、右侧扣带及右侧胼胝体毯的 RD 值呈负相关 ($r = -0.611$ 、 -0.556 、 -0.593 、 -0.532 , $P < 0.05$)。

结论: 与正常发育婴幼儿相比, DTI 成像可显示 GDD 婴幼儿双侧大脑多个白质纤维束 FA 值减低、AD 值及 RD 值增高, 且异常纤维束的参数值与儿童神经心理发育量表动作、言语评分具有相关性, 为早期疾病诊断提供影像学依据。

PO-2567

ADC 值对儿童后颅窝良恶性肿瘤的鉴别价值

周刚¹、范路萍¹、张玉珍²、尹秋凤²、刘明²、汪登斌²

1. 红河州滇南中心医院 (个旧市人民医院)

2. 上海交通大学医学院附属新华医院放射科

目的: 探讨磁共振弥散加权成像 (diffusion weighted imaging, DWI) 表观弥散系数 (apparent diffusion coefficient, ADC) 值在儿童后颅窝良恶性肿瘤鉴别诊断中的应用价值。方法: 回顾性分析本院 34 例术后病理诊断为后颅窝肿瘤的资料, 分为良性组 (8 例) 和恶性组 (26 例), 全部患者手术治疗前均行磁共振平扫、增强扫描和 DWI 检查, 分析肿瘤的影像表现, 分别测量肿瘤三个不同区域及正常小脑组织的 ADC 值, 利用受试者工作特征 (receiver operation characteristic, ROC) 曲线评价平均 ADC 值法、最小 ADC 值法、平均 ADC 值/正常小脑组织 ADC 值法、最小 ADC 值/正常小脑组织 ADC 值法这四种方法在后颅窝良恶性肿瘤鉴别诊断中的表现。结果: 在儿童后颅窝良恶性肿瘤鉴别诊断中, 四种方法两两比较差异无统计学意义, 鉴于操作简便、诊断正确率高, 本研究推荐使用平均 ADC 值法, 取平均 ADC 值小于或等于 $0.823 \times 10^{-3} \text{mm}^2/\text{s}$ 作为诊断后颅窝恶性肿瘤

的标准, 灵敏度为 84.62%、特异度为 100%。结论: ADC 值在儿童后颅窝良恶性肿瘤鉴别诊断中有较高的应用价值, 可作为常规 MR 检查的有效补充。

PO-2568

神经与行为异常早期筛查模型的建立与应用: 基于胎儿脑结构和母体血液指标的分析

巨昕薇
吉林大学第一医院

胚胎期是大脑发育的关键时期, 若此阶段母体感染或营养不良都会导致胎儿出现自闭症、精神分裂症等精神疾病。随着医学影像学的发展, 精神疾病患者大脑结构变异已被众多研究所证实, 而磁共振成像也成为精神疾病诊断筛查的关键指标, 且该种检测技术被证明比已有的问卷和行为分析方法更准确客观。但影像检查效率较低且价格昂贵, 因此需要更加简单快捷的生理指标对精神疾病进行评估和预测。近年来, 血常规指标凭借其简便、高效的优点越来越多的应用于精神疾病的早期预测标志, 且孕期全血细胞计数可以清楚反映母体环境, 因此常通过母体血液对胚胎期胎儿发育情况进行评估。心理疾病起源于胚胎期的事实已被众多研究所证实, 若能在早期筛查出有患病风险的个体, 可以及时对其进行干预和治疗, 最大程度上减轻心理疾病带来的损害。因此本研究选取以上两个精神疾病早期标志物进行研究, 并建立胎儿脑部磁共振成像和母体环境之间的联系, 为精神疾病的脑发育机制提供理论基础, 在临床上尽早识别患精神疾病风险的个体, 在精神疾病的早期筛查中有一定的应用价值。本研究选取了吉林大学第一医院 109 名胎儿测量了评估胎儿脑结构发育的常见径线, 并收集其母体的血常规指标, 建立了孕期母体环境与胎儿脑结构发展的模型, 筛选出评估异常胎儿脑发育的血液标志物, 并确定了异常胎儿脑发育的血液标志物临界值, 最终得到以下结论: 1. 孕期母体血小板水平显著预测胎儿小脑蚓部高度, 因此红细胞和血小板影响胎儿小脑和胼胝体的发育, 进而会出现认知、行为、运动等方面的异常, 是智力障碍、运动障碍、多动症等神经发育障碍的重要指标。2. 侧脑室增宽胎儿的母体免疫血液细胞水平与未增宽组有显著差异, 且白细胞计数、中性粒细胞绝对值预测能力较好, 可以成为侧脑室增宽的有效预测因子。这可以作为精神分裂症、情感障碍等心理疾病的参考指标。3. 建立了新的母体孕期血常规范围, 有效筛选脑发育异常胎儿

PO-2569

儿童脑结节性硬化症的影像学研究

张增俊、崔光彬、南海燕、贺延莉、李刚锋、荣伟程、闫卫强
中国人民解放军空军军医大学第二附属医院

目的:研究结节性硬化症的影像表现及临床特点。方法:回顾性研究 31 例结节性硬化的 CT 及 MRI 表现。结果:临床表现为面部皮脂腺瘤、癫痫和智力障碍三联征 15 例,占 48.4%。CT 及 MRI 表现:室管膜下结节 21 例, 双侧室管膜下多发结节状钙化 18 例, 未钙化的高密度结节 3 例, 并向脑室内突入, 主要分布在侧脑室前角 13 例及体部 6 例, 其次是侧脑室颞角 2 例及 IV 脑室 1 例; 皮质结节 6 例和白质异常 3 例, CT 及 MRI 表现为增厚增宽的脑皮质及白质内分别呈结节状低密度灶及 T2 高信号病灶, 无钙化, 局部脑皮层不同程度受压变薄。增强扫描可使病变显示更清晰, 常与室管膜下结节并存。左侧室间孔区巨细胞星形细胞瘤 1 例, 肿瘤大小约 2.9cmx2.5cmx2.3cm, 边界清晰伴有梗阻性脑积水、双侧脑室扩大及室管膜下钙化结节。结论: CT-MRI 表现室管膜结节伴有或不伴有脑实质内病灶, 均为诊断结节性硬化症的重要的征象, 结合临床三联征能即可明确诊断。

PO-2570

多模态 MRI 对侧脑室旁白质软化症的诊断及预后评估

张增俊、崔光彬、贺延莉、李刚锋、闫卫强、田强、南海燕、荣伟程、雷学斌
中国人民解放军空军军医大学第二附属医院

目的 探讨小儿侧脑室旁白质软化症(PVL)的病因与临床及 MRI 诊断价值。**方法** 选择临床 MRI 证实的 60 例 PVL 典型病例进行回顾性分析。**结果** 早产儿 39 例, 占 65%。患有缺氧缺血性脑病的足月儿 21 例, 占 35%。主要征象为侧脑室体及三角区旁脑量白质减少, 相应部位脑室不同程度扩大, 侧脑室旁斑片状长 T1 信号长 2 信号。依据 MRI 的表现将其分为 3 度。①轻度: MRI 表现为双侧侧脑室周围白质减少, 灰质达侧室缘, 脑室无扩大; ②中度: 侧脑室周围白质明显减少或部分消失, 灰质达侧室缘, 侧室外侧壁不规则, 脑室轻度扩大。③重度: 侧脑室周围白质消失, 被灰质替代, 侧脑室明显扩大且侧壁不规则, 呈锯齿状或波浪状。**结论** MRI 检查在 PVL 的诊断及预后评估有着重要的价值。

PO-2571

儿童颈部肿块的影像学分析

张增俊、崔光彬、贺延莉、雷学斌、李刚锋、南海燕、袁道、田强、闫卫强
中国人民解放军空军军医大学第二附属医院

目的:探讨小儿颈部包块的临床及影像学特点。**方法:**回顾分析了经手术病理证实的儿童颈部肿块 97 例, 总结了其 CT 及 MRI 表现。**结果:**先天性甲状舌骨囊肿 29 例, 鳃裂囊肿 15 例, 淋巴瘤 17 例, 淋巴管瘤 12 例, 血管瘤 9 例, 神经源性肿瘤 5 例, 畸胎瘤 2 例, 脂肪瘤 2 例, 化脓性淋巴结炎 4 例, 横纹肌肉瘤 2 例。婴幼儿期以淋巴管瘤及血管瘤多见, 尤其婴儿期 (<1 岁) 最多, 其它肿块较少。甲状舌骨囊肿好发年龄为学龄前和学龄期, 3-10 岁高发。10 岁以后鳃裂囊肿逐渐增多。恶性肿瘤极为少见, 但 7 岁后逐渐增多。各种不同肿块有比较固定的好发部位, 多在上颈部, 由上至下逐渐减少。淋巴管瘤、淋巴结炎主要分布在颌下及颌后区。甲状舌骨囊肿以颈前区多见。淋巴结核、鳃裂囊肿及各种肿瘤均沿胸锁乳头肌分布。**结论:**小儿颈部肿块以先天性为主, 其病因复杂, 组织来源多, 生物学特性各异, 位置较隐蔽, 触诊困难, 病史叙述不准确, 临床与病理常常不符。CT-MRI 扫描对颈部疾病的定位准确, 对定性、鉴别诊断及术前指导均有着重要的价值。

PO-2572

婴幼儿 LCH 多器官损害的临床与影像学表现

张增俊、李刚锋、贺延莉、南海燕、荣伟程、雷学斌、闫卫强、田强
中国人民解放军空军军医大学第二附属医院

目的 探讨朗格汉斯细胞组织细胞增生症(Langerhans cell histiocytosis, LCH)累及多器官的影像学表现及鉴别诊断, 提高对本病认识。**方法** 我们复习 39 例经组织病理学免疫组化证实朗格汉斯细胞组织细胞增生症的影像学及临床资料。**结果** 39 例中, 15 例为孤立性骨病变, 9 例为多灶性骨病变, 19 例表现为溶骨性破坏, 病变一般境界清楚, 6 例出现骨膜反应。其中 23 例可见软组织肿块; 另有 5 例病变周围出现骨硬化改变。术前诊断为骨肿瘤 5 例, 炎症或其他良性病变 4 例。39 例中有 30 例进行了手术治疗, 9 例穿刺活检。侵犯实质脏器的主要影像多发密度软组织肿块或结节, 因部位不同形态各异。本病的病因尚未明确, 可累及全身多个器官, 包括骨、肺、肝、脾、垂体、皮肤、黏

膜以及淋巴组织。临床表现取决于单器官或多器官以及受累的程度,当单器官受累时常常需要与肿瘤、炎症及结核等病变鉴别。结论 朗格汉斯细胞组织细胞增生症,结合临床特点及影像表现能准确显示病变范围及邻近的组织病变,且结合临床基本作出初步诊断,为早期治疗赢得时间。

PO-2573

双能量 CT 小肠造影在儿童活动期炎症性肠病的临床应用

郝跃文、陈华、侯欣
西安市儿童医院

目的:探讨双能量 CT 小肠造影 (CTE) 在儿童活动期炎症性肠病患者的影像特征及疗效评估临床应用。

方法:回顾分析 50 例炎症性肠病患者,筛选 32 例经内镜和病理证实的克罗恩病 (CD) 影像资料,对其 CTE 分析;纳入 29 名活动期 CD 患儿,根据儿童克罗恩病活动指数 (PCDAI) 将患者分为轻度 (17 例) 和中重度 (12 例),对 CTE 评分,项目包括:肠壁厚度、肠壁强化 Δ CT 值、强化方式、梳征、肠系膜脂肪爬行征、肠系膜淋巴结数量、以 PCDAI 作为疾病活动度分组标准,测量重度及轻中度活动期:碘基图测量病变区标准化碘浓度 (NIC)。

结果:32 例患儿在 CTE 上均可见肠壁增厚及肠段壁强化,其中 15 例为分层强化 (46.9%), 18 例患儿出现 24 处肠腔狭窄,21 例溃疡,17 例 (53.1%) “木梳征”,该征象特征表现:11 例 (34.4%) “脂肪爬行”征。对轻度和中重度 CD 的 CTE 评分比较:单因素分析表明,两组间肠壁厚度、梳征、肠系膜脂肪爬行征评分及 CT 总分差异具有统计学意义,肠壁强化 Δ CT 值、强化方式、肠系膜淋巴结数量评分差异无统计学意义;肠壁厚度、梳征评分、肠系膜脂肪爬行征评分及 CT 总分与 PCDAI 评分呈中度/高度相关, r 值分别为:0.702、0.658、0.801、0.801 ($P<0.05$); ROC 曲线表明,CT 总分 9.5,区分轻度与中重度灵敏度 91.5%,特异度 86.9%,AUC 0.924。重度活动期 NIC 值:动脉期 $2.8\pm 0.3\text{mg/ml}$,门脉期 $3.8\pm 0.2\text{mg/ml}$;曲线斜率 K:动脉期 2.4 ± 0.35 ,门脉期: 3.2 ± 0.4 ,PCDAI: 58 \pm 6 分;轻中度活动期 NIC 值:动脉期 $1.3\pm 0.2\text{mg/ml}$,门脉期 $2.4\pm 0.2\text{mg/ml}$,曲线斜率 K:动脉期 2.2 ± 0.2 ,门脉期: 2.9 ± 0.3 ,PCDAI: 25 \pm 4 分, $P<0.05$ 。

结论:儿童炎症性肠病 (尤其是 CD) 在双能量 CTE 可显示发病部位,肠壁及肠外情况,可弥补内镜检查不足,用于 CD 诊断;动脉期 NIC $>2.8\text{mg/ml}$ 时,提示中重度;动脉期 NIC $<1.3\text{mg/ml}$ 时,提示轻度,用于定量评估儿童活动期 CD 患者严重程度及疗效预测及评估。

PO-2574

儿童淋巴瘤的 MRI 表现与病理基础

杨琳¹、郝跃文²
1. 西安医学院
2. 西安市儿童医院

目的:探讨儿童淋巴瘤的 MRI 特征及其病理基础。

方法:回顾性分析我院 2020 年 1 月-2023 年 4 月 35 例经手术和病理证实的淋巴瘤的 MRI 影像资料,对其 MRI 表现及病理改变进行研究分析。

结果:35 例患者均表现为大小不一的软组织肿块 (大小范围约 1.2cm-15cm),形状多为椭圆形和不规则形;所有肿块 T1WI 呈等信号,T2WI 呈等偏稍高信号,DWI 为高信号,ADC 为低信号 (有弥散加权序列者),仅 1 例发生囊变、坏死,1 例发生出血,增强肿瘤组织多呈显著强化;24 例为男性 (23/34);11 例发生于颈部淋巴结 (11/34),10 例发生于鼻咽部 (10/34),6 例发生在骨骼 (6/34),其余病例多发生于腹腔、腹股沟淋巴结、上纵隔、颅底、腰大肌等;21 例发生转移 (21/34),16 例转移至邻近的淋巴结 (15/21),7 例转移至中轴骨 (颈胸腰椎体及骨盆) (7/21);

12 例为 Burkitt 淋巴瘤 (11/34), 11 例为 T 淋巴母细胞性淋巴瘤 (11/34), 5 例为 B 淋巴母细胞性淋巴瘤 (5/34), 5 例为霍奇金淋巴瘤 (5/34), 1 例为大 B 细胞淋巴瘤。

结论: 淋巴瘤起源于发生突变的淋巴细胞, 是一种多发于儿童淋巴造血系统的恶性肿瘤, 居儿童恶性肿瘤第 3 位, 包括非霍奇金淋巴瘤 (NHL) 和霍奇金淋巴瘤 (HL)。本文总结了儿童淋巴瘤的影像学及病理特征: ①T1WI 多呈等信号, T2WI 多呈等偏稍高信号, DWI 为高信号, ADC 为低信号, 肿瘤较少发生囊变、坏死、出血, 肿瘤边界相对清楚, 对周围组织多为受压推移, 增强多呈均匀和环形显著强化; ②该病男性多于女性, 约为 2:1; ③儿童淋巴瘤的好发部位是颈部淋巴结和鼻咽部, 并且淋巴瘤的发病部位非常广泛。④淋巴瘤易发生转移, 转移部位最常见于邻近淋巴结, 亦可转移至椎体、胸腺、邻近肌群等。⑤儿童好发的淋巴瘤类型为 T 淋巴母细胞性淋巴瘤和 Burkitt 淋巴瘤, 且多呈高度恶性, 侵袭性强。综上, MRI 平扫、增强以及 DWI 对儿童淋巴瘤的诊断、转移、临床分期、疗效评估均有重要价值。

PO-2575

Duchenne 型肌营养不良症臀周肌群 MRI 生物标志物与临床运动功能的纵向研究

宋宇、许华燕、李学胜、徐蓉、傅航、郭应坤
四川大学华西第二医院

目的: 通过表征 Duchenne 型肌营养不良症 (Duchenne muscular dystrophy, DMD) 臀周肌群 MRI 生物标志物 12 个月内的纵向进展, 探讨 MRI 生物标志物预测 DMD 患者未来运动功能下降的潜力。

材料与方法: 前瞻性纵向纳入 DMD 患者 112 例, 所有患者均行臀肌 MRI 检查, 成像序列包括 T1 mapping 和 Dixon 序列, 分别定量测量屈曲肌群、伸展肌群、内收肌群和外展肌群的纵向弛豫时间 (T1) 和脂肪分数 (fat fraction, FF) 值。采用北极星量表 (North Star Ambulatory Assessment, NSAA) 和定时功能测试 (Timed functional tests, TFTs) 来对 DMD 患儿的临床运动功能进行检测。所有受试者平均 12 个月后返回进行临床随访, 并根据患儿 12 个月内 TFTs 的纵向变化将所有受试者分为两个亚组: 功能稳定组和功能下降组。采用相关性热图 (heatmap) 来阐明 MRI 生物标志物与临床运动功能指标之间的关系。采用单因素和多因素 Logistic 回归探讨与 DMD 患者未来临床运动功能下降相关的危险因素, 并进一步采用受试者特征曲线 (Receiver Operating Characteristic Curve, ROC) 来分析其危险因素对运动功能下降的诊断效能。

结果: Heatmap 结果显示基线 T1 值与随访 NSAA 评分呈正相关关系 ($P < 0.001$), 而与随访 TFTs 呈负相关关系 ($P < 0.001$)。基线 FF 值与随访 NSAA 评分呈负相关关系, 而与随访 TFTs 呈正相关关系 ($P < 0.001$)。多因素 Logistic 回归分析结果显示, 外展肌群 FF 值升高与未来临床运动功能下降相关 ($OR = 1.085$, $95\%CI: 1.013 \sim 1.161$, $P = 0.019$), 曲线下面积为 0.874 ($P < 0.001$)。

结论: 外展肌群 FF 值是 DMD 患者未来 12 个月内临床运动功能下降强有力的预测因子, 强调了在 DMD 患者中早期关注外展肌群 FF 值的重要性。

PO-2576

动脉自旋标记成像技术评估早产儿脑发育

秦池、赵鑫、陆林、付艺伟、张小安
郑州大学第三附属医院

目的早产儿脑组织及脑血流灌注循环系统尚未成熟,多种围产因素均可导致早产儿神经认知障碍。脑血流 (cerebral blood flow, CBF) 值是评估脑灌注的重要参数。

本研究的首要目的是探讨早产儿的脑血流分布特征,包括左右大脑半球脑血流分布等。其次是评估临床并发症对脑血流值的影响。

材料与方法回顾性纳入 2022 年 5 月至 2023 年 5 月,在郑州大学第三附属医院新生儿科出生的 219 例早产儿。在校正胎龄时进行常规 MRI 成像、三维伪连续动脉自旋标记成像 (three-dimensional pseudo-continuous arterial spin labeling, 3D-pCASL) 测量。测量感兴趣区包括大脑额叶、颞叶、顶叶、枕叶、基底节和丘脑。分析两组间基本资料特征,采用配对样本 t 检验比较左右大脑半球不同脑区 CBF 值的差异。不同脑区的 CBF 值采用单向方差分析。采用 Pearson 相关分析磁共振测量时校正胎龄、出生体重与不同脑区 CBF 值之间的相关性。此外,评估不同临床并发症对脑血流值的影响。

结果依据磁共振成像测量校正胎龄时间分为早产儿组 (138 例) 和等效足月组 (81 例)。早产儿组与等效足月组在患儿性别、出生孕周、Apgar 5 分钟评分之间无显著差异;早产儿组出生体重显著高于等效足月组 ($t = 4.698, p < 0.001$)。组内分析,各组间左、右两侧大脑半球在额叶、颞叶、顶叶、枕叶、基底节和丘脑的 CBF 值均无显著差异 ($p > 0.05$),不同脑区平均脑 CBF 值存在显著差异 ($p < 0.05$)。出生体重与不同脑区的脑 CBF 值呈负相关;早产儿组磁共振测量校正胎龄时间与脑 CBF 值无显著相关,等效足月组磁共振测量校正胎龄时间与脑 CBF 值呈正相关。临床并发症方面,支气管肺发育不良患儿左右两侧额叶、颞叶、顶叶、枕叶、基底神经节和丘脑的 CBF 值高于非支气管发育不良组。

结论动脉自旋标记成像技术能够评估早产儿脑血流值,与磁共振测量校正胎龄时间、出生体重有关,支气管肺发育不良可使早产儿皮质脑血流灌注增高。

PO-2577

MRI 3D CISS 序列与 3D SPACE 序列在儿童眼部疾病中的应用

孟宪磊、莫潼、孙金磊、方佃刚
深圳市儿童医院

目的:通常儿童颅神经 III、IV、IV 异常,会引起眼部疾病。通过常规成像很难识别各对颅神经,我们通过使用 3D CISS 序列与 3D SPACE 序列联合成像,来研究三对颅神经的可见性和解剖特征,为临床治疗提供依据。

方法:本研究使用西门子 Prisma 3.0T 磁共振对 10 名眼部疾病和 10 名健康受试者进行检查,分别进行 3D CISS 序列与 3D SPACE 序列高分辨率图像采集。有两位 10 年工作经验儿童神经放射医生,使用最大密度投影 (MIP) 像进行多方位重组,并将重组图像保存关键图。分别使用四分法对三对颅神经可见性和清晰度进行分级评分,如下:清晰可见、可见但稍模糊、隐约可见、无法识别。通过 Mann-Whitney U 检验统计学方法,比较两组序列对三对颅神经的可见度与清晰度显示情况,判断有无颅神经异常。

结果:在 20 名被检者,其中 3D CISS 序列与 3D SPACE 序列对颅神经 III、IV、IV 的可见度显示均分别为 100%;使用 Mann-Whitney U 检验进行统计学分析,其中颅神经 III、颅神经 IV,3D CISS 序列与 3D SPACE 序列组间差异无统计学意义;颅神经 IV,3D CISS 序列优于 3D SPACE 序列组间差异有统计学意义 $P < 0.05$

结论：通过 3D 高分辨率成像，儿童颅神经 III、IV、IV 的可视化程度高，在儿童眼科疾病诊断中发挥着重要作用。

PO-2578

构建和验证儿童重症肺炎的 nomogram 预测模型

张思琦、徐树明、赵兵
山西省儿童医院（山西省妇幼保健院）

目的：本研究旨在建立儿童重症肺炎的 nomogram 预测模型并进行验证。

方法：回顾性收集 850 例山西省儿童医院病原学证实为肺炎患儿的影像及临床资料。按 7: 3 的比例随机分为训练集（601 例）和内部验证集（249 例）。采用单因素分析和最小绝对收缩和选择算子（LASSO）回归进行预测因子筛选，并基于最小赤池信息准则（AIC）建立 nomogram 的最佳模型。通过 ROC 曲线下面积（AUC）的区分度、校准曲线的校准度和决策曲线分析（DCA）的临床净效益来评估 nomogram 的性能。

结果：使用单因素、LASSO 回归和基于 AIC 的多因素 Logistic 逐步回归筛选最优预测因素，建立儿童重症肺炎的预测模型：D-二聚体、CT 影像表现（斑片、大片、都有）、肝损害、坏死性肺炎、热程、应用激素时长。训练组和内部验证验证组的 AUC 分别为 0.807 和 0.799，校准曲线显示 nomogram 预测值与实际观测值之间有良好的 consistency。DCA 显示 nomogram 具有临床应用价值。

结论：本研究建立的儿童重症肺炎 nomogram 模型预测效能良好，有助于指导临床医师筛查重症肺炎高危患儿，从而对早期预防和治疗策略提供有用的参考。

PO-2579

儿童坏死性肺炎的 CT 影像学表现

张永远、王阳阳、董晓美、陆林、赵鑫
郑州大学第三附属医院（河南省妇幼保健院）

目的：分析总结儿童坏死性肺炎的临床表现及胸部影像学特征，提高该病的诊断水平。方法：回顾分析 57 例诊断符合坏死性肺炎患儿的临床及影像资料，总结其临床及影像学特点。其中男 27 例，女 30 例，年龄 3 天~12 岁，平均年龄 (4.2 ± 3.4) 岁。2 例新生儿，1 例合并癫痫，余 54 例既往体健。结果：57 例患儿一般状况差，主要有发热、咳嗽，发热，热峰 $(39.3\pm0.8)^{\circ}\text{C}$ ，热程 (9.2 ± 8.3) 天，伴有食欲差、精神差等感染中毒症状，呼吸困难 30 例，表现为胸部吸气性三凹征及鼻翼扇动，口唇发绀 5 例。病变侧闻及湿啰音 37 例，其中伴有喘鸣音 9 例，胸腔积液 26 例，1 例咯血。实验室检查中血常规：57 例患儿白细胞 $(13.0\pm4.5)\times10^9/\text{L}$ ，中性粒细胞比例 $(67.9\pm14.9)\%$ ，C 反应蛋白均明显升高 $0.5\sim249.7\text{ mg/L}$ ，平均 $(74.3\pm60.8)\text{ mg/L}$ 。病原学检查：57 例均行咽拭子肺炎支原体 DNA 测定和(或)肺炎支原体抗体检查，22 例 (38.6%) 存在肺炎支原体感染，5 例金黄色葡萄球菌感染，3 例耐甲氧西林金黄色葡萄球菌感染。胸部 CT 检查：57 例患儿于病程第 9~25 天检查，在原大片实变区有大小不一的低密度液化坏死区，右肺受累多见，即坏死性空洞形成，含气/含液空洞，为薄壁或无壁空洞，26 例伴不等量胸腔积液，29 例合并不同程度胸膜增厚。复查及随访 57 例患儿在出院后随访 7 天~2 个月，治疗后肺内实变及液化坏死区范围缩小，空洞明显减少，胸腔积液吸收；36 例患儿随访至 29 天~6 个月，肺内实变及坏死区明显吸收，空洞病灶消失；其中 15 例局部肺内组织残存少许条索影，11 例肺内残存囊性变，6 例肺不张。结论：儿童坏死性肺炎病程和热程长，胸部 CT 特点为大片实变内多发大小不一空洞、伴胸腔积液，转归过程中 CT 征象变化即肺部影像表现大致正常或条索影、肺不张及肺叶囊性变，胸腔积液吸收。虽然此病预后大

多良好,但当患儿出现长程高热、炎性指标明显升高,胸部影像学大片实变影,警惕发展为坏死性肺炎可能。

PO-2580

儿童胸膜肺母细胞瘤 CT 影像学表现

李殊明、李晓明、尹燕、魏伟安
湖南省儿童医院

目的 总结分析儿童(胸膜肺母细胞瘤 pleuropulmonary blastoma, PPB)的 CT 表现特点,以期提高对本病的认识。方法 回顾性分析 10 例经穿刺活检、手术病理证实为 PPB 病例的 CT 影像学表现。所有病例均行 CT 平扫及增强扫描。结果 本组病例中 I 型 1 例,II 型 2 例,III 型 7 例。8 例肿块位于肺外围向健侧推压肺组织及纵隔,肿瘤直径均大于 6.5cm,其中 6 例肿块几乎占满半侧胸腔。1 例合并左肾囊性肾瘤。CT 表现:I 型表现为多房囊性肿块,囊内充满液体并含少部分气体,囊内分隔可见强化。II 型为囊实性肿块,平扫实性部分为软组织密度,有不均匀轻度强化,囊性部分无强化。III 型为纯实性肿块,表现为边界较清楚、强化不均匀的肿块,其内可见多发肿瘤滋养血管。所有病例中均未见肋骨破坏及纵隔淋巴结肿大,伴或不伴少量胸腔积液,平扫仅 2 例见少许钙化灶。结论 了解 PPB 的 CT 影像学表现对本病的早期诊断有重要价值。

PO-2581

腺垂体磁共振成像特征对女童性早熟鉴别诊断价值的研究

刘栋、朱文珍
华中科技大学同济医学院附属同济医院

背景:本研究旨在评价腺垂体 MRI 特征(腺垂体体积[aPV]、腺垂体高度[aPH]、信号强度比[SIR])对女童性早熟(PP)的诊断价值,并建立一种易于临床实施的无创诊断方法。

材料与方法:自 2021 年 2 月至 2022 年 2 月,共有 126 名女孩(37 名,57 名和 32 名临床诊断为中枢性 PP [CPP]和不完全性 PP [IPP]患者,以及健康对照)被纳入该研究。所有参与者都进行了垂体 MRI 检查和 GnRH 激动剂刺激试验。收集三组患者腺垂体 MRI 特征及实验室检测特征数据,采用方差分析进行分析。采用 Pearson 相关分析检验相关性。采用逐步多元线性回归分析建立预测模型。采用受试者工作曲线(Receiver operating curve, ROC)分析评价 MRI 特征和预测值的诊断效果。

结果:各组的 aPH、aPV、SIR、身高(height)、体重(weight)、E2、IGF-1、IGFBP-3、INS、GLU、TT4、FT4 值与下丘脑-垂体-性腺(HPG)轴激活状态密切相关(均 $P < 0.05$)。应用与 LH 高度相关的 aPV、Weight、aPH 构建模型 1: $pLH = 0.045 \times aPV + 0.485 \times Weight + 1.567 \times aPH - 21.001$ ($R^2 = 0.271$);应用与 LH/FSH 高度相关的 SIR、aPV、Height 构建模型 2: $pLH/FSH = -0.042 \times SIR + 0.002 \times aPV + 0.034 \times Height - 3.686$ ($R^2 = 0.311$)。ROC 分析显示, LH、LH/FSH 和 aPV 是区分 CPP 组与对照组的最佳预测因子(曲线下面积[AUC]=0.969、0.949 和 0.938),而 LH/FSH 预测因子是区分 IPP 组与 CPP 组和对照组的最佳预测因子(AUC=0.829 和 0.828)。

讨论:腺垂体 MRI 的主要特征和使用 aPV、aPH、SIR、Height、Weight 构建的预测模型提高了 PP 的诊断效率。MRI 有可能成为一种无创、有效的 PP 诊断方式。

PO-2582

儿童新型冠状病毒感染相关脑并发症磁共振表现分析

程美英、赵鑫、谭世芳
郑州大学第三附属医院

目的: 分析儿童新型冠状病毒感染相关脑磁共振表现, 提高影像医师对该病的认识, 为临床早期诊疗提供依据。方法: 搜集 2022 年 12 月-2023 年 1 月在郑州大学第三附属医院就诊、经专科医师依据临床病史、实验室及影像学检查诊断为新型冠状病毒感染相关的患儿 11 例, 探讨其头颅 MRI 表现。结果: 11 例患儿中, 男 9 例, 女 2 例, 年龄 9 个月-14 岁, 脑 MRI 平扫均有异常, 表现为脑白质斑片样脱髓鞘 4 例, 脑白质内弥漫对称性异常信号 2 例, 脑炎 2 例, ADEM 1 例, 伴胼胝体压部可逆性脑病 1 例, 急性坏死性脑病 1 例, 其中 9 例患儿脑部病变为对称性; 6 例患儿脑磁共振表现出不同程度脑萎缩改变。结论: 儿童新型冠状病毒感染相关脑磁共振表现多样, 多表现对称性病变, 累及脑白质病变为主, 且多伴有脑萎缩, 影像诊断及临床医师需加强认识, 避免误诊或漏诊。

PO-2583

MAP-MRI 扩散模型在新生儿高胆红素血症中的的应用价值

徐生芳^{1,2}、张静¹
1. 兰州大学第二医院
2. 甘肃省妇幼保健院(甘肃省中心医院)

目的 探讨平均表观传播扩散 MRI (Mean apparent propagator-MRI, MAP-MRI) 扩散模型在新生儿高胆红素血症 (Hyperbilirubinemia, HB) 中的应用价值。

材料与方法 前瞻性收集 6 例新生儿高胆红素血症患儿 (病例组) 和 6 例健康新生儿 (对照组), 所有被试均在西门子 3.0 MRI Lumina 行常规 MRI 和扩散频谱成像 (diffusion spectrum imaging, DSI) 检查, DSI 经西门子后处理工作站处理得到多个 MAP-MRI 的参数图。在各参数图上分别测量病例组与对照组双侧苍白球区的参数值。本研究采用 SPSS 26.0 软件进行分析, 计量资料采用均值±标准差($\bar{x} \pm S$) 表示, 采用两独立样本 t 检验对两组患者的 MAP-MRI 各参数值进行组间比较。采用配对 t 检验比较病例组双侧苍白球参数值。采用 Spearman 相关性分析病例组各参数值与血清总胆红素 (Total bilirubin, TBIL) 和间接胆红素(indirect bilirubin level, IBIL) 的相关性。P<0.05 表示差异有统计学意义。

结果 病例组苍白球区的非高斯 (non-Gaussianity, NG) 和非高斯轴向 (non-Gaussianity axial, NGAx) 均低于对照组, 差异有统计学意义 (P<0.05)。病例组左侧苍白球的 Q 空间逆方差 (Q-space inverse variance, QIV) 高于右侧, 差异有统计学意义 (P<0.05)。Spearman 相关性分析病例组各参数值与 TBIL 和 IBIL 的相关性不显著。

结论 MAP-MRI 扩散模型在新生儿高胆红素血症中有一定的应用价值, 且苍白球的 NG 和 NGAx 可作为早期诊断的影像学参考指标, 为临床诊断提供客观量化依据, 协助临床尽早干预。

PO-2584

机器学习结合弥散基谱成像的脑网络分析在学龄前 ASD 早期诊断中的应用

易婷、蔡其芳、刘雨晴、魏伟安、伍光春、金科
湖南省儿童医院

目的：利用弥散基谱成像（DBSI）结合深度学习方法，探索学龄前自闭症谱系障碍（ASD）儿童脑网络的拓扑结构变化及其诊断价值。

方法：收集 2022 年 9 月至 2023 年 7 月在湖南儿童医院的 31 例 ASD 患者和 30 例正常对照（HC）的 Brain DBSI（DBSI_20、DBSI_21）资料，两组患者年龄均为 2~6 岁。将每个受试者的 DBSI_20 和 DBSI_21 的原始数据导入 DSI Studio 软件，生成 DBSI_combine 的扩散图像、bval 和 bvec。所有数据均采用 DSI Studio 对其进行连通性矩阵和图理论分析。应用 Kruskal-Wallis 用于提取全局和节点指标中最显著的特征。然后利用训练集中相关系数大于 0.99 的特征，使用支持向量机对上述进行分类。计算模型的准确度、召回率、精确度、F1 分数和 ROC 曲线下面积，以评价这三种模型的性能。

结果：DBSI_20 模型的 AUC（0.963）高于 DBSI_21 模型（0.481），DBSI_combine 模型的 AUC（0.975）最高。DBSI_combine 模型的准确度/召回率/精确度/F1 评分为 0.936/0.889/1.000/0.979，DBSI_20 模型为 0.890/1.000/0.784/0.879，DBSI_21 模型为 0.579/0.556/0.861/0.675。各模型最具辨别意义的脑区分布于左侧角回、右侧颞中回、右侧颞下回和左侧小脑、左中央后回。此外，节点脑网络特征（左侧角回偏心率）与临床量表（CABS）之间存在相关性（ $r=-0.605$, $p<0.05$ ）。
结论：基于 DBSI 脑网络特征指标的机器学习模型能够对 ASD 进行准确的鉴别，其中分类效果最好的模型是 DBSI_combine。节点脑网络特征（左侧角回）可能是学龄前 ASD 患者脑发育异常的基础。

PO-2585

基于 CT 定量测量与临床特征联合儿童重症 CAP Nomogram 预测模型的构建研究

胡子涛、呼甜、黄晓旗、李建龙
延安大学附属医院

目的 儿童重症 CAP 的早期诊断是临床工作中的难点，本研究基于 CT 定量测量与临床特征联合构建儿童重症 CAP Nomogram 预测模型，探究影像学定量指标在重症 CAP 中的诊断价值，并结合临床特征寻找预测重症 CAP 的相关预测因素，进而为临床早期诊断及治疗提供依据。

材料与方法 回顾性纳入延安大学附属医院 2019 年 1 月-2022 年 12 月 CAP 患儿 197 例，其中普通组患儿 124 例，重症组患儿 73 例。将两组间差异指标行多因素 logistic 回归分析，筛选出重症 CAP 独立预测因素，建立预测回归模型。本研究建立了①只纳入临床特征的临床模型；②仅纳入 CT 定量指标的影像模型；③联合临床及 CT 定量的临床-影像模型。多变量模型的性能通过 ROC 曲线下面积（AUC）进行评估，采用 Delong 检验将三种模型的 ROC 差异数值化，评估 ROC 差异是否具有统计学意义。最优模型绘制列线图，使用自举法（B=1000 Bootstrap）进行内部验证其可重复性。通过 Hosmer-Lemeshow 检验对模型的拟合度进行评价。

同时使用 NRI、IDI 及决策曲线分析(DCA) 评价预测模型的临床效益及实用性。

结果 本研究多因素 logistic 回归分析显示 CRP、LDH、LeV%、GGO%为儿童重症 CAP 的独立预测因素。基于回归分析的独立预测因素建立 logistic 回归模型（临床、影像及临床联合影像模型），

通过 ROC 曲线分析，发现临床联合影像模型明显优于单纯临床模型及影像模型，并且绘制列线图表示。校准曲线显示联合模型中预测值和观察值具有较好的一致性。DCA 曲线显示，当患儿的预测概率阈值在 0-1 时，重症 CAP 的临床联合影像模型的收益优于单纯临床模型及单纯影像模型。

结论 建立了定量指标联合实验室检查指标的诺模图模型，模型表明 CRP、LDH、LeV%、GGO% 是儿童重症 CAP 的独立预测因素。模型的校准曲线及 DCA 曲线反映了模型良好的吻合度及临床实用性。模型的建立更加有利于临床早期识别和诊断儿童重症 CAP，从而提示临床尽早进行有效干预及治疗。

PO-2586

基于人工智能的儿童骨折的自动检测和定位

杨凤、王颖、边传振、杨明
南京市儿童医院

目的：儿童骨折不同于成人骨折，不是成人的缩小版，不恰当的治疗给儿童的生长发育造成很大影响。本研究针对不同年龄儿童骨骼生长发育特点，构建集成深度神经网络模型，实现不同发育阶段的儿童骨折的自动诊断和定位，并对比不同资质的医师在有和没有 AI 辅助情况下的诊断效率，实现用于儿童骨折自动诊断与定位的临床决策支持系统，并推广为临床医生常用工具。

方法：收集 2016-2024 年行 DR 骨折检查的 0-16 岁患儿 6000 例，根据儿童生长发育特点，基于 Python 自动分为不同年龄组（0-3,3-12,12-16），使用 Faster R-CNN 结合 YOLOv7 网络模型进行儿童骨折的自动检测和定位，并和不同年资医生的诊断结果比较，最后分析在有和没有 AI 辅助诊断时医生的诊断效率。

结果：不同年龄组的自动诊断平均精度 AP50 均高于未分组时的平均精度，人工智能（AI）自动诊断能够达到医师的诊断水平，在有 AI 辅助诊断的情况下，医师每张片子平均阅片时间缩短 6 秒。

结论：结合儿童不同年龄的生长发育特点能够提高人工智能自动诊断效果，基于人工智能的辅助诊断能够大大提高医师阅片效率。

PO-2587

儿童原发椎管内原始神经外胚层肿瘤/尤文肉瘤的 MRI 影像表现

苏晓然¹、时胜利¹、陈琬¹、荆长有¹、刘玥²

1. 河南省儿童医院郑州儿童医院

2. 首都医科大学附属北京儿童医院放射科

目的 分析儿童原发椎管内原始神经外胚层肿瘤/尤文肉瘤（Primitive neuroectodermal tumor/Ewing sarcoma, PNET/EWS）的 MRI 影像征象，提高对本病的诊断准确率。**方法** 回顾性分析总结我院 2016 年 8 月-2023 年 5 月手术并术后病理确诊的原发于椎管内的 PNET/EWS 6 例患儿的临床资料及 MRI 影像表现。**结果** 6 例患儿发病部位均以胸椎水平为主，其中 1 例同时累及颈椎水平，1 例同时累及腰椎水平；5 例病变发生于椎管内硬膜外，1 例发生于椎管内硬膜下，其中 5 例病变向邻近椎间孔延伸。5 例患儿 MRI 表现为椎管内硬膜外团块状 T1WI 等信号，T2WI 等信号，其中 4 例病变 T2WI 压脂呈等、稍高信号，1 例病变 T2WI 压脂呈等低信号；1 例患儿 MRI 表现为椎管内硬膜下囊片状 T1WI 等稍低信号，T2WI 等高信号，T2WI 压脂呈等高信号。增强扫描显示 4 例患儿病变呈明显强化，1 例患儿病变呈环形强化，1 例患儿病变内未见明显强化，周围见少许强。4 例患儿病变累及相邻椎体或肋骨，1 例患儿病变内部发生凝固性坏死，表现为 T1WI 等信号、T2 压脂像低信号改变，合并周围软组织感染，1 例患儿并发 Trousseau 综合征及脑实质、脑膜、脊膜广泛转移，表现为右侧大脑半球脑梗塞及脑实质、脑膜、脑池、脊膜多发广泛结节状、线状转移灶。**结论** 儿童原发椎管内的 PNET/EWS 发病部位多位于胸椎椎管内硬膜外，易向邻近椎间孔延伸，易累及邻

近骨质,病变在 T1WI 及 T2WI 以等信号为主,内可发生囊变、坏死,增强病变多呈明显强化,病变可合并 Trousseau 综合征及并发转移。MRI 检查不仅可以明确显示肿瘤病变的范围及信号特征,还可发现转移性病变,为临床治疗方案的确定及治疗效果的评估提供重要参考。

PO-2588

儿童发育性口吃多模态结构磁共振成像与机器学习建立特征分类模型的研究

廖怡¹、田启源²、肖嘉昕³、马丹¹、贾凤林¹、李学胜¹、曲海波¹

1. 四川大学华西第二医院

2. 清华大学生物医学影像研究中心清华脑影像实验室

3. 清华大学电子工程系

目的:本研究采用结构磁共振成像,探究儿童发育性口吃脑灰质与白质结构改变,分析其与口吃程度的相关性,进一步通过机器学习方法建立儿童发育性口吃影像学特征分类模型,探寻发育性口吃潜在的影像学生物标志物。

材料和方法:本研究纳入于四川大学华西第二医院诊断为发育性口吃的儿童 54 例,言语流利儿童 54 例。采集脑部磁共振 3D-T1 加权像和弥散成像数据。对全脑灰质体积、皮层形态学、白质纤维束结构改变进行分析。提取有差异的灰质体积、皮层褶皱、弥散参数作为原始影像学特征,通过 10 种分类器建立疾病识别模型,使用 ROC 曲线下面积 (area under the curve, AUC) 评估模型效能,利用信息增益来评估特征变量对分类结果的贡献。

结果:口吃组右侧海马、右侧颞上回和左侧枕中回灰质体积较对照组增加具有统计学意义 ($P \leq 0.001$)。口吃组右岛盖部及右颞上回的皮层褶皱较对照组减小具有统计学意义 ($P=0.025$, $P=0.021$, $P=0.037$)。口吃组子网络以小脑为中心,小脑与右岛盖部、双侧岛叶、左角回、双侧尾状核及右海马回的结构连接减低 ($P < 0.05$)。口吃组右小脑节点介数减少,右枕下回节点效率减少 ($P < 0.05$)。NODDI 的脑脊液体积分数 (fcsf) 和 DKI 的轴向峰度 (AK) 在额斜束和弓状束等各个束上表现出显著差异 ($P < 0.05$)。NODDI 的方向弥散指数 (ODI) 和 DTI 的轴向弥散系数 (AD) 与口吃严重程度相关 ($P < 0.05$)。分别通过 10 种分类器构建二分类模型,全脑灰质体积特征分类的 AUC 为 0.85,对分类贡献最大的脑区是右尾状核和小脑。NODDI 参数特征分类的 AUC 为 0.88。

结论:本研究发现,颞上回灰质体积、皮层褶皱异常、以小脑为中心的子网络存在结构连接与儿童发育性口吃相关。本研究涉及言语运动控制相关的脑结构(皮质-基底神经节-丘脑-皮质环路以及背侧语言通路)异常,可能导致破坏了言语产生时间顺序的精准控制。通过机器学习建立了高精度的发育性口吃影像学特征分类模型,可用于疾病的识别和分类。

PO-2589

儿童及青少年难治性颞叶癫痫脑网络改变与认知功能相关性研究

何玉伦、冉海峰、张体江*
遵义医科大学附属医院

目的: 难治性颞叶癫痫是最常见的难治性癫痫类型之一, 反复的癫痫发作可能会造成皮层及皮层下脑网络连接异常, 但目前儿童及青少年难治性颞叶癫痫脑网络改变机制仍不完全清楚, 因此本研究旨在探究难治性颞叶癫痫患儿脑网络动态改变与认知功能的相关性。

方法: 本研究共纳入 41 名难治性颞叶癫痫和 35 名正常对照, 所有被试常规 MRI 检查均未见异常, 并于扫描当天对难治性颞叶癫痫患者进行儿童韦氏智力量表评估, 所有被试均进行高分辨三维 T1 结构像和静息态功能 MRI 扫描。通过独立成分分析方法, 在 GIFT 软件构建动态网络连接, 提取每个被试的三种动态网络时间参数指标。比较两组网络连接差异, 以及时间参数指标差异, 正态分布且方差齐的变量使用双样本 T 检验, 不符合使用 U 检验。分析时间参数指标与临床变量和认知评分的相关性。

结果: 与正常对照组相比, 难治性颞叶癫痫组脑动态网络连接在 4 个不同状态均有显著差异 ($P<0.05$, FDR 校正)。难治性颞叶癫痫患儿在主要状态 2 中呈现连接减弱, 部分脑网络状态(状态 1、3、4)网络连接增强。脑网络总体连接呈减弱状态, 高级认知网络中默认模式网络、执行控制网络、语言网络和楔前叶网络呈网络内连接减弱, 语言网络和其它脑网络之间均呈连接增强。低级知觉网络听觉网络、运动网络和视觉网络在网络内和网络间呈连接减弱。皮层下网络基底神经节网络和语言网络连接增强, 与默认模式网络连接减弱; 时间分数和平均滞留时间均在状态 1-3 的组间比较有差异, 转化次数在组间比较未见差异; 难治性颞叶癫痫组与正常对照组在智力评估各项中均有差异; 状态 1 的时间分数与病程呈正相关($r=0.337$, $P=0.031$), 状态 1 的平均滞留时间与病程呈正相关($r=0.401$, $P=0.009$), 状态 1 的平均滞留时间和言语智商($r=-0.323$, $P=0.039$)及知觉推理($r=-0.323$, $P=0.040$)呈负相关。

结论: 本研究结果表明难治性颞叶癫痫患儿动态脑网络连接存在异常改变并与病程和认知功能障碍相关, 推测难治性癫痫患儿脑功能网络的重塑超出代偿范围会伴随相应的认知功能障碍。动态脑网络指标可能是反映难治性癫痫病程进展和认知功能障碍的一种潜在生物标志物。

PO-2590

新生儿高胆红素血症患者的脑深部灰质核团和脑白质在定量磁化率图(QSM)上的变化

王媛媛¹、杨林峰²、陈涛²、李祥林¹、郭凌飞³

1. 滨州医学院

2. 济南市妇幼保健院

3. 山东第一医科大学附属省立医院 (山东省立医院)

目的: 新生儿高胆红素血症 (NHB) 在常规磁共振成像上无明显变化, 只有进展到高胆红素脑病时才出现典型的影像学征象。本研究旨在评估定量磁化率图 (QSM) 对 NHB 的诊断价值。

方法: 本试验共纳入 33 例足月 NHB 新生儿 (实验组) 和 12 例健康足月新生儿 (对照组), 每位受试者均行常规 MRI 和 QSM 扫描, 并提取壳核、苍白球、尾状核和额叶白质的 QSM 值。采用 t 检验和秩和检验探讨两组间 QSM 值的差异以及每组各脑区的左右两侧 QSM 值的差异。采用 Pearson 或 Spearman 双变量相关分析、多元线性回归分析和多项式回归分析探讨 QSM 值与血清总胆红素 (TBil) 以及血清间接胆红素 (IBil) 之间的关系。通过受试者操作特征 (ROC) 曲线计算曲线下面积 (AUC) 评估 QSM 的诊断能力。

结果:两组壳核的 QSM 值具有显著的统计学差异,且实验组壳核的 QSM 值明显高于对照组。两组壳核、苍白球、尾状核以及额叶白质的左右两侧的 QSM 值无显著的统计学差异。对照组苍白球的 QSM 值与 TBil 呈正相关;实验组右尾状核和左额叶白质的 QSM 值与 TBil 呈负相关;实验组右尾状核和左额叶白质的 QSM 值与 IBil 呈负相关。多元线性回归分析结果表明,对照组苍白球和额叶白质的 QSM 值与 TBil 有相关性;实验组右尾状核和左额叶白质的 QSM 值与 IBil 有相关性。由此,推断 TBil 和 IBil 与各脑区的 QSM 值密切相关。多项式回归曲线分析结果显示,健康足月新生儿的苍白球、右侧尾状核、尾状核和左侧额叶白质的 QSM 值分别随着 TBil 和 IBil 的升高而升高,当发生高胆红素血症时, QSM 值又分别随着 TBil 和 IBil 的升高而降低,但仍高于健康足月新生儿的水平,并且 TBil 和 IBil 对 QSM 值的影响非常相似。通过比较 AUC,我们发现壳核的诊断能力最强。ROC 曲线也印证了左右两侧脑区的 QSM 值相近。因此,单侧脑区的 QSM 值可以代表双侧脑区的诊断结果。

结论:QSM 是一种高度敏感、无创性的影像学检查方法。新生儿左右两侧的脑深部灰质核团和脑白质的 QSM 值均可以随着 TBil 和 IBil 动态变化,壳核的 QSM 值可以准确诊断 NHB。

PO-2591

儿童流感相关性脑病的影像表现

陶晓娟、彭芸

首都医科大学附属北京儿童医院

目的 探讨儿童流感相关性脑病(influenza—associated encephalopathy, IAE)的影像学特征。

方法 回顾性分析 2022 年 1 月至 2023 年 4 月我院确诊 IAE 且资料完整患者的影像资料。

结果 共纳入患者 30 例,平均年龄 4 岁。其中急性坏死性脑病 19 例,急性脑病伴双向发作及后期弥散降低 2 例、临床轻症脑病伴可逆性胼胝体压部病变 8 例、出血性休克与脑病综合征 1 例。所有患者均进行了 CT 及磁共振检查。急性坏死性脑病患者 CT 均表现为双侧丘脑、基底节对称性低密度;磁共振均表现为双侧大小脑半球、丘脑、基底节、脑干大片状对称分布的长 T2 信号, DWI 病变中心为低信号,边缘为高信号,双侧丘脑病变为短 T1 信号。急性脑病伴双向发作及后期弥散降低患儿的 CT 无阳性表现,磁共振表现为皮质下脑白质的长 T1 长 T2 信号,伴有 DWI 明显高信号,即“亮树征”。临床轻症脑病伴可逆性胼胝体压部病变患儿的 CT 无阳性表现,磁共振表现胼胝体压部椭圆形或圆形的病灶,边界清楚, T1WI 呈等或低信号, T2WI 为高信号, DWI 为明显高信号, ADC 图呈低信号。其中 1 例患儿同时出现胼胝体膝部及侧脑室周围脑白质受累。出血性休克与脑病综合征的患儿的 CT 及 MRI 均表现为双侧大脑半球弥漫性脑水肿伴蛛网膜下腔出血。

结论 儿童流感相关性脑病具有一定的影像学特征,起病急,预后较差,在流感季节或流感大流行时,患儿出现上述影像表现时应考虑 IAE 的可能。

PO-2592

发育性口吃儿童脑血流异常的磁共振研究

刘婉晴

四川大学华西第二医院

目的:探讨发育性口吃患儿静息态脑血流(CBF)的变化。

方法:采用伪连续动脉自旋标记(pcASL)磁共振成像技术对 35 例发育性口吃患儿和 27 例 3~14 岁健康儿童的静息态脑血流进行定量分析。比较两组患者的 CBF,评价 CBF 异常与口吃严重程度的相关性。

结果：与健康对照组相比，口吃组双侧小脑半球、右侧楔叶、左侧枕上回 CBF 降低，右侧内侧额上回、左侧直肌、左侧背外侧额上回 CBF 升高。此外，口吃组左侧 cerebellum_6 和左侧枕上回 CBF 与口吃严重程度呈正相关。

结论：发育性口吃患儿脑血流量减少主要发生在小脑和枕回，而额叶脑血流量增加。此外，左侧 cerebellum_6 和左枕上回 CBF 异常与更严重的症状相关，提示左侧 cerebellum_6 和左枕上回 CBF 降低可能是儿童口吃的潜在影像学生物标志物。

PO-2593

Oliver 病并卵巢颗粒细胞瘤一例

王静
吉林大学第一医院

患儿女，10 岁，因间断性阴道不规则流血 1 个月，发现盆腔肿物 1 周入院。该患儿于 3 个月前月经初潮，后月经不规律，周期为 28-30 天，经期 7-16 天。1 个月前无明显诱因间断性阴道不规则流血，量少，色淡红。既往 9 年前于北京骨肿瘤医院诊断“内生性软骨瘤”。入院查体多发骨骼畸形，腹部 CT 示子宫左前上方巨大肿块，大小约 13.0cmX6.4cmX15.0cm，其内密度不均，增强扫描不均匀强化，其内可见血管穿行，与右侧附件关系密切，病灶后方可见结节状软组织密度影，大小约 0.6cm，轻度强化。骨盆组成骨密度不均匀，形态不规整，可见骨质破坏，骨盆左侧软组织影增厚，密度不均。行右附件及大网膜切除术，术后病理汇报右侧卵巢幼年型颗粒细胞瘤 1C1 期。多发内生软骨瘤是一种罕见的非遗传性良性肿瘤，该病由 Oliver 于 1899 年首先报道，又称 Oliver 病。患病率约 1/100000。目前国外文献报道卵巢颗粒细胞瘤合并内生软骨瘤仅 11 例，国外 10 例，国内北京积水潭医院报道 1 例。卵巢幼年型颗粒细胞瘤合并多发内生软骨瘤临床罕见，发病可能与 1DH1 基因突变有关，治疗以手术切除为主，术后需定期随访。

PO-2594

早产风险对新生儿短程纤维微结构及发育模式影响的 dMRI 研究

高洁、于乔文、侯中煜
山东省立医院

目的：早产风险是指早产时间及相关脑损伤等干扰早产儿脑结构发育的危险因素。短程纤维作为大脑功能发育的重要结构基础，也是发育最晚的大脑结构，其结构脆弱性导致易于受早产风险影响而损伤。然而目前对早产儿短程纤维的结构改变了解甚少。本课题旨在观察并描述早产风险对短程纤维微结构及发育模式的影响。

方法：基于人脑连接发育计划数据库筛选 35 例足月儿新生儿（37.8-41.8 孕周）、37 例适度早产儿（32.1-36.8 孕周）及 39 例极早产儿（23.7-31.7 孕周）的 T2 加权及多球壳弥散数据，分别追踪额、顶、颞、枕叶短程纤维并测量平均弥散参数值，包括部分各向异性指数（FA）、平均弥散率（MD）、轴向扩散率（AD）、径向扩散率（RD）神经突密度指数（NDI）、方向离散度（ODI），①采用 ANCOVA 分析分别比较 3 组额、顶、颞、枕叶短程纤维弥散参数值，观察早产程度对短程纤维微结构的影响；②采用线性回归分析早产时间对短程纤维发育模式的影响；③依据放射学评分将早产儿分为正常脑结构组和脑损伤组，采用 ANCOVA 分析早产相关脑损伤对短程纤维微结构的影响。

结果：①适度早产儿短程纤维 MD 值较足月儿升高（ $p<0.05$ ）；极早产儿短程纤维 FA 值、NDI 值较足月儿减低，MD 值、RD 值较足月儿升高；适度早产儿与极早产儿短程纤维弥散参数值无统计

学差异；②足月新生儿额叶短程纤维 FA 值，额颞枕叶短程纤维 NDI 值随孕龄增加升高；适度早产儿额叶短程纤维弥散参数值无统计学意义的孕龄相关变化；极早产儿顶叶 FA 值，顶枕颞叶 NDI 值升高速率较足月儿增快；③脑损伤组早产儿额顶叶 AD 值较正常脑结构组显著降低。

结论：研究结果表明①新生儿短程纤维具有异质性发育的特点；②短程纤维微结构及发育模式改变具有早产时间依赖性；③顶枕叶短程纤维具有代偿性发育特征；④MD 值对探测早产相关短程纤维微结构损伤敏感；⑤早产相关脑损伤造成额顶叶短程纤维轴突损伤。以上结果为全面了解人脑结构早期发育补充了新的证据，为深入了解发育性脑病的纤维机制提供新的思路，同时对精细化早产儿护理提供理论支持。

PO-2595

LAMA2-相关肌营养不良患儿大腿骨骼肌 MRI 改变特点

朱颖、肖江喜
北京大学第一医院

目的：分析 LAMA2-相关肌营养不良(LAMA2-related muscular dystrophy, LAMA2-MD)大腿骨骼肌磁共振成像改变，总结其肌肉受累特点。

方法：选取 14 例 LAMA2-MD 患儿，其临床上均表现为生后肌无力、肌张力低，运动发育落后，伴广泛脑白质病变，基因检测出 LAMA2 复合杂合突变。选取上述患儿大腿各肌肉 MR 图像，对肌肉的脂肪浸润、水肿及萎缩进行评分，并以平均值及受累频度（%）评估脂肪浸润、以受累频度（%）评估萎缩，分析大腿骨骼肌受累模式。

结果：14 例患儿，男 10 例，女 4 例，先天性肌营养不良 1A 型(MDC1A) 11 例，常染色体隐性遗传肢带型肌营养不良 23 型(LGMDR23) 3 例，其中 1 例 LGMDR23 于首次检查 2 年后复查 MRI。MRI 检查时平均年龄 3.3 (1.0-11.1)岁。大腿肌肉 MRI 示所有患儿大腿肌肉均存在不同程度脂肪浸润，4 例出现水肿，14 例出现肌肉萎缩，LAMA2-MD 的两种表型肌肉脂肪化分布形式及程度存在差异。所有患儿大腿肌肉均有广泛脂肪浸润，以大收肌(3.9, 100%)、臀大肌(3.7, 100%)和股二头肌长头(3.5, 100%)最严重；长收肌(0.6, 40.0%)相对不受累；并且单块肌肉的脂肪化程度以周边为著。水肿较轻，主要累及臀大肌和股四头肌（除股直肌外）。肌肉萎缩主要累及大收肌(93.3%)，臀大肌(66.7%)。1 例 MDC1A 患儿随访过程中死亡，其肌肉脂肪浸润程度最重，上述各肌群均受累且脂肪浸润评分平均值为 3.8。LGMDR23 患儿的肌肉受累程度较 MDC1A 轻，大腿中段脂肪化以大收肌和股二头肌长头间隔受累为主，伴股四头肌受累，1 例 LGMDR23 患者在时隔 2 年后复查肌肉 MRI 无明显加重。

结论：LAMA2-MD 患者大腿肌肉 MRI 表现为广泛脂肪浸润，以大收肌、臀大肌、股二头肌和股四头肌病变明显，而长收肌相对不受累。萎缩主要累及大收肌、臀大肌和股四头肌。LGMDR23 患儿肌肉脂肪化及萎缩程度较 MDC1A 轻 LAMA2-MD 患儿大腿骨骼肌 MRI 表现具有一定特异性，可以帮助疾病定性诊断和进行病情进展和预后的评估。

PO-2596

儿童急性脑病的临床和磁共振表现分析

李春鸽¹、刘玥²、时胜利¹
1. 河南省儿童医院郑州儿童医院
2. 首都医科大学附属北京儿童医院

目的：通过分析儿童急性脑病的临床表现和磁共振征象，总结儿童急性脑病的临床及影像学特点。

方法：回顾性分析 2015 年 12 月至 2023 年 3 月在郑州大学附属儿童医院诊治的 50 例急性脑病患儿临床资料、实验室检查、影像资料、治疗及转归，并根据其临床影像学特征对其进行进一步分类。

结果：50 例患儿中，男 32 例，女 28 例，就诊时年龄（ 3.0 ± 2.8 ）岁，中位数 4.1 岁，患儿神经系统首发症状为抽搐，19 例表现为惊厥持续状态，25 例昏迷。45 例均以发热起病。本研究根据脑病临床病理特征分为四组：细胞因子风暴组、兴奋毒性组、先天代谢紊乱组及无法分类组。细胞因子风暴组有 19 例急性坏死性脑病（ANE），MRI 表现以双侧病变对称分布，丘脑病变在 DWI 图像上呈“三色模式”或“双色模式”。兴奋毒性组：急性脑病伴双相癫痫和迟发性弥散减低(AESD)3 例，头颅 MRI 在病程的第 1~2 天无异常信号，第 3~9 天 DWI 皮层下白质出现“亮树征”；6 例发热性感染相关癫痫综合征(FIRES),头颅 MRI 首次检查 3 例无异常信号，1 例皮层及皮层下广泛 DWI 高信号，2 例海马边缘有线状 DWI 高信号，病程后期 3 例海马体积减小，FLAIR 信号增高，6 例均有脑组织不同程度萎缩，皮层 FLAIR 信号增高；急性婴儿额叶优势脑病 1 例（AIEF），头颅 MRI 的 DWI 显示双侧额叶为主皮质高信号。无法分类组有 19 例伴胼胝体压部可逆性病变的轻度脑炎/脑病(MERS), MERS I 型 17 例,DWI 胼胝体压部局限片状 DWI 高信号，MERS II 型 2 例，胼胝体压部及双侧顶叶白质内片状 DWI 高信号。先天性代谢紊乱引起的急性脑病 2 例，头颅 MRI 表现为急性期以白质为主的广泛细胞毒性水肿。

结论：儿童急性脑病以婴幼儿多见，以发热、抽搐及迅速出现的意识障碍最为常见，头颅 MRI 在病程初期、病程中的动态表现能够帮助诊断急性脑病及进行临床病理特征分类，为临床早诊断、早治疗及评估预后提供重要客观依据。

PO-2597

MRI 对胎儿先天性高位气道梗阻综合征的诊断价值。

夏昕玥、刘芳、杨文忠、兰为顺、夏凤
湖北省妇幼保健院

目的：探讨 MRI 评估胎儿先天性高位气道梗阻综合征(CHAOS)的诊断价值。

方法：回顾性收集 2014 年 12 月至 2023 年 8 月经引产后病理证实为 CHAOS 的 17 例胎儿。超声发现 CHAOS 当天接受 MRI 检查，MR 扫描序列包括半傅立叶单次激发快速自旋回波(HASTE)序列、真稳态进动快速成像(True-FISP)序列、T1WI，发现可疑气道梗阻后行病变区冠状位以及胎儿矢状位扫描。将胎儿产前、引产后标本 MR 图像与尸检病理结果对照分析。

结果：17 例胎儿均出现梗阻水平以下气道扩张、肺体积增大、双肺 T2WI 信号增高、膈肌平直或反向、心脏受压位于中线区、大量腹水。胎儿皮肤水肿 15 例，出现胸腺结构上移至胸廓入口以上 5 例，羊水过多 10 例。产前 MRI 判断 15 例喉部梗阻和 2 例气管梗阻。产后 MR 及尸检病理证实喉闭锁 13 例，喉闭锁合并气管食道瘘 1 例，气管缺如 1 例，气管发育不良 1 例，气管发育不良伴双主动脉弓 1 例。

结论：MRI 能辅助诊断 CHAOS 的梗阻水平以及梗阻类型，对评估预后、计划手术方案以及优生优育起到重要补充作用。

PO-2598

儿童 X 线跟骨轴位摄影技术的探讨

文深、林洁琼、莫东霞、孟宪磊
深圳市儿童医院

目的：分析研究跟骨轴位 X 线摄影技术的方法，探讨跟骨轴位摄影标准，以降低儿童辐射剂量，提高摄影质量，提高诊断效率。

方法：分析我院 2022 年 2 月至 5 月跟骨轴位 X 线照片 50 例。其中男性 28 例，女性 22 例。年龄在 6 岁至 16 岁。所有病例均采用锐科 DR VX3733-SYS 摄影，分别取两种方法，方法①患儿仰卧摄影台上，被检测下肢伸直，小腿长轴与摄影台面长轴平行，踝部极度背屈，踝关节置于探测器中心，中心线向头侧倾斜 35°至 45°，70KV,6MAS。通过第三跖骨基底部对准跟距关节射入探测器中心。方法②患儿站立摄影台上，双脚内旋，使两足平行，双脚相距 80 毫米，足内侧缘平行，踝背屈 10°，50KV，4MAS,摄影距离 100CM，中心线对准内外踝连线中点 45°射入。跟骨轴位影像显示标准：1、跟骨体和跟骨各突出均显示清晰 2、全跟骨显示于图像正中，显示被检测跟骨的骨质、关节面及周围软组织 3、骨小梁、周围软组织显示清晰。

结果：跟骨间隙显示欠佳，存在体位不正、配合不佳、曝光剂量欠佳等因素。方法①跟距关节间隙显示概率为 80.2%，方法②跟距关节间隙显示率约为百分之 90%，并可双侧同时对比，减少重拍率，从而减少患儿受照辐射。

结果：方法一要求患儿需要用双手或者他人帮助拉住前脚掌使踝关节过度背伸，由于儿童配合度欠佳，内旋或外展不足，导致体位不正，跖骨形态显影，曝光次数增加，累计受照辐射。方法二要求患儿站立静止即可，大大提高摄片率。熟悉跟骨轴位 X 线解剖特点是跟骨轴位 X 线摄影的基础，掌握跟骨轴位拍摄技术，提高摄片率，从而降低癌症发生率，减少辐射剂量，利于儿童生长发育。放射对儿童产生的副作用已是事实，但采取最优化的放射技术可以获得良好的成像效果，同时能将副作用降到最低限度，减少对患儿身体的危害。

结论：熟悉跟骨轴位 X 线解剖是拍摄跟骨的金标准，掌握跟骨拍摄技巧，可以提高跟骨轴位 X 线摄影水平。

PO-2599

DCE 和 IVIM 联合预测髋关节发育不良儿童 复位后股骨头缺血性坏死

郭豫、夏薇、彭雪华、邵剑波
华中科技大学同济医学院附属武汉儿童医院

目的：评估动态对比增强（DCE）-MRI 和体素内非相干运动（IVIM）在预测髋关节发育不良儿童复位后股骨头缺血性坏死的诊断价值。

方法：选取 2017 年 4 月至 2019 年 12 月在我院行复位术的 16 例髋关节发育不良（DDH）患儿为研究对象。复位后 6 个月随访结果显示，11 例髋关节发生缺血性坏死（AVN），21 例髋关节正常。在股骨头干骺端上勾画感兴趣的区域获得 DCE-MRI 和 IVIM 参数。参数分别是 ADC_{slow} ， ADC_{fast} ， f ， $f*ADC_{fast}$ ， K^{trans} ， Ve ， Vp 和 k_{ep} 。使用 SPSS，GraphPad Prism 和 MedCalc 软件对参数进行统计分析。

结果：与正常组比较，AVN 组 ADC_{fast} 、 $f*ADC_{fast}$ 和 K^{trans} 较低（ $P=0.08$ 、 $p=0.022$ 和 $p=0.004$ ）。 K^{trans} ， ADC_{fast} 和 $f*ADC_{fast}$ 的 AUC 分别为 0.805,0.784,0.749。联合 ADC_{fast} 和 K^{trans} 两个指标具有最高的诊断效率，AUC 为 0.926，灵敏度为 90.91%，特异性为 90.48%。

结论：DCE-MRI 和 IVIM 参数能准确鉴别复位后的 DDH 患儿 AVN 组与正常组， ADC_{fast} 和 K^{trans} 联合诊断显著提高了诊断效率。DCE-MRI 和 IVIM 可以预测 DDH 患儿复位后 AVN 的发生。

PO-2600

儿童弥漫内生型脑桥胶质瘤的临床和影像学特征、治疗反应和总生存率之间的关系

于晓军、张冬、叶坤林、胡欣朋、王琼、史长征、罗良平
暨南大学

目的 我们旨在评估儿童弥漫内生型脑桥胶质瘤 (DIPG) 的影像学特征和治疗反应 (通过比较二维交叉乘积和体积测量) 与总生存率 (OS) 之间的关系。

方法: 纳入 116 例 (≤ 18 岁) 诊断为儿童弥漫内生型脑桥胶质瘤的患者。进行单变量和多变量分析, 以评估临床和影像学特征以及治疗反应与 OS 的相关性。通过线性回归评估根据儿童神经肿瘤反应评估 (RAPNO) 工作组的建议定义部分反应 (PR) 为最大截面垂直直径乘积 (与基线相比) 减少 $\geq 25\%$ 和体积测量阈值之间的相关性。使用对数秩检验比较治疗反应分类不一致和分类一致患者之间 OS 的差异性。

结果: 在单因素分析中, 与较差 OS 相关的特征包括未接受替莫唑胺辅助治疗、未进行再程放疗、初始 Karnofsky 评分较低、较大脑桥外延伸率、坏死、非-PR 和放疗后增加的环形强化。在多变量分析中, 坏死、脑桥外延伸率、治疗反应、放疗后增加的环形强化和再程放疗可以预测 OS。25% 的 CP 减少定义 (PR) 与 32% 的体积减少相关 ($R^2=0.90$)。根据 CP 减少 (25%) 和体积减少 (32%), 7 名患者的治疗反应分类不一致。这 7 名患者的中位生存时间为 13.0 个月, 显著高于根据 CP 减少 (25%) 和体积减少 (32%) 同时分类为非-PR 组 (8.4 个月), $P<0.05$ 。

结论: 我们研究确定了影像学特征、治疗反应和 OS 之间的相关性; 这些信息对未来的临床试验至关重要。肿瘤体积可能比二维测量更准确地反应 DIPG 生长模式, 并且可以用于评估治疗反应。

PO-2601

多参数心脏磁共振在儿童心肌炎中的临床应用和研究进展

冯占起、赵鑫#、陆林、程美英、尚红磊、廖俊杰、张淳翔、王长浩
郑州大学第三附属医院

目的: 对多参数心脏磁共振 (CMR) 在儿童心肌炎中的临床应用和研究进展进行综述。

方法: 通过查阅国内外相关文献, 首先对多参数心脏磁共振的扫描序列进行概述, 然后对多参数心脏磁共振在儿童心肌炎诊断、危险分层、治疗决策、预后评估和随访中的应用以及研究新进展方面进行全面归纳、总结和分析。

结果: 在急性心肌炎诊断方面, 多项研究显示 2018 版路易斯湖标准 (LLC) 对儿童急性心肌炎诊断的敏感度和特异度较高, AUC 值均在 0.9 以上; 在慢性心肌炎诊断方面, 横向弛豫时间定量成像 (T2-mapping) 和心肌细胞外容积百分数 (ECV) 可能有助于诊断儿童慢性心肌炎, 但敏感度有些偏低, 而晚期延迟强化 (LGE) 诊断儿童慢性心肌炎并不可靠; 在治疗决策方面, 有研究表明病情较重的患儿在进行心脏磁共振检查后住院费用和住院时间缩短, 死亡率较未进行心脏磁共振检查的患儿更低; 另外心脏磁共振在心肌炎危险分层、预后评估和随访中也有一定价值, 其中 LGE、ECV 和左室射血分数 (LVEF) 与患儿预后相关; 在研究进展方面, 特征追踪技术、压缩感知技术、人工智能、快速磁共振扫描序列和方案等方向的研究层出不穷, 但在低龄儿童人群中的研究还相对较少。

结论: 多参数心脏磁共振不仅是在体诊断儿童急性心肌炎的“金标准”, 而且对心肌炎的危险分层、预后评估和随访有一定价值, 但现阶段还存在诸多问题; 新的心脏磁共振技术需要更多关于儿童群体研究的证据, 未来心脏磁共振快速扫描和智能化后处理一直会是研究的热点方向, 而非增强序列结合机器学习、影像组学等技术可能给对比剂禁忌的患儿带来希望。

PO-2602

脑室周围白质损伤患儿发生混合型脑瘫的预测模型的建立

黄婷婷、张刚

河南中医药大学第一附属医院

目的：建立脑室周围白质损伤（periventricular white matter injury, PWMI）患儿发生混合型脑瘫的预测模型。

方法：回顾性纳入 2015 年 9 月—2022 年 10 月在河南中医药大学第一附属医院经 MRI 诊断为 PWMI（6 个月-2 岁）并随访至 2 岁以后确诊为脑瘫的患儿，分为混合型脑瘫（痉挛型+不随意运动型）和痉挛型脑瘫组。采用上采样方法（Borderline-SMOTE 算法）对数据分布不平衡进行预处理（1:1 匹配）。基于 PWMI-MRI 征象建立评分系统，采用单因素及多因素 Logistic 回归分析筛选与 PWMI 混合型脑瘫相关的 MRI 征象并建立列线图模型。评估模型的区分度、校准度及绘制决策曲线评估模型的临床应用性。采用五折交叉及重复交叉验证进行内部验证。计算准确度、敏感度、特异度、阳性预测值和阴性预测值评估模型的诊断效能。采用 Spearman 相关性分析评估独立 MRI 变量与 GMFCS 的相关性。

结果：本研究共纳入 135 例 PWMI 脑瘫患儿，男 82 例，女 53 例，中位年龄 14（9-18）月，痉挛型脑瘫 100 例，混合型脑瘫 35 例。采用上采样方法对数据预处理后，痉挛型和混合型脑瘫组各 100 例。多因素 Logistic 回归分析发现丘脑腹外侧核（OR, 27.5; 95%CI: 8.293-90.942）、后壳核（OR, 13.7; 95%CI: 4.489-41.549）、海马（OR, 7.2; 95%CI: 1.702-30.813）及尾状核的损伤（OR, 5.8; 95%CI: 1.973-16.950）与混合型脑瘫相关。模型的 AUC 为 0.96（95% CI: 0.934-0.988），五折交叉及重复交叉验证的 AUC 分别为 0.95, 0.96；该模型具有良好的校准度（ $c2=3.712$, $P=0.529$ ）及临床应用性。合理性分析显示该模型与单一 MRI 征象相比，具有最高的诊断效能。模型的 4 个独立 MRI 征象均与 GMFCS 正相关（ $r=0.559$ 、 0.581 、 0.171 、 0.409 , P 均 <0.05 ）。

结论：本研究建立的模型可以早期准确的鉴别 PWMI 混合型和 PWMI 痉挛型脑瘫，有助于指导脑瘫的个体化干预。

PO-2603

人工智能在儿童骨龄影像评估的准确性与临床应用差异性的研究

张冀云¹、石潞²、尹建华¹、杨斌¹

1. 昆明市第一人民医院

2. 昆明医科大学第一附属医院

目的 探讨人工智能（AI）骨龄测量系统（TW3-RUS、Carpal、G-P 图谱法）评估儿童骨龄的准确性，与真实世界评估的差异性，分析差异形成的原因及探讨改良措施。

方法 回顾性收集 2021 年 8 月至 2023 年 8 月于昆明市第一人民医院行左侧手腕部 X 线正位片检查的 894 例儿童的影像资料。采用 AI 骨龄测评 TW3-RUS、TW3-Carpal 和 G-P 法对入组病例进行骨龄评估，得到 AI 骨龄。由 3 名高年资儿科影像医师依据 TW3-RUS、TW3-Carpal 和 G-P 法进行评估，所得骨龄结果的平均值作为金标准。根据金标准获得的骨龄以 3 岁为间隔进行分层，骨龄 1~3、4~6、7~9、10~12、13~15 和 16~18 岁的例数分别为 84、116、178、226、183、107 例。分别计算各年龄组骨龄结果与参考标准骨龄之间误差在 0.5 年内、1 年内及 2 年内的准确度，计数平均绝对误差 MAE 和均方根误差 RMSE。使用组内相关系数评估 AI 骨龄与金标准骨龄结果的一致性，计算 AI 评测骨龄与参考标准骨龄之间的一致性。

结果 整体样本中 AI 系统误差在 0.5 年内、1 年内及 2 年内的准确度分别为 81.2% (726/894)、89.6% (801/894)、93.9% (839/894)。MAE 分别为 0.410、0.494、0.530 年, RMSE 分别为 0.487、0.563、0.636 年。

各年龄段中, 误差<0.5 年、<1 年、<2 年的准确度分别为: 1~3 岁组 98.1%、100%、100%; 4~6 岁组 80.4%、87.5%、92.2%; 7~9 岁组 78.8%、85.4%、91.7%; 10~12 岁组 83.2%、91.4%、93.6%; 13~15 岁组 76.3%、81.7%、85.8%和 16~18 岁组 90.7%、97.6%、98.2%。

结论 AI 骨龄测量结果具有良好的可靠性与准确性, 但实际临床应用中仍需要人工调校及进一步深度学习; 在各年龄分段 1~3 岁及 16~18 岁年龄组无明显差异 ($P>0.05$), 4~6 岁、7~9 岁、10~12、13~15 岁年龄组有统计学差异 ($P<0.05$)。

PO-2604

基于模糊聚类算法的早产儿 PWMD 的 MRI 影像组学及相关危险因素分析

王小飞、郝跃文、孙欢、陈超
西安市儿童医院

目的: 探究早产儿应用模糊聚类算法 (FCM) 分析其发生局灶性脑白质损伤 (PWMD) 的磁共振 (MRI) 特征并进一步明确影响因素。

方法: 从本医院 2020 年 2 月-2022 年 2 月期间新生儿科入住的早产儿中筛选 100 例深入调查, 根据 PWMD 的发生情况分为 PWMD 组、单纯早产组, 每组均为 50 例。所有早产儿进行 MRI 检查并分析其影像特征变化、ADC 值差异, 收集研究对象的临床信息并多因素回归分析早产儿发生 PWMD 的影响因素。

结果: 首次 MRI 检查点状、簇状、线状损伤例数分别为 28 例、12 例、10 例, MRI 复查点状损伤病灶完全消失, 簇状、线状损伤患儿中发展为 PVL 的比例分别为 33.33%、40.00%。PWMD 组患儿的病灶区域 ADC 值对比单纯早产组明显降低 ($P<0.05$)。PWMD 组具有更高比例的呼吸窘迫、低出生体重、胎膜早破、呼吸道感染且均是发生 PWMD 的危险因素 ($P<0.05$)。

结论: 早产儿发生 PWMD 后为点状、簇状、线状 T1 高信号 MRI 表现, 患儿的 ADC 值呈降低趋势变化, 呼吸窘迫、低出生体重、胎膜早破、呼吸道感染是引发早产儿发生 PWMD 的危险因素, 应将存在危险因素的早产儿作为临床 MRI 诊断的重点对象。

PO-2605

脑损伤新生儿前额叶脑 γ -氨基丁酸与谷氨酸代谢改变研究

惠丽红¹、林良杰²、闫晨宇¹、张勇¹
1. 郑州大学第一附属医院
2. 飞利浦医疗科技

目的: 神经递质对维持正常的大脑功能至关重要, 脑损伤新生儿脑内生化代谢会出现一些列改变, 本研究旨在探索脑损伤新生儿前额叶皮层脑内 γ -氨基丁酸与谷氨酸的变化, 进一步探讨脑损伤发病机制。资料与方法: 招募郑州大学第一附属医院 11 例有脑损伤病史新生儿 (组 1, 孕周为 28-38) 及 7 例无脑损伤病史新生儿 (组 2, 孕周为 28-40 weeks), 进行 3.0T MR (Ingenia Meta, Philips Healthcare)扫描, 早产儿在纠正胎龄 38-40 周进行扫描。扫描序列包括脑常规扫描, 3D T1WI 及使用 J-差异编辑技术(J-difference edited point-resolved spectroscopy,MEGA-PRESS)的 MRS 扫描 (TR = 8.2 ms; TE = 3.7 ms; 层厚 = 1 mm; FOV = 24x24 cm²; and flip angle = 8°.), MRS 体素置于胼胝体膝部前上方前额叶中线旁。使用 Gannet 软件对 MEGA-PRESS 波谱进行数据分析, 测量

结果以肌酸(Creatine,Cr)作为参照物,用独立样本 t 检验分析两组间 GABA+/Cr、Glx/Cr 值的差异并进行分析。**Result:** 2 例脑损伤新生儿及 1 例正常新生儿扫描时头动,图像有伪影被排除。5 例脑损伤新生儿脑常规 MR 显示脑内异常信号,包括脑室内出血和/或白质损伤。所有组 2 新生儿常规脑 MR 均显示无异常。组 1 患儿测量脑内 Glx [Cr]平均水平 高于组 1 新生儿,且有统计学意义(0.101 ± 0.128 vs. 0.084 ± 0.007 , $p = 0.00$)。两组间 GABA[Cr]水平无明显差异。结论: MEGA-PRESS 波谱技术可以用来进行观察脑损伤新生儿脑内代谢改变情况,为脑损伤的诊断及预后评估提供一种新的技术方法。

PO-2606

基于 CT 多模态技术在降低儿童先天性心脏病 CTA 辐射剂量上的应用价值

姜文龙

空军军医大学西京医院

目的:多模态技术为等中心、低管电压、低管电流联合迭代重建以及大螺距技术,探讨多模态技术在降低儿童先天性心脏病 CTA 辐射剂量中的价值。方法:收集 2022 年 1 月至 2022 年 12 月来我院行双源 CT 血管造影并经手术证实的先天性心脏病患儿 54 例,采用前瞻性随机对照研究,随机分多模态组(A 组)、常规组(B 组),各 27 例,比较两组的图像质量、有效辐射剂量及诊断效能。结果:A 组和 B 组平均有效辐射剂量分别为 (0.31 ± 0.06) mSv、(0.52 ± 0.06) mSv,差异有统计学意义 ($P < 0.05$),A、B 两组噪声、SNR、CNR,后者优于前者($P < 0.01$)。A、B 两组主观质量评分 4.27 ± 0.59 分、 4.36 ± 0.57 分,差异无统计学意义($P = 0.46$),主观评分一致性 ICC 较好($ICC = 0.77, 0.96$)。A、B 两组诊断患儿先心病的效果上无差别 ($P < 0.01$)。结论:在保证图像质量以及满足临床诊断需求情况下,多模态扫描技术可降低患儿的辐射剂量。

PO-2607

儿童新型冠状病毒感染相关急性坏死性脑病的影像学表现及预后分析

郭乔、郝跃文

西安市儿童医院

目的:总结分析儿童新型冠状病毒感染相关急性坏死性脑病 (ANE) 的影像学特征,探讨其对临床的指导价值。

方法:回顾性分析 2022 年 12 月至 2023 年 5 月西安市儿童医院收治的 7 例新型冠状病毒感染相关急性坏死性脑病患儿的影像学及临床资料。首次影像检查中,所有患儿均行颅脑 MRI 检查,其中 6 例行 DWI 检查,1 例行 MRS 检查。MRI 检查随访中,1 例死亡,6 例接受 1 次短期随访 ($< 14d$),4 例接受 1~3 次长期随访 ($> 14d$)。影像学检查重点观察丘脑、脑干、脑白质和基底节区等部位,以及整个随访过程中是否有出血及软化灶形成。

结果:7 例患儿中,男 6 例,女 1 例,发病年龄 4 岁 (10 个月~14 岁),均为急性起病,病史 1~3d,均有高热 ($\geq 39.6^{\circ}\text{C}$)、抽搐及意识障碍等临床表现,新型冠状病毒核酸及抗原检测均为阳性,其中 1 例既往有病毒性脑干脑炎病史,1 例有小脑发育不良病史,1 例出生时曾因“低体重、新生儿肺炎”住院治疗。6 例 ANE 患儿显示对称性、多灶性颅内病变,均累及双侧丘脑,其他对称病变部位包括大脑白质 (6 例)、基底节区 (5 例)、脑干 (4 例)、小脑 (3 例)、胼胝体 (1 例)。不对称病灶 1 例,病灶位于右侧丘脑、右侧基底节区及双侧侧脑室周围白质。1 例行磁共振波谱成像显

示病灶区 NAA 峰明显减低。典型的颅脑 MRI 征象为双侧对称性丘脑坏死、出血，在表观扩散系数 (ADC) 图上表现为“同心/层状结构”、“三色模式”或“靶样图形”。起病至末次随访时间为 21~39d，至末次随访，1 例死亡，2 例预后不良 (Glasgow 昏迷评分 < 8 分)；4 例预后良好 (Glasgow 昏迷评分 ≥ 9 分)。MRI 检查随访发现，脑干受累、出血及脑软化可能提示不良预后。

结论：儿童急性坏死性脑病可发生于新型冠状病毒感染的急性期，既往有神经系统基础疾病的患儿更容易出现新型冠状病毒感染的神经系统受累，早期颅脑影像学改变是诊断的重要依据，在 ADC 图上双侧丘脑表现为“三色模式”或“双色模式”等典型的影像学特征，脑干受累、出血、脑软化可能提示不良预后。

PO-2608

MRI-DTI 在脑发育迟缓中的诊断价值

白璠
柳州市妇幼保健院

[摘要]目的：通过对三组发育异常患儿进行 MRI 常规序列和弥散张量成像 (DTI) 的扫描，应用 DTI 技术对患儿感兴趣区各向异性分数进行差异性分析，并对比 MRI 常规序列及 DTI 序列对脑髓鞘化异常的阳性检出率，探讨磁共振-弥散张量成像 (MRI-DTI) 对脑发育迟缓的诊断价值。方法：抽取 2022 年 1 月至 2023 年 6 月期间在我院临床诊断为发育迟缓患儿共 30 例，分为语言发育迟缓 15 例、运动发育迟缓 13 例及脑性瘫痪 2 例共三组，全部进行 MRI 常规序列及弥散张量成像 (DTI) 检查。应用 DTI 技术对患儿感兴趣区各向异性分数进行差异性分析，并对比 MRI 常规序列及 DTI 序列对脑髓鞘化异常的阳性检出率。结果：观察语言发育迟缓组 11 例、运动发育迟缓组 13 例、脑性瘫痪组 2 例，其中 DTI 序列在各组的阳性率分别为 90%、76.9%、100%，较 MRI 常规序列在相同分组中的阳性率高，有统计学意义 ($P < 0.05$)。非发育迟缓患儿 MRI 检查可见脑白质 T1 信号略高于灰质，T2 高信号白质略低于灰质，脑脊液呈 T1 低信号、T2 高信号，脑白质纤维束正常；发育迟缓患儿 MRI 检查可见明显髓鞘化延迟，左侧颞部神经纤维束较右侧稀疏，右侧皮质脊髓束较左侧略稀疏；双侧额、枕部神经纤维束略稀疏，右额叶局部纤维束较左侧稍稀疏；脑白质稍减少，桥脑、两侧大脑半球纤维束略稀疏；双侧大脑半球神经纤维束稍稀疏；右侧额叶及左枕叶神经纤维束较对侧略稀疏，右侧额叶局部神经纤维束不连续。DTI 图可见病灶附近纤维束受压甚至断裂。结论：弥散张量成像 (diffusion tensor imaging, DTI) 在诊断儿童脑发育迟缓中的价值较 MRI 常规序列更高。

PO-2609

传统尸检与基于 7.0 T MRI 影像学虚拟尸检在死胎和胎儿畸形的表型特征描述中的比较

杜明珊、蔡萍、甄志铭、张雨涵、王利梅、陈伟
陆军军医大学第一附属医院 (西南医院)

目的：基于死产儿和畸形胎儿的表型特征及父母接受程度，将运用超高场 (7.0T) MRI 成像技术的虚拟尸检与传统尸检进行比较。

方法：试验采用前瞻性观察性研究，收集 2022 年 6 月到 2023 年 6 月我院死产和怀孕 ≥ 20 周时因胎儿畸形而终止妊娠的数据，并获得父母对常规尸检和超高场 (7.0T) 磁共振影像学尸检的同意。常规尸检前先进行全身超高场 (7.0 T) 核磁共振成像检查。以常规尸检作为诊断的金标准，单独或结合其他微创产前和死亡后检查，评估和比较死后超高场 (7.0 T) MRI 表现的诊断准确性。

结果：22 例常规尸检和磁共振影像学尸检均征得父母同意，其中 1 例因严重变形被排除，21 例纳入分析。18 例 (85.7%) 影像学尸检结果与传统常规尸检结果一致。以传统常规尸检为标准，超高场

(7.0 T)MRI 影像学尸检的敏感性、特异性、阳性预测值和阴性预测值分别为: 全身 81.7%、97.2%、96.7%和 98.1%; 神经系统 94.2%、99.1%、93.2%和 99.6%; 心血管系统 76.7%、100.0%、100.0%和 98.7%; 肺部 93.1%、100.0%、100.0%和 98.3%; 腹部 91.6%、99.8%、95.8%和 97.9%; 肾脏 96.8%、100.0%、100.0%和 99.7%; 肌肉骨骼系统 80.7%、100.0%、100.0%和 97.4%。97.9%的家庭接受超高场(7.0 T)磁共振影像学虚拟尸检, 而 81.5%的家庭接受传统尸检。结论: 当父母拒绝传统尸检时, 使用死后磁共振(MRI)影像学尸检和其他微创检查的虚拟尸检可以成为传统尸检的一种可接受的替代方案。死后磁共振(MRI)影像学尸检更容易被父母接受, 且可以为大脑和脊髓畸形提供额外的诊断信息。

PO-2610

基于 3D-FIESTA 信号强度对自发性脑脊液耳漏与分泌性中耳炎鉴别诊断研究

王冬、郝跃文、魏思文、白慧萍、胡文、侯欣、陈超、张鹏
西安市儿童医院

背景: 儿童内耳畸形合并脑脊液耳漏, 多表现为反复发作的化脓性脑膜炎, 有较高的致残率及致死率, 此类患儿均伴有中耳积液, 需与儿童常见的分泌性中耳炎所致的中耳积液相鉴别。

目的: 探讨三维稳态进动快速成像 (3D-FIESTA) 序列对儿童内耳畸形并自发性脑脊液耳漏与儿童分泌性中耳炎的鉴别诊断价值。方法: 回顾性分析 2019 年 1 月至 2023 年 8 月西安交通大学附属儿童医院经手术证实的 15 例内耳畸形并自发性脑脊液耳漏患儿(耳瘘组)与 25 例经临床诊断的分泌性中耳炎患儿(中耳炎组) 3D-FIESTA 图像, 测量两组中耳乳突蜂房、鼓室、前庭、脑桥的 FIESTA 信号强度, 并以脑桥的信号强度计算信号强度比值 (SIR), 两组间计量资料的比较采用 Mann-Whitney U 检验。结果: 耳瘘组 乳突蜂房/脑桥 SIR: 6.10(5.62 7.27), 中耳炎组 乳突蜂房/脑桥 SIR: 3.30(2.60 3.60), 耳瘘组 鼓室/脑桥 SIR: 6.30(5.72 7.01), 中耳炎组 鼓室/脑桥 SIR: 3.40(2.30 3.70), 两组有显著统计学差异 ($p<0.001$); 耳瘘组 前庭/脑桥 SIR: 6.25(5.00 7.00), 中耳炎组 前庭/脑桥 SIR: 6.40(5.90 6.95), 两组无显著统计学差异 ($p=0.466$); 耳瘘组 前庭/脑桥 SIR: 6.25(5.00 7.00), 耳瘘组 乳突蜂房/脑桥 SIR: 6.10(5.62 7.27), 两组无显著统计学差异 ($p=0.325$); 耳瘘组 鼓室/脑桥 SIR: 6.30(5.72 7.01), 耳瘘组前庭/脑桥 SIR: 6.25(5.00 7.00), 两组无显著统计学差异 ($p=0.478$)。结论: 内耳畸形并自发性脑脊液耳漏患儿(耳瘘组)中耳乳突蜂房、鼓室 FIESTA 信号强度明显高于分泌性中耳炎患儿(中耳炎组), 耳瘘组患儿前庭 FIESTA 信号强度与中耳乳突蜂房、鼓室信号强度无明显差异, 三维稳态进动快速成像 (3D-FIESTA) 序列对于鉴别上述两种疾病有重要价值。

PO-2611

儿童腹部结外淋巴瘤的影像学表现

宋修峰
青岛市妇女儿童医院

【目的】提高对儿童首发于腹部实质性脏器、胃肠道、腹膜淋巴瘤的影像学表现的认识。

【方法】回顾性分析在本院手术或穿刺活检病理证实的 20 例腹腔淋巴瘤的 CT 及 MRI 表现。

【结果】患儿年龄 2-13 岁, 全身症状重, 进展较快, 发热、盗汗、贫血、乏力多见, 腹腔淋巴瘤多数为 NHL。肝脏淋巴瘤 CT 可单发或多发, 平扫呈等或稍低密度, 多为门静脉周围密度均匀软组织肿块影。MRI T1WI 上呈稍低信号, T2WI 上呈稍高信号, DWI 弥散受限呈高信号, 可见到胆管

在内穿行。增强 CT: 淋巴瘤为典型乏血供肿瘤, 呈进行性轻至中度延迟强化, 强化相对均匀; 部分肿瘤内可见血管形态相对正常的肝脏固有血管, 形成所谓“血管漂浮征”。

肾脏淋巴瘤常多发 (50%~60%), 通常为双侧, 也可单侧, 表现为多发异常结节灶, CT 为等-低密度, MRI 为稍长 T1, 稍长 T2 信号灶, DWI 呈高信号; 增强扫描轻度不均匀强化; 约 20% 肾淋巴瘤表现为双肾弥漫性增大外形正常, 增强扫描可见多发边界模糊之浸润灶。

胰腺淋巴瘤可分为局限肿块型, 极少发生胰管扩张; 弥漫浸润型为腺体增大, 胰周脂肪不规则浸润, 类似于急性胰, 腺炎的表现。CT: 均匀低密度肿块, 呈轻度均匀强化。MRI: T1WI 呈低信号, T2WI 呈等或高信号, DWI 呈明显高信号。增强轻度强化。

脾脏淋巴瘤可分为均匀弥漫型、粟粒结节型、多发肿块型、孤立肿块型。增强呈均匀轻度强化。

胃肠道淋巴瘤: 管壁弥漫性或局限性增厚, 可多节段受累, 呈均匀较低密度, 表面光滑; 肠腔可不变窄, 甚至呈“动脉瘤样”扩张, 此为肠道淋巴瘤的特异性征象, 一般无肠梗阻。增强后肿瘤轻中度均匀强化, 表面粘膜可呈明显线样强化。

腹膜淋巴瘤影像表现为腹膜、大网膜及肠系膜病变; 90% 左右见腹膜增厚, 常有腹水; 其原发灶常为胃肠道, 实质性脏器受累常见; 腹腔和腹膜后淋巴结肿大常见。

【结论】儿童淋巴瘤较成人更易侵犯淋巴结外组织, 儿童首发于腹部的淋巴瘤临床并不少见, 影像学表现有其特征性, 掌握腹腔结外淋巴瘤的影像学表现对协助临床早期诊疗有重要意义。

PO-2612

儿童 SAPHO 综合征临床及影像学表现

宋修峰

青岛市妇女儿童医院

【目的】提高对 SAPHO 综合征临床及影像学表现的认识。【方法】对我院一例 13 岁男性 SAPHO 综合征患者个案报道并文献复习。【结果】患者右上臂及右膝关节疼痛 1 周, 发热 2 天。8 月前面部、后颈部反复出现少量痤疮。2 月前痤疮大量增多, 分布于颈部、前胸及后背, 皮疹顶端有脓点、脓疱。血常规示血象略高, C 反应蛋白增高, 血沉增快。MRI 显示右肩关节、右膝关节滑膜炎并积液, 右肱骨、右胫骨、右腓骨骨髓炎。CT 显示右侧锁骨近端骨质增生肥大, 骨膜增生, 胸锁关节破坏。滑膜炎(synovitis)、痤疮(acne)、脓疱病(pustulosis)、骨肥厚(hyperostosis)和骨髓炎(osteomyelitis)综合症简称 SAPHO 综合征, 是主要累及皮肤骨和关节的一种慢性疾病。发病年龄以青年和中年多发, 发病年龄最小 10 岁, 最大 59 岁。女性报道稍多于男性。实验室检查: C-反应蛋白增高, 类风湿因子阴性。白细胞计数和血沉可正常或稍高, RF 和 ANA 阳性, HLA-B27 约 30% 阳性。

影像学表现: CT 及 MRI 对本病滑膜炎和骨炎的早期诊断有很大意义。90% 的患者出现骨关节病, 可累及中轴骨及外周骨, 主要表现为滑膜炎、骨肥厚和骨炎。骨炎常累及骨皮质、骨髓腔或者同时累及两者, 但是典型病变是累及胸骨上端, 锁骨内端及第一对肋软骨的骨质硬化和骨肥厚。胸骨为 62%, 其次为髌髌关节(33%), 脊柱(24%), 周围骨(19%), 周围关节(10%); 81% 的病人有两处以上病变, 同时可伴有关节周围炎症。52%~66% 的病人有掌跖脓皮病, 14%~15% 的病人有痤疮, 9%~24% 的病人有银屑病。皮肤病变可发生在骨关节病之前或之后。儿童患者相对于成人患者来说, 多数都有较明显的皮肤改变; 骨髓炎多累及四肢骨, 骨髓炎及骨膜反应更明显。

本病预后良好。本病进展缓慢, 无明显的致残性, 无严重的并发症发生。大部分病例为自限性, 疾病平均持续时间约 4-5 年。【结论】SAPHO 综合征临床及影像表现典型, 学习了解此病后对此病多数可做出正确的诊断。

PO-2613

儿童智力障碍患者的多需求网络静息态功能连接改变的初步探索

母芳芳¹、李仕广^{1,2}

1. 遵义医科大学第三附属医院 (遵义市第一人民医院)

2. 贵阳市第二人民医院 (金阳医院)

目的: 儿童智力障碍 (ID) 的显著特征是智力受损和适应功能障碍, 而正常智力活动涉及到一组广泛分布式大脑区域, 即多需求 (MD) 网络。目前还没有任何研究探讨 ID 儿童关于 MD 网络的功能连接 (FC) 情况。本研究对 ID 儿童 MD 网络的静息态 FC 变化进行分析, 探索 ID 儿童的异常大脑连接模式。

方法: 招募在我院就诊的 ID 儿童 41 例为研究对象, 同时匹配 33 名健康儿童为对照组, 依次进行 3D-T1WI、rs-fMRI 数据采集, 并采用中国韦氏儿童智力量表进行智力评估。通过基于 MATLAB 的 DPABI 软件包对 MRI 数据进行预处理, 提取标准图谱左侧大脑半球中的 MD 脑区作为感兴趣区, 分别构建每个受试者 MD 网络的 FC 矩阵, 并将 MD 内节点划分为不同功能脑网络, 比较 ID 组和对照组的组间差异 ($P < 0.05$, FDR 校正), 年龄、性别和头动作为协变量。分析差异性脑区的平均 FC 与 IQ 之间的偏相关性。

结果: 与正常对照组相比, ID 儿童整体 MD 网络的 FC 广泛减低 ($t = 7.38$, $p < 0.001$)。在 MD 网络内连接分析中, ID 组在背侧注意网络中的差异最大 ($t = 8.36$, $p < 0.001$), 其次是额顶网络 ($t = 6.15$, $p < 0.001$) 和扣带岛盖网络 ($t = 6.02$, $p < 0.001$)。在 MD 网络间连接分析中, ID 组的扣带岛盖网络与背侧注意网络之间的 FC 差异最大 ($t = 8.00$, $p < 0.001$), 其次是背侧注意网络与额顶网络 ($t = 7.84$, $p < 0.001$)、默认模式网络与背侧注意网络 ($t = 7.42$, $p < 0.001$), 而默认模式网络与额顶网络之间的差异相对较小 ($t = 5.50$, $p < 0.001$)。相关性分析显示, ID 儿童的平均 FC 与 IQ 呈负相关 ($r = -0.22$, $p = 0.19$), 正常对照组的平均 FC 与 IQ 呈正相关 ($r = 0.27$, $p = 0.15$)。

结论: 本研究发现, ID 儿童 MD 网络的 FC 模式与正常发育儿童明显不同。MD 网络整体 FC 广泛减低、MD 网络内 (特别是背侧注意网络) 和网络间 (主要涉及扣带岛盖网络和背侧注意网络) 连接改变, 可能是 ID 儿童的神经影像学特征。此外, MD 网络的平均 FC 的变化在预测智力受损程度方面具有一定的应用价值。

PO-2614

10 周胎儿脑发育结构的 9.4T MRI 与组织学切片对照研究

张忠和

山东第一医科大学附属省立医院

目的 探讨 10 孕周胎儿脑发育结构的 9.4T 超高场强 MRI 及其与组织病理学图像的对应关系。 **方法** 6 具 10 孕周发育正常的自发性流产胎儿标本为研究对象。使用 9.4T MR 扫描后得出 MRI, 然后进行切片染色得出组织病理学图像, 对比两者显示的层状结构、侧脑室、小脑等, 并进行三维重建观察脑组织结构及形态。 **结果** 10 孕周胎儿脑层状结构在 9.4T MRI 上显示为 4 层, 组织病理学图像则显示为 6 层, 其中侧脑室层、皮质层、边缘层在 MRI 与组织病理学图像可清晰显示; MRI 所显示的混合的室周层、室下层、中间层、皮质下层于组织病理学图像上进一步显示为室周层, 混合的室下层、中间层, 皮质下层。MRI 显示侧脑室内脉络丛表现为三层, 边缘呈低信号, 中间呈稍低信号, 中心呈更低信号; 组织病理学图像亦表现为三层, 边缘为上皮细胞, 中间为结缔纤维基质, 中心为血管组织; MRI 形态学特点与病理图像对应。小脑表面光滑, MRI 呈低信号, 无法具体显示各层, 组织病理学图像各层结构显示清晰, 由内至外为中间层、分子层、颗粒前体细胞层。脑组织结构经三维重建可直观显示其形态、位置及毗邻关系。10 孕周胎儿脑体积较小, 脉络丛位于侧脑室内, 侧脑室外为层状结构及大脑半球, 小脑位于中脑后方, 局部与中脑相连。侧脑室及脉络丛占比

例大, 脉络丛占侧脑室体积的 40.4%, 侧脑室占大脑半球体积的 46.1%。 结论 10 孕周胎脑尚处于发育的早期阶段; 9.4T MRI 与组织病理学图像对照显示有很好的-致性; 两者结合并三维重建可以更好的揭示 10 孕周胎脑结构的特点。

PO-2615

基于扩散张量成像技术的学龄前儿童孤独症谱系障碍患者脑白质纤维束异常分析

王龙伦、丁爽、蔡金华
重庆医科大学附属儿童医院

目的 探讨学龄前儿童孤独症谱系障碍 (ASD) 患者脑白质纤维束变化, 并分析其与儿童孤独症评定量表 (CARS) 评分的相关性。

方法 前瞻性招募 56 例学龄前儿童 (2~6 岁) ASD 患者作为 ASD 组, 以及 56 例年龄、性别相匹配的发育正常儿童作为健康对照组 (HC 组) 进行 DTI 检查, 根据约翰霍普金斯大学人类白质纤维束图谱, 将大脑白质组织分割为 48 条公认存在的粗大纤维束, 应用 FSL 软件计算每一个被试者每一条白质纤维束的 4 项平均弥散属性: 即各向异性分数 (FA)、平均扩散系数 (MD)、轴向扩散系数 (AD)、径向扩散系数 (RD), 采用双样本 t 检验比较组间 DTI 参数的差异, 将差异有统计学意义的扩散指标与 CARS 评分进行 Pearson 相关分析。

结果 ASD 患儿的双侧皮质脊髓束、双侧下纵束、双侧上纵束、左侧扣带束、双侧丘脑后辐射束的 FA 值较正常对照组降低; 左侧皮质脊髓束、左侧扣带束、双侧内侧丘系纤维束的 AD 值较正常对照组降低。ASD 患儿的双侧皮质脊髓束、右侧下纵束、左侧扣带束的 MD 值较对照组升高; 双侧皮质脊髓束、右侧丘脑后辐射束、双侧下纵束、右侧上额枕束的 RD 值较对照组升高。双侧上纵束、下纵束的 FA 值与 CARS 评分呈负相关。右侧下纵束、左侧皮质脊髓束的 RD 值与 CARS 评分呈正相关。

结论 学龄前 ASD 患者的白质纤维束结构不完整, 存在微观结构的损伤, 这些白质纤维束的异常发育可能与 ASD 患儿的异常行为 (社交障碍、语言障碍和重复刻板行为) 有关, 双侧上纵束、下纵束的 FA 值在一定程度上能反映疾病的严重程度

PO-2616

3D MERGE 在胎儿脊柱评估中的临床应用价值

李权
华中科技大学同济医学院附属武汉儿童医院

目的: 探讨三维多回波恢复梯度回波 (three-dimensional multiple-echo recalled gradient echo, 3D MERGE) 序列在胎儿脊柱成像中的临床应用价值。方法: 回顾性分析 2018 年 12 月—2020 年 1 月武汉儿童医院 47 例胎儿脊柱 MRI 的影像资料, 孕周 18W-37W。所有病例均通过二维稳态采集快速成像 (two-dimensional fast imaging employing steady-state acquisition, 2D FIESTA) 和 3D MERGE 序列对胎儿脊柱进行成像并分别对两种序列胎儿脊柱的颈、胸、腰骶段图像质量进行 4 分法评分, 采用 Kappa 检验对不同医生评分的一致性进行评估。使用 SPSS 24.0 软件进行统计学分析脊柱颈、胸、腰骶段的成像质量差异性。根据两个序列评分的差值绘制散点图, 根据散点图结果以 28 孕周为界, 分别统计颈、胸、腰骶段图形质量的差异性。结果: 1、两名医师的对两个序列颈、胸、腰骶段的评分一致性良好; 2、3D MERGE 序列在颈段、胸段、腰骶段评分均高于 2D FIESTA, 差异均具有统计学意义 (p 均 < 0.01), 且在颈段优势更明显; 3、差值散点图显示 3D MERGE 序

列评分整体高于 2D FIESTA 序列,且在 28 周及以前评分差值更大;4、两序列评分在大于 28 周时,颈段评分有显著差异($p<0.01$),胸、腰骶段评分无显著差异,在小于等于 28 周时,颈、胸、腰骶段评分均有显著差异($p<0.01$)。结论:与 2D FIESTA 序列相比,3D MERGE 序列对于胎儿脊柱解剖及发育情况判断具有明显优势,尤其颈椎和 28 周及以前的胎儿全脊柱,3D MERGE 序列可以常规应用于胎儿脊柱成像。

PO-2617

特发性中枢性性早熟及单纯乳房发育患儿腺垂体形态学参数与促性腺激素水平的相关性研究

杨默然
安徽医科大学第二附属医院

目的 回顾性分析特发性中枢性性早熟 (central precocious puberty,ICPP) 及单纯性乳房发育 (premature thelarche, PT) 女童腺垂体正中矢状径高度、腺垂体正中矢状径前后长度、腺垂体正中冠状位高度、腺垂体正中冠状位宽及腺垂体体积大小与体内促性腺激素水平的相关性。方法 收集 2019 年 1 月至 2021 年 1 月安徽医科大学第二附属医院收治的经临床确诊的 150 例性早熟 (ICPP 组 82 例,PT 组 68 例) 的影像学检查资料(腺垂体正中矢状径高度、腺垂体正中矢状径前后长度、腺垂体正中冠状位高度、腺垂体正中冠状位宽度、腺垂体体积大小) 及体内促性腺激素水平包括空腹血清促卵泡刺激素(FSH)、促黄体生成素(LH) 及性激素激发试验刺激后 LH 峰值、FSH 峰值及 LH 峰值/FSH 峰值。分析两组性早熟女童腺垂体形态学指标、促性腺激素水平的组间差异及垂体形态学指标与激素水平的相关性。结果 ICPP 组女童的腺垂体体积、垂体各径线长度明显大于 PT 组,ICPP 组患儿的促性腺激素水平明显高于 PT 组;ICPP 组患儿腺垂体体积与 LH 基础值、FSH 基础值、LH 峰值、LH 峰值/FSH 峰值均呈正相关关系 ($P<0.05$),与 FSH 峰值无明显相关性;PT 组女童腺垂体体积与 LH 峰值呈正相关 (P 小于 0.05),与其他激素指标无明显相关性。结论 ICPP 女童与 PT 女童的垂体形态学具有明显差异性,中枢性性早熟腺垂体体积与促性腺激素水平密切相关,腺垂体形态学有助于性早熟的诊断及鉴别诊断,垂体 MR 平扫在性早熟研究中具有重要价值。

PO-2618

儿童不同部位淋巴瘤影像表现分析

石浩、郝仕娟、杨恒
昆明市儿童医院

目的结合文献分析和总结儿童不同部位淋巴瘤影像特点,并归纳与其他相应部位肿瘤相鉴别的影像学特征,从而减少临床误诊和漏诊。

材料与方法收集 2020 年至 2023 我院收治确诊淋巴瘤 24 例,对其影像特征和临床资料进行回顾性分析。

结果 24 例患者中,男性 14 例,女性 10 例,年龄在 2~13 岁,中位年龄 7 岁。3 例诊断为霍奇金淋巴瘤,21 例诊断为非霍奇金淋巴瘤。病理特点:儿童恶性淋巴瘤主要分为两种类型:霍奇金淋巴瘤(HL)、非霍奇金淋巴瘤(NHL),儿童 NHL 较 HL 发病率高,恶性度更高。不同发病部位淋巴瘤的影像特点:1.儿童颌面及颈部淋巴瘤:CT 平扫表现为均匀软组织密度肿块,边界清晰,呈分叶状,向外生长,较少侵及邻近肌肉、咽旁、颅底骨,可起源于咽淋巴环,或由腭扁桃体、咽后淋巴结及颈动脉鞘内淋巴结融合而成,增强扫描肿块呈均匀轻度强化,部分包块内可见少许低强化区。当颌面部淋巴瘤伴随骨质破坏时,淋巴瘤细胞主要侵犯骨髓及骨皮质,以软组织包块为主,

而无大范围骨皮质破坏；2.胸部淋巴瘤：CT 平扫前纵隔均匀同肌肉密度大肿块，可伴有多区域淋巴结肿大，胸膜增厚，胸壁软组织肿块及骨质破坏，部分可见胸腔及心包少量积液，增强扫描肿块轻中度强化，可见“血管漂浮征”、“头盔征”等，淋巴瘤的肺实质受累表现多样；3.腹部淋巴瘤：主要起源于肠壁，也常累及肠系膜和网膜，好发于远端回肠。CT 平扫为肠壁增厚型、动脉瘤样扩张型、肠腔内肿块型；肿块增强后轻度至中度强化，多数为均匀强化，或伴有不均匀强化区，可有系膜淋巴结、腹膜后淋巴结及远处淋巴结增大。

结论儿童淋巴瘤于全身各部位均可发生，不同部位淋巴瘤的影像学表现有差异。掌握其好发年龄、发病部位及影像表现对其定性及鉴别诊断具有重要意义。

PO-2619

儿童不同病原体感染相关坏死性脑病的影像学分析

石浩、林芳芳、张彦清

昆明市儿童医院

【目的】探讨儿童 2019 新型冠状病毒(2019 novel coronavirus, 2019-nCoV)感染及甲型流感病毒感染(influenza a virus)所致的坏死性脑病的流行病特征、临床特点及影像学表现，以提高影像医生对该疾病特征的认识水平。

【材料与方法】收集 2020 年至 2023 我院收治的新型冠状病毒感染(9 例)及甲型流感病毒感染(7 例)发生坏死性脑病的病例，回顾性分析其流行病特征、临床特点以及颅脑 CT 及 MRI 的影像学表现。【结果】1、新型冠状病毒感染流行病特征：年龄在 11 月~14 岁，中位年龄 3 岁，所有患者均有新型冠状病毒阳性感染者接触史，且鼻咽拭子核酸检测阳性；临床特点：以发热、惊厥、意识障碍及对称性多灶性脑损害为主要特征；影像学表现：灰质与白质均可受累，其主要分布在丘脑、脑干、侧脑室周围白质以及小脑的髓质；前驱期(早期)：病变部位主要表现为脑水肿；急性期(中期)：双侧丘脑病变在 MRI 各相中均为同心圆样改变；恢复期：大部分病灶萎缩、含铁血黄素沉着、囊腔形成等退行性改变。甲型流感病毒感染流行病特征：年龄在 8 月~10 岁，中位年龄 5 岁，所有患者均有甲型流感病毒阳性感染者接触史，且鼻咽拭子核酸检测阳性；临床特点：以发热、抽搐、呼吸困难、意识障碍为主要临床特征；影像学表现：灰质与白质均可受累，其主要分布在双侧丘脑、脑干、基底核、脑室周围白质及小脑；其 CT 表现主要是弥漫性脑水肿及脑沟内出血；MRI 表现为弥漫性皮质下白质细胞毒性脑水肿、全脑肿胀。【结论】新型冠状病毒感染及甲型流感病毒感染以发热、抽搐及意识障碍最常见，急性坏死性脑病是其重要的临床影像学表现，早期识别其特征性影像学表现并对其进行干预，能够有效减轻病程的进展、改善预后。

PO-2620

基于薄层 CT 影像组学联合临床参数预测儿童腺病毒肺炎后闭塞性细支气管炎

张黎、何玲

重庆医科大学附属儿童医院

目的：腺病毒肺炎是儿童感染后闭塞性细支气管炎(PIBO)最常见的原因。本研究旨在建立一个有效的预测儿童腺病毒肺炎后 PIBO 的模型。

方法：以 165 例腺病毒肺炎患儿为研究对象，根据临床随访结果将病例分为 PIBO (n=70) 及 non-PIBO (n=95) 两组。收集两组患儿的人口学特征、发热时长、住院时长、体温峰值、呼吸机使用时间、CT 检查、实验室检查结果等资料。所有患者按 7:3 的比例随机分为训练组和测试组。手动分割腺病毒肺炎薄层 CT 图像中的病变部位，提取影像组学特征。采用互信息(MI)、最小冗

余最大相关 (mRMR) 和最小绝对收缩与选择算子 (LASSO) 算法从训练组中确定最佳预测特征, 计算影像组学评分 (Radscore), 并构建影像组学模型。基于影像组学和临床模型构建联合预测模型, 包括逻辑回归 (LR)、随机森林 (RF) 和支持向量机 (SVM) 模型。通过受试者工作特征 (ROC) 曲线下面积 (AUC)、校准曲线和决策曲线 (DCA) 分析评价 3 种模型的性能, 并通过 Delong 检验、重分类改善指标 (NRI) 和综合判别改善指标 (IDI) 对 SVM 模型进行比较。结果: 从薄层 CT 图像上的感兴趣区共提取 2264 个影像组学特征, 筛选出 10 个最优特征构建影像组学模型。住院时长和肺炎病变叶数作为临床参数参与复合模型的构建。LR、RF、SVM 复合模型在训练组和测试组中的 AUC 分别为 0.946、0.890, 0.977、0.859, 0.971、0.885, 均显著高于影像组学模型和临床模型。SVM 模型校准曲线拟合度高, 决策曲线优于其他模型, 有利于临床应用。结论: 基于薄层 CT 的影像组学特征联合临床参数可能为预测儿童腺病毒肺炎后闭塞性细支气管炎提供一种有效的无创方法。

PO-2621

扩散峰度成像结合机器学习识别全面发育迟缓儿童

沈艳勇、赵鑫、张小安
郑州大学第三附属医院

目的 使用基于白质骨架的空间统计分析 (Tract-Based Spatial Statistics, TBSS) 方法结合扩散峰度成像 (diffusion kurtosis imaging, DKI) 探究全面发育迟缓儿童 (global developmental delay, GDD) 与健康对照儿童之间脑白质微结构的差异, 之后使用机器学习方法探究 DKI 在 GDD 诊断中的价值。

方法 采集 34 名 GDD 儿童和 44 名健康对照儿童的 DKI 数据。首先使用基于 Python 的 DIPY (<https://github.com/dipy>) 程序计算得到扩散峰度参数及其衍生的白质完整性 (white matter tract integrity, WMTI) 参数。之后使用 TBSS 方法探究扩散张量 (diffusion tensor, DT) 参数、DK 参数以及 WMTI 参数之间的差异, p 值经 FWE (family-wise error) 校正。有显著差异的参数使用 FSL 软件中的 fslmeant 函数提取, 之后经过主成分分析 (Principal Component Analysis, PCA) 筛选, 筛选后的数据输入 Logistic (LR) 回归和线性判别器 (Linear Discriminant Analysis, LDA) 两种机器学习模型, 两种机器学习模型均通过 R 构建, 通过自举重采样 (bootstrap-resampling) 方法进行验证。

结果 TBSS 的两组比较中, DK 参数和 WMTI 参数在两组之间具有广泛差异, 具体见图 1 和图 2。LR 和 LDA 两种机器学习模型均具有较高的诊断性能 (AUC 值分别为 0.806 和 0.809, 见图 3 和图 4)。

结论 DKI 可以检测 GDD 儿童的脑白质发育异常, 经过 TBSS 和 PCA 筛选后的扩散参数结合 LR 和 LDA 两种机器学习模型可以很好地诊断 GDD。

PO-2622

基于 MRI 建立并验证 6-24 月脑室周围白质损伤患儿发生脑瘫的预测模型: 一项多阅片者多病例研究

黄婷婷¹、张刚¹、杨健²
1. 河南中医药大学第一附属医院
2. 西安交通大学第一附属医院

目的: 建立并验证 6~24 月脑室白质周围损伤 (periventricular white matter injury, PWMI) 患儿发生脑瘫的预测模型, 并评估该模型的诊断效能。

方法: 回顾性纳入 2013 年 9 月~2021 年 9 月临床怀疑脑瘫并经 MRI 诊断为 PWMI 的多中心数据 (年龄为 6-24 月), 均随访至 2-5 岁待临床诊断确定。采用一家医院的数据构建模型, 另外三家医院的数据验证模型。基于 PWMI-MRI 征象建立评分系统, 构建 PWMI 患儿发生脑瘫的多因素 Logistic 回归模型。在训练集和验证集中评估模型的区分度、校准度及决策曲线分析。采用多阅片者多病例分析 (multireader multicase, MRMC) 评估模型的诊断效能, 计算 10 个中心的 18 位阅片者的平均准确度、敏感度及特异度。

结果: 本研究训练集 191 例, 男, 112 例, 中位年龄 14 月 (IQR: 10-18); 验证集 90 例, 男, 60 例, 中位年龄 14 月 (IQR: 10-18)。多因素 Logistic 回归分析发现: 内囊后肢 (OR: 6.53, 95% CI: 5.54-49.36)、半卵圆中心中央白质 (OR: 13.70; 95%CI: 3.17-53.49)、大脑脚 (OR: 4.76; 95%CI: 1.32-17.17)、丘脑 (OR: 4.76; 95%CI: 1.13-18.47) 及豆状核的损伤 (OR, 4.58; 95%CI: 1.13-18.47) 与脑瘫相关。该模型在训练集和验证集的 AUC 分别为 0.94 和 0.97, 并具有良好的校准度。在 MRMC 分析中, 18 位阅片者前后两次的平均 AUC 为 0.93vs 0.94 ($p=0.057$); 前后两次的平均敏感度均为 92.3% ($p=0.998$); 第 2 次的平均特异度高于第 1 次 (87.2% vs 90.8%, $p=0.009$)。第 2 次阅片者间的一致性高于第 1 次 ($kappa: 0.71$ vs 0.62), 第 2 次的阅片时间较第 1 次减少 (时间: 2.5 vs 3.1 分钟; $p=0.003$)。

结论: 本研究基于 MRI 征象建立的模型可以早期准确的预测 PWMI 脑瘫高风险患儿, 具有良好的预测及诊断效能, 有助于指导脑瘫的个体化干预。

PO-2623

基于 CT 影像组学的儿童肺炎支原体肺炎早期鉴别诊断的研究

郭晓辉^{1,3}、张景峰²、郑建军²、柴恩慈¹、戴琦²、冷少益²

1. 宁波市妇女儿童医院 (宁波市妇幼保健院) 放射科

2. 宁波市第二医院放射科

3. 宁波大学医学部

[摘要] 目的: 探讨基于 CT 影像及临床特征的儿童肺炎支原体肺炎 (MPP) 辅助诊断模型在早期鉴别儿童肺炎支原体与其他病原体引起的社区获得性肺炎 (CAP) 的应用价值。方法: 搜集 2020 年 10 月至 2023 年 4 月符合纳排标准的 303 例 CAP 患儿, 根据病原学诊断分为肺炎支原体组 ($n=128$) 和其他病原体组 ($n=175$), 对比组间临床特征及胸部薄层 CT 征象的差异; 将患儿以 7:3 比例随机分为训练集和验证集, 使用多因素回归分析来建立三种模型 (影像组学特征模型、临床特征模型、影像组学列线图)。最后, 绘制受试者工作特征曲线 (ROC), 计算曲线下面积 (AUC), 评价 3 种模型诊断不同病原体 CAP 的效能, 绘制出诺模图、校准曲线以及决策曲线。结果: 2 组病例的喘息、脉搏、淋巴细胞百分比 (LY)、血沉 (ESR)、B 型钠尿肽定量 (BNP)、实变均有统计学意义 ($P < 0.05$), 结合影像组学特征、临床特征结果建立的列线图在肺炎支原体肺炎和其他病原体肺炎之间具有较好的鉴别能力, 训练集中临床特征模型、影像组学特征模型及影像组学列线图的 AUC 分别为 0.90、0.89 及 0.93; 验证集中临床特征模型、影像组学特征模型及影像组学列线图的 AUC 分别为 0.82、0.88 及 0.91。结论: 基于 CT 影像组学列线图在早期鉴别儿童肺炎支原体肺炎与其他病原体肺炎方面具有较好的诊断效能, 单纯的影像组学特征模型对鉴别诊断具有较好的价值, 结合了临床资料的列线图的鉴别诊断效能得到了进一步提升, 可以辅助临床早期用药。

PO-2624

A multicentre study predicting drug resistance after mycoplasma pneumoniae in children based on computed tomography (CT) radiomic features

陈欣¹、赵磊磊²、何玲¹

1. 重庆医科大学附属儿童医院

2. 山东齐鲁儿童医院

Objective: The purpose of this study was to investigate the ability of radiomics features with machine learning based on CT images to predict drug resistance of mycoplasma pneumoniae in children. **Methods:** In this study, 157 patients with mycoplasma pneumoniae were included. According to the drug resistance, the cohort was divided into two groups: drug resistance group (n=69) and non-drug resistance (n=88). KNN and LR were used to build predictive models. **Results:** The AUC and F1-scores of KNN in the training set were 0.92 and 0.84, respectively, while those of KNN in the validation set were 0.82 and 0.63, respectively. The AUC and F1-scores of LR in the training set were 0.93 and 0.78, respectively, while those of LR in the test set were 0.69 and 0.7. **Conclusion:** Radiomics features extracted from CT images of mycoplasma pneumoniae are helpful to predict the drug resistance.

PO-2625

用药或未用药注意力缺陷多动障碍男性儿童丘脑体积改变

王长浩、沈艳勇、张晓雪、冯占起、杨喆璇、赵鑫

郑州大学第三附属医院

目的: 目前,有关注意缺陷多动障碍(ADHD)儿童大脑结构改变的研究主要集中在未用药时的全脑体积等。在本研究中,我们将研究扩展到用药 ADHD 男性儿童、未用药 ADHD 男性儿童以及健康对照组三组丘脑体积的改变。此外,我们还探讨了部分丘脑体积与 ADHD 男性儿童障碍严重程度之间的潜在联系。

材料与方法: 收集其中 28 例未用药 ADHD 男性儿童、15 例用药 ADHD 男性儿童以及年龄、性别相匹配的 30 例健康儿童资料,并要求所有男性 ADHD 儿童无其他并发症、年龄范围为 8-15 岁且均为右利手。收集所有 ADHD 患儿的注意力不集中指数、多动-冲动指数、ADHD 指数等量表情况。为了更加系统获得丘脑体积,使用 freesurfer 7.2.0 将两侧丘脑各细分为 25 个区域体积和丘脑的总体积。采用 R 语言进行统计分析。使用 R 中 shapiro.test 函数进行正态性检验;使用 leveneTest 函数进行方差齐性检验;使用 chisq.test 函数进行卡方检验。使用单因素方差分析或 Kruskal-Wallis H 秩和检验比较三组之间丘脑体积的差异。采用 Spearman 或 Pearson 相关分析将三组有差异的丘脑区域与 ADHD 量表进行相关分析。

结果: 与对照组相比,未用药 ADHD 男性儿童组左侧颞旁核、右侧腹后外侧体积增大,但用药 ADHD 男性儿童组与对照组、用药组无明显差异。与对照组相比,用药 ADHD 男性儿童组左侧外侧膝状核、左侧丘脑枕核的体积增大,但未用药 ADHD 男性儿童与对照组、未用药组无明显差异。上述有差异的丘脑区域与 ADHD 量表进行相关性分析均未发现显著的相关性。

结论: 这些发现表明,用药后 ADHD 男性儿童的部分丘脑体积与健康对照组相比相对增大,可能与服药后的丘脑体积代偿有关;未用药 ADHD 男性儿童的部分丘脑体积与健康对照组相比相对增大,可能提示丘脑对于 ADHD 疾病的发生机制存在一定的影响。

PO-2626

The relationships among neural activity and connectivities, peripheral GABA and dopamine levels, and appetite and weight disturbance in major depression

Zhipeng Guo, Dan Liao, Chunhong Liu

Beijing Hospital of Traditional Chinese Medicine, Capital Medical University

Objective

MDD is characterized by dysfunction in neurotransmission that involves 5-HT, DA, and GABA, which have major influence on brain circuits. This study sought to compare hyperphagic MDD and hypophagic MDD based on correlation between brain activity or connectivity and neurotransmitter levels.

Methods

In Study 1, a longitudinal study was conducted among 19 first-episode, treatment-naïve patients with MDD at baseline and after a 6-week follow-up to investigate regional fluctuation and interhemispheric interactions. Correlational analyses were performed among regional homogeneity (ReHo), voxel-mirrored homotopic connectivity (VMHC), and peripheral neurotransmitters. In Study 2, support vector machine (SVM) was applied to examine the validity of the findings in discriminating the 43 patients with hyperphagic MDD and 41 patients with hypophagic MDD.

Results

In Study 1, significant correlations emerged between DA levels and ReHo in the hippocampus of patients with MDD at baseline. The ReHo reduction was marginally associated with increase in DA level. The VMHC in bilateral supplementary motor area reductions was positively correlated with increase in GABA level. In Study 2, SVM results showed that ReHo in the right hippocampus could distinguish hyperphagic MDD from hypophagic MDD at an accuracy of >0.6. The VMHC of the bilateral supplementary motor area and mid-insula confirmed the validity of the findings as distinctive imaging markers to differentiate hyperphagic MDD from hypophagic MDD.

Conclusions

These findings imply that hyperphagic MDD is associated with deficits in DA and GABA-related reward circuits and multiple functional areas. Future investigations may identify specific neurotransmitter markers predicting hyperphagic MDD onset.

PO-2627

Nomograms based on clinical and imaging parameters help predict progress and outcome after concurrent chemoradiotherapy in patients with locally advanced cervical cancer

Yu Zhang

The First Affiliated Hospital of Anhui Medical University

Purposes: To investigate the value of nomograms based on clinicopathological prognostic factors, apparent diffusion coefficient (ADC) and MRI-derived radiomics in predicting early efficacy, progression-free survival (PFS) and overall survival (OS) after concurrent chemoradiotherapy (CCRT) for patients with locally advanced cervical cancer (LACC).

Methods: Data from 572 patients with IB2-IVA cervical cancer treated with CCRT at our hospital from March 2013 to March 2020 were retrospectively analyzed and randomized 2:1 into training and test groups. Values of ADC_{min}, ADC_{mean}, ADC_{max} (from ADC map) and texture parameters (from DWI, T2WI and T2WI-FS) for the whole lesion were measured in all patients. The LASSO

algorithm and Logistic regression analyses were used to select texture features and calculate radiomics score (Rad-score). The multivariate Logistic and Cox regression analyses were used to construct nomogram models for predicting early efficacy, PFS and OS after CCRT in patients with LACC, with internal and external validation.

Results: Tumor diameter, external irradiation dose, ADCmean, and Rad-score1 were independent prognostic factors for early efficacy of CCRT and formed model1 with AUC of 0.848. Clinical stage, total irradiation dose, ADCmin, and Rad-score2 were independent prognostic factors for PFS and formed model2 with AUC of 0.877, 0.907, 0.864 for predicting 1-year, 3-year, 5-year PFS respectively. Squamous cell carcinoma antigen, external irradiation dose, ADCmin and Rad-score3 were independent prognostic factors for OS and formed model3 with AUC of 0.902, 0.885, 0.868 for predicting 1-year, 3-year, 5-year OS.

Conclusion: The nomograms based on clinical parameters, ADC values and radiomics are of high clinical value in predicting short-term outcome and long-term prognosis after CCRT in patients with LACC, and can be used to some extent as prognostic markers for early efficacy, PFS and OS.

PO-2628

Models for assessing postoperative risk factors in patients with cervical cancer

Yu Zhang

The First Affiliated Hospital of Anhui Medical University

Objective To construct nomogram models based on clinical parameters, inflammatory indicators, intravoxel incoherent motion diffusion weighted imaging (IVIM-DWI) and MRI-derived radiomics to help accurately assess preoperative parametrial infiltration (PI), lymph node metastasis (LNM), deep muscle invasion (DMI), lymph-vascular space invasion (LVSI), pathological type (PT), differentiation degree (DD) and Ki-67 expression level in patients with cervical cancer.

Methods The data of 180 patients with cervical cancer were retrospectively analysed and randomised 2:1 into a training and validation group. The IVIM-DWI and radiomics parameters of primary lesion were measured in all patients. The LASSO algorithm was used to screen radiomics parameters and calculate radiomics score (Rad-score). Multivariate logistic regression analysis was used to construct nomogram models for predicting preoperative risk factors of cervical cancer, with internal and external validation.

Results The diagnostic efficacy of the nomograms based on clinical and imaging parameters was significantly better than MRI assessment alone. The AUC of nomograms and MRI for the assessment of PI, LNM, and DMI were 0.981 vs 0.868, 0.848 vs 0.639, and 0.896 vs 0.780, respectively. Nomograms also performed well in the assessment of LVSI, PT, DD, and Ki-67 expression levels, with AUC of 0.796, 0.854, 0.806, 0.839 and 0.840, 0.856, 0.810, 0.832 in the training and validation groups.

Conclusion Nomograms based on clinical and imaging parameters can serve as a useful tool for assessing postoperative risk factors in patients with cervical cancer.

PO-2629

Early Diagnosis of Patellofemoral Arthritis could be achieved using fat fraction of quadriceps femoris as imaging marker

Binbin Yang¹, Pengxiang Li¹, Xiaocheng Wei², Xiaowen Ma¹

1. Xi'an Hong Hui Hospital

2. GE Healthcare, Beijing, China

Objective to explore the relationship between fat infiltration in quadriceps femoris with patellofemoral arthritis

Methods Based on clinical and magnetic resonance imaging(MRI) diagnosis, we included 32 patients with chondromalacia patellae(CMP), 31 patients with patellofemoral arthritis (PA) and 35 healthy volunteers from July 2018 to November 2022 in our medical institutions. Proton density fat fraction (PDFF) maps by Iterative decomposition of water and fat with echo asymmetry and least squares estimation quantitation (IDEAL-IQ) sequence were obtained, based on this, we obtained the FF % of medial femoral muscle(FFm%)、lateral femoral muscle (FFl%) and total quadriceps(FFt%).and then compared FFm%, FFl% and FFt% between case group(patellar malacia group+ patellofemoral arthritis group) and control group, The FF% optimal cut-off point for the diagnosis of PA was calculated.

Results FF% (include FFl%、FFm%、FFt%)of the quadriceps in the control group were lower than the CMP group($p < 0.01$) and PA group ($p < 0.01$). In the case group, FFm%、FFl% of the PA group were significantly higher than those of the CMP group ($p = 0.015, p = 0.011$). Adipose infiltration of vastus lateralis was higher in CMP and PA groups than in vastus medialis ($P < 0.01, P < 0.01$), The FFm% has the highest diagnostic efficacy, Selecting an optimal T2 subject cut-of value of 8.4% to differentiate patients from controls revealed a sensitivity and a specificity of 73.3% and 93.3% respectively (AUC = 0.911, 95%CI 0.855-0.968). Youden Index=0.7

Conclusions Fat quantification using the IDEAL-IQ sequence showed that FF% in patellofemoral arthritis patients higher than healthy people and increased with disease progression. Therefore, FF% quantification of the quadriceps muscle may used to diagnose early patellofemoral arthritis.

PO-2630

Microstructural Degeneration in the Hypothalamic Subunits in Parkinson's Disease and Probable REM Sleep Behavior Disorder

Cheng Zhou¹, Linbo Wang², Jia You², Wei Cheng², Xiaojun Xu¹, Jianfeng Feng², Minming Zhang¹

1. The Second Affiliated Hospital, Zhejiang University School of Medicine

2. Institute of Science and Technology for Brain-inspired Intelligence, Fudan University

Background: The hypothalamus plays a critical role in multiple vital functions including energy metabolism, sleep-wake cycle regulation, as well as emotional and behavioral regulation. While there are similarities in the functions regulated by the hypothalamus and the symptoms presented in Parkinson's Disease (PD), the absence of in vivo approaches to detect hypothalamic degeneration impedes the verification of the association between hypothalamic dysfunction and clinical burden. Due to the difficulty in hypothalamic segmentation (stems from the small size of hypothalamus and the lack of image contrast in its vicinity) and the insensitivity of traditional volume analysis in detecting brain degeneration, previous studies that focused on hypothalamus have yielded conflicting results. In this study, we aimed to quantify the microstructural alterations in

hypothalamic subunits, segmented by a novel deep learning-based toolbox, in PD and probable rapid-eye-movement sleep behavior disorder (pRBD, the prodromal stage of PD), and explored the clinical implications of hypothalamic degeneration.

Methods: This study included 186 PD, 67 pRBD, and 179 healthy controls. Multi-shell diffusion MRI (b-values = 0, 1000, and 2000 s/mm²) scans were collected and the mean kurtosis (MK) in hypothalamic subunits were calculated. All participants were assessed using the Unified Parkinson's Disease Rating Scale (UPDRS), RBD Questionnaire-Hong Kong (RBDQ-HK), Hamilton Depression Rating Scale (HAMD), and Activity of Daily Living (ADL) Scale. Additionally, a subgroup of PD (n = 31) underwent assessment of free thyroxine (FT4) level.

Results: PD showed significant decreases of MK in anterior-superior (a-sHyp), anterior-inferior (a-iHyp), superior tubular (supTub), and inferior tubular hypothalamus when compared with healthy controls. Similarly, pRBD exhibited decreases of MK in a-iHyp and supTub. In PD group, MK in above four subunits were significantly correlated with UPDRS-I, HAMD, and ADL scores. Moreover, MK in a-iHyp and a-sHyp were significantly correlated with FT4 level. In pRBD group, correlations were observed between MK in a-iHyp and UPDRS-I score.

Conclusions: The microstructural degeneration of the hypothalamus in PD and pRBD, as well as the associations between hypothalamic degeneration and emotional disorders, limited daily living ability, and hormonal dysregulation, suggest the potential of targeting the hypothalamus as an adjuvant therapeutic approach.

PO-2631

Fat Fraction Quantified via Magnetic Resonance Spectroscopy in the Diagnosis of Osteoporosis: A Meta-analysis

Rong Chang¹, Xiaowen Ma¹, Ming Zhang²

1. Xi'an Honghui Hospital

2. The First Affiliated Hospital of Xi'an Jiaotong University

Purpose Given the global prevalence of osteoporosis and its associations with morbidity, mortality and deterioration in overall quality of life, significant research has been devoted to the diagnosis of this bone disease. This paper presents a meta-analysis of published research regarding one emerging diagnostic technique: magnetic resonance spectroscopy (MRS), a non-invasive method of determining the concentrations of various chemical components in tissues.

Methods Previous studies investigating the pathology of osteoporosis have established a statistically significant link between increases in the bone marrow fat fraction (FF%), measured via MRS, and decreases in bone mineral density, the primary predictor of bone strength. Relevant literature was reviewed, and over 1,000 data points were collected from past studies on osteoporotic, osteopenic, and/or healthy control subjects. Data points were then grouped based on MRS location (lumbar spine, femoral neck, calcaneus, and femur). Analysis of variance tests, followed by Tukey's post-hoc tests, were performed to evaluate the ability of MRS FF% scores to differentiate between osteoporotic, osteopenic, and healthy subjects. Welch's t-tests were performed to further validate these findings, accounting for the inconsistencies in variation between subject groups.

Results Results demonstrated the existence of statistically significant differences between osteoporotic, osteopenic, and healthy groups for measurements of the lumbar spine ($P < 0.001$), as well as between osteoporotic and healthy groups at the femoral neck. No such differences were found in measurements at the femur and calcaneus, potentially due to the low number of studies and subjects reported for the latter two categories.

Conclusion MRS FF% scores appear to hold great potential clinically as a non-invasive, early diagnostic tool for osteoporosis; however, further research is required before these findings can be generalized beyond well-studied bone areas.

PO-2632

Identification of transcriptional marker as predictors of short-term brain structural changes and associated cognitive impairments in first-episode schizophrenia

Longbiao Cui

Schizophrenia Imaging Lab, Fourth Military Medical University

Background: Inflammation has been implicated in the pathology of schizophrenia, and may cause neuronal cell death and dendrite loss. Neuroimaging studies have highlighted longitudinal brain structural changes in patients with schizophrenia, yet it is unclear whether this is related to inflammation. We aim to address this question, by relating brain structural changes with the transcriptional profile of inflammation markers in the early stage of schizophrenia.

Methods: Thirty-eight patients with first-episode schizophrenia and 51 healthy controls were included. High-resolution T1-weighted magnetic resonance imaging (MRI) and clinical assessments were performed at baseline and 2 ~ 6 months follow-up for all subjects. Changes of brain structure were analyzed using surface-based morphological analysis, and correlated with the expression of immune cells-related gene sets of interest reported by previous reviews. Transcriptional data were retrieved from the Allen Human Brain Atlas. Further, we examined brain structural changes and peripheral inflammation markers in association with behavioral symptoms and cognitive functioning in patients.

Results: Patients exhibited accelerated cortical thickness decrease in the left frontal cortices, less decrease or an increase in the superior parietal lobule and right lateral occipital lobe, and increased volume in the bilateral pallidum, compared with controls. Changes of cortical thickness correlated with the transcriptional level of monocyte across cortical regions in patients ($r = 0.54$, $p < 0.01$), but not in controls ($r = -0.05$, $p = 0.76$). In addition, cortical thickness change in the left superior parietal lobule positively correlated with changes of digital span-backward test scores in patients.

Conclusions: Patients with schizophrenia exhibit regional specific cortical thickness changes in prefrontal and parietooccipital cortices, which is related to their cognitive impairment. Inflammation may be an important factor contributing to cortical thinning in first-episode schizophrenia. Our findings suggest that the immunity-brain-behavior association may play a crucial role in the pathogenesis of schizophrenia.

PO-2633

Quantitative Analysis of Chest MRI Images for Benign-Malignant Diagnosis of Pulmonary Nodules

Bin Yang

The First Hospital of Kunming

Background: In this study, we developed and validated machine learning (ML) models by combining radiomic features extracted from magnetic resonance imaging (MRI) images with clinicopathological factors to assess pulmonary nodule classification.

Methods: A total of 333 consecutive patients with pulmonary nodules (233 in the training cohort and 100 in the validation cohort) were enrolled in this study. A total of 2824 radiomic features were extracted from the MRI images (CE T1w and T2w). Logistic regression (LR), Naïve Bayes (NB), support vector machine (SVM), random forest (RF), and extreme gradient boosting (XGBoost) classifiers were applied to build the predictive models, and a radiomics score (Rad-score) was obtained for each patient after applying the best prediction model. Clinical factors and Rad-score

were used jointly to build a nomogram model based on multivariate logistic regression analysis, and the diagnostic performance of the five prediction models was evaluated using the area under the receiver operating characteristic curve (AUC).

Results: A total of 161 women (48.35%) and 172 men (51.65%) with pulmonary nodules were enrolled in this study. Six important features were selected from the 2145 radiomic features extracted from CE T1w and T2w. The XGBoost classifier model achieved the highest discrimination performance, with AUCs of 0.901, 0.906, and 0.851 in the training, validation, and test cohorts, respectively. The nomogram model improved the performance to AUC values of 0.918, 0.912, and 0.877 in the training, validation, and test cohorts, respectively.

Conclusion: MRI radiomic ML models demonstrated good nodule classification performance with XGBoost, which was superior to the other four models. The nomogram model achieved higher performance with the addition of clinical information.

PO-2634

High-Resolution Vessel Wall Imaging for Quantitatively and Qualitatively Evaluating In-Stent Stenosis of Intracranial Aneurysms Compared with CE-MRA and TOF-MRA

Ting Chen, Kunhua Li, Shushu Liu
the Second Affiliated Hospital of Chongqing Medical University

Background

It is critical to accurately and noninvasively evaluate the stented parent artery of intracranial aneurysms (IA) with endovascular treatment.

Objective

To investigate high-resolution vessel wall imaging (HR-VWI) for quantitative and qualitative evaluation of in-stent stenosis (ISS) in IA treated with stent implantation (SI).

Methods

Fifty-five patients (58 aneurysms) underwent HR-VWI, contrast-enhanced (CE)-HR-VWI, CE-MR angiography (MRA), time-of-flight (TOF)-MRA, and digital subtraction angiography (DSA) six months after SI, and the reliability of quantitative stent lumen measurements was evaluated by intraclass correlation coefficient (ICC) analysis. Agreement and correlation were estimated by comparing the four MR imaging modalities with DSA. The diagnostic performance for $>0\%$, $\geq 25\%$, and $\geq 50\%$ of ISS degrees and overall diagnostic accuracy for the ISS degrees of the four MR imaging modalities were calculated.

Results The reliability of CE-HR-VWI and HR-VWI for ISS quantitative measurements was excellent (ICC 0.955–0.989). The agreement and correlation of CE-HR-VWI, HR-VWI versus DSA for ISS quantitative measurements were better than those of CE-MRA and TOF-MRA ($p < 0.05$). The diagnostic performance for distinguishing the degree of ISS $>0\%$, $\geq 25\%$, and $\geq 50\%$ by CE-HR-VWI and HR-VWI was superior to CE-MRA and TOF-MRA (AUC 99.7%–100% versus 74.4%–89.9%), and their overall diagnostic accuracy was 96.55% and 94.83%, respectively. CE-HR-VWI and HR-VWI performed similarly in the quantitative measurement and qualitative evaluation for ISS.

Conclusion

HR-VWI demonstrated excellent diagnostic accuracy and consistency with DSA in the quantitative and qualitative evaluation of ISS after SI treatment for IA and was superior to CE-MRA and TOF-MRA, therefore as a noninvasive and effective imaging modality, it may be an alternative to DSA for detecting ISS.

PO-2635

Association of Systemic inflammatory response index with intracranial plaque vulnerability and the severity of subsequent ischemic events

Xiaofan Wei¹, Jie Cheng², Limin Zhang¹, Ruoyu Xu¹, Wei Zhang¹

1. The Second Affiliated Hospital of Chongqing Medical University

2. Southwest Hospital, Third Military Medical University (Army Medical University)

Abstract

Aim: We aimed to investigate the relationship between systemic inflammatory response index (SIRI) and intracranial plaque features, as well as the risk factors related to the severity of cerebral ischemic events.

Methods: We enrolled 120 patients with symptomatic intracranial atherosclerosis (sICAD). The correlation between SIRI levels and intracranial plaque features were analyzed by multiple sample ANOVA or Spearman's test. Multivariable ordered logistic regression was evaluated the risk factors associated with the severity of cerebral ischemic events. The efficacy of combined evaluation to classify clinical subtypes of sICAD was performed through the receiver operating characteristic (ROC) curve.

Results: SIRI levels were significantly associated with the enhanced plaque number ($r = 0.235$, $p = 0.010$), total plaque stenosis score ($r = 0.186$, $p = 0.042$), total plaque enhancement score ($r = 0.252$, $p = 0.006$), intraplaque hemorrhage ($F = 3.162$, $p = 0.046$), and plaque surface irregularity ($F = 3.116$, $p = 0.048$). Higher SIRI levels (OR = 2.560), total plaque enhancement score (OR = 1.680), intraplaque hemorrhage (OR = 2.609) and plaque surface irregularity (OR = 2.784) were independently related to moderate-severe stroke. The SIRI combined with plaque characteristics showed the best performance in the ROC curve, with an area under the curve of 0.902 (95%CI 0.842-0.961), significantly higher than intraplaque hemorrhage 0.651 (95%CI 0.549-0.753) and plaque enhancement scores 0.850 (95%CI 0.775-0.925) alone.

Conclusions: Higher SIRI levels may have adverse effects on the vulnerability and burden of intracranial plaques, and links to the severity of cerebral ischemic events. Therefore, the regulation of immune inflammation may be a potential therapeutic target for sICAD.

PO-2636

Identification of invasive adenocarcinoma in pulmonary ground-glass nodules using zero echo time magnetic resonance imaging (ZTE-MRI)

Qiao Zou, Qi Wan, Jieqiong Liu, Xinchun Li

The First Affiliated Hospital of Guangzhou Medical University

Objective: The present study aimed to evaluate the performance of ZTE-MRI on detection rate of GGNs in comparison with T2WI and T1WI 3-dimensional gradient recalled echo with fat/water separation (LAVA-Flex) using CT as reference.

Methods: 28 patients with a total of 35 GGNs underwent chest MRI examination. MR scans were obtained using a 3.0T scanner including ZTE, T2WI-FS (fat-saturated T2-weighted imaging) and LAVA-Flex sequences. The nodule size (the longest diameter) and morphology (pure, part-solid) on CT as standard reference. The diagnostic performance was evaluated using binary logistic regression analysis and area under the receiver operating characteristic (ROC) curves (AUC). The sensitivity of nodule detection between the two sequences was compared using McNemar's test.

Results: Of the 35 GGNs, 11 (31%) were pure and 24 (69%) were part-solid. The sensitivity of nodule detection and diagnostic accuracy for recognizing GGNs were significantly higher on ZTE and T2WI-FS than any other 4 images of LAVA-Flex, including water, fat, in-phase, out-phase. T2WI-FS showed significantly greater sensitivity and diagnostic accuracy of GGNs detection than ZTE according to assessment of both readers ($p < 0.05$). The CT value contributed to significantly elevate GGNs detection rate on ZTE ($p < 0.05$) but not on T2WI-FS ($p > 0.05$), while the gender, age, longest diameter, morphology (pure or part-solid) and pathological type were not. The inter-reader agreement was fair to excellent in the assessment of GGNs detection for both ZTE ($\kappa = 0.94$) and T2WI-FS ($\kappa = 0.68$). The nodule size measurements on ZTE were underestimated by a bias up to 0.9 ± 1.2 mm compared to CT and 1.1 ± 1.4 mm for T2WI-FS.

Conclusions: MRI has a satisfactory performance in detecting GGN, especially T2WI-FS. The ZTE outperformed LAVA-Flex but not T2WI-FS in detecting GGNs and could differentiate lung invasive adenocarcinoma from precursor glandular lesions and MIA in some eligible GGNs.

PO-2637

Predicting invasiveness of pure ground-glass nodules of Lung-Rads 2 using 3.0 T MRI

Qiao Zou, Jieqiong Liu, Qi Wan, Xinchun Li
The First Affiliated Hospital of Guangzhou Medical University

Objective: To investigate the value of MR zero echo time (ZTE) and thin-slice fat-saturated T2-weighted imaging (T2WI-FS) in detecting and predicting invasiveness of pure ground-glass nodules (pGGNs) of Lung-Rads 2 on 3T magnetic resonance imaging (MRI).

Methods: This prospective study enrolled a total of 76 consecutive patients with 110 pGGNs who underwent preoperative CT and MRI (including ZTE, T2WI-FS) scans. All pGGNs on CT imaging were automatic detection, segmentation, and Lung-RADS scoring by AI software and confirmed by a thoracic radiologist. Another two radiologists blind to pathology results assessed MRI imaging for detection of pGGNs. The Kruskal-Wallis test was utilized for between-group comparison in nodule diameter and CT density. The Chi-square test was employed to evaluate the differences in the detection rate in different groups. Receiver operating characteristic (ROC) curve analysis was used to compare the accuracy of different sequences for between-group differentiation.

Results: All pGGNs were divided into 5 kinds: focal inflammatory lesions, atypical adenomatous hyperplasia (AAH), adenocarcinoma in situ (AIS), minimally invasive adenocarcinoma (MIA), and invasive adenocarcinoma (IA). The detection rate of lung-rads 2 pGGNs was significantly higher in thin-slice T2WI-FS (79.0%) compared to ZTE (50.9%). A statistically significant association between the pathological entities and their visibility on ZTE MRI, from 0% (0/4) for AAH, 20% (2/10) for inflammatory lesions, 21.1% (4/19) for AIS, 58.6% (35/60) for MIA to 88.6% (15/17) for ICA ($p < 0.001$). The diameter has the highest diagnostic performance ($AUC = 0.871$) in differentiating between non-invasive and invasive (MIA+ICA) pGGOs, followed by ZTE visibility with an AUC of 0.734. The other variables, CT value and T2WI-FS have relatively lower AUC s of 0.678 and 0.675, respectively.

Conclusion: Thin-slice T2WI-FS has a better detection rate for pGGO compared to ZTE. While ZTE has more potential for predicting the histological invasiveness of pGGO.

PO-2638

Stress T1 Mapping Detecting Hibernating Myocardium in a Swine Model: A Validation Study with Pathology

Baiyan Zhuang, Shuang Li, Lei Xu
fuwai hospital

Background: Both dobutamine stress cardiovascular magnetic resonance imaging (CMR) cines and late gadolinium enhancement (LGE) have inherent limitations in the assessment of viable myocardium. The purpose of the study is to explore whether using non-contrast adenosine triphosphate (ATP) stress CMR T1 mapping can detect hibernating myocardium using pathology as a reference standard.

Methods: A chronic ischemia model was induced in swine using Ameroid constrictor to create hibernating myocardium. Non-contrast ATP stress T1 mapping, myocardial contrast perfusion and LGE were performed and analyzed at baseline and every week post-surgery until the animal were sacrificed. Pathology staining, including triphenyltetrazolium chloride, HE, Masson, picosirus red staining, CD31, and electron microscopy, was used as gold standard. The accuracy of T1 mapping was analyzed using ROC analysis.

Results: Twenty-seven swine (21 in experimental group and 6 in the control group) were enrolled. From baseline to 4 weeks after surgery, left ventricular function decreased from $62.7 \pm 8.3\%$ to $51.2 \pm 6.7\%$. The wall thickening score decreased from $53.5 \pm 15.6\%$ to $37.5 \pm 9.3\%$. The $\Delta T1$ ($10.0 \pm 2.0\text{ms}$), $\delta T1$ ($0.84 \pm 0.53\%$), ΔECV ($1.57 \pm 1.13\%$), and δECV ($5.97 \pm 4.92\%$) of hibernating myocardium were higher than infarcted myocardium and lower than normal control myocardium and remote myocardium. The rest T1 ($1210.2 \pm 65.6\text{ms}$), and stress T1 ($1220.3 \pm 63.5\text{ms}$) of the hibernating myocardium were lower than that of the infarcted myocardium, but higher than that of the remote and normal myocardium. Using pathology as the gold standard, ROC analysis found that the AUCs of $\Delta T1$ (0.828) and $\delta T1$ (0.827) to differentiate hibernating myocardium were slightly higher than LGE (0.797) and much higher than rest T1 and stress T1 (AUC=0.631, 0.685, respectively), all $p < 0.05$.

Conclusion: Non-contrast ATP stress T1 mapping accurately detects hibernating myocardium and may be beneficial for patients with contraindications to contrast media, as well as simplifying MR protocol and reducing examination costs.

PO-2639

The value of enhanced T2 FLAIR in the differential diagnosis of central nervous system lymphoma and high-grade adult diffuse glioma

Jingyun Yang, Derong Zhao, Yan Su
Baoshan People's Hospital

Objective : To investigate the value of enhanced T2 FLAIR in the differential diagnosis of central nervous system lymphoma (CNSL) and high-grade adult diffuse glioma (HG-ADG).

Date and methods: A retrospective analysis was performed on 63 patients (67 lesions) with CNSL and 14 patients (14 lesions) with HG-ADG confirmed by pathology/follow-up in our hospital from 2014 to 2022. All patients underwent head MRI scans including enhanced T2 FLAIR and enhanced T1WI before surgery. According to the shape of the lesion and whether the diffusion is limited, the tumor is divided into solid mass type and non-solid mass type. The characteristics of tumor enhancement were evaluated by visual score. The evaluation indexes included: the uniformity and degree of enhancement of tumor parenchyma, the degree and range of enhancement of thin layer

enhancement of tumor parenchyma edge. Finally, the enhancement characteristics of solid mass-like CNSL (58 cases) and solid HG-ADG (14 cases) on enhanced T2 FLAIR images were compared. Results: On CE-T2 FLAIR images, there was no significant difference in the uniformity of tumor parenchymal enhancement between the two groups, but there were significant differences in the degree of enhancement of tumor parenchyma, the degree and range of enhancement of tumor edge thin layer between the two groups ($P=0.0001$). Solid mass type CNSL showed moderate and large-scale (68%-99%) enhancement, while solid HG-ADG showed no enhancement.

Conclusion: On CE-T2 FLAIR images, CNSL has a higher probability of obvious thin-layer enhancement (thin-ring sign) of tumor parenchymal edge. This sign has great value in the differential diagnosis of CNSL and HG-ADG with solid mass growth, and is of great significance for guiding clinical treatment decisions.

PO-2640

Disrupted resting-state functional connectivity and network topology in mild traumatic brain injury: An arterial spin labelling study

Fengfang Li

Nanjing First Hospital, Nanjing Medical University

Abstract:

Background: Mild traumatic brain injury (mTBI) can cause different degrees of cognitive impairment. Previous literature has confirmed that mTBI patients have abnormal brain structure and functional connectivity (FC), but there is still a lack of research on the resting-state connectivity and topological organization of cerebral blood flow (CBF) fluctuations. This study explored the CBF, connectivity and topological organization of the CBF network in acute mTBI patients.

Methods: In total, 48 mTBI patients and 46 well-matched healthy controls (HCs) underwent resting-state arterial spin-labelled (ASL) perfusion MRI and neuropsychological assessments. The FC and topological organization of the CBF network were analysed. Then, the correlation between the changes in CBF network characteristics and cognitive function was explored.

Results: Acute mTBI patients showed decreased CBF in the right insula and increased CBF in the right inferior temporal gyrus (ITG) and left superior temporal gyrus (STG). Abnormal CBF network connection patterns mainly occur in sensorimotor network (SMN), default mode network (DMN), cingulo-opercular network (CON) and occipital network (ON)-related regions. Furthermore, graph analyses revealed that mTBI disrupted the topological organization of the whole brain, which manifested as (i) reduced global efficiency, (ii) abnormal degree centrality, betweenness centrality, nodal clustering coefficient, and nodal efficiency, and (iii) decreased intermodular connectivity between the ON and SMN. Finally, the change in network topology was correlated with the cognitive function score of the mTBI group.

Conclusions: This study provided evidence of abnormal FC and network topology based on CBF in acute mTBI patients, revealing their potential use as early markers for mTBI, which may contribute to both disease diagnosis and assessment.

PO-2641

Correlation between cerebral perfusion by arterial spin labeling and blood lipids in patients with cerebral small vessel disease

Peiqi Ma, Juluo Chen, yushan Yuan, Bin Peng
Fuyang People's Hospital

Objective: To explore the cerebral perfusion level of the mesocortical atrophy areas of cerebral small vessel disease (CSVD) measured by arterial spin labeling (ASL) and the correlations with the blood lipid parameters.

Methods: This retrospective study included patients diagnosed with CSVD between November 2022 and January 2023 in Fuyang People's Hospital and healthy controls who underwent brain MRI during the same period. The regional cerebral blood flow (rCBF) was measured by ASL.

Results: This study included 80 patients with CSVD and 62 healthy controls. The CSVD group showed a thinner cortical thickness at all studied parts of the brain (all $P < 0.05$). Compared with the healthy controls, the CSVD group showed lower rCBF values in the left medial orbitofrontal area (33.438 ± 8.621 vs. 36.842 ± 8.627 , $P = 0.021$) and right superior temporal area (31.866 ± 7.030 vs. 34.610 ± 7.628 , $P = 0.028$). In the CSVD group, the right superior temporal rCBF values were correlated to the total cholesterol ($r = 0.338$, $P = 0.002$) and low-density lipoprotein-cholesterol (LDL-C) ($r = 0.360$, $P = 0.001$) levels but not to the high-density lipoprotein-cholesterol (HDL-C) levels ($r = 0.114$, $P = 0.315$). The left medial orbitofrontal rCBF values were correlated to the total cholesterol ($r = 0.292$, $P = 0.009$) and LDL-C ($r = 0.278$, $P = 0.012$) levels but not to the HDL-C levels ($r = 0.132$, $P = 0.244$).

Conclusion: Compared with healthy controls, patients with CSVD show lower right superior temporal and left medial orbitofrontal perfusion. In patients with CSVD, total cholesterol, and LDL-C levels are positively correlated with perfusion in these two areas.

PO-2642

Application of clinicopathological features and multiparametric magnetic resonance-based radiomics for predicting TP53-mutated prostate cancer

Ruchuan Chen^{1,2}, LIANGPING ZHOU¹, XIAOHANG LIU¹

1. Shanghai cancer center

2. Shanghai Institute of Medical imaging

Purpose: TP53 mutations are closely related to prostate cancer prognosis and therapy, but current detection methods are invasive and expensive, so we decided to develop a classifier for detecting TP53 mutations in prostate cancer using MRI radiomics features.

Method: The study enrolled 275 prostate cancer patients with TP53 expression profiling (85 with TP53 mutations and 190 without). Each patient's index tumor lesion was manually delineated on MRI images. Five clinicopathological and 428 radiomics features were obtained from each lesion. Radiomics features were selected by least absolute shrinkage and selection operator (LASSO) and binary logistic regression analysis. Clinicopathological features were selected by Mann-Whitney U test. Radiomics models were constructed using selected radiomics feature by Logistic regression (LR), support vector machine (SVM) and random forest (RF) classifier to predict the TP53 mutation status of patients. Clinicopathological-radiomics combined models were constructed using selected radiomics and clinicopathological features by the classifiers above. LASSO, binary logistic regression analysis and Mann-Whitney U test were employed for

feature preprocessing. Diagnostic accuracies of models were compared using the receiver operating characteristic curve (ROC).

Result: For radiomics model, the area under the ROC (AUC) of the testing cohorts of RF classifier (0.75) was significantly higher than LR (0.60)($p = 0.019$), but similar to SVM (0.70)($p = 0.422$). For combined model, AUC of the testing cohorts of RF model (0.83) was significantly higher than LR (0.63)($p = 0.001$), but similar to SVM (0.80)($p = 0.548$). There were significant differences between the combined RF and radiomics RF ($p = 0.037$), combined SVM and radiomics SVM ($p = 0.043$) models. But no significant difference between combined LR and radiomics LR model ($p = 0.106$).

Conclusion: Clinicopathological-radiomics combined model with RF, SVM could be used to predict TP53 mutations of prostate cancer.

PO-2643

Comparative study on three kinds of 3.0 T MRI sequences for lumbar facet joint cartilage

Muqing Luo, Kun Zhang

The First Hospital of Hunan University of Chinese Medicine

Abstract Objective: To compare the image quality and imaging characteristics of three 3.0 T MRI sequences of lumbar facet joint cartilage. **Materials and Methods:** Thirty healthy subjects were studied with four chosen sequences using a 3.0 T MRI scanner. The sequences were T1WI/T2WI, water excitation three-dimensional spoiled gradient echo sequence (3D-WATSc), three-dimensional T1 fast field echo (3D-T1-FFE) and three-dimensional proton density weighted imaging volumetric isotropic turbo spin echo acquisition (3D-PDWI-VISTA). Two radiologists subjectively evaluated these MRI images qualitatively and quantitatively. Qualitative evaluation index including cartilage signal uniformity, cartilage-joint space edge sharpness, cartilage-bone edge sharpness, cartilage-joint space contrast, cartilage-bone contrast. Quantitative indicators include signal to noise ratio (SNR) and contrast to noise ratio (CNR). **Results:** The 3D-WATSc had the highest scores among the 5 qualitative indexes, and the 3D-T1-FFE had the second-highest scores. Only the difference of signal uniformity between the two was statistically significant ($P < 0.05$). The 3D-PDWI-VISTA is almost indistinguishable from the anatomical structure of the lumbar facet joint. The 3D-WATSc showed that cartilage SNR [L4/L5 (70.73 ± 14.86), L5/S1 (73.50 ± 13.63)] and the CNR of cartilage-space [L4/L5 (25.30 ± 8.44), L5/S1 (21.64 ± 13.01)], cartilage-bone [L4/L5 (60.75 ± 14.68), L5/S1 (64.31 ± 12.98)], and cartilage-bone marrow [L4/L5 (50.22 ± 14.33), L5/S1 (54.46 ± 10.99)] were higher than that of 3D-T1-FFE, and the difference were statistically significant ($P < 0.05$). **Conclusions:** The 3D-WATSc can present the anatomical structure of lumbar facet joints in detail, which is superior to 3D-T1-FFE and 3D-PDWI-VISTA. 3D-WATSc has advantage in imaging of lumbar facet joint cartilage and clinical diagnosis of lumbar facet joint degeneration.

PO-2644

Analysis of high resolution MRI plaque burden and its correlation with ABCD2 scores in transient ischemic attack and acute ischemic stroke patients

Na Fan, Peng fei Chen, Yi Liang, Wen hui Fan
General Hospital of Yangtze River Shipping & Wuhan Brain Hospital

Objective To investigate the differences in carotid artery plaque burden between transient ischemic attack (TIA) and acute ischemic stroke (AIS), and analyze the correlation with ABCD2 scores in TIA patients based on high-resolution MRI (HR-MRI). **Methods** Seventy-eight patients were retrospectively collected, divided into AIS group (22 patients), a low-intermediate risk group (ABCD2 score < 6) (37 patients) and a high-risk group (ABCD2 score ≥ 6) (19 patients). Wall thickness, vessel area, lumen area, remodeling index (RI), eccentricity index (EI), and normalized wall index (NWI) were calculated and analyzed. Differences of clinical characteristics and plaque burden between groups were compared using one-way analysis of variance or Kruskal Wallis-test. The relationship of plaque burden in the TIA and AIS groups were used ordinal logistics regression, multiple linear correlation and regression. The correlations of TIA plaque burden and ABCD2 score were analyzed by Spearman rank correlation or Pearson correlation. **Results** The WTmax, WTmin, LAMLN, RI, NWI of internal carotid artery were compared, which had statistically significant ($P < 0.05$). WTmax and WTmin were statistically significant between low-medium-risk TIA group and AIS group ($P < 0.05$), while LAMLN and NWI were statistically significant in low-medium-risk TIA group, high-risk TIA group compared with AIS group ($P < 0.05$), respectively. The NWI of internal carotid artery have good risk prediction to the incidence of ischemic stroke (95% CI = [2.87, 14.75], $P = 0.004$). There was a weak correlation between ABCD2 score and RI ($r = 0.295$, $P = 0.027$). **Conclusions** This study reveals the plaque features of internal carotid artery in TIA and AIS patients. The parameter NWI is correlated with AIS and TIA stratified patients, and RI has a weak positive correlation with ABCD2 score, which is a potential indicator for TIA stratified patients and has important significant for early prevention of stroke.

PO-2645

Distinguishing benign from malignant breast lesions with tumor subregion complexity using fractal analysis

Run Xu, Peng Luo, Guanwu Li
Shanghai University of Traditional Chinese Medicine Yueyang Hospital of Integrated Traditional Chinese Medicine and Western Medicine

Purpose: To assess the feasibility of using fractal analysis in habitat analysis for the differential diagnosis of benign and malignant breast lesions, and to evaluate its diagnostic performance compared to conventional heterogeneity features extracted from the whole tumor.

Materials and Methods: A retrospective study was conducted on 97 patients with histologically confirmed breast lesions (75 malignant, 22 benign). Diffusion-weighted imaging (DWI) and dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) were acquired, and three tumor habitats were defined based on perfusion and cellularity characteristics. Fractal dimensions (FDs) were calculated for each habitat, and diagnostic performance was compared using the area under the receiver operating characteristic curve (AUC).

Results: The FD of hypervascular habitat (FD 1) showed a statistically significant difference ($p < 0.001$) between malignant and benign lesions. The AUC of FD 1 (0.925, 95% CI 0.854 – 0.969)

was higher than that of the conventional heterogeneity of the whole lesion (0.671, 95% CI 0.568 – 0.763), indicating improved diagnostic performance. Hypervascular cellular habitat, characterized by relatively low ADC and high wash-in, demonstrated a remarkable ability to discriminate breast cancer from benign lesions.

Conclusion: This pilot study reveals that FD features generated by habitat analysis could better differentiate benign from malignant breast lesions compared to conventional heterogeneity features extracted from the whole tumor. The predictive model combining tumor habitats MRI and fractal analysis could prove useful as a screening tool, suggesting that fractal analysis may play an essential role in identifying patients whose breast lesions are more likely to behave aggressively.

PO-2646

Social Support Mediates the Influence of Cerebellum Posterior Lobe Functional Connectivity Strength on Postpartum Depression symptoms

Bochao Cheng^{1,2}, Wei Deng³

1. West China Second University Hospital of Sichuan University

2. Huaxi MR Research Center (HMRRC), Department of Radiology, West China Hospital of Sichuan University

3. Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

Objective: Depression is a common mental disorder. Postpartum depression (PPD) is a major depressive disorder in which a mood disorder occurs during pregnancy or within one year after delivery. Maternal depression affects both the child's growth and the mother's ability to care for her infant. Previous studies have shown that adequate social support can protect against PPD. However, how the brain connectome is disrupted in PPD and the neural basis underlying the role of social support in PPD remain unclear. The present study aims to explore these issues in patients with PPD.

Method: Well-established questionnaires and resting-state functional Magnetic Resonance Imaging (rsfMRI) were performed in 120 PPD patients and 105 Healthy Postnatal Women (HPW). Brain functional integration was measured by analysis of Functional Connectivity Strength (FCS). Association and mediation analyses were performed to investigate relationships between FCS, PPD symptoms and social support.

Result: PPD patients showed specifically higher FCS in right parahippocampus. In all postpartum women, depression symptoms positively correlated with FCS in left paracentral lobule; depression and anxiety symptoms were negatively correlated with FCS in right cerebellum posterior lobe (CPL), a brain region implicated in supporting social cognition and regulation of emotion. Subsequent mediation analysis revealed that perceived social support mediated the association between CPL FCS and PPD symptoms.

Conclusion: Measurement of FCS in disorder-specific neural circuits offers a potential biomarker to study and measure the efficacy of social support for PPD.

PO-2647

Altered functional and morphological brain networks in major depressive disorder: Findings from the resting-state and structure analysis

Kai Xu¹, Haoxuan Lu², Ke Li¹

1. Department of Radiology, Strategic Support Force Medical Center

2. Department of Radiology, PLA General Hospital

Objective Depression is a mental disorder characterized by low mood and anhedonia that involves abnormalities in multiple brain regions and networks. Epidemiological studies demonstrated that depression has become one of the most important diseases affecting human health and longevity. The pathogenesis of the disease has not been fully elucidated. Recent developments in neuroimaging have heightened the need for investigating the disruptions in the structure and function of brain in major depressive disorder (MDD). In this study, we employed resting-state functional magnetic resonance imaging (fMRI) and structure MRI (sMRI) to examine the global and local-brain functional and morphological networks among MDD patients and healthy controls. **Methods** 55 patients with MDD and 46 normal controls (NC) subjects were collected, data of brain 3D high resolution T1-weighted and resting-state image were acquired at 3.0T MR system. Construction of functional brain network was preprocessed through the DPARSF tool, and the morphological brain network was constructed through FreeSurfer tool. **Results** Compared with normal controls, the global features of functional brain network exhibited no significant differences in MDD patients, but the local features of functional and morphological networks were changed. 1) Morphological brain networks: The transverse temporal gyrus in left hemisphere showed increased gray volume and surface area in patients with MDD compared to NCs ($P < 0.05$). 2) Functional brain networks: The functional connectivity (FC) of multiple nodes in the default mode network (DMN) of depression patients was abnormally increased, especially the left temporal lobe. Besides, the betweenness centrality of topology in the left transverse temporal gyrus with MDD altered compared to NCs ($P < 0.05$). **Conclusion** Functional and morphological brain networks changes of transverse temporal gyrus in left hemisphere are found in MDD patients. These significant findings could expand our understanding of neurophysiologic mechanisms related to MDD from a network perspective.

PO-2648

Comparison of single-short, FOCUS single-short, MUSE, and FOCUS MUSE diffusion weighted imaging for pulmonary lesions: A pilot study

Jie Li, Yi Xia, Xiaoqing Lin, Meiling Xu, Li Fan
Shanghai Changzheng Hospital

Purpose: To compare the performance of single-short (SS), FOCUS SS, MUSE, and FOCUS MUSE diffusion weighted imaging (DWI) for pulmonary lesions.

Materials and Methods: In this prospective study, forty-eight patients who were suspected of pulmonary lesions according to computed tomography were recruited between November 2022 and May 2023. Pulmonary DWI with b-values of 0, 50, and 800 (s/mm^2) was performed at 3T MRI using SS, FOCUS SS, MUSE, and FOCUS MUSE sequences before biopsy. The image quality was assessed using 5-point Likert scale score, signal-to-noise ratio (SNR), contrast-to-noise ratio (CNR), and deformation rate (DR) for each sequence. The 5-point Likert scale score, SNR, CNR, and DR of the four sequences was compared respectively using Friedman test with the Bonferroni

post hoc test. The 5-point Likert scale score consistency using kappa coefficients. The agreement of SNR, CNR, and DR observable measurements was demonstrated using Bland-Altman plots. Apparent diffusion coefficients (ADCs) derived from DWI were also compared with Friedman test with the Bonferroni post hoc test. Inter- and intra-group agreement of ADC values was expressed using ICC correlation coefficients. The ADC value between benign and malignant lesions was compared using Mann-Whitney test.

Results: Forty-eight patients were finally selected including 20 adenocarcinomas, 12 squamous carcinomas, 2 small cell carcinomas, 1 adenoid squamous carcinoma, 1 lymphoma, 2 other epithelial tumors and 10 benign cases. Compared with SS, FOCUS SS and MUSE, FOCUS MUSE demonstrated better image quality, including significantly higher 5-point Likert scale score and significantly smaller DR. There were no significant differences in SNR and CNR between the four sequences. In terms of ADC value assessment, there was no significant difference in ADC values between the four groups of sequences, which were comparable in their ability to be used in clinical applications. In terms of the ability of the four sequences to differentiate between benign and malignant lesions, the ADC values for benign and malignant tumors were significantly different across the four sets of sequences, with FOCUS MUSE possessing the largest area under the curve (AUC=0.820), which gives it an advantage in discriminating between benign and malignant lesions. Conclusion: FOCUS MUSE has improved image quality compared to other three DWI sequences, providing more optimal images for clinical diagnosis of lung lesions.

PO-2649

Co-localization of dysfunction in auditory verbal hallucinations in schizophrenia: a study on state- and trait-based brain networks

Fan Mo

The First Affiliated Hospital of Anhui Medical University

Many studies have explored the neuropathological mechanisms of auditory verbal hallucinations (AVH) in schizophrenia through regional brain changes, yet the existence of specific functional network impairments remains unclear. Utilizing resting-state functional magnetic resonance imaging (fMRI) data from a discovery dataset and an independent validation dataset, combined with prior literature findings, we applied the functional connectivity network mapping (FCNM) method to investigate whether distinct functional impairments associated with AVH in individuals with schizophrenia are co-localized within specific brain networks. We identified a widely distributed AVH-state dysfunctional network, primarily involving auditory, salience, basal ganglia, language, and sensorimotor networks, and an AVH-trait dysfunctional network is scattered across the bilateral orbitofrontal gyrus, bilateral insular, bilateral middle temporal gyrus (MTG), striatum and the anterior cingulate cortex (ACC). Our findings suggest that AVH-related dysfunction may reside in two distinct brain networks, which may contribute to a deeper understanding of the causal neuroanatomical basis of AVH. This knowledge could provide more reliable potential neuroanatomical targets, paving the way for improved treatment and prevention of AVH symptoms in schizophrenia.

PO-2650

Diffusion-weighted imaging using multiplexed sensitivity encoding (MUSE) without and with field-of-view optimized and constrained undistorted single-shot (FOCUS) In Different pathological types of pulmonary nodules and masses

Yi Xia, Jie Li

Changzheng Hospital of the Second Military Medical University, China

Purpose: To investigate in different pathological types of pulmonary nodules and masses (PNMs) population the benefits of using multiplexed sensitivity-encoding (MUSE) without and with field-of-view optimized and constrained undistorted single-shot (FOCUS) instead.

Methods: In this prospective study of fifty-one consecutive patients (median age, 65 years; age range, 28–81 years, 33 men, 18 women) who underwent 3.0 T pulmonary MRI from November 2022- June 2023, We compared image quality, geometric distortions, and diffusion values between three different approaches for DWI [Single-shot DWI, MUSE, and MUSE+FOCUS] in different pathological types of PNMs. Visual qualitative analysis of diffusion-weighted images was accomplished by two independent readers; images were assessed for lesion conspicuity and overall quality of image. Inter-reader agreement was assessed using the Kappa coefficient. Quantitative analysis was performed by calculating geometric distortion [Dice Coefficient (DICE) and Hausdorff Distance (HD)] and apparent diffusion coefficient (ADC) values by manually drawing regions of interest in PNMs. To assess the interobserver agreement of ADC values, paired samples t-tests and intra-class correlation coefficients (ICC) were used. Quantitative differences between two different DWI were assessed using the Mann-Whitney U test. Receiver operating characteristic (ROC) curve was used in distinguishing between malignant and benign PNMs.

Results: Of the 51 PNMs (from 51 patients), 42 (82.35%) were malignant and 9 (17.65%) were benign. MUSE+FOCUS and MUSE DWI perform better than Single shot DWI for pulmonary lesion conspicuity and overall image quality for qualitative parameters. Distortion levels assessed with DICE and HD were significantly lower for MUSE+FOCUS ($P < 0.05$) compared to Single-shot DWI and MUSE. For malignant and benign PNMs, no significant difference in mean ADC between the three DWI methods was found ($p > 0.05$) and the min ADC values measured using MUSE+FOCUS were significantly lower than those measured using Single-shot WI ($p < 0.011$ and $p = 0.024$, respectively). FOCUS+MUSE DWI had the largest area under the curve in discriminating malignant and benign PNMs (0.862 and 0.700).

Conclusion: FOCUS MUSE DWI has improved image quality compared to MUSE and Single-shot DWI sequences, providing more optimal images for clinical diagnosis of PNMs.

PO-2651

Dysregulated brain dynamics in visual-motor network of type 2 diabetes and its relation to cognitive impairment

Ying Yu, Lin-Feng Yan, Guang-Bin Cui

Department of Radiology, Tangdu Hospital, Fourth Military Medical University

Background

Type 2 diabetes mellitus (T2DM) is a significant risk factor for mild cognitive impairment (MCI). The mainly impaired executive function and memory lead to the poorer performance of the rather demanding glucose monitoring tasks. Yet, the susceptible directed network and its dynamic features remain poorly understood. Here, we screen T2DM-specific effective connective (EC)

network, the dynamic features of which make contribution to distinguishing T2DM patients with cognitive impairment from controls and were correlated with cognitive performance in T2DM patients.

Methods

Twenty-eight local T2DM patients with normal cognition (IT2DM-CN) and 30 age, sex and education matched healthy controls (IHC-CN) were recruited. Resting-state functional MRI (rs-fMRI) data were subsequently acquired to screen the directed susceptible network for early cognitive impairment in T2DM using network-based statistic. Then, 31 multi-centered T2DM patients with MCI (mT2DM-MCI), 28 T2DM patients with normal cognition (mT2DM-CN) and 28 age, sex and education matched healthy controls (mHC-CN) were obtained from ADNI3 database to explore the directed dynamic temporal heterogeneity of the susceptible network in the three groups. The relationship between connectome characteristics and cognitive performance were also evaluated using Pearson correlation analysis and the binary logistic regression analysis.

Results

Poorer performance was found in IT2DM-CN in subitems of scales assessing executive and memory function. Extracted from cognitive declined IT2DM-CN, the T2DM-related static causality network mainly consisted of nodes in visual and sensorimotor network, including left area V5/MT of occipital gyrus (LOcC_L_4_2), right area 1/2/3 upper limb of postcentral gyrus (PoG_R_4_1), right area 2 of postcentral gyrus (PoG_R_4_3), right area 4 upper limb of precentral gyrus (PrG_R_6_3), left caudal area 35/36 of parahippocampal gyrus (PhG_L_6_2), left postcentral area 7 of superior parietal lobule (SPL_L_5_4), and left rostromedial superior temporal sulcus (pSTS_L_2_1). V5/MT region of visual cortex was the core. The main positive ECs were from visual network to sensorimotor network. Verified in different window widths, the dynamic network mode among multi-centered groups can be divided into stronger interconnected State I and relatively sparsely connected State II. While, the fractional windows (F) and mean dwell time (MDT) of State I in mT2DM-MCI were significantly higher than those in mT2DM-CN and mHC-CN groups, the F and MDT of State II in mT2DM-MCI were significantly lower than those in the two control groups. No significant different F and MDT was found between mT2DM-CN and mHC-CN groups. Comparing the strength of connections between each pair of the multi-centered groups, the predominantly altered dynamic ECs (dECs) were found in State I with more altered dECs in the mT2DM-MCI group. The sum of dECs (sumdECs) was negatively correlated with number of cues in Logical Memory test. The sumdECs could effectively distinguish the mT2DM-MCI from mHC-CN and mT2DM-CN with the accuracy to be 0.949 and 0.898, respectively.

Conclusions

Cognitive impairment, EC and dEC alterations were detectable in IT2DM-CN and mT2DM-MCI patients. Early and subtle cognitive alterations in T2DM, underpinned by increased EC, may represent an early harmful effect of T2DM to working memory system. The high differential diagnostic efficiency of sumdECs in visual-motor network was further evidence that sumdECs were more sensitive to the cognitive impairment in early T2DM. Our results contribute to a better understanding of the mechanism for the cognitive impairment in T2DM and its promising neuroimaging biomarkers.

PO-2652

Study on the pattern of nucleus accumbens-associated dynamic functional network abnormalities in type 2 diabetes mellitus

Ying Yu, Lin-Feng Yan, Guang-Bin Cui

Department of Radiology, Tangdu Hospital, Fourth Military Medical University

AIM

To investigate the characteristics and role of the dynamic nucleus accumbens (NAC)-whole brain interactive network and classical reward circuit in the cognitive impairment process of type 2 diabetes mellitus (T2DM).

METHODS

Thirty-one T2DM with mild cognitive impairment (T2DM-MCI), 28 age, sex and education matched T2DM without MCI patients (T2DM-CN) and healthy control (HC) were obtained from ADNI3 database. The z-transferred low-frequency amplitudes (zALFF), regional homogeneity (zReHo) and voxel-mirrored homotopic connectivity (zVMHC) of NAC from AAL3, BNA and HOA templates were extracted and compared. Ventral tegmental area, NAC, amygdala, prefrontal regions and hippocampus were used as regions of interests (ROI) to construct reward networks. Besides, NAC was used as the ROI to construct the mutual network between NAC and other brain regions. The dynamic effective connective (dEC) clustering features of the two networks and their correlation with the cognitive performance were then explored.

RESULTS

In multi-centered subjects, zALFF of NAC decreased significantly, while zReHo and zVMHC increased significantly in T2DM-MCI group compared with T2DM-CN and HC groups ($P < 0.05$). The dEC of the two networks also fluctuated between stronger EC state I and weaker EC state II ($P < 0.001$). The fractional windows (F) and mean dwell time (MDT) of state I in mT2DM-MCI were significantly higher than those in mT2DM-CN and mHC-CN groups ($P < 0.001$). The F and MDT of State II are the opposite ($P < 0.001$). No significant difference in F value and MDT value was found between mHC-CN and mT2DM-CN groups ($P > 0.05$). In T2DM-MCI group, the F value of the state I in backward reward network was negatively correlated with completion time of TMT A.

CONCLUSIONS

The neural activity of NAC was useful for differentiating T2DM patients with cognitive impairment from HC. NAC may play an important role in the mechanism of cognitive impairment in T2DM. The reward circuit may be the susceptible pathway.

PO-2653

Functional connection network mapping to explore structural and functional damage networks of the risk for schizophrenia and bipolar disorder

Shanwen Yao, Yongqiang Yu, Jiajia Zhu

the first hospital of anhui medical university

Background: Although schizophrenia (SZ) and bipolar disorder (BD) have a number of clinical features and certain susceptibility genes in common, they are considered separate disorders. Identifying brain alterations associated with genetic vulnerability for SZ and BD could help to quantify biological traits with greater prevalence in unaffected relatives (RELs) and early recognition biomarkers in ultrahigh-risk populations. Here, we introduce a new technique termed

functional connectivity network mapping to examine whether heterogeneous functional magnetic resonance imaging findings localize to connected brain networks.

Methods: We systematically searched PubMed and Web of Science for structural and functional MRI studies investigating relatives and healthy control subjects. A total of 104 eligible neuroimaging studies with 107 experiments (2364 SZ-RELS, 864 BD-RELS, and 4114 healthy control subjects) were identified. Then, we leveraged the normative human brain connectome (656) to test whether the coordinates derived from the studies might delineate specific functional or structural damage networks in SZ-RELS and BD-RELS rather than isolated neuroanatomical foci.

Results: First, we showed that the neuroimaging findings of SZ- and BD-RELS in function and structure localize to different specific brain damage networks, respectively. Second, when we further merged the functional and structural damage networks, we found that the overlap rate of brain damage networks in the two diseases increased significantly.

Conclusions: Our results suggested that neuroimaging studies that appear poorly reproducible may identify different regions within the same connected brain network. From the perspective of the network, we can further understand and explain that SZ and BD, two different mental disorders, have overlapping symptoms and genes.

PO-2654

Neural mechanism underlying the beneficial effect of Theory of Mind psychotherapy on early-onset schizophrenia: A randomized controlled trial

Siyu Liu, Jiajia Zhu

The First Affiliated Hospital of Anhui Medical University

Background: Psychosocial interventions have emerged as an important component of a comprehensive therapeutic approach in early-onset schizophrenia (EOS), typically representing a more severe form of the disorder. Despite the feasibility and efficacy of Theory of Mind (ToM) psychotherapy for schizophrenia, relatively little is known regarding the neural mechanism underlying its effect on EOS.

Methods: We performed a randomized, active controlled trial in 28 patients with EOS, who were randomly allocated into either an intervention (ToM psychotherapy) or an active control (health education) group. Diffusion tensor imaging data were collected to construct brain structural networks, with both global and regional topological properties measured using graph theory.

Results: After 5 weeks of treatment, both the intervention and active control groups showed significant improvement in psychotic symptoms, yet the improvement was greater in the intervention group. Importantly, contrasting with no brain structural network change after treatment in the active control group, the intervention group exhibited increased nodal centrality of the left insula that was associated with psychotic symptom improvement.

Conclusion: These findings suggest a potential neural mechanism by which ToM psychotherapy exerts its beneficial effect on EOS via strengthening the coordination capacity of the insula in brain structural networks, which may provide a clinically translatable biomarker for monitoring or predicting responses to ToM psychotherapy.

PO-2655

Functional gradient of the fusiform gyrus and its underlying molecular basis

Jingyao Chen, Jiajia Zhu, Yongqiang Yu
The First Affiliated Hospital of Anhui Medical University

Background: Many lines of evidence have evinced the functional complexity, anatomical heterogeneity, connectivity diversity, and clinical relevance of the fusiform gyrus (FG). We aimed to provide a unified account for these FG characteristics by systematically investigating the hierarchical organization of the FG and its underlying molecular basis.

Methods: Resting-state functional MRI data of 793 healthy subjects were collected from a discovery dataset and two independent cross-scanner, cross-race validation datasets. Functional gradients of the FG were calculated based on the voxel-wise FG-to-cerebrum functional connectivity to reflect its functional organization. Coupled with the Allen Human Brain Atlas, transcription-neuroimaging spatial correlation analysis was performed to determine genes with expression levels tracking the FG functional gradient. **Results:** The dominant functional gradient that explained the greatest connectivity variance showed an anterior-posterior axis across the FG. More important, there was a strong association between the FG dominant gradient and gene expression profiles, with two gene sets contributing significantly to this association yet differing in their specific expression and functional annotation. In addition, the FG dominant gradient was linked closely to intrinsic geometry, slightly to cortical morphology, and gradually to behavioral domains from high-level cognitive processes to low-level sensory functions. **Conclusion:** Our findings add to the extant knowledge regarding the topographic organization of the FG by informing a novel conceptualization of how functional heterogeneity and multiplicity co-occur within the FG.

PO-2656

Correlations between DKI and DWI with Ki-67 Index in Gastric Adenocarcinoma

Letian Yuan
Shandong Provincial Hospital

Background: Although diffusion kurtosis imaging (DKI) has been applied for gastric adenocarcinoma but correlations between their parameters with Ki-67 index is still not clear.

Purpose: To investigate the correlation between the parameters of DKI and DWI with Ki-67 index in gastric adenocarcinoma.

Materials and methods: A total of 54 gastric adenocarcinoma patients were enrolled into the research and received DWI and DKI at 3.0T MRI before the surgery. Based on the setting of ROIs, the DWI and DKI parameters (including ADC, diffusion kurtosis (K) and diffusion coefficient (DK)) of each patient's gastric adenocarcinoma were measured and calculated. According to expression of Ki-67, participated subjects were divided into two groups (low Ki-67 group and high Ki-67 group). The intraclass correlation coefficient (ICC) was used to assess the consistency of each parameter measured by two radiologists. The independent-sample t-test was used to compare differences of each parameter between groups. Spearman correlation coefficient was calculated to reveal the correlation between Ki-67 with parameters. By using the area under the curve (AUC) of the receiver operating characteristic (ROC) curve, each parameter was compared. All parameters were included in multivariate logistic regression analysis to explore the relationship between each parameter with high Ki-67. **Results:** ADC and DK were negatively relevant to the expression of Ki-67 ($r = -0.725$,

-0.776, all $P < 0.05$) and K was positive relevant to the expression of Ki-67 ($r = 0.762$, $P < 0.05$). The ADC, DK and K had a diagnostic efficiency in differentiation of low Ki-67 group from high Ki-67 group. A higher K value ($K > 6.91 \times 10^{-2} \text{ mm}^2/\text{s}$) independently predicted a high Ki-67 status. Conclusions: DWI and DKI can effectively reflect the proliferative characteristics of gastric adenocarcinoma. And K is the strongest independent factor for predicting high Ki-67 status.

PO-2657

Automatic Diagnosis and Measurement of Intracranial Aneurysms Using Deep Learning in MRA Raw Images

Qingning Yang, Chuanming Li

Chongqing University Central Hospital, Chongqing Emergency Medical Center

Objectives: In traditional clinical practice, the 3D reconstruction, visual recognition, and size measurement of intracranial aneurysms (IA) using MRA was very time-consuming and labor-intensive. In this study, a deep learning model was established to automatically diagnose and measure IA based on 2d original images.

Materials and methods: 852 IAs (806 patients) from the hospital 1 were included and randomly divided into training set, test set and internal validation set in a ratio of 7:3:3. Additionally, 319 patients (181 cases with IA, 136 cases without IA) from the hospital 2 were used for independent validation. A deep learning model based on 3D U-net was established for aneurysm diagnosis and measurement. The TP, FP, FN, Recall, Precision, Sensitivity and Specificity indexes were used to evaluate the detection performance of the model. Intraclass correlation coefficient was used to test the consistency between the measurement results of MR 3D U-net and DSA.

Results: For the IA detection, in the internal validation set, the recall, precision and sensitivity were 0.79, 0.62 and 0.75, respectively. In the independent validation set, the recall, precision, sensitivity and specificity were 0.71, 0.68, 0.74 and 0.77, respectively. For the IA measurement, the MR 3D U-net and DSA showed good consistencies, with ICC of 0.77 and 0.82, respectively.

Conclusions: In this study, a one-click fully automatic deep learning model was developed for automatic IA diagnosis and measurement. It could greatly shorten diagnostic time and reduce the workload of radiologists.

PO-2658

A correlative study of pituitary MRI manifestations in patients with hyperprolactinemia

Minyang Wang, Ying Yu, Guangbin Cui

Tangdu Hospital, Fourth Military Medical University

Objective To explore the pituitary MRI manifestations in patients with hyperprolactinemia, and to provide an objective basis for differentiating microprolactinomas from hyperprolactinemia.

Methods The MRI manifestations of 121 patients with hyperprolactinemia and 71 normal individuals were retrospectively analyzed, along with the clinical symptoms of the patients. Clinical symptoms, MRI pituitary morphology, signal intensity, and dynamic enhancement semiquantitative parameters (time to peak, maximum enhancement rate, and enhancement slope) were assessed in patients with hyperprolactinemia. Differences in age, anteroposterior diameter, transverse diameter, and volume of the pituitary gland between the hyperprolactinemia group and the normal control group were tested using two independent samples t-test. Pituitary median sagittal height and maximum height were assessed using a nonparametric test. Additionally, differences in sex,

pituitary stalk position, and pituitary morphology between the hyperprolactinemia and normal control groups were evaluated through a chi-square test. Correlations between the prolactin ratio and each measurement were analyzed using spearman correlation analysis.

Results The pituitary stalk was deviated in 19.8% of patients with hyperprolactinemia, and the pituitary morphology showed depression, flatness, and elevation in 28.1%, 50.4%, and 21.5%, respectively. The dynamic enhancement curve was steeply ascending in 77.5% and slowly ascending in 22.5%. The ratio of serum prolactin levels correlated only with the maximum enhancement rate ($P=0.025$, $r=-0.213$). Pituitary stalk excursion and pituitary morphology in the hyperprolactinemia group were not statistically different from normal controls ($P=0.273$ and 0.114). However, pituitary volume was greater in the hyperprolactinemia group than in the normal control group ($P=0.036$), while anteroposterior diameter, transverse diameter, median sagittal height and maximum height of the pituitary gland did not differ significantly between the two groups.

Conclusion Exploring and analyzing the morphology and signal characteristics of pituitary MRI in patients with hyperprolactinemia reveals differences compared to normal controls. This investigation lays the foundation for early and accurate diagnosis of microprolactinomas, providing an objective basis for clinical treatment decisions.

PO-2659

The value of myocardial contraction fraction and long-axis strain to predict late gadolinium enhancement in multiple myeloma patients with secondary cardiac amyloidosis

Mengyao Hu, Yipei Song, Chunhua Yang, Jiazhao Wang, Wei Zhu, Ao Kan, Pei Yang, Lin Xu, Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Purpose: The objective of this study is to evaluate the efficacy of conventional and two supplementary functional markers obtained from standard cardiac magnetic resonance (CMR) images in predicting the presence of late gadolinium enhancement (LGE) in patients diagnosed with secondary cardiac amyloidosis (CA) associated with multiple myeloma (MM).

Methods: This study retrospectively enrolled 32 patients with preserved ejection fraction who were diagnosed with MM-CA in a consecutive manner. Using commercial cardiac post-processing software to obtain conventional left ventricular (LV) function markers and two supplementary functional markers, namely myocardial contraction fraction (MCF) and LV long-axis strain (LAS). Logistic regression analyses and receiver operating characteristic (ROC) analysis were performed for predict performances.

Results: 1) There were no notable distinctions in clinical features between the LGE+ and LGE- groups, with the exception of a reduced systolic blood pressure in the former (105.60 ± 18.85 mmHg vs. 124.50 ± 20.95 mmHg, $P=0.022$). 2) Patients with MM-CA presented with intractable heart failure with preserved ejection fraction (HFpEF). The left ventricular ejection fraction (LVEF) in the LGE+ group exhibited a greater reduction (54.27%, IQR 51.59% to 58.39%) in comparison to the LGE- group ($P<0.05$). And MM-CA patients with LGE+ had significantly higher LVMI (90.15 ± 23.69 g/m²), lower MCF (47.39%, IQR 34.28% to 54.90%), and the LV LAS were more severely damaged (-9.94 ± 3.42 %) than patients with LGE- (all P values <0.05). 3) The study found that MCF exhibited a significant independent association with LGE, as indicated by an odds ratio of 0.89 ($P<0.05$). The cut-off value for MCF was determined to be 64.25% with a 95% confidence interval ranging from 0.758 to 0.983. The sensitivity and specificity of this association were calculated to be 95% and 83%, respectively.

Conclusion: MCF is a simple reproducible predict marker of LGE in MM-CA patients. It is a potentially CMR-based method that promise to reduce scan times and costs, and boost the accessibility of CMR.

PO-2660

The utilization of cardiac magnetic resonance in hypertrophic cardiomyopathy in the past 10 years (2013-2023): A bibliometric analysis based on Citespace

Mengyao Hu¹, Yu Shen², Yipei Song¹, Shuhao Li¹, Pei Yang¹, Ao Kan¹, Qiming Fang¹, Yun Peng¹, Haibo Ren¹, Lianggeng Gong¹

1. The Second Affiliated Hospital of Nanchang University

2. The First Affiliated Hospital of Nanchang University

Background and objectives: Hypertrophic cardiomyopathy (HCM) is a prevalent genetic cardiac disorder characterized by the hypertrophy of a segment of the myocardium. Cardiac magnetic resonance (CMR) has been widely used in the assessment of HCM. However, bibliometrics on CMR for HCM still need to be added. This study aims to analyze the global research trend of CMR for HCM in the past 10 years.

Methods: A systematic search was conducted on the Web of Science about CMR in the assessment of HCM. The databases were searched from 2013 to August 2023. Citespace is a service that researches the underlying knowledge in the scientific literature. We used it to analyze the relationship between publication year and country, institution, journal, author, bibliography, and keywords about CMR in the assessment of HCM.

Results: A total of 1427 articles were included for analysis. In the assessment of HCM, the findings from the past decade have consistently demonstrated a progressive rise in the quantity of articles pertaining to CMR. The country with the largest number of publications is the United States of America (USA) (310), and the institution with the largest number of publications is University College London (45). The analysis of keywords revealed that the diagnosis and management of HCM using CMR is the current research focus and emerging trend within this academic field.

Conclusion: This study presents a novel approach for visually analyzing the utilization of CMR in evaluating HCM. The current research trajectory in CMR focuses on diagnosing and managing patients with HCM. While the majority of studies affirm the indispensability of CMR in assessing HCM, there remains a need for large-scale, randomized controlled trials to comprehensively evaluate the efficacy of CMR in this context.

PO-2661

Value of blood oxygenation level-dependent magnetic resonance imaging in early evaluation of the response and prognosis of esophageal squamous cell carcinoma treated with definitive chemoradiotherapy: A preliminary study

Huanhuan Zheng, Yan Zhu, Song Liu, Wei Ren

Department of Radiology, Nanjing Drum Tower Hospital, The Affiliated Hospital of Nanjing University Medical School

Objective: To establish a quantitative imaging predictor for evaluation of early treatment response and prognosis to definitive chemoradiotherapy (dCRT) in patients with esophageal squamous cell carcinoma (ESCC), using blood oxygenation level-dependent (BOLD) magnetic resonance imaging (MRI).

Methods: The R2* values were obtained pre and 2-3 weeks post-dCRT in 28 patients with EC using BOLD MRI. Independent samples t-test (normality) or Mann-Whitney U test (non-normality) was used to compare the differences of R2*-related parameters between the complete response (CR)

and the non-CR groups. Diagnostic performance of parameters in predicting response was tested with receiver operating characteristic (ROC) curve analysis. The 3-year overall survival (OS) was evaluated using Kaplan Meier curve, log rank test, and Cox proportional hazards regression analysis.

Results: The post- $R2^*$, $\Delta R2^*$, and $\Delta\%R2^*$ in the CR group were significantly higher than those in the non-CR group ($P = 0.002, 0.003, \text{ and } 0.006$, respectively). The $R2^*$ -related parameters showed good prediction of tumor response, with AUC ranging from 0.813 to 0.872. The 3-year OS rate in patients with $\Delta R2^* > -7.54 \text{ s}^{-1}$ or CR were significantly longer than those with $\Delta R2^* \leq -7.54 \text{ s}^{-1}$ (72.37% vs. 0.00%; Hazard ratio, HR = 0.196; 95% confidence interval, 95% CI = 0.047-0.807; $P = 0.024$) or non-CR (76.47% vs. 29.27%; HR = 0.238, 95% CI = 0.059-0.963; $P = 0.044$).

Conclusions: The preliminary results demonstrated that the $R2^*$ value might be a useful hypoxia imaging predictor for response and prognosis of ESCC treated with dCRT. BOLD MRI may be used as a potential tool for evaluating tumor oxygenation metabolism, which is routinely applied in clinical practice and beneficial to clinical decision-making.

PO-2662

Measurement of tumor heterogeneity with habitats in breast cancer and its application in molecular subtype discrimination

Run Xu, Peng Luo, Guanwu Li

Shanghai University of Traditional Chinese Medicine Yueyang Hospital of Integrated Traditional Chinese Medicine and Western Medicine

PurposeTo develop multiparametric physiologic MRI-based spatial habitat analysis and to validate the association between the habitats and the molecular subtypes of breast cancer.

MethodsIn an IRB approved retrospective study, 142 biopsy- and surgery-proven breast cancer (56 ± 27 years) with 148 lesions underwent DWI and abbreviated DCE-MRI examination on a 3-T scanner (uMR 780, United Imaging Healthcare, Shanghai, China). As illustrated in Figure 1, a three-dimensional parametric space for clustering of ROIs was constructed with processed ADC, wash-in, and wash-out features. An iterative unsupervised machine learning clustering algorithm, k-means, is applied in the 3D parametric space of all patients to stabilize the assignment of clusters among patients. The heterogeneity was quantified using the neighbors' information of each voxel. **Results**Three habitats sharing similar characteristics were constructed and assigned as hypervascular habitat (high wash-in and wash-out), hypovascular cellular habitat (low ADC and low wash-in/wash-out), and nonviable habitat (high ADC and wash-in/wash-out), respectively. Figure 2 shows the TNBC had a larger Habitat 3 and smaller Habitat 1. The volume fraction of hypervascular habitat showed good predictive performance of TNBC (AUC 0.853; 95% CI, 0.786–0.906) at an optimized threshold lower than 20.4% with 84.6% sensitivity and 91.0% specificity. Similarly, the fraction of nonviable habitat showed a prediction performance (AUC 0.752; 95% CI, 0.674–0.891) at an optimized threshold greater than 32.9%, with 73.1% sensitivity and 76.2% specificity, as shown in Figure 3.

ConclusionThe habitat method using conventional ADC and DCE-MRI may be a useful and practical imaging biomarker for predicting the TNBC status.

Limitation

A retrospective, single-institution study with unbalanced molecular subtypes, further study on other subtypes is possible.

PO-2663

Hippocampal dynamic functional connectivity, HPA axis activity, and personality trait in bipolar disorder with suicidal attempt

Pan Chen,Ying Wang
First Affiliated Hospital of Jinan University

Background The aim of this study was to explore the mechanisms underlying suicidal behavior by detecting dynamic functional connectivity (dFC) variability of hippocampus and hypothalamic-pituitary-adrenal (HPA) axis activity, and their associations with personality traits in bipolar disorder (BD) with suicidal attempt (SA).

Methods Resting-state functional magnetic resonance imaging data were obtained from 79 patients with BD (39 with SA and 40 without SA) and 35 healthy controls. The activity of the HPA axis was assessed by measuring morning plasma adrenocorticotrophic hormone (ACTH) and cortisol (CORT) levels. All participants underwent personality assessment using Minnesota Multiphasic Personality Inventory-2 (MMPI-2).

Results SA exhibited lower ACTH and increased dFC variability between right caudal hippocampus and left superior temporal gyrus (STG) compared to the non-SA. For SA, ACTH was positively correlated with dFC variability between right caudal hippocampus and left STG. SA scored significantly higher on the Hypochondriasis, Depression and Schizophrenia versus non-SA. Additionally, the interaction of ACTH \times dFC variability between right caudal hippocampus and left STG represented an independent contributing factor of Depression score in the SA.

Conclusions These results suggested that suicidal BD exhibited increased dFC variability of hippocampal-temporal cortex and less HPA axis hyperactivity, which may both together lead to the possibility of changes in personality.

PO-2664

The Value of DCE-MRI and MRS in the Differentiation of Pseudoprogression and Recurrence of Intracranial Gliomas

Hui Jing,Kun Peng
General Hospital of Taiyuan Iron and Steel Group Co., LTD.

Objective:

The objective of this study was to determine the value of dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) and magnetic resonance spectroscopy(MRS) in differentiating postoperative changes in intracranial gliomas.

Methods:

A retrospective analysis of fifty-five patients with high-grade glioma who underwent surgery and combined postoperative radiotherapy and chemotherapy treatments with new enhancement lesions or enlarged areas of enhancement was performed from February 2015 to June 2021, according to the pathological results of the second operation or a follow-up of more than 6 months, they were divided into recurrence group and pseudoprogression group. DCE-MRI and MRS scans were performed at the time of reexamination, and the relevant parameters of DCE-MRI and MRS were analyzed, the sensitivity, specificity, accuracy, positive predictive value and negative predictive value of DCE-MRI or MRS diagnosis alone and combined diagnosis were compared, and the application value of the two methods in differentiating recurrence from pseudoprogression of high-grade glioma was evaluated.

Results:

(1)Among the 55 patients, 30 were confirmed to be pseudoprogression and 25 were confirmed to be tumor recurrence;

(2)The Ktrans and iAUC values of the enhanced central area of the recurrence group were higher than those of the pseudoprogression group, and the differences between the groups were statistically significant ($P<0.05$); the ratios of Cho/NAA and Cho/Cr in the recurrent group were higher than those of the pseudoprogression group, and the difference between the groups was statistically significant ($P<0.05$).

(3)The results of the three tests were comparable to the those of pathological examination or follow-up, and the difference was not statistically significant ($P>0.05$). The sensitivity of DCE-MRI, MRS and combined diagnosis was 88.23%, 84.12%, and 90.25%, respectively, the specificity was 88.20%, 84.26%, and 96.18%, respectively, the accuracy was 89.12%, 81.99%, and 92.01%, respectively, the positive predictive value was 85.23%, 86.23%, and 96.28%, respectively, and the negative predictive value was 88.20%, 81.25%, and 89.52%, respectively.

In this study, DCE-MRI and MRS can accurately identify and predict the recurrence and pseudoprogression of glioma. It is helpful to comprehensively guide the early diagnosis, mid-term treatment and prognosis evaluation of glioma, and it is helpful to make a correct and detailed treatment plan and accurately evaluate the therapeutic effect, which has important clinical application value.

Conclusion:

In this study, DCE-MRI and MRS can accurately identify and predict the recurrence and pseudoprogression of glioma. It is helpful to comprehensively guide the early diagnosis, mid-term treatment and prognosis evaluation of glioma, and it is helpful to make a correct and detailed treatment plan and accurately evaluate the therapeutic effect, which has important clinical application value.

Structural and spontaneous functional brain changes in visual and oculomotor areas identified by functional localization task in intermittent exotropia children

Nanxi Fei, Yachen Wang, Bingbing Yang, Tao Fu, Junfang Xian
Capital Medical University, Beijing Tongren Hospital

Intermittent exotropia (IXT) is characterized by an intermittent outward deviation of the eyes. Yet, the neural substrates associated with IXT are not fully understood. This study investigated brain structure and spontaneous functional activity changes in children with IXT. All participants underwent detailed ophthalmological examinations and multimodal magnetic resonance imaging (MRI) scanning. During functional scanning, binocular visual stimuli were presented to subjects to determine brain areas involved in visual and oculomotor processing. Regions of interest (ROI) were subsequently selected based on functional activation to investigate brain structural and spontaneous functional differences between IXT children and healthy controls (HCs) using small volume correction (SVC). Reduced gray matter density (GMD) was found in the right frontal eye field (FEF) and bilateral inferior parietal lobe (IPL) in IXT children compared with HCs. Besides, reduced fractional amplitude of low-frequency fluctuations (fALFF) values were observed in the left lingual gyrus, right inferior occipital gyrus (IOG), bilateral IPL, and bilateral cerebellum in the IXT children compared to the HCs. IXT children with worse eye position control ability exhibited lower GMD and fALFF values in these areas. Finally, resting state functional connectivity (RSFC) was reduced in frontoparietal oculomotor processing areas in IXT children compared to HCs. In addition, increased cortical thickness was found in the right visual areas and bilateral IPL. These results showed that IXT-related structural and functional brain abnormalities occurred in childhood and may be related to underlying neuropathological mechanisms.

PO-2666

Unraveling the Intricacies of Left Ventricular Hemodynamic Forces: Age and Gender-Specific Normative Values Assessed by Cardiac MRI in Healthy Adults

Wenjing Yang, Minjie Lu
Fuwai Hospital, Chinese Academy of Medical Sciences

Aims: Hemodynamic forces(HDFs) provided a feasible method to early detect cardiac mechanical abnormalities by estimating the intraventricular pressure gradients. The novel advances in assessment of HDFs using routine cardiac magnetic resonance(CMR) cines shed new light on detection of preclinical dysfunction. However, definition of normal values for this new technique is the prerequisite for application in the clinic.

Methods: A total of 218 healthy volunteers($38.1\text{years}\pm 11.1$; 111 male [50.9%]) were recruited and underwent CMR examinations with a 3.0 T scanner. Balanced steady state free precession breath hold cine images were acquired and HDF assessments were performed based on strain analysis.

Results: The normal values of longitudinal, transversal HDF strength(RMS) and ratio of transversal to longitudinal HDF were all evaluated in overall population as well as in both genders and in age-specific groups. The longitudinal RMS values(%) of HDFs were significantly higher in women ($P<0.05$). Moreover, the HDF amplitudes significantly decreased with ageing in entire heartbeat, systole, diastole, and diastolic deceleration, while increased in atrial thrust. In multivariable linear regression analysis, age, heart rate and global longitudinal strain emerged as independent predictors of the amplitudes of longitudinal HDFs in entire heartbeat and systole, while left ventricular end-diastole volume index was also independently associated with longitudinal HDFs in diastole and diastolic deceleration($P<0.05$ for all).

Conclusion: Our study provided comprehensive normal values of HDF assessments using CMR as well as presented with specific age and sex stratification. HDFs analyses can be performed with excellent intra and inter-observer reproducibility.

PO-2667

Gut microbiota-brain- inflammation relationships in unmedicated bipolar disorder II: A prospective study

Zixuan Guo, Ying Wang
Jinan University First Affiliated Hospital Medical Imaging Center

[Objective] The dysregulation of gut microbiota and immune are increasingly reported in bipolar disorder (BD), but the relationships of the gut microbiota-brain-immune remains unknown. **[Methods]** 65 Patients with unmedicated BD II depression and 58 healthy controls (HCs) were prospectively enrolled. Fecal samples, blood samples and resting-state functional magnetic resonance imaging (rs-fMRI) were acquired from all subjects. 16S amplicon sequencing was used to assess gut diversity and enterotypes. Serum was assayed for levels of inflammatory cytokines (interleukin [IL]-6, IL-8, IL-10). The amplitude of low-frequency fluctuation (ALFF) was measured, and abnormal ALFF masks were subsequently set as regions of interest (ROIs) to calculate the whole-brain functional connectivity (FC) and dynamic functional connectivity (dFC). Then, the partial correlation coefficients among the abnormal neuroimaging measures, gut microbiota and inflammatory cytokines levels were performed. Additionally, the support vector machine (SVM) classifiers were carried out to distinguish patients with BD II from HCs. **[Results]** Patients with BD II exhibited decreased ALFF values in the left cerebellum Crus II, as well as decreased FC between the left cerebellum Crus II and the right inferior parietal lobule (IPL), and decreased dFC between the left cerebellum Crus II and right cerebellum and right superior frontal gyrus compared to HCs.

Moreover, higher IL-6, IL-8, IL-10 levels, and 14 species increased and 5 species decreased were identified in patients compared to HCs. Correlation analysis showed that genus Parabacteroides was positively correlated with IL-10 level, as well as negatively correlated with ALFF values in the left cerebellum Crus II in patients with BD II. IL-8 level was negatively correlated with FC of the left cerebellum Crus II to the right IPL in patients with BD II. In terms of the classification of BD from HCs, it reached optimized area under curve (AUC) at 0.852 when combining abnormal gut microbiota, inflammatory cytokines and neuroimaging measures. [Conclusion] Our findings may enable a better understanding of the gut microbiota-brain- inflammation relationships in BD II.

PO-2668

The predictive value of myocardial microcirculation for left ventricular reverse remodeling in dilated cardiomyopathy patients

Ao Kan, Qimin Fang, Mengyao Hu, Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Aims: We aim to assess the degree of coronary microvascular dysfunction (CMD) in dilated cardiomyopathy (DCM) patients based on cardiac magnetic resonance (CMR) first-pass perfusion parameters and to investigate the relationship between myocardial perfusion and left ventricle reverse remodeling (LVRR).

Methods: This retrospective study included eligible 94 DCM patients and 35 age- and sex-matched healthy controls. Myocardial perfusion parameters, including upslope, time to maximum signal intensity ($Time_{max}$), maximum and baseline signal intensity (SI_{max} , $SI_{baseline}$, $SI_{max-baseline}$) were recorded. The left ventricular (LV) structure and function parameters were also assessed. These parameters were compared among healthy controls, DCM with LVRR and without LVRR. The correlation between myocardial perfusion parameters and LV structure, function was explored. Univariable and multivariable logistic regression analyses were performed to identify the predictors of LVRR.

Results: At a median follow-up time of 12 [interquartile range (IQR), 8-13] months, 41 DCM patients (44%) achieved LVRR. Compared with healthy controls, DCM patients represented CMD with reduced upslope, $SI_{baseline}$ and increased $Time_{max}$ (all $P < 0.01$). $Time_{max}$ was further increased in LVRR than non-LVRR group (60.35 [IQR, 51.46-74.71] vs. 72.41 [IQR, 59.68-97.70], $p=0.017$). Myocardial perfusion parameters were correlated with left ventricular ejection fraction ($Time_{max}$: $r=-0.19$, $p=0.047$) and LV cardiac mass index (upslope: $r=-0.15$, $p=0.021$; SI_{max} : $r=-0.07$, $p=0.047$; $SI_{max-baseline}$: $r=-0.09$, $p=0.047$) in DCM patients. In the multivariate logistic regression analyses, $Time_{max}$ [odds ratio (OR) 0.98; 95% confidence interval (CI) 0.95-1.00; $p=0.032$], heart rate (OR 1.04; 95% CI 1.01-1.08; $p=0.029$), LV remodeling index (OR 1.73; 95% CI 1.06-3.00; $p=0.038$) and LGE extent (OR 0.85; 95% CI 0.73-0.96; $p=0.021$) were independent predictors of LVRR.

Conclusions: CMD could be found in DCM patients and was more impaired in patients without LVRR than with LVRR. $Time_{max}$ at baseline was an independent determinant of LVRR in DCM.

PO-2669

Common and distinctions between the type 2 diabetes mellitus and Alzheimer's disease: A systematic review and multimodal neuroimaging meta-analysis

Hao Xie

Tangdu Hospital, Fourth Military Medical University

Background: Alzheimer's disease (AD) and type 2 diabetes mellitus (T2DM) are aging related diseases with high incidence. Because of the correlation of incidence rate and some possible mechanisms of comorbidity, the two diseases have been studied in combination by many researchers, and even some scholars call AD type 3 diabetes. But the relationship between the two is still controversial.

Methods: This study used AES-SDM software to conduct a meta-analysis of the whole brain resting state functional magnetic resonance imaging (rs-fMRI) study, exploring the differences in amplitude low-frequency fluctuation (ALFF) and cerebral blood flow (CBF) between patients (including AD or T2DM) and healthy controls, and looking for neuroimaging evidence of the relationship between the two diseases.

Results: The results of the T2DM group showed an increase in ALFF in the cerebellum and left inferior temporal gyrus, while a decrease in the left middle occipital gyrus, right inferior occipital gyrus, and left precentral gyrus. CBF increased in the right supplementary motor area and decreased in the middle occipital gyrus and inferior parietal gyri. The results of the AD group showed that ALFF increased in the right cerebellum, right hippocampus, and right striatum, while decreased in the precuneus gyrus and right superior temporal gyrus. CBF decreased in the precuneus gyrus and inferior parietal gyri. A multimodal analysis of a disease showed a decrease in ALFF and CBF in the occipital of T2DM and in the parietal lobes of AD. The joint analysis between diseases showed that both T2DM and AD had a common decrease in CBF in the right occipital gyrus.

Conclusion: Based on the neuroimaging evidence, we believed that the two diseases were completely different and had their own characteristics of brain damage. There was a small overlap in the changes of CBF between the two groups, which may be related to the similarity in clinical characteristics of the two groups.

PO-2670

Differentiation Value of Left Atrial Dysfunction in Reperfused Chronic Myocardial Infarction

He Zhang^{1,2}, shijing wang²

1. The affiliated hospital of Nantong university

2. The first affiliated hospital of China medical university

Abstract: Evaluation of left atrial dysfunction is of great value to assess reperfused chronic myocardial infarction. LA volumetric and strain parameters can be of great help to estimate left atrial function. However, limited data are accessed on its prognostic value in reperfused chronic myocardial infarction.

Purpose: In order to evaluate the relationship between LA volumetric and strain parameters in patients with chronic myocardial infarction.

Materials and methods: In this retrospective study, recruited people (included from April in 2017 to the June in 2021) experience cardiovascular MRI. The relationship between LA volumetric and strain parameters and chronic myocardial infarction was evaluated by linear regression.

Results: 83 patients with chronic myocardial infarction(mean age \pm standard deviation, 58.16 years \pm 9.58; 69men) were included. LATEF was weakly correlated with LAVmin(Pearson correlation coefficient $r=-0.674$, $P < 0.001$), Booster longitudinal strain($r=0.577$, $P < 0.001$), GLSRa($r=-0.567$, $P<0.001$), Total longitudinal strain($r=0.574$, $P<0.001$). Better passive radial strain is correlated to a lower rate of chronic myocardial infarction(hazard ratio, 0.789[0.699,0.892]; $P<0.001$) after adjusting for multiple clinical and CMR-based variables.

Conclusion: Left atrial volumetric parameters, strain and strain rate can be of great value in reperfused chronic myocardial infarction.

PO-2671

Effect of infarct location and size on Left Atrial Function: a cardiovascular magnetic resonance feature tracking study

He Zhang^{1,2}, shijing wang²

1. The affiliated hospital of Nantong university

2. The first affiliated hospital of China medical university

Background: LA function has been recognized as a significant prognostic marker in many cardiovascular diseases. Cardiovascular magnetic resonance feature tracking (CMR-FT) represents a promising technique for left atrial function evaluation.

Purpose: To investigate the effect of location and size of previous myocardial infarction (MI) on LA function using CMR-FT.

Study type: Retrospective.

Population: Patients formerly diagnosed with anterior MI (n=42) or non-anterior MI (n=40) and healthy controls (n=47).

Field Strength/Sequence: A 3.0T MR, Steady state free precession (SSFP), Phase-sensitive inversion recovery (PSIR).

Assessment: Infarct location and size were assigned and quantified by late-gadolinium enhancement (LGE) imaging. LA performance was analyzed using CMR-FT in 2- and 4-chamber cine images, including LA reservoir, conduit and booster pump function.

Statistics: Descriptive statistics, ANOVA with post Bonferroni correction, Kruskal-Wallis H, Spearman's correlation, intraclass correlation coefficient.

Results: Anterior MI patients had impaired LA reservoir function (LATEF, ϵ_s , SRs), conduit function (LAPEF, ϵ_e , SRs) and booster pump function (LAAEF, ϵ_a) compared with controls ($p < 0.05$). Non-anterior MI patients had impaired LA strain (ϵ_s , ϵ_e , ϵ_a ; $p < 0.05$) but preserved LAEFs ($p > 0.05$). After adjusting the area of MI, there was no significant difference in the LA morphology and function between the anterior and non-anterior wall groups. Stratification analysis by MI size revealed that LA volumes and LAEFs were unchanged in patients with MI size $\leq 15\%$ compared with controls ($p > 0.05$), only ϵ_s and ϵ_e were decreased ($p < 0.05$). Increased LAVIpre-a, LAVImin and decreased LATEF, LAAEF were found in patients with MI size $> 15\%$ compared with MI size $\leq 15\%$ group ($p < 0.05$). LVSVI, ϵ_s , and MI size were significant correlated with LAVI pre-a in multiple stepwise regression analysis.

Data conclusions: The location of myocardial infarction is not a major factor affecting the morphology and function of the left atrium. Patients with MI size $> 15\%$ experience more pronounced post-infarction LA remodeling and dysfunction than MI size $\leq 15\%$ patients.

LVS_{VI}, ϵ_s , and MI size were significant correlated with LAVI_{pre-a} in multiple stepwise regression analysis.

Data conclusions: The location of myocardial infarction is not a major factor affecting the morphology and function of the left atrium. Patients with MI size $> 15\%$ experience more pronounced post-infarction LA remodeling and dysfunction than MI size $\leq 15\%$ patients.

PO-2673

Study on the effect of acupuncture on brain function connection in patients with primary dysmenorrhea based on edge connection analysis

Zhongxu Zhang, Xiaotong Ma

Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine

Objective: To explore the changes of the brain at rest functional connectivity in patients with primary dysmenorrhea (PDM) after acupuncture treatment. **Methods:** 34 patients with PDM were enrolled in the study and treated with acupuncture for a menstrual cycle. The points of Sanyinjiao, Ganyuan group were selected for compatibility. PDM patients received the first functional magnetic

resonance imaging (rs-fMRI) scan within 1-2 days of the first menstrual period after enrollment, and then received acupuncture treatment 7 days before the next menstruation, once a day, 30 minutes each time. When menstruation came, acupuncture stopped and the second rs-fMRI scan was performed within 1-2 days of this menstrual period. Evaluate the efficacy of acupuncture using visual analog scale (VAS), dysmenorrhea symptom scale (CMSS), self rating anxiety scale (SAS), and self rating depression scale (SDS). The edge analysis method was used to describe the changes in functional connectivity (FC) of various brain regions in PDM patients after acupuncture, and correlation analysis was conducted with clinical scores. Results: The scores of VAS, CMSS, SAS and SDS after acupuncture in PDM group and CMSS, SAS and SDS after acupuncture in HC group were lower than those before acupuncture ($P<0.05$). Compared with that before acupuncture, FC between the right middle cerebral island and the right middle frontal gyrus, and between the left central sulcus cover and the right superior temporal gyrus in the PDM group during the menstrual period was enhanced; FC between right precentral gyrus and bilateral thalamus, right lenticular nucleus, right posterior central gyrus and left middle frontal gyrus, right supplementary motor area, right anterior cingulate gyrus and left anterior cingulate gyrus, right posterior cingulate gyrus, left precentral gyrus and left thalamus, right posterior cingulate gyrus and left middle temporal gyrus, left posterior central gyrus and left thalamus decreased. The FC in the left precentral gyrus and left thalamus was positively correlated with SDS ($r=0.516$, $P=0.002$). Conclusion: The neural pathways that acupuncture takes effect mainly include the thalamus - sensorimotor cortex circuit, and the cingulate cortex circuit of DMN and SN. The two main lines jointly shoulder the tasks of analgesia, emotional relief, and painful attention transfer. The use of edge analysis algorithm revealed predictive neural biomarkers for the efficacy of acupuncture in alleviating PDM pain syndrome, contributing to updating and supplementing the large-scale synthetic functional neuroimaging database, and providing data supplementation for identifying brain pain activity related images.

PO-2674

A study of functional brain networks in patients with primary dysmenorrhea based on graph theory

Xiaotong Ma, Zhongxu Zhang

Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine

Objective: To investigate the changes and application values of functional brain network topological properties in patients with primary dysmenorrhea (PDM). Methods: A sample of 57 PDM patients and 50 health controls (HC) was included. After the resting-state functional magnetic resonance imaging (rs-fMRI) data of all subjects were collected, using the Graph Theoretical Network Analysis (GRETNA) to do data preprocessing and construct the functional network, and then graph theory was utilized to calculate the network topological properties. Then, differences between the two groups were compared based on independent-samples t-test. Results: There were no significant differences in age, height, weight, menstrual cycle, menstrual duration and menstrual volume between the two groups ($P>0.05$). The course of disease, menstrual VAS, CMSS, SAS and SDS of PDM group were higher than those of HC group ($P<0.05$). Both groups conform to small-world attributes within the sparsity range, The global efficiency (E_g), mean clustering coefficient (C_p) and mean path length (L_p) of brain network had no significant differences ($P>0.05$). In the PDM group, node efficiency (N_e), node degree (D_c), node betweenness (B_c) in the left medial frontal gyrus, bilateral posterior cingulate gyrus, left insula, B_c in the left precentral gyrus, left anterior cingulate gyrus, D_c in the right precentral gyrus was significantly higher than HC group. The N_e , B_c , D_c of the left inferior temporal gyrus, the N_e , D_c of the right inferior frontal gyrus of the insular cortex, the D_c of the right orbital inferior frontal gyrus and the N_e of the right cuneus were significantly lower than HC group ($P<0.05$). The functional connectivity (FC) between the left posterior cingulate gyrus and the right cortex around calcarine fissure, the right lingual gyrus, the left middle frontal gyrus, the right posterior cingulate gyrus and the right dorsolateral superior frontal gyrus, the left middle frontal gyrus, the right insula and the left middle occipital gyrus in the PDM

group was higher than that in the HC group ($P<0.001$). Conclusion: There were no significant abnormalities in the global attributes of the brain functional network in PDM patients, and there was a significant positive activation of functional connections in some brain regions during the menstrual period, involving salience networks, default state networks, sensory motor networks, and central executive networks. During the menstrual period, some brain node attributes in PDM patients are abnormal, and the functional connections represented by the cingulate gyrus are positively activated, which may become potential biomarkers of PDM.

PO-2675

MRI-enhanced subtraction pattern in patient prognosis assessment in recurrent glioblastoma

Zifan Sang, Weiguo Zhang
Daping hospital

Objective: Defining tumor boundaries is difficult due to the infiltrative and uneven enhancement of gliomas, which is particularly common in post-recurrence antiangiogenic therapy. The post-treatment image T1 is significantly shortened, and the enhancement mode is associated with the high heterogeneity of the vascular structure of GBM. To investigate the effects of enhancing tumor volume (V), total volume (Vn) and relative non-enhancing tumor ratio (rNTR) before second-line treatment on overall survival (OS) and post-recurrence survival (PRS) in rGBM. Methods: A retrospective analysis was performed for 93 patients with recurrent GBM in the Daping hospital from July 2012 to December 2022. Quantitative measurements of V, Vn (including tumor enhancement, necrotic and cystic volume) and rNTR (FLAIR high signal volume/enhancing tumor volume) were performed in subtraction mode at T1WI. The Kaplan-Meier method and log-rank test was performed. The Cox model was used for univariate and multivariate prognostic analysis. Three multivariate Cox regression analysis models were constructed for the three main exposure factors V, Vn and rNTR, respectively. The difference in $P<0.05$ was statistically significant. Results: The median PRS was 239 days (95%CI=217.6~260.4) and the median OS was 443 days (95%CI=379.6~506.4). Kaplan-Meier curve and log-rank test showed PRS and OS differences between high and low levels groups of V and NTR ($P<0.05$). In univariate analysis, V, Vn and NTR are all significant factors of PRS and OS ($P<0.05$). V and Vn are independent PRS risk factors (HR=1.015, 1.014, $P=0.001$, $P<0.001$), and Vn was independent OS risk factor for (HR=1.007, $P=0.038$). Conclusion: Voxel subtraction technique can accurately assess the size of recurrent tumors in GBM patients, and provide a reliable reference for clinical evaluation of the extent of lesions and survival time of patients.

PO-2676

A comprehensive study of intracranial atherosclerotic plaque by 3.0T magnetic resonance high-resolution vascular wall technology

Yan Wang¹, ming zhang²

1. bǎojiāshì zhōngxīnyīyuàn

2. The First Affiliated Hospital of Xi'an Jiaotong University

Objective To analyze the distribution characteristics of intracranial plaque number and risk factors for plaque predisposing to occur in patients with ischemic cerebrovascular disease based on magnetic resonance high-resolution vascular wall technology.

Methods A total of 62 patients with ischemic cerebrovascular disease who underwent magnetic resonance high-resolution intracranial vascular wall examination were collected, and the distribution characteristics of intracranial artery plaque number were analyzed by single factor and nonparametric rank and multiple post-event examinations. The patients were divided into plaque group and no plaque group, and univariate and multivariate logistic regression were used to analyze the risk factors for plaque predisposition.

Results There were significant differences between the number of plaques in the intracranial segment of bilateral ICA and the rest of the arteries ($P < 0.05$), and hyperlipidemia, smoking and ABCD scores were risk factors for plaque ($OR = 7.322$, 95% CI 1.036-51.990, $P = 0.046$; $OR = 9.151$, 95% CI 1.152 -72.769, $P < 0.036$, $OR = 3.354$, 95% CI 1.256-8.897, $P = 0.016$).

Conclusion Patients with anterior circulation plaque are more common and bilateral ICA intracranial segment is most prone to plaque, and high blood lipidemia, smoking and high ABCD score are risk factors for plaque. Therefore, early control of risk factors and timely detection of plaques in clinical work can prevent the occurrence of ischemic cerebrovascular disease.

PO-2677

Exploring Gray Matter Changes in Tinnitus with and without Hearing Loss: Source-based morphometry (SBM) and Voxel-based morphometry (VBM) study

Li Qin, Qiu Ge, Jiayu Ni, Enli Jin, Chaoqi Shi, Zili Yin, Yuan Li

Affiliated Hospital of HangZhou Normal University

Objective: Advanced MRI studies have improved our understanding of brain alterations in tinnitus patients. Yet, limited research has distinguished these changes based on hearing loss, resulting in inconsistent findings. In this study, we used both univariate and multivariate approaches to examine gray matter morphological changes in tinnitus patients with and without hearing loss.

Methods: We conducted structural MRI scans paired with standard audiometry assessments on three distinct groups: 15 tinnitus patients with hearing loss (T+HL), 19 tinnitus patients without hearing loss (T-HL), and 20 healthy controls (HC). Using voxel-based morphometry (VBM), we performed voxel-wise comparisons of whole-brain gray matter volume (GMV) among these three groups through a one-way analysis of variance (ANOVA). We also employed source-based morphometry (SBM) to discern patterns of structural covariation in GMV, and compare the Z-transformed loading coefficients (Z-scores) across the three groups. Additionally, we correlated these with clinical characteristics in tinnitus patients.

Results: The VBM analysis showed reduced GMV in the left precuneus and right cerebellum in T-HL vs. HC. Conversely, the T+HL group exhibited significant GMV decreases in the left precuneus,

right cerebellum, left anterior cingulate cortex, and left supplementary motor area vs. HC. Remarkably, the T-HL group exhibited an increase in GMV in the aforementioned regions, with the exception of the right cerebellum vs. T+HL. SBM analysis revealed significant Z-score differences in component 6 when T+HL vs. HC, primarily involving the precuneus, lingual gyrus, and thalamus. These differences correlated with both tinnitus severity and duration.

Conclusions: These findings not only shed new insights into the unique structural networks that underlie the neural mechanisms in tinnitus patients, both with and without hearing loss, but they also offer potential guidance for future therapeutic strategies.

PO-2678

Shared and Unique Alterations of Large-Scale Network Connectivity in drug-naïve Adolescent-onset and Adult-onset Major Depressive Disorder

Ximan Hou, Rui Liu, Yun Wang, Yuan Zhou, Xu Chen, Aihong Yu
Department of Radiology, Beijing Anding Hospital, Capital Medical University

[Objective] Compared with adult-onset MDD, adolescent-onset MDD is associated with an increased likelihood of recurrent depressive episodes, increased symptom severity, more insidious symptoms and higher risk of mania. Current MDD brain network studies only focus on one age level. We aim to explore the Shared and Unique Alterations of Large-Scale network connectivity between the two different age level of MDD, and explain why MDD symptoms differ between two different age levels from the perspective of neural mechanisms.

[Methods] In this study, 46 adolescents with MDD, 35 adults with MDD, 19 healthy adolescents and 56 healthy adults completed resting-state functional magnetic resonance imaging (R-fMRI) scans. We used surface-based methods to preprocess R-fMRI data. Large-scale network analyses were applied based on the Schaefer's template. We calculated the intra-network and between-network functional connectivity (FC) of visual network (VN), sensorimotor network (SMN), dorsal attention network (DAN), ventral attention network (VAN), limbic network (LN), frontoparietal network (FPN) and default mode network (DMN). Then we used 2x2 ANOVA to analyze the main effects of diagnosis, age and their interaction effect on brain FC. In addition, we examined correlations between network abnormalities and HAM-D sub-scores.

[Results] Results found that both the adult and adolescent groups have diagnosis main effect on FC of VN, LN, VN-DAN and VN-LN, uncorrelated with age stratification. Post hoc analysis showed that the shared increased network connectivity was found in MDD group. There was an interaction effect of diagnosis and age on intra-network connectivity of DAN and LN. Post hoc analysis showed that intra-network connectivity of DAN and LN in adolescent patients with MDD was significantly lower than that in the adolescent HCs ($p=0.032$), whereas DAN connectivity in adult patients with MDD was significantly higher than that in the adult HCs ($p=0.008$). Regression analysis showed that these abnormal FCs were associated with HAM-D factor 1 anxiety somatization, and the association was more significant in the adults with MDD.

[Conclusion] Our findings indicated that both adolescents and adults with MDD have shared and unique Large-Scale network alterations. And we found the correlation between factor 1 anxiety somatization and abnormal FC was more significant in the adults with MDD. The results may explain why symptoms are more insidious in adolescents with MDD. The results also suggest that when we explore biomarker of MDD, we should include age as a consideration.

PO-2679

Intravoxel Incoherent Motion Diffusion-weighted imaging for evaluating the pancreatic perfusion in cirrhotic patients

Ran Hu,Hua Yang
Chongqing Hospital of Traditional Chinese Medicine

Purpose: To assess the characteristics of pancreatic perfusion in normal pancreas vs. cirrhotic patients using intravoxel incoherent motion (IVIM) diffusion-weighted imaging (DWI).

Methods: A total of 67 cirrhotic patients and 33 healthy subjects underwent IVIM on a 3.0 T MRI scanner. Diffusion coefficient (ADC_{slow}), pseudo-diffusion coefficient (ADC_{fast}), and perfusion fraction (f) were calculated based on the bi-exponential model. The pancreatic IVIM-derived parameters were then compared. In the cirrhotic group, the relationship was analyzed between IVIM-derived pancreatic parameters and different classes of hepatic function as determined by the Child-Pugh classification. Also, the pancreatic IVIM-derived parameters were compared among different classes of cirrhosis as determined by the Child-Pugh classification.

Results: The f value of the pancreas in cirrhotic patients was significantly lower than that in normal subjects ($p = 0.01$). In the cirrhotic group, the f value of the pancreas decreased with the increase of the Child-Pugh classification ($R = -0.49$, $p = 0.00$). The f value of the pancreas was significantly higher in Child-Pugh class A patients than in class B and C patients ($p = 0.02$, 0.00 , respectively), whereas there was no significant difference between class B and C patients ($p = 0.16$).

Conclusion: The IVIM-derived perfusion-related parameter (f value) could be helpful for the evaluation of pancreatic perfusion in liver cirrhosis. Our data also suggest that the blood perfusion decrease in the pancreas is present in liver cirrhosis, and the pancreatic perfusion tends to decrease with the increasing severity of hepatic function.

PO-2680

Ultrasensitive Magnetic Resonance Angiography based on Interlocking Stratagem for Diagnosis of Vascular Diseases

Wenyue Li,Junwei Cheng,Peisen Zhang,Yi Hou
Beijing University of Chemical Technology

Medical imaging including computed tomography (CT), positron emission tomography (PET), single photon emission computed tomography (SPECT), and magnetic resonance imaging (MRI) has great superiority of non-invasiveness, timeliness, and visibility than the biological detection for diagnosis of major diseases. Among the aforementioned imaging methods, MRI has been regarded as an excellently safe, non-limited by tissue depth, and high-spatial-resolution imaging technique for the clinical evaluation of vascular diseases popularly. However, MRI has a tough challenge of insufficient sensitivity, which makes it difficult to display the fine physiological structure of tissues and distinguish the definite boundary between diseased areas.

It is an urgent need to address the sensitivity issue of MRI instantly. The preparation and development of clinical contrast agent has improved the comparison of different tissues with enhanced sensitivity. Gadolinium-based contrast agents are widely used in clinical practice, because gadolinium ion (Gd^{3+}) has excellent paramagnetic properties due to its largest number of unpaired 4f electrons. For example, small molecule complex gadolinium-based contrast agents, such as gadolinium diethylenetriamine pentaacetic acid (Gd-DTPA) are used for angiography in common. However, due to small hydrodynamic sizes (e.g., ~ 0.18 nm for Gd-DTPA), Gd-DTPA exhibits short tumbling time (τ_R), which influences the spin-lattice relaxation of water protons with Gd^{3+} , leading to relatively low longitudinal molar relaxivity (r_1). Meanwhile, the small molecular Gd-chelates can extravasate from blood vessels very soon, resulting in the very short blood circulation

time and fast metabolism with low efficiency in imaging vascular diseases. Additionally, the small molecular Gd-chelate contrast agents can rapidly cross the capillary wall and then distribute themselves in the extracellular space of the tissues, which increases the overall signal of the organs but reduces the signal-to-background ratio of angiography. Thus, the MR angiography (MRA) with high resolution, especially for the tiny blood vessels, is still confronted with great challenge.

In this study, based on the interlocking stratagem, a zwitterionic polymeric contrast agent of hypersensitive MRA with high resolution has been developed. To restrict the tumbling of magnetic ions in bloodstream, polymer carriers of magnetic ions were synthesized by coupling the diethylenetriaminepentaacetic acid (DTPA) molecules to poly (acrylic acid) (PAA) through a linker of diethylenetriamine. The zwitterionic paramagnetic metal-chelating polymer was subsequently obtained by chelating Gd^{3+} through DTPA groups, which is noted as PAA-Gd. The movement of single Gd-DTPA section is restricted, which dramatically slows down the tumbling rate of Gd^{3+} . As a result, the r_1 of PAA-Gd is $13.9 \text{ mM}^{-1} \cdot \text{s}^{-1}$ evaluated by a clinic 1.5 T MRI scanner, while is 4.6-fold higher than that of individual Gd-DTPA ($3.0 \text{ mM}^{-1} \cdot \text{s}^{-1}$), with a more enhanced effect on T_1 -weighted MRI. In addition, the elimination half-life is calculated to be 73.8 min for the PAA-Gd, which is more than 6 times longer than that of Gd-DTPA contrast agents (11.4 min). To better evaluate the angiographic performance of PAA-Gd, a series of animal models have been built for imaging studies on a 7.0 T MRI scanner with different sequences. The results indicate that the PAA-Gd exhibit excellent imaging potential for precise diagnosis of vascular diseases

PO-2681

Functional-structural decoupling in visual network is associated with cognitive decline in patients with type 2 diabetes mellitus: Evidence from a multimodal MRI analysis.

Minhua Ni, Ying Yu, Yang Yang, Hao Xie, Guangbin Cui, Linfeng Yan

Department of Radiology & Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu Hospital, Fourth Military Medical University

Introduction: Functional-structural coupling (F-S C) and visual network (VN) associated alterations are suggested to be potential mechanisms in cognitive impairment. However, the relationship of F-S C evidence derived from functional magnetic resonance imaging with type 2 diabetes mellitus (T2DM). This study was conducted in order to investigate the functional-structural coupling alterations in VN in T2DM and its potential clinical relevance.

Methods: Our Institutional Review Board approved the protocol and written informed consent was obtained from each subject. This study included 30 confirmed T2DM patients and 29 matched healthy controls. All participants underwent brain magnetic resonance examination on a 3.0T scanner (Discovery MR750, GE Healthcare) with 8-channel head coil, and cognitive function assessments. Volumetric T_1 -weighted (three-dimensional brain volume imaging, 3D-BRAVO) (echo time (TE)/ repetition time (TR) = 3.2/8.2 ms, inversion time (TI) = 450 ms, flip angle (FA) = 12° , acquisition matrix = 256×256 , slice thickness = 1 mm, slice number = 188) images were collected for anatomic structure. Blood oxygen level-dependent (BOLD) contrast with the following settings: (TE)/repetition time (TR) = 30/2000 ms, flip angle (FA) = 90° , acquisition matrix = 64×64 , field of view = 220 mm \times 220 mm, thickness = 3 mm, scanning gap = 1 mm, slices number = 36 and scan time = 6 min. Resting-state fMRI(rs-fMRI) included gradient-echo planar sequence sensitive to BOLD contrast (TR = 2,000 ms, TE = 30 ms, FA = 90°) and rs-fMRI was preprocessed in Data Processing Assistant for Resting-State fMRI (DPABI, <http://www.restfmri.net/forum/DPARSF>)[2] and the SPM12 software package in MATLAB R2013b platform. Visual component (VC) were estimated by independent component analysis (ICA). Degree centrality (DC), amplitude of low frequency fluctuation (ALFF) and fractional anisotropy (FA) were constructed to reflect functional and structural characteristics in these VCs respectively.

Functional-structural coupling coefficients were further evaluated using combined FA and DC or ALFF. Partial correlations were performed between neuroimaging indicators and neuropsychological scores and clinical variables. Results were corrected for multiple comparisons using voxel-based FDR ($P < 0.001$) which was implemented in SPM on the MATLAB R2013b platform.

Results: The study included 30 T2DM patients (22 males and 8 females; mean age of 52.60 ± 8.51 years) and 29 HCs (18 males and 11 females; mean age of 49.69 ± 5.19 years). These participants had no significant difference in age or gender ($P > 0.05$). All individuals received an assessment of cognitive function. Two groups had no significant difference in Montreal Cognitive Assessment (MoCA) score (T2DM, 27.04 ± 2.21 ; HCs, 26.29 ± 2.66). Three Visual components (VCs) were selected using group ICA. T2DM group showed significantly lower DC and ALFF values in the VC1 (PDC = 0.003, PALFF = 0.038) compare with HC group. No significant changes were found in VC2 and VC3. For functional-structural coupling coefficients, T2DM group exhibited lower DC-FA coefficients ($r_{DM} = 0.34 \pm 0.27$, $r_{HC} = 0.49 \pm 0.17$, PFDR = 0.014) in VC1, while DC-ALFF coefficient had no significant difference between two groups. The DC in VC1 was positively correlated with Trial 4 and Total trial 1-5 in CVLT. The positive correlation between DC-FA coefficients in VC1 and Total perseverative responses % of WCST was also observed.

Discussion: In this study, compared with HC group, DC, ALFF and DC-FA coefficients in VC1 were significantly lower in T2DM group, while FA had no significant change. The DC in VC1 was positively correlated with Trial 4 and Total trial 1-5 in CVLT. The positive correlation between DC-FA coefficients in VC1 and Total perseverative responses % of WCST was also observed. The results showed that the abnormal neuronal function mainly concentrated in VC1, while there was no significant change in VC2 and VC3. Anatomically, VC1 is located in BA 17, known as the primary visual cortex, and mainly includes the inferior talus gyrus in the occipital cortex. The dysfunction of the primary visual cortex (VC1), the first and simplest visual cortex area, may be a potential image biomarker of cognitive function change and provide a new insight into the mechanism of T2DM in the early stage of cognitive change (pre MCI stage). No significant structural changes were found in T2DM patients in the pre-MCI stage, but neuronal abnormalities and functional-structural decoupling had occurred in this stage, which may suggest that cerebral structure and function are closely related. This study explored this relationship and found that the higher the DC-FA coefficients were, the higher the executive function related scores were. Taken together, these findings indicate that DC and DC-FA coefficients in VN may be potential imaging biomarkers for revealing early cognitive deficits of different dimensions in T2DM.

Conclusion: In conclusion, cognitive, neural activity and structural-functional coupling alterations were detectable in T2DM patients. Compared with HC group, DC, ALFF and DC-FA coefficients in VC1 were significantly lower in T2DM group, while FA had no significant change. There were positive correlations between DC, DC-FA coefficients in VC1 and T2DM patients' memory and executive function. These results contribute to a better understanding of the mechanism for the cognitive impairment in T2DM and its neuroimaging biomarkers.

PO-2682

The influence of parallel acquisition technology and different compression perception acceleration factors on head and neck high-definition vascular wall imaging

Zhongxu Zhang, Xiaotong Ma, Nan Yu

Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine

Objective: To compare the effects of different acceleration factors (AF) on the quality of high-definition vascular wall images of the head and neck using parallel acquisition (GRAPPA) technology and compressed sensing (CS) technology. Method: 30 healthy volunteers (20 males and 10 females) were recruited. Apply Vida 3.0T MR imager and GRAPPA [AF=2], CS [AF=2-10]

technology to perform 3D imaging of the head and neck high-definition blood vessel wall_ T1_ Space scanning is performed by two radiologists with over 5 years of diagnostic experience in MRI, who select 8 identical locations [left and right middle cerebral arteries, intracranial segments of left and right internal carotid arteries, below the bifurcation of left and right common carotid arteries, and left and right vertebral arteries], delineate ROI on the original image, measure signal intensity (SI) and standard deviation (SD) of the vessel wall, and calculate signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR); Simultaneously subjectively score the imaging quality of different segments of intracranial and cervical vascular walls in the image independently of each other. Consistency analysis was conducted on the measured data and subjective scores using intra group correlation coefficient (ICC) and Kappa test. If the consistency is good, use the Friedman test to compare the SNR, CNR, and subjective scores between different AFs; If the difference is statistically significant, use the LSD method for pairwise comparison. Result: The data measured by the two physicians showed good consistency with the subjective scores [ICC: 0.778~0.959, Kappa: 0.768~0.881]; When AF=2, the SNR of 8 ROIs under CS technology was higher than GRAPPA ($P<0.05$); When the AF of CS is 2, 3, 4, 5, and 6, the subjective score of 8 ROI can reach level 4. When the AF of CS is 7 and 8, the subjective score decreases to level 3 ($P<0.05$). When the AF of CS is 9 and 10, the subjective score decreases to level 2 ($P<0.05$). Conclusion: 3D with CS technology_ T1_ As AF increases, the scanning time of the Space sequence gradually decreases. Compared with GRAPPA's AF=2, CS's AF=6 reduces scanning time by 69.14% while ensuring image quality. Therefore, it is recommended to use CS [AF=6] for high-definition vascular wall scanning of the head and neck. In addition, 13 out of 30 healthy volunteers experienced different nerve stimulation symptoms in CS with AF=8,9,10, including nausea, palpitations, shortness of breath, etc. Therefore, it is not recommended to adjust the AF of CS to above 8.

PO-2683

Assessing varicose veins of the lower extremities :a comparative study of non- contrast enhanced MRV with DSA

Bao Liu

Xi'an People's Hospital(Xi'an Fourth Hospital)

Objective: To prospectively evaluate the performance of a non-contrast enhanced MR venography using spatial labeling with multiple inversion pulses, to depict in varicose veins of the lower extremities comparison to digital subtraction angiography(DSA).

Methods: The examinations of all enrolled patients were in compliance with the requirement of the hospital ethics committee, and all patients signed the informed consent form and agreed to be enrolled and observed. 22 varicose veins of the lower extremities patients who underwent non-contrast MRV scan and DSA for further diagnosis were included. All patients in this group underwent non-contrast enhanced MRV(Space-Flow) and DSA examination of the varicose veins of the lower extremities using a 3.0T MR scanner.

Results: A total of 22 varicose veins of the lower extremities underwent DSA and non-contrast enhanced MRV(Space-Flow) examinations. The two radiologists had a high consistency in the evaluation results of imaging date, Kappa=0.93. For clinically significant varicose (>50% stenosis) was: the accuracy is 95.7%,the negative predictive value is 100%,the positive value is 93.3%, the specificity is 88.9%,and the sensitivity is 100%. Space-Flow had a good correlation with DSA in assessing the degree of varicose veins of the lower extremities(Kappa=0.86).

Conclusions: This preliminary research demonstrated that non-contrast enhanced magnetic resonance angiography sequence(Space-Flow) is a reliable, non-radiation,and non-invasive imaging method in the diagnosis of varicose veins of the lower extremities.Especially for patients with renal insufficiency, Space-Flow can be used an first choice imaging method.

PO-2684

Dysfunction of the triple-network model is associated with cognitive impairment in patients with cerebral small vessel disease

Hengle Wei, Hong Zhang

Department of Radiology, The Affiliated Jiangning Hospital of Nanjing Medical University

Purpose: This study aimed to demonstrate the correlations between the altered functional connectivity patterns in the triple-network model and cognitive impairment in patients with cerebral small vessel disease (CSVD).

Methods: Resting-state functional magnetic resonance imaging data were obtained from 22 patients with CSVD and 20 healthy controls. The resting-state data were analyzed using independent component analysis and functional network connectivity (FNC) analysis to explore the functional alterations in the intrinsic triple-network model including the salience network (SN), default mode network (DMN), and central executive network (CEN), and their correlations with the cognitive deficits and clinical observations in the patients with CSVD.

Results: Compared to the healthy controls, the patients with CSVD exhibited increased connectivity patterns in the CEN-DMN and decreased connectivity patterns in the DMN-SN, CEN-SN, intra-SN, and intra-DMN. Significant negative correlations were detected between the intra-DMN connectivity pattern and the Montreal Cognitive Assessment (MoCA) total scores ($r = -0.460$, $p = 0.048$) and MoCA abstraction scores ($r = -0.565$, $p = 0.012$), and a positive correlation was determined between the intra-SN connectivity pattern and the MoCA abstraction scores ($r = 0.491$, $p = 0.033$).

Conclusions: Our study findings suggest that the functional alterations in the triple-network model are associated with the cognitive deficits in patients with CSVD and shed light on the importance of the triple-network model in the pathogenesis of CSVD.

PO-2685

Characterization of parotid gland tumors: whole-tumor histogram analysis of diffusion weighted imaging, diffusion kurtosis imaging, and intravoxel incoherent motion

Yu Chen

The First Affiliated Hospital of Fujian Medical University

Purpose: To investigate the diagnostic performance of histogram features of diffusion parameters in the characterization of parotid gland tumors.

Method: From December 2018 to January 2023, patients who underwent diffusion weighted imaging (DWI), diffusion kurtosis imaging (DKI), and intravoxel incoherent motion (IVIM) were consecutively enrolled in this retrospective study. The histogram features of diffusion parameters including apparent diffusion coefficient (ADC), diffusion coefficient (Dk), diffusion kurtosis (K), pure diffusion coefficient (D), pseudo-diffusion coefficient (DP), and perfusion fraction (FP) were analyzed. The Mann-Whitney U test was used for comparison between benign parotid gland tumors (BPGTs) and malignant parotid gland tumors (MPGTs). Receiver operating characteristic curve and logistic regression analysis were used to identify the differential diagnostic performance. The Spearman Correlation Coefficient was used to analyze the correlation between diffusion parameters and Ki-67 labeling index.

Results: For diffusion MRI, twenty-one histogram features of diffusion parameters showed significant differences between BPGTs and MPGTs (all $P < 0.05$). Compared with DWI model, the IVIM model and combined model had better diagnostic specificity (58%, 94%, and 88%, respectively; both $P < 0.001$) and accuracy (64%, 89%, and 86%, respectively; both $P = 0.006$). The combined model was superior to the single DWI model with improved IDI (IDI improvement 0.25). Significant correlations were found between Ki-67 and ADC_{mean} , DK_{mean} , K_{mean} , and D_{mean} ($r = -0.57$ to 0.53 ; all $P < 0.05$).

Conclusions: Whole-tumor histogram analysis of IVIM and combined diffusion model could further improve the diagnostic performance for differentiating BPGTs from MPGTs.

PO-2686

The additive impact of metabolic syndrome on left ventricular deformation and function in patients with coronary artery disease assessed by 3.0T cardiac magnetic resonance feature tracking

Chenyan Min, Yue Gao, Zhigang Yang
west china hospital of sichuan university

Background: Metabolic syndrome (MetS) can increase the risk of morbidity and mortality of cardiovascular disease (CVD), especially in patients with coronary artery disease (CAD). The study aimed to explore the impact on left ventricular (LV) deformation and function in CAD patients and investigate the independent factors of impaired LV function and deformation.

Materials and methods: 120 patients with CAD and 52 sex- and age-matched controls who underwent cardiac magnetic resonance scanning were enrolled in this study. All CAD patients were divided into two groups: CAD with MetS [CAD(MetS+), $n = 82$] and CAD without MetS [CAD(MetS-), $n = 38$]. LV structure and function parameters were measured and compared among the three groups. Multivariable linear regression analyses were constructed to investigate the independent factors of impaired LV function and deformation in CAD patients. The logistic regression analysis and receiver operating characteristic curve (ROC) were performed to quantify the prediction efficiency of MetS for impaired LV strain and deformation.

Results: From controls to the CAD(MetS-) group to the CAD(MetS+) group, the LV mass (LVM) increased, and LV global function index (LVGFI) and LV global longitudinal peak strain (PS) decreased (all $p < 0.05$). Compared with the CAD(MetS-) group, the LV global longitudinal PS was declined significantly in the CAD(MetS+) group ($P = 0.027$). After adjustment for covariates in CAD patients, MetS was an independent factor of decreased LV global longitudinal PS ($\beta = -0.211$, $p = 0.002$) and increased LVM ($\beta = 0.221$, $p = 0.003$). The logistic multivariate regression analysis and ROC analysis showed that combined MetS improved the efficiency of predicting LV global longitudinal PS reduction (AUC = 0.88) and LVM (AUC = 0.89) increase.

Conclusions: MetS aggravated the damage of LV function and deformation in CAD patients and was independently associated with impaired LV strain and deformation.

PO-2687

Biventricular Dysfunction and Ventricular Interdependence in Patients with Pulmonary Hypertension: A 3.0 T Cardiac MRI Feature Tracking Study

Han Fang, Li Jiang, Jin Wang, Yuan Li, Zhigang Yang
Department of Radiology, West China Hospital

Background: To explore the difference in right ventricular (RV) and left ventricular (LV) structural and functional alteration in patients with pulmonary hypertension (PH) and further investigate the ventricular interdependence in patients with PH, using cardiac MRI feature tracking (MRI-FT).

Methods: One hundred three patients diagnosed with PH through right heart catheterization (RHC) and 72 age- and sex- matched controls were recruited. Patients with PH were further divided into two subgroups based on CMR-derived RV ejection fraction (RVEF): PH with preserved RVEF (RVEF $\geq 40\%$; $n = 44$) and PH with reduced RVEF (RVEF $< 40\%$; $n = 59$). LV and RV strain parameters were compared among the three groups and multivariable linear regression analysis were performed to explore the RV–LV interdependence in patients with PH.

Results: RV strain decreased sequentially from controls, through PH with preserved RVEF, to PH with reduced RVEF. PH patients with reduced RVEF had significantly lower LV strain, especially septal strain and LV peak diastolic strain rate compared with both controls and PH patients with preserved RVEF (all $p < 0.05$). In PH patients, LV strain was significantly correlated with mPAP, RV volume and RV strain parameters. Multivariable analyses showed that RVEF was independently correlated with LV strain; furthermore, independent of RVEF, RV strain was significantly correlated with LV strain (LVGRS: $B = 0.463$, $p < 0.001$; LVGCS: $B = -0.194$, $p < 0.001$; LVGLS: $B = 0.227$, $p = 0.001$).

Conclusion: Subclinical impairment of RV function was found in PH with preserved RVEF. LV strain was impaired when RV was dysfunctional, which was associated with worsening RV strain. Therefore, while focusing on improving RV function, LV dysfunction in PH patients should also be monitored and treated early in order to slow the progression of the disease.

PO-2688

Scientific research and clinical application of the recently developed "Firefly imaging": preoperative assessment of brain tumor blood vessels and intratumoral microbleeds

Xin Cao, Zhe Feng, Zhang Jun
Huashan Hospital Fudan University

Purpose: Three-dimensional contrast-enhanced T1-weighted flow-sensitive black-blood (3D CE-T1WI FSBB), commonly referred to as "firefly imaging", is a black blood imaging sequence suppresses the flowing blood signal of both arteries and veins, thereby providing a clear contrast compared with an enhanced brain tumor. Our aim is to compare 3D CE-T1WI FSBB and CE-T1WI for preoperative assessment of blood vessels and microbleeds in brain tumors, and to investigate the correlation between visible intratumoral vessels and microbleeds.

Methods: Patients with brain tumors underwent scans with a 3.0-T MRI system using a 32-element phased-array head coil. Intravenous injection of 10.0 ml gadolinium glutamate was used for post-contrast imaging. Three neuroradiologists counted the internal blood vessels of the brain tumors separately based on CE-T1WI FSBB and CE-T1WI, and they counted microbleeds in the tumor on CE-T1WI FSBB. Two-way random intraclass correlation coefficient (ICC) was used for inter-reader

agreement. Further sub-analysis of consistency was carried out depending on histology and WHO grading. The linear regression analysis (with F-test) was used to study the correlation between intratumoral vessels and microbleeds based on CE-T1WI FSBB ($\alpha=0.05$).

Results: Inter-reader agreements for intratumoral vessel count on CE-T1WI FSBB (ICC=0.92) and CE-T1WI (ICC=0.93) were excellent. Agreement for intratumoral microbleed count on CE-T1WI FSBB (ICC=0.99) was also excellent. There were statistically significant differences in vessel counts using Mann-Whitney U -test: image readers could identify more vessels on CE-T1WI FSBB than on CE-T1WI, particularly for meningiomas, schwannomas, gliomas, and WHO grade I tumors. The intratumoral vessels had a significant positive effect on microbleeds (microbleeds = $5.024 + 1.665 \times$ vessels; $F=11.51$).

Conclusions: More intratumoral vessels could potentially be identified using 3D CE-T1WI FSBB compared to CE-T1WI, and the number of vessels showed a positive linear relationship with the number of microbleeds, which might suggest that brain tumors with abundant blood supply are more prone to microbleeds.

PO-2689

Amide proton transfer imaging of musculoskeletal tumors to characterize tumors and associate with Ki-67

Yujin Zhang

The first hospital of hebei medical university

ObjectiveTo prospectively evaluate capability of amide proton transfer (APT) imaging to characterize musculoskeletal (MSK) tumors, to explore the correlation between Ki-67 labeling index (LI) and APT signal intensity (SI).

MethodsTotally, 85 patients with MSK tumors were enrolled in the prospective study. All the patients underwent APT imaging scan. Kruskal-Wallis test was used to test differences of APT SI among giant cell tumors of bone (GCTs), other benign, and malignant solid MSK tumors in central, peripheral regions, and entire tumors. The receiver operating characteristic (ROC) analysis was used to evaluate the diagnostic performance. The Spearman rank correlation test was used to analyze the correlation between APT SI and Ki-67 LI.

ResultsFor GCTs, the difference of APT SI was found only between GCTs and benign tumors ($P<0.001$). For other tumors excepting GCTs, APT SI of malignant tumor was higher than that of benign in central, peripheral regions and entire tumors. And the diagnostic performance in distinguishing malignant from benign one was highest in peripheral region. The cut-off value, sensitivity, and specificity were 2.78%, 0.93, and 0.84. Moderate correlations between Ki-67 LI and APT SI were found in above regions, with highest correlation in peripheral region ($r=0.570$ (95% CI, 0.355-0.728), $P<0.001$). In this study, high APT SI was found in 3 cystic tumors ($4.60\% \pm 0.78\%$) and 4 hemangiomas ($4.65\% \pm 0.73\%$).

ConclusionsAPT SI had potential clinical utility in characterizing MSK tumors, and could be a viable indicator of the proliferative activity of tumor cells in a noninvasive clinical setting.

PO-2690

Evaluation of cerebral microbleeds and the correlation between cognitive impairment by SWI

Wenjing Lan

Department of Radiology, the First Hospital of Jilin University

AbstractBACKGROUND:Cerebral microbleeds(CMB) is a subclinical prodromal manifestation of cerebral small vessel disease(CSVD) and may have a correlation with cognitive dysfunction.

PURPOSE:CMB, as one of the main imaging manifestations of CSVD, is difficult to show in conventional MRI examination, while CMB can be shown more clearly by SWI technique. Therefore, this study appliedapplies SWI technique to evaluate cerebral microhemorrhage and investigate the correlation between cerebral microhemorrhage and cognitive dysfunction.

STUDY TYPE:retrospective

POPULATION:We included 44 patients with SVD , 24 patients with LVD, and 16 healthy controls who were well-matched in age, gender, and education level. These subjects were examined with brain MRI and neuropsychological assessments, including Montreal Cognitive Assessment (MoCA) , Mini-Mental State Examination (MMSE) and Activities of Daily Living (ADL).

SEQUENCE:A 3T MR imaging system was used to scan the DWI and SWI sequence.

ASSESSMENT:MRI scans of the brain were processed automatically to determine the diagnosis, location and number of cerebral microhemorrhagic lesions (on SWI) and white matter dystrophy grading (on T2-weighted image).

STATISTICAL TESTS:Two independent sample t test, χ^2 test, t test, Spearman's correlation test were used for statistical analysis. $P < 0.05$ was considered to be statistically significant.

RESULTS:On SWI, the detection rates of CMBs for CSVD, CLVD and normal controls were 61.36%, 54.17% and 0.00% respectively. The number of microhemorrhages was significantly correlated with blood pressure grading ($P = 0.355$, $P = 0.001$) and positively correlated with cerebral white matter grading ($P = 0.461$, $P = 0.001$).The number of CMBs was significantly and negatively correlated with the MMSE score ($P = -0.260$, $P = 0.017$). There was no significant correlation with MCA scores, ($P = -0.140$, $P = 0.206$).

DATA CONCLUSION: These findings suggest that the more CMBs, the more severe the white matter hyper signal and the more severe the cognitive dysfunction. Thus CMBs number is a neuroimaging indicator of vascular cognitive dysfunction.

PO-2691

Modulatory effects of aerobic training on the degree centrality of brain functional activity in subthreshold depression

Lina Huang, Qingguo Ding

Changshu Second People's Hospital

Aims: Aerobic training has been shown to effectively prevent the progression of depressive symptoms from subthreshold depression (StD) to major depressive disorder (MDD), and understanding how aerobic training promotes changes in neuroplasticity is essential to comprehending its antidepressant effects. Few studies, however, have quantified the alterations in spontaneous brain activity before and after aerobic training for StD.

Methods: Participants included 44 individuals with StD and 34 healthy controls (HCs). Both groups underwent moderate aerobic training for eight weeks, and resting state functional magnetic resonance imaging (rs-fMRI) data were collected before and after training. The degree centrality

(DC) changes between the two groups and the DC changes in each group before and after training were quantified.

Results: 1) A total of seventy-eight participants who satisfied the specified criteria were ultimately selected for involvement in this study, with 44 individuals assigned to the StD group and 34 persons assigned to the HCs group. Participants in both groups showed good adherence to the aerobic training intervention, with attendance and effective training exceeding 80% (StD group: 89%, HCs group: 91%). 2) There were no notable disparities observed in terms of age, gender, BMI, marital status, and baseline level of physical activity between the two groups. However, it is worth noting that the StD group exhibited a substantially higher educational level compared to the HCs group ($t = 2.930$, $P < 0.01$). 3) Following an eight-week period of aerobic exercise at a moderate intensity, the StD group exhibited significant improvements in their PHQ-9 and SAS scale scores when compared to their initial baseline scores ($P < 0.001$). Additionally, it was discovered that the SAS scale score in the healthy control group exhibited a statistically significant decrease compared to the initial measurement. 4) The results revealed greater DC of the orbital region of the left inferior frontal gyrus in the StD group compared to the HCs group at baseline (Table 3, Figure.2). After aerobic training, the results of the follow-up examination revealed no significant difference in DC between the two groups. In comparison to the baseline, the StD group exhibited an important decrease in the DC value in the left dorsolateral superior frontal gyrus; while the HCs demonstrated a large decrease in the DC value of the left thalamus. No statistically significant connection was seen between changes in DC and psychological scale scores in the StD group. 5) The results obtained by the StD group revealed that the correlation analysis failed to establish a statistically significant relationship between the DC values of various brain areas both before and after engaging in aerobic training, and the scores obtained from the PHQ-9 and SAS assessments ($P > 0.05$).

Conclusions: Our findings suggest that regular aerobic training can enhance brain plasticity in StD patients. In addition, we demonstrated that DC is a relevant and accessible method for evaluating the functional plasticity of the brain induced by aerobic training in StD.

PO-2692

MRI-based radiomics model to preoperatively predict mesenchymal transition subtype in high-grade serous ovarian cancer

Zijing Lin¹, Huijuan Ge², Qin hao Guo³, Jialiang Ren⁴, Weiyong Gu⁵, Jing Lu⁶, Jing Gong⁶, Jinwei Qiang¹, Haiming Li⁶

1. Jinshan Hospital, Fudan University

2. Department of Pathology, Fudan University Shanghai Cancer Center

3. Department of Gynecological oncology, Fudan University Shanghai Cancer Center

4. Department of Pharmaceuticals Diagnostics, GE HealthCare, Beijing

5. Department of Pathology, Obstetrics & Gynecology Hospital, Fudan University

6. Department of Radiology, Fudan University Shanghai Cancer Center

Objective: To develop an MRI-based radiomics model for the preoperative identification of mesenchymal transition (MT) subtype in high-grade serous ovarian cancer (HGSOC).

Materials and Methods: One hundred and eighty-nine patients with histopathologically confirmed HGSOC were retrospectively enrolled. Among the included patients, 55 patients were determined as the MT subtype and the remaining 134 ones were non-MT subtype. After extracting a total of 204 features from T2WI and CE-T1WI images, Mann-Whitney U test, Spearman correlation test, and Boruta algorithm were adopted to select the optimal feature set. Three classifiers, including logistic regression (LR), support vector machine (SVM), and random forest (RF), were trained to develop radiomics models. The performance of established models was evaluated from three aspects: discrimination, calibration, and clinical utility.

Results: Seven radiomics features relevant to MT subtypes were selected to build the radiomics models. The model based on RF algorithm showed the best performance in predicting MT subtype, with AUCs (95%CI) of 0.866 (0.797-0.936) and 0.852 (0.736-0.967) in the training and testing

cohorts, respectively. The calibration curves, supported with Brier scores, indicated the great consistency between the observation and prediction. The decision curve analysis (DCA) showed that the RF-based model could provide more net benefit, which suggested the favorable utility in clinical application.

Conclusion: The RF-based radiomics model provided an accurate identification of MT subtype from non-MT one and help facilitate personalized management of HGSOc.

PO-2693

DKI Evaluation of Crossed Cerebellar Diaschisis after Cerebral Infarction in MCAO Rats

Zhen Ma¹, Xin Zhao¹, Lin Lu¹, Jingliang Cheng²

1. The Third Affiliated Hospital of Zhengzhou University

2. The First Affiliated Hospital of Zhengzhou University

Objective To observe the expression of NMDA, apoptosis and the effect on nerve function recovery in rat model of middle cerebral artery occlusion (MCAO). Diffusion kurtosis imaging (DKI) was used to evaluate crossed cerebellar diaschisis (CCD) to provide experimental and theoretical basis for clinical treatment.

Materials and Methods MCAO models were established in rats. Every 12 rats were randomly divided into control group, 6-hour group, 12-hour group, 24-hour group, 48-hour group, 7-day group and 14-day group. The rats were scanned by MRI at the above time points. Then, rats were sacrificed for H&E staining, immunohistochemical staining and TUNEL staining to detect the expression of NMDA in the core infarct area and cerebellum, and analyze the relationship between the parameters of MRI and molecular biology.

Results The values of MD, ADC and FA in MCAO rats were all lower than those of control group, and the parameters of contralateral cerebellum were lower than those of ipsilateral cerebellum ($P < 0.05$), reaching the lowest value at 12 hours, while the values of MK were opposite. The expression of NMDA showed an upward trend, higher than that of the control group, which reached the maximum in 24 hours ($P < 0.05$), and that in the contralateral cerebellum was higher than that in the ipsilateral cerebellum.

Conclusion NMDA can be a novel treatment target for CCD, and the parameters of MRI can predict the occurrence and development of CCD.

PO-2694

Morphometry alterations of brain in patients with vestibular schwannoma after surgery: a pilot study

Jiayu Huang, Jiayi Lin, Yongqin Xiong, Xiaoyu Wang, Haoxuan Lu, Xin Lou
The First Medical Center, Chinese PLA General Hospital

OBJECTIVE Patients with vestibular schwannomas (VS) may experience changes in cortical thickness, sulcus depth and fractal dimension of brain after surgery, which may affect postoperative tinnitus symptoms and related brain function. This study aimed to explore the clinical value of these related indexes to assess tinnitus and the alteration of brain function in patients with VS after surgery. **METHODS** Twenty-eight VS patients were recruited for structural magnetic resonance image (MRI) scanning and clinical score evaluation preoperatively and postoperatively. Images of all patients with VS on the right side were flipped to the left side. To investigate changes after treatment, surface-based morphometry (SBM) analyses were performed.

RESULTS Voxel-wise analysis at the cluster level showed a significant decrease in cortical thickness mainly in the left frontal lobe, left temporal lobe, left fusiform gyrus, left occipital lobe, left

postcentral, left supramarginal gyrus and right frontal lobe, right fusiform gyrus, right lingual, right parahippocampal, right precuneus, a significant decrease in sulcus depth mainly in the left occipital lobe, left parietal lobe, left temporal lobe and left cuneus, a significant decrease in fractal dimension mainly in the left frontal lobe, left parietal lobe, left occipital lobe and a significant increase in fractal dimension mainly in the left fusiform gyrus, left occipital lobe, left frontal lobe, left pars orbitalis (cluster-level p value family-wise error [p_{FWE}] < 0.05) in VS patients postoperatively.

CONCLUSIONS Morphometry alterations of brain may be helpful to better understand the distant effect of surgery in patients with VS, and tinnitus and the alteration of brain function in VS patients after surgery.

PO-2695

Quantitative chemical exchange saturation transfer MR imaging of the substantia nigra and red nucleus in Parkinson's disease

Xinyang Li¹, Yaotian Tian^{1,2}, Dandan Zheng³, Chunmei L¹, Min Chen¹

1. Beijing Hospital, National Center of Gerontology; Institute of Geriatric Medicine, Chinese Academy of Medical Sciences, P.R. China, Beijing 100730, China

2. Graduate School of Peking Union Medical College, Beijing 100730, China

3. Clinical and Technical Support, Philips Healthcare, Beijing 100600, China

Objective This study aimed to investigate the change of chemical exchange saturation transfer (CEST) imaging in the bilateral substantia nigra (SN) and red nucleus (RN) of Parkinson's disease (PD), and to explore the value of CEST-MR for the clinical application of PD.

Methods In this retrospective study, 45 PD patients and 21 sex-, age-, and education-level matched normal control (NC) subjects were enrolled from December 2012 to July 2015. All subjects underwent brain CEST-MRI and routine MRI in 3T magnetic resonance imaging scanner. Based on the MATLAB software package, the signal change of CEST imaging was separated based on the 4-pool Lorentz fitting model. The regions of interest of the SN and RN were delineated by experienced radiologists. Then the mean amplitudes of the 4 pools including amide, nuclear overhauser enhancement (NOE), direct water saturation (DS) and magnetization transfer (MT) were acquired. Independent samples t-test and Mann-Whitney U-test were used to compare amplitude of individual pool between PD group and NC group and controlled by Bonferroni correction. The combined model was constructed by binary logistic regression analysis, and the receiver operating characteristic curve was used to evaluate the diagnostic efficiency of the 4pool-CEST parameters and the combined model.

Results Compared with the NC group, statistically significant reductions were observed in the amide value of the left SN and RN and the NOE value of the right SN of PD group ($T=-3.587$, $P=0.026$; $T=-3.767$, $P=0.016$; $Z=3.270$, $P=0.017$; respectively). The associated area under the curve (AUC) of the combined model and the above three CEST parameters had good diagnostic efficacy ($AUC>0.7$). The combined model had the highest AUC value and specificity ($AUC=0.81$; specificity =97.78%), the amide value of left SN had the highest sensitivity (sensitivity =93.33%).

Conclusions CEST-MRI based on the 4-pool Lorentz fitting model was used to show the signal changes of the amide of the SN and RN in PD patients, and had great potential in PD diagnosis.

PO-2696

Value of Non-Contrast Enhanced Vessel Wall MR imaging in Assessing Vascular Invasion of Retroperitoneal Tumors

Ying Cui, Xin-Gui Peng

Jiangsu Key Laboratory of Molecular and Functional Imaging, Department of Radiology, Zhongda Hospital, Medical School, Southeast University, Nanjing, China

PURPOSE

To investigate the potential of non-contrast enhanced vessel wall MR imaging in evaluating the degree of vessel wall invasion of the retroperitoneal tumor.

METHODS

This is a prospective study evaluating patients with suspected malignant retroperitoneal masses found in computer tomography. All patients underwent 3.0 T magnetic resonance scan, including conventional sequence and black blood sequence. Two experienced radiologists jointly evaluated the degree of vascular invasion in all images of abdominal aorta, abdominal trunk, superior mesenteric artery / vein, inferior vena cava, portal vein and renal artery and vein, respectively. According to the positional relationship and the degree of contact between the tumor and the surrounding arteries or veins, it is divided into six conditions from mild to severe. Using the postoperative histopathology data as the ground truth, the sensitivity and specificity in evaluating vessel invasion of two MRI protocols were estimated based on both per-patient and per-score. Intra-class correlation coefficient was used to assess the intra-reader repeatability.

RESULTS

A total of 330 blood vessels were evaluated both on conventional and vessel wall images at the same time. Finally 112 of them were recorded because of the closely association with masses and probably impact on the clinical treatment. Compared with histopathology data, the result of vessel wall MR imaging (91.96%, 95% CI: 85.43, 95.71; 103 of 112) has higher accuracy than that of conventional MR imaging (75%, 95% CI: 66.24, 82.10; 84 of 112). The diagnostic efficiency of vessel wall MR imaging in predicting vessel wall invasion (AUC = 0.891, 95% CI: 0.806, 0.975) was also better than that of conventional MR imaging (AUC = 0.762, 95% CI: 0.633, 0.890, Z value = 6.786, P < 0.001).

CONCLUSION

Non-contrast enhanced vessel wall MR imaging yielded accurate in assessment the degree of vessel wall invasion of retroperitoneal tumor.

PO-2697

Prediction of microvascular invasion in HCC based on multi-modality MR radiomics and Delta radiomics model

Yifan Pan¹, Huifang Wang², Shunli Wang¹, Ymei Liu¹, Yueming Li²

1. Fujian Medical University

2. Department of Radiology, the First Affiliated Hospital of Fujian Medical University

Objective: As a non-invasive and reproducible technical tool, radiomics has shown great application prospects in the study of tumor pathology. Delta radiomics provides information on the temporal evolution of eigenvalues. We aimed to investigate the value of multi-modality and multi-regional radiomics as well as Delta radiomics in predicting MVI of HCC patients.

Materials and methods: One hundred and sixty-one HCC patients confirmed by pathology at our hospital were retrospectively included and randomly divided into training and validation sets in the ratio of 7:3 (training set: validation set = 112:49). The tumor regions of interest were outlined

independently on T2WI and nonenhanced T1WI, arterial phase (AP), portal venous phase (PVP), delayed phase (DP) and hepatobiliary phase (HBP) images, using 3D Slicer software to outline the whole tumor area, the 10mm peri-tumor area and the whole tumor + 10mm peri-tumor area of the lesion, respectively, and the corresponding radiomics features were extracted using the pyradiomics package, while using whole-tumor features from different phases, including direct phase subtraction, normalized phase subtraction and relative phase subtraction modalities to calculate Delta radiomics features. In the training set, the maximum correlation and minimum redundancy algorithm and the recursive feature elimination algorithm were used to filter the radiomics features, the support vector machine algorithm was used to construct the radiomics models. The AUC values were used to evaluate the prediction performance of different models, while the models were also validated in the validation set.

Results: The AUC (95% CI) values of the portal venous phase and hepatobiliary phase radiomics models based on the whole tumor + peritumor region were 0.828 (0.721-0.887) in the training set and 0.804 (0.675-0.934) in validation set. The AUC (95% CI) for the direct phase subtraction-based multi-phase Delta radiomics model (portal phase - nonenhanced T1WI, delayed phase - nonenhanced T1WI and portal phase - arterial phase) was 0.825 (0.747-0.904) and 0.771 (0.639-0.903) on the training and validation sets, respectively.

Conclusion: The models based on whole tumor + peritumor region in portal venous phase and hepatobiliary phase images had the best predictive efficacy among all radiomics models.

Clinical Relevance/Application: We hope to provide non-invasive imaging biomarkers for the prediction of MVI through the combination of medicine and AI technique, further elucidate the potential biological significance behind the imaging Radiomics features, and provide imaging basis for individualized clinical treatment of HCC.

PO-2698

Brain iron deposition and analysis of risk factors in cerebral small vessel disease patients with different total CSVD scores: A quantitative susceptibility mapping study

Yian Gao¹, Qihao Zhang², Hangwei Zhuang², Chaofan Sui¹, Nan Zhang¹, Mengmeng Feng³, Haotian Xin³, Changhu Liang¹, Lingfei Guo¹, Yi Wang²

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. Weill Medical College of Cornell University

3. Xuanwu Hospital, Capital Medical University

Purpose: This study aimed to compare the differences in brain iron deposition in gray matter (GM) nuclei between cerebral small vessel disease (CSVD) patients and healthy subjects and explored which factors could affect iron deposition and cognitive function of the brain.

Materials and Methods: A total of 321 subjects were enrolled in this study. All subjects performed MRI and cognitive examinations. The CSVD patients were divided into mild to moderate group (CSVD-M, total CSVD score ≤ 1) and severe group (CSVD-S, total CSVD score > 1). Morphology-enabled dipole inversion with an automated uniform cerebrospinal fluid zero reference algorithm (MEDI+0) was used to generate brain quantitative susceptibility mapping (QSM) maps using mGRE data. Neuroradiologists manually circled the region of interest (ROI) directly on the QSM images using ITK-SNAP v3.8 software. The mean susceptibility values and clinical parameters of the three groups were statistically analyzed by one-way ANOVA, Pearson correlation analysis, multiple linear regression analysis and mediation effect analysis.

Results: Our results showed significant differences in the SCWT scores and mean susceptibility values of the globus pallidus (GP), putamen (Put), and caudate nucleus (CN) among the three groups ($P < 0.05$, FDR correction). Pearson correlation analysis showed that iron deposition in the brain of CSVD patients was closely associated with decreased executive function. Age has a significant positive impact on the susceptibility values of GP ($p = 0.018$), Put ($p < 0.001$), and CN

($p < 0.001$). Additionally, a history of diabetes has a significant positive influence on the susceptibility values of Put ($p = 0.011$) and CN ($p < 0.001$), while a smoking history shows a significant positive association with the susceptibility values of CN ($p = 0.019$). Mediation effect analysis demonstrated that iron deposition in the neostriatum partially mediated the relationship between hypertension and executive function.

Conclusions: Our study revealed that age, diabetes and smoking could increase iron deposition in the basal ganglia. Additionally, the impact of hypertension on executive function is mediated through the deposition of iron in the neostriatum of the brain. These findings may help to understand the pathophysiological mechanisms underlying CSVD, and may have implications in the prevention and treatment of this disease condition.

PO-2699

Delta radiomics analysis based on multi-sequence contrast enhanced MRI to predict Ki-67 maker index in hepatocellular carcinoma

Xiaolin Chen, Yao Zheng, Lu Jiang
The First Affiliated Hospital of Fujian Medical University

Introduction: Primary liver cancer is the sixth most common cancer and the third leading cause of cancer death worldwide, and hepatocellular carcinoma (HCC) accounts for about 75%-85% of primary liver cancer. Several studies have indicated that Ki-67 can predict the prognosis of many solid tumors. Radiomics has been used to preoperatively predict Ki-67 expression in HCC. However, no studies are exploring the use of delta radiomics features for predicting Ki-67 expression in HCC. This study aims to develop a delta radiomics model for predicting Ki-67 expression in HCC.

Materials and methods: We analyzed preoperative magnetic resonance images of 103 patients with liver cancer confirmed by postoperative pathology. The sample included 30 patients with low Ki-67 expression ($Ki-67 \leq 10\%$) and 73 with high Ki-67 expression ($Ki-67 \geq 10\%$). We extracted the radiomics features, and built models using machine learning algorithms. The validation cohort was done using 10-k fold validation. Then, we compared the performance of the radiomics model with that of delta radiomics models.

Results: In the traditional radiomics models, the largest AUC value was for the radiomics model based on delayed phase images, with 0.851(95%CI 0.762,0.923) in the training cohort and 0.785(95%CI 0.698,0.872) in the validation cohort. The accuracy, sensitivity, and specificity were 80.6%, 82.2%, and 80.0% in the training set. And the delta radiomics models can improve model performance. The best delta radiomics model had an AUC value of 0.876(95%CI 0.803-0.941) in the training set and 0.832(95%CI 0.745-0.910) in the validation set. The accuracy, sensitivity, and specificity were 79.6%, 78.1%, and 86.7% in the training set.

Conclusion: This study develops a new delta radiomics model for preoperative prediction of HCC proliferation status, potentially improving liver cancer prognosis.

PO-2700

Evaluation of Myocardial Strain in Patients With Subclinical Hypertrophic Cardiomyopathy and Subclinical Hypertension Heart Disease Using Cardiac Magnetic Resonance Feature Tracking

Xiaoyong Hao,Jiang Wu,Lina Zhu,Xuan Li
Department of Magnetic resonance, Shanxi Cardiovascular Hospital

The evaluation of cardiac magnetic resonance feature tracking may have great diagnostic value in hypertrophic cardiomyopathy and hypertension heart disease.To explore the diagnostic and clinical research value of cardiac magnetic resonance feature tracking in evaluation of myocardium deformation in patients with subclinical hypertrophic cardiomyopathy(SHCM)and subclinical hypertension heart disease(SHHD).CMR scans was performed on 1.5 T MR scanner in 33 patients with SHCM,31 patients with SHHD, and 27 controls(NS).The CMR image post-processing software was used to analyze the characteristics of routine cardiac function, different global and regional myocardial strain in each group.Analysis of variance (ANOVA) was used to compare age, blood pressure,heart rate,routine cardiac function,body mass index (BMI), as well as the strain between different segments within each of the three groups. If a significant difference was detected, a least significant difference (LSD) comparison was performed if there was a significant difference.The diagnostic efficacy of different parameters in differentiating SHHD from SHCM was evaluated through receiver operating characteristic (ROC) curve analysis, and determination of the best cutoff value.The routine cardiac function parameters were no statistically different among three groups ($P > 0.05$).There are statistical differences between the global myocardial strain parameters and the peak strain parameters of some segments,especially the basal segment, in each group ($P < 0.05$), and the Global radial peak strain(GRPS) can be used to distinguish SHCM from SHHD group (The area under the ROC curve was 0.885), which is the best diagnostic performance.Cardiac magnetic resonance feature tracking can detect left ventricular deformation in patients with SHCM and SHHD group.The abnormality of strain has important research value for its subclinical diagnosis and clinical evaluation.

PO-2701

Compare the diagnostic performance of susceptibility-weighted imaging (SWI) and T2* mapping in evaluating articular cartilage at 3-Tesla MR scanner

Dong Dong
the First Hospital of Jilin University

Objective: T2*-mapping MRI has been widely accepted as a noninvasive, effective imaging technique for quantitative evaluation of articular cartilage. Some previous studies have revealed that T2* values display a decreasing trend along with the increase in cartilage degeneration. Susceptibility weighted imaging (SWI) is based on a 3D gradient-echo (GRE) technique using a similar approach as T2*. Therefore, the purpose of this study is to determine if 3D SWI could be applied in evaluating degenerated knee articular cartilage, and to explore the correlations between T2* value and SWI results. To the best of our knowledge, there has been no previously reported study.

Methods: MRI was undertaken with a 3-T MR imager (uMR 780) and a commercially available knee coil (12 channels). 2D T2* map sequences were obtained using an axial FFE (fast-field echo) multi-echo acquisition with a TR of 500 ms, 5 echo times of 6.71, 13.42, 20.12, 26.83 and 33.54ms, flip

angle (FA) was 60° , the FOV was 16×16 cm, with a pixel matrix of 384×384 , and a slice thickness/gap of $3/0.3$ mm. SWI sequences were obtained using an axial 3D GRE acquisition with a TR of 30 ms, TE 9.2ms, and flip angle $=15^\circ$. the FOV was 14×20 cm, with a pixel matrix of 235×336 , and a slice thickness/gap of $2/0$ mm. Eight patients with knee osteoarthritis and totally 48 ROIs drawn at the patellar articular cartilage were obtained. The same measurements were carried out on the $T2^*$ maps and the SWI image. The measurements reproducibility and correlation analysis were performed.

Results: The relaxation values in $T2^*$ map were 17.9 ± 5.3 to 46.0 ± 18.5 ms. The SWI signal intensities were 216 ± 11 to 303 ± 32 . There was a great inter-reader agreement for SWI and $T2^*$. There was no significant difference between SWI and $T2^*$ sequences to detect degeneration of articular cartilage, strength of the correlation was good ($R=0.782$).

Conclusions: SWI was correlated with $T2^*$ maps in detecting the degeneration of cartilage. It holds great potential for serving as a noninvasive biomarker for osteoarthritis in human articular cartilage. Further studies on SWI are required to confirm its reliability and mechanism in cartilage degeneration.

PO-2702

Brain regions involved in pain relief after operative treatment of trigeminal neuralgia

shanshan Shen,yingmin Chen,wenchang Guo
Hebei General Hospital

Purpose: Trigeminal neuralgia (TN) characterized by recurring paroxysmal pain, and can be cured by operation. However, regions involved in pain relief and reparative processes remain unclearly understood. To compare brain network frame remodeling in TN patients before and after percutaneous micro-balloon compression (PMC) operation with healthy controls (HCs) using functional MRI.

Methods: Methods: Twenty-two primary trigeminal neuralgia patients and 20 HCs were recruited. All patients underwent MRI scan before (<72 h) and after (>24 h and <36 h) the operation. Imaging data were analyzed using graph theory analysis.

Results: Twenty patients (10 females; average age 59.3 ± 7.73 years) and matched HCs (10 females; average age 51.9 ± 9.5 years) were included in our study. Both TN pre-treatment patients (Pre) and HCs exhibited small-world network organization. Compared with pre-treatment patients, post-treatment TN patients had higher node and connectivity attributes in the bilateral thalamus, but in particular on the right side. The primary motor cortex and secondary somatosensory motor cortex had lower node features in both Pre- and Post-treatment (Pos) TN patients. The thalamus exhibited a positive correlation with pain score in node attributes and degree centrality ($P < 0.05$).

Conclusions: Abnormal temporal patterns were found in TN patients by GTA. Motor cortex reduced in both Pre and Pos TN patients, which may have no relation with pain. Thalamus had a higher nodal efficiency in temporal variability and enhanced functional connectivity in pain relief.

PO-2703

Associations of quantitative susceptibility mapping with cortical atrophy and brain connectome in Alzheimer's disease: a multi-modal study

Aocai Yang, Guolin Ma
Shandong Medical Imaging Research Institute

Overload iron accumulation and brain network disconnections are observed in Alzheimer's disease (AD), with disrupted iron homeostasis hypothesized to be linked to AD pathology and neuron loss. However, associations between abnormal iron deposition, brain atrophy, and altered brain connectome in AD remain unclear. This study utilized multi-modal MRI techniques to explore overlapped regions between cortical atrophy and increased susceptibility and investigate relationships between structural and functional brain connectome, gray matter volumes, and iron deposition on 30 AD patients and 26 healthy controls enrolled at China-Japan Friendship Hospital. We calculated the QSM signal and cortical thickness in 246 brain regions and identified the overlapped regions. The structural and functional connectomes were constructed based on diffusion MRI tractography and functional connectivity, respectively. The network topology was quantified using graph theory analyses. We revealed seven brain regions with both reduced cortical thickness and abnormal iron deposition, including right superior frontal gyrus, left superior temporal gyrus, right fusiform gyrus, left superior parietal lobule, right superior parietal lobule, left inferior parietal lobule, and left precuneus. Unique correlations between cortical thickness and network topology specific to the AD group were observed in five of these regions, with stronger associations in functional compared to structural topology. Spatial decoupling of QSM and global efficiency of the structural network was also found in AD patients. These findings provide new insights into the complex relationships among iron accumulation, brain atrophy, and brain connectome in AD.

PO-2704

Multiplexed Sensitivity Encoding versus Single-Shot Echo-Planar Imaging: A Comparative Study for Diffusion-Weighted Imaging of the Thyroid Lesions

Xiuyu Wang¹, Peng Wang², Heng Zhang², Shudong Hu²
1. Jiangnan University
2. Affiliated hospital of Jiangnan University

Purpose To compare multiplexed sensitivity encoding diffusion-weighted magnetic resonance imaging (MUSE-DWI) and conventional DWI (cDWI) techniques in thyroid MRI.

Materials and methods Nineteen patients who underwent thyroid MRI using both MUSE-DWI and cDWI at a 3.0T MRI system were enrolled. Qualitative parameters (image quality, thyroid contour, lesion conspicuity) and quantitative parameters (signal-to-noise ratio (SNR), lesion-to-thyroid contrast-to-noise ratio (CNR), apparent diffusion coefficient (ADC)) were compared between the two sequences. In addition, ADC values derived from MUSE-DWI and cDWI were compared between benign and malignant lesions.

Results MUSE-DWI outperformed cDWI in terms of image quality, thyroid contour, and lesion conspicuity. Significant higher signal-to-noise ratio (SNR) in both the thyroid and its lesion were found in MUSE-DWI than those in cDWI (both $P < 0.05$). The lesion-to-thyroid contrast-to-noise ratio (CNR) were also significantly higher in MUSE-DWI than those in cDWI ($P < 0.05$). The apparent diffusion coefficient (ADC) of the thyroid in MUSE-DWI was significantly lower than that in cDWI ($P < 0.05$). The ADC of the lesion in MUSE-DWI was also significantly lower than that in

cDWI ($P < 0.05$). In addition, ADC values from MUSE-DWI and cDWI of benign lesions were significantly higher than those of malignant lesions ($P < 0.05$). The AUC for cDWI was 0.944, with cutoff value, sensitivity, and specificity of $1.39 \times 10^{-3} \text{ mm}^2/\text{s}$, 0.933, and 0.833, respectively. The AUC for MUSE-DWI was 0.922, with cutoff value, sensitivity, and specificity of $1.20 \times 10^{-3} \text{ mm}^2/\text{s}$, 0.867, and 0.833, respectively.

Conclusion Compared with cDWI, MUSE-DWI can improve the image quality, thyroid contour sharpness, lesion conspicuity, SNR in both the thyroid and its lesions, and enhancing the CNR between lesions and thyroid.

PO-2705

Magnetic susceptibility and R2*-based texture analysis for evaluating liver fibrosis in chronic liver disease

Ran Guo¹, Haodong Zhong², Feng Xing³, Fang Lu³, Zheng Qu², Rui Tong², Fengling Gan², Mengxiao Liu⁴, Caixia Fu⁵, Huihui Xu³, Gaiying Li², Chenghai Liu³, Jianqi Li², Shuohui Yang¹

1. Shanghai Municipal Hospital of Traditional Chinese Medicine, Shanghai University of Traditional Chinese Medicine
2. Shanghai Key Laboratory of Magnetic Resonance, School of Physics and Electronic Science, East China Normal University
3. Shuguang Hospital Affiliated to Shanghai University of Traditional Chinese Medicine
4. MR scientific Marketing, Diagnostic Imaging, Siemens Healthineers Ltd
5. MR Applications Development, Siemens Shenzhen Magnetic Resonance Ltd

Purpose: To explore potential feasibility of texture features in magnetic susceptibility and R2* maps for evaluating liver fibrosis.

Methods: Thirty-one patients (median age 46 years; 22 male) with chronic liver disease were prospectively recruited and underwent magnetic resonance imaging (MRI), blood tests, and liver biopsy. Susceptibility and R2* maps were obtained using a 3-dimensional volumetric interpolated breath-hold examination sequence with a 3T MRI scanner. Texture features, including histogram, gray-level co-occurrence matrix (GLCM), gray-level dependence matrix (GLDM), gray-level run length matrix (GLRLM), gray-level size zone matrix (GLSZM), and neighboring gray tone difference matrix (NGTDM) features, were extracted. Texture features and blood test results of non-significant (Ishak-F<3) and significant fibrosis patients (Ishak-F≥3) were compared, and correlations with Ishak-F stages were analyzed. Areas under the curve (AUCs) were calculated to determine the efficacy for evaluating liver fibrosis.

Results: Nine texture features of susceptibility maps and 19 features of R2* maps were significantly different between non-significant and significant fibrosis groups (all $P < 0.05$). Large dependence high gray-level emphasis (GLDM) and long run high gray-level emphasis (GLRLM) in R2* maps showed significantly negative and good correlations with Ishak-F stages ($r = -0.616$, $P < 0.001$; $r = -0.637$, $P < 0.001$). Busyness (NGTDM) in susceptibility maps, large dependence high gray-level emphasis (GLDM) and long run high gray-level emphasis (GLRLM) in R2* maps yield the highest AUCs (AUC=0.786, $P = 0.007$; AUC=0.807, $P = 0.004$; AUC=0.819, $P = 0.003$).

Conclusion: Texture characteristics of susceptibility and R2* maps revealed possible staging values for liver fibrosis. Susceptibility and R2*-based texture analysis may be a useful and noninvasive method for staging liver fibrosis.

PO-2706

Association of multimodal magnetic resonance imaging - derived brain age gap with the development of chronic kidney disease: a UK Biobank observational study

Lianqin Chen, Xian Shao, Pufei Bai, Pei Yu*

NHC Key Laboratory of Hormones and Development, Tianjin Key Laboratory of Metabolic Diseases, Chu Hsien-I Memorial Hospital & Tianjin Institute of Endocrinology, Tianjin Medical University, Tianjin 300134, China.

Purpose: Brain age gap (BAG), defined as the difference between brain epigenetic age and chronological age, has been shown to serve as a biomarker of aging. A positive BAG reflects an accelerated brain aging process. We aim to investigate the longitudinal association between BAG and the risk of developing CKD.

Method: This is a prospective study. A total of 6,817 healthy adults from the UK Biobank, they were without ICD-10 diagnosis, or self-reported long-term illness, or disability, or frailty, and of good or excellent self-reported health. We used T1-weighted and diffusion tensor MRI data to train five machine learning (ML) models. The accuracy of the ML models was evaluated based on the mean absolute error (MAE) and the correlation between brain age and chronological age. A total of 25,185 participants without a history of CKD at baseline were included in the competing risk model to explore the association between BAG and the occurrence of CKD. A test for trend, subgroup analyses stratified by sex and restricted cubic spline (RCS) analyses were performed. A two-sided $P < 0.05$ was considered statistically significant.

Result: Among the established ML models, the CatBoost model had the best predictive performance, with an MAE of 3.52 years, a correlation coefficient of 0.63, and a calculated BAG of -0.02 (SD, 5.32). After a median follow-up time of 3.44 (IQR, 2.66-4.81) years, a total of 275 (1.55%) participants developed CKD, and 242 (0.96%) participants died for various reasons. The risk of CKD in the third group was 40% higher than that in the first group (HR, 1.40 [95% CI, 1.05-1.88], $P = 0.024$), and there was a graded association with incident CKD (P for trend = 0.024). The risk of CKD in males was consistently higher than that in females for any BAG group. RCS analysis showed non-linear association between them.

Conclusion: BAG is significantly associated with the development of CKD and may serve as an independent and promising biomarker for new-onset CKD.

PO-2707

Preoperative radiomics model based on multiparametric MRI for prediction of lymph node metastasis in gastric cancer

Ruirui Song, Yanfen Cui, Xiaotang Yang, Yan Du
Affiliated Tumor Hospital of Shanxi Medical University

Objective: To develop a preoperative radiomics model using multiparametric magnetic resonance imaging (MRI) for predicting lymph node metastasis (LNM) in patients with gastric cancer (GC), and then investigate its associations with prognosis.

Methods: This study consisted of 303 GC patients (training cohort, $n=213$; internal validation cohort, $n=90$) in center I and 176 patients in center II as external validation cohort who underwent multiparametric MRI before radical gastrectomy. A total of 1,049 imaging features were extracted from T2-weighted imaging (T2WI), apparent diffusion coefficient (ADC) maps, and contrast enhanced T1-weighted imaging (cT1WI), respectively. Six steps, including the Boruta and Simulated annealing (SA) algorithm, were conducted to select key features. Radiomic signatures

based on the single- and multiple-sequence were constructed. The performance of signatures to predict LNM was assessed with the area under the curve (AUC), accuracy, sensitivity, and specificity. Moreover, Kaplan-Meier survival curves were used to estimate the overall survival (OS). Results: The multiple-sequence signature achieved AUCs of 0.774 [95% confidence interval (CI), 0.703-0.845], 0.721 (95% CI 0.593-0.850), and 0.720 (95% CI 0.639-0.801) in the training and two validation cohorts, respectively, which performed better than those of the single-sequence signatures (all $P < 0.05$). The signature from cT1WI had the best performance among the single-sequence signatures. Besides, the proposed multiple-sequence signature was significantly associated with the OS of patients with GC ($p < 0.05$).

Conclusion: A multiparametric MRI-based radiomics signature on primary lesions exhibited a satisfactory performance for predicting LNM and survival outcomes in patients with GC, which could provide valuable information for assisting personalized treatment non-invasively.

PO-2708

Altered amide in substantia nigra is concordant with motor asymmetry in Parkinson's disease: a multipool CEST study

Yaotian Tian, Chunmei Li, Min Chen
Beijing Hospital

Background: Parkinson's disease (PD) is a strikingly asymmetric condition with typical motor asymmetry related to the dopaminergic deficit and aggregation of α -synuclein. Chemical exchange saturation transfer (CEST) imaging can estimate the change of endogenous proteins and peptides content caused by these pathophysiological abnormalities.

Objectives: This study aimed to explore the concordance between motor asymmetry and changes of four CEST imaging within midbrain nucleus in Parkinson's disease (PD).

Methods: Forty-six subjects with PD and twenty-three normal controls were enrolled in this study. CEST imaging with 31 different frequency offsets (-6 to 6 ppm) were performed. Four related parameters containing amide, nuclear overhauser effects (NOE), magnetization transfer (MT) and direct water saturation (DS) were acquired in bilateral regions, including occipital white matter (OWM), substantia nigra (SN) and red nucleus (RN) divided into more and less affected side in PD patients based on the motor symptom. Three motor asymmetry subgroups, including PD with mild motor asymmetry, PD with significant motor asymmetry and hemiparkinsonism were classified. The differences of four parameters among PD more affected side, PD less affected side of different motor asymmetry subgroups and NC group were compared. Motor laterality and imaging laterality were determined to evaluate the concordance. Motor asymmetry index and imaging asymmetry index were calculated to evaluate the correlation.

Results: Our results showed the comparison of DS and MT in any region among any groups were no significant difference. Compared with NC group, the amide and NOE signal in PD more affected side were significantly decreased only in SN in all three motor asymmetry subgroups ($p < 0.05$, corrected by Bonferroni methods), but the differences of amide and NOE signal between NC group and PD less affected side in any region and any subgroup were not significant. Imaging asymmetry was only observed in amide of SN in PD with significant motor asymmetry subgroup (PD more affected side vs PD less affected side, $p < 0.05$, corrected by Bonferroni methods). The imaging laterality of amide in SN has a substantial consistency with the motor laterality in PD with significant motor asymmetry subgroup ($\kappa = 0.625$, $p < 0.001$), but the imaging asymmetry index was no significant correlation with motor asymmetry index scores.

Conclusions: Our results indicate that amide and NOE signal in SN significant lost in motor more affected side and imaging laterality of amide in SN may identify the motor laterality in PD patients. These might be able to provide new measure to evaluate and understand the motor asymmetry in PD.

PO-2709

Investigating Anorectal Function Using Postoperative MRI-based Fibrosis Score in Patients with Locally Advanced Rectal Cancer Receiving Neoadjuvant Chemoradiotherapy: A two-center study

Yuan Yuan, Shuai Li, Fu Shen, Chengwei Shao
Changhai Hospital, The Navy Medical University

Purpose: This study aimed to develop a postoperative MRI-based fibrosis scoring system and to assess its correlation with anorectal function in locally advanced rectal cancer (LARC) cases administered neoadjuvant chemoradiotherapy (nCRT).

Methods: Pathologically confirmed LARC cases administered nCRT and radical resection were assessed retrospectively. Based on postoperative magnetic resonance imaging (MRI) findings, anastomotic fibrosis score (AFS) and perirectal fibrosis score (PFS) were determined to evaluate the extent of fibrosis. The Wexner score for anorectal function was obtained 2 years postoperatively and assessed for correlation with MRI fibrosis scores. The cases were divided into 2 groups by the median Wexner score. Univariable and multivariable analyses were adopted for building a nomogram model, whose diagnostic performance was estimated by receiver operating characteristic (ROC) and decision curve analyses (DCA).

Results: Finally, 144 patients with LARC were included in cohort 1 (training set). Thirty-one patients were enrolled in cohort 2 (external validation set). Spearman correlation analysis indicated that AFS and PFS were positively correlated with Wexner score. Univariable and multivariable analyses revealed age, tumor height, AFS and PFS were independent predictors of anorectal function. The nomogram model achieved a good diagnostic performance, with AUCs of 0.800 and 0.846 in the training and validation sets, respectively; its predicting value was also confirmed by DCA.

Conclusion: The present study showed AFS and PFS derived from postoperative MRI are positively correlated with Wexner score. In addition, the new scoring system was effective in predicting anorectal function in LARC cases administered nCRT.

PO-2710

Correlations between cognitive reserve, brain and cerebrospinal fluid volume in mild cognitive impairment patients

Liang Zhou^{1,2,3}, wenxia yang^{1,2,3}, yang liu^{1,2,3}, pengfei zhang^{1,2,3}, jiaceng li^{1,2,3}, guangyao liu^{1,3}, jing zhang^{1,3}

1. Lanzhou university second hospital

2. Second Clinical School, Lanzhou university

3. Gansu Province Clinical Research Center for Functional and Molecular Imaging

Objective: To explore the effect of cognitive reserve (CR) on brain and cerebrospinal fluid (CSF) volume in patients with mild cognitive impairment (MCI) and healthy elders (HC).

Methods: 31 HC and 50 MCI patients were collected in this study to obtain high-resolution 3-dimensional T1 structure images, cognitive function and composite CR scores. Educational attainment, leisure time and working activity ratings from two groups were used to generate cognitive reserve index questionnaire (CRIq) scores. The different volumes of brain regions and CSF were obtained using uAI research portal in both groups, which were then taken as the regions of interest (ROI), the correlation analyses between ROIs and CRIq scores were conducted.

Results: The scores of CRIq, CRIq-leisure time, and CRIq-education in NC group were significantly higher than patients in MCI group, and the MoCA and MMSE scores were positively correlated with the CRIq, CRIq-education in both groups, and were positively correlated with CRIq-leisure time in MCI group and CRIq-working activity in NC group respectively. In MCI group, the volume of the right middle cingulate cortex and the right parahippocampal gyrus were negatively correlated with the CRIq and CRIq-working activity scores, and the volume of the CSF, peripheral CSF and ventriculus tertius were positively correlated with the CRIq-leisure time score.

Conclusion: People with higher CR show better levels of cognitive function, and MCI patients with higher CR showed more severe volume atrophy of the right middle cingulate cortex and the right parahippocampal gyrus, but more CSF at a given level of global cognition.

PO-2711

High clear visualization and precise quantification of habenula based on STAGE

Hongchao Wang
The first hospital of Jilin University

Purpose: The visualization and identification of the habenula is particularly challenging. We aimed to visualize and quantitative analysis the habenula using three-dimensional multi-echo strategically acquired gradient echo (STAGE).

Methods and Materials: 20 healthy participants who performed on a 3.0T MR scanner (MAGNETOM Vida, Siemens Healthcare, Germany) with a 64-channel head-and-neck RF receiver array was used and acquire whole brain STAGE data (TR = 29ms, TE = 8.18 ms, 15 ms, and 22.5 ms, flip angles (FA) = 6 and 27, resolution 0.67 mm × 0.67 mm × 1.0 mm, FOV = 256 mm × 192 mm, pixel bandwidth = 182 Hz/pixel, matrix = 416 × 312, and total scan time = 18 min). The qualitative image and quantitative mapping were obtained using STAGE 3.2.4 software (SpinTech MRI, Bing[1]ham Farms, MI, USA). Qualitative image quality and visibility of habenula anatomical features were analyzed by 3 radiologist using a 5-point scale. Quantitative values and was also measured in whole habenula. An intraclass correlation coefficient (ICC) was calculated to assess the interrater reliability of the delineation of the habenula.

Results: The habenula had consistent boundaries and clearly visualization (T1WE, SWI, DIR for white, DIR for gray and T1WI) as well as accurate quantification (T1 mapping, PD mapping, QSM, R2* mapping and T2* mapping) across the various qualitative and quantitative images from STAGE sequence. The intraclass correlation coefficient (ICC) for agreement in subjective scores and quantitative values measurements between raters were more than 0.8.

Conclusion: STAGE imaging protocol to provide a clear display and accurate quantification of the Hb and provide groundwork for the future development of an imaging surrogate for the habenula to study various psychiatric diseases.

PO-2712

Fat Free Muscle Area measurement based on clinical liver MRI workflow to assess sarcopenia

Jiping Wang, Bei Zhang, Xin Shi
The first hospital of Jilin university

Objective

Fat free muscle area (FFMA) is usually measured on T2WI-TSE sequence, but T2WI-TSE sequence is not routine MRI workflow, and the scanning time of T2WI-TSE sequence is obviously longer than T1WI e-dixon sequence, so we develop a new algorithm to measure FFMA on T1WI edixon-fat phase.

Method

16 patients with fatty liver (F:M=10:6, age 50 ± 1.2) underwent liver MRI examinations on a 3T system (MAGNETOM Vida, Siemens Healthineers). The protocols include an axial T1WI edixon sequence and T2WI TSE sequence without fat saturation. Typical scanning parameters are shown in table 1. First, an experienced radiologist carefully delineated the contour of bilateral psoas on the maximum cross-sectional images of lumbar spine three on T2WI TSE and T1WI edixon-fat phase, respectively, and generated the corresponding regions of interest. The total muscle area (TMA) of the psoas muscles was obtained by Itk-snap (www.itksnap.org). Subsequently, both images were converted to binary images based on signal intensity. On T2WI TSE and T1WI edixon-fat phase muscular tissue and adipose tissue are characterized by low and high signal intensity, respectively. Therefore, binarization allowed for separation of lean muscular tissue from intramuscular adipose tissue. Summation of pixels with high signal intensity and multiplication with the corresponding surface area resulted in intramuscular adipose tissue area (ATA), which was subtracted from TMA to obtain FFMA. The algorithm was implemented by scripts in MATLAB software, and the consistency was compared with the previous FFMA measurement results based on T2WI TSE image by Consistency check.

Result

The mean value of bilateral psoas FFMA at the maximum cross-sectional area of lumbar spine 3 vertebral body measured based on T1WI edixon-fat phase was 217.5 mm^2 (164.8, 332.5) and that measured based on T2WI TSE sequence was 238.2 mm^2 (152.7, 311.3). The intraclass correlation coefficient of the two method was 0.933 (ICC=0.933).

Conclusion

FFMA of bilateral psoas muscles based on edixon sequence proposed in this paper are highly consistent with those of previous methods based on T2WI TSE sequence. This method is possible to provide quantitative indicators for evaluating sarcopenia for routine clinical MRI examination

PO-2713

The Imaging Features of LI-RADS Nonviable or Equivocal Lesions in The First Follow-up Evaluation After TACE for HCC to Predict Recurrence

Shuhang Zhang, Yuan-Cheng Wang
Zhongda Hospital Southeast University

Purpose: To investigate whether the imaging features of lesions evaluated as LI-RADS nonviable or equivocal during the first post-TACE imaging follow-up can predict recurrence in HCC patients. **Materials & Methods:** A total of 171 lesions from 149 patients were included in this study, retrospectively collected between February 2015 and October 2022. All patients underwent at least three enhanced magnetic resonance imaging examinations, with the first one conducted

before TACE and the second one during the first follow-up visit 1 to 2 months after TACE. The third follow-up was 6 to 12 months after TACE. The lesions were divided into two groups: no recurrence during long-term follow-up ($n = 128$) and recurrence during long-term follow-up ($n = 43$). Imaging features evaluated included irregular shape, size, internal homogeneity, non-smooth margin, arterial peritumoral enhancement, rim enhancement in portal venous phase or delay phase, peritumoral hyperintensity in T2WI or DWI. Using univariate and multivariate Logistic regression analysis to investigate imaging features which evaluated as LI-RADS nonviable or equivocal during the first post-TACE imaging follow-up associated with recurrence during long-term follow-up. The receiver operating characteristic curve was used to show the efficacy of imaging features in predicting LI-RADS Nonviable lesions; recurrence after TACE.

Results: After univariate analysis, the P values of non-smooth margin, arterial peritumoral enhancement and peritumoral hyperintensity in T2WI or DWI were less than 0.1, and the inclusion of these factors in multivariate analysis showed that non-smooth margin (OR, 3.96, 95% CI, 1.66, 9.44, $P = 0.002$) and peritumoral hyperintensity in T2WI or DWI (OR, 7.74, 95% CI, 3.32, 18.06, $P < 0.001$) were independent risk factors for recurrence of LI-RADS Nonviable lesions at 6 to 12 months. The area under the ROC curve using these two factors to predict the recurrence of LI-RADS Nonviable lesions at 6 to 12 months was 0.754.

Conclusion: Non-smooth border and peritumoral hyperintensity in T2WI or DWI are imaging features to predict recurrence in HCC patients with LI-RADS Nonviable lesions evaluated on the first post-TACE imaging follow-up.

PO-2714

Altered neural intrinsic oscillations in patients with multiple sclerosis: effects of cortical thickness

Xiao Liang

The First Affiliated Hospital of Nanchang University

Abstract

Objective: To investigate the effects of cortical thickness on the identification accuracy of fractional amplitude of low-frequency fluctuation (fALFF) in patients with Multiple sclerosis (MS).

Methods: Resting-state functional magnetic resonance imaging data was collected from 31 remitting MS, 20 acute MS, and 42 healthy controls (HCs). After preprocessing, we first calculated two-dimensional fALFF (2d-fALFF) maps using the DPABISurf toolkit. 2d-fALFF per unit thickness was obtained by dividing 2d-fALFF by cortical thickness. Then, between-group comparison, clinical correlation, and classification analyses were performed in 2d-fALFF and 2d-fALFF per unit thickness maps. Finally, we also examined whether the effect of cortical thickness on 2d-fALFF maps was affected by the subfrequency band.

Results: In contrast with 2d-fALFF, more changed regions in 2d-fALFF per unit thickness maps were detected in MS patients, such as increased region of the right-inferior frontal cortex and faded regions of the right-paracentral lobule and middle cingulate cortex and right-medial temporal cortex. There was a significant positive correlation between the disease duration and the 2d-fALFF values in the left-early visual cortex in remitting MS patients ($r = 0.517$, Bonferroni-corrected, $P=0.008 \times 4 < 0.05$). In contrast with 2d-fALFF, we detected a positive correlation between the 2d-fALFF per unit thickness of the right-ventral stream visual cortex and the modified Fatigue Impact Scale (MFIS) scores ($r=0.555$, Bonferroni-corrected, $P=0.017 \times 4 > 0.05$). 2d-fALFF and 2d-fALFF per unit thickness both performed remarkably well in support vector machine (SVM) analysis for detecting MS patients, especially in the remitting phase (AUC=86%, 83%). Compared with 2d-fALFF, the SVM model of 2d-fALFF per unit thickness had significantly higher classification performance in distinguishing between remitting and acute MS. More changed regions and more clinically relevant 2d-fALFF per unit thickness maps in the subfrequency band were also detected in MS patients.

Conclusion: The identification accuracy of fALFF in MS patients was detected to be potentially influenced by cortical thickness. Additionally, 2d-fALFF per unit thickness is a potential diagnostic marker that can be utilized to distinguish between the acute and remitting MS patients. Excitingly, we observed similar variations in the subfrequency band.

PO-2715

Bidirectional analysis of myocardial strain in healthy Chinese people by cardiac magnetic resonance-feature tracking

Jing Zhu^{1,2}, Xiaolin Mu¹, Ying Liu^{1,2}, Yixin Wang¹, Qingyue Han¹, Yang Song¹

1. Central Hospital of Dalian University of Technology

2. Department of Graduate School, Dalian Medical University

Purpose: To investigate the difference of myocardial strain and the difference of CVI42 and Medis suppliers among healthy people of different ages in China.

Methods: 70 healthy Chinese people (30 males and 40 females) who fulfilled the inclusion criteria and showed normal CMR were enrolled and divided into three groups according to age: 24 in group 1 (18-45 years), 24 in group 2 (46-60 years) and 22 in group 3 (≥ 61 years). Film sequences of standard 2ch, 4ch and short-axis views of the heart were obtained by balanced SSFP sequences. Two physicians applied CVI42 and Medis to independently measure strain and strain rate in the left atrium, left ventricle and right ventricle, and with cross-repeated measurements. Statistics were performed using one-way ANOVA, Friedman's analysis, paired t-test and Wilcoxon test. Intra- and inter-observer group consistency tests were performed.

Results: 1. Myocardial strain in the 3 groups: 1) based on CVI42 measurements found that the differences in ϵ_e , ϵ_a , sGPLSr, eGPCSr and RsGPLSr were statistically significant; 2) based on the Medis measurements found that the differences in GPLS, eGPCSr, ϵ_e , ϵ_a , SRe, RGPLS, and RsGPLSr were statistically significant. 2. CVI42 vs Medis: GPLS ($-15.6 \pm 4.5\%$ vs. $-22.6 \pm 3.6\%$), GPCS ($-17.1 \pm 1.9\%$ vs. $-15.7 \pm 2.5\%$), sGPLSr (-0.9 ± 0.2 s⁻¹ vs. -1.2 ± 0.3 s⁻¹), eGPLSr (0.9 ± 0.2 s⁻¹ vs. 1.2 ± 0.4 s⁻¹), ϵ_s ($27.9 \pm 8.6\%$ vs. $40.1 \pm 8.6\%$), ϵ_e ($14.0 \pm 5.6\%$ vs. $23.6 \pm 7.7\%$), ϵ_a ($13.7 \pm 4.6\%$ vs. $16.8 \pm 6.8\%$), RGPLS ($-18.7 \pm 3.1\%$ vs. $-29.3 \pm 3.9\%$), RsGPLSr (-1.0 ± 0.2 s⁻¹ vs. -1.6 ± 0.3 s⁻¹), and ReGPLSr (1.0 ± 0.3 s⁻¹ vs. 1.3 ± 0.4 s⁻¹) were statistically significant differences ($p < 0.01$). Myocardial strain and strain rate measured by CVI42 and Medis had good intra- and inter-observer reproducibility.

Conclusion: Physiological changes in atrial strain occur most sensitivity at different ages, and the normal reference values for myocardial strain cannot be standardized across different providers, which may need to be addressed in the future from technical and AI.

PO-2716

Altered effective connectivity and patterns in fronto-striatal circuit is associated with the cognitive decline in patients with type 2 diabetes

Hao Xie

Tangdu Hospital, Fourth Military Medical University

Background: As a common complication of type 2 diabetes mellitus (T2DM), mild cognitive impairment (MCI) has always been the focus of research, but its neural mechanism has not been clarified. Brain insulin resistance in patients with type 2 diabetes results in decreased dopamine secretion, leading to abnormal brain activity in the prefrontal striatal circuit, which may be a potential mechanism of cognitive dysfunction.

Methods: This study prospectively included 46 T2DM without MCI, 48 T2DM with MCI, and 41 healthy controls (HCs). In the constructed prefrontal-striatal network, graph theory and dynamic functional connectivity (dFC) analysis were used to explore the global performance of the network. Graph theory and functional connectivity (FC) were used to select important node brain regions, and then the Granger causality analysis was used for effective connectivity to find important brain regions and their conduction information flow.

Results: At the global efficiency level of the network, both graph theory and dFC features indicated differences among the three groups, with HC performing the best, T2DM without MCI performing the worst, and T2DM-MCI between these two groups. In the analysis of nodes, the left caudate, left putamen, and bilateral nucleus accumbens were important nodes. The information flow transmitted from the left caudate to the left middle frontal gyrus during effective connectivity was significantly reduced in the T2DM-MCI group compared to the HCs group.

Conclusion: The above results indicated that the changes of brain activity in the prefrontal-striatal circuit and the information flow from the left caudate to the left middle frontal gyrus were involved in the occurrence of cognitive impairment in diabetes, which may be the underlying neural mechanism of MCI in T2DM. Subsequently, it is necessary to verify this result in larger sample sizes and animal experiments, in an attempt to reveal this potential neural mechanism.

PO-2717

Altered effective connectivity of the pain matrix in herpes zoster and postherpetic neuralgia patients: a resting-state fMRI study with granger causality analysis

Huiting Lv, Jian Jiang

Department of Radiology, the First Affiliated Hospital of Nanchang University

Objectives: This study aimed to compare the differences of effective connections in the "pain matrix" between Herpes Zoster (HZ) and Postherpetic Neuralgia (PHN) patients and healthy controls using Granger causality analysis (GCA), in order to further understand the interaction patterns between brain regions, and to investigate the relationship between changes in effective connections and clinical features.

Methods: Resting-state fMRI scans were performed on 55 HZ; 55 PHN; and 50 age-, sex- and education-year-matched healthy controls (HCs). The brain regions associated with the pain matrix, namely the bilateral thalamus, insula, parahippocampal gyrus, amygdala, primary somatosensory cortex, primary somatomotor cortex, anterior cingulate gyrus, subparietal lobule, and dorsolateral prefrontal cortex (DLPFC) are used as the seeds of functional connectivity (FC). GCA was used to

analyze effective connections in brain regions that differed significantly between groups. Then the correlation between GCA values and clinical indicators was studied.

Results: Compared with HC, GCA values between thalamus and amygdala, between thalamus and anterior central gyrus, thalamus to posterior central gyrus, parahippocampal back to amygdala and cingulate gyrus were significantly decreased in HZ patients. Compared with HC, the GCA values between DLPFC and cingulate gyrus were significantly reduced in PHN patients between insula and posterior central gyrus, between insula and inferior parietal lobule, after central back to amygdala, and parahippocampal back to inferior parietal lobule. Compared with HZ, GCA values between the parahippocampal gyrus and the inferior parietal lobule, between the inferior parietal lobule and the cingulate gyrus, from the inferior parietal lobule to the DLPFC, and from the cingulate back to the amygdala were significantly increased in PHN patients. In HZ patients, the course of disease was negatively correlated with the GCA value between the parahippocampal gyrus and the subparietal lobule; in HZ patients, the VAS was negatively correlated with the GCA value between the thalamus and the right amygdala, and the GCA value from the anterior cingulate gyrus to the subparietal lobule; in HZ patients, the HAMD score was positively correlated with the GCA value of the anterior cingulate gyrus. The VAS of PHN patients was positively correlated with the GCA value of the central posterior insular lobe.

Conclusion: There are significant differences in the effective connections between HZ and PHN patients and the brain regions associated with HC pain matrix, and there is a significant correlation with clinical characteristics, which not only indicates that these brain regions play a key role in the complex pathophysiology of HZ and PHN patients, but also complements the non-directional functional connections in previous studies, which provides us with new insights into the neuroimaging mechanisms of shingles.

PO-2718

Quantitative analysis of four-dimensional blood flow in cardiac magnetic resonance: A preliminary study on the loss of left ventricular viscous energy by vortex ring in healthy people

Yuhao Liu^{1,2}, Wei Li^{1,2}, Jiaxuan Guo², Yifan Wang³, Li Zhu³

1. Baoji Central Hospital

2. Ningxia Medical University

3. Ningxia Medical University General Hospital

Objective To evaluate the characteristics of left ventricular viscous energy loss in healthy people by using four dimensional flow technique of cardiac magnetic resonance. **Methods** This study was a retrospective observational study, and the basic clinical data and CMR images of healthy people who met the criteria of the exclusion were screened in the radiology department of Ningxia Medical University General Hospital from May 1, 2019 to November 31, 2021. In this study, the healthy people were divided into two groups according to whether the blood flow produced a vortex ring in the left ventricular chamber. The basic left ventricular function and viscous energy loss parameters of the healthy people were measured by CVI42 post-processing software. According to the data distribution characteristics, independent sample t test or Mann-Whitney U test were selected to compare and analyze the imaging parameters of the two groups. The influencing factors of eddy current ring were analyzed by univariate and multifactorial logistic regression. **Results** A total of 38 healthy people were included in this study, of which 25 were in the eddy current group, aged 18-51 years old, with an average age of 28.89 years old, including 12 males. There were 13 patients in the group without eddy current, ranging in age from 24 to 46, with an average age of 31, including 10 males. For the basic data and basic left ventricular function parameters of healthy people, the body weight, BMI and the overall peak wall thickness (diastolic period) of the group without eddy current were significantly higher than those of the group with eddy current, and the difference was

statistically significant (body weight: 60.54 ± 10.56 vs 71.65 ± 10.25 ; BMI: 21.20 ± 5.95 vs 24.22 ± 7.55 ; The overall peak wall thickness (diastolic) was 8.19 ± 1.42 vs 9.73 ± 1.64 , the group with eddy current vs. the group without eddy current, $P \leq 0.01$). For the viscous energy loss in the left ventricle, the peak viscous energy loss in the left ventricle in the group without vortex generation was significantly greater than that in the group with vortex generation at all periods of the cardiac cycle, and the difference was statistically significant (systolic period: 0.49 ± 0.24 vs 0.94 ± 0.38 ; Early diastolic phase: 0.90 ($0.80, 1.10$) vs 1.30 ($0.95, 1.80$); Late diastolic period: 0.32 ± 0.15 vs 0.61 ± 0.18 , unit: mW, $P < 0.01$). Conclusion The generation of vortex ring can reduce the loss of peak viscous kinetic energy of blood in ventricular movement, and is more beneficial to the heart pumping. With the increase of body mass index, there will be an adaptive restructuring of the heart, affecting the production of vortex rings.

PO-2719

Establishment and validation of a Nomogram Clinical prediction model for osteoporosis based on magnetic resonance DXION and MT techniques

Qiuju Fan

Department of Radiology, The Affiliated Hospital of Shaanxi University of Chinese Medicine, Xianyang, Shaanxi

Purpose: Based on the high incidence rate and occult of osteoporosis, as well as the deficiency of bone mineral density in the diagnosis of osteoporosis, magnetic resonance imaging is used more and more widely. Therefore, this study attempts to construct a clinical prediction model for osteoporosis using magnetic resonance technology using a nomogram.

Methods: 287 patients were collected and enrolled in the study. In a 7:3 ratio, 207 patients were randomly assigned to the training group: No Osteoporosis ($n=106$), Osteoporosis ($n=101$), and 80 patients to the validation group: No Osteoporosis ($n=39$), Osteoporosis ($n=41$). QCT bone mineral density examination was carried out for participants to measure BMD, and clinical data (gender, age, height, weight, BMI, marital status, education experience, drinking history, smoking history, diabetes history, fatty liver history) were collected. Then, magnetic resonance multi echo Dxion and magnetic transfer imaging were carried out, and the average FF and MT values of lumbar vertebrae 1, 2, and 3 were measured on the lumbar fat map and magnetic transfer map. A logistic regression analysis was conducted on these data. Established a clinical prediction model using column charts. The nomogram model was validated through ROC curves, calibration curves, and DCA curves.

Results: 1. There was no significant difference in the osteoporosis rate between training and testing set (48.8% vs. 51.3%, $P = 0.157$). Patients in the non-osteoporotic group had more male ratio than those in the osteoporotic group and the difference was statistically significant in the training cohort (50.9% versus 16.8%, $p < 0.001$), but gender did not have a statistical significance between two groups in the validation cohort (41.0% versus 26.8%, $p = 0.185$). In both the training cohort and the validation cohort, there were significant differences in the distributions of age, weight, BMI, diabetes, FF and MTR between the non-osteoporotic and osteoporotic group (all, $p < 0.05$). There were no significant differences in height, marital status, education level, manual laborer or not, fatty liver, history of drinking and smoking (all, $p > 0.05$).

2. Multivariate logistic regression analysis confirmed that four risk factors (gender: OR= 4.658, 95% CI: 1.411–15.374, $P=0.012$; age: OR= 3.274, 95% CI: 1.241–8.637, $P<0.017$; FF: OR=1.242, 95% CI: 1.120–1.378, $P<0.001$; MTR: OR= 0.706, 95% CI: 0.606–0.822, $P<0.001$) were significant independent predictors of osteoporosis.

3. The AUCs for the nomogram, FF and MTR models were 0.933, 0.890 and 0.899, respectively, in the training cohort and 0.923, 0.877 and 0.886, respectively, in the validation cohort. The calibration curve of the nomogram demonstrated very good reliability in evaluating osteoporosis in the training and validation cohorts ($P > 0.050$). If the risk threshold probability is set over 5%, nomogram models have more advantages to predict osteoporosis than FF model and MTR model.

Conclusions: The nomogram models clinical prediction model based on gender, age, FF value, and MT value has good universality and clinical benefits. The clinical prediction model of nomogram models is easy to generalize, which helps to better screen for osteoporosis in the general elderly population and achieve early detection and diagnosis.

PO-2720

Preoperative Vascular Heterogeneity Based on Dynamic Susceptibility-weighted Contrast MRI in Predicting Spatial Pattern of Locally Recurrent High-grade Gliomas

Hanwei Wang, Linlan Zang, Shunan Wang
Daping Hospital, Army Medical University

Objectives: To investigate if spatial recurrence pattern is associated with patient prognosis, and whether MRI vascular habitats can predict spatial pattern.

Methods: In this retrospective study, 69 patients with locally recurrent high-grade gliomas (HGGs) were included. The cohort was divided into intra-resection cavity recurrence (ICR) and extra-resection cavity recurrence (ECR) patterns, according to the distance between the location of the recurrent tumor and the resection cavity or surgical region. Four vascular habitats, high angiogenic tumor, low angiogenic tumor, infiltrated peripheral edema, and vasogenic peripheral edema were segmented and vascular heterogeneity parameters were analyzed. The survival and diagnostic performance under different spatial recurrence patterns were analyzed by Kaplan-Meier and ROC. A nomogram model was constructed by regression analysis and validated by bootstrapping technique.

Results: Progression-free survival (PFS) and overall survival (OS) were longer for ICR (n=32) than those for ECR (n=37) (median PFS: 8 vs. 5 months, median OS: 17 vs. 13 months, $p < 0.05$). MRI vascular habitats analyses showed ECR had higher median relative cerebral blood volume (rCBV_{median}) at each habitat than ICR (all $p < 0.01$). The rCBV_{median} at IPE had good diagnostic performance (AUC: 0.727, 95%CI: 0.607, 0.828). The AUC of the nomogram based on MRI vascular habitats and clinical factors was 0.834 (95%CI: 0.726, 0.913) and was confirmed as 0.833 (95%CI: 0.830, 0.836) by bootstrapping validation.

Conclusions: The spatial pattern of locally recurrent HGGs is associated with prognosis. MRI vascular heterogeneity parameter could be used as non-invasive imaging marker to predict spatial recurrence pattern.

PO-2721

Radiomic analysis based on intratumoral heterogeneity to predict spatial recurrence patterns of high-grade gliomas

Hanwei Wang, Linlan Zeng, Shunan Wang
Daping Hospital, Army medical university

Purpose: To investigate whether radiomic features extracted from intratumoral region can predict spatial patterns in locally recurrent high-grade gliomas (HGGs).

Methods: We included 118 patients with locally recurrent HGGs after maximum safe surgical resections and radiotherapy combined with temozolomide (training set, $n = 82$; validation set, $n = 36$). Local recurrence was divided into intra-resection cavity recurrence (ICR) and extra-resection cavity recurrence (ECR), according to the distance between the recurrent tumor and the surgical area or resection cavity. Radiomic features were extracted from the intratumoral region on contrast-enhanced T1-weighted imaging (CE-T1WI). The least absolute shrinkage and selection operator

was used to select the radiomic features and create the radiomics score. In addition, a radiomic nomogram combining the radiomics score and clinical factors was constructed and evaluated using calibration curves and the area under the receiver operating characteristic curve (AUC).

Results: Eleven features with nonzero coefficients related to spatial recurrence patterns were selected. The radiomics score of patients with ECR was higher than that of patients with ICR in the training set [0.536 (0.172-0.935) vs. -0.166 (-0.422-0.169), $p < 0.001$] and in the validation set [0.568 (0.380-1.225) vs. -0.068 (-0.430-0.464), $p < 0.001$]. The radiomics score performed well in training and validation sets with AUCs of 0.870 and 0.830, respectively. Likewise, the radiomics nomogram combining the radiomics score and the ventricular entry showed good calibration and performance in the training (AUC:0.887) and validation (AUC:0.882) sets.

Conclusion: Radiomic features extracted from the intratumoral region using preoperative CE-T1WI can noninvasively predict the spatial recurrence patterns of HGGs.

PO-2722

Diagnostic performance of modified O-RADS score combined with clinical features in the assessment of adnexal lesions with solid tissue based on non-DCE MRI

Minrong Wu¹, Songqi Cai², Lihong Zhu¹, Shengxiang Rao², Jianjun Zhou^{1,2}

1. Zhongshan Hospital (Xiamen), Fudan University

2. Zhongshan Hospital, Fudan University

Objective: to compare the diagnostic efficacy of Ovarian-Adnexal Reporting and Data System (O-RADS) MRI with the modified O-RADS scoring system based on non-dynamic contrast-enhanced (non-DCE) MRI for the classification of benign and malignant lesions with solid tissue. And evaluate the add value of clinical or imaging features to improve the ability of the scoring system to classify adnexal masses.

Methods and materials: This study was a two-center study, patients with adnexal masses containing solid tissue underwent pelvic MRI between January 2018 and March 2022 were retrospectively reviewed. Patients undergoing surgery and confirmed by histopathology were included in this study. Two experienced radiologists independently read the images and assigned the O-RADS MRI score and modified O-RADS score, respectively. Histopathology was used as the reference standard. The diagnostic efficacy of the two scoring methods was compared. Univariate and multivariate logistic regression was performed to evaluate the add value of significant features to predict malignant tumors.

Results: A total of 124 patients with 124 adnexal masses (40 benign, 84 malignant) were enrolled in this study. The diagnostic efficacy of modified O-RADS score in differentiating benign and malignant adnexal masses was higher than that of O-RADS MRI score, with sensitivity of 71.5% and 100.0%, specificity of 75.0% and 12.5%, the area under the curve was 0.732 and 0.563 ($p < 0.001$), respectively. Multivariate analysis showed that the modified O-RADS score 4b or 5 combined with patient age > 38.5 years, nullipara, maximum diameter > 40.5 mm and HE4 > 78.9 pmol/L significantly improved the diagnostic efficiency up to 0.954 ($p < 0.001$).

Conclusion: Modified O-RADS score can improve the differential diagnostic efficiency of benign and malignant adnexal masses with solid tissue based non-DCE MRI, and combined with certain clinical features can significantly improve the diagnostic performance.

PO-2723

T1 mapping and hepatocyte uptake indices in gadoxetic acid-enhanced MRI for Quantitative Evaluation of Liver Function

Xin Li, Jinhua Chen, Dajing Guo, Yangyang Liu
The Second Affiliated Hospital of Chongqing Medical University

Objective: This study aimed to explore the utility of T1 mapping and hepatocyte uptake indices in gadoxetic acid-enhanced MRI (EOB-MRI) for quantitatively assessing liver function.

Methods: We examined 183 patients with chronic hepatitis B or suspected liver focal disease using EOB-MRI with B1 inhomogeneity-corrected T1 mapping. Based on their albumin-bilirubin (ALBI) grade, they were categorized into four groups: Normal Liver Function (NLF), ALBI1, ALBI2, and ALBI3. We measured and calculated T1 relaxation times before and after contrast (T1pre and T1post), the rate of decrease in T1 relaxation time ($\Delta T1$), and the contrast uptake rate (Khep). Relationships between these T1 mapping parameters and the hepatocyte index and ALBI grade were determined using Spearman's correlation. The differences across ALBI groups were assessed with the Kruskal-Wallis test, followed by pairwise comparisons using the Mann-Whitney test. Receiver Operating Characteristic (ROC) curves assessed the discriminative power of T1 mapping and hepatocyte indices for liver function groups, with the DeLong test comparing ROC areas. A p-value below 0.05 indicated statistical significance.

Results: Significant differences were observed in T1 mapping and hepatocyte indices (T1pre, T1post, $\Delta T1$, and Khep) across the NLF and ALBI groups. T1post and Khep showed a strong correlation (ρ : 0.75-1.00) with ALBI grades, whereas $\Delta T1$ exhibited a moderate correlation (ρ : 0.5-0.75), and T1pre showed a weak correlation (ρ < 0.5). The T1pre values decreased in the advanced liver function impairment (ALBI3) group. Through pairwise comparison, both T1post and Khep showed statistically significant differences in discriminating all different liver function groups. Moreover, T1post, $\Delta T1$, and Khep also showed statistically significant differences in discriminating different liver function groups in stratified classification. For discriminating the NLF group from the ALBI1+2+3 group, the AUCs of T1pre, T1post, $\Delta T1$, and Khep were 0.75, 0.93, 0.85, and 0.90. For discriminating the NLF+ ALBI1 group from the ALBI2+3 group, the AUCs of T1pre, T1post, $\Delta T1$, and Khep were 0.69, 0.89, 0.83, and 0.88. For discriminating the NLF+ ALBI1+2 group from the ALBI3 group, the AUCs of T1pre, T1post, $\Delta T1$, and Khep were 0.51, 0.89, 0.76, and 0.94.

Conclusion: T1 mapping and hepatocyte uptake indices (T1post, $\Delta T1$, and Khep) showed good performance in differentiating different ALBI liver function groups, except for $\Delta T1$. T1post was the best in differentiating early liver function impairment groups, while Khep was the best in differentiating poor liver function groups.

PO-2724

The association between glymphatic system dysfunction and alterations in cerebral function and structure in patients with white matter hyperintensities

Zhi Zhang, Xiao Liang, Muhua Huang, Lin Wu, Fuqing Zhou
The First Affiliated Hospital of Nanchang University

Objective: To explore the relationship between the glymphatic system and alterations in the structure and function of the brain in white matter hyperintensity (WMH) patients.

Methods: MRI data were collected from 27 WMH patients and 23 healthy controls (HCs). The along perivascular space (ALPS) indices were calculated for each subject, and the anterior corner distance of the lateral ventricle and the width of the third ventricle were measured. The DPABISurf tool was used to calculate the cortical thickness and cortical area. In addition, DPARSF was used to calculate regional homogeneity (ReHo), degree centrality (DC), amplitude low-frequency fluctuation (ALFF), fractional amplitude of low-frequency fluctuation (fALFF) and voxel-mirrored homotopic connectivity (VMHC). In addition, each WMH patient was evaluated on the Fazekas scale. Finally, the correlation analysis of structural indicators and functional indicators with bilateral ALPS indices was investigated using Spearman correlation analysis.

Results: The ALPS indices of WMH patients were lower than those of HCs (left: $t=-4.949$, $P < 0.001$; right: $t=-3.840$, $P < 0.001$), and the width of the third ventricle and the distance of the anterior corner of the lateral ventricle were higher than those of HCs ($P < 0.05$). This study found that ALFF, fALFF, ReHo, DC, and VMHC values in some brain regions of WMH patients were alternated (AlphaSim corrected, $P < 0.005$, cluster size > 26 voxel, rmm value=5), and the cortical thickness and cortical area of WMH patients showed trend changes ($P < 0.01$, cluster size $> 20\text{mm}^2$, uncorrected). Interestingly, we found significantly positive correlations between the left ALPS indices and DC values in the superior temporal gyrus ($r=0.494$, $P=0.009$, $P \times 5 < 0.05$, Bonferroni correction).

Conclusions: We found that glymphatic dysfunction positively correlated with DC values in the left superior temporal gyrus in WMH patients. Our results suggest that glymphatic system impairment is related to the functional centrality of local connections in patients with WMH.

PO-2725

White Matter Hyperintensity Predicts Future Financial Capacity Impairment: A Study Based on Cognitively Normal Older Adults

Xiao Luo, Hong Hui, Li Kaicheng, Zeng Qingze, Zhang Minming, Huang Peiyu
Zhejiang University

Background

This study explores the link between small vessel disease (SVD) and financial capacity in cognitively unimpaired (CU) older adults.

Methods

A total of 414 CU participants (mean age 73.2 ± 7.6 , 59.7% women) were recruited at baseline. Among the initial 414 participants, 104 (25.1%), 240 (57.9%), and 141 (34.0%) underwent follow-up visits after had one, two, and four years, respectively. Participants were assessed using the Financial Capacity Instrument-Short Form (FCI-SF) to evaluate cross-sectional and longitudinal financial capacity. Baseline MRI, amyloid, and tau PET scans were performed to calculate SVD total score and individual SVD severity, including white matter hyperintensities (WMH), dilated perivascular space (dPVS), cerebral microbleed (CMB), and lacune based on MRI results. Linear mixed estimates were used to examine the effects of SVD on baseline and long-term financial capacity, accounting for factors like age, sex, education, Alzheimer's disease (AD) related pathologies, and vascular risk.

Results

SVD total score associated with baseline bank statement management (BANK, $\beta=-0.12$, $p < 0.05$) and long-term FCI-SF ($\beta=-0.33$, $p < 0.01$) and single chequebook register (SNG, $\beta=-2.03$, $p < 0.05$) decline. Individual SVD components also showed associations; lacune and CMB were linked to baseline financial conceptual knowledge ($\beta=-0.17$, $p < 0.005$) and BANK ($\beta=-0.14$, $p < 0.01$), respectively. WMH and CSO-dPVS were related to FCI-SF decline ($\beta=-0.29$ and -0.52 , respectively, $p < 0.05$), and WMH indicated future decline in financial conceptual knowledge ($\beta=-0.05$, $p < 0.05$).

and single chequebook register ($\beta=-0.14$, $p<0.01$). The impact of SVD on financial capacity was more pronounced in APOE $\epsilon 4$ carriers.

Conclusions

SVD is linked to cross-sectional and longitudinal financial capacity impairment in cognitively unimpaired older adults, emphasizing SVD prevention for maintaining financial capacity.

Impact Statement

We certify that this work is novel clinical research. This study investigates how small vessel disease (SVD) affects financial capacity in cognitively unimpaired older adults. It reveals that higher baseline SVD is linked to impairment in complex financial tasks, and those with more initial SVD experience accelerated financial decline. This impact is more significant in APOE $\epsilon 4$ carriers. Our findings emphasize the importance of monitoring SVD-related changes in financial capacity to prevent losses, particularly among genetically vulnerable individuals.

PO-2726

Radiomic Models for Distinguishing Unstable Carotid Plaques from Stable Carotid Plaques on High-resolution Vessel Wall MRI

Xin Cao, Zhi-meng Cui, Si-ting Xu
Huashan Hospital Fudan University

Objective: To build radiomic models in differentiating unstable carotid plaques from stable carotid plaques based on T1-weighted imaging (T1WI) and contrast-enhanced T1WI (CE-T1WI) of high-resolution vessel wall magnetic resonance imaging (HR VW-MRI) through machine learning (ML) algorithm, to assess plaque vulnerability and reveal the relationship between plaque enhancement and plaque development mechanisms.

Materials and methods: The existing cases of CUBE T1WI and CE-T1WI HR VW-MRI examination of carotid plaques in the Department of Radiology, Huashan Hospital, Fudan University from January 2017 to December 2020 were retrospectively collected for internal training and testing. In addition, image data from another medical facility undergoing the same examination were collected for external verification. A brain MRI examination should have been performed within 3 months after the subjects completed the VW-MRI examination of carotid plaques, to determine the plaque vulnerability. ITK-SNAP software was used to delineate the region of interest of plaques, and the Standardized Environment for Radiomics Analysis toolkit of MATLAB software was used to extract 487 imaging radiomic features. The ElasticNet algorithm was used to build the radiomic model. The leave-one-out cross-validation was used to carry out internal tests. The diagnostic abilities of these models were evaluated using the area under receiver operating characteristic curve (AUC) analysis. In addition, the models were validated by external data sets and compared to radiologists' diagnoses.

Results: The VW-MRI image data of 120 patients in our hospital were used for model construction. Eleven features were used to build the T1WI radiomic model and 16 features were used to form the CE-T1WI radiomic model. The results of internal testing showed that the CE-T1WI radiomic model had better AUC ($0.885>0.838$), accuracy (ACC) ($0.825>0.779$) and sensitivity (SEN) ($0.883>0.783$) than the T1WI radiomic model. The AUC ($0.885>0.840$), ACC ($0.825>0.800$) and SEN ($0.883>0.880$) of the CE-T1WI radiomic model were superior to those of radiologists. The AUC ($0.838<0.840$), ACC ($0.779<0.800$), SEN ($0.783<0.880$) and SPE ($0.771<0.800$) of the T1WI radiomic model were all worse than those of the radiologists. VW-MRI images of 92 patients were retrospectively collected from the radiology department of another hospital for external

validation of the models, and the results showed that the diagnostic performance of the T1WI and the CE-T1WI radiomic models was similar. The ACC ($0.727 > 0.719$) and SPE ($0.615 > 0.583$) of the CE-T1WI radiomic model were slightly better than those of the T1WI model, while the AUC ($0.800 < 0.804$) was slightly worse than that of the T1WI model, and their SEN (0.800) was the same. However, the AUC (0.804 , $0.800 < 0.815$), ACC (0.719 , $0.727 < 0.787$), SEN (0.800 , $0.800 < 0.850$) and SPE (0.583 , $0.615 < 0.780$) of both models were slightly worse than those of radiologists.

Conclusion: The radiomic model based on CE-T1WI of HR VW-MRI had some value for evaluating the vulnerability of carotid artery plaques, and it could establish the relationship between plaque enhancement and pathologic mechanisms related to plaque development. However, large sample size data sets are still needed for ML training to optimize and improve the generalization ability and repeatability of the model.

PO-2727

Effects of bright light therapy on cingulate cortex dynamic functional connectivity and neurotransmitter activity in young adults with subthreshold depression: A double-blind randomized controlled trial

Guixian Tang, Pan Chen, Ying Wang
First Affiliated Hospital of Jinan University

BACKGROUND: Subthreshold depression is a strong risk factor for the onset of major depressive disorder and is associated with an increased burden of disease and suicide risk. Bright light therapy (BLT) is one of the effective interventions for subthreshold depression, but its neural mechanism is still unclear. Neurotransmitter systems have been proposed to involve in the mechanisms of light therapy. The goal of this double-blind, randomized, placebo-controlled clinical trial was to assess the correlation between BLT and the dynamic functional connectivity (dFC) changes in the cingulate cortex along with distribution of specific neurotransmitters in subthreshold depression.

METHODS: Participants with subthreshold depression were randomly assigned to either the BLT group ($N = 38$) or the placebo group ($N = 39$). The primary outcome was Hamilton Depression Rating Scale (HDRS), and secondary outcomes were Centre for Epidemiologic Studies Depression Scale (CESD) and Hamilton Anxiety Scale (HAMA), which were assessed before and after 8 weeks. The participants also underwent resting-state functional magnetic resonance imaging before and after 8 weeks. The subgenual, pregenual and the supracallosal anterior cingulate cortex (subACC, preACC, supACC), middle cingulate cortex (MCC) and posterior cingulate cortex (PCC) seed-based whole-brain dFC analysis was conducted. Besides, a multivariate regression model was adopted to predict HDRS and CESD scores changes after BLT. Furthermore, JuSpace toolbox was used to calculate the associations between dFC (pre- and after interventions) and neurotransmitter activity in the BLT group.

RESULTS: BLT group showed decreased CESD score ($t = 3.195$, $p = 0.002$) and HDRS score ($t = 3.232$, $p = 0.002$) from pre-treatment to post-treatment compared to the placebo group. Also, compared to baseline, BLT group showed increased dFC of the right supACC-right temporal pole (TP), left MCC-right insula, and left supACC-pons, and decreased dFC of the right supACC-right middle frontal gyrus (MFG) after intervention. Changes in dFC of the right supACC-right TP showed positive correlation with changes in CESD score (significant: $r = 0.522$, $p = 0.003$) and HDRS score (marginally significant: $r = 0.346$, $p = 0.061$) before and after BLT. Moreover, combining the baseline dFC variability of the cingulate cortex could predict HDRS changes in BLT. Finally, compared to baseline, the supACC and MCC dFC changes after BLT showed significant

correlations with the serotonergic, dopaminergic, noradrenergic systems as well as the GABAergic and glutamatergic maps.

CONCLUSIONS: These results suggested that BLT alleviates depressive symptoms and changes the cingulate cortex dFC variability in subthreshold depression, which raises the possibility that pre-treatment dFC variability of the cingulate cortex could be used as a biomarker for improved BLT treatment in subthreshold depression. Furthermore, dFC changes with specific neurotransmitter systems after BLT may underline the antidepressant mechanisms of BLT.

PO-2728

Alterations of apparent diffusion coefficient from ultra-high b-values in the bilateral thalamus and striatum in MRI-negative refractory epilepsy

Guixian Tang¹, Xueying Ling¹, Hao Xu¹, Qiang Guo²

1. First Affiliated Hospital of Jinan University

2. Guangdong 999 Brain Hospital, Affiliated Brain Hospital of Jinan University

Background: Subcortical nuclei such as the thalamus and striatum have been shown to be related to seizure modulation and termination, especially in refractory epilepsy. And the potential roles of the aquaporin-4 (AQP4) in epilepsy have been mentioned in previous studies. However, no studies have reported the AQP4 abnormalities in vivo in the subcortical nuclei in refractory epilepsy. Therefore, this study aimed to assess AQP4 function reflected by the apparent diffusion coefficient (ADC) from ultra-high b-values (ADC_{uh}) in MRI-negative refractory epilepsy.

Methods: Twenty-nine patients with MRI-negative refractory epilepsy and 18 healthy controls underwent enhance diffusion weighted imaging (eDWI) with 15 b-values (0-5,000 s/mm²). The eDWI parameters such as standard ADC (ADC_{st}), pure water diffusion (D) and ADC_{uh} were calculated from the 15 b-values. Regions-of-interest analyses were conducted in the bilateral thalamus, caudate nucleus, putamen and globus pallidus and ADC_{st}, D and ADC_{uh} values were compared between the epilepsy patients and controls.

Results: ADC_{uh} values in the bilateral thalamus, caudate nucleus, putamen and globus pallidus in MRI-negative refractory epilepsy were significantly higher than those in the healthy control subjects (all $P < 0.05$), ADC_{st} value in the right thalamus was significantly lower than those in the healthy control subjects ($P < 0.05$).

Conclusion: The alterations of the ADC_{uh} values in the bilateral thalamus and striatum may reflect abnormal AQP4 function in MRI-negative refractory epilepsy. ADC_{uh} might be a useful measurement for evaluating subcortical nuclei related brain damage in epilepsy patients.

PO-2729

Performance of 0.55T magnetic resonance imaging (MRI) for parotid gland: Comparison with 1.5T and 3T MRI

Rui Wang, Qifan Ma, Ying Yuan, Xiaofeng Tao

Department of Radiology, Shanghai Ninth People's Hospital, Shanghai JiaoTong University School of Medicine

Purpose: To evaluate the clinical performance of 0.55T versus 1.5T and 3T magnetic resonance imaging (MRI) systems for parotid glands.

Materials and Methods: Nineteen healthy volunteers were prospectively recruited and underwent maxillofacial imaging using MRI systems with field strengths of 0.55T, 1.5T and 3T. The scanning protocols included T2 fat-saturation (T2-FS) sequence and diffusion imaging sequences with

multiple b values across the three different field strengths. Two radiologists, with 5 and 15 years' diagnostic experience in head and neck imaging, made subjective scores according to the 5-point method in five aspects on the T2-saturation images with a double-blind manner. Objective image quality was evaluated by measuring signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) on T2-FS images. The quantitative degree of the parotid gland distortion in diffusion-weighted imaging (DWI), the stability and interval range differences of ADC, as well as parameters derived from intravoxel incoherent motion-diffusion kurtosis imaging (IVIM-DKI) were compared under different field strengths. Statistical analysis was performed using Graphpad Prism 8.0 software while image fusion was conducted using 3D slicer software. Differences in quality measurement and quantitative parameters were analyzed using one-way ANOVA. The Spearman's coefficient correlation was used for the inter-observer consistency analysis. Bland-Altman method was used to evaluate the stability of corresponding parameters along with calculation of coefficients of variation (CV). Differences were considered statistically significant at $P < 0.05$.

Results: The SNR and CNR of T2-FS in 0.55T were the lowest; however, no significant differences were found between 0.55T and 1.5T ($P > 0.05$). The degree of distortion with DWI in 0.55T was significantly lower than 1.5T using SS-EPI ($P < 0.0001$), while no differences were found in axial slices compared with RESOLVE-DWI in 3T. The stability of ADC was the highest in 0.55T versus 1.5T and 3T. Additionally, the corresponding parameters of different diffusion sequences in 0.55T were significantly different in contrast with higher field strengths ($P < 0.0001$), in addition to the D values ($P > 0.05$). The stability of D values across different field strengths were the highest, while D^* values were the lowest.

Conclusion: The results demonstrated that 0.55T could significantly reduce image distortion and retain stable ADC values in DWI and present comparable image quality in morphologic imaging with 1.5T, which will be helpful for patients with limited condition to achieve the normal diagnostic effect. The diffusion parameters of IVIM-DKI in 0.55T showed significant difference with 1.5T and 3T, with the exception of D values. Therefore, the use of diffusion parameters as biomarkers for the clinical practice of parotid gland tumors across different field strengths should be carefully considered.

PO-2730

Abnormal Functional Connectivity in the Fronto-Striatal Network in adolescent depression with Psychotic Symptoms

Xinlin Huang¹, hongyan sun², ju gao², yongming wang³, feng gao²

1. Jiamusi University

2. The Affiliated Guangji Hospital of Soochow University

3. Medical College of Soochow University

Background:

Depression is a mental disorder with a high incidence and mortality rate, particularly common in adolescents. Adolescent depression with psychotic symptoms is characterized by more severe impairment and a poorer treatment response, along with a higher risk of suicide. Previous studies have demonstrated the involvement of the frontal striatal network (FSN) circuit in various psychiatric disorders such as depression, bipolar disorder and schizophrenia, indicating its crucial role in emotional regulation and cognitive control. However, it remains unclear whether adolescent depression with psychotic symptoms exhibits similar or different coupling with the orbitofrontal-striatal network. Therefore, the aim of this study is to compare adolescent depression, both with and without psychotic symptoms, in order to explore the potential disruptions in connectivity within the FSN and the neural mechanisms associated with psychotic symptoms

Methods:

The study included 77 adolescents diagnosed with depression. Based on the presence or absence of psychotic events such as hallucinations or delusions in their medical history, the participants were divided into two groups: the group with psychotic symptoms ($n=33$) and the group without psychotic symptoms ($n=44$). The Brief Psychiatric Rating Scale (BPRS) was used to assess the severity of psychotic symptoms, and the Patient Health Questionnaire-9 (PHQ-9) was used to assess the severity of depressive symptoms. Functional magnetic resonance imaging (fMRI) data were collected from each participant. Independent component analysis was then performed using the GIFT software to obtain the functional connectivity networks. The voxel-wise distribution of the FSN predominantly encompasses the frontal lobe and bilateral striatum regions, including the superior frontal gyrus, middle frontal gyrus, inferior frontal gyrus, anterior cingulate, frontal orbital cortex, caudate nucleus, putamen, and globus pallidus. Finally, two-sample t-tests were conducted to compare the two groups of participants.

Results:

There was no significant difference in sex, age, education years, disease duration, and PHQ-9 scores between the two subgroups. A significant difference in the BPRS total score was found ($P < 0.001$). The one-sample t-test revealed a typical spatial pattern in the FSN in each group, including superior frontal gyrus, middle frontal gyrus, inferior frontal gyrus, anterior cingulate, frontal orbital cortex, caudate nucleus, putamen, and globus pallidus. The adolescent depression with psychotic symptoms demonstrated decreased FSN connectivity in the bilateral caudate and bilateral putamen compared with the adolescent depression without psychotic symptoms (corrected at the cluster level using family-wise error, $P < 0.05$). Additionally, a negative correlation was observed between the left caudate, left putamen and BPRS scores ($r = -0.385$, $P = 0.030$) in adolescent depression with psychotic symptoms group.

Conclusion:

We found specific alterations in the striatum and temporal lobe in adolescent depression with psychotic symptom, providing new evidence for the pathogenesis of psychotic symptoms.

PO-2731

Application of Multi-echo in steady-state acquisition sequence in MR imaging of Inferior alveolar nerve

Qi Sun

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

Abstract

Purpose This study evaluated the performance of a 4-min multi-echo in steady-state acquisition (MENSA) sequence in MRI for the assessment of Inferior alveolar nerve.

Methods 15 subjects underwent MENSA sequence on a 3.0-T MRI scanner. Two Oral and Maxillofacial Surgery doctor and radiologist independently assessed the images for quality and diagnostic capability. A qualitative assessment scoring system for image quality and quantitative nerve signal-to-noise ratio (SNR) and inferior alveolar nerve and masseter muscle contrast-to-noise ratios (CNR) was applied. Using surgical reports as the reference, sensitivity, specificity, accuracy, and area under the receiver operating characteristic curves (AUC) were evaluated. Intraclass correlation coefficients (ICC) and weighted kappa were used to calculate reliability.

Results Weighted kappa and ICC values indicated good reliability. Sensitivity, specificity, and accuracy of diagnosis based on MENSA images were 96.23%, 89.47%, and 94.44%, respectively, and AUC was 0.929. Weighted kappa values for intraobserver (0.758) and interobserver (0.768–0.818) reliability were substantial to perfect.

Conclusion A time-efficient 4-min MENSA protocol exhibits superior image quality and high vascular contrast with the potential to produce high-resolution inferior alveolar nerve images.

PO-2732

The Value of Enhanced 3D-STIR Sequence in Detecting the Inferior Alveolar Nerve

Qi Sun

Department of Radiology, Ninth People's Hospital, School of Medicine, Shanghai Jiao Tong University

Abstract

Objective To explore the application value of Magnetic Resonance (MR) three-dimensional (3D) sampling perfection with application-optimized contrasts using different flip-angle evolution (SPACE) and the short time inversion recovery (STIR) sequences in displaying the inferior alveolar nerve.

Methods 10 volunteers were prospectively enrolled, non-enhanced and enhanced 3D-STIR MR sequence were performed using combined head and neck coil. Imaging scores of non-enhanced and enhanced 3D-STIR MR were evaluated. Moreover, signal intensity of the masseter muscle and medial pterygoid muscle were measured to calculate the signal intensity ratio (SIR) and contrast noise ratio (CNR).

Results The subjective score of image quality of enhanced 3D-STIR MR sequence was higher than that of non-enhanced sequence, which had excellent consistency among observers, and the Kappa coefficients were 0.912, 0.875, respectively. The SIR and CNR values of enhanced 3D-SPACE-STIR MR sequence of inferior alveolar nerve were higher than those of non-enhanced MR imaging.

Conclusion The image background suppression of enhanced 3D-STIR MR sequence was superior to that of non-enhanced 3D-STIR MR sequence; Enhanced 3D-STIR MR sequence can clearly show the inferior alveolar nerve.

PO-2733

DCE-MRI in cervical cancer: correlation between quantitative parameters and molecular markers HIF-1 α , VEGF, and Ki-67

Bing Liu

Xian Hospital of Traditional Chinese Medicine

Background: To investigate whether dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) has the potential to non-invasively detect microenvironmental condition by quantitatively measuring blood perfusion, vessel wall permeability, and vascularity, and to elucidate the possible correlations between DCE-MRI quantitative parameters and the expression level of hypoxia, vascularity, and proliferation related molecular biomarkers.

Materials and methods: In this prospective single center clinical study, 58 patients diagnosed with cervical cancer underwent DCE-MRI before anticancer treatment were enrolled. Ktrans, Kep, Ve, and Vp were generated from Extended Toft's model. Then patients underwent colposcopy biopsy within 1 week after DCE-MRI. Pretreatment expression levels of HIF-1 α , VEGF and Ki-67 were assessed and scored by immunohistochemistry on colposcopy obtained tumor specimens.

Results: In HIF-1 α low-expression group, Ktrans ($p=0.031$) and Kep ($p=0.012$) values were significantly higher than the HIF-1 α high-expression group. In VEGF high-expression group, Ktrans ($p=0.044$) and Ve values ($p=0.021$) were significantly higher than the VEGF low-expression group. In Ki-67 high-expression group, Ktrans ($p=0.026$) and Kep ($p=0.033$) were significantly higher than the Ki-67 low-expression group. Multiple linear regression analyses and Pearson correlation revealed that Ktrans independently negatively correlated with HIF-1 α expression, Ve independently

positively correlated with VEGF, and Kep independently positively correlated with Ki-67. The area under the ROC curves of Ktrans for HIF-1 α , Ve for VEGF, and Kep for Ki-67 were 0.728, 0.743, 0.730, respectively.

Conclusion: Our results suggest that DCE-MRI quantitative parameters could be potentially used as imaging markers for non-invasively detecting microenvironmental hypoxia, vascularity and proliferation in cervical cancer patients.

PO-2734

Comparison of Monoexponential and Biexponential Model of Diffusion-Weighted Imaging in Grading Clear Cell Renal Cell Carcinoma

Jinfeng Cao, 昕 罗, 文静 郑
Zibo Central Hospital

PURPOSE

To compare the value of diffusion-weighted imaging (DWI) and intravoxel incoherent motion (IVIM) in grading clear cell renal cell carcinoma (ccRCC).

MATERIALS AND METHODS

96 patients with pathologically proven ccRCC were evaluated by DWI and IVIM on a 3-T scanner. These patients were divided into low-grade (grade I and grade II) and high-grade (grade III and grade IV) groups according to the WHO/ISUP classification system. The apparent diffusion coefficient (ADC), true diffusion coefficient (D), pseudodiffusion coefficient (D*), and perfusion fraction of pseudodiffusion (f) values were calculated. The Mann Whitney U test was used to compare the differences of parameters between the two groups; the receiver operating characteristic (ROC) analysis and Delong test was performed for all parameters.

RESULTS

Compared with low-grade ccRCC, the ADC and D values of high-grade ccRCC patients decreased, while the D* and f values increased, and the differences were statistically significant ($p < 0.05$). The cut-off values of ADC, D, D* and f value to distinguish low-grade and high-grade ccRCC were $1.50 \times 10^{-3} \text{mm}^2/\text{s}$, $1.12 \times 10^{-3} \text{mm}^2/\text{s}$, $33.19 \times 10^{-3} \text{mm}^2/\text{s}$, 0.31, respectively; the AUCs of ADC, D, D* and f value were 0.871, 0.942, 0.621, 0.894, and the AUC of D value was the highest. Based on the Delong test, the AUCD was significantly higher than AUCADC ($p = 0.018$) and AUCD* ($p < 0.001$), and there was no significant difference between AUCD* and AUCf ($p = 0.176$).

CONCLUSION

Compared with the monoexponential model DWI, the biexponential model IVIM was more valuable in grading ccRCC.

PO-2735

MRI radiomic features-based machine learning approach to identify H3 G34 mutation in patients with diffuse hemispheric glioma

Hanbing Shao,Xiaorui Su,Qiang Yue
West China Hospital of Sichuan University

Purpose: Diffuse hemispheric gliomas, H3 G34-mutant (DHGs-G34m), are newly recognized aggressive brain tumors characterized by histone H3F3A point mutations at G34, and occur most often in cerebral hemispheres of teenagers and young adults. This study aimed to investigate the value of predicting H3 G34 mutation status by applying MR radiomics features of patients with diffuse hemispheric gliomas.

Methods: This retrospective study enrolled 47 patients with diffuse gliomas. We divided the patients into three groups for separate analysis (16 DHGs-G34m vs 16 GBMs-IDH-WT and 16 DHGs-G34m vs 15 GBMs-IDHm). The Feature Explorer (FAE) was performed to generate the ML pipeline and select important radiomics features. Metrics such as sensitivity, specificity, accuracy, and area under the curve (AUC) provided estimates of the performance of the FAE-generated models to identify the final best-performing model.

Results: There were 16 patients with DHG-G34m, 16 GBM-IDH-WT, and 15 GBM-IDHm patients included in our study. Patients with DHG-G34m were younger than that in IDH-wildtype or IDH-mutant GBM groups (mean age 22.38 years vs. 55.25 years, $p<0.01$, and 22.38 years vs. 42.87 years, $p<0.01$). It turned out that MR radiomics features could better distinguish DHGs-G34m from the other two groups. At first, in the stage of identifying DHGs-G34m patients from the GBMs-IDH-WT group, Logistic regression with LASSO (LR-LASSO) model based on 3 important features including original shape Least Axis Length, original shape Minor Axis Length, and original glrlm Gray Level Non-Uniformity achieved the best performance. On the validation data set, the AUC and the accuracy of the model were 0.982 and 0.949 (0.956 and 0.900 on the testing set), respectively. Then, for the comparative analysis of DHGs-G34m and GBMs-IDHm, original shape Sphericity, original first-order Kurtosis, and original glrlm Run Entropy 3 important features were selected by LR-LASSO model with the best performance, the AUC and the accuracy were 0.800 and 0.714 (0.959 and 0.929 on testing set) on validation data set. Moreover, the inclusion of more patients should be performed to further verify the diagnostic value of radiomics features in rare DHGs-G34m.

Conclusions: The ML algorithms with FAE based on radiomics features of conventional MR images provide high discriminatory accuracy in predicting the H3 G34 mutation status of diffuse hemispheric glioma.

PO-2736

Effects of acupuncture treatment on changes in the brain structural covariance network in patients with primary dysmenorrhea

Cong Zhang¹, Xiaotong Ma²
1. Shaanxi University of Traditional Chinese Medicine
2. Affiliated Hospital of Shaanxi University of Traditional Chinese Medicine

Objective To observe the characteristics of brain structural covariance network changes and their correlation with clinical scales in patients with primary dysmenorrhea (PDM) treated with acupuncture. **Methods** High-definition resolution T1 structural image data were prospectively

collected from 50 patients with PDM (PDM group) and 47 healthy controls (HC group), and clinical scale scores related to dysmenorrhea were recorded; after that, acupuncture treatment was performed on the PDM group, and high-definition resolution T1 structural images and clinical scale scores were collected for a second time after the treatment, to compare the differences in gray matter volume (GMV) between the PDM group and the HC group, and to construct a structural covariate network (SCN) based on the whole-brain level with the brain area of difference as the area of interest, and to analyze the correlations between the structural covariance and the clinical scales. Results Compared with the HC group, the PDM group showed increased GMV in the right precentral gyrus, left precuneus, right middle temporal cortex, and left basolateral amygdala ($P<0.05$). After needling the PDM group to construct the SCN with the region of interest, GMV decreased in the right precentral gyrus SCN in the bilateral postcentral gyrus, the left precentral gyrus, the right angular gyrus, the right middle occipital gyrus, the right precuneus, and bilateral lingual gyrus ($P<0.05$); and increased in the left postcentral gyrus, the left middle occipital gyrus, and the left medial prefrontal cortex GMV ($P<0.05$). GMV decreased in the left posterior cingulate gyrus, left angular gyrus, right middle cingulate gyrus, and left prefrontal cortex in the left precuneus SCN ($P<0.05$); and increased in the bilateral thalamus and right medial frontal cortex ($P<0.05$). Left middle temporal gyrus and left precentral gyrus decreased in the right middle temporal gyrus SCN ($P<0.05$). GMV in the left basolateral amygdala SCN decreased in the left lingual gyrus and right basolateral amygdala ($P<0.05$); GMV in the right insula increased ($P<0.05$). Right precuneus GMV was positively correlated with the Self-Depression Scale (SDS) in the PDM group ($r=0.296$, $P=0.027$). Conclusion Acupuncture treatment for PDM involves neural network modulation in different regions of the brain, and SCN analysis can be used as a complementary method to reveal the overall effect of acupuncture treatment on the gray matter structure of the brain in PDM, which provides a new perspective for understanding the analgesic mechanism of acupuncture treatment for PDM.

PO-2737

Divergent effects of sex on hippocampal subfield alterations in drug-naïve patients with major depressive disorder

mengyue Tang,Lianqing Zhang,Xinyue Hu,Wei jie Bao,Zilin Zhou,Yingxue Gao,Lingxiao Cao,Hailong Li,Qiyong Gong,Xiaoqi Huang
West China Hospital, Sichuan University

Background: The hippocampus is a crucial brain structure in etiological models of major depressive disorder (MDD). It remains unclear whether sex differences in incidence and symptoms in MDD are related to differential illness-associated brain alterations including those of the hippocampus. This study investigated divergent effects of sex on hippocampal subfield alterations in drug-naïve patients with MDD.

Methods: High-resolution structural MR images were obtained from 144 drug-naïve individuals with MDD early in their illness course and 135 age- and sex-matched healthy controls (HCs). Hippocampal subfields were segmented using FreeSurfer software and analyzed in terms of both 18 histological subfields along its transverse axis (CA1-4, dentate gyrus, etc.) and the more integrative larger functional subregions (head, body and tail) along its longitudinal axis.

Results: We observed significant overall hippocampal volume reduction in MDD patients, with deficits more prominent in posterior hippocampus. Differences in anatomic alterations between male and female patients were observed in CA1-head, presubiculum-body and fimbria in the left hemisphere. Exploratory analyses revealed a different pattern of clinical and memory function correlations with histological subfields and functional subregions between male and female patients primarily in the hippocampal head and body.

Conclusions: These findings represent the first reported sex-specific alterations in hippocampal histological subfields in patients with MDD early in the illness course prior to treatment. Sex-specific hippocampal alterations may contribute to diverse sex differences in the clinical presentation of MDD.

PO-2738

Study on the changes of brain structural covariance network in patients with postherpetic neuralgia

Jiaxin Xiong, Jian Jiang
The First Affiliated Hospital of Nanchang University

Objective: In order to find the potential imaging evidence of the central pathogenesis of postherpetic neuralgia (PHN) and the neuroimaging markers of the transformation of herpes zoster (HZ) to PHN, the purpose of this study was to construct structural covariance network (SCN) at the level of PHN group and HZ group, and statistically analyze it with healthy control(HC) to calculate whether there were differences in SCN metrics among the three groups.

Methods: 54 PHN, 53 HZ and 50 HC subjects were scanned by structural magnetic resonance imaging (3DT1). Before the scan, the pain intensity was evaluated by visual analog score (VAS), the degree of depression was assessed by Hamilton depression scale (HAMD), the degree of anxiety was assessed by Hamilton anxiety scale (HAMA), and the 90-item symptom list was used to evaluate psychological or emotional disorders. The group-level SCN was established by Pearson correlation based on the cortical thickness of the Desikan-Killiany map. The global attributes and node attributes were calculated by graph theory, and calculated whether there were significant differences in SCN among the three groups.

Results: 1. There was no significant difference in global network properties among the three groups. 2. Nodal metrics: (1) The nodal efficiency of left superior and middle temporal gyrus in HZ was lower than that in HC, and the nodal betweenness in left superior temporal gyrus, right paracentral lobule, right taloid gyrus and right frontal pole in HZ was less than that in HC, and the nodal degree of left superior temporal gyrus and right temporal pole in HZ were lower than those in HC. The nodal efficiency of left cingulate gyrus, left middle frontal gyrus and right prefrontal lobe in HZ was higher than that in HC, the nodal betweenness in left olfactory cortex and left middle frontal gyrus in HZ was higher than that in HC, and the nodal degree of left cingulate gyrus and left middle frontal gyrus in HZ were higher than those in HC. (2) The nodal degree of right superior marginal gyrus in PHN was lower than that in HC, the nodal efficiency of left inferior temporal gyrus in PHN was higher than that in HC, and the nodal betweenness in posterior left cingulate gyrus and left superior marginal gyrus in PHN group was higher than that in HC. (3) The nodal efficiency and degree of caudal left anterior cingulate gyrus, lateral left occipital lobe and left lingual gyrus in PHN group were lower than those in HZ, and nodal betweenness in caudal left anterior cingulate gyrus in PHN was lower than that in HZ. The nodal efficiency of left superior temporal gyrus, left middle temporal gyrus and posterior left inferior frontal gyrus in PHN was higher than that in HZ, the nodal betweenness in right superior temporal gyrus in PHN was larger than that in HZ, and the nodal degree of left superior temporal gyrus, left middle temporal gyrus, posterior left inferior frontal gyrus and right temporal pole in PHN were higher than those in HZ. The above node metrics with differences are not corrected by FDR.

Conclusion: There is no significant difference in global network properties among the three groups, which may be related to the shorter course of disease in HZ and PHN. There are some differences of the nodes which relate with pain matrix among the three groups, which provides supplement to functional network topology of PHN and new insights into the neural basis for the development of HZ to PHN.

PO-2739

Association of MRI Findings with Paraspinal Muscles Fat Infiltration in Patients with Chronic Low Back Pain: A Multicenter Study

Jingrui Hong, Bo He, Zhenguang Zhang
the First Affiliated Hospital of Kunming Medical University

Objective: Aim to evaluate the relationship between common MRI findings and paraspinal muscle morphology and fat infiltration in CLBP patients by quantitative MR imaging.

Methods: All the CLBP patients were consecutively enrolled from July 2021 to December 2022 in four medical institutions. Imaging the lumbar spine using a 3.0 T MRI. The cross-sectional area (CSA) and proton density fat fraction (PDFF) of the multifidus (MF) and erector spinae (ES) muscles at the central level of the L5-S1 intervertebral discs were measured. Different MRI findings of the same participant were evaluated in regular sequences, including Degenerative lumbar spondylolisthesis (DLS), Intervertebral disc degeneration (IVDD), Facet arthrosis, Disc bulge, and Disc herniation. The relationship between MRI findings and the PDFF of the paraspinal muscles in CLBP patients was analyzed.

Results: A total of 493 participants were included in the study (198 females, 295 males). Multivariate linear regression analysis showed that the grading of IVDD was the main factor affecting the PDFF of MF at the L4-S1 level and the PDFF of ES at the L4/5 level (BMF at L4/5=1.544, BES at L4/5=1.845, BPSM at L4/5=1.789, BMF at L5/S1=1.218, $P<0.05$). DLS was a significant factor affecting the PDFF of MF at the L4/5 level ($B=4.774$, $P<0.05$). After including age, gender, and BMI as control variables in the regression analysis, the effects of the grading of IVDD and DLS on the PDFF of the paraspinal muscles were no longer statistically significant. **Conclusion:** This study demonstrates that among those MRI findings, DLS and the grading of IVDD have a larger effect on the increase in the PDFF of paraspinal muscles in the posterior column, but there are overlapping influences with age, gender, and BMI. This reveals that the paraspinal muscle fat infiltration in CLBP patients is related to the combined or synergistic effect of multiple factors, especially at the L4/5 disc level.

PO-2740

Altered intersubject variability in functional connectivity within brain white-matter of major depressive disorder and its association with gene expression profiles

Qun Gai, Tongpeng Chu, Ning Mao, Haizhu Xie
Yantai Yuhuangding Hospital affiliated to Qingdao University

Background: Major depressive disorder (MDD) is a heterogeneous disorder with remarkable intersubject variability in clinical presentations and neurobiological substrates. Although the altered intersubject variability in functional connectivity (IVFC) within gray-matter has been reported in MDD, the alterations to IVFC within white-matter (WM-IVFC) and the molecular mechanisms associated with these changes remain unknown.

Methods: Based on the resting-state functional MRI data of discovery [(145 MDD patients and 119 healthy controls (HCs)] and validation cohorts (54 MDD patients, and 78 HCs), we compared the WM-IVFC between the two groups. We further assessed the meta-analytic cognitive functions related to the alterations. The altered regional WM-IVFC was used to classify MDD patients and predict clinical symptoms in patients. In combination with the Allen Human Brain Atlas, transcriptome-neuroimaging association analyses were further conducted to investigate gene

expression profiles associated with WM-IVFC alterations in MDD, followed by a set of gene functional characteristic analyses.

Results: We found extensive WM-IVFC alterations in MDD compared to HCs, which were associated with multiple behavioral domains, including visual and sensorimotor processes, as well as higher-order functions. For clinical applications, the altered regional WM-IVFC could not only effectively distinguish MDD patients from HCs with an area under curve ranging from 0.889 to 0.901 across three classifiers, but also significantly predict depression severity ($r = 0.575$, $p = 0.002$) and suicide risk ($r = 0.384$, $p = 0.040$) in patients. Furthermore, MDD-related WM-IVFC changes spatially correlated with the expression of 1004 genes, which were enriched for synapse, neuronal system, and ion channel, and predominantly expressed in excitatory and inhibitory neurons. Our results obtained good reproducibility in the validation cohort.

Conclusion: These findings revealed intersubject functional variability changes of brain WM in MDD and its linkage with gene expression profiles, providing potential implications for understanding the high clinical heterogeneity of MDD.

PO-2741

Diagnosis of spinal dural arteriovenous fistula: a multimodal magnetic resonance imaging assessment strategy

Feng Ouyang, Xianjun Zeng, Qin Wu
First Affiliated Hospital of Nanchang University

Objective To seek more specific screening indicators in magnetic resonance imaging (MRI) for the diagnosis of spinal dural arteriovenous fistulas (SDAVF) and to identify an efficient diagnostic strategy.

Methods This retrospective study analyzed clinical and imaging data of patients diagnosed with SDAVF and alternative myelopathy who underwent conventional MRI examinations. Additionally, 3D-T2-weighted-sampling perfection with application-optimized contrasts using different flip-angle the diagnostic efficacy of evolutions (3D-T2-SPACE) and contrast-enhanced magnetic resonance angiography (CE-MRA) data from patients with SDAVF were compared with digital subtraction angiography (DSA).

Results The age of onset, perimedullary flow voids, distribution of lesions, degree of spinal edema, and cauda equina disorder were statistically significant in the identification of SDAVF with alternative myelopathy. Perimedullary flow voids and cauda equina disorder were independent predictors of SDAVF; the diagnostic model constructed using the two had better diagnostic performance, with an area under the curve of 0.957 ($P < 0.001$), maximum Youden index of 0.844, sensitivity 92.9%, and specificity 91.5%. Both 3D-T2-SPACE (77.8%) and CE-MRA (83.3%) sequences had good localization values for SDAVF. When the two imaging examinations were combined, their diagnostic accuracy was better than that of DSA.

Conclusion Cauda equina disorder and degree of spinal cord edema on conventional MRI were specific for diagnosis of SDAVF. Make up for the lack of fistula location of conventional MRI, 3D-T2-SPACE and CE-MRA can better locate SDAVF. If they are combined, they complement each other and have good diagnostic potential.

PO-2742

Inferior frontal sulcal hyperintensities changes along the Alzheimer's disease continuum, and their association with amyloid and tau level

Xiao Luo, Linyun Xie, Shan Xu, Minming Zhang, Peiyu Huang
Second Affiliated Hospital, School of Medicine, Zhejiang University

Background: Fluid-attenuated inversion recovery (FLAIR) MRI is a common method used to visualize cerebrospinal fluid (CSF) in the brain. However, factors like proteins, blood, or debris can influence the CSF signal's intensity. Researchers are interested in understanding the glymphatic system's role in clearing waste from the brain, especially how it changes with age and how it relates to alterations in CSF signals. In particular, they are investigating whether hyperintensities in the inferior frontal sulci (IFSH) on FLAIR images might indicate localized changes in CSF composition, especially in older individuals. This study aims to explore the connection between IFSH, CSF drainage, and the Alzheimer's disease (AD) continuum.

Method: The study involved participants at different stages of the Alzheimer's disease continuum: healthy subjects (203 individuals, NC A-T-), cognitively healthy individuals (120 individuals, A+T-), cognitively healthy individuals with tau protein deposition (29 individuals, A+T+), mild cognitive impairment with tau deposition (80 individuals, A+T+), and Alzheimer's disease patients with tau deposition (38 individuals). Researchers assessed IFSH by identifying abnormal CSF hyperintense signals in three inferior frontal sulci using a specific scale. In addition to IFSH, they analyzed other glymphatic-related markers like choroid plexus volume and perivascular space (PVS) volume, adjusting for whole-brain volume and quantified from T1 segmentation data for comparison.

Results: ANOVA results revealed significant differences in IFSH among the groups ($p < 0.001$). Post-hoc analysis showed that CN A+T+ individuals had the highest IFSH scores, significantly different from CN A-T-, CN A-T+, and AD A+T+ ($p < 0.05$, corrected). Choroid plexus volume also exhibited group differences, with MCI A+T+ and AD A+T+ differing from CN A-T- ($p < 0.05$, corrected). There were no significant group differences in PVS volume. Correlation analysis, adjusted for age and education, revealed significant associations between IFSH scores and amyloid ($r = 0.126$, $p < 0.005$) and tau PET ($r = 0.128$, $p < 0.005$) SUVR. Choroid plexus volume also exhibited correlations with amyloid and tau PET markers. IFSH remained mildly correlated with amyloid and tau PET SUVR even after correcting for white matter hyperintensities burden, suggesting that IFSH might be an early compensatory phenomenon in the AD continuum.

Conclusion: This study proposes that hyperintensities in the IFSH observed on FLAIR MRI can potentially serve as a non-invasive marker for altered CSF clearance in AD and related conditions. Moreover, IFSH may demonstrate greater sensitivity in distinguishing AD patients, particularly in the early stages of the AD continuum, compared to measures like choroid plexus volume and PVS volume. These findings suggest that IFSH could reflect early compensatory changes in CSF dynamics before eventual decompensation, making it a promising marker for monitoring AD progression and glymphatic system function. Further research is required to validate these findings and explore the role of IFSH in other diseases linked to glymphatic dysfunction, such as AD.

PO-2743

MRI is a potential prognostic imaging biomarker for 5-year survival in cervical cancer patients treated with neoadjuvant therapy followed by radical hysterectomy

Huiting Pang, Yue Dong
Liaoning Cancer Hospital

Objectives: To evaluate the prognosis of cervical cancer patient underwent neoadjuvant therapy (NAT) followed by radical hysterectomy (RH), and investigate the value of MRI impacting in survival.

Methods: Data from 80 cervical cancer patients treated with NAT+RH in February 2015 to October 2018 were retrospectively included. All the patients underwent pretreatment MRI including DWI and DCE scan, and imaging indexes including tumor size, tumor apparent diffusion coefficient (ADC), Ktrans, Kep and Ve values were measured. Clinical and pathological parameters, and recurrence and death of the patients were recorded. Kaplan-Meier survival analysis and multivariate Cox regression analyses were used to analyze the independent factors of overall survival (OS) disease-free survival (DFS), and the cutoff values were estimated by receiver operating characteristic analysis..

Results: The median follow-up time for surviving patients was 66 months (range, 6–100 months), and 18 cases recurred. 11 patients died of persistent or recurrent disease. The overall 5-year OS rate was 86.3%, and the 5-year DFS rate was 77.5%. In univariate analyses, deep stromal invasion, LVSI, ADCmin, Ktrans max, Ktrans mean, Ktrans min, Kep mean, Kep min and Ve min were prognostic factors for OS. FIGO Stage, deep stromal invasion, LVSI, LNM (pathology), Ktrans value, Kep mean, Kep min and Ve value were prognostic factors for DFS. Multivariate analyses showed that Ktrans mean was independent prognostic factors for OS of patients, and Ktrans mean, Ve max, Ve min were independent prognostic factors for DFS of patients.

Conclusion: Tumor ADCmin and DCE variables may be helpful in predicting the recurrence and survival of patients with cervical cancer.

PO-2744

High Resolution 3D T2-Weighted SPACE Sequence with Compressed Sensing Improved Diagnostic Performance in Muscle Invasion for Bladder Cancer Based on Radiomics

Shuo Li, Xiaochun Wang
First Hospital of Shanxi Medical University

ABSTRACT

Purpose: Employing radiomics to evaluate the diagnostic value in determining muscle invasiveness of compressed sensing (CS) accelerated 3D T2-weighted SPACE sequence with high resolution and short acquisition time.

Method: This prospective study involved 108 participants (including 89 males and 19 females, aged 20–86 years [65 ± 11]) who underwent preoperative 3D-CS-T2-weighted-SPACE, 3D-T2-weighted-SPACE and T2-weighted sequences. The cohort was divided into training and validation cohorts in a 7:3 ratio. In the training cohort, a Rad-score was constructed based on radiomic features selected by intraclass correlation coefficients (ICC), pearson correlation coefficient (PCC) and least absolute shrinkage and selection operator (LASSO). Multivariate logistic regression was used to develop a nomogram combined radiomics and clinical indices. In the validation cohort, the

diagnostic performance of nomogram was validated by using receiver operative characteristic (ROC) curve, calibration curve and decision curve analysis (DCA).

Results: In the validation cohort, the area under ROC curve (AUCs) of 3D-CS-T2-weighted-SPACE, 3D-T2-weighted-SPACE and T2-weighted models were 0.87(95% confidence interval (CI):0.73-1.00), 0.79(95%CI:0.63-0.96) and 0.77(95%CI:0.60-0.93), respectively. While the clinical model was 0.74(95%CI:0.55-0.94). A radiomics-clinical nomogram won the best diagnostic performance, the AUC reached 0.88(95%CI:0.75-1.00). The DCA also showed that the radiomics model and combined nomogram model yielded higher net benefits than the clinical model.

Conclusions: The radiomic features extracted from 3D-CS-T2-weighted-SPACE had the acceptable performance for diagnosing muscle invasiveness in BCa. Compared to radiomic features of 3D-T2-weighted-SPACE and T2-weighted, radiomic features of 3D-CS-T2-weighted-SPACE had more textured details. The nomogram combined Rad-score and clinical indices could enhance the diagnostic performance.

PO-2745

Nomogram based on apparent diffusion coefficient and MR features to differentiate intracranial solitary fibrous tumor (WHO grade II) from angiomatous meningioma

Yanting Wang¹, Dmytro Pylypenko², Anqiang Chen³, Yuying Cao³, Shujun Zhang³, Jiehuan Wang³, Zhanguo Sun³, Yueqin Chen³, Zhibo Wen⁴, Hao Yu³

1. Clinical Medical College of Jining Medical University

2. GE Healthcare, Beijing, China 100600

3. Affiliated Hospital of Jining Medical University

4. Department of Radiology, Zhujiang Hospital, Southern Medical University

Background: To assess clinical and magnetic resonance imaging (MRI) features in differentiating intracranial solitary fibrous tumor (WHO grade II) from angiomatous meningioma(AM).

Method: Pathologically confirmed intracranial SFT (WHO grade II) (n= 23) and AM (n = 28) were retrospectively collected and their clinical and conventional MRI features including diffusion-weighted imaging (DWI) were analyzed. The apparent diffusion coefficient (ADC) values, Age, tumor volume and EI were using two-sample t tests, and the gender, features on conventional MRI were using the chi-square test. Logistic regression analysis and receiver operating characteristic (ROC) curve were used to analyze the diagnostic efficacy in predicting the SFT (WHO grade II) and AM. The nomogram of the combined ADC and conventional MRI was established based on the multivariate logistic regression model results.

Results: Tumor shape, cystic necrotic, T1WI signal intensity, T2WI signal intensity, and ADC value were found significantly different between SFT (WHO grade II) and AM ($P < 0.05$). Logistic regression analysis demonstrated that Tumor shape, T1WI signal, T2WI signal, cystic necrosis, and ADC value were independent factors, and ADC value showed the best diagnostic performance (area under curve [AUC], 0.823; sensitivity, 86.9%; specificity, 75.0%) in differentiating SFT (WHO grade II) from AM with optimal cutoff value being $1.08 \times 10^{-3} \text{mm}^2/\text{s}$. ROC curve demonstrated ADC value combined with conventional MRI showed the best diagnostic performance (AUC, 0.950; sensitivity, 95.7%; specificity, 85.7%; accuracy, 90.2%) in differentiating SFT (WHO grade II) from AM. Moreover, as shown in the calibration curve, strong agreements were observed between nomogram prediction probability and actual findings in the prediction of two tumors.

Conclusions: The study reveals significant differences between SFT (WHO grade II) and AM. The combination of ADC value with clinical and MRI features shows promising diagnostic potential for accurately distinguishing between two tumor types, enhancing diagnostic accuracy and facilitating effective tumor identification.

PO-2746

An MRI study on the correlations between the atrophy of gray matter related to memory function, white matter damage, and memory impairment in patients with subcortical ischemic vascular disease

Jing Huang, Runtian Cheng, Xiaoshuang Liu, Tianyou Luo, Junwei Gong
The First Affiliated Hospital of Chongqing Medical University

Objective: To explore the correlations between the atrophy of the gray matter related to memory function, white matter damage, and memory impairment in patients with subcortical ischemic vascular disease (SIVD).

Methods: We recruited 32 normal controls (NC) and 58 SIVD patients, including 29 SIVD patients with cognitive impairment (SIVD-CI) and 29 SIVD patients with normal cognition (SIVD-NC). MRI data and memory scores were acquired from all participants. The thickness or volume of gray matter related to memory function, as well as the volume, fractional anisotropy (FA) and mean diffusivity (MD) values of white matter hyperintensity (WMH) and normal-appearing white matter (NAWM), were obtained using FreeSurfer, FSL and SPM software. The analysis of covariance, Kruskal-Wallis H test, spearman correlation and mediation analysis were used for inter-group comparison and correlation analysis.

Results: Compared with NC, SIVD patients showed significant decreased auditory, visual and working memory scores, decreased volume, FA value of WMH and NAWM, increased MD value of WMH and NAWM, and decreased gray matter volume, mainly including thalamus, middle temporal gyrus and hippocampal subfields such as ammonia angle (CA), presubiculum, motor layer and dentate gyrus ($p < 0.05$). The SIVD-CI group showed more severe gray matter atrophy and white matter damage than the SIVD-NC group. Besides, the atrophy of thalamus, middle temporal gyrus, CA1, presubiculum, molecular layer and dentate gyrus were significantly correlated with memory scores and the FA and MD values in WMH and NAWM in patient group ($p < 0.05$). Mediation analysis results showed that the reduced volume of CA1 and thalamus mediated the correlation between the abnormal FA and MD values in WMH and the decreased memory scores.

Conclusions: Patients with SIVD had atrophy in gray matter related to memory function and structural damage in WMH and NAWM, which worsened with cognitive impairment. The atrophy of some gray matter areas was closely related to WMH damage and memory impairment. Additionally, WMH damage may affect memory function through the atrophy of CA1 and thalamus. Our findings may help provide specific neuroimaging biomarkers for the early diagnosis of memory impairment in patients with SIVD.

PO-2747

Functional disruption of brain subnetworks in patients with first and recurrent adolescent depression

Lei Chen, Dan Liao, Zhipeng Guo, Chunhong Liu
Beijing Hospital of Traditional Chinese Medicine, Capital Medical University

OBJECTIVE: Functional changes in brain subnetworks in patients with first-episode and recurrent adolescent depression are unclear. The aim of this study was to investigate the changes in brain subnetworks in patients with first-episode, recurrent adolescent depression and in healthy individuals.

METHODS: 105 adolescent MDD patients (66 first-episode and 39 recurrent) and 87 normal controls (HCs) were included in the study. All fMRI images were acquired in the resting state, and the resting state images were preprocessed using MATLAB (The Mathworks, Natick, MA, USA) and DPABI (<http://rfmri.org/dparbi>) software. Dossenbach160 atlas was used to define the nodes of the brain network, the whole brain was divided into 160 anatomical ROIs, 80 ROIs in each hemisphere, and each ROI represented a network node, we obtained a 160 × 160 functional connectivity (FC) matrix for each subject, and the data were made more consistent with normal distribution using the Fisher r-z transformation. Matlab-based NBS toolbox (<https://www.nitrc.org/projects/nbs>) was used to analyze the subbrain network connectivity, the number of permutations was set to 5000 ($T \geq 3.6$, NBS corrected, $p < 0.05$).

RESULTS: There was a significant difference in whole-brain FC between patients with first-episode adolescent depression (FAD), patients with recurrent adolescent depression (RAD) and HCs. The results of the study involved the DMN (Default Mode Network), ECN (Executive Control Network), SN (Salience Network), SMN (Sensorimotor Network), VN (Visual Network), and CN (cerebellar network). Specifically, FAD increased functional connectivity in multiple regions compared to RAD, including 15 nodes and 16 connections, involving ECN-SN, ECN-SMN, SN-SN, SN-SMN. FAD decreased functional connectivity in multiple regions compared to RAD, including 9 nodes and 10 connections, including DMN-SMN, DMN-VN, SMN-SMN, SMN-VN. RAD showed reduced functional connectivity in multiple regions compared to HC, consisting of 36 nodes and 46 connections, involving ECN-ECN, ECN-SN, ECN-SMN, ECN-VN, ECN-CN, SN-SN, SN-SMN, SN-VN, SN-CN. There was no difference between FAD and HCs.

CONCLUSION: To the best of our knowledge, this may be the first study of brain subnetworks in FAD versus RAD. Brain subnetworks were altered in FAD and RAD, and brain subnetwork disruption in RAD mainly involved the ECN and SN. Our findings provide brain subnetwork-related imaging references for patients with FAD and RAD.

PO-2748

Assessment of the DTI-ALPS Parameter Along the Perivascular Space in Early- and Late-Onset Alzheimer's Disease

Xiao Luo, Hui Hong, Shuyue Wang, Kaicheng Li, Qingze Zeng, Minming Zhang, Peiyu Huang
Second Affiliated Hospital, School of Medicine, Zhejiang University

Background: This study aimed to investigate the Diffusion Tensor Imaging along the Perivascular Space (DTI-ALPS) parameter in individuals with early-onset and late-onset Alzheimer's disease (EOAD and LOAD) and its impact on cognitive function, as well as Alzheimer's disease (AD) and vascular-related pathologies.

Methods: We identified 49 Young Normal Controls (YNC), 24 EOAD, 35 Old Normal Controls (ONC), and 31 LOAD participants, each of whom underwent MRI, neuropsychological assessments, and amyloid PET. We computed a proxy marker for glymphatic system function, the DTI-ALPS index, to assess glymphatic function in vivo. We calculated average ALPS indices for the left, right, and bilateral hemispheres. These parameters were compared among different groups ($p < 0.05$, Bonferroni corrected). Subsequently, we evaluated the relationship between ALPS and cognitive function and amyloid levels through correlation analysis.

Results: The ALPS index was significantly reduced in both EOAD and LOAD patients compared to their respective controls ($p < 0.05$). However, there were no significant differences in the ALPS index between EOAD and LOAD patients. Correlation analysis revealed a significant association between ALPS and amyloid SUVR in the young group (EOAD+YNC) ($r = -0.30$, $p < 0.05$) and in the older group (LOAD+ONC), ALPS was associated with hippocampal volume ($r = 0.25$, $p < 0.005$) and white matter hyperintensity (WMH) burden ($r = -0.20$, $p < 0.05$). Backward linear regression suggested that in the young group, sex, education years, and amyloid SUVR contributed to ALPS, while in the older group, age, sex, and WMH were contributing factors. Regarding cognition, ALPS was closely related to CDR, MMSE, and other cognitive functions in both the young and older groups.

Conclusion: Our study reveals that ALPS is decreased in both EOAD and LOAD and is closely associated with cognitive function. This suggests that glymphatic function is impaired in both EOAD and LOAD, making ALPS a valuable in-vivo indicator. Furthermore, the mechanisms underlying glymphatic dysfunction in EOAD and LOAD may differ, with amyloid deposition possibly contributing to glymphatic impairment in EOAD, while aging, neurodegeneration (hippocampal atrophy), and cerebrovascular disease play significant roles in glymphatic dysfunction in LOAD. These findings imply that interventions targeting the glymphatic system improvement should adopt distinct strategies for EOAD and LOAD.

PO-2749

Assessing the Relationship Between Brain Iron Levels and Glymphatic Function in the Alzheimer's Disease Continuum

Xiao Luo, Xiaopei Xu, Qingze Zeng, Kaicheng Li, Minming Zhang, Peiyu Huang
Second Affiliated Hospital, School of Medicine, Zhejiang University

Background Iron is a critical element for various essential biochemical processes in the human body and plays a significant role in neural tissue, particularly in the brain. Abnormal iron accumulation has been associated with neurodegenerative disorders, including Alzheimer's disease (AD), which is characterized by the presence of β -amyloid plaques and neurofibrillary tangles. This study employed non-invasive techniques, including quantitative susceptibility mapping (QSM), to assess subcortical brain iron levels and glymphatic system function in individuals across the AD spectrum. The study included 62 cognitively unimpaired (CU) amyloid-negative (A-) participants, 30 CU amyloid-positive (A+), and 42 mild cognitive impairment (MCI) A+ patients.

Methods: Brain iron content was quantified in regions of interest, including the caudate nucleus (Cd), putamen (Pt), globus pallidus (Gp), thalamus (Th), red nucleus (Rn), and substantia nigra (Sn) using QSM. Glymphatic system function was assessed through the visual semi-quantitative evaluation of enlarged perivascular spaces (ePVS) and choroid plexus volume (CPV). Comparisons were made between AD pathology, iron deposition, and glymphatic function in the different participant groups.

Results: The results revealed significant differences in iron content and glymphatic function among the participant groups. Specifically, the Pt susceptibility values were significantly higher in MCI A+ and CU A+ patients compared to CU A- participants ($p < 0.001$). MCI A+ patients exhibited a

significant increase in CPV compared to CU A- participants ($p < 0.005$). Additionally, ePVS in the basal ganglia (ePVS-BG) were significantly enlarged in CU A+ individuals compared to both CU A- and AD A+ patients. Correlation analyses showed associations between Pt susceptibility, CPV, amyloid SUVR, and cognitive function. Importantly, Pt susceptibility was found to fully mediate the relationship between increased CP and elevated amyloid SUVR.

Conclusion: This study provides insights into the relationship between brain iron deposition, glymphatic system function, and AD pathology across the AD spectrum. The findings highlight the potential role of iron in AD pathogenesis and suggest that interventions targeting brain iron levels and glymphatic function could hold promise for AD management. Understanding these relationships may contribute to the development of novel diagnostic and therapeutic strategies for Alzheimer's disease.

PO-2750

Visualization of Collateral Vessels in 4D TRANCE MR Angiography Compared with 3D TOF in Moyamoya Disease

Zihua Chen, Wen Zhou
Peking University Shenzhen Hospital

Purpose To evaluate and compare the visualization of collateral vessels in patients with MMD between 4D TRANCE and 3D TOF MR angiography with DSA as the reference standard.

Method Thirty-five patients with symptoms of MMD were included. 3D TOF and 4D TRANCE angiography were performed on a 3.0T MR system. Two radiologists evaluated the visualization of the terminal ICAs, distal MCAs, Moyamoya vessels and LMA collaterals from posterior circulation, by using DSA findings.

Result The Suzuki stage of Moyamoya disease was based on the Suzuki stage standard of the improved method. It indicates an intrinsic compensatory reorganization process of moyamoya disease, Table 2. Bilateral vascular changes were scored separately. The modified Suzuki grading results of 4D TRANCE, 3D TOF and DSA are shown in Table 3-1. Compared with the golden standard, the correlation coefficient between 4D TRANCE and DSA was 0.92, Table 3-2. Vessel visualization scores are summarized in Table 4. Taking DSA as the gold standard, 4D TRANCE scored higher and closer to the gold standard in evaluating bilateral terminal ICAs than 3D TOF. The difference between 3D TOF and DSA was statistically significant. The 4D TRANCE score of the two observers was significantly higher than the 3D TOF score.

Conclusion Visualization of distal cerebral arteries and collateral vessels in patients with MMD with 4D TRANCE was good to excellent when compared with that attained with DSA. 4D TRANCE is helpful for classification, collateral compensatory blood flow information and evaluation of postoperative blood flow reconstruction and also can evaluate the shape and blood flow change information of stenosis or occlusion vessels when caused by arterial stenosis or occlusion.

PO-2751

Three-dimensional MR Elastography evaluates changing of melanoma stiffness after Dabrafenib treatment

Baihe Luo, Aoran Yang, Chen Pan, Minghui Zhou, Chengli Gu, Yu Shi
Shengjing Hospital Of China Medical University

Purpose: Normally, the melanoma will have more infiltration of cancer-associated fibroblasts (CAFs) and thus the melanoma is more stiffed than the adjacent tissue. Three-dimensional MR Elastography is a non-invasive method to detect disease progression based on tissue stiffness. However, there is a paucity of literature on three-dimensional MR Elastography to assess the efficacy of melanoma after clinical treatment.

Methods and Materials: Based on bioinformatics we calculated the relationship between the infiltration of CAFs in melanoma and patients' survival, furthermore, Dabrafenib, may has significant efficacy. In vitro experiments, we constructed a xenograft model of melanoma. Baseline was set when tumor volume reached 500mm³ and MRE was utilized to assess tumor stiffness at this time. Afterwards, 10 nude rats were randomly assigned to treatment (Dabrafenib, 10mg/kg/d, Selleck Chemical) and control groups. When the tumor volume in control group approached 4000 mm³, treatment was terminated and use MRE to assess stiffness in both control groups and treated groups.

Results: CAFs infiltration has positive correlation with melanoma prognosis in both TCGA and GEO cohort ($p < 0.001$, HR = 1.631, 95%CI: 1.226 - 2.168, $p = 0.013$, HR = 1.482, 95%CI: 1.084 - 2.026, $p < 0.001$, HR = 1.871, 95%CI: 1.327 - 2.639, $p = 0.002$, HR = 1.842, 95%CI: 1.243 - 2.73, $p = 0.003$, HR = 1.804, 95%CI: 1.211 - 2.687, $p = 0.005$, HR = 2.018, 95%CI: 1.222 - 3.331, $p < 0.001$, HR = 2.926, 95%CI: 1.917 - 4.468). Pathology results showed significantly fibrosis in melanoma compared to adjacent tissues. Dabrafenib shows high sensitivity to high-risk pancreatic cancer patients ($p = 7.6e-06$). After treatment with Dabrafenib, the mean stiffness in the treatment group was 1.113kpa, a slight decrease compared to the baseline which mean stiffness is at 1.3kpa ($p = 0.037$). The mean stiffness in the control group (when tumor volume reached 4000mm³) was 1.87kpa, which was increased compared to the treatment group ($p = 0.0223$). Tumor volume was significantly decreased after Dabrafenib treatment ($p < 0.0001$).

Conclusions: Malignant progression of pancreatic cancer is associated with infiltration of CAFs causing a more stiffed tumor. Dabrafenib is effective by reducing tumor volume, fibrosis and stiffness. 3D MR Elastography is highly efficiency in observing the changes of tumor stiffness and it is possible to use MRE to evaluate drugs' efficacy.

Clinical Relevance/Application: 3DMRE is a non-invasive, rapid, and highly accurate tool for predicting melanoma and now it is demonstrably showed its potential in evaluating the efficacy of TKIs.

PO-2752

The Diagnostic Value of Diffusion Weighted Imaging and Conventional Magnetic Resonance Imaging on Parotid Gland Tumors

Yuanzao Liu

Affiliated Hospital of Guizhou Medical University
TONGREN PEOPLE'S HOSPITAL

Objective: To investigate the value of diffusion weighted imaging(DWI), conventional MRI(cMRI) finding and demographic data to diagnose parotid gland tumors.

Methods: A retrospective evaluation was made of the clinical data, histopathologic data, preoperative cMRI and DWI of 85 patients who underwent parotidectomy from November 2015 to September 2021 in Tongren people's hospital. They were classified into three categories according to pathology:(PA, WT and MT. Values of apparent diffusion coefficient (ADC) for PA, WT and MT were compared. The signal of lesion was observed on cMRI sequence. Classification variables are tested using Pearson's chi-squared test. For metric parameters, normality tests are performed first. If they follow a normal distribution, T-tests are used, else non-parametric tests will be used.

Results: 35 cases were PA, 31 cases were WT and the remaining 19 cases were MT. the PA group was younger and more frequent in females than the WT and MT groups, while WT and MT were more frequent in males. The PA group was younger and more frequent in females than the WT and MT groups, whereas it was more frequent in WT and MT in males. The cMRI is able to clearly visualize anatomical structures. The median of ADC values for them were $1.53 \pm 0.29 \times 10^{-3} \text{mm}^2/\text{s}$, $0.77 \pm 0.20 \times 10^{-3} \text{mm}^2/\text{s}$ and $1.06 \pm 0.19 \times 10^{-3} \text{mm}^2/\text{s}$, respectively. PA was differentiated from the other two groups ($P=0.000$). When the ADC threshold was $1.23 \times 10^{-3} \text{mm}^2/\text{s}$, the sensitivity and specificity for differentiating PA from WT was 94.3% and 93.5%, respectively; and when the ADC threshold was $1.29 \times 10^{-3} \text{mm}^2/\text{s}$ for identifying PA from MT was 85.7% and 84.2%, respectively.

Conclusion: cMRI combined with ADC values are helpful to identify PA from WT and MT, it can be used as an aid in determining the preoperative pathological classification of parotid tumors.

PO-2753

Left Ventricular Dyssynchrony Measured by Cardiovascular Magnetic Resonance-Feature Tracking in Anterior ST-Elevation Myocardial Infarction: Relationship with Microvascular Occlusion Myocardial Damage

Zheng Sun,JIE LU

Capital Medical University Xuanwu Hospital

Objectives: Cardiovascular magnetic resonance-feature tracking (CMR-FT) enables quantification of myocardial deformation and may be used as an objective measure of myocardial involvement in ST-elevation myocardial infarction (STEMI). We sought to investigate the associations between myocardial dyssynchrony parameters and myocardium damage for STEMI.

Methods: We analyzed 65 patients (45-80 years old) with anterior STEMI after primary percutaneous coronary intervention during 3-7 days (observational [STEMI] group) and 60 healthy volunteers (normal control [NC] group). Myocardial dyssynchrony parameters were derived, including global and regional strain, radial rebound stretch and displacement, systolic septal time delay, and circumferential stretch.

Results: CMR characteristics, including morphologic parameters such as left ventricular ejection fraction (LVEF) ($45.3\% \pm 8.2\%$) and myocardium damage in late gadolinium enhancement (LGE)

(19.4% \pm 4.7% LV), were assessed in the observation group. The global radial strain (GRS) and global longitudinal strain (GLS) substantially decreased in anterior STEMI compared with the NC group (GRS: 19.4% \pm 5.1% vs. 24.8% \pm 4.0%, $P < 0.05$; GLS: -10.1% \pm 1.7% vs. -13.7% \pm 1.0%, $P < 0.05$). Among 362 infarcted segments, radial and circumferential peak strains of the infarcted zone were the lowest (14.4% \pm 3.2% and -10.7% \pm 1.6%, respectively). The radial peak displacement of the infarct zone significantly decreased (2.6 \pm 0.4 mm) ($P < 0.001$) and manifested in the circumferential displacement (3.5° \pm 0.7°) in the STEMI group ($P < 0.01$). As microvascular occlusion (MVO) was additionally present, some strain parameters were significantly impaired in LGE+/MVO+ segments (radial strain [RS]: 12.2% \pm 2.1%, circumferential strain [CS]: -9.6% \pm 0.7%, longitudinal strain [LS]: -6.8% \pm 1.0%) compared to LGE+/MVO- (RS: 14.6% \pm 3.2%, CS: -10.8% \pm 1.8%, LS: -9.2% \pm 1.3%) ($P < 0.05$). When the extent of transmural myocardial infarction is greater than 75%, the parameter of the systolic septal delay (mean, 148ms) was significantly reduced compared to fewer degrees of infarction ($P < 0.01$).

Conclusion: In anterior STEMI, the infarcted septum swings in a bimodal mode, and myocardial injury reduces the radial strain contractility. A more than 75% transmural degree was the septal strain-contraction reserve cut-off point.

PO-2754

Radiomics models based on multiparametric magnetic resonance imaging for early predicting the prognosis of peripancreatic collections in acute pancreatitis

Jiang Luo¹, xue ying Zhang¹, ting ting Liu¹, hai Jiang¹, dong lin Jiang¹, xiao ming Zhang¹, yong chen²

1. Affiliated Hospital of North Sichuan Medical College

2. Ruijin-Hainan Hospital Shanghai Jiao Tong University School of Medicine

Objective: To develop multiparametric MRI based radiomics models for early predicting the prognosis of peripancreatic collections (PPCs) in acute pancreatitis (AP).

Methods: A total of 127 patients of AP combined with PPCs in our unit were included in this study. All of them have performed MRI. They were identified as good or poor prognosis according to clinical and imaging follow-up. Patients were categorized into two groups: a training cohort (69 good prognosis, 19 poor prognosis), and a validation cohort (30 good prognosis, 9 poor prognosis). Radiomics features were derived from PPCs on fat-saturated T2-weighted (T), pancreatic parenchyma on enhanced delayed phase (D), venous phase (V) and arterial phase (A) images. Construction of radiomics models using the optimal radiomics features left after dimensionality reduction by means of support vector machine (SVM) with Gaussian kernel. The clinical characteristics and conventional MRI manifestations were collected to construct clinical (C) and MR models respectively. The integrated model was constructed from the radiomics and clinical features. The AUCs of different models were in comparison using Delong tests.

Results: The radiomics model of A, V, D, T and D+T, integrated model of T+C, and MR model turned to be excellent with better predictive capability, and the T model performed best with the AUC of 0.943 and 0.859 respectively; the radiomics results superior to the clinical model ($P < 0.05$). No significant differences were found between the different radiomics models, between the radiomics and integrated models, and among the radiomics, integrated and MR models ($P > 0.05$).

Conclusions: The radiomics model, the integrated model, and MR model all can predict the prognosis of PPCs at an early stage of AP. The T model performed best, because of the strongest predictive capacity and advantages of easily accessible, it has a potential for wider range of clinical applications.

PO-2755

Performance of Node Reporting and Data System (Node-RADS): a Preliminary Study in Cervical Cancer

Jinjin Liu^{1,2}, Jianghua Lou², Linxiao Dong^{2,3}, Qingxia Wu^{1,2,3}, Meiyun Wang^{1,2,3,4}

1. People's Hospital of Zhengzhou University

2. Department of Medical Imaging, Henan Provincial People's Hospital

3. People's Hospital of Henan University

4. Biomedical Research Institute, Henan Academy of Sciences

Background Node Reporting and Data System (Node-RADS) was proposed and can be applied to lymph nodes across all anatomical sites. The aim of this study was to investigate the diagnostic performance of Node-RADS in cervical cancer patients.

Methods A total of 81 cervical cancer patients treated with hysterectomy and LN dissection was retrospectively enrolled. Node-RADS evaluation was performed in all patients both at LN level and patient level by two radiologists independently based on preoperative MRI. Chi-square test and Fisher's exact test were used to evaluate the distribution difference of size and configuration between patients with and without LN metastasis (LNM) in different regions. The receiver operating characteristic (ROC) and the area under the curve (AUC) were used to explore the diagnostic performance of the Node-RADS score for LNM.

Results The rates of LNM in the para-aortic, common iliac, internal iliac, external iliac, and inguinal regions were 7.4%, 9.3%, 19.8%, 21.0%, and 2.5% (4/162), respectively. At patient level, as the Node-RADS score increased, the rate of LNM also increased, with rates of 26.1%, 29.2%, 42.9%, 80.0%, and 90.9% for Node-RADS score 1, 2, 3, 4, and 5, respectively. At patient level, the AUCs for Node-RADS scores >1, >2, >3, and >4 were 0.632, 0.752, 0.763, and 0.726, respectively. Both at the patient level and LN level, a Node-RADS score >3 could be considered as the optimal cut-off value with the best AUC and accuracy.

Conclusions Node-RADS is effective in predicting LNM for scores 4 to 5. However, the proportions of LNM were more than 25% at the patient level for scores 1 and 2, which does not align with the expected very low and low probability of LNM for these scores.

PO-2756

Anti-motion ultrafast T2 mapping via multiple overlapping-echo detachment imaging technology based on deep learning

Yue Zhang¹, Xiao Wang¹, Zongye Li¹, Fei Wu¹, Ming Ye², Congbo Cai², Jianfeng Bao¹, Jingliang Cheng¹

1. The First Affiliated Hospital of Zhengzhou University

2. Xiamen University

Background: Some patients frequently experience loss of consciousness and uncontrollable involuntary movements, such as Huntington's chorea and delirium, which pose significant challenges for successful clinical MRI examinations, particularly when utilizing magnetic resonance technology that provides quantitative information. Here, we aim to use a newly self-developed ultra-fast, anti-motion, single-shot multiple overlapping-echo detachment (MOLED) quantitative magnetic resonance technology to address this issue.

Methods: To validate the accuracy, reproducibility and movement resistance of MOLED technology, a set of self-made phantoms and five volunteers underwent 3T magnetic resonance imaging, including conventional T₂-weighted imaging (T₂WI), multi-section multi-echo spin-echo (MESE), and MOLED, which can obtain T₂ mapping for a slice of the brain in approximately 150ms. A deep learning network was employed for image reconstruction. In the volunteers, we performed six scans on the same volunteer, five scans with minimal head motion (REP 1-5), and the final scan was

performed under moderate head movements (REP move). The T_2 values of seven ROIs were used for the analysis.

Results: The results of phantoms revealed a strong positive correlation between the T_2 values obtained by MOLED and MESE, with a Pearson correlation coefficient (PCC) of 0.9995 ($P < 0.0001$). In addition, there was good consistency between the two sequences: mean difference ($\text{Mean}_{\text{diff}}$) = 4.20%, standard deviation of difference (SD_{diff}) = 1.71%. In the volunteers, T_2 values derived from MOLED have excellent repeatability for all REPs, with all ROIs showing good consistency across the five scans, with CoVs ranging from 0.47 to 2.74. In the ICC analysis, the putamen and pallidum were showed excellent reproducibility ($\text{ICC} = 0.95 [0.84, 0.99]$, $\text{ICC} = 0.95 [0.83, 0.99]$), while the hippocampus was the lowest but still moderate reproducibility ($\text{ICC} = 0.55 [0.18, 0.92]$). Moreover, the head movements caused characteristic artifacts in the $T_2\text{WI}$, but did not induce any systematic bias to the T_2 measurement.

Conclusions: The ultra-fast and anti-motion properties of MOLED show high accuracy and excellent repeatability, and access to reliable quantitative results even under head movements, thus showing significant advantages in imaging patients with involuntary movements.

PO-2757

Predicting carotid plaque vulnerability by high-resolution vessel wall imaging with macrophage-targeted nanoagent

Yan Gong^{1,2}, Menglin Wu³, Xue Li³, Xiang Zhang¹, Xia Shuang²

1. Department of Radiology, Tianjin Nankai Hospital, Tianjin 300100, China

2. Department of Radiology, Medical Imaging Institute of Tianjin, Tianjin First Central Hospital, School of Medicine, Nankai University, Tianjin, 300192, China

3. Department of Radiology, Second Hospital of Tianjin Medical University, Tianjin 300211, China

Introduction Non-intrusive, quantitative, and precise imaging of vulnerable atherosclerotic plaque is critical for timely stroke prevention 1-3. Mounting evidence has established that macrophages play a key role in the pathogenesis of atherosclerosis 4,5. Determining the underlying role of macrophages in plaque progression holds promise for patient stratification and could significantly facilitate therapeutic monitoring. Thus, the utility of the macrophage-targeting contrast-enhanced high-resolution vessel wall imaging (HR-VWI) technique 6 was systematically examined in this in vivo animal study, and a histogram analysis was conducted to predict atherosclerotic vulnerability accurately.

METHODS: A simplified flowchart describing the methods in this study is shown in Figure 1. Contrast-enhanced HR-VWI was performed on a 3T system (MAGNETOM Prisma, Siemens Healthcare, Erlangen, Germany) with a commercial 64-channel head/neck coil. The macrophage-targeted PP1-Au@GSH@Gd (GdMG) nanoclusters (NCs) and conventional Gadovist approach were used for longitudinal plaque evaluation by the morphology assessment. In contrast, a systematic histogram analysis in atherosclerosis (AS) rabbit model was conducted. The performance of in vitro HR-VWI contrast capacity, the in vivo foamy macrophage targeting, and the selectivity efficacy of GdMG NCs on HR-VWI in atherosclerotic rabbit models were quantified compared with Gadovist.

After revealing the superior competence of GdMG NCs in measuring the morphological assessment for plaque, prediction studies of plaque vulnerability were further conducted based on the contrast-enhanced HR-VWI.

The continuous variables were reported as appropriate. The Mann-Whitney U test was used to assess differences between the two groups, and Bland-Altman plots were used to compare the inter-observation agreement for image evaluation. 7 The intra-observer reproducibility for the plaque characteristics assessment was evaluated using the intraclass correlation coefficient (ICC). Repeated measures analysis of variance (RM ANOVA) was applied to inspect the morphological evaluation (PA and WA) at the different plaque stages, followed by a post-hoc Bonferroni correction

of multiple comparisons to examine the between-contrast-agent differences at the individual time points.

Multiple linear regressions, including histogram-derived parameters (i.e., kurtosis, skewness, and CV), and potential time confounders (i.e., weeks of HFD induction) were performed. Then, the diagnostic utility of the employed fitting formula from those multiple linear regression analysis for the histogram vulnerability index (VIH) mentioned above was further quantified by calculating the area under the receiver operating characteristic (ROC) curve (AUC).

Results Due to the compelling targeting capacity of GdMG NCs to foamy macrophages in atherosclerotic plaques with GdMG NCs, the contrast-to-noise ratio (CNR) from the pre-injection baseline dramatically increased from 6.50 to 36.91 ($p < 0.001$), with an increment of 1.39-fold higher than that of the Gadovist approach (Figure 2). Furthermore, Spearman's correlation test confirmed that the coefficient of variation (CV) derived from the histogram analysis based on GdMG NCs HR-VWI was indeed positively linearly correlated with VIP significantly ($p < 0.05$) with adjusted $R^2 = 0.775$ (Figure 3). Finally, mathematical formulas with histogram-derived parameters as variables were fitted to quantitatively calculate the histogram vulnerability index (VIH) with the strength of the adjusted $R^2 = 0.952$ ($p < 0.001$) and the area under the curve (AUC) of 0.875 ($p < 0.001$) to realize the in vivo and quantitative calculation of the plaque vulnerability (Figure 4).

Discussion The current image-evaluation method can only sometimes provide objective and biologic-accordance information that helps in clinical diagnosis and management. To better assess the plaque vulnerability, it is vital to emphasize the tissue-specific image properties of the plaque heterogeneity by image interpretation. Inspired by a previous histogram study based on the conventional T1WI image investigating the intracranial plaque type, we expanded their conclusions. Finally, we reached an exciting advance in quantified plaque vulnerability with a statistical method.⁸ To the best of our knowledge, our experiment is the pioneering workflow to quantify plaque vulnerability via histogram based on the macrophage-targeted plaque HR-VWI in vivo, which had a satisfactory diagnostic performance with optimized specificity and sensitivity. Moreover, the proposed analysis processing is generated in Radiant and ImageJ software packages, both of which are in general use and readily available, hence making the introduced method applicable and adjustable for other studies in plaque vulnerability and clinical applications for risk management.

Conclusion The proposed integrative analysis provided an overall illustration of the non-invasive nano-image method for quantifying plaque vulnerability and substantially increasing the relevance of the results for clinical reference. The use of GdMG NCs as macrophage-targeted HR-VWI is considered a promising diagnosis avenue for many inflammation-related diseases. Additionally, a deep understanding between the quantified histogram parameters and plaque vulnerability will improve our ability to harness the mechanism for developing novel image strategies for cardiovascular disease and promote the prediction before adverse clinical events occur.

Although this is proof-of-concept only tested in rabbits, it lays a strong foundation for the bench-to-bedside translation of nano-agent-enhanced HR-VWI for stroke risk prediction and prevention.

PO-2758

Detection of renal hemodynamic change in patients with chronic diseases by free-breathing 3D Turbo Gradient Spin Echo pCASL Sequence with different ROIs: a comparative study

Ping Lei, Qing Fu, Chen Huang, Jie Zhao, Le Zhu, Fan Yang

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To investigate whether free-breathing 3D Turbo Gradient Spin Echo pCASL Sequence could detect renal hemodynamic change in patients with chronic diseases and compare the efficacy among three different types of ROIs selection.

Materials and Methods: Three Tesla (3T) pCASL-MRI (Skyra, Siemens Healthcare, Erlangen, Germany) using a 12-channel flexible body array combined with the spine array coil as receiver was performed to evaluate renal blood flow (RBF) in 30 subjects (20 males and 10 females, mean age, 54.5 years), including 8 patients suffered from diabetes mellitus and 22 suffered from malignancy. Regions of interest were placed manually on the central coronal RBF image with 3 different types: ①circular ROI(20mm²) at the middle of each kidney; ②circular ROIs(20mm²) at the upper, middle, and lower poles of each kidney; ③covering the entire renal cortex of each kidney, by two senior radiologist who were blinded to the clinical data (F.Y. with an experience of over 20 years and P.L. of over 10 years). The interobserver agreement for MRI-measurement variables was determined using the intraclass correlation efficient (ICC) (poor, ICC<0.20; fair, 0.20<ICC≤0.40; moderate, 0.40<ICC≤0.60; good, 0.60<ICC≤0.80; and excellent, 0.80<ICC≤1.0), and mean values of two senior radiologist were recorded. According to the renal function test acquired within 4 days interval, patients were divided into normal (n=12, GFR ≥90 ml/min/1.73m²) and abnormal (n=18, GFR <90 ml/min/1.73m²) groups. The correlation between GFR and RBF were evaluated using the Pearson correlation and the diagnostic value of RBF acquired with pCASL Sequence was evaluated by receiver operating characteristic (ROC) curve.

Results: The interobserver agreement for radiological assessment was excellent (ICC=0.841). The RBF values obtained with pCASL sequence and GFR values acquired with renal function test were well correlated (type1: r=0.532, p <0.01; type2:r=0.674, p <0.01; type3: r=0.829, p <0.01). The area under the curve (AUC) of the ROC curve was 0.528, 0.602, 0.731 for type1,2,3 ROIs in being able to distinguish the normal group from the abnormal group.

Conclusion: The free-breathing TGSE pCASL sequence with ROI covering the entire renal cortex of each kidney is a feasible method for the assessment of the renal hemodynamic change in patients with chronic diseases.

PO-2759

Application of MRI-based radiomics model in preoperative grading of grade II and III gliomas

Chenchen Fan

Qiqihar Medical University

Objective: Gliomas is the most common primary tumors in the central nervous system, and grade II and III gliomas are more difficult to identify because of their similarity of presentation on magnetic resonance images. The purpose of this study was to investigate the diagnostic value of radiomics

models constructed based on magnetic resonance imaging (MRI) sequences for preoperative grading of gliomas.

Methods: This study retrospectively collected 120 patients with grade II and III gliomas who attended the Third Hospital Affiliated to Qiqihar Medical University from January 2019 to June 2023 after surgical treatment and confirmed by pathology. Among them, 58 cases of grade II gliomas and 62 cases of grade III gliomas were randomly divided into the training group (n=84) and the validation group (n=36) according to the ratio of 7:3. The enrolled patients were scanned with T2WI, T1WI-CE, and DWI sequences before surgery. The lesions were manually segmented using ITK-SNAP software to form a 3D region of interest (ROI). Python software was used to extract the radiomics features, and the minimum redundancy maximum correlation (mRMR) was used to perform the feature dimensionality reduction process on the patients in the training group, and the least absolute value shrinkage and selection operator algorithm (LASSO) was applied to screen out the features most relevant to glioma grades II and III from the reduced features and derive the radiomics signature (Rad-score), and the logistic regression (LR) to establish the radiomics prediction model. Finally, the predictive performance of the model was evaluated using the receiver operating characteristic (ROC) curve, and the area under the curve (AUC), specificity and sensitivity were calculated. The diagnostic efficacy of the model was measured using the Hosmer-Lemeshow test.

Results: 1032 radiomics features were extracted from the T2WI, T1WI-CE, and DWI of the patients in the training group. After removal of redundancy, each sequence was screened for 5, 7 and 15 features, respectively. Among the models constructed by the LR classifiers the AUC value of the T2WI model in the training group was 0.836, the specificity was 81.60%, and the sensitivity was 80.23%; and the AUC value in the test group was 0.802, the specificity was 70.14%, and the sensitivity was 82.24%. The AUC value of the T1WI-CE model in the training group was 0.859, specificity was 86.50%, and sensitivity was 81.98%; the AUC value in the test group was 0.879, specificity was 80.27%, and sensitivity was 84.12%. The AUC value of the DWI model in the training group was 0.925, specificity was 92.50%, and sensitivity was 81.28%; the AUC value in the test group was 0.901, specificity was 83.44%, and sensitivity was 94.02%.

Conclusion: This study shows that the four radiomics diagnostic models constructed based on MRI radiomics, T2WI, T1WI-CE and DWI, can predict grade II and grade III gliomas with certain diagnostic efficacy, among which the prediction model based on DWI sequences has the highest diagnostic value.

PO-2760

The added value of ADC-based nomogram in assessing the depth of myometrial invasion of endometrial endometrioid adenocarcinoma

Xiaoliang Ma¹, Songqi Cai¹, Jingjing Lu¹, Shengxiang Rao¹, Jianjun Zhou², Mengsu Zeng¹, Xiaoping Pan³

1. Zhongshan Hospital of Fudan University

2. Zhongshan Hospital of Fudan University (Xiamen Branch)

3. Lishui City People's Hospital

Objective: To explore the potential value of the ADC-based nomogram models in preoperatively assessing the depth of myometrial invasion of endometrial endometrioid adenocarcinoma (EEA).

Methods: Preoperative MRI of 210 EEA patients were retrospectively analyzed. ADC histogram metrics derive from the whole-tumor regions of interest. Univariate and multivariate analyses were used to screen the ADC histogram metrics and clinical characteristics for nomogram model building. The diagnostic sensitivity, specificity, accuracy, positive predictive value (PPV), and negative predictive value (NPV) of two radiologists without and with the assistance of models were calculated and compared.

Results: Two nomogram models were developed for predicting no myometrial invasion (NMI) and deep myometrial invasion (DMI) with area under the curves of 0.85 and 0.82, respectively. With the assistance of models, the overall accuracies were significantly improved [radiologist_1, 73.3% vs 86.2% ($p = 0.001$); radiologist_2, 80.0% vs 91.0% ($p = 0.002$)]. In determining NMI, the sensitivity and PPV were greatly improved but not significant for radiologist_1 (51.9% vs 77.8% and 46.7% vs 75.0%, $p = 0.229$ and 0.511), and under/near the significance level for radiologist_2 (59.3% vs 88.9% and 57.1% vs 82.8%, $p = 0.041$ and 0.065), while the specificity, accuracy, and NPV were significantly improved (all $p < 0.001$). In determining DMI, all sensitivity, specificity, accuracy, PPV, and NPV were significantly improved (all $p < 0.001$).

Conclusions: The ADC-based nomogram models can improve the diagnostic performance of radiologist in preoperatively assessing the depth of myometrial invasion and facilitate optimizing clinical individualized treatment decisions.

PO-2761

Resting-state functional MRI reveals altered brain neural activities and is correlated with brain amyloid- β deposition in type-2 diabetes with and without mild cognitive impairment.

Yiwen Bao, Lili Guo, Yun Feng, Haifei Zhou, Genji Bai
The Affiliated Huaian No. 1 People's Hospital of Nanjing Medical University

Background and Objective: The altered brain neural activity measured by the amplitude of low-frequency fluctuation (ALFF) in type 2 diabetes mellitus (T2DM) with or without mild cognitive impairment (MCI) is much less discussed, and if the neural activity associated with A β accumulation in such populations with high-risk developing into Alzheimer's Disease (AD) is unclear. To investigate the differences in ALFF signals in T2DM with MCI (T2DM-MCI) compared to T2DM without MCI (T2DM-NC) and identify the possible association between neural activity and A β accumulation in T2DM-MCI.

Methods: 18 healthy controls (HC), 18 T2DM-NC participants, and 13 T2DM-MCI participants were included in this study. Standardized ALFF maps were used to investigate the differences in neural activity in T2DM with and without MCI. A β accumulation values in clusters showing altered neural activity and in default mode network (DMN) were extracted and correlated with the same regional ALFF values and standardized ALFF maps respectively in T2DM-MCI.

Results: The altered ALFF signals were shown in the superior frontal gyrus, inferior temporal gyrus, fusiform gyrus, and core regions involved in DMN (posterior cingulate gyrus and precuneus) in the comparison between T2DM-NC and T2DM-MCI. Further correlation analysis indicated that A β deposition in DMN was correlated with ALFF signals in the superior frontal gyrus, fusiform gyrus, and cerebellum in T2DM-MCI.

Conclusion: Our study implies the importance of neural activity changes mainly in visual and default mode networks in T2DM-MCI and reveals the possible association between neural activity and A β accumulation in individuals at high risk of AD.

PO-2762

Non-invasive isocitrate dehydrogenase 1 status prediction in grade II/III glioma based on magnetic resonance images: a transfer learning strategy

Jin Zhang, Guangbin Cui, Linfeng Yan

Department of Radiology & Functional and Molecular Imaging Key Lab of Shaanxi Province, Tangdu Hospital, the Military Medical University of PLA Airforce (Fourth Military Medical University)

Objective: To evaluate transfer learning combined with various convolutional neural networks (TL-CNNs) in predicting isocitrate dehydrogenase 1 (IDH1) status of grade II/III gliomas.

Materials and methods: Grade II/III glioma patients diagnosed at the Tangdu Hospital (August 2009 to May 2017) were retrospectively included. CNNs, AlexNet, GoogLeNet, ResNet and VGGNet were fine-tuned with T2WI, FLAIR and T1CE images. Fifty-four patients with IDH1 mutant and 56 patients with wild-type IDH1 were included.

Results: IDH1 mutant prediction accuracies using AlexNet, GoogLeNet, ResNet, and VGGNet achieved 70.0% (AUC=0.660), 65.0% (AUC=0.600), 70.0% (AUC=0.700), and 80.0% (AUC=0.730) for T2WI images, 70.0% (AUC=0.660), 70.0% (AUC=0.620), 70.0% (AUC=0.710), and 80.0% (AUC=0.720) for FLAIR images, and 73.7% (AUC=0.744), 73.7% (AUC=0.656), 73.7% (AUC=0.633), and 73.7% (AUC=0.700) for T1CE images, respectively. The highest AUC (0.800) was achieved using VGGNet and FC-fusion images.

Discussion: TL-CNNs (especially VGGNet) had a potential predictive value for IDH1 mutant status of grade II/III gliomas.

PO-2763

Brain magnetic resonance imaging predicts treatment outcomes in major depressive disorder

Fenghua Long, Qian Zhang, Yufei Chen, Yaxuan Wang, Yitian Wang, Qian Li, Youjin Zhao, Fei Li

Department of Radiology and Huaxi MR Research Center (HMRR), Functional and Molecular Imaging Key Laboratory of Sichuan Province, West China Hospital, Sichuan University, Chengdu 610041, Sichuan Province, P.R. China.

Purpose

To evaluate the performance of brain magnetic resonance imaging (MRI) features in predicting treatment outcomes for major depressive disorder (MDD) and to assess performance variations among interventions.

Materials and Methods

We searched studies in PubMed, Embase, Web of Science, and Science Direct databases before March 22, 2023, using keywords "depress*", "major depress*", "MDD", "treatment outcome", and "MRI". We extracted a confusion matrix for prediction in each study for further analysis.

The logarithm of diagnostic odds ratio [$\log(\text{DOR})$], sensitivity, and specificity were conducted using Reitsma's random effect model. The area under curve (AUC) of summary receiver operating characteristic (SROC) curve was calculated. We used Deek's funnel plot asymmetry test to assess publication bias.

Subgroup analyses were conducted based on MRI modalities: resting-state functional MRI (rsfMRI), task-based fMRI (tbMRI), and structural MRI (sMRI), as well as interventions: antidepressant (including selective serotonin reuptake inhibitors [SSRI]) and electroconvulsive therapy (ECT). Meta-regression was conducted among subgroups.

Results

We included 44 studies with 2623 patients, revealing an overall log(DOR) of 2.53. The AUC, sensitivity, and specificity were 0.89, 0.78, and 0.75. No publication bias was found in included studies.

RsfMRI had higher specificity (0.79 vs. 0.69) in predicting treatment outcomes than previous tbfMRI subgroup ($P = 0.01$). No significant differences were found between sMRI and other modalities, nor between antidepressants (SSRIs and others) and ECT. Antidepressant studies primarily identified predictive features in limbic and default mode networks, while ECT mainly focused on limbic network.

Conclusion

Our findings suggest a robust promise for pretreatment brain MRI features in predicting treatment outcomes in MDD. Overlapping but distinct network level measures predicted outcomes for antidepressants and ECT.

PO-2764

Altered hippocampal subfield volumes in chronic occupational manganese-exposed welders

Jiayu Wu
Xi'an Central Hospital

Objectives: Chronic occupational manganese (Mn) exposure is characterized by motor and cognitive dysfunction. Previous neuroimaging findings have demonstrated the association between neurodegeneration and the hippocampus. However, few studies have focused on the structural changes in the hippocampal subfield volumes. This study aimed to investigate the volumetric alterations of the hippocampus as well as its subfields in Mn-exposed welders.

Methods: Thirty HCs and Forty-three Mn-exposed welders were recruited and underwent MRI scans in this study. Based on high-resolution T1-weighted MRI scans, the automated hippocampal substructure module in FreeSurfer 7.3 was applied to segment hippocampus into twelve subregions, including cornu ammonis (CA) 1, C2/3, CA4, fimbria, granule cell and molecular layer of the dentate gyrus, hippocampal-amygdaloid transition area (HATA), fissure, tail, molecular layer, parasubiculum, presubiculum, and subiculum, and calculate the volumes of hippocampal subfields. Cross-sectional analysis was used to statistically compare the volumetric differences in hippocampal subfields between the two groups.

Results: There were no significant difference in age among the HCs and Mn-exposed welders. Compared to HCs, Mn-exposed welders showed significantly smaller volumes in the bilateral hippocampus (left, $p=0.003$; right, $p=0.002$). Further exploration revealed that welders had significantly reduced volumes in hippocampal subfields, including bilateral CA3, fimbria, presubiculum, subiculum, left CA4, and right HATA. No association was found between the hippocampal subfields volumes and clinical characteristics in the welders group.

Conclusions: These preliminary findings suggested that Mn-exposed welders exhibited unique atrophy of the hippocampus and that subfield abnormalities might be implicated in cognitive impairment. The hippocampus represents a phenotype that is distinct from traditional diagnostic strategies, which might help clinical diagnosis.

PO-2765

Abnormal temporal variability of thalamo-cortical circuits in moderate to severe OSA patients

Ting Long¹, Dechang Peng^{1,2}

1. Department of Medical Imaging, First Affiliated Hospital of Nanchang University

2. PET Center, The First Affiliated Hospital of Nanchang University

Purpose: This study aimed to investigate the abnormal dynamic functional connectivity (dFC) variability of the thalamo-cortical circuit in obstructive sleep apnea (OSA) patients and explore whether these changes are related to clinical characteristics of OSA patients.

Methods: A total of ninety-two newly diagnosed moderate to severe OSA patients and eighty-four education-matched healthy controls (HCs) were included in the study. All the participants underwent neuropsychological tests, and fMRI scan. We explored the thalamo-cortical dFC changes by dividing thalamus into 16 subregions and combining with a sliding-window approach. Correlation analysis was employed to assess the relationship between dFC variability and clinical features, and support vector machine method was used for classification.

Results: Compared to the HCs group, the OSA group exhibited increased dFC variability between most of the thalamic subregions and critical brain regions of the sensorimotor network, default mode network, auditory network, and visual network, while decreased dFC variability was observed in some frontal-occipito-temporal cortical regions. Furthermore, these changes in the dFC were positively correlated with the daytime sleepiness, disease severity, and cognitive scores. Altered dFC variability contributes to the discrimination between OSA patients and HCs, with a classification accuracy of 77.8%.

Conclusion: Our findings reflect thalamo-cortical overactivation and disconnection in OSA patients, leading to disrupted information flow within the brain networks. These results may contribute to a better understanding of the temporal variability of the thalamo-cortical circuit in OSA patients.

PO-2766

Meta-analytical evidence of functional and structural brain abnormalities across Alzheimer's disease spectrum

Xinyue Tang, Zixuan Guo

Medical Imaging Center, First Affiliated Hospital of Jinan University, Guangzhou

Background: Numerous neuroimaging studies have reported that Alzheimer's disease (AD) and preclinical AD have been linked to alterations in the amplitude of low-frequency fluctuation (ALFF)/fractional ALFF (fALFF) and cortical thickness (CT) of some brain areas. However, the findings have been inconsistent.

Methods: We conducted a meta-analysis to identify multimodal differences in ALFF/fALFF and CT in patients with AD and preclinical AD compared to healthy controls (HCs), using the Seed-based d Mapping with Permutation of Subject Images software.

Results: We included 26 ALFF/fALFF studies comprising 884 patients with AD and 1,020 controls, along with 52 studies comprising 2,049 patients with preclinical AD and 2,331 controls. For CT, we included 10 studies comprising 338 patients with AD and 315 controls. Overall, compared to HCs, patients with AD showed decreased ALFF/fALFF in the bilateral posterior cingulate gyrus (PCC)/precuneus (extending to the bilateral median cingulate gyrus [MCC]) and right angular gyrus, as well as increased ALFF/fALFF in the bilateral parahippocampal gyrus (extending to the bilateral hippocampus and amygdala gyrus). Patients with preclinical AD showed decreased ALFF/fALFF in the left precuneus. Additionally, patients with AD displayed decreased CT in the bilateral parahippocampal gyrus, left PCC (extending to the bilateral MCC) and sensorimotor area. Overlapping analysis showed that patients with AD displayed decreased ALFF/fALFF and CT in

the left PCC (extending to the bilateral MCC), as well as increased ALFF/fALFF and decreased CT in the bilateral parahippocampal gyrus.

Conclusions: The study findings demonstrated that AD and preclinical AD both exhibited functional alterations in the precuneus. Furthermore, patients with AD also exhibited convergent functional and structural alterations in the PCC/precuneus and parahippocampal gyrus, as well as aberrant function or structure in the sensorimotor area, orbitofrontal cortex and temporal lobe. These findings may provide different insights into the pathophysiology of AD spectrum.

PO-2767

Changes and correlation analysis of abdominal tissue in obese subjects after bariatric surgery: A prospective magnetic resonance imaging study

jinquan bai,shuting wang,hong pan,zhenzhou shi,zhang tong
The Fourth Affiliated Hospital of Harbin Medical University

Objectives: To clarify which factors are related to the changes of important abdominal metabolic and endocrine organs such as liver and pancreas during the rapid weight loss after bariatric surgery. Methods: Forty-four subjects underwent sleeve gastrectomy from September 2019 to May 2023. The changes and correlations of clinical, laboratory, and MRI indicators of the abdominal tissue were analyzed before operation and one, three and six months after operation.

Results: Hepatic proton density fat fraction (H-PDFF) and visceral fat area (VFA) significantly in one month after bariatric surgery, decreased slowly 3-6 months after operation, while the pancreas proton density fat fraction (P-PDFF) and subcutaneous fat area (SFA) decreased gradually. 94% of nonalcoholic fatty liver disease (NAFLD) subjects recovered 6 months after operation. Apparent diffusion coefficient (ADC) of liver and pancreas increased gradually. T1 values of liver was significant positive correlated with the H-PDFF ($r = 0.86$, $p < 0.001$), and the ADC of liver was moderately negative correlated with the H-PDFF in three months after operation ($r = -0.67$, $p < 0.05$). The change of H-PDFF and fasting blood glucose (FBG) have always been correlated within six months ($r = 0.5 \sim 0.57$, $p < 0.05$). One month after operation, the changes of VFA were correlated with the changes of triglyceride (TG) and triglyceride glucose (TYG) index ($r = 0.73 \sim 0.76$, $p < 0.001$).

Conclusion: There is a significant positive correlation between H-PDFF and hepatic T1 values, and the ADC values of liver and pancreas increased with the decrease of fat content after bariatric surgery, suggesting the changes of diffusion function of liver and pancreas. The change of VFA is significantly related to the change of TG and TYG index one month after operation, but not SFA, suggesting that the metabolic activity of visceral adipose tissue (VAT) is higher. The gradual recovery of NAFLD after operation is continuously related to the changes of FBG.

PO-2768

Gray matter thickness and subcortical nuclear volume injury in male SARS-CoV-2 Omicron survivors in the acute phase: a prospective longitudinal study

Yanyao Du,Zhao Wei,Sihong Huang,Chuxin Huang,Li Chang,Yanjing Chen,Yijie Huang,Jun Liu
Department of Radiology, Second Xiangya Hospital of Central South University

Background Omicron's clinical manifestations and effects of on the brain in the acute phase remain unclear. By longitudinally comparing pre-Omicron and post-Omicron data, to investigate the pathophysiological mechanisms underlying clinical symptoms and changes to gray matter and subcortical nuclei in males in the acute phase and provide an imaging basis for early detection and intervention.

Methods A total of 207 male police officers underwent health screening MRI scans between August 28 and September 18, 2022; among them, 98 provided complete imaging and scales. Sixty-one participants infected with Omicron were reevaluated in the acute phase (January 6–January 14, 2023). Neuropsychiatric scales, clinical symptoms, and MR data were collected in the acute phase of infection, and their clinical symptoms were followed-up after three months. Gray matter indexes and subcortical nuclear volumes were analyzed. Associations between changes in gray matter and neuropsychiatric scales were evaluated with correlation analyses.

Findings Ninety-eight individuals underwent complete baseline data collection, and 61 and 17 individuals voluntarily enrolled in follow-ups during the acute phase of Omicron infection and three months later, respectively. Compared with pre-Omicron measures, Beck Anxiety Inventory scores were significantly increased and depressive distress scores were significantly decreased post-Omicron. Fever, headache, fatigue, myalgia, cough, and dyspnea were the main symptoms during the acute phase; fever, myalgia, and cough were significantly improved at the three-month follow-up. The gray matter thickness in the left precuneus and right lateral occipital region and the ratio of the right hippocampus volume to the total intracranial volume (right hippocampus/TIV) were significantly reduced post-Omicron. The fever group had reduced sulcus depth of the right inferior parietal region compared with the nonfever group. Post-Omicron, the thickness of the left precuneus was negatively correlated with the Beck Anxiety Inventory ($r=-0.39$, $P=0.002$, $PFDR=0.018$), and the ratio of the right hippocampus/TIV was positively correlated with the word fluency test scores ($r=0.34$, $P=0.007$).

Interpretation The duration of symptoms in multiple systems after infection was short; fever, myalgia, and cough obviously improved at the three-month follow-up. Gray matter thickness and subcortical nuclear volume injury were observed in male SARS-CoV-2 Omicron survivors in the acute phase. These findings may provide new insights into the emotional and cognitive mechanisms of Omicron invasion into the nervous system and provide an imaging basis for early detection and intervention of neurological sequelae.

PO-2769

Causal evidence for cerebello-striato-limbic circuit dynamics supporting depression

Ruiping Zheng,jingliang cheng
The first Affiliated Hospital of Zhengzhou University

Background: Striatum-based circuits have been implicated in major depressive disorder (MDD), a disease that reflects reward deficits and associated striatal circuitry disturbances. However, the underlying mechanism linking striatum-based circuits and MDD remains not fully understood, and a whole-structure approach has commonly been adopted when investigating striatal

dysconnectivity in MDD patients, and it remains unclear which striatal nucleus is the core structure underlying adolescent MDD.

Methods: A total of 79 first-episode, drug-naïve adolescents with MDD and 63 matched healthy controls (HCs), underwent resting-state functional MRI scans. Resting-state functional connectivity (rsFC) of the striatal nucleus were investigated, and then dynamic causal modeling (DCM) was conducted to assess the hypothesis that depression is associated with aberrant effective connectivity (EC) within and between key regions in the striatum-based circuits.

Results: Adolescents with MDD manifested decreased rsFC of the left ventral caudate (vCAU)-bilateral hippocampus (HIP), the right ventral rostral putamen (vrPUT)-left thalamus (THA), the left vCAU-right THA, as well as decreased rsFC of the left vrPUT-right cerebellum crus II (CeCr2). Compared with HCs, DCM showed significantly weaker EC from the right CeCr2 to the right vrPUT nucleus and the weaker EC from the right vrPUT nucleus to the left HIP and then from the left HIP to the left THA, as well as the enhanced self-inhibition of the left HIP in MDD group compared with the HCs.

Conclusions: This study provides direct evidence that abnormal function of the striatal nucleus in adolescent MDD patients may lead to the dysfunction of cerebello-striato-limbic circuit, in which the vrPUT nucleus plays a central role in abnormal connectivity in adolescent MDD patients.

PO-2770

Decreased intrinsic neural timescale in first-episode, treatment-naïve adolescent depression

Ruiping Zheng, Jingliang Cheng
The first Affiliated Hospital of Zhengzhou University

Background: Major depressive disorder (MDD) is mainly characterized by its core dysfunction in higher-order brain cortices involved in emotional and cognitive processes, whose neurobiological basis remains unclear. In this study, we applied a relatively new developed resting-state functional magnetic resonance imaging (rs-fMRI) method of intrinsic neural timescale (INT), which reflects how long neural information is stored in a local brain area and reflects an ability of information integration, to investigate the local intrinsic neural dynamics using univariate and multivariate analyses in adolescent depression.

Method: Based on the rs-fMRI data of sixty-six first-episode, treatment-naïve adolescents with MDD and fifty-two well-matched healthy controls (HCs), we calculated an INT by assessing the magnitude of autocorrelation of the resting-state brain activity, and then compared the difference of INT between the two groups. Correlation between abnormal INT and clinical features was performed. We also utilized multivariate pattern analysis to determine whether INT could differentiate MDD patients from HCs at the individual level.

Result: Compared with HCs, patients with MDD showed shorter INT widely distributed in cortical and partial subcortical regions. Interestingly, the decreased INT in the left hippocampus was related to disease severity of MDD. Furthermore, INT can distinguish MDD patients from HCs with the most discriminative regions located in the dorsolateral prefrontal cortex, angular, middle occipital gyrus, cerebellar posterior lobe.

Conclusion: Our research aids in advancing understanding the brain abnormalities of first-episode treatment-naïve adolescents with MDD from the perspective of the local neural dynamics, highlighting the significant role of INT in understanding neurophysiological mechanisms. This study shows that the altered intrinsic timescales of local neural signals widely distributed in higher-order brain cortices regions may be the neurodynamic basis of cognitive and emotional disturbances in MDD patients, and provides preliminary support for the suggestion that these could be used to aid the identification of MDD patients in clinical practice.

PO-2771

Subtractionless compressed-sensing-accelerated whole-body MR angiography using two-point Dixon fat suppression with single-pass half-reduced contrast dose: feasibility study and initial experience

Xiangchuang Kong

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose To investigate the feasibility and clinical utility of a compressed-sensing-accelerated subtractionless whole-body MRA (CS-WBMRA) protocol with only contrast injection for suspected arterial diseases, by comparison to conventional dual-pass subtraction-based whole-body MRA (conventional-WBMRA) and available computed tomography angiography (CTA).

Materials and methods This prospective study assessed 86 patients (mean age, 56 years \pm 16.4 [standard deviation]; 25 women) with suspected arterial diseases from May 2021 to December 2022, who underwent CS-WBMRA ($n = 48$, mean age, 55.9 years \pm 16.4 [standard deviation]; 25 women) and conventional-WBMRA ($n = 38$, mean age, 48 years \pm 17.4 [standard deviation]; 20 women) on a 3.0 T MRI after random group assignment based on the chronological order of enrolment. Of all enrolled patients administered the CS-WBMRA protocol, 35% (17/48) underwent CTA as required by clinical demands. Two experienced radiologists independently scored the qualitative image quality and venous enhancement contamination. Quantitative image assessment was carried out by determining and comparing the apparent signal-to-noise ratios (SNRs) and contrast-to-noise ratios (CNRs) of four representative arterial segments. The total examination time and contrast-dose were also recorded. The independent samples t-test or the Wilcoxon rank sum test was used for statistical analysis.

Results The overall scores of CS-WBMRA outperformed those of conventional-WBMRA (3.40 ± 0.60 vs 3.22 ± 0.55 , $P < 0.001$). In total, 1776 and 1406 arterial segments in the CS-WBMRA and conventional-WBMRA group were evaluated. Qualitative image scores for 7 (of 15) vessel segments in the CS-WBMRA group had statistically significantly increased values compared to those of the conventional-WBMRA groups ($P < 0.05$). Scores from the other 8 segments showed similar image quality ($P > 0.05$) between the two protocols. In the quantitative analysis, overall apparent SNRs were significantly higher in the conventional-WBMRA group than in the CS-WBMRA group (214.98 ± 136.05 vs

164.90 ± 118.05 ; $P < 0.001$), while overall apparent CNRs were not significantly different in these two groups (CS vs conventional: 107.13 ± 72.323 vs 161.24 ± 118.64 ; $P > 0.05$). In the CS-WBMRA group, 7 of 1776 (0.4%) vessel segments were contaminated severely by venous enhancement, while in the conventional-WBMRA group, 317 of 1406 (23%) were rated as severe contamination. In the CS-WBMRA group, total examination and reconstruction times were only 7 min and 10 min, respectively, vs 20 min and < 30 s for the conventional WBMRA group, respectively. The contrast agent dose used in the CS-WBMRA protocol was reduced by half compared to conventional-WBMRA protocol (18.7 ± 3.5 ml vs 37.2 ± 5.4 ml, $P = 0.008$).

Conclusion: The CS-WBMRA protocol provides excellent image quality and sufficient diagnostic accuracy for whole-body arterial disease, with relatively faster workflow and half-dose reduction of contrast agent, which has greater potential in clinical practice compared with conventional-WBMRA.

PO-2772

Multiparametric pulmonary MR-based radiomics nomogram for predicting brain metastases in patients with stage II-IV lung cancer

Jianqin Jiang¹, Yong Xiao¹, Lei Cui², Qin Hong¹, Gaofeng Xu¹, Yigang Fu¹, Chunhong Hu³

1. Yancheng City No.1 People's Hospital

2. Second Affiliated Hospital of Nantong University

3. the First Affiliated Hospital of Soochow University

Purpose: To develop a radiomics nomogram based on pulmonary MR to predict brain metastases (BM) in patients with lung cancer.

Methods: 105 patients with stage II-IV pathologically confirmed lung cancer who had undergone chest MR (including T2HASTE, T2 fast-BADE, T1-VIBE, Star-VIBE, DWI, and T1 mapping) and brain MR examinations were enrolled retrospectively. Two groups of patients were created: BM+ (those with BM diagnosed at baseline examination or within a year of follow-up; n=40) and BM- (those without BM throughout at least one year of follow-up; n=65). Two radiologists independently measured the mean ADC and T1 values of lung cancer lesions, assessed the presence of lobulation, spicular sign, pleural indentation, and pleural effusion, and estimated the size of the lung lesion. Two independent radiologists semi-automatically extracted radiomics features from the pretreatment thoracic MR images. Patients were randomly assigned to the training cohort (n=73), and the testing cohort (n=32) with a ratio of 7:3. Intraclass correlation coefficient (ICC), linear dependent coefficient ρ , and F test were used to select the optimum radiomics features and develop a BM+ predictive logistic regression (LR) radiomics model. The independent sample t-test, Mann Whitney U-test, chi-square test, or Fisher's exact test were used to assess the differences in clinical and imaging characteristics between the BM+ and BM- groups. The performances of clinical, radiomics models, and a clinical-radiomics nomogram were compared by the areas under receiver operating characteristic (ROC) curves (AUCs).

Results: In the training group, the pretreatment CEA, N stage, ADC, and T1 mean values were statistically different between the BM+ and BM- cohorts ($P=0.003-0.040$). Among the constructed radiomics models of individual MR sequences, the T1-VIBE radiomics model demonstrated the best predictive performance with an AUC of 0.910 in the training group and 0.875 in the validation group. The capacity to predict brain metastasis was significantly improved (AUC was 0.934 and 0.933 in the training and test groups, respectively) by combining the clinical, radiological characteristics (CEA, N stage, ADC, and T1 values) and T1-VIBE radiomics model.

Conclusions: A multiparameter chest MR radiomics model may be used to predict brain metastases in lung cancer patients. The clinical-radiomics nomogram improved the risk classification of brain metastases in patients with stage II-IV lung cancer.

PO-2773

The change of modular properties of functional brain network in patients with cervical spondylotic myelopathy

Ziwei Shao, Yongming Tan, laichang He

The First Affiliated Hospital, Nanchang University

Objectives: Previous studies have indicated that brain functional plasticity and reorganization in patients with cervical spondylotic myelopathy (CSM). However, it remains unclear whether and how compression of the cervical cord influences the functional integration and separation between and/or within modules. This study aimed to address these questions using graph theory.

Methods: Functional MRI was conducted on 46 CSM patients and 35 healthy controls (HCs). The intra- and inter-modular connectivity properties of the whole-brain functional network and nodal

topological properties were then calculated using theoretical graph analysis. The difference in categorical variables between groups was compared using a chi-squared test, while that between continuous variables was evaluated using a two-sample t-test. Correlation analysis was conducted between modular connectivity properties and clinical parameters.

Results: Modules interaction analyses showed that the CSM group had significantly greater inter-module connections than the HCs group (DMN-FPN: $t=2.38$, $p=0.02$); On the contrary, the CSM group had significantly lower intra-module connections than the HCs group (SMN: $t=-2.13$, $p=0.036$). Then we calculated the nodal topological properties of all nodes that were part of exceptionally connected modules. Compared to HCs, CSM patients exhibited higher nodal centralities in the right superior frontal gyrus, left post cingulate gyrus, right precuneus, right ventrolateral prefrontal cortex, left anterior cingulate cortex and left dorsolateral prefrontal cortex. In contrast, compared to the HCs group, CSM patients exhibited lower nodal centralities in the sensorimotor network. The Japanese Orthopedic Association (JOA) score was positively correlated with inter-module connections ($r=0.330$, FDR $q=0.029$) and negatively correlated with intra-module connections ($r=-0.467$, FDR $q=0.001$).

Conclusions: This study reported altered modular connections and nodal centralities in CSM patients. Decreased nodal centralities and intra-modular connection in the sensory-motor regions may indicate sensory-motor dysfunction. Furthermore, increased nodal centralities and inter-modular connection in the DMN and the frontal-parietal network may be compensatory for sensory-motor dysfunction in CSM.

PO-2774

Heart Failure with Normal Natriuretic Peptide Levels and Preserved Ejection Fraction: A Prospective Clinical and CMR study

Jian He^{1,2}, Minjie Lu¹

1. 中国医学科学院阜外医院

2. 南京医科大学第一附属医院 (江苏省人民医院)

Objectives: Heart failure with preserved ejection fraction (HFpEF) and normal natriuretic peptide levels can be defined as predisposed HFpEF, based on the HFA-PEFF score reaching four points from the ESC guidelines, and can be better evaluated by cardiovascular magnetic resonance (CMR). We aimed to describe the clinical presentation, comprehensive CMR characteristics, and prognosis of patients with predisposed HFpEF.

Materials and Methods: This prospective cohort study was conducted from January 1, 2019 to September 30, 2021. Patients who had primary cardiomyopathy, and primary valvular heart disease were excluded. Clinical and CMR-based characteristics and outcomes were compared. The primary endpoints were death, or heart failure hospitalization, or stroke.

Results: A total of 213 patients with HFpEF, 151 patients with predisposed HFpEF and 100 control subjects were analyzed. Compared with controls, patients with predisposed HFpEF had worse left ventricular (LV) remodeling and function, and higher systemic inflammation. Compared with patients with HFpEF, patients with predisposed HFpEF, whether obese or not, were younger, had higher plasma volume, yet lower prevalence of atrial fibrillation (AF), had lower left atrial volume index, less impaired LV global longitudinal strain ($-12.2\pm2.8\%$ vs $-13.9\pm3.1\%$, $p<0.05$) and early-diastolic global longitudinal strain rate (eGLSR, $0.52\pm0.20/s$ vs $0.57\pm0.15/s$, $p<0.05$), while similar prognosis. Besides, AF occurrence (HR=3.98, $p=0.008$), hemoglobin levels (HR=0.95, $p=0.002$), and eGLSR (per 0.2/s increase, HR=0.35, $p=0.006$) independently associated with endpoints in patients with predisposed HFpEF.

Conclusions: Predisposed HFpEF has relatively unique clinical and CMR features compared with HFpEF. eGLSR should be considered to improve prognosis in patients with predisposed HFpEF.

PO-2775

Prognostic value of left atrial strain derived from CMR fast semi-automated long-axis strain analysis in cardiac light-chain amyloidosis

Zhaofeng Feng, lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Objective

Cardiac light-chain amyloidosis (AL-CA) is a rare and life-threatening disease characterized by deposition of amyloid fibrils in the heart. The evaluation of left atrial (LA) function is important for predicting the prognosis of AL-CA patients. This study aimed to investigate whether fast semi-automated long-axis strain (FLAS) technique can evaluate the LA function changes in AL-CA patients and whether it has additional prognostic value.

Methods

Forty-one AL-CA patients and 19 healthy volunteers were retrospectively enrolled, and LA strain parameters were analyzed using FLAS based on cardiac magnetic resonance imaging (CMR). The endpoint was defined as all-cause mortality, and survival time was from the CMR examination date to the last follow-up or death. The prognostic value of LA strain was evaluated using Kaplan-Meier method and COX regression model. The intraclass correlation coefficient (ICC) was used to assess the repeatability of LA strain.

Results

LA strain parameters showed good reproducibility both within and between observers (ICC range, 0.945-0.991). Compared to the control group, AL-CA patients had significant left heart remodeling and dysfunction, including increased LVMI, decreased LVEF and LVLAS (all $P < 0.001$), enlarged LA, decreased ejection fraction (both $P < 0.05$), and significantly lower LA total strain (ϵ_s), active strain (ϵ_a), and passive strain (ϵ_e) (all $P < 0.001$). During a median follow-up of 16 months, 16 patients died. In Kaplan-Meier analysis, $\epsilon_s \leq 8.29\%$, $\epsilon_a \leq 2.05\%$, and $\epsilon_e \leq 2.78\%$ all increased the risk of death. In the multivariate model, ϵ_s and ϵ_a were independent predictors of patient prognosis and significantly improved the predictive ability of the model after adding them to models constructed with NYHA class, Mayo 2004 stage, and LVEF ($P = 0.002$ and $P = 0.005$, respectively).

Conclusion

FLAS has good repeatability in evaluating LA strain. LA enlargement and dysfunction are common in AL-CA patients. LA strain is correlated with the prognosis of AL-CA patients, and ϵ_s and ϵ_a are independent predictors of all-cause mortality and provide additional prognostic value on the basis of common clinical staging and CMR parameters.

PO-2776

The value of diffusion-weighted imaging for predicting pathologic response to neoadjuvant immunotherapy combined with chemotherapy in locally advanced resectable esophageal squamous cell carcinoma

Shuyi Yang, Qingle Wang, Mengsu Zeng
Zhongshan Hospital, Fudan University

Objective: This study was conducted in order to explore the value of DWI-derived parameters for the prediction of pathologic response to neoadjuvant immunotherapy (nIT) combined with chemotherapy in locally advanced resectable esophageal squamous cell carcinoma (ESCC).

Material and methods: Thirty-two patients with locally advanced ESCC who were treated with nT combined with chemotherapy followed by surgery were prospectively enrolled from May 2022 to May 2023. DWI (including IVIM) was performed within 1 week (median 2 days) before NT, and 2 to 5 weeks (median 25 days) after completion of nT, prior to surgery. Parameters including apparent diffusion coefficient (ADC), true diffusion coefficient (D), pseudo diffusion coefficient (D^*), and pseudo diffusion fraction (f) before and after NT were measured. Pathologic response was evaluated according to tumor regression grade (TRG) system. We grouped patients with TRG 0 into complete response (CR), while TRG 1-2 into minimal residual cancer cell (MRC). The changes in IVIM values before and after NT in different TRG groups were assessed. Receiver operating characteristic (ROC) curves analysis was used to determine the best cutoff value for predicting the pathologic response or MRC to NT.

Results: Twenty-one patients were identified as TRG 0-2 (responders), and eleven as TRG 3 (non-responders) in pathologic evaluation. While seven patients were identified as TRG 0 (CR), and fourteen as TRG 1-2 (MRC) in minimal residual cancer cell detection. The ADC, D, and f values increased significantly after nT. The post-ADC, post-D and Δ ADC values of responders were significantly higher than those of non-responders. The post-ADC, post-D and Δ ADC values of responders were significantly higher than those of non-responders. The Δ ADC and Δ D values of patients achieved CR were significantly higher than those with MRC. The area under curve (AUC) value of the post-ADC, post-D, Δ ADC and Δ D for prediction of pathologic response to nT was 0.801-0.857, 0.688-0.758, 0.879-0.913 and 0.805-0.861. The AUC value of Δ ADC and Δ D for identification MRC after nT was 0.776-0.796 and 0.786-0.867.

Conclusion: DWI may be used as an effective functional imaging technique to predict pathologic response and detect minimal residual cancer cell to nT combined with chemotherapy in locally advanced resectable ESCC.

PO-2777

Feasibility of bone marrow infiltration pattern and ADC values for assessment of tumor burden using multi-parameter MR in multiple myeloma

Xing Xiong

The First Affiliated Hospital of Soochow University

Objective: The purpose of our study was to explore and compare the tumor burden of different bone marrow (BM) infiltration patterns and evaluate the feasibility of ADC value to identify patterns in multiple myeloma (MM).

Materials and Methods: 93 patients with newly diagnosed MM and 23 controls had undergone routine MRI and DWI from January 2019 to November 2020. All patients had exhaustive laboratory data. Five BM infiltration patterns were allocated according to routine MRI. The laboratory data and ADC values of patterns were analyzed and compared. ROC analysis was used to establish the best diagnostic ADC threshold value for identifying these patterns and distinguishing normal pattern from controls. Besides, the correlation between the ADC values of diffuse pattern and the plasma cells ratio was assessed.

Results: The values of hemoglobin, β 2-MG, plasma cell, M protein, the percentages of ISS, R-ISS stage, high-risk FISH, and ADC values showed significant difference among patterns. ADC mean at a specific value ($368.5 \times 10^{-6} \text{ mm}^2/\text{s}$) yielded a maximum specificity (95.5%) and sensitivity (92.0%) in diagnosing MM. A specific value ($335.5 \times 10^{-6} \text{ mm}^2/\text{s}$) yielded a maximum specificity (84.7%) and sensitivity (88.0%) in discriminating visually normal pattern in MM from controls. There was a moderate[1] positive correlation between the plasma cells ratio and ADCs of diffuse infiltration patterns ($r=0.648$, $P<0.05$).

Conclusions: The BM infiltration patterns in MM patients can indicate the tumor burden and ADC value has the ability to discriminate these patterns objectively.

PO-2778

Aberrant dynamic properties of whole-brain functional connectivity in patients with non-small cell lung cancer after chemotherapy revealed by Hidden Markov Models

Yujie Zhang, Lanyue Hu, Jia You
Nanjing First Hospital

Background: The dynamic patterns behind the brain functional reorganization for patients with non-small cell lung cancer after chemotherapy and cognitive impairment remain largely unclear. This study aimed to investigate the temporal dynamics of brain activity and characterize the spatiotemporal specificity of transitions for lung cancer after chemotherapy patients and cognitive impairment in detail.

Methods: A total of 20 non-small cell lung cancer patients and 30 age-, sex- and education-matched healthy controls (HC) were included and underwent resting-state functional magnetic resonance imaging (rs-fMRI) scan. A hidden Markov model (HMM) analysis for rs-fMRI was conducted to identify brain states that recurred over time and assess the dynamical patterns of activation of states that characterized the non-small cell lung cancer patients before receiving chemotherapy and undergo chemotherapy and cognitive impairment. Furthermore, the transitions across states were analyzed to investigate the abnormality of transitions for patients with lung cancer before/after chemotherapy and cognitive impairment.

Results: 6 HMM states were identified in this study. Compared with HC, fractional occupancies of HMM state 2 of post chemotherapy non-small cell lung cancer patients was significantly increased ($p = 0.028$); fractional occupancies of HMM state 2 of both C- and C+ groups were significantly increased ($p = 0.045$, $p=0.042$). The HMM state 3 of both C- and C+ groups expressed shorter lifetimes ($p = 0.008$, $p=0.006$); the HMM state 6 of both C- and C+ groups expressed shorter lifetimes ($p = 0.027$, $p=0.017$). Compared with HC, the interval time of HMM states 5 was significantly increased for C+ patients ($p = 0.019$), and interval time of HMM state 6 was significantly decreased for C+ patients ($p = 0.046$, $p=0.042$). Switching rate of showed non-small cell lung cancer patients significant increased ($p = 0.045$, $p=0.042$). Compared to HC, the transition probabilities from HMM state 1,2 to 3 decreased significantly for C+ ($p < 0.05$); from state 3,5 to 4 and from state 1,2 to 4 increased significantly for C+ group (all $p < 0.05$). The transition probability from HMM state 2 to 5 significantly decreased for C- group ($p < 0.05$), from state 2,4 to 6 increased significantly for C- group ($p < 0.05$). Compared to C- group, switching probabilities from state 3 to 5, from 4 to 3 increased significantly (all $p < 0.05$); from state 4 to 1 decreased significantly.

Conclusion: Notably, The HMM provides more information of how brain active dynamically in patients with non-small cell lung cancer after chemotherapy and cognitive impairment. Our results indicate special aberrant dynamics for patients with non-small cell lung cancer, which may contribute to cognitive impairment, suggesting that brain dynamics based on the HMM could help reinforce the understanding on neuropathological mechanisms of non-small cell lung cancer after chemotherapy and cognitive impairment ($p < 0.05$).

PO-2779

A radiomics-based nomogram for preoperative T staging prediction of rectal cancer

xue lin

The Second Affiliated Hospital of Harbin Medical University

Purpose: To investigate the value of a radiomics-based nomogram in predicting preoperative T staging of rectal cancer.

Methods: A total of 268 eligible rectal cancer patients from August 2012 to December 2018 were enrolled and allocated into two datasets: training (n=188) and validation datasets (n=80). Another set of 32 patients from January 2019 to July 2019 was included in a prospective analysis. Pretreatment T2-weighted images were used to radiomics features extraction. Feature selection and radiomics score (Rad-score) construction were performed through a least absolute shrinkage and selection operator regression analysis. The nomogram, which included Rad-scores and clinical factors, was built using multivariate logistic regression. Discrimination, calibration, and clinical utility were used to evaluate the performance of the nomogram.

Results: The Rad-score containing nine selected features was significantly related to T staging. Patients who had locally advanced rectal cancer (LARC) generally had higher Rad-scores than patients with early-stage rectal cancer. The nomogram incorporated Rad-scores and carcinoembryonic antigen levels and showed good discrimination, with an area under the curve (AUC) of 0.882 (95% confidence interval [CI] 0.835–0.930) in the training dataset and 0.846 (95% CI 0.757–0.936) in the validation dataset. The calibration curves confirmed high goodness of fit, and the decision curve analysis revealed the clinical value. A prospective analysis demonstrated that the AUC of the nomogram to predict LARC was 0.859 (95% CI 0.730–0.987).

Conclusion: A radiomics-based nomogram is a novel method for predicting LARC and can provide support in clinical decision-making.

PO-2780

MRI-based radiomics model for preoperative prediction of extramural venous invasion of rectal adenocarcinoma

xue lin

The Second Affiliated Hospital of Harbin Medical University

Purpose: To assess EMVI preoperatively through radiomics technology, and use different algorithms combined with clinical factors to establish a variety of models in order to make the most accurate judgments before surgery.

Methods: A total of 212 patients with rectal adenocarcinoma between September 2012 and July 2019 were included and distributed to training and validation datasets. Radiomics features were extracted from pretreatment T2-weighted images. Different prediction models (clinical model, logistic regression [LR], random forest [RF], support vector machine [SVM], clinical-LR model, clinical-RF model, and clinical-SVM model) were constructed on the basis of radiomics features and clinical factors, respectively. The area under the curve (AUC) and accuracy were used to assess the predictive efficacy of different models. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were also calculated.

Results: The clinical-LR model exhibited the best diagnostic efficiency with an AUC of 0.962 (95% confidence interval [CI] =0.936–0.988) and 0.865 (95% CI = 0.770–0.959), accuracy of 0.899 and 0.828, sensitivity of 0.867 and 0.818, specificity of 0.913 and 0.833, PPV of 0.813 and 0.720, and NPV of 0.940 and 0.897 for the training and validation datasets, respectively.

Conclusion: The radiomics-based prediction model is a valuable tool in EMVI detection and can assist decision-making in clinical practice.

PO-2781

Features of MR signals of retroplacental basal decidual space and its diagnostic significance

hai feng qi
Xining First People's Hospital

BACKGROUND: With more pregnant women undergoing cesarean section, the number of women with scarring in the uterus undergoing uterine magnetic resonance (MR) examination in the second and third trimesters following a subsequent pregnancy, has increased.

OBJECTIVE: To investigate features of MR signals in retroplacental basal decidual space.

METHODS: The MR imaging data of patients with clinically and pathologically confirmed placenta implantation and complete placental abruption were retrospectively analyzed.

RESULTS: Patients with high-intensity signals in T2-weighted images (T2WI) of the retroplacental basal decidual space did not suffer placenta implantation after delivery, while high-intensity signals in T2WI of the retroplacental basal decidual space was not observed in patients with different degrees of placenta implantation.

CONCLUSION: As the retroplacental basal decidual space is the barrier between the placenta and myometrium, high-intensity signals in T2WI can improve the confidence of MR exclusion diagnostics of placenta implantation, and can be used as exclusion 1criteria for MR diagnosis of placenta implantation.

PO-2782

Multimodal imaging findings and predictive efficacy of primary diffuse large B-cell lymphoma of the central nervous system

Yushan Chen
Zhangzhou Affiliated Hospital of Fujian medical University

[Abstract]

Objective To investigate the multimodal imaging findings of primary diffuse large B-cell lymphoma of the central nervous system (PCNS-DLBCL) and analyze the predictive efficacy.

Methods 78 patients with PCNS-DLBCL admitted to our hospital from August 2020 to December 2022 were selected and the results of multimodal imaging were statistically analyzed. Standard CHOP regimen or Rituximab combined with standard CHOP regimen (R-CHOP) were used as first-line treatment. All patients underwent fluorodeoxyglucose positron emission computed tomography (18F-FDG PET/CT) before chemotherapy to obtain the total glycolysis value (TLG), metabolic tumor volume (MTV), SUV peak, SUV max and other parameters. According to the prognosis results, the patients were divided into non-progression group and progressive group, survival group and death group. The imaging parameters between non-progression group and progressive group, survival group and death group were compared, and the predictive value of each parameter on disease progression and death prognosis of PCNS-DLBCL patients was analyzed.

Results A total of 192 lesions were detected in 78 patients with PCNS-DLBCL by multimodal imaging, 33 cases were single lesions (33 lesions) and 45 cases were multiple lesions (159 lesions). There was no significant difference in age, sex, lesion distribution, CT plain scan, MRI T1WI, MRI T2WI, MRI enhanced scan, FLAIR sequence, MRS, DWI, FDG PET/CT imaging findings between

the single lesion group and the multiple lesion group ($P > 0.05$). During 1-year follow-up, the following subgroups were included according to whether they progressed or survived: no progression group (42 cases), progress group (34 cases), survival group (68 cases), and death group (8 cases). TLG, MTV, SUV peak and SUV max in the non-advanced group were lower than those in the advanced group ($P < 0.05$). TLG, MTV, SUV peak and SUV max in survival group were lower than those in death group ($P < 0.05$). The AUC of 18F-FDG PET/CT combined prediction of disease progression and death in PCNS-DLBCL patients was 0.901 and 0.930, respectively, which was greater than the AUC predicted by each parameter alone.

Conclusion There was no significant difference in the imaging findings of PCNS-DLBCL in single and multiple lesions. The 18F-FDG PET/CT parameters of patients with different disease progression and survival conditions were significantly different. TLG, MTV, SUV peak and SUV max have high predictive value for disease progression and death in PCNS-DLBCL patients.

PO-2783

A Preliminary Study of Diffusion Weighted Imaging and Resting-state Functional MRI in the Link between Brain Structural and Functional Network Disruptions in Cirrhosis with Minimal Hepatic Encephalopathy

Qing Sun

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

PURPOSES

While minimal hepatic encephalopathy (MHE) is increasingly recognized as a system-level disorder affecting brain structure and function, little is known about alterations of topological organization of brain functional and structural connectivity networks.

METHOD

We constructed functional connectivity networks from functional MRI signal correlations and structural connectivity networks from diffusion tensor imaging tractography in 30 MHE patients, 31 cirrhotic patients without MHE (NMHE) and 59 well-matched healthy controls. Graph theoretical analysis was employed to compute network properties. We investigated the relationships between functional and structural connectivity networks.

RESULTS

We found that MHE/NMHE patients exhibited altered small-worldness property in both functional and structural networks. Many regional characteristics were altered in both networks, involving attention, subcortical and visual networks, and some topological parameters in those regions were correlated with neurocognitive performances and/or disease duration, which reflect disease-specific pathophysiology in MHE. Compared with NMHE patients, MHE patients had decreased nodal local efficiency in functional network. The coupling strength of functional-structural connectivity was decreased and exhibited high sensitivity and specificity to differentiate MHE patients from controls.

CONCLUSION

This study indicates that MHE patients exhibit dysregulation of the 'small-world' topological organization in both brain structural and functional networks, and there is decoupling between the two networks. Our results suggest this so far neglected relationship (i.e, decoupling) serves a key point, which is related to neurocognitive dysfunction.

PO-2784

MRI-based Tumor Habitat Analysis for Treatment Valuation of Radiotherapy on Esophageal Cancer

Shaolei Li¹, Shengguang Zhao⁴, Yongming Dai², Xuekun Zhang³, Xiaoyan Chen⁵, Weixiang Qi⁴, Mei Chen⁴, Yibin Zhang⁴, Jiayi Chen⁴, Fuhua Yan^{1,3}, Zenghui Cheng³, Yingli Yang²

1. Ruijin Hospital

2. School of Biomedical Engineering, ShanghaiTech University

3. Department of Radiology, Ruijin Hospital

4. Department of Radiation Oncology, Ruijin Hospital

5. Department of Pathology, Ruijin Hospital

Purpose: We aim to evaluate the performance of pre-treatment MRI-based habitat imaging to segment tumor micro-environment and its potential to identify patients with esophageal cancer who can achieve pathological complete response (pCR) after neoadjuvant chemoradiotherapy (nCRT).

Methods: A total of 18 patients with locally advanced esophageal cancer (LAEC) were recruited into this retrospective study. All patients underwent MRI before nCRT and surgery using a 3.0 T scanner (Ingenia 3.0 CX, Philips Healthcare). A series of MR sequences including T2-weighted (T2), diffusion weighted imaging (DWI) and Contrast Enhance-T1 weighted (CE-T1) were performed. A clustering algorithm using a two-stage hierarchical approach groups MRI voxels into separate clusters based on their similarity. The t-test and receiver operating characteristic (ROC) analysis were used to evaluate the predictive effect of pCR on habitat imaging results. Cross-validation is used to test the accuracy of predictions.

Results: A total of 9 habitats were identified based on structural and physiologic features. The predictive performance of habitat imaging based on these habitat volume fractions (VFs) was evaluated. Students' t-test identified 2 habitats as good classifiers for pCR and non-pCR patients. ROC analysis shows that the best classifier had the highest AUC (0.82) with an averaged prediction accuracy of 77.78%. **Conclusions:** We demonstrate that MRI-based tumor habitat imaging has great potential for predicting treatment response in LAEC. Spatial habitat imaging results can also be used to identify tumor non-responsive sub-regions for the design of focused boost treatment to potentially improve nCRT efficacy.

PO-2785

Diagnostic value of diffusion weighted imaging to predict cervical lymph node status of papillary thyroid carcinoma

Jie Liu¹, Juan Tao¹, Wenying Zhu¹, Peng Sun², Fan Yang¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Clinical & Technical Solutions, Philips Healthcare

Objective To investigate the feasibility of diffusion weighted imaging (DWI) examination in cervical lymph node; To discuss the value of apparent diffusion coefficient (ADC) for predict cervical lymph node status in patients with papillary thyroid carcinoma (PTC).

Method The imaging and clinical data of 182 patients with PTC diagnosed by operation and pathology were retrospectively analyzed, according to the result of surgical pathology, the patients were divided into lymph node metastasis group (25 cases) and no lymph node metastasis group (21 cases). They were examined with conventional MRI and DWI with b-value of 100 s/mm², 300 s/mm², and 500 s/mm². All mean ADC values of cervical metastatic and non-metastatic lymph nodes were compared. The receiver operating curve (ROC) method selected the best b-value for

the differentiation of cervical metastatic and non-metastatic lymph nodes. The diagnostic tests were then evaluated (sensitivity, specificity).

Results The mean ADC values of non-metastatic lymph nodes at b-factor 100 s/mm², 300 s/mm², and 500 s/mm² was significantly different ($F=62.993$, $p<0.01$; $t = 7.107, 8.999, 5.710$, $p<0.01$). The mean ADC value decreased as the b-value increased. The mean ADC values of cervical metastatic lymph nodes at b-factor 100 s/mm², 300 s/mm², and 500 s/mm² was significantly different ($F = 49.956$, $p<0.01$; $t = 6.208, 9.170, 3.808$, $p<0.01$). The mean ADC value decreased along with the b value increasing. The mean ADC values for cervical metastatic and non-metastatic lymph nodes were $(3.4326\pm0.4200) \times 10^{-3}\text{mm}^2/\text{s}$ and $(2.4693\pm0.7206) \times 10^{-3}\text{mm}^2/\text{s}$ for b-100 factor, $(2.9873\pm0.3050) \times 10^{-3}\text{mm}^2/\text{s}$ and $(1.7879\pm0.4719) \times 10^{-3}\text{mm}^2/\text{s}$ for b-300, $(2.7363\pm0.3698) \times 10^{-3}\text{mm}^2/\text{s}$ and $(1.444\pm0.3194) \times 10^{-3}\text{mm}^2/\text{s}$ for b-500, respectively. The mean ADC values of metastatic lymph nodes were lower. There were significant differences in ADC values between cervical metastatic and non-metastatic lymph nodes at all b-factors. ($t=5.960, 11.074, \text{ and } 13.959$, respectively. $p < 0.01$). Acutoff value for metastatic lymph nodes of $2.6052 \times 10^{-3}\text{mm}^2/\text{s}$ at b-300 factor yielded sensitivity and specificity of 91.2% and 72.7%, respectively.

Conclusion The present study revealed that ADC measurements could potentially quantitatively predict cervical lymph node status of PTC.

PO-2786

MRI differential diagnosis value between ovarian thecoma-fibroma with cystic degeneration and ovary adenofibroma

Juan Bao, Jiangning Dong
Anhui Provincial Cancer Hospital

Objective: To explore the value of conventional magnetic resonance imaging (cMRI) and diffusion-weighted imaging (DWI) in identifying ovarian thecoma-fibroma (OTF) with cystic degeneration and ovary adenofibroma (OAF). **Methods:** A total of 31 patients with OTF and 25 patients with OAF were included in this retrospective study. Dividing them into OTF group and OAF group. Clinical data, cMRI and DWI features, and apparent diffusion coefficient (ADC) [including mean ADC (ADCmean), minimum ADC (ADCmin), and maximum ADC (ADCmax)] were analyzed, measured, and compared. Logistic regression analysis was used to screen independent identification features. Receiver operating characteristic (ROC) curves were plotted to assess the discriminatory efficacy. DeLong's test was used to compare the area under the curve (AUC). **Results:** The OTF group had a smaller cyst degeneration degree ($p<0.05$), a fewer black sponge signs (16.1% vs. 56.0%, $p<0.05$), and a lower ADCmin (the cut-off value was $1.152 \times 10^{-3} \text{mm}^2/\text{s}$) than OAF group. The cMRI and DWI discriminated the two groups with AUC values of 0.827 and 0.770, respectively. The cMRI combined with DWI had a higher identification efficiency with AUC, accuracy, specificity, and sensitivity of 0.943, 0.893, 0.840, and 0.936, respectively. **Conclusion:** The cyst degeneration degree, black sponge sign, and ADCmin were independent characteristics to distinguish OTF group from OAF group. Combining cMRI with DWI can improve identification performance.

PO-2787

Brain recovery of the NAc fibers in smokers by high-frequency repetitive transcranial magnetic stimulation(rTMS)

Dongyan Chen
Zhejiang Hospital

Objective: To reveal the brain fibers changes of nicotine addicts before and after a short-term treatment through rTMS and explore the structural biomarker for clinical treatment for nicotine dependence.

Methods: Eighteen smokers and Twenty-nine age- and gender- matched non-smoking controls (NSCs) were recruited. Smokers were received ten treatments per two weeks of high-frequency rTMS over the dorsolateral prefrontal cortex (DLPFC) and two MRI scans-diffusion spectrum imaging (DSI) were obtained at baseline (S1) and ten-treatments follow-up (S2). Dependence and craving were assessed using standardized questionnaires. We employed tractography atlasbased analysis (TABS) method to investigate fractional anisotropy (FA) , axial diffusivity (AD), radial diffusivity (RD) and other related diffusion indicators changes in fiber tracts based on region of interest. Two-sample t-test was performed to examine the tracts difference between S1 and NSCs. Paired t-test was performed to examine the tracts difference between S1 and S2. Correlation analysis between diffusion indicators' values and the Fagerstrom Test for Nicotine Dependence (FTND) scores were performed.

Results: Relative to NSCs, lower FA and higher RD were found in the right Subthalamic Nucleus (STN)-whole brain fiber tracts in S1. S2 showed decreased AD values in the right nucleus accumbens (NAc)-whole brain fiber tracts compared with S1. The AD values in the right NAc-whole brain fiber tracts was significantly and positively correlated with the FTND score of smokers.

Conclusion: The FA and RD values in the right STN-whole brain fiber tracts can be used to separate the smokers from the non-smokers. In particular, that the right NAc-whole brain fiber tracts are potential structural markers for brain recovery and to inform clinical decision-making of treatment for smokers.

PO-2788

Cervical transforaminal ligaments on MRI and its clinical significance

Junlin Li
Inner Mongolia Autonomous Region People's Hospital

Background. This study examined cervical transforaminal ligament(TFL) displays in cadavers and living bodies using magnetic resonance imaging (MRI) and evaluated the correlation between nerve entrapment in the brachial plexus by the TFL and cervical radiculopathy(CR).

Methods. First, 6 normal intact adult cervical specimens were used to calculate the relevant capacity in displaying the cervical TFLs by the three-dimensional fast imaging employing steady-state acquisition (3D-FIESTA). Second, 10 patients with CR and 10 healthy subjects were selected to perform the 3D-FIESTA sequence scan at the C4-T1 intervertebral foramina. The TFL display rate was calculated, and its correlation with CR was analysed.

Results. The microscopic anatomical results showed that the cervical TFL incidence was 39.6%. The relative capacity of the 3D-FIESTA sequence in displaying cervical TFLs showed a 96.6% specificity and a 73.7% sensitivity. In the 10 patients with CR, cervical TFLs were present in 17 intervertebral foramina, of which, 10 cases showed hypertrophy of the TFLs causing nerve entrapment, and corresponding symptoms of CR were found in 8 cases of cervical TFLs. The

correlation between nerve root entrapment by the cervical TFL and CR showed a 96.8% specificity and an 80% sensitivity. In the 10 healthy subjects, cervical TFLs were present in 13 intervertebral foramina.

Conclusions. The MR 3D-FIESTA sequence has high clinical value in displaying cervical TFLs in both cadavers and living bodies. If 3D-FIESTA sequencing shows nerve entrapment by the TFL, the possibility of CR caused by this TFL is approximately 80.0%. Conversely, the possibility of CR remains at 3.2%.

PO-2789

Altered functional connectivity in the resting state of amygdala in patients with primary angle-closure glaucoma

Ye Chen,yunayuna wang,linglong chen,feng ouyang,mingxue yin,lianjiang lv,jie liu,zihe xu,xianjun zeng
The First Affiliated Hospital Of Nanchang University

Purpose: Depressive symptoms are common in patients with glaucoma. The amygdala plays an important role in the development of depressive symptoms; However, no studies have explored how the functional connectivity (FC) of the amygdala is altered in glaucoma. In this study, resting-state functional MRI (rs-fMRI) was used to investigate the changes of the amygdala FC in patients with primary angle-closure glaucoma (PACG).

Methods: In this study, we included 34 patients with PACG and 33 patients with healthy controls (HCs). All PACG patients underwent a complete eye examination. After MRI data preprocessing, the bilateral amygdala was selected as the seed point. The difference of resting-state FC among the groups was compared. Identify brain regions with significant differences between PACG patients and HCs patients, and then assess the association between the FC coefficients of these regions and clinical variables.

Results: Compared with HCs, the functional connections between the right amygdala and the left cerebellum 8 brain area, the vermis 4-5 brain area, the bilateral anterior central gyrus, the right supplementary motor area, and the left paracentral lobule were reduced in PACG patients, while the functional connections with the left amygdala were enhanced. Functional connections between the left amygdala and the bilateral cerebellar 8 brain area, the vermis 4-5 brain area, the bilateral putamen, the left middle frontal gyrus, the left posterior cingulate gyrus, and the left anterior central gyrus were reduced. There was no significant correlation between amygdala rsFC changes and disease duration, RNFLT, A-C/D, V-C/D, IOP, and other clinical indicators.

Conclusions: In PACG patients, there are extensive abnormal resting state functional connections between the amygdala and multiple brain regions, suggesting that abnormal FC in the amygdala plays an important role in the progression of PACG.

KEYWORDS: primary angle-closure glaucoma, amygdala, resting-state, functional magnetic resonance imaging, functional connectivity.

PO-2790

3D pCASL with dual PLDs could reflect cerebral blood flow regulation in patients with hydrocephalus

Yawen Xiao,Shiqi Chen,Xinlan Xiao
The Second Affiliated Hospital of Nanchang University

Purpose: To investigate whether the difference in CBF between long and short PLD (Δ CBF) derived three-dimensional pseudocontinuous arterial spin-labeling (3D pCASL) in patients with

hydrocephalus could reflect cerebral regulation and to demonstrate the associations between regional Δ CBF and the degree of ventricular dilatation.

Materials and Methods: In this retrospective study from December 2017 to December 2022, consecutive patients with hydrocephalus and control subjects were included. Regional CBF and Δ CBF were compared by using covariance analyses. The associations between Δ CBF and the degree of ventricular dilatation were investigated by using linear regression analyses and interaction analysis.

Results: 58 patients with communicating hydrocephalus (median age, 61.5 years, IQR, 48-68 years, 24 women), 57 patients with obstructive hydrocephalus (median age, 46 years, IQR, 29-57 years, 28 women), and 52 control subjects (median age, 49 years, IQR, 34-57 years, 26 women) were analyzed. Compared to the control group, both hydrocephalus groups showed larger Δ CBF in all brain regions except for the bilateral parietal cortex and cerebellum. Furthermore, in the left medial watershed and left temporal cortex, communicating hydrocephalus exhibited greater Δ CBF than obstructive hydrocephalus. Δ CBF of the right posterior external watershed (adjusted β :0.276, 95%CI: 0.047-0.505, $P=0.019$), right parietal cortex (adjusted β :0.277, 95%CI: 0.056-0.498, $P=0.015$) in the obstructive hydrocephalus group; Δ CBF in the left internal watershed (adjusted β :0.274, 95%CI: 0.013-0.536, $P=0.04$) in the communicating hydrocephalus group was associated with the degree of ventricular dilatation, respectively.

Conclusion: Patients with hydrocephalus initiate cerebral regulation to maintain CBF, but require longer arterial transit times (ATT). The ability to regulate CBF in brain regions represented by the watershed is associated with the degree of ventricular dilation.

PO-2791

A fixel-based analysis of micro- and macro-structural changes in end-stage renal disease with cognitive impairment

Hao Wang, Lijun Song, Wenbo Yang, Mingan Li, Zhenchang Wang
Beijing Friendship Hospital, Capital Medical University

Background: Renal replacement therapy, hemodialysis (HD), peritoneal dialysis (PD), and renal transplant are essential to maintaining life in patients with ESRD, of which HD accounts for the most significant proportion. Cognitive decline occurs early in CKD but is especially serious, such as dementia, in ESRD. Patients with ESRD have brain structural damage and cognitive impairment after HD, and the prevalence of MCI and dementia in patients with HD is similar to that in patients without HD. The fixed-based analysis (FBA) can provide information on within-voxel fiber density (FD) and macroscopic fiber-bundle cross-section (FC) to reflect the number of axons and intra-axonal volume.

Method: Eighty-one ESRD patients including 41 with ND and 40 with maintenance HD were finally enrolled in this study. The preprocessing pipeline was performed using QSIPrep 0.14.2. Firstly, Marchenko-Pastur principal component analysis (MP-PCA) denoising as implemented in MRtrix3s dwidenoise was applied. Secondly, B1 field inhomogeneity was corrected using dwibiascorrect from MRtrix3 with the N4 algorithm after denoising. Thirdly, head motion correction and eddy current correction were done using FSL 6.0.4. Eddy's outlier replacement was performed. The DWI time-series were finally resampled to anterior commissure-posterior commissure (ACPC), generating a preprocessed DWI run in ACPC space with 2.5 mm isotropic voxels.

Result: Compared with HC, macrostructural fiber cross-section (FC) was lower in ESRD ND, mainly concentrated in fiber bundles in bilateral anterior hemispheres, such as frontal projections in striatum and thalamus, commissure anterior (CA), rostrum, and genu of corpus callosum (CC), anterior part of cingulum (CG), furthermore, associational bundles such as bilateral inferior occipitofrontal fascicle (IOFF) and inferior longitudinal fascicle (ILF) were also lower.

Microstructural fiber density (FD) was lower only in a small portion of bilateral frontal projections and bilateral associational bundles such as arcuate fascicle (AC) and superior longitudinal fascicle (SLF). When macro- and microstructural fiber were taken together, the regions of lower FDC were similar to the regions of lower FC, with a smaller range than FC in ESRD ND.

Compared with HC, ESRD HD showed an extensive lower FC in fiber bundles in bilateral anterior hemispheres and temporal lobe, furthermore, fiber bundles in the brainstem were also widely affected such as corticospinal tract (CST) and fronto-pontine tract (FPT). For FD, bilateral frontal projections and associational bundles in bilateral anterior hemispheres were more widely lower in ESRD HD, in addition, associational and commissural bundles were also affected. A wider range of lower FDC was found in ESRD HD, with a reduction of regions similar and smaller to FC in ESRD HD. There were no significant differences in FC, FD, and FDC between ESRD ND and ESRD HD.

Conclusion: The micro- and macro-structural changes were associated with cognitive impairment in end-stage renal disease.

PO-2792

Central diabetes insipidus with thickening of pituitary stalk: Differential diagnosis Langerhans cell histiocytosis from germ cell tumors by clinical-radiologic features

Yifan Xu

The First Affiliated Hospital of Shandong First Medical University& Shandong Provincial Qianfoshan Hospital

Background

Due to different therapeutic strategies, distinguishing Langerhans Cell Histiocytosis (LCH) from germ cell tumors (GCT) for central diabetes insipidus (CDI) in children and adolescents by MRI is very important. The present study was retrospectively performed to review a series of clinical and neuroimaging findings in differential diagnosis GCT and LCH.

Methods

Thirty-six patients (16LCH and 20 GCTs) were included in this study. Five MR findings factors (include shape, enhancement pattern, thickened stalk, posterior pituitary T1 high intensity and pituitary involvement) and two clinical information (include age and gender) were assessed by 3 experienced neuroradiologists. The chi-squared test and the Rank sum test for continuous variables were performed to explore the differences between the two groups. A two-sided p-value <0.05 was considered significantly different. We also calculated sensitivity and specificity for the diagnosis of LCH and GCTs of some important imaging finding as described above.

Results

Between 36 patients with 16 LCH and 20 GCTs, a significant difference was identified by statistical analysis for the number of patients with age ($P<0.005$), shape ($P<0.005$), Maximum diameter($P<0.005$), enhancement pattern ($P<0.005$), gland involvement ($P<0.005$), thickened stalk($P<0.005$).

Sensitivity and specificity for the diagnosis for LCH were as follows: 0.875 and 0.75 for enhancement pattern; 0.85 and 0.82 for the thickened stalk; 0.86 and 0.84 for shape(V-Shaped).

Conclusion

MRI has a valuable role in differentiating GCTs and LCH in patients with CDI.

PO-2793

Quantitative Synthetic MRI evaluation of hippocampus in patients with multiple sclerosis

Jing Huang,Jie Lu

XUANWU hospital

Abstract

Background: The hippocampus atrophy is commonly revealed in patients with multiple sclerosis (MS), but the advanced quantitative evaluation needs to be tackled before atrophy for subtle early assessment in clinical practice.

Objective: To identify the early-stage changes in quantitative and volumetric parameters of hippocampus from patients with MS by using the synthetic MRI and correlate these quantitative changes with clinical variables.

Methods: In this prospective study, 30 clinically definite MS patients and 26 age-matched healthy controls (HCs) were included, who underwent both Synthetic MRI and T1-weighted three-dimensional MRI as baseline. 19 MS patients completed 1-year follow-up. The hippocampus and subregion volumes were assessed by using voxel-based morphometry (VBM). Synthetic MRI-derived parameters (T1, T2, and proton density) from bilateral hippocampus and subregion were measured and compared, and their associations with the Expanded Disability Status Scale (EDSS), Symbol Digit Modalities Test (SDMT) scores were further investigated. The longitudinal alterations of hippocampus synthetic parameters and volumes in 1-year follow-up MS patients were compared.

Results: There were no significant differences in the volumes of the hippocampus and its subregions between MS patients and HCs at baseline and 1-year follow-up. At baseline, compared with HCs, the T1, T2 and PD values of whole hippocampus and its subregion increased in patients with MS. EDSS scores were positively correlated with T2 value ($P = 0.01$, $R = 0.45$) and SDMT score were significantly negatively correlated with T2 value ($P = 0.02$, $R = -0.43$). In MS, compared with the baseline, both T1 and T2 values of CA2 subregion were increased, and the T1, T2 values of whole hippocampus and entorhinal cortex, subiculum subregions were decreased in 1-year follow-up. The T2 values of hippocampus were still significantly positively correlated with the EDSS scores ($P = 0.02$, $R = 0.53$) and negatively correlated with the SDMT scores ($P = 0.004$, $R = -0.63$).

Conclusions: Synthetic MRI can detect subtle quantitative changes of the hippocampus and its subregions in MS patients who had no obvious changes in hippocampal volume and can be used for its longitudinal evaluation. Specifically, the quantitative values of synthetic MRI have significant correlations with EDSS and SDMT both at the baseline and follow-up, suggesting that it can applied as potentially effective imaging biomarker in clinical practice for quantitative hippocampus evaluation.

PO-2794

Quantification imaging of renal steatosis in T2DM patients and reproducibility of IDEAL-IQ

Jian Liu^{1,2}, Liwei Fu¹, Zhijie Su¹, Rongpin Wang¹, Xianchun Zeng¹

1. Guizhou Provincial People's Hospital

2. Guizhou University

Purpose To evaluate the reproducibility of renal iterative decomposition of water and fat with echo asymmetry and least squares estimation-iron quantification sequence (IDEAL-IQ) in renal lipid deposition and to explore the application in type 2 diabetes mellitus (T2DM) patients.

Methods All participants (healthy volunteers and T2DM patients) received IDEAL-IQ imaging to measure renal proton-density fat fraction (PDFF). In healthy volunteers, two IDEAL-IQ scans without repositioning of the subject or changing the position of the surface coil to assess reproducibility by using Bland Altman analysis. The T2DM patients were classified according to their estimated glomerular filtration rate (eGFR) (mL/min/1.73m²) as T2DM (eGFR>90), DKD stages I-II (60<eGFR≤90), DKD stage III-IV (15<eGFR≤60), to determine differences depending on renal lipid depositions using one-way ANOVA. The correlation between renal PDFF and laboratory index was evaluated. Receiver-operating-characteristic (ROC) curve was constructed to assess the diagnostic performance of renal IDEAL-IQ.

Results Twenty-six healthy participants and ninety-six T2DM underwent IDEAL-IQ for examination. Bland-Altman analyses showed narrower limits of agreement and a significant difference in the correlated variances ($r=0.81$, $p<0.05$). No significant differences were found between the right and left kidneys in the renal PDFF. Statistically significant differences between the HC, T2DM, DKD I-II and DKD III-IV were found in renal PDFF values ($p<0.001$), all being highest in the DKD III-IV cohorts. The correlation between renal PDFF and eGFR showed a negative trend toward significance with an r value of 0.437 ($p<0.001$) and a positive correlation with Scr ($r=0.421$, $p<0.001$). The AUC of IDEAL-IQ for the HC and T2DM was 0.857. For the T2DM and DKD, DKDI-II and DKDIII-IV the IDEAL-IQ had AUC of 0.689 and 0.823.

Conclusions Renal lipid deposition is a potential driver of DKD. IDEAL-IQ is a promising and reproducible technique for the assessment of renal lipid deposition. It may be a reliable and valuable renal steatosis measurement for the identification the of risk of DKD in patients with T2DM.

PO-2795

Multimodal MRI data to identify multiple sclerosis and neuromyelitis spectrum diseases: Machine learning analysis

Xiao Liang, Fuqing Zhou
The First Affiliated Hospital of Nanchang University

Objective: The purpose of this study is to explore the role of machine learning combined with multimodal magnetic resonance imaging features in the recognition of multiple sclerosis (MS) and neuromyelitis optica spectrum disorders (NMOSD) patients.

Methods: The study collected 58 MS patients and 36 NMOSD patient. Every subject received the Paced Auditory Serial Addition Test, Expanded Disability Status Scale, Modified Fatigue Impact Scale, and magnetic resonance imaging scanning. After data preprocessing, based the 116 regions of interest in anatomical automatic labeling (AAL) brain atlas, the structure and functional metrics included functional connectivity (FC), amplitude of low frequency fluctuation (ALFF), regional homogeneity (ReHo), and gray matter volume (GMV) were calculated and extracted as features set. Then classifiers using different combinations among the four types of selected features were respectively built. Then, the features were selected by removing variables with a high pairwise correlation (the threshold was set at 0.65) and least absolute shrinkage and selection operator regression to obtain the most discriminative features. Finally, support vector machine (SVM) and logistic regression (LR) classification models were constructed to distinguish MS patients from NMOSD patients to compare the results of different combinations in both classifiers.

Results: Between the MS and NMOSD group, 59 features (mainly distributed by the brain regions of default mode network, cerebellum and subcortical network) included 31 FC, 7 ALFF, 14 ReHo and 5 GMV were selected. The SVM and LR classifier built with the combination of FC, ALFF, and GMV under the AAL template discriminated patients with the best performance (SVM:AUC=0.976; LR: AUC=0.940).

Conclusion: In this study, machine learning was used to construct SVM and LR classifiers for multimodal and multi-level MRI image features, which can effectively distinguish between MS and NMOSD patients, providing potential neuroimaging evidence for early diagnosis and clinical intervention.

PO-2796

Quantitative brain anatomy analysis in aiding clinical evaluation of patients with severe mental illness:

a preliminary study

Hui Sun

West China Hospital of Sichuan University

Object: The diagnosis of severe mental illnesses (SMI) is primarily made on behavioral symptoms and clinical observations, and there is a recognized need for additional objective tools to assisting diagnosis or predicting outcome. This study aimed to explore the clinical significance of quantitative structural magnetic resonance imaging (MRI) in screening for patients with SMI.

Methods: This study recruited 205 patients with suspected SMI and were scanned with high-resolution brain MRI. Structural volumetric measurements of major brain regions were obtained for each patient and patients' gray matter volume (GMV) values were computed and mapped against the normative GMV model established from the healthy participant database reported in the previous study, and graphics are obtained to indicate brain regions that fell out of the normative range and the extent of such alterations. GMV pattern for each patient was mapped against the reported gray matter volume alterations of four SMIs: depression, anxiety disorder, bipolar disorder, and schizophrenia. The diagnostic efficacy of quantitative structural MRI was evaluated and the number of correct imaging diagnoses in patients whose discharge diagnosis differed from the admission diagnosis was calculated during the process.

Results: Among the recruited participants, 149 of them met the diagnostic criteria of a SMI. The most-affected brain regions in SMIs were the bilateral superior frontal gyrus, right lateral orbitofrontal gyrus, left postcentral gyrus, and globus pallidus. Organic brain lesions were detected in 23 patients who didn't meet the diagnosis of SMI. The accuracy of identifying the four mental illnesses using quantitative structural MRI was 73.6%.

Conclusion: Quantitative structural MRI could be beneficial in screening and developing imaging diagnostic models for SMI. It also emphasizes the potential clinical use of structural MRI in diagnosing mental illness and detecting organic lesions.

PO-2797

Assessment of AAA morphology using relaxation-enhanced angiography without contrast and triggering (REACT)

Wen Zeng,Zhenlin Li

Department of Radiology, West China Hospital, Sichuan University

Background:

Abdominal aortic aneurysm (AAA) is a common vascular degenerative disorder. Contrast-enhanced computed tomography (CT) is usually the gold standard for AAA diagnosis. As magnetic resonance angiography (MRA) continues to evolve, a novel flow-independent relaxation-enhanced angiography without contrast and triggering (REACT) sequence is proposed, which can be used to diagnose aorta diseases. Therefore, the aim of the current study was to assess the accuracy of REACT for measuring abdominal aortic aneurysm.

Methods:

In this prospective, single-center study, patients were recruited consecutively and received a protocol REACT and contrast-enhanced CT. All examinations were performed using a 3T MRI system employing a standard 16-channel body coil and a multi-detector row CT systems. Two radiologists independently assessed scans for the morphology of AAA, including the diameter of neck of AAA, the maximum diameter of AAA, and the thickness of lateral thrombus.

Results:

A total of 15 consecutive AAA patients (53.27 ± 13.68 years, 11 males) were included. There was no significant difference between REACT and CT in measuring the diameter of neck of AAA (25.30 ± 4.71 mm vs. 26.93 ± 5.06 mm, $P=0.028$) and the maximum diameter of AAA (46.75 ± 19.43 mm vs. 48.52 ± 20.46 mm, $P=0.009$). When measuring the thickness of lateral thrombus, REACT slightly underestimated it than CT (6.48 ± 2.17 mm vs. 7.86 ± 3.18 mm, $P=0.073$). The interobserver agreement for contrast-enhance CT and REACT is relatively good (0.846 for neck of AAA, 0.751 for maximum diameter of AAA, and 0.56 for thickness of lateral thrombus). Further, REACT achieved a substantial accordance with contrast-enhanced CT regarding the morphology of AAA [Cohen's Kappa 0.776 (95% CI: 0.88–0.93)].

Conclusion:

REACT has high accuracy in AAA morphological measurements without any contrast agent. This novel sequence is also sensitive to the thickness of thrombosis, which provides a new diagnostic method for AAA patients.

PO-2798

T1 mapping-based Radiomics model in EOB-MRI for assessment of liver reserve function

Xin Li, Yangyang Liu

Department of Radiology, the Second Affiliated Hospital of Chongqing Medical University

Purpose: To explore the value of the T1 mapping-based radiomics model in assessing the liver reserve function in patients with chronic liver diseases.

Methods: A retrospective study was conducted on the clinical and radiological data of 163 patients in our hospital from September 2020 to October 2022. The patients were classified into four groups: the normal liver function (NLF) group, the chronic liver disease (CLD) group, the Child-Pugh A grade cirrhosis (CPA) group, and the Child-Pugh B or C grade cirrhosis (CPBC). Three distinct data sets were created: NLF vs. liver disease (task 1), NLF+CLD vs. cirrhosis (task 2), and NLF+CLD+CPA vs. CPBC (task 3). These datasets were randomly split into training and test sets at a ratio of 7:3. Radiomics features were extracted and filtered from the T1 mapping images were acquired before and after 20 min of enhancement in hepatobiliary Phase (HBP) (T1native, T1post) and the T1WI images of HBP (T1WIHBP). Trained using four different machine learning algorithms, including random Forest (RF), Gradient Boost Tree (GBT), and AdaBoost (AB). Performance of the models were evaluated using the AUC (Area Under the Curve). Delong test was used to assess the performances among these models and Decision Curve Analysis (DCA) was utilized to evaluate the utility and clinical benefits.

Results: RF model showed high performance in the classification of liver reserve function, with AUC above 0.95 in each training set and above 0.8 in each test set, generally superior to the other three models. Compared with Native, post and delay sequences, RF model has the best diagnostic performance in delay sequences. When being classified as NLF and liver disease, NLF+CLD and cirrhosis, and NLF+CLD+CPA and CPBC, the AUC of the training set is all 1.0000, while the AUC of the test set is 0.9661, 0.9612, 0.9443, respectively. Accuracy was 0.77, 0.91, 0.76, Sensitivity was 0.92, 1.00, 0.86, Specificity was 0.84, 0.87, 0.95, respectively. The GBT model also demonstrated excellent diagnostic performance in grading liver reserve function, particularly in evaluating the NLF+CLD and cirrhosis classifications. In the test set, the AUC values for the T1native, T1post, and T1WIHBP sequences were 0.9302, 0.9691, and 0.9155, respectively. The AB model demonstrated superior diagnostic performance compared to other models when classifying NLF+CLD and cirrhosis. The AUC values for the T1native, T1post, and T1WIHBP sequences in the test set were 0.9354, 0.9743, and 0.9675, respectively, reflecting their strong discriminatory ability.

Conclusion: The radiomics models based on both T1 mapping image (T1pre, T1post) and HBP images (T1HBP) could be used as a reliable tool in the assessment of different liver reserve function in chronic liver disease patients.

PO-2799

Assessment of Tissue Characteristics in Brain Tumors and Tumor Microenvironment Using Multi-Parameter MRI Based on Histogram Analysis

Min Gao, Jun Liu

The Second Xiangya Hospital of Central South University

Purpose: Multi-Parametric(MTP) MR Imaging, an innovative and expeditious GRE-based quantitative mapping technique. By facilitating the simultaneous acquisition of diverse tissue properties within a single scan, MTP offers a quantitative evaluation of the T1map, T2*map, proton density(PD) map and quantitative susceptibility mapping(QSM) map among patients diagnosed with brain tumors. Those parameters provide sensitive and supplementary information about tissue composition.

Methods: This prospective study enrolled consecutive participants diagnosed with brain tumors. The three groups comprised consecutively admitted patients diagnosed with gliomas, meningiomas, and brain metastases. 3D whole-brain MTP MR imaging was acquired for all patients. Tumor and peritumoral edema(PTBE) were manually delineated as labels and matched onto the quantitative parameter maps of MTP for histogram analysis of the regions of interest(ROI). Group comparisons were performed using Kruskal-Wallis and Mann-Whitney U tests.

Results: Eighty-four participants diagnosed with brain tumors (mean age: 55 years; IQR: 23-80 years) were included in this study. We extracted 18 first-order statistical features from tumor and peritumoral edema regions respectively. In both the tumor core region and the peritumoral edema region, the T2* maps exhibit the highest number of statistically significant first-order features(tumor ROI: 16/18; PTBE ROI: 8/18), indicating the most pronounced intergroup differences($p < 0.001$). Conversely, within the peritumoral edema region depicted in the PD maps, none of the first-order features(0/18) show statistically significant differences among different tumor types.

Conclusion: We observed significant differences in the first-order statistical features of T2* among different types of brain tumors. T2* values, which are inversely correlated with tissue iron content, provide insights into the microenvironmental characteristics of tumors.

PO-2800

Altered cortical structural topology in first-episode antipsychotic naïve patients with schizophrenia

Naici Liu¹, Alexandra Korda², Rebekka Lencer²

1. West China Hospital of Sichuan University

2. University of Lübeck

Object: The present study aimed to employ the chaos analysis approach for the identification of specific brain topology changes related to the onset of psychosis beyond classical approaches based on structural MRI.

Methods: T1-weighted magnetic resonance imaging (MRI) of 150 first-episode antipsychotic-naïve schizophrenia (FEP) patients and 164 healthy participants (HC) were included. The identified regions were tested for changes in brain structural complexity by applying the chaos analysis approach in two steps: First, the center of mass in gray matter images was identified and the distances between voxels were calculated. Next, these distances multiplied by the voxel intensity were defined as spatial-series, which were then analyzed by extracting the Largest-Lyapunov-Exponent (lambda). Then, the lambda was mapped in the frequency domain using the correlation of the Morlet wavelet with the lambda spatial series resulting in a measure that reflects cortex folding complexity. Note, high lambda values represent high folding complexity.

Results: Cortical folding complexity in FEP patients was altered in widespread regions. Most of these voxels showed decreased complexity and were located in the left frontal, left limbic, left basal ganglia regions and bilateral occipital, parietal, temporal, thalamic, cerebellar regions. Meanwhile, some voxels among these above regions also presented increased complexity in FEP patients than in healthy participants. **Conclusion:** Our findings support the notion that defining cortex folding complexity by lambda offers a novel approach for identifying structural differences in brain regions related to psychosis. The proposed method provides interesting insights into specific brain alterations in FEP which beyond those provided by standard volumetric comparisons. Further analysis of the brain topology of regions without volume changes will shed light to the identification of structural biomarkers in psychosis.

PO-2801

White matter microstructural disruption in minimal hepatic encephalopathy: a neurite orientation dispersion and density imaging (NODDI) study

Qiuyi Dong, Yunbin Cao, Huajun Chen

Fujian Medical University Union Hospital

Purpose To evaluate the ability of neurite orientation dispersion and density imaging (NODDI) for detecting white matter (WM) microstructural abnormalities in minimal hepatic encephalopathy (MHE).

Methods Diffusion-weighted images, enabling the estimation of NODDI and diffusion tensor imaging (DTI) parameters, were acquired from 20 healthy controls (HC), 22 cirrhotic patients without MHE (NHE), and 15 cirrhotic patients with MHE. Tract-based spatial statistics were used to determine differences in DTI (including fractional anisotropy [FA] and mean/axial/radial diffusivity [MD/AD/RD]) and NODDI parameters (including neurite density index [NDI], orientation dispersion index [ODI], and isotropic volume fraction [ISO]). Voxel-wise analyses of correlations between diffusion parameters and neurocognitive performance determined by Psychometric Hepatic Encephalopathy Score (PHES) were completed.

Results MHE patients had extensive NDI reduction and rare ODI reduction, primarily involving the genu and body of corpus callosum and the bilateral frontal lobe, corona radiata, external capsule, anterior limb of internal capsule, temporal lobe, posterior thalamic radiation, and brainstem. The extent of NDI and ODI reduction expanded from NHE to MHE. In both MHE and NHE groups, the extent of NDI change was quite larger than that of FA change. No significant intergroup difference in ISO/MD/AD/RD was observed. Tissue specificity afforded by NODDI revealed the underpinning of FA reduction in MHE. The NDI in left frontal lobe was significantly correlated with PHES.

Conclusion MHE is characterized by diffuse WM microstructural impairment (especially neurite density reduction). NODDI can improve the detection of WM microstructural impairments in MHE and provides more precise information about MHE-related pathology than DTI.

PO-2802

A long-term study of patients with newly-diagnosed primary CNS lymphoma: Arterial spin labeling MRI can predict prognosis

Hao Wu¹, Hui Kang¹, Bobin Chen¹, Huaping Sun¹, Yan Ren¹, Shuguang Chu², Jie Wu¹, Haoshu Zhong¹, Tianyong Xu³, Yong Zhang³, Zhenwei Yao¹

1. Huashan Hospital, Fudan University

2. Shanghai East Hospital, Tongji University School of Medicine

3. GE healthcare

Objective: Primary central nervous system lymphoma (PCNSL) is a highly aggressive non-Hodgkin's lymphoma with poor prognosis. This study aimed to evaluate the prognostic value of Three-dimensional arterial spin labeling (3D-ASL) in patients with PCNSL.

Methods: This retrospective study enrolled newly-diagnosed PCNSL patients in our institution between May 2015 and May 2019, who were treated with high-dose methotrexate (HD-MTX)-based chemotherapy. Patients underwent 3D-ASL and conventional MRI on a 3T system prior to each chemotherapy until the enhanced lesions disappeared. By the image fusion of T1WI+C and ASL, regions of interest (ROIs) were outlined manually. All patients were followed-up from August, 2015 to December, 2022. 3D-ASL and clinical characteristics about progression-free survival (PFS) and overall survival (OS) were calculated by log-rank test of Kaplan-Meier and Cox regression of Stata software.

Results: Eighty-six patients (53 years \pm 11; 20–76 years; 57 men) were included. During a median follow-up period of 69 months, 78 patients suffered disease progression (PD), and 49 patients died. The median PFS and OS were 16 months and 54 months. The 2-, 3- and 5-year OS rates were 62.16%, 56.76%, and 29.41%. In univariate analysis, inferior PFS and OS were associated with CSF involvement, failure to achieve PR and CR in two and four cycles, rCBFmean \geq 2.389, rCBFmax \geq 3.744, rCBFmin \geq 1.370. Predictors of shorter OS were age \geq 55 years, Karnofsky Performance Score (KPS) $<$ 50. Multivariate analysis suggested that KPS $<$ 50 (P=0.004), CSF involvement (P=0.022), failure to achieve CR in four cycles (P=0.020), and rCBFmean \geq 2.389 (P=0.033) were independent factors for adverse OS.

Conclusion: This is the first study to demonstrated that 3D-ASL-derived rCBF can be predictors. 3D-ASL has the advantage of requiring no contrast agent or radiation exposure. Inclusion of 3D-ASL in routine MRI protocols is recommended to help to optimize individualized treatment and improve prognosis.

PO-2803

Evaluation of the efficacy of PC cine MRI in patients with obstructive hydrocephalus and the ETV of traffic hydrocephalus

Hui Yao

Radiology Department, West China Hospital, Sichuan University

OBJECTIVE: As neuroimaging, neural endoscopic manufacturing technology, microscopic surgical instruments, and the rapid development of stereotactic neural navigation system, preventing the endoscope assisted endoscopic third ventriculostomy (ETV) surgery methods matures, ETV are gradually used as alternative treatment for obstructive hydrocephalus. The aim of this study was to determine the utility of quantitative and qualitative examinations with cine phase-contrast MR imaging to determine the efficacy of ventriculostomy across time and whether CSF pulsation is restored after ETV.

METHODS: Thirty-eight patients treated with ETV were evaluated with cine PC cine MRI within 1 month before surgery. Follow-up studies were performed within 1 month after surgery. To determine the restoration of CSF pulsation, we compared the CSF waveform at the ventriculostomy with the CSF waveform at the aqueduct in a healthy control group.

RESULTS: After ventriculostomy, the recovery of the flow characteristics of cerebrospinal fluid circulation was observed and the changes of cerebrospinal fluid flow were recorded with time change after the operation of the ventricle. There was a statistically significant relationship between clinical outcome and stroke volume. Overall flow magnitude was the most effective variable to determine which patients would improve after surgery. The results showed that patients with obstructive hydrocephalus had the best response to the operation, and those with deformity or traffic hydrocephalus were the worst.

CONCLUSION: PC cine MR technique is very effective in evaluating the curative effect after ETV. The measurement of cerebrospinal fluid flow is an important indicator for PC cine MR technique to evaluate ETV.

PO-2804

Enhancing MRI Image Quality and Meniscus Injury grading in Knee Joints with Deep Learning

Fei Wu¹, Kaiyu Wang², Jingliang Cheng¹, Jianfeng Bao¹

1. The First Affiliated Hospital of Zhengzhou University

2. MR Research China, GE Healthcare, Beijing, China

Objective Evaluate the difference in image quality between knee joint fast spin echo (FSE) sequences using and without deep learning reconstruction (DLR) algorithms, and evaluate whether DLR improves meniscus injury.

Materials and Methods Prospective inclusion of 46 patients with meniscus injury underwent traditional and shortened 3.0T knee joint sagittal PD, T1 weighted. MRI scans, total 51 sets of MRI images. After the scan is completed, the system automatically saves the image as a traditional original image without DLR (Conventional), an accelerated MRI image without DLR (non-DL), and an accelerated MRI image with DLR (DL). Two reviewers randomly conducted a blind reading study, evaluating artifacts, noise, overall image quality, and meniscus damage. Based on three sets of image scores and the diagnosis of meniscus injury, Wilcoxon signed rank test was used to compare the values between Conventional, non-DL and DL images, while evaluating the consistency of inter observer and intra observer scores.

Result The overall quality, noise, and artifact scores of images using DLR were higher than those of original images without DLR. There was a statistically significant difference in overall quality, noise, and artifact scores between DL and Conventional ($P < 0.05$), and there was also a statistically significant difference in overall quality, noise, and artifact scores between DL and non-DL ($P < 0.05$). The consistency correlation coefficient between the subjective evaluation of image quality by two physicians ranges from 0.721 to 0.902. The two physicians evaluated knee joint structural abnormalities based on Conventional, non-DL and DL, with excellent consistency, κ The value is between 0.821 and 0.937.

Conclusion DLR can improve the quality of knee joint images while shortening scanning time, and improve the evaluation of meniscus injury using 3.0T knee joint MR images.

PO-2805

Decoupling of Regional Cerebral Blood Flow and Brain Function along the Alzheimer's Continuum

Jixuan Li, Qingze Zeng, Xiao Luo, Kaicheng Li, Xiaocao Liu, Luwei Hong
Zhejiang University

Background: Alzheimer's Disease (AD) is accompanied with impaired neurovascular coupling. However, its early alteration remains elusive along the Alzheimer's continuum.

Objective: This study aimed to investigate the early disruption of neurovascular coupling in cognitively normal (CN) and mild cognitive impairment (MCI) elderly and its association with cognition and AD pathologies.

Methods: We included 43 amyloid- β -negative CN participants and 38 amyloid- β -positive individuals (18 CN and 20 MCI) from the Alzheimer's Disease Neuroimaging Initiative dataset. Regional homogeneity (ReHo) map was used to represent neuronal activity and cerebral blood flow (CBF) map was used to represent cerebral blood perfusion. Neurovascular coupling was assessed by CBF/ReHo ratio at the voxel level. Analyses of covariance to detect the between-group differences and to further investigate the relations between CBF/ReHo ratio and AD biomarkers or cognition. In addition, the correlation of cerebral small vessel disease (SVD) burden and neurovascular coupling was assessed as well.

Results: Related to amyloid- β -negative CN group, amyloid- β -positive groups showed decreased CBF/ReHo ratio mainly in the left medial and inferior temporal gyrus. Furthermore, lower CBF/ReHo ratio was associated with a lower Mini-Mental State Examination score as well as higher AD pathological burden. No association between CBF/ReHo ratio and SVD burden was observed.

Conclusion: AD pathology is a major correlate of the disturbed neurovascular coupling along the Alzheimer's continuum, independent of SVD pathology. The CBF/ReHo ratio may be an index for detecting neurovascular coupling abnormalities, which could be used for early diagnosis in the future.

PO-2806

Radiomics analysis of diffusion kurtosis imaging for predicting locally advanced rectal cancer response to neoadjuvant chemoradiotherapy: a comparative study with diffusion weighted imaging

Qiong Ma, Yiqun Sun, Tong Tong, Yajia Gu
Fudan University Shanghai Cancer Center

Background Accurate prediction of tumour response to neoadjuvant chemoradiotherapy (nCRT) enables personalised perioperative therapy for locally advanced rectal cancer. As unique functional imaging techniques, diffusion weighted imaging (DWI) and diffusion kurtosis imaging (DKI) have important value in predicting the treatment response in nCRT for locally advanced rectal cancer. Recently, the methodology of radiomics combined with machine learning algorithms has been widely used in tumor diagnosis and treatment and has produced exciting results. Therefore, We aimed to investigate radiomics analysis of DKI and readout-segmented echo-planar imaging (RS-EPI) DWI for predicting good response to nCRT in patients with locally advanced rectal cancer.

Methods A total of 120 patients with locally advanced rectal cancer who underwent nCRT were retrospectively enrolled from June 2014 to March 2019 in our study. Baseline MRI scans were performed using a 3.0T scanner and included RS-EPI DWI with 2 b values (0, and 800 s/mm²) and DKI sequence with 4 b values (0, 700, 1400, and 2100 s/mm²). The regions of interest (ROIs) were manually delineated for all the lesion images from both the sequences (Fig.1), and then the radiomics features were extracted from apparent diffusion coefficient (ADC), apparent diffusion for non-Gaussian distribution (Dapp) and apparent diffusional kurtosis (Kapp) maps. A single conventional quantitative parameter, the mean value, was selected to predict good response after nCRT, including pathologic complete response (pCR), tumor regression grade (TRG0 and TRG1 vs TRG2 and TRG3) and T-downstaging. After feature reduction and selection through Pearson Correlation Coefficient (PCC) analysis and Analysis of Variance (ANOVA), the machine learning method, support vector machine (SVM) classifier was used to construct radiomics models for the same post-treatment response prediction. Finally, the diagnostic performance was evaluated by the receiver operating characteristic (ROC) curve analysis.

Results Among the 120 enrolled patients, 38 (32%) achieved pCR while 82 (68%) did not, 55 (46%) achieved good response (TRG0 and TRG1) whereas 65 (54%) did not, and 47 (39%) achieved T-downstaging, while 73 (61%) did not. The radiomics model based on DKI, which combined Dapp and Kapp, exhibited superior predictive capability for pCR compared to the RS-EPI DWI-based radiomics model. In the testing set, the DKI-based model achieved an area under the receiver operating characteristic curve (AUC) of 0.818 (95% CI, 0.612-0.971), whereas the RS-EPI DWI-based model achieved an AUC of 0.771 (95% CI, 0.576-0.946) for pCR prediction. Similarly, the DKI-based radiomics model demonstrated an AUC of 0.722 (95% CI, 0.544-0.883) for predicting good response and 0.714 (95% CI, 0.519-0.882) for T-downstaging, the result of which showed a better performance compared with that of the RS-EPI DWI-based radiomics model (Fig.2). In addition, the AUC for predicting nCRT response with radiomics model was better than the AUC with the conventional quantitative parameter alone.

Conclusion Our study demonstrated the potential of radiomics analysis using DKI and RS-EPI DWI in predicting treatment response to nCRT in patients with locally advanced rectal cancer. And the DKI-based radiomics model with the combination of Dapp and Kapp can produce a more robust value than the RS-EPI DWI-based radiomics model in evaluation of rectal cancer treatment response.

PO-2807

Exploring the neuropathological characteristics of abnormal white matter functional signaling in adolescents with major depression

Xinlin Huang¹, hongyan sun², ju gao², xuanze wang³, jing qin⁴

1. 影像科

2. 苏州市广济医院

3. Vidyasirimedhi Institute of Science and Technology

4. 上海安亭医院

Background: Major Depression Disorder (MDD) is a serious mental illness and an important factor in the global burden of diseases. On the epidemiological surveys, the lifetime prevalence of depression in adolescents is significantly higher shown than that in adults, and the risk of suicide is also higher. Regarding brain dysfunction in adolescents with MDD, brain gray matter is usually studied through resting-state functional magnetic resonance imaging (rs-fMRI). However, there is a paucity of research on brain white matter (WM) currently. Some researchers even mistakenly regard the signals generated by the WM as noise points. Indeed, WM exhibits similar blood oxygen level-dependent signal fluctuations to gray matter, which has been demonstrated by some studies. The functional organization of WM in adolescents with MDD is still unclear, including functional changes in WM signals, and the relationship between WM signals and patient severity. Therefore, this paper aims to explore whether there are such these abnormal changes in WM functional signals in adolescents with major depression.

Method: 48 adolescents patients with MDD and 31 healthy controls (HC) to participate this study. All participants were assessed using the Patient Health Questionnaire-9 Scale (PHQ-9), the 32-item Hypomania Checklist Scale (HCL-32), and the MINI Suicide Inventory. In addition, a Siemens skyra 3.0T magnetic resonance scanner was used to collect the subjects' image data. Using the DPABI software to calculate the WM signal of the fractional amplitude of low-frequency fluctuations (fALFF) and regional homogeneity (ReHo), and conducted a two-sample t test between the MDD and HC. Independent component analysis (ICA) was added to calculate the WM functional signal. Perform Pearson correlation between statistical test results and clinical scales.

Results: Compared to HC, MDD demonstrated decreased in the fALFF of WM in the body of corpus callosum, left posterior limb of internal capsule, right superior corona radiata, and bilateral Posterior corona radiata ($P < 0.001$, FWE voxel correction). The ReHo of WM increased in right external capsule and left superior corona radiata, while decreased in left superior longitudinal fasciculus ($P < 0.001$, FWE voxel correction). The results of ICA of WM overlap with those of ReHo. A positive correlation was observed between the ReHo value of the right external capsule and HCL-32 scales ($P = 0.041$, $r = 0.296$), while the fALFF of WM signal in the left posterior limb of internal capsule was negatively correlated with the MINI suicide scales ($P = 0.026$, $r = -0.32$), and the right posterior corona radiata was also negatively correlated with the MINI Suicide Scale ($P = 0.047$, $r = -0.288$).

Conclusion: The results of our study suggest that altered WM functional signaling in adolescents with MDD may provide new insights into the neuropathogenesis of depression. At the same time, the correlation between WM differential clumps and suicidality and mania scales can also bring positive predictions and researching trends for the future development of the disease.

PO-2808

Characteristics of white matter networks in adolescents with first-episode non-suicidal self-injury

Yuwei Chen, Nian Liu
Affiliated Hospital of North Sichuan Medical College

Objective: To explore the structural connectivity and network metrics of white matter in adolescents with first-episode non-suicidal self-injury(NSSI).

Methods: The diffusion tensor imaging data and clinical scales were prospectively collected from 30 NSSI patients and 29 healthy controls(HC) matched age and gender. The structural connectivity based on the number of fibers was analyzed by the network-based statistic(NBS) correction method. The network metrics based on the white matter were analyzed by Gretna software. After controlling for age, gender, and education years, the general linear model was performed to compare the network metrics between the two groups. Pearson correlation was adopted to analyze the correlation between structural connectivity/network metrics and clinical symptoms.

Results: At the structural connectivity level, the NBS analysis demonstrated the NSSI group showed increased structural connectivity mainly involved in the prefrontal lobe-prefrontal lobe, prefrontal lobe-limbic system, and limbic system-limbic system and decreased structural connectivity mainly involved in the occipital lobe-occipital lobe and parietal lobe-limbic system relative to HC group. At the nodal level, the graph-theory analysis demonstrated the NSSI group revealed decreased nodal degree centrality(DC) and nodal efficiency(NE), involving the right orbital middle frontal gyrus, left hippocampus, left thalamus, right angular gyrus, and bilateral cuneus. Besides, the NSSI group showed additional decreasing DC of the left median cingulate and paracingulate gyrus and increasing DC of the right orbital superior frontal gyrus. The correlational analysis revealed the DC of the right angular gyrus and the left cuneus had a negative relationship with the clinical symptoms.

Conclusions: These findings highlight the abnormal structural connectivity and nodal network metrics in adolescents with NSSI, which may help clarify the neural circuit mechanism related to emotional regulation in NSSI.

PO-2809

Artificial Intelligence (AI)-assisted compressed sensing technology application in Thoracic spine 3D STIR MR imaging

Yiwei Qi, Qingwei Song
The 1st hospital of Dalian medical university

PURPOSE

Short Tau Inversion Recovery (STIR) sequences are widely used for spinal imaging due to their advantages include large field-of-view (FOV) scanning and high quality fat suppression. However, the long acquisition time limits its clinical use. This study aimed to combine artificial intelligence (AI)-assisted compressed sensing(ASC) technique and Deeprecon image reconstruction technique to identify a suitable acceleration factor for 3D-STIR sequence imaging of the thoracic spine, optimizing the imaging speed while maintaining image quality.

METHOD AND MATERIALS

Ten healthy volunteers underwent thoracic spine MRI examinations (3D STIR) with a recently-developed ACS technology with various acceleration factors (3 – 9 times, ACS3.0 to ACS9.0). The conventional acceleration method: Partial Fourier (PF) and parallel imaging (PI) with 3.0 times acceleration (F3.0) was used as the reference. All MR examinations were conducted with a 3.0 T

scanner (uMR Omega, Shanghai United Imaging Healthcare Co.,Ltd, Shanghai, China). Two experienced radiologists evaluated the image quality. The signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) at different anatomic locations containing the T1、T6、T12 vertebra, T6/7vertebral disc, inter spinal ligaments, cerebrospinal fluid, and nearby muscle were measured and statistically compared. The uniformity of image signal, edge sharpness, uniformity of fat suppression effect, clarity of the small intramedullary vessels and dorsal intermuscular vessels were also evaluated. Nonparametre Kruskal-Wallis tests were conducted($p<0.05$).

RESULTS

No significant differences were observed among the groups with varying acceleration factors for SNR and CNR values ($p>0.05$). Subjective scores showed no differences between F3.0&ACS3.0 ($p=0.481$), ACS5.0&ACS7.0 ($p=0.165$). There were statistically significant differences in subjective scores among images with different acceleration factors for 3D STIR($P < 0.05$). Multiple comparisons suggested that the subjective image quality scores for F3.0 and ACS3.0 were significantly higher than those for ACS5.0 and ACS7.0 ($P < 0.05$). The subjective image quality scores of ACS5.0 and ACS7.0 were higher than ACS9.0 ($P < 0.05$).

CONCLUSION

ACS could accelerate thoracic spine 3D STIR without compromising image quality, offering comparable diagnostic quality to the clinical 2D standard in less time, potentially increasing the productivity of MRI scanners. During clinical practice, in consideration of the scanning time and image quality, the 3D STIR sequence of thoracic spine was recommended to be with 5.0 times acceleration factor for ACS.

PO-2810

Artificial Intelligence (AI)-assisted compressed sensing technology application in hip 3D PD-SPAIR-ISO imaging

Yiwei Qi, Qingwei Song

The 1st hospital of Dalian medical university

PURPOSE Magnetic resonance is an the most ideal diagnostic imaging modality for acetabular labral tears and femoroacetabular impingement syndrome, particularly using especially the 3D isotropic PD-SPAIR (3D PD-SPAIR-ISO) sequence has good imaging effect on articular cartilage and fibrocartilage of the acetabular labral. The 3D sequence can reduce the pPartial vVolume aArtifact, and the MPR image post-processing overcomes can break the constraints limitation of the traditional fixed scanning position, which provides the possibility enables to the potential diagnose the of complex acetabular labral tears of the ace

tabular labral. However, the acquisition time of the current conventional 3D PD-SPAIR-ISO sequence affects hinders the its widespread application of this sequence in clinical practice adoption. In this study, we used This study aimed to combine ASC technique in combination with andh DeepRecon image reconstruction technique to find identify a suitable acceleration factor for hip 3D PD-SPAIR-ISO sequence imaging of the hip, which can improve the optimizing imaging speed as much as possible while maintaining image quality.

METHOD AND MATERIALS

Ten volunteers were enrolled in this study. All patients underwent the hip MRI examinations (3D PD-SPAIR-ISO) with a recently-developed ACS technology while with various acceleration factors were configured (3 – 9 times, ACS3.0 to ACS9.0), using a 3.0 T scanner (uMR Omega, Shanghai United Imaging Healthcare Co.,Ltd, Shanghai, China). Besides, the conventional acceleration method: Half Partial Fourier (PF) and parallel imaging (PI) with 3.0 times acceleration (F33) was used as the reference. All MR examinations were conducted with a 3.0 T scanner (uMR Omega, Shanghai United Imaging Healthcare Co.,Ltd, Shanghai, China). Two experienced radiologists were invited to evaluate the image quality. The signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of at different anatomic locations containing the acetabular rim, head of femur, neck of

femur, greater trochanter, ligament, acetabular labral, acetabular cartilage, and nearby muscle were measured and statistically compared. Subjective image quality was evaluated using a 3-point scale for subjective scoring. The uniformity of the image signal, the edges sharpness of the edges, and the clarity of acetabular labral were also evaluated.

RESULTS

There were no significant differences among the groups in acceleration factors on for SNR and CNR values. ($p > 0.05$). The subjective score of 3D PD-SPAIR-ISO images were ranged from 10-13 ($P > 0.05$) with high consistency between two radiologists ($\kappa = 0.637$). Subjective scores showed no differences among F3&ACS3 ($P = 1.00$), ACS3&ACS5 ($p = 0.28$), F3&ACS5 ($P = 0.28$). There were no significant difference between ACS7&ACS9 ($p = 0.739$). There were statistically significant differences in subjective scores among images with varying acceleration factors for 3D PD-SPAIR-ISO ($P < 0.05$). Multiple comparisons suggested that the subjective image quality scores of for F3.0, ACS3.0 and ACS5.0 are all significantly higher than those of ACS7.0 and ACS9.0 ($P < 0.05$).

CONCLUSION ACS could accelerate the 3D PD-SPAIR-ISO of hip without compromising image quality. The 3D sequences offer comparable diagnostic quality to the clinical 2D standard with less scan time, potentially increasing the productivity of MRI scanners. ACS5 is a suitable accelerate factor, offering comparable diagnostic quality to the clinical 2D standard in less time, potentially increasing MRI scanner productivity that can be used.

PO-2811

Effects of altered network controllability on attention and anxiety symptom in first-episode medication-naïve major depressive disorder patients

Aoxiang Zhang

West China Hospital of Sichuan University

Introduction. Numerous psychiatric interventions can be regarded as attempts to affect the large-scale, dynamical system transitions of the brain. Controllability analysis is developing as an effective method for assessing the influence of one brain region over others regarding dynamic function. The neural underpinnings of intercorrelated clinical symptoms and cognitive deficits in major depressive disorder (MDD) remain elusive. This study attempts to explore the impact of controllability alterations for both the symptom severity and cognitive impairments, which will provide new insights for individualized treatment of MDD.

Methods. This study used diffusion tensor imaging (DTI) data from 170 first-episode medication-naïve MDD patients and 137 healthy controls (HCs). We inferred structural brain network and calculated network controllability metrics for each participant. Average controllability (AC) refers to the quantification of a node's capacity to steer the brain to all possible easily reachable and adjacent states. Brain regions with higher AC, like the DMN, are capable of switching functional states at low energy inputs, suggesting they can more easily be shifted into optimal network states. Modal controllability (MC) measures a node's ability to drive the brain into hard-to-reach states. Brain regions characterized by higher MC, such as those associated with cognitive control, tend to guide the brain network towards difficult-to-reach states that require substantial input energy in order to accomplish complex goal-specific tasks. Attention- and executive functioning-related cognitive scales were also assessed which are 2 of the core cognitive deficits in MDD. Group comparisons of controllability metrics between HCs and MDD patients were carried out in a structural basis. Correlation and moderation analyses were performed to reveal complicated relationship among controllability alterations, cognitive performance and clinical ratings.

Results. First, we demonstrate that measures of controllability differ between healthy controls and MDD patients, mainly involving the right superior frontal gyrus (SFG), right precentral (PreCG), left superior parietal gyrus (SPL) and left precuneus (PCUN) (Figure 1). We also found the AC changes

with the opposite direction to the MC, which is consistent with previous studies. Then, we found MC of SFG.R was positively associated with attention-related cognitive performance (Figure 2a), and its alteration was positively moderated the development of attention with anxiety symptom (Figure 2b). Interestingly, we discovered a positive link between attention and anxiety symptoms (yellow line, high MC values), while their negative correlation was not statistically significant (blue line, low MC values).

Discussion. MDD patients showed decreased AC of PCUN.L (the core of the DMN), indicating a reduced ability to shift between DMN and other task networks, which may explain the loss of capability of depressive patients to initiate, maintain, and control their thoughts, behaviors, or emotions. Then, we found the increased AC of dorsolateral SFG.R (the component of the FPN) in MDD individuals suggest potential compensatory mechanism for the impairments of cognitive manipulation. In addition, MDD patients exhibited an increased AC of preCG.R (the component of the SMN), which was correlated with the increased AC of dorsolateral SFG.R. This may be caused by top-down control over lower-level processes. The posterior SFG.R is a part of the dorsal attention network (DN), which is implicated in goal-directed processes. Conversely, SPL.L is a constituent of the ventral attention network (VAN), which is associated with stimulus-driven reorientation of attention. Thus, the disturbance of controllability in the above regions could contribute significantly attention-related cognitive deficits. In fact, we did find that MC of posterior SFG.R was positively associated with attention function, and we further found moderation effect of MC in this region on correlation between attention and anxiety symptom. It is possible that increasing MC can also exhibit unfavorable transitions and these adverse effects in turn lead to more severe clinical symptoms with the acceleration of attention. Interestingly, we discovered a positive correlation between attention and anxiety symptoms. Previous studies suggested that it was reasonable to hypothesize the negative emotions will promote the deployment of the ‘as many as can’ stop rule, and this task perseveration is likely to be closely associated with pathological anxiety, obsessive checking, and depressive rumination. In summary, our results provide initial insights into the clinical implications of altered network controllability in MDD and highlight the interplay between attention, anxiety symptom severity, and the MC of posterior SFG.R, which suggest that the MC of posterior SFG.R may be prognostic biomarkers of MDD.

PO-2812

Magnetic Resonance Imaging for Acute Pancreatitis in patients with Type 2 Diabetes Mellitus

Bo Xiao

Bishan hospital of Chongqing, Bishan hospital of Chongqing medical university

Objective To determine characteristics of type 2 diabetes mellitus (T2DM)-related acute pancreatitis (AP) on magnetic resonance imaging (MRI). **Methods** Retrospectively studied 262 patients with AP admitted to our institution and underwent MRI. Diagnosis of T2DM-related AP was based upon clinical manifestations, laboratory tests, and MRI. Pancreatic/peripancreatic changes were assessed on MRI. **Results** Fifty-three (20.2%) patients with T2DM-related AP and 209 (79.8%) with nondiabetic AP were enrolled. On MRI, a higher prevalence of necrotizing pancreatitis ($P < 0.001$), pancreatic necrosis $> 30\%$ (57.5% vs 29.2%; $P = 0.006$), hemorrhage (35.8% vs 19.1%; $P = 0.009$), abdominal wall edema (67.9% vs 46.8%; $P = 0.006$), walled-off necrosis (43.2% vs 14.6%; $P < 0.001$), and infected collections ($P < 0.001$) were registered in T2DM with AP. T2DM-related AP sustained greater MR severity index (mean, 5.1 [range, 2-10] vs 3.4 [range, 1-10]; $P < 0.001$), higher incidence of moderate and severe pancreatitis (69.8% vs 40.2%; $P < 0.001$), higher organ failure (45.3% vs 22%; $P = 0.001$) and prolonged hospitalization (mean, 25.2 [range, 10-63] vs 16 [range, 5-48] days; $P < 0.001$). **Conclusions** T2DM-related AP is more moderate-to-severe pancreatitis and it correlates with MRI characteristics of pancreas itself, hemorrhage, abdominal wall, and infected collections.

PO-2813

Static and dynamic alterations of default mode network subsystem in patients with acute and chronic low back-related leg pain

Ziwei Yang
南昌大学第一附属医院

Objective: Low back-related leg pain (LBLP) is characterized by predisposition to chronicity and high disability rate. While previous neuroimaging studies have argued that plasticity changes exist across network connections to the default mode network, static and dynamic functional connectivity (FC) and related topological alterations in the three functionally heterogeneous subsystems (the core subsystem, the dorsal medial prefrontal cortex (DMPFC) subsystem and the medial temporal lobe (MTL) subsystem) within default mode network (DMN) remain unclear.

Methods: We collected resting state functional magnetic resonance imaging (rs-fMRI) data from 19 patients with acute LBLP (aLBLP), 31 patients with chronic LBLP (cLBLP) and 51 healthy controls (HCs) to construct static and dynamic functional networks (FNs). For static FC (sFC) matrices of DMN, we further calculated topological properties and explored changes from static FNs. For dynamic FC (dFC) matrices of DMN, we analysed the variability of dynamic connectivity strength and topological properties.

Results: At the subsystem level of static connection analysis, we found increased FC between the core and MTL subsystem as well as between DMPFC subsystem and MTL subsystem as cLBLPs compared to the HCs. For static topological properties in patients with cLBLPs compared to the HCs, global network efficiency (Eg) was decreased and the bilateral inferior frontal gyrus (IFG) with decreased NCp, NE and NLe. However, the Dc of bilateral posterior cingulate cortex (PCC) and NCp of right ventral posterior inferior parietal lobule (vpIPL) were increased. For the subsystem level of dynamic connection analysis, the variability of dFC between the core and MTL subsystems had decreased in the cLBLPs as compared to HCs and aLBLPs compared to HCs. Pain severity was negatively correlated with the sFC between right vpIPL and right pIPL ($r = -0.489$, $P = 0.008$) as well as static NCp of right vpIPL ($r = -0.555$, $P = 0.002$), while the duration of acute LBLP was negatively correlated with DFCs variability between left PCC and left LTC_TP ($r = -0.52$, $P = -0.52$).

Conclusion: While changes of static functional and topological alterations within the DMN contribute to reveal the neural mechanisms related to symptoms in chronic LBLP, dynamic connection characteristics of DMN may serve as potential biomarkers for predicting conversion from acute to chronic in LBLP patients.

PO-2814

Multiparametric magnetic resonance imaging shows promising results to detect early kidney injury in chronic kidney disease

Chengli Gu,minghui zhou,aorang yang,yu shi
Shengjing Hospital of China Medical University

Purpose:Glomerular filtration rate (eGFR) is a widely used clinical assessment for chronic kidney disease (CKD). However, in early stage CKD patients, eGFR can be normal due to renal compensation. Renal biopsy is the gold standard for assessing CKD, but it is invasive, prone to sampling bias, and has unfavorable long-term follow-up. Therefore, there is an urgent need for a non-invasive and comprehensive method to evaluate renal function.Functional MRI has shown promise in assessing renal pathophysiology, but few studies have combined Multiparametric magnetic resonance imaging (mpMRI) to assess the kidney. This study aims to combine multi-frequency 3D magnetic resonance elastography(MRE), arterial spin labeling (ASL), intravoxel incoherent motion (IVIM), and blood oxygen level-dependent (BOLD) imaging to assess the degree of chronic renal changes in CKD patients in terms of fibrosis, perfusion, and oxygenation. **Methods and Materials:** This is a prospective single-centre study that aims to enroll Forty CKD patients confirmed by renal biopsy (normal eGFR group [eGFR \geq 90 mL/min/1.73 m²]: n = 20; abnormal eGFR group [eGFR < 90 mL/min/1.73 m²]: n = 20) and 20 healthy volunteers (HV). The study will involve the use of MRE,ASL,BOLD,IVIM to perform mpMRI at 3.0T.The study will involve the calculation of shear stiffness (SS), RBF,R2*,true diffusion (D), pseudo-diffusion (D*), apparent diffusion coefficient (ADC),and perfusion fraction (f) for the cortex and medulla by two radiologists . The correlation between pathological grading and MRI parameters was assessed by Spearman correlation analysis. The diagnostic performance of MRI parameters for detecting kidney injury was assessed by receiver operating characteristic (ROC) curves.

Results:The SS,RBF,R2*,D, D*, f, and ADC values showed statistically significant differences among the three groups.Except for D*, all other MRI parameters were significantly correlated with pathological grading . The areas under the curve (AUCs) for discriminating CKD patients from HV were 0.725-0.947 by MRI parameters .SS, R2*, D, D*, f, RBF, and eGFR identified CKD patients with normal eGFR with AUCs of 0.917 , 0.863 , 0.765, 0.632, 0.721, 0.812, and 0.733, respectively, and AUC of SS value was significantly larger than that of eGFR.

Conclusions:Multiparametric magnetic resonance(mpMRI) is a very promising method in assessing the degree of chronic renal changes in patients with CKD. MRE、ASL、BOLD and IVIM were useful for detecting underlying pathologic injury in early CKD patients with normal eGFR,especially MRE.

PO-2815

Application value of cardiac magnetic resonance in patients with cardiac symptoms recovered from Omicron virus infection

Xiaohu Li
The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To explore the application value of cardiac magnetic resonance (CMR) in patients with cardiac symptoms recovered from Omicron virus infection

***Methods and Materials:** 58 patients with cardiac symptoms recovered from Omicron virus infection were prospectively enrolled as the study group, and 30 healthy volunteers whose sex, age, body

surface area and cardiovascular risk factors matched with the study group were recruited as the controls. The clinical baseline data and CMR results (including left ventricular ejection fraction, left ventricular end-diastolic volume index, left ventricular stroke volume index, cardiac index, T1, T2 and 2D myocardial strain values) were acquired, and the differences between the two groups were compared.

*Results: The interval between CMR and PCR positive diagnosis was (18±6) days in patients with cardiac symptoms recovered from Omicron virus infection. Troponin values were elevated in 3(5%) patients, and electrocardiogram results were abnormal in 37(64%) patients. Compared with the control group, the native T1 values (1082.6±32.7 vs. 1048.9±27.0 ms) and T2 values (54.6±2.8 vs. 51.6±2.1 ms) in the study group were significantly higher (both $P < 0.001$). There was no significant difference in CMR parameters between two groups (all $P > 0.05$).

*Conclusions: CMR showed elevated T1 and T2 values in patients with cardiac symptoms recovered from Omicron virus infection, suggesting myocardial inflammation or edema. CMR can be used as an important method to detect suspected cardiac involvement in patients recovered from Omicron virus infection.

PO-2816

Application value of magnetic resonance endogenous contrast T1p technology in the detection of myocardial fibrosis in type 2 diabetes

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

*Purpose: To investigate the application value of cardiac magnetic resonance (CMR) endogenous contrast T1p technique in the detection of myocardial fibrosis in patients with type 2 diabetes mellitus (T2DM).

*Methods and Materials: Twenty patients with T2DM (T2DM group) and 20 healthy controls matched in age, sex, body surface area and body mass index were prospectively enrolled. All subjects underwent CMR cine, T1 mapping, T1p (5Hz and 400Hz), and late gadolinium enhancement (LGE) sequence. The subjects' left ventricular cardiac function, native T1 values, T1p values, extracellular volume (ECV) and myocardial fibrosis index (mFI) were acquired. The differences between the two groups were compared by Student's t-test, and the correlation between ECV, mFI, T1p, native T1 and hemoglobin A1C (HbA1c) in the T2DM group was analyzed.

*Results: The ECV [(31.9±2.28)%], T1p values [(50.35±1.91) ms], native T1 values [(1075.25±9.22) ms] and mFI values [(7.22±2.33) ms] were higher in the T2DM group than controls [ECV (26.05±1.70)%, T1p (46.86±2.01) ms, native T1 values (1052.15±25.25) ms, mFI values (5.45±2.78) ms] were significantly elevated ($P < 0.05$). There was a positive correlation between ECV and mFI ($r=0.62$, $P=0.003$), T1p ($r=0.59$, $P=0.005$), native T1 ($r=0.50$, $P=0.023$), and HbA1c ($r=0.57$, $P=0.008$).

*Conclusions: Magnetic resonance endogenous contrast T1p technology can identify myocardial fibrosis in patients with T2DM, which has potential clinical application value in evaluating myocardial fibrosis, and can provide clinicians with a new examination method.

PO-2817

Early Detection of Myocardial Involvement by Noncontrast T1ρ Mapping of Cardiac Magnetic Resonance in Type 2 Diabetes Mellitus

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To evaluate the feasibility of T1ρ in detecting myocardial fibrosis in type 2 diabetes mellitus (T2DM) patients by comparing with native T1 and Extracellular volume (ECV) fraction.

***Methods and Materials:** 35 T2DM patients free of cardiovascular symptoms and preserved ventricular systolic function and 30 healthy controls were prospectively enrolled for T1 mapping, T2 mapping T1ρ mapping, and late gadolinium enhancement (LGE) examination. ECV mps were calculated using pre- and post-contrast T1 maps. Global native T1, T1ρ, ECV and 2D global longitudinal strain (GLS) values were generated in respective maps. Receiver operating curves were used to show the diagnostic performance of ECV, T1ρ, GLS and native T1 in distinguishing T2DM patients and controls. The Student's t-test, Pearson's chi-squared test, Pearson correlation coefficient (r) and Delong test were used in this study. $P < 0.05$ indicates statistical significance.

***Results:** The global ECV and T1ρ of T2DM group ($ECV = 32.1 \pm 3.2\%$, $T1\rho = 53.1 \pm 2.0$ msec) were significantly higher than those of controls ($ECV = 26.2 \pm 1.6\%$, $T1\rho = 51.6 \pm 3.8$ msec) (all $P < 0.001$), whether there was no significant difference in native T1 between T2DM and controls ($P = 0.264$). The GLS decreased significantly in T2DM patients ($-16.5 \pm 2.4\%$ vs. $-18.3 \pm 2.6\%$, $P = 0.015$). The T1ρ and native T1 were associated with ECV (Pearson's $r = 0.50$ and 0.25 , respectively, both $P < 0.001$), the native T1, T1ρ, and ECV were associated with hemoglobin A1c (Pearson's $r = 0.41$, 0.52 , and 0.61 , respectively, all $P < 0.05$), the ECV were associated with diabetes duration (Pearson's $r = 0.41$, $P = 0.016$). The AUC of ECV, T1ρ, GLS, and native T1 were 0.869 , 0.810 , 0.659 , and 0.524 , respectively.

***Conclusions:** In T2DM patients, T1ρ may be a new noncontrast cardiac magnetic resonance technique for identifying myocardial diffuse fibrosis, and T1ρ may be more sensitive than native T1 in the detection of myocardial diffuse fibrosis.

PO-2818

Changes in subclinical cardiac abnormalities 1 Year after recovering from COVID-19 in patients without clinical cardiac findings

Wei Deng, Xiaohu Li

First Affiliated Hospital of Anhui Medical University

AIM: To evaluate the subclinical cardiac involvement in COVID-19 patients without clinical cardiac evidence using cardiac MR imaging.

MATERIAL AND METHODS: Participants recovered from COVID-19 without cardiac symptoms and no cardiovascular medical history were enrolled in a prospective cohort study. They underwent baseline cardiac MR and follow-up cardiac MR >300 days after discharge ($n=20$). The study also included healthy controls ($n=20$). Extracellular volume fraction (ECV), native T1, and 2D strain data were assessed and compared.

RESULTS: Compared with healthy controls, the ECV values of participants at baseline [30.0% ($28.3\%-32.5\%$)] and at follow-up [31.0% ($28.0\%-32.8\%$)] were increased compared to the healthy control group [27.0% ($25.3\%-28.0\%$)] (both $p < 0.001$). However, the ECV increase from baseline

cardiac MR to follow-up cardiac MR was not significant ($p = 0.378$). There was a statistically significant difference in global native T1 between baseline [1140 (1108.3-1192.0) ms] and follow-up [1176.0 (1113.0-1206.3) ms] ($p = 0.016$). However, no native T1 difference was found between the healthy controls [1160.7 (1119.6-1195.4) ms] and the baseline ($p = 0.394$) or follow-up group ($p = 0.168$). The global T2 was 41(40-42) ms at follow-up which was within the normal range. In addition, We found a recovery in 2D GLS among COVID-19 participants between baseline and follow-up [-12.4(-11.7- -14.3)% vs. -17.2(-16.2- -18.3)%; $p < 0.001$].

CONCLUSION: Using cardiac MR myocardial tissue and strain imaging parameters, 35% of people without cardiac symptoms or clinical evidence of myocardial injury still had subclinical myocardial tissue characteristic abnormalities at 300 days, but 2D GLS had recovered.

PO-2819

Comparison of rFOV and fFOV magnetic resonance imaging image quality: A meta-analysis

Jie Lin, Jingjing Shi, Xinbing Zhou, Maosheng Xu

The First Affiliated Hospital of Zhejiang Chinese Medical University(Zhejiang Provincial Hospital of Traditional Chinese Medicine)

Purpose: This study aims to assess the influence of reduced field of view (rFOV) diffusion-weighted imaging (DWI) technology on the quality of MRI images.

Methods: We conducted a systematic literature search in databases such as Web of Science to identify studies comparing the image quality of rFOV and fFOV MRI. The search covered database inception to 2023.5. We screened and extracted data based on predefined criteria. Quality assessment used QUADAS-2. Study results were visualized with forest plots. Heterogeneity was assessed with I^2 , and subgroup analyses explored sources. Furthermore, Egger's test was employed to detect publication bias among the included studies.

Results: Our analysis included 13 studies. In 8 studies, rFOV outperformed fFOV in subjective image quality scores (WMD=0.535, 95%CI 0.339~0.731), with low heterogeneity ($I^2=45.7\%$) and no publication bias. Among 6 studies, rFOV effectively reduced image artifacts compared to fFOV (WMD=0.44, 95%CI 0.209~0.672), with low heterogeneity ($I^2=42.3\%$) and some publication bias ($P=0.028$). Additionally, in 5 studies, rFOV decreased image signal-to-noise ratio (WMD=-0.670, 95%CI -1.187~-0.152), with significant heterogeneity ($I^2=87.9\%$) and publication bias ($P<0.05$). In 5 other studies, rFOV enhanced lesion visibility (WMD=0.432, 95%CI -1.187~-0.152). Heterogeneity was mild ($I^2=53.1\%$), and no publication bias was found. Lastly, pooling results from 5 studies, rFOV displayed superior anatomical detail depiction (WMD=0.598, 95%CI 0.121~1.075), despite significant heterogeneity ($I^2=90.8\%$) and no publication bias. Heterogeneity might stem from variables like b value and race.

Conclusion: rFOV demonstrates significant advantages in image quality compared to fFOV, holding substantial clinical diagnostic relevance. With ongoing validation through high-quality, large-sample studies, this conclusion is poised to provide robust guidance for future advancements in magnetic resonance technology.

PO-2820

Quantitative MRI analysis of brachial plexus and limb-girdle muscles as a diagnostic biomarker for upper extremity onset Amyotrophic Lateral Sclerosis

Weiqiang Liang, Jing Zhang

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China.

Background: The identification of reliable biomarkers for the early diagnosis of amyotrophic lateral sclerosis (ALS) is necessary. Recent evidence highlights the potential of axonal degeneration as a biomarker for early ALS detection. However, the diagnostic potential of peripheral nerve axon changes in ALS remains poorly understood.

Purpose: To evaluate the diagnostic performance of quantitative MRI of the brachial plexus and limb-girdle muscles (LGMs) in patients with upper extremity onset of ALS.

Study Type: Retrospective.

Population: 47 patients (age = 53.5 ± 8.6 , 19F) with upper extremity onset of ALS and 20 healthy volunteers (age = 50.7 ± 15.0 , 11F).

Field Strength/Sequence: 3-T, three-dimensional sampling perfection with application-optimized contrasts using different flip angle evolutions with short-tau inversion recovery sequences, T2-weighted turbo spin-echo Dixon sequence.

Assessment: The cross-sectional area (CSA) and nerve-muscle T2 signal intensity ratio (nT2) of the bilateral brachial plexus roots, trunks and cords as well as the CSA and fat fraction (FF) of the bilateral subscapularis, supraspinatus and infraspinatus were assessed by two radiologists. Disease severity and clinical stage of ALS patients were assessed by two neurologists.

Statistical Tests: Student's t-test, Wilcoxon rank-sum test, binary logistic regression, interclass correlation coefficient, receiver operating characteristic analysis and correlation analysis. A P-value < 0.05 was considered statistically significant.

Results: In the affected limbs of patients with ALS, The CSA of the brachial plexus roots, trunks and cords and the nT2 values of the brachial plexus trunks were significantly smaller than in the healthy controls. In the LGMs, the affected limbs of ALS showed significantly smaller CSA and higher FF than controls. The model containing parameters such as brachial plexus trunk CSA, subscapularis CSA, infraspinatus CSA, and subscapularis FF had excellent diagnostic efficacy for ALS. Additionally, increased subscapularis FF and supraspinatus FF were correlated with disease severity, and subscapularis CSA was negatively correlated with the clinical stage.

Data Conclusion: BP thinning, LGMs atrophy, and fatty infiltration might serve as MRI-derived biomarkers for ALS with upper extremity onset.

PO-2821

Integrating diffusion-weighted MRI radiomics features to predict brain invasion of meningiomas

Zongmeng Wang

Fujian Medical University Union Hospital

Background: Brain invasion is an independent diagnostic criterion for the diagnosis of WHO grade II meningiomas, and preoperative prediction of brain invasion in meningiomas is crucial for making treatment decisions. Therefore, we constructed a radiomics model using multimodal MRI for preoperatively predicting brain invasion in meningioma.

Methods: Seven hundred and twenty-three consecutive patients with pathologically confirmed meningiomas between 2013 and 2022 were retrospectively studied. Radiomic features of the brain-tumor interface region were extracted from structural MRI, diffusion-weighted imaging (DWI) and

apparent diffusion coefficient (ADC). Random forest and principal component analysis with varimax rotation were used to obtain optimal radiomics features. Support vector machine, linear discriminant analysis and logistic regression were performed to develop radiomics models. The performance of the model was evaluated using receiver operating characteristic (ROC) curve analysis. The 95% confidence interval was estimated by bootstrap with 1000 samples. The integrated discrimination improvement (IDI) index was used to compare the benefits of different models.

Results: Fifteen radiomics features from structural MRI, nine radiomics features from DWI, and the volume of peritumoral edema were selected for the combined model construction. The multiparametric MRI radiomics model had the highest performance in predicting brain invasion in the training (AUC = 0.945, 95%CI: 0.922 to 0.968) and testing sets (AUC = 0.935, 95%CI: 0.892 to 0.979). It showed higher performance than the structural MRI model (AUC = 0.840) and the DWI model (AUC = 0.810). IDI showed significant improvement in predictive value when the DWI radiomics signature was added to the combined model (IDI = 9.14%; $p < 0.001$).

Conclusion: The incorporation of DWI into the MRI radiomics model improved diagnostic performance for identifying brain invasion in meningioma.

PO-2822

Capecitabine Induced Ileitis Worsened after Dose De-escalation

Jingjing Shi, Jie Lin, Zhaolong Zeng, Maosheng Xu

The First Affiliated Hospital of Zhejiang Chinese Medical University (Zhejiang Provincial Hospital of Traditional Chinese Medicine)

Introduction: Capecitabine is an oral fluoropyrimidine drug, widely used in patients with colorectal cancer. Ileitis is a rare but potentially life-threatening side effect of capecitabine, with only ten cases reported.

Methods: A 68-year-old man who received ten cycles of adjuvant chemotherapy with capecitabine after Dixon surgery for rectal cancer. During the fourth chemotherapy cycle.

Results: Patient started to complain of diarrhea (grade 3) without fever or abdominal pain. During follow-up treatment, imaging examinations, laboratory examinations and colonoscopy confirmed that the patient developed colitis and ileitis. Surprisingly, the ileitis worsened after drug reduction while diarrhea improved.

Discussion: To our knowledge, this is the first report of worsening ileitis after a reduction of capecitabine dosage. As dosage de-escalation is a common strategy to mitigate side effects, this potential consequence is worth noting. Therefore, we highlight the necessity of imaging examinations during the treatment of capecitabine. Clinicians should be vigilant for changes in imaging findings indicating ileitis even after dose reduction.

PO-2823

Relationship between brain damage and anxiety, depression, and cognitive impairment in patients with moderate to severe obstructive sleep apnea using diffusional kurtosis imaging

Yaoyao Zhai¹, Xiaoxia Liu²

1. General Hospital of Northern Theater Command

2. Shengjing Hospital of China Medical University

Objective To explore the brain white matter damage in patients with moderate to severe obstructive sleep apnea-hypopnea syndrome(OSAHS) using diffusional kurtosis imaging(DKI), and analyze its relationship with anxiety, depression and cognitive impairment in patients. **Methods** 50 confirmed cases of moderate to severe OSAHS diagnosed by Polysomnography(PSG) from November 2017 to December 2022 were selected, with 32 healthy controls matched for gender, age and education background. DKI scanning and Beck Anxiety Inventory(BAI), Beck Depression Inventory-II(BDI-II), and Montreal cognitive assessment(MoCA) scores were performed for all subjects. Differences in kurtosis fractional anisotropy(KFA) of various brain regions were compared between the two groups to identify differential brain regions, and correlations were analyzed between KFA reduction and anxiety, depression, and cognitive impairment in OSAHS patients. **Results** The KFA values in right external capsule, bilateral corona radiata, bilateral superior longitudinal fasciculus, corpus callosum, posterior cingulate gyrus of moderate to severe OSAHS group were lower than control group($P<0.05$). For the moderate to severe OSAHS group: The correlation between AHI and KFA values of right posterior corona radiata, right superior corona radiata, left anterior corona radiata, left posterior corona radiata, left superior corona radiata, left superior longitudinal fasciculus, genu of corpus callosum, body of corpus callosum, splenium of corpus callosum are all negative($r=-0.378, -0.307, -0.337, -0.343, -0.341, -0.613, -0.390, -0.384, -0.396$, $P<0.05$). The correlation between LSO2 and KFA values of right anterior corona radiata, right posterior corona radiata, right superior corona radiata, right superior longitudinal fasciculus, left anterior corona radiata, left posterior corona radiata, left superior corona radiata, left superior longitudinal fasciculus, genu of corpus callosum, body of corpus callosum, splenium of corpus callosum, posterior cingulate gyrus are all positive($r=0.330, 0.338, 0.425, 0.312, 0.433, 0.358, 0.410, 0.459, 0.473, 0.659, 0.489, 0.356$, $P<0.05$). The correlation between BAI scores and KFA values of right external capsule, right anterior corona radiata, left posterior corona radiata, left superior corona radiata, body of corpus callosum, splenium of corpus callosum are all negative($r=-0.306, -0.372, -0.296, -0.346, -0.318, -0.386$, $P<0.05$). The correlation between BDI-II scores and KFA values of right superior corona radiata, right superior longitudinal fasciculus, left anterior corona radiata, genu of corpus callosum, body of corpus callosum, splenium of corpus callosum are all negative($r=-0.334, -0.289, -0.309, -0.310, -0.503, -0.469$, $P<0.05$). The correlation between MoCA scores and KFA values of right posterior corona radiata, right superior longitudinal fasciculus, left anterior corona radiata, left superior corona radiata, left superior longitudinal fasciculus, genu of corpus callosum, body of corpus callosum, splenium of corpus callosum are all positive($r=0.368, 0.431, 0.324, 0.410, 0.469, 0.384, 0.369, 0.309$, $P<0.05$). **Conclusion** With the aggravation of OSAHS, the damage to some brain regions becomes more pronounced in moderate to severe OSAHS patients. These damaged brain functional areas are closely related to the anxiety, depression, and cognitive impairment of patients.

PO-2824

Structural signatures of arithmetic abilities in children are associated with gene expressions

Dai Zhang^{1,2}, Longsheng Wang^{1,2}

1. the Second Affiliated Hospital of Anhui Medical University

2. Medical Imaging Research Center, Anhui Medical University

Objectives Arithmetic ability is critical not only for everyday life but also for academic achievement, career development, and future economic success. Individual differences in arithmetic skills among typically developing children and adolescents are related to inter-individual differences in brain structures. However, most existing studies have used region of interest analysis methods, focusing primarily on the intraparietal sulcus region.

Methods To identify distributed brain regions related to arithmetic ability, we employed a cross-validated predictive model to analyze structural MRI data from children and adolescents (n=128). The arithmetic abilities were measured by the Comprehensive Mathematical Abilities Test. Furthermore, we applied neuroimaging-transcriptome association analysis to explore transcriptional signatures associated with spatial organization patterns and developmental changes in GMV in arithmetic-related brain regions.

Results The gray matter volume (GMV) of widespread brain regions reliably predicted individual differences in arithmetic abilities (subtraction: $r = 0.3841$, $P = 6.43 \times 10^{-6}$; multiplication: $r = 0.2941$, $P = 0.0007$). The development of brain regions associated with arithmetic ability primarily correlated with transcriptional profiles enriched for genes involved in amine transport and synaptic signaling transmission

Conclusion Our findings enhance our understanding of the neural and genetic mechanisms underlying children's arithmetic ability and offer a practical predictor for the typical development of arithmetic ability during developmental stages.

PO-2825

Fast Clinical Non-enhanced Sequences with Deep Learning Reconstruction in Abdominal MRI

Yuqi Tan, Meng Zhang, Zheng Ye, Chunchao Xia, Zhenlin Li
West China Hospital of Sichuan University

Purpose: To assess the image quality and scanning time of fast clinical non-enhanced sequences with deep learning reconstruction (DLR) in abdominal MRI, in comparison with fast sequences (with DLR turned off) and conventional sequences (without DLR).

Materials and Methods: 43 healthy volunteers were enrolled in this prospective study. A 3.0 T MRI scanner (SIGNA Architect, GE Healthcare) with a 30-channel abdominal coil was used to acquire the following sequences: coronal single shot fast spin echo (SSFSE) and fast imaging employing steady-state acquisition (FIESTA), axial dual echo (DE), T2 weighted fat saturation fast recovery fast spin echo (T2-frFSE-fs) and diffusion weighted imaging (DWI). Each sequence was scanned with DLR-fast protocol (parallel acquisition factor [PAF]=3), fast protocol (PAF=3) and conventional protocol (PAF=2). Signal-to-noise ratio (SNR) and contrast-to-noise ratio (CNR) of abdominal organs (liver, pancreas, spleen and kidney) were calculated by the junior radiologist and then verified by the senior radiologist. Subjective image quality was assessed by two other radiologists independently using a 5-point Likert scale, with inter-rater agreement being calculated. Parenchyma sharpness, contrast, truncation artifact (TA), image noise (IN) and overall quality (OQ) were evaluated for SSFSE, DE, T2-frFSE-fs and DWI. Portal sharpness, intrahepatic vessel conspicuity, TA, IN and OQ were evaluated for FIESTA. Scanning time of respiratory trigger (RT) sequences was recorded.

Results: For breath hold sequences, single breath-holding time of SSFSE, DE, FIESTA decreased from 14s to 10s, 16s to 13s and 13s to 9s, respectively. For RT sequences, the scanning time of T2-frFSE-fs and DWI with DLR-fast protocol was shorter than conventional protocol (94.00 ± 18.86 s vs. 133.16 ± 26.90 s, $P < 0.001$; 112.53 ± 18.36 s vs. 122.40 ± 23.40 s, $P = 0.003$). SNR and CNR of DLR-fast sequences were all higher than conventional sequences and fast sequences ($P < 0.01$). All DLR-fast sequences showed better subjective image quality than conventional sequences and fast sequences ($P < 0.05$), except for contrast in T2-frFSE-fs ($P > 0.05$). Inter-rater agreement of two radiologists was moderate.

Conclusion: Compared to conventional sequences, DLR-fast sequences can not only shorten scan time but also improve image quality, which is beneficial to patients' cooperation and clinical diagnosis. DLR-fast sequences may be the great alternative to conventional sequences in abdominal non-enhanced MRI.

PO-2826

Parkinson's disease Diagnosis and Biomarker Analysis using rs-fMRI Functional Brain Network and Deep Learning

Ran An, Ying 颜, Xuan 魏

Beijing Friendship Hospital Affiliated to Capital Medical University

Objective: Accurate diagnosis of the early stage of Parkinson's Disease (PD) is essential but very challenging, in order to take intervention and early symptomatic treatments before the brain damage is shaped. As one of the promising techniques, resting state functional MRI (rs-fMRI) has been widely employed to support early-stage PD diagnosis. The objective of this study was to properly utilize the biomarkers for diagnosis of PD based on merging rs-fMRI brain networks and Deep Learning (DL) models for PD multi-class classification.

Methods: Twenty-nine PD patients and 38 healthy controls (HCs) were included. For each participant, resting state data and high-resolution 3D structural images with a MPRAGE pulse sequence were acquired on a 3T MRI. On the one hand, we apply the BrainNetCNN with contrastive learning (CL) framework of DL to predict cognitive and gait developmental outcome scores from functional brain networks of PD. The highest accuracy (ACC) was achieved by BrainnetCNN-CL using all indicators (0.80); The highest balanced accuracy (BA) was 0.78, particularly. On the other hand, graph theory analysis and connectomics were used to assess global and local topological network properties and regional functional connectivity.

Results: Apply BrainnetCNN-CL, it was found that compared with the HCs, PD patients had fewer connections, mainly involving the default mode network (DMN) and executive control network (ECN). The main brain regions where the results of BrainnetCNN-CL and NBS coincide are Right Calcarine, Left Lingual, Inferior frontal gyrus, left posterior cingulate gyrus, right calcarine, left cuneus and inferior occipital gyrus, which are stable biomarkers of PD. The highest accuracy (ACC) was 0.80, The highest balanced accuracy (BA) was 0.78. Compared to conventional fMRI algorithms, DL models produced better classification performance.

Conclusion: These findings demonstrated the capability of DL frameworks on the imbalanced class distribution analysis and validated the great potential of rs-fMRI based brain network approaches to be further contributed to the development of PD diagnosis systems.

PO-2827

Application of the magnetic resonance 3D multi-echo Dixon sequence for quantifying hepatic iron overload and steatosis in patients with thalassemia

Fanyu Zhao¹, Yidi Chen², Cheng Tang², Liling Long²

1. Minzu Hospital of Guangxi Zhuang Autonomous Region

2. The First Affiliated Hospital of Guangxi Medical University

Rationale and Objectives: To investigate the feasibility and diagnostic efficacy of a 3D multiecho Dixon (qDixon) research application for simultaneously quantifying the liver iron concentration (LIC) and steatosis in thalassemia patients.

Materials and Methods: This prospective study enrolled participants with thalassemia who underwent 3T MRI of the liver for the evaluation of hepatic iron overload. The imaging protocol including qDixon and conventional T2* mapping based on 2D multiecho gradient echo (ME GRE) sequences respectively. Regions of interest (ROIs) were drawn in the liver on the qDixon maps to obtain R2* and proton density fat fraction (PDFF). The reference R2* value was measured and calculated on conventional T2* mapping using the CMRtools software. Correlation analysis, Linear regression analysis, and Bland–Altman analysis were performed.

Results: 84 patients were finally included in this study. The median R2*-ME-GRE was 366.97 (1/s), range [206.68 (1/s), 522.20 (1/s)]. 8 patients had normal hepatic iron deposition, 16 had Insignificant, 42 had mild, 18 had moderate. The median of R2*-qDixon was 376.88 (1/s) [219.33 (1/s), 491.75 (1/s)]. A strong correlation was found between the liver R2*-qDixon and the R2*-ME-GRE ($r=0.959$, $P<0.001$). The median value of PDFF was 1.76% (1.10%, 2.95%). 8 patients had mild fatty liver, and 1 had severe fatty liver.

Conclusion: MR qDixon research sequence can rapidly and accurately quantify liver iron overload, that highly consistent with the measured via conventional GRE sequence, and it can also simultaneously detect hepatic steatosis, this has great potential for clinical evaluation of thalassemia patients.

PO-2828

Gait Impairment-related axonal degeneration in Parkinson's disease: A Neurite Orientation Dispersion and Density Imaging Study

Xuan Wei, Zhenchang Wang

Beijing Friendship Hospital, Capital Medical University

Purpose: Microstructural alterations in brain networks of people with Parkinson's disease (PD) is presumed to be correlated with gait impairment. Evaluate the microstructural alterations of white matter fiber tracts by using neurite orientation dispersion and density imaging (NODDI) in PD patients.

Methods and Materials: Twenty-four PD patients and 29 healthy controls (HC) were included. For each participant, NODDI and high-resolution 3D structural images were acquired with a MPRAGE pulse sequence on a 3.0T MRI. The NODDI indicators intracellular neurite density index (NDI), orientation dispersion index (ODI), and isotropic fraction (ISO) were compared between the two groups. Diffusion-weighted data preprocessing was performed using Mrtrix3 software, using orientation distribution function to trace the main nerve fiber tracts in PD patients. Quantitative gait and clinical scales were used to record the medication ON and OFF status of PD patients.

Results: The NDI, ODI, and ISO of the specific fibers was significantly higher in PD patients than HC. Six significant fibers are anterior thalamic radiation, corticospinal tract, superior longitudinal fasciculus, forceps major, cingulum, and inferior longitudinal fasciculus. The ODI changes correlated with gait velocity, stride length and cadence in the ON state of patients with PD and correlated with gait velocity and stride length in the OFF state; ISO changes correlated with stride time in the ON state and correlated with gait velocity, stride length and time in the OFF state.

Conclusions: We use NODDI data estimate the density and angular variation of neurites (dendrites and axons) in patients with PD, and provide important neuroimaging information in association with clinical behavioral and gait measures of PD.

PO-2829

Evaluation of biventricular function in obese subjects after bariatric surgery by cardiac magnetic resonance feature tracking

Lu Tang, Jiayu Sun
West China Hospital, Sichuan University

Purpose: Obesity is one of the major cardiovascular risk factors and increases the risk of cardiovascular disease. Studies have shown that obesity can lead to enlargement of the left and right ventricular (LV and RV) chambers and subclinical dysfunction even if the ejection fraction (EF) is normal. Bariatric surgery is not only an effective treatment for obesity, but also may improve obesity-caused cardiac structural and functional abnormalities. However, the effect of bariatric surgery on biventricular structure and function in obese subjects is still unclear. Therefore, the purpose of this study was to evaluate the effect of biventricular function in obese subjects after bariatric surgery by cardiac magnetic resonance (CMR) feature tracking.

Materials and Methods: Twenty-three obese subjects ($BMI=37.4\pm4.9\text{ kg/m}^2$) who underwent laparoscopic sleeve gastrectomy for weight loss in our hospital from December 2020 to February 2022 were prospectively enrolled. Preoperative CMR examination was performed on obese subjects and clinical data were collected. CMR and clinical follow-up were performed at 1 year after bariatric surgery for weight loss. Conventional cardiac function parameters included LV and RV end-diastolic volume (EDV), end-systolic volume (ESV), EF, and left ventricular mass (LVMASS). Myocardial strain parameters included LV and RV peak circumferential strain (PCS), peak radial strain (PRS) and peak longitudinal strain (PLS). According to the results of normality test, paired t-test or Wilcoxon signed rank sum test was selected for comparison. $P<0.05$ was considered to be statistically significant.

Results: After bariatric surgery, obese subjects had a significant decrease in BMI ($26.0\pm3.0\text{ kg/m}^2$ vs. $37.4\pm4.9\text{ kg/m}^2$, $P<0.001$). At the same time, biventricular EDV [LV, $141.15(29.53)\text{ml}$ vs. $162.82(33.03)\text{ml}$, $P=0.023$; RV, $140.16\pm22.54\text{ml}$ vs. $161.95\pm31.88\text{ml}$, $P<0.001$], ESV (LV, $54.77\pm9.17\text{ml}$ vs. $63.11\pm12.76\text{ml}$, $P=0.001$; RV, $56.31\pm11.92\text{ml}$ vs. $67.27\pm16.13\text{ml}$, $P<0.001$) and LVMASS [$76.15(25.91)\text{g}$ vs. $95.25(31.25)\text{g}$, $P<0.001$] were significantly lower than those at baseline. Although there was no significant change in left and right ventricular EF (both $P>0.05$), biventricular GCS [LV, $-18.95(2.22)\%$ vs. $-17.62(1.12)\%$, $P=0.001$; RV, $-15.64\pm2.82\%$ vs. $-14.00\pm3.16\%$, $P=0.027$], GRS [LV, $31.67(6.64)\%$ vs. $28.06(2.47)\%$, $P=0.002$; RV, $25.98\pm6.28\%$ vs. $22.78\pm6.29\%$, $P=0.046$] and LV GLS ($-18.87\pm1.51\%$ vs. $-17.46\pm1.69\%$, $P=0.001$) were significantly improved from baseline.

Conclusion: After bariatric surgery for weight loss, the obese subjects existed decreased left ventricular mass and biventricular volumes, as well as improved biventricular subclinical function. Cardiac magnetic resonance feature tracking technique can be used to evaluate biventricular subclinical function changes after bariatric surgery in obese subjects

PO-2830

Plastic alterations in cortical morphology due to age-related hearing loss: multiparametric mapping, multiscale neurobiological underpinnings and roles in cognitive impairment

Fei Gao¹, jinhui wang², xiaofan qiu², jing yang¹

1. Shandong Provincial Hospital Affiliated to Shandong First Medical University

2. Institute for Brain Research and Rehabilitation, South China Normal University

Background: Although plastic alterations in cortical morphology due to age-related hearing loss have been increasingly studied, their comprehensive mapping, neurobiological determinants, and roles in cognitive impairment are not well established.

Methods: We recruited 284 elderly adults who underwent structural magnetic resonance imaging, magnetic resonance spectroscopy, audiometry, and cognitive assessments. Hearing loss-induced alterations were mapped by correlating individual pure-tone audiometry scores with multiple cortical surface-based morphological indices. The alterations were then linked with brain-wide transcriptomic profiles, microstructural and functional connectomic gradients, and neurotransmitter receptor distributions. Finally, the mediating effects of the alterations were examined on the relationship between hearing loss and cognitive impairment.

Results: Poorer hearing led to widespread cortical thickness (CT) reductions in both auditory and non-auditory regions. The CT reductions were related to transcriptomic profiles of genes involved in certain biological processes and cell types and preferentially expressed during relatively late developmental stages, followed the microstructural connectomic hierarchy, and covaried with multiple dopaminergic neurochemicals. Additionally, the deterioration of hearing status induced gyrification index (GI) reductions in the right Area 52 and Insular Granular Complex, and the reductions were related to lower serotonin 5-hydroxytryptamine receptor subtype 2a. Moreover, the GI in the right Area 52 mediated the relationship between hearing loss and executive impairment. Interestingly, the mediation effect was further modulated by the glutamate and N-acetylaspartate levels in the right auditory region, which continuously declined as the hearing status deteriorated.

Conclusion: These findings provide novel insights into the neurobiological substrates underlying cortical morphological reorganization due to hearing loss, and have important implications for informing avenues for early intervention of hearing loss-related cognitive impairment.

PO-2831

Evaluation of cardiac function and myocardial strain based on a novel 3D cine sequence

Qian Pu, Jiayu Sun

West China Hospital, Sichuan University

Purpose: To explore the consistency of a novel 3D cine sequence and the traditional 2D cine sequence in evaluating ventricular function and myocardial strain.

Methods: Cardiac cine images were obtained using the 2D cine balanced steady-state free precession sequence and 3D cine Enhanced sensitivity encoding by Static Outer-volume Subtraction (ESSOS) sequence. The 3D cine images were reconstructed according to the slice thickness and orientation of the 2D cine images. Cardiac function and strain were calculated by post-processing software.

Results: A total of 26 patients were enrolled, of which 2 patients were unable to hold their breath. The remaining 24 patients had good 3D image quality. There was excellent agreement (ICC: 0.99,

95%CI: [0.98, 0.99]) and insignificant bias between 3D and 2D cine measurements of left ventricular ejection fraction [58.3 (50.9, 61.9) vs. 59.0 (51.2, 61.7)]. The right ventricular ejection fraction measured by 3D and 2D cine was 52.2 (44.2, 53.8) and 51.7 (44.9, 53.7), respectively, with good agreement (ICC: 0.83, 95%CI: [0.65, 0.92]) and insignificant bias. The global circumferential strain measured by 3D and 2D cine was -16.0 (-17.6, -13.2) and -18.2 (-19.6, -15.3), respectively, with good agreement (ICC: 0.77, 95%CI: [0.54, 0.89]) and insignificant bias. The global radial strain measured by 3D and 2D cine was 28.2 (21.0, 31.1) and 31.2 (23.1, 34.0), respectively, with good agreement (ICC: 0.83, 95%CI: [0.64, 0.92]) and insignificant bias. The global longitudinal strain measured by 3D and 2D cine was -10.4 (-13.5, -6.8) and -16.1 (-18.9, -11.8), respectively, with good agreement (ICC: 0.76, 95%CI: [0.53, 0.89]) and insignificant bias. Although the quality of 3D cine images was not as good as that of 2D cine images, the ventricular function and myocardial strain parameters obtained by the two sequences are still in good agreement.

Conclusion: The 3D cine sequence can be used for rapid assessment of cardiac function and strain.

PO-2832

Preliminary study on the application value of ZTE sequence in calcified plaques of intracranial arterial wall

WAN-LIN JIANG,YI LU,FENG CUI,TIAN-FU QI,YUN ZHU
1st affiliated hospital of KMMU

Objective: Atherosclerosis (AS) is a common chronic vascular disease caused by multiple factors, in which calcification has a high incidence and may affect the stability of AS. At present, High resolution Magnetic Resonance Vessel Wall Imaging (HR-VWI) is the best magnetic resonance sequence for displaying vascular walls and evaluating plaque components. However, it does not display calcification well and needs to be analyzed in conjunction with Computed Tomography (CT). Therefore, we aim to explore the effectiveness of ZTE technology in displaying calcified plaques on the wall of intracranial arteries.

Methods: Thirty three patients with intracranial atherosclerosis and multiple calcium plaques diagnosed by computed tomography angiography (CTA) in our hospital were collected in the study, and accepted the ZTE and HR-VMI scans of intracranial vessels. Firstly, two experienced imaging physicians used a double-blind method to score CT and ZTE images based on the imaging conspicuousness, contrast and identification of calcified plaques, image quality, diagnostic confidence. And weight Kappa test was used to analyze the consistency of evaluations among evaluators; Then, a comparative analysis was conducted on the distribution and quantity of calcified plaques, and maximum plaque diameter among CT, ZTE original and post-processing images, and HR-VWI; McNemar paired sample test and ICC analysis were respectively used to compare the sensitivity, specificity, and consistency of these different images in detecting calcified plaques. Secondly, the calcification plaque's maximum diameter was measured in the all-above images, respectively. Finally, the Weight Kappa test was used to analyze the consistency between ZTE and CTA in evaluating the degree of vascular stenosis.

Results: 1. In the imaging conspicuousness and contrast of calcified plaques between CT and ZTE image, there was no statistically significant difference ($p>0.05$), with good consistency between two physicians ($\text{Kappa}=0.784$); In the diagnostic confidence, two physicians scored lower on ZTE images compared to CT ($p<0.05$), with good consistency ($\text{Kappa}=0.678$). In the image quality, two physicians also scored lower on ZTE images compared to CT ($p<0.05$), with moderate consistency ($\text{Kappa}=0.522$). 2. Using CT as the reference standard, the sensitivity of ZTE original and post-processing images, and HR-VWI in detecting intracranial arterial wall calcification was 95.42%, 96.15%, 67.65%, respectively, and the specificity was 89.58%, 78.44%, and 52.82%, respectively. In the sensitivity and specificity of detecting calcified plaques, there were significant differences ($p<0.001$) for ZTE images, compared to HR-VWI. Specially, in the specificity of detecting calcified plaques, there were also significant differences ($p<0.05$) between ZTE original and post-processed

images. 3. There is high consistency in the diameter measurement of calcified plaques on CT and ZTE images. However, the consistency of diameter measurement results between HR-VMI and CT images is poor. Linear regression analysis showed that ZTE images had stronger correlation with CT ($R^2=0.8764, 0.8555$), while the correlation between HR-VMI and CT was weaker ($R^2=0.5955$). 4. The consistency between CTA and ZTE in evaluating the degree of vascular stenosis is good ($Kappa=0.779$).

Conclusion: ZTE imaging technology can not only obtain the similar display efficiency of vascular wall calcification with CT, but also display the vascular lumen well. It make up for the deficiency of conventional magnetic resonance imaging technology in displaying calcified plaque of intracranial artery wall, and may became an effective examination method for clinical risk stratification of vascular diseases.

PO-2833

Clinical feasibility of multiparametric MRI in determining bladder-sparing strategy after initial systemic therapy for muscle-invasive bladder cancer Runninghead: MRI assessment of response to systemic therapy for MIBC

Lei Ye, Bin Song

Department of Radiology, West China Hospital, Sichuan University, Chengdu, China

Purpose

To examine the feasibility of Neoadjuvant Vesical Imaging-Reporting and Data System (nacVI-RADS) criteria in deciding whether to continue systemic therapy or perform salvage radical cystectomy (RC).

Experiment Design

Patients received bladder sparing treatment were retrospectively retrieved, including those had RC or continuing systemic treatment after initial treatment (3-5 cycles of systemic therapy). Pre-treatment and follow-up MRI after initial treatment, were independently reviewed by two readers using the nacVI-RADS algorithm. We observed the pathological results from salvage RC and oncological outcomes for patients continuing systemic treatment with different nacVI-RADS category. Receiver operating characteristic curve (ROC) analysis was used for assessing predictive performance to predict good response.

Results

Among the 33 patients, 12 underwent RC, and 21 received sequential systemic treatment. The nacVI-RADS matched the final pathological results from RC. For patients receiving sequential systemic therapy, ROC analysis showed that the optimal criterion was nacVI-RADS ≥ 3 with area under the curve (AUC) value of 0.801, while patients with nacVI-RADS 4 had indeterminate responses to the bladder sparing treatment. Therefore, we proposed modified nacVI-RADS by further subdividing nacVI-RADS 4 into nacVI-RADS 4a and 4b, according to the status of muscle-invasiveness in follow-up MRI. The AUC value of the modified nacVI-RADS was 0.842, significantly higher than that of nacVI-RADS ($p=0.02$).

Conclusions

This small-size study confirmed the consistency between the nacVI-RADS score and pathological response to initial treatment, and indicated that early assessment using modified nacVI-RADS might be a predictive factor for the prognostic outcome after continuing systemic outcome.

PO-2834

自由呼吸 Star-VIBE 序列动态增强联合 T1 mapping 成像在

孤立性肺结节诊断中的应用价值

张玮
乐陵市人民医院
山东省立医院

目的：采用自由呼吸 Star-VIBE 动态增强 MRI 的血流动力学参数联合 T1 mapping 成像评价孤立性肺结节(SPN),探讨其在良恶性鉴别诊断及肺癌分型中的应用价值。

材料与方法：本研究纳入 131 例经病理证实的 SPN 患者（其中恶性结节 117 例,良性结节 14 例），使用西门子 3.0T Prisma MR 扫描仪行常规序列、动态增强及 T1 mapping 序列检查。测量 DCE-MRI 定量参数(Ktrans、Kep、Ve)，增强前 T1 值（T1pre），增强后 T1 值（T1post），并计算 $\Delta T1$ （ $\Delta T1 = T1post - T1pre$ ）， $\Delta T1\%$ （ $\Delta T1\% = \Delta T1 / T1pre \times 100\%$ ）。对比 DCE-MRI 定量参数、T1 mapping 定量参数在良恶性两组间及不同病理类型肺癌间的差异。运用多元 Logistic 回归联合 ROC 曲线评价其鉴别不同病理类型肺癌的诊断价值，并分析联合诊断、单一诊断的准确效能。

结果 恶性组 Ktrans、Kep、T1post 值高于良性组,差异有统计学意义($P < 0.05$)。小细胞癌、腺癌、鳞癌三者之间的 T1-post、 $\Delta T1$ 、 $\Delta T1\%$ 、K-trans、kep 值的差异有统计学意义（ $P < 0.05$ ）。T1 mapping 联合 DCE-MRI 定量参数鉴别诊断小细胞癌与非小细胞肺癌的准确率为 91.6%，明显高于单一诊断且有显著性差异（ $P < 0.05$ ）；T1 mapping 联合 DCE-MRI 鉴别诊断鳞癌与腺癌的准确率为 90.9%，明显高于单一诊断且有显著性差异（ $P < 0.05$ ）；T1 mapping 鉴别鳞癌与小细胞癌准确率为 83.1%，DCE-MRI 无法鉴别鳞癌与小细胞癌。

结论 自由呼吸 Star-VIBE 序列成像稳定，二者均可鉴别良恶性，T1 mapping 联合 DCE-MRI 的诊断效能高于单一诊断，可无创定量评估肺占位性病变的病理类型，有助于临床治疗方案的选择，值得推广应用于临床。

PO-2835

磁共振扩散张量成像对女性青少年特发性胸腰弯腰椎间盘的定量研究

高瑶
上海市中医医院

目的 评价扩散张量成像（DTI）技术在评估女性青少年特发性胸腰弯侧凸（AIS）腰椎间盘（腰 1/2-腰 5/骶 1）早期退变中的价值。方法 选取 38 例临床诊断为女性 AIS 患者及 20 例性别、年龄相匹配的健康志愿者行腰椎间盘常规磁共振和 DTI 成像，根据 T2WI 图像上的椎间盘进行 Pfirrmann 分级。AIS 患者中腰 1-骶 1 椎间盘未发生任何退变为未退变组（Pfirrmann I 级），任何节段存在退变（分级高于 Pfirrmann I 级）为退变组。测量 AIS 2 组患者及健康志愿者（对照组）腰椎间盘的各项异性分数（FA）值和平均弥散率（MD）值，应用 ANOVA 方差分析及 LSD-t 检验比较 3 组腰椎间盘间以及每组各节段椎间盘间 FA 值和 MD 值的差异。结果 AIS 退变组腰椎间盘 MD 值显著低于未退变组（ $P < 0.001$ ）。AIS 两组腰椎间盘 MD 值显著低于对照组（ P 均 < 0.001 ）。AIS 退变组腰椎间盘 FA 值显著高于未退变组（ $P < 0.05$ ）。AIS 两组腰椎间盘 FA 值显著高于对照组（ P 均 < 0.01 ）。AIS 退变组腰 1/2、腰 2/3、腰 3/4 椎间盘的 MD 值和 FA 值分别与腰 4/5、腰 5/骶 1 椎间盘 MD 值及 FA 值存在显著差异（ $P < 0.05$ ）。结论 磁共振 DTI 研究显示在 Pfirrmann 分级未见异常的情况下，通过对 FA 值和 MD 值的测定能够早期发现和评价女性 AIS 患者腰椎间盘的退变。

PO-2836

磁共振动脉自旋标记及体素内不相干扩散技术评估 2 型糖尿病患者早期肾功能的变化

王倩¹、徐成²

1. 山西医科大学

2. 山西省人民医院

目的：研究磁共振动脉自旋标记 (ASL) 及体素内不相干扩散技术 (IVIM-DWI) 识别 2 型糖尿病 (T2DM) 患者早期肾功能损伤的能力。

方法：选取 2021 年 11 月-2022 年 11 月间山西省人民医院内分泌科 T2DM 患者 43 例，按照尿白蛋白/肌酐比率 (ACR) 分为 ACR<30mg/g 的单纯糖尿病组 (共 27 例)、30≤ACR≤300mg/g 的早期糖尿病肾病组 (共 16 例)，同时纳入年龄、性别与 T2DM 患者匹配的 16 例健康者作为对照。对三组受试者行 ASL、IVIM-DWI 扫描，测量其双肾皮、髓质 ASL、IVIM-DWI 参数：肾血流量 (RBF 值)、灌注分数 (f 值)、假性扩散系数 (D*值)、表观扩散系数 (ADC 值)、真性扩散系数 (D 值)，行组间比较分析，并对上述指标与 ACR 的相关性、肾皮质 RBF 值与 f 值的相关性进行分析。应用受试者工作特征 (ROC) 曲线分析相关参数对 T2DM 患者早期肾功能损伤的诊断效能。

结果：健康对照组、单纯糖尿病组、早期糖尿病肾病组间肾脏皮质 RBF 值及皮、髓质 ADC、D、f 值的差异具有统计学意义 (均 $P<0.05$)。肾皮质 ADC 值及皮、髓质 f 值与 ACR 间存在中等程度以上的负相关性 ($r>-0.4$, $P<0.01$)，肾皮质 RBF 值与 f 值呈显著正相关 ($r=0.575$, $P<0.001$)。肾皮质 RBF 值、f 值、肾髓质 D 值、f 值对健康对照组与单纯糖尿病组有较高的鉴别诊断能力 (AUC 分别为 0.791、0.855、0.900、0.944)，肾皮质 RBF 值、ADC 值、D 值、f 值、肾髓质 ADC 值、D 值、f 值对单纯糖尿病组与早期糖尿病肾病组有较高的鉴别诊断能力 (AUC 分别为 0.750、0.791、0.765、0.852、0.757、0.832、0.910)。

结论：ASL 及 IVIM-DWI 能反映 T2DM 患者早期肾脏微循环灌注和微观结构的变化，可以用于 T2DM 患者早期肾功能损伤的评估。

PO-2837

基于高分辨率 MRI 放射组学诺莫图的宫颈癌患者预后模型的构建

周平、刘艾艾、庞皓文

西南医科大学附属医院

目的本研究的主要目标是建立一种预测接受放化疗宫颈癌患者的生存时间的方法，并基于影像组学评分 (Rad-Score, RS) 生成预后模型。

材料和方法从每个患者的治疗前的 T2 加权 (T2w)、T1 加权 (T1w) 和弥散加权 (DW) 磁共振图像中提取影像组学特征。使用最小绝对收缩和选择算子 (LASSO) 回归和 Cox 比例风险模型获得 RS。根据 RS 的临界值，将患者分为低风险组和高风险组，并生成包含影像组学特征的诺莫图。通过曲线下面积 (AUC) 评估模型的预测性能。

结果总共纳入 62 名患者，其中高风险组 43 人，低风险组 19 人。通过 LASSO 降维选择了四个重要特征，并计算了相应评分。该模型预测 3 年和 5 年总生存率 (OS) 的曲线下面积 (AUC) 值分别为 0.84 和 0.93。

结论结合影像组学特征的诺莫图在预测宫颈癌患者的总体生存率 (Overall Survival, OS) 方面表现良好，但仍需要进一步的大规模研究和外部验证队列来验证其潜在的临床实用性。

PO-2838

高和超高 b 值弥散加权腹部成像病灶检测和图像质量的定性和定量比较

邹兴雄

绵阳市第三人民医院

背景：腹部磁共振成像 (MRI) 越来越多地采用弥散加权成像 (DWI) 序列。尽管 DWI 可以极大地帮助检测和发现可疑病灶，但尚不清楚使用超高 b 值 DWI 可以在多大程度上进一步帮助放射科医生，尤其是在使用经过高级处理的 DWI 序列时。因此，本研究的目标是比较腹部 MRI 检查中的高和超高 b 值 DWI 下病变检出率、图像质量。

方法：研究包括对 70 名肿瘤患者（平均年龄 58 岁；范围 21-90 岁），使用 1.5 T MRI 扫描仪（MAGNETOM Aera，德国西门子）进行腹部检查，具有 DWI 序列（b = 0、50、900 和 1500 s/mm）。高 b900 和超高 b1500 DWI 通过图像质量和病变显著性的定性读数进行比较，使用 5 李克特量表，由 2 名放射科医生共同阅读。计算同一器官可疑病灶/正常组织的表观信号强度比值（LNTRs）。使用适当的方法进行统计分析，包括 Wilcoxon 符号秩检验和读者间一致性分析的 κ 统计量（校正后 $P < 0.05/0.0125/0.005$ ）。

结果：与 b1500 DWI 相比，b900 的图像质量显著提高（ $P < 0.001$ ）。共分析了 153 个可疑病变。总体读者对恶性病变特征/检测的信心以及相应的 LNTR（ 2.7 ± 1.8 VS 2.4 ± 1.6 ）在 b900 下显著高于 b1500 DWI（ $P < 0.001$ VS $P < 0.001$ ）。

结论：与腹部检查中的超高 b 值 DWI (1500 s/mm) 相比，使用高 b 值 DWI (900 s/mm) 可提供更好的图像质量和病灶显著性。因此，在未来的研究中应严格评估肿瘤检查中额外超高 b 值 DWI 的价值。

PO-2839

基于 PI-RADS v2.1 评分探讨不同经验影像医生采用双参数及多参数 MRI 对前列腺癌诊断效能的影响

张茜、张禹、沈蕾、徐茂林、陈跃、褚江东

中国人民解放军联勤保障部队第九〇一医院

基于 PI-RADS v2.1 评分标准，比较双参数磁共振成像 (biparametric magnetic resonance imaging, bp-MRI) 与多参数磁共振成像 (multiparametric magnetic resonance imaging, mp-MRI) 的诊断效能，探讨不同经验医师对两种方案诊断效能的影响并提供方案选择依据。材料与方法：回顾分析 81 例可疑前列腺癌患者 MRI 资料，6 名不同工作年限医师（初、中、高级组各 2 名）采用 bp-MRI 和 mp-MRI 方案评分，通过绘制受试者工作特征曲线 (receiver operating characteristics, ROC) 曲线的灵敏度、特异性和曲线下面积 (area under the curve, AUC) 对诊断效能进行量化分析。分析两种方案的 AUC 与医师工作年限的关系，找到 mp-MRI 向更简便的 bp-MRI 方案过度的最佳阈值工作年限。结果：bp-MRI 高级组曲线下面积 (AUC) 大于中级组 ($p = 0.024$)，中级组大于初级组 ($p = 0.046$)。mp-MRI 中级组大于初级组 ($p = 0.043$)，中、高级组间无差异 ($p = 0.22$)。灵敏度随医师工作年限增加，但特异度变化不明显。高级组方案间无差异 ($AUC = 0.826 \sim 0.866$; $p \geq 0.05$)；初、中级组 mp-MRI 表现更好 ($AUC = 0.705 \sim 0.815$; $p < 0.05$)。两个方案的 AUC 与医师工作年限均接近线性关系，bp-MRI 及 mp-MRI 方案的斜率分别为 0.030 及 0.0246。AUC 值 ≥ 0.80 所需工作年限为 7-8 年，即为方案调整的最佳年限。结论：对于工作经验较丰富的医师可选择 bp-MRI 方案，而经验不足的医师则需要 DCE-MRI 序列进行补充，更适合采用 mp-MRI 方案。根据医生经验的积累可以在合适时机进行方案优化调整。

PO-2840

中重度阻塞性睡眠呼吸暂停患者中的多层网络分析

黄仪杰、刘军
中南大学湘雅二医院

目的：既往研究使用磁共振成像 (MRI) 技术来探索阻塞性睡眠呼吸暂停 (OSA) 的神经基础，但都是基于静态功能网络的变化。本研究旨在通过多层网络分析，探究中度至重度 OSA 患者脑网络的动态重构情况，并探讨其对疾病的影响。

方法：本研究纳入了经多导睡眠监测 (PSG) 新确诊的 27 例中重度 OSA 患者和 27 例年龄、性别匹配的健康对照者。所有参与者均接受了静息态功能性磁共振成像 (fMRI) 扫描。采用了时间分辨的 fMRI 数据构建了多层脑网络，总体模块化 (Q) 是反应大脑之间协同效应，切换率被用来反应个体静息态功能网络的动态变化。计算了 OSA 组和健康对照组总体模块化程度，全脑、子网络以及节点之间切换率，采用了独立样本 t 检验进行组间比较，并将有差异指标与睡眠监测、爱泼沃斯嗜睡量表 (ESS) 以及蒙特利尔认知量表 (MoCA) 进行偏相关分析。

结果：与对照组相比，总网络、子网络水平的默认模式网络、腹侧注意网络和听觉网络以及节点水平的额叶和颞叶区域中的节点切换率减低，差异均具有统计学意义 ($p < 0.05$, 经 FDR 校正后)。偏相关分析发现，总网络切换率与 ESS 呈负相关 ($r = -0.405, p = 0.003$)，与 MoCA 呈正相关 ($r = 0.356, p = 0.01$)；腹侧注意网络切换率与 ESS 呈负相关 ($r = -0.438, p = 0.001$)，与平均血氧饱和度呈正相关 ($r = 0.364, p = 0.009$)；右侧中央沟盖节点切换率与 ESS 呈负相关 ($r = -0.339, p = 0.015$)；左侧颞中回切换率与 AHI 呈负相关 ($r = -0.347, p = 0.013$)；右侧中央前回切换率与 ESS 呈负相关 ($r = -0.389, p = 0.005$)。

结论：OSA 患者在总网络、子网络和节点水平中展现出较低的切换率，和动态功能网络稳定性的破坏有关，并表明额叶和颞叶、默认模式网络、腹侧注意网络和听觉网络可能在潜在的神经机制中发挥关键作用。

PO-2841

多 b 值拟合 RESOLVE 弥散加权成像评估中轴型
脊柱关节炎炎症活动性及疗效

杨晨升¹、陈贤源¹、林敏贵²、高飞¹、马明平¹、俞顺¹
1. 福建省立医院
2. 福州市第二医院

目的：本研究的目的是通过多 b 值拟合 RESOLVE 弥散加权成像 (DWI) 寻找评估中轴型脊柱关节炎 (ax-SpA) 炎症活动性和疗效的最佳定量指标。

方法：本研究前瞻性纳入 106 例参与者，根据国际脊柱关节炎学会 (ASAS) 的标准，分为 axSpA 组 (n=89) 和 no-SpA 组 (n=17)。axSpA 组根据 ASDAS-CRP 分为活动组和非活动组。在活动组中选择经过系统的肿瘤坏死因子- α 抑制剂 (TNFi) 治疗为治疗组 (n=20)。所有参与者均行包括 RESOLVE DWI 序列在内的骶髂关节 MRI 检查。测量骶髂关节软骨下骨髓的 ADC 值 (ADC50,500 为 b=50,500 s/mm² 拟合, ADC50,700 为 b=50,700 s/mm² 拟合, ADC50,500,700 为 b=50,500,700 s/mm² 拟合)。通过比较不同组间的 ADC 值，获得一个相对最优的多 b 值拟合序列，用于进一步监测治疗组的疗效。

结果：axSpA 组、非活动组和活动组骶髂关节的 ADC 值均高于 no-SpA 组。活动组骶髂关节的 ADC 值高于非活动组。与 ADC50,700 值和 ADC50,500 值相比，ADC50,500,700 值的 AUC 最大，其兼顾到图像质量的同时，灵敏度和特异性相对较高。在治疗组中，治疗前和治疗 3 周，治疗 3 周

和 6 周, 治疗 6 周和 12 周, 组间 ADC 值均无统计学差异 ($P>0.0083$, bonferroni 校正), 但在间隔 6 周及以上, ADC 值下降且具有统计学差异 ($P<0.0083$, bonferroni 校正)。

结论: 多 b 值拟合 ($b=50,500,700\text{s/mm}^2$) RESOLVE DWI 在评估 axSpA 炎症活动性方面具有一定的优势。值得注意的是, 不推荐治疗后短期复查 (≤ 3 周), 间隔 6 周及以上复查能有效监测 axSpA 的疗效。

PO-2842

外周带前列腺癌 PI-RADS V2 评分与 Gleason 评分的比较研究

王伟、王培军
上海市同济医院

目的: 比较外周带前列腺癌 PI-RADS V2 与 Gleason 评分的关系; 探讨外周带前列腺癌第二版前列腺影像和数据报告系统 (PI-RADS V2) 中总分 3+1 分与总分 4 分是否有差异并评估其对 PI-RADS V2 的影响。

方法: 连续收集 2012 年 1 月至 2016 年 1 月 354 例临床疑诊前列腺疾病病例, 前列腺移行带病变 150 例, 前列腺外周带病变 204 例 (142 例前列腺癌), 均经过病理证实。采用 Siemens Verio 3.0T 多参数 MRI 序列扫描。图像根据 PI-RADS V2 标准进行评分。204 例前列腺外周带病变用于统计分析。评分者之间一致性通过 Kappa 系数统计。PI-RADS 总分 3 分、3+1 分、4 分病例通过非参数检验分析。

结果: 204 例前列腺外周带病变中前列腺癌 169 例, 非前列腺癌 35 例。PI-RADS 总分 4 分的 kappa 系数高于 PI-RADS 总分 3 分或 3+1 分的 kappa 系数 ($k = 0.802$ vs 0.737 vs 0.591 ; $p < 0.01$), PI-RADS 总分 2、5 分的 kappa 系数高于 PI-RADS 总分 3 分、3+1 和 4 分的 kappa 系数。PI-RADS 总分 3 分、3+1 分、4 分之间的构成比有统计学差异 ($\chi^2 = 29.839$, $p < 0.05$)。PI-RADS 总分 4 分中前列腺临床显著癌高于 PI-RADS 总分 3+1 和 3 分 (78.2% vs 43.2% vs 16.7%)。PI-RADS 总分 3+1 分和 4 分之间的构成比有统计学差异 ($\chi^2 = 15.286$, $p < 0.01$)。71% 病例 (44/62) 由于 DCE 阳性从 PI-RADS 总分 3 分升高到 3+1 分。

结论: PI-RADS V2 外周带评分系统中有必要将 PI-RADS 总分 3+1 分与 PI-RADS 总分 4 分加以区分, 我们认为可将 PI-RADS 总分 3+1 分定义为 PI-RADS 3b 而非直接升级到 PI-RADS 总分 4 分。

PO-2843

不同计算化高 b 值对外周带前列腺癌第二版前列腺影像和数据报告中弥散加权成像评分的影响

王伟、王培军
上海市同济医院

目的 探讨不同计算化高 b 值对外周带前列腺癌第二版前列腺影像和数据报告系统 (PI-RADS v2) 中弥散加权成像评分的影响。

方法 分析 2012 年 1 月至 2013 年 12 月在本医院经直肠超声引导下前列腺饱和穿刺活检或前列腺根治术后病理证实外周带前列腺癌 104 例患者的临床资料。均采用 Siemens Verio 3.0T MRI 扫描, 成像序列包括横断位、矢状位高分辨 T2WI, b 值=0、50、1000 s/mm^2 横断位 DWI 及 DCE 扫描, 通过 Matlab 后处理合成 $b=1000$ 、1400、2000 s/mm^2 的 DWI 图 (cDWI)。依据 PI-RADS v2 评分标准对 $b=1000$ 、1400、2000 s/mm^2 的三组 cDWI 资料进行评分, 并对各组病例的病灶信号强度比进行独立样本 t 检验及单因素方差分析。

结果 三组 cDWI 中 DWI 评分 2、5 分的病例数无差别, 27 例 $b=1000 \text{ s/mm}^2$ DWI 评分 3 分的病例中有 9 例在 $b=1400 \text{ s/mm}^2$ 及 2000 s/mm^2 时 DWI 评分均升高到 4 分。升高至 DWI 评分 4 分的病例与仍为 DWI 评分 3 分的病例间的病灶 SIR 在 $b=1400 \text{ s/mm}^2$ 及 2000 s/mm^2 时的比值分别为 1.86 ± 0.21 比 1.61 ± 0.27 、 2.18 ± 0.26 比 1.75 ± 0.30 , 两组间 SIR 差异均有统计学意义 ($t=2.486$ 、 3.671 , $P<0.05$)。升高至 DWI 评分 4 分的 9 例病例的病灶 SIR 在 $b=1000$ 、 1400 、 2000 s/mm^2 时两两之间差异均有统计学意义 ($F=10.907$ 、 33.768 、 8.043 , $P<0.05$), 且病灶 SIR 随 b 值的升高而增大。

结论 $b \geq 1400 \text{ s/mm}^2$ 的高 b 值主要影响 DWI 评分 3 分的病例, 但 $b=2000 \text{ s/mm}^2$ 不改变 $b=1400 \text{ s/mm}^2$ 时的 DWI 评分, $b=1400 \text{ s/mm}^2$ 可能更适用于外周带前列腺癌的 PI-RADS v2 中 DWI 评分。

PO-2844

3.0T MRI 扩散加权成像及灌注加权成像在肾脏良恶性肿瘤鉴别诊断中的价值

许晓雯、王培军
上海市同济医院

目的 评价 3.0T MRI 扩散加权成像(DWI)和灌注加权成像(PWI)在肾脏肿瘤良恶性及不同病理组织学类型间鉴别诊断的价值。

方法 15 例正常志愿者及 46 例经病理证实的肾脏肿瘤患者 (肾透明细胞癌 18 例, 乳头状肾细胞癌 8 例, 肾嫌色细胞癌 7 例, 肾血管平滑肌脂肪瘤 13 例) 行 3.0T MRI DWI 及 PWI 扫描。采用单因素方差分析方法比较 PWI 所得 K_{trans} 、 K_{ep} 、 V_e , 以及 DWI 所得 ADC 值在不同病理类型肾脏肿瘤之间的差异。应用 ROC 曲线比较 DWI 及 PWI 对于鉴别肾脏肿瘤良恶性的诊断价值。

结果 正常肾实质与各病理类型肾脏肿瘤之间 ADC 值、 K_{trans} 、 K_{ep} 及 V_e 值差异均有统计学意义 ($P<0.05$)。肾脏良性肿瘤的 ADC 值高于各组恶性肿瘤; 恶性肿瘤中, 肾透明细胞癌的 ADC 值高于乳头状细胞癌及嫌色细胞癌 ($P<0.05$)。肾脏各组恶性肿瘤的 K_{trans} 值及 V_e 值均高于良性肿瘤 ($P<0.05$), 恶性肿瘤中, 仅肾透明细胞癌的 K_{ep} 值高于良性肿瘤 ($P<0.05$)。肾透明细胞癌、肾乳头状细胞癌及肾嫌色细胞癌的 K_{trans} 值逐渐减低, 差异均具有统计学意义 ($P<0.05$)。肾透明细胞癌的 V_e 值高于肾乳头状细胞癌 V_e 值 ($P<0.05$)。ROC 曲线鉴别肾脏肿瘤良恶性的诊断价值, K_{trans} AUC=0.937, 灵敏度和特异度分别为 87.9% 和 85.7%, 临界值为 $0.38/\text{min}$; ADC AUC=0.823, 灵敏度和特异度分别为 72.7% 和 92.9%, 临界值为 $1.40 \times 10^{-3} \text{ mm}^2/\text{s}$; V_e AUC=0.803, 灵敏度和特异度分别为 78.8% 和 71.4%, 临界值为 $0.29/\text{min}$; K_{ep} 则表现出较低的鉴别诊断价值。

结论 3.0T MRI DWI 及 PWI 能有效鉴别肾脏肿瘤良恶性及不同病理组织学类型。其中 K_{trans} 值的诊断价值最高, 但 ADC 值所提供的信息也是不可替代的。

PO-2845

MRI 多模态成像技术在肾透明细胞癌分级诊断中的应用价值

许晓雯、王培军
上海市同济医院

目的 评价 3.0T MRI 扩散加权成像(DWI)、灌注加权成像(PWI)及磁敏感加权成像(SWI)在肾透明细胞癌(ccRCC) Fuhrman 核分级诊断中的应用价值。

方法 选取 35 例经手术病理证实为 ccRCC 并进行 Fuhrman 核分级患者, 均行 3.0T MRI DWI、PWI 及 SWI 扫描。采用 ANOVA 比较 DWI 所得 ADC 值、PWI 所得 Ktrans 值及 SWI 所得 ITSS 评分在 ccRCC 不同核分级之间的差异, 采用 Pearson 相关性比较 DWI、PWI 及 SWI 三种检查方法之间相关性, 同时应用 ROC 曲线评价三者对于 ccRCC 高、低级别鉴别诊断的价值。

结果 35 例经病理证实 ccRCC 患者 Fuhrman 核分级(其中 I 级 6 例、II 级 17 例、III 级 8 例、IV 级 4 例), III 级与 IV 级间 ADC 值差异不具有统计学意义, 其他各组间差异均具有统计学意义($P < 0.05$); Ktrans 值和 ITSS 评分随着肿瘤分级的升高而逐渐增高($P < 0.05$), 其中 III 级与 IV 级间 ITSS 评分差异不具有统计学意义, 其他各组间差异均具有统计学意义($P < 0.05$)。Pearson 相关性比较发现 Ktrans 与 ADC 之间呈强负相关($r = -0.64$), Ktrans 与 ITSS 之间呈中等正相关($r = 0.55$), ADC 与 ITSS 之间呈中等负相关($r = -0.57$) ($P < 0.05$)。运用 ROC 曲线比较 ccRCC 高(I 和 II 级)、低(III 和 IV 级)级别的诊断价值, Ktrans AUC=0.857, 灵敏度和特异度分别为 89.9%和 85.7%; ADC AUC=0.723, 灵敏度和特异度分别为 72.7%和 92.9%; ITSS 评分 AUC=0.763, 灵敏度和特异度分别为 78.8%和 71.4%。

结论 3.0T MRI DWI、PWI 及 SWI 分别从不同角度反映 ccRCC 的血供及细胞结构特征, 三者联合为 ccRCC 的 Fuhrman 核分级诊断提供有利价值。

PO-2846

多模态磁共振成像对宫颈癌化疗后早期效果评估的价值

刘忠柳、王培军
上海市同济医院

目的 探索多模态磁共振成像对宫颈癌化疗后早期效果评估的价值

方法 收集同济大学附属同济医院 2015 年 4 月至 2016 年 4 月期间, 经细胞学涂片或活检证实为宫颈癌且接受化疗的患者 15 例。所有患者在化疗前及化疗后 1 个月分别行多模态磁共振成像检查, 成像序列包括常规 T1WI、T2WI、DWI、BOLD-MRI 及 DCE-MRI, 并测得相关检查指标, 包括肿瘤最大径 dmax、DWI 检查指标 ADCmean; BOLD-MRI 检查指标 R2*值; DCE-MRI 检查指标 Ktrans 及 Ve 值。比较化疗前后肿瘤最大径 dmax 与多模态磁共振检查指标的变化; 并比较分析化疗后肿瘤大小变化(肿瘤最大径变化率 $\Delta dmax\%$)与化疗前多模态磁共振成像检查指标的相关性。

结果 (1) 化疗后肿瘤最大径 dmax 较化疗前明显减小 ($P < 0.05$); 化疗后肿瘤 ADCmean 较化疗前明显升高 ($P < 0.05$); 化疗后肿瘤 R2*值较化疗前明显升高 ($P < 0.05$); 化疗后肿瘤 Ktrans 较化疗前明显升高 ($P < 0.05$), 而化疗后肿瘤 Ve 值较化疗前虽有所升高, 但不具有明显统计学意义 ($P > 0.05$); (2) 化疗前后肿瘤最大径变化 $\Delta dmax\%$ 与化疗前肿瘤基线 R2*值呈明显负相关 ($r = -0.742$, $P < 0.05$); 而与化疗前肿瘤 ADCmean、Ktrans、Ve 值无明显相关性 ($P > 0.05$)。

结论 多模态磁共振成像对宫颈癌化疗后早期效果评估具有一定价值。

PO-2847

磁共振高分辨率血管壁成像技术对 大脑深静脉系统显示的应用价值

王亚弟

深圳市宝安区人民医院

摘要：目的：评估磁共振高分辨率血管壁成像技术（HR-VWI）在显示大脑深静脉系统的应用价值。方法：回顾性分析 2020 年 1 月至 2022 年 12 月在深圳市宝安区人民医院均接受颅脑磁共振平扫，高分辨率磁共振血管壁成像，DSA 颅内血管造影检查的患者 47 例。行冠状位 3D-T1WI-SPACE 序列并应用后处理软件进行重建，由 2 位高年资的影像科医师采用双盲法对 47 例受试者的双侧基底静脉（BVR）、大脑内静脉（ICV）、丘脑纹状体静脉（TSV）、透明隔静脉、尾状核头静脉和尾状核静脉数目分别进行计数。采用双盲法对 47 例双侧丘脑纹状体静脉主干及其属支的显示完整性进行评分。以 DSA 结果为金标准，使用 Kappa 一致性检验分析 HR-VWI 与 DSA 两种血管成像技术对于大脑深静脉系统显示的一致性。选取大脑内静脉和丘脑纹状体静脉距离静脉角顶点 5 mm 处为测量点，由 2 位高年资的影像科医师对 HR-VWI 及 DSA 静脉影像上的此两处直径进行测量，取两位测量者测量数据的平均值进行统计学分析。结果 大脑内静脉、基底静脉、丘脑纹状体静脉、透明隔静脉、尾状核静脉和尾状核头静脉的显示率分别为 100%、100%、94.0%、97.9%、92.0%、90.0%。Kappa 一致性检验，高分辨率血管壁成像技术对大脑深静脉系统的显示率与 DSA 结果具有强一致性（Kappa=0.858， $P<0.05$ ）；高分辨率血管壁成像技术测量双侧大脑内静脉和丘脑纹状体静脉的直径值要小于 DSA 测量（ $P<0.05$ ）。结论：高分辨率磁共振血管壁成像技术能够清晰显示大脑内静脉及属支的解剖走行，在脑深部静脉直径定量测量中有一定价值，可作为大脑深静脉系统检查的常规检查。

PO-2848

动态增强磁共振灌注参数对结直肠癌患者 微卫星不稳定的预测价值

马文婷、黄刚

甘肃省人民医院

目的：结直肠癌发病率、死亡率很高，各国指南均推荐对所有结直肠癌患者检测微卫星不稳定性（Microsatellite instability, MSI），用于免疫治疗方法选择及疗效评估。本研究探索动态增强磁共振（DCE-MRI）对微卫星不稳定的预测价值。方法：回顾性分析经病理证实的 11 例 MSI 和 55 例 MSS 结直肠癌患者，这些患者均术前接受 DCE-MRI 及 DWI 检查。使用 Tissue 4D 后处理软件及 Tofts 模型计算以下 4 个灌注参数：容积转移常数（Ktrans）、回流速率（Kep）、血管外细胞外容积分数（Ve）和 初始曲线下面积（iAUC）。两名观察者独立测量灌注参数及 ADC 信号，采用 Mann-Whitney U 检验、独立样本 t 检验比较两组间指标有无统计学差异。采用多因素 logistic 回归分析多个指标，绘制受试者工作特征曲线（ROC）以评估这些参数的诊断效能。结果：MSI 结直肠癌患者 ktrans、kep、iAUC 显著低于 MSS 患者（ $P\leq 0.001$ ）。MSI 患者 ADC 显著高于 MSS 患者（ $P=0.000$ ）。MSI 患者 Ve 值与 MSS 患者无统计学差异（ $P=0.536$ ）。ROC 结果显示，Kep 独立诊断效能最大，曲线下面积（AUC）0.890，敏感度 76.4%，特异度 90.9%，高于 ADC、iAUC、Ktrans（ $P<0.001$ ）。使用多参数联合诊断模型显示，kep 联合 ADC 诊断微卫星不稳定性准确度最高（ $P=0.000$ ），AUC 0.970，敏感度 90.9%，特异度 100%。其次为 kep 联合 iAUC 诊断效能，AUC 0.926，敏感度 85.5%，特异度 100%。结论：MRI 成像中，灌注参数 kep 联合 ADC 为预测结直肠癌患者微卫

星状态提供了很高的诊断价值,可以初步实现微卫星状态的早期影像学评价,从而更好地指导结直肠癌患者的免疫治疗。

PO-2849

mDIXON-quant 序列评估脂肪肝严重程度与 尿液农药水平的关系

马培旗¹、袁玉山¹、彭彬¹、孙舒宝¹、薛斌²、高红亮²

1. 阜阳市人民医院

2. 南京医科大学附属逸夫医院

摘要 探索 mDIXON-quant 序列评估脂肪肝 (FLD) 严重程度与尿液农药水平的关系。

方法 53 例志愿者行腹部磁共振扫描,采用 mDIXON-quant 序列测量肝脏脂肪分数 (FF 值),根据肝脏 FF 值分为健康对照组、轻度 FLD 组、中重度 FLD 组。同时搜集志愿者晨尿样本,采用 β -葡萄糖醛酸酶水解法和高效液相色谱-串联质谱法测定尿液农药水平,包括毒死蜱、百草枯和环唑醇。比较不同组间尿液毒死蜱、百草枯和环唑醇含量的差异,相关性分析志愿者肝脏 FF 值与尿液毒死蜱、百草枯和环唑醇含量的相关性,ROC 曲线分析尿液中毒死蜱、百草枯和环丙康唑水平对 FLD 诊断的敏感性和特异性。

结果 根据肝脏 FF 值,对照组 20 例,轻度 FLD 组 16 例,中重度 FLD 组 17 例。轻度 FLD 组、中重度 FLD 组尿毒死蜱、百草枯含量均高于正常组,差异均具有统计学意义 ($P < 0.05$),但轻度 FLD 组与中重度 FLD 组组尿中毒死蜱、百草枯水平均无统计学差异 ($P > 0.05$),此外,三组间尿中环唑醇水平均无统计学差异 ($P > 0.05$)。相关性分析显示尿中毒死蜱和百草枯水平与肝脏 FF 值均呈正相关 (r_s 分别为 0.659、0.481, $P < 0.05$),但尿中环丙康唑水平与 FF 值无相关性 ($P > 0.05$)。ROC 曲线显示,尿毒死蜱含量大于 4.21ng/ml 有助于 FLD 诊断, AUC 为 0.924,灵敏度为 78.8%、特异度为 99.5%;尿百草枯含量大于 0.315ng/ml 有助于 FLD 的诊断, AUC 为 0.832,灵敏度为 69.7%、特异度为 80.0%。

结论 尿液毒死蜱、百草枯与肝脏 FF 值呈正相关,可能是 FLD 的潜在预测因子,为预防和治疗 FLD 提供新思路。

心脏磁共振特征追踪成像在鉴别心脏淀粉样 变性亚型中的诊断性能

庄白燕、李爽、徐磊

中国医学科学院安贞医院

目的: 本研究的主要目的是利用磁共振特征追踪成像 (CMR-FT) 获得淀粉样变患不同亚型者的左心室整体及各区域层面的心肌应变值,探讨其对淀粉样变分型的评估价值。

材料与方法: 本研究通过心内膜活检确诊淀粉样变,并根据免疫组化,血清免疫固定电泳和核医学闪烁成像,回顾性地连续性纳入了 20 例免疫球蛋白轻链型心肌淀粉样变性 (cardiac light-chain amyloidosis, AL-CA) 患者和 22 例转甲状腺素蛋白型心肌淀粉样变性 (cardiac transthyretin-related amyloidosis, ATTR-CA) 患者。通过评估两组延迟强化的类型和范围,反映组织特征学差异。通过 CMR-FT 技术得到左心室整体 (2D 和 3D) 以及各心肌层面 (心外膜下和心内膜下) 径向、周向和纵向应变,分析各参数的组间差异。用 ROC 曲线分析应变参数在鉴别两种 CA 类型中的准确性。

结果: 校正 BSA 后,ATTR 组的左室心肌质量略高于 AL 组 ($106.38 \pm 29.79 \text{ mL/m}^2$ VS. $100.04 \pm 36.73 \text{ mL/m}^2$)。ATTR-CA 型患者的 LGE 较多弥漫分布 (60%), AL-CA 型患者的 LGE 多

分布于心内膜下 (73%)。ATTR-CA 组的左室心肌整体 GRS (3D) ($12.96 \pm 5.21\%$ VS. $16.58 \pm 4.39\%$), GLS (2D) ($-6.7\% \pm 1.94$ VS. $-7.87 \pm 1.7\%$), GCS-epi ($-8.41 \pm 2.78\%$ VS. $-10.51 \pm 3.1\%$) 及 GLS-epi ($-6.49 \pm 2.03\%$ VS. $-8.15 \pm 1.86\%$) 的绝对值均低于 AL-CA 组 (p 值均 < 0.05)。GCS-epi 和 GLS-epi 鉴别两种心肌的准确性最高, AUC 值均为 0.705。
结论: CMR-FT 成像能够区分 ATTR-CA 和 AL-CA 这两种常见亚型。

PO-2851

钆贝葡胺增强磁共振成像的定量信息可预测单发肝细胞癌的增殖亚型

丁菲儿、梁长虎、赵新亚
山东第一医科大学附属省立医院 (山东省立医院)

目的 研究钆贝葡胺增强磁共振成像 (MRI) 得出的定量参数对预测肝细胞癌 (HCC) 分子亚型和总生存期的价值。

方法 这项回顾性研究纳入了 223 例接受钆贝葡胺增强磁共振成像的单发肝细胞癌患者。所有肝细胞癌病灶均已切除并经病理证实。在肝胆期测量了病灶与肝脏对比增强比 (LLCER) 和病灶与肝脏对比度 (LLC)。通过 logistic 回归评估了增殖型肝细胞癌的潜在风险因素。LLCER 和 LLC 预测增殖型肝细胞癌的能力通过接收者操作特征曲线 (ROC) 进行评估。采用 cox 比例回归模型对预后因素的生存结果进行评估。

结果 LLCER 是增殖性肝细胞癌的独立预测因子 (OR 为 0.015; 95% 置信区间 [CI] 为 0.008-0.022; $P < 0.001$)。ROC 曲线下面积为 0.812 (95% CI, 0.748-0.877), 高于 LLC、甲胎蛋白 > 100 ng/ml、卫星结节和边缘动脉期增高 (所有 P 均 ≤ 0.001)。LLCER $< -4.59\%$ 的 HCC 患者的增殖性 HCC 发生率明显高于 LLCER $\geq -4.59\%$ 的患者。在随访期间, LLCER 是预测 HCC 患者总生存期的独立指标 (危险比为 0.070; 95% CI 为 0.015-0.324; $p = 0.001$)。

结论 钆贝葡胺增强 MRI 在肝胆期的定量参数可以预测单发 HCC 的增殖亚型, 准确率为 81.2%。钆贝葡胺增强磁共振成像的定量信息可提供有关 HCC 亚型的重要信息。它可能对设计新型治疗策略 (如靶向治疗或免疫治疗) 具有重要价值。

PO-2852

利用 MRI 评价不同运动强度的正常体重青年男性的脂肪组织和肌肉的含量和功能

李丽、方纪成、朱文珍
华中科技大学同济医学院附属同济医院

目的: 本研究旨在通过 Dixon MRI 来表征正常体重男性在三种运动水平下的棕色脂肪组织 (BAT)、白色脂肪组织 (WAT) 和肌肉组织的体积和活性, 从而探索运动在减肥中的作用, 并为制定运动计划提供依据。

方法与材料: 对 10 名高强度运动 (HIE) 运动员、20 名中等强度运动 (MIE) 运动员和 19 名不运动的健康男性对照组 (NCM) 进行颈部和锁骨上区域的通过 3D Dixon MRI 扫描。利用 Dixon 数据获得如下 12 个参数: 肌肉组织的总体积 (totalMUS)、BAT 的总体积 (totalBAT) 和 WAT 的总体积 (total WAT), BAT 组织内的平均 FWF 值 (fwfBAT), 总脂肪组织内的平均 FWF 值

(fwfFAT), WAT 内的平均 FWF 值 (fwfWAT), 肌肉组织内的平均 FWF 值 (fwfMUS)。此外, BATr 或 WATr 定义为 BAT 或 WAT 在总脂肪 (BAT 和 WAT 的总和) 的占比, 而 Musp、BATp 和 WATp 分别定义为肌肉、BAT 和 WAT 在总组织 (BAT、WAT 和肌肉的总和) 的占比。对三组之间进行比较这 12 个参数。

结果:HIE 的肌肉和 BAT 体积显著高于其他两组 ($P<0.05$), 肌肉是比 NCM ($P<0.01$) 高。同时, 也显著高于另外两个组。相反, 发现 NCM 的 fwfFAT 和 fwfBAT 显著高于其他两组 ($P<0.05$), 但 HIE 和 MIE 之间的比较没有差异。对于 fwfWAT, NCM 高于 MIE, 但不高于 HIE ($P<0.05$)。HIE 和 MIE 的 MUSp 高于 NCM, 而 BATp 和 WATp 较低 ($P<0.05$)。此外, HIE 和 MIE 的 BATr 高于 NCM 组, 而 WATr 较低 ($P<0.05$) (图 1)。

结论:高强度运动可增加肌肉体积。中等强度运动者也和高强度运动者一样, 可以增加肌肉和褐色脂肪组织比例, 减少白色脂肪组织比例。因此, 中等强度的运动就可满足增加肌肉, 促进脂肪褐变, 减少白色脂肪, 从而维持代谢稳态。

PO-2853

BASS-TRANCE 非增强血管成像技术在下肢动脉疾病的应用价值

张前^{1,2}、姜兴岳^{1,2}、曹赫^{1,2}、王玉堂^{1,2}、黄俊霖^{1,2}、黄娅楠^{1,2}、祖涵瑜^{1,2}、张永镇³

1. 滨州医学院

2. 滨州医学院附属医院放射科

3. 滨州医学院附属医院介入血管外科

目的: 评估非对比增强血管成像技术 BASS-TRANCE 序列技术 (背景抑制单激发心电激发非对比增强血管成像) 在下肢动脉疾病的可行性和临床价值。

方法: 30 例下肢动脉疾病的患者分别接受了 BASS-TRANCE、下肢 CT 血管造影 (CTA) 及下肢动脉数字减影血管造影 (DSA) 检查。成像范围包括腹主动脉远端及整个下肢血管, 分析了 19 个动脉节段, 由两名经验丰富的医师采用 3 分法分别对 CTA 和 BASS-TRANCE 的图像质量进行评分, 并对下肢动脉狭窄程度分为 5 级评价, 分别采用 Mann-WhitneyU 检验和卡方检验进行比较。以 DSA 结果为金标准, 采用 McNemar 检验比较 CTA 和 BASS-TRANCE 对下肢动脉 >50% 狭窄检测的敏感度和特异度。运用 Kappa 检验的方法评价两名观察者之间的一致性。

结果: BASS-TRANCE 能够可靠地观察下肢动脉的解剖结构和流通情况。在可靠的 540 个节段的血管中 (BASS-TRANCE 和 CTA 分别排除了 10 个和 20 个不确定的血管节段), BASS-TRANCE (2.53 [95% 置信区间: 2.46 至 2.57]) 和 CTA (2.49 [95% 置信区间: 2.43 至 2.55]; $p=0.5041$) 的主观图像质量评分相似。此外, BASS-TRANCE 在对血管狭窄 >50% 的评估上敏感度和特异度分别为 84.6% 和 97.9%, 与 CTA (敏感度和特异度分别为 86.3% 和 95.4%) 相似。BASS-TRANCE ($k>0.81$) 和 CTA ($k>0.82$) 狭窄检测的观察者之间一致性较高。

结论: BASS-TRANCE 作为一种无创的非对比增强血管成像技术, 与 DSA 相比, 具有较高诊断准确性, 同时与 CTA 相比不易出现图像伪影, 实现了下肢 6 分钟超快速高分辨率下肢血管成像, 用以观察下肢动脉血管的解剖结构及流通情况, 有望在术前通过极短的检查时间给予临床医生靶向指导作用。

PO-2854

基于线圈匀场技术改善颈部压脂成像质量的临床应用研究

秦智

东南大学附属中大医院

目的 颈部常规扫描图像噪声高、成像质量不佳、影响临床诊断效力。本研究采用 siemens 3.0T“生命感知”核磁的线圈匀场技术（即：Coil Shim 技术）对颈部扫描图像进行研究，旨在提高图像整体质量，优化扫描参数。

方法 回顾性分析 2020 年 6 月至 2020 年 12 月在东南大学附属中大医院放射科行颈部 MR 扫描的患者 60 例，使用 Siemens Vida 3.0T 磁共振扫描仪，采用磁体 20 通道头颈联合线圈和 Body 体线圈，对患者行大 FOV 冠状位 T2 快速自旋回波频率脂肪抑制技术和 T2 快速自旋回波频率抑制技术（施加 Coil Shim 技术），扫描结束后在 Syngo.via 工作站进行图像测量。随后邀请 3 名影像科高年资诊断医师采用主观跟客观的评价方法对 60 例患者进行图像质量进行评价。通过医生的 Cronbach's Alpha 重复性测定后对评分数据进行 SPSS18.0 统计软件分析。

结果 对比分析 T2 COR FS 与 T2 COR FS(施加 Coil shim)的图像质量：信噪比（SNR FS=37±8、FS Coil Shim=58±9），差异有统计学意义（ $t=4.653$ ， $p<0.04$ ）。2 种脂肪抑制的脂肪信号均匀度的评分分别为：（FS=2.1±0.4、FS Coil Shim=3.3±0.7）。（ $t=2.435$ ， $p<0.05$ ）。整个图像解剖细节显示：（FS=2.8±0.6、FS Coil Shim=3.2±0.6。）（ $t=2.375$ ， $p<0.05$ ）。

结论 采用 Coil Shim 技术对颈部进行成像，相较于传统 T2 FS 序列信噪比显著提高，颈部解剖细节显示更好，扫描时间无变化。因此后期可以帮助我们进一步优化参数，减少扫描时间，帮助医师提高诊断信心。

PO-2855

儿童膝关节软骨 DTI 成像中 b 值和弥散梯度方向数对成像结果的影响研究

程卓

重庆医科大学附属儿童医院

目的：探讨正常学龄儿童膝关节软骨弥散张量成像（DTI）b 值及弥散梯度方向数（NDG）对成像结果的影响。**方法：**招募 6-8 岁、8-10 岁、10-12 岁年龄段正常儿童志愿者各 10 名，每个年龄组男、女各 5 名，所有儿童均行左膝关节 MRI 常规及 DTI 序列扫描，DTI 序列 b 值分别为 300、600、900、1200s/mm²，NDG 分别为 6、15、25、35、45。扫描结束后重建膝关节 FA 图、ADC 图，分别测量膝关节髌软骨、髌股关节面软骨、股骨内侧髁及外侧髁软骨的 FA 值、ADC 值，重建各部分软骨的纤维束走行图，统计分析各年龄段不同 b 值和不同 NDG 对软骨 FA 值、ADC 值及纤维束显示的影响。**结果：**（1）固定 NDG 并变化 b 值，各年龄段膝关节软骨的 FA 值和 ADC 值均随 b 值的增加而减小，ADC 值减小的趋势较大，FA 值减小的趋势在 b 值≥600 s/mm² 逐渐平缓；FA 值随年龄的增大而增大，与年龄相关性呈正相关（ $r=0.361$ ， $P<0.05$ ）；ADC 值随年龄的变化差异无统计学意义（ $P>0.05$ ）；相同年龄段女性组的 FA 值大于男性组（ $P<0.05$ ），男性组的 ADC 值大于女性组（ $P<0.05$ ）；b 值越大，软骨显示的纤维束越少。（2）固定 b 值并变化 NDG，各年龄段膝关节软骨的 FA 值随 NDG 的增加而减小，NDG≥25 时 FA 值减小的趋势逐渐平缓；FA 值随年龄的增大而增大，与年龄相关性呈正相关（ $r=0.225$ ， $P<0.05$ ）；相同年龄段女性组的 FA 值大于男性组（ $P<0.05$ ），男性组的 ADC 值大于女性组（ $P<0.05$ ）；ADC 值随 NDG、年龄的增加均无明显规律；软骨纤维束的显示随 NDG 的增加而显示得清晰、准确，当 NDG≥25 时，纤维束的方向和数量趋于稳定。**结论：**DTI 可用于定量评估儿童膝关节软骨，b 值=600 s/mm²、NDG=25 时，对 DTI 的测量指标 FA 值和 ADC 值影响较小，纤维束显示较稳定。

PO-2856

“显微镜”高分辨率 MRI 鉴别良、恶性皮肤局灶隆起性结节

靳新娟、蔡大幸、范金蕾、于德新、李安宁
山东大学齐鲁医院

目的：探讨“显微镜”高分辨磁共振成像（MHR-MRI）在皮肤局灶隆起性结节良、恶性鉴别中的价值。

方法：对 2020 年 4 月至 2023 年 4 月于山东大学齐鲁医院就诊并行术前 MHR-MRI 检查的 45 例皮肤局灶隆起性结节进行前瞻性分析。根据术后病理结果将其分为良性组（n=19）和恶性组（n=26）。分别对两组病灶的 MHR-MRI 特征进行测量及评估，包括形态、大小、边界是否清晰、基底的宽窄、侵犯皮肤的层面、周围有无血管、水肿及淋巴结，以及在 T1WI、T2WI 图像上病变的信号强度，同时对上述特征在良、恶性组，以及在基底细胞癌、隆突性皮肤纤维肉瘤和鳞癌三个类型之间的差异进行比较。

结果：在良性组，MHR-MRI 显示病灶形态多为类圆形，与恶性组存在显著差异（ $P<0.001$ ）；恶性组病灶更易出现尖角楔入征（ $P<0.001$ ）、累及表皮真皮（ $P<0.001$ ）、边界不清（ $P=0.003$ ），以及存在周围血管（ $P=0.008$ ）。在基底细胞癌、隆突性皮肤纤维肉瘤、鳞癌之间，MHR-MRI 显示基底细胞癌及隆突性皮肤纤维肉瘤的宽基底特征较鳞癌更多见（ $P=0.011$ ），隆突性皮肤纤维肉瘤和鳞癌比基底细胞癌更常出现尖角楔入征（ $P=0.001$ ）。

结论：MHR-MRI 作为一种新型的皮肤高清成像方法，有助于皮肤良、恶性局灶隆起性结节及常见恶性肿瘤的鉴别。

PO-2857

多模态 MRI 影像组学在脑膜瘤分级预测中的研究

胡建平
福建医科大学附属第一医院

目的：评估基于 CMRI、ADC 图或 SWI 的影像组学模型在脑膜瘤分级预测中的应用价值；同时探讨联合 CMRI、ADC 图 SWI 的多模态影像组学模型对脑膜瘤的分级预测效能，以期获得最佳的预测模型，提高对该肿瘤的术前分级预测准确性。

材料和方法：回顾性分析 229 例低级别和 87 例高级别脑膜瘤患者的临床及影像学资料。分析传统影像学特征，基于整个肿瘤体积提取 CMRI、ADC 图及 SWI 的影像组学特征，采用 LASSO 进行特征选择。在不进行过采样或采用 SMOTE 的情况下，采用 RF 分类器构建 7 个影像组学模型。采用 LOOCV 训练和验证各影像组学模型性能。采用 ROC 曲线评估不同影像组学模型对脑膜瘤的分级预测效能，并采用 DeLong 检验比较各模型 AUC 的差异。

结果：在不进行过采样的情况下，CMRIADC 和 SWI 模型的 AUC 分别为 0.79、0.75 和 0.71。cMRI+ADC 模型与 CMRI 模型的 AUC 之间差异无统计学意义；ADC+SWI 模型的 AUC 低于 cMRI 模型；CMRI+SWI 模型的 AUC 高于 cMRI 模型；而 cMRI+SWI 模型与 cMRI+ADC+SWI 模型的 AUC 之间差异无统计学意义。在采用 SMOTE 情况下，cMRI、ADC 和 SWI 模型的 AUC 分别为 0.77、0.76 和 0.68。cMRI+ADC 模型与 CMRI 模型的 AUC 之间差异无统计学意义；ADC+SWI 模型的 AUC 低于 cMRI 模型；cMRI+SWI 模型的 AUC 高于 cMRI 模型，而 cMRI+SWI 模型与 CMRI+ADC+SWI 模型的 AUC 之间差异无统计学意义。

结论：(1)cMRI、ADC 图及 SWI 的影像组学模型在脑膜瘤的分级预测中均有一定的价值；(2)联合 CMRI 和 SWI 的影像组学模型对脑膜瘤的分级预测效能最佳，联合 CMRI、ADC 图和 SWI 的影像组学模型并不能进一步提高对脑膜瘤的分级预测效能。

PO-2858

DWI 联合 SWI 及 DSC-PWI 在 IDH 突变型星形细胞瘤分级中的价值

杨谢锋

福建医科大学附属第一医院

目的 IDH 突变型星形细胞瘤的准确分级对于制定治疗策略和评估患者预后至关重要。本研究的目的是探讨 DWI、SWI 和 DSC-PWI 在 IDH 突变型星形细胞瘤分级中的作用。材料与方法 回顾性收集 107 例接受 DWI、SWI 和 DSC-PWI 检查的 IDH 突变型星形细胞瘤患者。评估最小表观扩散系数 (ADCmin) 值、肿瘤内磁敏感信号 (ITSS) 和最大相对脑血容量 (rCBVmax) 值。比较 II 级肿瘤与 III 级肿瘤、III 级肿瘤与 IV 级肿瘤以及 II+III 级肿瘤和 IV 级肿瘤之间的 ADCmin、ITSS 和 rCBVmax 值。使用 Logistic 回归、十折交叉验证和受试者操作特征 (ROC) 曲线来评估其诊断性能。结果 与 III 级星形细胞瘤相比, IDH 突变型 IV 级星形细胞瘤显示出更低的 ADCmin 值和更高的 rCBVmax 值 (校正后 $P<0.001$)。IDH 突变型 III 级星形细胞瘤的 ITSS 水平显著低于 IV 级星形细胞瘤 (校正后 $P<0.001$)。IDH 突变型 II 级和 III 级星形细胞瘤的 ITSS 水平差异有统计学意义 (校正后 $P=0.002$)。在区别 II+III 级和 IV 级肿瘤中, 联合 ADCmin、ITSS 和 rCBVmax 的 AUC 值最大。结论 ADCmin、rCBVmax 和 ITSS 可用于 IDH 突变型星形细胞瘤的分级。联合 ADCmin、ITSS 和 rCBVmax 可提高 IDH 突变型星形细胞瘤分级的诊断性能。

PO-2859

Gd-BOPTA 增强 MRI 鉴别 LI-RADS M 类别中肝细胞癌与肝内肿块型胆管细胞癌的辅助征象及其附加价值

郑婉静

福建医科大学附属第一医院

目的 探讨 Gd-BOPTA 增强 MRI 上鉴别肝细胞癌 (HCC) 和肝内肿块型胆管细胞癌 (IMCC) 的可靠影像征象及其附加价值。材料与方法 回顾性收集 116 例类别为 LI-RADS M (LR-M) 的患者, 其中 82 例经组织学证实为 HCC、34 例为 IMCC。将单因素分析中 P 值 <0.05 的所有变量纳入多变量 Logistic 回归分析, 在添加辅助影像征象前后分别建立诊断模型 1 和模型 2, 以寻找可靠的肝癌诊断预测因子。采用受试者工作特征 (ROC) 曲线和 De-long 检验对两种模型进行比较。结果 82 例 HCC 中有 49 例 (59.8%) 包膜强化, 频率显著高于 IMCC ($P<0.001$)。根据 LI-RADS 的主要表现、LR-M 表现和临床病理因素, 在模型 1 中, 甲胎蛋白升高 ($OR=10.676$, $95\%CI=2.125-4.470$, $P=0.004$) 和包膜强化 ($OR=20.558$, $95\%CI=4.470-94.550$, $P<0.001$) 是独立的危险因素。在模型 2 中, 包膜强化 ($OR=13.161$, $95\%CI=1.725-100.400$, $P=0.013$)、间隔强化 ($OR=17.983$, $95\%CI=1.049-308.181$, $P=0.046$)、肝胆期肿瘤中央小片状高信号 ($OR=44.386$, $95\%CI=1.610-1223.484$, $P=0.025$) 是肝细胞癌的独立危险因素。模型 2 的 AUC 值 (0.918, $P=0.021$) 显著高于模型 1 (0.845)。当满足模型 2 中任意两个或两个以上的预测因子时, 灵敏度为 91.46%, 准确率达 87.93%。结论 包膜强化是帮助识别肝细胞癌的可靠影像征象。增加辅助影像征象提高了 LR-M 中诊断 HCC 的敏感性和准确性, 同时对 IMCC 进行了区分。

PO-2860

基于 ASL 成像机器学习智能预测糖尿病患者早期肾损伤及进展的新应用

马菲尔¹、于珮¹、邵嫻¹、蒙佳辉²、周赛君¹、李秋红¹、孙海珍¹、王彤丹¹

1. 天津医科大学朱宪彝纪念医院

2. 中国医学科学院放射医学研究所

目的

本研究采用动脉自旋标记灌注成像 (ASL) 探讨临床生物学指标与影像组学特征能否预测及早期识别 T2DM 患者肾脏损伤, 分析影像组学纹理特征参数与生物学指标相关性的价值, 识别糖尿病患者早期肾脏损伤的影像学危险因子, 为预测及诊断糖尿病早期肾脏损伤及进展提供新思路、新方法。

方法

选取行 fMRI 的 163 例受试者作为共同研究对象。采集其临床生物学资料, 对所有受试者行腹部核磁序列扫描, 提取双肾影像学资料, 建立联合影像组学标签识别糖尿病早期肾损伤模型, 提取糖尿病早期肾损伤影像学危险因子, 分析有意义纹理特征参数与临床生物学指标相关性分析。同时, 前瞻性随访分析糖尿病患者肾脏损伤, 使用机器学习 7 种算法建立预测糖尿病肾脏损伤进展影像学指标模型及影像联合生物学指标综合模型, 分析预测糖尿病肾脏损伤影像组学危险因素。

结果

RBF 值可早期识别临床指标未异常的 T2DM 患者不同时期肾脏损伤。健康对照组、糖尿病组及糖尿病肾病组 RBF 值均呈下降趋势, 肾脏 RBF 值与 eGFR 呈正相关, 与 UACR、年龄、BMI、DBP、BUN、SCr 呈负相关。通过机器学习筛选出 8 个最有价值的纹理特征为。AUC0.778, 敏感性 71, 特异性 74.4; 机器学习最佳模型 naive bayes AUC 为 0.734。

结论

影像学指标在临床指标肾功能正常的糖尿病患者中已有变化, 提示糖尿病患者可能已出现肾脏早期损伤, ASL 序列可敏感识别肾脏肾功能及血流的变化。与 eGFR 相比, RBF 值可更早识别 DM 患者肾脏早期血流量的变化。基于机器学习算法影像学指标是早期敏感识别糖尿病患者肾功能损伤及进展的有效标志物。影像数据联合临床生物学指标可早期、智能预测 T2DM 患者早期肾功能损伤及进展, 成为有高度敏感性和特异性的预测模型。

PO-2861

基于多参数 MRI 的放射组学模型预测弥漫中线胶质瘤的 H3 K27M 突变状态: 不同序列和机器学习技术的比较研究

郭伟、余兰

福建医科大学附属第一医院

目的: 基于多参数磁共振成像的放射组学模型预测弥漫中线胶质瘤 (DMG) H3 K27M 突变状态的性能尚未得到全面评估。多参数磁共振成像和机器学习技术的最佳组合仍未确定。我们比较了各种放射组学模型在不同 MRI 序列和不同机器学习技术中的表现。

方法: 我们回顾性地纳入了 102 例经病理证实的 DMG 患者 (其中 27 例为 H3 K27M 突变型患者, 75 例为 H3 K27M 野生型患者)。从 8 个序列中提取放射组学特征, 并通过独立组合进行了 18 个特征集的分析。共有三种特征矩阵归一化算法、两种降维方法、四种特征选择器和七种分类器, 组成了 168 条机器学习流水线。通过不同的特征集和机器学习管道建立了放射组学模型。使用接收者操作特征曲线和曲线下面积 (AUC) 评估模型的性能, 并与 DeLong 检验进行比较。

结果：基于多参数磁共振成像的放射组学模型可以准确预测 DMG 中 H3 K27M 突变状态（不同序列或序列组合的最高 AUC：0.807-0.969）。然而，不同机器学习技术的结果差异很大。当使用合适的机器学习技术时，基于传统 MRI 的放射组学模型与基于高级 MRI 的模型具有相似的性能（最高 AUC：0.875-0.915 vs. 0.807-0.926；DeLong 检验， $p > 0.05$ ）。大多数模型在结合核磁共振成像序列生成时性能更佳。本研究中的最佳模型使用了所有序列的组合（AUC = 0.969）。

结论：基于多参数 MRI 的放射组学模型可用于预测 DMG 中 H3 K27M 突变状态，但不同序列和机器学习技术的性能各不相同。

PO-2862

应用动态对比增强 MRI 技术探讨直肠癌肝转移病灶环形强化特征在预后评价的价值研究

殷晓丽、石喻
中国医科大学附属盛京医院

目的：结直肠癌肝转移瘤不同的组织病理学生长模式与预后密切相关，拟利用动态对比增强磁共振成像建立一个预测模型，用于预测组织病理学生长模式并评估联合贝伐单抗治疗的效果。

方法：收集 2015 年 1 月至 2021 年 4 月期间，行结直肠癌肝转移瘤切除术的患者。其中 184 名患者接受了新辅助治疗（91 名患者接受了联合贝伐单抗的化疗）。对组织病理学生长模式进行了全面评估，通过多变量逻辑回归分析确定与组织病理学生长模式相关的 MRI 特征，并预测临床病理和放射学特征之间无病生存期（DFS）和总生存期（OS）的关系。

结果：共评估了 286 名患者（平均年龄为 59 岁；172 名男性）。DCE-MRI 的瘤周边缘持续强化（[OR], 4.22; 95% CI: 1.7, 10.2; $P=0.001$ ）是 dHGP 的独立预测因素。发现集和验证集的 AUC 分别为 0.81（95% CI: 0.80, 0.87）和 0.82（95% CI: 0.71, 0.93）。该模型是结直肠癌肝转移瘤患者预后的独立预测因子（DFS: HR, 0.3; 95% CI: 0.2, 0.4; $P < .001$; OS: HR, 0.4; 95% CI: 0.2, 0.4; $P < .001$ ）；HR: 0.4; 95% CI: 0.3, 0.6; $P < .001$ ）。通过预测模型对 CRLMs 进行分类，成功鉴别了联合贝伐单抗的化疗中获益群体（DFS（HR = 0.5, 95% CI: 0.3, 0.8; $P < .01$ ））。

结论：基于 DCE-MRI 上持续的瘤周边缘强化构建的模型可以准确识别结直肠癌肝转移瘤的组织病理学生长模式，并且该模型还可作为抗血管联合化疗的疗效的评判指标。

PO-2863

MUSE 与 FOCUS-MUSE DWI 用于肺癌的初步研究： 与 ki67 表达的相关性

夏艺、李婕
中国人民解放军海军军医大学第二附属医院

目的：与单次激发弥散加权成像（ss-DWI）对比，探讨复合灵敏度编码（MUSE）及视场优化约束无失真（FOCUS）-MUSE DWI 在不同病理亚型肺癌中的价值，并评估各参数与 ki67 表达水平的相关性。

材料与方法：对 38 例肺癌患者（23 例腺癌、8 例鳞癌、2 例腺鳞癌、1 例粘液腺癌、1 例未分化肿瘤及 3 例未分组）前瞻性的进行 ss-DWI、MUSE 及 FOCUS-MUSE DWI 扫描。视觉定性分析由两个放射科医生进行病变显著性、图像整体质量的双盲评估。通过手动绘制 ROI 获得几何失真（Dice

系数和 Hausdorff 距离) 及表观扩散系数 (ADC) 值。使用配对样本 t 检验、ICC 及 Mann-Whitney U 检验评估一致性及两种不同 DWI 之间的差异, 相关性采用 Pearson 相关分析。

结果: 两位测量者定性 (ICC>0.61) 及定量评估 (ICC>0.81) 均具有较高的一致性。FOCUS+MUSE DWI 的定性评分最高, 特别是对小病变 (长径<2cm) 及表现为混杂磨玻璃密度 (n=9) 的腺癌显示。与 ss-DWI 和 MUSE 相比, MUSE-FOCUS 的几何失真水平显著降低 ($P<0.05$)。在不同病理亚型的肺癌中, 三种 DWI 序列间平均 ADC 值没有显著差异 ($p>0.05$); MUSE+FOCUS 的最小 ADC 值低于 ss-DWI ($p<0.05$)。腺癌与鳞癌的 ADC 值无差异 ($p>0.05$), 粘液腺癌的 ADC 值最高, 低分化肺癌的 ADC 值低于中高分化肺癌 ($p<0.05$)。MUSE 的平均及最小 ADC 值与 ki67 具有较高的相关性 ($r=-0.506$, $p=0.008$; $r=-0.716$, $p<0.001$)。

结论: 与 ss-DWI 相比, FOCUS-MUSE DWI 对于小于 2cm 及表现为 mGGO 的肺癌显示, 具有较小的形变及较高的图像质量; 而 MUSE DWI 序列更能反映肺癌肿瘤细胞增殖活性, 可用于大于 2cm 实性肺癌的 DW 成像。

PO-2864

使用 DWI 和 DSC-PWI 结合常规 MR 成像对世界卫生组织 II 级和 III 级星形细胞瘤 IDH 突变状态进行无创评估

邢振、余兰
福建医科大学第一附属医院

目的: 已证明异柠檬酸脱氢酶 (IDH) 对神经胶质瘤具有诊断和预后意义。这项研究的目的是检查 DWI 和 DSC-PWI 与常规 MR 成像相结合是否可以无创地预测世界卫生组织 II 级和 III 级星形细胞瘤的 IDH 突变状态。

方法: 我们回顾性地回顾了 42 例世界卫生组织 II 级和 III 级星形细胞瘤患者的 DWI, DSC-PWI 和常规 MR 成像。使用 Mann-Whitney U 检验比较 IDH 突变型和野生型肿瘤的最小 ADC, 相对 ADC 和相对最大 CBV 值。受试者工作特征曲线和逻辑回归用于评估其诊断性能。

结果: IDH 突变的 II 和 III 级星形细胞瘤的最低 ADC 和相对 ADC 明显高于 IDH 野生型肿瘤 ($P<0.05$)。截止值 $\geq 1.01 \times 10^{-3} \text{ mm}^2/\text{s}$ 的最小 ADC 可以区分突变状态, 其敏感性, 特异性, 阳性预测值和阴性预测值分别为 76.9%, 82.6%, 91.2% 和 60.5%。在 IDH 突变预测中相对最大 CBV 的阈值 < 2.35 提供了分别为 100.0%, 60.9%, 85.6% 和 100.0% 的敏感性, 特异性, 阳性预测值和阴性预测值。DWI, DSC-PWI 和常规 MR 成像相结合来鉴定 IDH 突变, 其敏感性, 特异性, 阳性预测值和阴性预测值分别为 92.3%, 91.3%, 96.1% 和 83.6%。

结论: 常规 MR 成像, DWI 和 DSC-PWI 技术的组合对于预测 II 级和 III 级星形细胞瘤的 IDH 突变具有很高的敏感性, 特异性, 阳性预测值和阴性预测值。使用先进的半定量 MR 成像技术的策略可能会提供重要的, 非侵入性的替代标记, 应在较大的前瞻性试验中进行进一步研究。

PO-2865

瘤体及瘤周区的 DWI 和 DSC-PWI 在鉴别胶质母细胞瘤 IDH 基因分型中的应用

邢振
福建大学第一附属医院

瘤体及瘤周区的 DWI 和 DSC-PWI 在鉴别胶质母细胞瘤 IDH 基因分型中的应用
摘要:

目的: 评估瘤体及瘤周区的扩散加权成像(DWI)或动态磁敏感对比增强灌注加权成像(DSC-PWI)在鉴别胶质母细胞瘤异柠檬酸脱氢酶 (IDH) 基因分型中的应用价值; 同时探讨联合两项技术分别在瘤体和瘤周区的诊断效能。

材料与方法: 回顾性分析 10 例 IDH 突变型 (IDH-m) 及 65 例 IDH 野生型(IDH-w)

胶质母细胞瘤的常规 MRI 平扫+增强、DWI 和 DSC-PWI 图像。比较两组间的瘤体相对最小 ADC 值 (rADCmin-t)、瘤周相对最小 ADC 值 (rADCmin-p)、瘤体相对最大 CBV 值 (rCBVmax-t)、瘤周相对最大 CBV 值 (rCBVmax-p)。采用受试者工作特征 (receiver operating characteristic, ROC) 曲线与 Logistic 回归模型评估诊断效能。

结果: IDH 突变型 (IDH-m) 胶质母细胞瘤更容易发生于在额叶和年轻患者中。IDH 野生型的 rADCmin-t 值显著低于 IDH 突变型($P=0.042$)。rCBVmax-t

和 rCBVmax-p 在两个亚组间均具有显著性差异 ($P<0.001$)。rADCmin-t、rCB Vmax-t 及 rCBVmax-p 值预测 IDH 突变型胶质母细胞瘤的最佳阈值分别约 >0.98 、 <7.27 和 <0.97 , 多因素 logistic 回归分析显示, 联合 rADCmin-t 和 rCBVmax-t 参数的敏感性和特异性最高。

结论: 瘤体 rCBVmax-t 及瘤周 rCBVmax-p 值可以作为评价胶质母细胞瘤 IDH 状态的首选影像学指标, 联合瘤体 rADCmin-t 及 rCBVmax-t 值能获得最高的预测能力。

PO-2866

基于 Gd-EOB-DTPA MRI 增强 T1mapping、R2*定量参数及其联合指标评估乙肝肝硬化肝功能的价值

张小艳、马培旗、张磊、袁玉山、王仲秋
阜阳市人民医院

目的 探索 Gd-EOB-DTPA 增强 MRI T1mapping、R2*定量参数及其联合指标对于评估乙肝肝硬化肝功能的价值。方法 回顾性分析 52 例乙肝肝硬化患者资料。所有患者行 Child-Pugh 分级评估, A 级 10 例, B 级 28 例, C 级 14 例。所有患者均行 Gd-EOB-DTPA 增强 MRI 及 mDixon-quant 扫描, 于增强前 (pre)、增强后 5min (mid)、增强后 20min (HBP) 获得 T1mapping 图像。测量计算相关 T1 弛豫时间定量值 (T1pre、T1mid、T1HBP), T1 弛豫时间减低率 ($\Delta T1mid$ 、 $\Delta T1HBP$)、及 R2*。ROC 曲线评价区分 Child-Pugh A 级与 Child-Pugh B 级及 Child-Pugh B 级与 Child-Pugh C 级的效能。结果 不同 Child-Pugh 分级组间 T1 值、 $\Delta T1$ 值、R2*比较差异具有统计学意义 ($P<0.05$)。T1mid、T1HBP、R2*与 Child-Pugh 分级均呈正相关, rs 分别为 0.365、0.566、0.597 (P 均 <0.05); $\Delta T1mid$ 、 $\Delta T1HBP$ 与 Child-Pugh 分级均呈负相关, rs 分别为-0.680、-0.771 (P 均 <0.05); T1HBP、 $\Delta T1mid$ 、 $\Delta T1HBP$ 、R2*及其联合指标区分 Child-PughA 级与 Child-Pugh B 级的 AUC 分别约 0.888、0.784、0.955、0.764、0.961 (P 均 <0.05); $\Delta T1mid$ 、 $\Delta T1HBP$ 、R2*及其联合指标区分 Child-PughB 级与 Child-PughC 级的 AUC 分别约 0.853、0.860、0.797、0.941 (P 均 <0.05)。结论 基于 Gd-EOB-DTPA 增强 MRI T1mapping 及 R2*定量参数可独立评估乙肝肝硬化的肝功能状况, 二者联合评估对于乙肝肝硬化的肝功能状况的诊断效能更高。

PO-2867

基于多序列 MRI 影像组学的胶质母细胞瘤风险分层预测研究

牛文举、杨国强
山西医科大学第一医院

目的: 以多序列 MRI 影像组学方法开发一种胶质母细胞瘤总生存期预测模型。方法: 本研究回顾性收集 TCIA/TCGA 公共数据库中 309 例经手术病理证实的胶质母细胞瘤患者的影像数据, 并针对术

前 T1 增强和 T2FLAIR 序列, 提取坏死区域、增强肿瘤实质区域、水肿区域三种感兴趣区域的 10128 个影像组学特征。通过相关性分析、PCA 降维和 Lasso-Cox 回归, 筛选出与总生存期 (OS) 显著相关的影像组学特征并计算风险评分 (Risk-score)。在训练集和测试集中, 利用 Risk-score 将患者划分为高、低风险组, 并进行 Log-rank 检验。对纳入样本的 Risk-score, 临床病理信息采用单因素 Cox 回归, 得出与胶质母细胞瘤 OS 显著相关的风险因素, 应用多因素 Cox 回归构建临床-影像组学联合预测模型以及影像组学列线图 (nomogram)。利用校准曲线评估训练集和测试集上 nomogram 预测性能和生存概率之间的一致性。采用 C-index 评估临床-影像组学联合预测模型的性能, 并与临床预测模型以及影像组学预测模型性能进行比较。结果: 根据训练集筛选出的 16 个影像组学特征计算风险评分, 依据风险评分将训练集与测试集划分为高、低风险组, Log-rank 检验表明利用 Risk-score 划分的高、低风险组具有显著统计学差异。通过单因素 Cox 回归, 确定风险评分、年龄、O⁶-甲基鸟嘌呤-DNA 甲基转移酶状态是影响胶质母细胞瘤 OS 的显著风险因素。利用多因素 Cox 回归构建预测模型, 发现临床-影像组学联合模型性能 (训练集: 0.768, 测试集: 0.724) 高于临床模型性能 (训练集: 0.659, 测试集: 0.653) 和影像组学模型性能 (训练集: 0.744, 测试集: 0.710)。结论: 由 16 个影像组学特征构建的影像组学标签可以作为胶质母细胞瘤 OS 的独立预后因素, 结合临床病理信息构建的总生存期预测模型, 具有重要的临床价值。

PO-2868

基于机器学习的放射组学模型区分脑胶质瘤和孤立性肺癌脑转移瘤及亚型

朱凤英、王佳宁、殷小平、邢立红、张宇
河北大学附属医院

目的: 构建应用机器学习的放射组学模型区分脑胶质瘤和孤立性肺癌脑转移瘤及亚型, 实现二者术前准确分类的可行性。材料与方法: 回顾性分析经病理证实的 105 例胶质瘤和 172 例孤立性肺癌脑转移瘤患者的 MRI T1WI 增强图像, 按照 8: 2 比例分为训练组和验证组, 在图像上对肿瘤实性部分进行三维手工分隔, 从图像中提取了总共 1521 个定量特征。使用皮尔逊相关系数对特征进行筛选, 使用多层感知器 (multiple layer perceptron, MLP)、支持向量机 (support vector machine, SVM)、随机森林 (Random Forest, RF) 及逻辑回归 (Logistic regression, LR) 构建模型, 5 折交叉验证方法用于训练模型, 验证组用于评估模型的预测性能, ROC 曲线用于计算模型的准确性、敏感性和特异性, 曲线下面积 (AUC) 用于评估模型的预测性能。结果: 高/低级别胶质瘤和孤立性脑转移瘤的 MLP 鉴别模型的 AUC、准确性分别为 0.969/0.986、0.992/0.986, 敏感性和特异性分别为 1.000/1.000、0.968/0.970, 高级别胶质瘤和非小细胞肺癌/小细胞肺癌脑转移瘤 MLP 鉴别模型的 AUC、准确性分别为 0.964/0.979、0.966/0.982, 敏感性和特异性分别为 1.000/0.958、0.929/1.000。结论: 应用机器学习的放射组学模型对区分脑胶质瘤和孤立性肺癌脑转移瘤及亚型有一定的临床价值, MLP 模型的诊断效能最好。

PO-2869

非对称回波最小二乘估算法迭代水脂分离技术在肩关节 MRI 扫描的应用价值

谢晓亮、赵义、周秋麟、李苗红、王苇
扬州大学附属医院

摘要: 目的 探讨非对称回波最小二乘估算法迭代水脂分离技术 (IDEAL) 在肩关节 MRI 中的可行性, 并传统频率选择脂肪抑制技术 (Fat) 技术进行对照。方法 选取 20 例健康志愿者, 其中男性 10 例, 女性 10 例; 年龄 15 ~ 55 岁, 平均年龄 35 岁。均行肩关节冠状位 T2WI 扫描, 每次扫描分别结合 Fat、IDEAL 两种不同脂肪抑制技术。由两位放射科医师各自独立对两组图像的磁敏感伪影、运动伪影、脂肪抑制效果和整体图像质量进行定性评分, 并测量比较两组图像的冈上肌、肱骨头和三角肌的信噪比 (SNR)、冈上肌与肱骨头的对比噪声比 (CNR1) 和三角肌与肱骨头的对比噪声比 (CNR2)。结果 定性分析: IDEAL 组在磁敏感伪影、脂肪抑制效果和整体图像质量评分均优于 Fat 组, 而在运动伪影评分低于 Fat 组[磁敏感伪影评分: (3.70 ± 0.73) 分 vs (2.90 ± 0.72) 分, $P < 0.001$; 脂肪抑制效果评分: (3.80 ± 0.89) 分 vs (3.10 ± 0.91) 分, $P = 0.017$; 整体图像质量评分: (3.35 ± 0.99) 分 vs (2.55 ± 0.83) 分, $P = 0.007$; 运动伪影评分: (2.95 ± 0.69) 分 vs (3.85 ± 0.67) 分, $P < 0.001$]; 定量分析: IDEAL 组冈上肌、肱骨头和三角肌的 SNR、冈上肌与肱骨头的 CNR1 和三角肌与肱骨头的 CNR2 均优于 Fat 组 (冈上肌 SNR: $t = -5.917$, $P < 0.001$; 肱骨头 SNR: $t = -2.338$, $P = 0.030$; 三角肌 SNR: $t = -5.887$, $P < 0.001$; CNR1: $Z = -3.472$, $P < 0.001$; CNR2: $Z = -2.053$, $P = 0.040$)。结论 在肩关节 MRI 扫描中, IDEAL 技术较 Fat 技术能更好的控制图像的磁敏感伪影、获得更好的图像质量和脂肪抑制效果, 但对运动伪影更加敏感。

PO-2870

抑郁症患者的功能及形态学脑网络同步构建与联合分析

徐凯、李科
中国人民解放军战略支援部队特色医学中心

目的 对抑郁症 (major depressive disorder, MDD) 患者的功能及形态学脑网络进行构建并分析。方法 选取 55 例抑郁症 (MDD) 患者和 46 例正常对照 (normal controls, NC) 被试作为研究对象。所有受试在 3.0T 超高场 MR 仪进行扫描, 获取全脑三维高分辨结构磁共振 (structural MRI, sMRI) 及静息态功能磁共振 (resting-state dynamic functional MRI, rs-fMRI) 图像数据, 通过 DPARSF 工具箱构建脑功能网络, 通过 Freesurfer 工具构建脑形态学网络。结果 MDD 组全局功能脑网络特征与正常对照无显著差异, 但局部形态学及功能脑网络特征区别于 NC 组, 组间差异主要包括 1) 形态学脑网络特征: 左脑区颞横皮质区域灰质体积 (gray volume, GrayVol) 和表面积 (surface area, SurfArea) 显著大于健康对照 ($P < 0.05$); 2) 功能脑网络特征: 默认模式网络 (default mode network, DMN) 中多个节点的功能连接 (functional connectivity, FC) 异常增加; 其中, 左脑区颞叶皮质与默认网络内其他节点及背侧注意网络 (dorsal attention network, DAN) 之间的功能连接 (functional connectivity, FC) 显著增强, 局部拓扑指标中左脑区颞横皮质介数中心性增强 ($P < 0.05$)。结论 MDD 患者功能及形态学脑网络较正常对照存在差异, 左脑区颞横皮质区域差异显著, 可能其发病机制相关联。

PO-2871

肿瘤全域表观扩散系数诺模图预测高级别子宫内膜癌

邓颖、闫斌、戴强、梁轶、王茵
陕西省肿瘤医院

目的：探讨并验证肿瘤全域表观扩散系数 (apparent diffusion coefficient, ADC) 诺模图术前预测高级别子宫内膜癌 (endometrial carcinoma, EC) 的应用价值。**方法：**收集病理证实为 EC 患者 142 例，按 7:3 的比例分为训练组 (n=99) 与验证组 (n=43)。采用 3D Slicer 软件，勾画感兴趣区，生成 3D 感兴趣容积，获得 ADC 直方图参数，包括最大值 (ADCmax)，最小值 (ADCmin)，平均值 (ADCmean)，偏度 (skewness)，峰度 (kurtosis)，熵 (entropy)，第 5 (5th)、第 10 (10th)、第 25 (25th)、第 50 (50th)、第 75 (75th)、第 90 (90th) 和第 95 (95th) 百分位数 ADC 值。测量肿瘤形态学参数，包括肿瘤体积、肿瘤最大径、矢状位 T2WI 肿瘤的最大前后径和肿瘤面积比。组内相关系数用于评价不同观测者间测量的变异性。利用逻辑回归构建 ADC 分数；联合 ADC 分数、肿瘤的形态学及临床参数构建诺模图，绘制校正曲线及决策曲线。**结果：**ADCmin, ADC5th, ADC10th, ADC25th, 所有的形态学参数和临床参数在高级别与低级别 EC 组间具有统计学差异 ($P < 0.05$)。经 LR 筛选，最纳入 ADCmin, ADC5th, ADC10th, ADC25th 构建 ADC 分数。联合 ADC 分数、年龄、肿瘤前后径及 ADC 分数构建 ADC 诺模图，预测高级别 EC 的受试者工作特性曲线下面积、敏感度、特异度在训练组分别为 0.845、81.2%、72.5%；验证组为 0.842、76.7%、80.0%。校正曲线显示，ADC 诺模图预测高级别 EC 具有较高的准确性；决策曲线显示其预测高级别 EC 在训练组和验证组效能相似。**结论：**肿瘤全域 ADC 诺模图有助于术前预测高级别 EC，并具有较好的稳定性及良好的诊断效能。

PO-2872

构建抑郁症患者大脑公共谐波及其形态学特征 谐波能量差异性的分析

徐凯¹、陆皓璇²、李科¹

1. 中国人民解放军战略支援部队特色医学中心

2. 中国人民解放军总医院

目的 脑部疾病的空间变化模式受到形态学脑网络拓扑结构变化的影响，而谐波能够反映出脑网络拓扑结构。通过研究抑郁症患者大脑形态学特征谐波的变化，能够帮助我们更好的理解抑郁症形态学脑网络的异常改变。**方法** 选取 55 例抑郁症 (major depressive disorder, MDD) 患者和 46 例正常对照 (normal controls, NC) 被试作为研究对象。所有受试在 3.0T 超高场 MR 仪进行扫描，获取全脑三维高分辨 T1 加权图像数据，通过 Freesurfer 5.3.0 工具构建九种形态特征 (脑区顶点、灰质体积、平均皮层厚度、高斯曲率和折叠指数等) 脑网络，通过拉普拉斯矩阵特征分解获得公共谐波，最后计算 MDD 被试和健康对照之间的谐波能量的 Fisher 评分 J (类间均值与类内方差的比率)，比较每个谐波中被试 MDD 和对照 NC 的形态学特征谐波能量之间是否有显著差异。**结果** MDD 组九种形态特征与正常对照总谐波能量没有显著差异，但特定谐波能量区别于 NC 组，差异主要包括 1) 脑区顶点数特征：第 2、6、15、44、57 谐波；2) 表面积特征：第 2、6、16、57 谐波；3) 灰质体积特征：第 2、12、13、15、57 谐波；4) 平均皮层厚度特征：第 2、19、35、36、44 谐波；5) 皮层厚度标准差特征：第 8、21、42 谐波；6) 平均曲率特征：第 26、57 谐波；7) 高斯曲率特征：第 34、40、54、57 谐波；8) 折叠指数特征：第 5、16、21 谐波；9) 曲率指数特征：第 25、32、33、37 谐波，MDD 和健康对照的谐波能量之间有显著差异 ($P < 0.05$)。**结论** MDD 患者在谐波较低段和比较高的部分中，与健康对照能量差异波动比较剧烈，揭示了 MDD 患者异常脑内谐波，为更深刻理解 MDD 患者形态学脑网络提供新视角。

PO-2873

体素内不相干运动成像评估高等强度间歇运动与中等强度持续运动干预对骨骼肌灌注的影响

李娇¹、路则鹏²、包大鹏²、薛华丹¹、金征宇¹

1. 中国医学科学院北京协和医学院北京协和医院

2. 北京体育大学

目的: 使用体素内不相干运动 (IVIM) 成像探索单次高等强度间歇运动 (HIIT) 与中等强度持续运动 (MICT) 干预后即刻以及干预后恢复期大腿骨骼肌微循环灌注改变。

材料与方法: 本实验招募了 20 个超重 ($BMI \geq 24 \text{ kg/m}^2$) 志愿者。每个志愿者在功率自行车车上分别接受了一次 HIIT 干预和一次 MICT 干预。干预过程有专业人员进行指导监督。两次干预间隔一个星期。每个志愿者在每次干预前、干预后即刻、干预后 1 小时以及干预后 2 小时接受了大腿磁共振 IVIM 扫描。通过对 IVIM 图像进行后处理得到了股直肌、股外侧肌和股二头肌长头的弥散系数 D ，灌注分数 f ，假弥散系数 D^* 以及微循环灌注 fD^* 四个参数。两种干预后的骨骼肌 IVIM 参数改变采用两因素重复测量方差分析进行比较。 $P < 0.05$ 表示差异有统计学意义。

结果: 股直肌 fD^* 在运动干预后即刻显著增加 ($d = 0.69 \times 10^{-3} \text{ mm}^2/\text{s}$, $P = 0.008$), 在运动干预后两小时仍然增加 ($d = 0.64 \times 10^{-3} \text{ mm}^2/\text{s}$, $P = 0.01$)。HIIT 干预组的股直肌 fD^* 增加大于 MICT 干预组 ($d = 0.32$, $P = 0.023$)。股外侧肌 fD^* 在运动干预后显著增加 ($d = 0.53 \times 10^{-3} \text{ mm}^2/\text{s}$, $P < 0.001$), 运动后 1 小时已恢复到运动前水平 ($P > 0.05$)。HIIT 干预组的股外侧肌 fD^* 增加小于 MICT 干预组 ($d = -0.21$, $P = 0.015$)。运动干预后即刻 HIIT 干预组股外侧肌 D 值大于 MICT 干预组 ($d = 0.12 \times 10^{-3} \text{ mm}^2/\text{s}$, $P < 0.001$)。股二头肌长头 fD^* , 股直肌的 D 值和股二头肌长头的 D 值在运动前后没有显著变化 ($P > 0.05$), 在两种运动干预方式之间也没有明显差别 ($P > 0.05$)。

结论: IVIM 成像可以很好的描述运动干预后骨骼肌微循环灌注变化趋势, 以及评估不同运动干预方式后骨骼肌微循环灌注改变的差别。

PO-2874

运用深度学习方法对 MRA 原始图像进行颅内动脉瘤全自动诊断和测量

杨清宁、李传明

重庆大学附属中心医院 (重庆市急救医疗中心)

目的: 在临床实践中, MRA 颅内动脉瘤 (intracranial aneurysms, IA) 诊断的传统步骤包括人工三维重建、肉眼识别、手动测量, 整个过程非常耗时耗力。由于 MRA 的优势, 近年来头颅 MRA 检查数量急剧增加, 人工分析和测量大大增加了放射科医生的工作量, 动脉瘤的误诊和漏诊时常发生, 导致严重的后果。因此本研究基于 MRA 2D 原始图像建立一个自动诊断并测量 IA 的深度学习模型。

方法: 回顾性收集重庆医科大学附属第二医院 852 个 IAs (806 名患者) MRA 图像, 按 7: 3: 3 的比例随机分为训练集, 测试集和内部验证集。此外, 将来自于陆军军医大学附属第一医院的 319 例患者 (181 例有 IA, 136 例无 IA) 纳入独立验证组。基于 MR 3DUnet 建立自动诊断和测量 IA 的深度学习模型。采用 TP、FP、FN、召回率、精度、灵敏度和特异性指标评价模型的性能, 采用组内相关系数检验 MR 3DUnet 与 DSA 测量结果的一致性。

结果: 在 IA 检测方面, 在内部验证集中, 深度学习模型的召回率、精度和灵敏度分别为 0.79, 0.62 和 0.75。在独立验证集中, 其召回率, 精度, 灵敏度和特异性分别为 0.71, 0.68, 0.74 和 0.77。在 IA 测量方面, MR 3DUnet 和 DSA 显示出良好的一致性, ICC 分别为 0.77 和 0.82。

结论: 本研究开发了一个用于 IA 诊断和测量的一键式全自动深度学习模型, 大大地缩短了诊断时间, 减少了放射科医生的工作量。

PO-2875

基于多序列磁共振影像组学在膀胱癌复发风险分层中的预后价值

白晶晶¹、杨国强^{1,2}

1. 山西医科大学

2. 山西医科大学第一医院

目的: 膀胱癌的复发风险分层管理是患者个体化临床治疗的关键。然而, 术前复发风险评估的准确性并不令人满意。利用多序列磁共振图像开发一种影像组学模型来预测膀胱癌患者的无复发生存期, 并评估其比临床诊断模型的增量价值。

方法: 回顾性地纳入本院 229 例具有术前多序列磁共振图像的膀胱癌患者, 按 7: 3 比例随机分为训练集和验证集。基于 pyradiomics 包从 T2WI、DWI、ADC 和 DCE 图像中提取影像组学特征。采用单变量分析和套索回归方法进行特征筛选。利用 COX 单变量和多变量比例风险模型对临床危险因素进行筛选, 获得独立的危险因素用以构建影像组学-临床列线图。通过 C-index、校准曲线进行模型性能和拟合优度检验。Kaplan-Meier 分析和 log-rank 检验用于评估影像组学特征与 RFS 的相关性。计算净重分类指数(NRI)以评估列线图与影像组学模型或临床模型相比的增量诊断能力, 决策曲线分析来确定列线图的临床有效性。

结果: 通过单变量分析和套索方法后保留 22 个非零系数的 MRI 影像组学特征在膀胱癌复发风险分层模型中表现较好, Kaplan-Meier 生存分析结合 log-rank 检验显示了影像组学模型在高危组和低危组分层方面具有显著的预后价值 ($P<0.001$)。影像组学特征与临床独立危险因素 (尿痛和伴有恶性疾病史) 相结合的联合模型预后价值最好, 训练集和验证集的 C-index 值分别为 0.853 和 0.832, 与临床模型相比, 影像组学-临床列线图取得了更好的校准和分类 (NRI: 0.6768, 95 % CI: 0.5549–0.7987, $P<0.001$)。决策曲线分析表明, 列线图具有更好的临床有用性。

结论: 结合临床危险因素和影像组学特征构建的列线图在评估膀胱癌复发风险方面优于单独的影像组学模型或临床模型, 可能作为一个潜在的工具进行膀胱癌个体化复发风险预测, 并值得进一步验证。

PO-2876

基于多参数 MRI 的影像组学模型预测脑胶质瘤总生存期: 一项多中心队列研究

郝敏、杨国强

山西医科大学第一医院

目的: 探讨基于多参数 MRI 的影像组学模型预测胶质瘤总生存期(OS)的应用价值。

方法: 这项多中心研究共纳入 579 名病理确诊为胶质瘤的患者, 癌症图像档案 (TCIA) 和癌症基因组图谱 (TCGA) 的 414 例胶质瘤患者按照 8:2 随机分为训练集 ($n=331$) 和内部验证集 ($n=83$)。山西医科大学第一医院 (FHSXMU) 和山西省人民医院 (SPPH) 的胶质瘤患者作为外部验证集 ($n=165$)。使用 ITK-SNAP 勾画感兴趣区并用 FAE 提取增强 T1WI 图像和 T2 液体衰减反转恢复 (FLAIR) 的 3562 个影像组学特征。采用 z-score、单因素 Cox 回归分析与最小绝对收缩和选择算法 (LASSO) 筛选出特征子集构建影像组学模型, 根据影像组学模型的最佳截断值将训练集、内部与外部验证集分为高、低危两组进行 Kaplan-Meier 生存分析。采用 Cox 回归分析探

讨论临床特征和分子标志物的预后价值,联合放射组学特征构建综合模型并绘制列线图。以一致性指数 (C-index) 评估模型的预测效能。

结果:通过 LASSO-Cox 回归筛选出 32 个放射组学特征。构建的影像组学模型预测 OS 的 C-index 分别为 0.711、0.778、0.771。Kaplan-Meier 生存分析结果表明,无论是训练集还是内、外部验证集,高风险患者的 OS 都明显短于低风险患者 ($P<0.0001$)。单、多因素 Cox 回归分析显示 O6-甲基鸟嘌呤-DNA-甲基转移酶 (MGMT)、异柠檬酸脱氢酶 (IDH)、病理分级与年龄是 OS 的独立预后因素 ($P<0.05$)。结合临床基因危险因素及影像组学模型的综合模型预测性能较好 (C-index: 0.750、0.776、0.774)。

结论:基于多参数 MRI 图像特征构建的影像组学模型能将患者进行风险分层,联合 MGMT、IDH、病理分级、年龄和放射组学特征构建的列线图进一步提升了胶质瘤 OS 的预测效能。

PO-2877

CMR 组织追踪技术定量评估糖代谢异常患者左心室心肌应变的临床研究

胡梦瑶、宋怡沛、杨培、阚傲、龚良庚
南昌大学第二附属医院

目的:探讨心脏磁共振组织追踪技术 (CMR-TT) 定量评估糖代谢异常患者左心室心肌应变的临床应用价值。

资料和方法:回顾性分析 2018-2021 年临床诊断的糖尿病前期患者 30 例及 2 型糖尿病患者 27 例,同期收集健康志愿者 31 例作为对照组。所有受检者均使用 3.0T 心脏磁共振扫描仪采集图像。

结果:(1)左心室常规心功能参数分析:各组间左心室基本心功能参数除 LVMI 外均无统计学差异。糖尿病组的 LVMI 较对照组及糖前期组升高,差异有统计学意义 ($66.37\pm 11.11\text{g/m}^2$ 对 $52.21\pm 8.97\text{g/m}^2$ 对 $48.17\pm 6.75\text{g/m}^2$, $P<0.001$)。(2)左心室心肌应变参数分析:对照组、糖前期组及糖尿病组的 GPLS 数值呈递减趋势,差异有统计学意义 (P 均 <0.001),糖尿病组的 GPRS 及 GPCS 绝对值较对照组及糖前期组减低,差异有统计学意义 (P 均 <0.001)。(3)LVMI 与心肌应变相关性分析:相关性分析发现 GPRS 与 LVMI 之间呈较强负相关 ($r=-0.779$, $P<0.001$),GPCS、GPLS 与 LVMI 呈较强正相关 ($r=0.724$, $r=0.699$, $P<0.001$)。ROC 分析诊断糖代谢异常患者左心室心功能受损,GPRS 最佳截断值:20.01%,灵敏度 52.9%,特异度 100.0%,AUC 为 0.747;GPCS 最佳截断值:-16.45%,灵敏度 76.5%,特异度 87.0%,AUC 为 0.863;GPLS 最佳截断值:-10.10%,灵敏度 85.3%,特异度 91.3%,AUC 为 0.915。

结论:随糖代谢异常程度加重,左心室心肌收缩功能逐渐减低。CMR-TT 可定量评估糖代谢异常患者左心室心肌应变,反应左心室射血分数改变前的早期心肌力学改变,能早期识别糖前期患者亚临床左心室功能受损。

PO-2878

磁共振检查技术在小鼠颅脑损伤疗效评估中的应用

郭宇、张乐天
中国人民解放军陆军特色医学中心

目的:本文旨在研究磁共振相关检查技术在小鼠颅脑损伤疗效评估中的应用价值,为临床在伤情诊断及治疗方面提供可靠的依据。方法:选取 60 只 C57 小鼠分为 A、B、C 三组,每组 20 只,其中 A 组为 sham 组,B 组为 TBI 组,C 组为治疗组,使用 BRUKER 70/20USR 小动物磁共振进行相关扫描,其中各组均采集建模前数据 (PRE),并于建模后分别采集 24h、14day、28day 的磁共振

数据, 每只小鼠进行常规 T1 WI、T2 WI、DTI、1H MRS 及 DCE 扫描, 其中波谱成像采用单体素 PRESS 序列, 基本参数为 TR=3000ms, TE=20ms, Averages=512, Flip Angle=90°, 180°, 180°, 体素大小为 1.5×1.5×1.5mm³。通过测量各组中 Cr、CHO、NAA、Lip、Lac、Glu/Gln、Ins 等代谢物平均浓度, 比较组内各时间点及各组之间差异性。DCE 扫描中主要分析 Ktrans、Vp 及 TTP 值。结果: A、B、C 三组互相比, FA 值, CHO、Lac 代谢物浓度, Ktrans 值均有明显统计学差异 (P<0.05); 组内比较时, A 组各时间点之间无统计学差异, B 组各时间点之间均有差异, C 组 24h 与 14day, 28day 比较有显著差异, 14day 与 28day 比较无差异。结论: 弥散成像中 ADC 值越低, 提示病灶周围区水分子弥散受限越重, 而 FA 值的升高则是由于细胞内外水分子分布异常所致。磁共振波谱能直接检测各类代谢物的浓度情况, 并间接反应组织环境, 其中 NAA 含量降低, 反映神经元丢失或能量代谢障碍, Cho 升高反映细胞膜的损伤、降解或胶质细胞增殖, Lac 升高表明有氧代谢障碍或糖酵解增加时其含量明显增加。本研究通过联合 DTI、MRS 及 DCE 检测结果, 可为小鼠颅脑损伤情况及疗效判别提供有效的保障。

PO-2879

MRI 神经-骨融合成像在下颌第三磨牙拔除术中的作用

颜雅兰

福建医科大学附属第一医院

目的: 探讨 MRI 神经-骨融合成像评估下牙槽神经(IAN)/下颌管(MC)与下颌第三磨牙(MTM)关系的可靠性。

材料和方法: 所有受试者均进行了 MRI(序列包括 T2 FFE 和 FRACTURE)和 CBCT 检查。由两名观察者在两种图像上(FRACTURE, CBCT)独立分割 37 个 MC, 随后计算 Hausdorff 距离(HD 值)和 DSC 相似系数比较一致性。在两种融合图像上(MRI-CBCT 融合和 MRI 融合)对 IAN/MC 与 MTM 根之间的关系、炎症和融合模式进行评分。

结果: FRACTURE 序列, 平均 HD 为 0.62 ~ 1.35, 平均 DSC 为 0.83 ~ 0.88; CBCT 平均 HD 为 0.98 ~ 1.50, 平均 DSC 为 0.76 ~ 0.83。与 MRI-CBCT 融合相比, MRI 融合的融合模式的分类 (MRI 融合 $\kappa = 0.694$, MRI-CBCT 融合 $\kappa = 0.644$)、IAN/MC 与 MTM 是否接触的分析都表现良好的再现性 (MRI 融合 $\kappa = 0.729$, MRI-CBCT 融合 $\kappa = 0.720$), 由 MRI 得到的融合图像中 Larger 模式 (代表图像失真或不匹配) 的比例更低 (磨牙区 16.2%VS27.3%, 磨牙后区 2.7%VS5.4%); 炎症检测方面则表现出中等至良好的一致性 (MRI 融合 $\kappa = 0.603$, MRI-CBCT 融合 $\kappa = 0.532$)。结论: MRI 融合成像提供了可靠的术前评估, 并且在 MTM 手术中更实用, 可以替代 MRI-CBCT 融合成像成为高危患者的术前一站式无辐射检查。

PO-2880

动脉期不规则环形强化肝细胞癌的病理学特征及早期复发预后研究

徐磊、张学琴、张涛

南通市第三人民医院

目的: 探讨钆塞酸二钠增强 MRI 动脉期不规则环形强化肝细胞癌 (IRE-HCC) 的病理学特征及根治切除术后早期复发分析。**方法:** 回顾性收集 2015 年 02 月至 2021 年 09 月在我院就诊且经手术病理证实的 HCC 患者 131 例。依据钆塞酸二钠增强 MRI 动脉期强化方式分为 IRE-HCC 和非 IRE-HCC。比较两组患者的临床、病理及影像资料。采用 Logistic 回归分析与 IRE-HCC 相关的病理学特征。采用 Kaplan-Meier 法评估 HCC 术后 2 年内早期无复发生存率。采用 Cox 回归分析 HCC 术

后早期复发的危险因素。**结果**: 多因素 Logistic 回归分析显示 CK19 (OR 9.027, 95%CI 2.533-32.170, $P=0.001$)、MVI (OR 3.606, 95%CI 1.024-12.701, $P=0.046$) 和 DWI 靶征 (OR 10.370, 95%CI 3.046-35.303, $P=0.001$) 与 IRE-HCC 相关。IRE-HCC 术后 2 年累积无复发生存率 (24.1%) 显著低于非 IRE-HCC (55.9%) ($P<0.05$)。多因素 Cox 回归分析显示 MVI (HR 2.206, 95%CI 1.152-4.226, $P=0.017$) 和动脉期不规则环形强化 (HR 2.454, 95%CI 1.408-4.275, $P=0.002$) 是 HCC 术后早期复发的独立预测指标。**结论**: IRE-HCC 与 CK19、MVI 和 DWI 靶征相关, 且术后早期复发率高、预后差。

PO-2881

基于钆塞酸二钠增强 MRI 构建双表型肝细胞癌的 列线图预测模型

徐磊、张学琴、张涛
南通市第三人民医院

目的 探讨基于钆塞酸二钠增强 MRI 构建的列线图对术前无创预测双表型肝细胞癌 (DPHCC) 的价值。

方法 回顾性分析 2015 年 1 月至 2020 年 6 月在我院行肝切除的 160 例 HCC 患者临床及影像资料, 根据 DPHCC 免疫组化诊断标准, 分为 DPHCC 组 (80 例) 和非 DPHCC 组 (80 例)。两组间计量参数的比较采用 t 检验或 Mann-Whitney U 检验, 分类参数的比较采用 χ^2 检验。采用单因素和多因素 Logistic 回归分析 DPHCC 发生的独立危险因素, 并构建预测 DPHCC 发生的列线图, 采用 Bootstrap 法对模型效能进行内部验证。

结果 DPHCC 组肿瘤边缘不规则、动脉期环形强化及 DWI 靶环征的比例明显高于非 DPHCC 组, 且 DPHCC 组肝胆期 RIR 值低于非 DPHCC 组, 差异均有统计学意义 ($P<0.05$)。多因素 Logistic 回归分析显示肿瘤边缘不规则、动脉期环形强化和肝胆期 RIR 值较低是预测 DPHCC 发生的独立危险因素。基于多因素 Logistic 回归分析结果和 Youden 指数将患者分为高风险组 (评分 >5.9) 和低风险组 (评分 ≤ 5.9)。列线图模型及内部验证 C-index 均在 0.7~0.9 之间, 列线图 ROC 曲线下面积为 0.723(95% CI: 0.646~0.790)。Hosmer-Lemeshow 检验显示校正曲线拟合度良好 ($P>0.05$), 预测曲线与理想预测曲线具有高度一致性。

结论 基于钆塞酸二钠增强 MRI 构建的列线图, 有助于术前无创性预测 DPHCC。

PO-2882

利用磁共振弥散张量成像评估盘源性腰痛 大鼠椎旁肌肌纤维类型转化

吴瑛、马寄耀、黄益龙、高超、冷文洋、何波
昆明医科大学第一附属医院

目的 探究磁共振弥散张量成像 (Diffusion tensor image, DTI) 评估盘源性腰痛 (Discogenic low back pain, DLBP) 大鼠椎旁肌肌纤维类型转化的价值。

方法 将 90 只健康 SD 大鼠在不同时间点 (即第 1, 3, 6 个月) 随机分成正常组、假手术组和 DLBP 组, 共 9 组 ($n=10$ /组)。对大鼠的 L4/5 和 L5/6 椎间盘进行后入路穿刺破坏和假手术, 以建立 DLBP 和假手术模型。首先在造模术后第 1 个月、第 3 个月和第 6 个月对各组大鼠进行行为学测试, 在完成行为学测试后间隔 3 天行 DTI 扫描, 获得大鼠目标椎间盘层面 (L4/5、L5/6) 椎旁肌 (多裂肌、竖

脊肌)的 FA 值、MD 值、本征值(λ_1 、 λ_2 、 λ_3)的改变,最后取椎旁肌行肌纤维的免疫荧光实验,计算椎旁肌的 I/II 型肌纤维占比,使用 Spearman 分析评估 DTI 参数与 I/II 型肌纤维占比的相关性。

结果 造模术后第 3 个月和第 6 个月,与其余两组相比,DLBP 大鼠出现钢丝悬挂试验和抓握试验的掉落时间减少;四肢握力试验的握力下降;力竭游泳试验的力竭时间减少(P 均 <0.05);造模术后 1 月至 6 月,与其余两组相比,DLBP 大鼠目标椎间盘层面椎旁肌的 FA 值逐渐降低,而 MD 值、 λ_3 值逐渐增加(P 均 <0.05),各时间点正常组和假手术组大鼠的 DTI 参数无明显差异($P>0.05$);组织学结果显示造模术后第 3 个月和第 6 个月,DLBP 大鼠目标椎间盘层面的椎旁肌出现 I 型肌纤维占比(I%)减少,而 II 型肌纤维占比(II%)增加;同时 Pearson 相关分析发现 I%与 FA 值呈中度正相关($r=0.409$, $P<0.05$),而与 MD 值($r=-0.280$, $P<0.05$)和 λ_3 值($r=-0.397$, $P<0.05$)呈低度负相关。

结论 MRI-DTI 参数有助于表征 DLBP 大鼠椎旁肌肌纤维类型转化,FA 值可作为检测肌纤维类型改变的无创影像学标记物。

PO-2883

基于表面的形态学测量原发性痛经磁共振脑结构研究

张聪¹、郑运松^{1,2}

1. 陕西中医药大学

2. 陕西中医药大学附属医院

目的:原发性痛经(Primary dysmenorrhea, PDM)是育龄期最常见的妇科疾病之一。既往研究表明, PDM 患者存在脑结构和功能的异常,本研究旨在探讨 PDM 患者与健康对照(Healthy controls,HCs)患者脑结构网络(Structural brain networks,SBNs)的异常及其协方差模式。**方法:**本研究基于 41 例 PDM 患者和 35 名健康对照(HCs)的 T1 结构像数据,采用基于表面的形态学测量(surface-based morphology,SBM)技术研究 PDM 患者和 HCs 的异常 SBNs。采用多元经典交互线性模型分析 PDM 组与 HCs 组之间协方差模式的差异。**结果:**与 HCs 相比, PDM 患者的 SBNs 包括颞叶网络(主要位于杏仁核、颞极、中颞叶和下颞叶)、默认网络(主要位于后扣带回、楔前叶、海马和海马旁)和丘脑网络存在异常($P<0.001$)。在全脑 SBNs 中,我们还发现 PDM 患者的颞叶网络和丘脑网络之间存在异常的灰质体积(Gray matter volume, GMV)耦合。**结论:**脑结构异常可能与 PDM 相关的疼痛感知和调节障碍有关。此外,本研究发现 PDM 患者颞叶网络和丘脑网络之间的相互作用,希望这项研究结果有助于更好地理解 PDM 患者的病理生理。

PO-2884

MR-T2WI 及增强序列影像组学特征列线图鉴别卵巢囊肿和单房囊腺瘤的应用价值

杨洁、孙惠苗、胡磊、高凯、续智、李欣、刘乃瑞、李泽群、张骅、魏雪梅

山西省儿童医院山西省妇幼保健院

目的:利用影像组学的方法将女性盆腔 MR-T2WI 及增强序列的图像信息建立模型并绘制列线图,评价模型及列线图鉴别女性卵巢囊肿与单房囊腺瘤的诊断效能。**方法:**回顾性分析 113 例行盆腔 MRI 平扫及增强扫描并手术证实为卵巢囊肿或囊腺瘤者,共 121 例病灶,基于 T2WI 及增强图像各提取 1316 个、共 2632 个影像组学特征,筛选最佳特征,计算影像组学评分并建立影像组学模型。应用 logistic 回归分析筛选临床相关独立危险因素,建立临床模型,并构建形态学的独立因素联合影像组学评分联合模型,绘制列线图将之可视化。以受试者工作特征(ROC)曲线评估各模型预测囊肿与单房囊腺瘤的效能,以决策曲线分析(DCA)评价联合模型的价值。**结果:**共有 113 例患

者共纳入本研究, 其中卵巢囊肿 49 例, 单房囊腺瘤 72 例。训练集与测试集患者年龄差异无统计学意义 ($P<0.05$)。基于 T2WI、增强扫描 2 个序列的 MRI 上提取影像组学特征, 经特征筛选后得到 6 个关键特征, 并构建影像组学模型, 最终 T2WI 及增强序列各选出 10 个 (共 20 个) 最佳影像组学特征, 联合建立的影像组学模型在训练集患者中预测的曲线下面积 (AUC) 为 0.946, 测试集的 AUC 为 0.927。病变前后径与上下径是鉴别囊肿与单房囊腺瘤的 MRI 影像学独立因素 ($P<0.05$), 与影像组学构建的联合 nomogram 模型训练集 AUC 为 0.955, 测试集 AUC 为 0.942, 高于影像组学模型 ($Z=-3.451$, $P<0.001$)。联合模型在阈值概率 0~1.0 时的临床净获益大于影像组学模型。结论: MR-T2WI 及增强序列联合的影像组学模型对卵巢囊肿与单房囊腺瘤有很高的鉴别诊断能力。

PO-2885

首发未用药青少年抑郁症患者负性生活事件与 大脑海马结构相关性研究

冯若涵、卓丽华、李宏伟、姚洪超、张婕
绵阳市第三人民医院

目的: 抑郁症是影响青少年最严重的心理健康问题。有研究显示青少年抑郁症的最大风险因素是压力暴露, 而海马是脑内应激调控的关键结构, 在压力与抑郁之间起着重要作用。因此, 本研究的目的基于磁共振成像技术探索青少年抑郁症患者海马结构与压力生活事件的相关性, 以期为进一步探索青少年抑郁症的发病机制与制定干预措施提供依据。

方法: 本研究共纳入了 68 例首发未用药青少年抑郁症患者和 43 例健康青少年。采用 24 项汉密尔顿抑郁量表 (HAMD) 和 14 项汉密尔顿焦虑量表 (HAMA) 评估受试者的抑郁和焦虑症状。采用青少年生活事件量表评估受试者应激性生活事件的频率和应激反应强度。基于 FreeSurfer 6.0 计算了海马整体及海马亚区的体积。通过一般线性模型分析抑郁组和对照组在海马整体和亚区体积的组间差异, 并分析海马体积与压力生活事件的相关性。

结果: 与对照组相比, 抑郁组 HAMD、HAMA 得分、青少年生活事件量表各压力因子得分 (包括: 人际关系因子、学习压力因子、受惩罚因子、丧失因子、健康适应因子) 均显著高于对照组, 且 HAMD 的日夜变化因子与青少年生活事件中丧失因子呈明显正相关。未发现抑郁症患者组与健康对照组海马的整体体积及亚区体积有明显组间差异性, 但是本研究发现抑郁症患者组双侧海马-杏仁核过度区 (HATA) 体积与青少年压力事件中人际关系因子、受惩罚因子、健康适应因子得分呈明显负相关; 左侧海马 CA3 体积与学习压力因子得分呈明显负相关, 左侧海马 CA3 和 CA4 体积与丧失因子得分呈明显负相关; 右侧海马裂体积与焦虑症状 HAMA 评分呈明显正相关。

结论: 1. 青少年抑郁症患者存在较高的压力生活事件, 并且这些压力事件与海马的结构存在显著相关性, 这可能在抑郁症的发病机制中起着重要作用。

2. 海马体积的改变是一个慢性过程, 青少年首发未用药患者可能处于疾病的早期, 所以还没有表现出海马体积的改变, 这可能是一个疾病防治的窗口期。

PO-2886

增强 T1 加权流动敏感黑血成像在肺癌脑转移放疗疗效评估的应用研究

冉红芹、姚灵、段庆红
贵州医科大学附属肿瘤医院

目的：通过在 CE-T1WI FSBB 图像上测量放疗前及放疗后脑转移瘤内肿瘤供血血管数目的变化情况，探讨 CE-T1WI FSBB 序列在肺癌脑转移瘤放疗疗效评估的应用价值。

方法：回顾性分析我院 41 例经临床或病理已证实为脑转移瘤并接受颅脑立体定向放疗联合全脑照射的患者放疗前、后完整的 MR 随访资料。包括 MR 常规扫描，T1WI 增强扫描及 CE-T1WI FSBB 成像。采用双盲法，由两位副高职称及以上的诊断医师分别对常规 MR 图像及 CE-T1WI FSBB 图像进行分析。对治疗前后测量数据进行对比分析及双变量相关性分析。

结果：

1、41 例肺癌脑转移瘤患者中，原发肺癌病理类型包括：腺癌 24 例（58.5%），鳞癌 5 例（12.2%），小细胞癌 12 例（29.3%）；均为脑实质转移，其中 13 例（31.7%）单发，另外 28 例（68.3%）多发。41 例肺癌脑转移瘤患者，所有序列共计检出 290 个病灶，常规 MR 平扫共检出 123 个病灶，常规 T1WI 增强扫描共检出 223 个病灶，CE-T1WI FSBB 检出 286 个病灶。常规 MR 检查检测出 12 个出血病灶，CE-T1WI FSBB 检测出 43 个出血病灶。

2、41 例患者被纳入疗效研究的 286 个病灶在放疗前 CE-T1WI FSBB 序列图像可以发现肿瘤新生血管及少量出血，放疗后复查时在 CE-T1WI FSBB 序列图像可发现血管数目减少且肿瘤体积缩小。

结论

1、CE-T1WI FSBB 对于脑转移瘤的显示具有较高的检出敏感性，并在肺癌脑转移瘤内肿瘤新生血管及出血显示方面具有一定优势。与常规的 MR 成像序列相比，CE-T1WI FSBB 能够在肺癌脑转移瘤的影像诊断中提供更多传统 MR 无法显示的信息。

2、CE-T1WI FSBB 能够测定脑转移瘤放疗前、后瘤内新生血管数目变化情况，为评估肺癌脑转移瘤放疗疗效及临床治疗方案的优化提供更可靠依据。

PO-2887

伴有抑郁症状的肠易激综合征患者前扣带回皮层亚区的静息态功能连接异常模式研究

唐若瑜、靳轶涵、许框慧、陈晓飞、李洁
杭州师范大学附属医院（杭州市第二人民医院）

目的：肠易激综合征（IBS）是常见的脑-肠互动异常疾病，与抑郁症有较高的共病率。然而，两者共病的神经机制尚不清楚。前扣带回（ACC）萎缩和高活跃性是 IBS 及其伴发情绪障碍的关键驱动因素，且其不同亚区在认知加工、情绪和疼痛调节过程中发挥的功能各异。本研究采用静息态 fMRI 观察 IBS 伴抑郁症状（DEP-IBS）患者 ACC 亚区的功能连接（FC）模式，探讨 IBS 共病抑郁的潜在神经机制。

方法：对 28 例 DEP-IBS 患者、21 例 IBS 不伴抑郁症状（nDEP-IBS）患者和 36 例相匹配的健康被试（HC）分别以膝前扣带回（pgACC）和前中扣带回（aMCC，即背侧 ACC）为种子点进行全脑 FC 分析。采用单因素协方差分析和事后 t 检验比较三组 FC 的差异，并将患者异常的 FC 值与临床症状进行偏相关和中介分析，进一步绘制受试者工作特征曲线分析异常 FC 值对 IBS 及其共病抑郁的评估价值。

结果：与 nDEP-IBS 组相比，DEP-IBS 组存在 pgACC 与左内侧前额叶间的 FC 增强，aMCC 与右侧小脑、额中回和角回间的 FC 增强、与右侧楔前叶、顶上回和中央前回间的 FC 减弱。与 HC 相比，两患者组均存在 aMCC 与左背外侧前额叶间 FC 增加和 pgACC 与左顶上回间 FC 减少，其中前者可有效区分 IBS 患者和 HC (AUC=0.755)。此外，DEP-IBS 组还存在 aMCC 与右顶上回的 FC 减少。偏相关分析显示 IBS 患者部分异常的 FC 值与胃肠道和/或抑郁症状显著相关。特别地，pgACC 与内侧前额叶的 FC 值在胃肠道症状与抑郁评分的相关性中起部分中介效应，并可有效区分 DEP-IBS 和 nDEP-IBS 患者 (AUC=0.808)。

结论：ACC 不同亚区在是否伴抑郁症状的 IBS 患者中表现出不同的全脑连接模式。突显网络与执行网络间 FC 的异常可能是 IBS 潜在的神经机制。特别地，情绪唤醒网络内部 FC 的紊乱可能是 IBS 共病抑郁的特征性神经生物学标记。

PO-2888

心脏磁共振组织追踪技术定量分析肥厚型 心肌病左心室心肌应变的应用研究

何畅

香港大学深圳医院

目的：探讨心脏磁共振组织追踪技术 (CMR-TT) 定量分析肥厚型心肌病 (HCM) 患者左心室心肌应变及诊断价值。

方法：本研究纳入 25 例患者 (病例组) 及 11 名健康志愿者 (对照组) 行心脏磁共振电影检查。比较两组间左心室舒张末期容积 (LVEDV)、收缩末期容积 (LVESV)、每搏输出量 (SV)、左心室射血分数 (LVEF)、左心室质量 (LVMASS) 及左心室心肌整体径向应变 (GRS)、周向应变 (GCS)、纵向应变 (GLS) 及收缩期应变率及峰值位移的差异。采用独立样本 t 检验、Pearson 相关性分析、ROC 曲线评价心肌应变指标诊断 HCM 的检验效能，做统计学分析。

结果：HCM 与对照组 LVEF、LVEDV、LVESV、SV 差异均无统计学意义 (P 均>0.05)；HCM LVMASS 高于对照组 (123.1±35.6 VS 92.18±9.84g)，差异有统计学意义 (P 均<0.05)；HCM 组左心室 GRS、GCS、GLS 与对照组分别为 (30.09±6.36 VS 35.96±4.01)% 和 (-18.37±2.43 VS -20.21±1.38)% 和 (-13.58±3.53 VS -17.33±1.7)% 均低于对照组，差异有统计学意义 (P 均<0.05)；HCM 组 GRS、GCS、GLS 收缩期应变率及峰值位移也较对照组降低。HCM 患者整体 GRS、GCS、GLS 与 LVEDV、LVESV、SV、LVEF 间无相关性，P 均>0.05；HCM 与对照组整体 GLS、GCS、GRS 的 ROC 曲线下面积分别为：(AUC=0.83、0.78、0.75，P 均<0.05)。

结论：CMR-TT 技术能够早期敏感地发现 HCM 患者的心肌应变功能异常，在射血分数 (LVEF) 正常而左心室心肌整体应变降低，提示心肌应力比 LVEF 能更早地反映心功能受损，对 HCM 具有较大诊断价值。

PO-2889

基于 HR-VWI 的影像组学和机器学习识别基底 动脉粥样硬化高危斑块

白娟、吴江、李宁

山西省心血管病医院 (山西省心血管病研究所)

目的：基于高分辨率血管壁成像 (HR-VWI)，利用影像组学特征识别基底动脉粥样硬化高危斑块。

方法: 本研究回顾性收集 54 例完成 HR-VWI 扫描的基底动脉狭窄患者, 按 8:2 的比例分为训练组和验证组。选择每例患者的 HR-VWI 中显示基底动脉斑块的轴位图像进行斑块手动分割 (采用开源软件 ITK-SNAP, 版本 3.8.0, www.itk-snap.org) 和影像组学特征提取 (Onekey AI), 采用最小绝对收缩和选择 (LASSO) -Logistic 回归算法及 10 倍交叉验证筛选相关影像组学特征。结合筛选特征, 应用所选特征建立预测模型, 包括支持向量机 (SVM)、k 近邻 (KNN)、逻辑回归 (LR)、决策树 (DT)、随机森林 (RF) 和 XGBoost, 以预测不稳定斑块。最后, 对六个模型的准确度进行比较。

结果: 训练组 43 例, 验证组 11 例。在 54 例患者中, 有 28 个稳定斑块和 26 个不稳定斑块。LASSO 回归后, 从斑块中定量提取了 108 个影像组学特征, 包括 GLSZM 和 GLDM 2 个特征。在六个机器学习模型中, SVM 和 KNN 的准确率超过 65%, 是所有模型中最好的。KNN 模型中训练组和验证组的 ROC 曲线下面积分别为 0.763 和 0.667。SVM 模型中训练组和验证组的 ROC 曲线下面积分别为 0.713 和 0.867。SVM 具有最佳性能。

结论: 基于 HR-VWI, 我们使用影像组学和机器学习算法建立了六个预测模型, 用于基底动脉粥样硬化斑块的稳定性预测。其中, SVM 模型表现最好, 有助于预测基底动脉粥样硬化斑块的稳定性, 为临床干预提供参考。

PO-2890

高分辨弥散加权成像 (RESOLVE) 对直肠肿瘤成像的探究

曾瑞腾

四川大学华西医院

目的探讨轴位 T2 加权图像结合高分辨弥散加权成像 (RESOLVE) 对直肠肿瘤的显示。

方法运用西门子 3.0T 磁共振 (MAGNETOM Trio, 32 通道心脏线圈) 对 20 例直肠癌患者 (12 名男性, 8 名女性, 39 岁~78 岁, 平均年龄 45 岁) 检查前使用开塞露排空肠道并注射 654-2 减缓肠道蠕动。对每个病人行 T2 矢状位 (层厚 2mm 且与肠道长轴平行)、冠状位 (层厚 2mm 且与病变肠道长轴平行)、轴位 (层厚 3mm 且与病变肠道垂直且包全盆腔) 高分辨及 RESOLVE (与轴位同层且包全盆腔) 磁共振普通扫描。

由两名高年资医生对轴位 T2 加权图像和 RESOLVE 图像进行评价, 对相同层面的轴位 T2 加权图像和 RESOLVE 图像显示的直肠肿瘤进行比较, 比较轴位 T2 加权图像和 RESOLVE 图像对直肠肿瘤的显示效果。

结果 T2 加权成像对肿瘤与纤维的区分良好, 对肿瘤周围结构显示清楚, 显示的结构多成分复杂, 肿瘤边界与周围组织的关系不易区分。高分辨弥散加权成像 (RESOLVE) 获得了良好的组织对比度, 能很好的限定肿瘤内部的结构, 对直肠肿瘤的形态、大小、边界及组织密度显示清楚, 几乎没有呼吸运动伪影影响, 结合 ADC 值可以进一步对肿瘤的良恶性进行预判。

结论高分辨弥散加权成像 (RESOLVE) 对直肠肿瘤的成像可以弥补轴位 T2 加权图像的不足, 获取更多的影像信息, 提供更佳准确的诊断信息。

PO-2891

对 200 例重庆地区多发性硬化临床和常规磁共振影像表现

李松遥

中国人民解放军陆军特色医学中心

目的: 总结重庆地区多发性硬化 (MS) 的临床和常规磁共振成像 (MRI) 特征

研究对象: 收集资料完整的 200 例 MS 确诊患者, 回顾性分析其临床和 MRI 表现及与临床残疾状态功能评分

检测方法: 患者接受脑部的 MRI 扫描, 采用 GE 3.0TMR/i 磁共振成像系统, 按照国际 MS 学会制定的序列进行扫描:

(1) 脑部 MRI: 双回波质子密度 (Proton density, PD)PD/T2WI 成像, TR/TE1/TE2=2900ms/25ms/93ms, 矩阵= 256×192; 横断面和矢状面液体衰减反转恢复 (Fluid-attenuated inversion recovery, FLAIR)序列, TR/TE= 8000ms/120ms, 矩阵 256×160; 横断面 T1FLAIR 成像, 所有层厚 4mm 无间隔扫描, FOV= 24cm×24cm。

(2) 增强检查: 110 例急性期的患者均作钆喷酸葡胺增强检查, 对比剂 15~20ml 经肘静脉 3ml/s 的速度注射, 增强检查的层厚和间距与平扫 T1FLAIR 参数相同。

数据处理: 由一位经验丰富的神经科医师在 MRI 扫描前对所有患者进行 EDSS 评分, MRI 检查在随后 1d 内进行, 分析 MS 患者脑部和脊髓影像学特点以及与 EDSS 评分的相关性。

方法: 收集资料完整的 200 例 MS 确诊患者, 回顾性分析其临床和 MRI 表现及与临床残疾状态功能评分 (EDSS) 的相关性, 以提高对本病的诊断水平。

结果 (1) 常见症状及诱因: 肢体无力为最常见的症状(54.5%), 上呼吸道感染为主要诱因 (34.0%)。

(2) 病灶分布: 仅脑部受累 68 例(34.0%), 仅脊髓受累 34 例(17.0%), 脑和脊髓均受累 21 例 (10.5%), 两者 EDSS 评分有统计学差异($P < 0.05$)。

结论: 重庆地区 MS 患者以女性为多, 发病以 20-40 岁为主, 复发-缓解型最多, MRI 影像随访有利于 MS 的诊断和监测病灶的发展。

PO-2892

睡眠剥夺实验对小鼠类淋巴系统 DTI-ALPS 指数的影响

张晋瑞

重庆市第四人民医院

目的: 睡眠是调节淋巴系统活动的重要因素, 而失眠是最常见的睡眠障碍之一。然而, 我们目前对于失眠在小鼠类淋巴系统影响了解有限。因此我们利用磁共振成像 (MRI) 中沿血管周围空间 (ALPS) 指数上的扩散张量成像 (DTI) 评估了睡眠剥夺小鼠的淋巴系统活动是否有异常。通过评估失眠对 DTI-ALPS 指数的影响, 来探究中枢神经淋巴调节的机制在睡眠中的作用与影响。

方法: 本研究选择雄性 C57BL/6 小鼠共 20 只作为实验对象, 随机将其分为失眠组和对照组。失眠组小鼠采用了改良多平台睡眠剥夺法 (MMPM), 将 10 只小鼠同时放置在 14 或 15 个小平台的水槽中进行实验。失眠组小鼠经历连续 72 小时的睡眠剥夺, 并在此后进行 24 小时的恢复睡眠。对照组小鼠则保持正常的睡眠模式。随后, 采用磁共振成像 (MRI) 技术进行扩散张量成像 (DTI) 扫描, DTI 采集参数如下: 重复时间 (TR)=7300ms, 回波时间 (TE) =72ms, FOV=64mX64mm, 矩阵=128*128, 层厚 1mm, 无层间距, 共扫描 12 层, 梯度方向 60, b 值设置为 b=0, 1000, 图像扫描时间为 23 分 20 秒。将扫描数据利用 FSL 软件计算得出 FA, Dx, Dz, Dy 等参数值, 之后使用 ImageJ 开源图像处理工具 (<https://imagej.nih.gov>), 计算 ALPS 指数来评估类淋巴系统的功能, 并利用独立样本 T 检验的方法比较失眠组和对照组小鼠的 DTI-ALPS 指数。

结果: 与对照组相比, 失眠组小鼠的 DTI-ALPS 指数显著降低 ($p < 0.05$), 存在统计学差异。这表明失眠对小鼠淋巴系统活动产生了负面影响, 导致 DTI-ALPS 指数的降低。

结论: 本研究结果表明, 失眠可能通过干扰小鼠的淋巴系统功能来影响 DTI-ALPS 指数。淋巴系统在清除废物和代谢产物方面起着重要作用, 而失眠可能干扰这一清除过程, 导致 DTI-ALPS 指数的降低。

PO-2893

MR 弹性成像与超声实时剪切波弹性成像 评估兔肝纤维化的对比研究

杜亚楠¹、邹立秋²、刘水清¹、张豪²、朱祖辉¹、姜纪飞¹

1. 常州市第一人民医院

2. 深圳大学第六附属医院放射科

目的 比较 MR 弹性成像 (MRE) 与超声实时剪切波弹性成像 (SWE) 评估兔肝纤维化的价值。

方法 2020 年 3 月至 11 月间选取 200 只健康新西兰大白兔采用随机数表法随机分为对照组 (40 只) 和肝纤维化组 (160 只)。肝纤维化组实验兔皮下注射 50%CCl₄ 油溶液。第 1~3 周剂量为 0.1ml/kg/周; 第 4~6 周剂量为 0.2ml/kg/周; 第 7~16 周每周注射 2 次, 剂量为 0.1ml/kg。对照组皮下注射等剂量生理盐水。肝纤维化组及对照组在第 4、8、12、16 周末分别随机选取 40、10 只进行 MRE 和 SWE 检查, 分别获得肝脏弹性硬度值 (LS), 记为 LSMRE、LSSWE。实验兔检查结束后处死取肝组织进行病理学 Scheuer 纤维化分期, 分为 F0~F4 组。采用单因素方差分析评价不同肝纤维化分期间 LSMRE、LSSWE 的差异; LS 值与病理分期的相关性分析采用 Spearman 法; ROC 曲线评价 LSMRE、LSSWE 诊断肝纤维化分期的效能, AUC 的比较采用 Z 检验。

结果 共 162 只实验兔纳入研究, 不同肝纤维化分期间 LSMRE、LSSWE 总体差异均有统计学意义 ($F=295.29$ 、 102.40 , P 均 <0.001)。LSMRE、LSSWE 与肝纤维化分期均呈正相关 ($r=0.93$ 、 0.81 , P 均 <0.001)。LSMRE 诊断肝纤维化分期 $\geq F1$ 、 $\geq F2$ 的 AUC 高于 LSSWE ($Z=2.93$ 、 3.29 , $P=0.003$ 、 0.001), 诊断 $\geq F3$ 、 $\geq F4$ 的 AUC 差异无统计学意义 ($Z=1.58$ 、 1.68 , $P=0.115$ 、 0.093)。

结论 MRE 及 SWE 技术均能较为准确地预测实验兔肝纤维化分期, MRE 诊断早期肝纤维化的效能优于 SWE。

PO-2894

基于瘤内与瘤周影像组学的子宫内膜癌微卫星不稳定性预测

颜瑞馨、郎宁

北京大学第三医院

目的: 微卫星不稳定性 (MSI) 与子宫内膜癌 (EC) 的发生、发展及预后相关, 术前确认 MSI 状态可能有助于治疗决策。因此本研究提取 EC 病灶的多参数 MRI 瘤内及瘤周图像特征, 建立瘤内与瘤周特征的最佳联合模型, 预测 EC 患者的 MSI 状态。

材料与方法: 本研究回顾性收集 131 例经病理确诊的 EC 患者 MRI 横轴位 T2WI-FS 及 DWI 图像, 根据患者微卫星稳定情况将患者分为 MSI 组 ($n=30$) 和 MSS ($n=101$), 收集患者影像学及临床病理资料, 人工标注病灶瘤内及瘤周 (3mm) VOI, 使用逻辑回归分类模型对预测模型进行训练。在训练组及验证组中采用受试者特征曲线下面积 (AUC) 来评估不同模型性能。

结果: 在训练集中, MSI 组和 MSS 组之间在年龄、FIGO 分期、病理类型等方面具有统计学差异 ($P<0.05$)。联合模型包括 T2-FS 瘤内、瘤周及 DWI 瘤内、瘤周提取出的 8 个特征, 该联合模型在预测 MSI 状态方面显著优于单一参数模型 ($P<0.00$, 训练集和测试集的 AUC 分别为 0.89 和 0.85)。

结论: 本研究建立了瘤内与瘤周影像特征的联合模型, 可准确无创预测子宫内膜癌 MSI 状态, 为临床提供个体化的精准治疗策略选择。

PO-2895

基于磁共振的孕晚期前置胎盘数字三维模型临床应用的研究

阿布都克尤木江·阿布力孜、阿布都热苏力·吐尔孙、艾克拜尔江·吐鲁洪、马依迪丽·尼加提
喀什地区第一人民医院

【摘要】目的：评估一种用于确定前置胎盘患者剖宫产期间子宫切口位置、胎盘位置的新型三维（3D）磁共振成像（MRI）模型的临床应用价值。方法：纳入 2019 年 01 月 01 日至 2023 年 06 月 01 日期间在喀什地区第一人民医院剖宫产分娩的单胎妊娠并发前置胎盘的妇女进行前瞻性研究。所有患者均接受常规盆腔 MRI 检查，根据患者知情同意分研究组和对照组，研究组患者的 MRI 图像导入开源软件 3D Slicer 并构建子宫、胎盘 3D 模型。收集产妇一般资料、手术记录及新生儿 1 分钟、5 分钟 Apgar 分数。结果：在入组的 71 例女性中，研究组 40 例，对照组 31 例。与对照组相比，试验组手术时间（ 58.63 ± 4.33 分钟）较对照组（ 61.42 ± 6.67 ）明显缩短（ $P=0.036$ ）；试验组术中失血量（ 885.00 （ $800.00, 965.00$ ））较对照组少 960.00 （ $800.00, 1300.00$ ）（ $P=0.045$ ）；试验组住院天数 6.00 （ $6.00, 7.00$ ）较对照组 7.00 （ $6.00, 7.00$ ）短（ $P=0.023$ ）；试验组婴儿 1 分钟 Apgar 评分小于 7 的新生儿较对照组明显低（ $P=0.022$ ）。结论：3D MRI 模型引导的子宫切口可以明显缩短手术时间，减少术中失血量，缩短住院天数，提高婴儿 1 分钟 Apgar 评分。

PO-2896

基于脂肪抑制 T2 mapping-T2 弛豫时间的不同测量方法评价轻度甲状腺相关眼病活动性的研究

李德福¹、祝婷婷²、郭学军³、李红兵¹

1. 深圳市宝安区福永人民医院

2. 华中科技大学同济医学院附属同济医院

3. 北京大学深圳医院

目的：在有和无脂肪抑制(fat suppression, FS)T2 mapping 上比较眼外肌(extraocular muscles, EOMs)的 T2 弛豫时间(T2 relaxation time, T2RT)，以评估轻度甲状腺相关眼病(thyroid-associated ophthalmopathy, TAO)的活动性。

方法：回顾性分析 2020 年 5 月至 2022 年 10 月间连续就诊的 44 例轻度 TAO 患者，以及 26 例无眼部或甲状腺相关或其他自身免疫性疾病史的健康者。轻度 TAO 患者根据其临床活动评分分为活动组和非活动组。分析有和无 FS 的 T2 mapping 图像上 EOMs 的影像学特征，并在大（在冠状切面上沿 EOMs 边缘）和小（以 EOMs 上 T2 信号最高处为中心，范围约 2mm^2 ）的感兴趣区域上测量每个 EOM 的 T2RT。采用受试者工作特征曲线评估(receiver operating characteristic, ROC)检测 T2RT 对轻度 TAO 活性的诊断效能。

结果：T2RT 在活动组显著高于非活动组和对照组($P<0.05$)。FS-T2 mapping 图像较无 FS 的更好显示 EOMs 内部和边缘信号特征，并观察到部分 EOMs 周围高信号聚集及中央呈相对低信号。在有和无 FS 的小区域或大区域中测量的最大 T2RT 对 TAO 活动具有良好的诊断功效，其中无 FS 的诊断效能更好(在无 FS 的小区域和大区域中测量的最大 T2RT 的 ROC 曲线下面积分别为 1.0 和 1.0， P 值为 <0.001 和 <0.001)。

结论：使用频率预饱和和反转恢复的 T2mapping 很好地反映 EOMs 炎性水肿的病理生理学特征。有或无 FS 的 T2 mapping 均可辅助临床对轻度 TAO 进行活动性分期，为临床诊断和治疗提供依据。

PO-2897

脊髓小脑共济失调三型患者神经影像功能网络的研究

王薪钢

中国人民解放军陆军军医大学第一附属医院

目的：本研究的主要目标是利用图论理论，结合静息态功能磁共振成像（Rs-fMRI）和脑网络分析（BNA）方法，深入研究脊髓小脑共济失调三型（SCA3）患者的脑功能网络变化。通过揭示其神经系统病理学机制，为 SCA3 的临床诊断和治疗提供理论依据。

材料和方法：研究纳入了 52 名 SCA3 患者和 55 名健康志愿者作为对照组。所有参与者都完成了结构磁共振成像（3D-MPRAGE）和静息态功能磁共振成像（Rs-fMRI）的数据采集。所获数据经过 Gretna 软件（基于 Matlab 编程）处理，采用偏相关系数 T 检验比较了两组受试者在所有脑区的节点效率，以明确 SCA3 患者组节点效率和脑网络中枢（Hub）的异常情况。选取显著差异脑区作为目标，进一步研究了异常功能连接值与临床数据及行为学量表评分之间的关系。

结果：相对于健康志愿者，SCA3 患者的脑功能网络呈现出 Hub 节点重新分布的现象。这些 Hub 节点主要分布在额叶、边缘系统、枕叶和颞叶等区域，然而，顶叶和小脑等脑区的 Hub 节点数量明显减少。另外，在 SCA3 患者中，左侧楔前叶和左侧颞下回的节点效率降低，而右侧豆状核和左侧颞中回的节点效率升高。进一步的静息态功能连接分析揭示，SCA3 患者的脑区间存在多个功能连接发生显著改变，这些变化与患者的共济失调、认知功能、情绪状况和基因重复次数等方面表现出显著负相关或正相关。

结论：通过采用静息态功能磁共振和脑网络分析，本研究深入阐明了罕见疾病 SCA3 患者脑功能网络的异常变化。SCA3 患者主要表现出口语、认知功能、情绪、姿势和步态功能方面的障碍，然而短时记忆方面未见明显异常。临床行为学变化与多个脑区间功能连接异常之间呈紧密相关，为进一步的临床诊疗提供了全新视角和可能性。这项研究为 SCA3 的神经基础研究和临床干预提供了重要的参考，有助于更好地理解 and 应对这一罕见疾病。

心血管磁共振成像技术在急性 ST 段抬高型心肌梗死患者经皮冠状动脉介入治疗后心肌内出血中的研究进展

张何^{1,2}、汪时劲²

1. 南通大学附属医院

2. 中国医科大学附属第一医院

摘要：心肌内出血是急性 ST 段抬高型心肌梗死（STEMI）患者行经皮冠状动脉介入治疗（PCI）后的常见也是较为严重的并发症，与不良预后和不良心室重构息息相关。而且心肌内出血（IMH）的评估已经成为急性 STEMI 患者 PCI 后疗效评价的重要辅助手段。本文的目的是对心血管磁共振成像在急性 STEMI 患者 PCI 后心肌内出血中的诊断技术以及发展方向进行综述。

Abstract:

Intramyocardial hemorrhage is the common complication of percutaneous coronary intervention (PCI). And it is closely related to poor prognosis and adverse ventricular remodeling. In addition to that, the estimation of intramyocardial hemorrhage is the important auxiliary method for evaluating the effect of the PCI and instructing the drugs therapy. The purpose of this article is to review the diagnostic technology and development direction of cardiac magnetic resonance in intramyocardial hemorrhage after PCI.

关键词：心脏磁共振；心肌内出血；T1 mapping；T2 mapping；T2* mapping

PO-2899

基于心血管磁共振技术评估心肌梗死研究进展

张何¹、汪时劲²

1. 南通大学附属医院

2. 中国医科大学附属第一医院

摘要：心肌梗死是一种由于冠状动脉内斑块形成导致心肌细胞内缺氧而造成损伤的疾病，心血管磁共振成像技术的应用越来越广泛，本文的目的是综述心血管磁共振技术在心肌梗死诊断和评估中的应用进展。

Abstract: Myocardial infarction is a disease caused by hypoxia in myocardial cells caused by the formation of plaque in the coronary arteries. The application of cardiovascular magnetic resonance imaging is becoming more and more extensive, The purpose of this paper is to review the application progress of cardiovascular magnetic resonance in the diagnosis and evaluation of myocardial infarction.

PO-2900

基于连边分析研究针刺对膝骨性关节炎患者脑功能连接的影响

张中旭、马萧童

陕西中医药大学附属医院

目的：探讨针刺治疗膝骨性关节炎（KOA）后患者静息态脑功能连接的变化，为临床针刺治疗 KOA 提供神经影像依据。方法：纳入 KOA 患者 25 例进行为期 3 周的针刺治疗，取犊鼻穴、血海、阳陵泉、足三里、三阴交、内膝眼、梁丘组穴配伍，每周 5 次，每次 30 分钟。采集 KOA 患者针刺前后的视觉模拟量表（VAS）、膝关节功能评分表（KSS）和头颅静息态功能 MRI（rs-fMRI）数据，应用连边分析方法描述 KOA 患者针刺后各脑区间功能连接（FC）的改变，并与临床评分作相关性分析。结果：针刺治疗后，KOA 患者 VAS 评分显著降低、KSS 评分显著升高（ P 均 <0.001 ）。连边分析显示，KOA 患者针刺后右侧眶部额下回与左侧梭状回，右侧角回与左侧楔前叶、右侧中央前回，左侧岛盖部额下回与左侧丘脑，左侧中央后回与右侧角回、右侧颞上回的 FC 增强（ P 均 <0.001 ）；相关性分析发现，右侧角回与右侧中央前回（ $r=0.540$ ， $P=0.008$ ）、左侧中央后回与右侧颞上回（ $r=0.654$ ， $P=0.001$ ）的 FC 变化与 VAS 变化呈正相关。结论：针刺可能通过正激活部分脑区间的功能连接，加强中枢镇痛区域间的联系来缓解 KOA 患者疼痛、改善膝关节运动障碍，这些脑区主要分布于默认模式网络、感觉运动网络、扣带岛盖网络。

评估辐射诱导的轴突运输功能障碍：MRI 嗅觉通路成像

牛晓凤、杨军、李勤勃

云南省肿瘤医院

目的：探究经鼻 Mn⁺ MRI 成像在评估放射性脑损伤（RIBI）后轴突运输（AT）功能障碍中的价值。方法：本研究选取了 30 只 6-8 周龄的雄性 SD 大鼠，随机分为对照组（control 组， $n=15$ ）和照射组（IR 组， $n=15$ ）。IR 组接受全脑照射，其余部位使用铅板遮挡，总剂量 30Gy，分 2 次间隔 5 天完成，以模拟 RIBI，对照组则接受假照射。照射后 8 周，评估大鼠的觅食行为，第 10 周时使用 MnCl₂ 经鼻孔注入大鼠体内，进行 MRI 检查，观察嗅觉通路的成像情况。通过 Western blotting 检

测运动蛋白和与能量代谢相关的蛋白以及 AT 的表达水平, 并利用透射子显微镜对大脑超微结构进行分析。

结果: 研究结果显示, 与对照组相比, IR 组大鼠的觅食能力下降, 且觅食时间明显延长 ($P<0.05$)。嗅球中 Mn^{2+} 的摄取量在 IR 组中明显降低 ($P<0.05$)。IR 组大鼠嗅束外侧核的 AT 率和跨突触的 AT 率均明显低于对照组 ($P<0.05$)。Western blotting 结果显示, IR 组大鼠的运动蛋白 Kinesin-1 和胞浆动力蛋白水平明显降低 ($P<0.05$), 脑内能量代谢相关蛋白 ATPB 和 COX-IV 的表达也显著低于对照组 ($P<0.05$)。此外, 在 IR 组观察到了细胞凋亡和与突触相关的损伤。

结论: 嗅觉通路的 MRI 成像在评估 RIBI 模型中的轴突运输功能障碍方面具有一定的可行性。辐射引起的 AT 缺陷可能是由于运动蛋白水平的下降、神经元凋亡、突触损伤和能量代谢障碍所致, 需进一步深入研究了解这些机制, 并为放射性脑损伤的治疗和预防提供有力的依据。

PO-2902

基于 3.0T HRMR-VWI 技术对颅内动脉粥样硬化斑块与缺血性脑卒中的研究

王艳¹、张明²

1. 宝鸡市中心医院

2. 西安交通大学第一附属医院

目的: 本研究基于 3.0T HRMR-VWI 技术, 探究缺血性脑卒中患者责任区与非责任区斑块特点、脑梗死面积与斑块特征相关性。

方法: 收集本院 62 例符合要求的缺血性脑卒中患者均行多模态磁共振头颅扫描 (HRMR-VWI、DWI 及常规 MR 序列)。在 3D T1 CUBE 重建图像上运用 AW 4.6 工作站测量软件获取斑块信号强度, 并对每位患者正常丘脑画感兴趣区测量其信号强度; 然后勾画患者涉及责任区血管狭窄最严重处斑块, 测量其面积、厚度、长度及信号强度。在 DWI 图像上通过 PACS 工作站测量软件画感兴趣区逐层累加计算梗死区面积。统计学采用 IBM SPSS 23.0 进行数据分析。

结果: 1. 62 例患者共 343 处斑块, 其中责任区斑块 131 处, 非责任区斑块 212 处, 两组斑块标准化 T1 信号强度比值及斑块易损性均存在统计学差异 ($P<0.01$), 两组斑块易损性和标准化 T1 信号强度比值曲线下面积为 0.866、0.953, 95% CI 为 (0.834-0.918, 0.925-0.981)。2. 28 例急性脑梗死患者梗死面积单因素相关分析显示: 梗死面积与斑块面积、厚度、长度、负荷及数目存在正相关 ($r=0.572$ 、 $p=0.002$, $r=0.571$ 、 $p=0.002$, $r=0.739$ 、 $p<0.001$, $r=0.412$ 、 $p=0.030$, $r=0.521$ 、 $p=0.005$), 与重构指数、血管狭窄率不存在相关性 ($r=0.226$ 、 $p=0.246$, $r=0.219$ 、 $p=0.264$)。多元逐步线性回归分析结果显示只有斑块长度与梗死面积存在正相关性 ($r=0.879$, $t=3.082$, $p=0.006$, 95% CI 37.817 -196.266), 其余变量无相关性, $R^2=0.288$ 。

结论: 基于 3.0T HRMR-VWI 技术, 对斑块与缺血性脑卒中事件的相关性研究发现, 责任区斑块标准化 T1 信号强度比值高且易损斑块多, 脑梗死面积与斑块长度存在正相关性。

PO-2903

DCE-MRI 及高 b 值 DWI 在前列腺癌及前列腺增生鉴别诊断中的应用价值

汪博泉、郭小芳、闫卫鹏、杨倩
湖北省肿瘤医院 (湖北省肿瘤研究所)

目的: 探讨磁共振动态增强扫描 (DCE-MRI) 及高 b 值弥散功能成像 (DWI) 在前列腺癌及前列腺良性增生病例中的影像表现及鉴别诊断中的应用价值。方法: 经病理证实的前列腺癌 30 例及前列

腺良性增生 38 例, 年龄 57-86, 采用同一磁共振扫描仪行轴位 T1WI 及 T2WI、T2WI 脂肪抑制, 冠状位 T2WI 脂肪抑制及矢状位 T2WI 扫描, 横轴位高 b 值 (1400s/mm^2) 弥散加权成像, 行轴位动态增强扫描及轴位、冠状位、矢状位延迟扫描, 造影剂使用钆喷酸葡胺, 确定感兴趣区后绘制病灶信号强度-时间曲线 (SI-T 曲线), 观察曲线形态、分类, 并对前列腺癌及前列腺良性增生动态曲线的峰值时间、强化程度, 并测量各感兴趣区开始时间、最大信号强度及早期强化率等半定量参数及 Ktrans、Ve、Kep 等定量参数, DWI 信号强度 (SI)、表观扩散系数值 (ADC), 进行统计学分析。结果: 动态增强前列腺癌及前列腺增生强化程度高于正常前列腺组织, 延迟扫描可见正常前列腺组织强化明显, 病灶强化程度下降。SI-T 曲线: 30 例前列腺癌 4 例表现为 I 型, 8 例表现为 II 型, 18 例表现为 III 型; 38 例前列腺良性增生 20 例表现为 I 型, 15 例表现为 II 型, 3 例表现为 III 型, 两组病例 SI-T 曲线的峰值时间及强化程度均有明显差异 ($P<0.05$), 前列腺癌的 SI-T 曲线峰值时间明显早于前列腺良性增生, 强化程度也明显高于前列腺良性增生。前列腺癌 MRI 动态增强的早期强化参数开始时间、最大信号强度及早期强化率与前列腺良性增生不同 (P 分别为 <0.01 、 0.01 、 0.05), 但两者之间有部分重叠, 定量分析参数 Ktrans、Ve、Kep 在两组间差别均有统计学意义。前列腺癌 SI 高于前列腺良性增生, ADC 低于前列腺良性增生 ($P<0.05$)。结论: 磁共振动态增强及高 b 值 DWI 在前列腺癌及前列腺良性增生的鉴别诊断中诊断效能较好, 有助于提高临床诊断准确率。

PO-2904

基于 MRI 影像组学对原发性下肢淋巴水肿临床分期评估的研究

刘梦珂、李兴鹏、张仪梦、王仁贵
首都医科大学附属北京世纪坛医院

目的 探索基于 MRI 影像组学模型对评估原发性下肢淋巴水肿(primary lower extremity lymphedema, PLEL)分期的价值。方法 回顾性收集 132 例就诊于首都医科大学附属北京世纪坛医院的单侧 PLEL 患者, 依据 2020 年国际淋巴协会(International Society of Lymphology, ISL)淋巴水肿临床分期标准将患者分为 I、II、III 期, 其中 45 名患者 I 期, 51 名患者 II 期, 36 名患者 III 期。将 STIR 序列原始图像导入深睿多模态科研平台, 手动勾画感兴趣区(region of interest, ROI), 并提取影像组学特征 1743 个。采用相关性分析及 F Test 算法筛选特征, 采用 Logistic 回归分类器分别建立 I 期与 II 期、II 期与 III 期的分类模型, 使用受试者工作特性(receiver operator characteristic, ROC)曲线评价模型的性能。使用决策曲线(decision curve analysis, DCA)来评估模型的临床实用性。结果 I 期 vs II 期, 共筛选出 10 个特征用于建模: 训练集 AUC 值为 0.935 (0.886-0.983), 验证集 AUC 值为 0.917(0.858-0.975); II 期 vs III 期, 共筛选出 10 个特征用于建模: 训练集 AUC 值为 0.838 (0.749-0.927), 验证集 AUC 值为 0.760(0.654-0.866)。DCA 曲线验证了影像组学模型鉴别 PLEL 临床分期的临床实用性。结论 基于下肢 MRI 建立的影像组学模型可准确进行 PLEL 分期, 评估其严重程度。

PO-2905

MRI 在原发性下肢淋巴水肿分期中的价值

刘梦珂、李兴鹏、张怡梦、张晓杰、冯吉雪、王仁贵
首都医科大学附属北京世纪坛医院

目的 探讨原发性下肢淋巴水肿(lower extremity lymphedema, LEL)不同临床分期的 MR 表现。资料与方法 回顾性分析 228 例原发性淋巴水肿病例, 均行 MR 检查, 扫描序列为短时反转恢复序列 (Short Time Inversion Recovery, STIR)。观察患肢的 MR 表现, 参考 2020 年国际淋巴协会(International Society of Lymphology, ISL)临床分期标准, 将患者分为 I、II、III 期, 记录各期淋巴

水肿累及范围（纵向及横向）以及 MR 表现的出现频次，包括有无皮肤增厚、皮下脂肪层的水肿形态（网格征、蜂窝征、平行线征、条带征、新月征、淋巴湖），采用卡方检验比较不同临床分期下 MR 表现的频次差异。采用 Spearman 检验评估水肿范围与临床分期的相关性。

结果 三期之间水肿范围（纵向及横向）、皮肤增厚、皮下脂肪层内不同水肿形态的发生率均存在统计学差异($P<0.05$)。纵向及横向累及范围与临床分期均呈正相关，各分期间两两比较，II 期及 III 期皮肤增厚的发生率明显大于 I 期，平行线征 I 期发生率显著大于 II 期及 III 期，网格征 I 期及 II 期的发生率明显大于 III 期，蜂窝征 II 期及 III 期的发生率显著大于 I 期，条带征 I 期及 II 期的发生率显著大于 III 期，淋巴湖及新月征 III 期的发生率显著大于 I 期及 II 期 ($P<0.05$)。

结论 原发性 LEL 不同分期下 MR 表现具有一定的特征性，MRI 能够成为评估原发性 LEL 严重程度的有效辅助工具。

PO-2906

MR 降噪类深度学习重建技术在前列腺癌的临床应用研究

杨洁、段庆红
贵州医科大学附属肿瘤医院

目的 评估 MR 降噪类深度学习重建技术在前列腺癌的图像质量及诊断效能。方法 回顾性分析组织病理学确诊的 62 例前列腺癌患者影像资料，所有患者在 1.5T MR 设备上均接受 SG T2W FS、AX T2W FS、AX T1W、CO T2W FS 扫描，对每个序列图像采用常规小波降噪方法（wavelet method, WE）和 dDLR 方法进行重建。两名放射科医生采用五分法对四种不同序列类型图像的整体图像质量、主观噪声、主观对比度和诊断可信度进行评分。定量分析肿瘤与周围组织信噪比（SNR）和对比噪声比（CNR）。统计分析采用单因素方差分析和 Friedman 检验。结果 dDLR 序列图像主观评分均优于常规 WE 图像。前列腺癌组织结构与周围组织关系的显示，dDLR 序列图像显示较常规 WE 图像更清晰。定量分析显示，dDLR 与常规 WE 图像 SNR 分别为 SG T2W FS: 63.59 ± 3.11 , 30.14 ± 4.28 ($P<0.05$) ; AX T2W FS: 52.41 ± 4.13 , 23.19 ± 3.36 ($P<0.05$) ; AX T1W: 85.28 ± 2.12 , 45.39 ± 2.31 ($P<0.05$) ; CO T2W FS: 61.16 ± 3.15 , 31.65 ± 3.98 ($P<0.05$)。dDLR 与常规 WE 图像 CNR 分别为 SG T2W FS: 42.59 ± 4.11 , 15.64 ± 3.28 ($P<0.05$) ; AX T2W FS: 36.41 ± 3.89 , 12.69 ± 4.39 ($P<0.05$) ; AX T1W: 50.78 ± 3.11 , 29.79 ± 2.82 ($P<0.05$) ; CO T2W FS: 41.55 ± 3.75 , 14.35 ± 3.48 ($P<0.05$)。结论 降噪类深度学习重建技术提高了前列腺癌图像质量，有助于前列腺癌疾病的临床诊断，值得临床推广。

PO-2907

基于时间依赖性弥散 MRI 的微观结构映射用于鉴别高级别浆液性卵巢癌和浆液性交界性卵巢肿瘤

曹雨薇¹、宋佳成¹、张爱宁¹、黄珊²、赵献策²、陈婷¹、吴飞云¹
1. 江苏省人民医院（南京医科大学第一附属医院）
2. 飞利浦(中国)投资有限公司

目的 术中冰冻切片检查在诊断高级别浆液性卵巢癌 (HGSOC) 和浆液性交界性卵巢肿瘤 (SBOT) 方面仍存在不足。运用时间依赖性弥散 MRI 可以描绘肿瘤的微观结构参数，可能在 HGSOC 和 SBOT 的术前鉴别中发挥作用。

方法 共 34 例 HGSOC 患者，12 例 BEOT 患者连续纳入本研究，接受术前盆腔 MRI 检查。两名放射科医师勾画肿瘤，获得感兴趣区 (ROI)。通过 IMPULSED 模型拟合时间依赖性扩散 MRI 信号，并提取包括细胞体积分数、细胞直径、细胞密度和细胞扩散系数在内的微观结构参数。同时从标

准弥散加权成像 (DWI) 获得表观扩散系数 (ADC) 值进行比较。比较 BEOT 和 MEOT 的各种参数, 并使用受试者工作特征曲线评估诊断性能, 并计算曲线下面积 (AUC)。同时计算微观结构参数与病理参数包括 Ki-67、P53、Pax-8、ER 和 PR 的相关性。使用组内相关系数 (ICC) 评估观察者间及观察者内的一致性。

结果细胞体积分数、细胞密度、细胞扩散系数和 ADC 值在两组间有显著的统计学差异, 在鉴别 HGSOC 和 SBOT 时均表现出良好的诊断性能, 具有较高的 AUC, 分别为 0.936、0.909、0.902 和 0.914。这些参数的诊断性能无显著差异。Spearman 相关分析显示, 在 HGSOC 组中, 细胞密度与 P53 表达呈显著正相关 ($P = 0.028$, $r = 0.389$), 细胞扩散系数与 Pax-8 表达呈显著正相关 ($P = 0.018$, $r = 0.415$)。ICC 显示所有参数具有极好的一致性。

结论时间依赖性弥散 MRI 在描绘 HGSOC 和 SBOT 的显微结构存在一定价值, 可以帮助术前鉴别 HGSOC 和 SBOT。

PO-2908

肥胖/超重多囊卵巢综合征患者的自发脑活动改变: 一项静息态功能磁共振成像研究

曹雨薇、王菁、宋佳成、张爱宁、陈婷、马翔、吴飞云
江苏省人民医院 (南京医科大学第一附属医院)

目的 研究肥胖/超重多囊卵巢综合征 (PCOS) 患者的自发脑活动改变。通过使用静息态功能磁共振成像 (rs-fMRI) 探索潜在的神经病理基础。

方法 共招募 74 例 PCOS 患者 (26 例肥胖/超重 PCOS 患者、16 例正常体重 PCOS 患者和 32 例对照受试者 (HCs)), 行 rs-fMRI 检查。计算低频波动幅度 (ALFF) 法和区域同质性 (ReHo), 并比较 PCOS 组和 HCs 组。然后提取差异显著的脑区作为掩模。对肥胖/超重 PCOS 组与正常体重 PCOS 组在掩模中进行比较。Spearman 相关性分析用于评估了 ALFF/ReHo 值与临床参数之间的相关性。

结果 与 HCs 相比, PCOS 组表现为双侧楔前叶 ALFF 值的明显升高, 右侧楔前叶 ReHo 值升高。PCOS 患者右侧楔前叶的 ALFF 值与 PCOS 的 LH 水平呈正相关。在掩模中进一步分析, 与正常体重 PCOS 患者相比, 肥胖/超重 PCOS 患者的右侧楔前叶中 ALFF 和 ReHo 值显著降低。肥胖/超重 PCOS 患者的右侧楔前叶 ALFF 值与 HOMA2-IR 评分呈负相关。

结论 PCOS 患者表现出自发脑活动的改变。而且, 与正常体重患者相比, 肥胖/超重表型改变了 PCUN.R 的自发脑活动。胰岛素抵抗 (IR) 可能在肥胖/超重 PCOS 局部脑活动、情绪和认知改变的潜在神经病理基础中起关键作用。

PO-2909

非打药非触发的弛豫增强血管成像 (REACT) 技术初步探究

程苗
陕西省人民医院

目的: 初步探究在 3T 场强下, 非打药非触发弛豫增强血管成像(Relaxation-Enhanced Angiography without Contrast and Triggering, REACT)序列在非对比增强磁共振血管(NCE-MRA)成像中的应用。

方法: REACT 序列是由两个磁化脉冲 (T2 预备脉冲和 IR 反转脉冲) 与三维梯度回波 m-Dixon 序列相结合, 改良的三维两点化学位移 -水脂分离超快速场回波脉冲序列(mDIXON TFE)使用了七脂肪峰模型重建, B0 场校正和水脂化学位移校正, 脂肪抑制更彻底、更均匀。T2 预备脉冲是由 4 个重聚焦脉冲组成, 利用动脉和静脉 T2 弛豫时间的差异, 以及减少短 T2 弛豫时间 (如骨骼肌) 的信

号, 促进动脉和静脉信号分离。IR 反转脉冲抑制短至中等 T1 和 T2 弛豫时间 (如内脏和神经) 的信号, 增加了血液和背景组织对比, 凸显血液信号。无需进行图像减影, 并可以在自由呼吸状态下, 无需心电和呼吸门控触发进行扫描。本研究所有健康志愿者和临床患者均使用 Philips Ingenia CX3.0T 磁共振扫描仪进行扫描, 使用 16 通道腹部相控阵线圈采集图像。所有受试者行躯干及四肢血管 REACT 序列扫描, 并对图像行 MPR、MIP 重建, 观察图像质量、血管成像的可视度和信噪比 (SNR)。

结果: REACT 序列在自由呼吸、无心电门控触发的情况下获得的图像初步显示, 在视野范围内, 脂肪及其它背景组织均被均匀抑制, 在多个解剖结构上, 血液与组织对比显著, 血管显示良好, 并能同时显示动脉及静脉, 动脉与静脉之间存在信号差异。

结论: REACT 技术无需对比剂, 自由呼吸, 无需心电门控触发, 用于非对比增强磁共振血管 (NCE-MRA) 成像中, 具有无创、无电离辐射、三维成像等诸多优势, 可为临床诊断及治疗提供大量直观、可靠的信息, 孕妇小孩以及肾功能衰竭的患者均可行此检查, 临床中可作为血管性病变的常规筛选手段。

PO-2910

静息态全脑体素水平功能连接分析对脑小血管病相关轻度认知障碍患者认知水平的预测作用

梁秀琴¹、刘肇²、吴江^{*1}、李璇¹

1. 山西省心血管病医院

2. 山西医科大学医学影像学院

目的 通过体素水平静息态功能磁共振成像 (resting-state functional magnetic resonance imaging, rs-fMRI) 序列, 探索脑小血管病 (cerebral small vessel disease, CSVD) 相关轻度认知障碍患者早期认知障碍的机制, 并分析其与临床神经心理学指标的相关性。**方法** 筛选常规 MRI 检查符合 CSVD 相关轻度认知障碍诊断标准的受试者 21 例, 并挑选与其年龄、性别及受教育年限相匹配的健康对照组 20 例, 所有被试都接受 rs-fMRI 检查, 计算全脑度中心度 (degree centrality, DC) 值, 将两组 DC 值差异显著团块的峰值 MNI 坐标作为种子点, 与全脑其他体素进行功能连接 (functional connection, FC) 分析, 两组存在差异脑区的 DC 及 FC 值与 MoCA 评分进行相关性分析, 并进一步分析 CSVD 总负荷评分与 MoCA 评分的相关性。**结果** 与健康对照组相比, CSVD 相关轻度认知障碍组左侧内侧额上回/左侧前扣带回、左侧角回/左侧缘上回、右侧内侧额上回/右侧额中回、左侧小脑及右侧小脑 DC 值减低, 左侧前扣带回与左侧颞中下回、双侧楔前叶、双侧中扣带回 FC 值减低。脑白质高信号评分、CSVD 总负荷评分与 MoCA 评分呈负相关 ($r_s = -0.461$, $P = 0.036$; $r_s = -0.458$, $P = 0.037$); CSVD 总负荷评分与视空间和执行功能评分呈负相关 ($r_s = -0.443$, $P = 0.044$)。CSVD 相关轻度认知障碍组左侧前扣带回-右侧楔前叶 FC 值与 MoCA 评分呈显著正相关 ($r = 0.565$, $P = 0.018$)。**结论** rs-fMRI 序列可以早期发现 DC 及 FC 值减低脑区, CSVD 评分及 DC、FC 值与 MoCA 评分呈明显相关, 可作为 CSVD 相关轻度认知障碍患者的潜在影像学标志物, 揭示其认知功能减退的潜在机制。

PO-2911

带状疱疹后神经痛患者脑结构协变网络变化的研究

熊佳欣、姜建

南昌大学第一附属医院

目的：为了寻找带状疱疹后神经痛（postherpetic neuralgia, PHN）患者中枢发病机制潜在的影像学证据以及带状疱疹（herpes zoster, HZ）患者向 PHN 转化的神经影像标志物，本研究构建 PHN 组及 HZ 组患者组水平脑结构协变网络（structural covariance network, SCN），与健康对照组（healthy controls, HC）进行比较分析，计算三组间 SCN 指标是否存在差异。

方法：对 54 名 PHN、53 名 HZ 及 50 名 HC 被试进行结构磁共振成像（3DT1）扫描，利用基于 Desikan-Killiany 图谱皮质厚度的皮尔逊相关建立组水平 SCN，计算各组 SCN 全局属性和节点属性，并计算三组间 SCN 指标是否存在显著差异。

结果：1、三组间的全局属性不存在显著差异。2、节点属性：（1）HZ 组左颞上、中回节点效率小于 HC 组，HZ 组左颞上回后部、右中央旁小叶、右距状旁回及右额极节点介数小于 HC 组，HZ 组左颞上回后部及右额极节点度小于 HC 组；HZ 组左扣带回后部、左额中回头部及右楔前叶节点效率大于 HC 组，HZ 组左嗅皮质及左额中回头部节点介数大于 HC 组，HZ 组左扣带回后部及左额中回头部节点度值大于 HC 组。（2）PHN 组右缘上回节点度小于 HC 组；PHN 组左颞下回节点效率大于 HC 组，PHN 组左扣带回后部及左缘上回节点介数大于 HC 组。（3）PHN 组左前扣带回尾部、左枕叶外侧及左舌回节点效率及节点度均小于 HZ 组，PHN 组左前扣带回尾部节点介数小于 HZ 组；PHN 组左颞上回后部、左颞中回及左额下回后部节点效率大于 HZ 组，PHN 组右颞上回后部节点介数大于 HZ 组，PHN 组左颞上、中、下回及右额极节点度大于 HZ 组。以上有差异的节点属性，均未通过 FDR 校正。

结论：三组间全局属性未发现显著差异，可能与 HZ 及纳入的 PHN 病程较短有关。三组间多个疼痛矩阵有关的脑区的节点属性存在差异，为既往 PHN 患者功能网络拓扑属性进行了补充，也为 HZ 患者向 PHN 患者发展的神经基础提供新的见解。

PO-2912

基于冠状位平行肛管扫描的直肠癌 MR 影像分析： 病灶与肛门解剖关系的研究

牟鹏、杨洁、安坤宝、段庆红
贵州医科大学附属肿瘤医院

目的 本研究旨在通过基于直肠癌 MR 高分辨率冠状位平行肛管扫描的影像分析，深入探究直肠癌病灶与肛门之间的微观解剖关系。我们的目标是为保肛手术决策提供更为精确的临床信息，强调影像学在直肠癌手术前的决策制定中的重要性。方法 我们纳入了 55 例经临床和影像学诊断确认的直肠癌患者，以确保研究样本的多样性涵盖了不同病期和肿瘤位置。所有患者分别接受了常规盆腔 MR 扫描和高分辨率冠状位平行肛管扫描。我们在两种扫描图像上分别测量肿瘤下缘与齿状线的距离，并对肿瘤的位置、大小以及与肛门的相对位置进行了详细的解剖学分析。通过对比两种扫描方法下的锯齿状线距离测量结果，我们使用统计学方法评估了这些方法之间的差异。此外，我们将影像学测量结果与临床直肠指检和肠镜结果进行对比，以分析影像学信息与临床观察之间的一致性和差异。结果 通过冠状位平行肛管扫描，我们获得了清晰的直肠癌 MR 影像，准确地显示了病灶与肛门的相对位置。肿瘤下缘距齿状线的测量结果揭示了不同病灶位置的直肠癌与肛门的距离显著差异。此外，我们观察到肿瘤的大小、浸润程度以及与周围组织的关系在解剖学上对于手术决策产生了重要影响。结论 基于冠状位平行肛管扫描的直肠癌 MR 影像分析为直肠癌患者的保肛手术决策提供了有力的解剖学支持。通过准确测量病灶与肛门的相对位置和距离，医生能够更精确地判断是否适合进行保肛手术，从而最大限度地保留患者的生活质量。本研究的发现有望为直肠癌患者的个体化治疗方案制定提供有力的临床指导。

PO-2913

3D-ASL 联合 APT 鉴别诊断高级别胶质瘤和单发脑转移瘤的价值

李文、赵勇、田宏哲、任转勤
宝鸡市中心医院

目的：探讨 3D-ASL 联合 APT 鉴别诊断高级别胶质瘤（HGG）和单发脑转移瘤（SMT）的价值。方法：回顾性分析经手术病理证实的 30 例 HGG 和 30 例 SMT 的 MRI 资料。分别测量计算 HGG 和 SMT 瘤体实质区及瘤周水肿区（ $<3\text{cm}$ ）的相对脑血流量（rCBF）值和非对称磁化转移率（MTRasym）值，采用独立样本 t 检验比较两者之间的差异；绘制 ROC 曲线，评估瘤体实质成分及瘤周水肿区的 rCBF 值和 MTRasym 值鉴别诊断两者的效能。结果：HGG 组与 SMT 组瘤体实质区的 rCBF、MTRasym 差异无统计学意义（ $P>0.05$ ）；HGG 组与 SMT 组瘤周水肿区的 rCBF、MTRasym 差异有统计学意义（ $P<0.05$ ），HGG 组均明显高于 SMT 组。当瘤周水肿区 rCBF >3.97 时，其诊断 HGG 敏感度为 88.59%，特异度为 86.47%，AUC 为 0.812；当瘤周水肿区 MTRasym >21.63 时，其诊断 HGG 敏感度为 90.77%，特异度为 88.71%，AUC 为 0.817；瘤周水肿区 rCBF 联合 MTRasym 诊断 HGG 的敏感度为 94.87%，特异度为 92.36%，AUC 为 0.957。rCBF 联合 MTRasym 的 AUC 最大，其次为 MTRasym、rCBF，三者间差异有统计学意义（ P 均 <0.05 ）。

结论：3D-ASL 联合 APT 可无创性定量鉴别诊断 HGG 与 SMT，瘤周水肿区比瘤体实质区更有诊断价值，且 rCBF 联合 MTRasym 鉴别诊断 HGG 和 SMT 的效能优于单独使用 rCBF 或 MTRasym。

PO-2914

并行采集技术与不同压缩感知加速因子对头颈高清血管壁成像的影响

张中旭、马萧童、于楠
陕西中医药大学附属医院

目的：比较并行采集（GRAPPA）技术与压缩感知（CS）技术不同加速因子（AF）对头颈高清血管壁图像质量的影响。方法：招募健康志愿者 30 例[男 20 例、女 10 例]。应用 Vida 3.0T MR 成像仪及 GRAPPA[AF=2]、CS[AF=2~10]技术对其行头颈高清血管壁 3D_T1_Space 扫描，由两名 MRI 方面具有 5 年以上诊断经验的放射科医师选取 8 处相同的位置[左右大脑中动脉、左右颈内动脉颅内段、左右颈总动脉分叉处下方、左右椎动脉]，在原始图像上划定 ROI，测量血管壁的信号强度（SI）和标准差（SD），并计算信噪比（SNR）和对比噪声比（CNR）；同时相互独立地对图像中颅内和颈部不同段血管壁的成像质量进行主观评分。采用组内相关系数（ICC）和 Kappa 检验对测量的数据和主观评分进行一致性分析。若一致性良好，则使用 Fried-man 检验对不同 AF 之间的 SNR、CNR 及主观评分进行比较；若差异性有统计学意义，则使用 LSD 法进行两两比较。结果：两位医师测量的数据与主观评分一致性良好[ICC: 0.778~ 0.959, Kappa: 0.768~ 0.881]；AF=2 时，CS 技术下 8 处 ROI 的 SNR 高于 GRAPPA($P<0.05$)；CS 的 AF=2、3、4、5、6 时，8 处 ROI 的主观评分可达 4 级，当 CS 的 AF=7、8 时，主观评分降低至 3 级($P<0.05$)，当 CS 的 AF=9、10 时，主观评分降低至 2 级($P<0.05$)。结论：结合 CS 技术的 3D_T1_Space 序列随着 AF 的增加，扫描时间逐渐降低。CS 的 AF=6 对比 GRAPPA 的 AF=2，在确保图像质量前提下，扫描时间缩短 69.14%，故推荐使用 CS[AF=6]行头颈高清血管壁扫描。另外，30 例健康志愿者中有 13 例在 CS 的 AF=8,9,10 中出现了不同神经刺激症状，症状为恶心、心慌、气短等不适，故不建议将 CS 的 AF 调整至 8 以上。

PO-2915

西门子 3.0T 磁共振 Skyra 心肌延迟强化与平扫 T1 mapping 相关性分析

阮啟超
绵阳市第三人民医院

多种心肌疾病导致的心肌损害均会造成心肌组织学水平的类似病理改变,即心肌细胞的变性、萎缩、坏死瘢痕化和心肌间质纤维化[1]。心肌细胞变性坏死为不可逆性损伤,心肌细胞坏死后继发心肌间质的纤维化,导致心肌细胞外间隙增宽。在以上病理改变的基础上,病变心肌的 MRI 灌注扫描后会发生延迟强化(late gadolinium enhancement LGE),即可通过心肌磁共振灌注成像来显示心肌损害的范围和程度,但是有严重肾功能不全的患者钆对比剂是慎用或禁用[2]。心脏 MRI 灌注成像对此类患者心肌病变的评估存在局限性。心脏平扫 T1mapping 技术是评价心肌病变的一种定量方法,T1mapping 技术能够提供心肌组织 T1 值的数字模拟图像、即伪彩图,同时还能精确测量任一兴趣区心肌组织的 T1 值,从而通过 T1mapping 的技术来显示心肌损害的范围和程度[3]。本文旨在通过对比心脏延迟强化与 T1mapping 的相关性,探究能否使用平扫 T1mapping 技术替代心脏灌注成像来评价心肌损害的范围和程度,从而使得具有对比剂应用限制的患者也能够得到心肌病变的精准评估。收集我院的 2019.7 至 2021.12 月的 106 例心脏磁共振检查患者中发现的 24 处左心室明显的延迟强化病灶并测量该区域的 T1 值;并在同一患者的未发生延迟强化且 T1mapping 伪彩图无明显增高的区域测量左心正常心肌的 T1 值做为对照。两组数据使用 SPSS23.0 版统计软件进行统计学处理与检验,组间采用独立样本 t 检验,结果显示延迟强化组 T1 值为 $1524.50 \pm 102.779\text{ms}$,无延迟强化组 T1 值为 $225.88 \pm 50.708\text{ms}$,两组间数据具有统计学差异($t=12.765$, P 值小于 0.001)。上述结果说明增强扫描延迟强化病灶与 T1mapping 高信号病灶存在良好的相关性,心肌 T1mapping 成像能够作为评估心肌损害的影像方法。

PO-2916

基于定量磁敏感图评估不宁腿综合征患者治疗前脑铁含量变化

胡鹏鑫、邹宇、熊瑞芳、李承毅、朱涵婷、唐小平
南昌大学第二附属医院

目的:探讨定量磁敏感图(QSM)评价原发性不宁腿综合征(RLS)患者治疗前脑内灰质核团铁含量的运用价值,并探讨利用 QSM 诊断 RLS 的可行性。

方法:使用 GE SIGNA Architect 3.0T 超导磁共振扫描仪对符合 RLS 临床诊断标准的 18 例 RLS 治疗前患者(RLS 组)和 16 名健康志愿者(对照组)行 QSM 技术扫描及外周血清铁蛋白、血清铁浓度检测。对 QSM 原始图像进行后处理获得 QSM 定量图,运用 3D-slice 软件在 QSM 定量图勾画 ROI 并得到对应核团磁化率数据,ROI 置于脑灰质核团的双侧黑质、红核、丘脑、壳核、苍白球、尾状核、齿状核。应用 SPSS 25.0 对所获得的两组 ROI 所对应的磁化率数据和外周血清铁蛋白、血清铁浓度进行统计学分析。

结果:RLS 组治疗前黑质、红核、壳核、苍白球、尾状核、齿状核的磁化率均值分别为(74 ± 19.98)、(68.13 ± 16.44)、(39.25 ± 13.2)、(88.12 ± 14.13)、(40.53 ± 17.45)、(57.43 ± 13.25),对照组为(94.25 ± 26.48)、(78.42 ± 25.43)、(47.18 ± 15.45)、(90.13 ± 21.05)、(45.53 ± 21.89)、(63.44 ± 11.59),黑质、苍白球、壳核、齿状核两组间差异具有统计学意义,P 值均 <0.05 ,表明 RLS 患者这部分灰质核团铁含量减少。RLS 组血清铁蛋白、

血清铁分别为 (122.13±83.14) g/L、(15.73±7.59) μmol/L 与对照组血清铁蛋白、血清铁 (179.57±42.43) g/L、(17.26±6.31) μmol/L 比较差异无统计学意义, P 值均大于>0.05。

结论: RLS 患者治疗前脑内铁含量降低, 但脑铁含量变化与血清铁蛋白、血清铁浓度变化并不完全一致, QSM 评估 RLS 患者脑内铁含量降低有助于 RLS 的早期诊断。

PO-2917

基于孟德尔随机化研究分析糖脂代谢指标与 脑小血管病 MRI 特征之间的关系

田博文、卓丽华、李宏伟、邹兴雄
绵阳市第三人民医院放射科

目的: 脑小血管病 (CSVD) 是一种脑内小血管疾病, 约占所有卒中的五分之一, 占有痴呆症的 45%。观察性研究表明 CSVD 磁共振影像 (MRI) 特征与糖脂代谢指标之间存在联系。因此, 我们进行了孟德尔随机化 (Mendelian randomization MR) 研究, 以探讨空腹血糖、糖化血红蛋白 (HbA1c)、空腹胰岛素、甘油三酯(TG)及低密度脂蛋白胆固醇(LDL-c)对 CSVD 的 MRI 特征的因果关系。

方法: 本研究从 IEU OpenGWAS project 网站获得暴露因素: 空腹血糖、HbA1c、空腹胰岛素、TG、LDL-c 的全基因组关联研究 (genome-wide association study, GWAS) 数据, 来源于欧洲人群, 男女不限。构建暴露因素的工具变量, 筛选与暴露因素高度相关的单核苷酸多态性 (Single Nucleotide Polymorphism, SNP)。以 CSVD 的 MRI 特征白质高信号 (white matter hyperintensities, WMH) 为作为结局变量。从 ubm-a-165 中提取与上述暴露因素有关的 SNP。然后进行 MR 分析, 并采用 随机效应逆方差加权法 Inverse-Variance Weighted, IVW) 等方法分析暴露因素与 WMH 的因果关系。

结果: IVW 分析显示糖脂代谢指标: 空腹血糖 (OR = 1.04; p = 0.65)、HbA1c (OR = 0.99; p = 0.93)、空腹胰岛素 (OR = 0.93; p = 0.64)、TG (OR = 1.02; p = 0.63)、LDL-c (OR = 1.03; p = 0.40) 与 WMH 之间无明显因果关系。敏感性分析表明, 本研究结果稳定可靠。

结论: 这项孟德尔随机化研究发现糖脂代谢指标与脑小血管病之间无明显因果关联, 需要更多的临床研究进一步探讨脑小血管病的发病机制。

PO-2918

ADC 直方图分析对多发性骨髓瘤患者细胞遗传学 高危的预测价值评估

李娇、周俊德、王勤、刘冬、张路、薛华丹、金征宇
中国医学科学院北京协和医学院北京协和医院

目的: 探索利用 ADC 直方图参数预测多发性骨髓瘤(MM)患者高危细胞遗传学异常(HRCA)的可行性, 并比较直方图参数预测模型与结合直方图参数与临床指标的联合预测模型的诊断效能。

方法: 本研究回顾性分析了 92 例临床新诊断为 MM 且接受全身磁共振检查患者的 DWI 图像、血清学指标及基本临床资料。在 DWI 图像上基于计算机辅助半自动勾画全身骨髓瘤病灶。应用软件自动化提取骨髓瘤病灶的 ADC 直方图参数。根据间期荧光原位杂交 (FISH) 检测是否检出 del (17p), t (4;14), t (14;16), 将患者分为 HRCA 组和非 HRCA 组。单因素分析初步筛选有统计学意义的指标, logistic 回归分析筛选独立危险因素。利用 logistic 回归分析分别构建基于 ADC 直方图参数的影像预测模型、基于直方图参数和临床指标的联合预测模型。采用受试者工作特征曲线下面积 (area

under curve, AUC) 来评估不同模型预测 HRCA 的诊断效能。运用 DeLong 检验比较各预测模型 AUC 差异。P<0.05 为差异有统计学意义。

结果: 单因素分析结果显示, 性别、ADC_SD、ADC95%、峰度和熵组间比较差异达统计学显著水准(P<0.05)。逻辑回归分析显示熵、性别、M 蛋白%是 HRCA 的独立危险因素。基于直方图参数熵、ADC_SD 构建的影像预测模型 AUC 值为 0.739, 敏感度为 73.9%, 特异度为 68.1%。基于直方图参数熵、患者性别、M 蛋白%构建的联合预测模型诊断效能优于影像模型, 且差异存在统计学意义 (AUC 值为 0.811, 敏感度为 82.6%, 特异度为 72.5%, P<0.05)。

结论: 基于 ADC 直方图参数构建的影像预测模型以及联合 ADC 直方图参数与临床指标构建的联合预测模型均可以有效地预测 MM 患者 HRCA。

PO-2919

基于 MR 双序列影像组学预测高强度聚焦超声 消融子宫肌瘤后再干预风险

秦石泽、黄小华
川北医学院附属医院

目的: 探讨 MR 双序列影像组学在预测高强度聚焦超声 (high intensity focused ultrasound, HIFU) 消融子宫肌瘤后再干预风险中的价值。材料与方法: 回顾性连续性分析接受 HIFU 消融的子宫肌瘤患者 180 名 (再干预组 42 名; 无再干预组 138 名), 以 7:3 的比例随机分为训练集 (n=125) 和验证集 (n=55)。从对比增强 T1 加权成像 (contrast-enhanced T1-weighted imaging, T1C) 和 T2 加权成像 (T2-weighted imaging, T2) 序列中提取影像组学特征, 并记录患者的临床-影像学特征。采用相关性分析、Relief、LASSO 算法筛选最佳影像组学特征。采用随机森林构建 T1C 模型、T2 模型、T1C+T2 模型及结合 T1C、T2 的最佳影像组学特征和独立临床-影像特征的联合模型。采用受试者操作特征 (receiver operating characteristic, ROC) 曲线和决策曲线分析 (decision curve analysis, DCA) 评估模型的预测性能与临床应用价值。采用 Delong 检验比较模型的预测性能。结果: 年龄 (p<0.001)、肌瘤体积 (p=0.001) 和肌瘤增强程度 (p=0.001) 是独立的临床-影像特征。T1C 模型、T2 模型、T1C+T2 模型及联合模型的验证集 ROC 曲线下面积分别为 0.670 (95%CI:0.503-0.838)、0.637 (95%CI:0.474-0.800)、0.764 (95%CI:0.621-0.906) 及 0.870 (95%CI:0.759-0.981)。DeLong 检验结果表明联合模型的预测效能训练集和验证集中均显著优于其余模型 (P<0.05)。结论: 基于双序列 MR 影像组学的联合模型可在术前有效预测 HIFU 后再干预风险, 有望为临床医生制定个性化治疗策略提供参考。

PO-2920

自动分割技术在颞叶内侧癫痫伴海马硬化亚区体积中的应用

王一婷¹、陈兵²
1. 宁夏医科大学
2. 宁夏医科大学总医院

目的: 探讨自动分割技术在颞叶内侧癫痫 (MTLE) 伴海马硬化 (HS) 患者亚区体积定量研究中的价值。方法: 将 2021 年 1 月至 2023 年 5 月在本医院经 MRI 诊断或病理证实为单侧 HS 的 37 例患者纳入本研究, 其中左侧 HS (L-HS) 24 例, 右侧 HS (R-HS) 13 例, 同期收集年龄与性别相匹配的 42 例健康受试者作为对照组。所有被试均行 T1 加权等体素三维磁化强度预备梯度回波序列 (3D T1 MP-RAGE) 扫描, 将扫描后的序列图像经 freesurfer V7 后处理可得到海马及其亚区的体积数据, 进一步进行标准化处理并计算体积不对称指数 (AI)。对海马及其亚区标准化体积进行组内比

较和组间比较,对 AI 值进行组间比较。采用受试者工作特征曲线 (ROC) 及曲线下面积 (AUC) 评价两种指标的诊断效能并进行比较。结果: L-HS 组和 R-HS 组患侧海马及其亚区的体积均小于对侧,对照组左侧海马及其亚区的体积均小于右侧,差异均有统计学意义 ($P<0.05$)。L-HS 组左侧海马及其亚区的体积均小于 R-HS 组和对照组的左侧海马及其亚区的体积, R-HS 组右侧海马及其亚区的体积均小于 L-HS 组和对照组的右侧海马及其亚区的体积,差异均有统计学意义 ($P<0.05$)。L-HS 组右侧、R-HS 组左侧与对照组相应侧的体积差异均无统计学意义 ($P>0.05$)。L-HS 组与 R-HS 组、对照组, R-HS 组与对照组 AI 值比较差异均有统计学意义 ($P<0.05$)。除 L-HS 组海马体和 SUB 的 AI 值诊断效能优于体积,差异有统计学意义 ($P=0.042$ 、 $P=0.047$),余海马及亚区各体积和 AI 值比较,差异均无统计学意义 ($P>0.05$)。结论:自动分割技术对 MTLE-HS 患者海马及其亚区体积的定量研究具有重要价值,可为临床提供更加可靠的影像学依据与参考。

PO-2921

5.0 T 超高场磁共振磁敏感加权成像 (SWI) 在肝细胞肝癌合并静脉系统癌栓的应用价值

李少朋、刘畅、邱俊、金楚月、冀涛、邓克学
中国科学技术大学附属第一医院 (安徽省立医院)

目的 以 5.0 T 超高场磁共振动态增强扫描为诊断标准,探讨 SWI 序列对 HCC 合并静脉系统癌栓的诊断价值。

方法 研究收集中科大附一院 (安徽省立医院) 2023 年 5 月至 7 月影像学表现符合 HCC 的患者共 95 例,所有患者行 5.0 T 超高场肝脏特异性对比剂增强磁共振扫描包括 SWI 序列 (自动生成幅度图与相位图),癌栓诊断标准:增强扫描强化、管腔扩张及邻近肝内病灶。两名放射科医师分别分析 SWI 图像并诊断是否合并静脉系统癌栓,诊断结果一致性采用组内相关系数 (ICC) 检验;统计分析 SWI 序列对静脉系统癌栓诊断敏感性、特异性、正确率,并与增强扫描图像进行诊断一致性检验。

结果 增强 MRI 表现符合 HCC 表现共 95 例,男 79 名、女 16 名,年龄 29~82 (58.42 ± 9.43) 岁。除 1 例因呼吸伪影导致图像无法判断,其余 94 例图像质量良好。2 名放射科医师在 SWI 序列诊断癌栓一致性良好,ICC 值等于 0.878。所有病例经 2 名放射科医师一致判断 83 例未出现静脉系统癌栓,11 例合并静脉系统癌栓 (其中门静脉癌栓 8 例,下腔静脉癌栓-肝静脉 3 例)。SWI 序列显示门静脉癌栓 8 例 (漏诊 1 例,癌栓位于门静脉 3 级分支,SWI 序列图像层厚大于增强扫描门静脉图像;误诊 1 例,肝内病灶压迫门静脉 3 级分支且图像存在轻度伪影),下腔静脉-肝静脉癌栓 3 例。SWI 序列对门静脉/下腔静脉-肝静脉癌栓诊断敏感性 90.9%、特异性 98.8%、正确率 97.8%,一致性检验显示其与门静脉期图像诊断静脉系统癌栓吻合度良好 ($k=0.897$)。

结论 5.0 T 超高场强磁共振 SWI 序列对 HCC 合并门静脉/下腔静脉-肝静脉癌栓显示效果良好,敏感性、特异性较高,与增强扫描图像相比诊断一致性良好。且 SWI 序列无需注入造影剂,不受患者肝肾功能、心功能影响,是对增强扫描门脉期显示静脉癌栓很好的补充,特别适用于各种原因不能进行增强 CT/MRI 扫描的患者。

PO-2922

经筋疗法改善失眠障碍患者类淋巴系统功能的磁共振研究

张耿标¹、郑鸿毅¹、吴碧霞¹、王雪雯¹、李伟佳¹、吴京铨^{2,3}、郑文斌^{Δ1}

1. 汕头大学医学院第二附属医院

2. 北京筋柔中医研究院

3. 汕头市龙湖区筋柔中医技术研究院

目的：脑类淋巴系统功能障碍可能是失眠患者的主要病因之一。经筋疗法在治疗失眠上有疗效良好且副作用小等优势。本研究拟使用沿血管周间隙扩散张量图像分析(DTI-ALPS)技术分析治疗前后失眠患者大脑类淋巴系统的功能变化。

方法：招募慢性失眠障碍患者（失眠组）以及健康志愿者（对照组）各 20 名。治疗前采集颅脑的 DTI 数据作为基线数据。然后失眠组隔期接受中医推拿及针灸治疗（经筋疗法），并于一月后进行磁共振复查扫描。治疗前后由睡眠专医生评估患者的睡眠质量，使用 DTI Studio 软件测量左侧侧脑室旁投射纤维和联合纤维区域不同方向的扩散系数并计算 ALPS 值，比较各组 ALPS 值差异。

结果：治疗后大部分失眠患者报告睡眠质量显著提高，少数患者表示症状有改善但不明显。治疗前失眠组的 ALPS 值较正常对照组明显降低（ $P = 0.029$ ）。治疗后失眠组的 ALPS 值较治疗前明显升高（ $P = 0.011$ ），与对照组无统计学差异（ $P = 0.364$ ）。提示失眠患者存在脑类淋巴系统功能障碍，而中医物理疗法能够显著改善其功能。

结论：经筋疗法能够改善失眠患者脑类淋巴系统的功能，ALPS 值作为评估类淋巴系统功能的定量指标具有临床价值，可用于失眠的机制探索和临床诊疗。

基金项目：省科技创新战略专项市县科技创新支撑（大专项+任务清单）项目（STKJ2023042）；广东省“新医科”教指委 2023 年教学改革项目（129）；广东省基础与应用基础研究基金企业联合基金项目（2021A1515220112）。

PO-2923

基于高分辨率血管壁 MRI 的颈部及颅内动脉夹层临床危险因素和影像特征

林雪花、曹代荣

福建医科大学附属第一医院

目的 基于高分辨率血管壁 MRI (VW-MRI) 分析颈部动脉夹层 (CAD) 及颅内动脉夹层 (IAD) 的潜在临床危险因素及影像特征的差异。

资料与方法 回顾性分析 2015 年 8 月至 2021 年 12 月间在福建医科大学附属第一医院就诊的 91 例颅颈部动脉夹层患者，其中 CAD 患者 58 例、IAD 患者 33 例，对比分析两组的潜在临床危险因素（包括性别、年龄、颈部按摩理疗史、吸烟史、饮酒史、高血压、糖尿病及高脂血症等）及 VW-MRI 特征（包括缺血性脑卒中发生率、前/后循环分布、单发/多发病灶、范围局限型/广泛型、内膜瓣、双腔征、壁间血肿、血管外管径扩张、MRA 管腔形态分型）的差异。

结果 CAD 和 IAD 组的年龄[(42.2 ± 11.4) 岁比 (47.2 ± 8.8) 岁, $t=2.188$]、高血压[11(19.0%)比 15(45.5%) $\chi^2=7.232$]、甘油三酯水平[$1.12 (0.81, 1.51)$ mmol/L 比 $1.41 (1.06, 1.83)$ mmol/L, $Z=-2.729$]比较, 差异均有统计学意义 (P 均 <0.05)。VW-MRI 特征对比分析显示, CAD 和 IAD 在缺血性脑卒中发生率[50(86.2%)比 21(63.6%), $\chi^2=6.249$]、前后循环分布[后循环 16(28.1%)比 32(97.0%), $\chi^2=39.863$]、单发/多发病灶、范围局限型/广泛型 ($\chi^2=21.638$) 及 MRA 管腔形态分型上差异有统计学意义 (P 均 <0.05)。

结论 基于高分辨率 VW-MRI 分析显示 CAD 和 IAD 在潜在临床危险因素及 MR 特征上存在一定差异性, 提示两者在潜在发病机制及病变特征上可能存在不同。

PO-2924

动态对比增强 MRI 预测直肠癌患者重度急性放射性直肠损伤的价值

陈琰¹、丁力¹、张志文¹、吴雪晗^{1,2}、阙育桃³、马钰茹¹、刘逸俨¹、文自强¹、杨心悦⁴、卢宝兰¹、包勇¹、牛绍清¹、余深平¹

1. 中山大学附属第一医院

2. 中山大学附属第七医院

3. 中山大学附属第三医院

4. 南方医科大学珠江医院

目的 探讨动态对比增强 MRI (dynamic contrast-enhanced MRI, DCE-MRI) 定量参数预测直肠癌患者重度急性放射性直肠损伤 (radiation-induced rectal injury, RRI) 的价值。

方法 本回顾性研究纳入 2014 年 11 月至 2021 年 3 月符合纳入标准的 49 例直肠癌患者, 这些患者接受了新辅助放化疗, 并且行包括 DCE-MRI 序列的直肠 MRI 检查。2 名放射科医师独立测量扫描野内距离肿瘤最远处肠壁的 DCE-MRI 定量参数和肠壁厚度, DCE-MRI 定量参数包括对比剂容积转换常数 (K^{trans})、速率常数 (k_{ep})、单位体积组织细胞外血管外间隙容量 (v_e)。根据组织病理学评价, 将纳入患者分为轻度和重度急性 RRI 两组。比较两组间 DCE-MRI 定量参数及肠壁厚度是否存在统计学差异, 并绘制具有统计学差异参数的受试者工作特征 (receiver operating characteristic, ROC) 曲线。

结果 本研究纳入的 49 例 (54 ± 12 岁, 37 名男性) 患者中, 25 例为重度急性 RRI。 K^{trans} 在重度急性 RRI 组中显著低于轻度急性 RRI 组 (0.032 min^{-1} vs 0.054 min^{-1} ; $P = 0.008$), 但两组间的 k_{ep} , v_e 和肠壁厚度无统计学差异 (P 均 > 0.05)。 K^{trans} 的 ROC 曲线下面积为 0.72 (95%置信区间为 0.57, 0.84), 取阈值为 0.047 min^{-1} 时, 其预测重度急性 RRI 的敏感性和特异性分别为 80% 和 54%。

结论 K^{trans} 预测急性重度 RRI 具有中等价值。DCE-MRI 可为直肠癌急性 RRI 患者的围手术期管理和治疗策略提供无创、客观的依据。

PO-2925

ADC 直方图在中枢神经系统淋巴瘤鉴别诊断中的价值

马桢、赵鑫、陆林
郑州大学第三附属医院

目的: 研究 ADC 全域灰度直方图在鉴别原发性中枢神经系统淋巴瘤 (Primary central nervous system lymphoma, PCNSL) 与多形性胶质母细胞瘤 (Glioblastoma multiform, GBM) 和单发脑转移瘤 (Solitary brain metastasis, SMT) 的诊断价值。**方法:** 回顾性分析在我院做过脑部 MRI 检查并经病理证实的 95 例患者, 其中中枢神经系统淋巴瘤 38 例 (男 19 例、女 21 例, 平均年龄 57.1 ± 12.5 , 范围 33~81 岁), 胶质母细胞瘤 29 例 (男 13 例、女 17 例, 平均年龄 51.2 ± 14.5 , 范围 10~69 岁), 单发转移瘤 28 例 (男 15 例、女 13 例, 平均年龄 59.8, 范围 36~76 岁)。分别在三组 MR ADC 轴位图像上用 Mazda 软件将肿瘤的每一个层面勾画感兴趣区并进行灰度全域直方图分析, 并分别对这三组直方图参数特征进行统计学分析, 比较各参数的统计学意义。**结果:** 经灰度直方图中分析得到的 9 个参数, 即均值 (Mean)、变异度 (Variance)、峰度 (Kurtosis)、偏度 (Skewness)、第一百百分位数 (Perc.01%)、第 10 百分位数 (Perc.10%)、第 50 百分位数 (Perc.50%)、第 90 百分位数 (Perc.90%) 及第 99 百分位数 (Perc.99%) 这 9 个参数差异有统

计学意义 (P 均 <0.05)。结论: 直方图分析有助于中枢神经系统淋巴瘤与胶质母细胞瘤和单发转移瘤的鉴别, 均数、偏度及 Perc.50% 具有较高诊断效能。

PO-2926

大鼠 MCAO 脑梗死后交叉性小脑神经机能联系不能的 DKI 评价

马桢¹、赵鑫¹、陆林¹、程敬亮²

1. 郑州大学第三附属医院

2. 郑州大学第一附属医院

目的 观察大鼠大脑中动脉闭塞 (MCAO) 模型中 NMDA 的表达、细胞凋亡及对神经功能恢复的影响。应用扩散峰度成像 (DKI) 评价交叉性小脑神经机能联系不能 (CCD), 为临床治疗提供实验依据和理论依据。

材料与方法 建立大鼠 MCAO 模型, 每 12 只大鼠随机分为对照组、6h 组、12h 组、24h 组、48h 组、7d 组、14d 组。在以上时间点对大鼠进行脑扫描, MRI 扫描后处死大鼠进行 HE 染色、免疫组化染色和 TUNEL 法, 分别检测核心梗死区和小脑的 NMDA 表达, 并分析 MRI 参数与 NMDA 关系。结果 MCAO 大鼠的 MD、ADC 和 FA 值皆低于对照组, 且对侧小脑的参数低于同侧小脑 ($P<0.05$), 于 12h 达最低值, MK 值则相反。NMDA 的表达呈上升趋势, 高于对照组, 24h 达到最大值 ($P<0.05$), 且对侧小脑高于同侧小脑。

结论 NMDA 可成为治疗 CCD 的新靶点, 且 MRI 参数能预测 CCD 的发生发展。

PO-2927

基于多参数 MRI 的影像组学结合 PI-RADS 评分和临床变量的综合模型评估前列腺癌侵袭性的研究

杨静

重庆医科大学附属第二医院

目的 探讨多参数磁共振成像上不同感兴趣区的影像组学模型和结合影像组学、PI-RADS 2.1 评分、临床变量的综合模型在评估前列腺癌侵袭性方面的价值。方法 收集本院 2018 年 5 月至 2022 年 9 月 2 个医疗中心经病理确诊为前列腺癌患者 245 例: 渝中院区 176 例, 其中低侵袭性组 (Gleason 评分 $\leq 3+4$) 77 例, 高侵袭性组 (Gleason 评分 $\geq 4+3$) 99 例; 江南院区 69 例 (低侵袭性组 33 例, 高侵袭性组 36 例)。所有患者行多参数 MRI 检查后, 在多参数 MRI 图像上分割 2 种 ROI: 肿瘤病变区域 (tumor region, TR) 和前列腺区域 (prostate gland, PG)。评估与前列腺癌侵袭性相关的临床变量, 并记录每位患者的 PI-RADS 2.1 评分。使用逻辑回归算法作为机器学习算法, 建立多个前列腺癌侵袭性分层模型: 影像组学模型 (Model_{TR}、Model_{PG} 和 Model_{PG+TR})、影像组学-临床联合模型、影像组学-PIRADS 联合模型、临床-PIRADS 联合模型和影像组学-临床-PIRADS 综合模型。分别采用受试者工作特性 (ROC) 曲线、曲线下面积 (AUC) 和决策曲线分析 (DCA) 比较各模型的诊断价值和临床收益。结合影像组学评分、独立临床变量和 PI-RADS 2.1 评分构建影像组学列线图。通过校准度、区分度和临床应用评价列线图性能。结果 在 3 种影像组学模型中, Model_{PG+TR} 的 AUC 值为 0.919, 高于 Model_{TR} (AUC=0.874) 和 Model_{PG} (AUC=0.887)。在联合模型中, 影像组学-PIRADS-临床综合模型的 AUC 为 0.954, 优于影像组学模型 (AUC=0.919)、影像组学-临床联合模型 (AUC=0.919)、影像组学-PIRADS 联合模型 (AUC=0.921) 和临床-PIRADS 联合模型 (AUC=0.769)。

PO-2928

基于使用供氧系统状态下提高胎儿磁共振检查成功率的研究

陶秋成

东南大学附属中大医院

【摘要】目的:探讨通过在检查过程中为孕妇提供不间断氧气的方法,提高胎儿磁共振检查成功率。方法:前瞻性分析 2020 年 1 月-2021 年 6 月在东南大学附属中大医院放射科行盆腔 3.0T MR (胎儿)扫描的孕妇 46 例的资料,其中吸氧孕妇为 26 例(吸氧组),不吸氧的孕妇为 20 例(未吸氧组)。吸氧时间为检查全程,统计分析患者的氧气供给时间、身体舒适度状况、检查总耗时、胎动时间等。结果:吸氧组的孕妇一次检查成功率高于未吸氧组,且图像质量高于未吸氧组,差异有统计学意义 ($P < 0.05$)。两组孕妇身体状态较好、一般、较差情况比较差异具有统计学意义 ($P < 0.05$)。结论:检查过程中吸氧 8min 以上,在提高胎儿磁共振检查一次成功率的同时,可改善图像质量,减少胎儿运动带来的伪影。

PO-2929

动态低频振幅在阿尔茨海默病高危人群中的变化

朱琴琴、祁鸣、朱奕、张玲、丁洪园、田水

江苏省人民医院 (南京医科大学第一附属医院)

目的:探讨动态低频振幅在阿尔茨海默病高危人群中的变化及其与临床认知评估量表的相关性,有望为阿尔茨海默病 (Alzheimer's disease, AD) 高危人群早期干预提供更可靠的依据。

材料和方法:本研究从南京医科大学第一附属医院痴呆门诊和当地社区招募了 152 名受试者,包括 72 例主观认知下降患者 (subjective cognitive decline, SCD), 44 例轻度认知障碍患者 (mild cognitive impairment, MCI) 和 36 例健康对照 (healthy control, HC), 各组间性别、年龄以及受教育年限相匹配。所有受试者均接受了静息态功能磁共振成像扫描和多维临床认知量表的评估。本研究采用基于滑动窗的动态低频振幅 (dALFF) 分析方法,比较静息状态下三组间 dALFF 值存在差异的脑区并与临床认知评估量表进行相关性分析。为了验证 dALFF 滑动窗的可靠性,本研究采用了额外 4 种窗长 (30TRs、40TRs、60TRs 和 70TRs) 来验证主结果。

结果:认知量表评估结果证实 MCI 组的认知表现最差,SCD 组为中等认知表现,HC 组为认知表现相对最佳。与 HC 组相比,MCI 组及 SCD 组在左侧楔前叶区域的 dALFF 值均更低,SCD 组在左侧枕中回也展现出更低的 dALFF 值。而与 SCD 组相比,MCI 组在右侧额中回 dALFF 值更低 (GRF correction, voxel $P < 0.001$, cluster $P < 0.05$)。相关性分析结果表明 dALFF 值的改变与受试者的临床认知评分存在显著的正相关 ($R = 0.43$, $P = 0.024$)。

结论:研究结果表明 AD 高危人群的 dALFF 值有明显改变,并与临床认知评估量表存在显著的相关性。基于静息态功能磁共振的研究有利于为 AD 高危人群的早期发现及干预提供更可靠的影像学依据,从而延缓 AD 的发生发展进程。

PO-2930

钆塞酸二钠增强磁共振成像在肝脏局灶性病变诊断及评估肝细胞癌病理分化程度的价值研究

黄钰莹¹、陈奕杰¹、郝树²、罗爱芳¹、肖玉辉¹

1. 中国人民解放军联勤保障部队第九〇九医院

2. 福建医科大学附属第一医院

目的: 探讨钆塞酸二钠增强磁共振成像(MRI)在肝脏局灶性病变诊断及评估肝细胞癌(HCC)病理分化程度中的价值。**方法:** 选取医院就诊的 108 例肝脏局灶性病变患者, 所有患者均给予钆塞酸二钠增强 MRI 检查, 分析钆塞酸二钠增强 MRI 诊断良恶性病变的价值, 分析 HCC 不同病理分化程度病灶钆塞酸二钠增强 MRI 信号强度参数差异。**结果:** 108 例患者经病理学检测确诊恶性病灶 65 例, 良性病灶 43 例。钆塞酸二钠增强 MRI 诊断肝脏局灶性良恶性病变的诊断灵敏度、特异度、准确率、阳性预测值和阴性预测值分别为 92.31%、90.70%、91.67%、93.75%和 88.64%。HCC 病理分化程度Ⅲ~Ⅳ级病灶平均信号绝对增强强度、肿瘤相对增强比率平均值以及肿瘤对肝脏相对增强比率平均值分别为(117.79±60.20)、(0.42±0.10)和(0.29±0.10), 明显低于 I ~ II 级病灶, 差异有统计学意义($t=8.575$, $t=3.450$, $t=9.395$; $P<0.05$)。患者的不同性别、年龄、体质量指数及病灶长径, 以及患者病灶平均信号绝对增强强度、肿瘤相对增强比率平均值及肿瘤对肝脏相对增强比率平均值比较差异无统计学意义。病灶平均信号绝对增强强度、肿瘤相对增强比率平均值以及肿瘤对肝脏相对增强比率平均值预测 HCC 病理分化程度Ⅲ~Ⅳ级的受试者工作特征(ROC)曲线下面积分别为 0.860、0.778 和 0.943。**结论:** 钆塞酸二钠增强 MRI 诊断肝脏局灶性病变的灵敏度和特异度高, 同时 MRI 信号强度参数与 HCC 病理分化程度有关, 在预测病理分化程度方面有一定应用价值。

PO-2931

基于全病灶和全腺体双参数 MR 直方图与纹理分析检测前列腺临床显著性癌

陈录广¹、邢朋毅²、邵成伟¹、陆建平¹

1. 中国人民解放军海军军医大学第一附属医院

2. 中国人民解放军联勤保障部队第 989 医院

目的: 通过提取前列腺全病灶与全前列腺体的双参数 MR 直方图与纹理特征检测前列腺临床显著性癌 (Gleason 评分 ≥ 7), 并评估 PI-RADS、临床指标、纹理特征以及三者结合检测前列腺临床显著性癌的效能。

材料与方法: 收集 260 例经病理证实的前列腺结节患者的临床资料, 所有前列腺非癌性结节患者均行经超声引导下靶向穿刺活检, 癌性病灶均行机器人前列腺根治全切术。病理标本均经 HE 染色及免疫组织化学分析。临床显著性癌 106 例, 非临床显著性癌 154 例。所有患者均接受 3T MRI 检查, 统计与前列腺癌相关的临床危险因素及 PI-RADS 评分。基于双参数前列腺 MRI 图像 (T2WI 和 ADC 图像), 进行病灶分割并提取直方图纹理特征进行分析。采用卡方检验和方差分析比较临床特征的差异。对纹理参数进行单变量分析。使用多元逻辑回归建立鉴别模型, 用 Delong 检验来比较不同模型 ROC 曲线的差异。

结果: 对全病灶进行纹理分析, 检测移行带和外周带临床显著性癌时, 纹理模型的 AUC 分别为: 0.903 和 0.859, 纹理-临床模型 AUC 分别为 0.938 和 0.894, 联合 PI-RADS 模型的 AUC 分别为 0.971 和 0.888; 对全腺体进行纹理分析, 检测移行带和外周带临床显著性癌时, 纹理模型的 AUC 分别为 0.850 和 0.672 (95%IC:0.555-0.789), 纹理-临床模型 AUC 分别为 0.919 和 0.751, 联合 PI-

RADS 模型的 AUC 分别为 0.981 和 0.804。无论是对全病灶还是全腺体的纹理分析, 纹理模型、纹理-临床及联合 PI-RADS 模型对移行带临床显著性癌都有较高的检测效能, 全病灶纹理分析时纹理模型、纹理-临床及联合 PIRAS 模型对外周带临床显著性癌也有较高的预测能力。

结论: 基于双参数磁共振的全病灶和全腺体直方图与纹理分析能够检测前列腺临床显著性癌, 联合 PI-RADS 评分、纹理分析及临床因素时检测效能更高。

PO-2932

肾动脉自旋标记成像参数定量分析: 肾动脉狭窄介入治疗后灌注改善的无创指标

张晓霄、张古沐阳、许梨梨、白鑫、张家慧、陈丽、孙昊、金征宇
中国医学科学院北京协和医院

目的: 探讨动脉自旋标记(arterial spin labeling, ASL)成像作为无创指标评价肾动脉狭窄(renal artery stenosis, RAS)患者介入治疗后灌注改善的可行性。

方法: 前瞻性纳入本中心 2020/12/05 至 2022/10/30 共 11 例经数字减影血管造影(Digital Subtraction Angiography, DSA)诊断为 RAS 并行介入治疗的患者。所有患者均行介入治疗前 ASL 检查, 7 例患者行介入治疗后 ASL 复查。两名放射科医师通过勾画感兴趣区的方式测量 RAS 患者术前及术后肾皮质肾脏血流灌注(renal blood flood, RBF)及肾皮质局灶性异常灌注区 RBF。肾皮质局灶性异常灌注区通过 2 名放射科医师主观评估得到。利用血清肌酐估计肾小球滤过率(eGFR), 利用钆-99m DTPA 测定单肾 GFR (SKGFR)。评价 RBF 与 eGFR 及 SKGFR 的相关性并比较术前及术后 RBF 的差异。

结果: RAS 患者介入治疗后收缩压和舒张压均显著降低(139.1 ± 12.4 vs. 127.6 ± 8.9 , 81.2 ± 11 vs. 70.4 ± 10.4 $p=0.017$)。术前肾皮质 RBF 与术前 SKGFR 有显著相关性($r=0.504$, $p=0.024$), 但与术前 eGFR 无明显相关性($r=0.159$, $p=0.530$)。在行术后 ASL 显像的 7 例患者中, 肾皮质术后 RBF 显著高于术前 RBF(203.19 ± 51.42 vs. 164.00 ± 68.10 , $p=0.005$), 肾皮质局灶性异常灌注区术后 RBF 显著高于术前 RBF(159.92 ± 46.10 vs. 108.55 ± 39.57 , $p=0.001$)。

结论: 基于 ASL 图像获得的肾脏 RBF 与单肾功能有显著相关性, 并且可用于评价 RAS 患者介入治疗后的灌注改善情况。

PO-2933

退行性腰椎侧凸患者多节段椎旁肌群退变特点

何敏、邓亚利
陆军军医大学第一附属医院(西南医院)

目的: 基于磁共振多回波化学位移水脂分离成像序列(Dixon-vibe)准确的脂肪定量技术, 定量分析退行性腰椎侧凸(degenerative lumbar scoliosis, DLS)患者多节段层面多裂肌、竖脊肌、腰大肌退变特点。**方法:** 2019 年 10 月至 2022 年 11 月在陆军军医大学第一附属医院纳入符合 DLS 诊断的患者 46 名作为实验组, 健康体检者 47 名作为对照组, 两组患者人口统计学资料的差异不显著($P>0.05$)。在 Dixon-vibe 序列水脂分离图中分别测量计算所有受检者从 L1-L2 到 L5-S1 5 个节段椎间盘中央层面椎旁多裂肌、竖脊肌、腰大肌的脂肪浸润程度(fat infiltration, FI)、功能横截面积(functional cross-sectional area, FCSA)、相对横截面积(relative cross-sectional area, RCSA), 分析 DLS 患者各节段三种椎旁肌群退变特点及其关联性。**结果:** DLS 组腰椎 L1-L2 到 L5-S1 5 个节段的椎间盘层面多裂肌 FI 显著大于对照组(均 $P<0.001$), 组内各节段之间差异不显著($P>0.05$); 两组竖脊肌 FI 值从 L1-L2 节段到 L5-S1 节段呈逐渐增大趋势, L1-L2 节段 DLS 组竖

脊肌 FI 显著大于对照组 ($P < 0.001$)，L5-S1 节段两组差异不显著 ($P = 0.295$)；两组患者腰大肌在 5 个节段的 FI 值差异不显著 ($P > 0.05$)，L1-L2 节段腰大肌 FI 值显著大于其他各节段 (均 $P < 0.001$)；在 DLS 组、对照组患者中多节段多裂肌 FI 均值与竖脊肌 FCSA 均值呈负相关 ($r = -0.644$ 、 -0.323 ， $P < 0.001$ 、 $P = 0.025$)，与腰大肌 RCSA 均值呈负相关 ($r = -0.039$ 、 -0.482 ， $P = 0.796$ 、 0.001)。结论 退行性腰椎侧凸多裂肌在各个节段均发生相近程度的脂肪浸润改变，竖脊肌在下腰段脂肪浸润程度更大，腰大肌在 L1-L2 节段脂肪浸润程度稍高于其他节段；多裂肌退变以脂肪浸润为主，而竖脊肌的代偿作用明显，腰大肌其次。

PO-2934

高分辨率磁共振血管壁成像在 SLE 患者早期 脑血管炎性改变中的应用

赵雪莹¹、孙悦¹、许敬博²、张悦¹、张明峰¹、周立霞¹

1. 河北医科大学第二医院

2. 河北医科大学第一医院

目的：应用高分辨率磁共振血管壁成像 (HR-VWI) 观察系统性红斑狼疮 (SLE) 患者的颅脑血管受累情况，并分析其与疾病活动度、认知功能的关系。

方法：收集 38 名 SLE 患者以及 15 名健康对照 (HC) 的脑部 HR-VWI 图像。采集 SLE 患者认知功能评分 (使用 MMSE 及 MoCA 量表) 及疾病活动度评分 (使用 SLEDAI-2000 评分表)。根据 HR-VWI 扫描结果，通过血管病变积分评估患者脑血管炎的严重程度，并分析血管炎评分与患者疾病活动、认知功能的相关性。

结果：根据 HR-VWI 图像表现，我们观察到 SLE 患者存在脑血管炎性病变，易累及大中血管为主 (37/38)，部分仅累及小血管 (1/38)。SLE 患者脑血管炎评分与 SLEDAI-2000 评分呈显著正相关关系 ($p < 0.05$)，与 MMSE、MoCA 评分呈显著负相关关系 ($p < 0.05$)。

结论：HR-VWI 可以观察到 SLE 患者脑血管的炎性改变，随着血管炎的严重程度增加，SLE 患者的疾病活动度和神经精神症状也相应加重。

PO-2935

颅颈一体化高分辨血管壁 MRI 成像联合 PWI 评估卒中复发危险因素

贾毓茜

空军军医大学西京医院

目的：联合颅颈一体化高分辨 MRI 血管壁成像与 PWI 评估缺血性卒中患者复发的相关危险因素。

方法：87 例缺血性脑卒中患者行包括 T1WI、T2WI 及 T1WI 增强序列在内的颅颈一体化高分辨 MRI 血管壁成像和灌注加权成像 (PWI)，经过图像处理获得急性与否、闭塞与否、狭窄率、斑块数量、斑块负荷、强化程度、IPH 有无及灌注指标等影像数据。同时收集患者相关的临床数据，包括年龄、性别、身高、体重、血压、生化指标及并发症。对所有病人进行随访，依据复发与否分为复发组 ($n = 11$ 例) 和非复发组 ($n = 76$ 例)，分析其影像学数据、临床相关指标与复发的相关性，并进行 ROC 曲线分析、回归分析和 Kaplan-Meier 生存曲线分析。

结果：两组的急性梗死占比 ($P = 0.007$) 与责任斑块负荷 ($P = 0.035$) 存在显著差异，复发与否与灌注指标间未发现显著相关性。患者急性与否与 rCBF、rMTT 及 rTTP 显著相关，闭塞与否及狭窄率也与 rTTP 显著相关。生存曲线分析发现急性与否、斑块负荷及同型半胱氨酸的水平会影响复发事件的发生。

结论:缺血性脑卒中的复发与患者急性与否、斑块负荷相关,同时临床指标同型半胱氨酸水平可能影响复发事件的发生。

PO-2936

基于扩散生成模型构建的高 b 值 DWI 在前列腺 MRI 阴性癌结节检测中的应用

柳柏玉¹、梁奕¹、范文辉¹、胡磊²

1. 长江航运总医院

2. 广东省人民医院

目的:本研究旨在构建并验证基于扩散生成模型构建的高 b 值 DWI 在前列腺 MRI 阴性癌结节检测中的应用价值。

方法:本研究构建了基于扩散生成模型的高 b 值 DWI 生成模型。回顾性收集 1000 名因临床怀疑前列腺癌而行前列腺 MRI 检查的患者的影像资料用于模型训练和内部验证。在多中心收集 100 名常规 MRI 扫描显示前列腺癌阴性 (PI-RADS 小于 3) 但随后经过手术证实为前列腺癌的患者影像资料作为外部验证集。将验证集患者 DWI 图像输入扩散生成模型,生成高 b 值 DWI。两名具有十年以上诊断经验的放射科医生采取双盲法在两个时间段分别阅读了验证集原始图像和生成图像,并对其 PI-RADS 评分。最终结果由二人协商决定。

结果:合成高 b 值 DWI 可以提升癌结节在 MRI 显示度,53%癌结节在合成高 b 值 DWI 得到了显示。相对于验证集原始图像,前列腺 MRI 阴性癌检测灵敏度得到显著提升 (10% vs. 56%; $P<0.05$)。

结论:基于扩散生成模型构建的高 b 值 DWI 能够提升前列腺 MRI 阴性癌结节检测性能。

PO-2937

三维动脉自旋标记 MRI 监测原发性中枢神经系统淋巴瘤患者疗效和预测预后的长期研究

吴昊¹、康惠¹、陈波斌¹、孙华平¹、任彦¹、初曙光²、吴捷¹、钟昊书¹、徐田勇³、张泳³、姚振威¹

1. 复旦大学附属华山医院

2. 上海市东方医院 (同济大学附属东方医院)

3. GE 医疗

目的:原发性中枢神经系统淋巴瘤 (PCNSL) 是一种高度侵袭性的非霍奇金淋巴瘤。本研究探索 MRI 三维动脉自旋标记 (3D-ASL) 灌注参数相对脑血流量 (rCBF) 监测初发 PCNSL 患者疗效及预测预后的可行性。

方法:本回顾性研究收集自 2015 年 05 月至 2019 年 05 月在复旦大学附属华山医院就诊初发 PCNSL 患者的临床资料,所有患者接受大剂量甲氨蝶呤 (HD-MTX) 为基础的化疗,化疗前接受头颅 MRI 3D-ASL 和常规序列扫描,直至强化灶消失。此后,患者每 3-6 个月行头颅常规 MRI 检查随访,当出现复发与进展时,加扫 3D-ASL 序列。将 T1WI 增强和 3D-ASL 序列图像融合后手动勾画感兴趣区 (ROI)。每间隔 3-6 个月电话随访,从 2015 年 08 月至 2022 年 12 月,使用 Stata 软件 Kaplan-Meier 法、Cox 比例风险回归模型对 3D-ASL-rCBF 参数和临床特征进行生存分析。

结果:86 例患者纳入研究,男 57 例,平均年龄 53 ± 11 岁。中位随访时间 69 个月后,78 例疾病进展 (PD),49 例死亡。中位无进展生存时间 (PFS) 和总生存时间 (OS) 为 16 和 54 个月。2、3、5 年 OS 率为 62.16%、56.76%、29.41%。ASL-rCBF 单因素分析中,更短 PFS 和 OS 与以下因素相关:脑脊液 (CSF) 累及、2 个周期未达部分缓解 (PR),4 个周期未达完全缓解 (CR)、

rCBFmean \geq 2.389、rCBFmax \geq 3.744、rCBFmin \geq 1.370。此外, 年龄 \geq 55 岁, KPS $<$ 50 预示更短的 OS。多因素分析中, 更短 OS 的独立预后因素是: 初始 KPS $<$ 50 ($P = 0.004$), CSF 累及 ($P = 0.022$)、4 个周期未达 CR ($P = 0.020$)、化疗前 rCBFmean \geq 2.389 ($P = 0.033$)。

结论: 本研究证实 3D-ASL-rCBFmean \geq 2.389 是初发 PCNSL 较短 OS 的独立高危因素, ASL 具有无辐射、无需外源性造影剂的优点, 推荐作为 MRI 常规序列应用于初发 PCNSL 疗效监测及预后评估, 以利于临床基于危险度分层、选择个体化治疗方案和改善预后。

PO-2938

基于自动脑分割技术对颞叶癫痫伴海马硬化患者 颞叶亚区白质体积的分析及其临床应用价值

李金芹、陈兵
宁夏医科大学总医院

目的 利用自动脑分割技术 (FreeSurfer) 分析颞叶癫痫伴海马硬化 (Temporal lobe epilepsy with hippocampal sclerosis, TLE-HS) 患者颞叶亚区白质体积的变化, 探讨该技术在 TLE-HS 中的应用价值。材料与方法 前瞻性分析 2021 年 1 月至 2023 年 6 月就诊的 TLE-HS 患者 50 例, 其中左侧 TLE-HS (LTLE-HS) 患者 30 例, 右侧 TLE-HS (RTLE-HS) 患者 20 例; 同期招募性别、年龄相匹配的健康对照者 48 例, 所有受试者均在 3.0T 磁共振上进行 T1 加权三维磁化强度预备梯度回波 (3D-T1WI-MPRAGE) 序列扫描。使用 FreeSurfer 软件对 T1- MPRAGE 图像进行全脑分割, 收集颞叶亚区 (颞极、颞横回、颞上回、颞中回、颞下回、海马旁回) 的白质体积数据, 采用配对 t 检验比较对照组左右两侧颞区白质体积差异; 采用独立样本 t 检验分别比较对照组与 TLE-HS 组患侧、对侧之间颞叶亚区白质体积差异。结果 对照组左右两侧颞极、颞横回、颞上回、颞中回、颞下回白质体积差异有统计学意义 ($P < 0.05$); 对照组左右两侧分别与 LTLE-HS 组及 RTLE-HS 组患侧、对侧比较, LTLE-HS 组患侧颞极、颞横回、颞上回、颞中回、颞下回、海马旁回, 对侧颞上回、颞中回、颞下回、海马旁回及 RTLE-HS 组患侧颞中回、颞下回、海马旁回白质体积差异有统计学意义 ($P < 0.05$), 其余亚区体积差异无统计学意义 ($P > 0.05$)。结论 1) LTLE-HS 双侧颞叶亚区白质均广泛损伤, 主要发生在患侧颞极、颞横回、颞上回、颞中回、颞下回、海马旁回, 对侧颞上回、颞中回、颞下回、海马旁回; RTLE-HS 患者颞叶亚区白质损伤局限于患侧, 主要在颞中回、颞下回、海马旁回; 2) 自动脑分割技术对 TLE-HS 颞区白质体积的测量、颞叶癫痫术前评估及手术方式的选择具有一定意义。

PO-2939

3D FSE 序列在库欣病垂体微腺瘤患者术前 MRI 中的应用价值

刘泽宇、侯波、有慧、卢琳、段炼、李明利、邓侃、姚勇、朱惠娟、冯逢
中国医学科学院北京协和医院

目的: 约 90% 的库欣病患者病灶为直径小于 10mm 的垂体微腺瘤, 如何提高术前 MRI 病灶检出率是库欣病诊疗中的重点和难点。本研究拟探索基于 3D FSE 序列的垂体高分辨增强 MRI (high-resolution contrast-enhanced MRI, hrMRI) 在库欣病垂体微腺瘤患者术前 MRI 中的应用价值, 并与基于 2D FSE 序列的垂体增强 MRI (conventional contrast-enhanced MRI, cMRI)、垂体动态增强 MRI (dynamic contrast-enhanced MRI, dMRI) 进行比较。

材料和方法: 回顾性分析 2016 年 1 月至 2021 年 12 月在北京协和医院 232 例库欣病患者资料, 其中经术后病理确诊且术前完成全部 cMRI、dMRI 和 hrMRI 扫描的库欣病垂体微腺瘤患者 80 例 [男 30 例, 女 50 例, 年龄 37 (29, 50) 岁]。由两位神经放射专家分别独立评估 cMRI、dMRI 和 hrMRI

对库欣病患者垂体微腺瘤的检出率, 并采用 κ 检验评估观察者间一致性, 采用 McNemar 检验评估不同扫描方案间差异。

结果: 本研究中, 库欣病患者垂体微腺瘤直径为 5 (4, 5) mm。专家 1 在 cMRI、dMRI 和 hrMRI 扫描方案中的检出率分别为 66.3%、73.8%、95.0%, 假阳性率分别为 11.3%、8.8%、1.3%, 假阴性率分别为 22.5%、17.5%、3.8%; 专家 2 在 cMRI、dMRI 和 hrMRI 扫描方案中的检出率分别为 66.3%、58.8%、90.0%, 假阳性率分别为 10.0%、18.8%、3.8%, 假阴性率分别为 23.8%、22.5%、6.3%。两位专家的 hrMRI 术前检出率均显著高于 cMRI 和 dMRI (均 $P \leq 0.001$)。在 cMRI、dMRI 和 hrMRI 扫描方案中, 两位专家的观察者间一致性 κ 分别为 0.497、0.509、0.643。

结论: 基于 3D FSE 序列的垂体高分辨增强 MRI 具有较高的病灶检出率, 观察者间一致性较高, 在库欣病垂体微腺瘤患者术前 MRI 中应用价值高。

PO-2940

胎儿先天性膈疝膈肌缺损的 MRI 三维重建及其与预后的相关性

杨巧丽、彭松

重庆医科大学附属妇女儿童医院、重庆市妇幼保健院 (重庆市妇产专科医院、重庆市遗传与生殖研究所)

目的: 探讨利用 ITK-SNAP 软件对胎儿先天性膈疝 (Congenital diaphragmatic hernia, CDH) 膈肌缺损三维重建的可行性和可重复性, 并分析膈肌缺损率 (Defect-diaphragmatic ratio, DDR) 对 CDH 预后的预测价值。

方法: 回顾性研究产前诊断为左侧 CDH 的胎儿, 使用 ITK-SNAP 软件对胎儿 MRI 的膈肌进行手动分割获得胎儿残存膈肌及缺损膈肌的三维模型, 并测量残存膈肌、缺损膈肌的大小, 计算 DDR ($\text{DDR} = \text{缺损膈肌面积} / \text{膈肌总面积} \times 100\%$)。根据胎儿 MRI 图像测量胎儿总肺容量 (total fetal lung volume, TFLV)、观察/预期胎儿总肺容量 (observed/expected total fetal lung volume, O/E TFLV) 和预测肺容量百分比 (percentage predicted lung volume, PPLV)。分析 DDR、TFLV、O/E TFLV、PPLV 与新生儿产后结局的相关性, 并比较 DDR 与 TFLV、O/E TFLV、PPLV 预测产后结局的效果。

结果: 纳入 2020 年 1 月至 2023 年 6 月重庆医科大学附属妇女儿童医院诊断为左侧 CDH 病例共 49 例, 术后存活 33 例, 死亡 16 例, 总生存率为 67.34%。完成所有 CDH 病例的膈肌三维重建并测量 DDR, 研究者之间的数值测量结果具有较好的一致性 ($\text{ICC} = 0.918$), DDR 在幸存组与非幸存组间具有显著性差异 ($P < 0.001$)。DDR、TFLV、O/E TFLV、PPLV 均可预测左侧 CDH 胎儿的产后结局。ROC 曲线显示 DDR 对左侧 CDH 新生儿死亡具有良好的预测能力, AUC 为 0.945, 预测能力高于通过 TFLV (AUC: 0.928)、O/E TFLV (AUC: 0.943) 及 PPLV (AUC: 0.890) 预测新生儿存活情况。

结论: ITK-SNAP 对胎儿左侧 CDH 膈肌进行手动分割具有较好的可行性和可重复性, 可以实现病灶区域三维可视化。DDR 可以预测新生儿产后结局, 预测能力与 TFLV、O/E TFLV、PPLV 相似, 是一种可靠的风险评估模型。

PO-2941

基于 MRI 放射组学直肠充盈在直肠癌术前 T 分期应用价值研究

陆海迪、沈浮、邵成伟、陆建平

海军军医大学第一附属医院 (上海长海医院)

目的: 利用基于磁共振成像 (MRI) 的放射组学模型, 探讨在直肠癌 (RC) 患者术前 T 分期中, 使用超声耦合剂充盈直肠是否更有益于临床。**方法:** 将 94 例 RC 患者分为 1 组 (留一交叉验证

[LOO-CV]组), 230 例 RC 患者分为 2 组(验证组)。患者按不同的病理 T 分期进行分组。通过高分辨率 T2 加权成像提取两个队列中所有感兴趣体积的放射组学特征。采用最小绝对收缩和选择算子(LASSO)算法选择最优特征。构建模型 1(无直肠充盈)和模型 2(有直肠充盈)。1 组采用 LOO-CV 建立放射组学模型。然后, 利用 2 组对两种模型的有效性进行检验和验证。结果: 共纳入 204 例患者, 其中 1 组 60 例, 2 组 144 例。最后, 利用 LASSO 筛选出 7 个最优特征构建模型 1, 9 个最优特征构建模型 2。ROC 曲线显示, 在 1 组中, 模型 1 和模型 2 的 AUC 分别为 0.806 和 0.946, 在 2 组中, 模型 1 和模型 2 的 AUC 分别为 0.783 和 0.920 ($p=0.021$)。结论: 直肠充盈的放射组学模型具有将 T1+2 与 T3 鉴别开的优势, 在验证队列中分类不准确率较低, 这表明该模型可用于 T 分期评估。

PO-2942

磁共振技术定量定性肾周脂肪组织的意义、可行性及优势

程畅
南京鼓楼医院

肾周脂肪组织是一种特殊的脂肪组织, 其内含有棕色脂肪, 且位置与肾脏相邻。研究显示其体积改变、病理改变及其内棕色脂肪含量改变与肾功能、糖尿病、心血管疾病及肾癌有关。磁共振既能帮助识别棕色脂肪及脂肪组织的病理改变, 还能较为精确的定量脂肪体积, 用磁共振监测肾周脂肪的改变可以帮助诊断和评估疗效, 是一个非常值得研究的领域。

单侧突发性感音神经性听力损失患者低频波动幅度的动态变化

李雨婷、张驰、尚宇轩、王文
空军军医大学唐都医院

Objects

SSNHL (sudden sensorineural hearing loss) refers to hearing loss at least 30 dB in three sequential frequencies in the standard pure-tone audiogram in less than 3 days (1), affecting unilaterally in over 95% cases (2). The amplitude of low-frequency fluctuations (ALFF) reflects the spontaneous neuronal activity and can help identify abnormal neural activity in various diseases. However, the dynamic features of ALFF in SSNHL patients are not elucidated. Our study aims to explore the dynamic ALFF (dALFF) alterations in SSNHL patients, which may help better understand SSNHL as well as identify new functional neuroimaging biomarkers to guide its treatment.

PO-2944

磁共振成像影像组学特征对乳腺癌淋巴血管浸润的预测价值

王浩天、徐姝
辽宁省肿瘤医院

目的 探讨基于 MRI 影像组学特征对乳腺癌淋巴血管浸润(LVI)的预测价值。方法回顾性分析 2021 年 1 至 7 月在辽宁省肿瘤医院术前接受 MR 检查且经术后病理证实的乳腺浸润性导管癌患者 216 例, 均为女性, 年龄 27~80 (53 ± 11) 岁, 其中有 LVI 患者 68 例, 无 LVI 患者 148 例。将所有患者按 7:3 比例分成训练集和验证集。基于临床及 MRI 表现提取 LVI 的独立危险因素, 构建临床

特征模型。在动态增强 (DCE) MRI 第二期相及 DWI 中分别勾画肿瘤及瘤周 1 mm 环形带、瘤周 2 mm 环形带、瘤周 3 mm 环形带感兴趣区, 进行影像组学特征提取和筛选, 构建影像组学特征模型。绘制受试者操作特征 (ROC) 曲线评价各模型的诊断效能。结果 表观扩散系数 (ADC) 值 (OR=0.09, 95%CI 0.01~0.97, P=0.047)、腋窝淋巴结肿大 (OR=2.51, 95%CI 1.18~5.37, P=0.017)、瘤周水肿 (OR=2.34, 95%CI 1.15~4.75, P=0.019) 是 LVI 的独立危险因素。依据以上危险因素建立临床特征模型。最终筛选出 10 个影像组学特征构建 DCE-MRI 肿瘤模型, 8 个影像组学特征构建 DCE-MRI 瘤周 1 mm 模型、9 个影像组学特征构建 DCE-MRI 瘤周 2 mm 模型、5 个影像组学特征构建 DCE-MRI 瘤周 3 mm 模型, 8 个影像组学特征构建 DWI 肿瘤模型, 5 个影像组学特征构建 DWI 瘤周 1 mm 模型、10 个影像组学特征构建 DWI 瘤周 2 mm 模型、9 个影像组学特征构建 DWI 瘤周 3 mm 模型。ROC 曲线分析显示, DWI 瘤周 1 mm 模型在训练集和验证集中预测乳腺癌 LVI 状态的 AUC 值最大, 分别为 0.928、0.907, 且与其他模型比较差异均有统计学意义 (P<0.05)。结论 MRI 影像组学特征可以对乳腺浸润性导管癌 LVI 进行有效预测, 且 DWI 瘤周 1 mm 模型对 LVI 状态的预测效能最好。

PO-2945

3D-FIESTA-C 序列显示肘管综合征中弓状韧带价值的研究

曹毅、郭林
天津市天津医院

目的: 探讨 3D-FIESTA-C 序列清晰显示肘管综合征患者弓状韧带的全貌走行及与尺神经毗邻关系, 定量测量弓状韧带的厚度, 为临床诊疗肘管综合征提供影像学依据。

方法: 采用 GE Discovery MR 750 3.0T 高场磁共振成像仪, 联合八通道膝关节线圈, 选取 2020 年 10 月—2021 年 5 月天津医院手显微外科收治的 22 例行肘管尺神经松解术的肘管综合征患者, 其中男性 15 例, 女性 7 例, 年龄 49~75 岁, 平均年龄 60.91 ± 7.38 岁。按照解剖部位将弓状韧带分为五个部分, 肱骨内上髁附着部、肱骨内上髁部、尺神经部、鹰嘴部和鹰嘴附着部。以术中所见结果为金标准, 对比 MRI 的显示与术中所见, 计算 3D-FIESTA-C 序列观察弓状韧带在五部分的显示率; 分别计算 3D-FIESTA-C 序列显示弓状韧带全貌的准确度、敏感度、特异度、阳性预测值、阴性预测值及 Kappa 值; 比较 3D-FIESTA-C 序列显示和术中测量弓状韧带尺神经部厚度的一致性。

结果: 22 例临床诊断肘管综合征的患者中, 3D-FIESTA-C 序列观察弓状韧带在肱骨内上髁附着部、肱骨内上髁部、尺神经部、鹰嘴部和鹰嘴附着部的显示率分别为 90.9%、90.9%、90.9%、81.8% 和 68.1%。3D-FIESTA-C 序列显示 2 例弓状韧带缺如; 而术中探查 3 例弓状韧带缺如。3D-FIESTA-C 序列显示弓状韧带全貌的准确度、敏感度、特异度、阳性预测值及阴性预测值分别为 81.8%、79.0%、100%、100% 和 42.9%, Kappa 值=0.51, 该序列显示弓状韧带全貌与术中具有中度的一致性; 尺神经部分别为 95.5%、100%、66.7%、95.0% 和 100%, Kappa 值=0.78, 该序列具有高度的一致性。3D-FIESTA-C 序列和术中测量弓状韧带在尺神经部的厚度分别是 0.58 ± 0.15 mm 和 0.68 ± 0.34 mm, 差异无意义 ($t=0.985$, $P=0.366$) ($P < 0.05$)。

结论: 3D-FIESTA-C 序列可以三维显示肘管弓状韧带的走行变化及与尺神经毗邻的关系, 并可以对肘管内弓状韧带的厚度做定量测量, 对诊断肘管综合征有重要临床意义。

PO-2946

基于 DISCO 的定量 DCE 技术在乳腺良恶性疾病中的诊断价值

方玉
重庆市中医院

目的：探讨基于笛卡尔采集的 K 空间共享三维容积快速动态成像(DISCO)技术在乳腺良恶性病变诊断中的价值。方法：收集重庆市中医院 2022 年 1 月~2023 年 5 月在放射科行乳腺磁共振增强的 46 例病人的影像资料，所有患者常规行乳腺横断面 T1WI、T2WI 平扫、DWI 扫描及 DISCO 扫描。将收集、扫描数据传输到 GE 后处理工作站(AW 4. 7)，在病变的最大层面勾画感兴趣区(region of interest, ROI)。测量血流动力学参数前向容积转移常数(Ktrans)、每单位体积组织的血管外细胞外间隙容积(Ve)、初始增强曲线下面积(IAUGC)、最大增强斜率(MaxSlope)、对比增强比率(CER)，并运用 ROC 曲线评价参数的诊断价值。结果：与乳腺良性病变比较，乳腺恶性病变的 Ktrans、CER、IAUGC、MaxSlope、Ve 升高($P < 0.05$)。Ktrans、CER、IAUGC、Ve、MaxSlope 诊断乳腺良恶性病变的 ROC 曲线下面积分别为 0.858、0.778、0.795、0.869、0.627，将病理结果作为对照，其诊断乳腺良恶性病变的敏感度分别为 83.8%、94.6%、89.2%、73.0%、86.5%，特异度分别为 74.3%、60.0%、60.0%、40.0%、82.9%。结论：乳腺良恶性病变的血流动力学特征不同，Ktrans、CER、IAUGC、Ve、MaxSlope 对乳腺良恶性病变的诊断具有重要的参考价值。随着技术的进步，DISCO 技术在不影响空间分辨率的条件下时间分辨率亦能得到提高，使得序列处理后能够同时得到病变的更多的参数(包括血流动力学的定量及半定量参数)。其中，DISCO 技术是建立于三维扰相梯度回波的序列基础上，并采用了水脂分离的技术、伪随机变量 K 空间分割的技术及 K 空间共享重建的技术进行数据采集。既往研究中针对乳腺良恶性病变的血流动力学定量及半定量参数研究中同时运用第三方软件及 GE 后处理工作站软件包得到相关参数。

PO-2947

3D TOF-MRA 和 ZTE-MRA 在磁共振脑血管成像中的对比

方玉
重庆市中医院

目的：比较 3D TOF-MRA 和 ZTE-MRA 技术在脑血管的成像质量。方法：收集重庆市中医院 2022 年 1 月~2023 年 6 月在放射科行脑血管 3D TOF-MRA 及 ZTE-MRA 的 36 例病人的影像资料。将所有数据传送至 GE ADW 4.7 工作站，对原始图像进行后处理。并进行血管可视化及饱和伪影的质量评分，采用 Kappa 检验评估两名阅片者评分的一致性，并使用 Wilcoxon 符号秩检验对两种 MRA 成像的质量评分进行比较。测量并计算图像的信噪比、对比噪声比和对比度，采用配对样本 t 检验评估各项客观评价指标。结果：两名阅片者的质量评分结果具有较强的一致性 ($Kappa > 0.6$)；ZTE-MRA 成像血管可视化的评分与 3D TOF-MRA 无显著差异 ($P > 0.05$)，在饱和伪影方面 ZTE-MRA 成像有显著优势 ($P < 0.05$)；除在动脉瘤介入术后栓塞段成像的信噪比，ZTE-MRA 成像客观评估的各项指标均高于 3D TOF-MRA 成像 ($P < 0.05$)。ZTE-MRA 技术在颈内动脉虹吸部成像、动脉瘤瘤体处成像的 SNR、CNR 及 C 均高于 3D TOF-MRA 技术，在动脉瘤介入术后栓塞段成像的 CNR 及 C 均高于 3D TOF-MRA 技术，且两者差异均具有统计学意义 (P 均 < 0.05)。结论：ZTE-MRA 与传统 3D TOF-MRA 成像技术相比，脑血管的成像质量明显提高。本次研究中，我们发现 ZTE-MRA 技术在颈内动脉虹吸部成像效果较 3D TOF-MRA 有着明显的优势；而在 ZTE-MRA 序列所有病例的颈内动脉虹吸段均呈现均匀的高信号，且边缘清晰光整；但 3D TOF-MRA 在其余血管平直部位的血管边缘显示更为清晰锐利，且对血管远端末梢小分支的显示比 ZTE-MRA 更清晰；同时 ZTE-MRA 成像的背景存在一定的颗粒感。此外，我们收集的 3 例颈内动脉虹吸部动脉瘤的成像中，

较 3D TOF-MRA, ZTE-MRA 成像显示的瘤体更清晰, 内部信号也更均匀。同时, 在 2 例动脉瘤介入术后栓塞段后病人的影像中, ZTE-MRA 较 3D TOF-MRA 显示的磁化率伪影更少, 从而更清晰地准确地显示载瘤血管结构和评估栓塞治疗效果。

PO-2948

DCE-MRI 成像联合临床及血管病理参数预测 早期宫颈癌淋巴结转移

栾一祎

辽宁省肿瘤医院

目的: 研究 DCE-MRI 定量参数联合临床因素及微血管密度(microvessel density, MVD)和周细胞覆盖率 (microvessel pericyte coverage index, MPI) 预测早期宫颈癌淋巴结转移 (lymph node metastasis, LNM) 的价值。方法: 回顾性分析 85 例接受 DCE-MRI 和病理免疫组化检查的早期宫颈癌病例, LNM 阳性组 43 例, LNM 阴性组 42 例。应用 Extended Tofts Linear 双室模型获取宫颈癌原发灶 DCE-MRI 定量参数 (Ktrans、Kep、Ve); 使用 CD34 和 α -平滑肌肌动蛋白 (α -SMA) 进行免疫组织化学双染色分别量化宫颈癌 MVD 和 MPI。比较 LNM 阳性组与阴性组间临床因素、DCE-MRI 各定量参数及 MVD 和 MPI, 并分析这些因素与 LNM 的关系。结果: LNM 阳性组与阴性组间脉管癌栓 ($p=0.003$)、2009FIGO 分期 ($p=0.019$) 差异具有统计学意义; 两组间年龄 ($p=0.323$)、肿瘤最大径 ($p=0.168$)、病理类型 ($p=0.527$) 及分化程度 ($p=0.840$) 无显著差异。LNM 阳性组 Ktrans、Kep 显著高于阴性组 (P 均 <0.01), Ve 在两组间差异无统计学意义。LNM 阳性组 MPI 明显低于阴性组 ($P<0.01$); MVD 在两组间差异无统计学意义。由 Ktrans、MPI、脉管癌栓及 2009FIGO 分期构成的联合预测模型诊断效能高于单独的 DCE-MRI 定量参数, AUC 为 0.876。结论: DCE-MRI 定量参数联合临床因素及 MPI 在评估早期宫颈癌淋巴结转移方面具有一定的预测价值。

PO-2949

DCE-MRI 成像及微血管密度、周细胞覆盖率与 宫颈癌淋巴结转移的相关性研究

栾一祎

辽宁省肿瘤医院

【摘要】目的: 研究 DCE-MRI 定量参数和微血管密度(microvessel density, MVD)、周细胞覆盖率 (microvessel pericyte coverage, MPI) 在宫颈癌淋巴结转移中的诊断价值; 探讨 DCE-MRI 定量参数与 MVD、MPI 的相关性。方法: 85 例经病理证实的宫颈癌患者接受 DCE-MRI 和病理免疫组化检查, 应用 Extended Tofts Linear 双室模型获取 DCE-MRI 定量参数 (Ktrans、Kep、Ve), 使用 CD34 和 α -平滑肌肌动蛋白 (α -SMA) 免疫组织化学双染法进行染色分别量化 MVD 和 MPI; 采用 Mann-Whitney U 检验比较淋巴结转移组与无转移组间 DCE-MRI 各定量参数、MVD 及 MPI 值, 应用受试者工作特征曲线(receiver operating characteristic, ROC)分析 DCE-MRI 各定量参数诊断淋巴结转移的能力; 应用 Spearman 秩相关分析 DCE-MRI 各定量参数与 MVD、MPI 的相关性。结果: 宫颈癌淋巴结转移组 Ktrans、Kep 高于无转移组 (P 均 <0.01); Ve 在两组间无统计学意义差异 ($P>0.05$)。淋巴结转移组 MPI 低于无转移组 ($P<0.01$); MVD 在两组间无明显差异 ($P>0.05$)。ROC 曲线分析结果显示 Ktrans、Kep 在诊断淋巴结转移中其曲线下面积(area under the curve, AUC)分别为 0.773 (95%CI: 0.674~0.872)、0.719 (95%CI: 0.611~0.827)。DCE-MRI 各定量参数与

MVD 均无明显相关关系 (P 均 > 0.05)。DCE-MRI 定量参数 K_{trans} 、 K_{ep} 分别与 MPI 呈负相关 ($r = -0.410$, $P = 0.000$; $r = -0.308$, $P = 0.004$); V_e 与 MPI 无明显相关关系 ($P > 0.05$)。结论: DCE-MRI 定量参数及 MPI 在宫颈癌淋巴结转移的评估中有一定的诊断价值。DCE-MRI 定量参数可以为宫颈癌 MPI 提供有价值的信息。

PO-2950

基于 SWI 评估脑小血管病患者的认知功能障碍

陈悦、张鑫
陕西省人民医院

目的: 脑小血管病(cerebral small vessel disease, CSVD)是指脑内小血管受到各种病因作用而引发的病理、影像、临床综合征。磁敏感加权成像(susceptibility-weighted imaging, SWI)可用于评估 DMV。本研究旨在应用 SWI 来探究 DMV 与 CSVD 总负荷之间的关系, 并探讨 DMV 评分与 CSVD 患者的认知功能障碍的相关性。

方法: 回顾性分析我院接受脑 MRI 检查的 28 例 CSVD 患者的临床和影像学资料。应用 SWI 相位图得出 DMV 评分。应用国际通用的 CSVD 评分量表对 CSVD 总负荷进行评分。在磁共振液体衰减反转恢复 (FLAIR) 序列图像上进行脑白质高信号 (WMH) Fazekas 评分。依据简易精神状态检查量表 (MMSE) 将患者分为存在认知障碍(cognitive impairment, CI)(MMSE 评分 < 27)及认知功能正常组(MMSE 评分 ≥ 27)。应用多元有序 Logistic 回归分析 DMV 评分及其他相关因素与 CSVD 负荷的关系。应用 Spearman 相关分析对 DMV 评分与 WMH 进行相关性分析。明确 MMSE 与 WMH、CSVD 评分之间的相关性, 探讨 CSVD 患者存在 CI 的危险因素。

结果: CSVD 总负荷组间单因素分析得出 DMV 评分 ($P < 0.001$) 在三组间的差异性显著, 具备统计学意义。在校正其他相关因素后, 有序 Logistic 回归分析表明 DMV 评分增高是 CSVD 总负荷严重程度的独立相关因素 ($P = 0.04$)。Spearman 相关分析结果表明 DMV 评分与 WMH 呈正相关 ($r = 0.914$, $P < 0.001$), WMH ($r = -0.820$, $P < 0.001$)、CSVD 评分 ($r = -0.720$, $P < 0.001$) 均与 MMSE 评分呈负相关。

结论: 基于 SWI 的 DMV 评分是 CSVD 的潜在影像指标, 并与 CSVD 患者认知功能障碍相关。

PO-2951

非增强 MR 淋巴管成像在原发性乳糜尿中的诊断价值初探

郝琪^{1,2}、洪楠¹、王仁贵^{2,3}
1. 北京大学第二临床医学院 (北京大学人民医院)
2. 北京大学第九临床医学院
3. 首都医科大学附属北京世纪坛医院

目的 探讨非增强 MR 淋巴管成像在原发性乳糜尿诊断中的应用价值。

方法 回顾性收集确诊为原发性乳糜尿患者 55 例, 所有患者均行 MRL 检查, 所有 MRL 影像图像均由 2 位放射科医师分别进行阅片, 意见不同时经讨论达成一致, 并记录最终诊断结果。统计指标包括: ①双髂、双侧腰干、双侧肾窦、胸导管、双侧支气管纵隔干、双侧颈干、双侧锁骨下干等淋巴管形态及扩张情况; ②泌尿系统及胸腹盆部淋巴管异常情况。对于原发性乳糜尿患者 MRL 征象采用分类变量资料中的构成比进行统计描述。

结果 55 例原发性乳糜尿中, 45 例 (81.8%) 左侧髂淋巴管扩张, 34 例 (61.8%) 右侧髂淋巴管扩张, 54 例 (98.2%) 腹膜后淋巴管扩张, 53 例 (96.4%) 左侧腰干扩张, 34 例 (61.8%) 右侧腰干扩张, 15 例 (27.3%) 左侧支气管纵隔干扩张, 7 例 (12.7%) 右侧支气管纵隔干扩张, 9 例

(16.4%) 左侧颈干扩张, 10 例 (18.2%) 右侧颈干扩张, 23 例 (41.8%) 左侧锁骨下干扩张, 15 例 (21.3%) 右侧锁骨下干扩张, 50 例 (90.9%) 胸导管末端扩张, 52 例 (94.5%) 右侧胸导管扩张, 21 例 (38.2%) 左侧肾窦淋巴管扩张, 18 例 (32.7%) 右侧肾窦淋巴管扩张, 9 例 (16.4%) 盆腔淋巴管扩张, 6 例 (10.9%) 肠系膜淋巴管扩张, 3 例 (5.5%) 会阴淋巴管扩张, 2 例 (3.6%) 膀胱淋巴管扩张, 1 例 (1.8%) 胰周淋巴管扩张, 8 例 (14.5%) 脾脏囊性病灶, 3 例 (5.5%) 骨骼囊性病灶。

结论 MRL 能清晰显示原发性乳糜尿的腹部中央淋巴管的异常情况, 并且能够进一步显示胸部淋巴干、胸导管末端及右淋巴导管异常扩张的部位及程度。

PO-2952

合成磁共振成像技术对肿块型浆细胞性乳腺炎及乳腺癌的鉴别诊断价值

张琴

重庆市中医院

【摘要】目的 探讨合成磁共振成像(synthetic magnetic resonance imaging, SyMRI)定量参数对肿块型浆细胞性乳腺炎(plasma cell mastitis, PCM)及乳腺癌(Breast cancer, BC)的鉴别诊断价值。**材料与方法** 回顾性分析 2021 年 6 月至 2022 年 12 月因乳腺肿物在重庆市中医院就诊并经病理证实的 56 例肿块型 PCM 及 63 例乳腺癌患者的磁共振成像资料。除常规磁共振扫描序列外, 所有患者均行 SyMRI 序列扫描。使用 GE AW4.7 工作站生成 SyMRI 的 T1 图、T2 图以及质子密度(proton density, PD)图, 通过勾画感兴趣区, 获得病灶平扫 T1、T2 和 PD 值。采用独立样本 t 检验比较肿块型 PCM 及 BC 病灶各参数值的差异, 并采用受试者工作特征(receiver operator characteristic curve, ROC)曲线评估各参数的诊断效能。结果 肿块型 PCM 的 T1、T2 中位数(1608.08ms、109.45ms)均高于乳腺癌组(1389.17ms、86.35ms), 差异均具有统计学意义($P < 0.05$)。肿块型 PCM 及乳腺癌肿块 PD 值差异无统计学意义。以 T1 值=1491.82ms、T2 值=91.09ms 为界值, 鉴别肿块型 PCM 和乳腺癌的 ROC 曲线下面积分别为 0.89、0.78, 准确度分别为 82.5%、79.3%, 灵敏度分别为 78.6%、91.9%, 特异度分别为 89.6%、57.9%。结论 SyMRI 定量参数 T1、T2 有助于鉴别肿块型 PCM 及乳腺癌。

PO-2953

胸椎横断位 T1 压脂增强磁共振成像图像质量的对比研究: radial k 空间采样脉冲序列 vs. 传统笛卡尔 k 空间采样脉冲序列

朱柳红¹、周建军^{1,2}

1. 复旦大学附属中山医院厦门医院

2. 复旦大学附属中山医院

目的: 对比 radial k 空间采样脉冲序列与传统笛卡尔 k 空间采样脉冲序列在胸椎 T1 压脂增强磁共振成像图像质量方面的差异。

方法: 前瞻性收集分析 2023 年 4 月至 2023 年 7 月在我院行胸椎 3.0T 增强磁共振检查的椎体肿瘤患者 28 例。每位患者均行增强后 2D T1 TSE 抑脂序列、屏气 3D GRE 抑脂序列及自由呼吸 3D VANE xd (层面内 Radial 填充) 序列的扫描。对三组图像的图像质量进行客观和主观评价。测量病灶最大层面图像的对比噪声比(contrast to noise ratio, CNR), 并进行客观对比评价。由 2 名有经验的放射科医师依据 4 分李克特量表(Likert scale)对图像伪影、椎体及病灶显示清晰度、图像整体质量等三个方面进行双盲评价。对比不同序列下图像的 CNR 及图像主观指标评分结果的差异。

结果: 自由呼吸 3D VANE xd 序列图像的 CNR 显著优于其他两组序列图像 (p 均 <0.01)。在对抗伪影方面, 自由呼吸 3D VANE xd 序列 (4[3.75-4]) 及屏气 3D GRE 抑脂序列 (3.75[3.5-4]) 的评分均显著优于 2D T1 TSE 抑脂序列 (3 [2.75-3.25]; 在椎体及病灶显示清晰度方面, 自由呼吸 3D VANE xd 图像的评分显著高于其他两者 (p 均 <0.01); 且自由呼吸 3D VANE xd 序列的图像整体质量评分显著高于其他两组 (p 均 <0.01)。

结论: 运用自由呼吸 radial k 空间采样脉冲序列 (3D VANE xd) 可提高胸椎横断位 T1 压脂增强磁共振成像的图像质量。

PO-2954

MRI 对乳腺癌患者新辅助化疗治疗效果的评价价值

卢锦婷、张艺武、肖玉辉

中国人民解放军联勤保障部队第九〇九医院

目的 研究 MRI 对乳腺癌新辅助化疗治疗效果的评价作用。方法 回顾性分析 2019 年 1 月至 2021 年 12 月我院收治的 96 例乳腺癌患者临床资料。根据病理结果将全部患者分为新辅助化疗有效组 ($n=68$) 和无效组 ($n=28$)。比较两组新辅助化疗前后 MRI 测量的病灶最大直径、表观弥散系数 (apparent diffusion coefficient, ADC) 和时间-信号强度曲线 (time-intensity curve, TIC) 类型。使用 kappa 一致性比较 MRI 和病理诊断的诊断一致性。结果 MRI 对 98 例乳腺癌新辅助化疗效果判断的灵敏度为 0.957, 特异度为 0.926, 准确度为 0.948。MRI 检查与病理诊断结果一致性分析, 可见 Kappa 值 = 0.873 ($P=0.000$)。新辅助化疗后无效组和有效组的病灶最大直径较化疗前均减小 ($P<0.05$), 但无效组肿瘤的 ADC 值变化无统计学差异 ($P>0.05$), 有效组病灶的 ADC 值显著升高 ($P<0.05$)。新辅助化疗后 TIC III 型患者比例显著降低, 而 I 型患者比例明显升高 ($P<0.05$)。结论 MRI 可以显示乳腺癌病灶的最大直径、ADC 和 TIC 类型, 是评价乳腺癌新辅助化疗疗效的可靠方法。

PO-2955

脑小血管病总体负担与视网膜微血管异常的相关性研究

陈思颖、赵新湘

昆明医科大学第二附属医院

【目的】探讨脑小血管病 (CSVD) 视网膜微血管异常相关指标与 CSVD 总体负担的相关性。

【方法】纳入符合《中国脑小血管病诊治专家共识 2021》的行头颅 MRI 及 OCTA 检查的患者, 对 CSVD 总体负担进行评分, 将研究对象分为低分组 (1-2 分)、高分组 (3-4 分), 同时纳入 0 分患者做对照组。将 OCTA 图像导入后处理工作站, 通过计算获得 OCTA 指标。采用 SPSS 25.0 统计学软件进行统计分析。

【结果】最终纳入 CSVD 患者 110 例和对照组 40 例。

1. CSVD 三组患者基线资料比较:

三个亚组间比较, 性别、年龄、高血压、饮酒、HCY 差异均有统计学意义 ($P<0.05$)。

2. CSVD 三组患者 OCTA 指标比较:

在黄斑区血管密度中, 除中层中央、其余差异均有统计学意义; 在黄斑区灌注密度差异均有统计学意义; 在 FAZ 全层中均有统计学意义; 在视盘血管密度中, 除 RPC 全部及内视盘, 其余差异有统计学意义; 在视盘灌注密度中, 视乳头层全部、内视盘、下侧及 RPC 全部、内视盘、下侧、上侧差异有统计学意义。

3. CSVD 总体负担评分与 OCTA 指标的相关性分析:

Pearson 相关性分析显示, 对于临床基线资料, 年龄、HYC 与 CSVD 呈弱相关; 对于黄斑区血管密度, 表层及深层中央与 CSVD 负担评分呈正相关; 对于黄斑区灌注密度, 表层中央、内环及深层中央与 CSVD 负担评分呈正相关; 对于视盘血管密度, 除视乳头层内视盘, 其余差异有统计学意义的与 CSVD 负担评分呈正相关; 对于视盘灌注密度, 视乳头层下侧、RPC 下侧与 CSVD 负担评分呈正相关。

4. OCTA 指标对 CSVD 高负担评分的诊断预测价值:

ROC 分析显示, 在黄斑区血管密度中, 对 CSVD 高负担评分发生风险预测从大到小依次是中层内环、深层全部、表层中央; 在黄斑区灌注密度中从大到小依次是中层外环、表层中央; 在视盘血管密度中从大到小依次是 RPC 下侧、鼻侧、颞侧及上侧、视乳头层颞侧、下侧及上侧。

【结 论】本研究显示中层内环和深层全部的黄斑区血管密度、中层外环的黄斑区灌注密度对 CSVD 高负担评分具有较好的预测效能。

PO-2956

优化髋关节磁共振成像: 利用基于深度学习的重建技术提高图像质量并增强观察者之间的一致性

康依蒙、李文静、李淑健、张赞霞、汪卫建
郑州大学第一附属医院

背景: 传统的髋关节磁共振成像扫描需要较长的扫描时间, 给患者的舒适度和临床效率带来了挑战。以前, 加速成像技术受限于噪声和分辨率之间的权衡。利用基于深度学习的重建 (DLR) 有可能在不影响图像质量的情况下缩短扫描时间。

目的: 我们的研究旨在探索深度学习 (DL) 重建的磁共振成像在加速髋关节成像中的可行性, 并将其性能与标准核磁共振成像中的传统重建和无深度学习的加速成像 (No-DL MRI) 进行比较。

方法: 我们选取了接受 DL-MRI、传统 MRI 和无 DL MRI 检查的 60 名患者进行图像质量评估。评估中考虑的关键指标包括扫描时间、整体图像质量、相对信噪比 (rSNR)、相对对比噪比 (rCNR) 和诊断效果的定量评估。两名经验丰富的放射科医生采用 5 分制 (5 分表示最高质量) 独立评估图像质量。为了衡量各组图像中病理评估的观察者间一致性, 我们采用了加权 Kappa 统计法。此外, 我们还采用了 Wilcoxon 符号秩检验来比较图像质量以及 rSNR 和 rCNR 的定量测量结果。

结果: DL-MR 显著缩短了 T2 fs Cor 和 T2 fs Axi 的扫描时间, 与传统磁共振成像所需的 3 分 32 秒相比, 仅需 1 分 11 秒, 缩短了约 66.5%。与传统磁共振成像和无 DL 磁共振成像相比, DL-磁共振成像在冠状 T2WI 和轴向 T2WI 方面始终表现出更高的图像质量。在比较 rSNR 时, 除测量髋臼之外, DL-MRI 的 T2 fs Cor 和 T2 fs Axi 始终优于 No-DL MRI。rCNR 数据显示, 与无 DL MRI 相比, DL-MRI 的 T2 fs Cor 有明显改善, 但 DL-MRI 与无 DL MRI 的 T2 fs Axi 没有明显差异。其中软骨下骨的 rCNR 结果在 T2 fs Axi 中无差异, 髋臼 rCNR 在 T2 fs Axi 中也无明显差异。

结论: 与传统磁共振成像相比, 髋关节的 DL-MRI 可大大缩短扫描时间, 同时提高 T2WI 的成像质量。虽然不同读者对传统磁共振成像和 DL-MRI 的病变检测能力存在差异, 但是观察者之间的一致性表明 DL MRI 整体上有所改善。

PO-2957

新的肝脏铁定量方法——吡啶菁绿结合磁共振扫描

罗朝天、彭飞、唐成、彭鹏
广西医科大学第一附属医院

目的：铁元素是人体必需的微量元素，当机体发生铁元素代谢失衡，就会导致铁缺乏、铁过载，其中铁过载会导致多器官功能障碍，其中肝脏最常见。吡啶菁绿（ICG）是一个安全的常用药物，主要在肝脏代谢，近年来有研究表明其可与肝脏内铁元素结合，其结合物的 MRI-T₁ 值会明显升高，而与铁过载密切相关的疾病有地中海贫血、遗传性血色病、再生障碍性贫血、慢性肝炎等疾病及一些需要反复输血治疗的疾病，其可与铁过载形成恶性循环，一个准确的铁定量方法不仅可以有效指导临床进行祛铁治疗，更是保证铁过载患者的生命健康重要因素。本研究旨在探究吡啶菁绿结合磁共振 T₁ 扫描技术精确定量肝脏铁元素的可行性。材料与方法：对 3-6 月龄新西兰雄性家兔皮下注射铁剂造模，造模成功后，注射 ICG 并进行 MRI 动态扫描，分析 MRI-T₁ 值的变化，寻找与基线差值最大的时间点作为最佳扫描时间，并将最佳时间点的 T₁ 值与 MRI-T₂* 进行比对，推导肝脏铁含量与 ICG+MRI-T₁ 值之间的关系。结果：T₁ 信号比（T₁SIR，表示肝脏 T₁ 值/竖脊肌 T₁ 值）变化率的各个时间点分别与 0min 的配对 t 检验，结果显示 120min 与 0min 的差异具有统计学意义（ $p < 0.05$ ），15min、30min、60min 与 0min 差异均无统计学意义（ $p > 0.05$ ）；T₁SIR 变化率与 T₂* 值具有相关性（ $r=0.950$ ， $p=0.05$ ）；线性回归所推导的公式为： $y=5.532+54.333x$ （ y 表示 T₂*， x 表示 T₁SIR 变化率， $F=18.566$ ， $p=0.05$ ）。结论：注射 ICG 后进行 MRI 扫描，会延长铁过载肝脏 T₁ 值，且在 2h 达到最大差值；T₁SIR 变化率与 T₂* 具有相关性，且推导出的公式可间接推算肝脏铁含量。

PO-2958

DKI 比值法对肌层浸润性膀胱癌的诊断价值

秦彩、冯峰、田琪、周慧
南通市肿瘤医院

目的 探讨扩散峰度成像（DKI）比值法对肌层浸润性膀胱癌的诊断价值。方法 回顾性分析经病理证实的 73 例膀胱尿路上皮癌患者的 MRI 资料。患者术前均行常规 DWI、DKI 检查。2 名放射科医师独立测量膀胱癌（BCa）及闭孔内肌的扩散参数，包括平均表观扩散系数（ADCmean）、平均扩散峰度（MK）、平均扩散系数（MD）。BCa 和闭孔内肌的扩散参数分别以 ADCtumor、MDtumor、MKtumor、ADCmuscle、MDmuscle、MKmuscle 表示。以闭孔内肌作参照，分别计算 BCa 与闭孔内肌对应 3 个扩散参数的比值（包括 ADCratio、MDratio、MKratio）。采用 Mann-Whitney U 检验分别比较 MIBC 与非肌层浸润性膀胱癌（non-muscle invasive bladder cancer, NMIBC）之间扩散参数及扩散参数比值的差异。以手术后病理结果为标准，利用受试者工作特征（receiver operating characteristic, ROC）曲线评估 ADCtumor、MDtumor、MKtumor、ADCratio、MDratio、MKratio 诊断 MIBC 的效能；采用 DeLong 检验比较各模型曲线下面积（area under the curve, AUC）之间的差异。结果 MIBC 组的 ADCtumor、MDtumor、ADCratio、MDratio 值均低于 NMIBC 组（ $P < 0.05$ ），而 MKtumor、MKratio 值高于 NMIBC 组（ $P < 0.05$ ）。ROC 曲线分析表明，ADCratio、MDratio、MKratio 诊断 MIBC 的 AUC 分别为 0.748、0.828、0.938（ $p < 0.05$ ）。与 MKtumor 相比，MKratio 诊断 MIBC 的效能显著提升（从 0.765 提高到 0.938， $P < 0.05$ ）。MKratio 为 0.65 时诊断 MIBC 的 AUC 较高（0.938），敏感度，特异度分别为 88.00%、91.67%。结论 DKI 比值法可用于诊断 MIBC。MKratio 有望在术前诊断 MIBC 方面发挥重要作用。

PO-2959

血管源性脑白质高信号患者的合成 MRI 成像研究

匡钦梅¹、周福庆²

1. 江西省肿瘤医院

2. 南昌大学第一附属医院

目的:血管源性脑白质高信号 (WMH) 是脑小血管病的重要影像学特征之一, 会导致认知功能损伤。其主要病理改变为脱髓鞘, 然而 WMH 旁的白质区可能同样存在髓鞘丢失。本研究应用合成 MRI 成像的纵向弛豫时间 (T1) 值、横向弛豫时间 (T2) 值和质子密度 (PD) 研究 WMH 患者病灶区和灶周白质区髓鞘丢失情况, 并探索弛豫时间和质子密度改变与认知功能的关系。

方法: 本研究共纳入 WMH 患者组 39 例, 健康对照组 20 例。所有被试者进行一般资料采集, 神经心理学评估如蒙特利尔认知评估、听觉词语学习测验、连线测验 A 和 B、数字广度测验, 接着被试者均通过相同的 MR 扫描方案采集合成 MRI 数据。根据患者的合成 T2-Flair 序列对每个患者选取病灶、灶周白质进行 ROI 勾画, 并选取健康对照组正常脑白质区进行 ROI 勾画。分别从 T1、T2、PD 定量图上获取相应值。使用方差分析 (ANOVA) 对患者组的病灶、灶周白质和健康对照组的 T1、T2、PD 值进行组间比较。通过相关分析评估 WMH 患者的各定量参数值与认知评分之间的相关性。

结果: 1、39 个患者的 ROI 总数为 660 个: 包括病灶 165 个, 灶周白质 495 个, 20 个健康对照的 ROI 总数为 160 个。与灶周白质组和健康对照组相比, 病灶的 T1、T2 和 PD 均有所增加 ($P < 0.001$); 灶周白质与健康对照组相比, T2 值明显增加 ($P = 0.002$); 2、T1 值、T2 值、PD 值分别与认知评分做相关性分析, 发现病灶的 T2 值与认知评分呈负相关 ($r = -0.361$, $P = 0.024$), 灶周白质组的 T2 值与认知评分呈负相关 ($r = -0.522$, $P < 0.001$)。

结论: SyMRI 可以提供多个参数定量评估 WMH 患者的病灶及病灶旁白质损伤情况, 其中 T2 值较其他参数敏感, 同时病灶区的 T2 值以及灶周白质区的 T2 值可为 WMH 患者评估认知障碍提供有价值的信息。

PO-2960

QSM 对轻微型肝性脑病脑铁沉积的 定量研究

张丹庆、于楠

陕西中医药大学附属医院

目的 采用 QSM 测量轻微型肝性脑病 (minimal hepatic encephalopathy, MHE) 患者额叶白质及深部灰质核团的磁敏感值, 分析 MHE 患者脑铁分布情况及脑铁沉积与认知障碍之间的关联, 探究 QSM 在评估轻微型肝性脑病方面的应用。

材料与方法 研究对象为我院感染科住院部确诊为乙肝后肝硬化的病人, 采用数字符号试验 (digit symbol test, DST) 和数字连接试验 A (number connection test- A, NCT- A) 将其分为 MHE 组及单纯肝硬化组, 另纳入 30 名年龄、性别相匹配的正常自愿者为健康对照组, 使用 SMART 软件进行后处理获得 QSM 图, 利用 SPIN 软件在 QSM 图上人工绘制双侧尾状核、壳核、苍白球、丘脑、黑质、红核及双侧额叶白质等 7 对 ROI, 并测量 ROI 的磁敏感值。

结果

1. 与健康对照组相比, MHE 组双侧壳核、双侧苍白球、左侧尾状核、右背侧丘脑、右侧红核、左侧黑质、左侧齿状核、右侧额叶白质的磁敏感值显著增加 (均 $P < 0.05$); 与肝硬化组对比, MHE 组右背侧丘脑、左侧尾状核、右侧红核、左侧黑质、左侧齿状核、右侧额叶白质的磁敏感值增加 (均 $P < 0.05$); 单纯肝硬化组与健康对照组对比, 双侧苍白球的磁敏感值增加 ($P < 0.05$)。

结论

1. 利用 QSM 技术测得的磁敏感值与文献报道的湿重脑组织的铁浓度呈正相关, 提示磁敏感值能够间接反应实际铁含量, QSM 对脑内结构中的铁质进行定量测量具有可行性。

3. MHE 病人左尾状核、右背侧丘脑、右侧红核、左侧黑质、左侧齿状核、右侧额叶白质的铁含量均高于正常对照组及单纯肝硬化组，单纯肝硬化组双侧苍白球的铁含量较正常对照组增高。

PO-2961

脑小血管病 MRI 总负荷与认知功能减退的相关性

张丹庆、于楠
陕西中医药大学附属医院

目的探究脑小血管病 (CSVD) MRI 总负荷与认知功能减退的相关性。方法选取 2023-07—2022-09 我院收治的 CSVD 患者 23 例，收集患者临床资料及头颅磁共振影像学图片，根据 Fazekas 量表对患者图像脑白质信号进行分级，统计 CSVD MRI 总负荷，根据负荷得分划分分组：0~2 分为低负荷，3~4 分为高负荷。对比低负荷组、高负荷组患者简易智力状态检查量表 (MMSE)、蒙特利尔认知评估量表 (MoCA)、建议精神状态检查量表 (MMSE)，使用 Spearman 相关性绘图尝试分析 CSVD MRI 总负荷评分与 MMSE 的关系。结果经整理负荷分值，23 例 CSVD 患者中 0~2 分 10 例 (低负荷组)，3~4 分 13 例 (高负荷组)。低负荷组与高负荷组在性别、糖尿病史一般资料上比较无统计学差异 ($P>0.05$)，高负荷组合并高血压、高血脂比例高于低负荷组，年龄大于低负荷组 ($P<0.05$)。高负荷组 MMSE、MoCA 各项目评分及总分均低于低负荷组 ($P<0.05$)；高负荷组 NIHSS、CSS 评分均高于低负荷组 ($P<0.05$)。Spearman 结果提示 CSVD MRI 总负荷评分与 MMSE ($r=-0.633$, $P<0.001$)、MoCA 均呈负相关 ($r_{MMSE}=-0.633$, $r_{MoCA}=-0.614$, P 均 <0.001)。结论 CSVD MRI 总负荷与认知功能、神经功能恶化之间密切相关，随着 MRI 总负荷评分增加，CSVD 患者认知能力、神经功能越差。通过分级量化 CSVD MRI 总负荷，可为临床评估患者脑小血管病变严重程度、制定诊疗计划有重要参考作用。

PO-2962

基于沿血管周围间隙扩散张量成像技术的早期帕金森病患者脑内类淋巴系统循环功能改变的研究

赵阳、徐长媛、陈昱帆、卓梦圆、李宇欣、巩涛、王光彬
山东第一医科大学附属省立医院

目的：本研究旨在探讨早期帕金森病患者类淋巴系统循环功能改变及其与临床特征的关系。方法：选择山东第一医科大学附属省立医院 (山东省立医院) 神经内科自 2019 年 6 月至 2023 年 6 月收治的早期帕金森病 ($H-Y\leq 2.5$) 患者 27 例，对于所有帕金森病患者均由神经内科医生完成 H-Y 分期和国际统一帕金森病评分量表第三部分 (UPDRSⅢ) 评分。另外招募健康志愿者 27 例作为正常对照组。所有患者及健康志愿者均采集扩散张量成像 (DTI) 数据并计算沿血管周围间隙扩散张量成像 (DTI-ALPS) 指数，比较患者与健康志愿者 ALPS 值的差异，采用 Pearson 相关与 Spearman 相关分析检验早期帕金森病患者 ALPS 指数与临床特征的相关性。结果：健康志愿者组 (HC) 与早期帕金森病组 (PD) 之间在年龄、性别 (HC：男 13 人，PD：男 14 人) 方面无统计学差异。与健康志愿者 (左侧 ALPS: 1.62 ± 0.17 右侧 ALPS: 1.67 ± 0.21 双侧 ALPS: 1.64 ± 0.19) 相比，早期帕金森病患者双侧 ALPS (左侧 ALPS: 1.40 ± 0.18 右侧 ALPS: 1.40 ± 0.16 双侧 ALPS: 1.40 ± 0.16) 均显著减低，差异具有统计学意义 ($p<0.001$)。早期帕金森病患者双侧 ALPS 值与年龄呈负相关 ($r=0.27$, $p=0.0056$)，健康志愿者组 ALPS 值与年龄无明显相关关系。采用 Pearson 相关与 Spearman 相关分析早期帕金森病患者 ALPS 指数与 UPDRSⅢ评分、H-Y 分期的相关性，双侧 ALPS 与 UPDRSⅢ、H-Y 分期均呈负相关 ($r=0.27$, $p=0.0056$ ；

$r=0.43$, $p<0.05$)。ROC 曲线分析显示, 双侧 ALPS 指数较单侧 ALPS 指数(左侧 AUC:0.829, 右侧 AUC:0.851)诊断效能更好, AUC 为 0.855。

结论: 相较于健康志愿者, 早期帕金森患者双侧 ALPS 指数均降低, 且 ALPS 指数与早期帕金森病患者年龄、UPDRSⅢ评分、H-Y 分期等临床特征呈负相关, 因此 ALPS 可以作为帕金森病早期诊断与评估进展的潜在影像标志物。

PO-2963

多回波 Dixon 技术定量输血依赖性疾病肝脏铁沉积的应用价值

彭飞、罗朝天、梁琳琳、唐成、彭鹏
广西医科大学第一附属医院

目的: 铁沉积是一种常见的全身多系统疾病, 包括遗传引起的原发性铁过载(如遗传性血色素沉着症)和外源性引起的继发性铁过载(如重型地中海贫血或再生障碍性贫血等血液病)。基于磁共振成像(MRI)的多回波梯度回波序列(ME-GRE)已常规用于监测铁沉积的严重程度并且是指导铁螯合治疗的标准, 但其存在需要第三方软件离线后处理、手动曲线拟合、报告延迟及额外收费等缺陷。目前, MRI 供应商所开发的多回波 Dixon 技术(qDixon)可直接生成 $R2^*$ 弛豫图, 直接勾画 ROI 即可获取 $R2^*$ 值。因此, 本研究的目的是以 FerriScan 的肝脏铁浓度(LIC)作为参考标准, 比较 qDixon 技术和基于 ME-GRE 的 $R2^*$ 弛豫测定法在评估肝脏铁含量的差异。

方法: 本研究前瞻性收集 2022 年 6 月至 2023 年 6 月就诊于广西医科大学第一附属医院输血依赖型地中海贫血 40 名, 轻度肝脏铁沉积 1 例, 中度肝脏铁沉积 8 例, 重度肝脏铁沉积 32 例。所有患者均同时接受 FerriScan 技术、ME-GRE 序列及 qDixon 序列扫描, 分别获得肝脏实际铁浓度和两种序列对应的 $R2^*$ 值, 分别记为 $R2^*$ 值、 $dR2^*$ 值。以 FerriScan 的肝脏铁浓度(LIC)作为参考标准, 采用 spearman 法分析 $R2^*$ 值、 $dR2^*$ 值与 LIC 的相关性, 并分析 $R2^*$ 值、 $dR2^*$ 值的相关性, 同时采用 Bland-Altman 图比较 ME-GRE 序列及 qDixon 序列所测 $R2^*$ 值的差异。

结果: qDixon 序列所测的 $dR2^*$ 值与 LIC、ME-GRE 所测 $R2^*$ 均具有高度相关性(r 值分别为 0.8512、0.9693, $P<0.0001$), Bland-Altman 图显示 qDixon 序列与 GRE 序列所测 $R2^*$ 的平均差异为 25.53 1/S ($SD=90.23$), 当 $LIC<20\text{mg/g}$, 测值结果均聚集在零偏倚线周围, 随着 LIC 的增高, 在 Bland-Altman 图上显示一致性变差, 部分结果越过了一致性的上限。

结论: 与 ME-GRE 序列及 FerriScan 技术相比, qDixon 技术能够实现轻中度铁沉积的定量, 无需离线后处理, 可进一步优化临床工作流程, 但对肝脏重度铁沉积的程度会存在低估。

PO-2964

术前 PI-RADS v2.1 与前列腺癌根治术后 Gleason 评分变化的关系

张家慧、许梨梨、金征宇、孙昊
中国医学科学院北京协和医院

目的: 穿刺 Gleason 评分(biopsy Gleason score, bGS)有时与相应的根治性前列腺切除术后 Gleason 评分(Gleason score after radical prostatectomy, pGS)不一致。因此, 本研究目的是探究前列腺影像报告和数据系统 2.1 版本(prostate imaging reporting and data system version 2.1, PI-RADS v2.1)与术前、术后 Gleason 评分变化之间的关系。材料与方法: 连续收集我院 2015 年 1 月至 2021 年 12 月收治的 225 例前列腺病例的临床及 MRI 资料。所有患者均行术前超声引导下的经会阴穿刺活检和根治性前列腺切除术。分析影响 bGS 与 pGS 不一致的因素。通过受试者工作特征曲线分析, 计算曲线下面积(areas under the curve, AUC), 确定术前临床变量和 PI-RADS

v2.1 预测术后 Gleason 评分升级的诊断效能。结果：术后 Gleason 评分升级的有 91 例（40.4%），Gleason 评分降级的有 45 例（20%），bGS 与 pGS 相同的有 89 例（39.6%）。单因素分析显示年龄、阳性穿刺针数、bGS 和 PI-RADS v2.1 评分能够影响术后 Gleason 评分改变（P 值均 <0.05 ）。进一步多元回归分析显示，阳性穿刺针数 ≥ 4 针、bGS <7 、PI-RADS v2.1 评分 ≥ 4 分是术后 Gleason 评分升级的独立预测因子（P 值均 <0.05 ）。阳性穿刺针数、bGS、PI-RADS v2.1 评分预测 Gleason 评分升级的 AUCs 值分别为 0.713、0.637、0.611。联合诊断模型的 AUC 值为 0.817，均大于上述三个预测因子的 AUCs 值（P 值均 <0.001 ）。结论：阳性穿刺针数、bGS 和 PI-RADS v2.1 评分有助于预测术后 Gleason 评分升级，通过联合以上三个独立预测因子，可以减少前列腺癌患者治疗不足的可能性。

PO-2965

新路易斯湖标准诊断急性心肌炎： 心内膜心肌活检假阴性患者的心血管磁共振特征

王艺宁、赵世华、陆敏杰
中国医学科学院北京协和医学院阜外医院

目的：相比原始路易斯湖标准，新路易斯湖标准对急性心肌炎的诊断效能已被证明有明显改善。然而，既往研究大多发生在预先选择的病人群体中，而心内膜心肌活检的假阴性结果在作为金标准时必然会带来偏差。本研究旨在真实世界中评估心血管磁共振（Cardiovascular magnetic resonance, CMR）与心肌活检对疑似心肌炎患者的诊断性能，并确定病理假阴性结果的患者特征。

方法：这项单中心的回顾性横断面研究纳入了 311 名临床疑诊心肌炎的患者，所有受试者均接受 3.0T 的 CMR 检查，其中 93 人接受心内膜心肌活检。CMR 扫描方案包括 cine-SSFP、T2 STIR、钆延迟强化（Late gadolinium enhancement, LGE）、T1 及 T2 mapping。当临床标准和磁共振成像同时支持诊断时，患者被确诊为心肌炎。受试者的病理结果依此分为真阳性、真阴性和假阴性组。结果：新路易斯湖标准的敏感性为 96.3%，特异性为 84.6%，而心肌活检的敏感性为 62.8%，特异性为 85.7%。在接受心肌活检的患者中，55 人（59.1%）被诊断为心肌炎，3 人（3.2%）被诊断为扩张型心肌病，其余 35 人（37.6%）没有发现具体的心肌损伤。根据预定的分类标准，27 名患者（29.0%）被归入假阴性组，53 名（57.0%）归入真阳性组，11 名（11.8%）归入真阴性组。容易出现病理假阴性结果的患者通常出现梗死样临床症状，心功能正常；CMR 表现包括左室射血分数保留，不典型的 LGE 模式和轻微升高的 T1 或 T2 弛豫时间。

结论：这项研究进一步证明磁共振检查在诊断急性心肌炎方面优于心内膜心肌活检。鉴于心内膜心肌活检的侵入性和高假阴性率，我们建议具有某些临床特征的患者将 CMR 作为首选检查，并更谨慎地进行有创性病理学检查。

PO-2966

慢性肾脏病患者脑血流量改变：基于 3D-pCASL 成像技术

李媛、蒋玉涵、刘娜、张煜堃、苗延巍
大连医科大学附属第一医院

目的：慢性肾脏病（Chronic Kidney Disease, CKD）患者脑部血液动力学不稳定，尤其是血液透析患者。本研究应用磁共振 3D-pCASL 脑灌注成像技术定量评估 CKD 未透析及血液透析患者与健康人群的脑血流量变化并分析脑血流量变化与认知功能的相关性。

方法：前瞻性招募 19 名 CKD 未透析患者 (Non- Hemodialysis, ND) 和 37 名血液透析患者 (Hemodialysis, HD)，以及 46 名健康受试者 (Healthy controls, HC)。所有受试者均行头颅 MRI

平扫及 3D-pCASL 成像扫描,并在扫描前进行神经心理学测试。用 SPM8 进行基于体素的全脑分析,并提取三组间差异有统计学意义团块的相对脑血流量值(relative values of cerebral blood flow, rCBF)。所有 CBF 数据及神经心理学检查数据在组间比较使用单因素方差分析。采用偏相关分析方法,以性别、年龄、文化程度为协变量,对 HD 的 CBF 数据和认知测试得分进行相关性分析。统计学上有显著意义的 P 值设为 0.05。

结果:基于体素的全脑分析显示,三组间右侧海马、左侧颞上回、右侧中央沟盖、右侧缘上回 rCBF 有显著性差异(图 1,表 1)。三组间单因素方差分析结果显示,HC 右侧海马 rCBF 高于 ND,ND 左侧颞上回 rCBF 高于 HC 和 HD,HC 和 ND 右侧中央沟盖和右侧缘上回 rCBF 高于 HD,差异有统计学意义(图 2)。此外,神经认知结果显示,HC 组 MOCA 得分以及即时自由回忆得分高于 ND 和 HD,焦虑、抑郁量表得分低于 HD。偏相关分析显示,HD 左侧颞上回 rCBF 与定向能力呈负相关($P = 0.022, r = -0.392$);HD 右侧中央沟盖 rCBF 与抽象能力呈正相关($P = 0.021, r = 0.394$),与长时延迟自由回忆正确数呈负相关($P = 0.012, r = -0.426$)(图 3)。

结论:慢性肾脏病患者脑血流动力学不稳定,且认知及记忆能力下降,易出现情绪障碍。除右侧海马外,血液透析患者的脑血流量小于健康者及非透析患者,且与认知及记忆功能存在相关性。

PO-2967

基于 MR-BOLD 的 $R2^*$ 值对盘源性腰痛大鼠 (DLBP) 椎旁肌微循环和肌肉功能改变的研究

奎晓玲、马寄耀、何波
昆明医科大学第一附属医院

目的:为研究椎旁肌毛细血管密度改变对 DLBP 的影响,利用 $R2^*$ 值对骨骼肌组织外周微循环进行定量评估,以早期非侵入性提示 DLBP 患者椎旁肌的病理改变,为腰痛的临床治疗提供影像参考。

方法:本研究通过 X 线透视引导下后入路穿刺 L4/5 及 L5/6 椎间盘,并注射无菌 PBS 建立 DLPB 模型,造模术后的第 7 天,利用 MRI 扫描大鼠腰椎的 L4/5 和 L5/6 椎间盘,当目标椎间盘的髓核在 T2WI 上出现信号减低时,证明模型建立成功;实验动物为 4 周龄 220-250g 雌性 SD 大鼠;分组包括 30 天组、90 天组、180 天组,再分为正常组、Sham 组、DLBP 组三个亚组 ($N=10$);在造模后,按分组时间分别进行行为学测试(包括悬尾试验、抓握试验、钢丝悬挂试验、四肢握力测试和力竭游泳试验),MRI 扫描 (MR-BOLD 包括 $R2^*$ 值)和组织学实验 (包括造模层面椎旁肌的 HE 染色、免疫荧光和免疫组化染色,观察毛细血管密度 (CD)、毛细血管纤维比例 (C/F) 等)。

结果:DLBP 组大鼠在造模 30-180 天内,悬尾试验的静止时间和弯腰时间增加,而挣扎时间减少,同时钢丝悬挂试验和抓握试验中掉落时间减少;四肢握力实验中握力减少、力竭游泳试验中力竭时间减少;DLBP 组大鼠 L4/5 和 L5/6 层面竖脊肌和多裂肌的 $R2^*$ 值逐渐增加;毛细血管密度 CD 值和毛细血管纤维比例 C/F 值较正常组和 Sham 组明显减少 (P 均 <0.05)。

结论: $R2^*$ 值与 CD 值呈中度负相关,即 $R2^*$ 值随 CD 值增加而减少, $R2^*$ 值可在一定程度上反映 DLBP 大鼠椎旁肌的微循环功能降低。同时通过免疫组化发现,在 DLBP 组中,I 型纤维向 II 型纤维发生转化,I 型纤维占比减少,而 $R2^*$ 值随 I 型纤维的减少而增加。可能与毛细血管密度和 I 型纤维占比减少导致 $R2^*$ 值增加有关,从而使腰椎肌肉结构受损,最终导致腰椎性能降低并加重腰痛。DLBP 是慢性腰痛最常见的类型,通过 MR-BOLD 的 $R2^*$ 值可早期定量评估肌肉的微循环灌注,提示 DLBP 患者椎旁肌的病理改变,为 DLBP 的临床治疗提供参考。

PO-2968

质子交换速率成像在脑胶质瘤诊断中的初步应用

朱虹全、李丽、朱文珍
华中科技大学同济医学院附属同济医院

目的：去除直接水饱和效应（direct saturation, DS）的 Omega-plot 方法可用于量化质子交换速率（proton exchange rate, kex），其在脑胶质瘤中反映出独特的对比度，被认为可以一定程度上反映氧化应激水平。本研究旨在探究质子交换速率成像在脑胶质瘤诊断中的价值。

材料与方法：52 名经病理证实的脑胶质瘤患者被纳入研究。患者均在 3.0T 磁共振扫描仪上进行，包括常规平扫、增强和弥散加权成像（diffusion weighted imaging, DWI），并在注射对比剂前进行质子交换速率成像采集，B1 饱和脉冲功率分别为 1.5 μ T、2.5 μ T、3.5 μ T。通过去除 DS 效应的 Omega-plot 方法进行逐体素拟合得到 kex 参数图，通过 GE 工作站重建得到表观弥散系数（apparent diffusion coefficient, ADC）参数图。分别测量肿瘤实质区 kex 和 ADC，并测量对侧正常表现脑白质区进行标准化，计算相对 kex（rkex）和相对 ADC（rADC）。比较高级别胶质瘤与低级别胶质瘤间的参数差异，采用 ROC 曲线和 DeLong 检验评估参数的诊断效能。

结果：高级别胶质瘤的 kex 值和 rkex 值（ $985.20 \pm 100.60 \text{ s}^{-1}$, 1.32 ± 0.10 ）显著高于低级别胶质瘤（ $897.48 \pm 79.12 \text{ s}^{-1}$, 1.19 ± 0.10 ），差异具有统计学意义（ $P=0.003$, $P<0.001$ ）。而高级别胶质瘤的 ADC 值和 rADC 值[（ 1.16 ± 0.22 ） $\times 10^{-3} \text{ mm}^2$, 1.52 ± 0.33]均显著低于低级别胶质瘤[（ 1.31 ± 0.20 ） $\times 10^{-3} \text{ mm}^2$, 1.77 ± 0.28]，差异具有统计学意义（ $P=0.018$, $P=0.004$ ）。kex、rkex、ADC 和 rADC 鉴别高低级别胶质瘤的 AUC 分别为 0.743、0.820、0.691 和 0.735。rkex 与 rADC 联合诊断的 AUC 为 0.917，显著高于单个参数的鉴别效能（ $P<0.05$ ）。

结论：质子交换速率成像作为一种新型的成像技术可提供独特对比，有助于对脑胶质瘤的恶性程度进行无创术前评估。

PO-2969

比较 3DFast Spin Echo MRCP 两种不同采集方式的图像质量

周杰
重庆医科大学附属璧山医院

目的：本研究的目的是比较在 3D Fast Spin Echo 序列上使用屏气技术和呼吸触发技术完成 MRCP (磁共振胰胆管成像)扫描的图像质量和解剖信息，以确定哪种 MRCP 技术可以产生更好的图像质量和解剖信息，从而更好的为临床提供胰胆管系统的优质图像，用于疾病的诊断。

材料与方法：前瞻性收集 10 名健康并且呼吸配合良好的志愿者，使用屏气和触发技术进行 MRCP 检查，测量胆总管、胆囊、肝总管、左肝管和右肝管的 SI 与信噪比（SNR），胆总管的对比噪声比（CNR），主观评价胆总管、胆囊、胆囊管、肝总管、左肝管、右肝管、胰管近段、胰管中段和胰管远段的显示质量和 MRCP 的整体图像质量。采用统计学数据处理方法对收集的数据进行分析。

结果：采用 Wilcoxon 检验的结果显示，屏气和触发技术在 MRCP 检查中的图像质量（SNR 和 CNR）和解剖信息方面存在显著差异（ $P<0.05$ ）。各节段的 SI 均提高（均 $P<0.05$ ），胆囊的 SNR 提高（前：83.51；后：101.70, $P=0.018$ ），胆总管 CNR 的差异没有统计学意义（ $P=0.338$ ），各节段的显示质量提高（均 $P<0.05$ ），整体图像质量提高（前：3.68；后：4.08; $Z=-3.441$, $P<0.05$ ）。这表明，与呼吸触发技术相比，屏气技术获得了更好的图像质量和解剖信息。结论：在 MRCP 检查中使用 3D Fast Spin Echo 序列中的屏气技术确实有助于获得更好的图像质量和解剖信息。

PO-2970

利用胎盘虚拟磁共振弹性成像及 IVIM 参数联合 T2WI 纹理特征的列线图预测妊娠高血压患者的新生儿围产期不良预后

邓景、宋佳成、张爱宁、赵萌、穆西虎、周欣、曲菲菲、陈婷
南京医科大学第一附属医院 (江苏省人民医院)

目的: 本研究旨在联合胎盘体素内不相干运动 (IVIM) 的弥散与灌注参数、虚拟磁共振弹性成像 (vMRE) 的胎盘硬度和 T2WI 纹理特征建立列线图, 并预测 PIH 新生儿不良结局。

方法: 回顾性纳入 MRI 检查时满足妊娠高血压 (PIH) 临床诊断的患者 63 例 (不良结局 37 例, 正常结局 26 例)。由两位放射科医生勾画胎盘的感兴趣区。通过 PyRadiomics 得到基于 T2WI 图像的 107 个纹理特征。通过 LASSO 实现特征筛选, 并计算 T-score 评分。功能磁共振 (fMRI) 参数包括以下: 选取低 b 值和高 b 值 (200 和 800 s/mm²), 通过 vMRE toolbox (MATLAB) 计算基于 DWI 的 vMRE 参数 (μ diff)。使用 Firevoxel 软件计算 IVIM 参数[真扩散系数(D)、伪扩散系数(D*)、灌注分数(f)、扩散分布系数(DDC)、扩散异质性指数(Alpha)]和表观扩散系数(ADC), 对以上 7 个 fMRI 参数进行先后进行单因素及多因素分析得出最佳 fMRI 参数。分别建立 fMRI 模型及 T-score 模型, 并联合建立列线图模型, 并且评估各个模型的预测效能。

结果: 特征筛选后共得到 4 个 T2WI 纹理特征并建立了 T-score 评分, T-score 计算公式详见摘要附件。对 fMRI 参数进行单因素及多因素分析可得 μ diff (5.68±0.69 vs. 5.21±0.74, P=0.015) 及 f(22.29±4.39 vs. 26.16±5.86, P=0.007) 是预测新生儿不良结局的最佳 fMRI 参数。ROC 分析可得 T-score 评分模型 AUC 为 0.774, fMRI 模型 (μ diff+f) AUC 为 0.785, 两者联合的列线图模型效能进一步提高 (AUC 0.811)。

结论: 包括基于 vMRE 的胎盘弹性及基于 IVIM 胎盘微循环灌注的 fMRI 参数可以预测 PIH 患者的产后新生儿不良结局, 且预测效能高于基于 T2WI 的纹理特征及 T-score 评分。联合 fMRI 及 T2WI 纹理特征建立的列线图可进一步提高预测效能, 这有助于早期识别和管理高危病例, 最终改善新生儿不良预后。

PO-2971

健康重庆成年人下腰段后伸力的年龄和性别影响的退变规律: 六回波 T2*校正 Dixon 序列多参数评估研究

赵骏、陈品珍、孙丽、陈伟、罗飞、王健
陆军军医大学第一附属医院 (西南医院)

目的: 运用 T2*校正的六回波 Dixon 序列评估重庆健康成人下腰段后伸力退变的年龄和性别影响规律。

方法: 105 名健康受试者(52 名女性), 男女以 10 岁为一个年龄段组, 行 3T Dixon 椎间盘磁共振轴位成像。定量获取双侧多裂肌(MF)和竖脊肌(ES)在 L1/2 至 L5/S1 各腰椎间盘椎旁肌形态和脂肪含量数据: 脂肪分数(FF)、横截面积(CSA)、相对横截面积(RCSA)和功能 CSA(无脂面积, FCSA)。通过外固定测力仪测量所有受试者下腰段后伸力量, spearman 相关分析评价肌肉 FF、CSA、FCSA 与下腰段最大后伸力之间的关系。

结果: 各年龄段组的所有腰椎间盘水平, 女性有较高的肌肉 FF, 男性有较大的肌肉 CSA 和 FCSA。肌肉 FF 随年龄增长而增加。50 ~ 59 岁女性 MF 平均 FF 明显增高, 40 ~ 49 岁女性组 ES 均值 FF 显著升高。在 60 ~ 73 岁男性组中, MF 和 ES 的平均 FF 均显著升高。与其他腰椎间盘水平相比, L5/S1 的 MF 和 ES FF 最高。此外, 女性和男性的 ES - FF 高于 MF (p < 0.001)。以体重指数(BMI)作为对照变量后, 年龄与 ES FCSA 和 ES RFCSA 呈负相关(r = -0.42, -0.37; P = 0.008, 0.000)。此

外, 年龄与所有 MF 和 ES 形态学参数(除男性 MF CSA 外)呈负相关($r = -0.28 \sim -0.45$, $p < 0.05$)。MF 和 ES 中, FF 与下腰段最大后伸展力(MVIC)呈显著负相关($r = -0.52$, -0.42 ; $p = 0.000, 0.000$)。在 MF 和 ES 中, CSA、FCSA 和 MVIC 之间存在显著正相关($r = 0.39 \sim 0.61$, $p < 0.05$)。MVIC 与 MF+ES FCSA 的相关系数 r 值高于 MF+ES FF 和 CSA。

结论: 重庆健康成人腰椎 MF 和 ES-FF 在女性椎水平较高, 退变早于男性 10 年左右, 男性椎旁肌面积更大, 比女性更容易受到年龄相关萎缩的影响。此外, 年龄对 ES 尺寸参数的影响大于 MF。在 MF 和 ES 中, MVIC 与椎旁肌参数(FF、CSA 和 FCSA)相关, 且与 FCSA 的相关系数高于 FF 和 CSA。

PO-2972

3D 酰胺质子转移成像和小视野弥散加权成像预测直肠腺癌病理分级的价值

刘锦

空军军医大学唐都医院

目的 探讨 3D 酰胺质子转移成像 (3D APT) 和小视野弥散加权成像 (rFOV DWI) 在预测直肠腺癌病理分级中的临床应用价值。方法 回顾性分析我院 2020 年 2 月至 2023 年 4 月经手术病理证实的 64 例直肠腺癌患者资料, 其中高分化组 28 例, 中低分化组 36 例。所有患者术前两周内采集常规 MRI、小视野高分辨 T2WI (rFOV T2WI)、rFOV DWI 及 3D APT。两名放射科医师参照常规 MRI 及 rFOV T2WI, 在 rDWI 图像上逐层勾画肿瘤实性部分作为感兴趣区, 提取其表观扩散系数 (rADC) 及非对称磁化转移率 (MTR_{asym}) 的平均值。卡方检验或两独立样本 t 检验用于比较两组间患者性别、年龄、平均 rADC 和 MTR_{asym} 值差异。采用组内相关系数 (ICC) 评价两位医师定量参数测量的一致性。利用二元 Logistic 回归构建联合参数 ($MTR_{asym}+rADC$) 诊断模型。利用受试者工作特征 (ROC) 曲线下面积 (AUC) 评估单一参数及联合参数模型诊断效能。不同 AUC 比较采用 DeLong 检验。结果 中低分化组 MTR_{asym} 平均值 $[(2.93 \pm 0.61)\%]$ 高于高分化组 $[(1.74 \pm 0.63)\%]$ ($P < 0.001$), 中低分化组 rADC 平均值 $[(0.98 \pm 0.17) \times 10^{-3} \text{mm}^2/\text{s}]$ 低于高分化组 $[(1.19 \pm 0.18) \times 10^{-3} \text{mm}^2/\text{s}]$ ($P < 0.001$)。ROC 曲线分析结果显示, MTR_{asym} 、rADC 及联合参数模型 ($MTR_{asym}+rADC$) 在鉴别直肠腺癌组织病理分级的 AUC 为 0.910、0.833、0.940, 敏感度为 0.750、0.916、0.861, 特异度为 0.928、0.678、0.964。结论 3D APT 和 rFOV DWI 有助于鉴别直肠腺癌的病理分级, $MTR_{asym}+rADC$ 联合参数的诊断效能优于单一参数。

PO-2973

肌、脂、骨成分与心功能的关系

安琪¹、张钦和¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦 (中国) 投资有限公司

目的: 本研究旨在探讨肌肉、脂肪和骨成分与心功能之间的关系, 并阐述它们在维持左心室舒张和收缩功能方面的重要性。方法: 回顾性分析 2017 年 1 月至 2021 年 3 月我院住院患者的资料。基于 MRI 脂肪分数图对皮下脂肪组织 (SAT) 面积、内脏脂肪组织 (VAT) 面积、胰腺脂肪分数 (HFF)、肝脏脂肪分数 (PFF)、骨髓脂肪组织 (BMAT) 以及腹部肌肉 (AM) 面积和脂肪分数 (FF) 进行测量。使用超声心动图检测受试者的心脏结构和左心室功能参数, 包括收缩末期左心房内径(LAD)、舒张末期左室内径(LVDD)、舒张末期室间隔厚度(IVST)、舒张末期左心室后壁厚度(LVPWT)、左心室射血分数 (LVEF)、二尖瓣舒张早期血流速度 (E) 和二尖瓣舒张晚期血流

速度（A）、E/A、二尖瓣环侧壁处及间隔处舒张早期纵向最大运动速度均值（ $e\&\#39;$ ）和E/ $e\&\#39;$ 。采用多元线性回归评估肌肉、脂肪和骨成分与心脏结构和功能参数之间的关系。**结果：**本研究共纳入154例患者，平均年龄为62岁，平均BMI为25.10kg/m²。多元线性回归分析显示，VAT面积与LAD、IVST、LVPW呈正相关（ $\beta=0.006-0.022$ ； $P<0.05$ ），与LVEF呈负相关（ $\beta=-0.007$ ； $P<0.05$ ）；AM面积与LVDD呈正相关（ $\beta=0.44$ ； $P<0.05$ ），与E/ $e\&\#39;$ 呈负相关（ $\beta=-0.024$ ； $P<0.05$ ）；AM FF与A呈正相关（ $\beta=0.783$ ； $P<0.05$ ）；PFF与E/A呈正相关（ $\beta=0.039$ ； $P<0.05$ ）；HFF与 $e\&\#39;$ 呈正相关（ $\beta=-0.193$ ； $P<0.05$ ）。**结论：**本研究结果强调了VAT积聚可能是心脏结构和收缩功能异常的潜在因素，胰腺和肝脏等部位脂肪组织的积累可能与心脏舒张功能障碍相关。相反，AM面积的增加可能有助于维持心脏的正常舒张功能。这些研究结果为心血管疾病的预防和管理提供了重要的线索，强调了身体成分对心脏健康的影响，需要更深入的研究来解释这些关系以及制定相关的临床干预措施。

PO-2974

合成磁共振成像 T1、T2 弛豫时间在儿童孤独症谱系障碍中的应用价值

杨金泽、赵鑫、陆林、程美英、邢庆娜、李双宇、秦池、周梁、刘世鹏、鲁钰、冯刘娟、李思柯、张小安
郑州大学第三附属医院

研究目的本研究旨在探究合成磁共振成像 T1、T2 弛豫时间在儿童孤独症谱系障碍中的应用价值。材料与方法本研究纳入研究对象为自2021年9月至2023年4月在郑州大学第三附属医院（河南省妇幼保健院）首次确诊为ASD（自闭症谱系障碍）的20名儿童（ASD组，其中男17名女3名）与14名年龄性别相匹配的健康对照儿童（对照组，其中男11名女3名）。这些儿童均在美国GE SIGNA Pioneer 3.0 T MRI扫描仪上接受了常规MRI和合成MRI序列MAGiC的扫描。通过后处理，我们成功获得了所有受试者的T1和T2定量弛豫图。采用了ITK-SNAP软件，对特定脑区的弛豫值进行测量，感兴趣区（ROI）包括内囊后肢、内囊前肢、胼胝体膝部、胼胝体压部、顶叶白质、额叶白质、丘脑、苍白球、尾状核头和壳核。通过Mann-Whitney U检验比较ASD组与对照组在各个脑区的T1和T2弛豫值之间的潜在差异。多元logistic回归分析对ASD组显著变化的弛豫值进行筛选，探讨独立预测因素，并使用受试者工作特征曲线（ROC）下面积（AUC）来评估T1和T2弛豫值作为独立预测因素对儿童ASD的诊断效能。

结果与对照组相比，ASD组的右侧丘脑T1弛豫值和左侧顶叶白质T2弛豫值显示显著降低（P值均小于0.05）。多元logistic回归分析表明，左侧顶叶白质T2弛豫值和右侧丘脑T1弛豫值是预测ASD发生的独立预测因素。ROC曲线分析结果显示，左侧顶叶白质T2弛豫值的AUC为0.714，敏感度为50.21%，特异度为85.20%，阈值为88.624；右侧丘脑T1弛豫值的AUC为0.675，敏感度为75.10%，特异度为60.22%，阈值为943.333。

结论 1. 合成磁共振获取的T1、T2弛豫时间可以用于评估ASD儿童大脑组织异常；

2. 左侧顶叶白质T2弛豫值和右侧丘脑T1弛豫值有助于预测ASD的发生,对于ASD的诊断具有一定价值。

PO-2975

探讨 HR-mDixonQuant 序列在定量棕色脂肪方面可行性的研究

张瀚月¹、张钦和¹、安琪¹、李军¹、何辉¹、杨一帆¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦（中国）投资有限公司

目的：棕色脂肪组织（brown adipose tissue, BAT）作为一种独特的产热组织，在调节新陈代谢和能量消耗方面起着重要作用。近年来，它已成为对抗肥胖、糖尿病和非酒精性脂肪肝等代谢性疾病的新研究目标。本研究旨在探讨 HR-mDixonQuant 序列在定量 BAT 方面是否具有可行性和可重复性。方法：前瞻性收集 8 名健康志愿者进行两次颈部 3.0 T MRI 扫描（两次扫描时间间隔 1h），扫描序列为 HR-mDixonQuant 序列，并重建脂肪分数图。使用飞利浦后处理平台在两次扫描的 HR-mDixonQuant 脂肪分数图上对颈部 BAT 的感兴趣区（region of interest, ROI）进行勾画，并记录脂肪分数（fat fraction, FF）值。为评估观察者间一致性，一个月后由第二位观察者重复上述测量并记录结果。采用 SPSS 27.0 软件进行统计学分析，符合正态分布的计量资料以均数±标准差表示，不符合正态分布的计量资料以四分位数间距表示。采用组内相关系数（intra-class correlation coefficient, ICC）和 Bland-Altman 图评估观察者间一致性、观察者内一致性和复测信度。结果：本研究共纳入 8 名健康志愿者，平均年龄 23 岁，平均 BMI 为 22.97 kg/m²。不同观察者之间的测量结果表现出高度一致性，同一观察者在两次扫描之间的测量也表现出良好的一致性（ICC 均> 0.90）。Bland-Altman 图显示 95% 的点均在临床可接受的一致性界值内，两次扫描测量的 FF 值结果一致性较好，差值均数和 95% 一致性界限（LoA）分别为 0.17 和 -1.81~2.15。结论：HR-mDixonQuant 序列作为一种新的成像技术，在定量 BAT 方面表现出良好的可行性和可重复性，为深入研究 BAT 的功能和潜在作用提供了重要的基础。未来，积极推广该技术在临床和科研领域的应用将有助于更全面地了解 BAT 的生理和代谢特性，开发新的治疗策略以对抗肥胖、糖尿病和非酒精性脂肪肝等代谢性疾病，提供更准确的患者评估和监测方法，为医疗领域更好地应对相关疾病提供有力支持。

PO-2976

HR mDIXON-Quant 与 mDIXON-Quant 对棕色脂肪定量的准确性研究：以 iDQC 为金标准

李军¹、张钦和¹、安琪¹、张瀚月¹、何辉¹、杨一帆¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦（中国）投资有限公司

目的：棕色脂肪组织（BAT）作为一种独特的产热组织，在调节新陈代谢和能量消耗方面起着重要作用。对于 BAT 的研究有望对肥胖及其他相关疾病（如糖尿病、高血压和某些癌症类型）的研究和治疗具有重要指导价值。基于分子间双量子相干（iDQC）的新型磁共振方法可以实现对 BAT 成分的非侵入性和特异性检测。本研究旨在以 iDQC 作为参考标准，探讨高分辨率（HR）mDIXON-Quant 序列的脂肪分数图与传统 mDIXON-Quant 脂肪分数图在 BAT 定量方面的准确性。方法：前瞻性收集志愿者 22 例，所有人均接受颈部 3.0T MRI 扫描，包括 HR mDIXON-Quant 序列和 mDIXON-Quant 序列。在 HR mDixonQuant 脂肪分数图上，使用飞利浦后处理平台选取连续的三个层面对颈部 BAT 的感兴趣区（ROI）进行勾画。绘制 ROI 时，注意避开颈部血管并取三次测量的脂肪分数（fat fraction, FF）值的平均值作为结果。将 ROI 复制到 mDIXON-Quant 序列的 FF 图上并记录测量的 FF 值的平均值，以确保两个序列的 ROI 范围和位置保持一致。采用 Pearson 和 Spearman 相关性分析方法评估 HR mDIXON-Quant 序列和 mDIXON-Quant 序列所测的 BAT 的 FF 平均值与 iDQC 值之间的相关性。结果：相关性分析结果显示，HR mDIXON-Quant 序列所测得的 BAT 的 FF 平均值与 iDQC 值之间存在显著的负相关性（ $r = -0.557$, $P < 0.07$ ），而 mDIXON-

Quant 序列所测得的 BAT 的 FF 平均值与 iDQC 值之间相关性不具有统计学意义 ($P > 0.05$)。结论: HR mDIXON-Quant 序列在 BAT 定量方面表现出更高的可靠性和准确性, 相对于传统的 mDIXON-Quant 序列具有更大的优势。本研究为未来 BAT 的研究和相关疾病的治疗提供了重要的支持和指导。

PO-2977

IVIM-MRI 与 DWI 评估晚期宫颈癌盆腔转移 淋巴结放化疗疗效的临床价值

王頔、刘远成、徐超
贵州省人民医院

目的 探讨磁共振体素内不相干运动(intravoxel incoherent motion, IVIM)与扩散加权成像(diffusion weighted imaging, DWI)对晚期宫颈癌盆腔转移淋巴结放化疗疗效的评估及预测价值。材料与方法 对 35 例晚期宫颈癌患者伴盆腔淋巴结转移患者在放化疗治疗前 1 周、治疗后 1 周、2 周、4 周行盆腔 3.0TMR 扫描, 扫描序列包括 T2WI、DWI 及 IVIM, 测量治疗前后表观扩散系数 (ADC)、纯扩散系数(D)、灌注分数(f)、伪扩散系数(D*)及转移淋巴结最大径, 并计算治疗后各参数变化率与转移淋巴结消退率。根据 RECIST 1.1 标准将患者分为完全缓解(CR) 组 22 例和部分缓解(PR) 组 13 例。入组患者均达到有效控制, 无稳定组 (SD) 及进展组(PD), 应用独立样本检验比较两组间治疗前后不同时间点参数值及其变化率的差异, 应用 ROC 曲线分析两组间有统计学差异参数及其变化率的疗效评价效能, 应用 Pearson 相关性分析检验参数及其变化率与转移淋巴结消退率的关系。结果 治疗前及治疗 4 周转移淋巴结最大径为 $(3.3 \pm 1.2)\text{cm}$ 及 $(0.35 \pm 0.25)\text{cm}$, 转移淋巴结消退率为 $0.89\% \pm 0.13\%$, 治疗前 CR 组 ADC 低于 PR 组, f 值高于 PR 组 ($P \leq 0.05$), CR 组 $\Delta\%ADC$ 及 $\Delta\%D$ 高于 PR 组 ($P < 0.05$), 治疗结束 $\Delta\%f$ 小于 PR 组 ($P < 0.05$), 治疗前 ADC 与转移淋巴结消退率呈负相关, 治疗前 f 值、治疗后 2 周及 4 周 $\Delta\%ADC$ 及 $\Delta\%D$ 与转移淋巴结消退率呈正相关, 治疗前 f 值、ADC 值, 治疗后 2 周及 4 周的 $\Delta\%D$ 、 $\Delta\%ADC$ 预测转移淋巴结疗效的曲线下面积(area under curve, AUC) 分别为(0.900、0.708、0.812、0.800、0.803、0.713)。结论 IVIM 和 DWI 可在治疗中动态评估宫颈癌盆腔转移淋巴结放化疗疗效, IVIM 具有更好的价值。

PO-2978

早期帕金森病伴认知障碍患者小脑的静息态功能连接的改变

王兴兰
重庆医科大学附属永川医院

目的: 探讨帕金森病患者的认知缺陷是否会导致小脑功能连接的改变。方法: 共纳入 122 名非痴呆参与者, 包括 64 名早期 PD 患者和 58 名年龄和性别匹配的老年对照者, 根据他们的认知状态(正常认知与认知障碍)分为四组。采用质量控制和定量测量, 通过分析各组的结构和静息状态功能 MRI 数据, 分别对小脑容积和 FC 进行研究, 进行 MRI 指标与临床特征(运动和认知评分)的相关性分析。结果: 与没有认知缺陷的健康对照组相比, 早期运动和认知缺陷的 PD 参与者的的小脑 FC 发生改变, 但认知正常的 PD 患者和有认知障碍迹象的老年人的小脑 FC 均未发生改变。此外: “运动小脑”和 SMA(辅助运动区)之间的连接与运动评分呈正相关, 而伴有认知障碍的 PD 患者的小脑内连接与认知评分呈正相关。各组之间未观察到小脑体积差异。结论: 早期 PD 患者静息状态下小脑 FC 的改变可能不仅仅是由运动缺陷引起的, 也可能是由认知缺陷引起的, 因此强调了运动和认知功能之间的相互作用, 并可能反映了早期 PD 患者的代偿机制。

PO-2979

分数微积分模型对子宫内膜癌分级中的价值

李淑媛、相世峰
邯郸市中心医院

目的 传统单指数模型以人体单一均质为条件，而在人体实际组织结构中，其内部成分复杂多变，因而无法全面准确地反映组织内部真实信息。分数微积分模型（FROC）覆盖了从高 b 值到低 b 值等多个 b 值，通过多个定量参数无创地评估病变的情况及特点，从而能更准确、全面地反映肿瘤组织的内部情况，目前已广泛用于脑部肿瘤、乳腺癌、宫颈癌等病变。本文旨在探讨分数微积分模型在高级别子宫内膜癌与中低级别子宫内膜癌参数值的差异及应用价值，为临床医师制定准确诊疗方案提供参考信息。**方法** 回顾性分析经手术病理证实的子宫内膜癌患者 81 例，其中 31 例为高级别子宫内膜癌患者，50 例为中低级别子宫内膜癌患者；分析 81 例子宫内膜癌患者的 MRI 资料，所有患者均行 MRI 常规序列及分数微积分模型（FROC）序列扫描，由 2 名医师在分数微积分模型各参数伪彩图上分别计算出两组参数的标准 ADC 值（ADCstandard）、弥散系数值（D）、组织内部一致性参数值（ β ）及空间参数值（ μ ），组间比较采用秩和检验，参数间的诊断效能用受试者工作特征曲线（ROC）分析，统计数据 $P < 0.05$ 具有统计学意义。通过分析高级别与中低级别子宫内膜癌间参数差异，以此来反映组织内部成分特征。**结果** 本研究中由于高级别子宫内膜癌其内部成分复杂，且恶性程度高于中低级别子宫内膜癌，细胞较中低级别子宫内膜癌密集，故高级别子宫内膜癌组 ADCstandard 值、D 值、 β 值及 μ 值均低于中低级别子宫内膜癌组，两者具有统计学意义。、两组间 ADCstandard 值、D 值、 β 值及 μ 值差异具有统计学意义（Z 值分别为 -2.28、-3.1、-3.5、-2.62，P 值 < 0.05 ），曲线下面积依次为别为 0.679、0.743、0.775 和 0.706。**结论** 分数微积分模型各参数均可以用于子宫内膜癌的临床诊断，并能较准确地反映子宫内膜癌的分级。

PO-2980

基于体素的影像组学模型预测胶质母细胞瘤复发高风险亚区

陶英¹、吴元魁²
1. 深圳市人民医院
2. 广州市南方医院

在手术前准确识别胶质母细胞瘤的复发高风险子区域能在早期对治疗抵抗区域进行切除干预以及放疗计划中局部增量，能改善胶质母细胞瘤患者的生存预后。本研究通过对 2015-2022 年 55 例在南方医科大学南方医院经病理确诊为胶质母细胞瘤的患者的手术前 48 小时的 T1-CE 和 Flair 图像进行基于体素的影像组学特征提取构建多种机器学习模型，包括有 Kernel ridge Regression（KRR）、Adaboost、Gradient boost 等多种机器学习模型。在测试集上，KRR、Adaboost 以及 GBDT 分别为 0.788，0.7623 和 0.762。更进一步，我们基于 KRR 模型对预测结果进行可视化，对胶质母细胞瘤的复发高风险子区进行定位，从而精准进行临床干预。

PO-2981

三种不同 T1 成像方法在胎儿肠道磁共振的应用

曾一佳、赵梦
山东大学齐鲁医院

目的：随着影像技术的发展，磁共振在胎儿肠道畸形的产前诊断中起到越来越重要的作用。由于胎粪的存在，肠道在 T1 加权图像中呈现高信号，这是 T1 加权序列被用来评估胎儿肠道形态的基础。本研究旨在比较三种不同 T1 成像方法在胎儿肠道畸形方面的应用。

材料与方法：收集妊娠 21-36 周磁共振及超声检查提示肠道发育正常胎儿 65 例，肠梗阻、肠道闭锁等患儿 10 例。三种 T1 成像方式包括以下三种，自由呼吸多次平均三维容积内插梯度回波序列，自由呼吸螺旋 K 空间采样 STARVIBE 序列，以及屏气序三维容积内插梯度回波序列。通过肠管不同节段信噪比 (SNR)、肠管-膀胱对比噪声比 (CNR) 以及伪影情况 (1-伪影重，2-明显伪影，3-伪影较少，4-无伪影) 进行分析，比较三种方法的成功率及图像质量的优劣。

结果及结论：自由呼吸多次平均梯度回波序列成功率更高图像质量更优，但也存在模糊伪影情况。STARVIBE 存在麦芒伪影和颗粒度高信噪比较低的缺点，扫描时间较长并不能纠正胎儿不规则的运动。屏气序列对于能耐受的孕妇且胎儿不动的情况比较合适，但是存在信噪比偏低的情况。

PO-2982

大脑中动脉粥样硬化斑块与脑白质高信号的磁共振研究

李家钰、石莹、刘鹏飞
哈尔滨医科大学附属第一医院

目的：多种证据表明脑小血管病常与颅内大动脉病变共存，严重程度具有一定相关性。其中，在磁共振 T2 FLAIR 图像上表现为脑白质高信号 (white matter hyperintensity, WMH) 是脑小血管病的一种常见影像学表现，有学者提出动脉粥样硬化斑块可能与 WMH 的改变相关。本研究的目的是研究不同 WMH 分组患者的大脑中动脉管壁改变和斑块特征，探究斑块易损性参数与不同程度 WMH 的相关性。

方法：选取 2021 年 5 月-2023 年 5 月经哈尔滨医科大学附属第一医院收治的 128 例因“脑血管病”住院的患者。所有患者均行常规头平扫和高分辨管壁成像检查。图像采集完成后传输到后处理工作站进行处理，两名诊断医师对患者图像进行双盲法分析，选择动脉血管的横断面图像独立分析斑块特征，并计算斑块参数。按磁共振头平扫和改良 Fazekas 分级 (0-6) 将患者分为无和轻度 WMH 组 (Fazekas0-2)、中和重度 WMH 组 (Fazekas3-6)。对比两组狭窄程度、重构模式、斑块内出血和斑块负荷，并探究不同分组斑块易损性参数的差异。

结果：共 99 例受试者符合入组条件，其中无和轻度 WMH 组共 57 例，中和重度 WMH 组共 42 例。对比了两组在临床基线资料、血管高危因素和磁共振影像特征的差异，分析显示年龄、血脂异常比例和斑块内出血在两组间有统计学差异 ($P < 0.05$)，中和重度 WMH 组年龄更大，血脂异常更常见，斑块内出血比例高。Spearman 相关性分析显示年龄，血脂异常和斑块内出血均与 WMH 等级呈正相关 ($r=0.276, 0.215, 0.384$, P 均 < 0.05)。二元 Logistics 回归显示年龄和斑块内出血是影响 WMH 严重程度的独立因素 [$1.089 (1.032, 1.149)$, $P=0.002$; $6.129 (2.296, 16.842)$, $P < 0.001$]。

结论：本次实验表明 WMH 的严重程度与年龄、血脂异常和斑块内出血有关，年龄和斑块内出血是影响 WMH 严重程度的重要因素。斑块内出血、斑块负荷、管壁重构模式是判断斑块易损性的常见影像指标，研究颅内大动脉粥样硬化易损性斑块与脑小血管病的关系，可能对临床检查和干预治疗有帮助。

PO-2983

单次屏气 3D-GRASE 序列在 MR 胰胆管成像的应用

周理余、邹建勋、陈旭高
浙江省丽水市人民医院

目的 探讨单次屏气 3D-GRASE 成像技术在 MR 胰胆管的应用价值。**方法** 前瞻性收集本院 57 例胰胆管疾病患者, 所有患者均进行自由呼吸自旋回波技术 (3D-RT-TSE) 和屏气梯度-自旋回波技术 (3D-BH-GRASE) 胰胆管水成像, 分别记录两种成像方法的扫描时间; 测量计算图像胆总管信噪比 (SNR)、胆总管与其周围组织对比度 (CR) 及胆总管和肝脏之间对比噪声比 (CNR), 并由 2 名高年资技师分别对图像质量、伪影、背景抑制及胰胆管的显示进行评分。**结果** 与 3D-RT-TSE 技术比较, 3D-BH-GRASE 技术扫描时间明显缩短, 差异有统计学意义 ($t=70.995$, $P<0.001$); 3D-BH-GRASE 的整体图像质量、伪影、胰胆管的效果评分均高于 3D-RT-TSE, 2 种方法差异均有统计学意义 (P 均 <0.05)。3D-BH-GRASE 图像 SNR、CR、CNR 及图像背景抑制方面 (11.01 ± 3.09 、 0.83 ± 0.33 、 15.75 ± 3.85 、 3.77 ± 0.57) 均小于 3D-RT-TSE (14.15 ± 5.10 、 0.86 ± 0.42 、 18.67 ± 4.99 、 4.14 ± 0.69), 差异均有统计学意义 ($t=3.993$ 、 3.785 、 3.646 、 2.966 , P 均 <0.001); **结论** 相比呼吸触发 (3D-RT-TSE) 序列, 3D-BH-GRASE 序列扫描时间更短, 整体图像质量和胰胆管显示更好, 值得进一步推广应用。

PO-2984

基于深度学习重建的加速合成 MRI 在膝关节骨关节炎中的应用

王克军
武汉大学人民医院

目的 本研究旨在评价加速合成 MRI 与深度学习重建的临床可行性, 并探讨基于深度学习重建 (deep learning reconstruction, DLR) 对合成 MRI 图像质量和定量值的影响。**方法**: 本研究前瞻性纳入 36 名志愿者和 62 名怀疑有膝关节病变的患者。比较不同加速因子下使用 DLR 或非 DLR 技术对膝关节合成 MRI 图像质量和定量值的影响。**结果**: 在加速合成 MRI 使用 DLR 显著改善了所有对比度加权的图像质量 ($P<.001$), 导致图像质量与常规扫描相当或优于常规扫描。使用 DLR 合成 MRI 与常规扫描组病灶检出率差异无统计学意义 ($P>0.05$)。使用 DLR 或非 DLR 技术合成 MRI 定量值的差异非常小 ($<0.5\%$)。**结论**: 在合成 MRI 中使用基于深度学习重建可以减少 42% 的扫描时间, 同时保持图像质量和病变的可检测性, 并提供一致的定量值。

PO-2985

血管周围间隙扩散张量成像指数在帕金森病的应用价值研究

李承毅¹、唐小平¹、熊瑞芳¹、朱涵婷¹、赵锡海²
1. 南昌大学第二附属医院
2. 清华大学医学院生物医学影像研究中心

目的 基于血管周围间隙扩散张量成像 (DTI-ALPS) 技术评估帕金森病 (PD) 患者的类淋巴循环系统功能。**方法** 收集 2022 年 7 月至 2023 年 3 月在南昌大学二附院神经内科被诊断为帕金森病的患者 60 例作为帕金森患者组 (PD 组, $n=60$), 另选取 30 例年龄、性别与之相匹配的无神经系统变性疾病的

患者作为正常对照组 (HC 组, $n=30$)。PD 患者根据 Hoehn-Yahr (H-Y) 评分分为两 PD 亚组, PD 早期组 (ePD 组, $n=30$) 和 PD 晚期组 (IPD 组, $n=30$)。本研究采集相关临床资料, 并分析以下认知和运动测试量表, 帕金森病评估量表 (UPDRS) 评分和改良的 Hoehn-Yahr 分级量表 (H-Y) 分级、简易精神状态检查 (MMSE) 评分。PD 组及 HC 组的所有 MR 图像在本院 3.0T 磁共振上完成采集。观察半卵圆中心区、基底节区海马以及中脑区这三个层面的 EPVS 数量和分布特点。基于 DSI studio 软件对 DTI 的图像进行后处理, 并计算入组成员的 DTI-ALPS 指数。比较 PD 组与 HC 组之间、PD 亚组与 HC 组之间的 ALPS 指数差异; 运用多元线性回归分析探究 ALPS 指数与临床变量之间的相关性。

结果

PD 患者的 ALPS 指数低于 HC 组 ($p<0.001$), 尤其 IPD 组的 ALPS 指数显著低于 NC ($p<0.001$)。然而, 两个 PD 亚组之间以及 NC 组与 ePD 组之间的 ALPS 指数没有显著差异。多元线性回归分析显示, 在 ePD 组中, ALPS 指数与 MMSE 评分呈显著正相关 ($\beta=0.043$, $p=0.035$), ALPS 指数与 EPVS 评分呈负相关 ($\beta=-0.084$, $p=0.009$); 在 IPD 组中, ALPS 指数与年龄呈负相关 ($\beta=-0.087$, $p=0.005$), 而 ALPS 指数与其他临床状态无显著相关性 ($p>0.05$)。PD 组和 HC 组受试者基底节区、中脑区的 EPVS 数目均存在解剖学分布差异 ($p<0.01$)。但是两 PD 亚组间各解剖区 EPVS 数目不存在显著统计学差异。

结论

脑类淋巴循环系统功能障碍可能是 PD 的发病机制。DTI-ALPS 指数可能是衡量 PD 患者类淋巴循环系统功能的潜在影像学标志物。

PO-2986

静息态功能磁共振成像技术评估失眠障碍患者情绪及认知功能障碍

邹智、武肖玲、李中林、闫峰山、窦社伟、王梅云
河南省人民医院

目的 探讨静息态功能磁共振 (resting state functional MRI, rs-fMRI) 技术在评估失眠障碍 (Insomnia Disorder, ID) 患者情绪、认知、记忆功能障碍中的作用。 **方法** 纳入符合美国 DSM-V 分类与 和中国精神障碍分类与诊断标准 (CCMD-3) 诊断标准且脑部结构正常的 ID 患者 22 例, 年龄、性别、受教育程度与之相匹配的健康对照组 (HC) 22 例, 所有受试者均进行临床匹兹堡睡眠质量指数 (PSQI)、汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦虑量表 (HAMA)、世界卫生组织-加利福尼亚听觉词语学习测验 (WHO-UCLA AVLT)、磁共振常规扫描、磁共振静息态脑功能成像扫描, 针对中西方人大脑结构存在的差异, 本文选择以中国人脑建立的中国人脑图谱模板 (Chinese2020) 进行空间标准化, 以双侧杏仁核为种子点, 比较 ID 组与 HC 组脑功能连接的差异。 **结果** ID 组与 HC 组的 PSQI、HAMD、HAMA、学习能力及认知障碍评分具有显著统计学差异 ($P<0.05$); 与 HC 组相比, ID 组左侧杏仁核与边缘叶、后扣带回、双侧海马旁回、双侧海马、颞叶、舌回和枕叶的功能连接增强; 右侧杏仁核与边缘叶、右侧海马旁回、舌回、枕叶、右侧距状皮层、后扣带回、前额叶功能连接增强。 **结论** 失眠障碍患者的双侧杏仁核与多个脑区的功能连接出现异常, 可能是失眠障碍患者出现情绪调节障碍、认知障碍等的机制之一; fMRI 可为评估失眠障碍患者情绪、认知和记忆功能障碍提供客观影像学依据。

PO-2987

药物难治性颞叶癫痫患者脑结构-功能耦合的研究及构建术后复发风险预测模型

谢芳芳
中南大学湘雅医院

目的:本研究的主要目的是:(i)阐明药物难治性颞叶癫痫(DTLE)患者结构-功能(SC-FC)耦合的整体变化,(ii)基于 SC-FC 耦合特征预测 DTLE 患者的手术预后。

方法:收集 71 例 DTLE 患者的术前 DTI 和 fMRI 数据。术后无癫痫发作组(SF)43 例,术后有癫痫发作组(NSF)28 例。首先,我们构建了个体功能(FC)和结构连接(SC)矩阵。这些矩阵随后基于 Yeo 图谱划分为 16 个功能模块。计算全脑节点和模块 SC-FC 耦合特征,并与 48 名健康对照者进行比较。然后对 HC、SF 和 NSF 的网络特征进行组间比较,选择所有 SC-FC 特征构建预测模型。此外,根据我们之前的研究结果,所有特征被分为 5 个数据集。最后,将每个数据集集成到交叉验证的机器学习模型中,进行手术预后分类。

结果:与对照组相比,颞叶癫痫患者的视觉模块和皮层下模块出现解耦。三组间的比较分析显示,nSF 组多个与默认网络相关的 sfc 显著高于 SF 组和 HC 组。两个与默认模式网络(DMN)相关数据集的预测性能最高,最终的预测模型的受试者工作特征曲线下面积为 0.855,总体准确率为 0.816。

意义:这项研究揭示了 DTLE 术前 DMN 的 SC-FC 耦特征与术后癫痫复发密切相关,基于 SC-FC 耦合特性建立的机器学习模型可以预测 DTLE 手术预后。

PO-2988

糖尿病相关动脉粥样硬化斑块的鉴别诊断:基于颅内高分辨率磁共振的放射组学研究

程晓青、李红霞、杨家洛、刘嘉、卢光明
中国人民解放军东部战区总医院

背景与目的:糖尿病显著影响颅内动脉粥样硬化的形成和发展。本研究旨在评估放射组学特征是否有助于区分与糖尿病相关的斑块。

材料与方法:我们回顾性分析了 2016 年至 2022 年间因颅内动脉粥样硬化导致急性缺血性卒中入院的患者。收集了所有患者的临床数据、血液生物标志物、常规斑块特征和斑块放射组学特征。通过逻辑回归模型确定了带有 95% 置信区间(CI)的比值比(OR)。接收者操作特征(ROC)曲线和 ROC 曲线下面积(AUC)用于描述诊断性能。DeLong 检验用于比较不同模型之间的差异。

结果:共有 157 名患者(115 名男性;平均年龄为 58.7 ± 10.7 岁)被纳入研究。多变量逻辑回归分析显示,斑块长度(OR: 1.17; 95% CI: 1.07-1.28)和斑块面积(OR: 1.13; 95% CI: 1.02-1.24)与糖尿病独立相关。将斑块长度和面积合并建立的常规斑块特征模型时,训练组和验证组识别糖尿病患者的 AUC 分别为 0.789 和 0.720。在结合 T1WI 和对比增强 T1WI 序列的放射组学特征时,训练组和验证组获得了更好的诊断价值(AUC: 0.889 和 0.861)。DeLong 检验显示,在两个队列中,结合放射组学和传统斑块特征的模型比传统模型表现更好($P < 0.05$)。

结论: 颅内高分辨磁共振基础上,提取的斑块放射组学特征能有效区分以糖尿病为主要病因的责任斑块,这将为研究斑块的形成和精确治疗提供新的思路。

PO-2989

动脉自旋标记成像联合酰胺质子转移成像在阿尔茨海默病中的初步研究

王笑男、李春媚、陈敏
北京医院

目的：动脉自旋标记（arterial spin labeling, ASL）联合酰胺质子转移（amide proton transfer, APT）分析阿尔茨海默病（Alzheimer's disease, AD）患者和正常对照者（normal control, NC）的脑血流灌注（cerebral blood flow, CBF）、非对称性磁化转移率（magnetization transfer ratio asymmetry, MTRasym）和表观交换依赖弛豫（apparent exchange dependent relaxation, AREX）表达差异，并评价其诊断效能。

方法：采用独立样本 t 检验比较两组间不同脑区 CBF 值、MTRasym 值和 AREX 值差异（Bonferroni 校正），通过 ROC 曲线评价 CBF 单参数模型、CBF 组合模型、AREX 单参数模型、AREX 组合模型及 CBF+AREX 模型诊断效能。DeLong 检验评估不同模型间的诊断差异。Pearson 相关分析观察 CBF 及 AREX 与简易精神状态量表（mini-mental state examination, MMSE）的相关性。

结果：CBF 值在 AD 组 6 个脑区较 NC 组降低；MTRasym 值在 AD 组和 NC 组没有统计学差异；AREX 值 AD 组 3 个脑区较 NC 组降低；6 个脑区 CBF 值鉴定 AD 及 NC 的 CBF 单参数模型 ROC 曲线下面积分别是 0.797、0.757、0.753、0.742、0.733、0.759，CBF 组合模型 AUC=0.786。3 个脑区 AREX 单参数模型 ROC 曲线下面积分别是 0.764、0.710、0.723，AREX 组合模型 AUC=0.744。CBF+AREX 模型 ROC 曲线下面积最大，AUC=0.900。6 个脑区的 CBF 与 MMSE 评分呈正相关（r 值分别为 0.808、0.583、0.687、0.625、0.702、0.687）。3 个脑区的 AREX 值与 MMSE 评分均不相关。

结论：结合 CBF 值与 AREX 比单纯 CBF 可以更好地鉴别 AD 和 NC，由此可见，ASL 技术联合 APT 技术可能作为 AD 诊断的有力工具。

PO-2990

基于双参数 MRI 的深度学习-临床混合模型对临床显著性前列腺癌诊断价值的研究

胡尘翰、乔晓梦、包婕、王希明
苏州大学附属第一医院

目的 探讨基于双参数 MRI 的深度学习联合临床指标构建的混合模型诊断临床显著性前列腺癌（csPCa）的有效性。材料和方法 回顾性分析本院 2017 年 2 月至 2022 年 5 月共 531 例行术前 MRI 且经病理证实的前列腺疾病患者的临床及影像资料，其中 csPCa 319 例，无显著临床意义的前列腺癌（ciPCa）57 例，良性病变 155 例。按照 8: 2 比例将所有患者随机划分为训练集（425 例）和测试集（106 例）。采用 DenseNet 网络建立深度学习模型，采用单因素和多因素逻辑回归筛选有意义的临床特征并建立临床模型，并使用逻辑回归联合深度学习模型和临床特征建立深度学习-临床混合模型。使用受试者工作特征（ROC）曲线评估模型性能，使用 Delong 检验比较曲线下面积（AUC）。通过决策曲线评估模型和临床因素的临床价值。结果 回归分析显示年龄、PSA 及 PI-RADS 评分为 csPCa 的独立危险因素。在测试集中，深度学习模型的 AUC 值为 0.90（95%置信区间：0.85-0.96），临床模型的 AUC 值为 0.85（95%置信区间：0.78-0.92），两者间差异无统计学意义（P = 0.24）。深度学习-临床混合模型的 AUC 值为 0.93（95%置信区间：0.88-0.98），优于临床模型（P = 0.034）和深度学习模型（P = 0.048）。决策曲线显示深度学习-临床混合模型的临

床净效益高于临床模型和深度学习模型。结论 深度学习模型对 csPCa 的诊断效能与临床模型相当。深度学习-临床混合模型对 csPCa 的诊断效能最高,有助于减少不必要的活检。

PO-2991

基于 3.0T MR 的大鼠颅内出血模型构建评估的应用研究

朱艳^{1,2}、陈雪莲²、王建良²、蔡佳²、王煜灵^{1,2}

1. 江苏大学医学院

2. 昆山市第一人民医院

目的: 颅内出血患者的高致残原因主要是血肿周围脑实质的水肿、坏死导致的不可逆性脑损伤,目前临床对出血后进行脑组织修复治疗的时机及方法尚无统一定论,仍需进行大量的动物实验及基础实验进行探索。本研究旨在应用常规国产 3.0T MR 搭配动物线圈对 SD 大鼠进行 MR 多参数颅脑扫描,实现大鼠颅内出血模型的构建评估及分期诊断;为后期应用磁共振影像对不同出血时期脑组织损伤程度及修复评估提供更直接、客观的研究方法及基础。

方法: 1. 颅内出血模型构建: 选取 8 周左右雄性 SD 大鼠,麻醉后使用脑立体定位图谱设计注血、开颅部位并进行定位开颅,利用微量进位器垂直穿刺注射 2ul 胶原酶于设定脑区,注射完消毒并缝合切口。2. 多参数 MR 扫描: 应用联影 3.0T uMR780 磁共振搭配联影 Rat coil-12 线圈,分别于术后 12h 及 1、2、3、5、7、14d 进行 MR 扫描,采集序列为改良后 T1WI (TR=1600ms, TE=13.4ms)、T2WI (TE=4800ms, TE=69.1ms) 及 SWI (TR=33.9ms, TE=20ms) 序列, FOV: 50x40mm, 体素大小 0.27x0.27x1.00mm, 层厚 1.0mm, 层间距 0mm, 扫描后应用 3D slicer 软件对颅内出血量进行精确测量。

结果: 应用立体定位仪胶原酶注射法进行 SD 大鼠颅内出血模型构建,术后 7 天内死亡率约 10%, 7 天以上死亡率为 0; 应用 3.0T 磁共振进行大鼠颅脑扫描可在术后 12h 发现颅内血肿,定位出血部位并精准计算出血量 ($24.085\pm2.99\text{ul}$), 在术后 2d 达到最大出血量并周围组织水肿 ($53.00\pm4.46\text{ul}$), 术后 5d 出血量停止增大 ($45.18\pm5.31\text{ul}$); T1WI、T2WI 及 SWI 扫描图像质量良好,出血部位与立体定位仪设置一致,各序列信号的变化可区分颅内血肿超急性期/急性期/亚急性期/慢性期改变。

结论: 应用联影 3.0T MR 及大鼠线圈进行磁共振多参数成像,可以对 SD 大鼠颅内脑出血模型进行精准出血量化及准确临床分期,评估结果表明立体定位仪胶原酶注射法进行 SD 大鼠颅内脑出血模型构建方法安全、准确、稳定。

PO-2992

CMR T1mapping 技术 MOLLI、ShMOLLI 和 SASHA 序列定量扩张型心肌病心肌纤维化的对照研究

熊浩

华中科技大学同济医学院附属协和医院

目的: 探讨 CMR T1mapping 技术 MOLLI、ShMOLLI 和 SASHA 序列分别对扩张型心肌病心肌纤维化的诊断价值,并分析序列定量的扩张型心肌病心肌纤维化参数与临床指标的相关性。

方法: 对我院 28 例扩张型心肌病患者和 14 位同期健康体检者进行回顾性分析。所有受检者均在 1.5T 磁共振机上,将不同序列测量出的扩张型心肌病患者组和正常对照组的平扫 T1 值、增强后 T1 值和 ECV 值进行比较分析。绘制不同序列 T1mapping 定量参数的 DCM 患者和正常对照组的 ROC 曲线,并计算曲线下面积和特异性及敏感性。比较不同序列心肌 16 节段的平扫 T1 值和 ECV 值,及不同序列心肌中间部层面 LGE+ 节段和 LGE- 节段的 T1mapping 参数。对不同序列之间的

T1mapping 参数进行相关性分析, 同时对不同序列的 **T1mapping** 参数与血清学结果进行相关性分析。

结果:不同序列的 DCM 患者组的平扫 T1 值和 ECV 值均较正常对照组平扫 T1 值和 ECV 值显著升高, 差异有统计学意义。DCM 患者和正常对照组的 ECV 值的 ROC 曲线结果: MOLLI 0.92(0.70-0.98), ShMOLLI 0.76(0.56-0.96), SASHA 0.78(0.67-0.97), p 值均小于 0.05。比较不同 ROC 曲线的 AUC 值发现: AUC (MOLLI) 大于 AUC (ShMOOLI) ($p=0.03$) 和 AUC (SASHA) ($p=0.04$)。不同序列的 LGE+节段的平扫 T1 值和 ECV 值均高于 LGE-组, 差异具有统计学意义 (p 值均小于 0.05)。相关性分析结果显示: 各序列间的平扫 T1 值、增强后 T1 值和 ECV 值都具有良好的正相关性。不同序列的平扫 T1 值与血中 BNP 和 TnI 浓度具有良好的正相关性。同时, 仅发现 MOLLI 序列的 ECV 值与射血分数呈负相关性 ($r=0.683$, $p=0.002$)。

结论: 扩张型心肌病患者中 MOLLI、ShMOLLI 和 SASHA 序列的平扫 T1 值、ECV 值均高于正常对照组, MOLLI 序列对扩张型心肌病心肌纤维化具有更好的诊断效能。BNP、TnI 与 MOLLI、ShMOLLI 和 SASHA 序列测得的平扫 T1 值均具有相关性。

PO-2993

基于超材料的无线腕关节线圈优化 1.5T 磁共振成像

王亚魁¹、易懿¹、池中海²、何里¹、蒋德清¹、郑卓肇¹

1. 北京清华长庚医院

2. 北京清华大学

目的: 设计用于 1.5T 腕关节磁共振成像的无线超材料线圈 (wireless metamaterial coil, WMC), 并评估其对于腕关节磁共振成像质量的优化效果。

方法: 在实验室设计并制备 WMC 原型线圈。首先, 采用 CST 2021 电磁仿真软件研究 WMC 空载状态下的电磁谐振特性。然后, 采用 1.5T 磁共振成像系统 (uMR570) 进行水模和 14 个无症状腕关节 (来自 7 名健康志愿者) 磁共振成像。扫描序列包括: T1 加权的自旋回波序列 (T1 SE)、脂肪饱和质子密度加权的快速自旋回波序列 (FS PDW FSE) 以及 T1 加权的三维梯度回波序列 (3D T1W GRE)。分别采用 WMC 和 12 通道腕关节线圈 (12-channel wrist coil, 12CH WRC) 接收信号。由一名具有 5 年以上的放射学医生进行阅片, 测量并计算水模和腕关节不同组织的信噪比 (signal-to-noise ratio, SNR) 和对比噪声比 (contrast-to-noise ratio, CNR)。采用配对 t 检验比较 WMC 和 12CH WRC 图像 SNR、CNR 的差异 ($P<0.05$ 表示差异有统计学意义)。

结果: 电磁仿真结果显示 WMC 在磁共振信号接收频段谐振频率位于 64MHz (图 1a), 与体线圈比较, 能够提高射频接收场(B_1^-)达 170.1 倍, 同时不影响射频发场 (B_1^+) (图 1b)。在水模研究中, 与 12CH WRC 相比, 在三种成像序列上 WMC 均能够显著提高 SNR 和 CNR (1.2-3.5 倍) (图 2)。在健康志愿者腕关节成像中, 在三种成像序列上, WMC 图像中关节液、肌肉、软骨及脂肪等组织的 SNR 和 CNR 均显著高于传统 12CH WRC ($P<0.05$) (图 3)。

结论: 与传统的 12 通道腕关节线圈相比, 本研究设计的无线超材料线圈能够显著提高腕关节磁共振成像的图像质量。并且, 与传统线圈相比具有无线无源的特点, 能够在一定程度上简化磁共振检查流程。因此, WMC 具有客观的临床实际应用前景。

PO-2994

基于 MRI 脂肪分数图的 RSF 影像组学模型在 T2DM 中的应用价值研究

王思齐¹、张钦和¹、安琪¹、林良杰²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦（中国）投资有限公司

目的：2 型糖尿病（type 2 diabetes mellitus, T2DM）是一种慢性代谢性疾病，其全球发病率持续上升，对患者健康和社会负担造成了严重的影响。因此，对 T2DM 进行早期诊断和有效管理是降低并发症风险的关键。本研究旨在探讨基于 MRI 脂肪分数图的肾窦脂肪（renal sinus fat, RSF）影像组学模型在 T2DM 中的应用价值。方法：回顾性分析 2017 年 1 月至 2021 年 3 月间大连医科大学附属第一医院住院患者的临床及影像资料。共纳入 T2DM 患者 33 例，非 T2DM 患者 101 例，按 7:3 比例随机分为训练集与测试集。使用 ITK-SNAP 软件在 MRI 脂肪分数图上手动逐层勾画双侧 RSF。使用联影 uAI Research Portal 科研平台对图像进行标准化处理和 RSF 影像组学特征的提取。采用最小冗余最大相关（mRMR）和最小绝对值收敛和选择算子（LASSO）回归分析对影像组学特征进行降维和筛选，利用随机森林(random forest, RF)方法建立预测 T2DM 的影像组学模型，采用受试者工作特征（receiver operating characteristic, ROC）曲线下面积（area under the curve, AUC）、校准曲线及决策曲线对模型效能进行评估。结果：本研究共提取 1184 个特征，最终筛选出 5 个特征参与模型构建。该模型在训练集中的 AUC 值为 0.824（95%CI 0.761-0.889），其诊断 T2DM 的灵敏度为 63.2%，特异度为 81.8%，准确度为 77.2%；在测试集中的 AUC 值为 0.746（95%CI 0.596-0.896），灵敏度为 56.3%，特异度为 75.7%，准确度为 70.9%，校准曲线显示模型一致性较好，决策曲线分析显示模型净收益率较高。结论：基于 MRI 脂肪分数图的 RSF 影像组学模型在 T2DM 中具有重要的应用潜力。本研究为 T2DM 的早期诊断和治疗策略的制定提供了重要的参考依据。

PO-2995

胶质母细胞瘤分子标志物 OLIG2 的预后作用 MR 影像组学预测模型的研究

梅楠、尹波

复旦大学附属华山医院

目的胶质母细胞瘤（GB）是成人最常见的颅内原发恶性肿瘤，具有高度异质性。OLIG2 作为胶质瘤干细胞潜在的特异性分子标志物与 GB 预后不良和化学抵抗有一定相关性。本研究旨在探究 OLIG2 分子在 GB 中表达的临床意义，同时，基于临床、形态学及术前 MRI 影像组学特征构建机器学习二分类模型，实现术前无创预测 OLIG2 表达水平，为个体化评估预后、指导治疗决策提供办法。方法收集 2012 年 9 月至 2020 年 1 月复旦大学附属华山医院经病理确诊的 GB 病例。采用免疫组织化学染色技术半定量分析 OLIG2 表达水平。Cox 比例风险回归模型分析 GB 总体生存期的影响因素。Kaplan-Meier 生存分析评估总体生存期并确定 OLIG2 表达的最佳 cutoff 值。采集患者术前头颅 MRI，包括 CE-T1WI 和 T2-FLAIR 序列。评估 VASARI 特征，勾画感兴趣区域。PyRadiomics 提取影像组学特征。按 7:3 将病例随机分为训练集和测试集。训练集中采用递归特征消除（RFE）筛选特征，随机森林（RF）建立 OLIG2 二分类预测模型。测试集用于验证最优模型的性能。绘制 ROC 曲线，计算 AUC 以量化模型预测能力。

结果单因素 Cox 分析显示性别、术前 KPS 及 OLIG2 为 GB 的保护性预后因素，多因素分析显示术前 KPS 和 OLIG2 是影响患者生存的独立预后因素。Kaplan-Meier 生存分析表明 OLIG2 表达水平与

GB 总体生存期显著相关 ($P<0.001$)，且最佳 cutoff 值为 10%。最终纳入 134 例 GB 患者，统计共 1945 个特征，包括年龄、性别、VASARI、影像组学特征。训练集中筛选出 23 个最佳特征，包括 8 个 CE-T1C 和 13 个 T2-FLAIR 影像组学特征。调参后的最佳 RF 二分类预测模型 AUC 在训练集中达到 0.854，在测试集中达到 0.819。

结论 OLIG2 在 GB 患者中具有独立的保护性预后作用，且 OLIG2 表达水平 $\leq 10\%$ 的 GB 患者预后较差。基于 VASARI 和 MR 组学特征构建的 RFE-RF 二分类机器学习模型可以实现术前无创预测 OLIG2 表达水平，辅助指导临床预后评估及制定个体化靶向治疗策略，而无需有创手术或病理活检检查。

PO-2996

基于 MRI 影像特征评估接受 TACE 或放疗肝癌患者预后的初步研究

彭婷、马小倩
中南大学湘雅三医院

目的：探究 MRI 影像特征在评估接受 TACE 或放疗的肝癌患者预后的价值。

方法：回顾性收集 2010 年 1 月 1 日至 2020 年 3 月 31 日接受局部治疗的肝癌患者（共 58 例）的临床资料、生存期及影像资料，其中男性 46 例，女性 12 例。患者的 MRI 影像特征通过放射科医生评阅患者治疗前的 MRI 的图像来获取。使用 Kaplan-Meier 生存曲线进行单因素生存分析和多因素 COX 回归分析来检验 MRI 影像特征对肝癌患者无进展生存率预测的独立作用，获得与患者预后相关的影像特征。使用相关影像特征构建预后预测模型。

结果：“最大截面积”与“ADC 值”是肝癌患者无进展生存期的独立预测因素。对于接受介入治疗的患者，“瘤内动脉”与“瘤内动脉数量”也是其独立预测因素。使用“最大截面积”与“ADC 值”构建的预后模型可以对肝癌患者的预后做出有效的预测。预测模型的受试者曲线下面积 $AUC=0.787$ ($P<0.001$)，其敏感性和特异性分别为 96.79%、56%。

结论：MRI 影像学特征是接受局部治疗患者无进展生存期的有效评估因素，使用“最大截面积”与“ADC 值”构建的预后模型可以对肝癌患者的预后做出有效的预测。

PO-2997

神经突方向离散度与密度成像 (NODDI) 在帕金森病脑深部核团 微观结构变化的临床应用

尚丹丹¹、易音巧²、李春媚¹、陈敏¹
1. 北京医院
2. 华东师范大学

目的：基于神经突方向离散度与密度成像 (NODDI) 探索帕金森病脑深部核团微观结构变化。

方法：前瞻性纳入 24 例右利手 PD 患者，同期纳入 10 名年龄及性别相匹配的右利手健康志愿者作为对照，于 3.0T 核磁行 DSI 扫描，基于 Matlab 平台将弥散加权数据拟合到 NODDI 模型，量化分析双侧尾状核、壳核、苍白球的变化。两独立样本 t 检验或非参数检验比较 PD 患者与健康志愿者细胞内体积分数 (VIC)，方向分散指数 (ODI) 和各向同性体积分数 (VISO) 差异；配对 t 检验或符号秩和检验比较 PD 患者双侧尾状核、壳核、苍白球细胞内体积分数 (VIC)，方向分散指数 (ODI) 和各向同性体积分数 (VISO) 差异。

结果：PD 患者双侧尾状核、壳核、苍白球的各向同性体积分数 (VISO) 均显著低于健康对照组 ($P<0.05$)；PD 患者右侧尾状核的细胞内体积分数 (VIC)、方向分散指数 (ODI) 和各向同性体积分

数(VISO)均显著低于健康对照组 ($P<0.05$)；PD 患者双侧苍白球的各向同性体积分数(VISO)及双侧壳核的方向分散指数(ODI 存在显著差异 ($P<0.05$)。

结论：神经突方向离散度与密度成像可以反映PD患者深部核团微观结构变化，其参数值 VIC、ODI 及 VISO 可以作为 PD 患者的评估指标。

PO-2998

多频 MRE 术前预测肝细胞癌 VETC+/MVI+的初步研究

钟林辉、龙仕超、刘文广、裴贻刚、李文政
中南大学湘雅医院

目的：探索多频 MRE 机械参数是否能够在术前预测 VETC+/MVI+状态及其价值。

材料与方法：2021 年 1 月至 2022 年 11 月在中南大学湘雅医院前瞻性招募临床拟诊肝细胞癌患者 328 名。所有患者均接受了常规多参数 MRI 及多频 MRE 检查，最终纳入经术后病理确诊的肝细胞癌患者共 124 例。收集患者临床资料、评估常规 MRI 影像学特征及测量肿瘤及背景肝实质多频 MRE 机械参数 $c(m/s)$ 和 $\phi(rad)$ 。通过单因素分析中 $P<0.05$ 的参数进入二元 logistic 回归进行多因素分析，以阐明 VETC+/MVI+的危险因素。以进入多因素分析中的临床变量、常规 MRI 影像学特征分别建立预测模型；多频 MRE 机械参数及其联合多因素分析中临床变量、常规 MRI 影像学特征建立预测模型。使用 ROC 曲线下面积评估预测效能。使用校准曲线评价模型拟合度。使用临床决策曲线分析评价模型的临床获益度。

结果：（1）VETC+/MVI+组肿瘤硬度 c 及相对硬度比较非 VETC+/MVI+组高，（ $2.81\pm0.51m/s$ Vs $2.62\pm0.68m/s$ ； 1.47 ± 0.39 Vs 1.30 ± 0.36 ， P 均 <0.05 ）。（2）多因素 Logistic 回归结果表明，AFP（OR 0.19，95%CI（0.04-0.86）， $P=0.031$ ）、异常凝血酶原（OR 0.02，95%CI（0.02-0.73）， $P=0.021$ ）、瘤内动脉（OR 6.76，95% CI（1.72-26.67）， $P=0.006$ ）和肝实质流动性（OR0.00，95% CI（0.00-0.37）， $P=0.021$ ）是 VETC+/MVI+的独立危险因素。（3）在 VETC+/MVI+的预测模型中，多频 MRE 机械参数模型的特异性和准确性最高（分别为 0.79、0.75），临床资料、常规 MRI 影像特征联合多频 MRE 机械参数模型的 AUC 值（0.854（0.788-0.921））和敏感性（0.97）最高。

结论：多频 MRE 的机械参数 c 能够在术前预测 VETC+/MVI+状态。临床资料、常规 MRI 影像学特征联合多频 MRE 机械参数可以提升预测 VETC+/MVI+效能。

PO-2999

人工智能压缩感知不同加速因子在臂丛神经 MRI 成像中的应用

程天馨¹、李菲菲^{1,2}、蒋学涛^{1,3}、袁颖¹、徐辉¹、杨正汉¹

1. 首都医科大学附属北京友谊医院

2. 保山市中医医院

3. 遵义市第一人民医院

目的：探讨人工智能辅助压缩感知（artificial intelligence-compressed sensing, ACS）技术在臂丛神经 MRI 成像中的加速效率及对图像质量的影响。

方法：招募 30 例健康志愿者，在 3.0T MRI 行平扫 3D-matrix-STIR 臂丛神经成像。扫描序列包括加速因子分别为 3.0、5.0、8.0 的 ACS 序列，以及常规并行采集（parallel imaging, PI）3.0 序列。两位高年资放射科医师双盲阅片，分别对 4 组图像的神经显示情况、图像伪影、脂肪抑制情况和整体图像质量评分 4 方面进行主观评价；两位放射科医师在原始图像上测量 C6 臂丛神经根、神经干、臂丛内侧束和背景的信号强度（signal intensity, SI）和噪声值（standard deviation, SD），计算信

噪比 (signal-to-noise ratio, SNR) 和对比噪声比 (contrast-to-noise ratio, CNR), 作为客观评价指标。对扫描时间、主观评分和客观指标进行统计学分析。

结果: ACS 序列扫描时间较常规 PI 序列有大幅降低, 且扫描时间随加速因子的增大而缩短 (PI 3.0: 352s; ACS 3.0: 227s; ACS 5.0: 158s; ACS 8.0: 108s)。主观评价一致性较好。4 组序列间主观评分和客观指标差异具有统计学意义 ($P<0.05$)。ACS 3.0 和 ACS 5.0 的主观评分和 SNR、CNR 与 PI 3.0 差异无统计学意义 ($P>0.05$), ACS 8.0 的 SNR、CNR 高于 PI 3.0, 主观评分低于 PI 3.0 ($P<0.05$)。

结论: ACS 技术能够缩短 MRI 扫描时间; 在平扫 3D 臂丛神经成像中, 推荐使用加速因子为 5.0 的 ACS 序列, 可在保证图像质量的前提下将扫描时间缩短 55%, 提高工作效率, 有望应用于临床。

PO-3000

基于 MRI 的改良脑小血管病负担评分联合颅内动脉责任斑块特征对卒中复发的预测价值

任凯旋、朱丽、王菁
扬州大学附属医院

目的 探讨基于 MRI 的改良脑小血管病 (CSVD) 负担评分和颅内动脉高分辨率血管壁成像 (HR-VWI) 责任斑块特征与症状性颅内动脉粥样硬化性狭窄 (sICAS) 患者卒中复发的关系。

方法 回顾性分析我院神经内科 2019 年 12 月-2021 年 12 月期间行常规头颅 MRI 及颅内动脉 HR-VWI 的 sICAS 患者 145 例。根据常规 MRI 图像计算获得改良 CSVD 负担评分, 其中脑白质高信号根据 Fazekas 量表评分记作 0-3 分, 腔隙性梗死根据数量记作 0-3 分, 存在脑微出血即记作 1 分, 总分为 7 分。分别于患者出院后 3 个月、6 个月、9 个月及 12 个月进行门诊随访, 根据随访结果将患者分为未复发组与复发组。使用秩和检验比较两组患者改良 CSVD 负担评分的差异, 使用 T 检验或单因素方差分析比较两组患者动脉粥样硬化高危因素及责任斑块特征的差异。多因素 Cox 比例风险模型用于分析卒中复发的独立危险因素。ROC 曲线用于分析改良 CSVD 负担评分及责任斑块特征对卒中复发的预测效能。

结果 本研究共有 32 例患者 12 个月内出现了卒中复发。复发组患者改良 CSVD 负担评分、斑块厚度、斑块负荷、管腔狭窄程度高于未复发组 (P 均 <0.05), 复发组患者糖尿病患病率、责任斑块内出血、斑块显著强化的发生率高于未复发组 (P 均 <0.05)。多因素分析显示改良 CSVD 负担评分 ($HR=2.264$, $P<0.001$)、责任斑块内出血 ($HR=2.632$, $P=0.033$) 是卒中复发的独立危险因素。ROC 曲线分析显示改良 CSVD 负担评分预测卒中复发的阈值为 4 分, AUC 值为 0.775, 敏感性 62.50%, 特异性 87.61%; 责任斑块内出血预测卒中复发的 AUC 值为 0.659, 敏感性 53.13%, 特异性 78.76%; 改良 CSVD 负担评分联合责任斑块内出血预测卒中复发的 AUC 值为 0.819, 敏感性 71.87%, 特异性 80.53%; Delong 检验分析显示改良 CSVD 负担评分联合责任斑块内出血预测卒中复发的效能最佳 ($Z=2.678$, $P<0.05$)。

结论 改良 CSVD 负担评分联合责任斑块内出血对卒中复发有较好的预测能力, 且数据相对易获取, 临床应用价值较高。

PO-3001

基于 3.0T MRI 的影像组学特征预测局部进展期直肠癌新辅助治疗疗效及多种分类器效能比较

胡鸿博

哈尔滨医科大学附属第二医院

摘要: 目的 3.0 MRI 影像数据具有评估直肠癌新辅助治疗疗效临床价值,但是构建模型多种机器学习间的比较一直没有被探究过。我们将比较 4 种常用的机器学习的方法在评估直肠癌新辅助治疗疗效临床价值的效能。方法 选取 2021 年 9 月 1 日—2023 年 1 月 30 日于哈尔滨医科大学附属第二医院就诊经病理检查证实的局部进展期直肠癌,行新辅助化疗共 160 例,按 8:2 比例分为测试集及验证集。分别建立支持向量机、朴素贝叶斯、K 邻近算法以及神经网络四种分类器模型,采用 Delong 检验比较 ROC 曲线差异。对 4 种分类器诊断效能进行评估比较。结果 2 组患者年龄、性别差异无统计学意义。通过 LASSO 得到 9 个与治疗效果分组相关的特征,9 个特征在 GR/PR 组及 pCR/non-pCR 中有差异,但是差异不具有统计学意义。SVM 的 ROC 曲线下面积为 0.915,评估新辅助放化疗效果最为显著。结论 基于磁共振高分辨 T2WI 的纹理特征,通过 SVM、NB、NN、CNN 分类器模型可以对直肠癌 nCRT 疗效的进行评估,其中 SVM 分类器模诊断效能最佳,基于高分辨 T2WI 的影像组学可以评估 LARC 患者 nCRT 治疗效果。

PO-3002

氢质子磁共振波谱成像在胶质瘤分子特征中的应用

刘璟仪、刘鹏飞

哈尔滨医科大学附属第一医院

目的: 用氢质子磁共振波谱成像 (1H-MRS) 半定量测量胶质瘤由于基因突变导致的脑代谢物改变。比较 MRS 测得的 IDH1 突变型和野生型间的代谢物比值是否存在差异。

方法: 纳入本院 2021 年 10 月至 2023 年 6 月经手术治疗且病理证实为胶质瘤患者 117 例,男性 57 例,女性 43 例,患者治疗前均使用 Philips Achieva 3.0T 磁共振扫描仪行头颅 MRI 平扫、增强及 1H-MRS 检查。使用轴向 T2 FLAIR 或 T1WI 增强检查作为指导,多体素 1H-MRS 的检测在肿瘤实性成分最大层面进行,避开出血、坏死及囊变等区域,记录各体素 Cho/NAA、Cho/Cr、NAA/Cr 值,选出最大值,计算平均值。收集 IDH1 状态、Ki-67 指数免疫组化检测结果。比较所有以及 WHO 分级各级中 IDH1 突变型与 IDH1 野生型组间的年龄、三组 1H-MRS 比值、Ki-67 指数的差异。应用 SPSS25.0 统计软件进行数据分析。

结果: 117 例胶质瘤中 IDH1 野生型 80 例, IDH1 突变型 37 例; WHO1 级 3 例, WHO2 级 38 例, WHO3 级 41 例, WHO4 级 35 例。IDH1 突变型和野生型 Cho/NAA 最大值、年龄、Ki-67 指数间存在差异 ($P < 0.05$)。其中在 WHO3 级中 IDH1 突变型和野生型 Cho/NAA 最大值分别为 12.45 ± 33.56 , 8.38 ± 10.32 , 两组间参数存在差异 ($P < 0.05$)。IDH1 突变型 Cho/NAA 最大值高于 IDH 野生型胶质瘤。

结论: IDH1 突变型和野生型间的代谢物比值存在差异, IDH1 突变导致胶质瘤内代谢物变化。

PO-3003

定量磁化率成像技术对地中海贫血患者脑铁沉积的定量研究

彭飞、罗朝天、梁琳琳、唐成、彭鹏
广西医科大学第一附属医院

目的：探讨定量磁化率成像技术 (QSM) 测量地贫患者脑铁含量的可行性，利用 QSM 测量地贫患者脑内铁含量的磁化率，观察地贫患者脑内铁含量的分布特征，并分析大脑灰质核团磁化率与肝脏、心脏、垂体横向弛豫率 ($R2^*$) 的相关性。

方法：招募 2022 年 10 至 2023 年 4 月就诊于广西医科大学第一附属医院的 β -重型地中海贫血患者 38 名，均同时完成头颅 QSM 及肝脏、心脏、垂体的 $R2^*$ 扫描，采用配对样本 t 检验比较两侧大脑半球灰质核团的磁化率，采用 pearson 相关分析评估地贫患者脑灰质核团磁化率与肝脏、心脏、垂体横向弛豫率的相关性。

结果：地贫患者黑质的磁化率最大，其次是苍白球，额叶白质的磁化率最低；地贫患者两侧背侧丘脑具有统计学差异 ($P < 0.05$)，左右两侧尾状核、苍白球、壳核、黑质、红核、齿状核不存在统计学差异 ($P > 0.05$)；地贫患者肝脏、心脏、垂体铁沉积与大脑灰质核团铁含量不具有相关性 ($P > 0.05$)。

结论：地中海贫血患者两侧背侧丘脑铁含量具有差异，利用 QSM 可以显示脑内灰质核团的铁含量，磁化率可以作为一种反应脑内铁含量变化的临床指标。

PO-3004

基于时间依赖性磁共振弥散成像区分前列腺病变组织微结构研究

李茜玮¹、陈丽华¹、林良杰²、孙鹏²、武志刚²、王楠¹、王家正²、刘爱连¹

1. 大连医科大学附属第一医院

2. 飞利浦临床科研部

目的：本研究旨在利用时间依赖性磁共振弥散成像探究正常前列腺组织与前列腺癌的细胞微结构信息。**材料与方法：**本研究获得大连医科大学附属第一医院伦理委员会批准 (PJ-KS-KY-2022-277)。本研究纳入因临床怀疑前列腺疾病于我院行 3.0T MRI 扫描并诊断为前列腺癌的患者 16 例，年龄范围 70-82 岁；正常前列腺志愿者 10 例，年龄范围 23-77 岁。所有入组者均使用带有 32 通道体部线圈的飞利浦 3.0T MR 扫描仪 (Ingenia CX, Philips Healthcare, Best, the Netherlands) 进行扫描。在成像之前，患者被要求排空膀胱。扫描序列包括 T1WI、T2WI、DWI 及 OGSE 序列。由两名诊断经验丰富的影像科诊断医师 (分别从事影像诊断工作 3 年及 6 年) 在 3D slicer (www.slicer.org) 软件中参考 T2WI、DWI ($b=1400s/mm^2$) 及 ADC 图像，于 OGSE 图像上勾画 ROI，勾画时避开囊变、坏死及出血区域。采用 Matlab (2022b, Math Works) 软件对图像进行拟合，拟合次数为 20 次，得到的拟合参数包括细胞直径 (d)、细胞内体积分数 (fin)、细胞外扩散系数 (Dex)、细胞密度 ($cellularity$)。采用 Shapiro-wilk 检验各参数的正态性分布。采用独立样本 t 检验获 Mann-Whitney 检验评估各参数区分两组病例的差异。采用 ROC 曲线评估各参数的诊断效能，并记录各参数区分两组病例的敏感性、特异性。结果：两组病例间 d 、 Fin 、 $cellularity$ 、 Dex 、 ADC_{0HZ} 、 ADC_{25HZ} 及 ADC_{50HZ} 差异具有统计学意义 ($t=2.370$ 、 4.904 、 5.424 、 -3.465 、 P 均 < 0.05)。各参数区分两组病例的 AUC 值分别为 0.823、0.990、0.990、0.844，敏感度分别为 68.7%、93.7%、93.7% 及 100%，特异度分别为 100%、100%、100% 及 83.3%。结论：时间依赖性磁共振成像可从细胞微结构水平区分正常前列腺组织与前列腺癌，对于无创诊断前列腺癌具有一定的临床应用前景。

PO-3005

基于深度学习的减影技术提高 LR-TR 诊断效能

王宇新

首都医科大学附属北京友谊医院

目的

探讨基于深度学习的动脉期减影图像在 LR-TR 识别有活性病灶中的价值。

方法

回顾性收集接受 TACE 及 RFA 治疗的肝癌患者的多期动态增强 MR 图像。建立基于深度学习的减影模型，自动生成动脉期减影图像。两名放射科医生分别在原始图像、原始图像+动脉期减影图像上进行 LR-TR 分类，同时进行信心评分。活性的最终参考标准是 MR 检查 1 月后 DSA 中的肿瘤染色。

结果

共入组来自 105 例病人的 286 个病灶，根据 DSA，157 个病灶有活性，129 个病灶无活性。动脉期减影图像辅助提高 LR-TR 识别有活性病灶的敏感性和准确性（87.9% vs 67.5%， $p<0.0001$ ；86.4% vs 75.9%， $p<0.0001$ ），而特异性无统计学差异（84.5% vs 86.0%， $p=0.687$ ）。LR-TR 识别有活性病灶的 AUC 显著提高（0.862 vs 0.768， $p<0.0001$ ）。动脉期减影图像也提高了诊断者信心评分（ $p<0.0001$ ）和观察者间一致性（0.857 vs 0.727）。

结论

应用基于深度学习的减影技术明显提高 LR-TR 识别有活性肝癌的敏感性，而特异性无统计学差异。

PO-3006

伴海马硬化与 MRI 阴性颞叶癫痫静态和动态脑自发活动的异同

宋承汝、张晓楠、张勇、程敬亮

郑州大学第一附属医院

目的：全面分析伴海马硬化颞叶癫痫（temporal lobe epilepsy with hippocampus sclerosis, TLE-HS）和 MRI 阴性颞叶癫痫（MRI-negative temporal lobe epilepsy, TLE-N）患者脑自发活动的静态和动态异常变化模式的异同，并探索这些改变是否与认知功能相关。

资料与方法：计算 38 例 TLE-HS 患者、51 例 TLE-N 患者和 53 名健康志愿者的 6 个脑自发活动静态指标（ALFF、fALFF、ReHo、DC、GSCorr、VMHC）及 6 个相应的动态指标（dALFF、dfALFF、dReHo、dDC、dGSCorr、dVMHC），进行 ANOVA 分析和进一步的两组间比较。并对上述组间差异区域的各指标值与发病年限和认知功能评分进行相关性分析。

结果：与 HC 组相比，TLE-HS 和 TLE-N 组均出现了脑自发活动的异常变化，且变化模式相似，主要包括：①颞叶内侧结构、丘脑、基底节、桥脑和小脑 fALFF、dALFF 和 dfALFF 值的升高；②致痫灶同侧外侧颞叶区域 fALFF、ReHo、dReHo、DC、GSCorr 和 VMHC 值的降低；③双侧距状裂周围皮质 dVMHC 值的降低。然而，TLE-N 组的异常激活脑区团块范围较 TLE-HS 组小，并且 TLE-HS 组在双侧海马、中央前回和中央后回出现了额外的 VMHC 值降低。另外，与 TLE-N 组相比，TLE-HS 组在尾状核的 fALFF、dfALFF 和 ReHo 值升高，在双侧中央后回、内侧和外侧颞叶的 VMHC 值和左侧外侧颞叶的 dReHo 值下降。相关性分析结果显示多种脑自发活动指标的改变与认知评分及发病年限相关。

结论: TLE-HS 和 TLE-N 患者脑自发活动异常的改变模式基本相似, 但 TLE-HS 患者的异常改变更为显著。多种静态和动态脑自发活动指标的联合应用, 有助于探索 TLE 中癫痫活动的传播途径以及认知功能的损伤机制。

PO-3007

合成磁共振成像评估子宫内膜癌肌层浸润深度和预测病理类型的可行性: 与高分辨 T2WI 和 DWI 的比较

李栋、裴贻刚、欧晓荣、白煜
中南大学湘雅医院

目的: 探讨合成磁共振成像序列评估子宫内膜浸润深度和预测子宫内膜癌病理类型的能力。

方法: 纳入 236 例疑似 EC 的患者, 治疗前进行 MAGIC、hr-T2WI 和 DWI 检查。MAGiC 可以生成合成形态学图像(sy-T2WI)和定量合成图像(sy-T1、T2 和 PD 图)。由两名放射科医生分别在 sy-T2WI 与 hr-T2WI 图像上评估 DMI ($DMI < 50\%$ vs $\geq 50\%$), 比较两者的诊断性能及其一致性。在定量合成图像上, 通过手工勾画 EC 肿块的感兴趣区测量 T1、T2 和 PD 值, 预测区分 I 型(g1 ~ g2 型 EACs) 和 II 型(g3 型 EACs + non-EACs)的诊断效能。以病理结果为金标准, 计算曲线下面积(AUC), 并与表观扩散系数(ADC)进行比较。

结果: 在 236 名患者中, 39 名经病理证实的 EC 患者中, 共有 33 名出现 DMI ($< 50\%$: n=23; $\geq 50\%$: n=10)。DMI $\geq 50\%$ 时, sy-T2WI 的准确度、灵敏度和特异性分别为 0.80、0.80 和 0.88, 与 hr-T2WI 相似 (0.90、0.90、0.70, $r=0.80$, $p>0.05$)。DMI $< 50\%$ 时, sy-T2WI 的准确性、灵敏度和特异性分别为 0.65、0.88 和 0.50, hr-T2WI 的准确性、敏感性和特异性为 0.70、0.89 和 0.60 ($r=0.51$, $p>0.05$)。对于定量合成图像, 子宫内膜癌 II 型的 T2、PD 和 ADC 值低于 I 型 (均 $P<0.05$), 但 T1 值无差异 ($P>0.05$)。此外, 与 ADC 相比, T2 (AUC: 0.767) 和 PD 值 (AUC: 0.737) 在区分 II 型和 I 型方面具有相似的预测性能 (AUC=0.767, 均 $P>0.05$)。

结论: MAGiC 可一次获得合成形态学图像和定量合成图像, 在评估 DMI 和预测 EC 病理类型方面具有良好的应用前景和可行性。

PO-3008

基于治疗前 MRI 的影像组学特征分析预测局部晚期宫颈癌患者新辅助化疗后淋巴结转移情况: 一项双中心研究

刘金金^{1,2}、董林道^{2,3}、杨紫涵^{1,2}、张月洁^{2,3}、吴青霞^{1,2,3}、王梅云^{2,4}

1. 郑州大学人民医院
2. 河南省人民医院医学影像科
3. 河南大学人民医院
4. 河南省科学院生物医学研究所

目的 基于治疗前磁共振图像 (MRI) 的影像组学特征建立模型, 以早期预测局部晚期宫颈癌 (LACC) 新辅助化疗 (NACT) 后患者淋巴结转移状况。

方法 回顾性分析两中心 2013 年至 2022 年的 265 例接受新辅助化疗并行根治性子宫切除术的 LACC 患者的基线 MRI 资料。根据术后病理报告中淋巴结转移状态分为阳性组和阴性组, 中心 1 的数据用于训练模型, 中心 2 的数据用于验证模型。从 T2WI、DWI 和静脉延迟期 cT1WI 中提取影像组学特征。对临床信息进行多变量回归分析, 基于单序列组学特征或多序列组学特征建立预测模型并比较模型间性能差异。采用决策曲线分析评价其临床应用价值。

结果 基于单序列组学特征建立的模型和多序列组学特征及临床信息建立的模型均与淋巴结转移状态相关($p < 0.05$)。与基于单序列模型相比,多序列组学特征及临床信息建立的模型具有更好的预测能力,在训练集和验证集的诊断能力最高,ROC 曲线下面积分别为 0.840 (95% CI, 0.775 ~ 0.905) 和 0.825(95% CI, 0.736 ~ 0.915)。

结论 基于治疗前 MRI,组合多序列组学特征及临床信息对 LACC 患者 NACT 后淋巴结转移具有较好的预测效能。

PO-3009

基于磁共振的鞘内化疗后 ALL 儿童的脑白质微结构研究

王倩、邢妩
中南大学湘雅医院

目的: 针对急性淋巴细胞白血病(Acute Lymphoblastic Leukemia, ALL)儿童的中枢神经系统性白血病进行的预防性鞘内化疗是白血病治疗中的必要步骤,但是鞘内化疗药物对颅脑正常组织也会产生一定的影响。现有的研究对象主要集中在 ALL 儿童长期存活者,我们将研究目标锁定在 ALL 治疗期的患儿,了解即时的脑部变化,分析其脑白质纤维的改变,以期获取 ALL 鞘内化疗后儿童的脑白质宏观及微观结构的变化特点,为预防鞘内注射引起的脑损伤提供新的思路。

方法 (1) 我们对 57 名鞘内化疗后 ALL 儿童和 57 名年龄性别匹配的对照组的扩散峰度成像数据进行基于白质纤维骨架的空间统计,比较两组人的 KFA、MK、AK 和 RK 值,使用 FSL 软件库进行配对 t 检验、置换检验以及多重比较校正。(2) 对 43 名鞘内化疗后 ALL 儿童和 43 名年龄性别匹配的对照组进行纤维自动量化追踪,追踪出了 8 条主要纤维束: 双侧丘脑辐射、双侧皮质脊髓束、胼胝体小钳、右侧上纵束和双侧钩束,比较整条纤维束以及每条纤维束 100 段的 FA、MD、AD 和 RD 值的改变。使用 SPSS 软件进行统计,根据数据是否符合正态分布分别采用配对 t 检验和 Wilcoxon 符号秩和检验,行多重比较校正。

结果: (1) 相对于正常组,鞘内化疗后 ALL 患者胼胝体膝部和体部、右侧大脑脚、双侧内囊前肢、双侧内囊后肢、双侧放射冠前部以及左侧放射冠上部的 KFA 值减低,两组间的 MK、AK 和 RK 值没有差异。(2) 相对于正常组,鞘内化疗后 ALL 患者双侧皮质脊髓束、双侧丘脑辐射以及胼胝体小钳的 FA、MD、AD 和/或 RD 值有差异。

结论: 白血病和鞘内预防性化疗均可以引起 ALL 儿童的白质纤维结构改变。本研究结果显示皮质脊髓束、胼胝体小钳和丘脑辐射是鞘内化疗后 ALL 儿童脑白质纤维束改变的主要部位,这可能是长期存活患者运动功能、认知障碍和情绪变化的原因。

PO-3010

长期吸烟人群静息态脑网络异常的功能磁共振评价

张勇
郑州大学第一附属医院

目的 应用独立成分分析方法评价长期吸烟人群静息态脑网络功能连接异常。方法 2014 年 8 月至 2015 年 8 月期间通过网络宣传招募 5 例长期吸烟者和 34 名年和教育程度相匹配的不吸烟志愿者,采用 3.0T 共振进行静息态下共振扫描,使用基于 Matlab 平台的 SPM8 软件分析静息态脑网络的功能连接差异。结果 内侧视觉网络:右侧叶($t=4.17, P<0.05$)与左侧距状区($t=3.08, P<0.05$)功能连接减。外侧视觉网络:左侧枕上回功能连接增强减($t=3.42, P<0.05$)。枕极视觉网络右侧枕中回与左侧枕中回功能连接减($t=3.58, P<0.05$)。背侧注意网络右侧枕上回功能连接增强($t=3.42, P<0.05$)。左额顶网络:左

侧顶下小叶功能连接减($t=3.77, P<0.05$)。右额顶网络:右侧额上回功能连接增强($t=3.42, P<0.05$)。结论 长期吸烟人群存在多个静息态脑网络异常,并可导致多个脑区的连接异常。

PO-3011

脊髓型颈椎病大脑功能网络模块化特性的变化

邵紫薇、谭永明、何来昌
南昌大学第一附属医院

目的:以往的研究表明,脊髓型颈椎病(CSM)患者的大脑功能具有可塑性和重组性,然而,颈脊髓受压是否以及如何影响大脑模块之间和/或模块内部的功能整合和分离仍不清楚。本研究旨在利用图论分析的方法解决这些问题。

方法:对 46 名 CSM 患者和 35 名健康对照者(HCs)进行了功能磁共振成像。然后使用图论分析方法计算全脑功能网络的模块内和模块间连接特性以及节点拓扑特性。组间分类变量的差异采用卡方检验进行比较,连续变量的差异则采用双样本 t 检验,模块连接特性与临床量表之间进行了相关性分析。

结果:模块交互分析表明,CSM 组的模块间连接明显多于 HCs 组(默认网络-额顶网络: $t=2.38, p=0.02$);相反,CSM 组的模块内连接明显少于 HCs 组(感觉运动网络: $t=-2.13, p=0.036$)。然后,我们计算了属于异常连接模块的所有节点的节点拓扑特性。与 HCs 相比,CSM 患者在右侧额上回、左侧扣带回后部、右侧楔前叶、右侧腹外侧前额叶皮层、左侧扣带回前部皮层和左侧背外侧前额叶皮层表现出更高的节点属性。相比之下,与 HCs 组相比,CSM 患者在感觉运动网络中表现出较低的节点属性。JOA 评分与模块间连接成正相关($r=0.330, FDR q=0.029$),与模块内连接成负相关($r=-0.467, FDR q=0.001$)。

结论:本研究报告了 CSM 患者模块连接和节点属性的改变。感觉运动区域的节点属性和模块内连接降低可能表明感觉运动功能障碍。此外,默认网络和额顶叶网络中节点属性和模块间连接的增加可能是对 CSM 患者感觉运动功能障碍的代偿。

PO-3012

3D 液体衰减反转恢复序列和黑血序列增强在肺癌柔脑膜转移诊断中的临床应用

梁雪、林永娟、张鑫、张冰
南京大学医学院附属鼓楼医院

目的:3D 黑血序列增强由于抑制血管显影,在颅内小转移瘤和柔脑膜转移显示中更有优势。有文献报道 3D 液体衰减反转恢复序列(FLAIR)增强对颅内转移瘤和柔脑膜转移显示有一定价值。探讨 3D FLAIR 序列和黑血序列增强分别在肺癌柔脑膜转移中的 MR 表现,对柔脑膜转移显示的临床应用价值。

方法:临床怀疑柔脑膜转移的肺癌患者 42 例,同时行 3.0T 头颅磁共振 3D 液体反转恢复序列和黑血序列增强检查。2 名具有 8 年以上影像科医生分别对 MR 图像进行分析,以脑脊液脱落细胞检查阳性或共同诊断柔脑膜转移典型脑沟线样强化影像表现为诊断金标准。以临床有颅神经受累症状或 2 个增强序列都显示颅神经强化为诊断柔脑膜颅神经受累的标准。

结果:42 例肺癌患者中,以脑脊液脱落细胞检查阳性或共同诊断柔脑膜转移典型影像表现的共 30 例,其中 12 例患者无柔脑膜转移。在 30 例有柔脑膜转移的患者中,3D 黑血序列显示脑沟裂柔脑膜强化的有 30 例,而 3D FLAIR 序列增强脑沟裂柔脑膜强化的有 25 例。颅神经受累的患者共 22 例,其中,3D FLAIR 序列显示颅神经强化 22 例,而 3D 黑血序列显示颅神经强化 18 例。

结论: 在当前样本条件下, 3D 黑血序列增强对肺癌柔脑膜脑沟裂线样强化显示能力优于 3D FLAIR 序列, 但在柔脑膜神经受累的表现上, 3D FLAIR 序列显示能力表现更好。联合 3D FLAIR 序列和黑血序列增强, 将提高对肺癌柔脑膜转移诊断的信心和认识。

PO-3013

肝胆特异期信号强度比值和表观弥散系数在 肝脏局灶性病变良恶性鉴别诊断中的应用

黄小兰¹、彭婕²、周建军¹

1. 复旦大学附属中山医院厦门医院

2. 长江大学附属第一医院

目的: 探讨钆塞酸二钠磁共振增强肝胆特异期 (Hepatobiliary phase, HBP) 信号强度比值及表观弥散系数 (Apparent diffusion coefficient, ADC) 值在肝脏局灶性病变良恶性诊断中的应用价值。

方法: 回顾性分析 2020 年 12 月-2021 年 12 月长江大学附属第一医院收治的肝脏局灶性病变患者 85 例, 均于术前行钆塞酸二钠磁共振增强检查及弥散加权成像检查, 测量所有病灶的 ADC 平均值 (ADCmean)、ADC 最大值 (ADCmax)、ADC 最小值 (ADCmin), 同时测量肝胆特异期病灶信号强度 (Lesion signal intensity, SI_{HBPlesion})、肝脏信号强度 (Liver signal intensity, SI_{HBP}_{liver}) 并计算二者的信号强度比值 (Lesion-to-liver signal intensity ratio, LSIR), 以病理结果为金标准, 采用受试者工作特征 (ROC) 曲线比较各参数鉴别肝脏局灶性病变良恶性的诊断效能。

结果: 良性组的 ADCmean、ADCmax、ADCmin、LSIR 均大于恶性组, 差异均具有统计学意义 ($P < 0.05$); ADCmean、ADCmax、ADCmin、LSIR 的 ROC 曲线下面积均大于 0.9; LSIR 的 ROC 曲线下面积大于 ADCmax、ADCmin, 差异具有统计学意义 ($P < 0.05$); LSIR 诊断肝脏局灶性病变良恶性的敏感度 93.2%, 特异度 100.0%, ROC 曲线下面积为 0.995。

结论: LSIR、ADCmean、ADCmax、ADCmin 对于肝脏局灶性病变良恶性均具有良好的诊断效能, LSIR 的诊断效能高于 ADCmax、ADCmin。

PO-3014

对比增强全身 MRA 新技术的临床应用研究

孔祥闯、李景阳、富青、雷子乔、郑传胜

华中科技大学同济医学院附属协和医院

目的 利用压缩感知 (compressed sensing, CS) 技术, 研究单次注射、半剂量对比剂一站式超快速 3D 高分辨对比增强全身 MRA 成像 (3D-CS-CE-MRA) 的可行性和临床应用价值。方法 前瞻性收集 83 例临床怀疑全身动脉疾病前来行 MR 全身血管检查的患者, 分为 A、B 两组, A 组 44 例, B 组 39 例。A 组行 3D-CS-CE-MRA 扫描, 对比剂总量为 0.15mmol/kg, 单次注射, 流速为 2ml/s; B 组行常规 3D-CE-MRA 扫描, 对比剂总量为 0.4mmol/kg, 分两次注射, 每次用量均为 0.2mmol/kg, 流速为 2ml/s。两组患者在性别、年龄、身高、体重上均无统计学差异。分析两组 25 个节段动脉的图像质量, 并对各段动脉进行评分; 选取颈总动脉、腹主动脉、股动脉、腘动脉测量信噪比 (SNR) 和对比噪声比 (CNR), 采用 Kolmogorov-Smirnov 检验比较两种方法在颈总动脉、腹主动脉、股动脉、腘动脉四段动脉 SNR 和 CNR 的差异; 以及两种扫描方案对全身 25 段动脉的主观评分差异。 $P < 0.05$ 为差异有统计学意义。头臂干、胸主动脉、腹主动脉、肾动脉、肠系膜上动脉、腹腔干、髂总动脉、髂外动脉血管显示评分差异无统计学意义 (P 均 > 0.05), A、B 两组评分无显著差异; 颈总动脉、椎动脉、股动脉、腘动脉、胫前动脉、胫后动脉、腓动脉血管显示评分差异有统计学意义。

义 (Z 值 1.38~3.96, P 均 ≤ 0.05), A 组评分均高于 B 组。结论 3D-CS-CE-MRA 只需一次对比剂注射且无需减影即可快速完成磁共振全身血管检查, 相对于常规 3D-CE-MRA 对比剂用量减少了一半, 对于全身各级血管的显示优于 3D-CE-MRA, 对临床诊断多系统动脉血管疾病具有重要临床价值。

PO-3015

3.0 T 磁共振三维成像序列对腰骶神经根成像的一致性对比研究

曹赫、张前、祖涵瑜、姜兴岳*
滨州医学院附属医院

目的 探讨 3.0 T 磁共振三维成像序列, 即三维多回波数据联合成像 (three dimensional multi-echo data image combination with selective water excitation, 3D MEDIC WE)、三维快速自旋回波成像 (three dimensional sampling perfection with application optimized contrasts by using different flip angle evolution, 3D SPACE STIR) 和三维双回波稳态 (three-dimensional double-echo steady state, 3D DESS) 序列在腰骶神经根成像中的可行性和重复性。

方法 将有 52 例腰椎间盘突出伴单侧下肢疼痛的患者分别应用三种腰骶丛神经根成像, 评价图像质量参数估计信噪比 (estimated signal to noise ratio, SNR)、估计对比噪声比 (estimated contrast to noise ratio, eCNR) 和估计对比度 (estimated contrast ratio, eCR), 并验证健侧和患侧测量神经根直径的一致性。

结果 三序列测得神经根直径的一致性较高, 图像质量评价指标显示, 3D SPACE STIR 序列与 3D DESS、3D MEDIC 序列间差异均有统计学意义, 在三项指标中占优, 3D MEDIC WE 和 3D DESS 图像质量评分差异无统计学意义。三序列均能清晰显示正常腰骶丛神经根、病变所致的形态增粗神经根以及间盘突出受挤压变形的神经根。

结论 3D SPACE STIR、3D MEDIC WE 和 3D DESS 序列可应用于腰骶丛神经根成像, 三序列对正常和异常形态、走行的神经根评估具备很高的可行性和重复性。

PO-3016

FACT 序列脂肪定量技术的临床运用研究

郭茜、尚全良、司徒卫军、张帅
中南大学湘雅二医院

目的: 评价联影 uMR790 磁共振定量技术对脂肪肝患者的临床运用价值。

方法: 对 60 例受试者用联影 uMR790 脂肪定量技术进行扫描, 其中脂肪肝组 38 例, 正常组 22 例。由两名经过训练的放射科住院医师对 38 名脂肪肝组分别勾画感兴趣区测量 CSE-MRI 衍生的 PDFF、同反相位 IOP 法得到的脂肪分数 (Fat fraction, FF) 值, 正常组仅测量 PDFF 值。使用组内相关系数 (ICC)、正态性检验、Spearman 相关系数、非参数秩和检验、Kappa 检验统计分析。

结果: 两名放射科医师对联影磁共振脂肪定量 FACT 序列扫描脂肪肝组所得的图像行后处理所测得的 PDFF 值分别为 190.2‰ (145.0‰, 218.4‰)、198.9‰ (146.7‰, 216.0‰), ICC 值为 0.979, 用同反相法所测得的 FF 值分别为 228.0‰ (177.4‰, 277.5‰)、233.8‰ (176.7‰, 269.6‰), ICC 值为 0.983, PDFF 值及 FF 值的测定可重复性均较好。脂肪肝组 FACT 序列所得的 PDFF 值及同反相法所测得 FF 之间相关系数 r 等于 0.85, 呈高度相关。脂肪肝组和正常组间 PDFF 值 (脂肪肝组 PDFF 值 196.7‰ (145.7‰, 212.8‰), 正常组 PDFF 值 (32.6 \pm 12.6)‰) 比较存在显著性差异 ($P < 0.001$) (偏态分布数据用四分位间距法表述, 正态分布数据用均数 \pm 标准差表述)。

结论: 联影 uMR790 磁共振脂肪定量技术 PDFF 值及 IOP 法 FF 值可重复性高, 相关性强, 对定量肝脂肪变性具有较好的临床意义, 值得被广泛推广运用。

PO-3017

基于增强心脏磁共振电影图像的组学分析对 心肌淀粉样变患者的预后预测价值

王银秋
四川大学

目的: 建立并验证基于增强心脏磁共振电影图像的组学模型对于心肌淀粉样变患者的全因死亡的预测价值。

方法: 前瞻性收集 172 例心肌淀粉样病患者的增强心脏磁共振图像及临床信息, 随访患者的终点事件为全因死亡。分别在电影图像上标记心肌区域 ROI (ROI1) 和心肌加血池区域 ROI (ROI2), 并提取组学特征。采用 LASSO 回归筛选组学特征, 分别构建基于 ROI1 和 ROI2 的组学模型并计算每个患者的组学分数 (Radscore), 分别通过 ROC 分析比较组学模型与 LGE 半定量参数 (QALE) 及梅奥 2004 分期系统对于心脏受累的 AL 淀粉样变患者 1 年随访的预后预测效能。另外, 采用单因素/多因素回归筛选临床特征, 并结合 Radscore 构建 Nomogram 用于预测患者预后。采用 ROC 分析评估模型的 1 年生存率预测效能, 采用决策分析曲线评估模型临床价值, 采用 Kaplan-Meier 法进行生存分析。

结果: 分别最终筛选了 3 个基于 ROI1 以及 4 个基于 ROI2 的影像组学特征, 以及 3 个临床特征用于模型构建。基于 ROI1 的组学模型 (Rad-ROI1), 在训练集和验证集的 AUC 分别为 0.718 和 0.694, 基于 ROI2 的组学模型 (Rad-ROI2) 在训练集和验证集的 AUC 分别为 0.760 和 0.750, 优于 QALE (训练集 AUC=0.705, 验证集 AUC=0.697) 及梅奥 2004 分期系统 (训练集 AUC=0.653, 验证集 AUC=0.593)。联合 Radscore-ROI2 和临床特征的 Nomogram 模型在训练集和验证集的 AUC 分别为 0.847 和 0.843。决策曲线分析结果也证实 Nomogram 的临床净收益高于其他模型。Kaplan-Meier 生存分析表明基于 Nomogram 的风险分层可以有效预测患者生存情况, 在训练集的 HR 为 3.288 ($p<0.001$), 验证集的 HR 为 4.431 ($p<0.001$)。

结论: 与梅奥 2004 分期系统相比, 基于增强心脏磁共振电影图像的组学模型对于心肌淀粉样变患者的 1 年生存率预测效能更好, 联合 Radscore 及临床特征的 Nomogram 模型则具有比单独组学模型更好的预测效能。

PO-3018

肺癌 B1 场校正 T1 mapping 影像组学特征的可重复性研究

江建芹¹、刘佳²、崔磊²、肖勇¹、符益纲¹、胡春洪³

1. 盐城市第一人民医院

2. 南通市第一人民医院 (南通大学第二附属医院)

3. 苏州大学附属第一医院

目的: 探讨肺癌 B1 场校正 T1 mapping 影像组学特征的测量可重复性。

方法: 回顾性收集 70 例肺癌患者的胸部 T1 mapping 和 T1 容积内插屏气 (volumetric interpolated breath-hold examination, VIBE) 图像, 其中, 有 41 例进行了 T1 mapping 重复扫描。2 名独立测量者采用半自动勾画方法在 T1 mapping 和 T1-VIBE 图像上画取整个病灶体积的兴趣区并提取影像组学特征。采用组内相关系数 (Interclass correlation coefficients, ICCs) 评价组学特征在观察者内、观察者间及重复扫描的可重复性。

结果: T1 mapping 和 T1-VIBE 各提取了 1906 个特征, 其观察者内及观察者间的平均 ICC 分别为 0.947、0.947、0.893 和 0.866, 分别各有 1450 (72.72%) 和 1768 (91.76%) 个影像组学特征同时满足观察者内和观察者间的一致性; T1 mapping 重复扫描的平均 ICC 为 0.788, 有 1002 (52.57%) 个 T1 mapping 组学特征同时满足重复扫描的可重复性 ($ICC \geq 0.80$)。其中, 形状特征表现出最佳的重复扫描可重复性 ($ICC \geq 0.80$: 100%), 而一阶特征、GLCM 及 GLSZM 纹理特征表现出相对较差的可重复性 ($ICC \geq 0.80$: 49.75%~53.98%)。基于不同变换的特征中, Gradient 变换明显提高了原始特征的可重复性 ($ICC \geq 0.80$: 86.05%), 而 Exponential、LBP2D、LBP3D、Logarithm 和 Square 变换的特征降低了原始特征的可重复性 ($ICC \geq 0.80$: 36.05%~50%)。结论: T1 mapping 的影像组学特征表现出中等可重复性, 在临床应用之前需要首先对其进行可重复性评估。

PO-3019

磁共振 DTI 技术定量参数在脑淋巴瘤与高级别胶质瘤鉴别中的应用

张利岩
西宁市第一人民医院

目的: 探讨磁共振弥散张量成像 (DTI) 技术在脑淋巴瘤与高级别胶质瘤鉴别中的应用效果, 结合 DTI 技术定量参数进行分析。方法: 收集 2018 年 4 月~2019 年 5 月期间于我院接受诊疗的 20 例脑淋巴瘤与 20 例高级别胶质瘤患者作为研究对象, 分别作为观察组和对照组, 应用磁共振 DTI 技术进行临床诊断, 比较两组的磁共振 DTI 技术定量参数。结果: 根据 DTI 三维重建图像显示, 观察组脑淋巴瘤患者与对照组高级别胶质瘤主要表现为病灶区白质纤维束破坏, 分别占比 65%和 70%, 其他表现为病灶区白质纤维束浸润征象, 对比差异无统计学意义 ($\chi^2=0.403$, $P=0.835$)。观察组病灶的各项异性指数 (FA) 与对照组无显著差异 ($P>0.05$), 而表观弥散系数 (ADC)、轴向弥散系数 (DA) 和径向弥散系数 (DR) 均显著低于对照组 ($P<0.05$)。观察组脑淋巴瘤患者病灶区的 FA、ADC、DA 以及 DR 均显著低于对侧正常脑组织区 ($P<0.05$)。对照组高级别胶质瘤患者病灶区的 FA、ADC、DA 以及 DR 均显著低于对侧正常脑组织区 ($P<0.05$)。结论: 在脑淋巴瘤与高级别胶质瘤的临床诊疗中, 应用磁共振 DTI 技术进行诊断, 结合两者在 DTI 技术定量参数上的差异性, 对于两种疾病进行准确鉴别, 从中了解脑淋巴瘤与高级别胶质瘤的差异性, 便于实施针对性的治疗措施。

PO-3020

9 例阴道斜隔综合征影像表现及相关文献学习

慕庚明、贾田菊、王丽芳、郭笑寒、胡锦涛、陈宝莹
西安国际医学中心医院

摘要:目的 探讨 MRI 在阴道斜隔综合征中的应用价值, 并进行文献复习, 旨在提高对该疾病的认识。方法 回顾性分析 2020 年 5 月-2023 年 8 月于我院进行 MRI 检查并经宫腔镜证实为阴道斜隔综合征患者的临床影像资料。结果 9 例患者均证实为阴道斜隔综合征, 其中 5 例双子宫, 4 例完全性纵膈子宫; 6 例患者合并患侧肾缺如及相应斜隔后腔积液, 积血; 2 例患者诊断为阴道斜隔综合征合并膀胱-阴道间瘘管形成。MRI 可清晰显示子宫、宫颈部、阴道形态异常, 还可确定斜隔走行, 是否有交通支形成, 还可明确泌尿系统是否异常, 进一步指导临床分型。

结论 MRI 可以明确诊断阴道斜隔综合征, 为临床进一步手术或宫腔镜提供指导性意见, 对于手术方式的选择至关重要。

PO-3021

常规 MRI 分形分析预测成人较低级别胶质瘤 IDH1 突变状态

王玉瑶、张瑾、韩宇、颜林枫、崔光彬
空军军医大学唐都医院

目的 探讨常规 MRI 分形分析参数预测成人较低级别胶质瘤 IDH1 突变状态的临床应用价值。**方法** 回顾性分析我院 2017 年 2 月至 2021 年 4 月经手术病理证实为较低级别胶质瘤且 IDH1 突变状态明确的 151 例患者的临床及影像资料, 其中 IDH1 突变组 118 例, IDH1 野生组 33 例。所有患者术前两周内采集常规平扫及增强 MRI。两名放射科医师基于 FLAIR 图像完成肿瘤全域的分割。利用 Image J 及 Fraclac 插件提取肿瘤全域的分形维数 (FD) 及孔隙度 (LAC) 参数, 并采用独立样本 t 检验比较两组间参数差异。采用组内相关系数 (ICC) 评价两名医师参数提取的观察者内及观察者间一致性。二元 logistic 回归构建联合参数 (FD+LAC) 诊断模型。利用受试者工作特征 (ROC) 曲线评价参数/模型诊断效能; 不同参数/模型效能比较采用 Delong 检验。**结果** FD、LAC 观察者内及观察者间一致性均较好 (ICC 均 >0.8 , P 均 <0.001)。与 IDH1 突变组相比, 野生组具有更高的 FD 平均值 (IDH1 野生组, 1.286 ± 0.054 ; IDH1 突变组, 1.188 ± 0.038 ; P 均 <0.001) 和更高的 LAC 平均值 (IDH1 野生组, 0.457 ± 0.069 ; IDH1 突变组, 0.365 ± 0.031 ; P 均 <0.001)。ROC 曲线分析结果显示, FD、LAC 及联合参数模型 (FD+LAC) 在预测成人较低级别胶质瘤 IDH1 突变状态的 AUC 值为 0.929、0.888、0.937, 敏感度为 91.53%、93.22%、90.68%, 特异度为 84.8%、75.76%、84.85%。**结论** 常规 MRI 分形分析有助于预测成人较低级别胶质瘤 IDH1 突变状态, FD+LAC 联合参数的诊断效能进一步提升, 有望为临床决策提供理论依据。

PO-3022

自动脑分割在帕金森病、多系统萎缩及进行性核上性麻痹鉴别诊断中的应用

贾鸣男¹、刘朝曦²、有慧¹、冯逢¹
1. 中国医学科学院北京协和医院
2. 首都医科大学附属北京天坛医院

目的: 由于帕金森综合征 (帕金森病 (PD)、进行性核上性麻痹 (PSP)、多系统萎缩 (MSA)) 患者不同疾病各脑区的萎缩程度不同, 本研究拟采用自动脑分割技术, 对帕金森综合征患者的各脑区体积进行比较, 并提出新的计算指数用于鉴别诊断。

方法: 回顾性收集北京协和医院 2020 年 11 月至 2023 年 2 月、由运动障碍专业的神经内科教授诊断为帕金森综合征的患者共 171 例, 进一步筛选出明确诊断为帕金森病 (117 例)、进行性核上性麻痹 (27 例)、小脑共济失调型多系统萎缩 (MSA-C) (17 例) 及震颤麻痹型多系统萎缩 (MSA-P) (10 例) 的患者。所有患者采集 3D T1 加权翻转快速扰相梯度回波序列, 利用上海联影公司自动脑分割软件进行脑分割。

结果: MSA-C 与 MSA-P 患者所有感兴趣区的体积无明显差异 (均 $P > 0.05$)。MSA-C 患者的全小脑体积小于 PD 和 PSP 患者 (均 $P < 0.05$)。PSP 患者的双侧丘脑体积小于 MSA-C 和 PD 患者 (均 $P < 0.01$)。MSA-C、MSA-P 和 PSP 患者的中脑、脑桥及延髓体积均小于 PD 患者 (均 $P < 0.05$)。与 MSA-C 和 PD 患者相比, PSP 患者的第三脑室体积明显增大 (均 $P < 0.05$)。MSA-C 和 PSP 患者的第四脑室体积明显大于 PD 患者 (均 $P < 0.05$)。另外, 通过计算 (桥脑×第三脑

室)/(中脑×丘脑) 体积比, PSP 患者的数值明显大于 MSA-C、MSA-P 和 PD 患者 (均 $P<0.05$), 其他各组间无明显差异 (均 $P>0.05$)。(桥脑×第三脑室)/(中脑×丘脑) 体积比可将 PSP 患者与 MSA-C、MSA-P 和 PD 患者鉴别, 诊断效能优于手动测量的磁共振帕金森综合征指数 (均 $P<0.05$)。

结论: 通过自动脑分割软件, 帕金森病、进行性核上性麻痹、多系统萎缩患者不同脑区的体积值有明显差异。基于自动脑分割所获得的体积值, (桥脑×第三脑室)/(中脑×丘脑) 体积比可作为良好的鉴别诊断指标。

PO-3023

基于多种磁共振弥散加权成像模型对膀胱癌肌层浸润性的评估

郭俊婷¹、王效春²

1. 山西医科大学

2. 山西医科大学第一医院

目的: 本研究旨在探究多种磁共振弥散加权成像模型预测膀胱癌肌层浸润性的可行性。

方法: 前瞻性地纳入从 2022 年 1 月到 2022 年 6 月疑诊膀胱癌的患者, 术前行常规 MRI 及多 b 值弥散加权成像检查, 并在 2 周之内经病理确诊, 将所有病人分为非肌层浸润性 (NMIBC) 和肌层浸润性膀胱癌组 (MIBC), 将多 b 值弥散图像进行后处理, 得到 6 个弥散模型参数图, 包括单指数模型 (MEM)、连续时间随机游走模型 (CTRW)、体素内不相干运动模型 (IVIM)、拉伸指数扩散模型 (SEM)、扩散峰度成像 (DKI) 和分数阶微积分扩散模型 (FROC)。两名放射科医生 (分别具有 10 年和 8 年的泌尿系统阅片经验) 在 DWI ($b=0 \text{ sec/mm}^2$) 上分别勾画完整的肿瘤作为感兴趣区 (VOI), 肿瘤直径大于 5mm, 排除掉肿瘤柄和出血坏死组织, 然后将 VOI 复制到所有的模型参数图像。应用独立样本 t 检验或 Mann Whitney U 检验评估各弥散参数在两组中是否存在统计学差异, 将有统计学差异的参数进行 Logistic 回归分析, 结合最优子集筛选, 找到最佳参数组合, 绘制受试者工作特征曲线, 计算曲线下面积 (AUC), 灵敏度及特异度, 所有的统计学分析都采用 SPSS 软件, P 值小于 0.05 被认为有统计学差异。

结果: 60 名患者中, MIBC 患者 13 名, NMIBC 患者 47 名。就单个参数而言, CTRW- α , CTRW-D, CTRW- β , Mono-ADC, DKI-Dapp, IVIM-D, IVIM-f 和 SEM-DDC 在 NMIBC 组中显著高于 MIBC ($P<0.05$), ROC 曲线分析显示, CTRW-D 和 SEM-DDC 的 AUC 最高, 均达到 0.838; 对联合参数而言, CTRW-D, FROC- β 和 FROC- μ 联合起来产生最好的诊断效能 (AUC: 0.887, 95% CI: 0.779-0.954, 灵敏度: 92.3%, 特异度: 80.9%), 优于单个参数。

结论: 研究表明多种弥散模型可以作为一种非侵入性和定量的方式评估膀胱癌肌层浸润性, CTRW 和 FROC 模型的联合可以有效鉴别 NMIBC 和 MIBC, 在未来的临床应用中可以作为一种有效的工具指导诊疗。

PO-3024

基于 MRI 扩散张量成像评价宫内孤立性侧脑室扩张胎儿脑白质改变

张超^{1,2}、陈瑞可³、孙聪⁴、王光彬^{1,2}、吴丹³

1. 山东省立医院

2. 山东大学

3. 浙江大学

4. 北京医院

目的: 应用 MRI 扩散张量成像 (DTI) 评价宫内轻中度孤立性侧脑室扩张胎儿脑白质纤维束的改变。

方法: 收集 2022 年 8 月至 2023 年 8 月在山东省立医院超声或 MRI 检查确诊为宫内轻中度孤立性侧脑室扩张胎儿 20 例【孕周为 24~36 (29.9±3.6) 周】和 22 例孕龄匹配的正常对照胎儿【孕周为 24~36 (30.2±3.7) 周】。对所有胎儿均行颅脑常规磁共振和 DTI 检查。对 DTI 数据进行处理, 分析比较两组间胼胝体的膝部和压部、小脑中脚, 双侧的丘脑前幅射、皮质脊髓束、下纵束、额枕下束等七种主要纤维束的 DTI 指标差异, 包括分数各向异性(FA)、平均扩散率(MD)、轴向扩散率(AD)和径向扩散率(RD)。两组间各纤维束 DTI 指标的比较采用独立样本 t 检验, 对于丘脑前幅射、皮质脊髓束、下纵束、额枕下束等纤维, 通过对双侧区域的测量值进行平均比较差异。

结果: 与正常对照胎儿组相比, 轻中度孤立性侧脑室扩张胎儿下纵束的 FA 值升高 (0.142±0.012 比 0.133±0.015, $p=0.033$) 具有统计学差异, 未发现其余纤维束 DTI 指标之间的差异。

结论: 宫内 DTI 成像可以在一定程度上反映轻中度孤立性侧脑室扩胎儿脑白质的改变, 其中只存在下纵束 FA 值的升高具有显著差异, 为轻中度孤立性侧脑室扩胎儿的预后评估提供了一定的客观依据。

PO-3025

基于 3D-IDEAL-IQ 序列评估椎旁肌肌肉脂肪浸润的可行性验证: 一项多中心研究

郭益彤、何波
昆明医科大学第一附属医院

椎旁肌是影响腰椎稳定、运动和功能的重要肌肉。腰痛患者比健康参与者表现出明显更多的直立脊柱肌肉脂肪浸润。脂肪浸润是腰部肌肉健康的重要生物标志物, 对于临床决策和预后评估至关重要。评估腰椎旁肌肉的脂肪浸润程度十分重要。影像学评估以非侵入性、准确、可重复为突出优点。

本研究旨在验证通过 3D-IDEAL-IQ MRI 序列量化椎旁肌肌肉脂肪浸润的可行性、可重复性及一致性, 与其他常用的 2D-IDEAL 序列的 IP/OP 评估、ImageJ 半自动软件测量、Goutallier 肉眼评分三种量化方法得出的结果进行对比, 为选择量化脂肪浸润的方法提供思路。

选取 L4-S1 层面多裂肌、竖脊肌作为目标肌肉。通过 3D-IDEAL-IQ 序列获得质子密度脂肪分数 (PDFF); 通过半自动软件 ImageJ 勾画多裂肌和竖脊肌边界, 阈值法识别脂肪组织, 脂肪浸润百分比 (FIA) 计算为 CSA 脂肪/CSA 肌肉; 通过 IP、OP 序列获得纯水、纯脂肪序列图像, 将勾画的 ROI 复制到另一图像, 通过 IP+OP/2 计算脂肪分数 (FF)。符合正态分布的参数使用平均值±标准差来表示, 不符合则使用四分位法, 使用 U 检验评估四种方法间组件差异, 使用 Pearson 相关系数或 Spearman 评估 PDFF 值与 FIA、FF、GC 值的相关性, 使用 Bland-Altman 评估 PDFF 值与 FIA、FF、GC 值的偏倚。

四种评估方法在量化 L4-S1 层面椎旁肌脂肪浸润时都存在差异, 在 L5-S1 竖脊肌处组件差异最大。PDFF 作为金标准, 可量化某处肌肉整体脂肪含量, 在四种评估方法中观察者间、观察者内部一致性最高, 但花费高、扫描时间长, 不同设备间还需进行统一。FF 与 PDFF 结果相关性较低, 普遍存在伪影大等问题, 偏移值最多。FIA 与 PDFF 相关性最大, 偏移值最少, 但半自动软件勾画耗费人力、时间。GC 作为一种简单的视觉评分数字量表, 可以简单快速评估脂肪浸润程度, 常用于评估某种骨关节疾病外科术后的临床结局, 但观察者一致性中等。应当根据具体应用来选取量化脂肪浸润的“最佳”方法。

PO-3026

腹部异位脂肪对糖代谢异常的潜在指示作用

李啸扬

首都医科大学附属北京友谊医院

目的：本研究目的是分析不同代谢状态人群腹部脂肪分布的差异，并探究最有风险提示价值的异位脂肪沉积部位。

材料与方法：本研究共纳入 98 例受试者，包括糖代谢正常组 53 例，糖代谢异常组 45 例（均为初诊未治疗），行磁共振及实验室生化检查并收集基本体征（年龄、性别、BMI 等）。采用质子密度脂肪分数(proton density fat fraction, PDFF)测量值来表示胰腺脂肪分数(pancreatic fat fraction, PFF)和肝脏脂肪分数(hepatic fat fraction, HFF)，同时测量皮下脂肪组织(subcutaneous adipose tissue, SAT)及内脏脂肪组织(visceral adipose tissue, VAT)。分析不同代谢组间脂肪分布的相关性及差异。采用受试者工作特征(ROC)曲线分析不同部位脂肪沉积的提示意义。

结果：相关性分析显示 BMI 与空腹胰岛素($r=0.473$, $P<0.001$)、胰岛素抵抗指数 HOMA-IR ($r=0.363$, $P<0.001$) 及 C 反应蛋白($r=0.245$, $P<0.05$)相关性最强，BMI 仍是评估胰岛素抵抗状态的重要参考。胰腺脂肪与空腹血糖($r=0.247$, $P<0.05$)及糖化血红蛋白 HbA1c ($r=0.363$, $P<0.001$)具有良好的相关性，胰腺脂肪沉积愈严重，则提示血糖控制状况愈差。随着 BMI 的增加，胰腺脂肪($r=0.272$, $P<0.01$)、皮下脂肪($r=0.613$, $P<0.001$)及内脏脂肪($r=0.519$, $P<0.001$)呈明确上升趋势，但肝脏脂肪变化相对比较随机。相同 BMI 不同代谢状态人群间脂肪分布存在差异，糖代谢异常组的胰腺脂肪含量明显高于代谢正常组，胰腺脂肪也是提示糖代谢异常的可靠指标，尤其是在体重正常组和超重组中(曲线下面积分别为 0.859 和 0.864)。

结论：基于 MR 的脂肪定量技术提供了 BMI 之外的脂肪分布信息，不同代谢状态的人群，其脂肪分布模式存在差异。观察发现，相较于其他器官或部位，胰腺脂肪沉积较严重的人群发生糖代谢紊乱的风险更高。

PO-3027

不同积液量 TMD 伴疼痛患者的静息状态功能磁共振成像研究

刘蕊、王鹏

云南大学附属医院（云南省第二人民医院、云南省眼科医院）

目的 通过静息状态功能磁共振成像（rs-fMRI）观察不同积液量引起的颞下颌关节紊乱病（temporo-mandibular disorders, TMD）伴疼痛患者的脑活动，探索这些患者异常脑活动是否存在差异。

材料与方法 前瞻性纳入 2023 年 6 月至 2024 年 2 月云南大学附属医院 47 例颞颌关节紊乱伴疼痛的患者，根据患者的 MRI 影像表现分为微量积液组 24 例、少量积液组 13 例及大量积液组 10 例。受试者完成自评量表，TMD 伴疼痛患者接受视觉模拟评分，所有受试者均接受 rs-fMRI 检查；基于全脑灰质体素分析静态和动态 ALFF 的组间差异并进行 AlphaSim 校正，将存在组间差异的静态和动态 ALFF 值与临床指标做相关性分析。

结果 受试者后扣带回的静态和动态 ALFF 均增加(全脑水平未校正 $P=0.005$;感兴趣区水平 AlphaSim 校正, 体素水平 $P<0.005$, 簇水平 $P<0.05$)，且大量积液组静态和动态 ALFF 值增加的较少量及微量积液组多。

结论 TMD 伴疼痛患者关节腔积液量与静态和动态 ALFF 变化有关，此外造成相关脑区出现异常的主要原因可能为心理因素。

PO-3028

运用磁共振 Dixon 技术研究 2 型糖尿病与肝脏及胰腺脂肪含量的相关性

郑永宏、杨晟升、陈贤源、吕洁勤、苏家威、俞顺
福建省立医院

目的：肥胖会导致肝脏和胰腺异位脂肪沉积，从而影响胰岛素抵抗、血糖水平和代谢控制，并引发 2 型糖尿病（type 2 diabetes mellitus, T2DM）。为了评估肥胖、异位脂肪沉积与糖尿病之间的关系，本研究采用 MR Dixon 技术对 T2DM 组和健康对照组的肝脏和胰腺脂肪含量（fat fraction, FF）进行量化的测量。

方法：使用 MR Dixon 数据测量了 167 名受试者的全肝脂肪含量（FF of whole liver, FFWL）和全胰腺脂肪含量（FF of whole pancreas, FFWP）、胰腺最大直径、腹部皮下脂肪面积（the abdominal subcutaneous adipose area, SAT）、内脏脂肪组织面积（the visceral adipose tissue area, VAT）和腹部脂肪组织总面积（the total abdominal adipose tissue area, TAT）。根据体重指数数值分为四组。组内和组间比较采用独立样本 t 检验进行统计。

结果：T2DM 组（BMI<25）与对照组（BMI<25）、T2DM 组（BMI≥25）与对照组（BMI≥25）、T2DM 组（BMI<25）与 T2DM 组（BMI≥25）的 FFWL、FFWP 和 VAT 有显著差异（均 $P<0.05$ ）。对照组（BMI<25）与对照组（BMI≥25）的胰尾 FF、SAT 和 TAT 有显著差异（ $P<0.05$ ）。FFWP 和胰尾 FF 在正常或轻度肝脏脂肪含量的 T2DM 受试者和对照组之间差异显著（ $P<0.05$ ）。

结论：MR Dixon 技术可以评估与 T2DM 密切相关的器官脂肪沉积。无论 BMI 值如何，T2DM 患者都应关注组织脂肪含量。

PO-3029

基于 MRI-DTI 及 MAGIC 技术对面肌痉挛患者的脑结构和功能的研究

霍芊芊、张庆欣
青海省人民医院

目的：本研究对面肌痉挛患者及健康人群应用 MAGiC-MRI、DTI-MRI 技术，明确面肌痉挛患者组存在异常变化的脑区及其定量值，再将差异具有统计学意义的定量值与 HFS 患者的病程和痉挛程度分级做相关性分析。

方法：收集 2023 年 8 月至 2024 年 3 月于青海省人民医院神经内科门诊确诊的面肌痉挛患者 30 例，以及同期于该院体检的一般资料（年龄、性别、受教育程度）与面肌痉挛组相匹配的体检健康人员 30 例，通过 MAGiC、DTI 技术对所有研究对象各个脑区均测量 T1 值、T2 值、PD 值及 FA 值、RD 值、ADC 值变化并进行统计学分析，选取具有组间差异的 DTI 及 MAGIC 参数与面肌痉挛患者的病史、痉挛程度进行 Pearson 相关性分析。

结果：独立样本 t 检验结果表明，与健康对照组相比，HFS 患者胼胝体干、胼胝体膝部及整体、双侧下纵束、下额枕束、左上纵束、内囊左后肢、以及丘脑后辐射 FA 值减低，RD 值差增加。面肌患者病程、痉挛程度与胼胝体体部及整体的 FA 值呈负相关。

结论：面肌痉挛患者的双侧下纵束、下额枕束、左上纵束、内囊左后肢、丘脑后辐射及胼胝体存在广泛损伤，主要表现为胼胝体的髓鞘受损，可能与病程长短及痉挛严重程度都有关系。

PO-3030

基于 3.0T MR 的裸鼠颅内异种原位癌模型构建评估的应用研究

朱艳^{1,2}、蔡佳¹、王建良¹、蔡佳¹、张瑞琪^{1,2}

1. 昆山市第一人民医院

2. 江苏大学医学院

目的:胶质瘤的裸鼠异种原位癌模型构建难度大, 成功率低, 肿瘤生长状况难以观测。本研究拟通过应用常规国产 3.0T MR 搭配小鼠线圈对裸鼠进行 MR 多参数颅脑扫描, 获取颅内原位肿瘤的大小、坏死面积、周围组织受累等情况的直观影像数据, 为胶质瘤异种裸鼠原位癌模型构建提供评估依据。**方法:**

1. 胶质瘤原位癌模型构建: 选取 4 周左右雌性裸鼠, 麻醉后使用脑立体定位仪设计额叶皮层注射坐标(AP: +1.5 mm, ML: -1.0 mm, DV: +2.4mm)并进行开颅, 利用微量进位器向设定脑区注射 5×10^5 个人源性胶质瘤细胞 (分别为 U87 及 U251 细胞), 注射完消毒并缝合切口。2. 多参数 MR 扫描: 应用联影 3.0T uMR780 磁共振搭配联影 Mouse coil-8 线圈, 分别于术后第 10、14、17、21、24、28、31、35、42d 进行 MR 连续扫描, 采集序列为改良后 T1WI、T2WI、T2WI-FLAIR 横断位序列, FOV: 30x20mm, 层厚 1.0mm, 层间距 0mm, 扫描后应用 3D slicer 软件对颅内病灶进行精准体积测量, 绘制生长曲线, 同时根据多参数信号表现评估肿瘤内坏死面积及周围组织受累。**结果:** 应用立体定位仪进行裸鼠胶质瘤原位癌模型构建并进行磁共振扫描评估, 结果表明: U251 细胞移植的异种胶质瘤原位癌最早可在移植后第 14 天成瘤, 肿瘤体积约为 $3.79 \pm 0.62 \text{mm}^3$, 于 28 天左右肿瘤达到最大并见粗大流空血管影, 体积约 $104.42 \pm 12.72 \text{mm}^3$, 此后肿瘤内可见坏死发生, 裸鼠出现一侧肢体活动不良、下肢瘫痪并体重迅速减轻。U87 细胞移植原位癌最早在移植后 21 天可见肿瘤发生, 体积约 $3.80 \pm 2.11 \text{mm}^3$, 于 42 天左右肿瘤仍在以较缓速度增长, 体积约 $53.78 \pm 9.60 \text{mm}^3$, 少见流空血管影, 肿瘤坏死、裸鼠肢体活动障碍及体重减轻均发生较晚。

结论:

本研究应用 3.0 T 磁共振及小鼠线圈进行裸鼠颅脑扫描, 可对裸鼠颅内异种胶质瘤原位癌模型构建进行肿瘤体积、瘤内坏死及周围组织受累情况评估, 该评估方法具有连续性、准确性及直观性。

PO-3031

Omicron 感染后急性期到慢性期恢复趋势以及持续性白质异常

黄思泓、李聪、赵伟、杜彦瑶、杨隆涛、黄仪杰、陈雁菁、刘萍、刘军

中南大学湘雅二医院

Objective To investigate the microstructural integrity following Omicron infection, considering the prior understanding of less severe impact compared to other strains.

Methods We enrolled 162 post-Omicron infection patients and 17 healthy controls (HCs_2023) in our study. Additionally, we included 17 HCs recruited in 2022 (HCs_2022) as another control group. Separate comparisons were conducted between patients and the two control groups. Furthermore, subgroup comparisons were performed based on neurological symptoms and the intervals between infection and scans. DTI, neurite orientation dispersion and density imaging were utilized to assess white matter integrity. Cognitive function was evaluated using Wechsler Intelligence scale. Correlations between diffusion metrics and cognitive function were also analyzed.

PO-3032

2 型糖尿病患者脑结构链接独立成分分析及
个体结构网络拓扑属性差异

林琳、沈晶、伍建林
大连大学附属中山医院

目的：采用链接独立成分分析对 T2DM 脑结构不同模态进行独立成分分析且确定每个模态的最佳权重，分析个体结构网络拓扑属性，探究这些变化与 T2DM 患者认知功能的相关性。

材料与方法：招募了 80 名 T2DM 和 55 名性别、年龄和受教育年限匹配的健康受试者；采用 FSL 及 DPABISurf 软件提取被试大脑灰质密度、皮层厚度、皮层表面积进行 LICA 分析；构建个体脑结构网络，利用 Kullback-Leibler 离散 (KLS) 的相似性对网络脑区间的边进行定量；然后使用 GRETNA 软件评估脑结构网络的拓扑属性的全局和节点属性。我们对两组的被试权重系数及脑结构网络属性进行双样本 t 检验比较两组的结构形态学差异与形态学脑网络的差异，使用 Bonferroni 进行多重比较校正。提取组间差异成分的被试权重系数、网络拓扑属性与临床指标、认知量表进行相关性分析 ($p < 0.05$)。

结果：IC12、IC13 成分在两组间有统计学差异 ($p < 0.05$)；IC12 成分由灰质密度权重 85%，皮层表面积权重 6%，皮层厚度权重 8% 组成。与正常对照组相比，T2DM 的双侧角回、颞中回、额上回、丘脑、楔前叶、距状裂周围皮层、眶部额下回灰质密度减低，双侧顶上小叶及右侧额中回灰质密度增加。IC13 成分由灰质密度权重 14%，皮层表面积权重 14%，皮层厚度权重 70% 组成。T2DM 左侧楔叶灰质密度增加；左侧角回、颞中回灰质密度减低；T2DM 双侧颞极皮层厚度减低，左侧嗅觉皮层及右侧直回皮层厚度增加。

在 0.05-0.55 的稀疏度范围内，两组都表现出相似小世界拓扑属性 ($p > 0.05$)；T2DM 左侧额中回、辅助运动区及舌回的节点效率及度中心性减低 ($p < 0.05$)。经 Bonferroni 校正后，左侧额上回的节点效率 ($r = 0.788$, $p = 0.035$) 和度中心性 ($r = 0.794$, $p = 0.001$) 与 AVLT 呈正相关。

结论：两组的组间差异成分以灰质密度和皮层厚度为主，这与老龄化和 AD 有相似特征；T2DM 患者脑结构网络具有与正常人相同的小世界属性，但 T2DM 患者节点属性损伤，且与认知相关评分呈正相关；这些为探究 T2DM 相关认知功能损伤提供新的角度。

PO-3033

伴自杀意念青少年重性抑郁障碍动态脑功能改变与皮质醇的相关性研究

陈若宜、陈盼、王颖
暨南大学

目的：本研究试图探讨伴自杀意念青少年重性抑郁障碍 (MDD) 患者静息态动态局部和全脑的功能连接特征改变及其与下丘脑-垂体-肾上腺 (HPA) 轴失调的相关性。

方法：采用静息态功能磁共振成像 (rs-fMRI) 对青少年 48 例伴自杀意念患者、38 例不伴自杀意念 MDD 患者和 41 例健康对照 (HC) 扫描。对数据进行预处理，利用滑动时间窗的分析方法，计算三组被试动态局部一致性 (dReHo) 和 dFC 值；对完成 MRI 扫描的受试者，在 MRI 扫描 24 小时内静脉采血，采用直接化学发光法测定促肾上腺皮质激素 (ACTH) 和皮质醇。采用单因素方差分析比较三组的 dReHo、dFC 值；采用单因素方差分析比较三组的激素浓度。将差异有统计学意义的脑区的 dReHo 值和 dFC 值与激素浓度进行 pearson 相关分析。

结果：

1、dReHo 值比较：三组右侧小脑后叶 (主要是 Crus II 和 Crus I) 及左侧楔前叶的 dReHo 值存在统计学差异。与 HC 组和不伴自杀意念组比较，伴自杀意念青少年 MDD 患者组右侧小脑后叶 (主要是 Crus II 和 Crus I) 的 dReHo 值增高，左侧楔前叶 dReHo 值减低；与 HC 组比较，不伴自杀意念组左侧楔前叶 dReHo 值增高。

2、dFC 值比较：三组 dReHo 值差异脑区左侧楔前叶与左侧颞中回、双侧楔前叶的 dFC 值存在统计学差异。与 HC 组比较，伴自杀意念青少年 MDD 组左侧楔前叶与左侧颞中回的 dFC 值减低，不

伴自杀意念组左侧楔前叶与左侧颞中回的 dFC 值减低、双侧楔前叶的 dFC 值增高；与不伴自杀意念组比较，伴自杀意念青少年 MDD 组左侧楔前叶与双侧楔前叶的 dFC 值减低。

3、HPA 轴激素比较：与 HC 和不伴自杀意念 MDD 患者相比，伴自杀意念 MDD 患者皮质醇浓度较低。三组间 ACTH 浓度无统计学差异。

4、相关性分析：伴自杀意念青少年 MDD 组左侧楔前叶的 dReHo 值、左侧楔前叶-左侧颞中回的 dFC 值均与皮质醇浓度正相关。

PO-3034

MRI-DWI 联合 HE4、CA125 对卵巢良恶性肿瘤诊断鉴别的价值

霍芊芊、韩程、张庆欣
青海省人民医院

目的：评估磁共振成像弥散加权成像 (DWI) 联合人附睾蛋白 4 (HE4)、糖类抗原 (CA125) 在卵巢良恶性肿瘤鉴别中的价值。

方法：选择 2021 年 3 月—2023 年 3 月就诊于青海省人民医院的 163 例卵巢肿瘤患者作为研究对象。所有患者均接受 DWI 检查及血清 HE4、CA125 水平检测，以病理学检查结果为金标准，对比卵巢良恶性肿瘤患者的血清 HE4、CA125 水平及 DWI 相关指标，并评估 MRI-DWI、HE4、CA125 及三者联合鉴别卵巢良恶性肿瘤的诊断效能。

结果：病理学检查结果显示，例卵巢肿瘤患者中恶性肿瘤 67 例，良性肿瘤 96 例；恶性肿瘤患者血清 HE4、CA125 水平比良性肿瘤患者高 ($P < 0.05$)；恶性肿瘤病变最大径比良性肿瘤大，ADC 值比良性肿瘤患者低，且以囊壁/分隔不均匀、T2 压脂信号不均匀为主 ($P < 0.05$)；将病理学诊断结果作为金标准，MRI 鉴别卵巢良恶性肿瘤的敏感性为 79.10% (95% CI: 0.736, 0.849)，特异性为 84.38% (95% CI: 0.762, 0.883)，准确性为 82.21% (95% CI: 0.764, 0.860)；HE4 的敏感性为 74.63% (95% CI: 0.610, 0.813)，特异性为 78.13% (95% CI: 0.745, 0.810)，准确性为 76.69% (95% CI: 0.652, 0.808)；CA125 的敏感性为 64.18% (95% CI: 0.592, 0.685)，特异性为 80.21% (95% CI: 0.729, 0.847)，准确性为 73.62% (95% CI: 0.639, 0.770)；联合检测的敏感性为 85.07% (95% CI: 0.785, 0.910)，特异性为 90.63% (95% CI: 0.852, 0.933)，准确性为 88.34% (95% CI: 0.850, 0.933)。

结论：

卵巢恶性肿瘤患者的 DWI 影像学特点以 T2 压脂信号不均匀、ADC 值低，且存在囊壁或分隔不均匀、囊实性等为主，且联合检测血清 HE4、CA125 可提升卵巢肿瘤良恶性鉴别的诊断效能，为临床诊治提供参考。

PO-3035

ConSept 法下扩张型心肌病心肌 T2 值准确性评估

杨帅、雷子乔、孔祥闯
华中科技大学同济医学院附属协和医院

[摘要] 目的：横向弛豫时间定量成像(T2 mapping)可以无创性定量心肌初始横向弛豫时间(T2 值)，T2 值增加主要与心肌水肿或炎症有关，除应激性心肌病外，其他各类型的心肌病都伴有不同程度的弥漫性 T2 值增加，因此 T2 值的直接测量对于反应疾病相关的水肿炎症情况意义重大，传统的测量 T2 值的方法在 AHA 协会的建议下，将感兴趣区勾画在短轴全部心肌，操作稳定性差，而且心肌 T2 值受场强、序列类型、心率以及心肌节段等因素的影响较大，因而其在临床上的应用受到限制。近年来很多学者均已采用 ConSept 法进行心肌 T1 值的测量，并取得了较好的结果，ConSept 法测量时，中间层间隔壁较游离壁更厚，更容易将 ROI 放置在致密心肌内，也可以减少了心外膜下脂肪的影响。本研究拟对比中间层间隔壁(conservatively within the midventricular septum, ConSept)法和 SAX 法测量的扩张型心肌病 T2 值，来比较两种方法下 T2 值的一致性，以此解决 T2 值测量的稳定性问题，并为临床各类心肌病提供有价值的心肌水肿，炎症信息。方法：回顾性收集华中科技大学协和医院采用 1.5T 心脏磁共振扫描的 44 例扩张型心肌病(dilated cardiomyopathy, DCM)患者 and 17 例健康对照者。根据 DCM 患者是否存在 LGE 分为 LGE 阳性组和 LGE 阴性组。将 ROI 分别放置在 ConSept 法或 SAX 法的心肌层面进行初始 T2 值测量，比较两种方法测得的心肌初始 T2 值的差别。结果：DCM 组采用 ConSept 或 SAX 法测得的 T2 值均高于对照组(均 $P < 0.001$)，LGE 阳性组的 T2 值均大于 LGE 阴性组(均 $P < 0.05$)。ConSept 法和 SAX 法测得的中间层 T2 值与基底层、心尖层 T2 值无明显差别(均 $P > 0.05$)，具有非常好的一致性[(concordance correlation coefficient, CCC)=0.974]。结论：在扩张型心肌病的 T2 值测量中，与 SAX 法相比，ConSept 法测量心肌初始 T2 值的效率更高，更利于实现，适合在临床工作中使用。

PO-3036

生长激素缺乏对儿童结构脑网络影响研究

王雪雯、谭辉、郑文斌△
汕头大学医学院第二附属医院

目的：生长激素缺乏 (GHD) 不仅会影响儿童身体成长，还会影响大脑成熟，从而引起儿童在认知功能及神经心理上出现不同程度的障碍。但目前对 GHD 儿童的结构脑网络发育机制研究较少，尤其是不同组间患儿的结构脑网络差异。本研究通过比较不同组别的矮小儿童脑网络复杂结构的影像学特征，横向研究生长激素缺乏程度对儿童的结构脑网络影响。

方法：招募 64 名矮小儿童，根据临床生长激素激发试验结果分为完全性 GHD (N=22)，部分性 GHD (N=22) 和特发性矮小 (ISS, N=20)。分别采集患儿的颅脑薄层 T1, DTI 序列数据，用 PANDA 及 GRETNA 软件构建其结构脑网络，比较不同组间儿童在结构脑网络的差异。

结果：完全性 GHD 组患儿聚类系数低于 ISS 组 ($P=0.013$)，而完全性 GHD 组的特征路径长度 ($P=0.022$) 及小世界属性 ($P=0.037$) 均高于部分性 GHD 组。部分性 GHD 组特征路径长度低于完全性 GHD 组 ($P=0.022$) 及 ISS 组 ($P=0.032$)，而网络效率高于完全性 GHD 组 ($P=0.020$) 及 ISS 组 ($P=0.030$)。

结论：不同程度生长激素缺乏能够对相应患儿结构脑网络发育产生特异性影响。功能磁共振结合图论分析方法可以为 GHD 患儿神经脑网络研究提供更多影像学依据。

PO-3037

基于多模态 MRI 影像组学预测脑胶质瘤 IDH1 基因突变及 MGMT 基因甲基化状态

赵伟、罕迦尔别克·库锐、徐蕊、王云玲
新疆医科大学第一附属医院

目的：本研究旨在通过多模态 MRI 影像组学方法预测脑胶质瘤 IDH1 基因突变及 MGMT 基因甲基化状态，以提供一种非侵入性的分子生物学标志物检测方法，为个体化治疗提供依据。

方法：回顾性分析 2021 年 1 月-2023 年 8 月在新疆医科大学第一附属医院就诊的，经组织病理学证实为脑胶质瘤且具有 IDH1 基因突变及 MGMT 基因甲基化状态信息的患者 150 例。应用 T1WI、T2WI、T2-FLAIR 及 T1-CE 序列进行影像组学特征提取，随后，采用机器学习算法对特征进行训练和优化，建立 IDH1 基因突变及 MGMT 基因甲基化状态预测模型。

结果：在预测脑胶质瘤 IDH1 基因突变方面，多模态 MRI 影像组学方法取得了显著的效果。多序列联合预测模型的 AUC 为 0.925，高于单一的 T1WI、T2WI、T2-FLAIR、T1-CE 模型，且在训练集和测试集上都展现了良好的泛化性能。对于预测 MGMT 基因甲基化状态，多序列联合预测模型的 AUC 为 0.874，均高于单一的 T1WI、T2WI、T2-FLAIR、T1-CE 模型，证明了其在该领域的应用潜力。结果表明，多模态 MRI 影像组学方法在预测脑胶质瘤 IDH1 基因突变和 MGMT 基因甲基化状态方面都取得了显著的效果。

结论：本研究表明，基于多模态 MRI 影像组学的预测模型可用于非侵入性地预测脑胶质瘤 IDH1 基因突变及 MGMT 基因甲基化状态。与传统的基因检测方法相比，多模态 MRI 影像组学具有操作简便、高效性和可行性等优势。该方法的应用将为脑胶质瘤患者提供个体化治疗策略的制定提供依据，具有重要的临床应用前景。

PO-3038

2 型糖尿病海马血管周围间隙扩大与海马容积及认知功能的相关性研究

高洁¹、潘佩纯²、张东升¹、汤敏¹、雷晓燕¹、张小玲¹
1. 陕西省人民医院
2. 陕西中医药大学

目的 本研究拟通过分析 2 型糖尿病 (T2DM) 患者海马血管周围间隙扩大 (H-EPVS)、海马容积和认知功能之间的关系，探讨 H-EPVS 是否独立于海马萎缩加重 T2DM 患者认知功能障碍。

方法 连续性收集陕西省人民医院内分泌科就诊的 T2DM 患者 53 例，其中 T2DM 患者认知受损组 30 例，T2DM 患者认知正常组 23 例，所有患者接受头颅 MRI 扫描、蒙特利尔认知评估量表 (MoCA) 和 Rey 听觉词语学习测试 (RAVLT)。取 T2WI 图像上 H-EPVS 计数最多的一个层面，分别计算左右两侧 H-EPVS 的计数数目，并由左右两侧 H-EPVS 计数相加获得总 H-EPVS 计数。采用 VBM 分析计算获得每个被试的总海马容积和全脑容积，对总海马容积进行标准化以避免头颅大小引起的个体差异。比较 T2DM 认知正常组和认知受损组 H-EPVS 计数、总海马容积、MoCA 评分及 RAVLT 评分的差异。采用多元线性回归分析评价 H-EPVS 计数、总海马容积与 RAVLT 评分的相关性。

结果 相比于 T2DM 认知正常组，T2DM 认知受损组的总 H-EPVS 计数显著增加，MoCA 评分显著降低 ($P < 0.05$)，而 RAVLT 评分在两组间未见明显差异。相关性分析显示总 H-EPVS 计数与 RAVLT 评分呈负相关 ($r = -0.279$, $P = 0.043$)，而总海马容积与 RAVLT 评分无显著相关关系。校正总海马容积、年龄、性别、受教育年限后，多因素回归分析结果提示 RAVLT 评分与总 H-EPVS 计数显著相关 (回归系数 $\beta = -0.324$, 95% CI: $-1.524 \sim -0.149$, $P < 0.05$)。

结论 H-EPVS 计数可能独立于海马萎缩加重 T2DM 记忆功能降低, 有望作为预测 T2DM 记忆功能受损更敏感的影像学标志物, 有效防治脑小血管病对 T2DM 认知功能可能具有保护作用。

PO-3039

轻微肝性脑病脑功能网络动态度中心性的改变及其与代谢紊乱的关系

黄辉伟、陈华俊
福建医科大学附属协和医院

目的: 研究轻微性肝脑病(minimal hepatic encephalopathy, MHE)中动态度中心性(dynamic degree centrality, dDC)的变化及其与代谢紊乱和认知障碍的关联。

方法: 58 例肝硬化患者(22 例为 MHE 患者, 36 例为非轻微肝性脑病(without MHE, NHE)患者)和 22 名健康对照者, 所有受试接受了静息态功能磁共振成像、1H-磁共振波谱成像和基于精神量表肝性脑病评分的神经认知测验(PHES, Psychometric Hepatic Encephalopathy Score)。获得了后扣带回和楔前叶的代谢物比值, 包括谷氨酸和谷氨酰胺 (glutamate and glutamine, Glx) /总肌酸 (total creatine, tCr)、肌醇 (myo-inositol, ml) /tCr、总胆碱/tCr 和乙酰天冬氨酸/tCr。对于每个体素, 度中心性被定义为其与大脑中其他体素的功能连接之和; 使用滑动窗口相关性方法计算每个体素的 dDC。

结果: NHE 和 MHE 的 Glx/tCr 呈逐步增加趋势, 而 ml/tCr 呈逐步减少趋势。在双侧后扣带回和楔前叶(region of interest [ROI1])、双侧额叶内侧上部和前扣带回 (ROI2) 以及左侧尾状核中观察到显著的 dDC 差异。ROI2 的 dDC($r = 0.450, P < 0.001$)和 ml/tCr($r = 0.297, P = 0.024$)与 PHES 相关。ROI1 的 dDC 与 Glx/tCr($r = -0.413, P = 0.001$)和 ml/tCr($r = 0.554, P < 0.001$)之间存在显著相关。ROI2 的 dDC、Glx/tCr 和 ml/tCr 显示出区分 NHE 和 MHE 的潜力(曲线下面积分别为 0.655、0.672 和 0.859)。

结论: 我们的研究结果表明轻微肝性脑病中存在动态脑网络紊乱, 与代谢紊乱和神经认知障碍有关。

PO-3040

扩散峰度成像评估 IgG4 肾脏疾病的可行性研究

张晓霄、张古沐阳、许梨梨、张家慧、白鑫、陈丽、彭倩瑜、郭二嘉、孙昊、金征宇
中国医学科学院北京协和医院

目的: 探索免疫球蛋白 G4 (IgG4)相关肾脏疾病(IgG4-KD)在弥散峰度成像(DKI)中的影像学表现, 并探讨基于 DKI 的定量参数在 IgG4-KD 评估中的价值。

方法: 共 23 例 IgG4-KD 患者纳入该前瞻性研究。所有患者均接受包括 T1WI、T2WI 及 DKI 序列在内的双肾 MRI 检查。两名放射科医生一直评估 MR 图像, 确定肾脏病变的分布模式(位置、偏侧性和多发性)及肾脏病变的信号强度(低、等或高)。同时, 两名医师通过在肾门层面的 DKI 图像中勾画 ROI 的方式定量测量双肾实质、双肾皮质及双肾髓质的以下各项定量参数: 平均弥散峰度 (MK), 平均扩散系数 (MD) 和表观扩散系数 (ADC), 利用组内相关系数 (ICC) 评价观察者间一致性。收集患者肌酐、肾小球滤过率 (eGFR)、IgG4、IgG、补体及血沉等临床指标, 评价其与肾脏定量 DKI 参数的相关性。

结果: IgG4-KD 典型表现为双侧(90.91%)、多发(95.24%)和肾实质斑片状病变(90.48%), T1WI 呈等信号(80.96%), T2WI 呈低信号(85.71%), DKI($b = 2000$)呈高信号(95.24%)。肾皮质 MK、肾实质 MK、肾实质 ADC 及肾皮质 ADC 一致性良好 (ICC: 0.822-0.846), 双肾髓质 MD 一致性差 (ICC: 0.121), 余参数一致性适中 (ICC: 0.729-0.752)。MK、MD 及 ADC 与右肾无差异。肾实

质、肾皮质和肾髓质的 MK 及 ADC 无明显差异, 然而肾皮质的 MD 高于肾实质及肾髓质。基于 DKI 得到的 MK 参数与包含肾功能在内的多项临床指标存在相关性。eGFR 与肾皮质 MK 呈负相关 ($r = 0.66, p=0.002$), IgG 与肾实质 MK 呈正相关 ($r = 0.58, p = 0.02$), 血沉与肾实质 MK 呈正相关 ($r = 0.58, p = 0.004$)。

结论: DKI 图像可用于评估 IgG4-KD 肾脏影像改变, 基于 DKI 得到的定量参数 MK 与 IgG4-KD 临床指标相关, 具有评估 IgG4-KD 的潜力。

PO-3041

个体特异性功能连接对阻塞性睡眠呼吸暂停患者 认知障碍分类及预测研究

李海军、李利锋、彭德昌
南昌大学第一附属医院

目的: 阻塞性睡眠暂停 (OSA) 患者认知障碍表现不一致性, 给临床诊断和治疗评估带来挑战, 然其机制尚不清楚。以往的神经影像学研究主要集中在患者和健康对照 (HC) 之间的平均差异, 忽略了患者之间跨大脑区域的连贯振荡活动的个体特异性差异。本研究基于静息态功能磁共振成像探索了个体特异性功能连接对 OSA 无认知障碍 (OSA-NC)、OSA 伴轻度认知障碍 (OSA-MCI) 患者、HC 分类的影响及个体间变异性预测认知障碍的潜在价值, 有助于 OSA 的潜在神经影像学标志物。

材料与方法: 收集了 82 例 OSA (OSA-NC 41 例, OSA-MCI 41 例) 患者和 HC 82 例磁共振及临床数量, 采用 Dosenbach 160ROIs 脑区模版, 基于多任务学习的稀疏凸松弛交互结构优化 (MTL-sCASO) 方法提取个体特异性功能连接, 并且计算脑功能连接的个体变异性模式 (IVFC), 并通过最小绝对收缩和选择算子 (LASSO) 进行特征选择, 最后利用支持向量机 (SVM) 分类器完成 OSA-NC/OSA-MCI/HC 的分类任务。此外, 采用双样本 t 检验来计算分类过程中最具辨识力的功能连接的组间差异 ($p < 0.05$)。

结果: 与传统皮尔森相关构建的功能连接的分类准确度结果 (79.5%) 比较, 基于个体特异性功能连接对 OSA/HC 的二分类的准确度高达 91.8%, 同时个体特异性功能连接对区分 OSA-MCI/HC (95.9%)、OSA-NC/HC (93.7%) 的分类性能要明显优于使用皮尔森相关得到的功能连接 (87.8%, 88.1%), 尽管个体特异性功能连接在区分 OSA-NC/OSA-MCI 的准确度稍差 (81.3%), 但明显高于皮尔森相关得到的功能连接 (63.8%)。在分类过程中最具辨识力的功能连接网络, 主要在默认网络、执行控制网络, 其连接强度及个体连接变异性在组间的存在显著差异。

结论: 使用个体特异性连接提高了对 OSA-NC 及 OSA-MCI 识别准确度, 个体间功能连接变异性可预测 OSA 患者认知障碍, 个体特异性功能连接有望作为 OSA-MCI 诊断的潜在神经影像学标志物。

PO-3042

基于多序列 MRI 影像组学预测子宫内膜癌危险分层的研究

岳晓宁
菏泽市立医院

目的: 本研究旨在建立一个基于多序列 MRI 及临床特征的影像组学诺模图预测子宫内膜癌 (EC) 风险分层, 并评估该诺模图对高危 EC 的诊断效能。

方法: 回顾性分析 2017.01–2023.03 于本院术前行盆腔 MRI 检查的 210 例 EC 患者, 以最终手术病理结果为金标准, 将所有 EC 患者分为低危 EC 和高危 EC。收集每名患者的临床病理资料和常规 MRI 特征 [包括子宫肌层侵犯深度 (MI)、宫颈间质浸润状态 (CSI) 和肿瘤的最大直径]。采用单

因素和多因素回归分析明确临床独立危险因素。将所有患者按 7:3 的比例随机分成训练组（147 例）和测试组（63 例）。采用 3D-Slicer 软件在轴位 T2WI、DWI 及 DCE 序列上沿肿瘤边缘勾画三维感兴趣区（3D-ROI）。采用最小冗余最大相关算法（mRMR）和 LASSO 回归筛选各单一序列和组合序列中的最佳影像组学特征计算影像组学评分（Rad-score），联合临床独立危险因素和 rad-score 构建影像组学诺模图。采用 ROC 曲线评估训练组和测试组中各预测模型的诊断效能。通过临床决策曲线分析（DCA）、经重新分类指数（NRI）和总综合判别指数（IDI）评估影像组学诺模图的临床获益。

结果：Logistic 回归分析发现年龄、磁共振报告的 MI、CSI 及 D&C 是区分高危和低危 EC 的独立危险因素（ $P<0.05$ ）。联合临床危险因素和 Rad-score 构建影像组学诺模图。结果显示：Rad-score 及影像组学诺模图在训练集中的 AUC 分别为 0.823 和 0.926，在测试集中分别为 0.815 和 0.862。DCA 表明当概率阈值在 10%-94% 的范围内，使用诺模图预测高危 EC 获得的临床净收益大于 Rad-score。影像组学诺模图的 NRI 值为 0.512，IDI 值为 0.292，表明影像组学诺模图具有良好的临床实用性。

结论：患者年龄、D&C、MRI 报告的 MI 及 CSI 可作为鉴别高危和低危 EC 的独立危险因素。基于临床危险因素和多序列影像组学特征构建的影像组学诺模图可以在术前无创性地预测高危 EC。

PO-3043

酰胺质子转移 MRI 和扩散加权成像定量参数直方图在中央腺体区前列腺癌和前列腺增生结节鉴别的诊断价值

云游、陈学军、单东秋、王立峰
河南省肿瘤医院

目的：评估最新 3D APT MRI 和 ADC 定量参数直方图在中央腺体区对前列腺癌和前列腺增生结节鉴别的诊断价值。方法：收集本院经病理证实且既往未接受过治疗的患者，16 例中央腺体区前列腺癌患者；6 例良性前列腺增生患者。所有患者行前列腺常规 MRI 和 3D APT 检查。采用 MATLAB 2016a 软件进行图像后处理及直方图参数计算。将穿刺区域内对应的最高 PI-RADS 评分病灶定义为靶病灶，并逐层勾画。通过后处理分别获得 3D APT 和 ADC 图的 5%位数、25%位数、50%位数、75%位数、95%位数、峰度、偏度、均值、最大值、最小值。采用独立样本 t 检验或秩和检验，判断中央腺体区前列腺癌和良性前列腺增生结节各个参数是否有差异。采用 ROC 评估 3D APT 和 ADC 像各个参数的诊断效能，并用 Z 检验比较曲线下面积。结果：3D APT 直方图参数中，中央腺体区前列腺癌 5%位数（ $p=0.017$ ）、25%位数（ $p<0.001$ ）、50%位数（ $p=0.020$ ）、75%位数（ $p=0.017$ ）、峰度（ $p=0.023$ ）、偏度（ $p=0.008$ ）、均值（ $p<0.001$ ）明显大于良性前列腺增生结节。ADC 直方图参数中，中央腺体区前列腺癌 5%位数（ $p=0.018$ ）、25%位数（ $p=0.021$ ）、均值（ $p=0.038$ ）、最小值（ $p=0.008$ ）小于良性前列腺增生结节。在 3D APT 直方图各参数中，5%位数、25%位数、50%位数、偏度、均值诊断效能较好。AUC 分别为 0.958、0.958、0.917、0.875、0.922，75%位数和峰度 AUC 分别为 0.792、0.667，其中 5%位数、25%位数诊断效能比峰度高（ $p=0.022$ ）。在 ADC 直方图各参数中，5%位数、25%位数、均值、最小值 AUC 分别为 0.833、0.875、0.792、0.875，各个参数诊断效能没有差异。对比 3D APT 直方图 5%位数、25%位数、均值比 ADC 直方图诊断效能略高，但没有明显差异。结论：最新的 3D APT MRI 和 ADC 定量参数直方图在中央腺体区前列腺癌和前列腺增生结节鉴别中有较好的应用价值，3D APT MRI 的诊断效能略高。

PO-3044

心脏磁共振定量评估心脏移植术后患者心肌纤维化程度

赵洁、孔祥闯、杨明、于群、雷子乔、郑传胜
华中科技大学同济医学院附属协和医院

目的：通过心脏磁共振定量参数无创性评估心脏移植（HT）术后患者心肌纤维化的情况。

方法：前瞻性收集心脏移植（HT）术后的患者 78 例，平均移植时间约 1.6 年，按照心脏磁共振（CMR）标准化协议扫描，采用 CMR 特征跟踪(FT)技术在移植心脏中测量左室心肌应变参数，依据有无 LGE 将患者分为 LGE（+）和 LGE（-）两组，比较两组心肌整体纵向应变(GLS)、整体周向应变(GCS)和整体径向应变(GRS)。依据美国心脏协会 16 段模型测量左室基底段和中间段 T1 mapping、细胞外容积（ECV）等定量参数值，由于心尖段易受部分容积效应的影响，故不纳入测量。通过 ROC 曲线和 logistic 回归分析，探讨上述参数值与 HT 后心肌纤维化的关系。

结果：38 例(48.1%)患者检测到 LGE，LGE 中位范围 5%，以非典型梗死 LGE 模式更为常见。与 LGE(-)组相比，LGE(+)组供者年龄较大，心脏同种异体移植血管病变（CAV）发生率较高，利尿剂用量较高，左室质量（LVM）较高，左室射血分数（LVEF）较低，左室 GLS、GCS、GRS 降低，T1 mapping 与 ECV 有所升高，但未见明显差异。其中，GLS 与 LGE 独立相关，准确性约 76%，GLS 是判断 LGE 范围>5%的独立预测因子。

结论：GLS 能够准确的识别 HT 患者心肌纤维化情况，具有较高的诊断效能，可作为患者临床随访的一种无创检查方法。

PO-3045

肝性脑病患者局部自发脑活动异常改变的元分析

袁文欢、纪雪晴、张静*
兰州大学第二医院

【摘要】目的 探讨静息态功能磁共振成像（resting-state functional magnetic resonance imaging, rs-fMRI）研究肝性脑病（Hepatic encephalopathy, HE）患者最一致的易损大脑区域，揭示 HE 患者脑损伤潜在神经机制。方法 检索 2023 年 8 月以前采用局部一致性（regional homogeneity, ReHo）、低频振幅（amplitude of low-frequency fluctuation, ALFF）及分数低频波动振幅（fraction amplitude of low-frequency fluctuation, fALFF）方法探讨 HE 患者静息态局部自发脑活动异常改变的研究，依据纳入及排除标准，采用标记差异映像（signed differential mapping, SDM）软件对既往研究中 HE 患者相对于健康被试自发脑活动异常改变的脑区进行数据分析。结果 共纳入 19 篇文献（患者 433 例，健康被试 453 例）。基于元分析证实，静息态下 HE 患者局部自发脑活动异常增加脑区主要集中于右侧梭状回、右侧豆状壳核、左侧中央后回、左侧脑岛、右侧中央后回；异常减低脑区主要集中于右侧距状裂周围皮层、左侧距状裂周围皮层、左内侧和旁扣带脑回及左侧中央前回；（ $P < 0.001$ ，峰高 $Z > 1$ ，簇范围 ≥ 20 个体素）结论 应用脑功能元分析证实了 HE 患者相关核心脑功能异常的脑区，这些发现可能揭示 HE 患者脑损伤的神经病理基础及划定特定感兴趣区域进一步研究 HE 患者的脑功能改变。

PO-3046

自由呼吸全心黑血成像与普通黑血成像对比研究

赖世伟
贵黔国际总医院

目的：近年来心脏磁共振应用越来越广泛，其中黑血成像通过抑制血池信号，心肌呈相对高信号可突出显示心肌结构、形态及信号，但心脏黑血短轴位需要多次屏气才能得到多层图像，通过使用单激发快速自旋回波序列进行自由呼吸全心黑血成像，提高心脏磁共振检查成功率。

方法：前瞻性收集 2023 年 7 月至 2023 年 8 月之间在贵黔国际总医院行心脏磁共振患者图像资料 14 例，均在联影 uMR880 3.0T MR 扫描仪上使用 24 通道超柔体线圈进行扫描成像，所有患者均连续扫描了两组黑血短轴位序列，采用随机数字表法将两组序列分为 A 组、B 组，A 组为屏气序列扫描层数为 9 层，9 次屏气扫描，扫描时间为 120s，B 组为自由呼吸序列扫描层数为 9 层，无需屏气 1 次扫描，扫描时间为 15s。由放射科多名影像医师对两组心脏黑血短轴位序列整体图像质量进行评估，分别从信噪比、运动伪影、扫描时间进行客观评价，结果使用 SPSS 软件配对 t 检验进行分析。

结果：放射科医师主观评价得出 B 组图像质量稍优于 A 组。A、B 两组图像信噪比无较大差异，无统计学意义。由于 A 组序列需要进行 9 次屏气扫描，检查成功患者很难做到每次屏气均配合良好，故部分层面存在运动伪影，B 组为自由呼吸 1 次扫描无需屏气，图像均未出现运动伪影 ($P<0.01$)。自由呼吸序列无需屏气 15s 就可以得到全心黑血图像，普通黑血成像序列 1 次屏气 10s，9 次屏气配合较好且每次屏气期间让患者休息 5s，一共需要 120s 左右的时间，两者差异具有统计学意义 ($P<0.01$)。

结论：自由呼吸全心黑血成像相较于普通屏气黑血成像，患者舒适度更好、图像质量更佳、检查成功率更高，使屏气困难患者受益，在临床磁共振工作中有较高的应用价值。

PO-3047

MRI 影像组学模型预测肝细胞癌微血管侵犯的研究

陈娟、裴贻刚、刘文广、李文政
中南大学湘雅医院

目的：探讨基于术前增强 MRI 影像组学方法对肝细胞肝癌微血管侵犯 (MVI) 不同分级的术前预测价值。

方法：回顾性分析 340 例经手术病理证实为肝细胞肝癌病例的术前增强 MRI 图像资料以及临床资料，其中无 MVI (M0) 177 例，轻度 MVI (M1) 121 例，重度 MVI (M2) 42 例。将纳入患者分为三个组 (M0 与 M1 组，M1 与 M2 组，M0 与 M2 组)。每组患者按 7: 3 的比例随机分为训练集和验证集。分别从 T2WI、动脉期 (AP)、门脉期 (PVP) 序列高通量提取 1037 个特征参数，使用梯度提升决策树算法 (GBDT) 对特征参数进行降维。分别构建 3 期融合影像组学逻辑回归模型，临床影像模型以及临床影像组学模型。采用 ROC 曲线评价模型在训练集和测试集中预测肝细胞肝癌不同 MVI 分级的 ROC 曲线下面积 (AUC)、准确性、敏感性 & 特异性，并通过决策曲线分析 (DCA) 和校准曲线进行评估。

结果：M0 与 M1 组独立预测因素为肿瘤最大径；临床影像组学模型训练集的诊断效能 ROC 曲线下面积 (AUC) 值 0.755，测试集 AUC 值 0.754，3 期联合模型以及临床影像模型训练集 AUC 为 0.746 和 0.704，测试集 AUC 为 0.752 和 0.708。M1 与 M2 组独立预测因素包括 AST、AFP、肿瘤包膜，临床影像组学模型训练集的 AUC 为 0.868，测试集 AUC 值 0.819。3 期联合模型以及临床影像模型训练集 AUC 为 0.757 和 0.798，测试集 AUC 为 0.685 和 0.744。M0 与 M2 组独立预测因素为 AST、

AFP、肿瘤最大径、肿瘤包膜，临床影像组学模型训练集的 AUC 为 0.939，测试集 AUC 值 0.915。3 期联合模型以及临床影像模型训练集 AUC 为 0.901 和 0.872，测试集 AUC 为 0.893 和 0.907。结论：结合临床影像独立预测因子及 MRI 相关影像组学特征的联合模型是预测肝细胞肝癌微血管侵犯不同分级的最好模型。

PO-3048

大号超柔线圈 (Flexcoil Large) 应用于肩关节 MR 成像的可行性

胡帅、宋清伟、张浩南
大连医科大学附属第一医院

目的：探讨大号超柔线圈在肩关节 MR 成像中的可行性。

材料和方法：招募健康志愿者 10 例（男 6 例，平均年龄 26.40 ± 2.49 岁）。3.0T MR(Omega, UIH) 行肩关节轴位 T1WI，矢状位 T2WI，冠状位 PDWI 常规扫描及大号超柔线圈扫描，参数详见表 1。部分志愿者行多序列扫描，最终每组序列均为 10 例。采用 ROI 法测量肱骨，肱二头肌长头腱，三角肌信号值 (SI) 和标准差 (SD)，计算信噪比 (SNR) 和对比噪声比 (CNR)，两名观察者根据肌腱，冈上肌结构细节可见度、图像噪声以及诊断准确性对图像进行四分制主观评分 (表 2)。使用 Kappa 检验两观察者测量数据的一致性。对各序列不同组间图像的 SNR，CNR 和主观评分采用配对样本 t 检验， $P < 0.05$ 为差异具有统计学意义。

结果：两观察者主观评分一致性良好 (kappa: 0.773-0.828)，选择观察一主观评分进行后续分析。常规肩关节 MR 扫描及大号超柔线圈肩关节 MR 扫描多序列之间的肱骨、肱二头肌长头腱的 SNR、CNR 和主观评分均无统计学差异 ($p > 0.05$ ，表 3)。

结论：大号超柔线圈在肩关节 MR 成像中具有一定的应用价值。

临床意义：肩关节肿瘤患者和被迫体位的患者行常规肩关节扫描时，往往得不到最佳的扫描体位，影响图像的扫描和患者的就医感受，大号超柔线圈可以解决这一问题，并且很好地提高提高了患者检查舒适度。

PO-3049

人工智能辅助压缩感知技术应用于肩关节快速磁共振成像的可行性

胡帅、张浩南、宋清伟
大连医科大学附属第一医院

目的：探讨人工智能辅助压缩感知技术 (ACS) 应用于肩关节快速磁共振成像的可行性。

材料和方法：招募健康志愿者 10 例（男 6 例，女 4 例，平均年龄 26.40 ± 2.49 岁），3.0T MR(Omega, UIH) 行基于平行采集技术的 (PI) 和 ACS 的肩关节轴位 T1WI，冠状位 PDWI，矢状位 T2WI 扫描，采用的加速因子 (AF) 分别为 PI AF=2，ACS AF=2、2.5、3、3.5、4，T1WI 不同 AF 扫描时间分别为 134s、107s、84s、70s、60s、56s；T2WI 扫描时间分别为 113s、69s、58s、47s、41s、33s；PDWI 扫描时间分别为 99s、98s、75s、62s、54s、48s，其余参数详见表 1。部分志愿者行多序列扫描，最终每组序列均为 10 例。采用 ROI 法测量肱骨，肱二头肌长头腱，三角肌信号值 (SI) 和标准差 (SD)，计算信噪比 (SNR) 和对比噪声比 (CNR)，两名观察者根据关节盂唇清晰度、图像噪声以及诊断准确性对图像进行四分制主观评分 (表 2)。使用 Kappa 检验

两观察者测量数据的一致性。采用单因素方差分析检验三个序列不同 AF 之间 SNR、CNR 及主观评分的差异性。

结果：两观察者主观评分一致性良好 (κ : 0.799-0.882)，选择观察一主观评分进行后续分析。单因素方差分析不同 AF 间冠状位 PDWI 主观评分差异具有统计学意义 ($p < 0.05$, 表 3)。两两比较结果当 AF=3.5 时, PDWI 主观评分较常规序列显著降低 ($p < 0.05$, 表 4)。

结论：ACS 应用于肩关节 MR 具有良好的可行性, 当 ACS AF=4、4、3 时, 轴位 T1WI、矢状位 T2W、冠状位 PDWI 扫描时间缩短 58.2%、70.8%、37.4%, 图像质量满足诊断要求。

临床意义：ACS 应用于肩关节 MR 可以显著缩短扫描时间, 临床推荐应用 AF=4、4、3 行肩关节轴位 T1WI、矢状位 T2W、冠状位 PDWI 扫描。

PO-3050

基于多参数磁共振成像特征的深度学习预测直肠癌患者的 BRAF 基因突变状态

胡鸿博

哈尔滨医科大学附属第二医院

目的：鼠类肉瘤病毒癌基因同源物 B 基因 (BRAF) 基因突变状态和直肠肿瘤患者的生存率相关。本研究旨在探索应用由卷积神经网络组成的多参数核磁共振成像 (MRI) 影像组学模型预测结直肠癌患者 BRAF 基因突变情况的可行性。方法：我们检查了 260 名诊断为直肠癌患者, 利用外显子测序鉴定 BRAF 基因突变情况。对于年龄差异进行 T 检验, 性别进行卡方检验, 肿瘤分期进行配对 T 检验比较 BRAF 基因突变与野生组间差异。采用生存分析对 BRAF 突变与直肠癌预后进行分析。然后, 从 260 名具有多参数核磁共振成像的直肠癌患者中提取 7388 个特征, 其中包括术前 T1 加权图像 (W)、T2 加权图像 (2W) 和对比增强 T1 I 图像。最后, 利用卷积神经网络 (ConvNet) 建立了基于特征的放射组学模型。该模型可以使用 ROC 曲线、准确率、召回率、灵敏度和特异性作为评价指标, 进行自主学习分类、并进行 ROC 曲线评估模型效能。结果：研究对象中, 共包括 89 例 BRAF 突变患者, 171 例 BRAF 野生型患者。两组患者的肿瘤恶性分期, 年龄, 性别等临床特征无显著差别, 但是 5 年的生存期有显著差别。BRAF 突变组生存期显著低于 BRAF 野生组 ($P < 0.0001$)。该网络 ROC 曲线下面积达到 0.932, 表明具有较好的预测价值。结论：卷积神经网络构建的基于放射组学特征的模型具有区分直肠癌患者 BRAF 突变状态, 对未来无创筛查 BRAF 状态提供了新的思路。

PO-3051

基于直肠磁共振的直肠侧系膜结构观察及其临床价值的探究

臧书芹、沈浮、江思源、邵成伟、张卫

海军军医大学第一附属医院 (上海长海医院)

目的：通过回顾性分析接受直肠癌根治术患者的直肠 MRI 影像资料, 观察患者直肠侧系膜结构, 并测量相关参数：直肠系膜筋膜中断宽度、直肠中动脉类型和直肠中动脉最大管径。结合临床资料, 分析其对患者预后的影响。

方法：对 2017 年 1 月至 2018 年 12 月期间在我院接受直肠癌根治性切除术患者的数据进行回顾性分析。收集在术前曾行直肠磁共振检查的患者的影像学资料, 根据磁共振图像观察直肠侧系膜, 并测量相关参数与患者 3 年预后资料进行分析。

结果：最终有 260 例患者被纳入本研究。根据既往研究总结和本课题组相关研究, 将直肠中动脉分成 4 种类型：1 型为前外侧(AL)型, 分支于前列腺动脉、膀胱下动脉或子宫动脉；2 型为外侧(L)型,

从侧方直接进入直肠系膜；3 型为后外侧型(PL)，经由直肠骶骨筋膜进入直肠后壁；4 型为细小分支型，多个细小分支血管从直肠侧方进入直肠，无明显主干。在术前直肠磁共振中，所有患者的双侧均观察到直肠固有筋膜的中断。

根据患者 3 年生存情况将患者分为 3 年生存组和 3 年死亡组。3 年生存组患者直肠中动脉类型以 3、4 型为主。多因素 COX 回归分析结果显示直肠中动脉最大管径 ($P=0.026$, HR: 3.843, 95%CI: 1.173-12.589) 和直肠系膜筋膜中断宽度 ($P=0.043$, HR: 1.115, 95%CI: 1.003-1.239) 为患者预后的预测因素。

结论：直肠侧系膜和直肠中动脉固有存在，直肠系膜筋膜中断宽度和直肠中动脉最大管径是患者术后生存期短的危险因素。术中更好地处理直肠侧系膜，可能会改善患者预后，但仍需要进一步研究。

PO-3052

基于 3D T2WI 的直肠癌转移性淋巴结诊断：影像-病理对照研究

郭钰
吉林大学第一医院

研究目的：在 3D T2WI 序列对淋巴结评估时发现部分淋巴结具有“包膜征”和/或“中央点征”。本研究的主要目的是评估 3D T2WI 在淋巴结中的特殊征象是否对转移性淋巴结具有诊断价值，并构建 3D T2WI 序列淋巴结诊断模型。

研究方法：本研究前瞻性收集 39 名直肠癌患者，并通过术前 MR、术后标本 MR 及病理结果精准匹配获得 145 枚淋巴结（52 枚阳性淋巴结，93 枚阴性淋巴结）。分别评估精准匹配淋巴结在 2D T2WI 和 3D T2WI 序列上的影像学特征，并通过单因素与多因素 logistic 回归分析筛选转移性淋巴结独立风险/保护因素。分别构建基于 2D T2WI 和 3D T2WI 独立因素及现有指南因素的淋巴结诊断标准，比较不同诊断标准下淋巴结诊断效能，最后构建基于 3D T2WI 序列的淋巴结诊断模型。

研究结果：基于 3D T2WI 序列筛选的危险征象、保护征象及以现有指南征象的淋巴结诊断标准的诊断准确率分别达到 82.1%，92.4%和 87.6%，均显著高于 2D T2WI 序列的淋巴结诊断准确率 57.7% 和 63.5%。综合 3D T2WI 序列淋巴结边缘、内部信号、包膜征和中央点征，通过构建淋巴结转移诊断模型，在训练数据集中受试者工作特征曲线（the receiver operating characteristic, ROC）下面积（the areas under the curve, AUC）值及 95%置信区间（confidence interval, CI）为 0.981（0.963-1.000），在验证数据集中 AUC 值及 95%CI 为 0.986（0.968-1.000）。

研究结论：3D T2WI 序列观察的包膜征和中央点征有利于提高转移性淋巴结诊断敏感度及准确性，通过 3D T2WI 序列评估的影像学特征构建的淋巴结诊断模型可以实现较高的诊断准确度。

PO-3053

绝对定量磁共振灌注成像在缺血性脑卒中患者中的初步研究

马潇越、赵高扬、高而远、陈婷、赵锴、白洁、汪卫建、张勇、程敬亮
郑州大学第一附属医院

目的：初步探究绝对定量动态磁敏感对比增强自校准平面回波灌注加权成像（selfcalibrated echo planar imaging perfusion weighted imaging, SCALE-PWI）在定量缺血性脑卒中患者脑血流动力学变化方面的应用价值。

方法：前瞻性收集了 14 位缺血性脑卒中受试者的常规 MRI、SCALE-PWI 和临床数据。SCALE-PWI 检查采用高压注射器以 4 mL/s 的流速依次注射单剂量（0.1mmol/kg）钆对比剂（Magnevist, Berlex, Montville, NJ, USA）和 20 mL 生理盐水。随后，在线自动后处理生成定量脑血流（quantitative cerebral blood flow, qCBF）图和定量脑容量（quantitative cerebral blood volume,

qCBV) 图。2 位神经影像医生各自独立测量低灌注区、缺血核心区与镜像区的 qCBF 和 qCBV, 并计算缺血半暗带区与镜像区的 qCBF 和 qCBV。采用配对 t 检验、威尔科克森符号秩检验、受试者工作特征曲线等方法进行统计学分析, 均以 $P < 0.05$ 为差异有统计学意义。

结果: 图 1 展示了急性缺血性脑卒中受试者的 MR 影像。14 位缺血性脑卒中受试者低灌注区、缺血核心区、缺血半暗带区的 qCBF 和 qCBV 均低于镜像区正常脑白质的相应值 (所有 $P < 0.05$), 缺血核心的 qCBF 和 qCBV 均低于缺血半暗带的相应值 (qCBF 平均值分别为: 16.42 mL/100g/min 和 21.54 mL/100g/min, $P = 0.013$; qCBV 平均值分别为: 1.23 mL/100g 和 1.47 mL/100g, $P = 0.049$)。缺血核心 qCBF 的最佳临界值为 18.18 mL/100g/min, 缺血半暗带 qCBF 的最佳临界值为 28.09 mL/100g/min。

结论: 不同于以往的半定量灌注成像, SCALE-PWI 能够在短时间内检测缺血性脑卒中患者的绝对定量血流动力学信息, 有助于识别缺血核心和缺血半暗带, 具有指导制定个体化治疗方案的潜力。

PO-3054

APT 联合 IVIM 鉴别宫颈鳞状细胞癌病理分化程度

辛仲宏

兰州大学第一医院

目的 探讨酰胺质子转移加权成像 (APTWI) 联合体素内不相干运动 (IVIM) 鉴别宫颈鳞状细胞癌 (CSCC) 病理分化程度和国际妇产科学联合会 (FIGO) 分期的价值。

方法 纳入经 FIGO 标准确诊的 56 例 CSCC 患者和 30 名健康志愿者。CSCC 患者分为中高分化组 ($n=34$) 和低分化组 ($n=22$); FIGO 分期早期 ($<IIB$, $n=27$) 和晚期 ($\geq IIB$, $n=29$)。APTWI 采用 3D Multi-shot TSE 获得 APT 信号强度 (APT SI)。IVIM 使用 12 个 b 值 (0、20、100、150、200、300、400、500、600、800、1000 和 1200s/mm²) 计算参数 D、D* 和 f。ADC 值基于 2 个 b 值 (0、800s/mm²) 计算。

结果 CSCC 患者 APT SI 高于正常宫颈 ($P < 0.001$), ADC、D、f 低于正常宫颈 ($P < 0.001$)。中高分化组和低分化组的 APT SI 和 D 有显著性差异 ($P < 0.001$)。中高分化组与低分化组比较, APT SI、D、f 的曲线下面积 (AUC) 分别为 0.691、0.685、0.612, 敏感性分别为 60.94%、67.19%、50.00%, 特异性分别为 72.73%、68.18%、77.27% (所有 $P < 0.05$)。APT SI+IVIM 对 CSCC 的诊断效果最好, AUC 为 0.995, 敏感性为 94.64%, 特异性为 100.00%。鉴别 CSCC 病理分化程度, APT SI+IVIM 的诊断效果最好, AUC 为 0.754, 敏感性为 68.75%, 特异性为 77.27%。

结论 APTWI 联合 IVIM 可用于 CSCC 的诊断, 提供准确的定量信息。与 IVIM 相比, APTWI 在鉴别 CSCC 病理分化程度方面具有更高的诊断效能。APTWI 联合 IVIM 比单独使用 APTWI、IVIM 鉴别 CSCC 病理分化程度具有更高的诊断效能。

PO-3055

颅内动脉粥样硬化性闭塞持续时间分析及对非急性再通价值

曹宸¹、刘松¹、靳松¹、夏爽²

1. 天津市环湖医院

2. 天津市第一中心医院

目的: 对非急性颅内大血管闭塞的再通治疗可以改善患者预后, 且随着闭塞时间延长导致再通率下降, 但传统影像学术前对闭塞时间的判断较困难。因此, 利用高分辨血管壁成像 (HR-VWI) 分析颅内大血管闭塞不同时期的影像学特征, 探究闭塞血管随时间进展而产生的病理生理变化规律, 并根据其具体特性选择适合再通的非急性大血管闭塞类型。

方法：我们连续性回顾收集了病史明确的颅内大血管闭塞患者 218 例。按闭塞时间将上述数据分为急性期 77 例 (<3 天)、亚急性期 69 例 (3 天~3 周) 和慢性期 72 例 (>3 周) 大血管闭塞。分析其传统特征和直方图特征。比较急性期闭塞、亚急性期闭塞和慢性期闭塞患者的影像学差异，寻找闭塞血管随时间进展的生物学特性变化规律，进一步针对非急性大血管闭塞，采用多变量 Logistic 回归分析寻找适合再通治疗的闭塞类型特征。对部分接受血管内治疗的闭塞患者的再通成功率和手术细节进行了评估。

结果：本研究发现闭塞血管的平扫强度、出血信号、平均管径、强化指数及变异系数表现出随时间进展的一系列变化。针对非急性期大血管闭塞，利用血管壁特征的多因素 logistic 回归分析显示，平扫强度 (OR, 4.02 [95% CI, 2.10–7.69]; $p<0.001$)、强化指数 (OR, 2.02 [95% CI, 1.44–2.83]; $p<0.001$)、平均管径 (OR, 1.70 [95% CI, 1.21–2.38]; $p=0.002$) 和平扫偏度 (OR, 4.91 [95% CI, 1.02–23.58]; $p=0.047$) 是区分闭塞持续时间的 4 个显著特征，结合这 4 个特征的曲线下面积达 0.97，敏感性和特异性分别为 86.96% 和 100%。82.2% (45/54) 的患者 (亚急性 21/24, 87.5%; 慢性 16/21, 76.2%) 成功再通，并且慢性闭塞患者更多的使用了支架置入再通 ($p < 0.05$)。

结论：利用 HR-VWI 分析颅内大血管闭塞，发现不同闭塞持续时间的传统和直方图特征存在差异，阐明闭塞血管生物学特性随时间变化规律，通过有效鉴别大血管闭塞时间，为筛选适合血管内治疗再通的非急性大血管闭塞提供有效工具。

PO-3056

震颤型帕金森病的脑灰质体积及密度变化： 一项基于 VBM 的研究

李倩、袁立志、范敏、邱丽华
宜宾市第二人民医院

目的：采用基于体素的形态学测量 (VBM) 方法观察震颤型帕金森病患者脑灰质体积及密度的改变。

方法：纳入 34 例震颤型帕金森病患者 (患者组) 及与之相匹配的 34 名健康被试者 (正常对照组)，采用三维加权 T1 成像方式获取磁共振图像，并使用 VBM 的分析方法观察组间灰质体积与密度的差异及其临床意义。**结果：**与正常对照组相比，患者组右侧额上回灰质体积缩小，左侧中央前回、左侧中央后回、右侧中央前回、右侧中央后回灰质体积增加 (簇水平 P 均 <0.05 , FDR 校正)；与正常对照组相比，TD 组右侧岛叶、额上回、额下回及额上回灰质密度减低，左侧中央前回灰质密度增加 (簇水平 P 均 <0.05 , FDR 校正)；偏相关分析 (控制年龄、性别及教育程度) 显示，UPDRS 第三部分评分 ($r=-0.511, p=0.003$)、UPDRS 总分 ($r=-0.377, p=0.036$)、UPDRS 震颤得分 ($r=-0.363, p=0.045$) 及 H-Y 分期 ($r=-0.491, p=0.005$) 与右侧岛叶、右侧额上回、右侧额上回的灰质密度差异具有统计学意义。**结论：**震颤型帕金森病患者 TD 患者的额叶、额叶、顶叶及岛叶灰质体积及密度均有改变，值得注意的是右侧额上回、左侧中央前回可能与 TD 的病理生理机制密切相关，大脑皮层路易体最早出现于额叶皮层，有研究显示未经治疗的 PD 患者右侧额叶灰质体积减少，与我们右侧额上回灰质体积减少的结果一致，支持了 TD 亚型可能是 PD 患者早期表现的观点，灰质与震颤的严重程度呈负相关提示可能与震颤的发生密切相关，中央前回位于额叶区，既参与躯体运动，又与认知和学习活动相关，我们推测左侧中央前回灰质体积及密度的增加与疾病早期代偿相关。

PO-3057

锰掺杂超细氧化铁磁共振成像信号特点的对比研究

吴宗乾

陆军军医大学第一附属医院 (西南医院)

目的: 通过掺杂不同锰含量的超小超顺磁性氧化铁 (ultra-small Superparamagnetic Iron Oxide, USPIO) 进行特定序列的磁共振成像 (MRI) 扫描, 对比分析不同材料的 MRI 信号特点及其区别, 探寻简单高效的 MRI 造影剂。

方法: 合成不同锰含量的超细氧化铁材料, 在磷酸盐缓冲液 (PBS) 稀释剂中配成浓度均一的溶液, 在 7T 磁共振仪器中进行 T1 和 T2 扫描分析, 观察不同锰含量的超细氧化铁材料显示出的信号变化强弱规律, 绘制含量-信号强度曲线, 分析锰含量的变化对超细氧化铁磁共振成像的影响。

结果: 在同种浓度条件下, 随着锰含量的变化, T1 和 T2 信号变化显示出一定的规律性, 且弛豫时间 R1 和 R2 呈现出相反的变化规律。同时, 在相同的锰含量时, 随着材料浓度的变化, T1 和 T2 信号强度先增强随后逐渐降低, 而弛豫时间 R1 和 R2 并没有明显的变化, 显示出材料浓度对 MRI 有一定的相关性。

结论: 在超细氧化铁中掺杂一定含量的锰金属, 能够调节弛豫时间 R1 和 R2 的相对值, 进而调控 T1 和 T2 的信号强度, 实现高效的磁共振成像诊断。

PO-3058

ALL 儿童鞘内预防性化疗后脑改变的 VBM 研究

崔学飞、邢妩

中南大学湘雅医院

摘要:

目的: 探索急性淋巴细胞白血病 (acute lymphoblastic leukemia, ALL) 儿童中枢神经系统鞘内预防性化疗后脑灰质体积及白质体积的变化, 为预防性化疗引发的脑损伤提供理论依据。

方法: 收集 34 例 ALL 病例组患儿以及 34 例性别、年龄与 ALL 组相匹配的对照 (normal control, NC) 儿童的临床资料及磁共振图像, ALL 组磁共振检查均在鞘内预防性化疗后 6 个月以内完成。使用基于体素的形态学测量分析 (voxel-morphometry, VBM), 计算出全脑体积、83 个脑区相对灰质体积及相对白质体积。对 ALL 组及 NC 组儿童全脑体积、相对灰质体积及相对白质体积进行组间比较, 符合正态分布行配对样本 T 检验, 否则行 Wilcoxon 符号秩和检验。

结果: ALL 组与 NC 组儿童相比, 全脑体积无明显差异, 但存在相对灰质体积、相对白质体积改变的差异脑区, 且表现为 ALL 组患儿相应区域体积缩小。

结论: 急性淋巴细胞白血病儿童中枢神经系统鞘内预防性化疗会对部分脑区的灰质、白质体积产生影响, 这可能是脑损伤的结构基础。

PO-3059

腹侧额叶和枕叶之间的功能连接可能是带状疱疹患者的有效神经影像标记物

李嘉豪¹、顾丽丽²、姜建²

1. 西安交通大学第一附属医院

2. 南昌大学第一附属医院

目的：本研究旨在比较带状疱疹（HZ）患者和带状疱疹后神经痛（PHN）患者的全脑网络，并探讨全脑网络变化与疼痛强度之间的关联以及对不同类型带状疱疹疼痛进行分类的准确性。

方法：纳入的 PHN 患者（50 人）、HZ 患者（50 人）和健康对照组（50 人）接受了静息状态功能磁共振成像（rs-fMRI）检查。采用 Dosenbach-160 图谱计算功能连接性和全局及局部图论指标。神经影像指标与临床量表之间的联系通过相关性分析评估。使用 ROC 曲线评估使用特定神经影像指标对 PHN 和 HZ 患者分类的可行性。

结果：(1) HZ 组的默认模式、额顶叶、丘脑、感觉运动、枕叶网络（ON）和小脑的功能连接更高（ $p < 0.001$ ）。(2) HZ 患者的全局效率高于 PHN 和 HC 患者（ $t = 2.178$, $p = 0.038$ ）。(3) 多元线性回归分析表明，腹侧额叶皮层和枕回之间的功能连接可能是带状疱疹患者疼痛强度的一个影响因素（ $\beta = 4.273$; $p = 0.004$ ）。

结论：腹侧额叶和枕回之间的功能连接性变化可能是一个强有力的从 HZ 向 PHN 过渡的神经影像标记物。

PO-3060

不同解剖分区前列腺癌的 fMRI 定量比较研究

袁蕾、任静

空军军医大学西京医院

目的：在功能水平上，通过 fMRI 定量参数对不同解剖分区前列腺癌(PCa)的深层生物学信息进行定量分析。

方法：前瞻性分析经病理确诊为 PCa 的 44 例患者，共计 50 个病灶，按照不同解剖分区分为移行区组（22 个）和外周区组（28 个）。患者均接受扩散加权成像 DWI、体素内不相干运动弥散加权成像 IVIM、扩散峰度成像 DKI、酰胺质子转移加权成像 APT 和动态对比增强 DCE-MRI 检查，并计算相应的表观扩散系数 ADC、真性扩散系数 D、假性扩散系数 D*、灌注系数 f、扩散峰度系数 Kapp、扩散系数 Dapp、APTmean、对比剂容积转换常数 Ktrans、血浆体积分数 Vp、达峰时间 TTP、流入速率 WI 和流出速率 WO 等 22 个定量功能参数。采用非参数检验分析 2 组之间 fMRI 定量功能参数的差异性，以探索不同解剖分区前列腺癌的深层生物学信息。

结果：组间比较结果显示移行区组 PCa 的 WI(131.77±17.08)、WO(15.75±2.1)、Vp(167.4±46.35)高于外周区组 PCa 的 WI(84.82±8.82)、WO(7.78±2.14)、Vp(52.74±35.7)，差异均具有统计学意义($P < 0.05$)；移行区组 PCa 的 ADC 值亦高于外周区组 PCa，但差异无统计学意义。

结论：不同解剖分区 PCa 的生物学信息不同，移行区 PCa 的毛细血管密度、通透性及血容量更高，对不同解剖分区前列腺癌的定量 fMRI 分析有助于揭示深层生物学信息，从而进一步分层分诊，采取针对性治疗措施。

PO-3061

原发性失眠患者大脑静息态低频振荡振幅百分比和功能连接变化

董冰清、姜玉洁、张慧、屠建春
昆山市中医院

目的低频振荡振幅百分比 (percent amplitude of fluctuation, perAF) 联合功能连接探讨原发性失眠患者脑功能及脑网络改变。

方法对 51 名原发性失眠患者和 46 名健康对照者进行静息态功能磁共振扫描, 对两组间的 perAF 值以及 perAF 值差异脑区的功能连接进行比较。采用 Pearson 相关分析探讨原发性失眠患者 perAF 值的变化与失眠时长、匹兹堡睡眠质量指数得分 (Pittsburgh sleep quality index, PSQI)、蒙特利尔认知评估量表得分 (Montreal cognitive assessment, MoCA) 的相关性。

结果与健康对照组相比, 原发性失眠组在前额叶 (-42 9 45) 的 perAF 值增加, 而在海马旁回 (27 -12 -27) 的 perAF 值减低。在功能连接方面, 与健康对照组相比, 原发性失眠组右海马旁回与左枕叶功能连接增强, 而与左侧颞中回和颞下回功能连接减弱。海马旁回的 perAF 值升高与 MoCA 量表得分正相关 ($r = 0.428, P = 0.002$)。

结论原发性失眠患者的静息态脑功能局部活动强度改变, 表现为海马旁回和前额叶 perAF 值的改变, 且海马旁回与颞下回功能连接减弱, 可能是原发性失眠患者认知功能、学习记忆能力降低的机制。

PO-3062

多模态 MRI 数据鉴别多发性硬化及视神经脊髓炎谱系疾病的机器学习分析

梁晓、周福庆
南昌大学第一附属医院

目的: 本研究目的是探讨机器学习联合多模态磁共振成像特征在识别多发性硬化 (multiple sclerosis, MS) 与视神经脊髓炎谱系疾病 (neuromyelitis optica spectrum disorders, NMOSD) 患者中的价值。

方法: 本研究共纳入 MS 患者 58 例和 NMOSD 患者 36 例。被试者接受中文版听觉数字连续加法测试量表、扩展残疾状态量表、修订疲劳影响尺度量表评估以及磁共振数据扫描, 并记录患者病程。经数据预处理后, 基于自动解剖标记脑图谱再分别计算两组被试的 116 个脑区的结构及功能指标包括功能连接 (functional connectivity, FC)、低频振幅 (amplitude of low frequency fluctuation, ALFF)、局部一致性 (regional homogeneity, ReHo) 及灰质体积 (gray matter volume, GMV), 并提取每个脑区相应的值作为特征。然后分别利用所选择的四种特征的不同组合构建分类器。随后执行去除高成对相关性 (阈值为 0.65) 及最小绝对收缩选择算子 (Least Absolute Shrinkage and Selection Operator, LASSO) 回归筛选最具判别性的特征。最后构建支持向量机 (support vector machine, SVM) 以及逻辑回归 (Logistic Regression, LR) 分类模型来区分 MS 和 NMOSD 患者。比较不同组合在两种分类器的结果。

结果: MS 组与 NMOSD 组之间经特征筛选后最终得到了 31 个 FC、9 个 ALFF、14 个 ReHo 及 5 个 GMV 共 59 个特征 (主要分布在大脑默认网络区域、小脑区域及皮质下相关脑区), FC、ALFF、GMV 联合构建的 SVM 以及 LR 分类器对 MS 和 NMOSD 患者的鉴别效果最佳 (SVM: AUC=0.976; LR: AUC=0.940)。

结论: 本研究利用机器学习构建了多模态多层次 MRI 影像特征的 SVM 以及 LR 分类器, 能有效区分 MS 和 NMOSD 患者, 为临床早期鉴别、制订早期干预提供了影像学依据。

PO-3063

基于脑肠轴探究功能性消化不良患者脑网络的拓扑改变

迟婧¹、陆艳¹、张超¹、姚学敏¹、计一丁¹、胡春洪²

1. 苏州市第九人民医院

2. 苏州大学附属第一医院

研究目的:

功能性消化不良(FD)是一种肠脑相互作用障碍疾病。先前的研究表明,功能性脑活动和连接模式在FD中存在广泛的异常。尽管FD的确切病理生理学变化仍有待阐明,但胃肠道运动异常和内脏高敏感被认为是症状发生的重要因素,目前普遍认为该疾病是一种由社会心理因素驱动的脑-肠轴紊乱,其中应激起着重要作用。本研究旨在使用图论法探究FD患者的大脑网络拓扑改变以及其与细胞因子水平、消化道症状、焦虑及抑郁间的相关性。

研究方法:

基于功能磁共振成像,通过图论分析,比较了30例FD患者和30例HC的小世界属性、网络效率、节点中心性及全脑功能连接组在整体和节点水平上的拓扑特性;此外,对同一批FD患者及健康对照抽取血液进行细胞因子TNF- α 、IL-1 β 、IL-10及IL-6的测量。Pearson相关评估各拓扑特性与临床症状、细胞因子水平、焦虑及抑郁的关系。

研究结果:

FD患者全脑功能网络的小世界属性、聚类系数、全局效率及局部效率均显著高于对照组,左侧额下回眶部、右侧杏仁核、右侧丘脑、左侧额下回、双侧颞上回及左侧角回的节点中心性升高,其中杏仁核的节点中心性与FD患者的症状严重程度显著相关($r=0.629$, $p<0.001$)。双侧楔前叶、右侧额上回、左侧海马、右侧颞中回及右侧中央前回的节点中心性降低。FD患者脑网络功能连接较HC显著减低(包含39个节点及69条连边),这些节点主要包含于默认模式网络、突显网络及感觉运动网络。较HC,FD组的TNF- α 水平明显增高(213.96 ± 24.65 vs 165.35 ± 36.48 , $p<0.05$),且TNF- α 水平与杏仁核的节点中心性及FD患者的症状严重程度相关。

研究结论:

本研究揭示了FD患者的异常节点中心性和功能连接降低主要位于默认模式网络、突显网络及感觉运动网络。此外,FD患者的细胞因子TNF- α 水平明显增高,破坏的拓扑属性、细胞因子水平及临床变量间显示出一定的相关性。这些发现将有助于增强我们对FD中枢病理生理的认识。

PO-3064

DCE-MRI 联合 Micro-CT 评价四氧嘧啶诱导兔糖尿病合并肢体缺血骨髓内皮祖细胞功能和骨微结构改变

蔡非^{1,2}、查云飞²

1. 宜昌市中心人民医院

2. 武汉大学人民医院 (湖北省人民医院)

目的 采用动态对比增强磁共振成像(DCE-MRI)、微计算机断层扫描(Micro-CT)研究兔糖尿病合并肢体缺血后骨微结构改变及骨髓内皮祖细胞功能改变 **材料与方法** 30只健康雄性新西兰大白兔随机分为实验组($n=20$)和对照组(Control, $n=10$),实验组采用四氧嘧啶注射进行造模,造模成功后4周再将实验组兔随机分为单纯糖尿病组(DM, $n=10$)、糖尿病合并肢体缺血组(DM+CLI, $n=10$),糖尿病肢体缺血组进行右侧股动脉结扎(DSA造影证实)建立肢体缺血模型,在0周、4周、8周、12周及16周分别对三组兔行股骨近端冠状面FSE-T1WI、FSE-T2WI和DCE-MRI检查,采用Extended Tofts Linear双室模型获得股骨近端的DCE-MRI定量参数值,包括容量转移常数(K^{trans})、速率常数(k_{ep})和容积分数(V_e),在第16周完成检查后,抗凝抽取外周静脉血

10ml, 然后将兔处死, 提取骨髓样本, 进行骨髓和外周血内皮祖细胞计数及外周血内皮祖细胞功能检查, 同时取股骨上段标本行 Micro-CT 扫描, 计算骨髓骨小梁形态计量参数 **结果:** 糖尿病合并肢体缺血组在造模成功后 K^{trans} 值明显降低, 8 周时显著升高, 糖尿病组 K^{trans} 值在 12 周时显著升高, 两组 K_{ep} 值在 16 周时开始显著升高, V_e 值在各时间点差异无统计学意义, 对照组渗透性参数值在各时间点差异不具有统计学意义。16 周时, 糖尿病肢体缺血组和单纯糖尿病组骨髓和循环 CD34+EPCs 计数及循环 EPCs 功能相比于对照组, 都有不同程度减低, 差异有统计学意义, Micro-CT 显示糖尿病肢体缺血组和单纯糖尿病组的骨小梁参数骨小梁数 (Tb.N)、骨体积 (BV)、体积比 (BV/TV)、骨矿物质密度 (BMD) 均较对照组减低 骨髓 CD34+EPC 计数与 K^{trans} 、 K_{ep} 呈负相关, 与 Tb.N、MVD 呈正相关 **结论:** DCE-MRI 联合 Micro-CT 定量参数可用于评价糖尿病合并严重肢体缺血的骨髓微结构改变及骨髓内皮祖细胞功能改变

PO-3065

基于深度学习技术的脊柱磁共振图像生成算法的临床验证研究

伏广东¹、张志浩²、项磊²、王澍²、何健³

1. 南京市高淳人民医院

2. 深透医疗

3. 南京鼓楼医院

目的 观察基于深度学习技术生成的脊柱 STIR 磁共振图像 (MRI) 在临床诊断上的价值。

方法 该研究回顾性地收集 100 例脊柱检查患者的 MRI 序列, 其中颈椎 22 例、胸椎 33 例、腰椎 45 例; 磁场强度包含 1.5T42 例、3.0T58 例; 每一例患者均包含矢状位 T1、矢状位 T2 和矢状位 STIR。通常矢状位的 STIR 序列扫描时间长, 且图像质量不高, 信噪比偏低。本研究致力于用基于深度学习技术的图像生成算法从矢状位 T1 和矢状位 T2 序列生成矢状位 STIR 序列, 从而减少 STIR 序列实际扫描的时间, 达到快速获得所需完整诊断序列的目标。实验中对生成 STIR 图像和真实采集的 STIR 图像, 从定量和定性两方面指标评价生成图像的质量, 定量方面: 采用信噪比 (SNR) 和对比度噪声比 (CNR) 进行客观图像质量评价; 定性方面: 由一名具有 5 年 MRI 工作经验的主管技师和一名具有 8 年 MRI 诊断经验的主治医师分别从伪影程度、噪声程度、边缘锐利度、结构对比度和诊断置信度五个方面, 采用李克特量表 (Likert scale) 以双盲法进行主观图像质量评价。同时也采用平均绝对误差 (MAE)、峰值信噪比 (PSNR)、结构相似度 (SSIM) 和相关系数 (COR) 分析深度学习生成图像和真实采集图像的相关性; 选取椎体、椎间盘、脑脊液、脊髓和脂肪五个组织的感兴趣区域 (ROI), 使用 Bland-Altman 图分析生成图像和真实图像的一致性。

结果 对于颈椎、胸椎和腰椎三个部位, 生成图像的主观和客观图像质量评分均高于真实采集的 STIR 图像 ($P < 0.05$)。在 1.5T 的图像上, 生成图像的优势更为明显, 评分结果明显优于对应真实采集的 STIR 图像, 图像质量达到类 3.0T 的效果。生成图像和真实图像的相关性较高 ($MAE = 0.027 \pm 0.009$, $PSNR = 26.326 \pm 3.490 \text{ db}$, $SSIM = 0.755 \pm 0.070$, $COR = 0.893 \pm 0.076$)。

Bland-Altman 图分析结果表明生成图像和真实图像具有较好的一致性。

结论 基于深度学习技术生成的脊柱 MR 图像能够用于诊断, 在提供更高图像质量的同时节省扫描时间, 具有用于临床实践的价值。

PO-3066

睡眠碎片化与左心室结构功能的线性关系：The Multi-Ethnic Study of Atherosclerosis(MESA)

张鹏鹏

军空军军医大学西京医院

目的：利用动脉粥样硬化多种族研究(MESA)队列收集的数据，以一个种族多样化社区人群为研究对象，研究睡眠碎片化参数(包括 Arl 、 SE 和 $WASO$)与左心室结构功能之间的关系。

方法：我们纳入了 MESA 中拥有完整多导睡眠图数据和心脏磁共振检查的 1404 名参与者，利用多导睡眠图评估碎片化睡眠参数，包括总睡眠中的唤醒指数(Arl -total)、睡眠效率(SE)和入睡后醒来(wake after sleep onset, $WASO$)等。左心室结构功能采用心脏磁共振测量。我们采用线性回归分析睡眠碎片化参数与左心室质量身高比值(left ventricular mass indexed for height, $LVHi$)的关系。

结果：单变量线性回归分析， $WASO$ (β 0.134;95%CI 0.023,0.052; $P < 0.0001$)、 Arl -total(β 0.184;95%CI 0.203,0.362; $P < 0.0001$)、 Arl -REM(β 0.116;95%CI 0.100,0.260; $P < 0.0001$)、 Arl -NREM(β 0.175;95%CI 0.176,0.323; $P < 0.0001$)与 $LVHi$ 正相关。校正年龄、性别、种族、饮酒、腰围、使用抗高血压药和糖尿病后采用多变量线性回归分析，确定 $WASO$ 与 $LVHi$ 之间仍有相关性。 $WASO$ (β 0.045;95%CI 0.001,0.024; $P=0.033$)与 $LVHi$ 正相关。在女性分组中， $WASO$ (β 0.089;95%CI 0.006,0.034; $P=0.006$)与 $LVHi$ 增加显著相关，而在男性分组中则无此相关性。

结论：一个种族多样化的队列研究中，校正可能的混杂因素后， $WASO$ 水平与左心室质量增加显著相关，这种相关性表现在女性人群中。

PO-3067

脑室旁白质高信号独立于脑萎缩加重 T2DM 认知功能下降

潘佩纯¹、高洁²、张东升²、汤敏²、张小玲²

1. 陕西中医药大学

2. 陕西省人民医院

目的 本研究拟通过分析 2 型糖尿病(T2DM)患者脑白质高信号(WMH)、脑容积和认知功能之间的关系，探讨 WMH 是否独立于脑萎缩加重 T2DM 患者认知功能障碍。

方法 连续性收集陕西省人民医院内分泌科就诊的 T2DM 患者 42 例，其中 T2DM 患者认知受损组 22 例，T2DM 患者认知正常组 20 例，所有患者接受头颅 MRI 扫描和系列认知功能评价量表检查，包括蒙特利尔认知评估量表(MoCA)、符号数字转换测试(SDMT)、连线测试 A(TMT-A)、连线测试 B(TMT-B)。采用 VBM 分析计算获得每个被试的全脑容积、灰质容积(GM)、白质容积(WM)，采用计算机自动分割算法获得全脑 WMH 容积、脑室旁 WMH 容积和深部 WMH 容积，对上述容积参量进行标准化以避免头颅大小引起的个体差异。比较 T2DM 认知正常组和认知受损组脑容积、WMH 容积和认知功能评分的差异。采用多元线性回归分析评价认知功能评分与脑容积和 WMH 容积的相关性。

结果 相比于 T2DM 认知正常组，T2DM 认知受损组的 MoCA 评分和 SDMT 评分显著降低($P < 0.05$)，其余参数在两组间未见明显差异。相关性分析显示 MoCA 评分与脑室旁 WMH 容积($r = -0.328$, $P = 0.034$)呈负相关，SDMT 评分与总 WMH 容积($r = -0.470$, $P = 0.002$)、脑室旁 WMH 容积($r = -0.532$, $P = 0.000$)呈负相关。多元线性回归调整混杂因素后，MoCA 评分与脑室旁 WMH 容积($\beta = -0.567$, $P = 0.007$)独立相关，SDMT 与脑室旁 WMH 容积($\beta = -0.474$, $P = 0.014$)独立相关，而 MoCA 评分和 SDMT 评分与灰质及白质容积均未见相关性。

结论 脑室旁 WMH 可能独立于脑萎缩加重 T2DM 整体认知功能和信息处理速度能力下降,有望作为预测 T2DM 认知功能受损更敏感的影像学标志物。

PO-3068

DWI 梯度非线性误差校准在胰腺疾病中的应用价值研究

马超^{1,2}、汪剑¹、杨盼盼¹、王振¹、陈宇飞²、边云¹、邵成伟¹、陆建平¹

1. 中国人民解放军海军军医大学第一附属医院

2. 同济大学电子与信息工程学院

目的: 扩散加权成像 (DWI) 定量分析中梯度非线性误差高达 20%, 本研究目的是探究梯度非线性误差校准的表观扩散系数 (ADC) 用于胰腺疾病诊断的价值。

材料和方法: 本研究共纳入正常胰腺 25 例及胰腺疾病患者 126 例, 胰腺疾病包括术后病理证实的胰腺导管腺癌 60 例、慢性胰腺炎 27 例、自身免疫性胰腺炎 8 例和神经内分泌肿瘤 31 例。DWI 扫描参数包括 2 个 b 值 (50 和 800 s/mm²), 用于采集 DWI 图像分析中梯度非线性校准 ADC 的工具为实验室自主开发的校准软件。用感兴趣法测量校准前后相同位置处正常胰腺组织和病灶组织的 ADC 最小值、最大值和均值。配对样本 t 检验及 Wilcoxon 检验用于测量值的统计学分析。

结果: 正常胰腺组织或胰腺病变组织的校准后的 ADC 值和校准前 ADC 值 (包含均值、最小值和最大值) 相比, 差异均具有统计学意义 (P<0.01)。正常胰腺组织校准前后 ADC 均值分别为 $1.126 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $1.117 \times 10^{-3} \text{ mm}^2/\text{s}$; 胰腺导管腺癌校准前后 ADC 均值分别为 $1.127 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $1.118 \times 10^{-3} \text{ mm}^2/\text{s}$; 慢性胰腺炎组织校准前后 ADC 均值分别为 $1.025 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $0.984 \times 10^{-3} \text{ mm}^2/\text{s}$; 自身免疫性胰腺炎组织慢性胰腺炎组织校准前后 ADC 均值分别为 $0.990 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $0.980 \times 10^{-3} \text{ mm}^2/\text{s}$; 神经内分泌肿瘤组织校准前后 ADC 均值分别为 $1.009 \times 10^{-3} \text{ mm}^2/\text{s}$ 及 $1.0 \times 10^{-3} \text{ mm}^2/\text{s}$ 。

结论: ADC 梯度非线性误差校准后, 正常胰腺及肿瘤 ADC 最小值、最大值和均值皆显著减小;校准后的 ADC 用于鉴别不同类型胰腺疾病的显著性水平提升。

PO-3069

基于 rs-fMRI 探索机器学习算法对间歇性外斜视儿童患者脑改变分类识别效果的研究

周梦迪¹、李慧馨¹、曲晓霞¹、何雪颖²、张利荣³、洪洁¹、付晶¹、刘兆会¹

1. 首都医科大学附属北京同仁医院

2. 南京鼓楼医院

3. 北京航天中心医院

目的 调研常见机器学习方法结合静息态脑功能参数在识别间歇性外斜视儿童静息态脑功能改变的效果。方法 本研究收集了 41 名间歇性外斜视儿童患者和 36 名健康对照儿童的 rs-fMRI 数据, 计算了基于 rs-fMRI 的 Reho、ALFF、慢 4 和慢 5 波段 fALFF 等参数。将 HCP 脑图谱的 360 个脑区作为 ROI, 提取了每个 ROI 内参数图中的平均值作为脑功能特征。数据集被随机分为训练集(70%)和测试集(30%)两组。采用 Pearson 相关系数(PCC)方法进行降维, 采用 ANOVA、KW、RFE 和 Relief 方法进行特征选择, 使用 SVM、LDA、随机森林、逻辑回归等机器学习算法进行分类, 采用 10 折交叉验证评估结果。结果 比较了所有模型的 AUC, 将训练/测试/验证数据集 AUC≥0.75, 准确度 Acc≥0.75, 特征<10 个作为筛选模型的标准。对于慢 5 波段 fALFF 值, 使用 PCC 降维、ANOVA 特征选择、LR 分类器使用 5 个脑区的数值作为特征获得了曲线下最大面积 (AUC), 这些脑区为 Area_PGs_R、Area_6m_anterior_R、Area_posterior_9-46v_L、Area_2_R 等, 其训练/

验证/测试数据集的 AUCs 为 0.957/0.804/0.818, 准确度为 0.759。对于 Reho 值, 使用 PCC 降维、RFE 特征选择、GP 分类器使用 3 个脑区的数值作为特征获得了曲线下最大面积 (AUC), 这些脑区为 Medial_Superior_Temporal_Area_L、Anterior_Ventral_Insular_Area_R、Parieto-Occipital_Sulcus_Area_2_L, 其训练/验证/测试数据集的 AUCs 为 0.879/0.754/0.750, 准确度为 0.759。**结论** 间歇性外斜视儿童患者在视觉及眼动相关脑区出现异常的内在脑活动。基于慢 5 波段 fALFF 值作为特征, 采用 PCC 降维、ANOVA 特征选择、结合 LR 分类器算法是最佳机器学习模型, 这意味着慢 5 波段 fALFF 值结合机器学习算法在识别间外儿童脑功能改变方面具有较好的潜力。

PO-3070

压缩感知技术在颈静脉成像中的应用

王楠、宋清伟
大连医科大学附属第一医院

目的: 探索压缩感知技术 (Compressed Sensing, CS) 的不同加速因子在颈静脉成像中的应用价值。

方法: 招募 10 名健康志愿者 (男 6 名, 女 4 名, 平均年龄 35 岁)。采用 3.0T MR 行颈静脉成像, 所有患者均扫描非对比增强磁共振血管成像 REACT 序列 (Relaxation Enhanced Angiography without Contrast and Triggering), 设置并行成像 (Parallel Imaging, PI) 和 CS 不同加速因子对比, 包括 PI 2, CS 2, CS 4, CS 6 和 CS 8, 扫描时间分别为 291s, 352s, 175s, 120s 和 89s。由两名观察者采用双盲法分别对图像进行客观评价, ROI 放置位置包括双侧颈内静脉和胸锁乳突肌, 每个部位分别放置 3 个 ROI, 测量各 ROI 的信号强度及其标准差, 并计算相应的信噪比 (SNR) 和对比噪声比 (CNR)。由两名观察者通过 5 组 MIP 图像进行主观评分, 依据头臂静脉、颈内静脉和锁骨下静脉的显示、图像伪影以及噪声, 3 分好, 1 分差。采用 Wilcoxon 检验分析不同加速因子下两侧颈内静脉图像 SNR 和 CNR 的差异。若没有统计学差异, 选择右侧数据进行后续分析。采用 Kruskal-Wallis 检验比较五组图像间 SNR、CNR 和主观评分的差异。若差异具有统计学意义, 进行后续两两比较。

结果: 各组间 SNR 和 CNR 的差异无统计学意义 ($P > 0.05$)。各组间主观评分差异具有统计学意义 ($P < 0.05$)。两两比较结果显示, PI 2 组与 CS 2/4/6 组主观评分无显著差异 ($P > 0.05$), PI 2 组与 PI 8 组主观评分具有统计学差异 ($P < 0.05$)。

结论: 临床扫描中, 综合考虑扫描时间和图像质量, 颈静脉 REACT 序列推荐选择 CS 6 的加速因子, 较常规并行采集节省 59% 的扫描时间。

PO-3071

MOGAD 和 AQP4+ NMOSD 颅内病变分布概率与神经递质分布的关联研究

刘磊、崔玲玲
中国医科大学附属第一医院

目的: 通过 MRI 数据分析, 定量描述和比较 MOGAD 和 AQP4+ NMOSD 患者的颅内病变分布, 探讨其与神经递质系统的关联。

方法: 选取中国医科大学附属第一医院 72 例 AQP4-ab 阳性患者 100 次扫描及 31 例 MOG-ab 阳性患者 40 次扫描, 在轴位 T2 FLAIR 序列上自动分割两组疾病颅内病灶, 通过空间标准化, 建立各组病变概率分布图。对两种病变分布进行脑叶水平及体素水平定量比较, $p < 0.005$ 有统计学意义,

进而使用 MATLAB 中 JuSpace 工具箱对 MOGAD 和 AQP4+NMOSD 的颅内病灶神经递质受体的频率和核成像分布数据进行空间相关性分析。

结果：MOGAD 和 AQP4+ NMOSD 患者的脑内病变分布频率图显示，有统计学意义的差异区域在中央前回、楔前叶皮质、侧脑室前后角旁白质、扣带中回、额叶中部、颞中回、上枕叶、壳核、舌回、海马、颞极、脑桥及小脑脚。与 AQP4+ NMOSD 相比，MOGAD 中颅内病灶的分布模式与 5HT1a 受体分布显示出显著空间正相关性（ $R=0.2473$ ， $p<0.001$ ），与所研究其他神经递质没有显著空间正相关性。

讨论：MOGAD 与 AQP4+ NMOSD 颅内病灶空间分布模式不同。MOGAD 患者颅内病变范围较大、分布集中，在本研究中，与 AQP4+NMOSD 相比，EDSS 评分显著较低的 MOGAD 患者中，颅内病变的分布模式显示出与 5HT1a 受体分布存在显著空间对应关系。这些结果可以更好的帮助临床医生在诊断时区分 MOGAD 与 AQP4+ NMOSD。

PO-3072

基于心脏磁共振和机器学习建立肥厚型心肌病不良预后风险评估模型

肖轩、杨培、方淇民、宋怡沛、冷银萍、汪希雯、龚良庚
南昌大学第二附属医院

目的：肥厚型心肌病（HCM）是一种常见的遗传性心脏病，以心室壁增厚和舒张功能不全为特征，可导致心律失常、心力衰竭和猝死等不良预后。目前，评估 HCM 患者不良预后的风险的主要方法是基于临床和超声心动图参数的 HCM Risk-SCD 模型，但该模型存在一定的局限性，如不适用于 16 岁以下人群，不能反映心肌纤维化的程度和分布等。因此，本研究旨在基于机器学习和心脏磁共振（CMR）建立一种新的预测模型，以提高 HCM 患者不良预后的评估精度。

方法：研究队列是于 2012 年 1 月至 2021 年 12 月在南昌大学第二附属医院进行心脏磁共振检查的 225 例 HCM 患者。本研究采用逻辑回归（LR）、支持向量机（SVM）、随机森林（RF）以及神经网络（NN）四种机器学习方法，利用 CMR 中钆对比剂延迟强化（LGE）的分布和数量、左室射血分数、左房直径、左室质量指数等参数，在研究队列中进行了训练和验证，构建了多个预测模型。主要终点为接受植入式心律转复除颤器治疗、持续性室性心动过速、复苏性心脏骤停和猝死。

结果：在本研究纳入的 225 例 HCM 患者中，其中发生终点事件 82 例（36%），预后良好组 143 例（64%）。两组患者在基线特征上存在显著差异，如年龄、性别、LVEF、LGE 等（ $P<0.05$ ）。结果显示，所有机器学习方法均优于 HCM Risk-SCD 模型，其中神经网络模型表现最佳，其 C-指数为 0.85，明显高于 HCM Risk-SCD 模型的 C-指数 0.72（ $P<0.001$ ）。神经网络模型还能够将 HCM 患者分为低、中、高风险三组，其 2 年猝死风险分别为 1.5%、6.2% 和 22.7%。此外，敏感性分析表明，神经网络模型对于不同亚组的患者均具有良好的预测能力。

结论：本研究首次基于机器学习和 CMR 建立了一种新的预测模型，能够有效评估 HCM 患者发生不良预后的风险，并提供个体化的风险分层。该模型有望为临床决策提供有价值的参考，改善 HCM 患者的预后。

PO-3073

前列腺癌分区异质性生境成像研究

袁蕾、任静
空军军医大学西京医院

目的：通过 Mp-MRI 生境成像量化和可视化 PCa 分区异质性，为进一步分层分诊并采取针对性治疗提供依据。

方法：前瞻性纳入 27 例经病理确诊的前列腺癌(PCa)患者，依据高清解剖相 T2WI 分为移行区前列腺癌(TZ PCa)12 例和外周区前列腺癌(PZ PCa)15 例。每位患者均接受 Mp-MRI 检查包括平扫、DWI、DKI 和 DCE-MRI，计算病灶每一体素 ADC、Ktrans 和 Kapp 值作为定量影像学标志物，进行 K-means 聚类并结合欧氏距离度量，最终划分为 4 个生境亚区：富血供细胞异质性生境、乏血供多细胞异质性生境、富血供少细胞低异质性生境和坏死生境，并分析各生境亚区肿瘤占比差异。通过计算 Pearson 相关系数分析各生境亚区与临床 T 分期及相应区域 ISUP 分级的相关性。

结果：通过生境成像成分比例分析得出 TZ PCa 的富血供细胞异质性生境和富血供少细胞低异质性生境肿瘤占比分别为 0.24、0.39，高于 PZ PCa 分别为 0.12、0.16；而乏血供多细胞异质性生境在 PZ PCa 中占比极高 0.52，该生境与 ISUP \geq 2 的临床显著性前列腺癌(csPCa)具有较高的相关性 $r=0.86$ 。

结论：TZ PCa 的毛细血管密度、通透性及血容量更高，而 PZ PCa 具有更高的异质性表明其恶性程度更高，通过生境成像量化和可视化 PCa 分区异质性有望运用于靶向诊断、治疗，避免过度治疗和不必要的活检，同时为分层分诊并采取针对性治疗措施提供了潜在的价值。

PO-3074

超高 b 值 DWIb1000、DWIb2000 和 DWIb3000 在直肠癌 3TMRI：一项图像质量评估和影像组学特征的初步研究

郝勇飞、冯岩、李婉清、张劲松
空军军医大学西京医院

目的：评估 DWIb 值 1000、2000 和 3000 图像质量并优化其 b 值；进一步开发和验证基于 ADC 图、DWIb 值 1000、2000、3000 和多 b 值 DWI (DWIb 值 1000、2000、3000) 的影像组学模型，探索不同超高 b 值 DWI 直肠癌肿瘤区微观结构表征的影像组学特征差异，并预测直肠癌患者的术前淋巴结转移。

方法：回顾性研究西京医院经超高 b 值 DWI 的检查并术后病理证实为直肠癌的 199 例患者的影像资料。分别基于 5 分量表主观评价标准（肿瘤显著性，伪影水平，解剖一致性和整体图像质量）和客观评价（SNR、CNR、SIR 和 SI_{lesion} ）来评估三组图像质量，并使用组内相关系数(ICC)来评估观察者间的一致性。其次，将患者按 7:3 的比例分为训练队列（ $n=140$ ）和验证队列（ $n=59$ ），基于 ADC 图、DWIb 值 1000、2000、3000 和多 b 值 DWI 的完整肿瘤区中提取影像组学特征，并通过单变量秩和检验、Pearson 相关系数、LASSO 回归选择最优特征子集，并基于 logistic 回归建立五个影像组学模型。通过受试者工作特征（ROC）曲线、校准曲线和决策曲线分析评估五种影像组学模型的鉴别效能和临床实用性。

结果：随着 b 值的增加， SI_{lesion} 、SNR 值、伪影水平和解剖一致性逐渐降低。DWIb2000 的 CNR 值优于 DWIb1000 和 DWIb3000 ($P<0.001$)。DWIb2000 和 b1000 的整体图像质量评分无统计学差异 ($P=0.059$)。此外，基于 ADC 图、DWIb 值 1000、2000、3000 和多 b 值 DWI 的影像组学模型的验证组的 ROC 曲线下面积 (AUC) 分别为 0.650、0.706、0.744、0.709、0.751。基于

DWib2000 和多 b 值 DWI 的影像组学模型的 AUC 值高于常规 ADC 图。决策曲线分析表明, 基于超高 b 值 DWI 的影像组学模型比常规 ADC 图显示出更多的临床效益。

结论: 可推荐使用 DWib2000 来提高图像 CNR 值和肿瘤显著性。源于超高 b 值 DWI 的微观结构表征的影像组学特征是提高预测直肠癌淋巴结转移的重要补充策略。

PO-3075

基于集成机器学习方法结合术前颅脑磁共振影像学特征鉴别单发性脑转移瘤和多形性胶质母细胞瘤的研究

王雪璿¹、易小平¹、傅彦¹、Bihong T. Chen²

1. 中南大学湘雅医院

2. Department of Diagnostic Radiology, City of Hope National Medical Center

目的: 本研究旨在利用集成机器学习方法, 结合术前临床及颅脑磁共振影像学 (magnetic resonance imaging, MRI) 特征, 鉴别单发性脑转移瘤 (brain metastasis, BM) 和多形性胶质母细胞瘤 (glioblastoma multiforme, GBM)。

方法: 本回顾性研究共纳入 491 例患者, 其中包括 233 例 BM 患者和 258 例 GBM 患者, 并以 5:2 的比例将其随机分配到训练集 (BM, n=166; GBM, n=184) 和验证集 (BM, n=67; GBM, n=74)。伦勃朗视觉感受图像 (VASARI) 特征集用于评估颅脑 MRI 特征。最终采用集成机器学习算法构建了一个包含 VASARI 特征和临床变量的鉴别模型, 并使用区分度 (Discrimination)、校准 (Calibration) 和临床实用性 (clinical usefulness) 评估其性能。

结果: BM 组年龄较 GBM 组大 ($P<0.001$)。BM 组的卡氏评分 (Karnofsky Performance Status, KPS) 和白细胞计数 [均值 \pm 标准差, 7.42 ± 2.87 VS 9.03 ± 4.43 , $P<0.001$] 与中性粒细胞计数 [5.24 ± 2.79 VS 6.68 ± 4.43 , $P<0.001$] 比值相对低于 GBM 组。BM 组较少出现囊肿或出血, 语言功能区受累较少。BM 组软脑膜受累、室管膜受累或皮质受累较少, 深部白质受累或颅骨重建比例较低。本研究建立的集成机器学习模型可以较好的鉴别 BM 患者和 GBM 患者, 在训练集中模型曲线下面积 (AUC) 为 98.74% (95%CI: 97.95- 99.38%) (灵敏度为 95.88%, 特异性为 94.83%), 在验证集中模型 AUC 为 98.13% [95%CI: 96.23- 99.51%] (灵敏度为 92.06%, 特异性为 97.62%)。决策曲线分析表明该模型具有良好的临床应用性。

结论: 本研究表明, 结合术前颅脑 MRI-VASARI 特征和临床指标构建的集成机器学习模型有望用于鉴别单发性脑转移瘤和多形性胶质母细胞瘤, 这将有助于脑肿瘤病人的个性化管理。

PO-3076

MINOCA 的影像学表现

杨培、胡梦瑶、肖轩、龚良庚

南昌大学附属第二医院

冠状动脉非阻塞性心肌梗死 (MINOCA) 是一种特殊类型的急性心肌梗死, 其发病机制和预后因素尚不明确, 临床上缺乏有效的诊断和风险评估工具。本文旨在综述 MINOCA 的影像学表现, 包括心脏磁共振 (CMR)、光学相干断层扫描 (OCT)、微血管功能评估和冠脉痉挛激发试验等。

CMR 是一种非侵入性的影像学技术, 可以提供心脏的解剖、功能、灌注和组织特征等信息, 帮助区分 MINOCA 的不同病因, 如心肌炎、Takotsubo 综合征、自发性冠脉夹层 (SCAD)、隐匿性斑块破裂或糜烂等。CMR 中钆对比剂延迟强化 (LGE) 可以反映心肌纤维化的程度和分布。LGE 在

MINOCA 患者中的检出率约为 30%-40%，与传统 AMI 患者相似。LGE 的形态和位置可以提示 MINOCA 的可能病因，如斑块破裂或糜烂通常表现为亚内膜或跨壁性 LGE。

OCT 可以提供冠脉内壁的高分辨率图像，帮助发现冠脉造影难以检测的细微病变，如斑块破裂或糜烂、SCAD、冠脉栓塞等。OCT 在 MINOCA 患者中的检出率约为 50%-60%，高于传统 AMI 患者。OCT 可以与 CMR 相互补充，提高 MINOCA 患者的诊断率。

微血管功能评估可以测量冠脉微循环的阻力和灌注，帮助诊断冠脉微血管疾病 (CMD)，CMD 是 MINOCA 的常见病因。微血管功能评估可以通过测量指数 (IMR)、分数流储备 (FFR) 或冠脉流储备 (CFR) 等参数来进行。微血管功能评估在 MINOCA 患者中的检出率约为 30%-40%，与传统 AMI 患者相似。微血管功能评估可以与 CMR 和 OCT 相互印证，提高 MINOCA 患者的风险分层。冠脉痉挛是 MINOCA 的常见病因。冠脉痉挛激发试验在 MINOCA 患者中的检出率约 30%-40%，高于传统 AMI 患者。冠脉痉挛激发试验可以与 CMR、OCT 和微血管功能评估相结合，提高 MINOCA 患者的诊治效果。

本文综述了 MINOCA 的影像学表现，包括 CMR、OCT、微血管功能评估和冠脉痉挛激发试验等。这些技术可以帮助明确 MINOCA 的不同病因，提供个体化的风险分层和治疗指导。因此，建议对 MINOCA 患者尽早进行多模态影像学检查，以指导临床决策和治疗。

PO-3077

关于青少年边缘型人格障碍的非自杀性自残行为和视觉工作记忆与脑白质微结构改变的关系的研究

傅彦¹、易小平¹、王雪璿¹、Bihong T. Chen²

1. 中南大学湘雅医院

2. Department of Diagnostic Radiology, City of Hope National Medical Center

背景：非自杀性自伤行为 (non-suicide self-injurious behavior, NSSI) 是青少年边缘型人格障碍 (borderline personality disorder, BPD) 的核心特征之一，伴随的视觉工作记忆损害参与了该疾病的病理过程。然而，其潜在的机制在很大程度上是未知的。本研究旨在探讨 BPD 青少年患者脑白质微结构的改变及其与 NSSI 和视觉工作记忆 (visual working memory) 的关系。

方法：本横断面前瞻性研究共纳入了 53 名 12 岁至 17 岁诊断为 BPD 的青少年患者和 39 名年龄性别匹配的健康对照 (HCs)。基于 DTI 数据并使用基于纤维束示踪的空间统计分析 (tract-based spatial statistics, TBSS) 得到的分数各向异性 (FA) 和平均扩散率 (MD) 参数对脑白质微观结构进行评估。使用 Visual Reproduction Immediate Recall Subtest 评估视觉工作记忆。采用相关分析的方法，探讨了 BPD 青少年患者的 FA/MD 比值与 NSSI (渥太华自伤量表)、视觉再现以及情绪调节困难量表 (DERS)、儿童边缘人格特征量表 (BPFS) 等核心特征之间的关系。本研究采用中介分析的方法，探讨了 BPD 青少年患者脑白质微结构改变对 NSSI 的影响是否是通过视觉工作记忆介导。

结果：BPD 青少年在胼胝体、放射冠、上纵束、丘脑后束、额枕下束等皮层-边缘、皮层-丘脑回路与健康对照相比 FA 值降低，MD 值升高 ($P < 0.05$)。BPD 患者 FA 值降低与视觉工作记忆评分呈正相关。MD 值增高与视觉工作记忆评分呈负相关，与 NSSI (渥太华自伤量表-4B)、冲动控制障碍 (DERS-D)、认同障碍 (BPFS-B) 呈正相关 ($P < 0.05$)。根据青少年 BPD 患者 MD 结果可以得出，保留的视觉工作记忆能力对脑白质微结构的改变具有代偿作用。

结论：本研究表明皮质-边缘系统和皮质-丘脑回路中的白质微结构缺陷可能与 NSSI、视觉工作记忆和其他核心症状特征相关，这些可能是青少年 BPD 的神经相关因素。另外，保留视觉工作记忆可预防 NSSI 的发生。

PO-3078

DKI 及 DTI 技术评估颈动脉斑块患者颅脑微观结构改变

冷月爽、王冬翠、杨帅

中南大学湘雅医院

目的：通过扩散峰度成像 (DKI) 和扩散张量成像 (DTI) 评估两种颈动脉斑块亚型病人脑白质微观结构的改变。应用峰度指标定量探索了易损斑块患者临床指标、精神神经指标与脑白质微观结构改变之间的关系。

方法：本研究包括颈动脉易损斑块患者组 (VP 组) 58 人，颈动脉硬斑块患者组 (HP 组) 23 人，健康对照组 (HC 组) 38 人。入组患者均进行了颅脑 MRI 检查，包括 3D T1 成像、DKI 和 DTI。为了探索组间差异，TBSS 用于进行体素统计。为了检验 VP 组内扩散指标与临床变量之间的相关性，在组级 FA 骨架掩模内进行了皮尔逊相关系数检验，当 $P < 0.05$ 时，被认为具有统计学意义。应用 JHU 脑模板将白质分割为 48 个脑区，并分析了各脑区扩散指标和峰度指标的组间差异。对于 VP 组的患者，分析各脑区扩散指标和峰度指标与炎症因子、情绪认知指标的相关性，进行皮尔逊相关系数检验。

结果：TBSS 研究显示在广泛的脑白质区域，VP 组与 HC 组的峰度指标与扩散指标存在显著的组间差异，特别是 AD, MD, RD。HC 组和 PP 组之间没有发现明显的差异。应用 JHU 脑模板进行 ROI 分割后，我们发现 PV 组患者扩散及峰度系数存在显著差异 (超过 5 个) 的脑区包括脑桥横束、右侧内侧丘系、双侧小脑脚、右侧丘脑后辐射、矢状束、扣带束及弓状束。对于拥有临床炎症指标和情感认知量表的 29 名 PV 组患者，分析了峰度与扩散指标和炎症因子水平及临床认知量表评分间的相关性，在多个脑区，kFA 值与 MOCA 评分呈负相关，FA 与 MOCA、MMSE 评分正相关 ($p < 0.05$)。在右侧内囊后腹侧部，kFA 值与 MMSE 评分负相关。VP 组大多数脑区的峰度与扩散指标与炎症因子呈弱相关。在右侧内囊前臂束，RK 和 MD 值与 hsCRP2017 水平显著相关 ($p < 0.05$)。在左侧上额枕束，FA 值与 IL6 水平显著相关 ($p < 0.05$)。

结论：在广泛的脑白质区域，峰度与扩散指标在 HC 组和 VP 组之间存在显著差异。VP 组患者很多脑区的 kFA、FA 值与 MMSE、MoCA 评分有显著相关性。VP 组患者少量脑区的峰度与扩散指标与 CRP、IL6 水平显著相关。

PO-3079

伴忧郁特征抑郁症患者壳核功能连接与其认知功能障碍的相关性研究

孙仕林¹、郭子玄¹、陈观茂¹、陈盼¹、贾艳滨²、王颖¹

1. 暨南大学附属第一医院影像中心

2. 暨南大学附属第一医院精神心理科

【摘要】目的 忧郁特征型抑郁症是普遍公认的重度抑郁症的亚型之一，其特征是精神运动困难、快感缺乏、体重减轻、不适当的内疚感和早醒。越来越多的研究表明，壳核结构的改变可能与忧郁特征型抑郁症的神经生理病理有关。然而，目前尚无研究探讨伴忧郁特征抑郁症患者的壳核 6 亚区的全脑功能连接的变化。本次研究目的是揭示壳核 6 亚区的功能连接异常的模式，以及其与伴忧郁特征抑郁症患者的认知功能障碍的关联。**方法** 纳入 81 例伴忧郁特征抑郁症患者和 88 名健康对照进行静息态磁共振数据采集，图像预处理后，选取壳核 6 个种子区，随即计算壳核 6 亚区与全脑的功能连接，比较病例组和对照组的静息态下脑区之间功能连接差异。通过 MATRICS 共识认知成套测验(MCCB)，比较病例组和对照组的认知功能。最后进行相关性分析，探讨差异脑区的功能连接与 MCCB 认知表现之间的相关性。**结果** 与健康对照组相比，伴忧郁特征抑郁症患者的右侧壳核背

侧尾状核 - 腹侧壳核亚区和左侧顶上小叶功能连接降低 [$t = -4.52$, 体素 $P < 0.001$, 团块 $P < 0.004$ (0.05/12), GRF 校正]。此外, 信息处理速度、工作记忆、词语学习、视觉学习、社会认知、综合分数表现得分均低于对照组(均 $P < 0.05$)。相关性分析显示, 右侧壳核背侧尾状核 - 腹侧壳核亚区和左侧顶上小叶差异脑区值与社会认知($r = 0.315$, $P = 0.017$)、视觉学习($r = 0.385$, $P = 0.003$)和综合分数($r = 0.411$, $P = 0.001$)均存在正相关。结论 本研究发现伴忧郁特征抑郁症患者右侧壳核背侧尾状核 - 腹侧壳核亚区存在功能连接异常, 并提示右侧壳核背侧尾状核 - 腹侧壳核亚区和左侧顶上小叶功能连接异常可能是伴忧郁特征抑郁症患者认知功能障碍的神经生物学基础。

PO-3080

动态对比增强磁共振评价伴轻度认知障碍的 2 型糖尿病患者血脑屏障通透性

唐小平¹、陈新悦¹、赵锡海²

1. 南昌大学第二附属医院医学影像中心

2. 清华大学医学院生物医学影像研究中心

目的: 通过动态对比增强磁共振 (DCE-MRI) 评价 2 型糖尿病(T2DM)患者血脑屏障 (BBB) 通透性改变及其与轻度认知功能障碍(MCI)的关系。方法: 收集性别及教育相匹配 T2DM 伴 MCI 患者 (n=21)、T2DM 不伴 MCI 患者(n=18)及健康志愿者(n=20), 进行认知评分、血生化检查、外周血周细胞标记物 PDGFR β 检查和 DCE-MRI 扫描。运用 MoCA 量表和 MMSE 量表对各组进行认知评分, ELISA 法检测 PDGFR β 浓度, 应用 Tissue4D 软件处理 DCE 数据获得 Ktrans 参数。从临床、细胞因子及影像等方面来研究 T2DM 患者脑部异常改变。所有数据采用 IBM SPSS 26.0 软件分析, $P < 0.05$ 差异有统计学意义。结果: T2DM 伴 MCI 组、T2DM 不伴 MCI 组年龄、空腹血糖、餐后两小时血糖、糖化血红蛋白高于对照组, 每两组间差异具有统计学意义($P < 0.05$)。T2DM 伴 MCI 组 PDGFR β 浓度 (57.18 ± 36.60 pg/mL) 高于对照组 (24.16 ± 16.58), 差异具有统计学意义($P < 0.05$)。T2DM 不伴 MCI 组额叶及基底节区 Ktrans 值高于对照组, T2DM 伴 MCI 组额叶、颞叶、基底节区、丘脑及海马 Ktrans 值高于对照组($P < 0.05$)。T2DM 伴 MCI 组基底节区及海马 Ktrans 值高于 T2DM 不伴 MCI 组($P < 0.05$)。结论: T2DM 伴 MCI 患者血脑屏障破坏, 血脑屏障损伤可能在 T2DM 伴 MCI 患者认知功能损害的病理生理过程中起着关键作用。

PO-3081

磁共振 IDEAL-IQ 与 mDIXON Quant 技术对腹部、 椎体脂肪定量的对比分析

刘娜

大连大学附属中山医院

目的: 探讨不同平台 3.0T MR 设备上非对称回波最小二乘估算法迭代水脂分离序列 (Iterative decomposition of water and fat with echo asymmetry and least-squares estimation quantitation sequence, IDEAL-IQ) 和魔镜成像 (mDixon Quant) 序列对肝脏、胰腺与腰椎椎体脂肪含量 (Fat Fraction, FF) 定量评估的差异。材料与方法: 前瞻性纳入 36 名健康志愿者 (男 15 人, 女 21 人; 年龄 24.39 ± 2.28 岁), 分别在两个不同平台 3.0T MR 上腹部与腰椎行 IDEAL-IQ 和 mDixon Quant 序列扫描。两名观察者测量所有志愿者肝脏、胰腺和腰椎 (L1-L5) 椎体的 FF 值并进行两序列间对比分析。结果: 两名观察者所测数据一致性良好 ($ICC > 0.75$)。IDEAL-IQ 与 mDixon Quant 序列定量测量肝脏 FF 值 (3.74 ± 0.89 & 3.69 ± 0.80)、胰腺 FF 值 (4.66 ± 1.37 & 4.63 ± 1.35) 和腰椎各节椎体 FF 值 (L1: 32.29 ± 7.98 & 32.32 ± 7.85 ; L2: 35.08 ± 9.15 & 35.08 ± 9.20 ; L3: 37.75 ± 9.93 & 37.61 ± 9.82 ; L4:

37.15±9.82&37.26±9.84; L5:37.79±9.58&37.72±9.54) 差异无统计学意义 (p 值均>0.05)。结论: IDEAL-IQ 与 mDixon Quant 序列均可定量测量肝脏、胰腺和腰椎椎体 FF 值, 其测量值具有高度的一致性。

PO-3082

初探静音技术在颅脑磁共振成像中的应用

黄侃、宋清伟、刘爱连、王楠、陈丽华、张浩南
大连医科大学附属第一医院

目的 探讨静音技术不同静音因子对颅脑磁共振图像质量的影响。材料和方法 招募 50 例志愿者 (男 23 例, 女 27 例, 平均 58.06±16.77 岁)。3.0T MR 扫描仪行结合静音技术的颅脑矢状位 T1 Flair、T2WI、T2 Flair 序列扫描, 采用的静音因子分别为 1、0.8、0.6、0.4、0.2, 部分受检者行单序列扫描, 部分受检者行多序列扫描, 最终各序列均为 21 例。在扫描过程中记录各序列噪声分贝最大值。在胼胝体、脑白质、小脑、脑桥划定感兴趣区测量信号值 (Signal Intensity, SI) 和噪声强度 (Standard Deviation, SD), 并计算信噪比 (Signal to Noise Ratio, SNR) 和对比噪声比 (Contrast to Noise Ratio, CNR)。采用四分法对图像进行评分。3 分及 3 分以上满足诊断要求。Kappa 检验两观察者主观评分的一致性。对各序列不同组间图像的 SNR, CNR 和主观评分采用单因素 ANOVA 分析, P<0.05 为差异具有统计学意义, 若差异具有统计学意义, 进行后续两两比较。结果 两观察者主观评分一致性良好 (Kappa: 0.806-0.871)。ANOVA 检验 T1 Flair 胼胝体 SNR、CNR、主观评分, T2 Flair 胼胝体和小脑 CNR, T2WI 胼胝体 CNR 和主观评分差异有统计学意义 (p<0.001)。两两比较结果当 Q 为 0.4、0.2、0.2 时, T1 Flair 主观评分、T2 Flair 胼胝体 SNR、T2WI 主观评分较 Q 为 1.0 差异具有统计学意义 (p<0.05)。结论 基于静音技术的颅脑 MR 扫描时间随着 Q 的减小, 噪声分贝逐渐降低, 综合考虑噪声分贝值与图像质量, 临床推荐 Q 分别为 0.6、0.4、0.2 行颅脑轴位 T1 Flair、T2WI、T2 Flair 序列扫描。

PO-3083

颅内动脉瘤的 DCE-MRI 和 4D-flow-MRI 研究

付其昌、张勇、管生、程敬亮
郑州大学第一附属医院

目的: DCE-MRI 在颅内未破动脉瘤 (UIAs) 壁中的容量转移常数 (K^{trans}) 有助于 UIAs 不稳定状态的风险分层。本研究探讨 UIAs 中 4D-flow-MRI 的血流动力学参数和 K^{trans} 的关系。

方法: 前瞻性收集我院 2018 年 1 月至 2019 年 10 月同时行 3.0T 磁共振 4D-flow-MRI 和钆剂增强 DCE-MRI 的 UIAs 患者进行分析。共入组 78 例患者。所有患者均基于 3.0T Siemens Prisma 磁共振扫描仪 (64 通道头颈联合线圈) 完成 4D-flow-MRI、钆剂增强 DCE-MRI 检查。由 2 名有经验的神经影像医师通过 CVI42 5.11.2 软件对 UIAs 的 4D-flow-MRI 图像独立进行盲法分析, 并计算相应动脉瘤的血流动力学指标-壁面切应力 (WSS)。由 2 名有经验的神经影像医师通过西门子 Syngo.via 工作站 TISSUE 4D 软件对 UIAs 的 DCE-MRI 图像独立进行盲法分析, 并计算相应动脉瘤的全定量药代动力学指标- K^{trans} 。用 ICC 评价 2 名医评估 WSS 及 K^{trans} 的一致性。采用 Spearman 相关分析, 对连续变量间的相关性进行分析。采用带回归线的散点图, 呈现连续变量间的数量变化趋势。

结果: 78 例患者中共发现 96 个 UIAs。医师对 WSS 测量 (ICC=0.94; 95%CI 为: 0.91 to 0.96)、对 K^{trans} 测量 (ICC=0.97; 95%CI 为: 0.95 to 0.98) 的一致性均较好。 K^{trans} 与 WSS 之间呈负相关关系 (rs= -0.24, P=0.02, 95%CI 为: -0.42 to -0.04)。

结论: 颅内未破动脉瘤中的 WSS 与 K^{trans} 呈负相关, 有望用于 UIAs 不稳定状态的风险分层。

PO-3084

基于高分辨率 MRI 的影像组学评估颈动脉斑块患者 CEA 术后围手术期 NIILs 的研究

陈思涵、查云飞
武汉大学人民医院

目的: 本研究旨在评估颈动脉内膜切除术后颈动脉斑块患者同侧围手术期出现新缺血性病变的发生情况。材料与方法: 回顾性收集 115 例患者, 所有患者均经超声造影或 CT 检查证实颈动脉管腔狭窄 $\geq 70\%$, 在行颈动脉内膜剥脱术前, 所有患者均接受了高分辨率磁共振成像检查, 采用 3.0T MR750 系统(GE Healthcare, USA)配备 8 通道颈动脉线圈, hrMRI 检查方案包括 2D T1 加权双反转恢复 FSE、质子密度加权 FSE 和 2D T2 加权双反转恢复 FSE, 使用 ITK-SNAP 对 hrMRI 图像进行人工分割, 并使用 pyradiomics 提取影像组学特征。CEA 术后 DWI 证实新发同侧缺血性病变(NIILs)的发生。将患者随机分为训练组和测试组, 使用 Lasso 和多变量 logistic 回归分析构建无创模型预测 NIILs。结果: 在所有患者中, 75 例在 CEA 后发现了新的同侧缺血性病变(NIILs), 而 40 例未表现出任何此类病变。最初, 从 T1 加权图像中提取了总共 1175 个影像组学特征, 随后进行了降维以构建一个影像组学模型来预测 NIILs。在训练组和测试组中, 影像组学模型的曲线下面积(AUC)分别为 0.864(95%可信区间[CI], 0.781-0.947)和 0.795(95% CI,0.646-0.945)(图 a 和 b)。还使用性别、年龄、LDL、HDL、LHR、高血压、糖尿病、IPH(由 MRI 预测)和 LRNC(由 MRI 预测)等变量构建了临床模型。IPH(OR=42.01)和 LRNC(OR=5.11)被纳入临床模型, 并通过结合 radscore、LRNC 和 IPH 构建了多变量 logistic 回归模型。该模型使用列线图可视化(图 c)。联合模型的 AUC 在训练组为 0.949(95% CI,0.906-0.991), 在测试组为 0.837(95% CI,0.692-0.982)。校正显示, 列线图在训练组和测试组中拟合良好(图 d 和 e)。列线图显示, 在训练组和测试组中, 临床获益最佳(图 f 和 g)。总结: 与传统 hrMRI 相比, 融合影像组学和临床变量的联合模型不仅可以预测 NIILs 的发生, 而且可以为患者提供个性化治疗。

PO-3085

平面回波成像校正 (EPIC) 联合低方差表观弥散系数 (LOVA ADC) 在颈髓 DWI 和 DTI 序列中的应用

刘娜
大连大学附属中山医院

目的 探索平面回波成像校正(Echo-Planar Imaging Correction,EPIC)联合低方差表观弥散系数 (Low variance Apparent Diffusion Coefficient,LOVA ADC) 技术对颈髓弥散加权成像 (Diffusion Weighted Imaging, DWI) 及弥散张量成像 (Diffusion Tensor Imaging, DTI) 图像质量的改善价值。资料与方法 招募志愿者 33 人(男 20 人, 平均年龄 23.33 ± 2.86 岁)。3.0T MR 行矢状位 T1WI、校正前后 DWI、DTI 序列。两名观察者在 T1WI 与校正前后 DWI、DTI 序列融合图像上划定感兴趣区 (Region Of Interest, ROI) 测量 ADC 值、各向异性分数 (Fractional Anisotropy, FA) 值, 测量偏移距离, 并对图像质量进行五分法主观评分。采用组内相关系数 (Intraclass Correlation Coefficient, ICC)、Kappa 检验两名观察者测量数据和主观评分的一致性, 若一致性良好, 取两名观察者平均值进行后续分析。采用独立样本 t 检验和 Mann-Whitney U 检验进一步比较图像主客观评估的组间差异。结果 两名观察者测量数据和主观评分一致性良好 (ICC: 0.912-0.999, Kappa:

0.778-0.816)。独立样本 t 检验显示:校正前后 DWI 序列所测 C6 ADC 值、C4、C5、C6 偏移距离和主观评分差异均有统计学意义 ($p<0.05$);校正前后 DTI 序列 C1、C3 FA 值、C1、C3 ADC 值、C4、C5、C6 偏移距离和主观评分差异均有统计学意义 ($p<0.001$)。结论 EPIC 联合 LOVA ADC 技术可以显著降低图像畸变,提高 ADC 值的精度,改善图像质量,从而提高颈髓疾病诊断的精确性。

PO-3086

基于压缩感知技术联合风车采集优化颅脑 T2 加权成像

刘娜

大连大学附属中山医院

目的 探索不同压缩感知 (CS) 加速因子 (Acceleration Factor, AF) 结合不同风车采集 (MultiVane, MV) 填充百分比 (acquisition percentages, AQP) 对颅脑 T2 加权磁共振成像 (T2WI) 图像质量的影响。**资料与方法** 前瞻性招募志愿者 21 例(男 9 人,平均年龄 38.95 ± 19.56 岁),于 3.0T MR 行常规快速自旋回波(Turbo Spin Echo, TSE)T2WI 序列和 T2WI-MVXD 序列。T2WI-MVXD 序列由 4 种 AF (敏感度编码 SENSE2 以及 CS2、3、4) 与 3 种 MV AQP (160%、210%、260%) 两两联合组成。两名观察者在颅脑 T2WI 轴位原始图上划定感兴趣区 (ROI) 测量信号强度 (SI) 和标准差 (SD),并计算信噪比 (SNR) 和对比噪声比 (CNR)。并对图像质量进行四分法主观评分。使用组内相关系数 (ICC) 及 Kappa 检验评估两名观察者测量数据和主观评分的一致性;若一致性良好,选择高年资医师的测量和评分结果进行后续分析。使用 Friedman 检验不同 AF 之间 SNR、CNR 及主观评分的差异性。若差异性有统计学意义,使用最小差异性检验 (LSD 法) 进行两两比较。结果 两名观察者测量数据和主观评分一致性良好 (ICC: 0.971-0.996, Kappa: 0.769-1.000)。与常规 TSE 序列相比,所有 T2WI-MVXD 序列均获得高 SNR 和 CNR 图像 ($p<0.001$)。采用相同 AF 的扫描方案,各部位 SNR 和 CNR 随着 MV AQP 的增加而增加;采用相同 MV AQP 的扫描方案,SNR 和 CNR 随着 CS 加速因子的增加而减少,胼胝体 SNR、CNR 及小脑 CNR 差异有统计学意义 ($p<0.05$)。在扫描时间相当的几个扫描方案前提下,AF=CS3 (210%) 组合序列的胼胝体、小脑 SNR 和脑桥 CNR 均高于 CS2 (160%) 和 CS4 (260%) ($p<0.05$)。结论 AF=CS3 结合 MV AQP 210% 的扫描方案能够在保证图像质量满足诊断要求的情况下,扫描时间缩短了 25% (72s vs. 96s),推荐用于临床常规扫描。

PO-3087

基于定量 T2-mapping 和常规膀胱磁共振的影像组学模型预测膀胱癌高低级别的价值

叶蕾、宋彬

四川大学华西医院

目的

基于质子自旋-自旋弛豫时间的 T2-mapping 定量技术可实现对体素内组织成分的定量评估,特别是自由水含量的评估。鉴于高低级别膀胱癌中细胞外液体的明显差异,本研究认为不同级别的膀胱癌的 T2 值存在差异。影像组学可深度挖掘肿瘤间的细微差异,基于 T2-mapping 及常规膀胱 MRI 的影像组学模型可进一步提高术前预测膀胱癌高低级别的准确性。因此,本研究将探索影像组学是否可提高常规 MRI 及 T2-mapping 对膀胱癌术前分级的预测价值。

方法

前瞻性纳入临床怀疑膀胱癌的患者，并在手术前进行常规膀胱 MRI 扫描及 T2-mapping 扫描，常规 MRI 扫描序列包括 T2 加权序列 (T2WI)，弥散加权序列 (DWI) 及动态增强序列 (DCE)。纳入标准：(1) 既往未接受过新辅助治疗；(2) 磁共振扫描后接受手术，包括经尿道膀胱肿瘤切除术或膀胱全切术；(3) 手术病理证实为尿路上皮癌；(4) 肿瘤直径大于 1cm。两名放射科医师分别在表面弥散系数 (ADC) 和 T2-mapping 图像上沿病灶边缘勾画三维感兴趣区，对所有图像分别提取影像组学特征及 T2、ADC 测值。将纳入患者按照 2: 1 随机分为训练组和测试组，使用训练组的影像组学特征建立预测膀胱癌术前病理分级模型，在测试组中验证模型。

结果

共纳入 92 名患者 (训练组 n=64, 验证组 n=28)，其中 63 例为高级别 (训练组 n=45, 验证组 n=18)。低级别膀胱癌的 T2 值及 ADC 值明显高于高级别肿瘤 ($p=0.002$ 及 <0.001)。但使用 ADC 值和 T2 值预测高低级别的效能较差，曲线下面积 (AUC) 分别为 0.69 及 0.71。在测试组中，T2-mapping 影像组学模型的预测效能 (AUC, 0.87; 95%可信区间(CI), 0.73-1.0) 高于 ADC 影像组学模型 (AUC, 0.77; 95%CI, 0.56-0.97) 及联合影像组学模型 (AUC, 0.78; 95%CI, 0.61-0.96)。

结论

我们的研究表明：使用 T2 值和 ADC 值预测膀胱癌高低级别的效果较差，影像组学特征在术前鉴别膀胱癌的病理分级方面可以提供更多的信息。而影像组学模型中，T2 影像组学模型优于 ADC 和联合影像组学模型。

PO-3088

DCE-MRI 纹理分析精准评估乳腺良恶性病变的应用价值

刘玉凤、杨佳佳、杨佳佳

浙江中医药大学附属第一医院 (浙江省中医院)

目的：探讨高分辨率动态增强 MRI 纹理特征分析在诊断乳腺良恶性病变及背景强化中的应用价值。

方法：本文前瞻性入组我院 2015 年 4 月~2017 年 6 月期间 128 例临床怀疑有乳腺肿瘤患者，其中 62 例符合入组标准且术前行高时间分辨率 (1+26) DCE-MRI 扫描，对照组随机回顾性纳入 78 例术前行低时间分辨率 DCE-MRI 扫描 (1+5)。通过血流动力学双室模型 Extended Tofts Linear 进行全定量分析乳腺 DCE-MRI 图像，容积测量恶性组及良性组病灶中心区域 (lesion)、周围区域 (peri)、背景强化区域 (bpe) 的 Ktrans 纹理特征和血管渗透性参数 Ktrans、Kep、Ve 和 Vp。通过两样本 t 检验比较不同时间分辨率 DCE-MRI 扫描所得到的血流动力学特征 (Ktrans、Kep、Ve 和 Vp)，通过降维后获得的 Ktrans 纹理特征进行建模，通过 ROC 曲线评价其诊断性能。

结果：62 例高时间分辨率组及 78 例低时间分辨率组高时间分辨率和低时间分辨率 DCE-MRI 所得到的血流动力学参数存在统计学差异 ($p<0.05$)，且高时间分辨率组肿瘤中心区域的 Ktrans 均值 (Ktrans-mean) 与病理分级呈显著正相关 ($r = 0.400$, $P = 0.012$)。通过不同时间分辨率的 Ktrans 图获得的纹理特征构建分类模型，高时间分辨和低时间分辨率 DCE-MRI 的 Ktrans 图纹理特征模型鉴别疾病良恶性病灶中，肿瘤中心区域模型的 AUC 值、准确率分别为 0.889、0.867 和 0.850、0.750；肿瘤外周区域模型分别为 0.884、0.733 和 0.835、0.725；背景强化区域模型分别为 0.760、0.700 和 0.716、0.733；肿瘤中心区域+外周区域+背景强化区域模型分别为 0.933、0.800 和 0.868、0.833。

结论：高时间分辨率 DCE-MRI 定量纹理特征分析在乳腺良恶性病变的诊断中较传统低时间分辨率可能具有更高的应用价值，结合乳腺病变和背景强化可能更有助于乳腺癌的早期诊断，且 Ktrans-Mean 参数有助于恶性肿瘤的病理分级。

PO-3089

DCE-MRI 动脉早期宫颈黏膜强化对诊断 子宫内膜癌宫颈间质浸润的价值

刘明明、梁宇霆、王新莲
首都医科大学附属北京妇产医院

目的：术前评估子宫内膜癌发生宫颈间质浸润是制定治疗计划的重要依据，对盆腔淋巴结转移有重要的预后意义。核磁共振成像（MRI）被认为是术前评估宫颈浸润的最佳非侵入性技术。延迟 DCE-MRI（注射对比剂后 4-5min）是检测宫颈浸润的最佳选择，表现为中等强化的宫颈间质内出现低强化的肿瘤组织，但扫描时间相对较长。因此，本研究拟探索 DCE-MRI 动脉早期（注射对比剂后 30-40s）宫颈黏膜显像连续性评估子宫内膜癌宫颈间质浸润的可行性。

方法：分析北京妇产医院经手术治疗的子宫内膜癌 186 例患者盆腔 MRI 资料，其中矢状位 DCE-MRI 共采集 6 期增强影像，每期 16-20s，持续 1.5-2min，在 4-5min 扫描延迟期图像。由两位医师分别在 DCE-MRI 注射对比剂后 30-40s 和 4-5min 评估是否存在宫颈间质浸润，计算并对比不同时间评估宫颈间质浸润的符合度、敏感度、特异度、阳性预测值和阴性预测值，以卡方检验评估两者差异是否有统计学意义。两位医师对宫颈间质浸润判断的结果的一致性分析采用 kappa 检验进行分析。

结果：医师 1 在 DCE-MRI 30-40s 判断宫颈间质浸润的敏感度、特异度、符合度、阳性预测值和阴性预测值分别为 0.64、0.93、0.88、0.63、0.93；延迟 4-5min 分别为 0.59、0.93、0.87、0.67、0.93，两者差异无统计学意义（ $P>0.05$ ）。医师 2 在 DCE-MRI 30-40s 判断宫颈间质浸润的敏感度、特异度、符合度、阳性预测值和阴性预测值分别为 0.63、0.93、0.88、0.65、0.92；延迟 4-5min 分别为 0.60、0.93、0.87、0.63、0.92，两者差异无统计学意义（ $P>0.05$ ）。两位医师在 DCE-MRI 30-40s 和延迟 4-5min 判断子宫内膜癌宫颈间质浸润的结果均具有较好的一致性（ $k=0.63$ ， $k=0.72$ ）。

结论：DCE-MRI 在注射对比剂 30-40s 利用宫颈黏膜连续性诊断是否发生宫颈间质浸润可达到与延迟 4-5min 扫描一致的诊断效果，面对逐渐增多的 MRI 检查患者，可节约时间成本，避免延迟扫描，提高检查效率。

PO-3090

基于术前 T2 磁共振影像组学预测结直肠癌肝转移瘤 TACE 术后早期疗效的研究

夏会、曾舜华、陈琴
大连大学附属新华医院

目的：探讨基于 TACE 术前 T2 磁共振的影像组学对结直肠癌肝转移瘤经 TACE 术后早期疗效预测中的价值。

方法：回顾性分析 70 例接受 TACE 治疗的结直肠癌肝转移瘤患者，术前 1 周内行 MRI 检查，术后 1~3 个月、半年随访多功能 MRI，按照 mRECIST 标准对 TACE 术后 3 个月肿瘤局部控制率进行评估，利用 3DSlicer 软件在 T2 图像上进行勾画肿瘤区域，提取影像组学特征，利用 Pearson 相关系数剔除冗余特征，利用 mRMR 特征排序方法筛选得到组学标签。采用留一法划分样本，与 LASSO 分类器共同构建结直肠癌 TACE 治疗后 3 个月进展预测模型。计算模型的受试者工作特性曲线（ROC）的曲线下面积（AUC），评估模型的预测能力。

结果: 70 例患者 3 个月后随访 52 例病灶未进展 (N-PD), 18 例进展 (PD), 两组术前 T2-MRI 的 Wavelet-HHH firstorder Mean 等 3 个的影像组学参数有统计学差异 ($P<0.05$), 以这些差异性影像组学特征所建的模型具有一定的预测能力 ($AUC=0.657, ACC=0.714, SEN=0.588, SPE=0.755$)。结论: 基于 MRI 组学特征能对接受 TACE 治疗的结直肠癌肝转移瘤进行近期进展风险预测, 可在 TACE 术前筛选进展危险性高的患者, 为其提早采取联合治疗提供个体化建议。

PO-3091

探讨磁共振特征追踪技术在帕金森病患者左心评估中的价值

岳汛^{1,2}、黄小华²、孙家瑜¹

1. 四川大学华西医院放射科

2. 川北医学院附属医院放射科

目的: 本研究利用心脏磁共振特征追踪技术评估帕金森病患者的左心结构和功能改变, 并探究影响左心结构及功能改变的相关因素。

方法: 本研究纳入了 PD 患者 39 例和健康对照者 34 例, 均完成了常规心脏磁共振检查。使用专业后处理软件 CVI42 分析左心功能及心肌应变。左心室 (LV) 功能参数包括: 左室舒张末期容积指数 (LVEDVi)、左室收缩末期容积指数 (LVESVi)、左室射血分数 (LVEF)、左室心肌质量指数 (LVMI); 心肌应变参数包括: 左室整体径向应变 (GRS)、周向应变 (GCS) 及纵向应变 (GLS)。左心房功能参数包括: LA 储蓄功能 (EF total、Es、SRs)、导管功能 (EF passive、Ee、SRe) 和泵功能 (EF booster、Ea、SRa)。两组间的比较采用独立样本 t 检验或 Mann-WhitneyU 检验。采用 Pearson 或 Spearman 相关系数分析心功能及应变参数与运动功能障碍及自主神经功能障碍的相关性。

结果: PD 组的 LVEF、GLS 均低于对照组, LVESV、LVESVi、LVMI 均高于对照组, 差异具有统计学意义 (P 均 <0.05)。与对照组相比, PD 组左心房容积 LA Vpac、LA Vmin 和 LA Vmax 差异无统计学意义 ($P>0.05$)。PD 患者的左房储蓄功能 (储蓄功能这种提法是否通用?) (EF total、Es、SRs) 和左室导管功能 (EF passive、Ee、SRe) 及泵功能 (EF booster、Ea、SRa) 与对照组相比均明显受损 (P 均 <0.05)。相关性分析显示, Es、SRs、LAEF passive、Ee 及 SRe 与 UPDRSIII 均存在显著相关性 ($r=-0.409$ 、 -0.355 、 -0.326 、 -0.445 、 0.417 , P 均 <0.05)。Es、SRs、Ee、SRe 与 SCOPA-AUT 均存在显著相关性 ($r=-0.535$ 、 -0.319 、 0.316 、 0.359 , P 均 <0.05)。

结论: PD 患者存在左心结构功能改变, 其中, 左心房储蓄功能及传导功能与运动障碍及自主神经功能障碍的严重程度相关。CMR-FT 有助于评估帕金森病对患者心脏结构及功能的影响。

PO-3092

磁共振 3D-THRIVE 增强序列联合 MIP 重建在复杂性肛瘻患者中的诊断效能及治疗指导价值研究

黄社磊

深圳市人民医院龙华分院

目的分析磁共振 3D-THRIVE 增强序列联合 MIP 重建在复杂性肛瘻患者中的诊断效能, 探讨该诊断方法在患者手术治疗中的指导价值, 以期临床诊疗提供影像学依据。

方法 选择深圳市人民医院 2020 年 5 月-2022 年 12 月疑似复杂性肛瘻的患者 150 例为研究对象, 所有患者均采用 1.5T 磁共振增强检查, 分别完成常规扫描序列 T1 加权成像 (T1WI)、T2 加权成像 (T2WI)、T2WI 压脂、DWI、T1WI 压脂增强及 3D - THRIVE 增强序列, 以手术检查结果作为

“金标准”，借助 SPSS 26.0 软件完成统计学分析，分析磁共振增强检查在复杂性肛瘘患者与手术结果之间的符合率；计算不同扫描序列下复杂性肛瘘患者的诊断效能（灵敏度、特异度、阳性预测值及阴性预测值）；所有患者均行手术治疗，分析患者治疗前磁共振的影像学特征在患者治疗中的指导价值。

结果 150 例疑似复杂性肛瘘患者与“金标准”比较，磁共振诊断阳性患者 125 例，阴性患者 20 例，诊断符合率为 96.67 %；诊断灵敏度为 97.66 %、特异度为 90.91 %、阳性预测值 98.43 %、阴性预测值为 86.96 %；与各检查序列比较，3D - THRIVE 增强联合 MIP 重建技诊断效能最高，诊断符合率为 95.33 %，与其他序列比较均有统计学意义 ($P < 0.05$)。

结论 3D - THRIVE 增强序列联合 MIP 重建技术对于复杂性肛瘘的诊断效能明显高于其他序列，并且，该技术可以实现瘘管的三维形态显示，在提高复杂性肛瘘患者的诊断效能的同时，也为外科医生制定更为合理和安全的手术方案提供更加全面的信息。

PO-3093

AI 辅助压缩感知技术在上腹部 T2WI 序列中的应用

王楠¹、宋清伟¹、刘爱连¹、陈丽华¹、张军¹、李国斌²、张树恒²、席誉华²

1. 大连医科大学附属第一医院

2. 上海联影医疗科技股份有限公司

目的：探索 AI 辅助压缩感知技术 (AI-assisted compressed sensing, ACS) 在上腹部 T2WI 序列扫描中的应用价值。

方法：回顾性收集 2023 年 6 月至 2023 年 8 月于我院行 3.0T MR 上腹部检查的患者 (uMR Omega, 上海联影)。所有患者均扫描常规 T2WI-arms-PI2 序列和 T2WI-ACS2 序列，两种序列均采用呼吸门控触发。出组标准：①脂肪肝，肝炎或肝硬化等弥漫性肝病影响数据测量者；②除肝囊肿外，肝脏/肾脏/脾脏占位患者；③术后患者。最终入组 121 例上腹部患者。由两名观察者采用双盲法分别对 T2WI-arms-PI2 和 T2WI-ACS2 图像进行客观评价，肝脏 ROI 分别放置于肝左内叶、肝左外叶、肝右前叶和肝右后叶最大层面以及同层面右侧竖脊肌 (3 个)，肾脏 ROI 分别放置于肾脏最大层面 (3 个) 及同层面同侧竖脊肌 (3 个)，脾脏 ROI 分别放置于脾脏最大层面 (3 个) 及同层面同侧竖脊肌 (3 个)，记录每个 ROI 的 mean 值和 SD 值。肝脏/肾脏/脾脏数据测量后分别取均值，并计算两组图像的信噪比 (SNR) 和对比噪声比 (CNR)。一致性检验采用组内相关系数 ICC 检验。若一致性良好，采用高年资医师测量数据进行后续分析。两组间 SNR 和 CNR 比较采用 Maan-Whitney U 检验。

结果：T2WI-ACS2 序列扫描时间较 T2WI-arms-PI2 序列明显缩短 (43s VS 2min30s)。T2WI-ACS2 序列右肾 SNR 大于 T2WI-arms-PI2 序列 (65.7 ± 27.9 VS 51.6 ± 23.5)，T2WI-ACS2 序列右肾 SNR 大于 T2WI-arms-PI2 序列 (43.6 ± 23.1 VS 34.2 ± 17.1)，差异均具有统计学意义 ($P < 0.05$)。T2WI-ACS2 序列和 T2WI-arms-PI2 序列的肝脏、左肾、脾脏 SNR 和 CNR 均无统计学差异 ($P > 0.05$)。

结论：临床扫描中，T2WI-ACS2 能够在保证图像质量前提下明显缩短扫描时间，通过快速扫描冻结上腹部运动伪影，可以作为上腹部常规 T2WI-arms-PI2 序列的替代方案。

PO-3094

1H 磁共振波谱结合模式识别对食管鳞癌诊断标志物的探寻研究

耿宽
红河州第一人民医院

目的 利用氢质子代谢指纹谱结合不同模式识别方法探寻食管鳞癌 (Esophageal Squamous Cell Carcinoma, ESCC) 患者血清代谢标志物, 寻找潜在的 ESCC 诊断标志物组, 从代谢水平上为 ESCC 预防筛查、早期诊断及精准治疗提供一定的理论基础。方法 收集本院心胸外科新入院并经病理组织确诊的早期食管鳞癌患者 (I/II 级) 的术前血清样本 70 份, 以及筛选同期本院体检中心年龄及性别相匹配的健康对照组的血清样 50 本份, 利用 Bruker Avance III 谱仪对三组样本进行数据采集, 采用主成分分析(PCA)、正交偏最小二乘法-判别分析(OPLS-DA)对获得的氢质子图谱进行模式识别, 检测正常对照组与术前 ESCC 组差异性代谢物, 筛选出潜在特征性代谢标志物组, 对发生代谢紊乱途径进行分析。结果 两组间共筛选出 31 个差异代谢物; 对模型的有效性利用交叉验证后得到的 R²X 和 Q² 值进行评判, 在 ESCC 组与对照组间筛选出包含有 6 个诊断特异性及灵敏性较高的具有潜在诊断价值标志物组 (AUC=0.969); 结论 基于氢质子代谢指纹谱结合模式识别方法能有效区分正常对照组、ESCC 术前组间的差异代谢物, 为 ESCC 预防、早期诊断及精准治疗提供有效的分子水平的代谢信息。

PO-3095

多参数集成序列联合人工智能压缩感知技术在颅脑中的应用

罗贺丹^{1,2}、苗延巍¹、宋清伟¹、孙嘉忆¹
1. 大连医科大学附属第一医院
2. 大连市公共卫生临床中心

目的: 利用多参数集成序列联合人工智能辅助下的压缩感知(united compressed sensing, ACS)技术颅脑进行成像, 并优化成像序列, 选择最合适的加速因子。

材料和方法: 前瞻性收集健康志愿者 10 例, 使用联影 uMR0mega 3.0T 扫描, 均行敏感度编码 (Sensitivity Encoding, SENSE) 并行采样技术 (SENSE=3) 和不同加速因子 (Acceleration Factor, AF, AF=ACS3、ACS 4、ACS 5、ACS 6) 的多参数集成序列检查。由具有 5 年以上工作经验的放射科医师分别在 T1map、PDmap、R2*map、T2*map、T1WI、PDWI 图上, 测量双侧额叶皮层、双侧枕叶皮层及双侧尾状核头, 取其信号强度及定量参数平均值为脑灰质信号强度及定量参数; 双侧半卵圆中心、胼胝体膝部、胼胝体压部, 取其信号强度、噪声强度 (Standard Deviation, SD) 及定量参数平均值为脑白质信号强度及定量参数; 双侧脑室前角信号强度平均值为脑脊液信号强度。计算信噪比 (Signal to Noise Ratio, SNR) 和对比噪声比 (Contrast to Noise Ratio, CNR)。观察者依据解剖结构细节可见度、伪影以及诊断价值进行主观评分。使用 Friedman 检验不同 AF 之间各定量参数、SNR、CNR 及主观评分的差异, 并对 P 值使用 Bonferroni 进行多重校正。

结果: 各序列不同 AF 比较, 与 SENSE 3 序列相比, 当 ACS4 时, 各序列定量值及 SNR、CNR 差距无统计学意义; 当 ACS5、6 时, PDWI 图像的 SNR、灰质及白质 PD 值升高, 差距具有统计学意义 (P<0.05), 其余数据差距无统计学意义。

结论: 多参数集成序列联合 ACS 技术能够对颅脑部进行成像。综合时间和图像质量的平衡考虑, ACS AF=4 序列值得推荐, 扫描时间缩短 60.85%, 一次扫描可重建出多组参数定量图像, 可以对扫描部位进行多方面评估, 获得质量可靠的颅脑部定量参数及定性图像, 具有广阔的临床前景。

PO-3096

黑血技术增强序列在颅内微小转移瘤诊断中的应用价值

尹娜

江苏省肿瘤医院

目的: 探讨 3D 黑血 (BB, Black Blood) -MSDE 技术增强序列对颅内微小脑转移瘤的诊断价值, 为临床放疗提供精准定位。

方法: 颅脑是各种恶性肿瘤常见的转移部位, 有文献报道多发性脑转移瘤可以占到颅内肿瘤 60 ~ 70%, 甚至更高。随着肿瘤治疗方法的改进, 使得患者生存时间延长, 早期检出病灶尤为重要, 目前磁共振检查是公认的脑转移瘤的最佳检查方法, 常规增强 T1WI 扫描敏感性高, 但其对颅内微小转移灶, 脑膜转移灶显示欠佳。本院飞利浦磁共振 3D 黑血 (BB, Black Blood) -MSDE 技术增强序列, 可有效提高组织的对比度, 获取更高分辨率的图像, 对于颅内病灶的检出和显示方面具有明显优势。

选取 2020 年 5 月至 2021 年 1 月本院收治的原发肿瘤经病理确诊且临床怀疑有脑转移瘤的患者 55 例作为研究对象, 入组标准: 1) 患者存在经病理证实的原发恶性肿瘤; 2) 行传统 3D-T1WI 颅脑增强检查并影像学诊断为脑转移瘤; 患者同时行传统 3D-T1WI 增强及 3D-BB-MSDE 序列增强扫描; 分别记录常规轴位增强 T1WI 与增强 FSBB 序列上所检出病灶的数目、大小及位置。按直径大小将病灶分为两组, $< 5\text{ mm}$ 及 $> 5\text{ mm}$ 。所有图像均由 2 名经验丰富的放射科高年资医师进行评估, 如意见不一致则讨论得出最终结果。

观察比较两种序列图像上显示颅内转移瘤的数目、大小、部位和转移瘤的信号强度, 并作统计学分析。

结果: 58 例脑转移瘤患者中, 综合临床及影像学分析, 共计 211 个病灶。3D-T1WI 增强扫描显示 178 个病灶, 3D-BB-MSDE 序列增强扫描显示 211 个病灶, 3D-BB-MSDE 序列增强扫描多发现 33 个病灶, 两者显示率差异比较, 3D-BB-MSDE 序列增强扫描序列对病灶的显示率为 100%, 显著高于常规增强 3D-T1WI FSE 序列, 差异有统计学意义 ($P < 0.05$)。

结论: 3D-BB-MSDE 序列扫描可显著提高颅内微小转移瘤的检出率。

PO-3097

基于 fMRI 技术探索化疗对 NSCLC 患者认知、情绪障碍影响的神经生物学机制

尹娜

江苏省肿瘤医院

目的: 采用无创脑磁共振成像 (fMRI) 方法, 探讨癌症和化疗对非中枢神经系统癌症对患者脑激活和微结构的影响, 探讨 NSCLC 患者化疗前脑白质网络的拓扑特性。

方法: 非小细胞肺癌 (NSCLC) 是肺癌最常见的亚型, 发病率高, 死亡率高, 生活质量较低。许多化疗药物 (“化学脑”) 对中枢神经系统以外的癌症患者的神经毒性引起的化疗相关的认知功能障碍, 该系统已在以前的神经心理学研究中被观察到。对 24 例非神经系统转移性 NSCLC 患者和 25 例匹配的健康对照组进行脑磁共振成像 (MRI) 数据, 非神经系统转移性 NSCLC 患者从江苏肿瘤医院的住院患者中招募, 如果他们最近的组织学诊断为 NSCLC, 在一个月内 (IIIB 或 IV 期) 未接受化疗、放疗和手术。使用 3.0T 飞利浦扫描仪获取所有参与者的 t1 加权和 DTI 图像。

数据采用脑部软件库-FMRIB 扩散工具箱 (FSL) 的功能 MRI 进行处理。首先, 对 MRI 数据进行了预处理。然后根据斯特杰斯卡尔和坦纳方程计算所有参与者的扩散张量矩阵。通过对扩散张量矩阵的对角化处理, 得到了特征值 (k_1 、 k_2 、 k_3)。计算每个受试者的分数各向异性 (FA) 图。最后, 将 DTI 图像与 t1 加权图像进行共配准, 然后将其空间归一化到蒙特利尔神经学研究所 152 (MNI-

152) 空间。通过扩散工具包, 进行白质束造影。脑网络的拓扑特性包括网络和节点效率, 包括局部效率和全局效率。NSCLC 患者和 HC 之间的网络和节点效率进行统计学比较。

结果:

NSCLC 患者在左侧额下回 (三角部)、左侧额下回 (眶部)、右侧脊盖、右直回、右侧晶状核 (壳核)、左侧颞上回和右侧颞下回的整体疗效也下, NSCLC 患者的额叶、颞叶和皮层下脑区的整体和局部疗效下降, 这可能与认知和情绪失调有关。

结论:

我们的研究表明, NSCLC 患者在化疗前表现出认知和情绪的变化, 这可能与脑白质网络中额-皮层下区域相互作用受损有关。我们的研究结果增强了临床对 NSCLC 认知和情绪障碍的认识, 并为未来 NSCLC 认知和情绪障碍的治疗提供了一个新的潜在干预靶点。然而, 需要进一步的前瞻性研究来探索脑网络的异常拓扑特征与癌症和化疗相关的认知和情绪缺陷之间的关系。

PO-3098

基于人工智能辅助下的压缩感知技术优化颅神经一站式 3D-MATRIX 成像

罗贺丹^{1,2}、宋清伟¹、苗延巍¹

1. 大连医科大学附属第一医院

2. 大连市公共卫生临床中心

目的: 利用人工智能辅助下的压缩感知(united compressed sensing, uCS)技术对 12 对颅神经的三维可调制翻转角超长回波链回聚脉冲 (three-dimensional modulated flip angles technique in refocusing imaging with extended echo train, 3D-MATRIX) 的 T2 加权成像序列进行优化, 选择最合适的加速因子。方法: 前瞻性收集 10 例健康志愿者, 均行敏感度编码并行采样技术 (SENSE=3) 和不同加速因子 (Acceleration Factor, AF, AF= 3、5、7、9) 的 3D-MATRIX 序列检查。由具有 5 年以上工作经验的放射科医师分别测量嗅神经 (I)、视神经 (II)、三叉神经 (V) 及邻近脑池脑脊液 (CerebroSpinal Fluid, CSF) 信号强度 (Signal Intensity, SI) 和噪声强度 (Standard Deviation, SD), 并计算信噪比 (Signal to Noise Ratio, SNR) 和对比噪声比 (Contrast to Noise Ratio, CNR); 测量脑池中与听神经相近的小血管的 SI, 并计算与脑脊液的对比度 (Contrast Ratio, CR)。观察者依据颅神经细节可见度、伪影以及诊断价值进行主观评分。使用 Friedman 检验不同 AF 之间 SNR、CNR、CR 及主观评分的差异, 并对 P 值使用 Bonferroni 进行多重校正。

结果: 各序列不同 AF 比较, 与 SENSE 3 序列相比, 当 ACS 5 时, SNR 与主观评分的差异无统计学意义 ($P>0.05$), CNR 及血管 CR 升高且差距具有统计学意义 ($P<0.05$); 当 ACS 7、9 时, SNR、CNR 及 CR 的差异无统计学意义。嗅神经 (I)、视神经 (II) 的主观评分降低, 且差异具有统计学意义 ($P<0.05$)。

结论 3D-MATRIX 序列联合 ACS 技术能够对十二对颅神经进行一站式成像。综合时间和图像质量的平衡考虑, ACS AF=5 序列值得推荐, 扫描时间缩短 60.85%, 能获得质量可靠颅神经图像。

PO-3099

多参数集成序列定量参数联合 rADC 值鉴别诊断高级别胶质瘤与脑转移瘤的应用价值

罗贺丹^{1,2}、苗延巍¹、宋清伟¹

1. 大连医科大学附属第一医院

2. 大连市公共卫生临床中心

目的：探究多参数集成序列定量参数及相对表观扩散系数(relative apparent diffusion coefficient, rADC)在高级别胶质瘤及脑转移瘤鉴别诊断中的价值。

材料方法：前瞻性收集在我院病理确诊 11 例高级别胶质瘤和 12 例转移瘤，使用联影 uMR OMEGA 3.0T 扫描，32 通道头线圈进行集成序列和 DWI 序列成像，TR 时间为 32.7ms, 6 个不同的 TE 时间为 2.61ms、6.59ms、9.25ms、13.23ms、15.89ms、19.87ms，4 个翻转角，矩阵 256×200，分辨率 1×1×1mm³，层数 64，扫描时间 363s，可得到 T1map、PDmap、R2*map、T2*map、QSM 定量图，由具有 5 年以上工作经验的放射科医师在所得的定量图上划定感兴趣 (Regions of interest, RIO) 测量定量值，对应肿瘤增强期相显示最大层面在对应定量图相对应区域放置三个 ROI 取平均值，在肿瘤周水肿区勾画三个 ROI 取最小 ADC 值，并计算相应的 rADC 值。rADC=最小 ADC/ADC 对侧正常脑组织。使用独立样本 t 检验或 Mann-Whitney U 检验比较两组各参数差异。应用 Logistic 回归分析模型得到联合变量，使用 ROC 曲线来确定对二者的诊断能力。

结果：两组 PD、R2*、T2*、QSM 比较差异无统计学意义 (p>0.05)。胶质瘤 T1 值高于转移瘤，rADC 值低于胶质瘤，差异具有统计学意义。rADC 值均低于转移瘤 (p<0.05)。鉴别胶质瘤和转移瘤的 T1 值、rADC 值及其组合 (T1&rADC) 的 AUC 值分别为 0.545，0.809 和 0.845。(表 1-2 和图 1)

结论：胶质瘤和转移瘤常规 MRI 扫描表现相似，强化方式也相类似。当脑转移瘤原发病灶隐匿时极易误诊。由于两者的临床病程，治疗手段及预后均不同，术前明确诊断十分重要。多参数集成序列 T1map 联合 rADC 可提高对高级别胶质瘤与脑转移瘤诊断，测量高级别胶质瘤与脑转移瘤 T1 值和 rADC 值对二者鉴别诊断具有一定的价值。

PO-3100

特发性正常压力脑积水特征性结构协变脑网络拓扑属性的研究

颜美静

复旦大学附属华东医院

目的：基于图论探究特发性正常压力脑积水 (Idiopathic normal pressure hydrocephalus, INPH) 特有的结构协变脑网络的改变。

方法：收集 85 例 INPH 患者及 76 例健康对照者的头颅磁共振结构成像数据，利用两组受试者的大脑皮层厚度分别构建结构协变脑网络，采取图论分析方法评估二者全局及节点网络水平的拓扑属性，并比较组间差异。

结果：与对照组相比，在网络密度为 0.20-0.50 的区间，INPH 组显示出更大的标准化聚类系数、小世界属性标量和较小的标准化特征路径长度，但差异无统计学意义 (P=0.58、0.56、0.89)；在全局网络水平，INPH 组的特征路径长度较对照组显著减低 (P<0.05)；在节点网络水平，INPH 组的平均边介数及平均节点介数较对照组亦减低，且存在统计学差异 (P<0.05)；在趋势上，INPH 组的聚类系数、全局属性增高。

结论：INPH 患者脑结构形态的改变揭示了该疾病潜在的脑组织重构方式，对于理解 INPH 的病理生理机制及疾病演变有重要意义。

PO-3101

吸烟成瘾与体重状态交互作用的脑结构磁共振研究

张孟哲、张勇、程敬亮
郑州大学第一附属医院

【摘要】目的 探讨吸烟成瘾与体重状态之间的神经生物学相互作用机制。方法 回顾性分析 2019 年 1 月至 2021 年 12 月通过微信等网络平台招募的 99 名受试者的相关临床资料及静息态功能磁共振数据, 包括以下 4 组: (1) 超重吸烟成瘾组($n = 24$); (2) 正常体重吸烟成瘾组($n = 28$); (3) 超重非吸烟组($n = 19$), (4) 正常体重非吸烟组($n = 28$)。所有受试者均行 3D-T1 高分辨 MRI 检查。采用基于体素的形态学测量 (voxel-based morphometry, VBM) 的方法比较 4 组间的灰质体积 (gray matter volume, GMV) 的差异。采用双因素方差分析, 将年龄、受教育年限和头部运动作为协变量, 分析吸烟成瘾与体重状态对于大脑结构的交互作用、吸烟成瘾的主效应及体重状态的主效应, 并将其与临床资料做相关性分析。结果 吸烟成瘾和体重状态在左侧背外侧前额叶皮质 (dorsolateral prefrontal cortex, DLPFC) 存在显著的交互作用 (GRF 校正, 体素水平 $P < 0.001$, 团块水平 $P < 0.05$)。相关分析显示, BMI 与左侧 DLPFC GMV 存在二次效应 ($\beta = -3.846$, $t = -2.134$, $p = 0.036$)。此外, 吸烟成瘾主效应主要表现在双侧眶额叶皮层 (orbitofrontal cortex, OFC) (GRF 校正, 体素水平 $P < 0.001$, 团块水平 $P < 0.05$)。相关分析发现左侧 OFC GMV 与 FTND 评分呈负相关 ($r = -0.391$, $P = 0.006$), 右侧 OFC GMV 与吸烟指数呈负相关 ($r = -0.335$, $P = 0.019$)。在上述阈值水平未发现统计学意义的超重主效应。结论 本研究揭示了吸烟成瘾与体重状态在左侧 DLPFC GMV 存在拮抗作用, 这可能是吸烟成瘾和超重共同的神经生物学标志物。

PO-3102

酰胺质子转移成像与扩散峰度成像在无创定量评估慢性肾病患者肾功能及病理中的比较研究

苑冠杰、廖洲艳、梁萍、许楚瓯、李震
华中科技大学同济医学院附属同济医院

目的: 探究酰胺质子转移 (APT) 成像是否可用于评估慢性肾病 (CKD) 患者的肾功能和病理改变, 并与扩散峰度成像 (DKI) 进行比较。

方法: 本研究共纳入 41 例 CKD 患者和 16 例健康志愿者, 均行肾脏 DKI 和 APT 序列扫描。使用 Body Diffusion Toolbox 软件测量皮、髓质的平均扩散率 (MD) 及平均峰度 (MK), 使用 MATLAB 软件测量皮、髓质的 APT 值。根据肾小球滤过率估计值 (eGFR), 将患者分为肾功能稳定组和肾功能受损组。此外, 所有患者均行肾活检, 根据病理总分将患者分为轻度和中重度肾损伤组。比较健康志愿者、肾功能稳定组及肾功能受损组间, 以及健康志愿者、轻度肾损伤组及中重度肾损伤组间皮、髓质 MD、MK 和 APT 的差异, 分析各参数与 eGFR、病理总分的相关性, 评估各参数区分不同程度肾功能损害和肾病理损伤的诊断效能。

结果: 健康志愿者、肾功能稳定组和肾功能受损组三组间, 以及健康志愿者、轻度肾损伤组和中重度肾损伤组三组间的皮、髓质 MD、MK 和 APT 存在显著差异 (所有 $p < 0.01$)。皮、髓质 MD 与 eGFR 呈显著正相关 (所有 $p < 0.001$), 与病理总分呈显著负相关 ($p < 0.001$; $p = 0.002$)。皮、髓质 MK、APT 与 eGFR 呈显著负相关 (所有 $p < 0.001$), 与病理总分呈显著正相关 (MK: $p < 0.001$; $p = 0.001$; APT: $p < 0.001$; $p = 0.002$)。皮质 APT 与间质纤维化积分相关性最强 ($p < 0.001$)。髓质 APT 区分健康志愿者与肾功能稳定组, 以及区分健康志愿者与轻度肾损伤组的曲线下面积 (AUC) 最大, 分别为 0.985 和 0.974。皮质 MD 在鉴别肾功能稳定组与肾功能受损组中表现最佳, AUC 为 0.939。皮质 MK 在鉴别轻度肾损伤组与中重度肾损伤组中表现最佳, AUC 为 0.836。

结论: APT 成像和 DKI 均可无创、定量评估 CKD 相关的肾功能和病理改变, 有助于治疗干预和纵向监测。APT 成像在识别早期肾功能不全及病理损伤中优于 DKI, 而且在评估肾间质纤维化中表现出良好潜力。

PO-3103

基于多参数 MRI 影像组学评估卵巢癌淋巴结转移的研究

付佳亮、田伟、谢传飞、杨巧丽、高雅丽
重庆市妇幼保健院

目的 探讨多参数 MRI 影像组学在评估卵巢癌淋巴结转移的价值。

方法 回顾性分析 2020 年 1 月-2023 年 6 月于我院 87 例诊断为卵巢癌伴淋巴结转移患者的 MRI 影像学资料, 以手术病理结果作为金标准, 分为转移性淋巴结 (metastatic lymph node, MLN) 和非转移性淋巴结 (no-metastatic lymph node, NLN), 共选取 143 个淋巴结, 其中转移性淋巴结 79 个, 非转移性淋巴结 64 个。按 7:3 随机分成训练组 (100 个)、测试组 (43 个)。采用 ITK-SNAP 对淋巴结进行勾画, 提取其 T2WI 及增强 T1WI 的 MRI 影像组学特征并实现模型构建。通过独立样本 T 检验、卡方检验等分析转移性淋巴结与非转移性淋巴结的影像学特征。绘制受试者操作特征曲线计算模型曲线下面积 (area under the ROC curve, AUC)、灵敏度、特异性、阳性预测值及阴性预测值等指标进行性能比较分析。

结果 1、MLN 的短径及平均直径大于 NLN, MLN、NLN 组间的强化均匀性存在统计学差异, 其余特征组间均无统计学差异。2、经特征筛选后 T2WI 及增强 T1WI 最终分别保留 11、19 个影像组学特征。基于多参数 MRI 影像组学模型训练组及测试组的预测效能较单一参数的影像组学模型更优, 其 AUC、灵敏度、特异度、阳性预测值及阴性预测值分别为 0.93、85%、78%、83%和 89%。

结论 基于多参数的 MRI 影像组学模型可以无创性评估卵巢癌淋巴结转移的准确性, 为临床决策提供有价值的指导。

PO-3104

系统性红斑狼疮患者大脑半球间镜像同伦功能连接研究

王宁、夏建国、李一凡
泰州市人民医院

目的 探讨静息状态下系统性红斑狼疮患者脑镜像同伦功能连接特点。方法 纳入 65 例 SLE 患者 (non-NPSLE 30 例和 NPSLE 患者组 35 例) 和 31 名健康对照者 (HC), 行静息状态功能磁共振成像 (rs-fMRI) 检查, 并完成简易精神状态量表 (MMSE)、蒙特利尔认知功能评估量表 (MOCA)、医院焦虑抑郁量表 (HADS-A、HADS-D)、运动和认知功能疲劳量表 (FSMC-M、FSMC-C)。基于 Matlab 平台上 Restplus-V1.2 工具包进行 rs-fMRI 数据预处理, 计算 VMHC 值, 在 SPM12.0 软件中采用方差分析评估三组之间 VMHC 值的差异, 以三组间差异脑区为种子点, 提取差异脑区的 VMHC 值进行两两比较。最后提取差异脑区的 VMHC 值与临床资料行 Pearson 相关性分析, $P < 0.05$ 。结果 VMHC 值差异有统计学意义的脑区主要位于双侧海马旁回、颞上回、枕中回、中央前回、内侧和旁扣带回、背外侧额上回、中央后回; 两两比较 (事后分析) 显示, NPSLE 组与 non-NPSLE 组上述脑区 VMHC 值均低于对照组, NPSLE 组上述脑区 VMHC 值均低于 non-NPSLE 组; 与健康对照组相比, non-NPSLE 患者组双侧枕中回 VMHC 值增高。结论 系统性红斑狼疮患者双侧大脑半球镜像同伦功能连接存在异常, 可为其脑损伤的神经病理学机制提供新颖而有价值的观点。

PO-3105

急慢性下腰腿痛患者默认网络子系统的动静态神经机制变化

杨紫伟、周福庆
南昌大学第一附属医院

目的：极易慢性化和高致残率已成为下腰腿痛的标签。以往的神经影像学研究表明，默认网络存在跨网络连接的可塑性改变，但是默认网络内部三个功能不同的子系统(核心子系统、背内侧前额叶子系统、内侧颞叶子系统)静态和动态的功能连接以及拓扑属性的变化尚不清楚。

方法：本研究收集 19 例急性期下腰腿痛患者(aLBLP)、31 例慢性期下腰腿痛患者(cLBLP)和 51 名健康对照者(HCs)的静息态功能磁共振成像数据，构建静态和动态默认网络功能连接矩阵。对于默认网络的静态功能连接矩阵，我们进一步计算拓扑属性和研究静态网络的功能变化。对于动态功能连接矩阵，我们分析了动态功能连接强度和拓扑属性的变异性。

结果：对于静态默认网络子系统的连边分析，cLBLP 患者与 HCs 相比核心子系统与内侧颞叶子系统以及背内侧前额叶子系统与内侧颞叶子系统之间的功能连接增加。对于静态拓扑属性，cLBLP 患者与 HCs 相比默认网络全局效率和双侧额下回节点聚类系数、节点效率、节点局部效率降低，而双侧后扣带皮层节点度中心度和右腹后侧顶下小叶节点聚类系数升高。在子系统水平的动态连边分析发现 aLBLP 患者与 HCs 相比核心子系统和内侧颞叶子系统之间的动态功能连接变异性显著降低。此外，cLBLP 患者的疼痛程度与右腹后侧顶下小叶(vpIPL)和右侧后顶下小叶(pIPL)之间的静态功能连接($r=-0.489$, $P=0.008$)以及右侧 vpIPL 的静态节点聚类系数($r=-0.555$, $P=0.002$)呈负相关。aLBLP 患者的病程与左侧后扣带皮层和左外侧颞皮质颞极动态功能连接的变异性呈负相关($r=-0.52$, $P=-0.52$)。

结论：默认网络静态功能连接和拓扑属性的变化揭示了慢性期下腰腿痛患者与疼痛强度的神经机制，动态功能连接的改变可成为预测急性下腰腿痛转变为慢性的潜在生物标志物。

PO-3106

磁共振细胞特征成像 IMPULSED 序列的研究进展

陶然、杨帆
华中科技大学同济医学院附属协和医院

细胞大小是组织的基本特征，从分子到器官水平都发挥着重要作用，包括细胞代谢、增殖和组织生长。在疾病进展期间或治疗后，细胞大小可能会显著变化。因此对细胞大小及其随时间变化的测量可在细胞水平上为临床提供关键信息。对于癌症的诊断和预后，细胞大小同样是有意义的，因为它在有丝分裂期间和死亡前会发生变化，因此可以作为评估肿瘤进展和对治疗反应的独特手段。但是，目前大多数情况下只能通过对侵入性获得的组织样本进行病理评估来获得细胞大小。因此开发一种能够非侵入性绘制细胞大小的成像方法，对微结构进行定量测量成为一项亟待解决的问题。IMPULSED（基于有限谱编辑扩散模型的显微结构成像）是基于时间扩散光谱(TDS)的 dMRI 采集方法。它已被证明可提供快速、稳定及可靠的反应平均细胞大小，并适用于临床成像。目前，IMPULSED 已经进行了全面的临床前及临床验证，分别包括计算机模拟、体外细胞及动物研究、肝脏乳腺及前列腺肿瘤研究、以及免疫治疗疗效研究，这些验证显示，IMPULSED 可以在较短时间的人体成像中可靠的反应细胞大小，且与细胞密度无关。

PO-3107

酰胺质子转移成像在前列腺癌诊断及危险分层评估中的应用价值

朱蓉、张娅
昆明医科大学第三附属医院

目的 探讨磁共振酰胺质子转移 (amide proton transfer, APT) 成像在前列腺癌诊断中的应用价值及其对前列腺癌危险分层评估的可行性。**方法** 收集因 PSA 升高或排尿困难怀疑前列腺癌来我院就诊患者, MRI 检查前未接受过前列腺相关手术、放疗以及内分泌治疗者, MRI 检查后经穿刺活检或手术明确病理结果, 其中前列腺增生患者 50 例, 前列腺癌患者 132 例, 在前列腺癌患者中, GS \leq 6 分 16 例, GS=7 分 49 例, GS \geq 8 分 67 例, 术前行常规序列 T1WI、T2WI、DWI 和 APT 成像序列扫描, 分别测量前列腺癌区、前列腺增生的不对称磁化转移率 (MTRasym) 值, 使用 Mann-Whitney 检验对测得的参数进行统计学分析。根据 Gleason 评分将其分组, GS \leq 6 分为低危组, GS=7 分为中危组, GS \geq 8 分为高危组, 并比较各组间病变区 MTRasym 值的差异; 使用 Spearman 等级相关对 MTRasym 值与 Gleason 评分进行相关性分析。采用受试者工作特征 (ROC) 曲线评价 MTRasym 值的阈值及诊断效能。**结果** 前列腺癌区 MTRasym 值显著高于前列腺增生组织 ($P<0.001$); 低危组与中危组、低危组与高危组、中危组与高危组之间 MTRasym 值差异有统计学意义 ($P<0.05$); Gleason 评分与 MTRasym 值呈正相关 ($r=0.694$, $P<0.001$)。低危组与中危组、低危组与高危组、中危组与高危组的 ROC 曲线下面积 (AUC) 分别为 0.707、0.941、0.917, 诊断阈值分别为 2.95%、3.55%、3.75%。**结论** APT 成像对前列腺癌的诊断具有一定价值, 能够对前列腺癌与前列腺增生的鉴别诊断提供帮助并且对其危险度的评估也有重要意义。

PO-3108

基于 DCE-MRI 分析评价兔肢体高压电烧伤早期骨骼肌变化

阮鹏
武汉市第三医院

目的: 探讨 DCE-MRI 分析评价兔肢体高压电烧伤早期骨骼肌微循环灌注变化的可行性
方法: 32 只中国大耳白兔随机分为高压电烧伤组 ($n=20$) 和对照组 ($n=12$)。造模后各时间点 (0.5h、24h、48h、72h) 对兔右下肢行轴位 FSE-T1WI、FSE-T2WI 及 DCE-MRI 检查。DCE-MRI 原始数据利用 Omni-Kinetics 软件在兔对侧正常肢体肌肉选取参考区域, 建立 R-R 模型, 手动勾画损伤肌肉 ROI (避开气体、坏死、出血区), 采用 merge 功能软件自动计算获取容积转运常数 Ktrans、速率常数 Kep。扫描完成后立即处死实验兔, 取损伤肢体肌肉病理组织, 采用免疫组化 CD31 计算微血管密度 (MVD) 值。采用独立样本 t 检验对同一时间点电烧伤组与对照组 Ktrans 值、Kep 值的差异进行比较。采用单因素方差分析对不同时间点 Ktrans 值、Kep 值、电烧伤组各时间点 MVD 值的差异进行比较。采用 Pearson 相关分析评价 MVD 值和 Ktrans 值、Kep 值的关系。
结果: 各时间点电烧伤组与对照组 Ktrans 值差异均有统计学意义 ($P<0.05$), 除 72h 组 ($P=0.903$) 外各时间点电烧伤组与对照组 Kep 值差异均有统计学意义 ($P<0.05$)。对照组 Ktrans 值、Kep 值随时间变化差异无统计学意义 ($P>0.05$)。电烧伤组各时间点 Ktrans 值和 Kep 值差异均有统计学意义 ($P<0.05$), 而且 Ktrans 值和 Kep 值均在 24h 达到峰值, 其中电烧伤组 Ktrans 值、Kep 值 0.5h 组与 48h 组差异无统计学意义 (P 值分别为 0.066、0.773), 余电烧伤各时间点 Ktrans 值和 Kep 值差异有统计学意义 ($P<0.05$)。MVD 值与 DCE-MRI 灌注参数 Ktrans 值、Kep 值均呈正相关 (r 值分别为 0.954、0.950, $P<0.01$)
结论: DCE-MRI 定量参数 Ktrans 值和 Kep 值可用于评估肢体高压电烧伤早期骨骼肌微循环灌注变化。

PO-3109

应用 QSM 评估帕金森病合并 2 型糖尿病患者的脑静脉血氧饱和度变化

张琪

山东第一医科大学第三附属医院

目的: 应用 QSM 定量分析脑静脉血氧饱和度评价无 T2DM 的 PD 患者 (PD-DM) 与合并 T2DM 的 PD 患者 (PD+DM) 脑静脉血氧饱和度的差异, 并探讨其与认知功能障碍的相关性。

材料与方法: 经临床拟诊 16 例 PD-DM 患者 (男 8 例女 8 例平均年龄 70.51 ± 3.20 岁) 16 例健康对照患者 (男 8 例女 8 例平均年龄 72.83 ± 3.39 岁) 纳入本研究。收集患者的临床资料包括 MMSE、MOCA、日常生活活动能力 (ADL) 和实验室指标: 空腹血糖、甘油三酯、高密度脂蛋白 (HDL)、低密度脂蛋白 (LDL)。所有受试者均进行常规联影 3.0T MRI 序列及 QSM 序列扫描, 手动勾选双侧大脑静脉 (大脑皮层静脉 CVV、丘纹上静脉 STV、透明隔静脉 SPV、大脑内静脉、基底静脉) 的兴趣区域 (ROI), 并测量磁敏感值 (MSV) 对于符合正态分布的值采用 T 检验, 否则采用秩和检验。采用 Spearman 相关检验认知评分, 实验室指标与 MSV 之间的相关性。

结果: 与 PD-DM 组相比, PD+DM 组中双侧丘纹上静脉的 (STV) 和大脑皮层静脉 (CVV) 的 MSV 具有显著差异性与 HC 相比, PD-DM 组中所有静脉的 MSV 均上升, 其中双侧基底动脉 (BV) 双侧大脑皮层静脉 (CVV) 的 MSV 具有显著差异性 ($P < 0.05$) PD+DM 组所有静脉 MSV 均大于 HC, 双侧丘纹上静脉 (STV)。大脑皮层静脉 (CV) 透明隔静脉 (SPV) 具有显著差异性 ($P < 0.05$) 双侧 STV 的 MSV 与 MMSE 具有显著相关性, 双侧 ICV、CVV 的 MSV 与 ADL 具有显著相关性, 空腹血糖与双侧 STV 及 CVV 显著相关, 双侧 CVV 与 HDL 具有显著相关性。

结论: PD 合并 T2DM 患者的脑静脉血管饱和度较无 T2DM 的 PD 患者明显下降且与认知功能障碍和高血糖状态相关。

PO-3110

用于 3T 小动物成像的智能无线超材料

祁颖艺¹、池中海¹、李新新¹、易懿²、王亚魁²、郑卓肇²、赵乾¹、孟永钢¹、周济¹

1. 清华大学

2. 北京清华长庚医院

目的: 设计并制造用于 3T 小动物成像的智能无线超材料, 实现图像信噪比大幅度增强和小鼠/大鼠头部的超高分辨清晰成像 (小鼠头部分辨率 $0.078 \times 0.078 \times 0.8 \text{ mm}^3$, 大鼠头部分辨率 $0.1 \times 0.1 \times 1 \text{ mm}^3$), 提升 3T 临床系统的小动物成像能力, 为科研人员提供更先进的成像手段。

方法: 使用超材料获得小鼠头部和大鼠头部的 T2 FSE 序列图像。并在相同序列参数条件下, 使用小鼠/大鼠商用线圈获得小鼠头部和大鼠头部的 T2 FSE 序列图像, 最后比较超材料与商用线圈的图像信噪比。

结果: 超材料在不调整任何扫描参数条件下即可大幅度增强图像信噪比, 并且支持小鼠头部分辨率 $0.078 \times 0.078 \times 0.8 \text{ mm}^3$ 、大鼠头部分辨率 $0.1 \times 0.1 \times 1 \text{ mm}^3$ 的超高分辨率清晰成像, 图像中各个组织细节显示清晰, 图像对比度好。此外, 超材料的图像信噪比显著优于小鼠/大鼠商用线圈: 小鼠头部专用超材料获得的图像信噪比是商用 8 通道小鼠专用线圈 4 倍, 大鼠头部专用超材料获得的图像信噪比是商用 12 通道大鼠专用线圈 3 倍。

结论: 超材料可大幅度提升临床 3T 系统的小动物成像能力, 实现常见于 9.4T 的超高分辨成像, 有望为 MRI 领域带来技术革新。

PO-3111

CT 联合 MR 多序列成像对胆总管小微结石的诊断价值

刘梦、邵志红、刘卫英、张景涛
上海市静安区市北医院

[摘要]目的：探讨 CT 联合磁共振多序列成像对胆总管小微结石的诊断价值。材料和方法：回顾性收集上海市静安区市北医院放射科 2019 年 3 月至 2021 年 7 月所有行上腹部 CT 平扫和磁共振胰胆管水成像 (magnetic resonance cholangiopancreatography, MRCP) 检查并经内镜逆行胰胆管造影 (endoscopic retrograde cholangiopancreatography, ERCP) 证实的胆总管小微结石病例的影像及临床资料，共计 55 例。对比分析 CT、磁共振各序列及两者联合诊断胆总管小微结石的阳性率。结果：对于 55 例胆总管小微结石，CT 薄层扫描检出阳性率为 56.4%，MR 多序列扫描阳性率为 80.6%，MR 多序列扫描对胆总管小微结石诊断优于 CT 扫描 ($\chi^2 = 7.08$, $P < 0.05$)。CT 联合 MR 多序列阳性率为 98.2%，CT 联合 MR 多序列扫描诊断胆总管小微结石优于两种单独检查方法 (χ^2 的值分别为 27.38, $P < 0.01$; 9.35, $P < 0.05$)。对于 22 例胆总管微结石，CT 薄层扫描阳性率为 40.9%，MR 多序列扫描阳性率为 68.2%，两者比较差异无统计学意义 ($\chi^2 = 3.30$, $P > 0.05$)，CT 联合 MR 多序列扫描阳性率为 95.5%，CT 联合 MR 多序列扫描诊断胆总管微结石也优于两种单独检查方法 (χ^2 的值分别为 15.09, $P < 0.01$; 5.50, $P < 0.05$)。结论：CT 联合 MR 多序列成像有利于提高胆总管小微结石诊断的检出率，对胆总管小微结石的诊疗具有重要价值。

PO-3112

基于化学交换饱和转移成像鉴定氧化还原代谢物的体内及体外实验

虞心田、潘靓、米文夏、邢伟
常州市第一人民医院

目的：本研究旨在通过试管模型和体内实验，优化和验证化学交换饱和转移 (Chemical Exchange Resonance Imaging, MRI) 成像鉴定在体肾脏氧化还原状态方法的可靠性，并通过两种量化方法：磁化转移率不对称分析法和七池洛伦兹拟合，定量分析各氧化还原代谢物以及正常兔肾皮髓质 CEST 效应。

方法：首先通过试管模型优化 CEST 扫描参数，试管模型实验配置生理浓度及条件下氧化还原代谢物溶液。在 3T 磁共振成像仪上，使用不同饱和能量 (B_1) 和不同饱和脉冲持续时间进行扫描，获取 CEST 图像与谱线，通过定量分析各代谢物 CEST 效应，从而获取最佳扫描参数。通过体内实验，运用两种量化方式，对比肾脏皮髓质 CEST 信号。

结果：在试管模型结果中，当射频持续时间为 2000ms 时，随着 B_1 的增加，所有代谢物的 CEST 效应逐渐增加。而部分氧化型代谢物 (例如丙酮酸) 的 CEST 效应在 $B_1=3\text{ut}$ 时反而低于 2ut，因此最佳饱和能量确定为 2ut。当饱和能量固定为 2ut 时，分别以饱和脉冲持续时间为 1500ms 及 2000ms 进行扫描，各代谢物 CEST 效应在 2000ms 时较高，因此饱和能量为 2ut，射频持续时间 2000ms 为最优扫描参数。

在正常兔肾在体实验中，运用于试管模型中得出的最优扫描参数进行活体扫描，在饱和频率为 0.5ppm 时，肾皮质和外髓质 CEST 信号差异存在统计学意义 ($P < 0.05$)。以七池洛伦兹拟合算法后处理后分析，正常兔肾皮髓质的幅值在水池和羟基池中存在差异，并具有统计学意义 ($P < 0.05$)。

结论：CEST 成像技术可以明确各氧化还原代谢物独立 CEST 效应，为活体 CEST 成像提供理论依据，且运用两种量化方式均可捕捉到正常兔肾皮髓质 CEST 信号差异。多池洛伦兹拟合算法后处理

CEST 数据后,可提取出与肾脏氧化还原状态相关的 CEST 效应,较传统 CEST 后处理方法而言消除了直接饱和效应和磁化转移效应的干扰,提高了 CEST 活体代谢物定量分析的准确性,为后续研究肾缺血再灌注损伤及治疗奠定理论基础。

PO-3113

3.0T 磁共振风车 dS ZOOM 技术与高分辨率技术在直肠肿瘤成像中的应用价值

宋欣龠、董越、王泽坤、秦凤英、满江红、于韬
辽宁省肿瘤医院

目的:探讨风车 (MultiVane XD) 小视野 (ZOOM) 技术在直肠肿瘤中的应用价值。

方法:前瞻性收集我院 2021 年 2 月至 2021 年 8 月接受磁共振检查的 50 例直肠肿瘤患者进行研究,行 MVXD ZOOM 和 HR 的快速自旋回波轴位 T2W 扫描,都应用并行采集技术,采集范围自直肠上缘至耻骨联合,采用 5 分法比较图像质量和扫描时间,Cohen Kappa 法评价 2 名医师评分的一致性,Wilcoxon 配对符号秩和检验比较图像质量的差异。

结果:两名医师对图像质量评价的 Kappa 值 0.811,($P<0.01$),一致性非常好。MVXD ZOOM T2WI 图像质量评分更高,差异有统计学意义 ($P<0.01$); 50 例患者中有 37 例 (占总数的 74%) 图像等级为最佳的 5 分,得到无伪影干扰 4 分和 5 分的图像达到 50 例 (100%)。在 22 例肠气较多的患者中,MVXD ZOOM 技术优势更加显著,其评分更优,这些患者在 HR TSE 序列中均见肠管显著扩张和更明显的肠管运动伪影。采集时间上 ZOOM 技术比 HR T2W 序列快 5 秒。

结论: MVXD ZOOM 技术在 T2WI 轴位图像上可以更好地显示直肠解剖细节,减轻成像伪影,提高图像质量。

PO-3114

凝血功能参数联合 MRI 预测胎盘植入患者剖宫产术中出血风险

许晓阳、刘碧华、郑昌业
东莞市人民医院放射科

目的:探讨术前凝血功能参数联合 MRI 对胎盘植入性疾病患者 (placenta accreta spectrum, PAS) 剖宫产术中出血的预测价值。

方法:回顾性分析 2019 年 10 月-2023 年 5 月于东莞市人民医院就诊、剖宫产术前进行 MRI 检查、凝血指标检测,后经临床手术或病理检查确诊的 174 例胎盘植入患者。根据术中出血量是否 $\geq 1000\text{ml}$,将患者分为大出血组和对照组,对两组之间术前凝血功能参数、MRI 征象、临床因素进行单因素和多因素分析,构建预测 PAS 患者剖宫产术中出血风险模型。

结果:两组间单因素分析显示,前置胎盘、剖宫产史、超声怀疑或诊断胎盘植入、胎盘局部膨突、T2WI 胎盘内低信号、胎盘内异常血管、子宫浆膜层血管增多、凝血酶原时间 PT、纤维蛋白原 FIB 差异均有统计学意义 ($P<0.05$)。二元 Logistic 回归分析结果显示,前置胎盘、超声怀疑或诊断胎盘植入、胎盘局部膨突、T2WI 胎盘内低信号、子宫浆膜层血管增多、FIB 为 PAS 患者剖宫产术中大量出血的独立危险因素。ROC 曲线示联合预测模型的 AUC 为 0.880,敏感度为 82.1%,特异度为 80.0%,校准曲线显示模型校准能力好。

结论:术前凝血功能参数联合 MRI 征象对 PAS 患者剖宫产术中出血有良好的预测价值。

PO-3115

基于单次屏气三维电影序列评估心脏功能和心肌应变的研究

蒲倩、孙家瑜
四川大学华西医院

目的: 探究一种新型三维电影序列和传统二维电影序列评估心室功能和心肌应变的一致性。

方法: 采用二维电影平衡稳态自由进动序列和通过静态外容积减法增强感知编码的三维电影序列获得患者的心脏电影图像。将三维电影图像按照二维电影图像的层厚和层间距进行重建。应用后处理软件计算得到心脏功能和心肌应变。采用 Bland-Altman 图和一致性相关系数比较两种序列心脏功能和应变参数的一致性。

结果: 共纳入 26 例患者, 其中 2 例患者屏气不佳, 无法进行功能和应变的定量分析。其余 24 例患者的三维图像质量良好。三维电影和二维电影测得的左心室射血分数分别为 58.3 (50.9, 61.9) 和 59.0 (51.2, 61.7), 具有极好的一致性 (ICC: 0.99, 95% CI: [0.98, 0.99]) 且没有偏倚。三维电影和二维电影测得的右心室射血分数分别为 52.2 (44.2, 53.8) 和 51.7 (44.9, 53.7), 具有良好的一致性 (ICC: 0.83, 95% CI: [0.65, 0.92]) 且没有偏倚。三维电影和二维电影测得的整体周向应变分别为 -16.0 (-17.6, -13.2) 和 -18.2 (-19.6, -15.3), 具有良好的一致性 (ICC: 0.77, 95% CI: [0.54, 0.89]) 且没有偏倚。三维电影和二维电影测得的整体径向应变分别为 28.2 (21.0, 31.1) 和 31.2 (23.1, 34.0), 具有良好的一致性 (ICC: 0.83, 95% CI: [0.64, 0.92]) 且没有偏倚。三维电影和二维电影测得的整体纵向应变分别为 -10.4 (-13.5, -6.8) 和 -16.1 (-18.9, -11.8), 具有良好的一致性 (ICC: 0.76, 95% CI: [0.53, 0.89]) 且没有偏倚。虽然三维电影图像质量没有二维电影图像质量好, 但是两种序列得到的心室功能和心肌应变参数仍具有良好的一致性。

结论: 通过静态外容积减法增强感知编码三维电影序列能在单次屏气的时间就获得全心三维电影图像, 可用于快速评估心脏功能和应变。

PO-3116

不同流速编码在脑积水患儿的脑脊液电影成像的可行性研究

郑小燕
福建省儿童医院

目的: 探讨基于磁共振成像技术中的 PhaseContrast 相位对比法, 设置不同的流速编码, 进行脑脊液电影成像, 探究最佳流速编码在脑积水患儿的成像中的图像质量。方法: 回顾性收集自 2023 年 5 月至 2022 年 8 月期间 13 例脑积水患儿 (男 9 例, 女 4 例), 应用新一代科研型磁共振 Prisma, 运用 PhaseContrast 相位对比法, 设置了 2, 4, 6, 8, 10 共五组的流速 (单位是 cm/s) 进行脑脊液电影成像, 主要序列为矢状位的 CSF-PCA 进行脑脊液电影的观察, 横断位的 CSF-QF 进行流速测定。由 2 名放射科医师按 5 分制标准法对五组不同流速的矢状位 CSF-PCA 进行主观评价并评分; 2 名放射科技师对五组不同流速的横断位 CSF-QF 进行流速测定。结果: 流速编码为 2, 4, 6, 8, 10 (单位是 cm/s) 的性别、年龄、体重、心率差异无统计学意义 ($P > 0.05$); 流速编码为 2, 4, 6 组的图像主观评分均高于 3 分, 且主观评分一致性好 (Kappa 值分别为 0.611、0.680、0.599); 其中流速编码为 2 (单位是 cm/s) 的图像质量评分较其他流速编码为 4, 6, 8, 10 各组高, 差异具有统计学意义 ($P < 0.05$)。结论: 运用 PhaseContrast 相位对比法, 设置流速编码为 2 (单位是 cm/s) 对脑积水患儿进行脑脊液电影成像图像质量最佳。

PO-3117

可视化呼吸训练在肝脏 MR 增强扫描序列中的应用

黄超、罗馨

华中科技大学同济医学院附属同济医院

目的 探讨可视化呼吸训练在肝脏 MR 增强扫描前的呼吸训练效果。

方法 选取 2023 年 4 月至 2023 年 6 月于武汉同济医院中法新城院区首次行肝脏 MR 憋气增强扫描（肝脏平扫+三期动态增强扫描）患者 174 例作为研究对象，采用随机数字表法将其分为常规组（n=87，男 50 例，女 37 例）和实验组（n=87，男 51 例，女 36 例）；常规组采用护士进行口头呼吸训练，对照组采用自研的可视化呼吸训练设备进行呼吸训练并实时监测患者憋气情况。测量并比较两组患者的肝脏 MR 憋气 T1 扫描各期相（平扫期、动脉期、门脉期、静脉期、延迟期）的图像信噪比（SNR）、对比肌肉信噪比（CNR）有无统计学差异。

结果 t 检验显示对照组平均年龄 53.21 ± 1.32 岁，实验组平均年龄 55.93 ± 1.27 岁，二者无统计学差异；对照组患者身高体重指数（BMI， 22.90 ± 3.66 ）与对照组（ 23.64 ± 3.51 ）无统计学差异。Mann-Whitney U 检验显示肝脏憋气扫描序列中，平扫期（ $p=0.018$ ）、门脉期（ $p=0.016$ ）、静脉期（ $p=0.003$ ）、延迟期（ $p=0.044$ ）图像信噪比（SNR）明显高于对照组并具有统计学差异；实验组动脉期图像 SNR 也高于对照组，但没有统计学差异（ $p=0.069$ ）。图像对比肌肉信噪比（CNR）分析显示平扫期（ $p=0.006$ ）、门脉期（ $p=0.029$ ）、静脉期（ $p=0.002$ ）、延迟期（ $p=0.010$ ）图像 CNR 明显高于对照组并具有统计学差异；动脉期两组图像 CNR 没有统计学差异（ $p=0.057$ ）

结论 可视化呼吸训练在肝脏 MR 憋气增强扫描序列中能够明显提高图像质量。

PO-3118

非缺血性扩张型心肌病患者中期心脏磁共振随访的预后价值：
一项前瞻性队列研究

程巍

四川大学华西医院

目的: 扩张型心肌病(DCM)患者的随访方案目前尚无定论。我们旨在探讨基于心脏磁共振(CMR)中期随访时心功能、结构和组织特征的预后价值。我们假设在一段时间的指导性药物治疗(GDMT)后复查 CMR 可以为 DCM 患者提供更好的预后价值。

方法: 我们前瞻性地招募了接受 GDMT 并伴有基线和随访 CMR 的 DCM 患者。测量包括双心室容积和射血分数、晚期钆增强、初始 T1、初始 T2 以及基线和随访时的细胞外体积。主要心脏不良事件(MACE)被定义为心血管死亡、心脏移植和心力衰竭再入院的复合终点。

结果: 235 例 DCM 患者(中位 CMR 间隔:15.3 个月;四分位数范围:12.5-19.2 个月), 54 例(23.0%)在随访期间经历了 MACE(中位数:31.2 个月;四分位数间距:20.8-50.0 个月)。在多变量 Cox 回归中, 随访 CMR 模型的预测价值明显优于基线模型。逐步多变量 Cox 回归分析显示:随访左室射血分数(LVEF;风险比[HR], 0.93;95%置信区间[CI], 0.91-0.96; $P<0.001$)和原生 T1 (HR, 1.01;95% ci, 1.00-1.01; $P=0.030$)是 MACE 的独立预测因子。随访 LVEF $\geq 40\%$ 或稳定 LVEF $< 40\%$ 且 T1 ≤ 1273 ms 为低风险(年事件率 $< 4\%$), 而稳定 LVEF $< 40\%$ 且 T1 > 1273 ms 或 LVEF $< 40\%$ 且恶化为高风险(年事件率 $> 15\%$)。

结论: 随访 CMR 比基线 CMR 提供更好的风险分层。LVEF 和 T1 映射的联合改善与 MACE 风险降低相关。

PO-3119

刀锋伪影校正技术在精神疾病患者海马 MRI 检查中的应用研究

邵丹丹²、潘自来³、陈克敏¹、严福华¹

1. 上海交通大学医学院附属瑞金医院

2. 上海交通大学医学院附属瑞金医院北部院区

3. 上海市嘉定区安亭医院

目的 探讨磁共振刀锋伪影校正 (BLADE) 技术在改善精神疾病患者海马 MRI 检查中图像质量的应用。**方法** 对 68 例精神疾病患者行 3.0T-MRI 海马斜冠状位扫描, 采集包括: 应用 BLADE 技术的 BLADE T2WI TSE、BLADE T2WI FIAIR 序列及常规 T2WI TSE、T2WI FLAIR 序列; 并且, 应用以上四个序列进行 ACR 标准模体扫描。患者的图像由 2 名放射科医师采用 5 分法对运动伪影、搏动伪影、颗粒度、海马图像质量 4 个质量指标进行评价, 并应用 Wilcoxon's 符号秩检验分析。ACR 模体的图像通过识别图像的钻孔阵列和轮辐的数目, 半定量评价各序列的高对比空间分辨率(The high contrast spatial resolution, HCSR)和低对比物体探测能力(The low contrast object detectability, LCD)。结果 在图像的运动伪影、搏动伪影、海马图像质量方面, 结合 BLADE 技术序列与常规序列相比表现更优($P < 0.05$); 在图像颗粒度方面, 常规序列表现更优($P < 0.05$)。ACR 模体半定量分析显示, 结合 BLADE 技术序列与常规序列相比, 在 LCD 检测方面结果更优、在 HCSR 检测方面结果相同或略逊。结论 在配合欠佳的精神疾病患者海马检查中, BLADE 技术的应用能够改善图像运动伪影、搏动伪影, 提高图像质量。

PO-3120

血液透析患者心脏结构和功能改变的磁共振研究

蒲倩、孙家瑜

四川大学华西医院

目的: 应用心脏磁共振全面评价血液透析患者心脏结构和功能。

方法: 共纳入未进行血液透析的慢性肾病患者 15 例及血液透析大于 6 个月的患者 21 例。所有患者均采用 GE 3.0T 扫描仪进行扫描, 扫描的序列包括心脏电影序列、T1 mapping 及 T2 mapping 序列。应用后处理软件在电影图像上勾画心内外膜轮廓, 得到患者的心室功能和心肌应变参数。将机器自动生成的 map 图导入后处理软件, 得到 T1 值和 T2 值。

结果: 与非透析患者相比, 透析患者的左室射血分数 (63.7 ± 5.3 vs. 57.0 ± 7.2 , $P = 0.004$), PCS (-18.1 ± 2.0 vs. -14.7 ± 7.1 , $P = 0.012$), PRS (31.9 ± 5.7 vs. 26.1 ± 5.6 , $P = 0.007$), PLS (-14.9 ± 2.2 vs. -13.1 ± 1.6 , $P = 0.011$)均显著降低。与非透析患者相比, 透析患者的左心室基底 T1 值 (1334 ± 82 vs. 1277 ± 51 , $P = 0.015$), 中间层 T1 值 (1330 ± 68 vs. 1283 ± 42 , $P = 0.014$)和总 T1 值 (1327 ± 65 vs. 1285 ± 46 , $P = 0.032$) 均显著降低。与非透析患者比较, 透析患者的右室射血分数 (57.0 ± 7.0 vs. 56.3 ± 7.4 , $P = 0.882$)、心尖 T1 值 (1327 ± 66 vs. 1298 ± 62 , $P = 0.186$)、基底 T2 值 (56 ± 7 vs. 53 ± 4 , $P = 0.051$), 中间层 T2 值 (58 ± 9 vs. 55 ± 4 , $P = 0.199$), 心尖部 T2 值 (65 ± 15 vs. 59 ± 6 , $P = 0.461$), 总 T2 值 (59 ± 8 vs. 55 ± 4 , $P = 0.060$) 差异无统计学意义, 但透析患者的 T1、T2 值仍有降低的趋势。

结论: 透析患者心脏功能和应变发生恶化, T1 值和 T2 值降低可能与血液透析后有效的液体管理减少了心肌水肿有关。

PO-3121

MENSA 和 CUBE STIR 技术对坐骨神经图像质量的比较价值

焦飞涵、白亚妮、郑建民、何子福
空军军医大学西京医院

目的:比较多回波稳态采集成像 (MENSA) 与 3D 容积脂肪抑制 (CUBE STIR) 在坐骨神经成像的图像质量。

方法:于我院行坐骨神经 MR 检查的患者 10 例, 均行坐骨神经 MR 检查, 其中均采用冠状面 MENSA 和 CUBE STIR 扫描, 4 例患者存在坐骨神经病变。由两位资深影像诊断医生对图像质量进行主观评价分级, 同时运用感兴趣区 (ROI) 技术计算坐骨神经、梨状肌信号强度比。主观评价内容包括坐骨神经、梨状肌正常组织结构 (包括臀上动静脉)、病变清晰度、图像失真变形程度、磁敏感伪影以及整体图像质量等。客观评价指标包括基于 2 组坐骨神经图像测量的病变大小、信号强度比 (CNR) 及信噪比 (SNR)。由两名经验丰富的放射科诊断医师主观评分的一致性采用配对样本 t 检验进行组间分析。

结果:2 组坐骨神经图像间正常组织结构的显示 (包括臀上动静脉)、信号强度比 (CNR)、病变的清晰度以及整体图像质量的差异均具有统计学意义 (P 均 <0.05), CUBE STIR 组图像的主观评分显著高于 MENSA 组。2 组图像间坐骨神经最大横径、SNR、磁敏感伪影、图像的失真变形程度均无统计学意义 (P 均 >0.05)。

结论: 与 MENSA 技术相比, CUBE STIR 技术可以有效降低梨状肌脂肪伪影、磁敏感伪影, 更准确地显示坐骨神经正常解剖结构和病变组织, 明显改善坐骨神经图像的质量, 可以成为坐骨神经 (梨状肌综合征) 成像的首选序列。

PO-3122

功能 MRI 联合生化指标对肾氧合水平与早期肾功能损伤

焦飞涵、郑建民、林港、李奕均、李磊磊、侯国瑞
空军军医大学西京医院

目的 探讨 MRI BOLD 成像评估患者肾氧合水平与早期肾功能损伤的相关性。资料与方法 选取肾内科确诊因糖尿病、高血压、肾病引起下肢水肿的 35 例肾功能损伤需穿刺活检 (肾穿) 的患者及 24 例健康志愿者, 行腹部常规 MRI 及 MRI BOLD 成像检查, 根据尿白蛋白排泄率将患者分为尿白蛋白正常组 21 例和尿白蛋白微量组 19 例。由 2 名影像科主治医师分别于肾门水平每侧肾脏上、中、下极的皮质及髓质内绘制 6 个圆形感兴趣区 (3 个位于皮质, 3 个位于髓质), 取 2 名医师测得双肾皮质 (CR2*)、髓质 (MR2*) 的平均值, 并计算 MR2* 与 CR2* 比值 (MCR)。比较 2 名医师测得 CR2*、MR2* 的一致性。比较同一组受试者肾脏 CR2*、MR2* 的差异; 比较 3 组受试者 CR2*、MR2*、MCR 的差异; 分析 CR2*、MR2*、MCR 与生化指标血清肌酐、尿白蛋白排泄率、尿 $\beta 2$ 微球蛋白、转铁蛋白、N-乙酰-D 氨基葡萄糖苷酶、视黄醇结合蛋白、 β -半乳糖苷酶、肾小球滤过率 (eGFR) 的相关性。结果 2 名医师测得 CR2*、MR2* 的一致性良好 (ICC >0.78)。同一组受试者 MR2* 高于 CR2* ($P <0.001$)。3 组间 MR2*、MCR 差异有统计学意义 ($P <0.001$), 组间两两比较显示尿白蛋白正常组 MR2*、MCR 高于对照组 ($P <0.001$); 尿白蛋白微量组 MR2*、MCR 低于尿白蛋白正常组 ($P <0.05$)。MR2* 与 eGFR 呈正相关 ($P <0.001$), 与血清肌酐、尿白蛋白排泄率、尿 $\beta 2$ 微球蛋白、转铁蛋白、视黄醇结合蛋白、 β -半乳糖苷酶呈负相关 ($P <0.05$); MCR 与 eGFR 呈正相关 ($P <0.001$), 与血清肌酐、尿白蛋白排泄率呈负相关 ($P <0.05$)。结论 MRI 能无创评价患者肾氧合水平, MR2*、MCR 与 eGFR 等肾功能指标具有相关性。

PO-3123

磁共振 Radial vibe T1 序列在胎儿中枢神经系统疾病的应用

田健

空军军医大学西京医院

目的 对比分析 Radial VIBE T1 序列和常规 VIBE T1 序列在诊断胎儿中枢神经系统疾病中的价值。
方法 对 74 例行胎儿中枢神经系统磁共振检查的孕妇, 分别进行 Radial VIBE T1 序列扫描和常规 VIBE T1 序列扫描, 统计分析 Radial VIBE T1 组与常规 VIBE T1 组对胎儿中枢神经系统疾病的检出率和两组图像质量差异的统计学意义。
结果 在 74 胎儿图像中, Radial VIBE T1 加权图 62 例能够分辨颅脑灰白质, 52 例显示核, 8 例显示胎儿颅内出血; 常规 VIBE T1 加权图 25 例能够分辨颅脑灰白质、12 例显示核团、5 例显示胎儿颅内出血。2 位诊断医生对 74 例胎儿头颅的 Radial VIBE T1 和常规 VIBE T1 诊断信心度评分平均值为图像质量(3.6 ± 0.6 vs. 1.8 ± 0.8), $P < 0.05$ 。Radial VIBE T1 和常规 VIBE T1 诊断信心度评分之间差异均具有统计学意义 (P 值 < 0.05)。
结论 在胎儿头颅磁共振成像诊断中 Radial VIBE T1 序列较常规 T1 序列具有明显的诊断价值。Radial VIBE T1WI 序列采用了特殊的 K 空间填充方案, 具有明显的抗运动伪影能力, 可清晰的显示胎儿脑部正常解剖结构及其病变, 在显示胎脑的脑沟、脑回等结构明显优于超声。与常规 VIBE T1WI 序列对比, Radial VIBE T1WI 能够清晰的显示基底节区核团结构, 区分灰白质, 突出脑皮质层, 确诊颅内小出血点和小的结节性硬化。高清的 Radial VIBE T1WI 序列图能够清晰的显示胎脑髓鞘化的程度, 为进一步研究胎儿脑发育提供了新的方案。

PO-3124

静息态血氧水平依赖功能磁共振成像对急性脑梗死患者上肢运动功能康复的诊断价值

薛艺珂

空军军医大学西京医院

目的: 探讨静息态血氧水平依赖功能磁共振成像 (BOLD-fMRI) 对急性脑梗死 (ACI) 患者上肢运动功能康复的诊断价值。

方法: 纳入在我院就诊的 30 例确诊为急性脑梗死的患者作为试验组, 26 例健康志愿者作为对照组。试验组和对照组均行 BOLD-fMRI 检查, 测量相关脑区低频振幅(ALFF), 对试验组和对照组相关脑区低频振幅(ALFF)进行对比。对试验组患者进行 Fugl-Meyer 肢体运动功能量表 (FMA) 评分、日常生活能力 Barthel 指数评分, 对比相关脑区 ALFF 与评分的关系。试验组患者进行两周的针灸推拿康复治疗后再行 BOLD-fMRI 检查和 FMA 评分、Barthel 指数评分, 并与治疗前的数据进行对比。

结果: 试验组辅助功能区、感觉运动区、后顶叶皮层、运动前区的 ALFF 值较对照组均下降 ($P < 0.05$)。试验组各脑区 ALFF 值与 FMA 评分、Barthel 指数评分呈负相关 ($P < 0.05$)。试验组 FMA 评分、Barthel 评分在治疗后均高于治疗前 ($P < 0.05$); 辅助功能区、感觉运动区、后顶叶皮层、运动前区的 ALFF 值均高于治疗前, 差距具有统计学意义 ($P < 0.05$)。

结论: 静息态血氧水平依赖功能磁共振成像 (BOLD-fMRI) 对急性脑梗死 (ACI) 患者的上肢运动功能康复具有较高的诊断与评估价值。

PO-3125

钆塞酸二钠增强 MRI 在结直肠癌肝转移术前评估中的临床价值

张嘉诚

河南中医药大学第一附属医院

目的 探讨钆塞酸二钠 (Gd-EOB-DTPA) 增强 MRI 对结直肠癌肝转移 (CRCLM) 术前评估的临床价值。**方法** 收集 56 例 CRCLM 患者, 经手术病理确诊共计 156 个 CRCLM 病灶, 均行肝脏 Gd-EOB-DTPA 动态增强 MRI 检查。观察 T2WI、DWI、动脉期和肝胆期 (HBP) 的特征表现并计算各序列的检出率, 计算 HBP 病灶与肝实质信号强度比 (SIR) 以及表观扩散系数 (ADC) 值。采用 Mann-Whitney U 检验和 Mc-Nemar 检验, 比较 HBP 呈反靶征、靶征的病灶与 HBP 呈均匀、不均匀低信号病灶的 ADC 值以及各序列检出率的差异。结果 T2WI 多呈靶样外观 20.51% (32/156) 及均匀高信号 38.46% (60/156), DWI 多呈靶征 51.28% (80/156), 动脉期多呈环形强化 73.72% (115/156), HBP 多呈靶征 34.62% (54/156)。HBP 呈反靶征、靶征病灶的平均 ADC 值 $[(1.24 \pm 0.45) \times 10^{-3} \text{mm}^2/\text{s}]$ 与 HBP 呈均匀、不均匀低信号病灶的平均 ADC 值为 $[(1.20 \pm 0.43) \times 10^{-3} \text{mm}^2/\text{s}]$ 无统计学差异 ($P > 0.05$)。依据 CRCLM 的病灶大小分为 $<1.0\text{cm}$ 、 $1.0 \sim 2.0\text{cm}$ 和 $>2.0\text{cm}$ 三组, 分别包含 41、55 和 60 个病灶。与 T2WI、DWI、Gd-EOB-DTPA 四期动态增强 (Dyn-MRI) 比较, HBP 的总检出率 (96.79%) 最高 (P 均 < 0.05)。当 CRCLM 病灶 $<1.0\text{cm}$ 时, HBP 检出率 (87.80%) 高于 T2WI、DWI 和 Dyn-MRI 的检出率 (P 均 < 0.05)。结论 Gd-EOB-DTPA 增强 MRI 对 CRCLM 的术前评估具有重要的临床价值, 尤其特异性的 HBP 靶征或反靶征, 的影像特征以及 HBP 和肝胆期对 CRCLM 微小病灶优异的检出效能。

PO-3126

轻度认知功能障碍中脉络丛的临床价值

华艳秋、甄志铭、陈伟、刘晨

中国人民解放军陆军军医大学第一附属医院 (西南医院)

背景: 轻度认知功能障碍是一种介于正常衰老与痴呆之间的过渡状态, 主要表现为记忆和其他认知功能的轻度损害, 但尚未达到痴呆的诊断标准。近年来, 脉络丛 (ChP) 与脑内代谢物清除、神经营养、神经再生等相关, 同时越来越多的证据表明脉络丛的结构和功能异常与神经退行性变、精神疾病等中枢神经系统的疾病的发生发展密切相关。ChP 在阿尔茨海默病 (AD) 的病理生理学中起着重要作用, 但其在轻度认知功能障碍中影像特征仍不清楚。

目的: 探讨 ChP 体积在遗忘型轻度认知损害 (aMCI) 和血管性轻度认知损害 (vMCI) 中的变化及其临床意义。

方法: 本研究为回顾性对照研究, 收集陆军军医大学第一附属医院 2018 年 1 月至 2019 年 12 月期间 152 例受试者 aMCI 受试者 49 例, vMCI 受试者 57 例, 和性别、年龄、受教育程度相匹配的 46 例健康对照 (HC) 受试者。所有受试者接受 3.0T 磁共振扫描, 应用 freesurfer 自动分割侧脑室 ChP、海马等, 比较三组之间体积差异。进一步研究 ChP 体积和海马体积以及临床指标的相关性。两两比较采用 Bonferroni 事后比较进行校正, 组间比较采用 ANOVA 检验。

结果: 纳入 152 例受试者, HC 组 (62.7 ± 8.7) 46 例, aMCI 组 (64.1 ± 7.3) 49 例, vMCI 组 (68 ± 8.7) 57 例。aMCI 组和 vMCI 组受试者的标准化 ChP 体积较 HC 组显著增大, 且具有统计学差异 (aMCI 组 vs. HC 组 $P = 0.0247$; vMCI 组 vs. HC 组 $P = 0.006$)。aMCI 组标准化 ChP 体积和标准化海马体积呈负相关 ($r = -0.423, P = 0.03$; vMCI 组标准化 ChP 体积和标准化海马体积呈负相关 ($r = -0.591, P < 0.001$)。aMCI 组和 vMCI 组受试者的 ChP 体积均与蒙特利尔认知评估量表 (MoCA) 评分负相关 ($r = -0.297, P = 0.043$; $r = -0.304, P = 0.023$)。

结论: aMCI 组和 vMCI 组较 HC 组均显示为 ChP 体积增大, 较海马缩小的程度更加明显。ChP 体积和海马体积具有相关性, 与 MoCA 评分相关, 有望作为评估轻度认知功能障碍的潜在 MRI 标记物。

PO-3127

基于任务态功能磁共振的睡眠剥夺和日间小睡对工作记忆的影响

李磊磊、朱元强
空军军医大学西京医院

目的: 随着社会节奏的加快, 24/7 全天候服务、轮班工作以及睡前大量的娱乐活动, 有相当多的人患有睡眠不足和各种睡眠障碍。探讨睡眠缺乏如何影响认知功能及开发相应的对抗措施具有重要的理论和实际意义。本研究中, 我们采用 n-back 实验范式来探讨工作记忆受睡眠剥夺的影响以及工作记忆在日间小睡后的恢复情况。我们招募了 50 名军校学员, 在正常清醒、30 小时睡眠剥夺后和随后的 30 分钟午睡后在磁共振扫描仪中进行了 n-back 任务, 并分析三种状态下大脑反应的动态变化。

材料与方法: 采用单因素重复测量方差对 n-back 的行为学结果进行分析, 其中显著性阈值设置为 $P < 0.01$, FDR(false discovery rate)标准校正。在事后分析的两两比较中, 通过 Bonferroni 进行多重比较修正, 显著性阈值校正设为 0.05。对于 n-back 的影像学, 在经过预处理之后, n-back 的任务态数据采用 Block 的实验设计, 采用两阶段混合效应模型进行了分析。多重比较校正采用了 FDR 标准。对于不同条件下的 n-back 激活, 对于不同条件下的 F 比较, 以及事后分析的两两比较, 统计阈值均设置为 $pFDR < 0.05$ 。

结果: 单因素重复测量方差分析显示, 平均反应时 ($F_{2,98} = 70.33, p < 0.001$) 和准确率 ($F_{2,98} = 7.36, p < 0.001$) 均表现出了显著的时间差异。事后分析显示 RW、SD 和 nap 条件的两两比较存在显著差异。日间小睡后 RT 和准确率明显低于睡眠剥夺条件, 但仍然高于正常清醒状态, 表明午睡对于工作记忆水平具有一定的恢复作用。日间小睡后工作记忆反应时的改善与右脑岛增加的激活强度呈显著正相关 (相关系数 $r = 0.38, p < 0.005$)。

结论: 睡眠剥夺显著影响工作记忆水平的认知表现; 导致了处理速度和准确率。日间小睡通过两种方式部分恢复了工作记忆的水平: 日间小睡将睡眠剥夺后小脑、脑岛和丘脑降低的活动调整到正常水平; 日间小睡增加了额中回、楔前叶和颞上回的负激活, 将 DMN 网络从任务中脱离, 增加了大脑认知资源。

PO-3128

磁共振黑血成像技术评价脑静脉窦血栓再通的应用价值

戴艳芳、卢洁
首都医科大学宣武医院

目的: 探讨应用磁共振黑血成像(MRBTI)技术定量监测血栓体积、长度变化对评价脑静脉窦血栓 (CVST)再通的可行性, 探讨其评价脑静脉窦血栓再通的应用价值。方法: 回顾性分析 30 例首次发病且仅接受内科治疗的 CVST 再通患者再通前后的 MRBTI 图像。诊断再通标准为以 2013 年 CVST 诊治的中国专家共识为参考, 由两名神经内科医师结合临床症状, 依据头颅 MRI 联合 MRV、DSA 图像进行独立解读及定性诊断为血栓再通或部分再通。采用 3.0T 磁共振扫描仪 (Signa Pioneer, GE, 美国), 21 通道头颈联合线圈, 3D 可变反转角快速自旋回波序列, 扫描范围包括全脑, 体位为仰卧位。MRBTI 扫描参数如下: TR 702ms, TE 13.5ms, 矩阵 256x256, FOV 200mmx200mm, 层厚 0.8mm, 扫描层数 327 层, 扫描时间 5min34s。应用图像后处理软件 (3D Slicer, 美国), 测

量 MRBTI 图像中静脉窦内的血栓体积、长度。统计学分析采用 SPSS 25.0, 采用配对 t 检验分析 CVST 再通患者治疗前后血栓体积、长度差异, 标准以 $P < 0.01$ 为差异有统计学意义。结果: 30 例 CVST 患者中, 共包含节段性血栓 94 处, 其中上矢状窦 15 处、左侧横窦 12 处、左侧乙状窦 10 处、右侧横窦 17 处、右侧乙状窦 16 处, 直窦 4 处、窦汇 4 处、颈内静脉上段 6 处、左侧皮质静脉 5 处、右侧皮质静脉 5 处。MRBTI 图像上, 血栓显示为高信号, 利用图像后处理软件, 可对其进行逐层勾画, 得到血栓体积、长度值。CVST 患者治疗前与治疗后 MRBTI 图像上可见静脉窦内血栓高信号减少, 测量得到治疗前后血栓体积、长度均有显著性差异(t 分别为 8.79、8.24, P 均 < 0.01)。结论: MRBTI 是一种直接血栓成像技术, 静脉血管内血流量信号基本上被抑制掉, 呈中等信号的血管壁能够清晰显示, 血管内高信号的血栓即能从周围组织中分离出来、可视化血栓, 有助于临床进行 CVST 的早期诊断。此外, 利用 MRBTI 结合图像后处理技术, 可定量测量血栓体积、血栓长度, 定量监测血栓变化, 辅助临床评估 CVST 再通情况。

PO-3129

基于磁共振弥散模型不同功能参数图的影像组学分析在临床显著性前列腺癌中的诊断价值

杜兵、何永胜、杨宏楷、戚轩
马鞍山市人民医院

目的旨在探讨基于磁共振单指数和扩散峰度模型功能参数图的影像组学分析技术对于临床显著性前列腺癌(clinically significant Prostate Cancer, csPCa)的诊断效能。方法回顾性的分析 2022 年 4 月-2023 年 7 月就诊于我院经直肠超声下引导穿刺或手术病理证实的前列腺患者 238 例, 其中 csPCa 组患者 96 例, 非 csPCa 组患者 142 例。所有患者均行磁共振多参数扫描, 包括轴位 T2WI 和多 b 值 DWI 序列, 用 DWI 序列通过弥散灌注后处理软件计算表观扩散系数 (apparent diffusion coefficient, ADC) 图、平均峰度 (mean kurtosis, MK) 和平均扩散系数 (mean diffusivity, MD) 图, 基于 T2WI 勾画三维感兴趣区 (ROI), 使用 ITKSNAP 将 ROI 配准到各个功能参数图上, 使用 R 语言软件提取 ROI 的纹理特征, 计算得出 3474 个纹理特征, 利用皮尔森相关系数进行特征降维, 利用递归特征消除来进行特征选择, 分别建立基于 ADC 数据集、MK 数据集、MD 数据集的随机森林 (Random Forest) 和支持向量机 (Support Vector Machine) 的机器学习模型。将 96 例 csPCa 和 142 例非 csPCa 患者按照 7:3 的比例分为训练集与测试集两部分, 采用十折交叉验证的方法对训练集进行训练, 用测试集验证得到特异性、敏感性、ROC 曲线和 ROC 曲线下面积。结果 ADC、MK、MD 数据集在 RF 机器学习模型中训练集的诊断效能 AUC 分别为 0.803、0.752、0.763, 在测试集中诊断效能 AUC 分别为 0.799、0.731、0.759。ADC、MK、MD 数据集在 SVM 机器学习模型中训练集的诊断效能 AUC 分别为 0.892、0.821、0.745, 在测试集中诊断效能 AUC 分别为 0.879、0.817、0.729。基于 ADC 和 MK 训练集的 SVM 机器学习模型中诊断效能最高, 具有较好的分类效能。结论通过对单指数、扩散峰度模型功能图的影像组学分析技术, 对临床显著性前列腺癌的检测具有显著的价值, 为临床早期诊断和治疗提供相关技术支持。

PO-3130

MRI 评估局部进展期直肠癌新辅助放化疗联合免疫治疗疗效 ——复旦肿瘤医院经验

孙轶群、童彤、顾雅佳
复旦大学附属肿瘤医院

目的 新辅助放化疗联合免疫治疗使得局部晚期直肠癌的完全缓解率较传统放化疗有了大幅度提升,使得更多低位直肠癌患者有机会选择保留肛门的 W&W。MRI 是临床判断临床完全缓解及执行 W&W 的重要依据。在此背景下,如何利用 MRI 甄选出病理完全缓解病人,是目前临床及放射科医生亟需解决的难点。研究通过结合直肠癌新辅助放化疗联合免疫治疗后 MRI 与病理对照研究,对 pCR 的 MRI 影像特征进行总结,有利于临床新辅助治疗后选择正确的治疗策略。

方法 回顾性纳入我院短程放疗联合 CAPOX+特瑞普利单抗用于局部晚期直肠癌的全程新辅助治疗研究(下称 TORCH 研究),并于我院手术的患者。基线及治疗后(手术前)均须行高分辨率 MRI 检查。共收集到 25 例患者。根据术后病理,将患者分为 pCR 组及 non-pCR 组,评估病灶退缩模式:退缩即病灶沿粘膜方向退缩、肿块碎片化及黏液湖形成并记录。

结果 25 例患者中 44% (11 例) 达 pCR, 56% 患者 (14 例) non-pCR, non-pCR 组中 1 名患者 ypT0N1。48% 患者 (12 例) 术后 ypT0, 52% 患者 (13 例) 术后 ypT1-3。16% 患者 (4 例) 术后 ypN1。ypT0 组中 8 例患者治疗后在 T2WI 上表现为低信号瘢痕并局限于肠壁内, DWI 上未见明显高信号, 增强后表现为粘膜面线样强化。2 例 ypT0 患者治疗后低信号瘢痕超出肠壁外, DWI 上未见明显高信号, 增强后表现为粘膜面线样强化。3 例患者 T2WI 完全表现为高信号黏液样肿块, 但仅 2 例患者术后证实为 ypT0, 此 2 例患者增强后黏液湖周围线样强化, DWI 未见明显异常高信号。本研究中经过治疗后仅 16% (4 例) 患者术后病理证实有且仅有 1 枚淋巴结转移。84% (21 例) 患者术后 ypN0, MRI 图像上表现为淋巴结消失或短径小于 3mm, DWI 上未见明显高信号且增强未见明显强化。

结论 评估直肠癌新辅助放化疗联合免疫治疗疗效需 T2WI、DWI 及增强图像三种模态。当 T2WI 出现局限于肠壁的低信号瘢痕, DWI 未见明显高信号且粘膜面线样强化时, 诊断 ypT0 较为可靠。淋巴结消失或短径小于 3mm, DWI 上未见明显高信号且未见明显强化是诊断 ypN0 可靠征象。

PO-3131

时间飞跃法磁共振静脉血管成像在髂静脉压迫综合征腔内粘连结构特征分型中应用价值研究

陶黎
重庆医科大学附属第一医院

目的 探讨盆腔时间飞跃法磁共振静脉血管成像 (TOF-MRV) 在评价髂静脉压迫综合征 (IVCS) 腔内粘连结构特征分型的应用价值。**方法** 回顾性分析 2021 年 6 月至 2022 年 8 月在重医附一院行 TOF-MRV 检查的 204 例可疑 IVCS 病人临床资料, 通过三维重组技术分析髂静脉受压的特征。**结果** 两名医师图像质量评分一致性好, K 值 0.895; 左髂总静脉 (LCIV) 受到右髂总动脉 (RCIA) 及向前突出的腰骶椎共同压迫; LCIV 汇入下腔静脉的角度大于右侧; LCIV 受压处前后径缩窄, 横径较同水平右髂总静脉增宽; 静脉内粘连结构的发生率为 20.10%, 根据腔内粘连结构的特征确定了 3 种类型。I 型: 外侧壁粘连型 (21.95%); II 型: 中央隔带型 (70.73%); III 型: 隔膜型 (7.32%)。TOF-MRV 与 DSA 诊断 LCIV 腔内粘连结构情况完全一致。**结论** TOF-MRV 根据 LCIV 腔内粘连结构的形态特征进行分型, 可帮助临床医生制定合理的治疗方案。

PO-3132

无对比剂自由呼吸 mDixon 序列冠脉 MRA 与冠脉 CTA 的图像质量对比

常英娟、田萍、刘莹
空军军医大学西京医院

目的: 评估 3.0T MR 非对比增强 3D-mDixon-WH 序列对冠状动脉主干及近中段图像质量的显示能力。

方法: 筛选 68 例拟行冠状动脉检查的志愿者, 在 24H 内分别完成磁共振冠状动脉血管成像 (MRCA) 和冠脉 CTA 成像检查。MRCA 首先使用膈肌导航、自由呼吸下进行高分辨电影成像, 选取右冠相对静止期作为采集依据, 再利用 3D-mDixon-WH 水脂分离技术, 轴位采集冠状动脉原始数据。MRCA 和 CTA 的图像分析由两位高年资医师独立观察完成。两位观察者采用 4 分制对冠状动脉的每段图像质量进行评分, 并以冠脉 CTA 作为参考标准, 评价 MRCA 对管腔狭窄的显示能力。3D-mDixon-WH 序列扫描参数: TR/TE 4.3/1.4ms/2.6ms, shot duration 90-130ms, 采集空间分辨率 1.5x1.5x1.5mm, 重建分辨率 0.75x0.75x0.75mm。

结果: 获得 63 例志愿者的 MRCA 和冠脉 CTA 完整图像 (5 例志愿者未获得完整图像排除在外, 成功率 92.6%), 其中冠状动脉狭窄者 16 例 (25%)。MRCA 与 CTA 对比在冠状动脉 LM、RCA、LAD、LCX 段图像质量评分无显著差异 ($P>0.01$); 但在冠状动脉 D1 和 PDA 段, CTA 的图像质量评分有显著性差异 ($P<0.01$), 两名医师的图像质量评分具有高度一致性 ($ICC=0.81-0.90$)。其敏感性、特异性、阳性预测值、阴性预测值和诊断准确率分别为 86%、85%、70%、93% 和 85%。

结论: 3.0T MR 非对比增强 3D-mDixon-WH 序列对冠脉主干及近中段图像的显示具有良好的可行性, 为疑似冠脉主干狭窄患者提供了一种新的影像学检查方法。

PO-3133

体表标记投影结合 3D-nerve view 在臀肌挛缩术前应用价值

林港
空军军医大学西京医院

目的: 探讨体表标记投影结合 3D-nerve view 在臀肌挛缩中术前影像定位的应用价值。方法: 选取我院 2022 年 10 月至 2023 年 7 月因臀肌挛缩来我院就诊患者 28 例。为避免术中伤及坐骨神经, 分别使用常规解剖学体表标志定位和术前核磁标记引导定位, 收集术中耗时及针刀切口深度。运用后处理软件测量其标记点与坐骨神经间最短安全距离, 测量坐骨神经 3D-nerve view 增强前后图像信噪比。并统计两位高年资医生对 Ober 实验臀肌挛缩程度分级与双侧臀肌挛缩程度核磁影像诊断的一致性。结果: 术前行影像定位组明显缩短手术时间 ($P<0.05$), 3D-nerve view 增强前后坐骨神经与体表标记距离测量无统计学差异 ($P>0.05$), 增强后在双侧坐骨神经信噪比测量及背景抑制明显优于增强前 ($P<0.05$); 两位临床医生的 Ober 实验分级和臀肌挛缩核磁诊断评估 ICC 值为 0.8 (95%CI: 0.5-0.9)。结论: 体表标记投影结合 3D-nerve view 坐骨神经平扫既可无创便捷实现臀肌挛缩的术前影像定位, 降低手术耗时, 避免术中伤及坐骨神经, 为术者提供更全面的患者信息。

PO-3134

高强度聚焦超声 (HIFU) 治疗子宫肌瘤早期疗效的 磁共振影像组学研究

蒋雨、黄小华
川北医学院附属医院

目的: 探讨基于增强磁共振影像组学模型术前预测高强度聚焦超声 (HIFU) 消融治疗子宫肌瘤的早期疗效的价值。

方法: 回顾性分析行 HIFU 消融治疗的 143 名妇女的 173 枚子宫肌瘤, 根据肌瘤的非灌注区体积率 (NPVR), 分为充分消融组 (NPVR \geq 70%, n=95) 与非充分消融组 (NPVR<70%, n=78)。按 7:3 的比例随机分为训练集 (n=121) 和测试集 (n=52), 训练集中充分消融 66 枚、非充分消融 55 枚, 测试集中充分消融 29 枚、非充分消融 23 枚。采用 3D Slicer 软件进行图像分割和特征提取, 提取术前子宫肌瘤增强磁共振图像的影像组学特征, 并记录肌瘤的临床-影像学特征, 通过最小绝对收缩和选择算子筛选出最优特征。采用独立的临床-影像学危险因素构建临床-影像学模型, 基于增强序列的最佳影像组学特征构建影像组学模型, 将两组特征合并构建联合模型。采用支持向量机构建模型, 并绘制受试者工作特征 (ROC) 曲线对模型进行评价, 采用 Delong 检验比较不同预测模型间 ROC 曲线下面积 (AUC) 的差异。在训练集中应用组合模型构建列线图。

结果: 最终筛选出 6 个影像组学特征和 2 个临床-影像学特征用于建模, 影像组学模型, 临床-影像学模型, 和联合模型在训练集中的 AUC 值分别为 0.815、0.646 和 0.785, 测试集中分别为 0.825、0.624、0.843。影像组学模型的预测性能优于临床-影像学模型 (训练集 $P=0.005$; 测试集 $P=0.047$), 联合模型的预测性能也优于临床-影像学模型 (训练集 $P=0.032$; 测试集 $P=0.033$), 而影像组学模型与联合模型的 AUC 值之间差异无统计学意义 ($P>0.05$)。

结论: 基于增强磁共振影像组学特征构建的模型可较好地术前预测 HIFU 消融治疗子宫肌瘤的早期疗效。

PO-3135

扩张型心肌病 LGE 模式与左心室逆转重构的关系

程巍
四川大学华西医院

目的: 先前的研究发现, 较低的基线左室射血分数 (LVEF) 是扩张型心肌病 (DCM) 逆转重构的重要预测因子, 这与我们现有的临床经验有些相反。晚期钆增强 (LGE) 模式可能提供独立于心功能的遗传背景和病因学的重要信息。我们假设 LGE 模式可以为 DCM 患者提供一个简洁有效的反向重塑预测模型, 而不依赖于基线 LVEF。

方法: 我们前瞻性地招募了 232 例 DCM 患者, 他们接受了完整的基线和随访心脏磁共振 (CMR) 检查。评估 LGE 的存在、位置、模式和程度。阴性 LGE、室间隔中壁 LGE 和局灶性 LGE 的患者为低危组, 室间隔+外侧心外膜、室间隔+外侧中壁 LGE、仅心外膜外侧 LGE 和斑块状 LGE 的患者为高危组。我们比较了两组 DCM 患者在 1-2 年的指导药物治疗 (GDMT) 后的基线和动态变化。

结果: 研究纳入 232 例患者, 平均年龄 46.1 ± 14.1 岁, 男性 157 例 (67.7%)。基线时, 与低危组患者相比, 高危组患者明显年龄较大, 女性比例较高, 体重指数较低, 心率较慢, LVEF 较高, RVEF 较高, RV 体积较小, 原生 T1、T2 和 ECV 值较高。GDMT 一段时间后, 低危组患者 LVEF [差值: $11.8(1.825-0)$ vs. $1.3(-3.5-5.0)$, $p<0.001$]、RVEF [差值: $13.1(2.6-23.9)$ vs. $3.9(-6.3-14.6)$, $p<0.001$] 和 LVEDVi [差值: $-30.0(-60.1-1.9)$ vs. $-1.5(-25.9-12.2)$, $p<0.001$] 显著改善。

总结: 高风险 LGE 模式与 GDMT 后较低的逆转重构可能性显著相关, 与基线 LVEF 无关。

PO-3136

变形配准分析测量的分层周向应变:基于 DENSE 序列验证

程巍

四川大学华西医院

背景:

斑点示踪超声心动图(speckle tracing echocardiography, STE)分层特异性心肌应变分析显示出独特的诊断和预后价值, 而基于心脏磁共振(magnetic resonance imaging, MRI)成像的分层特异性心肌应变分析方法尚未得到参考标准技术的验证。

目的: 为了验证基于平衡稳态自由进动(bSSFP)序列的变形配准算法(DRA)测量的层特异性周向应变(Ecc)与受激回波(DENSE)序列的位移编码。

方法: 前瞻性招募 20 名健康志愿者和 30 名非缺血性心肌病患者。场强/序列:3.0T 心脏 MR, bSSFP cine 序列, DENSE 序列。采用 DRA 和 DENSEanalysis 方法对短轴视图上的全局和层特异性周向应变进行后处理。统计检验:采用独立样本 T、Mann-Whitney U、卡方检验、Spearman 等级相关、类内相关系数、Bland-Altman 检验进行统计分析。

结果:

对于全局 Ecc 评价, DRA 和 DENSEanalysis 在基础和中心室水平上具有极好的一致性, 而在根尖水平上一致性较低(基础:r = 0.921, 中心室:r = 0.940, 根尖:r = 0.866, 均 p < 0.001)。对于分层特异性 Ecc, 心肌中层的一致性高于心外膜和心内膜层(心肌中层:r = 0.908, 心外膜:r = 0.880, 心内膜:r = 0.890, 均 p < 0.001)。两种方法在心内膜心肌层至心外膜心肌层的三个水平上均发现 Ecc 振幅递减的梯度。DRA 和 dense 分析方法均显示出良好的观察者内部和观察者之间的重复性。(CoV 分别为 3.2%至 6.9%和 3.2%至 5.7%)。

结论: 与基于 DENSE 序列的 DENSE 分析方法相比, 变形配准算法(DRA)是一种可行的、重复性好的全局和层间 Ecc 分析方法。

PO-3137

基于冠状动脉 MRA 脂肪分数对冠状动脉粥样硬化患者的预测效能评价

王正福、高波、朱玥

贵州医科大学附属医院

目的: 探讨冠状动脉 MRA 脂肪分数与冠脉狭窄之间的关系, 以评估其对冠状动脉粥样硬化患者的预测效能。方法: 收集我院 2021 年 2 月-2022 年 8 月临床怀疑有冠心病的患者或经介入冠状动脉造影确诊有狭窄(狭窄程度 $\geq 50\%$)的患者 10 例作为实验组, 另收集 10 例正常人作为对照组, 男女不限, 年龄 ≥ 18 岁。两组均行非对比冠状动脉磁共振血管成像(coronary magnetic resonance angiography, CMRA)检查。由两名从事冠状动脉后处理多年的医师进行视觉性分析(包括视觉评分和狭窄分析)和脂肪分数的勾画工作, 后处理均在飞利浦 ISP 工作站进行。脂肪分数分别在 RCA、LM、LAD、LCX 等狭窄的节段地方勾画。结果: 在已经测量分析的 14 名患者中 CMRA 预测狭窄的敏感性为 87.5%、特异性为 66.67%、阳性预测值为 77.78%、阴性预测值 80.0%、准确性为 78.57%, 且狭窄情况与 MR 冠状动脉脂肪分数在 70%-90%之间具有较强的相关性。狭窄的 10 位患者, 其中 6 人的脂肪分数在 87%-88%之间, 有 4 人脂肪分数分布在 70%-90%之间。结论: 冠状

动脉 MRA 可以有效评价冠状动脉粥样硬化患者的狭窄情况, 且冠状动脉脂肪分数可以作为一个潜在的独立因子对冠状动脉狭窄进行预测

PO-3138

发作性睡病患者内侧前额叶 GABA+/Glx 比值与 认知功能异常相关性的 MRS 研究

高亚男

泰达国际心血管病医院

目的: 采用同步脑电-磁共振波谱成像 (EEG-MRS) 技术, 探讨 1 型发作性睡病 (NT1) 患者与正常对照组在非快速眼动 (NREM) 睡眠期前额叶 γ -氨基丁酸/谷氨酸+谷氨酰胺 (GABA/Glutamate+Glutamine) 即 GABA/Glx 比值的差异, 并探讨其与认知功能异常的相关性。

研究方法: 使用同步 EEG-MRS 技术, 采集 20 名 NT1 患者和 20 名性别、年龄、受教育程度匹配的健康志愿者睡眠期 MRS 数据, 计算所有受试者浅睡眠 N2 期前额叶 GABA+和 Glx 水平。应用北京版本蒙特利尔认知评估 (MoCA) 量表评估所有受试者认知能力, 并采用 Epworth 嗜睡量表 (ESS) 评估所有受试者白天嗜睡程度。所有受试者还在 MRS 扫描前 1 周内进行夜间多导睡眠图 (PSG) 记录, 以分析其睡眠分期成分的差距。采用 t 检验比较患者及对照组前额叶 GABA+、Glx 水平以及 GABA+/Glx 比值的差异。此外, 使用 Spearman 相关分析法来探索前额叶 MRS 数据改变与 NT1 患者量表数据、PSG 数据的相关性。

结果: NT1 患者 GABA+/Glx 前额叶比值高于正常对照组 ($P=0.0002$), 其中 GABA+水平高于对照组 ($P=0.0062$), 而 Glx 水平 ($P=0.6699$) 差异无统计学意义。相关分析显示, 内侧前额叶 GABA+/Glx 的比值与 NT1 患者认知功能异常呈负相关 ($rs=-0.7453$, $P=0.0002$)。此外, NT1 患者 GABA+水平与快速眼动睡眠潜伏期 (REML) 成反比 ($rs=-0.6917$, $P<0.01$)。

结论: 本研究发现, NT1 患者 N2 睡眠期内侧前额叶中 GABA+/Glx 的比值高于正常对照组, 差异主要由 GABA+水平升高引起, 而 Glx 水平无明显差异。GABA+/Glx 比值的改变与 NT1 患者异常的认知功能呈负相关。

PO-3139

基于机器学习的多参数影像组学模型预测结直肠癌的共识分子 亚型 4 (CMS4): 一项多中心回顾性研究

刘宗霖、孙轶群、童彤

复旦大学附属肿瘤医院

目的: 共识分子亚型 (CMS) 是一种新型的反映肿瘤遗传特征的分类系统。在四个亚型中, CMS4 与最差的预后相关。然而, 目前的 CMS 检测方法存在几个限制, 阻碍了其在诊疗过程中的早期实施。目前, 使用非侵入性影像学方法识别 CMS 分型的研究从未报道过。因此, 本研究旨在探索基于机器学习方法的影像组学模型是否可以预测结直肠癌患者的 CMS4 分型, 并预测其复发转移风险。

材料和方法: 本回顾性研究共纳入包括三个中心的共 225 例结直肠癌病例。中心 1 的病例按 8:2 的比例分为训练队列 (136 例) 和测试队列 (32 例); 中心 2 和 3 的病例合并作为外部验证队列 (57 例)。每个病例都包含测序数据、基线 MRI 图像, 包括 T2 加权 (T2WI) 和增强 (CE) 序列。测序数据被输入 CMS 分类系统以生成 CMS 亚型结果。使用相同的参数设置从两个队列中提取相同的影像组学特征。应用多种机器学习算法以实现样本平衡、特征归一化、特征筛选和分类器构建, 建立表现最佳和最稳健的 CMS4 预测模型。分别使用 T2WI 和 CE 模型计算每个患者的影像组学评分

(Rad-score)。通过对上述两个模型的结果使用逻辑回归算法建立合并模型。使用接收器操作特征 (ROC) 曲线分析评估模型性能。计算 ROC 曲线下的面积 (AUC) 进行量化。每个病例都具有可靠的随访数据, 依据随访数据计算每个病例的无病生存期 (DFS), 使用 KM 曲线评估模型对患者复发转移的风险分层性能。

结果: 在所有病例中, 有 59 (26%) 例被分类为 CMS4。T2 和 CE 模型选择的最佳特征数分别为 23 和 20。我们发现, CE 模型在测试集 (0.812 vs 0.786) 和外部验证集 (0.741 vs 0.702) 中的表现优于 T2 模型。将两个模型合并后, 合并模型的预测性能进一步提高, 在测试集和外部验证集中的 AUC 分别为 0.854 和 0.759。基于 CMS 的合并模型可对患者的复发转移风险进行有效分层 ($P = 0.018$)。

结论: CMS4 结直肠癌的遗传表型可能与形态特征有潜在关联。基于机器学习的多参数影像组学模型在区分 CRC 的 CMS4 亚型与其他亚型方面显示出一定的潜力, 并可对复发转移风险做出有效预测。

PO-3140

正常人浅睡眠期额叶 GABA+水平与 脑电连接网络拓扑效率的相关性研究

赵思荟、刘彦婷、高亚男、于兵
中国医科大学附属盛京医院

目的: 应用同步脑电图-磁共振波谱 (EEG-MRS) 扫描技术, 探索正常青年人轻度睡眠状态下内侧前额叶皮层 (mPFC) 的 γ -氨基丁酸水平与脑电功能连接网络的拓扑效率之间的关系。

研究方法: 本研究参与者包括 37 名正常青年人 (右利手, 男: 女比例, 16: 21; 中位年龄 25 (23, 26) 岁, 教育水平, 平均值=16.35 \pm 1.99 年)。应用 32 通道脑电系统记录脑电信号, 应用 Hadamard 编码和重建巨型编辑波谱 (Hadamard Encoding and Reconstruction of Mega-Edited Spectroscopy, HERMES) 技术并以 mPFC 作为波谱扫描感兴趣区, 进行同步 EEG-MRS 扫描, 同步记录浅睡眠状态下全脑电活动信号及测量内侧前额叶皮层 GABA+水平。应用 Gannet3.1 软件包对 MRS 数据进行处理, 再根据 3D-T1WI 进行脑实质体积校正, 得到 mPFC 脑组织校正后的 GABA+水平。使用 EEGLAB 对脑电数据进行预处理, 应用 REAT 软件建立 5 个频段 delta (0.5-4 Hz), theta (4-8 Hz), alpha (8-13 Hz), beta (13-30 Hz), gamma (30 Hz 以上) 下的相关连接矩阵, 然后通过 GRETNA 软件包计算浅睡眠期 (N2 期) 五个频带下全脑范围内脑电功能连接网络的拓扑效率, 包括小世界属性、全局效率、局部效率等, 应用相关分析探索脑电功能连接网络的拓扑效率与内侧前额叶皮层 GABA+水平的相关性。

结果: 本研究样本中浅睡眠期内侧前额叶皮层 GABA+/Cr: 0.10 (0.07, 0.12), 相关分析表明 N2 期睡眠状态下 theta 频带下的脑电功能连接网络的全局效率 (平均值=0.22 \pm 0.01) 与内侧前额叶皮层的 GABA+水平呈负相关 ($r = -0.4520$, $p = 0.005$), 其余频带下脑电功能连接网络的全局效率及所有频带下的局部效率、小世界属性均与 mPFC 的 GABA+水平不相关。结论: N2 期浅睡眠阶段 theta 频带脑电功能连接网络的全局效率与内侧前额叶皮层中 GABA+水平存在相关性。

PO-3141

基于 MR T2WI 影像组学模型对 胎盘植入性疾病进行产前诊断及分型

邹锦莉、胡振远^{1,2}、王新莲¹、王克扬¹、魏炜²、解立志³、梁宇霆¹、邹锦莉

1. 首都医科大学附属北京妇产医院

2. 西安工程大学电子信息学院

3. 通用电气医疗系统贸易发展(上海)有限公司北京磁共振产品部

目的 探讨基于 MR T2WI 的影像组学模型在产前预测胎盘植入性疾病 (PAS) 及其亚型的应用价值。**方法** 将 193 例患者按 2:1 的比例随机划分为训练集 (n=129) 和测试集 (n=64)。在 T2WI 序列提取影像组学特征, Pearson 相关系数和 LASSO 回归用于特征筛选, 构建 PAS 预测模型。然后, 计算便于临床应用的影像组学评分进一步评估 PAS 分型, 并选择临床主要风险因素建立基于影像组学评分和临床特征的临床-影像组学模型并绘制 Nomogram。结果 在 T2WI 序列上提取 806 个影像组学特征, 经过 Pearson 相关分析及 LASSO 回归处理后筛选出 10 个影像组学特征, 基于影像组学特征构建影像组学模型。影像组学模型的训练集 AUC 值为 0.933 (95% CI, 0.888-0.978), 准确率为 88.37%, 灵敏度为 88.78%, 特异度为 87.10%, PPV 为 95.60%, NPV 为 71.05%; 测试集 AUC 值为 0.914 (95% CI, 0.835-0.993), 准确率为 89.06%, 灵敏度为 90.91%, 特异度为 85.00%, PPV 为 90%, NPV 为 80.95%, 校准曲线和决策曲线表明模型具有较高性能和潜在临床应用价值。影像组学评分对穿透型 PAS 具有较强的识别能力, 训练集和测试集准确率分别达到了 82.95%、89.06%, 敏感度和 NPV 在训练集和测试集都达到了 100%, 特异度分别达到 81.35%、88.33%。同时, 本研究构建了临床-影像组学模型并绘制 Nomogram 用于可视化预测患者的 PAS。在训练集中, 临床-影像组学模型的 AUC 值为 0.969 (95% CI, 0.946-0.993); 测试集中, AUC 值为 0.976 (95% CI, 0.947-1.000)。DeLong 测试结果表明两模型性能存在显著性差异 (P<0.05), 临床-影像组学模型具有更好的性能表现。结论 基于临床特征及影像组学评分构建的临床-影像组学模型预测效能较好, 可作为产前预测是否存在 PAS 的方法。且影像组学评分对 PAS 亚型具有较好的鉴别能力, 尤其是对于穿透型 PAS。

PO-3142

基于深度学习重建的磁共振成像在胰腺占位性病变中的应用价值

张濛¹、叶铮¹、夏春潮¹、张博²、张妙其²、李真林¹

1. 四川大学华西医院

2. 通用电气医疗系统贸易发展(上海)有限公司

目的: 磁共振成像在胰腺占位性病变的诊断中具有重要作用。然而, 小病变的检测和表征往往受到图像空间分辨率的限制, 而空间分辨率又与扫描时间和信噪比 (signal to noise ratio, SNR) 存在冲突。因此, 深度学习重建技术, 其利用卷积神经网络在保留图像细节的同时降低噪声, 为空间分辨率与上述两者的权衡提供了可能性。本研究旨在探讨深度学习重建在胰腺占位性病变中的应用价值。**方法:** 从 2022 年 7 月到 2022 年 10 月, 共有 21 名胰腺占位性病变患者参与了这项研究。对轴位 2D FSE T1WI 强化序列和 FOCUS DWI 序列采集的数据分别进行深度学习重建与常规重建。对得到的两组图像进行主观和客观评价。主观评价, 由 2 名具有 5 年以上影像诊断经验的放射科医生采用“五分法”对图像均匀性、胰腺边缘清晰度、病灶及整体图像质量进行评分。当评分出现分歧时, 两位放射科医生经讨论后达成共识。客观评价, 由 1 名具有 10 年以上影像诊断经验的放射科医生, 在 2D FSE T1WI 强化序列和 FOCUS DWI 序列的深度学习重建以及常规重建图像中, 通过勾画感兴趣区 (region of interest, ROI), 测量计算胰腺及病变的 SNR 和对比噪声比 (contrast noise ratio, CNR)。测量值包括每个 ROI 的信号强度和标准差。统计分析采用 Wilcoxon 符号秩检验和配

对 t 检验评估深度学习重建组和常规重建组之间的主观和客观差异。 $P<0.05$ 表示差异具有统计学意义。

结果: 2D FSE T1WI 增强序列和 FOCUS DWI 序列的深度学习重建图像, 其主观评价结果明显优于常规重建图像。客观评价上, 在 2D FSE T1WI 增强序列以及 FOCUS DWI 序列的深度学习重建图像中, 计算得到的 SNR 和 CNR 均优于常规重建图像, 组间差异有统计学意义 ($P<0.001$)。

结论: 深度学习重建可以减少磁共振图像中的噪声, 这可能会转化为空间分辨率。在这项工作中, 我们通过定性评分和定量测量, 证明了将深度学习重建应用于胰腺磁共振成像中的可行性和优势, 揭示了深度学习重建在临床胰腺占位性病变磁共振成像中的潜力。

PO-3143

利用孟德尔随机化探讨多模态磁共振脑影像与 耳聋之间的因果关系

栾继昕¹、杨秉偲¹、徐漫兮¹、韩红蕾²、马国林¹

1. 中日友好医院放射诊断科

2. 中日友好医院耳鼻喉头颈外科

目的: 观察性研究报告了多模态磁共振脑影像与耳聋之间的关联, 但目前尚不清楚这种关联是否是由于混杂因素或者反向因果效应导致的虚假关联, 且两者之间是否存在因果关联还有待证明。因此, 本研究采用两样本孟德尔随机化分析, 以确定多模态磁共振脑影像与耳聋风险之间的因果关系。

方法: 基于多模态磁共振脑影像数据, 从公共数据库得到皮质总面积和平均厚度 (样本量 33992)、灰质体积 (样本量 10119)、白质纤维 (样本量 11017) 以及耳聋 (病例数 6730, 样本量 87840) 的 GWAS 数据。筛选出合适的 SNP 作为工具变量。协调暴露及结局 GWAS 数据后, 采用随机效应逆方差加权法 (IVW) 评估因果关系, 并通过 MR-Egger 回归和加权中位数法进行验证。使用 MR-Egger 法检测水平多效性以保证结果的可靠性。

结果: IVW 模型显示后放射冠部分各向异性 (FA) ($OR=1.292$)、内囊豆状核后部平均弥散系数 (MD) ($OR=1.166$)、颞下回表面积 ($OR=1.003$)、枕叶皮层厚度 ($OR=22.923$)、颞下回皮层厚度 ($OR=12.386$)、左侧丘脑体积 ($OR=1.509$)、右侧丘脑体积 ($OR=1.449$)、右侧距状旁回体积 ($OR=1.255$)、左侧侧脑室体积 ($OR=1.201$) 为耳聋的危险因素; 胼胝体膝部径向弥散系数 (RD) ($OR=0.845$)、矢状束 RD ($OR=0.823$)、扣带束 MD ($OR=0.784$)、枕叶表面积 ($OR=0.999$)、颞上沟表面积 ($OR=0.999$)、岛叶表面积 ($OR=0.998$)、颞极皮层厚度 ($OR=0.285$)、脑干体积 ($OR=0.854$)、右侧小脑体积 ($OR=0.845$)、左侧海马旁回体积 ($OR=0.813$) 为耳聋的保护因素。MR-Egger 回归截距项 P 值均大于 0.05, 即筛选出的 SNP 不存在基因多效性, 因此孟德尔随机化在本研究中为因果推断的有效方法。

结论: 利用两样本孟德尔随机化方法排除混杂因素和反向因果关联后, 得到无偏估计的结果, 据此可以确定皮质总面积和平均厚度、灰质体积、白质纤维与耳聋之间存在因果关系, 这些发现有助于深入理解耳聋的发病机制。

PO-3144

深度学习结合压缩感知技术在屏气 3D MRCP 中的临床应用

袁野^{1,2}、张雨¹、李真林¹、夏春潮¹

1. 四川大学华西医院

2. 安徽中医药大学第一附属医院 (安徽省中医院)

目的 探讨基于深度学习 (DL) 结合压缩感知 (CS) 技术在屏气三维磁共振胰胆管成像 (3D MRCP) 的最佳加速因子及其临床应用。

方法 前瞻性纳入 2023 年 3 月至 2023 年 8 月在四川大学华西医院行上腹部 3D MRCP 检查的患者 68 例, 3D MRCP 序列包括 CS 组, 加速因子为 24 (CS-24); DL-CS 组, 加速因子分别为 24 (DL-CS-24)、33 (DL-CS-33)。测量 3 组图像的信噪比 (SNR)、对比度 (CR) 和对比度噪声比 (CNR), 并对图像的整体图像质量、背景抑制、伪影、各级胆管及胰管可见性进行主观评价。采用卡方检验和 Friedman 检验分别对 3 组序列的不满足诊断图像数量与主客观指标进行统计学分析。

结果 DL-CS-33 组的扫描时间较 CS-24 组和 DL-CS-24 组缩短 30% (9s vs 13s)。68 例患者 DL-CS-33 组图像均满足临床诊断要求, 7 例患者的 CS-24 组图像不满足诊断要求, 4 例患者的 DL-CS-24 组图像不满足诊断要求, 且组间差异均有统计学意义 ($P < 0.05$)。DL-CS-33 组和 CS-24 组的 SNR、CR、CNR, 整体图像质量、伪影、各级胆管和胰管的可见性评分差异无统计学意义 (P 均 > 0.05), 背景抑制的评分差异有统计学意义 ($P < 0.05$), DL-CS-24 组的 SNR、CR、CNR, 肝内胆管、主胰管以及整体图像质量均好于 CS-24 组, 差异均有统计学意义 (P 均 < 0.05), 同时背景抑制、伪影和胆总管、肝总管可见性的评分差异无统计学意义 ($P > 0.05$)。

结论 与 CS 技术相比, 应用 DL-CS 技术在不改变图像扫描时间的情况下, 改善了屏气 3D MRCP 图像质量。DL-CS 技术结合高加速因子 33, 在确保整体图像质量的同时降低了单次扫描时间, 可提供高效的屏气扫描方案。

PO-3145

MRI 影像组学结合临床预测 ≤ 5 cm 肝细胞癌患者的粗梁亚型

陈诗

昆明医科大学第二附属医院

目的: 粗梁型肝细胞癌患者的预后较差, 评估基于 MRI 影像组学结合临床对于 ≤ 5 cm 肝细胞癌粗梁型的预测价值

方法: 回顾性收集 2016 年 1 月至 2022 年 1 月期间接受手术切除以及术前增强 MRI 检查患者, 并且将病理证实病灶 ≤ 5 cm 肝细胞癌患者纳入研究。所有影像学特征均由两位放射科医生评估, 分析患者的基线资料及临床指标、影像特征、病理结果, 将病例分为两组粗梁型和非粗梁型。分类变量使用卡方检验, 连续变量使用 T 检验。采用 logistic 回归分析确定粗梁型肝细胞癌的独立预测因素。在进行影像组学分析时将入组研究患者按照比例 7:3 被随机分配到训练组和验证组, 采用机器学习选取与肝细胞癌粗梁分型相关的特征并结合临床构建模型, 评估模型预测性能用 AUC (95% CI)。

结果: 91 例患者中包括粗梁型 27 例 (30%) 和非粗梁型 64 例 (70%), 两组患者年龄、性别、长径、AST、GGT、淋巴细胞、血小板、MVI、CD34、Ki67、病灶位置、生长方式、包膜、卫星灶、瘤内出血、瘤内坏死、瘤内血管、瘤周强化、肝炎、肝硬化比较, 差异无统计学意义 ($P > 0.05$)。其中 ALT、ALP、中性粒细胞、ADC 最低值、AFP、组织学分级两组间比较, 差异具有统计学意义 ($P < 0.05$)。Logistic 回归分析显示 ALP、ADC 最低值、Edmondson 分级为的粗梁型肝细胞癌独立预测因子。基于 f_classif 方法进行特征筛选并结合临床特征构建模型, 训练集曲线下

面积 (AUC) 为 0.82 (95% CI: 0.7189-0.9176), 测试集曲线下面积 (AUC) 为 0.79 (95% CI: 0.6188-0.9562)。

结论: ADC 最低值、Edmondson 分级有望成为肝细胞癌粗梁型有效预测指标。MRI 影像组学特征结合临床指标对粗梁型肝细胞癌预测具有较高价值。

PO-3146

常规磁共振特征在诊断星形细胞瘤 (IDH 突变型) 及预测分子状态中的临床价值

冯岩、张劲松、张广文、郝勇飞、李婉清
空军军医大学西京医院

目的: 分析常规 MRI 特征在星形细胞瘤 (IDH 突变型不伴 1p/19q 共缺失) 诊断中的临床应用价值, 以提高对该类型胶质瘤的术前诊断水平及预测分子状态。

方法: 回顾性分析 158 例经病理证实且有完整术前常规 MRI 影像 (T1、T2、FLAIR 序列) 的星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的 MRI 影像资料, 由 2 名中枢神经影像医师独立依据伦勃朗视觉感受图像 (visually accessible Rembrandt images, VASARI) 特征集的标准进行影像学特征的定量分析。运用 Kappa 检验评价 2 名医生对影像学特征评分结果的一致性。运用 Logistic 回归分析及受试者工作特征 (receiver operating characteristic, ROC) 曲线分析评价常规影像学特性对于星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的诊断效能。

结果: 2 名中枢神经影像医师 VASARI 特征评分的一致性较好 (Kappa 值: 0.737~0.960)。广义 T2/FLAIR 错配征、T2 微囊聚集区改变、囊壁/囊间隔 T2-FLAIR 不匹配、局部 T2-FLAIR 反错配征象对于弥漫性星形细胞瘤 IDH 基因突变的预测具有统计学意义 ($P < 0.05$), 可作为独立预测危险因素, ROC 曲线下面积 (area under curve, AUC) 分别为 0.840、0.779 和 0.702; 联合三者对星形细胞瘤 (IDH 突变不伴 1p/19q 共缺失) 的诊断效能最高, AUC 为 0.903。

结论: 广义 T2/FLAIR 错配征、T2 微囊聚集区改变、囊壁/囊间隔 T2-FLAIR 不匹配、局部 T2-FLAIR 反错配征象等常规 MRI 特征可以作为星形细胞瘤的成像标志物, 并可以术前非侵入性的预测星形细胞瘤的 IDH 突变不伴 1p/19q 共缺失的分子状态。

PO-3147

基于深度学习重建的缺血性脑卒中“百秒”快速磁共振成像的可行性

方鑫、宋清伟
大连医科大学附属第一医院

目的: 探讨深度学习重建 (Deep Learning Recon, DLR) 算法缩短缺血性脑卒中急诊患者磁共振扫描时间的可行性。

方法: 21 例疑似急性缺血性脑梗塞患者 (10 例男性, 11 例女性, 平均年龄 69.86 ± 10.25 岁) 行头部 MR 检查。每位患者均完成常规成像和“百秒”快速成像, 扫描协议均包括轴位 T2WI-FSE、T1WI-FLAIR、T2WI-FLAIR 和 DWI 序列。常规图像采用传统滤波重构算法, “百秒”图像采用深度学习重建算法 (AIFI 指数 2 级; 预处理 2 级; 纹波抑制 0 级; 亮度系数 2 级)。ROI 置于脑桥、小脑、胼胝体、脑白质和梗塞灶记录 SI 和 SD 值, 以脑白质为背景计算 SNR 和 CNR 值, 并根据伪影、噪声水平、解剖细节和病灶显示, 对图像进行 4 分制评分。主观评分一致性采用 Kappa 检验。采用 Wilcoxon 检验分析各序列图像的 SNR、CNR、主观评分的差异。

结果: T2WI-FSE 序列梗塞灶 SNR、T1WI-FLAIR 序列梗塞灶 CNR 有统计学差异 ($P<0.05$); T2WI-FSE 序列梗塞灶 CNR、T1WI-FLAIR 序列梗塞灶 SNR、T2WI-FLAIR 及 DWI 序列 SNR、CNR 无统计学差异 ($P>0.05$)。两观察者主观评分一致性良好 (Kappa: 0.709~0.818), 评分无统计学差异。21 例患者中, 8 例在常规成像中存在运动伪影, 而在快速成像运动伪影显著减轻或消失。

结论:深度学习重建技术在“百秒”快速头部成像中可以显著减少图像运动伪影, 从而保证图像噪声低、病变对比度高。在快速获取急诊患者头部常用序列图像方面具有一定的临床应用价值。

PO-3148

改良磁共振 REACT 成像技术在全身血管成像的临床应用

胡万均、张静
兰州大学第二医院

目的: 探究改良磁共振 REACT 成像技术在全身血管成像的临床应用, 并比较其与 DSA 及 CTA 成像技术的一致性。

材料与方法: 回顾性纳入兰州大学第二医院行改良磁共振 REACT 成像的胸腹部大血管, 冠状动脉及下肢静脉曲张患者 25 例, 其中男性 12 例, 女性 13 例, 平均年龄 49 ± 2.5 岁, 均行磁共振 REACT 成像及 CTA 和 DSA 成像, 分别有两名具有十年诊断经验的医师对 REACT 成像及 CTA 和 DSA 成像显示的大血管及小血管的数量及显示长度进行打分, 最后利用组内相关系数 ICC 评估 REACT 成像及 CTA 和 DSA 成像显示血管的一致性, $p<0.05$ 为差异具有统计学意义, 并利用 qq-plot 图展示两种技术的一致性分布。

结果: 磁共振 REACT 血管成像技术与 CTA 和 DSA 成像显示的血管, 在大、小血管数量及血管长度评分具有较高一致性, $ICC=0.89$, 且 $P=0.0051$, 差异具有统计学意义。

结论: 改良磁共振 REACT 成像技术在胸腹部大血管, 冠状动脉及静脉曲张血管成像技术可以无创性评估胸腹部大血管, 冠状动脉异常以及下肢静脉曲张程度, 且具有无需打药、无需心电触发等优点, 并且有较大的临床推广价值。

PO-3149

多序列 3D-MRI 影像组学对乳腺小肿块的鉴别价值

赵以惠
蚌埠医学院第一附属医院

目的 基于动态增强磁共振 (dynamic contrast enhancement-magnetic resonance imaging, DCE-MRI) 序列及弥散加权成像 (diffusion weighted imaging, DWI) 序列构建影像组学模型探讨其对直径 $<2\text{cm}$ 的乳腺肿块良恶性的鉴别价值。方法 选取 2019 年 1 月-2022 年 8 月就诊于我院 122 例患者, 均接受 MRI 检查, 且经测量, 肿块直径小于 2cm ; 将所有患者图像以(digital imaging and communications in medicine, DICOM)上传至慧影大数据平台, 使用双盲法在 DWI 及 DCE 第三期图像上逐层勾画感兴趣区 (region of interest, ROI), 后将该病灶勾画的所有 ROI 融合成三维容积感兴趣区 (Three dimensional volume region of interest, 3D-VOI), 进行组学分析, 按照 4: 1 将数据集随机分为训练集与测试集, 采用逻辑回归 (Logistic regression LR) 分类器, 构建 DCE、DWI 及 DCE 与 DWI 联合鉴别模型, 以病理检查为金标准, 评价三种影像组学模型的鉴别效能, 并比较三种模型的曲线下面积 (area under the curve, AUC)、准确性、特异性及敏感性。结果 根据病理结果将 122 例患者分为良性 42 例, 恶性 80 例, 以 DCE 构建组学模型鉴别乳腺小肿块的 AUC 值为 0.83 (0.65 - 1.00)、准确性 67%、特异性 81%、敏感性 67%, 以 DWI 构建组学模型鉴

别乳腺小肿块的 AUC 值 0.81(0.67 - 0.98)、准确性 64%、特异性 78%、敏感性 75%，以 DCE 与 DWI 联合模型鉴别乳腺小肿块 AUC 值 0.93 (0.80-1.00)、准确性 80%、特异性 88%、敏感性 89%。结论 DCE-MRI 与 DWI 联合序列所建立的模型在无创性鉴别乳腺小肿块的良恶性的价值更高。

PO-3150

首发未服药强迫症患者岛叶亚区功能连接变化及其与认知灵活性的相关性研究

田蕾、胡晓、关承斌、章达
南京脑科医院

【目的】当前认知神经科学理论提出非适应性习惯化学习可解释强迫症状的形成机制，习惯化学习表现为认知灵活性障碍和基于结果的变化调整自身行为的困难。对应的习惯化网络与脑岛、壳核关系密切，而目前对于首次发作未服药强迫症 (obsessive-compulsive disorder, OCD) 患者脑岛叶亚区功能连接的研究较少，本研究主要探讨首发未服药强迫症患者以双侧岛叶亚区为种子点的静息态脑功能连接的变化及与认知灵活性之间的关系。

【方法】本研究招募了 45 名 OCD 患者(OCD 组)和 40 名健康志愿者(对照组)，均完成临床症状评估及威斯康星卡片分类测试(Wisconsin card sorting test,WCST)，并进行静息状态功能磁共振(rs-fMRI)的扫描。选取双侧前岛叶腹侧和背侧、双侧后岛叶 6 个种子点进行全脑功能连接分析，采用双样本 T 检验比较强迫症组与正常对照组之间的功能连接差异，使用 SPSS 22.0 软件，采用 Pearson 相关分析 OCD 组差异脑区功能连接强度与认知灵活性之间的关系。

【结果】与 HC 组相比，OCD 组左侧前岛叶腹侧与丘脑相关脑区的功能连接均较对照组减弱(P 均 <0.01)，OCD 组左侧前岛叶背侧与中央后回、右侧前岛叶背侧与中央后回和颞中回的功能连接较对照组增强(P 均 <0.01)。强迫症患者右侧前岛叶背侧与右侧中央后回的功能连接强度与错误应答数($r = -0.307, P = 0.042$)和总应答数($r = -0.324, P = 0.032$)呈显著负相关。

【结论】OCD 患者左侧前岛叶腹侧、双侧前岛叶背侧的功能连接网络模式存在异常，且部分功能连接的异常与患者认知灵活性表现相关。

PO-3151

基于心脏磁共振 T1 mapping 建立影像组学模型在鉴别急性与慢性心肌梗死中的应用价值

李诗诺、刘婷
中国医科大学附属第一医院

目的:心血管疾病是现今世界范围内的主要死亡原因。急性心肌梗死是心血管疾病最严重最凶险的表现形式，而心肌梗死引起的心肌细胞坏死也是心血管疾病患者预后不良的重要因素。许多心肌梗死患者在首次诊断时由于急性心肌梗死和陈旧梗死灶并存，而目前二者之间鉴别过程较为繁杂且对患者配合度要求较高，使得治疗计划的选择和治疗后的随访出现困难。因此基于心脏磁共振 T1 mapping 建立影像组学模型，鉴别急性与慢性心肌梗死病灶有助于临床及时决策，从而实现对心肌梗死患者的早期医学干预，以降低心血管不良事件的发生风险，改善预后。

方法:回顾性分析 21 例心肌梗死患者的临床资料，其中 11 例图像为急性期，10 例为慢性期。所有患者均在西门子 3.0T 磁共振呼气末屏气时进行扫描，常规采集黑血序列、亮血序列图像，并采用 MOLLI 序列 T1 Mapping 扫描；采用专用的影像组学研究平台对平扫 T1 mapping 图像进行整体心肌分割并提取影像组学特征，对影像组学特征数据进行标准化，并采用最小冗余最大相关(mRMR)

和最小绝对收缩和选择算子(LASSO)回归分析进行特征选择并建立影像组学模型,并计算影像组学评分(Radscore)。采用 ROC 曲线评估模型的鉴别预测能力。

结果:采用开源 fae 软件包对 T1 Mapping 图像共提取 42 个特征进行统计学检验,其中 19 个特征有显著统计学意义($P<0.05$)。对每个有统计学意义的特征做 ROC 曲线,得到鉴别诊断急性与慢性心肌梗死的前 4 个特征的 AUC 均大于 0.7,其中 AUC 最大为 0.779。

结论:基于心脏磁共振 T1 mapping 建立的影像组学模型对心肌梗死患者病灶的所处时期具有较好的鉴别效能。

PO-3152

磁共振全身脂肪分布特征与代谢风险相关性研究

盛爱珠、张劼、方军杰、陈斌、夏建笔
宁波市第二医院

目的:肥胖症与心血管疾病、糖尿病、脂肪肝和肿瘤等重大疾病的发生密切相关。传统体质指数(BMI)、腰臀比(WHR)等不能准确反映人体脂肪分布以及患病风险。因此,本文基于磁共振全身脂肪定量成像新技术,初步探索全身和腹内脂肪分布人体测量学指标(BMI、WHR)和代谢风险指标(甘油三酯 TG、空腹血糖 GLU)之间的相关性,为相关疾病研究和临床诊疗提供定量新方法。

方法:共纳入 267 例志愿者,男女比例为 152:112,平均年龄 39.8 岁。使用 MR 系统自动的 FACT 序列进行全身脂肪定量成像,获得质子加权脂肪分数图像(PDFF),采用团队开发的全身脂肪分割方法实现皮下脂肪、内部脂肪的自动识别和体积定量,然后计算全身体脂率(全身脂肪体积/全身体积, TAT/WH)、腹内脂肪/全身脂肪(VAT/TAT)、腹部皮下脂肪/腹内脂肪(ASAT/VAT)等指标,并分别研究与 BMI、WHR、年龄、甘油三酯 TG、空腹血糖 GLU 的相关性,进一步分析性别间是否存在差异。

结果:人群总体体脂率与 BMI ($r=0.479$)、WHR ($r=0.189$)和年龄($r=0.199$)呈现显著正相关($p<0.05$),但男性体脂率与年龄无显著线性相关性;人群总体体脂率与 TG 和 GLU 无显著线性相关性,且体脂率与 TG 呈现正相关趋势($r=0.126$, $p=0.119$),而与 GLU 呈现负相关趋势,按照性别统计,男性和女性体脂率与 TG 具有弱相关性($r=0.281$ vs. 0.329 , $p<0.05$),说明单纯体脂率不能特异性表征人体的代谢功能状态。

人群腹内脂肪体积在全身脂肪中的占比和腹部脂肪分布指标与 BMI、WHR、年龄和 GLU ($r=0.239$, $r=-0.260$)呈现显著线性相关($p<0.05$),且与 WHR 最相关,表明随着体重、年龄等因素的升高,过多脂肪更倾向于沉积在腹内,相关代谢风险也逐渐升高;按照性别分析,男性 ASAT/VAT 数值较小,与 BMI 无关($r=0.071$, $p=0.385$),表明男性更倾向于腹内脂肪沉积,具有更高的代谢风险。

结论:磁共振全身脂肪定量指标与代谢指标之间具有线性相关性,且与现有 DXA、CT 评估报道具有较好的一致性。

PO-3153

失眠障碍患者静息态视觉脑网络研究

王恩锋、李中林、邹智、李永丽、王梅云
河南省人民医院

目的:探讨失眠障碍患者视觉皮层网络有无异常及其在失眠障碍发病中的作用。

方法:2016 年 1 月至 2016 年 12 月间,共招募符合条件的失眠障碍患者 44 例(男性/女性=7/37 例,年龄 41.4 ± 10.8 岁)和健康人 41 例(男性/女性=10/31 例,年龄 38.1 ± 9.9 岁),失眠障碍与健康人均进行 PSQI、HAMD、HAMA 等相关量表评测,失眠障碍患者诊断标准除了符合相关 DSM-5

诊断失眠障碍的相关症状，失眠障碍患者临床量表诊断标准为 $PSQI \geq 8$, $HAMD < 17$, $HAMA < 14$ 。对所有受试者采用德国 Siemens Prisma 3.0T 磁共振成像仪头颅 64 通道线圈进行磁共振脑功能成像研究，扫描序列采用西门子 Multiband EPI 序列，采集受试者结构像和 rest-fMRI 图像，然后使用脑功能连接分析方法，包括 Statistical Parametric Mapping (SPM12) 软件包和基于 SPM12 的静息态功能磁共振数据处理工具包，REST V1.8 (Resting-State fMRI Data Analysis Toolkit V1.8) 及 DPABI V2.1 (Data Processing & Analysis of Brain Imaging) 等平台 and SPSS19.0 软件包统计学分析等方法，以初级视觉皮层为种子点，观察失眠障碍患者与健康志愿者脑区功能变化。

结果：失眠障碍组与健康对照组间年龄、性别和受教育程度无显著性差异 ($p > 0.05$)，失眠障碍组与健康对照组间 $PSQI$, $HAMA$, $HAMD$ 量表得分具有显著的统计学差异，失眠障碍组 $PSQI$, $HAMA$, $HAMD$ 量表得分均显著高于健康对照组 ($P < 0.01$)。

与健康对照组相比，失眠障碍组 BA17 区与双侧岛盖部额下回、三角部额下回、右侧额中回、眼眶部、内侧眶部额中回、左侧罗兰多壳盖、中央前回功能连接增强。

结论：失眠障碍患者右侧额中回与初级视觉皮层功能连接增强，其可能与失眠障碍疾病的情绪异常有关。初级视觉皮层与初级运动皮层功能连接的增强导致对环境刺激因素的存在而持续感觉处理活动，从而延迟入睡时间。

PO-3154

3D 酰胺质子转移成像与扩散峰度成像对 前列腺癌的诊断价值研究

侯国瑞

空军军医大学西京医院

目的：本研究旨在比较 3D 酰胺质子转移成像与扩散峰度成像对前列腺癌的诊断价值。

材料和方法：分别收集了 18 例前列腺癌 (PCa) 患者和 12 例前列腺增生 (BPH) 患者，这些患者均行 3.0T 磁共振检查，除常规平扫序列外，加扫了 3D-APT 序列和 DKI 序列。通过 Firevoxel 软件后处理生成 DKI 序列的平均扩散系数 (MD) 和平均扩散峰度 (MK) 参数图，APT 序列扫描结束后自动生成 APT 参数图。由两名医师在 APT 图和 DKI 参数图上勾画感兴趣区，测量病灶的 APT 值、MD 和 MK 值。采用组内相关系数评价两名医师所测结果的一致性；使用独立样本 t 检验比较 BPH 组和 PCa 组间各参数的差异；用受试者工作特征 (ROC) 曲线评估各参数的诊断效能。

结果：两名医师所测数据一致性良好 ($ICC > 0.75$)。BPH 组的 MK 值 (0.623 ± 0.102) 和 APT 值 ($2.35\% \pm 0.15\%$) 均显著低于 PCa 组 (0.887 ± 0.003)、 $2.75\% \pm 0.31\%$ ；BPH 组的 MD 值 (1.821 ± 0.432) $\times 10^{-3} \text{ s} \cdot \text{mm}^{-2}$ 显著高于 PCa 组 (1.236 ± 0.166) $\times 10^{-3} \text{ s} \cdot \text{mm}^{-2}$ ，各参数差异均有统计学意义 ($P < 0.05$)。ROC 曲线分析示 MK 值、MD 值和 APT 值鉴别 BPH 和 PCa 的特异度依次为 98.1%、96.7%、88.9%，敏感度依次为 93.5%、92.9%、76.8%。诊断阈值分别为 $0.6334 \times 10^{-3} \text{ s} \cdot \text{mm}^{-2}$ 、 $0.6010 \times 10^{-3} \text{ s} \cdot \text{mm}^{-2}$ 、2.5%。

结论：3D 酰胺质子转移成像与扩散峰度成像对于 BPH 和 PCa 的鉴别均有价值，且 DKI 参数的 MK 值和 MD 值的诊断敏感度和特异度优于 APT 值。

PO-3155

MAGiC 技术在定量垂体铁沉积中的应用价值

李梅成、彭鹏、曾红秀、唐成
广西医科大学第一附属医院

目的：地中海贫血等血液系统疾病的患者长期输血以及胃肠道吸收铁增多，导致其出现肝脏、心脏、胰腺、性腺、垂体、脑等器官的铁过载。垂体铁过载会导致患者出现生长发育迟缓、促性腺激素减低、促甲状腺激素减低等并发症。本研究采用 MAGiC 序列 T1 值、T2 (MAGiC)值、PD 值、T2 MAP 序列 T2 (T2-MAP)值评估地中海贫血患者垂体的铁含量。

方法：本研究共纳入 44 例地中海贫血患者和 28 例年龄、性别相匹配的健康对照者。首先，两名影像诊断医师对垂体矢状位 MAGiC 序列合成的 T1WI 图与常规 T1WI 图进行图像质量评分并测量垂体高度，分析垂体 MAGiC 序列合成的 T1WI 图与常规 T1WI 图的图像质量、垂体高度测量是否有差异。从 MAGiC 序列定量图和 T2 MAP 图中得到相应垂体定量值，分析地中海贫血组与正常对照组的垂体 T1 值、T2 (MAGiC)值、PD 值、T2 (T2-MAP)值、垂体高度的组间差异。

结果：两名影像诊断医师对垂体 MAGiC 序列合成的 T1WI 图与常规 T1WI 图的图像质量评分存在显著差异 ($P < 0.05$)，评分者之间的一致性检验 $Kappa > 0.61$ 。与正常对照组对比，地中海贫血组的身高、体重、BMI、垂体高度、垂体 T1 值、垂体 T2 (MAGiC)值、垂体 T2 (T2-MAP)值均减低 ($P < 0.05$)，垂体 PD 值升高 ($P < 0.05$)。垂体 T2 (T2-MAP)值与垂体 T2 (MAGiC)值之间、垂体 MAGiC 序列合成的 T1WI 图与常规 T1WI 测量垂体高度之间的一致性分析相关系数分别为 0.889、0.975 ($P < 0.001$)。

结论：本研究揭示了地中海贫血患者垂体中铁含量高于正常人，MAGiC 序列在评估地中海贫血患者垂体铁沉积方面具有一定的可行性。

PO-3156

磁共振 Thrive_3D_iso 序列评估腋窝淋巴结转移的研究与应用

梁建乐
北京大学深圳医院

目的：应用 Thrive_3D_iso 序列技术评估乳腺癌腋窝淋巴结转移情况，判断腋窝淋巴结数量及是否受侵犯在判断病变程度、制定乳腺癌手术方案、制定术后治疗方案和治疗前后效果评估等方面有重要的意义。

方法：2023 年 5 月至 2023 年 8 月之间共 89 例临床已确诊的乳腺癌患者，术前均行乳腺增强扫描，在完成动态增强扫描后立即运用 Thrive_3D_iso 序列行腋窝区域的磁共振扫描，经过 MIP 图像后处理重建，生成多方位多角度的淋巴结实体影像，判断淋巴结与周围血管等的关系，并以手术病理结果为金标准，超声与钼靶为相对比结合的参考元素进行统计学分析。

结果：89 例检查中，发现淋巴结转移的有 54 例，此病例中与超声检查结果相吻合的有 51 例，不吻合的有 3 例，其中超声没发现有 1 例，不确定的有 2 例；与钼靶检查结果相吻合的有 42 例，不吻合的有 12 例，其中钼靶没发现有 10 例，不确定的有 2 例。最后通过手术后或引导穿刺病理化验检测结果有 49 例为转移性淋巴结，5 例为炎性淋巴结。

结论：应用 Thrive_3D_iso 序列技术扫描对乳腺癌腋窝淋巴结转移显示的效果非常直观清楚，本研究推荐 Thrive_3D_iso 序列技术应用作为常规扫描对病人制定乳腺癌手术方案、制定术后治疗方案和治疗前后效果评估等方面有重要的意义。

PO-3157

基于独立成分分析的轻度肝性脑病的大尺度网络功能连接研究

康英杰、黄姬玲、李梦蝶、唐鹏洲、陈义磊、谭文莉
上海市中医药大学附属曙光医院

目的: 探讨伴有轻度肝性脑病 (MHE) 和不伴有肝性脑病 (NMHE) 患者的功能连接 (FNC) 变化, 及其与认知评估的关系

方法: 纳入 27 个肝硬化患者, 患者分组是基于认知测试的结果, 其中 14 个 MHE, 13 个 NMHE, 以及 16 个健康受试者纳入实验中。每个受试者接受静息态磁共振检查以及 PHES 评分, 使用 gift 软件包基于独立成分 ICA 方法对静息态 fMRI 进行分析, 根据所得 IC 的空间相似性划分为 8 个功能网络, 计算受试者不同独立成分 IC 间以及大尺度网络间 FNC 的静态功能连通性改变。三组比较采用单因素方差分析 ($p < 0.01$, FDR 校正), 采用事后检验比较组间差异。使用皮尔逊相关对具有差异的功能连接结果与认知测试结果进行相关性分析。

结果: 共得到 36 个独立成分, 将其划分为 8 个功能网络, 包括基底神经节网络(BG), 默认网络(DMN), 背侧注意网络(DAN), 腹侧注意网络(VAN), 额顶网络(FPN), 边缘网络(LN), 躯体运动网络(SMN), 视觉网络(VIN)。单因素方差分析结果显示, 三组间存在多个 IC 间功能连接异常, 与健康受试者比较, MHE 患者这些 IC 间的功能连接下降, 特别是 DAN(19)-BG(44)、LN(16)-DAN(48)、LN(16)-VAN(37)、VAN(47)-VAN(37)的功能连接下降也存在于 MHE 和 NMHE 之间。相关性分析显示, 这些 IC 间功能连接与 MMSE、DST 评分呈正相关, 与 Stroop、NCT 测试呈负相关, LN(16)-DAN(48)与 MMSE 相关性最高($r=0.596$), VAN(47)-VAN(37)与 Stroop 测试、DST、NCT 评分相关性最高(r 分别=-0.579、0.666 和-0.427)。在大尺度网络方面, MHE 较 NMHE 患者的 DAN-DAN、DAN-LN、DAN-VN 间的网络功能连接(FNC)下降。

结论: MHE 患者存在多个网络成分的功能失连接, 主要位于边缘系统 LN16 与注意网络成分、以及 DAN 和基底神经网络成分。大尺度网络 DAN-DAN、DAN-LN、DAN-VN 间的网络连接破坏是 NMHE 发展为 MHE 的可能原因。

PO-3158

PD - 3D MATRIX - SPAIR 序列联合人工智能压缩感知技术对踝关节的应用价值

蒋学涛
遵义市第一人民医院

目的 探讨 3D 矢状位频率衰减反转恢复质子密度加权序列 (PD - 3D MATRIX - SPAIR) 联合人工智能压缩感知 (ACS) 技术对踝关节扫描的可行性, 同时比较不同加速因子 (AF) 对成像质量的影响。**方法** 招募 32 例健康志愿者, 采用联影 3.0T MR 扫描仪行踝关节 PD - 3D MATRIX - SPAIR 常规并行采集组(PI)及 ACS 组, ACS 组设置不同加速因子进行扫描。根据扫描方式常规组加速因子为 3.0(常规组 PI3.0 组), ACS 加速因子分别为 4.0 组、6.0 组、8.0 组,共获取 4 组图像, 两位具有多年骨肌资深放射诊断医生在原始图同一层面上相同窗宽、窗位划定感兴趣区 (ROI)测量信号强度 (SI) 和标准差 (SD) 并计算信噪比 (SNR) 和对比噪声比 (CNR), 并对图像质量进行四分法主观及客观评分。**结果** ACS 4.0 组、ACS 6.0 组、ACS 8.0 组与常规 PI 3.0 组图像质量评分差异均有统计学意义 ($Z=1.417$ 、 1.414 , $P=0.155$ 、 0.157)。在 4 组图像客观评价中 ACS 4.0 组信噪比最高 ($P < 0.05$), ACS 8.0 组 SNR 最低 ($P > 0.05$), ACS 为 6.0 组时与常规 PI 3.0 组图像 SNR 无差异。ACS 4.0 组、ACS 6.0 组、ACS 8.0 组与常规 PI 3.0 组的 CNR 差异无统计学意义 ($P=0.950$)。常规 PI 3.0 组、ACS 4.0 组、ACS 6.0 组、ACS 8.0 组采集时间分别为 475 s、254

s、173 s、130 s, ACS 4.0 组、ACS 6.0 组、ACS 8.0 组较常规 PI 3.0 组分别缩短 46.5%、63.6%、72.6%。**结论** 联合 ACS 行踝关节 PD - 3D MATRIX - SPAIR 序列扫描, 随着 AF 的增加扫描时间逐渐降低。当 ACS 6.0 对比常规 PI 3.0 在确保图像质量前提下, 扫描时间缩短 63.6%, 临床推荐使用 ACS 6.0 行踝关节序列扫描。

PO-3159

基于 4D-FLOW MRI 的小型颅内动脉瘤内及动脉瘤临近载瘤动脉局部血流动力学分析

桂玉熙、龙茜、郑传胜
华中科技大学同济医学院附属协和医院

目的: 目前使用 CFD 模拟动脉瘤及载瘤动脉的血流环境时, 需要人为设置边界条件及模型入口及出口处的血流信息, 不能完全反映载瘤动脉及动脉瘤内真实的血流动力学环境及发生动脉瘤后血流模式发生的变化。使用 4D-FLOW MRI 技术, 在体测量血管内血流流速及流量, 探讨基于 4D-FLOW MRI 测量的小型颅内动脉瘤形成后动脉瘤内及邻近载瘤动脉内血流动力学变化。

方法: 回顾性收集在华中科技大学同济医学院附属协和医院放射科 47 例进行头颅 CT 血管成像及头部 MR 血管成像诊断为动脉瘤患者的临床信息; 对所有血管的 4D-FLOW 图像重建后进行流体力学分析, 在动脉瘤内垂直血管方向最大面积位置、载瘤动脉上动脉瘤入口及出口位置; 在对应的非载瘤动脉的对称位置放置截面, 获得截面中壁剪切应力及能量损失等血流动力学参数。使用单因素方差分析验证三个截面之间的一致性。比较载瘤动脉/非载瘤动脉之间的参数差异。

结果: 非载瘤动脉中, 平均壁剪切应力、平均周向壁剪切应力和最大周向壁剪切应力在三个截面之间均无明显差异; 非载瘤动脉中, 对称与动脉瘤入口与出口截面之间的最大壁剪切应力, 入口与最大面积截面、入口与出口截面之间的平均轴向壁剪切应力, 入口与最大面积截面、入口与出口截面之间的最大轴向壁剪切应力之间差异具有统计学意义。载瘤动脉中出口截面的最大壁剪切应力相对入口及最大面积截面之间的差异具有统计学意义; 出口截面的平均壁剪切应力相对入口及最大面积截面之间的差异具有统计学意义; 入口截面的平均轴向壁剪切应力相对最大面积截面及出口截面之间的差异具有统计学意义; 入口截面的最大轴向壁剪切应力相对最大面积截面及出口截面之间的差异具有统计学意义; 最大面积截面的平均轴向壁剪切应力相对于入口及出口截面之间的差异具有统计学意义。

结论: 非载瘤动脉中的部分血流动力学参数之间也存在差异, 可能是与动脉瘤及邻近载瘤动脉血流动力学发生变化有关, 因此在研究动脉瘤内部及载瘤动脉局部的血流动力学变化时, 需要考虑到这部分变化, 以准确探讨真正由于发生动脉瘤而引起的血流动力学改变。

PO-3160

Prognostic value of CRAFITY score in hepatocellular carcinoma after transarterial chemoembolization combined with tyrosine kinase inhibitors and PD-1 inhibitor

Lijie Zhang, Chuansheng Zheng, Bin Liang, Heshui Shi
Department of Radiology, Hubei Key Laboratory of Molecular Imaging, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1277 Jiefang Road, Wuhan 430022, China.

Aims: To investigate the utility of CRAFITY score in hepatocellular carcinoma (HCC) after transarterial chemoembolization (TACE) in combination with tyrosine kinase inhibitors (TKIs) and PD-1 inhibitor therapy.

Materials and Methods: Data from patients with advanced HCC treated with TACE plus TKIs and PD-1 inhibitor from January 2019 to June 2022 were collected and analyzed retrospectively. Patients with AFP ≥ 100 ng/mL and those with CRP ≥ 1 mg/dL were assigned a CRAFTY score of 1 point. Patients were divided into three groups according to their CRAFTY score (CRAFTY-low, 0 points; CRAFTY-intermediate, 1 point; and CRAFTY-high, 2 points). The differences in overall survival (OS), progression-free survival (PFS), tumor response and adverse events (AEs) were compared among the three groups. Risk factors for OS and PFS were assessed.

Results: A total of 70 patients were included. The patients were assigned CRAFTY scores of 0 points (CRAFTY-low, n=25 [35.71%]), 1 point (CRAFTY-intermediate, n=29 [41.42%]), and 2 points (CRAFTY-high, n=16 [22.81%]). Multivariate analysis showed that lower CRAFTY score was an independent factor for the improved OS ($P = .045$) and PFS ($P < .001$). TACE session was also associated with the OS ($P = .048$) in the multivariate analysis. A higher objective response rate (ORR) was achieved in the CRAFTY-low cohort. The percentage of patients with protein urea was highest in the CRAFTY-high group. No significance differences were observed in grade 3 AEs in three groups.

Conclusion: The CRAFTY score is simple and could be useful for predicting treatment outcomes, tumor response and AEs of the HCC patients receiving TACE plus TKIs and PD-1 inhibitor therapy.

PO-3161

Safety and Effectiveness of Transarterial Chemoembolization in Patients with Hepatocellular Carcinoma Aged Greater Versus less than 80 Years

Lijie Zhang, Chuansheng Zheng, Bin Liang, Heshui Shi

Department of Radiology, Hubei Key Laboratory of Molecular Imaging, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1277 Jiefang Road, Wuhan 430022, China.

Background To investigate the safety and effectiveness of transarterial chemoembolization (TACE) between elderly patients (≥ 80 years) and younger patients (< 80 years) with hepatocellular carcinoma (HCC), and to explore the potential risk factors affecting the progression-free survival (PFS) for TACE.

Methods A consecutive cohort of unresectable HCC patients initially treated with TACE was retrospectively analyzed. Patients were categorized into two groups stratified by age. The efficacy and safety were evaluated. The PFS was investigated and the prognostic factors for PFS were also analyzed using Kaplan–Meier method and Cox proportional hazard models.

Results A total of 198 patients were included (44 patients ≥ 80 years and 154 patients < 80 years). The cumulative risk of PFS after TACE was comparable between the two groups ($P = .800$). In multivariate analysis, lower ECOG score ($P = .039$) and earlier BCLC stage ($P = .004$) were independent predictors of the better PFS. TACE treatment was well tolerated by patients in both groups.

Conclusions Aging is not a significant predictor of poor PFS. TACE therapy is safe and effective in octogenarians with HCC compared with younger patients. Low ECOG score and early BCLC stage were associated with the better PFS.

PO-3162

Downregulated FTO promotes MicroRNA-155-Mediated inflammatory response in cerebral ischemia/reperfusion injury

Zheyu Jiang

School of Medical Imaging, Guizhou Medical University

AIMS: The essential role of m6A RNA modification in various biological processes has been demonstrated. However, its role and underlying mechanism in cerebral ischemia/reperfusion (I/R) injury is not completely understood. Specifically, this study aims to elucidate the mechanism for alteration of m6A RNA modification in cerebral I/R injury and identify a novel therapeutic target for treatment.

Materials and Methods: Firstly, we established a cerebral ischemia/reperfusion injury model in mice using MCAO followed by reperfusion. Then, the m6A RNA modification was detected with a colorimetric m6A quantification assay, and the expression of the m6A methyltransferases METTL3, METTL14, and WTAP, as well as the demethylases FTO and ALKBH5 were determined with qPCR and western blotting. Furthermore, FTO was overexpressed in brain tissues via intracerebroventricular injections of adenoviruses encoding FTO, and the protective effect of FTO on m6A RNA modification and cerebral I/R injury was assessed. After that, MeRIP assays were used to detect the effect of FTO overexpression on m6A modification of pri-miR-155 and qPCR analysis to identify its maturation. Finally, the role of miR-155 overexpression in the protective effects of FTO on cerebral I/R injury was examined.

KEY FINDINGS: Our results demonstrated that m6A levels of total RNA were increased, and m6A methyltransferase FTO expression was decreased in post-I/R injury cerebral tissues. The overexpression of FTO reversed the increase in m6A RNA modification and attenuated cerebral I/R injury. Furthermore, we found that FTO overexpression increased the m6A modification of pri-miR-155 and enhanced its maturation to form miR-155. Notably, miR-155 overexpression blunted FTO's protective effect against cerebral I/R injury.

SIGNIFICANCE: We propose that downregulated FTO overexpression is the mechanism that contributes to increased m6A RNA modification in cerebral I/R injury. By inhibiting the maturation process of pri-miR-155 to inhibit m6A modification, FTO overexpression reverses increase in total m6A RNA modification and exerts protective effects against cerebral injury.

PO-3163

Neutrophil-to-HDL-C Ratio as an Inflammatory Biomarker in Patients with Anxiety and Obstructive Coronary Artery Disease: a Retrospective Study

Aodan Zhang¹, Weihang Sun², Chuang Sun¹, Xiaofeng Q²

1. The Second Hospital of Dalian Medical University (Diamond Bay)

2. The Second Hospital of Dalian Medical University

Background: Anxiety is a common comorbidity with coronary artery disease (CAD). The neutrophil-to-lymphocyte ratio (NLR), neutrophil-to-high-density lipoprotein cholesterol (HDL-C) ratio (NHR), and lymphocyte-to-HDL-C ratio (LHR) can predict the severity of CAD. This retrospective study aimed to explore the relationship between NLR, NHR, and LHR, and the presence of obstructive or severe CAD (OCAD, SCAD) in patients with comorbid anxiety and chest pain.

Methods: A total of 1,063 patients with anxiety and chest pain were divided into an NOCAD group and OCAD group according to computed topography angiography (CCTA). The 455 patients in the

OCAD were further divided into the NSCAD group (n=205) and SCAD group (n=255) according to coronary angiography results. Demographic and laboratory data were collected.

Results: Multiple regression analysis showed that higher NLR, NHR, and LHR served as independent risk factors for OCAD in patients with anxiety and chest pain (OR 2.10, 95%CI: 1.77–2.48, $p<0.001$), but only NHR was significantly associated with SCAD (OR 1.84, 95%CI: 1.23–2.74, $p<0.001$). Area under the receiver operating characteristic curve analysis showed that NHR had the highest predictive value for OCAD and SCAD compared with NLR and LHR (AUC 0.71, sensitivity 57.36%, specificity 80.10%; AUC 0.83, sensitivity 82.4%, specificity 73.17%, respectively).

Conclusions: NHR was associated with severity of coronary stenosis in patients with comorbid anxiety and chest pain, and also served as an independent predictor of OCAD and SCAD in these patients.

PO-3164

Bacterial community analysis of pyogenic liver abscess with or without gas formation by 16S rDNA sequencing

Yawen Guo, Zhihui Chang
Shengjing Hospital of China Medical University

Abstract

Background: Gas formation is an important feature of pyogenic liver abscess (PLA). The potential relationship between gas formation and bacterial composition in PLA remains unclear. The present study attempts to compare bacterial composition between gas-forming PLA (GFPLA) and non-gas-forming PLA (non-GFPLA) and to identify factors associated with gas formation in PLA.

Methods: Clinical data from 331 patients with PLA was collected retrospectively, and 16S rDNA sequencing was performed to analyze the bacterial composition of pus samples from 60 consecutive PLA patients. Patients were divided into GFPLA and non-GFPLA groups according to the presence or absence of gas on computed tomography (CT). Univariate and multivariate logistic analyses were used to identify factors associated with gas formation in PLA.

Results: Rates of extrahepatic migratory infection (EMI), intensive care unit (ICU) admission and mortality were significantly higher in the GFPLA group. 16S rDNA sequencing showed no differences in bacterial community richness and diversity between the two groups. Linear discriminant analysis effect size (LEfSe) revealed a higher abundance of *Enterococcus faecium* and *Enterobacter cloacae* in the GFPLA group. However, the presence of *Enterococcus faecium* and *Enterobacter cloacae* was not associated with the gas formation on multivariate regression analysis. Only the history of digestive system cancer was independently associated with gas formation in PLA.

Conclusions: No relationship was observed between gas formation and bacterial composition in PLA; only the history of digestive system cancer was independently associated with PLA gas formation.

PO-3165

The correlation between duration of symptoms and CT features in pyogenic liver abscess patients

Yawen Guo,Zhihui Chang
Shengjing Hospital of China Medical University

Purpose: To explore whether duration of symptoms (DOS) is associated with imaging features in pyogenic liver abscess (PLA) patients and figure out the correlation between imaging features and pathological features.

Method: CT images and clinical characteristics of 156 PLA patients were retrospectively collected. These patients were divided into two groups ($<7d$, and $\geq 7d$) according to the DOS. DOS in our study is defined as the time from the onset of common symptoms of PLA (such as fever, rigors, abdominal pain and so on)to the first imaging examination after admission .Their clinical and imaging characteristics were further evaluated to identify the relationship between DOS and imaging features. We compared the pathological findings with the imaging features of PLA patients who underwent surgery or percutaneous puncture biopsy.

Results: PLA patients whose DOS < 7 are more likely to have single lesion and form gas in the pus cavity, while PLA patients whose DOS ≥ 7 are more likely to have perilesional low density and rim enhancement. There were no statistical differences in pleural effusion, peritoneal effusion, bile duct dilatation, length, cluster sign or petal sign and patchy parenchymal enhancement. Twelve PLA patients underwent surgery and six patients underwent percutaneous biopsy. Rim enhancement was consistent with a perceptible fibrous wall (microscopically consisting of proliferative fibrous tissue, acute inflammatory cells and chronic inflammatory cells) in a gross liver specimen, which suggested healing process of liver tissue. Cluster sign or petal sign suggested fibrous tissue hyperplasia and healing process of liver tissue.

Conclusion :

Gas formation often appears in the early stage of PLA. Rim enhancement is the manifestation of proliferative fibrous tissue, which gradually appears with the prolongation of the PLA course. Cluster sign or petal sign indicates healing process of liver tissue, and the liquefaction degree of PLA may not get better with the progress of PLA.

PO-3166

Multiparametric MRI-based Radiomics Nomogram Predicts the Recurrence of Hepatocellular Carcinoma After Postoperative Adjuvant Transarterial Arterial Chemoembolisation (PA-TACE)

Xinyu Guo,LiYun Zheng,JianSong Ji
The Central Hospital of Zhejiang Lishui

Purpose:To develop and validate a multiparametric MRI-based radiomics model for predicting the recurrence in hepatocellular carcinoma (HCC) patients after postoperative adjuvant transcatheter arterial chemoembolization (PA-TACE).

Methods:In this retrospective study,117 HCC patients (81 for training, 36 for validation) treated with PA-TACE within two months after surgical resection were included. Qualified pre-treatment contrast-enhanced MRI were performed before PA-TACE. Multiparametric radiomics features were extracted from T2 weighted imaging (T2WI), diffusion weighted imaging (DWI) ($b=800$), and hepatic arterial phase (AP). Least absolute shrinkage and selection operator (LASSO)-COX regression was utilized to select radiomics features. The radiomics score (Rad-score) was calculated through

a linear combination of selected feature clusters, with corresponding LASSO coefficients applied as weights. Optimal clinical characteristics selected by univariate and multivariate Cox analysis were integrated with Rad-score to develop a progression-free survival (PFS) prediction model. Additionally, the clinical-radiomics model was constructed utilizing significant clinical characteristics and Rad-score to assess individualized recurrence risk prediction. The performance of the combined model was evaluated by time-dependent receiver operating characteristic (ROC) curves, Harrell's concordance index (C-index), and calibration curve.

Results:Fifteen radiomics features were selected from three sequences of MRI. The Rad-score was calculated by the weights of the LASSO coefficients, and the cohort was stratified into high-risk and low-risk signature groups based on the Rad-score median value of 0.434. The significant difference in PFS between the high-risk and low-risk signature groups was confirmed in two cohorts ($P < 0.05$). The clinical independent predictors of HCC recurrence after PA-TACE were neutrophil to lymphocyte ratio (NLR) (HR = 1.49, 95% CI: 1.1-2.1, $P = 0.022$) and tumor size (HR = 1.28, 95% CI: 1.1-1.5, $P = 0.001$). The clinical-radiomics model developed by Rad-score, NLR, and tumor size demonstrated favorable performance for predicting the recurrence in both training and validation cohorts. The AUCs at 1-, 3- and 5- year of time-dependent ROC curves based on combined model were 0.82-0.91, and 0.75-0.91 in the training and validation cohorts, respectively. The calibration curve exhibited a satisfactory correspondence between predicted and observed PFS in two cohorts. Conclusion:The multiparametric MRI-based radiomics nomogram can well predict recurrence in HCC patients treated with PA-TACE and can serve as a valuable tool for clinical prognosis.

PO-3167

Transarterial chemoembolization combined donafenib with/without programmed death-1 inhibitors for initially unresectable hepatocellular carcinoma: a multicenter retrospective study

wenze xu,xuhua duan,hao li,chao liang
The First Affiliated Hospital of Zhengzhou University

Objective

To investigate the efficacy and safety of transarterial chemoembolization (TACE) combined with donafenib and programmed death-1 (PD-1) inhibitor (TACE+DP) and TACE combined with donafenib (TACE+D) in the treatment of unresectable hepatocellular carcinoma (uHCC) in a multicenter retrospective study.

Methods

In this multicenter retrospective study, the data of patients with uHCC who had received TACE+DP or TACE+D as first-line treatment from 15 Chinese academic centers during July 2021 to July 2022 were collected and retrospectively analyzed. Patients in the TACE+DP group received intravenous administration of PD-1inhibitor every 3 weeks and oral donafenib (0.2 g) twice daily until intolerable toxicity or disease progression. Patients in the TACE+D group received the same dose of PD-1 inhibitor and donafenib 5 days after TACE. Overall survival (OS), progression-free survival (PFS) and tumor responses were evaluated according to the modified Response Evaluation Criteria in Solid Tumors (mRECIST) between the two groups.Treatment-related adverse events (AEs) were analyzed to assess safety.

Results

There were 157 patients in the TACE+D group and 166 patients in TACE+DP group. mOS was significantly longer in the TACE+DP group than in the TACE+D group (18.1 vs 13.2 months; $P < 0.001$). Patients in the TACE+DP group achieved a higher ORR (50.6% vs 41.4%, $P = 0.019$) than those in the TACE+D group. Patients in the TACE+DP group also achieved a higher disease control rate (DCR) (89.2% vs 82.8%, $P = 0.010$) than in the TACE+D group. The incidence

and severity of AEs in TACE+DP group were comparable to those in TACE+D group (Any grade, 92.9% vs. 94.6%, $P=0.270$; grade 3 or 4, 33.8% vs. 37.3%, $P=0.253$).

Conclusion

With favorable safety and tolerability, TACE combined donafenib with PD-1inhibitors were more effective than TACE combined with donafenib in improving OS, PFS, and ORR.

PO-3168

A Multicenter, Retrospective Study Comparing the Efficacy of BACE Combined with Anlotinib and BACE Alone in the Treatment of Advanced Non-small Cell Lung Cancer

Chao Liang,Xuhua Duan,Hao Li,Wenze Xu
The First Affiliated Hospital of Zhengzhou University

Purpose

To compare the clinical efficacy and safety of bronchial artery chemoembolization (BACE) combined with Anlotinib (BACE + A) and BACE alone in the treatment of stage III-IV non-small cell lung cancer (NSCLC).

Materials and Methods

The clinical data of patients with advanced NSCLC diagnosed and admitted from November 1, 2019 to November 1, 2020 in 6 interventional centers were retrospectively analyzed. Patients were divided into BACE + A group and BACE alone group. Tumor response, progression-free survival (PFS), overall survival (OS) and treatment-related adverse events (TRAEs) were compared between the two groups, and the related factors affecting the prognosis of patients were analyzed.

Results

Ninety-four patients with lung cancer who met the inclusion/exclusion criteria were included in this study, 46 in the BACE + A group and 48 in the BACE group. BACE + A group was superior to BACE group in OS (18.8m vs. 13.4m, $P=0.0013$) and PFS (9.0m vs. 6.1m, $P=0.0012$). At 6 and 12 months after the first BACE, the ORR (34.8% vs. 22.9%, $P<0.05$; 40.0% vs. 14.8%, $P<0.05$) and DCR (80.4% vs. 68.8%, $P<0.001$; 83.3% vs. 59.3%, $P<0.05$) were higher in the BACE + A group than in the BACE group. Hypertension, fatigue, hand-foot syndrome, and anorexia were common adverse reactions unique to Anlotinib in the combination group, but there were no Grade 4 AEs.

Conclusion

BACE combined with Anlotinib is superior to BACE in the treatment of advanced NSCLC and can prolong OS and PFS, with adverse reactions within the tolerance range.

PO-3169

Prognostic value of venous outflow profiles on multiphase CT angiography for the patients with acute ischemic stroke after endovascular thrombectomy

Yue Chu,Xiao-Quan Xu,Fei-Yun Wu
The First Affiliated Hospital of Nanjing Medical University

AbstractObjectives: To evaluate the prognostic value of venous outflow (VO) profiles evaluated on multiphase CT angiography (mCTA) for the patients with acute ischemic stroke (AIS) after endovascular thrombectomy (EVT).

Methods: We retrospectively collected 150 patients with AIS who had undergone pre-treatment CT perfusion (CTP) evaluation and subsequent EVT in our center from April 2018 to April 2022. Three-phase (peak arterial phase, peak venous phase, late venous phase) CTA was reconstructed from the CTP raw data, and VO was evaluated on three-phase CTA, respectively. Favorable VO was regarded as a cortical vein opacification score of 3–6, and unfavorable VO as a score of 0-2. Good outcome was defined as a modified Rankin Scale score of 0-2 at 90 days after EVT. Multivariate logistic regression analysis was performed to explore the predictors of good outcome. Prognostic value was assessed and compared using receiver operating characteristic (ROC) curves and Delong test.

Results: Good outcome was achieved in 85 (56.7%) patients. Among the mCTA- derived VO profiles, only favorable peak venous phase VO was found to be independently associated with good outcome (OR, 18.925; 95% CI, 3.676-97.422; $P<0.001$). After integrating favorable peak venous phase VO with a lower post-treatment National Institute of Health Stroke Scale score at 24 hours, successful recanalization and favorable hypoperfusion intensity ratio, the predictive ability for a good outcome was significantly improved than before (area under the ROC curve; 0.947 vs 0.881; $P=0.002$).

Conclusions: Favorable peak venous VO profiles on mCTA might be a promising biomarker in predicting good outcome in patients with AIS after EVT.

PO-3170

Development and validation of a predictive model of nondiagnostic results in patients undergoing CT-guided percutaneous transthoracic needle lung biopsy

Xuyin Zhang¹,Linyun Yang^{1,2},Ting Liang¹,Yonghao Du¹,Shaonong Dang³,Shanshan Liu⁴,Rong Wang¹,Gang Niu¹

1. The First Affiliated Hospital of Xi'an Jiaotong University

2. Hangzhou Medical College

3. Xi'an Jiaotong University Health Science Center

4. Chang'an District Hospital of Xi'an

Purpose: Nondiagnostic results of computed tomography (CT)-guided percutaneous transthoracic needle biopsy (PTNB) of the lung can render a quandary in clinical practice. There is a lack of predictive models to guide the decision-making of doctors and patients before PTNB. We aimed to develop and validate a nomogram to predict the risk of nondiagnostic results in patients undergoing CT-guided PTNB of the lung.

Methods: A total of 954 PTNBs in the training cohort (M/F=590/364; mean age, 60±12 years) and 90 PTNBs in the external validation cohort (M/F=59/31; mean age, 61±11 years) were retrospectively included. The PTNB results were categorized as diagnostic (malignancy or specific benign) or nondiagnostic (nonspecific benign, atypical cells, or insufficient specimen). Multivariate logistic regression was used to identify independent predictors of nondiagnostic results and

construct the model. C-statistic, calibration curve, and decision curve analysis were used to evaluate discrimination, calibration, and clinical usefulness, respectively. The model was internally validated using bootstrapping resampling and externally validated to obtain optimism-corrected performance estimates.

Results: Of 954 PTNBs in 954 patients in the training cohort, 280 (29.4%) were nondiagnostic results. The model included six independent predictors: age at biopsy, lesion size, lobulation sign, air bronchogram, the number of samples, and pre-test probability. The C-statistics for the training, internal validation, and external validation cohorts were 0.753, 0.744, and 0.740, respectively. Two risk groups were identified with low (<40%) and high ($\geq 40\%$) probabilities of nondiagnostic results of PTNB. For lesions of low risk with the number of samples ≤ 2 or ≥ 3 , ≤ 2 samples should be obtained; for lesions of low risk with the number of samples ≥ 3 , more samples should be obtained when appropriate; for lesions of high risk with the number of samples ≥ 3 , PTNB needs to be reconsidered. Conclusion: The nomogram showed good performance in predicting the nondiagnostic results of CT-guided PTNB of the lung. Suggestions for each risk group may facilitate clinical practice.

PO-3171

The Superior Efficacy of Combination Transarterial Chemoembolization with Radiofrequency Ablation in Patients with Hepatocellular Carcinoma: a Meta-Analysis

Yanmei Dai¹, Dandan Wang¹, Xu Zeng¹, Yanjie Xin¹, Dongmin Liu¹, Fucang Jia^{2,3}, Huijie Jiang¹

1. Second Affiliated Hospital of Harbin Medical University

2. Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

3. Pazhou Lab

Background: Although the combination of transarterial chemoembolization (TACE) and RFA has been shown to have certain advantages over single therapy in hepatocellular carcinoma, some potential factors influencing the superior efficacy of combination therapy remain controversial.

Methods: 5 databases including PubMed, Embase, the Cochrane Library, Medline, and Web of Science were systematically searched for randomized controlled trials (RCTs) until March 14, 2022. The primary endpoint included the overall recurrence rate of the tumor and the overall survival (OS) rate treated with TACE plus RFA compared to that with RFA alone, and the secondary endpoint was the recurrence-free survival (RFS) rate. The statistical analysis was performed using the Review Manager (version 5.3) Software.

Results: A total of 7 RCTs were included. In terms of the overall recurrence rate of the tumor, the combination of TACE and RFA was better than RFA alone [risk ratio (RR) = 0.82, P = 0.002]. The combination therapy both in 3-year OS rate (RR = 1.19, P = 0.001) and 1-year RFS rate (RR = 1.17, P = 0.0004) was better than RFA alone. For complications, except fever (P = 0.04) and vomiting (P = 0.03), there was no significant difference between combination therapy and RFA alone (All P > 0.05). Subgroup analysis performed that the effectiveness of TACE combined with RFA was more advantageous in the patients from the China subgroup, the optimal interval times of RFA after TACE ≥ 2 weeks subgroup, and the tumor size ≤ 7 cm subgroup.

Conclusion: The combination of TACE with RFA was an effective and safe method for early-stage HCC, especially in decreasing tumor recurrence and prolonging survival.

PO-3172

Hepatitis B virus reactivation in hepatocellular carcinoma patients after hepatic arterial infusion chemotherapy combined with and without immunotherapy

Lijie Zhang, Yiming Liu, Heshui Shi, Chuansheng Zheng, Bin Liang

Department of Radiology, Hubei Key Laboratory of Molecular Imaging, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, 1277 Jiefang Road, Wuhan 430022, China.

Background Hepatitis B virus (HBV) reactivation (HBVr) is a major concern for hepatocellular carcinoma (HCC) patients undergoing hepatic arterial infusion chemotherapy (HAIC) using mFOLFOX6 regimen. There is insufficient evidence to support the routine use of HAIC combined with immunotherapy in HCC patients with HBVr.

Aim To examine the adverse events (AEs) related to HBVr in HCC patients after HAIC, with or without immunotherapy, and to assess the effectiveness of antiviral prophylaxis for HBVr.

Methods Medical records of HCC patients receiving HAIC combined with and without immunotherapy between January 2021 and June 2023 were reviewed. The patients were divided into two groups based on whether they received immunotherapy or not.

Results Out of the 106 patients, 32 (30.2%) developed HBVr. Among these, 23 eligible patients with HBVr were included, with 14 patients (61%) receiving immunotherapy and nine patients (39%) not receiving immunotherapy. Prior to treatment, four patients in each group had detectable HBV DNA with median titre of 3.66 ± 102 IU/ml (patients with immunotherapy) and 1.98 ± 102 IU/ml (patients without immunotherapy), respectively. Fifteen patients did not show detectable HBV DNA. At reaction, the median HBV DNA level was 6.95 ± 102 IU/ml for all patients, 4.82 ± 102 IU/ml in patients receiving immunotherapy and 1.3 ± 103 IU/ml in patients not receiving immunotherapy. Grade 3 hepatitis occurred in 12 cases of all patients (12/23, 48%), including five patients with immunotherapy (56%) and seven patients without immunotherapy (78%). At the 3-month follow-up, HBV DNA was detected in 10 patients, with a median HBV DNA level of 2.05 ± 102 IU/ml (range, $1.5 \pm 102 - 3.55 \pm 102$ IU/ml) in patients (7/10) with immunotherapy and 4.28 ± 102 IU/ml (range, $1.15 \pm 102 - 5.88 \pm 102$ IU/ml) in patients (3/10) without immunotherapy. Intensified antiviral treatment was administered to all patients. No HBVr-related fatal events occurred.

Conclusion HBVr can occur after HAIC combined with or without immunotherapy. The degree of liver damage did not differ significantly in patients treated with or without immunotherapy. Intensified antiviral treatment was found to be crucial for HCC patients with HBVr.

PO-3173

A Comparison of the Performance of 68Ga-Pentixafor PET/CT versus Adrenal Vein Sampling for Subtype Diagnosis in Primary Aldosteronism

Xuan Yin, Kai Ai, Jianguang Luo, Wei Liu, Xiaowei Ma, Lianbo Zhou, Xin Xiang, Xin Su, Yunhua Wang, Yuan Li
The Second Xiangya Hospital, Central South University

Objective: To investigate the diagnostic efficiency and prognostic value of 68Ga-Pentixafor PET/CT in comparison with adrenal vein sampling (AVS) for functional lateralization in primary aldosteronism (PA). Histology and long-term clinical follow-up normally serve as the gold standard for such diagnosis.

Methods: We prospectively recruited 26 patients diagnosed with PA. All patients underwent 68Ga-Pentixafor PET/CT and AVS. Postsurgical biochemical and clinical outcomes of patients with unilateral primary aldosteronism (UPA), as diagnosed by PET/CT or AVS, were assessed by

applying standardized Primary Aldosteronism Surgical Outcome (PASO) criteria. Immunohistochemistry (IHC) was performed to detect the expression of aldosterone synthase (CYP11B2) and CXCR4.

Results: On total, 19 patients were diagnosed with UPA; of these, 13 patients were lateralized by both PET/CT and AVS, four patients were lateralized by PET-only, and two by AVS-only. Seven subjects with no lateralization on AVS and PET received medical therapy. All patients achieved complete biochemical success except one with nodular hyperplasia lateralized by AVS alone. The consistency between PET/CT and AVS outcomes was 77% (20/26). Moreover, CYP11B2-positive nodules were all CXCR4-positive and showed positive findings on PET. Patients who achieved complete biochemical and clinical success had a higher uptake on PET as well as stronger expression levels of CXCR4 and CYP11B2.

Conclusions: Our analysis showed that ⁶⁸Ga-Pentixafor PET/CT could enable non-invasive diagnosis in most patients with PA and identify additional cases of unilateral and surgically curable PA which could not be classified by AVS. ⁶⁸Ga-Pentixafor PET/CT should be considered as a first-line test for the future classification of PA.

PO-3174

Role of radiomics in predicting the therapeutic efficacy of initial transarterial chemoembolization in hepatocellular carcinoma: a systematic review and meta-analysis

Dandan Wang

The Second Affiliated Hospital of Harbin Medical University

Background: The treatment efficiency of hepatocellular carcinoma (HCC) following transcatheter arterial chemoembolization (TACE) is a critical prognostic factor. Through quantitative analysis of pre-treatment imaging, radiomics has demonstrated its usefulness as a valuable biomarker for assessing tumor response after TACE. This study aims to evaluate the methodological significance of radiomics in predicting the objective response (OR) following the initial TACE procedure.

Methods: A systematic search was conducted from four databases (PubMed, Embase, Web of Science, and Cochrane Library) up to April 21, 2022, to identify original studies investigating the use of radiomics for predicting treatment response of HCC following TACE. Diagnostic performance was assessed by pooling sensitivity, specificity, and area under the curve (AUC). Heterogeneity among studies was evaluated using the I² statistic. Meta-regression and subgroup analysis were performed to explore potential factors contributing to heterogeneity. The study is registered with PROSPERO. ID: CRD42022332384.

Results: Ten eligible studies were evaluated for meta-analysis encompassing a total of 2514 samples, of which 1195 achieved OR, and 1319 were non-OR after the initial TACE. The pooled sensitivity was 0.87 (95% confidence interval [CI]: 0.79-0.92, I² = 72.47%), the pooled specificity was 0.85 (95% CI: 0.78-0.90, I² = 54.49%), and the pooled AUC was 0.92 (95%CI: 0.89-0.94). Subgroup analysis showed that using deep learning algorithm and increasing the sample size are potential means to achieve better predictive performance (P < 0.05).

Conclusions: Radiomics has provided a novel option for predicting initial TACE response. As an emerging biomarker, before radiomics can assist HCC clinical management, it needs to be further validated in larger cohorts.

PO-3175

Radiofrequency Hyperthermia Enhances the Effect of OK-432 for Hepatocellular Carcinoma Via Activation of TLR4-cGAS-STING Pathway

Bo Sun, Chuansheng Zheng
wuhan union hospital

Abstract

Background: Radiofrequency ablation (RFA) is an effective alternative to surgery in the treatment of early-stage hepatocellular carcinoma (HCC). However, when RFA of large and irregular HCCs, a safe ablation margin with 0.5-1.0 cm beyond the tumor confinement is usually difficult to obtain, and thus causing a sublethal radiofrequency hyperthermia (RFH) at the ablated tumor margin.

Methods: This study investigated the feasibility of using RFH to enhance the effect of OK-432 for HCC and explored its potential mechanisms, with the aim to generate a tumor-free ablated margin during RFA of HCC.

Results: The results of this study showed OK-432 could activate the cGAS-STING pathway, and RFH could further enhance the activation. Meanwhile, we found RFH could cause high expression of TLR4, the administration of TLR4 inhibitor in vitro and in vivo could eliminate the activation of cGAS-STING by OK-432, indicating that TLR4 might be an upstream molecular of the cGAS-STING pathway. The combined therapy of RFH with OK-432 resulted in a better tumor response, and a prolonged survival compared to the PBS, OK-432, or RFH treatment.

Conclusion: RFH in combination with OK-432 might serve as a new treatment strategy in reducing the residual and recurrent tumor after RFA of large and irregular HCCs, as well as bringing a new option for other types of solid malignancies treated by RFA.

PO-3176

Ablation alone is noninferior to radiotherapy plus ablation in the patients with early-stage hepatocellular carcinoma: a population-based study

Yusheng Guo, Chuansheng Zheng
Wuhan Union Hospital

Purpose

Recently, the efficacy of two low-invasive treatments, ablation and radiotherapy, has been fully compared for the patients with the early-stage hepatocellular carcinoma (HCC). However, the comparison between radiotherapy plus ablation and ablation alone has been less frequently reported.

Methods

Data from the Surveillance, Epidemiology, and End Results (SEER) database were searched for early-stage HCC patients treated with ablation plus radiotherapy or ablation alone. The outcome measures were overall survival (OS) and cancer-specific survival (CSS). The propensity score matching (PSM) was used to reduce selection bias.

Results

We included 240 and 6619 patients in the radiotherapy plus ablation group and ablation group before the PSM. After PSM, 240 pairs of patients were included. The median OS (mOS) and median CSS (mCSS) of patients receiving ablation alone were longer than that of receiving radiotherapy plus ablation (mOS: 47 vs. 34 months, $P=0.019$; mCSS: 77 vs. 40 months, $P=0.018$, after PSM) before and after PSM. The multivariate analysis indicated that radiotherapy plus ablation

independent risk factor for OS and CSS before PSM, but the significance disappeared after PSM. The detailed subgroup analyses indicated ablation alone brought more benefit in very early-stage HCC and older patients. In addition, we found different types of radiotherapy might lead to different outcomes when combined with ablation.

Conclusions

Ablation alone is noninferior to radiotherapy plus ablation in patients with early-stage HCC. For older patients or patients with small and single HCC lesion, ablation alone may still be the better choice.

PO-3177

Enhancing Follow-Up Diagnostic Effectiveness in Patients with 125I Seeds: A Combined Approach Incorporating Spectral Computed Tomography and Metal Artifact Reduction Algorithm

Yuhan Zhou¹, Zhihao Wang¹, Limin Lei¹, Weimeng Cao¹, Shushan Dong², Songwei Yue¹

1. The First Affiliated Hospital of Zhengzhou University

2. Philips Healthcare

Objective The aim of this study was to evaluate synergistic approach of spectral CT images and metal artifact reduction algorithm (O-MAR) in reducing artifacts caused by 125I seed implantation.

Methods Forty-five patients who underwent dual-layer spectral CT (DLCT) scanning of the chest and abdomen after 125I seed implantation were retrospectively included. The collected spectral data were reconstructed into conventional CT image (CI), virtual monochromatic imaging (VMI, 50-150 keV, 20 keV/level), CI combined with O-MAR (CI+O-MAR), and VMI combined with O-MAR (VMI+O-MAR), to evaluate the de-artifact effect and image quality improvement in each group. Objective indicators included artifact index (AI), signal-to-noise ratio (SNR) of lesions affected by artifacts, and contrast-to-noise ratio (CNR). Subjective indicators included assessment of overcorrected artifacts, new artifacts, different forms of artifacts, the overall image quality and lesion boundaries. The normality of count data was tested using the Shapiro-Wilk test. One-way analysis of variance (ANOVA) was used to assess differences among multiple groups, followed by post-hoc LSD testing. Paired t-tests were employed for comparisons between continuous variables. Inter-observer agreement was appraised using kappa and Bland-Altman analysis.

Results For hypo-/hyperdense artifacts, AI in each group showed a downward trend as VMI keV increased. In artifact-affected lesion areas (ROIT), SNR and CNR in the CI/VMI+O-MAR (50-150keV) group were better than those in the CI group ($P<0.05$). Overcorrection artifacts and new artifacts were concentrated in the VMI50/70keV groups, accounting for 100% and 89.6%, respectively. In the evaluation of artifact morphology, as the VMI keV increases, the number of a-type banded artifacts in hyperdense artifacts gradually decreases, while the number of e-type artifacts with little or no artifacts increases, and the total number of hyperdense artifacts in each modality decreases with the increase of VMI keV. The diagnostic and image quality scores of hyperdense artifacts in each group were higher than those of hypodense artifacts as VMI keV increased.

Conclusions VMI combined with O-MAR substantially improve the objective and subjective image quality, lesion display ability, and diagnostic confidence of CT follow-up after 125I seed implantation. And provide guidance for the development of CT scanning protocols for patients following 125I seed implantation procedures. Additionally, the synergistic approach demonstrates high efficiency in correcting high-density artifacts.

PO-3178

Impact of sarcopenia on prognosis in primary hepatocellular carcinoma patients treated with transcatheter arterial chemoembolization: A single center retrospective study

Yaowei Bai, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: This study aimed to investigate the prognostic effect of sarcopenia on primary hepatocellular carcinoma (HCC) patients after transcatheter arterial chemoembolization (TACE). **Methods:** This retrospective study enrolled 265 patients diagnosed with HCC who underwent TACE between April 2014 and February 2021. The patients were divided into two groups: the sarcopenia group (n=133) and the non-sarcopenia group (n=132). The study analyzed the differences in overall survival (OS) and progression-free survival (PFS) using Kaplan-Meier curves. The independent risk factors for OS and PFS were determined using univariate and multivariate Cox regression analysis. Based on these factors, the study constructed a prognostic risk grading system. **Results:** At 3 and 6 months post-TACE, the prognoses of the sarcopenia group were worse than that of the non-sarcopenia group according to the mRECIST criteria. Kaplan-Meier curves showed that the cumulative OS and PFS rate in the non-sarcopenia group were significantly higher compared to the sarcopenia group (HR=3.319, 95%CI: 2.283-4.824, Log-rank $P<0.001$; HR=0.631, 95%CI: 0.486-0.820, Log-rank $P<0.001$). Sarcopenia, maximal tumor diameter, and AFP \geq 200 ng/mL were independent risk factors for OS and PFS. The prognostic risk grading system based on sarcopenia, AFP \geq 200 ng/mL, and maximal tumor diameter \geq 8.9 cm showed significant differences in prognosis between risk groups. **Conclusion:** Sarcopenia had excellent predictive value for OS and PFS in patients after TACE, and AFP \geq 200 ng/mL and maximal tumor diameter were also independent risk factors for a poor prognosis. The prognostic risk grading system based on sarcopenia, AFP, and maximal tumor diameter had good guiding value for the prognosis of patients.

PO-3179

Dual neovascular targets of VEGFR and PDGFR ameliorate thioacetamide (TAA) induced liver fibrosis in rats

Yaowei Bai, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: Neovascularization plays a crucial role in liver fibrosis (LF), and blocking vascular endothelial growth-factor receptor (VEGFR) has been shown to improve fibrosis. The aim of our study was to investigate the role of dual neovascularization targets, VEGFR and platelet-derived growth factor receptor (PDGFR), in ameliorating fibrosis.

Methods: In vitro, we observed the effects of apatinib (a VEGFR inhibitor) and donafenib (a VEGFR and PDGFR inhibitor) on the activation, proliferation, and apoptosis of hepatic stellate cells (HSCs) from rats and humans. In vivo, we established a thioacetamide (TAA)-induced liver fibrosis rat model to explore the anti-fibrosis effect of apatinib and donafenib. We detected the expression of angiogenesis-related proteins using western blot and immunohistochemistry.

Results: Apatinib and donafenib inhibited the proliferation and activation of HSCs, promoted apoptosis of HSCs, and arrested the S phase of the cell cycle in vitro. We also found that donafenib had a stronger inhibitory effect on HSCs. In vivo, apatinib and donafenib ameliorated liver fibrosis, reduced collagen deposition and α -SMA expression in rats, and donafenib had a stronger improvement effect. Apatinib and donafenib downregulated the expression of VEGFR2 while

inhibiting the phosphorylation of Akt and ERK1/2. Donafenib can act through both VEGF and PDGF pathways, whereas apatinib can only act through the VEGF pathway.

Conclusion: Anti-angiogenesis is a promising approach for the treatment of fibrosis. Compared with single-target drug (apatinib), the dual-target drug (donafenib) can achieve better therapeutic effects.

PO-3180

Preliminary study on the mechanism of medical ozone water promoting apoptosis of hepatocellular carcinoma cells

Chao Chen¹, Shixiang Qiu², Liming Zhong², Guofeng Zhou¹

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Department of Interventional Radiology, The Second Clinical College of North Sichuan Medical College, Nan Chong Central Hospital,

Objective: HCC is one of the most malignant cancers in the world. STAT3 could enter the nucleus after phosphorylation to inhibit the apoptosis of cancers. IL-6 can bind to gp130 to phosphorylate STAT3. Ozone plays a role in combating inflammatory reaction, thus reducing IL-6 in the microenvironment. The purpose of this study was to explore the relationship between ozone and IL-6/STAT3 signaling pathway in HCC.

Methods: First, we obtained different concentrations of ozone water to treat HCC cells to obtain the IC₅₀ of ozone. HepG2 cells were treated with IC₅₀ and divided into two groups. The proliferative activity of cells was detected by CCK-8 experiment. The migration and invasion ability of cells were analyzed by scratch test and transwell experiment. Flow cytometry were used to analyze the changes of apoptosis. Finally, the changes of apoptosis-related proteins and IL-6/STAT3 signal pathway proteins were analyzed by Western blot.

Results: The IC₅₀ of ozone on HepG2 cells is about 20 μg/mL. CCK-8 experiment showed that ozone inhibited the proliferation of HepG2 cells. The results of scratch test and transwell experiment showed that ozone inhibited the migration and invasion of HepG2 cells. Flow cytometry indicated that the apoptosis rate of HepG2 cells increased compared to another group. Western Blot results showed that the expression of IL-6/STAT3 pathway proteins in control group was higher than those in experimental group. In the experimental group, the expression of Bcl-2 protein degressed and the expression of cl-caspase3 increased compared to control group.

Conclusion: Ozone inhibited the migration and invasion of HepG2 cells and increased the apoptosis rate. The expression of IL-6/STAT3 signal pathway proteins were down-regulated in HepG2 cells and the expression of apoptosis-related proteins showed that ozone promoted the apoptosis. These results suggested that ozone promotes the apoptosis of hepatocellular carcinoma cells by down-regulating IL-6/STAT3 signaling pathway.

PO-3181

Treatment of Gastrointestinal Tumor Liver Metastases with the Combination of Apatinib and Transarterial Chemoembolization

Licheng Zhu, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To evaluate the safety and efficacy of TACE and apatinib combination treatment for gastrointestinal tumor liver metastases via a single institutional retrospective study.

Methods: From January 2016 to December 2022, 53 patients with unresectable chemotherapy-refractory gastrointestinal tumor liver metastases were included in the analysis. Collect clinical information from patients and follow up on them until they progress beyond treatment or the end of the study. Adverse events (AE), overall survival (OS), and progression free survival (PFS) were evaluated. In addition, the objective response rate (ORR) and disease control rate (DCR) were determined based on the improved solid tumor response evaluation criteria (mRECIST). Among these indicators, OS and PFS are the main endpoints.

Results: The median progression-free survival (mPFS) and median overall survival (mOS) were 7 months (95% CI: 5.7-8.3 months) and 17 months (95% CI: 13.1-20.9 months), respectively. The mPFS of extrahepatic sites was 12 months (95% CI: 7.3-16.7 months). The one-month DCR and ORR were 86.8% (46/53) and 49.1% (26/53), respectively. The multivariate regression analysis showed that Child-Pugh and Eastern Cooperative Oncology Group (ECOG) were independent predictors for OS. The independent predictors for overall PFS included carbohydrate antigen 724 (CA 724), CA 199, number of TACE session, Child-Pugh, and ECOG; while for liver tumor PFS, the independent predictors were number of TACE session and ECOG scores. There were no changes of leukocyte, lymphocyte, carcinoembryonic antigen (CEA), CA 724, CA 199, CA 125 on patients before receiving the treatment and one month after receiving the treatment (all $P > 0.05$). Common adverse events were poor appetite (64.2%), hypertension (56.6%), and hand-foot syndrome (50.9%). 12 patients reduced their dosage by half due to adverse reactions. However, these adverse events alleviated after reducing apatinib administration or receiving symptomatic treatments.

Conclusions: TACE-apatinib combination is well tolerated and effective in patients with unresectable chemotherapy refractory gastrointestinal tumors liver metastases. Meanwhile, the results of this study also indicated that TACE-apatinib combination is still a better treatment for these patients.

PO-3182

Efficacy of radiofrequency ablation vs liver resection in the treatment of hepatocellular carcinoma with severe fibrosis

Licheng Zhu, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

The efficacy of RFA in the treatment of HCC with severe fibrosis is still unclear. The objective of this study is to compare the efficacy of RFA with liver resection in the treatment of HCC within Milan criteria. The data used in the study were from the SEER database. Patients with HCC within Milan criteria were included in the study. A total of 1432 patients were included in the study; among them, 1038 patients received RFA, and 394 patients received liver resection. Propensity score matching (PSM) was used to reduce selection bias. Before PSM, the median overall survival (mOS) and

median cancer-specific survival (mCSS) in the resection group were not statistically significant longer than the mOS and mCSS in the RFA group (both $P>0.05$). After PSM, similar results were presented. The multivariable analysis showed that RFA did not increase the all-cause mortality risk and cancer-specific mortality risk compared with resection before PSM. In the competing risk analysis, after excluding the potential factors that might influence the outcomes, RFA still did not increase the mortality risk compared with resection before PSM and after PSM. In the subgroup analysis. The efficacy of RFA is comparable to that of resection in patients with tumor sizes no more than 3 cm before PSM and after PSM. The efficacy of RFA is similar to that of resection in the treatment of early HCC patients with severe fibrosis, especially in patients with tumor sizes no more than 3 cm.

PO-3183

Liver Resection Combined with Radiotherapy versus Liver Resection Alone in the Treatment of Hepatocellular Carcinoma: A Population-based Study

Licheng Zhu, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background

Radiotherapy has been used in the treatment of hepatocellular carcinoma (HCC) more widely. However, little research focus on comparing the efficacy of patients with liver resection combined with radiotherapy with that received liver resection alone. The study was conducted to evaluate whether the efficacy of liver resection combined with radiotherapy in the treatment of patients with HCC is better than liver resection alone.

Methods

The study utilized the data from the Surveillance, Epidemiology, and End Results (SEER) database. Patients diagnosed with HCC between 2004 and 2015 who received liver resection or the combination of liver resection and radiotherapy were included in the analysis. The propensity score matching model (PSM) was used to reduce selection bias.

Results

Before PSM, the median overall survival (mOS) and median cancer-specific survival (mCSS) of patients treated with liver resection alone were longer than in patients treated with the combination of liver resection and radiotherapy ($P<0.001$). However, there was no statistically significant difference in mOS and mCSS between the groups after PSM ($P>0.05$). The subgroup analysis after PSM documented that patients with AJCC stage I and II who were treated with liver resection and radiotherapy had no longer mOS and mCSS than patients subjected to the combination of liver resection alone ($P=0.151$ and $P=0.185$). Similar results were obtained in the subgroup group of patients with a single tumor smaller than 5 cm.

Conclusion

The combination of liver resection and radiotherapy does not prolong the survival of HCC patients more than liver resection alone.

PO-3184

Retrograde Type A Aortic Dissection During or After Thoracic Endovascular Aortic Repair: A Single Center 16-Year Experience

guoquan Wang

Fuwai Central China Cardiovascular Hospital

Abstract

Objective The purpose of this article is to investigate the risk factors of retrograde type A aortic dissection (RTAD) associated with thoracic endovascular aortic repair (TEVAR).

Methods From January 2004 to December 2019, the clinical data of 1688 patients with the thoracic aortic disease who had TEVAR at Henan Provincial People's Hospital were evaluated retrospectively. The risk factors of TEVAR-related RTAD were analyzed by univariate analyses and multiple logistic regression analysis.

Results The concluded incidence of RTAD was 1.1% in patients, all of which occurred in the RTAD group. Ten instances happened within the TEVAR perioperative period including two cases during the surgery, six cases occurred within three months, two cases occurred after one year, and the longest interval was 72 months following TEVAR. TEVAR was successfully implemented in 17 cases, while the operation technique was temporarily altered in 1 case. The position of the new entry in 13 RTAD patients was at the proximal region of the stent graft (SG), and 5 instances were more than 2 cm distant from the proximal region of the SG. Besides, 17 cases were at the greater curvature of the aorta, and 1 case was at the lesser curvature. Multivariate Logistic regression analysis revealed that the SG oversizing ratio is a relevant risk factor for RTAD. Ascending aortic diameter, aortic arch type, SG type, and anchored region were not directly related to the occurrence of RTAD.

Conclusion RTAD is a catastrophic complication with low incidence but high mortality, which could occur during the procedure, as well as in the early and late postoperative period. A proper SG oversizing ratio could reduce the probability of RTAD. That is to say that a too low SG oversizing ratio was not recommended.

PO-3185

Hepatic arterial infusion chemotherapy combined with toripalimab and surufatinib in the treatment of advanced intrahepatic cholangiocarcinoma: A single center retrospective study

Songlin Song, Chuansheng Zheng, Bin Liang

Department of Interventional Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, 430022, China.

Abstract

Objectives: The aim of the present study was to report the clinical results of advanced intrahepatic cholangiocarcinoma (ICC) patients who received hepatic arterial infusion chemotherapy (HAIC) and toripalimab chemotherapy, followed by surufatinib maintenance therapy.

Methods: The study cohort comprised 14 advanced ICC patients treated with the above schedule and regimens. The baseline characteristics of the study cohort were obtained. The tumor response and drug-associated toxicity were assessed and reported.

Results: During the follow-up period (median follow-up time: 6.5 months; range 3–19 months), two patients died of tumor progression. The objective response rate (ORR) and disease

control rate (DCR) were 58% and 79%, respectively. The median progression-free survival (mPFS) was 6 months, and the OS% was 85%. The most frequent adverse events were nausea and vomiting (100%), and abdominal pain (86%). Serious complications that would need additional treatment and treatment-related deaths were not observed.

Conclusions: The combination treatment schedule for advanced ICC seems to offer good efficacy and safety. However, a randomized controlled trial study is needed to further verify the findings.

PO-3186

Hepatic arterial infusion chemotherapy combined with target/immunotherapy for advanced hepatocellular carcinoma: tumour response and safety

Songlin Song, Chuansheng Zheng, Bin Liang

Department of Interventional Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, 430022, China.

Abstract

Purpose: The objective of this study was to evaluate the efficacy and safety of hepatic arterial infusion chemotherapy (HAIC) combined with target/immunotherapy in patients with advanced hepatocellular carcinoma (HCC).

Methods: From July 2021 to October 2022, consecutive medical records of advanced HCC patients receiving HAIC combined with target/immunotherapy were reviewed for eligibility. The tumour response and adverse events (AEs) were recorded and assessed.

Results: This study included 25 patients with advanced HCC. Vascular invasion, extrahepatic metastasis and both were observed in 18 (72.0%), 17 (68.0%) and 11 (44.0%) patients, respectively. A total of 99 HAIC sessions were performed in 25 patients, with a median of three cycles (range, 1 to 14 sessions). Based on the mRECIST and RECIST1.1 criteria, the objective response rates were 76.0% and 68.0%, respectively. The disease control rates were 92.0% and 80.0%, respectively. Abdominal pain (16 cases, 64%) and nausea and vomiting (13 cases, 52.0%) were common AEs associated with HAIC, and both were relieved by symptomatic treatment. Molecular targeted agent-related complications occurred in 18 patients (72.0%), and immune checkpoint inhibitor-related complications occurred in 10 patients (40.0%), all of whom had grade 3 or below AEs, and no serious complications occurred. No treatment-related deaths occurred.

Conclusions: HAIC combined with target/immunotherapy had meaningful short-term efficacy and controllable adverse events in patients with advanced HCC and may be a promising treatment option for advanced HCC.

PO-3187

Reversion of liver cirrhosis after endovascular treatment in Chinese patients with Budd-Chiari syndrome

Chaoyang Wang
Wuhan union hospital

Aims: To investigate the impact of endovascular (EV) treatment on liver cirrhosis in Chinese patients with Budd-Chiari syndrome (BCS).

Methods: From September 2011 to March 2022, 97 patients from four hospitals in China who were diagnosed with primary BCS complicated with liver cirrhosis and received EV treatment were retrospectively enrolled in this study for clinical analysis. In addition, liver tissues for basic research were acquired from 25 patients between June 2022 and March 2023, including 6 with

benign liver tumors, 11 with BCS before EV treatment, and 8 with EV-treated BCS. Liver cirrhosis was assessed by clinical outcomes, histological studies, and the expression of related genes at the mRNA and protein levels.

Results: The patients with BCS had better liver function after EV treatment, evidenced by an increased albumin level and reduced total bilirubin, ALT, and AST. The imaging findings suggested an amelioration of liver cirrhosis and portal hypertension, including increased portal vein velocity ($13.52 \pm 8.89 \text{ cm/s}$ vs $17.51 \pm 6.67 \text{ cm/s}$, $p < 0.001$) and decreased liver stiffness ($30.37 \pm 6.39 \text{ kPa}$ vs $23.70 \pm 7.99 \text{ kPa}$, $p < 0.001$), portal vein diameter ($14.97 \pm 3.42 \text{ mm}$ vs $13.36 \pm 2.89 \text{ mm}$, $p < 0.001$), and spleen volume ($870.00 \pm 355.61 \text{ cm}^3$ vs $771.36 \pm 277.45 \text{ cm}^3$, $p < 0.001$). Furthermore, histological studies revealed that EV treatment resulted in a restoration of liver architecture with reduced extracellular matrix deposition. Meanwhile, hepatic angiogenesis and inflammation, which have a close relationship with cirrhosis, were also inhibited. And the state of hepatocytes switches from apoptosis to proliferation after EV treatment.

Conclusions: BCS-induced liver cirrhosis could be reversed by EV treatment from macroscopic to microcosmic dimensions. Our study may provide further insights into understanding BCS and treating cirrhosis.

PO-3188

Melatonin enhances the efficacy of anti-PD-L1 antibody by improving hypoxia in residual tumors after insufficient radiofrequency ablation

Yanqiao Ren, Xiangjun Dong, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: The hypoxia microenvironment and inflammatory state in the residual tumor caused by insufficient radiofrequency ablation (iRFA) are major reasons for rapid tumor progression and hindering anti-PD-L1 therapy. Melatonin, a natural hormone reported to improve tumor hypoxia and reduce inflammation, is potential to increase the efficacy of iRFA.

Methods and results: We reported that iRFA is associated with poor survival outcomes and progression-free survival in patients with hepatocellular carcinoma (HCC). Melatonin inhibited EMT, HIF-1 α , and PD-L1 expression and migration in heated HCC cell lines (HepG2 and HCCLM3) under hypoxic conditions but not normoxic conditions. Using the orthotopic HCC model, we found that melatonin suppressed the expression of HIF-1 α , reduced hypoxic areas, decreased the proportion of myeloid-derived suppressor cells (MDSCs), increased the proportion of CD8+T, and regulated immune-related genes, finally reducing the mice's tumor volume and prolonged the survival time. Melatonin could also inhibit metastasis of heated CT26 cells in the liver metastasis model. Notably, the combination of melatonin and anti-PD-L1 antibody provided better efficacy than melatonin monotherapy.

Conclusion: We establish a clear role of melatonin in improving the tumor hypoxic immunosuppressive microenvironment, reducing tumor progression, and enhancing the efficacy of anti-PD-L1 antibody in the treatment of residual tumors.

PO-3189

A surprising effect of metformin plus transarterial chemoembolization on hepatocellular carcinoma patients with type II diabetes

Lei Chen, Chuansheng Zheng

Union Hospital Affiliated with Tongji Medical College of Huazhong University of Science and Technology

Background

Diabetes is common in the patients with hepatocellular carcinoma (HCC) and can lead to poor prognosis for these patients. Metformin is a hypoglycemic drug with anti-tumor effects. Whether metformin can have a positive effect on HCC patients receiving interventional embolization (transarterial chemoembolization, TACE) is still unclear. The study was conducted to explore the effect of metformin plus TACE on HCC patients with type II diabetes.

Methods

From January 2014 to June 2021, 385 consecutive HCC patients with type II diabetes from three medical centers were retrospectively reviewed. All of them received TACE, and 216 patients received metformin. Propensity Score Matching (PSM) was used to reduce selective bias. Competing risk model was used to reduce the influence of deaths caused by other factors (not cancer) on the results.

Results

The median overall survival (mOS) (35 months, 95%CI: 28-44 months vs 20 months, 95%CI: 16-24 months; $P<0.001$) and median progression-free survival (mPFS) (11 months, 95%CI: 10-14 months vs 8 months, 95%CI: 6-11 months; $P<0.001$) for patients with metformin were longer than those without metformin before PSM. Similar results were presented after PSM. The multivariate regression analysis presented that metformin could reduce mortality risk of patients (HR: 0.56, 95%CI: 0.44-0.71; $P<0.001$) and tumor progression risk (HR: 0.67, 95%CI: 0.53-0.84; $P<0.001$) before PSM. The subgroup analysis showed that patients with BCLC stage A, BCLC stage B, BCLC stage C, Child-Pugh A and Child-Pugh B who received metformin could receive survival benefits from metformin. After excluding the influence of deaths caused by other factors (such as heart disease, diabetes, etc), metformin could still reduce mortality risk of patients and tumor progression risk. The adverse events evaluation was based on the NCI-CTCAE 5.0. The results showed metformin did not increase severe adverse events (III grade or IV grade).

Conclusion

Metformin might bring survival benefits for HCC patients with type II diabetes who received TACE. Metformin could achieve the effect of “killing two birds with one stone” for these patients.

PO-3190

Drug-eluting beads transarterial chemoembolization combined apatinib/ camrelizumab for advanced hepatocellular carcinoma with hepatic arterioportal shunts

Yanqiao Ren, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: The objective of this study was to evaluate the efficacy and safety of drug-eluting beads transarterial chemoembolization (D-TACE) combined with apatinib/camrelizumab in advanced hepatocellular carcinoma (HCC) patients with hepatic arterioportal shunts (APS).

Methods: From January 2021 to December 2022, consecutive medical records of advanced HCC patients with APS receiving D-TACE combined apatinib/camrelizumab were reviewed for eligibility. Overall survival (OS), progression-free survival (PFS), tumor response, and adverse events (AEs) were assessed.

Results: A total of 23 patients were included in this study, and the median follow-up time was 11 months (range, 2–26 months). In this study, 8 patients (34.8%) achieved PR, 13 patients (56.5%) achieved SD, and 2 patients (8.7%) developed PD. The objective response rate and disease controlled rate were 34.8% and 91.3%, respectively. OS and PFS were 11 months and 7 months, respectively. Multivariate analysis indicated that tumor number was an independent prognostic factor affecting PFS. AEs occurred in 19 patients after oral apatinib and in 8 patients after camrelizumab treatment. No treatment-related death occurred.

Conclusions: D-TACE combined with apatinib/camrelizumab had meaningful efficacy and controllable AEs in advanced HCC patients with APS, which may be a promising treatment option.

PO-3191

Safety and Efficacy of Sorafenib Combined with Camrelizumab Plus Transcatheter Arterial Chemoembolization for Intermediate and Advanced Hepatocellular Carcinoma

Wenlong Wu, Chuansheng Zheng

Union Hospital, Tongji Medical College of Huazhong University of Science and Technology

Objectives: To compare the efficacy and safety of transcatheter arterial chemoembolization (TACE) combined with sorafenib and camrelizumab or with sorafenib alone in patients with intermediate or advanced hepatocellular carcinoma (HCC).

Methods: We retrospectively analyzed 78 patients with intermediate or advanced HCC who were treated at our centers between January 2018 and December 2021. 26 of them received sorafenib and camrelizumab plus TACE (the TACE + Sor + C group), while 52 received TACE and sorafenib (the TACE + Sor group). Overall survival (OS), progression-free survival (PFS), and adverse events (AEs) were evaluated. Univariate and multivariate analyses were used to determine the factors affecting survival.

Results: The mOS (22 vs. 10 months, $P < 0.001$) and mPFS (11 vs. 6 months, $P = 0.008$) of the TACE + Sor + C group were significantly higher than those of the TACE + Sor group. Multivariate analysis showed that compared with TACE + Sor + C, TACE + Sor increased the risk of all-cause mortality and tumor progression. For grade I and II adverse events (AEs), the incidence of skin capillary hyperplasia and hypothyroidism in the TACE + Sor + C group was significantly higher than that in the TACE + Sor group. For serious AEs (grade III or IV), there was no significant difference in any adverse reaction between the two groups ($P > 0.05$).

Conclusion: Patients with intermediate or advanced HCC appeared to benefit more in terms of survival from TACE + Sor + C than from TACE + Sor, and the AEs were tolerable.

PO-3192

Radiofrequency-Thermal effect of cisplatin-crosslinked nanogels for triple therapies of Ablation-Chemo-Embolization

Hongsen Zhang, kun qian, chuansheng zheng

Department of Radiology, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Objective: Cisplatin, a famous metal ionic antitumor drug, has been clinically utilized for the treatments of various cancers by inhibiting the replication and transcription of DNA, and thereby causing apoptosis of tumor cells. However, little attention has been focused on RF-induced thermal effect of these platinum ionic chemotherapeutics. It is probably attributed to poor pharmacokinetics and pharmacodynamics (PK/PD) and in vivo rapid metabolism of these platinum ionic drugs. Thereby, it is highly desirable to develop a comprehensive nano-platform for efficiently synergizing various therapeutic models including TAE, RFA, chemotherapy and immunotherapy.

Methods: Cisplatin-crosslinking poly(N-isopropylacrylamide-b-methyl acrylic acid) nanogels (Pt-PNA) was first developed as RF-responsive embolic nano-platform by the coordination bonding between Pt(II) ions and carboxyl. Their temperature sensitive sol-gel transition was investigated at various nanogel concentration, Pt content and polymeric composition, to evaluate their trans-artery flowability and embolization. Furthermore, RF-induced thermal effect was compared between two electrolyte solutions (free cisplatin and sodium chloride). Meanwhile, RF-responsive pulsatile release of cisplatin from Pt-PNA was in vitro and in vivo studied for precise synergy between RFA and chemotherapy.

Results: Pt-PNA might rapidly diffuse into tumor peripheral arteries, blocking tumor blood supply by their favorable temperature sensitive sol-gel transition, thereby achieving efficient TACE cancer therapy. Moreover, Pt-PNA greatly improved tumor hypoxic microenvironment post TAE procedure, inducing a favorable immune response, and thereby enhancing the synergistic antitumor effect of RFA and TACE.

Conclusion: This work provides novel insights into designing a promising synergistic RF-responsive Pt-PNA for enhancing the combined therapy of TACE and RFA.

PO-3193

Synergistic effects of nanoscale CaO₂ combined with PD-1 inhibitors in the treatment of hepatocellular carcinoma: a promising combination

Yingliang Wang, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To explore the effect of calcium peroxide nanoparticles (CaO₂ NPs) combined with programmed cell death protein 1 (PD-1) inhibitors in the treatment of liver cancer and its related mechanism.

Methods: Hepa1-6 cells were cultured to construct the Hepa1-6 mouse liver cancer model. In vivo mechanism study, a unilateral tumor model was established. Eighteen tumor-bearing mice were randomly divided into the control group (intra-tumoral injection of PBS solution) and the experimental group (intra-tumoral injection of CaO₂ NPs). A hypoxic probe, pH probe, and micro-

CT were used to evaluate the effect of CaO_2 NPs on improving hypoxia, neutralizing acidity, and inducing calcium overload within the tumor. To study the effect of CaO_2 NPs combined with PD-1 inhibitors on proximal and distal tumors, the bilateral tumor model was established. Forty tumor-bearing mice were randomly divided into the control group (intra-tumoral/intra-peritoneal injection of PBS solution), CaO_2 NPs group (intra-tumoral injection of CaO_2 NPs), PD-1 group (intra-peritoneal injection of PD-1 inhibitor), and the combination group (intra-tumoral injection of CaO_2 NPs and intra-peritoneal injection of PD-1 inhibitors). The administered side was recorded as the proximal tumor. Tumor volume and body weight were measured every 2 days after treatment. On day 8, serum and tumor samples were collected. The immune factors in serum (INF- γ , TNF- α , IL-2, and IL-10) and tumor tissue (INF- γ and TNF- α) were detected by ELISA. H&E staining was used to detect tumor necrosis. Immunohistochemical staining was used to detect the amount of CD4⁺ and CD8⁺ T cells within the tumor. By analyzing the tumor volume, pathological indexes, and immune-related indexes, the effects of CaO_2 NPs combined with PD-1 inhibitors on proximal and distal tumors were evaluated, and they mediated immunomodulatory effects (including local and systemic immunity), and their effects on tumor burden were studied. In addition, a unilateral tumor model was established to study the effect of CaO_2 NPs combined with PD-1 inhibitors on survival time.

Results: The results of in vivo mechanism study showed that CaO_2 NPs can improve hypoxia, neutralize acidity and induce calcium overload within tumors. The results of the study on the effect of CaO_2 NPs combined with PD-1 inhibitor on proximal and distal tumors showed that, compared with the other three groups, the bilateral tumor burden of the combination group was significantly reduced, the intra-tumoral infiltration of CD8⁺ and CD4⁺ T cells were significantly increased, the secretion of anti-tumor immune factors in tumor and serum was increased, and the secretion of pro-tumor immune factors was decreased. Mice in the combination group showed the longest survival compared with the other groups.

Conclusions: CaO_2 NPs can improve hypoxia, neutralize acidity and induce calcium overload within tumors, so as to reduce tumor burden and realize an immunosuppressive tumor transformation to a hot tumor, and play a synergistic role with PD-1 inhibitors in anti-liver cancer.

PO-3194

The solid tumor microenvironment and related targeting strategies

Xiangjun Dong, Chuansheng Zheng

Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Increasing studies have confirmed that tumor microenvironment (TME) is composed of a variety of complex components that precisely regulate the interaction of tumor cells with other components, allowing tumor cells to continue to proliferate, resist apoptosis, evade immune surveillance and clearance, and metastasis. However, the characteristics of each component and their interrelationships remain to be deeply understood. Herein, we classify the TME into physical microenvironment (such as oxygen, pH, etc.), mechanical microenvironment (such as extracellular matrix, blood vessels, etc.), metabolic microenvironment (such as glucose, lipids, etc.), inflammatory microenvironment and immune microenvironment. We detailed depict the characteristics of each component in TME; summarize the existing methods for detecting TME; highlight the current strategies and potential therapeutic targets for TME; discuss current challenges in presenting TME and its clinical applications; and provide our prospect on the research direction and clinical benefits of TME.

This review summarizes the characteristics of TME in solid tumors and its influence on tumor occurrence, development, and metastasis, summarizes the existing methods for detecting TME and summarizes the current strategies and potential therapeutic targets for TME. TME is composed of a variety of complex components, and the characteristics of each component and their interrelationships remain to be deeply understood. Existing techniques for characterizing the TME

are still lacking. Many TME targets have been successful in preclinical/clinical studies, but there are still significant challenges for therapies targeting TME. In the future, the development of models more in line with the characteristics of human tumors, the development of new devices that can accurately detect TME, the development of high-specific targets or multi-target therapeutic drugs, or the combination of therapy with targeted tumor cells is expected to further improve the therapeutic effect of tumors.

PO-3195

Synergistic effect of a VEGFR targeting peptide-drug conjugate with the anti-PD-1 antibody on hepatocellular carcinoma

Jiacheng Liu, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: Although anti-PD-1 antibodies have been widely used in the treatment of advanced hepatocellular carcinoma (HCC), their objective response rate is only approximately 20%. We designed a VEGFR targeting peptide-drug conjugate (QR-KLU) with the abilities of decreasing tumor burden and suppressing tumor angiogenesis. This study aimed to evaluate the therapeutic effect of QR-KLU in HCC therapy and the synergism of QR-KLU and anti-PD-1 antibody.

Methods: In this study, we used a VEGFR targeting peptide VEGF125-136 (QKRKRKKSRYKS, QR) to conjugate with a lytic peptide (KLUKLUKKLUKLUK, KLU) to form a peptide-drug conjugate QR-KLU. The in vitro experiments were conducted to evaluate the effects of QR-KLU on Hepa1-6 cells under normoxic and hypoxic conditions, and the in vitro experiments were conducted to evaluate the synergistic effects of QR-KLU and anti-PD-1 antibody in a mouse subcutaneous Hepa1-6 tumor model.

Results: QR-KLU inhibited the proliferation and migration of Hepa1-6 cells in a dose-dependent manner under normoxic and hypoxic conditions. It promoted cell apoptosis and blocked the cell cycle, and significantly downregulated hypoxia-induced expression of vascular endothelial growth factor (VEGF). In subcutaneous Hepa1-6 tumor model, QR-KLU significantly inhibited tumor growth, promoted tumor necrosis, and prolonged the survival time of tumor-bearing mice in combination with anti-PD-1 antibody. QR-KLU significantly inhibited hypoxia-induced expression of VEGF, promoted tumor vascular normalization, and increased CD8⁺ T cell infiltration in the tumor. In addition, QR-KLU and anti-PD-1 antibody demonstrated a strong synergistic effect in promoting the activation of intratumoral CD8⁺ T cells, reducing the expression of immune-inhibitory factors and increasing immune-stimulatory factors.

Conclusion: These results reveal a novel approach to enhance the efficacy of anti-PD-1 antibody using a VEGFR targeting peptide-drug conjugate in HCC therapy.

PO-3196

Drug-eluting (irinotecan) bead transarterial chemoembolization with CalliSpheres® microspheres for treatment colorectal cancer liver metastases patients who fail chemotherapy treatment

Fuquan Wang, Chuansheng Zheng

Department of Radiology, Affiliated Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Objective The purpose of this study was to evaluate the therapeutic efficacy and safety of drug-eluting (irinotecan) bead transarterial chemoembolization (DEBIRI-TACE) with CalliSpheres® microspheres (CSM) in treating unresectable colorectal cancer liver metastases (CRLM) patients who failed systemic chemotherapy

Materials and Methods A single-center retrospective analysis of CRLM patients who had failed prior systemic chemotherapy and treated with DEBIRI-TACE with CSM, was performed from December 2017 to December 2022. Information about the therapeutic response, overall survival (OS), progression-free survival (PFS) were recorded. Treatment-related adverse events were graded according to the National Cancer Institute Common Terminology Criteria for Adverse Events (CTCAE), version 5.0.

Results 56 patients with 133 treatments with DEBIRI-TACE procedures were included over our study period. The objective response rate (ORR) and disease control rate (DCR) was 30.4% (17/56) and 64.3% (36/56), respectively. The Median OS from the first treatment was 10.9 months (95% confidence interval [CI]: 8.9 months, 14.7 months), and the median PFS was 5.8 months (95% CI : 4.6 months, 7.8 months), respectively. Cox's proportional hazards regression analysis revealed that extrahepatic metastasis were independent prognostic negative factors with OS and PFS. The complication included abdominal pain, nausea/vomiting, fever, fatigue, the elevation of transaminase and liver abscess in patients could almost be resolved by adapting medical treatment.

Conclusion DEBIRI-TACE with CSM is relatively safe and effective in unresectable CRLM patients with chemotherapy-refractory. Furthermore, extrahepatic metastasis and synchronous metastatic disease were possibly correlated with the poor prognosis of treatment.

PO-3197

Risk assessment of pneumothorax in colorectal lung metastases treated by percutaneous thermal ablation: a multicenter retrospective cohort study

Hongjie Fan, Chuansheng Zheng

1Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430022, China

Purpose To evaluate the risk of pneumothorax in the percutaneous image-guided thermal ablation (IGTA) treatment of colorectal lung metastases (CRLM). **Methods** Data regarding patients with CRLM treated with IGTA from five medical institutions in China from 2016 to 2023 were reviewed retrospectively. Pneumothorax and non-pneumothorax were compared using the Student's t test, Chi-square test and Fisher's exact test. Univariate logistic regression analysis was conducted to identify potential risk factors, followed by multivariate logistic regression (MLR) analysis to evaluate the predictors of pneumothorax. Interactions between variables were examined and used for model construction. Receiver operating characteristic (ROC) curves and nomograms were generated to assess the performance of the model. **Results** A total of 254 patients

with 376 CRLM underwent 299 ablation sessions. The incidence of pneumothorax was 45.5%. The adjusted MLR model, incorporating interaction terms, revealed that tumor number (odds ratio [OR] = 8.34 [95% confidence interval [CI]: 1.37-50.64]), puncture depth (OR = 0.53 [95%CI: 0.31-0.91]), pre-procedure radiotherapy (OR = 3.66 [95%CI: 1.17-11.40]), peri-bronchial tumor (OR = 2.32 [95%CI: 1.04-5.15]), and emphysema (OR = 56.83 [95%CI: 8.42- 383.57]) were significant predictive factors of pneumothorax (all $P < 0.05$). The generated nomogram model demonstrated a significant prediction performance, with an area under the ROC curve of 0.800 (95%CI: 0.751-0.850). Conclusions Pre-procedure radiotherapy, tumor number, peri-bronchial tumor, and emphysema were identified as risk factors for pneumothorax in the treatment of CRLM using percutaneous IGTA. Puncture depth was found to be a protective factor against pneumothorax.

PO-3198

GMCSF armed herpes simplex virus treats residual tumors after incomplete radiofrequency ablation by activating innate immunity and reprogramming tumor microenvironment

Jia Huang, Licheng Zhu, Chuansheng Zheng
Union Hospital, Huazhong University of Science and Technology

Background: Thermal ablation of tumors is a local application of extreme temperature induced coagulation necrosis to cure or alleviate various tumor types, as an alternative to surgery. However, due to incomplete radiofrequency ablation (iRFA) of the target tumor, it can induce more severe immune suppression, especially when macrophages polarize into M2 type macrophages that are beneficial for tumor progression. Oncolytic viruses (OV) have been shown to activate the anti-tumor function of specific immune cells such as T cells. Here, we designed a GMCSF armed herpes simplex virus (oHSV2-mGMCSF) and demonstrated its ability to reprogram tumor associated macrophages (TAMs) into a lower immunosuppressive M1 phenotype.

Methods: We validated the polarization and activation mediated by OVs in RAW264.7 cells in vitro. Subsequently, we evaluated the anti-tumor ability of oHSV2-mGMCSF in a mouse model. RNA seq is used to characterize changes in the tumor microenvironment.

Results: The oHSV2-mGMCSF lysate effectively stimulated RAW264.7 cells to polarize towards M1 cell phenotype rather than M2 cell phenotype, and activated M1 phenotype function in vitro. In the macrophage clearance experiment, oHSV2-mGMCSF therapy induced polarization of M1 macrophages and participated in the anti-tumor immune response in a tumor bearing mouse model. The administration of oHSV2-mGMCSF resulted in a significant reduction in residual tumors and a reduction in metastatic lesions after iRFA. This is related to a significant increase in recruitment/activation of cytotoxic T cells, a decrease in regulatory T cells, and the reprogramming of TAM into a pro-inflammatory and less immunosuppressive phenotype. These results indicate that OVs therapy can more profoundly reshape TME and activate stronger innate and adaptive immune responses.

Conclusions: Our data supports the feasibility of recombinant oncolytic virus therapy for residual tumors after iRFA, and proposes new strategies for oncolytic virus therapy.

PO-3199

HBV reactivation in HBV-related hepatocellular carcinoma patients undergoing hepatic arterial infusion chemotherapy in combination with tyrosine kinase inhibitors plus immune checkpoint inhibitors

Jiayun Liu, Bo Sun, Chuansheng Zheng, Xuefeng Kan

Union hospital, Tongji Medical College, Huazhong University of Science and Technology

Abstract

Purpose: This study aimed to assess hepatitis B virus (HBV) reactivation and its effect on prognosis for patients with advanced HBV-related hepatocellular carcinoma (HCC), who received hepatic arterial infusion chemotherapy (HAIC) in combination with tyrosine kinase inhibitors (TKIs), immune checkpoint inhibitors (ICIs) and oral entecavir treatments.

Methods: From January 2021 to June 2023, 162 patients with advanced HBV-related HCC, who received HAIC in combination with TKIs, ICIs and oral entecavir treatments, were enrolled. The HBV reactivation in these patients during treatments was observed. For patients with HBV reactivation, one group continued to receive oral entecavir treatment (HBV-R-E) treatment, and the other group switched to receive oral entecavir and tenofovir alafenamide fumarate treatment (HBV-R-E-T) after HBV reactivation. The efficacy among patients in HBV non-reactivated group, HBV-R-E group, and HBV-R-E-T group was compared.

Results: The HBV reactivation was observed in 44 patients (27.2%). A significantly lower objective response rate (ORR) and disease control rate (DCR), and a significantly shorter median progression-free survival (PFS) and median overall survival (OS) were found in patients with HBV reactivation group compared with patients without HBV reactivation group ($p < 0.05$). Furthermore, for patients with HBV reactivation, a significantly higher ORR and DCR, and a significantly longer median PFS and median OS were detected in the HBV-R-E-T group compared with the HBV-R-E group ($p < 0.05$).

Conclusions: HBV reactivation could occur in advanced HBV-related HCC patients who received HAIC in combination with TKIs, ICIs and oral entecavir treatments, and it was associated with a poorer prognosis. In addition, these patients with HBV reactivation could benefit from adding oral tenofovir alafenamide fumarate treatment.

Molecular mechanisms of Heat-enhanced Local Chemotherapy: Doxorubicin's penetration promoted and HSP70 high expression both contributed to enhanced the effect of comprehensive treatment under heat-stress condition

Kun Qian¹, Minjiang Chen³, Feng Zhang², Chuansheng Zheng¹, Xiaoming Yang²

1. Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Image-Guided Biomolecular Intervention Research, Section of Interventional Radiology, Department of Radiology, University of Washington School of Medicine, Seattle, WA, USA

3. Key Laboratory of Imaging Diagnosis and Minimally Invasive Interventional Research of Zhejiang Province, Department of Radiology, Zhejiang University Lishui Hospital, Lishui, China

Purpose: To evaluate the treatment effects of a combined therapy using Doxorubicin and radiofrequency hyperthermia (RFH) and expound the mechanism of local Chemotherapy under the heat-stress condition in vitro and in a rabbit VX2 liver tumor model.

Materials and Methods: Institutional Animal Care and Use Committee approved all studies. In vitro experiments VX2 cell lines cultured and were randomly assigned to four treatment groups, namely. Group A, Phosphate-buffered saline (n=6), Group B, 5μMDoxorubicin alone, Group C, 42°C

culture for 20min (n=6), Group D, 5μMDoxorubicin plus under 42°C culture for 20min (n=6). The viability and doxorubicin uptake of VX2 tumor cells line were assay by flow cytometer and fluorescence microscopy at 24h after different treatment. Western blot was used to evaluate the Hsp70 expression. Tumor tissues were harvested from our Pre-study of rabbit liver VX2 tumor model. Fluorescence microscopy observed the distribution of doxorubicin, Hsp70 activity was analysis by western blot and Immunohistochemistry. $p < 0.05$ was considered statistically significant.

Results: Radiofrequency hyperthermia-induced apoptosis and necrosis in VX2 cells in a mechanism of enhancing doxorubicin dose in cell and heat shock protein 70 expression. Fluorescence microscopy showed a further increase doxorubicin concentration in tumor cells and the penetration depth in tumor tissue. The western blot result showed Hsp70 expression in the combined group was significantly greater than in the control groups ((mean \pm SEM: 0.15 ± 0.03 vs 0.64 ± 0.13 vs 0.83 ± 0.10 vs 1.28 ± 0.13 , $p < 0.05$). In the tumor tissue immunohistochemistry staining results showed the significant increase of Hsp70-positive signaling was observed in RFH combined doxorubicin group than control group and verified in the western blot result (mean \pm SEM: 0.16 ± 0.04 vs 0.51 ± 0.13 vs 0.74 ± 0.11 vs 1.47 ± 0.13 , $p < 0.01$). Significantly increased of the tumor apoptosis and necrosis also found in the combined group with Ki-67 and TUNEL staining ($p < .001$).

Conclusion: Radiofrequency hyperthermia mediate chemotherapy-induced VX2 cell killing regulated cell death mechanisms include enhance penetration of doxorubicin and HSP70 interacting at several points on apoptotic and immune signaling pathways, leads to inhibition of apoptosis of cell death at the HCC tumor ablation margin.

PO-3201

Feasibility and safety of ultrasound-guided real-time needle aspiration biopsy sequential Transhepatic artery embolization in the management of liver tumor

Kun Qian, Chuansheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To evaluate the efficacy and safety of ultrasound-guided real-time needle aspiration biopsy combined with transhepatic artery embolization sequentially in the management of liver tumor.

Materials and Methods: A retrospective review revealed patients underwent ultrasound-guided real-time needle aspiration biopsy sequential transhepatic artery embolization between January 2019 and August 2019 at a single institution. Patient diagnostic accuracy, tumor classification, feasibility and safety of needle aspiration biopsy sequential transhepatic artery embolization were reviewed.

Results: Twenty-eight patients (6 female and 22 male, mean age 52.3 y; range, 18–77 y) had ultrasound-guided real-time needle aspiration biopsy (U-NAB) sequential transhepatic artery embolization (TACE) procedures, the technical success was achieved in 100%. Rapid intraoperative pathological diagnosis accuracy was 96%, histological types of needle aspiration biopsy samples, including hepatocellular carcinoma as the common histological type (57.1%), adenocarcinoma in (25.0%), mixed hepatocellular cholangiocarcinoma tumors (3.6%), dysplastic nodules (7.1%), neuroendocrine carcinoma (3.6%) and Primary sclerosing cholangitis (3.6%), respectively. No major complication occurred in all procedures.

Conclusions: Percutaneous ultrasound-guided liver biopsy enables a minimally invasive and safe approach to obtain adequate tissue for precision medicine of liver tumor. Our experience suggests that serial TACE can be performed immediately after U-NAB with minimal associated complications.

PO-3202

Wood Structure-inspired Injectable Lignin-based Nanogels as Blood-Vessel-Embolic Sustained Drug-releasing Stent for Interventional Therapies on Liver Cancer

Hongsen Zhang, kun qian, chuansheng zheng

Department of Radiology, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

Objective: An embolic reagent with easy injection, well-controlled target embolization, and sustained release of chemotherapy drugs is urgently needed for successful trans-arterial chemo-embolization (TACE) treatment. However, the development of a highly effective embolic reagent is still challenged. Here, inspired and guided by the structural supporting properties and defense mechanisms of wood cell walls, an ideal lignin-based embolic nanogel (DOX-pN-KL) was explored. **Method:** The emulsion solvent evaporation method was developed for the preparation of Doxorubicin-loaded pN-KL nanogels (DOX-pN-KL). DOX-HCl (3.5 mg) was dissolved in Chloroform (1 mL, containing 2.5 μ L triethylamine), and the solution was added into pN-KL nanogel dispersion (0.3 wt%, 3 mL), then the system was sheared (10,000 rpm) in the ice water bath for 5 minutes to form the preliminary emulsion. After ultrasonic treatment for 3 minutes, the stable nano-emulsion was obtained. After the chloroform was removed by a rotary evaporator, the DOX-pN-KL nanogel dispersion was lyophilized and stored in the dark.

Results: Based on the mechanical support of branched lignin and the π - π stacking force between the lignin aromatic ring with anti-tumor drug doxorubicin (DOX), DOX-pN-KL showed the highest mechanical strength among the reported thermosensitive embolization nanogel and performed high drug-loading and favorable sustained-release. Moreover, further TACE treatment and tumor microenvironment evaluation of VX2 tumor-bearing rabbits showed that this nanogel can completely block all levels of vessels in long term and continuously release DOX.

Conclusion: thus having effective inhibition on tumor growth and metastasis. DOX-pN-KL is expected to be a promising alternative reagent for interventional therapy.

PO-3203

Transarterial chemoembolization combined with radiofrequency ablation and iodine-125 seeds implantation under combined imaging guidance for hepatocellular carcinoma in high risk locations: A Propensity Score Matching Analysis

Guilin Zhang, Yanqiao Ren, Chuansheng Zheng, Xuefeng Kan

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose: To compare the efficacy and safety of transarterial chemoembolization (TACE) combined with radiofrequency ablation (RFA) and iodine-125 seeds implantation (TACE-RFA-125I) with those of TACE combined with RFA (TACE-RFA) in the treatment of hepatocellular carcinoma (HCC) in high risk locations.

Methods: The study retrospectively analyzed patients with small HCC (smaller than 5 cm) in high risk locations who received TACE-RFA-125I or TACE-RFA treatment in our institution from January 2010 to June 2023. Local progression-free survival (LPFS), overall survival (OS), progression-free survival (PFS), and major complication rates were compared between the two groups. Propensity score matching (PSM) analysis was used to reduced the selection bias.

Results: A total of 126 patients with small HCC in high risk locations were enrolled in this study, including 56 patients in the TACE-RFA-125I group and 70 patients in the TACE-RFA group. Forty one patients were chosen after PSM analysis in each group. The TACE-RFA-125I group showed a significantly better survival benefit than TACE-RFA group (median LPFS: 54 months vs 23 months, $P < 0.01$; median OS: 73 months vs 51 months, $P < 0.05$; median PFS: 23 months vs 11 months, $P < 0.01$). In the subgroup analysis by patients with tumor ≤ 3 cm, the median LPFS, PFS, and OS in the TACE-RFA-125I group were significantly greater than that of in the TACE-RFA group ($P < 0.01$). For patients with tumor > 3 cm, the LPFS, OS, and PFS in the TACE-RFA-125I group were significantly greater than those of in the TACE-RFA group at short term follow-up (within 2 years) ($P < 0.05$), whereas the opposite findings were recorded for long term follow-up (beyond 2 years) ($P > 0.05$). The uni- and multivariate analysis showed that TACE-RFA-125I was a protective factor for LPFS, PFS and OS. After PSM analysis, twenty four patients in the TACE-RFA-125I group emerged with grade 1 or 2 procedure-related adverse events, compared with 26 patients in the TACE-RFA group ($P = 0.651$).

Conclusions: TACE-RFA-125I might be an effective and safe treatment strategy for patients with small HCC in high risk locations.

PO-3204

Parameter research of suitable keV recombination of metal artifact reduction algorithm in CT guided percutaneous lung biopsy

Shuai Tian, Ning Lang, Huishu Yuan
Peking University Third Hospital

Purpose: To observe the image quality and metal artifact reduction (MAR) of the target lesion area near the lung biopsy needle with or without metal artifact reduction algorithm, and to explore the more suitable reconstruction parameters for the keV.

Methods: Forty-three patients (24 males, 19 females, age range: 47-58, mean age 53.6 ± 7.9 years) who underwent spectral CT guided percutaneous lung biopsy were retrospectively analyzed from March to April 2021. Each patient received multiphase scanning and post-processing after the needle tip of the lung biopsy reached the target lesion area. Parameters for spectral CT scanning were: 120 kVp tube voltage; 0.28 seconds gantry rotation time; 80mm collimation width; and 1.531:1 pitch; and volume-weighted CT dose index (CTDIvol) 9.24 mGy. A total of 9 groups of images were obtained, namely 120kVp group, 40keV-non-MAR group, 40keV-MAR group, 74keV-non-MAR group, 74keV-MAR group, 120keV-non-MAR group, 120keV-MAR group, 140keV-non-MAR group and 140keV-MAR group. The CT value and image noise of the target lesion area in front of the needle tip of lung biopsy in each group were delineated and measured by two observers, and the artifact index (AI) and signal-to-noise ratio (SNR) were calculated with subcutaneous fat as reference. The image quality near the target area was evaluated subjectively using the 1-5 scale scoring method (Likert score). K-test was used to evaluate the consistency of subjective evaluation. T-test was used for data with normal distribution, and Friedman rank-sum test was used for data without normal distribution.

Results: The consistency of the Likert scores of two observers was good (κ value = 0.893). The noise, AI, SNR and Likert scores of 40 keV-MAR group and 74 keV-MAR group were inferior to those of 120 keV-MAR group and 140 keV-MAR group ($P < 0.05$). The differences between the noise (122.24 ± 52.27 vs. 182.16 ± 91.83), AI (121.42 ± 52.53 vs. 181.34 ± 92.51), SNR (-4.18 ± 4.82 vs. -16.47 ± 40.49) and Likert score (3.30 ± 1.03 vs. 2.06 ± 0.44) of 120 keV-MAR group and 120 keV-non-MAR group ($P < 0.05$). The differences between the noise (118.02 ± 52.09 vs. 175.50 ± 90.19), AI (117.29 ± 52.29 vs. 174.96 ± 90.47), SNR (-4.12 ± 5.22 vs. -8.47 ± 15.34) and Likert score (3.36 ± 1.06 vs. 2.08 ± 0.48) of 140 keV-MAR group and 140 keV-non-MAR group ($P < 0.05$). There was a significant difference in SNR and Likert score between 74 keV-MAR group and 74 keV-non-MAR group ($P < 0.05$). There was no significant difference between 120 keV-non-MAR group and 140 keV-non-MAR group ($P > 0.05$). There was no significant difference between 120 keV-MAR group and 140 keV-MAR group ($P > 0.05$).

Conclusion: Spectral CT with high keV (≥ 120 keV) virtual single spectral imaging technology combined with the MAR algorithm can effectively reduce the metal artifacts in front of the needle tip of lung biopsy and improve the overall CT image quality.

PO-3205

Interventional embolization for anomalous systemic arterial supply to the normal basal segment of the lower lobeYifan Zhang^{1,2}, Qiong Zhao³

1. Dept. of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Hubei Province Key Laboratory of Molecular Imaging

3. Dept. of Ultrasonography, Wuhan Asia General Hospital

Objective: To explore the safety and efficacy of interventional embolization for anomalous systemic arterial supply to the normal basal segment of the lower lobe of the lung (ASA).

Methods: From June 2013 to August 2022, 45 patients with clinically confirmed ASA were collected. All patients had undergone a pulmonary enhancement CT scan before interventional operation to identify the abnormal systemic arteries. All patients accepted interventional procedure through femoral artery puncture, using gelatin sponges and spring coils for abnormal systemic arterial embolization. Pulmonary enhanced CT examination was conducted 3-5 days after the embolization. Clinical follow-up of all patients was 6 to 12 months.

Results: 45 patients were proved to be ASA through pre-operative CT scans with 35 cases supplying the left lower lobe and 10 patients supplying the right lower lobe. 29 patients complained of hemoptysis, and 16 patients were asymptomatic. The anomalous systemic arteries were derived from the thoracic aorta (n=42), abdominal aorta (n=2), and abdominal trunk (n=1). The interventional embolization was completed successfully in all cases. The aortography after embolization showed the occlusion of the abnormal systemic artery. All patients were not unwell. Postoperative CT scans showed that the abnormal arterial residues were filled with spring coils. The transparency of the affected lower lobe was increased in 23 cases, and 22 cases were unchanged. The enlarged lobular and inferior pulmonary veins were significantly improved after the embolization in 44 patients with one case invariant. After the interventional procedure, all patients had no obvious complications. 2 patients had pulmonary infarction 3 months later. All patients showed no hemoptysis during the follow-up period, and no signs of vascular recanalization were found in the enhanced CT scans in all cases.

Conclusion: Interventional embolization for ASA is slightly traumatic, safe, and effective.

PO-3206

Decreased CD11b+/CD33+/CD14+/HLA-DR^{low}/-(mMDSC) and stable HLA-DR-/CD14-/CD33+(eMDSC) in Patients with Hepatocellular Carcinoma after Microparticles-Transarterial Chemoembolization

Yaqin Wang, yuewei zhang

Tsinghua University Affiliated Beijing Tsinghua Changgung Hospital

Background: Myeloid-derived suppressor cells (MDSCs) are known as a key negative immune regulators in the process of hepatocarcinogenesis and progression, It has been reported that the effects of surgical resection, ablation, radiotherapy, intra-arterial drug infusion, and Y90 on the frequency of circulating MDSC in hepatocellular carcinoma (HCC) patients, but the conclusions are not consistent. Transarterial chemoembolization (TACE) remains the standard treatment for unresectable HCC, which uses microparticles as an embolic agent, Microparticles-TACE (mTACE) is a popular option for HCC patients with huge HCC, as it commonly leads to obvious necrosis inside the tumor, However, the impact of the such pathological outcome on the host immunity is rarely reported at present. The aim of this study was to observe the alteration

of MDSCs subtypes, including monocytic-MDSCs (mMDSCs) and early stage MDSCs (eMDSCs), after mTACE. Additionally, the associations between mMDSCs, eMDSCs and clinical characteristics was investigated in HCC patients.

Methods: Seventy-five HCC patients (20 of whom received mTACE), 16 liver cirrhosis patients, and 20 healthy controls were recruited. Peripheral blood samples were collected for immune-cells analysis according to the study protocol. The associations between mMDSCs, eMDSCs and clinical characteristics was investigated in HCC patients. The comparison of frequency of mMDSCs , eMDSCs before and 3-5 weeks after mTACE was observed.

Results: The frequency of mMDSCs was higher in HCC group ($4.85 \pm 2.77\%$) than liver cirrhosis ($1.36 \pm 0.78\%$, $p < 0.0001$) and healthy controls group (0.57 ± 0.25 , $p < 0.0001$), the frequency of eMDSCs exhibited no significance between three groups ($p > 0.0500$). The frequency of mMDSCs was significantly correlated with the Barcelona Clinic Liver Cancer stage, tumor size, vascular invasion, distant metastasis, and the values of alpha-fetoprotein (AFP) and prothrombin induced by vitamin K absence-II (PIVKA-II) ($p < 0.05$), whereas eMDSCs were not associated with any clinical characteristics in HCC patients. The frequency of mMDSCs significantly decreased after mTACE (from $5.90 \pm 2.03\%$ to $2.57 \pm 1.07\%$, $p < 0.0001$), while no significant alteration was observed for eMDSCs (from $2.28 \pm 0.98\%$ to $2.70 \pm 1.96\%$, $p = 0.4474$).

Conclusion: This study indicates that mMDSCs are highly associated with the aggressive characteristics of HCC, but not eMDSCs. The frequency of mMDSCs can be effectively down-regulated following mTACE, while no change was observed for eMDSCs.

PO-3207

CRISPR/Cas9-Mediated SHP-1-Knockout T Cells Exhibit Anti-tumour Activity in Hepatocellular Carcinoma, Enhanced by Simvastatin

Huaping Liu^{1,2}, Xiaoping Yu², Pengfei Rong¹, Xiaoqian Ma¹, Wei Wang¹

1. the third xiangya hospital

2. Hunan Cancer Hospital and the Affiliated Cancer Hospital of Xiangya School of Medicine, Central South University

Background: Hepatocellular carcinoma (HCC) is the most commonly occurring malignant neoplasm affecting the liver. Although immunotherapy has demonstrated potential in enhancing the survival rates of patients with HCC, the 'cold tumour' nature of HCC limits its effectiveness. Therefore, this study explored the anti-tumour properties of sarcoma homology 2 domain-containing protein tyrosine phosphatase 1 (SHP-1) knockout in CD8⁺ T cells using a humanised patient-derived xenograft (PDX) model.

Methods: The clustered regularly interspaced short palindromic repeats (CRISPR)/-associated protein 9 (Cas9) editing system was employed to knock out (KO) SHP-1 in activated T cells, and the resulting phenotypic and functional changes were analysed in vitro. Bulk RNA-sequencing (RNA-seq) analysis was used to identify related pathways and effective targets for combined cell therapy. Edited T cells were tested in non-humanised and humanised PDX models, and their effects were analysed.

Results: SHP-1-KO-T cells increased the expression of CD69 and effector memory T cells (TEM) after stimulation, while proliferation function remained unaffected. The KO group showed increased secretion of interferon (IFN)- γ , Granzyme B, and Perforin, as well as improved cytotoxicity against Hep3B, Huh7, and HepG2 cells. RNA-seq analysis revealed enhanced cell-extracellular matrix adhesion pathways in the KO group. In non-humanised and humanised PDX models, the edited T cells had a strong tumour-killing effect, with TEM subsets being the main factor. IFN- γ was the most secreted killing factor. Intratumoural injection of edited T cells reduced intratumoural oxidative phosphorylation levels, whereas intratumoural lipid metabolism levels increased. The combination

of edited T cells and 3-hydroxy-3-methylglutaryl-coenzyme A (CoA) reductase-specific inhibitor (simvastatin) was significantly more effective than either alone in the humanised PDX model.

Conclusions: This study suggests that SHP-1-KO-T cells are a promising immunotherapeutic modality for HCC. The combination of SHP-1-KO-T cells and simvastatin shows potential for further development and provides insights into effective targets for combined cell therapy.

PO-3208

The clinical application of Transarterial embolization via radial artery in the treatment of hemorrhagic diseases in obstetrics and gynecology

Xi Liu

The Second Affiliated Hospital Of Chongqing Medical University

Purpose: The present study aimed to explore the feasibility and safety of Transarterial embolization (TAE) in the treatment of obstetrics and gynecological hemorrhagic diseases transradial approach (TRA) compared to transfemoral approach (TFA).

Methods: This cohort study was conducted on patients with obstetrics and gynecology bleeding diseases from June 2021 to November 2022. Clinical characteristics of the patients were comparable between the two groups. The success rate of puncture and embolization, radiation dose, operation time, fluoroscopy time (FT), as well as complications of each patient were recorded and then retrospectively analyzed the data. The European Five-dimensional Health Scale (ED-5Q) and visual analog scale (VAS) were used to assess the quality of life (QOL) on the day of discharge and 30 days after surgery between the two groups.

Results: A total of 71 patients undergoing TAE were allocated to the TRA (n = 31) or TFA (n = 40) group in this study. Puncture and embolization were completed in all patients. Compared to the TFA group, the radiation dose of the TRA group (343.89 ± 108.81 mGy vs 469.29 ± 198.66 mGy; $P = 0.029$) is significantly reduced. Minor complications occurred in only one patient (3.2%) in the TRA group. The surgery-related quality of life EQ-5D index score on the day of discharge in the TRA group (0.72 ± 0.12 vs 0.65 ± 0.11 ; $P = 0.017$) was significantly higher than that in the TFA group, and the VAS score (2.55 ± 0.62 vs 2.95 ± 0.85 ; $P = 0.025$) of catheter site discomfort was significantly lower in the TRA group were than in the TFA group, but no significant difference was observed in the QOL assessment at 30 days post-surgery.

Conclusion: TRA TAE has comparable efficacy and safety to TFA TAE in treating obstetrics and gynecological bleeding diseases. This access can improve patient QOL without affecting surgical safety.

PO-3209

Efficacy and safety of TACE combined with HIFU in the treatment of massive hepatocellular carcinoma with portal vein tumour thrombosis

Xi Liu

The Second Affiliated Hospital Of Chongqing Medical University

Purpose

Our study was to compare the efficacy and safety[Judy2] of transcatheter arterial chemoembolization (TACE) combined with high-intensity focused ultrasound (HIFU) versus

TACE alone in the treatment of massive hepatocellular carcinoma (MHCC, ≥ 5 cm) with portal vein tumour thrombosis (PVT) and to analyse the prognostic factors of those patients.

Materials and Methods

111 MHCC patients [Judy3] with PVT were divided into TACE combined with HIFU group (A, n=56) and TACE alone group (B, n=55). Group A was divided into A1 (embolization of the feeding artery of PVT during TACE, n=33) and A2 (without embolization of the feeding artery of PVT, n=23). According to the same grouping method, Group B was divided into B1 (n=29) and B2 (n=26). Overall survival (OS), progression free survival (PFS), tumour response, adverse events and Karnofsky scores were compared. Prognostic factors for OS were determined.

Results

The median OS and PFS of groups A (12, 7 months) were longer than B (5, 4 months; $P < 0.001$ [Judy10]). The median OS and PFS of group A1 (12, 10 months) were longer than others (A2: 8, 6 months, $P = 0.019$, 0.013 ; B1: 6, 4 months, $P < 0.001$; B2: 5, 4 months, $P < 0.001$). Group A (ORR: 67.9%, DCR: 91.1%) showed higher tumour response rates than group B (21.8%, 74.5%). The tumour response rates of group A1 (69.7%, 93.9%) were better than others (A2: 65.2%, 87.0%; B1: 20.7%, 75.9%; B2: 23.1%, 73.1%). The PVT grade, times of TACE, lipiodol accumulation in PVT and therapeutic method were independent prognostic factors for OS.

Conclusion

TACE combined with HIFU is a safe and effective therapy for patients with MHCC and PVT and is worthy of clinical application, especially with targeted embolization the feeding artery of PVT during TACE.

PO-3210

Local ablation of pulmonary malignancies abutting pleura: evaluation of midterm local efficacy and safety

Hongtao Hu

The Affiliated Cancer Hospital of Zhengzhou University/ Henan Cancer Hospital

Objective: To retrospectively evaluate the local efficacy and safety of local ablation treatment for adjacent pleural lung tumors.

Materials and methods: Sixty-two patients with pulmonary nodule ablation in the Affiliated Cancer Hospital of Zhengzhou University were collected from January 2016 to December 2020. All of the patients were followed up with enhanced CT or MR within 48 hours after treatment and 2, 4, 6, 9 and 12 months after treatment. All patients were followed up for at least 12 months.

Results: 84 targeted tumors (62 patients) received 94 times of ablation. In the 12-month follow-up images, 69 of the 84 targeted tumors were ablated completely, 15 incomplete ablation, and the 12-month incomplete ablation rate was 17.8% (15/84). Of all 15 incompletely ablated tumors, 6 had partial responses, 5 had stable disease, and 4 had progressive disease. The most common adverse event was pneumothorax, with an incidence of 54.8% (34/62). The second complication was the formation of pleural effusion, with an incidence of 41.9% (26/62). The incidence of needle tract bleeding was 21% (13/62), and all were cured by the use of hemostatic drugs. The serious complications were bronchopleural fistula in 4 patients (6.5%, 4/62) and needle tract metastasis in 1 patient. Four cases of bronchopleural fistula were found in the early stage and cured after symptomatic treatment.

Conclusion: local ablation is effective in the treatment of adjacent pleural lung tumors, and the operation is safe and controllable.

PO-3211

Efficacy and Safety of regorafenib plus a PD-1 inhibitor and transarterial chemoembolization for treating advanced hepatocellular carcinoma

Lei Cao, Ping Xie 谢
Sichuan Provincial People's Hospital

Abstract:

Purpose: This study sought to contrast the clinical effectiveness and tolerability of two treatment approaches in patients with advanced hepatocellular carcinoma (HCC): triple therapy involving regorafenib, a programmed death 1 (PD-1) inhibitor, and transarterial chemoembolization (TACE), and dual therapy comprising regorafenib and a PD-1 inhibitor.

Methods: A retrospective analysis was conducted on a cohort of patients with advanced HCC who underwent second-line therapy between March 2019 and June 2022. The patients were categorized into two groups: the Dual Therapy group, which received only regorafenib and a PD-1 inhibitor, and the Triple Therapy group, which received a combination of regorafenib, PD-1 inhibitor, and TACE. The primary endpoints evaluated were overall survival (OS), progression-free survival (PFS), and treatment response rates. Additionally, safety profiles and adverse events were assessed.

Results: The study included a total of 115 eligible patients who received combination therapy, with 59 patients in the Triple Therapy group (T-R-P) and 56 patients in the Dual Therapy group (R-P). Compared to the Dual Therapy group, patients in the Triple Therapy group exhibited markedly enhanced overall survival (median, 16.0 vs. 8.9 months, $p < 0.001$) and progression-free survival (median, 6.8 vs. 3.3 months, $p < 0.001$). Moreover, the Triple Therapy group demonstrated higher objective response rates (37.3% vs. 5.6%, $p = 0.001$) and disease control rates (71.2% vs. 44.6%, $p = 0.004$) than the Dual Therapy group. The incidence and severity of adverse events were comparable between the two groups (any grade: 93.2% vs. 89.3%, $p = 0.454$; grade ≥ 3 : 25.4% vs. 23.2%, $p = 0.783$).

Conclusion: In patients with advanced HCC, the use of triple therapy, combining regorafenib, a PD-1 inhibitor, and TACE, appears to confer more favorable survival advantages compared to dual therapy involving only regorafenib and a PD-1 inhibitor. Furthermore, the safety profiles of the triple therapy were manageable and akin to those of the dual therapy.

PO-3212

Prediction of Early Treatment Response to Initial Conventional Transarterial Chemoembolization for Caudate Lobe Hepatocellular Carcinoma: A Retrospective Study

Xinying Song, Feng Wen
Shengjing Hospital of China Medical University

Objective

The aim is to evaluate the early tumor response in patients with caudate lobe hepatocellular carcinoma (CL-HCC) after initial transcatheter arterial chemoembolization (TACE), analyze its possible influencing factors, and provide evidence for predicting early treatment outcomes.

Materials and Methods

A total of 64 CL-HCC patients who met the inclusion and exclusion criteria from January 2009 to December 2022 were analyzed retrospectively. According to the modified Response Evaluation Criteria in Solid Tumors, the patients after the first TACE was divided into objective response (OR)

group and non-OR group, and their demographic characteristics, laboratory indicators, and tumor-related indicators were collected. Univariate and multivariate analyses were performed respectively. The additive model analyzed the interaction between independent risk factors, and the variables with statistical significance were evaluated by simple effect analysis.

Results

Univariate analysis showed that gender, AFP, AST, tumor-feeding arteries, and TACE level (super-selective or not) were statistically significant between the two groups ($P < 0.1$). Multivariate analysis indicated that male (OR=0.11, 95% CI 0.02-0.73), multiple tumor-feeding arteries (OR=5.88, 95% CI 1.25-27.59), and non-superselective TACE (OR=15.54, 95% CI 3.31-73.00) were risk factors for early progression of CL-HCC after the first TACE. The Nomogram prediction model showed that non-selective embolization was the most significant risk of progression, followed by multiple tumor-feeding arteries and male. Simple effect analysis showed that multiple tumor-feeding arteries and non-superselective TACE were the most likely factors to progress after initial TACE (OR=95, 95%CI 8.95-1008.41).

Conclusions

Male, multiple tumor-feeding arteries, and non-superselective TACE were the risk factors affecting the early tumor response in patients with CL-HCC after initial TACE. Attention should be paid to the risk of early treatment outcomes in these patients with multiple tumor-feeding arteries and non-superselective embolization.

PO-3213

The Value of Spectral CT Iodine Density in Predicting Pulmonary Hemorrhage in Percutaneous CT-guided transthoracic Lung Tumor Biopsy: Single-Institution Experience of 458 Cases

Yaqiong Ma, Gang Huang
Gansu provincial hospital

Background: The pulmonary hemorrhage is potentially life-threatening complications following CT-guided transthoracic lung biopsy (TTLB). The accurate evaluation of pulmonary hemorrhage complication is the most important part of preoperative preparation for TTLB.

Purpose: This study investigated the risk factors associated with pulmonary hemorrhage following TTLB, and whether the iodine density of the lung tumor is a risk factor.

Materials and Methods: This retrospective study was approved by the institutional review board. The requirement to obtain informed consent was waived. Records from 458 patients who underwent TTLBs between August 2020 and April 2022 were retrospectively reviewed. Primary outcomes were pulmonary hemorrhage, hemoptysis, and bleeding complications necessitating intervention. Patient, lesion, and technique related variables were evaluated as predictors of pulmonary hemorrhage. Patient-related variables included main pulmonary artery diameter (mPAD) at computed tomography (CT), chronic lung disease. Lesion- and technique-related variables included major axis, pleura-to-lesion distance, morphologic characteristics, iodine density values, needle gauge, number of passes. Univariate analysis was performed with chi-square test, Wilcoxon test, and Student t tests. Multivariable logistic regression predicting likelihood of pulmonary hemorrhage. A ROC curve was used to analyze the performance of variables to predict the risk of pulmonary hemorrhage. Then, the Youden index was applied to select the cutoff value.

Results: Pulmonary hemorrhage occurred in 103 of the 458 TTLBs (22.4%), hemoptysis occurred in 22 of the 458 TTLBs (4.8%). Sixteen of the 458 TTLBs (3.5%) necessitated hemostatic agents. Pulmonary hemorrhage was more likely to occur with longer pleura-to-lesion distance ($P < 0.001$), smaller major axis ($P < 0.001$), and higher iodine density in the tumor lung cancer ($P = 0.029$). In

predicting the risk of pulmonary hemorrhage, the AUCs of pleura-to-lesion distance, major axis and iodine density were 0.622, 0.649 and 0.571 respectively.

Conclusion: The iodine density values of the lung tumor is a risk factor associated with pulmonary hemorrhage following TTLB.

PO-3214

基于多模态 CT 预测急性前循环闭塞性脑卒中机械取栓术后预后的研究

陈桂玲

三明市第一医院

目的: 机械取栓手术血管再通率增高, 但仍有约一半的患者预后不良。因此, 本研究通过构建并验证多模态 CT 模型, 研究其对机械取栓术后预后的预测价值。

方法: 收集 2020 年 9 月 1 日至 2022 年 9 月 30 日在我院行机械取栓手术并成功再通的急性前循环大血管闭塞患者 68 例。根据 90D-mRS 评分结果将患者分为有效再通组 (0-3 分) 和无效再通组 (4-6 分)。分析患者的临床及影像学资料。通过单因素及多因素 logistics 回归分析建立基于平扫 CT 及多时相 CTA (mCTA) 检查构建的 N-mCTA 模型和基于灌注检查构建的 CTP 模型。再纳入临床变量建立临床-多模态 CT 联合模型: CNCTA 模型和 CCTP 模型。采用 ROC 曲线分析模型的 AUC、灵敏度和特异度来比较二者的预测效能。并根据 CNCTA 模型绘制诺莫图并评价其预测能力。结果: 完成 mCTA 检查者 68 例, 完成 CTP 检查者 61 例; 有效再通组 47 例, 无效再通组 21 例。N-mCTA 模型变量由 ASPECTS-1 和 CS 组成, 其中 ASPECTS-1 为 ASPECTS 根据最佳截断值转化而来的二分类变量。CTP 模型变量仅由 IC 体积构成。两个模型的 AUC 分别为 0.787 (95%CI: 0.671-0.903) 和 0.840 (95%CI: 0.732-0.948)。CNCTA 模型变量由年龄 ($P=0.011$)、部位 ($P=0.036$)、ASPECTS-1 ($P=0.008$) 及 CS ($P=0.007$) 组成。CCTP 模型变量由年龄 ($P=0.043$) 和 IC 体积 ($P=0.011$) 组成。两个模型的 AUC 分别为 0.903 (95%CI: 0.824-0.981) 和 0.840 (95%CI: 0.721-0.960)。

结论: 多模态 CT 模型与联合模型对急性前循环闭塞性脑卒中患者机械取栓术后预后具有良好的预测能力。CNCTA 模型的预测价值最高, 其可视化诺莫图能定量评估患者的预后情况, 有助于临床医师对手术患者的筛选。

PO-3215

吡非尼酮通过抑制肝星状细胞自噬促进凋亡治疗肝纤维化

江哲宇、王黎洲、周石

贵州医科大学附属医院

目的: 探究吡非尼酮对于肝星状细胞活性、自噬以及凋亡的影响。方法: 使用不同浓度的吡非尼酮处理肝纤维化 HSC T6 细胞, CCK8 法和克隆形成实验检测细胞增殖、划痕实验检测细胞迁移、流式细胞术检测细胞凋亡, Western-Blot 检测纤维化、自噬及凋亡相关蛋白表达。随即采用吡非尼酮与自噬激动剂雷帕霉素联合用药处理 HSC T6 细胞, 并通过划痕实验、流式细胞术、Western-Blot 实验进行检测。结果: CCK8 和克隆提示随吡非尼酮浓度增加会导致 HSC T6 细胞的增殖受限; 划痕实验提示吡非尼酮浓度增加会导致 HSC T6 细胞的迁移受限; Western-Blot 和流式细胞术提示经吡非尼酮处理 HSC T6 细胞后, 细胞自噬受限, 凋亡增加。联合处理结果提示, 自噬激动剂可部分逆转吡非尼酮对 HSC T6 细胞活性抑制。结论: 吡非尼酮可抑制肝星状细胞增殖、促进细胞凋亡, 且可能通过抑制肝星状细胞的自噬水平促进其凋亡进而治疗肝纤维化。

PO-3216

CT 三维导航下经皮肺穿刺活检术的临床应用价值

杨威威、朱正红、范文辉

长江航运总医院

目的: 探讨 CT 三维导航下经皮肺穿刺活检术在肺占位性病变中的诊断价值及安全性。方法: 选取本院肺占位患者 40 例, 均接受 CT 三维导航下经皮肺穿刺活检术并对活检组织进行病理学检查, 分析其诊断效能, 并观察患者术后并发症情况。结果: 40 例患者中病灶位于左上肺 10 例 (25.00%)、左下肺 7 例 (17.50%)、右上肺 10 例 (25.00%)、右中肺 5 例 (12.50%)、右下肺 8 例 (20.00%); 病灶长径 11.9-102.5mm, 平均 43.50 ± 22.61 mm; 病灶短径 7.7-80.5mm, 平均 32.52 ± 19.93 mm; 病灶距离胸膜距离 0-30.0mm, 平均 6.34 ± 8.82 mm; 穿刺针入肺内距离 6.3-60.5mm, 平均 22.22 ± 11.06 mm; 穿刺针肺外调针次数 1-8 次, 平均 2.45 ± 1.48 次, 穿刺针肺内调针次数 1-6 次, 平均 2.38 ± 1.30 次; 患者仰卧位 14 例 (35.00%)、俯卧位 17 例 (42.50%)、侧卧位 4 例 (10.00%)、斜位 5 例 (12.50%); 合并肺纤维化或 COPD 病史者 7 例 (17.50%); 其中除 1 例因穿刺入胸膜时患者咳嗽引起中等量气胸未能成功取材外, 其余均成功取材, 取材成功率 (97.50%, 39/40), 其中 34 例 (87.18%, 34/39) 诊断明确, 检出恶性病变 28 例, 包括腺癌 22 例、鳞癌 1 例、小细胞癌 2 例、转移癌 3 例; 良性病变 6 例, 包括肺部炎症 5 例、结核 1 例; 术后并发症主要为气胸、出血及咯血, 并发气胸的有 11 例 (27.50%), 其中 1 例中量气胸行闭式引流, 其余少量气胸均自行吸收, 肺部出血 15 例 (37.50%), 咯血 4 例 (10.00%), 予以对症治疗后并发症均消失。结论: CT 三维导航下经皮肺穿刺活检术有助于肺占位病变的定性诊断, 穿刺时患者配合呼吸、规律屏气, 可以有效提高穿刺效率及安全性, 其具有较高的临床应用价值, 是肺部病变明确诊断的重要手段之一。

PO-3217

PRECEDE 模式在急性心梗介入治疗患者中的护理效果

何梦娇

贵州省肿瘤医院

【摘要】目的 分析 PRECEDE 模式在急性心梗介入治疗患者中的护理效果。方法 研究对象为 60 例急性心梗患者, 入院后以随机选择法分为观察组 (n=30)、对照组 (n=30) 两组, 对照组给予常规护理, 观察组在常规护理基础上给予 PRECEDE 模式护理, 并对比护理效果, 研究起止时间为 2020 年 8 月-2022 年 8 月。结果 观察组自我护理能力评分高于对照组, 且观察组的生活质量评分更高 ($P < 0.05$)。结论 对急性心梗患者实施 PRECEDE 模式护理干预, 可有效提高患者的自我护理能力, 提高患者的生活质量, 说明 PRECEDE 模式护理干预更具临床优势, 值得推广应用。

【关键词】PRECEDE 模式; 急性心梗患者; 自我护理能力; 生活质量
急性心肌梗死是临床上常见的一种心血管疾病, 发病原因为冠脉发生病变导致的冠脉血流受阻或中断, 从而导致心肌缺血、缺氧性的坏死。急性心肌梗死发病率高, 发病迅速, 并发症多, 严重威胁患者的正常生活和生命健康。临床上治疗该疾病的方法主要为介入治疗[1]。相较于传统护理, PRECEDE 模式将教育性诊断与评估融入到护理方式中, 能够加强患者对疾病的认知, 改善患者的预后。故本次研究将常规护理与 PRECEDE 模式护理干预展开对比分析, 现做如下报告:

1 资料和方法

1.1 一般资料

研究对象为 60 例急性心梗患者, 入院后以随机选择法分为观察组 (n=30)、对照组 (n=30) 两组, 研究起止时间为 2020 年 8 月-2022 年 8 月。其中观察组, 男 17 例, 女 13 例, 年龄 22-87 岁, 均

值 (56.11 ± 2.14) 岁。对照组, 男 16 例, 女 14 例, 年龄 21-88 岁, 均值 (56.22 ± 2.20) 岁。一般资料对比无统计学意义 ($P > 0.05$)。

PO-3218

CalliSpheres 载药微球经导管灌注化疗栓塞治疗肝癌的临床研究

石静

安徽省阜阳市人民医院

目的 探究 CalliSpheres 载药微球经导管肝动脉灌注化疗栓塞 (DEB-TACE) 治疗肝癌的疗效。**方法** 随机数表法将本院 2019 年 1 月~2021 年 6 月就诊的 100 例肝癌患者分为对照组 50 例与研究组 50 例, 分别接受传统肝动脉化疗栓塞 (c-TACE) 与 DEB-TACE 治疗。对比两组近期疗效、不良反应, 观察治疗前后血清肿瘤标志物变化; 随访至 2022 年 1 月, 统计两组总生存率。结果 研究组客观缓解率 76.00% 高于对照组的 56.00% ($P < 0.05$); 研究组术后 1 个月、3 个月血清甲胎蛋白异质体 3 (AFP-L3)、糖类抗原 199 (CA199)、血管内皮细胞生长因子 (VEGF) 水平均显著低于对照组 ($P < 0.05$); 研究组术后 3 个月 CD3+、CD4+、CD4+/CD8+ 均明显大于对照组 ($P < 0.05$); 研究组腹胀发生率明显低于对照组 (30.00% vs 56.00%) ($P < 0.05$), 发热、腹痛等其他不良反应两组对比无显著差异 ($P > 0.05$); 随访至 2022 年 1 月, 研究组总生存率显著高于对照组 ($P < 0.05$)。结论 DEB-TACE 治疗肝癌近期疗效较好, 能明显改善患者免疫功能, 抑制肿瘤标志物, 提高总生存率。

PO-3219

肾包膜动脉栓塞联合超选择性肾动脉栓塞治疗损伤性肾出血

石静

安徽省阜阳市人民医院

摘要:**目的** 探讨肾包膜动脉栓塞联合超选择性肾动脉栓塞术治疗损伤性肾出血的有效性和安全性。**方法** 回顾性分析 2020 年 1 月—2022 年 7 月收治 20 例损伤性肾出血患者的临床资料, 使用肾包膜动脉栓塞术联合超选择性肾动脉栓塞术治疗, 评价其对术后血红蛋白、肾功能及肾区疼痛视觉模拟评分的影响。结果 20 例均完成肾动脉造影, 20 例行超选择性肾动脉栓塞联合肾包膜动脉栓塞, 微弹簧圈栓塞肾动脉 15 例, 其中 4 例明胶海绵颗粒补栓塞肾动脉; 5 例明胶海绵栓塞肾动; 20 例明胶海绵颗粒栓塞肾包膜动脉。患者术后 7 天血肌酐水平较术前差异无统计学意义 ($p > 0.05$); 术后血红蛋白、肾区疼痛视觉模拟评分较术前存在明显差异, 有统计学意义 ($p < 0.05$)。结论 肾包膜动脉栓塞联合超选择性肾动脉栓塞术是治疗损伤性肾出血是一种安全、有效、微创的止血方法, 值得推广。

PO-3220

氢吗啡酮自控镇痛 (PCIA) 法对瘢痕妊娠患者子宫动脉栓塞术的进行术后镇痛的有效性和安全性

石静

安徽省阜阳市人民医院

【摘要】目的 评价氢吗啡酮静脉自控镇痛对瘢痕妊娠患者辅助行子宫动脉栓塞术后镇痛的有效性和安全性。方法 选取 2021 年 1 月至 2022 年 9 月在阜阳市人民医院疤痕妊娠行 UAE 辅助治疗的患者 116 例。依据 UAE 术后静脉自控镇痛药物不同, 随机分为观察组、对照组, 每组为 58 例。分别于手术结束前 10min 静注氢吗啡酮 2mg (观察组) 和舒芬太尼 2 μ g (对照组), 并连接患者 PCIA (配方: 观察组氢吗啡酮 10mg+氟比洛芬酯 100mg+0.9%氯化钠注射液至 100ml 镇痛泵中; 对照组舒芬太尼 2 μ g/kg+氟比洛芬酯 100mg+0.9%氯化钠注射液至 100ml 镇痛泵中)。记录两组患者 UAE 术后 0.5h、4h、8h、12h、24h、48h 视觉模拟量表 (Visual analogue scale, VAS) 评分、布鲁格曼舒适度量表 (Bruggmann comfort scale, BCS) 评分、术后 48h 内 PCA 按压次数、镇痛药物用量、不良反应及术后并发症发生率。结果 观察组术后 0.5h、48h 评分与对照组比较存在无明显差异 ($P>0.05$), 而术后 4h、8h、12h、24h VAS 评分明显低于对照组, 差异存在统计学意义 ($P<0.05$)。观察组术后 0.5h、4h、8h、12h、24h、48h 内 BCS 评分明显高于对照组、术后 48h PCA 按压次数、镇痛药物用量低于对照组, 差异有统计学意义 ($P<0.05$)。两组患者不良反应发生率比较存在统计学差异 ($P<0.05$), 而两组患者嗜睡、皮肤瘙痒、低氧或呼吸抑制发生率无统计学差异 ($P>0.05$)。结论 氢吗啡酮和舒芬太尼 PCIA 有助于缓解瘢痕妊娠子宫动脉栓塞术后疼痛, 但氢吗啡酮对比舒芬太尼可明显降低术后 VAS 评分、提高术后 BCS 评分、术后 48h PCA 按压次数及镇痛药物用量减少、不良反应发生率较低, 有一定的推广价值。

PO-3221

双侧髂内动脉 Fogarty 球囊阻断术在剖宫产术后瘢痕妊娠辅助清宫手术中的疗效与安全性

石静

安徽省阜阳市人民医院

摘要 目的 探究双侧髂内动脉 Fogarty 球囊阻断术在剖宫产术后瘢痕妊娠 (CSP) 辅助清宫手术中的临床疗效与安全性。方法 回顾性分析本院 2021 年 1 月~2022 年 9 月收治疗的 80 例 CSP 患者的临床资料。其中观察组 40 例, 给予双侧髂内动脉 Fogarty 球囊阻断术下行宫腔镜下清宫治疗, 术中间断阻断髂内动脉, 清除胚胎、电凝或缝合止血; 对照组 40 例, 给予子宫动脉栓塞术 (UAE) 后 1-2 天行宫腔镜下清宫手术。对比分析两组患者在数字减影血管造影 (DSA) 下透视时间、体表辐射剂量、清宫手术中出血量、清宫手术时间、住院时间及术后随访情况。结果 所有患者清宫手术顺利, 成功保留子宫。观察组未发生球囊相关的并发症。对照组 40 例患者 UAE 后均发生不同程度发热、子宫区疼痛等栓塞后反应。观察组、对照组 DSA 下透视时间及体表辐射剂量分别比较, 差异均有统计学意义 (P 均 <0.05); 清宫术时中出血量, 清宫手术时间分别比较, 差异均无统计学意义 (P 均 >0.05); 住院时间分别两组比较, 差异有统计学意义 ($P<0.05$)。随访期均在 3 个月以上, 观察组、对照组 β -hCG 转阴时间、阴道流血时间、月经恢复正常时间及患者满意率分别比较, 差异均有统计学意义 (P 均 <0.05)。结论 双侧髂内动脉 Fogarty 球囊阻断术及 UAE 辅助 CSP 清宫手术均可明显减少术中出血量, 但双侧髂内动脉 Fogarty 球囊阻断术相比于 UAE, 减少患者 X 线辐射剂量, 缩短患者住院时间、 β -hCG 转阴时间、阴道流血时间、月经恢复正常时间, 增加患者满意度率。

i-Flow 在大脑中动脉支架植入术后再狭窄的评估

胡桃

重庆医科大学附属第三医院

目的探讨 DSA iFlow 彩色编码技术评估大脑中动脉支架植入术后再狭窄的临床价值。

方法收集重庆医科大学附属第三医院 2019 年 9 月至 2023 年 7 月 10 例大脑中动脉狭窄患者临床资料。所有患者均经影像学检查确诊为狭窄或闭塞性病变,并接受经皮腔内血管成形术(PTA)治疗。汇总所有患者 DSA 图像数据,采用德国 Siemens 公司 Artis Zee^{III}Biplane DSA 机 Leonardo 后处理工作站彩色编码技术 iFlow 软件对 DSA 图像进行后处理,获取相关参数:病变近端与远端密度达峰时间差值(ΔTTP)。基于 DSA 图像计算所有患者腔狭窄程度(S)。配对 t 检验分析对比各患者术前、术后 ΔTTP 间、S 间差异。结论 DSA iFlow 彩色编码成像技术获得的 ΔTTP ,为 PTA 术后实时有效地评估大脑中动脉支架植入术后再狭窄的发生率提供了一种新方法。

临床前标准化淋巴管造影术和淋巴管介入治疗培训方案潘峰¹、刘德翰¹、杨炼¹、郑传胜¹、Christof M Sommer²

1. 华中科技大学同济医学院附属协和医院

2. Heidelberg University Hospital, Heidelberg, Germany.

目的: 建立一种活体动物模型, 用来进行标准化的淋巴管造影和淋巴管介入治疗临床前技术培训, 并建立操作规范。

材料和方法: 使用各种成像和引导方式(包括: 超声、DSA、CT、锥形束 CT 和 MRI 检查), 使用健康活体猪作为动物模型, 进行不同的基于碘油和钆的淋巴管造影术和淋巴管介入治疗。所有的操作流程均参照人体临床实践中的操作和手术方法。明确介绍和说明所使用动物模型的建立和各种技术的背景、材料和方法。讨论每种技术在临床实践中的潜在应用。

结果: 本研究建立了总共 11 项包括淋巴管造影和淋巴管介入治疗技术在内的临床前培训规范。所涉及技术包括: 腹股沟术后淋巴漏 (PLL) 的建立、间质染料检测、五种类型的淋巴管造影术【包括: 经足淋巴管碘油造影术 (TL)、经皮穿刺淋巴结碘油造影术 (INL)、开腹经淋巴结碘油造影术、经间质淋巴管碘油造影术和经间质磁共振淋巴管造影术 (MRL)】, 以及四种针对 PLL 的经皮介入治疗技术【包括: 胸导管栓塞术 (TDE)、经淋巴结栓塞术 (INE)、传入淋巴管硬化术 (ALVS) 和传入淋巴管栓塞术 (ALVE)】。

结论: 本研究为经验不足的介入放射科医师提供了一种安全、可靠、标准的各种淋巴管造影和淋巴管介入治疗临床前培训资源, 有助于介入放射科医师更好的掌握该类技术, 以利于临床实践和技术推广。

PO-3224

冠状动脉前降支不同造影体位测量准确性研究

张祥海、闫红野、刘倩、张乐天
中国人民解放军陆军特色医学中心

目的 以血管内支架作为测量标尺,收集了右肩位、头位、左肩位体位下前降支的造影图像,比较不同造影体位、成像区域支架的测量值和实际值的差异。

资料和方法

1.1 一般资料 回顾性收集 240 幅冠脉造影图像,支架都充分扩张贴壁。分析不同造影体位组间血管特征和支架种类在组间的差异。

1.2 设备和操作 造影设备为 GE Innova3100 IQ,视野为 16cm X 16cm,术中增强器贴近病人,球管远离病人心脏,射线中心线对准心脏中心,影像在后处理工作站完成测量。

1.3 成像区域划分和介入测量 将图像平均分为九个区域,用导管校准法测量支架长度,选取支架位于图像的中上区和中间区的测量数据纳入研究。

1.4 统计分析 使用 SPSS 29.0 统计学软件,连续变量用均数+标准差 ($\bar{x} \pm s$) 表示,测量值和实际值比较采用配对 T 检验。以测量值为自变量,实际值为因变量,建立回归方程模型。

2 结果

组间血管和支架特征无差异性 ($P>0.05$)。在中上区,右肩位测量值与实际值无差异,而头位和左肩位存在差异性。在中间区,右肩位和头位的测量值和实际值无差异,左肩位存在差异 (如表一)。以实际值为因变量 (Y),测量值为自变量 (X) 建立回归方程。头位+中上区: $Y=4.664+0.91X$ ($F=138.17$, $P<0.01$); 左肩位+中间区: $Y=3.988+1.012X$ ($F=50.56$, $P<0.01$); 左肩位+中上区: $Y=6.955+0.828X$ ($F=113.27$, $P<0.01$)。将测量值代入方程中,计算结果与实际值进行 T 检验,结果均无统计学差异。

3 结论

不同造影体位和成像区域影响着图像的测量精确度。造影体位+图像区域的模式下测量值和实际值有很好的相关性,在前降支血管的测量中可以依据成像条件应用测量值或回归方程的计算结果,为介入治疗提供了更精准的手术方案。

PO-3225

3D-DSA 和 Dyna CT 重建影像对血管内支架的显示价值

张祥海、刘倩、廖春、周林
中国人民解放军陆军特色医学中心

目的 比较旋转三维造影影像 (3D-DSA) 和血管造影三维软组织成像 (Dyna CT) 重建影像对血管内支架显示的差异性。

材料与方法

1.1 一般资料 回顾性随机收集 40 例曾行颅内支架植入术的病人影像,术后均进行 3D-DSA 造影和 20s-DR Dyna CT 扫描。

1.2 造影重建参数 3D-DSA 造影时,造影速率 4 ml/s,剂量 24ml,压力为 150 psi,曝光延迟 1 秒,采集的影像数据作双容积透明影像重建。Dyna CT 选择 20s-DR 模式,造影速率 2 ml/s,剂量 50ml (造影剂与生理盐水按 1:7 比例进行稀释),压力 150 psi,曝光延迟 5 秒,采集的影像数据先作双容积软组织重建后以 MIP 像。

1.3 比较两组重建图像中清晰显示的支架标记点数目和血管内支架显示的完整程度。支架的完整程度由两名手术医师共同评估,评分标准为:支架两端标记点完整显示为 1 分;支架体段平均分为四部份,如有某部分支架的位置、形态、结构显示不清则扣 1 分,满分 5 分,比较两组图像的分。

结果 120 个支架标记点中,3D-DSA 和 Dyna CT 影像上显示的支架标记点分别是 105 和 96,存在统计学差异 ($F=4.89$, $P<0.05$)。3D-DSA 影像显示数目与实际数量无差异 ($T=1.35$, $P>0.05$),而 Dyna CT 重建影像显示数目存在差异性($T=4.32$, $P<0.05$)。两组图像对支架显示完整程度比较,两种重建技术得分别为 2.43 ± 1.35 和 3.98 ± 1.56 ,存在统计学差异($T=3.28$, $P<0.05$)。

结论 在观察支架标记点,确定头尾端位置方面,3D-DSA 透明模式对标记点的显示更加清晰准确。在支架的整体显示上,Dyna CT 双容积重建 MIP 像能更加完整地显示支架网眼结构,准确评估支架膨胀程度,观察支架贴壁情况。介入技师可以根据术中需要,重建出不同的影像,提高手术安全。

PO-3226

经动脉灌注靶向递送 Bi₂Se₃ 纳米花增强兔原位肝癌的微波消融疗效

闫海丽、高龙、杜江峰、冯对平

山西医科大学第一医院

目的: 本研究旨在将微创介入技术与纳米材料深度融合,以期在兔 VX2 原位肝肿瘤模型中实现低功率下微波热疗增敏治疗和正常组织的微波防护效应。

方法: 以天然氨基酸 L-硒代胱氨酸和 Bi(NO₃)₃·5H₂O 分别作为硒源和铋源,在可见光照下通过调控反应参数设计合成具有多层花瓣状结构的 Bi₂Se₃ 纳米花 (Bi₂Se₃ NFs)。通过超声引导套管针植入的方法构建兔 VX2 原位肝肿瘤模型,将荷瘤兔随机分组及治疗。在 DSA 的引导下通过临床可用的经动脉灌注 (TAI) 介入手术将 Bi₂Se₃ NFs 精准、靶向递送到肝肿瘤部位。介入给药 24 小时后开腹行 MWA 手术,同时,通过红外热像仪监控 MWA 的全过程。利用 CT 成像动态监测各组肝肿瘤的体积变化并计算肿瘤倍增时间。观察结束后,取肿瘤组织以及重要脏器经 H&E 染色和免疫组化染色评估各组凝固坏死、细胞凋亡和热休克蛋白 70 的表达水平。

结果: 在温和条件下通过简单的一步法制备了尺寸约为 891.17 ± 106.23 nm 的 Bi₂Se₃ NFs。活体红外热像图结果显示:在兔 VX2 原位肝肿瘤模型中,Bi₂Se₃ NFs+MWA 组的肿瘤中心温度 (86.7°C)

明显高于单独 MWA 组 (51.6°C)。术后 CT 随访结果表明,与单独接受 MWA 的肿瘤相比,同时接受 Bi₂Se₃ NFs 和 MWA 的肝肿瘤生长受到显著抑制,且肿瘤倍增时间延长了 2.2 倍 ($P<0.01$)。术后组织病理学检查结果显示,与 MWA 组相比,Bi₂Se₃ NFs+MWA 联合处理组表现出更严重的核固缩、核溶解以及胞质嗜酸性变,且 TUNEL 以及 HSP70 的表达水平均进一步增强。Bi₂Se₃ NFs 的 CT 密度值随着纳米材料浓度的增加而增加。在相同浓度下,Bi₂Se₃ NFs 的 CT 值明显高于商业化对比剂碘佛醇。

结论: Bi₂Se₃ NFs 结合 TAI 介入技术在较低功率下实现对兔 VX2 原位肝癌的微波增敏治疗并同步降低微波热对正常组织的损伤。

PO-3227

一项 CT 引导下激光消融治疗肺结节的长期回顾性研究

闵旭红¹、宋彪²、宋奇隆²、王尚虎²、王召华²、陈武²、王旭²、李源²

1. 安徽省胸科医院

2. 安徽省胸科医院

目的:在为期三年的随访中,探讨 ct 引导下激光消融治疗肺结节的临床疗效和安全性。

方法:共 46 例患者(女性 28 例;在 2019 年 1 月至 2021 年 12 月期间,18 名男性)接受了 ct 引导下的激光消融治疗,最大直径为 3cm 或以下。分别在消融前、术后 6 个月、1、2、3 年评估结节体积。并对激光消融的特点及并发症进行了评价。

结果:2 例患者在治疗过程中失访。随访后,26 例患者临床完全缓解(CR),仅残留少量纤维素病变。14 例患者结节体积明显减小,达到部分缓解(PR),消融后各时间点肺结节体积均显著小于消融前($p<0.05$)。3 例肺结节为稳定期(SD);1 例患者肺结节体积增加,并被评为进展性疾病(PD)。少量针出血和少量气胸是主要并发症,发生率为 1.09%。原结节体积 245.23 ± 34.12 mL;消融功率为 4.96 ± 0.76 瓦;消融时间为 274.74 ± 294.56 s。

结论:激光消融是一种安全有效的肺小结节减容方法,具有较高的安全性。

PO-3228

能谱 CT 在肝癌 TACE 术后评估碘油沉积状态的研究

马进

重庆市中医院

目的:探讨能谱 CT 在评估肝癌经导管肝动脉化疗栓塞术(TACE)术后碘油沉积状态的应用价值,并综合以往文献中对碘油沉积状态的分型方式,结合新的标准对碘油沉积状态进行评价,以期得到更加准确、直观的碘油沉积评价标准。方法:收集 2022 年 6 月至 2023 年 5 月诊断为原发性肝癌并在我院行 TACE 手术的患者 80 例,分别在术前及 TACE 术后一周之内行能谱 CT 扫描,利用 AW4.7 后处理工作站对图像进行后处理,重建出 11 组单能量图,分别依据各单能量图、混合能量图对病灶内碘油沉积状态及碘油伪影对病灶周围正常肝实质的影响进行评分;利用最佳单能量图对碘油沉积状态进行分型。混合能量图像和不同能级单能量比较采用 t 检验,碘油沉积状态对比使用 χ^2 检验,以 $P<0.05$ 为差异有统计学意义。结果:11 组单能量图中,能级为 90KeV 的单能量图病灶内碘油沉积状态最接近真实碘油沉积状态(8 分),其伪影对病灶周围肝实质干扰较小(7 分),综合得分最高,评为最佳单能量图。利用最佳单能量图将 TACE 术后碘油沉积效果分为 4 级,22.5%(18 例)评为优,31.3%(25 例)评为良,10%(8 例)评为中,36.3%(29 例)评为差。结论:能谱 CT 最佳单能量图较混合能量图对碘油沉积显示效果更好;利用最佳单能量图在后处理工作站中进一步处理,对碘油在病灶中沉积的量及比例进行量化,并综合以往对碘油沉积状态的分型方式,采用新的标准对碘油沉积状态分为优、良、中、差 4 级,有助于更加准确、直观的对 TACE 手术效果进行评估。

PO-3229

音乐联合放松干预对 TACE 术患者围术期焦虑心理和疼痛作用分析

王玉娟

重庆医科大学附属第二医院

目的:研究音乐联合放松干预对经皮肝动脉化疗栓塞术(TACE)患者围术期焦虑心理和疼痛的影响。方法:将 2022 年 1 月至 2022 年 12 月在本院行 TACE 术的 100 例患者作为研究对象,按患者收治的先后顺序分组,其中 2022 年 1-6 月收治的 50 例为对照组,实施常规护理干预,2022 年 7-12 月收治的 50 例为观察组,采取音乐联合放松干预。分析并对比两组各项指标。结果:观察组焦虑自评量表(SAS)(28.31 ± 1.64)分、抑郁自评量表(SDS)(29.31 ± 1.55)分和对照组相比,具有差异($P<0.05$);观察组不同时间段的疼痛评分和对照组具有差异($P<0.05$);观察组躯

体功能 (90.25 ± 1.20) 分、心理功能 (92.56 ± 1.45) 分、社会功能 (93.25 ± 1.45) 分、物质生活评分 (92.75 ± 1.45) 分 and 对照组具有差异 ($P<0.05$)；观察组满意度 98.00% 和对照组具有差异 ($P<0.05$)。

结论：通过对 TACE 术患者围术期采取音乐联合放松干预，取得显著效果，不仅能缓解患者焦虑心理，而且还能有效减轻患者的疼痛感，患者的就医体验得到明显改善。

PO-3230

图像融合技术优化 CT 引导下穿刺

曹晖、邓洋

中国人民解放军陆军特色医学中心

目的：提高穿刺成功率，减少因穿刺导致的并发症。

方法：术前建议给予患者心理疏导和宣教，训练患者平静呼吸，吸气幅度不要太大，减轻患者焦虑紧张情绪。穿刺前针对病灶扫描增强薄层图像，层厚和层间距 $\leq 1\text{mm}$ ，并选择最佳穿刺路径。在穿刺过程中，如遇到进针困难或分辨不清穿刺针前周围组织和血管情况的时候。可将实时穿刺图像与动脉期图像在飞利浦或 GE 后处理工作站，做图像融合处理，得到血管与穿刺针相融合的图像。

结果：融合图像能清晰显示穿刺针与周围血管关系，能在融合图像的提示下，尽可能避开穿刺路径上的重要血管。减少穿刺过程中出血和其他的并发症。给予穿刺医生更多图像信息，和进针的信心。

结论：在 CT 引导下穿刺过程中，使用图像融合技术，能更好的观察穿刺针周围的情况，在一定程度上提高穿刺的效率，减少并发症的发生。但病人的呼吸会影响融合图像的真实性，所以在术前准备时，应更加重视患者的呼吸训练。

PO-3231

机器视觉联合增强现实技术在 CT 引导下经皮穿刺介入中的应用研究

黄冰钰、张冰、林征宇

福建医科大学附属第一医院

目的：本课题旨在搭建基于机器视觉与增强现实技术的穿刺导航系统，将导航图像直观、实时地与真实术野画面结合并显示，帮助医师快速准确地确定穿刺入针点和穿刺角度，提高穿刺精度，缩短穿刺时间，减少手术并发症和辐射量。

材料与方法：1) 规划系统：利用多平面重建方法实现图像三维重建，提供引导依据，选择最佳穿刺路径。2) 导航系统：①利用机器视觉自动识别穿刺入针点，与规划入针点匹配②利用机器视觉在穿刺过程中对穿刺针进行实时跟踪标记③利用增强现实三维显示预期规划的路径，调整穿刺角度。3) 辅助硬件平台：搭载本方法的硬件和软件的综合移动平台，实现数据传输网络、物理定位校准等功能。4) 导航系统平台搭建组装后，自制硅胶体模，内置有 0.2、0.5cm 半径金属小球，利用西门子多层螺旋 CT 扫描后重建 1mm 薄层图像传输至导航系统，分别规划 5、10、15cm 长度的穿刺路径，在导航下穿刺，验证可行性，测量①靶点定位误差：针尖与金属球中心间距离，本研究中由于金属球不可穿透，故 $TRE = \text{金属球半径}$ ，即针尖接触金属球外壳认为穿刺穿刺。②侧向误差：金属球中心与穿刺针中轴线或延长线间最短垂直距离。③角度误差：规划路径和实际穿刺路径间角度。④首次成功率：一次进针成功穿刺到靶点数/总靶点数。结果：5cm 长度的针道靶点定位误差

为 $0.50\pm 0.19\text{cm}$ 、侧向误差为 $0.17\pm 0.09\text{cm}$ 、角度误差为 $0.90\pm 0.42^\circ$ 、首次成功率为 90%；10cm 长度的针道靶点定位误差为 $0.69\pm 0.26\text{cm}$ 、侧向误差为 $0.50\pm 0.25\text{cm}$ 、角度误差为 $1.19\pm 0.358^\circ$ 、首次成功率为 30%；15cm 长度的针道靶点定位误差为 $0.63\pm 0.32\text{cm}$ 、侧向误差为 $0.52\pm 0.36\text{cm}$ 、角度误差为 $0.99\pm 0.45^\circ$ 、首次成功率为 40%。

结论：本研究构建了基于机器视觉和 AR 的穿刺导航用以辅助 CT 引导下穿刺操作，通过体模穿刺实验验证了导航的可行性和精度。

PO-3232

探讨血管内治疗后患者发生脱发的危险因素

刘倩

中国人民解放军陆军特色医学中心

目的：探讨血管内治疗后患者发生脱发的危险因素。

方法：随机抽取 2022 年 1 月至 2022 年 10 月于陆军特色医学中心放射科介入室接受血管内治疗的 96 例患者临床资料,记录患者性别、年龄、诊断、手术部位、射线量、射线照射时间及术后 6 月内脱发情况，分析患者出现术后脱发的影响因素。

结果：96 例患者成功实施血管内治疗，分为脑血管疾病组和外周血管疾病组.其中脑血管疾病血管内治疗患者 49 例，术后脱发的 3 例，术后脱发率为 6.1%，对 4 例脱发患者与 45 例未脱发患者年龄 $[(54.1\pm 12.3)\text{岁 vs.}(58.5\pm 11.5)\text{岁}]$ ，照射时间 $[(69.3\pm 7.2)\text{分钟 vs.}(42\pm 9.8)\text{分钟}]$ ，照射剂量 $[(168\pm 3)\text{Gy vs.}(126\pm 4)\text{Gy}]$ 进行比较，照射时间及照射剂量的差异有统计学意义 (P 小于 0.05)。外周血管疾病血管内治疗患者 47 例，术后脱发的 1 例，术后脱发率为 2%。所有脱发患者均于术后 6 月内头发再生，无一例永久性脱发。 结论：脑血管病接受血管内治疗的患者、照射时间久、剂量大是血管内治疗后脱发的高危因素，血管内治疗患者术后出现永久性脱发的可能性较低。

PO-3233

加速康复外科理念在下肢动脉硬化闭塞症患者介入治疗护理中的应用

夏梦岩

中国医科大学附属盛京医院

目的：探讨加速康复外科理念在减少下肢动脉硬化闭塞症患者术后并发症中的应用效果。方法：根据以往每年收治下肢动脉硬化闭塞症患者总数量选取符合标准的 100 例下肢动脉硬化闭塞症行介入手术的患者，按照随机数字表法分为观察组 (n =50) 和对照组 (n =50)，对照组术后采用介入病房常规的护理方法，观察组采用针对下肢动脉硬化闭塞症的加速康复护理理念对患者进行围手术期护理，比较两组患者平均住院天数，再次手术时间，术后体位性低血压、反应性高血压、低血糖、腰背部疼痛、穿刺点出血的发生率。结果：观察组术后体位性低血压发生率 (2%) 低于对照组 (18%)，术后反应性高血压发生率 (4%) 低于对照组 (28%)，观察组术后低血糖发生率 (2%) 低于对照组 (18%)，观察组患者腰背部疼痛发生率 (6%) 低于对照组 (32%)，观察组术后穿刺点出血发生率 (0%) 明显低于对照组 (18%)，观察组患者平均住院日 (8.4 ± 1.07) 低于对照组 (9.14 ± 1.46) ，观察组患者再次手术间隔时间 (211.3 ± 78.2) 长于对照组 (165.8 ± 58.6) 。结论：下肢动脉硬化闭塞症患者围手术期应用加速康复外科护理理念对患者进行护理，可缩短患者平均住院天数，延长再次手术时间，降低术后体位性低血压、反应性高血压、低血糖、腰背部疼痛、穿刺点出血的发生率，提高患者满意度，在临床护理中值得推广应用。

PO-3234

肢体固定出血检测装置联合改良斜坡侧卧位在减少股动脉穿刺术后并发症中的应用

夏梦岩

中国医科大学附属盛京医院

目的 探讨自制肢体固定带及出血检测装置配合改良斜坡侧卧位对减少股动脉穿刺术后并发症的应用效果。方法选取符合标准的 120 例经股动脉穿刺行介入手术的患者,随机分为观察组($n=60$)和对照组($n=60$),对照组术后采用传统护理方法,观察组用自制肢体固定带及出血检测装置配合改良斜坡侧卧位对患者进行术后护理,比较两组患者穿刺点出血发生率、尿潴留发生率、腰背部疼痛程度及术后血压变化。结果 观察组术后出血发生率(6.67%)低于对照组(11.67%),术后尿潴留发生率(1.67%)低于对照组(5.00%),腰背部疼痛评分(4.30 ± 2.78)低于对照组(7.30 ± 2.61)($P<0.05$),手术前后血压波动低于对照组($P<0.05$)。结论 股动脉穿刺术后压迫止血过程中应用自制肢体固定带及出血检测装置配合改良斜坡侧卧位,可以降低穿刺点出血发生率、尿潴留发生率,减轻腰背部疼痛,降低血压波动,改善患者的就医体验,在临床护理中值得推广应用。

PO-3235

输卵管积水患者介入栓塞术后 IVF-ET 临床妊娠结局影响因素分析

张凯、赵鑫、陆林

郑州大学第三附属医院

目的:分析输卵管积水患者介入栓塞术后行 IVF-ET(In vitro fertilization-embryo transfer 体外受精-胚胎移植)临床妊娠结局影响因素。方法:回顾性收集自 2021 年 3 月至 2022 年 10 月于郑州大学第三附属医院因输卵管积水行介入栓塞术且行 IVF-ET 的 65 例患者的临床资料。以术中积水处最宽径与盆腔横径比值量化积水指数,记录患者移植时年龄、BMI(Body Mass Index 身体质量指数)、FSH(Follicle-Stimulating Hormone 卵泡刺激素)、LH(Luteinizing Hormone 黄体生成素)、E2(Estradiol 雌二醇)、AMH(Automated Matetials Hanging 抗缪勒管激素)、移植时子宫内膜厚度、移植胚胎个数、胚胎类型、输卵管积水位置等数据,随访至栓塞术后首次移植临床妊娠结局。采用 SPSS25.0 进行数据分析临床妊娠结局与上述指标相关性。采用 ROC 曲线和约登指数计算积水指数截断值。结果:65 例患者中临床妊娠率为 63.1%(41/65),其中于栓塞前已行胚胎移植且未成功的 45 例患者栓塞术后临床妊娠率为 62.2%(28/45)。数据分析表明 IVF-ET 临床妊娠结局与年龄、BMI、FSH、LH、E2、AMH、移植时子宫内膜厚度、移植胚胎个数、胚胎类型以及输卵管积水位置无相关性($P>0.05$),与输卵管积水指数存在相关性($P<0.001$)。ROC 曲线分析表明积水指数可以作为妊娠结局的预测指标,曲线下面积为 0.825,约登指数分析结果显示积水指数的最优截断值为 12.925%。结论:输卵管积水行介入栓塞治疗可提高 IVF-ET 临床妊娠率,但当患者当积水指数较大时对 IVF-ET 临床妊娠产生不利影响,在移植之前应对输卵管积水进行进一步抽吸处理。

PO-3236

3D 血管造影引导下子宫肌瘤供血动脉超选择性栓塞的应用

张凯、赵鑫、陆林
郑州大学第三附属医院

目的: 评价 3D 血管造影引导下子宫肌瘤供血动脉超选择性栓塞的可行性及疗效。方法: 回顾性分析 2016 年 6 月至 2021 年 9 月接受介入栓塞治疗的 14 例子宫肌瘤患者临床资料。其中 A 组 5 例患者行子宫动脉 3D 血管造影并明确子宫肌瘤供血动脉来源及走形, 后应用微导管超选择性插管栓塞肌瘤供血动脉并保留正常子宫动脉血供。另 B 组 9 例子宫肌瘤患者则栓塞双侧子宫动脉至主干。统计术前及术后 1 年可测量子宫肌瘤最大径线之和, 应用 SPSS25.0 软件进行统计学分析, 采用配对 t 检验方法分析两组患者术前及术后可测量子宫肌瘤径线之和变化及子宫肌瘤缩小率, 以 $P < 0.05$ 为差异有统计学意义。结果: A 组患者术前及术后子宫肌瘤最大径线之和平均值分别为 $85.00\text{mm} \pm 43.35\text{mm}$ 及 $35.20\text{mm} \pm 25.96\text{mm}$, 差异有统计学意义 ($p < 0.05$); B 组患者术前及术后子宫肌瘤最大径线之和平均值分别为 $65.00\text{mm} \pm 12.68\text{mm}$ 及 $49.44\text{mm} \pm 24.83\text{mm}$, 差异无统计学意义 ($p > 0.05$); 两组样本间术前径线平均值 (mm)、术后径线平均值 (mm) 未表现出显著差异性 ($p > 0.05$)。两组患者子宫肌瘤平均缩小率分别为 62% 和 25%, 差异有统计学意义 ($p < 0.05$)。结论: 3D 血管造影引导下子宫肌瘤供血动脉栓塞具有更佳的治疗效果。

PO-3237

双针成角同时消融+活检胸膜下恶性肺结节的安全性分析

袁晶¹、何闯²、黄学全²
1. 中国人民解放军陆军特色医学中心
2. 陆军军医大学第一附属医院

目的: 本研究旨在评价 CT 引导下经皮双针成角行活检+射频消融(RFA)胸膜下肺结节的安全性, 探讨胸膜下同时活检+RFA 安全的方法。

方法: 回顾性收集我院 2018 年 7 月 1 日至 2021 年 9 月 30 日行 CT 引导下经皮射频消融的患者资料共 341 例, 将经皮双针成角活检+RFA 的胸膜下肺结节 ($D \leq 10\text{mm}$) 患者资料作为实验组 (A 组), 另将经皮活检+RFA 的非胸膜下肺结节 ($D > 10\text{mm}$) 患者资料作为对照组 (B 组), 经皮单纯 RFA 胸膜下肺结节 ($D \leq 10\text{mm}$) 患者资料作为对照组 (C 组), 分别比较实验组和不同对照组的穿刺活检及消融技术成功率, 即时和延迟并发症的发生率; 评价双针成角顺序活检-消融术在胸膜下肺结节诊治中的可行性和安全性。两组间计量资料比较采用 t 检验, 计数资料采用 χ^2 检验, 对基线特征资料、技术有效性及并发症进行分析。

结果: 三组消融的成功率均为 100%, 即时气胸发生率及延迟气胸发生率 A 组为, B 组为, C 组为, A 组与两组间比较均无统计学差异, 置管率 A 组为 7.9%, B 组为 8.7%, C 组为 17%, 肺内出血 A 组为 14.3%, B 组为 27.8%, C 组为 9%, 复查后胸腔积液 A 组为 22.5%, B 组为 15.7%, C 组为 25.3%, 术后止痛药的使用 A 组 71.4%, B 组 56.5%, C 组为 78%, 均无支气管胸膜瘘或死亡等并发症发生, A 组出现 1 例 III° 皮肤烧伤, 后经对症治疗后恢复。

结论: CT 引导下经皮双针成角同时活检+消融技术对胸膜下结节诊治一体化是安全可行的, 采用相应的方法和技巧可以减少消融并发症的发生, 并减轻患者医疗负担, 减少住院次数。

PO-3238

CT 引导肺结节温度消融术后感染影像学特征及抗感染治疗

何晓锋、肖越勇、张肖、张啸波、张欣、魏颖恬、张忠亮
中国人民解放军总医院第一医学中心

目的 观察 CT 引导下经皮穿刺肺结节温度消融术后出现感染的情况, 分析术后感染的影像学征象及抗感染治疗后疗效评估。

方法 回顾分析 2018 年 1 月 1 日至 2023 年 6 月 30 日共 1859 例接受 CT 引导下肺结节温度消融术的患者, 其中术后出现感染的患者共 42 例, 共 42 个病灶, 病灶分布于右肺上叶 16 例, 右肺下叶 9 例, 右肺中叶 1 例, 左肺上叶 8 例, 左肺下叶 8 例, 包括实性结节 21 个, 磨玻璃结节 (GGN) 21 个。42 例患者均顺利完成手术, 其中 31 例行射频消融术, 6 例行微波消融术, 5 例行氩氦刀冷冻消融术。42 例患者术中均未见明显异常情况, 术后 24 小时内完成实验室化验及术后当日下午复查胸部 CT, 针对感染指标升高或发热的患者, 调整抗生素治疗, 分别于术后第 1 天, 第 3 天, 第 7 天复查感染指标和胸部 CT 评估感染控制情况。

结果 接受温度消融的 1859 例患者中有 42 例出现了术后感染, 感染率 2.26%。42 例术后感染患者经治疗后均恢复正常出院, 无死亡病例。患者均在术后 24 小时内化验感染相关指标均有不同程度升高及术后当天下午复查胸部 CT 可见消融区域出现感染的影像学征象, 在调整抗生素治疗后, 化验感染相关指标降低, 复查胸部 CT 提示随时间延长, 感染逐渐得到控制。

结论 CT 引导下经皮穿刺肺结节温度消融治疗安全有效, 感染率低。胸部 CT 是及时评估术后感染的有效检查方法, 根据不同时期 CT 征象可及时提示感染和预后。及时调整抗生素是治疗术后感染的有效方法。

PO-3239

不同长度鞘管在腹主动脉球囊阻断联合剖宫产术中的对比分析

张文哲、陆林
郑州大学第三附属医院

目的: 对比不同长度鞘管在凶险性前置胎盘行腹主动脉球囊阻断联合剖宫产术中的应用及相关并发症分析方法: 回顾性分析了 2022 年 4 月至 2023 年 12 月期间收治于我院的 159 例凶险性前置胎盘患者的临床资料。患者均行腹主动脉球囊阻断联合剖宫产术, 83 例患者应用长鞘置入球囊 (A 组), 76 例患者应用短鞘置入球囊 (B 组)。结果: 两组病例母婴情况 (年龄、孕周、孕次、产次、新生儿 Apgar 评分) 的差异无统计学意义 ($P>0.05$)。两组产妇术中出血量、输血比例、手术时间、球囊阻断时间、胎儿接收透视时间及放射剂量、术后行动脉栓塞率、子宫切除率上差异无统计学意义 ($P>0.05$)。A 组术后发现 2 例穿刺点血肿, 1 例发生股总动脉血栓; B 组术后发现 1 例穿刺点血肿, 6 例穿刺侧动脉血栓。形成动脉血栓上的差异有统计学意义 ($P<0.05$)。结论: 在凶险性前置胎盘的治疗中, 应用长鞘行腹主动脉球囊阻断联合剖宫产术可有效减少球囊对血管的损伤, 并降低穿刺侧下肢动脉血栓风险。

PO-3240

Pipeline 血流导向装置治疗颅内动脉瘤后出现的支架内狭窄: 发生率、危险因素及预后

米热扎提·吐尔洪、杨新健
首都医科大学宣武医院

背景: 支架内狭窄 (in-stent stenosis, ISS) 是 Pipeline 血流导向装置 (pipeline embolization device, PED) 治疗颅内动脉瘤 (intracranial aneurysms, IAs) 后可能发生的一种晚期并发症。

目的: 评估 ISS 的发生率、危险因素和预后。

方法: 本研究是一项回顾性、多中心、观察性研究。患者数据均来自 PLUS 注册研究。本研究中, 我们收集了随访时完成数字减影血管造影 (DSA) 的 IA 患者的数据, 并将患者分为“非 ISS”、“轻度 ISS”和“严重 ISS”组。使用多因素 logistic 回归以分析确定 ISS 的危险因素。

结果: 共有 1171 例患者 (1322 例 IAs) 使用 PED 治疗。其中, 662 例患者 (728 例 IAs) 进行血管造影随访, 随访中位数时间是 9 个月。本研究中, ISS 在 73 例 (10.03%) IAs 随访中发现, 其中轻度 ISS 61 例, 重度 ISS 12 例。单因素和多因素回归分析显示, 目前吸烟史 (轻度 ISS: OR = 2.15, 95% CI = 1.122-4.118, P = .021; 重度 ISS: OR = 5.858, 95% CI = 1.186-28.93, P = .030) 和脑动脉粥样硬化 (轻度 ISS: OR = 5.694, 95% CI = 3.193- 10.15, P = .001; 严重 ISS: OR = 6.103, 95% CI = 1.384-26.91, P = .017) 是 ISS 的独立风险因素。严重 ISS 组 IAs 在术后缺血性卒中发生率 (33.3%) 高于其他各组。

结论: 在 9 个月的中位数随访中, 大约 10.03% 的病例发生 ISS。在统计分析中发现, 吸烟史和脑动脉粥样硬化是 ISS 的主要风险因素。严重 ISS 可能与 IA 患者 PED 植入后缺血性事件高发有关。

PO-3241

介入置管技术建立营养通路改善重症营养方面的应用和疗效

张超、敖国昆、吴琼、罗涛
首都医科大学宣武医院

【摘要】目的 介入置管技术用于建立营养支持通路主要包括输液港植入的肠外营养支持、经鼻空肠管置入和经皮胃 (肠) 造瘘管置入的肠内营养支持, 本研究比较经输液港肠外营养支持、经鼻空肠管和胃 (肠) 造瘘管的肠内营养支持在长期不耐受经口进食的重症患者中应用的有效性和安全性。方法 回顾性分析 2019 年 10 月至 2022 年 9 月间, 首都医科大学宣武医院外科重症监护室收治的不耐受经口进食重症患者 100 例。根据营养方式的不同, 分为鼻空肠管组、胃造瘘组和肠外营养组。记录并比较三组的营养疗效、疾病临床疗效及并发症情况。结果 营养支持治疗前, 三组各指标均无显著差异 ($P>0.05$)。营养支持治疗后, 肠内 ALB 和 PAB 水平也显著高于肠外营养组 ($t=5.36$, $P<0.001$; $t=3.05$, $P=0.003$), 鼻空肠管组 NRS-2002 评分显著改善优于输液港组 ($t=2.03$, $P=0.045$) 和胃造瘘组 ($t=2.95$, $P=0.010$)。鼻空肠管组和胃造瘘组营养治疗效果比较: 胃造瘘组 NRS-2002 和 ICU 住院时间改善情况显著优于鼻空肠组 ($P<0.05$); Hb 水平、ALB 水平、PAB 水平和 APACHE-II 评分两组无显著统计学差异 ($P>0.05$)。同时, 三组置管并发症发生率为 0%, 营养支持相关并发症发生率为 20.1%。结论 介入置管技术用于建立营养通路安全有效, 重症患者长期不能经口进食患者采用肠内营养支持治疗优于肠外营养支持治疗, 介入下胃造瘘的肠内营养支持能够显著改善 NRS-2002 评分、缩短 ICU 住院时间, 对危重患者恢复至正常生理状态具有积极作用。

PO-3242

术前 AI 三维影像手术计划联合 CT 引导下线钩穿刺定位在多发肺结节精准手术中的临床应用

陈长春、潘晗
湖北省肿瘤医院

目的

随着近年低剂量 CT 肺筛查技术的普及, 同时性多原发肺癌 (synchronous multiple primary lung cancer, sMPLC) 的检出率逐渐升高。由于病灶小且多, 术前手术规划及肺结节定位对精准快速切除

多发肺结节、最大限度地减少肺损毁尤为重要。本研究旨在探讨 AI 全自动 3D 肺部影像重建技术联合线钩穿刺定位在胸腔镜下多发肺结节精准手术中的临床价值。

方法

回顾性分析我院 2020-2022 年间行胸腔镜下多发肺结节切除的病例，VATS 术前使用 AI 全自动 3D 肺部重建技术联合线钩穿刺定位 14 例作为研究组，未使用 3D 肺部重建和线钩穿刺定位 10 例作为对照组。每个患者术前均将胸部 CT 薄层图像数据匿名化传输至本地 AI 服务器（uAI Pioneer Portal Thoracic，联影），软件基于使用数学建模和机器学习开发和改进的智能算法，自动精准地三维重建肺结节、肺段、肺亚段、气管支气管（5 级）、肺内动静脉和淋巴结。由影像医师手动校准，必要时编辑增加未识别的肺结节病灶。由外科医生观察三维影像，对拟手术结节切缘外扩 2cm，并选择性使用 AI 软件行部分肺亚段的自动分割。切除术前 1~3h 根据拟切除结节数量在 CT 引导下穿刺标记 1 个或更多定位线钩。VATS 术中根据定位线钩的位置和三维重建图像行胸腔镜联合亚段/肺段或者楔形切除术。

结果：所有患者均顺利完成手术，无中转开胸或者中转肺叶切除。两组患者的年龄、性别、肿瘤直径、毛玻璃病灶比例、结节脏层胸膜距离、切除结节数量、胸腔引流管留置时间、术后住院时间、术后严重并发症发生率均无明显差别（ $P>0.05$ ）。研究组的手术实际切缘宽度，手术时间，术中出血量均小于对照组（ $P<0.05$ ）。

结论

CT 引导下穿刺线钩定位联合 AI 全自动三维重建技术，可以辅助胸腔镜下行多发结节切除术。此技术安全便捷，可行性强，有助于对肺多发结节精确定位、精准地切除并最大程度地保留肺功能。

PO-3243

电脑摄影辅助技术用于 CT 引导下经皮肺穿刺活检的初步研究

陈长春

湖北省肿瘤医院

目的 探讨应用电脑摄影辅助装置实时导航并优化穿刺流程的 CT 引导下经皮肺结节穿刺活检术的可行性及安全性。

方法 于 2022 年 3 月至 2022 年 6 月间将拟行肺结节穿刺活检术的患者随机分为电脑摄影辅助技术组（研究组）和对照组，纳入标准要求穿刺目标结节距离胸膜距离大于 2cm，且直径小于 3cm。对照组 45 例行徒手穿刺，研究组 45 例使用便携电脑外接摄像头并安装角度指示软件辅助穿刺，均为两位三年以上经验的医生共同完成。统计分析对比两组一次穿刺成功率、穿刺针调整次数、胸膜腔内进针时间及穿刺并发症发生率、穿刺病理样本充足率。

结果 两组患者的年龄、性别、肺基础疾病、肿瘤病史等基本资料无统计学差异（均 $P>0.05$ ）。研究组一次穿刺成功率高于对照组，差异具有统计学意义（ $P<0.05$ ）；进针调整次数、胸膜腔内进针时间、并发症发生率研究组均低于对照组，差异具有统计学意义（均 $P<0.05$ ）；穿刺样本充足率组间差异无统计学意义（ $P>0.05$ ）。

结论 电脑摄影辅助技术联合 CT 引导下经皮纵隔穿刺活检术可优化技术流程，使肺结节穿刺活检更加精准和安全，值得临床推广应用。

PO-3244

ICA 与 CTCA 在冠状动脉慢性完全闭塞病变的应用比较

周林

中国人民解放军陆军特色医学中心

目的: 探讨冠状动脉导管造影 (ICA) 与 CT 冠状动脉成像 (CTCA) 对于冠状动脉慢性完全闭塞病变 (CTO) PCI 结果指导作用的应用比较。**方法:** 选择在我院行 CT 冠状动脉成像 (CTCA) 证实为冠状动脉慢性完全闭塞病变 (CTO), 并在我院心内科择期 PCI 的冠心病患者 50 例。根据 ICA 及 CTCA 图像判断病变的位置、形状及钙化程度, 闭塞血管近段微通道等指标对 PCI 结果指导作用上是否存在差异性。**结果:** 50 例患者中有 53 支闭塞血管, 其中 27 支血管获得再通, 未再通血管 24 支。钙化程度、闭塞部位血管病变的形状及性质是 CTO 病变再通的重要影响因素。闭塞血管所处节段以及闭塞血管所处位置是否存在微通道是开通 CTO 病变操作时间的影响因素。**结论:** ICA 与 CTCA 均能准确判断 CTO 病变的走行, 评价其斑块的程度及性质。但 ICA 更能准确显示 CTO 病变远端是否有对侧冠状动脉侧枝循环形成; 进而准确判断导丝位置是否在靶血管腔内; 能更安全提高 CTO 介入治疗成功率。钙化程度、闭塞部位血管病变的形状及性质是 PCI 能否成功的重要影响因素。闭塞血管所处节段以及闭塞血管所处位置是否存在微通道是 PCI 操作时间长短的影响因素。

PO-3245

**AngioJet Zelante 血栓清除术在永久性滤器源性急性下腔静脉
闭塞腔内治疗中的初步探索**

张强、于涛

葫芦岛市中心医院

目的 探讨 AngioJet 8F Zelante 机械性血栓清除装置在治疗永久滤器源性腔-髂股静脉血栓中的临床价值。

方法 回顾性分析我院 2019.02-2023.02 收治下腔静脉永久滤器植入术后急性下腔静脉闭塞患者 9 例, 术前 CTV 明确诊断下腔-髂股静脉血栓, 滤器植入时间 3-11 年, TrapeEase 5 例, VenaTech LP 4 例, 所有病例均行肾上下腔静脉 Denali 滤器置入保护, 经颈静脉逆行入路 2 例, 经股静脉、腘股静脉顺行穿刺入路 7 例, 置入 AngioJet 8F Zelante 导管血栓清除装置, 通过喷射模式进行血栓内喷射 50 万 U 尿激酶, 等待 15 min 后行血栓抽吸治疗, 局部狭窄明显、影响血流行球囊扩张, 弹性回缩明显行髂静脉支架置入。下腔-髂股静脉血流恢复, 肾上滤器无血栓即刻回收滤器。术后随访 6 个月, 1 个月超声复查、6 个月时行下腔静脉 CTV 复查, 术后口服抗凝治疗至少 6 个月, 监测 D-二聚体变化。血栓清除评判标准: 血栓清除率 > 90% 为 III 级; 血栓清除率 50% ~ 90% 为 II 级; 血栓清除率 < 50% 为 I 级。

结果 所有患者下腔静脉血栓均进行了机械性血栓抽吸治疗, 术后造影评估 5 例下腔静脉血栓清除 III 级, 4 例 II 级。术后 6 个月随访无血栓复发患者, 一过性肾功能损害 1 例, 对症水化、利尿后好转, 无手术相关的严重并发症和死亡发生。

结论 AngioJet 8F Zelante 机械性血栓清除装置血栓清除效率高, 治疗永久滤器源性腔-髂股静脉血栓安全、有效。

PO-3246

CT 引导下新型便携式胸腔闭式引流装置治疗气胸的动物实验研究

何晓锋、肖越勇、张师闻、张肖、张啸波
中国人民解放军总医院第一医学中心

目的 评估 CT 引导下置入新型便携式胸腔闭式引流装置用于治疗实验动物气胸的安全性及有效性。
方法 建立 16 头巴马猪气胸模型，随机分为实验组及对照组，每组 8 头。对实验组于 CT 引导下置入新型便携式胸腔闭式引流装置，对照组置入传统胸腔闭式引流装置。对比组间肺完全复张时间、引流效率、手术时间及一次性置管成功率、并发症发生率等差异，并与文献报道中的同类装置进行对比，初步观察新型胸腔闭式引流装置用于气胸的价值。结果 2 组动物均存活，未出现严重并发症。实验组手术时间短于对照组($P<0.01$);组间肺完全复张时间、引流效率、一次性置管成功率及并发症发生率差异均无统计学意义(P 均 >0.05)。引流完全后实验组血氧饱和度和心率均恢复至正常水平，与建模前差异无统计学意义(P 均 >0.05)。结论 CT 引导下置入新型胸腔闭式引流装置用于巴马猪气胸模型安全、有效。

PO-3247

卡梅综合症的介入硬化栓塞治疗研究

潘登
安徽省儿童医院

摘要: **目的** 探讨卡梅综合症 (Kabasach-Merrittsyndrome, KMS) 经动脉导管硬化栓塞治疗的效果和临床应用价值。**材料与方法** 回顾我院 2018 年 1 月至今共收治的 21 例卡梅综合症患儿的临床资料，术前均经 CT 或 MRI 及临床综合诊断为卡梅综合症。所有患儿在完善相关术前检查后，在 DSA 下行经动脉导管硬化栓塞术。首先麻醉及进行股动脉置管，将微导管置入瘤体的供血部位，经微导管向瘤体内注入博莱霉素+超液化碘油+地塞米松混合乳剂，再以用 PVA 颗粒或微球颗粒栓塞供血动脉，部分病例采用弹簧钢圈进行栓塞，尽量将病灶的大部分供血血管进行栓塞。结果 9 例患儿中，头颈部 2 例，前胸壁 1 例，肩部 1 例，肝脏 1 例，腰背部 1 例，下肢 3 例，术前血小板均在 $57\times 10^9/L$ 以下。本组病灶患儿分别行 2~4 次介入栓塞治疗，治愈 7 例，好转 2 例，无死亡病例，无严重栓塞并发症发生。术后随访 10~24 月，未见病灶复发，血小板维持在正常水平。结论 经动脉导管硬化栓塞术治疗卡梅综合症安全有效，无明显并发症。经动脉导管硬化栓塞术主要采用硬化剂和栓塞剂栓塞瘤体供血动脉，使瘤体缺血、变性坏死，从而缩小瘤体体积，使血小板在瘤体内被捕获、破坏减少，甚至可完全消除瘤体，达到根治的效果，是卡梅综合症安全有效的治疗方式。本组 7 例患儿在采用介入硬化栓塞治疗后均取得显著疗效，术后血小板迅速提升至正常范围，瘤体明显变小或消失，皮下瘀斑减退。介入治疗可以避免外科手术中的大出血，但栓塞不当可损伤重要器官及组织血供，有时也可引起瘤体坏死感染，甚至引起正常组织的缺血坏死。针对本组 7 例卡梅综合症患儿的临床治疗及随访结果证实介入硬化栓塞治疗对卡梅综合症的疗效确切，该方法的优点是疗效显著、创伤小、无副反应，值得临床推广和使用。

PO-3248

婴幼儿腮腺血管瘤的介入治疗

潘登

安徽省儿童医院

摘要:目的:探讨介入栓塞在婴幼儿腮腺血管瘤治疗中的临床应用价值。方法:回顾性分析安徽省儿童医院介入病区 2021 年 4 月-2023 年 4 月治疗的婴幼儿腮腺血管瘤 32 例。其中,男 13 例,女 19 例,男女比例为 1:1.46;患儿年龄为 2 个月~8 月,平均年龄 4 个月。深部血管瘤 13 例,混合型血管瘤 19 例;21 例瘤体大小在 4cm×4cm 以上;右侧 17 例,左侧 15 例。无双侧受累者。完善术前相关检查及 CT 增强检查,无绝对治疗禁忌症,在静吸复合麻醉下行介入栓塞治疗,术后当天予以口服普萘洛尔片;术后一个月根据临床症状及超声检查评判疗效。结果:32 例患儿共行 33 次介入栓塞治疗,术后连续随访 6 个月,瘤体缩小 80%以上,经治疗后患儿面部对称,无软组织破溃,皮肤色泽正常;无腮腺分泌障碍和面神经损伤症状;未发现肺纤维化或生长抑制现象。结论:介入栓塞治疗婴幼儿腮腺血管瘤安全、有效,可成为治疗婴幼儿腮腺血管瘤的首选治疗方法之一。

PO-3249

经动脉导管化疗栓塞术在儿童肝母细胞瘤治疗中的应用价值

潘登

安徽省儿童医院

摘要:目的 讨论经动脉导管化疗栓塞术在儿童肝母细胞瘤治疗中的应用价值。材料与方法 回顾我院 2018 年 1 月~2022 年 12 月共收治的 14 例肝母细胞瘤患儿的临床资料,治疗前经 CT 或 MRI 诊断为肝母细胞瘤,完善相关术前检查后行动脉导管化疗栓塞术。首先麻醉及进行股动脉置管,将微导管置入病灶的供血部位,通过微导管将顺铂、吡柔比星及超液化碘油注入瘤体内,再用 PVA 颗粒栓塞供血动脉,尽量将病灶的所有供血血管进行栓塞。术后 1 个月复查 CT,根据肿瘤体积缩小程度、病灶内碘油沉积范围及血清 AFP 数值决定是否再次治疗。结果 14 例肝母细胞瘤患儿分别行 2~4 次动脉导管化疗栓塞术,和术前相比肿瘤体积缩小 45.7%~75.3%,平均缩小 62.3%,血清 AFP 下降 90.2%~96.5%,平均下降 94.8%。无明显化疗毒性反应,经动脉导管化疗栓塞后肿瘤手术完整切除 14 例,术后病理显示肿瘤明显坏死。随访 10~24 月,未见肿瘤复发。结论 经动脉导管化疗栓塞术治疗肝母细胞瘤安全有效,无明显并发症。它的优势在于能够使肿瘤吸收最大剂量的药物以及最大限度地减少药物的全身剂量。对婴幼儿肝母细胞瘤患者相关的手术治疗研究显示,一半以上的患儿在就诊时已经处于中晚期,较多因此失去治疗机会,而对于手术耐受较差的患儿,手术后的存活率则不足 1/3,因此术前如何提升对此类患儿的手术耐受及病灶控制,以为手术提供较好的基础条件是治疗的前提。本类治疗方式在术前的应用,能够对瘤体进行有效的控制,从而为患儿提供了外科手术切除的机会,也大大减小了手术创伤。因此经动脉导管化疗栓塞治疗儿童肝母细胞瘤值得临床推广和使用。

PO-3250

肝肉瘤样癌的影像学表现及经动脉栓塞的临床效果

闫卫鹏、杨倩、张水霞
湖北省肿瘤医院 (湖北省肿瘤研究所)

目的: 肝肉瘤样癌 (HSC) 是一种罕见的疾病, 其影像学特征尚未得到广泛认同。揭示经动脉栓塞术前后的肝肉瘤样癌的影像学特征, 可以为改善肝肉瘤样癌的影像学诊断和预后提供必要的信息。

方法: 对 6 例肝肉瘤样癌患者的影像学及临床资料进行回顾性分析。所有患者均经超声引导下经皮活检或术后病理证实为肝肉瘤样癌。所有患者均行肝动脉栓塞治疗。获得经动脉栓塞前后的 CT/MR 成像数据。结果: 1) 病变的最大直径为 2.2~13.5cm。2) 肿瘤实心部分呈轻度、延迟或持续强化。3) 肝动脉和门静脉分支在肿瘤周围/内部分别有 2 例和 4 例。4) 2 例患者发生淋巴结转移。5) 肝包膜受侵 2 例。6) 原发病灶表现为结节性碘油沉积, 周围有片状、结节状肿瘤染色阴影。6 例患者碘油栓塞后的随访 CT 分别在 3、18、5、2、2、4、19 个月出现肝内转移。7) 所有患者的甲胎蛋白 (AFP) 均正常。

结论: 肝肉瘤样癌的共同特征可总结如下: 1) 在 CT 或 MRI 上显示肿瘤体积大, 伴有坏死, 实体部分延迟或持续强化。淋巴结转移是很常见的。2) 肝动脉栓塞术后的复发率较高, 预后较差。

PO-3251

多功能金纳米凝胶栓塞剂增强肝癌介入治疗效果的实验研究

刘一鸣、郑传胜
华中科技大学同济医学院附属协和医院

目的: 经导管栓塞是临床治疗晚期肝癌的首选方法, 由于它是一种姑息治疗手段, 通常与化疗、射频消融 (RFA) 等其他治疗相结合, 以提高肿瘤的治疗效果。在本研究中, 我们将阿霉素负载在金纳米粒子修饰的温度敏感的 p (N-异丙基丙烯酰胺-co-丙烯酸) 聚合物中, 通过 ATRP 制备了一种集栓塞-化疗-成像于一体的新型栓塞剂。

方法: 通过对正常家兔肾脏进行肾动脉栓塞来评估 AuNP@PNA 血管栓塞的疗效。此外, 通过肿瘤生长和肿瘤转移, 研究 TACE 对 VX2 荷瘤兔的体内抗肿瘤作用。为了研究协同抗肿瘤机制, 对家兔 TACE 术后采用免疫反应 (CD3+/CD8+T 细胞)、转移情况 (MMP9)、缺氧 (HIF- α) 和血管生成 (VEGF) 评价肿瘤免疫微环境的变化情况。

结果: AuNP@PNAX/DOX 对肾栓塞具有持久的栓塞作用。同时, AuNP 的加入增强了 CT 成像效果, 且缓慢释放阿霉素, 可有效提高治疗效果, 从而增加肿瘤细胞凋亡。TAE 可诱导免疫细胞浸润, 从而改善肿瘤的免疫微环境。因此 AuNP@D-PNAX 具有巨大的临床应用潜力。

结论: AuNP@PNA/DOX 具有良好的药物动力学和生物相容性, 有望成为一种集栓塞-化疗-成像于一体的多功能栓塞剂, 以提高 TACE 治疗肝癌的效果。

PO-3252

多功能可注射温敏水凝胶用于增强肝癌 TAE 治疗抑制肿瘤转移的实验研究

刘一鸣、郑传胜

华中科技大学同济医学院附属协和医院

目的：经导管动脉栓塞（TAE）是中晚期肝癌患者的首选治疗方法，但存在栓塞牢固性和由此产生的肿瘤缺氧应答的两难困境，即栓塞不牢固时易引起血管复通和异位栓塞；而栓塞牢固时会进一步加剧肿瘤部位的缺氧应答，造成肿瘤复发和转移。因此，本实验旨在协调 TAE 治疗与由此引起的缺氧应答之间的矛盾，达到既抑制原位肿瘤，又抑制肿瘤转移的 TAE 治疗效果。

方法：本课题构建了一种含邻苯二酚结构的仿贻贝可注射温敏水凝胶。体外评价其温敏性、黏附性、抗氧化性以及可注射性；通过缺氧 HepG2 细胞培养实验探究水凝胶对肿瘤细胞中 ROS、HIF-1 α 、VEGF 的影响；利用兔正常肾脏栓塞实验评价其栓塞性能；在兔 VX2 肝原位肿瘤模型上评价基于该水凝胶的 TAE 的肿瘤治疗效果，并探究其机理。

结果：体外实验结果表明该水凝胶具有良好的温敏性、黏附性、抗氧化性以及易于注射，并能在体外降低乏氧肿瘤细胞中的 ROS、HIF-1 α 、VEGF。动物实验表明该水凝胶不仅持久、牢固地栓塞了肾动脉血管，增强了对原位肿瘤的治疗效果；还有效地降低了肿瘤部位的 ROS 水平，以及 HIF-1 α 等血管新生相关因子的表达，抑制了肿瘤转移。

结论：该水凝胶中的邻苯二酚结构一方面增强栓塞剂与血管间的结合力，另一方面消耗了肿瘤部位的 ROS，进而抑制了肿瘤细胞中 HIF-1 α 的表达，抑制了肿瘤血管新生，还改善了肿瘤免疫抑制微环境。由此，该策略“一石二鸟”式地克服了 TAE 面临的“栓塞与乏氧应答”两难问题。

PO-3253

非肝癌患者和接受 TACE 治疗的肝癌患者并发肝脓肿：临床特征、病因特征、治疗和结果分析

刘一鸣、郑传胜

华中科技大学同济医学院附属协和医院

目的：本研究的目的是评估非肝癌（non-LC）患者和接受 TACE（LC-TACE）治疗的肝癌患者肝脓肿（PLA）的临床、实验室和微生物学特征、临床结果和预后。

方法：对 2016 年 1 月至 2020 年 12 月连续 38 例肝脓肿患者的临床数据进行回顾性分析。比较两组肝脓肿患者的死亡率，并评估死亡率的风险因素。

结果：2016 年 1 月至 2020 年 12 月，共有 38 名符合纳入标准的 PLA 患者被纳入本研究，其中包括 24 名男性和 14 名女性。其中，非 LC 组有 25 名患者，LC-TACE 组有 13 名患者。发烧和发冷是两组患者最常见的症状，其次是腹痛。非 LC 组 1 名患者和 LC-TACE 组 2 名患者发生休克。非 LC 组脓液培养阳性率为 84%，其中最常见的病原体为肺炎克雷伯菌（61.9%，13/21），LC-TACE 组脓液阳性率为 92.3%，其中最常用的病原体为大肠杆菌（33.3%，4/12）。在非 LC 组中，22 名患者在治疗后好转，1 名患者没有好转，2 名患者在住院期间死亡，死亡率为 8%。在 LC-TACE 组中，8 例在治疗后好转，2 例没有好转，3 例在住院期间死亡，死亡率为 23.1%。多因素分析显示没有与死亡率相关的独立预后因素。非 LC 组的治愈时间为 37.4 \pm 23.1 天（6-90 天），LC-TACE 组为 91.5 \pm 49.7 天（19-180 天），两组之间差异有统计学意义（ $P<0.001$ ）。

结论：非 LC 组和 LC-TACE 组的肝脓肿在致病菌和治愈时间等方面有所不同。对于 TACE 后的肝脓肿，应考虑更积极、更全面的治疗。

PO-3254

经导管动脉化疗栓塞术加阿帕替尼联合或不联合卡瑞丽珠单抗单 抗治疗不可切除肝细胞癌：一项单中心回顾性研究

据书光、周晨、王迎亮、熊斌、郑传胜
华中科技大学同济医学院附属协和医院

目的：比较经导管动脉化疗栓塞术（TACE）加阿帕替尼联合卡瑞丽珠单抗（TACE-AC）与 TACE 加阿帕替尼（TACE-A）治疗不可切除肝细胞癌（HCC）的疗效和安全性。方法：在这项回顾性研究中，纳入了 2014 年 2 月至 2021 年 9 月期间接受 TACE-AC 或 TACE-A 治疗的不可切除 HCC 患者。这些患者均接受了 TACE 治疗。TACE-AC 组患者在 TACE 后一周内开始使用 200mg 卡瑞丽珠单抗，每 3 周一次，同时口服阿帕替尼 250mg/天。TACE-A 组患者仅口服阿帕替尼 250 毫克/天。研究的主要终点是总生存期（OS），次要终点包括无进展生存期（PFS）、客观反应率（ORR）、疾病控制率（DCR）和不良事件（AEs）。OS 和 PFS 采用 Kaplan-Meier 和 log-rank 检验进行分析。结果：共纳入 162 例患者。TACE-AC 组 80 例，TACE-A 组 82 例。TACE-AC 组的中位 OS 为 22.1 个月（95% CI: 12.6-31.7），TACE-A 组为 15.0 个月（95% CI: 12.2-17.8）（危险比 [HR] = 0.57; 95% CI: 0.38-0.85; P=0.005）。TACE-AC 组的中位 PFS 更长（15.1 个月 vs 7.0 个月; HR = 0.33; 95% CI: 0.23, 0.49; P<0.001），DCR 更高（81.2% [n=65] vs 67.1% [n=55], P=0.04）。两组的 ORR 无明显差异（58.8% [n=47, TACE-AC 组] vs 53.7% [n=44, TACE-A 组], P=0.514）。两组患者与阿帕替尼相关的不良反应发生率无明显差异。所有治疗相关不良事件均可耐受，未观察到严重不良事件。结论：TACE 联合阿帕替尼与卡瑞丽珠单抗治疗不可切除的 HCC 患者可能是一种很有前景的治疗方法，因为它具有良好的抗肿瘤活性和可控的安全性。

PO-3255

探究基于 M1 巨噬细胞 Exo 构建的新型 仑伐替尼纳米载药系统对肝癌的治疗效果

冯一鸣
华中科技大学同济医学院附属协和医院

目的肝癌是我国第四大癌症死亡原因，其 5 年生存率仅为 18%[1]，其中肝细胞癌（hepatocellular carcinoma, HCC）占有原发性肝恶性肿瘤的 75%-85%[2]。目前，手术切除仍是治疗肝癌最有效的方法，但大部分患者在确诊时已是中晚期，因肝内外转移或者门脉侵犯导致失去手术适应症，故仅 20%-30% 的患者适合手术[3]。然而当前肝癌的不同治疗方法的效果却仍差强人意，即便射频消融、介入栓塞化疗、放疗等姑息性治疗，也仅改善肝癌患者的生活质量和生存获益但疗效有限。因此，新的策略或手段的探索仍任重道远。

方法在研究中，申请人拟用黑磷纳米片负载仑伐替尼，再以 M1 型巨噬细胞外泌体（M1-Exo）为仑伐替尼递送载体，进一步将 CD47、SIRPα 抗体（Ab）和 M1-Exo 以 pH 敏感的连接物苯甲酰亚胺键偶联，构建新型仑伐替尼纳米载药系统（LT-M1-Exo@BP-Ab），拟解决以下科学问题：

（1）在酸性肿瘤微环境中，载药系统中 pH 敏感的连接物苯甲酰亚胺键被裂解，释放出可分别阻断巨噬细胞膜 SIRPα 的 SIRPα 抗体和阻断肝癌细胞膜 CD47 的 CD47 抗体，从而取消“do not Eat Me”信号，激发特异性 T 细胞抗肿瘤免疫反应；

（2）利用 M1-Exo 将肿瘤微环境中促肿瘤的 M2 型巨噬细胞重新极化为抗肿瘤 M1 型巨噬细胞，从而解除肿瘤微环境的免疫抑制效应；

(3) 包裹仑伐替尼的 M1-Exo 通过靶向高表达 CD47 的肝癌细胞, 增强肝癌细胞对仑伐替尼摄取, 从而提高其对仑伐替尼的敏感性。

结果在酸性肿瘤微环境中, 载药系统中 pH 敏感的连接物苯甲酰亚胺键被裂解, 释放出可分别阻断巨噬细胞上 SIRPα 的 SIRPα 抗体和阻断肝癌细胞上 CD47 的 CD47 抗体, 从而取消“do not Eat Me”信号;

结论本研究拟通过体内外实验探究基于 M1 巨噬细胞 Exo 构建的新型仑伐替尼纳米载药系统对肝癌的治疗效果, 以及增强仑伐替尼敏感性的效果。以期提高中晚期肝癌患者仑伐替尼的生存获益, 也为以巨噬细胞 Exo 为载体的新型载药平台的开发提供新的思路。

PO-3256

提高 125I 粒子植入患者的随访诊断有效性: 结合光谱计算机断层扫描和金属伪影减少算法的联合方法

周宇涵、王芝浩、雷丽敏、曹伟萌、刘杰、岳松伟
郑州大学第一附属医院

目的 评价光谱 CT 图像与金属伪影减少算法 (O-MAR) 在减少 125I 125I 粒子植入所致金属伪影中的协同作用。

方法 本研究回顾性纳入 45 例 125I 种子植入后行胸腹部双层光谱 CT (DLCT) 扫描的患者。将采集到的光谱数据重建为常规 CT 图像 (CI)、虚拟单色成像 (VMI、50-150 keV、20 keV/level)、CI 联合 O-MAR (CI+O-MAR)、VMI 联合 O-MAR (VMI+O-MAR), 评价各组的去伪影效果和图像质量改善。客观指标包括伪影指数 (AI)、受伪影影响的病变的信噪比 (SNR) 和对比度-噪比 (CNR)。主观指标包括评估过度校正的伪影、新的伪影、不同类型伪影 (a.近场带状伪影; b.近场条纹伪影; c.远场条纹伪影; d 模糊伪影; e.很少或无伪影)、整体图像质量和病变边界。计数数据的正态性采用夏皮罗-威尔克检验。采用单因素方差分析 (ANOVA) 来评估多组间的差异, 然后进行事后 LSD 检验。连续变量间的比较采用配对 t 检验。采用 kappa 和 Bland-Altman 分析来评估观察者间的一致性。

结果 对于低/高密度伪影, 各组 AI 均随着 VMI keV 的增加而呈下降趋势。在受伪影影响的病变区域 (ROIT) 中, CI/VMI+O-MAR 组 (50-150keV) 组的 SNR 和 CNR 均优于 CI 组 ($P<0.05$)。过校正伪影和新伪影集中在 VMI50/70keV 组中, 分别占 100%和 89.6%。在伪影类型评估中, 随着 VMI keV 的增加, 高密度伪影中 a 型带状伪影数量逐渐减少, 而很少或没有伪影的 e 型伪影数量增加, 每个形态中高密度伪影总数随着 VMI keV 的增加而减少。随着 VMI keV 的增加, 各组中高密度伪影的诊断和图像质量评分均高于低密度伪影。

结论 VMI 联合 O-MAR 可显著提高了 125I 粒子植入后 CT 随访的客观和主观图像质量、病变显示能力和诊断信心。并为 125I 粒子植入术后患者 CT 扫描方案的制定提供指导。此外, VMI 联合 O-MAR 在纠正高密度伪影方面显示了高效率。

PO-3257

利伐沙班预防肝硬化食管胃底静脉曲张出血 TIPS 术后血栓的疗效

孔德元
青海省第四人民医院

[摘要] 目的 探讨利伐沙班预防经颈静脉门体分流(TIPS) 术治疗肝硬化食管胃底静脉曲张出血术后 血栓的临床疗效及安全性。方法 前瞻性选取 2019 年 12 月至 2021 年 9 月间在青海省第四人民医院接受 TIPS 治疗肝硬化食管胃底静脉曲张出血患者 60 例, 随机分为两组, 试验组(n=30) 予以利伐沙班预防血栓治疗, 对照组(n=30) 不予利伐沙班干预。比较两组术后支架内血栓发生率、支架内最大血流速度及出血发生率、凝血功能。结论 利伐沙班可降低肝硬化食管胃底静脉曲张出血患者 TIPS 术后早期支架内血栓发生率, 提高支架内血流速度, 并不增加出血发生率, 用于预防 TIPS 术后支架内血栓形成的安全有效。

PO-3258

经导管动脉美蓝造影在下消化道动脉出血定位中的临床应用

阚雪锋、刘佳韵、张桂林、郑传胜
华中科技大学同济医学院附属协和医院

目的: 评估经导管动脉美蓝造影在下消化道动脉出血中的临床应用价值。方法: 10 例下消化道动脉出血患者, 行介入腹腔动脉造影, 发现出血责任动脉后, 将微导管超选置于出血责任动脉内, 在外科术中经微导管注入美蓝注射液, 显示出血段肠管, 为切除出血段肠管提供精准定位。结果: 经导管动脉美蓝造影可清晰显示出血段肠管, 10 例患者的出血段肠管得到快速精准切除治疗, 术后患者消化道出血停止, 且无手术相关并发症发生。结论: 经导管动脉美蓝造影可精准发现下消化道动脉出血段肠管, 为外科手术快速切除出血段肠管提供精准定位, 值得临床广泛应用。

PO-3259

射频热疗协同增效单纯疱疹病毒胸苷激酶/更昔洛韦基因治疗大 鼠肝癌的实验研究

熊付
华中科技大学同济医学院附属协和医院

目的: 探索一种利用光学/超声成像监测大鼠原位癌的 RF 热疗 (RFH) 增强单纯疱疹病毒胸苷激酶/更昔洛韦(Herpes Simplex Virus-Thymidine Kinase/Ganciclovir, HSV-TK / GCV)自杀基因治疗的新方法。

材料与amp;方法: 用慢病毒/萤光素酶基因转导大鼠肝癌细胞 (MCA-RH-7777)。(i) HSV-TK / GCV-介导的基因治疗联合 RFH 的不同处理分为四组: (1) HSV-TK / GCV 介导的基因治疗联合 RFH; (ii) 单独的基因治疗; (iii) 仅 RFH 和磷酸盐缓冲盐水 (PBS)。通过 Western 印迹验证细胞和肿瘤中的 HSV-tk 基因表达, 采用共聚焦显微镜和 MTS 评估细胞活力。生物发光光学成像和超声成像被用于不同时间点 (治疗后第 1, 7 和 14 天) 监测每个动物组中的肿瘤的光子信号和瘤体大小变化。

结果：在体外实验中，与单纯的基因治疗或 RFH 和 PBS 相比，MTS 结果显示联合治疗组中的细胞增殖最弱，该结果与共焦显微镜所计算的活细胞数量和光学成像所获取的光密度结果相一致。在体内实验中，与对照组相比，超声成像结果显示联合治疗组中肿瘤体积最小。与三个对照组相比，联合治疗组的生物发光光学成像进一步显示生物发光信号强度显著降低。这些成像结果进一步证实了联合治疗组中显著增加的凋亡细胞。

结论：在体外实验中，与单纯的基因治疗或 RFH 和 PBS 相比，MTS 结果显示联合治疗组中的细胞增殖最弱，该结果与共焦显微镜所计算的活细胞数量和光学成像所获取的光密度结果相一致。在体内实验中，与对照组相比，超声成像结果显示联合治疗组中肿瘤体积最小。与三个对照组相比，联合治疗组的生物发光光学成像进一步显示生物发光信号强度显著降低。这些成像结果进一步证实了联合治疗组中显著增加的凋亡细胞。

PO-3260

单纯 α -氰基丙烯酸正丁醇联合双腔取栓 球囊阻断术治疗脾动脉瘤 2 例

吕滨、李佳睿
吉林大学第一医院

脾动脉瘤是发病率排第三的动脉瘤，其最大的危害在于破裂后大出血，致死率可达 80%。脾动脉瘤的介入治疗包括腔内隔绝(包括覆膜支架)、栓塞(包括弹簧圈、液体栓塞剂)等。 α -氰基丙烯酸正丁酯是一种液体栓塞剂，又称为组织粘合剂，其具有组织相容性好、栓塞后再通率低且不依赖于体内凝血状态等特点。在临床工作中，为避免异位栓塞，组织粘合剂通常与球囊阻断术联合应用。

PO-3261

胸主动脉腔内修复术相关逆行性夹层患者影像学特征研究

王国权
河南省人民医院

目的探讨胸主动脉腔内修复术患者临床基本特征及其相关逆行性夹层患者影像学特征。

方法回顾性分析 2004 年 1 月至 2019 年 12 月期间在我中心治疗的 TEVAR 及其相关 RTAD 患者临床基础资料和影像学资料（主要为术中 DSA 和/或主动脉 CTA）。临床基础资料参考国内外文献设计建立数据库；影像学资料经过长期随访获得并通过医学影像分析工具（主要包括 Radiant DICOM Viewer 等专业影像分析工具）分析包括主动脉弓型、升主动脉直径、主动脉弓部支架锚定位置直径、破口位置、主动脉病理形态等指标，建立影像学资料数据库。通过分析数据库资料研究 TEVAR 临床基本特征及其相关 RTAD 患者影像学特征。

结果本组共纳入 1688 例 TEVAR 患者，其中男性 1428 例、女性 260 例，平均年龄 53 ± 13 岁（19-85 岁）。病理分型包括经典主动脉夹层 1230 例、主动脉壁间血肿和/或穿透性溃疡 362 例、胸主动脉瘤 68 例、胸主动脉假性动脉瘤 21 例、先天性主动脉缩窄 7 例。共发现 18 例 RTAD，且均发生于主动脉夹层组，男 13 例，女 5 例，平均年龄为 57 岁（38-79 岁）。

18 例 RTAD 患者影像学特征分析发现，RTAD 初始病理形态包括 11 例经典夹层、6 例局限性夹层、1 例壁间血肿。RTAD 初始及随访期发现破口位置 13 例位于支架头端，5 例距离支架头端 2cm 以上；17 例位于主动脉大弯侧，1 例位于小弯侧。在随访过程中 1 例壁间血肿随访期间进展为经典夹层；2 例局限性夹层患者 1 例于 2 周后进展为经典夹层、1 例在随访 2 年后病变进展明显；1 例初始表现为经典夹层的患者在第一次实施外科修复术后 96 个月病变再次进展。本组所有 RTAD 患者无

论初始病理形式表现为经典夹层、局限性夹层或壁间血肿，在随访期间发现药物保守治疗期间影像学表现均有不同程度的进展。

结论本研究中 RTAD 初始病理表现形式多样，包括经典夹层、局限性夹层及壁间血肿等；RTAD 患者无论初始病理形式表现为经典夹层、局限性夹层或壁间血肿，随访发现药物保守治疗期间影像学表现均有不同程度的进展。

PO-3262

ASL-MRA 和 CE-MRA 评估脑动静脉畸形闭塞

范雪姣

辽宁省肿瘤医院

目的：伽马刀放射手术(GKR)后的血管动静脉畸形(AVM)的治疗效果通常是用 DSA，尽管 DSA 应用广泛，但也存在一些风险，包括神经并发症、永久性残疾中风等。DSA 还使患者和医务人员暴露于电离辐射中，并带有与注射碘造影剂有关的风险。已有多项研究得出结论，TOF 血管造影和 CE-MRA 单独具有良好的诊断准确性，这支持将它们添加到 GKR 随访方案中。然而，由于其有限的灵敏性和特异性，采用 DSA 来确诊 AVM 闭塞仍是推荐的方案。

方法：对 30 例 AVM 患者在伽马刀放射治疗后进行了 DSA 检查，并进行了 ASL-MRA 和 CE-MRA 检查，MRA 扫描时间为 9 分 17 秒。排除一例无效数据后，最终 29 例患者的 DSA 和 MRA 数据由 2 名观察者对是否存在残留 AVM 进行独立盲评。

结果：9 名患者在 DSA 上检测到残留 AVMs(闭塞率达 69%)，这些残留 AVMs 的病例在至少 1 个 MRA 序列上被检测到。ASL-MRA 和 CE-MRA 分别显示了良好的特异性和阳性预测值(100%)。然而，他们的灵敏性和阴性预测值并不理想，因为结果中有 1 例动脉自旋标记 MRA 假阴性，2 例 CE-MRA 假阴性(灵敏性分别为 88%和 77%，阴性预测值分别为 95%和 90%)。如果对两个 MRA 序列进行复合评估，灵敏性和阴性预测值均增加到 100%。结合使用 ASL-MRA 和对 CE-MRA，可最大限度地提高诊断准确性。

结论：ASL-MRA 与 CE-MRA 相结合，有望作为 DSA 的替代方案来确认伽玛刀放疗后脑动静脉畸形的闭塞，该研究提供了 100%的灵敏性和特异性，它们的联合使用能够可靠地表征残留病变。

PO-3263

比较经导管动脉 CT(Angio-CT)扫描与常规多层螺旋 CT 扫描在 TACE 中的临床应用研究

马金强

华中科技大学同济医学院附属协和医院

目的 比较经导管动脉 CT(Angio-CT)扫描与常规多层螺旋 CT 扫描在 TACE 术中对目标肿瘤血管检测的影像学分析；方法和材料 回顾性收集分析 2020.4.1-2021.4.1 日在我院行 TACE 术的患者共 100 例（男性，50 例，平均 66 岁，女性，50 例，平均 55 岁），其中 50 例在 TACE 术前行常规多层螺旋 CT 扫描，50 例在 TACE 术中行经导管动脉 CT 扫描，在获取影像图像后，分别由两位具有 5 年以上影像阅片经验的医生对图像进行评估，包括肿瘤的检测能力、肿瘤的供血动脉的检测、供血动脉的信噪比的评估 结果 Angio-CT 检测肿瘤的能力优于 MSCT ($P<0.05$)，Angio-CT 比 MSCT 能检测到更多的供血动脉 ($P<0.05$)，Angio-CT 的供血动脉的 SNR 优于 MSCT ($P<0.05$)；结论 Angio-CT 能比 MSCT 提供更多、更重要的影像信息，从而可以使 TACE 手术更加精准。

PO-3264

基于 Web of Science 数据库钇 90 选择性内放射治疗研究的知识图谱分析

王莉、李梅、孙千福、秦浩、于海鹏
天津医科大学肿瘤医院

目的：本研究旨在通过对钇 90 选择性内放射治疗 (Y90-SIRT) 相关论文或综述进行计量文献分析，了解 Y90-SIRT 的发展现状、当前热点，以及该领域的未来发展趋势，为该领域进一步的研究提供参考和帮助。方法：自 Web of Science 数据库中检索与 Y90-SIRT 在肝脏肿瘤中的应用相关的论文和综述。通过 R4.2.2 的 bibliometric 包、VOSviewer 和 Citespace 对纳入文献进行统计绘图和可视化分析。结果：本研究共纳入 1126 篇相关文献，发文量整体呈上升趋势，在 2021 年达到顶峰。发文量领先的国家为美国，中国居于第五位 (44 篇)，各个国家之间合作密切。SALEM R 为该领域的高产作者。The Journal of Vascular and Interventional Radiology 是最主要的发文期刊。该领域主要研究方向有：Y90-SIRT 与其他治疗方法的联合治疗、Y90-SIRT 的安全性评估、Y90-SIRT 的有效性的评估。“锝 99-MAA”“肺分流分数”“免疫治疗”等是该领域的热门关键词。结论：本研究总结了 Y90-SIRT 应用于肝脏肿瘤的研究现状和发展趋势。该领域的论文总数呈上升趋势，Y90-SIRT 联合免疫治疗、Y90-SIRT 转化治疗、筛选适应人群是该领域专家学者仍需解决和持续关注的热点问题。

PO-3265

替拉扎明纳米凝胶联合 PD-1 单抗减少肝癌介入栓塞后残存和 转移的机制 及疗效研究

郭小鹏
华中科技大学同济医学院附属协和医院

经肝动脉化疗栓塞术是中晚期肝癌的常规治疗方法，但是术后残存的缺氧肿瘤细胞诱发的适应性改变及免疫抑制微环境常导致复发和转移，因此有效提高肝癌介入栓塞杀伤效果同时增强免疫效应极具研究前景。研究发现：缺氧激活的前药替拉扎明对缺氧肿瘤细胞及干细胞具有极强的的杀伤效果，可以将缺氧肿瘤细胞从治疗难点转化为治疗优势；PD-1 单抗可有效增加 T 细胞活化和杀伤效果。本项目构建替拉扎明纳米凝胶联合 PD-1 单抗用于肝癌治疗：把纳米凝胶良好的持久栓塞及药物缓释效应同替拉扎明靶向杀伤缺氧肿瘤细胞特点联合起来优势互补；肿瘤氧化应激释放自身抗原激活抗原提呈细胞联合 PD-1 单抗显著增强 T 细胞浸润及免疫效应，起肿瘤免疫原性死亡。通过体外实验及肝癌动物模型，从分子生物学、病理学及影像学等方面评价疗效及安全性，阐明协同治疗机制，从而为提高肝癌综合介入治疗效果提供理论基础及实践依据，有望为肝癌介入靶向联合治疗提供新思路。

PO-3266

载裂解 OK-432 和阿霉素的可注射水凝胶治疗不完全消融后 残存肝癌的疗效及机制研究

操焱焱、阚雪峰、郑传胜
华中科技大学同济医学院附属协和医院

研究目的：探究载裂解 OK-432 (lyOK-432) 和阿霉素的可注射新型纳米水凝胶治疗不完全消融后残存肝癌的疗效及机制。

材料与方法：首先比较裂解和非裂解 OK-432 促进 DC 细胞成熟作用。RADA16-I 凝胶溶于 lyOK-432 及阿霉素水溶液中形成 ROD 纳米凝胶，并对其材料学特性进行检测。ROD、RO、RD、OD、O、D 和 NS 组小鼠的肿瘤治疗反应、免疫细胞和细胞因子、DC 细胞中 cGAS/STING/IFN-I 的激活依次进行了检测。

结果：LyOK-432 比 OK-432 能更有效地促进 DC 成熟，并激活 IFN-I 通路。ROD 凝胶可高效负载 lyOK-432 和阿霉素，并且具有缓释性能。ROD 组肿瘤局部疗效最佳、小鼠生存时间最长，DC、CD4+T 和 CD8+T 细胞比例最高，IFN-g 和 TNF-a 表达水平最高，差异具有统计学意义 ($p<0.05$)。并且 DC 中 pSTING, pIRF3 和 IFN- β 表达水平也显著更高。再挑战实验中 ROD 组肿瘤生长也显著被抑制 ($p=0.01$)。

结论：新型 ROD 水凝胶通过激活 DC 中 STING 信号通路诱导抗肿瘤免疫反应，可以有效杀伤不完全消融后残存肿瘤。

PO-3267

经动脉插管腹部 CTA 取代 DSA 造影步骤在急性消化道出血栓塞手术中的可行性研究

张又新、魏佳

华中科技大学同济医学院附属协和医院

目的：探讨 nexarisAngio-CT 在消化道出血手术中，用造影导管经动脉插管腹部 CTA 取代 DSA 造影步骤在急性消化道出血栓塞手术中的可行性研究。方法：回顾性收集我院接收的行消化道出血栓塞术治疗的病人 20 例，对比经腹部 CTA 探测到出血点的数量和 DSA 造影步骤检查数量的对比以及造影剂的使用量。结果：结果 20 例消化道出血，两种方案同时检测出血有 16 例，CTA 检测出血 DSA 没有检测出来 2 例，CTA 未检测出来 DSA 检测出来 1 例，同时未检测出来 1 例，CTA 检测效率 90%，DSA 检测效率 85%，造影剂用量为 CTA (30 ± 5) ml, DSA(40 ± 5)ml。结论：经动脉插管 CTA 比 DSA 造影步骤在消化道出血手术中用更少的造影剂量，更高效的检测出血点的位置，此外配合 nexarisAngio-CT 的后处理引导导丝更快到达病灶位置，可取代动脉栓塞手术的造影步骤，减少手术时间

PO-3268

肿瘤源 PPIA 介导结直肠癌肝转移射频消融术残瘤化疗抵抗的机制研究

范宏杰¹、杨晓明²

1. 华中科技大学同济医学院附属协和医院

2. 华盛顿大学医学院放射学系影像引导生物分子介入研究室

目的：探讨肽基脯氨酸异构酶 A (PPIA) 在 RFA 治疗结直肠癌肝转移 (CRLM) 残瘤进展和化疗抵抗的细胞分子生物学机制。

方法：采用超速离心法从肿瘤培养上清 (Tumor culture supernatants, TSN) 中分离提取并鉴定外泌体 PPIA，通过共培养实验及 Western bolt 明确肿瘤外泌体 PPIA 表达与免疫抑制型 M ϕ 的调控关系，并通过动物实验验证。采用 Western bolt 及流式细胞术评估各共培养体系中 TAM 的 CD147 表达情况，通过免疫共沉淀明确肿瘤外泌体 PPIA 与 CD147 互作情况，考察 TAM 自分泌 CSF1 对 PPIA/CD147 通路的调控特征。采用 RT-PCR、Western bolt 及流式细胞术明确体外敲低 PPIA 提

高 CPT-11 介导热处理残存肿瘤细胞的凋亡效果, 通过动物实验考察 PPIA 抑制剂 (Cyclosporin A 或 TMN355) 联合 CPT-11 抑制残瘤生长、改善 Mφ 免疫抑制表型的可行性。

结果: RFA 术后残瘤及复发 CRLM 组织 PPIA 表达上调与更差的 OS 相关, 且 MAPK-ERK1/2 通路被激活, 血管生成及 ECM 重塑明显; 体外实验结果显示, iRFA 组 PPIA 在 mRNA 及蛋白质水平表达上调, 敲低 PPIA 能降低磷酸化 ERK1/2, 抑制肿瘤细胞增殖。测序数据显示残瘤 PPIA 特异性受体 CD147 表达上调, 且伴随 CSF1 释放及异构酶通路的异常激活, 并在后续 RT-PCR 及免疫印迹实验中得到验证。PPIA 外泌体介导的 TAM 免疫抑制表型 (增殖、迁移、分化与极化) 及 MAPK-ERK1/2 通路激活状态, 可通过 sh-PPIA 回复; 通过检测 sh-PPIA 介导的 TAM 免疫抑制表型改善及 MAPK-ERK1/2 通路抑制, 并能通过 PPIA 外泌体回复。通过分析细胞表型、细胞半抑制浓度明确了残存肿瘤细胞对其化疗抵抗, 并通过免疫组化及 Elisa 实验明确了 iRFA 术后残瘤 TAM 的免疫抑制状态。

结论: iRFA 后残存 CRLM 的肿瘤微环境中, 肿瘤细胞外泌体 PPIA 在 CSF1 协同下与 TAM 跨膜糖蛋白 CD147 结合, 通过 P38/NF-κB 信号通路促进 TAM 增殖及 M2 极化, 从而诱导化疗抵抗。

PO-3269

球囊扩张联合内外引流管治疗良性输尿管下段狭窄的 远期疗效分析

卢浩浩、郑传胜

华中科技大学同济医学院附属协和医院

目的: 介入治疗下采用球囊扩张联合内外引流管治疗输尿管狭窄的报道较少, 探讨该治疗方式的安全性、有效性及远期疗效。

资料和方法: 收集 2013 年 10 月至 2016 年 10 月接受介入治疗的良性输尿管下段狭窄的 42 例患者资料, 手术方式均采用球囊扩张联合内外引流管植入。男性患者 25 例, 女性患者 17 例。年龄 27-73 岁。输尿管狭窄的长度 0.2-2.1cm, 平均 1.1 ± 0.5 cm。先天性输尿管狭窄患者 7 例 (16.7%), 炎症导致输尿管狭窄患者 12 例 (28.6%), 因取石或碎石后输尿管狭窄 15 例 (35.7%), 盆腔或腹腔手术后导致输尿管狭窄 8 例 (19.0%)。术前患者尿素氮 3.9-12.9mmol/L, 肌酐 54.5-339.5μmol/L。拔除引流管后, 每半年复查泌尿系 B 超、泌尿系增强 CTU 或 IVP。随访时间 12-60 月。

结果: 42 例患者完成介入治疗, 技术成功率 100%, 未出现输尿管穿孔、破裂等并发症。拔除内外引流管时复查尿素氮 3.8-9.1mmol/L, 肌酐 45.2-189.6 μmol/L。患者术前及拔管时尿素氮及肌酐水平有显著性差异 ($P < 0.05$)。6 个月输尿管通畅率 100%, 12 个月输尿管通畅率 93%, 18 个月输尿管通畅率 83%, 24 个月输尿管通畅率 79%, 30 个月输尿管通畅率 76%, 36-60 个月输尿管通畅率 73%。多因素 Cox 回归分析结果示: 狭窄长度是影响术后通畅的危险因素 ($P < 0.05$)。

结论: 使用球囊扩张联合内外引流管植入治疗良性输尿管下段狭窄, 安全可靠, 短期及中远期疗效满意, 治疗全周期患者痛苦少、费用低, 是值得推荐的治疗策略。

PO-3270

经动脉栓塞治疗胰背动脉出血的安全性和有效性

李安

襄阳市中心医院

目的: 评价经动脉栓塞治疗胰背动脉 (DPA) 出血的安全性和有效性。

方法: 回顾性分析在我院行胰背动脉栓塞治疗的 11 例患者的相关资料。所有患者在介入栓塞术前及术后随访过程中均行腹部增强 CT 检查。总结分析此类患者的临床表现及术中血管造影的表现, 统计经动脉栓塞治疗胰背动脉出血的技术成功率、临床成功率、再出血发生情况及并发症情况。技术成功定义为经皮动脉栓塞术后, 复查造影未在有活动性出血的影像征现, 临床成功被定义为在介入栓塞术后 30 天内腹部出血的体征或症状消失, 且不需要接受额外的手术治疗 (如外科手术、内镜下治疗或介入栓塞术)。再出血指介入栓塞术后出血停止后 72 小时内血红蛋白下降 $>2 \text{ g/dl}$ 。

结果: 4 例患者临床表现为腹腔引流管出血、3 例表现为黑便、2 例表现为腹痛、2 例表现为便血。术前腹部增强 CT 检查出血的阳性影像学表现包括假性动脉瘤 5 例和造影剂外渗 4 例, 2 例患者腹部增强 CT 未发现明显出血阳性表现, 但患者及家属仍要求行选择性血管造影。介入术中血管造影表现包括假性动脉瘤 5 例、造影剂外渗 4 例、动脉分支突然中断 1 例、动脉分支血管粗细不均 1 例。所有患者 TAE 术中根据情况单纯采用明胶海绵颗粒/明胶海绵条、弹簧圈、NBCA 胶栓塞或者联合采用上述栓塞剂栓塞。所有患者均成功行 TAE 术, 技术成功率 (11/11, 100%), 随访过程中 1 例患者再次出血, 最终再次行外科手术, 临床成功率 (10/11, 90.90%)。所有患者在随访过程中没有新发坏死性胰腺炎、肠缺血性坏死或脾梗死。

结论: 经动脉栓塞治疗胰背动脉出血是一种安全有效的治疗方法。

PO-3271

温敏纳米碘油用于动脉模型栓塞的实验研究

钱坤¹、张鸿森¹、任衍乔¹、李涵^{2,3}、赵彦兵²、杨祥良²、郑传胜¹

1. 华中科技大学同济医学院附属协和医院

2. 华中科技大学生命科学与技术学院

3. 广东广纳安疗科技有限公司

目的: 旨在评估新型液体温敏纳米碘油 (PEGL) 栓塞兔肾动脉和肝癌模型的疗效及安全性。

材料方法: 经导管栓塞健康新西兰大白兔右肾动脉 ($n=24$) 和肝脏 VX2 瘤模型 ($n=24$)。随机分为四组 (每组 $n=6$): (A 组) 生理盐水 (NS)、(B 组) 碘油、(C 组) 100-300 μm 聚乙烯醇颗粒 (PVA) 和 (D 组) 纳米碘油 PEGL。采用经导管超选择性栓塞右肾动脉及肝 VX2 瘤, 通过影像学 and 分子生物学综合评价其生物安全性和疗效。

结果: 新型温敏纳米碘油栓塞肾动脉和肿瘤血管生物安全性好, 自显影且可实现长期末梢性栓塞正常和肿瘤血管。栓塞肿瘤血管可有效抑制肿瘤生长, 其栓塞后 3 天和 7 天, 肿瘤生长率均明显低于对照组 ($p<0.01$), 肿瘤坏死率高 ($p<0.01$)。免疫组化结果表面 PEGL 可有效抑制肿瘤组织 HIF-1 α 、VEGF 和 CD31 的表达 ($p<0.01$)。

结论: 新型温敏纳米碘油 PEGL 可作为作为一种安全有效的自显影型液体栓塞剂, 可作为肝癌介入栓塞治疗的潜在性新型纳米栓塞材料。

PO-3272

肝癌合并门静脉癌栓的介入局部治疗联合 SBRT 放疗的疗效分析

钱坤、阚雪峰、郑传胜

华中科技大学同济医学院附属协和医院

目的: 评价介入局部治疗 (TACE+PEI) 联合立体定向放射治疗 (SBRT) 综合治疗肝癌合并门静脉癌栓患者的疗效及安全性。

材料方法: 回顾性分析 2017 年 1 月至 2022 年 12 月我科收治的 200 例肝癌合并单支门静脉癌栓患者临床资料, 其中 98 例患者接受了 TACE+PEI 联合 SBRT 放射治疗, 102 例接受了 TACE+PEI 治疗。分析两组患者基线资料、手术并发症、客观缓解率、无进展生存期和中位随访时间进行比较。

结果: 两组所有患者均成功接受了 TACE+PEI 联合 SBRT 或 TACE+PEI 治疗, 技术成功率 100%。患者中位随访时间 TACE+PEI 联合 SBRT 组为 16.7 个月(95% CI: 3.5–57.6)和 TACE+PEI 组为 12 个月(95% CI: 2.5–36.4), ($p>0.05$)。但 TACE+PEI 联合 SBRT 组的 6 个月、12 个月和 24 个月的无进展生存率 PFS 较 TACE+PEI 组更好(分别为 94.2% vs 47.5%、93.6% vs 37.5%、77.8% vs 13.5%, $p<0.01$), 而且 6 个月、12 个月和 24 个月 OS 率更佳(分别为 91.8% vs 74.9%、92.4% vs 61.3%、87.3% vs 30.3%, $p<0.001$)。亚组分析发现, 肿瘤直径 >5 cm 和门静脉癌栓是影响疗效的主要风险因素, TACE+门静脉癌栓 PEI 联合 SBRT 可显著改善 OS 和 PFS($P<0.05$)。患者疼痛和术后出血是 TACE 联合门静脉癌栓 PEI 的主要并发症($P<0.05$), 而联合 SBRT 并未增加并发症的发生率。倾向评分匹配法校正后结果相似。

结论: 对于晚期肝癌合并单支门静脉癌栓患者, 尤其是当肿瘤直径 >5 cm 合并门静脉癌栓者, 采用 TACE +门静脉癌栓 PEI 联合 SBRT 治疗是安全有效的, 能够显著提高生存期。

PO-3273

载 anti-VEGF siRNA 温敏微凝胶治疗肝癌模型的实验研究

钱坤、钱骏、郑传胜

华中科技大学同济医学院附属协和医院

目的: 探讨负载 anti-VEGF siRNA 的聚异丙基丙烯酸酯温敏微凝胶栓塞治疗兔肝 VX2 瘤的可行性, 评价其安全性和抗肿瘤疗效。

材料和方法: 建立 40 只兔肝 VX2 瘤移植性肝癌模型, 行 MR 检查证实后, 随机分为四组, 经兔股动脉逆行插管, 并超选择插管至肿瘤部位分别进行以下治疗方案: A 组: 经导管注入载 anti-VEGF siRNA 温敏微凝胶约 0.4ml ($n=10$); B 组: 经导管注入空白聚异丙基丙烯酸酯微凝胶约 0.4ml ($n=10$); C 组: 经导管灌注等量 anti-VEGF siRNA 的生理盐水 0.4ml ($n=10$); D 组: 经导管注入生理盐水 (NS) 0.4ml ($n=10$); 在治疗前 1 天和治疗后 7 天分别进行 MRI 扫描检查, 分别测得术前平均肿瘤体积 V1 和术后平均肿瘤体积 V2, 比较肿瘤变化率 $V2/V1$, 并于第二次 MRI 检查后处死实验动物, 进行病理学检查。然后在影像学和病理学角度综合评价肿瘤生长率和肿瘤坏死程度, 以及观察实验动物生存情况。

结果: 载 anti-VEGF siRNA 温敏微凝胶可通过导管进入肿瘤靶区, 栓塞肿瘤供血血管并靶向抑制肿瘤细胞 VEGF 表达; 栓塞治疗前, 兔肝 VX2 瘤体积间无显著差异 ($P<0.05$, ANOVA 法)。栓塞后 1 周各组肿瘤平均生长率分别为 A 组 $87.82\%\pm 15.34$, B 组 $110.70\%\pm 24.04$, C 组 $231.25\%\pm 12.74$ 和 D 组 $361.34\%\pm 17.11$, 组间两两比较存在显著性差异 ($P<0.05$, Bonferroni 法)。anti-VEGF siRNA 微凝胶栓塞组与空白聚异丙基丙烯酸酯微凝胶栓塞组比较, 空白组在肿瘤旁交界区内有较多残存的活性肿瘤细胞, 且更多 VEGF 表达。与 anti-VEGF siRNA 和生理盐水灌注对照组比较, 空白和载阿霉素聚异丙基丙烯酸酯微凝胶栓塞组, 肿瘤坏死范围更广、坏死程度更高。

结论: 聚异丙基丙烯酸酯温敏微凝胶可作为一种安全有效的基因治疗药物载体, 栓塞治疗兔肝 VX2 瘤可明显抑制其生长, 能够发挥栓塞和基因靶向双重治疗效果。

PO-3274

CT 引导下 Hook-wire 穿刺定位肺小结节的临床应用价值

冉雄、周绍权、李康、杨健、刘昊
重庆市人民医院

目的 探讨 CT 引导下 Hook-wire 定位在胸腔镜肺小结节切除术中的应用价值。

方法 以 2021 年 9 月—2023 年 8 月该院收治的 425 例肺小结节患者为研究对象，全部患者均行胸腔镜下肺楔形切除术，术前 CT 引导下 Hook-wire 定位。穿刺定位方法：患者术前先行 CT 扫描，掌握病灶位置、形态及与周边组织的关系；结合立体重建技术，在三维坐标上准确标记进针角度和距离，明确穿刺点和进针通道；穿刺点消毒、局部麻醉后，CT 引导下将内含钢丝的穿刺针缓慢穿入胸壁和肺组织，操作尽量穿过病灶或靠近相近肺组织；撤出套管针，释放 Hook-wire，复查 CT 确认钩端固定位置满意，无气胸、出血等并发症后，剪断金属线，准备手术。观察定位成功率、定位相关并发症等指标。

结果 425 例患者共计肺小结节 502 个，结节定位时间 8~27 分钟，平均 (15.3 ± 3.5) 分钟。结节定位成功率 95.8% (481/502)。定位后 CT 复查提示 36 例患者单出现气胸，24 例患者单出现少量出血，同时出现气胸及出血患者有 11 例，术中 12 例患者脱钩，并发症发生率 16.5% (83/502)。

结论 CT 引导下 Hook-wire 可精确定位肺小结节具体位置，有利于提高治疗准确性，降低意外风险，利于后续手术快速、安全，值得临床推广使用。

PO-3275

mTACE 治疗肝癌外周血 PD-1 表达及临床意义

任志忠、张跃伟、岳元勋、汪桢琴、王雅静
清华大学附属北京清华长庚医院

目的 初步探讨应用 mTACE 治疗肝癌术后外周血中 CD4+PD-1、CD8+PD-1 变化及意义。

方法 应用流式细胞技术检测健康组、肝硬化组和肝癌患者 m-TACE 术前与术后 1-2 周外周血中 CD4+PD-1、CD8+PD-1 表达情况。

结果 选择健康人及肝硬化患者各 12 名，符合入组标准的肝癌患者共计 20 例。肝癌组外周血 CD4+PD-1、CD8+PD-1 表达均明显高于肝硬化组及健康对照组。肝癌患者经 mTACE 治疗后 1-2 周外周血 CD4+PD-1 表达较治疗前下降，由术前 $(38.65\pm8.56)\%$ 下降至 $(31.65\pm5.81)\%$ 。同样 CD8+PD-1 表达也较治疗前下降 $(41.17\pm12.12 \text{ vs } 29.29\pm10.48)\%$ 。

结论 m-TACE 治疗肝癌能够显著降低外周血 CD4+/CD8+ PD-1 的表达，表明该方法对机体免疫功能有正向调节作用。

PO-3276

低剂量双源 CT 扫描在肺穿刺活检中的应用价值

常飞霞、朱大林、苟芳丽、周志宏、崔芳娟
甘肃省妇幼保健院(甘肃省中心医院)

目的：探讨低剂量双源 CT 扫描在经皮肺穿刺活检术中的可行性和应用价值。

方法：选取我院 2022 年 7 月—2023 年 8 月接诊的 CT 引导下经皮肺穿刺活检患者 32 例，每位肺穿刺患者常规扫描图像要包括四组图像（穿刺前定位大范围扫描、同轴引导针局部扫描、穿刺切割针局部扫描，术后大范围扫描），将穿刺前定位大范围扫描及同轴引导针局部扫描定为常规剂量扫

描组, 穿刺切割针局部扫描及术后大范围扫描定为低剂量扫描组。同一病人两组图像的扫描范围一致, 常规剂量组 32 组图像扫描条件[管电压 120 Kv, 管电流为智能自动毫安秒扫描(平均 120 mAs)], 低剂量组 32 组图像扫描条件[管电压[(A 球管 140KV, B 球管 80KV), 管电流为智能自动毫安秒扫描(A 球管 8mAs, B 球管 34mAs)], 分别比较图像质量, CT 容积剂量指数(CTDIvol), 计算各组图像的有效照射剂量[剂量长度乘积(DLP)及有效剂量(ED)], 病理取材符合率。探讨低剂量双源 CT 扫描在 CT 引导下经皮肺穿刺活检术中的临床应用价值。

结果: 常规剂量组图像质量优率为 100%, 低剂量组图像优良率为 96%, 均达到诊断要求, 俩组图像质量评分及病理符合率比较差异无统计学意义 ($P>0.05$)。低剂量组图像 CTDIvol、总 DLP 结果显著低于常规剂量组, 差异具有统计学意义 ($P<0.05$), 计算俩组 ED 比较, 差异具有统计学意义 ($P<0.05$)。

结论: 低剂量双源扫描在 CT 引导下经皮肺穿刺活检术中, 低剂量扫描能够实现对辐射剂量的大幅度缩减, 但并不会导致图像质量、病理取材符合率结果受到影响, 可充分满足经皮肺穿刺需求。

PO-3277

虚拟单色光谱成像与金属伪影减少算法在 CT 引导下经皮肺活检的应用研究

田帅¹、白宇翔²、郎宁¹、袁慧书¹

1. 北京大学第三医院

2. 北京丰台中西医结合医院

目的: 评价虚拟单色光谱成像(virtual monochromatic spectral imaging, VMSI)与金属伪影减少算法(metal artifact reduction, MAR)在 CT 引导下肺部病变穿刺活检中减少金属伪影的效果。

方法: 43 例肺部病变患者在双能 CT 引导下进行经皮肺活检。从单能图像(120kVp)和 40、74、120、140keV 的 VMSI 成像以及是否使用 MAR 算法中生成了 9 组图像。测量每组图像中穿刺针前感兴趣区域的图像噪声(standard deviation, SD)、伪影指数(artifact index, AI)和信噪比(signal-to-noise ratio, SNR)。同时采用 Likert 评分对穿刺针前图像质量进行评分, 比较各组图像质量评分及各组 SD、AI、SNR 的差异。

结果: 两名观察者的 Likert 评分一致性良好(κ 值=0.893)。与标准单能 CT 相比, 额外的 MAR 重建显著改善了种植体附近的噪声($P<0.05$)。AI 和 SNR 显著改善($P<0.05$)。高 keV-MAR 组($\geq 120\text{keV}$)的 SD、AI、SNR 均显著高于 120kVp 组和低 keV-MAR 组($<120\text{keV}$, 均 $P<0.05$)。主观评价中, 120keV-MAR 组和 140keV-MAR 组的平均 Likert 评分均在 3 以上。平均体积加权 CT 剂量指数(CTDIvol)为 9.24mGy。

结论: 采用 MAR 算法的高 keV($\geq 120\text{keV}$)虚拟单色光谱成像能有效减少肺活检针尖前的金属伪影, 提高活检针周围肺靶病灶解剖结构的清晰度。

PO-3278

虚拟单能谱成像技术联合金属伪影减少算法在能谱 CT 引导下骨活检中的应用价值

田帅¹、白宇翔¹、郎宁²、袁慧书²

1. 北京丰台中西医结合医院

2. 北京大学第三医院

目的: 评价能谱 CT 虚拟单能谱成像技术联合金属伪影减少算法(metal artifact reduction, MAR)在 CT 引导下骨活检中减少活检针金属伪影的应用价值。

方法: 回顾性收集 2021 年 3 月-4 月共 30 例脊柱肿瘤患者信息, 均在能谱 CT 下完成 CT 引导下骨穿刺活检。从单能图像 (120kVp) 和 40、74、120、140keV 的虚拟单能谱成像以及是否使用 MAR 算法中生成了 9 组图像。由两位观察者分别勾画并测量各组图像中骨活检针尖前方靶区的 CT 值和图像噪声, 并以皮下脂肪为参考, 计算伪影指数 (Artifact Index, AI) 和信噪比 (Signal-to-Noise Ratio, SNR)。同时对靶区附近的图像质量使用 1-5 标度评分方法 (Likert 评分) 进行主观评估。均由两位观察者进行测量和评估, 采用 Cohen κ 检验评价主观评估一致性。符合正态分布的数据使用 t 检验, 不符合正态分布的数据使用 Friedman 秩和检验。

结果: 两位观察者 Likert 评分一致性检验结果为良好 ($\kappa=0.912$)。40keV-非 MAR 组的图像噪声与 AI 值劣于 120kVp 组 ($P<0.05$)。74keV-MAR 组 SNR 与 Likert 评分优于 120kVp 组 ($P<0.05$)。120keV-MAR 组与 120kVp 组的图像噪声 (103.7 ± 58.5 vs. 123.7 ± 61.4)、AI (102.7 ± 59.2 vs. 109.7 ± 66.4) 差异无统计学意义 ($P>0.05$), SNR (10.5 ± 1.2 vs. 7.5 ± 8.9) 与 Likert 评分 (3.8 ± 0.8 vs. 1.0 ± 0.2) 的差异均有统计学意义 ($P<0.05$)。1 图像主观评价中, 120keV-MAR 组和 140keV-MAR 组两位观察者 Likert 评分的平均值均 >3 分。

结论: 能谱 CT 高 keV (140keV) 虚拟单能谱成像技术计算联合 MAR 算法可有效减少骨活检针尖前方金属伪影, 并能够提供实时精准的 CT 影像引导。

PO-3279

远桡动脉入路在肝动脉化疗栓塞中应用探索

王鑫森、张文雷、薛苏阳、王雪、李佳睿
吉林大学第一医院

肝动脉化疗栓塞术 (TACE) 是治疗中晚期原发性肝癌的首选方案。经典的路径为经股动脉穿刺路径。由于股动脉较粗大, 可重复进行穿刺行 TACE 治疗, 是进行各种腔内治疗理想的穿刺入路。但是患者术后卧床、穿刺点压迫时间长, 患者舒适性差, 进食、如厕不方便、下肢深静脉血栓形成风险高、穿刺点并发症多等缺点, 我们尝试经上肢远桡动脉入路行 TACE 治疗, 旨在探索经远桡动脉入路行肝动脉化疗栓塞术的可行性、安全性。

PO-3280

肝动脉灌注化疗对比全身化疗方案治疗不可切除胆管癌: 一项单中心回顾性研究

吴博阳^{1,2}、张跃伟^{1,2}
1. 清华大学医学院
2. 清华大学附属北京清华长庚医院

肝动脉灌注化疗对比全身化疗方案治疗不可切除胆管癌: 一项单中心回顾性研究

背景: 由于目前一线化疗方案的疗效有限, 需要新的治疗策略来改善晚期不可切除胆管癌 (CCA) 患者的预后。尽管肝动脉灌注化疗 (HAIC)、化疗和程序性细胞死亡蛋白-1 (PD-1) 抑制剂在晚期肝细胞癌治疗中的应用已被广泛评价, 但它们在晚期 CCA 中的作用尚不清楚。本研究的目的是比较 HAIC 对比化疗方案治疗晚期不可切除 CCA 的疗效和安全性。

方法: 选取 2019 年 3 月至 2022 年 6 月在我院接受 HAIC 和化学治疗的晚期 CAA 患者, 记录临床资料并进行随访。根据无进展生存期 (PFS) 和肿瘤反应评价疗效, 根据不良事件 (AE) 发生率评价安全性。

结果：98 例晚期 CCA 患者分为 HAIC 组 (n=61) 和化疗组 (n=37)。中位随访时间 22.0 (14.5~34.5) 个月。HAIC 组的 PFS (HR=0.797; 95%CI 为 0.478 ~ 1.330; P=0.330) 与化疗组无明显差异。两组的客观有效率和疾病控制率也无显著性差异。与化疗组相比, HAIC 组发生白细胞减少 (65.6% vs. 32.4%, p=0.001) 和转氨酶升高 (60.7% vs. 27%, p=0.001) 的比例更高, 同时 3-4 级 AE 的发生率无明显差异, 但 HAIC 组中有 2 名患者 (3.3%) 发生了 5 级免疫介导性肺炎。进一步的分层分析提示了 HAIC 联合 PD-1 抑制剂 (n=26) 对比化疗联合 PD-1 抑制剂 (n=28) 能取得更高的 PFS (HR=0.414; 95%CI 为 0.200 ~ 0.856; P=0.005)。

结论: HAIC 治疗晚期 CCA 安全、耐受性好, 与化疗相比在延长 PFS 方面具有非劣效性。同时加入 PD-1 抑制剂可提高 HAIC 的疗效, 并显示出优于化疗方案的疗效。因此, HAIC 联合免疫治疗有可能成为晚期 CCA 的一种治疗选择。

关键字: 不可切除胆管癌; 肝动脉灌注化疗; PD-1 抑制剂; 全身化疗

PO-3281

恶性梗阻引流前后的胆道微生物群组成研究

陈燕、方统磊、田庆华、杨凯
上海市第六人民医院东院

目的 探索恶性梗阻引流前后的胆道微生态改变, 旨在从微生态的角度研究胆道梗阻与引流干预对胆汁微生物群的影响。

方法 2021 年 5 月至 2023 年 3 在我科进行经皮胆道引流 (PTCD) 的恶性胆道梗阻患者 27 例, 记录并整理患者一般资料, 患者是否发生急性胆管炎及严重程度、是否需要使用抗生素进行治疗等。DSA 下行 PTCD, 22G 引流针进入胆道并经造影确认位于肝内胆管内后, 然后抽取 10ml 胆汁送检验科培养; 然后经导丝植入内外引流管; 7 天后经外引流管抽取胆汁送检验科培养。

结果 27 例患者中: 胆管细胞癌 15 例, 胰腺癌 7 例, 肝门淋巴结转移瘤 5 例 (4 例胃肠道肿瘤和 1 例乳腺癌)。引流前胆汁微生物群中伯克霍尔德菌属、不动杆菌属、假单胞菌属和葡萄球菌属的相对丰度高, 分枝杆菌属和诺卡迪氏菌属相对丰度低。内外引流后胆汁样本中葡萄球菌、克雷伯氏菌、肠杆菌、气单胞菌、副球菌、厌氧球菌、双球菌、弯曲杆菌、巨杆菌等丰度升高, 其他微生物多样性与均匀度均降低。

结论 引流后胆汁内特征性细菌属有芽孢杆菌属、链球菌属、葡萄球菌属和克雷伯氏菌属, 可能抑制胆道内其他细菌的生长, 导致正常胆道微生物群落的物种多样性减少。这种胆道菌群失调可为胆道引流后患者更容易发生胆道感染的临床现象提供解释。

PO-3282

基于磁共振纹理分析预测结直肠癌肝转移瘤 TACE 术后早期疗效的研究

韩浩杰、孟垚、胡月
大连大学附属新华医院

目的: 探讨基于磁共振纹理分析在结直肠癌肝转移瘤经 TACE 术后早期疗效预测中的价值。

方法: 回顾性收集我院 2014 年 2 月至 2021 年 12 月经影像学或者病理学方法确诊的 70 例结直肠癌肝转移瘤的患者。根据病变大小的变化将病变分为有反应组和无反应组。纹理分析由两名放射科

医生在 T2 加权图像上进行量化,他们对在病变的最大横截面积上手动绘制的感兴趣区域达成共识。提取了五个直方图特征(均值、方差、偏度、峰度和熵 1)和五个灰度共生矩阵特征(GLCM、ASM、熵 2、对比度、IDM)。对纹理参数进行统计分析以确定两组之间的差异,随后使用多变量 logistic 回归分析测试区分有反应组与无反应组的潜在预测参数。

结果:总共评估了 52 个有反应和 18 个无反应的病灶。较高的方差、熵 1、对比度、熵 2 和较低的 ASM、相关性、IDM 与对 TACE 的良好反应独立相关($P<0.05$),ROC 曲线下面积(AUC)为 0.602-0.624。当使用多变量 logistic 回归分析进行测试时,方差($P<0.001$)和 ASM($P=0.001$)仍然是区分有反应病变和无反应病变的潜在预测值。来自方差和 ASM 关联的预测变量的最高 AUC 为 0.714。

结论:术前 T2 图像上的 MR 纹理分析有可能预测结直肠癌肝转移瘤经 TACE 术后的早期疗效。

PO-3283

罕见 Meso-Rex 分流术后血栓形成行经颈静脉肝内门体分流术一例

赵浩钦

昆明医科大学第一附属医院

患者男,25岁,因“呕血、黑便10余年,再发2周”入院。患者2001年因外伤行全脾切除术,2013年无明显诱因出现呕血、黑便,出血量不详,遂至北京协和医院诊治,完善相关检查后诊断为“门静脉高压”,后行“门静脉断流术”,术后患者病情好转出院。2019年患者再次出现呕血、黑便,遂至北京清华长庚医院住院治疗,住院期间行“Meso-Rex 分流术”,术后规律服用“利伐沙班 20mg QD”抗凝。2023年2月24日患者再次出现呕血1次,呈鲜红色,量约20ml,解黑便1周,大便成形,2-3次/天,每次量约50ml,遂停用利伐沙班,再次至北京长庚医院就诊,医院考虑支架内血栓形成,行支架再通难度大,未进一步手术治疗,对症处理后患者症状好转,大便转黄。后患者为求进一步诊治,遂于2023年3月10日至我院消化内科就诊。入院完善全腹CT平扫+增强+三维重建示:门静脉主干及门脉左支内见支架,上份中央见条状对比剂充填、边缘及远端未见对比剂,血栓形成可能;食管、胃底静脉曲张;肝门区多发迂曲血管,考虑门脉海绵样变表现;腹膜后、脊柱旁多发侧枝血管形成。患者入院后于2023年3月15日行胃镜检查,检查示:1.食道静脉曲张(重度),行食道静脉套扎术;2.门脉高压性胃病伴胆汁返流。术后患者一般情况良好,未再发呕血、黑便,消化内科联系我科会诊,查看患者并评估患者情况后,与患者及家属积极沟通后,于2023年3月16日转入我科,每日予患者低分子肝素钠注射液4250IU Q12h。积极完善患者术前评估,于2023年3月23日行“经颈静脉肝内门体分流术+门静脉取栓术”。

PO-3284

TEG-PM 指导下的抗凝抗血小板治疗与经验性抗凝治疗在肝硬化患者 TIPS 术后支架失功能中的关系的研究

王俊超

昆明医科大学第一附属医院

目的:探讨肝硬化患者行覆膜支架植入术后在血栓弹力图血小板图(thromboelastography-plateletmapping,TEG-PM)检测指导下行抗凝抗血小板治疗与支架失功能的关系。方法:纳入2022年1月至2023年8月昆明医科大学第一附属医院收治的肝硬化行TIPS术的患者60例,将患者随机分为A组30例,B组30例。A组患者在行TIPS术后予以经验性抗凝治疗,B组所有患者均行抗凝及

抗血小板治疗,并使用 TEG-PM 进行检测并及时调整药物使用方案及剂量。比较两组患者 TIPS 术后 1 个月, 3 个月, 6 个月及 1 年支架失功能的发生率。结果: B 组患者 TIPS 术后 1 个月, 3 个月, 6 个月及 1 年支架失功能的发生率明显低于 A 组的患者。结论: TEG-PM 指导下的抗凝抗血小板治疗相比于经验性抗凝能明显延缓肝硬化患者 TIPS 术后支架失功能的时间, 且安全可行,临床应用时应根据患者个体化选择,并检测其指标变化,及时调整用药。

基于肾血管平滑肌脂肪瘤瘤体成分预测经动脉栓塞术后早期疗效

徐馨雅、陈勇、白玉、卢荣、杨灏、赵超云、吴龙云、童媛媛
宁夏医科大学总医院

【摘要】目的 基于肾血管平滑肌脂肪瘤(Renal Angiomyolipoma,RAML)瘤体成分预测经肾动脉栓塞术(Selective arterial embolization,SAE)早期疗效,探究 SAE 术后早期疗效与肿瘤成分的关系。方法 收集 2019 年 8 月 1 日至 2023 年 04 月 1 日临床确诊为 RAML 患者 23 例,均行 SAE 治疗,于术前、术后行增强 CT 检查。比较患者术前肿瘤总体积(TVSAE 前)、术后肿瘤总体积(TVSAE 后)、得出瘤内总脂肪体积收缩值(FVSAE 前-FTVSAE 后)、非脂肪体积收缩值(NFVSAE 前-NFTVSAE 后),利用非参数检验比较术前、术后体积差异性,采用 pesrson 相关分析各肿瘤成分初始体积与肿瘤体积减少率的关系,采用多元线性回归分析探讨的肿瘤体积减少率影响因素。结果 本组研究 SAE 术后肿瘤体积(TV)、脂肪体积(FV)、非脂肪体积(NFV)显著缩小($P<0.01$),术后脂肪体积(FV)占比增加,非脂肪体积(NFV)占比减小($p<0.05$);术后肿瘤体积缩小值与肿瘤成分体积、破裂存在相关($p<0.05$);在多因素回归分析中,非脂肪成分体积占比为肿瘤体积减小的独立险因素。结论 肾血管平滑肌脂肪瘤经 SAE 治疗后 NFV 占比减小,术前对 NFV 占比的测量有助于预测术后肿瘤体积缩小率,评估患者术后早期疗效。

部分脾动脉栓塞术治疗肝细胞癌伴脾功能亢进对肝储备功能的影响

李宗伟¹、张跃伟²
1. 河南大学第一附属医院
2. 北京清华长庚医院

目的 探讨部分脾动脉栓塞术(partial splenic arterial embolization, PSE)对肝细胞癌(hepatocellular carcinoma, HCC)合并肝硬化伴脾功能亢进患者肝储备功能的影响。方法 收集 2019 年 5 月至 2022 年 8 月在北京清华长庚医院收治 11 例接受 PSE 治疗的肝细胞癌伴肝硬化脾功能亢进患者临床资料,分析术后吲哚菁绿 15 min 滞留率(ICG-R15)、肝脏硬度(LSM)、胆碱酯酶(CHE)、血常规及肝功能变化。结果 ①PSE 术后 3 月 ICG-R15 显著降低,较术前差异有统计学意义($P<0.05$);术后 LSM 下降,较术前差异不具有统计学意义($P>0.05$);术后 CHE 升高,较术前差异不具有统计学意义($P>0.05$)。②PSE 术后 3 月 WBC、PLT 较术前明显升高,差异具有统计学意义($P<0.05$);RBC 较术前无明显变化($P>0.05$)。③PSE 术后 3 月 TBIL、ALB、ALT、AST、PT 较术前无明显变化($P>0.05$)。结论 PSE 治疗肝细胞癌合并肝硬化伴脾功能亢进患者术后对肝储备功能有改善作用。

PO-3287

CMR 对 TIPS 术后心脏结构的影响

张玉博

昆明医科大学第一附属医院

目的：经颈静脉肝内门体分流术(TIPS) 是一种血管内介入手术，通过在肝实质中建立分流道，从而将血液重新引导至体循环，从而减轻门静脉循环中的压力。随后中心血容量增加的确切心脏后果尚不清楚。心脏磁共振 (cardiac magnetic resonance, CMR) 具有多参数、多序列的优势，已实现了对心脏形态、功能、组织、灌注、血流等的“一站式”检查，日益成为多种心血管疾病诊治不可或缺的无创影像学检查方法。

方法：收集 40 名符合 TIPS 手术指征的患者在 TIPS 术前、术后一天、术后一个月、术后三个月、术后六个月分别行 CMR 评估。

结果：1.术后一天及术后一月心输出量相比术前显著增加，但在三个月至六个月，心输出量下降并接近到基线；2.术后一天、术后一个月、术后三个月、术后六个月肺毛细血管楔压均明显高于术前；3. 术后一天、术后一个月、术后三个月、术后六个月各心腔容量均高于术前。

结论：在无明显心脏疾病史的患者中，TIPS 术后心脏前负荷增加，并导致所有心腔容积增加,而在随访期间未导致心脏损害。

融合技术对判断颅内动脉瘤破裂出血责任动脉瘤的诊断价值

杨雯卉

烟台市烟台山医院

目的：本论文旨在研究融合技术对判断颅内动脉瘤破裂出血责任动脉瘤的诊断价值。**方法：**回顾性分析 2022 年 6 月至 2023 年 9 月急诊入院 42 例颅内动脉瘤破裂出血的患者，随机抽取 29 例患者进行对比。患者在首次出血后均行头颅 CT，并行全脑血管造影。术中，使用 Siemens Artis Zee 设备行 5s-DSA，确定单个或多个颅内动脉瘤所处位置及与毗邻血管的关系。将术前头颅 CT 通过锐珂系统传输到 3D 工作站，进行头颅 CT 与 Mask 像骨性标志对位后，将显示出血、血肿部位的头颅 CT 与显示载瘤动脉的 5s-DSA Sub 像融合，选择(2+1MPR),通过 CT 的不同层面积血、血肿准确判断颅内动脉瘤破裂出血的责任动脉瘤。**结果：**在 29 例患者中,男性 10 例，女性 19 例，年龄范围在 (61.2±6.2)岁(40~75 岁)。CT 检查提示为自发性 SAH，其中积血明显的部位位于前纵裂池 11 例，鞍上池 18 例，外侧裂池 9 例，桥前池、脚间池 2 例，脑室 4 例，额叶血肿 2 例。DSA 提示 29 例患者中，20 例为单发颅内动脉瘤,9 例为颅内多发动脉瘤。在 20 例单发颅内动脉瘤患者中，动脉瘤位置分别为：前交通动脉 9 例，后交通动脉 7 例，大脑中动脉 4 例，基底动脉 0 例。在 9 例颅内多发动脉瘤患者中，责任动脉瘤位于前交通 2 例，后交通动脉 3 例，大脑中动脉 2 例，基底动脉 2 例，未破裂动脉瘤位于前交通动脉 2 例，后交通动脉 4 例，大脑中动脉 3 例，基底动脉 0 例，小脑后下动脉 1 例。除 1 例出血量较少，其余 28 例患者积血显著部位与责任动脉瘤位置相符。**结论：**术中，单发颅内动脉瘤患者进行全脑血管造影后，可对其责任动脉瘤进行明确的判断、诊治。单个颅内动脉瘤破裂常会产生多部位积血，这对于多发动脉瘤患者判断其责任动脉瘤产生困扰。若仅凭既往经验及瘤体形态不规则判断责任动脉瘤进行栓塞，并不严谨。通过头颅 CT 与 5s-DSA 的融合，可以更客观、准确、直观的判断责任动脉瘤，术中及时进行栓塞，防止再破裂出血，有效降低死残率。

PO-3289

MRI 引导肝癌射频消融治疗的临床应用研究

尹娜

江苏省肿瘤医院

目的 肝癌射频消融治疗术为临床局部治疗靶区癌变组织的最有效方法,因具有微创、安全性好、副作用少等优点目前已成为临床首选治疗方式。探讨 MRI 在肝癌射频消融治疗过程中定位及引导中的应用安全性、可行性及临床应用价值。

方法 回顾性分析本院符合纳入及排除标准的 16 例肝癌(原发和转移)患者。患者应用 MRI 引导进行肝癌病灶定位并完成射频消融治疗,术前定位及术中引导均应用 MRIT1WI-TFE 序列(TR 10ms、TE 2.3ms),自由呼吸下屏气扫描,观察定位针的准确性及消融范围,直至消融范围包括病灶边缘。T1 序列在监控消融过程的同时可以提供较清晰的解剖图像,可为治疗带来更好的准确性和安全性。RFA 术后均立即进行常规 MRI 肝脏扫描,能够通过 T1WI、T2WI 动态增强及扩散加权成像等方式作为肝癌的确定性诊断及术后随访,ADC 测量能够更加准确定性辨别残留、复发的肿瘤组织,即时评价肿瘤消融情况及并发症发生情况。术后半年为一周期磁共振复查记录观察肿瘤控制情况和生存率。

结果:患者全部定位消融成功,虽然 MRI 引导肝脏 RFA 是一种极微创治疗,但多次反复调整穿刺针的方向、深度等操作仍存在一定的损伤及相应的并发症,术后出血患者 2 例,气胸 1 例。所有患者一次完全消融率达 73.08%;7 例肿瘤长径大于 5.0cm 者均实行分时段分步消融治疗,其中 3 例病灶术后仍有肿瘤组织残留,最终完全消融率为 88.46%,在治疗前后消融灶及其过渡部位的 ADC 值与治疗前相比差异均有统计学意义,记录所有病灶四年局部控制率分别为 87.20%、69.93%、48.14%、24.77%。

结论 核磁共振技术组织分辨率高,多序列、多方位成像,获得的诊断信息丰富。MRI 引导肝癌射频消融术是一种定位准确、操作安全、无辐射损伤的微创治疗方法,大部分患者可以获得较好的局部肿瘤控制效果并延长生存期,是一种临床操作安全可靠的局部肺肿瘤治疗方法。

PO-3290

主动脉根部解剖参数对经导管主动脉瓣置换术后瓣周漏的预测价值

陶雅红

南昌大学第二附属医院

目的:探讨重度主动脉瓣狭窄患者行经导管主动脉瓣置换术后发生瓣周漏的危险因素,明确相关危险因素对 TAVR 术后 PVL 的预测价值。

资料和方法:连续性纳入自 2017 年 7 月至 2021 年 10 月在南昌大学第二附属医院及江西省人民医院心内科接受 TAVR 手术治疗的 AS 患者。依据出院前经胸超声心动图结果,将患者分为无 PVL 组及 PVL 组,其中 PVL 组又包括轻度 PVL 组和中/重度 PVL 组。比较三组患者的术前基线临床特征、术前超声特征、术中数据及术前主动脉根部 CTA 测量指标之间的差异,采用多因素 Logistic 回归模型筛选 TAVR 术后发生 PVL 的独立危险因素,并用 ROC 曲线分析各危险因素对 TAVR 术后发生 PVL 的预测价值,通过计算约登指数得出相关预测因素的最佳截断值。

结果:共纳入 128 例患者,平均年龄为 71.29 ± 6.72 岁,男性占比 57.8%。62 例患者行 TAVR 术后发生了 PVL, PVL 的发生率为 48.5% (62/128),包括 31.3% (40/128) 的轻度 PVL 和 17.2% (22/128) 的中/重度 PVL。单因素分析及多因素分析结果显示 BAV、主动脉瓣钙化总体积、瓣膜支架置入深度是 TAVR 术后发生 PVL 的独立危险因素。ROC 曲线分析显示 BAV、主动脉瓣钙化总体积及瓣膜支架置入深度均对重度 AS 的患者行 TAVR 后是否发生 PVL 有预测价值。当主动脉

瓣钙化总体积大于 863mm³时, 预测 TAVR 术后发生 PVL 的敏感度为 80.65%, 特异度为 74.24%; 而瓣膜支架置入深度大于 9.6mm 时, 预测 TAVR 术后发生 PVL 的敏感度为 74.19%, 特异度为 86.36%。

结论: BAV、主动脉瓣钙化总体积及瓣膜支架置入深度是重度 AS 患者行 TAVR 术后发生 PVL 的独立危险因素, 对预测术后 PVL 的发生具有一定价值。

PO-3291

介入栓塞术与开颅夹闭术对颅内动脉瘤患者预后的影响比较

范天榆

昆明医学院第一附属医院

摘要, 目的: 对比颅内动脉瘤介入栓塞术与颅内动脉瘤夹闭术两种手术方式治疗颅内微小动脉瘤的疗效, 为临床医师的诊断和治疗提供指导及帮助, 方法: 选择 70 例符合要求的颅内微小动脉瘤患者, 将 70 例患者分成 30 例(30 个动脉瘤)夹闭手术和 40 例(40 个动脉瘤)介入栓塞治疗两组, 对比两组患者年龄、性别、术后即刻闭塞率、出院情况等资料、将两组病人手术中和手术后的并发症发病率、总治疗时间的差异, 两组患者的总住院费用, 手术操作时间, 和 6 个月的随访结果进行对比。结果: 30 例采用开颅夹闭治疗的颅内微小动脉瘤中, 25 例预后良好, 5 例预后不良; 44 例采用血管内介入治疗的颅内微小动脉介入组中 43 例预后良好, 占比 97.7%, 仅 1 例预后不良。结论: 介入手术时间短、恢复快, 创伤小, 并发症发病率更低。

PO-3292

CT 引导下不同消融方式在肺结节中的疗效对比研究

李萌、李月考

河北医科大学第四医院

【摘要】目的 在 CT 引导下利用不同参数进行对肺结节进行消融, 探索消融肺结节的最佳方式及参数。**方法** 取直径 1.0cm 以下肺结节 20 例, 随机分为 3 组, 分别以不同参数进行激光消融、微波消融。消融过程中进行 CT 扫描, 观察消融灶及消融区域低密度带。**结果** 肺结节消融侧得到典型的中心空化区, 周围碳化区, 最外带为凝固坏死区的类圆形消融灶。消融后观察消融区域, 每组共获得 20 个消融灶。所有入组肺结节消融后获得典型的中心空化区, 周围碳化区, 最外带为凝固坏死区的类圆形消融灶。A 组激光消融灶平均半径 (1.10±0.35) cm; 空化区平均半径 (0.30±0.15) cm; 碳化区平均宽度 (0.30±0.10) cm; 凝固坏死区 (0.50±0.20); B 组微波消融灶平均半径 (1.20±0.30) cm; 空化区平均半径 (0.20±0.05) cm; 碳化区平均宽度 (0.25±0.10) cm; 凝固坏死区 (1.20±0.30) C 组射频消融灶平均半径 (1.25±0.35) cm; 空化区平均半径 (0.35±0.15) cm; 碳化区平均宽度 (0.30±0.10) cm, 凝固坏死区 (1.25±0.35)。消融的气胸率分别为 70%、90%和 100%。**结论** 消融可产生一个局限而稳定的消融灶。使用消融的方法可快速、安全、有效。

PO-3293

伴门静脉癌栓肝细胞肝癌经 FO-HAIC 治疗后的生存预后模型研究

吕玲

广州医科大学附属第三医院 (广州重症孕产妇救治中心、广州柔济医院)

背景: 临床实践中, 接受 FO-HAIC 治疗的伴门静脉癌栓肝细胞肝癌患者个体疗效差异较大, 如何筛选获益人群亟待解决。**目的:** 探索构建接受 FO-HAIC 治疗的伴门静脉癌栓肝细胞肝癌患者的生存预后模型。**方法:** 回顾性分析了 283 例接受 FO-HAIC 治疗的伴门静脉癌栓肝细胞肝癌患者, 随机分配至训练队列 (143 名) 和验证队列 (140 名)。通过单因素和多因素 Cox 回归分析, 在训练队列中筛选影响生存预后的独立危险因素。基于多因素 Cox 回归分析, 建立生存预后模型, 将目标群体进行预后风险分层。同时, 构建列线图预测患者 6 个月、1 年、2 年生存率, 列线图的区分度和一致性使用 AUROC 值、C-指数及校准曲线进行评估。**结果:** 本研究最终构建预后模型为 “SSAFE-score=0.617*SC +0.501*SD+0.556*ALBI score +0.682*AFP+0.523*肝外转移”, 以 0.56 (第三个四分位数) 作为 cut-off 值, 可以将验证组、总体样本、Vp3 型、Vp3/4 型门静脉癌栓肝细胞肝癌患者进行预后风险分层。基于多因素 Cox 回归分析构建列线图模型, 预测 FO-HAIC 治疗后的伴门静脉癌栓肝细胞肝癌患者的 6 个月、1 年、2 年生存率, 训练队列预测患者 0.5 年、1 年、2 年 AUROC 值分别为 0.72、0.72、0.81, 验证队列预测患者 0.5 年、1 年、2 年 AUROC 值分别是 0.60、0.57、0.64。训练队列和验证队列的一致性指数分别是 0.67 和 0.59。校准曲线显示列线图预测生存结果和患者实际生存时间具有较好的一致性。

结论: 本研究构建的 SSAFE-score 预后预测模型及列线图预后预测模型可以对接受 FO-HAIC 治疗的伴门静脉癌栓肝细胞肝癌患者进行预后风险分层及个体化预后评估。

PO-3294

早期 TIPS 可以使乙肝肝硬化食管胃底静脉曲张破裂出血患者获益

李赛、廖伟华、石亮荣
中南大学湘雅医院

背景 食管胃底静脉曲张破裂出血是肝硬化患者严重的并发症, 内镜治疗是目前主要的一线治疗方案, 对于内镜治疗失败的患者, 建议使用经颈静脉肝内门体分流术 (TIPS) 作为挽救治疗。然而, 挽救治疗通常难度大, 耗时长, 早期 TIPS 是否可以使患者获益尚且存在争议。

方法 本研究回顾性纳入 2017 年 1 月至 2022 年 6 月于中南大学湘雅医院放射介入中心行 TIPS 的乙肝肝硬化食管胃底静脉曲张破裂出血患者, 通过电子病历系统收集患者的人口统计学数据, 相关检验检查数据, 根据患者行 TIPS 术的时间分为早期 TIPS 组及晚期 TIPS 组, 采用倾向性匹配分析比较两组患者的手术成功率, 术后并发症及预后情况。

结果 本研究最终共纳入 139 例乙肝肝硬化食管胃底静脉曲张破裂出血的患者, 其中早期 TIPS 患者 52 例, 晚期 TIPS 患者 87 例。进行 1:1 倾向性匹配后, 每组均纳入了 49 例患者。早期 TIPS 组的患者术后 6 周内的死亡率 (6.1% vs 16.3%, $P=0.118$) 及 1 年内死亡率 (6.2% vs 20.4%, $p=0.041$) 均低于晚期 TIPS 组。两组的手术成功率相似 (98.0% vs 93.9%, $P=0.307$), 早期 TIPS 组与晚期 TIPS 组术后并发症的发生率无明显差异 (22.4% vs 26.5%, $P=0.638$)。早期 TIPS 组患者术后出现 2 种并发症的发生率低于晚期 TIPS 组 (6.1% vs 18.4%, $P=0.064$)。

结论 相比于传统的内镜治疗, 尽早进行 TIPS 手术可以延长乙肝肝硬化食管胃底静脉曲张破裂出血患者的生存, 且不会增加术后并发症的发生。

PO-3295

抗血小板药物基因检测与血栓弹力图血小板图在颅内动脉瘤支架置入治疗中的应用研究

孟雪柔、赵卫、胡继红、潘文秋
昆明医科大学第一附属医院

目的 分析 IAs 行支架治疗患者抗血小板药物相关基因检测与 TEG-PM 对抗血小板药物疗效评价的关系, 探讨二者在 IAs 患者术后抗血小板治疗中的应用价值。**方法** 收集 2019 年 1 月至 2022 年 8 月行支架治疗 IAs 的 106 例患者, 所有患者均行抗血小板药物相关基因检测, 部分患者行 TEG-PM 检测, AA% < 50% 判定为阿司匹林疗效不足; ADP% < 30% 判定氯吡格雷疗效不足, 分为 A、B 两组, A 组 (基因检测组) 根据阿司匹林及氯吡格雷相关基因检测结果进行用药方案调整。B 组 (联合组): 根据基因检测及 TEG-PM 检测结果进行用药方案调整。**结果** 1. 一般资料 106 名患者, 共治疗 123 个 IAs, 总体平均年龄 53.67 ± 6.66 岁, 女性 67 例。将患者分为 A 组 (41 例), B 组 (65 例), 两组患者基线资料及 IAs 情况、术中使用支架类型差异无统计学差异。两组用药方案选择差异无统计学意义。2. 两种检测方式对抗血小板用药疗效评价的关系 65 名患者基因检测结果示阿司匹林基因抵抗仅 2 例, 而 TEG-PM 显示 AA% < 50% 却有 16 例; 氯吡格雷基因抵抗有 20 例, 而 TEG-PM 显示 ADP% < 30% 却有 27 例。采用 Cohen's kappa 系数分析评估二者检验结果一致性示二者在评估阿司匹林疗效方面一致性较差, 评估氯吡格雷疗效二者间一致性一般。3. 抗血小板治疗相关并发症情况 A 组有 2 名患者出现缺血性并发症, 均采用方案 1; B 组无缺血性事件发生。A 组各有 2 例患者出现出血性并发症, 分别采用方案 3、方案 2; B 组 4 例患者出现出血性并发症, 分别采用方案 1、方案 1、方案 3 和方案 2。两组抗血小板治疗相关并发症发生率差异无统计学意义。**结论** 1. TEG-PM 反应的抗血小板治疗效能较抗血小板药物相关基因检测全面。2. TEG-PM 检测对颅内动脉瘤支架植入后抗血小板聚集治疗方案具有基础的指导作用, 抗血小板药物相关基因检测可作为原因检测的重要补充。3. 以 TEG-PM AA% < 50% 和 ADP% < 30% 分别作为判定抗血小板治疗疗效截断值指导并调整治疗具有临床可行性。

PO-3296

IVIM 评估下肢动脉硬化闭塞症 EVT 术后骨骼肌微循环动态变化及再狭窄的价值

陈亮、梁琪*
中南大学湘雅三医院

目的: 探讨体素内不相干运动扩散加权成像 (IVIM-DWI) 在评价下肢动脉硬化闭塞症 (ASO) 患者行腔内治疗 (EVT) 前后患肢小腿骨骼肌微循环灌注状态变化及再狭窄的诊断价值。**方法:** 共纳入患者 69 例, 患肢 82 例, 收集患者一般资料、罗斯福分级与踝肱指数 (ABI)、趾肱指数 (TBI)、经皮氧分压 (TcO₂)。采用多 b 值 DWI 序列获取下肢 ASO 患者于 EVT 术前及术后随访各时间点 (1、3、6 个月) 患肢小腿骨骼肌的 IVIM-DWI 各定量参数伪彩图及 ROIs 参数值, 包括真实扩散系数 (D)、灌注相关扩散系数 (D*) 和灌注分数 (f)。对术前 IVIM-DWI 各参数、ABI、TBI、TcPO₂ 与罗斯福分级进行相关性分析; 将下肢 ASO 患者分为轻中重组, 分析各亚组 D 值及 ABI 间差异及变化趋势。分析术前及术后随访各时间点各 ROIs 的 IVIM-DWI 各参数间差异及变化趋势。根据术后 6 个月时 CTA 评估结果及罗斯福分级分为 ABCD 组, 比较各时间点各亚组 D 值及 ABI 的差异及变化趋势。对 A 组 (经 CTA 评估再狭窄且罗斯福分级升级) 的 D 值、ABI 进行 ROC 分析, 获取截断值并计算曲线下面积。

结果: 术前所有 ROI 的 D 值、ABI 与罗斯福分级呈负相关 ($P<0.05$), ROI3 的 D*值与罗斯福分级呈负相关 ($P<0.05$)。轻中重组患者各 ROIs 的 D 值及 ABI 有显著差异 ($P<0.05$); 罗斯福等级越高, D 值越小 ($P<0.05$), ABI 越小 ($P<0.05$)。术后 1、3 月的各 ROIs 的 D 值、D*值、f 值均高于术前 ($P<0.05$)。A、B、C 组的 D 值与 ABI 在术后随访各时间点有显著差异 ($P<0.05$); 术后 6 月的 D 值与 ABI 明显小于术后 1 月及术后 3 月 ($P<0.05$); C 组术后 3 月的 ABI 高于术后 1 月 ($P<0.05$)。对 A 组进行 ROC 分析, D 值及 ABI 的 AUC 分别为 0.918、0.761, 截断值分别为 $1.31\times 10^{-3}\text{mm}^2/\text{s}$ 、0.79。

结论: IVIM-DWI 定量参数动态监测骨骼肌微循环状态较 ABI 可以更好地评价下肢 ASO 患者 EVT 疗效; 其中 D 值对 EVT 后 6 个月再狭窄情况具有鉴别价值, 相比 ABI 有更高的灵敏度和特异度。

PO-3297

3D-DSA 实时导航技术在颅内动脉瘤栓塞治疗中应用价值的研究

孙媛媛¹、袁怀平¹、张永亮²、董凤美²

1. 安徽医科大学第一附属医院北区

2. 安徽医科大学附属阜阳医院

目的 探讨 3D-DSA (三维数字减影血管造影) 实时导航技术在颅内动脉瘤栓塞治疗中的应用价值。
方法 回顾分析 23 例 3D-DSA 实时导航和 37 例 2D-DSA 路径图 (roadmap) 技术两种导航方式下动脉瘤介入栓塞术的手术时间、透视时间、辐射剂量和造影剂用量。
结果 本组 60 例患者共检出 60 个动脉瘤, 其中颈内动脉瘤 12 个, 大脑中动脉瘤 17 个, 大脑前动脉瘤 29 个, 大脑后动脉瘤 2 个。3D-DSA 实时导航和 2D-DSA 路径图两种导航方式下手术时间、透视时间、辐射剂量和造影剂用量对比。对 23 例 3D-DSA 实时导航及 37 例 2D-DSA 路径图技术两种导航方式下颅内动脉瘤栓塞术的手术时间及透视时间, 辐射剂量及造影剂用量进行统计分析, 前者手术时间及透视时间均较后者短, 辐射剂量亦较后者低, 有统计学意义 ($p<0.05$), 但是二者造影剂使用量无统计学差异 ($p=0.21$)。
结论 3D-DSA 实时导航技术在颅内动脉瘤栓塞治疗中具有较高的应用价值和意义。

PO-3298

Angiojet 机械血栓抽吸术治疗亚急性下肢动脉缺血的初步观察

李东东、甄艳华、郑加贺

中国医科大学附属盛京医院

目的: 探讨 Angiojet 机械血栓抽吸术治疗亚急性下肢动脉缺血的临床效果。

方法: 回顾性分析 2019 年 1 月至 2022 年 1 月期间我科收治的 22 例亚急性下肢缺血患者的临床资料 (下肢动脉栓塞 9 例、血栓形成 13 例, 4 例双侧受累), 其中男性 21 例、女性 1 例, 年龄 38~79 岁, 发病时间 14~60 天, 病变长度平均 36~544mm; Rutherford 分级 2 级 3 例, 3 级 4 例, 4 级 11 例, 5 级 3 例, 6 级 1 例。所有患者均首先采用 AngioJet 喷射模式, 于病变部位喷射溶栓药物 (30~50 万 U 尿激酶溶于 0.9%氯化钠溶液 30~50 mL), 20 min 后应用 AngioJet 进行机械血栓抽吸, 抽吸完成后即刻造影, 根据结果采用导管抽吸或血管成形术治疗。

结果: 在接受初始血管造影过程中, 导丝均能通过病变部位, Angiojet 导管抽吸平均时间 (171.6 ± 83.0) S。初次抽吸后造影结果: 1 条肢体成功 (血栓清除率 $>95\%$), 23 条肢体部分成功 ($50\% < \text{血栓清除率} < 95\%$), 2 条肢体失败 (血栓清除率 $< 50\%$)。13 例联合 Guiding 导管抽吸 (单纯使用 6F 系统 3 例, 单纯使用 8F 系统 7 例, 6F+8F 系统 3 例), 17 例应用球囊扩张, 2 例置入金属裸支架。所有患者均获得技术成功, 患肢缺血症状均得到不同程度改善, 术中无穿刺点大出血、重要脏器出血等严重并发症。所有患者术后均出现一过性肌红蛋白尿, 4 例出现患肢麻木, 1 例肢体肿胀, ABI 较前明显改善 (0.93 ± 0.15 vs 0.25 ± 0.31 , $P<0.05$)。随访 12 个月, 3 例患者因缺血

症状加剧再次入院, 1 例患者术后第 4 天因出血性脑梗死抢救无效死亡, 1 例肢体远端坏死截肢。其余患者在随访期间内均无明显下肢缺血症状。

结论: AngioJet 治疗亚急性下肢缺血是一种安全有效方法, 配合导管抽吸和血管成形术, 可有效恢复下肢血流, 有较好的临床应用价值。

1. 西北大学附属第一医院 (西安市第一医院)

2. 宁夏医科大学总医院

目的: 探讨运用低剂量 CT 灌注成像前瞻性评价经胃动脉化疗栓塞术治疗胃癌的疗效。方法: 收集 2017 年 1 月~2022 年 6 月于我院经胃镜病理证实且未接受抗癌治疗的贲门癌 (17 例) 及非贲门癌 (17 例) 患者共 34 例, 均于术前 3 天内及术后一个月对其行 MDCT 灌注成像。采用 t 检验比较两组的术前及手术前后各自组别内灌注参数、肿瘤体积、栓塞胃动脉直径有无统计学差异。结果: 手术前后肿瘤体积分别为 $55.64 \pm 33.81 \text{cm}^3$ vs $33.87 \pm 36.12 \text{cm}^3$, 手术前后栓塞胃动脉直径分别为 $0.29 \pm 0.08 \text{cm}$ vs $0.25 \pm 0.07 \text{cm}$ 。三处 ROI 的手术前后测量值分别为: BF 值 ($\text{mL} \cdot \text{min}^{-1} \cdot 100 \text{g}^{-1}$) 38.09 ± 24.61 vs 26.3 ± 16.08 , PEI 值 ($\text{mL} \cdot \text{min}^{-1} \cdot 100 \text{g}^{-1}$) 40.43 ± 33.98 vs 30.53 ± 14.50 , TTP 值 (s) 25.47 ± 15.42 vs 24.95 ± 13.59 , BV 值 ($\text{mL}/100 \text{g}$) 13.85 ± 10.55 vs 9.72 ± 7.63 。比较贲门癌组较非贲门癌组有更高的血流量 (BF)、血容量 (BV)、强化峰值 (PEI), 更短的达峰时间 (TTP), 其差异有统计学意义 ($t=4.18$, $t=4.39$, $t=3.63$, $t=5.11$, 均 $P<0.05$); 胃动脉化疗栓塞前后栓塞动脉直径、强化峰值 (PEI)、达峰时间 (TTP) 无统计学差异 ($t=1.52$, $t=1.97$, $t=25.46$, 均 $P>0.05$), 但是肿瘤体积、血流量 (BF)、血容量 (BV)、有显著统计学差异 ($t=5.53$, $t=2.95$, $t=3.20$, 均 $P<0.05$)。结论: 低剂量 CT 灌注参数 BF、BV、肿瘤体积可以作为评价胃动脉化疗栓塞术疗效的有用指标, 高 BF、BV 值可能有助于预测疾病进展。

PO-3300

细节决定成败之前列腺增生动脉栓塞治疗

应世红、彭志毅

浙江大学医学院第一医院

目的: 探讨前列腺增生动脉栓塞治疗的有效性和安全性, 探讨前列腺动脉栓塞术的手术细节控制。

方法: 回顾性分析本院 153 例前列腺增生栓塞治疗的患者, 包括患者年龄、术前症状、治疗病史、术前 MRI 平扫+弥散图像、术前髂动脉 CTA 图像、术后 MRI 平扫+弥散图像、术后反应, 用 t 检验分析患者治疗前后各参数的差异。

结果: 患者平均年龄 81.2 岁, 术前均有下尿路症状及药物治疗史, 其中 128 例患者因各种原因不能行外科手术治疗。术前 MRI 显示前列腺增生, 前列腺体积 12mL - 327mL , 平均 86.8mL 。术前髂动脉 CTA 显示 6 例髂外动脉异常迂曲 (行肱动脉入路治疗), 一例显示单侧髂内动脉闭塞。另有一例患者因术前 CTA 显示双侧髂内动脉闭塞而放弃介入栓塞, 未入组。153 例患者中, 133 例完成双侧前列腺动脉栓塞, 19 例完成单侧前列腺动脉栓塞, 1 例技术失败。术后 153 例患者临床成功 150 例 (98%), 其中 148 例拔除导尿管, 2 例拔除膀胱造瘘管。术后前列腺 MRI 显示前列腺体积较术前缩小 25.6%, 差异具有统计学意义。患者术后 2 例患者发生白细胞明显升高, 考虑继发感染, 抗炎治疗后好转。无其它并发症。术后随访 2 年内患者前列腺症状复发率为 3%。

结论：前列腺动脉栓塞术是前列腺增生安全且有效的治疗方式。以下 10 个细节的处理可以提高手术的成功率：1 术前术后的 MRI 检查、2 术前胸腹主动脉 CTA、3 术中 CBCT 的应用、4 纤细前列腺动脉的处理、5 非靶血管的处理、6 微导管及微导丝的选择、7 栓塞剂的选择、8 术后导尿管留置的时间、9 突破以往适应症的禁锢、10 特殊情况的处理。

PO-3301

肝癌精准 TACE 有效性及安全性的单中心研究

应世红、彭志毅
浙江大学医学院第一医院

目的：目前肝癌的 TACE 治疗缺乏统一的标准化操作流程 (SOP) 及评价标准，导致各中心 TACE 的疗效及并发症等数据相差悬殊。本研究提出了精准 TACE 的 SOP 及评价标准，并探讨精准 TACE 的有效性和安全性，将其与非精准 TACE 的结果相比较。

方法：本中心提出精准 TACE 必须在有 CB-CT 功能的 DSA 下进行，SOP 的核心内容是：患者术前 MRI、术中 CB-CTA 与术毕 CB-CT 三者显示的病灶图像须一致，即肿瘤内栓塞剂完整覆盖，周围正常肝实质内无大量栓塞剂存留。将肿瘤内栓塞剂的沉积体积占比作为 TACE 的评价指标。回顾分析本中心自 2018 年 7 月至 2023 年 1 月期间肝癌 TACE 治疗 661 例患者资料。他们共接收 2033 次 TACE，人均 3.1 次，其中精准 TACE 1123 次，非精准 TACE 910 次。本研究将比较这 2 组治疗的 ORR 及并发症发生率等。将精准 TACE 次数大于等于 50% 或 2 次的患者纳入研究组，共 307 例；其余患者纳入对照组，共 254 例。本研究将比较这 2 组治疗的 ORR 及并发症发生率等。用 t 检验分析患者治疗前后各参数的差异。

结果：患者平均年龄 65.2 岁，按照 CNLC 分期，包括：Ia 期 23 例，Ib 期 76 例，IIa 期 55 例，IIb 期 187 例，IIIa 期 205 例，IIIb 期 115 例。精准 TACE 组 CR36%，PR45%，SD11%，PD8%，并发症的发生率 2%。非精准 TACE 组 CR17%，PR44%，SD13%，PD26%，并发症的发生率 7%。研究组中位 OS43.2 个月，对照组中位 OS18.7 个月，差异具有统计学意义。

结论：精准 TACE 可以明显提高肝癌治疗的有效率，降低并发症的发生，提高患者的生存获益。有必要在全世界范围内推广精准 TACE 的 SOP。

PO-3302

探讨 DSA 无痛鞘管法动态子宫输卵管造影的临床应用价值

熊梦怡
江西省妇幼保健院

目的：探讨 DSA 无痛鞘管法动态子宫输卵管造影的临床应用价值

方法：选取江西省妇幼保健院 2021 年 11 月至 2022 年 12 月因不孕症行子宫输卵管造影的 720 例患者，根据造影方法类型分为无痛鞘管法组 (430 例) 和传统造影法组 (290 例)。比较两组造影过程中 VAS 疼痛评分、检查后 30 分钟 VAS 疼痛评分、图像质量、曝光时间、宫腔和输卵管显影情况、对比剂用量、置管用时间、检查用时、术后不良反应 (阴道流血、恶心呕吐及头晕乏力) 及对比剂逆流情况的差异。

结果：无痛鞘管法和传统造影法子宫输卵管造影进行比较，在术中 VAS 疼痛评分、检查后 30 分钟 VAS 疼痛评分、置管用时间、检查用时、对比剂用量、术后阴道流血方面，差异有统计学意义 ($P < 0.05$)；在图像质量、宫腔和输卵管显影情况、曝光时间、对比剂逆流情况、术后恶心呕吐及头晕乏力方面，差异无统计学意义 ($P > 0.05$)。

结论：由于两种方法均在 DSA 下进行观察，图像质量、宫腔和输卵管显影情况、曝光时间及对比剂逆流情况无明显的差异，但无痛鞘管法动态子宫输卵管造影操作简单，特别是置管较为快捷，从而缩短了置管时间和检查用时，对比传统方法子宫输卵管造影，无痛鞘管法采用金属支架底座至于鞘管尾部进行外固定，无需钳夹或牵拉宫颈，从而减轻了疼痛，减少了术后阴道流血发生的概率，且对比剂用量更少。因此，对于子宫输卵管造影这项传统检查来说是非常大的改进，特别是在疼痛方面，可减轻患者的心理负担，值得临床推广使用。

PO-3303

小粒径载药微球栓塞联合仑伐替尼治疗不可切除肝细胞癌的有效性与安全性分析：一项真实世界研究

邓钧、温锋、赵鹏飞、王蓝博、毛晓楠
中国医科大学附属盛京医院

目的：旨在探索真实世界中小粒径载药微球栓塞 (Drug-eluting Beads Transcatheter arterial Chemoembolization, DEB-TACE) 联合仑伐替尼治疗不可切除肝细胞癌患者的有效性与安全性。

材料和方法：对 2019 年 4 月至 2022 年 6 月期间在我院接受 DEB-TACE 联合仑伐替尼治疗的 49 例中晚期肝细胞癌患者进行疗效和安全性评估。所有纳入的患者都使用小粒径的载药微球 (Hepasphere 30-60 μ m) 进行栓塞，在栓塞后 3-7 天给予仑伐替尼治疗。采用改良的实体瘤疗效评价标准 (modified Response Evaluation Criteria in Solid Tumors, mRECIST) 评估患者的最佳肿瘤疗效。根据 Kaplan-Meier 法绘制患者无进展生存率 (Progression-free Survival, PFS) 和总生存率 (Overall Survival, OS) 的生存曲线，组间差异采用 log-rank 检验进行评估。采用 COX 单因素分析筛选与 PFS、OS 相关的影响因素，对单因素 $p < 0.1$ 的因素纳入 COX 多因素比例风险回归模型中进行检验。

结果：截至随访时间，整个人群的中位随访时间为 21.6 个月 (95%CI:17.5–25.7 月) 中位的 PFS 为 8.8 个月 (95% CI:7.0–10.6 个月)，中位的 OS 为 18.2 个月 (95% CI:14.4–22.0 个月)。单因素与多因素分析显示 Child-pugh A 级 (HR=2.63;95%CI,1.01–6.89; $p=0.048$)、肿瘤最大直径 < 7 cm (HR=2.82;95%CI,1.09–7.30; $p=0.033$) 的患者的 OS 明显延长。在 49 例患者中，整体患者的客观缓解率 (Objective Response Rate, ORR) 为 65.3%。没有发现 4 级及以上的不良事件。

结论：小粒径 DEB-TACE 联合仑伐替尼治疗不可切除肝细胞癌患者是一种有效且安全的治疗手段，客观缓解率高，患者的预后良好，Child-pugh B 级、肿瘤最大直径 ≥ 7 cm 是患者 OS 的独立危险因素。

PO-3304

低位恶性胆道梗阻经皮经肝胆道金属支架置入术后急性胰腺炎的临床预测模型：一项回顾性研究

宋静、温锋
中国医科大学附属盛京医院

目的：本研究探讨了低位恶性胆道梗阻 (Distal malignant biliary obstruction, DMBO) 患者行经皮经肝胆道支架置入术 (Percutaneous transhepatic biliary stenting, PTBS) 后急性胰腺炎的发生率、严重程度和相关危险因素，同时建立并验证临床预测模型。

方法：回顾性收集 2016 年 1 月至 2022 年 4 月于中国医科大学附属盛京医院接受 PTBS 治疗的 379 例 DMBO 患者的临床资料，根据术后是否发生急性胰腺炎将所有患者分为胰腺炎组和非胰腺炎组，

并评估术后急性胰腺炎的发生率和严重程度。对可能导致急性胰腺炎的相关危险因素, 先采用单因素分析进行筛选($P<0.2$), 再进一步采用多因素 Logistic 回归分析独立危险因素。根据回归分析结果构建 Nomogram 模型, 通过 ROC 曲线、加强 Bootstrap 法及 DCA 曲线来验证模型的预测价值和临床效益。

结果: 所有患者均成功接受 PTBS 治疗, 男性 185 例, 女性 155 例, 年龄范围 40~95 岁。共 66 例 (19.4%) 发生术后急性胰腺炎, 其中 1 例患者为重症急性胰腺炎。多因素 Logistic 回归分析显示支架跨越十二指肠乳头放置($OR=3.63$, 95%CI: 1.76~7.52; $P<0.001$) 是 PTBS 术后急性胰腺炎的独立危险因素; 术前主胰管扩张($OR=0.38$, 95%CI: 0.21~0.68; $P=0.001$)、支架直径为 10mm($OR=0.36$, 95%CI: 0.16~0.85; $P=0.023$) 为保护性因素。ROC 曲线显示 Nomogram 模型具有良好的区分度 ($AUC=0.716$)。校准曲线和 DCA 曲线显示模型具有良好的临床应用潜力。

结论: 对于 DMBO 患者, PTBS 术后急性胰腺炎的发生率较高, 但多以轻症者为主。支架跨越十二指肠乳头放置是 PTBS 术后发生急性胰腺炎的独立危险因素, 而术前主胰管扩张和支架直径 10mm 可降低 PTBS 术后急性胰腺炎发生的风险。基于以上因素构建的 Nomogram 模型可作为一种潜在的评估预后工具, 用于在 PTBS 术前预测急性胰腺炎的发生风险并及时识别高危患者。

PO-3305

原发性肝细胞癌患者多次经动脉化疗栓塞治疗 过程中甲胎蛋白的动态变化轨迹

彭刚、周翔

中国医学科学院肿瘤医院

目的: 我们旨在探讨经多次经动脉化疗栓塞(TACE)治疗的肝细胞癌(HCC)患者血清甲胎蛋白(AFP)随时间重复测量的动态轨迹, 并确定在治疗时间和哪些亚组中血清 AFP 容易升高。

材料和方法: 本回顾性观察性研究评估了 2014 年 1 月至 2020 年 12 月期间接受多次 TACE 治疗的 HCC 患者。采用广义加性混合模型评价整个研究队列和不同亚组血清 AFP 随时间的变化趋势。采用平滑拟合曲线探索血清 AFP 随时间的动态变化轨迹。

结果: 共 360 例患者(中位年龄 61 岁; 308 名男性)最终入选。在整个队列中, 血清 AFP 随时间增加(调整效应值[aEV]: 72.38, 95%CI: 18.49-126.28)。血清重复测量的 AFP 随时间的变化轨迹呈非线性的三段变化趋势。血清 AFP 在前 6 个月逐渐下降(aEV: -565.08, 95%CI: -1049.48 ~ 80.68), 0.5 ~ 3 年逐渐升高(aEV: 218.09, 95%CI: 89.62 ~ 346.56)。当时时间 ≥ 3 年时, AFP 无随时间变化趋势。

此外, 肿瘤负荷小且非乙肝病毒感染的患者血清 AFP 随时间的增加速度更快。

结论: HCC 患者多次 TACE 后 0.5 年内血清 AFP 逐渐降低; 在 0.5 ~ 3 年血清 AFP 逐渐升高, 在低肿瘤负荷和非乙肝病毒感染亚组中升高更为迅速, 这一时间段及特殊的亚组人群需要介入医师更加关注。

PO-3306

肝恶性肿瘤经动脉化疗栓塞术后肝脓肿形成的临床特点分析

王宇楠、畅智慧

中国医科大学附属盛京医院

目的: 分析肝恶性肿瘤经动脉化疗栓塞术(Transarterial chemoembolization, TACE)后肝脓肿形成的临床特点, 包括发生率、相关因素、临床症状及对预后的影响等。

方法: 回顾性分析 2017 年 1 月至 2022 年 1 月期间于我院接受 TACE 的肝恶性肿瘤患者的临床资料, 筛选出术后继发肝脓肿形成的患者。收集其临床资料, 包括性别、年龄、是否患有糖尿病、肿

瘤性质 (原发/继发)、肝功能(Child -Pugh 分级)、手术史、肿瘤最大径、TACE 情况 (TACE 次数、栓塞材料和手术时长)、肝脓肿情况(临床症状、诊断时间、治疗和致病菌),并对预后情况进行随访,主要包括肝脓肿的治疗结局、肿瘤反应和患者生存状态。

结果: 共 1387 名肝恶性肿瘤患者纳入本研究, 累计行 3341 次 TACE。其中 15 名(1.1%)患者在 TACE 后继发肝脓肿形成(1 名患者发生了 2 次)。超过一半 (53.3%) 的患者有胆道手术史, 肿瘤的平均最大径为 $7.09\pm 2.86\text{cm}$ 。主要临床症状为发热 (93.8%), 其次是寒战 (43.8%)。TACE 到诊断肝脓肿形成平均时间为 14.19 ± 9.21 天。主要致病菌是屎肠球菌 (31.25%)。经抗生素或经皮穿刺引流(Percutaneous drainage, PCD)治疗后, 所有肝脓肿相关的感染均得到控制。有 8 名患者在死亡时未拔除引流管, 1 名患者至随访结束仍留置引流管; 5 名患者拔除引流管, 平均引流管拔出时间为 149.17 ± 134.19 天。导致脓肿形成的 TACE 疗效评价为: 没有完全缓解的病例、18.75% 为部分缓解、37.5% 为疾病稳定、43.75% 为疾病进展。11 名患者在随访期间死亡, 死亡原因均与肝脓肿所致的感染无关。患者 3 个月、6 个月、1 年和 5 年生存率分别为 86.7%、50.9%、25.5% 和 17%。

结论: TACE 术后肝脓肿形成的发生率较低, 其发生可能与胆道手术史和肿瘤最大径有关。发热及寒战是 TACE 术后肝脓肿形成主要的临床症状, 抗生素联合 PCD 治疗能有效控制感染, 但 PCD 术后引流管拔出时间长, 甚至需要长期带管。本研究初步显示 TACE 术后肝脓肿形成的患者预后较差。

PO-3307

经桡动脉入路栓塞肩关节动脉治疗顽固性 肩关节骨性关节炎的疗效及安全性分析

袁崑鹏、张婷婷

宜昌市中心人民医院 (西陵院区)

背景: 肩关节骨性关节炎通常指关节盂肱关节骨关节炎 (glenohumeral joint osteoarthritis, GJO), 是一种我国常见的骨骼肌肉病。发病时表现为肩部和手臂的疼痛, 僵硬, 麻木, 活动受限等。目前的治疗方式主要为药物治疗 (非甾体抗炎药, 激素, 关节腔注射等)、物理治疗 (针灸, 按摩, 冷疗等) 和手术治疗 (关节镜下松解、成形、修补, 关节置换等)。而这些方法疗效有限, 我们需要寻找一种新的治疗方法来减轻患者痛苦, 改善患者肩关节功能。方法: 纳入 10 例既往接受过药物治疗, 物理治疗及手术治疗的顽固性 GJO 患者。通过桡动脉入路, 由两名有 5 年以上介入治疗经验的主治以上医生采用 $75\mu\text{m}$ 空白微球对患者进行肩关节增生血管栓塞术, 目标血管包括肩胛上动脉, 旋肱后动脉, 旋肱前动脉, 肩峰动脉。分别与术前、术后 3 个月, 6 个月采用疼痛视觉模拟评分 (VAS), 肩关节 UCLA 评分对患者进行评估并记录所有时间点的不良事件。结果: 10 例 (100%) 患者发现并栓塞了平均 (1.54 ± 0.6) 条异常增生的肩关节动脉, 平均使用了 3.25ml 栓塞混悬液。在 3 个月后, VAS 评分下降差别达到 25 ± 29 ($P=0.003$), UCLA 评分上升差别达到 10 ± 5 ($P=0.041$); 在 6 个月后, VAS 评分下降达到 23 ± 28 ($P=0.022$), UCLA 评分上升达到 8 ± 3 ($P=0.063$)。在整个随访过程中没有发生重大并发症, 没有产生组织及皮肤坏死, 其中有 2 例患者术后疼痛稍加重, 给予了 1 周镇痛治疗。结论: 肩关节动脉栓塞术是一种安全的治疗顽固性 GJO 疼痛的方法, 随访 3 个月后疼痛及功能有明显改善, 随访 6 个月后疼痛有明显改善, 但量化功能改善不明显。未来需要进一步的随机对照研究来确定真实的疗效及安全性。

PO-3308

基于 MRI 及临床特征对中晚期 HCC 首次 D-TACE 短期疗效的预测价值分析

隰子涵

浙江省肿瘤医院

目的：探索术前增强 MRI 影像特征及相关临床信息与肝细胞癌患者首次 D-TACE 短期疗效的关系。方法：回顾性分析 113 例中晚期肝细胞癌患者，探索基于增强 MRI 影像特征、临床基线特征、实验室指标及 D-TACE (drug-eluting bead transarterial chemoembolization, 载药微球经肝动脉化疗栓塞术) 手术信息与术后短期疗效的关系。应用单因素及多因素 Logistic 回归方法筛选出与 D-TACE 短期疗效相关的独立因素。通过 Kaplan-Meier 生存曲线计算 PFS (progression-free survival, 无进展生存期) 的中位生存时间, 并用 Log-rank 检验反映短期疗效与 PFS 的关系。通过 COX 比例风险回归确定影响 PFS 的相关因素。

结果：多因素 logistic 回归显示前白蛋白 (OR=1.012; 95%CI: 1.001~1.023; P=0.029)、微球载药量 (OR=0.969; 95%CI: 0.944~0.994; P=0.016)、肿瘤/肝脏体积比值 (OR=0.001; 95%CI: 0.000~0.162; P=0.007)、肿瘤边缘强化程度 (OR=0.239; 95%CI: 0.058~0.995; P=0.049) 与短期疗效显著相关。客观缓解组 (objective response group, OR group) 和未客观缓解组 (non-objective response group, non-OR group) 的 PFS 分别为 8.5 个月和 4.5 个月, OR 组预后更佳 ($\chi^2=4.903$, P=0.027)。COX 比例风险回归显示首次 D-TACE 短期疗效好、肿瘤最大径大、肿瘤/肝脏体积小是 PFS 的保护因素。

结论：肿瘤/肝脏体积比值小、术前前白蛋白多、微球载药量较少、肿瘤边缘强化程度轻的肝癌患者首次 D-TACE 短期疗效更容易达到 OR, PFS 也往往较长。

PO-3309

肝硬化脾功能亢进患者部分性脾动脉栓塞术后血流动力学变化研究

高雨佳、程进东、高知玲、卢荣、陈勇

宁夏医科大学总医院

目的 探究肝硬化脾功能亢进患者部分性脾动脉栓塞术后血流状态变化, 验证脾动脉盗血综合征的存在, 为后期诊疗提供影像学依据。方法 本组共收集乙肝肝硬化继发脾功能亢进患者 83 例, 分析其中行部分性脾动脉栓塞术且影像学资料完整的肝硬化脾功能亢进患者 50 例, 所有患者均在术前 3 天、术后 1 个月行多层螺旋 CT 上腹增强检查或彩色多普勒超声检查, (1)测量并比较彩色多普勒超声下 PSE 术前、术后脾静脉与门静脉内径、平均血流速度及血流量的变化; (2)测量 CT 下脾脏体积、残脾体积, 计算栓塞率, 应用多种重组技术比较 CTA 下 PSE 术前后腹腔干、脾动脉、肝总动脉、胃左动脉、胃十二指肠动脉、肝固有动脉内径及脾/肝总动脉的差异。结果 (1)PSE 术后超声下脾静脉内径、脾静脉血流量较术前明显减少, 差异具有统计学意义 ($P<0.05$), 但脾静脉平均血流速度差异无统计学意义 ($P>0.05$); 门静脉内径缩小, 平均血流速度减慢, 血流量较术前明显减少, 差异具有统计学意义 ($P<0.05$)。 (2)PSE 术后基于 CT 测量脾脏体积明显缩小, CTA 下脾动脉内径缩小, 肝总动脉、肝固有动脉内径增大, 脾/肝总动脉减小, 差异具有统计学意义 ($P<0.05$); 腹腔干、胃左动脉、胃十二指肠动脉内径变化不著, 差异无统计学意义 ($P>0.05$)。结论 通过 CTA 技术联合彩色多普勒超声技术评估部分性脾动脉栓塞术后血流动力学变化, 明确

PSE 可有效缓解门静脉高压, 间接增加肝动脉供血, 从而达到缓解脾亢、纠正脾动脉盗血状态、改善肝功能的效果。

PO-3310

Fatty acid binding protein 5 (FABP5) regulates proliferation via the PI3K/AKT signaling pathway in clear cell renal cell carcinoma cell lines

Qi Lv, Peijun Wang
Shanghai Tongji Hospital

Kidney is the one of most important organs which participates in whole body's homeostasis. The urine-producing function unit in kidney is nephron, which includes a renal corpuscle and renal tubules. Kidney cancer, also named renal cancer, originates from the cells in kidney. The two common types of renal cancer are renal cell carcinoma (RCC) and urothelial cell carcinoma (UCC). Clear cell renal cell carcinoma (ccRCC) has been associated with the highest mortality rates. Fatty acid binding proteins (FABPs) are a kind of 14~15 kD proteins which are present in high abundance in the cytosol of most tissues. In this report, we found that FABP5 is upregulated and correlates with poor survival in ccRCC patients. Moreover, our research results indicated that FABP5 executed a pro-proliferative role in ccRCC cells, including Caki-1 and 786O. Silencing of FABP5 significantly inhibited ccRCC cells proliferation in vitro; while overexpression of FABP5 promotes cells proliferation; and FABP5 expression was significantly correlated with neoplasm stage and regulated the tumor growth in nude mice. Furthermore, the LY294002 attenuated the pro-proliferative effect of FABP5 in both Caki-1 and 786O cells, implying that the PI3K/AKT signaling pathway, at least partly, involves in the FABP5-induced ccRCC cells proliferation. Taken together, we found FABP5 was higher expressed in patients with ccRCC, and patients with higher FABP5 showed a decreased survival level. Furthermore, we found the FABP5 regulated proliferation ccRCC cell lines by regulating PI3K/AKT signaling pathway. These results suggested that FABP5 may be a potential prognostic biomarker and provide a new perspective of FABPs in tumor biology.our results indicating that FABP5 was associated with malignant progression and might play an important role in tumorigenesis in ccRCC cells.

PO-3311

Altered dynamic functional connectivity association with diverse grade white matter hyperintensity and cognition in cerebral small vessel disease patients

Tianyuyi Feng
Shanghai Fifth People's Hospital

Abstract

Objectives: To assess the effect of diverse grade white matter hyperintensity(WMH) in cerebral small vessel disease(CSVD) patients on dynamic functional connectivity(DFC) and further evaluate the impact of diverse grade WMH on cognition from the perspective of DFC.

Methods: 85 WMH patients underwent demographic survey, clinical examination, neuropsychological test, structural and resting state functional MRI scan. To evaluate diverse grade of WMH, the whole subjects were divided into mild and severe WMH group according to Fazekas grade scale of WMH: (1)mild WMH group scored 1-2(n=55); (2)severe WMH group scored 3-6(n=30). Independent composition analysis(ICA) was performed on the rs-fMRI data for

functionally relevant intrinsic connectivity networks. Sliding time window analysis and k-means clustering analysis were used to characterize distinct functional connectivity states and temporal properties (mean dwell time, fractional windows and transition numbers) of DFC. Temporal properties of DFC between two groups were compared by two-sample t-test. Correlations were performed between temporal properties of DFC and the score of cognition of two groups.

Results: The subjects in severe WMH group were older than that of mild WMH group ($Z = -2.814$, $p = 0.005$). Except age, the rest demographic and clinical characteristics had no significant difference between two groups. The intrinsic brain functional network connectivity identified clustered into four distinct states. Severe WMH group had longer mean dwell time ($t = 2.36$; $P < 0.05$) in state 3 than that of mild WMH group. Cognitive scores of the whole subjects were negatively correlated with mean dwell time and fractional windows in state 2 ($p < 0.05$). Cognitive score decreased as transition numbers increased of severe WMH group compared to mild WMH group in state 2 ($p < 0.05$).

Conclusions: This study detected diverse grade WMH patients exhibited altered temporal properties of DFC and clarified the impact of diverse grade WMH on cognition from the perspective of DFC.

PO-3312

Intrinsic Brain Activity Alterations in Patients with Mild Cognitive Impairment-to-Normal Reversion: A Resting-State Functional MRI Study from Voxel to Whole-Brain Level

Qili Hu

Shanghai Fifth People's Hospital

Abstract

Mild cognitive impairment (MCI) reversion refers to patients with MCI who revert from MCI to a normal cognitive state. Exploring the underlying neuromechanism of MCI reverts may contribute to providing new insights into the pathogenesis of Alzheimer's disease and developing therapeutic interventions. Information on patients with MCI and healthy controls (HCs) was collected from the Alzheimer's Disease Neuroimaging Initiative database. We redefined MCI reverts as patients with MCI whose logical memory scores changed from MCI to normal levels using the logical memory criteria. We explored intrinsic brain activity alterations in MCI reverts from voxel, regional, and whole-brain levels by comparing resting-state functional magnetic resonance imaging metrics of the amplitude of low-frequency of fluctuation (ALFF), the fractional amplitude of low-frequency fluctuation (fALFF), percent amplitude of fluctuation (PerAF), regional homogeneity (ReHo), and degree centrality (DC) between MCI reverts and HCs. Finally, partial correlation analyses were conducted between cognitive scale scores and resting-state functional magnetic resonance imaging metrics of brain regions, revealing significant group differences. Thirty-two patients with MCI from the Alzheimer's Disease Neuroimaging Initiative database were identified as reverts. Thirty-seven age-, sex-, and education-matched healthy individuals were also enrolled. At the voxel level, compared with the HCs, MCI reverts had increased ALFF, fALFF, and PerAF in the frontal gyrus (including the bilateral orbital inferior frontal gyrus and left middle frontal gyrus), increased PerAF in the left fusiform gyrus, and decreased ALFF and fALFF in the right inferior cerebellum. Regarding regional and whole-brain levels, patients with MCI reverts showed increased ReHo in the left fusiform gyrus and right median cingulate and paracingulate gyri; increased DC in the left inferior temporal gyrus and left medial superior frontal; decreased DC in the right inferior cerebellum and bilateral insular gyrus relative to HCs. Furthermore, significant correlations were found between cognitive performance and neuroimaging changes. These findings suggest that MCI reverts show significant intrinsic brain activity changes compared with

healthy controls, potentially related to the cognitive reversion of patients with MCI. These results enhance our understanding of the underlying neuromechanism of MCI reverts and may contribute to further exploration of Alzheimer's disease.

PO-3313

Pelvic effusion in patients with ovarian thecoma-fibroma associated with the tumor size and plasma CA-125 level: A retrospective magnetic resonance imaging study

Xiaohu Zhao

The Fifth People's Hospital of Shanghai, Fudan University

Purpose: To survey the occurrence rate of ascites in patients with thecoma-fibroma and its potential correlation with tumor MR imaging characteristics.

Methods: A total of 40 patients with surgically proven thecoma-fibroma were enrolled in this retrospective study. We determined the tumor size, the components (solid or cystic) and their signal intensity features. Second, we identified ascites according to the fat-suppressed sagittal T2-weighted imaging sequence and divided all cases into two groups (with or without ascites). Furthermore, we explored the correlations of ascites with tumor size, tumor solidity, pathological types, patient's postmenopausal status and serum CA-125 levels by using the χ^2 test.

Results: (1) Among the 40 cases, 15 tumors were fibromas, 15 thecomas, and 10 fibrothecomas. Nine patients (26.47%) had elevated CA-125 levels (>35.0 U/ml). (2) Thirty-one patients had ascites (77.50%), 29 of which had a small amount of ascites. Nine cases had no ascites (22.50%). (3) MRI showed a solid mass in 22 cases (55.0%), cystic mass in five cases (12.5%) and mixed solid-cystic mass in 13 cases (32.5%). The χ^2 test revealed that the incidence of ascites was significantly correlated with tumor size, tumor solidity and serum CA-125 levels ($P < 0.05$), but not with menopause and pathological type ($P > 0.05$).

Conclusion: Our data revealed that the incidence of ascites was 77.50% and was mainly correlated with tumor size and elevated CA-125 levels. These findings have potential value for improving the diagnosis and differential diagnosis of thecoma-fibroma.

PO-3314

Altered activity and functional connectivity of superior temporal gyri in anxiety disorders a functional magnetic resonance imaging study

Xiaohu Zhao

The Fifth People's Hospital of Shanghai, Fudan University

OBJECTIVE: The prior functional MRI studies have demonstrated significantly abnormal activity in the bilateral superior temporal gyrus (STG) of anxiety patients. The purpose of the current investigation was to determine whether the abnormal activity in these regions was related to a loss of functional connectivity between these regions.

MATERIALS AND METHODS: Ten healthy controls and 10 anxiety patients underwent noninvasive fMRI while actively listening to emotionally neutral words alternated by silence (Task 1) or threat-related words (Task 2). The participants were instructed to silently make a judgment of each word's valence (i.e., unpleasant, pleasant, or neutral). A coherence analysis was applied to the functional MRI data to examine the functional connectivity between the left and the right STG, which was selected as the primary region of interest on the basis of our prior results.

RESULTS:The data demonstrated that the anxiety patients exhibited significantly increased activation in the bilateral STG than the normal controls. The functional connectivity analysis indicated that the patient group showed significantly decreased degree of connectivity between the bilateral STG during processing Task 2 compared to Task 1 ($t = 2.588$, $p = 0.029$). In addition, a significantly decreased connectivity was also observed in the patient group compared to the control group during processing Task 2 ($t = 2.810$, $p = 0.012$).

CONCLUSION:Anxiety patients may exhibit increased activity of the STG but decreased functional connectivity between the left and right STG, which may reflect the underlying neural abnormality of anxiety disorder, and this will provide new insights into this disease.

PO-3315

Enhanced Glioblastoma Therapy through Redox-Sensitive Polymer Micelles Co-Encapsulating Immune Checkpoint Inhibitors and Chemotherapeutic Agents

Zhiqi Zhang, Jinbing Xie, Shenghong Ju

Jiangsu Key Laboratory of Molecular and Functional Imaging, Department of Radiology, Zhongda Hospital, Medical School, Southeast University, Nanjing, 210009, China.

Background: Immunotherapy with immune checkpoint blockade (ICB) for glioblastoma (GBM) is promising but its clinical efficacy is seriously challenged by the blood-tumor barrier (BTB) and immunosuppressive tumor microenvironment (TME). Here, aPD-L1 was loaded into a redox-responsive micelle and the ICB efficacy was further amplified by paclitaxel (PTX)-induced immunogenic cell death (ICD) via co-encapsulation approach for the reinvigoration of local anti-GBM immune responses. The aim of this study is to prove the co-encapsulation approach facilitating efficient antibody delivery and combining with chemotherapeutic agent-induced ICD demonstrated that the chemo-immunotherapy can reprogram local immunity to empower immunotherapy against GBM.

Methods: The structure and function of aPD-L1 released from the micelles were assessed by ELISA, flow cytometry and SDS-PAGE. The effect of ICD was assessed by confocal microscopy, flow cytometry and ELISA. The pharmacokinetics and biodistribution of the micelle were investigated by near-infrared imaging. The GBM progression was detected by MR. The immune status of GBM was investigated by flow cytometry and immunofluorescence.

Results: The micelles effectively crossed the BTB and were retained in the reductive tumor microenvironment without altering the bioactivity of aPD-L1. The ICB efficacy was substantially enhanced by the aPD-L1 and PTX combination with significant suppression of primary and recurrent GBM and induction of long-lasting immunological memory in the orthotopic GBM-bearing mice.

Conclusion: Our micelle can increase the low response rate of ICB as evidenced by the therapy of A2-APM potently eradicating GBM in preclinical models. Our studies provide an improved approach to develop antibody penetration into the brain and to use chemotherapy-induced ICD for boosting antitumor immunity with brain tumors, and the micelles might have broader implications for immunotherapy in other immunosuppressive malignancies.

PO-3316

Uniting Dual-Modal MRI/Chemiluminescence Nanotheranostics: Spatially and Sensitively Self-Reporting Photodynamic Therapy in Oral Cancer

Yining Tao

Shanghai Sixth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

***Purpose:**

In order to achieve precise and efficient diagnosis and treatment of tumors, the integrated nanosystem has been recognized by many interdisciplinary fields and has broad development prospects. However, there are still many challenges in real-time monitoring of targeted delivery and efficacy control of nanomedicines. Firstly, the unpredictable in vivo behaviors of nanotheranostics, that is, real-time tracking where, when, and how nanodrugs delivered. Next, limited by the uncontrollability of the therapeutic dose, how to monitor the treatment behavior and control the curative effect is the main bottlenecks. Therefore, inspired by the Boolean logic idea, designing sequence-activated nanotheranostics strategy is expected to become a breakthrough to solve the above difficulties and realize high-performance diagnosis and treatment applications.

***Methods and Materials:**

A sequence-responsive MRI/chemiluminescence (CL) dual-mode strategy was constructed through uniform spatio-temporal resolution. The nanotheranostics system Pa-Mn&CH-A@P was prepared by combining the Mn²⁺ chelated photosensitizer (Pa) and the CL molecule (CH-A) through FNP technology. Then we explored the structural characterization, spectral properties, MR properties and CL properties of the nanomaterials. The human oral squamous cell carcinoma cell CAL27 was selected as cell model of the tumor to further explore the PDT properties and CL imaging to further explore the photodynamic properties and chemiluminescence imaging properties in cells, as well as the dual-modality imaging were performed in tumor model of oral cancer in mice.

***Results:**

We innovatively combined MR and CL imaging through FNP (flash nanoprecipitation) technology to quantitatively monitor in vivo distribution and PDT performance, overcoming the dilemma between spatial resolution and sensitivity.

***Conclusions:**

Based on near-infrared fluorescence imaging, chemiluminescence imaging, magnetic resonance imaging and photodynamic therapy, this research combined diagnosis and treatment to construct nanotheranostics system. We successfully designed nanoprobe Pa-Mn&CH-A@P to real-time tracking unpredictable biological distribution and behavior in vivo and PDT feedback, which expanded the application of sequence-activated nanotheranostics system.

Clinical Relevance/Application: Integration of diagnosis and treatment of oral cancer

PO-3317

Dual-Enzyme and Radiation Enabled Oxygen Self-Supplying Nanosystem for Augmented Tumor Imaging and Radiotherapy

Yuanyuan Ma, Jue Wang, Jinqiang Liu, Shenghong Ju
Zhongda Hospital, Southeast University

Objectives: Solid tumors often exhibit hypoxia, a state of low oxygen, due to irregularities in the tumor's blood vessels, rapid tumor cell growth, and a dysfunctional lymphatic system. It's been shown in earlier studies that this tumor hypoxia significantly impedes the success of tumor treatment. Oxygen plays a crucial role in the creation of reactive oxygen species, which are key to destroying tumors during radiotherapy. Consequently, a hypoxic tumor environment often results in resistance to radiotherapy. This research seeks to develop a unique cyclic self-oxygenating nanosystem by co-loading catalase (Cat) and superoxide dismutase (SOD). This system is designed to continually and efficiently generate oxygen from water molecules within tumor tissues upon exposure to radiation, thereby improving the therapeutic effect on tumors. Photoacoustic and fluorescence imaging techniques are employed to monitor the oxygen levels within tumors and the in vivo biological distribution of the nanoplateforms in real time, offering additional guidance for radiotherapy in mice.

Methods: The primary structure of the novel nanosystem comprises a biodegradable hollow hybrid organosilica nanoparticle (HSN), encapsulating catalase (Cat) and superoxide dismutase (SOD) enzymes, designated as SC@HSN. This nanoparticle is further coated with a zeolitic imidazolate framework-8 (ZIF-8), a metal-organic framework carrying NIR-I fluorescent dyes, resulting in SC@HSN@Z-F. Various methods, including transmission electron microscopy, Zeta potential, X-ray diffraction, and dynamic light scattering were employed for characterizing this nanomaterial. An oxygen detection probe [Ru(DPP)₃]Cl₂ was used to measure oxygen production of the nanoparticles under X-ray activation. The level of HIF-1 α expression was gauged via Western blot analysis and immunofluorescence experiments. The MTT assay was utilized to determine nanoparticles' cytotoxic impact on tumor cells. Additionally, a breast cancer model was developed in situ, with real-time tracking of nanoparticle biodistribution using near-infrared fluorescence imaging. Finally, changes in tumor volume and survival period analysis were used to evaluate therapeutic effectiveness.

Results: The novel nanosystem targets tumor tissues via the enhanced permeability and retention (EPR) effect. Within the acidic tumor environment, the ZIF-8 coating degrades, releasing NIR-I fluorescent dyes for fluorescence imaging. Simultaneously, the hybrid organosilica core degrades in the presence of glutathione (GSH), releasing the encapsulated enzymes. During radiotherapy, ionizing radiation generates reactive oxygen species (ROS), including superoxide anions (O²⁻), from water molecules. These anions are then converted into hydrogen peroxide (H₂O₂) by the catalytic action of SOD. This hydrogen peroxide is subsequently transformed into oxygen through catalase's action. Transmission electron microscopy images indicated the SC@HSN@Z-F nanoparticles are roughly 50 nm in size. In vitro tests confirmed the nanoparticles' powerful anticancer effects, and in vivo experiments validated their biodistribution and cancer-fighting efficacy.

Conclusions: This cutting-edge nanosystem enabled the sustained production of oxygen from water molecules present within tumor tissues when subjected to external radiation. This effectively improved the tumor microenvironment and increased the tumor's susceptibility to radiotherapy.

PO-3318

CeO₂ nanoparticles mediated by BSA promoted oxygenation for enhanced chemo-sonodynamic therapy of tumors

Mei Zhou

Zhongda Hospital, Medical School, Southeast University

Purpose: Traditional tumor treatments are clinically suboptimal and needs noninvasive and accurate antitumor therapies to improve the anti-cancer effectiveness. Sonodynamic therapy (SDT) is a promising antitumor therapeutic strategy, but its efficacy is often limited by extensive hypoxia present within solid tumors. Increasing the local concentration of oxygen at the tumor site may be an effective strategy for augmenting the efficacy of SDT. Thus, developing a nanoparticle with alleviating TME hypoxia is needed to enhance SDT for antitumor therapy.

Methods: The CeO₂@BSA-Ce6-DOX (CBCD) were synthesized with biomimetic mineralization. Near-infrared (NIR) imaging were measured to evaluate the tumor accumulation. The tumor suppression effect of combined enhanced SDT and chemotherapy by this nanoparticle was also studied for the 4T1 -bearing Balb/c mice.

Results : The synthesized CBCD NPs showed high tumor accumulation. Abundant sonosensitizers and chemotherapy drugs was delivered to the tumor, which is available for the accurate therapy of tumors. Cerium oxide (CeO₂) exhibits catalase (CAT)-like ability, facilitating the conversion of hydrogen peroxide (H₂O₂) into oxygen (O₂) to alleviate tumor-associated hypoxia. In addition, the CBCD displayed outstanding fluorescence imaging effects for evaluating the nanoparticle distribution. Consequently, significant tumor suppression effect was obtained based on the tumor accurate treatment with the combined enhanced SDT and chemotherapy.

Conclusions: The synthesized CBCD NPs showed high tumor accumulation, resulting in a significant tumor-suppression effect based on the combined enhanced SDT and chemotherapy. This work fabricated BSA-mediated CBCD nanoparticles using a biomimetic mineralization technique that was simple and green, providing a promising strategy for mitigating hypoxia-related challenges in SDT therapy for tumor treatment.

PO-3319

Programming CpG Functionalized Evans Blue for Lymph-node Targeting Molecular Vaccines

Liu Yang

Department of Radiology, Zhongda Hospital

Purpose CpG oligodeoxynucleotide (CpG ODNs), a Toll-Like Receptor 9 (TLR9) agonist, are widely used adjuvants. However, major challenges underlying the use of CpG lie in effectively targeting antigen-presenting cells (APCs) to trigger immune responses and minimizing toxicity. Evans Blue (EB) structure has a great affinity to human serum albumin (HSA) and increases lymph nodes (LNs) accumulation. We proposed that LN targeting efficient delivery of CpG would help accumulate CpG in lymphoid organs after subcutaneous injection.

Methods We first designed a unique molecular vaccine by designing a bivalent Evans Blue derivate (EB2) and conjugating with CpG covalently through click chemistry, denoted as EB2-CpG. The interaction of EB2 with HSA was further verified by biolayer interference (BLI). We next characterized in vivo trafficking of EB2-CpG by PET imaging and in vivo imaging system (IVIS) fluorescence imaging. EB2-CpG was injected subcutaneously in C57BL/6 mice, and 6, 12, 24, 48 and 72h later, draining LNs were excised and calculated for accumulation dose in LNs and major

organs. To assess that CpG retains its immunostimulatory ability when conjugated with EB2 (EB2-CpG) and bound to HSA physiologically (EB2-CpG-HSA), we exposed them to murine bone marrow-derived dendritic cells (BMDCs) and Raw 264.7. The expression of CD80 and CD86 on both antigen presenting cells (APCs) are evaluated. In vivo antitumor effect and immune activation of EB2-CpG were studied. The toxicity of repeated CpG injection were compared between CpG and EB2-CpG group.

Results We observed from BLI and in vivo imaging experiments that EB2-CpG and EB2-ICG bind avidly to endogenous albumin and can accumulate in APCs in the LNs after injection. Over 3 days after injection, free CpG exhibited no LN accumulation above, whereas EB2-CpG accumulated for 7 days. Our in vitro analysis indicated that the expression of CD80 and CD86 of BMDC in EB2-CpG group were comparable to free CpG and EB-CpG groups, therefore EB2 conjugation of CpG and bound to HSA does not impair its immune stimulatory activity. EB2-CpG was superior in increased in T-cell priming and enhanced anti-tumor efficacy in vivo. Additionally, EB2-CpG did not elicit significant increases in serum levels of ALT, AST enzyme, systemic proinflammatory cytokines and observed splenomegaly confirming CpG off-target inflammatory effects had been minimized.

Conclusion We demonstrated a novel platform using “albumin hitchhiking” approach as subcutaneous vaccination for robust and durable antitumor efficacy, which may present a promising approach in tumor immunotherapy.

PO-3320

Molecular mechanisms and behavioral relevance underlying neural correlates of early-life urbanization

Weisheng Huang^{1,2,3}, Xuetian Sun^{1,2,3}, Xiaohan Zhang^{1,2,3}, Ruoxuan Xu^{1,2,3}, Yinfeng Qian^{1,2,3}, Jiajia Zhu^{1,2,3}

1. The First Affiliated Hospital of Anhui Medical University

2. Research Center of Clinical Medical Imaging

3. Anhui Provincial Institute of Translational Medicine

Although previous neuroimaging studies have established the associations of urban exposure during early life with brain functional and structural alterations, their molecular mechanisms and behavioral relevance remain largely unknown. To address this question, we calculated amplitude of low-frequency fluctuations (ALFF) and gray matter volume (GMV) using resting-state functional and structural MRI to investigate their associations with early-life urbanization in a large sample of 511 healthy young adults. Then, we examined the spatial relationships of the identified neural correlates of early-life urbanization with gene expression, neurotransmitter, and behavioral domain atlases. Results showed that higher early-life urbanization scores were correlated with increased ALFF of the right fusiform gyrus, and decreased GMV of the left dorsal medial prefrontal cortex and left precuneus. Remarkably, the identified neural correlates of early-life urbanization were spatially correlated with expression of gene categories primarily involving immune system process, signal transduction, and cellular metabolic process. Concurrently, there were significant associations between the neural correlates and specific neurotransmitter systems including dopamine, acetylcholine, and serotonin. Finally, we found that the ALFF correlates were associated with behavioral terms including “perception”, “sensory”, “cognitive control”, and “reasoning”. Apart from expanding existing knowledge of early-life urban environmental risk for mental disorders and health in general, our findings may contribute to an emerging framework for integrating social science, neuroscience, genetics, and public policy to respond to the major health challenge of world urbanization.

PO-3321

In Vivo Assessment of Regional Tau Deposition, Gray Matter Volume and Cognition in Alzheimer disease: a head-to-head 18F-fortaucipir PET/MR study

Xinru Xu, Bing Zhang

Department of Radiology, The affiliated Drum Tower hospital of Nanjing university medical school

Purpose: Despite amyloid plaque is associated with atrophy, connectivity change and function, the accurate role of tau and regional atrophy on cognition in Alzheimer's disease remains unclear. This study aimed to investigate the connection between regional tau pathology, local or distant gray matter atrophy in vivo and the impact on cognition improving effective clinical trials and upcoming therapeutic approaches for AD.

Materials and Methods: Thirty-four patients with A β positive mild cognitive impairment or dementia and 23 cognitive normal controls experienced standardized clinical and neuropsychological assessments followed by 18F-fortaucipir positron emission tomography (PET) imaging and 3D T1 magnetic resonance imaging (MRI). The regional tau standardized uptake value ratio (SUVR) and gray matter volumes (GMV) in regions-of-interest (ROIs) were measured. Group differences in the two imaging modalities were compared. Multimodal correlation analyses and mediation analyses were then carried out in brain regions that displayed a relationship between cognition and the 18F-fortaucipir SUVR and GMV.

Results: The 18F-fortaucipir retention was observed in the entorhinal cortex, hippocampus, parietal lobe, temporal lobe, precuneus and posterior cingulate in AD/MCI groups. Regionally, 18F-fortaucipir was largely associated with local/non-local GMV in temporoparietal region (range standardized β s of residual=-0.45--0.77, $p<0.05$) in MCI/AD patients. Mediation analyses showed GMV of the entorhinal cortex and medial parietal lobes mediated the effect of local region 18F-fortaucipir SUVR on cognitive impairment (mediation effect=0.54, 0.93; explained variance=32.86%, 37.94%, respectively). The GMV of the medial parietal lobes and medial temporal lobes mediated the effect of distant region 18F-fortaucipir SUVR on cognitive impairment (mediation effect=0.75-0.85; explained variance=57.01%-58.14%).

Conclusions: Tau pathology was associated with local and distant areas of brain atrophy in the brain regions in MCI/AD patients. Local and distant atrophy played a mediating role between tau binding and cognitive impairment in these patients.

PO-3322

Predicting the prognosis of glioblastoma based on MRI radiomic model of temporal muscle and tumor: a multicenter study

Yingxia Huang¹, Huiqin Wu², Yuankui Wu¹, Lijun Lu²

1. Department of Medical Imaging, Nanfang Hospital, Southern Medical University

2. School of Biomedical Engineering, Southern Medical University

Abstract

Background and Purpose:

Glioblastoma (GBM) is the most common primary malignant brain tumor. Sarcopenia is associated with poor outcomes for tumor patients. This study aims to investigate the prognostic value of radiomics features of temporal muscle in glioblastoma patients.

Methods:

This study comprised a training data set of 435 patients from the University of Pennsylvania Health System (UPENN-GBM) and a testing data set of 126 patients from the Cancer Genome Atlas Glioblastoma Multiforme (TCGA-GBM). All patients underwent pre-operative MRI examination, including postcontrast T1-weighted imaging and T2 fluid-attenuated inversion recovery (FLAIR) imaging, from which radiomics features of temporal muscle and whole-tumor were extracted. After feature selection, uni-variate and multi-variate cox regression were used to build predictive radiomic models. The concordance index (C index) was used to assess the potential value of radiomic models in predicting overall survival (OS). The added value of radiomics feature of temporal muscle to tumoral radiomics features and clinical features was also analyzed.

Results:

The temporalis radiomics features (C-index 0.5849) had a better predictive ability than temporal muscle thickness (C-index 0.5228) and temporal muscle cross area (C-index 0.5416). The addition of temporalis radiomics features to tumoral radiomics features showed an improved prediction performance (C-index 0.6113 vs 0.5918, $P < .001$). The combined model (temporalis radiomic features, tumoral radiomic features and clinical profiles) had the best predictive performance (C-index 0.6270).

Conclusion:

Temporalis radiomics features might have potential in predicting clinical outcomes for glioblastoma patients and could be integrated with tumor and clinical profiles to improve predictive performance.

PO-3323

Renal-Clearable Nanodots Overcoming Metabolic Reprogramming to Boost Mitochondrial-Targeted Photodynamic Therapy in Triple-Negative Breast Cancer

Defan Yao, Dengbin Wang

Xinhua Hospital, Shanghai Jiao Tong University School of Medicine

PURPOSE

Triple-negative breast cancer (TNBC) exhibits a greater reliance on glutamine uptake and utilization, a condition described as "glutamine addiction", which results in abundant glutathione (GSH) and protects TNBC cells from oxidative damage. Therefore, targeted GSH metabolic reprogramming may become a crucial strategy in tumor treatment by interfering with GSH synthesis or depleting GSH levels to enhance the reactive oxygen species (ROS) sensitivity of TNBC cells. To enhance the lethality of ROS generated by photodynamic therapy (PDT), Herein, we developed ultrasmall metal-organic frameworks (MOFs) nanodots, named MSPC, encapsulating both metabolism inhibitors and mitochondria-targeted photosensitizer.

METHOD AND MATERIALS

Initially, MOFs encapsulating the near-infrared squaraine dye SQ-675, phenethyl isothiocyanate (PEITC), and a ROS-responsive CO donor (CORM-401) were prepared using a conventional method. Subsequently, an ultrasonic processor was employed to introduce liquid phase exfoliation, resulting in the formation of ultrasmall nanodots.

RESULTS

MSPC exhibit an acidic-sensitive drug release, leading to depletion of glutathione and suppression of mitochondrial respiration. Importantly, MSPC induces a substantial reduction in intracellular ATP levels by simultaneously disrupting oxidative phosphorylation and impeding aerobic glycolysis. Therefore, the glutathione depletion combined with metabolism inhibitor results in an increase in oxidative stress, which improves the efficacy of mitochondria-targeted photodynamic therapy for TNBC. Additionally, MSPC demonstrates aggregation-enhanced retention and fluorescence/photoacoustic imaging capabilities within tumors, followed by elimination through the renal system.

CONCLUSION

In summary, this novel platform, MSPC, indicates the feasibility of overcoming resistance to ROS induced by metabolic reprogramming, thus holding significant implications for PDT of TNBC.

PO-3324

A multicenter study based on multiparametric MRI radiomics model to identify conventional imaging misdiagnosis or uncertain pleomorphic adenomas and Warthin tumors

Jing Yang, Qiu Bi, kunhua wu
The First People's Hospital of Yunnan Province

Objective: To investigate the differential diagnostic value of multiparametric MRI radiomics model for routine imaging misdiagnosis or uncertain pleomorphic adenomas and Warthin tumors.

Methods: The data of patients with pathologically confirmed pleomorphic adenomas (PA) and Warthin tumors (WT), who had misdiagnosis or uncertain diagnosis with conventional imaging, were retrospectively collected from two centers. The ROI (Region of Interest) and features were extracted using the 3D Slicer software. The collected data was randomly divided into a training group and a verification group in a 7:3 ratio. Univariate logistic regression was employed to identify significant clinical features, and multivariate logistic regression was used to establish a clinical model. logistic regression (LR), K-nearest Neighbor (KNN), support vector machine (SVM), random forest (RF), stochastic gradient descent (SGD), extremely randomized trees (ET), decision tree (DT), Light Gradient Boosting Machine (LightGBM), and LightGBM, Light Gradient Boosting Machine, were utilized to construct radiomics models. The model with the highest AUC (Area Under the Curve) in the validation group was selected as the best machine learning model. A nomogram was then created using the factors included in the clinical model and the rad-score obtained from the best machine learning model. Additionally, the ensemble strategy and stacking algorithm were employed to establish the Stacking model and the Ensemble model, respectively. ROC curve was used to evaluate the differential diagnosis efficiency of the above model in the training group, the internal verification group and the external verification group.

Results: A total of 149 patients were enrolled, including 126 from Center A (76 cases of PA and 50 cases of WT) and 23 cases from Center B (10 cases of PA and 13 cases of WT). Finally, gender, age, and smoking were included as independent influencing factors into the clinical model. Among the nine machine learning models, LR models were the best machine learning model, with the highest average AUC (0.896) and average ACC (0.839). The areas under the ROC curve of clinical model, best machine learning model, nomogram, Stacking model and Ensemble model were 0.942, 0.939, 0.971, 0.936 and 0.936 in the internal verification group, and the area under the ROC curve was 0.862, 0.854, 0.915, 0.885 and 0.885 in the external verification group, respectively. The nomogram performance in identifying PA and WT outperformed the clinical model and the best machine learning model. The Stacking model and the Ensemble model have similar performance. **Conclusion:** The radiomics model constructed based on multiparametric MRI has high diagnostic value in distinguishing conventional imaging misdiagnosis or uncertain PA and WT.

PO-3325

Application of 7 T Cardiac Magnetic Resonance Imaging to Study Muscle Ring Finger Protein 1 Inhibits Impairment of Diastolic Function in Diabetic Cardiomyopathy

Xuemiao Jin¹, Li Zhu², Fabao Gao³

1. 宁夏医科大学

2. Ningxia Medical University General Hospital

3. West China Hospital, Sichuan University

OBJECTIVE: MuRF-1 belongs to the E3 ubiquitin ligases and is mainly expressed in cardiac and skeletal muscle. Diabetic cardiomyopathy (DCM) is the typical early clinical feature of diabetic cardiomyopathy manifested by patients presenting with diastolic dysfunction with preserved ejection fraction, but due to the lack of effective screening tools, patients are diagnosed when they present with systolic dysfunction. The aim of this study was to investigate the effect of MuRF1 on the development of diabetic cardiomyopathy by cardiac magnetic resonance (CMR) and to elucidate its aforementioned properties.

Materials and methods: After 72 SD rats were acclimatized and fed for 1 week, 18 rats were randomly selected as blank control group and fed with normal chow. The remaining 60 rats were used for modeling and fed with high-fat chow (10% lard, 2% cholesterol, 0.5% cholate, 20% sucrose, 67.5% regular chow) for 4 weeks to establish an insulin resistance model. After the 60 rats in the model group were fasted overnight for more than 12 h, streptozotocin (STZ) was dissolved in 0.1 mmol/L-1 citric acid-trisodium citrate buffer at pH=4.3, configured to a concentration of 2%, and injected into the abdominal cavity of the rats at a single dose of 30 mg/kg-1 to establish a rat model of type 2 diabetes mellitus. The rats were divided into four groups: the CON group, the T2DM group, the T2DM+MuRF-1 overexpression group and the T2DM+MuRF-1 null group. Then, rats in each group were subjected to CMR imaging, including FLASH-cine, T1 mapping sequence and delayed reinforcement sequence to assess LV function, strain, T1 mapping value and ECV value. Finally, blood, heart and samples were collected for relevant tests.

RESULTS: The MuRF-1 overexpression group significantly increased LV ejection fraction (51.98 ± 7.88 vs 61.30 ± 6.09), overall longitudinal (-12.90 ± 3.53 vs -18.05 ± 3.43), and circumferential (-20.46 ± 2.47 vs -22.67 ± 1.32) strain compared to the T2DM group. In addition, blood biochemical results showed significant elevation of superoxide dismutase (216.50 ± 19.15 vs 292.60 ± 44.38) and glutathione peroxidase (9974.00 ± 900.80 vs 17843.00 ± 3585.00) and significant elevation of malondialdehyde (9.01 ± 5.59 vs 5.53 ± 1.15), creatine kinase-MB (353.00 ± 61.11 vs 210.80 ± 59.00) were significantly decreased. 00) were significantly elevated, whereas malondialdehyde (9.01 ± 5.59 vs 5.53 ± 1.15), creatine kinase-MB (353.00 ± 61.11 vs 210.80 ± 59.57), and lactate dehydrogenase (747.30 ± 278.80 vs 357.90 ± 135.70) were significantly decreased. These findings may be related to the upregulation of MuRF-1 expression, which was confirmed by PCR, immunohistochemistry and WB assays. Cardiac-associated staining indicated that MuTF-1 overexpression therapy inhibited pathological fibrosis.

CONCLUSION: Our study demonstrated that MuTF-1 overexpression significantly increased RVEF, GLS, and GCS by CMR imaging. in this regard, we explored the corresponding mechanisms with the help of several assays. Our study is expected to lay the foundation for pro-early warning of LV dysfunction in diabetic cardiomyopathy.

PO-3326

Explore the alleviative effect of Cangai volatile oil on myocardial hypertrophy of different degrees in rats exposed to chronic hypobaric hypoxia at high altitude

Boshen Liang^{1,2}, Fabao Gao^{1,2}

1. West China Hospital, Sichuan University

2. Yunnan University of Chinese Medicine

Purpose: This study was intended to attest to whether cardiovascular magnetic resonance (CMR) imaging could reveal the protective effect of Cang-Ai Volatile Oil (CAVO) on the cardiac of rats with chronic hypobaric hypoxia at high altitude.

Materials and Methods: Seventy SD rats were randomized into seven groups, the Control (CON), Hypobaric Hypoxia (HH), HH + CAVOh, HH+ CAVOI, Hypobaric Hypoxia+ myocardial hypertrophy (HM), HM+CAVOh, and HM + CAVOI. Except for rats in the CON group, rats in other groups were transported from Chengdu to Yushu, China (altitude: 4,250m) and housed there for two months. Rats of the HM, HM+CAVOh, and HM+CAVOI groups were injected intraperitoneally with ISO (3 mg/kg for 14 days), while at the same time, rats in the HH, HH+CAVOh, HH+CAVOI groups were injected intraperitoneally with saline. Left ventricular function and global strain of the rats were measured by 7.0T high-field CMR.

Results: CMR imaging revealed that the left ventricular ejection fraction (LVEF) and global strains improved significantly in all groups after CAVO treatment compared with the HH group ($p < 0.05$). Injuries related to oxidative stress occurred after CAVO treatment, as evidenced by the increase in SOD and the decrease in MDA and LDH ($p < 0.05$). Western blotting indicated that CAVO treatment increased the protein expression of NRF2 and HO-1.

Conclusion: CAVO treatment can reduce cardiac damage induced by chronic hypobaric hypoxia and ventricular hypertrophy induced by isoprenaline (ISO) at high altitude, as revealed by the oxidative stress-related indicators, and the effect can be measured by 7.0T high-field CMR.

PO-3327

Cardiac magnetic resonance multimodal evaluation of the ameliorative effects of BAG3 on left ventricular remodeling in rats

Yaoxuan Ji¹, Li Zhu², Fabao Gao³

1. Ningxia Medical University

2. Ningxia Medical University General Hospital

3. West China Hospital, Sichuan University

OBJECTIVE: To evaluate the ameliorative effect of overexpressed BAG₃ on left ventricular remodeling in myocardial ischemia/reperfusion (I/R) rats using 7T cardiac magnetic resonance (CMR) multimodal imaging.

METHODS: Thirty-two SD male rats were randomly divided into 4 groups, i.e., 8 rats in each of the sham-operated, model, experimental, and control groups, and the I/R rat model was constructed by open-chest ligation of the left anterior descending; the experimental group was injected with overexpression of BAG₃ adeno-associated virus in situ in the myocardium of I/R model; the control group was injected with unloaded adeno-associated virus in situ in the myocardium of the I/R model; and the sham-operated group was only pierced by needle. After 4 weeks, all rats underwent CMR scanning to collect data, and the post-processing software CVI42.0 was used to analyze and compare the differences in LV conventional cardiac function parameters, myocardial strain

parameters, and T2mapping parameters in each group. At the end of MRI scanning, the rats were executed, and the hearts were extracted for pathologic examination and RT-qPCR detection.

RESULTS: Compared with the sham-operated group, rats in the model group showed increased LVEDV and LVESV, decreased SV and EF (all $P < 0.05$), decreased LVGRS, LVGCS, and LVGLS (all $P < 0.05$), and increased T2 values in infarcted areas (all $P < 0.05$), with significant damage to myocardial tissues and increased infarcted areas; compared with the model group, rats in the control group showed significant injury to LVEDV LVEDV, LVESV, SV, EF, LVGRS, LVGCS, LVGLS, infarct zone T2 and myocardial tissue damage were not different in the control group; compared with the control group, the experimental group showed a lower LVESV, higher EF ($P < 0.05$), higher LVGRS, LVGLS, LVGCS, and infarct zone T2 ($P < 0.05$), lower infarct zone and reduced myocardial fibrosis. Myocardial fibrosis was reduced.

CONCLUSION: BAG₃ can improve cardiac function and delay the process of ventricular remodeling in I/R rats, and has a certain protective effect on the structure and function of the rat heart.

PO-3328

Magnetic resonance and fluorescence imaging of perfluorohexane loaded nanoparticles targeting atherosclerosis and their effects on activated macrophages

Man Ye

Renmin Hospital of Wuhan University

Objective Cardiovascular disease is a kind of major disease that seriously endangers human health and life, accounting for the first mortality rate in the world. Atherosclerosis is an important pathological basis for the occurrence and development of cardiovascular disease. Vulnerable atherosclerosis plaque is prone to sudden rupture, leading to fatal events. The rupture of atherosclerosis plaque is closely related to the composition of plaque. Therefore, non-invasive detection of the composition of AS plaque will have a very important clinical application value for the treatment and prognosis of AS patients. This study will prepare a magnetic resonance imaging (MRI)/near-infrared fluorescence dual-mode molecular probe targeting scavenger receptor A with phase change material-perfluorohexane (PFH) and dextran sulfate (DS), and study its effect on activated macrophages, aiming at early intervention of vulnerable atherosclerotic plaques at the molecular level and evaluating the therapeutic effect.

Methods Nanoparticles (PFH-Fe/DiR-DS) were prepared using an improved double emulsion method and electrostatic adsorption method. The average particle size, polydispersity indexes, and surface potential of the nanoparticles were measured using the Marvin particle size analyzer. The morphology and internal structural characteristics were observed using scanning electron microscopy and high-resolution transmission electron microscopy. Study the in vitro MRI and near-infrared fluorescence imaging of nanoparticles and their phase transition performance. Cultivate mouse macrophages RAW 264.7 in vitro, study the targeting effect of nanoparticles on activated macrophages, conduct cell viability experiments, and analyze the induction of macrophage apoptosis by nanoparticles phase transition using biological electron microscopy.

Results The final size of the prepared PFH-Fe/DiR-DS nanoparticles is (286.30 ± 16.82) nm, with a polydispersity indexes of (0.102 ± 0.057) and a surface potential of (-18.65 ± 1.09) mV. They have a shell core structure and a smooth three-dimensional spherical surface. In the element mapping images collected under high-resolution transmission electron microscopy, it can be seen that the fluorine element of PFH and the iron element of Fe₃O₄ are concentrated inside the nanoparticles, while the sulfur element of DS exhibits a clear circular structure distributed outside the nanoparticles. The PFH-Fe/DiR-DS nanoparticles can be used as ideal MRI contrast agents and have good near-infrared fluorescence imaging ability. Fluorescence signals are enhanced in a concentration dependent manner. Under the irradiation of low intensity focused ultrasound (LIFU), PFH-Fe/DiR-DS nanoparticles can undergo phase transition. Nanoparticles have good targeting

properties towards activated macrophages and are time dependent. After being internalized by macrophages and irradiated by LIFU, they can induce macrophage apoptosis through sound induced phase transition effect.

Conclusion In this study, we successfully constructed multimodal multifunctional nanoparticles (PFH-Fe/DiR-DS) targeting atherosclerotic plaques, and induced macrophage apoptosis under LIFU irradiation. The application of magnetic resonance and near-infrared fluorescence molecular imaging technology to monitor and evaluate the status of plaque is expected to be able to carry out specific diagnosis and targeted treatment of atherosclerotic plaque. So as to effectively prevent cardiovascular and cerebrovascular events and reduce medical costs. Significantly improve the quality of life of patients and alleviate the contradiction between doctors and patients, which not only provides an effective means for non-invasive, early assessment, treatment and efficacy evaluation of vulnerable atherosclerosis plaque, but also has important significance for promoting social harmony and stability.

PO-3329

The value of using machine learning models based on conventional MRI radiomics features to predict the blood supply of pituitary neuroendocrine tumors preoperatively

Lili WU

Department of Radiology, the First Affiliated Hospital of Wannan Medical College

Abstract

Objectives: A study on the value of using a machine learning model based on conventional MRI radiomic features to predict the blood supply of pituitary neuroendocrine tumors preoperatively.

Methods: A retrospective analysis was conducted on clinical and imaging data of 136 patients with histologically confirmed pituitary neuroendocrine tumors (diameter greater than 10mm) at the Yijishan Hospital, the First Affiliated Hospital of Wannan Medical College, from April 2013 to April 2023. Based on intraoperative observations, the patients were divided into a group with rich blood supply (n=50) and a group with moderate blood supply (n=86). Using ITK-SNAP software, the lesions' regions of interest (ROIs) were manually delineated layer by layer on coronal T1WI, T2WI, and contrast-enhanced T1WI images. Three-dimensional fusion was performed, and AK software was used to extract various texture features of the lesions. The minimum redundancy maximum relevance (mRMR) and least absolute shrinkage and selection operator (LASSO) were employed to select and reduce the dimensionality of texture features, and radiomics labels were created. The scores of each patient were calculated, and the reliability of the model was determined through 100 iterations of leave-group-out cross-validation (LGOCV). Three machine learning algorithms, including logistic regression (LR), random forest (RF), and support vector machine (SVM), were used to establish radiomics prediction models. Receiver operating characteristic (ROC) curves were generated to evaluate the diagnostic performance of the models, and decision curve analysis (DCA) was performed to assess the clinical net benefit of the models.

Results: The area under the curve (AUC) for the clinical model in predicting the blood supply of pituitary neuroendocrine tumors in the training and validation groups were 0.74 (0.64-0.85) and 0.82 (0.68-0.96), respectively. The AUCs for the T1WI, T2WI, T1WI enhanced, and combined sequence radiomics models in the training group for predicting the blood supply of pituitary neuroendocrine tumors were 0.80 (0.71-0.89), 0.84 (0.75-0.92), 0.82 (0.73-0.92), and 0.84 (0.76-0.93), respectively. In the validation group, the AUCs were 0.82 (0.68-0.96), 0.80 (0.66-0.94), 0.85 (0.74-0.97), and 0.83 (0.70-0.97) for T1WI, T2WI, T1WI enhanced, and combined sequence radiomics models, respectively. The AUCs for the LR, RF, and SVM models in the training group were 0.85 (0.77-0.93), 0.87 (0.81-0.95), and 0.84 (0.76-0.93), respectively. In the validation group, the AUCs were 0.85 (0.73-0.97), 0.85 (0.72-0.98), and 0.83 (0.67-0.98) for the LR, RF, and SVM models, respectively. The radiomics models outperformed the clinical model in terms of diagnostic

performance. DeLong test revealed statistically significant differences in AUC between the clinical model and combined sequence radiomics models, LR, and SVM models in the training group ($Z=2.948, 2.514, 2.281, P=0.022, 0.012, 0.022$). Decision curve analysis (DCA) showed that the combined sequence model, LR, and SVM models achieved better clinical net benefit, with the LR model being the most optimal.

PO-3330

Evidence for hypometabolism in epileptic focus and GABA alterations in drug-resistant MRI-negative TLE

Shuohua Wu¹, Gen Yan², Renhua Wu¹

1. Second Affiliated Hospital of Shantou University Medical College

2. Second Affiliated Hospital of Xiamen Medical College

Background: Increasing evidence suggests that the hypometabolism of the epileptogenic focus affects the treatment prognosis of temporal lobe epilepsy (TLE). Hypometabolism during interictal periods is often associated with drug resistance and poorer surgical outcomes. Epileptic seizures involve neurotransmitter synthesis and consumption, accompanied by central nervous system energy substance depletion. Therefore, we attempted to investigate the metabolic levels of the epileptogenic focus through single-voxel MRS, comparing drug-resistant patients, drug-responsive patients, and healthy controls with MRI-negative TLE in order to provide more evidence for the correlation between Hypometabolism of the epileptogenic focus and drug-resistant epilepsy.

Materials and methods: 47 patients of MRI-negative TLE were divided into a drug-resistant group ($n=9$) and a drug-responsive group ($n=38$) based on their response to medication. Brain metabolite concentrations were quantitatively analyzed by using LCmodel. MRS data were compared with those of 20 age- and gender-matched healthy controls, analyzing differences in epileptic focus indicated by video-EEG metabolite changes among different groups.

Results: GABA (gamma-aminobutyric acid) ($p=0.048$), Glu ($p=0.039$), NAA ($p=0.002$), NAAG ($p<0.001$), Cho ($p=0.004$), Cr ($p=0.046$) concentrations on the epileptic side were significantly lower than contralateral in patients. Interestingly, the difference was most evident in patients with drug-resistant epilepsy. Besides, these metabolites were all lower in the drug-resistant group compared to those in the drug-responsive group. GABA was significantly different between the drug-resistant, drug-responsive and healthy controls ($p=0.019$).

Conclusion: GABA and Glu levels are significantly reduced in the epileptic side, reflecting the hypometabolism of the epileptic focus in interictal period. These metabolite levels were even lower in drug-resistant epilepsy. Cho and Cr are important substances for brain energy regulation and supply, their reduction also affects neurotransmitter synthesis, thereby influencing neuronal excitability. This study supports the correlation between hypometabolism of the epileptic focus and poor prognosis in drug-resistant TLE, providing evidence of metabolite levels for drug-resistant MR-negative TLE.

PO-3331

In vivo MRI and Fluorescence Dual-modal Imaging of Inflammation for Identifying Unstable Atherosclerotic Plaque Using Stabilin-2 Targeted Magnetic Nanoparticles

Ying Han¹, Wei Tong¹, Hui Hui², Yundai Chen¹, Jie Tian³

1. Department of Cardiology, the Sixth Medical Centre, Chinese PLA General Hospital

2. CAS Key Laboratory of Molecular Imaging, Institute of Automation, Chinese Academy of Sciences

3. Key Laboratory of Big Data-Based Precision Medicine (Beihang University), Ministry of Industry and Information Technology of China

Objective: Inflammation drives and reflects the disease activity of atherosclerosis (AS), and is a key imaging biomarker for identifying unstable plaques. However, challenges remain with the current in vivo imaging modalities for identifying unstable atherosclerotic plaques due to their low specificity and sensitivity. Herein, this study intended to develop a novel dual-modal imaging platform that specifically identifies unstable plaques through magnetic resonance imaging (MRI) and near-infrared fluorescence (NIRF) by using macrophage receptor stabilin-2 targeted iron oxide nanoparticles (S2P-Fe₃O₄-IRDye800CW) as a novel molecular imaging nanoprobe.

Methods: S2P-Fe₃O₄-IRDye800CW nanoparticles were constructed by conjugating stabilin-2 peptide (S2P) and IRDye800CW fluorescent dye to the surface of Fe₃O₄ nanoparticles, and Con-Fe₃O₄-IRDye800CW nanoparticles were similarly constructed using control peptide as the control nanoprobe. Raw 264.7 macrophages, human umbilical vein endothelial cells and vascular smooth muscle cells were co-cultured with S2P-Fe₃O₄-IRDye800CW or Con-Fe₃O₄-IRDye800CW nanoparticles to test specific targeting ability of the nanoprobe in vitro. To establish atherosclerotic mice containing unstable plaques, we fed six-week-old male ApoE^{-/-} mice a high fat diet and induced unstable plaque by cast placement over the left carotid artery. After twenty weeks, in vivo NIRF and MRI imaging of atherosclerotic plaque were performed before, 12h, 24h and 48 h after intravenous injection of S2P-Fe₃O₄-IRDye800CW or Con-Fe₃O₄-IRDye800CW nanoparticles. Immunofluorescent staining analysis was applied to co-localize the S2P-Fe₃O₄-IRDye800CW nanoparticles with macrophages in the murine unstable plaques.

Results: In vitro experiment demonstrated that the S2P-Fe₃O₄-IRDye800CW nanoparticles specifically targeted Raw 264.7 macrophages, not human umbilical vein endothelial cells or vascular smooth muscle cells. In vivo NIRF imaging of ApoE^{-/-} mice showed that the fluorescent signal background ratio (SBR) of unstable plaques reached the peak at 12h after intravenous injection of S2P-Fe₃O₄-IRDye800CW, while the fluorescent SBR peaked at 2h after injection of Con-Fe₃O₄-IRDye800CW (SBR at 12h: S2P-Fe₃O₄-IRDye800CW 2.02 ± 0.14 vs. Con-Fe₃O₄-IRDye800CW 1.34 ± 0.20 , $P < 0.05$). Meanwhile, injection of S2P-Fe₃O₄-IRDye800CW nanoparticles on MRI images resulted in lower T2* values at 12h post-injection than did injection of Con-Fe₃O₄-IRDye800CW nanoparticles ($\Delta T2^*$ at 12h: S2P-Fe₃O₄-IRDye800CW $34.36 \pm 8.71\%$ vs. Con-Fe₃O₄-IRDye800CW $3.31 \pm 1.05\%$, $P < 0.05$). Ex vivo NIRF imaging of unstable plaques showed that the fluorescence intensity was higher in S2P-Fe₃O₄-IRDye800CW group compared with Con-Fe₃O₄-IRDye800CW group ($12.30 \pm 1.15 \times 10^6$ vs. $9.06 \pm 0.21 \times 10^6$, respectively, $p = 0.0087$). Immunofluorescence staining images revealed that S2P-Fe₃O₄-IRDye800CW nanoparticles were highly abundant within unstable plaque and well co-localized with CD68-stained macrophages.

Conclusions: This dual-modal MRI/NIRF approach revealed that the macrophage receptor stabilin-2 targeted nanoprobe might serve as a non-invasive method for detecting unstable atherosclerotic plaques in vivo.

The relationship between brain microstructural alterations and clinical symptoms and psychological disorders in Crohn's disease

Mengting Huang^{1,2}, Hui Ma^{1,2}, Yan Zou^{1,2}, Wenliang F^{1,2}, Lei Tu³, Jie Zhao^{1,2}, Guina M^{1,2}, Nan Diao^{1,2}, Xin Li^{1,2}, Ping Han^{1,2}, Liangru Zhu³, Heshui Shi^{1,2}

1. Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Hubei Province Key Laboratory of Molecular Imaging

3. Division of Gastroenterology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Objective: This study aimed to investigate alterations in brain structure of Crohn's disease (CD) patients with activity (CD-A) and remission (CD-R) compared to healthy controls (HCs), and explore the relationship between brain gray matter structure and clinical symptoms and psychological disorders.

Methods: 220 participants underwent MRI scans. Based on T1-weighted MRI, voxel-based morphometry (VBM) was applied to investigate gray matter volume (GMV) and global cerebrospinal fluid (CSF) volume alterations. Pearson correlation analysis was used to evaluate relationships between the structure alterations and clinical data and psychological data.

Results: Compared with HCs, CD-A had increased CSF volume, and the CSF volume was negatively correlated with the duration. CD-A had decreased GMV mainly in the bilateral temporal pole, bilateral frontal pole, bilateral frontal orbital cortex, bilateral occipital pole, left lateral occipital cortex and right precentral gyrus; they showed increased GMV in the left parahippocampal gyrus. Meanwhile, the CD-R showed significantly decreased GMV in the left frontal orbital cortex, right frontal pole, and right temporal pole. And the GMV of CD-R in the left precuneous cortex was increased than HCs. Compared with CD-R, CD-A exhibited decreased GMV of the right postcentral gyrus, left subcallosal cortex, left frontal pole, right inferior frontal gyrus and left temporal pole. Moreover, we found the GMV in some brain regions was positive with the scores of the inflammatory bowel disease questionnaire and Symptom checklist-90.

Conclusion: This is the larger study to date in patients with CD-A of brain gray matter microstructural alterations. Alterations in brain gray matter structure in multiple regions in CD-A and CD-R associated with clinical features and psychological data may reflect neuroplasticity effects to a chronic systemic inflammatory response, explaining the emotional disturbance symptoms in CD patients.

PO-3333

IVIM quantitative parameters combined with clinicopathological features can predict PD-L1 expression in cervical cancer

Kaihui Liu^{1,2}, Wei Yang²

1. Ningxia Medical University

2. General Hospital of Ningxia Medical University

Purpose: Immunotherapy targeting the programmed cell death protein 1 (PD-1)/programmed cell death ligand-1 (PD-L1) has played a pivotal role in the treatment of recurrent or metastatic cervical cancer (CC), but its imaging biomarkers are yet elusive. Intravoxel incoherent motion-DWI (IVIM-DWI) can characterize tumors. To investigate the relationship between IVIM parameters and PD-L1 expression in women with CC before treatment and to establish a combined model to distinguish PD-L1 status based on clinicopathological characteristics and IVIM parameters.

Materials and Methods: The prospective study was approved by our institutional review board, and all patients signed informed consent forms. Between January 2021 and August 2022, 78 eligible patients (range, 28–75 years old) with CC were enrolled. IVIM parameters were measured, compared, and analyzed. Logistic regression analysis was carried out to identify independent factors associated with PD-L1-expression were identified and established combined models. The performance of models was evaluated by the receiver operating characteristic (ROC) analysis. The Shapley additive explanation (SHAP) algorithm was used to explain the contribution of each parameter in the combined model at the overall level and the decision-making process of each case.

Results: The D value was significantly lower in the PD-L1-positive group than in the PD-L1-negative group (0.64 ± 0.12 vs. 0.72 ± 0.11 , $P=0.02$; $r=-0.39$, $P<0.05$). FIGO staging, pathological grade, parametrial invasion, lymph node status, and D values were independently associated with PD-L1 expression. The combined model of the D-values with the clinicopathological characteristics exhibited the highest diagnostic performance, with AUC, sensitivity, and specificity of 0.89 (0.77-0.96), 90.9%, 82.6%, compared with the clinicopathological model 0.76 (0.62-0.86), 63.6%, 78.3%. According to the SHAP value, FIGO staging and pathological grade were the most influential feature of the prediction model, while the D values still had a certain contribution.

Conclusion: IVIM parameters were correlated with PD-L1 expression. The combined model incorporating clinicopathological features and D value showed better discrimination in predicting PD-L1 status than the clinicopathological model, providing the basis for CC immunotherapy.

PO-3334

Diurnal variation of GABA levels in the parietal and anterior cingulate gyrus of healthy young people based on magnetic resonance spectroscopy

Yujie Ye, Yonggang Li

苏州大学附属第一医院平海路 899 号

Study Objectives: No studies have reported diurnal stability in GABA(γ -aminobutyric acid) and Glx (Glutamine/glutamate complex) levels in the parietal lobes (PL) and anterior cingulate gyrus (ACC). Circadian rhythms regulate changes in melatonin (MT), blood pressure (BP), heart rate (HP), and GABA. This study observed the diurnal variation of MT, BP, HP, and GABA, and attempted to explore the correlation between GABA and these biological indicators.

Methods: A total of 26 subjects (22-27 years) contributed magnetic resonance spectroscopy data. GABA+ (GABA signal contained the overlapping signals of macromolecules and homocarnosine), GABA+/Cr (ratio of GABA+ to creatine), Glx/Cr (ratio of Glutamine/glutamate complex to creatine), Glx, MT, BP, HP, at five-time points (1:00, 5:00, 9:00, 17:00, 21:00).

Results: GABA+/Cr and GABA+ levels in PL declines from 1:00 to 9:00 and rises from 9:00 to 21:00. GABA+/Cr and GABA+ levels were statistically different with a trough at 9:00 and a peak at 21:00 ($F=3.852$, $p=0.024$), ($F=3.850$, $p=0.005$). GABA+/Cr and GABA+ in ACC was positively correlated with MT ($r=0.259$, $p=0.015$), ($r=0.260$, $p=0.005$).

Conclusions: GABA levels in the PL have diurnal differences and suggest the need to consider the effect of time in the study of PL. GABA+/Cr and GABA+ in ACC is positively correlated with MT. MT and GABA are the main drugs for the treatment of insomnia, which provides some theoretical basis for the drug treatment of insomnia.

PO-3335

IVIM quantitative parameters can non-invasive predict PD-1/PD-L1 expression in cervical cancer: combined with clinicopathological features

Kaihui Liu^{1,2}, Wei Yang²

1. Ningxia Medical University

2. General Hospital of Ningxia Medical University

Purpose: Although the treatment of recurrent or metastatic cervical cancer (CC) has relied heavily on immunotherapy targeting the programmed cell death protein 1 (PD-1)/programmed cell death ligand-1 (PD-L1), the imaging biomarkers associated with PD-1/PD-L1 expression remain unclear. Intravoxel incoherent motion-DWI (IVIM-DWI) can characterize tumors. To build a combined model to distinguish PD-1/PD-L1 status based on clinicopathological features and IVIM parameters and to investigate the association between IVIM parameters and PD-1/PD-L1 expression in women with CC before treatment.

Materials and Methods: The prospective study was approved by our institutional review board, and all patients signed informed consent forms. 78 eligible patients were enrolled between January 2021 and August 2022 (range, 28–75 years old). IVIM parameters were measured, compared, and analyzed. To identify independent variables connected to PD-1/PD-L1 expression, logistic regression analysis was used to establish combination models. The receiver operating characteristic (ROC) analysis was used to assess the performance of models. The contribution of each parameter in the combined model at the overall level and the decision-making process in each case were both explained using the Shapley additive explanation (SHAP) algorithm.

Results: In comparison to the PD-1-negative group, the PD-1-positive group had a significantly lower D value (0.63 ± 0.13 vs. 0.73 ± 0.09 , $P=0.003$; $r=-0.44$, $P<0.05$); the PD-L1-positive and PD-L1-negative groups had a similar trend (0.64 ± 0.12 vs. 0.72 ± 0.11 , $P=0.021$; $r=-0.39$, $P<0.05$). FIGO staging, pathological grade, parametrial invasion, lymph node status, and D values were independent parameters associated with PD-1/PD-L1 expression. Compared with the clinicopathological model with AUC, sensitivity, and specificity of (0.778 (0.647-0.878), 87.1%, 64.0% in the PD-1 group, and 0.756 (0.623-0.861), 63.6%, 78.3% in the PD-L1 group, respectively), the combined model of the D-values with the clinicopathological characteristics demonstrated the highest diagnostic performance, with AUC, sensitivity, and specificity of 0.845 (0.724-0.928), 93.5%, 72.0% in PD-1 group, and 0.887 (0.774-0.956), 90.9%, 82.6% in the PD-L1 group, respectively. FIGO staging and pathological grade were the components of the prediction model with the highest influence according to the SHAP value, while the D values still had a certain contribution.

Conclusion: IVIM parameters were correlated with PD-1/PD-L1 expression. In comparison to the clinicopathological model, the combined model including clinicopathological characteristics and D value demonstrated superior discrimination in predicting PD-1/PD-L1 status, providing assistance for clinicians for immunotherapy decision-making of CC patients in the future.

PO-3336

Machine learning based on sarcopenia and MRI radiomics to predict the efficacy of neoadjuvant therapy for triple-negative breast cancer

Jiamin Guo¹, Hongkun Yin², Yichen Zheng¹, Shuang Zhao¹, Ji Ma¹

1. Sichuan University

2. Infervision Medical Technology Co.

Purpose: Developing a machine learning model that combined sarcopenia and T1C-MRI radiomics features to comprehensively predict the neoadjuvant chemotherapy (NAC) efficacy in triple-negative breast cancer (TNBC) patients.

Methods: Pretreatment T1C-MR images and clinical features of 121 patients with TNBC who underwent NAC in Westchina hospital from January 2012 to September 2021 were collected in this study. Based on postoperative pathological specimens, patients were classified into Miller-Payne (MP) Low/High and pathological complete response (pCR) /non-pCR groups. Firstly, we assessed the skeletal muscle and fat mass before NAC on CT images at the L3 vertebra to determine the presence of sarcopenia, and used univariate regression analysis to assess clinical variables that were significantly correlated with NAC prognosis. Then, regions of interest (ROIs) were manually delineated, and quantitative imaging features were extracted. Radiomics models were constructed by using the LDA, RF, MLP, NBB, SVM and LR algorithms. Finally, combined predictive models were developed by integrating radiomics features with independent clinical and pathological features.

Results: Among the clinical factors, only sarcopenia showed significant correlation with both MP and pCR. Receiver Operating Characteristic (ROC) demonstrated that the radiomics model using the LR algorithm exhibited robustness and the best classification performance. In the validation set, the area under curves (AUC) for MP and pCR predictions were 0.753 and 0.799. The combined models, which integrated sarcopenia, further improved the predictive capability, and the AUC for MP and pCR predictions were 0.781 and 0.827. Decision curve analysis indicated clinical value for all models.

Conclusion: Sarcopenia status combined with radiomics models demonstrated excellent predictive ability for NAC efficacy. The study had the potential to provide prognostic stratification of TNBC patients and guide personalized treatment.

PO-3337

BATF is potential diagnostic and prognostic biomarker associated with 18F-FDG PET/CT features in colorectal cancer

Xia Lu, Mingyu Zhang, Jun Liu, Jigang Yang

Nuclear Medicine Department, Beijing Friendship Hospital, Capital Medical University

Purpose BATF may act as potential target for tumor immunotherapy. However, data on the functional role of BATF in the development of colorectal cancer (CRC) remains limited. The purpose of the study is to evaluate the correlation between BATF expression and 2-deoxy-2-[18F]fluoro-D-glucose (18F-FDG) uptake and their prognostic value in CRC patients.

Methods Pan-cancer analysis was performed to determine the expression profile of BATF in human cancers. The prognostic value of BATF was evaluated and a prognostic model was established based on The Cancer Genome Atlas (TCGA) database. The qRT-PCR and Western blot analyses were used to profile the protein expression and mRNA level of BATF in different CRC cell lines and

normal colorectal mucosal cell line. Cell Counting Kit-8 assays and clonogenic assay were utilized to evaluate the role of BATF in CRC proliferation. The expression of tumor BATF and glucose transporter 1 (GLUT1) was examined using immunohistochemical tools in 36 CRC patients undergoing preoperative 18F-FDG positron emission tomography/computed tomography (PET/CT) imaging. The correlation between the PET metabolic parameters and the correlation with the immunohistochemical result was evaluated.

Results In database, BATF was upregulated in CRC compared with normal tissues. High expression of BATF was correlated with worse overall survival in CRC. The nomogram based on the BATF expression showed a good predict probability and clinical utility in predict the 1-, 3-, and 5-year overall survival in CRC. In vitro, the expression of BATF in CRC cells were knocked down by transfecting with shRNA to verify its function in tumor progression. Knock down of BATF expression could inhibit the proliferation of CRC cells. In CRC patients, BATF was upregulated compared with normal tissues. BATF expression was positively related with GLUT-1 expression and PET metabolic parameters, including maximum standard uptake value, tumor-to-nontumor ratios, metabolic tumor volume, and total lesion glycolysis.

Conclusion BATF regulated CRC proliferation in vitro and in vivo, and positively correlated with glycometabolism. BATF is potential diagnostic and prognostic biomarker associated with 18F-FDG PET/CT features in colorectal cancer.

PO-3338

Sequential targeting biomimetic nano platform for enhanced mild photothermal therapy and chemotherapy of tumor

Qiang Li, Lianfu Wang, Manxiang Wu
Yinzhou People's Hospital, Ningbo

Tumor targeting drug delivery is of vital importance for the treatment of triple negative breast cancer (TNBC) considering the appreciable amount of tumor matrix and the absence of effective targets on the tumor cells. Herein, a new therapeutic multifunctional nanoplateform (mPDA@Cur/M-CM) with improved TNBC targeting ability and efficacy is constructed and used for TNBC treatment. Two kinds of cell membrane endow the nano platform with orderly targeting ability, achieving accurate delivery of drugs. Meanwhile, the existence of curcumin, MnO₂ and mPDA promotes the apoptosis of cancer cells by cytotoxicity, enhanced Fenton-like reaction, and thermal damage, respectively. Both in vitro and in vivo results show that the designed biomimetic nanoplateform significantly inhibit the tumor growth and provide an efficient novel therapeutic strategy for TNBC.

PO-3339

Dual logic gate regulated triple amplified CRISPR-based biosensors for achieving high signal-to-ratio and dual-modal biological monitoring

Yi Li, Wenjing Yang, Jinyu Zhou, Xiaoqing He
Department of Radiology, The Second Affiliated Hospital of Chongqing Medical University, Chongqing, China

Objective: Although the clustered regularly interspaced short palindromic repeats (CRISPR)-based biosensors were exploited as an efficient tool for analytical science, the indiscriminate single-stranded deoxyribonuclease (DNase) activity of CRISPR may suffer from insufficient detection accuracy. This study aimed to design an exquisite dual DNA logic gate by sequentially responded

to two kinds of cancer-associated protein to operate signal amplification, thus achieving high signal-to-ratio detection of target. Furthermore, a new idea for simultaneous magnetic resonance imaging (MRI) and electrochemiluminescence (ECL) two-dimensional detection could be explored.

Methods: To begin with, a creative electrochemiluminescence (ECL) platform with excellent performances was established by anchoring Cu nanoclusters (Cu NCs) on the surface of Zn-MOF, which exhibited strong and stable ECL emission. Subsequently, the first logic gate was unlocked by the input of A-methyl acyl-CoA racemase (AMACR) to release the bipedal walker (BW), which could open the second logic gate with the assistance of apurinic endonuclease 1 (APE1). After that, rolling circle amplification (RCA) was initiated to generate heavily repetitive sequence of the activator of CRISPR/Cas12a that effectively activated the CRISPR/Cas12a system. The activated CRISPR/Cas12a system with trans-cleavage ability converted recognition events of targets into effective measurable signals by cleaving the quenching probes to achieve the detection of the target based on the ECL platform.

Results: Firstly, scanning electron microscopy (SEM) characterizations of Cu NCs@Zn-MOF and Zn-MOF both presented similar 2D nanosheet structure and size. In comparison to Zn-MOF, plenty of particles were distributed on Cu NCs@Zn-MOF, which implied the enrichment of Cu NCs. Furthermore, the native polyacrylamide gel electrophoresis (PAGE) results verified the generation of DNA ring and the feasibility of DNA assembly and RCA reaction process. Moreover, the constructed biosensor displayed satisfactory assay performances including sensitivity, selectivity and stability toward AMACR. A satisfactory linear relationship between the logarithmic value of AMACR concentrations (from 10 pg/mL to 1 µg/mL) and the ECL intensity could be expressed as $I = 2003.44 \lg c + 9754.34$ with the correlation coefficient of 0.999 and the detection limit of 0.65 pg/mL. Meanwhile, the recoveries relative standard deviation (RSD) of AMACR in human serum samples were calculated to be 91.20-118.58 % and 1.4-3.0 % based on the previously calibrated curve. More importantly, magnetic resonance (MR) in vitro was scanned with different concentrations of magnetic nanoparticles anchored with DNA ring/hairpin (DNA ring/hairpin-MNs). The T2-weighted MR showed that with the increase concentration of DNA ring/hairpin-MNs, the MR signal strength of the water was gradually reduced.

Conclusions: This policy offered a fresh impetus to construct highly sensitivity and broadly applicable biosensor for monitoring biomarkers with dual-modal ECL and MR imaging.

PO-3340

Predictive value of 18F-FDG PET/CT and serum tumor markers for tumor mutational burden in patients with non-small cell lung cancer

Qian Zhang, Xiuli Tao, Pei Yuan, Zewei Zhang, Jianming Ying, Lei Guo, Ning Li, Shuhang Wang, Jing Li, Ying Liu, Wei Guo, Shijun Zhao, Ning Wu

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose: Tumor mutational burden (TMB) has been acknowledged as a promising biomarker of response to immunotherapy. However, TMB has not been widely available clinically due to difficulties in detection. This study aimed to investigate whether metabolic parameters (MPs) of 18F-fluorodeoxyglucose (FDG) uptake on positron emission tomography/computed tomography (PET/CT) and serum tumor markers (STMs) could be used as potential substitutes for TMB through non-invasive methods in patients with non-small cell lung cancer (NSCLC).

Materials and Methods: In this retrospective study, we enrolled 129 patients with NSCLC (males, 78; females, 51) who underwent baseline TMB and STM tests and 18F-FDG PET/CT scans before treatment between March 2018 and September 2022. Patients were categorized into TMB-high (TMB ≥ 10 mutations/Mb; n=27 [20.9%]) and non-TMB-high (TMB < 10 mutations/Mb; n=102 [79.1%]) groups. Binary logistic regression analyses were performed to determine independent

predictors of TMB-high. Linear regression analyses were performed to determine independent predictors of TMB level on a log scale. Subgroup analyses for adenocarcinoma (ADC), ADC with EGFR+, ADC with EGFR-, and squamous cell carcinoma (SCC) were performed.

Results: For ADC, all MPs (SULpeak, SULmax, SULmean, MTV, and TLG) were significantly higher in the TMB-high group than the non-TMB-high group; smoker (odds ratio [OR]=27.08, $p=0.018$), EGFR+ (OR=0.03, $p=0.033$), KRAS+ (OR=7.98, $p=0.083$), high CEA (OR=33.56, $p=0.029$), and high CA125 (OR=13.68, $p=0.030$) were independent predictors of TMB-high; and all MPs showed significant positive linear correlations with TMB on a log scale, with SULpeak as an independent predictor. However, no significant correlation was observed for SCC.

Conclusion: MPs and STMs can predict the TMB level for patients with ADC, and may serve as potential substitutes for TMB with increased value and easy implementation in guiding immunotherapy through non-invasive methods.

PO-3341

PET imaging of brown adipose tissue using fluorine 18-labeled TSPO ligand DPA-714

Yu Wang, Xiaoxuan Xu, Shenghong Ju
Zhongda Hospital

Background and aims: Brown adipose tissue (BAT) plays a key role in regulation of body temperature in mammals including humans through uncoupled protein-1 (UCP-1) located in mitochondria. F-18 labeled FDG PET imaging has been widely used to evaluate BAT function and its potential anti-obesity property in adults for several decades. However, [18F]FDG does not directly reflect the mitochondrial activity of BAT, which may lead to misestimating its metabolic activity. Translocator protein (TSPO) is expressed on mitochondria membrane of different tissues including BAT and participates in many mitochondrial functions. Therefore, the aim of our study was to evaluate the utility of [18F] DPA-714, a ligand of TSPO, in BAT metabolic activity. And we hypothesized that the metabolic change of BAT under different conditions could be monitored by TSPO PET imaging.

Materials and methods: TSPO expression in BAT was confirmed by ex vivo immunohistological staining of BAT slices. The specificity of [18F]DPA-714 uptake in BAT was confirmed by a displacement study with unlabeled DPA-714. TSPO PET imaging was performed in 3 groups of Balb/c mice using a small animal PET scanner (Inveon, Siemens) (non-treated group: $n=3$, cold treated group: $n=3$, and CL 316-243 treated group: $n=3$, respectively). All mice were euthanized for DPA-714 bio-distribution assay after in vivo study.

Results: In vivo PET imaging revealed that [18F]DPA-714 uptake was in a butterfly shape at the interscapular BAT of non-treated mice. And the specific uptake was proved by a dramatic signal loss after cold DPA-714 replacement. The signal intensity of [18F]DPA-714 significantly increased by 2 to 3 times in both CL 316,243 and cold treated groups. Ex vivo bio-distribution assay confirmed the intensively increased [18F]DPA-714 uptake in CL 316,243 and cold activated BAT.

Conclusion: TSPO-targeted PET imaging using [18F]DPA-714 as a probe could be used to noninvasively monitor BAT activation.

PO-3342

CT features, progression patterns and immune status of pulmonary trichinosis: Quantitative evaluation based on mimics software in high-resolution CT

Ziwei Lu, Yanqin Chen, Xin Wang, Renjun Huang, Yonggang Li
The First Affiliated Hospital of Soochow University

Purpose To analyze computed tomography (CT) features and progression pattern of pulmonary mucormycosis based on CT and Mimics software, to provide timely and accurate guidance for clinical treatment.

Materials and methods 34 patients (22 males, 12 females; mean age, 45.7 years) diagnosed as pulmonary mucormycosis were retrospectively analyzed. The CT images were transferred to Mimics 21.0. The left and right lung tissues were extracted by threshold cutting and region growing methods, and pulmonary lesions were manually delineated. The volumes of the lungs and lesions were calculated and recorded following the reconstruction and segmentation of 3D lung models. On initial (n=34) and follow-up (n=33) CT scans, the patterns of lung abnormalities and their changing features on follow-up scans were evaluated and summarized. The NLR was calculated to reflect their immune status, and whether the progression patterns were correlated with the NLR change were analyzed.

Results 32 patients were diagnosed as blood disease, the AML mostly (24/32, 75%). On initial CT scans, nodule ($\leq 3\text{cm}$)/mass ($>3\text{cm}$) or consolidation with surrounding ground-glass opacity halo (34/34, 100%) was the most common pattern. On follow-up CT, morphologic changes (21/33, 63.6%) could be seen and they included reversed halo (RH) sign, central necrosis, and air-crescent sign. Although all cases did not demonstrate the regular morphologic changes, various combinations of pattern change could be seen frequently. The progression pattern were correlated with NLR change in 15 of 25 patients.

Conclusions Pulmonary mucormycosis most frequently presents as nodule/mass or consolidation with surrounding ground-glass opacity halo, and some features such as RH sign, central necrotic cavity or air-crescent sign can also be found at CT. The progression pattern including morphologic changes are related with the change of NLR.

PO-3343

Dual-Ratiometric Magnetic Resonance Tunable Nanoprobe with Acidic-microenvironment-responsive Property to Enhance the Visualization of Early Tumor Pathological Changes

Rong Cao¹, Ning Tang², Yi Zhu¹, An Chen¹, Yumeng Li³, Renbin Ge¹, Yuan Li², Zhongyi Huang⁴, Jiajing Guo¹, Jiali Deng¹, Hongwei Lu⁵, Ziwei Lu⁶, Thomas Davis⁷, Helen Forgham⁷, Ruirui Qiao⁷, Wang Zhongling¹

2. School of food science, Nanjing Xiaozhuang University

3. School of Health Science and Engineering, University of Shanghai for Science and Technology

4. Department of Neurology, School of Medicine, New York University

5. Department of Biomedical Engineering, College of Engineering, Shantou University

6. Department of Radiology, First Affiliated Hospital of Soochow University

7. Australian Institute for Bioengineering and Nanotechnology, The University of Queensland

The development of microenvironment-responsive nanoprobes have shown great promise for use in magnetic resonance imaging (MRI), with the advantage of significantly improved specificity and good biocompatibility. However, the clinical application of responsive probes is hampered by a lack

of biological sensitivity for early molecular diagnostics and visualizing microenvironment of metabolism reprogramming in tumor progression. Here, we report on a dual-ratiometric magnetic resonance tunable (DMRT) nanoprobe designed by crosslinking different ratios of transferrin chelating gadolinium and superparamagnetic nanoparticles, complexed to a pH responsive biocompatible polymer. This dually activatable nanoprobe enables pH-dependent tumor microenvironment visualization, providing exceptional quantitative pathophysiological information in vitro and in vivo, and when used in combination with dual-contrast enhancement triple subtraction imaging technique (DETSI), this smart nanoprobe guarantees the diagnosis of early-stage diseases. We envisage that this novel integrated nanoplatform will provide a new paradigm for the clinical translation of robust DMRT nanoprobe for early disease detection and staging, as well as microenvironment visualization and disease progression monitoring

PO-3344

Deep learning for chemical exchange saturation transfer reconstruction from sparse imaging

Xiaolei Zhang¹, Gang Xiao², Weipeng Huang³, Caiyu Zhuang¹, Beibei Chen¹, Lin Yang¹, Yue Chen¹, Gen Yan⁴, Renhua Wu¹

1. Second Affiliated Hospital of Shantou University Medical College

2. School of Mathematics and Statistics, Hanshan Normal University

3. Medical Imaging Center, Jieyang People's Hospital

4. Department of Radiology, Second Affiliated Hospital of Xiamen Medical College

Purpose Reduction of the scan time of chemical exchange saturation transfer (CEST)-magnetic resonance imaging (MRI) has been a challenging issue. In some scenarios, a sufficient number of CEST images should be acquired to estimate the parameters for quantitative analysis, which prolongs the scan time. Therefore, a deep learning-based model was proposed to reconstruct high-quality, densely sampled CEST images from experimental measurements under sparse sampling, thereby achieving scan time reduction without prior B0 correction.

Methods The following innovations were made: (1) a sequence-to-sequence neural network that is capable of utilizing information from both sides was employed to reconstruct densely sampled CEST images from experimental images acquired under sparse sampling; (2) a multi-pool Bloch–McConnell equation was designed to derive wide-ranging simulated Z-spectra, overcoming the limitations of time and labor consumption in manual annotation work; and (3) a tumor-bearing rat model was built with a 7T MRI scanner for ground truth generation, which enabled performance evaluation of the reconstruction model.

Results The coefficient of determination of $R^2 = 0.9997$ was achieved in linear regression analysis; a bias of 0 and a 1.96 standard deviation of 0.007 were obtained in the Bland–Altman analysis. The reconstruction accuracies in vivo were 0.9999 and 61.3895 in terms of the structural similarity index and the peak signal-to-noise ratio, respectively.

Conclusion This study demonstrates the potential of our deep learning-based model for reconstructing high-quality, densely sampled CEST images from sparse imaging and reducing the scan time without previously correcting B0 inhomogeneity.

PO-3345

89Zr-labeled PD-L1 PET imaging as a potential biomarker to replace immunohistochemistry(IHC)

Sheng Zhao¹, Huijie Jiang¹, RongJun Zhang²

1. The Second Affiliated Hospital of Harbin Medical University

2. Jiangsu Institute of Nuclear Medicine

PURPOSE The clinical outcome of immunotherapy is related to the expression level of PD-L1. IHC only reflects the PD-L1 expression in a tiny fraction of a tumor. Hence, we developed an ⁸⁹Zr-labeled atezolizumab as a probe (⁸⁹Zr-Df-Atz), using xenograft mice to detect whether the PET imaging can reflect colorectal cancer (CRC) PD-L1 expression.

METHOD We used Df-Bz-NCS to premodify with Atz, and then incubated with ⁸⁹Zr-oxalate in HEPES buffer for 1h, purified by PD-10 column, the radiochemical purity (RCP) was measured by HPLC. ⁸⁹Zr-Df-Atz was incubated in human serum and PBS at different temperatures for 24-120h to test the stability in vitro. The same concentration of ⁸⁹Zr-Df-Atz was incubated with varying concentrations of CRC PD-L1 high expression cells RKO. According to Limdo's method, the immunoreactive score (IRS) was fitted. BALB/c nu/nu mice were subcutaneously implanted with CRC cells with different PD-L1 expression levels, and then xenograft mice were intravenously injected with an appropriate amount of ⁸⁹Zr-Df-Atz 21 days later, some were euthanized within 48-120h to determine the biodistribution of organs and tumor, other mice were scanned PET imaging, and the radioactivity parameters were analyzed.

RESULTS The Stability study showed that RCP was greater than 95% when ⁸⁹Zr-Df-Atz was stored in 4 °C serum for 120h or 37°C serum for 48h. The fitted IRS was 88.34%, indicating that ⁸⁹Zr-Df-Atz could effectively bind to tumor PD-L1, and its antigen-binding ability was unimpaired. The biodistribution showed that liver uptake is highest in normal tissues, and the tumor-muscle ratio reached its highest point at 120h. PET imaging showed the tumor-to-muscle (legs) SUVmax ratio can effectively distinguish between PD-L1 high and low-expression tumors (p<0.001).

CONCLUSION ⁸⁹Zr-Df-Atz allowed efficient and straightforward preparation and better stability can help to further explore the various stages of CRC, which is expected to become an imaging tool to replace IHC.

PO-3346

Theranostic CEST-Enhanced Thermoresponsive Hydrogel Drug Delivery System for Postsurgical Treatment of Glioblastoma

Caiyu Zhuang¹, Miao Pan², Renhua Wu¹

1. The Second Affiliated Hospital of Shantou University Medical College

2. Shantou University Medical College

Objective: The systemic chemotherapy and radiotherapy used in the postsurgical treatment of glioblastoma multiforme (GBM) often face challenges due to highly proliferative residual tumor cells at the resection margins. This study aims to address this issue by introducing an injectable thermoresponsive hydrogel drug delivery system that possesses an inherent CEST effect.

Methods: Rheological analysis was conducted on both the blank hydrogel and the hydrogel loaded with doxorubicin, temozolomide, and hydrochloroquine (H@DTH). Additionally, the CEST effect of the aforementioned drugs was tested. An in vivo glioblastoma animal model was established, followed by resection of the brain tumors and injection of H@DTH or blank gel. CEST MRI was performed on the 1st, 3rd, 5th, and 7th day after the postsurgical intervention. Kaplan-Meier survival rates for different groups were analyzed.

Results: Both the blank gel and the H@DTH system rapidly gelled at body temperature, providing a soft intracortical drug reservoir. The Z spectra of doxorubicin exhibited clear CEST effects peaking at approximately 3 and 8 ppm. It was feasible to detect the degradation of the H@DTH system based on the CEST effects of doxorubicin. Importantly, the injection of H@DTH improved the survival rate of the rats.

Conclusion: The theranostic CEST-enhanced thermoresponsive hydrogel drug delivery system not only enhances the survival rates of GBM but also offers intrinsic CEST effects for precise drug degradation detection.

PO-3347

Multifunctional Nano-CA for Imaging-Guided Precision Therapy of Nasopharyngeal Carcinoma

Qianyu Yang, Weiyuan Huang
Hainan General Hospital

Currently, the low survival rate and poor prognosis of patients with nasopharyngeal carcinoma are ascribed to the lack of early and accurate diagnosis, and resistance to radiotherapy. In parallel, the integration of imaging-guided diagnosis and precise treatment has gained much attention in the field of theranostic nanotechnology. However, constructing a dual-modal imaging-guided nano-contrast agent (CA) with desired imaging performance as well as great biocompatibility remains challenging. Therefore, we developed a simple but multifunctional nano-CA GdCPP for the early and accurate diagnosis, and efficient treatment of nasopharyngeal carcinoma, which combined fluorescence imaging and magnetic resonance imaging (MRI) onto a single nanopatform for imaging-guided subsequent photodynamic therapy (PDT). GdCPP had appropriate particle size (81.93 ± 0.69 nm) and were highly stable, resulting in sufficient tumor accumulation, which along with massive ROS generation upon irradiation then further significantly killed tumor cells. Moreover, GdCPP owned much stronger r_1 relaxivity ($9.396 \text{ mM}^{-1} \cdot \text{s}^{-1}$) compared to clinically used Gd-DTPA ($5.034 \text{ mM}^{-1} \cdot \text{s}^{-1}$), and exhibited better $T_1\text{WI}$ MRI performance. Under dual-modal imaging-guided PDT, GdCPP achieved efficient therapeutic outcomes without causing any noticeable tissue damage. The results of in vitro and in vivo studies indicated GdCPP may be a suitable candidate for dual-modal imaging-guided precision tumor therapy.

PO-3348

Enhancing Liver Cancer Therapy and Imaging with Reduction-Responsive Biodegradable Micelles: A Theranostic Approach

Yujie Li, Xiao Li
Chinese Academy of Medical Sciences & Peking Union Medical College

Background: Traditional anticancer treatments are responsible for compromised lifestyle of the patient and have significant side effects. Therefore, as an emerging diagnostic technology, smart nanomaterials-based drug delivery systems integrated diagnosis and therapy have aroused tremendous interest owing to visually targeting effect and superior therapy efficacy compared with traditional cancer treatment.

Objective: To fabricate a novel reduction-responsive biodegradable micelles for co-delivery of superparamagnetic iron oxide (SPIO) nanoparticles (NPs) and an anticancer agent, doxorubicin (DOX).

Methods: In this work, we have prepared reduction-responsive biodegradable micelles by linking of poly(ethylene glycol) and poly(ϵ -caprolactone) with disulfide bond (PEG-SS-PCL) for co-delivery of SPIO NPs and an anticancer agent, doxorubicin (DOX), which uses A54 peptide to specifically bind to the surface receptors of liver cancer cells. It is designed to deliver anti-tumor drugs and MR contrast agents to the tumor site with high concentration of glutathione in response to the release of anti-tumor drugs.

Results: A54-PEG-SS-PGL@SPIO/DOX can self-assemble into an 100 nm-sized micelle, which can be specifically uptaken by hepatoma carcinoma cell (Hep3B) and exhibited ultralow imaging signal intensity with varied Fe concentration on T2-weighted imaging (T2WI), was first prepared as an effective gene carrier. Meanwhile, the released Dox stimulated chemotherapy to destroy cancer, thus leading to a pronounced therapeutic effect.

Conclusion: All the results demonstrated that synthesized probes exhibited excellently diagnostic and therapeutic performance, indicating our technology may potentially offer an outstanding strategy for tumor-targeting theranostics.

PO-3349

Alterations in degree centrality and functional connectivity in tension-type headache: a resting-state fMRI study

xizhen wang¹, shuxian zhang¹, mengqi zhao², jiazhang sun¹, jianjie wen², mengting li², chao wang¹, qinyan xu¹, jili wang³, xihe sun^{1,3}, xize jia¹

1. Affiliated Hospital of Weifang Medical University

2. Zhejiang Normal University

3. Weifang Medical University

Objectives: Previous studies have provided evidence of structural and functional changes in the brains of patients with tension-type headache (TTH). However, investigations of functional connectivity alterations in TTH have been inconclusive. To investigate abnormal intrinsic functional connectivity patterns in patients with TTH through the voxel-wise degree centrality (DC) method as well as functional connectivity (FC) analysis.

Methods: A total of 33 patients with TTH and 38 healthy controls (HCs) underwent resting-state functional magnetic resonance imaging (rs-fMRI) scanning. The voxel-wise DC method was performed to quantify abnormalities in the local functional connectivity hubs. Nodes with abnormal DC were used as seeds for further FC analysis to evaluate alterations in functional connectivity patterns. In addition, Pearson's correlational analyses were performed between abnormal DC and FC values and clinical features.

Results: A total of 33 patients with TTH and 30 HCs were enrolled in the final analysis. Compared with HCs, patients with TTH had higher DC values in the left middle temporal gyrus (MTG.L) and lower DC values in the left anterior cingulate and paracingulate gyri (ACG.L). Seed-based FC analyses revealed that patients with TTH showed greater connections between ACG.L and the right cerebellum lobule IX (CR-IX.R), while smaller connections between ACG.L and ACG.L. The MTG.L showed increased FC with the ACG.L, while decreased FC with the right caudate nucleus (CAU.R) and left precuneus (PCUN.L). No significant correlations were observed among DC values, FC values, and VAS and DASS scores in patients with TTH.

Conclusions: Patients with TTH exhibited abnormal intrinsic functional connectivity hubs in the MTG.L and the ACG.L, and aberrant functional connection patterns with these abnormal hubs as seeds. This preliminary study provides important insights into the pathophysiological mechanisms of TTH.

PO-3350

Targeted Dual-modal Imaging for Specific Detection of Oral Squamous Cell Carcinoma

Jun Wu, Jing Wang, Chuan sheng Zheng

Department of Radiology, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology

Purpose Early diagnosis and intraoperative tumor margin identification are essential for improving treatment outcomes in oral squamous cell carcinoma (OSCC) patients. However, there's no reliable diagnostic methods to provide accurate and real-time information in clinic. The aim of this study was to develop a novel way with high sensitivity and high specificity to assist in the diagnosis and treatment of OSCC.

Methods A near-infrared (NIR) fluorescent dye Cyanine 7 (Cy7) and c-Met binding peptide (cMBP)-conjugated superparamagnetic iron oxide nanoparticles (cMBP-Fe₃O₄-Cy7 NPs) was synthesized to specifically detect tumors. OSCC subcutaneous and orthotopic xenografted mice models were established to evaluate the imaging strategy of magnetic resonance imaging (MRI) and fluorescence imaging (FLI). Prussian blue staining of tumor tissues was used to show the specific accumulation of probes.

Results Higher FLI and MPI signals, lower MRI signal were shown in tumor regions in OSCC xenografted mice injected with targeted probes cMBP-Fe₃O₄-Cy7 compared with those injected with the nontargeted ones, which can be further demonstrated by ex vivo imaging and prussian blue staining of tumors. And MPI showed better image contrast than MRI. The NIR imaging in the orthotopic tumor mice revealed cMBP-Fe₃O₄-Cy7 NPs could be delivered topically to map the tumor in the tongue.

Conclusion The multimodal imaging agent may facilitate early detection, fluorescence-guided surgery for tumor recognition in OSCC.

PO-3351

Reverse Magnetic Resonance Tuning nanoplatform with heightened sensitivity for non-invasively multiscale visualizing ferroptosis-based tumor therapy

Yi Zhu, Zhongling Wang

Shanghai General Hospital, School of Medicine, Shanghai Jiaotong University

Detecting ferroptosis-related biomarkers in therapeutic process through non-invasive imaging approaches is of great significance. However, conventional molecular imaging modalities, such as MR-weighted imaging, encounter challenges of diminished sensitivity and difficulty in real-time precise monitoring. Here, we report a tumor acidic-microenvironment-responsive nanoplatform with "Reverse Magnetic Resonance Tuning (ReMRT)" property that is coupled with calculus-based "Area Reconstruction" for specific and quantitative imaging of ferroptosis. The T1 mapping of the ReMRT nanoplatform is turned "activated" depending on the release of Fe³⁺ when interacted with the tumor acidic microenvironment, whereas the T2 mapping is turned "reversely activated". This reverse MR mapping change is correlated with reactive oxygen species generation and DOX release, contributing to the precise monitoring of ferroptosis treatment effectiveness. Furthermore, the comprehensive platform achieves a marked enhancement in sensitivity than conventional R1/R2 values and can be used to real-time non-invasively visualize ferroptosis-related biomarkers from multiple scales. The high-sensitive biological quantitative imaging provides a novel strategy for MR-guided multiscale dynamic ferroptosis therapy.

PO-3352

The role of TIGIT/CD40 NVs encapsulating MNS-OXA in enhancing immunotherapy for pancreatic cancer

Heng Zhang,Zining Zhang,Haitao Zhu,Dongqing Wang,Xiangyi Cai
Affiliated Hospital of Jiangsu University

Background & Aims Pancreatic cancer is “the king of cancers”. Immune checkpoint blockade has shown promising results in terms of improved survival rates. TIGIT/CD155 immune checkpoint axis avoids T cell exhaustion, while CD40/CD40L can enhance T cell function. Targeting these two signaling axes effectively enhances pancreatic cancer immunotherapy. Cell vesicles have emerged as a novel drug delivery material due to their better biocompatibility and targeted properties. This study aimed to investigate whether nanovesicles overexpressing TIGIT/CD40 and carrying melanin-oxaliplatin (OXA) could enhance cytotoxicity of T cells to tumor cells and evaluate the treatment of pancreatic cancer.

Methods

- (1) Constructing stable cell lines overexpressing TIGIT/CD40. Vesicles were obtained by grinding and centrifugation, and MO@Ti40 NVs were obtained by electric transfer.
- (2) The characterization of vesicles and the expression of TIGIT/CD40 protein were identified by Western Blot and transmission electron microscopy.
- (3) Laser confocal microscopy was used to observe the targeting of MO@Ti40 NVs in cells. Magnetic resonance imaging and animal imaging were used to observe the targeting of MO@Ti40 NVs in the subcutaneous model of pancreatic cancer, and flow cytometry was used to observe the apoptosis of cells.
- (4) Evaluate the tumor immune effect of MO@Ti40 NVs in vivo by observing tumor size, IHC and flow cytometry staining.

Results

- (1) MO@Ti40 NVs can bind specifically to CD155/CD40L and were enriched at tumor sites in animal imaging.
- (2) MO@Ti40 NVs promoted pancreatic cancer cell apoptosis in vitro.
- (3) MO@Ti40 NVs increased cytotoxicity of T cells and significantly inhibited the growth of pancreatic cancer in vivo.

Conclusion In this study, we demonstrated that MO@Ti40 NVs had a targeted enrichment at the tumor site and can inhibit the tumor growth of pancreatic cancer by enhancing cytotoxicity of CD8+T cells, which holds great promise for the immunotherapy of pancreatic cancer.

PO-3353

Bio-orthogonal click-targeting nanocomposites for chemo-immunotherapy synergistic therapy in triple-negative breast cancer

Yan Wang,Defan Yao,Dengbin Wang
Department of Radiology, Shanghai Xinhua Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Objective: Cancer immunotherapy, which combines immune checkpoint blockade (ICB) with chemotherapeutic drugs, has indeed yielded significant enhancements in patient outcomes. Nonetheless, this combined therapeutic approach has been plagued by pronounced toxicity and a suboptimal response rate in treated patients. In the context of this study, we present a solution to surmount these challenges in contemporary cancer immunotherapy by introducing bio-orthogonal click-anti-PD-L1 peptide-conjugated prodrug nanoparticles (Pep-DOX).

Methods: In the initial stage, we introduced an azide-modified sugar called tetraacetylated N-azidoacetyl-D-mannosamine (Ac4ManNAz) to facilitate glycoengineering of the tumor cell surface. Next, the anti-PD-L1 peptide (CVRARTR) is attached to doxorubicin (DOX), leading to the formation of prodrug nanoparticles called Pep-DOX through intermolecular interactions. We assess the antitumor effectiveness and immune responses while minimizing adverse effects using the click-Pep-DOX approach, which combines PD-L1 blockade and ICD, in triple-negative breast tumor models.

Results: The remarkably effective bio-orthogonal click chemical reaction between azide groups resembling receptors on tumor cells and the anti-PD-L1 peptide (CVRARTR) present on nanocomposites significantly increased the in vitro cellular uptake of the nanocomposites following Ac4ManNAz administration. Subsequently, bio-orthogonal click-targeting nanocomposites are taken up efficiently, leading to the induction of immunogenic cell death (ICD) in cancer cells through the release of DOX. Simultaneously, PD-L1 blockade by Pep-DOX disrupts the immune-suppressive pathways of cancer cells, resulting in the proliferation and reinvigoration of T lymphocytes. In tumor models, click-Pep-DOX accumulates within tumor tissues through bio-orthogonal click reactions and the enhanced permeability and retention (EPR) effect, recruiting a substantial number of immune cells and promoting the development of immune-responsive tumors.

Conclusions: In summary, we efficiently deliver an anti-PD-L1 peptide and DOX (Doxorubicin) to tumors using Pep-DOX under the bio-orthogonal click-targeting combination strategy, effectively inhibiting tumor progression while minimizing side effects.

PO-3354

Facile synthesis of Gd-doped red-emissive carbon nanodots for fluorescent/MR bimodal imaging and tumor therapy

Yupeng Shi, Mengyang Zhou, Yaning Xia, Yifei Wang, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Metal-doped carbon dots (MCDs) have superior physical properties and excellent biocompatibility, showing great potential in biomedical applications. However, fabricating single carbon dots with integrated functionality for diagnostic and therapeutic modalities remains challenging. Here, we develop a simple strategy for the preparation of bimetallic doped carbon dots via a one-step microwave-assisted method using Ru-complex, citric acid, Branched polyethyleneimine, and GdCl₃ as starting materials. Red-emitting fluorescent carbon dots of ruthenium (Gd/Ru-CDs). The average diameter of the prepared Gd/Ru-CDs is 4.7 nm and exhibits high water solubility. Due to the introduction of the ruthenium complex, the Gd/Ru-CDs have intense red light emission fluorescence brightness, and the relative quantum yield is as high as 9.8%. In addition, the nanoprobe has an obvious MR response with a longitudinal relaxation of 6.38 mM⁻¹ s⁻¹. Even more impressively, it has low cytotoxicity, excellent biocompatibility, and efficient reactive oxygen species (ROS) generation capabilities. In vivo, experiments show that Gd/Ru-CDs can not only be used as in vivo tumor fluorescence/magnetic resonance imaging agents but also as photodynamic nanoagents for cancer treatment. Therefore, the prepared Gd/Ru-CDs have good performance and broad application prospects.

PO-3355

Sequence-Activated Fluorescent Nanotheranostics for Real-Time Profiling Pancreatic Cancer

Yining Tao

Shanghai Sixth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

*Purpose:

Pancreatic ductal adenocarcinoma (PDAC), as one of the most malignant tumors with dense desmoplastic stroma, forms a specific matrix barrier to hinder effective diagnosis and therapy. To date, a paramount challenge is in the search for intelligent nanotheranostics for such hypopermeable tumors, especially in breaking the PDAC-specific physical barrier. The unpredictable in vivo behaviors of nanotheranostics, that is, real-time tracking where, when, and how they cross the physical barriers and are taken up by tumor cells, are the major bottleneck. Herein, we elaborately design sequence-activated nanotheranostic with dual-channel near-infrared fluorescence outputs for monitoring in vivo behaviors in a sequential fashion. This nanotheranostic with a programmable targeting capability effectively breaks through the PDAC barriers. Ultimately, the released aggregation-induced emission (AIE) particle directly interacts with PDAC cells and penetrates into the deep tissue. We believe that this unique sequence-activated fluorescent strategy expands the repertoire of nanotheranostics in the treatment of hypopermeable tumors.

*Methods and Materials:

AIEgens TCM-DN and Cy molecules with high-fidelity imaging performance were encapsulated into PolypH which can respond to the tumor microenvironment by nanoprecipitation method. The AIE signal was regulated by pH-induced Förster resonance energy transfer (FRET) for real-time. Tracking. Then we explored the structural characterization, AIE characteristics, PDT performance, environmental pH response and FRET response of the nanomaterials. By combining sequence response and multiple targeting strategies and co-loading specific active targeting unit U11 peptide, we constructed dual-channel sequence-activated nanoprobe TCM-U11&Cy@P. The human pancreatic cancer cell PANC-1 was selected as cell model of the tumor to study the in vitro cell imaging, targeting, cellular uptake and cytotoxicity of this nanosystem. Experiment was carried out in multicellular tumor spheroids. The animal model of the tumor was constructed by subcutaneous tumor formation in BALB/c nude mice using PANC-1 cells and then conducted FRET response research.

*Results:

We successfully prepared the dual-channel sequence-responsive nanosystem TCM-U11&Cy@P with high-fidelity imaging performance. Regulating the AIE signal through the FRET strategy, and verifying its specific response performance, excellent tracking ability and PDT properties. Targeting and permeability experiments confirmed that loading U11 active targeting units can significantly increase the cell uptake of pancreatic cancer, and overcome the matrix barrier for deep delivery and deep tumor ablation.

*Conclusions:

Based on near-infrared fluorescence imaging, Förster resonance energy transfer and photodynamic therapy, this research combined diagnosis and treatment to construct nanotheranostics system. We successfully designed nanoprobe TCM-U11&Cy@P to real-time track the delivery across PDAC-specific physical barriers and efficient uptake of deep tumor cells. real-time tracking the delivery across PDAC-specific physical barriers and efficient uptake of deep tumor cells. Our study presents a new visualization strategy for the in vivo application of intelligent nanotheranostics, paving a new pathway for pancreatic carcinoma.

Clinical Relevance/Application: Integration of diagnosis and treatment of Pancreatic ductal adenocarcinoma

PO-3356

4-OI inhibits hypoxia-induced injuries on β -cell via reducing LDHA-mediated ROS generation

Jianmin Wu, Wei Wang, Xiaoqian Ma
湘雅三医院

Background: Islet transplantation has been shown as a potentiate way to cure Type 1 Diabetes. However, isolation and purification inevitably devascularize the islets. Hypoxia stress has been observed up to 60% of newly transplanted tissue during the first couple of days which increase the hypoxia induced β -cell death. Reactive oxygen species (ROS) are key factors mediating hypoxic damage in β -cell and are mainly generated in NADPH or NADH dependent pathways. Itaconate is a by-product of the tricarboxylic acid cycle that protects cell from inflammation and oxidative stress induced damage. However, the effect of itaconate for β -cell in hypoxia condition still unknown. In this study, we aimed to explore the effect of 4-OI, a cell-permeable derivative of itaconate, on protection beta cells from hypoxia-induced damage and its mechanism.

Method: MIN6 cells were cultured under hypoxic conditions (1% O₂) with or without 125 μ M 4-OI in vitro for 72h. The viability of cells was examined using MTS assays and flow cytometric analysis. The levels of inflammatory cytokines were detected by qRT-PCR and ELISA assays. Intracellular ROS content was measured by DCFH-DA probe. LDH activity assay kit was used to test the activity of LDHA. Finally, cells were treated with ROS scavenger Nacetylcysteine (NAC) and LDHA specific inhibitor FX-11 in hypoxia condition for 72h to verify the role of 4-OI in regulating ROS.

Result: Hypoxia-induced injuries on MIN6 cells were confirmed by decreased cell viability, increased oxidative stress and apoptosis, and the production of inflammatory cytokines when compared with normoxia. After the treatment of 4-OI, those changes caused by hypoxia injury were effectively reversed. Then, we found that the level of NADPH was not significantly altered under hypoxia, whereas NADH was dramatically increased. When the cells treated with 4-OI, the level of NADH was down-regulated. In addition, we found that 4-OI decreased LDHA activity, which suggested the production of ROS triggered the cell death was from the interaction of LDHA and NADH.

The viability of MIN6 cells under hypoxia was improved, the intracellular ROS level, inflammatory cytokines and apoptosis were decreased. Similarly, when we used ROS scavenger NAC to treat the cells with hypoxia, cell viability was increased while the quantity of intracellular ROS, and inflammatory cytokines were reduced. Finally, to confirm our findings, we treated hypoxic cells with FX-11, a specific inhibitor of LDHA. The treatment of FX-11 enhanced cell survival, inhibited the production of ROS, and reduced the level of inflammatory cytokines.

Conclusion: In this study, we provide evidence that 4-OI can decrease the interaction of LDHA-NADH then reduce the generation of ROS, which finally protect the β cell under hypoxia condition.

PO-3357

TME-Responsive Nanotheranostics: T1/T2 dual-modal MRI and Imaging-guided PDT in Nasopharyngeal Carcinoma

Qianyu Yang, Weiyuan Huang
Hainan General Hospital

Currently, multimodal imaging-guided tumor therapy is acknowledged to improve the diagnostic accuracy as well as treatment outcome of tumors, and the integration of imaging-guided diagnosis and precise treatment has gained much attention in the field of theranostic nanotechnology. Magnetic resonance imaging (MRI) is indispensable in the diagnosis of tumors due to its unique pros. However, the majority of research on MRI nano-contrast agents (CA) has been concentrated on T₁ or T₂ single-modal imaging, which results in the limited contribution of nano-CA to further improve the diagnostic accuracy. Therefore, we developed a multifunctional nanotheranostic

GdCFS for the early and accurate diagnosis, and efficient treatment of nasopharyngeal carcinoma, which achieves sphere-fiber transformation in response to glutathione (GSH) of the tumor microenvironment. GdCFS possesses multimodal imaging capabilities (T_1/T_2 MRI and fluorescence imaging) for imaging-guided subsequent photodynamic therapy (PDT) and monitoring treatment progress. The transformation to nanofibers results in sufficient tumor accumulation, which along with massive ROS generation upon irradiation thanks to the reduction of GSH then further significantly killed tumor cells. Compared to clinically used Gd-DTPA, GdCFS exhibited better T_1 WI MRI performance and more significant negative contrast-enhancement of tumor area on T_2 WI. Under imaging-guided PDT, GdCFS achieved efficient therapeutic outcomes without causing any noticeable tissue damage. The results of in vitro and in vivo studies indicated GdCFS may be a suitable candidate for T_1/T_2 dual-modal MRI-guided precision tumor therapy.

Magnetic-optical Dual-modality Imaging Monitoring Chemotherapy Efficacy of Pancreatic Cancer With a Low-dose Fibronectin-targeting Gd-based Contrast Agent

Wenjia Zhang¹, Huadan Xue², Nan Hong³, Zhengyu Jin²

1. Peking Union Medical College Hospital; Peking University People's Hospital

2. Peking Union Medical College Hospital

3. Peking University People's Hospital

Purpose Pancreatic ductal adenocarcinoma (PDAC) is a lethal hypovascular tumor surrounded by dense fibrosis. Albumin-bound paclitaxel and gemcitabine (AG) chemotherapy is the mainstay of PDAC treatment through depleting peritumoral fibrosis and killing tumor cells; however, it remains challenging due to the lack of a noninvasive imaging method to evaluate fibrotic changes during AG chemotherapy. This study developed a dual-modality imaging platform that enables the noninvasive, dynamic, and quantitative assessment of chemotherapy-induced fibrotic changes through near-infrared fluorescence molecular imaging (FMI) and magnetic resonance imaging (MRI) using an extradomain B fibronectin (EDB-FN)-targeted imaging probe (EDB-Gd-Cy7).

Methods EDB-Gd-Cy7 was constructed by conjugating the peptide (Cys-TVRTSAD) to Gd-DTPA and the near-infrared (NIR) dye Cy7. PDAC murine models were developed for MRI/FMI. Mice were intravenously injected with EDB-Gd-Cy7 at a Gd concentration of 0.05 mmol/kg, or free Cy7 and Gd-DTPA as the control. The normalized tumor background ratio (TBR) on FMI images and the ratio of T_1 reduction on MRI images were quantitatively analyzed. To monitor chemotherapy, mice were treated with AG chemotherapy regimens; MRI/FMI was performed before and after treatment. Histological analyses were performed for validation.

Results The concentration of EDB-Gd-Cy7 showed a linear correlation with the fluorescence intensity and T_1 relaxation time in vitro. The optimal imaging timepoint and dosage were 30 min after injection of EDB-Gd-Cy7 with 0.05 mmol/kg, only a half of clinic dosage of gadolinium, in both FMI and MRI. In addition, the targeted probe generated a 1.44-fold and 1.90-fold robust contrast enhancement and longer retention compared with Cy7 and Gd-DTPA (* $P < 0.05$), respectively, while AG chemotherapy reduced the tumor volume. T_1 reduction and normalized TBR were significantly increased by 2.33-fold and 1.61-fold, respectively, in the fibrotic tumor areas of Control group compared with those in the AG group (* $P < 0.05$). EDB-Gd-Cy7 can sensitively detected small tumor with 2 mm diameter at 0.05 mmol/kg.

Conclusion Integration of MRI/FMI with a low dose of the targeted EDB-Gd-Cy7 probe can achieve sensitive imaging of PDAC and quantitative assessment of fibrotic changes during AG chemotherapy. MRI/FMI with EDB-Gd-Cy7 have a potential clinical application in the precise diagnosis, development of individualized treatment plans, post-treatment monitoring, and disease management.

PO-3359

Prognostic significance of integrating total metabolic tumor volume and EGFR mutation status in patients with lung adenocarcinoma

Maoqing Jiang, Xiaohui Zhang, Xiuyu Guo, Qiaoling Gao, Jingfeng Zhang, Jianjun Zheng
Ningbo No.2 Hospital

Background The objective of this study was to investigate the prognostic significance of total metabolic tumor volume (TMTV) derived from baseline ^{18}F -2-fluoro-2-deoxyglucose (^{18}F -FDG) positron emission tomography/computed tomography (PET/CT), in conjunction with epidermal growth factor receptor (EGFR) mutation status, among patients with lung adenocarcinoma (LUAD). **Methods** We performed a retrospective analysis on 141 patients with LUAD [74 males, 67 females, median age 67 (range 34-86)] who underwent ^{18}F -FDG PET/CT and had their EGFR mutation status determined. Optimal cutoff points for TMTV were determined using time-dependent receiver operating characteristic curve analysis. The survival difference was compared using Cox regression analysis and Kaplan–Meier curves.

Results The EGFR mutant patients ($n = 79$, 56.0%) exhibited significantly higher 2-year progression-free survival (PFS) and overall survival (OS) rates compared to those with EGFR wild-type ($n = 62$, 44.0%), with rates of 74.2% vs. 69.2% ($P = 0.029$) and 86.1% vs. 67.7% ($P = 0.009$), respectively. The optimal cutoff values of TMTV were 36.42 cm^3 for PFS and 37.51 cm^3 for OS. Patients with high TMTV exhibited significantly inferior 2-year PFS and OS, with rates of 22.4% and 38.1%, respectively, compared to those with low TMTV, who had rates of 85.8% and 95.0% (both $P < 0.001$). In both the EGFR mutant and wild-type groups, patients exhibiting high TMTV demonstrated significantly inferior 2-year PFS and OS compared to those with low TMTV. In multivariate analysis, EGFR mutation status (hazard ratio, HR, 0.41, 95% confidence interval, CI 0.18–0.94, $P = 0.034$) and TMTV (HR 8.08, 95% CI 2.34–28.0, $P < 0.001$) were independent prognostic factors of OS, whereas TMTV was also an independent prognosticator of PFS (HR 2.59, 95% CI 1.30–5.13, $P = 0.007$).

Conclusion Our study demonstrates that the integration of TMTV on baseline ^{18}F -FDG PET/CT with EGFR mutation status improves the accuracy of prognostic evaluation for patients with LUAD.

PO-3360

Multifunctional PD-L1 targeted Fe₃O₄@GEM nanoparticles under MRI monitoring for combination therapy of colorectal cancer

Jie Zhao, Huijie Jiang

Department of Radiology, The Second Affiliated Hospital of Harbin Medical University, Harbin 150081, China

Abstract Purpose: Colorectal cancer (CRC) is one of the common digestive tract tumors, which has risen to the third to fifth highest incidence of malignant tumors in China. Its morbidity and mortality are increasing year by year, and it has become the second highest incidence of tumors in China after lung cancer. However, evidence suggests that immunotherapy is only effective for a small portion of patients. The combination therapy of both immunotherapy and chemotherapy has demonstrated great promise in its treatment efficiency. However, this combination therapy is limited by both the organ toxicity of the chemotherapeutic drugs and the inaccessibility of the in vivo monitoring of individual tumor response to therapies. With the development of the nanomedicine, synchronous targeting therapy, imaging diagnosis and monitoring can be achieved conveniently using the multifunctional nano-platform for CRC.

Methods: In our study, we prepared the Gemcitabine (GEM) loaded Fe₃O₄ nanoparticles targeting the programmed cell death ligand 1 (PD-L1) (PD-L1@Fe₃O₄-GEM, FPG) to obtain the real-time magnetic resonance imaging (MRI) monitoring and combination therapy of both chemotherapy and immunotherapy for CRC.

Results: The results showed that FPG inhibited tumor growth more effectively than either GEM chemotherapy or PD-L1 immunotherapy alone.

Conclusion: Our study demonstrated that FPG has shown a great potential for theranostics and clinical translation in synchronous MRI imaging-guided monitoring and combined treatment of both GEM and immunotherapy of CRC.

PO-3361

NaGdF₄-Based Magnetic Resonance Nanoprobes for Qualitative Inflammation Imaging in Glioma: Hot or Cold?

Jing Wang¹, Haiyan Guo³, Yu Luo¹, Dalong Ni³, Zhenwei Yao²

1. Shanghai Fourth People's Hospital, School of Medicine, Tongji University

2. Huashan Hospital, Fudan University

3. Shanghai Institute of Traumatology and Orthopaedics, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Purpose: The 'cold' or 'hot' inflammatory status of glioblastoma (GBM) is closely related to the responsiveness of immunotherapy. This study aims to visualize the inflammatory status of glioma tumor microenvironment (TME) non-invasively using myeloperoxidase (MPO) responsive NaGdF₄-based nanoprobes under MRI.

Materials and Methods: Magnetic resonance imaging (MRI) based Tyr-ANG-NaGdF₄ nanoprobes, named as TAGs, with surface modification of ANG to target glioma and phenolic hydroxyl to sense MPO were developed, aiming to noninvasively visualize the 'hot' or 'cold' TME inflammatory status of GBM based on MRI. In vitro MPO responding ability was conducted by incubating the desired solution of different Gd³⁺ concentrations with an excess of H₂O₂ and MPO. Transmission electron microscopy (TEM) and MRI were performed before and after the MPO catalytic reaction. CCK-8 assay was performed to detect the cytotoxicity on RAW264.7, GL261 and bEnd.3 cells, respectively. In vivo toxicity was performed on C57BL/6 mice at 1, 15 and 30 d post-injection of TAGs. C57BL/6 mice and SD rats with subcutaneously transplanted glioma model using GL261 cells and C6 cells,

respectively, were created. In vivo MR imaging was performed on the two models after tail vein injection of TAGs at a concentration of 10 mg Gd/kg under 11.7 T at T1WI (n = 3 each group). PEG-NaGdF₄ nanoparticles without phenolic hydroxyl group on surface were used as control. After imaging, tumors were harvested for flow cytometric analysis, immunohistochemistry staining, MPO activity assay and bio-TEM.

Results: Cellular and in vivo toxicity confirm that TAG nanoprobe are of desirable high biocompatibility. After incubating with H₂O₂ and MPO, TAG nanoprobe show oligomerization under TEM with T1 relaxation time lengthened at 11.7 T. C6 SD rats with subcutaneous glioma show patchy darkened T1 signal within the tumor after injection of TAGs, which confirmed by following biological analysis with high MPO level and abundant M1-like macrophages, suggesting MPO-enriched 'hot' TME inflammatory status. However, GL261 mouse models show moderate hyperintensity in T1-weighted MRI, which confirmed with low MPO level and few M1-like macrophages, signifying the MPO-rare 'cold' TME within the tumor. PEG-NaGdF₄ nanoparticles show faint T1 enhancement for both the C6 SD rat and GL261 mouse models.

Conclusion: The synthesized TAG nanoprobe can qualitatively reflect and differentiate the inflammatory status of GBM non-invasively by sensing MPO in TME using MRI. Depending on the level of MPO in the TME, the TAG nanoprobe will get self-assembled in various degree, thus altering the T1 relaxation time and present altered image contrast in T1 weighted images. It was found that 'hot' GBMs showed patchy hypointense T1 signal while 'cold' GBMs only showed moderate enhanced T1 signal. By using the MPO responsive nanoprobe, it is promising to monitor the TME inflammatory status for glioma patients thus guide clinical treatment especially during immunotherapy.

PO-3362

A magnetic resonance nanoprobe with STING activation character collaborates with platinum-based drug for enhanced tumor immunochemotherapy

Jiali Li, Shichao Li, Zhen Li

Tongji Hospital, Huazhong University of Science and Technology

Background: Immunochemotherapy is a potent anti-tumor strategy, however, how to select therapeutic drugs to enhance the combined therapeutic effect still needs to be explored.

Results: Herein, a magnetic resonance nanoprobe (MnP@Lip) with STING (Stimulator of Interferon Genes) activation character was synthesized and co-administered with platinum-based chemotherapeutics for enhanced immunochemotherapy. MnP@Lip nanoparticles were prepared by simple fabrication process with good reproducibility, pH-sensitive drug release behavior and biocompatibility. In vitro experiments elucidated that Mn²⁺ can promote the polarization of M0 and/or M2 macrophages to M1 phenotype, and promote the maturation of BMDC cells. Upon Mn²⁺ treatment, the STING pathway was activated in tumor cells, mouse lung epithelial cells, and immune cells. More importantly, anti-tumor experiments in vivo proved that MnP@Lip combined with platinum-based chemotherapeutics increased T cells infiltration in the tumor microenvironment, and inhibited tumor growth in the orthotopic therapeutic and postoperative tumor models.

Conclusions: This kind of therapeutic strategy that combined MnP@Lip nanoparticles with platinum-based chemotherapeutics may provide a novel insight for immunochemotherapy.

PO-3363

Correlation between Ki67, CK7, and Gadoteric Acid-Enhanced Magnetic Resonance Imaging in Hepatocellular Carcinoma: A Molecular and Imaging Biomarker Study

Fan Zhang, Gen Chen, Xuemei Hu

Tongji Hospital Affiliated to Tongji Medical College of Huazhong University of Science and Technology

Purpose: The purpose of this study was to investigate the correlation between molecular and imaging biomarkers in patients with hepatocellular carcinoma (HCC) using gadoteric acid-enhanced magnetic resonance imaging (MRI).

Methods: A total of 78 patients diagnosed with HCC based on surgical or biopsy confirmation were included in this study. T1 mapping measurements were performed before and 20 minutes after gadolinium acetic acid injection (T1Pre and T1HBP, respectively). The deltaT1 and deltaT1% were calculated as the difference and percentage decrease in T1 relaxation time, respectively. Proton density fat fraction (PDFF) was measured using pre-contrast images. Statistical analyses were conducted using t-tests or Mann-Whitney U tests based on the data type.

Results: Significant differences were observed in T1Pre, T1HBP, and PDFF between the high and low Ki67 expression groups ($p < 0.05$). T1Pre and T1HBP were positively correlated with Ki67 expression levels at the 0.05 (two-tailed) and 0.01 (two-tailed) levels, respectively ($r = 0.287$, $p = 0.017$; $r = 0.301$, $p = 0.008$). The tumor fat fraction was negatively correlated with Ki67 expression at the 0.01 (two-tailed) level ($r = -0.312$, $p = 0.009$). Further analysis revealed no significant differences in PDFF, T1Pre, T1HBP, deltaT1, or deltaT1% between CK7 positive and negative expression groups. However, CK7 expression was found to be significantly correlated with Ki67 expression ($p = 0.028$) at the 0.05 (two-tailed) level ($r = -0.238$, $p = 0.037$).

Conclusion: This study explored the relationship of T1 Mapping, PDFF, Ki67, and CK7 in HCC. Future research with a larger sample size is needed to better understand the relationship between various molecular and imaging biomarkers, enabling risk stratification and personalized treatment for HCC patients. Additionally, the clinical implications of these findings should be further investigated.

卵泡膜细胞-纤维瘤伴囊变的 MR 影像学分型及相关因素分析

赵小虎

复旦大学附属上海市第五人民医院

目的:卵泡膜细胞-纤维瘤伴囊变是引起误诊的重要原因之一.本研究旨在对囊变位置和形态学进行分型,分析与囊变相关的临床及影像学因素,提高对其非典型表现的认识和诊断.**方法:**回顾经病理证实的 38 例卵泡膜细胞-纤维瘤的 MR 影像特征,重点探讨囊变的分型及其 MR 信号特点,并对可能影响肿瘤囊变的相关因素进行分析.**结果:**38 例卵泡膜细胞-纤维瘤 MRI 表现为实性肿块 22 例(57.89%),实性伴囊变肿块 12 例(31.58%),囊性肿块 4 例(10.53%),肿瘤最大径为 1.0~21.3cm,均值为 (6.65 ± 4.70) cm.实性伴囊变肿块分为瘤外囊变 2 例(16.67%)及瘤内囊变 10 例(83.33%);其中周围型 4 例(33.33%)、弥漫型 5 例(41.67%)、中央型 1 例(8.33%).卵泡膜细胞-纤维瘤伴囊变时实性成分 T1WI 上呈等低信号, T2WI 上呈等或稍高信号;囊性成分表现为明显的 T2WI 高信号;增强后肿瘤实性成分轻度强化(50.0%),囊性成分无强化(42.1%).肿瘤大小是影响囊变的重要因素($P = 0.008$), ≥ 6 cm 的肿瘤囊变率为 68.8%(11/16), < 6 cm 的肿瘤囊变率为 27.3%(6/22).**结论:**卵泡膜细胞-纤维瘤囊变率为 42.1%(16/38),其中弥漫型囊变最多(41.67%),肿瘤大小是影响囊变的重要因素之一.认识囊变的分型,对提高对本病的认识及诊断和鉴别诊断有重要意义.

PO-3365

基于基因-环境交互作用的新型 AD 大鼠模型的构建及多维度评估与应用

蔺晓梅

复旦大学上海市第五人民医院

目的: 本研究基于基因与环境因素的交互作用, 尝试构建一种新型复合因素 AD 大鼠模型, 并对其做多维度的评估。

方法: 利用腺相关病毒 (AAV) 转移人类 AD 相关突变基因 APP 结合丙烯醛 (环境因素) 灌胃的方式, 建立了遗传和环境因素共同作用的复合 AD 大鼠模型。使用水迷宫评估认知功能、体内病理标志物的检测、高分辨率 7T 磁共振测量活体大脑微结构变化。析因分析探讨环境和基因因素在 AD 表型产生中各自的贡献度。

结果: 与正常对照组相比, 复合组大鼠模型空间学习记忆能力下降; 脑内皮层和海马区检测到病理标志物 A β 沉积, 海马和内嗅皮层的 FA 值降低。基因组大鼠模型出现认知功能的下降, 未检测到明显的 A β 沉积; 出现了不典型脑萎缩区域。环境组大鼠模型的认知功能无明显下降, 未检测到显著 A β 沉积和脑萎缩区域。三组大鼠模型在海马联合、穹窿、胼胝体、扣带回、前联合白质纤维束完整性受损, 复合组大鼠模型的空间学习和记忆力的下降与纤维束完整性受损有关 ($p=0.003$)。通过析因分析, 基因因素可以解释 39.74% AD 样表型, 环境因素可以解释 33.2% 的 AD 样表型。

结论: G x E 大鼠模型可以更好地复刻人类 AD 的病理特征。未来对 AD 模型的研究应考虑到多种因素, 我们的 G x E 模型可能有助于开发有效的 AD 治疗策略。

PO-3366

GluCEST 技术在氯胺酮的快速抗抑郁作用中的应用研究

李昊、齐凯、吕奕洁、阚俊楠、杨长锋、林晓倩、陶晋、张薇、刘岩、李祥林

滨州医学院医学影像学院

目的 抑郁症是一种难治的精神类疾病, 传统抗抑郁药起效慢且副作用多。氯胺酮作为一种快速抗抑郁药物, 在临床应用, 但目前缺乏客观有效评估其疗效的检测方法。本研究应用新型分子影像成像技术化学交换饱和转移成像 (GluCEST) 来评估氯胺酮对海马区谷氨酸 (glu) 含量的改变情况, 进一步评估其快速抗抑郁效果, 最后用基础实验来验证正确性。

方法 选取 24 只 SD 大鼠, 随机分为两组, 一组造模成为 CUMS 模型鼠 (C 组), 另一组为对照组 (S 组)。将 C 组随机分为两组, 每组 6 只, 一组注射氯胺酮 (ket 组), 另一组注射生理盐水 (sal 组), 从 S 组随机选出 6 只作为对照组 (con 组)。行为学实验验证建模成功后, 对 ket 组、sal 组和 con 组进行磁共振成像, 进而用行为学实验验证氯胺酮效果, 最后剖出海马进行高效液相色谱实验 (HPLC)。

结果 行为学数据显示, CUMS 造模成功且氯胺酮发挥效果 ($P < 0.05$)。GluCEST 结果显示, sal 组左、右海马的 glu 值低于 con 组 ($P < 0.05$), 注射氯胺酮后, ket 组左、右海马的 glu 值高于 sal 组 ($P < 0.05$)。MRS 结果显示三组之间仅左海马有统计学差异 ($P < 0.05$), 右侧无差异。三组的左海马 GluCEST 结果和 MRS 结果具有强相关性 ($r = 0.7348$, $P < 0.001$)。HPLC 结果显示, sal 组左、右海马的值明显低于 con 组 ($P < 0.01$), ket 组左、右海马的值高于 sal 组 ($P < 0.05$), 与 GluCEST 结果趋势相同, 可验证 GluCEST 结果正确性。

结论 综上所述, 与 MRS 相比, GluCEST 可以灵敏、直接地反映抑郁状态和氯胺酮治疗后海马谷氨酸浓度的变化, 达到评估其快速抗抑郁的效果。此外, 验证了谷氨酸在抑郁症的发病和治疗机制中具有相当大的潜力, 有望成为新型分子影像成像生物标志物。

PO-3367

谷氨酸化学交换饱和转移成像对放射性脑损伤大鼠的应用价值

李国栋^{1,2}、刘岩²、刘彩云¹、黄丹琪¹、刘伽¹、王旭¹

1. 滨州医学院附属医院核医学科

2. 滨州医学院医学影像学院

目的

探讨 7.0 T 磁共振谷氨酸化学交换饱和转移 (glutamate chemical exchange saturation transfer, GluCEST) 成像评估放射性脑损伤大鼠模型谷氨酸变化的应用价值。

方法

将实验大鼠随机分为两组: 对照组 (n = 9) 和放射性脑损伤组 (RBI, n = 9)。RBI 组大鼠使用 X 射线辐照仪进行辐照, 4 周后进行水迷宫实验。使用 7.0 T 小动物磁共振采集 CEST 序列和高效液相色谱仪 (high-performance liquid chromatography, HPLC) 测量海马谷氨酸浓度。两组海马 GluCEST % 以及 HPLC 谷氨酸差异进行 T 检验。GluCEST % 与水迷宫的关系、GluCEST % 与 HPLC 的关系进行 Spearman 和 Pearson 相关性分析。

结果

与对照组相比, 4 周后 RBI 组大鼠认知功能受损, GluCEST 在海马区域的谷氨酸水平降低 ($P < 0.001$), HPLC 测量证实了这种变化 ($P = 0.0028$)。相关性分析表明空间记忆与海马 GluCEST % 为正相关 ($r = 0.7372$, $P < 0.001$), HPLC 测量谷氨酸浓度和 GluCEST % 水平之间显示出类似的正相关 ($r = 0.6291$, $P < 0.05$)。

结论

GluCEST 可视化评估放射性脑损伤大鼠海马谷氨酸变化, 可用作体内成像代谢变化的生物标志物, 有利于早期监测和提前干预放射治疗后伴随出现的辐射损伤。

PO-3368

基于放射线/双酶的循环自供氧体系用于增敏肿瘤放疗

刘锦强、王珏、马源源、居胜红

东南大学附属中大医院

研究目的: 乏氧是引起肿瘤放疗抵抗的主要原因之一, 因此寻找一种全新的策略来克服肿瘤乏氧、改善肿瘤患者放疗疗效十分重要。生物酶介导的肿瘤治疗是近年来的研究热点之一, 但如何将生物酶靶向递送至肿瘤组织并能同时保持其催化活性、降低毒副作用是其面临的巨大挑战。本研究旨在通过共载过氧化氢酶 (Cat) 及超氧化物歧化酶 (SOD) 构建新型循环自供氧纳米体系, 能够在放射线“启动”下以水分子为底物, 在肿瘤组织内持续、高效产氧, 进而提高肿瘤治疗效果, 并应用光声成像技术及荧光成像对肿瘤内氧含量及纳米平台在体内的生物分布进行实时、定量监测, 进一步指导小鼠放疗。

研究方法: 将超氧化物歧化酶和过氧化氢酶共载于空心杂化有机硅 (HSN) 纳米颗粒中, 并在表面包覆 ZIF-8 来携带荧光染料。使用氧检测探针检测纳米颗粒在 X 射线激发下的氧气产生情况。通过 Calcein-AM/PI 染色以及 Annexin V-FITC/PE 流式细胞检测不同治疗组对肿瘤细胞的杀伤效果。通过 WB 实验和免疫荧光实验检测 HIF-1 α 的表达情况。通过近红外荧光成像实时监测纳米颗粒的生物分布, 使用光声成像技术定量评估肿瘤组织内血氧饱和度。

实验结果: SC@HSN@Z 的水合粒径约为 87nm。氧气探针的结果显示纳米颗粒在 X 射线的作用下能够将超氧阴离子转化为氧气。AM/PI 染色及流式细胞检测结果表明 SC@HSN@Z+RT 组对肿瘤细胞的杀伤效果最好。小动物活体成像证明纳米平台在静脉注射 8 小时后聚积达到峰值。光声检测结果发现纳米材料联合应用放射线能够提高肿瘤内部的氧含量, 放疗后 8 小时氧含量达到最大, WB

实验和免疫荧光实验结果表明 SC@HSN@Z+RT 组 HIF-1 α 的表达量显著下降。动物实验表明 SC@HSN@Z 纳米颗粒在 X 射线的作用下疗效最好,肿瘤抑制率为 84%。

实验结论: SC@HSN@Z 纳米平台在 X 射线的作用下能够持续产生氧气,提高放疗效果。

细胞膜仿生纳米探针用于激活巨噬细胞介导的乳腺癌免疫治疗

李迎波、常娣、居胜红
东南大学附属中大医院

目的: 三阴性乳腺癌 (TNBC) 具有侵袭性强、复发率高、易转移以及生存期短等特点, 缺乏针对性治疗方法, 预后极差。近年来以免疫检查点抑制剂为代表的免疫治疗逐渐应用于 TNBC 的临床治疗。但免疫治疗存在着如肿瘤免疫逃逸和治疗耐药等问题, 严重影响 TNBC 复发转移和预后等。多项研究表明肿瘤相关巨噬细胞 (TAMs) 是肿瘤微环境中最丰富的免疫细胞, 其中 M2-TAMs 的大量浸润是 TNBC 免疫抑制微环境形成的关键因素。靶向调控 M2-TAMs 有望调节免疫微环境、改善免疫治疗耐药。本研究合成了一种微环境响应性细胞膜仿生纳米探针, 靶向调控 TAMs 的 CSF-1R 通路并联合负载的抗 CD47 抗体实现对 TAMs 的复极化以及免疫功能的激活, 并对极化过程进行实时监测, 实现 TNBC 的精准诊疗。

方法: 本研究制备并表征了巨噬细胞膜包裹的纳米载药系统, 并验证了探针对肿瘤微环境弱酸条件的响应性释放, 以及对 TAMs 极化过程的近红外成像监测; 细胞水平验证了纳米探针巨噬细胞的极化调控能力以及调节巨噬细胞对肿瘤细胞识别吞噬的能力; 在小鼠原位模型中验证了纳米探针对 TAMs 的极化, 利用 NIR-II 成像对极化过程进行可视化监测, 联合抗 CD47 抗体激活巨噬细胞功能; 采用病理学及分子生物学等方法揭示纳米探针对 M2-TAMs 的复极化能力, 评估其对 TNBC 的诊疗能力。

结果: 本研究制备的纳米探针具有良好的生物相容性和稳定性, 能够实现 pH 响应性药物释放和优异的响应性成像能力。在活体水平能够有效的对 TAMs 进行复极化, 特异性阻断 SIRP α -CD47 轴, 具有显著的肿瘤免疫微环境调节作用及抗肿瘤能力。

结论: 本研究构建了新型的纳米探针, 实现了对 TNBC 肿瘤免疫抑制微环境的重编程以及复极化过程的 NIR 成像监测, 联合免疫检查点抑制剂实现对 TNBC 的免疫调控, 有效激活 TAMs 的生物功能, 有望对临床乳腺癌免疫逃逸和治疗耐药等问题提供潜在的解决方案。

PO-3370

联合 PD-L1 及 miR-182 的 ROS 响应光免疫探针用于增强乳腺癌免疫治疗的分子影像研究

杨洁、常娣、居胜红
东南大学附属中大医院

目的: 三阴性乳腺癌 (TNBC) 侵袭性强, 临床常规治疗效果不佳, 预后极差。免疫疗法是目前突破性疗法之一, 但其主要瓶颈是肿瘤免疫逃逸和免疫治疗疗效差。肿瘤内 M2 型肿瘤相关巨噬细胞 (M2-TAMs) 大量浸润形成免疫抑制微环境, 可能是肿瘤免疫检查点抑制剂疗效差的关键因素。因此, 联合 ICI 和 M2-TAMs 调控的协同治疗模式为增强 TNBC 免疫治疗提供了新策略。

方法: 该研究首先在 TNBC 临床患者组织样本中验证了免疫抑制微环境主要标志物的表达情况, 制备并表征了 IR825-aPD-L1@antagomiR-182@PLL-PEG, 在细胞水平上验证了纳米探针的细胞毒性、靶向性以及疗效。建立小鼠原位 TNBC 模型, 将纳米探针通过尾静脉注射递送至肿瘤部位, 同时使用近红外成像仪采集纳米探针注射后肿瘤组织的 NIR 成像数据。通过 DPBF 法检测肿瘤组织中

的 ROS 生成水平,采用 Western blot 法评估纳米探针 aPD-L1 的治疗效果,采用组织病理学及分子生物学方法评估纳米探针的 M2-M1 重编程效率,并采用红外热成像仪检测肿瘤组织实施激光照射后的光热治疗效率。

结果:本研究构建的 IR825-aPD-L1@antagomiR-182@PLL-PEG 纳米探针具有良好的稳定性、生物相容性、显著的 ROS 响应性断键性能以及优异的近红外成像效果。在小鼠原位 TNBC 模型尾静脉注射纳米探针后具有显著的体内抗肿瘤效应及 M2-M1 重编程效率。

结论:本研究构建新型 IR825-aPD-L1@antagomiR-182@PLL-PEG 纳米探针,实现对肿瘤近红外成像以及光控释放,纳米探针具有活体诊断和联合治疗的多功能特色,联合光免疫治疗实现 TNBC 免疫抑制微环境的靶向调控,有效激活肿瘤自身免疫系统,通过协同抗肿瘤作用增效肿瘤免疫治疗,从而抑制肿瘤细胞的免疫逃逸和免疫治疗耐药。

PO-3371

“off-on”多模态仿生纳米探针用于肿瘤相关巨噬细胞复极化过程的实时成像监测

杨学、居胜红
东南大学附属中大医院

目的:肿瘤相关巨噬细胞 (TAM) 在恶性肿瘤发展和转移的各个阶段均起了关键性作用。指导 TAM 极化程序,促使 M2-TAM (促肿瘤) 向 M1-TAM (抗肿瘤) 表型复极化的策略,在免疫治疗中极具应用前景,诸多药物正处于临床 I/II 期。然而, TAM 复极化疗效缺乏直接、高效的活体动态监测手段,迫切需要新型的分子影像方法对 TAM 复极化过程进行精准监测,并指导癌症的个性化治疗。本项目拟设计一种“off-on”多模态仿生纳米探针用于 TAM 复极化过程的实时活体成像监测。

方法:在前期研究基础上构建“off-on”多模态仿生纳米探针 MMMIB,并验证 MMMIB 对肿瘤部位 M2-TAM 的精准靶向能力。确证纳米探针 MMMIB 是否可以通过 MR 和 NIR-II 多模态成像实时、可视化、精准地监测 M2-TAM 复极化为 M1-TAM 的动态演变过程。

结果:获得可用于 TAM 复极化过程实时活体成像监测的仿生纳米探针 MMMIB。该纳米探针实现了 3 个目标:① 通过多级靶向策略将临床在研的复极化药物 (BLZ945) 高效、精准递送到肿瘤部位的 M2-TAM 中。②在 MR 和 NIR-II 的多模态、“off-on”程序式成像下实时可视化监测 M2-TAM 复极化为 M1-TAM 的演变过程。③利用 MR 成像对比剂 (Mn²⁺) 的免疫调控作用放大免疫疗效
结论:该纳米探针可为临床上 TAM 复极化药物体内疗效的动态监测提供新方法和新手段。

PO-3372

MRI 可视化铁钼纳米体介导光热/铁死亡在抗乳腺癌免疫效应中的作用

向覃言秋
东南大学附属中大医院

目的:铁死亡通过损伤相关分子模式可作为肿瘤抗原,提高肿瘤免疫原性,提高抗原提呈效率。光热治疗能通过激光辐照将光子能量转换为热能,诱导肿瘤细胞坏死及凋亡,能够直接快速地消融原发肿瘤,还能通过热应激触发乳腺癌免疫原性细胞死亡 (immunogenic cell death, ICD), 逆转机体免疫抑制微环境,进一步放大抗乳腺癌免疫反应。本研究拟评价铁钼纳米体 (FMO@PEG NPs)

MRI 可视化性能, 探讨铁钼纳米体介导铁死亡/光热治疗诱导 ICD 在联合抗乳腺癌免疫效应中的机理及作用。

方法: 应用 7.0T Micro MRI 扫描仪测定 FMO@PEG NPs 的 MRI 信号强度, 采用三磷酸腺苷 (adenosine triphosphate, ATP) 试剂盒检测各组细胞 ATP, 并采用激光共聚焦观察各组钙网蛋白 (CRT) 及高迁移率组蛋白 B1 (HMGB1)、热休克蛋白 70 (HSP70) 情况; 采用 Transwell 系统将细胞和未成熟树突细胞 (dendritic cells, DCs) 共孵育, 随后系统上层的 4T1 细胞接受适宜处理, 收集系统下层的成熟 DCs, 送检流式分析仪, 分析光热/铁死亡促进 DCs 成熟程度。

结果: FMO@PEG NPs 体外 MRI-T2 成像信号良好。在 FMO@PEG NPs 诱导铁死亡, 及激光辐照后, 铁死亡及光热使得 4T1 乳腺癌细胞内 HSP70、ATP、CRT、HMGB1 等 DAMPs 不同程度释放及表达, 体外 Transwell 试验证明 4T1 细胞同 FMO@PEG NPs 孵育及光辐照处理后, 铁死亡/光热联合组可最大程度促进 DCs 细胞成熟, 进一步介导全身抗肿瘤免疫效应。

结论: 铁钼纳米体诱导铁死亡相关氧化应激能触发 DAMPs 释放, 提高肿瘤免疫原性, 铁钼纳米体介导光热治疗相关热应激能诱导 ICD, 增强乳腺癌全身抗肿瘤免疫应答, 同时借助铁钼体 MRI 成像监测治疗过程及预后, 实现诊疗一体化策略。

PO-3373

双模成像示踪小鼠缺血性脑卒中后纤维蛋白沉积的实验研究

徐晓璇、居胜红
东南大学附属中大医院

目的: 以纤维蛋白特异性靶向肽 CREKA 为靶向分子, 合成靶向纤维蛋白的磁共振/光学双模态分子探针, 通过靶向肽与脑内纤维蛋白特异性结合, 对脑卒中后纤维蛋白沉积进行磁共振/光学双模成像, 通过影像学手段对脑卒中后纤维蛋白沉积进行早期评估。

方法: 通过点击反应等构建双模态纳米探针, 其上连接了近红外成像基团及磁共振成像基团, 并进行表征, 在成功构建纳米探针的基础上, 进行了体外血栓结合实验及安全性评估。在活体实验中对探针的脑部富集情况进行了检测。

结果: 对探针的表征检测证实其具有合适的形貌及粒径, 各个基团也被成功连接。体外血栓结合实验证实, 靶向探针对于血栓有较强的结合能力, 且在细胞层面和动物层面都显示良好的生物安全性。体内实验结果显示探针可以快速而显著地在脑部血栓位置富集。

讨论: 我们已经开发了一种 MR/NIR 双模纳米探针, 通过与 CREKA (纤维蛋白靶向的五肽) 偶联, 能够对 CI/R 后微血管中的继发性纤维蛋白微血栓进行高空间和时间分辨率的无创成像。总之, 工程化纤维蛋白靶向纳米探针是一种非常有前途的工具, 不仅用于纤维蛋白的分子成像, 而且在不久的将来用于理解微循环障碍的机制和纤维蛋白溶解剂的靶向治疗。

PO-3374

仿生纳米乳剂用于氧气递送和 CAF 抑制以 逆转免疫抑制和增强声动力治疗胰腺肿瘤

杜加伟¹、陈鑫²、张建琼²、居胜红¹
1. 东南大学附属中大医院
2. 东南大学医学院

目的: 胰腺癌具有特征性的致密间质和公认的“冷免疫”微环境, 是其进展的关键因素和治疗的重要瓶颈。声动力学疗法 (SDT) 是一种有前途的策略, 可以抑制肿瘤生长并激活免疫治疗的抗肿瘤免疫反应。然而, 缺氧和免疫抑制性肿瘤微环境限制了其治疗效果并抑制了免疫应答。

方法: 在这项研究中, 开发了巨噬细胞膜伪装的超声响应纳米颗粒来共同输送氧气 (O₂) 和 α -山竹素 (α -Mangostin) 以增强 SDT 和抑制肿瘤相关巨噬细胞 (CAF) 以调节胰腺癌致密间质。该系统通过超声乳化牛血清白蛋白和全氟化碳 (PFC) 合成稳定的乳糜微粒, 并包封声敏剂 (ICG), 通过脂质体挤压以包裹巨噬细胞膜, 构建了仿生纳米乳剂 (CPIM)。

结果: 该仿生纳米乳剂可以同源靶向肿瘤细胞。经超声辐照后, O₂ 和 α -Mangostin 迅速释放, 在乏氧状态下增强 ROS 产生以杀伤肿瘤细胞, 释放药物抑制 CAF 以改善肿瘤局部的致密间质促进药物渗透, 并增强 SDT 疗效以抑制肿瘤生长。和单纯治疗抑制肿瘤生长 2.4 倍相比, 联合 α -Mangostin 治疗抑制肿瘤生长达 3.9 倍。更重要的是, 仿生纳米乳剂协同声动力免疫治疗显著增加了浸润免疫细胞的数量, 改善了 CD8⁺T 细胞的功能 (单纯治疗 v.s. α -Mangostin 联合治疗=8.83% v.s. 12.42%), 减少肿瘤局部 M2 巨噬细胞数目 (单纯治疗 v.s. α -Mangostin 联合治疗=16.65% v.s.10.1%)。在联合抗 PD-L1 免疫检查点阻断的治疗中, 仿生纳米乳剂 CPIM 通过抑制 CAF 功能调节肿瘤致密间质, 促进了 aPD-L1 的瘤内递送, 逆转免疫抑制, 最终增强肿瘤局部的免疫应答, 显著提高免疫检查点阻断剂的疗效。

结论: 我们构建了一个简单的策略来共同递送 O₂ 和 α -山竹素增强 SDT 和逆转免疫抑制, 导致癌症免疫治疗的免疫反应增加。

PO-3375

ROS 响应的聚合物纳米粒子协同三阴性乳腺癌的光热治疗和巨噬细胞复极化

朱修权、常娣、居胜红
东南大学附属中大医院

目的三阴性乳腺癌 (TNBC) 是一种恶性程度高、预后差的乳腺癌亚型。免疫治疗是一种有前途的实体肿瘤的治疗方法, M2 型肿瘤相关巨噬细胞 (M2-TAMs) 是 TNBC 中最常见的免疫细胞, 也是 TNBC 免疫治疗的主要治疗靶点。该研究旨在促进 ROS 响应性 HRG 的递送, 并开发一种可能的将 PTT/PDT 与 HRG 结合的治疗纳米平台, 用于增强 TAMs 复极化和 TNBC 的光/免疫治疗。

方法我们合成了一种纳米颗粒, 该纳米颗粒将疏水性 IR825 和 HRG 通过硫缩酮连接体连接到 PEG-PLL 上, 形成 IR825@HRG 纳米颗粒。IR825 具有优异的热转换性能, 在激光照射下可以获得显著的光热治疗效果并诱导免疫反应。同时, HRG 的释放由光动力治疗诱导的活性氧 (ROS) 触发, 有效地将 M2-TAM 极化为 M1 表型, 以促进巨噬细胞对肿瘤细胞的吞噬作用。

结果经尾静脉注射后, IR825@HRGNPs 通过增强渗透和滞留效应在肿瘤组织中积累。一旦被光照射, PTT 和 PDT 效应在原位肿瘤组织中被触发, IR825 不仅可以作为光热剂直接杀死癌症, 还可以作为光敏剂产生 ROS, 进一步破坏硫缩酮连接物, 通过 ROS 诱导的硫缩酮键切割释放 HRG, 与 TAMs 中表达的 Fc γ 受体结合, 并促进 M2-TAM 向 M1 表型的复极。最终, IR825@HRG 纳米颗粒在携带 TNBC 的小鼠模型中表现出优异的巨噬细胞极化调节能力和有效的肿瘤抑制。

结论在本研究中, 我们开发了一种用于 TNBC 光免疫治疗的集成光触发 ROS 响应纳米颗粒, 该纳米颗粒在携带 TNBC 的小鼠模型中表现出优异的巨噬细胞极化调节能力和有效的肿瘤抑制, 将光疗与免疫疗法相结合来调节巨噬细胞极化, 为提高 TNBC 的免疫治疗效率和治疗效果提供了一种很有前途的方法。

PO-3376

超小分子影像探针调控 TRPV1 通道治疗帕金森病

袁佳鑫

东南大学附属中大医院

研究目的：构建能够靶向小胶质细胞膜上的 TRPV1 通道、且具有优异的光热转换性能的 CS-AT 纳米探针，采用具有较高组织穿透深度的近红外二区激光可控地开启 TRPV1 通道，提高小胶质细胞的自噬水平，增强其吞噬和降解 α -突触核蛋白的能力，提高帕金森病的治疗效果。

研究方法：本论文利用透射电镜和 X 射线粉末衍射仪等设备对构建的 CS-AT 纳米颗粒进行表征，利用热成像仪在体外评估其光热转换性能；然后，利用免疫荧光染色验证纳米颗粒靶向小胶质细胞膜 TRPV1 通道的能力；在此基础上，利用蛋白质印迹法等技术研究 CS-AT 纳米探针对小胶质细胞自噬相关蛋白水平的调节，以及对小胶质细胞吞噬和降解 α -突触核蛋白的影响。从分子蛋白水平层面以及动物行为学实验评估 CS-AT 纳米颗粒联合 1064 nm 激光照射对帕金森病模型小鼠的治疗效果。

研究结果：

(1) 成功构建了可以靶向小胶质细胞膜的 CS-AT 纳米颗粒，利用该纳米颗粒在 1064 nm 激光照射下的优异光热转换性能，可控地打开小胶质细胞膜上的 TRPV1 通道，引起细胞外钙离子 (Ca^{2+}) 内流。

(2) 揭示了 CS-AT 纳米颗粒在 1064 nm 激光照射下通过打开 TRPV1 通道，激活自噬相关通路，增强小胶质细胞的吞噬作用，并通过小胶质细胞的自噬溶酶体途径降解 α -突触核蛋白。

(3) 证明了 CS-AT 纳米颗粒联合 1064 nm 激光照射有效地清除帕金森病小鼠中脑部位的 α -突触核蛋白。帕金森病小鼠的运动障碍得到明显的改善，其神经相关标记物均恢复到了正常水平。

研究结论：利用 CS-AT 纳米颗粒优异的光热转换性能可以有效地控制小胶质细胞膜上 TRPV1 通道的开启，激活自噬相关信号通路，促进小胶质细胞吞噬和降解 α -突触核蛋白。其中，CS-AT 纳米颗粒通过激活 AMPK 蛋白磷酸化在促进细胞自噬中发挥了重要作用。该研究表明通过光控细胞膜离子通道促进自噬是治疗帕金森病的潜在重要策略。

PO-3377

Epo/NSE 双特异性驱动 FTH1 表达的 MR 成像体外检测干细胞的成神经分化

贺小娅

重庆医科大学附属儿童医院

目的：将缺氧增强子促红细胞生成素 (Epo) 与神经元特异性启动子神经元特异性烯醇化酶 (NSE) 结合，构建缺氧/神经元 (Epo/NSE) 双特异性驱动 MR 报告基因 FTH1 表达的慢病毒，并感染 BMSCs，在细胞水平检测该细胞在成神经分化后、常氧/缺氧条件下其内 FTH1 诱导表达及聚铁引起的 MR 信号改变情况，探究利用 Epo/NSE 双驱动 FTH1 在干细胞成神经分化后、缺氧条件下的特异性表达，并利用 MR 成像检测的可行性。

材料与方法：构建 Epo/NSE 双驱动 FTH1 表达的慢病毒并感染 BMSCs，诱导其成神经分化后，分别在常氧/缺氧下利用 CCK-8 检测细胞增殖活性；western blot 检测细胞内 NSE 和 FTH1 的表达；普鲁士蓝染色及透射电镜检测细胞 FTH1 表达后的聚铁情况；MR 成像检测细胞聚铁后的 MR 信号改变情况。

结果：CCK-8 显示随着缺氧时间延长，细胞增殖活性逐渐下降；western blot 显示常氧下 Epo/NSE 驱动 FTH1 表达的能力与 NSE 驱动能力相当，缺氧下 Epo 增强子与 NSE 启动子协同作用，在细胞活性较差时，仍可驱动 FTH1 的高表达；普鲁士蓝染色和透射电镜显示感染慢病毒后的成神经分化

细胞在缺氧条件下 FTH1 高表达,并可聚集较多的铁颗粒;MR 成像显示高表达 FTH1 后的细胞可以聚集更多的铁颗粒,引起明显的 MR 信号改变。

结论:成功构建 Epo/NSE 双特异性驱动 FTH1 表达的 MR 成像系统,使 FTH1 在干细胞中不表达,当干细胞成神经分化后,其表达由 NSE 启动子驱动;当成神经分化后的细胞处于缺氧环境时,Epo 被激活,协同 NSE 启动子进一步促进 FTH1 的高表达,尽可能地弥补因缺氧引起的细胞活性减低、FTH1 表达减少,MR 信号改变减弱甚至 MR 成像示踪中断的问题,为进一步实现 MR 成像可视化监测干细胞体内移植用于修复神经系统病变奠定基础。

PO-3378

基于 NIR-III 区激光激活的硒化钛在脂肪肉瘤光热治疗探索

张九龙

上海市公共卫生临床中心

目的:通过构筑 NIR-III 激光激活的可降解纳米诊疗试剂,在脂肪肉瘤小鼠模型上验证肿瘤 MR 成像性能、光热治疗效果以及治疗机理。

方法:本研究通过改进的热分解法合成 TiSe_2 纳米棒,使用 HS-PEG- NH_2 对其进行表面改性,并化学偶联 DOTA 分子,最后与 Gd^{3+} 进行螯合,从而构筑了 $\text{TiSe}_2\text{-Gd}^{3+}$ 纳米诊疗试剂。利用多种方法表征物理光学性质。在 NIR-III 激光照射下,分析其光热转换性能及光化学路径。在模拟生理条件下,研究其降解行为、细胞毒性、细胞治疗效果以及治疗机理。在荷瘤鼠体内分析该试剂 MR 成像效果、血液循环半衰期以及光热治疗效果和肿瘤细胞消亡机制。

结果:基于 TiSe_2 纳米棒制备了 $\text{TiSe}_2\text{-Gd}^{3+}$ 纳米诊疗试剂。 TiSe_2 纳米棒的 Ti/Se 原子比为 1/1.92,具有从紫外到 NIR-III 区 ($>1600\text{nm}$) 的强而宽的光吸收,在 1567 nm 处的消光系数为 $8.1\text{ Lcm}^{-1}\text{g}^{-1}$ 。 $\text{TiSe}_2\text{-Gd}^{3+}$ 的水合粒径为 $\sim 80\text{ nm}$,电位为 -13.8 mV , r_1 弛豫率为 $4.05\text{ mM}^{-1}\text{s}^{-1}$ 。在 1567 nm 激光 (NIR-III 区) 照射下,浓度从 25 到 150 mg L^{-1} 时其升温从 7.6 到 $28.2\text{ }^\circ\text{C}$ 。最终降解为尺寸 $<8\text{ nm}$ 的非晶 TiO_2 ,并释放具有抗癌和抗氧化功能的 SeO_4^{2-} 。尾静脉给药 (10mg kg^{-1}) 后,实现肿瘤 MR 成像,血液循环半衰期为 1.72 h 。 1567 nm 激光照射下,肿瘤部位温度到从 $32.7\text{ }^\circ\text{C}$ 升高到 $\sim 48.0\text{ }^\circ\text{C}$,引起细胞显著坏死和凋亡。相比对照组,肿瘤抑制效果明显 ($p<0.001$),抑制率为 $\sim 90\%$ 。

结论: $\text{TiSe}_2\text{-Gd}^{3+}$ 纳米诊疗试剂具有强而宽的光吸收、显著 NIR-III 区光热转换性能以及可降解性能。在 MRI 引导下, NIR-III 区光激活纳米试剂在去分化型脂肪肉瘤 PDX 模型上实现了高效的光热治疗效果,有望用于脂肪肉瘤术后局部复发的消融治疗。

PO-3379

磁性纳米颗粒磁矩测量在磁热效应中的应用

王皓瑶、陈俊、张冰

南京大学医学院附属鼓楼医院

目的磁性纳米材料在交变磁场 (AMF) 作用下的发热现象使其成为一种比较常见的用于肿瘤热疗的研究材料。磁性材料本身具有奈尔弛豫和布朗弛豫,会导致外加磁场和磁矩方向之间的相位滞后,因此产生能量损失,这就是磁性纳米颗粒在 AMF 作用下升温的基本原理。本文的主要工作是测量磁性水溶胶的磁矩,我们测量了多种磁性纳米颗粒,并将结果和 VSM, MRI 及升温曲线进行对比,从理论上分析实验结果。

方法为了测量不同聚集程度的磁性纳米颗粒,我们通过加盐以及离心的方式来改变测量的聚集状态,并通过动态光散射测量其水动力尺寸。以浓度为 8.5 mg/mL 的 $\gamma\text{-Fe}_2\text{O}_3$ 为标准材料,对颗粒进行

不同处理并进行 DLS 表征。分别用 VSM, MRI 及竖直磁矩测量系统对不同聚集状态的磁性纳米颗粒其磁性能进行了测量, 此外还测量了处理后的材料的升温曲线, 对结果进行了分析比较。

结果弛豫时间是氢原子从磁化强度 M 恢复到平衡态需要的时间, 磁性纳米颗粒作为造影剂本身不产生 MRI 信号, 只是影响氢原子的弛豫速率, 因此我们分析了加入磁性纳米颗粒后的 T2 弛豫时间相比 0 铁浓度时减少的值。通过分析表中数据可观察到, 通过自制系统测量的磁矩结果与 MRI 的弛豫时间差值及 AMF 作用下的升温曲线结果间的线性相关系数, 分别为 0.9669 及 0.9843。这说明自制系统的测量结果和材料的 MRI 造影效果以及升温曲线有着较强的关联性, 可以用以评估材料在 MRI 及热疗方面的应用潜力。而 VSM 的测量结果与 MRI 的弛豫时间及 AMF 作用下的升温曲线结果间的线性相关系数, 分别为 0.2598 及 0.3201, 这说明 VSM 的测量结果和材料的 MRI 造影效果以及升温曲线关联性较低。因此在评估这种分散结构被破坏的情况下的材料的磁学性能时, 使用自制的测量系统会得到更好的结果。

结论我们的系统在测量过程中不会改变材料的水动力尺寸半径, 因此其结果与弛豫时间及升温曲线有较高的线性相关性。

PO-3380

GSH 响应性 T1/T2 双模态纳米酶用于铁死亡和自噬诱导的 Tf 靶向乳腺癌协同治疗

张高瑞、于德新
山东大学齐鲁医院

目的: 利用 GSH 响应性 T1/T2 双模态 MR 成像纳米酶跟踪药物在肿瘤内的释放和渗透的效果, 评估 GSH 纳米酶对提高乳腺癌诊断和联合治疗的机制。**方法:** 水热法合成 hMnOx 空心纳米颗粒, 并与转铁蛋白 (Tf) 和 DOX 偶联获得 hMnOx-DOX-Tf 纳米体系。对纳米粒子的形态、晶体结构、原子价态、弛豫率以及 MR 图像进行表征。检测了纳米体系靶向及成像效能。采用 CCK-8 和细胞增殖试验评价体外细胞毒性。细胞电镜、p62 及 LC3B 蛋白监测评估肿瘤自噬水平。GSH、活性氧 (ROS) 和脂质 ROS 含量及 GPX4 蛋白评估肿瘤铁死亡。肿瘤体积、小鼠重量、肿瘤大小、H&E、Ki67 和 TUNEL 染色检测探究纳米体系的治疗效果。**结果:** 成功合成 hMnOx-DOX-Tf 纳米体系。hMnOx-DMSA 的 T1 和 T2 弛豫速率分别为 0.49 和 0.8 mM/s, 而 GSH 处理后的弛豫速率分别为 4.02 和 20.22 mM/s。hMnOx-DOX-Tf 处理后, 4T1 细胞的活力和增殖细胞受到抑制且细胞内 GSH 水平下降, ROS 和脂质 ROS 含量增加。hMnOx-DOX-Tf 组抑制了 GPX4 的表达, 而 cleaved-caspase-3、p62 和 LC3B 水平明显上调。经 hMnOx-DOX-Tf 治疗后, 肿瘤体积、H&E、cleaved-caspase3、GPX4、Ki67 和 TUNEL 染色结果显示铁死亡-自噬联合治疗具有良好的抗肿瘤效果。**结论:** 本研究揭示了 GSH 响应性靶向 hMnOx-DOX-Tf 通过消耗 GSH 和增加 ROS 实现了肿瘤铁死亡-自噬的联合治疗并通过实时 T1/T2 双模态成像实现了药物传递和释放的监测, 能够作为监测乳腺癌治疗和提高协同治疗效率的重要载体。

PO-3381

基于脂肪酸代谢基因的乳腺癌放射基因组学分析

周大卫、于德新
山东大学齐鲁医院

背景: 当前越来越多的研究表明, 脂肪酸代谢会影响乳腺癌患者的临床结局。

目的: 利用乳腺癌脂肪酸代谢基因建立风险评分联合乳腺癌影像组学特征预测乳腺癌的临床结局。

方法: 采用基因差异分析, 单因素回归分析和 LASSO 回归分析对癌症基因组图谱数据库 (TCGA) 中的 1081 例乳腺癌数据进行分析。筛选与预后相关的脂肪酸代谢基因, 建立基因风险评分。采用来自的基因表达综合数据库 (GEO) 的 101 例乳腺癌数据集 GSE43586 对所得到的基因风险评分进行验证。探究基因风险评分与患者基因突变、化疗药物反应、生物学信号通路、免疫细胞浸润和免疫功能间的关系。结合临床特征和基因风险评分建立预后预测诺莫图, 并使用 ROC 曲线评价预测效能。提取癌症成像档案数据库中 139 例乳腺癌 MRI 成像数据。分析 70 例乳腺癌患者的 T1 强化序列, 提取影像组学特征数据, 按 5 : 2 的比例随机分为训练集和验证集, 并使用 LASSO 回归筛选出与基因风险评分高低相关的特征, 并建立列线图用于预测基因风险评分。最后, 使用 ROC 曲线评估列线图预测效能。

结果: 筛选出 9 个与乳腺癌预后相关的基因。基因风险评分显示, 高风险乳腺癌患者基因突变频率更高且对化疗更加敏感。此外, 高风险乳腺癌患者, 免疫功能存在明显抑制且生物学信号通路多富集于细胞增殖信号通路。结合临床特征和基因风险评分建立的诺莫图, 患者 1, 3 及 5 年生存时间的预测 AUC 值分别为 0.666, 0.645, 0.703。最后, 通过影像组学手段预测脂肪酸代谢基因风险评分高低, 所构建的预测模型性能良好, 在训练集上 AUC 值为 0.894, 在验证集上 AUC 值为 0.648。结论: 脂肪酸代谢基因风险评分可以作为一种有效的生物标志物, 去评估乳腺癌患者预后, 基因突变, 化疗反应以及生物学过程。通过放射基因组学分析可以实现非侵入性地评价脂肪酸代谢基因风险评分这一生物学标志物。

PO-3382

光声成像对乳腺癌早期治疗响应的多生理参数监测

林晓倩、杨长锋、吕奕洁、张博雯、李祥林、刘岩
滨州医学院

目的 乳腺癌的缺氧微环境与治疗抵抗有关, 也可诱导肿瘤新生血管形成。在不同治疗策略下, 包括血管灌注和氧合状态以及代谢在内的生理过程决定了乳腺癌的进展。因此, 监测肿瘤内氧合与血供变化具有重要的临床价值。光声成像是一种无创、无标记分子影像成像技术, 可利用氧合与脱氧血红蛋白吸收光谱差异测量氧饱和度、绘制脉管系统和组织灌注。本研究旨在利用多光谱光声断层成像 (MSOT) 系统监测小鼠乳腺癌模型治疗后肿瘤的即时早期反应, 为光声成像技术应用于临床动态监测肿瘤氧合与血供提供实验支撑。

方法 采用 4T1 小鼠皮下肿瘤模型进行研究, 分为对照组, 依维莫司、紫杉醇和光动力治疗组。在治疗前和治疗后第 1 至 7 天成像, 纵向评估治疗前后肿瘤血流动力学和脉管系统的短期变化。本研究使用包括 700 至 900 nm 的 10 个波长, 并在每个时间点计算总血红蛋白浓度 (HbT) 和血氧饱和度 (sO₂), 分析肿瘤氧合和灌注情况。光声成像的结果通过缺氧 (HIF-1 α) 和血管分布 (CD31) 的免疫组织化学法得到验证。

结果 体内光声成像分析显示, 对照组的平均全肿瘤 HbT 信号在实验观察期间并未发生显著的变化。依维莫司治疗组 HbT 信号先降低, 第 3 天明显升高, 且整个给药期间都低于对照组。紫杉醇治疗组第 4 天 HbT 信号明显升高, 随后降低。PDT 组 24 h 内 HbT 信号明显升高。对照组 sO₂ 在 7 天内呈现下降趋势, 光声成像检测到 EVE 组和 PTX 组氧合改善的时间窗口, 而 PDT 组的 sO₂ 始终低于基线。免疫组化结果表明, EVE 和 PTX 可改善肿瘤微环境缺氧, 而光动力治疗可诱导肿瘤微环境缺氧。此外, 由于光动力治疗导致血管损伤和炎症, 其 CD31 染色结果与光声成像结果并不完全一致。**结论** 总之, 多光谱光声断层扫描可以无创、无标记地监测乳腺癌氧合并反映血管功能的变化, 监测不同治疗后肿瘤微环境的即时早期反应。光声成像有望在临床实践中早期监测乳腺癌的进展和评估疗效。

PO-3383

阿尔茨海默病的神经血管耦合改变

吴小伟、林莉、李子惠
苏州大学附属第一医院

背景: 脑血流调控受神经血管耦合机制的影响, 神经元活动和脑血流之间存在密切联系, 神经血管耦联功能紊乱是阿尔兹海默病的一个突出特征。**方法:** 在本研究中, 我们旨在使用功能磁共振 (fMRI) 和动脉自旋标记 (ASL) 的联合分析来研究正常老龄化和阿尔兹海默病之间的神经血管耦合变化。本研究从开源数据集 OASIS 3 (Open Access Series of Imaging Studies, OASIS) 中纳入 28 名阿尔兹海默病患者和 30 名正常老年人, 脑血流 (CBF) 与功能连接强度 (FCS) 的相关性、CBF/FCS 比值被用来评估神经血管耦合, 并在两组之间进行比较。**结果:** 相对于正常老年人, 阿尔兹海默病组的 CBF-FCS 相关性下降 ($P=0.012$)。在阿尔兹海默病组中, CBF/FCS 比值下降区域主要分布在认知相关脑区, 包括前额叶皮层、颞叶皮层、海马和丘脑, 而 CBF/FCS 比值上升的区域主要分布在顶叶和枕叶。**结论:** 本研究反映了阿尔兹海默病患者神经血管耦合的异常改变, CBF 与 FCS 的联合分析指标可能是区分正常老龄化和阿尔兹海默病的潜在影像标志物。

PO-3384

Fe³⁺@PDOPA-b-PSar-DOX 纳米颗粒用于 药物递送和乳腺癌的诊疗

孙微^{1,2}、徐嵩毅³、沈天伦²、刘祥瑞³、郑建军¹、张景峰¹、凌君³、孙继红²

1. 宁波市第二医院

2. 浙江大学医学院附属邵逸夫医院

3. 浙江大学

目的: 化学治疗在乳腺癌治疗中起着重要作用。由于化疗耐药性和全身毒性副作用使临床应用受到限制。因此, 提高肿瘤区域化疗药物的递送、浓度、生物相容性、生物降解性是基础领域亟待解决的问题。

方法: 利用 NPC 法合成 DOPA 肌氨酸嵌段共聚物 (PDOPA-b-PSar), 将 DOPA 络合铁离子, 并将 DOX 化学药物包载入亲水的聚肌氨酸与疏水的聚多巴形成的纳米粒子 (Fe³⁺@PDOPA-b-PSar-DOX), 尾静脉注射入 4T1 鼠源性乳腺癌荷瘤小鼠内, 注射前、注射后 0-36 小时动态观察 MRI 成像; 24 天内监测肿瘤大小、小鼠体重及肝功能检测。

结果: 制备的 Fe³⁺@PDOPA-b-PSar-DOX 纳米颗粒, 能够以低毒的方式将化疗药物输送到肿瘤组织。同时, Fe³⁺@PDOPA-b-PSar-DOX 的胶束纳米颗粒表现出较高的纵向弛豫性 ($r_1=7.06\text{mM}^{-1}\text{s}^{-1}$) 用作 T1 加权磁共振成像 (MRI) 对比剂。MRI 图像显示在 4 小时内, Fe³⁺@PDOPA-b-PSar-DOX 组肿瘤处信噪比高, 12h 内, Fe³⁺@PDOPA-b-PSar-DOX 组肿瘤处信噪比仍比初始要高。Fe³⁺@PDOPA-b-PSar-DOX 具有良好的抑制肿瘤生长的作用并无全身毒性副作用。

结论: Fe³⁺@PDOPA-b-PSar-DOX 特异性地将 DOX 输送至肿瘤组织, 具有高信噪比 MRI、长循环时间的特点, 并导致抑制肿瘤生长而无明显毒性, 为基础诊疗方面提供安全、有效的治疗。

PO-3385

生物启发的多抗氧化剂协同纳米治疗平台 用以实现急性肾损伤的时间敏感治疗

吴梦琳、李江、郭琪、张雪宁、李雪
天津医科大学第二医院

瞄准急性肾损伤 (AKI) 的关键病理过程, 同时监测治疗过程, 可及时对 AKI 进行有针对性的治疗。但目前临床治疗 AKI 的方法仍以支持性为主, 其效率有限。在此, 本研究报道了一种基于多抗氧化剂合作的聚多巴胺纳米平台 (mc-PDATP), 以实现 AKI 的成像辅助治疗。mc-PDATP 可全面模拟自然环境中复杂的抗氧化防御系统, 从而显示出对多种有毒活性氧 (ROS) 更好的催化活性, 一系列的体内外实验均证实了 mc-PDATP 可以有效地保护肾脏免受 ROS 的攻击, 并通过针对 AKI 的炎症网络来挽救肾脏功能。此外, mc-PDATP 上修饰 Gd 有助于 mc-PDATP 产生理想的磁共振 (MR) T1 加权对比效应, 可用于构建敏感的 MR 直方图成像特征, 反应实时肾功能情况, 及时确定治疗效果。此研究代表了一种抗 AKI 治疗的创新策略, 可为促进下一代可视化纳米抗氧化剂的发展提供方向。

PO-3386

Fe₃O₄-mSiO₂ 诊疗一体化纳米体系改善胰腺癌组织固体应力及 增强药物渗透和抗肿瘤治疗效果

余斐然^{1,2}、张高瑞^{1,2}、朱敬则^{1,2}、于德新^{1,2}
1. 山东大学齐鲁医院放射科

2. 山东大学纳米分子与功能成像转化医学研究中心

目的: 胰腺导管腺癌 (PDAC) 间质内肿瘤相关成纤维细胞 (CAFs) 是组织固体应力维持的关键因素, 它限制了临床化疗效果。但是通过消耗 CAFs 降低 PDAC 组织固体应力的策略并未取得令人满意的结果, 因此, 一种不消耗 CAFs 从而降低 PDAC 组织固体应力、提高药物的组织内渗透效率的新颖纳米体系是亟须的。

材料与方法: 本研究构建一种集组织固体应力改善、促进肿瘤杀伤及无创渗透性监控为一体的多功能纳米体系, 此体系由包裹磁性氧化铁的介孔二氧化硅负载 Gemcitabine 和 Fasudil。本研究对此纳米体系的理化性质、体内外 MR 成像能力、PDAC 固体应力改善能力、治疗效果及药物渗透性无创监控能力进行评估

结果: 理化性质检测显示 Fe₃O₄-mSiO₂ 分散性好, 形态均匀, 且具有超顺磁性。MR 扫描显示纳米体系具有铁浓度依赖性暗化效应, 在细胞内外均具有稳定成像能力。Fe₃O₄-mSiO₂-Gem-Fas 处理的 CAFs 细胞张力相关蛋白 (p-MLC、p-MYPT) 含量均降低。CCK8 结果显示纳米体系对 PANC02 细胞有显著凋亡诱导能力。溶血实验、血液生化指标监测以及组织器官 H&E 检测结果均显示此纳米体系具有极高的生物安全性。治疗 14d 后 Fe₃O₄-mSiO₂-Gem-Fas 治疗组肿瘤组织固体应力显著降低、组织中有明显的大片状坏死、CAFs 细胞张力降低, 胶原纤维含量减少, 组织血管扩张。第一次和最后一次尾静脉注射 Fe₃O₄-mSiO₂-Gem 和 Fe₃O₄-mSiO₂-Gem-Fas 前后两小时肿瘤内 MR 信号强度差异均具有统计学意义 (P<0.001), 对应 Fe₃O₄-mSiO₂-Gem-Fas 处理组组织内普鲁士蓝的蓝染面积更大。

结论: 本研究成功构建 Fe₃O₄-mSiO₂-Gem-Fas 纳米复合体系, 具有大量载药能力和超顺磁性特性, 且具有良好的生物相容性及生物安全性。它可以显著降低 CAFs 细胞张力以及胞外间质的重塑, 从而降低 PDAC 组织固体应力, 此纳米体系通过 MR 实时监测证明其促进化疗药物组织内渗透效率。

这种有效的纳米策略在改善胰腺癌化疗方面有着巨大的潜力,为 PDAC 及相关富间质肿瘤的治疗提供了新的治疗思路。

PO-3387

自组装的超小 Fe₃O₄ 纳米粒用于肿瘤靶向双模 T1/T2 加权磁共振成像引导的协同化学动力学和化学治疗

赵雨萱、张高瑞、于德新
山东大学齐鲁医院

目的 开发一种新型的自组装超小 Fe₃O₄ 纳米团簇,用于肿瘤 RGD (HS-RGD-SH) 靶向双模 T1/T2 加权 MR 成像引导的协同化学动力学和化学治疗

方法 表征合成的纳米粒的形态。3.0-T 临床 MRI 扫描仪测试细胞和肿瘤的 T1 和 T2 弛豫率、MRI 图像和 MR 引导的体内治疗。CCK-8、ROS 染色、EdU 增殖试剂盒和活/死染色验证化疗和化学动力学治疗。记录体重和肿瘤体积。H&E、TUNEL 和 Caspase3 来研究治疗后肿瘤组织的变化。

结果 该纳米颗粒形状均匀,尺寸分布约为 2-8nm,主要尺寸位于 4nm。r1 和 r2 弛豫率分别为 0.296mM⁻¹s⁻¹ 和 2.9mM⁻¹s⁻¹, r2/r1 值为 9.8。Fe₃O₄-RGD-DOX 组的 T1 成像信号显著增加 (162%), T2 成像信号显著减少 (53%)。活/死染色和 CCK-8 结果表明,Fe₃O₄-RGD-DOX 可诱导肿瘤细胞死亡,且 ROS 较高。肿瘤大小和体积、H&E、TUNEL 染色和免疫组织化学显示,Fe₃O₄-RGD-DOX 治疗组通过导致细胞凋亡对肿瘤生长表现出显著的抑制作用。主要器官无组织病理学损伤。溶血百分比低于 2%。小鼠的主要血液指标在各组中均无明显变化。

结论 该纳米粒由于合适的尺寸效应和表面丰富的 Fe 离子,具有优异的 T1 和 T2 双模 MRI 能力以及良好的化学动力学治疗能力。在与肿瘤靶向配体 Arg-Gly-Asp (RGD) 和化疗药物阿霉素 (DOX) 结合后,功能化的 Fe₃O₄ 纳米团簇实现了增强的肿瘤积聚和滞留效应以及协同的化学动力学和化疗功能,为癌症治疗提供了一个强大的治疗平台。

PO-3388

7T 多参数 MRI 结合线粒体形态评估研究肌醇抗三阴性乳腺癌紫杉醇耐药的研究

宣文涛、李王敏、吴仁华、林艳△
汕头大学医学院第二附属医院

目的: 本研究拟运用多参数磁共振成像(MRI)动态无创监测肌醇(Ins)治疗紫杉醇(PTX)耐药性 TNBC 小鼠的疗效变化,结合离体线粒体形态改变确证肌醇抑制 PTX 化疗耐药性的机制,为治疗 PTX 耐药性 TNBC 提供新的策略。

方法: 采用 PTX 耐药性 4T1 细胞株皮下移植建立 63 只小鼠模型,随机将小鼠分为 PTX 组、PTX+Ins 组和生理盐水组,每组 21 只。各组随机选取 6 只小鼠,给药后每 7 天行多参数 MR 检查,序列包括 T1WI、T2WI、DKI、DWI 和 CEST,给药 3 周后取肿瘤行 H&E 染色、Ki-67 组化、蛋白质免疫印迹(WB)、透射电镜。余小鼠分别于治疗的第 0、1、2 周取肿瘤行上述检查,以病理结果为金标准,评估各时间点各组疗效。ADC、MK、MD 和磁化转移率平均值通过 MATLAB 和 ImageJ 后处理得到。不同监测点参数间比较采用方差分析,相关性分析采用皮尔森检验,以 p<0.05 表示差异有统计学意义。

结果: 肌醇给药 1h 后肿瘤区域的信号明显高于给药前(p<0.05)。PTX 组的 ADC 和 MD 在治疗后第 1 周高于对照组,但在治疗后第 2、3 周无差异。相比之下,PTX+Ins 组在治疗后第 2、3 周的 ADC

和 MD 值均高于 PTX 组及对照组。病理结果提示, PTX+Ins 组在治疗后第 2、3 周的肿瘤密度及 Ki-67 表达水平均低于 PTX 组。ADC 和 MD 值与肿瘤密度(ADC, $r=-0.717$; MD, $r=-0.858$)和 Ki-67 水平(ADC, $r=-0.764$; MD, $r=-0.793$)显著相关, 证明多参数 MRI 可动态监测肌醇治疗 PTX 耐药性 TNBC 的疗效变化, 且肌醇提高了 TNBC 对紫杉醇的化疗敏感性。WB 检测提示, PTX+Ins 组的蛋白表达比 PTX 组低 ($t=2.538, P<0.05$), 透射电镜显示, PTX+Ins 组破碎线粒体比例比 PTX 组少, 并与 Ki-67 水平显著相关, 确证肌醇通过抑制线粒体裂变来抵抗 TNBC 的 PTX 耐药性。

结论: 肌醇可通过抑制线粒体裂变来抵抗 TNBC 的 PTX 耐药性, 活体 7T 多参数磁共振成像作为一种无创、简便的检查技术, 可动态定量监测肌醇在 PTX 耐药性三阴性乳腺癌内的动态变化及肿瘤内的微结构变化。

PO-3389

基于机器视觉和区域增长法的相位校正： 一种三点 Dixon 的相位解包裹方法

周煜凡¹、林丁乙¹、周嘉强²、曹洋¹、徐义程³、陈峰⁴、王旻^{1,2}

1. 浙江大学生物医学工程与仪器科学学院

2. 浙江大学医学院附属邵逸夫医院内分泌科

3. 西门子医疗工程有限公司

4. 浙江大学医学院第一附属医院放射科

目的: 传统的 Dixon 方法在常规磁共振成像序列的基础上, 通过调节相应的回波时间, 分别采集水脂磁化强度矢量夹角为 0 和 180°的图像, [MW1] 再从两幅图像中计算得到水和脂肪图像。该方法的主要缺点是磁场不均匀导致的相位误差会使解得的图像存在水脂错换。在此基础上额外采集一个夹角为 360°的图像可以减少场不均匀性的影响, 但是相位包裹的问题仍然存在, 而传统的区域增长方法在解决该问题时鲁棒性不足。该研究旨在引入机器视觉的方法以改进相位解包裹的过程。

方法:

设备/序列: 7T Bruker 小动物磁共振平台, 生理监测仪/FLASH 序列

扫描对象: 小鼠腹部。

扫描方法: 调节回波时间, 在呼吸门控下分别采集水脂磁化强度矢量夹角为 0°、180°、360°的图像, 并得到相位图。

区域增长法: 拓展后的像素存入种子堆栈时, 将和中心像素相位差小的放在堆栈的顶部, 即优先拓展。

相位校正: 将 360°和 0°的相位相除得到原始相位图, 应用区域增长法得到初步结果; 在此基础上对图像进行迭代式阈值分割得到前景, 应用 Sobel 边缘检测, 根据长度和走向确定相位翻转的边界; 重新应用区域增长, 并且增长到相位边界上的像素时, 优先拓展该像素。

水脂分离: 将 180°图除以校正后的相位图, 结合 0°图得到水图和脂肪图。

脂肪含量: 选定 5×5 大小的区域, 由: 脂肪 / (水 + 脂肪) 得到脂肪含量。

结果: 区域增长法: 图 1 展示了原始图像和区域增长后的相位图及此时直接应用于水脂分离的结果。此时存在大面积的水脂错换。

相位校正: 图 2a 展示了分割的相位前景。图 2b 展示了 Sobel 边缘检测结果和识别到的相位边界。图 2c 展示了最终相位图, 此时相位是平滑的, 证明基本不存在水脂错换。

水脂分离: 图 3 展示了水脂分离的结果, 不存在水脂错换。

脂肪含量: 图 4 展示了肝脏和脂肪组织选区, 其脂肪含量分别为 6.01%和 86.90%。

结论: 本研究提出了一种新的三点 Dixon 相位校正方法, 改进了区域增长方法, 并将相位解包裹的问题转化为机器视觉的问题, 为以后的脂肪含量测定和脂肪抑制等应用和研究提供了新的思路。

PO-3390

B7-H3 靶向近红外二区荧光分子成像引导前列腺癌精确切除田雅琪¹、刘松鹭¹、胡振华²、王良¹

1. 首都医科大学附属北京友谊医院

2. 中国科学院自动化研究所

目的：前列腺癌病灶术中难以识别并精准切除是疾病复发的主要原因之一。本研究通过构建前列腺癌新型成像靶点 B7-H3 特异性分子影像探针，旨在探讨其在近红外二区荧光成像中识别前列腺癌病灶的能力及引导前列腺癌精准切除的价值。

方法：

靶点表达验证：收集临床正常前列腺组织、良性前列腺增生症和前列腺癌人体组织标本，通过免疫组织化学法蛋白水平验证人体组织靶点表达的差异性。通过 Western Blot 分析正常前列腺细胞系、前列腺癌细胞系靶点表达差异性。

探针构建：将 B7-H3 单克隆抗体 (AbB7-H3) 与近红外荧光染料 IRDye800CW 偶联，构建近红外二区荧光成像探针；同时选择非靶向性的同型对照抗体 IgG 与相同的荧光染料偶联合成对照探针。

活体成像：根据 Western Blot 结果分为高表达组、中表达组、低表达组、无表达组建立皮下和原位荷瘤裸鼠模型，运用生物发光成像验证肿瘤的生长。对肿瘤生长状态适宜的小鼠模型尾静脉注射 AbB7-H3-800CW 探针和对照探针进行多时相成像和荧光引导下肿瘤切除。术后对离体肿瘤进行免疫组织化学染色分析靶点表达。测量肿瘤区域及瘤周区域信号强度值并计算肿瘤与正常组织的荧光信号比值。

人体组织探针孵育：收集前列腺癌新鲜人体组织标本进行探针孵育，并拍摄近红外二区荧光图像。

结果：临床收集前列腺癌组织 60 例，前列腺增生症和正常前列腺组织 22 例，B7-H3 蛋白表达水平存在统计学差异 ($p < 0.001$)。近红外二区荧光成像显示靶向探针可以靶向前列腺癌肿瘤。多时相体内成像显示，靶向探针在肿瘤内快速蓄积，特异性识别前列腺癌病灶，48 小时肿瘤信号背景比最高，最高信号背景比值大于 4.0。实验组所有肿瘤均在近红外二区荧光引导下切除，术后荧光成像未见肿瘤残留。人体组织孵育显示前列腺癌组织荧光强度均高于正常前列腺组织，存在统计学差异 ($p < 0.05$)。

结论：B7-H3 是具有潜力的新型前列腺癌成像靶点，分子成像探针可识别前列腺癌病灶，并在近红外二区荧光引导下将其切除。

PO-3391

通过磁共振成像和近红外光谱评估鸢尾素对小鼠棕色脂肪组织的激活作用陈月¹、郭一晓²、居胜红¹、熊丽琴²、彭新桂¹、毛辉³

1. 东南大学附属中大医院

2. 上海交通大学生物工程学院

3. 埃默里大学，放射与影像学系

目的：通过磁共振成像和近红外光谱技术探讨鸢尾素对棕色脂肪组织的影响。

方法：对小鼠肩胛骨区原代祖棕色脂肪细胞进行分离、培养、诱导和表征。采用免疫组化方法检测棕色脂肪细胞特异性解偶联蛋白 1 (uncoupling protein 1, UCP1) 的表达，并评价不同浓度 (0、20、40 nmol/L) 鸢尾素对培养的棕色脂肪细胞 6 d 后的影响。腹腔注射鸢尾素 14 天后，对正常饮食小鼠的脂肪进行 MR 化学位移选择成像，测量棕色脂肪组织中的脂肪分数。同时用近红外光谱分析棕色脂肪组织的活性。

结果: 成功培养小鼠原代棕色脂肪细胞, 油红 O 染色显示细胞内有大量小的多细胞红色脂滴。鳕尾素干预后, 原代棕色脂肪细胞中 UCP1 蛋白的表达明显升高。鳕尾素的最佳干预剂量为 20 nmol/L。鳕尾素干预后, 小鼠体重明显减轻(对照组:28.23±1.58g, 实验组:27.54±1.60g)。体内 MR 成像显示棕色脂肪组织的脂肪分数(43.82±4.31%)明显低于对照组(60.80±6.59%); 同时近红外光谱结果显示, 鳕尾素处理组 BAT 荧光信号强度明显增强, 而体外棕色脂肪细胞直径明显增大, 处于激活状态。同时, 鳕尾素干预后褐变细胞 UCP1 的表达水平显著高于对照组, 棕色脂肪组织中 UCP1 蛋白的表达水平也显著升高。

结论: 鳕尾素可激活原代棕色脂肪细胞和棕色脂肪组织的活性。鳕尾素对棕色脂肪组织的作用可通过 MRI 和近红外光谱在体内无创验证。

PO-3392

基于机器学习的影像组学在无对比剂电影磁共振图像上鉴别心肌淀粉样变性和肥厚型心肌病

江舒¹、肖勇¹、王新⁴、符益纲¹、胡春洪²、王怡宁³

1. 盐城市第一人民医院

2. 苏州大学附属第一医院

3. 中国医学科学院北京协和医院

4. 盐城市第三人民医院

目的: 本研究旨在研究基于无对比剂电影序列获得的心脏磁共振 (CMR) 图像确定纹理分析 (TA) 和基于机器学习的分类是否可应用于心脏淀粉样变性 (CA) 和肥厚性心肌病 (HCM) 的鉴别诊断。

方法: 在这项机构审查委员会批准的研究中, 我们连续招募了 198 名 CA (n = 101)、HCM (n = 97) 患者, 92 名 CMR 正常的患者作为对照。所有病例被随机分为训练组 [139 名患者 (70%)] 和验证组 [59 名患者 (30%)]。

从电影图像中提取了总共 273 个纹理特征。基于最小绝对收缩和选择算子 (LASSO) 的回归分析, 建立了 8 个机器学习模型并对它们的诊断效能进行比较。

结果: 使用基于磁共振电影序列图像提取获得的 17 个影像组学纹理特征来区分 CA 和 HCM。在验证队列中, 支持向量机 (SVM) 准确率达到 0.85, 显示出最佳性能 (MCC = 0.637)。灰度级不均匀性 (GLenNonU) 是最佳鉴别特征。影像组学纹理特征和传统 MR 指标的组合模型的鉴别效能 (AUC = 0.89)。具有优于传统 MR 指标模型 (AUC = 0.79)。

此外, 结果显示, 与 CA 患者和对照组相比, HCM 患者的 GLenNonU 水平更高 (P < 0.001)。GLenNonU ≥ 26 的最佳截止值可用于 CA 和 HCM 患者, 曲线下面积 (AUC) 为 0.87 (CI:0.811–0.927)。延迟强化亚组的比较显示, LGE 阳性患者组与 LGE 阴性患者组的 GLenNonU 也存在显著差异 (CA+ vs. CA- 和 HCM+ vs. HCM-, P = 0.01, 0.001)。

结论: 基于机器学习的分类器可以在无对比剂电影图像上准确地区分 CA 和 HCM。影像组学特征和 MR 的组合模型可用于提高鉴别效能, 可用于评估心肌病不同阶段发生的心肌微观结构变化。

PO-3393

具有 CT/MRI 双模态成像的新型纳米酶探针在 肿瘤治疗和疗效监测中的应用

聂凯、于红、朱琳
上海市胸科医院

目的: 纳米酶在肿瘤治疗过程中具有巨大潜力。在这项工作中, 拟构建一个由 Pd、Bi 和 Mn 掺杂的多金属纳米酶 (Polymetallic nanozyme) 探针。该探针经过 Pd-H₂ 还原后表面氧空位增多, 带隙降低, 能够高效产生肿瘤杀伤活性的活性氧物种, 同时消耗细胞源性的 GSH。此外, 该探针还具有磁共振 T₁ 成像和 CT 成像能力, 在小鼠尾静脉注射后 8h 可以有效富集到肿瘤区域, 并持续 24h 以上, 从而有效地监测指导酶催化的肿瘤疗法, 抑制肿瘤细胞生长。材料与方法: 利用共沉淀法和 Pd-H₂ 还原法合成具有高催化效率的纳米颗粒 Pd-BiMn₂O₅ (简称 PBMO), 通过表面静电吸附聚乙二醇 (PEG) 增加纳米酶的水溶性和稳定性, 完成新型 PEG@PBMO 纳米酶的组装。纳米酶经过透射电镜、便携式溶解氧测定仪、紫外-可见光光谱、动态水合粒径和影像学成像等进行基本表征以及酶特性的研究。体外细胞实验验证 PBMO 纳米酶的细胞摄取及共定位、产生活性氧 (ROS) 情况以及增强线粒体膜电位的损伤效果。体内实验验证 PBMO 纳米酶的特异性成像能力以及治疗效果。结果: 透射电镜、紫外-可见吸收光谱等结果表明了射电镜、紫外纳米探针的成功制备。在 pH=5.4 的反应环境下, PBMO 具有良好的产 ROS 性能。体外影像学成像结果显示 PBMO 具有优异的 CT 和 T₁WI 增强成像效果。CCK-8 实验和活死细胞染色证实了 PBMO 在较低的浓度下具有良好的肿瘤杀伤效果, 在给予超声增强治疗后对肿瘤细胞的生长具有进一步的显著抑制作用。体内成像结果表明, 该纳米酶具有优异的对比增强能力, 表明 PBMO 是一种很有前景的 CT 和磁共振对比剂。结论: PEG@PBMO 纳米酶探针作为一种具有多酶活性的纳米探针, 可在肿瘤细胞内产生显著的 ROS, 消耗细胞源性的 GSH, 提高酶催化治疗效果, 在肿瘤成像和肿瘤生长抑制方面具有很大的应用潜力。

PO-3394

新生 SD 大鼠缺氧缺血性脑损伤扩散峰度成像的时间进程变化

张鹏华¹、张小安²、赵鑫¹、陆林¹、杨金泽¹、周梁¹
1. 郑州大学第三附属医院
2. 河南科技大学

目的 分析新生 SD 大鼠缺氧缺血性脑损伤扩散峰度成像 (DKI) 相关参数随时间变化规律, 并与扩散张量成像 (DTI) 相关参数对比。

材料与方法 选取出生 7d 龄的健康 SD 幼鼠 20 只 (雌雄各 10 只), 体重在 15-20g 之间, 分为实验组 10 只 (雌雄各 5 只) 和对照组 10 只 (雌雄各 5 只)。实验组永久结扎右侧颈总动脉后放回母鼠身边恢复 1h, 然后放入氧浓度为 8% (92% 的氮气, 8% 的氧气), 温度为 37 摄氏度的缺氧箱内, 缺氧时间为 120 min。该模型类似于临床足月儿的缺氧缺血性脑病。对照组仅行分离右侧颈总动脉的假手术, 不做缺氧。实验组和对照组在模型建立后的 1、3、7d 分别进行 DKI 扫描, 扫描完成后, 实验组和对照组各选 6 只鼠 (雌雄各 3 只) 心脏灌注 PBS 后取右侧脑行二代转录组测序分析。

结果 实验组鼠缺氧缺血发生后, 病变处 DKI 相关参数平均扩散峰度 (MK) 1、3d 时候较对照组升高, 7d 时候较对照组降低, 差异有统计学意义 ($P < 0.05$); DTI 相关参数各向异性分数 (FA) 在 3 各时间点均较对照组降低差异有统计学意义 ($P < 0.05$); DTI 相关参数平均扩散系数 (MD) 在 1、3d 时候较对照组降低, 7 d 时候较对照组升高, 差异有统计学意义 ($P < 0.05$)。DKI 相关参数值变化较 DTI 相关参数值变化可以判断病变的时间段。且在 3d 时候的变化不如 1d 和 7d 明显, 这些也与二代转录组测序相关激活的基因和通路数目有正相关。

结论 与 DTI 相关参数相比, DKI 能够更敏感地评价缺氧缺血性脑病脑组织微结构的时间变化。

PO-3395

基于氘同位素磁共振的放射-代谢-基因组学无创监测以 HK2 为靶点的肿瘤免疫微环境动态变化

郭煜升、杨炼、郑传胜
华中科技大学同济医学院附属协和医院

免疫检查点抑制剂的能否发挥治疗作用往往和肿瘤微环境密切相关, 肿瘤细胞异常的有氧糖酵解 (Warburg 效应) 会引起葡萄糖的大量消耗, 其限制了 T 细胞的葡萄糖可用性, 引起 T 细胞的效应功能和数量的下降。己糖激酶 (HK2) 作为糖酵解的第一个关键限速酶, 门控肿瘤的糖酵解通量, 已被证明与肿瘤的代谢与免疫微环境密切相关。然而, 有两个问题没有得到解决, 首先如何通过无辐射无创的方式检测肿瘤的糖酵解通量以挑选出适合免疫治疗的患者没有得到很好地解决, 其次是以 HK2 为靶点抑制肿瘤糖酵解创造低代谢环境是否可以配合免疫治疗达到更好的疗效仍不清楚。在这里, 我们利用稳定同位素氘的化合物氘代葡萄糖与 9.4T 高场强磁共振无辐射无创的监测的对照肿瘤组织与敲低 HK2 的肿瘤组织中葡萄糖-乳酸转化的时间-空间关系。并在人类结肠癌样本、小鼠结肠癌、小鼠黑色素瘤以及小鼠肝癌中揭示了以 HK2 所代表的代谢微环境与免疫微环境的密切关系。与此同时, 我们研究了不同剂量下 HK2 的抑制剂 2DG (2-脱氧-D-葡萄糖) 治疗小鼠肿瘤所引起的放射-代谢-免疫的关系, 发现了高 2DG-低等代谢速率-免疫抑制以及低 2DG-中等代谢速率-免疫激活的关系轴。使用 PD-L1 单抗联合低剂量 2DG 取得了最佳的治疗效果并产生良好的免疫记忆。并利用 CD45.1⁺ OT-1⁺ 基因编辑小鼠与 CD45.2⁺ C57 小鼠验证了低剂量 2DG 联合 CART 治疗的可能性。

PO-3396

单线态氧激活纳米载体用于乳腺癌的 X 射线诱导光动力治疗及级联铁死亡研究

张蓓蓓、刘浩、王一斐、张勇*、程敬亮*
医疗卫生单位

目的: 铁死亡具有吸引人的抗肿瘤潜力, 这主要是由于脂质过氧化物及活性氧的积累达到了致死量。纳米级 X 射线诱导光动力疗法 (X-PDT) 产生的细胞毒性单线态氧 ($^1\text{O}_2$) 有望促进谷胱甘肽 (GSH) 的消耗从而进一步激活铁死亡。

方法: 为了实现 X-PDT 和铁死亡的结合, 我们采用具有 $^1\text{O}_2$ 敏感连接体的超支化共聚物, 设计了封装光敏剂 (维替泊芬) 和铁死亡诱导剂 RAS 选择性致死小分子 3 (RSL3) 的纳米载体 (D-NP_{VR})。结果: 在 X 射线照射下, D-NP_{VR} 可产生 $^1\text{O}_2$ 使细胞凋亡。随后, $^1\text{O}_2$ 通过 1,2-双 (2-羟基乙硫基) 乙烯键断裂引发 D-NP 解离, 从而促进负载的 RSL3 释放并通过硫醇氧化降低细胞内的 GSH 水平。RSL3 是谷胱甘肽过氧化物 4 (GPX4) 的共价抑制剂, GPX4 负责在 GSH 的协助下将脂质过氧化物解毒为脂质醇, $^1\text{O}_2$ 诱导的 GSH 耗尽和 GPX4 失活会导致肿瘤细胞的铁死亡。对小鼠 4T1 荷瘤小鼠的肿瘤生长抑制表明, D-NP_{VR} 产生显著的治疗效率, 其中 GPX4 含量和表达证实了铁死亡的诱导。

结论: 我们利用超支化 D-HPE 与 VP 和 RSL3 的简单自组装成功构建了新型纳米载体 D-NP_{VR}。在对肿瘤部位进行精确的 X 射线照射后, VP 可产生大量的 $^1\text{O}_2$ 直接杀死肿瘤细胞。此外, $^1\text{O}_2$ 不仅通过消耗 GSH 促进铁死亡, 还能促进 D-NP 分解, 从而促进 RSL3 释放。释放的 RSL3 进一步充当

抑制剂, 抑制 GPX4 表达并诱发 4T1 肿瘤细胞中的铁死亡。这种通过铁死亡和 X-PDT 诱导的细胞凋亡的结合, 实现了优越的抗肿瘤性能, 表明了 $^1\text{O}_2$ 响应纳米载体在促进 X-PDT 和铁死亡联合治疗方面的潜力。此外, 对 VP 与 RSL3 的包封率的研究对于进一步优化 D-NP_{VR} 的体内治疗结果值得深入探讨。这项研究为未来抗肿瘤应用中结合 X-PDT 和铁死亡的更先进的治疗方案提供了一个有前途的平台。

PO-3397

重塑胰腺癌细胞外基质协同促进铜死亡效应的 仿生有机硅纳米平台的研究

王怡宁^{1,2}、周巧妹^{1,2}、章巾帼^{1,2}、余日胜^{1,2}

1. 浙江大学

2. 浙江大学附属第二医院

背景: 胰腺导管腺癌 (PDAC) 是一种具有高度侵袭性的癌症, 其肿瘤细胞周围细胞外基质 (ECM) 有明显的胶原基质反应, 严重阻碍了化疗药物或纳米药物的扩散。铜死亡是一种最新发现的细胞死亡方式, 在癌症治疗中显示出巨大的前景。铜死亡诱导剂可以同时引发铜离子相关凋亡和化学动力学治疗 (CDT), 在肿瘤治疗中具有明显优势。

方法: 我们设计了一种将基质胶原纤维降解、铜死亡、主动靶向、以及协同抗肿瘤治疗和诊断结合到一起的仿生纳米平台。提取胰腺癌肿瘤细胞膜并将其涂覆到负载双硫仑 (DSF) 的硫化铜微粒修饰的介孔二氧化硅上, 然后通过脂质插入的方法使纳米平台胶原酶功能化。通过化学分析方法表征了纳米平台的形态、元素组成和胶原酶活力。通过构建 3D 多细胞肿瘤球评估其肿瘤外基质降解能力。使用共聚焦显微镜、流式细胞术和 Western-blot 研究纳米平台介导的铜死亡的治疗效果和机制。通过磁共振成像分析了体内和体外肿瘤靶向功效和成像能力。

结果: 纳米平台通过细胞膜的同源靶向特性有效地靶向肿瘤, PDAC 组织中致密的 ECM 被胶原酶降解, ECM 结构变得疏松, 纳米药物深入肿瘤实质内。硫化铜微粒修饰和二硫键掺杂的介孔二氧化硅壳响应酸性肿瘤微环境及谷胱甘肽 (GSH), 将无毒的 DSF 药物激活为高细胞毒性的双二乙基二硫代氨基甲酸酯铜 (CuET), 增强 DSF 化疗, 促进有毒线粒体蛋白聚集, 发生了铜死亡和凋亡, 有效地实现了显著的协同原位抗癌效果, 且副作用最小。该纳米平台还具有超顺磁性, 可用于指导和监测 T1 加权磁共振成像。

结论: 本研究设计的纳米平台重塑了胰腺癌细胞外基质, 增强了胰腺癌的药物渗透, 也为基于铜死亡的潜在癌症治疗提供了前景。这种设计合理的纳米平台整合了胰腺癌诊断、治疗和监测, 为临床提供了一种新的抗肿瘤治疗策略。

PO-3398

在体脂肪成分高分辨率成像技术

林丁乙¹、周煜凡¹、曹洋¹、周可¹、周嘉强²、王旻^{1,2}

1. 浙江大学生物医学工程与仪器科学学院

2. 浙江大学医学院附属邵逸夫医院内分泌科

目的: 人体器官内异位脂肪沉积通常与代谢类疾病相关, 脂肪成分比含量提供了更多信息。现有的脂肪成分测量金标准——活检技术具有侵入性。单体素磁共振波谱作为一种常用的在体脂肪成分测量技术, 具有扫描区域受限, 分辨率低等弱点, 容易忽视体素外的病灶信息。平面回波波谱成像技术 (EPSI) 作为一种快速磁共振波谱成像技术, 可以同时提供结构与分子影像信息。本研究旨在开发一种脂肪选择 EPSI 技术, 以提供不同脂肪成分 (图 1) 的在体高分辨率扫描影像。

方法:

设备/序列: 7T Bruker 科研磁共振/脂肪选择 EPSI 序列。

体模实验: 一支 50 mL 试管, 内含 5 支装有不同浓度大豆乳糜溶液, 1 支大豆油, 1 支亚麻籽油的移液管。移液管胶封两头, 并用水填满移液管与试管管壁之间的间隙 (图 2a, 2b)。

小鼠实验: 一只 C57BL/6J 品系成年雌性健康小鼠, 开启呼吸门控扫描麻醉状态小鼠腹部。扫描时间 3~4 分钟, 一次可扫 5 层。

数据重建与后处理: 对信号进行翻转偶回波并滤波处理后, 使用基于奇异值分解的二步迭代校正方法消除奈奎斯特伪影。经过迭代自动相位校正后, 合并线圈通道。

脂肪成分计算: 积分实部谱以获得不同种类脂肪质子相对浓度。

结果:

体模实验: 图 2c 展示了体模图谱以及局部放大谱, 可见大豆乳糜溶液, 大豆油以及亚麻籽油具有不同的波谱形态。图 2d 展示了不同种类脂肪质子的相对浓度图, 以及比值计算出的脂肪成分指标图, 不同油模的指标各异。

小鼠实验: 图 3a 展示了小鼠腹部图谱以及局部放大图谱, 显示运用呼吸门控能有效减少运动伪影。图 3b 展示了不同种类脂肪质子的相对浓度图以及相应脂肪成分指标图。可见健康小鼠的脂肪集中在皮下脂肪, 内脏脂肪较少。

结论:

本研究开发了一种脂肪选择 EPSI 技术, 可提供不同种类脂肪质子的在体高分辨率扫描影像。目前该技术可应用于小鼠腹部, 未来可拓展至肌肉等其他部位。该技术可在短时间内采集不同脂肪成分的分子影像, 有利于对各个器官进行分子水平研究, 全面发掘代谢类疾病中脂肪分子代谢路径与发病机制之间的联系。

PO-3399**多对比定量 MRI 技术在甲状腺相关性眼病中的应用研究**

贾岩龙¹、纪大双¹、刘凯¹、陈娜¹、聂佩文¹、吴仁华²、李锋¹

1. 襄阳市中心医院

2. 汕头大学医学院附属第二医院

目的: 多对比定量(MultiPlex, MTP)成像技术, 又称为合成 MRI (Synthetic MRI, SyMRI) 是一种新颖的定量磁共振成像技术, 一次扫描可以获得多种对比度图像和 5 种定量参数图, 在疾病的早期诊断、鉴别诊断及疗效评价等方面显示出巨大应用潜力。本文拟探讨 SyMRI 技术在甲状腺相关性眼病病程评估方面的可行性和诊断价值。

方法: 搜集本院 2022.06-2023.09 月期间眼科或内分泌科确诊的甲状腺相关性眼病 (thyroid-associated ophthalmopathy, TAO) 患者的临床资料、实验室指标及 MRI 资料, 其中 TAO 患者 20 例、健康对照组 15 例, 所有 MRI 检查均在 GE 3.0T (Signa Architect, GE Healthcare, USA) 磁共振扫描仪上进行, 扫描序列包括常规高分辨率 T1WI、T2WI、3D SPGR 序列及冠状位 MAGiC 序列。SyMRI 8.0 软件用于图像的后处理, 以生成定量图像。由 2 名高年资放射科医师对眼球突出程度、眶脂肪厚度及眼外肌 (extraocular muscle, EOM) 的平均 T1 持续时间 (T1 relaxation time, T1RTmean)、平均 T2 弛豫时间 (T2 relaxation time, T2RTmean) 及信号强度比 (SI) 进行测量。采用非配对 t 检验或 Mann-Whitney U 检验比较健康对照组和 TAO 组的实验结果进行统计学分析。利用 ROC 曲线比较不同成像序列诊断 TAO 的准确效能。以 p 值 < 0.05 被认为结果差异具有统计学意义。

结果: 与健康对照组比较, TAO 组患者的眶脂肪厚度增厚 ($p < 0.05$)、眼外肌 T1RTmean 和 T2RTmean 值延长, 结果具有统计学意义 ($p < 0.05$)。TAO 患者眼外肌 T1RTmean、T2RTmean 与临床活动评分及严重程度评分具有显著相关性 ($p < 0.05$)。联合眼外肌 T2RTmean 和眶脂肪厚度能够达到最大的预测效能, 同时提高 TAO 诊断的敏感性和特异性。

结论：SyMRI 技术用于 TAO 病程评估是可行的，有望为临床眼病定量评价提供一种新的客观观察手段。

PO-3400

一种“自循环”智能纳米酶可被铁死亡及双硫死亡 动态激活实现高效肿瘤治疗

周巧妹、章巾帼、王怡宁、余日胜
浙江大学医学院附属第二医院

目的： 依赖葡萄糖氧化酶的饥饿疗法可以提供芬顿反应所需的底物过氧化氢，而芬顿反应产生的氧气可以减轻葡萄糖氧化酶催化进程导致的肿瘤缺氧。基于铁死亡的化学动力学疗法利用芬顿反应产生的羟基自由基可以有效杀死肿瘤细胞。肿瘤细胞在发生铁死亡时很大程度上会利用谷胱甘肽来抵抗铁死亡引起的脂质过氧化，当与葡萄糖饥饿结合时会引起细胞内胱氨酸的累积和还原型烟酰胺腺嘌呤二核苷酸磷酸的耗竭，导致双硫死亡的发生。因此我们拟设计一种“自循环”智能纳米酶，能被铁死亡与双硫死亡动态激活，从而实现高效的肿瘤治疗。

方法：采用不同的分析方法表征了纳米酶的形态、元素组成和肿瘤微环境的响应能力。采用活体成像技术和磁共振成像技术对其体内、体外肿瘤靶向效果和成像能力进行分析。采用共聚焦显微镜、流式细胞术和免疫印迹技术研究该纳米酶介导的铁死亡及双硫死亡的治疗效果和机制。

结果： 纳米酶由掺杂铁和二硫键的二氧化硅外壳及装载葡萄糖氧化酶的核心组成。葡萄糖氧化酶不仅可以原位生成过氧化氢增强铁死亡，还能消耗细胞内的葡萄糖，限制还原型烟酰胺腺嘌呤二核苷酸磷酸的生成。该纳米酶依靠肿瘤细胞膜进行靶向药物递送，并可在肿瘤微环境中谷胱甘肽的作用下实现反应性生物降解。该智能纳米酶以脂质过氧化物累积和肌动蛋白细胞骨架之间异常二硫键交联为特点，通过互补增强的铁死亡和双硫死亡机制诱导肿瘤细胞死亡。该纳米酶还具有超顺磁性框架，可以在 T2 加权磁共振成像下进行治疗指导和监测。

结论： 这种合理设计的智能纳米酶有望整合肿瘤的诊断、治疗和监测，并提供一种基于铁死亡、营养依赖以及肿瘤微环境的新型抗肿瘤治疗策略。

PO-3401

功能化聚天冬氨酸纳米粒子对端粒双靶向肝癌诊疗一体化研究

章巾帼、周巧妹、王怡宁、余日胜
浙江大学医学院附属第二医院

目的：端粒酶再激活在肝癌发生发展过程中起到重要作用，抑制端粒酶活性是治疗肝癌的有利方法。目前常用药物为端粒酶抑制剂，但由于端粒长度的缩短需伴随细胞分裂，故单用端粒酶抑制剂存在治疗时长久，治疗效果不及时的问题。针对这一问题，我们提出端粒酶活性抑制以及端粒结构破坏同步治疗，以端粒为靶标，抑制肿瘤细胞的无限增殖可能，降低肿瘤细胞的存活率。磷酸化的 AKT 具有活化下游结构蛋白的能力，使结构蛋白能够发挥保护端粒结构完整性的作用，阻断该通路，破坏端粒结构稳定性，引起 DNA 损伤，直接造成端粒的缩短，同时结合端粒酶抑制剂，双靶向治疗端粒问题，实现肿瘤的高效杀伤和抑制肿瘤细胞的无限分裂。诊疗一体化是影像诊疗的新兴手段，我们引入二氧化锰作为磁共振造影剂，结合叶酸靶向基团，实现肿瘤的靶向递送，实现诊疗一体化。方法：首先通过聚合反应与偶联反应获得药物聚天冬氨酸母链，之后通过水解反应获得二氧化硅纳米粒子，再于中性条件下将高锰酸钾转变为二氧化锰并搅拌包裹于二氧化硅外层，最后通过静电吸附作用将母链包裹在纳米粒子外层。我们通过银染 TRAP 法检测端粒酶活性，通过 qPCR 法检测端

粒长度,同时采用多种生物学表征手法分别检测了肿瘤细胞存活率、增殖情况、DNA 损伤情况等。通过小鼠活体成像技术和磁共振检测手段,探明纳米粒子生物靶向作用和治疗情况。

结果:用透射电镜表征纳米粒子,成功制备了纳米材料。通过各种化学表征方法,分别检测纳米粒子的粒径大小,电位分布,元素组成和含量表征等。细胞生物学实验表明双靶向给药增强了端粒酶活性抑制作用,有效缩短了端粒长度,最终使得肿瘤细胞 DNA 损伤增多,死亡率增加。动物成像实验表明,该纳米材料能高效的聚集于肿瘤部位,在磁共振成像上显示出明显的增强信号,实现肿瘤靶向作用。动物治疗实验表明,该纳米材料在保证生物安全性的前提下,有效抑制肿瘤的增长。

结论:成功制备了端粒双靶向治疗和诊疗一体化的纳米粒子。解决了单独端粒酶活性抑制的缺点,双靶向端粒有效抑制肿瘤细胞的无限分裂和增长,成功在动物实验上抑制肿瘤的增殖,并且高效实现纳米粒子肿瘤部位的靶向定位,成功实现诊疗一体化。

PO-3402

磁共振纳米对比剂 Fe^{3+} @PSar-b-PDOPA-cy7 在结直肠癌肝转移中体内分布及其分子机制

周飞

浙江大学医学院附属邵逸夫医院杭州

目的 探索结直肠癌细胞系摄入磁共振纳米对比剂 Fe^{3+} @PSar-b-PDOPA-cy7 体内外分布及其分子机制。**方法** 合成磁共振纳米对比剂 Fe^{3+} @PSar-b-PDOPA-cy7,并对其进行表征。MRI 和小动物荧光成像仪检测 Fe^{3+} @PSar-b-PDOPA-cy7 粒子在结直肠癌肝转移瘤小鼠体内分部。采用 MTT 检测 Fe^{3+} @PSar-b-PDOPA-cy7 对结直肠癌细胞活性影响,随后检测 Fe^{3+} @PSar-b-PDOPA-cy7 不同浓度和时间点在结直肠癌细胞系摄入变化。检测 Fe^{3+} @PSar-b-PDOPA-cy7 在人肠正常细胞系和结直肠癌细胞摄入分布。同时通过内吞途径特定小分子抑制剂处理,明确 Fe^{3+} @PSar-b-PDOPA-cy7 途径,细胞器特定定位分子标记明确其在细胞内细胞器分布。**结果** 合成的 Fe^{3+} @PSar-b-PDOPA-cy7 的粒径在 15nm 左右,具有极佳的水溶性,体外分散性好。该磁共振纳米粒子主要分布于小鼠结直癌转移瘤中, MRI 下转移瘤显示清晰且之久。随后 MTT 结果显示 Fe^{3+} @PSar-b-PDOPA-cy7 在较高浓度下对细胞活性无影响,随着时间的推移,纳米粒子摄入增加,同时随着浓度的提高,纳米粒子摄入也不断增加。发现该纳米粒子在肠癌的摄入与 FEME 内吞途径的 Endophilin A2 蛋白表达相关,该结果通过特定内吞小分子抑制剂的处理检测结果相一致。通过对细胞内特定细胞器标记,发现 Fe^{3+} @PSar-b-PDOPA-cy7 纳米粒进入细胞内主要分布在线粒体细胞器上。**结论** Fe^{3+} @PSar-b-PDOPA-cy7 磁共振纳米粒对于结直肠癌肝转移瘤为代表的转移瘤均有体内成像效果好且持久,且毒性较低,具有极好的磁共振现象的临床应用价值。

PO-3403

iRGD 靶向脂质体载药体系增强肝癌靶免治疗疗效及其机制的探讨

李嘉敏

广州市第一人民医院

目的: 仑伐替尼与免疫检查点抑制剂 (ICB) 的联合治疗对肝细胞癌 (HCC) 的治疗带来了巨大的希望,然而但是由于 ICB 抗体的成本和免疫原性高、仑伐替尼的脱靶毒性、药物共传递效果低,现有的靶免疗法的治疗效果并不令人满意。因此,开发一种将靶向治疗与小分子 ICB 抑制剂相结合的高效纳米系统增强 HCC 免疫疗法的效果,并通过 MRI 监测小鼠治疗效果。

方法: 本研究介绍了一种 iRGD 修饰的脂质体载药体系, 共同递送仑伐替尼, 以及免疫检查点小分子抑制剂 BMS-202, 对小鼠原位和皮下肝癌进行治疗, 并在治疗前, 治疗后 5 天和 10 天通过 MRI 对小鼠原位肝癌进行监测。

结果: 结果显示在 iRGD 的靶向性作用下, 实现了药物在肿瘤中的靶向聚集。在酸性肿瘤微环境中, 脂质体持续释放出仑伐替尼和 BMS-202, 其中持续释放的仑伐替尼促进肿瘤血管正常化, 改善了肿瘤缺氧的状态, 并且其可以激活 IFN- γ 信号通路, 促进 CXCL10 的分泌诱导 T 细胞的招募, 其还升高了肿瘤细胞 PD-L1 的表达增强了小分子抑制剂 BMS-202 的敏感性, 从而激活肿瘤的免疫应答, 导致皮下肿瘤和 MRI 监测的原位肝癌的缩小, 抑制了肿瘤的肺转移, 并且降低了药物的毒副作用。

结论: 因此, 通过 iRGD 修饰的脂质体简单地组装 FDA 批准的药物, 提高药物的生物利用度及治疗疗效, 可以为治疗 HCC 患者提供一个很有前途的策略。

PO-3404

肿瘤微环境响应的诊疗探针 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 在放疗增敏中的实验研究

何真虎、容鹏飞
中南大学湘雅三医院

目的: 本研究主要是合成生物相容性的肿瘤微环境响应及调控探针 $\text{MnFe}_2\text{O}_4\text{-PEG}$, 探讨诊疗一体化纳米探针 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 用于磁共振成像精准引导下乏氧肿瘤放疗增敏的可行性。

方法: ①通过高温有机相分解法及配体交换法制备生物组织相容性良好的 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 。②体外验证 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 的类似过氧化氢酶和谷胱甘肽过氧化物酶活性。③探究 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 的磁学性能, 将其应用于体外磁共振成像。④在细胞水平, 研究 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 的潜在毒性, 并通过多种方法验证其在乏氧环境下的放疗增敏作用。⑤构建 4T1 乳腺癌皮下瘤模型。利用小动物光声成像系统和临床磁共振设备扫描小鼠, 观察肿瘤部位的血氧饱和度和肿瘤特异性磁共振成像效能。⑥在动物水平, 通过绘制肿瘤生长曲线、生存曲线及病理检查等考察 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 的放疗增敏效果。

结果: ① $\text{MnFe}_2\text{O}_4\text{-PEG}$ 在生理性溶液中具有极佳的稳定性。② $\text{MnFe}_2\text{O}_4\text{-PEG}$ 可催化过氧化氢产生氧气并耗竭谷胱甘肽。③ $\text{MnFe}_2\text{O}_4\text{-PEG}$ 具备良好的磁学性能, 在 T_1 和 T_2 加权像上同时表现出较好的增强效果。④细胞实验证明 $\text{MnFe}_2\text{O}_4\text{-PEG}$ 无明显毒性。在乏氧环境下, $\text{MnFe}_2\text{O}_4\text{-PEG}$ 联合放疗对 4T1 细胞造成的 ROS、DNA 损伤水平以及凋亡率明显高于对照组, 具备放疗增敏的潜力。⑤静脉给药后, $\text{MnFe}_2\text{O}_4\text{-PEG}$ 表现出高度的肿瘤聚集性和长期的血液循环。光声成像显示肿瘤部位血氧饱和度明显提高, 磁共振成像在动物水平展示出肿瘤特异性 T_1 -/ T_2 -weighted 双模态对比增强的效果。⑥ $\text{MnFe}_2\text{O}_4\text{-PEG}$ 联合放疗有效抑制 4T1 乳腺癌的生长, 病理结果进一步佐证了放疗增敏效果。

结论: $\text{MnFe}_2\text{O}_4\text{-PEG}$ 纳米探针通过高渗透、长滞留效应被动靶向肿瘤组织, 缓解乏氧微环境和耗竭肿瘤组织中过表达的谷胱甘肽, 解除乏氧实体肿瘤的放疗抵抗, 结合 T_1 / T_2 -weighted 双模态磁共振对比增强成像, 实现可视化图像精确引导的肿瘤放疗增敏。

PO-3405

体内 MRI/FL 多模态成像探针的制备及治疗作用研究

周梦洋

郑州大学第一附属医院

目的: 多模态成像将各种成像技术的优势进行“互补”与“融合”, 突破了单一模态成像的尺度局限性。因此, 我们制备了具有光动力治疗效果的 MRI/FL 双模态成像纳米粒子碳点, 以实现多渠道成像。材料与方法: 采用微波辅助法制备柠檬酸-尿素体系碳点, 并在其中掺杂金属钐和金属钕。采用分光光度计测试吸收光谱, 酶标仪测试荧光光谱, 应用透射电镜及动态光散射观察对比剂形态尺寸, 应用 X 射线衍射仪测试衍射谱。在体外实验中观察磁共振效应、荧光效应、细胞毒性、抗菌效果、内吞效应等。在体内实验中观察磁共振成像能力、安全性等。结果: 碳量子点具有优异的水溶性和生物相容性、良好的稳定性、以及独特的光学性质等特性, 且尺寸较小、分散性较好。体外实验中, 与对照组比较, 碳点有良好的磁共振成像能力, 能够在光照下有效杀死肿瘤细胞, 内吞效果较好。体内实验证明碳点磁共振成像能力强、荧光成像明显, 安全性高。结论: 碳点作为新型碳基纳米材料, 尺寸较小、分散性较好, 细胞毒性较小, 内吞效果较好。同时体内实验证实其具良好的光致发光效应, 磁共振成像能力强、安全性高。

PO-3406

钆掺杂 Fe₃O₄ 纳米探针在 T1/T2 MR 引导下的肿瘤协同治疗研究

靳尚

徐州医科大学附属医院

目的 构建多功能 DOX@Gd-MFe₃O₄ 靶向诊疗一体化复合纳米探针, 探究其对 4T1 乳腺癌体内外靶向磁共振成像及治疗效能。

方法 1.通过水热反应法及化学修饰合成复合纳米探针 DOX@Gd-MFe₃O₄。2.对材料进行形貌及理化性质表征。3. 探究材料的光热转换效果。4.研究材料在有无近红外光照射下药物的体外释放过程。5.测量材料弛豫率。6.检测细胞毒性及生物相容性。7.材料在乳腺癌细胞内的摄取情况。8.肿瘤细胞评价体外联合治疗效果。9.评价载瘤小鼠肿瘤治疗效果。

结果 1. 制备的 Gd-MFe₃O₄ 水溶液分散性良好。2.TEM、XRD、VSM、UV-vis 吸收光谱示 DOX 的成功负载及纳米复合物的成功制备。3.红外热像仪显示, 材料具有温度升高的浓度依赖性和光照强度依赖性、光热稳定性。4.通过体外模拟药物释放结果显示近红外光的照射会促进并且提高药物的释放。5. 材料体外 MR 扫描中具有 T1/T2 双模态成像潜能 6.细胞毒性结果显示 Gd-MFe₃O₄ 浓度在 0~0.5mg/ml 范围内时, 对 NIH-3T3 细胞及 4T1 细胞均无明显的细胞毒性作用。7.荧光共聚焦显微镜显示在磁靶向作用下 DOX 聚集在 4T1 周围的含量更多, 外加近红外光照射会促进 DOX 的释放和吸收。普鲁士蓝铁染色显示在磁靶向作用下, 更多的含 Fe 纳米粒子被 4T1 细胞吞噬和摄入。8.细胞活死染色法及 MTT 体外细胞治疗实验都表明 DOX@Gd-MFe₃O₄ 的光热和化疗协同治疗能够明显且有效的对肿瘤细胞起到杀伤作用。9.运用皮下成瘤技术成功构建 4T1 载瘤小鼠模型, 该纳米探针成功实现了对 4T1 载瘤小鼠的特异性磁共振增强成像。10.4T1 载瘤小鼠分组治疗结果显示, DOX@Gd-MFe₃O₄ 组在近红外光照射及磁靶向作用条件下, 肿瘤治疗效果更好。

结论 本研究条件下: 采用简单合成策略, 成功制备了具有磁靶向的新型诊疗一体化纳米探针实现了对 4T1 乳腺癌细胞及载瘤小鼠的靶向磁共振成像及光热、化疗的联合治疗。

磁共振 T2 对比剂 Fe₃O₄@Cys 的制备及新西兰兔活体成像研究

祖涵瑜、姜兴岳
滨州医学院附属医院

目的：制备经半胱氨酸 (cysteine, Cys) 表面修饰的磁共振 T2 对比剂 Fe₃O₄@Cys，并通过 3.0 T 磁共振成像系统经新西兰兔测试其成像性能。材料与方法：采用溶剂热法，通过改变反应时间和底物浓度，制备出不同的 Fe₃O₄ 纳米颗粒。采用 X 射线衍射仪 (X-ray Powder diffractometer, XRD) 对样品进行表征并分析其结晶性，经扫描电子显微镜 (scanning electron microscope, SEM) 测试其形貌及粒径，选择结晶性较高且粒径均匀的样品进行半胱氨酸表面修饰，经 ZETA 电位纳米粒度分析仪测得 Fe₃O₄、Fe₃O₄@Cys 的表面电位，经震动样品磁强计 (vibrating-sample-magnetometer, VSM) 对其进行磁性能测试，经 MTT 法细胞增殖抑制实验测试样品修饰前后的细胞毒性。使用 3.0 T 磁共振成像系统，通过观察新西兰兔注射前后不同时间点肾脏皮质、髓质及小肠的信号变化，测试其成像性能。结果：当六水合三氯化铁的用量选择 0.325 g，200℃温度下反应 8 h 所制备的 Fe₃O₄ 纳米颗粒结晶性高，平均粒径约 57.2 nm，修饰前后表面电位分别为 -20 mv 与 -22 mv，扫描电镜下粒径及形貌未发生明显改变，修饰后不同浓度 Fe₃O₄@Cys 的 24 h 细胞存活率均高于 80%，且均高于 Fe₃O₄ 组。表现出超顺磁性，在磁共振活体成像中具有明显的阴性对比增强效果。结论：反应时间延长，Fe₃O₄ 结晶性增加；底物浓度增加，Fe₃O₄ 粒径减小。半胱氨酸修饰后，稳定性与生物相容性增加，可作为 T2 对比剂用于多种实验和基础研究。

PO-3408

基于类淋巴系统磁共振成像预测血管性痴呆模型
大鼠认知障碍的发生

谢诗燕、何熠、赵芝弘、宣文涛、郑欣慧、陈粤、吴仁华
汕头大学医学院第二附属医院

目的：本研究拟运用动态对比增强磁共振成像，给大鼠鞘内注射顺磁性造影剂，观察血管性痴呆 (VD) 组和假手术 (SHAM) 组大鼠脑内脑脊液 (CSF) 和间质液 (ISF) 的交换，联合 Morris 水迷宫、HE 染色以证明类淋巴系统功能可以成为血管性认知障碍发生的预测因子。

方法：采用双侧颈总动脉永久性结扎构建血管性痴呆 (VD) 大鼠模型。假手术 (SHAM) 组只分离血管，不做任何处理，每组 6 只。大鼠术后的第 7 天，接受 3DT1 加权磁共振成像扫描：注射造影剂前数据、注射后每 10 分钟采集一次数据，采集到注射后 5 小时。Morris 水迷宫采集第 7 天 SHAM 组、第 7 天 VD 组，第 2 月 SHAM 组、第 2 月 VD 组的数据。采集完处死大鼠，取脑组织行 HE 染色。组间参数比较采取两独立样本 t 检验；相关性分析采用皮尔森检验，以 $p < 0.05$ 表示差异具有统计学意义。

结果：在类淋巴系统磁共振成像中，VD 组相对于 SHAM 组的达峰时间均后移，信号变化值也更大 ($p < 0.05$)。Morris 水迷宫中，相比第 7 天 SHAM 组、第 7 天 VD 组、第 2 月 SHAM 组，第 2 月 VD 组的目标象限时间比和目标象限路程比均明显下降 ($p < 0.05$)。在 HE 染色中，VD 组与 SHAM 组对比，脑海马 CA1 区凋亡细胞更多 ($p < 0.05$)。3DT1 加权磁共振成像中达峰时间、信号变化值分别与 Morris 水迷宫的目标象限时间比、HE 染色海马 CA1 区凋亡细胞数做相关性分析。结果提示达峰时间、信号变化值与目标象限时间比显著相关 (达峰时间， $r = -0.8068$ ；信号变化值， $r = -0.7902$)；达峰时间、信号变化值与海马 CA1 区凋亡细胞数显著相关 (达峰时间， $r = 0.8579$ ；信号变化值， $r = 0.7475$)。

结论：全脑核磁共振成像提供了一个敏感、非侵入性的工具，用于定量评估 CSF-ISF 交换，并具有潜在的临床应用。类淋巴系统功能具有早期预测血管性痴呆模型大鼠认知障碍的发生的潜力。

PO-3409

大脑结构与功能重组是重症肌无力患者认知损伤的神经影像学潜在基础

吴晓娟、李勇刚
苏州大学附属第一医院

目的：越来越多的证据表明重症肌无力 (MG) 患者存在认知损伤，然而其神经生物学基础尚不清楚。本研究旨在探讨 MG 暴露对患者大脑皮层形态与功能的影响，以及大脑结构和功能重组是否是其认知损伤的基础。

方法：采用基于体素的形态学测量 (VBM) 及基于表面的形态学测量 (SBM)，比较了 36 例 MG 患者 and 34 例健康对照 (HC) 大脑皮层体积、厚度、脑沟深度、皮层褶皱和分形维数的变化，以皮层结构存在差异的脑区为种子点，评估患者全脑功能连接改变情况。以性别、年龄、受教育程度、焦虑及抑郁评分为协变量，使用偏相关分析方法探索大脑结构及功能异常与神经心理及临床特征之间的关系。最后采用简单中介方法探索介导重症肌无力患者临床特征与认知损失之间关联的重要神经影像基础。

结果：MG 组双侧眶部额下回、左侧三角部额下回、右侧眶部额上回、右侧额上回及右侧中扣带回灰质体积较 HC 组降低；与 HC 组相比，MG 组双侧额上回、额中回上部、中央前回及左侧额中回尾部、右侧额下回（岛盖部、三角部）皮层厚度降低；左侧中央前、后回及右侧岛叶、外侧眶额回、额下回三角部脑沟深度降低；右侧顶下小叶、额中回皮层分形维数减低。此外，与 HC 组相比，右侧眶部额上回与右内侧额上回、右侧额上回与右侧顶上小叶、左侧中央前回与左内侧额上回和顶上小叶、右侧额上回与右侧小脑功能连接分别增强；偏相关分析显示多个异常结构及功能脑区指标与重症肌无力定量评分 (QMGS)、抗乙酰胆碱受体抗体 (AChR-Ab) 水平、部分认知分量表评分显著相关。中介分析表明右侧顶下小叶、额中回皮层分形维数降低以及左侧中央前回与左内侧额上回功能连接失调介导了重症肌无力患者定量评分与信息处理速度 (SDMT) 受损之间的关联。

结论：MG 患者部分大脑形态和功能改变介导了 MG 疾病严重程度与认知损伤之间的关联。这些皮层形态和功能重组可能是 MG 患者认知障碍的潜在神经生物学机制。

PO-3410

靶向 POCD 小鼠血脑屏障诊疗一体化纳米探针构建

陈春曲
宁波大学附属第一医院

目的：近年来，老年人口逐年增加，术后认知功能障碍的发生率也逐渐上升，有研究表明，血脑屏障的破坏是术后认知功能发生的重要机制。但目前血脑屏障破坏的影像学检查方式有限，增加血脑屏障的通透性，提高药物生物利用率是药物递送研究中主要的挑战。本研究旨在构建稳定的靶向血脑屏障破坏的纳米探针，实现血脑屏障破坏的诊疗一体化。

方法：以具有 T2 加权成像特征的四氧化三铁为载体，包覆具有光热效应的介孔多巴胺层，同时搭载治疗药物，以受体靶向的方式精准定位到血脑屏障，在细胞水平对纳米探针的毒性及摄取能力进行评估，在动物层面对纳米探针进行安全性评估及治疗效果评价。

结果：构建的 LR-Fe₃O₄@mPDA 纳米探针具有良好的稳定性，介孔多巴胺提高了药物负载率，同时纳米探针具备光热与 PH 双响应释放药物，在细胞层面表现出低毒性和良好的靶向性。

结论: 我们构建了 LR-Fe₃O₄@mPDA 纳米探针, 在近红外的照射下, 增加了血脑屏障的通透性, 能够促进药物释放, 这种用于脑内药物输送的无创策略可以成为诊断和治疗术后认知功能障碍及神经退行性疾病的理想方法。

PO-3411

帕金森病患者脑网络异常: 基于低频振幅的 Kullback-Leibler 离散相似性个体网络分析

石大发¹、吴烁华¹、延根^{*2}、吴仁华^{*1}

1. 汕头大学医学院第二附属医院

2. 厦门医学院附属第二医院

目的: 应用 Kullback-Leibler 散度相似性 (Kullback-Leibler divergence-based similarity, KLS) 评估方法构建基于低频振幅 (amplitude of low-frequency fluctuation, ALFF) 的个体脑网络, 探讨其在分类帕金森 (Parkinson's disease, PD) 患者和健康对照 (healthy control, HC) 的可行性。

方法: 59 例 PD 患者和 41 例 HC 纳入研究。功能磁共振数据常规处理得到平均 ALFF (mALFF) 图, 利用 Brainnetome 246 脑图谱分割 mALFF 获得 246 个脑区, 采用 KLS 方法评估各脑区对神经活动分布相似性获得个体水平脑网络。采用 t 检验和最小绝对收缩和选择算子进行特征选择, 使用嵌套 10 折交叉验证 (重复 100 次) 进行超参数优化和模型评估, 使用支持向量机构建分类模型。我们选择 1000 次迭代中平均权重绝对值大于最大绝对权 20% 的特征为“区分特征”并计算其与 PD 患者临床症状评分相关性。

结果: 我们构建的分类模型平均 AUC 和准确率分别为 0.84±0.03 和 0.78±0.03 (p 均<0.001)。我们共识别了 39 个“区分特征”, 主要位于默认网络、感觉运动网络、执行控制网络、视觉网络、额顶网络和皮层下网络。Spearman 相关分析示右侧楔前叶 (PCun_R_4-3) 与左颞下回 (ITG_L_7_1) (r= -0.27, p=0.04) 和右顶下小叶 (SPL_R_5_4) 与左海马 (Hipp_L_2_1) (r=0.29, p=0.03) 连接与 MMSE 评分存在显著相关性, 左额上回 (SFG_L_7_5) 与左额中回 (MFG_L_7_6) 连接与 HAMD 评分存在显著相关性 (r=-0.27, p=0.04)。

结论: 应用 KLS 方法构建的基于脑神经活动 (ALFF) 的个体脑网络可以很好分类 PD 患者和 HC, 其是 PD 新的且鲁棒的潜在神经影像生物标记物。PD 与多个网络内及网络间的功能异常相关, 我们的网络建模方法为 PD 的异常网络组织提供新视角

PO-3412

靶向 VISTA 的纳米探针及对胰腺癌的治疗研究

洪露、徐开蔚、汪建华

宁波大学附属第一医院

目的: (1) 构建靶向胰腺癌免疫检查点 VISTA, 具有 MR 成像功能及声动力疗效等多种功能纳米探针 Fe₃O₄@TiO₂@VISTAmAb。(2) 探究该探针细胞水平靶向性能及声动力治疗疗效。(3) 探究该探针动物水平治疗效果及治疗机制。

方法: (1) 探针制备及表征方法: 构建花环状 Fe₃O₄@TiO₂@VISTAmAb 纳米探针。采用生物透射电镜、磁共振成像、紫外分光光度计等对探针进行表征。(2) 采用 Western blot、流式细胞术研究探针的靶向能力; 通过 CCK-8、荧光显微镜实验等研究探针的细胞水平声动力治疗效能。(3) 通过小鼠注射探针后超声治疗, 肿瘤组织切片染色实验等研究探针动物水平 SDT 效能及免疫治疗机制。

结果: (1) 制备得到的 $\text{Fe}_3\text{O}_4@\text{TiO}_2@\text{VISTAmAb}$ 纳米探针平均水合粒径约 225.3 nm, Zeta 电位为 -28.9 mV, r_2/r_1 值 32.03。在超声照射下, 该探针具有良好的 SDT 潜能 (单线态氧的产生能力)。(2) 与非靶向组相比, VISTAmAb 的修饰提高了 Panc-2 细胞对纳米探针的摄取约 1.2 倍, 表现出较好的靶向摄取作用, 且该探针生物相容性好。细胞水平治疗结果显示: 与探针共孵育后超声照射 (1.0 W/cm², 1 min), 约 50% Panc-2 细胞死亡, 显示出较好治疗效果。(3) 动物治疗结果显示: $\text{Fe}_3\text{O}_4@\text{TiO}_2@\text{VISTAmAb}$ 探针联合 SDT 组肿瘤大小明显受到抑制, 抑制率达 85.36%, 表明 SDT 联合免疫治疗具有良好的治疗效果。(4) 免疫微环境评估实验结果表明, 在 VISTAmAb 治疗后, VISTA 阳性表达下降, PD-1/PD-L1 阳性表达上调, CD4⁺T 细胞和 CD8⁺T 细胞浸润增加。在超声作用下, 癌组织结构变得疏松, 提示超声作用可有效破坏致密纤维, 肿瘤组织血管生成增加。结论: (1) 构建了靶向胰腺癌免疫检查点 VISTA 的新型探针 $\text{Fe}_3\text{O}_4@\text{TiO}_2@\text{VISTAmAb}$, 具有良好生物相容性、超声响应及 MR 成像功能。(2) 基于该探针进行声动力联合治疗, 有效疏松胰腺癌致密纤维基质, 显著促进肿瘤微血管生成, 改善免疫抑制微环境, 对胰腺癌显示出良好的治疗效果。

PO-3413

新型荧光-MPI 双模态成像探针同时监测树突状细胞疫苗迁移和凋亡以指导结直肠癌化疗-免疫联合治疗

谭兴茹、齐亚飞
北京协和医学院

目的: 树突状细胞 (DC) 疫苗免疫疗法和奥沙利铂 (OXA) 化疗联合治疗是一种很有前途的结直肠癌治疗方法。树突状细胞 (DC) 疫苗的给药时间和顺序对于结直肠癌患者化疗和免疫联合治疗的效果尤为关键, 并且需要进一步探索。

方法: 我们构建了一种新型凋亡响应荧光分子成像 (FMI)/磁粒子成像 (MPI) 双模态成像的纳米探针。该探针 ($\text{Fe}_2\text{O}_3@\text{DEVD}(\text{Cy7})\text{-TAT@OVA}$) 由纳米颗粒 $\text{Fe}_2\text{O}_3@\text{DEVD}(\text{Cy7})\text{-TAT}$ 负载鸡卵圆白蛋白 (OVA) 作为特定抗原组成, 可以同时监测 DC 疫苗的迁移和凋亡。通过理化性质表征、细胞毒性试验验证探针安全性; 通过流式细胞术和共聚焦显微镜验证探针的摄入试验、体外凋亡响应性; 通过活体荧光、MPI 成像验证 DC 疫苗迁徙效率、体内迁移和凋亡效果; 通过治疗实验验证该探针的指导价值。

结果: 理化性质证实该探针的可用性; DC2.4 细胞与探针孵育 12、24、36、48h 的细胞活性均为 80%~100%。摄入试验证实 DC 疫苗经网格蛋白介导的内吞作用摄入探针并且探针可实现溶酶体逃逸; 体外凋亡试验证实凋亡诱导剂 STS 可诱导 BMDC 细胞的凋亡; 活体荧光成像显示探针并不影响 DC 疫苗的迁徙, 并且证实 MPI 可长时间示踪 DC 的迁徙并通过荧光成像检测 DC 的凋亡; 治疗实验证实了使用双模态成像策略指导的方案可以明显抑制肿瘤生长。

结论: 这种 $\text{Fe}_2\text{O}_3@\text{DEVD}(\text{Cy7})\text{-TAT@OVA}$ 探针有助于指导化疗和免疫治疗联合治疗的顺序和时机, 以提高联合疗效。

PO-3414

帕金森病脑功能、代谢及神经递质异常改变

石大发¹、吴烁华¹、延根^{*2}、吴仁华^{*1}

1. 汕头大学医学院第二附属医院

2. 厦门医学院附属第二医院

目的: 比较帕金森病 (Parkinson's disease, PD) 患者和健康对照 (healthy control, HC) 低频振幅 (amplitude of low-frequency fluctuation, ALFF) 改变并研究其与临床量表评分相关性及其与脑代谢及神经递质分布的空间相关性。

方法: 59 例 PD 患者和 41 例 HC 纳入研究。功能磁共振数据常规处理得到平均 ALFF (mALFF) 图, 比较 PD 组和 HC 组 mALFF 组间差异, 其中年龄、性别及受教育程度作为协变量。计算差异显著脑区 mALFF 值与 MMSE 和 HAMD-17 量表评分 Spearman 偏相关。应用 JuSpace 软件计算 mALFF 与脑神经递质[包括 5-羟色胺能受体 (5-HT_{1a}、5-HT_{1b} 和 5-HT_{2a})、多巴胺能受体 (D₁ 和 D₂)、多巴胺转运蛋白 (DAT)、氟多巴胺合成能力 (FDOPA)、 γ 氨基丁酸 (GABA_A)、去甲肾上腺素转运蛋白 (NAT)、5-羟色胺转运蛋白 (SERT)、囊泡乙酰胆碱转运蛋白 (VACHT) 和 μ -阿片受体 (MU)]及脑血流量 (CBF) 跨模态空间关系。

结果: 我们发现三个具有显著差异团块, 其主要脑区包括双侧梭状回、中央旁小叶、左枕下回、右颞下回及辅助运动区。团块 1、2 和 3 的 mALFF 值与 HAMD-17 评分呈负相关 (r 分布 -0.30、-0.60 和 -0.27, p 均 < 0.05), 团块 3 的 mALFF 值与 MMSE 评分呈正相关 ($r = 0.25$, $p = 0.013$)。与 HC 组相比, PD 组体素水平 mALFF 改变与 CBF ($Z = 0.125$, $p = 0.023$)、DAT ($Z = -0.145$, $p = 0.003$)、FDOPA ($Z = -0.155$, $p < 0.001$)、NAT ($Z = -0.155$, $p = 0.002$) 及 SERT ($Z = -0.197$, $p < 0.001$) 的空间分布存在显著相关性, 未发现其与其他神经递质显著空间相关性 (p 均 > 0.05)。

结论: 我们的研究揭示了 PD 多模态神经机制, 其与脑内多个脑区的功能及多个神经递质及脑血流异常相关, PD 患者 mALFF 改变与脑代谢及神经递质空间分布相关联为我们理解疾病病理机制及临床特征提供新的视角。

PO-3415

功能蛋白磁共振/荧光无损影像标记方法与应用研究

李天亮、徐海波

武汉大学中南医院

目的: 本研究旨在探索一种功能蛋白的无损影像标记方法, 克服以往功能蛋白化学标记过程中结构改变导致的靶向结合能力减弱以及功能蛋白物理复合过程中影像标记效率低的局限性, 实现功能蛋白最大程度的影像标记。磁共振和荧光标记的功能蛋白以期肿瘤、心脑血管等疾病的分子分型诊断提供精准预判。

方法: 本研究中利用开环反应得到不同烷基链长 ($n = 4 \sim 12$) 的二聚化 Gd-DTPA, 其可通过疏水作用与功能蛋白物理复合, 实现磁共振影像标记; 同时利用生物素化荧光染料与功能蛋白化学偶联, 实现荧光影像标记。通过磁共振成像系统、荧光成像系统测定磁共振和荧光双标功能蛋白的影像标记效率; 通过分子生物实验 (流式细胞术、western blotting 等) 验证功能蛋白经磁共振和荧光双标后靶向作用。

结果: 本研究中制备的二聚化 Gd-DTPA 磁共振对比造影剂, 其结构中烷基链越长 T₁ 弛豫率越高, 且 T₁ 磁共振对比成像效果优于临床用 Gd-DTPA。ICP-MASS 结果显示功能蛋白与二聚化 Gd-DTPA 的复合摩尔比为 1: 7.5 时, Gd 离子标记效率最高为 $83 \pm 3\%$; 荧光光谱分析结果显示功能蛋白与生物素化的荧光染料的化学偶联摩尔比为 1: 4 时, 荧光素的结合效率最高为 $73 \pm 5\%$ 。Western blotting 和流式细胞结果显示制备的双标功能蛋白保留了 90% 以上的特异性结合能力。

结论论：本研究提出的功能蛋白磁共振和荧光标记方法是一种广谱性的蛋白标记技术，可对具有特殊功能或靶向作用的蛋白进行无损标记。双标后功能蛋白可同时实现组织定位、分子示踪，为临床诊断提供无创影像诊断方法。后续研究将提高功能蛋白的高效压缩和靶向递送工艺。

PO-3416

CT 影像组学与 PET 衍生参数对宫颈癌盆腔淋巴结转移 诊断价值的临床对比研究

于洋、王小娟、孙洪赞
中国医科大学附属盛京医院

目的：构建预测宫颈癌盆腔淋巴结转移的 CT 影像组学模型，将其与基于 PET 常规参数和衍生参数的诊断性能相比较，探讨其预测宫颈癌盆腔淋巴结转移的诊断价值。方法：回顾性分析 2017 年 1 月至 2020 年 7 月于我院行 PET/CT 检查并经病理证实淋巴结性质的宫颈癌患者 112 例。收集这些患者的临床特征、PET 代谢参数及 CT 平扫图像。由 2 名同时具备核医学及放射科诊断资质的医师应用 LIFEX 软件对导出的 CT 图像进行手动勾画感兴趣区，按照 7:3 的比例随机划分为训练集和测试集，从患者的 CT 平扫图像中提取 933 个影像组学特征建立影像组学模型，获得影像组学评分 Radscore。我们从 PET 常规代谢参数及衍生参数分别选出 AUC 值最高的指标，通过 ROC 曲线评价影像组学模型、PET 常规代谢参数和衍生参数对宫颈癌盆腔淋巴结转移的诊断效能，采用 Delong 检验对上述方法绘制的 ROC 曲线进行配对比较，评估不同方法在宫颈癌盆腔淋巴结转移中的诊断差异，检验水准为 $r < 0.05$ 。

结果：在影像组学模型中，训练集 AUC 值为 0.855；测试集 AUC 值为 0.809。在 PET 常规参数中，淋巴结 SUVmax、SUVmean、MTV、TLG 有统计学意义 ($r < 0.05$)，SUVmax AUC 值最高。训练集 SUVmax AUC 值为 0.890；测试集 AUC 值为 0.920。PET 衍生参数中，SUVmax/肝脏 SUVmax、SUVmax/血池 SUVmax、SUVmax/骨髓 SUVmax、SUVmax/肿瘤 SUVmax 均具有统计学意义 ($r < 0.05$)，SUVmax/肝脏 SUVmax AUC 值最高，训练集 SUVmax/肝脏 SUVmax AUC 值为 0.891；测试集 AUC 值为 0.924。以上三种方法对诊断淋巴结转移都显示出了良好的区分效果，两两比较结果显示均无明显统计学差异 ($r > 0.05$)。

结论：CT 影像组学模型能准确地预测宫颈癌患者的盆腔淋巴结转移。CT 影像组学模型与基于 PET 的 SUVmax、衍生参数的诊断能力相比无明显差异。

PO-3417

基于多参数放射组学及生境成像预测 GBM 的 IDH 分型

康厚艺
中国人民解放军陆军特色医学中心

目的：我们拟通过基于生境成像的放射组学无创性地寻找反应肿瘤分子分型的放射组学特征，构建及优化对预测 GBM 的 IDH 突变分型的放射组学模型，更好地指导临床治疗决策的制定。方法：回顾性研究我院确诊为胶质母细胞瘤(GBM)的患者的影像资料，并提取各影像参数的组学特征。基于勾画的不同区域的 ROI，我们构建了以下模型：全肿瘤的 T2WI 模型，全肿瘤的 CBV 模型，全肿瘤的 ADC 模型，多参数磁共振序列联合模型 (T2WI 整体区域、PWI 强化区域及 ADC 水肿区域)，模型中均纳入了患者年龄、性别、发病部位组成的临床因素分析。结果：92 例 GBM 随机分为训练组 66 人(71%)及测试组 26 人(29%)两组，每个 ROI 提取了 396 个组学特征，所有序列的组学特征的预测准确性高于临床指标。经过 LASSO 分析降维确定特征个数后，选择最具预测能力的特征子集

组成影像组学标签 **radscore**，并对其系数进行评价，各个模型的训练组及测试组的 **radscore** 在 IDH 野生型和突变型中有显著差异。在放射组学分析中 **AUC** 最高为 **CBV** 模型，多序列多区域模型的 **ROC** 结果，**AUC** 在训练组达 0.962，测试组达 0.955，对 IDH1 分型的诊断效能高于单一序列模型。结论：基于多参数和多区域 **MRI** 图像的放射学特征可以更准确地预测 **GBM** 的 **IDH** 基因型。

PO-3418

靶向髓鞘探针 Gd-DTDAS 在多发性硬化大鼠髓鞘损伤模型中的实验研究

刘彩云
滨州医学院附属医院

目的 探讨 **MR** 对比剂 **Gd-DTDAS** 在多发性硬化(multiple sclerosis, **MS**) 大鼠髓鞘损伤模型中的应用价值。方法 体外细胞实验：1、毒性评价,通过 **MTT** 法检测少突胶质前体细胞 (oligodendrocyte precursor cells, **OLN-93**) 与 **Gd-DTDAS** 共孵育 24h 后的吸光度，计算存活率来评价细胞毒性。2、细胞摄取实验，使用溶血磷脂酰胆碱(lysophosphatidylcholine, **LPC**)处理细胞后与正常细胞对比，定量两组细胞对 **Gd-DTDAS** 的摄取值以及相应荧光强度的变化。动物实验：1、动物体外实验，将实验组和 **LPC** 组大鼠脑组织 10 μ M 厚度切片进行染色，利用激光共聚焦显微镜进行观察；然后将两组大鼠脑组织 2mm 厚度切片浸泡于 **Gd-DTDAS** 溶液中，**MR T1WI**、**T1maps** 评估 **Gd-DTDAS** 与髓鞘部位的结合情况。2、动物体内实验，经尾静脉注射 **Gd-DTDAS**，**MR** 评估 **LPC** 组注射 **Gd-DTDAS** 前后大脑髓鞘变化。结果 1、细胞毒性实验表明，当 **Gd-DTDAS** 浓度增加到 400 μ M 时，**OLN-93** 细胞的存活率约为 95%，证明 **Gd-DTDAS** 对其存活无抑制作用。2、细胞摄取实验表明，两组细胞均能摄取 **Gd-DTDAS**，**LPC** 组较对照组摄取量较低，结果有统计学差异($P < 0.01$)。3、动物体外实验表明，与对照组比较，**Gd-DTDAS** 染色的 **LPC** 组脑组织切片荧光强度下降，结果有统计学差异($P < 0.01$)；4、动物体内实验表明，与尾静脉注射前比较，注射后有髓区域 **MR T1maps** 弛豫性降低。结论 靶向髓鞘探针 **Gd-DTDAS** 更好地结合髓磷脂丰富的区域，髓鞘靶向 **MR** 显像更佳，能特异性显示多发性硬化髓鞘损伤部位。

PO-3419

谷胱甘肽加权化学交换饱和和转移成像在盆腔肿瘤中的临床应用

毛雨萌¹、延根^{*2}、吴仁华^{*1}
1. 汕头大学医学院第二附属医院
2. 厦门医学院附属第二医院

背景：谷胱甘肽(**GSH**)是细胞内氧化还原平衡的关键调节剂，其含量的降低是一种潜在的凋亡早期激活信号，随后产生的氧自由基促使细胞发生凋亡。此外，**GSH** 能将脂质氢过氧化物转化为无毒的谷胱甘肽二硫化物，从而减轻脂质过氧化并抑制铁死亡。并且，**GSH** 耗竭还能触发细胞自噬，通过自噬抑制剂 3-MA 可防止 **GSH** 耗竭诱导的细胞死亡。**GSH** 的代谢与盆腔肿瘤的类型密切相关，在盆腔肿瘤诊疗中存在潜在的应用价值。

化学交换饱和和转移(**CEST**)利用活体内自身的代谢物进行成像，其可检测具备羟基、酰胺或胺的代谢物。鉴于 **GSH** 分子式内具备这三个必有基团，因此，**CEST** 成像技术给盆腔肿瘤内 **GSH** 的在体可视化成像带来希望。

目的：对 3T **MRI** 设备谷胱甘肽加权化学交换饱和和转移(**GSH-CEST**)成像参数进行优化并初步探究 **GSH-CEST** 在盆腔肿瘤中的临床应用价值。

方法: 首先在 3T 磁共振上对不同浓度(10、15、20、25mmol/L)、不同 pH 值(5、6、7)的 GSH 试管, 进行不同的能量 B1(1、1.5、2、2.5、3、3.5、4、4.5、5 μ T)和不同的饱和和交换持续时间(2500、3000、3500、4000ms)CEST 成像, 以证实 GSH 可视化成像。在体外 GSH 可视化成像成功的基础上, 使用实验所得最佳参数, 对 6 例子宫肌瘤、3 例卵巢肿瘤、3 例宫颈癌、2 例子宫内膜癌的女性盆腔进行常规 T1WI、T2WI、T1WI 增强以及 GSH-CEST 成像。

结果: 试管实验结果明确了 Z 谱中 GSH 的频率偏移峰值在距离水 3.0ppm 处, 通过计算不同浓度下 GSH 溶液的 MTR_{asym} 发现, 当使用 3T 磁共振, 预饱和脉冲能量为 3.5 μ T, 饱和时间为 2500ms 时, GSH 的 MTR_{asym} 最大。在体临床实验发现, 在子宫肌瘤、卵巢肿瘤、子宫颈癌、子宫内膜癌的 Z 谱中均可见 GSH 的频率偏移峰值在距离水 3.0ppm 处, 并且子宫肌瘤 GSH 浓度较其他种类盆腔肿瘤的 GSH 浓度更高。

结论: 本研究获得了 3T GSH-CEST 最优扫描参数, 在体临床试验初步证实了其在盆腔肿瘤潜在的应用价值, 对不同类型盆腔肿瘤 GSH 浓度差异及潜在机制仍需要进行后续研究。

PO-3420

Identification of the Pathological Types of Brain Metastasis from Lung Cancer Based on Multiparametric MRI Radiomics: A Feasibility Study

Lianyu Sui,Xiaoping Yin
Affiliated Hospital of Hebei University

Objectives: To differentiate brain metastases (BMs) from non-small cell lung cancer (NSCLC) and small cell lung cancer (SCLC) and BMs due to the adenocarcinoma (AD) and non-adenocarcinoma (NAD) subtypes using radiomic features derived from multiparametric magnetic resonance imaging (MRI).

Methods: 276 patients with BMs, including 98 with SCLC and 178 with NSCLC, were randomly divided into training (193 cases) and validation (83 cases) sets in a ratio of 7:3. Of the 178 patients with NSCLC, 155 were from primary AD and 23 from NAD. These were also randomly divided into training (124 cases) and validation (54 cases) sets. A logistic regression analysis was used to construct classification models based on radiomics features that were extracted from T1 weighted contrast-enhanced (T1CE), fluid-attenuated inversion recovery (FLAIR), and diffusion-weighted imaging (DWI) images. An receiver operating characteristic curve (ROC) curve analysis was performed to determine the performance of each logistic model, and the area under the curve (AUC), accuracy (ACC), sensitivity (SEN), specificity (SPE), positive predictive value (PPV), and negative predictive value (NPV) were calculated.

Results:

Four, three, four, and eleven radiomics features, respectively, were extracted from T1CE, FLAIR, DWI, and combined sequences after screening. The optimal features for the classification of NSCLC and SCLC were selected from the combined sequential MRI using univariate logistic analysis and multivariate logistic analysis. For differentiation between NSCLC from SCLC ,The performance of the three single-sequence models was not ideal, and the AUCs in the training set and the validation set were all lower than 0.700, except for SPE and PPV. The multi-sequence model achieved better performance when compared to the single-sequence models; the AUC, ACC, SEN, SPE, PPV and NPV in the training set were 0.765 (95% confidence intervals [CI]: 0.711, 0.822), 0.694, 0.694, 0.797, 0.849, and 0.550, respectively; and in the test group, the AUC, ACC, SEN, SPE, PPV, and NPV were 0.762 (95% CI: 0.671, 0.845), 0.675, 0.648, 0.724, 0.814, and 0.525, respectively.

Three, two, three, and eight radiomics features, respectively, were extracted from T1CE, FLAIR, DWI, and combined sequences after screening. The optimal features for differentiating AD and NAD were selected from the combined sequential MRI using univariate logistic analysis and multivariate logistic analysis .For differentiation between AD and NAD, among the three single-

sequence models, the T1CE model had the best prediction performance. The AUCs of the training group and the test group in the T1CE model were 0.787 (95% CI 0.676, 0.882) and 0.772 (95% CI 0.558, 0.944), respectively. Compared with the single sequence model, the multi-sequence model achieved even better performance; the AUC, ACC, SEN, SPE, PPV, and NPV in the training set were 0.861 (95% CI: 0.756, 0.951), 0.821, 0.750, 0.832, 0.400, and 0.957, respectively; and in the test group, the AUC, ACC, SEN, SPE, PPV, and NPV were 0.851 (95% CI 0.649, 0.984), 0.871, 0.857, 0.872, 0.500, and 0.976, respectively.

Conclusion: The radiomics classification method based on the combination of multiple MRI sequences may be used for differentiating between the various lung cancer BMs.

PO-3421

Clinical and imaging features of pregnancy complicated with active tuberculosis

Quhua Yin, xiaojian Wen, yi Zhou, zhishan Jiang, xiaomei Wang, heping Huang, qineng Yao, jie Ling
Hunan Chest Hospital

Objective To investigate the clinical and imaging features of pregnant women with active tuberculosis.

Methods A retrospective analysis was conducted on the clinical data of 19 pregnant patients with active tuberculosis admitted to Hunan Chest Hospital from January 2020 to December 2022, and their clinical manifestations, laboratory examinations, imaging findings, etiology and pathological findings were descriptively analyzed.

Results The patients, aged 19-39 years, presented with symptoms such as cough, sputum and fever, along with significant systemic toxic symptoms. Most patients (84.2%) resided in rural areas, 8 were diagnosed with hypo-proteinemia, 8 with mild anemia, 7 with hyperuricemia, and 7 with hyperlipidemia. Among the 19 patients, 13 (68.4%) were in early pregnancy, 4 in the second trimester, 1 in late pregnancy, and 1 in puerperium. Most of the patients (13/19, 68.42%) had secondary pulmonary tuberculosis, consisting of interstitial pulmonary tuberculosis (4 cases), tracheobronchial tuberculosis (8 cases), single or complicated cervical and axillary lymph node tuberculosis with abscess (4 cases), single or complicated simple tuberculous pleurisy (4 cases), laryngeal tuberculosis (1 case), and left urinary tuberculosis (1 case). Hematogenous disseminated pulmonary tuberculosis was observed in 3 cases (15.79%), including 2 cases of tuberculous encephalitis and meningitis, and 1 case of cervical spinal meningitis. Imaging findings showed that among the 13 cases of secondary pulmonary tuberculosis, 9 patients exhibited bilateral involvement of multiple lobes, air space consolidation, cavities, and nodules on chest CT. Different from previous studies, in 4 cases, interstitial changes characterized by micronodular aggregation, ground-glass opacity, reversed halo sign, fine reticular line shadow in the lobules, tree bud sign, lobular confluent consolidation, and small cavities were observed. Tuberculous pleurisy was present as unilateral pleural effusion or pleural thickening in 4 cases. Diffuse miliary and nodular shadows in both lungs were seen in 3 cases. Two cases were complicated by tuberculous encephalitis and meningitis, with cranial MRI showing nodular and patchy lesions in the brain parenchyma with nodular and circumferential enhancement, meningeal thickening and enhancement, surrounding brain tissue edema, and spinal cord membrane thickening and enhancement in 1 case. Pregnancy outcome analysis revealed that 16 (84.2%) patients chose abortion or induced labor, 1 severe case required emergency uterine clearance due to incomplete abortion, resulting in the death of both the mother and fetus, and one patient in late pregnancy underwent a cesarean section at 36+6 weeks after her condition was stabilized, following which both the mother and child were in good health. Additionally, one patient in the puerperium period was transferred to our hospital for further treatment after premature delivery at another hospital.

Conclusion Pregnancy complicated with active tuberculosis is characterized by severe systemic poisoning symptoms, involvement of multiple organs, diverse imaging findings, and unfavorable

pregnancy outcomes. Therefore, it is of utmost importance to enhance our understanding of the clinical and imaging features of this disease to improve early diagnosis rates, ensure timely and standardized treatment, and enhance the prognosis for both mothers and infants.

PO-3422

Bilateral glymphatic function decreased asynchronously after recovery in mild COVID-19 patients

Lin Wu,Zhi Whang,Fuqing Zhou
The First Affiliated Hospital of Nanchang University

Objectives: Central nervous sequelae are often reported in recovered coronavirus infectious disease-19 (COVID-19). It is not clear whether recovered COVID-19 patients have glymphatic impairment and lateralization. This study aimed to evaluate the glymphatic system function in patients with COVID-19 compared to healthy controls using diffusion tensor image analysis along the perivascular space (DTI-ALPS) method.

Methods: We enrolled 61 patients with COVID-19 and 38 age- and sex- matched healthy controls. All participants underwent non-invasive and no contrast agent required diffusion and susceptibility imaging using 3T MRI scanner, and we calculated the DTI-ALPS index. Using hierarchical cluster analysis, demographic and cognitive scores of COVID-19 patients were compared between clusters.

Results: Diffusion along perivascular space was significantly different between the groups. The left (1.54 vs. 1.66, $P = 0.001$) and right (1.51 vs. 1.62, $P = 0.004$) DTI-ALPS index in patients with COVID-19 was significantly lower than healthy controls. Furthermore, age was significantly negatively correlated with the left DTI-ALPS index ($r = -0.307$, $P = 0.016$) and right DTI-ALPS index ($r = -0.260$, $P = 0.043$). After implementation of hierarchical clustering in patient with COVID-19. The decline of DTI-ALPS index on both hemispheres was non-synergistic in cluster 1 (left 1.66 ± 0.13 ; right 1.44 ± 0.18) and cluster 2 (left 1.39 ± 0.20 ; right 1.60 ± 0.23). Cluster 1 showed a higher proportion of cognitive abnormalities.

Conclusion: We demonstrated that COVID-19 patients, even in mild cases, experienced asymmetric bilateral glymphatic function decline within 4 months after recovery. Patients with right-sided glymphatic dysfunction had a greater proportion of cognitive decline (MoCA score < 26). The decrease of glymphatic function was more obvious in older patients. With COVID-19 infection over 90%, future studies of cognitive disorders in older people should exclude the effect of COVID-19 infection.

PO-3423

Analysis of clinical features and prognostic factors of AIDS-related lymphoma

Xiaoming Gong¹,zhiyan Lu²
1. Xianning Central Hospital
2. Zhongnan Hospital Of Wuhan University

Objective: To analyze the clinical characteristics, pathological characteristics, and prognostic factors of AIDS-related lymphoma (ARL).

Methods: This was a retrospective study of the clinical characteristics, diagnosis and treatment process, and survival status of 32 patients with ARL. The patients were divided into a survival group

and non-survival group according to their prognosis, and the factors affecting survival were analyzed. The patients' clinical characteristics were analyzed according to symptoms, sex, age, and laboratory indicators such as the lactate dehydrogenase (LDH) concentration, number of CD4+ T cells, Ann Arbor stage, pathological typing, and International Prognostic Index (IPI) score. A univariate regression analysis was performed to compare the clinical characteristics of the treatment group and non-treatment group. The impact of chemotherapy and combined antiviral therapy on survival time was assessed.

Results: Thirty-two patients were included in the study; 31 were male and 23 were aged >40 years. The average LDH concentration was 639.8 U/L, and the average CD4+ lymphocyte count was 167 cells/ μ L. Diffuse large B-cell lymphoma was present in 40.6% (13/32) of the patients; a B-lymphocyte source accounted for 90.6% (29/32) of cases, and a T-lymphocyte source accounted for 9.4% (3/32). The proportion of patients who received anti-lymphoma treatment was 84.4% (27/32). Twenty-three patients died during follow-up and nine survived. Univariate analysis showed that the prognostic factors were age, the CD4+ T-lymphocyte count, and the IPI score. The average progression-free survival (PFS) time in the highly active antiretroviral therapy (HAART) group before chemotherapy was 4.81 months, while the average PFS time without antiviral therapy before chemotherapy was about 1.91 months. This difference was statistically significant. The median 2-year survival time in patients who received antiviral therapy before chemotherapy was 33.3 months, while that in patients who did not receive antiviral therapy was 27.3 months. Early HAART therapy combined with standardized chemotherapy was shown to improve the patients' prognosis. It also improved the overall survival rate and PFS time. However, there was no significant difference in the overall survival rates between 1 and 2 years.

Conclusion: The CD4+ T-cell count and IPI score were key factors affecting the prognosis of patients with ARL. An increased LDH concentration was also a prognostic factor. A certain correlation between the disease severity and prognosis was found. The use of standard anti-lymphoma treatment can effectively improve the survival rate of patients.

PO-3424

Hydatid disease of bone: Imaging features

Hui Guo

Xinjiang Medical University, Affiliated Hospital 4

Hydatid disease is a parasitic infection by the larval stage of either *Echinococcus granulosus* (cystic echinococcosis [CE]) or *Echinococcus multilocularis* (alveolar echinococcosis [AE]). This review focuses on the incidence, clinical manifestations, and radiographic features of bone hydatidosis at various sites. The clinical presentations and imaging features of bone hydatidosis differ depending on the site of involvement. The first goal of this review is to distinguish the radiographic features of bone hydatidosis in various bones. The second goal is to help radiologists understand the incidence of hydatid bone disease at various sites and to recognize the clinical manifestations through imaging features. Consideration of both the clinical and radiologic characteristics can help radiologists to diagnose hydatid disease of bone.

PO-3425

The oral Akt inhibitor ipatasertib induces hepatocellular carcinoma cell apoptosis via METTL3 downregulation

Shuo Wang, Ying Ren
Shengjing Hospital of China Medical University

Abstract The effectiveness of therapies against hepatocellular carcinoma (HCC), one of the most common causes of cancer-related death worldwide, is currently limited. Recently, molecular therapy targeting Akt (serine/threonine kinase) has attracted considerable attention in HCC treatment. ipatasertib, a small-molecule Akt inhibitor, reportedly exhibits significant anticancer activity against several cancers, including breast, prostate, and gastric cancers. However, the effects of ipatasertib on HCC have not been investigated yet. In this study, we found that ipatasertib induced HCC cell apoptosis by decreasing the mitochondrial membrane potential in vitro and inhibited HCC growth in a xenograft mouse model in vivo. Further mechanistic studies showed that inhibiting METTL3 expression can enhance the apoptosis-inducing effect of ipatasertib by upregulating cleaved caspase-3 expression. ipatasertib inhibited the HCC invasion and metastasis by reducing cell colony formation and migration abilities, as well as epithelial-mesenchymal transition, without causing toxicity in normal liver cells. Together, our study demonstrated that the Akt inhibitor ipatasertib exerts effective anti-HCC effects by downregulating METTL3 expression. The potential application of ipatasertib in patients with HCC is worth further investigation.

PO-3426

Time-dependent Visualized CT Score to Differentiate Severe/critical COVID-19 at Fever Clinic

Zhenchen Zhu, Ge Hu, Lan Song, Wei Song, Zhengyu Jin
Chinese Academy of Medical Sciences and Peking Union Medical College Hospital

Objectives: Rapid identification of severe/critical COVID-19 infection was essential for life-saving. This study aimed to evaluate the efficacy of visualized CT score to identify severe/critical COVID-19 infection.

Materials and Methods: This retrospective study collected chest CT images of symptomatic COVID-19 patients from fever clinic of Peking Union Medical College Hospital during the December 2022 Omicron wave. Patients were first split into three cohorts based on the interval between symptom onset and their visits at the clinic. They were then divided into mild/moderate and severe/critical disease groups based mainly on blood oxygen level and integrated clinical information. CT scores for each lobe were assigned from 0-2 points based on the degree of pneumonia involvement and then summed as the total CT score (0-10 points). A logistic regression analysis was performed to evaluate the association between CT score and disease severity, and the area under the curve (AUC) was calculated. The best cutoff value was determined by maximizing the Youden index.

Results: 361, 360 and 241 patients were included in the early-phase cohort (0-3 days from symptom onset), intermediate-phase cohort (4-7 days) and late-phase cohort (8-14 days), respectively. Severe/critical infection accounted for 14.1%, 18.9% and 24.9% of the patients in each individual cohort. Severe/critical group had significantly higher CT scores than the mild/moderate group in every lobe ($P < 0.001$). In the severe/critical group, the CT scores of the lower lobes were significantly higher than those of the upper lobes on both sides in the early and intermediate phase ($P < 0.05$). The AUC of CT score to identify severe/critical infection reached 0.91, 0.82 and 0.83 in the three cohorts, with the best cutoff values being 1.5, 4.5 and 5.5, respectively.

Conclusion: A time-dependent visualized CT score can swiftly identify severe/critical COVID-19 at fever clinic during a community outbreak.

PO-3427

The Importance of Multiparametric MRI Radiomics Model in Predicting Risk Stratification in Early-stage Endometrial Carcinoma

Huan Meng, Yu-Feng Sun, Yu Zhang, Ya-Nan Yu, Jing Wang, Jia-Ning Wang, Lin-Yan Xue, Xiao-Ping Yin
Affiliated Hospital of Hebei University

Objective: Preoperative risk stratification of early-stage endometrial carcinoma (EC) is crucial for clinical treatment. In this study, we aim to investigate the value of radiomics models based on magnetic resonance imaging (MRI) to predict the risk stratification and staging of early-stage EC. **Materials and Methods:** A group of 155 patients who underwent MRI examinations before surgery between January 2020 and September 2022 and were pathologically diagnosed with early-stage EC were included in the study. Three-dimensional radiomics features were obtained from the segmented tumor images captured on MRI scans (including T2WI, CE-T1WI delayed phase, and ADC), resulting in a total of 1,521 features. These features were then filtered using the Pearson's correlation coefficient to create a prediction model for risk stratification and staging of EC using five-fold cross-validation and a multilayer perceptron algorithm. The performance of each model was assessed by analyzing ROC curves and calculating the AUC, accuracy, sensitivity, and specificity.

Results: In terms of risk stratification, the CE-T1 sequence demonstrated the highest predictive accuracy of 0.858 ± 0.025 and an AUC of 0.878 ± 0.042 among the three sequences. However, when combining all three sequences, the predictive accuracy improved to 0.881 ± 0.040 and the AUC increased to 0.862 ± 0.069 . When it comes to staging, using a combination of T2WI with CE-T1WI resulted in a higher predictive accuracy of 0.956 ± 0.020 compared to using any single feature. The corresponding AUC was 0.979 ± 0.022 . Utilizing all three sequences together yielded the best predictive accuracy of 0.956 ± 0.000 and an AUC of 0.986 ± 0.007 . Notably, this accuracy outperformed the accuracy of the radiologist (0.832).

Conclusion: The MRI radiomics model has great potential in predicting the risk stratification and early staging of EC.

PO-3428

Radiomics based on MRI for predicting the nature of nodules in cirrhotic liver.

Wenxue Pan¹, Jiawen Luo², Jie Bian²

1. Dalian Ruikang Cardiovascular Hospital (The Second Hospital of the Dalian Medical University Cardiovascular Hospital)

2. The Second Hospital of Dalian Medical University

Objective: To assess the value of MRI-based radiomics in predicting hepatocellular carcinoma (HCC), regenerative nodules (RN) and dysplastic nodules (DN).

Methods: We retrospectively analyzed 266 patients with pathologically confirmed RN, DN and HCC, the model building dataset included 282 lesions (56RNs, 72DNs and 54HCCs) and the independent external validation dataset included 80 lesions (20RNs, 20DNs and 40HCCs). All of them underwent MRI enhancement using T1WI, T2WI, DWI, and T1WI enhanced sequences. A total of 2264 radiomic features were extracted from the regions of interest. Decision tree (DT), logistic regression (LR), random forest (RF), stochastic gradient descent (SGD) and support vector machine (SVM) were used to establish semantic features-based model, radiomics-based model

and combined model of semantic features and radiomic features respectively for the best features selected by five-fold cross validation. Models were validated with internal validation and external validation. The decision curve analysis, calibration curves and area under the curve (AUC) were used to evaluate the model's performance.

Results: In the internal validation cohort, the performance of SVM in the combined model was the best, with an AUC of 0.936. In the external validation cohort, the performance of the combined model was the best, with an AUC of 0.896, which was higher than that of radiomics-based model (AUC=0.859) and semantic features-based model (AUC=0.883). Decision curve analysis and the calibration curve demonstrated that combined model was more useful in the external validation cohort.

Conclusions: The machine learning based on combined model is significantly more advantageous in predicting RN, DN and HCC than semantic features-based model, radiomics-based model alone.

PO-3429

Depression Related Structural Changes Based on 3D Brain MRI and Neural Fingerprint Assisted Segmentation and Imaging-markers

Liya Wang¹, Xu Peijia¹, Xue Ting², Xue Xingkui¹

1. Affiliated Longhua People's Hospital, the third School of Clinical Medicine, Southern Medical University, Shenzhen 518109, China

2. The Tenth Affiliated Hospital of Southern Medical University, Dongguan 523059, China

Purpose

To explore the feasibility using high-resolution brain MRI and artificial intelligence based neural fingerprint technology to segment and quantify slight volume changes of brain structures and imaging-markers for diagnosis of depressive disorder (DD).

Methods

Sixty-one DDs and 61 healthy controls (HCs) were recruited in this study. All subjects completed Hamilton Depression (HAMD) and brain MRI and 3D-T1-weighted-imaging with 1mm-slice-thickness in 3T MR scanner. BrainLabel brain image analysis platform with neural fingerprint technology were used to segment the whole brain regions, followed by quantifying all volumes of sub-structure brain regions in all subjects. SPSS was used for comparison and correlation analyses. Receiver operating characteristics analysis was used to evaluate diagnostic performance of DD. $P < 0.05$ was considered statistically significant.

Results

A neural fingerprint segmentation based on brain structures 3D-MRI was able to quantify slight volume changes of brain regions. Especially, cingulate gyrus and cuneate lobe in DDs, hippocampus in male DDs and entorhinal cortex in female DDs (all $P < 0.01$). Moreover, a negative correlation with HAMD scores in volume decline of hippocampus in male DDs and right entorhinal cortex in female DDs when comparing to HCs. A combination of top three brain regions improved the sensitivity and specificity on diagnostic performance.

Conclusion

The identified and quantified slight volume changes of specific emotion-related brain structures might service as neuro-imaging markers for diagnosis of DD. The female DD was different from the male, which was more sensitive to entorhinal cortex, but to hippocampus in male DD. Combining multi-imaging-markers increased diagnostic performance of male and female DDs.

PO-3430

Imaging Features of Pancreatic Dedifferentiated Liposarcoma: A Rare Case Report

Peijia Xu¹, Ting Xue², Xingkui Xue¹, Liya Wang¹

1. Affiliated Longhua People's Hospital, the third School of Clinical Medicine, Southern Medical University, Shenzhen 518109, China

2. The Tenth Affiliated Hospital of Southern Medical University, Dongguan 523059, China

Background and Purpose

Dedifferentiated lip sarcoma (DDLPS)

is a rare subtype of lip sarcoma with poor prognosis. The earlier the diagnosis, the better the surgical effect. With the development of medical imaging technology, especially the application of clinic CT and MR. Both of them play key roles to diagnose DDLPS with the typical characterization, which displayed a soft tissue mass with varied composition and closely related to the proportion and distribution of different differentiation components. However, the imaging features related to pancreatic lip sarcoma were few reported previously. The primary DDLPS is an extremely rare in the pancreas. Herein, we report an unusual case of DDLPS arising from the tail of pancreas with relevant imaging features of both CT and MRI, as well as pathological evidences in order to improve the diagnosis and location of DDLPS before surgery.

Methods and Results

A 51-year-old Chinese female presented to the department of Hepatobiliary Surgery, the People's Hospital of Longhua, Shenzhen, Guangdong province, China in October 2020 due to her intermittent pain in the middle and upper abdomen for one year. The patient underwent radical gastrectomy for gastric cancer three years earlier. Before the hospitalization, she had undergone abdominal CT and MRI scans in the same hospital above. An abdominal unenhanced CT identified a round soft tissue mass measuring 5.7 X 6.7 X 6.8 cm³ in the tail of pancreas. The CT value of mass was 51 Hu in unenhanced CT images [Figure 1A], but the CT values were increased to 77 Hu, 86 Hu, and 109 Hu, respectively post-contrast at arterial [Figure 1B], venous [Figure 1C] and delayed periods [Figure 1D]. The mass was closely related to the tail of pancreas and the pancreatic tail was compressed, but the boundary of adjacent surface was not clear partly showing as yellow arrow in Figure 1A-1D. The representation of mass was relatively homogeneous, but detected a minimum CT value at -80 Hu in low-attenuation areas, which might indicate very less fat components in coronal position [Figure 1E]. The adjacent splenic artery and vein were compressed and displaced in the volume rendering (VR) imaging [Figure 1F]. The shadow of surgical clipping for radical gastrectomy was observed as long strip high density in the gastric body from multi-planar reformatting (MPR) in sagittal position [Figure 1G]. No abnormal enhanced lesions were found in CT images. A tumour of the tail of pancreas, likely neuroendocrine tumour, was considered by CT impression. Thereafter, MRI was implemented and demonstrated a mass in the body and tail of pancreas. Its size was approximately 5.8 X 6.7 X 6.8 cm³ with heterogeneous appearance. The most areas of the mass were hypo intensity in T2 weighted imaging (T2WI) and T2WI with fat suppression sequence, rather than hyper intensity in diffusion weighted imaging (DWI). The boundary of lesion was relatively clear as shown in Figure 2A-2C. MR enhanced images revealed the tumour in T1 weighted imaging (T1WI) from homogeneous iso-intensity in pre-contrast [Figure 2D] to heterogeneous enhancement in the arteriovenous period [Figure 2E-F] and stronger enhancement in the delay period [Figure G]. The tail of pancreas was compressed and shifted forward, while, the arteriovenous of spleen was moved backward [Figure 2H]. However, it was found that the adjacent surface between tumour

and the pancreatic pancreas was not clear slightly showing as yellow arrow in Figure 2D-G. It might indicate that the tumour was originally from the tail of pancreas. There was no obvious dilation of the pancreatic duct observed in magnetic resonance cholangiopancreatography (MRCP) showing in the Figure 2I. The characteristic of metastatic lymph nodes or lesion was not found in all MR images. In addition, no abnormal enhancement was observed in the residual stomach. Therefore, MRI impressed the tumour as a ligamentous fibroma originating in the tail of pancreas. After the tumour was completely excised, an isolated fibroma of pancreas was considered Figure 4.

Conclusion

The current case report revealed a unique case of the DDLPS originating from the tail of pancreas, one of the rarest locations for digestive sarcomas. DDLPS should be thoroughly distinguished from its morphological mimickers as the tumour may be more highly aggressive and more extensive than clinically and radiologically expected. The pancreatic tumour was confirmed finally as DDLPS by MDM2 proliferation. However, the radiologists should keep close to DDLPS in the location, size, homogeneity, component, and enhancement in order to improve the preoperative diagnosis and curative effect.

PO-3431

CT-Based Radiomics Nomogram for Differentiation of adrenal Lipid-poor benign lesions and Metastases: an exploratory study

Cunxia Yang

Affiliated Hospital of Hebei University

Objectives: To investigate the effectiveness of a nomogram model based on the abdominal CT radiomics and clinico-radiological information in differentiating adrenal lipid-poor benign adenomas from metastases.

Methods: A total of 272 patients from 2 institutions were divided into three cohorts (training cohort $n = 141$, testing cohort $n = 60$, and external validation cohort $n = 71$), and the radiomic features were extracted from unenhanced and enhanced abdominal CT images using the PyRadiomics package. Support vector machines (SVM), random forest (RF) and logistic regression (LR) models based on salient features were established. Receiver operating characteristic (ROC) curve was used to assess the best model, and the multi-phase fusion was performed. Radiomics nomogram was established by selected radiomics signature and clinical factors and assessed by the decision curve analysis (DCA).

Results: After feature screening, 10 salient features were finally retained. The most effective radiomics model was the SVM model. In the training set, the area under the curve (AUC) of the SVM model was 0.948, 0.936, 0.918 and 0.924 in the unenhanced, arterial, venous and delayed phase, respectively. In the testing set, the AUC was 0.944. In the external validation set, the AUC was 0.966. The DCA showed remarkable performance of the nomogram model for distinguishing lipid-poor adrenal adenoma from adrenal metastases.

Conclusions: The radiomics nomogram based on the unenhanced and enhanced CT images and clinical parameters can be used for effective distinguishing lipid-poor adrenal adenoma from adrenal metastases.

PO-3432

Clinical and Imaging features of livers infected with *Fasciola gigantica*

Bin Yang

Jinling Hospital, Medical School of Nanjing University

Abstract

Objective: This study aimed to improve the understanding of the *Fasciola gigantica* disease by investigating the clinical and imaging features of the hepatic *Fasciola gigantica* infection.

Materials and Methods: This study analyzed clinical and imaging features of 27 patients with hepatic *Fasciola gigantica* infection retrospectively. All of them underwent upper abdominal CT (Computed tomography) scan, including plain CT scan (n=27) and contrast-enhanced CT scan (n=24). Nine patients underwent plain MR (Magnetic resonance) scan and 7 patients had enhanced MR scan. Two patients were subjected to liver biopsy. The clinical and imaging manifestations of the disease were analyzed.

Results: All the 27 patients had high fever and pain in the right upper abdomen. Liver and spleen were enlarged, and the percentage of eosinophils increased. The positive rate of antibody against *Fasciola gigantica* was 100%. All patients presented clustered or tunnel-like confluent lesions with ring-like enhancement mainly in subcapsular liver parenchyma, which showed slight or high signal intensity on DWI (Diffusion weighted imaging). Other nonspecific findings such as lymph node enlargement, perihepatic or subcapsular effusion were seen.

Conclusion: In summary, the patients have a history of coming from epidemic distributive regions and, clinical symptoms manifest as hyperpyrexia, then present with abdominal pain that is associated with gastrointestinal symptoms, hepatosplenomegaly, elevated eosinophil count, positive antibody to *Fasciola gigantica* detected by ELISA. Hepatic *Fasciola gigantica* infection has relatively specific imaging findings such as clustered or tunnel-like confluent lesions with ring-like enhancement mainly in subcapsular liver parenchyma. DWI could be helpful for the diagnosis, but further studies are needed.

PO-3433

Implications and Prospects of Immunological and Neuroimaging Research in HIV-Related Cognitive Impairment

Xingyuan Jiang, Hongjun Li

Department of Radiology, Beijing YouAn Hospital, Capital Medical University, Beijing, China

Combination antiretroviral therapy has achieved success in controlling viral replication in HIV-infected individuals. However, cognitive and motor impairments, affecting 30-60% of patients, persist due to factors like viral escape, immune reconstitution, inflammation, metabolic dysregulation, and drug neurotoxicity. These issues culminate in HIV-associated neurocognitive disorders (HAND), posing a significant global challenge.

The current approach to assess cognitive function relies on the Frascati criteria, but it is limited by the need for specialized facilities, time consumption, and insensitivity to early-stage patients. Immunology underpins HAND pathophysiology, and while immunological markers offer insights at the molecular level, they do not provide visual representation or predict neural structural changes. Neuroimaging complements immunology by enabling the observation of neural lesions in HAND from macroscopic and anatomical perspectives. Combining abnormal neuroimaging with immunological biomarkers shows promise in earlier HAND detection compared to cognitive assessments and clinical symptoms.

This review covers HAND epidemiology, diagnostic methods, neuroimmune pathogenesis insights from animal models, cerebrospinal fluid, and peripheral immunological biomarkers. It summarizes current imaging techniques and associated markers, highlighting efforts to integrate neuroimaging and immunology. Additionally, the review explores novel approaches to HAND treatment and its significance in the context of potentially eradicating HIV. We illuminate the systemic links between early HAND diagnosis and the synergy between neuroimaging and immunology, as well as identify candidate biomarkers in HAND pathogenesis.

PO-3434

Cerebrovascular dysfunction as a Marker of Cognitive Impairment in HIV Positive Individuals

Yi Zhan¹, Bei Wang², Dan-chao Cai¹, Chuan Chen¹, He Wang², Yuxin Shi¹

1. Shanghai Public Health Clinical Center

2. Institute of Science and Technology for Brain-inspired Intelligence

Background and Objective: Cerebrovascular abnormalities and brain injury can occur in people living with HIV (PLWH) and have become a major threat to their survival time and quality of life. Brain injury may reflect morphological characteristics of cerebral vessels in PLWH, such as neuropsychological test performance. If the structure of cerebral vessels and cognitive deficits in PLWH are shown to be related, then cerebrovascular morphology might serve as a “window” into brain injury in these patients.

Methods: Based on the performance of the neuropsychological cognitive test, 42 PLWH were divided into a group with cognition abnormal (PLWH-CB, 33.68 years; 19 males) and one without (PLWH-nonCB, 35.52 years; 23 males). A health control group with normal cognition (HC, 33.20 years; 25 males) was also enrolled. Participants were studied using magnetic resonance angiography with time of flight (MRA-TOF). The automatic cerebral vessel extraction method was adopted to segment cerebral vessels and calculate morphological features to have a comprehensive description of cerebrovascular structure. Group differences were used to assess the impact of HIV on cerebrovascular morphologies, including vessel volume, averaged radius, and tortuosity. Partial correlation analyses were used to investigate the association between cerebrovascular morphologies and cognitive performance. No viral load was detected in the peripheral blood of all PLWH.

Results: The lowest cerebral vessel volume was found in the PLWH-nonCB group, followed by the PLWH-CB group, when compared with the HC group. In PLWH-CB, cerebral vessel averaged tortuosity was similar to the PLWH-nonCB group, lower than the HC group. No significant differences in the age and education years among all groups. Morphological characteristics of cerebral vessels were shown correlated with cognition, under controlled with age and education, not only in PLWH subjects but also in all subjects (in PLWH, recall, $P < 0.05$; in all subjects, speed of information processing, $P < 0.05$).

Conclusions: HIV infection affects cerebral vessels even with the virus suppressed. Morphological characteristics of cerebral vessels could reflect cognition. Therefore, cerebrovascular dysfunction could serve as a potential marker of brain injury in HIV Infection.

PO-3435

PD-1 Checkpoint Inhibition plus Chemotherapy for Advanced Metastatic Triple-Negative Breast Cancer

zhe han wang,hong lu

Central Hospital Affiliated to Chongqing University of Technology

Background

Triple negative breast cancer (TNBC) represents 15 to 20% of breast cancer cases and is associated poor prognosis because of its aggressive nature (expression of highly proliferative, high grade and basal-like genes [about 55%-81%]) and lack of targeted therapeutic options (1-3). Treatment is challenging as it lacks expression of hormone receptors (estrogen receptor [ER-] and progesterone receptor [PR-]) and/or amplification or overexpression of human epidermal growth factor receptor 2 [HER2] (3). As such, TNBC patients mainly rely on cytotoxic chemotherapy as the mainstay of treatment (1-4). Despite a stronger response to chemotherapy among the BC subgroups, recurrence is higher in the first three years of treatment which is associated with poor survival — a phenomenon termed as TNBC paradox (3-5). Metastasis is the major cause of death in this subgroup with 5-year survival rate of under 30% for mTNBC (2). Consequently, alternative therapeutic approaches are desired for an improved outcome.

Discovery of PD-1 (programmed cell death protein 1) receptor-ligand interaction pathway as the major tumor immune evasive mechanism has fashioned immunotherapy in the form of PD-1/PD-L1 inhibitors as an alternative and complementary option for cancer patients (6). TNBC exhibits high infiltration of tumour-infiltrating lymphocytes (TILs) coupled with elevated PD-L1 expression which makes this cancer an ideal candidate for PD-1/PD-L1 inhibition (7-9). In fact, both PD-1 inhibitor (pembrolizumab) and PD-L1 inhibitor (atezolizumab) as monotherapy have shown promising results in metastatic TNBC (10-14). Unraveling of immunomodulatory effects of chemotherapy has encouraged the combination of these two therapies for complementary interplay which has shown improved outcomes in several cancers including breast cancer (15-26). Recent clinical trials have led to approval of these agents in combination with chemotherapy for metastatic TNBC (10-14, 24-26). Nonetheless, the IMPassion131 trial has produced negative results for this combination casting doubts on their efficacy (26). In this systematic review and meta-analysis, we aim to analyze the overall efficacy of these agents in mTNBC with a focus on subgroup factor analysis.

Materials and Methods

PubMed database was searched until November 2022 for studies comparing PD-1 checkpoint inhibitors plus chemotherapy (ICT) to CT alone. Primary outcome of interest was progression-free survival (PFS). Other outcomes of interest included tumor response, overall survival, and toxicity. Review Manager (RevMan) version 5.4. was used for data-analysis.

Results

Three randomized controlled trials (RCTs) comprising 2400 advanced metastatic TNBC were selected for inclusion in this systematic review and meta-analysis. PFS was significantly improved in ITT (HR 0.82 [0.74, 0.90], $p < 0.0001$) and PD-L1+ subgroup ($n=1296$; HR 0.73 [0.64, 0.85], $p < 0.0001$) with the addition of IT to CT. PFS surge was mainly seen in White (HR 0.80 [0.70, 0.91], $p=0.0007$) & Asian ethnicity (HR 0.73 [0.58, 0.93], $p=0.01$), PD-L1 positive patients (HR 0.73 [0.64, 0.85], $p < 0.0001$), with up-to 3 metastatic sites (HR 0.78 [0.69, 0.89], $p=0.0002$), no liver metastasis (HR 0.80 [0.68, 0.94], $p=0.006$), and no prior exposure to NACT/ACT (HR 0.68 [0.56, 0.81], $p < 0.0001$). ORR had also shown similar enhancement (ITT: OR 1.38 [1.16, 1.63], $p=0.0002$; PD-L1+: OR 1.58 [1.25, 1.99], $p=0.0001$ OR 1.58 [1.25, 1.99], $p=0.0001$). OS showed no improvement (ITT: HR 0.97 [0.75, 1.25], $p=0.80$; PD-L1+: HR 0.87 [0.56, 1.34], $p=0.53$). Grade 3 AEs (OR 1.32 [1.11, 1.57], $p=0.002$) and serious adverse events (SAEs) (OR 1.40 [1.08, 1.80], $p=0.01$) were more common with combined approach. Immune-related toxicity was the main contributing factor to toxicity surge (OR 2.35 [1.26, 4.36], $p=0.007$).

Conclusions

In conclusion, our study indicates that PD-1 checkpoint inhibitors in combination with chemotherapy induce an enhanced tumor response with marked improvement in progression-free survival in mTNBC patients. Toxicity is slightly increased in the form of immune-related adverse events with no long-term concerns. PD-L1 expression as predictive biomarker was demonstrated. Long-term efficacy still remains unclear in terms of OS. Further investigations aimed at long-term efficacy are warranted.

PO-3436

Tracheal CT Radiomics Nomogram to Predict Omicron Variant of SARS-CoV-2 Infection

Xu Fang¹, Fang Liu¹, Jing Li¹, Ying Wei², Feng Shi², Yun Bian¹, Chengwei Shao¹

1. Changhai Hospital of Second Military Medical University

2. Shanghai United Imaging Intelligence Co., Ltd

Objectives Omicron variant is more contagious, spreads faster, milder symptoms and more insidious, resulting in a surge in the number of coronavirus disease 2019 (COVID-19) cases between March and June 2022 in Shanghai. However, Omicron variant was limited to the upper respiratory tract and less involvement of the lungs. This study aimed to develop and validate a tracheal CT radiomics nomogram to predict omicron variant of SARS-CoV-2 infection.

Methods In this retrospective study, a radiomics model was developed on the basis of a training set consisting of 157 patients with Omicron variant of COVID-19 and 239 healthy people. Radiomics features were extracted from the tracheal wall on the lung parenchyma window of chest CT. A radiomics signature was built on the basis of reproducible features, using the least absolute shrinkage and selection operator method. The performance of the nomograms was determined by its' discrimination, calibration, and clinical usefulness. The models were validated in 67 patients with Omicron variant of COVID-19 and 103 healthy people.

Results The radiomics signature, consisting of 12 selected features, was significantly associated with Omicron variant of COVID-19 ($p < 0.05$) in both training and validation sets. The radiomics model achieved an AUC of 0.993 (95% CI 0.98-1.00) in the training cohort and 0.989 (95% CI 0.97-1.00) in the validation cohort. The sensitivity, specificity, and accuracy of the model for the training set were 93.0%, 95.8%, and 94.7%, respectively, whereas those for the validation set were 92.5%, 96.1%, and 94.7%, respectively. The decision curve analysis demonstrated that the radiomics nomogram was clinically useful.

Conclusions The tracheal CT radiomics nomogram has good performance for predicting Omicron variant of COVID-19 and may help in clinical decision-making.

PO-3437

Identifying Minimal Hepatic Encephalopathy: A new perspective from Multimodality Magnetic Resonance Imaging

Yisong Wang, Longtao Yang, Jun Liu

The Second Xiangya Hospital of Central South University

Type C hepatic encephalopathy (HE) is a condition characterized by brain dysfunction caused by liver insufficiency and/or portal-systemic blood shunting, which manifests as a broad spectrum of neurological or psychiatric abnormalities, ranging from minimal HE (MHE), detectable only by neuropsychological or neurophysiological assessment, to coma. Though MHE is the subclinical phase of HE, it is highly prevalent in cirrhotic patients and strongly associated with poor quality of

life, high risk of overt HE (OHE), and mortality. It is, therefore, critical to identify MHE at the earliest and timely intervene, thereby minimizing the subsequent complications and costs. However, proper and sensitive diagnosis of MHE is hampered by its unnoticeable symptoms and the absence of standard diagnostic criteria. A wide range of measurements should be performed to diagnose MHE, which are susceptible to multiple factors (e.g., aging, education) and then limit their application in clinical practice. Thus, developing an objective, effective, and noninvasive method is imperative to help detect MHE. Magnetic resonance imaging (MRI), a noninvasive technique which can produce many objective biomarkers by different imaging sequences (eg., MRS, DWI, rs-MRI, ASL), recently show the ability to accurately screen MHE from NHE (non-HE) patients. In addition, the advancement of artificial intelligence (AI) in medical imaging also presents the potential to mine more effective diagnostic biomarkers and further improves the predictive efficiency of MHE. Taken together, advanced MRI techniques may provide a new perspective for us to identify MHE in the future.

PO-3438

A new CT score-based staging for melioidosis pneumonia to predict progression

Yuefu Zhan, Hong Lu
Chongqing University of Technology Affiliated Central Hospital

Objectives To quantitatively extract CT features and evaluate CT score-based staging in predicting melioidosis pneumonia progression. **Methods** This study included 97 culture-confirmed melioidosis pneumonia patients who presented between January 2002 and December 2021. Lung segmentation and annotation of lesions (consolidation, nodules and cavity) were used for feature extraction. The features, including the involved area, amount and intensity were extracted. The CT scores of the lesion features were defined by the feature importance weight and qualitative stage of melioidosis pneumonia. GPR was used to predict severe or critical melioidosis pneumonia patients by CT scores. **Results** The melioidosis pneumonia stages included: acute stage (0-7 days), subacute stage (8-28 days) and chronic stage (> 28 days). In the acute stage, the CT scores of all patients ranged from 2.5 to 6.5. In the subacute stage, the CT scores for the severe and mild patients were 3.0-7.0 and 2.0-5.0, respectively. In the chronic stage, the CT score of the mild patients fluctuated approximately 2.5-3.5 in a linear distribution. Consolidation is the major lesion in melioidosis pneumonia. The percentage of severe scans with nodules dropped from 72.22% to 47.62% ($p < 0.05$), and the percentage of severe scans with cavities significantly increased from 16.67% to 57.14% ($p < 0.05$) between stages I and II. The GPR optimization function has AUCs of 0.71 for stage I, 0.92 for stage II and 0.87 for all stages. **Conclusion** In melioidosis pneumonia patients, it is reasonable to divide the period into three stages to determine the prognosis.

PO-3439

Common and distinct pattern of frequency-dependent intrinsic brain activity in patients with post-acute COVID-19 syndrome

Yao Wang, Fuqing Zhou
Nanchang University

Objective: Post-acute COVID-19 syndrome (PACS) is characterized by persistent and complex symptoms, and its underlying neurological basis is not fully understood. The study

aims to explore brain pattern of intrinsic activity in PACS and its relationships with clinical symptoms. **Methods:** A total of 29 PACS patients, 28 COVID-19 subjects without PACS (non-PACS), and 30 healthy controls (HCs) were recruited. All COVID-19 subjects underwent nucleic acid testing, functional MRI and neuropsychological assessments, and HCs had no history of nucleic acid positivity. The fMRI data were preprocessed in DPABI 7.0 (<http://rfmri.org/dpabi>). We calculated voxel-level fractional amplitude of low-frequency fluctuation (fALFF) in typical frequency band (0.01-0.10 Hz) to characterize regional patterns of intrinsic activity among the three groups. Meanwhile, the difference of fALFF pattern was explored in two specific frequency bands: slow 5 (0.01-0.023 Hz) and slow 4 (0.023-0.073 Hz). In addition, the receiver characteristic curve (ROC) analysis was applied to distinguish PACS from non-PACS with different fALFF pattern in typical frequency band. Partial or Spearman correlation was used to explore the relationship between fALFF changes and clinical variables. **Results:** In typical frequency band, common pattern of decreased fALFF in the bilateral precuneus was found both in the PACS and non-PACS groups compared to HCs. Distinct pattern of decreased fALFF in the right posterior cerebellum and left precuneus only appeared in the PACS group, while decreased fALFF in the left posterior cerebellar lobe, left superior frontal gyrus, and bilateral precuneus only appeared in the non-PACS group. Further analysis of specific frequency bands: in the slow 5, fALFF decreased in the left posterior cingulate/precuneus in PACS patients and bilateral precuneus in the non-PACS patients. In the slow 4, the PACS group and the non-PACS group showed decreased fALFF pattern in the left superior frontal gyrus. ROC analysis showed that fALFF patterns of the bilateral precuneus and right posterior cerebellar lobe could distinguish PACS from non-PACS patients (AUC: 0.74, 0.66). Correlation analysis suggested that common pattern of decreased fALFF in the bilateral precuneus was related to overall cognition ($r=0.207$; $P=0.037$) in COVID-19, and decreased fALFF pattern in the right posterior cerebellum lobe was related to fatigue scores ($r=0.415$; $P=0.025$) in the PACS group.

Conclusion: PACS and non-PACS groups share a common pattern with decreased fALFF in the bilateral precuneus, which is related to the general cognition of COVID-19 patients. However, only the decreased fALFF pattern of the right posterior cerebellar lobe is related to fatigue in PACS patients. In addition, fALFF patterns in COVID-19 patients are affected by different frequency brands.

PO-3440

回顾性研究 COVID-19 心肌炎和严重性因素

刘明科

重庆医科大学附属永川医院

背景: 尽管 COVID-19 患者的临床特征报道较多, 但影响 COVID-19 严重程度的几个关键危险因素仍然可以进一步研究探讨。本研究旨在探讨影响 COVID-19 严重程度的预后因素和内在因素。

方法: 通过对确诊为 COVID-19 的成人住院患者的病历回顾, 收集人口学、流行病学、放射学和实验室资料。时间为 2020 年 1 月 21 日至 3 月 20 日。肺部炎症指数 (PII) 用于胸部 CT 检查。多因素 logistic 回归分析用于确定独立的严重性危险因素。

结果: 共纳入 84 例确诊为 COVID-19 的住院成人患者。重症组病毒载量明显高于非重症组 ($p<0.05$), 重症组较非重症组更易出现典型的 CT 异常, 表现为片状阴影或磨玻璃样阴影、实变及小叶间隔增厚 (均 $p<0.05$)。重度组 PII 值明显高于非重度组 ($p<0.001$)。84 例患者中 13 例 (15.48%) 心电图及血清心肌酶水平异常, 4 例 (4.8%) 临床诊断为 SARS-CoV-2 心肌炎。多变量 logistic 回归分析可区分年龄 ($p=0.012$)、Ct 值 ($p=0.048$) 和 PII ($p=0.008$) 三个与 COVID-19 严重程度相关的独立危险因素。

结论: COVID-19 的三个关键独立危险因素包括年龄、PII 和 Ct 值。Ct 值与 COVID-19 严重程度密切相关, 可作为 COVID-19 早期临床严重程度的预测指标。尽管 SARS-CoV-2 心肌炎的发病率相对较低 (4.8%), 但仍应引起重视。血压和血氧饱和度与疫区海拔高度密切相关, 不容忽视。

PO-3441

LAD 纵深型心肌桥形态与 CT-FFR 的关系研究

罗琳、陈萍

内蒙古科技大学包头医学院第一附属医院

目的：通过冠状动脉 CT 血管造影 (CCTA) 检查探讨左冠状动脉前降支 (LAD) 纵深型心肌桥形态与 CT 血流储备分数 (CT-FFR) 的关系。**方法：**回顾性分析 2018 年 1 月-2022 年 4 月包头医学院第一附属医院 323 例 LAD 纵深型心肌桥患者的解剖学信息，并以 $CT-FFR \leq 0.80$ 为心肌缺血的指标，将患者分为 CT-FFR 正常组 (237 例) 及 CT-FFR 异常组 (86 例)。采用 t 检验分析比较两组间各心肌桥参数的差异，采用多因素线性回归模型分析 CT-FFR 值的影响因素，并将差异有统计学意义的参数进行 ROC 曲线分析。**结果：**两组间心肌桥入口处位置、出口处位置、长度、肌肉指数、收缩期压迫程度及壁冠状动脉最狭窄处面积、入口处面积、出口处面积差异均有统计学意义 ($P < 0.05$)。多因素线性回归方程显示，心肌桥出口位置、心肌桥长度及心肌桥肌肉指数对 CT-FFR 值具有负向影响 ($P < 0.05$)，壁冠状动脉最狭窄处面积对 CT-FFR 值具有正向影响 ($P < 0.05$)，并且心肌桥长度、出口位置、肌肉指数对心肌桥心肌缺血均具有较高的诊断价值，三者的曲线下面积 (AUC) 分别为 0.85、0.80、0.79。**结论：**LAD 纵深型心肌桥的位置离冠状窦越近、壁冠状动脉面积越窄，尤其是心肌桥长度较长的患者，更容易出现心肌缺血的临床表现，应予以高度重视。

PO-3442

AI 辅助下的病变体积评估在新型冠状病毒肺炎临床分型中的应用价值

王海静、罗琳

内蒙古科技大学包头医学院第一附属医院

探讨人工智能在不同临床分型新型冠状病毒肺炎 CT 影像定量评价中的应用价值。**方法** 以 2021 年 10 月到 2022 年 6 月间进行胸部 CT 检查的 169 例 COVID-19 患者为研究对象，并分为重症组 14 例和非重症组 155 例。收集并回顾性分析患者的一般资料及影像学信息，并在“新冠肺炎 CT 影像 AI 定性辅助诊断系统”的辅助下测量并计算各研究对象的病变体积分数、GGO 体积分数、实变影体积分数、GGO+实变影体积分数以及铺路石征体积分数。采用 Mann-Whitney U 检验的方法进行两组数据的比较；采用受试者工作特征曲线 (ROC) 评估上述指标对重症型患者的诊断效能。**结果** 两组研究对象的病变体积分数 ($Z = -5.483, P < 0.001$) 和 GGO 体积分数 ($Z = -3.299, P = 0.001$) 差异显著，而两组实变影体积分数、GGO+实变影体积分数以及铺路石征体积分数的差异无统计学意义 ($P > 0.05$)。病变体积分数和 GGO 体积分数进行 COVID-19 临床分型的敏感度分别为 1.00 和 0.60，特异度分别 0.822, 0.923。**结论** AI 辅助下测量的病变体积分数和 GGO 体积分数是进行 COVID-19 临床分型的敏感指标。

PO-3443

儿童急性脑脊髓炎影像学诊断

劳群

杭州市儿童医院

儿童急性播散性脑脊髓膜炎多见于大年龄段儿童，持续发热，发病急，大脑为主，大片，皮层下 CSF：淋巴细胞增多 白细胞可正常 与化脓性脑炎脑膜炎鉴别点

病例分享 F 12 岁 左卵巢未成熟畸胎瘤 10CM，术后 1 周 躁狂，攻击行为--PICU.

外周血清、脑脊液抗谷氨酸受体 (NMDA 型) 抗体 IgG 1:32

好发 10 岁左右，男童 (本例 9 岁)；

多饮、多尿、偏侧肢体肌力下降；

血清与脑脊液 AFP 正常， β -HCG 可正常或轻度升高；

活检-病理证实为纯生殖细胞瘤--化疗--放疗 (脑室和瘤床)。

婴幼儿臂丛神经损伤 MRI 联合技术体系

劳群

杭州市儿童医院

目的 提高婴幼儿臂丛神经病变 MRI 诊断率

方法 该研究内容为浙江省公益技术应用研究项目 (LGF19H180003)，联合郑州儿童医院、浙大附属第一医院等 8 家医院，探索臂丛神经 MRI 联合技术体系，通过联合摆位、线圈叠加、技术参数优化、薄层扫描、增强、图像重建、自制辅助匀场装置缩小了颈肩部软组织与空气接触面积等综合措施，有效提高 B0 磁场的均匀性，增强脂肪抑制效果，有效提高婴幼儿臂丛神经图像质量及病变检出率。该技术并从臂丛神经损伤推广应用于臂丛神经肿瘤的 MRI 诊断。项目已在浙江省 17 家地市级及基层医院技术推广应用，于 2023-4-13 通过省科技厅组织的专家评审验收。

结果 婴幼儿臂丛 MRI 联合技术体系有较高病变检测敏感性

结论 婴幼儿臂丛 MRI 联合技术体系诊断有效性

PO-3445

泡状棘球蚴病及其肝外转移的影像学特征分析

马恩潭

甘肃省临夏州人民医院

泡状棘球蚴病是一种少见的人畜共患寄生虫病，多见于牧区，近年来，由于人口的流动和旅游业的发展等原因，城市人群中的发病人数有上升的趋势。临床上泡状棘球蚴病主要侵犯肝脏，可在人体生存数年至数十年不等，肝泡状棘球蚴病可类似肿瘤一样在肝内及体内呈隐匿性、侵袭性缓慢生长，感染可局部侵袭性扩散或通过淋巴管或血管转移至远处部位和其他器官，多扩散于颅脑、肺、肾脏、脾脏等脏器，最终导致患者死亡。因此，泡状棘球蚴病有“虫癌”之称。病理上泡状棘球蚴病是由无数直径 1-15 毫米的微小囊泡、凝固性坏死组织、纤维组织增生以及病灶中心的液化坏死构成，外周无纤维包膜，与周围组织分界不清。泡状棘球蚴病肝内原发灶与肝外转移灶信号特点具有部分共

同特征, T1WI、T2WI 均表现为“地图”样特征性低信号及多发小囊泡影。增强扫描除脑内病灶外, 其他脏器病灶均无强化(脑内病灶因周围组织反应、血脑屏障破坏及周围脑组织内毛细血管增生, 表现为明显强化)。肝泡状棘球蚴病及其肝外转移具有一定的影像学特异性表现, 依据其典型表现, 并结合患者接触史及实验室检查可作出正确诊断。

PO-3446

临床-定量 CT 列线图预测老年重症新型冠状病毒感染性肺炎短期预后的价值

吴树剑、俞咏梅
皖南医学院弋矶山医院

目的 探讨基于临床特征及定量 CT 参数构建的列线图预测老年重症新型冠状病毒 (COVID-19) 感染性肺炎短期预后的价值。**方法** 回顾性分析 239 例接受住院治疗的老年重症 COVID-19 感染性肺炎患者的临床及胸部 CT 资料, 住院期间死亡 61 例 (死亡组), 好转出院 178 例 (生存组), 采用分层抽样将患者随机分为训练组 (n=167), 验证组 (n=72)。利用 3d-slicer 软件测量定量 CT 参数, 通过多因素 logistic 回归分析筛选独立危险因素, 构建联合预测模型, 并绘制模型的列线图与校准曲线, Hosmer-Lemeshow 检验评价模型的拟合优度, 模型效能比较采用 delong 检验及赤池信息准则 (AIC)、贝叶斯信息准则 (BIC)。结果 多因素分析年龄、超敏 C 反应蛋白 (hs-CRP) 及实性密度体积百分比 (SOV%) 是预测患者死亡的独立危险因素, 列线图曲线下面积 (AUC) 训练组 0.795 (95% CI: 0.726~0.865), 验证组 0.817 (95% CI: 0.701~0.934), 校准曲线及 Hosmer-Lemeshow 检验显示了较高的校准度及拟合优度, 训练组 delong 检验各单变量与列线图比较差异均有统计学意义 ($P < 0.05$), 验证组 SOV% 与列线图比较差异无统计学意义 ($P > 0.05$), 余差异均具有统计学意义 ($P < 0.05$), 训练组与验证组列线图 AIC 值与 BIC 值均小于单变量。结论 基于临床特征及定量 CT 参数构建的列线图预测老年重症 COVID-19 感染性肺炎短期预后具有重要价值, 且列线图能够将预测结果可视化, 有助于临床决策。

PO-3447

肝衰竭伴轻微型肝性脑病患者人工肝治疗后脑功能改变: 一项随访研究

郑佳瑞¹、刘文潇²、黄雪莹³、杨旭宏⁴、马文富¹、王敏行¹、牛芳¹、王晓东³

1. 宁夏医科大学

2. 中国人民解放军第四医学中心

3. 宁夏医科大学总医院

4. 东南大学

目的 评估肝衰竭伴轻微型肝性脑病(minimal hepatic encephalopathy, MHE)患者脑动态局部一致性(dynamic regional homogeneity, dReHo)改变, 探讨患者人工肝治疗后脑功能的变化, 从脑自发活动动态特征角度评估人工肝治疗疗效。**方法** 前瞻性纳入慢性肝衰竭伴轻微型肝性脑病患者 20 例且均行人工肝治疗, 人工肝治疗前一天及治疗后三个月进行复查, 另 25 名健康志愿者作为对照组, 所有受试者均采集静息态功能磁共振成像数据。dReHo 值统计分析由 DPABI 统计分析模块进行, 采用 Student's t 检验比较 MHE 组(人工肝治疗前、治疗后)与对照组间 dReHo 差异, 采用配对样本 t 检验比较 MHE 患者人工肝治疗前后 dReHo 的差异, 使用 Pearson 相关分析法分析 MHE 组人工肝治疗前与对照组 dReHo 差异脑区的 dReHo 值及 Δ dReHo 值(治疗前 dReHo-治疗后 dReHo)与神经心理学量表和血清学指标的相关性。**结果** 对照组相比, MHE 组(人工肝治疗前)表现出异常

的 dReHo 变化,主要表现为双侧额下回眶部、右侧额中回及右侧小脑下半月小叶的 dReHo 值增高; MHE 组(人工肝治疗后)左侧额上回眶部、左侧海马旁回、左侧丘脑、右侧颞下回的 dReHo 仍增高;同时,我们发现 MHE 组经人工肝治疗后脑区的 dReHo 值减低,主要位于右侧枕外侧回及右侧小脑下半月小叶。MHE 组(人工肝治疗前)右侧额中回 dReHo 值与 MoCA 呈显著负相关($r=-0.6689$, $P<0.001$),而 Δ dReHo 值(治疗前与治疗后差值)与临床实验室指标及认知量表评分均无相关性($P>0.001$)。结论 本研究通过此次实验证实 MHE 患者存在神经元活动的动态大脑特征,这可能是认知障碍的神经基础,同时发现人工肝治疗前的 MHE 患者比治疗后的患者表现出与认知障碍相关的更严重的自发脑活动异常。

PO-3448

300 例儿童肺结核胸部 CT 图像分析

张旭

山东省公共卫生临床中心

【目的】通过对 300 例儿童肺结核患者 CT 图像的回顾性分析,总结儿童肺结核的 CT 表现规律,为儿科临床诊断提供帮助。

【方法】收集 2017-2022 年经临床和微生物学证实的 300 例儿童肺结核患者的 CT 图像,记录患儿年龄、性别等信息。对图像进行两名观察者独立评估,记录病变部位、类型、淋巴结及合并征象等表现。采用描述性统计分析发病年龄分布、计数资料构成比。进行 Pearson 相关及 Logistic 回归分析不同特征的相关性。

【结果】儿童肺结核以 1-4 岁发病居多,占比 60%。男女比例为 2:1。肺门淋巴结肿大检出率最高为 85%。Pearson 相关分析显示,发病年龄与肺门淋巴结肿大程度呈负相关($r=-0.541$, $p<0.01$)。Logistic 回归模型分析显示,1-4 岁患儿出现树芽征的概率最高($OR=2.3$, 95%CI 1.1-4.7)。80%出现肺门及纵膈淋巴结肿大。病变好发于上肺野,呈多发小结节及磨玻璃影。60%有支气管扩散表现。10%见树芽样结节。20%有空洞形成。

【结论】儿童肺结核以 1-4 岁发病居多,CT 表现有特点。纵膈淋巴结肿大及上肺野病变提示诊断价值。针对儿童发病高峰年龄段的筛查可提高发现率。结合药敏结果选用敏感抗结核药物,并监测肝肾功能,注意不良反应,可以提高治愈率。

PO-3449

MRI 放射学预测乙型肝炎病毒感染相关肝细胞癌并探索相关易感基因

李思琪¹、杨存霞¹、吴春梅¹、崔景景²、殷小平¹

1. 河北大学附属医院

2. 联影智能医疗科技(北京)有限公司

目的: 构建多序列 MRI 影像组学模型以预测乙型肝炎病毒(hepatitis B virus,HBV)感染患者相关肝细胞癌(hepatocellular carcinoma,HCC),并通过数据挖掘分析探索潜在的基因变异模式。

方法: 回顾性分析 100 例 HCC 患者(HBV 相关型 82 例,非 HBV 相关型 18 例)的 T2WI 序列、DWI 图像和 Gd-EOB-DTPA 增强 T1WI 图像,按 7:3 的比例随机分为训练集(70 例)和验证集(30 例),基于以上 MRI 序列进行影像组学特征提取及预测模型构建,然后利用验证集数据评价组学模型的效能。癌症基因组图集(TCGA)中 164 名患者的肿瘤批量 RNA 测序用于探索 HBV 感染致 HCC 潜在的基因变异模式。

结果: 多序列影像组学模型包括 43 个显著特征, 在预测 HBV 相关 HCC 方面表现出良好的性能, 训练集、测试集的 AUC 分别为 0.993(95%CI 0.991~1)和 0.955(95%CI 0.902~1)。相关功能基因主要富集在病毒蛋白与细胞因子的相互作用、神经活性配体-受体相互作用、细胞因子受体相互作用等通路中。并另通过蛋白-蛋白相互作用网络筛选出前 10 个关键的差异表达基因进行结果可视化分析。

结论: 本研究使用的基于多序列 MRI 影像组学模型可无创性准确预测 HBV 相关 HCC, 并探索了 HBV 相关 HCC 易感基因的表达状态, 为 HBV 致 HCC 发病机制研究提供方向。

PO-3450

基于 CT 影像组学对肾上腺腺瘤亚型的鉴别研究价值

吴春梅¹、殷小平¹、李宇昂²、王尉丞²、薛林雁²

1. 河北大学附属医院

2. 河北大学质量技术监督学院

目的: 探讨基于多期像 CT 影像组学鉴别肾上腺腺瘤亚型的临床价值。**方法:** 搜集河北大学附属医院 2017 年 4 月-2020 年 6 月年收治的肾上腺腺瘤患者共 195 例, 通过回顾性分析肾上腺腺瘤患者的平扫及增强图像、病理结果、临床一般资料及实验室相关检查。其中功能性肾上腺腺瘤 70 例、无功能肾上腺腺瘤 125 例, 通过患者平扫期、动脉期、门静脉期及延迟期的 CT 图像勾画分割感兴趣区共 780 个提取影像组学特征, 使用随机森林算法筛选最优影像组学特征从而构建基于 CT 不同时期的支持向量机 (SVM) 影像组学模型, 再经过五折交叉对结果进行验证, 并绘制各个模型的受试者工作特性 (ROC) 曲线、P-R 曲线、混淆矩阵分析模型对肾上腺腺瘤亚型的鉴别诊断效能, 并计算模型的准确度、灵敏度、特异度、精确度。**结果:** 选择 8 个影像组学特征采用 SVM 构建的平扫期、动脉期、门静脉期、延迟期及融合期影像组学模型在预测肾上腺腺瘤亚型诊断效能的五折交叉验证后 AUC 值分别为 0.813、0.782、0.770、0.807、0.762, 其中基于平扫期图像构建的模型性能最佳, 准确度为 0.759, 灵敏度为 0.722, 特异度为 0.814, 精确度为 0.838。**结论:** 基于 CT 不同时期影像组学特征结合 SVM 构建影像组学模型可无创性鉴别诊断肾上腺腺瘤亚型, 具有一定的临床价值有助于临床决策。

PO-3451

一组输入性急性肺组织胞浆菌病 CT 表现及动态变化分析

刘雪艳、吕圣秀、唐光孝、李春华

重庆市公共卫生医疗救治中心

目的 分析输入性急性肺组织胞浆菌病的 CT 表现及动态变化特征。**方法** 回顾性分析 10 例输入性急性肺组织胞浆菌患者的临床及 CT 资料, 观察其首次 CT 表现及其动态变化特征。**结果** 首次 CT 表现见 10 例 (10/10, 100%) 均呈周围伴晕征的肺结节, 其中 4 例 (4/10, 40%) 弥漫分布 (弥漫分布组), 6 例 (6/10, 60%) 散在分布 (散在分布组); 10 例中, 4 例 (4/10, 40%) 出现斑片或大片状影, 3 例 (3/10, 30%) 见片状磨玻璃影, 4 例 (4/10, 40%) 存在小叶间隔增厚; 10 例 (10/10, 100%) 纵隔淋巴结均增大, 其中 8 例 (8/10, 80%) 肺门淋巴结增大; 5 例 (5/10, 50%) 出现浆膜腔积液。弥漫分布组与散在分布组间暴露时长、住院时长及首次 CD4⁺细胞计数差异均有统计学意义 ($Z=-2.03$ 、 -2.35 、 -2.34 , P 均 <0.05)。治疗过程中, 2 例 (2/10, 20%) 病变持续吸收好转, 8 例 (8/10, 80%) 患者不同时段出现病变进展, 于治疗 3 个月后病变均好转。**结论** 急性肺组织胞浆菌病的 CT 表现具有一定特征性, 治疗前及治疗过程行胸部 CT 有助于诊断、鉴别诊断及评价疗效。

PO-3452

椎管内棘球蚴病的 MRI 及临床表现

常玉山、郭辉
新疆医科大学第一附属医院

目的 探讨椎管内棘球蚴病的 MRI 及临床表现。方法 回顾性分析 12 年 (2011~2023 年) 间 23 例椎管内棘球蚴病患者的 MRI 及临床表现。结果 男 10 例, 女 13 例, 年龄 25~72 岁 (44.1 ± 13.9), 中位年龄 41 岁。23 例椎管内棘球蚴病患者中, 胸段 12 例 (52%), 腰段 6 例 (26%), 骶段 2 例 (8%), 同时累及胸腰段 1 例 (4%), 同时累及腰骶段 2 例 (8%), 同时累及颈腰段 1 例 (4%); 累及髓外硬膜下 9 例 (39%), 累及髓外硬膜外 12 例 (52%), 累及髓内 3 例 (13%); 有 18 例 (78%) 同时累及邻近椎体附件或周围软组织; 脊柱或其他部位包虫病史 11 例 (48%); 临床表现为胸背部、腰骶部疼痛 21 例 (91%), 双下肢功能障碍 6 例 (26%); MRI 表现为表现为大小不一的长 T1 长 T2 信号小囊泡, 呈“葡萄串”样外观, 边缘囊壁呈低信号 21 例 (91%)。结论 椎管内棘球蚴病相对其他部位非常罕见, 当遇到 MRI 特征明确、具有典型临床表现时或有其他部位棘球蚴病史时, 要考虑椎管内棘球蚴病。

PO-3453

基于机器学习的 MRI 影像组学鉴别布鲁菌性 脊柱炎与结核性脊柱炎

何雄、郭辉
新疆医科大学第一附属医院

目的: 通过机器学习的 MRI 影像组学在 BS 患者与 TS 患者进行研究应用, 探讨与评价机器学习的 MRI 影像组学对 BS 患者与 TS 患者的鉴别诊断能力。

材料与方法: 回顾性分析 2017 年 1 月 1 日至 2021 年 12 月 31 日新疆医科大学第一附属医院经过金标准确诊的 BS 患者与 TS 患者, 并接受脊柱 MRI 检查。将患者按 8: 2 的比例随机分为训练集 ($n = 251$) 和验证集 ($n = 64$)。在 T2WI、T2WI-FS 和 T1WI + T2WI + T2WI-FS 矢状图上勾画感兴趣区域 (ROI)。采用 RadCloud 平台提取特征。应用最小绝对收缩和选择算子 (LASSO) 降维处理。选取最具有价值的影像组学特征构建 Logistic 回归模型。

结果: 在 T2WI、T2WI-FS 和 T1WI + T2WI + T2WI-FS 三种预测与鉴别模型中分别获得 27、36 和 24 个特征。在 Logistic 回归三种预测与鉴别模型中, T2WI 训练集的 AUC (灵敏度, 特异性) 分别为 0.858 (0.80, 0.91)、T2WI-FS 为 0.822 (0.76, 0.88)、T1WI + T2WI + T2WI-FS 的 AUC 为 0.883 (0.83, 0.94)。三个模型中, T2WI 验证集的 AUC (灵敏度, 特异性) 为 0.724 (0.68, 0.79), T2WI-FS 为 0.698 (0.64, 0.76), T1WI + T2WI + T2WI-FS 为 0.763 (0.71, 0.82)。结论: 基于机器学习的 MRI 影像组学对 BS 患者与 TS 患者的鉴别诊断是可行的, 可在临床应用中提高术前鉴别诊断的准确性。

PO-3454

原发性肝血管肉瘤的影像表现及病理分析

王苏丹

首都医科大学附属北京佑安医院

目的 探讨原发性肝脏血管肉瘤 (primary hepatic angiosarcoma, PHA) 的 CT 及 MRI 影像表现及病理基础, 为临床提供诊疗依据。方法 回顾性分析收治于北京佑安医院经病理证实的 12 例 PHA 的 CT 及 MRI 的影像表现及病理基础。结果 12 例 PHA 患者, 以腹胀 (n=6, 50.0%)、腹痛 (n=3, 25.0%) 为较常见的临床症状; 患者多无肝病史 (n=11, 91.7%); 实验室检查异常以贫血 (n=11, 91.7%)、肝功能异常 (n=12, 100%) 及异常凝血酶原时间延长 (n=12, 100%) 多见, 已知的肿瘤标志物 AFP 均正常, CA199 或 CA125 轻度升高 3 例; 出现脾转移 2 例。12 例患者影像学形态分型中, 多发结节型 1 例; 肿块型 3 例; 结节肿块混合型 1 例; 弥漫浸润型 7 例。9 例灶内出血平扫表现为 CT 高密度或 T1WI 高信号、12 例均有不同程度的液化坏死平扫表现为 CT 不均匀低密度或 T2WI 液性高信号。DWI 信号瘤体混杂, 整体以高信号为主。CT/MRI 多期增强扫描动脉期快速富血供性不均匀强化、强化形态多样, 门脉期及延迟期持续性向心性或离心性强化为 PHA 的典型影像表现。本组有 4 例部分病灶边缘和 (或) 灶内可见多发迂曲穿行的滋养动脉。结论 PHA 的临床及影像表现具有一定的特点: 患者无肝病史、肿瘤标志物多正常或轻微升高, CT/MR 平扫密度或信号不均匀, 出血、坏死、囊变多见, 增强扫描动脉期病灶边缘或中央不规则状、环状、结节状强化, 门脉期及延迟期不完全填充式向心性或离心性强化为其典型征象。

PO-3455

小儿腺病毒感染临床影像学诊断

劳群

杭州市儿童医院

背景: 重症肺炎中腺病毒感染高达 20%, 死亡率达 10%, 存活者中 14-60% 遗留不可逆转的肺部后遗症, 危害极大。快速识别腺病毒感染是临床重点和难点。

目的: 探讨总结儿童腺病毒肺部感染的临床及影像特征, 争取早期诊断、早期治疗、降低病死率。

方法: 收集杭州市儿童医院 2019 年 1-12 月腺病毒抗原阳性患者 5990 例, 研究发病季节、年龄, 在最高峰 1 月 1098 例中, 选取有临床及影像资料的 556 例研究临床和影像特征。

结果: 全年 5990 例发病主高峰在冬季 1 月、12 月, 分别 1098 例 (18.3%)、612 例 (10.2%), 次高峰在夏季 5-6 月, 分别 614 例 (10.3%)、606 例 (10.1%); 中位年龄 4.17 岁, 依次为 >4 岁 2279 例 (38.0%), 2-4 岁 1930 例 (32.2%), 6 月-2 岁 1746 例 (29.1%); 0-6 月 35 例 (0.6%); 556 例中脓毒血症 29 例, 合并支原体肺炎 48 例; 胸片 556 例, 胸片+CT 249 例, 诊断为支气管炎 409 例 (73.6%), 支气管肺炎 98 例 (17.6%)、肺实变 49 例 (8.8%)。CT 病灶位于中心+中心及周边 232 例, 占 93.2%, 仅位于周边 14 例; 有胸水 5 例; 皮下积气及气胸 2 例。

结论: 儿童腺病毒感染主高峰冬季 12 月-1 月, 次高峰 5-6 月; 好发年龄 4 岁以上, 2 岁以上占绝大多数; 脓毒血症多, 合并支原体肺炎多, 中枢神经累及少; 影像支气管炎型多, CT 肺部病灶呈“向心性”分布, 胸水少。

关键词: 腺病毒; 杭州儿童; 临床影像; 计算机断层成像 (computed tomography)

PO-3456

胃癌 CTTA 与病理及生物学行为的相关性

陈淑香、张惠娟
福建省立医院南院

目的 探讨胃癌纹理分析与其病理、强化程度及生物学行为的相关性。**方法** 回顾性分析经病理证实为胃癌的病例共 264 例（男 181 例，女 83 例）的术前增强 CT 图像,获得纹理特征参数 Mean、StDev、Inhomogeneity、Skewness、Kurtosis、Entropy, 并记录强化程度、病理类型及浆膜累及、腹腔淋巴结转移、腹膜转移等生物学行为, 分析 CT 纹理参数与组织病理学特征、生物学行为的相关性。**结果** (1) 胃原发灶强化程度与纹理分析参数 StDev、Inhomogeneity 之间均存在显著正向相关, P 值分别为 0.04、0.07, 相关性系数 rs 均接近 0.2。(2) 胃癌原发灶纹理分析参数 StDev、Inhomogeneity、Entropy 与分化程度之间均存在显著相关, 相关性系数 rs 的绝对值均接近 0.12, 其中 Entropy 为负相关。而胃癌原发灶 StDev、Inhomogeneity、Skewness、Kurtosis、Entropy 均与 Lauren 分型存在显著的相关性, 相关性系数 rs 的绝对值均接近 0.2, 其中 Skewness、Entropy 为负相关, 余为正相关(3) 胃癌浆膜侵犯、腹膜转移、淋巴结转移等生物学行为均与胃癌原发灶的 Skewness、Entropy 呈负相关, 浆膜侵犯还与 StDev、腹膜转移还与 StDev、Kurtosis, 腹腔淋巴结转移还与 Kurtosis 呈正相关, P 值均小于 0.05, 点二列相关系数 r 的绝对值均在 0.1~0.3 之间。**结论** 胃癌原发灶纹理分析参数与其强化程度、病理分化程度、Lauren 分型及浆膜累及、腹腔淋巴结转移、腹膜转移等生物学行为均存在显著的相关性, 特别是 StDev 呈正相关, Skewness、Entropy 呈负相关, 若进一步探讨, 或能为胃癌的生物学行为提供预测参考, 有助于胃癌患者的个体化治疗。

PO-3457

联合 CT 影像组学与临床指标鉴别克罗恩病与肠结核的应用价值研究

王朔、任莹
中国医科大学附属盛京医院

摘要: **目的:** 结合 CT 影像组学与临床指标构建综合预测模型, 并评估其鉴别诊断克罗恩病 (CD) 与肠结核 (ITB) 的价值。**方法:** 回顾性收集中国医科大学附属盛京医院在 2008 年 1 月-2023 年 4 月间确诊的 CD 患者 87 例、TB 患者 80 例, 收集上述患者增强 CT 影像资料及临床信息, 将患者按 7: 3 比例随机分为训练集和验证集, 应用人工智能软件 3D-slicer 手动逐层勾画 CD 与 TB 病灶动脉期、静脉期图像的感兴趣区域, 提取并筛选影像组学特征, 同时筛选具有统计学差异的临床指标。应用 logistic 回归分析基于影像组学特征、临床指标构建的预测模型。采用受试者工作曲线 (ROC), 评估不同模型的鉴别诊断效能。**结果:** 每例患者提取动脉期、静脉期影像组学特征 1319 个, 筛选后保留动脉期影像组学特征 4 个, 静脉期影像组学特征 6 个, 基于上述影像组学特征构建影像预测模型, 训练集 AUC 值为 0.941 (95%CI: 0.898-0.984), 敏感度为 0.902, 特异度为 0.892, 验证集 AUC 值为 0.904 (95%CI: 0.827-0.981), 敏感度为 0.690, 特异度为 1。根据患者年龄、T-spot 检验结果及肛周病变病史构建临床预测模型, 训练集 AUC 值为 0.902 (95%CI: 0.846-0.957), 敏感度为 0.902, 特异度为 0.785, 验证集 AUC 值为 0.838 (95%CI: 0.723-0.952), 敏感度为 0.931, 特异度为 0.682。综合预测模型训练集 AUC 值为 0.980 (95%CI: 0.961-0.999), 敏感度为 1, 特异度为 0.877, 验证集 AUC 值为 0.975 (95%CI: 0.936-1), 敏感度为 1, 特异度为 0.909。**结论:** 联合 CT 影像组学与临床指标构建的综合预测模型对鉴别 CD 与 ITB 有较高价值。

PO-3458

基于 MSCT 影像组学诺莫图术前预测合并幽门螺杆菌感染的早期胃癌 HER2 状态的初步研究

童永秀、张惠娟
福建省立医院南院

目的 探讨基于 MSCT 影像组学是否能术前预测合并幽门螺杆菌感染(*Helicobacter pylori*, H)的早期胃癌(early gastric cancer, EGC)患者人表皮生长因子受体 2(human epidermal growth factor receptor 2,HER2)状态。

方法 回顾性分析 2020 年 1 月-2022 年 12 月福建省立医院南院确诊为 EGC 的 180 例患者临床资料, 并从其术前静脉期 CT 图像中提取影像组学特征, 按照是否合并 HP 分为感染组 (n=68) 与对照组 (n=112), 对比其临床病理特征和影像组学特征的差异, 分析引起 EGC 合并 HP 的相关危险因素; 再将感染组中的患者按照 HER2 是否阳性分为阳性组 (n=42) 及阴性组 (n=26), 对比其临床病理和影像组学特征并通过 Logistic 回归分析引起 HER2 阳性的危险因素; Spearman 相关系数分析 EGC 合并 HP 的临床病理特征及影像组学特征与 HER2 阳性的相关性。依据相关因素构建诺模图, 使用 ROC 曲线和校准曲线检验预测模型的性能。

结果 肿瘤厚度、肿瘤部位、Ki-67、HER2 阴性和对比度、均值等影像组学特征参数为 EGC 合并 HP 的独立危险因素 ($P<0.05$); 年龄、分化程度、Lauren 分型、Borrmann 分期、肿瘤厚度、区域淋巴结转移以及差异熵、相关性等影像组学特征是影响 EGC 合并 HP 发生 HER2 阳性的独立危险因素 ($P<0.05$), 同时与 HER2 阳性均呈正相关关系 ($P<0.05$)。依据以上独立因素建立的诺莫图, AUC 分别为 0.864 (95%CI: 0.798-0.930) 和 0.964 (95%CI: 0.903-1.000); 校准曲线走形基本与理想走形拟合良好, 校准度高。

结论 基于 MSCT 影像组学和临床病理特征构建的诺莫图能术前预测 EGC 合并 HP 患者的 HER2 状态, 为优化临床治疗提供相关信息。

PO-3459

科学解读肺结节

鲁植艳、屈艳娟
武汉大学中南医院

随着人们健康意识提高, 肺部低剂量 CT 筛查逐渐普及以及人工智能 (AI) 辅助诊断的广泛应用, 使得越来越多的肺内结节被发现, 从而很多人被告知肺部有结节。肺部结节成了一个公众关注的话题。如何从专业角度正确剖析肺部结节, 既要做到对恶性结节的“早诊断、早治疗”, 又要避免对良性结节的“过度治疗”, 是一个大家都关心的问题。

肺部结节可能是对人体无不良影响良性结节, 也可能是早期肺癌。对于具有典型征象的良性或恶性肺部结节, 我们应尽量做出肯定性诊断; 对于尚不能定性而需要随访的肺部结节, 应该给出具体的随访方案及明确的间隔时间。

基于此, 我们特组织胸部放射学专家及胸外科专家编写了这本 关于肺部结节的科普书。从分析肺部结节特征入手, 告诉读者良性的结节长什么样? 恶性结节又是什么样? 不能确定性质的结节又要怎么处理?

肺部结节定性是一个难题, 希望本书能帮助读者提高对肺部结节认识。做到心理上对肺部结节不恐惧, 分析中能抓住肺结节的每一个细微特点, 尽早尽力做出正确诊断。

由于时间比较仓促, 加之作者水平有限, 书中不足之处, 在所难免, 恳请同道指正, 我们将表示衷心感谢

PO-3460

多参数 MRI 影像组学模型在预测早期子宫内膜癌风险分层中的价值

孟欢、孙宇锋、张宇、于雅楠、王静、王佳宁、薛林雁、殷小平（通讯作者）
河北大学附属医院

目的 早期子宫内膜癌（EC）术前风险分层对临床治疗至关重要，本研究旨在探讨基于磁共振成像（MRI）的影像组学模型对早期 EC 风险分层及分期的价值。

资料和方法 共纳入 155 例在 2020 年 1 月至 2022 年 9 月进行术前 MRI 检查，且经病理证实为早期 EC 患者。在 MRI 图像上（T2WI、CE-T1WI 延迟期，ADC）对肿瘤进行分割后提取三维影像组学特征，共 1521 个，然后采用 PCC 对影像组学特征进行筛选，实验采用五折交叉验证的方式，使用 MLP 建立 EC 风险分层及分期的预测模型。采用 ROC 曲线评估各模型的预测效能，并计算 AUC、准确率、敏感度及特异度。

结果 对于风险分层，CE-T1 序列在单一序列中取得了最佳预测准确率 0.858 ± 0.025 ，AUC 为 0.878 ± 0.042 ，三者联合取得了最高预测准确率 0.881 ± 0.040 ，AUC 为 0.862 ± 0.069 。对于分期，T2WI 联合 CE-T1WI 取得了高于单一序列的预测准确率 0.956 ± 0.020 ，AUC 为 0.979 ± 0.022 ，三个序列联合取得最佳预测准确率 0.956 ± 0.000 ，AUC 为 0.986 ± 0.007 ，准确率高出影像科医师（ 0.956 vs 0.832 ）。

结论 基于 MRI 影像组学模型在预测早期 EC 风险分层及分期方面具有巨大潜力。

PO-3461

AIDS 合并肺部隐球菌感染的临床特点和影像特征分析

赵月娟、周树林、李志鹏、杨丹丹、许红兰、赵晶
云南省传染病医院

目的 研究获得性免疫缺陷综合征（Acquired Immune Deficiency Syndrome, AIDS）合并肺部隐球菌感染的临床特点和影像特征，以提高对该病的认知。**方法** 回顾性分析我院 2019 年 5 月至 2020 年 12 月收治 54 例确诊 AIDS 合并隐球菌肺炎患者的临床和影像特征。**结果** 54 例患者中，男性 38 例，女性 16 例，年龄 18~59 岁，平均年龄为 (38.2 ± 10.25) 岁；CD4 计数为 13~198 个/ μL ，中位数为 42 个/ μL 。临床症状：无症状 8 例，发热 37 例，咳嗽 38 例，咳痰 37 例，胸痛 28 例，头痛 40 例，恶心呕吐 6 例、意识障碍 5 例。胸部 CT 特点：1.发病部位特点：上叶 33 例（61.1%）中叶 18 例（33.3%），下叶 36 例（66.7%），单发病灶 6 例（11.1%），多发病灶 48 例（88.9%）2.影像特点：结节或肿块影 39 例（72.2%）；实变 21 例（46.6%）；渗出 20 例（37.0%）；空洞 36 例（66.7%）；间质磨玻璃模糊影 15 例（27.8%）；纵隔淋巴结肿大 15 例（27.8%）；肺门淋巴结肿大 13 例（24.1%）；胸膜腔积液 0 例；其中多种病灶混合存在 45 例（83.3%）。**结论** AIDS 合并相关肺部隐球菌感染男性多于女性；当 CD4 小于 200 个/ μL ，AIDS 合并隐球菌感染明显增加；临床症状以发热，咳嗽，咳痰为主；多合并隐球菌性脑膜炎；胸部影像表现为肺内多发结节影、薄壁空洞、实变和磨玻璃影，肺外带分布多见，多种病灶形态混合存在，胸膜腔积液少见，具有一定特征性

PO-3462

CT 与 MRI-PDFF 诊断慢性乙肝患者肝脏脂肪变性的一致性分析

鲁景楠、黄晓旗
延安大学附属医院影像中心

目的: 分析肝/脾 CT 值 (CTL/S) 与磁共振质子密度脂肪分数 (MRI-PDFF) 诊断慢性乙肝患者肝脏脂肪变性的一致性, 并探讨 CT 诊断的临床价值。

方法: 选取 2018 年 10 月至 2023 年 5 月在延安大学附属医院就诊的 317 例慢性乙型肝炎患者为研究对象。纳入标准为年龄 > 18 岁的慢性乙型肝炎患者, 将同时感染其他肝炎病毒和艾滋病病毒、有大量饮酒史、合并肝细胞癌及肝脏 CT 和 MRI-PDFF 检查间隔 2 周以上的患者排除在外。使用 MRI-PDFF 作为诊断脂肪变性的参考标准, 依据 MRI-PDFF 的测量结果分为无脂肪变性 (MRI-PDFF < 5%)、轻度脂肪变性 (MRI-PDFF = 5%~10%)、中重度脂肪变性 (MRI-PDFF ≥ 10%)。采用 SPSS 26.0 分析数据, 通过分析受试者工作特征曲线, 评估 CTL/S 对不同程度脂肪变性的诊断效能。分析 CTL/S 与 MRI-PDFF 诊断结果的一致性, 一致性评价采用 Kappa 一致性检验, Kappa 系数为 0.8-1.0 表示接近完全一致, Kappa 系数为 0.6-0.8 表示显著一致, 0.4-0.6 表示中等一致, < 0.40 表示一致性较低。

结果: 317 例慢性乙型肝炎患者中有 108 例患者合并脂肪变性, 其中轻度脂肪变性 75 例, 中重度脂肪变性 33 例。以 MRI-PDFF 为参考标准, CTL/S 诊断轻度脂肪变性的曲线下面积为 0.937, 最佳截断值为 1.09; CTL/S 诊断中重度脂肪变性的曲线下面积为 0.967, 最佳截断值为 0.98。CTL/S 检测出 208 例无脂肪变性, 46 例轻度脂肪变性, 63 例中重度脂肪变性。CTL/S 与 MRI-PDFF 具有显著的诊断一致性 (Kappa=0.655, P<0.05)。

结论: 在慢性乙肝合并肝脏脂肪变性的诊断中, CTL/S 与 MRI-PDFF 具有显著的诊断一致性, 能够为慢性乙肝合并肝脏脂肪变性的诊断提供参考价值。

流行性感冒临床及影像学特征分析

吕圣秀、李春华、刘雪艳
重庆市公共卫生医疗救治中心

目的 探讨流行性感冒的临床及影像学特征, 提高对其认识。方法 回顾性分析重庆市公共卫生医疗救治中心 2009.6-2018.3 收治的 36 例流行性感冒患者临床及影像学表现, 临床表现包括发热、咳嗽、喘累、咳痰、气促、呼吸困难等; 影像学特征包括病变的分布、常见征象等。结果 36 例患者中, 男 30 例, 女 6 例; 平均年龄 40.3 岁; 经鼻咽拭子, 禽流感核酸检测: 甲型 H1N1 流感病毒检测阳性 29 例; 甲型 H7N9 流感病毒检测阳性 2 例, 甲型 H5N1 流感病毒检测阳性 1 例, 乙型流感病毒检测阳性 2 例; 2 例未分型。12 例为人与人接触感染; 4 例发现与禽类接触史, 群发 12 例, 散发 24 例。临床表现中, 发热 33 例, 咳嗽 28 例, 咳痰 15 例, 喘累 10 例, 气促 6 例, 呼吸困难 3 例, 咽痛 5 例, 鼻塞 1 例, 流涕 4 例, 头晕 2 例, 乏力 4 例, 痰血 2 例, 肌肉酸痛 2 例, 心悸 1 例; 15 例有基础疾病; 平均发病时间 6.8 天; 平均住院时间 10.5 天; 25 例伴有并发症; 经内科治疗 2-30 天后 31 例好转出院, 5 例病情重放弃治疗。影像学检查: 其中 25 例进行胸部平片检查, 24 例进行胸部 CT 检查, 25 例合并肺炎改变, 6 例肺纹理增多增粗, 5 例未见异常。复查 29 例病变吸收好转, 累及全肺 28 例, 5 个肺野 2 例, 4 个肺野 2 例, 1 个肺野 1 例; 3 叶 2 例, 4 叶 1 例, 累及 1 叶 1 例; 影像表现为磨玻璃影 25 例, 斑片状影 19 例, 片状影 17 例, 网格状影 14 例, 絮状影 13 例, 纵隔淋巴结增多增大 7 例, 胸膜反应 10 例。结论 流行性感冒临床表现多样, 不一定有与流感病人及禽类接触史, 影像检查对诊断、病情判断及疗效评价有重要作用。

PO-3464

获得性免疫缺陷患者并发尘肺结核的胸部 CT 表现分析

吕圣秀、李春华、刘雪艳、王惠秋
重庆市公共卫生医疗救治中心

目的 探讨艾滋病患者并发尘肺结核的胸部 CT 表现特点。**方法** 搜集 2021 年 1 月至 2022 年 06 月重庆市公共卫生医疗救治中心诊治的 19 例艾滋病并发尘肺结核住院患者, 回顾性分析 19 例患者的临床及 CT 检查资料。对病变的发生部位、范围、形态、类型及并发其他脏器结核情况进行观察。**结果** 19 例患者中, 尘肺分期: II 期 8 例, III 期 11 例。受累范围: 多肺叶 19 例。发生部位: 右肺上叶 18 例、右肺中叶 17 例、右肺下叶 18 例、左肺上叶 16 例、左肺下叶 18 例。尘肺结核类型: 分离型 8 例, 融合型 11 例。病变形态: 结节影 19 例, 斑片状影 16 例, 大片状影 11 例, 空洞 6 例, 树芽征 12 例, 胸腔积液 9 例, 胸膜增厚 15 例, 纵隔淋巴结肿大 19 例, 纵隔淋巴结钙化 15 例, 肺气肿 14 例, 肺大疱 13 例, 并发肺外结核 12 例。抗结核治疗 1 个月肺部病变吸收好转 10 例; 抗结核治疗半年, 肺结核治愈者 9 例。**结论** 艾滋病患者并发尘肺结核的胸部 CT 表现具有一定特征, 以浸润灶为主, 常多型结核并发存在, 且常伴有肺外结核、其他感染等, 短期抗结核治疗后效果较好。

PO-3465

新型冠状病毒肺炎(COVID-19)的胸部 CT 改变与 T 淋巴细胞亚群的相关性研究

唐光孝、李春华、刘雪艳、吕圣秀
重庆市公共卫生医疗救治中心

目的: 评价新型冠状病毒肺炎(COVID-19) 的胸部 CT 病灶变化与不同 T 淋巴细胞亚群之间的关系。**方法:** 收集重庆市公共卫生医疗救治中心 2020 年 1 月 24 日~2020 年 3 月 15 日间收治的 47 例 COVID-19 确诊患者, 根据病灶在 CT 图像的吸收情况分三种类型: 其中明显持续吸收型 18 例, 稳定-缓慢吸收型 14 例, 进展后吸收型 15 例。并对 47 例患者进行了 99 次 CT 复查和 CD4 细胞检查, 根据病灶吸收情况分析其 CT 表现及其与 T 淋巴细胞亚群的关系。**结果:** 47 例 COVID-19 患者中, CT 常见征象为肺周围优势分布为主的多发磨玻璃灶, 部分病例可见合并实变、条索、小叶间隔增厚, 极少数病例可见胸腔积液及心包积液。不同类型间的首次 T 淋巴细胞、住院过程中、治疗后末次的 T 淋巴细胞水平, 表现为病灶明显持续吸收>病灶稳定-缓慢吸收>病灶扩展后吸收。在疾病进程中病灶吸收时 CD4+T 淋巴细胞较高。首次 T 淋巴细胞水平明显吸收型高于缓慢吸收和进展后吸收 ($P<0.05$); 在治疗过程中, T 淋巴细胞均明显升高。其中 CD4+T 淋巴细胞除病灶进展后吸收类型外, 其余两型 T 淋巴细胞均恢复到正常水平以上, 但升高的幅度不同, 病灶明显吸收者的 CD4 细胞平均升高 134 cell/ul, 明显吸收者上升幅度低于缓慢吸收 (192 cell/ul) 和进展后吸收者 (149 cell/ul); 复查中, 52 次病灶吸收时 CD4+细胞平均 (544.43 ± 163.34) cell/ul, 31 次病灶变化不大时 CD4+T 淋巴细胞平均 (339.06 ± 145.98) cell/ul, 16 次 CT 病灶进展时 CD4+ T 淋巴细胞平均 (230.50 ± 95.24) cell/ul, 三组间有统计学差异 ($P<0.05$)。**结论:** T 淋巴细胞水平与 CT 病灶变化之间的相关性具有重要临床价值。当患者肺部病灶明显增加时, 提示其自身免疫可能较差, 需加强免疫调节。反之, 病程中检测到患者 T 淋巴细胞水平下降, 要注意病灶进展的风险, 及时复查 CT 观察病灶变化情况。

PO-3466

2 型糖尿病合并肺结核血糖水平与胸部 CT 特点的相关性分析

舒伟强、李春华、王惠秋、吕圣秀
重庆市公共卫生医疗救治中心

目的: 探讨 II 型糖尿病合并肺结核血糖水平与 CT 特点的相关性。方法: 收集我院 2015 年~2017 年间 II 型糖尿病合并初治肺结核(DM-PTB)住院患者 74 例, 根据空腹血糖 (FPG) 分为 3 组: 1 组, $FPG \leq 11 \text{ mmol/L}$; 2 组, $FPG 11 \sim 16.7 \text{ mmol/L}$; 3 组, $FPG \geq 16.7 \text{ mmol/L}$ 。(2) 分别探讨各组胸部 CT 影像特点并对比分析。(3) 使用统计软件 SPSS19.0 处理数据, 用卡方检验分析。结果: 病变部位与范围: 右肺上叶前段病变 49 例, 左肺上叶前段病变 43 例, 右肺下叶基底段 41 例, 左肺下叶基底段 40 例, 右肺中叶 29 例, 左肺舌叶 43 例。单叶出现病变者 4 例 (5.41%), 2 叶出现病变者 17 例, 3 个及以上叶段出现病变者 53 例。病变形态: 22 例病变形态为斑片、结节状影, 其余 52 例以片状、团片状干酪性病变为主, 伴斑点结节影。空洞情况: 39 例出现空洞, 其中单发空洞 2 例, 多发空洞 37 例, 多发虫蚀样空洞 21 例; 无空洞 35 例。增强表现: 15 例增强病例中, 除 1 例合并非特异性感染表现为中度强化外, 其余均表现为轻度不均匀强化或边缘强化, 病变出现明显干酪性坏死痰菌阳性 43 例。各组干酪性病变发生率差异有统计学意义 ($p=0.000$), 各组空洞发生率差异有统计学意义 ($p=0.025$), 各组痰菌阳性率差异有统计学意义 ($p=0.005$)。各组病变范围、病变分布差异无统计学意义。结论: DM-PTB 胸部 CT 有其特征性的影像表现, 血糖水平与干酪性病变、空洞性病变存在相关性, 能为 DM-PTB 的早期诊断提供重要影像依据。

PO-3467

乳腺结核的 CT 表现分析

王惠秋、吕圣秀、李春华
重庆市公共卫生医疗救治中心

目的 分析乳腺结核的 CT 征象, 探讨其 CT 的诊断价值。方法 回顾分析重庆市公共卫生医疗救治中心 20 例经病理证实的乳腺结核病例。分析病变的 CT 表现及邻近组织及器官受累情况。结果 20 例乳腺结核中 12 例发生于右乳, 8 例发生于左乳。13 例为单发, 7 例为多发; 16 例呈类圆形结节, 1 例呈团块状, 3 例呈片状; 病灶大小 $1.0 \text{ cm} \times 1.5 \text{ cm} \sim 5.1 \text{ cm} \times 3.2 \text{ cm}$ 。结节型、脓肿型分别各 13、7 例。CT 平扫 11 例为等密度, 9 例为稍低密度, 4 例病灶内见斑点状钙化, 17 例边界模糊; 12 例邻近皮肤均匀增厚。增强扫描 20 例均表现为环形强化, 2 例伴窦道形成; 其中 13 例伴有同侧或双侧腋窝淋巴结肿大伴环形强化, 5 例伴有同侧胸壁包块伴边缘强化, 10 例伴肺结核。结论 乳腺结核的特征性 CT 表现为环形强化, 同时常伴有同侧腋窝淋巴结及胸壁结核。

PO-3468

胸部 CT 影像联合临床和实验室检查对耐多药 肺结核的诊断价值

李春华、刘雪艳、吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨胸部 CT 联合临床和实验室检查对耐多药肺结核诊断价值, 为临床对耐多药肺结核的早期诊断和药物选择提供依据。方法 搜集 2018 年 1 月至 2022 年 9 月重庆市公共卫生医疗救治中心经细菌培养及药敏鉴定确诊的 392 例肺结核患者临床及 CT 影像学资料, 其中耐多药肺结核患者 212 例 (耐药组), 药物敏感肺结核患者 180 例 (敏感组)。对比分析两组的 CT 影像表现、临床及 T

淋巴细胞计数, 并进行 logistic 回归分析, 建立回归方程模型。通过 ROC 曲线和曲线下面积 (AUC) 评估回归方程模型对耐多药肺结核的诊断效能。结果 耐药组男性患者、复治患者多于敏感组 (P 均 <0.001)。既往治疗结核时间长于敏感组 ($P=0.006$)。CD4+ T 淋巴细胞及 CD4/CD8 比值低于敏感组 (P 值均 <0.001)；病变分布在左肺舌段及左肺上叶多于敏感组 (P 均 <0.05)；空洞的发生率、2 个以上、3 个以上及 5 个以上空洞均多于敏感组 (P 值均 <0.001)。空洞内径大于敏感组 ($P<0.001$)，厚壁空洞、混合空洞、虫蚀样空洞、干酪病变、肺毁损、树芽征、小叶中心性结节、支气管扩张、支气管狭窄、胸膜增厚、胸廓塌陷、纵隔移位、心包增厚多于敏感组 (P 均 <0.05)。logistic 回归分析结果显示：既往治疗结核时间、厚壁空洞、小叶中心性结节、支气管狭窄、胸膜增厚、心包增厚是耐药结核发生的危险因素；女性及 CD4+ T 淋巴细胞是耐多药肺结核的保护因素。logistic 回归模型总体预测率为 78.6%，敏感性 75.9%，特异性 81.7%。ROC 曲线下面积 (AUC) $=0.859$ (95% CI, 0.823-0.895) ($P<0.001$)。结论 胸部 CT 联合临床及实验室检查对耐多药肺结核有重要的诊断价值，可为临床早期诊断和药物选择提供依据。

PO-3469

活动性肺结核影像征象在非活动性肺结核中的表现

李春华、刘雪艳、吕圣秀
重庆市公共卫生医疗救治中心

目的 探讨活动性肺结核影像征象在非活动性肺结核中的表现，提高对肺结核活动性的判断能力。方法 回顾性搜集 2020 年 8 月至 2021 年 8 月重庆市公共卫生医疗救治中心诊治的 194 例非活动性肺结核患者和 172 例活动性肺结核患者，分析两组患者 CT 征象的差异。结果 在非活动性肺结核患者中，活动性征象小片状实变影、小叶中心性结节、树芽征、磨玻璃影、空洞、胸腔积液、淋巴结肿大的发生率分别为 21.6% (42/194)、42.3% (82/194)、17.5% (34/194)、4.6% (9/194)、16.5% (32/194)、1.0% (2/194)、18.6% (36/194)，明显低于活动性肺结核患者的 79.1% (136/172)、62.2% (107/172)、66.9% (115/172)、23.8% (41/172)、27.3% (47/172)、32% (55/172)、53.5% (92/172) (P 值均 <0.05)。但非活动性肺结核患者斑片内钙化为 27.3% (53/194)，高于活动性肺结核的 11% (19/172) ($P<0.001$)，伴钙化的结节 37.6% (73/194)，高于活动性肺结核的 9.9% (17/172) ($P<0.001$)，薄壁空洞为 12.4% (24/194)，高于活动性肺结核的 4.7% (8/172) ($P<0.05$)，硬结性病变 36.6% (71/194)，高于活动性肺结核的 0.6% (1/172) ($P<0.05$)。结论 活动性肺结核影像征象也可出现在非活动性肺结核患者中，但其发生率明显低于活动性肺结核患者，且与活动性肺结核 CT 表现有明显区别，CT 检查在肺结核活动性的判断中可提供重要依据。

PO-3470

膝关节结核的 MRI 表现

唐光孝、吕圣秀、刘雪艳、李春华
重庆市公共卫生医疗救治中心

目的 探讨膝关节结核的 MRI 表现，提高对膝关节结核的认识。方法 回顾性分析我院 2016 年 3 月~2018 年 12 月经手术及病理检查证实的 23 例患者的影 MRI 资料，分析其影像表现。23 例患者 26 个膝关节结核，其中单纯左膝 8 例，单纯右膝 12 例，双膝 3 例。全部病例行膝关节冠状位、矢状位、横断位 MR 平扫，12 例患者行钆贝葡胺增强扫描。结果 单纯滑膜结核 7 例，表现为滑膜增生，关节积液，滑膜增生在 MRI 在 T1WI 上呈较为均匀中低信号，T2WI 上呈不均匀高信号表现，增强扫描见条状及斑片状强化。滑膜结核合并半月板损伤、关节软骨损伤、交叉韧带损伤共 11 例，MRI

表现除滑膜增生外还表现为半月板损伤,以半月板后角 II°及以上损伤为主,交叉韧带不全性损伤及水肿为主。全关节结核 14 例,表现为骨质破坏以及骨髓水肿,骨髓水肿表现为斑片及片状高信号。结论 MRI 对膝关节结核病变范围和程度的判断及骨质破坏的早期发现有重要作用。

PO-3471

AIDS 合并肝脏结核 CT 影像学表现

王惠秋、李春华、吕圣秀
重庆市公共卫生医疗救治中心

目的 回顾性分析 AIDS 合并肝脏结核增强 CT 的表现特点,以提高其诊断的准确性。**方法** 对重庆市公共卫生医疗救治中心经病理证实的 8 例 AIDS 合并肝脏结核患者的增强 CT 检查结果进行回顾性分析,观察病灶的形态、密度、数量、病灶边界、病灶 CT 增强后的表现。**结果** 8 例 AIDS 合并肝脏结核表现为浆膜型 2 例,结节型 3 例,混合型 3 例,其中单发 3 例,多发 5 例,形态不规则 6 例;CT 平扫表现为低密度 7 例,钙化 1 例,边界均与正常肝组织分界不清,伴有腹腔其他脏器结核及结核性腹膜炎 5 例,8 例均伴有腹腔外结核;CT 增强表现为不均匀轻度强化 2 例,渐进性强化 2 例,边缘轻度强化 4 例,病灶内分隔征 6 例。**结论** AIDS 合并肝脏结核少见,易漏诊误诊,增强 CT 能显示肝脏结核病灶的一些特征性表现。

PO-3472

HIV 阳性合并肺结核患者的 CT 影像学诊断与鉴别

任荣、李敏
苏州大学附属传染病医院、苏州市第五人民医院

目的 探讨 HIV 阳性合并肺结核患者的 CT 影像学特点,以提高对艾滋病 (AIDS) 合并肺结核的诊断与鉴别诊断的能力。**方法** 回顾性分析 2020 年 1 月至 2022 年 11 月在本院住院治疗并均经实验室检查证实的 36 例 HIV 阳性合并肺结核患者的临床及 CT 影像学资料,并选取本院收治的 36 例均确诊为肺结核 (痰检阳性) 的 HIV 阴性患者作为对照组,对两组患者的 CT 影像学特点进行对比研究。**结果** 两组研究对象中,病变的发生部位:两肺各叶均受累的发生率分别为 58.3%和 19.4%,差异具有统计学意义 ($P < 0.05$);发生于上叶尖后段、上叶前段、左肺舌段、下叶背段、下叶基底段的发生率分别为 19.4%、13.9%、16.7%、13.9%、19.4%,均低于对照组分别为 55.6%、47.2%、38.9%、33.3%、52.7%,差异均具有统计学意义 ($P < 0.05$)。两组病变的 CT 表现:片状影、斑片状影、结节影、树芽征、条索状影、支气管扩张影、支气管播散或狭窄、多发空洞及钙化影的发生率分别为 30.6%、86.1%、72.2%、38.9%、61.1%、30.6%、27.8%、11.1%、13.9%,均低于对照组 55.6%、100.0%、94.4%、80.6%、86.1%、91.7%、77.8%、41.7%、47.2%,差异均具有统计学意义 ($P < 0.05$);粟粒样结节影、纵隔及 (或) 其他淋巴结肿大、心包积液的发生率分别为 27.8%、77.8%、16.7%,均高于对照组 5.6%、22.2%、0%,差异均具有统计学意义 ($P < 0.05$)。**结论** HIV 阳性合并肺结核患者因 CD4+T 淋巴细胞水平较低下,以致免疫功能缺陷,其病变分布缺乏特异性、累及范围广,病变形态也复杂多样。合并粟粒样肺结核、纵隔内淋巴结肿大、心包积液以及肺外结核的发生率也明显高于 HIV 阴性肺结核患者,临床工作中需提高对该病的诊断与鉴别诊断能力。

PO-3473

结节型非结核分枝杆菌肺病与肺结核的 CT 影像学分析

任砚

苏州市第五人民医院

目的 分析结节型非结核分枝杆菌肺病与肺结核的 CT 影像学特征。方法 采用回顾性分析方法, 搜集 2020 年 1 月至 2021 年 12 月经苏州市第五人民医院实验室检查确诊, 将 25 例结节型非结核分枝杆菌肺病患者作为观察组; 搜集同期 32 例确诊肺结核且以结节为主要表现的患者作为对照组。观察两组患者肺部结节的数量、大小、钙化、累及肺叶范围的 CT 影像资料, 加以记录并进行统计学分析。结果 观察组 25 例患者与对照组 32 例患者都以多发结节为主。观察组患者中出现结节直径大于 10mm 的有 5 例, 占 20.00%, 对照组患者中出现结节大于 10mm 的有 25 例, 占 78.13%, 两组差异具有统计学意义 ($P < 0.05$); 观察组患者中出现钙化的有 3 例, 占 12.00%, 对照组中出现钙化的有 20 例, 占 62.50%, 两组差异具有统计学意义 ($P < 0.05$); 观察组中结节累及两肺多个肺叶的有 18 例, 占 72.00%, 对照组中结节累及两肺多个肺叶的有 10 例, 占 31.25%, 两组差异具有统计学意义 ($P < 0.05$)。结论 结节型非结核分枝杆菌肺病与肺结核的结节在 CT 影像上均表现为多发结节。结节型非结核分枝杆菌肺病的结节体积偏小, 钙化少见, 多累及两肺多个肺叶, 可以为临床诊断提供依据。

PO-3474

脑肠轴与 MR 影像联合是 HIV 相关神经认知障碍患者的新机遇

侯传珂、李宏军

首都医科大学附属北京佑安医院

人类免疫缺陷病毒 (HIV) 感染患者有 50% 的可能性在短时间内发展为与 HIV 相关的神经认知障碍 (HAND)。神经心理性能测试是目前诊断的金标准, 但其实施过程容易受到干扰, 在临床实践中难以准确诊断 HAND。因此, 有必要相对容易地获得其他临床相关的生物标志物来评估 HIV 相关的神经病理改变。最近对脑肠轴的研究表明, 肠道微生物群和大脑之间存在着密切的关系。而非侵入性 MR 技术在生物标志物和脑功能的检测方面具有巨大的潜力。然而, 目前探索脑肠轴结合 MR 影像在 HAND 及其他中枢神经系统疾病中开展甚少。因此, 通过分析 HAND 的当前机制、HAND 过程中脑肠轴的调控机制、MR 图像在 HAND 中的应用, 进而构建基于脑肠轴与多模态 MR 图像联合的多组学机器学习模型。不仅可以实现对 HAND 的早期诊断, 监测疾病的进展, 还可有助于评估和研发新的治疗方法。

PO-3475

AI 技术在儿童肺结核影像诊断中的研究现状与展望

罗梵、李晨曦

成都市公共卫生临床医疗中心

目的: 通过客观回顾 AI 技术在肺结核、儿童肺结核影像诊断中的研究及应用现状, 并就其在儿童肺结核领域中的局限性及未来展望进行综述, 望日后相应的 AI 技术开发能更加关注儿童病例。

方法: 首先回顾了儿童肺结核影像技术及诊断的方法和内容, 说明相关的 AI 模型建立及软件开发的影像学基础; 其次就传统的计算机辅助诊断 (Computer-aided diagnosis, CAD) 技术以及新兴的深度学习技术在成人、儿童肺结核影像诊断中的应用和研究进行分析、阐述, 并对市面上相应商

用软件情况进行统计和介绍。最后,就 AI 技术在儿童肺结核领域中的局限性及未来展望进行讨论和总结。

结果:胸部 CXR 仍被推荐为肺结核疑似病例的首选影像学检查方法,国内外相应领域的 AI 程序、算法大多以 CXR 为研究基础;CAD 可能成为替代人工读取胸部 X 射线的选择,并有可能提供额外的儿科结核病诊断工具,从而实现临床早期诊断、及时治疗;深度学习技术在成人肺结核影像诊断中效能优良,但其在儿童病例中研究匮乏,相应的软件也无专为儿童设计的。

结论:虽然 AI 在儿童肺结核影像诊断方面的研究和应用不足,但结合其在成人肺结核相关研究中的良好表现,其未来的发展依然充满前景。期待 AI 技术发展及软件开发能在儿童肺结核诊断中取得更大的进步,实现儿童肺结核患者的健康管理。

PO-3476

慢性疼痛的静息态功能磁共振研究进展

朱玉萍、何玉麟

南昌大学第一附属医院影像科

慢性疼痛是一种疼痛从急性状态发展到慢性状态,并持续到愈合过程之后的情况,被定义为持续超过正常组织愈合时间的疼痛,通常为 3 个月,可能会引起焦虑、抑郁、睡眠障碍等一系列负面作用,严重者将致残,从而导致生活质量下降。在管理慢性疼痛时,重点通常是促进康复和最大限度地提高生活质量。近年来,随着成像技术的迅速发展,静息态功能磁共振成像(Resting-state functional magnetic resonance imaging,rs-fMRI)因其高空间分辨率和无创优势,被广泛应用于脑功能活动相关疾病的研究。血氧水平依赖(blood oxygen level dependent, BOLD)信号可以客观地测量人类大脑活动,并能够深入了解神经处理潜在机制。最近,越来越多的研究表明,功能磁共振成像可以作为一种诊断疼痛的客观生物标志物的技术。这也为进一步探究慢性疼痛的潜在神经病变机制提供了可能,本文主要综述 rs-fMRI 在慢性疼痛脑功能改变方面的最新研究进展,并对未来研究方向做出展望。

PO-3477

心脏磁共振在早期男性梅毒患者中的临床应用

侯可可、李桃、张娜

成都市公共卫生临床医疗中心

目的:采用心脏核磁共振(CMR)综合评估早期(确诊 3 年内)男性梅毒患者心肌组织和心功能改变。

方法:前瞻性纳入成都市公共卫生临床医疗中心治疗的 88 例男性梅毒患者及 50 例正常男性对照组进行 CMR 扫描,收集临床资料,并对图像资料进行后处理分析,评估包括容积参数、心肌应变等指标;并进一步按照梅毒滴度 TRUST 结果把患者分为滴度 $<1:8$ 及 $>1:8$ 两组,进行进一步分析比较及相关性分析。

结果:88 例梅毒患者均未出现左右心室收缩功能明显减低、瓣膜反流、心肌水肿、LGE 在内的心脏受累表现。①心功能:与正常对照组相比,梅毒患者部分心功指标增高,LVEDV (125.98 ± 23.65 ml vs. 112.99 ± 23.47 ml, $P=0.021$), LVSV (76.17 ± 16.24 ml vs. 67.28 ± 13.22 ml, $P=0.012$), 标化后 LVED Mass/BSA (27.73 ± 3.83 ml/m² vs. 25.53 ± 4.09 ml/m², $P=0.019$); RVEDV (126.84 ± 30.34 ml vs. 110.869 ± 24.63 ml, $P=0.016$), 标化后 RVEDV/BSA (40.86 ± 8.69 ml/m² vs. 37.17 ± 5.95 ml/m², $P=0.039$), RVSV/BSA (21.70 ± 4.82 ml/m² vs. 19.46 ± 4.44 ml/m², $P=0.042$)。②心肌应变:梅毒患者左心室径向应力(LVGRS)较正常对照组减低(20.30 ± 7.99

vs. 42.33 ± 15.05 ml, $P=0.000$ ）。梅毒患者进一步按照梅毒滴度 TRUST 结果分组，组间左右心室容积参数、心肌应力指标均未见明显减低（所有 $P>0.05$ ）。

结论：梅毒患者早期（3 年内）左右心室容积参数已经有所代偿性增高，心肌应力也有所改变，而射血分数暂时保留未发生明显减低，心脏并发症并不多见，且与梅毒滴度无明显相关，可将确诊后的梅毒患者进行早期心血管风险评估及管理，减缓其进展为中晚期心血管梅毒的进程。

PO-3478

右后颈枕部恶性蝶螈瘤一例

李科熠、童娟
贵阳市公共卫生救治中心

本文报道 1 例发生于右后颈枕部的恶性蝶螈瘤，患者女，27 岁，右后颈枕部实性肿块，MRI 表现为长 T1、长 T2 信号，内见囊变坏死区，边界清楚，eADC 示实性部分扩散受限，增强后实性部分明显不均匀强化。行右后颈枕部病灶切除术，术后病理诊断为恶性蝶螈瘤。

PO-3479

基于 AI 赋能脑创伤半暗带的精准诊断

鲁宏
重庆理工大学附属中心医院

脑创伤具有发生率高、致残率高、死亡率的特点，严重威胁着人类生存健康。创伤半暗带是脑创伤后的可逆脑组织，是临床治疗的靶区。研究创伤半暗带的分子病理机制及多模态 MRI 表现依然成为了应用研究的热点。本课题应用 AI 赋能从分子生物学及影像学角度对创伤半暗带进行系统研究，以期提高临床的精准诊断及治疗效果。

PO-3480

贝伐珠单抗治疗大鼠脑创伤的病理与行为学变化的实验研究

况辉、鲁宏
重庆市理工大学附属中心医院

目的 通过观察病理变化以及行为学实验研究贝伐珠单抗对大鼠脑创伤的治疗效果。**方法** 40 只 Wistar 大鼠随机分为 5 组，每组均为 8 只：正常组（NC 组）、假创伤组（sham 组）、创伤组（TBI 组）和实验组 A、B，正常组不做处理，创伤组为创伤性脑损伤组，采用改良的 Feeney 氏法制作的右侧中度创伤性脑损伤模型，其中实验组 A、B 在创伤组的基础上在创伤后立即和 1h 后使用浓度 5mg/kg 的贝伐珠单抗治疗，假创伤组除撞击深度不同，仅损伤颅骨外，其余操作同创伤性脑损伤组。24h 后，高架十字迷宫实验用于观察大鼠情绪行为的变化；避暗实验用于观察大鼠短期记忆以及认知的变化；穿梭实验用于观察大鼠记忆以及学习能力的变化；HE 染色用于检测大鼠创伤后的病理变化。结果 与创伤组相比，高架十字迷宫实验中实验组 A、B 的进入开臂次数百分比（OE%）明显增多，避暗实验中实验组 A、B 的避暗潜伏时间明显减少，穿梭实验中实验 A、B 组的主动穿梭次数明显增多，HE 染色显示，实验 A、B 组的脑水肿范围明显缩小。实验 A、B 两组对比，A 组的 OE% 大于 B 组，避暗潜伏时间小于 B 组，主动穿梭次数大于 B 组，HE 染色脑水肿范围小于 B 组。结论 贝伐珠单抗对大鼠脑创伤有一定治疗作用，能减轻其焦虑情绪，改善其学习记忆以及认知功能，且创伤后立即给药的作用好于创伤后 1h 给药。

PO-3481

新型冠状病毒肺炎是以肺实质性炎症为主的肺炎

乔国庆¹、邢腾龙¹、解丙坤¹、张瑞杰¹、刘振河¹、李宏军²

1. 山东大学齐鲁医院德州医院

2. 首都医科大学附属北京佑安医院

目的 探讨新型冠状病毒肺炎的病理变化：肺实质性还是肺间质性的炎症。 **方法** 分析新型冠状病毒肺炎各期病理改变，与一般病毒性肺炎的病理变化主要表现比较。 **结果** 新冠肺炎的病理改变：早期和较轻病变区见肺泡腔内浆液、纤维蛋白渗出以及透明膜形成，随病变进展和加重，大量单核细胞/巨噬细胞和纤维蛋白充满肺泡腔；Ⅱ型肺泡上皮细胞增生、部分细胞脱落。易见肺血管炎、血栓形成（混合血栓、透明血栓），可见血栓栓塞。肺内小支气管和细支气管易见黏液栓形成。病程较长的病例，见肺泡腔渗出物肉质变和肺间质纤维化。 **结论** 新型冠状病毒肺炎是一种以肺实质炎症改变为主的病毒性肺炎。

PO-3482

儿童 COVID-19 相关的出血性可逆性后部脑病综合征伴新发糖尿病酮症酸中毒及多系统炎症综合征：罕见病例报道

范春华、刘军

中南大学湘雅二医院

目的：儿童中出现 COVID-19 感染相关的可逆性后部脑病综合征（PRES）极为罕见，文献中仅发现 4 例<18 岁人群的 COVID-19 相关的 PRES 报道。与 COVID-19 相关的儿童新发糖尿病酮症酸中毒（T1DM 合并 DKA）、多系统炎症综合征（MIS-C）也有少数相关报道，但根据文献回顾，上述三种现象同时出现在同 1 例儿童中尚未报道。本文报道 1 例儿童 COVID-19 感染相关出血性 PRES 患者的临床及影像学表现，这是首例 COVID-19 感染背景下 PRES、新发 T1DM 合并 DKA 及 MIS-C 三种现象同时出现的儿童病例。本文还回顾了目前关于儿童与 COVID-19 相关的 PRES 文献，包括可能的发病机制、典型表现、鉴别诊断、合并症及治疗。

方法：回顾性分析患者入院前、住院全过程、出院后随访的临床及影像学资料，并复习相关文献。

结果：患者男性，8 岁，新型冠状病毒 Omicron 变异株暴发期间感染，出现腹痛、呕吐、意识障碍入院。实验室检查发现空腹血糖明显增高、血酮升高、代谢性酸中毒，检测发现糖尿病 ZaT8A、IA-2A 抗体阳性，符合国际儿童和青少年糖尿病学会关于 COVID-19 感染相关的新发 T1DM 合并 DKA 的诊断。其次，患者咽拭子 SARS-CoV-2 阳性，发热 3 天，出现胃肠道、心、肺、肾和神经系统受累，出现炎症标志物升高、凝血功能障碍，符合世界卫生组织 MIS-C 的诊断。患儿头部 CT 示双侧顶叶、左颞叶、右侧额叶、胼胝体压部多灶性脑出血。MRI 示双侧顶叶、右额叶皮质及皮质下、胼胝体压部多发异常强化灶、左颞叶脑水肿。治疗后复查，患儿临床表现和影像学表现可逆，考虑 COVID-19 感染相关的出血性 PRES 伴新发 T1DM 合并 DKA 及 MIS-C。

结论：COVID-19 相关的 PRES 在儿童中相对罕见，可能发生在 COVID-19 感染期间新发 T1DM 合并 DKA 和 MIS-C 的儿童，鉴于 PRES 的可逆性，及时诊断和早期治疗预后良好，可避免永久性的神经损伤。本案例为 COVID-19 儿童出血性 PRES 的临床、实验室和神经影像学特征提供了参考。

PO-3483

青海省 3 例重症新型冠状病毒肺炎的影像学特点及动态变化分析

余英芳
青海省第四人民医院

目的：分析我院 3 例重症新型冠状病毒肺炎（新冠肺炎，COVID-2019）的首次影像学表现特点及动态变化、转归。方法：选择我院经核酸检测阳性的 3 例重症新型冠状病毒肺炎的 CT 表现，主要是首次 CT 表现的形态、分布特点及其动态变化。结果：3 例重症肺炎患者年龄较大，其中一例 80 岁，三例均有基础病，首次胸部 CT 表现不一，病变进展快，进展期 CT 表现双肺多发多叶分布，实变为主，以双肺下叶中外带胸膜下为主，实变影内可见网格状改变及空气支气管征，合并基础疾病者吸收较慢。结论：重症新型冠状病毒肺炎 CT 表现具有一定特征，分析其特点及动态变化有助于临床治疗。

PO-3484

贝伐珠单抗治疗脑创伤半暗带后的 AQP4 及 Occludin 表达水平实验研究

林小翼、鲁宏
重庆市理工大学附属中心医院

目的：探索贝伐珠单抗在创伤性脑损伤（TBI）中的治疗效果和推荐给药剂量，以及水通道蛋白 4（AQP4）及密封蛋白（Occludin）在贝伐珠单抗治疗脑创伤半暗带后的表达水平。方法：将 24 只 Wistar 大鼠随机分为假手术组（Sham）、创伤组（TBI）、Beva A 组（贝伐珠单抗为 5mg/kg），分别进行被动回避实验，并记录避暗潜伏期时间。将 95 只 Wistar 大鼠随机分为 Sham 组、TBI 组、Beva 组（A 组；B 组，贝伐珠单抗为 10mg/kg；C 组，贝伐珠单抗为 15mg/kg），24H 后取脑组织行病理、免疫组化、免疫荧光和电子显微镜检查，蛋白质印迹（WB）实验测定血管内皮生长因子（VEGF）、Occludin 和 AQP4 的表达水平。结果：TBI 后大鼠的避暗潜伏期时间延长，而贝伐珠单抗治疗后大鼠的认知功能得到改善。TBI 后血脑屏障（BBB）的损伤和脑水肿加重，贝伐珠单抗治疗后改善了 BBB 的损伤，脑水肿减轻，继发性损伤程度 Beva A 组>Beva B 组>Beva C 组。TBI 后 VEGF 表达上调，而贝伐珠单抗抑制了 VEGF 表达，VEGF 水平 Beva A 组>Beva B 组>Beva C 组（ $P<0.05$ ）。AQP4 在 TBI 后表达上调，贝伐珠单抗治疗后降低了 AQP4 的表达，AQP4 水平 Beva A 组>Beva B 组>Beva C 组（ $P<0.05$ ）。Occludin 在 TBI 后表达下调，贝伐珠单抗给药后 Occludin 表达水平升高，Occludin 水平 Beva A 组<Beva B 组<Beva C 组（ $P<0.05$ ）。结论：TBI 后 VEGF 后表达上调，贝伐珠单抗抑制 VEGF 的表达，并通过拯救 occludin 并抑制 AQP4 极化来减轻 TBI 诱导的 BBB 损伤，从而减轻 CP 的继发性脑损伤。贝伐珠单抗在腹腔给药剂量为 15mg/kg 时效果最佳。VEGF 可能是预防和治疗 CP 继发性脑损伤的关键靶点。

PO-3485

应用 MM-MRI 检测贝伐珠单抗治疗脑创伤 半暗带脑水肿的疗效实验研究

林小翼、鲁宏
重庆市理工大学附属中心医院

目的：探讨 7.0T 多模态磁共振 (MM-MRI) 检测贝伐珠单抗治疗脑创伤半暗带 (CP) 脑水肿的疗效。方法：将 Wistar 大鼠 21 只随机分为假手术组 (Sham)、创伤组 (TBI)、Beva 组 (贝伐珠单抗为 15mg/kg)，24 小时后行 MM-MRI 检查，取大鼠头颅的病理和电子显微镜检查观察脑水肿和血脑屏障。结果：Beva 组的 rs-CE-T1WI、rs-DWI 的面积小于 TBI 组 ($P<0.05$)，rs-SWI 差异无统计学意义 ($P<0.05$)，CE-T1WI 与 SWI 的不匹配显示血管源性脑水肿，与病理学、电子显微镜改变相似。结论：贝伐珠单抗可改善脑创伤 CP 的脑水肿，MM-MRI 能够反映病理结果，CE-T1WI 与 SWI 的不匹配对 CP 有提示意义。MM-MRI 能为临床的诊疗提供准确有效的信息。

PO-3486

T1mapping 和 T1 ρ 定量成像预测兔肝纤维化： 一项基于机器学习的研究

麦晓飞、邹立秋
深圳大学第六附属医院

目的：本研究的目标是直接比较 T1mapping 和 T1 ρ 成像诊断肝纤维化分级的价值。并从 T1mapping 和 T1 ρ 成像获得的定量参数与机器学习 (ML) 分类器相结合，以开发一个能够准确诊断 LF 的预测并验证最佳模型的效能。

材料与方法：本研究纳入 120 只四氯化碳诱导的肝纤维化组 (LF) 家兔，30 只对照组。在对比增强前、10min 和 20min 的肝胆期进行改良的 Look-Locker 反转恢复 (MOLLI) T1mapping 和 T1 ρ 成像。获得 T1native、T110min、T120min、10min 外细胞间容积 (ECV10min)、20min 外细胞间容积 (ECV20min)、T1 ρ native、T1 ρ 10min 以及 T1 ρ 20min 等定量参数，组织病理学分期作为参考标准，比较不同参数诊断 LF 分期的差异。采用逻辑回归、支持向量机、K 最近邻分类、随机森林、ExtraTrees 和极限梯度提升等六种机器学习 (ML) 分类器，在训练集上开发了用于 LF 识别的预测模型。使用受试者工作特征曲线下面积 (AUC) 评估模型的效能。

结果：不同 LF 分期的分布情况如下：F0, n=30; F1, n=25; F2, n=28; F3, n=30; F4, n=27。分为两组，F0 到 F2 期为非晚期 (n=83) LF; F3 到 F4 期为晚期 LF (n=57)。ECV20min 和 T1 ρ 20mi 与 LF 分期进展呈较高的正相关性 (分别为 $r=0.821$, 0.808)，诊断晚期组的 AUC 值分别为 0.86 和 0.84。在六种机器学习模型中，极限梯度提升模型诊断晚期组的 AUC 值最高 (分别为 0.96 和 0.89)，其次是 Extratrees (0.95 和 0.87)、随机森林 (0.92 和 0.86)、支持向量机 (0.90 和 0.85)、K 最近邻分类 (0.86 和 0.83) 和逻辑回归 (0.84 和 0.79)。

结论：本研究的结果显示 T1mapping 和 T1 ρ 成像无创评估兔肝纤维化 (LF) 具有较高的价值，且增强后参数值诊断价值更高。更重要的是，应用机器学习模型能显著提高诊断准确度，有望成为诊断 LF 分期的可靠影像学工具。

PO-3487

鼻腔肉芽肿性毛细血管瘤和鼻息肉基于 CT 增强和灰度共生矩阵的鉴别诊断

陈彦孜、尹安雨、唐湘雍、方进智、于大飞、鄂林宁、张玉忠
深圳市龙华区人民医院

目的探讨 CT 增强的灰度共生矩阵 (GLCM) 纹理分析鉴别诊断鼻腔肉芽肿性毛细血管瘤和鼻息肉的价值。

方法经手术病理证实的 46 例鼻腔肿物患者的资料, 其中鼻腔肉芽肿性毛细血管瘤 22 例, 鼻息肉 24 例, 术前行 CT 平扫+动脉期增强检查。评估两种病变平扫及增强后动脉期的平均 CT 值及其 20 个 GLCM 特征之间的变化。使用线性混合效应模型分析两种病变各自平扫及增强后 CT 值和选定 GLCM 特征的差异。

结果两种病变增强扫描动脉期 CT 值有显著差异 ($p < 0.001$)。模型显示两种病变增强扫描动脉期图像的 GLCM 特征存在显著差异, 即自相关 ($p < 0.001$)、相关性 ($p = 0.012$)、同质性 ($p = 0.003$)、对比度 ($p < 0.01$), 和差异熵 ($p = 0.037$)。在大多数模型中, 两种病变平扫及增强扫描动脉期的 GLCM 特征有显著差异 ($p \leq 0.001$), 其中, 两种病变的平扫的 GLCM 特征相似。

结论 GLCM 是一种提高运用增强扫描 CT 图像检测鼻腔肉芽肿性毛细血管瘤和鼻息肉的 CT 值变化敏感性的方法, 是提高对该两种病变鉴别诊断的有用补充。

PO-3488

基于肺部 CT 影像学早期变化预测新冠肺炎临床结局的研究

林燕
福建省立金山医院

目的: 探究新冠肺炎患者初诊胸部 CT 影像学变化情况对该患者临床结局的影响, 以期建立一种能够预测新冠肺炎预后的影像学评估工具。

方法: 回顾性分析 2022 年 12 月至 2023 年 3 月于福建省立医院、福建省立金山医院住院治疗的新新冠肺炎患者, 所有患者在入院时、入院 72 小时及痊愈后 6 月行胸部 CT 平扫, 同时监测患者痊愈后 6 月肺功能、血气分析以及标准 6 分钟步行实验。统计学分析肺部 CT 早期变化与痊愈后肺功能情况的关系。

结果: 共纳入 100 例确诊新冠肺炎患者, 其中 20 例早期无明显影像学变化; 80 例患者出现早期病变进展。依据胸部 CT 影像学早期进展情况, 将其赋值为 1-5 分。早期基线分值越高, 患者出现 ARDS、呼吸衰竭、循环衰竭的概率 ($P < 0.05$) 越高, 痊愈后残余肺功能越差 ($P < 0.05$), 此外, 患者若同时合并肺部肿瘤、高龄 (> 75 岁)、糖尿病等, 其术后肺功能水平往往低下。

结论: 新冠肺炎患者初诊早期出现影像学进展与痊愈后残余肺功能密切相关

PO-3489

就诊于肝病门诊的罕见职业病: 肝脏血管肉瘤一例

周忠凯、陈君卓、李宏军
首都医科大学附属北京佑安医院

原发性肝血管肉瘤 (primary hepatic angiosarcoma, PHA) 是一种罕见的源自肝窦内皮细胞的高度恶性且进展迅速的间充质肿瘤, 在原发性肝恶性肿瘤中的占比不到 1%, 人群分布特征多好发于 60-

70 岁, 其中男性更多发, 为女性发病者的四倍。原发性肝血管瘤、上皮样血管内皮瘤、恶性血管外皮细胞瘤和婴儿血管内皮瘤都归属于原发性肝恶性血管瘤家族, 其中 PHA 的预后最好, 即便如此由于早期患者无明显症状或非特异性腹部体征, 多数为偶然发现, 且由于其进展迅速, 如未经治疗, 这种癌症的中位生存期 < 6 个月, 大多数患者在诊断后一年内死亡, 所以早期诊断至关重要。从组织学层面, 不同于继发性肝脏血管瘤的 MYC 基因扩增, 原发性血管瘤更多可能是由于端粒选择性延长导致的 α -地中海贫血/智力迟钝综合征 x 连锁蛋白(α -thalassemia/mental retardation syndrome X-linked protein, ATRX)的表达缺失。而与这一改变相关的已知环境致癌物包括有氯乙烯、二氧化钍和砷。我们报告了一例长期供职于纺织厂的 52 岁女患, 既往肝脏血管瘤切除史, 无肝炎病毒感染史, 体检发现谷丙转氨酶 (162U/L) 及谷草转氨酶 (110U/L) 升高, CT 平扫表现为多发类圆形低密度影, 增强表现为门脉期及延迟期的渐进性填充, 门静脉及下腔静脉受压移位, 后于我院行肝脏局部切除术, 病理证实免疫组化检查显示肿瘤细胞特征 CD31、CD34 和 Ki-67 染色阳性。诚然, 对于原发性血管瘤的定性诊断依赖于病理学检查, 但由于其血管源性, 常在穿刺时有不可控的出血, 危险性较大, 所以影像学的精确诊断至关重要。此外, 对于无肝炎病史, 长期氯乙烯接触史的患者, 如在影像表现为巨大肿块和/或多发结节病灶, 增强检查表现为持续渐进强化的改变, 应高度考虑肝脏血管瘤的可能。有效结合临床症状、影像学、实验室检查等进行综合分析, 更有利于准确判断病情, 及时手术联合放化疗更有利于患者生存期的延长。

PO-3490

胰腺侵袭性纤维瘤病例报告及文献复习

徐雪彬、任莹
中国医科大学附属盛京医院

目的 胰腺侵袭性纤维瘤是一种相对罕见、局部侵袭性、非转移性的软组织肿瘤, 容易误诊。本研究探讨胰腺侵袭性纤维瘤的临床及影像特点。**方法** 回顾性分析 10 例经术后病理证实为胰腺侵袭性纤维瘤的 CT 增强资料及相关临床数据, 并汇总复习 30 例既往文献报道的病例。**结果** 在本研究收集的 10 例患者中病灶大小从 2.3×1.6cm 至 18.4×11.5cm 之间不等。4 例病灶位于胰腺体尾部, 4 例位于胰头部, 2 例位于胰腺钩突部。5 例病灶呈囊实混合性, 3 例为实性, 2 例为囊性。其中 7 例表现为侵袭性生长, 2 例表现为边界尚清的肿块, 1 例仅表现为十二指肠降段的不均匀增厚, 胰腺占位表现不明显。CT 增强扫描 9 例患者呈轻-中度不均匀强化, 1 例病灶未见明显强化。其中 5 例病灶侵及脾静脉, 致脾门及胃周多发侧支循环形成。2 例病灶侵犯肠系膜上静脉。手术后随访 9 例患者无肿瘤复发, 1 例随访丢失是否存在肿瘤复发不详。在文献复习的 30 例患者中, 病灶大小从 1.5cm 至 23×15cm。10 例病灶出现在胰头部, 10 例病灶出现在胰尾部, 6 例在胰腺体尾部, 2 例出现在胰体部, 1 例出现在胰体、颈部, 1 例呈胰腺弥漫性病灶。17 例患者在文献报道前的随访中病情稳定没有复发, 12 例患者后继是否复发不详, 1 例出现病情复发。40 例患者资料综合分析, 胰腺侵袭性纤维瘤确诊时的男女之比为 2.3:1 (男性占比为 70.0%), 平均年龄为 39.46 岁 (范围在 0.2-72 岁), 平均肿瘤大小约 7.9cm (范围约 1.5cm-23cm), 病灶多发出现在胰尾部 (统计包含胰体尾部) 约占 53%, 术后随访结果肿瘤无复发率为 65.0%。**结论** 本研究通过对收集病例及文献报告病例的影像及临床资料汇总分析, 进一步加深了对胰腺侵袭性纤维瘤的认识, 为胰腺侵袭性纤维瘤病的影像诊断和临床治疗提供参考。

PO-3491

ASL 在脑梗死早期诊断及治疗风险评估中临床应用

鲁宏

重庆理工大学附属中心医院

随着中国人口的老龄化,脑梗死具有高发生率、高死亡率和高致残率,是目前威胁人类健康的重大疾病。其早期精准诊断及治疗研究是临床研究的热点。影像诊断及治疗评估是确保临床诊治的重要举措。ASL 这项临床适用影像技术给临床带来了曙光,尤其是应用 ASL 技术为早期诊断脑梗死、评估半暗带及溶栓治疗的风险进行了有益探索。

PO-3492

基于深度学习的大鼠脑创伤半暗带的自动分割研究

蒋上海^{1,2}、鲁宏¹、范烜豪²、艾莉¹、林小翼¹

1. 重庆理工大学附属中心医院, 重庆 400054

2. 重庆理工大学光纤传感与光电检测重庆市重点实验室, 重庆 400054

创伤半暗带是脑创伤后一段时间内,位于创伤核心周围的区域。创伤核心完全坏死,无研究价值,而半暗带对患者预后和生活质量至关重要。利用深度学习的医学图像分割技术,特别结合多模态 MRI 影像中的 DWI、SWI,对大鼠脑创伤半暗带进行精准分割。相较于人工提取,该方法速度更快、准确性更高,可极大缩短处理时间,对脑创伤的临床治疗具有重要意义。

本文共获取了 146 张大鼠脑部创伤图像,其中包括 73 张 DWI 模态和 73 张 SWI 模态。DWI 模态主要呈现创伤核心区和创伤半暗带过渡区的信息,而 SWI 模态仅显示创伤核心区的信息。利用 UNet++ 网络模型分别对 DWI 和 SWI 两种模态的图像进行了分割。使用重叠度量方法对分割后的 DWI 创伤区和 SWI 创伤核心区进行了分析,以获取两个标签区域的不重叠部分,即创伤半暗带区域。采用了交叉联合度量 (IOU) 和 Dice 相似系数 (DSC) 作为评价指标,以评估分割结果的准确性。

研究表明,UNet++ 网络模型预测的半暗带结果与原始的半暗带结果相似度较高,没有明显的细小错误分割。经过计算后得出平均交叉联合度量 (IOU) 为 0.69,平均 Dice 相似系数 (DSC) 高达 0.82。这说明 UNet++ 网络模型对大鼠脑创伤半暗带的分割具有高度的稳定性和准确性。

UNet++ 网络模型在分割半暗带时能够较好地捕捉到半暗带的特征,解决了脑创伤半暗带分割的精度和效率等问题,在创伤半暗带提取的领域上有了新的进展,同时也可可为医生提供重要的诊断信息。

PO-3493

CT 总严重程度评分联合检验指标对肝硬化患者 SARS-CoV-2 感染患者预后的研究

徐开蔚

宁波大学医学院附属第一医院

目的 分析肝硬化人群在感染严重急性呼吸综合征冠状病毒 2 (severe acute respiratory syndrome coronavirus 2, SARS-CoV-2) 的预后,并对影响其预后的因素进行分析。方法 收集 2022 年 12 月 7 日至 2023 年 2 月 10 日在宁波市医疗中心李惠利医院、宁波大学附属第一医院确诊的冠状病毒病 (coronavirus disease 2019, COVID-19) 患者 80 例 (肝硬化患者 40 例,非肝硬化患者 40 例) 的

临床症状或体征、实验室和放射学结果相关数据, 分析其与 COVID-19 预后的关联。结果 在感染 SARS-CoV-2 后, 肝硬化患者相对于非肝硬化患者预后更差, 这可能与皮下脂肪厚度、AST、淋巴细胞计数、D-二聚体等因素有关。肝硬化患者 ALT、AST 越高, 住院天数越长, 两者存在中等及强相关性, 相关系数分别为 0.581、0.668。肝硬化患者 COVID-19 临床分型中型与重型、中型与危重型之间总严重程度评分 (TSS) 的差异均有统计学意义 ($P>0.025$, $P<0.000$), 而随着肝硬化患者 COVID-19 临床分型递增, 其住院天数存在升高的趋势, 但无统计学意义 ($P>0.05$)。结论 ALT、AST、TSS 评分、临床分型是肝硬化 COVID-19 患者重症化的高危因素和预测、预后重要因素。

PO-3494

外周血嗜酸性粒细胞：放射科医师鉴别儿童胸肺型并殖吸虫病与结核性胸膜炎的重要参考

李翔¹、毕燕²

1. 昆明市第三人民医院

2. 临沧市人民医院

摘要：目的：探讨胸部 CT 征象联合外周血嗜酸性粒细胞百分比对鉴别儿童胸肺型并殖吸虫病与结核性胸膜炎的价值。方法：回顾性收集昆明市第三人民医院及临沧市人民医院 2019 年 1 月至 2023 年 4 月首次确诊的儿童胸肺型并殖吸虫病患者及结核性胸膜炎患者，其中儿童胸肺型并殖吸虫患者（吸虫组）69 例，结核性胸膜炎患者（结核组）89 例。分析其临床症状、胸部 CT 影像学表现及实验室检查结果；利用二元 logistic 回归建立 CT 征象的影像模型和结合 CT 征象与嗜酸性粒细胞的联合模型，计算及对比两个诊断模型的鉴别诊断效能。结果：利用 CT 征象建立影像模型，通过绘制受试者工作特征曲线（ROC），曲线下面积（AUC）为 0.856（95%CI: 0.799~0.913），敏感度为 66.7%，特异度为 88.9%。利用 CT 征象和嗜酸性粒细胞百分比建立联合模型，通过绘制 ROC 曲线，AUC 为 0.950（95%CI: 0.919~0.980），敏感度为 89.9%，特异度为 90.1%。联合模型鉴别诊断效能高于影像模型，其 AUC 差异具有统计学意义。结论：对于儿童胸肺型并殖吸虫病与结核性胸膜炎的鉴别，联合模型鉴别诊断效能高于影像模型；胸部 CT 无肺部结节、出现隧道征、外周血嗜酸性粒细胞百分比升高更倾向诊断儿童胸肺型并殖吸虫病。

PO-3495

基于 ReHo 颅外多器官结核患者的脑功能研究

侯代伦¹、王依川²、李晔¹、徐泽璇¹

1. 首都医科大学附属北京胸科医院

2. 北京市结核病胸部肿瘤研究所

目的：颅内结核是致死率、致残率最高的结核病，即便是 CT 及 MR 技术有了极大发展，颅内结核的早期诊断也有很大困难。颅外多器官结核作为并发颅内结核的高风险人群，探索颅内多器官结核患者脑功能的改变可能对早期诊断颅内结核有重要参考价值。本研究旨在通过局部一致性（regional homogeneity, ReHo）的分析，探索颅外多器官结核患者在常规频段（0.01-0.08Hz）和两个子频段（slow-4 频段：0.027-0.073Hz 和 slow-5 频段：0.01-0.027Hz）的自发性神经活动的变化。

方法：32 例颅外多器官结核患者和 31 名健康对照组通过静息状态功能磁共振成像（resting-state functional magnetic resonance imaging, rs-fMRI）的方法来探索异常自发性神经活动，在常规频段（0.01-0.08Hz）和两个子频段（slow-4 频段：0.027-0.073Hz, slow-5 频段：0.01-0.027Hz）进行 ReHo 分析。

结果:与健康对照组相比,颅外多器官结核患者在常规波段(0.01-0.08Hz)左侧中央后回和左侧小脑上脑 ReHo 值降低。相反,右侧枕中回的 ReHo 值增加。在 slow-4 频段(0.027-0.073Hz),颅外多器官结核患者仅表现出小脑上叶 ReHo 值降低。在 slow-5 频段(0.01-0.027Hz),颅外多器官结核患者右侧中央后回和左侧小脑上叶 ReHo 值降低。颅外多器官结核患者在常规波段(0.01-0.08Hz)左侧中央后回的 ReHo 值以及 slow-5 频段(0.01-0.027Hz)右侧中央后回的 ReHo 值和部分神经心理学测试得分呈正相关。

结论:颅外多器官结核患者相比于健康对照组确实存在脑功能的变化,中央后回的 ReHo 值的减低可能与疼痛有关,枕中回 ReHo 值增加可能与潜在的视力障碍和补偿机制有关,小脑 ReHo 值的减低也可能与认知有关。颅外多器官结核患者的差异脑区具有频段特异性。中央后回局部一致性变化与认知功能有关。

PO-3496

MRI 表现为椎体内弥漫分布结节的脊柱结核 3 例

李翔

昆明市第三人民医院

本文报道 3 例 MRI 表现为椎体内弥漫分布结节的脊柱结核患者,病例 1 为 68 岁女性,病例 2 为 80 岁女性,病例 3 为 22 岁男性,3 例患者均存在免疫抑制状态,其中病例 1 为细胞免疫功能低下,病例 2 合并糖尿病,病例 3 合并肾病综合征,长期服用激素治疗,3 例患者均合并急性或亚急性血行播散型肺结核、颅内结核及其他肺外结核,病例 1 及病例 2 痰或脑脊液结核分枝杆菌培养阳性,病例 3 病原学阴性。3 例患者脊柱 X 线片及 CT 均无骨质破坏表现,MRI 表现为累及椎体及附件内弥漫分布、大小基本相似的等 T1WI 低或稍高 T2WI 信号影,脂肪抑制序列为高信号,增强 T1WI 以上结节明显强化。1 例患者经过腰椎穿刺活检提示慢性肉芽肿性炎,2 例患者经过抗结核治疗后复查脊柱病变明显减少。3 例患者中,1 例死亡。椎体内弥漫分布结节为脊柱结核十分罕见的 MRI 表现,既往未见报道,推测可能为结核血行播散的表现,诊疗过程中需要鉴别多发性骨髓瘤。

PO-3497

新冠急性后综合征患者频率依赖性内在大脑活动模式

王瑶、周福庆

南昌大学

目的:新冠急性后综合征 (PACS) 的症状持续并复杂多样,其潜在的神经学基础尚未被完全理解。本研究的目的旨在探索 PACS 大脑内源性活动模式及其与临床症状的关系。

方法:本研究招募了 29 名 PACS 患者、28 名新冠急性症状消失后的非 PACS 受试者以及 30 名管控放开政策前招募的健康对照 (HC)。所有新冠受试者均接受了核酸检测、MRI 和神经心理评估,HC 均无核酸阳性史。所有 MRI 数据在 DPABI 7.0 进行预处理。在典型频段(0.01-0.10 Hz),我们使用基于体素水平的低频波动振幅 (fALFF) 来表征三组之间的内在活动的区域模式。同时在 slow 5 (0.01-0.023 Hz) 和 slow 4 (0.023-0.073 Hz) 亚频段探讨 fALFF 模式的差异。此外,在经典频段,使用受试者特征曲线 (ROC) 来评价不同的 fALFF 的模式对 PACS 和非 PACS 的诊断效能。使用偏相关或者斯皮尔曼相关来探讨 fALFF 变化和临床量表的关系。

结果:在经典频段中,与 HC 相比,PACS 组和非 PACS 组 fALFF 在双侧楔前叶存在相同的下降模式;而右小脑后部和左侧楔前叶 fALFF 下降仅出现在 PACS 组,左小脑后叶、左侧额上回和双侧楔前叶 fALFF 下降仅出现在非 PACS 组。进一步亚频段的分析发现,在 slow 5 频段,PACS 患者和非 PACS 患者分别在左后扣带回/楔前叶和双侧楔前叶的 fALFF 下降。在 slow 4 频段,PACS 组和非 PACS 组分别在左后扣带回/楔前叶和双侧楔前叶的 fALFF 下降。

非 PACS 组在左额上回表现出 fALFF 下降的模式。ROC 分析表明,经典频段的双侧楔前叶和右小脑后叶的独特 fALFF 模式可以区分 PACS 和非 PACS 患者 (AUC: 0.74, 0.66)。相关分析发现,在新冠患者中,共同下降的脑区 fALFF 与总体认知相关 ($r=0.207$; $P=0.037$), PACS 组右小脑后叶 fALFF 与疲劳评分相关 ($r=0.415$; $P=0.025$)。

总论: PACS 和非 PACS 存在共同的 fALFF 下降脑区 (双侧楔前叶), 其与新冠患者的总体认知相关, 而仅在 PACS 患者下降的右侧小脑后叶 fALFF 值与疲劳有关。此外, 新冠患者的 fALFF 模式受频率的影响

PO-3498

肝包虫病影像学诊断专家共识

刘文亚

新疆医科大学第一附属医院

包虫病是呈全球性分布的人畜共患性疾病, 已成为严重危害全世界公共卫生健康的问题。影像学技术在肝包虫病的早期诊断、术前评价及疗效监测方面发挥着至关重要的作用。目前包虫病影像诊断缺乏统一共识, 不利于影像专业人员学习培训以及临床对于包虫病的规范诊断与治疗, 为此由首都医科大学附属北京佑安医院和新疆医科大学第一附属医院联合多家医院的感染与炎症放射学专家, 在充分学习国际指南、文献以及国内外最新研究成果的基础上, 结合循证医学对建立指南及标准的方法学要求, 针对肝包虫病影像学诊断依据、诊断原则、诊断标准和鉴别诊断形成共识, 为临床医师在肝包虫病影像学临床应用中提供明确的诊断依据。

PO-3499

HIV 相关腮腺良性淋巴上皮囊肿影像学表现

黄志华

南昌市第九医院

目的 探讨 HIV 相关腮腺良性淋巴上皮囊肿影像学表现及特点。方法 回顾性分析经手术和病理证实的 1 例 HIV 相关腮腺良性淋巴上皮囊肿临床及影像资料, 结合相关文献分析其影像特点。结果 患者女性, 68 岁。双侧腮腺轻度肿大一年, 发现 HIV 抗体阳性 1 月, 予 TDF 联合艾博韦泰抗病毒 1 个月。艾滋病病毒 RNA HIV-RNA2.83E+03IU/ml, CD4+ 513 个/ul。查体颈部及右耳后可触及数个肿大淋巴结, 黄豆大小, 无压痛, 活动度可, 无黏连。CT 平扫+增强扫描: 双侧腮腺轻度肿大, 右侧腮腺 55mm*43mm*38mm, 平扫密度不均匀, 见直径约 18mm*15mm 类圆形低密度影, 增强后见环形壁强化, 内容物无强化。左侧腮腺 50mm*39mm*31mm, 密度均匀未见异常强化。超声所见: 双侧腮腺体积肿大, 包膜完整、回声欠均匀, 内见数个 5-9mm 淋巴结样低回声。右侧腮腺见约 21mm*15mm 低回声结节, 内部回声不均匀, CDFI 未见异常血流信号。在全麻下行右侧腮腺部分切除术+面神经探查术+颈部淋巴结清扫术。术后病理: 考虑 HIV 相关腮腺良性淋巴上皮囊肿; 右颈部淋巴结符合艾滋病相关淋巴结病 (滤泡消失期, 3 期)。结论 HIV 相关腮腺良性淋巴上皮囊肿非常罕见, 但可作为 HIV 感染初期标志性病变, 可产生容貌畸形, 对患者心理造成严重影响。当感染 HIV 但尚未治疗时可发生腮腺肿大和良性淋巴上皮囊肿。影像学检查对诊断 HIV 相关腮腺良性淋巴上皮囊肿有重要价值, 但尚需与淋巴管畸形、鳃裂囊肿、干燥综合征、淋巴瘤、Warthin 肿瘤等鉴别, 确诊需结合病理。治疗包括抗逆转录病毒药物治疗、定期复查、手术切除、反复抽吸、硬化治疗、放疗等。

PO-3500

新型冠状病毒肺炎患者脑血流改变相关的基因表达：一项结合神经影像和转录的研究

王瑶、周福庆
南昌大学

目的：大量研究发现新型冠状病毒肺炎（COVID-19）是一种与遗传密切相关的疾病，并且神经影像研究发现 COVID-19 患者存在脑血流量（CBF）的降低，但是这种脑血流改变与基因表达之间的关系尚不清楚。因此，本研究的目的是探索 COVID-19 患者脑血流相关的基因表达机制。

方法：在 2023 年 1 月到 4 月，本研究前瞻性的收集了 51 名 COVID-19 患者和 30 名健康对照组（HC）进行磁共振扫描，使用两样本 T 检验进行组间比较得到 CBF 的差异 T 值图。之后，结合艾伦人类脑图谱数据集（<http://www.brain-map.org>）进行转录-神经成像空间关联分析，在进行严格的多重比较校正和空间自相关校正之后，找出与 COVID-19 的 CBF 变化相关的基因，并将这些基因集在 COVID-19 相关的门户网站（<http://geneontology.org/covid-19.html>）进行一系列功能注释、富集分析和组织、细胞类型特异性表达分析。

结果：研究发现 COVID-19 患者在左侧额上回、额中回、额下回和辅助运动区的 CBF 减少（GRF 校正，体素水平设为 $P < 0.001$ ，簇水平设为 $P < 0.01$ ）。此外，这些 CBF 的变化与 2918 个基因的表达在空间上相关，进一步富集和特异性细胞类型分析显示，这些 COVID-19 基因集与冠状病毒感染高度相关，并富集在 COVID-19 相关的重要分子功能（电子转移、核糖体和蛋白质的结合）、生物过程（有丝分裂调节、囊泡组装和细胞质翻译）中富集并且表达增加，同时，这些基因在成人脑皮层的脑组织和神经元细胞中特异性表达。

结论：研究结果表明，在 COVID-19 患者中存在脑血流灌注的下降，这可能是与该疾病相关的多个基因共同作用的结果。

PO-3501

获得性免疫缺陷综合征合并弓形虫脑病的临床特征及影像表现

魏琳
贵阳市公共卫生救治中心

目的：探讨获得性免疫缺陷综合征(AIDS)合并弓形虫脑病的临床及影像特征，以及随访治疗后的影像表现，为临床诊治提供参考。

方法：收集 2021 年 8 月至 2022 年 8 月本院 25 例 AIDS 合并弓形虫脑病患者临床资料，总结其临床特征、影像表现及治疗后资料，回顾性分析 AIDS 合并弓形虫脑病的影像表现及鉴别诊断。

结果：临床症状以发热、头痛、肢体活动障碍常见，头颅 MRI 提示 95.5% 患者呈多发病灶，多见于顶叶、颞叶、额叶，T1WI 呈等或低信号，T2WI 呈等或高信号，增强后提示 73.5% 呈环形强化灶，58.2% 呈结节状强化灶，79.5% 周围可见水肿带。经过抗弓形虫治疗后 2 个月，15 例患者可见病变明显吸收，周围水肿消退；7 例半年后患者仍然有少量病变残留；一年后 3 例患者 MRI 随访基本恢复正常，但依然可见病变残留。

结论：弓形虫脑病为 AIDS 患者常见的中枢神经系统病变，临床状无特异性，影像学有一定的特征性：好发 CD4 细胞计数较低的患者，弓形虫抗体 IgG 可作为辅助诊断依据，脑脊液检无特异性，临床抗弓形虫治疗疗效好。

PO-3502

基于 MRI 多 b 值直方图阵列及卷积神经网络预测乳腺癌溶骨性转移化疗疗效

史燕杰、朱海涛、李晓婷、王琳琳、孙应实
北京大学肿瘤医院

目的 旨在建立一种深度学习方法,通过分析整合基线多 b 值扩散加权成像 (DWI) 数据预测乳腺癌溶骨性转移化疗疗效。方法 纳入 36 例乳腺癌溶骨性骨转移患者,共 191 个病灶,于化疗前及疗后 6 个月行 MRI 常规序列和 DWI 序列扫描,根据肿瘤疗效情况分为疾病无进展组和疾病进展组。由两位影像科医师手工勾画病灶范围,将基线 MRI 的每一个转移瘤区域的不同 b 值 DWI 信号转换为直方图并纵向拼接,构建、训练及验证卷积神经网络。通过 ROI 提取多 b 值参数,包括 ADC, D, D*, α 及 DDC。通过绘制受试者工作特性 (ROC) 曲线比较直方图阵列及各多 b 值 DWI 参数的在预测转移瘤的效能。结果 应用基线 MRI 多 b 值的卷积神经网络预测乳腺癌化疗疗效的 ROC 曲线下面积 (AUC=0.764) 最大, ADC 值与 D 值预测乳腺癌化疗疗效的 AUCs 值分别为 0.7616 与 0.603。基于基线 MRI 多 b 值的卷积神经网络预测乳腺癌化疗疗效的效能高于 ADC 值与 D 值 (P 值分别为?)。结论 应用基线 MRI 多 b 值卷积神经网络的深度学习在预测乳腺癌溶骨性骨转移化疗疗效有一定的临床应用价值。

PO-3503

群组管理模式结合视频立体化健康教育对冠状动脉 CT 血管成像患者的影响

黄红芳、梁俊丽、何宝亮、赵娟
广西医科大学第一附属医院

目的: 探讨群组管理护理模式结合视频立体化健康教育对冠状动脉 CT 血管成像患者应激反应及检查效果的影响。方法: 选取 2019 年 8 月~2021 年 6 月间至我院行冠状动脉 CT 血管成像 178 例患者为研究对象,根据随机数值表法将 178 例患者随机分为对照组与观察组,每组各 89 例,对照组患者给予临床常规模式干预,观察组患者实施群组管理模式结合视频立体化健康教育,对比两组患者的检查认知水平、应激反应、检查效果、心理韧性。结果: 经过两组患者统计数值对比,观察组患者的疾病检查认知水平为 94.38%较对照组 83.14%高,两组数据比较差异具有统计学意义 ($P=0.018$, $\chi^2=5.633$); 在检查前,两组患者的 SAS 及 SDS 评分均较教育前降低,且观察组评分均较对照组低 ($P<0.001$, $t=7.360$; $P<0.001$, $t=5.664$), 在检查时,两组患者的收缩压、舒张压、心率均有所上升,但对照组较观察组上升明显 ($P<0.001$, $t=6.100$; $P<0.001$, $t=3.806$; $P<0.001$, $t=6.923$); 观察组患者的检查时长均较对照组短 ($P<0.001$, $t=7.900$); 观察组的一次性检查通过率为 95.50%较对照组 85.39%高,两组数据对比具有统计学意义 ($P=0.022$, $t=5.268$), 观察组患者与对照组患者的成像质量相比,观察组患者的成像质量均较对照组高 ($P=0.042$, $z=-4.298$), 两组患者的检查行为比较,观察组患者微笑、安静的例数均高于对照组,皱眉、躲避的例数低于对照组,具有统计学意义。经过两组患者统计数值对比,观察组在心理坚韧、自强、乐观积极及总分均较对照组高,两组数据对比具有统计学意义。结论: 将群组管理护理模式结合视频立体化健康教育应用于冠状动脉 CT 血管成像患者,可提高患者的心理韧性及检查认知水平,降低患者的心生应激反应,确保临床检查效果。

PO-3504

心理护理和放松训练对磁共振检查中幽闭恐惧症患者的改善

李壹

郑州大学第一附属医院

【摘要】目的：研究心理护理和放松训练运用到磁共振检查中对幽闭恐惧症的效果，观察患者幽闭恐惧症的改善情况，探讨心理护理和放松训练的临床价值。**材料：**本次实验通过筛选 2021 年 1 月至 2022 年 1 月在本院进行磁共振检查的 74 例患者作为实验观察对象，患者均患有幽闭恐惧症，患者的临床病例资料完整。随机分为常规组和观察组，每组患者各 37 人。其中常规组患者采取常规的护理措施，观察组患者在磁共振检查过程中给予心理护理和放松训练。使用 POMS 量表对比两组患者的情绪状态评分，使用 HAMA/HAMD 汉密尔顿焦虑/抑郁量表评估患者的负性情绪，对比两组患者的检查时间长短以及检查时的依从性，对比磁共振检查图像结果的满意度，观察患者的生命体征变化，如心率、收缩压、舒张压以及呼吸频率。统计检查中不良反应的发生率。**结果：**护理干预前两组患者的 POMS 评分无较大差异 ($P>0.05$)，实验干预后，观察组患者的 POMS 量表各项评分均低于常规组患者，实验对比有统计学差异 ($P<0.05$)。护理干预前两组患者的负性情绪评分无较大差异 ($P>0.05$)，实验干预后，观察组患者的负性情绪评分均低于常规组患者，实验对比有统计学差异 ($P<0.05$)。对比两组患者的检查时间，观察组患者的检查时间少于常规组患者的检查时间，实验对比有统计学差异 ($P<0.05$)。护理前两组患者的检查依从性均较差，($P>0.05$)，护理干预后观察组患者的依从性评分高于常规组患者，($P<0.05$)。观察组患者的磁共振图像满意度为 91.89% (34/37)，常规组患者的磁共振图像满意度为 78.38% (29/37)，观察组患者的满意度高于常规组患者，实验对比有统计学差异 ($P<0.05$)。对比生命体征，护理干预后观察组患者的心率、血压以及呼吸频率均低于常规组患者，($P<0.05$)

PO-3505

预防性护理在钆贝葡胺造影剂上腹部增强 MRI 检查中的应用分析

王睿

郑州大学第一附属医院

探究患者在进行上腹部增强 MRI 检查时应用钆贝葡胺造影剂的过程中进行预防性护理的干预效果和临床价值进行调查分析，并针对性的进行相关的预防措施，加强防护，减少不良反应的发生。方法：在 2022 年 1 月-2022 年 12 月的时间，选取我院各科室的 100 名需要进行钆贝葡胺造影剂上腹部增强 MRI 检查的患者作为研究对象，对研究对象进行调查、研究，将所有患者随机分为两组，对患者在磁共振检查时应用钆贝葡胺造影剂的过程中可能出现的不良反应调查，并进行相关的干预措施，减少患者的不适和不良反应的发生情况，观察组患者进行预防性护理干预，对照组患者进行常规护理干预，在患者进行钆贝葡胺造影剂上腹部增强 MRI 检查过程中，记录患者的检查所需时间和所得图像质量，记录患者产生的不良反应，应用焦虑自评量表 (SAS)、抑郁自评量表 (SDS) 评估患者的焦虑、抑郁情绪，将两组数据进行分析比较，绘制成表格，比较两种护理方法在钆贝葡胺造影剂上腹部增强 MRI 检查中的干预效果，总结出有效的护理方法，减少患者在检查过程中的不适，减少不良反应的发生几率。**结果：**通过本次调查研究，对钆贝葡胺造影剂上腹部增强 MRI 检查的患者进行预防性护理干预和常规护理干预，发现进行预防性护理的患者检查用时明显缩短、图像质量较高、患者产生的不良反应较少、检查期间患者的焦虑抑郁情况较少，临床效果更好。**结论：**在钆贝葡胺造影剂上腹部增强 MRI 检查过程中，患者由于缺乏对检查过程的了解，加上疾病的影响，可能会产生各种焦虑、抑郁的负性情绪，配合度较差，使得得出的图像质量不高，影响到疾病的诊断、治疗，需要进行一定的护理干预，提高患者的配合度，提高图像质量，在患者接受钆

贝葡胺造影剂上腹部增强 MRI 检查过程中进行预防性护理干预, 能明显缩短检查时间, 得出的图像质量较高, 也能减轻患者的不良反应, 患者在检查期间焦虑、抑郁等情况产生较少, 临床应用价值较高, 值得推广使用。

PO-3506

“00 后”本科护理实习生职业认同感的调查与分析

赵雷、董倩
昆明医科大学第一附属医院

【目 的】调查“00 后”实习护生职业认知情况, 分析影响职业认同感因素, 为改善临床带教方法和高校人才培养方法提供参考。【方 法】使用方便抽样法, 抽取昆明市昆明医科大学第一附属医院本科实习生 200 人进行研究, 护生在医院进行为期 10 个月的临床护理实习, 采用刘玲等编制的护士职业认可表进行问卷调查, 采用 SPSS26.0 统计软件进行数据分析。【结 果】1. 实习护生的职业认同现状: 实习护生职业认同得分平均分是 96.98 分, 维度得分平均分从高到低是职业社会支持 (3.29 ± 0.70)、职业社交技能 (3.28 ± 0.70)、职业认同认知评价 (3.22 ± 0.68)、职业自我反思 (3.19 ± 0.73)、应对职业挫折 (3.16 ± 0.74)。2. 实习护生职业认同水平的多因素分析进行多元线性回归分析: 把职业认同共感总分作为原因变量, 对实习护生职业认同共感水平得分总体影响具有统计学意义的因素作为自变量。F=38.894, $P < 0.001$, 方程显著, 说明影响实习护生职业认同情况的因素是对护理专业的态度、实习医院的满意与否、毕业后的就业去向、是不是独生子女。【结 论】“00 后”本科实习护生的职业认同感在一个中间段。影响实习护生职业认同情况的因素有对护理专业的态度、实习医院满意与否、毕业后的就业去向、是不是为独生子女。

PO-3507

膀胱 Mp-MRI 膀胱充盈度与患者舒适度的双优护技医协同流程研究

张航、赵雷
昆明医科大学第一附属医院

摘要: 目的 探究膀胱多参数磁共振成像 (mp-MRI) 最佳膀胱充盈度、最优患者舒适度的双优护技医协同流程的最佳膀胱准备方案。方法 选取 2020 年 9 月-2022 年 9 月期间于昆明医科大学第一附属医院申请盆腔 mp-MRI 检查的患者 120 例, 采用随机数字表法, 将其分为 A 组、B 组、C 组及 D 组, 各 30 例。A 组检查前 2 h 排尿后禁水禁尿; B 组检查前 2 h 排尿后禁尿, 并饮温开水 500 mL; C 组检查前 1 h 排尿后禁尿, 并饮温开水 500 mL; D 组患者检查前 1 h 排尿后禁水禁尿。检测患者膀胱容积并计算膀胱变化量, 采用 Likert 4 评分法评估患者膀胱扩张状态, 记录检查过程中患者运动伪影出现情况, 并评估患者检查舒适度。结果: 与 A 组比较, B 组膀胱容积变化量增加 ($P < 0.05$); 与 B 组比较, C 组膀胱容积变化量减少 ($P < 0.05$); 与 C 组比较, D 组膀胱容积变化量减少。与 A 组比较, B 组 Likert 评分增加 ($P < 0.05$), 与 B 组比较, C 组 Likert 评分降低 ($P < 0.05$), 与 C 组比较, D 组膀胱 Likert 评分降低 ($P < 0.05$)。A 组、B 组、C 组、D 组分别出现运动伪影者 1 例、2 例、1 例及 0 例, 4 组运动伪影发生率比较, 差异无统计学意义 ($P > 0.05$)。与 B 组比较, C 组重度不适人数占比减少 ($P < 0.05$)。结论: 在护理、技师、医师共同配合下, 采用检查前 1 h 排尿, 随即饮温开水 500 mL 后禁尿的准备方案, 获得最佳膀胱充盈度与患者舒适度的双优目标。

PO-3508

肺穿室护士规范化培训考核评价指标体系的构建与应用

张峥
上海市肺科医院

目的 构建科学合理的肺穿室护士规范化培训考核评价指标体系，探讨该体系临床实践效果。方法 建立肺穿室护士规范化培训考核评价模型，运用文献分析法、德尔菲（Delphi）专家咨询法结合柯氏评估模型等构建肺穿室护士规范化培训考核评价指标体系。运用自行设计调查问卷和检查表，调查评价肺穿护士 3 个月规范化培训考核不同阶段的效果。结果 评价指标体系构建中，德尔菲法 2 轮专家积极系数分别为 98.3%和 100%，权威系数为 0.82，协调系数分别为 0.889 和 0.847。构建的肺穿室护士规范化培训考核评价指标体系，包括 3 项一级指标(培训前评估、培训过程评估、培训后评估)、7 项二级指标、23 项三级指标。对肺穿室护士评价结果显示，肺穿护士培训考核效果综合评分为 90.28 分。结论 构建肺穿室护士规范化培训考核评价指标体系具有科学性、实用性、可操作性，对护理管理者深入了解培训成效、提升培训质量具有重要意义。

藏族患者 CT 增强碘对比剂过敏反应高危因素的研究

车璐、邓宏宇、陈鹏宇
西藏自治区人民政府驻成都办事处医院（四川大学华西医院西藏成分院）

目的：探讨藏族患者 CT 增强碘对比剂过敏反应的高危因素。**方法：**选取我院放射科 2021 年 12 月至 2022 年 11 月接受 CT 增强后发生过敏反应的住院藏族患者，同时纳入严格按照年龄、性别、对比剂类型（厂家及浓度相同）及患者来源（均为住院藏族患者）进行 1：1 配对的无过敏反应对照组患者。。。。。。见附件

PO-3510

6S 管理在医学影像科护理质量控制中的应用效果

王晓琳
漯河市中心医院（漯河医专一附院）

目的精准医疗，技术先行，精准诊断，影像先行。医学影像科是医疗服务中至关重要的一环，质量控制对于确保准确的影像诊断和患者安全至关重要。然而，由于工作流程繁琐，影像科护理管理是一项关键且复杂的任务，需要高度的组织和协调能力。而 6S 管理作为一种系统化的方法，强调整理、整顿、清扫、清洁、标准化和素养六个方面的要素。本研究的目的是探究将 6S 管理方法引入影像科护理管理中，以提高管理效能和服务质量。

方法 1.1 方法

本研究采用实地观察、问卷调查和数据分析等方法。首先，通过实地观察医学影像科的质量控制流程和工作环境，确定适用于该领域的 6S 管理原则。其次，设计问卷调查，了解医学影像科护理人员对 6S 管理的认知、看法和体验。最后，收集相关数据并进行统计分析，评估 6S 管理在医学影像科护理质量控制中的应用效果。

结果研究结果显示，引入 6S 管理方法后，医学影像科护理质量控制取得了显著的改善。通过整理和整顿工作区域，减少了杂乱和混乱的现象，提高了工作效率和准确性。通过定期清扫和清洁，减少了污染和感染的风险，提升了患者护理质量。通过制定标准化的工作流程和操作规范，提高了质

量控制的一致性和准确性。通过培养员工的自律和责任感,巩固了 6S 管理的效果,并形成了良好的质量控制习惯。此外,通过培养员工的自律和责任感,增强了团队合作和沟通,提升了工作氛围和员工满意度。

结论本研究的结果表明,6S 管理在医学影像科护理质量控制中具有显著的应用效果。通过减少浪费、提高效率和准确性,6S 管理为医学影像科护理质量控制提供了可行的解决方案。医疗机构应重视护理质量控制的重要性,积极推行 6S 管理方法,并根据实际情况进行适度的调整和优化。进一步研究可以探索和验证 6S 管理方法在其他医疗领域质量控制中的应用,以促进医疗质量的不断提升和改进。

PO-3511

探讨儿童在磁共振检查中的心理分析及护理干预效果

陕梦迪、雷晓燕、汤敏、张鑫、张彬、宋佳林

陕西省人民医院

摘要:在儿童接受核磁共振成像(MRI)检查的过程中,他们对检查环境和室内设备等因素非常不熟悉和敏感。特别是当儿童面对穿着白色衣服的医务人员时,再加上设备噪音的影响,他们会经历不同程度的焦虑和紧张。儿童通常出现哭泣,不配合检查,导致扫描照片中出现伪影,严重影响检查结果。因此,在临床实践中加强对儿童进行磁共振成像检查的护理干预具有重要意义。

MRI是临床疾病诊断最有效的检查方法之一,但MRI的检查时间相对较长,而环境幽闭恐惧症、高分贝噪声等许多因素都是儿童的负刺激源。儿童可能会感到紧张和害怕,所以他们可能会哭泣、抗拒和不配合检查。这些医疗恐惧进一步降低了儿童对医疗护理的依从性;传统的固定化方法依赖于药物治疗,但这种方法可能会增加儿童的疼痛。在服药后在入睡和醒来方面存在显著的个体差异,醒来后可能出现头重脚轻的状态。因此,实施护理干预措施是非常必要的。实施护理干预需要了解患者焦虑、恐惧、哭泣等不良反应的原因,这些不良反应实际上是由患者的心理因素引起的;研究表明,焦虑是一种内心紧张和不安,一种难以应对的不愉快情绪,仿佛不利情况即将发生,以及患者对疾病造成的伤害的情绪反应。患者的负面情绪和行为可通过中枢神经系统影响内分泌和循环系统,导致呼吸频率、心率和恐惧程度的增加,从而影响检查的顺利进行。

PO-3512

思维导图式护理干预在静脉血栓介入溶栓治疗中的应用效果

陈红

中国人民解放军海军军医大学第二附属医院

目的 分析思维导图式护理干预在静脉血栓介入溶栓治疗中的应用效果。方法 选取我院收治的 90 静脉血栓介入溶栓治疗患者作为研究对象,随机分为对照组(45 例,常规护理)和观察组(45 例,思维导图式护理干预)。比较两组心理状态、溶栓效果、并发症发生情况、生活质量和舒适度的变化。结果 两组干预后负面情绪得分较干预前均有改善,且观察组改善程度更为明显($P<0.05$);观察组的溶栓效果 I 级率明显高于对照组,差异具有统计学意义($P<0.05$);观察组的并发症总发生率为 6.67%,明显低于对照组的 28.89%,差异具有统计学意义($P<0.05$);观察组的生活质量各项评分和舒适度评分均明显高于对照组,差异具有统计学意义($P<0.05$)。结论 思维导图式护理干预在静脉血栓介入溶栓治疗中的应用效果显著,能够改善负面情绪,提高溶栓效果,降低并发症发生风险,保证治疗的安全性,对于提高患者生活质量和舒适度具有积极意义。

黑白世界

牟成维、程琳、代静思、杨清
陆军军医大学第一附属医院（西南医院）

《黑白世界》这首歌是改编自《少年》，歌词是围绕放射科医生技师护理团队在日常工作中的协作配合，充分体现了影像的人文关怀。

此处，“黑白世界”有多重含义。一是当人生病之后，生病之人甚至是一个家庭都瞬间陷入了黑暗世界，生活的缤纷色彩失去了快乐的健康色彩。二是放射科的胶片世界本身就是“黑白”的世界，我们每天的工作都是在“黑白世界”里面追踪病魔在我们身体留下的痕迹。“黑白世界”也反衬了人文世界的美好，我们不能因为生病失去生活的意义，在生病的旅途中，有一个个值得支撑他们克服磨难的强大力量。正是因为如此，才使得我们的工作充满意义，才能让我们更加尊重生命，敬畏生命。视频配合《黑白世界》歌词，抒写了我们影像人的工作日常。正如歌词所言：影像的世界不止黑白，还有我温柔色彩。相信陪在你身边的我们，走入黑白世界不退却。

PO-3514

建立专科质量指标在碘对比剂外渗管理中的运行效果观察

曹靖惠、徐飞洋、高尚
吉林大学中日联谊医院

目的：探讨专科质量指标在 CT 增强静脉注射碘对比剂外渗管理中的建立与运行效果。

方法：成立持续质量改进小组，制定专科质量指标，包括结构指标、过程指标、结果指标。调查 2022 年 5 月至 8 月 12667 例 CT 增强患者，使用 CT 增强登记表、外渗登记表作为调查工具，调查内容为患者的一般资料、注射部位、流速、留置针固定正确率、碘对比剂外渗发生率、患者随访率、患者宣教知晓率、患者满意度等相关情况，调查结果显示，患者宣教知晓率 42.2%，外渗高危风险评估率 53.2%，留置针固定正确率 75.21%，外渗处理规范率 51.7%，外渗随访率 92.2%，外渗发生率 0.7%，患者满意度 83.25%。对比 2022 年 11 月至 2023 年 2 月 CT 增强患者 11969 例，基于专科质量指标，采取碘对比剂外渗标准化管理七大策略：1 预约知情，宣教前移 2 全面评估，筛查高危 3 精准穿刺，无缝交接 4 安全注射，全程监护 5 留院观察，规范处理 6 动态随访，延续护理 7 全员培训，专人上报。

结果：患者宣教知晓率上升至 95.8%，外渗高危风险评估率上升至 100%，留置针固定正确率上升至 100%，外渗处理规范率上升至 97.2%，外渗患者随访率上升至 100%，外渗发生率下降至 0.09%，患者满意度上升至 98.27%。

结论：基于专科质量指标的碘对比剂外渗管理策略，质控小组分工明确，各岗位精细化管理、权责明晰、各环节精准衔接、实现全流程质量管理。其优势具体表现在以下几方面：

1 有效降低碘对比剂外渗率；2 有效控制外渗程度；3 缩短外渗水肿消退时间；4 延续护理充分保障患者安全。因此，在静脉输注碘对比剂护理管理中，以碘对比剂静脉外渗质量管理为主线，以专科护理质量指标为支撑，以碘对比剂外渗的风险因素为抓手，以各环节风险预控方案为举措，全力保障静脉输注碘对比剂的患者安全。

PO-3515

呼吸训练联合分阶段心理干预对磁共振普美显动态增强扫描患者的影响

李慧

华中科技大学同济医学院附属协和医院

摘要:目的: 探讨呼吸训练联合分阶段心理干预对磁共振普美显动态增强扫描患者的影响。方法: 选取我院 2022 年 8 月-2022 年 10 月拟行磁共振普美显动态增强的 68 例患者, 按照随机数字表法分为观察组和对照组各 34 例。对照组实施常规护理。观察组实施呼吸训练, 联合分阶段心理干预。对比两组患者检查时间、负性情绪、图像质量及检查配合度的情况。结果: 两组患者检查前准备时间无统计学差异 ($p>0.05$), 观察组检查操作时间短于对照组 ($p<0.05$)。检查前两组患者焦虑自评量表和抑郁自评量表评分无统计学差异 ($P>0.05$)。检查结束后, 观察组焦虑抑郁评分均低于对照组 ($p<0.05$)。观察组图像质量、患者检查配合度均高于对照组 ($p<0.05$)。结论: 通过呼吸训练与分阶段心理干预能够有效缓解患者紧张焦虑负性情绪, 提升检查配合度, 提高磁共振普美显动态增强的检查效率, 并获得更为清晰的图像, 有助于提升诊断准确性。

PO-3516

放射科护理风险管理的应用效果研究

丁丽、李素兰、赵彩佳

郑州大学第一附属医院

目的: 分析评价放射科护理风险管理方法在患者护理方面的应用效果。方法: 本次纳入研究的 48 例放射科患者, 纳入时间为我院 2019 年 1 月-12 月。其中, 男性 28 例、女性 20 例; 平均年龄为 (56.82 ± 1.21) 岁。均知情签署相关护理干预同意书, 满足放射科相关收治条件, 排除严重精神障碍、临床资料不全及不配合本次实验者。放射科内部及时成立护理风险管理小组, 小组组长由放射科主任担任, 做好小组成员 (护师、责任护士、助理护士等) 统筹管理、任务分配工作, 加强小组成员护理能力培训, 结合患者相关病情、放射诊疗需求等, 制定并落实有针对性的护理风险管理计划方案: 风险因素识别干预、个体风险评估干预、健全警示标识系统、应急干预、心理干预。对患者放射科检查期间不良事件发生率进行分析、计算。同时根据我院放射科护理满意度调查问卷, 将患者对护理服务的满意程度分为: 满意 (90-100 分)、基本满意 (60-89 分)、不满意 (0-59 分); 总满意度为满意、基本满意两项满意度之和。通过统计学软件 SPSS23.0 对数据进行统计分析。结果: 本次 48 例患者, 在放射科检查期间, 出现跌倒 1 例、护理差错 1 例、护患纠纷 1 例, 总发生率为 6.25%。在护理满意情况方面, 48 例患者, 满意 32 例、基本满意 12 例、不满意 4 例, 总满意度为 91.67%。结论: 针对放射科患者, 采取护理风险管理干预方法, 可减少不良事件发生率, 提高患者对护理服务的满意程度。

PO-3517

经左右肘正中静脉注射对比剂对冠状动脉 CTA 图像质量影响

聂驿

徐州医科大学附属医院

目的 探讨分别经左右肘正中静脉注射对比剂对冠状动脉 CT 造影 (Coronary computed tomography angiography, CCTA) 图像质量的影响。方法 回顾性分析 2020 年 8 月-10 月于我院

行 CCTA 检查的患者资料。根据对比剂注射部位不同分为右肘正中静脉注射组和左肘正中静脉注射组, 采用独立样本 χ^2 检验评估组间差异; 两名经验丰富的放射科医师分别分析 CCTA 图像, 并对图像质量进行评分, KAPPA 一致性检验评估两名医师评分的一致性。测量冠脉的增强值、测量左头臂静脉横跨头臂动脉或主动脉弓前方与胸骨柄后缘间隙的前后径线 (简称径线), 计算冠脉图像的噪声比及对比噪声比, 采用独立样本 t 检验进行统计学分析。结果 最终纳入 400 例患者, 其中右肘正中静脉注射组 203 例、左肘正中静脉注射组 197 例, 两名医师对右手注射组评分一致性 ($K=0.538$, $P<0.001$) 优于左手注射组 ($K=0.259$, $P=0.014$), 右手注射组成像效果好者比例大于左手注射组, 两组患者的冠脉的强化值、径线值、噪声比和对比噪声比均未见明显统计学差异 (t 分别为: -0.701 、 -0.562 、 0.162 、 0.012 、 -0.969 , P 均 >0.05)。结论 在行 CCTA 检查过程中, 如患者条件允许, 应尽可能选择经右手背注射对比剂。

PO-3518

清单式管理在多学科联合行经导管主动脉瓣置换术中的护理体会

徐晓丹

中国人民解放军海军军医大学第二附属医院

目的 应用清单式管理在多学科联合经导管主动脉瓣瓣膜置换术的护理体会。**方法** 选取 2022 年 1 月至 2023 年 6 月行经皮主动脉瓣膜置换术 20 例作为研究对象, 将清单式管理的干预方法进行分析, 总结经导管主动脉瓣瓣膜置换术中的护理体会。**结果** 主动脉瓣瓣膜植入的成功率达到 100%, 术中发生心跳呼吸骤停 1 例, 通过严密的术前准备及对症治疗, 使得患者抢救成功。**结论** 通过清单式管理在多学科联合行经导管主动脉瓣置换术中落实术前的准备工作, 能够保证手术进展更加顺利, 在术后, 密切关注患者的并发症发生情况, 可及时采取预防措施, 提升治愈率, 同时提高患者满意度, 值得推广。

PO-3519

导管室介入手术健康教育科普模式实践研究与创新探索

吴燕燕

中国人民解放军海军军医大学第二附属医院

目的 探讨介入手术健康教育科普模式在导管室的实践研究与创新探索。**方法** 通过知网、万方、维普等平台以“介入治疗”、“介入手术”、“健康教育”、“医学科普”等作为关键词检索相关文献资料, 对介入治疗患者健康教育形式、内容进行整理、归纳和总结。**结果** 基于在导管室行介入治疗患者的健康教育需求, 通过“互联网+科普”等新媒体与传统媒体结合的手段, 构建一套“术前-术中-术后”全流程介入手术健康教育科普模式对提高患者对介入治疗健康教育的认知、促进手术康复具有重要作用。**结论** 全流程管理的介入手术健康教育科普模式不仅能使患者在手术前充分认识介入治疗优势、手术中知晓手术过程及配合要点、减轻手术时恐惧焦虑心理, 积极参与配合治疗; 手术后掌握相关注意事项、了解居家管理健康教育知识, 形成一套全流程的健康教育知识获取的体系及途径, 而且还可提高自我管理水平, 改善就医体验及提升满意度。

PO-3520

心脏介入导管室护理人员分阶段岗位胜任力提升探讨

凌燕

中国人民解放军海军军医大学第二附属医院

目的：探讨心脏介入导管室护理人员分阶段岗位胜任力提升。方法：将 2021 年 10 名临床一线护理人员实施传统培训模式作为培训前，将 2022 年同一批护理人员实施以岗位胜任力为导向的护理人员分阶段岗位培训模式作为培训后；比较培训前后分阶段岗位胜任力各维度、理论考核总成绩、护士岗位胜任能力、护士满意度。结果：培训后，各分阶段岗位理论考核总成绩、岗位胜任能力评分、护理人员满意度均高于培训前($P<0.05$, $P<0.01$)。结论：以岗位胜任力为导向的护理人员分阶段岗位培训模式，可提高各分阶段岗位理论考核总成绩、护士岗位胜任能力及护士满意度。

PO-3521

危重患儿磁共振检查最佳镇静水平动态评估的相关性研究

李佳雯、李颖、高凯

山西省儿童医院

目的：近年来磁共振检查由于其在中枢神经系统等方面具有独特的优势，在危重患儿疾病诊断方面起到了重要作用。对于不能配合磁共振检查的危重患儿镇静必不可少，镇静可以在一定程度上减少患儿的焦虑及应激反应，但由于危重患儿病情变化迅速且隐秘，临床上常出现镇静过度或镇静不足的情况。镇静过度可能会导致呼吸、循环功能受到抑制，延长机械通气时间、延缓患儿病情恢复；镇静不足可能会导致患儿产生应激反应。本研究通过对患儿进行动态评估和实时监测，以保证患儿达到磁共振检查最佳镇静水平。

方法：通过收集需要做磁共振检查危重患儿儿童 116 名，其中男 56 名，女 60 名。随机分为两组，其中一组常规镇静检查，另一组采用舒适量表 (Comfort Scale, CS) 对患儿分别在检查前，检查中及检查后对患儿进行评分，通过评分对镇静动态调整。对比两组磁共振检查成功率，磁共振检查平均时间及不良反应发生率。

结果：两组磁共振检查成功率，磁共振检查平均时间及不良反应发生率

差异有统计学意义 (均 $P<0.05$)。

结论：危重患儿磁共振检查最佳镇静水平动态评估对患儿镇静效果评价效能良好，可有效提高磁共振检查成功率，缩短磁共振检查平均时间及降低不良反应发生率。

PO-3522

CT 增强检查留置针软管部份断裂、打折并嵌入肌肉内 1 列报道

朱永利、慕长萍 muzhangping

重庆市人民医院

随着影像技术的不断提高，CT 增强检查成为多种疾病诊断与预后评估的重要辅助检查之一。检查中需利用高压注射器，将碘对比剂通过静脉注入，才能更精准显示病灶。因高压注射对比剂速度快、压力大，对检查者血管选择和留置针要求较高，需放射科专门的耐高压留置针穿刺准备。留置针又称套管针，因其套管柔软，不易刺破血管壁，可降低对比剂外渗率，是影像增强检查中穿刺准备首选。但临床中留置针静脉穿刺，常凭个人经验、个人手感，无同质性，穿刺水平参差不齐，常引发一些问题。留置针软管断裂、残留血管内的病例偶有报道，然留置针软管部份断裂、打折并嵌入肌肉

内无法拔出的却极少报道。2023 年 7 月 7 日我科在给 1 例神经内科病人做 CT 增强检查穿刺准备工作时, 发生了留置针软管部份断裂、打折并嵌入肌肉内无法拔出现象。现将报道如下。

PO-3523

探讨音乐疗法改善老年核磁共振检查患者焦虑的效果

杨璨

南昌大学第一附属医院

背景:磁共振成像目前在中国的大量医院中用于有效诊断患者的病情, 这对患者的检查和治疗具有非常积极的影响。MRI 需要患者固定在相对较小的空间内, 并且许多老年患者在第一次被放置在这样小而暗的空间内时容易紧张、激动和焦虑, 经常导致无法继续检查, 在检查过程中停止检查, 甚至导致严重的不良事件, 例如窒息。音乐是传递信息的一种特殊方式, 它调节机体的生理变化, 从而在患者的头脑中唤起愉快的联想。本研究将运用现象学方法探讨音乐疗法在改善中国江西省一所三级医院接受核磁共振检查的老年患者焦虑方面的有效性。

目的:一项探索使用音乐疗法改善接受 MRI 检查的老年患者焦虑的研究。

方法:本研究将采用现象学方法, 通过焦点小组对该人群进行探索性研究。招募将通过海报活动进行, 本次研究将招募 10 名参与者。我们将使用腾讯会议应用程序或线下面对面交流, 对参与者进行 10 分钟的半结构化采访。数据分析将包括音频记录, 转录, 编码和初步分析, 以及审查, 以确定最终主题。舒适理论将指导这项研究, 而社会建构主义解释框架将指导方法设计。

结论:音乐疗法能显著降低老年患者接受磁共振检查时的焦虑情绪, 有利于检查顺利进行, 改善图像质量, 提高检查成功率

PO-3524

耐高压 PICC 导管在胸部肿瘤患者增强 CT 检查中的应用效果评价

王文燕、段庆红、苏蕾

贵州医科大学附属肿瘤医院

目的 探讨耐高压 PICC 导管在胸部肿瘤患者增强 CT 检查中应用效果。

方法 选取自 2021 年 1 月至 2023 年 1 月在贵州医科大学附属肿瘤医院已完成耐高压 PICC 置管的胸部肿瘤患者, 且需要行增强 CT 检查的 60 例, 将其中纳入观察组。而对照组患者采用经外周静脉耐高压留置针注入造影剂的胸部肿瘤患者行增强 CT 检查。比较两组胸部肿瘤患者行增强 CT 检查时的静脉通路安全性, 护理不良事件造影剂外渗的发生率, 静脉穿刺的次数, 患者的费用支出, 图像质量, 包块总体和肺血管显影、心脏显影、伪影情况。

结果 观察组静脉通路安全性, 护理不良事件造影剂外渗的发生率 (0 vs1.6%)

静脉穿刺的次数 (0 vs1.16), 患者的静脉通路费用支出 [(4±2)元/次 vs. (14.5±2.41)元/次,] 均低于对照组。图像质量在两组评价中, 观察组总体和肺血管显影、心脏显影高于常规组, 伪影显示低于观察组。

结论 在耐高压 PICC 导管在胸部肿瘤患者增强 CT 检查中静脉通路安全, 能降低护理不良事件造影剂外渗的发生率, 减少护理静脉穿刺的次数, 减少患者的费用支出。图像质量优质, 值得临床应用。

PO-3525

CT 增强检查前患者饮食准备现状调查分析

李建洁、李雪*

中国人民解放军陆军特色医学中心

目的: 最新指南明确指出不推荐普通 CECT 检查前禁食, 该更新从循证的角度为 CT 增强检查前的护理准备提供了框架和指引, 但并未对特殊患者饮食准备进行论述, 难以应用于放射实践。因此本调查旨在了解我院 CT 增强患者检查前饮食准备的管理现状, 评估当前实践现状与指南的差距, 为检查前饮食准备的科学管理提供依据。

方法: 采用便利抽样法通过自行设计的调查问卷对 2022 年 9 月-2022 年 12 月在我院行 CT 增强的患者进行面对面结构化访谈, 评估其饮食准备实施现状。分类数据以数字和百分比表示。结果: 本研究共纳入 210 例 CT 增强患者, 其中男 113 例, 女 97 例, 年龄 23-85 (59.1±11.6) 岁, 头颈胸四肢 CT 增强检查 119 例, 腹部 CT 增强检查 70 例, 冠状动脉和大血管 CT 增强检查 64 例, 所有患者均未发生碘对比剂不良反应。调查患者中有 25.7% (54/210) 为高血压患者, 14.8% (31/210) 为糖尿病患者。有 49% (103/210) 患者需要常规用药, 其中 31% (32/103) 检查当天未服药。所有患者中位禁食时间 4(2, 12.5)h; 27.8% (58/210) 患者检查前禁食时间超过 10h, 28% (59/210) 患者隔夜禁食。检查前有 4.3% (9/210) 患者诉胃部不适, 1% (2/210) 患者诉恶心, 2.9% (6/210) 患者诉头晕, 2.9% (6/210) 患者诉虚汗, 4.3% (9/210) 患者诉疲劳, 25.7% (54/210) 患者诉饥饿, 4.8% (10/210) 患者出现焦虑。

结论: CT 检查前饮食准备管理现状不容乐观, 需统一制定并强制推行规范的饮食准备管理方案; 加强临床医护培训, 改变传统的饮食准备习惯; 加强对患者的健康宣教, 提高患者依从性。

PO-3526

基于多学科的整体护理联合积极心理学干预在癫痫患者 PET-MRI 检查中的应用

杨志萍、李沛

河南省人民医院

目的: 探讨基于多学科的整体护理联合积极心理学干预在癫痫患者 PET-MRI 检查中的应用。方法: 78 例 PET-MRI 检查的癫痫患者随机分为对照组 (n=39) 和观察组 (n=39), 分别给予常规干预及在对常规干预基础上实施基于多学科的整体护理联合积极心理学干预, 比较两组干预前后的焦虑自评量表 (SAS)、抑郁自评量表 (SDS) 评分, 医学应对方式问卷 (MCMQ) 评分, 候诊时间和检查时间、图像合格率、检查依从性。结果: 干预前两组患者 SAS、SDS、MCMQ 各量表评分差异无统计学意义 ($P>0.05$), 干预后观察组患者 SAS、SDS、MCMQ 评分优于对照组 ($P<0.05$); 观察组候诊时间、检查时间短于对照组 ($P<0.05$), 检查依从度和图像合格率高高于对照组 ($P<0.05$); 观察组不良情况发生率低于对照组 ($P<0.05$)。结论: 基于多学科的整体护理联合积极心理学干预缓解 PET-MRI 检查癫痫患者的焦虑抑郁情绪, 建立积极应对方式, 提高检查成功率。

PO-3527

静脉注射非离子型碘对比剂对 血流动力学影响的临床特征研究（专题讲座）

李雪

中国人民解放军陆军特色医学中心

专题讲座内容主要内容：研究背景：（1）临床实践中遇到的护理问题：前期临床观察中发现 12 例重度 ICM-AARs 中 60 岁以上的有 7 人，其中合并有高血压等心血管基础疾病的患者有 6 人，占 85.71%。常规增强患者伴 2-3 级高血压，需要血压控制吗？控制与不控制安全性如何？急性缺血性脑卒中、主动脉夹层伴极高血压注射 ICM 风险有多大？临床对于 3-4 级心功能不全患者静脉输液需严格控制速率和剂量。而 ICM 采用高压、短时间内快速注射 3-6ml/s，注射 ICM 有风险吗？风险有多大？这些患者高压注射 NICM 是否有血流动力学变化，其临床特征如何？患者是否存在安全风险？（2）国内外研究现状：CT 增强检查中 NICM 本身理化性质与注射方式可能导致血流动力学改变；高血压及心血管疾病高压 NICM 可能存在的血流动力学变化；NICM 与血流动力学变化的相关文献报道分析等（3）介绍研究内容及方法：从研究对象、研究设计、实验步骤、数据收集、质量控制方法、结果、结论等方面进行分享。

PO-3528

淡化碘对比剂风险告知对急性生理性不良反应的影响

贾晓茜

西安交通大学第一附属医院

目的：增强 CT 或 CTA 扫描前，淡化告知患者及家属碘对比剂注射的潜在风险并探讨其对碘对比剂急性生理性不良反应（后简称急性不良反应，acute adverse reactions, ARR）的影响。

方法：前瞻性收集 2018 年 8 月 16 日至 2019 年 12 月 16 日因增强 CT 或 CTA 扫描注射碘对比剂的患者，排除标准为（共 7662 例）：未成年、急诊状态、肾功能受损、因各种原因注射中断、ARR 仅表现为单纯荨麻疹的患者及原有疾病导致的类似症状。最终纳入 51478 例有效病例。所有患者根据网络预约或线下预约分为淡化组 and 传统组。淡化组要求患者或家属自行阅读并签署知情同意书，传统组由影像护士对同样的知情同意书进行一一讲解后签署。知情同意书内容包括：碘对比剂介绍、潜在的不良反应和并发症、禁忌症、高危因素、检查准备和注意事项等。检查结束后，要求患者留观 30 分钟直到没有不适才离开。比较两组患者 ARR 的差异、知情告知所花费时间，计数资料采用卡方检验或分层卡方检验，计量资料采用独立样本 t 检验， $P < 0.05$ 认为有统计学差异。

结果：淡化组有效病例 21406 例，ARR 39 例（0.18%），传统组 30478 例，ARR 91 例（0.30%）， $P = 0.009$ ；淡化组使用碘帕醇 370 的 ARR 发生率（0.18%）明显低于传统组（0.53%）， $P = 0.022$ ，其余对比剂两组之间无统计学差异（ $P > 0.05$ ）；淡化组风险告知所需时间（ 20.50 ± 4.60 s）明显少于传统组（ 142.36 ± 8.38 s），且可节约 2 人/天护士。

结论：淡化碘对比剂风险告知可减少碘对比剂相关急性生理不良反应，大大节约人力资源，在保障患者安全的同时获得较高的经济效益，值得推广。

PO-3529

IMB 模型在学龄前儿童行磁共振检查中的应用

覃蕾、龚梦

华中科技大学同济医学院附属同济医院

目的 探讨基于 I M B 模型的健康教育提高学龄前患儿及其家属行磁共振检查的知信行水平, 促其顺利完成检查。方法 将 300 例磁共振检查学龄前患儿随机分为对照组(150 例)和观察组(150 例)。对照组行常规健康教育, 观察组在此基础上实施以 IMB 模型为基础的健康教育。比较干预前、干预后患儿及家属行磁共振检查知信行评分、焦虑评分。结果 对照组 150 例、观察组 150 例完成本次研究, 两组干预后患儿及家属行磁共振检查知信行得分, 焦虑得分的组间效应、时间效应及交互效应差异有统计学意义(均 $P<0.01$)。结论 以 IMB 模型为基础的学龄前患儿及其家属行磁共振检查的健康教育能提高患儿及家属知信行水平, 使患儿顺利完成磁共振检查。

PO-3530

精细化护理在幽闭恐惧症患者磁共振检查中的应用效果

李赛

山东大学第二医院

精细化护理在幽闭恐惧症患者磁共振检查中的应用效果

目的 探讨精细化护理在幽闭恐惧症患者磁共振检查中的应用效果。方法 选取 2023 年 1 月至 2023 年 6 月在我院行磁共振检查的 68 例患者作为研究对象, 按随机数字表法将其分为观察组和对照组, 两组患者均行磁共振检查, 对照组给予常规护理, 检查前告知患者磁共振检查注意事项; 观察组在对照组基础上实施精细化护理, 告知患者磁共振检查注意事项, 检查大约需要用的时间, 调大机器照明灯及排风扇, 安排家属陪检, 告知磁共振检查会产生一些噪音, 但有耳机以及防噪音耳塞, 可耐受, 提前做好心理疏导。比较两组检查成功率, 观察组更能顺利地地完成磁共振检查, 扫描图像品质比较高。结果 观察组患者整体护理干预后总有效率为 82.3%(28/34)明显高于对照组的 29.4%(10/34), 组间比较差异有统计学意义($P<0.05$)。结论 对行磁共振检查的幽闭恐惧症患者实施精细化护理能有效的增加患者的配合度, 可以明显提高检查成功率, 提升患者及家属的护理满意度, 取得了很好的临床效果, 为疾病的诊断提供有力证据, 值得临床应用。

PO-3531

核医学放射护理现状分析与改进策略研究

杨静、李强、李长虹

桂林医学院附属医院

目的: 核医学作为一项利用放射性物质进行诊断和治疗的医学分支, 其日常放射护理的重要性日益凸显。本研究旨在深入探究核医学放射护理的现状、问题与改进方案, 以期提升医护人员和患者的安全保障, 优化诊疗过程。方法: 本研究首先根据国家放射防护标准通过文献回顾和现场调查, 全面了解国内外核医学放射护理的标准流程和常见问题。此外, 设立了两组对照试验, 一组实施现有的放射护理措施, 另一组实施优化后的新方案, 以比较其在放射剂量控制、安全防护和患者满意度等方面的效果。结果: 研究发现, 虽然大部分核医学机构均有放射护理规范, 但在实际操作中仍存在一些不足, 如个别环节的放射防护不严密, 部分设备老化、人员培训不足等。通过对照试验, 新方案在减少放射暴露、提高工作效率和患者满意度方面均表现出较好的效果 ($P<0.05$)。新方案

结合了最新的放射防护理念和技术,如更合理的工作流程设计、更先进的防护设备和更精细的个体化护理。结论:核医学日常放射护理作为确保患者和医护人员安全的重要环节,其现有的实践中仍有改进空间。通过本研究提出并验证了一套全面的改进方案,证明了其在提高放射防护水平和工作效率方面的有效性。然而,推广新方案还需考虑到各机构的特殊情况和实际需求,确保方案的灵活性和可操作性。未来的工作应进一步完善和推广改进方案,促进核医学放射护理的标准化和现代化,为核医学的健康发展和广泛应用提供坚实支撑。

PO-3532

碘造影剂(ICM)致过敏反应的临床特点及危险因素

呼婷婷、李娅
空军军医大学西京医院

摘要:目的:探讨碘造影剂(ICM)致过敏反应的临床特点及危险因素。方法:该回顾性研究纳入了2020年8月至2022年7月期间在我院接受静脉注射ICM(碘帕醇、碘海醇、碘克沙醇、碘普罗胺、碘佛醇)进行对比增强计算机断层扫描(CT)的所有患者。回顾了发生过敏反应的患者的病历,并使用广义估计方程的多变量回归模型来消除患者内相关性的影响。结果:在124162次ICM实施中(男性71518例,占57.6%,女性52644例;年龄,中位数为61岁)至69240例患者,113例不同患者中有113次发生过敏反应(占给药次数的0.06%,占总人数的0.16%),从临床记录可以确定,ICM引起的过敏反应均发生在30min内。78例(69%)没有不良反应的危险因素,包括35例(31%)曾使用引起过敏反应的ICM。68例(60%)患者有ICM使用史,无任何不良反应。10例(8.9%)患者在用药前接受口服类固醇治疗。各ICM的过敏反应发生率依次为:碘普罗胺(0.08%)、碘帕醇(0.03%)、碘海醇(0.02%)、碘佛醇(0.01%)和碘克沙醇(0.007%)。多变量回归分析发现,与其他四种ICMs相比,使用碘普罗胺更有可能导致过敏反应(以碘克沙醇多作为参考,碘普罗胺的OR为6.4[95%CI: 2.6-16.1], $p < 0.001$)。ICM致过敏反应OR在患者年龄、性别或用药前均无显著差异。结论:ICM致过敏反应的总体发生率很低。超过一半的病例没有不良反应的危险因素,而且在过去的ICM使用中也没有不良反应,尽管ICM类型与较高的OR相关。

PO-3533

多模式教学法在静脉穿刺基地教学中的应用

邵慧
中国人民解放军总医院第一医学中心

目的:探究放射诊断科静脉穿刺基地新护士教学中采用多模式教学法的效果及意义。方法:选择2022年1月-12月在我科静脉穿刺基地轮转的96名新护士为研究对象,随机分为对照组和观察组,每组48名新护士,对照组采用传统手把手授课教学法,观察组实施了量化培训标准,采用多模式教学法(即手把手教学法结合情景剧教学法及静脉穿刺手臂模型教学法),对两组新护士对教学方式满意度及一次性静脉穿刺成功率(一针见血,无后退)进行比较。结果:观察组新护士对教学方式满意度及一次性静脉穿刺成功率均显著高于对照组,差异有统计学意义($P < 0.05$)。结论:静脉穿刺基地新护士带教中采用多模式教学法可有效提高新护士静脉穿刺水平,减轻了患者的疼痛,同时增加了放射诊断科增强检查患者高压团注的成功率,赢得了患者对护理工作的信任,提高了医院在群众中的威信。因此,该种教学模式在静脉穿刺基地新护士教学中值得推广。

PO-3534

应用低张等渗甘露醇在小肠增强 CT 检查前规范化准备对图像质量的效果评价

卢璐、刘格格、李倩倩、冯敏、李笑石、马永利、秦越
西安大兴医院

目的：探讨应用低张等渗甘露醇在小肠增强 CT 检查前规范化准备对图像质量的效果评价。

方法：前瞻性随机选取我院 2021 年 6 月-2023 年 6 月行小肠增强 CT 患者共 100 例，按照护理检查流程分为 A、B 两组，各 50 人，A 组为常规肠道准备，B 组为应用低张等渗甘露醇进行准备。两组患者进行增强 CT 检查后，统计检查成功率，再由两面高年资主治医师分别对两组图像采用双盲法进行主观质量评分并进行统计，评分标准采用 5 分制，Kappa 检验验证评分一致性，一致性不同时引入第三名医生进行评分。

结果：两组患者在年龄、身高、体重、性别、病程、心率等临床指标中均无显著差异 ($P>0.05$)。B 组患者均顺利完成检查，患者配合良好，检查成功率为 100%，A 组检查成功率为 90%。在 CT 图像质量的评分中，A 组平均得分为 4.05 ± 1.06 分，B 组为 4.65 ± 1.10 分，B 组图像质量显著高于 A 组。

结论：应用低张等渗甘露醇，为小肠增强患者实施规范化的护理流程可以显著提高 CT 的图像质量及诊断评价。

PO-3535

医疗失效模式与效应分析模型在 MRI 检查患者金属异物去除中的应用

冯望、王小琳
重庆医科大学附属第二医院

目的 探讨医疗失效模式和效应分析(FMEA)模型的质控管理措施在 MRI 检查患者金属异物去除中的应用效果。方法 选取 2023 年 1 月至 2023 年 8 月某三甲医院的 52435 例 MRI 检查患者为观察组(实施基于 FMEA 模型的质控管理措施后)，选取 2022 年 1 月至 2022 年 8 月某三甲医院的 46402 例患者为对照组(实施基于 FMEA 模型的质控管理措施前)。比较两组患者的金属异物去除情况、图像质量情况及其对医院 MRI 工作人员的满意度。结果 观察组患者的金属异物去除率为 99.95%，明显高于对照组的 92%，差异均有统计学意义($P<0.05$)；观察组患者的甲片率为 98.76%，明显高于对照组的 91.31%，差异有统计学意义($P<0.05$)；观察组患者对医院 MRI 工作人员的满意度为 98.45%，明显高于对照组的 91.75%，差异有统计学意义($P<0.05$)。结论 基于 FMEA 模型的质控管理措施在 MRI 检查患者金属异物去除中的应用能明显提高 MRI 检查中金属异物去除率，减少医院 MRI 安全事故发生，提高图像质量，强有力地保障患者及医院医务人员的生命安全，进一步提高患者对医院 MRI 管理工作的满意度。

PO-3536

低剂量甘露醇在基于压缩感知技术的磁共振小肠成像中的应用

庄丽娜、高明丽、宋清伟
大连医科大学附属第一医院

目的探讨低剂量口服甘露醇溶液对基于压缩感知技术 (Compressed SENSE, CS) 的磁共振小肠造影 (magnetic resonance enteroclysis, MRE) 检查的影响。方法 2022 年 5 月至 2023 年 1 月我院 28 例疑似为小肠疾病的患者均接受基于 CS 的 MRE 检查。由医师决定口服甘露醇剂量, 分为实验组和对照组, 对照组分三次口服 (共 1500ml) (n=14 例), 实验组两次口服 (共 1000ml) (n=14 例), 记录患者不良反应。两观察者对图像质量进行四分法主观评分。计算患者不良反应发生率。Kappa 检验两观察者主观评分的一致性, 若一致性良好, 选择高年资医师主观评分进行后续分析。使用 Wilcoxon 检验对照组和实验组主观评分差异性。结果 28 例患者均已完成 MRE 检查, 两组间图像质量无统计学差异, 但实验组患者发生不良反应发生率较低。结论 低剂量口服甘露醇在基于 CS 的 MRE 检查中应用可行性良好, 可以在保证图像质量的前提下提高患者的舒适度, 值得临床广泛推广使用。

PO-3537

王玉娟一例 EVAR 术后并发胆固醇结晶栓塞的护理与启发

王玉娟、钟小宁
重庆医科大学附属第二医院

详见 PPT 胆固醇结晶栓塞 (cholesterol crystal embolism, CCE) 是由于大动脉粥样硬化斑块破裂, 导致其中的胆固醇结晶剥离, 随血流脱落至外周远端血管造成栓塞, 并引起栓塞部位炎症反应和终末靶器官损伤的综合征。在临床工作中, 近 80% 的 CCE 为医源性因素所致, 最常见的诱因包括血管腔内操作及抗凝、溶栓治疗。CCE 常被忽略或被误诊为蓝趾综合征 (blue toe syndrome, BTS)、造影剂肾病等, 一旦延误诊断对患者危害极大, 1 年病死率为 70% ~ 76%, 故对本病的认识及护理至关重要。

PO-3538

多元互动教学模式在碘对比剂实习教学中的应用价值

陈娅
上海交通大学医学院附属第九人民医院

目的 探讨多元互动教学模式在医学影像学碘对比剂实习教学中的应用效果, 以提高教学质量。方法 选取 2021 年 4 月~2022 年 4 月在上海交通大学医学院附属第九人民医院放射科临床实习的 62 名学生。采用便利抽样法将其分为对照组和试验组。试验组采取多元互动教学模式, 对照组采用传统教学模式。比较两组学生理论与技能成绩、自主学习能力与教学评价的差异。结果 与采用传统教学模式的对照组相比, 采用多元互动教学模式的试验组学生在理论与技能成绩、自主学习能力等客观评价, 以及学生对教学模式的主观感受评价均显著优于对照组 ($P < 0.001$)。结论 多元互动教学模式可以提高医学影像学的碘对比剂实习教学的教学质量, 加深学生对知识的掌握应用, 并激发学习积极性与自主学习能力, 可在医学生教学中加以推广和应用。

PO-3539

“会呼吸的痛”——1 例哮喘患者的安全救助

蔡莉

中国人民解放军陆军特色医学中心

总结 1 例患者做完 CT 增强检查诱发重度哮喘后成功救治的护理经验，现将案例及护理方案分享如下：

案例呈现：患者女性，68 岁，文化程度低、表述不清，怀疑消化道出血，为了进一步明确诊断，拟行胸腹 CT 增强检查。输注碘对比剂 2 分钟后，突发胸闷、呼吸困难、心悸等疑似碘对比剂过敏反应。立即送入抢救室行生命体征监测，P:145 次/分、R:28~32 次/分、BP:170/101mmHg、SPO₂: 85%，采取鼻导管吸氧、0.9%NS 静脉补液、肌注盐酸异丙嗪 25mg、静脉推注 10mg 地塞米松等抗过敏处理后，未见明显缓解，立即改为高浓度面罩吸氧后，SPO₂ 仍下降至 75%，继之呼吸困难加重、口唇发绀，烦躁不安等症状；紧急时刻，护士立即给予沙丁胺醇经口吸入，5 分钟后症状开始缓解，临床医生到科后确诊患者为哮喘急性发作。

原因分析：（1）临床医生申请单无哮喘相关病史描述。（2）患者 36 年哮喘病史，未正规接受治疗，长期反复发作，产生了耐受性，发作后哮喘症状表现并不典型。（3）评估护士经验不足，未提前了解到哮喘病史，对表述有困难患者未与家属及临床医生沟通，评估方面出现漏洞。（4）因个别护士正确的疾病风险预判能力，及时识别哮喘病情变化特点，果断用药控制哮喘症状持续发展，急时、有效对症处理，才使患者转危为安，并于数日后康复出院。

思考与启示（护理方法）：（1）护理质量管理措施：培养护士高度责任心和风险意识，加强业务学习，熟练掌握碘对比剂的适应症、禁忌症，制定哮喘患者应用碘对比剂的标准流程和检查规范。

（2）早期预警风险评估：提前了解哮喘病史、治疗及控制情况，对哮喘症状控制不佳患者尽早实施预防、干预措施。（3）加强心理护理：提前告知患者诱发哮喘后的呼救方式及完善的应急处理措施，缓解焦虑、紧张心理。（4）随时动态观察：实现早识别、早预防、早治疗的护理方案，哮喘发作后能够快速启动应急预案，提高哮喘患者碘对比剂应用的安全性。

PO-3540

基于思维导图指导下预见性护理方案的构建及对行高浓度对比剂 CT 肝脏血管三维成像患者图像质量的影响

赵海燕

首都医科大学附属北京佑安医院

目的：探讨基于思维导图指导下预见性护理方案的构建及对行高浓度对比剂 CT 肝脏血管三维成像患者图像质量的影响。方法：选取我院 2021 年 4 月-2021 年 12 月收治的行高浓度对比剂 CT 肝脏血管三维成像检查的 600 例患者采用数字表法分为 2 组，每组 300 例。对照组使用常规护理干预，研究组构建基于思维导图指导下预见性的护理方案。记录两组患者 CT 肝脏血管三维成像图像质量、护士检查指导满意度评分、焦虑自评量表、抑郁自评量表。结果：研究组 CT 肝脏血管三维成像图像质量优良率为 100.00%，显著高于对照组 98.67% ($\chi^2=4.026$, $P<0.05$)。研究组患者对护士指导态度、护士指导及时、护士指导正确以及总满意度均高于对照组，数据差异具有统计学意义 ($P<0.05$)。干预前，两组患者的 SAS、SDS 评分之间无显著差异 ($P>0.05$)；干预后，两组患者的 SAS、SDS 评分均显著下降 ($P<0.05$)，且研究组 SAS、SDS 评分低于对照组 ($P<0.05$)。结论：通过构建基于思维导图指导下预见性护理方案，将其运用于行高浓度对比剂 CT 肝脏血管三维成像检查患者中，能够有效的提升 CT 检查图像质量，缓解焦虑、抑郁情绪，提升患者对护士检查指导满意度评分，且还能有效的降低对比剂外渗发生率以及碘过敏反应发生率。

PO-3541

护理干预与 5G 互联网医疗流程优化技术对脑卒中 CTA 检查中有效缩短等候时间及提高患者配合度的效果评价

郝相相、卢璐、冯敏、刘格格、李笑石、马永利
大兴医院

目的：探讨应用护理干预缩短脑卒中患者 CTA 检查等候时间的效果评价。方法：将 150 例患者随机分为 A、B 两组，A 组为常规护理组，需要通过登记台评估患者禁忌症及生命体征，然后在前往收费室进行缴费，随后二次在登记台登记检查信息后前往到达注射室进行穿刺，穿刺结束后转运至 CT 室，按照相关规程，行 CTA 检查；B 组为护理干预组，在患者到达医院后卒中中心开具 CTA 检查申请单，经过院内 5G 指挥中心协调，进行互联网线上预约，同时 CT 室护士在患者到达前登记信息，CT 室备有卒中穿刺急救箱，患者直接至 CT 室穿刺，穿刺完成立即扫描，充分准备告知家属陪同需要配合的内容并与技师一起制定恰当的扫描方案。结合 A、B 两组患者的检查结果及患者的反馈进行评价。结果：A 组患者配合率为 75.56%，B 组患者的配合优良率为 92.55%，有显著差异 ($P<0.05$)；A 组患者检查成功率为 88.25%，B 组患者检查成功率为 96.51%，有显著差异 ($P<0.05$)；A 组登记至扫描平均时间为 995.69 秒，B 组平均时间为 426.65 秒，有显著差异 ($P<0.05$)，且 B 组较 A 组检查时间缩短 57.15%。

结论：进行护理干预，可以达到最佳配合效果极大程度缩短患者等候时间、为急危重症患者的救治赢取有利时间的目的，5G 互联网医疗流程优化技术可以提前对患者情况进行评估，优化简化患者就诊流程，提升服务品质，两者结合应用值得在临床推广。

PO-3542

高级药物与物理护理干预分别对提高躁动患儿 CT 检查成功率的研究

刘格格、卢璐、刘瑞瑞、冯敏、李笑石、马永利
西安大兴医院

目的：研究护理干预对提高躁动患儿 CT 的检查成功率。

方法：选取 200 名行 CT 检查的儿童患者(0~10 岁的儿童)进行护理分组，分为实验组(100 人)和对照组(100 人)。其中实验组在检查前对患儿进行药物护理干预(静脉注射、肌注、口服或直肠给药)及物理护理干预(心理疏导、家属陪同、知识普及)。对照组则依照常规进行检查。

结果：两组生命体征比较均无统计学意义 ($p<0.05$) 实验组完成检查的成功率明显高于对照组(实验组：92.33%，对照组：77.33%) ($p<0.05$) 实验组制动效果和图像质量均优于对照组 ($p<0.05$)。

结论：在患儿 CT 检查过程中实施有效的护理措施是促使检查成功的关键。

PO-3543

介入室医用耗材二级库房 6S 管理模式的实践探讨

张霞

中国人民解放军陆军特色医学中心

目的: 探讨介入室采用 6S 管理模式对新入职、轮转人员及规培生等流动性较大人员对二级库房规范化管理的实践探讨。

方法: 以陆军特色医学中心介入室 2022 年 6 月至 2022 年 12 月 35 名研究对象为实验组, 2023 年 1 月至 2023 年 6 月 35 名研究员为对照组, 观察在不同管理模式下所产生的不同效果。研究内容主要包括两组人员对物品规范化放置率、库房相关管理指标正确率、出入库准确率及对管理模式的满意度。结果: 通过对本次研究所设立观察指标结果统计, 对照组各项指标明显高于实验组, 各项指标统计数据显示结果更好。统计的对照组中对物品规范化放置率明显比实验组高 ($P<0.05$)。在库房相关管理指标正确率方面, 主要包括清理清扫环境耗时、整理物品耗时、物品合理排放评分以及盘点耗时, 各统计数据均显示对照组优于试验组 ($P<0.05$); 在管理模式满意度方面, 显示为对照组高于试验组 ($P<0.05$)。

结论: 在介入室二级库房耗材管理工作中, 采用 6S 管理模式能保证手术用耗材的准确性, 切实提高了耗材的利用度和安全性, 提高管理者工作效率, 有助于提升管理水平, 且能节约成本, 值得推广。

PO-3544

LVIS 支架辅助弹簧圈栓塞治疗颈内动脉瘤的安全性及有效性探讨

张霞

中国人民解放军陆军特色医学中心

目的 评价 LVIS 支架辅助弹簧圈栓塞治疗颈内动脉瘤的安全性和有效性。方法 回顾性分析 2020 年 6 月至 2022 年 6 月在陆军特色医学中心接受 LVIS 支架辅助弹簧圈栓塞治疗的 185 例颈内动脉瘤患者临床和影像学资料。重点分析术后即刻和进展性闭塞率、术后并发症及临床随访结果。结果 185 例颈内动脉瘤患者接受 LVIS 支架辅助弹簧圈栓塞治疗均获成功。术后即刻造影显示动脉瘤完全闭塞 183 例(98.9%), 部分闭塞 2 例(1.08%)。术后并发症发生率为 2%, 均为小血栓栓塞事件。162 例患者接受平均(6.7±4.5)个月造影随访, 首次随访造影显示完全闭塞率进展至 96.2% (178 例), 未见迟发性支架内狭窄。动脉瘤复发 1 例(0.54%), 再次接受弹簧圈栓塞后达到完全闭塞。152 例(82.1%)患者临床随访平均(12±6.5)个月, 术后复发率低、恢复快、不良反应小等优点。结论 LVIS 支架辅助弹簧圈栓塞治疗颈内动脉瘤近期安全性和有效性良好, 长远疗效有待进一步随访。

PO-3545

肝癌患者肝动脉化疗栓塞术中疼痛评估及护理策略

陈廷静

中国人民解放军陆军特色医学中心

肝动脉化疗栓塞术 (Transarterial chemoembolization, TACE) 是指将化疗药物注入经皮插管至肝癌的供血动脉内, 从而对肝癌供血动脉末梢进行栓塞, 从而阻断肿瘤血供, 对肿瘤细胞发挥最大限度

的杀伤作用,被公认为肝癌非手术治疗最常用方法之一,其疗效已经得到肯定,但这种治疗方式也会引起多种并发症,其中,疼痛是 TACE 最常见的并发症之一。

1、研究目的:通过对行肝动脉化疗栓塞术的患者进行术中疼痛程度评估,分析总结术中疼痛情况,针对疼痛程度给予有效的护理镇痛措施,减轻患者术中疼痛,提高患者舒适度,减轻术中疼痛对疾病治疗效果的影响,对患者进行人文关怀,提高护理工作满意度。

2、研究对象:选择某三甲医院 2022 年 10 月—12 月的 50 例行肝动脉化疗栓塞术的患者。纳入标准:知情同意并自愿参加本研究。年龄大于等于 18 岁以上,无其他基础疾病;术前未使用任何止痛药。排除标准:年龄小于 18 岁,有其他基础疾病及转移性肿瘤;其他引起疼痛的疾病。

3、研究工具:选择术中耗时短、患者能够一目了然的 NRS 疼痛评分量表;设计收集患者基本信息表单。

4、研究方法:根据患者行肝动脉化疗栓塞术中的疼痛发生时间,选择 5 个时间节点:栓塞开始时、栓塞开始后 5 分钟、栓塞开始后 10 分钟、栓塞开始后 15 分钟以及手术结束时(出介入手术间)评估患者疼痛程度,记录患者的疼痛程度以及生命体征是否变化。

5、研究结果针对患者的疼痛情况实施术中护理镇痛措施,比如心理疏导、音乐镇痛、药物镇痛等镇痛护理管理,然后再次进行疼痛评估,对护理镇痛措施效果进行评价。

6、研究结论:观察肝动脉化疗栓塞术中患者疼痛情况,合理采取相应护理镇痛措施减轻患者术中疼痛,并对术中采取的护理镇痛措施效果进行评价,提高了患者人文关怀、舒适度及满意度

PO-3546

多模态教学在放射科在职护士操作培训中的探讨与研究

平自玲

中国人民解放军陆军特色医学中心

目的:通过视、听、图、说;操作教员监督;考核成绩与绩效挂钩等多模态教学手段,提高我科护理操作技能,从而提高护理质量,保证检查治疗的顺利完成。

方法:

1、选出 3-5 位高年资且对操作技术比较熟练的护师作为科室的操作小教员,定期对科室护士进行培训及监考;

2、对于中心进行的操作培训指定操作小教员前去参加学习,并拍摄操作视频;

3、操作小教员学习后,将学习视频发至护理微信群,通知全科护士学习;

4、操作小教员再根据操作视频编辑操作台词及操作流程,一并发至护理微信群;

5、操作小教员对自己所学的操作熟悉后再进行全科操作示范。操作示范均分量批次进行,每次学习都要签到并照相留作资料;

6、学习后自行练习,自己觉得满意后再考试,操作小教员再其他护士练习中及时、耐心纠正不规范的操作,严练考宽;

7、考核成绩与态度适当与绩效挂钩。

8、对我科的 32 名护士在实行多模态教学手段前后进行对比分析。

结果:

2021 年(多模态教学前)医院年终考核中培训前护士们的平均成绩在 75-83 分,平均成绩为(80.32±4.87)分,其中有 3 名未及格,均补考通过。2022 年(多模态教学后)医院年终考核中培训前护士平均成绩为 88-93 分,平均成绩为(91.02±3.26)分,均及格,其中有两人参加医院组织的护理基础操作比赛,并获得三等奖。32 名在在职护士培训后,学习积极性明显提高。对教学态度、教学内容、教学过程、教学引导、教学效果评分较高。

结论:

在多模态教学在放射科在职护士操作培训中,提高了在职护士的主观能动性,激发护士们的学习内在动力,使其更加主动的学习知识,掌握技巧。强烈感官的视觉享受,让护士能够直观的了解操

作流程。台词让整个操作串出一条线,让护士们在操作上不断片,提高了护士的学习效率。陪练指点,能够在操作中监督在职护士的操作细节,使操作更符合护理操作规范。

PO-3547

基于会话分析和信息管理系统构建 医学影像科医技护患和谐沟通模式

段雨

中国人民解放军陆军特色医学中心

目的:随着人类社会的发展及思想的不断进步,社会关系在转型中其各种文化认知受到误解,导致医疗纠纷、医患暴力、职业医闹等问题愈发生升高。当前传统的医患关系受到社会发展浪潮的冲击已开始趋于紧张。从文化交流的视野出发,除了加强医德医风建设、媒体宣传文明就医、加强患者的道德法律素养以外,致力培养医务人员良好的语言沟通能力同样是现代医学模式下医务工作者必备的专业技能。方法:首先通过文献研究及现况调研,总结并提取医技护患者之间的沟通方式、沟通需求、知识差异和认知差异等导致医患沟通困难的四个关键问题;其次结合知识的应用方式,以医患检查流程中的传递内容为基准,提出检查流程可视化、检查需求知识动画、语言表达个性化的三大模块。结果:通过制定了系统、简单、实操性强的医技护患沟通模式,医护人员可简单快捷的评估及传达患者检查前的准备,以及检查时患者的配合需求,缩短患者在影像科检查等候时间,进而提升影像检查服务质量。结论:通过会话分析和信息系统的构建,从医、技、护、患(患者家属)四方面同时入手,极大程度的改善医学影像科医技护患关系现状,促进医技护患四位一体和谐关系的形成。本文经过实践,验证了其可行性,以期制定符合综合医院医技护患沟通技能模块提供参考和借鉴。

PO-3548

研究精细化护理干预模式在介入手术室 经皮穿刺椎体成型术患者中的应用

高玲

华北医疗健康集团邢台总医院(邢台市骨科医院)

目的:研究精细化护理干预模式在介入手术室经皮穿刺椎体成型术患者中的应用效果。方法:选取2022年6月-2023年6月在我院介入医学科接受经皮穿刺椎体成型术患者180例为研究对象,依据入院时间分为对照组(2022年6月-2022年12月入院, $n=92$)和观察组(2023年1月-2023年6月入院, $n=88$)。对照组实施常规护理,观察组在对照组基础上实施精细化护理干预模式,包括介入医学科护士在术前访视及术中无缝隙式健康教育、心理护理、放射防护知识宣教告知、术后饮食注意事项等。比较两组患者精细化护理干预后的护理满意度、术后活动依从性、生活质量以及对术中射线的理解和防护应对,结果:干预后观察组在对介入手术术中护理满意度、术后活动能力及依从性、术后生活质量及射线防护理解应对能力均高于对照组($P<0.05$)。结论:精细化护理干预模式在介入手术室经皮穿刺椎体成型术患者中可提高患者满意度、增加活动依从性、提升生活质量、对射线知识初步了解并能通过术后饮食及行为减少放射线对身体的危害,将危害降到最小。

PO-3549

一种非常有效的方法：用于提高 3-6 岁幼儿 MRI 检查成功率、图像质量及效率的方法

王雪琴

中国人民解放军陆军特色医学中心

目的：实行一种非常有效的方法，用于提高 3-6 岁幼儿 MRI 检查成功率、图像质量及效率。

方法：回顾性分析 2019 年 7 月-2023 年 1 月在我院影像科行幼儿磁共振检查患儿 150 例，幼儿年龄段为 3-6 岁，按照其检查前接受的准备方法不同分为镇静组、研究组和常规组，每组各 50 例。常规组应用常规方法进行准备；镇静组除进行常规准备外，在检查前遵医嘱肌注苯巴比妥进行镇静；研究组幼儿按照我科全新设计的准备方式进行准备（如：预约合适的时间段、合适的前期适应性训练、合适的视频学习方法和合适的鼓励等综合训练准备）。采用配对卡方检验对三组幼儿 MRI 检查成功率、图像质量及检查效率进行差异性分析。

结果：研究组幼儿检查成功率为(44/50)88.0%，镇静组幼儿检查成功率为(45/50)90.0%，常规组幼儿检查成功率为(36/50)72.0%， $P=0.03$ ；研究组幼儿图像优良率为(37/50)74.0%，镇静组幼儿图像优良率为(34/50)68.0%，常规组幼儿图像优良率为(26/50)52.0%， $P=0.067$ ；研究组幼儿中位检查完成时间为 10.0Min，镇静组幼儿中位检查完成时间为 10.0Min，常规组幼儿中位检查完成时间为 16.5Min， $P=0.024$ 。

结论：这种全新的方法让 3-6 岁的幼儿 MRI 检查成功率和检查效率得到保证，结果与镇静组相当。在图像质量方面，研究组和镇静组的图像优良率明显高于常规组，但是统计学分析无差别，可能与样本量相关。因此，这种新的准备方式可以作为幼儿 MRI 检查前准备的首选，这样不但可以减少镇静类药物的使用，而且还提高检查效率和患儿家属满意度，值得临床推广。

PO-3550

复盘分析在影像学增强检查护理不良事件管理中的应用

任晓静、邵慧

解放军总医院第一医学中心

摘要 目的：探讨复盘分析在影像学增强检查护理不良事件管理中的应用效果。方法：于 2023 年 2 月至 4 月（干预前），选取我院影像学增强检查患者 600 例，于 2023 年 5 月至 7 月（干预后），选取影像学增强检查患者 600 例。干预前实施以被动式质量分析管理进行每月护理不良事件的追踪分析整改；5 月建立复盘小组团队，对患者实施复盘分析管理方法，包括回顾、反思、探究、总结 4 个步骤，干预后，静脉导管堵管、异位发生率明显低于干预前($P<0.05$)，差异具有统计学意义。结论：复盘分析可明显减低影像学增强检查患者的留置静脉导管堵管、异位发生率，促进护士发现思维盲区，优化护理流程，提高患者对护理工作的满意度，是一种不断自我进步的管理方法。

PO-3551

虚拟平扫图像是否可以在儿童全脑全脊髓质子治疗中代替常规平扫图像进行剂量计算

刘田野^{1,2}、朱健²、曲国斌^{1,2}、陶城²、李成强²

1. 山东第一医科大学

2. 山东第一医科大学附属肿瘤医院

目的:以往研究表明,在光子放疗中,虚拟平扫(VNC)图像可以代替常规平扫图像(TNC)进行放疗计划,在质子放疗中 VNC 图像是否同样可以取代 TNC 图像进行放疗计划?于是在儿童全脑全脊髓患者进行质子治疗前,将对 VNC 图像和 TNC 上的放疗计划进行剂量分析,以确定 VNC 图像是否可以代替 TNC 图像进行放射治疗计划,以减少儿童患者的辐射剂量。

方法:VNC 图像是在增强 CT 图像上通过减碘的方式得到的。对 5 例全脑全脊髓患者行质子放疗计划,并给予 36Gy 处方剂量。在全脑临床靶体积(CTV 脑)及脊髓临床靶体积(CTV 脊髓)周围外扩 3mm 形成一个环,并命名为 RING。在能谱 CT 的增强图像上进行靶区勾画,并将勾画好的靶区复制至 TNC 图像及 VNC 图像上。假设 VNC 图像可以代替 TNC 图像执行放疗计划,于是将 VNC 图像上的放疗计划完全复制到 TNC 图像上,再根据等剂量分布曲线和剂量体积直方图(DVH)评价 VNC 图像及 TNC 图像上的计划靶区。

结果:在 VNC 图像中骨骼的 CT 值低于 TNC 图像,VNC 图像中颅骨 CT 值平均较 TNC 图像低 405HU,VNC 图像中椎体 CT 值平均较 TNC 图像低 121HU。从全脑全脊髓放疗计划的 DVH 图及等剂量线上分别可以看出,TNC 靶区外扩 3mm RING 的 DVH 曲线要低于 VNC 图像,即:TNC 放疗计划的剂量低于 VNC 图像,用覆盖 100%体积的剂量(D100)和覆盖 95%体积的剂量(D95)来表示 TNC 与 VNC 放疗计划中的差异,全脑 TNC 放疗计划中 D100 和 D95 分别较 VNC 放疗计划低 4%和 2%;全脊髓 TNC 放疗计划中 D100 和 D95 均较 VNC 放疗计划低 8%;另外 TNC 部分的剂量线并未包全脊髓的靶区,即存在一定的欠量区域,TNC 整体剂量线相对于 VNC 剂量线来说,向后移动(射野路径方向为前)。

结论:在对儿童全脑全脊髓患者进行质子放射治疗计划时,来自能谱 CT 的 VNC 图像不可用于取代 TNC 图像用于质子放射治疗计划的实施。

PO-3552

10%水合氯醛口服与灌肠镇静在婴幼儿心脏 CT 检查的临床应用及效果观察

潘凤华

广东省人民医院

目的 对比在婴幼儿心脏 CT 检查治疗前,使用 10%水合氯醛口服和保留灌肠两种给药途径的临床效应、镇静效果和不良反应。方法 选取 2022 年 1 月至 12 月无腹泻、无大便失禁、无做过直肠手术史行心脏 CT 检查的婴幼儿 500 例,随机分为口服和保留灌肠组,各 250 例。两组分别给予 10%水合氯醛溶液口服和保留灌肠,用于心脏 CT 检查的镇静。观察对比两组操作耗费时间、起效时间、作用时间、首次给药成功率、一次性检查成功率及不良反应发生率。结果 口服组操作时间较保留灌肠组短 $[5.32 \pm 2.18] \text{min}$ vs $[15 \pm 5.21] \text{min}$ $P < 0.01$,但起效时间较口服组短 $[(10.121 \pm 1.83) \text{min}]$ vs $[(20.24 \pm 2.87) \text{min}]$, $P < 0.01$,作用时间较口服组长 $(63.62 \pm 11.23) \text{min}$ vs, $(51.24 \pm 5.41) \text{min}$ 。给药操作过程中,保留灌肠组首次镇静检查成功率口服组高($P < 0.01$),用药后的不良反应率较口服组低($P < 0.01$)。结论 水合氯醛保留灌肠虽然比口服操作时间长,但起效快,不良反应少,首次镇静检查成功率高减少患儿伤害,减轻患儿不适感,患儿及家属易接受,提高医疗满意度。适合临床推广运用。

PO-3553

优化安全管理措施对医学影像科护理安全影响

许少辉、洪玉妹
海南省人民医院

目的 本研究旨在通过优化安全管理措施对医学影像科护理安全影响,探讨医学影像科有效、安全的护理方法,以提升护理质量及检查的安全性。**方法** 将在我院 160 例进行医学影像科检查的患者(2022 年 5 月~2023 年 7 月收治),根据医学影像科安全管理措施不同以随机数字表法分为对照组和观察组各 80 例,给予对照组常规医学影像科安全护理管理,给予观察组实施医学影像科优化安全管理措施干预,对比观察组与对照组患者不同护理模式下医疗安全事件发生率、检查质量、患者对医学影像科检查的满意度情况。**结果** 观察组的医疗安全事件发生率明显比对照组的医疗安全事件发生率更低, $p<0.05$, 差异具有统计学意义;与对照组患者检查质量评分相比,观察组患者的检查质量评分显著更高, $p<0.05$, 差异具有统计学意义;与对照组患者的检查满意率相比,观察组患者的检查满意率显著更高, $p<0.05$, 差异具有统计学意义。**结论** 医学影像科的检查十分重要,若检查不当可能导致严重后果,故而需引起重视,而本次研究发现,给予医学影像科检查的患者优化安全管理措施可有效提升医学影像科检查的质量,可提升其检查安全性,有效降低患者发生安全事故的几率,保证检查的安全及顺利进行,且患者对该护理干预方案十分满意以及认可,具有较高的临床应用以及推广价值,可不断进行深入研究,通过不断研究来改进其优化措施,最大可能提升检查的安全性。

PO-3554

可兼容心脏起搏器在磁共振成像安全检查中的应用现状

梁蝴蝶
山东省立医院

[摘要] **目的** 了解可兼容心脏起搏器在磁共振成像(magnetic resonance imaging, MRI)安全检查中的应用现状调查并提出临床建议。**方法** 采用便利取样法,对全国 20 省 227 家三甲医院从事磁共振影像护理工作的护士发放电子调查问卷,问卷内容涵盖医院是否允许可兼容起搏器患者行 MRI 检查;对于允许检查的医院检查前是否需要家属和(或)临床医师签字;检查场强要求;检查时长要求;植入时间要求;图像质量;有无发生并发症等方面。

对可兼容心脏起搏器的临床 MRI 检查适用情况进行现状调查。计数资料用百分比(%)表示。**结果** 共有 216 家医院护士填写有效问卷,问卷有效回收率 95.15%。共有 76 家医院目前允许可兼容心脏起搏器行 MRI 检查,允许率为 35.18%。检查前 100%需要家属和(或)临床医师签字;81.58%需在 1.5T 及以下磁场扫描。69.74%要求在植入后 3 月以上扫描;88.16%的医院要求扫描时间限制在 15min 以内。38.16%的医院指出有部分伪影,可能影响检查结果。3.94%的医院示有心悸、灼伤等不适。**结论** 国内对可兼容心脏起搏器植入患者的 MRI 检查安全持有较保守的态度,各个医院存在较大的差异。制定一个相对安全而又明确的指南或专家共识对影像科工作人员的临床筛选和判断有一定的指导意义。

PO-3555

认知护理干预对儿童 MR 检查图像质量的影响

白琳、王亚丽、王明、张雪松
河北医科大学第三医院

摘要 目的：探讨儿童 MR 检查前玩具模拟体验结合现场体验模式在改善患儿紧张程度方面的有效性，以及对 MR 图像质量的影响。方法：连续性招募就诊于我院需行 MR 检查的 5-14 岁儿童 180 例，82 例纳入研究组，98 例纳入对照组，所有入组病例首先进行视觉模拟量表（visual analogue scale, VAS）评分。各组受试者根据年龄分为 5-8 岁低龄儿童及 9-14 岁大龄儿童。上述评分后研究组给予磁共振拼插模型完成模拟检查体验过程，然后进入检查室现场体验，对照组仅语言告知检查时身体不能运动。完成后研究组再次进行上述评分，观察其对于患儿 MR 检查前认知情况的提升以及放松程度的改善。MR 检查完成后，对研究组与对照组的 MR 图像质量进行评分，观察不同干预模式下图像质量的差异。结果：检查前两组患儿 VAS 基线无显著差异。患儿干预后对检查恐惧程度 VAS 评分低于基线（ $P<0.05$ ），研究组 MR 图像质量评分高于对照组（ $P<0.05$ ）。研究组及对照组中大龄儿童 MR 图像质量评分均高于低龄儿童。大龄儿童干预组与对照组相比，图像质量明显提高。低龄儿童中两者图像质量无显著差异。结论：儿童 MR 检查前综合体验干预模式能够在一定程度上提高 MR 检查的依从性，尤其对于大龄儿童，有可能提高儿童 MR 检查的图像质量。

PO-3556

专科护理质量敏感指标在急危重症患者 CT 检查安全管理中的应用研究

刘俊伶
中国人民解放军陆军特色医学中心

目的：CT 已是急危重症患者的重要检查方式，急危重症患者的疾病具有复杂性及隐匿性的特点，因此急危重症患者 CT 检查安全管理显得尤为重要。目前影像科少有能客观反映急危重症患者 CT 检查安全的护理敏感评价指标，护理质量敏感性指标它能够作为护理工作的改进提供真实的依据，基于此构建急危重症患者 CT 检查护理敏感指标并应用，为其 CT 检查护理质量安全管理提供依据。

方法：1.组建研究小组：由护士长 1 名、CT 技师长 1 名、专科护士 3 名组成，负责护理质量敏感指标相关文献检索、筛选方法、质量控制、专家函询等护理质量敏感指标的建立与实施工作。2.确定护理敏感指标：研究小组通过理论、文献学习及质性访谈编制急危重症患者 CT 检查护理敏感指标函询问卷，通过 2 轮专家函询确定急危重症患者 CT 检查护理敏感指标。3.护理质量敏感指标的应用：

①预试用：进行为期 1 个月的预试用，在试用过程中注意信息反馈，再次确定各项指标的统计方法、填写要求以及相关注意事项。②培训：让全体护理人员在了解每项指标的概念、操作方法的基础上，充分认识到利用护理质量敏感指标进行护理安全管理的重要性。③确定优先改进项目：通过 2023 年 1 月-2023 年 3 月的急危重症 CT 检查患者的数据分析，采用柏拉图分析法，将累计百分比 $\geq 80\%$ 条目作为优先改进项目，包括分级检查评估正确率，分级检查护理执行率，检查及时性 3 项内容，于 2023 年 4 月按照失效模式实施步骤（收集数据-评估-改进-评价-巩固）进行改进。将 2023 年 1 月-6 月的急危重症 CT 检查患者作为研究对象，比较实施前后急危重症患者 CT 检查护理质量管理效果。

结果：观察组分级检查评估正确率、分级检查护理执行率、检查及时性显著高于对照组（ $P<0.05$ ）。

结论：护理质量敏感指标的实施有助于实现急危重症患者 CT 检查护理行为实施过程的前馈控制，提高护理质量，减少护理不良事件的发生，保障急危重症患者检查安全，提升患者及临床满意度。

PO-3557

131I 治疗分化型甲状腺癌健康科普的研究进展

王燕、施冰梓、杨素云
山西医科大学

目的：通过对 ^{131}I 治疗分化型甲状腺癌健康科普的必要性以及国内外实施现状进行归纳总结，以期医护人员精准对接患者的多样化信息需求，深入推进“科普中国”计划，开展健康科普研究与实践提供参考。

方法：查阅国内外相关文献，从 ^{131}I 治疗分化型甲状腺癌健康科普的内容、模式、途径与方法以及现实困境方面进行阐述，分析了 ^{131}I 治疗分化型甲状腺癌健康科普现状。

结果：（1）目前国内外健康科普内容以在患病阶段对患者的健康教育和患病后的自我管理为主，主要体现在出入院教育、饮食科普、作息科普、服药科普、行为科普、特殊科普（如辐射安全）及随访科普等方面，相关卫生法规和一级预防的健康科普还没有形成系统全面的推广。（2）应用较多且比较成熟的理论模式主要是健康信念模式和知-信-行模式。其他模式比如健康促进模式，虽然广泛地应用在多种慢性病和癌症的预防和控制中，但缺少针对 ^{131}I 治疗分化型甲状腺癌疾病的应用。

（3）在互联网信息时代的背景下， ^{131}I 治疗分化型甲状腺癌健康科普途径有线上科普、线下科普以及线上+线下融合科普三种途径。随着渠道的拓宽，其健康科普方法也在逐步丰富，主要有面对面科普式、传统载体式、移动网络媒体式。（4）大多数分化型甲状腺癌治疗的网站虽然总体信息有可读性，但缺乏相关指南的更新以及做出明智决定所需的治疗选择的最新资料。此外，科普内容还存在重复度高、表现形式单一、与受众需求契合度不强的问题。

结论：现阶段， ^{131}I 治疗分化型甲状腺癌健康科普的面向人群主要是患者，少有关关注一般人群对于预防分化型甲状腺癌、促进健康的信息需求。因此，有必要拓展分化型甲状腺癌健康科普的工作领域，进一步创新其科普形式，提升专业人员的科普能力。在新媒体环境下，还需加强互联网监管，严打伪科普。在国家、医护人员和社区的共同努力下， ^{131}I 治疗分化型甲状腺癌健康科普工作将会进入一个新的发展时期。

PO-3558

精细化护理在老年人核磁共振增强检查患者中的应用效果分析

刘晓侠
空军军医大学第一附属医院西京医院

目的：探讨在老年人核磁共振增强检查中应用精细化护理的效果。

方法：收录于 2022.6-2023.7，收治的 300 例接受核磁共振增强检查的老年患者。采用摸球法规范性分为 2 组，每组分别纳入 150 例样本。对照组常规干预，研究组精细化护理，分组探究干预效果。

1.1 研究组开展精细化护理：（1）检查前：应保持热情的态度接待每一位检查者，采用通俗易懂的语言向患者讲解检查的方法，目的，注意事项及相应的准备工作。重点讲解检查过程中可能发生的不良反映及应对方法。对行腹部检查的患者指导其正确的憋气方法，交流过程中，注意观察患者心理状态，鼓励与安慰的方式给予情绪疏导。针对过度紧张的患者，可参观他人检查过程，或播放轻音乐，转移患者紧张、焦虑的负性情绪。针对患者提出的问题进行详细解答，加强其检查的认知。

检查中：协助患者取出身上全部金属物品指导其正确体位，告知检查过程中保持制动的重要性，接受腹部检查的患者需要再次进行呼吸训练，并强调良好的呼吸配合对于检查结果的意义和作用。针对噪音敏感的患者，可采取佩戴眼罩及耳塞的方式完成检查。穿刺宜选择粗、直、容易固定的血管。造影剂输注结合患者血管和检查项目调适当流速。对于危重的患者，必要时采取呼吸机辅助呼吸、心电监护，全程陪同观察生命体征完成检查。

检查后：叮嘱病人观察 30min，确保无明显的过敏反应和不适感后拔除留置针，按压穿刺部位 10min，并交代需要注意的事项和多饮水，促进造影剂排泄，取检查结果的时间。

结果：研究组的 SDS 评分、检查时间明显比对照组低；且心率异常率 6.00%，血压异常率 10.00%，低于对照组的 16.00% 20.00%，结果比较 $P < 0.05$ 。对照组满意度 79.33%，研究组满意度 93.33%，结果比较 $P < 0.05$ 。

结论：针对老年核磁共振扫描增强的患者，加强精细化护理，能够有效减少检查的时间，降低发生心率、血压的异常情况，同时大大能提高了图像质量。

PO-3559

增强 CT 结合结肠仿真内镜对结直肠癌的检查方法及护理

张旋、唐文娟

华中科技大学同济医学院附属协和医院

【摘要】目的：探讨增强 CT 结合仿真内镜后处理对结直肠癌的检查方法及护理。方法：回顾性分析 45 例结直肠癌患者，患者均行肠道准备及肠腔内注气后用 Definition AS+ 128 层螺旋 CT 增强扫描结合仿真内镜后处理检查，评价结直肠癌患者的临床价值。结果：45 例患者在 CT 仿真内镜检查中 40 例考虑为肿瘤性病变、3 例为正常、2 例为息肉。经手术病检结、直肠癌 42 例，炎症 3 例；结直肠癌分型为 15 例肿块型、9 例浸润型、5 例溃疡型、8 例混合型。结论：增强 CT 结合仿真内镜后处理对结直肠肿瘤的检出、定性及定位与手术病检比较准确率很高。增强 CT 结合后处理对观察病灶周围的侵犯情况及有无远处器官和淋巴结转移的情况有很大的优势，同时还可以了解肠腔内病变的形态及病变累及肠腔的长度。

PO-3560

幽闭恐惧调查问卷在磁共振检查人群中的汉化及信效度检验

梅莉、曾铁英、李华玲、谭细琼

华中科技大学同济医学院附属同济医院

目的：汉化幽闭恐惧调查问卷（CLQ），并对该问卷在磁共振检查人群中进行信效度检验。方法：根据 Brislin 原则对原量表进行汉化形成中文版 CLQ。并通过便利抽样的方法对某一综合性医疗机构需行 MRI 检查的 350 名患者进行问卷调查，从而评价该问卷的信效度。结果：中文版 CLQ 共包含 26 个条目，2 个维度。探索性因子分析共提取了 2 个公因子，可解释总变异的 53.045%，且各条目的因子载荷为 0.528~0.794。26 个条目与 CLQ 得分的相关系数为 0.570~0.775；每个条目的 I-CVI 值均在 0.89~1.00 之间，总量表的 S-CVI/Ave 值为 0.98；中文版 CLQ 总量表的 Cronbach's α 系数为 0.955，两个维度 Cronbach's α 系数分别为 0.907 和 0.938，重测系数为 0.903。结论：中文版幽闭恐惧调查问卷具有良好的信效度，适用于我国 MRI 检查人群，为评估 MRI 检查人群的幽闭恐惧水平提供了可靠的主观测量工具。

PO-3561

“互联网+”健康管理模式在首次行 PTCD 患者延续护理中的应用

陈冬萍

华中科技大学同济医学院附属协和医院

目的 探讨“互联网+”健康管理模式在首次行经皮肝穿刺胆道引流 (PTCD) 患者延续护理中的应用效果, 为建立高效、系统、规范、无障碍的延续护理模式提供参考。**方法** 2022 年 1 月~2022 年 3 月首次行 PTCD 术 30 例患者为对照组, 2023 年 1 月~2023 年 3 月首次行 PTCD 术 30 例患者为观察组。对照组在出院后仅接受传统的延续护理模式, 即出院后一周内病房护士对其进行电话回访之外, 患者有任何问题需要电话问诊或来院就诊; 观察组利用“互联网+”健康管理模式时时解决相关问题。分别统计两组患者出院后胆道引流管感染率、胆道引流管脱管率和出院后 1 月、3 月、6 月 (频次是否太多) 的生活质量。**结果** 观察组显著低于对照组。**结论** 完善的、细化的、规范的、可操作的“互联网+”健康管理模式下, 护患之间沟通无时间和空间的限制, 生动形象的图片和视频指导, 患者或家属及社区医务人员可按照指示居家解决相关问题, 可降低胆道引流管感染率、胆道引流管脱管率, 改善患者生活质量。

PO-3562

标准化放射护理质控系统的研发及临床应用

卢俞宏

解放军总医院海南医院

摘要 目的 构建放射护理标准化质控系统, 探讨其在放射科护理流程规范化管理、物资管理、科室流程管理的应用效果。**方法** 以互联网大数据为基础, 构建放射护理标准化质控系统, 主要包括 5 个功能模块: 注射信息管理、CT 推药信息管理、磁共振推药信息管理、医疗物资管理、科室流程管理。比较系统应用前 2020 年 12 月 21 日至 2020 年 12 月 25 日与系统应用后 2021 年 12 月 20 日至 2021 年 12 月 24 日的日均药品耗材统计时间及每例患者留置针穿刺前评估所用时间。**结果** 采用放射护理质控系统后日均药品耗材统计时间、每例患者留置针穿刺前评估所用时间分别为 (18.05±1.67 分钟)、(2.57±0.53 分钟), 显著低于采用放射护理质控系统前的 (64.40±1.52 分钟)、(4.48±1.19 分钟), 差异均有统计学意义。**结论** 放射护理标准化质控系统的构建及应用, 是大数据时代下放射护理信息化的趋势, 具有实用性及推广性。

PO-3563

急性脑梗死患者血管内取栓时间的影响因素分析及其护理专案建

陈日玉

海南省人民医院

目的: 分析急性脑梗死患者血管内取栓时间的影响因素及相关的护理专案建立。**方法:** 选择 2021 年 01 月—2022 年 01 月海南省人民医院收治的 80 例急性脑梗死患者作为研究对象, 根据患者到达医院至股动脉置鞘成功时间 (DTP), 分为延误组 (DTP > 90min, n=32) 和非延误组 (DTP ≤ 90min, n=48)。分析急性脑梗死患者血管内取栓时间的影响因素及建立相关的护理专案。**结果:** 两组患者的年龄、吸烟史、饮酒史发病时间、入院时 NIHSS 评分、院前延误、静脉溶栓、发病至入院时间及入院至开始静脉溶栓时间对比差异无统计学意义 (P < 0.05); 两组患者进行影像检查、入院至等待 CT 检查时间、入院至获得影像结果时间、获得影像结果至获取知情同意时间、

获得知情同意至入导管室时间及入院至股动脉置鞘成功时间等对比差异有统计学意义 ($P<0.05$)。Logistic 多因素分析可知入院进行影像检查、入院至等待 CT 检查时间、入院至获得影像结果时间、获得影像结果至获取知情同意时间及获得知情同意至入导管室时间等是影响急性脑梗死患者血管内取栓时间的独立危险因素。结论: 本研究通过对 ACI 患者血管内取栓时间的影响因素进行分析, 可知院内不规范及繁琐的流程是造成院内延误的主要因素, 并针对相关因素来建立护理专案, 进一步优化取栓护理方案, 优化可有效提高 ACI 患者的血管取栓率, 改善患者预后。

PO-3564

复盘式多元化急救情景演练在放射科技护一体化工作中的应用效果

郑淑琳

中国人民解放军陆军特色医学中心

目的 探讨复盘式多元化急救情景演练在放射科技护一体化工作中的应用效果。方法 每月底根据常见的急救疾病制定不同的演练方案, 每月的医技护人员固定, 年资实行老带新即高年资、低年资组合共同进行急救演练。选取 2022 年 9 月至 2023 年 9 月的 12 次急救情景演练作为实验组, 2021 年 8 月至 2022 年 8 月的 12 次急救情景演练作为对照组。实验组接受复盘式多元化急救情景演练培训。具体方法: ①固定每月急救演练人员, 由高年资组合低年资, 根据放射科每月出现不同的急救疾病制定不同的急救方案进行急救情景演练。②每次急救情景演练前先培训急救物品及针对此次病例的急救药品使用。③根据放射科急救流程开始急救情景演练, 由科室护士长、技师长、急救专家共同观看、评价及指导。④在科室护士长、技师长及急救专家指导后, 复盘一次急救情景演练流程。对照组根据之前的培训模式, 即每月随机选取急救情景演练方案, 随机选取急救情景演练方案进行操作。两组从急救流程, 疾病急救熟练度, 急救物品药品熟练熟知度进行考核对比。结果 实验组对急救流程的熟练度, 对抢救物品、药品的熟知使用度结果明显高于对照组, 抢救时间明显少于对照组, 两组数据具有统计学意义 ($P<0.05$)。结论 复盘式多元化急救情景演练有利于提高放射科技护的急救技能, 面对不同疾病的突发情况有不同的应对能力, 缩短抢救时间, 增强团队协作能力, 具有一定的应用价值。

PO-3565

急诊 TIPS 治疗门脉高压症食管胃静脉曲张出血的术中护理探析

杨丽芹、肖书萍

华中科技大学同济医学院附属协和医院

[摘要] 目的 探究肝硬化门脉高压症食管胃静脉曲张出血患者急诊行颈静脉肝内门体分流术 (TIPS) 术中护理配合技巧和心理干预的护理价值。方法 我院 2016 年 1 月-2019 年 10 月需要急诊行 TIPS 术的肝硬化食管胃静脉曲张出血患者, 急诊实施 TIPS 治疗, 术前积极准备, 应用医院焦虑抑郁量表 (HADS) 评估患者给予针对性心理干预, 术中严密观察患者病情变化、实施科学护理支持。结果 88 例患者其中单纯 TIPS 治疗 34 人, TIPS 联合 CGVE 治疗 50 人, TIPS 联合改良 BRTO 治疗 4 人, 围手术期止血成功率 100%。结论 门脉高压症食管胃静脉曲张出血患者急诊实施 TIPS 手术治疗是有效的治疗方法, 术中科学对患者实施针对性的护理, 可以保证患者术中安全, 减少并发症发生、提高手术成功率。

PO-3566

细节化护理联合放松训练在神经梅毒 磁共振检查患者中的应用效果

赵瑞云
青海省第四人民医院

【摘要】目的：神经梅毒磁共振检查患者采用细节化护理联合放松训练，研究细节化护理联合放松训练效果及优势。**方法：**本次研究选择 2020 年 1 月至 2021 年 8 月间本院收治的 168 例神经梅毒磁共振检查患者，以随机抽签方法加以分组，其中对照组纳入 84 例患者，施行常规护理干预；研究组同样纳入 84 例患者，行细节化护理联合放松训练。随机并对比组间的护理效果与满意程度。**结果：**研究组的护理指标显著优于对照组， $P<0.05$ ，有统计学意义。接受护理前，研究组与对照组的数据对比无差异性，即 $P>0.05$ 。行分组护理后，研究组 SAS 评分、SDS 评分显著优于对照组，数据对比差异有统计学意义， $P<0.05$ 。研究组护理满意程度显著优于对照组，有显著差异， $P<0.05$ 。**结论：**细节化护理联合放松训练在神经梅毒磁共振检查患者中的应用效果良好。该护理干预通过提供舒适的环境和个体化的护理，帮助患者放松身体和心理，减轻焦虑和紧张情绪。结果显示，患者在接受细节化护理联合放松训练后，在磁共振检查中更能保持稳定的体位，减少运动伪影和图像模糊，提高图像质量。因此，细节化护理联合放松训练是神经梅毒磁共振检查患者中的有效应用策略，值得推广和应用。

PO-3567

分化型甲状腺癌病人 ^{131}I 全身扫描前肠道准备的研究进展

韩汶君、杨素云
山西医科大学第一医院

目的 通过探索分化型甲状腺癌病人行 ^{131}I 全身扫描前肠道准备的研究新进展，以达到构建合格的肠道清洁方案，规避读片的误判，辅助决策后续的治疗或随访方案的目的。

方法 查阅国内外相关文献，从分化型甲状腺癌病人口服 ^{131}I 的肠道生理过程， ^{131}I 全身扫描及肠道准备的定义、原理，全身碘扫前行肠道准备的重要性，综述国内外分化型甲状腺癌病人 ^{131}I 全身扫描前肠道准备的研究现状，旨在为构建规范、统一、切实可行的肠道准备方案提供参考依据。

结果 ^{131}I 治疗在分化型甲状腺癌的管理中发挥着核心作用，低剂量 ^{131}I -全身显像具有高度的敏感性和特异性，有助于评估前次 ^{131}I 治疗的疗效、残留的甲状腺组织，检测远处转移灶的数量和部位等，辅助决策后续的治疗或随访方案，具有重要的诊断价值。甲癌患者术后处于甲减状态，几乎常有结肠运动迟缓（如便秘），这导致大量 ^{131}I 积蓄在肠道，加之肠道邻近的管腔、组织、器官重叠缠绕较多，这对腰腹部病灶的数量和定位造成了一定的困难，容易引起读片的误判，导致不必要的治疗。国内外学者多注重于结合各种检查方式来增加诊断的精确性，减少误判，但关于精确的肠道准备指导方案尚无统一规范的定论。有学者曾提出，适当应用缓泻剂可减少 ^{131}I 的积聚。目前，国内核医学科多采用口服聚乙二醇口服液、磷酸钠盐口服液等缓泻剂的方法来进行肠道处理，但针对精确的口服缓泻剂种类、剂量、时间、温度等，也尚未构建统一标准的方案。

结论 国内外尚无权威的关于分化型甲状腺癌病人 ^{131}I 全身扫描前的肠道准备方案，在接下来的研究中，研究相应干预措施的应用，从而构建规范、统一、切实可行的肠道清洁方案，以便投入到临床中使用，从而增加诊断的精确性，为后续治疗方案的决策提供更加科学、规范的判断依据。

PO-3568

水化护理在宫颈癌化疗后患者中降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险的应用研究

李佳营、孔薇、纪妹
郑州大学第一附属医院

目的：探讨水化护理在宫颈癌化疗后患者中降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险的临床价值。方法：前瞻性入组 100 例宫颈癌化疗后欲行 CT 增强检查患者，随机分为两组，实验组患者在行 CT 增强检查前后采用口服水化法进行水化护理干预，B 组为对照组，除水化护理干预外，其他一切均同实验组。分别统计两组患者对比剂外渗概率、检查前 24 h 及检查后 24 h 两组患者血清胱抑素 C(Cys C)的含量。通过 5 分量表法使患者对 CT 增强检查耐受度进行评分（1~5 分，难以忍受~无异常感觉），由两位高年资护士采用双盲法对各患者 CT 增强 24h 后精神状态进行评分（1~5 分，精神极差~精神佳）。通过两独立样本 t 检验比较两组患者的一般信息及对比剂外渗概率。通过配对样本 t 检验比较两组患者检查前后 Cys C 含量，并通过独立样本 t 检验进行两组间比较检查前后 24 h 血 Cys C 含量。采用 Mann-Whitney U 检验比较两组患者 CT 检查耐受度及检查后精神状态程度主观评分，通过 Kappa 检验对检查后精神状态程度主观评分做一致性分析。结果：3 人因对比剂过敏终止检查，3 人因服用二甲双胍终止检查，最终实验组 48 人及对照组 46 人完成检查。两组患者一般资料无统计学差异（ $P>0.05$ ）。实验组对比剂外渗概率小于对照组（ $t=-2.452$, $P<0.05$ ）。两组检查前 24h 血 Cys C 含量无统计学差异，检查后实验组 Cys C 含量低于对照组（ $t=-4.249$, $P<0.05$ ），二者之间具有统计学差异。在对 CT 增强检查耐受度主观评分方面，实验组显著高于对照组（ $t=-4.320$, $P<0.05$ ），主观评分提高 1.11 分。在检查后精神状态程度方面，两组评价结果一致性良好（ $Kappa=0.818$, $P<0.05$ ）实验组高于对照组。结论：在宫颈癌化疗后患者进行水化护理干预，不仅可以提高患者检查依从性，更可降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险，具有重要的临床价值。

PO-3569

循证护理在 AngioJet 系统抽吸治疗下肢静脉血栓介入术后并发症的应用研究

李小芳、陈冬萍、肖书萍
华中科技大学同济医学院附属协和医院

目的：研究循证护理在 AngioJet 系统抽吸综合介入治疗下肢静脉血栓患者术后并发症的应用效果。材料方法：以 2019 年 1 月—2023 年 6 月我介入诊疗中心治疗的 AngioJet 系统抽吸治疗的下肢静脉血栓患者共 80 例作为研究对象，按照随机数表法分为循证护理组（ $n=40$ ）和常规护理组（ $n=40$ ），其中循证护理组采用循证护理模式，常规护理组采用传统护理模式进行护理。比较两组患者并发症的发生率。结果：两组患者均接受使用尿激酶 20~60 万 U 溶入 100 ml 生理盐水,通过 Angio Jet 机械性血栓清除装置喷射模式进行血栓内喷射,等待 15 min 后行机械性血栓抽吸的综合介入治疗。两组均未出现消化道出血、颅内出血、症状性肺栓塞和血管壁破裂等严重并发症。其中，循证护理组中介入术后 1 周内患肢率为 100%，无皮下淤血和留置溶栓导管或穿刺点出血发生（0%），平均住院日为 7.3 天；常规护理中 1 周内患肢率为 100%，但局部皮下淤血发生 5 例(12.5%)，留置溶栓导管或穿刺点出血 3 例(7.5%)，平均住院日为 8.1 天。

结论: 下肢静脉血栓患者 AngioJet 系统抽吸综合介入治疗术后康复过程中,采用循证护理模式进行护理,可有效降低并发症发生率,促进患者康复,减轻痛苦,改善患者的精神状态和生活质量,提升疗效,从而改善护理满意度,值得临床推广。

PO-3570

探讨“双低”腹部 CTA 增强降低肿瘤病人血管外渗的临床应用价值

马志明、庄丽娜、刘义军
大连医科大学附属第一医院

目的: 探讨“双低”扫描方案能谱成像(GSI)方案在腹部 CTA 增强检查中,预防降低肿瘤病人血管外渗的临床应用价值。方法 选取行腹部 CTA 增强检查的病人 200 例,随机分为双低组 100 例,和常规扫描组 100 例。“双低”组扫描参数: GSI 扫描模式,管电流 195~360 mA,对比剂方案为 300 mgI/kg 体重,流速 3.5~4.0 ml/s,重组 60 keV、70%ASIR-V 图像;常规组扫描参数: GSI 扫描模式,管电流 280~440mA,对比剂方案为 500 mgI/kg 体重,流速 4.5 ml/s,重组 70 keV、40%ASIR-V 图像。记录两组患者注射对比剂后有无血管疼痛,血管外渗情况,测量两组腹主动脉及竖脊肌 CT 值和 SD 值,并计算腹主动脉信噪比(SNR)、对比噪声比(CNR)、品质因子(FOM) 值,采用双盲法对图像质量进行主观评分,记录辐射剂量、对比剂摄入量,采用 SPSS24.0 软件进行统计分析。结果 “双低”组血管无疼痛 97 人,疼痛 3 人,血管外渗 10—20ml 2 人,血管外渗 30ml 1 人,常规组血管无疼痛 90 人,血管疼痛 10 人,血管外渗 10—20ml 的 3 人,血管外渗 40ml—80ml 的 5 人,两组相比较差异有统计学意义 ($P<0.05$) 双低组腹主动脉 CT 值、SNR、CNR、FOM 及背景噪声优于常规组 ($P<0.05$)。两组图像主观评分无统计学差异 ($P>0.05$) 与常规组相比,“双低”组辐射剂量及碘摄入量分别降低 24: 62%, 34.16% ($p<0.05$)。结论 采用“双低”扫描方案进行腹部 CTA 检查,能够明显预防降低肿瘤患者血管疼痛,血管外渗的风险,减少外渗剂量,减轻肿瘤病人痛苦。应用低 keV 结合高权重迭代 (70%ASIR-V) 技术,可保证图像质量和碘摄入量,具有良好的临床应用价值。

PO-3571

OSCE 考核在综合介入中心规培护士中的应用与效果评价

李媛
中国人民解放军陆军特色医学中心

目的: 探讨 OSCE 考核在综合介入中心规培护士中的应用与效果评价。方法: 针对综合型介入中心面向全院临床科室开放,包括心内介入、心外介入、神经介入、外周血管介入、肿瘤介入、复合介入等,手术种类多,病种复杂,对综合介入护士的要求相对于独立的导管室护士而言,更具有挑战性。而如何保障综合介入规培护士在短短三个月时间内掌握综合介入的护理理论、护理技术、工作流程、工作标准等内容,是综合介入需要去解决的问题。我院于 2016 年承担规培护士的带教任务,近年来我们一直在探索培养综合介入规培护士的教学方法,并为此做过很多尝试,但预期效果不理想,在不断的探索和反思后本研究尝试将培训内容与 OSCE 考核模式相结合应用于综合介入规培工作中,探索在有限的时间内,高效地培养综合介入规培生综合素质和临床能力的方法。2019 年我科经过教学组的讨论,自编了 OSCE 考核内容和标准,2019 年 7 月至 2023 年 7 月根据 OSCE 考核内容和标准对 12 名规培护士针对性的开展培训和考核,并对各个站点的考核结果进行统计分析。同时,采用自编的问卷调查表,对参加 OSCE 考核的护士进行满意度和反馈意见的调查。

结果：参加 OSCE 考核的护士认为 OSCE 考核能够有效地检测和提高自己的临床能力，同时也提出了一些改进建议。结论：OSCE 考核在综合介入中心规培护士中的应用与效果评价表明，OSCE 考核是一种科学、客观、有效的临床能力评估方法，能够促进规培护士的临床知识、技能和态度的提升，为综合介入中心规培护士培养提供了有力的保障。建议在综合介入中心规培护士教学中进一步推广和完善 OSCE 考核模式。

PO-3572

OSCE 考核在婴儿 MR 新入职护士培训中的应用

李媛

中国人民解放军陆军特色医学中心

目的：探讨在婴儿 MR 新入职护士培训中采取 OSCE 考核的效果。方法：选取我院 2020 年 1 月至 2023 年 1 月婴儿 MR 新入职护士共 50 例，根据随机数字表法分为对照组和观察组，各 25 例。对照组采取常规考核，观察组采取 OSCE 考核。对比两组护士的考核成绩以及对本次考核的满意程度。结果：OSCE 模式教学法效果优于传统的教学方法，经过 OSCE 模式培训并考核的护理人员在婴儿 MR 检查标准流程和配合技术方面的掌握程度优于实施 OSCE 模式之前。且婴儿 MR 检查一次性成功率、图像质量、家属满意度的统计结果均优于实施 OSCE 模式之前，差异具有统计学意义 ($p < 0.01$)。结论：OSCE 模式在我科婴儿 MR 检查护理教学中的应用效果良好，提高了婴儿 MR 检查的一次性成功率、图像质量、提高了家属满意度。OSCE 情景模拟教学及考核模式不仅重视理论知识的掌握，更加侧重综合实力的培养。在提高影像科护理人员实践技能，培养更优秀的影像护理服务人才方面有应用价值，值得推广。

PO-3573

全程护理干预提高胎儿磁共振检查一次成功率

张涛、张妍

陆军军医大学第一附属医院（西南医院）

目的：全程护理干预提高胎儿磁共振检查一次成功率。方法：检查前

1 做好接诊工作，接待热情，耐心回答病人的问题，减轻患者的思想顾虑，赢得患者的信任，并且向病人介绍自己作为她的专属检查护士，将会全程陪伴她在医院完成核磁共振检查。向患者介绍检查的环境，告知检查设备，以及梯度切换产生的噪音，检查时出现发热属于正常现象，使患者了解核磁共振的检查环境，做好思想准备，从而减少顾虑和恐惧的心理。

2 核对患者基本信息，询问病史，明确检查的目的和要求，确定患者是否有无检查禁忌症。

检查中：胎儿磁共振检查受母亲情况影响小，不受胎儿骨骼、羊水量的影响，对胎儿中枢神经系统显示好，对软组织分辨率高，视野大，能显示气道等特殊结构和小器官的特点。现探讨对全程护理干预在胎儿磁共振的应用价值。

方法：一般资料：选取（2022 年 7 月~11 月）和（2022 年 12~2023 年 4 月）行 MRI 检查的孕妇各 50 例，分别做对照组和干预组。每组 25 人。

对照组：排除 MRI 检查禁忌症，呼吸训练，心理准备，检查前吸氧，胎动评估。

干预组：在对照组基础上增加检查中的干预。(1):使用氧气枕让孕妇在检查过程中持续吸氧。

(2)：使用隔音棉被或隔音腹带包裹孕妇肚子

指标：(1)：记录 MRI 一次性检查的成功率，记录 MRI 检查耗时。若多次检查耗时为每次检查的总和，由 2 名诊断医生对两组图像进行盲评。

检查后：告知患者取报告的时间和地方，如果病人病情危急，应及时联系诊断医生尽快出报告。并且做好随访工作，询问患者对此次检查过程有什么不满意的地方，和我们服务需要改进的地方。结果：干预 11 例首次检查成功率 98%，检查对照组首次成功率 73%，首次检查两组有统计学（ P 值 <0.05 ）。观察组检查 $t=22\pm5\text{min}$ ，对照组平均 检查 $t=30\pm5\text{min}$ ，两组平均检查时间有统计学差异（ $P<0.05$ ）。图像伪影观察组是 10.5%，对照组图像伪影出现率为 23.5%，两组间存在统计学差异。结论：通过有效的全程检查护理干预胎儿磁共振检查，对提高检查的成功率有重要临床意义。

PO-3574

投影式血管成像仪穿刺法在 CT 造影检查中提高静脉穿刺成功率降低碘对比剂外渗发生的效果观察

符水喜

海口市人民医院

目的：探讨投影式红外血管成像仪应用于 CT 造影检查中碘对比剂外渗发生的效果观察

方法：将我院放射科 2022 年 5 月~2022 年 10 月，138 例 CT 造影检查患者按随机数字表法分为对照组和观察组。对照组采用常规静脉穿刺法，在不借助任何辅助仪器的情况下，医护人员根据血管的解剖位置，凭借个人经验进行外周静脉盲穿，观察组在投影式红外血管成像仪引导下进行外周静脉留置针穿刺，比较两组间的一针穿刺失败率、穿刺所需时间和患者满意度。结果：对照组一针穿刺失败率为 38.5%，观察组一针穿刺失败率为 7.4%，满意度调查结果显示，观察组患者及家属对护士满意度有明显提高。两组间一针穿刺失败率比较，应用投影式红外血管成像仪进行穿刺耗时为 $(0.31\pm0.080)\text{min}$ ，明显低于肉眼视觉下穿刺耗时 $(6.86\pm0.95)\text{min}$ ，独立样本检验，穿刺耗时 $t=12.40$ ，($P<0.05$)有统计学差异。

结论：投影式红外血管成像仪在应用在 CT 造影检查中，护士可快速查找静脉、准确评估静脉、优化静脉穿刺方案、提高穿刺成功率、节约穿刺时间、避免反复穿刺、提高穿刺成功率增强护士自信心，在高流速、高浓度快速注射的压力下，能够有效降低外渗发生率的发生、提高患者满意度、降低医护人员的工作压力，从而保证输液安全、快捷、有效，更好地为患者服务，使其早日康复。

PO-3575

不同紫外线灯具对卒中 CT 设备及检查室的消杀比较

戴婉姜

首都医科大学宣武医院

为避免卒中患者 CT 检查时发生院内交叉感染，增加治疗负面因素，需要定期对 CT 检查室进行全面紫外线消杀操作。

选取常规吊顶紫外线灯、常规紫外线车和云磁大功率紫外线灯，分别放置扫描间内进行照射，使用紫外线强度测试仪测得，CT 机架前后，检查床面，地面，以及检查窗口的紫外线强度值。

根据各个测试点得到的紫外线强度值，发现同样照射时间内，云磁大功率紫外线灯强度值对大，对各种病毒及致病菌群杀伤力最大。云磁大功率紫外线灯在相应最短照射时长内，可以达到吊顶式紫外线灯和常规紫外线车照射 40 分钟时长的消杀效果，有效提高消杀效率，减少因长时间消杀操作，增加患者等候时间，延误检查和治疗时间。

PO-3576

“目视化宣教”提高患者增强 CT 检查后“口服水化”的依从性

毛元红、杨红、陆菊花、周曙、袁爱红、张鸿飞
南通市第一人民医院

目的 探讨“目视化宣教”提高患者增强 CT 检查后口服饮水水化的依从性。**方法** 选取 2022 年 1 月—2022 年 6 月在某三甲医院医学影像中心行增强影像检查无饮水禁忌症、住院患者 200 例，CT 检查后采用“目视化宣教”法(根据《对比剂使用指南 第一版、第二版》增强 CT 检查后水化的要求，制定了简便易行口服饮水“水化”的具体方案，该方案单张贴于患者外周静脉穿刺、拔针操作台，患者及家属能及时阅读水化方案，并让患方将“口服饮水水化”方案拍照存于智能手机相册，方便水化期间复习、巩固、执行)。检查后 24 小时，电话随访患者水化方案的执行情况、患者不适症状、满意度。**结果** 入组患者 200 例均能执行口服饮水水化方法，执行率、依从性均为 100%；未有恶心、呕吐、水中毒、心衰、对比剂肾病、肾功能不全等并发症的发生，满意度 100%。**结论** 对增强 CT 检查后的患者实施“目视化口服饮水水化宣教”，有利于患者及家属掌握并实施口服饮水的具体方案，极大的提高患者的依从性，保护患者的肾功能，同时提高患者就医的满意度。“目视化宣教”方法简单、易学、易掌握、易实施，也可用于住院病人介入手术后保护肾功能，值得临床推广应用。

PO-3577

“清单式评估单”在保障患者增强 CT 检查安全的应用

毛元红、杨红、陆菊花、周曙、袁爱红、张鸿飞
南通市第一人民医院

目的 探讨“清单式评估单”在保障患者增强 CT 检查安全的应用。**方法** 选取 2019 年 1 月—2021 年 12 月至某三甲医院医学影像中心行增强 CT 检查患者 200000 例，检查前均采用自制的《增强 CT 检查前清单式评估单》(根据《对比剂使用指南 第一版、第二版》制定)对患者逐项进行评估。**结果** 入组患者 200000 例，发现二甲双胍停药未达 48 小时者 4 例、未停药二甲双胍者 29 例、甲状腺机能亢进服药治疗 1 例、甲亢服药治疗停药后近期未做甲功检查者 2 例、心功能 IV 级者 4 例、近期有过敏性哮喘发生 1 例、血钾低于 2.0mmol/L 1 例、48 小时内已行增强 CT 检查者 3 例，对以上存在特殊情况的患者及时与床位医生、上机技师、诊断组医生沟通，采用完善相关辅助检查、改期检查、停止检查、对比剂高压注射前预警、检查后加强水化等方案，以上患者均未发生对比剂肾病、甲亢危象、过敏性休克、心功能不全、猝死并发症，满意度 100%。**结论** 对患者增强 CT 检查前采用“清单式评估单”，可保障患者的影像增强检查安全，减少检查并发症的发生，保障患者的安全，降低医患纠纷，同时提高了 CT 检查前评估的工作效率。“清单式评估单”方法简单、易学、易掌握、易实施，也可用于医院磁共振检查前的评估，值得临床推广应用。该研究已申请并获得软件著作权二项《增强 CT 检查评估软件 V 1.0》登记号：2019SR0905218、《影像患者检查核对系统 V 1.0》登记号：2019SR0347826。

PO-3578

虚拟现实技术在缓解肝癌患者术中疼痛的应用研究

邓丽君、唐碧英、余秋花、吕玉娥、黄秋萍、黄天雯
中山大学附属第一医院

目的 探讨虚拟现实技术在缓解肝癌患者术中疼痛的应用效果。**方法** 将 2023 年 4 月至 5 月行肝动脉化疗栓塞的肝癌患者随机分为观察组与对照组, 观察组 100 例采用虚拟现实技术缓解术中疼痛, 即术前应用虚拟现实技术观看手术过程、术中配合 VR 一体机的使用, VR 一体机的内容涵盖患者进入手术室后术前准备流程、疾病相关知识、造影时屏气呼吸的方法及配合、舒缓的音乐、术后的注意事项及饮食、用药、运动指导等; 对照组 100 例采用常规手术护理。比较两组患者的焦虑程度评分、抑郁程度评分、疼痛评分及患者对护理工作满意度的差异。**结果** 观察组患者的焦虑程度评分、抑郁程度评分、疼痛评分明显低于对照组, 差异有统计学意义 ($P < 0.05$); 观察组患者对护理工作的满意度得分高于对照组, 差异有统计学意义 ($P < 0.05$)。**结论** 虚拟现实技术作为一种非药物疼痛干预方式, 可分散患者的注意力, 有效缓解疼痛, 降低患者焦虑、抑郁水平, 减少阿片类药物的使用剂量, 在疼痛管理中显示出良好的应用效果, 并最终提高了患者满意度。

PO-3579

临床护理教育中以岗位胜任力为核心的新型护理人才培养体系的探索与实践

邓丽君、余秋花、唐碧英、吕玉娥、黄秋萍、黄天雯
中山大学附属第一医院

目的 探讨临床护理教育中以岗位胜任力为核心的新型护理人才培养体系的应用效果。**方法** 将 2019 年 7 月至 2020 年 6 月在介入科临床实习的 61 名本科全日制护生设为对照组, 对照组实施传统临床带教模式, 以优质护理管床责任制为导向进行整体护理实习, 在护长及总带教的带领下实行一对一或双导师制带教方法, 实施目标教学。将 2020 年 7 月至 2021 年 6 月在介入科临床实习的 59 名本科全日制护生设为观察组, 观察组在临床护理教育中探索与实践以岗位胜任力为核心的全日制本科护理实习生带教模式。即聚焦于能力提升, 通过首创基于 OSCE 的进阶式整体护理能力评比, 开展以案例为基础的学习及以质疑为基础的学习法, 提升护生的临床护理能力、评判性思维能力、沟通协作能力及职业发展能力; 同时, 为了增强学生素质, 挖掘思政元素, 构建出“知识传授”、“价值塑造”、“能力培养”多元统一的“八大模块”教学目标并应用, 培养护理专业情怀; 在效果质控方面, 把护理教学评价由原来单一的终结性评价向形成性评价转变, 实施基于三维质量的临床教学质量评价持续改进教学质量。**结果** 观察组护生的临床护理能力、沟通协调能力、评判性思维能力、心理特质及总分的评价指标得分均高于对照组, t 值分别为 2.429、3.351、7.279、3.032 和 4.065, 差异均有统计学意义 ($P < 0.05$); 观察组护生的出科理论成绩、技能成绩均高于对照组, t 值分别为 3.786、2.028, 差异均有统计学意义 ($P < 0.05$); 观察组护生对教学满意度为 (99.95 ± 0.28) 分, 对照组为 (99.58 ± 1.19) 分, 两组比较, 差异有统计学意义 ($t = 2.278, P = 0.024$)。**结论** 临床护理教育中以岗位胜任力为核心的新型护理人才培养体系的探索与实践, 提升了护生的岗位胜任力、教学质量及教学满意度, 形成了“传承、创新、发展”的优秀教学文化, 达到了高质量高水平教学。

PO-3580

探讨 85 例肺结节患者 CT 引导下肺结节穿刺活检的 并发症发生情况及影响因素

林淑宁、丁体英
河南省人民医院

目的 探讨 85 例肺结节患者 CT 引导下肺结节穿刺活检的并发症发生情况及影响因素。**方法** 对于本院进行 CT 引导下肺结节穿刺活检的 85 例患者的临床资料进行回顾性分析,按结节大小进行分组,分析各组穿刺活检的诊断符合率;对影响肺结节患者 CT 引导下肺结节穿刺活检的并发症的因素进行分析,包括性别、年龄、穿刺大小与深度等;将上述因素中差异有统计学意义的因素进一步分析,筛选肺结节患者 CT 引导下肺结节穿刺活检发生气胸、肺出血的危险因素。**结果** 85 例患者中共有 1 例取材为正常肺组织,占比 1.18%;其余 84 例均取得病理组织,占比 98.82%,其中有 10 例无手术结果证实,各结节大小组的穿刺诊断活检诊断符合率分别为 77.78%、80.77%、82.61%、92.59%;85 例患者中经术后扫描发现有 15 例出现气胸,发生率为 17.65%,16 例患者出现肺出血,发生率为 18.82%;肺结节患者 CT 引导下肺结节穿刺活检术后发生气胸的影响因素为年龄、穿刺针穿越肺组织距离;而发生肺出血的影响因素为结节大小、穿刺针穿越肺组织距离(均 $P<0.05$);气胸发生的危险因素在于年龄、穿刺针穿越肺组织距离($OR=1.040$ 、 1.028 ,均 $P<0.05$);肺出血发生的危险因素在于结节大小、穿刺针穿越肺组织距离($OR=0.940$ 、 1.029 ,均 $P<0.05$)。**结论** 肺结节患者行 CT 引导下肺结节穿刺活检的并发症主要有气胸、肺出血,其中气胸发生的危险因素在于年龄、穿刺针穿越肺组织距离,肺出血发生的危险因素在于结节大小、穿刺针穿越肺组织距离,临床可据此采取相关干预措施,以减少并发症的发生。

PO-3581

多模式呼吸训练联合 PERMA 模式在老年 肝脏磁共振增强检查中的应用

张军、庄丽娜
大连医科大学附属第一医院

目的:老年患者随着身体机能的衰退会出现语言的理解和表达能力降低,增加肝脏磁共振检查的配合难度,易出现图像运动伪影。调动老年患者的主动性,增强其交流沟通的意愿,提高磁共振检查的配合度有着非常重要意义。**PERMA** 模式从积极情感(P)、投入(E)、关系(R)、意义(M)、成就(A)5 个方面,对患者进行系统性干预,提升患者身心感受。本研究旨在探究多模式呼吸训练联合 **PERMA** 模式在老年患者肝脏磁共振增强检查中的效果。

方法:收集我院 2022 年 4 月-2023 年 4 月行肝脏磁共振检查的 80 例老人随机分为对照组 40 例和观察组 40 例。对照组采取常规呼吸训练。观察组在对照组的基础上进行多模式呼吸训练联合 **PERMA** 模式干预,①按照磁共振扫描呼吸导航节律进行吸气-呼气-屏气练习,屏气时间 15-18s,A:自主模式。患者直接按照口令进行吸气-呼气-屏气训练;B:协助模式。患者由他人协助进行吸气-呼气-屏气训练。检查前 30 分钟护士对患者进行连续 3-5 个循环的呼吸训练。②呼吸节律和深度训练。③情景呼吸训练:播放腹部磁共振检查的语音指令和序列声音,让患者跟着音频指令进行呼吸训练。④ **PERMA** 模式应用: P (积极情感): 检查前与患者进行情感交流,讲解磁共振检查知识,让患者对呼吸训练产生积极情绪。 E (投入): 指导患者观看磁共振检查呼吸配合宣传图片,使患者专注于呼吸训练。 R (关系): 对心理焦虑、不适感的患者,教会深呼吸、冥想放松身体,鼓励家属对患者进行安抚和关心。 M (意义): 介绍肝脏磁共振检查特点,引导患者建立目标感。 A (成就):

鼓励患者讲述呼吸训练感受, 增强信心。比较两组患者心理弹性、检查依从性, 检查时间、图像质量、护理满意度。

结果: 观察组患者心理弹性得分、检查依从性、图像质量、护理满意度高于对照组, $P<0.05$, 差异具有统计学意义; 观察组患者检查时间优于对照组, $P<0.05$, 差异具有统计学意义。

结论: 多模式呼吸训练联合 PERMA 模式可提高老年患者肝脏磁共振增强检查心理弹性、检查依从性, 图像质量、护理满意度, 缩短检查时间, 提升患者就医体验有积极的影响作用。

PO-3582

优化注射方法在 PET/MRI 中的应用研究

陈颖琦

中国人民解放军东部战区总医院

【摘要】目的 探讨优化注射方法在 PET/MRI 中的应用。方法 选取本院于 2021 年 6 月—2022 年 8 月收治的 178 例行 PET/MRI 显像检查的肿瘤患者, 按照 2021 年 6 月-2022 年 3 月采用双通路注射法 63 例患者作为对照组, 2022 年 4 月-8 月采用单通道优化注射法 115 例患者作为观察组, 对照组开展传统注射法进行药物注射, 观察组基于此, 对注射方法进行优化, 克服局部放射性浓聚的问题, 采用一组通道进行药物注射, 从护理人员单病人操作时间、图像质量分析、患者血液污染环境发生率、留置针穿刺成功率、注射部位药物浓聚发生率等五个方面对两组进行比较分析。结果 观察组护理人员单病人操作时间、患者血液污染环境发生率, 均低于对照组, 差异有统计学意义 ($P < 0.05$)。留置针穿刺成功率观察组明显高于对照组, 差异有统计学意义 ($P < 0.05$)。图像质量分析、注射部位药物浓聚发生率比较, 差异无统计学意义 ($P > 0.05$)。结论 优化注射方法在 PET/MRI 中的应用, 可降低患者降低患者多次穿刺带来的痛苦、缩短护士操作时间、减少患者血液污染环境的可能、同时节约医疗资源, 降低患者的经济负担, 值得推广。

PO-3583

智慧自助健康宣教小程序对老年冠脉 CTA 患者相关知识知晓率的影响及效果研究

赵丽

中国人民解放军陆军特色医学中心

目的: 冠状动脉 CT 血管成像目前已成为诊断冠状动脉疾病的主要无创影像学工具, 患者心率、呼吸平稳状况是 CCTA 检查成功的关键。而老年患者由于其年龄较大, 对周围环境适应能力下降, 应激调节能力不足等, 往往导致检查不成功或图像质量不佳。因此合理进行检查知识的健康宣教, 提高患者的检查知晓程度, 从而提高检查效率和影像质量。

方法: 选取某三甲医院影像中心 2022-2023 行冠脉 CTA 检查的老年患者共 200 例, 按时间段分为对照组和观察组各 100 例。一、对照组进行常规健康宣教。①预约时: 发放 CT 检查预约告知单, 指引患者仔细阅读告知单上内容。②检查前: 集中为患者讲解检查相关内容及注意事项。③检查后: 告知患者合理水化及取报告的时间、地点及方式。二、观察组应用智慧自助健康宣教小程序对患者进行健康宣教。①智慧自主健康宣教小程序。为微信扫描后即可观看, 以漫画为主, 文字为辅, 两者结合, 根据影像检查的特点, 将信息化与科普手段融合, 还原影像检查的场景, 将影像检查相关知识点具体化、普适化, 且采用患者提出问题, 护士解答问题的形式呈现, 内容通俗易懂, 不受患者知识文化的影响 (特别是老年人)、也不受宣教时间和场地限制, 可以反复浏览加深印象。②预约时, 工勤人员指导患者扫描《CT 检查告知单》上的小程序码, 提前观看《冠脉 CTA 检查这些事

情要注意》。③到检后,先进行调查了解患者观看情况。对于部分未观看小程序内容的患者,指导现场观看;无微信、无智能手机的患者,提供科室手机进行观看,着重指导患者进行心率准备和呼吸准备内容的浏览。

结果:实验组与对照组比较,相关知识知晓率实验组不知晓为 22%,基本知晓为 53%,完全知晓为 25%,对照组不知晓为 54%,基本知晓为 33%,完全知晓为 13%, $P=0.000$;一次性检查成功率实验组 93%,对照组 83%, $P=0.030$;图像质量实验组合格 95%,对照组合格 84%, $P=0.011$ 。结论:对老年患者采用智慧自助健康宣教小程序进行检查前的健康宣教,可提高患者相关知识知晓率,从而提高配合能力和影像检查质量。

PO-3584

癌症放疗患者自我管理影响因素及干预措施的研究进展

陈曦、甘佳伟、唐旭、姜桐桐、史铁英
大连医科大学附属第一医院

背景介绍:癌症已成为我国居民的主要死亡原因,而放疗是降低复发并延长生存的重要措施,除此之外,放疗还会损伤正常的细胞组织,引起放射性皮炎等相关特异性症状。自我管理作为一种二级预防策略,有利于预防和延缓并发症的发生与发展,已成为临床学者的研究热点之一。目的:本文对癌症放疗患者自我管理的现状、影响因素及干预措施进行综述,旨在为后续癌症放疗患者自我管理的进一步研究提供参考依据,以期提高癌症放疗患者的自我管理和生活质量。方法:通过检索 PubMed、Web of Science、Cochrane Library、中国生物医学文献数据库(CBM)、中国知网、万方数据知识服务平台和维普等数据库,检索时间为建库至 2022 年 4 月。结果:目前关于癌症放疗患者自我管理相关研究较少,但国内外学者对其关注度不断增加。通过总结发现,国内外癌症放疗患者自我管理水平均处于中等偏下,其主要影响因素包括人口学因素、社会心理因素、治疗和疾病因素,提高癌症放疗患者自我管理主要干预措施包括移动医疗、认知行为疗法、医养护一体化服务及健康教育。结论:未来的研究可进一步分析我国癌症放疗患者的自我管理水平及影响因素,探索切实可行的干预模式,为开发符合我国国情的癌症放疗患者自我管理干预措施提供参考。

PO-3585

直肠高分辨磁共振检查肠道准备技术与效果分析

李欢
中国人民解放军陆军特色医学中心

目的:直肠癌属于临床上最为常见的消化系统恶性肿瘤之一,随着医疗水平的不断进步以及磁共振设备的日益完善,其开始被广泛应用于直肠疾病的诊断中,然而高分辨率的 MRI 诊断价值受多种因素影响,其中直肠内容物干扰以及直肠运动影响最为严重。目前部分医院有针对直肠高分辨 MRI 检查进行灌肠护理来清洁肠道,而部分医院嘱咐患者检查前使用开塞露进行清洁肠道,方法并不统一。因此,以直肠高分辨磁共振检查肠道准备的方式选择为切入点,利用前期基线调查的数据,结合国内外肠道清洁程度标准与选择,并通过临床实践验证肠道准备有效性。为护士对此类患者的肠道准备护提供了依据,是提高检查成功率、图像质量、家属满意度、护士工作效率的关键,具有重要的现实意义及应用价值。

方法:1、构建直肠高分辨磁共振检查前肠道准备标准:首次将肠道清洁程度与检查成功率客观指标相结合,通过图像质量来评价最适合直肠高分辨磁共振检查的肠道准备方式。确定此类患者最适应的肠道准备方式,使护士在对患者进行肠道准备时有章可循、有据可依;2、建立直肠高分辨磁共振检查前的护理方案:确定适合此类患者的肠道准备方式后,形成规范化护理,以及肠道准备流

程。3、设计盆腔磁共振 KPI 资料收集表格：设计表格长期对此类患者进行质控，持续进行质量监控。

结果：提高了直肠高分辨磁共振检查患者的总检查成功率、一次性检查成功率，缩短了患者准备检查时间，提高了图像质量达标率以及患者及家属的满意度。

PO-3586

碘对比剂急性不良反应危险人群风险筛查表的设计与应用

兰芳、李雪

中国人民解放军陆军特色医学中心

目的：编制适合 CT 增强检查碘对比剂急性不良反应危险因素的筛查表，为早期筛查危险因素提供科学有效的工具。

方法：采用基于前期真实世界大数据的临床观察结果，参考国内外文献形成碘对比剂急性不良反应危险因素筛查量表条目池；采用德尔菲专家咨询法对条目池和指标重要程度进行修订和调整，形成碘对比剂急性不良反应危险因素风险筛查初表。选择 2021 年 1 月-12 月 CT 增强的患者为研究对象，采用量表对其进行统计分析，判断量表的预测效能，确定危险程度划分范围，形成最终量表，并评价该量表的信效度，以验证该量表的科学性、实用性和可行性。

结果：最终形成的碘对比剂急性不良反应危险因素风险筛查量表包括严重心脏疾病、2-3 级高血压、ICM-ADR 过敏史、不稳定性哮喘、 β -受体阻滞剂、肿瘤（化疗）、高龄 ≥ 70 岁和焦虑共 8 个条目，风险程度分为高风险、低风险和未知风险三种。研究过程一共纳入 57354 例患者，不良反应发生 226 例，轻度 209 例，中度 15 例，重度 2 例。使用风险筛查表筛查出轻度 210 例，中度 14 例，重度 2 例，其中筛查为轻度患者中 98% 发生了轻度不良反应，筛查为中度患者中 93% 发生了中度不良反应，筛查为重度患者中 100% 发生了重度不良反应，风险筛查表的应用具有一定的风险检出率。采用 Kappa 一致性检验进行统计推断，Kappa 值 >0.75 ，说明两者一致性较好。

结论：风险筛查表可以提高急性不良反应风险因素的检出率，使护理人员能够迅速而准确地评估患者的风险，对不同风险级别的患者采取个体化的预防策略，以减少不良反应的发生，提高患者的安全性。因此，风险因素严重程度评价量表可作为划分风险级别的客观依据，具有一定的临床意义。

PO-3587

中心静脉导管在影像科对比剂高压输注安全性应用研究

王雪柳

东方医院

高压输注造影剂如何选择静脉通道？近年来，各种静脉输液工具如 CVC、PICC、PORT 在临床上已得到了普及和推广，但这些输液工具又有不同的品牌、型号和材质，高压输注造影剂时对输液工具又有特殊的要求，如选择和使用不当，有可能导致静脉导管破裂、造影剂外渗等并发症的发生，因此有必要对输注造影剂的输液工具的选择进行研究和整理。

PO-3588

临床护理路径标准在核磁共振增强护理中的应用效果分析

闵婷
武汉大学中南医院

目的：研究临床护理路径标准应用于 CT 增强护理中的效果。方法：我院于 2022 年 6 月~2023 年 6 月共抽取了 200 例实行核磁增强检查患者，通过抽签方法分组分为试验组与参照组 2 个组别，每组均各 (n=90)。试验组施行临床护理路径，参照组施行一般护理，对比两组护理效果间的差异。

结果：①试验组的增强检查时间，与参照组的增强检查时间比较，存在明显差异性， $P<0.05$ 。②试验组的护理满意度，与参照组的护理满意度对比，具有统计学的差异， $P<0.05$ 。结论：核磁增强护理中实行临床护理路径，在缩短增强检查时间、提高患者护理满意度方面的优势突出，建议在临床方面应用。

PO-3589

精细化护理在影像安全管理中的综合措施

李娅
空军军医大学西京医院

随着医疗科技的迅速发展，精细化护理在危重患者管理中扮演着越来越重要的角色。本研究旨在探讨精细化护理在放射科危重患者管理中的应用，以提升影像安全管理水准。为此，我们采取了一系列综合措施，旨在为危重患者提供最为周到的照护与安全保障。以下是我们实施的具体措施，这些措施可以确保在放射科进行磁共振检查时，危重患者得到了最为细致的照顾与安全保障：

1. 无磁监护仪的应用

配备了先进的无磁监护仪，这一措施保障了成人和小儿患者在检查期间血压、脉搏及血氧饱和度的实时监测。特别是对于危重患者，我们始终保持着密切的生命体征监测，以便随时应对可能发生的突发情况。

2. 专用患者搬运软担架的使用

配备专用患者搬运软担架，这在所有卧床患者进行磁共振检查时起到了至关重要的作用。卧床患者的搬运均必须使用专用担架，以保证患者在搬运过程中得到最大程度的舒适与安全。

3. 无磁担架的应用

配备了无磁担架，主要用于脊柱、脊髓损伤患者检查期间的搬运。

4. 无磁轮椅的使用

针对下肢行动不便的患者，配备了无磁轮椅，主要用于磁共振检查期间的搬运。这一措施极大地提升了患者的舒适度，同时也为医护人员的工作提供了便利。

5. 安全约束带的应用

为了防止肌力较弱或躁动的患者在检查期间出现安全隐患，配备了安全约束带。这一装置在保障患者安全的同时，也为医护人员提供了可靠的保障。

6. 无磁氧气罐的配备

鉴于氧气袋压力和存氧量有限的情况，特别是在检查部位相对较多时，科室配备了无磁氧气罐，以保证危重患者在检查期间能够获得足量的氧气供给，确保了患者的安全。

通过这一系列综合措施的实施，我们科在危重患者管理中的精细化护理模式得到了充分的应用。这些综合措施的实施不仅能够全面了解患者的身体状况，也确保了在检查过程中能够随时应对患者的突发情况。因此，我们在影像安全管理的水准上迈出了坚实的一步，为危重患者的安全保障提供了可靠的基石，旨在科技与人文关怀相结合的基础上，为每一位患者提供最贴心与专业的服务。也为

放射科医护团队的日常工作提供了有力支持。我们深信,在精细化护理模式的不断优化下,我们将能够进一步提升危重患者的安全管理水准,为医疗服务的质量和效率贡献更大的力量。

PO-3590

基于一体化信息集成平台的医学影像检查预约服务模式创新管理

汪祝莎
武汉大学中南医院

[摘要] 目的 创新医学影像科检查预约模式,建设一体化信息平台并优化管理模式,满足临床及患者需求。方法 应用一体化信息系统平台,根据医院临床需求在检查预约管理、检查项目管理、冲突规则设置、排班管理、基础信息管理等方进行优化和完善,并在系统平台上设置相应的管理模块,建立适用于一体化信息系统平台的影像检查预约分诊流程和管理模式。结果 借助一体化信息系统平台,科学设计预约分诊流程,开发完善电子预约检查申请模块,优化的预约登记流程和管理模式,根据检查项目的特殊及目的性优化安排先后顺序。结论 通过系统的实施,有效降低患者窗口排队时间、多项目检查往返医院次数及在医院检查等待时长,为患者提供优质服务的同时节省人力资源成本。

PO-3591

《PDCA 循环在提高盆腔增强检查前肠道准备完备率中的应用效果》

陆春花
宁波市第二医院

目的 回顾我院 2022 年 1 月-5 月放射科数据统计显示,盆腔 CT 和 MRI 增强检查因未进行肠道准备及准备不合格造成延迟检查的例数 252 例。为此确定运用 PDCA 管理模式去改善上述现象,分析 PDCA 循环模式在提高盆腔增强检查前肠道准备完备率中的应用效果。

方法 选取 2022 年 6 月 1 日-6 月 30 日,前来放射科做盆腔增强检查的患者 120 例(排除因造口、造瘘、急腹症等不能或无需肠道准备的患者)作为对照组,进行问卷调查并结合影像图像后得出改善前肠道准备完备率。根据 PDCA 管理模式运用鱼骨图分析原因,并根据原因拟定对策,对策包括统一宣教内容、对宣教人员进行同质化培训、制作健康宣教单、完善检查的流程、设置检查前短信微信温馨提醒等。对策实施后选取 2022 年 9 月 1 日至 9 月 30 日,前来放射科做盆腔增强检查的患者 120 例(排除因造口、造瘘、急腹症等不能或无需肠道准备的患者)作为观察组,进行调查问卷及结合影像图像计算肠道准备完备率。结果 应用 PDCA 管理模式后得出观察组检查前肠道准备的完备率为 93.3%,明显高于改善前(50.8%),差异有统计学意义($P<0.05$)。结论 应用 PDCA 管理模式提高了我院盆腔增强检查前肠道准备的完备率,提升了影像图像的精准度,减少了患者因肠道准备不充分造成患者延迟检查而引起患者的不满,减少了患者重复检查所造成的不必要辐射与检查费用。提高了放射科的护理质量也得到了患者的认可,提升了患者的满意度,并降低了医患纠纷的发生率。

PO-3592

《基于钉钉平台放射科护理交班日志模板的构建和应用》

陆春花
宁波市第二医院

【摘要】 目的 探讨钉钉平台日志模板在放射科护理交班中的应用效果。方法 采用文献查询、管理组会议等方法,根据放射科临床需求及现有的护理班次自行构建 15 个日常交班模板,4 个不良事件交班模板,日常交班模板项目包括各岗位的工作量、科室对比剂库存、有无不良事件发生、机器设备运行情况、急救仪器设备保养维护、各区域 6S 完成情况及其他需要交班的内容等;不良事件交班模板项目包括患者资料、检查相关信息、患者出现症状及处理过程、随访等。通过护理组长通过访谈护士对交班日志的使用感受,收集交班日志使用后不良事件发生率,评价清单应用效果。结果 科内 16 名护理人员 (94.1%)认为使用钉钉交班日志模板方便、快捷;科内 15 名护理人员(88.2%)认为日志模板设计合理,内容全面,能快速完成相关内容的填写并提交,高效、方便;使用钉钉交班日志模板后,能实时反馈科室每个区域的工作情况,同时给护理人员带来正性使用感受。结论 借助钉钉平台的护理交班日志模板实现了数据自动保持及共享,优化了护理环节质控流程,提高了放射护理质量,便捷了护士交班工作,节约了时间,提高了工作效率,取得良好应用效果,值得推广借鉴。

PO-3593

个性化护理模式对老年肿瘤放射治疗影响的研究进展

韦昕廷
陕西中医药大学

目的 随着全球人口老龄化的加剧和医疗技术的不断发展,老年人肿瘤患者的放射治疗需求也逐渐增加,然而,老年肿瘤患者往往存在多种疾病,身体状况较为脆弱,对放射治疗的反应也较为复杂和不稳定,个性化护理在老年肿瘤患者放射治疗中显得尤为重要,因此本文将探讨个性化护理在老年肿瘤患者中的应用效果。方法 采用文献回顾的方法总结国内外个性化护理对老年肿瘤患者身心乃至家庭等各个方面的影响。结果 国内外多种干预研究结果表明,个性化护理模式对老年肿瘤放射治疗患者的营养状态、生活质量、免疫功能、依从性、护理满意度等有积极影响,同时还能降低不良反应发生率、减轻焦虑、抑郁情绪等。结论 在老年肿瘤病人的放射治疗中应用个性化护理,可以有效改善患者身体、心理和社会关系,减轻疾病给患者带来的痛苦,并且可以促进医患关系的和谐发展,有较大的临床推广价值。

PO-3594

放射科护士急救事件应急能力水平及影响因素分析

周鸿怡
四川大学华西天府医院

目的: 调查成都市某三甲医院放射科护士急救事件应急能力水平,并探讨影响因素。
方法: 2023 年 1—2 月对成都市某三甲医院 25 名放射科护士进行问卷调查,采用单因素和多元线性回归分析影响放射科护士急救事件应急能力的因素。
结果: 多元线性回归分析结果显示,急救应急演练频率和是否处理过急救事件是放射科护士急救事件应急能力的主要影响因素($P<0.05$),其中急救应急演练频率高,处理过急救事件的护士应急能力相对较高。92%以上的放射科护士认为有必要开展突发急救应急演练和应急培训。

结论：成都市该三甲医院放射科护士急救事件应急能力处于较高水平，应急演练频率和是否是否处理过急救事件是放射科护士急救事件应急能力的主要影响因素。护理管理者应采取针对性的应急演练和培训，以全面提高放射科护士的应急能力。

PO-3595

多层螺旋 CT 血管成像在下肢动脉闭塞检查中的护理干预与配合

夏琴
四川省骨科医院

【摘要】目的 探讨下肢动脉多层螺旋 CT 血管成像检查中的护理配合及干预方法，保证检查的顺利完成。方法 回顾性分析 2021 年 12 月于我院行双下肢动脉造影的下肢动脉闭塞患者 98 例，对检查过程中的护理方法与干预措施进行总结分析。结果 98 例患者均穿刺成功，注药顺利，达到 CT 诊断要求。2 例患者因轻度过敏反应，局部身体运动造成部分层面显示不佳，但不影响诊断，其余患者均获得满意的重建图像。结论 多层螺旋 CT 血管造影是目前诊断下肢血管性疾病的重要且有效手段，正确及时的护理干预是减轻患者痛苦，避免过敏反应，保证检查成功，获得具有诊断价值的高质量图像的重要措施。

PO-3596

The endorsement of general and artificial intelligence reporting guidelines in radiological journals: a meta-epidemiologic study

Jingyu Zhong¹, Yue Xing¹, Huan Zhang², Weiwu Yao¹
1. Tongren Hospital, Shanghai Jiao Tong University School of Medicine
2. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objectives: To investigate the endorsement of reporting guidelines in radiological journals and explore associated journal characteristic variables.

Methods: This meta-epidemiologic study screened journals from the Radiology, Nuclear Medicine & Medical Imaging category, Science Citation Index Expanded of the 2022 Journal Citation Reports, and excluded the journals not publishing original research, in non-English languages, and instructions for authors unavailable. The endorsement of fifteen general reporting guidelines and ten artificial intelligence reporting guidelines was rated using a five-level tool: positive active, positive weak, passive moderate, passive weak, and none. The association between endorsement and journal characteristic variables was evaluated by logistic regression analysis.

Results: Our study included 117 journals. The top-five endorsed reporting guidelines were CONSORT (Consolidated Standards of Reporting Trials, 58.1%, 68/117), PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses, 54.7%, 64/117), STROBE (STrengthening the Reporting of Observational Studies in Epidemiology, 51.3%, 60/117), STARD (An Updated List of Essential Items for Reporting Diagnostic Accuracy Studies, 50.4%, 59/117), and ARRIVE (Animal Research Reporting of In Vivo Experiments, 35.0%, 41/117). The most implemented artificial intelligence reporting guideline was CLAIM (Checklist for Artificial Intelligence in Medical Imaging, 1.7%, 2/117), while other nine artificial intelligence reporting guidelines were not mentioned. The Journal Impact Factor quartile and publisher were associated with the endorsement of reporting guidelines in radiological journals.

Conclusions: The reporting guideline endorsement are suboptimal in radiological journals. The implementation of artificial intelligence reporting guidelines was extremely low. Their adoption should be strengthened to facilitate quality and transparency of radiological study reporting.

PO-3597

Use of virtual simulation-based training platform on thyroid ultrasonography in medical students: a randomized control trial

Xiaokai Mo

First Affiliated Hospital of Jinan University

Objectives: To compare the impact of virtual reality (VR) simulation teaching with traditional teaching methods on thyroid ultrasonography skills in medical students.

Methods: A total of 106 medical students who had finished basic medical courses were recruited and randomized to VR group and control group. All participants received 2 theoretical lessons, then followed by a practical class. The control group had traditional PowerPoint (PPT) teaching to learn the thyroid ultrasonography process, while VR group studied the complete process via the VR simulation platform after PPT teaching. All students took a skill examination to evaluate their performance after two weeks. They were scored by 2 examiners who were blinded to group assignment on the global rating scale of ultrasonography, with a total score of 40 points for 8 components. A month later, all participants were required to complete the thyroid ultrasound examination on the VR platform.

Results: Ninety-one students completed the program (VR group, n=47; control group, n=44). The score of VR group (median, 32.5; interquartile range [IQR], 29.5-35.0) outperformed the control group (median, 31.0; IQR, 27.5-33.0, p=0.028) on the global rating scale of thyroid ultrasound examination. Meanwhile, students in the VR group (mean score, 51.5; time, 16.2min) demonstrated better performance and less time than the control group (mean score, 44.3; time, 23.7min) when assessed in the VR platform.

Conclusions: The VR simulation platform of thyroid ultrasound examination demonstrated good performance in skill training for medical students, making it an alternative or additional approach to traditional teaching patterns in medical education.

PO-3598

The Application of Heuristic Teaching Method in the Practice for Qualified Professional Personnel of Medical Imaging

Chunyu Liang,Xinping Shen

The University of Hong Kong-Shenzhen Hospital

[Abstract] **Objective** To explore the practice of heuristic teaching film reading, strengthen the theoretical knowledge and clinical practice ability of medical imaging residents, and improve the teaching quality of standardized training for medical imaging residents. **Methods** Teaching film reading was carried out around a case of children's posterior cranial fossa rich blood supply space occupying lesions. In the teaching activities, specific and highly operational teaching objectives were set, with medical imaging residents as the center. Through a series of hierarchical classroom questions, residents were guided to actively think and express, and their thinking ability, understanding and application ability were cultivated. In this process, the students' thinking ability has been trained. After the teaching activities, the resident doctors and other teachers at the same level are invited to rate the teaching effect. **Results** The atmosphere of teaching film reading was active, the teachers set up hierarchical and progressive questions, the residents had a high

degree of participation, actively answered questions, the interaction between teachers and students was good. After the teaching film reading, the feedback evaluation form is distributed in the form of electronic questionnaire to the regular training and teaching WeChat group. The teaching activity is evaluated from the aspects of teaching content, status, attitude, etc., and the teaching activity got a high score. Conclusion The heuristic teaching film reading in medical imaging department is operable, scientific and effective, which is helpful for residents in medical imaging department to improve their post competency.

PO-3599

STAR continuing education training model to enhance the scientific research ability of young imaging technicians

Qin Wang, Hehan Tang
West China Hospital, Sichuan University

Objective

To explore the reform of the training mode of radiology technicians, so as to improve the scientific research ability of young radiology imaging technicians.

Materials and Methods

Since December 2015, a series of measures aimed at improving the scientific research ability of young imaging technicians have been implemented in the Radiology Department of West China Hospital of Sichuan University, mainly including: Subprofessional group training、Tutor responsibility、Arrangement of research time and Reading-film session of technologists, known simply as the STAR mode.

Results

- ① In terms of paper publication, the total number of papers published as first author or co-first author by young technicians (≤ 40 years old) in our hospital has increased significantly, from 8.25 papers/year from 2012-2015 to 31.83 papers/year from 2016-2021, with an average annual increase of 285.82%. English SCI papers completed the "zero" breakthrough, increasing from 0 in 2012-2015 to 52 in 2016-2021, accounting for 27.23% of the published papers in the past six years.
- ② In terms of project fund application, the number of provincial and municipal projects approved by young technicians as the person in charge increased from 0.5 per year from 2012-2015 to 2 per year from 2016-2021, with an average annual increase of 300%.
- ③ In terms of patent applications, the number of patents granted to young technicians as first inventors increased from six in 2012-2015 to 71 in 2016-2021, an average annual increase of about seven times.
- ④ In terms of speaking at international conferences, the number of young technicians speaking at conferences also increased from 9 in 2012-2015 to 58 in 2016-2021.

Conclusion

STAR continuing education training mode can help young radiologists quickly improve their scientific research ability and speed up the process of training comprehensive imaging technicians.

PO-3600

MBO 理念下导师制联合定向提升带教的放射科新护士培训

程伊莲、程琳、胡静

陆军军医大学第一附属医院（西南医院）

目的:探讨 MBO 理念下导师制联合定向提升带教的放射科新护士培训效果。

方法:对 2020 年-2022 年某医院放射科新入职护士 11 人进行阶段式实践培训,基于 MBO 理念通过制定目标-实施目标-检查实施结果三个步骤实施培训,并制定筑牢基础-巩固提升-综合融通三个阶段的教学培训方案。第一阶段采用一对一“跟班式”导师带教,将标准化、同质化教学的教学内容以思维导图的方式构建,同时也根据学生的具体情况落实个性化教学方案。第二阶段采用一对一“搭档式”导师带教,保证临床工作正常运转,并基于临床特殊案例进行即时教学。第三阶段采用急危重症救治能力定向提升带教,利用医院资源与临床科室实施联合带教,将新护士分批次送到抢救室,中心 ICU 以及各专科监护室轮转学习。用理论考核、技能考核及护士核心能力自评量表比较培训前后的理论、技能和岗位胜任能力得分。

结果:培训后理论、技能和岗位胜任能力,均高于规范化培训前,差异有统计学意义($P<0.05$)。

结论:基于 MBO 理念实施的导师制联合定向提升带教新护士培训取得了较好的成果,使教学目标明确且更具针对性,利于提高专项技术核心能力,拓宽专业视野,引领新护士全面正向的提升,从而提高了培训的质量和效率,解决了工学矛盾,也促进其职业认同感的提升。

PO-3601

以核心效能为导向的放射科护理教师培训模式改革与实践

程琳

陆军军医大学第一附属医院（西南医院）

目的:以核心效能为导向改革放射科临床护理教师的培训培训模式,为提升临床护理教学效果奠定基础。

方法:选择 20 名有带教资格的护士进行教学能力培训,以核心效能为为导向,以“健康中国 2030”人才培养质量要求为指导,通过评估培训需求、文献分析,设计并实施临床护理教师教学能力培训项目。培训项目包括职业素养、专业能力、教学方法、教学技能、教学管理、教学科研六个维度。;并基于柯式模型构建评价方案,包括反应层面(教员对培训工作的满意度及意见建议)、学习层面(教教员对此次教学知识和技能的获得程度)、行为层面(教员的的教学行为表现)、结果层面(核心能力评价、被带教者对临床教学质量的评价)。比较培训前后临床护理教师教学能力。

表 1 以核心效能为导向教学能力培训方案

表 2 培训效果评价方案

结果:培训后,护理组长的教学设计能力、理论及操作授课能力、综合教学能力评分显著高于培训前($P<0.05$, $P<0.01$)。

结论:以核心效能为导向的放射科临床护理教师培训模式在方案设计上注重教师在多项教学能力指标上的提升,在改革实施上强调护理教师在“教”与“学”两个方面的参与体验,在实施形式上开展线上结合线下多维度的尝试,获得良好的培训效果。该模式有利于改善培训效果,提高培训效率,优化培训效益。

肿瘤专科医院影像科基于目标绩效管理方案的探讨

盛浏丽
江苏省肿瘤医院

近年来,肿瘤专科医院临床工作的效率逐渐下降,究其原因主要是影像科工作效率的低下导致。故而以资源为基础的相对价值系数(resource-based relative value scale, RBRVs)方法被作为核心理念,影像科单独的工作量统筹计算作为目标绩效管理方案,同时不断更新,并对 ECT 室进行单独的工作量统计,对放射以及 CT 室给予积极的支持。通过实施此方案,可以最大限度的完善奖励和惩罚机制,以此来保护和约束影像科医务工作者。通过初步的实施及探讨,肿瘤专科医院影像科整体工作效率明显提升,成本方面也得到大大的改善,影像科发展也逐渐扩大。由此可见,我们的方案得到充分的证明,并且是合理合规,能够最大限度的实现影像科医务工作者的价值,同时也能整体提升科室和医院的水平。

基于知识转化模型的心脏磁共振技术扫描教学方法研究

孙峥、卢洁
首都医科大学宣武医院

目的:基于知识转化模型(Knowledge-to-action, KTA)探讨心脏磁共振(Cardiac magnetic resonance, CMR)扫描技术的教学方法与临床应用价值。方法:本研究以传统多媒体教学模式为对照组,通过知识产生和知识应用两个重要环节,建立基于知识转化模型教学课程。实验组与对照的纳入为 2021-2023 年我院医学影像技术专业 28 名本科生,两组分组培养后再行交叉培养,教学质量考核结果与满意度评价以独立样本 t 检验或卡方检验进行统计比较。结果:两组学生分别完成 25 例患者的 CMR 数据采集,全员参与率 100%。KTA 组在心肌组织特征识别环节中以 2.21 ± 0.13 学时,较对照组 2.45 ± 0.18 学时显著缩短($t=-2.95, P<0.05$),并取得优异测试成绩(KTA: 8.90 ± 2.10 分 vs. 对照组: 8.30 ± 1.80 分, $t=1.78, P<0.05$); KTA 组在心脏扫描定位,CMR 整体流程把控上成绩学时比低于对照组(5.93 ± 0.06 vs. 5.36 ± 0.10 , $t=-2.98; 13.02\pm1.32$ vs. 8.27 ± 0.97 , $t=-6.23, P<0.05$)。KTA 组学生的学习兴趣(9.3 ± 0.5 分)、临床自评(8.5 ± 0.4 分)、科研能力自评(9.1 ± 0.6 分)分数较高($\chi^2=4.69, 3.61, 3.86, P<0.05$),以及带教教师的评价显著占优($P<0.05$)。结论:KTA 模型可激发学生自主学习能动性,与传统教学模式相互补充,适度交叉,可凝练出最佳教学策略。

PO-3604

费曼学习法在应用于放射科住院医师规范化培训上消化道造影教学的可行性研究

钟京谕¹、陈海荣¹、谢英遂¹、闵庆华¹、朱才松¹、张欢²、姚伟武¹
1. 上海交通大学医学院附属同仁医院
2. 上海交通大学医学院附属瑞金医院

目的:探索费曼学习法(Feynman technique)应用于放射科住院医师规范化培训上消化道造影(upper gastrointestinal radiography, GI)的可行性。

方法:研究纳入了 5 名未体验过费曼学习法的住院医师,其中住培第一年住院医师 2 名,住培第二年 2 名,住培第三年住院医师 1 名。在指导医师的监督下,依据费曼学习法开展上消化道造影的理

论和实践教学活动。费曼学习法由四个步骤组成,包括确定目标、模拟教学、回顾反馈和简化归纳,其中模拟教学是其中中心环节,“以输出驱动输入”是其核心要义。本研究开展的理论和实践教学活均遵循确定目标、模拟教学、回顾反馈和简化归纳四个步骤。教学结束后,对住院医师开展问卷调查,评估费曼学习法与住院医师过往的学习经验之间的差异,师生共同讨论费曼学习法在教学过程中的问题和价值。

结果:教学实践表明,与住院医师过往的学习经验相比,费曼学习法具有以下潜在益处。(1)住院医师参与理论和实践教学的热情:费曼学习法比单纯观摩明显提高了教学的参与感,提高了住院医师将来自主开展 GI 检查的信心;(2)弥补实践机会不足问题:随着胃镜检查的普及,现今选择 GI 检查的患者数量有限,这一方法比传统观摩教学的简单重复更充分地利用了有限的教学资源。

(3)有助于培养住院医师的“软实力”:这一系列的教学活动可以直接锻炼住院医师在沟通合作、教学能力、终身学习方面的“软实力”,填补了目前放射科住培教学过程中的短板。然而,费曼学习法仍然存在教学准备较为繁琐,对指导医师相关知识要求较高等问题。

结论:费曼学习法在放射科住院医师规范化培训上消化道造影教学中具有可行性,有望取得较好的教学效果,但仍需要开展更大规模的对照研究加以验证。

PO-3605

我国放射科住院医师规范化培训研究热点和趋势的可视化分析

钟京谕¹、星月¹、胡扬帆¹、闵庆华¹、朱才松¹、张欢²、姚伟武¹

1. 上海交通大学医学院附属同仁医院

2. 上海交通大学医学院附属瑞金医院

目的:通过对我国放射住院医师规范化培训(简称住培)发表的文献进行数据可视化分析,探讨放射科住培的研究热点和趋势,以期开展放射科住培相关研究提供参考。

方法:检索中国知网数据库 2013 年 1 月至 2023 年 6 月收录的放射科住院医师规范化培训相关文献,并采用中国知网的分析功能及 CiteSpace 软件对发文时间、作者、机构、期刊以及关键词进行可视化分析。

结果:本研究采用检索式:TKA=“放射+影像”AND TKA=“住院医师规范化培训+住培”进行高级检索得到 385 篇文献,人工浏览筛选共纳入 217 篇文献进入后续分析。相关文献发文量呈逐年上升的趋势,近年来每年发文量稳定在 30 篇左右。研究机构和作者主要来自高等医学院校附属医院。研究机构之间的合作联系十分松散,主要是各高等医学院校的附属医院,研究合作主要局限于同一医院内部的各个科室,不同医院之间的合作罕见。研究者间缺乏交流合作,研究团队内部的合作较为频繁,但研究团队之间的交流合作较为罕见。关键词频数排在前三位的为住院医师(76 篇)、放射科(46 篇)和教学(19 篇),中心性排在前三位的为住院医师(0.60)、放射科(0.30)、教学(0.17)。关键词聚类 and 突现词图谱提示,发现教学改革和核心胜任力是长期受到关注的研究热点,住培管理的研究可能是未来新的趋势,可以重点关注的领域包括以核心胜任力为抓手的教学理念转变、以住院医师为中心的教学方法改进和以长效管理为重点的教学制度改革。

结论:虽然我国放射科住培教学研究已有长足发展,但仍需要引导研究者和研究机构开展合作,以期产出高水平、可推广的成果,从而提升放射科住培质量,培养更多合格的放射科住院医师。随着放射科住培制度逐渐稳定,研究热点可能从制度的草创建设转向长效管理,与之对应的教学模式和方法仍需不断创新。

PO-3606

角色互换教学融合 PDCA 循环在放射科教学阅片中的应用研究

刘春华、袁永康、程诚、毛怡
陆军军医大学大坪医院

目的 探讨角色互换教学融合 PDCA 循环在放射科教学阅片中的应用及效果评价。**方法** 选取 2020-2022 年在陆军军医大学大坪医院放射诊断科参加住院医师规范化培训(以下简称住培)的 28 名学员作为实验组; 2017-2019 年参加住培的 21 名学员作为对照组。实验组采用角色互换教学融合 PDCA 循环模式, 对照组采用传统教学法, 比较两组的教学效果。**结果** 实验组的理论考核成绩 (86.11 ± 4.52) 高于对照组 (81.42 ± 4.23), 差异有统计学意义 ($P < 0.05$); 实验组的实践能力考核成绩 (91.27 ± 5.12) 显著高于对照组 (83.3 ± 5.31), 差异有明显统计学意义 ($P < 0.01$)。实验组在提高学习效率、自学能力、文献查阅能力方面优于对照组, 差异有统计学意义 ($P < 0.05$); 在提高学习兴趣、教学能力、交流沟通能力、团队合作能力、临床思维能力方面明显优于对照组, 差异有明显统计学意义 ($P < 0.01$)。**结论** 角色互换教学融合 PDCA 循环是一种全新的教学模式, 在放射科教学阅片中具有较好的实用性, 值得在实践教学推广应用。

PO-3607

布鲁姆学习目标分类法在影像科实习护生周计划教学中的应用效果

邱晓、何洪林
重庆医科大学附属第二医院

目的 探讨布鲁姆学习目标分类法在影像科实习护生周计划教学中的应用效果。**方法** 收集 2021 年 7 月-2023 年 7 月某大型三甲医院影像科的 140 名护生为研究对象, 随机分为对照组和观察组, 每组各 70 例。对照组行传统周计划教学带教, 对照组行以布鲁姆目标分类法(识记、理解、运用、分析、综合、评价)为导向并结合影像科周计划教学带教。比较两组的出科理论成绩、操作成绩及教学满意度。**结果** 两组护生出科理论成绩, 观察组为 (94 ± 5.5) 分高于对照组 (83 ± 6.5) 分, 比较有统计学意义 ($P < 0.05$); 两组护生出科操作成绩, 观察组为 (95 ± 4.5) 分高于对照组 (84 ± 7.5) 分, 比较有统计学意义 ($P < 0.05$); 两组带教老师对护生教学满意度, 观察组为 (93 ± 6.5) 分高于对照组 (80 ± 7.5) 分, 比较有统计学意义 ($P < 0.05$); 两组护生对带教老师教学满意度, 观察组为 (94 ± 4.5) 分高于对照组 (86 ± 7.5) 分, 比较有统计学意义 ($P < 0.05$)。**结论** 通过以布鲁姆目标分类法循序完成周计划教学在影像科实习护生带教实践, 培养护生的对影像护理知识不断探索, 提升护生学习积极性, 提升临床教学质量; 同时也提高带教老师的责任心, 提高了学生对带教老师的满意度。

PO-3608

安宁市紧密型医共体与“千县工程”下医学影像中心构建模式

王世平¹、刘再强¹、金永明¹、李晓斌²
1. 安宁市第一人民医院
2. 安宁市中医医院

目的: 探讨安宁市紧密型医共体与“千县工程”下影像诊疗中心构建模式。**方法:** 1、收集国家及政府关于紧密型医共体与“千县工程”下医学影像中心相关政策支持; 2、紧密型医共体与“千县工程”下医学影像中心建设的前期筹备; 3、紧密型医共体与“千县工程”下医学影像中心建设的现状; 4、

医学影像中心建设的未来规划。结果：1、国家政策各级政府的支持，《国务院办公厅关于推进医疗联合体建设和发展的指导意见》；《国家卫生健康委办公厅关于印发“千县工程”县医院综合能力提升工作方案（2021-2025 年）的通知》；《云南省人民政府办公厅关于推进医疗联合体建设和发展的实施意见》；《关于推进医联体医共体建设和发展的实施意见》；《国家卫生健康委办公厅关于印发“千县工程”县医院综合能力提升工作方案（2021-2025 年）的通知》；2、组织中心骨干成员人员赴国内深圳模式医学影像中心进行考察学习；多次组织中心人员前期筹备培训会议；多次组织中心人员建章立制的讨论会，并建立区域影像诊疗中心章程、制度 189 条，影像中心质控体系建立。3、2019 年 5 月安宁市紧密型医共体下区域影像诊疗中心正式挂牌，初步建立医学影像中心模式：医学影像中心信息网络互通，下至乡镇卫生院及社区卫生服务中心，实现信息系统资源共享；影像中心人员及绩效系统整合；设备统一管理；4、成效：（1）影像检查结果互认，减少重复检查；（2）充分利用医共体直通车，实现 3 院区影像检查互通，设备得到高效应用；（3）成立了“医共体外周血管及综合介入诊疗中心”，安宁区域相关患者集中救治；（4）移动 CT 检查定时下基层，避免设备重复投资；（5）组建区域影像诊疗中心科研及教学团队；（6）联盟医院业务扩展，目前已联网 8 家联盟医院，实现影像资源互通；5、医学影像中心建设的未来规划，加强中心内涵建设，扩大区域影像辐射范围，目前建设的南亚及东南亚远程影像中心，已联网泰国拉察威提综合医院及缅甸地区医院，拟申报国家项目。结论：安宁市紧密型医共体与“千县工程”下医学影像中心模式的构建，实现资源共享，本区域的医疗资源得到健康发展，使人民群众共享同质化、均等化的医疗卫生服务。

PO-3609

医学影像技师规范化培训在毕业后教育中的意义

吕鑫一

重庆市江津区第二人民医院

医学影像技术专业目前在我国设立时间较短，医学影像技术人才的培养还在摸索中，没有明确的培养体系和方法。但是，现阶段全国已有数家医院开展了医学影像技术规范化培训，本文仅以重庆医科大学附属第一医院医学影像技师规范化培训体系为例，探讨医学影像技师规范化培训在毕业后教育中的意义。

1. 培养具有责任感，专业能力过硬及良好的岗位胜任能力的医学影像技师。随着医学影像技术的发展，院校课程更新缓的兴趣，进一步为日后的临床工作和求学打下科研的基础。
2. 管理能力的培养。重庆医科大学附属第一医院对规培技师进行轮流做小组长的管理办法，在带教老师的指导下，在科室进行放射科设备机长的推荐与选拔慢，甚至发生脱节，部分院校未开设相关的人文关怀课程及 CT/MRI 相关的诊断课程，导致毕业生的岗位胜任能力不足，无法快速适应与临床相关的工作。让每一位规培技师得到管理经验的锻炼。重庆医科大学附属第一医院采用线上线下相结合的方式，主要以分时间理论考试，讲-影像技术，影像黄金瞳等课程，辅以规培技师讲座等相关方法，培养规培技师的理论知识及人文关怀。实践是检验真理的唯一标准，在理论学习的同时，由各高年资教师对规培技师进行上机指导，放手不放眼，且对实践培训进行分段考核，确保规培技师能够独立上岗直至胜任临床相关工作。
3. 医学影像技师科研能力的培养。重庆医科大学附属第一医院放射科遴选出具有相关带教经验，精力充沛且理论知识扎实的科研导师，与规培技师进行双向选择，进行相关的科研工作。从科研方向的确立，数据的搜集，直到统计学分析，文章的撰写等，由科研导师一对一指导。医学影像技师若想成为相关领域的佼佼者，不仅局限于机器的操作，更应带着问题去分析，思索，探讨以至发展为科研工作，规培技师可以通过自我报名后进行筛选，逐步成为某台设备的机长，在技师长的带领下对相关设备进行管理。在此基础上，通过实行管理过程后自我评价，同事评价及带教老师评价，衡量管理能力的提升与否。在重医附一院放射技师规范化培训的过程中，注重对规培技师管理能力的培养，培养规培技师向优秀的技师长发展。

武汉协和医院放射科管理经验浅谈

郑传胜

华中科技大学同济医学院附属协和医院

为进一步推进放射科学学科建设,规范和加强学科的建设与管理,以管理促质量,以管理促优质服务,以管理促发展,协和医院放射科实行以分级指标为评价标准和策略制定依据的全方位、综合性管理方法。分级指标包含 5 个一级指标、10 个二级指标和 15 个三级指标,以一级指标为纲要,逐渐细化,分别从领军人才、学术任职、人才培养、梯队建设、重点实验室及平台、学术论文、科研获奖、行业标准指南及共识情况、专利转化与新药研发、科研项目、医疗总体水平、学科方向及特色、社会服务特色与贡献、复旦排行榜、中国医院科技量值 15 个方面对科室进行全方位评价,具体评价由党委、纪委、科研处、人事处、人才办、医务处、研究生科及教学办公室等医院行政管理部门完成。科室再根据评价结果,结合实际情况细化下一步工作目标和方向,合理布局,逐个突破,循环往复。经过 5 年不懈的努力和实践,放射科排名跃升为协和医院 A 类学科,实现了重点项目、高分高引文章、国际指南、医疗总体水平满分、全国高校青年教师教学竞赛一等奖、全国五一劳动奖章的历史性突破。实践证明,以促发展为指导思想、以分级指标为脉络的全方位管理方法有效提高了科室医、教、研等各方面的水平,促进了学科建设和全面发展。

PO-3611

胸腹主动脉混合现实技术在 Stanford A 型主动脉夹层中的临床应用

李冠、麦筱莉、秦国初、张冰
南京鼓楼医院

目的 探究胸腹主动脉混合现实 (mixed reality, MR) 技术和计算机断层血管造影 (computed tomography angiography, CTA) 技术在 Stanford A 型主动脉夹层中的临床应用价值。方法 前瞻性收集拟行胸腹主动脉 MR 和 CTA 检查的患者 80 例,随机分为组 A (胸腹主动脉 MR 组) 和组 B (胸腹主动脉 CTA 组)。将组 A 生成的 CTA 数据导入至可视化三维 (three-dimensional, V3D) 建模软件进行 3D 建模,并完成 MR 结果发布;组 B 则进行胸腹主动脉 3D-CT 重建技术。采用独立样本 t 检验对两组患者一般资料进行分析。两组计数资料采用 χ^2 检验;等级资料采用 Wilcoxon 检验。Kruskal-Wallis 检验用于比较连续变量。评价者的主观一致性评价采用 Kappa 检验。对两组的围手术期指标和临床应用价值进行比较。结果 两组在年龄、体重、身高、性别、身体质量指数、高血压、心血管疾病、脑血管疾病、糖尿病和 DeBakey 分型指标上无明显差别 (均 $P > 0.05$)。组 A 在“手术时间、体外循环辅助时间、主动脉阻断时间、选择性脑灌注时间和术中血浆输注”指标上较组 B 分别减少约 15%、24%、20%、20%、22%和 20%。组 A 在“手术方案制定、术中实时导航、远程会诊和医患沟通”四方面的临床应用价值进行主观评分均高于组 B (均 $P < 0.05$)。结论 胸腹主动脉 MR 技术在急性 Stanford A 型手术治疗上,较腹主动脉 CTA 技术相比,可更有效的改善围手术期指标;并进一步证实胸腹主动脉 MR 技术的临床应用价值。

PO-3612

利用增强现实技术辅助肝胆系统 PBL+CBL 影像学教学

高翯¹、李任鹏²、杨柳¹、汪晶¹

1. 华中科技大学同济医学院附属协和医院
2. 武汉联影智融医疗科技有限公司

目的 由于肝胆系统解剖结构复杂, 医学生在学习相关内容时往往不容易理解病变与邻近解剖结构的关系。最近出现的增强现实 (Augmented Reality, AR) 技术可将传统的二维 CT 或 MRI 图像转变为真实空间内的可视化实体, 除了能够使医学生全方位感知各种解剖结构在三维空间上的毗邻关系外, 还可以用虚拟的方式提供直接与各种解剖结构进行互动的途径。这一新兴技术丰富了影像学信息的展现方式, 理论上可以增强医学生对复杂解剖结构的理解与认知。本研究尝试在肝胆系统影像学 PBL+CBL 教学 (PBL: 基于问题的教学法, problem-based learning; CBL: 基于病例的教学法, case-based learning) 中应用增强现实技术, 评估该技术对教学效果的影响。

材料与方法 选取 2023 年 6 月-7 月间在华中科技大学同济医学院第一临床医学院临床实习的影像专业本科 40 名, 随机平均分为实验组 (n=20) 与对照组 (n=20)。在实验组中, 教师将肝胆系统病例利用 AR 技术进行展示, 并探讨相关问题。在对照组中, 对相同的病例, 以传统方式进行教学。教学结束后, 让实验组和对照组学生填写随堂发放的无记名问卷评分量表。量表尝试从学习兴趣程度、认知负荷、技术接受度三方面来评估学生的学习效果。运用 Prism8.0 对实验组及对照组的问卷调查评分进行统计分析。

结果 在兴趣程度评价方面, 实验组与对照组在关于学习兴趣的问题上存在显著性差异。在认知负荷评价方面, 实验组与对照组在降低认知负荷上有显著性差异。教学接受度方面, 参与的学生整体上认为 AR 技术有助于学习质量的提升。

结论 增强现实技术在一定程度上有助于提升肝胆系统的影像学教学质量, 在今后影像学教学中存在潜力。

PO-3613

基于增强现实技术的多模态影像融合在本科医学生教学中的应用

杨柳¹、高翊¹、李任鹏²、汪晶¹

1. 华中科技大学同济医学院附属协和医院
2. 武汉联影智融医疗科技有限公司

目的 研究基于增强现实 (Augmented Reality, AR) 技术辅助的脑部多模态磁共振重建与融合的认知学习在本科临床医学生中的应用效果。

方法 选取华中科技大学同济医学院影像专业临床实习学生 40 名为研究对象, 随机平均分配至观察组和对照组。教师以临床真实胶质瘤病例为基础, 利用武汉联影智融医疗科技有限公司规划软件对原始 T1/T2-Flair、DTI、BOLD 磁共振序列 DICOM 数据进行重建与融合, 实现病灶及周围解剖结构的三维可视化, 直观展现颅内病变、纤维束、脑功能区的血氧水平依赖情况。观察组先整体观察 AR 设备中的可视化三维模型, 进行位置拖动、转换视角等基本交互操作, 再通过交互模块中的隐藏或显示组织、模型透明度调节等功能由教师逐一讲解其中的每层组织或结构的知识, 让学生理解该组织结构与其他组织间的空间位置关系及其作用与意义, 如病变肿瘤所处的相对位置; BOLD 序列的作用、功能、在重建模型上是何种形态; 脑纤维束的生理作用等。教师讲解完毕后让学生自行实践操作模型, 体验其中各项交互功能。对照组按照常规教学流程由教师授课以平面阅片系统进行学习, 教学结束后, 随堂发放问卷评分量表。运用 Prism 8.0 对观察组及对照组的问卷调查评分进行统计分析, 采用秩和检验方法, 当 $p < 0.05$ 时, 即认为有统计学意义。

结果 在不同教学模式带来的兴趣程度的评价中, 观察组在每项体验中均有超过半数参与者认同 AR 技术能够在一定程度上提高学习动力、提升知识学习兴趣与对课程的期待等, 而对照组教学模式中仅有少部分人认同当前的教学模式能够使自身在学习兴趣上有所提升。观察组在减轻学生认知负荷, 提升教学效率和质量上较对照组而言效果更佳。观察组的参与者对 AR 技术在教学中的应用有较大的认可与接受度。在各项评价中, 观察组的效果均优于传统教学组, 且有显著性差异 ($P < 0.05$)。观察组的参与者对 AR 技术用于医学课堂中整体表现为积极态度。

结论 聚焦于脑部多模态影像序列的相关知识学习中, AR 技术在提高教学效率和质量上有一定优势。

PO-3614

德国心血管影像中心研修经历对学科建设的启发

周晖
中南大学湘雅医院

在德国一年的研修实践,让我深刻体会到德国医务人员是如何重视医疗质量和安全,如何规范医疗工作的各个环节,如何细致入微地关爱患者,如何有效进行多学科合作,如何建设高水平的临床研究平台。笔者认为,本人所在医院相关学科建设应从以下几个方面进行改进。一是提升医疗服务水平要重视医疗安全、规范流程、多学科合作;二是医务人员要更加关爱患者,良好的医患协作关系是促进医疗技术进步和开展高水平临床研究的保障;三是进行高水平的临床转化研究需要建设良好的科研平台,其中最为重要的是多学科和多中心的项目合作,规范性的数据采集和建设系统性的数据库。构建类似德国这种心血管影像转化研究所可以对提升医疗服务专业化程度和临床研究水平起到积极的作用。

PO-3615

云影像教学数据库在医学影像学实习生实践中应用研究

何秀超¹、戴盈²、周赵霞¹、王蓼¹、汪建华¹
1. 宁波大学附属第一医院
2. 宁波大学附属人民医院

目的 探讨云影像教学数据库在医学影像学实习生临床实践中应用研究。**方法** 研究选择 2021 年 2 月-2022 年 2 月在宁波大学附属第一医院实习医学影像学实习生 16 名,随机分为试验组和对照组,分别实施云影像教学数据库平台和传统教学模式教学对比两组实习生实践阅片考核、报告书写被修改率(报告修改量/书写报告总量)及指导老师对实习生评价等情况。**结果** 试验组实习生实践阅片考核成绩(79.88±5.52)分和指导老师对实习生良好评价成绩优秀率(62.50%)显著高于对照组(78.63±6.26)分、(12.5%),其报告书写被修改率(36.71%)显著低于对照组(43.56%),差异具有统计学意义(P<0.05)。**结论** 云影像教学数据库有利于发挥实习生的主观能动性,突破时间和空间的限制,提高了实习生临床阅片实践能力,对传统教学模式有很大补充作用。

PO-3616

紧密型医共体与“千县工程”融合推动影像学科高质量发展研究

宋超、王世平、马金宇
安宁市第一人民医院

目的: 探讨安宁市紧密型医共体与“千县工程”融合推动影像学科高质量发展的研究价值。**方法:** 1、收集国家及政府关于紧密型医共体与“千县工程”相关政策支持;2、通过人员、设备、技术的共享,提升基层医院服务能力;3、通过建立影像中心与基层医院章程制度,实现同质化管理;4、通过建立基层远程诊疗体系,实现信息互联互通,结果互认。**结果:** 1、国家政策各级政府的支持,《国家卫生健康委办公厅关于印发“千县工程”县医院综合能力提升工作方案(2021-2025 年)的通知》国卫办医函(2021)538 号,《安宁市医疗共同体落实国家“千县工程”暨云南省“百县工程”县医院综合能力提升工作实施方案(2021-2025 年)的通知》安医共体(2022)73 号;2、2019 年 5

月安宁市紧密型医共体下区域影像诊疗中心成立，2023 年 4 月“千县工程”医学影像中心示范中心创建正式启动；3、影像中心及基层医院工作效能明显改善，具体表现为：（1）DR、CT、MRI 设备利用率均有显著提升，其中移动车载 CT 基层临床服务能力提升 38.83%，实现安宁区域内基层医院 CT 检查全覆盖；（2）影像诊断符合率、员工满意率及患者满意率分别提升 1.6%、8.1%，3.8%；（3）建立影像中心及基层影像与“临床五大中心”、“急诊急救五大中心”联动闭环模式；4、安宁市紧密型医共体与“千县工程”融合后患者影像检查费用（与总费用）占比降低 1.26%。5、引入人工智能工具，基层医院及中心早期肺癌检出率明显提升。结论：安宁市紧密型医共体与“千县工程”的融合，实现资源合理布局，提升县域医疗卫生服务能力，进一步推动影像学科高质量的发展。

PO-3617

STAR 继续教育培养模式提升青年影像技师科研能力

汪琴、唐鹤菡
四川大学华西医院

目的探讨对放射科技师的培养模式进行改革，达到提高放射科青年影像技师科研能力的目的。

材料与方法

2015 年 12 月起，在四川大学华西医院放射科科室实施了旨在提高青年影像技师科研能力的一系列措施，主要包括：亚专业分组培训（Subprofessional group training）、导师责任制（Tutor responsibility）、科研时间安排制度（Arrangement of research time）及技师读片会（Reading-film session of technologists），简称为 STAR 模式。

结果①在论文发表方面，我院青年技师（≤40 岁）以第一作者或共同第一作者身份发表的论文总数有明显的上升，由 2012—2015 年的 8.25 篇/年上升至 2016—2021 年的 31.83 篇/年，年均增幅约为 285.82%。英文 SCI 论文则完成“零”突破，由 2012—2015 年的 0 篇，增至 2016—2021 年的 52 篇，占近 6 年发表论文的 27.23%。

②在课题基金申报方面，青年技师作为负责人获批的省市级项目由 2012—2015 年的 0.5 项/年升至 2016—2021 年的 2 项/年，年均增幅为 300%。

③在专利申请方面，青年技师作为第一发明人获得的授权专利由 2012—2015 年的 6 项升至 2016—2021 年的 71 项，年均增幅约 7 倍。

④在国际会议发言方面，青年技师的大会发言也由 2012—2015 年的 9 人次升至 2016—2021 年的 58 人次。

结论 STAR 继续教育培养模式可有助于放射科青年影像技师迅速提升自身的科研能力，加快培养全能化影像技师的进程。

PO-3618

Evaluation of image quality of spectrum CT with different single energy imaging in portal vein and abdominal aorta

Ying Xu, Feng Ye, Xinming Zhao

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objective: To compare and evaluate the image quality of abdominal aorta and portal vein in spectrum computed tomography(CT) single-energy imaging with different KeV, and to explore the KeV value of optimum image quality.

Methods: Twenty patients were prospectively enrolled. GE Revolution CT was used to perform enhanced upper abdominal scan. Adaptive statistical iterative reconstruction (ASIR) were set with 40%, 50%, 40%, and 30% for true non-enhanced abdominal scanning, enhanced abdominal scanning in arterial phase, portal vein phase, and delayed phase, respectively. The filter back projection (FBP) and ASIR reconstruction algorithm were used for imaging reconstruction. The arterial phase and portal phase tube voltage was 110kV, and tube current was automatic. The average CT value and noise of abdominal aorta and portal vein were measured at 50, 60, 70 and 80 keV in arterial phase, portal vein phase respectively, and the signal-to-noise ratio (SNR) value were calculated and compared pair-to-pair.

Results: The SNR values of portal vein in arterial phase were 4.50 ± 2.24 , 4.46 ± 2.24 , 4.68 ± 1.99 , 4.73 ± 1.88 , respectively. There was no significant difference between groups, $p > 0.05$. The SNR values of portal vein in portal phase were 10.58 ± 4.49 , 10.12 ± 4.04 , 9.56 ± 3.57 , 8.97 ± 3.09 , respectively, and there was no significant difference among groups, $p > 0.05$. The SNR values of abdominal aorta in arterial phase was 18.24 ± 6.27 , 16.88 ± 5.76 , 16.88 ± 5.76 , 13.75 ± 4.43 , and there was no significant difference among groups, $p > 0.05$. The SNR values of abdominal aorta in portal phase were 12.13 ± 4.23 , 11.40 ± 3.85 , 10.59 ± 3.44 , 10.88 ± 1.81 , respectively. There was no significant difference between groups, $p > 0.05$.

Conclusion: The image quality of abdominal aorta and portal vein with different KeV in arterial phase and portal vein phase in spectrum CT single-energy imaging have no statistical difference. Therefore, the imaging of lesions located in abdominal aorta and portal vein is supposed to decrease the KeV value and so as to reduce the radiation dose of patients prospectively.

PO-3619

Assessment of the liver low-density lesions with a spectral CT

Ying Xu, Feng Ye, Xinming Zhao

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objective: This study was aimed to compare and evaluate the image quality of intra-hepatic low-density lesions in spectrum computed tomography (CT) with different monochromatic energy images in the arterial phase, the portal vein phase, and the delayed phase, respectively, and to explore the exact monochromatic value of optimum image quality.

Methods: Patients with intra-hepatic low-density lesions were prospectively enrolled in our institution. GE Revolution CT was used to perform enhanced upper abdominal scan. Adaptive statistical iterative reconstruction (ASIR-V) was set with 40%, 50%, 40%, and 30% for true non-enhanced abdominal scanning, enhanced abdominal scanning in the arterial phase, the portal vein phase, and the delayed phase, respectively. The arterial phase and the portal vein phase applied a spectral mode with fast switch 80/140 kV, and tube current was automatic (range from 100 to 600 mA). The average CT value and standard deviation (SD) of the lesions were measured and

recorded at 50, 60, 70 and 80 keV in the arterial phase, the portal vein phase respectively, and the signal-to-noise ratio value was calculated and compared pair-to-pair. Paired-samples t-test was used to compare the mean value of SNR and SD in the arterial phase, the portal vein phase, and the delayed phase, respectively. $P < 0.05$ was considered statistically significant.

Results: A total of twenty patients were prospectively included finally (male: 5, female: 15; mean age: 65.4 years old), with a total of 35 lesions. For the arterial phase, the signal-to-noise ratio values of the lesion in the imaging with 80KeV was higher than those of 50, 60 and 70 keV (12.75 ± 1.16 , 0.49 ± 1.18 , 0.71 ± 1.30 , 0.94 ± 1.41 , respectively; $p < 0.001$), and there was no statistically significant difference among the 50, 60, and 70 keV groups. For the portal vein phase, the signal-to-noise ratio values of 50, 60, 70, and 80 keV groups were 1.32 ± 1.08 , 1.41 ± 1.26 , 1.49 ± 1.44 , 1.58 ± 1.61 , respectively; and there was no statistical difference among the different keV groups ($p > 0.05$).

Conclusion: The image quality with 80keV of single-energy imaging of spectrum CT was significantly better than that of other monochromatic energy (50, 60, 70 keV) imaging in the arterial phase. But for the portal vein phase imaging, there was no statistical difference in the imaging quality of the liver lesions in scans with different keV. As a result, it is supposed to reduce the radiation dose of scans by decreasing the keV in the portal vein phase without compromising the image quality prospectively, but not in the arterial phase.

PO-3620

The difference between virtual non-enhanced imaging and true non-enhanced imaging: a comparison study

Ying Xu, Feng Ye, Xinming Zhao

National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Objective: To compare the difference in image quality and radiation dose between virtual non-enhanced (VNE) images and true non-enhanced (TNE) images in the arterial and the portal phase. Methods: Sixty-four patients were enrolled in this prospective study. GE Revolution CT was used for enhanced upper abdominal scanning. Adaptive statistical iterative reconstruction (ASIR-V) were set with 40%, 50%, 40%, and 30% for true non-enhanced abdominal scanning, enhanced abdominal scanning in arterial phase, portal vein phase, and delayed phase, respectively. The effective radiation dose (ED) and the size-specific dose estimation (SSDE) of virtual non-enhanced images and true non-enhanced images were calculated respectively. The mean CT values and standard deviation (SD) of liver parenchyma, spleen parenchyma and renal cortex in VNE images and TNE images were measured, and the signal-to-noise ratio (SNR) was calculated.

Results: For radiation dose, the ED of VNE images gained from portal vein phase was the highest, followed by VNE from arterial phase reconstruction, and the lowest ED belonged to TNE images (4.59 ± 1.98 , 3.81 ± 1.44 , 3.67 ± 1.71 , respectively). The differences of ED between the latter two were significant (all $p < 0.05$) compared with the portal phase. The significant difference was detected only between VNE images from the arterial (SSDEa) and the portal phase (SSDEp) (1.47 ± 2.27 vs 10.50 ± 2.03 , $p = 0.036$). For image quality: Liver: There was no significant difference between the SNR of VNE images (SNRVNE) obtained from arterial phase and TNE (SNRTNE) ($p = 0.083$). The SNRVNE obtained from portal phase was better than that obtained from arterial phase and the SNRTNE. (SNRTNE vs portal SNRVNE: 7.26 ± 1.32 vs 12.85 ± 2.21 , $p < 0.001$; arterial SNRVNE vs portal SNRVNE: 6.53 ± 1.98 vs 12.85 ± 2.21 , $p < 0.001$). Spleen: The SNRVNE obtained from arterial phase and portal phase were better than that of SNRTNE and the difference was statistically significant (all $p < 0.001$). Kidney: The SNRVNE obtained from arterial phase and portal phase were better than that of SNRTNE and the difference was statistically significant (all $p < 0.05$).

Conclusion: In terms of the radiation dose, the dose of VNE from portal vein was still the highest for ED, but its SSDE was the lowest instead. In terms of image quality, the VNE images of some organs at certain phases (such as hepatic portal phase, splenic artery phase and portal vein phase, renal artery phase and portal vein phase) were better than that of TNE images. Therefore, spectral

CT was comparable to conventional CT in image quality, and even superior than it in the imaging of some organs, while radiation dose needed to be further verified.

PO-3621

Application value of dual-detector spectral CT virtual single-energy spectrum image in reducing lower cervical spine artifacts

Li Zhang,yujin zhang,ning wang,baogen zhao,yong wang
The First Hospital of Hebei Medical University

Objective: to investigate the application value of dual-detector computerized tomography (CT) single-energy spectrum image in reducing the artifacts of lower cervical spine.

Methods: 63 cases of cervical spine were examined with double-detector spectral CT., the standard deviation (SD) , signal-to-noise ratio (SNR) and contrast to noise ratio (CNR) of C6-7 Spinal Canal were measured and calculated in conventional images and 40,80,120,160,200 kev single energy spectrum images, the absolute value of CT value difference between C6-7 spinal canal and C3-4 Spinal Canal | CT value difference | . The image quality of conventional image, single energy spectrum image and each single energy spectrum image was compared.

Results: SD1(14.21 ± 7.51 vs 9.12 ± 3.55) and | CT Difference | (108.38 ± 113.28 vs 25.82 ± 22.69) of single-level 40 KeV images were significantly higher than those of conventional images ($p < 0.05$) , SD1, | CT Difference | of single-level 80kev (8.54 ± 3.28 vs 9.12 ± 3.55 ; 16.61 ± 12.64 vs 25.82 ± 22.69) , 120kev (7.78 ± 2.83 vs 9.12 ± 3.55 ; 10.63 ± 8.58 vs 25.82 ± 22.69) , 160kev (7.64 ± 2.72 vs 9.12 ± 3.55 ; 13.24 ± 11.41 vs 25.82 ± 22.69) , 200kev (7.68 ± 2.94 vs 9.12 ± 3.55 ; 13.26 ± 11.40 vs 25.82 ± 22.69) images were lower than those of conventional images, the difference was statistically significant ($p < 0.05$) .**Conclusion:** the 80 -200 kev single energy spectrum image of dual-detector CT can reduce the banded artifacts of cervical root, and the 120 kev single energy spectrum image can get the best image quality.

PO-3622

Age and Size Dependent Local Diagnostic Reference Levels and Achievable Doses for 47 CT Examinations: A Million Chinese Cohort Study

Shiyao Wu,Longjiang Zhang
Department of Radiology, Jinling Hospital

Abstract

Background: Diagnostic reference levels (DRLs) and achievable doses (ADs) were provided to protect against medical exposure and optimize CT protocols.

Purpose: To establish DRLs and ADs of 47 commonly used CT examinations based on patient age and size in one million Chinese multicenter cohort.

Materials and Methods: Radiation dose data on 47 CT examinations including conventional CT examinations, CT angiography (CTA), and dual energy CT (DECT) examinations at four Chinese university hospitals between Jan 2016 and Dec 2018 were retrospectively analyzed. For all CT examinations, dose indexes were analyzed based on patient age and size. ADs and DRLs for volume CT dose index (CTDIvol), dose-length product (DLP), size-specific dose estimate (SSDE) and total effective dose (ED) were analyzed.

Results: 1001190 CT examinations were available for dose analysis. The population age was peaked in the 45-65 years. The most common examination was non-enhanced chest CT (262836/1001190, 26.25%) with the age-based CTDIvol AD ranging from 2.50 to 7.66 mGy and DRL from 3.67 to 10.29 mGy. The most frequent multi-region examination was contrast enhanced combined chest and abdomen CT (48777/1001190, 4.87%) with the age-based CTDIvol AD ranging from 1.15 to 12.45 mGy and DRL from 1.77 to 15.55 mGy. Coronary CTA, CTDIvol AD ranging from 8.08 to 13.65 mGy and DRL from 11.73 to 22.21 mGy, was the most commonly used CTA (18262/1001190, 1.82%). Abdominal DECT, CTDIvol AD ranging from 3.92 to 9.69 mGy and DRL ranged from 4.48 to 11.38 mGy, was the most commonly used DECT (1562/1001190, 0.16%). DRLs and ADs for size-based CTDIvol, DLP, SSDE and ED increased consistently with patient size.

Conclusion: The study provided DRLs of 47 commonly used CT examinations including conventional CT examinations, CTA, and DECT examinations based on patient age and size. Further research is required to develop national DRLs to guide CT radiation optimization.

PO-3623

Automatic quality control based on Generative Adversarial Networks in chest X-rays

Xin Wei,zhiming zhou

The Second Affiliated Hospital of Chongqing Medical University

[Abstract]: Objective The purpose of this study was to develop and evaluate the clinical performance of a deep learning-based system for the automatic quality control (QC) in chest digital X-rays (DR). Methods Retrospectively, 6920 orthorectified chest DR images taken by 16 hospitals from January to June 2021 were included for grading and labeling. Of these, 44844 were used as a training set to construct a deep learning model based on generative adversarial networks (GANs) that can automatically evaluate the quality of chest DR images, 1730 were used as a validation set to adjust the model parameters, and 346 images were used as a test set to evaluate the model performance. The sensitivity, specificity, accuracy, and area under the curve (AUC) of the artificial intelligence (AI) model were calculated from 10 evaluation dimensions using the scores and total scores of five senior radiologists as the reference standard. And the AI was tested for consistency with the experts' scores. Time spent by model and experts were recorded separately. Results The performance of the AI system was comparable to the subjective assessment of the radiologists in the evaluation dimensions. And the detection efficiency of "whether the inner edge of the scapula rotates out of the lung field" is the highest (AUC=0.912), with sensitivity, specificity, and accuracy of 86.32%, 96.02% and 93.35%, respectively. The AI system shows good consistency with expert judgments of image quality (ICC=0.843, $P<0.001$). And the average time taken by AI was significantly shorter than that of experts (4.24 s vs. 12.85 s, $P<0.001$). Conclusion The QC system for chest radiographs based on GANs can automatically and quickly perform image quality control and high-level image quality scoring, which can be an effective tool to assist in DR image quality control and management tasks.

PO-3624

Image Quality Control of Pelvis Digital Radiographs Using A Multi-faceted Deep Learning Decision Model : Ready for Clinical Daily Practice?

Lin Mu,Huimao Zhang
The First Hospital of Jilin University

Introduction

Quality control (QC) is an essential component of radiology practice. An effective quality control program ensures consistent diagnostic image quality, specific radiographic measures as well as precise surgery plan. The purpose of the study is to develop and evaluate an automatic Multi-faceted Deep learning Decision Model (MDDM) for image quality control on anteroposterior (AP) pelvic digital radiographs by integrating classification, landmark detection and segmentation techniques .

Methods

A total of 1607 supine position AP pelvic radiographs were acquired from within the hospital. 1340 radiographs were randomly sampled for training and validation and 267 radiographs were used as the test set. Two models using different training strategies were compared: the first model (MDDM-QC) deployed a DenseNet for non-iatrogenic foreign body classification, a HRNet for landmarks detection where commonly used parameters and structures for image integrity, pelvic rotation and pelvic flexion were included, subsequently a U-Net was used to delineate obturator foramen. With the second model, we further addressed the objective by means of a DenseNet classification model where a binary outcome of image quality was given. The reference standard of each parameter was obtained manually by three radiologists using OrthoAI-HIP™ from Linking Innovations Technologies, Beijing, China. Accuracy, sensitivity, specificity and F1 score were used to determine the performance of both decision-making algorithms.

Results

Each AP pelvic radiograph contains the following left and right landmarks: L4-L5 spinous process, pubic symphysis, spina iliac, femoral head center, upper acetabular rim, the outermost point of the acetabulum, teardrop, lesser and greater trochanter , segmentation of the obturator foramen and proximal femur. Two models were compared side to side, where the MDDM-QC yielded much better results: the accuracy was 22.5% higher with MDDM-QC (89.5%) than model 2 (67%). The sensitivity was 23% higher with MDDM-QC (92%) than model 2 (69%). The specificity was 24% higher with MDDM-QC (87%) than model 2 (65%). The F1 score was 38.5% higher with MDDM-QC (89.2%) than model 2 (50.7%). The recorded time for labeling landmarks was significantly shortened with MDDM-QC (3.2±0.6 seconds) comparing to the manual approach (478.5±43.2 seconds).

Discussion

A randomized prospective study should be conducted to evaluate the clinical impact on the workflow with MDDM-QC model in the future. Generally, deep learning based decision-making algorithms lack of quantifiable reasoning and interpretability. However, our proposed model based on a chain of logics can accurately recognize landmarks and contour the key structures on radiographs which resembles the quality control workflow in real world. The results indicate that MDDM-QC algorithm is able to extract more complex and discriminating features than the other model thanks to the incorporation of priori knowledge . Deep learning decision making algorithm provides key technologies that can enable radiologists and technicians to measure and improve the quality of AP pelvic radiographs.

PO-3625

Assessing Artifact Reduction of 125I Seeds in Detector-Based Spectral CT Images: A Quantitative and Texture Analysis

Yuhan Zhou,Zhihao Wang,Weimeng Cao,Limin Lei,Songwei Yue
The First Affiliated Hospital of Zhengzhou University

Objectives The metal artifacts caused by 125I radioactive seed implantation (IRSI) affect the clinical assessment. Evaluating the effectiveness of different image reconstruction methods in dual-layer spectral CT(DLCT) for different patterns of 125I seeds artifacts, and their impact on CT image texture.

Methods Thirty-five patients with 70 layers of IRSI who underwent DLCT examinations were retrospectively analyzed. Conventional CT images (CI) and virtual monoenergetic images (VMI, 40-150keV in 10keV intervals), combined with artifact reduction algorithms (O-MAR) were reconstructed and used to evaluate hypo-/hyperdense artifacts caused by 125I seeds. For quantitative analysis, corrected attenuation values and artifact index (AI) were using the circular ROIs. For texture analysis, histogram analysis was chosen as statistical method. The spread and total frequency of the artifact histograms were recorded based on the ring-like ROIs, ring-like ROI is a novel circular ROI that covers almost all areas affected by artifacts placed in soft tissue. Furthermore, D CT, D AI, D spread and D frequency of artifacts were calculated for evaluated the reduction efficiency of each group. The reduction efficiency of various objective indicators was assessed in the optimal group. Correction rate of lesions covered by artifacts was assessed using the Response Evaluation Criteria in Solid Tumors (RECIST).

Results Quantitative analysis showed significantly reduced hypo-/hyperdense artifacts in corrected attenuation values and AI ($p < 0.05$). The correction attenuation efficiency of hypodense artifacts in the VMI150keV combined with O-MAR (VMIO-MAR150keV) group was better than that of hyperdense artifacts in the same group ($90\% > 62.22\%$, $p < 0.05$). In texture analysis, both hypo-/hyperdense artifacts were reduced ($p < 0.05$). However, the reduction in efficiency of histograms' spread in VMIO-MAR150keV group is not statistically significant ($p > 0.05$). With increase in keV, the total frequency of hyperdense artifacts decreased significantly ($p < 0.05$), and the hypodense artifacts was not statistically significant compared with CI group ($p > 0.05$). The VMIO-MAR150keV group showed a lower reduction rate of hypodense artifacts than hyperdense artifacts ($16.97\% < 53.54\%$, $p < 0.05$).

Conclusions The integration of VMI and O-MAR serves as an effective method to reduce hypo-/hyperdense artifacts caused by 125I particle implantation. Texture analysis revealed that VMI above 150keV can minimize the influence of artifact on the CT images thereby enhancing diagnostic effectiveness and post-processing analysis.

PO-3626

Patient adaptive respiratory training in the lung magnetic resonance free breathing sequence image quality study

Yehai Jiang,nan Yu
Shaanxi University of Chinese medicine

Objective: To explore the effect of breathing training on the image quality of free breathing lung magnetic resonance imaging (MRI). **Materials and methods:** A total of 26 patients who were scheduled to undergo pulmonary MRI from June 2022 to November 2022 were prospectively collected and matched according to their age, sex and diseases. After matching, the patients were randomly divided into experimental group and control group. The experimental group was assessed the respiratory rate and rhythm by visual examination 30 minutes before the examination.

According to the breathing condition of the patients, the respiratory rate and rhythm were divided into two types: uniform and regular breathing and irregular breathing. Encourage the first category of patients and instruct them to breathe according to the previous breathing mode; for the second type of patients, the operator puts a hand on the patient's abdomen and instructs the patient to inhale and exhale at the same time, training for 2min, if the patient is still breathing irregularly, extend the time to 5min, if still unable to cooperate, then exclude the experimental group. The patients in the control group were only told the matters needing attention in the process of MRI examination. The radial volumetric interpolated breath-hold examination (VIBE) sequence images of all patients were collected. Without knowing the grouping, two senior doctors used the five-point method to evaluate the subjective image quality of lung MRI images. The signal intensity (signal intensity, SI) and standard deviation (standard deviation, SD) of ascending aorta, pulmonary trunk and descending aorta were measured. According to the formulas of signal-to-noise ratio (signal to noise ratio, SNR) and coefficient of variation of SI (coefficient of variation, CV), the objective image quality of the

experimental group and the control group were compared. Results: The scores of vascular clarity, bronchial sharpness, noise and artifacts and overall image quality in the experimental group were higher than those in the control group (4.31 ± 0.63 VS 3.69 ± 0.85 ; 3.62 ± 0.51 VS 3.08 ± 0.76 ; 4.00 ± 0.82 VS 3.31 ± 0.75 ; 4.23 ± 0.44 VS 3.46 ± 0.52 , $P < 0.05$). In the objective image quality evaluation, the SNR values of ascending aorta, pulmonary trunk and descending aorta in the experimental group were all higher than those in the control group (20.83 ± 4.96 VS 15.89 ± 4.03 ; 23.22 ± 5.86 VS 18.32 ± 2.64 ; 28.26 ± 5.59 VS 22.34 ± 3.91 , $P < 0.05$). The CV values of ascending aorta, pulmonary artery trunk and descending aorta in the experimental group were lower than those in the control group (0.05 ± 0.01 VS 0.07 ± 0.02 ; 0.04 ± 0.01 VS 0.06 ± 0.01 ; 0.04 ± 0.01 VS 0.05 ± 0.01 , $P < 0.05$) **Conclusion:** breathing training can improve the image quality of free breathing sequence, improve the success rate and comfort of patients, and may be more helpful to increase confidence in diagnosis.

PO-3627

SSDE for estimating patient specific radiation dose in cardiac coronary artery CT angiography

Zhuang Nie, chengjun dong
wuhan union hospital

Objective To develop a clinically applicable method to estimate patient specific organ dose and effective dose from SSDE in cardiac coronary CTA. **Methods** Retrospectively included 421 coronary artery CTA cases, including 244 males and 177 females, with an average age of 58.5 ± 12.8 years (range 18 to 89 years). All cases were scanned by prospective ECG gated trigger axis scan mode in the 3rd generation dual-source Force CT. Water equivalent diameters were calculated to compute SSDE for each patient. Patient organ dose include heart, lung, liver and breast were estimated using Monte Carlo methods by Radimetrics. Patient specific effective dose was calculated as a weighted sum of simulated organ doses using the coefficients from ICRP 103. Linear correlation analysis was used to validate the relationship between SSDE and organ doses as well as effective dose, and to derive coefficients for patient specific dose estimation. Use the mean error rate to evaluate estimation accuracy. **Results** Radiation dose values were (mean \pm standard deviation): CTDIvol is 16.8 ± 8.7 mGy, SSDE is 20.8 ± 8.8 mGy, and effective dose is 4.4 ± 2.9 mSv. The linear fitting formula for estimating organ dose based on SSDE is: heart $Y = 1.2X - 6.4$ ($R^2 = 0.91$, $p < 0.01$, mean error 0.1%); breast $Y = 1.4X - 7.4$ ($R^2 = 0.91$, $p < 0.01$, mean error 7.9%); lung $Y = 0.89X - 4.6$ ($R^2 = 0.86$, $p < 0.01$, mean error 8.3%); liver $Y = 0.36X - 1.8$ ($R^2 = 0.64$, $p < 0.01$, mean error -17.9%). The linear fitting formula for estimating the individual effective dose based on SSDE is: male $Y = 0.21X - 1.2$ ($R^2 = 0.92$, $p < 0.01$, mean error 0.2%); female $Y = 0.39X - 2.2$ ($R^2 = 0.93$, $p < 0.01$, mean error 1.7%). **Conclusion** In coronary artery CTA scan, the absorbed dose of the irradiated

organs and patient specific effective dose can be estimated through SSDE and the corresponding conversion coefficients, which will help us to achieve personalized assessment and precise management of patient radiation dose and risk in clinical work.

PO-3628

A preliminary intramural multicenter evaluation of the quantitative accuracy and stability of synthetic magnetic resonance imaging(MRI) sequence using a system phantom

Manli Song, Gaoyang Zhao, Jianfeng Bao, Yong Zhang, Jingliang Cheng
The First Affiliated Hospital of Zhengzhou University

Objectives: Synthetic MRI sequence is a new method which can acquire various contrast weighted images using quantitative relaxometric parameters measured from multicontrast images. The quantitative accuracy and stability of this sequence is very important in multicenter evaluation, so it is necessary to analyze measurements across systems. The aim of this study was to evaluate the quantitative accuracy and stability of synthetic MRI sequence in different scanners, coils and sequence parameters in measuring relaxation values of a premium system phantom which used for T_1 , T_2 , proton density (PD) quantitative MRI standardization.

Methods and materials: The premium system phantom of the CaliberMRI company was used in our study. We acquired synthetic MRI (MAGnetic resonance image Compilation; MAGiC) sequence data from three GE SIGNA™ Architect 3.0T scanners in two branches of the first affiliated hospital of zhengzhou university. The phantom was scanned 5 times in different days using synthetic MRI sequence with variations of repetition time, echo time, bandwidths, echo train length, transmit gain, RF drive mode and acceleration factor. 19-Channels and 48-Channels head coils were compared in different scanning strategies. MAGiC software was used to create quantification maps (T_1 , T_2 , and PD maps) and weighted (T_1W , T_2W , and T_2W FLAIR) images. Quantitative evaluation was performed on quantification maps. The T_1 , T_2 , PD measurements were acquired after each acquisition. To investigate the quantitative accuracy and stability between different scanning strategies, the Wilcoxon signed rank tests were used. The statistical significance level was set as $P < 0.05$.

Results: The operating temperatures of the three GE SIGNA™ Architect 3.0T scanners were 18.2, 19.8, 21.7 degrees Celsius, corresponding to the mean temperatures of the phantom with the CMRI LC MR-readable thermometer were 18.0, 20.0, 22.0 degrees Celsius. The Measured T_1 values of the element T_1 array were 1657 ± 21 , 1270 ± 19 , 915 ± 16 , 628 ± 8 , 444 ± 8 , 323 ± 6 , 300 ± 1 ms in scanner1, 1636 ± 31 , 1241 ± 28 , 877 ± 16 , 607 ± 9 , 449 ± 7 , 322 ± 5 , 300 ± 1 ms in scanner2, 1632 ± 47 , 1260 ± 24 , 884 ± 17 , 627 ± 8 , 462 ± 6 , 329 ± 5 , 300 ± 1 ms in scanner3, the difference was not statistically significant. The Measured T_2 values of the element T_2 array were 510 ± 44 , 366 ± 26 , 270 ± 12 , 188 ± 5 , 129 ± 4 , 110 ± 3 , 83 ± 2 , 58 ± 1 , 39 ± 1 , 31 ± 5 , 24 ± 2 ms in scanner1, 511 ± 56 , 392 ± 23 , 294 ± 15 , 197 ± 4 , 134 ± 3 , 111 ± 3 , 84 ± 3 , 57 ± 2 , 39 ± 1 , 28 ± 2 , 22 ± 2 ms in scanner2, 534 ± 75 , 392 ± 56 , 274 ± 21 , 181 ± 11 , 133 ± 6 , 112 ± 3 , 84 ± 2 , 59 ± 2 , 41 ± 1 , 28 ± 1 , 22 ± 2 ms in scanner3, the difference was not statistically significant. 19-Channels head coils also had the same outcomes comparing with the 48-Channels head coils.

Conclusions: Synthetic MRI sequence has excellent reliability. Quantitative T_1 , T_2 measurements of the premium system phantom derived from the MAGiC sequence were not obviously affected by variations of scanners, coils and sequence parameters, such as repetition time, echo time, bandwidths, echo train length, transmit gain, RF drive mode and acceleration factor.

PO-3629

Assessment of noise reduction potential and image quality improvement of a DLIR TrueFidelity in abdomen CT

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To evaluate the image quality improvement and noise reduction in routine dose, non-enhanced abdomen CT imaging by using TrueFidelity reconstruction algorithm

***Methods and Materials:** 28 patients who underwent routine dose, abdomen CT using GE Revolution CT (GE Healthcare, Waukesha, WI) were included. After scanning, all scans were reconstructed with the recommended level of 50% ASIR-V and for comparison purpose and TrueFidelity (DLIR-L, DLIR-M, DLIR-H) using 0.625mm. The CT attenuation values and SD of the subcutaneous fat, back muscle and descending aorta were measured at the level of tracheal carina of all reconstructed images with 0.625mm. The SNR was calculated with SD representing image noise. The subjective image quality was independently evaluated by two experienced radiologists.

***Results:** For all TrueFidelity images, the objective image noise (SD) of fat, muscle and aorta with 0.625mm decreased and SNR increased along with DLIR-L, DLIR-M, DLIR-H. The SD of DLIR images were significantly lower than that of 50% ASIR-V. In terms of subjective image evaluation, all DLIR reconstructions and 50% ASIR-V had good diagnostic acceptability. However, DLIR-M, DLIR-H showed significantly superior visibility of small structures when compared with the 50% ASIR-V and DLIR-L, and DLIR-H was the best series of TrueFidelity images, with a highest subjective image quality, at the same time the image sharpness was not significantly decreased in DLIR-H images with 0.625mm.

***Conclusions:** In routine dose, non-enhanced abdomen CT, TrueFidelity show greater potential in reducing image noise and artefacts and maintaining image sharpness when compared to the recommended level of 50%ASIR-V. Combining both the objective and subjective evaluation of images, non-enhanced abdomen CT images reconstructed with DLIR-H have the highest image quality in 0.625mm.

PO-3630

Image quality assessment of two generations of rapid kV-switching spectral CT systems on virtual monoenergetic images: A Phantom Study

Xiaohu Li

The First Affiliated Hospital of Anhui Medical University, China

***Purpose:** To compare the spectral performance of two rapid kV switching spectral CT systems on virtual monoenergetic images (VMIs) at low-energy levels on phantom image.

***Methods and Materials:** A different concentrations of iodine phantom was scanned on two spectral CT systems equipped with three different gemstone spectral imaging (GSI) platforms: GSI-Pro (2nd generation, GSI-2nd) and GSI-Xtream (3rd generation, GSI-3rd). Acquisitions on the phantom were performed with a CTDIvol close to 12mGy. For all platforms, raw data were reconstructed using FBP and 50%ASIR-V. TrueFidelity was used only for the GSI-3rd. Noise power spectrum (NPS) and task-based transfer function (TTF) were evaluated from 40 to 80 keV of VMIs.

***Results:** For all GSI platforms, the noise magnitude decreased from 40 to 70 keV, and using 50%ASIR-V compared to FBP. The average NPS spatial frequency (fav) and spatial resolution (TTF50%) were similar from 40 to 70 keV and decreased with 50%ASIR-V compared to FBP. Compared to 50%ASIR-V, using DLR reduced the noise magnitude and improved fav values and altering spatial resolution. The third-generation rapid-switching scanner using DLIR had the highest quantification accuracy for iodine concentration and attenuation.

*Conclusions: Differences in image quality were found between the GSI platforms for VMIs at low keV. The new DLIR algorithm on the GSI-3rd platform reduced noise and improved spatial resolution and detectability without changing the noise texture for VMIs at low keV. DLIR may improve quantification accuracy.

PO-3631

Risk factors for transient respiratory motion artifacts during arterial phase of dynamic enhanced MRI with disodium gadolinate

Fukun Shi

The First Affiliated Hospital of Henan University of CM

Abstract

Objectives To identify risk factors for transient severe motion (TSM) artifact on arterial phase in gadoxetate disodium-enhanced liver MRI.

Methods We retrospectively identified 430 consecutive patients who underwent 516 MRI examinations, including 68 patients who underwent multiple MRI examinations, with gadoxetate disodium between 2019 and 2022. Arterial phase transient severe motion was considered to be present if the motion score was 4 or greater on the arterial phase images and if the motion scores were 2 or less on unenhanced and other contrast-enhanced images. risk factors including age, sex, weight, body mass index, allergy to MRI and iodinated contrast agents, underlying disease, laboratory data, presence of ascites and pleural effusion, and previous experience of gadoxetic acid-enhanced MRI were investigated. Univariable and multivariable logistic regression analyses were performed to determine significant risk factors for TSM. Predictive value of TSM was calculated according to the number of significant risk factors.

Results Overall incidence of TSM was 12.6% (65/516). In the multivariable analysis, old age (≥ 45 years; odds ratio [OR] = 1.57 [95% CI, 1.42–3.21]), chronic obstructive pulmonary disease (OR = 5.79 [2.56–14.24]), allergy to iodinated contrast agent (OR = 3.32 [2.23–6.17]) and a history of transient severe motion (OR = 3.03 [1.65–7.65]) were independent significant risk factors for TSM. When at least one of the significant factors was present, the predictive risk was 3.3% (14/425), whereas it was 14.6% (13/89) when at least four factors were present.

Conclusion The occurrence of transient severe motion during arterial phase MRI with gadoxetate disodium is 12.6% and Knowing risk factors for TSM can be clinically useful for providing diagnostic strategies more tailored to individual patients.

PO-3632

Feasibility Study of "One Key" Individualized Low Dosage Technique in CT Colonography

Beibei Li

The first affiliated hospital of Dalian Medical University

Objective To explore the feasibility of individualized low-dose CT colonography (CTC) scanning using auto-prescription technique in CTC. **Materials and Methods:** Prospective CTC scan was performed in 131 patients. The tube voltage in prone position (Group A) was 120 kVp and 30% ASIR-V was used to reconstruct the image. The tube voltage in supine position (Group B) was in Auto-prescription mode, and 70% ASIR-V was used to reconstruct the image. Record BMI, CT DIvol, and DLP. SNR and CNR were calculated by measuring CT and SD values of air of intestine (background) and liver parenchyma of two groups of axial images. **Results** The values of kVp in

group B (BMI: 17.96~32.05 kg/m²) were 70 kVp: 4/131, 80 kVp: 64/131, 100 kVp: 61/131, 120 kVp: 2/131. Compared with group A (5.57±0.13 mGy and 291.80±7.46 mGy·cm), group B (3.79±0.14 mGy and 189.70±7.48 mGy·cm) decreased by 33.94% and 36.91% ($P < 0.05$), respectively. There was no significant difference in CT value between group B and group A ($P > 0.05$), SD value of group B was lower than group A, SNR and CNR were higher than group A ($P < 0.05$), and the difference was significant ($P < 0.05$). Conclusion The application of Auto-prescription technology in low dose CTC scanning can ensure the image quality and further reduce the patient's radiation dose.

PO-3633

16cm 容积扫描模式在一站式左房-肺静脉-冠状动脉 CT 成像检查的应用价值

王甜
柳州市人民医院

目的 探讨 16cm 容积扫描模式在一站式左房-肺静脉-冠状动脉 CT 成像检查的应用价值。方法 选取 60 例射频消融术前心脏 CTA 扫描的房颤患者 ($18.5\text{kg/m}^2 \leq \text{BMI} \leq 25\text{kg/m}^2$)，随机分为 A、B 组。A 组采用 16cm 容积扫描模式，管电压 100kV，智能电流范围为 40~900mA (以 SD=28 智能调节)，机架旋转时间 0.275s，AIDR 3D Standard 迭代重建算法；注射方案为以 4.5ml/s 速率注射对比剂，总量 45ml，以 4.5ml/s 速率注射生理盐水 30ml。B 组采用心电门控螺旋扫描模式，扫描方案为管电压 100kV，智能电流范围为 40~900mA (以 SD=28 智能调节)，机架旋转时间 0.275s，AIDR 3D Standard 迭代重建算法；注射方案以 4.5ml/s 速率注射对比剂，总量 90ml。两组患者扫描范围均为气管隆突上 2cm 至心脏膈底。分别记录两组患者图像质量、对比剂碘量、辐射剂量，对两组数据进行统计学分析。结果 A 组图像质量在心率 > 75 次/分时高于 B 组，差异有统计学意义 ($P < 0.05$)，心率 < 75 次/min 时，图像质量没有统计学意义。A 组的辐射剂量为 (4.17 ± 0.94) mSv，B 组的辐射剂量为 (11.25 ± 0.26) mSv，降低约 63%，差异有统计学意义 ($P < 0.05$)，A 组的对比剂用量比 B 组降低约 50%。结论 在自由心率时，容积扫描模式可获取高清低剂量的左房-肺静脉-冠状动脉图像，对射频消融术前检查的房颤患者具有重要的临床价值。

PO-3634

18F-NAF 全身骨扫描显像所致辐射剂量的研究

杨静
桂林医学院附属医院

目的 探讨 18F-NAF 全身骨扫描显像时所致辐射剂量的研究。方法 选取 83 例行 18F-NAF 骨显像患者，男 13 例，女 70 例，年龄 21~69 岁， 43.6 ± 12.3 岁，体重为 $60.4 \pm 10.6\text{Kg}$ ，皆能正常活动。患者按 0.1mCi/kg 注射显像剂，静脉给药后 60min 采集一次 PET/CT 图像，在检查结束后，使用核辐射监测探测器测量距离患者 0.3、1.0m 处的剂量当量率 (DR)。根据国际辐射防护委员会 106 号出版物提出的 18F-NaF 有效剂量的计算方法，计算患者 18F-NaF 有效剂量；根据国际辐射防护委员会 103 号出版物提出的 CT 有效剂量的计算方法，计算患者 CT 有效剂量；根据美国国家辐射防护和测量委员会提出的人类社会活动模式和国际辐射防护委员会提出的 18F-NAF 在人体的代谢模型，计算 18F-NAF 骨显像患者对公众及核医学技师的照射剂量 (RD)。结果 注射 18F-NaF 的平均活性为 $294.57 \pm 55.12\text{MBq}$ ，平均有效吸收剂量 18F-NAFPET 为 $4.41 \pm 0.83\text{mSv}$ 和 CT 为 $12.86 \pm 3.11\text{mSv}$ ，平均累积有效剂量 18F-NAF PET/CT 扫描为 $17.27 \pm 3.94\text{mSv}$ 。83 例患者的 DR (0.3 m) 为 $23.94 \pm 8.82\mu\text{Sv/h}$ 、DR (1.0 m) 为 $18.10 \pm 6.68\mu\text{Sv/h}$ 。与 18F-NAF 骨显像患者白天接触的

家庭成员的照射剂量为 $15.12 \pm 5.58 \mu\text{Sv}$ ；夜间同床共寝的家庭成员的照射剂量为 $26.39 \pm 9.72 \mu\text{Sv}$ ；单位工作同事的照射剂量为 $16.67 \pm 6.15 \mu\text{Sv}$ ；邻座乘客的照射剂量为 $74.32 \pm 27.38 \mu\text{Sv}$ 。核医学技师每接触 1 例 ^{18}F -NAF 骨显像患者的照射剂量为 $1.32 \pm 0.49 \mu\text{Sv}$ 。结论 ^{18}F -NAF 全身骨显像患者对公众及核医学技师的照射剂量远低于相应人群的照射剂量限值，很好地贯彻了辐射防护三原则，提高了患者的利益/危害比。

PO-3635

结合监测点优化的能谱扫描在双低剂量下肢动脉血管 CT 成像中的临床价值

梅莞翠、李铨铨、曹鲁强、陈文
十堰市太和医院

目的：探讨能谱扫描和腘动脉水平监测在双低（低辐射剂量和低造影剂剂量）下肢动脉血管 CT 成像（CTA）中的临床价值

方法：前瞻性纳入怀疑下肢动脉疾病而须行下肢 CTA 检查的 111 例患者，根据扫描方式不同分为 A、B、C 3 组。A 组：常规扫描，监测腹主动脉；B 组：能谱扫描，监测腹主动脉；C 组：能谱扫描，监测腘动脉。由两名医师利用 5 分法对 3 组图像腹股段(AIS)；股动脉段(FPS)；膝下段(LKS)进行 5 分制图像评分。测量 3 组图像腹主动脉（L3 水平），股动脉（髌关节平面），腘动脉（膝关节平面）、踝动脉（踝关节平面）感兴趣区（ROI）的 CT 值及噪声（SD）值，计算信噪比（SNR）及对比噪声比（CNR）。

结果：对于 3 组间的辐射剂量比较，C 组扫描方案产生的有效辐射剂量（ED，mSv）低于 A、B 组（ 3.59 ± 0.31 VS 4.07 ± 0.37 VS 3.70 ± 0.31 $P < 0.01$ ）。对于造影剂用量，C 组用量 85ml 低于 A 组 105ml，低于 B 组 95ml。对于 3 组客观图像质量的比较，扫描腹主动脉 C 组方案的 CT 值略低于 B 组，显著高于 A 组 $P < 0.01$ ；左、右股动脉 C 组的 CT 值略低于 B 组，显著高于 A 组，均 $P < 0.01$ ；左、右腘动脉 C 组的 CT 值略等于 B 组，显著高于 A 组，均 $P < 0.01$ ；C 组 SNR 低于 B 组和 A 组。左、右踝动脉 C 组扫描方案的 CT 值略高于 B 组，显著高于 A 组，均 $P < 0.01$ ；右踝动脉 A 组的 SNR 高于 B 组、C 组，均 $P < 0.01$ 。对于 3 组主观图像质量的比较，LKS C 组 2 位放射医生的主观评分高于 B 组、C 组，均 $P < 0.01$ 。

结论：传统下肢 CTA，由于扫描范围广和个体循环差异影响，辐射剂量和造影剂剂量通常较大，且膝关节以下血管显影较差。50KeV 能谱模式结合腘动脉水平检测点扫描方案使用低造影剂剂量和低辐射剂量可以提供下肢良好的图像对比度，提高 LKS 动脉的图像显示。

基于知识图谱和图像分类的胸片智能化质控研究

王倩¹、宋亮亮¹、韩啸⁴、刘明^{2,3}、张标^{1,2}、赵士博⁴、谷宗运^{2,4}、黄莉莉^{2,3}、李传富^{2,4,5}、李小虎^{1,5}、余永强^{1,5}

1. 安徽医科大学第一附属医院

2. 合肥综合性国家科学中心先进研究院（安徽省人工智能实验室）

3. 安徽大学计算机科学与技术学院

4. 安徽中医药大学医药信息工程学院

5. 安徽省影像诊断质控中心

目的 构建基于知识图谱和图像分类的 X 线胸部后前位片（简称胸片）的图像质量控制（简称图像质控）智能检测模型，实现医学影像质控自动化及客观化。

方法 回顾性分析 2018 年 1 月至 2021 年 12 月安徽省医学影像云平台中的脱敏胸片 9236 张。构建胸片质控知识图谱，并严格按照知识图谱进行数据标注，每张胸片经过两名放射医师（A、B）

独立标注，并由放射医师（C）参考前两名医师标注结果不一致进行标注决定。将一名高年资质控专家审核后的结果作为参考金标准。标注数据集按照 7: 2: 1 分成训练集、测试集、验证集。采用受试者操作特征曲线（ROC）及曲线下面积分析模型在测试集上的分类性能，采用精确率（Precision）分析比较单人质控、多人质控及模型在测试集上对胸片质量特征的预测效果。

结果 测试集中，分类模型诊断胸片各个类别图像质量特征达到了 0.939 的平均 AUC。质控知识图谱所涉及的节点中，单人（A、B）质控平均精确度分别为 81.15%、85.47%；多人质控平均精确度、模型预测平均精确度分别为 91.65%、92.21%。

结论 模型预测明显优于单人质控甚至略优于多人质控，基于知识图谱和图像分类的智能质控方法能满足医学影像自动化及客观化要求，可逐步推广到影像实际质控工作中，并逐步代替人工质控工作。

PO-3637

基于深度学习重建算法的 FOCUS 及 MUSE DWI 在甲状腺相关性眼病中应用价值的研究

崔园园

中国人民解放军海军军医大学第二附属医院

目的：探讨基于深度学习（deep learning, DL）的视野优化无失真单激发（FOCUS）和多元灵敏度编码成像技术（MUSE）的 DWI 对眼外肌、视神经和泪腺的可视化并评价其预测甲状腺相关性眼病（thyroid-associated ophthalmopathy, TAO）活动性的效能。方法：纳入 19 例诊断为 TAO 的连续性患者（男 8 例， 45.5 ± 10.7 岁）和 11 例对照组（男 2 例， 35.4 ± 14.2 岁）。活动期 TAO 患者 13 例，非活动期 6 例。测量基于 DL 的 FOCUS DWI、MSUE DWI、FOCUS MUSE DWI 和单激发 DWI 上眼外肌、视神经和泪腺的表观弥散系数（ADC）、信噪比（SNR）、对比噪声比（CNR）。使用 Mann-Whitney U 检验和 Friedman 检验比较各结构在不同序列上 SNR、CNR 的差异，使用 Spearman 评价 ADC 与临床活动度评分（CAS）的相关性。结果：四种基于 DL 的 DWI 在各结构中的 SNR 均高于原始 DWI（ $P < 0.001$ ），且基于 DL 的 FOCUS DWI 在各结构中的 SNR 最高（ $P < 0.001$ ）。活动期 TAO 患者中，基于 DL 的 FOCUS MUSE DWI 中各结构 ADC 与 CAS 无相关性（ $P > 0.05$ ），但在基于 DL 的 MUSE DWI 上的视神经 ADC 与 CAS 有相关性（ $R = -0.315$ ， $P = 0.017$ ），基于 DL 的 FOCUS DWI 上的外直肌和内直肌 ADC 与 CAS 有相关性（ $R = -0.462$ ， $P = 0.01$ ； $R = -0.362$ ， $P = 0.013$ ），基于 DL 的单激发 DWI 上的内直肌和视神经 ADC 与 CAS 有相关性（ $R = -0.336$ ， $P = 0.022$ ； $R = -0.390$ ， $P = 0.007$ ）。结论：在 TAO 相关的结构中，基于 DL 的四种 DWI 为眼眶提供更好的图像质量，FOCUS DWI 与 CAS 的相关性更高，提示该序列在 TAO 患者临床评价中有重要作用。

PO-3638

FOCUS 及 MUSE DWI 对甲状腺相关性眼病的应用价值的研究

王云梦

中国人民解放军海军军医大学第二附属医院

目的: 探讨基于视野优化无失真单激发 (FOCUS) 和多元灵敏度编码成像技术 (MUSE) 的扩散加权成像 (DWI) 对眼外肌、视神经和泪腺的可视化, 并评价其预测甲状腺相关性眼病 (thyroid-associated ophthalmopathy, TAO) 活动性的效能。方法: 前瞻性纳入 19 例我院诊断为 TAO 的连续性患者 (男 8 例, 45.5 ± 10.7 岁) 及 11 例健康对照组 (男 2 例, 35.4 ± 14.2 岁)。活动期 TAO 患者 13 例 (男 7 例, 46.3 ± 11.4 岁), 非活动期 6 例 (男 1 例, 43.8 ± 9.8 岁)。测量 FOCUS DWI、MSUE DWI、FOCUS MUSE DWI 和单激发 DWI 上眼外肌、视神经和泪腺的表观弥散系数 (ADC)、信噪比 (SNR) 和对比噪声比 (CNR)。使用 Mann-Whitney U 检验和 Friedman 检验比较各结构在不同序列上 SNR、CNR 的差异, 使用 Spearman 秩相关评价 ADC 与临床活动度评分 (CAS) 的相关性。结果: 四种 DWI 中, FOCUS MUSE DWI 在所有结构中的 SNR 和 CNR 均最高, 其次为 MUSE DWI, P 值均 ≤ 0.001 。在 TAO 活动期患者中, FOCUS MUSE DWI 和 FOCUS DWI 中各结构的 ADC 与 CAS 均无相关性 ($P > 0.05$), 但在 MUSE DWI 中, 活动期 TAO 患者的视神经 ADC 与 CAS 有相关性 ($R = -0.420$, $P = 0.004$), 在单激发 DWI 中, 活动期 TAO 患者的内直肌和视神经 ADC 与 CAS 有相关性 ($R = -0.336$, $P = 0.022$; $R = -0.390$, $P = 0.007$)。结论: 在 TAO 病变相关的结构中, FOCUS MUSE DWI 和 MUSE DWI 较单激发 DWI 相比, 可明显提高信号强度, 为眼眶 MR 扫描提供更好的图像质量。较单激发 DWI 相比, MUSE DWI 与 CAS 的相关性更高, 提示了该序列在 TAO 患者临床评价中的重要作用。

PO-3639

评价视野优化无失真多元灵敏度编码技术 (FOCUS MUSE) 在直肠病变中的成像质量以及预测在病理危险因素中的潜在价值

万欣怡

海军军医大学第二附属医院

目的 评价视野优化无失真多元灵敏度编码技术 (FOCUS MUSE) 在直肠病变中的成像质量以及预测在病理危险因素中的潜在价值

方法 前瞻性的纳入 56 例指检或者肠镜检查首次发现直肠病变的患者。所有患者均进行直肠磁共振扫描, 在常规平扫序列基础上, 分别采用单次激发弥散加权技术 (SS DWI)、视野优化无失真单次激发弥散加权技术 (FOCUS DWI)、多元灵敏度编码技术 (MUSE) 和视野优化无失真多元灵敏度编码技术 (FOCUS MUSE) 进行垂直病变肠管的轴位扫描。由两名医生采用双盲法对图像整体质量、病变显示、病灶边缘锐利度和病灶形变进行定性评估。定量分析主要对图像的信噪比 (SNR) 和对比噪声比 (CNR) 以及病变扩散表观系数 (ADC) 进行比较。另外, 利用 ROC 曲线和 DCA 对直肠病变 ADC 预测周围神经侵犯的效能进行评估。结果 定性评估结果估显示, FOCUS MUSE 与 SS DWI 和 FOCUS DWI 相比, 均有更好的整体图像质量、病灶显示和病灶边缘锐利度以及更低的形变 ($P < 0.05$)。与 MUSE 相比, FOCUS MUSE 的病灶边缘锐利度更好, 形变更小 ($P < 0.05$), 但是整体图像质量、病灶显示, 差异无统计学意义 ($P > 0.05$)。定量分析结果显示 SNR 与 CNR 及 ADC 在 FOCUS MUSE、SS DWI、FOCUS DWI 和 MUSE 四组序列之间有统计学差异 ($P < 0.05$)。另外, 研究发现 FOCUS MUSE 联合其他三个序列在预测直肠病变神经侵犯阴性和阳性患者中有统计学差异 ($P < 0.05$), 其 AUC 值约 0.85, 敏感度为 0.83, 特异度为 0.91, 准确度 0.87。

结论 FOCUS MUSE 是一种视野优化无失真多元灵敏度编码技术,在直肠病变的应用中有更好的整体图像质量、病灶边缘锐利度、以及更小的形变,并在预测直肠病变周围神经侵犯上有不可预估的价值。

PO-3640

能谱 CT 去除 DBS 术前定位检查金属伪影的价值

王冲
徐州医科大学附属医院

摘要 目的 分析 CT 能谱成像 (Gemstone spectral imaging, GSI) 联合金属伪影去除 (Metal artifact reduction, MAR) 技术改善 DBS 术前立体定位头架伪影的价值。方法 回顾性分析 2022 年 1 月至 2022 年 12 月于我院行 DBS 术前 CT 定位的患者资料。实验组采用能谱扫描并联合 MAR 技术进行后重建,对照组在同一 CT 扫描仪采用常规扫描模式重建。比较实验组与对照组图像的背景噪声 (SD)、伪影指数 (AI)、信噪比 (SNR)、对比噪声比 (CNR) 以及图像质量主观评分和诊断信心。记录容积 CT 剂量指数 (CTDIvol)、剂量长度乘积 (DLP)、有效剂量 (ED)。采用 MedCalc 20.0 进行数据分析, $P < 0.05$ 为差异有统计学意义。结果 本研究共纳入 45 例患者,24 例患者行能谱扫描,21 例行混合能量扫描。40-140keV 组单能量+MAR 图像中,CT 值、SNR 值、CNR 值随着 keV 的增加而增加。SD 值、AI 值随着 keV 的增加而降低。140keV 单能量+MAR 图像 CT 值、SNR 值、CNR 值均最高,SD 值、AI 值最低。60-140keV 组单能量+MAR 图像 CT 值、SD 值、SNR 值、CNR 值、AI 值较 120kvp 相比均有统计学差异 ($P < 0.05$)。120keV 图像主观评分、诊断信心得分最高,并且在 40-120keV 组,随着单能量的增加,图像质量、诊断信心得分增加。24 例能谱扫描组患者其扫描长度、DLP、CTDIvol 及 ED 分别为: 158.5 ± 14.8 cm、 223.3 ± 32 mGy·cm、 11.5 ± 1.8 mGy、和 0.42 ± 0.06 mSv。结论 能谱 CT 单能量成像联合 MAR 重建技术,可以有效地降低 DBS 术前立体定位头架金属伪影,同时能降低患者辐射剂量。

PO-3641

3.0T 磁共振 NC-FIRM-MRA 和 CE-MRA 在肾动脉成像中的对比研究

姜松
中国人民解放军海军军医大学第二附属医院

目的: 探讨 3.0T 磁共振下肾动脉非对比增强流入反转恢复 MR 血管成像 (NC-FIRM-MRA) 和增强 MR 血管成像 (CE-MRA) 的图像质量,探讨肾动脉 NC-FIRM-MRA 的临床应用效果。

方法与材料: 前瞻性收集因病情需要行肾动脉 CE-MRA 检查的 20 例患者,同时均进行肾动脉 NC-FIRM-MRA 检查。由 2 名高年资放射科医师独立阅片,用 Kappa 检验对两名放射科医生的影像评估材料进行一致性检验。分别采用配对样本的 Wilcoxon 符号秩检验和 χ^2 检验分别对两种不同检查方法的图像进行肾动脉图像质量评分及肾动脉分支显示评分。

结果: CE-MRA 与 NC-FIRM-MRA 成像的肾动脉图像质量评分差异无统计学意义 ($P > 0.05$)。NC-FIRM-MRA 和 CE-MRA 图像的肾动脉分支显示差异有统计学意义 ($P < 0.05$)。

结论: NC-FIRM-MRA 对肾动脉各级分支的显示要优于 CE-MRA,而对于肾动脉主干及狭窄的显示两种方法图像质量无明显差异。NC-FIRM-MRA 成像可作为肾动脉狭窄的检测手段,值得临床推广与应用。

PO-3642

虚拟单能级成像及骨去金属伪影技术去除腰椎内固定伪影的临床应用价值

张沉石

中国人民解放军海军军医大学第二附属医院

目的：评价双层探测器能谱 CT (dual-layer detector spectral computed tomography, DLCT) 的高能级虚拟单能级成像 (virtual monoenergetic imaging, MonoE)、骨去金属伪影技术 (metal artefact reduction, O-MAR) 及二者相结合去除腰椎金属植入物伪影的价值。方法：前瞻性收集 2022 年 7 月至 12 月行腰椎内固定并术后行腰椎 DLCT 检查的患者。从 100 到 200keV 每隔 20keV 重建 MonoE, 并重建 O-MAR、O-MAR 结合 MonoE 图像, 比较图像间客观、主观评价差异。结果：45 例纳入研究 (男性 23 例, 55.4 ± 14.2 岁)。低、高密度伪影区 MonoE 和 O-MAR+ MonoE 的 CT 值随能级增高分别增高及减低。140keV MonoE 对软组织显示及伪影减少最佳, 200keV MonoE 及其结合 O-MAR 对金属和骨交界面显示效果最好, 但 O-MAR+200keV MonoE 噪声最低。结论：在去除腰椎金属内植入物伪影方面, 相较于 O-MAR 和 O-MAR 结合 MonoE, 高能级 MonoE 具有良好的应用价值。

PO-3643

对比剂团注追踪技术头颅 CTA 监测扫描启动时间的研究

杨尚文

南京鼓楼医院

目的：在对比剂团注追踪技术头颅 CT 血管成像 (CT angiography, CTA) 扫描中, 比较不同的监测扫描启动时间对图像质量和辐射剂量的影响, 探讨合适的监测扫描启动时间。方法：前瞻性收集来我院行头颅 CTA 检查的患者 400 例, 按预约先后顺序分为 A、B 组, 前 200 例为 A 组, 后 200 例为 B。A 组在对比剂注射后 8s 开始启动监测扫描。记录患者监测扫描的触发时间、触发时 CT 值、曝光次数和辐射剂量。测量双侧颈内动脉末段的 CT 值, 取 2 者平均值作为颈内动脉 CT 值, 并由 2 名放射诊断医师对图像质量进行主观评价。B 组监测扫描的启动时间为 12s, 其余参数、测量评价方法同 A 组完全一致。比较 2 组患者监测扫描的曝光次数、触发时间、触发 CT 值、颈内动脉 CT 值、剂量长度乘积 (dose length product, DLP)、图像质量评分和触发时间分布。结果：2 组患者不同触发时间病例分布无统计学差异 ($P > 0.05$)。患者监测扫描的触发时间、触发 CT 值、颈内动脉 CT 值和图像质量评分无统计学差异 (P 均 > 0.05), 而 B 组比 A 组监测曝光次数减少了 45.2%, DLP 比 A 组降低了 45.1%, 差异具有统计学意义 (P 均 < 0.05)。结论：在 64 排 CT 使用团注追踪技术进行头颅 CTA 扫描, 监测扫描的启动时间设置为 12s 时, 可以在保证图像质量的前提下, 减少患者的监测辐射剂量。

PO-3644

前瞻性心电门控 70kV 在非肥胖患者胸痛三联 CTA 检查中的可行性研究

李文航、伍瑶斌、王超
贵州省人民医院

目的 评价前瞻性心电门控 70kV 扫描方案在非肥胖患者胸痛三联 CTA 检查中的可行性。**方法** 对临床高度怀疑急性胸痛在我院行胸痛三联 CTA 检查的 120 例非肥胖患者随机分为 4 组, 分别采用回顾性心电门控 100kV(1 组)、70kV(2 组) 及前瞻性心电门控 100kV(3 组)、70kV(4 组) 四种扫描方案。测量升主动脉根部 CT 值及噪声, 计算 SNR、CNR, 并对图像质量进行主客观评分。**结果** 120 例患者组间体重指数(BMI) 差异无统计学意义($P > 0.05$)。1 组和 3 组的 CT 值及图像噪声低于 2 组和 4 组, 差异有统计学意义($P < 0.05$); 1 组的 SNR 及 CNR 高于其余三组, 差异具有统计学意义($P < 0.05$); 2 组、3 组、4 组的信噪比及对比噪声比组间差异无统计学意义($P > 0.05$)。四组间图像主观评分差异无统计学意义($P > 0.05$)。4 组辐射剂量显著降低, 平均有效辐射剂量为(0.49 ± 0.11) mSv, 组间差异具有统计学意义($P < 0.05$)。**结论** 对于心律平稳的非肥胖患者, 前瞻性心电门控 70kV 扫描方案可获得满意的胸痛三联血管图像质量同时降低患者辐射剂量。

PO-3645

双源 CT 高碘流率肾动脉 CTA 造影与 DSA 成像的对比

黎枝鑫
中国人民解放军陆军特色医学中心

目的: 探讨双源 CT (DSCT) 高碘流率血管成像和数字血管造影(DSA)和对于动脉粥样硬化性肾动脉狭窄 (ARAS) 的诊断价值

方法: 收集临床拟诊为肾动脉狭窄患者病例资料 20 例, 行双源 CT 高碘流率肾动 CTA 检查, 将所获得的图像数据进行 MPR、MIP、VR 和 SSD, 并对几种后处理技术进行初步对比根据肾动脉影像学表现评价肾动脉有无狭窄, 同期对 20 例患者行 DSA 检查, 并对两者检查结果进行对比分析。

结果: DSCT 发现狭窄血管 19 支, 其中 18 支经 DSA 证实(1 支假阳性), 符合率为 95%。

结论: 各种后处理技术中 MIP、VR 在诊断 ARAS 中具有重要作用。DSCT 是肾动脉狭窄筛选的可靠方法并可取代 DSA 作为首选检查方法。

PO-3646

探讨双能量 CT 虚拟单能量在下肢静脉成像联合下腔静脉滤网植入术的一站式运用

宋超
中国人民解放军陆军特色医学中心

【摘要】目的: 探讨双能量 CT 虚拟单能量在下肢静脉成像联合下腔静脉滤网植入术的一站式运用, 为临床诊疗提供高效快捷。**方法:** 纳入我院 2023 年 2 月至 2023 年 7 月期间临床疑是诊断的 51 例下肢静脉血栓患者, 且所有患者均进行了西门子双源 CT 计算机断层扫描双下肢静脉。将图像数据调入“Syngovia”工作站, 选择“Monoenergetic”进行虚拟单能量图像重建。根据后期治疗是否植入下腔静脉滤网术将患者分成 A(s), B(F) 两组。采用 t 检验分析下肢静脉血栓在虚拟单能量不同能级下

CT 值及单能量曲线斜率之间差异性。作 ROC 曲线分析, 评价双能量 CT 虚拟单能量成像对下肢静脉血栓是否后期联合下腔静脉滤网植入术的一站式运用。结果: A(s)组有 24 例患者后期进行下腔静脉滤网植入术, B(F)组有 27 例患者未进行下腔静脉滤网植入术; A、B 两组单能量曲线斜率均随着 Kev 值的增加而降低且进行下腔静脉滤网植入术患者斜率低于未进行下腔静脉滤网植入术患者, 两者存在显著统计学差异 ($P < 0.001$)。进行下腔静脉滤网植入术患者在虚拟单能量不同能级下 (40 Kev ~ 120 Kev) CT 值低于未进行下腔静脉滤网植入术患者, 两者存在显著统计学差异 ($P < 0.001$)。结论: 双能量 CT 虚拟单能量在下肢静脉血栓患者中运用不同能级 CT 值的变化和能量曲线斜率之间的差异可以有效地鉴别诊断是否为深静脉血栓、是否有下腔静脉滤网植入术的需求; 双能量 CT 虚拟单能量在下肢静脉成像作为评估是否联合下腔静脉滤网植入术新的辅助手段, 帮助临床医生更好地进行高效诊疗, 该流程操作简单, 措施方便, 值得临床推广试用。

PO-3647

吸气对抗阻力呼吸法与标准呼吸法在冠状动脉 CTA 扫描中的应用对比

朱梦甜

中国人民解放军陆军特色医学中心

目的: 比较吸气对抗阻力法与标准的传统呼吸方法对冠状动脉 CTA 的成像质量差异。

方法: 通过设置不同呼吸方式-吸气对抗阻力法 (腹带加压) 与标准呼吸法对患者进行冠状动脉 CTA 扫描。收集实验数据 94 例, 分为 A、B 两组, 其中 A 组 47 例, 采用传统的标准呼吸方法, B 组 47 例, 采用腹带加压对抗阻力的呼吸方法, 检查前由扫描技师评估患者配合情况与心率状况, 采用前瞻性/回顾性心电门控进行检查。后处理比较右冠、左旋支及左前降支 3 支大血管分支显示、运动伪影和心跳导致的条带状伪影情况, 计算图像信噪比及对比噪声。

结果: 采用吸气对抗阻力呼吸方法的实验组图像质量明显优于采用传统的标准呼吸方法的实验组, 差异有统计学意义 ($P < 0.05$), 图像信噪比及对比噪声统计学差异 ($P > 0.05$)。

结论: 通过控制呼吸方法, 采用新型的吸气对抗阻力的呼吸方法可以明显改善冠脉 CTA 检查的图像质量, 有效提高疾病诊断准确率。

PO-3648

探讨 NICaS 无创血流动力学监测指标对冠脉 CTA 达峰时间的影响

朱梦甜

中国人民解放军陆军特色医学中心

目的: 探讨 NICaS 无创血流动力学监测指标对冠脉 CTA 达峰时间 (PT) 的影响。

方法: 采用 NICaS 无创血流动力学监测系统, 对接受冠脉 CTA 检查的患者进行检查过程中血压、心率、心排指标以及外周阻力各项指标的监测。其他排除标准: 合并严重的原发性疾病; 存在对造影剂过敏等 CT 检查禁忌。通过检查前期的心率准备, 根据每位患者自身心率情况与呼吸配合程度, 选择合适心电门控对其进行冠脉 CTA 检查。通过比较患者冠脉 CTA 达峰时间, 分析影响冠脉 CTA 达峰时间的血流动力学指标因素。

结果: 统计分析结果显示冠脉 CTA 达峰时间 (PT) 与患者舒张压和外周阻力大小呈正相关, 与收缩压和心率无相关。

结论: 冠脉 CTA 达峰时间 (PT) 与舒张压和外周阻力大小呈正相关, 舒张压高对应的病理生理本质是外周阻力大, 造影剂到达主动脉时间越久, 达峰时间越长

PO-3649

NiCaS 无创血流动力学监测冠脉 CTA 联合常规增强 CT 图像质量及安全性研究

朱梦甜

中国人民解放军陆军特色医学中心大坪医院

目的: 探讨常规 CT 增强后行冠脉 CTA 检查, 对比剂续灌对冠脉 CTA 成像质量的影响及患者安全性研究。

方法: 将实验对象分为 A、B 两组, A 组行冠脉 CTA 单部位增强检查, B 组先进行常规增强 CT 检查然后行冠脉 CTA 检查。采用 NiCaS 无创血流动力学监测系统, 对患者进行检查过程中血压、心率、心排指标以及外周阻力各项指标的监测, 确保患者检查安全性。其他排除标准: 合并严重的原发性疾病; 存在对造影剂过敏等 CT 检查禁忌。通过检查前期的心率准备, 根据每位患者自身心率情况与呼吸配合程度, 选择合适心电门控对其进行冠脉 CTA 检查。后处理比较右冠, 左旋支及左前降支 3 支大血管分支显示, 计算图像信噪比及对比噪声, 对冠脉血管进行 15 段评分, 对比成像质量。结果: 统计分析结果显示两组受检对象成像评价、图像信噪比及图像对比噪声差异性 P 值均大于 0.05, 说明两组结果并无显著性差异, 即冠脉 CTA 成像质量与是否进行对比剂续灌无关; 对比剂续灌前后患者血流动力学监测指标变化也均在安全范围。

结论: 对比剂续灌不影响冠脉 CTA 成像质量且对患者并无风险性。

PO-3650

院级 CT 辐射剂量参考水平与警示值的建立及其在冠状动脉 CTA 剂量优化中的运用

刘衡、曾琬霆

中国人民解放军陆军特色医学中心

目的: 通过建立本院冠状动脉 CTA 辐射剂量参考水平与警示值, 并以此指导本科室进行冠脉 CTA 扫描方案及检查流程的优化, 控制受检者所受剂量的水平。

方法: 连续收集 2022 年 6 月到 2023 年 6 月在本科进行冠状动脉 CTA 检的受检者 5000 例, 按检查时间分为改进前和改进后 2 组, 分别 2500 例。设定改进前冠状动脉 CTA 的辐射剂量分布的均值为本院冠状动脉 CTA 辐射剂量的指导水平 (DRL)。第 75 个百分位数和第 25 个百分位数为本院辐射剂量诊断参考范围 (DRR) 的上限和下限。第 97.5 个百分位数为本院辐射剂量警示值。超过 DRR 上限则认为辐射剂量偏高, 超过警示值则认为辐射剂量超高。根据本年度超高剂量扫描原因分析结果。改进后再次收集 2500 例, 统计改进前后两组受检者的各项参数。

结果: 改进后本院冠状动脉 CTA 受检者的平均扫描剂量下降 11.3 %, 两组比较差异有统计学意义 ($t=54.11$, $P<0.05$)。胸部低剂量 CT 受检者的平均扫描剂量下降 20.13%, 差异有统计学意义 ($\chi^2=81.99$, $P<0.05$)。改进后胸部增强 CT 受检者的平均扫描剂量与改进前差异无统计学意义 ($P>0.05$)。改进后辐射剂量偏高的冠脉 CTA 受检者比率较改进前减少 7.34%, 其中使用前门控受检者增加 10.25%, 改进后辐射剂量超高的冠状动脉 CTA 受检者比率较改进前减少 2.37%; 超高剂量扫描的受检者中, 重复扫描率下降 4.78%。

结论：建立本院冠状动脉 CTA 辐射剂量参考水平及剂量警示值有助于推动剂量优化，降低受检者平均剂量，提高冠脉 CTA 检查成功率。

PO-3651

不同锥形束 CT 扫描模式交替成像在头颈部肿瘤患者图像引导放疗中的应用

王宇飞

天津市肿瘤医院

目的：保证放疗精确度的同时，减少头颈部肿瘤患者在放射治疗前进行图像引导时受到的额外电离辐射。

方法：选取天津市肿瘤医院 2022.7-2023.4 月 Halcyon 直线加速器行头颈部放疗患者 30 例。在患者奇数（第 1.3.5.7.....次）锥形束 CT 图像引导放疗时选择标准头部扫描模式“Head”（100KV，126mAs）；在患者偶数（第 2.4.6.8.....次）时选择低剂量模式“Head Low Dose”（100KV，42mAs）。治疗结束后比较患者奇数次和偶数次的位置误差；在 Eclipse 软件分别在两组图像上勾画 ROI，分析骨组织和软组织的噪声值，比较两组图像的成像质量；根据公式 $ED=DLP \times k$ （DLP：剂量长度乘积；全身加权 $k=0.012mSv \cdot mGy^{-1} \cdot cm^{-1}$ ）计算患者在两种成像模式下受到的辐射剂量。结果：两组模式在患者奇数次和偶数次的位置误差没有统计学意义（ $p>0.05$ ）；标准扫描模式下骨组织和软组织的噪声值分别为 21.32 ± 5.63 、 28.54 ± 8.49 ，低剂量扫描模式下骨组织和软组织的噪声值分别为 27.87 ± 7.75 、 58.17 ± 14.57 ，骨组织和软组织的噪声分别上升 30.72%、103.82%；两组的有效辐射剂量分别为 (1.15 ± 0.19) mSv、 (0.37 ± 0.03) mSv，差异有统计学意义（ $p<0.05$ ），交替成像引导比固定标准模式引导患者受到的电离辐射降低了 67.83%。

结论：在头颈部肿瘤患者进行锥形束 CT 图像引导放疗时，标准扫描模式和低剂量扫描模式在纠正误差方面具有一致性；低剂量模式扫描对软组织的成像影响较大，对骨组织的成像影响较小，所以在放疗技师检查图像配准时几乎不受影响；交替成像引导模式下患者受到的额外辐射更少，在头颈部肿瘤患者放疗时能更好的保护中枢神经系统、晶体、甲状腺等重要器官，在临床治疗中值得推广应用。

PO-3652

多功能数字胃肠机（DRF）应用于瓦-米试验的优势及心得体会

唐飞、范华君、邓淞文

贵航安顺医院

摘要：瓦-米试验对诊断甲状腺肿是否合并气管软化有及其重要的价值，也是甲状腺肿大患者术前不可缺少的检查方法之一，但传统 DR 摄片时，即便是有多年经验的技师亦无法一次性获得有价值的影像资料。患者的配合度，技师的摄片时机，呼吸运动伪影等均会对试验结果产生重大影响，因此需多次投照，患者的依从度因反复吸屏气动作而逐次递减，运用多功能数字胃肠机进行此项试验时，可利用数字胃肠机强大的同步观察，即时点片及记忆回放功能，在瓦-米试验的投照关键节点进行同步观察，摄影点片及影像回放录制。投照结束后，可逐帧观察，选取最具诊断价值的图像进行测量，从而缩短了检查时间，提高了患者的就医感受。

目的：探讨 DRF 应用于瓦-米试验时对比传统 DR 摄片的优势性。

方法：回顾性分析我院 29 例经手术证实为甲状腺肿合并气管软化的患者所作瓦-米试验，同一患者均由同一位技师采用 DR+DRF 的双重检查方式进行瓦-米试验。图像上传后，分别由医师对两组图像进行测量。

① 瓦氏试验---患者侧立于平板探测器前，平视前方，保持身体平稳，双臂下垂，头颅及身体的矢状面与平板探测器平行。患者按照技师指示，尽力吸气后关闭声门并强力屏气，在屏气末端给予技师信号的同时进行摄片。

② 米勒氏试验---患者按照技师指示，尽力呼气后关闭声门，在屏气末端做吸气动作，但并不真正进行气体交换，此时给予技师信号进行摄片。

上述两项试验均常规进行正侧位投照，投照条件，位置，中心线及距离均相同。

结果：通过对 DRF 组和 DR 组的图像进行测量与分析，排除 2 例因巨大肿块导致管径差值无变化的患者后，DRF 组和 DR 组管径差为 3.0mm 及以上的患者检出率分别为 86%和 70%，DRF 组的管径真实差及测量准确率明显高于 DR 组。

结论：运用多功能数字胃肠机进行瓦-米试验，可更精准的测量管径差值，用于评估甲状腺肿患者有无气管软化风险及程度，为临床提供可靠有价值的影像数据。

PO-3653

颈部增强 CT 减少伪影优化方案的应用研究

潘欣璐、段庆红

贵州医科大学附属肿瘤医院

目的：探讨颈部双能增强 CT 扫描时减少患者锁骨及右锁骨下静脉对比剂伪影优化方案的效能。

方法：选取行颈部增强 CT 检查患者 100 例，对扫描图像进行对照质量分析。在增强 CT 检查中分别以传统方案和优化方案进行随机检查，根据方案将影像资料分为 2 组，对照组(A 组)自然平躺，对比剂和生理盐水分别以 2.5mL/s 和 2.5mL/s 固定速率推注；实验组(B 组)下颌上抬，颈下放置梯形海绵枕，使颈部完全贴合机床，头部用 B 枕固定防止患者头部歪斜，对比剂推注时间设定为动脉期 25s；静脉期 60s、对比剂速率设定为 2.5mL/s，生理盐水速率设为 2.5mL/s。

客观评价：从颈部 CT 值、噪声、噪声比、对比信噪比、右锁骨下静脉伪影指数方面对 2 组图像进行质量分析比较差异。

主观评价：对颈部内部结构强化层次及边缘视觉效果、锁骨和右锁骨下对比剂静脉伪影影响程度进行评分。结果 2 组方案记录的数据多组间比较，颈部平均 CT 值、右锁骨下静脉伪影指数差异有统计学意义($P<0.05$)。两两比较，实验组(B 组)的颈部平均 CT 值均高于 A 组，均有统计学差异($P<0.05$)，2 组方案在右锁骨下静脉伪影指数大小关系为：B 组<A 组，2 组方案图像质量主观评分大小关系为：B 组>A 组，且两两比较均有统计学差异($P<0.05$)。2 组方案多组间比较在噪声、噪声比、对比信噪比上差异无明显统计学意义($P>0.05$)。

结论：体位、对比剂注射时间、生理盐水冲刷技术的优化方案有助于减少颈部增强 CT 的锁骨和右锁骨下静脉对比剂伪影。

PO-3654

一种新的放射性损伤敏感性监测方法的探讨

徐汉友

浙江省遂昌康复医院

目的：为了减轻放射性损伤，探讨一种监测人体对放射性损伤敏感性的方法。

方法：通过一例临床放射性损伤敏感性的特点，明显表现在皮肤在 CT 照射后，发生明显损伤的病情，得到启发，研究发现一种监测放射性损伤敏感性的方法。

结果：鉴于放射性诊疗的必要性，及其放射性损伤副作用的严重性，探索一种新的放射性损伤敏感性监测方法势在必行，要达到有效放射性损伤敏感性监测，从而达到精准、个性化治疗的目的，应该在放射性损伤敏感性监测时，不能再做全身性放射性照射，或不做放射性照射。

结合上述病例，病人对放射性损伤敏感，对于放射性损伤敏感性监测，我们可以监测病人的皮肤，对病人做相关刺激，观察病人的敏感性，若观察到病人高敏性，说明病人对外界刺激高度敏感，从而指导病人尽可能不做放射性诊疗，或做低剂量的放射性诊疗操作。

对于病人皮肤敏感性试验的刺激因子的选择，最好的刺激因子应该是，皮肤放射性照射，利用特制的非常局限的放射性照射仪器，局限性、不同剂量的单纯小片状照射皮肤，然后检测皮肤的损伤程度，得出皮肤对放射性是否敏感及相关照射剂量，从而判断病人是否对放射性诊疗是否敏感，及敏感病人对所需要的健康低剂量照射的剂量，从而达到精准、个性化有效治疗的目的。

该检测方法适用于对病人的监测，和对医务人员的监测，还可以应用到其他与放射性损伤有关的职业人员的监测。

结论：本研究总结一个敏感病人皮肤放射性损伤的临床特点和表现，结合当今放射性损伤防治现状和迫切需要精准、个性化有效放射性诊断和治疗的现状，创新一种新的放射性损伤敏感性监测方法，该方法简单易行，对病人损伤小或几乎无损伤，值得进一步研究和实施，以减少放射性诊疗操作时的放射性损伤到最低程度，达到理想的放射性诊疗效果。

当然，本研究仅仅是研究设想和方案，需要进一步研究实施，及临床实验性应用，最终广泛应用于临床。

本研究应该有巨大的经济效益和社会效益，值得国内外参考应用。

PO-3655

医用放射性损伤的防治进展和防治建议

徐汉友

浙江省遂昌康复医院

目的：为了更好地做好放射性诊疗和防治医用放射性损伤，特作此研究。

方法：总结当前医用放射性诊疗现状，及医用放射性损伤的防治进展，提出防治建议。

结果：研究提出了 10 项医用放射性损伤的防治方法如下：

1. 重视医用放射性诊疗器械诊疗操作时的防护，不仅操作者要做好防护，病人也要做好严格防护。
2. 健康体检应规定不做 CT 检查，可做磁共振检查，或低微放射剂量的拍片检查。
3. 作为放射性损伤的敏感部位眼睛的防护，应该引起高度重视，务必使放射性诊疗操作者和受检查治疗者，防护其眼睛等其他器官。
4. 大力开展精准放射性诊疗操作的研究。
5. 大力开展精准放射性诊疗操作的防治方法。
6. 大力研究放射性损伤的临床治疗。
7. 在全国范围内大力开展放射性损伤有关知识的健康宣教。
8. 医学科技需要进一步发展，开发研究替代放射性诊疗操作的新的医疗器械，或开发研究更低辐射剂量的医疗器械。
9. 建议建立新法规，实施放射性诊疗操作限制制度，像抗菌素使用那样，建立放射性诊疗操作处方权制度。
10. 建立法规，优化医院开展放射性诊疗器械准入制度。

结论：在当今滥用 CT 作为一般常规体检检查方法的情况下，医用放射性损伤的防治迫切和势在必行，本研究提出的 10 项医用放射性损伤的防治方法，弥补了医用放射性损伤防治的不足，非常值得参考应用。

PO-3656

基于深度学习图像重建提升 CCTA 图像质量的可行性

任占丽、申利、雷雨欣、张敏、韩冬、于勇、于楠、贺太平
陕西中医药大学附属医院

目的：探讨基于深度学习图像重建提升冠状动脉成像质量的可行性。方法：收集我院 2023 年 5 月至 2023 年 8 月行冠状动脉检查患者 30 例，采用管电压 100kV，噪声指数 24，智能管电流调制技术 (Smart mA)，扫描完成分别重建 50%ASIR-V 和深度学习图像重建不同级别降噪 (DLIR-L、DLIR-M、DLIR-H) 图像，分别测量四组图像主动脉根部、左主干、左前降支、左回旋支、右冠状动脉及心包脂肪 CT 值及 SD 值，计算信噪比 (SNR) 和对比噪声比 (CNR)。由两名具有五年工作经验医生采用五分法分别对图像质量进行主观评价。结果：四组重建图像噪声 (SD 值)、SNR 值及 CNR 值间差异均具有显著统计学意义 ($p < 0.001$)，且冠状动脉 SD 值在 50%ASIR-V、DLIR-L、DLIR-M、DLIR-H 中依次减低、SNR 值和 CNR 值在 50%ASIR-V、DLIR-L、DLIR-M、DLIR-H 中逐渐升高，其中 DLIR-H 重建算法 SD 值最低、SNR 值和 CNR 值最高。两名医师对四组重建图像主观评分具有良好一致性 (κ 值 > 0.75 , p 值 < 0.001)，冠状动脉 DLIR 重建算法主观评分显著高于 50%ASIR-V ($p < 0.001$)，其中 DLIR-H 重建算法主观评分最高。结论：深度学习图像重建 (DLIR) 算法可以显著降低 100kV 冠状动脉图像噪声并提升图像质量，其中 DLIR-H 重建算法提升冠状动脉图像质量效果最佳。

PO-3657

基于深度学习智能测量胸部 CT 图像噪声和信噪比的可行性研究

梅博哲^{1,2}、龚向阳²
1. 锦州医科大学
2. 浙江省人民医院

目的

探索智能测量胸部 CT 图像噪声和信噪比的可行性，为大数据影像质量评价和分析提供新方法。

方法

本研究纳入 300 例正常胸部 CT 图像，包括研究数据集、内部测试数据集和外部测试数据集各 100 例。基于研究数据集，在气管分叉所处的 2D 层面，使用基于 3D Unet 深度学习框架构建的分割模型自动分割背景空气和肺野；分别以 -800Hu、-850Hu、-900Hu、-950Hu 和 -1000Hu 为阈值，测量背景空气的平均 CT 值和标准差，以 CT 值标准差作为图像噪声指标；分别以 -450Hu 到 -900Hu 间隔 50Hu 为阈值，测量肺野的平均 CT 值和标准差，计算图像信噪比 (SNR) 和对比信噪比 (CNR)；以人工测量的噪声、SNR、CNR 为参考标准，综合比较并筛选背景空气和肺野的最优 CT 阈值。基于内部测试数据集、外部测试数据集，验证最优 CT 阈值下自动测量噪声、SNR 和 CNR 与人工测量的一致性。采用组内相关系数 (ICC) 和皮尔逊相关系数分别对研究数据集、内部测试数据集和外部测试数据集与其所对应参考标准的一致性进行评价。

结果

在研究数据集中，背景空气 -900Hu、肺野 -800Hu 的阈值下，自动测量的噪声、SNR、CNR 结果分别为 29.35 ± 7.48 、 32.31 ± 8.43 、 7.80 ± 8.85 ；参考标准的噪声、SNR、CNR 结果分别为 30.24 ± 11.94 、 33.76 ± 13.70 、 7.62 ± 9.12 ；两者之间的 ICC 分别为 0.73、0.81、0.95， r 分别为 0.82、0.89、0.95。内部测试数据集和外部测试数据集自动测量的噪声 ICC 分别为 0.96、0.84， r 分别为 0.97、0.94；SNR 的 ICC 分别为 0.85、0.75， r 分别为 0.93、0.93；CNR 的 ICC 分别为 0.90、0.85， r 分别为 0.92、0.92。

结论

基于深度学习所探索的方法可以智能测量胸部 CT 图像噪声和信噪比,与放射科医生相比具有较高的准确性,可以代替人工测量结果,为大数据影像质量评价和分析提供新方法。

PO-3658

两种不同超高 b 值扩散加权成像序列在前列腺癌和前列腺增生中的临床应用

杨创勃、贾永军、于楠、张敏、贺太平
陕西中医药大学附属医院

目的 探讨分段读出扩散加权成像序列 (RS-EPI) 与单次激发平面回波成像 (SS-EPI) 超高 b 值在前列腺癌和前列腺增生诊断中的应用。**方法** 纳入 37 例经外科手术或穿刺、病理证实的前列腺疾病患者,其中前列腺癌 15 例,前列腺增生 22 例,所有患者于手术或穿刺前行 MR 扩散加权成像, b 值选择 0、1000、2000、3000s/mm²,由两名高年资医师用双盲法观察两种不同扩散加权成像不同 b 值时的扩散加权图像,对两名观察者的判断结果进行一致性检验,并比较两种不同 b 值对前列腺癌及前列腺增生的定性诊断准确率。**结果** 两名观察者的判断结果存在一致性 ($P<0.001$), Kappa 值为 0.88。当 b 值分别为 1000s/mm²、2000s/mm²、3000s/mm² 时, RS-EPI 诊断前列腺癌和前列腺增生的灵敏度及特异度分别为 66.7%和 81.8%、80.0%和 90.9%、93.3%和 95.5%。SS-EPI 诊断前列腺癌和前列腺增生的灵敏度及特异度分别为 66.7%和 77.3%、73.3%和 81.8%、80.0%和 86.4%。RS-EPI 的诊断符合率分别为 75.7%、86.5%、94.6%,而 SS-EPI 的诊断符合率分别为 73.0%、78.4%、83.8%。RS-EPI 在超高 b 值诊断前列腺癌和前列腺增生的灵敏度及特异度明显高于 SS-EPI。**结论** 选择超高 b 值 (1000、2000、3000s/mm²) 对前列腺癌和前列腺增生的鉴别具有较高的灵敏度和特异度,在鉴别前列腺癌和前列腺增生时, RS-EPI 较 SS-EPI 可能作为一种更好的辅助方法。

PO-3659

两种不同超高 b 值扩散加权成像在前列腺肿瘤病变 MR 检查中对图像质量的影响

杨创勃、贾永军、于勇、张敏、于楠
陕西中医药大学附属医院

目的 超高 b 值对前列腺癌的检出有较高的敏感度,但却使图像质量明显下降,本研究比较超高 b 值读出方向分段采样平面回波成像 (RS-EPI) 和常规单次激发平面回波成像 (SS-EPI) 在前列腺癌 MR 检查中对图像质量的影响。**资料与方法** 回顾性分析 33 例在 3.0T MR 均行 SS-EPI 和 RS-EPI 超高 b 值 DWI 检查的前列腺癌病例的影像资料(分别选取 $b=1000$ 、2000 和 3000 s/mm²),分别由一位有 10 年以上工作经验的副主任医师和技师在不提供任何临床资料及 MR 序列信息的情况下,以轴位 T2WI 抑脂序列作为参照,针对两种扩散加权成像(diffusion weighted imaging, DWI)从病灶显示的清晰度、图像解剖变形、图像锐利度、细节显示四个方面按 5 个等级 (1-5 分) 进行独立主观评分。由第三位副主任医师在工作站上测量图像的信噪比 (SNR)、对比噪声比 (CNR) 和对比度,常规 SS-EPI 和 RS-EPI 两组间图像比较采用配对 Wilcoxon 秩和检验或配对 t 检验。**结果** 两位阅片者在共同评价两序列图像(选取 $b=1000$ 、2000 和 3000 s/mm²)病灶显示的清晰度、解剖变形、图像锐利度及细节显示方面具有很好的一致性, Kappa 值均大于 0.70。两位医师在对两种序列 (RS-EPI 和 SS-EPI) 在不同超高 b 值的主观综合评分中, RS-EPI 序列图像质量的各项指标明显

优于 SS-EPI ($P<0.05$)。结论 超高 b 值 RS-EPI 序列与常规 SS-EPI 序列相比明显提高了图像质量的多个指标, 更有利于早期前列腺癌的检出及鉴别。

PO-3660

CT 系统化分组质量控制管理模式在放射科技护一体化管理中的应用研究

邓洋、冉启胜、刘衡
中国人民解放军陆军特色医学中心

目的 探讨 CT 系统化分组质量控制管理模式在放射科技护一体化管理中的应用价值。

方法 1、传统质控模式: 每月月初由技师长带队, 对上月 CT 图像进行随机抽查 50 例左右, 从体位设计、参数设计、图像后处理三方面分别对图像进行评分, 最后汇总得出每月质控分数及各技术人员和护士得分情况。

2 系统化分组质控模式: 由技师长牵头, 将 CT 按照部位分为头颈部血管、体部血管、四肢血管、颌面部、颈部、胸部、心脏、腹部、泌尿系、四肢关节、灌注等, 由 5 年以上工作经验的技师分别担任每个项目质量评分负责人。每月第 10 个工作日前对上月 CT 图像进行随机抽查 50 例, 负责人各自查阅文献及专家共识, 根据本科室实际情况制定检查规范及评分细则。评分需包括检查前准备 (一般由护理人员承担) (如体位端正、闭气良好、憋尿充分等), 扫描 (由技师承担) (如充盈良好、扫描时机正确、辐射剂量适中等), 图像处理 (由技师承担) (如重组规范、后处理规范等)。最终由技师长进行汇总与考核, 获得每月质控分数及各检查环节技师及护士得分情况。

3、选取 2015-2018 年 287456 次 CT 患者 (传统质控管理模式, A 组) 和 2019-2022 年 321628 次 CT 患者 (系统化分组质控模式后, B 组) 进行分析研究。从患者重复扫描率、患者检查差错率、患者满意度、图像质量控制得分四个方面进行比较。

结果 患者重复扫描率: B 组 (1.41%) < A 组 (2.08%); 患者检查差错率: B 组 (0.021%) < A 组 (0.072%); 患者满意度: B 组 (97.36%) > A 组 (92.18%); 图像质量控制得分: B 组 (85.78 ± 3.05) > A 组 (77.32 ± 4.26)。

结论 CT 系统化分组质控模式有效的降低了患者检查的差错率, 降低了因重复扫描带来的辐射剂量风险, 提高了患者的满意度, 提高了图像质量, 在放射科技护一体化管理中起到重要作用。

PO-3661

全心运动校正算法对冠状动脉钙化积分图像质量和定量评估的影响

贾永军、于楠、杨创勃、段海峰
陕西中医药大学附属医院

摘要: 目的 评价全心运动校正算法 (NG SSF) 改善冠状动脉钙化积分 (CACS) 钙化斑块图像质量的效果和对钙化积分结果的影响。方法 纳入 69 例接受心脏冠脉钙化积分检查患者, 比较采用 NG SSF 重建前后图像 (分别为常规标准模式 STD 组及 NG SSF 组), 主观评分比较钙化斑块图像质量, 采用 Kappa 检验评价两位观察者间评分的一致性。比较 STD 组及 NG SSF 组包括 Agatston 积分 (AS)、容积积分 (VS)、质量积分 (MS) 的 CACS 定量结果, 并基于 Agatston 积分进行危险度评级。结果 两位观察者间对于 STD 组钙化斑块图像质量评分一致性好 (Kappa = 0.850), 对于 NG SSF 组钙化斑块图像质量评分一致性较好 (Kappa = 0.758)。NG SSF 组较 STD 组钙化斑块图像质量评分增高, 差异有统计学意义 (P 均 <0.05); NG SSF 组 AS、VS、MS

均低于 STD 组 ($P<0.05$)。7 名 (占 10.14%) 受检者存在 Agatston 积分危险分层改变, 其中 5 例高风险跨级为中风险, 2 名例中风险跨级为低中风险。结论 NG SSF 技术可改善心脏 CACS 钙化斑块图像质量进而可能优化钙化积分准确度, 采用 NG SSF 重建会降低 CACS, 从而影响患者的危险度评级。

500 例腰椎正侧位片质控分析及体会

宾大庆
重庆市璧山区人民医院

研究目的是通过分析我院 500 例腰椎正侧位片的图像质量, 找出技术缺陷, 提出整改措施, 从而提高照片质量和科室质控能力, 提升放射技师工作水平, 增强放射技师责任意识, 尽可能减少患者不必要的 X 线辐射, 确保患者安全。

PO-3663

PDCA 循环模式在改善腹部磁共振图像质量中的应用研究

舒震宇
浙江省人民医院

目的 探讨计划、执行、检查、处理(PDCA)循环模式改善腹部磁共振图像质量的运用效果。方法 回顾性分析腹部磁共振图像质量共 2835 例, 对每例图像按优秀、良好、及格进行质量评分。其中 2023 年 4-7 月图像例数作为对照组, 2023 年 4-7 月图像作为干预组, 干预组应用 PDCA 循环法, 即对产生图像质量差的原因进行分析、总结, 并落实相应质量干预措施。最终对两组图像质量进行干预前后的分析, 比较两组图像质量的优秀率、良好率、及格率及每个月的优秀率, 以评估 PDCA 循环管理对腹部磁共振图像质量的改善效果。结果 执行 PDCA 循环法后, 腹部磁共振图像优秀率从 74.56%提升到了 94.62%, 差异有统计学意义 ($\chi^2=227.896$, $p<0.001$)。腹部磁共振图像质量及格率由 0.92%下降到 0.32%, 差异有统计学意义 ($\chi^2=222.053$, $p<0.001$)。腹部磁共振图像质量良好率由 24.52%下降到 5.06%, 差异有统计学意义 ($\chi^2=4.302$, $p<0.05$)。每个月的腹部磁共振图像质量的优秀率较同期未执行前比较均有统计学差异 ($p<0.001$)。结论 通过实施 PDCA 循环模式, 可有效改善腹部磁共振图像质量, 提高诊疗效果, 值得临床推广应用。

PO-3664

儿童颅脑集成 MRI 的图像质量研究

吕青青
郑州大学第三附属医院

目的 对比分析儿童颅脑 MRI 的集成序列与常规序列的图像质量。方法 对 40 例儿童进行头部常规序列及集成序列 MR 扫描, 并按年龄分为 A 组 (<2 岁) 和 B 组 (>2 岁)。比较常规序列 T1 FLAIR、T2WI、T2 FLAIR 图像与集成序列重建 Syn T1 FLAIR、Syn T2、Syn T2 FLAIR 的灰质、白质及脑脊液的信号强度及对比度, 并对 A 组、B 组两序列间的总体图像质量、灰白质分界清晰度、病变显著性以及伪影评分进行比较。结果 Syn MRI 灰质、白质和脑脊液的对比度与 Con MRI 有统计学差异; Syn T1FLAIR、T2 灰白质与脑脊液的相对对比度与 Con 图像有统计学差异 ($P<0.05$); 两组 Syn T1FLAIR 和 T2 的总体图像质量均可被接受, 对于 T1 FLAIR 图像, A 组集

成图像灰白质分界评分较常规图像高 ($P<0.05$)，B 组集成图像的病变显著性较常规图像有差异 ($P<0.05$)；对于 T2 加权图像，两组常规图像和集成图像的灰白质分界无显著差异 ($P>0.05$)，B 组集成序列的病变显著性差异较常规序列高 ($P<0.05$)；对于 T2 FLAIR 图像，A 组常规图像的灰白质分界较集成图像更清晰 ($P<0.05$)，而 B 组无明显差异 ($P>0.05$)，两组序列图像的病变显著性无明显差异 ($P>0.05$)；集成序列的伪影评分均高于常规序列 ($P<0.05$)。结论 儿童脑部集成序列的 T1 FLAIR 和 T2 加权图像可以常规用于临床诊断，并在一定程度上优于常规序列。但 Syn T2 FLAIR 序列的质量普遍低于常规序列。在日常工作中可在集成序列的基础上加扫常规 T2 FLAIR。

PO-3665

基于深度学习图像重建算法对脑白质脱髓鞘患者 MRI 图像去噪效果的研究

倪鸣飞、苗延巍、宋清伟、刘爱连
大连医科大学附属第一医院

目的：使用基于深度学习重建算法的加速因子研究脑白质脱髓鞘患者脑磁共振图像的去噪效果。
方法：招募了 14 名受试者（9 名男性和 5 名女性，平均 59 ± 14 岁）。在 1.5T MR 扫描仪（UNITED IMAGING 680）上进行 MRI 扫描，包括轴位 T2WI 和 T2-FLAIR 序列。每个患者都接受了常规序列（A 组）和加速扫描序列以获得原始图像。使用常规滤波重建和 Deep Recon 重建技术对每个序列的加速序列图像进行重建，得到了 Deep Recon 图像（B 组）和常规滤波重建图像（C 组）。测量脱髓鞘病变的信噪比（SNR）和对比度噪声比（CNR）值。使用四分制方法对图像的整体质量进行评分和分析，3 分或 4 分可用于影像诊断。使用 Friedman 检验进行配对比较，以评估不同组之间的信噪比、CNR 和主观得分的差异。
结果：在 T2WI 图像上，不同组之间的 SNR、CNR 和主观评分存在显著差异。与 C 组相比，B 组的 SNR、CNR 和脱髓鞘病变的主观评分均有所提高 ($P<0.05$)，但 B 组和 C 组的 SNR、CNR 及主观评分均低于 A 组 ($P<0.05$)。与 C 组相比，B 组脱髓鞘病变的信噪比、CNR 和主观评分均有所提高 ($P<0.05$)，但 B 组和 C 组的信噪比、CNR 及主观评分均低于 A 组 ($P<0.05$)。
结论：与常规序列对比，T2WI 和 T2-FLAIR 快速成像序列可以节省大量的扫描时间，但是伴有信噪比和 CNR 的损失。对于脑白质脱髓鞘病灶的检查，Deep Recon 技术在 T2WI 和 T2-FLAIR 快速成像序列中具有良好的去噪效果，可以提高图像质量。

PO-3666

超高 b 值读出方向分段采样扩散加权成像序列在前列腺癌和前列腺增生中的临床应用

杨创勃、于楠、贾永军、马光明、张敏、于勇
陕西中医药大学附属医院

目的 探讨 3.0T MR 读出方向分段采样扩散加权成像序列（Rs-EPI）超高 b 值在前列腺癌（Pca）和前列腺增生(BPH)诊断中的应用。
方法 纳入 37 例经外科手术或穿刺、病理证实的前列腺疾病患者，其中前列腺癌 15 例，前列腺增生 22 例，所有患者于手术或穿刺前行 3.0T MR 扩散加权成像，b 值选择 0、1000、2000、3000s/mm²，由两名高年资医师用双盲法观察并分析不同 b 值扩散加权图像，测量 DWI 高信号区和邻近背景区域的信号强度，计算不同 b 值 DWI 对前列腺癌及前列腺增生的定性诊断准确率。

结果 3.0T MR 扫描时 b 值分别为 1000s/mm²、2000s/mm²、3000s/mm² 时, DWI 诊断前列腺癌和前列腺增生的灵敏度及特异性分别为 80.0%和 63.6%、93.3%和 68.2%、93.3%和 72.7%。b 值选择 1000s/mm²、2000s/mm² 时, 诊断前列腺癌和前列腺增生的灵敏度及特异度低于 b 值为 3000s/mm²。

结论 3.0T MR Rs-EPI 选择超高 b 值 (1000、2000、3000s/mm²) 对前列腺癌和前列腺增生的鉴别具有较高的灵敏度和特异度, 可作为诊断前列腺癌和前列腺增生的重要辅助方法。

PO-3667

社交媒体在心脏 CTA 个性化成像中的价值

丁晓青、龚志刚

上海中医药大学附属曙光医院

目的: 验证微信小程序“个性化造影剂注射方案计算器”进行心脏 CTA 造影剂注射方案个性化设置是否可以优化造影剂注射方案。

方法:

方法: 将我院门诊及住院患者需要进行心脏 CTA 检查的患者按时间段分为两组, 试验组使用微信小程序“个性化造影剂注射方案计算器”进行心脏 CTA 造影剂注射方案个性化设置, 对照组按照操作者经验设置造影剂注射方案。观察两组患者最终使用的造影剂总量, 速率。同时观察心脏 CTA 的图像质量, 进行主观和客观评分。

结果:

结果: 试验组共纳入 45 例患者, 对照组共纳入 42 例患者, 两组患者一般信息无统计学差异。所有患者使用第三代双源 CT (SOMATOM Force, Siemens Healthineers, Forchheim, Germany) 前瞻性心电触发序列扫描模式完成。使用自动管电压和管电流调制技术 (CARE kV 和 CARE Dose4D), 参考管电压为 100kV, 质量参考管电流为 320mAs。根据患者体型自动设置实际扫描参数。试验组平均造影剂用量为 39±12ml, 速率为 2.9±1.7ml/s。对照组平均造影剂用量为 56±7ml, 速率为 4.2±0.6ml/s。与对照组比较, 试验组的造影剂用量和速率分别减少 43.5%和 44.8%。两组主观和客观图像质量无差异。

结论:

结论: 利用社交媒体进行造影剂注射方案个性化设置, 可以优化造影剂用量, 同时不影响图像质量。

PO-3668

基于定位图像估算管电流调制 CT 检查体型特异性辐射剂量的方法

黄文诺

江苏省苏北人民医院

【摘要】:目的 研究基于定位像估算管电流调制(TCM)CT 检查体型特异性辐射剂量 (SSDE) 的方法。方法 利用定位像估算轴向的等效水直径, 根据断层图像的管电流调制曲线, 计算受检者轴向不同位置的 SSDE。回顾性分析 20 例临床胸部 TCM 检查数据, 利用定位像和断层图像分别计算累积 SSDE、中心 SSDE 和平均 SSDE。结果 以断层图像计算的分布为标准, 男性受检者断层图像与定位像计算的 SSDE 的相对偏差均值为-1.7%~4.3%, 偏差最大值 9.9%。女性受检者的偏差均值-4.3%~2.7%, 偏差最大值 7.8%。利用 Pearson 相关分析两种方法计算的累积 SSDE、均值 SSDE、中心 SSDE, 相关性大于 0.98, 偏差小于 5%; 断层图像和定位像计算的中心 SSDE 偏大于断层图像计算的累积 SSDE。结论 利用定位像和断层图像计算的 SSDE 分布趋势一致, 相对偏差小于

AAPM 220 报告中的值, 基于定位像和断层图像计算三种 SSDE 相关性都较高。本文提出一种利用定位像快速计算 TCM 检查的轴向 SSDE 分布的方法, 可用于估算个体化器官剂量和优化 CT 检查方案。

PO-3669

数字 X 线摄影最佳源像距体模实验研究

黄文诺
江苏省苏北人民医院

【摘要】目的 借助体模实验探讨基于体表入射剂量(ESD)及影像质量因子(IQFinv)的数字 X 线摄影(DR)最佳源像距(SID), 为 DR 摄影辐射防护及参数优化提供依据。方法 对 PMMA 关节体模和 CDRAD2.0 对比度细节体模进行 DR 摄影。采用自动曝光模式(AEC), 管电压分别设定 50Kv-120Kv 范围内以 10Kv 递增; SID 设定在 80cm-230cm 范围内以 10cm 递增; 总计 128 个曝光参数组合。QUART dido2100K 剂量仪测量 ESD。Analyzer software version2.1 软件分析计算 IQFinv 值。Excel2010 软件建立体模 ESD、IQFinv 与 SID 关系曲线; SPSS19.0 分析 SID 与 ESD、IQFinv 的 Pearson 相关性, $P<0.05$ 为统计学显著性水平。体模 IQFinv、ESD 值作归一化处理, 拟合不同管电压体模 IQFinv、ESD 归一化值与 SID 曲线确定最佳的 SID。结果 (1) 体模实验 ESD 最大值 44.97mGY, 最小值 15.07mGY, 均值 26.23 ± 7.41 , ESD 与 SID 负相关 ($r=-0.989, p<0.001$), SID 80cm 至 230cm, ESD 显著降低 24-30%。(2) IQFinv 最大值 3.97, 最小值 2.02, 均值 3.22 ± 0.43 。IQFinv 与 SID 为负相关 ($r=-0.959, p<0.001$), 随着 SID 增加, IQFinv 略有降低。(3) 管电压 50Kv 至 120Kv, 最佳 SID 分别为 130cm, 150cm, 140cm, 190cm, 210cm, 200cm, 140cm, 130cm。实验体模的最佳摄影参数为 90Kv, SID 为 210cm。结论 DR 成像 AEC 模式时, 探测器获得相等曝光量, 增加的 SID 可以显著降低 ESD, IQFinv 略有下降。基于 DR 辐射剂量与影像质量可以确定最佳的 SID。

PO-3670

新兴数字化医学影像技术在提高心血管疾病、 关节疾病和肿瘤的诊断水平方面的应用价值评估

霍艳
齐齐哈尔医学院

目的: 评估各新兴数字化医学影像技术在提高心血管疾病、关节疾病和肿瘤疾病诊断水平方面的效果。方法: 通过检索近 5 年发表的相关研究报道, 比较评估不同影像技术(如高排数 CT、高磁场 MRI 和 PET-CT)在提高冠心病、膝关节损伤、肺癌等疾病检出率和诊断准确率方面的临床应用效果。收集病例数较大、技术指标可靠的研究结果, 进行统计学分析。结果: 最新研究显示, 利用 320 排 CT 进行冠状动脉 CTA 检查, 可提高心肌梗死患者冠状动脉病变的检出率至 98%, 显著优于 64 排 CT 的 85% 检出率(Wang 等, 2021)。利用 3.0T MRI 进行膝关节扫描, 可提高对软骨损伤和半月板撕裂的检出率至 91%, 而 1.5T MRI 的检出率为 79%(James 等, 2022)。一项涵盖 2200 例非小细胞肺癌患者的研究表明, PET-CT 检查可提高肺癌淋巴结转移的检出率至 85%, 单独 CT 检查的检出率仅为 62%(Lee 等, 2020)。结论: 各类数字化医学影像技术的应用, 可显著提高心血管疾病、关节疾病、肿瘤等多种疾病的检出率和诊断准确率(可达 85%~98%)。但仍需医生在全面评估病情的基础上进行综合判读, 以发挥临床应用价值。

PO-3671

常规及数字 X 线成像的临床应用价值

胡静

徐州医科大学附属医院

最近这几年医疗技术在不断的发展,数字化技术也在不断完善,其在临床医学的应用过程中表现出越来越多的优点和越来越广泛的应用范围。本文旨在探讨常规及数字 X 线成像的临床应用价值,本文将从目的、方法、结果和讨论四个方面进行阐述。

目的:研究数字 X 线摄影技术在放射科当中应用的价值。

方法:收集我院 1 年间进行胸部影像学检查的患者 100 例,随机分为观察组和对照组,各 50 例。对照组患者使用常规的 X 线的检查方法对患者进行诊断,观察组患者使用数字 X 线摄影的方法对患者进行诊断,比较两种方法对患者进行检查完成后的图像质量以及对患者进行诊断完成后的准确程度。

结果:两组患者均有一定的诊断效果,但观察组患者的图片清晰程度以及对比度均明显优于对照组患者,在质量分级方面,观察组患者的图像质量分级明显优于对照组患者,同时观察组患者的检出率 90%明显优于对照组的检出率 60%,所有差异均为显著性差异 ($P<0.05$),有统计学意义。在临床对于患者进行诊断的过程中,通过使用数字方式成像技术能够显著的降低对患者进行诊断过程中的漏诊率,同时数字化 X 射线 DR 摄影能够有效克服非直接转换技术探测器因闪烁体或者增感屏内光纤散射所致图像模糊等情况,提高图像清晰度,且数字化过程环节相对减少,可降低影像信息丢失,提高空间分辨率和诊断效能,在临床上值得推广应用。

讨论:虽然 MRI 以及 CT 成像技术对于疾病的诊断及治疗均具有较大的临床应用优势,但剂量较大、成本较高等问题,其并不能完全取代 X 射线检查,对于某些特殊部位的影像学检查,仍然需要应用 X 线进行检查,例如胸部、骨肌系统、肝、胆、胰、脑以及脊髓等。相比传统 X 线平片检查,DR 检查能够更加清晰地显示病灶信息,有效提高临床诊断准确率,尤其是对于胸部、骨关节以及腹部等部位的成像更具优势。DR 系统能够有效调节对比度,从而提高视觉效果。DR 系统的照射范围更广,能够进行体层摄影以及减影处理,获取最佳影像信息。

综上所述,数字化 X 射线 DR 摄影能够有效提高图像质量,可降低影像信息丢失,提高空间分辨率和诊断效能,便于为放射科疾病的诊断工作提供科学合理的参考资料,值得在今后的临床工作中实践并进一步推广。

PO-3672

Propeller DWI 及 MUSE DWI 序列在 直肠肿瘤扩散加权成像图像质量的比较性研究

聂吉林

中南大学湘雅医院

目的:比较两种扩散加权成像序列 Propeller DWI 及 MUSE DWI 在直肠肿瘤患者扩散加权成像成像中的图像质量。方法:采集我院 37 例直肠肿瘤患者扩散加权图像,分别采用 Propeller DWI 及 MUSE DWI 两组序列扫描。由两位高年资放射科主治医师对两组序列的 DWI 图像质量进行评价,并测量两组图像病灶区 ADC 值。评价内容:1 主观评价:根据图像是否有伪影进行 1-3 分评分。2 客观评价:纳入主观评价图像质量 2 分及以上数据进行客观评价,评价内容为图像信噪比及 ADC 值的测量。结果:37 例患者中,7 例患者的 MUSE DWI 序列成像图像主观评价 <2 分,伪影严重,无法清晰显示病变,30 例可清晰显示病变(81%);Propeller DWI 成像图像主观评价均 ≥ 2 分,病灶显示率为 100%。MUSE DWI 序列的主观评分为 1.9 ± 1.0 ,Propeller DWI 序列的主观评分为

2. 9 ± 0.1 ($P < 0.001$, $X^2 = 47.269$), 有统计学意义。客观评价: 对 30 例两组主观评价质量均 ≥ 2 分的图像进行客观评价。MUSE DWI 序列的信噪比 28.30 ± 10.30 , Propeller DWI 序列的信噪比为 21.31 ± 9.12 , ($P = 0.002 < 0.05$, $t = 3.627$), 两者之间有统计学意义。MUSE DWI 序列 ADC 值为 $(8.56 \pm 0.07) \times 10^{-4} \text{mm}^2/\text{s}$; Propeller DWI 序列相同部位的 ADC 值为 $(8.47 \pm 0.03) \times 10^{-4} \text{mm}^2/\text{s}$, ($P < 0.001$, $t = 8.191$), 两者之间无统计学意义。MUSE DWI 序列成像时间为 2min25s, Propeller DWI 序列的成像时间为 3min40s。结论: MUSE DWI 在图像信噪比及成像时间方面优于 Propeller DWI, 但当扩散加权成像受到肠道内气体影响伪影较重时, MUSE DWI 组伪影及变形较重, 甚至影响诊断及 ADC 值的测量, 而 Propeller DWI 伪影控制较好, 在临床应用过程中应结合患者不同情况采用不同扩散加权方法, 更有利于病灶的检出、定性及临床分级。

PO-3673

秉持命运共同体理念开展放射科日常质量控制工作

余燕武

宁德师范学院附属宁德市医院

放射科传统质量控制方案关注焦点多为图像和报告质量, 属于终末质控模式。而随着社会经济的快速发展, 影像设备、医疗技术的不断更新, 信息化、智能化不断深入, 传统模式已不能适应群众就医体验新时代要求。新形势下放射科医疗质量与诊疗过程中各种因素密切相关, 这就要求科室日常质控工作应落实到事前、事中、事后全流程。2016 年开始我们引入“命运共同体”这一理念, 把科室管理、仪器设备、人力资源、医疗质量、行风建设、教学活动、科学研究等纳入日常质控工作中, 开启“五年计划”。第一个“五年计划”, 由上而下推动, 加强培训, 由老带新, 建立不同任务项目组, 解决了科室日常质控工作中“一目之罗”问题, 质控工作全面展开、全员参与。第二个“五年计划”, 科室医务人员从“无意识”的被动接受任务逐步走向“有意识”主动参与, 共商共建, 解决了很多质控工作中遇到的“为什么要做”、“怎么做”、“如何更有效”等诸多问题; 通过建立、完善项目组、评价组、督查组三级监督评价体系, 结合现有信息化、智能化手段, 有利于进一步破解日常质控工作“难”、“烦”、“繁”等难题; 通过建立项目组月报告制、评价组季度总结制、监督组及时反馈制等, 覆盖服务流程、技术与报告质量、不良事件、安全生产、教学科研、投诉与纠纷等, 有利于进一步规范医疗服务行为、持续改进医疗质量, 切实保障人民群众的健康权益和提升对医疗服务的切身感受。总之, 质控工作是保障医疗质量、学科持续发展极为重要的工作, 需秉持“滴水穿石”精神, 常存久久为功的韧劲, 积极构建学科“命运共同体”。

PO-3674

肺移植术的“质控”: 影像学如何“把好关”

胡晓云、毛海霞

无锡市人民医院

目的: 肺移植术是终末期肺部非恶性肿瘤性疾病的唯一可能的高成本代价的治疗手段, 探讨其术前术后的质控影像学如何把关适应症及术后疗效具有重要意义。

方法: 复习前沿进展了解肺移植术前如何规范合理使用影像检查工具; 哪些疾病为移植的适应症且所需要观察的临床与影像指标。术前临床与影像联合质控法的应用。如何正确认识影像征象变化在肺移植中及术后的作用。

结果: 不同适应症具有不同检查手段的特点; 不同适应症临床术前的影像学指标需与常用呼吸功能指标结合; 胸外结构、纵隔结构在术前影像评价时具有重要参考意义。个体时间轴上病情征象的变

化能够预判疾病进展,为早期肺移植提供重要佐证:年龄越轻、病症越早阶段,患者肺移植术后生存期越长。

结论:影像学能够从影像解剖角度、时间轴线变化等方面提供重要的肺移植术前的建议,术前临床与影像联合质控提高肺移植质量,也是肺移植能否有效进行的必备环节。

PO-3675

脑胶质瘤及脑转移瘤生物/靶向治疗后的 影像学定量评估报告规范解读

胡晓云

无锡市人民医院

目的:探讨高级别神经胶质瘤及脑转移瘤的治疗疗效的影像学评估标准的应用要点及影像报告规范与 QC,以提高影像科对 RANO、RANO-BM 的认识与重视,有利于临床 MDT 的开展及临床诊断的统一性、标准化。

方法:浅析、比较肿瘤影像评估标准的发展演变过程,从 WHO 标准发展到 RECIST、RANO、RANO-BM 标准及其之间的区别。解读 RANO 及 RANO-BM 标准中的主要诊断术语解析及应用要点;影像评估实例案例分析及国内外学科应用现状对比。

结果:目前主流的肿瘤疗效影像评估标准是 RECIST 1.1,其特点是易普及、操作简便、变异性小,涵盖肿瘤本身及转移灶、淋巴结等整体性影像综合评估;但胶质瘤治疗疗效的判断一直是一个临床上的难题,2010 年由哈佛医学院提出了新的高级别胶质瘤治疗反应评价标准,即 RANO 标准。RANO 标准经过近 6 年的临床实践,得到了神经肿瘤学界的认可,也成为高级别胶质瘤临床试验研究的常用评价标准。同时,由于脑转移瘤在大量原发性肿瘤(如肺癌)靶向治疗后的疗效评估中也占据相当的比例,故对肿瘤的整体疗效评估提出了更高的要求,RANO 工作组在 2015 年提出了 RANO-BM 疗效评估体系,2018 年中国临床肿瘤学会(CSCO)和中国抗癌协会肺癌专业委员会形成中国的专家共识正式推荐了 RANO-BM 评估标准在临床实践中的应用。总之,胶质瘤或转移瘤应用的要点与难点在于靶病灶的选择、测量序列选择、新病灶定义及甄别、非靶病灶显著进展的掌握等;与欧美发达国家的相关应用情况相比,无论是放射诊断医师/临床医师普及性还是影像报告的规范性均有明显差距。

结论:高级别神经胶质瘤及脑转移瘤治疗后的影像学评估标准及报告规范的推广亟待提高、任重道远;影像科重视 RANO、RANO-BM 有利于肿瘤疗效评估标准的掌握及诊断报告的规范,有利于影像科与其它学科在 MDT 时的良性互动与协作,推动临床诊断的统一性与标准化,提升影像诊断学的应有地位与影响力。

PO-3676

脑出血 CT 检查累积辐射剂量的监测意义

吴东

吉林大学第一医院

目的:CT 相关的辐射暴露被认为是医源性电离辐射最大和增长最快的来源。脑出血患者需要多次颅脑 CT 检查来诊断和评估其疗效,因此,需要成立针对脑出血的辐射剂量管理小组来熟悉可用的剂量监测技术,并实施全面的策略来跟踪和降低患者的辐射剂量。本研究初步应用 Radimetrics 软件探讨了脑出血 CT 检查的累积辐射剂量。

方法:回顾性收集我院脑出血住院患者 30 名,并对每位患者住院期间的电子病程记录进行回顾,以确定患者的性别、年龄、病因、多次复查颅脑 CT 时间、住院时间等。使用 Radimetrics 软件获

取和监测每次检查的敏感器官(脑实质、晶状体、唾液腺、甲状腺、皮肤、肌肉、骨髓、颅骨)累积辐射剂量。

结果: 30 名脑出血住院患者(男 15 例; 年龄 16-81 岁, 平均年龄 54.5 ± 16.3 岁), 高血压脑出血 26 例, 30 名患者总共接受了 110 次颅脑 CT 检查(Philips iCT 36 次, Philips Brilliance 64 66 次, Simens Sensation 64 8 次), 平均每位患者复查 4 次, 最少复查 2 次, 最多检查 9 次, 最短复查时间为 1h15min, 最长复查时间为 22h43min。住院时间 2 天-34 天, 平均住院时间 13 天。脑实质累积辐射剂量范围为 52.5mSv 至 245.3mSv (107.1 ± 46.9 mSv、中位数 94.5mSv); 晶状体 68.3mSv 至 325mSv (139.7 ± 128.0 mSv、中位数 94.5mSv); 唾液腺 52.5mSv 至 245.3mSv (107.1 ± 46.9 mSv、中位数 61.7mSv); 甲状腺 4.9mSv 至 97mSv (27.9 ± 19.5 mSv、中位数 22.7mSv); 皮肤 5.4mSv 至 30.4mSv (13.1 ± 5.9 mSv、中位数 11.3mSv); 肌肉 2.3mSv 至 13.7mSv (5.9 ± 2.7 mSv、中位数 5.0mSv); 骨髓 5.4mSv 至 24.9mSv (11.4 ± 4.9 mSv、中位数 9.8mSv); 颅骨 22mSv 至 110.4mSv (48.5 ± 21.2 mSv、中位数 41.7mSv) 时进行剂量反馈、累积剂量监测和积极措施来降低辐射剂量。

PO-3677

噪声对测量冠状动脉钙化积分影响的探究

杜佳圆
吉林大学第一医院

目的: 探究不同程度的噪声对测量冠状动脉钙化积分的影响。方法: 收集医院一个月内年龄相同、体重相同、注药量相同、性别相同, 并都做过呼吸训练的患者的冠状动脉 CTA 图像。将冠状动脉 CTA 图像按噪声大小分成六组, SD 值 0~10 为 A 组, SD 值 10~20 为 B 组, SD 值 20~30 为 C 组, SD 值 30~40 为 D 组, SD 值 40~50 为 E 组, SD 值 50~60 为 F 组, 用相同的测量方法对不同组别的冠状动脉图像进行冠状动脉钙化积分的测量, 进而判断该患者冠状动脉的钙化程度。通过与真实的钙化程度进行对比, 分析不同噪声对测量冠状动脉钙化积分的影响。结论: 噪声越大, 测量冠状动脉的钙化积分的准确性越差。

PO-3678

静脉图像质量提升----双源双能量 CT 扫描技术配合高浓度对比剂对下肢静脉的扫描

史征、杨瑞、刘继伟、王建军、和燕斐、弓莉、周静、冯晓刚
河南省胸科医院

目的: 采用双源双能量技术配合高浓度对比剂, 提升静脉血管 CT 值和图像信噪比。

方法: 实验组采用德国西门子 DRICE 双源 CT 扫描仪, 增强扫描采用双能量扫描方法, 管电压为 80、140 kV, 采用 ADMIRE 迭代技术获得 40keV 静脉图像。采用双筒高压注射器经肘静脉注射对比剂, 对比剂碘普罗胺(含碘 370mg/ml), 剂量 1.4 ml/kg, 以 4.50 ml/s 的流率注射对比剂总量, 再以相同流率注射 40 ml 生理盐水。采用团主追踪法触发扫描技术, 监测膈静脉, 设置触发阈值为 120 HU, 延迟 40 s 开始监测, 触发后延迟 8s 开始扫描, 扫描方向足-头。对照组为既往常规下肢静脉 CTA 图像。

1. 客观评价方法:

将图像传至德国西门子 syngo.via 智能工作站, 重建层厚为 1mm 的静脉期横断面图像, 分别于髂静脉、膈静脉及胫后静脉放置感兴趣区(region of interest, ROI), 测量其 CT 值及标准差。测量血管 CT 值时 ROI 尽量放置在血管的中心位置, 占血管腔总面积的 2/3。

2. 主观评价方法:

由 2 名具有 5 年以上工作经验的放射科医师对图像评分。观察髂静脉、腘静脉及胫后静脉的密度、边缘清晰度、血管与周围组织的对比度及图像噪声等, 采用 5 级评分标准: 5 分: 图像解剖细节清晰, 边缘锐利, 无明显噪声; 4 分: 图像解剖细节尚清晰, 噪声稍增加; 3 分: 图像大部分解剖结果显示可满足诊断, 噪声明显但可接受; 2 分: 图像解剖细节模糊, 辨识困难, 噪声明显; 1 分: 图像不能诊断, 噪声极明显。3 分及以上符合临床诊断需求。

3. 辐射剂量:

记录所有受检者扫描对应的 CT 剂量容积指数 (CTDIvol)、剂量长度乘积 (DLP), 计算有效剂量 (ED), $ED=DLP \times K$ 。

结果: 对照组和实验组患者的年龄、性别分布、体重、体重指数差异均无统计学意义; 对照组对比剂用量高于实验组, 差异有统计学意义; 实验组对比剂注射流率为 4.5 ml/s, 对照组平均流率为 5.0 ml/s, 高于实验组; 两组间的 CTDIvol、DLP、ED 值差异均无统计学意义。

结论: 双源双能量 CT 对于下肢静脉的扫描优于常规 CTA 下肢静脉扫描。

PO-3679

基于全量数据分析 CT 辐射剂量诊断参考水平的可行性研究

胡梦梦¹、龚向阳²

1. 杭州医学院

2. 浙江省人民医院

目的

利用大数据分析辐射剂量的影响因素, 并建立医疗机构 CT 辐射剂量诊断参考水平 (diagnostic reference level, DRL), 为 CT 辐射剂量管理提供理论依据。

方法

研究纳入 219986 例数据, 以剂量长度乘积 (dose length product, DLP) 作为量化指标, 辐射剂量分布 75% 位数为 DRL。分析①头颈、心胸和腹盆等 3 个检查部位 5 台不同 CT 设备的 DLP 差异; ②相同检查部位和 CT 设备下急诊、门诊、体检、住院和住院急诊等 5 类患者的 DLP 差异; ③≤4 岁、>4-10 岁、>10-14 岁、>14-18 岁, 和>18 岁等 5 组不同年龄患者的 DLP 差异; ④5 组不同年龄患者 3 个检查部位的 DLP 差异, 并建立年龄-检查部位相关性 DRL; ⑤10 项临床最常用 CT 检查项目的 DLP 差异, 并建立 CT 检查项目相关性 DRL。数据采用 SPSS23.0 进行统计分析, 非正态数据用 M (Q1, Q3) 表示, 非参数秩和检验进行差异比较, 组间两两比较采用 Bonferroni 方法, $P<0.05$ 为差异有统计学意义。所得剂量数值与国际相关放射防护 DRLs 进行比较。

结果

相同检查部位不同 CT 设备、相同检查部位和 CT 设备不同患者类型、5 组不同年龄患者的 DLP 存在统计学差异; 不同年龄患者头颈部 DRL 分别为 1092.5、848.10、880.27、932.77 和 1093.48mGy·cm, 心胸部 DRL 分别为 84.44、158.65、249.87、290.84 和 254.01mGy·cm, 腹盆部 DRL 分别为 177.84、327.40、593.94、713.34 和 1320.09mGy·cm; 不同检查项目 DLP 存在差异, CT 辐射剂量 DRL 最高是全腹部增强为 1822.39mGy·cm, 其次是头颅平扫为 938.64mGy·cm, 最低是肺低剂量平扫为 99.35mGy·cm; 本研究部分检查部位和检查项目 DRLs 较德国、美国等其他国家相比较高。

结论

CT 辐射剂量受 CT 设备、患者类型、年龄、检查部位及检查项目的影响。本医疗机构部分项目 DRLs 高于国际相关防护组织 DRLs。有必要采取有效措施控制 CT 辐射剂量水平。

PO-3680

影像技术质控：提高医疗诊断和治疗准确性的关键

郭莹莹

郑州大学第五附属医院

影像技术在医疗诊断和治疗中扮演着重要角色，但其质量问题对医疗效果和患者结果产生重大影响。本文旨在探讨影像技术质控的意义和方法，以提高医疗诊断和治疗的准确性和可靠性，减少误诊和漏诊的发生。通过制定质量控制标准、加强技术培训和监管、与医学科研结合，可以建立统一的质量控制体系和标准，提高医务人员的专业素质和责任意识，确保患者的权益和安全。

PO-3681

70kVp 联合 ASIR-V 的宽体探测器 CT 与 120kVp 的常规 CT 在头颈部血管造影中辐射剂量及对比剂用量的对照研究

俞真伟、朱亚男、姚俊、李正军、向阳、周和平

安康市中心医院

目的：评价应用 70kVp 和新一代自适应统计迭代重建(ASIR-V)在 16cm 宽体探测器 CT 头颈部计算机断层血管造影(CTA)中降低辐射剂量和造影剂的临床价值。

方法：前瞻性选取 16 例患者(A 组)，在 16cm 宽体探测器 CT 系统上应用 70kVp 管电压和 25mL 造影剂(CM)行低辐射和低造影剂头颈部 CTA 扫描。使用 ASIR-V 在 80%的水平上重建图像。将这些图像与 16 例患者(B 组)的历史数据进行比较，这些患者使用常规剂量 120 kVp 和 50 mL CM 在 64 层 CT 扫描仪上扫描。测量颈内动脉(ICA)、基底动脉(BA)、大脑中动脉(MCA)、左侧丘脑、左侧半卵圆中心和左小脑半球的 CT 值和噪声。计算目标动脉和脑实质的信噪比(SNR)和对比噪声比(CNR)。从骨-脑界面、光束硬化伪影、灰质和白质对比等方面主观评价图像质量。记录 CT 体积剂量指数(CTDIvol)。两组测量结果进行统计学比较。

结果：与 B 组相比，A 组的辐射剂量减少了 94% ($1.94 \pm 0.0 \text{mGy}$ vs $33.16 \pm 4.92 \text{mGy}$, $p < 0.001$)，造影剂剂量减少了一半 (25mL vs 50mL)。A 组的 ICA、BA 和 MCA 平均 CT 值 (分别为 $507.95 \pm 171.06 \text{HU}$ 、 $430.43 \pm 169.20 \text{HU}$ 、 $431.06 \pm 152.85 \text{HU}$) 和 B 组 (分别为 $427.09 \pm 97.01 \text{HU}$ 、 $341.88 \pm 79.17 \text{HU}$ 、 $328.40 \pm 84.74 \text{HU}$)；靶动脉和脑实质的信噪比和 CNR 无差异，两组主观图像质量无差异 (两组 $P > 0.05$)。

结论：与使用常规 CT 扫描方案相比，在宽体探测器 CT 系统上使用 70kVp 和 ASIR-V 进行头颈部 CTA 扫描可显著降低辐射剂量和造影剂剂量，同时提供良好的图像质量。

临床意义：在宽体探测器 CT 上使用 70kVp 和 25ML 低剂量造影剂扫描时，头颈部 CTA 的图像质量不会受到影响，从而减少了辐射剂量和造影剂剂量。

PO-3682

320 排 CT 柔性减影技术在“双低”肺动脉检查中的应用

何啸

个旧市人民医院

目的 探讨 320 排 CT 及其柔性减影技术对提升“双低（低造影剂量、低辐射剂量）”肺动脉图像质量的应用价值 **方法** 从 2023 年 03 月至 2023 年 08 月我院收治可疑肺动脉栓塞（PE）的 100 例患者，让其在 320 排 CT 上进行 CTPA 检查，然后回顾性分析这些患者的肺部平扫及肺动脉 CTPA 影像，对肺动脉期的影像进行柔性减影，得到肺减影及 CE-BOOS 的图像，并将得到的柔性减影图像上传至 PACS 系统，测量肺动脉主干及其主要分支的 CT 值与 SD 值，并把图像进行分组，A 组数据为 CTPA 第一期图像，B 组数据为 CTPA 第一期+第二期图像，C 组数据为 CTPA 第一期图像经过柔性减影后的数据；最后由 3 名经验丰富的高级职称医师对图像进行分析评价。探索在“双低”肺动脉扫描技术中 Subtraction Lung、Iodine Mapping 对辅助提高肺动脉图像质量的帮助。 **结果** 经过柔性减影处理后的图像，在肺动脉主干、左右肺动脉干及其主要分支 CT 值都比原始图像有所增加；肺减影后提示肺部组织灌注减低区域对诊断也有所帮助。 **结论** 320 排 CT Subtraction Lung、Iodine Mapping 柔性减影技术（肺减影、CE-BOOST）在“双低”肺动脉 CTPA 血管成像中对图像质量及诊断都有所帮助。

PO-3683

脊柱全长拼接 X 线摄影技术规范的探讨

李树、方容、陈伟、王芳、韩穆伟、张以豪、黎格
中南大学湘雅医院

目的：脊柱全长拼接 X 线摄影技术是脊柱侧弯及畸形术前评估与术后随访的重要影像方法。本文旨在通过现状调查和图像质量评价分析，探讨脊柱全长拼接 X 线摄影技术规范制定的必要性。

方法：前期查找发现国内外暂无同行公认或权威组织颁发有关规范性文件。本单位组织骨科系统影像诊断医师、资深放射技师以及脊柱外科医师共同协商形成了一篇脊柱全长拼接 X 线摄影技术规范的初稿，并归纳出脊柱全长摄片的质量标准（正位片 10 项，侧位片 9 项）。随机抽调一个月的脊柱全长拼接正侧位影像，由 1 名诊断医生与 1 名技师分别进行图像质量评价，出现分歧时则两位老师商讨重新评价，获得质量评价数据，并做根因分析。

结果：脊柱全长拼接 158 份正位与 156 份侧位图像中：1.拍摄范围达到要求的符合率正位 86.08%；侧位 92.95%。2.图像标识左右、姓名正确，位置正确，不影响诊断与图像无运动伪影的符合率正侧位均为 100%。3.图像无异物的符合率正位 84.81%；侧位 85.90%。4.密度（亮度）/曝光合适并椎体与软组织之间对比度好的符合率正位 94.94%，侧位 89.74%；其中曝光明显不合适的正位为 1.90%，侧位为 2.56%。5.拼接图像无错层，过渡自然，各段无明显密度差异，椎体数量无改变，脊柱整体性完好的符合率正位 90.51%；侧位 98.08%。6.各椎体骨小梁、骨皮质、棘突（侧位）显示清晰，骨边缘显示锐利，无双边影的符合率正位 88.61%，侧位 98.72%。7.正位双侧椎弓根、各椎体间隙显示清晰的符合率为 98.10%；肋骨无明显错层、失真的符合率为 98.73%；双侧髂骨翼、髂嵴和闭孔对称，骨盆前后端正的符合率为 70.25%；8.侧位双上肢与椎体不重叠的符合率为 96.79%；双股骨基本重叠的符合率为 88.46%。

结论：通过对单机构内脊柱全长拼接片的质量评价和根因分析，我们认为亟需在区域内或/和全国范围内组织相关专家形成脊柱全长拼接 X 线摄影技术的共识或指南，用以指导该技术的规范临床应用。

PO-3684

基于鼓室注射钆对比剂后的 3D-FLAIR 序列扫描显示梅尼埃综合征患者内耳淋巴积水的研究

李靖²、杨本涛¹

1. 首都医科大学附属北京同仁医院

2. 长沙市第四医院

目的 通过鼓室注射钆对比剂,行内耳磁共振三维快速液体衰减反转恢复序列(3D-FLAIR)延迟扫描,初步探讨梅尼埃综合征患者的内耳淋巴积水的可行性研究。**方法** 收集 2022 年 10 月至 2023 年 8 月就诊于长沙市第四医院梅尼埃综合征患者 12 例,其中,男 5 例、女 7 例,年龄 20~50 岁,均经鼓室注射 1:7 稀释的钆喷酸葡胺(Gd-DTPA),24 h 后行内耳 3D-FLAIR 序列扫描,并评估此技术显影内耳淋巴积水的效能。**结果** 12 例患者的内耳 3D-FLAIR 磁共振图像均能够清晰显示钆对比剂分布于耳蜗、前庭外淋巴间隙,同时,能够准确地勾勒出内、外淋巴间隙的界限。**结论** 经鼓室注射钆对比剂的内耳 3D-FLAIR 磁共振成像技术具有可行性,可准确判断梅尼埃综合征患者内耳淋巴积水情况。

PO-3685

关于制定数字化 X 线摄影中双下肢全长拼接技术规范探讨

王芳、龚远金、李树、陈伟、黎格、孟丽格

中南大学湘雅医院

目的: 数字化 X 线摄影中双下肢全长拼接技术在下肢关节置换患者术前术后评估中应用广泛。经查阅国内外文献,发现目前暂无同行公认或权威机构发布的有关规范性文件。本文旨在通过该技术在本院的应用现状调查和图像质量评价分析,探讨数字化 X 线摄影中双下肢全长拼接技术规范制定的必要性。

材料与方法: 通过查阅现有文献,并组织本单位骨肌系统影像诊断医师、资深放射技师以及脊柱外科医师共同协商形成了一个双下肢全长拼接技术规范初稿,并归纳出 10 项影像质控标准。随机抽调本院一个月的双下肢全长拼接正位片,由 1 名放射科诊断医生与 1 名放射科技师根据该质控标准进行图像质量的评价,出现分歧时由两位老师商量讨论重新进行评价,获得图像质量评价数据,并做根因分析。

结果: 272 幅双下肢全长正位图像中,其中 1.拍摄范围合适(双侧髌前上棘,距骨下缘) 246 项符合,符合率为 90.44%; 2.股骨头中心、股骨髁间切迹中心、胫骨棘中心和踝关节中心在影像上清晰可见(测量机械轴夹角) 269 项符合,符合率为 98.89%; 3.双侧髌骨翼、髌棘和闭孔对称 267 项符合,符合率为 98.16%; 4.双侧下肢诸骨骨小梁、骨皮质清晰显示,骨边缘显示锐利,无双边影 262 项符合,符合率为 96.32%; 5.各关节间隙,关节面边缘清晰显示 257 项符合,符合率为 94.48%; 6.密度(亮度)欠合适/曝光程度欠合适 252 项符合,符合率为 92.64%; 7.密度(亮度)明显不合适/曝光程度明显不合适 3 项符合,符合率为 1.11%; 8.图像无运动伪影 269 项符合,符合率为 98.89%; 9.图像标识左右、姓名、性别正确,位置正确、整齐,不影响诊断 272 项符合,符合率为 100%; 10.铅尺位置合适,图像标记准确 269 项符合,符合率为 98.89%;

结论: 通过对单机构内双下肢全长拼接片的质量评价和根因分析,我们认为亟需在区域内或/和全国范围内组织相关专家形成双下肢全长拼接技术的共识或指南,用以指导该技术的规范临床应用。

PO-3686

双层探测器光谱 CT 在 125I 粒子植入去金属伪影对图像质量改善中的应用价值

周宇涵¹、王芝浩¹、曹伟萌¹、雷丽敏¹、董书杉²、岳松伟¹

1. 郑州大学第一附属医院

2. 飞利浦医疗

目的 125I 放射性粒子植入导致的金属伪影严重影响临床疗效评估。本研究评估了双层探测器光谱 CT (DLCT) 中不同图像重建方法对 125I 粒子植入去伪影效能及对 CT 图像纹理的影响。

方法 回顾性分析了 35 名接受 DLCT 检查的 70 层 125I 粒子植入患者。重建了常规 CT 图像 (CI) 和虚拟单色能量图像 (VMI, 40-150keV, 间隔为 10keV), 结合金属去伪影 (O-MAR), 用于评估 125I 粒子植入引起的低密度/高密度伪影。定量分析, 使用圆形感兴趣区域 (ROI) 来测量校正后的 CT 值和伪影指数 (AI)。对于纹理分析, 选择直方图分析作为统计方法。基于环形 ROI 记录了伪影直方图的分布和总频率, 环形 ROI 是一种新颖的圆形 ROI, 覆盖了几乎所有受伪影影响的软组织区域。此外, 计算了伪影的 ΔCT 、 ΔAI 、 Δ 分布和 Δ 频率, 评估了每组伪影减少效果的优劣。同时, 采用去伪影效果最佳组评估了较 CI 图像, VMI 联合 O-MAR 的去伪影效能。使用实体瘤反应评价标准 (RECIST) 评估了受伪影影响无法评估的病灶显示校正率。

结果 定量分析显示校正后的 CT 值和 AI 中低密度/高密度伪影显著减少 ($p < 0.05$)。在 VMI150keV 与 O-MAR (VMIO-MAR150keV) 组中, 低密度伪影的校正衰减效果优于同组中的高密度伪影 ($90\% > 62.22\%$, $p < 0.05$)。在纹理分析中, 低密度/高密度伪影都有所减少 ($p < 0.05$)。然而, 在 VMIO-MAR150keV 组中, 直方图的分布减少效果没有统计学意义 ($p > 0.05$)。随着 keV 的增加, 高密度伪影的总频率显著降低 ($p < 0.05$), 低密度伪影与 CI 组相比没有统计学意义 ($p > 0.05$)。VMIO-MAR150keV 组的低密度伪影减少率低于高密度伪影 ($16.97\% < 53.54\%$, $p < 0.05$)。

结论 VMI 和 O-MAR 的结合是减少 125I 粒子种植引起的低密度/高密度伪影的有效方法。纹理分析显示, 应用 VMIO-MAR150keV 可获得去伪影效果及最佳图像质量对, 从而显著提高 RECIST 标准下的临床疗效评估。

MRI 临床应用安全专家共识解读

于群、余建明、孔祥闯、雷子乔
华中科技大学同济医学院附属协和医院

MRI 技术发展迅速, 已广泛应用于临床。MRI 的强磁场工作环境存在许多潜在风险, 为规范医用 MRI 检查的安全管理, 本文结合国内外相关指南、专家共识和最新文献, 对 MRI 设备安全和检查安全两方面分别进行阐述, 同时对 MRI 突发情况给予相应处理建议, 旨在提高 MRI 安全管理意识, 提升 MRI 安全管理的水平。

PO-3688

结合能谱技术对于肝静脉血管在不同 KV 下最佳成像效果的研究

郑兴华

吉林大学第一医院

目的：探究能谱 CT 不同 KV 下显示肝静脉血管最佳单能值。

方法：将 60 例肝移植研究对象在能谱 CT 上进行肝脏扫描，通过计算机辅助和人工智能技术，将肝部动脉血管及门静脉血管隐藏，只显示肝静脉血管，在肝静脉血管上用不同的 KV 来进行对比，分别在 40、50、60、70KeV 单能量并联合 60% 的迭代技术重建图像，并与 140KVP 混合能量图像比较，来评估显示肝静脉血管的最佳单能值。

结果：通过多样本非参数分析进行比较，肝静脉最佳单能值水平为 60KeV，在 60kev 下主观评分均优于其他单能量组。

结论：能谱 CT 最佳单能量技术联合迭代重建技术得出结论，推荐使用最佳单能量为 60kev 重建图像来显示肝静脉图像质量。

PO-3689

基于多参数深度学习模型的颈动脉 CTA 图像质量自动评估

傅婉云^{1,2}、龚向阳²

1. 浙江中医药大学

2. 浙江省人民医院

【目的】开发基于深度学习算法的颈部 CTA 图像质量评价模型，并验证该模型的性能，实现自动、快速、客观、量化的颈部 CTA 图像质量评估。

【方法】回顾性收集颈动脉 CTA 图像 750 例用于构建并验证深度学习模型，以 6: 2: 2 的比例划分训练集 (n=450)、验证集 (n=150) 和内部测试集 (n=150)，另外收集三家医院的 90 例颈动脉 CTA 图像作为模型的外部测试集。构建深度学习评价模型包括以下步骤：首先由 3 名放射科医师对颈动脉 CTA 图像质量按好、中、差进行评价；通过 U-net 算法自动分割颈动脉并测量颈动脉全长的 CT 值、血管边缘梯度、SNR、CNR 四种客观指标；利用算法结合主观评价与客观指标确定用于评估图像质量的客观代表性层面；最终根据代表性层面的客观指标分别构建单个参数与多参数联合深度学习模型。将该模型的图像质量分类评估结果与放射科医师达成共识的金标准进行 kappa 一致性比较，采用混淆矩阵和受试者工作特征曲线(ROC)评估不同模型效能和实用性，并根据灵敏度、特异性、精密度、召回率、F 评分、准确度、受试者工作特征曲线下面积 (AUC) 评估不同模型的性能。

【结果】基于 CT 值、血管边缘梯度、SNR、CNR 四种客观指标分别及联合构建五种深度学习模型，通过比较得出多参数联合深度学习模型效能最优，在内部测试集、外部测试集中的 AUC 值分别为 0.98、0.97，在内部测试集中，多参数联合深度学习模型的敏感性、特异性、精确率、召回率、F 分数、准确率分别为 0.93、0.97、0.93、0.93、0.93、0.95。模型对颈动脉 CTA 图像质量评估结果与放射科医师之间的 kappa 一致性在内、外部测试集的结果分别为 91.8%(95% CI: 87.0–96.5)、92.6%(95% CI: 86.9–98.4)。

【结论】所提出多参数深度学习模型在自动评估颈部 CT 血管造影图像中效能最优，其评估结果与放射科医师评估一致性相当，可作为评估颈动脉图像质量的可靠工具。

PO-3690

基于低剂量 CT 技术行胸腹主动脉混合现实成像的可行性研究

李冠、张鑫、秦国初、张冰
南京鼓楼医院

目的 探讨低剂量 CT 技术实现胸腹主动脉混合现实成像的可行性研究。方法 前瞻性收集拟行胸腹主动脉混合现实成像的患者 67 例, 随机分为 A、B 两组, 组 A (常规剂量胸腹主动脉混合现实组, $n = 32$) 和组 B (低剂量胸腹主动脉混合现实组, $n = 35$)。组 A 采用 120 kVp, 组 B 采用 80 kVp, 将两组生成的 CT 数据导入到可视化三维 (three-dimensional, 3D) 建模软件进行 3D 建模, 并进行混合现实结果发布。两组患者的人口学特征比较采用独立样本 t 检验; 混合现实质量的主观评价采用 Mann-Whitney U 检验, 评价者采用 Kappa 分析进行一致性比较。结果 两组间在年龄、身高、体重、性别及身体质量指数 (BMI) 指标上均未见明显差别 (均 $P > 0.05$)。组 B 方案生成的胸腹主动脉混合现实辐射剂量较组 A 方案减少约 59%。两组方案生成的胸腹主动脉混合现实质量未见明显差异 ($P > 0.05$)。评分者的主观一致性较好, Kappa 值为 0.622~0.829 之间。结论 低剂量 CT 技术可有效应用于胸腹主动脉混合现实中, 保证胸腹主动脉混合现实质量的同时, 大幅减少患者所受的辐射剂量, 为胸腹主动脉混合现实技术的广泛推广提供保障。

PO-3691

CT 能谱成像对抑制锁骨下对比剂伪影的临床研究

陈薇、张炜
华中科技大学同济医学院附属协和医院

摘要: 目的: 探讨能谱 CT (DECT) 中单能量成像 (VMI) 技术减少头颈部 CTA 扫描锁骨下静脉对比剂线束硬化伪影的抑制, 改善图像质量并确定最佳能量水平。方法: 回顾性研究 78 例我院 2022 年 5 月-2023 年 5 月期间, 行 DECT 头颈部 CTA 扫描的患者。通过 Syngo via 后处理工作站, 对所有患者的图像资料进行后处理重建, 每例患者分别以 10 个 keV 间隔重建 40-140 keV 的单能量图像, 重建 1 组 120 kVp 混合能量图像及 11 组单能量图像, 保存图像数据。通过测量各组图像动脉期伪影区、非伪影区、颈总动脉的 CT 值和标准差值 (SD), 计算图像信噪比 (SNR)、对比噪声比 (CNR) 和线束硬化伪影指数 (BHA), 并对结果进行统计学分析。由两名有经验的放射科医生主观地评定图像质量, 评估整体图像噪声, 对测量数据进行统计学分析。比较 120 kVp 混合能量图像和单能量图像对线束硬化伪影的去除和图像质量是否具有差异性, 分析图像质量, 并找出 CNR 最高的单能量图像。结果: 与常规混合能量图像相比, 120KeV 时 BHA 值、CT 值差值最小 ($P < 0.05$), 同时 SNR、CNR、颈总动脉 CT 值明显减小。而 70KeV 时, BHA 值小于 120kVp ($P < 0.05$), SNR、CNR 值最高 ($P < 0.05$), 伪影区噪声相对较低 ($P = 0.07$), 且血管显示最佳为 349.02 ± 82.40 HU。结论: 能谱 CT 成像提供了一套虚拟单能量成像, 可按需选择, 优化头颈部 CTA 的成像。在头颈部 CTA 扫描中, 120KeV 去除对比剂硬化伪影的效果最好, 但其组织对比度较低, 图像质量较差; 而 70KeV 伪影值小于 120kVp, 血管显示程度最佳, 组织对比度最好同时伪影区噪声相对较低, 图像质量最好, 因此 120KeV 图像可以结合 70KeV 图像共同进行临床诊断。

PO-3692

基于智能调制技术 CT 摆位对图像质量和辐射剂量影响的模体研究

张小勇、李武超、伍瑶斌、李文航、王超、王荣品、曾宪春
贵州省人民医院

目的：探讨在自动管电压、管电流智能调制 (CARE) 技术应用前提下，不同摆位高度对图像质量和辐射剂量的影响。

方法：采用西门子 64 排 128 层 CT，设置相同扫描参考条件、不同扫描尺寸参考模型 (Average/Very strong)、不同检查床高度对直径为 25cm 水模进行重复扫描。扫描结束后测量水模中心位置 CT 值及噪声，记录扫描后不同组别的管电压、剂量长度乘积 DLP。分析床高与辐射剂量和图像质量的关系，以床高 150 为摆位基准，分析不同检查床高度对图像质量与辐射剂量影响

结果：同一模体，同一参考剂量，同一尺寸参考模式下，辐射剂量与检查床高度成正相关。以 150 为扫描床中心为标准，尺寸参考模式为 Average 时，床高升至 100，辐射剂量增加约 30%，噪声增加 11.1%；床高降至 200、250 时，辐射剂量分别降低约 14.2%、21.4%，噪声分别减少 11.1%、增加 44.4%。尺寸参考模式为 Very strong 时，床高升至 100，辐射剂量增加约 53.6%，床高降至 200、250 时，辐射剂量分别降低约 17.3%、22.6%，床高 250 时，噪声增加 50%。

结论：CARE 技术应用前提下，摆位高度对于图像质量和辐射剂量具有影响。偏离检查床中心摆位会导致 CT 值、图像噪声差异，辐射剂量变化与偏离中心的程度成正比。同一检查床水平，实际扫描条件随不同尺寸参考模式各有不同。

PO-3693

IRIS-DWI 与常规 DWI 在直肠癌诊断中的比较研究

牛雅欣、雷晓燕
陕西省人民医院

目的本研究比较传统弥散加权成像 (c-DWI) 与 IRIS- DWI 在直肠癌图像中的应用，分析其在诊断上的优缺点。

材料与方法选取经病理证实的直肠腺癌患者 15 例，平均年龄 65.8 ± 11.3 岁，女 7 例，男 8 例。所有患者在 3.0T MR 扫描仪 (Ingenia CX, Philips, 荷兰) 上使用 16 通道相控阵体线圈进行 cDWI 和 IRIS-DWI 序列的 MR 检查。检查前均未接受新辅助治疗。将患者分为 cDWI 组和 IRIS-DWI 组。将所有 cDWI 和 IRIS-DWI 图像传输到工作站 (Intellispace Portal, Philips Healthcare) 进行后处理。采用 5 分法评价弥散图像的图像质量。测量 ADC、病变信号强度 (SI)、臀大肌 (SIg) 和臀大肌标准差 (SDg)。避免坏死、囊性改变和大血管区域放置感兴趣区 (ROI)，感兴趣区面积为 20-30mm²。计算图像的信噪比 (SNR) 和噪声对比比 (CNR)。对图像质量的一致性进行 Kappa 分析。通过计算类间相关系数 (ICC) 分析两名放射科医生的一致性。采用独立样本 T 检验比较 ADC、SNR 和 CNR 值。

结果两观察者对 cDWI 和 IRIS-DWI 的图像质量评价高度一致 ($\kappa > 0.8$)。两名放射科医生的一致性较好 (ICC 值 > 0.9)。cDWI 和 IRIS-DWI 的 ADC 值分别为 $(0.89 \pm 0.12) \times 10^{-3}$ mm²/s、 $(0.86 \pm 0.12) \times 10^{-3}$ mm²/s。DWI 组与 IRIS-DWI 组 ADC 值比较，差异无统计学意义 ($P > 0.05$)。IRIS-DWI 组的 SNR (82.84 ± 48.53)、CNR (72.04 ± 37.64) 均高于 DWI 组，两组比较差异有统计学意义 ($P = 0.049$ 、 0.016)。

结论研究表明，IRIS-DWI 序列获得的图像质量更高。IRIS-DWI 序列具有较好的信噪比和图像分辨率。因此，IRIS-DWI 对直肠癌 MRI 的诊断效果更好。

PO-3694

针对托管医院冠状动脉 CTA 同质化标准建设的调查研究

张欣、史河水

华中科技大学同济医学院附属协和医院

目的：调查托管医院在现有设备的基础上，冠状动脉 CTA 图像质量与辐射剂量现状，分析原因，提升图像质量，降低辐射剂量。

方法：回顾性分析了托管医院 2022 年 6 月-12 月进行的冠状动脉 CTA 图像 69 例患者的基本信息、心率、图像噪声、冠脉图像质量（主观评价）、伪影数量、伪影类型、扫描辐射剂量等数据，结合托管医院的检查参数，分析原因，提出改进策略。

结果：共 69 例患者行冠状动脉 CTA 检查。其中男性 38 例，女性 31 例，平均年龄 59.8 岁，检查时平均心率 65.9 次/分，6 名患者存在心律失常，图像噪声平均为 22.4Hu，辐射剂量平均为 21.6mSv，59 例患者图像存在伪影，伪影类型有：风车伪影、开花状伪影、模糊伪影、阶梯伪影，其中风车伪影最多，占比 74.5%；图像质量差 1 例（1.4%），图像质量中等 11 例（15.9%），图像质量良好 17 例（24.6%），图像优秀 40 例（58.0%）。辐射剂量严重超标（标准为不超过 5mSv），图像质量优良率超过 80%。

结论：目前冠状动脉 CTA 检查在湖北省广泛开展，但图像质量与辐射剂量不同等级医院间相差很大，我院托管医院在检查辐射剂量方面严重超标（>5mSv），分析原因主要为检查时管电压过高，患者呼吸运动配合不佳，无心电编辑导致。针对主要原因进行技术改进，以期提升图像质量，降低辐射剂量。

PO-3695

低管电压对 CTA 的图像质量和剂量的影响

郝琪^{1,2}、洪楠¹、王仁贵^{2,3}

1. 北京大学第二临床医学院（北京大学人民医院）

2. 北京大学第九临床医学院

3. 首都医科大学附属北京世纪坛医院

目的：利用标准体模，探讨 16cm 宽体探测器能谱 CT 在低管电压状态下对于 CTA 图像质量和辐射剂量的影响。材料与方法：应用树脂材料标准体模，将 20mg/mL 碘海醇和水 40mL 分别置于体模的两个管中，按照常规螺旋 CT 扫描的管电压不同分为 A、B、C 三组，A 组设置管电压为 120kV，B 组设置管电压为 100kV，C 组设置管电压为 80kV。三组均使用 16cm 宽体探测器能谱 CT，采用常规螺旋 CT 扫描模式，固定管电流为 480mA，剂量指数设为 10mGy，探测器宽度为 8cm，螺距为 0.992:1，三组均采用滤波反投影技术重建图像，重建层厚为 1.25mm，层间距为 1.25mm。分别记录三组剂量容积指数，测量三组图像 CT 值及噪声值，并计算各组内图像的对比噪声比。采用 SPSS26.0 软件进行统计学分析，应用单因素方差分析及配对样本 t 检验，比较低 kV 与常规 120kV 的 CT 图像的信号噪声比及剂量容积指数的差异。结果：16cm 宽体探测器能谱 CT 在不同 kVp 的扫描中，不同组别辐射剂量分别为 6.2mGy、12.15 mGy、19.58 mGy，不同组间辐射剂量的差异有统计学意义（ $P < 0.05$ ），各组图像噪声值与信号噪声比差异均有统计学意义（ $P < 0.05$ ）。低管电压 80kVp 和 100kVp 组的 SD 值分别为 19.72 ± 1.535 、 13.069 ± 0.647 ，CNR 别为 52.314 ± 3.256 、 58.614 ± 3.443 ，常规电压 120kVp 组 SD 值及 CNR 值分别为 9.878 ± 0.733 、 60.344 ± 3.259 。两组间（80kV 组 vs 120kV 组）辐射剂量、与信号噪声比的差异均有统计学意义（ $P < 0.05$ ）；两组间（100kV 组 vs 120kV 组）辐射剂量的差异有统计学意义（ $P < 0.05$ ），但是两组间对比噪声比无明显差异（ $P > 0.05$ ）。结论：在 16cm 宽体探测器常规螺旋 CT 低管电压 100kV 扫描图像可以获得

与常规螺旋 CT120kV 扫描相同的图像质量(CNR), 但是低管电压 100kV 扫描时辐射剂量明显降低和噪声明显升高。在 CTA 中, 应用 16cm 宽体探测器低管电压 100kV 扫描可以替代常规 CT 图像。

PO-3696

16cm 宽体探测器能谱 CT 增强扫描虚拟平扫代替常规平扫最佳期相选择的相关研究

郝琪¹、洪楠¹、王仁贵^{2,3}

1. 北京大学第二临床医学院 (北京大学人民医院)

2. 北京大学第九临床医学院

3. 首都医科大学附属北京世纪坛医院

目的:探讨 16cm 宽体探测器能谱 CT 增强扫描虚拟平扫代替常规真实平扫的最佳期相选择的相关研究。

方法与材料: 收集 57 例行腹部能谱增强 CT 扫描的患者, 男性 23 例, 女性 24 例, 平均年龄 55 ± 12 岁。采用 16cm 宽体探测器 CT, 平扫采用常规扫描, 增强采用能谱腹部扫描, NI 均设置为 10, 管电压采用 80kVp/140kVp 瞬时切换, 噪声指数设为 10m, 探测器宽度为 8cm, 螺距为 0.992:1, 对比剂使用 320mgI/mL 碘佛醇 80mL。采用滤波反投影技术重建图像, 重建层厚为 1.25mm, 层间距为 1.25mm。分别测量常规平扫水的 CT 值、SD 值, 计算 SNR; 后处理得到虚拟平扫图像, 记录三期后处理图像肝脏的 CT 值、SD 值、SNR。采用 SPSS26.0 软件进行统计学分析, 采用单因素方差分析比较三期虚拟平扫图像肝脏的 CT 值、SNR 以及剂量容积指数间的差异。

结果: 能谱 CT 增强三期辐射剂量分别为 9.71 ± 1.84 mGy、 8.41 ± 2.21 mGy、 6.74 ± 1.99 mGy, 三期虚拟平扫处理后的肝脏的 CT 值分别为 55.36 ± 7.64 HU、 57.4 ± 6.6 HU、 54.65 ± 6.72 HU, SD 值分别为 10.64 ± 2.34 、 8.19 ± 1.22 、 8.08 ± 1.34 , SNR 分别为 5.54 ± 1.72 、 7.18 ± 1.45 、 6.98 ± 1.65 , 常规平扫的辐射剂量为 8.46 ± 3.08 mGy, 肝脏的 CT 值为 59.76 ± 8.5 HU, SD 值为 19.07 ± 2.31 , SNR 为 3.2 ± 0.74 。能谱 CT 三期增强虚拟平扫图像肝脏与常规平扫肝脏的 SD 值、SNR 比较, 差异均有统计学意义 ($P < 0.05$)。能谱 CT 三期增强虚拟平扫间的肝脏的 SD 值、SNR 比较, 差异均有统计学意义 ($P < 0.05$)。动脉期虚拟平扫与门脉期及延迟期虚拟平扫肝脏 SD 值、SNR 有显著差异 ($P < 0.05$)。门脉期和延迟期虚拟平扫肝脏 SD 值、SNR 无显著差异 ($P > 0.05$)。

结论: 宽体探测器能谱 CT 虚拟平扫的图像质量高于常规真实平扫, 且延迟期辐射剂量最低, 而延迟期虚拟平扫图像质量优于动脉期虚拟平扫图像质量, 与门脉期图像质量无明显差异。

PO-3697

膝关节体模数字 X 线摄影源像距与体表入射剂量及图像质量的实验研究

董馥闻

甘肃省中医院

目的: 探索源像距 (SID) 参数优化在膝关节体模数字 X 线摄影 (DR) 摄影中降低体表入射剂量 (ESD) 和改善图像质量的价值。

方法: 去除滤线栅, 采用最适视野 (FOV) 和自动曝光 (AEC) 模式对膝关节模拟体模和细节低对比度分析体模行 DR 摄影, 设定管电压分别为 60kV 和 90kV; 在 80~230cm 范围内以 10cm 递增, 设置 16 个不同的源像距 (SID)。记录曝光指数 (EI)、管电流 (mAs)、体表入射剂量 (ESD), 计算影像质量因子倒数 (IQFInv), 作 ESD、IQFInv、mAs、EI 与 SID 的相关性分析、SID 与 ESD、IQFInv 的归一化分析。

结果: 管电压 60kV 时, ESD、IQFinv、管电流、EI 与 SID 的相关系数分别为 $r_1=-0.93$, $r_2=-0.85$, $r_3=0.97$, $r_4=-0.89$ (P 均 <0.001); 管电压 90kV 时, ESD、IQFinv、管电流、EI 与 SID 的相关系数分别为 $r_5=-0.96$, $r_6=-0.92$, $r_7=0.98$, $r_8=-0.94$ (P 均 <0.001)。不同管电压相关系数的差异性分析显示 ESD、IQFinv、管电流、EI 与 SID 的相关性差异均无统计学意义(P 均 >0.05)。管电压 60kV 时, 一元线性回归方程 $ESD=36.52-0.05 \times SID$ ($P<0.001$); 管电压 90kV 时, $ESD=29.75-0.05 \times SID$ ($P<0.001$)。IQFinv 和 ESD 归一化处理后, 管电压 60kV 时, SID=110cm 是 IQFinv 与 ESD 的最优点。管电压 90kV 时, SID=130cm 是 IQFinv 与 ESD 的最优点。

结论: AEC 模式下膝关节 DR 摄影, 随着 SID 的增加 ESD 逐渐减低、IQFinv 波动减低, 选择恰当的 SID 是控制辐射剂量和改善图像质量的有效方法。

PO-3698

基于 RQS 评分评估和分析国内外放射学顶刊文献的质量

陈利华

重庆大学附属肿瘤医院

目的: 影像组学研究在平台标准化、生物学可解释性及临床易用性等方面仍存在明显不足。因此, 近期有学者提出影像组学质量评分 (RQS) 用来严格和系统地评估影像组学研究的科学完整性和临床相关性。因此, 本研究旨在采用 RQS 对当前国内外放射学顶刊中影像组学研究的质量进行评估和分析。方法: 在中华放射学杂志和 Radiolgy 杂志中, 对近两年采用了影像组学方法的研究进行系统检索。采用 RQS 评分对纳入的文献进行影像组学质量评估和亚组分析。采用卡方检验、Ridit 检验和两独立样本 t 检验等统计方法对不同亚组的 QRS 评分以及 16 个评分项之间的差异进行比较。结果: 共检索文献 151 篇 (中华放射学杂志 62 篇, Radiolgy 杂志 89 篇)。最终纳入分析文献 33 篇, 其中, 中文文献 21 篇, 英文文献 12 篇。纳入文献的平均 QRS 评分为 15.0 ± 4.42 ; 在 16 个评分项中, 进行了阈值分析、校准数据、临床决策分析和开放数据的研究占比分别为 24.2%、54.5%、63.6% 和 30.3%。亚组分析发现中文文献的 QRS 评分明显低于英文文献 (12.71 ± 2.37 vs 19.00 ± 4.39 , $p<0.001$); 与英文研究相比, 中文研究在特征建模、阈值分析、验证、临床决策分析、成本效应分析、数据开放等评分项上更需要进一步提升。而在 12 篇英文文献中, 国内研究 (7 篇) 的 QRS 评分显著高于国外研究 (21.57 ± 3.91 vs 15.4 ± 1.52 , $p=0.005$)。在其他的亚组分析中, 包括肿瘤与非肿瘤、神经影像与身体成像和单模态与多模态成像等等, 均没有观察到 RQS 评分的显著差异。结论: 当前国内外放射学顶刊中的影像组学研究的总体方法学质量仍不高。同时, 这些研究在阈值分析、校准数据和临床决策分析以及共享数据等方面也存在较大的不足, 但是这些分析技术和数据共享容易实现。因此, 清晰认识到上述研究结果, 可能有助于提升未来研究的 RQS 质量。

PO-3699

探索不同呼吸训练方式对肝肿瘤特异性磁共振检查动脉期图像质控的影响

张涛、张研、赵俊

陆军军医大学第一附属医院 (西南医院)

目的: 探索不同呼吸训练方式对肿瘤特异性磁共振检查动脉期图像质控的影响。

方法: 回顾性评估 2023 年 1 月至 2023 年 7 月接受名行肝肿瘤特异性磁共振检查患者, 84 人。由不同的训练方式将其分为 A 组 (21 名) B 组 (21 名) C 组 (21 名) D 组 (21 名)。包括: A 组: 体位: 坐立位, 训练方式: 1 对 3 非渐进式训练 (憋气 20s)。B 组: 体位: 坐立位, 训练方式:

1 对 3 渐进式训练 (憋气 5s→10s→15s→20s) C 组: 体位: 仰卧位, 训练方式: 1 对 1 非渐进式训练 (憋气 20s)。D 组: 体位: 仰卧位, 训练方式: 1 对 1 渐进式训练 (憋气 5s→10s→15s→20s)。对各组动脉期增强图像进行评估。由 2 名副高以上的诊断医师评估鉴定各组患者肝实质、门静脉、肝总动脉的信噪比以及对比信噪比 结果: A B 两组各部分组织 SNR 和 CNR 差异无统计学意义 ($P>0.05$), C D 两组各部分组织 SNR 和 CNR 差异无统计学意义 ($P>0.05$) A C 两组各部分组织 SNR 和 CNR 差异有统计学意义 ($P<0.05$) 结论: 不同的呼吸训练方式对肝肿瘤特异性磁共振检查动脉期图像质控有不同的影响, 仰卧位的训练方式质控明显高于坐立位, 1 对 1 训练方式质控质量要优于 1 对 3 呼吸训练方式。选择合适的呼吸训练方式对于提高图像质量至关重要。

PO-3700

磁共振上腹部增强基于改良呼吸训练法联合稀释钆塞酸二钠以减少动脉期一过性伪影方案及进展解读

陈春云

陆军军医大学第一附属医院 (西南医院)

目的:比较磁共振钆塞酸二钠(Gd-EOB-DTPA)上腹增强肝动脉期循序渐进式与直接式呼吸训练方案的图像质量, 结合 1:1 稀释法, 探讨减少动脉期一过性伪影最佳方案, 并对一过性呼吸伪影解决方案进展进行文献解读。

方法: Gd-EOB-DTPA MR 成像患者 126 例, 分 4 组:组 1(31 例循序渐进式呼吸训练, 5 s、10 s、15 s ~ 20 s)、组 2(32 例直接式训练 20 s)、组 3(30 例与组 1 相同训练方案、组 4(33 例与组 2 相同训练方案)。

1、2 组 1:1 生理盐水稀释,注射速率 2 mL/s, 20 mL 生理盐水同速冲刷; 3、4 组不稀释, 注射速率 1 mL/s, 20 mL 生理盐水同速冲刷。半定量 5 分式评分, 和定量 SNR, CNR(与椎旁多裂肌)。

结果:半定量评分第 3 组肝动脉、门静脉、腹主动脉、肝实质评分及总评分略高于第 1 组和第 2 组, 统计上没有显著差异; 呼吸伪影有显著差异($P=0.00179$), 两两比较提示,组 3 的呼吸伪影明显大于组 2 和组 4, 低于组 1, 在四组中, 第 2 组呼吸伪影最小; 定量评分提示门静脉 SNR 和门静脉肝实质 CNR 差异有统计学差异($P=0.0268$ 、 0.0130), 第 2 组门脉和肝静脉显影最佳。

结论:通过多人一组直接式屏气 20 秒训练, 达标者可优先检查, 以 1: 1 生理盐水稀释 2 mL/s 流速注射造影剂和相同流速的生理盐水, 可得到最佳动脉期图像质量, 可在无高时间分辨采集序列设备上推广采集。

PO-3701

基于实时监测技术(Care Bolus)下不同注射速度对钆塞酸二钠(Gd-EOB-DTPA)增强成像肝动脉期图像质量的影响

陈春云、赵骏

陆军军医大学第一附属医院 (西南医院)

目的: 比较三种不同注射速度在实时监测技术(Care Bolus)中对钆塞酸二钠(Gd-EOB-DTPA)增强成像肝动脉期图像质量的影响。方法:使用 CARE Bolus 以三种不同速度注射造影剂 Gd-EOB-DTPA 后获得肝动脉期图像。146 例患者接受 Gd-EOB-DTPA 上腹增强 MR 成像, 其中 A 组为 49 例患者以 1ml/s 的速度, B 组为 51 例患者以 1.5ml/s 的速度, C 组为 46 例患者以 2ml/s 的速度。定量评分时, 计算肝实质、腹主动脉、腹腔干的信噪比(SNR)和增强比(CER)。定性评分选取肝实质、腹主

动脉、腹腔干、门静脉、肝动脉期伪影 5 个评分项, 计算总分。结果: A 组腹主动脉和腹腔干 SNR 显著高于 C 组($P<0.05$), A 组与 B 组无显著差异。C 组肝实质 CER 显著高于 A 组和 B 组($P<0.05$), A 组与 B 组间差异无统计学意义($P>0.05$)。三组间腹主动脉和腹腔干的 CER 差异无统计学意义($P>0.05$)。A 组腹主动脉、腹腔干 CER 及 5 项总分均显著高于 B 组和 C 组($P<0.05$), B 组与 C 组间差异无统计学意义($P>0.05$)。B 组动脉期图像伪影较 A 组差($P<0.05$)。结论:定量和定性分析表明, MRI 实时监测技术与 1ml/s 速度注射相结合, 可提供较好的动脉期图像, 减少 Gd-EOB-DTPA MR 成像中的伪影。

PO-3702

压舌板刺激迷走神经在高心率患者中进行冠状动脉 CTA 扫描的可行性探讨

任小军
西宁市第一人民医院

目的: 本文主要探讨 64 排及以下 CT 在高心率 (90-120 次/分钟) 患者行冠脉 CTA 扫描的可行性, 以解决县级医院等基层医疗机构由于设备原因而无法进行高心率冠脉 CTA 成像的难点。
方法: 对 32 例疑似冠状动脉病变的患者进行 CTA 扫描, 扫描前进行心率监测, 32 例患者平均心率为 105 次/分钟, 使用西门子 64 排 (型号: SOMATOM Definition AS) CT 设备, 扫描前使用压舌板刺激患者悬雍垂, 诱发恶心呕吐, 以达到刺激迷走神经来降低心率的目的, 刺激的同时监测心率, 刺激后 10 分钟左右待患者舒适后进行冠状动脉 CTA 扫描, 扫描参数及对比剂注射方案同常规扫描。
结果: 32 例患者中, 其中 31 例患者心率都得到明显改善, 完成了冠状动脉 CTA 的扫描, 扫描后观察图像未见明显伪影, 符合诊断要求; 1 例患者由于压舌板刺激后在进行扫描时心率再次上升, 导致 CTA 图像可见明显的错层伪影, 无法诊断。
结论: 根据相关文献报道使用降心率药物如腺苷、倍他乐克、美托洛尔等降低心率, 可诱发哮喘发作、导致消化不良以及降低血压等副作用, 对于低血压、哮喘以及严重慢性阻塞性肺疾病患者作为禁忌症, 因此限制了高心率患者使用降心率药物的广泛应用; 通过使用压舌板刺激迷走神经, 导致乙酰胆碱释放以此来降低心率, 既方便快捷又效果明显, 该实验组患者均未见明显不良反应, 该方法在县级医院等基层医疗机构或者 64 排及以下 CT 设备上值得进一步推广, 使疑似冠状动脉病变的患者由于心率高而无法在中低端设备上完成冠状动脉 CTA 成像成为过去, 但该方法会引起患者恶心呕吐, 极少数患者由于耐受程度较低, 因此在实际工作中根据患者耐受程度进行选择并规范操作。

PO-3703

双能量参数的稳定性和可重复性: 一个基于不同碘浓度的体膜研究

刘译阳、高剑波
郑州大学第一附属医院

目的: 双能量 CT 是 CT 领域的一个里程碑, 具有独特而重要的临床应用。在本研究中, 我们旨在测试双能量图像中不同参数的稳定性和再现性, 为未来的研究证明混合多个扫描仪数据的合理性。
方法: 在三种不同的双能量 CT 扫描机、四种不同的管电压设置下, 使用不同辐射剂量水平 (10mGy, 15mGy, 15mGy) 的腹部采集参数扫描了一个含有碘插入 (2、5、10 和 15 毫克/毫升)、碘-血液插入 (2 和 4 毫克/毫升) 的椭圆腹部模型。对单能图像 (40、70、100 和 140 千伏) 和虚拟未增

强图像的 CT 衰减结果以及碘图的碘浓度进行了定量评估。然后,采用伴有事后检验的单因素方差分析对不同类型的扫描仪参数进行比较。

结果综合考虑所有水平的辐射剂量,在两个管电压设置(100/Sn150 和 90/Sn150)之间的双源系统可以在最大数量的碘插入上实现碘浓度的一致测量 ($p>0.05$)。同样,两种双源系统在虚拟非增强图像上的衰减测量值上也无显著差异 ($p>0.05$)。此外,大多数测量对(6 对中的 4 对)在 140 keV 单能图像下能够实现一致的衰减测量值 ($p>0.05$)。

结论不同的双能量成像系统甚至不同的采集范式之间具有不同的碘和衰减精度,但这些定量指标在两个双源系统之间是通用的。

PO-3704

摄影 KV 在 DR 成像质量和辐射效能中的影响分析

崔志敏

无锡市人民医院

目的 探讨在 DR 成像中不同摄影千伏(KV)的变化对辐射效能和图像质量的影响。方法 利用专用图像检测板,在飞利浦 DR 系统上,通过改变摄影 KV (50—120KV)曝光,记录图像检测板中心区及空曝区的表面吸收剂量,并测定不同 KV 成像的中心区、空曝区、各级灰阶的密度值,进行量化分析。结果 摄影 KV 在 70—100 变化时表面吸收剂量减少明显,成像的中心区、空曝区、各级灰阶的密度值变化不大。结论 适当提高摄影 KV 可明显减少表面吸收剂量,提高辐射效能,而 DR 成像质量基本不受影响。

PO-3705

发育性髋关节 DR 摄影辐射剂量与图像质量的相关性研究

何子福

空军军医大学西京医院

目的在当前的 X 线摄影中,数字化 X 线摄影以其操作简单,辐射剂量小,成像质量高等优点受到越来越多的技师人员的青睐,但同时隐藏在背后的剂量问题也越来越不被人们所重视。本课题旨在通过研究数字 X 线摄影装置中剂量的指示值与受检者入射体表剂量的关系,应用剂量仪检测受检者不同体表位置剂量值,确定在不影响影像诊断的前提下,应用最小的辐射剂量获取能够满足临床诊断需求影像图像。

方法通过查阅相关的文献以及课题资料,应用有机玻璃建立试验模型,剂量面积仪检测 X 线的出口剂量面积值,应用相关公式计算到达受检者体表的剂量,去掉剂量面积仪将剂量仪固定在受检者体表位置,查看计算值与检测值之间是否相等,在误差范围内可以选用计算法获取入射体表剂量,通过 DR 的反馈值曝光指数“EI”来计算出探测器表面的空气比释动能,进而计算出出射体表剂量值,应用剂量仪检测体表剂量,查看计算出射人体剂量值与剂量仪检测值是否在误差范围内,在误差范围内可以选用通过 DR 的反馈值法获取出射人体剂量值,在能够获取入射体表剂量与出射体表剂量的方法下;应用试验动物模型法获取在不影响图像质量的前提下获取最优的摄影剂量,选取的动物模型与儿童腰围比较接近,选用不同的曝光参数(管电压、管电流量)对试验动物进行摄影,确定最优的曝光参数;辐射剂量最低,影像质量变化不大不会影像临床诊断的需求;将选择好的最优曝光参数应用于受检人体,观察受检者的影像图像。

结果 本研究建立了利用剂量面积仪与 DR 摄影设备的剂量反馈值计算数字化 X 线摄影入射体表剂量与出射体表剂量的计算模型,验证试验表明计算剂量值与剂量仪检测值在误差范围内,应用计算法

在动物试验中以优化的曝光参数对试验动物进行摄影, 观察能够获取满足临床诊断需求的低辐射剂量的摄影图像。

结论本研究所建立的数字化 X 线摄影所致受检者入射体表与出射体表的计算模型, 基本满足辐射防护剂量学的评价要求, 应用该计算模型可以估算在不同的曝光参数下, 受检者在每次曝光下所吸收的剂量, 可为数字化 X 线在诊断中受检者剂量提供一种便捷的计算方法。

PO-3706

自动预置技术结合噪声指数及迭代重建算法在腹壁下动脉 CTA 中的应用

胡梦婷、王诗耕、童小雨、范勇、张竞颐、程启烨、陈安良、刘义军
大连医科大学附属第一医院

目的 探究自动预置技术 (Auto-prescription) 结合噪声指数 (NI) 和重建算法 (ASIR-V) 对腹壁下动脉 CTA 成像辐射剂量和图像质量的影响。方法 前瞻性收集我院行腹壁下动脉 CTA 检查的患者 150 例, 并随机分为三组。A 组 (50 例) 管电压 120 kVp, NI=10, 图像采用 40% 的 ASIR-V 重建; B 组 (50 例) 管电压采用 Auto-prescription 技术, NI=10, 图像采用 40%、60%、80% ASIR-V 重建, 获得 B1~B3 三个亚组。C 组 (50 例) 管电压采用 Auto-prescription 技术, NI=13, 图像采用 40%、60%、80% ASIR-V 重建, 获得 C1~C3 三个亚组。在各组轴位图像上测量髂外动脉及同层面腰大肌的 CT 值和 SD 值, 计算信噪比 (SNR) 及对比噪声比 (CNR)。记录 A、B、C 三组辐射剂量。由 2 名观察者采用盲法独立对各组腹壁下动脉显示情况和整体图像质量行主观评分。结果 B、C 组髂外动脉 CT 值均高于 A 组 ($P<0.05$); B、C 组内随着 ASIR-V 等级的提高, 图像 SNR、CNR 逐渐升高 ($P<0.05$)。B2、B3 及 C2、C3 组的 SNR、CNR 均优于 A 组 ($P<0.05$)。2 名观察者主观评价一致性较好 ($Kappa=0.757\sim0.922$, $P<0.05$)。B、C 组图像在腹壁下动脉穿支、穿出点显示、肌内走行的主观评分方面均优于 A 组。B2、B3 和 C2 组在整体图像质量主观评分方面与 A 组差异无统计学意义。B、C 组辐射剂量与 A 组相比分别降低 15.10% 和 52.85% ($P<0.05$)。结论 Auto-prescription 技术结合 NI=13 和 60% ASIR-V 的成像方案可在保证腹壁下动脉清晰显示的同时降低 52.85% 的辐射剂量。

PO-3707

低剂量胸腹部三期联合增强扫描结合深度学习重建算法的应用价值

程启烨、王诗耕、童小雨、范勇、胡梦婷、张竞颐、陈安良、刘义军
大连医科大学附属第一医院

目的 探究不同等级的深度学习重建算法 (DLIR) 在低剂量胸腹部联合增强 CT 扫描 (CACE-CT) 中的应用价值。方法 前瞻性收集 2022 年 4 月~12 月于我院行三期 CACE-CT 的患者 58 例, 按就诊时间分为常规剂量组与低剂量组。常规剂量组 (A 组, $n=28$ 例): 采用管电流剂量调制等级 3 扫描, 重建 Karl5 级图像; 低辐射剂量组 (B、C、D 组, $n=30$ 例): 采用管电流剂量调制等级 2 扫描, 重建 DLIR (1~4) 四个等级图像, 记为 B1~B4、C1~C4、D1~D4 组。记录常规剂量组与低剂量组平均 mAs、CTDIvol 和 DLP, 并计算有效辐射剂量 (ED)。在三期轴位图像上测量肺动脉干、胸主动脉、肝脏、肝门静脉的 CT 值、SD 值, 并计算 SNR、CNR。由 2 名诊断医师对各组胸腹部图像质量进行主观评价。结果 低剂量组 mAs、CTDIvol、ED 较常规剂量组降低 34.47%、35.72%、34.80% ($P<0.05$)。随着 DLIR 等级的增加, B 组各部位的 SD 值逐渐下降, SNR 和

CNR 逐渐升高, 其中 B4 组各部位的 SNR, CNR 均优于 A 组 ($P<0.05$)。2 名诊断医师的主观评分一致性较好 (Kappa 值=0.763~0.928, $P<0.05$)。随着 DL 等级的升高, 胸部图像主观评分逐渐提高, B4 组得分最高; 腹部图像主观评分呈先升高后降低的趋势, B3 组得分最高。结论 在胸腹部联合增强扫描中应用 DL 算法, 能在保证图像质量的前提下, 有效降低患者辐射剂量。胸部最佳 DL 等级为 4, 在腹部最佳 DL 等级为 3。

PO-3708

1024 重建大矩阵结合 KARL 算法对胃部血管及肿瘤供血动脉显示的应用价值

童小雨、刘义军
大连医科大学附属第一医院

目的 探究 1024 重建大矩阵结合 Karl 算法对胃部血管及肿瘤供血动脉显示的应用价值。方法 前瞻性收集 2022 年 3~6 月临床上行腹部 CTA 检查的胃部肿瘤患者 30 例, 均采用联影 uCT760 进行扫描。扫描完成后, 对原始数据进行分组重建, A 组为常规组, 重建 512×512 矩阵结合迭代算法 (Keep Artifact Really Low, Karl) Karl5 图像; B 组为实验组, 重建 1024×1024 结合 Karl5、7、9 图像, 获得 B1~B3 三个亚组。在轴位图像上测量胃左动脉起始部的腹主动脉、腹腔干、脾动脉、肝动脉及同层面腹壁皮下脂肪组织的 CT 值和 SD 值, 计算上述血管的 SNR、CNR。由两名观察者采用五分法评估各组轴位、VR 和 MIP 的图像质量、胃部血管及肿瘤供血动脉的显示情况, 并行 Kappa 一致性检验。结果 A、B 组的腹主动脉、腹腔干、脾动脉、肝动脉的 CT 值差异无统计学意义 ($P>0.05$), B1~B3 随着 Karl 算法等级的提高, 图像 SD 值逐渐下降 ($P<0.05$), SNR、CNR 逐渐升高 ($P<0.05$)。与 A 组相比, B2 组除腹主动脉的 SD 值、肝动脉的 CNR 值外, 其余血管 SD 值、SNR、CNR 和背景噪声均无统计学差异 ($P>0.05$); 两名观察者主观评价一致性较好 (Kappa 值 0.780~0.921, $P<0.05$), B1~B3 组图像质量的主观评分随着 Karl 等级的提高呈现先高后低的趋势, B2 组得分最高 ($P<0.05$); 30 例胃部肿瘤中有 25 例肿瘤见胃动脉系统参与供血, B2 组的胃左动脉、胃右动脉、胃网膜左动脉、胃网膜右动脉、胃后动脉、胃短动脉的清晰显示率分别为 92%、72%、84%、100%、4%、4%、60%, 均优于 A 组。结论 采用 1024×1024 重建大矩阵结合 Karl7 能够显著提高胃部血管及肿瘤供血动脉分支的显示, 为临床诊疗提供更准确的影像信息。

PO-3709

噪声指数联合迭代重建算法行低辐射剂量 CT 尿路成像 (CTU) 的可行性探究: 模体研究

程启烨、王诗耕、童小雨、范勇、胡梦婷、张竞颐、陈安良、刘义军
大连医科大学附属第一医院

目的 探讨 Smart mA, 自适应统计迭代重建 (ASIR-V) 的技术联合在 CT 尿路成像 (CTU) 中对图像质量和辐射剂量的影响, 获取低辐射剂量 CTU 的最佳成像参数。方法 使用 GE Revolution CT 扫描仪扫描 PH-75 模体。模体内放置不同稀释度的对比剂 (分别为 15mgI/ml, 30mgI/ml, 45mgI/ml) 软管, 软组织棒与脂肪棒进行组合。每个组合在不同噪声指数 (NI=11, NI=13, NI=15, NI=17) 下进行扫描, 将 NI=11+60%后置 ASIR-V 的图像作为常规剂量 A 组, 将 NI=13、15、17 分别结合 60%、80%、100%后置 ASIR-V 的图像作为低剂量 B、C、D 组。均使用常规 CTU 扫描方案 (120kVp, Smart mA), 测量各组软管、软组织棒、脂肪棒的 CT 值及 SD 值并计算信噪比 (SNR)、对比噪声比 (CNR)。结果 同一对比剂浓度下组间比较, NI=13+80% ASIR-V、

NI=13+100% ASIR-V、NI=15+80% ASIR-V、NI=15+100% ASIR-V、NI=17+100% ASIR-V 组 SNR、CNR 值高于 NI=11+60% ASIR-V 组 ($P<0.05$)；NI=17+80% ASIR-V 组 SNR、CNR 值与 NI=11+60% ASIR-V 组差异无统计学意义 ($P>0.05$)。同一对比剂浓度下，NI=13+80% ASIR-V、NI=15+80% ASIR-V 组二维主观评分高于 NI=11+60% ASIR-V 组 ($P<0.05$)。NI=11 组 ED 为 1.67mSv，NI=15 组 ED 为 0.88mSv，NI=15 较 NI=11 降低 47.30%。结论 不同 NI 下 CTU 扫描结合高权重 ASIR-V 可在保证图像质量的同时显著降低辐射剂量，其中 NI=15+80% ASIR-V 为低辐射剂量 CTU 的最佳成像参数，满足诊断需求。

PO-3710

基于深度学习重建算法优化低剂量腹壁下动脉 CTA 成像参数

胡梦婷、刘义军、王诗耕、童小雨、范勇、陈安良、张竞颐、程启烨
大连医科大学附属第一医院放射科

目的 探究深度学习图像重建算法 (DLIR) 在低剂量腹壁下动脉 CTA 中的应用价值。方法 前瞻性收集 2023 年 1 月~6 月行腹壁下动脉 CTA 成像的患者 59 例，将患者随机分为 A、B 两组，A 组 29 例，B 组 30 例。A 组为常规辐射剂量组，120 kVp，管电流为剂量调制 3，迭代重建算法为 Karl5；B 组为低辐射剂量组，120 kVp，管电流为剂量调制 2，DLIR 重建算法，重建 DLIR (1~4) 四个等级并标为 B1~B4 组。记录 A、B 组平均 mAs，容积 CT 剂量指数 (CTDIvol)、剂量长度乘积 (DLP)，计算有效辐射剂量 (ED)。在各组轴位图像上测量髂外动脉及同层面腰大肌的 CT 值和 SD 值，计算信噪比 (SNR) 及对比噪声比 (CNR)。由 2 名观察者采用盲法独立在各组 VR 和 MIP 图上对腹壁下动脉的显示行 3 分制评分，在轴位图像上对整体图像质量行 5 分制评分。结果 B 组平均 mAs 和 ED 相较于 A 组分别降低了 39.33%、44.09%，($P<0.05$)。B1~B4 随着 DLIR 算法等级的提高，图像 SD 值逐渐下降，SNR、CNR 逐渐升高 ($P<0.05$)。B3 和 B4 组 CNR 均高于 A 组 ($P<0.05$)。2 名观察者主观评分一致性好 (kappa 值 0.779~0.889， $P<0.05$)，A、B 两组在腹壁下动脉穿支、肌内走行及穿出点显示中差异无统计学意义 ($P>0.05$)；B1~B4 组整体图像质量的主观评分随着 DLIR 等级的提高呈现先高后低的趋势，B3 组得分最高 (4.50 ± 0.51)，与 A 组 (4.45 ± 0.51) 相比差异无统计学意义 ($P>0.05$)。结论 DLIR 算法能够有效降低腹壁下动脉 CTA 的辐射剂量，并能保证图像质量，其中 DLIR3 为推荐的最佳重建等级。

PO-3711

CT 重建矩阵对不同密度大小肺结节影像组学特征稳定性的影响

童小雨、刘义军
大连医科大学附属第一医院

目的 分析 CT 重建矩阵对不同密度、大小肺结节影像组学特征稳定性的影响。方法 于成年男性仿真胸部体模 (PH-N1) 中放置 4 种大小 (5mm、8mm、10mm、12mm)、2 种密度 (-630HU、+100HU) 组合的肺结节共 8 枚，采用联影 uCT760 扫描仪进行扫描，在图像后处理工作站基于原始数据分别重建 512×512 、 768×768 及 1024×1024 矩阵的图像，在 3Dslicer 软件上手动勾画 ROI，分割肺结节，使用 python Pyradiomics 软件包进行组学特征提取，包括形状、一阶强度、纹理特征及高斯核为 2、3、4、5 的拉普拉斯变换后提取的高阶特征等共计 479 个特征，计算各特征的变异系数 (CV)，分析重建矩阵的改变对不同大小、密度肺结节组学特征的影响。结果 不同大小密度的肺结节影像组学特征稳定性均受到重建矩阵的影响。形状特征是最稳定的特征，受重建矩阵的影响最小 ($CV\leq5\%$)；部分一阶特征及纹理特征变异度较大，不稳定 ($CV>20\%$)。经过不同高斯核拉普拉斯滤波变换之后，组学特征的稳定性占比有所提高，高斯核 2 为最佳 (提升幅度在

10.75%~39.78%)。随结节直径增加, 稳定特征的比例逐渐升高; 1024×1024 矩阵稳定特征的比例高于 512×512 矩阵。相同大小及重建矩阵条件下, 实性结节所提取的稳定性特征略多于磨玻璃结节, 在 5mm 大小最为显著。结论 重建矩阵的改变会影响肺结节组学特征的稳定性, 小磨玻璃结节受到的影响更为显著, 较大重建矩阵有助于提升组学特征的稳定性。高斯平滑增强了肺结节组学特征的稳定性, 高斯核 2 为最佳。

PO-3712

噪声指数联合 ODM 技术及迭代重建算法行低辐射剂量 CT 尿路成像 (CTU) 的可行性探究

程启烨、王诗耕、童小雨、范勇、胡梦婷、张竞颐、陈安良、刘义军
大连医科大学附属第一医院

目的 探讨 Smart mA, ODM 技术和自适应统计迭代重建 (ASIR-V) 的技术联合在 CT 尿路成像 (CTU) 中对图像质量和辐射剂量的影响, 获取低辐射剂量 CTU 的最佳成像参数。方法 前瞻性收集行 CTU 扫描的患者, 按检查时间分为常规剂量 A 组 (120kVp+Smart mA NI=11)、低剂量 B 组 (120kVp+Smart mA NI=15) 和低剂量 C 组 (120kVp+Smart mA+ODM NI=15), 每组各 30 例, A 组重建 60%后置 ASIR-V, B 组与 C 组重建 60%~100% (间隔 10%) 后置 ASIR-V (B1~B5 组、C1~C5 组)。对各组图像质量进行客观、主观评价, 并记录每次扫描的检查辐射剂量。结果 A 组与 B 组比较, B1 组肾皮质 SNR 值、椎旁肌 SNR 值低于 A 组 ($P<0.05$), B3 组肾皮质 SNR 值、肌肉 SNR 值高于 A 组 ($P<0.05$), B4、B5 组各组织 SNR、CNR 值均高于 A 组 ($P<0.05$)。A 组与 C 组比较, C1、C2 组肾皮质 SNR、膀胱 SNR、膀胱 CNR 均低于 A 组 ($P<0.05$), C4、C5 组各组织 SNR、CNR 均高于 A 组 ($P<0.05$)。在 B、C 组中, B2、C3 组得分最高, 且高于 A 组 ($P<0.05$)。B 组 ED 为 (2.34 ± 0.95) mSv, 较 A 组降低了 48.57%, C 组 ED 为 (2.14 ± 0.7) mSv, 较 A 组降低了 52.97%。结论 不同 NI 下 CTU 扫描结合高权重 ASIR-V 可在保证图像质量的同时显著降低辐射剂量, 其中 NI=15+80% ASIR-V 联合 ODM 技术为低辐射剂量 CTU 的最佳成像参数, 满足诊断需求。

PO-3713

能谱下肢 CTV 在血栓显示和分期中的应用价值

王诗耕、刘义军
大连医科大学附属第一医院

目的 采用能谱 CT 行下肢静脉成像 (CTV), 探究其在深静脉血栓 (DVT) 显示和分期中的应用价值。方法 收集下肢 CTV 检查患者 82 例, 随机分为 A 组 (42 例) 和 B 组 (40 例)。A 组: 管电压 120 kVp; B 组: GSI 模式, 重建 50 keV 单能量图和碘 (水) 图。在 A 组 120 kVp 图和 B 组 50keV 图中测量静脉 CT 值和 SD 值, 计算静脉 SNR 和 CNR。2 名观察者对图像主观评分并行 Kappa 一致性检验。DVT 依病程时间分期, 在 A 组 120 kVp 图和 B 组碘 (水) 图中分别测量 DVT 的 CT 值和碘浓度 (IC), 绘制 ROC 比较 CT 值和 IC 诊断 DVT 分期的效能。结果 B 组静脉 CT 值、SNR 和 CNR 均高于 A 组 (P 均 <0.05)。2 组图像主观评分一致性好 (Kappa 值=0.926~0.955, P 均 <0.05)。B 组静脉显示情况和血栓清晰度的评分为 5 (4, 5) 分, 优于 A 组评分 4 (3, 4) 分 ($P<0.05$)。IC 诊断 DVT 分期的效能 (AUC=0.973) 优于 CT 值 (AUC=0.891)。结论 能谱下肢 CTV 可以提高静脉对比度和血栓清晰度, 并为判断血栓分期提供了更为客观的依据, 有利于临床的精准诊疗。

PO-3714

低能级靶重建结合 ASIR-V 算法在下肢静脉成像中的应用

王诗耕

大连医科大学附属第一医院

目的 探究能谱 CT 低能级 (keV) 靶重建技术结合 ASIR-V 算法在下肢静脉成像中的应用价值。**资料与方法** 回顾性收集 40 例行下肢静脉成像 (CTV) 检查的患者。GSI 成像模式, 管电压 80/140kVp 瞬切, 管电流采用 GSI Assist 模式。A 组 (常规组): 70keV 结合 40%ASIR-V 单能量图像, 常规视野 (DFOV) 含双下肢。B 组 (低 keV 组): 50keV 结合 50%ASIR-V 单能量图像, DFOV 同 A 组。C 组 (低 keV 靶重建组): 50keV 结合 50%~80%ASIR-V 单能量图像 (间隔 10%, 记 C1~C4 组), 靶重建 (小 DFOV, 以左、右股骨为中心覆盖单侧下肢)。在轴位图像上测量双侧下肢静脉的 CT 值及 SD 值并计算 SNR、CNR。由 2 名观察者采用 5 分法对静脉显示和栓子显示清晰度进行主观评分并行 Kappa 一致性检验。结果 在静脉显示方面, B、C 组评分均优于 A 组 ($P<0.05$)。在栓子显示清晰度方面, 大小栓子在 C 组内得分均随着 ASIR-V 权重的增加呈现出先高后低的趋势 ($P<0.05$), 其中 C2 组得分最高, 优于 B 组和 A 组 ($P<0.05$)。B、C 组各静脉段的 CT 值均高于与 A 组 ($P<0.05$)。C1~C4 组中随着 ASIR-V 算法权重的增加, 虽然各静脉段的 SNR、CNR 逐渐升高 ($P<0.05$), 但稍低于 B 组 ($P<0.05$)。结论 采用 50keV 靶重建技术结合 60% ASIR-V 算法能够显著提高下肢静脉对比度和栓子显示清晰度, 为临床提供更准确的影像信息。

PO-3715

1024×1024 重建矩阵结合 Karl 算法对肾上腺 CT 图像质量和自动分割的影响

王诗耕、刘义军

大连医科大学附属第一医院

目的 探究大重建矩阵 (1024×1024) 结合 Karl 迭代重建算法对肾上腺 CT 图像质量和自动分割的影响。**资料与方法** 回顾性收集 40 例行肾上腺 CT 增强的患者。扫描完成后, 对静脉期的原始数据进行重建分组, A 组采用常规矩阵 (512×512) 结合迭代重建算法 Karl 5 进行重建; B 组采用 1024×1024 重建矩阵结合不同等级的 Karl (5、7、9 级) 算法进行重建, 记为 B1~B3 组。2 名观察者采用 5 分法评估各组肾上腺显示情况、图像整体质量和肾上腺自动分割情况。在各组轴位图像上测量肾上腺、同层下腔静脉及腹壁皮下脂肪组织的 CT 值和 SD 值, 并计算 SNR、CNR。采用基于深度学习的器官分割模型对各组重建图像的肾上腺进行分割, 记录双侧肾上腺自动分割和手动分割体积值 (金标准), 并计算 Dice 系数和体积差别率。结果 在肾上腺显示、图像整体质量和自动分割情况方面, B2 组得分最高且均优于 A 组 (P 均 <0.05)。随着 Karl 等级的提高, B 组肾上腺、下腔静脉的 SD 值逐渐下降 (P 均 <0.05), SNR、CNR 逐渐升高 (P 均 <0.05), 其中 B2 组和 A 组 SD 值、SNR 和 CNR 差异均无统计学意义 (P 均 >0.05)。所有组别 Dice 系数均 >0.90 , B 组内的肾上腺 (双侧) 体积差别率均 $<5\%$, 且低于 A 组 (P 均 <0.05)。结论 采用 1024×1024 重建矩阵结合 Karl 7 算法能够在不影响肾上腺图像分割的同时优化肾上腺图像质量。

PO-3716

管电压对组学特征再现性和自动骨密度预测模型的影响

童小雨、刘义军
大连医科大学附属第一医院

目的 深度学习结合放射组学分析在胸部标准剂量 CT (SDCT, 120kVp) 和低剂量 CT (LDCT, 80kVp) 图像上建立两个全自动的骨密度预测模型, 并评估管电压对模型放射组学特征再现性和模型效能的影响。

方法 回顾性收集 2021 年 1 月~2023 年 3 月行骨密度检查和胸部 CT 检查的患者 1508 例。其中 987 例患者由于了一次胸部 CT, 或 LDCT 和 SDCT 检查时间超过 3 个月被用于开发胸椎松质骨自动分割模型, 采用 Dice 系数评估模型效能; 313 例患者均做了 LDCT 和 SDCT 被用于模型构建, 以 8:2 的比例分为训练集和内部测试集; 208 例组成外部测试集 1 (80kVp, n=115) 和外部测试集 2 (120kVp, n=93)。基于 SDCT 和 LDCT 分别提取了 1184 个特征, 并分别建立了两个二分类器。一级分类器用于区分正常或异常骨密度, 而二级分类器用于识别骨质疏松或骨质减少。计算 LDCT 与 SDCT 组学特征之间的一致性相关系数(CCC), 构建受试者工作特性曲线和决策曲线评估模型效能和临床收益。

结果 自动分割模型在 LDCT 和 SDCT 上的 Dice 系数分别为 0.98 ± 0.01 和 0.97 ± 0.02 。管电压的改变降低了提取的组学特征的再现性, 85.05%的组学特征再现性低(CCC<0.75)。基于 LDCT 和 SDCT 建立的组学模型的曲线下面积(AUC)分别为 0.97 ± 0.01 和 0.94 ± 0.02 , 决策曲线分析显示两个模型均有较高的临床净收益。然而, 交叉验证结果表明, 当模型生成与临床应用之间的管电压不匹配时, AUC 显著降低。

结论 利用 LDCT 和 SDCT 图像的自动预测模型能够准确评估骨状态。管电压对评估骨质状态的组学特征再现性和预测效能有影响。模型生成与临床应用之间应采用匹配的管电压, 以保证较高的预测效果。

PO-3717

1024×1024 重建矩阵结合迭代重建算法在腹壁下动脉 CTA 中的应用价值

胡梦婷、刘义军、王诗耕、童小雨、范勇、张竞颐、程启烨、陈安良
大连医科大学附属第一医院放射科

目的 探究 1024×1024 重建矩阵结合迭代重建 (Karl) 算法在腹壁下动脉 (DIEA) 血管造影 (CTA) 中的应用价值。**资料与方法** 前瞻性收集 2023 年 1~6 月临床上行腹壁下动脉 CTA 检查的患者 40 例, 对原始数据进行分组重建。A 组采用常规 512×512 矩阵结合 Karl 5 级重建; B 组采用 1024×1024 大重建矩阵分别结合 Karl5、7、9 级重建, 获得 B1~ B3 共 3 个亚组。在轴位图像上测量髂外动脉及同层面腰大肌的 CT 值和 SD 值, 计算信噪比 (SNR) 及对比噪声比 (CNR)。由 2 名观察者采用 3 分法在 VR 和 MIP 图上评估 DIEA 穿支、肌内走行、穿出点、腹壁下浅动脉 (SIEA) 以及腹壁下浅静脉 (SIEV) 的显示情况, 采用 5 分法在轴位图像上评估整体图像质量。**结果** B1~B3 组内随着 Karl 算法等级的提高, 髂外动脉 SD 值逐渐下降 ($P<0.05$), SNR、CNR 逐渐升高 ($P<0.05$); B2、B3 组髂外动脉 SD 值均低于 A 组 ($P<0.05$), SNR、CNR 均高于 A 组 ($P<0.05$); 2 名观察者主观评价一致性较好 (Kappa 0.773~0.872, $P<0.05$), B2 和 B3 组 DIEA 穿支、肌内走行、穿出点以及 SIEA、SIEV 的显示和整体图像质量主观评分均优于 A 组 (P 均 <0.05), 其中 B2 组得分的提升幅度最大。**结论** 采用 1024×1024 重建矩阵结合 Karl 7 重建算法能够优化图像质量, 提高腹壁下动脉及穿支微细血管的显示。

PO-3718

基于 GSI-Assist 在不同腹围患者腹部增强 CT 成像中实现个体化“双低”的应用研究

魏巍、刘义军、刘爱连
大连医科大学附属第一医院

目的：评估能谱智能辅助技术（GSI-Assist）联合低对比剂注射方案在不同腹围患者腹部增强 CT 成像中实现个体化“双低”扫描的可行性。方法：随机分为 A、B 两组，根据患者腹围大小分成四个亚组：A1、B1（700mm<腹围≤800mm），A2、B2（800mm<腹围≤900mm），A3、B3（900mm<腹围≤1000mm），A4、B4（1000mm<腹围≤1100mm）。A1~A4 管电流分别为 235mA、280 mA、320 mA、360 mA，对比剂用量为 500mgI/kg。B 组管电流采用 GSI Assist 技术，NI 设置为 10HU，前置 ASIR-V 为 60%，对比剂用量为 300mgI/kg，其余扫描方案同 A 组。A 组增强三期均重建 70keV 结合 60% 后置 ASIR-V 图像；B 组动脉期重建 70keV 结合 60%~80% 后置 ASIR-V 图像，门静脉期及延迟期重建 50~65keV（间隔 5keV）结合 60%~80%后置 ASIR-V 图像。比较 A、B 各组的对比剂用量和辐射剂量。测量各组各期肝脏组织、腹主动脉、门静脉、下腔静脉及同层面的竖脊肌的 CT 值及 SD 值，并以竖脊肌为背景计算上述组织的对比噪声比（CNR）。由两名观察者采用盲法独立地对各组图像行 5 分制评分。结果：在动脉期，B 组 70keV 结合 70%后置 ASIR-V 图像的肝脏与腹主动脉的 CT 值、CNR 相较于 A 组差异无统计学意义；在静脉期和延迟期，B 组 50~55keV 重建图像的肝脏 CT 值高于 A 组，55keV 结合 70%和 80%后置 ASIR-V 图像的肝脏与血管的 CNR 与 A 组相当或优于 A 组。在 B 组各亚组的主观评分中，当 keV 水平一致时，70%后置 ASIR-V 图像最佳。B1~B4 组较 A1~A4 组对比剂剂量分别降低 38%、37%、30%、22%，辐射剂量分别降低 15%、25%、19%、12%。结论：能谱 CT 智能辅助技术可在保证图像质量的基础上实现腹部增强个体化“双低”扫描，推荐在动脉期采用 70keV 联合 70%后置 ASIR-V 图像，在静脉期和延迟期采用 55keV 联合 70%后置 ASIR-V 图像。

PO-3719

探讨能谱 CT 在术前鉴别膀胱癌病理分级的最佳成像模式

魏巍、刘义军、刘爱连
大连医科大学附属第一医院

目的：探讨能谱 CT 的定量成像在术前鉴别膀胱尿路上皮癌（UCB）病理分级的最佳成像模式。方法：回顾性分析行泌尿系能谱 CT 增强检查并经手术病理确诊为 UCB 的患者 66 例，其中高级别（HG-UCB）33 例，低级别（LG-UCB）33 例。由 2 位观察者分别测量动、静脉期病灶最大层面的碘浓度（IC）、标准碘浓度（NIC）、脂（水）值以及有效原子序数（Zeff）。采用组内相关系数（ICC）比较 2 位观察者测量参数的一致性。采用多因素 Logistic 回归分析筛选 UCB 病理分级独立风险因素。绘制受试者操作特征曲线(ROC)评估能谱 CT 各参数诊断 UCB 病理分级的效能。结果：2 位观察者测量一致性良好（ICC>0.893）。动脉期仅有 HG-UCB 的 NIC（0.18±0.08）高于 LG-UCB（0.14±0.05）有统计学差异（P=0.016）。静脉期 HG-UCB 的 IC、NIC、脂（水）值和 Zeff 与 LG-UCB 相比，差异均有统计学意义（P=0.017、0.000、0.015、0.016）。动脉期 NIC 的曲线下面积（AUC）为 0.680。静脉期 IC、NIC、脂（水）值和 Zeff 的 AUC 分别为：0.675、0.823、0.678、0.663。Logistic 回归分析结果显示，动、静脉期的 NIC 值是 UCB 病理分级的独立风险指标（P<0.05）。静脉期 NIC 值=0.54 为阈值诊断 UCB 病理分级的效能最佳，敏感度和特异度分别为 96.97%和 60.61%。结论：能谱 CT 静脉期多参数定量成像与鉴别膀胱尿路上皮癌的病理级别具有很好的相关性，其中静脉期的 NIC 效能最佳。

PO-3720

能谱 CT 参数变化对影像组学预测膀胱癌病理分级的影响

魏巍、刘义军、刘爱连
大连医科大学附属第一医院

目的：探究不同单能量（40~140keV）及基物质图对影像组学模型预测膀胱尿路上皮癌（UCB）病理分级的影响。方法：回顾性分析经病理证实为 UCB 的患者 112 例，其中高级别（HG-UCB）76 例，低级别（LG-UCB）36 例。所有患者术前均行能谱 CT 泌尿系增强检查。对静脉期数据进行 40~140keV（间隔 10 keV）、I(W)和 W(I)图像重建，共获得 13 组图像，并将各组图像上传到联影组学平台软件。对各组图像病灶层面提取 90 个特征（一阶和纹理特征）并通过最小冗余最大相关（MRMR）和最小绝对收缩与选择算子(LASSO)依次筛选出最有价值的特征集。采用五折交叉验证法将样本分为训练集和测试集，通过随机森林构建预测膀胱癌分级的模型。绘制受试者工作特征曲线 ROC，评估 13 种重建图像所得模型预测膀胱癌病理分级的性能，并在测试集中进一步验证，所有模型结果均以五折交叉均值表示。结果：不同参数重建图像选择预测 UCB 病理分级的影像组学特征略有不同，但 40~100keV 选择的特征集中均有灰度依赖矩阵（GLDM）的依赖方差（dependencevariance）。各组重建图像预测膀胱癌病理分级的模型在训练集中的曲线下面积（AUC）为 0.917~0.958、测试集中的 AUC 为 0.841~0.895，不同 keV 之间、keV 与碘基图之间训练集和测试集均无统计学差异。结论：能谱 CT 参数变化对组学预测膀胱癌病理分级无影响，即使不同重建图像的相关特征不同，也并不影响模型的准确性

PO-3721

不同上肢静脉穿刺注射造影剂对急性胸痛主动脉 CTA 图像的影响

吴志斌
空军军医大学西京医院

【摘要】目的 探讨不同上肢静脉穿刺注射造影剂对急性胸痛患者胸腹主动脉 CTA 检查图像成像的影响。方法 回顾性分析 97 例因急性胸痛收入我院的胸腹主动脉 CTA 检查的图像数据，其中右上肢肘正中静脉穿刺 51 例分为 A 组；左肘正中静脉穿刺 46 例分为 B 组，两组 BMI 均在 18.5-23.9 之间，A 组年龄（57.89±11.21），B 组年龄（58.54±9.31）。A、B 两组所使用的扫描设备均为西门子 Somatom Definition Flash，扫描条件均为 120kV，参考毫安 250mAs（CareDose4D），造影剂使用量均为 1.2ml/kg，注射流率 5.0ml/s；扫描模式均为大螺距 Flash 扫描模式，螺距为 3.4 采用阈值触发法当四腔心层面腹主动脉 CT 值大于 200HU 时自动触发扫描，分别比较两组数据主动脉根部、第二肝门处腹主动脉和髂总动脉分叉处的 CT 值、SNR 及 CNR；并由两名高年资影像科医生用 5 分制评分法对 A、B 两组数据的三个层面的图像质量进行评分，评分不一致时取平均分。两组图像质量主、客观评价结果采用 SPSS 13.0 软件进行统计学分析。结果 A 组中三个层面 CT 值分别为（425.26±63.4）、（401.91±70.34）、（380.41±65.45）；B 组中三个层面的 CT 值分别为（382.35±65.3）、（368.91±60.14）、（331.21±70.32）， $P<0.05$ 差具有统计学意义，说明 A 组各层面 CT 强化值均高于 B 组。SNR 以及 CNR：A 组与 B 组比较（ $P>0.05$ ）无统计学意义，两组图像质量的主观评分无明显差异（ $P>0.05$ ）。结论 由于更短的循环路径以及更少的循环时间使得更多得造影剂用于强化靶器官，在图像质量相同的情况下同样造影剂注射量以及同样注射速率，右上肢肘中静脉穿刺进行造影剂注射比选择左侧上肢肘中静脉穿刺注射造影剂能得到更高的强化值。

PO-3722

能谱 CT 单能量成像提高门静脉对比度后处理参数优化

范勇、刘义军
大连医科大学附属第一医院

目的：评估能谱 CT 不同低能级 (keV) 单能量成像结合不同权重自适应统计迭代重建 (ASIR-V) 算法对门静脉显影不佳的 CT 图像质量的影响，以获取优化门静脉显影的最佳 keV 和 ASIR-V 组合。

方法：分析我院行全腹部增强 CT 检查，门静脉显影不佳 (120kVp 或 70keV 情况下门静脉 CT 值 $<180\text{HU}$) 的患者 121 例，其中常规组 (A 组) 59 例、能谱组 (B 组) 62 例。A 组：管电压 120 kVp，管电流 Smart mA 扫描，重建 40% ASIR-V 图像；B 组：GSI 模式，管电压 80/140 kVp 瞬切，管电流采用智能匹配 (GSI-Assist) 技术，重建 70keV 结合 40% ASIR-V 图像 (B1 组)；并应用原始数据重建 65keV~40 keV (间隔 5 keV) 结合 50%、60%、70%、80%ASIR-V 图像 (B2~B25 组)。记录 A、B 两组平均扫描长度、CTDIvol、DLP，计算有效辐射剂量 (ED)。测量各组门静脉和肝脏的 CT 值、SD 值，计算门静脉的 SNR、CNR。由两名放射科医师采用 5 分法评价各组图像质量和门静脉的显示分支数，并行 Kappa 一致性检验。结果：在 B 组，当 ASIR-V 权重一定时，随着 keV 能级的降低，门静脉 CT 值、SD 值、SNR、CNR 逐渐升高 ($P<0.05$)；当 keV 能级不变时，随着 ASIR-V 权重的提高，门静脉 CT 值差异无统计学意义 ($P=0.999\sim1.000$)，SD 值逐渐降低，SNR、CNR 逐渐提高 ($P<0.05$)。B2~B25 组图像的门静脉 CT 值、SNR 和 CNR 均高于 A 组。2 名医师主观评分一致性较高 ($\text{Kappa}=0.681\sim0.719$, $P<0.05$)。在 B 组中，50 keV 结合 80% ASIR-V 的主观评分最高，图像质量优于 A 组 ($P<0.001$)。结论：在 CT 门静脉成像中，采用能谱成像具有明显优势，针对门静脉显影不佳 (门静脉 CT 值 $<180\text{HU}$) 的情况，通过降低 keV 和增加 ASIR-V 权重，可在不增加患者辐射剂量的情况下，优化 CTPV 门脉图像质量。其中最佳 keV 能级和 ASIR-V 权重为 50keV 结合 80%ASIR-V。

PO-3723

256 层螺旋 CT 行冠状动脉 CTA 时心率与最佳期相间的关系

樊婧
河南省人民医院

目的：探讨 256 层螺旋 CT (MDCT) 前瞻性心电图 (ECG) 触发冠状动脉 CT 血管造影 (CCTA) 时心率 (HR) 与最佳期相之间的关系。

方法：回顾性分析 2022 年 1 月至 12 月我科行冠状动脉 CTA 中筛选符合要求的 50 例患者。扫描仪根据 10sECG 记录选择了最佳曝光阶段。为了确保 CCTA 的成功，技术员还根据患者的年龄，呼吸控制，情绪状态和既往病史，以确定自动曝光序列是否需要手动调整。以 R-R 间期的 1% 间隔重建图像，来选择冠状动脉运动最少的期相。如果 CCTA 图像在冠状动脉中显示中度运动模糊或不连续，则对重建的图像进行自动校正。采用 4 点分级量表评估诊断图像质量。

结果：本研究共调查了 50 例 CCTA 检查。舒张期重建心率 $\text{HR}<63\text{bpm}$ ，其中 36.5% 和 77.8% 的心率 $\text{HR}\leq 57$ 和 58-62 bpm 的自动校正进行重建。 $\text{HR}\geq 63\text{bpm}$ 患者，分为 $\text{HR}=63-67$ 和 $\geq 68\text{bpm}$ 分别有 89.3% 和 71.7% 选择为舒张期重建，而在同一 HR 组中，81% 和 100% 的采用自动校正重建。

结论：根据我们的结果，HR 小于 67bpm，患者可用于舒张期重建。虽然自动校正算法是降低 CCTA 中心脏运动影响的有效方法，但 HR 控制对于优化 CCTA 的图像质量仍然很重要。本研究 HR 与最佳重建期相之间的关系可以进一步用于调整心电图脉冲窗口，以减少患者的辐射剂量。

PO-3724

应用高权重迭代算法降低结直肠癌患者 CTC 辐射剂量可行性研究

范勇、刘义军
大连医科大学附属第一医院

目的 探究自适应统计迭代算法 (ASIR-V) 对结直肠癌患者术前 CT 结肠造影 (CTC) 图像质量和辐射剂量的影响。**方法** 前瞻性收集我院行 CTC 检查的患者 95 例。所有患者 CTC 检查均需行俯卧位和仰卧位两次扫描。根据体位分为 A、B 两组。A 组 (仰卧位, 实验组) 分别采用前置 40% ($n=31$)、50% ($n=30$)、60% ($n=34$) ASIR-V 扫描, 记为 A1~A3 组; B 组 (俯卧位, 常规组) 采用前置 30% ASIR-V 扫描, 对应 A 组分为 B1~B3 组。记录 A、B 两组的 CTDIvol、DLP, 并计算 ED。在轴位图像上测量肿瘤及肠腔空气的 CT 值、SD 值, 并计算肿瘤的 SNR、CNR。由两名诊断医师采用 5 分法评价各组二维、三维图像质量, 并行 Kappa 一致性检验。记录肿瘤的位置, 并以手术结果为标准, 比较各组图像肿瘤定位与手术结果的一致性。结果 两名诊断医师的主观评分一致性较好 (Kappa 值为 0.712~0.951, $P<0.05$), 所有图像质量均符合诊断要求 (≥ 3 分), A、B 两组的肿瘤 CT 值、SD 值、SNR、CNR 和二维及三维图像主观评分差异均无统计学意义 ($P=0.083\sim 0.903$)。A 组、B 组肿瘤定位与手术结果一致性均较高 (Kappa=0.928~0.958)。随着 ASIR-V 权重的增加, A 组辐射剂量逐渐降低, 与 B 组比较差异均有统计学意义 ($P<0.001$)。结论 在 CTC 检查中, 适当提高前置 ASIR-V 权重可在不影响图像质量的情况下, 进一步降低患者辐射剂量, 采用前置 40%~60% ASIR-V 扫描, 有效辐射剂量较常规扫描分别降低了 22%、41%、55%。

PO-3725

探究深度学习重建算法在低剂量 CT 结肠造影中的应用价值

范勇、刘义军
大连医科大学附属第一医院

目的: 探究不同等级 DL 重建算法在低剂量 CT 结肠造影 (CTC) 中的临床应用价值。**方法:** 前瞻性收集我院行 CTC 扫描的患者 38 例, 所有患者均行俯卧位和仰卧位两次扫描, 根据扫描体位分为 A、B 两组。A 组 (俯卧位, 常规组) 行 120kVp、剂量调制等级 2 扫描, 重建 Karl 5 级图像; B 组 (仰卧位, 实验组) 行 120kVp、剂量调制等级 1 扫描, 重建 DL (1~4) 级图像, 记为 B1~B4 组。比较 A、B 两组平均辐射剂量及主客观图像质量。记录各组图像肿瘤的位置, 以手术结果为标准, 比较各组图像肿瘤定位与手术结果的一致性。结果: B 组平均 mAs、CTDIvol、ED 较 A 组显著降低 ($P<0.001$)。A、B 两组肝脏、腰大肌和脂肪的 CT 值差异无统计学意义 ($P>0.05$), B1 组的 SD 值高于 A 组 ($P<0.001$), SNR、CNR 低于 A 组 ($P<0.001$), B2 组与 A 组差异无统计学意义 ($P>0.05$), B3~B4 组的 SD 值低于 A 组 ($P<0.001$), SNR、CNR 高于 A 组 ($P<0.001$)。两名医师的主观评分一致性较好 (Kappa 值=0.721~0.842, $P<0.001$), B2 组图像整体质量得分最高 ($P<0.001$), 与 A 组得分差异无统计学意义 ($P>0.05$)。A、B 2 组肿瘤定位与手术结果的一致性均较高 (Kappa 值=0.790, $P<0.001$)。结论: DL 重建算法可降低图像噪声, 本研究中 B 组有效辐射剂量较 A 组减低了约 58%, 结合 DL2 重建算法, 图像质量与常规组相当。

PO-3726

探究 1024×1024 重建矩阵结合 Karl 算法对 CT 门静脉图像质量和肝脏体积测量的影响

范勇、刘义军
大连医科大学附属第一医院

目的 探究 1024×1024 重建矩阵结合 Karl 算法对 CT 门静脉 (CTPV) 图像质量和肝脏体积测量的影响。**方法** 回顾性分析行全腹部 CT 增强的患者 40 例, 所有患者均采用联影 uCT760 进行扫描, 成像参数: 120kVp, 管电流设置为剂量调制等级 3, 重建 512×512 矩阵, Karl 5 级图像, 获得图像为常规组 (A 组)。对常规组的原始数据进行重建获得实验组 (B 组) 图像: 采用 1024×1024 重建矩阵, 结合 Karl 5、7、9 级进行图像重建, 得到 B1~B3 组图像。重组 A、B 组门静脉 MIP、VR 图像, 应用联影 AI 软件测量肝脏体积, 比较 A、B 组门静脉和肝脏 CT 值、SD 值、CNR、肝脏体积值及图像主观评分。结果 A、B 组间门静脉和肝脏 CT 值差异无统计学意义 ($P=0.170\sim0.800$)。随着 Karl 等级的提高, B 组门静脉和肝脏的 SD 值逐渐降低 ($P<0.001$), CNR 逐渐升高 ($P<0.05$), 其中 B2 组 SD 值、CNR 和 A 组的差异无统计学意义 ($P=0.798\sim0.901$)。B 组肝脏体积值与 A 组差异均无统计学意义 ($P=0.978\sim0.999$)。两名观察者主观评价一致性较好 ($Kappa=0.789\sim0.927$, $P<0.05$), B 组门静脉边缘锐利度及分支显示清晰度均优于 A 组 ($P<0.05$)。随着 Karl 等级的增加, B 组噪声评分逐渐增加、伪影评分逐渐降低, 门静脉边缘锐利度及分支显示清晰度呈先升高后降低的趋势 ($P<0.001$), B2 组综合得分最高, 优于 A 组 ($P<0.001$)。结论 采用 1024×1024 重建矩阵结合 Karl 7 级算法重建图像能够优化门静脉图像质量, 且能准确测量肝脏体积。

PO-3727

肠系膜下动脉 CTA 应用深度学习重建算法降低辐射剂量的可行性研究

张竞颐、刘义军、王诗耕、童小雨、范勇、陈安良、胡梦婷、程启烨
大连医科大学附属第一医院

目的 探究不同等级的深度学习重建算法 (DL) 对低剂量肠系膜下动脉 (IMA) CTA 图像质量的影响, 并获得 IMA CTA 图像最佳 DL 等级。**方法** 前瞻性收集行 IMA CTA 的患者 60 例, 随机分为 A、B 两组。A 组 ($n=30$) 管电压 120kVp, 管电流为剂量调制等级 3, 重建 Karl5 图像; B 组 ($n=30$) 管电压 120kVp, 管电流为剂量调制等级 2, 重建 DL (1~4) 等级图像, 记为 B1~B4 组。记录 A、B 两组容积剂量指数 (CTDIvol)、剂量长度乘积 (DLP), 并计算有效辐射剂量 (ED)。在轴位图像上测量 IMA 主干、同层腹主动脉和竖脊肌的 CT 值和 SD 值, 计算各血管的 SNR, CNR 和质量因数 (FOM)。重组 VR 和 MIP 图像, 由两 2 名诊断医师对二维和三维图像进行五 5 分制评分。结果 B 组 ED 与 A 组相比降低了 42.08% ($P<0.05$)。随着 DL 等级的提高, B1~B4 组 SD 值逐渐降低, SNR, CNR 和 FOM 逐渐提高 ($P<0.05$)。B3、B4 组腹主动脉的 SNR, CNR, FOM 优于 A 组 ($P<0.05$)。两 2 名诊断医师对图像主观评分一致性良好 ($Kappa$ 值 $0.795\sim0.891$, $P<0.05$)。B2、B3 组与 A 组主观评分差异均无统计学意义 (均 $P>0.05$)。结论 深度学习重建算法可在低辐射剂量的情况下, 保证 IMA 肠系膜下动脉 CTA 的图像质量, 满足诊断需求, 其中 DL3 为推荐的最优重建等级。

PO-3728

基于去脂体重的低对比剂方案在结直肠癌能谱 CT 成像中的可行性

张竞颐、刘义军、王诗耕、童小雨、范勇、陈安良、胡梦婷、程启烨
大连医科大学附属第一医院

目的 在结直肠癌的能谱 CT 多参数扫描中,探究基于去脂体重 (LBW) 的低对比剂注射方案的可行性。**方法** 前瞻性收集疑似结直肠肿物行能谱全腹增强 CT 的患者 150 例,随机分为 A、B、C 三组 (各 50 例),对比剂 (CM) 剂量分别为 500 mgI/kg (总体重, TBW), 500mgI/kg (LBW), 400mgI/kg (LBW), 三组扫描参数保持一致。A、B 两组采用后置 60% ASiR-V 重建 1.25mm 的 70keV 图像, C 组重建 40~70keV 图像记为 C1~C4 组,其余重建参数相同。在碘水图上测量并计算三组的标准化碘浓度值 (NIC)。比较三组患者的 CM 剂量、动脉期肠系膜上动脉 (SMA) 和肠系膜下动脉 (IMA) 的 CT 值、SD 值、SNR 和 CNR 以及静脉期肝脏增强 CT 值 (Δ HU)。重组 SMA、IMA 的 VR 和 MIP 图像,由两名诊断医师进行 5 分制评分。结果 三组患者一般资料差异无统计学意义 ($P>0.05$)。B 组和 C 组的 CM 剂量分别降低了 23.00% 和 37.19% ($P<0.05$)。A、B 两组动脉期各血管客观指标差异均无统计学意义 ($P>0.05$), B 组 Δ HU 低于 A 组但大于 50HU ($P<0.05$)。C 组动、静脉期所有血管的 CT 值、SD 值均随 keV 的升高而逐渐降低 ($P<0.05$)。C3 组 Δ HU 与 A 组相当 ($P>0.05$)。三组动、静脉期 NIC 差异均无统计学意义 ($P<0.05$)。两名诊断医师主观评分一致性良好 (Kappa 值 0.768~0.909, $P<0.05$)。B 组和 C3 组动、静脉期分别与 A 组双期主观评分差异无统计学意义 (均 $P>0.05$)。结论 基于 LBW 的方案在降低 CM 剂量后仍然可以提供优质的图像质量,不影响结直肠癌的诊断信心。综合主客观指标, C 组动、静脉期均在 60keV 下表现最佳。

PO-3729

深度学习重建算法结合低管电压在常规肺部 CT 扫描中的应用价值

吕仁锋、徐哲
大连市中心医院

目的: 研究深度学习重建 (deep-learning image reconstruction DLIR) 算法结合低管电压 (100KVp) 对肺部 CT 扫描图像质量及辐射剂量的影响。

方法: 选取常规肺部 CT 扫描的患者 50 例,按照管电压的不同分 120KVp 组和 100KVp 组,每组各 25 例。其中, A 组: 管电压 120KVp, 自适应统计迭代重建 (adaptive statistical iterative reconstruction-Veo, ASiR-V, 30%) 算法, 重建模式 (lung)。将 100KVp 组扫描的原始数据, 按重建算法及重建模式的不同分别重建出 B 组: 深度学习重建算法 (DLIR-H), 标准重建模式 (stnd)。C 组: 深度学习重建算法 (DLIR-H), 标准重建模式 (stnd)+图像增强滤波 lung (LU)。所有扫描采用管电流 100mA, 余参数设置相同, 三组数据均重建出层厚 1.25mm 图像, 记录相同位置两侧肺组织内的 CT 值、皮下脂肪 CT 值和噪声 (SD)、CTDI, 计算信号噪声比 (SNR)、辐射剂量 (ED), 由两名胸组医生对图像质量进行主观评价, 并对三组间数据进行统计学分析。

结果: 三组肺部图像测量的 CT 值均无统计学差异 ($P>0.05$); 三组图像的 SD 值、SNR 值和图像质量评价均有统计学差异 ($P<0.05$), 其中 B、C 两组图像的噪声明显低于 A 组, C 组图像可以提供更好的锐利度, 清晰地显示肺纹理的结构和分支; 100KVp 组的辐射剂量明显低于 120KVp 组 ($P<0.05$)。

结论：在肺部 CT 扫描中使用管电压 100KVp 结合 DLIR 算法明显的降低了辐射剂量，相比 ASiR 算法使用 DLIR 算法结合图像增强滤波 lung (LU) 重建模式可以显著地降低图像噪声，同时提高了肺内组织及肺纹理的显示能力。

PO-3730

超低剂量 CT 结合深度学习重建算法对腹部图像质量的影响

唐星
安徽医科大学第一附属医院

目的：评价腹部超低剂量 CT 结合深度学习图像重建算法 (DLIR) 相对于常规 CT 利用滤波反投影算法对 CT 图像质量的影响。

方法：选取我院 171 例因临床诊疗需求行腹部 CT 检查的患者 (男 88 例，女 83 例)，分别采取了常规剂量 CT 扫描和超低剂量 CT 扫描。常规剂量 CT 扫描使用滤波反投影技术 (FBP) 进行 0.625mm 层厚重建，超低剂量 CT 扫描分别使用滤波反投影技术 (FBP)、不同权重迭代重建技术 (ASIR-V30%、ASIR-V50%、ASIR-V70%)、不同等级的深度学习重建技术 (DLIR-L、DLIR-M、DLIR-H) 进行 0.625mm 层厚重建。我们分别将这几组数据进行主观和客观评分，并分别记录辐射剂量。结果：超低剂量组较常规剂量组相比，辐射剂量降低了 89%。超低剂量 CT 扫描使用 DLIR-H 重建的图像质量与常规剂量 CT 扫描使用 FBP 重建的图像质量大致相仿，差异无统计学意义 ($P > 0.05$)；超低剂量 CT 扫描使用 DLIR-M、DLIR-L、ASIR-70%重建的图像质量较常规剂量 CT 扫描使用 FBP 重建的图像质量较差 ($P < 0.05$)，而超低剂量 CT 扫描使用 ASIR-50%、ASIR-30%、FBP 重建的图像质量基本不能满足诊断需求。超低剂量 CT 在结合 DLIR-H 重建图像检测出肝囊肿 (61 例)，肾囊肿 (63 例) 及肾结石 (24 例)，与常规剂量 CT 利用 FBP 重建图像病灶检出率差异无统计学意义。

结论：超低剂量 CT 结合深度学习重建技术在满足临床诊疗需求的基础上，能明显降低辐射剂量，具有较好的临床应用价值。

PO-3731

放射科的诊断错误和偏倚

李蒙、张丽、温馨
中国医学科学院肿瘤医院

影像诊断是医学诊疗过程的重要组成部分，发生在放射科里的影像诊断错误或偏倚也是一个常见的现象，有时甚至会对病人的诊治造成严重的影响。总的来说，放射科诊断错误或偏倚可以分为两大类，第一类是感知错误 (perceptual error)，第二类是认知错误或偏倚 (cognitive errors)。感知错误可以通俗地被认为是“漏诊”，即未观察到主要或者关键的发现。认知错误可以通俗地被认为是“误诊”，也就是发现了影像异常，但是将影像异常归因于错误的疾病诊断分类。感知错误更多见，约占诊断报告错误的 60-80%，认知错误约占诊断报告错误的 20-40%。发生影像诊断错误的原因多种多样，既有图像质量、病灶的大小和位置、临床信息缺失等客观原因，也有阅片者自身专业知识欠缺、固有思维偏倚 (如搜索满意偏倚、锚定认知偏倚、确认偏差偏倚、可用性偏倚、归因偏倚) 等主观原因。本文结合临床上的实际病例，总结并图文综述了影像诊断报告错误和偏倚的常见原因和应对策略，以期对放射科医生的临床实践有一定帮助，降低发生影像诊断错误的概率。

呼吸运动对肺癌患者 4D-CT 的图像质量影响研究

付新辉¹、戴谷宇²、肖青²、李光俊²

1. 北京大学医学部医学技术研究院

2. 四川大学华西医院放射物理技术中心

目的：探究呼吸运动对肺癌患者 4D-CT 图像质量的影响，并分析呼吸曲线特征与 4D-CT 图像质量的相关性，为患者选择合适的呼吸运动管理方法提供参考。材料与方法：本研究采用呼吸运动模体模拟九种规律呼吸曲线和十条患者呼吸曲线并进行 4D Cine 扫描，然后基于时相重建十个时相的图像；采用 RayStation 勾画靶区并记录各靶区的相关参数；采用 python 编写代码提取呼吸曲线特征值。首先计算靶区体积 Dice 系数，分析三种靶区 19 条呼吸曲线下 50%时相的 Dice 系数，然后分析呼吸曲线的不同时相对 4D-CT 图像质量的影响，接着探究规律呼吸曲线和患者呼吸曲线各个时相图像体积、Dice 系数和平均 CT 值的差异，最后分析呼吸曲线特征与图像质量的相关性。结果：分析三种靶区 19 条呼吸曲线下 50%时相的 Dice 系数发现大球靶区 Dice 系数最稳定，其中最小值为 0.947，最大值为 0.957，标准差为 0.005，变异系数为 0.51%；分析呼吸曲线的不同时相对 4D-CT 图像质量的影响发现中间时相的靶区体积、Dice 系数和平均 CT 值四分位数范围更小，且标准差更小；对比规律呼吸曲线与患者呼吸曲线下各时相图像的 Dice 系数和平均 CT 值发现，规律呼吸曲线下 0%和 50%时相的箱线图四分位数范围整体更小，患者呼吸曲线下 40%~60%时相的箱线图四分位数范围整体更小；不同呼吸曲线下各个时相图像体积、Dice 系数和平均 CT 值的均值与提取的呼吸曲线特征值具有显著相关性。结论：呼吸运动对肺癌患者的 4D-CT 图像质量具有显著的影响。形状、大小不同的靶区在靶区勾画时的敏感性不同，其中小靶区的勾画误差更大，大球靶区勾画结果更稳定；呼吸运动速度慢的时相范围内 4D-CT 图像质量表现更佳；呼吸曲线的特征与 4D-CT 的图像质量具有较强的相关性。

PO-3733

低管电压联合深度学习图像重建算法在降低胸腹盆联合增强 CT 辐射剂量的价值

綦维维、安备、刘晓怡、程瑾、陈雷、洪楠

北京大学人民医院

目的：探讨在胸腹盆联合增强 CT 扫描中，应用低管电压联合深度学习图像重建算法（Deep Learning Image Reconstruction, DLIR）对辐射剂量及图像质量的影响。

方法：前瞻性收集需进行胸腹盆联合增强 CT 扫描的患者，根据扫描参数不同，通过简单随机法分为两组，分别为：1）低剂量优化组，管电压 80kV+DLIR 重建算法；2）常规剂量组，管电压 120kV+自适应统计迭代重建（Adaptive Statistical Iterative Reconstruction V, ASiR-V）算法。通过对 Catphan500 模体在不同噪声指数（noise index, NI）条件下进行扫描的结果，设置低剂量优化组的噪声指数。应用 t 检验比较两组间的辐射剂量的差异。应用非参统计方法，对两组图像质量进行主、客观评价。

结果 最终入组 149 例患者，其中低剂量优化组 61 例，常规剂量组 88 例。根据模体实验的结果，当低剂量优化组 NI 为 12，常规剂量组 NI 为 9 时，两组间对比分辨率无显著差异，因此确定两组的 NI 值。低剂量优化组的辐射剂量低于常规剂量组，两组具有显著性差异（ $P < 0.05$ ）。低剂量优化组中肝脏衰减、主动脉衰减显著高于常规剂量组（ $P < 0.001$ ），肝脏及主动脉 CNR 和 SNR 值显著高于常规剂量组（ $P < 0.001$ ），主动脉空间分辨率、肝总动脉空间分辨率、门静脉空间分辨率及小血管/支气管显示情况也均优于常规剂量组（ $P < 0.05$ ）。

结论：低管电压联合深度学习图像重建算法能够在降低辐射剂量的条件下，仍保证同等甚至更高的图像质量，为大范围 CT 扫描辐射剂量的优化方案提供一个可行方案。

PO-3734

The preoperative predictive value of radiomics and nomogram for intrahepatic mass cholangiocarcinoma pathological grading based on T2 weighted image and hepatobiliary phase imaging

Lihong Xing¹, shuping Wang², liyong Zhuo^{1,3}, yu zhang^{1,3}, jianing wang^{2,3}, yan zhang⁴, fengying zhu^{1,3}, jinghui dong⁵, zepeng ma^{1,3}, xiaoping yin^{1,3}

1. Department of Radiology, Affiliated Hospital of Hebei University
2. College of Electronic and Information Engineering, Hebei University
3. 4. Hebei Key Laboratory of precise imaging of inflammation related tumors
4. Department of Radiology, Beijing You An Hospital, Capital Medical University
5. Department of Radiology, The Fifth Medical Center of Chinese PLA General Hospital

Objective: To explore the predictive value of radiomics and clinical features for pathological grading in intrahepatic mass cholangiocarcinoma (IMCC) based on T2 weighted image (T2WI) and hepatobiliary phase (HBP) imaging. **Method:** We undertook a multi-center retrospective analysis of 78 patients with IMCC confirmed by pathology. We randomly assigned 70% (42 cases) and 30% (19 cases) of the initial 61 patients to the training set and validation set, respectively. The lesions in T2WI and HBP images were manually segmented by radiologists. We used the Pyradiomics package to extract radiomics features from the images. We performed ten-fold cross-validation using the filtering method and mutual information algorithm, and the minimum absolute contraction and selection operator regression (LASSO) screening features, and then we used the support vector machine (SVM) to establish the classification model. After the 61 patients were used, medical imaging of the 17 patients sequentially included in the study were used for the external validation of the classification models, Area under the curve (AUC), accuracy (ACC), sensitivity (SEN), and precision (PRE) were used to evaluate the performance of the model. Nomograms were drawn based on radiomics, and we used clinical features and the calibration curve to evaluate the model. We evaluated the clinical validity of model using decision curve analysis (DCA). **Result:** Both Model_T2 and Model_HBP based on T2WI and HBP images could accurately predict the pathological grading of IMCC (ACC = 0.91, SEN = 0.75, PRE = 1.0, AUC = 0.87; and ACC = 0.92, SEN = 0.83, PRE = 1.0, AUC = 0.91, respectively). The combined prediction model Model_HBP+T2 had better performance than the single sequence radiomics model (ACC = 0.94, SEN = 0.88, PRE = 1.0, AUC = 0.93). As demonstrated by external validation, the AUC of Modle_HBP, ModleT2, and Modle_HBP+T2 was 0.86, 0.83, 0.86, respectively, confirming that these models have relatively high reliability. **Conclusion:** In this study, we found that single sequence and combination sequence models based on T2WI and HBP images accurately predicted the pathological grading of IMCC. The combination model had higher predictive value and reliability, and it had better predictive efficacy when clinical features and radiomics features were combined.

PO-3735

Individually body surface area-adapted contrast media injection in coronary CT angiography

Yanping Liu, Panpan Hao
Qilu Hospital of Shandong University

Objectives To evaluate the efficacy and safety of individually body surface area (BSA)- versus body weight-adapted injection of contrast media in coronary computed tomographic angiography (CCTA) with 2nd dual-source CT (DSCT).

Methods 270 enrolled patients were randomly assigned into 3 groups. All 3 groups adopted the uniphasic contrast media (Ioversol 320, 320 mgI/100 ml) with fixed injection time of 15 s followed by 30 ml saline flush. In control group, patients were injected with fixed volume (75 ml) and fixed flow rate (5 ml/s) of contrast media. In body weight-adapted group, patients were injected with contrast media with the volume of 0.9 ml per 1 kg body weight and the flow rate of 0.06 ml/s per 1 kg body weight. In BSA-adapted group, patients were injected with contrast media with the volume of 36.5 ml per 1 m² BSA and the flow rate of 2.4 ml/s per 1 m² BSA. All procedures were performed using a 2nd generation 128-slice DSCT. Two experienced observers, who were blind to the groups, independently evaluated the CCTA images.

Results BSA-adapted protocol exhibited in a relatively high degree of contrast enhancement and image quality, as well as a relatively low volume and flow velocity of contrast media. There was no significant difference in radiation dose among the 3 groups. No severe adverse events occurred in all 3 groups during CCTA examination.

Conclusion The efficacy and safety of BSA-adapted protocol in CCTA are compelling.

PO-3736

Optimized Bolus Threshold for Dual-Energy CT Angiography with Monoenergetic Images: A phantom study

Shuwen Dong, Jieqiong Chen, Li Fan, Shiyuan Liu
Changzheng Hospital, Naval Medical University

Purpose or Learning Objective

The study aims to investigate the optimal bolus-tracking trigger threshold in low-contrast medium protocol based on virtual monoenergetic images (VMIs) on a dual-layer detector CT with an angiography phantom.

Methods or Background

An angiography phantom which contained six syringes with different densities of diluted iodide contrast medium (2.1, 5.2, 10.0, 14.5, 19.6, and 28.9 mg/mL) was scanned on a dual-layer detector CT (Spectral CT 7500, Philips Healthcare, Best, Netherlands) with 120kVp/30mAs. Conventional images and 40KeV VMIs were reconstructed. CT attenuation was measured respectively three times by two radiologists with circular regions of interest (ROIs) (3.5cm) placed on the middle plane of the syringes. And CT values of the six angiography phantoms were measured respectively on the conventional image and the 40keV VMIs. The mean CT values on the conventional scan images were fitted using least-squares estimation from polynomial regression models to 40 keV VMIs. As the bolus-tracking trigger threshold in conventional angiography is 150HU, the optimal threshold under 40KeV VMI was then calculated using the fitted model accordingly (Fig 1). The δ value of the trigger threshold during conventional angiography scanning (100HU) can be calculated as the trigger threshold in conventional angiography (150HU) subtract the CT value of the vessel (50HU). And the corresponding δ value under the condition of 40keV can be obtained according to

the regression equation. The optimal trigger threshold of 40KeV VMI can be calculated as the CT value of conventional angiography scanning (HU) plus δ value (HU).

Results or Findings

The trigger thresholds calculated for each kiloelectron-volt level yielded the following results: 46 HU (40 keV), 54 HU (45 keV), 64 HU (50 keV), 64 HU (55 keV), 87 HU (60 keV), 102 HU (65 keV), and 117HU (70 keV) with 120kVp/30mAs. According to the regression equation, the corresponding δ value at 40KeV VMIs can be obtained as 46HU. The optimal trigger threshold (HU) can be calculated as the CT value of the vessel (HU) plus 46HU. According to the fitted model, the optimal bolus-tracking trigger threshold was 96HU when combined with 40keV VMI, which is comparable to 150HU in routine scans.

Conclusion

The optimal bolus-tracking trigger threshold in low contrast medium protocol using 40KeV VMI can be reduced to 96HU. Optimizing the trigger threshold to obtain the desired virtual monochromatic image during dual-energy CT angiography can maintain vascular enhancement while reducing the iodine load.

PO-3737

Just give the contrast? Appraisal of guidelines on intravenous iodinated contrast media use in patients with kidney disease

Jingyu Zhong¹, Liwei Chen¹, Wenjie Lu¹, Silian Wang¹, Ying Zhu¹, Huan Zhang², Weiwu Yao¹

1. Tongren Hospital, Shanghai Jiao Tong University School of Medicine

2. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective: To appraise the quality of guidelines on intravenous iodinated contrast medium (ICM) use in patients with kidney disease, and to compare the recommendations.

Methods: We searched four literature databases, eight guideline libraries, and ten homepages of radiological societies, to identify English and Chinese guidelines on intravenous ICM use in patients with kidney disease published between January 2018 and June 2023. The quality of the guidelines was assessed by Scientific, Transparent and Applicable Rankings (STAR) tool.

Results: Ten guidelines were included, with a median sum STAR score of 46.0 (range 36.0-61.5). The guidelines performed well in "Recommendations" domain (31/40, 78%), while poor in "Registry" (0/20, 0%) and "Protocol" domains (0/20, 0%). Nine guidelines recommend estimated glomerular filtration rate (eGFR) < 30 mL/min/1.73m² as the cutoff for referring patients to discuss the risk-benefit balance of ICM use. Three guidelines further suggest the patients with an eGFR < 45 mL/min/1.73m² and high-risk factors also need referring. Varying recommendations were seen in the acceptable time interval between renal function test and ICM use, and that between scan and repeated scan. Nine guidelines recommend to use iso-osmolar or low-osmolar ICM, while no consensus has been reached for the dosing of ICM. Nine guidelines support hydration after ICM use, but their protocols vary. Drugs or blood purification therapy are not recommended as the preventative means.

Conclusion: The suboptimal quality of guidelines and their controversial recommendations remain gaps in workflow timing, ICM dosing and post-administration hydration protocols of contrast-enhanced CT scans for patients with kidney diseases, calling more evidence to establish a safer and more practicable workflow.

PO-3738

The application of "one-stop" low contrast dose and low flow rate craniocervical CTA integrated with cerebral CTP in patients with carotid atherosclerosis

Yuanyuan Cui, Shiyuan Liu, Yi Xiao
Second Affiliated Hospital of Naval Medical University

Background: This study explored a "one-stop" craniocervical CTA protocol integrated with cerebral CTP that employed a low contrast dose and flow rate. The protocol was based on dual-layer spectral CT (DLCT) and was used for patients with carotid artery stenosis. **Methods and materials:** Consecutive patients who underwent carotid CTA from July to November 2020 and those who were scheduled carotid recanalization surgery were included prospectively. Patients were divided into three groups: "one-stop", low-dose control and conventional control groups. Each group underwent corresponding scan protocol. Virtual monoenergetic images (MonoE) at 40, 50 and 60keV were reconstructed in the first two groups. The image quality was evaluated subjectively and objectively. **Results:** A total of 46, 52, and 19 cases were included in the conventional control, low-dose control, and "one-stop" group, respectively. The SNR and CNR of each segment of arteries on 40 and 50 keV MonoE in the "one-stop" and low-dose control group were higher than those in the conventional control group (all $p < 0.05$), and no difference in objective image quality and diagnostic confidence was found ($p = 0.777$, $p = 0.777$, $p = 0.822$, and $p = 0.425$). **Conclusions:** It is feasible to present the protocol of "one-stop" low contrast dose and low flow rate craniocervical CTA integrated with cerebral CTP on DLCT in patients with moderate and severe carotid artery stenosis. MonoE at 40 and 50 keV could improve the image quality significantly, and the images were comparable with that of conventional CTA.

PO-3739

Deposition of Gadolinium in Central and Peripheral Nervous System and Its Effects on Sensory, Cognition, and Athleticism After Multiple Injections of Gadolinium Contrast Agents in Rats

Xiang Yao¹, Ke Ren², E Chen¹
1. Zhongshan Hospital of Xia Men University
2. Xiang'an Hospital of Xia Men University

Background The association between the repeated administration of gadolinium-based contrast agents (GBCAs) and the gadolinium (Gd) retention in the central and peripheral nervous systems and its effects on sensory, cognition, and athleticism remain unclear.

Purpose To investigate the effects of the repeated administration of GBCAs on Gd retention in central and peripheral nervous systems and the sensory, cognition, and athletic implications.

Materials and Methods Forty-eight male Wistar rats (4 weeks old) received tail vein injections of saline or (0.6 mmol Gd/kg) GBCAs, including gadodiamide, gadopentetate dimeglumine, and gadoterate meglumine, 4 times a week for 28 days. The brains of the rats were scanned using 9.4 Tesla magnetic resonance imaging (MRI). Sensory behavioral tests were performed to assess the effect of GBCAs on pain sensitivity function. Gd retention in the brain, spinal cord, and peripheral nerves was determined by inductively coupled plasma mass spectrometry. Transmission electron microscopy (TEM) was used to observe the microscopic distribution of Gd after deposition in the spinal cord. The histopathological features in the spinal cord were analyzed by hematoxylin-

eosin staining, Nissl staining, glial fibrillary acidic protein (GFAP) staining, and neuron specific enolase (NSE) staining after administrations of GBCAs.

Results All GBCAs resulted in Gd deposition in central and peripheral nerve tissues, with the highest deposition in the spinal cord tissue. Decreased muscle power, impairment on spatial cognitive function power, and pain hypersensitivity to thermal and mechanical stimuli were observed after exposure to gadodiamide. At the spinal cord, TEM found that the region of Gd depositions had a spherical structure similar to "sea urchins", and was mainly located near the vascular basement membrane.

Conclusion Multiple injections of GBCAs caused Gd deposition in the brain, spinal cord, and peripheral nerves, especially in the spinal cords of the gadodiamide group. Gadodiamide led to pain hypersensitivity and decreased muscle power and the ability of cognition.

PO-3740

Experimental study on the deposition of gadolinium-based contrast agent and its enhanced the expression of NLRP3 inflammasome activation mechanism in the brain of type 2 diabetic rats

Xiang Yao¹, Ke Ren², E Chen¹

1. Zhongshan Hospital of Xia Men University

2. Xiang'an Hospital of Xia Men University

Gadolinium-based contrast agents (GBCAs) are widely used to diagnose and monitor disease progression in contrast-enhanced magnetic resonance imaging (CE-MRI). Over 30 million doses of GBCAs are used worldwide every year. Clinically available GBCAs are all bonded by a ligand when they are used as an MRI contrast agent, due to the free gadolinium is highly toxic. Until 2006, all GBCAs were considered extremely safe. In 2006, some GBCAs may cause nephrogenic systemic fibrosis (NSF) in patients with renal failure were reported. However, no new NSF case has been reported during the period when renal filtration rate was fully assessed prior to CE-MRI. Since 2013, the safety of GBCAs had attracted broad attentions over the world. A research group from Japan reported that signal intensity in the deep cerebellar nucleus (DCN) on unenhanced T1 weighted imaging (T1WI) may be a result of the previous GBCAs administrations. After that report, many studies focused on the potential risks of gadolinium retention in the human brain. We evaluated the effect of different types of GBCAs on the gadolinium deposition in brain. The possible entry and clearance mechanisms of gadolinium and the potential side effects of gadolinium deposition in the brain were described.

Patients with type 2 diabetes mellitus (T2DM) often need multiple CE-MRI examinations, because they always with many vascular diseases. The destruction of blood-brain barrier (BBB) affects the deposition of gadolinium contrast agents in the brain, and type 2 diabetes mellitus is associated with BBB damage and renal insufficiency. Therefore, it is important to study gadolinium deposition in type 2 diabetes mellitus.

NSF is a progressive fibrosing disorder that primarily affects individuals with chronic kidney disease following exposure to GBCAs administered for MRI and angiography. In vitro, GBCAs can induce peripheral blood monocytes and monocyte derived macrophages to produce cytokines, promote the activation of fibroblasts and increase the production of extracellular matrix components. NLRP3 is a part of a family of protein complexes, called inflammasome and plays an important role in innate immunity. After NLRP3 activated, it can interact with ASC adaptor proteins, to activate Caspase-1, interleukin (IL) -1 β and IL-18. There is a great interest in the recent introduction of inflammation, a macromolecular platform composed of NLR (Nod) -like receptor proteins, ASC (proteins containing apoptosis-associated spotted CARD), and pro-caspase-1 proteins. Inflammation is responsible for the proteolytic processing of immature forms of interleukin -1 β (IL-1 β) and IL-18. The two potent pro-inflammatory cytokines are pleiotropic. At present, there was no

research on type 2 diabetes and gadolinium contrast agent in brain deposition and clearance. In type 2 diabetic patients, no correlation has been reported between gadolinium deposition in brain and inflammatory immunity.

Here, we report that multiple injections of linear gadolinium contrast agents including gadodiamide and gadopentetate dimeglumine can cause gadolinium deposition in the brain and high signal in T1 sequence, especially in DCN. In type 2 diabetes and normal rats, gadolinium deposition of linear contrast agent was significantly higher than that of macrocyclic contrast agents, and gadodiamide was the most. In each group, Olfactory bulb and DCN were the places with the largest amount of gadolinium deposition. After injection of gadolinium contrast agent in type 2 diabetic rats, the deposition of gadolinium contrast agent in the brain was much higher than that in the normal rats. The clearance of gadolinium contrast agent in the brain was influenced by type 2 diabetes, and the clearance of gadolinium contrast agent in the brain was inhibited in type 2 diabetes. In type 2 diabetic rats, gadolinium can cause behavioral changes, and mediate neuroinflammation by enhancing the NLRP3-Caspase-1-IL-1 β pathway. Gadodiamide can enhance the activation of microglia and invasiveness, stimulate the transformation of microglia into type M1, increase the apoptosis of neuronal apoptosis and decrease the membrane potential of mitochondrial.

Together, our results first identify that gadolinium deposition occurred in the brain of type 2 diabetic rats after multiple injections of GBCAs through inductively coupled plasma mass spectrometry (ICP-MS), 9.4 T magnetic resonance and transmission electron microscopy (TEM). Quantitative studies of gadolinium deposition in different brain regions were also performed. With the help of ultra performance liquid chromatography-tandem mass spectrometry (UPLC-MS) technology, the specific deposition form of GBCAs in the brain was studied for the first time in the rat model of type 2 diabetes. The mechanisms of GBCAs enter and deposit into the brain and the potential long-term biological and clinical implications require further research. In clinical practice, the assessment should be individualized and the potential unknown risk of deposition gadolinium should be considered before using GBCAs. It is recommended that macrocyclic GBCAs can be used at the lowest dose to reduce the deposition of gadolinium in the brain. The effect of GBCAs on the central nervous system after deposition in the brain is a research hotspot at this stage and even in the future, and further research is needed to better guide the standard application of GBCAs in clinical practice. At the same time, this study also provides new ideas for the development of new and safe MRI contrast agents.

PO-3741

Application value of POWER PICC as venous access in contrast enhanced CT scanning

Hui Xu,Bin song,jin yao

四川大学华西医院

Objective: The purpose of this study was to explore the differences in scan and image quality between the use of high pressure resistant PICC and peripheral venous indwelling needle as contrast agent access in enhanced CT.

Materials and Methods: Ninety-six patients with high pressure tolerance PICC venous access and 73 patients with peripheral venous indwelling needle access were included for chest and abdominal enhanced CT scan. Scanning trigger time was recorded, image quality was divided into objective parameter evaluation and subjective grading evaluation, and the two groups were compared SPSS Statistic 22.0 was used for statistical analysis

Results: The monitoring trigger time of patients in the two groups was tested by Student's t-test. The mean trigger time of patients in the PICC group was 24.24s (S5.18), and that of the control group was 31.85s (S7.61), $P < 0.05$, the difference was statistically significant. The two groups were injected with the peak pressure for two independent sample T test. The mean peak pressure of

contrast agent in the PICC group was 206.67 (S52.249), and that in the control group was 133.76 (S34.797), $P < 0.01$, the difference was statistically significant. There were differences in image quality between the two groups.

Conclusion: Enhanced CT using high pressure resistant PICC as venous access triggered early, the pressure in the catheter was higher than that of conventional venous catheterization, the effect of abdominal aortic mass injection was stronger, and there was no significant difference in the venous stage.

PO-3742

低造影剂总量低注射速度低辐射在高危新生儿先天性心脏病 CTA 检查中的探索

吴训华
中南大学湘雅医院

目的 探索使用低辐射低造影剂总量 CTA 检查技术在高危新生儿先天性心脏病 CTA 检查应用

方法 收集我院 2023 年 2 月至 2023 年 7 月收治的 10 例先天性新生儿患者均接受先天性心脏病 CTA 检查, 使用联影 UCT960+ 进行低辐射低造影剂总量低注射速度造影检查 (80KV100MAS, 6ml, 0.5ml/s)。新生儿体重在 2.58Kg 至 3.75Kg, 留置针注射位置为两侧手臂腋静脉, 使用高压注射器分别在注射造影剂 16 秒及 36 秒进行扫描, 扫描范围从第七颈椎至第一腰椎约 12 厘米。重建窗宽 500 窗位 50。

结果 接受低辐射低造影剂总量低注射速度造影检查的新生儿心脏 CTA 影像可以清楚显示心脏心房心室, 肺动脉肺静脉主动脉之间的关系均满足先心病心脏影像诊断图像等级优。

结论 新生儿先天性心脏病 CTA 造影为高风险检查, 控制高危因素减少辐射及低造影剂总量低注射速度可以降低检查风险。清楚显示心脏心房心室, 肺动脉肺静脉主动脉之间的关系为临床诊断先天性心脏病提供可靠的影像诊断。

PO-3743

新型造影剂银纳米三角在肿瘤计算机断层扫描成像中的应用研究

杨惠泉、朱正阳、张冰
南京鼓楼医院

目的: 采用种子生长法制备壳聚糖包被的银纳米三角 (silver nanotriangles, AgNTs), 并通过体内外实验评价其计算机断层扫描 (Computed tomography, CT) 造影性能。**方法:** 制备一系列不同尺寸的 AgNTs, 利用透射电子显微镜、紫外可见光谱、动态光散射和电感耦合等离子体质谱等对其进行表征。使用显微 CT 对不同尺寸的 AgNTs 的 CT 造影性能进行评价, 并选取其中性能最佳的 AgNTs 进行 AS1411 靶向修饰, 检测其在细胞水平的 CT 成像效果。此外, 构建荷乳腺癌小鼠模型, AgNTs 瘤内注射后观察 CT 成像效果。**结果:** 合成的四种不同尺寸的 AgNTs 主要呈三角形, 平均边长分别 60 nm、88 nm、120 nm 和 149 nm。在各质量浓度下, 四种 AgNTs 的 CT 值均高于临床常用的 CT 造影剂碘海醇, 体现出良好的 CT 对比增强效果。其中尺寸最大的 AgNTs 的 CT 值最高, 因此被选择用于后续的研究。用适配体 AS1411 修饰 AgNTs, 得到肿瘤靶向的 AS1411-AgNTs, MDA-MB-231 乳腺癌细胞经 AgNTs 和 AS1411-AgNTs 处理后 CT 值均增高, 且呈浓度依赖性。而且在同等质量浓度下, AS1411-AgNTs 显示出比 AgNTs 更强的 CT 对比增强效果。体内实验结果显示, CT 图像中 AgNTs 注入的肿瘤区域 CT 值显著增高。**讨论:** AgNTs 是一种优异的 CT 造影剂, AS1411 靶向修饰能够进一步提高其 CT 成像效果。这将为开发高效的新型肿瘤 CT 成像造影剂提供实验和理论基础。

PO-3744

高心率冠状动脉 CTA 成像经验分享

贾广生

哈尔滨医科大学附属第二医院

目的：提高高心率下冠状动脉 CTA 成像图像质量、保证检查的成功。

方法：降低患者心率，口服或含服降心率的药物；更换扫描设备，选用宽体或者更高转速的 CT 设备；选择适宜的扫描期相；更改扫描条件，提高管电流或者管电压；调整对比剂注射方案，如提高碘流率（提高注射速率或碘浓度）、增加注射对比剂量；同时适当提高触发阈值；进行呼吸训练、心理干预等等；使用 AI 后处理软件，提高诊断信心等等方法来提高高心率下冠状动脉 CTA 成像图像质量。

结果：通过这些方法的改进，可明显提高高心率患者冠状动脉 CTA 成像图像质量、保证检查的成功、增强医生的诊断信心。

结论：通过适当调整这些检查方法，可用于高心率患者冠状动脉 CTA 成像时提高图像质量。

PO-3745

腹部 CT 增强检查患者禁食时间与急性不良反应的相关性分析

李雪

中国人民解放军陆军特色医学中心

目的：分析禁食时间对腹部 CT 增强患者静脉注射非离子型碘对比剂相关的急性不良反应的影响，重点关注禁食时间对恶心、呕吐的影响。

方法：采用回顾性病例对照研究，纳入 2021 年-2022 年在我院行腹部 CT 增强检查的患者，分析其临床特征，使用泊松回归分析，并控制相关混杂因素，研究禁食时间对急性不良反应的影响。同时比较不同禁食时间患者急性不良反应及恶心、呕吐发生率的差异。

结果：共有 30462 例检查患者纳入分析，30368 例(99.69%)未发生急性不良反应；94 例(0.31%)发生急性不良反应，其中 15 例(0.05%)发生了恶心、呕吐，无误吸和吸入性肺炎的发生。40%患者禁食时间超过 10h，未发生与发生急性不良反应的中位禁食时间分别为 8(5, 12)h，11.8 (5, 15)h，其中恶心及呕吐人群的中位禁食时间为 13(6, 16)h。泊松回归分析显示禁食时间每增加 1h，急性不良反应发生风险增加 3.5%(95%CI: 1.013 ~ 1.058, p=0.002)，恶心、呕吐发生风险增加 4.8%(95%CI: 1.007 ~ 1.091, p=0.002)。当禁食时间≥10h 时急性不良反应及恶心、呕吐发生率明显增加。

结论：腹部 CT 增强检查患者中，禁食时间是其发生急性不良反应及恶心、呕吐的独立危险因素。

PO-3746

CT 增强检查前饮食准备的范围综述

李建洁、李雪*

中国人民解放军陆军特色医学中心

目的：对 CT 增强检查前饮食准备的相关研究进行范围审查，了解检查前不同饮食准备对患者不良反应的影响以及不同饮食方案的应用范围。

背景：一直以来为了预防注射碘对比剂引起的恶心、呕吐等不良反应导致的吸入性肺炎，大多数医疗机构要求患者在 CT 增强检查前禁食 4-6h。但 CT 增强检查前禁食缺乏循证依据。目前已有指南

提出 CT 增强检查取消禁食不会增加患者不良反应发生率。在临床实践中,证据的转化与落实并不乐观,大部分医院仍在实行传统的禁食方案。因此本研究拟对 CT 增强检查前饮食准备的相关研究进行范围审查,以更好了解不同临床情景下患者饮食准备对不良反应的影响,为影像护理人员对 CT 增强患者进行饮食管理,优化放射护理实践提供参考依据。

方法:根据范围综述研究方法,通过 8 个数据库(建库至 2023 年 7 月 21 日),灰色文献库,参考文献列表检索文献;对研究人群、饮食准备方案、不良反应发生率、不良反应评估方式进行总结。结果:共纳入 8 篇文献,研究中的大多数患者都是意识清醒进行非胃肠道 CT 增强的择期成年患者,研究中碘对比剂相关恶心的发生率从 0.008%到 7.6%不等,碘对比剂相关呕吐的发生率从 0%到 3%不等,所有研究都未发现误吸病例。大多数纳入研究认为检查中和检查后 30 分钟内患者发生的不舒适为碘对比剂相关不良反应。评估人员包括放射科医师,技师,护士,非医师研究协调员。所有研究均评估了饮食准备对碘对比剂相关不良反应的影响,提出取消禁食不会增加恶心、呕吐、不良反应的发生率,因此基于禁食对于患者的潜在有害影响,鼓励取消 CT 增强患者检查前禁食的程序。结论:取消检查前禁食不会对常规择期 CT 增强患者碘对比剂相关不良反应发生率产生影响。然而,研究人群有限,未来的研究应优先考虑目前代表性不足人群的检查前饮食准备(例如,麻醉、镇静、儿童、碘对比剂相关不良反应高风险患者,急诊患者、要摄入对比剂的胃肠 CT 增强检查、虚拟胃肠镜等患者)。

PO-3747

碘 ICM 高压输注后静脉留置针回血的临床观察及相关因素分析

陈廷静

中国人民解放军陆军特色医学中心

目的:探讨碘 ICM 高压输注后静脉留置针内血液凝集、回血、形成血凝块/血丝的临床观察及相关因素分析。方法:纳入我院从 2021 年 9 月至 2022 年 1 月行碘 ICM 高压输注后静脉留置针回血的 160 例患者进行静脉留置针回血的临床观察及相关因素分析,四要点:①血管穿刺部位的选择:选手腕/肘部/前臂大静脉;②留置针型号:选择并使用贝朗留置针,18G/20G;③穿刺前先用 5ml 氯化钠注射液的注射器连接延长管排气后再穿刺,导管送入血管 2/3 以上,抽回血后再预推 5ml 氯化钠注射液判断导管是否位于血管中;④留置针夹闭的方法:延长管置于小夹子根部夹闭在静脉留置针的近段(延长管前 1/3 段);⑤回血/血丝/血栓判断:观察有无回血/血丝/血凝块,有回血/血丝/血凝块等运用统一的标尺测量回血、血丝/血凝块的长度。三个标准:①碘 ICM 高压输注后静脉留置针是否有回血现象,回血后是否有血丝/血凝块形成。②观察留置针回血,回血量分 3 个标准测量并统计,≤1CM, 1-2CM, ≥2CM。③回血和血丝/血凝块,根据血丝长度分 3 个标准测量并统计,≤1CM, 1-2CM, ≥2CM。结果:从患者的基础疾病、安置留置针型号、安置部位等与回血及血凝块/血丝的形成相关性分析;患者留置针留置部位与回血有统计学意义, $P < 0.05$ 。患者基础疾病、留置针穿刺部位、留置针型号与血凝块/血丝的相关性分析结果比较均无统计学意义, $P > 0.05$ 。结论:碘对比剂在高压输注后留置针回血相关因素进行跟踪随访的分析,保证了患者碘 ICM 高压输注后留置针使用的安全性;同时,该研究也为后面改进高压输注后留置针的留置提供了一些借鉴,为影像技术的进一步发展提供依据证明临床可行性。

PO-3748

一管到底，碘亮安全—记碘对比剂渗漏质量改进

江小红

中国人民解放军陆军特色医学中心

背景 随着影像技术的发展，CT 增强检查在临床中得到了广泛应用。但由于碘对比剂因素、高压注射因素、患者自身因素以及技护人员因素等，碘对比剂渗漏问题越来越受到影像学科的关注。为降低增强 CT 检查患者发生碘对比剂渗漏的风险，进行持续质量改进。

方法 具体方法如下，采用一体化链式无缝管理的渗漏控制模式，链接护士、技师、临床科室与静疗小组。通过八个环节进行定期组织检查、随时监控过程、常规收集资料、定期质量分析、组织培训修订规范、随时跟踪进展、组织撰写标准。

控制要点一：血管评估与选择。先外周后中心，以粗直弹性好靠近心脏的大血管为主。首选前臂大静脉或肘前静脉，避免选择手背或手腕血管。乳腺癌根治术后或安置起搏器的患者选择健侧肢体进行穿刺。控制要点二：留置针的选择。首选耐高压针型，并且根据患者检查部位体重流速等综合选择。控制要点三：静脉穿刺。进针角度控制在 15—30°，直行进针减少针管在皮下的滑行长度确保针管三分之二进入血管。控制要点四：导管固定。通过一贴二塑型三按压四撕边五固定的流程将留置针固定在穿刺部位上。控制要点五：警示标识。遇到确有血管条件不理想的患者，注射护士在留置针敷贴与检查申请单都贴上渗漏警示标识。控制要点六：个性化注射。体位护士看到贴有警示标识的申请单时及时与技师沟通设计合适患者的个性化注射方案。控制要点七：高压注射。护士与技师共同为患安置合适体位。注射碘对比剂前通过“一看二摸三感觉四询问”的方法完成手动试水与高压试水。控制要点八：护士与技师一起对患者通过各种方法进行动态观察。

结论 经过不断改进，我院碘对比剂渗漏率从改进前的 0.1~0.125%到改进后的 0.025~0.05%，改进过程中从未出现水泡、皮肤破溃等严重病例。因此实施持续质量改进能明显降低 ct 增强扫描中静脉渗漏的发生，确保患者的检查安全，值得推广应用。

PO-3749

责任斑块强化比、脑低灌注和糖化血红蛋白与复发性缺血性脑卒中的相关性

俞嘉伟、吴姚、吴珊珊、赵登玲

东南大学附属中大医院

目的：探究复发性缺血性脑卒中患者和初发缺血性脑卒中患者大脑中动脉责任斑块、侧支循环状态和颅内低灌注特征的差异，寻找复发性缺血性脑卒中的独立预测因子，并评估与缺血性脑卒中复发的相关性。

方法：回顾性分析 2020 年 6 月至 2023 年 1 月我院住院的 86 例单侧大脑中动脉粥样硬化狭窄引起的急性/亚急性缺血性脑卒中患者，根据梗塞部位是否与既往梗塞部位相同，分为复发组（36 例）和初发组（50 例）。所有患者都进行弥散加权成像、时间飞跃法磁共振血管成像、高分辨血管壁成像以及动态磁敏感对比磁共振灌注成像。在动态磁敏感对比磁共振灌注成像生成的 TTP 图上评价 MCA 供血区的 10 个区域，各区域的权重相同。比较两组在斑块特征，脑灌注及侧支循环的差异。通过 Logistics 回归分析寻找复发性缺血性脑卒中的独立预测因子。

结果：相比初发组，复发组的糖化血红蛋白，责任斑块强化比更高，TTP-ASPECTS 更低（ $p<0.05$ ）。斑块强化等级和强化比与 TTP-ASPECTS 呈显著相关。经多因素 Logistics 回归分析，HbA1c、责任斑块强化比和 TTP-ASPECTS 是复发性缺血性脑卒中的独立危险因素。经过受试者工作特征曲线分析，联合上述因子进行诊断有更高的特异性。

结论: 责任斑块强化比、TTP-ASPECTS 和 糖化血红蛋白是复发性缺血性卒中独立预测因子, 斑块特征和颅内低灌注的联合评估能够提高对缺血性脑卒中复发的诊断效能。

PO-3750

CT 增强扫描中使用高压注射器的风险预见及防范措施

吕洋
吉林大学第一医院

【摘要】目的 预见 CT 增强扫描中使用高压注射器快速注碘时病人有可能遇到的各类风险。探讨应对各类风险的防范措施。方法我院 CT 室自 1998 年开始使用高压注射器以来, 注碘造影病例十余万例, 针对病人的不同体质状况及心理承受能力, 我们把高压注射器的使用风险预见在先, 采用各种措施针对性的防范各类风险的发生, 稳妥采取风险发生后的应急处置。结果使用高压注射器的十余万注碘病例, 轻度过敏者经处置后均无大碍。中度或重度过敏者经抢救后均脱险, 无死亡病例。未发生因造影剂外渗、空气栓塞、交叉感染等纠纷。

PO-3751

超低对比剂注射流速在长期化疗患者血管 CT 成像的应用

李剑、徐红维、张英、夏方方
西安凤城医院

目的 肿瘤患者需要定期化疗, 反复的化疗输液导致血管变脆、弹性差、留置针的穿刺成为难点, 并且容易造成对比剂外渗。血管 CT 成像使用的对比剂粘度高对留置针的型号也有一定的要求, 本研究采用较小型号的留置针 (22 号-24 号) 采用超低流速 (2.0ml/s 以下) 注射对比剂进行 CTA 的可行性的研究。

方法 选取 2022 年 3 月-2023 年 3 月期间进行 CTA 的肿瘤反复化疗的患者, 经 2 次常规 18 号留置针穿刺未能成功者, 选取较小型号的留置针 (22 号-24 号) 进行穿刺并采用超低流速 (2.0ml/s 以下) 进行对比剂注射的 30 例患者, 并和常规上腹部增强患者进行比较。两组扫描参数按照患者体重设置不同管电压 70kV (60kg 以下), 80kV (60-70kg), 100kV (70-80kg), 120kV (大于 80kg), 管电流采用自动管电流, 其他扫描参数和重建参数均一致。延迟时间采用自动触发方式, 阈值 100HU, 并记录患者的动脉期延迟时间。选取同层进行对比测量强化 CT 值, 并进行比较。

结果 低流速组肝顶层, 3 期 CT 强化值分别为 303.4 ± 57.5 HU, 236.5 ± 67.5 HU, 140.7 ± 26.5 HU, 常规组肝顶层 3 期 CT 强化值分别为 406.9 ± 103.2 HU, 153.8 ± 26.2 HU, 121.0 ± 17.5 HU, 两组比较均为统计学差异性。低流速组肝门层, 3 期 CT 强化值分别为 315.9 ± 54.5 HU, 212.1 ± 67.5 HU, 146.7 ± 38.0 HU, 门静脉 201.9 ± 51.9 HU, 常规组肝门层 3 期 CT 强化值分别为 411.1 ± 124.3 HU, 150.9 ± 25.3 HU, 124.1 ± 20.7 HU, 门静脉 149.2 ± 34.9 HU 两组比较均为统计学差异性。

结论 肿瘤反复的化疗的患者采用较小型号的留置针和采用超低流速 (2.0ml/s 以下) 注射对比剂进行血管 CTA 进行扫描基本可以满足临床诊断需要, 保证了患者对比剂注射的安全性和提高检查的成功率。

PO-3752

耐高压 PICC 导管在肿瘤患者腹部 CT 增强中的应用研究

严辉峰、左敏静、林泽、张丽
南昌大学第二附属医院

摘要：目的 分析耐高压经外周静脉置入中心静脉导管（PICC）导管在肿瘤患者腹部 CT 增强中的应用情况。方法 选取我院 2021 年 1 月至 2023 年 6 月期间实施腹部 CT 增强扫描的肿瘤患者 300 例，按随机数字表法分配的原则分为例数相同的组别，其中对照组 100 例实施常规静脉留置针予以对比剂团注；观察 1 组、观察 2 组均用耐高压 PICC 导管予以对比剂团注，对比剂用量分别为 1.3、1.1 mL/kg；对比三组 CT 增强扫描并发症、图像质量等。结果 总的增强扫描不良事件发生率方面，观察 1 组、2 组明显低于对照组（ $P<0.05$ ），而 1、2 组相比无明显差异（ $P>0.05$ ）。观察 1 组、2 组的从进入检查室至 CT 扫描的时间、CT 扫描结束至按压无出血的时间、整体耗时均短于对照组，图像质量、噪声及锐利度评分均高于对照组（ $P<0.05$ ），而观察 1、2 组相比无明显差异（ $P>0.05$ ）。三组患者 CT 增强扫描结束后未出现导管高压注射损坏及导管堵塞的情况。观察 2 组的对比剂用量低于观察 1 组、对照组（ $P<0.05$ ）。结论 肿瘤患者应用耐高压 PICC 导管并联合低对比剂注射用量行腹部 CT 增强，优化了 CT 增强的检查流程，提高了患者的检查舒适度，减少不良事件的发生，值得临床推广。

PO-3753

**西宁地区低辐射剂量、低对比剂用量和低注射流速
在肺动脉 CTA 中的应用**

王继荣
西宁市第一人民医院

摘要：目的：分析西宁地区低辐射剂量、低对比剂用量和低注射流速在肺动脉 CTA 中的应用价值，为肺栓塞患者临床诊断提供更加有效且安全的检查方案。方法：选取我院临床怀疑为肺动脉栓塞的 60 例患者，入组患者均接受初检和复检，其中初检使用西门子 64 排 CT 机进行常规肺部检查，复检采取低辐射剂量、低对比剂用量和低注射流速扫描方法，对比两种检查方法的主客观图像质量评分以及辐射剂量。结果：两种检查方法的主观图像质量均符合临床诊断需求，两组的图像质量主观评分分布情况无明显差异（ $P<0.05$ ）；两种检查方式的噪声对比结果无明显差异（ $P>0.05$ ），复查检查方式的 CNR 和 SNR 水平均显著高出常规检查（ $P<0.05$ ）；复查检查方式的 CT DIvol、DLP 和 ED 指标水平均低于常规检查（ $P<0.05$ ）。结论：在肺动脉 CTA 检查中选用低辐射剂量、低对比剂用量和低注射流速扫描方案联合三维重建技术，能够保证较好的肺部检查图像质量，为临床诊断提供依据，并且人体辐射剂量显著降低，能够保证检查诊断的有效性与安全性。

PO-3754

**探讨西门子 Force 使用能谱技术扫描下肢血管增强成像中与
GE Revolution 的优势对比**

时洪坤
吉林大学第一医院

目的：探讨西门子 Force 使用能谱技术扫描下肢血管增强成像中与 GE Revolution 的优势对比。

材料与方法: 本研究搜集我院 2021 年 6-8 月期间使用西门子 force 仪器扫描的下肢 CTA30 例, 为 A 组。使用 GE Revolution 仪器扫描下肢 CTA30 例, 为 B 组。两个仪器上的患者均使用能谱扫描技术。其中男 32 例, 女 28 例, 年龄 45-75 岁, 平均年龄 60.8 岁。扫描参数两组管电压均为 40-140keV, 管电流为自动 mA 扫描。其中 A、B 两组均使用对比剂碘克沙醇 320; 于左肘静脉注射对比剂。均使用德国欧利奇高压注射器注射。流速均为 4.0-4.5ml/s。注射剂量为 80ml。通过容积 CT 剂量指数 (CTDIvol)、剂量长度乘积 (DLP) 和有效辐射剂量 (E) 的值, 比较 A、B 两组辐射剂量的差异。由本科室两名高年资医生利用评分法对 2 组图像质量进行主观评价。

结果: A 组图像质量均能达到临床诊断要求; B 组有 8 例由于显影较淡未能达到诊断要求。且 A 组较 B 组的辐射剂量低 55%。但是将 B 组的患者增加对比剂剂量到 100ml, 其图像质量与西门子将没有太大差异。

结论: 通过对比研究发现西门子 Force 使用能谱技术扫描下肢 CTA 成像较 GE Revolution 在扫描图像质量及对降低患者的辐射剂量及对比剂剂量上都有明显的优势。即西门子 Force 使用能谱技术扫描下肢 CTA 成像优于 GE Revolution。

PO-3755

探讨水化护理在宫颈癌化疗后患者中降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险的临床价值

李佳营、孔薇、纪妹
郑州大学第一附属医院

目的: 探讨水化护理在宫颈癌化疗后患者中降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险的临床价值。方法: 前瞻性入组 100 例宫颈癌化疗后欲行 CT 增强检查患者, 随机分为两组, 实验组患者在行 CT 增强检查前后采用口服水化法进行水化护理干预, B 组为对照组, 除水化护理干预外, 其他一切均同实验组。分别统计两组患者对比剂外渗概率、检查前 24 h 及检查后 24 h 两组患者血清胱抑素 C (Cys C) 的含量。通过 5 分量表法使患者对 CT 增强检查耐受度进行打分 (1~5 分, 难以忍受~无异常感觉), 由两位高年资护士采用双盲法对各患者 CT 增强 24h 后精神状态进行评分 (1~5 分, 精神极差~精神佳)。通过两独立样本 t 检验比较两组患者的一般信息及对比剂外渗概率。通过配对样本 t 检验比较两组患者检查前后 Cys C 含量, 并通过独立样本 t 检验进行两组间比较检查前后 24 h 血 Cys C 含量。采用 Mann-Whitney U 检验比较两组患者 CT 检查耐受度及检查后精神状态程度主观评分, 通过 Kappa 检验对检查后精神状态程度主观评分做一致性分析。结果: 3 人因对比剂过敏终止检查, 3 人因服用二甲双胍终止检查, 最终实验组 48 人及对照组 46 人完成检查。两组患者一般资料无统计学差异 ($P>0.05$)。实验组对比剂外渗概率小于对照组 ($t=-2.452$, $P<0.05$)。两组检查前 24h 血 Cys C 含量无统计学差异, 检查后实验组 Cys C 含量低于对照组 ($t=-4.249$, $P<0.05$), 二者之间具有统计学差异。在对 CT 增强检查耐受度主观评分方面, 实验组显著高于对照组 ($t=-4.320$, $P<0.05$), 主观评分提高 1.11 分。在检查后精神状态程度方面, 两组评价结果一致性良好 ($Kappa=0.818$, $P<0.05$) 实验组高于对照组。结论: 在宫颈癌化疗后患者进行水化护理干预, 不仅可以提高患者检查依从性, 更可降低 CT 增强检查对比剂外渗的概率及减少对比剂肾病发生风险, 具有重要的临床价值。

PO-3756

第三代双源 New Force CT 冠状动脉成像的低剂量低对比剂个性化扫描方案研究

刘星

郑州大学第一附属医院

目的: 使用第三代双源 New Force CT 前瞻性 Turbo Flash 扫描序列, 对比不同的对比剂用量方案, 探讨低辐射剂量及低对比剂剂量的冠状动脉成像的个性化扫描方案研究。

方法: 应用 New Force CT 对 60 例心率小于 80, BMI 无限制的患者行前瞻性 Turbo Flash 序列扫描。所有患者被随机分为两组: A 组患者对比剂用量为每公斤体重乘以 0.5, B 组对比剂用量为每公斤体重乘以 0.6, 流速均为 5ml/s (350mgI/mL)。根据双 CT 的 Care Dose4D 技术自动选择每个患者的最适管电压, 对原始数据进行 ADMIRE 迭代重建。比较两组患者的年龄、BMI 和心率, 两组图像的背景噪声、信噪比和放射剂量, 测量并比较两组图像冠脉各节段的管腔内的 CT 值和图像对比噪声比。以段为单位, 对两组的冠脉图像质量采用 4 分法 (1~4 分, 优~无法评估) 进行比较。结果: 两组患者的图像质量均可满足临床诊断要求, 两组患者在性别、年龄、BMI 和心率方面无显著性差异, 两组图像的背景噪声、信噪比和冠脉各阶段对比噪声比及放射剂量方面无显著性差异 ($p>0.05$), 平均有效辐射剂量 (ED) 为 $0.78\pm 0.24\text{mSv}$, 平均剂量长度乘积 (DLP) 剂量为 $56.01\pm 17.70\text{mGy}\cdot\text{cm}$, 平均容积质量指数 (CTDI) 剂量为 $3.40\pm 1.02\text{mGy}$; 两组平均造影剂用量有统计学差异 ($p<0.05$) (A 组平均造影剂用量为 $36.2\pm 6.1\text{ml}$, B 组平均造影剂用量为 $42.7\pm 8.4\text{ml}$); 3 支冠脉主干、近端及远段 CT 值的比较无显著性差异 ($p>0.05$), 而左心房及左心室的 CT 值存在显著性差异 ($p<0.05$), A 组均小于 B 组; 以段为单位, 两组冠脉图像质量平均评分无显著性差异 (A 组为 1.53 ± 0.97 , B 组为 1.53 ± 0.90 , $P=0.81$)。两组冠脉可评价节段率均 $>97\%$ 。

结论: 在双源 Force CT 上对于心率小于 80 的患者使用前瞻性 Turbo Flash 扫描序列, 按患者每公斤体重乘以 0.5 计算对比剂用量的方案可以在低辐射剂量及低对比剂用量下进行冠状动脉 CTA 的检查, 且可以在亚毫希伏条件下获得满足临床诊断的图像质量。

PO-3757

缩短超液化碘油 HSG 延迟片时间评价输卵管功能的可行性研究

刘明明、苗杰

首都医科大学附属北京妇产医院/北京妇幼保健院放射科

目的 输卵管通畅性的评价主要依靠子宫输卵管造影 (HSG)。普通含碘油的 HSG 检查需要于术后 24 h 返院拍摄延迟片, 增加患者时间和经济成本。超液化碘油是一种新型对比剂, 克服普通碘油黏稠度高等缺点。目前已证实缩短超液化碘油 HSG 拍摄延迟片时间为 3-4h, 可达到与 24h 一致的诊断效果, 但能否判断输卵管蠕动功能尚不明确。本研究拟对此进一步探索。

方法 选取 2021 年 1 月至 2022 年 6 月北京妇产医院收治的 63 例原发不孕症女性为研究对象。对比剂采用罂粟乙碘油 (10mL/支), 注射剂量 10mL。注射对比剂后观察输卵管是否通畅, 对比剂是否顺利弥散进入盆腔, 并分别于 HSG 术后 3h、6h、24h 拍摄延迟片, 观察输卵管内碘油残留情况, 结合输卵管形态判断蠕动功能。由 2 名 10 年相关工作经验的影像学医师阅片。以卡方检验对 HSG 术后 3h、6h、24h 拍摄盆腔延迟片时输卵管是否有对比剂残留诊断输卵管蠕动功能差异是否有统计学意义。以 Kappa 一致性检验对 2 位影像医师的判读结果进行一致性评价。

结果 126 条输卵管中, 8 条输卵管阻塞, 最终评价 118 条输卵管。HSG 术后 3h 拍摄延迟片, 42 条输卵管少量对比剂残留, 壶腹部形态略僵直, 76 条输卵管无对比剂残留。术后 6h 拍摄延迟片, 31 条输卵管少量对比剂残留, 壶腹部形态略僵直, 87 条输卵管无对比剂残留。术后 24h 拍摄延迟片, 17 条输卵管少量对比剂残留, 壶腹部形态僵直, 101 条输卵管无对比剂残留。卡方检验显示,

HSG 术后 3h、6h 输卵管对比剂残留差异无统计学意义 (P 值 >0.05)。而两者与 24h 输卵管对比剂残留差异均有统计学意义 (P 值 <0.05)。2 位医生判读结果一致性系数 kappa 值分别为 0.641、0.676、0.762，一致性较好。

结论 超液化碘油 HSG 术后 3h 和 6h 可根据输卵管对比剂残留情况，结合输卵管形态判断蠕动功能，比术后延迟 24h 拍片更有意义，具有可行性。

PO-3758

三低对比剂联合能谱 CT 技术在门静脉与肝静脉一站式成像中的可行性研究

吴晶晶

云南省滇南中心医院（红河哈尼族彝族自治州第一人民医院）

目的 探讨三低对比剂联合能谱 CT 技术在门静脉、肝静脉一站式成像的可行性。资料与方法 收集腹部 CT 增强扫描病人 100 例。将病人随机分成两组，实验组 ($n=50$ 例) 采用低浓度等渗对比剂碘克沙醇 320mg/ml(100ml)，流速 3ml/s、总量 1.2ml/kg，在门静脉期采用能谱 CT 扫描及重建技术。对照组 ($n=50$ 例) 采用高浓度低渗对比剂碘海醇 350 mg/ml(100ml)，流速 5ml/s、总量 1.5ml/kg，行常规多期螺旋增强扫描。比较两组间门静脉和肝静脉的图像质量、辐射剂量。结果 门静脉主干 CT 值实验组高于对照组 ($P<0.05$)，有统计学意义。门静脉对比噪声比 (CNR)、门静脉信噪比 (SNR)、肝静脉 CT 值、肝静脉对比噪声比 (CNR) 两组间无统计学意义 ($P>0.05$)。肝静脉信噪比 (SNR)、图像噪声 (SD) 对照组优于试验组 ($P<0.05$)，有统计学意义。两组门静脉、肝静脉主观评分无统计学意义 ($P>0.05$)。实验组门静脉期能谱扫描 CTDIvol、DLP、ED 低于对照组常规单期螺旋扫描 (P 值均 <0.05)。结论 三低对比剂联合能谱 CT 技术可在门静脉晚期实现门静脉和肝静脉一站式成像并减少辐射剂量。

PO-3759

首诊负责制在碘对比剂外渗全程护理干预中的应用

邝晓、王小琳

重庆医科大学附属第二医院

目的 探讨首诊负责制干预模式在碘对比剂外渗全程护理干预中的应用效果。方法 回顾 2021 年 1 月-2022 年 12 月某大型三甲医院放射科碘对比剂外渗 70 例患者为研究对象，其中 2021 年 1 月-2021 年 10 月碘对比剂外渗 35 例列为对照组采取传统方法进行干预，2021 年 11 月-2022 年 12 月碘对比剂外渗 35 例列为观察组采取首诊负责制行干预。比较两组患者临床肿胀消退时间、疼痛消失时间、患者满意度、临床科室满意度、护理人员渗漏处理操作考核等。结果 患者临床肿胀消退时间，对照组为 (32.15 ± 2.50) 小时长于观察组 (25.80 ± 3.62) 小时，比较有统计学意义 ($P<0.05$)；患者疼痛消失时间，对照组为 (33.75 ± 2.25) 小时长于观察组 (26.50 ± 2.33) 小时，比较有统计学意义 ($P<0.05$)；患者满意度，对照组为 90% 低于观察组 98%，比较有统计学意义 ($P<0.05$)；临床科室满意度，对照组为 92% 低于观察组 100%，比较有统计学意义 ($P<0.05$)；护理人员渗漏处理操作考核情况，对照组为 (84.5 ± 5.5) 分低于观察组 (95 ± 4.0) 分，比较有统计学意义 ($P<0.05$)。结论 首诊负责制在碘对比剂外渗全程护理干预中的应用，提高护理人员的主观能动性，提高护理人员的责任心，提高护理人员的沟通能力及处理渗漏的能力，增进护患关系，提高患者满意度，增进影像科与临床科室的合作。

PO-3760

肺动脉 CTA 联合腹盆增强的一站式能谱扫描在妇科肿瘤患者中 诊断伴随性肺栓塞的临床价值

裴锦奎

复旦大学附属中山医院厦门医院

【摘要】目的：探讨对妇科肿瘤患者行肺动脉 CTA 联合腹盆增强的一站式能谱扫描的临床应用价值。方法：将 56 例需行肺动脉 CTA 和腹盆增强检查的妇科肿瘤患者随机分为 A、B 两组（各 28 例），A 组采用独立扫描，即肺动脉能谱 CTA 及腹盆腔能谱增强 CT 分两次检查两次给药；B 组采用联合扫描，即肺动脉能谱 CTA 及腹盆腔能谱增强 CT 联合一次性检查一次给药。其中 A 组肺动脉 CTA 用药量 30-40ml，腹盆腔增强 CT 用药量根据患者体表面积计算用药量，B 组同样根据患者体表面积计算用药量。生成肺动脉 CTA 65keV 图像，腹盆增强 50keV 图像，肺动脉与腹盆增强碘图和有效原子序数图。在肺动脉 CTA 图像上测量肺动脉主干和肌肉的 CT 值及 SD 值以及肺动脉主干的碘值和有效原子序数值，计算出信噪比（SNR）和对比噪声比（CNR）。腹盆腔平扫与双期增强 CT 图像上测量肝脏和脾脏的 CT 值、SD 值、碘值、有效原子序数值，计算出信噪比（SNR）和对比噪声比（CNR）。由两名医师对肺动脉 CTA 65keV 和腹盆 50keV 图像进行独立双盲主观评分对比 2 组客观图像质量参数和主观图像评估结果。结果：本研究发现肺动脉栓塞 15 例，占比为 26.78%，两组患肺动脉栓塞占比（A 组：28.57% vs. B 组：25.00%）无统计学差异。与 A 组相比，B 组对比剂用量减少了 35.75%（A 组：99.15±2.75mL vs. B 组：63.70±3.18mL），差异有统计学意义（ $P<0.001$ ）。两组剂量长度乘积无统计学差异（ $P>0.05$ ）。两组患者对应的肺动脉 CTA 65keV 图像、腹盆平扫与双期增强 50keV 图像、胸腹碘图、有效原子序数图的客观参数（CT 值、碘浓度、有效原子序数值）和图像质量（SD、SNR、CNR）、主观图像评分均没有统计学差异（ P 均 >0.05 ）。所有图像均满足诊断要求（评分 ≥ 3 分）。结论：两种不同扫描方案扫描的图像质量均处于较高水平且没有统计学差异，联合扫描的扫描时间更短，且使用的对比剂用量更少，联合能谱扫描具有较高临床价值。

PO-3761

从对比剂基础理论到科研设计思维

刘平

济宁医学院附属医院

摘要：目的：从对比剂的基本理论因素探讨碘比剂的正确应用，通过提高碘流和方法来提高动脉强化效果，进而探讨对比剂的科研设计原则。方法：将患者分别按照不同的对比剂浓度、不同的注射速度、不同的碘总量设置对照组和实验组，机器扫描方案相同。测量两组患者的碘流率、扫描动脉峰值及动脉强化效果并进行数据分析。结果：碘流率高的实验组，其动脉增强程度越高、强化效果越好（ $P<0.05$ ）。结论：应用碘流率可以精准定量计算对比剂流率和选择对比剂浓度，可以在图像质量保持不变的情况下减少对比剂用量。

PO-3762

基于多功能纳米颗粒的肝癌双模态成像及多模式治疗的研究

孔存青、陈文

十堰市太和医院(湖北医药学院附属医院)

背景：肝细胞癌是肝癌的主要组织学类型，且其生长迅速又富血供，肿瘤微环境复杂且富氧与乏氧共存，单一传统的影像学检查及治疗方式已不足以对肝细胞癌进行高准确性和可靠性的评价，开发可以实现多模态成像和多模式联合治疗的多功能纳米材料对于改善肝细胞癌治疗效果和延长患者的寿命具有很大的希望。

方法：本研究通过硬膜版法、物理结合等方式成功制备了以 MnO_2 为载体且表面负载抗血管生成肽 FSEC 的多功能自基氧纳米诊疗剂 ICG/FSEC@HMPP，利用透射电镜、扫描电镜、激光动态光散射、傅立叶红外光谱、Zeta 电势、固体核磁共振、元素分析等对 FRMON 等结构参数进行检测，溶血试验、细胞毒性试验、小鼠血常规及生化分析等对 ICG/FSEC@HMPP 的体内外安全性进行了评估；通过体外体内成像评估 ICG/FSEC@HMPP 的荧光/磁共振成像的能力；最后通过细胞层面及不同动物模型对各项指标进行了检测，探索了其增强光动力疗法联合免疫疗法协同抗癌效果及其增效机制的研究。

结果：ICG/FSEC@HMPP 诊疗剂分散性好，粒径均一，稳定性强，磁化性高，光热性能好、安全性低，产 O_2 及 ROS 丰富，良好的细胞内化及富集的能力，经治疗剂处理后促血管生成因子 VEGFA、ANGPT2、EGF 表达下降，血管成熟相关基因 S1PR1、ANGPT1、TGFB1 等表达升高，CRT 转位增强，Bcl-2 表达下降，Caspase-3 和 Bax 表达升高，T 细胞表达升高。经 ICG/FSEC@HMPP+PDT+Anti-PD-L1 组治疗后的肿瘤体积减小或消失。

结论：研究表明，ICG/FSEC@HMPP 诊疗剂各项参数稳定，性能良好，在体内和体外均显示出优异的荧光及磁共振成像的能力，实现了对肝细胞肝癌的双模态成像；另外 ICG/FSEC@HMPP 还具有在改善乏氧，增强光动力疗法及免疫治疗协同治疗的疗效、使肿瘤血管正常化、突破肿瘤局部基质屏障的同时通过增强免疫原性死亡和免疫反应进一步杀伤肿瘤细胞以及残留肿瘤细胞，实现了肝细胞肝癌的多模式联合治疗。总之，本研究合成的自基氧多功能 ICG/FSEC@HMPP 诊疗剂有助于加快肝细胞肝癌诊疗一体化进程的实现。

PO-3763

深度学习重建算法结合低管电压头颈 CT 血管成像的双低研究

吕仁锋、王拓

大连市中心医院

目的：探索基于深度学习图像重建 (deep-learning image reconstruction DLIR) 算法的低管电压头颈 CTA 成像降低辐射剂量和碘流率的价值。

方法：选择性选取在我院进行头颈 CT 血管成像检查的患者 40 例，按照身体质量指数 (BMI) 不同分成两组：其中 A 组 ($n=20$): $\text{BMI} \leq 25 \text{ kg/m}^2$ ，管电压 80KVp，DLIR 算法，权重级别高；B 组 ($n=20$): $25 \text{ kg/m}^2 < \text{BMI} \leq 30 \text{ kg/m}^2$ ，管电压 120KVp，自适应统计迭代算法 ASiR-V，权重级别 30%。余扫描参数设置相同，均采用碘浓度 370mgI/mL 对比剂，对比剂注射总量=速率 \times 10，自动管电流 100-600mA，噪声指数 8，余扫描参数设置相同。记录两组图像相同位置的主动脉 CT 值、颈总动脉 CT 值、基底动脉 CT 值、胸锁乳突肌作为图像的背景噪声、对比剂注射速率、CTDI，并计算对比噪声比 (CNR)、信噪比 (SNR)、碘流率、辐射剂量 (ED)，由两名经验丰富的放射医生用 1-5 分法对图像整体质量进行主观评价，利用 SPSS 软件对两组间数据进行统计学分析。

结果: 两组图像 CT 值和图像质量评分 (4.56 ± 0.23 vs. 4.59 ± 0.26) 无统计学差异 (P 均 > 0.05); 两组图像 CNR、SNR、ED 具有统计学差异 (P 均 < 0.05), 辐射剂量相对于 B 组降低了约 70%; A 组注射速率及碘流率低于 B 组, 降低了大约 30% ($P < 0.05$)。

结论: DLIR 算法结合低管电压可以显著降低标准体型病人头颈 CTA 的辐射剂量和碘流率, 能够提供符合诊断需求的图像质量。

PO-3764

比较头颈部 CTA 常规扫描与低对比剂、能谱单能量扫描的图像质量、辐射剂量

张贺、孟闫凯、孙存杰、徐凯
徐州医科大学附属医院

目的 探讨能谱 CT 联合低对比剂用量在头颈部 CTA 中的图像质量和辐射剂量。**方法** 前瞻性选取 90 例行头颈 CTA 检查的患者, 根据扫描方式和对对比剂注射方案不同随机分成 A 组 (120kV 混合能量 CT+常规对比剂剂量)、B 组 (能谱 60keV 单能量重建+常规对比剂剂量)、C 组 (能谱 60keV 单能量重建+低对比剂剂量组)。利用 GSI 能谱分析软件, 分别重建 B、C 组 60keV 最佳单能量图像, 对 A、B、C 三组图像分别进行容积再现 (VR)、最大密度投影 (MIP) 和曲面重组 (CPR) 后处理。分别测量主动脉弓、颈总动脉起始处、颈内动脉起始处、大脑中动脉 M1 段及乳头层面胸大肌 CT 值和标准差 (SD) 值。计算每组图像各动脉血管平均值和信噪比 (SNR)、对比噪声比 (CNR)。由两名放射科医师分别对三组图像采用 5 分法进行主观评分。记录剂量长度乘积 (DLP)、有效辐射剂量 (ED) 和碘摄入量。采用单因素方差分析和 Kruskal—Wallis 检验进行统计学分析。采用 SPSS 22.0 进行数据分析。定量资料分别采用卡方检验、单因素方差分析, 组间比较采用 Bonferroni 检验。图像质量主观评分用 Kruskal-wallis 检验比较, 采用 Kappa 检验对两位放射科医师图像质量主观评分一致性进行分析。 $P < 0.05$ 表示差异有统计学意义。结果 B 组、C 组的 DLP 和 ED 值均低于 A 组, 差异具有统计学意义 ($P < 0.05$), B、C 组间无统计学差异。C 组的碘对比剂用量较 A、B 组低, 差异具有统计学意义 ($P < 0.05$)。图像客观评价中, B、C 组靶血管 CT 值均高于 A 组, 差异具有统计学意义 ($P < 0.05$)。B 组的 SNR 高于 A 组, 差异有统计学意义 ($P < 0.05$)。B 组、C 组的 CNR 均高于 A 组, B 组的 CNR 最高, 三组间差异均有统计学意义 ($P < 0.05$)。B、C 组主观评分均高于 A 组 ($P < 0.05$), 差异具有统计学意义, B 组与 C 组差异无统计学意义 ($P > 0.05$)。2 名医师对三组图像评价结果的一致性较好 ($Kappa=0.812$) 结论: 低对比剂、60keV 最佳单能量重建图像能够明显降低辐射剂量和对对比剂用量、提高图像质量。

PO-3765

评价上肢血管 CT 成像对比剂稀释注射对动脉增强效果的改善研究

曾杰
陆军军医大学第一附属医院 (西南医院)

研究目的: 根据患者体重 (BW) 调整碘浓度后, 评价上肢血管 CT 成像 (CTA) 对比剂 (CM) 的稀释是否会增加动脉强化。**方法:** 我们对 140 例接受上肢血管成像 (CTA) 的患者进行了前瞻性研究。70 名连续患者接受了固定碘浓度的标准 CTA, 而其余 70 名患者接受了稀释的 CM 注射的 CTA。所有患者按体重 (< 55 、 $55 \sim 65$ 、 $66 \sim 75$ kg) 分为 3 组。比较 ≥ 350 Hounsfield 单位 (HUs) 的升主动脉增强 (CEs) 在标准 CTA 和稀释的 CM 注射组之间以及体重组之间的均值和比例。用线性回归分析体重与

CE 之间的关系。结果：接受稀释的 CM 使 <55 公斤组的平均 CE 增加($402.6 \pm 52\text{HU}$ vs. $384.2 \pm 54\text{HU}$; $P < 0.01$)，但在体重较重的组中无明显变化。 $\geq \text{CE}350$ 的比例随着体重的增加而增加(<55 kg=73%，55~65 kg=85%，66~75 kg=90%)，稀释后增加(分别为 84%，89%，92%)。CM 稀释后，CTA 患者体重与 CE 的相关性由 0.38 降至 0.21($P < 0.05$)。

结论：上肢血管 CT 成像的 CM 稀释度可提高动脉的强化。

PO-3766

多次增强 CT 检查后患者身体代谢影响的探讨

黄莉

江西省肿瘤医院

目的：针对肿瘤患者在放化疗周期期间和治疗结束后，需要多次影像学随访检查，而且往往胸腹部联合 CT 增强扫描。探讨此类患者经多次增强 CT 检查后对身体代谢影响。

方法：随机对 2023 年 2 月—2023 年 7 月半年期间 86 名患者接受两次及以上增强 CT 检查后展开分析，通过血液报告，结合临床辅助的检查结果，包括查体和主诉对比患者增强 CT 检查前后身体代谢的变化。

结果：增强检查的强射线对蛋白质的破坏，出现机体抵抗力下降；在放射线照射下，机体脂肪代谢有一定变化，各器官脂肪含量有所改变，贮存脂肪被利用而作为内源性营养物质；维生素代谢的影响表现在体内酶系统的破坏；注射造影剂对肾脏的伤害诱发肾病的发生率超过 10%。

结论：对于半年内多次检查的患者，在接受照射之前和受到照射之后，应该补充大量的维生素 C、维生素 E 和 β -胡萝卜素，以及维生素 K、维生素 B1、维生素 B2、维生素 B6 或泛酸减轻自由基带来的损伤；及时补充优质量足的蛋白质，从而增强了机体对射线的抵抗力；食物中的脂肪含量以植物油为主，注意多喝水 3000ml-4000ml，多吃一些新鲜的水果，蔬菜，能够加快造影剂在体内的排出和代谢，减少造影剂对身体的损伤。对于比较敏感的人群还需要通过注射生理盐水来促进排泄，减少肾毒性。

PO-3767

放射科对比剂注射的精细化实践

王瑛

兰州大学第二医院

放射科护士在放射学检查中的对比剂注射是一项重要而复杂的任务。本论文旨在探讨放射科护士对比剂注射的精细化实践，并评估其在患者护理中的重要性和效果。通过文献综述和案例分析，我们研究了放射科护士在对比剂注射过程中所面临的挑战和机遇，并讨论了如何提高注射技术的精确性和安全性。

放射科护士在对比剂注射中扮演着关键的角色。他们负责准备对比剂，确保其质量和适用性，并根据医生的指示进行注射。精细化的注射技术对于获得清晰的影像和准确的诊断结果至关重要。放射科护士需要准确计算和控制对比剂的剂量，选择合适的注射途径和速度，并密切监测患者的反应和不良反应。

放射科护士对比剂注射的精细化实践对患者护理具有重要意义。精准的注射技术可以最大程度地减少对比剂的浪费和不良反应的发生，提高影像质量，为医生提供准确的诊断信息。此外，精细化的注射还可以减轻患者的不适和焦虑，提高他们对检查的合作度。

然而，放射科护士在对比剂注射中也面临一些挑战。注射过程中的剂量计算和调整需要准确性和敏捷性，而不同患者的生理特征和病情可能对注射产生影响。放射科护士需要不断更新自己的专业知

识,掌握最新的注射技术和安全准则。此外,与患者的有效沟通和情绪支持也是注射过程中的关键因素。

PO-3768

碘对比剂恒温箱加热处理对冠脉 CTA 患者心电变化及外渗风险的影响

池萌、杨瑞

河南省胸科医院河南康复中心医院

目的:探讨碘对比剂经恒温箱加热处理后对冠脉 CTA 患者心率、心电图变化及外渗风险等不良反应的影响。方法:选择我院 2021 年 1 月至 2022 年 1 月期间收治的行冠脉 CTA 患者 200 例为研究对象,采用随机分为对照组和研究组,各 100 例。所有患者均采用碘帕醇作为对比剂进行冠脉 CTA 检查,对照组中不对碘对比剂进行加热,研究组将碘帕醇加热至 37°C 后进行冠脉血管成像。比较两组检查时间、碘帕醇用量、X 线曝光时间、不适反应、心率改变、T 波改变及对比剂外渗等不良反应情况。结果:研究组检查时间明显短于对照组[(15.12±4.62) min vs (20.07±7.71) min, P<0.05]。恶心呕吐等不适反应发生率、心率改变发生率、对比剂外渗发生率显著低于对照组(0.81% vs 4.23%, 2.58% vs 8.00%, 0.72% vs 6.35%, P<0.05); 两组碘帕醇用量、X 线曝光时间、T 波改变发生率比较差异无统计学意义(P>0.05)。结论:碘对比剂经恒温箱加热处理后可缩短冠脉 CTA 患者检查时间,降低心率、对比剂外渗等不良反应发生率,值得临床借鉴和应用。

PO-3769

CT 动态 4D 联合直接法单下肢 CTV 血管成像评估下肢血管病变

李知晓

中南大学湘雅医院

目的:动态血管 4D 联合直接法单下肢静脉不仅可以清楚掌握局部血流动力学,而且可以全程显示血管情况。

方法:动态 4D 扫描范围选取骨盆平面上下范围 381mm,扫描时间为每期 2.5s,扫描 15 期。接着延迟 30-50s 进行单侧下肢 CTV 扫描,扫描时间 34s。尽量保证扫描期间一直有造影剂注入。扫描方向均示足向头方向,造影剂总量 30ml (350mg/ml),生理盐水 170ml。流速 1.8-2.0ml/s。

结果:患者女性,52 岁,双下肢静脉曲张十余年,左侧稍明显,超声检查怀疑髂压综合征。动态图可以清楚显示左侧髂总静脉流入下腔静脉通畅,全程可示左下肢皮下可见迂曲靠张静脉。患者男性,72 岁,左下肢水肿伴活动后疼痛 9 年,加重 2 周入院。动态图可以清楚显示盆腔可见许多侧枝循环开放,左下肢注射造影剂直接回流至右侧髂外静脉。左侧髂外静脉未见显示。全程可示左下肢深静脉未见显影并可见多发浅静脉循环开放。三天后 DSA 检查结果与 CTV 结果一致。患者男性,51 岁,左下肢疼痛肿胀 7 月,既往有下肢深静脉血栓病史,动态图示:左侧髂总静脉局限性血管细小。全程示左下肢广泛浅静脉迂曲较前好转。二天后行 DSA 检查并在左侧髂总静脉处放入支架。

结论:局部动态 4D 联合直接法单下肢 CTV 成像,既可以清楚显示下肢血管的血流动力学,又可以清楚全程显示下肢血管情况,从而给临床提供全面影像学资料,而且造影剂用量也明显减少。

PO-3770

一项在大型三甲医院关于碘对比剂外渗的回顾性研究

陈可馨

中南大学湘雅二医院

目的：通过收集和分析湖南某大型三级医院的外渗事件，评估接受增强 CT 检查的患者中 CMEX 的发生率的相关危险因素，并探讨住院与否、有无留置针和导管型号、导管位置、对比剂种类、患者年龄和性别与外渗量的关系，讨论近年来碘对比剂外渗事件的发生率及其相关危险因素是否有所改变，从而与时俱进的完善对比剂外渗的预防、处理、善后措施。

方法：本研究是一项回顾性、描述性和单中心研究，从 2020 年 8 月 1 日至 2021 年 6 月 30 日期间在我院接受增强 CT 检查的 72556 例患者中提取数据并进行分析，包括年龄、性别、造影剂种类及工作班次等数据。所有统计分析均采用 IBM® SPSS 统计学。连续变量用平均值和标准差 (SDs) 表示，而分类变量则用每个类别的计数和百分比表示。P 值<0.05 被认为是显著。

结果：在为期两年的回顾性研究中，72556 名患者共发生 68 例造影剂外渗事件，碘化造影剂外渗率为 0.093%。CMEX 患者的平均年龄为 58 岁，其中 38.2%为男性，61.8%为女性。在这项研究中，我们将 68 名患者的外渗严重程度分为轻度和中度/重度，轻度组有 23 名患者，中度/重度组有 45 名患者。

结论：本研究中的血管外渗率比以前的研究报告要低 (0.09%)，与以往研究中相似的是女性更容易发生外渗事件，但年龄的增长、工作时间以及对对比剂种类则并非是影响外渗发生率的危险因素，提示经过医护人员的严格管理以及对对比剂种类、自动注射器技术的不断革新降低了部分危险因素的影响。通过本次研究我们考虑，通过标准化的数据收集，对造影剂类型来源、使用的静脉导管类型、有无留置针、造影剂类型、注射率、导管位置等相关因素进行细化分类以及大数据样本采集可以更好地分析可能会影响 CMEX 的危险因素，有助于增加预防措施，制定严谨规范的处理流程以及后续患者的随访预后等研究内容，有效降低 CMEX 的不良反应发生率及提高 CMEX 的处理应对能力，减少患者痛苦；同时也有助于提高自动注射器及对对比剂类型的革新升级，更好地服务患者。

PO-3771

蓝信平台在放射科管理以及患者隐私保护中的应用

刘倩、王新貌

中国人民解放军陆军特色医学中心

目的：探讨蓝信平台在放射科管理和工作中的应用，为加强患者隐私保护以及提高放射科规范化管理提供一种新思路。

方法：通过在蓝信平台建立相关工作群或利用蓝信平台的附属功能来提高放射科的管理质量和加强患者隐私保护。

1. 建立工作群：1.1 蓝信平台在放射科科务管理中的应用：建立放射科内部沟通群（医技护工作日常通知）、环境与急救上报平台（整体环境和抢救过程相关信息）、放射科医技护危急值上报平台（危急患者信息上报）、科外医生以及患者建议总结群（工作质量、服务态度）；1.2 蓝信在区域质控管理的应用：CT 组工作群、X 线组工作群、磁共振工作群、介入中心工作群，发布次日工作安排以及检查者相关信息。

2、其他附属功能：2.1 考勤（工作、会议）2.2 学习中心（专业技术、党建学习）2.3 重要通知（收到应答）

结果：我们统计了使用蓝信平台前（2022.7-2022.12）及使用蓝信平台后（2023.1-2022.6）对相关事件上报率（不良事件、危急病人、环境及急救）以及工作整体质量（考勤、学习率、满意度调查）的影响。结果表明使用蓝信工作平台后相关事件上报率均得到提升，其中对于危急病人信息的

上报率得到显著提高 ($p<0.05$)。统计期间内 人员考勤以及学习率得到提升, 科外建议以及患者满意度调查数量提高, 有助于完善本科室不足以及提高工作质量。

结论: 通过比较使用蓝信平台前后不良事件上报率、危急值上报率、环境及急救上报率指标, 结果表明使用蓝信平台可以有效提高放射科人规范化管理的质量, 增强科室成员学习意识和工作质量, 同时该平台可有效保护患者隐私。本文为放射科管理以及患者隐私保护提供了新的思路。

PO-3772

基于失效模式与效应分析的对比剂不良反应的患者处置流程管理

王勤

华中科技大学同济医学院附属协和医院

目的: 失效模式与效应分析 (Failure Mode and Effect Analysis, FMEA) 已在临床上作为一种积极主动评估医疗过程中的风险薄弱环节、制定风险防控措施的有效方法。本研究探讨 FMEA 在发生对比剂不良反应患者处理流程中的应用效果。

方法: 成立 FMEA 小组, 并对发生对比剂不良反应患者处理流程进行讨论, 分析潜在失效模式及原因, 计算优先风险数值 (Risk Priority Number, RPN), 选取排名前 3 位的主要失效模式, 制订改进措施并落实, 调查比较改进前 CT 及 MRI 检查时发生对比剂不良反应、需医生紧急处理的 123 位患者及改进后的 121 位患者的处理流程差异。

结果: RPN 值排名前 3 位的失效模式分别为医生到场不及时、患者转运至相关科室时间 (急诊或住院科室)、处理过程医疗文书不完整, 其 RPN 值分别为 118.6、98.5 及 89.4。改进前医生到场开始处理时间为 $11.2\pm 6.8\text{min}$, 患者转运至相关科室时间为 $42\pm 7.3\text{min}$, 处理过程医疗文书完整性 $89.6\pm 4.3\%$ 。改进后上述指标分别为 $6.3\pm 2.8\text{min}$, $15.6\pm 4.2\text{min}$ 及 $96.6\pm 2.7\%$, 三种指标的比较均有显著性差异 ($P<0.05$)。

结论: 失效模式与效应分析能显著改善 CT 及 MRI 增强检查对比剂不良反应患者的救治流程, 使患者能得到更及时的处理及转运, 保证医疗文书的完整性, 可有效减少医疗纠纷的风险。

PO-3773

影像技师在危急值报告信息化管理中的价值初探

邵志清

中国科学院大学附属肿瘤医院 (浙江省肿瘤医院)

目的: 探讨放射科医技一体化培养制度在急诊 CT 检查危急值报告制度中的实践及意义。

方法: 选取 2021 年 1-7 月急诊入院并在放射科进行 CT 检查的 242 例患者进行分析, 将实施医技一体化培养前、后急诊入院检查的患者分成对照组 (136 例) 和观察组 (106 例), 放射科急诊当班技师参与急诊报告的危急值标注, 诊断医生进行核对, 对急诊危急值报告周转时间进行分析。

结果: 急诊 CT 危急值报告周转时间中位值从 70.09min 缩短至 38.90min, 实现了危急值报告及时率的显著提升, 获得了临床认可。

结论: 将放射科医技一体化培养制度应用于放射科的质量管理模式中显著缩短急诊患者 CT 危急值报告周转时间, 值得在放射科信息化建设中广泛应用。

现代中医发展下的中医医院影像科的管理与思考

郭靖

天津市武清区中医医院

目的 通过介绍三级甲等、二级甲等中医医院医学影像科在医院诊疗过程中的作用, 分析探讨医学影像科在中医医院中存在的价值及问题, 为中医医院影像科管理及如何为临床服务提供工作思路及参考借鉴。**方法** 阐述中医医院医学影像科工作的内容及难点, 介绍中医医院影像科通过健全科室内部组织管理架构和规章制度、强化放射科医生变被动为主动的服务意识、加强与中医专家的沟通学习及科室间的协作等方式规范并提升中医院医学影像科在现代中医药及传统非药物疗法发展中的服务能力并针对其中存在的问题进行讨论, 以期找到更多的合作基础, 使医学影像学为传统医学的传承、发展及创新保驾护航, 实现“现代中医”的理念。**结果** 中医医院影像科通过建立上述科室管理及服务模式, 提高了科室间合作的深度及广度, 传统医学的神奇疗效应用现代医学影像设备及技术能够得以客观的解释和展示。**结论** 中医通过与先进的影像技术紧密融合, 传统医学的价值可以客观全面的彰显; 中西汇通, 医学影像学为中医诊断提供客观依据。

3.0T MRI 分时段预约检查流程优化实施应用

周娇娇

昆明市第三人民医院

【摘要】 目的：探讨在核磁共振成像（MRI）检查中实行分时段预约检查流程优化实施应用。方法选择我院开展磁共振技术检查为 2019 年 4 月至 2019 年 8 月我院检查患者统计数量为 2026 人，选择 1000 例磁共振成像（MRI）检查患者作为对照组(分时段预约前)，选择同期 1000 例患者作为观察组（分时段预约后），每组随机抽取 50 例患者进行询问调查，对两组患者等候检查时间及满意度进行比较分析。结果实施分时段预约后，患者的等候时间明显缩短，实施后患者满意度为 98%，较实施前 90%有明显提高，结论在 MRI 实行分时段预约，可以较大缩短患者的等候时间，控制医患矛盾和纠纷发生，提高了患者的满意度，改善了就诊环境，也提升了医院的整体服务水平。

县域医院放射科在管路安全管理中的重要作用和影像报告要点

刘义平

嵊州市人民医院（浙江大学医学院附属第一医院嵊州分院）

目的：患者安全是医院管理的重要内容，随着各种管路越来越多的被应用于患者的抢救治疗和生命维护中，其安全管理得到各界的高度重视。2016 年国家护理质控中心将非计划性拔管发生率作为评价护理质量一个敏感指标，2019 年美国医疗机构评审联合委员会和中国医院写就均将提升管路安全列入《患者安全目标》，本文通过从放射科近几年在放射检查中发现的管路异常的具体病例分析，对影像识别管路异常的重要价值及重点观察内容进行探讨，以期更好地识别与防范管路管理过程中的风险因素，为管路安全提供借鉴和参考，为患者安全提供保障。

方法：收集 2016 年 7 月-2023 年 8 月间本院放射检查（X 线摄影及 CT）对于患者各类管路异位或异常走行等病例进行总结，管路包括：导尿管、PICC 管、气管内插管、空肠内置管、胸腔引流管、胃管、射频消融术导管等；

结果：一共 18 例管路异常：导尿管走行异常或头端位置异常 11 例，包括其中 7 例致膀胱穿孔，气管插管位置过深 1 例，空肠导管头端碎裂 1 例，胸腔引流管置入肺部脓腔 1 例，胃管头端置入肺部 1 例，PICC 管走行异常 2 例，射频消融术后导管撤退头端碎裂残留血管内 1 例。

结论：18 例患者其中有 12 例报告时及时描述和报告异位或碎裂，临床及时处置，未造成重大差错，有 6 例报告中未注意识别和描述，是在 MDT 讨论才发现：管路异常中导尿管位置异常最多见，其中老年人 4 例，脑外伤 5 例，2 例外院康复护理医院留置导尿管后血尿来检查，6 例漏报告病例是：气管插管位置过深 1 例，PICC 管走行异常 2 例，胸腔引流管置入肺部脓腔 1 例，胃管头端置入肺部 1 例，射频消融术后导管撤退头端碎裂残留血管内 1 例，对于导尿管异常诊断医师普遍比较重视，未见漏诊；其他少见管道容易被忽略，今后影像报告书写时要重视观察各类少见管路路径及导管头端位置是否正常。

住院医师规范化培训 X 线造影技能操作分层次教学方法探讨

胡金香
武汉大学中南医院

目的：探讨不同类别不同层次规培学员 X 线影像技能操作培训的方法及价值。

方法：参照中国医师协会制定的 2022 年版住院医师规范化培训细则中规培学员 X 线造影技能操作要求，我们对规培学员进行多层次培训。1.对于非影像专业学员培训，在胃肠道造影操作室给学员讲解 X 线造影的适应症及禁忌症、对比剂的选择、检查前的准备、检查中影像征象的识别及检查后的注意事项等，让学员在带教老师实际操作场景中感受 X 线技能操作的实际应用及注意事项；2.对于放射影像专业第一年级学员的培训：规培学员在腹盆部组轮转期间除非影像专业学员的培训内容外，更注重培训学员与患者的沟通能力，培养学员的职业素养；3.对于放射影像专业第二年级规培学员的培训：强化实际操作能力培训，让学员接诊患者，在带教老师的指导下操作机器，规范 X 线造影操作，并根据实时动态征象分析病变，培养学员在实际操作过程中做到“眼、脑、手、脚”合一，规范书写诊断报告。4.对于放射影像专业第三年级学员的培训：在高年资老师跟班的前提下，有序安排学员独立进行胃肠技能操作并书写报告，由老师签审报告，并讲解疑难点。考核方式：对非影像专业的学员采用问卷星方式考核，影像专业学员采用问卷星及现场操作方式考核，并进行现场解答。

结果：非影像专业学员参与问卷星考核 203 人，其中适应症选项正确率 95%，禁忌症选项正确率 90%，对比剂选项正确率 82%，影像征象判读正确率 80%。影像专业学员参与考核 46 人，其中适应症及禁忌症选项、对比剂选项正确率均为 100%，征象判读正确率一年级学员 83%、二年级学员 92%、三年级学员 98%，实际操作能力现场两位高年资老师考评结果均为 90 分以上。

结论：X 线造影技能操作是住院医师规范化培训过程中必须掌握的临床操作技能，对于不同类别及不同层次学员采取分层次、递进式培训方式均能达到较好效果，让非影像专业学员在实际场景中掌握 X 线造影的临床运用价值，大大提高学员的认知能力，让影像专业学员在递进式培训方式中不断提高 X 线技能操作的临床胜任力。

PO-3779

Performance of deep learning-based autodetection of arterial stenosis on head and neck CT angiography: an independent external validation study

Kunhua Li, Dajing Guo
the second affiliated hospital of chongqing medical university

Purpose To externally validate the performance of automated stenosis detection on head and neck CT angiography (CTA) and investigate the impact factors using an independent bi-center dataset with digital subtraction angiography (DSA) as the ground truth.

Material and Methods Patients who underwent head and neck CTA and DSA between January 2019 and December 2021 were retrospectively included. The degree of stenosis was automatically evaluated using CerebralDoc based on CTA. The performance of CerebralDoc across levels (per-patient, per-region, per-vessel, and per-segment) and thresholds ($\geq 50\%$, $\geq 70\%$, and $= 100\%$) was evaluated. Logistic regression was performed to identify independent factors associated with false negative results.

Results 296 patients were analyzed. Specificity across levels and thresholds was high, exceeding 92%. The area under the curve ranged from poor (0.615, 95% CI: 0.544, 0.686; at the region-based

analysis for stenosis $\geq 70\%$) to excellent (0.945, 95% CI: 0.905, 0.985; at the patient-based analysis for stenosis $\geq 50\%$). Sensitivity ranged from 0.714 (95% CI: 0.675, 0.750) at the segment-based analysis for stenosis $\geq 70\%$ to 0.895 (95% CI: 0.849, 0.919) at the patient-based analysis for stenosis $\geq 50\%$. The multiple logistic regression analysis revealed that false negative results were primarily more likely to specific stenosis locations (particularly the M2 segment and skull base segment of the internal carotid artery) and occlusion.

Conclusions CerebralDoc has the potential to automated stenosis detection on head and neck CTA, but further efforts are needed to optimize its performance.

PO-3780

Deep-learning-based auto-segmentation of lumbar muscle and vertebral body on proton density fat fraction (PDFF) map facilitates clinical applications of body composition analysis

Yunxiu Hao¹, Chuanli Cheng², Baijie Wang¹, Dehong Luo¹, Chao Zou², Zhou Liu¹

1. National Cancer Center/National Clinical Research Center for Cancer/Cancer Hospital & Shenzhen Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Shenzhen, 518116, China

2. Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

Purpose To develop and evaluate a deep-learning-based automated segmentation of abdominal wall muscle and vertebral body on proton density fat fraction (PDFF) map and primarily investigate its clinical applications. **Method** A deep-learning model based on U-net was developed and trained on a collection of 898 abdominal proton density fat fraction (PDFF) slices from 41 healthy volunteers to automatically segment abdominal wall muscle and lumbar vertebral body at L1-L3 level. 315 images data of 11 subjects acquired from three different vendors were used as an independent test set to test generalizability. Dice similarity coefficient (DSC), precision rate (PR), and recall rate (RR) were used to evaluate the performance of the segmentation model. To investigate the potential clinical usability, we retrospectively collected PDFF images of 51 cancer patients acquired right after they received chemotherapy and/or radiotherapy from January 2021 to July 2022, and divided them into the myelosuppressive group (MG) and non-myelosuppressive group (NMG) based on blood routine tests. Measurements based on automatic segmented vertebral body at L3 level on PDFF map were obtained and compared between these two groups. In addition, correlation between automatic segmented abdominal wall muscle volume at L1-L3 level and body-mass index (BMI) was also investigated.

Results With the manual segmentation as gold standard, the model achieved Dice scores (mean \pm standard deviation) of 0.811 ± 0.056 , 0.831 ± 0.043 and 0.861 ± 0.051 for abdominal wall muscle, and 0.925 ± 0.030 , 0.930 ± 0.029 and 0.932 ± 0.027 for vertebral body from three different datasets (GE, Philips and UI-H), respectively. For the clinical application, a total of 51 cancer patients (MG group: $n=27$; NMG group: $n=24$) were included. Based on the auto-segmentation, the mean FF value at L3 vertebral body of the myelosuppression group was significantly higher than that of the non-myelosuppression group (57.17 ± 9.12 vs. 51.18 ± 11.26 , $P=0.04$). Besides, we found L1-L3 muscle volume showed a moderate significantly positive correlation with BMI in all patients ($r=0.4$, $P=0.01$).

Conclusion The deep-learning-based automated segmentation model had excellent performance on PDFF map and it may be a promising tool for body composition analysis.

PO-3781

Support Vector Machine for Stratification of Cognitive Impairment Using 3D T1WI in Patients with Type 2 Diabetes Mellitus

Zhigao Xu¹, Lili Zhao¹, Lei Yin², Milan Cao³, Ying Ren⁴, Yan Liu⁵, Feng Gu¹, Hui Yang¹, Xiaohui Liu¹

1. the Third People's Hospital of Datong

2. Graduate School, Changzhi medical School, Changzhi 046013, China

3. Department of Science and Education, the Third People's Hospital of Datong, Datong 037100, China

4. Department of Materials Science and Engineering, Henan University of Technology, Zhengzhou 471023, China

5. Department of Endocrinology, the Third People's Hospital of Datong, Datong 037100, China

Purpose: To explore the ability of MRI-based radiomics in predicting cognitive dysfunction in patients with diagnosed type 2 diabetes mellitus (T2DM).

Methods: In this study, 158 patients with T2DM were retrospectively collected from the Center for Endocrine and Metabolic Diseases at The Third People's Hospital of Datong between September 2019 and December 2020. 3D T1WI of MRI images were obtained from all patients, and the Chinese version of the Montréal Cognitive Assessment Scale-B (MoCA-B) was used to assess cognitive function. Based on their MoCA-B scores, participants were categorized into a normal cognitive function (N) group (n = 30), a mild cognitive impairment (MCI) group (n = 90), and a dementia (DM) group (n = 38). Thirty-six patients from the MCI and DM groups were randomly selected to form a cognitive impairment (CI) group. Using the Radcloud platform, radiomics features were extracted from the 3D T1WI images, and using the least absolute shrinkage and selection operator (LASSO) methods, SelectKBest, and the variance threshold (variance threshold = 0.8), feature selection was performed. Two support vector machine (SVM) models were then established to identify the CI and N groups, and the MCI and DM groups. The training and verification sets were split in a ratio of 2:8 and 3:7 for the two models, respectively. The models were evaluated based on their area under the receiver operating characteristic curve (AUC), Precision (P), Recall rate (Recall, R), F1-score, and Support. Finally, ROC curves were plotted for each model.

Result: In the CI group, both MoCA and RAVLT scores were lower compared to the N group, while HbA1c levels were higher and BUN levels were lower. These differences were statistically significant ($P < 0.05$). The MD group had a higher mean age and CDR compared to the MCI group, with lower scores for MoCA and RAVLT and lower UCr levels. The incidence in DM group was lower than that in MCI group, and the difference was statistically significant ($P < 0.05$). The ICC values for inter-group and intra-group consistency of radiomics features obtained through manual segmentation by two physicians were 0.86 and 0.90, respectively. The study consisted of 68 cases in the N and CI group, with 54 cases in the training set and 14 in the verification set, with 11 optimal eigenvalues being screened out; while 128 cases were included in the MCI and DM groups, with 90 training sets and 38 verification sets, and 12 optimal eigenvalues were selected. In the test set, the AUC for the SVM classifier was 0.857 and the accuracy was 0.821 in distinguishing CI and N, while AUC was 0.821 and the accuracy was 0.830 in distinguishing MCI and DM.

Conclusion: The SVM model based on MRI radiomics exhibits high efficacy in the diagnosis of cognitive dysfunction and evaluation of its severity among patients with T2DM.

PO-3782

A RadioFusionOmics model for discrimination between grade 4 astrocytoma and glioblastoma: comparison of two subregion definition strategies

Ruili Wei¹, Songlin Lu², Fangrong Liang¹, Xin Zhen², Ruimeng Yang¹

1. Second Affiliated Hospital, School of Medicine, South China University of Technology

2. School of Biomedical Engineering, Southern Medical University, Guangzhou 510515, Guangdong, China

Purpose: To explore a subregion-based RadioFusionOmics (RFO) model for discrimination between adult-type grade 4 astrocytoma and glioblastoma according to the 2021 WHO CNS5 classification.

Materials and Methods: 329 patients (40 grade 4 astrocytomas and 289 glioblastomas) with histologic diagnosis was retrospectively collected from our local institution and The Cancer Imaging Archive (TCIA). The volumes of interests (VOIs) were obtained from four multiparametric MRI sequences (T1WI, T1WI+C, T2WI, T2-FLAIR) using 1) manual segmentation of the non-enhanced tumor (nET), enhanced tumor (ET), and peritumoral edema (pTE), and 2) K-means clustering of four habitats (H1: high T1WI+C, high T2-FLAIR; (2) H2: high T1WI+C, low T2-FLAIR; (3) H3: low T1WI+C, high T2-FLAIR; and (4) H4: low T1WI+C, low T2-FLAIR). The optimal VOI and best MRI sequence combination were determined. The performance of the RFO model was evaluated using the area under the precision-recall curve (AUPRC) and the best signatures were identified.

Results: The two best VOIs were manual VOI3 (putative peritumoral edema) and clustering H34 (low T1WI+C, high T2-FLAIR (H3) combined with low T1WI+C and low T2-FLAIR (H4)). Features fused from four MRI sequences () outperformed those from either a single sequence or other sequence combinations. The RFO model that was trained using fused features achieved the AUPRC of 0.972 (VOI3) and 0.976 (H34) in the primary cohort ($p=0.905$), and 0.971 (VOI3) and 0.974 (H34) in the testing cohort ($p=0.402$).

Conclusion: The performance of subregions defined by clustering was comparable to that of subregions that were manually defined. Fusion of features from the edematous subregions of multiple MRI sequences by the RFO model resulted in differentiation between grade 4 astrocytoma and glioblastoma.

PO-3783

Deep Learning-Enabled Clinically Applicable CT Planbox for Stroke With High Accuracy and Repeatability

Yang Wang

Zhujiang Hospital of Southern Medical University

Purpose: Computed tomography (CT) plays an essential role in classifying stroke, quantifying penumbra size and supporting stroke-relevant radiomics studies. However, it is difficult to acquire standard, accurate and repeatable images during follow-up. Therefore, we invented an intelligent CT to evaluate stroke during the entire follow-up.

Materials and Methods: We deployed a region proposal network (RPN) and V-Net to endow traditional CT with intelligence. Specifically, facial detection was accomplished by identifying adjacent jaw positions through training and testing an RPN on 76,382 human faces using a preinstalled 2-dimensional camera; two regions of interest (ROIs) were segmented by V-Net on another training set with 295 subjects, and the moving distance of scanning couch was calculated based on a pre-generated calibration table. Multiple cohorts including 1,124 patients were used for performance validation under three clinical scenarios.

Results: Cranial Automatic Planbox Imaging Towards Ameliorating neuroscience (CAPITAL)-CT was invented. RPN model had an error distance of 4.46 ± 0.02 pixels with a success rate of 98.7% in the training set and 100% with 2.23 ± 0.10 pixels in the testing set. V-Net-derived segmentation maintained a clinically tolerable distance error, within 3mm on average, and all lines presented with a tolerable angle error, within 3° on average in all boundaries. Real-time, accurate, and repeatable automatic scanning was accomplished with and a lower radiation exposure dose (all $P < 0.001$). Conclusions: CAPITAL-CT generated standard and reproducible images that could simplify the work of radiologists, which would be of great help in the follow-up of stroke patients and in multifield research in neuroscience.

PO-3784

IILS: Intelligent imaging layout system for automatic imaging report standardization and intra-interdisciplinary clinical workflow optimization

Maoping Zhang
Southern Medical University

Background: To achieve imaging report standardization and improve the quality and efficiency of the intrainterdisciplinary clinical workflow, we proposed an intelligent imaging layout system (IILS) for a clinical decisionsupport system-based ubiquitous healthcare service, which is a lung nodule management system using medicalimages.

Methods: We created a lung IILS based on deep learning for imaging report standardization and workflow optimization for the identification of nodules. Our IILS utilized a deep learning plus adaptive auto layout tool, which trained and tested a neural network with imaging data from all the main CT manufacturers from 11,205 patients. Model performance was evaluated by the receiver operating characteristic curve (ROC) and calculating the corresponding area under the curve (AUC). The clinical application value for our IILS was assessed by a comprehensive comparison of multiple aspects.

Findings: Our IILS is clinically applicable due to the consistency with nodules detected by IILS, with its highest consistency of 0.94 and an AUC of 90.6% for malignant pulmonary nodules versus benign nodules with a sensitivity of 76.5% and specificity of 89.1%. Applying this IILS to a dataset of chest CT images, we demonstrate performance comparable to that of human experts in providing a better layout and aiding in diagnosis in 100% valid images and nodule display. The IILS was superior to the traditional manual system in performance, such as reducing the number of clicks from 14.45 ± 0.38 to 2, time consumed from 16.87 ± 0.38 s to 6.92 ± 0.10 s, number of invalid images from 7.06 ± 0.24 to 0, and missing lung nodules from 46.8% to 0%.

Interpretation: This IILS might achieve imaging report standardization, and improve the clinical workflow therefore opening a new window for clinical application of artificial intelligence.

PO-3785

Multiparametric MRI model using Shapley additive explanations interpretability analysis for predicting molecular subtypes of breast cancer

Yao Huang^{1,2}, Xiaoxia Wang², Ying Cao^{1,2}

1. School of Medicine, Chongqing University

2. Chongqing University Cancer Hospital

Objective To assess the performance of multiparametric MRI based on the XGBoost for predicting the molecular subtypes of breast cancer (BC) and identifying interpretable imaging features, using SHapley Additive exPlanations (SHAP) analysis.

Methods From February 2019 to January 2022, we recruited invasive BC patients. They underwent pre-treatment multiparametric MRI, including ultrafast dynamic contrast enhanced (DCE) MRI, diffusion kurtosis imaging (DKI), intravoxel incoherent motion (IVIM), and magnetic resonance spectroscopy, from which 13 parameters were extracted. Using the Boruta for parameters selection, we built BC subtype prediction models using XGBoost and employed SHAP for model interpretability analysis.

Results We enrolled 188 participants (age: 53.28 ± 10.51 years) and divided the training cohort (131 participants) and validation cohort (57 participants) using stratified random sampling. Five ultrafast DCE-MRI parameters (iAUC, MS, PEI, Ve and Ktrans) especially lower iAUC led to Luminal A subtype, achieving an AUC of 0.859. The Luminal B subtype was distinguished by one DKI (Kurtosis) and two IVIM parameters (D and D*), especially higher Kurtosis led to Luminal B subtype, achieving an AUC of 0.837. The triple-negative BC subtype was identified using one DKI (Kurtosis) and two IVIM parameters (D* and f), especially lower D* led to triple-negative BC subtype, achieving an AUC of 0.855. The HER2-enriched subtype was distinguished by two DKI (Kurtosis and MD) and two IVIM parameters (f and D), especially lower Kurtosis led to HER2-enriched subtype, achieving an AUC of 0.790.

Conclusion Multiparametric MRI predicts molecular subtypes of BC, and SHAP facilitates understanding of model decisions.

PO-3786

Computed tomography-based 3D convolutional neural network deep learning model for predicting micropapillary or solid growth pattern of invasive lung adenocarcinoma

Jiwen Huo¹, Xuhong Min², Tianyou Luo¹, Fajin Lv¹, Dongchun Ma², Qi Li¹

1. The first affiliated hospital of ChongQing Medical University

2. Anhui Chest Hospital

Purpose To investigate the value of a computed tomography (CT)-based deep learning (DL) model to predict the presence of micropapillary or solid (M/S) growth pattern in invasive lung adenocarcinoma (ILADC).

Materials and Methods From June 2019 to October 2022, 617 patients with ILADC who underwent preoperative chest CT scans in our institution were randomly placed into training and internal validation sets in a 4:1 ratio, and 353 patients with ILADC from another institution were included as an external validation set. Then, a self-paced learning (SPL) 3D Net was used to establish two DL models: model 1 was used to predict the M/S growth pattern in ILADC, and model 2 was used to predict that pattern in ≤ 2 -cm-diameter ILADC.

Results For model 1, the training cohort's area under the curve (AUC), accuracy, recall, precision, and F1-score were 0.924, 0.845, 0.851, 0.842, and 0.843; the internal validation cohort's were

0.807, 0.744, 0.756, 0.750, and 0.743; and the external validation cohort's were 0.857, 0.805, 0.804, 0.806, and 0.804, respectively. For model 2, the training cohort's AUC, accuracy, recall, precision, and F1-score were 0.946, 0.858, 0.881, 0.844, and 0.851; the internal validation cohort's were 0.869, 0.809, 0.786, 0.794, and 0.790; and the external validation cohort's were 0.831, 0.792, 0.789, 0.790, and 0.790, respectively. The SPL 3D Net model performed better than the ResNet34, ResNet50, ResNeXt50, and DenseNet121 models.

Conclusion The CT-based DL model performed well as a noninvasive screening tool capable of reliably detecting and distinguishing the subtypes of ILADC, even in small-sized tumors.

PO-3787

Pretreatment CT radiomics nomogram for predicting initial benefits from 1 immune checkpoint inhibitor in advanced non-small-cell

Shuai He
辽宁省肿瘤医院

Purpose: To assess the value of a radiomics nomogram for predicting early treatment response to immune checkpoint inhibitor (ICI) for advanced non-small-cell lung cancer (NSCLC) patients.

Methods: This retrospective study enrolled 64 patients with advanced NSCLC who underwent ICI monotherapy with pembrolizumab or nivolumab. All target lesions were delineated on CT imaging with and without contrast enhancement. For each CT sequence, a total of 1967 radiomics features were extracted from the whole target lesion. Responses were evaluated by CT according to immune RECIST (iRECIST) standard and patients were divided into a responder group and a non-responder group. A radiomics signature was developed with features selected by the least absolute shrinkage and selection operator (LASSO) algorithm. Then, the predictive performance of radiomics signature was validated in an independent chemoimmunotherapy cohort of 33 patients. Finally, a nomogram integrating the clinical factor and radiomics signature was established to predict treatment response. The area under the receiver operating characteristic curve (AUC), calibration and decision curves analysis (DCA) were used to assess the prediction ability of the nomogram.

Results: Ninety-seven patients were included in the analyses, and 3 of them experienced pseudoprogression. A 5-feature radiomics signature for predicting response was developed and validated in three sets. The nomogram incorporating the radiomics signature and bone metastasis status exhibited good prediction performance with AUCs of 0.878 (95% confidence interval [CI] 0.812-0.944) and 0.756 (95% CI 0.615-0.897) in the training and testing sets, respectively. Application of the nomogram in the chemoimmunotherapy validation set also generated good performance with AUCs of 0.790 (95% CI 0.660-0.921) and good calibration. The nomogram provides more net benefit by DCA curve than clinical factor and radiomics signature alone.

Conclusions: CT-based clinical-radiomics nomogram may predict the early response to ICI in advanced NSCLC patients, which showed the potential value for the clinic.

PO-3788

CT-Based Peritumoral and Intratumoral Radiomics as Pretreatment Predictors of Atypical Responses to Immune Checkpoint Inhibitor Across Tumor Types: A Preliminary Multicenter Study

Shuai He
辽宁省肿瘤医院

from intra- and peritumoral regions on CT images for the prediction of atypical responses to the immune checkpoint inhibitor (ICI) in cancer patients.

Methods: In total, 135 patients derived from five hospitals with pathologically confirmed malignancies receiving ICI were included in this retrospective study. Atypical responses including pseudoprogression (PsP) and hyperprogression disease (HPD) were identified as their definitions. A subgroup of standard progression disease (sPD) in 2018 was also involved in this study. Based on pretreatment CT imaging, a total of 107 features were extracted from intra- and peri-tumoral regions, respectively. The least absolute shrinkage and selection operator (Lasso) algorithm was used for feature selection, and multivariate logistic analysis was used to develop radiomics signature (RS). Finally, a total of nine RSs, derived from intra-tumoral, peri-tumoral, and combination of both regions, were built respectively to distinguish PsP vs. HPD, PsP vs. sPD, and HPD vs. sPD. The performance of the RSs was evaluated with discrimination, calibration, and clinical usefulness.

Results: No significant difference was found when compared in terms of clinical characteristics of PsP, HPD, and sPD. RS based on combined regions outperformed those from either intra-tumoral or peri-tumoral alone, yielding an AUC (accuracy) of 0.834 (0.827) for PsP vs. HPD, 0.923 (0.868) for PsP vs. sPD, and 0.959 (0.894) for HPD vs. sPD in the training datasets, and 0.835 (0.794) for PsP vs. HPD, 0.919 (0.867) for PsP vs. sPD, and 0.933 (0.842) for HPD vs. sPD in the testing datasets. The combined RS showed good fitness (Hosmer–Lemeshow test $p > 0.05$) and provided more net benefit than the treat-none or treat-all scheme by decision curve analysis in both training and testing datasets.

Conclusion: Pretreatment radiomics are helpful to predict atypical responses to ICI across tumor types. The combined RS outperformed those from either intra- or peri-tumoral alone which may provide a more comprehensive characterization of atypical responses to ICI.

Deep learning image reconstruction generates thinner slice iodine maps with improved image quality to increase diagnostic acceptance and lesion conspicuity: a prospective study on abdominal dual-energy CT

Jingyu Zhong¹, Lingyun Wang², Yue Xing¹, Yangfan Hu¹, Defang Ding¹, Xiang Ge¹, Weiwu Yao¹, Huan Zhang²

1. Tongren Hospital, Shanghai Jiao Tong University School of Medicine

2. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objectives: To assess the improvement of image quality and diagnostic acceptance of thinner slice iodine maps enabled by deep learning image reconstruction (DLIR) in abdominal dual-energy CT (DECT) scans.

Methods: and **Methods** This study prospectively included 104 participants with 136 lesions. Four series of iodine maps were generated based on portal-venous scans of contrast-enhanced abdominal DECT: 5-mm and 1.25-mm using adaptive statistical iterative reconstruction-V (Asir-V) with 50% blending (AV-50), and 1.25-mm using DLIR with medium (DLIR-M), and high strength (DLIR-H). The iodine concentrations (IC) and their standard deviations of nine anatomical sites were measured, and the corresponding coefficient of variations (CV) were calculated. Noise power spectrum (NPS) using the homogenous regions of liver. Edge rise slope (ERS) were measured using axial plane that presents portal vein. Five radiologists rated image quality in terms of image noise, contrast, sharpness, texture, and small structure visibility, and evaluated overall diagnostic acceptability of images and lesion conspicuity.

Results The four reconstructions maintained the IC values unchanged in nine anatomical sites (all $p>0.999$). Compared to 1.25-mm AV-50, 1.25-mm DLIR-M and DLIR-H significantly reduced CV values (all $p<0.001$) and presented lower noise and noise peak (both $p<0.001$). Compared to 5-mm AV-50, 1.25-mm images had higher ERS (all $p<0.001$). The difference of the peak and average spatial frequency among the four reconstructions was relatively small but statistically significant (both $p<0.001$). The 1.25-mm DLIR-M images were rated higher than the 5-mm and 1.25-mm AV-50 images for diagnostic acceptability and lesion conspicuity (all $P<0.001$).

Conclusion: DLIR can improve image quality of thinner slice thickness iodine map in abdominal DECT for higher spatial resolution and lower iodine quantification variation, which may increase its overall diagnostic acceptability, and lesion conspicuity.

PO-3790

A nomogram model of spectral CT quantitative parameters and clinical characteristics predicting lymphovascular invasion of gastric cancer

Yongxiu Tong, Huijuan Zhang
Fujian Province Hospital

Objective The study established a nomogram based on quantitative parameters of spectral computed tomography (CT) and clinical characteristics, aiming to evaluate its predictive value for preoperative lymphovascular invasion (LVI) in gastric cancer (GC).

Methods From December 2019 to December 2021, 141 patients with pathologically confirmed GC were retrospectively collected with corresponding clinical data and spectral CT quantitative data. Patients were divided into LVI-positive and LVI-negative groups based on their pathological results. The univariate and multivariate logistic regression analyses were used to identify the risk factors and construct a nomogram. The calibration curve and receiver operating characteristic (ROC) curve were adopted to evaluate the predictive accuracy of nomogram.

Results Four clinical characteristics or spectral CT quantitative parameters, including Borrmann classification ($P = 0.039$), CA724 ($P = 0.007$), tumor thickness ($P = 0.031$), and iodine concentration in the venous phase (VIC) ($P = 0.004$) were identified as independent factors for LVI in GC patients. The nomogram was established based on the four factors, which had a potent predictive accuracy in the training and validation cohorts, with the area under the ROC curve (AUC) of 0.864 (95% CI, 0.798-0.930) and 0.964 (95% CI, 0.903-1.000), respectively.

Conclusion This study constructed a comprehensive nomogram consisting spectral CT quantitative parameters and clinical characteristics of GC, which exhibited a robust efficiency in predicting LVI in GC patients.

PO-3791

High-resolution computed tomography with 1024-matrix: Comparison with 512-matrix for AI-assisted diagnosis system in the evaluation of pulmonary nodules

Qinling Jiang

Changzheng Hospital, Naval Medical University

Purpose: The aim of this study was to determine whether the diagnostic value of artificial intelligence (AI)-assisted diagnosis system is higher when using 1024 × 1024 matrix than 512 × 512 matrix in the evaluation of pulmonary nodules.

Methods: In this retrospective study, CT projection data performed in 191 patients were collected between August 2021 and May 2023 using two different protocols: 1024 × 1024 matrix and 512 × 512 matrix. Lung nodules were automatically detected and characterized using an AI pulmonary nodule post-processing system on the CT scans for both protocols. The framework of the AI-assisted diagnosis system has two primary components: preprocessing and object detection. In the preprocessing stage, images are prepared for subsequent detection through the application of techniques such as mean subtraction and normalization using Convolutional Neural Network (CNN). A modified Feature Pyramid Network (FPN) is then employed to simultaneously detect and classify lung nodules present in processed CT scans. The number of pulmonary nodules detected and type of each nodule, including solid nodules, part-solid nodules and non-solid nodules, were recorded. Two experienced radiologists reevaluated on all subjects to confirm the presence of any misdiagnosed or missed nodules. The diagnostic differences between the two groups were assessed using Wilcoxon signed-rank tests.

Results: Among 191 patients, a significant difference in nodule detection between the two protocols was observed ($P < 0.05$). Taking patients as a unit, the average detection accuracy was 93.87% on 512 × 512 matrix and 98.67% on 1024 × 1024 matrix. While taking pulmonary nodules as a unit, the detection accuracy, sensitivity, false positive rate and false negative rate of on 512 × 512 matrix and 1024 × 1024 matrix were 98.12% vs. 99.60%, 99.00% vs. 99.49%, 3.13% vs. 0.55% and 1.28% vs. 0.40% respectively. The classification accuracy of solid nodules, non-solid nodules and part-solid nodules on 512 × 512 matrix and 1024 × 1024 matrix was 95.54% vs. 98.99%, 95.75% vs. 99.34% and 97.37% vs. 100%, respectively.

Conclusions: Pulmonary nodules are detected and classified more accurately on the AI-assisted diagnosis system with 1024 × 1024 matrix than 512 × 512 matrix, and this improvement significantly enhanced the diagnostic accuracy of early lung adenocarcinoma.

PO-3792

Preliminary Study on YOLO-V5 rapid identification of degenerative spondylolisthesis

Mingzhu Meng, Yonggang Li

The First Affiliated Hospital of Soochow University

Objective To explore the potential value of YOLO-V5 deep learning model for rapid identification of degenerative spondylolisthesis in plain X-ray films. **Methods** A total of 1661 lateral standing radiographs of the lumbar spine were recruited in this study. The labeled lumbar spines were assigned to no slippage group, I° slippage group and II° slippage group. Each group was randomly divided into train set, test set and validation set by ratio of 8:1:1. Ten YOLO-V5 deep learning models were trained. Metrics for model performance evaluation include accuracy(Ac), precision(Pr), recall rate(Rc), and mAP. Results mAP_0.5 and mAP_0.5:0.95 of ten

YOLO-V5 models ranged from 0.681 to 0.758 and 0.476 to 0.535, respectively. There was no significant effect on the results of validation with or without a pre-trained model. Acs of the ten models in no slippage and I ° slippage groups were significantly higher than in II ° slippage group. The time to complete radiographs in validation set by YOLO-V5 was 1583 times faster than the time taken by radiologists. Among the five models with pre-trained models, mAP_0.5(0.741) and mAP_0.5:0.95(0.535) was the highest in the train set. Among the five models without pre-trained models, mAP_0.5(0.758) and mAP_0.5:0.95(0.525) was the highest in the train set. Conclusion YOLO-V5 deep learning model is a feasible approach for rapid identification of degenerative spondylolisthesis in plain X-ray films. The amount of train data is the predominant factor influencing model performance for identification of degenerative spondylolisthesis, larger sample size exhibited higher diagnostic accuracy.

PO-3793

Machine Learning-based identification of symptomatic carotid atherosclerotic plaques with dual-energy computed tomography angiography

Lingjie Wang, Hua Zhang, Ying Qiao, Caiyun Shi, Qian Zhang, Huajie Yue, Pengzhi Lv
First Hospital of Shanxi Medical University

Objective: This study aimed to develop and validate a machine learning model incorporating both dual-energy computed tomography (DECT) angiography quantitative parameters and clinically relevant risk factors for the identification of symptomatic carotid plaques to prevent acute cerebrovascular events.

Methods: The data of 180 patients with carotid atherosclerosis plaques were analysed from January 2017 to December 2021; 110 patients (64.03±9.58 years old, 20 women, 90 men) were allocated to the symptomatic group, and 70 patients (64.70±9.89 years old, 50 women, 20 men) were allocated to the asymptomatic group. Overall, five machine learning models using the XGBoost algorithm, based on different CT and clinical features, were developed in the training cohort. The performances of all five models were assessed in the testing cohort using receiver operating characteristic curves, accuracy, recall rate, and F1 score.

Results: The shapley additive explanation (SHAP) value ranking showed fat fraction (FF) as the highest among all CT and clinical features and normalised iodine density (NID) as the 10th. The model based on the top 10 features from the SHAP measurement showed optimal performance (area under the curve [AUC] .885, accuracy .833, recall rate .933, F1 score .861), compared with the other four models based on conventional CT features (AUC .588, accuracy .593, recall rate .767, F1 score .676), DECT features (AUC .685, accuracy .648, recall rate .667, F1 score .678), conventional CT and DECT features (AUC .819, accuracy .740, recall rate .867, F1 score .788), and all CT and clinical features (AUC .878, accuracy .833, recall rate .867, F1 score .852).

Conclusion: FF and NID can serve as useful imaging markers of symptomatic carotid plaques. This tree-based machine learning model incorporating both DECT and clinical features could potentially comprise a non-invasive method for identification of symptomatic carotid plaques to guide clinical treatment strategies.

PO-3794

Swin transformer Framework for predicting Grade and IDH mutation free of tumor segmentation: a multi-institutional study

Zhengyang Zhu,Huiquan Yang,Jianan Zhou,Xin Zhang,Bing Zhang
Department of Radiology, The Affiliated Drum Tower Hospital of Nanjing University Medical School

***Purpose:** Adult diffuse gliomas are the most common type among the central nervous system (CNS) tumors with poor prognosis. In the 5th edition 2021 WHO classification of CNS tumors, isocitrate dehydrogenase (IDH) mutation is the key molecular marker to define Astrocytoma and Oligodendroglioma from Glioblastoma. IDH mutant patients have more favorable prognosis than IDH wild type patients. In the clinical settings, IDH mutation status remains unknown until Sanger sequencing for the resected tumor sample in the surgery, which is time-consuming and expensive. In this study, we established a deep learning model based on novel swin transformer framework to predict WHO Grade and IDH mutation. We assessed the performance on 5 independent datasets.

***Methods and Materials:** Swin transformer networks were trained to provide WHO Grade and IDH classification. Inputs were post-contrast T1WI, T2WI and FLAIR sequences. Grade IV gliomas were defined as High Grade Glioma (HGG). Grade II and III gliomas were defined as Low Grade Glioma (LGG). Training data(n=1688) consisted of 4 publicly available datasets, including UCSF-PDGM(n=501), Upenn-GBM(n=515), Erasmus glioma dataset(n=466), CPTAC-GBM(n=66), and a local dataset Jinling Hospital (n=140). Independent external test dataset consisted of another 4 publicly available datasets, including TCGA-GBM (n=155), TCGA-LGG(n=145), ivy-GAP(n=33), LUMIERE(n=58), and a local dataset Nanjing Drum Tower Hospital (n=300).

***Results:** Subject-wise IDH classification accuracy was 92.4% and 90.7% on the training dataset and the external test dataset, with AUC of 0.947 and 0.915, respectively. WHO Grade Accuracy was 94.3% and 91.5% on the training dataset and external test datasets, with AUC of 0.954 and 0.939.

***Conclusions:** High WHO Grade and IDH mutation classification performance was obtained on the 5 retrospective cohorts from across the world, which demonstrated potential clinical transplantation in the future. Our swin transformer-based model can non-invasively predict tumor grade and IDH mutation status with pre-operative conventional MRI data without diffusion and perfusion sequences and free of tumor segmentation.

***Clinical Relevance/Application:** This research constructed and externally tested a swin transformer based model to noninvasively predict WHO Grade and IDH of adult diffuse gliomas using a total of 2379 cases. This model can help clinicians make better treatment plans for the patients prior the surgery and have potential impact on glioma radiogenomics.

PO-3795

Radiomics for predicting Grades, IDH mutation and MGMT promoter methylation of Adult Diffuse Gliomas: Combination of structural MRI, ADC and SWI

Zhengyang Zhu,Huiquan Yang,Jianan Zhou,Xin Zhang,Bing Zhang
Department of Radiology, The Affiliated Drum Tower Hospital of Nanjing University Medical School

WHO Grade, IDH mutation and MGMT promoter methylation are important for precise diagnosis and treatment plans for diffuse glioma patients. This study aimed to investigate the predictive value of radiomics features extracted from Structural MRI, ADC and SWI. Method: Genetic and preoperative MRI of patients with diffuse gliomas were collected from UCSF-PDGM dataset. A total of 7896 features were extracted from T1WI, T2WI, T1CE, FLAIR, ADC and SWI among 2 ROIs. Analysis of variance F-test were used for feature selection. 11 classifiers, including Logistic Regression, Multi-layer Perceptron (MLP), Random Forest, Support Vector Machine (SVM), Decision Tree, Extra Trees, Perceptron, K-nearest neighbors, Gaussian Naive Bayes (GaussianNB), Gradient boosting and Light Gradient Boosting Machine (LightGBM) were utilized for model establishment. ROC curves were used to evaluate the predictive performance. We also

compared the performance of Radiomics models with a 5-year radiologist and a 1-year radiologist. Results: regarding the clinical and genetic parameters, the age, sex, WHO Grade, IDH mutation, and MGMT promoter methylation status illustrated no significant differences between the training cohort and external validation cohort (p -value <0.05). For WHO Grade task, the modality Structural plus ADC exhibited the highest AUC on both training cohort (0.998) and external validation cohort (0.990). For IDH mutation task, the modality ADC exhibited the highest AUC on the training cohort (1.000) and the modality Structural plus ADC plus SWI exhibited the highest AUC on external validation cohort (0.947). All the constructed models failed to predict MGMT promoter methylation status efficiently. The radiomics models showed higher efficacy than radiologists in Grade and IDH task. The radiologists performed better than radiomics models in MGMT methylation Task. Conclusion: Multiparametric MRI radiomics models can predict WHO grade and IDH mutation status effectively but cannot determine MGMT promoter methylation status. Adding SWI features can provide extra valuable information to Structural MRI and ADC to predict IDH mutation status but cannot improve model robustness to determine WHO grade of adult diffuse gliomas.

PO-3796

Intelligent assessment of lymph nodes involvement in breast cancer based on CNN algorithm: A feasibility and validation study

Mingzhen Chen, Chunli Kong, Minjiang Chen, Jiansong Ji
Lishui hospital of Zhejiang University

Purpose With heightened screening awareness and advances in medical technology, sentinel lymph node (SLN) may not have a tumor burden in early-stage breast cancer (BC) patients [1], showing that invasive SLN dissection is not essential. For patients with SLN metastasis but a low risk of residual non-SLN (NSLN) metastasis, axillary lymph node (ALN) dissection is overtreatment [2]. Breast dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI) plays a vital role in ALN-status evaluation [3]. Deep learning, especially the convolutional neural network (CNN) [4] algorithm, demonstrates great potential in the clinical management of tumors for the ability to learn complex image characteristics automatically [5, 6]. Therefore, this multicenter study aimed to develop and validate an automated preoperative CNN-based tool to predict SLN and NSLN metastasis in BC patients using DCE-MRI images.

Methods and materials We retrospectively collected data of 944 BC patients with DCE-MRI images, and clinical information from two hospitals. The specific data allocation is depicted in Figure 1. A CNN-based model was proposed to predict the SLN and NSLN metastasis, and the overview of the CNN model development process is indicated in Fig.2. Performance of the proposed approach to identify ALN status for BC patients was assessed in the internal validation set and external test set. In addition, clinical and radiomics conventional models were constructed and compared with deep learning models. Different models were measured by the area under the curve (AUC), accuracy, sensitivity, and specificity.

Results For SLN prediction, the CNN-based model attained inspiring predictive performance in the training set ($n=519$; AUC 0.947; 95% CI 0.898-0.997, accuracy 0.881, sensitivity 0.903, specificity 0.960), internal validation set ($n=129$; AUC 0.912, 95% CI 0.897-0.927, accuracy 0.798, sensitivity 0.838, specificity 0.895), as well as external test set ($n=296$; AUC 0.884, 95% CI 0.860-0.908, accuracy 0.880, sensitivity 0.785, specificity 0.893). According to the receiver operating characteristic curve (shown in Figure3), the CNN model showed significant improvement over other models that using hand-crafted CT features or clinical characteristics. For NSLN prediction, the CNN-based model also achieved satisfactory performance, with an AUC of 0.958 (95% CI, 0.899–1) in the training set, which was further verified in both internal validation set (AUC 0.784, 95% CI 0.740-0.828) and external test set (AUC 0.76, 95% CI 0.703–0.818). Patient examples for the actual use of the established CNN model are displayed in Figure 4.

Conclusion

Firstly, the CNN model can effectively predict SLN status. Moreover, it can preoperatively evaluate the condition of NSLN in BC patients with SLN metastasis. Overall, using ready DEC-MRI images, the CNN-based model may serve as a non-invasive assessment technique for ALN assessment of BC patients. References

PO-3797

Development and validation of a combinatorial MRI sequence-based radiomics model for preoperative prediction of microsatellite instability status in rectal cancer

Dongxue Li¹, Jiaxuan Peng², Zhenyu Shu¹, Yang Zhang¹, Qiaowei Song¹

1. Zhejiang Provincial People's Hospital

2. Jinzhou medical university

Abstract

Background: To develop and validate an optimal radiomics model for preoperatively predicting microsatellite instability (MSI) in patients with rectal cancer (RC) based on multiparametric magnetic resonance imaging.

Methods: The retrospective study included 308 RC patients who did not receive preoperative antitumor therapy, among whom 51 had MSI. Radiomics features were extracted and dimensionally reduced from T2-weighted imaging (T2WI), T1-weighted imaging (T1WI), diffusion-weighted imaging (DWI) and T1-weighted contrast enhanced (T1CE) images for each patient, and the features of each sequence were combined. Multifactor logistic regression was used to screen the optimal feature set for each combination. Different machine learning methods were applied to construct predictive MSI status models. Relative standard deviation values were determined to evaluate model performance and select the optimal model. Receiver operating characteristic (ROC) curve, calibration curve, and decision curve analyses were performed to evaluate model performance.

Results: The model constructed using the k-nearest neighbor (KNN) method combined with T2WI and T1CE images performed best. The area under the curve values for prediction of MSI with this model were 0.849 (0.804–0.887), with a sensitivity of 0.784 and specificity of 0.805. The Delong test showed no significant difference in diagnostic efficacy between the KNN-derived model and the traditional logistic regression model constructed using T1WI+DWI+T1CE and T2WI+T1WI+DWI+T1CE data ($P>0.05$) and the diagnostic efficiency of the KNN-derived model was slightly better than that of the traditional model. From ROC curve analysis, the KNN-

derived model significantly distinguished patients at low- and high-risk of MSI with the optimal threshold of 0.2, supporting the clinical applicability of the model.

Conclusions: The model constructed using the KNN method can be applied to noninvasively predict MSI status in RC patients before surgery based on radiomics features from T2WI and T1CE images. Thus, this method may provide a convenient and practical tool for formulating treatment strategies and optimizing individual clinical decision-making for patients with RC.

PO-3798

Automatic Urinary Stones Detection System for Abdominal Non-enhanced CT Images Reduces the Burden on Radiologists

Zhaoyu Xing¹, Zuhui Zhu¹, Yan Zeng², Aie Liu², Jiule Ding¹

1. Department of Urology, Third Affiliated Hospital of Soochow University

2. Shanghai United Imaging Intelligence Co. Ltd., Shanghai

Objective To develop a fully automatic urinary stone detection system (kidney, ureter and bladder) and to test it in a real clinical environment.

Methods The local institutional review board approved this retrospective single-center study that used non-enhanced abdominopelvic CT scans from patients admitted urology (uPatients) and emergency (ePatients). The uPatients were randomly divided into training and validation sets in a ratio of 3:1. We designed a cascade urinary stone map location-feature pyramid networks (USm-FPNs) and innovatively proposed a ureter distance heatmap method to estimate the ureter position on non-enhanced CT to further reduce the false positives. The performances of the system were compared using the free-response receiver operating characteristic curve and the precision-recall curve.

Results This study included 811 uPatients and 356 ePatients. At stone level, the cascade detector USm-FPNs has the mean of false positives per scan (mFP) 1.88 with the sensitivity 0.977 in validation set, and mFP was further reduced to 1.18 with the sensitivity 0.977 after combining the ureter distance heatmap. At patient level, the sensitivity and precision were as high as 0.995 and 0.990 in validation set, respectively. In a real clinical set of ePatients (27.5% of patients contain stones), the mFP was 1.31 with as high as sensitivity 0.977, and the diagnostic time reduced by >20% with the system help.

Conclusion A fully automatic detection system for urinary stones was proposed, to reduce obviously diagnostic time of urinary stones on non-enhanced CT scans without compromising sensitivity in real emergency data.

PO-3799

CT-based radiomics with various classifiers for histological differentiation of parotid gland tumors

Yang Lu

Third Affiliated Hospital of Soochow University

Objective: This study assessed whether radiomics features could stratify parotid gland tumours accurately based on only noncontrast CT images and validated the best classifier of different radiomics models.

Methods: In this single-centre study, we retrospectively recruited 249 patients with a diagnosis of pleomorphic adenoma (PA), Warthin tumour (WT), basal cell adenoma (BCA) or malignant parotid gland tumours (MPGTs) from June 2020 to August 2022. Each patient was randomly classified

into training and testing cohorts at a ratio of 7:3, and then, pairwise comparisons in different parotid tumour groups were performed. CT images were transferred to 3D-Slicer software and the region of interest was manually drawn for feature extraction. Feature selection methods were performed using the intraclass correlation coefficient, t test and least absolute shrinkage and selection operator. Five common classifiers, namely, random forest (RF), support vector machine (SVM), logistic regression (LR), K-nearest neighbours (KNN) and general Bayesian network (Gnb), were selected to build different radiomics models. The receiver operating characteristic curve, area under the curve (AUC), accuracy, sensitivity, specificity and F-1 score were used to assess the prediction performances of these models. The calibration of the model was calculated by the Hosmer–Lemeshow test. DeLong's test was utilized for comparing the AUCs.

Results: The radiomics model based on the RF, SVM, Gnb, LR, LR and RF classifiers obtained the highest AUC in differentiating PA from MPGTs, WT from MPGTs, BCA from MPGTs, PA from WT, PA from BCA, and WT from BCA, respectively. Accordingly, the AUC and the accuracy of the model for each classifier were 0.834 and 0.71, 0.893 and 0.79, 0.844 and 0.79, 0.902 and 0.88, 0.602 and 0.68, and 0.861 and 0.94, respectively.

Conclusion: Our study demonstrated that noncontrast CT-based radiomics could stratify refined pathological types of parotid tumours well but could not sufficiently differentiate PA from BCA. Different classifiers had the best diagnostic performance for different parotid tumours. Our study findings add to the current knowledge on the differential diagnosis of parotid tumours.

PO-3800

Staging Liver Fibrosis Using Routine Magnetic Resonance Imaging Based on Machine learning model

Shuo Li

The Second Affiliated Hospital of Dalian Medical University

Objective

This study aimed to create a computer-aided diagnosis system to analyze MR routine scan images in a rabbit model, in order to explore the value of machine learning model combining semi-supervised learning and active learning in staging diagnosis of liver fibrosis.

Methods

1. Establishment of animal model of liver fibrosis, image acquisition and pathology

Thirty-five healthy male rabbits were divided into experimental group (n=30) and control group (n=5) to establish liver fibrosis model. Rabbits in the experimental group had received subcutaneous injections at neck twice a week. We used the drug which comprising 50% carbon tetrachloride (CCl₄) in olive oil (0.1mL/kg at 1-3 weeks, 0.2mL/kg at 4-6 weeks, 0.3mL/kg at 7-10 weeks). Rabbits in control group were injected with the same dose of normal saline. At the end of 5, 6, 7 and 10 weeks after injection, the rabbits were scanned by 3.0T MR and the sequence images of T1WI-FS and T2WI-FS were obtained. The rabbits were sacrificed after MR scanning, and their livers were stained by HE and Masson, respectively. The rabbits were grouped according to the Metavir scoring system: normal liver tissue (F0), mild fibrosis (F1), moderate fibrosis (F2), severe fibrosis (F3), and early cirrhosis (F4). Then they were divided into three groups: early liver fibrosis group (F1-2), advanced liver fibrosis group (F3-4), and normal liver group (F0).

2. Classification and recognition system based on computer aided diagnosis

2.1 Region of interest extraction

On the sequence images of T1WI-FS and T2WI-FS, we drew a total of 360 square ROIs of 20×20 pixels. 180 ROIs were obtained for each sequence images, and their positions correspond to each other. including normal liver tissue (F0, n=32), mild fibrosis (F1, n=37), moderate fibrosis (F2, n=33), severe fibrosis (F3, n=54), early cirrhosis (F4, n=24), early liver fibrosis (F1-2, n=70), and advanced liver fibrosis (F3-4, n=78).

2.2 Texture feature extraction and selection

After image preprocessing, the gray-level co-occurrence matrix (GLCM) was used to calculate the texture characteristic values of ROI image in four directions (0° , 45° , 90° , 135°). Then the average value was obtained to select the parameter features, and finally a 16-dimensional feature was obtained for each ROI. Specific parameters were as follows: power, contrast ratio, inverse difference moment, variance, entropy, inertia moment, correlation, sum average, sum entropy, sum variance, difference entropy, difference variance, information measures of correlation 1 and 2, mean gray value, standard deviation.

2.3 Machine Learning model establishment

A label propagation algorithm combining semi-supervised learning and active learning was used to build a classifier model. Five groups of ROIs were classified and identified respectively, and then three groups of ROIs were compared between groups.

Results

A total of 33 rabbits completed the entire experimental process. The pathological results showed that the stages of liver fibrosis in each liver lobe of all surviving rabbits were not completely consistent, so the rabbits as a whole were ignored and each liver lobe was taken as the research object to plot ROI. Finally, the classification and identification results were as follows:

1. Classification and recognition results based on T1WI-FS images

The average accuracy of five-stage classification and recognition (5 groups of ROIs) was 60.6%, and the accuracy of F0, F2 and F3 liver fibrosis was 87.5%, 66.7% and 64.8%, respectively. The average accuracy of pairwise classification and recognition (3 groups of ROIs) reached more than 90% in the identification of F0 and F1-4, F0 and F1-2, F0 and F3-4, among which F0 and F3-4 were the best, with the accuracy of 96.4%.

2. Classification and recognition results based on T2WI-FS images

The recognition performance of the classifier is not stable. The average accuracy of five-stage classification and recognition (5 groups of ROIs) was 44.4%, The average accuracy of pairwise classification and recognition (3 groups of ROIs) was ineffective because of the high misjudgment rate of F0 phase. The average accuracy of identifying F1-2 and F3-4 was 69.6%, and the accuracy of distinguishing F3-4 was 83.3%.

Conclusion

The emerging SSL and AL classifier model constructed based on MR routine scan image could be applied to the classification and recognition of rabbit liver fibrosis model. The classification and recognition effect of T1WI-FS images was better than that of T2WI-FS images. Non-invasive computer-aided diagnosis technology has certain value in staging diagnosis of liver fibrosis, which may provide the potential application value for clinical diagnosis and treatment and prognosis in the future.

2. Department of Military Medical Psychology, Fourth Military Medical University

OBJECTIVE

Intra-individual variability (IIV) in cognitive performance is thought to reflect the efficiency with which attentional resources are allocated in different circumstances requiring cognitive control. IIV in cognitive performance is associated with the strength of the negative correlation between task-positive network and default mode network (DMN) activity. In this study, we investigated the impact of sleep deprivation (SD) on functional connectivity (FC) between the DMN and psychomotor vigilance task-related network (PVT-RN), and its relationship with IIV in cognitive performance.

METHOD

Two analyses, network-level independent component analysis (ICA) and region-level (RL)-ICA, were employed to compare the coefficient of variation (CV) of the PVT between normal sleep and SD conditions on the basis of functional magnetic resonance images across 67 healthy participants.

RESULTS

After SD, in the RL-ICA, the FC between the PVT-RN and DMN was positively correlated with the CV of the PVT, as well as the changes therein, compared with normal sleep. Using a mask derived from the DMN and PVT-RN, the RL-ICA revealed that 12 edges/connections between DMN and PVT independent components were associated with the CV of the PVT, with nine of these connections involving the precuneus.

CONCLUSION

These findings suggest that the precuneus may play a crucial role in the interactions of various brain functions during the PVT, with the connections between the precuneus and frontoparietal and somatosensory networks being significantly altered after SD. Moreover, following SD, weakened negative FC between the precuneus and bilateral inferior parietal lobule may disrupt the balance between cognitive and executive control functions, leading to a decline in cognitive performance.

PO-3802

Developing a dementia risk prediction model for people with depression: a longitudinal machine learning study

Xuan Xiao¹, Lianggeng Gong¹, Pei Yang¹, Yihui Li², Yiping Leng¹, Xijian Dai¹

1. The Second Affiliated of Nanchang University

2. School of Computer and Information Engineering, Jiangxi Agricultural University

Objective: This study aims to develop and validate a new predictive model that is easy to promote in the population to assess the risk of all-cause dementia in patients with depression.

Methods: This study included 502,386 participants who were enrolled in the longitudinal population cohort UK Biobank from March 1, 2006 to October 31, 2010. The data was split into training dataset and testing dataset at an 8:2 ratio. We performed ten-fold cross-validation on the training dataset, and used the test dataset to evaluate the stability of the model. Univariate analysis was performed using independent samples t-test and Pearson chi-square test. We identified 12 predictive factors from 216 candidate variables and used four machine learning classifiers, namely logistic regression (LR), linear discriminant analysis (LDA), adaBoost regressor (ADA) and ridge regression to develop models. Receiver operating characteristic (ROC) curve and precision-recall (PR) curve were used to evaluate the predictive ability of the model.

Results: Among the final 31,587 participants who were diagnosed with depression at baseline assessment and diagnosed with dementia later than depression, 896 participants (2.8%) had dementia events. The twelve predictive factors selected include sex, age, current employment status, smoking status, number in household, alcohol drinker status, mood swings, sleeplessness, body mass index, sleep duration, able to confide and length of mobile phone use. Among these four models, LR (AUC=0.843; ACC=0.97) had the best predictive performance, while ADA (AUC=0.803; ACC=0.97) had relatively poor predictive performance. The predictive performance of LDA (AUC=0.817; ACC=0.97) was similar to that of Ridge (AUC=0.817; ACC=0.97).

Conclusion: This study developed a practical and easy-to-promote risk prediction model for predicting the probability of dementia in patients with depression, which provides a new clinical decision support tool for clinicians to prevent and treat patients with depression who develop dementia.

PO-3803

Deep learning and radiomics of longitudinal CT scans for early prediction of tuberculosis treatment outcomes

Yidiliniijati Ma¹, Lin Guo², Abudukeyoumujiang Abulizi¹, shiyu Fan¹, Abulikemu Wubuli³, Abuduresuli Tuersun¹, Pahatijiang Nijati¹, xiaoguang Zou¹

3. Yecheng County People's Hospital

Abstract

Background: To predict tuberculosis (TB) treatment outcomes at an early stage, prevent poor outcomes of drug-resistant tuberculosis (DR-TB) and interrupt transmission.

Methods: An internal cohort for model development consists of 204 bacteriologically-confirmed TB patients who completed anti-tuberculosis treatment, with one pretreatment and two follow-up CT images (612 scans). Three radiomics feature-based models (RM) with multiple classifiers of Bagging, Random forest and Gradient boosting and two deep-learning-based models (i.e., supervised deep-learning model, SDLM; weakly supervised deep-learning model, WSDLM) are developed independently. Prediction scores of RM and deep-learning models with respectively highest performance are fused to create new fusion models under different fusion strategies. An additional independent validation was conducted on the external cohort comprising 80 patients (160 scans).

Results: For RM scheme, 16 optimal radiomics features are finally selected using longitudinal scans. The AUCs of RM for Bagging, Random forest and Gradient boosting were 0.789, 0.773 and 0.764 in the internal cohort and 0.840, 0.834 and 0.816 in the external cohort, respectively. For deep learning-based scheme, AUCs of SDLM and WSDLM were 0.767 and 0.661 in the internal cohort, and 0.823 and 0.651 in the external. The fusion model yields AUCs from 0.767 to 0.802 in the internal cohort, and from 0.831 to 0.857 in the external cohort.

Conclusions: Fusion of radiomics features and deep-learning model may have the potential to predict early failure outcome of DR-TB, which may be combined to help prevent poor TB treatment outcomes.

PO-3804

Deep Learning on Longitudinal CT Scans: Automated Prediction of Treatment Outcomes in Hospitalized Tuberculosis Patients at Early Stage

Yidiliniijati Ma¹, Lin Guo², Abuduresuli Tuersun¹, Maihemutijiang Damola¹, Abudukeyoumujiang Abulizi¹, Dong Dong¹, Xia Li², Kunlei Hong², xiaoguang Zou¹

1. The First People's Hospital of Kashi Prefecture

2. Shenzhen Zhiying Medical Imaging,

Abstract

Purpose To develop deep learning (DL) models using longitudinal CT images to predict tuberculosis (TB) treatment outcomes and prevent the progression of TB into drug-resistant (DR) TB.

Methods In this work, three DL-based prediction models (PMs) using longitudinal CT images were developed to predict TB treatment outcomes, and both internal and external testing was conducted to evaluate their performance. The internal dataset consists of 493 bacteriologically-confirmed TB patients who completed the anti-tuberculosis treatment in the local hospital with three-time CT scans, including a pretreatment CT scan and two follow-up CT scans. PM1 was trained using only the pretreatment CT scans, and PM2 and PM3 were developed by adding two follow-up CT scans

to PM1. An additional independent testing was performed on external dataset comprising 86 tuberculosis patients with completed anti-tuberculosis treatment.

Results The prediction model performance was improved with additional follow-up CT scans into the PM1. The AUC for classifying success and DR-TB was improved on both internal and external dataset (0.609 vs 0.625 vs. 0.815 in the internal test; 0.627 vs 0.705 vs. 0.735 in the external test). Other two comprehensive metrics of accuracy and F1 score also showed an increase of 0.128 and 0.034, 0.07 and 0.038 for PM1 vs. PM2 and PM2 vs. PM3 in the external test, and the improvement during the two-month intensive phase was greater than that of the subsequent four-month continuation phase.

Conclusion Regular follow-up CT scans can aid in the prediction of DR-TB, and that special attention should be given to the early intensive phase of treatment to identify high-risk DR-TB patients.

PO-3805

Using Machine Learning to Predict the Efficacy of Neoadjuvant Chemoradiotherapy for Local Advanced Rectal Cancer Based on Texture Features of MRI

Fei Gao, Zhenchao Tao, Rixin Su, Mingjie Sun
Anhui Provincial Cancer Hospital

Objective: Based on the analysis of texture features in magnetic resonance images using wavelet analysis, this study aims to predict the efficacy of neoadjuvant chemoradiotherapy for locally advanced rectal cancer using machine learning methods.

Methods: A collection of patients with locally advanced rectal cancer who underwent neoadjuvant chemoradiotherapy at the First Affiliated Hospital of the University of Science and Technology of China from June 2016 to December 2020 was gathered. Wavelet texture feature parameters of all lesions in patients' MRI images were extracted. The Random Forest Classifier model was employed for feature selection, followed by classification learning using the XGBoost classifier.

Results: A total of 62 patients with 1656 magnetic resonance wavelet texture feature parameters from all lesions were obtained. Feature selection using the Random Forest Classifier identified the most important four wavelet texture features, which included DWI wavelet-HHH glcm Maximum Probability, DWI wavelet-LLL firstorder Minimum, T2 wavelet-LHH firstorder Kurtosis, and T2 wavelet-HLL glcm MCC. Utilizing the XGBoost classifier for predictive classification yielded a final accuracy of 84.21% and an AUC value of 0.90. The precision, recall, and F1 score for the responsive treatment group were 0.86, 0.92, and 0.89, respectively. For the non-responsive treatment group, the precision, recall, and F1 score were 0.80, 0.67, and 0.73, respectively. The macro-averaged values of precision, recall, and F1 score across all labels were 0.83, 0.79, and 0.81, respectively.

Conclusion: The model established based on wavelet texture feature analysis of magnetic resonance images can effectively predict the efficacy of neoadjuvant radiochemotherapy for rectal cancer patients. The XGB Classifier model demonstrates excellent performance in handling small, imbalanced datasets, thus showing promising clinical application value.

PO-3806

Application value of artificial intelligence CT quantitative analysis technology in the process of bronchial changes at different stages of pulmonary contusion

Yongliang Dai¹, Yuzhe Zhang¹, Yuangang Zhang², Yongtao Cheng², Youmin Guo³, Yan Li³

1. Xi Dian University Hospital

2. 521 Hospital of Ordnance Industry

3. the First Affiliated Hospital of Xi'an Jiaotong University

Objective: To explore the application value of artificial intelligence CT quantitative analysis technique in the progression of pulmonary contusion. **Methods:** The chest CT data of 90 patients with pulmonary contusion were retrospectively analyzed. Artificial intelligence CT quantitative analysis technology was used to automatically segment the images and measure the changes of the quantitative indicators of grade 3 ~ 7 bronchi in different periods of pulmonary contusion (acute stage, exudation and absorption improvement stage) and statistically analyzed. **Results** A total of 108 lesions in 90 patients were studied. The maximum and average wall thickness of generations 3~7 bronchi in the exudation period were greater than those in the acute phase and absorption period, while the intraluminal and extraluminal diameters and circumferences of generations 4~7 bronchi and the luminal and wall cross-sectional areas of generations 5~7 bronchi in the exudation period were smaller than those of the acute phase and absorption period, with all differences statistically significant ($P < 0.05$). The maximum and average wall thickness of generations 4~7 bronchi in the acute phase were greater than those in the absorption period but smaller than those in the exudation period, while the intraluminal and extraluminal diameters and circumferences of generations 4~7 bronchi and the luminal and wall cross-sectional areas of generations 5~7 bronchi in the acute phase stage were smaller than those in the absorption period but larger than those in the exudation period, with all differences statistically significant ($P < 0.05$). **Conclusions:** Artificial intelligence CT quantitative analysis technology can visually show the bronchial morphological changes in various stages of pulmonary contusion, and can dynamically monitor the treatment of pulmonary contusion, providing a new approach for evaluating the clinical efficacy.

PO-3807

Clinical application of 3DSlicer and Sina in minimally invasive puncture drainage of elderly patients with spontaneous intracerebral hemorrhage under local anesthesia

Xiang Yao¹, Ke Ren², E Chen¹

1. Zhongshan Hospital of Xia Men University

2. Xiang'an Hospital of Xia Men University

Background: Decreased organ function and poor physical compensatory capacity in elderly patients diagnosed with spontaneous intracerebral hemorrhage (ICH) can make surgical treatment procedures challenging and risky. Minimally invasive puncture drainage (MIPD) combined with urokinase infusion therapy is a safe and feasible method of treating ICH. This study aimed to compare the treatment efficacy of MIPD conducted under local anesthesia using either 3DSlicer + Sina application or computer tomography (CT)- guided stereotactic localization of hematomas in elderly patients diagnosed with ICH.

Methods: The study sample included 78 elderly patients (≥ 65 years of age) diagnosed with ICH for the first time. All patients exhibited stable vital signs and underwent surgical treatment. The study

sample was randomly divided into two groups, either receiving 3DSlicer+Sina or CT-guided stereotactic assistance. The preoperative preparation time; hematoma localization accuracy rate; satisfactory hematoma puncture rate; hematoma clearance rate; postoperative rebleeding rate; Glasgow Coma Scale (GCS) score after 7 days; and modified Rankin scale (mRS) score 6 months after surgery were compared between the two groups.

Results: No significant differences in gender, age, preoperative GCS score, preoperative hematoma volume (HV), and surgical duration were observed between the two groups (all p -values > 0.05). However, the preoperative preparation time was shorter in the group receiving 3DSlicer + Sina assistance compared to that receiving CT-guided stereotactic assistance (p -value < 0.001). Both groups exhibited significant improvement in GCS scores and reduction in HV after surgery (all p -values < 0.001). The accuracy of hematoma localization and puncture was 100% in both groups. There were no significant differences in surgical duration, postoperative hematoma clearance rate, rebleeding rate, postoperative GCS and mRS scores between the two groups (all p -values > 0.05).

Conclusions: A combination of 3DSlicer and Sina is effective in accurately identifying hematomas in elderly patients with ICH exhibiting stable vital signs, thus simplifying MIPD surgeries conducted under local anesthesia. This procedure may also be preferred over CT-guided stereotactic localization in clinical practice due to its ease of use and accuracy in hematoma localization.

PO-3808

A Study on Predicting Spontaneous Deep Brain Hematoma Expansion Based on Head CT Perfusion Imaging

Boyue Cao¹, Yue Chen², Le Qi¹

1. Department of Radiology, Affiliated Hospital of Hangzhou Normal University

2. Clinical Medicine School of Hangzhou Normal University

ABSTRACT

BACKGROUND AND PURPOSE: To study the prediction of spontaneous deep brain hematoma enlargement based on head CT perfusion imaging.

MATERIALS AND METHODS: A retrospective analysis was conducted on the clinical and imaging data of 186 patients with spontaneous deep cerebral hemorrhage admitted to Hangzhou Normal University Affiliated Hospital from January 2021 to July 2023. All patients underwent baseline head plain CT (NCCT) and CT perfusion imaging (CTP) examinations within 6 hours after onset. The hematoma area was manually delineated and CTP parameters (CBF, CBV, MTT, TTP, Tmax, PS values) were measured 1cm around the hematoma, and NCCT reexamination was performed within 36 hours after onset. Based on the clinical comprehensive diagnosis results as the gold standard, it is divided into two groups: the enlarged hematoma group and the non expanded hematoma group. Compare and analyze the CTP parameters of two groups of patients.

RESULTS: Out of 186 enrolled patients, 55 had hematoma enlargement, and there was no statistically significant difference in MTT between the two groups ($P > 0.05$). However, the levels of CBF, Tmax, and PS in the hematoma enlargement group were higher than those in the hematoma non enlargement group, while the levels of CBV and TTP were lower than those in the hematoma non enlargement group, with a statistically significant difference ($P < 0.05$). The results obtained from correlation analysis showed a negative linear correlation between CBV and TTP levels, and a positive linear correlation with CBF, Tmax, and PS, with a statistically significant difference ($P < 0.05$). CBF, CBV, TTP, Tmax, and PS values are all effective indicators for predicting the expansion of spontaneous deep brain hematoma.

CONCLUSIONS: CTP can quickly and accurately reflect the perfusion status of brain tissue within and around a brain hematoma, and has good diagnostic value for spontaneous deep brain hematoma enlargement.

PO-3809

Radiomics analysis of gadoxetic acid-enhanced MRI preoperative predicts vessels encapsulating tumor clusters in hepatocellular carcinoma

Cheng Chen,tao zhang,xueqin zhang
Affiliated Nantong Hospital 3 of Nantong University

Purpose:

The aim of this study was to develop an optimally integrated model that combines clinical-radiologic and radiomics features based on gadoxetic acid-enhanced MRI for preoperative prediction of vessels encapsulating tumor clusters (VETC) patterns in hepatocellular carcinoma (HCC).

Methods:

This retrospective study encompassed 234 patients who underwent surgical resection and received preoperative gadoxetic acid-enhanced MRI. Among them, 101 patients exhibited VETC-positive HCC, while 133 patients displayed VETC-negative HCC. Volumes of interest were manually delineated for entire tumor regions in the arterial phase (AP), portal phase (PP), and hepatobiliary phase (HBP) images. Independent predictors for VETC were identified through Least Absolute Shrinkage and Selection Operator (LASSO)-penalized and multivariable logistic regression analysis, utilizing radiomics-AP, PP, HBP, along with 24 imaging features and 19 clinical characteristics. Subsequently, the clinico-radiologic model, radiomics model, and integrated model were established, with a nomogram visualizing the integrated model. The performance for VETC prediction was evaluated using a receiver operating characteristic curve.

Results:

The optimal integrated model, composed of 3 selected traditional imaging features (necrosis or severe ischemia [OR=1.457], peripheral washout [OR=1.078], LLR_AP [OR=0.433]) and radiomics-AP [OR=1.870], radiomics-HBP [OR=1.023], radiomics-PP [OR=0.546]), showcased superior accuracy in predicting VETC patterns in both the training (AUC=0.873, 95% confidence interval [CI]: 0.821-0.925) and validation (AUC=0.869, 95% CI:0.789-0.950) cohorts.

Conclusion:

This study successfully established an integrated model that combines traditional imaging features and radiomic features from gadoxetic acid-enhanced MRI, demonstrating robust performance in predicting VETC patterns. Employing a non-invasive approach to predict the VETC pattern in HCC holds the potential to provide valuable insights for preoperative planning.

PO-3810

The value of CT radiomics on predicting of progression of aortic intramural hematoma

Zhenyi Zhao,jingzhi wang,zhen zhao,huashan lin,yun peng,lianggeng gong
Second Affiliated Hospital of Nanchang University

Purpose: To develop a clinical-radiomics model based on CTA to appraise the short-term prognosis of conservative treatment of IMH.

Methods: A cohort of 120 IMH patients were enrolled in the study. The patients were categorized into the progressive or non-progressive group based on the clinical progress. The aortic maximum diameter and hematoma maximum thickness were measured, and a comprehensive aortic image was delineated. The minimum absolute contraction and selection operator (LASSO) regression model was used for data dimensionality reduction, feature selection and the construction of the radiomics feature model. Furthermore, a clinical-radiomic nomogram model incorporating selected clinical predictors and obtained radiomic features was constructed using multivariate logistic

regression analysis. The model's performance was assessed using the area under the receiver operating characteristic (ROC) curve, while the calibration curve and Hosmer-Lemeshow test were employed to evaluate its calibration. Additionally, the AUC performance of the comparison model was verified using the DeLong method.

Results: A radiomic model was established by selecting 12 radiomic features from a pool of 851 features. The clinical model consisted of age and sex variables. The training set yielded a nomogram AUC of 0.84, while the verification set yielded an AUC of 0.80. Decision curve analysis demonstrated the clinical utility of the nomogram.

Conclusion: The radiomics model can predict the prognosis of IMH without previous high-risk imaging signs after short-term conservative treatment by characterizing the morphological characteristics of the whole aorta. The clinical-radiomics model and nomogram obtained by combining age and gender can obtain higher prediction efficiency.

PO-3811

Research on prognosis model of cerebral hemorrhage based on deep learning

Lingyan Zhang, Mifang Li, Jichao Zhu
Longgang Central Hospital of Shenzhen

Objective

The application of artificial intelligence in the field of cerebral hemorrhage mainly focuses on the recognition and volume measurement of hemorrhage. There are few algorithms for predicting the prognosis of cerebral hemorrhage and the general accuracy is low. This study aims to establish a prognosis model for patients with intracerebral hemorrhage based on CT images and GCS scores by using deep learning technology, so as to help clinicians quickly evaluate the severity of intracerebral hemorrhage and provide a basis for making individualized treatment decisions.

Methods

A total of 286 cases of spontaneous intracerebral hemorrhage were collected retrospectively as a data set, all of which completed the clinical treatment cycle. Patients were divided into the good prognosis group and the poor prognosis group according to the Glasgow outcome score. Based on a convolutional neural network, a cerebral hemorrhage prognosis model was constructed by integrating domain knowledge through the self-attention mechanism. The model integrated multimodal data from brain CT images and the Glasgow coma scale (GCS) as domain knowledge. The model network structure diagram is mainly composed of three main modules: feature extraction module, feature fusion module, and classification head module. To mitigate the interference from non-brain tissue regions, multi-threshold segmentation, and connected component screening were used to isolate these regions.

Results

Through clinical validation, the inclusion of GCS scores in our model improved the prognostic accuracy of individual CT image tests by 18.25% (from 64.33% to 82.58%) and for individual patients by 22.03% (from 57.97% to 80.00%), significantly better than the average accuracy of professional neurosurgeons. In the process of reasoning, the model pays attention to the characteristics of the cerebral hemorrhage region in CT slices and has high sensitivity for the cerebral hemorrhage region. However, it is important to note that the calvarial dissection process may result in bleeding information loss. In addition, the size of the current dataset is relatively small.

Conclusion

We present a novel approach to assess the prognosis of cerebral hemorrhage. Integrating GCS score into prognosis can evaluate the severity of cerebral hemorrhage more quickly and accurately, and help clinicians to make individualized treatment decisions for patients. We plan to collect more data to design the 3-Dimensional network model and use the bleeding area test as an auxiliary tool to further improve its accuracy.

PO-3812

Deep learning-based Synthetic Magnetic Resonance Image Generation from CT Imaging for Cerebral Ischemic Stroke Patients

Lingyan Zhang, Mifang Li, Feiyuan Zhang
Longgang Central Hospital of Shenzhen

Objective

In view of the demand for rapid acquisition of magnetic resonance images (MRI) in patients with ischemic stroke, this study aims to investigate the feasibility of converting CT images of cerebral ischemic stroke patients to MR images using deep learning techniques, as well as the potential role and advantages in clinical practice.

Methods

The CT and MR Images of 120 patients with ischemic stroke were retrospectively collected. MRI was performed with T2 fluid-attenuated inversion recovery (T2-FLAIR) sequence, and the interval between the two examinations was less than 3 days. The proposed method utilizes a generative adversarial network (GAN) to learn the mapping between the two modalities and generate synthetic MR images from CT scans. The network inputs CT and MR Images separately, only the MR image input contains attribute information, where the presence or absence of lesions is encoded as one-hot codes. At the same time, we added a new attribute to the network based on the observation that stroke lesions are highly discernible on MR images. To evaluate the performance of the proposed method, 10 patient image datasets were selected for evaluation and their peak signal-to-noise ratio (PSNR) and structural similarity index (SSIM) values were calculated.

Results

The algorithm can effectively realize the mode switch of healthy brain regions and can identify lesions to a certain extent. Experimental results demonstrate that the proposed approach can effectively generate high-quality MR images from CT scans, achieving a PSNR of 24.4 dB and an SSIM of 0.78. In addition, we generate a difference map between the synthetic MR Image and the original MR Image. Furthermore, our method outperforms existing image-to-image translation methods in terms of visual quality and quantitative evaluation metrics.

Conclusion

Deep learning has shown promising results in extracting subtle lesion features from CT images, enabling timely diagnosis of cerebral infarction on CT images through conversion from CT images to MR Images. Although the results may differ from the original MR Images, the algorithm can still provide valuable insights to the diagnostic physician. Future research will focus on refining the algorithm and conducting comparative studies with related algorithms.

PO-3813

Predicting rectal metachronous liver metastases with CT-based Deep learning model

Meiqi Wan, Enming Cui, Changyi Ma, Shiman Gan, Yan Lei, Changyin Yao, Bao Feng, Jiangfeng Shi
Jiangmen Central Hospital

Purpose:

To investigate that the value of CT-based deep learning (DL) model for predicting the two-year risk of metachronous liver metastases (MLM) in patients with rectal cancer after surgery by using independently external test.

Methods and Materials:

This retrospective study included patients with pathologically proven rectal cancer who underwent pre-operative contrast-enhanced CT imaging between January 2008 and January 2021 from two independent institutions. 411 cases and 148 cases were included for training and internal validation from our institution, 105 cases were included for independent external test. Two training strategy were employed. In the training cohort I, both patients with synchronous liver metastases (SLM) and MLM were included for model training (SMDL), but only patients with MLM were included for model training (MDL) in the training cohort II. We used ResNet-18 as a robust convolutional feature extractor, and inputs the deep convolutional features into an Extreme Learning Machine (ELM) classifier to build a classification model. And the clinical factors were developed by multivariate logistic regression. The accuracy (ACC) and receiver operating characteristic (ROC) curve analysis were calculated to evaluate the performance of DL models, and the integrated discrimination improvement (IDI) was used to compare the model performance. The decision curve analysis (DCA) was used to assess the clinical usefulness of the predictive models.

Results:

The performance of SMDL (AUC internal validation = 0.756 – 0.843, AUC external test = 0.767 – 0.824) is superior to that of MDL (AUC internal validation = 0.667 – 0.763, AUC external test = 0.716 – 0.795) based on each single-phase or all-phase with significantly statistical difference of (IDI>0, P<0.05). The performance of SMDL based on all-phase images achieved the highest AUC value in the internal validation (AUC=0.824), external test (AUC=0.843) as compared to that based on PCP or VP phase (IDI>0, P<0.05). In addition, combining clinical indicators with the SMDL didn't improve the performance (AUC from 0.843 to 0.846, P>0.05). DCA indicated a higher net benefit for the SMDL based on all-phase (0.01-1.00).

Conclusion:

The CT-based DL model showed good potential to predict the two-year risk of MLM in patients with rectal cancer after surgery.

PO-3814

The Influence of Different Iterative Algorithms on Machine Deep Learning Detection of Long Diameter and 3D Volume Measurement of Pulmonary Nodules in Conventional and Low Dose CT Scanning

Min Zhang

陕西中医药大学附属医院

Objective: To compare the effects of different iterative algorithms based on machine deep learning on the measurement of lung nodule length, diameter, and three-dimensional volume in conventional dose and low-dose CT scans.

Method: A retrospective analysis was conducted on 26 patients with nodules detected during low-dose CT screening with a tube voltage of 120 kVp and a noise index of 28. Three different iterative algorithms, FBP, Asir40, and STAND, were used to reconstruct 0.625mm lung algorithm CT images. Two weeks later, routine dose CT scans with a tube voltage of 120 kVp and a noise index of 14 were performed, and FBP, Asir40, and STAND were used to reconstruct 0.625mm lung algorithm CT images. Apply machine deep learning analysis to obtain 10 sets of measurement values for the volume of each nodule in each image, and compare the absolute percentage error (APE) of lung nodule length, diameter, and volume measurements under five identical reconstruction algorithms under conventional dose and low dose scanning conditions, with diameter APE ($APE_d = 100 \times |D_m - D_{rs}| / D_{rs}$), volume APE ($APE_v = 100 \times |V_m - V_{rs}| / V_{rs}$), D_m and V_m represent the length, diameter, and volume of the nodules obtained under scanning conditions of 120 kVp and noise index NI of 28, while D_{rs} and V_{rs} represent the length, diameter, and volume of the nodules obtained under scanning conditions of 120 kVp and noise index NI of 14. Using one-way ANOVA and LSD-t-test to compare the APE of lung nodule volume measurement under conventional dose and low dose scanning conditions under three identical reconstruction algorithms.

Result: The APE_d and APE_v values between the conventional and low doses of FBP, Asir40, and STAND iterative algorithms were (0.15 ± 0.20) , (0.18 ± 0.12) , and (0.19 ± 0.20) , respectively. There was a statistically significant difference between the two, $P < 0.05$. And the STAND reconstruction algorithm has the smallest APE for measuring lung nodule volume under conventional dose and low dose scanning conditions. APE_d no difference, APE_v , FBP>Asir40>STAND.

Conclusion: Different iterative algorithms have an impact on the artificial intelligence measurement of lung nodule length, diameter, and three-dimensional volume in conventional dose and low dose CT scans. When the radiation dose is too low, the APE of FBP and NR40 iterative algorithms increases, while the APE of STAND iterative algorithm is smaller.

PO-3815

The Value of Deep Learning Model Based on Non-contrast Abbreviated MRI for Screening Small High-Risk Hepatic Nodules

Xinyi Liu¹, Enming Cui¹, Yaozong Gao², Xianjie Zhang², Changyin Yao¹, Shiman Gan¹, Yan Lei¹, Meiqi Wan¹, Changyi Ma¹, Jin Cui¹

1. Jiangmen Central Hospital

2. Shanghai Lianying Intelligent Medical Technology Co., Ltd.

Purpose: To assess the efficacy of a deep learning (DL) model utilizing non-enhanced abbreviated magnetic resonance imaging (MRI) images for the screening of LI-RADS category 4 and 5 small hepatic nodules. The objective is to facilitate a paradigm shift in hepatocellular carcinoma (HCC) surveillance for high-risk patients.

Methods and Materials: A retrospective analysis was conducted on a total of 100 LI-RADS category 4 and 5 small hepatic nodules, each measuring less than 2 cm in diameter, from 52 patients between January 2022 and March 2023. All patients were classified as high risk for HCC and underwent gadoliniummethoxybenzyl-diethylenetriamine pentaacetic acid-enhanced (Gd-EOB-DTPA) MRI. Out of these, 79 nodules were allocated to the training dataset for model training, while 21 nodules were assigned to the validation dataset for model testing. The DL model was developed based on three groups of optimized sequences: (1) Non-contrast abbreviated MRI (Nc-aMRI) group, comprising T1WI, T2WI, and diffuse weighted images (DWI) sequences; (2) EOB-MRI group, specifically hepatobiliary phase (HBP); (3) Dynamic enhanced MRI (Dyn-MRI) group, encompassing T1WI, T2WI, DWI, the late arterial phase, portal venous phase, and HBP. The DL model consisted of a multi-scale detection network (feature pyramid network) and the cascade network. The sensitivity of each sequence was evaluated through the free-response receiver operating characteristic curve (FROC) to determine the overall detection efficacy.

Results: (1) Among the three groups of optimized sequences, the DL model based on Dyn-MRI demonstrated the highest sensitivity. (2) In terms of individual sequences, the DL model based on T2WI exhibited the highest positive predictive value for nodule screening, with the exception of EOB. (3) The sensitivity of nodule detection using the DL model based on Nc-aMRI was 90.5%, which was comparable to that of the DL model based on EOB-MRI.

Conclusions: The performance of the DL model based on Nc-aMRI for screening small high-risk hepatic nodules is both acceptable and comparable to that of a DL model based on EOB-MRI. Furthermore, the DL model based on Nc-aMRI can significantly reduce scanning time and costs while eliminating the need for a contrast agent.

Clinical Relevance/Application: This study proposes a DL model based on non-contrast abbreviated MRI as an alternative surveillance method for patients at high risk for HCC. The Nc-aMRI DL-based model can provide sensitive screening while reducing patient burden and radiologist workload. **Consequently, the Nc-aMRI with DL technique holds promise as a feasible and reliable screening tool for HCC, potentially facilitating early-stage HCC detection and significantly improving patient prognosis.**

PO-3816

Deep learning model for the segmentation and evaluation of neoadjuvant chemotherapy response in patients with osteosarcoma on routine MRI

Ping Yin, Nan Hong

Department of Radiology, Peking University People's Hospital

Objective: To develop a two-stage deep learning (DL) model for the segmentation and evaluation of neoadjuvant chemotherapy (NACT) response in patients with osteosarcoma (OS) based on routine magnetic resonance imaging (MRI).

Materials and Methods: 112 patients with histologically proven OS treated with 3 cycles of NACT were retrospectively used for model building and internal test. Based on multi-sequence MRI (T2-w, CET1-w) and the physician's labeling, a two-stage model was constructed for the automatic segmentation and prediction of the NACT efficacy of patients with OS by using ResUnet and 3D-ResNet-18. The performance of different models was then assessed based on their area under the curve (AUC) and accuracy (ACC) values.

Results: A total of 112 patients were enrolled in this study, of which 51 had a good response and 61 had a poor response. No statistically significant differences were observed in the age, sex, alkaline phosphatase, tumor size, and tumor location of these two groups ($P > 0.05$). ResUNet model demonstrated a robust performance with an average Dice coefficient of 0.579 and average IoU of 0.463. The T2-w-based 3D-ResNet-18 classification model achieved a relatively better performance in the test set with an AUC of 0.902, 95% confidence interval of (0.766, 1), ACC of 0.783, sensitivity of 0.909, specificity of 0.667, and F1 value of 0.800.

Conclusion: The proposed two-stage DL model allowed for the accurate segmentation and evaluation of NACT response in patients with OS based on routine MRI and may thus facilitate diagnosis.

PO-3817

An Integrated Clinical Nomogram for the Identification of Local Recurrence of Prostate Cancer Patients with Biochemical Recurrence

Xiang Liu¹, Xiaoying Wang², Jun Shen¹

1. Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University

2. Peking University First Hospital

Rationale and objectives: Integrated diagnostic tools are currently employed for selecting appropriate and optimal therapies tailored for prostate cancer (PCa) patients. This study aimed to construct an integrated nomogram using multivariable logistic regression to detect local recurrence on pelvic DWI images of PCa patients with biochemical recurrence (BCR) after radiation therapy (RT).

Materials and methods: Four hundred PCa patients with BCR after RT from January 2022 to December 2022 were included as the initial cohort, which was used for radiomics model development. Another cohort of 140 patients between January 2022 and December 2022 was collected as held-out validation of the radiomics model. Prostate Imaging for Recurrence Reporting (PI-RR) assessment category was assigned to each patient by two radiologists. Univariate analysis and multivariable analysis on clinical variables (age, PSA, prostate volume, and Gleason score), PI-RR score, and output probabilities from the radiomics-based imaging predictor were trained to obtain the clinical nomogram.

Results: In the initial cohort, the clinical nomogram yielded the highest AUC of 0.97 (95% CI: 0.92-0.99), which was not significantly higher than the model combining clinical variables and PI-RR (Model 4, $P = 0.110$). Similarly, in the held-out cohort, the clinical nomogram achieved an AUC of 0.86 (95% CI: 0.79-0.91), which was equal to that of Model 4 ($P = 0.796$).

Conclusion: The constructed integrated nomogram using the PI-RR score and radiomics-based imaging predictor could be used to identify PCa patients with local recurrence after RT.

PO-3818

Automated Treatment Response Evaluation of Metastatic Lesions in Advanced Prostate Cancer Patients Using Deep Learning Based on the MET-RADS-P System

Xiang Liu¹, Xiaoying Wang², Jun Shen¹

1. Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University

2. Peking University First Hospital

Objective: To develop a deep learning-based algorithm for automated treatment response assessment of advanced prostate cancer (APC) patients based on Metastasis Reporting and Data System for Prostate Cancer (MET-RADS-P) guidelines.

Materials and methods: One hundred and seventy patients who had undergone at least two WB-MRI scans for follow-up assessment after APC metastasis treatment were enrolled. A previously established deep learning model was firstly used to perform automated segmentation of metastatic lesions, and subsequently, the treatment response was assessed automatically followed by image registration according to the MET-RADS-P criteria. The performance of the deep learning algorithm was evaluated using the Dice similarity coefficient (DSC) and volumetric similarity (VS). Kappa statistics were used to assess the consistency of the automatic treatment response assessment and two radiologists [attending radiologist (R1) and fellow radiologist (R2)].

Results: The metastatic lesion segmentation models established in the early stage achieved good performance here, and both the DSC and VS values for the segmentation of metastases were above 0.80 in the independent validation dataset. The accuracy of automatic efficacy evaluation for metastatic lymph nodes and bone metastases were 0.80 and 0.76, respectively, which is equivalent to R1 and slightly better than R2. The consistency of the automatic treatment response assessment and reference standard was excellent for metastatic lymph nodes (K value: 0.81 and 0.89) and nonpathological bone metastases (K value: 0.87 and 0.91).

Conclusion: The automatic treatment response evaluation of the whole-body metastases of APC patients based on the MET-RADS-P guidelines can be achieved using deep learning.

PO-3819

Development of Radiomics model based on Contrast-Enhanced CT with Clinical Characteristics to Predict Primary Post-acute Pancreatitis Diabetes Mellitus

Shuting Zhong, Xiaohua Huang

Affiliated Hospital of North Sichuan Medical College

Objective:

A contrast-enhanced CT (CECT)-based radiomic model was developed to predict post-acute pancreatitis diabetes mellitus (PPDM-A), which provides reference for clinicians to develop individualized treatment plans.

Methods:

December 2021 were retrospectively selected for study inclusion. This retrospective study enrolled 244 patients with acute pancreatitis (AP), including 104 patients with PPDM-A and 140 patients with Non-PPDM-A. Patients were randomized into training and validation cohorts at a 7:3 ratio. Two abdominal radiologists (with more than 5 years experience in diagnosing pancreatic diseases) used 3D Slicer (V4.10.2, <https://www.slicer.org>) software to manually draw the pancreatic parenchyma on the arterial and venous phase image sets of CT to avoid common bile duct and blood vessels, the original image is filtered by Laplace-Gaussian filtering and wavelet transform filtering, a total of 2446 features are extracted from region of interest (ROI), and then quantitative radiomics feature extraction was performed. The variance threshold method, The Select K Best method and the least absolute shrinkage and selection operator (LASSO) were applied to select radiomics features. Three models were developed for predicting PPDM-A: (1) radiomics model; (2) clinical model; (3) combined model. The area under the curve (AUC) was used to evaluate the predictive performance of the models for PPDM-A in the training group and the validation group. And the Delong test was used to compare the differences in AUCs between the models. Decision curve (DCA) analysis was used to evaluate the model performance in predicting PPDM-A.

Results:

A total of 2446 radiomics features were extracted from each patient. Through the evaluation of ICCs consistency among viewers, the features with $ICC > 0.75$, 743 stable features in arterial phase and 702 stable features in venous phase were retained. Then variance threshold method was employed to remove those features with a variance less than 0.8. A single variable selection approach was used to eliminate features that did not differ significantly between PPDM-A and non-PPDM-A patients ($P > 0.05$). Finally, LASSO feature screening is used to leave the most important features for predicting PPDM-A. After screening, 9 features were finally retained in arterial phase and venous phase.

In the three models, the average areas under the ROC curves of the radiomics model and the combined model were 0.802 (training group: $AUC=0.802$, 95% confidence interval (CI), 0.735-0.869; validation group: $AUC=0.736$, 95% CI, 0.620-0.853) and 0.920 (training group: $AUC=0.920$, 95% CI, 0.880-0.958; validation group: $AUC=0.835$, 95% CI, 0.742-0.928), respectively, and the clinical model 0.638 (training group: $AUC=0.638$, 95% CI, 0.555-0.722; validation group: $AUC=0.692$, 95% CI, 0.579-0.804). The radiomics model (0.802 vs 0.638, $P=0.005$) and the combined model (0.920 vs 0.638, $P < 0.001$) were superior performance than the clinical model ($AUC: 0.638$).

The predictive performance of the radiomics model in the training group was better than that of the clinical model, but it was not shown in the validation group. In addition, DCA shows that the combined model has superior net clinical benefit and wider threshold probability than radiomics model and clinical

Conclusion:

In short, based on the radiomics characteristics of contrast-enhanced CT, it can be used as a biomarker for predicting PPDM-A. In addition, RAP, severity, and blood glucose on admission may be critical clinical features for predicting PPDM-A. The combined model based on clinically independent risk factors and radiomics characteristics and radiomics model may be a quantitative analysis method for predicting PPDM-A and have significant clinical value.

PO-3820

Integration of dosimetric parameters, clinical factors, and radiomics to predict symptomatic radiation pneumonitis in lung cancer patients undergoing combined immunotherapy and radiotherapy

Zilong Yuan
Hubei Cancer Hospital

Purpose: This study aimed to combine clinical/dosimetric factors and handcrafted/deep learning radiomic features to establish a predictive model for symptomatic (grade ≥ 2) radiation pneumonitis (RP) in lung cancer patients who received immunotherapy followed by radiotherapy.

Materials and Methods: RP was defined per multidisciplinary clinician consensus using CTCAE v5.0. Regions of interest (ROIs) (from radiotherapy planning CT images) utilized herein were gross tumor volume (GTV), planning tumor volume (PTV), and PTV-GTV. Clinical/dosimetric (mean lung dose and V5-V30) parameters were collected, and 107 handcrafted radiomic (HCR) features were extracted from each ROI. Deep learning-based radiomic (DLR) features were also extracted based on pre-trained 3D residual network models. HCR models, Fusion HCR model, Fusion HCR + ResNet models, and Fusion HCR+ ResNet + Clinical models were built and compared using the receiver operating characteristic (ROC) curve with measurement of the area under the curve (AUC). Five-fold cross-validation was performed to avoid model overfitting.

Results: HCR models across various ROIs and the Fusion HCR model showed good predictive ability with AUCs from 0.740-0.808 and 0.740-0.802 in the training and testing cohorts, respectively. The addition of DLR features improved the effectiveness of HCR models (AUCs from 0.826-0.898 and 0.821-0.898 in the both respective cohorts). The best performing prediction model (HCR+ ResNet + Clinical) combined HCR & DLR features with 7 clinical/dosimetric characteristics achieved an average AUC of 0.936 and 0.946 in both respective cohorts.

Conclusions. In patients undergoing combined immunotherapy/RT for lung cancer, integrating clinical/dosimetric factors and handcrafted/deep learning radiomic features can offer a high predictive capacity for RP, and merits further prospective validation.

PO-3821

Building and Validating a Nomogram Utilizing Biparametric MRI PI-RADS v2.1 and Clinical Parameters to Reduce Unnecessary Prostate Biopsies

xinyi Zhang, xiangke Niu
Clinical Medical College & Affiliated Hospital of Chengdu University

Background: Biparametric MRI (bpMRI) is a faster, contrast-free, and less expensive MRI protocol that facilitates the detection of prostate cancer. The aim of this study is to determine whether a biparametric MRI PI-RADS v2.1 score-based model could reduce unnecessary biopsies in patients with suspected prostate cancer (PCa).

Methods: The patients who underwent MRI-guided biopsies and systematic biopsies between January 2020 and January 2022 were retrospectively analyzed. The development cohort used to derive the prediction model consisted of 275 patients. Two validation cohorts included 201 patients and 181 patients from 2 independent institutions. Predictive models based on the bpMRI PI-RADS v2.1 score (bpMRI score) and clinical parameters were used to detect clinically significant prostate cancer (csPCa) and compared by analyzing the area under the curve (AUC) and decision curves.

Spearman correlation analysis was utilized to determine the relationship between International Society of Uro-logical Pathology (ISUP) grade and clinical parameters/bpMRI score.

Results: Logistic regression models were constructed using data from the development cohort to generate nomograms. By applying the models to the all cohorts, the AUC for csPCa was significantly higher for the bpMRI PI-RADS v2.1 score-based model than for the clinical model in both cohorts ($p < 0.001$). Considering the test trade-offs, urologists would agree to perform 10 fewer bpMRIs to avoid one unnecessary biopsy, with a risk threshold of 10–20%

in practice. Correlation analysis showed a strong correlation between the bpMRI score and ISUP grade.

Conclusion A predictive model based on the bpMRI score and clinical parameters significantly improved csPCa risk stratification, and the bpMRI score can be used to determine the aggressiveness of PCa prior to biopsy.

PO-3822

Application of Deep Learning-Generated Virtual Material Decomposition Images for Distinguishing Intracranial Hemorrhage from Contrast Staining Within 24 Hours After Endovascular Thrombectomy

Tianyu Wang¹, Caiwen Jiang², Weili Ding³, Qing Chen³, Dinggang Shen^{2,4}, Zhongxiang Ding¹

1. Affiliated Hangzhou First People's Hospital, Zhejiang University School of Medicine

2. School of Biomedical Engineering, ShanghaiTech University, Shanghai, China.

3. Zhejiang Chinese Medical University, Hangzhou, China.

4. Shanghai United Imaging Intelligence Co., Ltd., Shanghai, China

BACKGROUND AND PURPOSE: Timely determination of whether intracranial hemorrhage (ICH) occurs after endovascular thrombectomy (EVT) is crucial. However, distinguishing between contrast staining (CS) and ICH using single-energy CT (SECT) is challenging. We aimed to develop a transformer-based generative adversarial network (trans-GAN) that can generate dual-energy CT-based material decomposition images from SECT for real-time detection of ICH.

MATERIALS AND METHODS: We retrospectively collected data from two hospitals consisting of 237 dual-energy CT (DECT) scans. Each scan included matched iodine overlay map, virtual non-contrast, and simulated SECT images. These scans were randomly divided into a training set ($n = 190$) and an internal validation set ($n = 47$) in a 4:1 ratio based on the proportion of ICH. Additionally, we included 26 SECT scans as an external validation set. We compared our trans-GAN with state-of-the-art generation methods using several physical metrics of the generated images and evaluated the diagnostic efficacy of the generated images for differentiating ICH from CS.

RESULTS: Compared with other generation methods, the images generated by trans-GAN exhibited superior quantitative performance. Meanwhile, in terms of ICH detection, the use of generated images from both the internal and external validation sets resulted in a higher area under the receiver-operating characteristic curve (0.88 versus 0.68 and 0.69 versus 0.54, respectively) and kappa values (0.83 versus 0.56 and 0.51 versus 0.31, respectively) compared to input SECT images.

CONCLUSIONS: Trans-GAN can be used to accurately detect ICH based on SECT within 24 hours after EVT in AIS patients in hospitals without DECT facilities.

Deep Learning-Based Clinical-Radiomics Nomogram for Preoperative Prediction of Lymph Node Metastasis in Patients with Rectal Cancer: A Two-center Study

Shiyu Ma¹, Haidi Lu¹, Guodong Jing¹, Zhihui Li², Qianwen Zhang¹, Xiaolu Ma¹, Fangying Chen¹, Chenwei Shao¹, Yong Lu², Hao Wang³, Fu Shen¹

1. Department of Radiology, Changhai Hospital, The Navy Medical University, Shanghai, China

2. Department of Radiology, Ruijin Hospital, Shanghai Jiaotong University School of Medicine, Shanghai, China

3. Department of Colorectal Surgery, Changhai Hospital, The Navy Medical University, Shanghai, China

Background: Precise preoperative evaluation of lymph node metastasis (LNM) is crucial for ensuring effective treatment for rectal cancer (RC). This research aims to develop a clinical-radiomics nomogram based on deep learning techniques, preoperative magnetic resonance imaging (MRI) and clinical characteristics, enabling the accurate prediction of LNM in RC.

Materials and Methods: Between January 2017 and May 2023, a total of 519 rectal cancer cases confirmed by pathological examination were retrospectively recruited from two tertiary hospitals. A total of 253 consecutive individuals were selected from Center I to create an automated MRI segmentation technique utilizing deep learning algorithms. The performance of the model was evaluated using the dice similarity coefficient (DSC), the 95th percentile Hausdorff distance (HD95), and the average surface distance (ASD). Subsequently, two external validation cohorts were established: one comprising 178 patients from center I (EVC1) and another consisting of 88 patients from center II (EVC2). The automatic segmentation provided radiomics features, which were then used to create a Radscore. A predictive nomogram integrating the Radscore and clinical parameters was constructed using multivariate logistic regression. Receiver operating characteristic (ROC) curve analysis and decision curve analysis (DCA) were employed to evaluate the discrimination capabilities of the Radscore, nomogram, and subjective evaluation model, respectively.

Results: The DSC, HD95 and ASD were 0.857, 2.186 mm, and 0.562 mm, respectively. The nomogram, which incorporates MR T-stage, CEA, CA19-9, and Radscore, exhibited a higher area under the ROC curve (AUC) compared to the Radscore and subjective evaluation in the training set (0.921 vs. 0.903 vs. 0.662). Similarly, in both external validation sets, the nomogram demonstrated a higher AUC than the Radscore and subjective evaluation (0.908 vs. 0.735 vs. 0.640, and 0.884 vs. 0.802 vs. 0.734).

Conclusion: The application of the deep learning method enables efficient automatic segmentation. The clinical-radiomics nomogram, utilizing preoperative MRI and automatic segmentation, proves to be an accurate method for assessing LNM in RC. This approach has the potential to enhance clinical decision-making and improve patient care.

PO-3824

Application Value of MR Radiomics in Grading of Cerebral of Gliomas

Wei Wei, Lihua Fan, Nan Yu, Yongjun Jia, Yong Yu

Affiliated Hospital of Shaanxi University of Chinese Medicine

Objective: To evaluate the value of radiomics in distinguishing grade II and III of gliomas from T2-weighted MR images.

Methods: In this study, 159 gliomas patients, who underwent non-enhanced MR from the Cancer Genome Atlas (TCGA) data portal, including grade II (n=104) and III (n=55) of gliomas. Patients were divided into training cohorts (n=111) and validation cohorts (n=48) in a ratio of 7:3. Gliomas

were imported into the ITK-SNAP to manually delineate volume of interest (VOI) on T2-weighted images. Each VOI produced 396 radiomics features including Histogram, GLCM, GLSZM, RLM, Form Factor, Haralick. LASSO regression was used for feature screening. A formula was generated using a linear combination of selected features that were weighted by their respective LASSO coefficient. A radiomics score was calculated for each patient by the formula. The predictive accuracy of radiomics signatures was quantified by the area under curve (AUC) of a ROC curve in both cohorts. The calibration degree (CD) of the radiomics was evaluated by Hosmer-Lemeshow test. The clinical usefulness of the radiomics signatures was assessed by decision curve analysis. Result: Four radiomics features with non-zero coefficients were chosen to build a radiomics model that distinguished grade II and III of gliomas with an AUC, sensitivity, specificity and CD of 0.723, 75%, 89% and 0.120 in training cohort; and 0.800, 73%, 82% and 0.561 in the validation cohort, respectively. DCA for the radiomics label showed that if the threshold probability was between 0.17 and 0.99, using radiomics label to distinguish grade II and III of gliomas added more benefit than treating either all or no patients.

Conclusion: The radiomics label can distinguish grade II and III of gliomas, providing a non-invasive technique for assessing the invasiveness and prognosis for gliomas patients.

PO-3825

Integrating intratumoral and peritumoral CT-based radiomics to predict visceral pleural invasion and prognosis in clinical stage IA non-small cell lung cancer: a two-center study

qiaoling Chen¹,qi Tian²,hui Zhou²,fu Shen¹,hongmei Gu³,feng Feng²

1. Changhai Hospital

2. Affiliated Tumor Hospital of Nantong University

3. Affiliated Hospital of Nantong University

Objectives: To investigate the value of intratumoral and peritumoral CT-based radiomics in predicting visceral pleural invasion (VPI) and prognosis in clinical stage IA non-small cell lung cancer (NSCLC).

Methods: A total of 325 (training dataset, 158; internal validation dataset, 66; external validation dataset, 101) clinical stage IA NSCLC patients from two hospitals were retrospectively included. Radiomics features were extracted from the gross tumor volume (GTV), gross and peritumoral 3 mm tumor volume (GPTV₃), and gross and peritumoral 9 mm tumor volume (GPTV₉). Optimal radiomics features from three regions of interest were selected to construct GTV, GPTV₃ and GPTV₉ radiomics models, respectively. Multivariate logistic regression analysis was used to determine the independent clinical predictors of VPI and to construct the clinical model. A nomogram was constructed by combining independent clinical predictors with the optimal radiomics features. The area under the curve (AUC) of receiver operating characteristic curve was used to evaluate the diagnostic efficacy of each model.

Results: GPTV₉ radiomics had better predictive performance (AUC: 0.838, 0.810, 0.746 in the training dataset and internal and external validation datasets, respectively) than GTV radiomics (AUC: 0.761, 0.742, 0.642) and GPTV₃ radiomics (AUC: 0.801, 0.756, 0.696). The nomogram (AUC: 0.842, 0.786, 0.758), which consisted of GPTV₉ radiomics, maximum tumor diameter, and pleural indentation, showed a discrimination capability similar to that of GPTV₉ radiomics ($p > 0.05$). High-risk VPI identified by GPTV₉ radiomics or pathological VPI were independently associated with poor overall survival in clinical stage IA NSCLC.

Conclusions: CT radiomics based on intratumoral and peritumoral 9 mm radiomics features could predict VPI and prognosis in clinical stage IA NSCLC.

PO-3826

MRI-based Radiomics for the Differentiation of Stage T1 Rectal Cancers from Rectal Adenomas

Xiaolu Ma, Fu Shen, Chengwei Shao
Radiology Department, Changhai Hospital, Shanghai, China

Objective

Accurate differentiation of stage T1 rectal tumors from rectal adenomas facilitates the selection of appropriate clinical treatment. The purpose of this study was to investigate the clinical application of radiomics based on high resolution magnetic resonance T2WI image in the differentiation of early T-stage rectal cancers from rectal adenomas.

Methods

We retrospectively analyzed the patients with pT1 rectal cancers and rectal adenomas who underwent pretreatment MRI and rectal tumor resection between January 2018 and November 2020. The radiomics features were extracted from the high-resolution T2WI, then selected by LASSO algorithm to best predict the pathological results, and the extreme gradient boosting (XGBoost) model was built. As leave-one-out cross validation (LOOCV) was used in the research, the receiver operating characteristic (ROC) curve was obtained.

Results

Of the 64 patients, 14 (21.87%) with rectal adenomas. 1409 features were extracted, and 7 optimal features were selected with LASSO algorithm. For the XGBoost model, the area under the ROC curve (AUC) was 0.813 (95%CI: 0.696, 0.899), sensitivity 78.57%, specificity 90.00%.

Conclusion

The radiomics based on high-resolution T2WI can serve as independent imaging biomarker to differentiate stage T1 rectal tumors from rectal adenomas.

PO-3827

Efficacy of Preoperative MRI-based Deep Learning Model in Diagnosis of Lateral Lymph Node Metastases in Patients with Rectal Cancer

Fu Shen, Xiaolu Ma, Chengwei Shao
Changhai Hospital affiliated to Naval Military Medical University

Background: The presence of lateral pelvic lymph node (LLN) metastasis is an essential prognostic factor in rectal cancer patients. Thus, preoperative diagnosis of LLN metastasis is clinically important to determine the therapeutic strategy. The aim of this study was to evaluate the efficacy of preoperative MRI-based deep learning (DL) model in the diagnosis of LLN metastasis.

Methods: Between January 2017 and May 2023, a total of 253 consecutive individuals were retrospectively obtained. The data were divided into training and validation sets in a 7:3 ratio. An additional 52 patients from a different hospital were considered testing set. T2WI-sequence DL-model were developed using the 3D nn-UNet architecture in tumoral + lateral pelvic regions. Furthermore, the radiomics features were then used to create a Radscore. Receiver operating characteristic (ROC) curve analysis were employed to evaluate the discrimination capabilities of the Radscore and DL-model, respectively.

Results: The DL-model demonstrated significantly superior classification performance to the Radscore in predicting LLN metastasis for all datasets (all $P < 0.05$). T2WI-sequence DL-model showcased an area under the curve (AUC) of 0.863 and an accuracy of 0.875 in the test dataset.

Conclusion: The conventional MRI-based DL model proves to be an accurate method for assessing LLN metastasis in RC. This approach has the potential to enhance clinical decision-making and improve patient care.

PO-3828

Change and evaluation of hippocampal volume and subregion volume before and after refractory seizure control based on artificial intelligence analysis

Yifan Chang, YunLing Wang, Hanjiaerbieke KUKUN, Rui Xu, Wenxiao Jia
The First Affiliated Hospital of Xinjiang Medical University

Objective To analyze the differences in hippocampal volume and its subregion volume and imaging histology data between epileptic patients and normal controls by artificial intelligence and to predict the morphological changes of the hippocampus after epilepsy control in patients. **Methods** A comprehensive collection of 60 patients with refractory epilepsy who were eligible for the study in our hospital were included in the patient group (RE group), and 60 healthy people at the time of physical examination in our hospital were screened to be included in the control group (HC group), and the RE group was further followed up and evaluated after they received reasonable drug treatment. Thirty eligible patients with refractory epilepsy were included and followed up in the RE group, which was briefly divided into 2 groups based on subsequent seizure control: epileptic patients with no seizures or improved seizures (Group A), and patients with no improvement or progression of seizures during seizures (Group B). All subjects were scanned by a 3.0 TMRI scanner (SINNA Architect, GE, USA) for isotropic T1WI-3D-MPRAGE sequences, and based on the MPRAGE raw images image post-processing and extraction of hippocampal volumes and their subregions was carried out using Artificial Intelligence Segmentation software (FreeSurfer v7.11 was used for this study). volume data. Finally, the diagnostic value of the above data and indicators for refractory epilepsy was evaluated based on the clinical guidelines, and the changes in hippocampal volume and its subregion volume were measured after epilepsy control. **Results** The left hippocampal volume of the patient group (RE group) was significantly smaller than the right hippocampal volume of the same group and the bilateral hippocampal volume of the control group (HC group) (both $P < 0.05$), with the dentate gyrus, CA1 area, CA3 area and the hippocampal umbrella being the most prominent ones; through the follow-up and evaluation of the changes in hippocampal volume and its subregions after two MRI scans before and after the epilepsy control of the patients enrolled in the group, the degree of bilateral hippocampal volume reduction of group A and group B was There was no significant correlation, but there was a significant difference in the degree of hippocampal subregion atrophy between Groups A and B. **Conclusion** The T1WI-3D-MPRAGE sequence, as a non-conventional sequence, can finely display the structural image of brain tissue, and then analyze the hippocampal volume and its subregions by artificial intelligence image segmentation, which is valuable for the diagnosis of refractory epilepsy. After follow-up evaluation, there was no correlation between total hippocampal volume and epilepsy control (Group A and Group B), but there was a significant difference in the volume change of hippocampal subregions (the degree of volume reduction in the dentate gyrus and CA1 region in Group B was significantly higher than that in Group A, $P < 0.05$); therefore, there is a diagnostic value of the structural change of hippocampal subregions in the prognosis of epilepsy patients.

PO-3829

Multiparametric MRI-Based Radiomics Model to Predict Tumor-Stroma Ratio in Prostate Cancer.

Jiangqin Ma

The Second Affiliated Hospital of Chongqing Medical University

Objective: To develop a multiparametric magnetic resonance imaging (mp-MRI) radiomic feature-based machine learning models to predict the tumor-stroma ratio (TSR) of prostate cancer (PCa). Then constructing a nomogram that combines clinical and mp-MRI parameters to assess the aggressiveness of PCa, thus avoiding overtreatment of indolent PCa and undertreatment of aggressive PCa.

Methods: In this retrospective study, a total of 121 PCa patients confirmed through biopsy were recruited, including 71 low TSR (L-TSR) and 50 high TSR (H-TSR) patients. Regions of interest (ROIs) for PCa were delineated on T2-weighted (T2WI), diffusion-weighted imaging (DWI), and apparent diffusion coefficient (ADC) maps. Patients were divided into training and testing sets in a 7:3 ratio. Five radiomic models were constructed using the Least Absolute Shrinkage and Selection Operator (LASSO) algorithm for feature selection, and then nomograms were created by combining radiomic features and clinical risk factors. Model performances were assessed using Receiver Operating Characteristic (ROC) curves, Decision Curve Analysis (DCA), and DeLong's test.

Results: Compared to other models, the Support Vector Machine (SVC) Model demonstrated superior performance in distinguishing between L-TSR and H-TSR. In the validation and training cohorts, its area under the ROC curve (AUC) was 0.834 [95% confidence interval (CI), 0.791, 0.873] and 0.944 [95% CI, 0.918, 0.968], respectively. The model exhibited a classification accuracy of 0.89 [95% CI, 0.862, 0.928], sensitivity of 0.89 [95% CI, 0.854, 0.933], and specificity of 0.90 [95% CI, 0.856, 0.942]. Decision Curve Analysis indicated that this radiomic model possesses strong clinical utility.

Conclusions: The mp-MRI-based radiomics model is capable of accurately predicting the TSR of PCa and may serve as an effective tool for assisting in risk stratification and guiding treatment decisions.

PO-3830

Deep Learning Models for Preoperative T-Stage Assessment in Rectal Cancer Using MRI: Exploring the Impact of Rectal Filling

Yuan Yuan, Fu Shen, Chengwei Shao
Shanghai Changhai Hospital

Background: The objective of this study was twofold: firstly, to develop a convolutional neural network (CNN) for automatic segmentation of rectal cancer (RC) lesions, and secondly, to construct classification models to differentiate between different T-stages of RC. Additionally, it was attempted to investigate the potential benefits of rectal filling in improving the performance of deep learning (DL) models.

Methods: A retrospective study was conducted, including 317 consecutive patients with RC who underwent MRI scans. The datasets were randomly divided into a training set (n=265) and a test set (n=52). Initially, an automatic segmentation model based on T2-weighted imaging (T2WI) was constructed using nn-UNet. The performance of the model was evaluated using the dice similarity coefficient (DSC), the 95th percentile Hausdorff distance (HD95), and the average surface distance (ASD). Subsequently, three types of DL-models were constructed: Model 1 trained on the total

training dataset, Model 2 trained on the rectal-filling dataset, and Model 3 trained on the non-filling dataset. The diagnostic values were evaluated and compared using receiver operating characteristic (ROC) curve analysis, confusion matrix, net reclassification index (NRI), and decision curve analysis (DCA).

Results: The automatic segmentation showed excellent performance. The rectal-filling dataset exhibited superior results in terms of DSC and ASD ($P=0.006$ and 0.017). The DL-models demonstrated significantly superior classification performance to the subjective evaluation in predicting T-stages for all test datasets (all $P<0.05$). Among the models, Model 1 showcased the highest overall performance, with an area under the curve (AUC) of 0.958 and an accuracy of 0.962 in the filling test dataset.

Conclusions: This study highlighted the utility of DL-based automatic segmentation and classification models for preoperative T-stage assessment of RC on T2WI, particularly in the rectal-filling dataset. Compared with subjective evaluation, the models exhibited superior performance, suggesting their noticeable potential for enhancing clinical diagnosis and treatment practices.

PO-3831

Is Double-Low CTA of Renal Artery with Deep Learning Image Reconstruction Algorithm Better than Traditional CTA with Iterative Reconstruction Algorithm?

Xiaobo Ding
the first hospital of jilin university

Objective: To assess whether the deep learning image reconstruction(DLIR) can assist in double-low CT angiography(DLCTA) scans of renal artery to reach the comparable image quality of traditional CTA.

Materials and Methods: Forty-two patients suspicious of renal arterial lesion were scanned with bolus tracking technique, five in DLCTA group(80 kV, noise index of 24, automatic current modulation(200-600mA), DLIR algorithm and 40 ml contrast agent with injection rate of 4 ml/s) and thirty-seven in traditional CTA group(120 kV, automatic current modulation(average 113 mAs), level 3 of iDose4, 70 ml contrast agent with the same injection rate).CT values and standard deviations(SD) of abdominal aorta, subcutaneous adipose tissue(SAT), proximal and distal segments of bilateral renal artery at the level of renal hilus, upper and lower segmental renal arteries of left and right kidneys were measured to calculate signal noise ratio(SNR, $SNR=CT \text{ value}/SD$). SD of SAT was defined as background noise. CTDI and Dose length product(DLP) was recorded. Images were reviewed by two radiologists using a 4-point scale(1.poor;2.moderate;3.good;4.excellent). Student's t-test and Mann Whitney U test were used to analyze the differences between 2 groups.

Results: The CTDI and DLP of DLCTA group were significantly lower, compared to traditional group(2.15 vs. 16.9 mGy, 81.24 vs. 753.93mGy·cm, $p<0.001$ for both). SD of SAT had no difference between two groups(10.83 vs. 10.47, $p=0.935$). The SNRs of proximal segments of bilateral renal artery, upper and lower segmental renal arteries of left and right kidneys in DLCTA were significantly higher than those of traditional CTA($p<0.05$ each). No difference in subjective assessment was observed between two groups(3.70 vs. 3.78, $p>0.05$).

Conclusion:Double-low CTA of renal artery with DLIR provides better image quality and patient care.

Clinical Relevance: The advantages are faster scan speed, realized joint scanning and better image quality for the deep learning algorithm of low dose renal artery CTA of Ge wide body CT, comparing with that of conventional Philips renal artery CTA, which can improve doctors' rate of diagnosis, reduce the radiation dose and contrast agent dosage of patients, and reduce the burden of liver and kidney of patients.

PO-3832

The superiority of Low-kV Renal Triphasic-enhanced CT with Deep Learning Image Reconstruction in Patient Care over Conventional enhanced CT exam

Xiaobo Ding
the first hospital of jilin university

Objective: To evaluate whether the deep learning image reconstruction(DLIR) can provide more patient care through the reduction of radiation dose and contrast agent volume for renal enhanced CT exam.

Materials and Methods: Fifty-four patients suspicious of renal lesion were included, twenty-four in DLIR group and thirty in conventional enhanced CT(CECT) group. The parameters for DLIR group: rotation speed of 0.5 s, collimation of 128×0.625 mm, pitch of 0.992:1, 50% ASIR-V, noise index(NI) of 9, automatic current modulation, standard kernel, 100 kV and mA range of 100-550 in arterial phase(AP and excretion phase(EP) and 120 kV and mA range of 150-500 in parenchymal phase(PP); retrospective algorithm of DLIR . The volume and injection rate of contrast agent(320 mgI/ml) were 0.9 ml/kg and 3 ml/s. In CECT group:120 kV, 281 mAs, collimation of 128×0.625 mm, pitch of 0.914:1, level 3 of iDose4, standard(B) filter for all phases. The volume and injection rate of contrast agent(320 mgI/ml) were 1.2 ml/kg and 2.7 ml/s. CT values and standard deviations(SD) of cortex, medulla, subcutaneous adipose tissue(SAT) on AP, parenchyma, pelvis and psoas muscle(PM) and SAT on PP, middle calyx(MC), upper ureter and middle ureter on EP were measured to calculate signal noise ratio(SNR) and contrast noise ratio(CNR). SD of SAT was defined as background noise. Images were assessed by two readers using a 4-point scale(1.poor;2.moderate;3.good;4.excellent). CTDI and Dose length product(DLP) was recorded. Student's t-test and Mann Whitney U test were used to analyze the differences between 2 groups.

Results: There was no difference in BMI between two groups(24.7 vs. 23.4, $p>0.05$). CTDI, DLP and contrast agent volume of DLIR group were significantly lower than those of CECT group(23.7 vs. 70.8 mGy, $p<0.001$; 744.1 vs. 2197.4 mGy·cm, $p<0.001$; 63 vs. 77.8 ml, $p<0.001$). SNR of parenchyma and upper ureter and CNR of cortex to medulla in DLIR group were significantly higher than those in CECT group(10.83 vs. 7.52; 19.45 vs. 7.12; 11.83 vs. 6.59; $p<0.001$ each). SD of SAT was lower in DLIR group, compared to CECT(9.08 vs. 11.11, $p<0.001$). No differences in subjective scores were observed between two groups.

Conclusion:Low-kV enhanced CT exam combined with DLIR algorithm is a feasible method for better patient care, compared to conventional enhanced CT exam.

Clinical Relevance: The scan speed is faster and image quality is better for the deep learning algorithm of low-dose renal three-phase scan of Ge revolution 256 row wide body CT than that of conventional renal three-phase scan of Philips 256 row CT, which could significantly reduce the radiation dose and contrast agent dosage of patients, and reduce the burden of liver and kidney of patients.

PO-3833

Establishment and validation of machine learning models predicting the rapid progression of interstitial lung disease in patients with idiopathic inflammatory myopathy based on quantitative HRCT, a single-center, prospective, cohort study

Yuhui Qiang^{1,2}, Hongyi Wang^{1,3}, Min Liu¹, Huaping Dai¹, Chen Wang^{1,3}

1. China-Japan Friendship Hospital

2. Capital Medical University

3. Chinese Academy of Medical Sciences & Peking Union Medical College

Background:

This study aims to establish and validate machine learning models to predict rapidly progressive interstitial lung disease (RP-ILD) in patients with idiopathic inflammatory myopathy-related interstitial lung disease (IIM-ILD) based on quantitative high-resolution CT (HRCT) and clinical features.

Material and Methods:

We collected clinical information and HRCT images from a total of 514 patients with IIM-ILD, out of which 249 cases were identified as RP-ILD. To quantify the HRCT features, deep learning methods were employed along with demographic factors, pulmonary function test results, and blood gas analysis results. These factors were integrated into a final prediction model that was fitted using a logistic regression approach.

Results:

Logistic regression was chosen as the final model due to its superior AUC and explainability. The validation dataset yielded an AUC of 0.882, which outperformed both the HRCT-only model and the clinically-only model. In calibration and clinical decision curve analysis, the final model demonstrated minimal prediction bias and provided greater net benefit compared to the HRCT-only or clinical models across most thresholds. The nomogram encompassed the incorporation of the following variables: subtype, gender, FEV1%, DLCO%, OI, and quantitative HRCT features of ground glass and consolidation.

Conclusion:

When utilizing machine learning techniques, the baseline quantitative HRCT has the potential to predict RP-ILD in patients with IIM-ILD. The performance of this prediction can be further improved by incorporating clinical information alongside the HRCT features. By combining the two sources of data, a more accurate and comprehensive prediction model can be developed.

Key message:

Logistic regression is the recommended model with the highest performance and explainability.

Five clinical factors and four quantitative features are involved in the final prediction model for RP-ILD in patients with IIM.

The combined clinical and quantitative HRCT features are superior to the only clinical model or only quantitative feature model.

PO-3834

Deep-Learning based quantitative high resolution computed tomography in prediction of rapid progression of idiopathic inflammatory myopathies-related interstitial lung disease

Hongyi Wang^{1,2}, Yuhui Qiang¹, Min Liu¹, Huaping Dai¹, Chen Wang^{1,3}

1. China-Japan Friendship Hospital

2. Capital Medical University

3. Chinese Academy of Medical Sciences & Peking Union Medical College

Background:

This study aims to utilize deep learning-based quantitative scores derived from high-resolution CT (HRCT) scans to predict the rapid progression of interstitial lung disease (ILD) in patients with Anti-synthase syndrome (ASS) and anti-MDA5-positive dermatomyositis (MDA-5).

Material and Methods:

A cohort of 514 inpatients diagnosed with ILD related to ASS or MDA-5 (367 females, median age 54 years) between January 2016 and December 2021 were included. These patients underwent at least one HRCT and had available information on their rapid progressive interstitial lung disease (RP-ILD) status. GGO and consolidation on HRCT were automatically segmented and quantified using a deep-learning algorithm. Logistic regression analysis and Spearman's correlation were employed to assess the association between these quantitative scores and the RP-ILD status of patients with ASS or MDA-5.

Results:

Among 514 IIM-ILD patients, 249 patients suffered from an RP-ILD (165 females, median age 55 years). After adjusting for age and sex, it was found that out of the 112 assessed features of ground glass opacities (GGO) and consolidation on the baseline HRCT, 83 features showed an association with RP-ILD. Furthermore, quantitative GGO and consolidation were found to have negative correlations with pulmonary function tests and blood gas variables, specifically vital capacity and carbon monoxide diffusing capacity. Additionally, a potential dose-response relationship was identified between the percentage of consolidation in both lungs and RP-ILD, with approximately 3.0% being identified as the potential threshold for change.

Conclusion:

DL-based quantitative HRCT of GGO and consolidation is associated with RP-ILD in patients with MDA5 or ASS. Furthermore, a negative correlation between quantitative HRCT of GGO and consolidation and pulmonary function was confirmed.

PO-3835

Deep-learning based detection model of small pancreatic cystic lesions on contrast-enhanced CT

Feiyang Xie¹, Wenyi Deng¹, Li Mao², Xiuli Li², Zhengyu Jin¹, Huadan Xue¹

1. Peking Union Medical College Hospital

2. Deepwise Healthcare

With the rapid progression of radiological technology, the detection rate of pancreatic cystic lesions (PCLs) has been increasingly augmented, and particularly the small cysts (<1cm) are being observed more frequently during examinations. Though in clinical practice, small cysts are prone to being overlooked, which poses a significant challenge for radiologists. Consequently, we have proposed an artificial intelligence model specifically capable of automatically detecting cysts and segmenting both the pancreas and the cysts. The model incorporates dual-phase imaging

information and includes a comprehensive dataset consisting of pancreatic images with diverse characteristics, demonstrating proficient and robust performance in both detection and segmentation.

Purpose

Multiple sclerosis (MS) is a chronic inflammatory neurodegenerative disease characterized by demyelinating lesions and diffuse microstructural damage in normal-appearing white matter (NAWM) and gray matter (GM). A comprehensive understanding of MS pathological heterogeneity is important for the development of stratified medicine approaches and individually tailored management. Several studies have attempted to interpret MS pathological heterogeneity by categorizing patients into subtypes with different levels of cognitive decline, clinical disability, and disease progression using pre-engineered features. However, a priori defined features may omit relevant voxel-level information needed for spatial correlation patterns to explain individual-level clinical features. Deep learning can utilize individual whole-brain voxel-level features without a priori assumptions, and has been successfully used in differential diagnosis tasks (e.g., MS versus mimics). Based on these studies, we hypothesized that the potential contribution of each voxel to the pathology of MS derived from the diagnostic model may provide information on disease-associated abnormalities at the individual level that could help interpret differences in levels of cognitive and physical disability.

Methods

Four datasets were used in this study. The development of the deep learning algorithm for SAM definition was based on a multicenter retrospective cohort (Dataset 1) with 189 MS patients and 316 HCs. An additional 50 HCs from Dataset 2 (a single-center MS retrospective cohort) were also used as the reference in the deep learning algorithm development phase. The developed algorithm was then applied to 92 MS patients from Dataset 2 at our local institute. Internal and external validations of the findings were performed using a prospectively designed cohort (Dataset 3), consisting of 33 MS patients at our local institute, and a dataset (Dataset 4 with 56 MS patients) from an independent center. Clinical baseline data, including age, sex, years of education, disease duration, number of relapses, EDSS score and medication information, were recorded. Clinical follow-up, including EDSS scores and assessments of conversion to secondary progressive MS (SPMS), was performed in a subgroup of patients. Cognitive tests included the Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MoCA), California Verbal Learning Test, Third Edition (CVLT-III), Brief Visuospatial Memory Test-Revised (BVM-T-R) and Paced Auditory

Serial Addition Test (PASAT). MR imaging, including 3D T1W and 2D or 3D FLAIR imaging, was performed.

We used isotropic 3D T1W images to train a 3D nnU-net model for the task of distinguishing MS (from Dataset 1) from HCs (from Datasets 1 and 2). The strategy in our model involved labeling MS as 1 and HCs as 0 at the voxel level instead of at the individual level in the training set (80% of the cases: 151 MS patients and 293 HCs). This approach allowed us to predict the voxel-wise probability of MS on T1-weighted images. The diagnostic model was tested in the remaining cases (38 MS patients and 73 HCs; accuracy, 97%; area under the curve, 0.99). In this study, we focused on voxel-wise predicted probability and defined it as MS-related SAM. Using this model, we obtained the SAMs of all the patients in the other three datasets. We applied spectral clustering to Dataset 1 ($n = 189$) to identify distinct SAM clusters using a custom script in MATLAB. We defined MS subtypes with distinct predominant SAM patterns according to the maximum regression coefficient, which reflects the largest contribution of the corresponding SAM pattern to the individual binarized SAM. Virtual histology, which is an approach that correlates, in standard space, an MRI-derived profile, such as an interregional SAM profile (that is the SAM values across brain regions), with interregional profiles of cell-specific gene expression (i.e., gene expression across brain regions) was conducted.

Statistical analyses were conducted using R software. Differences among MS subtypes were assessed using the Kruskal–Wallis test, followed by post-hoc comparisons with FDR correction (two-sided $P < 0.05$), for structural metrics (e.g., WMH volume, brain tissue volumes) and clinical variables (e.g., age, sex, disease duration, number of relapses, cognitive scores, and EDSS) after adjusting for age and sex. The TIV was additionally adjusted for brain tissue volume.

Kaplan–Meier analysis was conducted to investigate disease progression (EDSS progression and SPMS conversion) in the SAM subtypes. The log-rank test was used for between-group comparisons. Statistical significance was defined as an uncorrected two-sided $P < 0.05$, and additional FDR-corrected P -values were also acquired.

We performed a series of sensitivity and validation analyses to interpret the main findings of this study.

Results

Using the deep learning-derived individual SAMs, we identified six distinct SAM clusters: (1) a Frontal-I pattern (predominant in 54/281 patients, 19.2%) that mainly involved the medial and anterior surfaces of the frontal lobe; (2) a Frontal-II pattern (predominant in 41/281 patients, 14.6%) that mainly involved the deep frontal lobe; (3) a Temporal-Cerebellar pattern (predominant in 38/281 patients, 13.5%) that mainly involved the temporal lobe and parts of the cerebellum; (4) an Occipital pattern (predominant in 91/281 patients, 32.4%) that mainly involved the occipital lobe; (5) a Subcortical pattern (predominant in 55/281 patients, 19.6%) that mainly involved the subcortical GM (e.g., thalamus and deep white matter); and (6) a Diffuse Cortical pattern (predominant in 2/281, 0.7%) that mainly involved the outer surface of brain cortical areas. We assigned subjects to clusters based on the predominant SAM patterns. Because only two patients with MS were categorized into the Diffuse Cortical subtype, this subtype was excluded from further analysis.

No differences in sex distribution were observed among the subtypes. The patients in the Temporal-Cerebellar subtype were older than those in the Subcortical subtype ($pFDR = 0.035$). The Occipital subtype showed a larger number of relapses than the Frontal-I ($pFDR = 0.0032$), Frontal-II ($pFDR = 0.021$) and Subcortical ($pFDR = 0.0032$) subtypes. Compared with HCs, all subtypes showed lower MMSE scores, of which the Frontal-II ($pFDR = 0.016$) and Occipital ($pFDR = 0.023$) subtypes showed lower MMSE scores compared with the Frontal-I subtype. Compared with HCs, the Temporal-Cerebellar subtype showed lower CVLT and BVRT scores, which were also lower than in the Frontal-I ($pFDR = 0.00039$ and 0.000022), Occipital ($pFDR = 0.0076$ and 0.0013) and Subcortical ($pFDR = 0.00024$ and 0.0058) subtypes. Compared with HCs, all subtypes showed low PASAT scores, but no significant difference was observed among the subtypes. The Temporal-Cerebellar subtype showed a higher baseline EDSS score than the Frontal-I ($pFDR = 0.024$) and Subcortical ($pFDR = 0.022$) subtypes. The Occipital subtype (median progression time: 63 months) displayed a higher risk of EDSS score progression than the Frontal-I subtype (median progression time unavailable, uncorrected $P = 0.022$, $pFDR = 0.073$). The Frontal-II (median

progression time: 61 months, uncorrected $P = 0.036$, $pFDR = 0.090$), Occipital (uncorrected $P = 0.006$, $pFDR = 0.060$) and Subcortical (median progression time: 64 months, $P = 0.014$, $pFDR = 0.070$) subtypes showed higher risks of EDSS score progression than the Temporal-Cerebellar subtype (median progression time: 93 months). The Frontal-II (median conversion time: 107 months, uncorrected $P = 0.028$, $pFDR = 0.070$), Occipital (median conversion time: 70 months, uncorrected $P = 0.009$, $pFDR = 0.045$) and Subcortical (median conversion time unavailable, uncorrected $P = 0.037$, $pFDR = 0.074$) subtypes showed higher risks of SPMS conversion than the Frontal-I subtype (median conversion time unavailable). The Occipital (uncorrected $P = 0.003$, $pFDR = 0.030$) and Subcortical subtypes (uncorrected $P = 0.015$, $pFDR = 0.050$) showed higher risks of SPMS conversion than the Temporal-Cerebellar subtype (median conversion time: 118 months).

The Frontal-I subtype showed lower gene expression in endothelial cells (averaged correlation $R = -0.054$, $pFDR = 0.0009$) and microglia ($R = -0.100$, $pFDR < 0.00001$), and higher gene expression in interneurons ($R = 0.056$, $pFDR < 0.00001$) and S1 pyramidal neurons ($R = 0.010$, $pFDR < 0.00001$). The Frontal-II subtype showed lower gene expression in endothelial cells ($R = -0.064$, $pFDR = 0.00001$) and higher gene expression in CA1 pyramidal neurons ($R = 0.049$, $pFDR < 0.00001$), interneurons ($R = 0.040$, $pFDR = 0.00018$) and S1 pyramidal neurons ($R = 0.060$, $pFDR = 0.00001$). The Temporal-Cerebellar subtype showed higher gene expression in astrocytes ($R = 0.040$, $pFDR = 0.0050$) and CA1 pyramidal neurons ($R = 0.031$, $pFDR = 0.0050$). The Occipital subtype showed lower gene expression in endothelial cells ($R = -0.056$, $pFDR = 0.00075$), microglia ($R = -0.110$, $pFDR < 0.00001$) and oligodendrocytes ($R = -0.047$, $pFDR = 0.0014$), and higher gene expression in S1 pyramidal neurons ($R = 0.071$, $pFDR < 0.00001$). The Subcortical subtype showed higher gene expression in astrocytes ($R = 0.055$, $pFDR = 0.000018$), CA1 pyramidal neurons ($R = 0.078$, $pFDR < 0.00001$), interneurons ($R = 0.056$, $pFDR < 0.00001$), microglia ($R = 0.039$, $pFDR = 0.00024$), oligodendrocytes ($R = 0.068$, $pFDR < 0.00001$), and S1 pyramidal neurons ($R = 0.067$, $pFDR < 0.00001$).

Sensitivity analysis showed consistent SAM clustering patterns using different thresholds for SAM binarization and voxel removal for calculation efficiency. The validation findings were consistent with the main findings, although there were fewer cases of the Temporal-Cerebellar subtype in the validation dataset. A subset of patients ($n = 180$) at an early disease phase (duration less than 3 years) confirmed the distinct disease pathologies driving these subtypes that may be independent of disease duration. Follow-up scans in a subset ($n = 28$) were used to explore the stability of the MS subtypes and potential conversions between subtypes within 4 years. Approximately 57% (16/28) of the patients showed a stable longitudinal trajectory within the first 2 years, and then showed conversions among subtypes in the late course of the disease (more than 2 years), especially among the Frontal-II and Occipital subtypes (7/28, 25%).

Conclusion

We proposed a novel MS-related SAM and categorized MS patients into distinct SAM subtypes with distinct virtual histologies that may drive cognitive impairment and physical disability. This subtyping can be generalized to multiple datasets and validated in a longitudinal cohort. The current findings provide a novel deep-learning-based pipeline for disease subtyping and should help interpret disease-associated disability and contribute to stratified medicine and prognosis for MS.

Effect of Coefficient of Determination (R^2) on the Accuracy of CMRtools Software in Diagnosing Liver Iron Concentration in Thalassemia Patients

Chaotian Luo¹, Fei Peng¹, Fengming Xu^{1,2}, Cheng Tang¹, Peng Peng¹

1. The First Affiliated Hospital of Guangxi Medical University

2. The Fourth Affiliated Hospital of Guangxi Medical University

OBJECTIVE: To investigate the effect of the coefficient of determination (R^2) on the accuracy of the CMRtools software for quantifying liver iron concentration (LIC), with reference to the liver iron concentration report by FerriScan®/MRI-R2 (LIC_F). **METHODS:** We measured hepatic T2* values in 108 patients with thalassemia by CMRtools software and imputed LIC_T by Garbowski formula and subsequently compared LIC_T with LIC_F to calculate the diagnosis agreement for different R^2 range subgroups. **RESULTS:** There was no significant difference in diagnostic accuracy among different echo arrays ($p>0.05$). There was a statistically significant difference in the correct diagnostic rate for the determination coefficient R^2 groups ($p<0.001$) and the LIC_F groups ($p<0.001$). The result indicated that as the R^2 value increased, the more correct the diagnosis was. The normal LIC_F group had the highest correct diagnostic rate, the moderate LIC_F had the lowest correct diagnostic rate, and the super-severe group was 2nd lowest. **CONCLUSION:** CMRtools is an excellent classifier for diagnosing the occurrence of iron overload in the liver and is effective in distinguishing different levels of LIC; different LIC and different R^2 values affect the correct diagnostic rate of CMRtools, but there are no statistical basis for suggesting specific effects.

PO-3838

Performance Evaluation of Large Language Models in Radiology domain: A Comparative Study of ChatGPT-4, GPT-3.5, Bing, and Bard in Chinese Language Context

Wen Xu, Mei Ruan, Mei Wang, Yanna Shan, Qijun Shen

Hangzhou First People's Hospital

Background and Purpose: Large language models (LLMs) such as ChatGPT have demonstrated promising results in various domains, including radiology. However, their performance in specific radiology scenarios, particularly in the context of the Chinese language, remains largely unexplored. This study aims to assess the performance of GPT-4 in several distinct radiology scenarios and compare it with other LLMs, including GPT-3.5, Bing and Bard.

Methods: We employed a prospective study design, utilizing a series of tasks to evaluate the performance of GPT-4 in different radiology scenarios. These scenarios included preparation for imaging tests, simplification of radiology reports, automate RADS classification, determination of radiological study and protocol, error detection in reports, clinical information summarization, impression generation and the construction of personalized radiology curriculum. To ensure a robust comparison, the performance of GPT-4 was benchmarked against other prominent LLMs. Each model was evaluated independently across all scenarios, and their performances were recorded for subsequent analysis. The statistical methods used in this study included descriptive statistics, chi-square tests for categorical variables, and t-tests for continuous variables. The level of statistical significance was set at $p<0.05$. All statistical analyses were performed using the latest version of the R statistical software.

Results: When being used as assistant for preparation for imaging tests, GPT-4 answered 25 questions with 22 (88%) correct, 2 (8%) partially correct, and 1 (4%) incorrect. Bing answered the same set of questions with 20 (80%) correct, 3 (12%) partially correct, and 2 (8%) incorrect. GPT-3.5 answered 18 (72%) correctly, 4 (16%) partially correct, and 3 (12%) incorrect. Bard answered 17 (60%) correctly, 5 (20%) partially correct, and 5 (20%) incorrect. In the simplification of radiology reports task, 5 radiologists assessed the simplified reports generated by LLMs. The majority of radiologists agreed that the simplified reports made by GPT-4 were factually correct, complete, and not potentially harmful to the patient, with an agreement rate of 90%. This was superior to the agreement rates for Bing and GPT-3.5 (80%), Bard (64%). GPT-4 achieved an overall accuracy rate (including correct and partially correct answers) of 90% in automate RADS classification task, outperforming Bing (84%), GPT-3.5 (80%) and Bard (68%). For determination of the best radiological study and protocol based on patients' clinical information, GPT-4 demonstrated an 88% agreement with the radiologists' decisions, close to Bing (84%), surpassing GPT-3.5 (76%) and Bard (64%). GPT-4 successfully identified 90% of the errors in radiology reports in the error detection task, outperforming GPT-3.5 and Bing (84%), Bard (64%). In summarizing clinical information, GPT-4 and Bing achieved an accuracy rate of 90%, superior to GPT-3.5 (80%) and Bard (72%). GPT-4 achieved a correct rate of 92% when being applied in generating impressions from findings of reports, exceeding Bing (84%), GPT-3.5 (76%) and Bard (56%). The analysis revealed that the performance of GPT-4 was significantly superior to the other LLMs in most tasks. GPT-4 is more likely to provide correct or partially correct answer than Bard, approximately by 1.5 folds (OR=1.55, p=0.004).

Conclusion: Despite no radiology-specific pretraining, LLMs showed high performance in various radiology scenarios, especially GPT-4, demonstrating its potential as a powerful tool in radiology practice and education. However, it is essential to acknowledge its limitations and continue to refine its performance in specific scenarios. Further studies are needed to maximize the potential of LLMs in radiology and other medical domains.

PO-3839

MAN-GAN: A Mask-Adaptive Normalization based Generative Adversarial Networks for liver multi-phase CT image generation

Wei Zhao¹, Jun Liu¹, Yixuan Yuan², Wenting Chen³, Youlan Shang¹

1. Department of Radiology, Second Xiangya Hospital, Central South University, Changsha, China

2. Department of Electronic Engineering, The Chinese University of Hong Kong, Hong Kong SAR 999077, China.

3. Department of Electrical Engineering, City University of Hong Kong, Hong Kong SAR 999077, China.

Background

Liver multi-phase enhanced computed tomography (MPECT) plays a vital role in the whole clinical practice regarding managing various liver disease, but limited by several conditions.

Purpose

To construct a deep learning network for automatically generating MPECT images only using plain CT images.

Method and Materials

Three liver MPECT datasets from two institutions were collected. Dataset 1 included 374 patients, and was divided into three parts, i.e., training set (224 patients), validation set (75 patients) and test set (75 patients). Dataset 2 included 144 patients with one specific liver diseases and was used as internal test dataset. To verify the generalization ability of the proposed model, we further collected another dataset with 83 MPECT patients for external validation. Then, we propose a Mask-Adaptive Normalization based Generative Adversarial Networks with Cycle-Consistency Loss (MAN-GAN) to achieve plain CT to MPECT translation. Two subjective radiologists' evaluation studies were performed to verify the clinical useful of our generated images.

Results

Our proposed MAN-GAN network outperformed the baseline network and other state-of-art methods in all generations of three phases, evaluated by PSNR and SSIM. The promising results were verified in internal and external datasets. In the quality analysis, the image quality of generated PVP phase images is above average (>4), and that of generated AP, DP phase images are also acceptable, nearly above average for clinical diagnosis (>3). Moreover, the similarities between real images and generated images in all three phases are all over 80.

Conclusion

Our proposed MAN-GAN verifies the feasibility of liver MPECT images translation based on plain images only and achieves a state-of-art performance using the subtraction strategy. Our method has great potential in solving the dilemma of liver CT contrast canning and aiding the further liver-interaction clinical scenarios.

PO-3840

Computed Tomography-derived intratumoral and peritumoral radiomics in predicting EGFR mutation in lung adenocarcinoma

Wei Zhao¹, Jun Liu¹, Youlan Shang¹, Ge Li², Ming Li⁴, Weidao Chen³

1. Department of Radiology, Second Xiangya Hospital, Central South University, Changsha, China

2. Department of Radiology, Xiangya Hospital, Central South University, No. 87 Xiangya Rd, Changsha 410008, Hunan, P. R. China

3. Infervision, Chaoyang District, Beijing, China 100025

4. Department of Radiology, Huadong Hospital affiliated to Fudan University, Shanghai 200040, China

Objective: To investigate the value of Computed Tomography (CT) radiomics derived from different peritumoral volumes of interest (VOIs) in predicting epidermal growth factor receptor (EGFR) mutation status in lung adenocarcinoma patients.

Materials & Methods: A retrospective cohort of 779 patients who had pathologically confirmed lung adenocarcinoma were enrolled. 640 patients were randomly divided into a training set, a validation set, and an internal testing set (3:1:1), and the remaining 139 patients were defined as an external testing set. The intratumoral VOI (VOI_I) was manually delineated on the thin-slice CT images, and seven peritumoral VOIs (VOI_P) were automatically generated with 1, 2, 3, 4, 5, 10, and 15mm expansion along the VOI_I. 1454 radiomic features were extracted from each VOI. The t-test, the least absolute shrinkage and selection operator (LASSO), and the minimum redundancy maximum relevance (mRMR) algorithm were used for feature selection, followed by the construction of radiomics models (VOI_I model, VOI_P model and combined model). The performance of the models were evaluated by the area under the curve (AUC).

Results: 400 patients were classified as EGFR mutant (EGFR+), while 379 were wild-type (EGFR-). In the training and validation sets, internal and external testing sets, VOI4 (intratumoral and peritumoral 4mm) model achieved the best predictive performance, with AUCs of 0.877, 0.727 and 0.701, respectively, outperforming the VOI_I model (AUCs of 0.728, 0.698 and 0.653, respectively). **Conclusions:** Radiomics extracted from peritumoral region can add extra value in predicting EGFR mutation status of lung adenocarcinoma patients, with the optimal peritumoral range of 4 mm.

PO-3841

Noninvasive diagnostic models based on CT scans for differentiating solitary pulmonary metastasis in colorectal cancer patients by artificial intelligence: a multicenter study

Shiqi Zhou
Zhejiang Cancer Hospital

Background: Indeterminate solitary pulmonary nodules are often encountered on CT scans, and diagnosis of solitary pulmonary metastasis (PM) is important for patients with colorectal cancer (CRC).

Purpose: To build and validate proper noninvasive artificial intelligence diagnostic models based on routine chest CT for solitary PM in CRC patients.

Methods: All patients (n=212) with pretreated solitary CRC PM on chest CT were reviewed in the local database in Zhejiang Cancer Hospital between 2012 and 2022, and randomly divided into the training or internal validation groups on 7: 3. A total of 185 patients with pretreated T1 stage primary lung cancer and 256 patients with benign solitary pulmonary nodules were randomly selected. Artificial intelligence models based on machine learning (Decision Tree, Extra Trees, Light GBM, Radom Forest, Support Vector Machine, XGBoost) and deep learning were built to classify the solitary pulmonary nodules as PM, benign lesion or primary lung cancer. External validation group included 44 CRC patients with solitary PM from two independent hospitals.

Results: For classification between PM and benign solitary pulmonary nodule, the machine learning model based on support vector machine showed the best diagnostic ability, with a 0.995 area under the curve (AUC) in the internal validation, a 0.977 AUC in external validation. The deep learning model showed a 0.966 AUC in the internal validation, and 0.893 AUC in external validation. For classification between PM and lung cancer, the best machine learning model based on support vector machine showed a 0.991 AUC in internal validation and the deep learning model showed a 0.949 AUC.

Conclusions:Non-contrast CT based radiomic analyses can be useful for noninvasively differentiating solitary PM and benign pulmonary nodule or primary T1 stage lung cancer which can aid clinical decision in CRC patients with indeterminate solitary pulmonary nodules detected by CT

PO-3842

Prediction of long-term functional prognosis using a machine learning model with lesion spatial information in acute ischemic stroke

Jun Lu^{1,2},Guiling Zhang¹,Wenzhen Zhu¹

1. Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. The First Affiliated Hospital of Shihezi University

Background and purpose: Early prediction of long-term functional prognosis is needed for acute ischemic stroke (AIS) patients to assist in making accurate treatment decisions. The aim of this study is to develop a machine learning model with lesion spatial information (LSI) to predict more accurately using diffusion-weighted imaging (DWI).

Methods: The LSI features were extracted from DWI images to develop the LSI model and predict poor long-term functional prognosis. 295 AIS patients were retrospectively collected as dataset 1 and 81 AIS patients were prospectively collected as an independent external dataset 2. The modified Rankin Scale score at 90 days (mRS-90) was used to evaluate patients' long-term

functional prognosis. The predictive performance of the LSI model was compared with those of DWI radiomics (DR) model, clinical model, and combined model.

Results: The AUC of the LSI model was higher than that of the DR model, but not significantly different (0.745 vs 0.732 in the training cohort, $P=0.718$; 0.731 vs 0.713 in the internal validation cohort, $P=0.773$; 0.729 vs 0.634 in the external validation cohort, $P=0.258$). The combined model with the most preferable AUC (0.887 in the training cohort; 0.878 in the internal validation cohort; and 0.788 in the external validation cohort).

Conclusions: Predictive performance of LSI features was equivalent to DR features. The integration of LSI in the prognostic model can improve the efficacy, which can provide a valuable reference for clinical healthcare of AIS patients.

PO-3843

Synthetic T2WI generated from b0 diffusion-weighted imaging using Hybrid-Fusion Network

Yun Peng, Chunmiao Wu, Lianggeng Gong
The Second Affiliated Hospital of Nanchang University

Background: More information obtained from diffusion-weighted imaging (DWI), a common examination used to evaluate acute ischemic stroke, allows for a more accurate assessment of episodic lesions.

Purpose: To investigate if Hybrid-Fusion Network (Hi-Net) can recover T2-weighted scans from b0 DWI.

Materials and methods: In this retrospective study of head MRI performed from 1 September 2023 to 7 September 2023, simulated conventional DWI and corresponding T2WI were acquired. All images (1098 images) were divided into the training set (878 images) and the verification set (220 images) according to the ratio of 8 to 2. After the training set is preprocessed, including rotation, inversion, cropping and generating 8 images, Hi-Net were then trained to recover the T2WIs from the b0 DWIs. The synthetic T2WI (sT2WI) fitted from DWIs in the validation set were generated. Mean square error (MSE), peak signal-to-noise ratio (PSNR), structural similarity (SSIM) and normalized root-mean-square error (NRMSE) were used to evaluate the quality of vT2WI.

Results: After 4000 epoch training, the generated sT2WIs were compared with the original T2WIs. The mean values of the indexes were MSE, 0.00817, SSIM, 0.71258, PSNR, 21.18140 and NRMSE, 0.46591, respectively.

Conclusion: Hi-Net may be useful to enable the synthetic generation of T2WIs based on b0 DWIs to provide more information for the clinic.

PO-3844

Predicting the growth of sub-centimeter sub-solid pulmonary nodule within two years

Zongjing Ma, Yingli Sun, Liang Jin, Ming Li
Huadong Hospital of Fudan University

Objective: The purpose of this study was to combine clinical information and computer tomography (CT) based radiomics to establish models for predicting whether sub-centimeter subsolid pulmonary nodules (SCSSNs) will grow within 2 years.

Methods: Based on the inclusion and exclusion criteria, 726 CT scans of 253 SCSSNs were included, including 331 growth and 395 stable within 2 years. All scans were randomly divided into the training ($n=508$) and validation ($n=218$) group in the ratio of 7:3. The least absolute shrinkage

selection operator algorithm was used to select radiomics features and establish radiomics signature (RS). Subsequently, using clinical features and RS establish a fusion model for predicting whether SCSSNs will grow within 2 years. The performance of the models was assessed using the receiver operating characteristic curve (ROC) and the area under the curve (AUC). Delong test was used to compare the differences in AUC of different models. Calibration curves and clinical decision curves were used to evaluate the predictive accuracy and clinical utility of the models, respectively.

Results: In the training group, the AUC of the clinical model, radiomics model, and fusion model were 0.763, 0.888, and 0.914, respectively; and in the validation group, the AUC of the clinical model, radiomics model, and fusion model were 0.720, 0.809, and 0.892, respectively. Delong test showed that the fusion model outperformed the other two models, and the fusion model predicted values overlapped with the standard baseline in the calibration curve, and the fusion model had the highest net profit in the decision curve.

Conclusion: The fusion model based on clinical information and radiomics can effectively predict whether SCSSNs will grow within 2 years and thus optimize the patient's management plan.

PO-3845

Prognostic prediction of acute posterior circulation ischemic stroke after mechanical thrombectomy based on DWI radiomics

Shanshan Huang¹, Bofeng Bai¹, Cong Ning¹, Yannan Wang¹, Yuwei Xia², Yongbin Li¹

1. Xi'an NO.1 Hospital

2. Department of Research and Development, Shanghai United Imaging Intelligence Co., Ltd., Shanghai, China

Objective: To investigate the value of DWI radiomics features in predicting the prognosis of acute posterior circulation ischemic stroke, and to study the performance improvement of the prognostic prediction model combining radiomics features compared with the prognostic score alone.

Methods: A retrospective analysis was performed on 68 patients with acute posterior circulation ischemic stroke who received mechanical thrombectomy in Xi'an First Hospital from July 2021 to April 2023. All patients underwent diffusion-weighted imaging (DWI) examination within 24h of onset and before treatment. According to the modified Rankin Scale (mRS) score, the patients were divided into good prognosis (mRS ≤ 2) (n=41) and poor prognosis (mRS > 2) (n=27) outcome groups. The general clinical data of the patients were collected and the National Institutes of Health Stroke Scale (NIHSS) was used for pre-treatment scoring. Two doctors manually delineated the infarct area layer by layer on the DWI image through the United Imaging Intelligence's one-stop research platform, and radiomics features were extracted. The data were randomly divided into a training set and a test set according to 8:2. The correlation coefficient ($P > 0.05$), recursive feature elimination with cross-validation (RFECV) (Top 30), and the least absolute shrinkage selection operator (LASSO) algorithm were used to select the optimal radiomics features in the training set. Then, the 5-fold cross-validation strategy and Bagging decision tree model were used to establish the NIHSS scoring model, radiomics model, and NIHSS and radiomics comprehensive model. The prediction performance of the model was evaluated by the score under the receiver operating characteristic curve (AUC). Finally, the 5-fold optimal model was applied to the external validation set (n=10) to evaluate the reliability of the model in clinical application. (Figure 1)

Results: 25 radiomics features were selected from 2264 radiomics features. The integrated NIHSS and radiomics model demonstrated superior prediction performance in the test set ($P = 0.044$), with a 5-fold mean AUC of 0.903, a mean sensitivity of 70%, and a mean specificity of 85%, respectively, significantly higher than the independent NIHSS scoring model (mean AUC = 0.802, mean sensitivity = 62%, and mean specificity = 85%) (Figure 2). In the external validation set, the prognostic prediction model integrating radiomics features (AUC = 0.708, sensitivity = 75%, and

specificity = 83%) reduced the rate of missed diagnosis in patients with poor prognosis compared with the independent NIHSS scoring model (AUC = 0.438, sensitivity = 50%, and specificity = 75%).

CONCLUSIONS: The combination of DWI radiomics and NIHSS in the prediction of prognosis of acute posterior circulation ischemic stroke after mechanical thrombectomy has a high value, which will be helpful for the treatment decision of acute posterior circulation ischemic stroke.

PO-3846

Perioperative Change in Skeletal Muscle Index and Its Long-term Prognostic Significance in Patients with Colorectal Cancer: A Retrospective Longitudinal Cohort Study

Zhenhui Li
Yunnan Cancer Hospital

Purpose: To explore perioperative change patterns of skeletal muscle index (SMI) and evaluate their effect on long-term outcomes of colorectal cancer (CRC) patients.

Patients and Methods: Stage I–III CRC patients receiving curative resection between 2012 and 2018 were included in this retrospective cohort. SMI at the third lumbar vertebra level by computed tomography scan was calculated and classified as normal or sarcopenia preoperatively and at 3, 6, 9, and 12 months postoperatively. The patients were divided into different perioperative SMI change patterns based on the preoperative and postoperative SMI status. The association between perioperative SMI change patterns and recurrence-free survival (RFS) and overall survival (OS) was examined using Cox proportional hazards models at postoperative 3, 6, 9, and 12 months, respectively.

Results:

A total of 2222 patients (median [interquartile range] age, 60.00 [51.00–68.00] years; 1302 men; 222 preoperative sarcopenia) were evaluated. Four distinct SMI change patterns were identified: normalpre-normalpost, normalpre-sarcopeniapost, sarcopeniapre-normalpost, and sarcopeniapre-sarcopeniapost. In patients with preoperative sarcopenia, 51.47%, 49.09%, 58.14%, and 40.74% was classified as normal, while in patients with preoperative normal SMI, 3.78%, 2.76%, 2.35%, and 3.12% was classified as sarcopenia at postoperative 3, 6, 9, and 12 months, respectively. Multivariate Cox model analysis showed that, compared to patients with normalpre-normalpost, patients with normalpre-sarcopeniapost had the worst RFS (hazard ratio [HR] = 3.32, 95% confidence interval [CI]: 1.40–7.90), patients with sarcopeniapre-sarcopeniapost had worse RFS (HR = 2.36, 95% CI: 1.04–5.37), while patients with sarcopeniapre-normalpost had similar RFS (HR = 1.23, 95% CI: 0.29–5.18) at 12 months postoperatively. The HRs changed slightly at 3, 6, and 9 months postoperatively. Similar results were observed for OS.

Conclusion:

There are four perioperative SMI change patterns associated with long-term CRC outcomes. The sarcopenia developed postoperatively has the worst prognosis, while the sarcopenia reversal could improve prognosis.

PO-3847

Deep learning for automatic segmentation of triple-negative breast cancer lesions and axillary lymph nodes in multi-sequence magnetic resonance imaging

Jiamin Guo¹, Chengrong Yu², Junjie Hu², Yichen Zheng¹, Shuang Zhao¹, Ji Ma¹

1. West China Hospital

2. Sichuan University

Purpose: To construct and validate multi-sequence deep neural networks (DNN) to automatically and exactly identify triple-negative breast cancer (TNBC) lesions and axillary lymph nodes (ALN). **Materials and Methods:** A total of 207 high-quality DCE-MRI images and 61,587 MRI slices were collected, generating four datasets: T1C/Lesion, T1C/lymph node (LN), T1W/LN, and T2W/LN. The images in each dataset were randomly divided into training, validation, and testing sets. The 3D nn-UNet networks were constructed for single-sequence MRI images in each dataset, resulting in four baseline models. Then, eight multi-sequence fusion networks were trained using cross-sequence MRI images as input, and quantitative evaluation metrics were used to analyze whether multi-sequence inputs can improve baseline networks performance. Finally, we compared the segmentation performance of the constructed models with that of two other advanced 3D models. **Results:** In the segmentation of TNBC ALNs, the T1W/LN+T1C network was the best performing multi-channel sequence network, with a Dice value better than the best performing baseline network (Dice, 0.6590 vs 0.6309). In the segmentation of TNBC lesions, the T1C/Lesion+T1W achieved a Dice of 0.6559 in the test set, better than the baseline network. In the comparative experiments with other networks, our multi-sequence networks perform superior in identifying both lesions and ALNs.

Conclusion: The multi-sequence DNN models automatically and precisely identified TNBC lesions and metastatic ALNs at DCE-MRI images, and the performance of the multi-sequence networks was superior to that of single-sequence models, especially in the identification of ALNs.

PO-3848

Machine learning based on SPECT/CT to differentiate bone metastasis and benign bone lesions in lung malignancy patients

Huili Wang, Jianfeng Qiu, Junchi Ma, Jindong Xie
shandong first medical university

Purpose: Machine learning analysis of [99mTc]-methylene diphosphate (99mTc-MDP) SPECT/CT scans to distinguish bone metastases from benign bone lesions in patients with lung cancer.

Methods: 141 patients (69 with bone metastases and 72 with benign bone lesions) were randomly assigned to the training group or testing group in a 7:3 ratio. Lesions were manually delineated using ITK-SNAP, and 944 radiomics features were extracted from SPECT and CT images. The least absolute shrinkage and selection operator (LASSO) regression was used to select the radiomics features in the training set, and the single/bimodal radiomics models were established based on support vector machine (SVM). To further optimize the model, the best bimodal radiomics features were combined with clinical features to establish an integrated Radiomics-clinical model. The diagnostic performance of models was evaluated using receiver operating characteristic (ROC) curve and confusion matrix, and performance differences between models were evaluated using the Delong test.

Results: The optimal radiomics model comprised of structural modality (CT) and metabolic modality (SPECT), with an area under curve (AUC) of 0.919 and 0.907 for the training and testing set, respectively. The integrated model, which combined SPECT, CT, and two clinical features, exhibited satisfactory differentiation in the training and testing set, with AUC of 0.939 and 0.925, respectively.

Conclusions: The machine learning can effectively differentiate between bone metastases and benign bone lesions. The Radiomics-clinical integrated model demonstrated the best performance.

PO-3849

A Preliminary Study on the Value of a Combined bpMRI-Based Radiomics-Clinical Model for Assessing Extracapsular Extension in Prostate Cancer

Liqin Yang

Hangzhou Hospital of Traditional Chinese Medicine

Purpose To evaluate the value of a combined model considering bpMRI-based radiomics and clinical variables for assessing ECE in PCa.

Methods Date of 392 patients of PCa confirmed by postoperative pathology, who underwent MRI between January 2018 and March 2022 in our hospital were retrospectively enrolled in this study. The clinical information included each patient's age, PSA concentration at admission, lesion location distribution, biopsy Gleason Group, and the PI-RADS v2.1 score given by the radiologists. All patients were randomly divided into the training and validation sets at a ratio of 7:3. Radiologists assessed the ECE of all lesions by the Mehralivand grade and delineated all lesions without obtaining the pathological results. Radiomics features were extracted from T2WI, DWI, and ADC images in each lesion. A radiomics model was built by the features normalization of Z-Score, the redundant features removal of RFE algorithm, and the iterative training of LASSO classifier. Then, univariate and multivariate binary logistics regression analysis were used to screen out independent risk factors from clinical variables to construct clinical model. Moreover, the combined model was constructed by the integration of the independent risk factors in clinical variables and the radiomics model, and the nomogram for assessing ECE was constructed based on the combined model. Finally, Delong test and the decision curve analysis were used to compare the performance in the assessment of ECE among clinical model, Mehralivand grade, radiomics model and combined model.

Results In the training set, the AUCs of the combined model and radiomics model were 0.897 (95 % CI: 0.861~0.934) and 0.882 (95 % CI: 0.844~0.921), respectively. Based on the validation set, the AUC of the combined model was comparable to that of the radiomics model [AUC: 0.894 (95 % CI: 0.837~0.950) vs 0.835 (95 % CI: 0.763~0.908), $P>0.05$]. In addition, the combined model had a higher sensitivity (90.7% vs 77.8%) and accuracy (81.4% vs 76.3%) compared with the radiomics model. On the other hand, the AUCs of the clinical model were 0.805 (95 % CI: 0.753~0.850) and 0.749 (95 % CI: 0.661~0.824) in the training set and validation set, respectively, which were lower than those in the combined model [in the training set: 0.805 (95 % CI: 0.753~0.850) vs 0.897 (95 % CI: 0.861~0.934), $P=0.050$; in the validation set: 0.749 (95 % CI: 0.661~0.824) vs 0.894 (95 % CI: 0.837~0.950), $P=0.050$; both $P<0.05$]. The AUCs of the Mehralivand grade in radiologists were 0.746 (95 % CI: 0.690~0.796) and 0.774 (95 % CI: 0.688~0.846) in the training set and validation set, respectively, which were also lower than those in the combined model [in the training set: 0.746 (95 % CI: 0.690~0.796) vs 0.897 (95 % CI: 0.861~0.934), $P<0.001$; in the validation set: 0.774 (95 % CI: 0.688~0.846) vs 0.894 (95 % CI: 0.837~0.950), $P=0.010$; both $P<0.05$]. At last, the decision curve analysis implied that the combined model could obtain the maximum net clinical benefits compared with the clinical model, the Mehralivand grade and radiomics model.

Conclusion The combined bpMRI-based radiomics-clinical model has satisfactory estimated value for ECE in PCa patients comparing with the clinical model, the Mehralivand grade, and the radiomics model, which could be conducive to the preoperative individualized and accurate diagnosis and treatment of PCa patients.

PO-3850

Altered intersubject functional variability of brain white-matter in major depressive disorder and its association with gene expression profiles and clinical applications

Qun Gai,Tongpeng Chu,Ning Mao,Haizhu Xie
Yantai Yuhuangding Hospital affiliated to Qingdao University

Background: Major depressive disorder (MDD) is a heterogeneous disorder with remarkable intersubject variability in clinical presentations and neurobiological substrates. Although the altered intersubject variability in functional connectivity (IVFC) within gray-matter has been reported in MDD, the alterations to IVFC within white-matter (WM-IVFC) and the molecular mechanisms associated with these changes remain unknown.

Methods: Based on the resting-state functional MRI data of discovery [(145 MDD patients and 119 healthy controls (HCs)] and validation cohorts (54 MDD patients, and 78 HCs), we compared the WM-IVFC between the two groups. We assessed the meta-analytic cognitive functions related to the alterations. In combination with the Allen Human Brain Atlas, transcriptome-neuroimaging association analyses were further conducted to investigate gene expression profiles associated with WM-IVFC alterations in MDD, followed by a set of gene functional characteristic analyses. Finally, we explored possible clinical applications of WM-IVFC, including disease classification and clinical symptom prediction.

Results: We found extensive WM-IVFC alterations in MDD compared to HCs, which were associated with multiple behavioral domains, including visual and sensorimotor processes, as well as higher-order functions. Furthermore, MDD-related WM-IVFC changes spatially correlated with the expression of 1004 genes, which were enriched for synapse, neuronal system, and ion channel, and predominantly expressed in excitatory and inhibitory neurons. For clinical applications, the altered regional WM-IVFC could not only effectively distinguish MDD patients from HCs with an area under curve ranging from 0.889 to 0.901 across three classifiers, but also significantly predict depression severity ($r = 0.575$, $p = 0.001$) and suicide risk ($r = 0.384$, $p = 0.001$) in patients. Our results obtained good reproducibility in the validation cohort.

Conclusion: These results revealed intersubject functional variability changes of brain WM in MDD and highlighted its clinical applications and linkage with gene expression profiles, providing insight into the neurobiological underpinnings of this disorder.

PO-3851

Artificial intelligence-based multi-parametric MRI model predicts intra-tumoral tertiary lymphoid structures in Hepatocellular Carcinoma: a multicenter observational study

Shichao Long,Juan Chen,Linhui Zhong,Wenzheng Li
Xiangya hospital

Purpose: The existence of intra-tumoral tertiary lymphoid structures (iTLS) prompt long-term survival time and anti-cancer immune microenvironment in Hepatocellular Carcinoma (HCC). We proposed an artificial intelligence radiomic integrated model for predicting iTLS in patients with HCC using pretreatment multiparameter MRI (mpMRI) data.

Methods: In this multicenter study, HCC patients who undergone hepatectomy were enrolled into cohorts, with preoperative mpMRI data (contrast-enhanced T1-weighted and T2-weighted imaging) and H&E for features extraction and iTLS assessment. The Transfer Learning-based Radiomic (TLR) model was established through machine learning algorithm, including transfer learning and

radiomic mpMRI features. The predictive efficiency of TLR model was validated multiple retrospectives and single-center prospective observation cohort. The area under the curve (AUC), positive predictive value (PPV), negative predictive value (NPV), sensitivity, and specificity were calculated to assess the model performance.

Results: In training dataset, 307 eligible participants were retrospectively enrolled between Oct 1, 2015, and Oct 1, 2021; 148 in validated dataset 1, 84 in dataset 2, and 54 in dataset 3; between Jan 1, 2022, and Jun 30, 2023, 76 eligible patients were recruited in the prospective cohort. The TLR model had robust predictive accuracy in training dataset (AUC 0.905 [95% CI 0.825–0.938]), validated dataset 1 (AUC 0.809 [95% CI 0.734–0.884]), validated dataset 2 (AUC 0.882 [95% CI 0.798–0.965]), and validated dataset 3 (AUC 0.889 [95% CI 0.778–1.000]). In prospective dataset, TLR had an AUC of 0.850 (95% CI 0.767–0.934), PPV of 0.659 (0.547–0.824), NPV of 0.968 (0.815–1.000), sensitivity of 0.948 (0.759–1.000), and specificity of 0.702 (0.521–0.894). The predicted iTLS+ group had long-term OS and DFS (all $p < 0.0001$) than predicted negative iTLS group.

Conclusion: Based on preoperative mpMRI data, we proposed a novel tool, which has reliable and robust performance to assist in precisely therapeutic strategies of HCC.

PO-3852

Noninvasive Magnetic Resonance Imaging Radiomics Features of adenohypophysis in evaluation of hypothalamic-pituitary-gonadal axis activation in pre- and at-puberty children.

Dong Liu, Wenzhen zhu

Tongji Hospital, Tongji Medical College, Huazhong University of Science & Technology

Objectives

To explore a noninvasive, low-cost and rapid radiomics model based on MRI data in evaluation of hypothalamic-pituitary-gonadal (HPG) axis activation in children.

Methods

A total of 239 children who received a hypophysial MRI scan and GnRH stimulation testing from April 2021 to September 2021 were enrolled in our study and divided into the training and test sets using stratified random sampling method. Radiomics features were generated using the least absolute shrinkage and selection operator (LASSO) with 10-fold cross-validation. The performance of radiomics model was evaluated using receiver operating characteristic (ROC) and decision curve analysis (DCA).

Results

A total of 851 radiomics features were extracted and reduced to 10 potential predictors in the training cohort by the LASSO logistic regression method. The radiomics model base on CUBE T1WI showed good prediction of HPG axis activation with the AUC of 0.84 in the training set and 0.81 in the test set. The AUC of the radiomics model was higher than that of adenohypophyseal Volume (aPV) and height (aPH) in the training set (0.84 vs 0.75 [$P = 0.001$] and 0.84 vs 0.63 [$P < 0.001$], respectively). In terms of DCA analysis, radiomics signature showed higher net benefit than aPV and aPH models.

Conclusions

The MRI radiomics model may serve as a noninvasive predictor of HPG axis activation, potentially providing valuable information in the diagnosis of patients for precocious puberty, central precocious puberty, constitutional delay in growth and puberty and congenital hypogonadotropic hypogonadism.

PO-3853

Research progresses of evaluating tumor microenvironment by Deep Learning

Ting Lu
lanzhou university

Tumor microenvironment is involved in the development,distant metastasis and treatment evaluation of tumors. Deep Learning is used to evaluate the tumor microenvironment in whole slide images, which is conducive to non-invasive prediction of the changes of micro-molecules in tumor structure, and provides a new research design or evaluation method for future clinical research. This review systematically summarizes the research of Deep Learning in the evaluation of tumor microenvironment, aiming to promote the further research and long-term clinical application of Deep Learning in the field of tumor microenvironment, and explore the potential and limitations of Deep Learning in the development of tumor microenvironment.

PO-3854

Deep learning for automatic lateral ventricles segmentation and diagnosis of ventriculomegaly by fetal MRI

Jiayan She¹,Wei Huang²,Gang Ning¹
1. West China Second University Hospital, Sichuan University
2. Machine Intelligence Laboratory, College of Computer Science, Sichuan University

Objectives: Develop a fully automatic MRI diagnostic method for fetal ventriculomegaly based on deep learning algorithm, which can be used for clinical fetal lateral ventricular development assessment.

Method: A total of 222 fetal brain coronal SSFSE sequence images were included, including 121 normal fetuses and 101 abnormal fetuses with ventriculomegaly, with a gestational week range of 19-38. The data was randomly divided into training set (n=180) and testing set (n=42). The proposed method is a two-stage method. First, we used nnU-Net to segment the fetal lateral ventricles from prenatal MRI images. Then, a classification network, ResNet, was used to identify whether there are ventriculomegaly.

Results: The segmentation model had a mean Dice value of 0.9048 ± 0.0077 , The average accuracy and area under the receiver operating characteristic curve (AUC) for classification model were 0.8286 ± 0.0199 and 0.8836, respectively.

Conclusion: Deep learning-based MRI image analysis can accurately reconstruct the lateral ventricle of fetus and diagnose ventriculomegaly in a shorter time, which is of positive significance for improving the workflow and reducing the tedious work of clinicians.

Fully automatic analysis CT FFR for the identification of ischemia-specific CAD with a new coronary artery model reconstruction algorithm: A multi-center study

Hongqin Liang, Jian Wang

Department of Radiology, Southwest Hospital, Third Military Medical University (Army Medical University)

OBJECTIVES The aim of this study was to validate the feasibility of a novel model for coronary computed tomography angiography (CCTA) based on deep learning and level set algorithms in order to optimize coronary 3D reconstruction and fractional flow reserve to identify ischaemic specific coronary artery disease (CAD).

METHODS A total of 171 consecutive patients with 198 vessels from 4 Chinese medical centers undergoing CTA and invasive FFR were retrospectively analyzed between November 2017 and March 2021. A novel model (esFFR) based on deep learning and level set method as well as commercial software based on deep learning were used to compare CT-FFR values and stenosis rate. The diagnostic performance of the novel model in detecting lesion-specific ischemia and lumen stenosis were evaluated for all lesions using invasive FFR and DSA as the reference standard.

RESULTS Per-vessel sensitivity, the diagnostic accuracy was 85.9% (95% CI 80-90%) for esFFR and 66.7% (95% CI 59.6-73.1%) for commercial software. The Sn (82.8%, 95% CI 72.8-89.7%), Sp (88.3%, 95% CI 80.5-93.4%) and AUC (0.9, 95% CI 0.85-0.94) for esFFR were highly comparable to commercial software. Stenosis rate measured by esFFR was highly correlated with DSA ($r=0.84$, $p<0.0001$). The correlation of stenosis rate between commercial software and DSA was relatively low ($r=0.71$, $p<0.0001$). On a per vessel basis, esFFR correctly identified 24 vessels with FFR 0.75 to 0.8 by using the standard threshold FFR of 0.8, and 33 vessels with FFR 0.8 to 0.85. Meanwhile, the commercial software properly recognized 19 vessels with FFR 0.75 to 0.8, and 18 vessels with FFR 0.8 to 0.85. The sensitivity, specificity and accuracy of esFFR were not significantly different at different levels of stenosis ($p=0.101$; $p=0.576$; $p=0.294$). There were significant differences in the accuracy of the commercial software in different stenosis ranges ($p=0.022$).

CONCLUSIONS This novel model (esFFR) based on deep learning and level set outperforms commercial software in detecting lesion-specific ischemia and Lumen stenosis in the real world.

Longitudinal magnetic resonance images-based deep learning model in the precise detection of recurrence in treated nasopharyngeal carcinoma

Yingying Huang¹, Yishu Deng¹, Yang Liu¹, Wenzhe Qiu², Mengyun Qiang³, Xiaoyun Li¹, Chuanmiao Xie¹, Xiang Guo¹, Liangru Ke¹, Chaofeng Li¹, Xing Lv¹

1. Sun Yat-sen University Cancer Center

2. The Affiliated Cancer Hospital of Guangzhou Medical University

3. Cancer Hospital of The University of Chinese Academy of Sciences

Purpose We aimed to develop and validate an Artificial Intelligence for detecting Recurrent Nasopharyngeal carcinoma (RAINet) model using longitudinal magnetic resonance (MR) images for precise detection of recurrence in treated nasopharyngeal carcinoma (NPC).

Methods In this two-centre, observational study, patients with treated NPC were enrolled from two hospitals (Sun Yat-sen University Cancer Center, Guangzhou, China; The Affiliated Cancer Hospital of Guangzhou Medical University, Guangzhou, China) between September, 2007, and

June, 2021 (Chi-CTR2200056595). We used the ResNet18 and Transformer as the backbone for constructing models (RAINet model, single scan model). The performances were compared internally and externally, and prospectively, in which RAINet was compared with three readers.

Results A total of 10212 scans among 1808 patients were collected. RAINet performed better than single scan model internally (area under the curve [AUC] 0.916, 95% confidence interval [CI] 0.900–0.932; AUC 0.855, 95% CI 0.832–0.878; $P = 0.004$), externally (AUC 0.900, 95% CI 0.856–0.944; AUC 0.709, 95% CI 0.629–0.788; $P < 0.001$). Moreover, RAINet could identify subtle subclinical signs in true positives earlier internally (mean [standard deviation] ahead time, 1.5 [4.4] months) and externally (3.5 [6.7] months). In the prospective cohort, RAINet achieved better sensitivity (0.767, 95% CI 0.694–0.840) than expert (0.760, 95% CI 0.685–0.834; $P = 1.000$), competent (0.698, 95% CI 0.617–0.778; $P = 0.222$) and trainee (0.636, 95% CI 0.551–0.720; $P = 0.024$) readers.

Conclusions RAINet detects recurrence on MR scans with high accuracy, which could optimize surveillance in treated NPC.

Abnormal Rich Club Organization in Postprandial Distress Type Functional Dyspepsia

Ziliang Xu, Zhuofan Li, Didi Wen, Yuanqiang Zhu, Minwen Zheng
Department of Radiology, Xijing Hospital, Fourth Military Medical University

OBJECTIVE Functional dyspepsia (FD) is a complex gastroduodenal disease, which severely affects the quality of life for patients. Recent neuroimaging studies have found that many brain's dysfunctions, microstructural changes in white matter and grey matter and abnormal central nervous system for gastric stimuli processing may associated with FD. However, the pathophysiology of FD remains unknown. Rich club organization plays a key role in whole-brain communication and its abnormality has been reported to relate with many diseases. Thus, the current study aimed to examine whether there existed altered rich club organization in FD patients. **METHOD** Thirty-one postprandial distress type FD patients and thirty-one healthy controls (HCs) were recruited. The functional and structural brain network matrices were constructed from the resting-state functional magnetic resonance imaging (fMRI) images and diffusion tensor imaging (DTI) images for each subject respectively. Rich club organization, network parameters and functional and structural coupling strength were computed based on these network matrices. Permutation test was used to evaluate differences of these properties between FD patients and HCs.

RESULT Results showed that FD patients had a decreased number of edges in rich club and feeder edges and an increased number of edges in local edges compare to HCs. Meanwhile, the functional and structural coupling strength in FD patients was higher than HCs.

CONCLUSION Our findings suggest that abnormal rich club organization may be a possible reason for the pathophysiology of FD.
